dysmetria Impaired ability to gauge distance relative to bodily movements.

dysmnesia Impaired memory.

dysmorphophobia BODY DYSMORPHIC DISORDER.

dyspareunia Physical pain in sexual intercourse, usually emotionally caused and more commonly experienced by women; may also result from cystitis, urethritis, or other medical conditions. *See also* Genito-pelvic pain/penetration disorder.

dysphagia Difficulty in swallowing.

dysphasia Difficulty in comprehending oral language (receptive dysphasia) or in trying to express verbal language (expressive dysphasia).

dysphonia Difficulty or pain in speaking.

dysphoria Feeling of unpleasantness or discomfort; a mood of general dissatisfaction, restlessness, depression, and anxiety.

dysphoric mood *See* dysphoria.

dysprosody Loss of normal speech melody (prosody).

dyssocial behavior Former term for antisocial behavior.

dyssomnias Disturbances in the amount, quality, or timing of sleep. *See* insomnia disorder, hypersomnia disorder, and circadian rhythm disorder. *Compare* parasomnias.

dysthymia Mood disorder characterized by chronic depressed mood for at least 2 years that is not severe enough to meet criteria for major depressive episode. Also called depressive neurosis. *See also* depression.

dystonia Extrapyramidal motor disturbance consisting of slow, sustained contractions of the axial or appendicular musculature; one movement often predominates, leading to relatively sustained postural deviations; acute dystonic reactions (facial grimacing, torticollis) are occasionally seen with the initiation of antipsychotic drug therapy.

E

early ejaculation DSM-5 term for premature ejaculation.

eating disorders Disorders characterized by a marked disturbance in eating behavior; they include anorexia nervosa, bulimia nervosa, pica, and rumination disorder of infancy.

echolalia Repetition of another person's words or phrases, as observed in certain cases of schizophrenia, particularly the catatonic types. The behavior is considered by some authors to be an attempt by the patient to maintain a continuity of thought processes.

echopraxia Repetition of another person's movements, as observed in some cases of catatonic schizophrenia.

ecology Study of the mutual relationships between living things and their environment; includes such studies as the differential incidence of mental disorders in various populations and the distribution of crime and delinquency within a specified geographical area.

ecopsychiatry Study of genetic data and hypotheses about the role of social factors in mental disease.

ecstasy 1. State of rapturous delight. **2.** Slang term for methylenedioxymethamphetamine (MDMA).

ECT Electroconvulsive therapy.

ectomorphic Thin, characterized by a linear body musculature; one of Sheldon's constitutional types. *Compare* endomorphic; mesomorphic.

educable Capable of achieving a fourth- or fifth-grade academic level; describes the mildly mentally retarded (LQ of 50–55 to 70). *Compare* trainable.

educational psychology Area of psychology concerned with the application of psychological theories to teaching.

EEG Electroencephalogram.

ego One of the three components of the psychic apparatus in the freudian structural framework, the others being the id and the superego. It occupies a position between the primal instincts and the demands of the outer world, therefore mediating between the person and external reality. In so doing, it performs the important functions of perceiving the needs of the self, both physical and psychological, the qualities and attitudes of the environment. It evaluates, coordinates, and integrates those perceptions so that internal demands can be adjusted to external requirements. It is also responsible for certain defensive functions to protect the person against the demands of the id and the superego. Although the ego has some conscious

components, many of its operations are automatic; adaptation to reality is perhaps its most important function.

ego-alien Denoting aspects of a person's personality that are viewed as repugnant, unacceptable, or inconsistent with the rest of the personality. Also called ego-dystonic. *Compare* ego-syntonic.

ego analysis Psychoanalytic study of the manner in which the ego operates, especially in relation to intrapsychic conflicts. *See also* ego psychology.

ego boundaries Concept introduced by Paul Federn that refers to the ability of the intact ego to differentiate the real from the unreal. Ego boundaries prevent repressed unconscious material from overwhelming the ego; when that happens, a person experiences depersonalization and derealization. Boundaries are said to be weakened in schizophrenia and dissociative states.

egocentric Self-centered; selfishly preoccupied with one's own needs; lacking interest in others.

ego-coping skill Adaptive method or capacity developed by a person to deal with or overcome a psychological or social problem.

ego defense Defense mechanism to protect the person against the demands of the id and the superego.

ego-dystonic EGO-ALIEN.

ego-dystonic homosexuality State of a person who has unwanted and distressful homosexual arousal and wishes to acquire or increase heterosexual arousal.

ego ideal Part of the personality representing a fusion of the ego and the superego; feelings of self-satisfaction are experienced when the person's thoughts, behavior, or impulses coincide with an internalized goal or ideal.

egomania Morbid self-preoccupation or self-centeredness. *See also* narcissism.

ego model Person after whom one patterns the ego.

ego psychology Study of the operations of ego in regard to control and regulation of instinctual drives, the relation to reality, and the development of object relations. *See also* ego analysis.

ego strength Degree to which the ego's functions, for example, perception, thinking, speaking, are maintained.

ego-syntonic Denoting aspects of a person's personality that are viewed as acceptable and consistent with his or her total personality. *Compare* ego-alien.

eidetic image Unusually vivid or exact mental image seen or imagined event; may include color or movement.

ejaculation Expulsion of semen and seminal fluid from the urethra, as in male orgasm.

ejaculatory incompetence INHIBITED MALE ORGASM.

elaboration Unconscious process of embellishing the symbolic content of a dream.

elation Affect consisting of feelings of joy, euphoria, triumph, intense self-satisfaction, or optimism.

elective mutism Childhood mental disorder in which a child who is able and willing to speak to selected persons persistently refuses to speak in other social or school situations.

Electra complex Female analog of the Oedipus complex in the male; infrequently used term

to describe unresolved developmental conflicts influencing a woman's relationships with men.

electroconvulsive therapy (ECT) Convulsive therapy, usually for depression, that involves the application of electric current to the brain for a fraction of a second through scalp electrodes to induce a convulsive reaction and unconsciousness.

electroencephalogram (EEG) Recording of the brain's electrical potentials obtained by scalp electrodes.

electromyogram (EMG) Recording of the electrical activity of muscles at specific sites.

electroshock therapy (EST) *See* electroconvulsive therapy.

electrostimulation In aversion therapy, a negative conditioning technique consisting of (usually painful) electric shocks.

elevated mood Air of confidence and enjoyment; a mood more cheerful than normal but not necessarily pathologic.

elimination disorders Inability as a result of physiological or psychological immaturity to maintain bowel control (functional encopresis) or bladder control (functional enuresis).

elopement Escape; absenting oneself from a mental hospital without permission.

emancipated minor Legal term for a minor who exercises general control over his or her life and hence has the legal rights of an adult.

EMG Electromyogram.

emotion Complex feeling state with psychic, somatic, and behavioral components; external manifestation of emotion is affect.

emotional deprivation Relative lack of environmental or interpersonal experiences during the early developmental years. *See also* sensory deprivation.

emotional disorder Lay term for a mental illness or mental disorder; in common usage it does not specifically imply a mood disorder or schizophrenia.

emotional disturbance Emotional disorder or illness. *See also* mental disorder.

emotional illness General term for a behavioral or psychological syndrome or pattern associated with distress, disability, or increased risk of suffering.

emotional insight Deeper level of understanding or awareness that is more likely to lead to positive changes in personality and behavior.

emotional lability Excessive emotional responsiveness characterized by unstable and rapidly changing emotions.

emotional support Encouragement, hope, and inspiration given to one person by another.

empathy Intellectual and emotional awareness and understanding of another person's state of mind, involving the projection of oneself into another person's frame of reference; an important ability in a successful therapist or a helpful group member. *Compare* sympathy.

empty nest syndrome Depression that can occur in men and women when their youngest child is about to leave or has left home.

encapsulated delusion Delusion that has no significant effect on behavior.

encephalitis Inflammation of the brain.

encephalopathy Any disease of the brain.

encopresis Repeated passage of feces in inappropriate places, such as clothing or bed; diagnosis not made until after age 4.

encounter group Form of sensitivity training, introduced and developed by Jacob Moreno in 1914, that emphasizes the experiencing of individual relationships within the group and that minimizes intellectual and didactic input; the group focuses on the present, rather than concerning itself with the past or outside problems of its members. *See also* sensitivity training group.

endemic Belonging, native, restricted, or peculiar to a particular people, country, locality, or region.

endocrine disorder Dysfunction of any of the endocrine glands, frequently with psychiatric manifestations.

endogamy Marriage within a specific group. *Compare* exogamy.

endogenous depression Type of depression that originates within the person and is not related to external events, with a cause that is biological or somatic. Also called nonreactive depression.

endomorphic Obese, with prominence of the abdomen; one of Sheldon's constitutional types. *Compare* ectomorphic; mesomorphic.

endorphin Any of several endogenous opioid peptides (α-, β-, or γ-endorphin) found in highest concentrations in the pituitary gland and which has analgesic and behavioral effects in animals. *See also* enkephalin.

engram Memory trace, the neurophysiological substrate of memory.

enkephalin Endogenous opioid peptide released by β-endorphin that has analgesic properties and many of the actions of morphine.

entomophobia Fear of insects.

enuresis Repeated incontinence of urine in inappropriate places, such as clothing or bed; diagnosis not made until after age 5.

epidemiology In psychiatry, the study of the incidence, prevalence, control, and distribution of mental disorders within a particular population.

epigenesas Term introduced by Erik Erikson to refer to the stages of ego and social development.

epilepsy Neurological disorder resulting from a sudden, excessive, disorderly discharge of neurons in either a structurally normal or a diseased cerebral cortex; characterized by paroxysmal recurrence of short-lived disturbances of consciousness, involuntary convulsive muscle movements, psychic or sensory disturbances, or some combination thereof. Termed idiopathic epilepsy when there is no identifiable organic cause. For types of epilepsy, see the specific term.

epileptic dementia Epilepsy accompanied by progressive mental and intellectual impairment; some believe that the circulatory disturbances during epileptic attacks cause nerve cell degeneration and lead to dementia.

epileptic equivalent Epileptic phenomenon that is neither grand mal nor petit mal. *See also* complex partial seizure.

epileptic personality EXPLOSIVE PERSONALITY.

epinephrine Sympathomimetic catecholamine formed from norepinephrine and the major hormone secreted by the adrenal medulla; its release during states of fear or anxiety produces many of the physiological changes associated with those emotions. Also called adrenaline.

episodic Denoting an illness in which there are sustained disturbances clearly distinguished from previous functioning.

epistemology Study or theory of the nature and grounds of knowledge, especially with reference to its limits and validity.

erectile dysfunction MALE ERECTILE DISORDER.

eremophobia Abnormal fear of being by oneself.

ergasia Adolf Meyer's term for a person's total activity, as opposed to the functioning of parts of the whole.

Erikson, Erik (1902–1990) Psychoanalyst noted for his theory of ego development and psychosocial development, which he conceptualized in terms of social adaptation as it relates to Sigmund Freud's formulations.

erogenous zone Any area of the body, principally the genitals, anus, and mouth, capable of being stimulated sexually.

eros SEXUAL DRIVE.

erotic Invested with sexual feeling.

erotomania Delusional conviction that another person is in love with him or her; typically the object of the delusion is of higher rank or status. Also referred to as de Clérambault syndrome or psychose passionelle.

erythrophobia Abnormal fear of blushing.

escape learning *See* avoidance and escape learning.

ESP Extrasensory perception.

EST Electroshock therapy.

estrogen Hormone produced mainly by the ovaries and responsible for the development of the female reproductive organs and secondary sex characteristics: for example, estradiol, estriol, estrone. *Compare* androgen.

ethnocentrism Conviction that one's own group is superior to other groups; impairs one's ability to evaluate members of another group realistically or to communicate with them on an open, equal, and person-to-person basis.

ethnology Branch of anthropology dealing with the division of mankind into races and their origin, history, customs, and institutions.

ethology Study of animal behavior; often applied to the understanding of human behavior.

etiology Study of the causes of disease and their mode of operation.

euergasia Word used by Adolf Meyer to mean normal mental functioning.

euphoria Exaggerated feeling of well-being that is inappropriate to apparent events; may be induced by drugs such as opiates, amphetamines, and alcohol.

euphoric mood *See* euphoria.

euphorohallucinogen Substance capable of producing euphoric hallucinations.

euthymia Normal range of mood, implying absence of depressed or elevated mood.

euthymic Denoting a normal mood.

evasion Act of not facing up to or of strategically eluding something; consists of suppressing an idea that is next in a thought series and replacing it with another idea closely related to it. Also called paralogia; perverted logic.

event-related euphoria Morbid or abnormal sense of well-being associated with a specific situation or event.

evoked potential (EP) Following repetitive stimuli, the characteristic EEG waveform that remains after averaging out most of the brain electrical activity; clinically useful in evaluating the functional integrity of the somatosensory or special sensory pathways.

exaltation Feeling of intense elation and grandeur.

excited Agitated, purposeless motor activity uninfluenced by external stimuli.

excitement phase Stage in the human sexual response after sexual stimulation, as described by Masters and Johnson, characterized by an objective sense of pleasure and accompanying physical changes (penile erection and vaginal lubrication).

excitoxicity Increased simulation of neurons due to injury or chemical neurotransmitters that cause cell death.

excoriation disorder Disorder characterized by compulsive picking of one's own skin, resulting in lesions, despite repeated efforts to decrease or stop picking. Also called skin-picking disorder.

executive ego function Part of the ego that helps maintain or manage one's relationship to and sense of reality.

exhaustion state Final stage of the body's response to major stress, as in the general adaptation syndrome.

exhibitionism Paraphilia in which a man exposes his genitals to females in a socially inappropriate fashion; rarely occurs in women. Also called exhibitionistic disorder.

existentialism Philosophic theory that questions the purpose and nature of existence itself; a fundamental focus is on the meaning of life in face of death and the end of one's personal existence.

existential psychotherapy Type of therapy, based on existential philosophy, that puts the emphasis on here-and-now interaction and on feeling experiences, rather than on rational thinking; little attention is given to patient resistances, and the therapist is involved on the same level and to the same degree as the patient. *See also* phenomenology.

exogamy Marriage outside of a specific group; in a biological sense, the union of gametes of unrelated parents. *Compare* endogamy.

exogenous In psychiatry, denoting disordered behavior produced by forces outside of the body, as in adjustment disorder.

exorcism Magical practice in which mystical incantations are invoked to remove demons that are alleged to have entered the mind.

expansive mood Expression of feelings without restraint, frequently with an overestimation of their significance or importance. Seen in mania and grandiose delusional disorder.

experiencing Feeling emotions and sensations, as opposed to thinking; being involved in what is happening, rather than standing back at a distance and theorizing.

experimental bias Error in construction of an experiment or study that favors one outcome over another.

experimental design Manner in which an experiment is logically organized in order to maximize the probability of obtaining real effects.

experimental group In an experimental design, the group that is exposed to the experimental

manipulation under study. Compare control group.

experimental neurosis Abnormal behavior produced in a laboratory setting; used by Ivan Pavlov to describe symptoms of extreme and persistent agitation that he produced in dogs.

expert witness Legal concept that refers to the physician in the courtroom who is deemed sufficiently knowledgeable in a field to draw informed conclusions from data, for example, that a patient meets the required criteria for commitment or for an insanity defense.

explosive personality Personality type characterized by rigidity, egocentricity, selfishness, religiosity, seclusiveness, explosive outbursts of emotion, and extreme rage reactions when frustrated; enuresis is common.

expressive aphasia Disturbance of speech in which understanding remains, but ability to speak is grossly impaired; halting, laborious, and inaccurate speech. Also known as Broca's, nonfluent, and motor aphasias.

expressive dysphasia Difficulty in expressing verbal language; the ability to understand language is intact.

extended-family therapy Type of family therapy that involves family members, beyond the nuclear family, who are closely associated with it and affect it. *See also* social network therapy.

externalization More general term than projection that refers to the tendency to perceive in the external world and in external objects elements of one's own personality, including instinctual impulses, conflicts, moods, attitudes, and styles of thinking.

external validity Statistical term that refers to how well a test measures what it purports to measure and identifies what it is supposed to identify.

extinction Process by which an operant behavior occurs less frequently when its performance is no longer reinforced.

extrapsychic conflict Conflict that arises between a person and his or her environment. Also called interpersonal conflict. *Compare* intrapsychic conflict.

extrapyramidal dyskinesia Movement disorder related to dysfunction of the extrapyramidal motor system; signs include a variety of involuntary movements and postures, muscular rigidity, tremor, and gait disturbance, as seen in Parkinson disease, chorea, athetosis, and hemiballismus. Extrapyramidal dyskinetic syndromes may occur as a side effect of antipsychotic drugs; such drug-induced extrapyramidal effects include a parkinsonian syndrome, akathisia, acute dystonic reactions, and tardive dyskinesia.

extrapyramidal effect Bizarre, involuntary motor movement; a central nervous system side effect sometimes produced by antipsychotic drugs. *See also* extrapyramidal dyskinesia.

extrapyramidal motor system Polysynaptic neural pathways involving the basal ganglia and related subcortical nuclei that influence motor behavior.

extrapyramidal syndrome Abnormalities of movement related to injury of motor pathways other than the pyramidal tract; for example, parkinsonism, akathisia, dystonia, tardive dyskinesia.

extrasensory perception (ESP) Experiencing of an external event by means other than the five senses, as by telepathy or clairvoyance.

extroversion, extraversion State of one's energies being directed outside oneself. *Compare* introversion.

F

factitious disorder Mental disorder characterized by the voluntary production of false or unreal physical or psychological symptoms; unlike malingering, there is no apparent goal or obvious benefit. Also called Munchausen syndrome. *Compare* somatic symptom disorder; somatoform disorders.

factitious disorder by proxy A disorder in which one person deceitfully creates false signs or symptoms of illness in another person who is under his/her care; most commonly this condition involves a mother presenting her child as ill. In some cases actual injury or illness may be inflicted on the dependent person. Diagnosed as "factitious disorder imposed on another" in DSM-5.

factitious disorder imposed on another *See* factitious disorder by proxy.

factor analysis Data reduction technique used to reduce a large number of variables to a smaller number of linear combinations of variables.

failure to thrive Delay in physical growth in infants and young children; often accompanied by impaired social and motor development; commonly associated with parental deprivation or neglect when no medical illness is detected. *See* reactive attachment disorder.

false memory A person's recollection and belief of an event that did not actually occur. In false memory syndrome, persons erroneously believe that they sustained an emotional or physical (e.g., sexual) trauma early in life.

false negative Diagnosis of a disorder as being absent in a person (tested negative) when in fact it is present.

false positive Diagnosis of a disorder as being present in a person (tested positive) when in fact it is not present.

falsifiable hypothesis Testable hypothesis that can be confirmed or disconfirmed.

family neurosis Mental disorder in which a person's psychopathology is unconsciously interrelated with that of other members of the family.

family therapy Treatment of more than one member of a family in the same session; family relationships and processes are explored as potential causes of mental disorder in one or more of the family members. *See also* extended-family therapy.

fantasy Daydream; fabricated mental picture of a situation or chain of events. A form of thinking dominated by unconscious material and primary processes that seeks wish fulfillment and immediate solutions to conflicts; may serve as the matrix for creativity or for neurotic distortions of reality.

fatal familial insomnia An inherited prion disease characterized by insomnia and autonomic nervous system dysfunction (e.g., fever, sweating, tachycardia).

father surrogate, father substitute In psychoanalysis, a person onto whom the patient projects his or her father image and to whom he or she responds unconsciously in an inappropriate and unrealistic manner, with the feelings and attitudes held toward the real father.

fatigue A feeling of weariness, sleepiness, or irritability after a period of mental or bodily activity. Seen in depression, anxiety, neurasthenia, and somatoform disorders.

fausse reconnaissance False recognition, a feature of paramnesia. Can occur in delusional

disorders.

faux de mieux Literally, "for want of anything better," connoting in psychiatry a person's choosing a homosexual relationship when no partner of the opposite sex is available.

FDA Food and Drug Administration.

fear Unpleasurable emotional state consisting of psychophysiological changes in response to a realistic threat or danger. *Compare* anxiety.

feeble-mindedness Obsolete term for mental retardation, which is also called intellectual developmental disorder.

feedback 1. In a given system, the return, as input, of some form of information regarding the output; used as a regulatory mechanism. **2.** In psychiatry, the verbally or otherwise expressed response to a person's behavior by another person or a group.

feeding disorder of infancy or childhood *See* avoidant/restrictive food intake disorder.

fellatio Use of the mouth or tongue to stimulate the male genitalia.

femaleness Anatomic and physiological features relating to female procreative functions.

female orgasmic disorder Disorder characterized by a woman's inability to achieve orgasm by coitus or masturbation.

female sexual arousal disorder OMIT.

feminine identity Inner sense of gender affiliation with females. *Compare* masculine identity.

Ferenczi, Sandor (1873–1933) Hungarian psychoanalyst who was one of Sigmund Freud's early followers and a brilliant contributor to all aspects of psychoanalysis; he came to favor more active and personal techniques than Freud's, to the point that his adherence to psychoanalysis during his last years was questioned.

fetal alcohol syndrome A syndrome that occurs when mothers consume alcohol during pregnancy resulting in fetuses born with birth defects, CNS dysfunction, and intellectual disability.

fetishism Paraphilia in which sexual excitement and gratification are achieved by substituting an inanimate object (such as a shoe, piece of underwear, or other article of clothing) for a human love object. Also called fetishistic disorder.

fibromyalgia A chronic pain disorder characterized by pain and stiffness of the soft tissues (e.g., muscles, ligaments, tendons).

field theory Conceptual approach to the study of personality formulated by Kurt Lewin that focuses on an operational analysis of the causal determinants of human behavior; it is expressed in geometric and mathematical terms borrowed from physics in an attempt to provide a framework suitable to the scientific study of human behavior. The person and his or her environment together constitute the life space, a complex field of forces acting on the personality and determining behavior.

finger agnosia Agnosia characterized by inability to name fingers; suggests a lesion in the dominant parietal lobe.

fixation 1. Arrest of psychosexual development at any stage before complete maturation. **2.** Close and paralyzing attachment to another person, such as one's mother or father.

fixed-interval schedule *See* schedule of reinforcement.

fixed-ratio schedule *See* schedule of reinforcement.

flagellantism, flagellation Process by which sexual partners are aroused and gratified by

whipping or being whipped.

flashback hallucinosis Spontaneous recurrence, after a drug-free period, of hallucinations similar to those experienced during an acute toxic episode; often associated with repeated ingestions of LSD. Hallucinations are predominantly visual and may last for months after the last use of a drug.

flat affect Absence or near absence of any signs of affective expression.

flexibilitas cerea CATALEPSY.

flight of ideas Rapid succession of fragmentary thoughts or speech in which content changes abruptly and speech may be incoherent, as seen in mania.

floccillation Aimless plucking or picking, usually at bed-clothes or clothing, commonly seen in senile psychosis and delirium.

flooding Behavior therapy designed to extinguish phobias or anxiety through the presentation of the aversive stimuli in intense forms until the emotional responses cease. Also called implosion therapy.

fluent aphasia Aphasia characterized by inability to understand the spoken word; fluent but incoherent speech is present. Also called Wernicke aphasia, sensory aphasia, and receptive aphasia.

folie à deux Mental illness shared by two persons, usually involving a common delusional system; if it involves three persons, it is referred to as folie à trios, and so forth. *See* shared psychotic disorder.

follow-up examination To the physician, the aftercare and monitoring of patients' responses to treatment and the state of their physical health or mental status.

Food and Drug Administration (FDA) Federal agency that standards for the sale and use of drugs, food substances, and cosmetics.

forensic psychiatry Branch of psychiatry concerned with the aspects of mental illness.

foreplay Sexual play that precedes sexual intercourse. Also called forepleasure.

forepleasure FOREPLAY.

formal operations Jean Piaget's label for completely developed logical thinking capacities. *See also* Piaget, Jean.

formal thought disorder Disturbance in the form of thought rather than the content of thought; thinking characterized by loosened associations, neologisms, and illogical constructs; thought process is disordered, and the person is defined as psychotic. Characteristic of schizophrenia.

formication Tactile hallucination involving the sensation that tiny insects are crawling over the skin; most commonly encountered in cocaine addiction and delirium tremens.

for-profit hospital Investor-owned or proprietary hospital; hospital owned and operated by physicians or corporations that earns a profit for its investors.

fragile X syndrome A syndrome resulting from a mutation on the X chromosome. Includes severe intellectual disability, a large head, long face, prominent ears, and, in males, large testicles.

fragmentary delusion Poorly elaborated delusion, often one of many with no apparent interconnection.

fraternal twins DIZYGOTIC TWINS.

free association Investigative psychoanalytic technique devised by Freud in which the patient seeks to verbalize without reservation or censorship the passing contents of his or her mind.

freebase Cocaine hydrochloride mixed with ammonia and an alkali solution, and then extracted with a solvent into a crystalline form. *See also* crack.

free-floating anxiety Severe, pervasive, generalized anxiety that is not attached to any particular idea, object, or event; observed particularly in anxiety disorders, although it may be seen in some cases of schizophrenia.

fregoli syndrome The delusional belief that a known person is an imposter who assumes different appearances or disguises.

frequency Number of cases having a certain score or characteristic; relative frequency measures the number of persons in a specific group (e.g., sex or age) who have a disorder.

frequency distribution Statistical description of raw data in terms of the number of cases that fall into each interval within a set of data; often presented graphically in the form of a frequency histogram or frequency polygram.

Freud, Anna (1895–1982) Daughter of Sigmund Freud noted for her contributions to the developmental theory of psychoanalysis and the mechanisms of defense.

Freud, Sigmund (1856–1939) Austrian psychiatrist and the founder of psychoanalysis. With Josef Breuer, he explored the potentialities of cathartic therapy and then went on to develop the analytic technique and such fundamental concepts as mental sublimation, as well as superego, ego, and id formation and their applications throughout all spheres of human behavior. Among his publications are *The Interpretation of Dreams* (1899). *Studies on Hysteria* (1895, with Breuer), and *Three Essays on the Theory of Sexuality* (1905).

frigidity Colloquial term referring, in the female, to lack of sexual response or feeling, ranging from complete lack of arousal to incomplete climax.

frontal lobe syndrome Mental disorder characterized by a marked change in personality, with development of certain relatively characteristic patterns of relating to the environment that have been associated with lesions of the frontal lobes; such patterns include emotional lability, impairment in impulse control and social judgment, and marked apathy and indifference.

frontotemporal dementia Rare form of presenile dementia caused by cerebral atrophy predominantly in the frontotemporal regions of the brain; early stages are characterized by personality and behavior changes. The following progressive cognitive deterioration is indistinguishable clinically from the far more common Alzheimer disease, in which the cerebral atrophy is diffuse. Also called Pick disease. *See also* dementia of the Alzheimer type.

frottage, frotteurism Sexual aberration in which arousal results from rubbing up against someone, usually without specific genital contact, as in a crowd; a person so afflicted is a frotteur. Also called frotteuristic disorder.

frustration Result of the thwarting of any goal-directed behavior; the ability to tolerate frustration and delay gratification is considered a sign of maturity and good ego strength.

fugue Called dissociative fugue in DSM-5, a subtype of dissociative amnesia characterized by a period of almost complete amnesia, during which a person actually flees from an immediate life situation and begins a different life pattern; apart from the amnesia, mental faculties and skills are usually unimpaired. *See also* psychogenic amnesia.

fulfillment Satisfaction of a need or wish.

functional Denoting changes in functioning not attributable to known organic alterations.

functional disorder Disorder that is not caused by an anatomical defect or any other identifiable or demonstrable cause. *Compare* organic disorder.

functional neurological disorder *See* conversion disorder.

functional neurological symptom disorder Mental disorder in which the patient experiences an involuntary limitation or alteration of physical function that is an expression of a psychological conflict or need, not of a physical disorder. Previously called conversion disorder in DSM-IV. *See also* hysteria.

functional speech disorder DEVELOPMENTAL ARTICULATION DISORDER.

fusion In psychoanalysis, the joining together of instincts which enables the person to function normally.

G

GABA γ-(gamma) aminobutyric acid.

GAF Scale GLOBAL ASSESSMENT OF FUNCTIONING SCALE.

galactorrhea Abnormal discharge of milk from the breast; may be a result of the endocrine influence of phenothiazine drugs.

galvanic skin response (GSR) Measurable change in the electrical resistance of the skin, used as an index of emotional response.

gambling disorder DSM-5 disorder characterized by persistent and recurrent maladaptive gambling that leads to economic problems and disturbances in personal, social, and occupational functioning. Also called pathological gambling.

γ-(gamma) aminobutyric acid (GABA) Inhibitory amino acid neurotransmitter synthesized by the actions of glutamic acid decarboxylase; GABA receptors are located at postsynaptic sites.

gamophobia Abnormal fear of marriage.

Ganser syndrome Rare atypical disorder, seen in prisoners, characterized by a giving of approximate answers to questions and of talking past the point; to be distinguished from factitious disorder and malingering.

gargoylism Old name for the gargoyle-like facies and dwarfism seen in Hunter's and Hurler's syndromes: metabolic disorders of mucopolysaccharide metabolism characterized by severe developmental skeletal deformities and mental retardation.

GAS General adaptation syndrome.

gatekeeper In community psychiatry, a person who evaluates the degree of psychological or environmental stress sufficient to enable a patient to gain access to the mental health care system.

gateway drugs Substances of abuse, such as alcohol and marijuana, which provide major portals of entry into abuse of other drugs; considered particularly dangerous because they are believed by so many to be relatively harmless.

Gault decision U.S. Supreme Court 1967 decision mandating fair and accurate fact-finding procedures for juveniles when serious punishment could be inflicted should they be found guilty; rights guaranteed the juvenile include the right to notification of the specific charges,

the right to counsel, the right against self-incrimination, and the right to confront and cross-examine the accusers.

gay 1. Popular term for a homosexual, especially male. **2.** Denoting a homosexual or the lifestyle thereof.

gegenhalten Neurological term (from the German) for involuntary active resistance to passive movement of the extremities, as may occur in cerebral cortical disorders.

gender dysphoria The DSM-5 term for gender identity disorder. May first appear in childhood, adolescence, or adulthood.

gender identity Culturally determined sets of attitudes, behavior patterns, and physical attributes usually associated with masculinity and femininity. *Compare* sexual identity.

gender identity disorder Psychosexual disorder in which a person feels discomfort with and inappropriateness of his or her biological sex, with a marked preference for the clothing and activities of the opposite sex and/or repudiation of the sex organs. Also called gender dysphoria. *See also* transsexualism.

gender role Public declaration of gender; the image of maleness or femaleness that is communicated to others which may or may not coincide with gender identity.

general adaptation syndrome (GAS) Hans Selye's term for the responses of the body to major stress, passing through the alarm reaction, resistance and, finally, exhaustion.

generalization Process by which a behavior occurs in a setting in which it had not previously been reinforced.

generalized anxiety *See* free-floating anxiety.

generalized anxiety disorder An anxiety disorder characterized by chronic generalized anxiety consisting of feelings of tension, tremor, apprehension, and hyperarousal not attached to any particular idea, object, or event. *See* free-floating anxiety.

generalized tonic–clonic seizure Generalized onset of tonic–clonic movements of the limbs, tongue biting, and incontinence followed by slow, gradual recovery of consciousness and cognition. Also called grand mal seizure.

general paralysis, general paresis Mental disorder caused by chronic (tertiary) neurosyphilis.

general systems theory Theoretical framework asserting that the universe is composed of interacting components that are interrelated; in psychiatry, it emphasizes an integrated, holistic approach to understanding behavior.

genetic counseling Presentation and discussion, generally with a prospective parental couple, of factors involved in the inheritance of pathological conditions as they relate to the couple's generic endowment.

genetic endowment Characteristics that are inherited, usually regarding potential capacities of intelligence, temperament, and general adaptability.

genetic marker Detectable sign of the presence of or vulnerability to inherited disease, such as a measurable biochemical abnormality or an identifiable defect in a particular gene.

genetic material In psychiatry and psychoanalysis, a term used to reflect the data from a patient's personal past history that are useful in developing an understanding of the psychodynamics of his or her present adaptation.

genital phase Final stage of psychosexual development, occurring during puberty, in which

sexual gratification is achieved from genital-to-genital contact and the capacity exists for a mature, affectionate relationship with someone of the opposite sex.

genotype Genetic endowment of a person, consisting of a set of genes received from each parent at the time of conception. *Compare* phenotype.

geriatric psychiatry Branch of psychiatry concerned with the mental disorders that accompany old age. Also called geropsychiatry.

geriatrics Branch of medicine concerned with the aged and the problems of aging. *See also* gerontology.

genito–pelvic pain/penetration disorder Diagnostic category in DSM-5 referring to one or more of the following: genito–pelvic pain; difficulty having intercourse; fear of pain or penetration; and tension of the pelvic floor muscles; previously divided into the distinct categories of dyspareunia and vaginismus.

gerontology Scientific study of aging.

gerontophilia Sexual attraction for the old and the aged by a young person.

gerontophobia Fear of the elderly or of the aging process.

geropsychiatry GERIATRIC PSYCHIATRY.

Gerstmann–Straussler–Scheinker disease DEVELOPMENTAL ARITHMETIC DISORDER.

Gesell Developmental Schedules Developmental landmarks in infants and children that cover ages 8 weeks to 3.5 years. Data are obtained by direct observation of the child's responses to standard toys and other controlled stimulus objects and are supplemented by developmental information provided by the mother or primary caretaker; the schedules yield scores indicating the child's level of development in four separate areas: motor, adaptive, language, and personal and social.

gestalt psychology School of psychology primarily concerned with perceptual processes; a major tenet is that the whole is greater than the sum of its parts. Its development is associated particularly with Max Wertheimer, Wolfgang Koehler, and Kurt Koffka.

gestalt therapy Psychotherapy developed by Frederick S. Perls that emphasizes the treatment of the person as a whole: one's biological component parts and their organic functioning, one's perceptual configuration, and one's interrelationships with the outside world. It can be used in either an individual or a group therapy setting; focuses on the sensory awareness of the person's here-and-now experiences, rather than on past recollections or future expectations; and uses role playing and other techniques to promote the patient's growth process and development to full potential.

Gilles de la Tourette syndrome *See* Tourette disorder.

global aphasia Combination of grossly nonfluent aphasia and severe fluent aphasia.

Global Assessment of Functioning Scale (GAF Scale) Scale used in DSM to describe the highest social, occupational, or educational level of functioning of a person in the 12 months preceding the current evaluation.

global developmental delay Preferred term for a condition of intellectual and adaptive impairment in children that fail to meet expected developmental milestones in multiple areas of intellectual functioning before 5 years of age. *See also* intellectual disability.

globus hystericus Hysterical symptom in which a person is disturbed by the sensation of a

lump in the throat.

glossolalia Unintelligible jargon that has meaning to the speaker but not to the listener. Occurs in schizophrenia.

go-around Technique used in group therapy in which the therapist requires each member of the group to respond to another member, a theme, or an association to encourage the participation of all members in the group.

gonadal dysgenesis TURNER SYNDROME.

grandiose delusion DELUSION OF GRANDEUR. *See* delusion.

grandiosity Exaggerated feeling of one's importance, power, knowledge, or identity. Occurs in delusional disorder and manic states. *See also* delusion of grandeur.

grand mal epilepsy Major form of epilepsy in which gross tonic–clonic convulsive seizures are accompanied by loss of consciousness and, often, incontinence of stool or urine; frequently preceded by an aura.

gray-out syndrome Psychosis that occurs in pilots flying at high altitudes, out of sight of the horizon.

grief Alteration in mood and affect consisting of sadness appropriate to a real loss; normally, it is self-limited. *See also* depression; mourning.

group *See* therapeutic group.

group analytic psychotherapy Term applied by S. H. Foulkes to his pioneering group therapy procedure in which interventions dealt primarily with group, rather than individual, forces and processes, and the group was used as the principal therapeutic agent.

group cohesion Mutual bonds formed between members of a group as a result of their concerted effort for a common interest and purpose; until cohesiveness is achieved, the group cannot concentrate its full energy on a common task.

group dynamics Phenomena that occur in groups from their inception to their termination. Interactions and interrelations among members and between the members and the therapist create tension, which maintains a constantly changing group equilibrium; interactions and the tension created are highly influenced by individual members' psychological makeup, unconscious instinctual drives, motives, wishes, and fantasies. Understanding and effectively using group dynamics are essential in group treatment. Also called group process.

group mind Autonomous and unified mental life in an assemblage of people bound together by mutual interests; a concept used by group therapists who focus on the group as a unit rather than on the individual members.

group practice Delivery of medical services by three or more physicians formally organized to provide care, consultation, diagnosis, and treatment; they share the use of equipment and personnel, and income from the medical practice is distributed among the members of the group.

group pressure Demand by group members that individual members submit and conform to group standards, values, and behavior.

group process GROUP DYNAMICS.

group psychotherapy Application of psychotherapeutic techniques to a group of patients, using interpatient interactions to effect changes in the maladaptive behavior of the individual members.

group relations theory *See* Allport's group relations theory.

GSR Galvanic skin response.

guardianship Person appointed by the courts for the care and management of a person or the property of another, as of a minor or a person incapable of managing his or her affairs.

guilt Emotional state associated with self-reproach and the need for punishment. In psychoanalysis, refers to a neurotic feeling of culpability that stems from a conflict between the ego and the superego that begins developmentally with parental disapproval and becomes internalized as conscience in the course of superego formation. Guilt has normal psychological and social functions, but special intensity or absence of guilt characterizes many mental disorders, such as depression and antisocial personality disorder, respectively. Some psychiatrists distinguish shame as a less internalized form of guilt that relates more to others than to the self. *See also* shame.

gustatory hallucination Hallucination primarily involving taste.

gynecomastia Female-like development of the male breasts; may occur as an adverse effect of antipsychotic and antidepressant drugs due to increased prolactin levels or anabolic-androgenic steroid abuse.

gynephobia Abnormal fear of women.

gyrectomy Psychosurgery involving excision of a cerebral gyrus.

H

habeas corpus Legal term for the right to petition a court to decide whether confinement has been undertaken with due process of 1aw.

habit Behavior pattern acquired by frequent repetition that leads to regularity or increased facility of performance.

habituation **1.** Simple form of learning in which the response to a repeated stimulus lessens over time. **2.** Psychological dependence on the continued use of a drug or chemical substance to maintain a sense of well-being, which can result in addiction.

halfway house Facility for mental patients who no longer need the full facilities of a hospital but are not yet ready to return to their communities.

hallucination False sensory perception occurring in the absence of any relevant external stimulation of the sensory modality involved. For types of hallucination, see the specific term.

hallucinogenic drug, hallucinogen Chemical agent that produces hallucinations, such as LSD and mescaline. *See also* euphorohallucinogen; psychotomimetic drug.

hallucinosis State in which a person experiences hallucinations without any impairment of consciousness.

haloperidol Butyrophenone antipsychotic drug (trade name, Haldol).

Halstead–Reitan Scale Battery of neuropsychological tests used to determine the location and effects of specific brain lesions. A great variety of functions are tested: concept function, abstraction, and visual acuity; dexterity; spatial memory; auditory perception, attention, and concentration; finger-oscillation; speech-sounds perceptions; visual perception; time sense; and sensory stimulation, stereognosis, and tactile perception.

Hamilton Depression Scale Scale of depression based upon a clinical interview with the patient in which the examiner asks about guilt, suicide, sleep habits, weight change, and other

symptoms of depression.

haphephobia Abnormal fear of being touched.

haplology Rapid speech in which syllables are omitted; seen in certain manias and in schizophrenic conditions.

haptic hallucination Hallucination of touch.

harm avoidance A term used to describe a character trait in which the person avoids novel situations and taking risks; may be an inborn and genetically determined.

hashish Dried resinous tops of the marijuana plant (*Cannabis sativa*): the active ingredient is tetrahydrocannabinol, which is a potent psychedelic drug.

Health and Human Services Federal organization composed of the following: Office of Human Development Services, Public Health Service (includes Centers for Disease Control; Food and Drug Administration; Health Resources and Services Administration; National Institutes of Health; Alcohol, Drug Abuse, and Mental Health Administration; Agency for Toxic Substances and Disease Registry; and Indian Health Service), Social Security Administration, Health Care Financing Administration, and Family Support Administration. Formerly called Department of Health, Education, and Welfare (HEW).

health insurance Insurance that reimburses one for the costs of medical care or lost income arising from medical disability; may include coverage for the care of mental conditions.

health maintenance organization (HMO) Form of group practice by physicians, often including psychiatrists, and allied health professionals to provide comprehensive health services to subscribers who pay a fixed premium.

Health Systems Agency (HSA) Nonprofit, federally mandated, statewide organizations that promote or limit the development of health services and faculties depending on the needs of the particular state or locale. HSAs develop long- and short-term goals and plans, approve health care proposals requesting federal funding, review existing facilities and services, and suggest future consideration and renovation projects based on their findings.

healthy identification Modeling of oneself, consciously or unconsciously, on another person who has a sound psychic makeup; such identification has constructive results. *See also* imitation.

hearsay Out-of-court statement offered to prove the truth of the matter asserted; usually inadmissible as testimony.

hebephrenia Complex of symptoms, considered a form of schizophrenia, characterized by wild or silly behavior or mannerisms, inappropriate affect, frequent hypochondriacal complaints, and delusions and hallucinations that are transient and unsystematized. Hebephrenic schizophrenia is listed in DSM as disorganized schizophrenia. *See also* schizophrenia.

hedonism Pleasure-seeking behavior. *Compare* anhedonia.

helplessness 1. Learned: State of apathy that occurs as a type of experimental neurosis in animals who cannot escape an aversive stimulus; proposed as the animal model of human depression in which a patient feels helpless to control events. **2.** Psychic: State that occasions the first expressions of anxiety in humans, for example, the experience of birth.

hematophobia Abnormal fear of the sight of blood.

herd instinct Desire to belong to a group and to participate in social activities; used by Wilfred

Trotter to indicate the presence of a hypothetical social instinct in humans. In psychoanalysis, herd instinct is viewed as a social phenomenon, rather than as an instinct.

hermaphrodite Person who has both female and male gonadal tissue, usually with one sex dominating.

heroin Diacetylmorphine; an illicit, addictive alkaloid opioid that requires subsequent larger and larger amounts to achieve the same narcotic and analgesic effects. Injected intravenously, it produces a more rapid onset of euphoria than does morphine.

heterogeneity Dissimilarity in the genotypal structure of individuals originating through sexual reproduction.

heterosexuality Sexual attraction or contact between opposite-sex persons. The capacity for heterosexual arousal is probably innate, biologically programmed, and triggered in very early life, perhaps in part by olfactory modalities as seen in lower animals. *Compare* bisexuality; homosexuality.

heterozygous Possessing different allelic forms of a gene at a given locus in homologous chromosomes.

heuristic 1. Involving or serving as an aid to learning, discovery, or problem solving by experimental and especially trial-and-error methods. **2.** Of or relating to exploratory problem-solving techniques that utilize self-educating techniques.

5-HIAA 5-Hydroxyindoleacetic acid.

histrionic personality disorder Condition in which the patient, usually an immature and dependent person, exhibits unstable, overreactive, and excitable self-dramatizing behavior that is aimed at gaining attention and is at times seductive, although the person may not be aware of that aim.

HIV Human immunodeficiency virus.

HMO Health maintenance organization.

hoarding disorder Disorder characterized by persistent difficulty parting with or discarding possessions; delusional beliefs about the accumulated items may be present. Part of obsessive-compulsive disorder in DSM-5.

holism In psychiatry, the study of the total person as a distinctive entity, rather than as a collection of various characteristics.

holophrastic Using a single word to express a combination of ideas; schizophrenic persons may use holophrastic language.

homeless Persons who have no permanent place of residence, often sleeping in the street, many of whom require psychiatric treatment or hospitalization.

homeostasis Tendency to maintain a constancy and stability of bodily processes to ensure optimal functioning; the state of bodily equilibrium and the processes whereby such equilibrium is maintained.

homophobia Fear of homosexual persons.

homosexuality Sexual attraction or contact between same-sex persons. Some authors distinguish two types: overt and latent. *Compare* bisexuality; heterosexuality.

homosexual panic Sudden, acute onset of severe anxiety precipitated by the unconscious fear or conflict that one may be a homosexual or act out homosexual impulses.

homovanillic acid (HVA) Phenol found in human urine; as the major metabolite of

dopamine, it is most often measured in psychiatric research.

Horney, Karen (1885–1952) Psychiatrist and psychoanalyst whose theories of the genesis of neurosis emphasized environmental and cultural factors and thus departed from the biological-instinctual framework of orthodox freudian thought.

hostile transference *See* transference.

hostility Conflict, opposition, or resistance in thought or principle.

hotline Telephone assistance service for crisis intervention.

HSA Health Systems Agency.

5-HT 5-Hydroxytryptamine.

human immunodeficiency virus (HIV) An infection caused by a retrovirus that incorporates itself into deoxyribonucleic acid (DNA). Symptoms include fever, myalgia, headache, fatigue, gastrointestinal symptoms, and rash. Can cause acquired immunodeficiency syndrome (AIDS).

humanistic theory Group of diverse theories that share a holistic conceptualization that emphasizes the uniqueness, value, dignity, and worth of each human being as an individual. Human behavior is considered understandable only in terms of the meaning of experiences for the individual person; it represents a complex interplay of numerous physical, psychological, and sociocultural factors.

humiliation Sense of disgrace, dishonor, and shame; often experienced by depressed patients.

humor Defense mechanism that allows the overt expression of feelings and thoughts without personal discomfort or immobilization and does not produce an unpleasant effect on others; allows the individual to tolerate and yet focus on what is too terrible to be borne. Differs from wit, a form of displacement that involves distraction from the affective issue.

Huntington disease (chorea) Hereditary and progressive central nervous system disease characterized by jerking motions and progressive mental deterioration: inherited as an autosomal dominant, with onset in adult life.

HVA Homovanillic acid.

hydrocephalus Excessive accumulation of cerebrospinal fluid which dilates the cerebral ventricles.

hydrophobia In psychiatry and psychology, an abnormal fear of water.

hydrotherapy Use of water by external application in the treatment of disease.

5-hydroxyindoleacetic acid (5-HIAA) Metabolite of serotonin, the concentration of which can be measured in cerebrospinal fluid and serum: determination of 5-HIAA concentrations is used in psychiatric research and may help guide clinical practice.

5-hydroxytryptamine (5-HT) SEROTONIN.

hyperactivity Increased muscular activity. The term is commonly used to describe a disturbance found in children that is manifested by constant restlessness, overactivity, distractibility, and difficulties in learning. Also called hyperkinesis. *See also* attention-deficit hyperactivity disorder; minimal brain dysfunction.

hyperalgesia Excessive sensitivity to pain. Seen in somatoform disorder.

hyperarousal A state of increased psychological and physiological tension marked by such effects as reduced pain tolerance, anxiety, exaggeration of startle responses, insomnia, fatigue, and accentuation of personality traits.

hyperesthesia Increased sensitivity to tactile stimulation.

hyperkinesis HYPERACTIVITY.

hyperkinetic syndrome Disorder characterized by excessive muscular activity (hyperactivity) such as restlessness, aggressiveness, and destructive activity. *See also* attention-deficit hyperactivity disorder; minimal brain dysfunction.

hypermnesia Exaggerated degree of retention and recall. It can be elicited by hypnosis and may be seen in certain prodigies; also may be a feature of obsessive-compulsive disorder (OCD), some cases of schizophrenia, and manic episodes of bipolar I disorder.

hyperorexia Extreme appetite. *See also* bulimia nervosa.

hyperphagia Increase in appetite and intake of food.

hyperpragia Excessive thinking and mental activity, generally associated with the manic phase of bipolar I disorder.

hypersexuality Term used to describe excessive or compulsive interest in sex that may result in sex addiction.

hypersomnia Disorder characterized by excessive time spent asleep which may be nonorganic, organic, narcoleptic, idiopathic, part of Klein–Levin syndrome, or primary in nature. Also called hypersomnolence disorder.

hypersomnolence disorder *See* hypersomnia.

hypertensive crisis HYPERTENSIVE ENCEPHALOPATHY.

hypertensive encephalopathy Acute syndrome in which severe hypertension is associated with headache, nausea, vomiting, visual disturbances, convulsions, and alterations in consciousness characterized by confusion, somnolence, stupor, and coma. Prompt lowering of the blood pressure by pharmacological means may reverse the picture in 24 to 48 hours; if the blood pressure is not controlled, intracerebral hemorrhage and a fatal outcome may result. Usually, the patient has entered the malignant phase of essential or secondary hypertension, with marked blood pressure elevation (generally in the range of 250/150 mm Hg) and evidence of cardiac decompensation, declining renal function, and advanced hypertensive retinopathy; also seen as a side effect of monoamine oxidase inhibitors when tyramine-containing foods are consumed. Also called hypertensive crisis.

hyperthyroidism Excessive activity of the thyroid gland; may be associated with dementia, anxiety disorders, and insomnia. *Compare* hypothyroidism.

hyperventilation Excessive breathing, generally associated with anxiety, which can cause a reduction in blood carbon dioxide that produces symptoms of lightheadedness, palpitations, numbness and tingling periorally and in the extremities, and occasionally syncope.

hypervigilance Excessive attention to and focus on all internal and external stimuli; usually seen in delusional or paranoid states.

hypesthesia Diminished sensitivity to tactile stimulation.

hypnagogic hallucination Hallucination occurring while falling asleep, not ordinarily considered pathological.

hypnoanalysis Use of hypnosis in psychoanalysis to gain access to unconscious processes that the patient cannot reveal by means of ordinary therapeutic maneuvers.

hypnodrama Psychodrama under hypnotic trance; the patient is put into a hypnotic trance and encouraged to act out various past experiences.

hypnoid state Freud's term describing an alteration of consciousness that occurs characteristically in hysteria during periods of emotional stress: characterized by heightened suggestibility and provides a basis for hysterical somatic symptom formation.

hypnophobia Abnormal fear of sleep.

hypnopompic hallucination Hallucination occurring while awakening from sleep, ordinarily not considered pathological.

hypnosis Artificially induced alteration of consciousness characterized by increased suggestibility and receptivity to direction.

hypnotherapy Therapy that makes use of hypnosis.

hypnotic Drug used for the express purpose of producing sleep. *Compare* sedative.

hypoactive sexual desire disorder Sexual desire disorder characterized by deficiency or absence of sexual fantasies and desire for sexual activity. Also called sexual interest/arousal disorder in women.

hypoactivity Decreased motor and cognitive activity, as in psychomotor retardation; visible slowing of thought, speech, and movements. Also called hypokinesis.

hypochondria Exaggerated concern about health that is based not on real medical pathology, but on unrealistic interpretations of physical signs or sensations as abnormal.

hypochondriacal neurosis HYPOCHONDRIASIS.

hypochondriasis *See* somatic symptom disorder.

hypoglycemia Abnormally small concentration of glucose in the circulating blood; associated with anxiety and depression.

hypomania Mood abnormality with the qualitative characteristics of mania, but less intense; characterizes the hypomanic episode of bipolar II disorder when lasting 4 to 7 days.

hypothalamus Principal center in the forebrain for integration of visceral functions involving the autonomic nervous system. Functions include regulation of sexual activity, water, fat, carbohydrate metabolism, and temperature; also appears to play a role in the nervous mechanisms underlying moods and motivational states.

hypothyroidism Decreased activity of the thyroid gland; may be associated with dementia, depression, and sleep disorders. *Compare* hyperthyroidism.

hysteria A term previously used for a group of conditions involving a sudden impairment of function in response to emotional stress.

hysterical anesthesia Functional disorder characterized by the absence of tactile sensation in an area of the body; observed in certain cases of conversion disorder.

hysterical personality *See* histrionic personality disorder.

hysterics Expression of emotion often accompanied by crying, laughing, and screaming; a term generally used by laypersons rather than by psychiatrists.

I

iatrogenic Denoting an unfavorable response to a mode of treatment induced by the treatment itself. *Compare* idiopathic.

ICD *International Classification of Diseases.*

ice Pure form of methamphetamine that can be either inhaled or injected intravenously by abusers; its psychological effects last for hours and are particularly potent. Unlike the cocaine

of crack, which has to be imported, ice is a synthetic drug that can be manufactured in domestic illicit laboratories.

ICT Insulin coma therapy.

Id One of the three components of the psychic apparatus in the freudian structural framework, the others being the ego and superego. It operates unconsciously; harbors the innate, biological, instinctual drives; is the source of psychic energy (libido); follows the pleasure principle; seeks immediate reduction of drive tension without regard for external reality; and is under the influence of the primary-process mental activity that characterizes the unconscious.

idealization Mental mechanism whereby a person consciously or unconsciously overestimates an admired attribute or aspect of another person.

idea of reference Misinterpretation of incidents and events in the outside world as having a direct personal reference to oneself; occasionally observed in normal persons, but frequently seen in paranoid patients. If present with sufficient frequency or intensity or if organized and systematized, they constitute delusions of reference.

ideas of unreality Thought that events are artificial, illusory, unpredictable, or do not exist.

ideational shield Intellectual, rational defense against the anxiety that persons would feel if they became vulnerable to the criticisms and rejection of others; as a result of their fear of being rejected, they may feel threatened if they criticize another person, an act that is unacceptable to them. In both group and individual therapy, conditions are set up that allow the participants to lower the ideational shield.

idée fixe Fixed idea that is recurrent and most often associated with obsessional states.

identical twins MONOZYGOTIC TWINS.

identification Unconscious defense mechanism by which a person patterns himself or herself after another person; in the process, the self is more or less permanently altered. *See also* healthy identification; imitation.

identification with the aggressor Unconscious process by which a person incorporates within himself or herself the mental image of a person who represents a source of frustration from the outside world; a primitive defense that operates in the interest and service of the developing ego. A classic example of this defense occurs toward the end of the oedipal stage, when a boy, whose main source of love and gratification is his mother, identifies with his father who represents the source of frustration, being the powerful rival for the mother; the child cannot master or runaway from his father, so he is obliged to identify with him.

identity One's global role in life and the perception of the sense of self; problems with identity are common during adolescence, in schizophrenia, and in the borderline and schizotypal personalities.

identity crisis Social role conflict as perceived by a person; loss of the sense of personal sameness and historical continuity, and/or inability to accept or adopt the role the person believes is expected by society. Identity crises are frequent in adolescence.

identity disorder A disorder characterized by a chaotic sense of self; a loss of the sense of personal sameness, usually involving a social role conflict as perceived by the individual. It is common in adolescence, when adolescents feel unwilling or unable to accept or adopt the roles they believe are expected of them by society; often manifested by isolation, withdrawal, rebelliousness, negativity, and extremism. Not a DSM-5 diagnosis.

idiopathic Without known or identifiable cause. *Compare* iatrogenic.

idiot Obsolete and pejorative term for a classification of mental retardation in which individuals have a mental age of less than 3 years.

idiotropic Egocentric or introspective.

idiot-savant Mentally retarded person who is able to perform unusual mental feats in sharply circumscribed intellectual areas, such as complicated calculations or puzzle solving.

I-It Philosopher Martin Buber's description of damaging interpersonal relationships. If a person treats himself or herself or another person exclusively as an object, he or she prevents mutuality, trust, and growth. When pervasive in a group, I-It relationships prevent human warmth, destroy cohesiveness, and retard group process. *Compare* I-Thou.

illness anxiety disorder Preoccupation with being sick or developing a disease with few or no somatic symptoms and an absence of related pathologies found on medical examination. Differentiated from somatic symptom disorder (hypochondriasis) by the absence of somatic symptoms or complaints; patients with illness anxiety disorder are primarily concerned with "the idea" of being or becoming sick; a DSM-5 diagnosis. *Compare* somatic symptom disorder.

illogicality Pattern of speech or thinking in which conclusions that are reached do not follow logically; may take the form of unwarranted or faulty inferences.

illogical thinking Thinking containing erroneous conclusions or internal contradictions; psychopathological only when it is marked and not caused by cultural values or intellectual deficit.

illuminism State of hallucinations in which a patient converses with imaginary supernatural creatures.

illusion Perceptual misinterpretation of a real external stimulus. *Compare* hallucination.

imago Jungian term referring to an idealized unconscious mental image of a key person in someone's early life.

imbecile Obsolete and pejorative term for a classification of mental retardation in which individuals have a mental age of 3 to 7 years.

imitation Duplication or mimicking of behaviors or portions of behaviors observed in a model. *See also* identification.

immediate memory Reproduction, recognition, or recall of perceived material within seconds after presentation. *Compare* long-term memory; short-term memory.

impaired insight Diminished ability to understand the objective reality of a situation.

impaired judgment Diminished ability to understand the objective reality of a situation. *See also* judgment.

implosion Behavior therapy technique in which anxiety-arousing stimuli are vividly presented in imagination; the patient repeatedly experiences intense anxiety in the absence of objective danger until the anxiety response is extinguished.

impotence A term used to refer to the inability to obtain an erection. In DSM, it is diagnosed as erectile disorder.

imprinting Particular kind of learning that occurs during an early critical developmental stage in animals, characterized by rapid acquisition and great resistance to extinction. It seems to represent a biologically predetermined proclivity to learn certain persistent species-specific behavior patterns, give exposure to the proper stimulus during the critical stage, but its precise

role in human behavioral development has not been established.

improvisation In psychodrama, the acting out of situations without prior preparation.

impulse Psychic striving or urge to perform an action. *See also* drive; instinct.

impulse control Ability to resist an impulse, drive, or temptation to perform some action.

impulse-control disorders Mental disorders in which there is weak impulse control with impulsive behavior that is usually irresistible, pleasurable, and aimed at obtaining immediate gratification, without regard for the consequences of the behavior, for example, pathological gambling, kleptomania, pyromania, intermittent explosive disorder, trichotillomania.

impulsion Blind following of internal drives without regard for social acceptance or pressure from the superego, normally seen in young children. In adults, it is common in those with weak defensive organizations; in such cases it tends to be a symbolic phenomenon.

inappropriate affect Emotional tone out of harmony with the idea, thought, or speech accompanying it. Seen in schizophrenia.

incest Sexual activity between close blood relatives. Common patterns are father–daughter, mother–son, and between siblings; may also be homosexually oriented.

incidence Research term for the number of cases of a disease whose onset occurs during a specific period of time. *See also* prevalence.

incidence rate Rate at which new cases of a disease or a condition are occurring. The incidence rate per 1,000 persons in the population is the number of new cases that occur within a defined unit of time, divided by the persons exposed or at risk during the same time unit, multiplied by 1,000.

incoherence Communication that is disconnected, disorganized, or incomprehensible. *See also* word salad.

incompetence Legal term indicating that thought processes are inadequate for sound judgment and may lead to maladaptive or abnormal behavior; legally, incompetent persons cannot be held responsible for their actions.

incorporation Primitive unconscious defense mechanism in which the psychic representation of another person or aspects of another person are assimilated into oneself through a figurative process of symbolic oral ingestion; represents a special form of introjection and is the earliest mechanism of identification.

increased libido Increase in sexual interest and drive. Often associated with mania.

independent variable In research methodology, those qualities that the experimenter systematically varies, for example, time, dosage.

individual psychology System of psychiatric theory developed by Alfred Adler that stresses compensation and overcompensation for feelings of inferiority in a person's strivings to adapt to the social milieu, and emphasizes the interpersonal nature of a person's problems; applied by some practitioners to group psychotherapy and counseling.

individual therapy Traditional dyadic therapeutic technique in which a psychotherapist treats only one patient during a given therapeutic session.

individuation Jungian term denoting a process whereby the person molds and develops a healthy integrated individual personality through maximum differentiation and development of each system of the personality. *See also* actualization.

Indoklon therapy Type of biological therapy in which a convulsive seizure is induced by the

inhalation of the drug Indoklon (hexafluorodiethyl ether).

indolamine Class of biogenic amines that contain an indole ring and are derived from the essential amino acid tryptophan; includes lysergic acid diethylamide (LSD) and serotonin. Monoamine oxidase inhibitors elevate the levels of indolamines by delaying their breakdown.

induced psychotic disorder *See* shared psychotic disorder.

industrial psychiatry Branch of psychiatry concerned with workers' adjustments to their jobs and with the effects of a business organization on its members.

ineffability Ecstatic state in which a person insists that his or her experience is inexpressible and indescribable, that it is impossible to convey what it is like to one who never experienced it.

infancy Childhood period of helplessness and marked dependency, generally the first year of life.

infantile articulation DEVELOPMENTAL ARTICULATION DISORDER.

infantile autism A term now subsumed under autism spectrum disorder that refers to a syndrome beginning in infancy and characterized by withdrawal and self-absorption, failure to develop attachment to a parental figure, ineffective communication and mutism, preoccupation with inanimate objects, and an obsessive demand for sameness in the environment. Also called Kanner syndrome; autistic spectrum disorder. *See also* autistic thinking.

infantile dynamics Psychodynamic integrations, such as the Oedipus complex, that are organized during childhood and continue to exert an unconscious influence on adult personality.

infantile perseveration DEVELOPMENTAL ARTICULATION DISORDER.

infantile sexuality Freudian concept regarding the erotic life of infants and children, that, from birth, infants are capable of erotic activities; encompasses the overlapping phases of psychosexual development during the first 5 years of life and includes the oral phase (birth to 18 months), the anal phase (ages 1 to 3), and the phallic phase (ages 2 to 6).

infant psychiatry That aspect of child psychiatry concerned with the diagnosis, treatment, and prevention of maladaptive psychological functioning in infants.

inferential statistics Methods used for drawing general conclusions about probabilities on the basis of a sample. *See also* statistical inference.

inferiority complex Concept, originated by Alfred Adler, that everyone is born with a feeling of inferiority or inadequacy secondary to real or fantasied organic or psychological deficits; how the inferiority or feeling of inferiority is handled determines a person's behavior in life. *See also* masculine protest.

informal admission As a general hospital model, a patient admitted to a psychiatric unit is free to enter and to leave, even against medical advice.

information theory System dealing with the transmission, reception, and distortion of communicated messages.

informed consent Consent given by a patient to a physician to perform a procedure legally requires that the patient be informed of the nature of the proposed procedure, its risks, its proposed benefits, and the available alternatives; the major problem in giving informed consent, legally and psychologically, is the extent or depth of disclosure.

infradian rhythm *See* biological rhythm.

infusion Introduction of fluid other than blood, for example, medicines, into a vein.

inhalant Substance taken in by breathing. Production of psychoactive effects by the ingestion of such volatile substances as gasoline, airplane glue, aerosols (especially spray paints), or rubber cement, warrants the DSM diagnosis of inhalant dependence or inhalant abuse.

inhibited female orgasm Recurrent and persistent inhibition (absence) of the female orgasm, referring to the inability of a female to achieve orgasm by masturbation or coitus. Also called anorgasmia.

inhibited male orgasm Difficulty or inability of a male in achieving ejaculation during coitus. Also called ejaculatory incompetence; retarded ejaculation. *See also* primary retarded ejaculation; secondary retarded ejaculation.

inhibited sexual excitement Former term for female sexual arousal disorder.

inhibition Limitation or renunciation of ego functions occurring consciously, alone or in combinations, to evade anxiety arising out of conflict with instinctual impulses, the superego, or environmental forces or figures.

initial insomnia Falling asleep with difficulty; usually seen in anxiety disorder. *Compare* middle insomnia; terminal insomnia.

insane Of or pertaining to one who is of unsound mind. A legal rather than a psychiatric term.

insanity Legal concept denoting a mental disturbance, due to which a person lacks criminal responsibility for an alleged crime and hence cannot be convicted of the crime. *See also* American Law Institute formulation of insanity; Durham rule; M'Naghten rule.

insanity defense Criminal law defense plea that a person lacks criminal responsibility by reason of insanity.

insecurity Feelings of helplessness, unprotectedness, and inadequacy in the face of manifold anxieties arising from uncertainty regarding one's goals, ideals, abilities, and relations to others.

insight Conscious recognition of one's own condition. In psychiatry, it more specifically refers to the conscious awareness and understanding of one's own psychodynamics and symptoms of maladaptive behavior; highly important in effecting changes in the personality and behavior of a person.

insight-oriented psychotherapy Psychotherapy based on the principles of psychoanalysis in which persons develop a conscious awareness and understanding of their own psychodynamics and symptoms of maladaptive behavior. There is greater emphasis on day-to-day reality issues and a lesser emphasis on the development of transference issues than in psychoanalysis.

insight therapy *See* insight-oriented psychotherapy.

insomnia disorder Difficulty in falling asleep or difficulty in staying asleep. It can be related to another mental disorder (nonorganic), can be related to a known organic factor (such as a physical disorder or a medication), or can be primary (not related to a known organic factor or to another mental disorder). *See also* initial insomnia; middle insomnia; terminal insomnia.

instinct Basic inborn urge or drive. Freud postulated the existence of two opposing primal instincts: a life instinct (eros) and a death instinct (thanatos). An extensive array of human instincts has been proposed, including possessive instinct, mastery instinct, and herd or social instinct. Because of its implication of a fixed, essentially unalterable, largely hereditary

response or psychic tendency that does not involve learning or reason, the term has become ambiguous and controversial when applied to human behavior. Many modern psychoanalysts prefer the term "drive" for what Freud termed "instinct." *See also* drive.

institutionalization Process of placing a patient in a facility for extended care, for example, a mental hospital or nursing home.

instrumental conditioning OPERANT CONDITIONING. *See* conditioning.

insulin coma therapy (ICT) Type of biological therapy in which large amounts of insulin are given to a psychotic patient, usually a schizophrenic, producing profound hypoglycemia and resulting in a coma; introduced by Manfred Sakel in 1933, it declined in use drastically after the introduction of antipsychotic drugs. An occasionally used early stage of this treatment is called subcoma therapy.

intake Initial interview between a patient and a member of a psychiatric team, a term usually used in connection with admission to a mental health facility.

integration Constructive organizing, absorbing, and incorporating into the personality of data and experience; also refers to an amalgamation of separate parts into a functioning integral whole.

intellectual disability (ID) or intellectual developmental disorder Below average general intellectual functioning with concurrent impairment in adaptive behaviors, such as communication, self-care, and interpersonal skills, which manifests before adulthood. In DSM-5, the degree of ID is classified as mild, moderate, severe, or profound based on overall level of functioning. Previously called mental retardation.

intellectual insight Knowledge of the reality of a situation without the ability to successfully use that knowledge to effect an adaptive change in behavior. *Compare* true insight.

intellectualization Unconscious defense mechanism in which reasoning or logic is used in an attempt to avoid confrontation with an objectionable impulse and thus defend against anxiety. Also called brooding compulsion; thinking compulsion.

intellectual subaverage functioning I.Q. of more than two standard deviations below the test mean obtained on an intelligence test.

intelligence Capacity for learning and ability to recall, integrate constructively, and apply what one has learned; the capacity to understand and to think rationally.

intelligence quotient (I.Q.) Numerical measure of mental capability determined by dividing a mental age (M.A.) score achieved on a specific test, such as the Stanford–Binet Test, by the patient's chronological age (C.A.) and multiplying by 100.

intermission In psychiatry, the interval between attacks of a particular syndrome; when it is not certain that the symptoms will return, the interval is called a remission.

intermittent explosive disorder Condition in which a person has discrete episodes of losing control of aggressive impulses resulting in serious assault or destruction of property; often caused by a disorder of brain physiology, particularly in the limbic system.

intermittent reinforcement Any schedule of reinforcement in which the response is not always reinforced.

***International Classification of Diseases* (ICD)** World Health Organization's official list of disease categories subscribed to by all WHO member nations. ICD-CM is ICD's clinical modification, first published in 1919.

internship First year of clinical training following medical school, now called postgraduate year I (PGY-I), which progresses onto residency training in a specialty area.

interobserver reliability Degree of concurrence or disagreement among observers of a single event.

interpersonal conflict EXTRAPSYCHIC CONFLICT.

interpersonal psychiatry Dynamic-cultural system of psychiatry based on Harry Stack Sullivan's interpersonal theory, which proposes that each person must be viewed as an entity interacting with the sociocultural and interpersonal environment; emphasis is on interactive experiences.

interpersonal psychotherapy A type of brief psychotherapy used primarily for the treatment of depression. In a course of 10 to 12 sessions the therapist and patient focus of current problems with person in the environment which increases the patient's perception of self-defeating behaviors that contribute to low self-esteem and depression.

interpersonal skill Effectiveness of adaptive behavior in relation to other persons; ability to express feelings appropriately, to be socially responsible and responsive, and to work in harmony with others.

interpretation The formulation or description by the therapist to the patient of the therapist's understanding of the symbolic significance or meaning of any aspect of the patient's intrapsychic processes, behavior, or verbal productions; an attempt is made to construct into a more meaningful form the patient's resistances, defenses, transferences, and other symbolic activities, for example, dreams, fantasies.

Interpretation of Dreams The Sigmund Freud's major presentation (1899) not only of his theories about the meaning of dreams, a subject hitherto regarded as outside scientific interest, but also of his concept of a mental apparatus topographically divided into unconscious, preconscious, and conscious areas.

interview Person-to-person interaction in which information about a subject is collected. *See also* structured interview; unstructured interview.

intoxication Organic mental disorder due to the recent ingestion or presence in the body of an exogenous substance producing maladaptive behavior by virtue of its effects on the central nervous system. The most common psychiatric changes involve disturbances of perception, wakefulness, attention, thinking, judgment, emotional control, and psychomotor behavior; the specific clinical picture depends on the nature of the substance ingested. For types of intoxication, see the specific term.

intrapersonal conflict INTRAPSYCHIC CONFLICT.

intrapsychic Referring to what originates, takes place, or is situated within the psyche or mind.

intrapsychic ataxia *See* ataxia.

intrapsychic conflict State of tension arising from the clash of two or more incompatible or opposing forces; for example, wishes, needs, motives, thoughts operating within oneself. Also called intrapersonal conflict. *Compare* extrapsychic conflict.

intravenous Denoting introduction of a substance into a vein or veins. *See also* infusion.

introjection Unconscious, symbolic internalization of a psychic representation of a hated or loved external object with the goal of establishing closeness to and constant presence of the

object; considered an immature defense mechanism. In the case of a loved object, anxiety consequent to separation or tension arising out of ambivalence toward the object is diminished; in the case of a feared or hated object, internalization of its malicious or aggressive characteristics serves to avoid anxiety by symbolically putting those characteristics under one's own control. *See also* incorporation.

intropunitive Turning anger inward toward oneself; commonly observed in depressed patients.

introspection Contemplating one's own mental processes so as to achieve insight.

introversion State in which a person's energies are directed inward toward the self, with little or no interest in the external world. *Compare* extroversion.

introverted personality disorder SCHIZOID PERSONALITY DISORDER.

inversion Sigmund Freud's term for homosexuality, in which he distinguished three types: absolute, amphigenous, and occasional.

involuntary admission Hospitalization of a person against his or her will. Following an application by a friend or relative for the admittance of a person who does not recognize the need for hospital care, certification by two physicians is required, which allows the patient to be hospitalized for 60 days. Patients have access to legal counsel and, if brought to court, a judge can order the patient's release. After 60 days, the case must be reviewed by a board (of psychiatrists, physicians, lawyers, and citizens not affiliated with the hospital). *See also* parens patriae.

involuntary discharge Termination of hospitalization against a patient's will.

involuntary treatment Care of a person, who has a mental disorder that constitutes a danger to self or others, against that person's will.

involutional melancholia Depression occurring in late middle-age in persons who generally have no history of previous mental illness. Characteristic manifestations include delusions of sin, guilt, or poverty; an obsession with death; preoccupation with somatic (particularly gastrointestinal) function; despair, dejection, agitation, anxiety, and insomnia; and, in some cases, paranoid ideation. The term is not used in DSM-5, but is replaced by the diagnosis of major depressive episode, melancholic type. Also called involutional psychosis.

involutional psychosis *See* involutional melancholia.

I.Q. Intelligence quotient.

irregular sleep phase circadian rhythm disorder A circadian rhythm sleep–wake disorder characterized by a fragmented, disorganized, or unpredictable sleep–wake pattern.

irrelevant answer Answer that is not responsive to the question.

irresistible impulse Concept that a person charged with a criminal offense is not responsible for his or her act if the act was committed under an impulse that the person was unable to resist because of mental disease. The courts have chosen to interpret this law in such a way that it has been called the "policeman-at-the-elbow" law; in other words, the court will grant the impulse to be irresistible only if it determines that the accused would have gone ahead with the act even if he or she had had a policeman at his or her elbow.

irritability Abnormal or excessive excitability, with easily triggered anger, annoyance, or impatience.

irritable mood State in which one is easily annoyed and provoked to anger. *See also*

irritability.

isolated explosive disorder Disorder of impulse control in which a person has a single episode characterized by a failure to resist a violent impulse against others.

isolation In psychoanalysis, a defense mechanism involving the separation of an idea or memory from its attached feeling tone; unacceptable ideational content is thereby rendered free of its disturbing or unpleasant emotional charge. *Compare* relatedness. *See also* alienation.

isophilic Term used by Harry Stack Sullivan to mean liking or feeling affectionate toward people of the same sex, without the sexual or erotic aspects of homosexuality.

I-Thou Philosopher Martin Buber's conception that a person's identity develops from the true sharing by persons; basic trust can occur in a living partnership in which each member identifies the particular real personality of the other in his or her wholeness, unity, and uniqueness. In groups, I-Thou relationships promote warmth, cohesiveness, and constructive group process. *Compare* I-It.

J

jacksonian epilepsy Epilepsy characterized by recurrent episodes of focal motor seizures that usually begin with a highly localized tonic contraction or clonic movement which increases in severity and spreads progressively, often involving the entire body and terminating in a characteristic generalized convulsion with loss of consciousness; implies organic cerebral disease.

jamais vu Paramnestic phenomenon characterized by a false feeling of unfamiliarity with a real situation that one has experienced.

James–Lange theory of emotion Theory that the experience of emotion is preceded by a visceral or motor response, for example, first the person runs and then feels fear.

Janet, Pierre (1859–1947) Last great representative of the French school of psychiatry, known for his concept of psychological automatism and for his interest in cases of multiple personalities; first used the term "la belle indifférence."

jargon aphasia Aphasia in which the words produced are neologistic, that is, nonsense words created by the patient.

JCAHO Joint Commission on Accreditation of Healthcare Organizations. Formerly JCAH, Joint Commission on Accreditation of Hospitals.

JCMHC Joint Commission on Mental Health of Children.

Joint Commission on Accreditation of Healthcare Organizations (JCAHO) Group of agencies that influence the standards and performance of hospitals and health organizations; they inspect hospitals every 2 years and determine requirements for hospital accreditation (on which hospital reimbursements from Medicare and Medicaid are contingent).

Joint Commission on Mental Health of Children (JCMHC) Multidisciplinary agency authorized by U.S. Congress in 1965 to monitor the treatment of children with emotional illness.

Joint Commission on Mental Illness and Health Multidisciplinary study group established in 1955 whose "Action for Mental Health" (1961) was instrumental in the legislation and federal funding for community mental health centers; with the passage of the Community

Mental Health Centers Act in 1963, deinstitutionalization became a reality.

Jones, Ernest (1879–1958) Welsh psychoanalyst, and one of Freud's early followers, who was an organizer of the American Psychoanalytic Association (1911) and of the British Psychoanalytical Society (1919) and a founder and long-time editor of the journal of the International Psychoanalytical Association; a prolific author most noted for his three-volume biography of Sigmund Freud.

judgment Mental act of comparing or evaluating choices within the framework of a given set of values for the purpose of electing a course of action. If the course of action chosen is consonant with reality or with mature adult standards of behavior, judgment is said to be intact or normal; judgment is said to be impaired if the chosen course of action is frankly maladaptive, results from impulsive decisions based on the need for immediate gratification, or is otherwise not consistent with reality as measured by mature adult standards.

Jung, Carl Gustav (1875–1961) Swiss psychiatrist and psychoanalyst, originally associated with Sigmund Freud, who later founded the school of analytic psychology.

justice In the context of mental health, a fair distribution and application of psychiatric procedures.

K

Kanner syndrome INFANTILE AUTISM.

kindling effect Electrophysiological process in which repeated subthreshold stimulation of a neuron eventually generates an action potential; at the organ level, repeated subthreshold stimulation of an area of the brain results in the generation of a seizure.

kinesiology Study of body movement, especially in the context of its communicative function.

kinesthetic hallucination Hallucination primarily involving bodily movement.

kinesthetic sense Sense by which muscular motion, tension, position, and posture are perceived. Also called proprioception.

Kirkbride, Thomas S. (1809–1883) American psychiatrist, one of the 13 original founders of the American Psychiatric Association, noted for his 1854 manual advocating reform in the design of institutions for the mentally ill.

Klein, Melanie (1882–1960) British psychoanalyst and child analyst whose theories of early development departed from orthodox freudian thought.

Kleine–Levin syndrome Condition characterized by periodic episodes of hypersomnia and bulimia.

kleptomania Pathological compulsion to steal.

Klinefelter syndrome Chromosomal anomaly in which there is an extra X chromosome (karyotype 47-XXY). Affected persons are male in development, with small firm testes, eunuchoid habitués, variable gynecomastia and other signs of androgen deficiency, and elevated gonadotropin levels; there is an increased frequency of mental retardation (about 25 percent) and other forms of psychopathology, particularly antisocial behavior and delinquency. *See also* Turner syndrome.

Klüver–Bucy syndrome Behavioral syndrome, first described in monkeys after bilateral temporal lobe ablation, characterized by increased oral, sexual, and aggressive behavior; loss of visual recognition: memory defect; and hyperreactivity to visual stimuli.

Kohut, Heinz (1913–1981) Important innovator in psychoanalysis, who originated the psychoanalytic school of self-psychology, which requires that patients become aware of their excessive needs for approval and self-gratification.

koro Acute delusional syndrome, seen in Southeast Asia and southern China, in which the patient suddenly becomes acutely anxious that his penis is shrinking and may disappear into his abdomen, in which case he will die.

Korsakoff psychosis Mental disorder seen in long-term alcoholics. Its major characteristic feature is profound memory impairment, particularly for recent events, for which the individual attempts to compensate by confabulation. Called alcohol amnestic disorder in DSM. *See also* Wernicke fluent encephalopathy.

Kraepelin, Emil (1865–1926) German psychiatrist noted for his pioneering work in psychiatric nosology and classification systems, and who differentiated between manic–depressive psychoses and dementia precox (schizophrenia). One of the last representatives of the predynamic school of psychiatry, he is often considered the father of descriptive psychiatry.

Kretschmer, Ernest (1888–1964) German psychiatrist noted for his theories of the relation of physique to character and personality.

kuru A prion disease, seen in Papua, New Guinea, caused by cannibalistic funeral rituals.

L

la belle indifférence Inappropriate attitude of calm or lack of concern about one's disability; seen in patients with conversion disorder.

labile Unstable; characterized by rapidly changing emotions.

labile affect Affective expression characterized by repetitious and abrupt changes, unrelated to external stimuli.

labile mood Oscillations in mood between euphoria and depression or anxiety.

lability *See* emotional lability.

laconic speech Condition characterized by a reduction in the quantity of spontaneous speech; replies to questions are brief and unelaborated, and little or no unprompted additional information is provided. Occurs in major depression, schizophrenia, and organic mental disorders. Also called poverty of speech.

lacunar amnesia LOCALIZED AMNESIA.

lalophobia Abnormal fear of speaking. Also called glossophobia.

language disorder Persistent difficulties in the acquisition and use of language across modalities due to deficiencies in production (expressive) or comprehension (receptive-expressive) that include reduced vocabulary, difficulty with sentence formation, and impairments in discourse. Disorders lead to functional limitations in effective communication, social participation, and/or occupational performance. *See also* communication disorder.

lanugo Neonatal-like body hair; may be noted in anorexia nervosa.

lapsus linguae Slip of the tongue.

latah Culture-specific disorder found among Malaysians and characterized by either a sudden onset of unusual and inappropriate motor and verbal manifestations or by an echo reaction, in which the victim is compelled to imitate any words or actions to which he or she is exposed; in both forms affected persons cannot control or inhibit their behavior.

late language emergence DSM-5 disorder of early childhood characterized by delayed language onset in the absence of any developmental disabilities or delays.

late luteal phase dysphoric disorder (LLPDD) *See* premenstrual dysphoric disorder.

latency phase Period of psychosexual development after the phallic phase and succeeded by the genital phase, extending from about age 5 to the beginning of adolescence at age 12; during this phase there is an apparent cessation of sexual preoccupation and a blockade of libidinal impulses, and boys and girls are inclined to choose friends and join groups of their own sex.

latent content Hidden or unconscious meaning of symbolic representations, especially in fantasies and dreams. *See also* manifest content.

latent homosexuality Unexpressed conscious or unconscious homoerotic wishes that are held in check. Sigmund Freud's theory of bisexuality postulated the existence of a constitutionally determined, although experientially influenced, instinctual masculine-feminine duality; normally, the opposite-sex component is dormant, but a breakdown in the defenses of repression and sublimation may activate latent instincts and result in overt homoeroticism.

latent schizophrenia Condition characterized by clear schizophrenic symptoms without a history of prior overtly psychotic schizophrenic episodes. In DSM the condition is subsumed under the category of schizotypal personality disorder.

learned autonomic control Learned regulation by a person of physiological responses that are under autonomic nervous system control. *See also* biofeedback.

learned helplessness *See* helplessness.

learning disorders Disorders manifested in school-age children and characterized by specific difficulties in learning that are unrelated to intelligence. In DSM, disorders include reading disorder, dyscalculia, and disorder of written expression. *See also* dyslexia.

learning theory Approach to the understanding of human behavior that emphasizes the way in which learning comes about. Learning itself represents a change in behavior resulting from practice; through the application of certain laws of learning, learning theory attempts to explain the basic processes that are necessary for learning to occur.

lesbianism Female homosexuality. Also called sapphism.

Lesch–Nyhan syndrome A rare, X-linked disorder caused by a deficiency of an enzyme involved in purine metabolism. Characteristics include intellectual disability, seizures, self-mutilating behaviors (e.g., head banging, finger biting), microcephaly, choreoathetosis, and spasticity.

lethologica Momentary forgetting of a name or proper noun. *See* blocking.

leukotomy LOBOTOMY.

Lewin, Kurt (1890–1947) German psychologist who emigrated to United States in 1933. Two of his chief theoretical contributions are the field approach (field theory) and group dynamics, each of which has been useful in the experimental study of human behavior in a social situation.

Lewy body disease A type of dementia clinically similar to Alzheimer disease that is also accompanied by hallucinations and parkinsonian features. Often associated with Capgras' syndrome. *See also* dementia of the Alzheimer type.

Liaison Committee on Medical Education (LCME) Group sponsored by the American

Medical Association and the Association of American Medical Colleges that is principally involved in accrediting activities in undergraduate medical education.

liaison nursing Communication among nurses from various disciplines concerning the treatment of medical, surgical, and neuropsychiatric patients.

liaison psychiatry *See* consultation-liaison psychiatry.

libido In psychoanalysis, the psychic energy associated with the sexual drive (life instinct).

life instinct SEXUAL DRIVE.

lifetime expectancy Total probability of a person developing a disorder during a lifetime.

lifetime prevalence Measure at a point in time of the number of persons who had a given disorder at some time during their lives.

lilliputian hallucination Visual sensation that persons or objects are reduced in size, more properly regarded as an illusion. *See also* micropsia.

limbic system James Papez' proposal (1939) that a reverberating circuit or system, consisting of the hippocampus, hypothalamus, anterior thalamus, and cingulate gyrus, was the central nervous system localization for emotions; current models also include the amygdala and septal area, as well as other neuroanatomic areas. Various parts of the limbic system have been associated with emotions, sex drive, eating behavior, rage, violence, memory, and motivation.

lithium carbonate Lithium salt effective in the treatment of the manic phase of bipolar disorder and as a mood-stabilizing drug for chronic manic–depressive patients; may also be an effective antidepressant in some patients.

Little Albert Eleven-month-old boy who was conditioned to fear furry objects in experiments conducted by American psychologist John B. Watson (1920) to demonstrate that phobias are learned responses based on classical conditioning.

Little Hans Sigmund Freud's famous case history of a 5-year-old boy with a phobia. The boy's fear of horses, instead of his father, helped him to avoid hating his father, by whom he was threatened; and whom he also loved.

living will Legal document in which patients give instructions to their physicians about withholding life support measures, for example, Do Not Resuscitate (DNR) if in extremis.

LCME Liaison Committee on Medical Education.

LLPDD Late luteal phase dysphoric disorder.

LNNB Luria-Nebraska Neuropsychological Battery.

lobotomy Neurosurgical procedure, introduced by Egas Moniz, in which one or more nerve tracts in a lobe of the cerebrum are severed. Prefrontal lobotomy is the ablation of one or more nerve tracts in the prefrontal area of the brain and has been used in the treatment of certain severe mental disorders that do not respond to other treatments. Also called leukotomy.

localized amnesia Partial loss of memory; amnesia restricted to specific or isolated experiences. Also called lacunar amnesia; patch amnesia.

locus ceruleus Nucleus (a collection of neuronal cell bodies) that is located in the pons (a region of the brain stem) and contains the largest population of noradrenergic neurons in a single identified brain region; these neurons project their axons to virtually every region of the brain and are thought to be involved in the regulation of mood, anxiety, and attention.

logorrhea Copious, pressured, coherent speech; uncontrollable, excessive talking; observed in manic episodes of bipolar disorder. Also called tachylogia; verbomania; volubility.

logotherapy Existential analysis based on spiritual values, rather than psychobiological laws.

longitudinal study Examination or analysis carried out of a long period of time.

long-term memory Reproduction, recognition, or recall of experiences or information that were experienced in the distant past. Also called remote memory. *Compare* immediate memory; short-term memory.

loosening of associations Characteristic schizophrenic thinking or speech disturbance involving a disorder in the logical progression of thoughts, manifested as a failure to adequately verbally communicate; unrelated and unconnected ideas shift from one subject to another. *See also* tangentiality.

Lou Gehrig disease AMYOTROPHIC LATERAL SCLEROSIS.

LP Lumbar puncture.

LSD Lysergic acid diethylamide.

Lumbar puncture (LP) Use of a needle inserted into the lumbar spine intervertebral space to obtain cerebrospinal fluid for diagnostic purposes or to introduce local anesthetics or other drugs.

Luria-Nebraska Neuropsychological Battery (LNNB) Based on the work of the Russian psychologist A. R. Luria, the test assesses a wide range of cognitive functions: memory; motor functions; rhythm; tactile, auditory, and visual functions; receptive and expressive speech; writing; spelling; reading; and arithmetic. It is extremely sensitive for identifying specific types of problems (e.g., dyslexia, dyscalculia) rather than being limited to more global impressions of brain dysfunction; it also helps localize the various cortical zones that are involved in a particular function and is useful in establishing left or right cerebral dominance. The test is designed for persons at least 15 years of age; a children's version for use with 8 to l2 year olds is being developed.

lust dynamism Harry Stack Sullivan's term to describe clearly stated sexual desires and abilities.

lying Making statements that one knows consciously are false with intent to deceive; differentiated from confabulation, in which one is not conscious of lying.

lysergic acid diethylamide (LSD) A potent psychotogenic drug discovered in 1942 that produces psychotic-like symptoms and behavior changes, including hallucinations, delusions, and time-space distortions. Commonly called acid.

M

macropsia False perception that objects are larger than they really are. *Compare* micropsia.

magical thinking A form of dereistic thought; thinking similar to that of the preoperational phase in children (Jean Piaget), in which thoughts, words, or actions assume power (e.g., to cause or to prevent events). Common in dreams, certain mental disorders, and children.

magnetic resonance imaging (MRI) Diagnostic modality in which a patient's body is placed in a magnetic field and its hydrogen nuclei are excited by radiofrequency pulses at angles to the field's axis; resulting signals from the body's hydrogen ions are processed through a computer to produce an image; an excellent method for differentiating gray and white matter, visualizing cerebrospinal fluid, and estimating the size of ventricles.

Mahler, Margaret (1897–1985) Hungarian-born psychiatrist and child analyst who described

the separation-individuation process in children.

maintenance drug therapy Stage in the course of chemotherapy at which, after the drug has reached its maximal efficacy, the dosage is reduced and sustained at the minimal therapeutic level that will prevent a relapse or exacerbation.

major affective disorder *See* major depression.

major depressive disorder Severe mood disorder characterized by one or more depressive episodes but no history of a manic episode; a DSM-5 diagnosis. *See also* mood disorder.

major depressive episode, melancholic type DSM diagnosis replacing involutional melancholia.

major epilepsy *See* grand mal epilepsy.

major motor seizure *See* grand mal epilepsy.

major neurocognitive disorder DSM-5 term for dementia.

major tranquilizer ANTIPSYCHOTIC.

maladaptive Referring to any mental activity or behavior that is dysfunctional or counterproductive with regard to a person's ability to cope effectively with the problems and stresses of life.

maladjustment Maladaptive reaction; poor, faulty, or inadequate coping ability.

male erectile disorder DSM sexual arousal disorder characterized by the recurrent and persistent partial or complete failure to obtain or maintain penile erection until the completion of the sex act. Also called erectile dysfunction. *See also* impotence.

male hypoactive sexual desire disorder Disorder characterized by an absence of or reduction in sexual fantasies and/or the desire for sexual activity in men

maleness Anatomic and physiological features relating to the male's procreative functions.

malingering Feigning disease in order to achieve a specific goal, for example, to avoid an unpleasant responsibility. *Compare* factitious disorder.

malpractice Professional negligence including intentional or willful invasion of another's legally protected interests, such as battery or treatment without consent; must be demonstrated by the presence of *d*ereliction of a *d*uty *d*irectly causing *d*amages (the four D's of malpractice).

mania Mood abnormality characterized by elation; agitation; hyperactivity and hyperexcitability; accelerated thinking and speaking (flight of ideas); decreased need for sleep; and overinvolvement in pleasurable behavior. Characterizes the manic phase of bipolar I disorder when lasting more than a week or is severe enough to warrant hospitalization. *Compare* hypomania.

manic Denoting or characterized by mania. Sometimes used as a general description for a mentally disturbed person, often someone exhibiting violent or grossly irrational behavior.

manic–depressive illness Mood disorder characterized by severe alterations in mood that are usually episodic and recurrent. The unipolar type is characterized by either periodic episodes of mania (manic disorder) or periodic episodes of depression (depressive disorder). In the bipolar or circular type, the patient has at least one episode of each mood extreme and may alternate periodically between the two. Manic–depressive illness has been replaced by bipolar disorder in DSM.

manifest content That part of a dream or fantasy that a person remembers and reports; in a

dream, it represents a disguised and symbolic expression of the latent content of the dream.

manipulation Exploitativeness; the maneuvering by patients to get their own way, characteristic of antisocial personalities.

mannerism Stereotyped gesture or expression that is peculiar to a given person.

mantra In transcendental meditation, a Sanskrit syllable or word that is repeated over and over in an effort to produce total relaxation and control over one's state of consciousness.

MAOI Monoamine oxidase inhibitor.

marasmus Progressive emaciation, especially in malnourished infants and children, in which weight is often below the third percentile and markedly below appropriate weight for height.

marathon Technique developed by George Bach and Frederick Stoller that incorporates a group meeting that usually lasts 8 to 72 hours (although some may last for a week), in which the sessions interrupted only for eating and sleeping; the leader works for the development of intimacy and the open expression of feelings. The time-extended group experience culminates in intense feelings of excitement and elation.

marijuana Dried leaves and flowers of *Cannabis sativa* (Indian hemp), which induce somatic and psychic changes in a person when smoked or ingested in sufficient quantity. Somatic changes include increased heart rate, rise in blood pressure, dryness of the mouth, and increased appetite; psychic changes include a dreamy-state level of consciousness, a sense of enhanced vividness of visual and auditory sensations, disturbances of time perception and memory-dependent, goal-directed behavior, disruptions of sequential thought processes, and euphoria and other alterations of mood. The compound believed to be responsible for most of its psychological effects is tetrahydrocannabinol (THC). In strong doses, marijuana can produce hallucinations and, at times, paranoid ideation. Also called pot; grass; weed; dope; Mary Jane.

marital counseling Process whereby a trained counselor helps married couples resolve problems that arise and trouble them in their relationship; the husband and the wife are seen by the same worker in separate and joint counseling sessions that focus on immediate family problems. The theory and techniques of this approach were first developed in social agencies as part of family case work.

marital problems Maladaptive behavior between spouses in various areas, for example, attitudes toward sex, contraception, child rearing, money handling.

marital therapy *See* marriage therapy.

marriage therapy Type of family therapy that involves the husband and the wife and focuses on the marital relationship as it affects the individual psychopathology of the partners. The rationale for the method is the assumption that psychopathological processes within the family structure and in the social matrix of the marriage perpetuate individual pathological personality structures, which find expression in the disturbed marriage and are aggravated by the feedback between partners.

masculine identity Inner sense of gender affiliation with males. *Compare* feminine identity.

masculine protest Adlerian doctrine that depicts a universal human tendency to move from a passive and feminine role to a masculine and active role; an extension of Alfred Adler's ideas about organic inferiority that became the prime motivational force in normal and neurotic behavior in his system. *See also* Adler, Alfred; inferiority complex.

masculinity-femininity scale Any scale on a psychological test that assesses the relative masculinity or femininity of the testee. Scales vary and may focus, for example, on basic identification with either sex or preference for a particular sex role and are strongly influenced by cultural definitions of masculinity and femininity.

masochism Paraphilia in which sexual gratification is derived from being physically or psychologically maltreated by a partner or oneself; first described by an Austrian novelist, Leopold von Sacher-Masoch (1836–1895). *See also* sadism; sadomasochistic relationship.

masturbation Self-stimulation of the genitals for sexual pleasure. *See* autoerotism.

maternal deprivation Result of the premature loss or absence of the mother. In a broader sense, the lack of proper mothering may constitute a form of maternal deprivation which may lead to severe emotional disorders in infants and children.

maturational crises Normative stages of the life cycle that require adaptive coping or defense mechanisms.

maximum security unit That part of an institution for the mentally ill reserved or those who have committed crimes or who are considered dangerous to others.

MCE Medical care evaluation.

MDMA 3,4-Methylenedioxymethamphetamine.

mean Statistical measurement derived from adding a set of scores and then dividing by the number of scores. *See also* average.

mean deviation Statistical measure of the variability in a set of values defined as the sum of the absolute differences between the values and the mean divided by the number of values.

median Value in a set of values above and below which there are an equal number of values; for example, in the series 1, 3, 5, 9, 33 the value 5 is the median. *See also* average.

Medicaid Assistance program for certain needy and low-income persons, mandated by the federal government and financed by both federal and state governments; certain benefits, such as in- and outpatient hospital care, physicians' services, and laboratory tests, are required covered expenses, while other services may be provided at the state's option.

medical audit Retrospective assessment of the quality and utilization of care, including investigation of suspected problems, analysis of the problems identified, and a plan for corrective action. Also called medical care evaluation (MCE).

medical care evaluation (MCE) MEDICAL AUDIT.

medical ethics Moral set of principles that determine what is right or wrong and good or bad, as they pertain to professional responsibilities and opinions relating to the values of patients, patients' families, and society at large. For related issues, see the specific term.

medical record Written exposition describing a patient's diagnosis and treatment.

medical review Evaluation of the quality of care and assessment of medical care or services judged in terms of cost effectiveness.

Medicare Hospital and medical insurance system for the aged created in 1965 by amendments of the Social Security Act. Hospitalization in general hospitals for psychiatric conditions is covered in the same way as other conditions.

medication-induced movement disorders A group of disorders that include neuroleptic malignant syndrome, neuroleptic-induced parkinsonism, neuroleptic-induced acute akathisia, neuroleptic-induced tardive dyskinesia, neuroleptic-induced acute dystonia, and medication-

induced postural tremor.

megalomania Morbid preoccupation with expansive delusions of power, importance, or wealth.

megavitamin therapy *See* orthomolecular treatment.

melancholia A severe depressive state characterized by anhedonia, early morning awakening, weight loss, psychomotor retardation, and profound feelings of guilt and hopelessness; often associated with suicidal ideation.

memory Process whereby what is experienced or learned is established as a record in the central nervous system (registration), where it persists with a variable degree of permanence (retention) and can be recollected or retrieved from storage at will (recall). For types of memory, see the specific term.

menarche Onset of menstrual function.

mendacity Pathological lying.

mens rea Legal term meaning an intent to do harm.

mental aberration Pathological deviation from normal thinking; unrelated to a person's intelligence.

mental age Measure of mental ability as determined by standard psychological tests.

mental deficiency Term often used interchangeably with mental retardation, applied to individuals with an I.Q. of less than 70. *See* intellectual developmental disorder.

mental disorder, mental disease Psychiatric illness or disease whose manifestations are primarily characterized by behavioral or psychological impairment of function, measured in terms of deviation from some normative concept.

mental health State of emotional well-being in which persons are able to function comfortably within their society and in which their personal achievements and characteristics are satisfactory to them.

mental hygiene 1. Conditions and practices conducive to the establishment and maintenance of mental health. **2.** Field dealing with the prevention and early treatment of mental illness. *See also* orthopsychiatry.

mental illness Mental disorder; any serious impairment of adjustment; any psychiatric disorder listed in the American Psychiatric Association's *Diagnostic and Statistical Manual of Mental Disorders* or in the World Health Organization's *International Classification of Diseases*.

mental retardation Term previously assigned to the condition that DSM-5 now refers to as intellectual disability. Degrees of condition were historically classified according to IQ: mild (50–55 to 70), moderate (35–40 to 50–55), severe (20–25 to 30), and profound (below 20–25). *See* intellectual disability.

mental status General functional condition of mental and behavioral processes as determined by psychiatric assessment of a variety of areas of functioning, such as state of consciousness, mood and affect, thinking and speech, motor behavior, general knowledge, memory, calculation, judgment, abstraction, and insight.

mental status examination (MSE) Clinical evaluation, and the sum total of the examiner's observations and impressions, of a person's psychological and behavioral experiences. MSE includes specific references to such areas as attitude and general behavior during interview and

to sensorium, mental capacity, and other areas of function.

merycism RUMINATION DISORDER OF INFANCY.

mescaline Hallucinogenic drug obtained from buttons of the peyote cactus that has psychotomimetic effects similar to those of LSD.

mesmerism Early term for hypnosis.

mesomorphic Muscular, with a well-proportioned physique; one of Sheldon's constitutional types. *Compare* ectomorphic; endomorphic.

meta-analysis General consensus of many studies that results in one common data base that helps to eliminate bias.

metapsychiatry Branch of psychiatry concerned with altered state of consciousness, holistic health, and parapsychology.

metapsychology Branch of theoretical or speculative psychology concerned with theories, hypotheses, or phenomena that are largely beyond the realm of empirical verification. *See also* parapsychology.

methadone Orally active synthetic narcotic agent that is an effective analgesic with pharmacological actions qualitatively very similar to those of morphine. Its use in the maintenance treatment of heroin addicts is based on its extended duration of action in suppressing withdrawal symptoms in persons physically dependent on opiates.

methadone maintenance treatment *See* methadone.

3-methoxy-4-hydroxyphenylglycol (MHPG) Most significant metabolic product from central nervous system norepinephrine; excreted in urine.

3,4-methylenedioxymethamphetamine (MDMA) Hallucinogen more commonly known as ecstasy.

methyl-4-phenyl-1,2,3,6-tetrahydropyridine (MPTP) Contaminant of an illicitly made synthetic heroin that induces irreversible parkinsonism.

metonymy Speech disturbance common in schizophrenia in which the affected person uses a word or phrase that is related to the proper one but is not the precise one that would ordinarily be used; for example, the patient speaks of consuming a "menu," rather than a "meal," or refers to losing the "piece of string" of the conversation, rather than the "thread" of the conversation. *See also* paraphasia; word approximation.

Metrazol treatment Obsolete form of convulsive therapy in which a convulsive seizure is induced by injection of the drug Metrazol (pentylenetetrazol).

Meyer, Adolf (1866–1950) American psychiatrist known for his concept of psychobiology and "commonsense" psychiatry.

MHPG 3-Methoxy-4-hydroxyphenylglycol.

microcephaly Condition in which the head is unusually small as a result of defective brain development and premature ossification of the skull.

micropsia False perception that objects are smaller than they really are. Sometimes called lilliputian hallucination. *Compare* macropsia.

MID Multi-infarct dementia.

middle age, middle adulthood That period considered to be the prime of life, between the ages of approximately 40 to 65 years, following the termination of early adulthood.

middle insomnia Waking up after falling asleep without difficulty and then having difficulty

in falling asleep again. *Compare* initial insomnia; terminal insomnia.

midlife crisis Syndrome that occurs in both sexes as they enter their early 40s or 50s, consisting of depression, substance abuse, concern about growing old, and fear of death; more common in adults with prior psychiatric illness than in normal adults.

migraine Severe unilateral, throbbing headache that appears periodically, usually beginning during the teenage years and continuing to recur with diminishing frequency during advancing years. Classic migraine is a syndrome ushered in by a transient derangement of neurological function, often a visual disturbance, followed by hemicranial headache, nausea, and vomiting, all of which last for anywhere from several hours to 1 or 2 days. Common migraine has the same character and time course but develops without any prodrome. Patients with migraine are typically described as tense, meticulous, hard-driving persons who appear to have a high frequency of associated emotional conflicts.

mild mental retardation *See* mental retardation.

mild neurocognitive disorder Mild decline in cognitive function that is differentiated from the normal cognitive changes associated with aging; memory is impaired for age and education, however, general cognitive function and activities of daily living remain intact. In DSM-5 diagnosed as mild neurocognitive disorder due to multiple etiologies or unspecified neurocognitive disorder.

milieu therapy Treatment that emphasizes appropriate socioenvironmental manipulation for the benefit of the patient; the setting is usually the psychiatric hospital. *See also* moral treatment; therapeutic community.

mimicry Simple, imitative motion activity of childhood.

minimal brain dysfunction Behavioral syndrome of childhood, now called attention-deficit hyperactivity disorder, characterized by learning difficulties, decreased attention span, distractibility, hyperactivity, impulsiveness, emotional lability, and, often, disturbances in perceptuomotor and language development; its psychopathological mechanisms have not been defined. The term implies neurological causation, but in most cases there are no major unequivocal neurological signs and there has been a tendency to apply the term as a convenient explanatory label to any child presenting with a specific learning difficulty or behavioral dysfunction. Although the syndrome has been diagnosed with increasing frequency over the past 20 years, its validity as a diagnostic entity has been questioned, and it is not listed as such in DSM.

Minnesota Multiphasic Personality Inventory (MMPI) Questionnaire type of psychological test for persons age 16 and over consisting of true–false statements that are coded in various scales that assess different dimensions of the person's personality structure and measure the closeness of fit with various psychiatric diagnostic categories.

minor epilepsy PETIT MAL EPILEPSY.

minor tranquilizer ANXIOLYTIC.

Mitchell, S. Weir (1830–1914) American neurologist known for his concept of rest treatment to cure emotional disorders.

mixoscopia Sexual perversion in which a person attains orgasm by watching his or her love object make love with another person.

MMPI Minnesota Multiphasic Personality Inventory.

M'Naghten rule Set of rules established in 1843 in England to determine criminal responsibility, based on the person's ability to distinguish right from wrong. *See also* Durham rule; American Law Institute formulation of insanity.

mode In a set of measurements, the value that appears most frequently. *See also* average.

modeling Learning of a new skill or behavior by observation and imitation of another person.

Model Penal Code American Law Institute's test of criminal responsibility: "A person is not responsible for criminal conduct if at the time of such conduct, as a result of mental disease or defect, he lacked substantial capacity to either appreciate the criminality (wrongfulness) of his conduct or to conform his conduct to the requirement of the law."

moderate mental retardation *See* mental retardation.

molecular psychiatry Etiological view of psychiatry based on neurotransmitter chemicals as measured in molecular quantities.

mongolism Obsolete term for Down syndrome.

monoamine Biogenic amine or class of neurotransmitters that consists of three catecholamines (dopamine, norepinephrine, and epinephrine), an indolamine (serotonin), a quaternary amine (acetylcholine), and an ethylamine (histamine).

monoamine oxidase (MAO) Enzyme that deaminates monoamines and that functions, in the nervous system by breaking down monoamine neurotransmitters (e.g., norepinephrine, epinephrine, dopamine, and serotonin); has been subdivided into Type A and Type B.

monoamine oxidase inhibitor (MAOI) Agent that inhibits the enzyme monoamine oxidase (MAO). MAO inhibitors are highly effective as antidepressants and are also used in the treatment of panic disorders and some eating disorders.

monomania Morbid mental state characterized by preoccupation with one subject. Also called partial insanity.

monosymptomatic hypochondriacal psychosis A delusional disorder consisting of somatic delusions; common delusions include infestation, dysmorphophobia, and foul body odors or halitosis.

monozygotic twins Twins who develop from a single fertilized ovum. In contrast, dizygotic or fraternal twins develop from two separately fertilized ova. Also called identical twins.

mood Pervasive and sustained feeling tone that is experienced internally and that, in the extreme, can markedly influence virtually all aspects of a person's behavior and his or her perception of the world. Distinguished from affect, the external expression of the internal feeling tone. For types of mood, see the specific term.

mood-congruent delusion Delusion with content that is mood appropriate, for example, a depressed patient who believes he or she is responsible for the destruction of the world.

mood-congruent hallucination Hallucination with content that is consistent with either a depressed or a manic mood, for example, a depressed patient hearing voices telling the patient he or she is a bad person; a manic patient hearing voices telling the patient he or she has inflated worth, power, or knowledge.

mood-congruent psychotic features DSM term that refers to hallucinatory or delusional phenomena with contents that consistently reflect the mood of a manic or depressed patient.

mood disorders Qualitative terms used to describe the striking symptomatic features or timing patterns in various patients with moods disorders. Descriptive qualifiers include

psychotic, melancholic, atypical, and catatonic features; patterns include postpartum onset, rapid cycling, and seasonal pattern.

mood-incongruent delusion Delusion based on incorrect reference about external reality, with content that has no association to mood or is mood-inappropriate, for example, a depressed patient who believes he or she is the new Messiah.

mood-incongruent hallucination Hallucination not associated with real external stimuli, with content that is not consistent with either depressed or manic mood, for example, in depression, hallucinations not involving such themes as guilt, deserved punishment, or inadequacy; in mania, not involving such themes as inflated worth or power.

mood-incongruent psychotic features DSM term that refers to hallucinatory or delusional phenomena with contents that do not consistently reflect the mood of a manic or depressed patient.

mood stabilizer Drug used to prevent mood swings in bipolar disorder.

mood swing Oscillation of a person's emotional feeling tone between periods of elation and periods of depression.

moral treatment Philosophy and technique of treating mental patients, developed in the 18th century, that involved the establishment of a humane therapeutic environment designed to maximize the chances for recovery; considered the forerunner of current milieu therapy.

morbid jealousy Marked or severe jealousy. Also called pathological jealousy.

morbid perplexity Condition seen in schizophrenia in association with loss of ego boundaries; the patient exhibits profound confusion about his own identity and the meaning of existence.

moron Obsolete and pejorative term for a classification of mental retardation in which an individual has a mental age of approximately 8 years.

morphine Major phenanthrene alkaloid opium derivative that produces a combination of central nervous system excitation and depression; repeated administration can lead to tolerance, physical dependence, and psychological dependence; used as an analgesic, sedative, and anxiolytic.

Moses and Monotheism Title of a book by Sigmund Freud (1939) in which he undertook a historical but frankly speculative reconstruction of the personality of Moses and examined the concept of monotheism and the abiding effect of the patriarch on the character of the Jews; one of Freud's last works, it bears the imprint of his latter-day outlook and problems.

mother surrogate In psychoanalysis, a mother substitute onto whom a patient projects his or her mother image and responds to unconsciously, in an inappropriate and unrealistic manner, with the feelings and attitudes that he or she had toward the real mother.

motivation Force or energy associated with an internal state that propels a person to engage in behavior to satisfy a need or desire.

motor aphasia Aphasia in which understanding is intact but the ability to speak is lost. Also called Broca's, expressive, or nonfluent aphasia.

motor disorders A class of neurodevelopmental disorders defined by a delay in meeting expected milestones for motor skills, based on age and intelligence, which significantly impairs daily functioning. The major types of motor disorders include developmental coordination disorder, stereotypic movement disorder, and tic disorder.

mourning Syndrome following loss of a loved one, consisting of preoccupation with the lost individual, weeping, sadness, and repeated reliving of memories. *See also* bereavement; grief.

MPD Multiple personality disorder.

MPTP Methyl-4-phenyl-1,2,3,6-tetrahydropyridine.

MRI Magnetic resonance imaging.

multi-infarct dementia *See* vascular dementia.

multiple delusions Concurrent delusions in which the delusions need not be interconnected.

multiple personality disorder *See* dissociative identity disorder.

multiple regression Multivariate analysis in which a scaled variable is correlated with a linear combination of independent or predictor variables.

multiple therapy CO-THERAPY.

multivariate analysis Methods for considering the relationship of three or more variables, including multiple regression, multivariate analysis of variance, discriminant analysis, canonical correlation, and factor analysis.

Munchausen syndrome Alternate term for factitious disorder.

muscarine Naturally occurring alkaloid found in certain species of poisonous mushrooms; symptoms of mushroom poisoning develop within 30 minutes of ingestion and consist of vomiting, diarrhea, bronchospasm, hypertension, delirium, and shock.

mutism Organic or functional absence of the faculty of speech. *See also* stupor.

mydriasis Dilation of the pupil; sometimes occurs as an autonomic (anticholinergic) side effect of some phenothiazines and tricyclic antidepressant drugs.

mysophobia Abnormal fear of dirt or contamination.

N

naloxone Opiate antagonist that, unlike nalorphine which it has largely replaced as a narcotic antagonist is essentially devoid of agonist effects. In opioid-dependent persons, small doses of naloxone precipitate moderate to severe withdrawal symptoms, an effect that can be used to diagnose physical dependence on narcotic drugs; however, the most important use of naloxone is in the treatment of narcotic overdosage. (Trade name, Narcan.)

NAMI National Alliance for the Mentally Ill.

narcissism Self-love linked to autoerotism but devoid of geniality. In psychoanalytic theory, it is divided into primary and secondary types: primary narcissism, the early infantile phase of object relationship development, when the child has not differentiated the self from the outside world and all sources of pleasure are unrealistically recognized as coming from within the self, giving the child a false sense of omnipotence; secondary narcissism, when the libido, once attached to external love objects, is redirected back to the self. *See also* autistic thinking.

narcissistic personality disorder Personality disorder characterized by a grandiose sense of self-importance, preoccupation with fantasies of unlimited success, exhibitionistic need for attention and admiration, exaggerated responses to criticism or other perceived threats to self-esteem, and disturbance in interpersonal relationships.

narcoanalysis NARCOTHERAPY.

narcolepsy Sleep disorder characterized by recurrent, brief, uncontrollable episodes of sleep; often associated with cataplexy. *See also* hypersomnia.

narcosis Drug-induced stupor.

narcosynthesis NARCOTHERAPY.

narcotherapy Psychotherapy conducted with the patient in a drug-induced stupor or semiconscious state, as by the administration of barbiturates; originally used in the treatment of acute disorders arising in the setting of military combat; also called narcoanalysis; narcosynthesis.

narcotic Any natural or synthetic drug producing morphine-like analgesia, drowsiness, mental clouding, and, with prolonged use, physical dependence. *See also* opioid.

narcotic blockade Inhibition of the euphoric effects of even high doses of intravenous opioids, such as heroin, by the use of other drugs, such as methadone.

National Alliance for the Mentally Ill (NAMI) Self-help group and influential national advocacy network comprised of and supported by the family members and parents of schizophrenic patients.

National Board of Medical Examiners (NBME) National board, founded in 1915, for testing medical students by three examinations given during different stages of their medical education to qualify for licensure to practice medicine in the United States; the diploma is accepted in 50 states for obtaining licensure without further examination by the state.

National Center for Complementary and Alternative Medicine (NCAAM) A government agency, part of the National Institute of Health that tests and evaluated alternative medicine therapies, for example, nutritional supplements, prayer, yoga, among many others.

National Institute of Alcohol Abuse and Alcoholism (NIAAA) *See* Alcohol, Drug Abuse, and Mental Health Administration.

National Institute of Drug Abuse (NIDA) *See* Alcohol, Drug Abuse, and Mental Health Administration.

National Institute of Mental Health (NIMH) *See* Alcohol, Drug Abuse, and Mental Health Administration.

National Mental Health Association (NMHA) Voluntary citizens' organization, founded in 1909 as the National Committee on Mental Hygiene, to promote mental health.

National Training Laboratories (NTL) Organization started in 1947 at Bethel, Maine, to train professionals who work with groups; interest in personal development eventually led to sensitivity training and encounter groups.

natural group Any group that tends to evolve spontaneously inhuman civilization, such as a kinship, tribal, or religious group in contrast to various contrived groups or aggregates of people who meet for a relatively brief time to achieve some goal.

NBME National Board of Medical Examiners.

NCAAM National Center for Complimentary and Alternative Medicine.

necromania Pathological preoccupation with dead bodies.

necrophilia Sexual attraction to or sexual contact with dead bodies.

necrophobia Abnormal fear of dead bodies.

need Ambiguous term referring to an internal state of unsatisfaction or tension related to a wish, urge, desire, or other endogenous behavioral stimulus; classically, it implied an innate or instinctual internal stimulus. *See also* drive; instinct; motivation.

needle phobia The persistent, intense, pathological fear of receiving an injection.

negative reinforcement *See* reinforcement.

negative symptoms In schizophrenia: flat affect, alogia, abulia, and apathy.

negative transference *See* transference.

negativism Verbal or nonverbal opposition or resistance to outside suggestions and advice; commonly seen in schizophrenia in which the patient resists any effort to be moved or does the opposite of what is asked.

neologism New word or phrase whose derivation cannot be understood; often seen in schizophrenia. It has also been used to mean a word that has been incorrectly constructed but whose origins are nonetheless understandable (e.g., "headshoe" mean "hat"), but such constructions are more properly referred to as word approximations.

nervous breakdown Nonspecific lay term for mental disorder, often implying an acute decompensation.

neurasthenia Condition characterized by vague functional physical and mental fatigue; not used in DSM.

neurochemistry Branch of chemistry concerned with nervous system components, metabolism, and function.

neurocirculatory asthenia DA COSTA SYNDROME.

neuroendocrinology Subspecialty area concerned with the anatomical and functional relationships between the nervous system and the endocrine apparatus. *See also* psychoendocrinology.

neurohormone Chemical messengers formed by neurosecretory cells and released into the bloodstream.

neuroleptic drug ANTIPSYCHOTIC.

neuroleptic malignant syndrome (NMS) Life-threatening complication of antipsychotic treatment, including such symptoms as muscle rigidity and dystonia, akinesia, mutism, obtundation, and agitation.

neurological amnesia 1. Auditory amnesia: loss of ability to comprehend sounds or speech. *See also* Wernicke aphasia. **2.** Tactile amnesia: loss of ability to judge the shape of objects by touch. *See also* astereognosis. **3.** Verbal amnesia: loss of ability to remember words. **4.** Visual amnesia: loss of ability to recall or recognize familiar objects or printed words.

neurological disorders Disorders involving the organization and function of nervous tissue, including diseases of the peripheral nerves, the spinal cord, and the brain, which are based on organic pathology.

neurologist Physician who specializes in diseases of the nervous system.

neurology Medical specialty concerned with organic diseases of the nervous system.

neuron Nerve cell, consisting of cell body, dendrites, and neuroaxon, which is the basic functional unit of the nervous system.

neuronal plasticity Ability of the central nervous system to alter its functional organization; a capacity for change that serves as a mechanism to shape neuronal circuitry during development, to change the way information is processed, and to compensate for injury.

neurophysiology Physiology of the nervous system.

neuropsychiatry Medical specialty that combines psychiatry and neurology.

neuroreceptors Neuronal and other nervous tissue sites that are stimulated or inhibited by

neurotransmitters and/or psychotropic drugs.

neuroscience Branch of the life sciences concerned with the anatomy, physiology, biochemistry, or molecular biology of nerves and nervous tissue and, especially, with their relation to behavior and learning.

neurosis Mental or psychiatric disorder characterized primarily by anxiety, which may either be directly experienced and dominate the clinical picture or be unconsciously controlled and modified by various psychological mechanisms to produce other subjectively distressing and ego-alien symptoms. Although neuroses are not accompanied by gross distortion of reality or severe personality disorganization, normal functioning is impaired by the person's symptoms; they have no organic basis, are relatively persistent, and are treatable. Also called psychoneurosis.

neurotic disorder *See* neurosis.

neurotic process Process in which unconscious conflict is expressed by neurotic symptoms or personality disturbance.

neurotoxin Agent, such as an antibody, causing destruction to nervous tissue.

neurotransmitter Any specific chemical agent released by a presynaptic cell that, upon excitation, crosses the synapse to stimulate or inhibit the postsynaptic cell.

NIAAA National Institute of Alcohol Abuse and Alcoholism.

nicotine dependence Inability to control the use of and dependence on tobacco. Nicotine dependence and withdrawal are classified as disorders in DSM.

NIDA National Institute of Drug Abuse.

night eating syndrome Eating disorder characterized by the consumption of large amounts of food after dinner; generally associated with insomnia and a lack of daytime appetite. In DSM-5, included in "Other Specified Feeding or Eating Disorders."

night hospital Part-time hospital facility in which patients function in the outside world during the day but return to the hospital at night. *Compare* day hospital; weekend hospital.

nightmare Anxiety attack experienced while having terrifying or frightening dreams; characterized by mild anxiety, good recall of the dream, and mild autonomic reactions. *Compare* nightmare disorder; sleep terror disorder.

nightmare disorder Sleep disorder characterized by frequent nightmares and associated insomnia resulting from a fear of sleep.

night-terror SLEEP TERROR DISORDER.

nihilism Delusion of the nonexistence of the self or part of the self; also refers to an attitude of total rejection of established values or extreme skepticism regarding moral and value judgments.

nihilistic delusion Delusional disorder in which patients believe the world and everything related to it have ceased to exist.

NIMH National Institute of Mental Health.

nitrogen narcosis RAPTURE-OF-THE-DEEP SYNDROME.

NMS Neuroleptic malignant syndrome.

noesis Revelation in which immense illumination occurs in association with a sense that one has been chosen to lead and command. Can occur in manic or dissociative states.

nominal aphasia Aphasia characterized by difficulty in giving the correct name of an object.

See also anomia; amnestic aphasia.

nonaffective hallucination Hallucination whose content is apparently unrelated to either depression or elation. *Compare* illusion.

noncomplementary role *See* role.

noncompliance with medical treatment DSM category used when a patient does not cooperate with the physician in his or her medical care; motivated by denial of illness, by religious beliefs, or by decisions based on personal value judgments about the advantages and disadvantages of the proposed treatment.

nondirective approach Technique in which the therapist follows the lead of the patient in the interview, rather than introducing his or her own theories and directing the course of the interview; applied in both individual and group therapy.

nonfluent aphasia MOTOR APHASIA.

nonparametric Denoting statistical methods that do not require restrictive assumptions about population distributions.

nonreactive depression ENDOGENOUS DEPRESSION.

non-suicidal self injury A DSM-5 disorder in which the patient intentionally inflicts damage to his or her body to induce bruises, bleeding, or pain without suicidal ideation. Also called self-
mutilation.

non–24-hour sleep–wake circadian rhythm disorder A sleep–wake disorder characterized by a circadian period that is not congruent with the external environment; common in the blind, visually impaired, and those with traumatic brain injury.

noradrenaline NOREPINEPHRINE.

norepinephrine Catecholamine neurotransmitter substance liberated by adrenergic postganglionic neurons of the sympathetic nervous system; the precursor of epinephrine present in the adrenal medulla and also found in many areas of the brain. A disturbance in its metabolism at important brain sites has been proposed as an important factor in the causation of mood disorders. Also called noradrenaline.

normality In psychiatry, the absence of mental illness; that state of mental health about which there exists a scientific and professional consensus. The normal person has a sense of his or her own worth and maintains a confident and purposeful self-image.

nosology Science of the classification of diseases.

nosophobia PATHOPHOBIA.

not-for-profit hospital Any hospital not maintained for the purpose of monetary gain. *Compare* for-profit hospital.

not otherwise specified (NOS) Term used throughout DSM to describe unusual or uncharacteristic variations of different mental disorders; for example, eating disorder NOS, tic disorder NOS, pervasive developmental disorder NOS.

NREM sleep Non-REM sleep consisting of four stages, based on EEG findings: stage 1: low amplitude, first frequency immediately after sleep begins; stage 2: cycles of 12 to 16 Hz called sleep spindles; stages 3 and 4: increased amplitude and slow frequency EEG changes. *Compare* REM sleep.

NTL National Training Laboratories.

nuclear family Immediate members of a family, including the parents and the children.

nuclear magnetic resonance (NMR) *See* magnetic resonance imaging.

null hypothesis Research term for the hypothetical assumption that any difference observed between two groups or conditions or between a particular group and the general population is purely accidental and due to chance alone. *See also* Type 1 error; Type 2 error.

nyctophobia Abnormal fear of darkness or of the night.

nymphomania Abnormal, excessive, insatiable desire in a female for sexual intercourse. *Compare* satyriasis.

O

objective tests Typically, pencil-and-paper tests based on specific items and questions and that yield numerical scores and profiles easily subjected to mathematical or statistical analysis; for example, Minnesota Multiphasic Personality Inventory (MMPI).

object permanence As described by Jean Piaget, the child's (birth to 2 years) ability to understand that objects have an existence independent of his or her involvement with the object; the child is able to maintain a mental image of a person or object even though it is not present and not visible.

object relation Emotional attachment formed between one person and another, as opposed to interest in and love for oneself.

OBS Organic brain syndrome.

OSA Obstructive sleep apnea syndrome.

obsession Persistent and recurrent idea, thought, or impulse that cannot be eliminated from consciousness by logic or reasoning; obsessions are involuntary and ego-dystonic. *See also* compulsion.

obsessional jealousy disorder Descriptive condition in which a person has persistent thoughts about infidelity in a partner or spouse; not a diagnosis in DSM-5.

obsessive-compulsive disorder (OCD) Neurotic disorder characterized by the persistent recurrence of obsessions and compulsions.

obsessive-compulsive personality Personality disorder characterized by perfectionism, overconscientiousness, and excessive inhibition with regard to self-expression and relaxation. Also called anancastic personality.

obstructive sleep apnea syndrome (OSA) A dyssomnia characterized by periods of functional obstruction of the upper airway during sleepy, resulting in degreases in oxygen, after which breathing (at least briefly) resumes normally.

occupational problem Maladaptive patterns related to work. For example, job dissatisfaction and uncertainties about career choices.

occupational psychiatry Area of psychiatry concerned with mental illness in industry, including the psychiatric aspects of absenteeism, vocational adjustment, operational fatigue, and accident proneness.

occupational therapy Form of therapy in which the patient engages in useful, purposeful activities in a therapeutic social setting involving interaction with other patients and hospital personnel.

OCD Obsessive-compulsive disorder.

oedipal phase PHALLIC PHASE. *See also* Oedipus complex.

Oedipus complex Constellation of feelings, impulses, and conflicts in the developing child that concern sexual impulses and attraction toward the opposite-sex parent and aggressive, hostile, or envious feelings toward the same-sex parent; real or fantasied threats from the same-sex parent result in the repression of those feelings. Development of the Oedipus complex coincides with the phallic phase of psychosexual development; as one of Freud's most important concepts, the term was originally applied only to the male. *Compare* Electra complex.

olfactory hallucination Hallucination primarily involving smell or odors; most common in medical disorders, especially in the temporal lobe.

Olfactory reference syndrome Alternate term for monosymptomatic hypochondriacal psychosis with delusions of foul body odor.

oligophrenia Old term for mental retardation.

OMD Organic mental disorder.

OMS Organic mental syndrome.

onanism Coitus interruptus. Sometimes used interchangeably with masturbation.

oneiroid state Dream-like state in which a patient is deeply perplexed and not fully oriented in time and place.

ontogenetic Pertaining to the development of an individual person. *Compare* phylogenetic.

open hospital Mental hospital without locked doors or physical restraints.

operant behavior *See* conditioning.

operant conditioning *See* conditioning.

operational definition Means of defining a word so that it is scientifically measurable.

opiate Morphine or other alkaloids derived from opium, an extractable product of the poppy plant *Papaver somniferum* or its variety, *P. album*. *See also* opioid.

opiate receptor Specific site on a neuronal cell surface that interacts with opiate drugs and mediates their pharmacological actions; presumably, it also mediates the physiological functions of endogenous opioids, such as the enkephalins and endorphins.

opioid Any chemical substance that has morphine-like pharmacological activity; for example, narcotic analgesics, such as methadone and meperidine, and endogenous opioid peptides, the enkephalins and the endorphins. *See also* opiate.

opioid peptide Peptide that exerts morphine-like actions through interactions with opiate receptors; for example, endorphin, enkephalin.

oppositional defiant disorder Mental disorder of childhood characterized by pervasive negativism, continuous argumentativeness, and an unwillingness to comply with reasonable suggestions and persuasion.

oral dyskinesia *See* tardive dyskinesia.

oral phase Earliest stage in psychosexual development, which lasts through the first 18 months of life. During this period the oral zone is the center of the infant's needs, expression, and pleasurable erotic experiences; it has a strong influence on the organization and development of the child's psyche.

organic A term used in psychiatry to denote a structural change or a chemical imbalance in the brain to account for a mental disorder. The term is still in common use but is no longer part of

the official DSM nomenclature. *See also* organic disorder.

organic anxiety syndrome Syndrome characterized by prominent, recurrent panic attacks or generalized anxiety attributable to some clearly defined organic factor; cognitive functioning may be adversely affected as a secondary phenomenon.

organic brain syndrome (OBS) ORGANIC MENTAL SYNDROME.

organic delusional disorder Disorder characterized by the presence of prominent delusions in a state of full wakefulness and alertness than can be attributed to some clearly defined organic factor.

organic disorder Illness that is caused by structural or biochemical pathology. The term is not used in DSM but remains in common use. *Compare* functional disorder.

organic hallucinosis Disorder characterized by prominent or persistent hallucinations in a state of full wakefulness that can be attributed to some specific organic factor.

organic mental disorder (OMD) Mental disorder caused by transient or permanent brain dysfunction attributable to specific organic factors. In DSM, the organic mental disorders include dementias arising in the senium and presenium, psychoactive substance-induced organic mental disorders, and organic disorders associated with Axis III physical disorders or conditions or whose etiology is unknown. Also called organic psychosis.

organic mental syndrome (OMS) Psychological or behavior abnormality associated with transient or permanent dysfunction of the brain of unknown or unspecified etiology. OMS is characterized by a combination of disorientation to time, place, or person; signs of psychosis, for example, hallucinations or delusions; and impaired judgment and impulse control. In DSM, the organic mental syndromes include delirium, dementia, amnestic syndrome, organic delusional syndrome, organic hallucinosis, organic mood syndrome, organic anxiety syndrome, organic personality syndrome, intoxication, and withdrawal; if the cause is known, the condition is called organic mental disorder. Also called organic brain syndrome.

organic mood syndrome Disorder characterized by either a depressive or a manic mood attributed to a clearly organic factor.

organic personality syndrome DSM term for frontal lobe syndrome.

organic psychosis ORGANIC MENTAL DISORDER.

orgasm Sexual climax, the peak psychophysiological reaction to sexual stimulation.

orgasm disorders One of the major categories of sexual dysfunctions. Characterized by the recurrent and persistent inability to achieve orgasm. Also called orgasmic dysfunction.

orgasmic phase Stage in the human sexual response cycle, as described by Masters and Johnson, in which orgasm occurs.

orgasmic platform Outer third of the vagina, which displays marked vasocongestion and contraction in the plateau phase of the female sexual response cycle, as described by Masters and Johnson.

orientation State of awareness of oneself and one's surroundings in terms of time, place, and person.

original thirteen *See* American Psychiatric Association.

orphan drug Any pharmacological agent that is not economical to produce because the condition for which it is indicated affects relatively few persons.

Othello syndrome Eponym for conjugal paranoia.

orthomolecular psychiatry Theoretical school of thought proposing that psychiatric illnesses are due to biochemical abnormalities that result in increased requirements for specific substances, such as vitamins.

orthomolecular treatment Treatment that entails administration to psychiatric patients of large doses (megadoses) of vitamins (megavitamin therapy), trace elements, or other substances.

orthopsychiatry Interdisciplinary approach to the study and practice of maintaining or restoring mental health, involving principles derived from psychiatry, psychology, sociology, social work, medicine, and other fields; particular emphasis is placed on preventive techniques to promote healthy emotional development and growth, especially mental hygiene.

orthostatic hypotension Reduction in blood pressure brought about by a shift from a recumbent position to an upright position; observed as a side effect of several psychotropic drugs.

other-directed person Person who is readily influenced and guided by the attitudes and values of other people. *Compare* inner-directed person.

other interpersonal problems DSM category describing problems between one or more persons that cause sufficient strain to bring a person into contact with the mental health care system; the stress-inducing circumstances, coping mechanism, and symptoms that have brought someone to seek consultation or treatment must be individually evaluated.

other specified family circumstance DSM category used when the focus of attention or treatment is not due to a mental disorder or a parent–child or marital problem; may involve in-laws, grandparents, or other family members.

outcome variable DEPENDENT VARIABLE.

outpatient Ambulatory patient receiving medical care who does not require hospitalization.

ovarian dysgenesis TURNER SYNDROME.

overactivity Abnormality in motor behavior that can manifest itself as psychomotor agitation, hyperactivity (hyperkinesis), tics, sleepwalking, or compulsions.

overanxious disorder Anxiety disorder of childhood or adolescence characterized by excessive worrying and fearful behavior grossly disproportionate to the magnitude of the real environmental stress or threat.

overcompensation Conscious or unconscious exaggerated correction or compensation for a real or imagined physical or psychological deficit.

overdetermination Concept that phenomena such as dreams and neurotic symptoms reflect the operation of multiple causative factors, particularly with regard to symbolic meaning or significance.

overt homosexuality Behaviorally expressed homosexuality, as distinct from unexpressed conscious or unconscious homoerotic wishes that are held in check (latent homosexuality).

overvalued idea False or unreasonable belief or idea that is sustained beyond the bounds of reason. It is held with less intensity or duration than a delusion but is usually associated with mental illness.

P

pain disorder Disorder characterized by multiple, recurrent pain complaints with no apparent physical cause; symptoms are linked to psychological factors. Pain disorder is a variant of somatic symptom disorder in which pain symptoms are the predominant physical complaints; a DSM-5 diagnosis. The field of pain medicine encompasses pain linked to both psychological and/or organic factors.

pain-pleasure principle Psychoanalytic concept which states that, in psychic functioning, a person tends to seek pleasure and avoid pain. *See also* pleasure principle.

panic Acute, intense attack of anxiety associated with personality disorganization; the anxiety is overwhelming and accompanied by feelings of impending doom.

panic attack Episode of acute intense anxiety occurring in panic disorder, schizophrenia, major depression, and somatization disorder.

panic disorder DSM classification of anxiety disorder characterized by attacks of acute intense anxiety, with or without agoraphobia.

panphobia Overwhelming fear of everything.

pantomime Gesticulation; psychodrama without the use of words.

paradoxical sleep REM SLEEP.

paralogia EVASION.

paralysisagitans PARKINSONISM.

paralytic ileus Intestinal obstruction resulting from inhibition of bowel motility, a rare anticholinergic side effect of certain psychoactive drugs. Also called adynamic ileus.

parameter Way of measuring or describing an object or evaluating a subject.

parametric tests of significance Statistical methods used to estimate population parameters, such as the mean and standard deviation; use of these methods requires assumptions about the population characteristics, for example, that the variable under study is normally distributed within the population from which the sample is drawn.

paramnesia Disturbance of memory in which reality and fantasy are confused. It is observed in dreams and in certain types of schizophrenia and organic mental disorders; includes phenomena such as déjà vu and déjà entendu, which may occur occasionally in normal persons.

paranoia Rare psychiatric syndrome marked by the gradual development of a highly elaborate and complex delusional system, generally involving persecutory or grandiose delusions, with few other signs of personality disorganization or thought disorder.

paranoiac Person with paranoia.

paranoid delusion Includes persecutory delusions and delusions of reference, control, and grandeur.

paranoid disorder *See* delusional disorder.

paranoid ideation Thinking dominated by suspicious, persecutory, or grandiose content of less than delusional proportions.

paranoid personality disorder Personality disorder characterized by rigidity, hypersensitivity, unwarranted suspicion, jealousy, envy, an exaggerated sense of self-importance, and a tendency to blame and ascribe evil motives to others.

paranoid schizophrenia Type of schizophrenia characterized by the presence of persecutory or grandiose delusions, often accompanied by hallucinations; no longer included in DSM-5.

paraphasia Abnormal speech in which one word is substituted for another, the irrelevant word generally resembling the required one in its morphology, meaning, or phonetic composition; the inappropriate word may be either a legitimate one used incorrectly, such as "clover" instead of "hand," or a bizarre nonsense expression, such as "treen" instead of "train." Paraphasic speech may be seen in organic aphasias and in mental disorders, such as schizophrenia. *See also* metonymy; word approximation.

paraphilia Psychosexual disorder with a sexual dysfunction characterized by persistent and recurrent sexual fantasies, often of an unusual nature, without which imagery erotic arousal or orgasm is not attained; fantasies generally involve themes of suffering, humiliation, sexual activity with nonconsenting partners, or preference for a nonhuman object for sexual arousal. In DSM, the paraphilias include fetishistic disorder, transvestic disorder, frotteuristic disorder, pedophilic disorder, exhibitionistic disorder, voyeuristic disorder, sexual masochism disorder, and sexual sadism disorder. Also called sexual deviations.

paraphrenia Chronic condition characterized by fantastic and absurd delusions without significant personality deterioration and without the primary disturbances of thought and affect that characterize schizophrenia.

parapraxis Faulty act, such as a slip of the misplacement of an article. Freud ascribed parapraxes to unconscious motives.

paraprofessional Trained person who works in a mental hospital and may have a degree in the arts or from some professional school other than those serving the mental health group but has not obtained a degree in one of the usual mental health professions.

parapsychology Branch of psychology concerned with extra-normal events and behavioral phenomena not accounted for or explained by the tenets and laws of contemporary science; for example, clairvoyance, telepathy, psychokinesis. *See also* metapsychology.

parasomnias A group of dysfunctions associated with sleep, sleep stages, or partial arousals characterized by unusual behavior, experiences, or physiological events during sleep; composed of the three subtypes: non-REM movement sleep arousal disorders (incomplete awakening accompanied by sleepwalking, sleep-related eating, sleep-related sexual behavior, or sleep terror disorder); REM sleep behavior disorder (vocal or motor behavior during sleep); and nightmare disorder.

parasympathetic nervous system *See* autonomic nervous system.

parataxic distortion Harry Stack Sullivan's term for distortions in judgment or attitude in interpersonal relations based on patterns set by earlier experience; previously developed ways of coping with significant people in a person's life are applied by the person in later interpersonal integrations.

parens patriae Power of the state to involuntarily hospitalize mentally ill persons in need of care; also called "police power," in that it prevents mentally ill persons from doing harm to themselves or to others.

Parent–child problem DSM category that refers to problems between a parent and a child; for example, in a family in which the parents are divorced, with either the custodial or the noncustodial parent, and in the remarriage of a divorced or widowed parent.

paresis Weakness or partial paralysis of organic origin.

paresthesia Abnormal spontaneous tactile sensation, such as a burning, tingling, or pins-and-needles sensation.

peripartum depression Depressed mood, anxiety, insomnia, and weight changes that occur near parturition or within 1 month of giving birth; a DSM-5 diagnosis. Previously called postpartum depression.

parkinsonism Extrapyramidal dyskinesia characterized by resting tremor, rigidity, bradykinesia, and postural abnormalities. Parkinsonism is of unknown etiology and occurs in middle or late life, typically with a gradual progression and a prolonged course. Also called paralysis agitans; Parkinson disease; idiopathic parkinsonism. A parkinsonian syndrome may develop during the course of therapy with antipsychotic phenothiazine or butyrophenone drugs; such drug-induced parkinsonism is reversible when the causative drug is withdrawn or its dosage reduced.

Parkinson disease PARKINSONISM.

partial hospitalization System of treating mental illness in which the patient is hospitalized on a part-time basis. *See also* day hospital; night hospital; weekend hospital.

partial insanity MONOMANIA.

passive-aggressive personality disorder Personality disorder in which the patient manifests aggressive behavior in passive ways, such as obstructionism, pouting, stubbornness, and intentional inefficiency.

passive-dependent personality *See* dependent personality disorder.

pastoral counseling Use of psychotherapeutic principles by a clergyman in helping parishoners with emotional problems.

patch amnesia LOCALIZED AMNESIA.

pathognomonic Denoting a sign or symptom specifically diagnostic of a particular disease entity.

pathological gambling Compulsion to gamble, one of the disorders of impulse control. *See also* gambling disorder.

pathological intoxication ALCOHOL IDIOSYNCRATIC INTOXICATION.

pathophobia Abnormal fear of disease or suffering. Also called nosophobia.

paucity of speech Limited use of speech, seen in various pathological states.

pavlovian conditioning CLASSICAL CONDITIONING. *See* conditioning.

Pavlov, Ivan Petrovich (1849–1936) Russian neurophysiologist famous for his work in conditioning.

pavor nocturnus SLEEP TERROR DISORDER.

PCP Phencyclidine.

peccatophobia Abnormal fear of sinning.

pecking order Hierarchy or sequence of authority in an organization or social group.

pederasty Anal intercourse between a man and a boy.

pedophilia Paraphilia in which a child is the sexual object.

pedophobia Abnormal fear of children.

peer review Review of physician services by a panel of other physicians.

Peer Review Organization (PRO) Federal review organization for hospitals receiving Medicare funds. In order to promote compliance with federal guidelines for health and hospital care, the PRO conducts independent utilization reviews and quality-of-care studies, validates diagnostic related group (DRG) assignments, and reviews hospital admissions and readmissions. *See also* Professional Standards Review Organization; utilization review committee.

pellagra Deficiency of niacin (nicotinamide) characterized by diarrhea, dermatitis, and mental disturbance.

penis envy Sigmund Freud's concept that the woman envies the man for his possession of a penis; sometimes used to refer to a woman's generalized envy of men.

perception Conscious awareness of elements in the environment by the mental processing of sensory stimuli; sometimes used in a broader sense to refer to the mental process by which all kinds of data, intellectual, emotional, as well as sensory, are meaningfully organized. *See also* apperception.

perfectionism Practice of demanding of others or of oneself a higher quality of performance than is required by the situation.

period prevalence Research term for the total number of cases of a disease known to have existed during a specified time period. *Compare* point prevalence.

perseveration 1. Pathological repetition of the same response to different stimuli, as in a repetition of the same verbal response to different questions. **2.** Persistent repetition of specific words or concepts in the process of speaking. Seen in organic mental disorders, schizophrenia, and other mental illness. *See also* verbigeration.

persistence Term used to reflect a personality trait characterized by ambition, overachievement, resistance to frustration, and fatigue. Persistence may be enhanced by psychostimulants.

persistent (chronic) motor or vocal tic disorder A type of motor disorder consisting of either motor or vocal tics, but not both, that develops before adulthood. Compare Tourette disorder.

persistent complex bereavement disorder Disorder characterized by chronic and persistent grief about the death of someone close to the patient, accompanied by feelings of bitterness, anger, or ambivalence toward the deceased and social withdrawal; a DSM-5 diagnosis. Also known as complicated grief or complicated bereavement.

persona In Jungian psychology, the outside personality that a person presents to the world, as opposed to his or her inner self (anima).

personality Characteristic configuration of behavior response patterns that each person evolves as a reflection of his or her individual adjustment to life.

personality disorder Mental disorder characterized by inflexible, deeply ingrained, maladaptive patterns of adjustment to life that cause either subjective distress or significant impairment of adaptive functioning; manifestations are generally recognizable in adolescence or earlier. Personality disorders listed in DSM include paranoid, schizoid, schizotypal, histrionic, narcissistic, antisocial, borderline, avoidant, dependent, obsessive-compulsive, and passive-aggressive.

personality traits Descriptive features of an individual's personality that are within normal

limits.

persuasion Supportive psychotherapy in which the patient is encouraged to follow advice; persuasion is directive and limited in its goals.

pervasive developmental disorder Class of developmental disorders characterized by severe distortions in social skills, language, and contact with reality (e.g., autism spectrum disorder). Many psychological functions are deficient, and a child with this type of disorder displays abnormalities that are not normal for any stage of development. This condition was previously known as childhood schizophrenia. In DSM-5, Asperger syndrome, Rett syndrome, and childhood disintegrative disorder are types of pervasive developmental disorders. *Compare* specific learning disorder.

pervasive developmental disorder not otherwise specified A diagnostic category used in DSM-5 to refer to pervasive developmental disorders that may have contradictory features and/or lack sufficient findings to meet full criteria for one of the other pervasive developmental disorders (autism, Asperger syndrome, Rett syndrome, childhood disintegrative disorder).

perversion Deviation from the expected norm. In psychiatry it commonly signifies sexual perversion. *See also* psychosexual disorder.

perverted logic EVASION.

PET Positron emission tomography.

petit mal epilepsy Epileptic disorder characterized by recurrent minor, nonconvulsive, momentary lapses of consciousness, commonly beginning in childhood and having a self-limited course. A typical attack involves a sudden transient loss of contact with the environment, during which the patient develops a dazed expression and pauses in what he is doing; this type of seizure has a classical electroencephalographic representation consisting of synchronous, symmetrical spike-and-wave discharges at 3 per second, without cortical localization. Also called absence epilepsy; minor epilepsy.

phallic overbearance Domination of another person by aggressive means; generally associated with masculinity in its negative aspects.

phallic phase Third stage in psychosexual development, following the anal stage and lasting from about age 2 or 3 to about age 6; resolution of the Oedipus complex is the dominant developmental conflict during this stage. During this period, sexual interest, curiosity, and pleasurable experiences are centered on the penis in boys and the clitoris in girls. Also called oedipal phase.

phantasy Alternative spelling of fantasy.

phantom limb False sensation that an extremity that has been lost is in fact present.

pharmacokinetics Way in which the body processes a drug; its principal divisions are drug absorption, distribution, metabolism, and excretion.

pharmacotherapy PSYCHOPHARMACOLOGY.

phase of life problem DSM category that refers to problems not severe enough to warrant a psychiatric diagnosis but that interfere with functioning, as arising from marriage, work, change in job, culture shock.

phencyclidine (PCP) Substance of abuse with effects similar to hallucinogens. Also called angel dust.

phenomenology Study of events or happenings in their own right, rather than from the point

of view of inferred causes; associated with existential psychiatry and reflects the theory that behavior is determined by the way the person perceives reality, rather than by external reality in objective terms.

phenothiazine One of a class of psychotropic drugs, the prototype of which is chlorpromazine, which are effective in the treatment of psychoses, especially schizophrenia; they exert a favorable influence with regard to the fundamental symptoms of schizophrenia as well as the secondary or accessory symptoms. Their mechanism of action may be related to the blockade of dopamine receptors at critical sites in the central nervous system.

phenotype Outward, observable expression of a person's genetic constitution. *Compare* genotype.

phenylketonuria (PKU) Genetic metabolic disorder characterized by the inability to convert the amino acid phenylalanine to tyrosine. If untreated, severe mental retardation results from the accumulation of large concentrations of toxic phenylketones; when detected early in infancy, the condition is treatable by the elimination of phenylalanine from the diet.

phenylpyruvic oligophrenia Former name for phenylketonuria.

pheromone Chemical signal that a person releases into the external environment and that affects the behavior or physiological states of other persons.

phobia Persistent, pathological, unrealistic, intense fear of an objector situation; the phobic person may realize that the fear is irrational but is, nonetheless, unable to dispel it. Some examples are: acarophobia (small objects), acrophobia (high places), agoraphobia (open places, leaving familiar setting of home), aichmophobia (pointed objects), ailurophobia (cats), algophobia (pain), androphobia (men), astraphobia or astrapophobia (thunder and lightning), autophobia (being alone, or of self), bathophobia (depths), claustrophobia (closed or confined places), coprophobia (excreta), cynophobia (dogs), demophobia (crowds), erythrophobia (blushing), gynophobia (women), haphephobia (being touched), hematophobia (sight of blood), hydrophobia (water), hypnophobia (sleep), lalophobia or glossophobia (speaking), mysophobia (dirt, contamination), necrophobia (dead bodies), nyctophobia (darkness, night), panphobia (everything), pathophobia or nosophobia (disease, suffering), peccatophobia (sinning), pedophobia (children), phonophobia (speaking aloud), photophobia (strong light), sitophobia (eating), taphophobia (being buried alive), thanatophobia (death), toxophobia (being poisoned), xenophobia (strangers), zoophobia (animals).

phobic disorder Frequent disorder characterized by a specific fear, which may represent a temptation, a punishment for the forbidden impulse, or a combination of both.

phobic neurosis PHOBIC DISORDER.

phonological disorder *See* developmental articulation disorder.

phonophobia Abnormal fear of speaking aloud.

photophobia Abnormal fear of strong light.

phrenology Study of the bony conformation of the skull in the now discredited belief that it related to mental faculties and traits.

phylogenetic Pertaining to the development of the species. *Compare* ontogenetic.

physical dependence *See* drug dependence.

physical disorder Disorder of body function whose manifestations are not primarily behavioral or psychological.

Piaget, Jean (1896–1980) Swiss psychologist noted for his research on cognitive development in children; he divided the development of intelligence into three major periods: Sensorimotor (birth to 2 years), concrete operations (2 to 12 years), and formal operations (12 years through adult life).

piblotko Culture-specific syndrome seen in Eskimos, usually women, in which the affected person screams, cries, runs naked through the snow, sometimes with suicidal or homicidal tendencies.

pica Craving and eating of nonfood substances, such as paint and clay.

Pick disease *See* frontotemporal dementia.

pickwickian syndrome Condition characterized by obesity, hypoventilation, and hypersomnia.

Pinel, Phillipe (1746–1826) French reformer in the field of mental illness known for his work in abolishing physical restraints on hospitalized mental patients.

piperazine Phenothiazine derivative with antipsychotic affects; for example, fluphenazine (Prolixin).

piperidine Phenothiazine derivative with antipsychotic effects; for example, thioridazine (Mellaril).

PKU Phenylketonuria.

placebo 1. Inactive substance or preparation that is given as though it were a pharmacologically active medicine; primarily used in controlled studies to determine the efficacy of medicinal preparations; any beneficial or deleterious effects of the placebo may be ascribed to psychological factors. **2.** Any type of treatment that has no specific effects on the particular illness involved.

placebo effect Phenomenon in which a person exhibits a clinically significant response to a pill containing a therapeutically inert substance or a treatment without specific effect on the person's condition. Placebo effects are not limited to subjective reports; physiological functions may be objectively influenced.

plaques In psychiatry, pathological masses of axons, neurons, and dendrites with a central amyloid core; associated with Alzheimer disease.

plasma level *See* blood level.

plasticity *See* neuronal plasticity.

plateau phase Stage in the human sexual response cycle, as described by Masters and Johnson, characterized by increased genital blood flow and sense of sexual excitement; it precedes orgasm.

play therapy Type of therapy used with children in which they reveal their problems on a fantasy level with dolls, clay, and other toys; the therapist intervenes opportunely with helpful explanations about the patient's responses and behavior in language geared to the child's comprehension. *See also* activity group therapy.

pleasure principle In psychoanalysis, the principle by which the id seeks immediate tension reduction by either direct or fantasied gratification; developmentally, the pleasure principle antedates the reality principle. Also called the pleasure-pain principle. *See also* reality principle.

pleonexia Psychiatric disorder in which the patient has an excessive desire to acquire wealth or

objects.

pluralism In psychiatry, the notion that multiple factors affect behavior.

PMDD Premenstrual dysphoric disorder.

point prevalence Research term for the total number of cases of a disease known to have existed at a given point in time. *Compare* period prevalence.

police power PARENS PATRIAE.

polygenic Involving the combined action or effects of several genes.

polymorphous perverse sexuality Psychoanalytic conceptualization of sexuality in the human infant, for whom sexual gratification can be achieved by homosexual, heterosexual, or inanimate stimulation of several body zones; all humans, therefore, have the potential to develop sexual perversions in adulthood, depending on how the sexual drives are channeled developmentally.

polyphagia Excessive eating. *See also* bulimia nervosa.

polysomnography Battery of tests that include an electroencephalogram, electrocardiogram, and electromyogram; often given with tests for penile tumescence, blood oxygen saturation, body movement, body temperature, galvanic skin response, and gastric acid. The tests are of assistance in a variety of conditions, such as insomnia, nocturnal myoclonus, sleep apnea, enuresis, somnambulism, seizure disorders, impotence, vascular headache, gastroesophageal reflux, and depression.

polysubstance dependence Disorder characterized by dependence on at least three categories of psychoactive substances.

polyuria Excessive excretion of urine.

population Research term for the entire collection of a set of objects.

porphyria Metabolic disorder characterized by excessive urinary excretion of porphyrins (pigments found in hemoglobin and certain cellular enzyme systems) or their precursors; mental symptoms are prominent in the form known as acute intermittent porphyria. Abdominal pain, constipation, and neuromuscular disturbances complete the clinical picture. Attacks may be precipitated by barbiturates.

positive reinforcement *See* reinforcement.

positive symptoms In schizophrenia: hallucinations, delusions, and thought disorder.

positive transference *See* transference.

positron emission tomography (PET) Imaging technique using short-lived positron-emitting elements of oxygen, carbon, and nitrogen used to label organic compounds (e.g., glucose, amino acids, and neurotransmitters), which are then introduced into the body by injection or inhalation; energy emitted is recorded by scintillation detectors and computer analyzed to construct and display images of transverse sections of tissues, such as the brain. Quantitative data can be assessed in specific areas for such functions as blood flow, oxygen or glucose metabolism, and other complex physiological phenomena; alterations in metabolism associated with disease and the actions of medications can also be monitored in this way.

postpartum depression *See* peripartum depression.

postpartum psychosis A descriptive term for depressive or psychotic symptoms in women who have recently given birth; a subtype of bipolar disorder in DSM-5. Also called puerperal psychosis. *See also* peripartum depression.

posttraumatic stress disorder (PTSD) Anxiety disorder that occurs after and as a result of a major, disturbing, out of the ordinary event in a person's life, such as war or rape. The prominent symptoms of this disorder include nightmares, flashbacks, withdrawal, and hypervigilance; may have a delayed onset. *See also* acute stress disorder.

posturing Strange, fixed, and bizarre bodily positions held by a patient for an extended time. *See also* catatonia.

potency Male ability to perform the sexual act; specifically, the capacity to achieve and maintain an erection during coitus.

poverty of content of speech Speech that is quantitatively adequate but qualitatively inadequate because it imparts minimal, vague, or repetitious information.

poverty of speech Restriction in the amount of speech used; replies may be monosyllabic. *See also* laconic speech.

PPO Preferred Provider Organization.

practice effect Research term referring to the improvement of performance in a task as a result of repeated trials.

Prader–Willi syndrome A developmental disability as a result of a small deletion involving chromosome 15. Symptoms include compulsive eating, obesity, intellectual disability, hypogonadism, small stature, hypotonia, and small hands and feet. Children also exhibit oppositional and defiant behavior.

preconscious One of three divisions of the psyche in Freud's topographic theory of the mind (the others being the conscious and unconscious), including all mental contents that are not in immediate awareness but that can be consciously recalled with effort.

predictive value Proportion of true-positive or true-negative tests; indicates what percentage of test outcomes are expected to coincide with assigned diagnoses.

predictor variable Test or score used to assess or predict future performance.

Preferred Provider Organization (PPO) Alternative delivery organization that employs a prospective payment system in which a corporation or insurance company forms an agreement with a particular group of community hospitals and doctors to supply health services to PPO members at a previously determined lower rate; patients enrolled in a PPO select their physicians and hospitals from among the list of participants.

prefrontal lobotomy *See* lobotomy.

pregenital stages In psychoanalysis, the first stages of psychosexual development (the oral and anal stages) that occur before the genitals have begun to exert the predominant influence on sexual behavior.

prejudice Preconceived adverse judgment or opinion formed without just grounds or sufficient knowledge; elements of irrational suspicion or hatred are often involved, as in racial prejudice.

premature ejaculation Ejaculation occurring before or immediately after vaginal intromission during coitus; broader definitions take into consideration the ability of a male to delay ejaculation during coitus for a sufficient length of time to satisfy a normally responsive female partner.

premenstrual dysphoric disorder (PMDD) Depressive mood disorder characterized by irritability, emotional lability, headache, and anxiety or depression that occurs about 1 week before menses and resolves after the menstrual cycle is complete. Also called late luteal phase

dysphoric disorder.

premorbid Occurring before the onset of disease.

preoccupation of thought Centering of thought content on a particular idea, associated with a strong affective tone, such as paranoid trend or a suicidal or homicidal preoccupation.

presenile dementia DEMENTIA OF THE ALZHEIMER TYPE; PRESENILE ONSET.

presenium Period preceding old age, generally ages 55 to 65.

pressure of speech, pressured speech Increase in the amount of spontaneous speech; rapid, loud, accelerated speech, as occurs in mania, schizophrenia, and cognitive disorders.

prevalence Total number of cases of a disease existing at a given point in time (point prevalence) or during a specified time period (period prevalence). *See also* incidence.

prevalence rate Number of diagnosed cases of a disease or a condition at a particular point in time; prevalence rate per 1,000 is defined as the cases at a specific point in time, divided by the number of persons in the population at a specific point in time, multiplied by 1,000.

preventive psychiatry Branch of preventive medicine concerned with mental disorders. Encompassed within its scope are measures to prevent mental disorders (primary prevention); measures to limit the severity of illness, as through early case finding and treatment (secondary prevention); and measures to reduce disability after a disorder (tertiary prevention).

primal father Hypothetical head of a tribe depicted by Sigmund Freud in *Totem and Taboo* as slain by his sons, who subsequently devour him in a cannibalistic rite; later, he is promoted to a god. The son who murders him is the prototype of the tragic hero, and the memory of the crime is perpetuated in the conscience of the individual and of the culture.

primal scene In psychoanalysis, the real or fantasied observation by a child of sexual intercourse, particularly between his or her parents.

primary care physician Physician who specializes in family medicine, internal medicine, pediatrics, and obstetrics and gynecology; many believe psychiatry should be designated a primary care specialty.

primary diagnosis Major emotional disorder for which the patient is treated. Also called principal diagnosis.

primary gain Reduction of anxiety achieved by a defense mechanism; relief from tension or conflict through neurotic illness. *Compare* secondary gain.

primary narcissism *See* narcissism.

primary parkinsonism *See* parkinsonism.

primary prevention *See* preventive psychiatry.

primary process thinking In psychoanalysis, the mental activity directly related to the functions of the id and characteristic of unconscious mental processes; marked by primitive, prelogical thinking and by the tendency to seek immediate discharge and gratification of instinctual demands. Includes thinking that is dereistic, illogical, and magical; normally found in dreams, abnormally in psychosis. *Compare* secondary process thinking.

primary reinforcer *See* reinforcement.

primary retarded ejaculation Lifelong inability to ejaculate during coitus. *Compare* secondary ejaculation.

primitive idealization Defense mechanism in which external objects that are viewed as either "all good" or "all bad" are unrealistically endowed with great power; most commonly, the "all

good" object is seen as omnipotent, or ideal, while the badness of the "all bad" object is greatly inflated.

Prince, Morton (1854–1929) American neurologist and psychiatrist known for his study of multiple personalities.

principal diagnosis PRIMARY DIAGNOSIS.

prion disease A class of disorders caused by a transmissible infectious protein. Includes Creutzfeldt–Jakob disease (CJD), Gerstmann–Straussler–Scheinker disorder, kuru, and fatal familial insomnia.

prison neurosis *See* chronophobia.

prison psychosis Psychotic reaction to incarceration or to the prospect of incarceration.

privacy 1. Limiting access of others to one's body or mind, including dreams, fantasies, thoughts, or beliefs. **2.** Freedom from intrusion by the state or third persons. **3.** Restricted areas of personal decision, usually in such matters as personal association, abortion, or bodily integrity.

privilege Legal term referring to the legal right of patients to prevent their physicians from testifying about information obtained in the course of treatment; the legal formulation of the ethical principle of confidentiality. In some states, information obtained in the course of the doctor–patient relationship is considered privileged communication.

privileged communication *See* privilege.

PRO Peer Review Organization.

probability Quantitative statement of the likelihood that an event will occur. A probability of 0 means that the event is certain not to occur; a probability of 1.0 means the event will occur with certainty.

problem-oriented record Method for organizing a patient's clinical chart, consisting of five parts: data base, problem list, treatment plan, progress notes, and discharge summary.

problem-solving Capacity of a person to master a new or novel task.

process schizophrenia Unofficial term for schizophrenia attributed more to endogenous factors than to specific environmental influences. *Compare* reactive schizophrenia.

prodrome Early symptom of a disease, often serving as a warning or premonitory sign of the approach of a morbid condition; for example, the aura preceding an epileptic seizure or classic migraine.

Professional Standards Review Organization (PSRO) Organization of physicians in a given region established to review the quality of health care services, particularly with regard to whether the inpatient services rendered are medically necessary. Such an organization has been required by federal law since 1972 in relation to hospital care under Medicare and Medicaid. *See also* peer review organization; utilization review committee.

profound mental retardation *See* mental retardation.

prognosis 1. Opinion as to the probable future course, extent, and outcome of an illness. **2.** Specific goals of therapy.

projection Unconscious defense mechanism in which a person attributes to another those generally unconscious ideas, thoughts, feelings, and impulses that are in himself or herself undesirable or unacceptable as a form of protection from anxiety arising from an inner conflict; by externalizing whatever is unacceptable, the person deals with it as a situation apart

from themselves. *See also* blind spot.

projective identification Defense mechanism in which unwanted aspects of the self are projected onto another person such that the individual projecting feels at one with the object of the projection. It allows one to distance and make oneself understood by exerting pressure on another individual to experience feelings similar to one's own.

projective test Psychological test with loosely structured test material that requires the subject to reveal his or her own feelings, personality, or psychopathology; for example, Rorschach Test, Thematic Apperception Test.

prolactin Anterior pituitary hormone that has been studied as a potential index of dopamine activity and receptor sensitivity in studies of central nervous system function in psychiatric patients.

proprioception KINESTHETIC SENSE.

prosopagnosia Inability to recognize familiar faces that is not due to impaired visual acuity or level of consciousness.

prospective study Study based on observing events as they occur.

prototaxic Harry Stack Sullivan's term for primitive processes. *See also* primary process.

pseudoaggression Neurotic defense in which h patient denies basic masochistic feelings and displays them, instead, as false aggression.

pseudoauthenticity False or copied expression of thoughts and feelings.

pseudocollusion Sense of closeness, relationship, or cooperation that is not real but is based on transference.

pseudocyesis Rare condition in which a nonpregnant patient has the signs and symptoms of pregnancy, such as abdominal distention, breast enlargement, pigmentation, cessation of menses, and morning sickness.

pseudodementia 1. Dementia-like disorder that can be reversed by appropriate treatment and is not caused by organic brain disease. **2.** Condition in which a patient shows an exaggerated indifference to his or her surroundings in the absence of a mental disorder; also occurs in depression and factitious disorders.

pseudologia fantastica Disorder characterized by uncontrollable lying in which a patient elaborates extensive fantasies that he freely communicates.

pseudomotor agitation Physical and mental overactivity that is usually nonproductive and is associated with a feeling of inner turmoil, as seen in agitated depression.

pseudoparkinsonism Syndrome that resembles Parkinson disease, resulting from long-term use of antipsychotic drugs. Also called drug-induced parkinsonism.

psilocin *See* psilocybin.

psilocybin 4-Phosphoryloxy-N′,N′-dimethyltryptamine, the active ingredient of various Mexican hallucinogenic mushrooms, which acts as a psychedelic drug producing changes in perception and mood and alterations of consciousness. A variation is called psilocin.

PSRO Professional Standards Review Organization.

psychalgia PSYCHOGENIC PAIN DISORDER.

psychasthenia Obsolete term used by Pierre Janet to describe a syndrome characterized by fears and phobias.

psyche Mind, as divided into conscious, preconscious, and unconscious in Sigmund Freud's

topographic model.

psychedelic Denoting drugs that may induce hallucinations and psychotic states. LSD is the prototype; other psychedelic drugs include mescaline, psilocybin, and marijuana.

psychiatric emergency Disturbance in thoughts, feelings, or actions for which immediate treatment is necessary; for example, suicide intent.

psychiatric illness *See* mental disorder.

psychiatric nurse Clinical nurse specialist who functions as part of the mental health team, usually in an institutional setting; often carries out individual, family, and group psychotherapy.

psychiatric social worker Skilled professional, trained in social work, who works with psychiatrists, usually in an institutional setting; evaluates family, environmental, and social factors in the patient's illness; may work in intake and reception with new patients; may follow-up and counsel after discharge, and also carry out individual, family, and group psychotherapy and participate in community organizations.

psychiatrist Medical doctor whose specialty is the study and treatment of mental disorders. After receiving the M.D. degree, a physician spends 4 years as a resident in a hospital setting. When he or she passes the written and oral examinations of the American Board of Psychiatry and Neurology, he or she becomes a diplomat in psychiatry and is said to be Board certified.

psychiatry Branch of medicine concerned with the prevention, cause, and treatment of mental disorders.

psychic determinism Freudian concept that all mental phenomena have specific antecedent causes, often operating on an unconscious level.

psychic energizer Rarely used term for any antidepressant or stimulant drug.

psychic helplessness *See* helplessness.

psychic trauma Psychologically upsetting event that may have lasting consequences on a person's thinking, feeling, or behavior.

psychoactive drug PSYCHOTHERAPEUTIC DRUG.

psychoactive substance abuse *See* substance use disorder.

psychoactive substance dependence DSM term for drug dependence.

psychoactive substance-induced mental disorder Mental disorder caused by the direct effects on the nervous system of a drug or other substance. In DSM, the substances listed are alcohol; sedatives, hypnotics, or anxiolytics; inhalants; opioids; cocaine; amphetamine or similarly acting sympathomimetics; phencyclidine (PCP) or similarly acting arylcyclohexylamine; hallucinogens; cannabis; nicotine; and caffeine.

psychoanalysis Theory of human mental phenomena and behavior, a method of psychic investigation and research, and a form of psychotherapy originally formulated by Sigmund Freud. As a technique for exploring the mental processes, psychoanalysts includes the use of free association and the analysis and interpretation of dreams, resistances, and transferences. As a form of psychotherapy, it uses the investigative technique, guided by Freud's libido and instinct theories and by ego psychology, to gain insight into a person's unconscious motivations, conflicts, and symbols and thus to effect a change in maladaptive behavior. Also called analysis in depth.

psychoanalyst Psychotherapist, usually a psychiatrist, who has had training in psychoanalysis

and who uses its techniques in a treatment setting.

psychoanalytic group psychotherapy Method of group psychotherapy pioneered by Alexander Wolf and based on the operational principles of individual psychoanalytic therapy; analysis and interpretation of a patient's transferences, resistances, and defenses are modified to take place in a group setting.

psychobiology Adolf Meyer's term referring to the study of the human being as an integrated unit, incorporating psychological, social, and biological functions.

psychodrama Psychotherapy method originated by Jacob Moreno in which personality makeup, interpersonal relationships, conflicts, and emotional problems are expressed and explored through dramatization. Therapeutic dramatization of emotional problems includes: (1) protagonist or patient, the person who presents and acts out his or her emotional problems with the help of (2) auxiliary egos, persons trained to act and dramatize the different aspects of the patient that are called for in a particular scene in order to help the patient express feelings, and (3) the director, leader, or therapist, who guides those involved in the drama for a fruitful and therapeutic session.

psychodynamics Science of mental forces and motivations that influence human behavior and mental activity; the role of unconscious motivation in the causation of human behavior is

psychoendocrinology Study of the role of hormones on thinking, behavior, and emotional disorder.

Psychose passionelle *See* erotomania.

psychogenic Produced or caused by mental factors, rather than organic factors; usually refers to a symptom or an illness.

psychogenic amnesia DSM classification of dissociative disorder characterized by the sudden inability to recall information stored in memory in the absence of an underlying organic mental disorder; when associated with travel to another locale and the assumption of a new identity, the condition is called psychogenic fugue.

psychogenic fugue DSM classification of dissociative disorder characterized by periods of total amnesia in which one travels and assumes a new identity. *See also* fugue; psychogenic amnesia.

psychogenic pain disorder Condition in which there is a preoccupation with pain for at least 6 months in the absence of organic pathology to account for the pain. Also called psychalgia; somatoform pain disorder in DSM.

psychohistory Approach to history that examines events within a psychological framework; attempts to connect individual and collective ideas and emotions with wider historical currents.

psychoimmunology Study of the relationship between the immune system and emotions.

psychokinesis Parapsychological phenomenon in which directed thought processes influence physical events.

psycholinguistics Exploration of the psychological factors involved in the development and use of language.

psychological defense system *See* defense mechanism.

psychological factor affecting physical condition Disorder characterized by physical symptoms partially caused or affected by psychological factors; physiological and organic

changes stem in part from a sustained emotional disturbance; for example, atopic dermatitis, migraine, ulcer. Also called psychophysiological disorder; psychosomatic disorder.

psychologist Person trained in psychology, usually with a graduate degree (M.A., Ph.D.).

psychology Study and profession concerned with mental processes and behavior.

psychometry Science of testing and measuring mental and psychological functioning.

psychomotor Relating to combined physical and mental activity.

psychomotor agitation Physical and mental overactivity associated with a feeling of inner turmoil, as seen in agitated depression.

psychomotor epilepsy COMPLEX PARTIAL SEIZURE.

psychomotor retardation Slowing of mental and physical activity, common in depression.

psychomotor stimulant Drug that arouses the patient through its central excitatory properties; for example, amphetamine, methylphenidate (Ritalin). Also called analeptic.

psychoneuroimmunology Study of psychological factors as causes of diseases or their effect on the course of disease, particularly as it relates to the immune system. *See also* psychoimmunology.

psychoneurosis NEUROSIS.

psycho-oncology Study of the role of emotions and their relation to cancer in terms of prevention, diagnosis, and treatment.

psychopathic personality Former term for the personality characteristic of antisocial personality disorder.

psychopathological Denoting abnormal, maladaptive behavioral or mental activity.

psychopathology 1. Study of mental disorders. **2.** Abnormal, maladaptive behavioral or mental activity.

psychopharmacology Study of the mental and behavioral effects of drugs. *See also* pharmacokinetics.

psychophysiological disorder PSYCHOLOGICAL FACTOR AFFECTING PHYSICAL CONDITION.

psychopolitics 1. Psychological dimensions of political behavior, such as the reciprocal influence on persons of political environments and their societies. **2.** Specific tactics of politicians that are intended to yield benefits to them through the use of psychological strategies.

psychosexual development 1. Broadly, the maturation and development of the sexuality of a person throughout the life cycle. **2.** More specifically, in psychoanalysis, series of dynamic and crucial developmental stages that each person passes through and that influence basic personality characteristics in later life; the stages or phases are oral, anal, phallic, latency, and genital.

psychosexual disorder Disorder of sexual functioning, desire, or performance that is caused, wholly or partly, by psychological factors.

psychosis Mental disorder in which a person's thoughts, affective response, ability to recognize reality, and ability to communicate and relate to others are sufficiently impaired to grossly interfere with his or her capacity to deal with reality; the classical characteristics of psychosis are impaired reality testing, hallucinations, delusions, and illusions.

psychosocial deprivation Deprivation of social and intellectual stimulation; believed to be a

causative factor in mental retardation and emotional disorders in children.

psychosocial development Developmental progress of a person with regard to social relations and social reality, as primarily described by Erik Erikson. Specific developmental tasks characterize successive chronological periods from infancy through maturity: trust versus mistrust (infancy), autonomy versus doubt (toddler), initiative versus guilt (preschool), industry versus inferiority (school age), identity versus identity diffusion (adolescence), intimacy versus isolation (young adulthood), generativity versus self-absorption (adulthood), and integrity versus despair (mature age).

psychosocial dwarfism Syndrome usually first manifested in children 2 to 3 years of age, who typically are unusually short, have frequent growth hormone abnormalities, and have severe behavioral disturbances; all of these symptoms are the result of an inimical caretaker–child relationship and resolve without any medical or psychiatric treatment upon being placed in a more favorable domicile. Also called psychosocially determined short stature.

psychosocially determined short stature PSYCHOSOCIAL DWARFISM.

psychosocial stressor STRESS.

psychosomatic disorder PSYCHOLOGICAL FACTOR AFFECTING PHYSICAL CONDITION.

psychosurgery Neurosurgical intervention to treat a mental disorder that involves destruction or ablation of brain tissue.

psychotherapeutic drug Drug used to alter abnormal thinking, feelings, or behavior; traditionally divided into classes of antipsychotic, antidepressant, antimanic, and antianxiety (anxiolytic) drugs. Also called psychoactive drug; psychotropic drug.

psychotherapist Person trained to treat mental, emotional, and behavioral disorders. For types of therapists, see the specific term.

psychotherapy Treatment for mental illness and behavioral disturbances in which a trained person establishes a professional contract with the patient and through definite therapeutic communication, both verbal and nonverbal, attempts to alleviate the emotional disturbance, reverse or change maladaptive patterns of behavior, and encourage personality growth and development; distinguished from other forms of psychiatric treatment such as the somatic therapies, for example, drug and convulsive therapies.

psychotic 1. Person suffering from a psychosis. **2.** Denoting or characteristic of a psychosis.

psychotic depressive reaction Psychosis distinguished by depressed mood precipitated by some event, usually in a person who had not previously demonstrated severe depression. Also called major depressive disorder, single episode, with mood-congruent psychotic features, in DSM.

psychotomimetic drug Drug that produces psychic and behavioral changes that resemble psychosis; unlike other drugs that can produce organic psychosis as a toxic reaction (e.g., hallucinogenic and psychedelic drugs such as LSD, marijuana, mescaline), a psychotomimetic drug does not produce gross confusion, delirium, or overt memory impairment.

psychotropic drug PSYCHOTHERAPEUTIC DRUG.

PTSD Posttraumatic stress disorder.

puerperal psychosis *See* postpartum psychosis.

punishment Presentation of an aversive stimulus contingent on an operant response, resulting

in a decreased probability of that response recurring. *See also* reinforcement.

Purging disorder Eating disorder characterized by recurrent episodes of self-induced vomiting, laxative and diuretic abuse, and/or the use of enemas after consuming small amounts of food; patients are normal weight and have distorted body image. In DSM-5, included in "Other Specified Feeding or Eating Disorders."

pyromania Compulsion to set fires.

Q

q-sort Technique of personality assessment based on the degree to which a standard set of descriptive statements are believed to describe a particular person.

quadrangular therapy Marital therapy that involves four people, the married pair and each spouse's therapist.

quality assurance Measurement and evaluation of medical and other related services provided with regard to their effectiveness, efficiency, appropriateness, and acceptability; such evaluation will trigger corrective or remedial action for services not meeting the desired standards.

quantitative variable Experimental factor that can be measured.

R

random Statistical term that means occurring by chance or without attention to selection or planning.

random sample In a given population, a group of subjects selected in such a manner that each member of the population has an equal probability of being selected for the sample.

random variable Variable for which the variation is determined by chance.

range Statistical measure of the variability of a set of values, defined as the difference between the largest value and the smallest value.

Rank, Otto (1884–1939) Austrian psychoanalyst, long-time secretary and recorder of the minutes of the Vienna Psychoanalytic Society, and one of Sigmund Freud's earliest followers, who split with him on the significance of the birth trauma, which Rank used as a basis of brief psychotherapy. Rank's works include *The Trauma of Birth* and *The Myth of the Birth of the Hero*.

rape Sexual intercourse without the person's consent and against his or her will, chiefly by force; usually heterosexual but may be homosexual.

rapid eye movement *See* REM latency; REM sleep.

rapport Conscious feeling of harmonious accord, sympathy, and mutual responsiveness between two or more persons; contributes to an effective therapeutic process in both group and individual settings.

rapture-of-the-deep syndrome Psychosis, seen in scuba and deep-sea divers, characterized by disorientation and loss of judgment and skill, and associated with excessive blood nitrogen levels; sensory deprivation may also contribute to this acute, self-limited mental disorder. Also called nitrogen narcosis.

rationalization Ernest Jones's term for an unconscious defense mechanism in which irrational or unacceptable behavior, motives, or feelings are logically justified or made

consciously tolerable by plausible means.

Ray, Isaac (1807–1881) One of the original 13 founders of the American Psychiatric Association, known for his *Treatise on Medical Jurisprudence of Insanity* (1837).

rCBF Regional cerebral blood flow.

reaction formation Unconscious defense mechanism in which a person develops a socialized attitude or interest that is the direct antithesis of some infantile wish or impulse that is harbored either consciously or unconsciously. One of the earliest and most unstable defense mechanisms, closely related to repression; both are defenses against impulses or urges that are unacceptable to the ego.

reactive attachment disorder of infancy or early childhood Severe impairment of the ability to relate, beginning before age 5; presumed to develop from grossly pathological care-giving.

reactive depression Mental disorder characterized by depression developing in reaction to some precipitating life event or circumstance.

reactive disorder Mental disorder judged to be a reaction to one or more life events or circumstances, without which the disorder would not have occurred. *See also* brief reactive psychosis; reactive depression; reactive schizophrenia.

reactive schizophrenia Unofficial term for schizophrenia attributed primarily to predisposing or precipitating environmental factors. *Compare* process schizophrenia.

reading disorder Reading below the expected level for a child's age, education, and intelligence.

reality Totality of objective things and factual events; includes everything that is perceived by a person's special senses and is validated by other people.

reality principle In psychoanalysis, ego processes that modify the demands of the pleasure principle to meet the inescapable demands and requirements of the outside world; net result is behavior that gratifies id impulses within realistic limits. *See also* pleasure principle.

reality testing Fundamental ego function that consists of tentative actions that test and objectively evaluate the nature and the limits of the environment; includes the ability to differentiate between the external world and the internal world and to accurately judge the relation between the self and the environment.

recall Process of bringing stored memories into consciousness. *See* memory.

receiver operating characteristic (ROC) Special statistical method, recently used in psychiatry, which gives a balance between sensitivity and specificity for a diagnostic test, for example, Dexamethasone Suppression Test. The method was derived from signal detection theory as a way to determine how well an electronic receiver was able to distinguish signal from noise.

recent memory Recall of events over the past few days.

recent past memory Recall of events over the past few months.

receptive aphasia Organic loss of ability to comprehend the meaning of words; fluid and spontaneous, but incoherent and nonsensical, speech. *See also* fluent aphasia and sensory aphasia.

receptive dysphasia Difficulty in comprehending oral language; the impairment involves both comprehension and production or language.

receptors Proteins in the neuronal membrane that are exposed in part to the extracellular fluid and specifically recognize neuromessengers; stimulation of receptors generally causes a biological response to occur.

reciprocal inhibition and desensitization Behavior therapy in which a person is conditioned to associate comfortable, supportive surroundings with anxiety-producing stimuli, thus decreasing the anxiety associated with those stimuli.

recovered memory syndrome Condition that occurs when a repressed memory of a traumatic experience is brought back to consciousness, usually during psychotherapy or under hypnosis. A variant of this condition, false memory syndrome, occurs if the recalled memory did not actually happen, but the person believes the memory to be true.

recurrent brief depressive disorder Multiple, brief (less than 2 weeks duration) episodes of depressive symptoms.

recurrent depressive episode Depression that lasts between 2 and 13 days and occurs at least once a month.

recurrent isolated sleep paralysis Sleep disorder characterized by the inability to make voluntary movements while partially conscious at sleep onset or awakening. *See also* parasomnias.

refractory period Temporary state of psychophysiological resistance to sexual stimulation immediately after orgasm in the human sexual response cycle, as described by Masters and Johnson.

reframing Technique used in family therapy whereby a problem or conflict is viewed by the therapist in an entirely different and sometimes startling perspective, thus enabling the family members to achieve objectivity.

regional cerebral blood flow (rCBF) Test using xenon-133, a low-energy gamma ray-emitting isotope, to determine blood flow in the brain; useful for studying diseases that have a decrease in the amount of brain tissue, for example, dementia, ischemia, atrophy.

registration *See* memory.

regression Unconscious defense mechanism in which a person undergoes a partial or total return to earlier patterns of adaptation; observed in many psychiatric conditions, particularly schizophrenia.

regressive-reconstructive approach Psychotherapeutic procedure in which regression is made an integral element of the treatment process; an original traumatic situation is reproduced to gain new insight and to effect personality change and emotional maturation.

rehabilitation All methods and techniques used in an attempt to achieve maximal function and optimal adjustment in a given patient; the physical, mental, social, and vocational preparation of a patient for the fullest possible life compatible with his or her abilities and disabilities. Inasmuch as the process aims also to prevent relapses or recurrences of the patient's condition, it is sometimes called tertiary prevention.

Reich, Wilhelm (1897–1957) Austrian psychoanalyst who emigrated to the United States in 1939. He coined the term "orgone," a kind of universally pervasive physical and biological energy that was typified by the pent-up libidinal energy that sought free expression and release through orgasm.

Reik, Theodor (1888–1969) Psychoanalyst and early follower of Sigmund Freud, who

considered Reik one of his most brilliant pupils; Freud's book, *The Question of Lay Analysis*, was written to defend Reik's ability to practice psychoanalysis without medical training. Reik made many valuable contributions to psychoanalysis on the subjects of religion, masochism, and therapeutic technique.

reinforcement *Positive reinforcement* refers to the process by which certain consequences of behavior increase the probability that the behavior will occur again. Positive reinforcers tend to be viewed as pleasant. *Negative reinforcement* describes the process by which behavior that leads to the removal of an unpleasant event strengthens that behavior. Negative reinforcers tend to be viewed as unpleasant. Stimuli that possess inherent reinforcing characteristics are called *primary reinforcers*, for example, food. Stimuli that acquire reinforcing characteristics by being paired with primary reinforcers are called *conditioned reinforcers*, for example, money. *See also* conditioning.

reinforcer Reinforcing stimulus. *See* reinforcement.

relatedness Sense of sympathy and empathy with regard to others; sense of oneness with others. *Compare* isolation; alienation.

relational problems Impaired functioning of a relational unit. In DSM, parent–child relational problem, partner relational problem, and sibling relational problem.

relative frequency *See* frequency.

relative risk Epidemiological measure of the risk of developing a disorder in a specified subset of the population as compared with the total population or a different subset of it. Comparison is usually made between groups exposed and groups not exposed to a particular hereditary or environmental factor to gain information about the role of that factor in the disorder in question. Relative risk is then expressed as a ratio of the frequency of the disorder in exposed persons to its frequency in those not exposed.

Relative Value Scale Payment scale for medical services developed at Harvard University that reimburses physicians in terms of time spent with patients, office overhead expenses, years of training, and cognitive skills; under the program, surgeons would receive less money and internists would receive more money from third-party (insurance) carriers than under previous payment scale programs. Also called Resource-Based Relative Value Scale (RBRVS).

reliability Research term meaning replicability, that is, the degree to which a test result or experimental finding can be confirmed by repetition. *See also* validity.

religious delusion Delusion involving the Deity or theological themes.

reminiscence Recall or recollection of past experiences, with alternations of remembering an apparently lost memory and forgetting one that was just there.

remission Significant improvement or recovery which may or may not be permanent. *Compare* intermission.

remote memory LONG-TERM MEMORY.

remotivation Group treatment technique used patients in mental hospitals to encourage them and vocational skills.

REM (rapid eye movement) latency First REM episode of the night, about 90 minutes after sleep onset; shortening of REM latency frequency occurs with disorders such as depression and narcolepsy.

REM (rapid eye movement) sleep Stage of sleep during which dreaming occurs and the

sleeper exhibits coordinated rapid eye movement (REM). The electroencephalogram demonstrates a desynchronized pattern of cerebral activity. It accounts for one-fourth to one-fifth of total sleep time. Also called paradoxical sleep.

REM sleep behavior disorder Sleep disorder characterized by the absence of sleep paralysis (atonia) during the REM stage of sleep; consequently, patients will act out their dreams, putting themselves and/or their partners at risk of physical injury. *See also* parasomnias.

repetition compulsion Psychoanalytic concept of an impulse to repeat earlier experiences and situations.

repetitive pattern Continual attitude or mode of behavior characteristic of a person and performed mechanically or unconsciously.

repression Freud's term for an unconscious defense mechanism in which unacceptable mental contents are banished or kept out of consciousness; important in both normal psychological development and in neurotic and psychotic symptom formation. Freud recognized two kinds of repression: (1) repression proper, in which the repressed material was once in the conscious domain; (2) primal repression, in which the repressed material was never in the conscious realm. *Compare* suppression.

repressive-inspirational group psychotherapy Group therapy in which discussion is intended to bolster the patients' morale and help them avoid undesired feelings; used primarily with large groups of seriously regressed patients in institutional settings.

reserpine Alkaloid extracted from the *Rauwolfia serpentina* plant, formerly used as an antipsychotic agent because of its sedative effects but currently used primarily as an antihypertensive agent, although this use has declined partly because of its potential to produce a considerable incidence of nightmares and suicidal depression; that untoward effect may be related to reserpine's depletion of catecholamines at critical sites in the central nervous system.

resident 1. In psychiatry, a patient living in a treatment center for a prescribed period of time. **2.** In medicine, a physician in postgraduate training after graduation from medical school; 4 years of residency training are necessary to become a psychiatrist.

residential treatment facility Center where patients live and receive treatment appropriate for their particular needs; a children's residential treatment facility ideally furnishes both educational and therapeutic experiences for the emotionally disturbed child. Also called a halfway house.

residual Denoting a condition in which a person's acute mental symptoms have subsided.

residual schizophrenia Schizophrenia in which the patient no longer is psychotic but does have some remaining signs of the illness.

resistance Conscious or unconscious opposition to the uncovering of unconscious material; linked to underlying psychological defense mechanisms against impulses from the id that are threatening to the ego.

resistant attachment As described by Mary Ainsworth, a child's simultaneous yet antithetical wish for and avoidance of his or her mother's approach. *Compare* avoidant attachment; secure attachment.

resolution phase Final stage in the human sexual response cycle, as described by Masters and Johnson, during which the sexual system returns to its normal, nonexcited state following

orgasm.

respondent conditioning CLASSICAL CONDITIONING. *See* conditioning.

restless legs syndrome (RLS) A syndrome characterized by an uncomfortable, subjective sensation of the limbs, usually the legs. Tends to be worse at night.

restricted affect Reduction in intensity of feeling tone that is less severe than in blunted affect but clearly reduced. *See* constricted affect.

retardation Reduction or slowing down of mental and physical activity, as often observed in depression. *See also* mental retardation.

retarded ejaculation INHIBITED MALE ORGASM.

retention *See* memory.

retroflexion Psychoanalytic term used notably by Sandor Rado to describe the turning of rage onto oneself.

retrograde amnesia Loss of memory for events preceding the onset of the amnesia. *Compare* anterograde amnesia.

retrospective falsification Memory becomes unintentionally (unconsciously) distorted by being filtered through a person's present emotional, cognitive, and experiential state.

retrospective study Investigation based on past data or past events, such as a case control study or a case history study.

Rett disorder A progressive condition characterized by deceleration in head growth, loss of purposeful hand movements, development of stereotyped hand movements (e.g., hand wringing), psychomotor retardation, loss of social engagement, loss of acquired speech, and ataxia between the ages of 6 months to 2 years.

Rett syndrome A progressive condition characterized by deceleration in head growth, loss of purposeful hand movements, development of stereotyped hand movements (e.g., hand-wringing), psychomotor retardation, loss of social engagement, loss of acquired speech, and ataxia between the ages of 6 months to 2 years. In DSM-5 this disorder is diagnosed as Level 2 of the autism spectrum.

reversal In psychoanalysis, an impulse's change from passive to active or from active to passive, as when a destructive impulse changes from masochism to sadism or vice versa.

right to refuse treatment Legal doctrine that holds that a person cannot be forced to have treatment against his or her will unless it is a life-and-death emergency.

right to treatment Legal principle that a facility that has assumed the responsibility of providing treatment is legally obligated to provide adequate treatment for a patient.

rigidity In psychiatry, a person's resistance to change, a personality trait.

risk factor Factor that accounts for the increased risk of a disorder. *See also* attributable risk; relative risk.

ritual **1.** Formalized activity practiced by a person to reduce anxiety, as in obsessive-compulsive disorder. **2.** Ceremonial activity of cultural origin.

ritualistic behavior Automatic behavior of cultural or psychogenic origin.

RLS Restless legs syndrome.

ROC Receiver operating characteristics.

Rogers, Carl R. (1902–1987) American psychologist who developed person-centered or client-

centered theory of personality and psychotherapy, utilizing the concepts of self-actualization and self-direction; emphasized subjective experiential life of people and considered the self as a primary entity in both adjustment and maladjustment in people.

role Pattern or type of behavior developed under the influence of significant people in the person's environment. When the behavior pattern conforms to the expectations and demands of other people, it is said to be a complementary role; if it does not, it is known as a noncomplementary role. *See also* alternating role.

role playing Psychodrama technique in which persons are trained to function more effectively in their real-life roles. In the therapeutic setting of psychodrama, protagonists are free to try and to fail in their roles, for they are given the opportunity to try again until they succeed; new approaches to feared situations can thus be learned and applied outside the therapeutic setting.

Romberg sign Markedly increased swaying of the body or falling when a person stands erect with heels together and closes the eyes; typically indicates dysfunction of the dorsal column proprioceptive system, but it may also be seen in hysteria.

Rorschach Test Projective test, developed by Hermann Rorschach, in which the person is asked for associations in response to a series of inkblot pictures.

rumination Constant preoccupation with and thinking about a single idea or theme, as in obsessive-compulsive disorder.

rumination disorder of infancy Rare eating disorder of early childhood characterized by recurrent regurgitation of food in the absence of nausea, retching, or associated gastrointestinal disorder; regurgitated food is either ejected from the mouth or rechewed and reswallowed. Also called merycism.

Rush, Benjamin (1745–1813) Father of American psychiatry whose book, *Medical Inquiries and Observations upon the Diseases of the Mind* (1872), was the only American textbook on psychiatry until the end of the 19th century.

S

SAD Seasonal affective disorder.

sadism Paraphilia in which sexual gratification is achieved by inflicting pain or humiliation on a partner; first described by the French writer the Marquis de Sade (1740–1814). *See also* masochism; sadomasochistic relationship.

sadistic personality disorder Disorder in which a person shows a pervasive pattern of cruel, demeaning, and aggressive behavior whereby physical cruelty or violence is used to inflict pain on others and not to achieve some goal; such a person is fascinated by violence, weapons, injury, or torture. In DSM-III-R, this is a proposed diagnostic category requiring further study.

sadomasochistic relationship Relationship in which the enjoyment of suffering by one person (masochism) and the enjoyment of inflicting pain by the other person (sadism) are important and complementary attractions in their ongoing interaction.

sample Research term for a subset of observations selected from a population.

sanatorium Institution where patients are treated for chronic physical or mental diseases or where they are attended to during a period of recuperation.

satyriasis Morbid, insatiable sexual needs or desires in a male; may be caused by organic or

psychiatric factors. *Compare* nymphomania.

schedule of reinforcement Scheme of intermittent reinforcement in which a response is not reinforced every time it occurs. Four broad classes of intermittent schedules are based on either the number of responses required before an opportunity for reinforcement is presented or the passage of a certain amount of time before a given performance is reinforced (l) *fixed-ratio schedule,* in which reinforcement is delivered after a specified number of responses have occurred, for example, after every tenth response; (2) *variable-ratio schedule,* in which reinforcement is delivered on a schedule randomly changing around a given ratio, for example, after the third, sixth, then second response, and so on; (3) *fixed-interval schedule,* in which reinforcement is delivered contingent on the first required response after the elapse of a specified interval of time, for example, after every 10 minutes; and (4) *variable-interval schedule,* in which reinforcement is delivered after variable intervals of time have elapsed, for example, after 3, 6, then 2 hours, and so on. *See also* reinforcement.

schizoaffective disorder Psychotic disorder with signs and symptoms compatible with both a mood disorder and schizophrenia. In contrast to mood disorder with psychotic features, schizoaffective disorder is characterized by periods of at least 2 weeks without prominent mood symptoms.

schizoid fantasy Through fantasy, indulgence by a person in autistic retreat to resolve conflict and to obtain gratification; interpersonal intimacy is avoided and eccentricity serves to repel others. The individual does not fully believe in or insist on actins out the fantasies.

schizoid personality disorder Diagnostic category in DSM for persons with defects in the capacity to form social relationships but without other striking communicative or behavioral eccentricities. Also called introverted personality disorder.

schizophrenia Term introduced by Eugen Bleuler for a chronic, psychotic mental disorder of unknown etiology characterized by disturbances in thinking, mood, and behavior. The thinking disturbance is manifested by a distortion of reality, sometimes with delusions and hallucinations, accompanied by a fragmentation of associations that results in characteristic disturbances of speech; the mood disturbance includes ambivalence and inappropriate or constricted affective responses; the behavior disturbance may be manifested by apathetic withdrawal or bizarre activity. Subtypes of schizophrenia (disorganized, catatonic, paranoid, undifferentiated, and residual) are no longer formally in the DSM nomenclature, however they remain as useful descriptors. Formerly called dementia praecox.

schizophreniform disorder In DSM-5 a disorder similar to schizophrenia except that it lasts between 1 and 6 months.

schizotypal personality disorder Common term for mood disorder subtype characterized by depression, psychomotor slowing, hypersomnia, and hyperphagia that develops in autumn or winter and improves in spring and summer; not an official DSM-5 diagnosis.

schneiderian first rank symptoms Symptoms that Kurt Schneider, a German psychiatrist (1887–1967), considered to be of great pragmatic value in making a diagnosis of schizophrenia, including audible thoughts, arguing voices, thought withdrawal and insertion, delusions, and flat affect.

school phobia Young child's sudden fear of and refusal to attend school, usually considered a manifestation of separation anxiety but also may be a symptom of depression.

Schreber case One of Sigmund Freud's cases. Daniel Paul Schreber's published autobiographical account, entitled *Memoirs of a Neurotic* (1903), was analyzed by Freud (1911) and allowed him to decipher the fundamental meaning of paranoid processes and ideas, especially the relationship between repressed homosexuality and projective defenses.

scopophilia Sexual deviation in which a person achieves sexual gratification by viewing sexual acts or the genitals of others. *Compare* voyeurism.

scotoma 1. In psychiatry, a figurative blind spot in a person's psychological awareness. *See also* blind spot. **2.** In neurology, a localized visual field defect.

screening Initial patient evaluation that includes medical and psychiatric history, mental status evaluation, and diagnostic formulation to determine the patient's suitability for a particular treatment modality.

screen memory Memory that serves as a cover-up for an associated painful memory.

SCT Sentence Completion Test.

SD Standard deviation.

SDA Serotonin-dopamine antagonist.

SDS Zung Self-Rating Depression Scale.

seasonal affective disorder (SAD) Mood disorder subtype characterized by depression, psychomotor slowing, hypersomnia, and hyperphagia that develops in autumn or winter and improves in spring and summer.

seasonal pattern *See* seasonal affective disorder.

secondary gain Obvious advantage that a person gains from an illness, such as gifts, attention, and release from responsibility. *Compare* primary gain.

secondary narcissism *See* narcissism.

secondary prevention *See* preventive psychiatry.

secondary process thinking In psychoanalysis, the form of thinking that is logical, organized, reality-oriented, and influenced by the demands of the environment; characterizes the mental activity of the ego. *Compare* primary process.

secondary retarded ejaculation After previous normal sexual functioning, the inability to ejaculate during coitus. *Compare* retarded ejaculation.

secondary sexual characteristics Physical characteristics, other than the external sexual organs, that distinguish male from female.

secure attachment As described by Mary Ainsworth, the positive, happy responses of a child following the mother's appearance.

sedative Drug that produces a calming or relaxing effect through central nervous system depression; for example, barbiturates, chloral hydrate, paraldehyde, and benzodiazepines. *Compare* hypnotic.

seizure An attack or sudden onset of certain symptoms, such a convulsions, loss of consciousness, and psychic or sensory disturbances; seen in epilepsy and can be substance induced. For types of seizures, see the specific term.

selection bias Nonrepresentative sampling resulting in erroneous conclusions.

selective inattention Harry Stack Sullivan's term for inattentiveness to anxiety-generating areas.

selective mutism Persistent failure to speak in one or more specific social situations.

selective serotonin reuptake inhibitors (SSRIs) Drugs that increase the concentration of serotonin in the brain; commonly used for the treatment of depression and anxiety disorders.

self Psychophysical total of a person at any given moment, including conscious and unconscious attributes. *See also* identity.

self-actualization Abraham Maslow's term for the inborn capacity of people to direct themselves in the healthiest way, toward a level of completeness.

self-analysis Investigation of one's own psychic components, which plays a part in all analysis, although to a limited extent, since few people are capable of sustaining independent and detached attitudes to the degree necessary for this approach to be therapeutic.

self-awareness Sense of knowing oneself, particularly in terms of insight into one's own psychodynamics; a major goal of most psychotherapies.

self-defeating personality disorder Disorder in which persons avoid or undermine pleasurable experiences and are drawn to situations or relationships in which they will suffer, even when better options are available; positive personal events are responded to with guilt or depression, reasonable offers of assistance from others are rejected, and anger or rejecting responses from others are invited, leaving them feeling hurt or humiliated. Also called masochistic personality disorder.

self-discovery In psychoanalysis, the freeing of the repressed ego in a person who has been brought up to submit to the wishes of the significant others around him.

self-fulfilling prophecy Situation in which one predicts a type of behavior that eventually one carries out.

self-help groups Groups composed of persons who want to cope with a specific problem or life crisis; characterized by homogeneity and cohesion.

self-image One's conception of one's own identity, personality, and worth as a person.

self-reference Denoting a person's repeatedly referring the subject under discussion back to himself.

self-system Harry Stack Sullivan's term for a personality system designed to ward off anxiety and preserve a positive view of the self.

SEM Standard error of the mean.

senescence Aging, as determined by inherent or hereditary factors.

senile dementia Dementia secondary to diffuse cerebral atrophy associated with advancing age; onset is insidious, progression is slow and gradual, and no specific therapy is known.

senium Period of old age, generally after age 65.

sensate focus learning In the treatment of sexual disorders, exercises that focus on heightening sensory awareness to touch, sight, sound, and smell.

sensation Feeling or impression when the sensory nerve endings of any of the six senses (taste, touch, smell, sight, kinesthesia, and sound) are stimulated.

sense of self One's feeling of individuality, uniqueness, and self-direction.

sensitivity In research, the probability of a positive test result in one who has the disorder. *Compare* specificity.

sensitivity training group Group in which members seek to develop self-awareness and an understanding of group processes, rather than to gain relief from an emotional disturbance.

See also encounter group; T-group.

sensorimotor period *See* Piaget, Jean.

sensorium Hypothetical sensory center in the brain that is involved with clarity of awareness about oneself and one's surroundings, including the ability to perceive and process ongoing events in light of past experiences, future options, and current circumstances; sometimes used interchangeably with consciousness.

sensory aphasia Organic loss of ability to comprehend the meaning of words; fluid and spontaneous, but incoherent and nonsensical, speech. *See also* fluent aphasia and receptive aphasia.

sensory deprivation Lack of external stimuli and the opportunity for the usual perceptions; may be produced experimentally or may occur in real-life contexts (e.g., deep-sea diving, solitary confinement, loss of hearing or eyesight), leading to hallucinations, panic, delusions, and disorganized thinking. *See also* emotional deprivation.

sensory extinction Neurological sign operationally defined as failure to report one of two simultaneously presented sensory stimuli, despite the fact that either stimulus alone is correctly reported. Also called sensory inattention.

sensory inattention SENSORY EXTINCTION.

Sentence Completion Test (SCT) Test designed to tap patients' conscious associations to areas of functioning in which the clinician may be interested; it is composed of a series (usually 75 to 100) of sentence stems, such as "I like ....," "Sometimes I wish ...," that patients are asked to complete in their own words.

separation anxiety Reaction expressed in a child who is isolated or separated from the mother, such as tearfulness, irritability.

separation anxiety disorder In DSM, an anxiety disorder characterized by an infant's or child's fear and apprehension on being removed from the parent or parent figure.

separation-individuation As elaborated by Margaret Mahler, the phase during which the child perceives itself as distinct from the mother; as the child separates, it becomes more independent and aware of its physical and psychological autonomy and can endure separation from the mother.

serotonin 5-Hydroxytryptamine (5-HT), an endogenous indolamines synthesized from dietary tryptophan and found in the gastrointestinal tract, the platelets, and the central nervous system. Evidence indicates that this monoamine serves as a neurotransmitter substance in the central nervous system and may play an important role in such diverse functions as sleep, sexual behavior, aggressiveness, motor activity, perception (particularly pain),and mood; dysfunction in central serotonergic systems has been proposed as a cause or factor in various mental disorders, including schizophrenia and the mood disorders.

serotonin-dopamine antagonists (SDAs) Drugs that block the receptors for both serotonin and dopamine in the brain. Also known as second-generation or atypical antipsychotics. *Compare* dopamine-receptor antagonists.

serotonin-norepinephrine reuptake inhibitors (SNRIs) Drugs that inhibit the reuptake of both serotonin and norepinephrine in the brain.

serotonin syndrome An excess of serotonin in the brain that causes a syndrome of confusion, delirium, tremor, and hyperthermia which may be fatal. Caused by overdose of serotonergic

drugs.

serum levels *See* blood serum levels.

severe mental retardation *See* mental retardation.

sexual aberration Deviation from usual sexual practices. For types of sexual aberrations, see the specific term.

sexual arousal disorders Sexual dysfunction characterized by an inability to achieve a degree of sexual excitement sufficient to engage in coitus. Formerly called inhibited sexual excitement.

sexual aversion disorder Sexual desire disorder characterized by a disgust and/or avoidance of genital contact with a sexual partner.

sexual delusion Delusion centering on sexual identity, appearances, practices, or ideas.

sexual desire disorder Dysfunction characterized by a diminished or hypoactive sexual drive. Formerly called inhibited sexual desire. *See also* hypoactive sexual desire disorder; sexual aversion disorder.

sexual deviation PARAPHILIA.

sexual disorder DSM term for psychosexual disorder.

sexual drive One of the two primal drives or instincts (the other is the aggressive drive) in Freud's dual-instinct psychoanalytic theory. It operates under the pleasure–unpleasure (pleasure–pain) principle, with its main goal being the preservation and maintenance of life, in contrast to the aggressive drive that follows the repetition–compulsion principle; its unconscious psychic energy is known as libido. Also known as life instinct; Eros.

sexual dysfunction Class of sexual disorders characterized by inhibitions in sexual desire or the psychophysiological changes that characterize the sexual response cycle.

sexual identity Biologically determined sexual state. *Compare* gender identity.

sexualization Endowment of an object or function with a sexual significance that it previously did not have, or possessed to a lesser degree, in order to ward off anxieties associated with prohibited impulses or their derivatives.

sexual masochism *See* masochism.

sexual orientation distress Term that refers to a disorder characterized by persistent and marked distress about one's sexual orientation; most often characterized by a desire to acquire heterosexual rather than homosexual arousal.

sexual pain disorders Sexual dysfunction characterized by pain during coitus, such as dyspareunia and vaginismus.

sexual reassignment *See* transsexualism.

sexual sadism *See* sadism.

shaman Healer in a primitive tribe who uses supernatural or spiritual powers to cure the sick.

shame Failure to live up to self-expectation; often associated with fantasy of how person will be seen by others. *See also* guilt.

shaping Operant conditioning technique, used in behavior therapy, in which a behavioral goal is reached in stepwise fashion through selective reinforcement of closer and closer approximations of the desired behavior.

shared paranoid disorder *See* shared psychotic disorder.

shared psychotic disorder Rare disorder in which the delusion system of the patient has developed out of a close relationship with another person who had a previously established, similar delusional system. In DSM-5, this condition is called "delusional symptoms in partner of individual with delusional disorder." It has historically been referred to as shared paranoid disorder, induced psychotic disorder, folie à deux, and double insanity.

shell shock Obsolete World War I term for an acute mental disorder arising as a consequence of combat experience. *See* posttraumatic stress disorder.

shift work circadian rhythm disorder Characterized by sleep pattern disruptions that result from night shift work; associated with insomnia, excessive sleepiness, or both.

shock treatment Obsolete term for convulsive therapy.

short-duration depressive episode A DSM-5 diagnosis characterized by depressed mood lasting between 4 and 14 days that is nonrecurring.

short-term memory Reproduction, recognition, or recall of perceived material within seconds to minutes after the initial presentation. Compare immediate memory; long-term memory.

shyness disorder AVOIDANT DISORDER OF CHILDHOOD OR ADOLESCENCE.

sibling One of two or more individuals having one common parent.

sibling rivalry Competition among siblings for the attention, affection, and esteem of their parents or for other recognition or reward.

sick role Use of illness or complaints about bodily functioning as a means of escaping personal failure and the expectation to succeed, or as a way of avoiding other social responsibilities. *See also* hypochondriasis.

side effect Action of a drug other than the desired therapeutic effect.

sign Objective evidence of a disease or disorder. *Compare* symptom.

signal anxiety Sigmund Freud's term describing a type of anxiety characteristic of the psychoneuroses, in which a child learns to anticipate and react to the possibility of a traumatic situation before it becomes traumatic.

significant differences *See* statistical significance.

simple phobia Phobic disorder characterized by fear and avoidance of an object or situation not included in agoraphobia or social phobia.

simultanagnosia Impairment in the perception or integration of visual stimuli appearing simultaneously.

sitophobia Abnormal fear of eating.

skin-picking disorder *See* excoriation disorder.

Skinner, B. F. (1904–1990) American behavioral psychologist and author noted for his work on operant conditioning.

sleep Recurrent temporary period of relative unconsciousness, characterized by a reversible cessation of waking Sensorimotor activity are accompanied by characteristic electroencephalographic changes; divided into REM (rapid eye movement) and non-REM (NREM) sleep.

sleep disorder Abnormality of the sleep–wake cycle. Sleep disorders include dyssomnias (insomnia disorder, primary insomnia, hypersomnia disorder, sleep–wake schedule disorder) and parasomnias (dream anxiety disorder, sleepwalking disorder, sleep terror disorder).

sleep-related eating disorder Sleep disorder characterized by the inability to fall back asleep after awakening without having something to eat or drink; predominantly affects infants and children.

sleep-related hallucinations Hallucinations that occur at sleep onset (hypnagogic) or on awakening (hypnopompic); hallucinations are often visual and common in patients with narcolepsy.

sleep-related hypoventilation Dyssomnia characterized by recurrent episodes of shallow breathing during sleep associated with insomnia and/or frequent arousal during the breathing disturbances. *See also* breathing-related sleep disorders.

sleep terror disorder Sleep disorder in which there are repeated episodes of abrupt awakenings from sleep, usually beginning with a panicky scream; characterized by verbalizations, confusion, autonomic activity, and poor recall of the dream. A non-REM sleep arousal disorder in DSM-5; also called pavor nocturnus; night terror. *See also* parasomnias.

sleep–wake schedule disorder Sleep disorder in which persons cannot sleep when they wish to sleep, but are able to sleep at other times; correspondingly, they cannot be fully awake when they want to be fully awake, but they are able to be awake at other times. Term used in ICD.

sleepwalking disorder DSM-5 term for somnambulism; a non-REM sleep arousal disorder. *See also* parasomnias.

slow-wave sleep (SWS) Non-REM sleep stages 3 and 4; so termed because of the characteristic wave appearance on the electroencephalogram (EEG) record. Also called delta sleep.

SNRI Serotonin-norepinephrine reuptake inhibitor.

social adaptation Adjustment to the whole complex of interpersonal relationships; the ability to live and express oneself in accordance with society's restrictions and cultural demands. *See also* adaptational approach.

social anxiety disorder *See* social phobia.

social breakdown syndrome Signs and symptoms indicating that the long-term institutionalization of a mental patient has itself contributed to the patient's symptoms; for example, development of progressive social and vocational incompetence, excessive passivity, and learning the chronic sick role.

social control Influence exerted on a person or a group of persons to conform to the demands or expectations of a society or any of its representative institutions, agencies, or organizations.

social instinct *See* herd instinct.

socialization Process through which an individual becomes a competent member of society; the condition in which inner impulses, that is, instincts, are expressed in conformity with cultural demands of the environment.

social learning theory Approach to behavior therapy that incorporates the elements of respondent and operant conditioning, but views cognitive processes as important mediators in such learning; relies on role modeling, identification, and human interactions.

social network therapy Type of therapy in which the therapist assembles all persons (relatives, friends, social relations, work relations) who have emotional or functional significance in the patient's life to provide feedback and support to the patient; all or some of

the social network may be assembled at any given time. *See also* extended-family therapy.

social phobia Any of a variety of phobic disorders characterized by a fear of being observed by others (e.g., fear of public-speaking, blushing, eating in public, writing in front of others, using public lavatories). Also called social anxiety disorder. DSM-5 includes a "performance only" diagnostic category if the fear is limited to speaking or performing in public.

social psychiatry Branch of psychiatry concerned with ecological, sociological, and cultural variables that engender, intensify, or complicate maladaptive patterns of behavior and their treatment.

social (pragmatic) communication disorder Persistent failure to use verbal and nonverbal communication for social purposes; differentiated from Autism Spectrum Disorder

social therapy Rehabilitation therapy used with psychiatric patients to improve social functioning; for example, occupational therapy, therapeutic community, recreational therapy, milieu therapy, attitude therapy.

sociobiology Systematic study of the biological basis of social behavior, pioneered by E. O. Wilson.

sociology Scientific study of group behavior and social organization.

sociometry Study and measurement of the interpersonal psychological structure of a group or society.

sociopath Obsolete term for a person with an antisocial personality disorder.

sociopathic behavior Former term for antisocial behavior.

sociotherapy Any treatment modality whose primary emphasis is on socioenvironmental and interpersonal factors; for example, the therapeutic community.

sodomy Anal intercourse. Legally, the term may include other sexual deviations as well, such as bestiality.

soldier's heart DA COSTA SYNDROME.

soma The body.

somatic delusion Delusion pertaining to the functioning of one's body.

somatic hallucination Hallucination involving the perception of a physical experience localized within the body.

somatic therapy Treatment of psychiatric disorders with biological, organic, or physical treatments.

somatic symptom disorder Disorder characterized by multiple, recurrent physical complaints with no apparent physical cause and a preoccupation with the false belief of having a serious disease; symptoms have no demonstrable organic findings, are often misinterpreted by the patient, and are apparently linked to psychological factors. Previously called somatization disorder; also known as hypochondriasis; Briquet syndrome.

somatization disorder Somatoform disorder characterized by recurrent and multiple physical complaints with apparent physical cause; now called somatic symptom disorder in DSM-5. Also called Briquet syndrome.

somatoform disorders Term previously used for a group of mental disorders characterized by a marked preoccupation with the body and fears of disease; production of the symptoms is linked to psychological factors or conflicts but is not under voluntary control. Previously in DSM-IV, somatoform disorders included somatization disorder, conversion disorder, body

dysmorphic disorder, and somatoform pain disorder. This group of disorders is now referred to as somatic symptom and related disorders. *See also* factitious disorder; malingering.

somatopagnosia Inability to recognize a part of one's body as one's own (also called ignorance of the body and autotopagnosia).

somatotype Physical build and structure of a person; one's physique.

somnambulism Repeated episodes of arising from bed during sleep, usually during the first third of the night during non-REM (stages 3 and 4 sleep); on awakening, the person has amnesia for the episodes. More frequently seen in males than in females, most commonly in children, who generally outgrow it; in adults, often associated with other psychiatric disturbances, such as schizoid personality disorder and schizophrenia.

somnolence Pathological sleepiness or drowsiness from which one can be aroused to a normal state of consciousness.

spatial agnosia Inability to recognize spatial relations.

speaking in tongues Expression of revelatory message through unintelligible words; not considered a disorder of thought if associated with practices of specific Pentecostal religions. *See also* glossolalia.

specific developmental disorder *See* specific learning disorder.

specific learning disorders A class of neurodevelopmental disorders beginning in early childhood that are characterized by persistent difficulty or delays in learning skills in reading, written expression, and/or mathematics, which are inconsistent with the overall intelligence of the child. Specific learning deficit is indicated by the phrase, "with impairment in," either reading (dyslexia), written expression, or mathematics (dyscalculia). Previously called specific developmental disorder. *Compare* pervasive developmental disorder.

specificity In research, the probability of a negative test result in one who does not have the disorder.

specific reading disability DEVELOPMENTAL READING DISORDER.

speech disturbance Any of a variety of language and communication disorders not due to impaired function of speech muscles or organs of articulation.

speech sound disorder Language or speech disorder in which there is a consistent failure to correctly articulate a speech sound at the developmentally appropriate age in the absence of any underlying anatomical, physiological, auditory, or neurological abnormalities. Also called developmental articulation disorder, functional speech disorder, infantile perseveration, infantile articulation disorder, and phonological disorder.

splitting Defense mechanism in which external objects are divided into "all good" and "all bad," accompanied by the abrupt shifting of an object from one extreme category to the other.

SSRI Selective serotonin reuptake inhibitor.

stammering STUTTERING.

standard deviation (SD) Statistical measure of variability within a set of values so defined that, for a normal distribution, about 68 percent of the values fall within one SD of the mean, and about 95 percent lie within two SDs of the mean; sometimes represented by the Greek letter sigma (σ).

standard error of the mean (SEM) Statistical measure of how variable, that is, how reliable, a mean value calculated on the basis of a given sample is as an estimate of the mean of

the population from which the sample was selected; obtained by dividing the standard deviation of the population by the square root of the number of measures in the sample.

standardized score Deviation of a score from its group mean expressed in standard deviation units. Also called z-score.

Stanford–Binet Intelligence Scale Primarily a verbal test of intellectual functioning, administered individually to children and adults, which emphasizes problem solving; one of the most widely used I.Q. tests.

startle reaction Reflex response to a sudden intense stimulus, consisting of a diffuse motor response involving flexion movements of the trunk and extremities and associated with a sudden increase in alertness; occurs in normal persons and in anxiety disorders.

state-dependent learning or memory Facilitated recall of information when one is in the same internal state (e.g., drug state) or external environment that the information was first acquired.

statistical inference Research term used to make a general statement about a study based on a small group or to decide whether to attribute differences between two groups to chance or to nonchance factors.

statistical significance Research term referring to an experimental result, based on a sample of observations, which demonstrates an outcome or effect of sufficient magnitude such that the probability of that result being due to chance alone is less than 5 percent. *See also* Type I error.

status epilepticus Continuous epileptic seizures. *See also* epilepsy.

stereotypy Continuous mechanical repetition of speech or physical activities; observed in cases of catatonic schizophrenia.

stereotypy and habit disorder *See* stereotypic movement disorder.

stereotypic movement disorder Motor disorder consisting of intentional, repetitive, and typically rhythmic behaviors that are nonfunctional, that is, serve no constructive, socially acceptable purpose (e.g., hand flapping, body-rocking, head-banging, face-slapping, skin picking). Movements appear self-soothing or self-stimulating, but in certain cases may also result in self-injury.

stilted speech Excessively formal, stiff, stylized, or pompous speech; overly polite, distant, or antiquated speech.

stimulant Drug that stimulates the central nervous system to produce increased psychomotor activity; for example, methylphenidate (Ritalin), caffeine, amphetamines.

stimulus Any event, internal or external to the person, which elicits some kind of nervous system activity or response.

Stockholm syndrome Syndrome in which captives identify with, and have sympathy for, their captors on whom they are dependent for survival; seen in terrorist-hostage situations. The major defense mechanism, as described by Anna Freud, was known as identification with the aggressor.

STP Slang name for 2,5-dimethoxy-4-methylamphetamine.

street drugs Readily available, illegally acquired psychoactive substances; for example, marijuana, heroin, cocaine, crack.

strephosymbolia Reading and writing disability characterized by confusion between similarly formed but oppositely oriented letters (as in b and d, p and q), with tendency to reverse the

order of letters and words.

stress Circumstance in a person's life that causes tension or dysphoria. Stressors may be mild (e.g., termination of a friendship) or catastrophic (e.g., suicide of a spouse). DSM contains a Severity of Psychosocial Stressor Scale for children, adolescents, and adults. Also called psychosocial stressor.

stress immunity Failure to react to emotional stress.

stress reaction Disturbed psychological or physiological functioning encountered when strong, involuntary, often unconscious internal impulses press for action that conflict with one's conscious, reality-oriented behavior.

stroke CEREBROVASCULAR ACCIDENT.

structured interactional group psychotherapy Group therapy developed by Harold Kaplan and Benjamin Sadock, in which the therapist provides a structural matrix for the group's interactions, the most important of which is that a different member of the group is the focus of the interaction in each session.

structured interview 1. Interview in which the same questions are asked of all patients. **2.** Interview in which the interviewer asks specific questions about specific topics.

Studies on Hysteria Title of a book by Josef Breuer and Sigmund Freud (1895) that described the cathartic method of treatment and the beginnings of psychoanalysis; demonstrated the psychological origins of hysterical symptoms and the possibility of effecting a cure through psychotherapy.

stupor 1. State of decreased reactivity to stimuli and less than full awareness of one's surroundings; as a disturbance of consciousness, it indicates a condition of partial coma or semi coma. **2.** In psychiatry used synonymously with mutism and does not necessarily imply a disturbance of consciousness; in catatonic stupor, patients are ordinarily well aware of their surroundings.

stuttering Speech disorder characterized by repetitions or prolongations of sounds, syllables, or words, or by unusual hesitations and pauses that disrupt the normal flow of speech. May often be associated with habitual eye blinking, facial grimacing, head jerks, or abnormal body movements. Also called stammering; child-onset fluency disorder.

subcoma therapy *See* insulin coma therapy.

subconscious Obsolete term for the preconscious and the unconscious.

subjectivity State in which evaluation and interpretation are influenced by one's own feelings and thinking.

sublimation Unconscious defense mechanism in which the energy associated with unacceptable impulses or drives is diverted into personally and socially acceptable channels; unlike other defense mechanisms, it offers some minimal gratification of the instinctual drive or impulse.

substance abuse Called substance use disorder in DSM-5; diagnosed according to the substance used, for example, alcohol, cocaine, cannabis, hallucinogens, inhalants, opioids, sedatives, stimulants, or tobacco. *See also* drug abuse.

substance use disorder A maladaptive pattern of substance use leading to impairments in functioning characterized by the substance being used in larger amounts over time; unsuccessful efforts to cut down use; cravings; and symptoms of tolerance and withdrawals.

substance withdrawal Cessation or reduction of intake of a substance regularly used to induce a state of intoxication.

substitution Unconscious defense mechanism in which a person replaces an unacceptable wish, drive, emotion, or goal with one that is more acceptable.

succinylcholine Powerful skeletal muscle relaxant used in anesthesia and as a muscle relaxant in electroconvulsive treatment.

suggestibility State of uncritical compliance with influence or of uncritical acceptance of an idea, belief, or attitude; commonly observed among persons with hysterical traits.

suggestion Process of influencing a person to the point of uncritical acceptance of an idea, belief, or other cognitive process.

suicidal ideation Thoughts or acts of taking one's own life.

suicide Act of taking one's own life. Although the underlying factors that lead a person to take his or her own life may not necessarily be fully understood by that person, the act of suicide is considered to be both voluntary and intentional.

suicide cluster *See* cluster suicide.

Sullivan, Harry Stack (1892–1949) American psychiatrist and psychoanalyst best known for his interpersonal theory of psychiatry.

sundowner's syndrome SUNDOWNING.

sundowning Syndrome in the elderly that usually occurs at night and is characterized by drowsiness, confusion, ataxia, and falling as the result of being overly sedated with medications. Also called sundowner's syndrome.

superego One of the three components of the psychic apparatus in the freudian structural framework, the others being the ego and id. It represents the internalized values, ideals, and moral attitudes of society and has psychic functions that are expressed in guilt, self-criticism, and conscience. It develops through the child's identification with his parents, and the severity of its prohibitions or demands is said to be related to the intensity and extent of resolution of the Oedipus complex. *See also* conscience.

supportive psychotherapy Psychotherapy that seeks to strengthen patients' defenses and to provide them with reassurance, rather than to probe deeply into their conflicts.

suppression Conscious act of controlling and inhibiting an unacceptable impulse, emotion, or idea; differentiated from repression in that repression is an unconscious process.

surrogate One who takes the place of another; a substitute.

susto Culture-specific mental syndrome seen in Latin America; characterized by an intense fear of evil supernatural forces.

SWS Slow-wave sleep.

symbiosis Dependent, mutually reinforcing relationship between two persons. Generally a normal, constructive characteristic of the infant–mother relationship, it can also occur in a destructive context, as between two mentally ill persons who reinforce each other's pathology or in a mother–infant relationship that induces in the child an intense separation anxiety, autism, and severe regression (symbiotic psychosis).

symbiotic psychosis Disorder in children characterized by an inability to separate psychologically or physically from the mother; such children experience confusion, intense separation anxiety, and an inability to function.

symbolization Unconscious defense mechanism in which one idea or object comes to stand for another because of some common aspect or quality in both; based on similarity and association; the symbols formed protect the person from the anxiety that may be attached to the original idea or object.

sympathetic nervous system The part of the autonomic nervous system innervating the viscera by outflow from thoracolumbar segments of the spinal cord. Its physiological effects (e.g., tachycardia, peripheral vasoconstriction, pupillary dilation, decreased bowel motility) are predominantly adrenergic, and they characterize the fight-or-flight reaction that occurs in response to dangerous or threatening situations.

sympathomimetic drug Drug whose effects mimic the responses to stimulation of the sympathetic nervous system; for example, amphetamine, epinephrine.

sympathy Compassion for or sharing of another person's feelings, ideas, and experiences. *Compare* empathy.

symptom Any abnormality indicative of a mental or physical disorder experienced by the patient but not observable by a physician. *Compare* sign.

symptomatic psychosis Brain dysfunction as a result of some general physical disease, the most common feature of which is a delirious state; may occur in the course of an acute infectious disease, such as pneumonia, influenza, or pelvic infections following childbirth.

symptom formation Unconscious psychic process in which a repressed impulse is indirectly released and manifested through a symptom; may be regarded as a kind of compromise reflecting a partial satisfaction of both the forbidden impulse and the ego reaction against it.

symptom substitution Phenomenon in which a set of symptoms that are removed directly in therapy, without regard for the unconscious conflicts responsible for their formation, are replaced by new symptoms. It has constituted a theoretical objection to such modalities as behavior therapy and hypnotherapy.

synapse Specialized structure at which one neuron makes contacts with the receptor elements in the adjacent neuron.

syncretic thought Jean Piaget's term for the prelogical, egocentric, solipsistic thinking that characterizes early childhood mentation. *See also* primary process.

synesthesia Condition in which the stimulation of one sensory modality is perceived as sensation in a different modality, as when a sound produces a sensation of color.

syphilis A chronic bacterial disease caused by the spirochete *Treponema pallidum* (*T. pallidum*). Associated with delirium, dementia, mania, psychosis, personality change, and depression.

syntactical (central) aphasia Aphasia characterized by difficulty in understanding spoken speech, associated with gross disorder of thought and expression.

syntaxic mode of experience Harry Stack Sullivan's term denoting the highest level of interpersonal communication, which is based entirely on reality and which is considered the desirable outcome of healthy development. *See also* secondary process.

syntropy Adolf Meyer's term characterizing healthy or wholesome relationships.

systematic desensitization Form of behavior therapy developed by Joseph Wolpe and others in which anxiety-evoking stimuli are represented to a patient in a state of deep muscle relaxation in an attempt to weaken the bond between the stimuli and the anxiety; particularly

useful in the treatment of phobias. *See also* reciprocal inhibition and desensitization.

systematized delusion Group of elaborate delusions related to a single event or theme.

T

taboo Restrictions or prohibitions on behavior imposed by a culture, usually involving a dangerous, forbidden, or unclean entity.

tachylogia LOGORRHEA.

tactile amnesia *See* neurological amnesia.

tactile hallucination Hallucination primarily involving the sense of touch. Also called haptic hallucination.

talion Retaliation; the fear that all bad deeds, intentional or accidental, will be punished in kind; that is, an eye for an eye and a tooth for a tooth. In psychoanalysis, the fear of castration or punishment for oedipal strivings, as in the Oedipus complex.

tangentiality Disturbance in which the person replies to a question in an oblique, digressive, or even irrelevant manner and the central idea is not communicated; failure to communicate the central idea distinguishes tangentiality from circumstantiality, in which the goal idea is reached in a delayed or indirect manner. The term has also been used synonymously with loosening of associations and speech derailment.

taphophobia Abnormal fear of being buried alive.

Tarasoff decision California Supreme Court decision that a physician or psychotherapist who has reason to believe that a patient may injure or kill someone must notify the potential victim, his or her relatives or friends, or the authorities.

tardive dyskinesia Late-appearing extrapyramidal syndrome associated with antipsychotic drug use and characterized by stereotyped involuntary movements of the lips, jaw, and tongue (tardive oral dyskinesia) and by other involuntary dyskinetic movements; symptoms may remit eventually or persist indefinitely after discontinuation of the medication, and the condition does not respond to treatment with antiparkinsonism drugs.

TAT Thematic Apperception Test.

telepathy Extrasensory perception of the mental activities of another person.

telepsychiatry Psychiatric practice using the electronic transmission of images.

temperament Inherent, constitutional predisposition to react, in a certain way to stimuli; variations in temperament are evident very early in life.

temporal lobe epilepsy COMPLEX PARTIAL SEIZURE.

temporary admission Hospitalization in which a person is admitted on the recommendation of one physician (which must be confirmed by a psychiatrist, upon admittance), for no more than 15 days if against his or her will; applies to patients who are so senile or confused that they require hospitalization and are notable to make decisions on their own, or so acutely disturbed that they must be immediately admitted to a psychiatric hospital on an emergency basis.

tension Physiological or psychic arousal, uneasiness, or pressure toward action; an unpleasurable alteration in mental or physical state that seeks relief through action.

terminal insomnia Early morning awakening or waking up at least 2 hours before planning to. *Compare* initial insomnia; middle insomnia.

terrorism The use or threat of violence to instill fear with the intent to intimidate or coerce governments or societies in the pursuit of political, religious, or idealogical goals.

tertiary prevention *See* preventive psychiatry.

testamentary capacity One's competency to make a will. Three psychological abilities are necessary to demonstrate this competency: (1) the nature and extent of their bounty (property); (2) that they are making a will; and (3) who their natural beneficiaries are, for example, their spouse, children, and other relatives.

testimonial privilege Right to maintain secrecy or confidentiality in the face of a subpoena. Privilege belongs to the patient, not to the physician.

test of significance Statistical test used to determine whether a difference in the data obtained is due to chance or is meaningfully related to some specific factor or variable (statistically significant).

tetrahydrocannabinol (THC) Chemical substance produced by the Indian hemp plant (*Cannabis sativa*), believed to be responsible for most of the characteristic psychological effects of marijuana. Street drugs alleged to be THC frequently contain phencyclidine (PCP), a veterinary tranquilizer that may produce extreme excitement, visual disturbances, and delirium.

T (training)-group Group that emphasizes training in self-awareness and group dynamics.

thanatology Study of death and matters leading up to and following it.

thanatophobia Abnormal fear of death.

Thanatos A term used by Freud to refer to the death instinct. *Compare* eros.

THC Tetrahydrocannabinol.

Thematic Apperception Test (TAT) Projective psychological test in which subjects supply interpretations of a series of ambiguous life situation drawings, based on their own feelings and attitudes and reflecting their unconscious conflicts and defensive structures.

theory Plausible or scientifically acceptable general principle or body of principles offered to explain phenomena.

therapeutic agent Anything that promotes healing, such as a substance, person, or apparatus.

therapeutic alliance Conscious contractual relationship between therapist and patient in which each implicitly agrees that they need to work together to help the patient with his or her problems; involves a therapeutic splitting of the patient's ego into observing and experiencing parts. A good therapeutic alliance is especially necessary for the continuation of treatment during phases of strong negative transference.

therapeutic atmosphere All therapeutic, maturational, and growth-supporting agents, that is, cultural, social, and medical.

therapeutic community Institutional treatment setting designed with an emphasis on the importance of socioenvironmental and interpersonal influences in the therapy, management, and rehabilitation of the hospitalized mental patient. *See also* milieu therapy.

therapeutic group Group of patients joined together under the leadership of a therapist for the purpose of working together for psychotherapeutic ends; specifically, for the treatment of each patient's mental disorders.

therapeutic role Position in which one aims to treat, bring about an improvement, or provide alleviation of a distressing condition or state.

therapeutic window Range of blood plasma levels of a drug within which optimal therapeutic effects occur, based on such factors as age, sex, race, genetic makeup, and concurrent medications.

therapist *See* psychotherapist.

tetracyclic antidepressants One group of antidepressant drugs so named because of their four-ringed structure. *See also* tricyclic antidepressants.

thinking *See* cognition.

thinking compulsion INTELLECTUALIZATION.

thioxanthene derivative One of a class of antipsychotic drugs closely related, both structurally and pharmacologically, to the phenothiazines; for example, chlorprothixene (Taractan), thiothixene (Navane).

third ear Ability to make use of intuition, sensitivity, and awareness of subliminal cues to interpret clinical observations of individual and group patients; a term introduced by the German philosopher Friedrich Nietzsche and later used in analytic psychotherapy by Theodor Reik.

third-party payer Health or medical care insurer.

thought broadcasting Feeling that one's thoughts are being broadcast or projected into the environment. *See also* thought withdrawal.

thought control *See* delusion of control.

thought deprivation BLOCKING.

thought disorder Any disturbance of thinking that affects language, communication, or thought content; the hallmark feature of schizophrenia. Manifestations range from simple blocking and mild circumstantiality to profound loosening of associations, incoherence, and delusions; characterized by a failure to follow semantic and syntactic rules which is inconsistent with the person's education, intelligence, or cultural background.

thought insertion Delusion that thoughts are being implanted in one's mind by other people or forces.

thought latency The period of time between a thought and its verbal expression. Increased in schizophrenia (*see* blocking) and decreased in mania (*see* pressured speech).

thought process disorder Symptom of schizophrenia, involving the intellectual functions, manifested by irrelevance and incoherence of verbal productions; ranges from simple blocking and mild circumstantiality to total loosening of associations, as in word salad.

thought withdrawal Delusion that one's thoughts are being removed from one's mind by other people or forces. *See also* thought broadcasting.

three-cornered therapy CO-THERAPY.

Three Essays on the Theory of Sexuality Title of a book by Sigmund Freud (1905) in which the libido theory was applied to the successive phases of psychosexual maturation in the infant, child, and adolescent; made possible the integration of a vast diversity of clinical observations and promoted the direct observation of child development.

Tic Seemingly involuntary sudden, brief, and rapid motor movements or vocalizations stimulated by an irresistible internal urge. Common motor tics include eye blinking, head-jerking, and grimacing; common vocal tics include coughing, throat-clearing, and grunting. Tics may have symbolic meaning. *See also* Tourette disorder.

tic disorders Predominately psychogenic class of motor disorders consisting of involuntary, spasmodic, stereotyped movements of a small group of muscles or vocal sounds; seen prominently in moments of stress or anxiety, and rarely as a result of organic disease. The two types of tic disorder in DSM-5 include Tourette disorder and persistent chronic motor or vocal tic disorders.

timidity Inability to assert oneself for fear of some fancied reprisal, even in the absence of objective evidence of potential harm.

tinnitus Noises in one or both ears, such as ringing, buzzing, or clicking; a rare side effect of some tricyclic antidepressant drugs.

TMS Transcranial magnetic stimulation.

tobacco dependence *See* nicotine dependence.

toilet training Program of teaching a child to control bladder and bowel functions; attitudes of both parent and child during the period may have important psychological implications for the child's later development.

token economy Program applying principles of operant conditioning to the management of an institutional setting, such as a ward or a classroom, during which reinforcement of desirable behavior is provided in the form of tokens or credits (conditioned reinforcers) that may be exchanged for a variety of positive reinforcers, such as food, television time, or a weekend pass.

tolerance Phenomenon in which, after repeated administration, a given dose of a drug produces a decreased effect or increasingly larger doses must be administered to obtain the effect observed with the original dose. *Compare* drug dependence.

tomography *See* computed tomography; positron emission tomography.

tonic convulsion Convulsion in which the muscle contraction is sustained.

topectomy Psychosurgical procedure involving ablation of a small and specific area of the frontal cortex for the treatment of a chronic psychotic patient.

torture The intentional infliction of physical and psychological suffering with the intent to gain information or to intimidate individuals or communities.

Totem and Taboo Title of a book by Sigmund Freud (1913) in which he applied his psychoanalytic concepts to the data of anthropology. He was able to afford much insight into the meaning of tribal organizations and customs, especially by invoking the Oedipus complex and the characteristics of magical thought as discovered from his studies of the unconscious.

Tourette syndrome Rare motor disorder, first described by a Paris physician, Gilles de la Tourette, that has its onset in childhood and is characterized by multiple involuntary muscle movements (tics), motor incoordination, and the presence of at least one vocal tic, such as echolalia and coprolalia.

toxicity State of being poisonous.

toxic psychosis Psychosis caused by toxic substances produced by the body or introduced into it in the form of chemicals or drugs.

toxophobia Abnormal fear of being poisoned.

trailing phenomenon Perceptual abnormality associated with hallucinogenic drugs in which moving objects are seen as a series of discrete and discontinuous images.

trainable Capable of achieving a certain degree of self-care and social adjustment at home and vocational usefulness in a closed supervised setting; describes the moderately mentally

retarded (I.Q. of 35–40 to 50–55). *Compare* educable.

training group *See* T-group.

trait Distinguishing quality as an observed or measured characteristic of an individual.

trance Sleep-like state of reduced consciousness and activity.

tranquilizer Psychotropic drug that induces tranquility by decreasing anxiety or agitation, usually without clouding consciousness; formerly classified as major and minor tranquilizers which are now called antipsychotic and antianxiety agents, respectively.

transactional analysis Eric Berne's system of psychodynamic psychotherapy that focuses on the interactions (transactions) between the patient and the therapist in the treatment session and between the patient and others in a social environment; used in both individual and group psychotherapy. The system includes four components: (1) structural analysis of intrapsychic phenomena; (2) transactional analysis proper, the determination of the currently dominant ego state (parent, child, or adult) of each participant; (3) game analysis, identification of the games played in their interactions and of the gratifications provided; and (4) script analysis, uncovering of the causes of the patient's emotional problems.

transcranial magnetic stimulation (TMS) A form of brain stimulation in which a rapidly changing magnetic field is applied to the scalp to induce small, focused electrical currents in superficial cortex. Used for treatment-resistant depression.

transcultural psychiatry Branch of psychiatry concerned with the mental health of members of different cultures, that is, what may be considered normal for one culture may be unacceptable to another.

transference Unconscious tendency of a person to assign to others in the present and immediate environment those feelings and attitudes originally linked with significant figures in the person's early life, for example, identification of the therapist with a parent; the transference may be negative (hostile) or positive (affectionate). Analysis of transference phenomena is used as a major therapeutic tool in both individual therapy and group therapy to help patients better understand and gain insight into their behavior and its origins. *See also* countertransference; transference neurosis.

transference neurosis Phenomenon occurring in psychoanalysis in which the patient develops a strong emotional attachment to the therapist as a symbolized nuclear familial figure; repetition and the depth of that misperception or symbolization characterize it as a transference neurosis.

transsexualism Gender identity disorder in which a person has a desire to be of the opposite sex. Some transsexuals, many of whom have adopted the role of the opposite sex since childhood, have successfully undergone sex-changing surgical procedures, accompanied by intensive hormonal therapy and psychotherapy. *Compare* transvestism.

transvestism, transvestitism Paraphilia characterized by dressing in the clothing of the opposite sex for the purpose of sexual arousal; usually seen in men with a strong desire to appear as women. Also called cross dressing. *Compare* transsexualism.

trauma In psychiatry, a significant, upsetting experience or event that may precipitate or aggravate a mental disorder.

traumatic brain injury Damage to the structure of the brain caused by physical force that affects cognitive functioning with associated changes in mood and behavior. Most commonly

associated with war injuries.

traumatic neurosis *See* posttraumatic stress disorder.

treated prevalence Number of persons being treated for a disorder in a defined geographic area.

tremor Rhythmical alteration in movement, which is usually faster than one beat a second; typically, tremors decrease during periods of relaxation and sleep and increase during periods of anger and increased tension.

trend of thought Thinking that centers on a particular idea associated with an affective tone.

triad Interactional relationship among three persons. Its prototype, the father-mother-child relationship, may evolve projectively in group therapy.

triadic therapy, triangular therapy CONJOINT THERAPY.

trichotillomania Compulsion to pull out one's hair.

tricyclic antidepressants One of a group of antidepressant drugs so named because of their three-ringed structure; currently the most widely used drugs for the treatment of depression, although anticholinergic side effects are prominent; for example, imipramine (Tofranil), amitriptyline (Elavil).

triskaidekaphobia The fear of the number 13.

trisomy Chromosomal aberration in which there are three chromosomes of one type instead of the usual two in an otherwise diploid cell, as in Down syndrome.

trisomy 21 syndrome DOWN SYNDROME.

true insight Understanding of the objective reality of a situation coupled with the motivational and emotional impetus to master the situation or change behavior.

t-test Statistical procedure designed to compare two sets of observations.

Tuke, William (1732–1822) British pioneer in the treatment of mental patients without the use of physical restraints.

Turner syndrome Disorder secondary to a chromosomal anomaly in which affected females typically have an XO sex chromosome constitution (instead of the usual XX) and a total of 45 chromosomes (instead of the usual 46). Classical somatic features include short stature, webbed neck, distinctive facies, sexual infantifism, and cubitus valgus. The incidence of mental retardation is not increased and severe psychopathic manifestations are uncommon, in contrast to the increased frequency of those disorders in XXY males. Also called ovarian dysgenesis; gonadal dysgenesis. *See also* Klinefelter syndrome.

twilight state Disturbed consciousness with hallucinations.

twin studies Studies that are useful in separating genetic and environmental influences and in looking for protective and precipitating factors.

twirling Sign present in autistic children who continually rotate in the direction in which their head is turned.

Type 1 error Research term referring to the rejection of the null hypothesis when it should have been retained. When the statistically calculated probability (p value) of making a Type 1 error on the basis of an experimental result is less than 0.05, the result is considered statistically significant; that type of error and the arbitrarily chosen 0.05 level of significance are sometimes called alpha (α) error. *Compare* Type 2 error.

Type 2 error Research term referring to the failure to reject a false null hypothesis, that is,

concluding that any difference or effect demonstrated in an experiment is no greater than that expected by chance alone when, in fact, there is an actual difference or effect. Also called beta (β) error. *Compare* Type 1 error.

Type A personality As defined by Meyer Friedman and Ray Rosenman, cardiologists, an action-oriented individual who struggles to achieve poorly identifiable goals by means of competitive hostility; has increased amounts of low-density lipoprotein, serum cholesterol, triglycerides, and 17-hydroxycorticosteroids; and tends to develop coronary heart disease.

Type B personality As defined by Meyer Friedman and Ray Rosenman, cardiologists, a relaxed and less-aggressive individual (than Type A) who tends to strive less vigorously to achieve goals.

tyramine Sympathomimetic amine that acts by displacing stored transmitter from adrenergic axonal terminals; its degradation is normally aided by monoamine oxidase (MAO). Ingestion of food containing tyramine (e.g., cheese, beer, wine, yeast) by a patient on MAO inhibitors can provoke a potentially fatal hypertensive crisis.

U

UCR Unconditioned response or reflex.

UCS Unconditioned stimulus.

ultradian rhythm *See* biological rhythm.

ululation Incoherent crying of a psychotic or hysterical patient.

unconditioned response, unconditioned reflex (UCR) *See* conditioning.

unconditioned stimulus (UCS) *See* conditioning.

unconscious 1. One of three divisions of Sigmund Freud's topographic theory of the mind (the others being the conscious and preconscious) in which the psychic material is not readily accessible to conscious awareness by ordinary means; its existence may be manifested in symptom formation, in dreams, or under the influence of drugs. **2.** In popular but more ambiguous usage, any mental material not in the immediate field of awareness. **3.** Denoting a state of unawareness, with lack of response to external stimuli, as in a coma.

underachiever One who fails to perform at the level of his or her known potential or capability.

undersocialized Characterized by the absence of adequate social bonds to others, as a type of conduct disorder.

undifferentiated schizophrenia Type of schizophrenia with prominent psychotic symptoms that do not fall into the other schizophrenic subtypes; no longer included in DSM-5.

undoing Unconscious primitive defense mechanism, repetitive in nature, by which a person symbolically acts out in reverse something unacceptable that has already been done or against which the ego must defend itself; a form of magical expiatory action, commonly observed in obsessive-compulsive disorder.

unio mystica Feeling of mystic unity with an infinite power.

unipolar psychosis Mood disorder characterized by recurrent episodes of depression or, much more rarely, recurrent manic states. *Compare* bipolar disorder.

universality Total effect produced when all group therapy members share specific symptoms or problems.

unstructured interview 1. Interview in which the interviewer chooses questions based on clinical judgment. **2.** Interview in which questions are related to what the patient brings up spontaneously.

urolagnia Paraphilia in which sexual pleasure is derived from urinating on someone else, being urinated on, or drinking urine.

utilitarian principle In policy and ethical decisions, a choice that is determined by whatever promises the greatest advantage to the common good.

utilization review committee Hospital committee that reviews the quality of services rendered, with particular attention to the appropriate use of facilities.

V

vagina dentata Sigmund Freud's theory that an unconscious fantasy exists in certain persons who are afraid of women and who believe that there are "biting teeth" in the vagina.

vaginismus Painful vaginal spasms, usually psychogenic, that occur during coitus, causing dyspareunia; may have its onset during preparation for intercourse, making penile insertion impossible. *See also See also* Genito–pelvic pain/penetration disorder.

validity Degree to which a test measures what it claims to measure; the degree to which an experimental design yields data truly applicable to the phenomenon under investigation. *See also* reliability.

variable In research, any characteristic or factor that may assume different values. The terms "independent variable" and "dependent variable" indicate a relationship of cause and of effect, respectively.

variable-interval schedule *See* schedule of reinforcement.

variable-ratio schedule *See* schedule of reinforcement.

variance Statistical measure of the variability within a set of observations, defined as the sum of the squared deviations from the mean divided by the number of observations; it equals the standard deviation squared. *See also* analysis of variance.

variation Statistical term referring to the manner in which persons in a population vary among themselves with respect to a given quality or trait; variability of persons also affects the precision of sample estimates. Three common measures of variation are the range, the variance, and the standard deviation. Knowledge of variation in a population is important because it indicates how useful the mean value is as a representative figure.

vascular dementia A type of dementia in DSM-5 in which a succession of strokes has led to a stepwise deterioration of intellectual functioning with associated focal neurological signs and symptoms. Previously called multi-infarct dementia.

vegetative 1. Pertaining to autonomic functions that are largely physiological or concerned with the growth, nutrition, or general physical health and homeostasis of the organism. **2.** In depression, denoting characteristic symptoms such as sleep disturbance (especially early morning awakening), decreased appetite, constipation, weight loss, and loss of sexual response.

vegetative nervous system Obsolete term for autonomic nervous system.

velocardiofacial syndrome A genetic disorder caused by a microdeletion in chromosome 22. Characterized by cleft palate, heart defects, immune dysfunction, mild intellectual disability,

psychotic disorders, and mood disorders. Also called Shprintzen syndrome or DiGeorge syndrome.

verbal amnesia *See* neurological amnesia.

verbigeration Meaningless and stereotyped repetition of words or phrases as seen in schizophrenia. Also called cataphasia. *See also* perseveration.

verbiomania LOGORRHEA.

vertigo Sensation that one or the world around one is spinning or revolving; a hallmark symptom of vestibular dysfunction, not to be confused with dizziness.

visceral learning *See* biofeedback; learned autonomic control.

visual agnosia Inability to recognize objects or persons.

visual amnesia *See* neurological amnesia.

visual hallucination Hallucination primarily involving the sense of sight.

visual motor gestalt test BENDER-GESTALT TEST.

vitamin therapy *See* orthomolecular psychiatry.

voice disorder A DSM-5 communication disorder that is characterized by abnormalities in vocal quality, pitch, and volume.

volitional Self-initiated.

volubility LOGORRHEA.

voluntary admission Hospitalization in which patients apply in writing for admission to a psychiatric hospital and are admitted if psychiatric examination reveals such need.

voluntary control Deliberate bringing about of an activity or refraining from an activity. The person exercising the control is aware of the nature of the activities and of the end to be achieved.

volunteer bias Sampling bias of persons who volunteer to take part in an experiment; such persons are not truly representative of the population and may tend to skew the results of the study, for example, the subjects may be more cooperative.

von Domarus principle Theory proposed by Eilhard von Domarus (1946) to explain schizophrenic thinking, which is characterized by the idea that two things are identical merely because they have identical predicates or properties.

voyeurism Paraphilia in which sexual excitement, frequently with orgasm, is obtained by looking at others naked, disrobing, or engaging in sexual activity. Also called voyeuristic disorder. *Compare* scopophilia.

W

WAIS Wechsler Adult Intelligence Scale.

Watson, John B. (1878–1958) American psychologist who used Ivan Pavlov's theory of classical conditioning to explain human behavior. *See also* Little Albert.

waxy flexibility Condition in which a person maintains the body position into which they are placed. Also called catalepsy.

Wechsler Adult Intelligence Scale (WAIS) Intelligence test that assesses intellectual functioning in adults.

Wechsler Intelligence Scale for Children (WISC) Intelligence test that assess intellectual functioning in children aged 5 to 15.

Wechsler Preschool and Primary Scale of Intelligence (WPPSI) Intelligence test that assesses intellectual functioning in children aged 4 to 6.

Wednesday Evening Society Small group of Sigmund Freud's followers who in 1902 started meeting with him informally on Wednesday evenings to receive instructions in psychoanalysis; as the society grew in numbers and importance, it evolved in 1910 into the Vienna Psychoanalytic Society.

weekend hospital Partial hospitalization in which the patient spends only weekends in the hospital and functions in the outside world during the week. *Compare* day hospital; night hospital.

Wernicke–Korsakoff syndrome Thiamine deficiency seen in Korsakoff psychosis (alcohol amnestic syndrome). Also called alcohol dementia. *See also* Wernicke fluent encephalopathy; Korsakoff psychosis.

Wernicke aphasia FLUENT APHASIA.

Wernicke fluent encephalopathy Neurological disorder caused by nutritional deficiency of thiamine (vitamin B) as seen in chronic alcoholism, with hallmark clinical features of ophthalmoplegia, ataxia, and confusion; some patients show disorders of short-term memory and other cognitive functions characteristic of Korsakoff psychosis (alcohol amnestic disorder), which has come to be regarded as a more advanced and chronic stage of the same disease process. Wernicke encephalopathy responds dramatically to the administration of thiamine, which may also prevent progression into the largely irreversible Korsakoff psychosis.

Weyer, Johann (1515–1588) Dutch physician considered by some to be the first psychiatrist, whose interest in human behavior led to his writing *De Praestigiis Daemonum* (1563), a landmark in the history of psychiatry.

white-out syndrome Psychosis that occurs in Arctic explorers and mountaineers who are exposed to a lack of diverse stimuli in the snow-clad environment.

WHO World Health Organization.

Williams syndrome A genetic disorder associated with a microdeletion on chromosome 7 and is characterized by "elfin-like" facial features, mild or moderate intellectual disability, cardiovascular disease, hyperacusis, hypercalcemia, and neuromusculoskeletal and renal abnormalities.

Wilson disease An autosomal recessive genetic disorder that causes excessive amounts of copper in the liver or brain. Patient may show psychological symptoms such as depression, suicidal ideation, and aggression. Is fatal without treatment.

windigo Culture-specific syndrome seen in Canadian Indians, characterized by a delusion of transformation into or possession by a windigo (wihtigo), a feared supernatural cannibalistic monster.

WISC Wechsler Intelligence Scale for Children.

withdrawal 1. Pathological retreat from interpersonal contact and social involvement; extreme decrease of intellectual and emotional interest in the environment. It may be seen in schizophrenia and depression. **2.** *See* substance withdrawal.

withdrawal syndrome Stereotyped constellation of signs and symptoms that appears when a person stops taking a drug or chemical substance on which he or she has become physically dependent. It is more likely to appear immediately after abrupt discontinuation, but may also

appear a few days later; specific clinical features are characteristic for the particular drug or substance. Also called abstinence syndrome; discontinuation syndrome.

word approximation Use of conventional words in an unconventional or inappropriate way (metonymy) or of new words that are developed by conventional rules of word formation (e.g., "handshoes" for gloves and "time measure" for clock); distinguished from a neologism, which is a new word whose derivation cannot be understood. *See also* paraphasia.

word association technique Technique devised by Carl Jung, who presented stimulus words to patients and had them respond with the first word that came to mind; it gives insight into persons' unconscious or subconscious thinking.

word blindness Obsolete word for alexia.

word salad Incoherent, essentially incomprehensible mixture of words and phrases commonly seen in far-advanced cases of schizophrenia. *See also* incoherence.

working through In psychoanalysis, the repeated and varied examination of a conflict, neurotic trend, or other problem for the purpose of increasing insight into unconscious processes and effecting adaptive personality changes; constitutes a fundamental facet of the psychoanalytic process.

World Health Organization (WHO) Specialized agency of the United Nations, established in 1948, governed by the World Health Assembly. Technical committees and regional organizations further the purpose of the WHO: "the attainment by all people of the highest level of health." It publishes the *International Classification of Diseases* (ICD).

World Psychiatric Association (WPA) International association, encompassing psychiatric associations from 75 countries throughout the world, whose objectives are to strengthen and promote international cooperation in psychiatry and among psychiatrists working in different fields and to encourage the exchange of information concerning psychiatric disorders.

WPA World Psychiatric Association.

WPPSI Wechsler Preschool and Primary Scale of Intelligence.

X-Y-Z

xenophobia Abnormal fear of strangers.

yohimbine Drug that blocks adrenergic α-receptors; because of its parasympathetic effect that causes vasodilatation, it has been used as an agent to help induce penile erection.

York retreat One of the earliest hospitals for the mentally ill, founded in 1792 in York, England, by William Tuke and other Quakers.

yttrium-90 Radioisotope that has been implanted experimentally in the brain to destroy certain tracts and areas in an effort to improve severe mental disorder.

zeitgeist German word for the general intellectual, moral, and cultural climate of an era.

zoophilia Paraphilia in which animals are used to produce sexual excitement. *See also* bestiality.

zoophobia Abnormal fear of animals.

z-score STANDARDIZED SCORE.

Zung Self-Rating Depression Scale (SDS) Twenty-item report in which the patient answers questions about symptoms of depressive disorders such as sleep patterns, appetite disturbance, libido, irritability, and hopelessness.

zygote Fertilized egg produced by the union of two cells (sperm and ovum) to form a diploid cell in sexual reproduction.

zygotic Pertaining to a zygote or to the individual developing from such a fertilized egg.

Color Atlas of Psychiatry

COLOR ATLAS 1.13–5. Stress and bidirectional neural–immune interactions. (**A**) Activation of NF-κB through toll-like receptors (TLRs) during immune challenge leads to an inflammatory response including (**B**) the release of proinflammatory cytokines, TNF-α, IL-1, and IL-6. **C:** These cytokines, in turn, access the brain via leaky regions in the blood–brain barrier, active transport molecules, and afferent nerve fibers (e.g., sensory vagus), which relay information through the nucleus tractus solitarius (NTS). **D:** Once in the brain, cytokine signals participate in pathways known to be involved in the development of depression, including: (i) altered metabolism of relevant neurotransmitters such as serotonin (5HT) and dopamine (DA), (ii) activation ofCRH in the paraventricular nucleus (PVN) and the subsequent production and/or release of ACTH and glucocorticoids (cortisol), and (iii) disruption of synaptic plasticity through alterations in relevant growth factors (e.g., brain-derived neurotrophic factor [BDNF]). **(E)** Exposure to environmental stressors promotes activation of inflammatory signaling (NF-κB) through increased outflow of proinflammatory sympathetic nervous system responses (release of NE, which binds to the α [αAR] and β [βAR] adrenoceptors). **(F)** Stressors also induce withdrawal of inhibitory motor vagal input (release of acetylcholine [Ach], which binds to the α7 subunit of the nicotinic acetylcholine receptor [α7nACRh]). **(G)** Activation of the mitogen-activated protein kinase pathways, including p38 and Jun N-terminal kinase (JNK), inhibit the function of glucocorticoid receptors (GRs), thereby releasing NF-κB from negative regulation by glucocorticoids released as a result of the hypothalamic–pituitary–adrenal (HPA) axis in

response to stress. (From Raison CL, Capuron L, Miller AH. Trends in Immunology, 27, Cytokines sing the blues: inflammation and pathogenesis of depression, 24–31, 2006, with permission from Elsevier.)

COLOR ATLAS 1.15–19. Transient and steady-stated evoked activity are phase- and time-locked oscillations (**A** and **B**) elicited by discrete or steady-state sensory stimuli. For both of these types of activity, averaging across trials has the effect of cancelling out non–phase-locked oscillations (due to destructive interference), leaving the evoked response intact and magnified. Hence, time–frequency analysis can be performed on the averaged EEG (i.e., after averaging all the individual trials). By contrast, induced activity is typically elicited during higher perceptual processing, for example, during the perception of coherent motion or of illusory shapes (see **Panel C**). These responses are often non time-locked (jittered across time from trial to trial). Hence, averaging the trials cancels out the response of interest due to destructive interference, and is not visible in the time–frequency transform (bottom of **Panel C**, left). However, these responses can be detected if time–frequency analysis is performed on the single trials, and the time–frequency transforms of individual trials are then averaged (**Panel C**, right). (Adapted from Skosnik PD, Cortes-Briones JA. Electroencephalography (EEG) and cannabis: from event-related potentials (ERPs) to oscillations. In: Preedy VR, ed. *The Neuropathology of Drug Addictions and Substance Misuse*. Amsterdam, Netherlands: Elsevier Science; 2016.)

COLOR ATLAS 1.15–23. Example of EEG source analysis using sLORETA. The time–frequency transform on the left indicates a burst of transient gamma activity to an auditory click stimulus, which was localized to primary auditory cortex (right).

COLOR ATLAS 1.24–3. Diagram of neural circuits implicated in substance abuse and substance use disorders. **A:** Schematic illustrating the combination of neuroadaptations that are thought to occur within brain circuitry required for the three stages of the addiction cycle. The frontal cortex system is compromised, producing deficits in executive function and contributing to the incentive salience of drugs compared to natural reinforcers. Dopamine systems are compromised, and brain stress systems such as CRF are activated to reset further the salience of drugs and drug-related stimuli in the context of an aversive dysphoric state. **B:** Sagittal section through a representative rodent brain illustrating the pathways and receptor systems implicated in the acute reinforcing actions of drugs of abuse. The *blue arrows* represent interactions within the extended amygdala system hypothesized to have a key function in drug reinforcement. AC, anterior commissure; AMG, amygdala; ARC, arcuate nucleus; BNST, bed nucleus of the stria terminalis; Cer, cerebellum; CP, caudate–putamen; DMT, dorsomedial thalamus; FC, frontal cortex; Hippo, hippocampus; IF, inferior colliculus; LC, locus coeruleus; LH, lateral hypothalamus; N Acc., nucleus accumbens; OT, olfactory tract; PAG, periaqueductal gray; RPn, reticular pontine nucleus; SC, superior colliculus; SNr, substantia nigra pars reticulata; VP, ventral pallidum; VTA, ventral tegmental area. (From Koob GF, Volkow ND. Neurocircuitry of addiction. *Neuropsychopharmacology*. 2009;35:217.)

COLOR ATLAS 1.25–2. A: The nucleosome as a basic folding unit of chromatin. **B:** Chromatin can transition from a "beads on a string" 10-nm filament to a more compact 30-nm filament structure that is stabilized by the presence of histone H1 (*yellow circles*). Histone tails (*gray*) make contacts between neighboring nucleosomes (internucleosomal contacts) and with the underlying DNA (*red arrows*).

COLOR ATLAS 1.25–14. **Top:** Control mice show normal BDNF levels and euthymic-like phenotype. **Middle:** Exposure to repeated social defeat leads to an increase in repressive HK27-me2 methylation (*red hexagons*), leading to condensed chromatin, decreased BDNF levels, and a depressive-like phenotype. **Bottom:** Treatment of socially defeated mice with imipramine does not alter HK27-me2 levels, but instead decreases HDAC5 levels (*yellow circles*). Reduced HDAC5 levels contribute to the increase in histone acetylation (*green squares*), chromatin decondensation, increased BDNF levels, and restoration of euthymic phenotype.

COLOR ATLAS 1.25–16. **A:** In the absence of stress, when cortisol levels (*green "C" triangles*) are low, the GR (*blue*) is bound to the chaperone proteins FKBP5 (*yellow circle*), and HSP90 (*brown circle*). In this bound state, the GR is prevented from entering the nucleus and activating transcription. **B:** Exposure to stress increases cortisol levels allowing GR to enter the nucleus by displacing the FKBP5/HSP90 complex. Inside the nucleus, GR activates transcription of genes that terminate further cortisol release and activates transcription of FKBP5. Increased FKBP5 levels prevent further GR entry into the nucleus, resetting the system so it can respond to subsequent waves of stress. **C:** Overexpression of FKBP5 leads to GR resistance by preventing high levels of cortisol from driving GR into the nucleus. As a result, additional levels of cortisol are being released leading to high levels of circulating cortisol.

COLOR ATLAS 1.25–17. The FKBP5 gene has two GREs located in introns 2 (GRE-2) and 7 (GRE-7). The **top** two panels demonstrate the impact of the genetic risk on FKPB5 expression and GR resistance. On the **left,** GRE-2 containing the protective C/G allele is not recruited to the promoter/GRE-7 complex producing relatively low levels of FKBP5, and low cortisol levels in response to mild stress. The presence of the GRE-2 at the promoter/GRE-7 complex in the A/T allele (**top right**) produces higher levels of FKBP5, and hence higher levels of cortisol in response to mild stress. The bottom panels demonstrate the epigenetic contribution of early life stress to FKPB5 expression. Early life stress results in relatively low levels of cortisol and normal methylation at the GRE-7 in individuals with the C/G protective allele (**lower left panel**). In contrast, early life stress leads to higher cortisol levels and a decrease in the DNA methylation at the GRE-7 of individuals with the A/T risk allele. Demethylation at GRE-7 leads to more efficient GR binding to this site and therefore higher FKBP5 levels and GR resistance (**lower right panel**).

COLOR ATLAS 1.26–2. Hippocampus place cells generate an ensemble place code. **A:** Schematic of the dorsal hippocampus with the major subdivisions labeled and arrows indicating the feed-forward flow of information through the trisynaptic circuit. A 2-s example of the location-specific LFP has been superimposed such that the start of the LFP corresponds to the location where it was recorded. **B:** Photos of the two familiar environments in which place cells were recorded, a 76-cm diameter cylinder and a 1.8 × 1.4 m box. **C:** Blue-to-red color-coded average firing rate maps document the spatial tuning of place cells recorded as a rat foraged for scattered food in the cylinder and box. Each set of five cells was recorded simultaneously from the same anatomical subdivision of the hippocampus circuit. Notice that in the cylinder most place cells only discharge robustly in a single location, called the cell's place field, which suggests that the discharge provides a dedicated neural code for location. However, the fundamental nature of the place code is actually an ensemble code because in the larger environment of the box, the same cells typically discharge in multiple place fields. If each cell's discharge in the box is interpreted as a dedicated code, the activity of each cell provides an ambiguous indication of location that cannot be reliably disambiguated within the dedicated coding framework. If however, the discharge is interpreted as an ensemble code, the pattern of activity across the set of cells provides an accurate indication of location because the across-cell pattern of activity is

unique at each location. The minimum firing rate (measured as spikes/s) in the *red color* (highest firing rate) category is given below each firing rate map. The *blue color* indicates a firing rate of 0 spikes/s. Recordings by Dr. EunHye Park.

COLOR ATLAS 1.26–3. The psychotomimetic phencyclidine (PCP) discoordinates neural discharge with minimal effects on the spatial tuning of individual place cells. **A:** The blue-to-red color-coded firing rate maps of an ensemble of nine CA1 place cells that were recorded as a rat foraged for scattered food in a familiar cylinder before and after a systemic injection of 5 mg/kg of PCP. The PCP had no discernable effect on the spatial firing of the individual place cells. **B:** In contrast, when the same data are investigated as a time-varying across-cell pattern of discharge, it is obvious that the PCP radically changed the ensemble firing of the cells (PCP was administered at 30 minutes). To generate the correlation matrix that is shown, every minute the number of spikes that each cell discharged was counted and organized as an activity vector that described the temporal pattern of discharge across the population. Each activity vector was correlated with every other activity vector and the correlation is represented using the color code. The correlation at any point in the matrix represents the activity at time x correlated with the activity at time y. The correlations along the x = y line are exactly 1, because it is the activity vector correlated with itself. The activity vectors under PCP immediately changed relative to the preinjection vectors (independent or negative correlations) but the PCP activity formed a stable pattern

indicated by the correlations of approximately 1.30 to 40 minutes after PCP the place cell ensemble activity switched back and forth between the preinjection and the PCP patterns until it settled back to the preinjection pattern. Notice that at three and eleven minutes during the preinjection period, the PCP pattern was expressed (in the absence of PCP). Not only do these data demonstrate discoordination of neural activity without affecting the information tuning of individual neurons, but also they indicate that ensemble activity is multistable. The system prefers to exist in one effectively stable activity pattern and PCP radically changes the probability of observing the distinct patterns. Recordings by Dr. Hsin-Yi Kao.

COLOR ATLAS 1.28–1. Functional connectivity networks derived from resting state data. The top row is a lateral view of the brain and the bottom row is a medial view of the brain. The colored "parcels" were derived from a boundary identification approach using a "watershed by flooding" algorithm to identify boundaries in the gradients of change in whole brain maps of functional connectivity. The community structure of the parcels derived from this boundary mapping was generated using an InfoMap algorithm. (From Gordon EM, Laumann TO, Adeyemo B, Huckins JF, Kelley WM, Petersen SE. Generation and evaluation of a cortical area parcellation from resting-state correlations. *Cereb Cortex*. 2016;26(1):288–303, with permission.)

COLOR ATLAS 1.28–3. Patterns of altered thalamic connectivity in schizophrenia. Unpublished data showing regions (in *red*) where healthy individuals show greater thalamic connectivity than individuals with schizophrenia, and regions (in *blue*) where individuals with schizophrenia show greater thalamic connectivity than healthy individuals. The regions showing decreased thalamic connectivity in schizophrenia includes cerebellum, striatum, dorsolateral prefrontal cortex, and the dorsal anterior cingulate. The regions showing increased thalamic connectivity in individuals with schizophrenia include motor and somatosensory cortices, visual cortex, and anterior temporal poles.

COLOR ATLAS 1.30–2. Global spatiotemporal dynamics of the human brain transcriptome. **A:** This panel shows a multidimensional scaling (MDS) plot that describes gene expression differences between developmental periods. MDS is statistical/graphical technique that reduces the complexity of data by plotting individual data points apart from one another at distances corresponding to the degree to which they are different. In the plot, each dot represents a sample and is colored according to period as defined by Kang et al., 2011; the dotted line indicates birth. Note that the most pronounced differences (approximately two-thirds) occur during prenatal development (periods 1 to 7). By contrast, over four decades of adulthood (periods 13–15), less than 1 percent of genes are differentially expressed. **B:** Here the same MDS plot as in (**A**) is shown except that the new data points are colored by brain region. Note that the most prominent transcriptional differences between regions are between cerebellar cortex (CBC) and forebrain regions. NCX, neocortex; HIP, hippocampus; AMY, amygdala; STR, striatum; MD, mediodorsal nucleus of thalamus. **C:** A line graph illustrating the developmental trajectory of expression of genes important for major neurodevelopmental processes demonstrating how gene expression profiles are linked to the cellular processes that take place at different periods of development. The y-axis represents the percentage of gene expression relative to maximum and the x-axis corresponds to age.

COLOR ATLAS 2.9–1. Single-photon emission computed tomography (SPECT) scan demonstrating multiple areas of decreased blood flow in a Lyme patient (L) compared to a healthy control (R).

COLOR ATLAS 2.14–11. A 38-year-old woman with neuroacanthocytosis who first presented with adolescent obsessive–compulsive symptoms prior to adult-onset seizures and chorea. Blood smear showing characteristic red cell acanthocytes.

COLOR ATLAS 2.14–21. Reversibility in Hashimoto encephalopathy. Single photon emission computed tomography (SPECT) showing gross global hypoperfusion in all nonoccipital regions in a 59-year-old woman with rapidly progressive cognitive impairment and myoclonus, with Mini-Mental State Examination (MMSE) score of 20 (**top**) and after significant clinical improvement 6 weeks later, when MMSE score was 27 (**bottom**). (From Forchetti CM, Katsamakis G, Garron DC. Autoimmune thyroiditis and a rapidly progressive dementia: Global hypoperfusion on SPECT scanning suggests a possible mechanism. *Neurology.* 1997;49:623, with permission.)

COLOR ATLAS 3.5–2. A: Voltage imaging of thalamocortical activation of a somatosensory brain slice demonstrating temporal binding of specific and non-specific thalamocortical inputs. Upper left quadrant, response average of a set of single pulse stimulation of centrolateral (CL) thalamic nucleus (Context). Upper right quadrant response average to a set of single stimuli to the ventrobasal (VB) thalamic nucleus (Content). Both CL and VB stimulation activated the thalamic reticular nucleus and the striatum. A different cortical activation patterns was, however, observed for each stimulation site. Thus, Cl stimulation (upper left quadrant) activated layers 6, 5, and 1, while VB activated layer 4, 2/3, and 5, 6. When both thalamic nuclei were activated simultaneously (lower left quadrant), a clear increase in activity was observed at all sites, indicating functional resonance as expected during gamma band thalamocortical binding. **B:** Diagram of two thalamocortical systems. **Content:** Specific sensory or motor nuclei project to cortex layer 4, generating cortical oscillation by direct activation of layer 4 neurons that contact dendrites of layer 5 and 6. Layer 6 pyramids generate return inhibition to specific thalamus via the reticular thalamic nucleus. **Context:** The second loop relates to the nonspecific intralaminar nuclei projecting to the most superficial layer of the cortex and giving collaterals to the reticular nucleus. Pyramidal cells in layer 5 return the oscillation to the reticular and the nonspecific thalamic nuclei, establishing a second resonant loop. The conjunction of the specific and nonspecific loops (content and context) is proposed to generate temporal cognitive binding. (Modified from Llinás R, Leznik E, Urbano IF. Temporal binding via coincidence detection of specific and non-specific thalamocortical inputs: a voltage dependent dye imaging study in mouse brain slices. *Proc Natl Acad Sci USA.* 2002;99:449.)

COLOR ATLAS 7.7–5. Each component image (individual head map with nose up and left on the left) shows the results for the coherence between the labeled region and all other regions, in the labeled band (in this case the theta frequency band), color coded by significance level using the z-scale shown. Regions in black are within normal limits, all colored regions are significant at $p < 0.05$ with the extremes at $p < 0.001$. The top left image shows the connectivity between the left frontopolar regions (FP1) and all other regions in the theta band, a band which has been shown in the literature to be correlated with degree of cognitive decline in the elderly. It can be seen that there is a significant hypercoherence between this regions and both short and long distance relationships on the left hemisphere and midline regions. This hypercoherence is also reflected in the coherence between FP1 and the left central (C3), left parietal (P3) and midline parietal (Pz) regions. This hypercoherence between frontal and more distant regions in a patient with early cognitive decline might serve as a baseline for a trajectory of increasing abnormality when tracked longitudinally in this patient.

COLOR ATLAS 7.7–7. Three-dimensional low-resolution electromagnetic tomographic analysis (LORETA) image of a "dissolved brain" of a patient with AD, after removal of all voxels with a *Z* score less than 3.29 ($p < 0.001$). The maximum theta excess (*dark red shading,* 4.3 Hz) relative to age-expected normal values is in the hippocampal and parahippocampal regions, while the frontal cortex (Brodmann area 27) reveals a minimum beta deficit (*blue,* 17 Hz).

COLOR ATLAS 7.7–11. Source localization (sLORETA) images (axial, saggital and coronal views repsectively) for group average voxel *Z* scores for ROIs in the band 5.46 to 9.36 Hz for the chronic pain population ($n = 77$). The images are color coded for significance of difference according to the color scale (below figure) where extremes of the color scale are $p < +/-0.01$. Over-activation is shown in red/yellow and deactivation in blue/aqua (none seen in this image). [Left is on left in these images.]

COLOR ATLAS 12.7–7. Three-dimensional image reconstructed based on diffusion data acquired on a 3-T General Electric scanner, Brigham and Women's Hospital, Harvard Medical School, Boston, MA, which shows several major white matter fiber bundles identified through diffusion tensor imaging: Fornix (*magenta*), right cingulum (*green*), right inferior longitudinal fasciculus (*yellow*), right uncinate fasciculus (*blue*), and corpus callosum (*orange*).

COLOR ATLAS 12.8–4. Map of quantitative blood flow obtained in a healthy individual with arterial spin labeling magnetic resonance imaging.

COLOR ATLAS 12.8–8. Examples of stimuli used in "oddball" studies of attentional processing (*top*) and contrast images of patients with schizophrenia and comparison subjects for target and novel stimuli. Greater activation in patients is depicted by the scale on the right, whereas greater activation in comparison subjects is shown by the scale on the left. Images are in radiological convention (left hemisphere to viewer's right). (From Gur RE, Turetsky BI, Loughead J, Snyder W, Kohler C. Visual attention circuitry in schizophrenia investigated with oddball event-related functional magnetic resonance imaging. *Am J Psychiatry.* 2007;164:442–449.)

COLOR ATLAS 12.11–4. Sensorimotor reactivity by cognitive control as a function of biotype. Each dot indicates the location of an individual in this bivariate biomarker space (red, biotype-1; blue, biotype-2; green, biotype 3). The color-coded crosses and ellipsoids show the centroids and ±1 SD for each biotype. The gray cross and ellipse show the same values for the healthy group.

COLOR ATLAS 13.9–2. Composite coronal and sagittal sections of positron emission tomography scans show areas in which cerebral glucose metabolism is decreased in depressed patients relative to matched healthy controls. PFC, prefrontal cortex; VLPFC, ventrolateral prefrontal cortex. (From Wayne Drevets, M.D., and *Annu Rev Med*. 2002:49 by Annual Reviews, http://annualreviews.org.)

COLOR ATLAS 38–20. Cortical thickness in adolescents with generalized anxiety disorder (GAD) as compared to healthy controls. Warm colors (*red to yellow*) indicate greater cortical thickness in adolescents with GAD compared to healthy comparison subjects, and for each region, both cortical and inflated views are presented. Scatter plots are shown for the maximally significant vertex within each depicted region and healthy patients are represented by (•) while adolescents with GAD are represented by (°). The left temporal findings are shown in panel **A**, while the prefrontal differences and occipital findings are shown in panels **B** and **C**, respectively. Finally, an asterisk denotes a statistically significant difference between groups (p = 0.006 for the left temporal differences; p = 0.0004 for the frontal differences and p = 0.0001 for the occipital differences). (Reprinted with permission from Strawn JR, John Wegman C, Dominick KC, et al. Cortical surface anatomy in pediatric

patients with generalized anxiety disorder. *J Anxiety Disord.* 2014;28(7):717–723.)

COLOR ATLAS 44–1. Composite functional magnetic resonance image comparing a group of 14 normal controls (NCs) and 14 individuals with autism or Asperger syndrome (autism), matched on age and intelligence quotient. Composite images show areas preferentially activated by faces (**A,C**) and nonface objects (**B,D**). Note that the fusiform "face area" has been defined by a green box in **A**. Among individuals with autism or Asperger syndrome, there is significant underactivation of the fusiform gyrus during face perception and compensatory activation of a region lateral to the fusiform. This more lateral region was most strongly activated by the object task among the NCs. Hypoactivation of the fusiform face area is the best replicated functional neuroimaging finding in the literature. (Adapted from Schultz RT, Gauthier I, Klin A, et al. Abnormal ventral temporal cortical activity during face discrimination among individuals with autism and Asperger syndrome. *Arch Gen Psychiatry.* 2000;57:331–340.)

Ancillary Color Atlas Figures

COLOR ATLAS FIGURE 1. Emotional facial expressions[1]. In the 1960s, Paul Ekman demonstrated that facial expressions of emotion are universal and thus, presumably, biological in origin as Charles Darwin once theorized (Ekman & Friesen, 1975). Since Ekman's discovery, photographs of emotional expressions have been widely used in psychological research to understand how people recognize another's emotions. Neuroimaging research has focused on two areas that are involved in emotion recognition: **(A)** The amygdala, known to be involved in fear conditioning, is most active when recognizing fear compared to other facial expressions (Whalen, 1998). **(B)** The anterior insula, associated with taste processing, subserves the recognition of another's disgust (Calder, Lawrence, & Young, 2001).

[1]Development of the MacBrain Face Stimulus Set was overseen by Nim Tottenham and supported by the John D. and Catherine T. MacArthur Foundation Research Network on Early Experience and Brain Development.

Color Atlas Figure 2. Three-dimensional reconstruction of then Phineas Gage trauma showing the trajectory of the penetrating rod injuring the left orbital and ventromedial prefrontal cortices. (From Ratiu P, Talos IF: *N Engl J Med*. 2004;351:e21, with permission.) (For another picture of Phineas Gage, see Fig. 1.23–1.)

Color Atlas Figure 3. Three-dimensional reconstruction based on diffusion data acquired on a 3-T General Electric scanner, Department of Radiology, Brigham and Women's Hospital, Harvard Medical School, Boston, MA. Diffusion tensor imaging (DTI) image shows major long fiber tracts of the brain. (Courtesy of Hae-Jeong Park, Ph.D., at the Laboratory of Molecular Neuroimaging, Department of Diagnostic Radiology, Yonsei University College of Medicine, Seoul, South Korea.)
