Preface

The purpose of this book is to provide data for use in the preparation of analytical rates in the construction industry. Although there is a perception that there is a definitive rate for, say, a square metre of walling constructed of common bricks in cement mortar 112mm thick, this is not the case. Men work at varying rates, materials are bought at varying discounts and contractors seek to recover varying levels of overheads and profit.

Nevertheless, it is vitally important both for contractors and clients, that estimates are based upon the most accurate information available. This book's aim is to provide data for all aspects of the industry including building, civil engineering, landscaping, mechanical and electrical work. In addition to the provision of labour and plant constants or norms, further information is set out to assist in the ordering of materials.

This book is presented generally in the style and format of standard methods of measurements but there are many cases where I thought a departure would assist in presenting the data in a more helpful way.

I gratefully acknowledge the assistance I have received from many contractors and material manufacturers in the preparation of this book. In particular, I would like to thank the Rosebery Group, Trada Technology, Rotary North West and Richard Kimpton of Kimpton Queensway for their help.

I would welcome constructive criticism together with suggestions for improving the scope of the contents.

Although every care has been taken in the research and preparation of the data, neither the publishers nor I can accept any liability of any kind resulting from the use of the data provided.

Introduction

The vigorous pursuit by private and public clients for value for money in the construction industry has never been more pronounced. This has led to the need for a reassessment of analytical rate build-ups to ensure that the core data being used—labour and plant constants—are accurate.

These constants must be consistent and their validity proven by use and observation. They should only require minor adjustments in non-standard circumstances, such as small packages of work, difficult working conditions or where an unusually high standard of finish is required.

The contents of this book are intended to provide such a base. The book is presented under the following main headings:

- building;
- civil engineering;
- landscaping;
- mechanical;
- electrical.

Where appropriate, constants are also given for plant, and other helpful information is included to assist in the ordering of materials. The data provided are based upon the premise that the item descriptions refer to contracts large enough to warrant the establishment of site hutting and non-working supervisors.

Contracts of this size will have separate preliminary items which are not included here. The items which are assumed to be covered elsewhere are listed below:

- site supervision;
- site accommodation;
- lighting and power;
- water;
- safety, health and welfare;
- removal of rubbish;
- cleaning;
- drying;
- protection of work;
- security;
- insurances;
- scaffolding;
- temporary services;
- travelling time:

- temporary screens.

It should be noted that resources data on some specialist activities, such as lift installation and piling, are not included because of the difficulty in obtaining the information. Readers who need this data should contact The Lift Equipment Engineers Association (01279 816504) and The Federation of Piling Specialists (0181–663 0947) respectively.

The inclusion of BS numbers and Eurocodes has been kept to a minimum, whilst proprietary brand names have only been included where absolutely necessary. The reason for this decision lies in the aim of the book to provide estimators with information as broadly-based as possible. For example, the time taken to lay facing bricks is usually constant regardless of type, colour or cost. It is intended that this approach of providing data on a generic basis will enable the reader to extrapolate the data to similar materials or activities.

Detailed information has been included at the beginning of each chapter and is intended to assist the reader by presenting data relevant to the contents of the chapter. These include weights of materials and assessments of sundry items which must form part of the unit rate but are not mentioned in the item description, e.g. volumes of mortar per square metre of brickwork.

Labour

The labour constants are based upon work being carried out at floor or first floor level. The following adjustments should be made for working at other levels.

Basement	2.5%
2nd and 3rd floor	5%
4th and 5th floor	7.5%
6th and 7th floor	10%
8th and 9th floor	12.5%
10th and 11th floor	15%
12th and 13th floor	17.5%
14th and 15th floor	20%
16th and 17th floor	22.5%
18th and 19th floor	25%

There are 17 grades of labour in this book, as follows, and each chapter lists the relevant grades it contains:

LA	1 Craftsman
LB	1 Semi-skilled operative
LC	1 Unskilled operative

LD 2 Bricklayers and 1 unskilled operative
LE 1 Ganger and 1 unskilled operative
LF 2 Asphalters and 1 unskilled operative
LG 1 Roofer and 1 unskilled operative
LH 1 Ganger, 1 semi-skilled operative and 1 unskilled operative
LI 2 Craftsmen and 1 unskilled operative
LJ 1 Craftsman and 2 unskilled operatives
LK 1 Craftsman and 1 unskilled operative
LL 1 Ganger, 2 semi-skilled operatives and 1 unskilled operative
LM1 Ganger, 1 craftsman, 2 semi-skilled operatives and 1 unskilled operative
LN 1 Ganger, 1 craftsman and 1 unskilled operative
LO 1 Ganger, 2 craftsmen and 1 unskilled operative
LP 1 Foreman, 1 advanced fitter/welder (gas/arc), 2 advanced fitter/welders (gas or arc), 3 advanced fitters, 2 fitters and 1 mate
LQ 1 Technician, 1 approved electrician, 1 electrician, 1 apprentice (18 year old) and 1 unskilled operative

Plant grades

There are 27 plant grades as follows.

PA 1 Hydraulic excavator (1.73m³)
PB 1 Compressor (375cfm)
PC 1 Skip (8m³)
PD 1 Tipper (6 wheel)
PE 1 Vibratory roller
PF 1 Concrete mixer (10/7)
PG 1 Asphalt boiler
PH 1 Tractor and harrow
PI 1 Tractor and seeder
PJ 1 Hand roller
PK 1 Hydraulic excavator (3.5m³)
PL 1 Hydraulic excavator (3.5m³) with compressor, drills and breakers
PM 1 Crawler dozer
PN 1 Mobile crane
PO 1 Tractor and roller
PP 1 Hydraulic excavator (1.7m³), 1 crawler dozer and 1 tipper (6 wheel)
PQ 1 Crawler crane and concrete skip

PR 1 Saw bench and 20% mobile crane

- PS 1 Crawler crane
- PT 1 Compressor and boiler
- PU 1 Wheeled hydraulic excavator (1.7m³), 1 pump (170m³/h), 50 trench sheets, 50 props, 1 dumper (1.5t) and 1 vibratory compactor
- PV 1 Crawler hydraulic excavator (1.7m³), 1 pump (275m³/h), 125 trench sheets, 100 props, 1 dumper (1.5t) and 1 vibratory compactor
- PW 1 Wheeled hydraulic excavator (1.7m³), 1 dumper (1.5t) and 1 pump (170m³/h)
- PX 1 Tractor and 1 motorised roller
- PY 1 Concrete paver and 1 motorised roller
- PZ 1 Tractor trailer and 1 crawler crane
- PZA1 Land drain trencher

Materials

The information provided on materials is intended to assist in the ordering process. For example, the volume of concrete beds and coverings to drain pipes is stated as well as the linear measurement. Additional data on the weights of materials are also included as well as other information intended to help the estimator.

Elemental costs

A chapter has been included on elemental costs for 20 different types of buildings expressed in percentage terms. These percentages reflect the apportionment of individual elementals and should help in the early financial planning stages of a project.

Painting

Average coverage of paints

The following schedule of average coverage figures for painting work is the 1974 revision of the schedule compiled and approved for the guidance of commercial organisations when assessing the values of materials in painting work by the Painting Industries' Liaison Committee (constituent bodies: British Decorators' Association, National Federation of Painting and Decorating Contractors, Paintmakers Association of Great Britain and Scottish Decorators' Federation) whose permission to publish is hereby acknowledged.

In this revision a range of spreading capacities is given. Figures are in square metres per litre, except for oil-bound water paint and cement-based paint which are stated in square metres per kilogram. Figures are given for a single coat, but users are recommended to follow manufacturers' recommendations on when to use single or multicoat systems.

It is emphasised that the figures quoted in the schedule are for brush applications achieved in scale painting work and take into account losses and wastage. They are not optimum figures based upon ideal conditions, nor minimum figures reflecting the reverse of these conditions.

There will be instances when the figures indicated by paint manufacturers in their literature will be higher than those shown in the schedule. The Committee realise that under ideal conditions of application, and depending on such factors as the skill of the applicator and the type and quality of the product, better covering figures can be achieved.

The figures stated are for application by brush and for appropriate systems on each surface. They are given for guidance and allow for variation depending on certain factors.

Average coverage of paints in square metres per litre

- 7–9 7–9 - - - 7–9 -
- - 4–6 - - - - - -

Key

- A—Finishing plaster
- B—Wood-floated rendering
- C—Smooth concrete/cement
- D—Fair-faced brickwork
- E—Blockvork
- F—Roughcast/pebble dash
- G—Hardboard
- H—Soft fibre insulating board
- I—Fire-retardant fibre insulating board
- J—Smooth paper-faced board
- K—Hard asbestos sheet
- L—Structural steelwork
- M—Metal sheeting
- N—Joinery
- O—Smooth primed surfaces
- P—Smooth undercoated surfaces

* Aluminium primer/sealer is normally used over bitumen painted surfaces.

In many instances the coverages achieved will be affected by the suction and texture of the backing, for example, the suction and texture of brickwork can vary to such an extent that coverages outside those quoted may, on occasions, be obtained. It is necessary to take these factors into account when using the table.

Elemental percentage breakdowns

The cost of most buildings can be broken down into about 25 discrete standard sections or elements. In the early planning stages of a project and in the tender analysis process, values are allocated to each element and any imbalances can be identified.

These values can also be expressed as percentages of the overall cost and the following tables display these percentages for 24 different types of buildings. It should be noted that the analyses cover building costs only and exclude contingencies, land values and professional fees. The following types of buildings are covered:

- A Local Authority mixed housing development
- B Flats and maisonettes
- C Sheltered housing
- D Primary school
- E Middle secondary school
- F Sixth form college
- G Advance factory units
- H Factory built for owner-occupation
- I Warehouse (shell only), low bay, 10m high to eaves
- J Two storey office
- K Multi-storey car park
- L Fire station
- M Police station
- N Ambulance station
- O Health centre
- P Welfare centre
- Q Old persons' home
- R Community centre
- S Sports hall
- T Sports pavilion
- U Retail shops
- V Private housing
- W Banks
- X Garage/showrooms

The figures have been rounded off to the nearest whole number and there may be slight distortion in some cases.

Heating and cooling systems

Heat calculations

Heat lost from a building can be expressed as the product of the area of the surface, its thermal transmission coefficient and the difference between the outside and inside temperatures, viz.

$$Q=AU(T_1-T_2)$$

where Q is the heat lost through the fabric of the building in watts, A is the area of the surface of the building in square metres, U is the thermal transmission coefficient W/m² degrees centigrade, T₁ is the inside temperature required and T₂ is the outside temperature. An allowance must also be made for the heat lost through floors and ceilings. The power required can be assessed in approximate terms by allowing 49 watts per square metre to produce a temperature of 20 degrees centigrade with an outside temperature of 0 degrees centigrade.

Capacity of tanks and cylinders

Rectangular container gallons=length×width×height divided by 4546

Rectangular container litres=length×width×height divided by 1000

Cylindrical container gallons=radius×radius×height divided by 5788

Cylindrical container litres=radius×radius×height divided by 1273

(All above dimensions to be in centimetres)

Power required

Minutes required to heat water=litres×temperature rise in degrees centigrade divided by 14.33×kW×efficiency

Loading required in kW to heat water=litres×temperature rise in degrees centigrade divided by 14.33×minutes×efficiency

Labour gangs

General electrical information

Lighting

The formula for assessing the amount of illumination required is usually described as the lumen method and is expressed as:

$$F = \frac{A \times Eav}{CU \times M}$$

where F = is the total number of lumens required

A = is the area to be illuminated

Eav = is the average illumination on the working plane

CU = is the coefficient of illumination and

M = is the maintenance factor.

The maintenance factor is usually stated as 0.8 but can be 0.6 in dirty areas. The figures to be applied to Eav are based upon tables of average illumination levels in different working conditions.

Area	Lux	Lumens/ft ²
General office conditions	500	50
Drawing office	750	75
Corridors, store rooms	300	30
Shop counters	500	50
Watch repairing	3000	300
Proof reading	750	75
Living rooms	100	10
Bedrooms	50	5

To select the coefficient of utilisation (CU) it is necessary to determine the room index.

$$RI = \frac{L \times W}{Hm(L \times W)}$$

where RI = is the room index

L = is the length of the room

W = is the width of the room and

H_m =is the height of the fitting above the working plane

A working height of 0.85m above floor level should be allowed where the working plane is a desk or bench top. The coefficient of utilisation (CU) is selected from the manufacturer's design information and after calculating the total illumination required, the design lumens can be chosen and the number of light fittings can be assessed.

$$\text{Number of light fittings} = \frac{\text{Illumination required (F)}}{\text{Design lumens per lamp}}$$

Cable capacity

Measurement data

The metric system

Linear

1 centimetre (cm)	=10 millimetres (mm)
1 decimetre (dm)	=10 centimetres (cm)
1 metre (m)	=10 decimetres (dm)
1 kilometre (km)	=1000 metres (m)

Area

100 sq millimetres	=1 sq centimetre
100 sq centimetres	=1 sq decimetre
100 sq decimetres	=1 sq metre
1000 sq metres	=1 hectare

Capacity

1 millilitre (ml)	=1 cubic centimetre (cm ³)
1 centilitre (cl)	=10 millilitres (ml)
1 decilitre (dl)	=10 centilitres (cl)
1 litre (l)	=10 decilitres (dl)

Weight

1 centigram (cg)	=10 milligrams (mg)
1 decigram (dg)	=10 centigrams (cg)
1 gram (g)	=10 decigrams (dg)
1 decagram (dag)	=10 grams (g)
1 hectogram (hg)	=10 decagrams (dag)
1 kilogram (kg)	=10 hectogram (hg)

Conversion equivalents (imperial/metric)

Length

1 inch	= 25.4 mm
1 foot	= 304.8 mm
1 yard	= 914.4mm
1 yard	= 0.9144 m
1 mile	= 1609.34 m

Area

1 sq inch	= 645.16 sq mm
1 sq ft	= 0.092903 sq m
1 sq yard	= 0.8361 sq m
1 acre	= 4840 sq yards
1 acre	= 2.471 hectares

Liquid	
1 lb water	= 0.454 litres
1 pint	= 0.568 litres
1 gallon	= 4.546 litres
Horse-power	
1 hp	= 746 watts
1 hp	= 0.746 kW
1 hp	= 33,000 ft.lb/min
Weight	
1 lb	= 0.4536 kg
1 cwt	= 50.8 kg
1 ton	= 1016.1 kg

Conversion equivalents (metric/imperial)

Length	
1 mm	= 0.03937 inches
1 centimetre	= 0.3937 inches
1 metre	= 1.094 yards
1 metre	= 3.282 ft
1 kilometre	= 0.621373 miles
Area	
1 sq mm	= 0.00155 sq in
1 sq m	= 10.764 sq ft
1 sq m	= 1.196 sq yards
1 acre	= 4046.86 sq m
1 hectare	= 0.404686 acres
Liquid	
1 litre	= 2.202 lbs
1 litre	= 1.76 pints
1 litre	= 0.22 gallons
Horse-power	
1 watt	= 0.00134 hp
1 kw	= 134hp
1 hp	= 0759 kg m/s
Weight	
1kg	= 2.205 lbs
1kg	= 0.01968 cwt
1kg	= 0.000984 ton

Temperature equivalents

In order to convert Fahrenheit to Celsius deduct 32 and multiply by 5/9. To convert Celsius to Fahrenheit multiply by 9/5 and add 32.

Fahrenheit	Celsius
230	110.0
220	104.4
210	98.9
200	93.3
190	87.8
180	82.2
170	76.7
160	71.1
150	65.6
140	60.0
130	54.4
120	48.9
110	43.3
90	32.2
80	26.7
70	21.1
60	15.6
50	10.0
40	4.4
30	-1.1
20	-6.7
10	-12.2
0	-17.8

Areas and volumes

Figure	Area	Perimeter
Rectangle	Length×breadth	Sum of sides
Triangle	Base×half of perpendicular height	Sum of sides
Quadrilateral	Sum of areas of contained triangles	Sum of sides
Trapezoidal	Sum of areas of contained triangles	Sum of sides
Trapezium	Half of sum of parallel sides×perpendicular height	Sum of sides
Parallelogram	Base×perpendicular height	Sum of sides
Regular polygon	Half sum of sides×half internal diameter	Sum of sides
Circle	$\pi \times \text{radius}^2$	$\pi \times \text{diameter}$ or $\pi \times 2 \times \text{radius}$

Figure Surface area

Volume
$\text{Cylinder} \pi \times 2 \times \text{radius} \times \text{length}$ (curved surface only)
$\text{Sphere } \pi \times \text{diameter}^2$

$\pi \times \text{radius}^2 \times \text{length}$ div3

$\text{Diameter}^3 \times 0.5236$

Pyramid Half base perimeter \times sloping height plus area at base Base area \times vertical height divided by 3

Paper sizes

A0	841×1189mm
A1	594×841mm
A2	420×594mm
A3	297×420mm
A4	210×297mm
A5	148×210mm
A6	105×148mm
Imperial	30×22 inches
Super Royal	27×19 inches
Royal	24×19 inches
Half Imperial	15×22 inches
Foolscap	17×13.5 inches
