Earlier in this chapter, I referred to a set of basic tenets of learning and teaching. In the school intervention in which signifying was used as a cultural scaffold, these tenets were incorporated as part of the daily routine of instruction. It was necessary to model the strategies good readers use to know when to slow down their reading and pay close attention to details that the author uses to flag down the reader with a sign in invisible ink that says "Pay Attention To Me For Gold Lies Beneath the Surface." To accomplish this cultural modeling, the students were given a series of extended dialogues replete with signifying. They were asked to tell what each turn of talk in a signifying dialogue meant, since in such talk the words are never meant to be interpreted literally. The students had no trouble summarizing what each speaker meant. The challenge came when they were asked: (1) what strategies they used to know that the interpretation they made was appropriate, and (2) how they knew when to interpret figuratively and when to interpret literally. The purpose of these last two questions was to help the students construct strategies from their own storehouse of tacit knowledge that they would make explicit and public. From this process, the students

came to articulate a set of conditions requiring inferencing, often of either metaphor or irony. These conditions are listed in Table 26-1. This process required the students actively to construct their knowledge of strategies by linking old and new knowledge.

Once this milestone of coming to understand what Rabinowitz (1987) calls "rules of notice" had been addressed, consistent with the tenets of learning and teaching referred to earlier, the students needed opportunities to apply these "rules of notice" to literary texts, in this instance texts for which they had meaningful prior social knowledge. Applying these "rules of notice" to the literary texts demanded that they extend their knowledge again to include monitoring their on-going understanding as they read, testing their evolving understandings against the text and their knowledge of the world, and being flexible in their on-going interpretations. Use of small group work provided the environment for both application and strategic coaching by the teacher.

In the use of small group work, another kind of cultural scaffolding occurred. While Slavin and associates have documented that cooperative work groups have proved successful with African-American students (Slavin & Oickle, 1981), Boykin and associates have extended analyses of the effectiveness of small group work with African-American students to include cultural foundations as explanations for their success (Boykin, 1994). Boykin (1994) has outlined nine characteristics of what he calls Afro-cultural ethos:

- (1) spirituality—an acceptance of a nonmaterial higher force that pervades all of life's affairs;
- (2) harmony—This implies that functioning is inextricably linked to nature's order and one should be synchronized with this order;
- (3) movement—a premium placed on the interwoven amalgamation of movement, (poly)rhythm, dance, and percussion embodied in the musical beat;
- (4) verve—receptiveness to relatively high levels of sensate (i.e., intensity and variability) of stimulation;
- (5) affect—the centrality of affective information and emotional expressiveness and the equal and integrated importance of thoughts and feelings;
- (6) expressive individualism—a uniqueness of personal expression, personal style, and genuineness of self-expression;
- (7) communalism—a commitment to the fundamental interdependence of people and to the importance of social bonds, relationships, and the transcendence of the group;
- (8) orality—the centrality of oral/aural modes of communication for conveying full meaning and the cultivation of speaking as a performance;
- (9) social time perspective—commitment to a social construction of time as personified by an event orientation (p. 184).

According to Boykin's research, the inclusion of these attributes in the environment of classes where African-American youngsters are taught is associated with academic

achievement. In a series of studies conducted by Boykin and his associates, when groups of African-American elementary students were given different conditions in which to carry out academic tasks, the students preferred conditions of cooperation rather than competition and the students learned more when working in small cooperative groups. Boykin (1994) provides a full overview of these studies.

In the intervention based on signifying, the teacher first modeled how she marked the opening of *Their Eyes Were Watching God* and asked students what stood out for them from the opening page and why. As an essential part of the protocol of the teaching, the teacher always demanded that students prove any assertions they made, either about why a passage stood out for them, or about what that passage meant. From the group modeling, students were then divided into small cooperative work groups each day. They received a set of challenging questions demanding that they read between the lines, that they make inferences based on divergent sources within the text, and that they extend their interpretation of the work to what the text said about the world (Hillocks & Ludlow, 1984). The teacher served as coach by sitting in each group in order to determine if the group was on the right track, if the group was confused, or if the group was avoiding complexity and opting for simplistic responses. The teacher would then give advice or ask a devil's advocate question where appropriate. This use of small cooperative groups focusing on challenging questions and teacher coaching continued across two novels for a total of six weeks. A detailed description of classroom talk and the evolution of students' understanding are given in Lee (1993, 1994b). The daily routines included teacher modeling, small cooperative group work with teacher coaching and finally writing a response to at least one of the challenging questions.

By the time the classes reached the second novel, *The Color Purple*, the lines of authority had changed. Analysis of transcripts of classroom talk from the end of the intervention shows that students were now initiating the questions, rather than the teacher, and the students were dominating the talk. The percentages of teacher talk to student talk dramatically shifted by the end of the instructional unit (Lee, 1994b). I have argued (Lee, 1994b) that this dramatic shift occurred because students were explicitly taught the rules they needed to know and were strategically coached in their application. Delpit (1988) has argued strongly that minority students often feel lost in classes where they are asked to apply rules about writing and reading that they do not know. Many wonderful pictures of classrooms in which students are actively engaged in discussing and critiquing literature abound. However there is little evidence that these students are African-American, Latino or Native American, for example, and insufficient description about how the students reached this level of expertise.

In order to determine whether the students had internalized the reading strategies and whether they had developed habits of mind that allowed them to attack really difficult literary problems with patience, steadfastness, and sophistication, they were given pre- and posttests. For both the pre- and posttests, the students were given a short story that had not been read before in class and a series of questions ranging

from literal to inferential, to questions asking them to apply themes from the stories to real-life contexts. A full description of the tests—including pre- and posttests as well as tests of knowledge of signifying and prior social knowledge relevant to the texts in the instructional unit—is given in Lee (1993). Each of the four classes in the quasi-experimental treatment achieved a statistically significant gain from pre- to posttest over the classes in the control treatment. The instructional intervention has been repeated with similar results.

The lessons from this example of cultural scaffolding are important. First, it demonstrates the practical power of building on the language patterns that students from speech communities whose language varieties are devalued in traditional school settings. Second, it links philosophical and ethnographic arguments for what Ladson-Billings calls culturally responsive pedagogy (Au & Kawakami, 1994; King, 1991; Ladson-Billings, 1990; Villegas, 1991) to other mainstream research in reading comprehension (Barr, Kamil, Mosenthal & Pearson, 1991), literary schemata (Beaugrande, 1987), and cognition in everyday contexts (Lave, 1988; Rogoff & Lave, 1984). I point out these connections because there has been a tendency to see calls for cultural responsiveness in language arts teaching as ghettoized arguments that apply only to disenfranchised minorities or linked to self-esteem efforts, but not intellectually stimulating teaching. I have addressed the implications of this line of thought for teacher training in Lee (1993).

In addition, there is a growing body of research documenting community-based funds of knowledge as sources for cultural scaffolding. Some of this work has occurred in schools, some in other community settings, but all hold strong implications for teaching and learning to read and write well.

Related Research

Several studies investigate the impact of oral narrative styles on the support for literacy learning in classrooms. Taylor and Lee (1987), Michaels (1981, 1986), and Cazden, Michaels, and Tabors (1985) looked at a common speech event in primary level classes called *sharing time*, where children may bring objects from home and tell stories about these objects or stories about personally meaningful experiences. One goal of such lessons is for the teacher to act as coach and to support children in being articulate, including details about their experiences, and sequencing their narratives in such a way as to approximate either traditional story grammar structure or the logical linear expository style of writing and speaking that is valued by schools. These researchers found that the African-American children in their studies often related stories in what Michaels labeled a "topic associative" style. In this topic associative style, the stories told by African-American children contained segments of the narrative that on the surface appear to bear no explicitly stated relationship to one another. The teachers listening to these stories did not provide the kind of scaffolding support to the African-American children because they could not make sense of the stories. Michaels argued that segments of the stories were often linked

by the narrator's internal point of view that was not articulated and must be inferred by the listener. This narrative structure is in direct contrast to the sequential series of events and the explicit thematic cohesion of the topic-centered style expected by the school. Since the teachers in the study were able to perceive some rudimentary aspects of the topic-centered storytelling style in the narratives of the white children, these teachers were able to intercede at appropriate moments to make suggestions to the students about adding details, enriching language, and making explicit the point of the narrative. Cazden (1988) extended the findings of this line of research by asking groups of white adults and black adults to read and evaluate samples of topic-centered and topic-associative narratives. The white adults found the episodic stories of the African-American children hard to follow and made the assumption that the child who wrote the story was likely a low-achieving student. Black adults, on the other hand, were more likely to evaluate positively both the topic-centered and topic-associative stories. The black adults recognized the differences in the stories, but also appreciated the artistic qualities of both.

Using both a sociolinguistic and literary analysis of a topic-associative story taken from the corpus of narratives collected in the Michaels studies, Gee (1989a) argued that the topic-associative story structure was characterized by high literary elements and was more complex than the topic-centered style advocated by schools. From a practical standpoint, however, what it means to help African-American children who demonstrate this topic-associative narrative style to develop further that narrative style is still an open question. I have advocated cultural modeling in which, in this example, the topic-associative narratives would be used as objects of study, as case studies or data from which the children could infer formal properties of stories (Lee, 1994a). The students would then be supported in incorporating these formal properties both in their oral and written narratives. Research efforts are underway in this regard. (Carol Lee of Northwestern University and Wade Boykin of Howard University are initiating such a study under the auspices of the Center for Research on the Education of Students Placed at Risk (CRESPAR). I have also discussed the concept of language expertise within minority speech communities (Lee, 1994a). In the African-American speech community, such experts would include preachers, rappers, politicians and writers, all who have historically served as orators or wordsmiths through both oral and written media. In other words, it is possible that much can be gained by supporting the extension and refinement of the topic-associative narrative style, especially when one considers the detrimental effects of efforts to eradicate its use in school.

Hyon and Sulzby (1994), in a recent study, collected oral narratives from 48 African-American kindergarten children. These stories were produced in a context other than the sharing time activity reported in Michaels (1981, 1986). In contrast to Michaels, Hyon and Sulzby found that 33.3% of the narratives were in the topic associative style, while 58.3% were in the topic-centered style. These findings are significant; yet, they do not negate the arguments that have been made regarding the usefulness of building on indigenous narrative

styles in order to support school-based literacies. It is important to recognize the diversity of oral genres, including a diversity of oral narratives, within various speech communities. Sufficient research has not been conducted on the emergence of oral narrative styles among African-American children in different contexts, at home, among peers, in school settings, in community institutions such as social clubs and churches. The attention paid to Michaels' characterization of the topic-associative style has in part been a result of lack of information on other manifestations of narratives within this population. For teachers, the range of language competencies that African-American and other linguistically diverse youth bring to the school setting, for example, should be viewed as a pool of potential resources from which to draw, rather than a simplistic label that fits every African-American child one meets. As relates to the Hyon and Sulzby (1994) study, I would argue that one third of the total corpus is not insignificant and that additional criteria for the presence of elements of the African-American verbal tradition may reveal new insights. Ball (1992) and Smitherman (1994) offer potential examples of criteria by which to evaluate oral and print texts produced by speakers of African-American English.

In addition to looking at narrative styles, research has also focused on issues of expository style. Ball (1992) studied expository writing samples from African-American high school students. In both their personal writing and writing done at school, the students exhibited three expository structures that Ball indicates are rooted in African-American verbal traditions. Although the students were not conscious of their overt use nor why they used these structures, the students showed a preference for these African-American expository styles.

The expository structures included what Ball calls circumlocution, narrative interspersion, and recursion. Significantly, Ball's description of the expository pattern of circumlocution among African-American adolescents is very similar to the pattern described by Michaels as topic-associative narrative style among African-American primary school students. In both patterns of organization, "thematic development was typically accomplished through anecdotal association" (Ball, 1992, p. 509). In the narrative interspersion pattern, "the speaker or writer intersperses a narrative within expository text" (p. 511). In this pattern, often the narrative is expected to communicate the main point of the essay.

In the third pattern, recursion, "the speaker discusses a topic and then restates it using different words or images" (Ball, p. 511). Ball illustrates this pattern by references to the organizational pattern of Martin Luther King's speech "How Long? Not Long." One of the more important implications of Ball's research, consistent with that of Lee (1994a), is that these organizational patterns were observed in vernacular speech patterns and were, perhaps unconsciously, adopted by students into their school-based writings. Further, there are expert uses to which these patterns are applied by ministers, orators who are often political leaders, and by creative writers. As Gee (1989a) and Lee (1994a) observed, it may be possible to build on these tacit vernacular patterns in order to develop expertise in school-based writing. There may be differences between the traditional academic essay and oral

argumentative and narrative genres in terms of what characterizes optimal writing. However, it may well be the case that (1) transfer to the more conservative academic prose may be easier with cultural scaffolding, and (2) that such efforts to scaffold may expand the range of acceptable patterns of organization in academic prose. Certainly, Smitherman (1977; p. 19) has challenged those boundaries by publishing academic prose that incorporates uses of Black English Vernacular.

Smitherman (1994) studied samples of narrative, expository, and persuasive writing from the National Assessment of Educational Progress (NAEP) from 1969, 1979, 1984 to 1988–89. Extending earlier research by Chaplin (1987) and Scott (1981), Smitherman analyzed the writing samples for examples of Black English Vernacular syntax and black discourse styles. Scott (1981) and Chaplin (1987) had documented that black discourse patterns highly influenced the evaluation of African-American student writing. Smitherman extrapolated the following features as characteristic of an African-American discourse style:

- (1) Rhythmic, dramatic, evocative language. Example: "Darkness is like a cage in black around me, shutting me off from the rest of the world."
- (2) Reference to color–race–ethnicity (that is, when topic does not call for it).
Example: "I don't get in trouble at school or have any problems with people picking on me I am nice to every one no matter what color or sex."
- (3) Use of proverbs, aphorisms, Biblical verses. Example: "People might have shut me off from the world cause of a mistake, crime, or a sin.... Judge not others, for you to will have your day to be judge"
- (4) Sermonic tone reminiscent of traditional Black Church rhetoric, especially in vocabulary, imagery, metaphor. Example: "I feel like I'm suffering from being wwith world. There no lights, food, water, bed and clothes for me to put on. Im fighten, scared of what might happened if no one finds me. But I pray and pray until they do find me."
- (5) Direct address-conversational tone. Example: "I think you should use the money for the railroad track... it could fall off the tracks and kill someone on the train And that is very dangerius. Don't you think so. Please change your mind and pick the railroad tracks. For the People safety O.K." [From letter-writing, persuasive task]
- (6) Cultural references. Example: "How about slipping me some chitterlings in tonite"
- (7) Ethnolinguistic idioms. Example: "... a fight has broke loose"; "It would run me crazy"
- (8) Verbal inventiveness, unique nomenclature. Example: [The settlers] were pioneerific"; "[The box] has an eye look-out"
- (9) Cultural values-community consciousness. Expressions of concern for development of African Americans; concern for welfare of entire community, not just individuals, as for example several essays in which students expressed the view that recreational facilities would have to be for everybody, "young and old, and homeless among Blacks"
- (10) Field dependency. Involvement with and immersion in the events and situations; personalizing phenomena; lack of distance from topics and subjects. (pp. 86, 87)

Smitherman found a decline in BEV syntax in narrative writing

between 1969 and 1979 (Smitherman & Wright, 1983). Smitherman predictably found that BEV syntax was the most significant predictor of the rater's score. In contrast, however, from an analysis of NAEP essays of 1984 and 1988–89, Smitherman notes "the more discernibly African American the discourse, the higher the primary trait and holistic scores; the less discernibly African-American the discourse, the lower the primary trait and holistic scores" (p. 93). This finding is significant because of the sample size and the strength of the correlations. Smitherman posits that the shift in the unstated criteria of NAEP raters may have been influenced by the efforts of organizations such as the Center for Applied Linguistics, the National Council of Teachers of English, and the Conference on College Composition and Communication to "sensitize teachers to the linguistic-cultural norms of the African-American speech community" (p. 95).

Language and Literacy in Community Contexts

The discourse and rhetorical forms that have been identified as part of the African-American verbal tradition are developed and honed in community contexts, including the family and community institutions. Two classic studies of how reading and writing were used in one poor rural (Heath, 1983) and one poor urban (Taylor & Gaines, 1988) African-American community, document the myriad ways that reading and writing were used and how children were socialized into certain attitudes about language, what makes for a good story, and what quality of questions are worth asking (Heath, 1983). Both Heath, and Taylor and Gaines argue that the rich experiences with language that African-American children have in their family and community lives present a bountiful repertoire for teaching in school contexts. The challenge, however, has been how to translate these language experiences to uses in specific pedagogy and content. The uses of reading and writing within these two African-American communities are similar, including both functional and aesthetic uses. These studies contradict popular assumptions that because students from this population living in poverty tend to score lower on standardized tests of academic achievement and attend school districts with inordinately high drop-out rates (Kaufman, 1991; Mullis, et al., 1991), that their families and communities are either illiterate or have low levels of literacy. Heath (1983) and Taylor and Gaines (1988), among others, present a very different picture of poor African-American urban and rural communities. It is important to note, however, that in a follow-up study by Heath (1989) of families from Trackton who moved into an urban community, the language interaction between parents and children had lessened and peers were a primary source of socialization.

Williams (1991) studied how a group of middle-class African-American families socializes their young children through stories and joint construction of stories of personal experience. Stories reflecting African-American narrative conventions and rhetorical tools were used to reinforce the children's identities as African-Americans, and included learning how to deal with conflicts arising from racism. Potts (1989) analyzed stories of personal experience from young children living in public housing projects in Chicago. He

found the stories to be structurally complex. Potts concludes, "These children were especially adept at 'evaluating' or communicating the personal meaning of past experiences. In this corpus of narratives can be seen the incipient skills for becoming participants in an important tradition in Afro-American communities" (p. 25).

Moss (1994) carried out an ethnographic study of literacy acts within some African-American churches. She analyzed rhetorical structures of sermons in black churches and documented how print and oral media are jointly used in literacy acts. Moss' analyses of the argumentative structure of sermons delivered in the African-American church are of interest to those considering the possible uses of rhetorical models from the African-American verbal tradition for teaching in school contexts. Mahiri (1991) looked at language uses among African-American adolescent and preadolescent males and their coaches in a Youth Basketball League. Mahiri found that the young men developed skills in argumentation and routinely employed rhetorical techniques like signifying to dramatize their points of view. Like Moss, Mahiri documented many uses of literacy that were supported through this community institution. Delain, Pearson and Anderson (1985) found that proficiency in African-American English served as a predictor of general language ability.

CONCLUDING THOUGHTS

The acquisition of a language or a particular language variety involves more than learning a lexicon and syntax. Language competency involves knowing not only what to say, how to say it, where to say it, but also requires the invocation of certain worldviews and social norms (Gee, 1989b; Saville-Troike, 1989). Identity is tied to language acquisition and use. The acquisition of language competency also demands the assumption of cultural competencies. Due to this connection, Farr (1991) recommends that schools attend to bidialectism, bilingualism and biculturalism. DiPardo (1993) conducted case studies of language minority students in a writing program for basic writers in a major U.S. university. She found that both African-American tutors and students in the program showed great ambivalence about adopting

Edited American English and an academic expository essay style into their writing and personal communication. DiPardo concludes that those who design basic writing programs within universities must consider more carefully the goals of such programs and their possible impact on students.

Language is a complex symbol system through which we learn, think and are socialized. Bruner (1990) argues that "culture ... shapes human life and the human mind, ... [and] gives meaning to action by situating its underlying intentional states in an interpretive system. It does this by imposing the patterns inherent in the culture's symbolic systems—its language and discourse modes, the forms of logical and narrative explication" (p. 34). Wertsch (1991) uses the analogy of a psychological tool kit with which humans are endowed. This tool kit includes a variety of symbol systems and is shaped by culture and history. Language use is one big ticket item in such a tool kit.

Heath (1989) admonishes educational institutions to acknowledge and make productive use of the language competencies of language minority students:

The school has seemed unable to recognize and take up the potentially positive interactive and adaptive verbal and interpretive habits learned by Black American children (as well as other nonmainstream groups), rural and urban, within their families and on the streets. These uses of language—spoken and written—are wide ranging, and many represent skills that would benefit all youngsters: keen listening and observational skills, quick recognition and nuanced roles, rapid-fire dialogue, hard-driving argumentation, succinct recapitulating of an event, striking metaphors, and comparative analyses based on unexpected analogies. (p. 370)

Practitioners and researchers in literacy education would do well to pick up the gauntlet.

For schools to either ignore or depreciate the significance of indigenous language competencies is to lose a potentially powerful cognitive tool in the psychological tool kit of both youngsters and adults. The admonition that Heath makes about African-American youngsters rings true for students from all corners of the tapestry of languages and language varieties that constitute language use in the United States.

STUDENT CONVERSATIONS: PROVOCATIVE ECHOES

Eleanor Binstock

NATIONAL-LOUIS UNIVERSITY

Prologue: Many Literacies, Many Cultural Styles

I can't look up to my brother. He is locked up,
so [pause], how could I look up to him?
Before, I admired him; he had like a lot of girls and stuff.
I thought he was slick and badass', playing around.
Now he ain't got no girls.
You don't see any of his ladies out here visiting him,
or any of his boys visiting him.
Nobody cares. You get locked up, so what—"Oh, well, that's it."
Now that I look at him, I see him as another one that
didn't get away, just like that.
He ain't bad no more, he just ended like that.

—Maria, student at "West" High

As the high school students in my research group swap stories on videotape, their adolescence extends across streets of culture and consciousness. For them, the research is a forum in which to talk about their lives, and the videotape their passageway to voices and images not otherwise accessible. The technical process seems simple: conversation at one school is videotaped and played back at the second school where students watch, then respond on videotape for playback at the first school. The recording of the conversations on videotape inscribes them, fixing them in time; it captures and transports discourse, normally a "fleeting event" (Ricoeur, 1991). This enables Latino and African-American students on Chicago's west and south sides respectively to correspond with one another for a year, within and between their two alternative high schools. The lively combination of text and image brings students together, sustaining their interest and challenging them to "read" and respond to each others' stories of lived experience.

For example, Maria, a student at "West," one of the two alternative high schools, relates a story about her brother. Her

narrative conveys a poignant scenario of gang lifestyle, disintegration of family, divergent messages of success, and images of lost hope and lost respect. It assembles a reality and brings it to life for audiences from diverse backgrounds. Maria describes her brother's situation in a world they share with many of their Mexican and Puerto Rican friends. She laments his fall from social stature and the disintegration of their relationship. She depicts the texture of their lives together, intertwined with those around them.

In this chapter, videotaped student conversations lead us to consider the readability of students' oral texts and the literate qualities associated with constructing and interpreting these oral texts. We also examine how their conversation illuminates connections between them and the circumstances of their world, as we listen to the echo-structure of their conversations, the familiar ring of their voices.

CONVERSATION AS TEXT

As they talk about their lives, the students from the two schools exercise their capacity "to constitute their worlds as they begin to name them" (Greene, 1986, p. 782). This potential to create meaning through conversation is what initially inspired the research, what was to become a transnarrative journey into language, culture, and lifetexts. Constructing and interpreting lifetexts (the word I use for the oral text we create in representing our lived experience) are literate acts, like the composing and reading of written texts, even though literacy is usually related to written texts only, a facility with "letters." Although not in use today, "oracy" is a word that was used by Andrew Wilkinson to indicate literacy of the spoken, specifically the relating of people to people. It was intended to correspond both to literacy, traditionally connoting the relating of people to

books, and to numeracy, the relating of people to things (Watson, 1993). It is in the spirit of oracy that I argue for the literacy of the spoken word.

To speak of the readability of oral text identifies it with written text. According to Geertz (1983), the textual analogy is used by social scientists to accommodate a blurring of boundaries between systems and ideas and is the broadest and least well developed of the recent "refigurations" of social thought which see social institutions, customs, and changes as "readable." Both Bakhtin and Ricoeur corroborate this correspondence of forms. For Bakhtin, each of us has a dialogue with existence which takes on the textual form of a novel; the text we write is called life (Holquist, 1990). Ricoeur (1981) considers experience and consciousness structured like language and, therefore, all human experience and interactions interpretable as some kind of text.

Just as with our reading of the written text, we bring to the reading of lifetexts what we already know—our longings, trusts, biases, and (mis)understandings. We approach truth only in "transaction" (Rosenblatt, 1978) with the text, rather than in search of *a priori* meaning.

Language, Culture, and Oral Texts

For Wittgenstein (1973), "to imagine a language means to imagine a form of life" (p. 8e). It is in our imaginations where we first acknowledge pluralities of language and forms of life. Once in this knowledge, we are less apt to experience or engender cultural dissonance and more apt to recognize many lives, many languages. And to recognize the language of cultural "others" is to begin to grasp something about their forms of life.

Within "arche-writing," Derrida's term for language, he names

all that gives rise to an inscription in general, whether it is literal or not and even if what it distributes in space is alien to the order of the voice: cinematography, choreography, of course, but also pictorial, musical, sculptural "writing." (1976, p. 9)

In Derrida's image of the ark, all forms of "writing," all manners of inscription are contained (as were all forms of being in the biblical ark). His image evokes Eisner's view of literacy, with its many voices:

...one of the major aims of education is the development of multiple forms of literacy. What we ought to develop, in my view, is the student's ability to access meaning within the variety of forms of representation that humans use to represent the contents of their consciousness. (Eisner, 1994, p. x)

If we recognized the variety of literacies, we would "contribute to greater educational equity for students, especially those whose aptitudes reside in the use of forms of representation now marginalized by our current educational priorities" (p. x). This applies to the high school students taking part in video conversations, casualties of a public school system which, unwilling (or unaware of how) to accommodate their learning styles and language, drops them from the rolls. But many of these students are capable of producing exceptionally wise, poetic oral prose. If teachers would accept and

nurture the variety of expressive forms, while at the same time consider with their students the ethical guidelines for these forms, students could become more discerning and independent learners and communicators, trusting they will be accepted more wholly, cultural style and all.

Culture is shared learned behavior and language habits are part of it. In what Heath (1983) terms the "language socialization process," children learn to use language based on their culture's values, social legacies, styles of face-to-face interactions, and patterns of adjusting to the external environment. They become acculturated to the interactions between themselves and their parents; the ways in which reading and writing are used; and the content, enactment, and uses of storytelling—practices which lead to distinct learning styles. When the school fails to accept children's unique learning styles or communication styles, it contributes to sustaining cultural inequities still deeper than those identified by Eisner above:

...unless the boundaries between classrooms and communities can be broken, and the flow of cultural patterns between them encouraged, the schools will continue to legitimate and reproduce communities... who control and limit the potential progress of other communities and who themselves remain untouched by other values and ways of life. (Heath, 1983, p. 369)

What is considered in one milieu to be communicative competence may not be considered so in another, unaccepting milieu. The teachers in Heath's study learned how to incorporate their students' ways of "talking, knowing, and expressing knowledge" into the classroom ethos, enabling children from different communities to learn how to make choices among uses of languages and to understand that these choices are connected to life chances, instead of "growing restless in the uncertainties" of a system intolerant of their cultural style (1983, p. 343).

It is clear in the student conversations that communicative competence is in part related to one's command of the nuances and subtexts of language in context and that it emanates from and generates personal courage and conviction. The peer conversations I witness are filled with language and forms of life native to the communities in which the students are growing up. Although I have built friendships and collegiality in these communities over the years, listening to the peer conversations is often like being privy to the stories of travelers from unimagined lands (Jefferson, 1995). Yet these are the everyday lands of our urban terrain, so their unfamiliarity may underscore the distance between that terrain and a more privileged academic community.

Conversation as Correspondence

The video conversations engage students in expressing and interpreting lived experience. Their lifetexts are constituted and reconstituted in iterations of their own experiences and those of others; they become at once readers and authors as their stories converge and intersect with others. Often this is literally so, as in:

an overlapping-turn structure similar to the overlapping speech that is common in ordinary Polynesian conversations, and

especially in the stylized speech event called "talk-story." Here, a story is co-narrated by more than one person, and the speech of the narrators is also overlapped by audience response. (Cazden, 1988, p. 71)

There are talk-stories in the student conversations. They arise when speakers share common backgrounds or are tuned in to the same story, as in the following example from South, where not only is the story remarkable, but it could be the expression of a single voice (a slash indicates interrupted speech):

- Kevin: You can write a story, you ain't even got to gangbang. You can wear out the ordinary—wear all yellow, go into somebody neighborhood, you walkin' [pause], people be looking, "Who is that mark, who is that punk motherfuck—" I know, I know, I'm not—I can't say everybody bad out here 'cause I know I do devious things myself. We be outside, somebody strange be walking down the street, we be like, "Man, who the hell is that stud, who that punk is?" You know. We do it ourselves, that's why I can't trip on nobody else. I'm just saying it happens everyday.
- Darryl: Like, "Who is that, that nigger?" you know.
- K: "Look at that phone man, let get that, let get that."
- D: "Let's get this coat, he just like a nerd, let's bang"/
- K: /"Yea, let's bang that mug."
- D: Especially when niggers get under the influence of drugs they be, like, ah, they snap then. Get under influence of drugs, they go crazy. They take care of you.
- K: Man, they'll smack the fuck out you man.
- D: They he ready to fight they homeys.
- K: Don't get in no crap game, no dice game. It will be on then/
- D: /Be smoking mud or something, man.
- K: Beat me out in front of her house man, all this, all that, then it be on all over again/
- D: /homeys killing each other up.
- K: That's why you got to watch yourself, you know, you ain't got no friends or nothin' you know. I don't care what nobody say, you ain't got no friends, you got a lot of associates.
- D: That all there is.
- K: You could have a friend, now, 'cause it some people out here/
- D: /it some friends that'll stick by you like this, you know.
- K: And then it's some people out here [pause], ain't your friends.
- D: Like we here right now, I'm talking to you, this for an example you know, we here right now, I'm to you, and when you leave I can be like— all man, you know, people out here.
- K: Or like say, for instance, you know, alright, say Sam your friend, you know, I'm your friend, we shaking hands, you say "I love you"—he love me—you knowing inside you really ain't got no love for me and I ain't got no love for you. Or, you know, I get locked up or he get locked up and I suppose' to be his homey and I try to call him and tell, send his money or something, you know, I be jumpin, "All— all man, I got to break, you know."
- D: It's people out here that's a fool. ... They get a little money in they pockets, they go up you know. They use' to be your homeys from way back in the days, they

get some loot in they pockets, they be like, "What's up man, all yea man, what's up man," you know.

- K: They be trying to tell you to break North, you know what I'm saying, "I'm big now, I don't want to be around you." Then, you understand, when they go to jail you understand, all that, when they call, soon as they fall off, they see you outside, "All man, what's up man, let's get a St. Ides or something." You be looking at them like, "All yea nigger, the other day you was drinking cases of fifth of Hennessy, now you want to get a .40 St. Ides with me, man. Break North, man." There's a lot of perpetrator studs out here, that's all, trying to high cap.

- D: They think they get the money, they think they got the power and everything, you know. You can make money just like they too.

Kevin and Darryl are partners in narrative; together they shape the story—its content, flow, and tempo. Their storytelling resonates with their environment and serves to corroborate their individual perceptions of what is going on in a world they share. Their talk-story confirms the correspondence between them, as well as between the story and the sociocultural texture of their worlds. It may even be seen to confirm the accuracy of how they read the goings-on of their environment. Later in this conversation, it becomes obvious how the structure and rhythms of Kevin's stories are in tune with those of his life experience:

- Kevin: I—
you know,
they sell drugs out there.
It dope fiends out there, it crack houses out there.
It no change, it's everywhere.
It ain't gon' change, you know.
Long as the stuff keep comin' over here
and people keep gettin' it and baggin' it up,
it always gon' be.
Long as people see six-point star and five-point star,
the gangbanger gon' be here.
Long as people see a liquor store
the drinks gon' be here.
Long as people know where to get a gun,
the gun shop gon' be here.
So where's it gon' go? Where it been before.
It ain't gon' change.

The repetition in his speech mimics the ineluctability of his environment—"it always gon' be... It ain't gon' change." The gangbanger, the abuse of liquor, the gun shops, will continue in perpetuity until the conditions in which they incubate change: as long as such-and-such persists, then such-and-such "gon be here ... gon' be here ... gon' be here." The sound and form of his speech, as in a fugue, reiterate the enduring patterns of his environment. "So where's it gon' go? Where it been before. It ain't gon' change," he recapitulates in his closing, as in a musical coda, transforming consciousness into poetic language.

Not only are his speech and narrative creative renditions of his environment, but Kevin himself is in sync with it. He allows as much in his opening words, in his "I-they" switch, that he is not apart from it but a part of it, in tandem with it. Bakhtin says nothing is in itself: "existence is an event of co-being, a web of

interconnections so extensive that it cannot be known by only one of us. Its form is fluid, manifest in an ongoing and endless creation and exchange of meaning" (Holquist, 1990). The web of dialogue, too, pervades more than is knowable at one time, always at once more mysterious and more telling than any single one of its strands or motifs. Kevin's ability to connect the otherwise unordered pieces of his environment into a logical order—"Long as the stuff keep comin' over here ... long as people see six-point star and five-point star ... long as people see a liquor store ... long as people know where to get a gun..."—is an indication of his communicative agility in transliterating a grammar of daily life in one milieu (his neighborhood) to a grammar of language in another (the logic of argument in discourse).

In another conversation, between Sonja and William at "South" School, we experience a *pas de deux* in which the participants know the steps because they have danced the dance. As Tannen (1989, p. 18) says, "Finding a way into a conversation is like joining a line of dancers. It is not enough to know where other dancers have been; one must also know where they are headed."

The considerable conversational two-stepping at South (much more than at West), suggests it is a style well known and practiced by African-American students there, surely by the more skilled orators. It is a style also well remembered by this Jewish writer from her childhood—uncles and aunts gathered around a wood-burning stove, seemingly all speaking at the same time in what begins as serious, but inevitably lapses into comedic exaggerations of truth. The difference here is that Sonja does not allow William to lapse into comedy, and remains herself dead serious.

(A slash indicates interrupted and interrupting speech. Indented dialogue indicates continuation of prior interrupted speech):

- Sonja: Do you know what sellin' drugs gets you into,
 William: /Yeah. I know what drugs get/
 Sonja: /huh?
 William: I know what it do, but/
 Sonja: /I used to sell drugs./
 William: /it's like this, see/
 Sonja: /Do you wanna be six feet under for somebody
 else's fault?
 William: I don't know./
 Sonja: /Do you wanna end up in jail/
 William: /see (...)/
 Sonja: /for the rest of your life?

She asks why he does not get a legal job and he laughs, "'Cause me and a legal job ain't gonna work out right now." He has a police record, he explains.

"That's the purpose in why you supposed to tell 'em you goin' to school," Sonja argues, "they don't ask you all that on no application."

William retorts, a smile on his face, "I'm not made to flip hamburgers." Laughing, he gets a rise from another boy in the group. William repeats: "I'm not made to flip hamburgers."

Sonja shifts perspective:

- Sonja I know—I know quite a few people that's thirty years old, thirty-five years old and sellin' drugs. But when

they kids ask them where they get the money from, they always say, "UNHH," and have a stupid look on they face/

William: /Whatchya gonna/

Sonja: /you know. They have a stupid look on they face yet here they got all the money to buy all the gym shoes and take care they kids and stuff but as soon as they kids ask 'em, "Hey, Daddy, where you get all the money from"/

William: /It's like this,/

Sonja: /Then what you gonna tell 'em, you out there doin' wrong but you want them to do better than what you doin'?

William: Okay, but say you can't get no job. You ain't got nowhere else to turn to but to sell drugs."

Sonja: Well see, you still don't see what I'm gettin' at: you gonna be sellin' drugs for the rest o' your life.

William and Sonja engage each other in what Rosen (1984, pp. 12–14) calls "the story grammars of [their] society, [their] culture," grammars in which they are comfortable and competent because they share the forms of life in which those grammars are grounded. Neither is threatened by the other as they step in and out of each other's words and back into their own. They would have had difficulty sustaining such conversation had they not shared a full body of assumptions about the world and one another. When, for example, blacks and whites are interacting and such assumptions cannot readily be shared, there is a lack of ease or comprehension. Some of this lack "must be caused, or at least exaggerated, by cultural differences—by the different contexts in the mind, the expectations about form and topic, that black and white listeners bring to the listening task" (Cazden, 1988, p. 25). It is an apparent difference in social grammar or expectation that will cause dissonance between West and South in an example cited later.

Conversation as Echo

The most extraordinary, and certainly most enchanting aspect of the peer conversations is its echo-like quality, within the group conversation and between groups in video conversation. Within and across space and time, the echo signals the contextual and historical underliers of the students' lives. These underliers reflect and give rise to certain languages, certain forms of life. They are forceful antecedents of custom and attitude, and they resound in the conversations. Echoes of culture and history are fundamentally reincarnations of the past in the present, like recapitulative cycles of being—the archetype in the fetus, the child in the adult, for example. These echoes prompt feelings of familiarity, of having been here before, of having heard or seen this before:

Utterances are not indifferent to one another, and are not self-sufficient; they are aware of and mutually reflect one another. These mutual reflections determine their character. Each utterance is filled with echoes and reverberations of other utterances to which it is related by the communality of the sphere of speech communication. (Bakhtin, 1986, p. 91)

The stories told by Maria and by Kevin and Darryl contain this communality, a continuity characterized by repetition

and reflection. One common application of the echo is in verse, where one line repeats the end of the preceding line to supply an answer to the question contained within it, or to give a holistic sense. In the peer conversations, the echo gives this continuous sense between the ethos and the oral text, as we have already seen. And, as we will soon see, through reverberation and response, the echo also suggests congruity, or at least continuity between the Latino and African-American students.

The echo also facilitates or reinforces learning and communicative agility, because responding to the echo—reading and interpreting it—requires one to recognize connections between then and now, this and that, oneself and another. The most dynamic narrative element to emerge from the conversations between the Latino students at “West” School and the African-American students at “South” School, the echo appeared as corroboration, challenge, and collaboration, each with rules, mood, and consequence:

...not only formally distinct speech events but all kinds of casual talk are rule-governed, and ... the mechanisms which underlie speaker coordination can be studied empirically by examining recurrent strategies, responses they elicit, and ways in which they are modified as a result of those responses. (Gumperz, 1977, p. 196)

The video conversations are like call and response to expressions of lived experience. They stir up the interlocutors and myself as well, as I gain understanding of the forces and boundaries of the mother tongue—not only that of my hosts, but of my own. The echo harkens back in time and forward to the future; it mirrors meaning and summons a literacy of sound and voice. It is evident in the following three sequences (excluding intervening utterances of classmates) from a conversation in which Maria expresses her frustration with the system and the school curriculum, and her impatience with racism. Her ideas and feelings emanate from several places: her personal sense of schooling, family, and life; the mosaic of talk in her daily conversations with friends, family, and teachers; the music she listens and responds to; the television programs she watches; and the news she hears from the streets and the media. She reconstitutes her experience in a soliloquy on fairness, dignity, history, racism, voice, and change. Her words echo the circumstances of her life now and of a time before:

Maria: ...the system isn't perfect. The system, it's— it's not fair. It was probably fair for the people that made it at that time but it's not fair now for other people like minorities. It's not— it's obvious that— that you know, the government wasn't made, like, for minorities because minorities probably wasn't out there at the time. They didn't have a voice, so now that we do have a voice we— you know, want to change because the system is not perfect, you know. They make a lot of mistakes, a lot of big mistakes, okay.

Maria has an historical awareness: what may have been fair representation at one time is not now so. The system is not quite “of [all] the people,” or “for [all] the people.” Moreover:

Maria: Like the history, like George Washington and all that. I mean how are you goin' to compare to Martha

Washington, or George Washington? You can't compare to that people. I mean that you can't— your parents can't even compare to that people, so you kind of feel left out when you read that history, because you know damn well that they're not—not talking about your people and, it's not to be racist [pause], that we're racist again' all White people, but that's not fair. How would the White people feel if we came out teaching them the Mexican culture, or the Puerto Rican culture, the African culture [pause]? They wouldn't like it. They'll probably be mad just as well as we did. That's right, we're teaching them something they're not, you know. You can't make 'em— you can't—we can't, you know, erase the color of our skin, can't erase our heritage. I mean we could probably lie about who we are and all that, but deep down inside we know we can't lie to ourselves.

In the excerpt above, Maria develops the historical theme begun earlier, crowning it with a switch of subject and object—a hypothetical turning of the tables (“How would the White people feel if we came out teaching them the Mexican culture, or the Puerto Rican culture, the African culture...?”), making sure a multicultural audience will identify with the incongruity she is explaining.

In the next excerpt, she challenges her sister's teacher, whose attitude resonates with, even corroborates Maria's prior argument about unfairness:

Maria: My little sister asked her to help her for her math. The teacher says, “Why don't you ask your parents?” And then she said, “Oh, let me take that back, I wouldn't expect your parents to know this.” What the fuck does she mean by that, just because my parents are Mexican or something like that? That is why I know right away they don't expect—the teachers in there don't expect— there are a lot of teachers that are ignorant and racist. They have got to learn, too. They don't know everything and they expect us to fail. They do.

Maria's oral text is antecedent for Darryl and will be echoed by him at the next session at South. Her ideas will be reincarnated by his words in a perpetual cycle of disclosure and reknowing. Oral texts, like the written, come from and go to many places, assembled and rechanneled through the listener/speaker back into the world in a new configuration, welcoming and facilitating new generations of thought and knowing.

The peer video conversations are mirrors of the self and others: they reflect and generate images of selves in definition. They give rise to collaborative knowledge-building, and provide an arena for those less knowledgeable or less articulate to learn from peers who are more so, central to Vygotsky's concept of social learning and the contributions of “more capable peers” (1978, p. 86). Vygotsky's model is like that of apprenticeship, learning by witnessing and emulating competent practice. Bruner (1986) describes this emulative learning as the “method of the well-conceived tutorial or small discussion group” in a world where “we cease thinking of the growth of the mind as a lonely voyage of each on his own” (p. 142).

In the session following Maria's exposition on fairness and racism, Darryl echoes many of her themes. Although he does not seem here as practiced or skilled a speaker as she, he speaks with equal passion. The example shows how the echo operates corroboratively and collaboratively among less and more capable peers:

- Darryl: Because sometimes, you know, they do tell us that we can't accomplish, that we can't do this and we can't do that. They don't respect us [pause]—the past and stuff. They always put us down and tell us that we are gonna be dumb forever, you know. But we gotta come up and show 'em that we ain't gonna be dumb. ...

He expresses solidarity with Maria by echoing her concerns, if not her words. He holds them up as a mirror to his own lifetext and, strengthened by this new alliance, takes her argument a step further: "...we gotta come up and show 'em. ..." The echo is capable of conflating boundaries between cultures and languages, experience and lifetext, and often, even author and reader.

Echoes in Groupspeak. Bourdieu (1993) says there is an "objective relationship between corresponding languages, that is to say, the relationship between the groups speaking those languages" that transcends the conversational situation and determines linguistic interaction. He calls this phenomenon "linguistic power relations" (p. 82). This is evident in the next examples where West is challenging a prior videotape in which South called them stupid, and South subsequently answers. Within groups, the echo contributes to the construction of the argument. Between groups, it provides the scaffolding on which the challenge is mounted. The challenge is a version of the echo, derived from a source and directed back at it. It is not as much imitative as defiant.

West will challenge South's foul language and their use of inverted gang signs to show extreme disrespect. They are reacting mostly to South's accusations that West is stupid (for discussing family problems). Everyone fails to realize that whereas it is okay at West to talk about one's dysfunctional family life, it is apparently forbidden to do so at South. So South, thinking West is obviously violating rules that apply in all cultures, calls West "stupid." Kochman (1981) says this is due to a clash of cultural styles in which, for example, in the case of blacks and whites interacting, each may behave according to their own cultural norms, yet in the eyes of the other be perceived to be in violation.

- Maria: Okay, why are you calling us stupid, alright? If you think we are stupid, then back up your attitude, why are we stupid? Okay, just don't be saying we are stupid and then you don't got nothin' to say about it. You know, if I am going to say you're stupid, then I am going to tell you why I think you are stupid, right?
- Ines: They think it is fun and games.
- Eddie: They were probably thinking we weren't serious but we were serious. We were trying to talk about something important.

West's request for South to "back up your attitude" confirms that West does not know what they did "wrong" to

incur South's censure. While the Latino students at West consider it within the rules to discuss their families' dysfunctions, the African-American students at South, not sharing this rule, feel justified mocking and challenging West for doing so. Were they to get to know each other better, as I did in my two years with them (in person and in the transcripts) they would likely learn to be sensitive to "linguistic power relations" and to be more tolerant, to see friction and misunderstanding as a result of cultural variance rather than the inadequacy of any individual.

Later at South, where the videotape of West has just been viewed, William and Kevin respond in the form of a challenge also. Although brief, they offer a vivid picture of the dangers and frustrations of life in their environment. They use repetition and irony. This repetition, or echo, serves to emphasize and corroborate what each of them knows:

- William: Let them come in our 'hood.
 Kevin: Let 'em come in our 'hood.
 William: Let them come to our motherfucking castle.

With 19 words they reveal a world of information. Instead of replying directly to West's requests for South to back up their accusations, South tells West they need to understand that what must be conveyed about the lives of students at South is so complicated and deeply embedded in the ways of the neighborhoods in which they live, that words are not enough. If West wants to understand South, they will have to come over there in person to see for themselves what is going on. And if West thinks that life for South is so great, they have another "think" coming. Further, the invitation to come to "our motherfucking castle" seems to be an escalation of the combative tone of West's earlier response. A dare to West to "cross the line" into South turf, this invitation holds an unmistakable threat of violence. All this is said using eight basic words, a core phrase of five words repeated three times with variations (in parentheses): "Let them ('em) come in (to) our. ..." The word "'hood" is repeated once and then again in sarcastic aggrandizing, expressed in two words. So it basically takes eight words to encapsulate a world. To some extent, that world is unspeakable, calling to mind Rosenblatt's (1978) caution that language may be:

not simply the inked marks on the page or even the uttered vibrations in the air. The visual or auditory signs become verbal symbols, become words, by virtue of their being potentially recognizable as pointing to something beyond themselves. (p. 12)

Peer conversation is a conduit to students' (children's) ways of knowing and communicating. Greene (1986) says that if we understood how children reach for meaning and coherence we could make it possible for them to "join the conversation" of cultural ways of knowing so that they might overcome their powerlessness and passivity:

...paying a new kind of attention to children's lived lives has to do with our current recognition that much of what passes for learning represents a mastery of terminology, not a becoming different, not an entering the conceptual order, or the great "conversation." We cannot know this if we do not listen to children, talk with children, play with children, even dance with children. (p. 782)

Listening to Students

Peer video conversations offer rich opportunities for listening to the language of students' lives—their passions, disappointments, and their issues with the schools that renounce them. Only when we appreciate the particularities of their stories and ethos can we join them in conversation, be privy to their passages:

I research the spoken and written words of the students to learn what they know, what they want, and how they live. Their speeches and writings are privileged access to their consciousness. I examine the words and themes most important to them so I will have reality-materials for the class studies. (Shor & Freire, p. 9).

Through listening, we can come to know students. The "social texts" that emerge from their conversations with each other and with us present "patterns, motifs, themes, characters, imagery, as clues to meaning" (Shor & Freire, 1987, p. 24). These are the clues that lead us to them so that we may engage with them in the studies of the curriculum.

Travelers to Unimagined Lands

To share community in spite of the roads that separate us, we need to join together in search of a common language:

This is not an external matter of simply adjusting our tools, nor is it even right to say that the partners adapt themselves to one another but rather, in the successful conversation they both come under the influence of the truth of the object and are thus bound to one another in a new community. To reach an understanding with one's partner in a dialogue is not merely a matter of total self-expression and the successful assertion of one's own point of view, but a transformation into a communion, in which we do not remain what we were. (Gadamer, 1975, p. 341)

Learning together in dialogue transforms knowers and the known. We come into knowing and being in the world, says Grumet (1992), out of the dialogue we have with the world of our experience. Peer conversation is a supportive venue for students to grapple with personal and generational concerns. Together they can seek the conversation that will guide them through the mystery that they themselves are, or, in Husserlian fashion, inspect the conversation that each of them is, to approach the mystery of language (Gadamer, 1975). Shared stories spill over into one other, reinforcing, refuting, changing each other. They mingle together transformingly, an ideal way for (young) children to begin learning that there are many stories that can be theirs, and many lands that they can call their own.

We have looked at some striking properties of high school student conversation: its "literacy," its textuality; its attachment to temporal and situational context; its poetry. We have seen video as a means of generating conversation where distance would forbid, of confronting and penetrating borders normally hostile to interpersonal interaction. We have looked at the echo carrying meaning across place and time; reflective and resonant and indicating meaning beyond itself. Careful listening can yield for students and their teachers a renewed sensitivity to the diversity of life experience and cultural consciousness.

As teachers and researchers we can become facilitators in what bell hooks (1994) calls a "coming to voice," which she explains as "not just the act of telling one's experience [but] using that telling strategically—to come to voice so that you can also speak freely about other subjects" (p. 148). Putting words to experience is tantamount to reflective action, the criterion for self-determination. Teachers who aspire to guide students toward these ends will find their work easier once they allow for student voice as classroom text. Only then can forms of life and language be shared.

STREET LITERACY

Dwight Conquergood

NORTHWESTERN UNIVERSITY

What I'm writing here
Is the heart
Broken in half

Ghetto Boy explaining to Dwight Conquergood a graffiti symbol he has just drawn on a Chicago rooftop wall during videotaping of the documentary *The Heart Broken in Half*

(Conquergood, & Siegel, 1990; see Plate 28-1).

Gang graffiti is vilified by outsiders as a spectacle of filth, scene of vandalism, both symptom and source of social disorder and decay. In the middle-class imaginary, it is a metonym for incivility and barbarism: "wild, graffiti-like scratchings" (Freedberg, 1989, p. 425). Ghetto Boy, however, subversively reframed graffiti as "writing." With this assertion, he contested official control over the meanings and interpretations of literacy by disrupting its associations with refinement and the educated person. Ghetto Boy's metacommunicative statement unsettled the literate-illiterate hierarchy that naturalizes class privilege and supports the uneven distribution of

cultural capital (see Marvin, 1994; Bourdieu, 1984). According to official definitions of literacy, "graffiti writing" is an oxymoron, and the hooligan who "commits graffiti" is the anathema of a literate person.

Recent ethnographic studies of literacy open a space for Ghetto Boy's expansion of what counts as writing (Street, 1994; Boyarin, 1993). Invigorated by ethnographic theories and field methods, this new literacy research has four distinguishing features: (1) it foregrounds the politics of literacy, focusing on how it is implicated in the distribution of power and authority; (2) it shifts emphasis from abstract standards to concrete practices of literacy, a shift from normative to performative literacy; (3) it dismantles the orality-literacy dichotomy that dominated previous literacy research (Goody, 1986; Olson, 1994; Ong, 1982) and emphasizes the overlap, exchange, and interaction between oral and literate channels of communication within specific contexts; (4) it abandons the conformist ideal of a singular literacy, opening the door to multiple and nonstandard literacy practices, variously called "local literacies," "vernacular literacies," and "grassroots literacies" (see Street, 1994; Fabian, 1993). In recognition of the conceptual replenishment that a political perspective brought to literacy research, this new approach was named the "ideological model" of literacy (Street, 1994). Rockhill (1994, p. 171) sets forth the tenets of the ideological model: "The construction of literacy is embedded in the discursive practices and power relationships of everyday life: it is socially constructed, materially produced, morally regulated, and carries with it a symbolic significance which cannot be captured by its reduction to any one of these."

My ethnography of Chicago gang graffiti writing builds upon the ideological model of literacy but pushes it into even more radical territory. "Local" and "vernacular" are not strong enough adjectives to capture the moral outrage and repression that this literacy practice provokes. Graffiti writing is a counterliteracy that challenges, mimics, and carnivalizes the "textual power" (Scholes, 1985) that underwrites private ownership of property and the regulation, control, and

PLATE 28-1

policing of public space. This outlawed literacy grotesquely mirrors and mocks the literate bureaucracy that administers licenses, receipts, badges, diplomas, ordinances, arrest warrants, green cards, and other deeds of power and possession. What distinguishes graffiti writing from other subaltern literacies is its criminalization: more than an illegitimate literacy, it is illegal. To understand the complicated meanings of this counterliteracy, it must be situated within the discursive and visual practices of power and control that it struggles against.

THE VISUAL PREDICAMENT OF GANG CULTURE

Gang graffiti writing is a very ambivalent form of visual communication that pivots on a dialectic between display and disguise, visibility and veiling, spectacle and secrecy; it is communication that is simultaneously conspicuous and camouflaged. Street youth go to great lengths and risk to make spectacles out of their writing on the wall even as they take care to mask their messages. This ocular paradox is rooted in and a response to the visual politics of the dominant culture. Donna Haraway reminds us that "vision is *always* a question of the power to see—and ... the violence implicit in our visualizing practices" (1991, p. 192). Like most subordinate groups, street youths suffer from both too little visibility, and too much visibility. Either they are willed to disappear or they are rendered hypervisible within the scopic regimes of power. They are shuttled back and forth between erasure and exposure, being ignored and being exhibited by the ruling classes. Postcolonial critic Homi K. Bhabha (1994, p. 236) speaks of "the marginalized, the displaced, the diasporic" whose "very presence is both 'overlooked'—in the double sense of social surveillance and psychic disavowal— and, at the same time, overdetermined—psychically projected, made stereotypical and symptomatic."

Street youth are articulate about mainstream visual practices that refuse to see and recognize them. Chiquito, an "illegal alien" [sic] from Guatemala who also happens to be a member of the Almighty Latin King Nation of Chicago, protested:

We want to be recognized.
We want to be seen—not shoved to the side.
In the eyes of people,
We are the criminals, the drug dealers.

His words resonate with those of the protagonist of Ralph Ellison's novel *Invisible Man* who expressed the existential strain of living with relentless effacement, "you often doubt if you really exist" (1952, p. 4), and explained it as a socially constructed and political act of exclusion: "I am invisible, understand, simply because people refuse to see me. ... When they approach me, they see only my surroundings, themselves, or figments of their imagination—indeed, everything and anything except me" (p. 3). Adrienne Rich (1986, p. 199) affirms that "invisibility is a dangerous and painful condition. ... When those who have power to name and to socially construct reality choose not to see or hear you ... there is a moment of psychic disequilibrium, as if you looked

into a mirror and saw nothing."

The politics of who is visible and who is invisible are embedded in the politics of literacy and textual bureaucracy, what Michel de Certeau (1984, p. 140) named "intextuation." In addition to the fact that Chiquito is poor, young, orphaned, and a person of color, another reason that he must struggle just for simple recognition of his humanity—the everyday acknowledgements that a white, middle-class person can take for granted—is that he is "undocumented," he has neither green card nor social security number, he is one of the phantom people *sin papeles* (without papers). His elder sister, Maria, who at the age of 20 became the head of the family of four siblings after her mother's death, also complained:

Dwight, I can't be going around telling people I don't have papers. You don't know how much that hurts us,
Not having papers. I had that good job in the factory—processing chickens—
And I was making \$350 a week,
And I lost that job
Because I don't have papers.

It is no wonder that *Shadow* is one of the most common tags, nicknames, that Chicago street youth take for themselves.

Although these so-called "undocumented aliens" are denied papers that would enable them to secure nonexploitative employment, they, with cruel irony, are heavily "documented" by the police and legal system. On May 1, 1992, 1 testified in court to forestall deportation proceedings against Chiquito. The prosecutor presented a bulging file of papers that documented the 26 times Chiquito had been arrested for misdemeanors, most of them Disorderly Conduct, which Chiquito explained to me, "That means walking down the street if you're a person who looks like me—I just be walking down the street," or Mob Action, which he translated, "That means standing on a street corner with your friends." As the prosecutor displayed the fat file of Chiquito's documented transgressions, Maria astutely observed: "They just look at his file, not his face." When the identity of street youth and that of their families and neighborhoods is continuously erased or exiled to shadowy margins, then writing in illegal letters on the wall, "Here the Sun Shines," is Chiquito's brave gesture of refusal to a regime of power that banishes all of his kind from view, and, quite *literally*, has initiated deportation proceedings against him (see Plate 28–2).

The insult of effacement is compounded by surveillance. In the ocular politics of the ruling classes, subordinate groups are expunged from spaces of respectability, and then rendered hypervisible in the surreal zone of panoptic power (Foucault, 1977). Susan Buck-Morse (1989, p. 347) observed: "For the oppressed ... existence in public space is more likely to be synonymous with state surveillance, public censure, and political powerlessness." They are specularized and spectacularized in myriad and demeaning ways. The intimate spaces of their homes and bodies are overexposed. Once, a tactical squad of police officers kicked in the door of Chiquito and Maria's apartment, confusing it with that of one big-time drug dealer. While officers held guns to their heads, including 4-year-old Juanita's, police ransacked their humble

PLATE 28-2

furnishings: they pulled out and dumped dresser drawers, rifled through closets, emptied cabinets, stripped beds, overturned furniture, opened cushions, ripped off the backs of the television set and the stereo, pulled apart toys, fingered through family photograph albums, broke framed pictures. Having satisfied themselves that these Guatemalan youngsters were not major criminals, the law enforcement officers left without cleaning up the mess, leaving behind a baseball bat (one of their break-in tools) to add to the clutter. I arrived on the scene soon after Maria, still stunned by the assault, called me. Almost every inch of their homespace had been physically searched right down to Maria's carefully nursed plants, which had been uprooted and the flower pots spilled.

Even the personal space of the body is not safe from mandatory exposure. Body frisks and pat-downs often are preludes to strip searches. Since marijuana dealers sometimes conceal contraband in their underwear, Chicago police use this information as an excuse to pull down the pants of youth they stop on the street or in the park. This unauthorized police practice is more about public humiliation than the control of marijuana trafficking. Several of my neighbors and friends in the Big Red tenement—(where I lived during the early months of fieldwork, see Conquergood 1992a)—complained to me that police officers had deliberately pulled down their shorts in front of their girlfriends, sisters, and mothers, in order to embarrass them. Like the grotesquely invasive body searches that are part of the induction into jail and prison, these street strips function as degradation rituals in which the most private parts of street youth are subjected to the “compulsory visibility” of the state (Feldman 1991, p. 173). When I would return in the evening to my apartment in the Big Red tenement, I never became accustomed to the frequently encountered and eerie spectacle of half a dozen youths, most of whom I knew and tutored, spreadeagled against the wall while the hands of the state searched their bodies.

State surveillance is mimed and proliferated by the visual vigilance of private citizens. Chicago community councils, homeowners' associations, and block clubs form pervasive “Neighborhood Watch” groups with telephone trees and hotlines to police stations (see plates 28-3, 28-4). These grassroots scopic campaigns are set up to see some people and complexions in sharper focus than others, a class and color-coded way of seeing that is not lost on the youth themselves:

How do you think that makes us feel, Dwight,
When we see all those signs with eyes up in the windows of those
fine houses?
'Warning
Neighborhood Watch
WE CALL POLICE'
That means
NO BLACK TEENAGERS ALLOWED IN THIS NEIGHBORHOOD.
That's what those signs be saying.

These glaring signs of surveillance stand in stark contrast to the optics of intimacy that are captured in a phrase of leave-taking common in latino neighborhoods: “nos vemos,” “we will see each other.” *Nos vemos* expresses a supportive way of seeing that is connected to the security of togetherness and mutual affirmation, not the security of property and the state.

The hypervisibility and objectification of street youth are extended by new surveillance and computer mapping technologies that consolidate massive data bases on street gangs. Hidden cameras monitor public spaces and entrap graffiti writers. Chicago police use night-sensor goggles recycled from the Persian Gulf War to search and seize gang members after dark. These arrest records, along with an array of other information—addresses of those arrested, addresses of those recently released from prison, telephoned complaints of private citizens, as well as information compiled by

PLATE 28-3

neighborhood watch and community groups—are stored in geo-coded databases, “geo-archives.” The technology-driven scrutiny, documentation, and mapping of the movements of street youth and other stigmatized groups are accelerating. The Illinois Criminal Justice Information Authority has developed Spatial and Temporal Analysis of Crime (STAC) computer mapping software, which it promotes through workshops, conferences, and a widely circulated newsletter, *STAC News*. According to Rebecca Block (1991, p. 15) of the

PLATE 28-4

Authority's Statistical Analysis Center, “Computer mapping technology, coupled with the technology necessary to store and organize vast amounts of geo-coded data, has expanded extremely rapidly in the last year or two, and there is no end to the expansion in sight.”

When street youth are subjected to search warrants, strip searches, fingerprinting, and an array of invasive visual technologies, when the human face of their experience is displaced by a mug shot, then densely coded, creatively masked communication and secrecy provide a refuge from the gaze of gang squads and tactical units, a shield against the surveillance of panoptic powers. Dick Hebdige captures the creative response to these optical dilemmas with the conundrum that aptly titles his book on youth subcultures, *Hiding in the Light* (1988, p. 35): “Subculture forms up in the space between surveillance and the evasion of surveillance, it translates the fact of being under scrutiny into the pleasure of being watched. It is a hiding in the light.”

The fingerprint is in many ways emblematic of the optics of domination. It is an ocularcentric documentation of the presence, the touch, of transgressive bodies for penal purposes of discipline and control. Most of the time, subaltern groups are unable to register their presence in mainstream spaces. However, within the space of law enforcement and prosecution, their silent, tactile traces are pressed into harsh visibility and rendered severely legible. It is within this context of ocular politics and the criminalization of the subordinate classes that graffiti writing needs to be understood as ‘fingerprints in your face.’

When the technology of fingerprinting transcodes the embodied touch of a living person into a legible text for visual perusal and inspection, it mimes the “intersemiotic translation” (Fine, 1984) of dominant literacy that transposes embodied oral performance, the spoken word, into a visual text, what Johannes Fabian (1993, p. 87) called “disembodied literacy.” Carolyn Marvin (1994, p. 129) affirmed: “A mark of literate competence is skill in disguising or erasing the contributions of one’s own body to the process of textual production and practice.” New computer technology further disembodies the fingerprinting process as digital biometric scanners replace the press of flesh from inkpad onto paper. Graffiti writing as counterliteracy disrupts “the disembodied bourgeois text” (Marvin, 1994, p. 141), reconnects letters with bodies, and reincarnates writing. Although graffiti texts communicate complex and coded messages to other gang members (Conquergood, 1994a), most outsiders are not versed in the code and cannot read them for content in the same way that they read conventional texts. Their disturbing impact on middle-class citizens is derived from their indexical force, not their referential meaning. Property owners react to graffiti writing with revulsion because they viscerally experience it as a flagrantly sensuous sign of gang *presence*, as the contaminating touch of grotesque bodies out of place. They describe it in body-charged imagery: a wound, scar, defacement, violation, rape, excrement, human sewage, the territorial markings of a wild animal. While most mainstream texts dispassionately foreground referential meaning and hide the historical-material and embodied operations of text-production, graffiti writing seethes with and is haunted by the performing presence of

its producers. It is reviled and feared precisely for being the polluting point of corporeal contact in the “metonymic chain of contagion” that leads back to the dangerous classes (Stallybrass, & White 1986, p. 138). In *Crimes of Writing*, Stewart (1991, p. 226) observed that graffiti, unlike pornography, was not “a crime of content” but “a crime in mode of production.”

Graffiti gives new meaning to Mary Louise Pratt’s (1992) study of the “contact zone” as an intercultural space of friction, struggle, and resistance that stimulates new genres of writing that mimic and subvert dominant rhetorics of power. She speaks of

the possibilities and perils of writing in ... ‘contact zones,’ social spaces where disparate cultures meet, clash, and grapple with each other, often in highly asymmetrical relations of domination and subordination—like colonialism, slavery, and their aftermaths as they are lived out across the globe today. (p. 4; see also Mignolo, 1995)

Gang graffiti writing performatively constitutes middle-class and public spaces into contested zones of contact, site-specific theaters of defiance where excluded others re-present themselves. It is interesting to note that in Chicago the street term for writing graffiti and other displays of gang identity is “reppin’,” short for *representing* (Conquergood, 1992b). Graffiti writing articulates cross-class antagonisms by bodily *contact* with, touching, public space and private property. In doing so, it upends the hierarchy of the senses: sight, the highest sense, is collapsed into touch, the lowest sense (Gilman, 1991, p. 32), a reversal of the fingerprinting process. While official literacy is associated with detachment, distance, disclosure, and a scene of solo production and reception—(writing and reading are typically figured as private, contemplative activities)—graffiti writing is characterized by contact, coding, collaboration, and collusion.

GANGSTER GRAMMATOLOGY

In addition to its intense body-consciousness and performative aspects, graffiti writing has a number of other features that uncannily resemble Derrida’s grammarology project. Ulmer (1985) explicates Derrida’s “grammarology” project—his later creative experiments with writing and stylistic innovations—and sets it against his earlier and enormously influential program of philosophical studies known as “deconstruction.” A distinguishing hallmark of grammarology is its trickster disruption of boundaries and transmodal jostlings, particularly the way it plays with and across the border between words and pictures, its grafting of visual items onto verbal texts. Ulmer (pp. 98, 99) identified this “intermedia” coarticulation of both verbal and nonverbal materials as “double-valued Writing, ideographic and phonetic at once.” Influenced by studies of Mayan hieroglyphics and other non-Western writing systems, Derrida (1976, p. 90) described grammarology as “picto-ideo-phonographic” writing.

Graffiti writing likewise irreverently mixes and mingles visual and verbal modes of communication, transposing,

to create hybrid scripts. These playful, intricate, and elaborate transfusions between semiotic systems are, of course, key strategies for encrypting and hiding messages from the uninitiated. But the sheer creativity and boundless signifying energy of graffiti exceed the need to simply mask and conceal. There is a strong pleasure dynamic to graffiti writing. Street youth revel in the pleasures of underground semiosis, they take intense delight—as both performers and audience—in the kinetic energies of “breaking and remaking” the codes of master discourse (Conquergood, 1992c, p. 84; see also Gates, 1988; Gilroy, 1995). Gang graffiti writing is oppositional and transgressive, to be sure, but it is not formless or disorganized. Like other guerrilla formations, it has its own internal structure and highly efficient strategies for mobilizing meaning. Whatever else one wants to say about gang youth, one cannot say that they are unstructured or disorganized.

Structuralism in the Streets

Street literacy embraces three signifying modes: the alphabetic, iconographic, and corporeal. Plates 28–5 and 28–6 spell out complete words, “King Love” and “Queen Love.” This straightforward graffiti proclaims the ethos of solidarity, camaraderie, and bonding that are key to gang *esprit de corps*. They are examples of the poeticizing and eroticizing of space, what I have discussed elsewhere as the transformation of bleak, benighted inner city terrain into a “hood,” an intimate space of warmth, familiarity, and intense fellowship (Conquergood, 1994a). They also are metadiscursive statements: all forms of gang *representing* (“reppin’”), including graffiti writing, are interpreted by participants as expressions of love, “throwing up our love”: in the words of Latino Boy, “we write our love on the wall.”

Straightforward spelling of complete words is actually the exception, rather than the norm, of gang graffiti writing. A more common alphabetic form is the construction of gang logos, by using the initial letters of a gang name, that function as acronyms. An example is the “ALKQN” on the left side of Plate 28–6, which stands for Almighty Latin Kings and Queens Nation. Plate 28–7 demonstrates the coarticulated display of these three aspects of graffiti writing. The LK

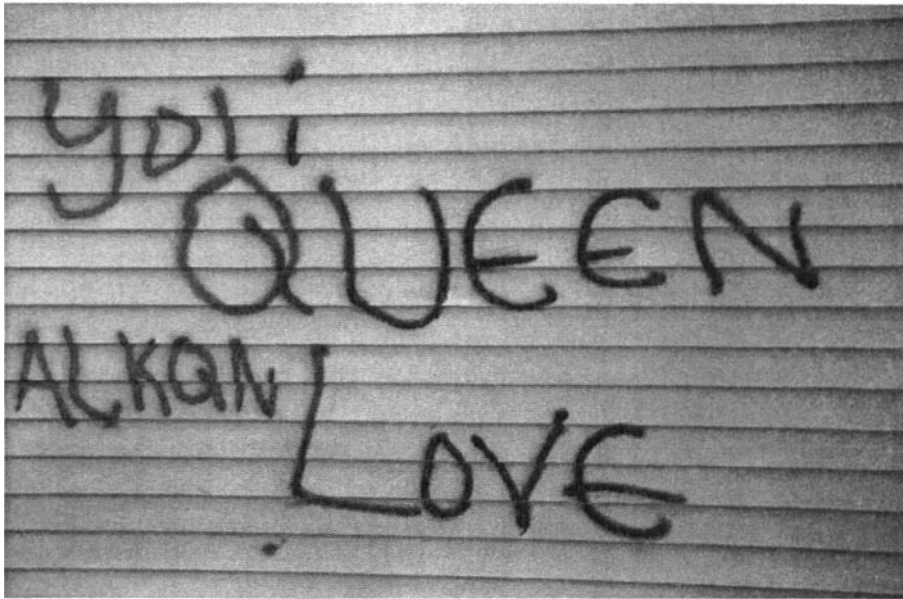

PLATE 28-6

PLATE 28-7

letters constitute the logo for the Latin Kings. The figure of the crown between the letters “L” and “K” is the icon that stands for the Latin Kings. The figure inside the shield underneath the crown is the pictorial representation of the embodied hand-sign of the crown. The two images of the crown, one iconographic, the other a pictograph of the corporeal hand-sign of the crown, are, in effect, mirror images of each other, albeit on different registers (Plate 28-8). Plate 28-9 is a photograph of the corporeal performance of making the crown handsign, in street argot called, “throwing up the crown.” Note that Chiquito is wearing a tee shirt that advertises Corona beer. The Corona beer advertising campaign is

of course, means “crown” in Spanish, and the colors, gold and black, are the emblematic colors of the Latin Kings. (The street term for signifying gang allegiance by wearing, for example, black and gold, is “flying the colors.”) John Fiske (1989, p. 15) coined the term “excorporation” to describe how subordinate cultures raid, refashion, and redeploy mainstream symbols for subversive ends. By strategically wearing the “Corona” tee shirt while performing the embodied handsign, Chiquito achieves the same doubling effect seen in Plate 28-8, although this time the modes are corporeal and alphabetic. He is also “signifying” on a commercial product associated with yuppies and upscale culture (see

PLATE 28-8

In addition to delight in doubling, elaboration, and embellishment, gangster grammar is characterized by turnings, flips, indirection, intricacy, and affirmation by negation. This complex and multichannelled play of symbols is structured along an agonistic division between two hostile factions. Most gangs in Chicago are aligned with one of the two supergang confederations: the People Nation, or the Folks Nation (for more detailed discussion of gang organizations, see Conquergood, 1994a). This binary opposition underpins all gang communication and provides a basic grid for particular graffiti. Since the Gangster Disciples is the largest gang in Illinois, its icon, the pitchfork, stands in for all Folks Nation gangs. Likewise, the initial "D", for Disciples, stands as a logo for the entire Folks Nation. All People Nation gangs represented by the number 5, such as a five-point star, and Folks Nation gangs by the number 6, such as a six-point star. A common feature of gangster grammar is the agonistic manipulation of the signifying letters, icons, numbers, and handsigns of the other, hostile nation, in street slang called, "throwing down" the rival nation. These semiotic manipulations fall into three patterns: inversions (turning symbols upside down), reversals (spelling letters backwards), fractures (breaking symbols).

The complexity and sophistication of this signifying system are best illustrated with concrete examples. Plate 28-10 is a graffiti written entirely in the alphabetic mode, but eight

PLATE 28-9

of the 13 letters have been either inverted or reversed. It displays the name of a gang member with his gang affiliation and local branch. The first word is GARFIELD, his street tag or nickname, taken from Garfield the cool cat. The most important thing for a street youth to decipher when encountering any graffiti writing in Chicago is, which nation claims this turf? People or Folks? The first letter in "Garfield" would signal immediately to a streetwise youth that this site was People territory. The "G" is reversed because it stands for the Gangsters, aligned with the Folks Nation (Imperial Gangsters and Gangster Disciples are both Folks Nation gangs). The streetwise youth would read the reversed "G" as an indirect way of proclaiming People Nation turf by "throwing down" the emblematic letter of a Folks Nation gang, a common strategy of affirmation by negation. This reading would be corroborated by proceeding through the other letters of GARFIELD. "A" is inverted because, as every streetsmart Chicago youth knows, it stands for Ambrose, another Folks Nation gang. "R" is reversed because it stands for Royals, short for Simon City Royals, one of the largest gangs of the Folks Nation. "F" is reversed, of course, because it stands for Folks. "E" is reversed because it stands for the Latin Eagles,

another Folks Nation gang. The inverted “L” and reversed “D” need to be taken together, standing for Latin Disciples, sometimes called Maniac Latin Disciples, a Folks Nation gang. From reading Garfield, a youth would know beyond the shadow of a doubt that he or she was on People Nation turf. From the next unit, a street-literate youth could read the precise identity of the particular People Nation gang, including further detail of the specific branch of the gang. Garfield is a member of the Clark Street and Winnemac Street branch of the Latin Kings gang (the subsection branches of a gang are named after the intersecting streets, the streetcorner, where the homeboys hang out; for more detail about gang organizational structure see Conquergood 1994a). The “C” is reversed to throw down the Insane Spanish Cobras, aligned with the Folks Nation. Note that the “L,” previously inverted, escapes defacement because in this unit it stands for the Latin Kings.

While Plate 28–10 was written entirely in the alphabetic

mode, Plate 28–11 extends the resources of street literacy into the iconographic mode, and also includes an example of the “fracture” pattern of semiotic defacement. The left panel displays a six-point star fractured by the number 5. From that “graffeme” alone, a streetwise youth would read this section of the park as belonging to the People Nation (I coin the term “graffeme” in order to discuss basic microunits within a complex graffiti text—obviously, I am punning on “grapheme” and other structuralist terms). From the right panel he or she could read the identity of the specific gang, in this case the Latin Kings. The right panel also demonstrates a combination of alphabetic and iconographic modes locked into an affirmation by negation. The unadulterated letters “LK,” standing for Latin Kings, are placed strategically on top of the inverted pitchfork, icon of the Disciples, the largest Folks Nation gang.

Plate 28–12 displays another proclamation of Latin Kings' space. This graffiti text draws on top or bottom, up or down

PLATE 28–10

PLATE 28–11

PLATE 28–12

PLATE 28-13

spatial symbolism: the alphabetic “LK” astride an inverted pitchfork and an inverted cross with three dots. A cross with three dots is an icon for Folks Nation gangs, and a cross with two dots is an icon for People Nation gangs. The Old English “LK” is followed by a smaller “ST” for “Street,” to punctuate the fact that this specific section of the Latin Kings is the Lawrence and Kedzie streetcorner branch (I lived inside this section for 4½ years; see Conquergood 1992a). The Lawrence and Kedzie homeboys delight in the fact that the letters of their branch duplicate the LK of Latin Kings. Note, also, that the “T” in upper right corner is written as an inverted pitchfork, thus mirroring the inverted icon in the lower left corner.

Plate 28-13 displays an elaborated variation of the same Latin Kings proclamations that we have seen in Plates 28-5 to 28-12 (with the exception of Plate 28-10, all these photographs were taken within two blocks of the Big Red tenement). At the top of the left panel is the word “AMOR,” which, of course, is Spanish for “love” that we saw spelled out in plates 28-5 and 28-6. In addition to that explicit meaning, there is a hidden meaning. Latin Kings gang members confided to me that “AMOR” also stands for Almighty Masters of Revolution, thus making it a true acronym, and adding another level of meaning to the politics of language. The O in AMOR is actually an inverted O or A fusion, which is the logo of Orchestra Albany, a Folks Nation gang. The reversed R we have seen already in Plate 28-10, and would read this as “throwing down” the Simon City Royals gang. Note that in this graffeme the “A” is not inverted, but it could have been, as we saw in Plate 28-10. There is always room for choice, variation, and innovation within this signifying system.

The centerpiece of this panel depicts the drama of two rival crowns locked in conflict, and counterbalanced by four opposing icons. The dominant crown on top is the icon of the Latin Kings that we would recognize from Plate 28-7. It

stands astride another crown, but the bottom crown is of a different style, and it is inverted. The bottom crown is the icon of the Imperial Gangsters, a Folks Nation gang that has excorporated the crown of the Imperial Margarine brand logo (see Plate 28-14). Note the same reversed G that we saw in Plate 28-10 inserted into the middle of the inverted crown, a grafting of the alphabetic onto the iconographic mode. The two icons on top of the crowns are the five-point star, an icon for all People Nation gangs for which the number 5 is sacred, and a dandy’s cane, one of the icons for the Vice Lords. The Latin Kings and the Vice Lords are the two largest gangs of the People Nation. By inserting the cane in a spatially privileged section of this text, that is, the top half, the Latin Kings who wrote this text are signaling solidarity with their Vice Lords brothers. The two counterbalancing icons in the bottom, polluted space of this text, are, on the left, an inverted cross with three dots, which, we remember from Plate 28-12, is an icon for all Folks Nation gangs, and an inverted diamond transected by a horizontal S, the icon of the Insane Spanish Cobras, a Folks Nation gang.

PLATE 28-14

The middle panel displays a more complex five-pointed crown, which is actually the more commonly used icon of the Latin Kings. The choice of crown styles, either three-point or five-point, is another example of variation even within a highly structured system. The choice not available for a graffiti writer aligned with the People Nation would be a six-point crown because that would signify allegiance with the Folks Nation. One of the reasons a five-point crown is slightly preferred to the three-point style is that its points enumerate the five cardinal virtues of the Almighty Latin King Nation: Love, Honor, Obedience, Sacrifice, and Righteousness. To punctuate the fact that this icon also functions as a mnemonic device for the five sacred values, note the dots drawn above each of the five points of the crown. Also note the number 5 emblazoned on the crown. The word **KINGS** is spelled out underneath the crown, an example of the alphabetic mode underlining the iconographic mode, and there is

PLATE 28-15

a numerological significance to the fact that **KINGS** is a five-letter word.

The right panel features a large polluted icon, inverted pitchfork of the Folks Nation, counterbalanced by alphabetic inscriptions. The **ALKN** on top stands for Almighty Latin Kings Nation. The reversed **D** at the bottom stands, of course, for the Disciples, largest gang of the Folks Nation. On the other side, separated by the middle tine of the pitchfork, is a **K**. It has not been reversed; it mirrors the **K** on top, and the **Ks** we have seen in previous plates, which stood for Kings. However, that reading is not possible because of the spatial position within the text of this particular **K**. As it is in the polluted bottom space, alongside the reversed **D** and inverted pitchfork, this **K** cannot stand for Kings. It stands for Killers. The reversed **D** and the **K** actually comprise a single graffeme; they must be read together as Disciple Killers, a grim example of affirmation by negation.

Four alphabetic graffemes on a boarded-up window of the Big Red tenement display this same stark strategy of affirmation by negation (see Plate 28-15). By now it would be clear to the reader that Big Red is located in the heart of Latin King turf, particularly the Lawrence and Kedzie branch of the Latin Kings gang. Plate 28-15 demonstrates how the Latin Kings at this site affirm their identity against enemies. Each graffeme combines a reversed letter that stands for a rival Folks Nation gang, followed by **K** which stands for Killers (note that the **K** is grafted onto the reversed letters in the top two graffemes). Reading from left to right and top to bottom, this graffiti panel proclaims Big Red as located in the territory of [Gangster] Disciple Killers, [Latin] Eagles Killers, [Simon City] Royals Killers and [Insane] Popes Killers. There is also a local history behind the choice to desecrate these particular four gangs, out of all the dozens of possible Folks Nation gangs that could have been targeted at this proclamation. As a resident of Big Red I was aware that the selection of

PLATE 28-16

PLATE 28-17

PLATE 28-19

PLATE 28-18

these four rival gangs was not random. Each graffeme represented the name of an enemy gang allegedly responsible for the killing of a local Latin King homeboy. "Local knowledge" (Geertz, 1983) enables one to read particular stories and commemorations out of this panel. I knew and went to the funerals of most of the youths whose murders were marked by these graffemes; I tutored the young Latin King who was

killed allegedly by a member of the Latin Eagles and whose memory is inscribed in the top right graffeme.

Just four blocks west of the Big Red tenement is Kimball Street, the dividing line between People Nation and Folks Nation territory in this section of northwest Chicago. The photographs in Plates 28-16 to 28-18 were taken on the west side of Kimball Street, on the Folks Nation side. Plate 28-16 shows the icon of the pitchfork standing right side up, alongside the letters MLD, which stand for the Maniac Latin Disciples. Plate 28-17 proclaims the territory of the Insane Spanish Cobras Nation in both alphabetic and iconographic modes, with the icon of the diamond transected by the horizontal S grafted on to the letter N. Plate 28-18 proclaims the turf of the Simon City Royals Nation with the Folks icon of the cross with three dots astride inverted icons and letters of the Vice Lords. It is interesting that in the bottom polluted half of this graffiti text the letters V and L for Vice Lords have been both inverted and reversed, a double defacement. The top hat and cane, Vice Lord icons, likewise have been inverted, and, to clinch the desecration, an inverted 5 has been emblazoned on the inverted top hat.

Plates 28-19 to 28-21 all are graffiti writings of the word FOLKS, but written on different turfs. Any streetwise youth

PLATE 28-20

PLATE 28-21

would know that the rendition of FOLKS in Plate 28-19 was written on Folks Nation turf because the second letter, O, doubles as a six-point star. This interpretation is reinforced immediately by the third letter, a reversed L, which signals that the third and fourth letters, LK, are to be read as a graffeme that throws down the Latin Kings. Plate 28-20 is the same word FOLKS, but written on People Nation territory, specifically Latin Kings gang turf. The F is inverted to pollute the Folks Nation, the O is written as an inverted O or A fusion, the logo of the Orchestra Albany Folks Nation gang. While the L was reversed in Plate 28-19, it is unadulterated in this text and separated by a hyphen from the following letter K to highlight the fact that these two letters are to be read as a separate graffeme affirming the Latin Kings. The alphabetic rendering of Folks towers over two polluted icons of the Folks Nation. On the left, there is the inverted icon of the Insane Spanish Cobras that we have seen before. The inverted icon on the right is quite interesting because it represents an innovation that we have not seen in previous plates. It is an inverted pitchfork, but if you look closely, each one of the three tines is punctuated by a dot, thus transforming the pitchfork into a cross with three dots, another popular icon of the Folks Nation. The pitchfork and the cross with three dots have been conflated in this double inversion. The name

PLATE 28-22

Chiquito spelled out at the right identifies the writer or creator of this text. Note that the T in Chiquito doubles as an inverted pitchfork.

Plate 28-21 represents another innovation on how a Latin Kings gang member writes the word Folks. This vertical writing in the alphabetic mode quite creatively draws on spatial symbolism to intensify affirmation by negation strategy. The F for Folks suffers a triple negation: it is inverted, reversed, and placed at the bottom of this column of letters. The LK, for Latin Kings, almost jumps off the column as this graffeme surges toward the top. This style of vertical writing was developed as a creative response to the limitations and possibilities of utility poles as surfaces for inscription (see Plate 28-22).

These inventive, playful, and intensifying innovations within the basic signifying system are deeply meaningful to street youth. Gang graffiti writers love to talk about their rhetorical art and to comment on the level of skill and creativity of other writers. Several times during the course of my fieldwork I have been taken on walking tours down back alleys and underneath bridges where articulate gang members take pride and pleasure in delivering detailed and insightful commentary on various graffiti walls in a presentational style that resembles that of docents at art galleries and museums. Although these "gallery" tours are typically organized for my benefit, they always attract an appreciative

audience of other gang members who, although cognoscenti of the streets, never tire of hearing graffiti texts explained, discussed, and contextualized. Audience members monitor the performance of the “docent” and interject comments that enrich, or sometimes contest, the “docent’s” commentary. If the “docent” does not have the requisite cultural authority, he or she will be quickly replaced by a more knowledgeable member of the audience who steps forward and takes over the role.

Scripting in the Streets

Although I have tracked through several graffiti texts in order to illustrate the structural conventions and complexity of this writing system, gangster grammatology exceeds the “model of the text” (Ricoeur, 1972) and pushes toward performance. According to Ulmer (1985, pp. xii, xiii):

Grammatology as composition (Writing) is not confined to books and articles, but is addressed more comprehensively to the needs of multichanneled performance.... Writing as Derrida practices it could be called Scripting.... It is to the program of grammatology what a screenplay is to a film—a set of descriptions and directions which for its full effect must be ‘enacted.’

Gang graffiti constitutes embodied, performative writing at every level of production and reception. Even as literal inscriptions on material surfaces we have seen how they are

read by mainstream authorities as dangerous scripts haunted with the performing presence of transgressive bodies and portents of more to come. Gang graffiti points to the scene of enactment and connects with performance on three levels: collaborative writing as ensemble staging; reciprocal doublings between bodies and buildings; interpretive collusions and the play of reading.

Collaborative writing as ensemble staging. While official literacy education enjoins linear activities of solo writing and silent reading, graffiti writing is a dynamic group performance characterized by complex interactions among the participants where oral and literate modes of communication are in constant exchange (see Plate 28–23; see also Camitta 1993; Shuman 1993). The borders between writing and reading, production and reception, actors and audience, collapse as questions, commentary, criticism, and suggestions circulate simultaneously and continuously throughout the collaborative event of “making a wall,” “putting up a wall,”—(also called “piece,” “set,” “envelope,” the street terms for graffiti writing). The coperformers are mutually supportive of one another’s efforts, but are not shy about counterbalancing praise and criticism. The evaluative terms alternate between “fresh” and “phony”: the former bespeaks highly skilled execution with a distinctive flair, and the latter refers to work that is amateurish, unimaginative, and careless.

The performance event of “making a wall” is a preeminently social process that requires planning, preparation, cooperation, and carefully coordinated interactions within the team. The paint and tools must be procured; no easy task because the sale of spraypaint and broad-tipped magic markers to minors was banned in Chicago (in 1995, the sale of these items was banned outright). Sites are selected strategically to maximize the impact display of but also with an eye for cover and ease of execution during the actual staging event. Since it is illegal to write graffiti on walls, scouts must be posted to warn of the approach of police or vigilant citizens. Alleys, rooftops, and the undersides of bridges offer sheltered staging grounds, which, when coupled with darkness, enable prolonged group performances that yield some of the most elaborate graffiti displays. But one thing that makes a “piece”

PLATE 28–23

PLATE 28–24

really “fresh” is the daring and challenge posed by the location, the scripting that takes place on the face of public facades, ‘in the face’ of heavy surveillance. The complementary “set” in Plate 28–24 is appreciated for its panache within the performance community of the local homeboys because the graffiti panels jump out from the well lighted facade of a busy shopping mall. The Latin Kings letters and icons on this building compete with other signs of proprietorship. The spacing of the panels creates a dramatic tension and magnitude of scale but can also be explained in terms of constraints of execution within such a busy, public place. The writer of the fractured six-point star on the left selected a panel that was near the alley, thus offering a quick exit. The writer of the LK astride an inverted pitchfork on the right likewise selected a panel near an intersection with multiple escape routes.

The danger of getting caught heightens the need for secrecy and contributes to the drama, excitement, and esprit de corps of these ensemble performances. It also encourages the development of considerable technical skill and improvisational savvy. The deft strokes, efficient movements, and well orchestrated interactions are based on endless rehearsals of solidarity, called “hanging out together” or “hanging together,” in which the art of “doing things together” gets finely tuned (see Becker, 1986). The art of scripting in the streets pivots on the ability to adapt to local environment, work with found materials, perform under pressure, and collaboratively

improvise solutions to technical problems (see Plate 28–25; see also Harrison-Pepper, 1990; Schechner, 1993). It is an example of what de Certeau (1984, pp. xiv, 29) called “make-shift creativity,” a mobile art of “making do.”

Reciprocal doublings between bodies and buildings. We have already seen in Plate 28–7 how graffiti writing copied the corporeal performance of “throwing up the crown.” Like the facades of buildings, the surfaces of the body are transformed into a mise-en-scene for performing gang identity, “reppin’.” The body becomes a mirror and mobile extension of graffiti writing on buildings. The same People Nation-Folks Nation agon is transcoded onto the body in terms of left side of the body associated with People Nation and right side of the body aligned with Folks Nation. The left-right distinction is from the point of view of the actor; it is stage left, and stage right. For example, the bill of a baseball cap is raked to the left to ‘rep’ affiliation with People Nation gangs, and to the right for Folks Nation gangs. In addition to tattoos (Plates 28–26, 28–27), there are myriad ways of using the body to ‘rep’ gang nation affiliation: a belt buckle left of center for People Nation, and right of center for Folks Nation, an earring in left or right ear, a jacket tossed over the left shoulder or the right shoulder, jeans torn on the left or right leg, a pants pocket pulled out on the left or right side, wearing bib overalls with one strap up and the other unbuckled and dangling, wearing a color-coded bandana handkerchief in the left or right rear pocket, hair braided down on one side and left unbraided on the other side, a tattoo on the left or right shoulder or thigh, standing “in position” with either the left or right foot turned out, leaning against a wall in low-rider pose with either the left or right knee bent, and so forth. Street youth transform themselves into “the body of the signifier” and thus participate in what Michel de Certeau (1986, pp. 39, 44) called “the intimacy of Exteriority.”

Plate 28–27 demonstrates the reciprocal reppin’ (“representing”) between buildings and bodies, the mirror extension and reinforcement between alphabetic or iconographic and corporeal modes of street literacy. In addition to the tattoos all over his body, the Latin King standing stage-left to the graffiti written on the wall is reppin’ with his body in a

PLATE 28–25

PLATE 28–26

PLATE 28-27

PLATE 28-28

precisely coded way called “crossing up.” True to his Latin Kings (People Nation) allegiance, he is “crossing up” to the left by placing his right hand over his *left* wrist, which remains pressed close to his body. Street youth aligned with the Folks Nation would “cross up” to the right by placing the left hand over the *right* wrist. The hand held closest to the body is the one that counts within this corporeal grid of left or right distinctions. A variation of this gestural practice involves crossing the arms so that the right hand grips the left *upper* arm, signifying People Nation alliance, and vice versa for Folks Nation (review Plate 28-2).

The legs and feet also are choreographed to rep’ gang identity. The Latin King in Plate 28-28 has turned out his *left*

foot to signify People Nation alignment, which simultaneously displays the Converse tennis shoe logo, a five-point star. Folks Nation gangs also rep’ by wearing Converse tennis shoes, but they fold down the flaps, thus breaking the five-point star. Note also that he has laced up five eyelets (Folks Nation gang members lace up six eyelets). Leaving the laces untied is part of street style. When gang members need laces tightened for traction when running from police or rival gangs they will tie the laces behind the heel or underneath the arch of the foot inside the shoe.

Plate 28-29 demonstrates a two-handed way of throwing up the crown. At this point the reader should review Plate 28-9 for a single-handed version of throwing up the crown, but note that the handsign is positioned over the *left* shoulder, a highly meaningful detail. Just as graffiti writing on buildings is a collaborative enterprise, so is the scripting on and with the body often a joint performance. Plates 28-30 and 28-31 enact variants of throwing up the crown: plate 28-30 is the collaborative version of the two-handed crown handsign in Plate 28-29, and Plate 28-31 is the collaborative version of the handsign in Plate 28-9. While throwing up the crown note that both sets of performers are simultaneously throwing down digital inverted pitchforks.

The stylized handshake enacts the interlocking relationships, camaraderie, and solidarity that define the gang ethos. Each street gang performs an elaborate and intricately choreographed rite of handshaking that incorporates a joint performance of the digital handsign of the respective totemic symbol (crown, pitchfork, eagle, etc.) extended into a series of bonding gestures that celebrate corporeal contact (these may include tapping the heart, multiple variations of inter-

PLATE 28-29

twining fingers and “giving skin,” and kisses). Plates 28–32 to 28–34 document key movements within the sequence of this kinetic performance. The underground “books,” “manifestos” that each gang develops (see Conquergood 1994a, p. 28, n. 6) contain exegetical commentary that deepens the meaningfulness of these embodied performances. I quote from the King Manifesto: “A fist upon our heart . . . It means, ‘I DIE FOR YOU’ for you are flesh of my flesh, blood of my blood,

son of my mother who is the Universal Nature and follower of Yahve.” Many working-class latinos refer to one another as *camales*, which means closer than a brother, literally “flesh” (Limon, 1994).

PLATE 28-31

PLATE 28-33

PLATE 28-35

PLATE 28-34

Scripting in the streets gives a new dimension to what Michail Bakhtin (1986, p. 6) called "bodies of meaning." It is a powerful pedagogy that deeply engages the body as a way of knowing. Peter McLaren (1995, p. 46) compared and contrasted the visceral power and intimacy of streetcorner knowledge with the disembodied and distant nature of classroom knowledge:

Streetcorner knowledge is epistemologically different from traditional conceptions of school knowledge. It is a type of mimesis or visceral/erotic identification.... In the streets, what mattered most was always somehow 'felt,' whereas classroom knowledge was often sullied by an inflated rationalism and logocentrism. In the streets, students made use of more affective engagement with symbols marked by the emotive rather than the rational.

Children learn street literacy, particularly the corporeal mode, through imitation and gestural play (see Plate 28-35). The little Khmer refugee boy on the right is miming the "crossing up" display he has seen the big boys perform on the streets. He is not yet in control of the technique because he is "crossing up" to the right, which, particularly if he were a few years older, would be a dangerous mistake to make within Latin Kings territory (see also Plate 28-36).

The walls of buildings are eroticized as the sensuous surfaces of the "hood," the intimate spaces of the homeboys and homegirls, the collective body of the gang. Likewise,

bodies are scripted as metonymic extensions of the hood, walking condensation symbols of gang geography, able to animate or antagonize the urban spaces they pass through. Perhaps the most poignant and compelling example of the meaning-making convergence between bodies and buildings is the RIP (Rest In Peace) death murals inscribed near the site where a street youth "went down" (died) for the hood (see Plate 28-37).

Interpretive collusions and the play of reading. Interpretation of a graffiti text is contingent upon performance. Instead of a disembodied, compliant consumer of communication, the reader is engaged as a dynamic player who *enacts* textual meanings. Since graffiti texts are intricately coded, cryptic, collusive, and context specific they demand a knowledgeable and energetic "interpretive community" that is able to supply the subtext, furnish supplementary readings, activate and play with conventions, generate interpretations, and cocreate or contest meanings (see Fish, 1980; Radway, 1984). Graffiti writing is an excellent example of what Roland Barthes (1974) called "writerly" texts wherein readers or audiences are scripted as active agents and coproducers of meaning, in contrast to "readerly" texts that position the reader as a passive depository of messages. In place of a disembodied

PLATE 28-36

PLATE 28-37

aesthetics of distance and detachment, street “protocols of reading” (Scholes, 1989) constitute a call to participate and connect, an aesthetics (and ethics) of contact, interaction, and collective life.

All manners of punning and visual-verbal play continuously exercise imaginations and keep the performance community interpretively alert and alive to witty flips and new twists and surprises of meaning. Fiske (1989, p. 107) argued that the pleasure of punning is its rough-house creativity, the way it tricks and startles the reader or audience into participatory play with meanings: “puns invite producerly readings, there is a pleasure in spotting and solving the pun. . . .” Through visual alterations the Latin King writer of the graffiti text in Plate 28-38 teases out a pun from the name of a rival gang, “disciples.” Although this is a classic pun, a play between written and oral forms of language, many graffiti texts create visual puns through optical illusions and tricks of the eye.

Mexico, the signed author of the text in Plate 28-39 has disrespected his rivals, the Latin Eagles, by turning their icon, an eagle, on its head, and bracketing it with a reversed letter “E” and the letter “K,” which stand for “Eagles Killers.” What makes this inversion witty as well as grim is that the upside down eagle’s head is “crowned” by the icon of the Latin Kings, a five-point crown. Further, the neck of the upended eagle’s head with elongated beak can be read as forming the letter “L” for “Latin” followed immediately by “K,” which can now be read as Kings. The letter “K” thus doubles and signifies simultaneously two different meanings: when part of the graffeme reversed-E K, it means Eagles Killers; when part of the graffeme LK (with the L formed from neck and beak of upended eagle’s head), it means Latin Kings. The meaning is in the movement, the unfixing and remobilizing of the signifiers, and their dancing, doubling, shape-shifting play across modes of representation (see Sanchez-Tranquilino, & Tagg, 1992).

Plate 28-40 represents an even more subtle and complex optical transformation. In this graffiti text the Lawrence and Kedzie branch of the Latin Kings gang has conflated the icons of two enemy gangs: the heart with devil’s horns and tail is the icon of the Latin Disciples, and the heart with wings is the icon of the Latin Lovers, both Folks Nation gangs. This hybrid heart with devil’s horns and tail as well as wings has been turned upside down and fractured, a double disfigurement. But there is one detail inconsistent with the overall strategy of “throwing down” the coupled icons: the wings remain right side up, even though the heart to which they are affixed has been inverted. This disruption of the pattern opens up another way of looking at the image: if you look at it long enough, it transforms into a chicken, specifically a chicken in distress with its hanging head, flustered wings, and the inverted curved horns as legs create a pigeon-toed effect. My Latin Kings neighbors relished this visual pun, delighted in

PLATE 28-38

PLATE 28-39

PLATE 28-40

the way the upside down icons of their rivals perceptually dissolved into a chicken in distress, with all the ridiculing power of that image. The dishonorable connotations of the chicken are played out in embodied performance as well. I have seen Latin Kings mimic the Latin Eagles handsign, which is interlocking thumbs with the fingers spread like eagles' wings, but then start nervously fluttering their fingers while vocally imitating the clucks and squawks of a chicken.

Puns and verbal-visual play excite and encourage active engagement with texts, close reading gives way to a participatory theater of proliferating interpretations. Street literacy gives new meaning to Barthes' (1974) theory of "writerly" texts—which makes the activity of reading coextensive with that of writing—because on the streets, reading, quite literally, often incites a performative rewriting of graffiti texts. Plate 28-41 documents the common practice of rewriting, or writing over, the graffiti texts of rival gangs. The Simon City Royals, a major Folks Nation gang, had dared to enter and appropriate Latin Kings' territory by marking it as their "camp." No self-respecting Latin King could countenance this flagrant violation of territorial boundaries, the gang equivalent of a nation-state planting its flag inside another country's borders (see Conquergood, 1994b). The Latin Kings reclaimed and reterritorialized their space by writing their letters over those of the insurgents. Significantly the Latin Kings

reestablished their dominion by deliberately writing on top of the offending letters instead of cleaning the slate and then putting up their own insignia. By not erasing but leaving the Simon City Royals graffiti in view but now reframed as a conquered relic, the Latin Kings dramatized their prowess, their "juice," in the ongoing struggle for territory and respect. Their status is enhanced by the palimpsest effect of writing

PLATE 28-41

over the text of a rival gang, which now serves as an aggrandizing foil to the lustrous insignia of the triumphant gang.

Plate 28–42 demonstrates an improvisatory variant on the practice of rewriting graffiti texts. The graffito inscribed on my personalized Northwestern University stationery is an ironic mirror image and subversive doubling of my name, “Dwight,” from the letterhead. The writer, Hitman, is a Latin King who seized the opportunity to “signify” (Gates, 1984) on my name when he found my memo tablet that I had brought to a tutoring session with him. He mimicked and carnivalized the conventions of official literacy and the insignia of institutional authority by rewriting my name within the conventions of street literacy and textual power displays. His translation and critical reframing of my name, my identity, is an important reminder that all writing is a creative act of interpretation and relocation. Hitman’s appropriation of my name unsettles the hierarchy of textual authority that underpins academic ethnographic writing (Clifford, & Marcus, 1986). Typically it is the more powerful participant in the ethnographic encounter who writes and makes texts, and the subordinate other who is written about, textualized. In this chapter, I have been taking examples of street literacy and analyzed and recontextualized them within the discourse of ethnographic analysis. Disrupting this process, Hitman took my printed name from a Northwestern University memo tablet and translated it into

the discourse of gang graffiti. This is instructive, critical, and fair play.

CONCLUSION

It is the truism of critical pedagogy and emancipatory literacy that schools should teach by engaging the creativities, competencies, and capacities of students: “[Emancipatory] literacy . . . is grounded in a critical reflection on the cultural capital of the oppressed” (Freire, & Macedo, 1987, p. 157). Gang youth are one of the most stigmatized groups of students, seen exclusively in terms of their difference, deficits, deviance, and danger. Going against the grain of popular perception and public policy, this chapter excavates the complex, intricate, subjugated knowledges and interpretive skills that gang youth learn and perform on the streets with great authority. “Critical reflection”, however, is the key term because just as it is counterproductive to vilify and further marginalize street youth, it is unhelpful to romanticize gang culture. As several examples make clear, street literacy is connected to violent action, although I hasten to point out that mainstream literacy is not innocent of battle metaphors, militaristic rhetoric, and actual declarations of war. It would be hypocritical to suggest that street youth were violence-prone, and mainstream culture was violence-pure. Violence at all levels must be resisted. The implicit and overarching argument of this chapter is that there are insights and capacities embedded in street literacy that can be recuperated by progressive educators for positive pedagogical ends.

Street literacy develops an impressive, albeit underground, body of knowledge and skills that are based on cooperative and interdependent learning that is embodied, coexperienced, refreshed and kept exciting through improvisation and play. It is difficult for most citizens, progressive educators included, to see anything of value in street culture because our perceptions are skewed by prevailing media metaphors that depict gangs as malignant microbes (“plague,” “cancer,” “blight,” “disease,” “scourge,” “virus,” “infestation,” “epidemic of violence”), or vicious animals (“wilding packs,” “superpredators,” “roving,” “prowling” beasts of prey from the “urban jungle” seized with “pack frenzy”), or violent terrorists (youths who “menace” and “terrorize neighborhoods,” creating “explosions of violence” and “little Beirut” in the inner city). It is difficult to think of groups other than gang youth that are publicly characterized as germs, animals, and monsters. Nonetheless, some educators have penetrated this sensationalist demonology and called for intervention programs that build on the capacities, communal strengths, and hopeful yearnings of street youth (Johnson, & Johnson, 1993; Rodriguez, 1994). In Chicago, the deeply committed and long-term work of Marvin Garcia at the Pedro Albizu Campos High School, Luis Rodriguez and Patricia Zamorra with Youth Struggling for Survival, Maria Dalida Benfield and Christopher Bratten with Video Machete, Lisa Kenner at the Juvenile Temporary Detention Center (Audy Home), and Meade Palidofsky with Music Theatre Workshop, all offer positive, hopeful, and inspiring

PLATE 28–42

examples of critical pedagogical strategies that tap into the intelligence, talent, and, yes, humanity of street youth.

At the turn of the last century, Jane Addams (1972 [1907], p. 66) wrote a book about street youth and gangs and how she and her Hull House workers were able "to utilize the gang spirit and to turn its collective force towards" successful drug rehabilitation programs. Instead of seeing street youth as problems, "delinquents," she focused on their potential, capacities, and energies, their "quest for adventure" (p. 57) and "spirit of revolt" (p. 117). She pointed out the political-economic conditions of oppression instead of blaming the poor for the circumstances within which they were forced to live. Above all, she called for new, insightful, and more compassionate ways of seeing urban youth and responding to their needs: "We fail to understand what he wants or even to see his doings, although his acts are pregnant with mean-

ing, and we may either translate them into a sordid chronicle of petty vice or turn them into a solemn school" for civic responsibility and social justice (p. 161). She concluded *The Spirit of Youth and the City Streets* with this haunting image:

We may either smother the divine fire of youth or we may feed it. We may either stand stupidly staring as it sinks into a murky fire of crime and flares into the intermittent blaze of folly or we may tend it into a lambent flame with power to make clean and bright our dingy city streets" (pp. 161, 162)

In the wake of the 1992 Los Angeles uprising, this passage stands as unheeded warning and critique of contemporary public policy that sees urban youth in terms of problems and pathologies instead of their potentials, possibilities, hopes, and struggles.

INTERGENERATIONAL DISCOURSES: LIFE TEXTS OF AFRICAN-AMERICAN MOTHERS AND DAUGHTERS

Vivian L. Gadsden

UNIVERSITY OF PENNSYLVANIA

Intergenerational literacy and the broader issues of family and intergenerational learning have been the center of discussions in educational research and practice for more than three decades. Compelling historical accounts of African-American education during slavery and reconstruction (Anderson, 1988, 1995) highlight the importance that ex-slaves and freed men and women assigned to literacy as an intergenerational legacy to ensure citizenship and the enrichment of the black family. In a work focused on family literacy in the 19th century home of Cotton Mather, Monaghan (1991) provides a critical analysis of literacy interactions between Mather and his children, attending specifically to issues of race, class, and gender within the household and the community. Durkin (1966, 1976), at the height of the antipoverty movement and early years of Head Start, studied low-income African-American children and parents in Chicago, focusing on how parents assisted their children in developing literate ability.

More recently, longitudinal ethnographic research demonstrates how issues of class, race, and social and political history are intergenerationally represented, understood, and enacted within different communities (e.g., Heath, 1983; Taylor, 1983; Taylor & Dorsey-Gaines, 1988; Taylor & Strickland, 1989). For instance, Purcell-Gates (1995) leads readers through a series of life and literacy events of a low-literate Appalachian family and describes the efforts of a mother and her son to improve their literacy. This and other

research situate the problems and successes of literacy within a larger discourse of life circumstances and pose a range of questions about literacy learning; cultural rules, norms, and roles within families and communities; and the constraints imposed by societal constructs such as gender bias and racial discrimination.

These and other studies connote newly-expanded conceptualizations and approaches to studying and supporting literacy development. They also enhance our understanding of the intergenerational, social, and cultural contexts that create opportunities for that development. Rather than assuming a unilinear focus on children in K-12 schools, these literacy analyses integrate into a more comprehensive framework issues from different domains, age ranges, and areas typically absent in traditional discourses in the field. Such analyses increasingly suggest that while many of the issues have been excluded historically from the primary discourses of literacy research, they are neither outside the domains of literacy nor oppositional to the purposes of literacy practice as it has emerged over the past decade. Instead, the issues are strongly connected to the premises that literacy is a social process reliant for meaning on contexts and that this meaning is embedded deeply in the lives of learners. By focusing on the social processes of reading and writing, literacy research and practice have begun to provoke discussions about how life events, cultural traditions, family beliefs, gender roles, and

This work was supported by funding from the Spencer Foundation/National Academy of Education and the National Center on Adult Literacy at the University of Pennsylvania, which is part of the Educational Research Development Center Program (Grant No. R1 17Q00003) as administered by the Office of Educational Research and Improvement, U.S. Department of Education, in cooperation with the Departments of Labor and Health and Human Services. The opinions expressed here do not necessarily reflect the position or policies of any of these organizations.

individual behaviors intersect and contribute to our understanding of how, why, and when individuals learn and use literacy; why some approaches to instruction engage learners more effectively than others; and what supports are necessary to help learners affect change in their lives.

This chapter examines the intersection of critical issues in the life-course and self-perception of two and three generations of African-American mothers and daughters, connected through biological ties, cultural history, social experiences, and educational aspirations. Specifically, I examine how issues of gender, race, and culture are raised and personal responses shared within the oral and written discourses. The content of these discourses forms here what I call "intergenerational life texts," that is, the accumulation of events and circumstances that affect the daily lives of learners and the ways they think about literacy, use it, and convey messages about its meaning across multiple generations and contexts.

In examining life texts as oral and written discourses, this chapter focuses on the development, uses, and sharing of reading and writing within two communities of African-American women and girls, and the meanings attached to the relationships that evolve from sharing these literacies. The issues of temporality, age, and agelessness are critical to this discussion which attempts to understand better *when and where* these women and girls meet around and about literacy, and create opportunities to engage in difficult conversations about family expectations, race, education, and persistence. The conjunctive adverb "when," rather than denoting a specific time, connotes activities and discourses that occur between girls and women—language, postures, and symbolic acts that inform us about who the women and girls are, what the literacies are that they value most, where they meet and for what purpose(s), how they come to meet, how they sustain literate relationships, and why these relationships are sustained.

This chapter is divided into four sections. The first section presents some of the current conceptualizations and issues in intergenerational literacy learning. The second describes the current and historical context for African-American women's literacy. The third presents the oral and written narratives from case studies with African-American women across two and three generations. The fourth summarizes the ways in which literacy converges for these different generations of women and the implications of these convergences for practice and research.

DEFINITIONS AND DISCOURSES IN INTERGENERATIONAL LITERACY

Definitions of intergenerational literacy learning typically have included a focus on the nature of literacy within each generation and the mechanisms (e.g., local programming and recruitment) and approaches (e.g., literature-based instruction) used to convey reading and writing abilities (Gadsden, 1993b). Intergenerational literacy has come to be associated almost solely with families and often is used interchangeably with family literacy. However, intergenerational literacy in-

cludes more than the family, although families create obvious intergenerational connections. Indeed, intergenerational literacy may be conceptualized more broadly as a wide array of participants—parents, grandparents, teachers, and children—learning and teaching one another about literacy.

Much practice and research on intergenerational literacy are developed out of an assumption that in settings where children and adults have opportunities to interact over periods of time, adults transmit knowledge, beliefs, and practices to children either through direct teaching or informal activities (e.g., Pellegrini, Brody, & Sigel, 1985). Such transmission and learning may take place in formal settings such as schools where adult teachers share with children the strategies for reading and writing and facilitate the development of these abilities using a set of accepted approaches. It may take place within homes—between parent and child, grandparent and grandchild, or other adult-child configurations. The relationship may include an adult relative modeling a variety of literacy behaviors, talking about literacy, or demonstrating the value and importance of literacy by engaging children in activities requiring increasingly sophisticated literate ability. Intergenerational literacy learning may be a part of relationships established in community settings such as churches in which an adult helps a child understand the written ritual of the church or participate in literacy activities integrated into the church program, such as singing in a choir. It is tied as well to family literacy programs in which parents are assisted in supporting their children's literacy development or where parents and children learn together.

While several forms and formats are evident in family and intergenerational literacy programs, there is some agreement that such programs are designed largely to improve literacy for adults (typically parents) and children in a family and to increase the likelihood that children in the family will experience fewer literacy problems than their parents (Gadsden, 1993b). Many intergenerational literacy programs are located in schools, churches, community centers, libraries, and private agencies; others may be linked to existing efforts described in Chapter 1, compensatory education, adult education, Head Start, and welfare initiatives. The programs may be defined broadly as intergenerational or multigenerational but include only a limited literacy strand, or they may involve adults and children in one family. Some programs simply pair one child in a family with an adult outside the family who volunteers to assist the child by tutoring, book reading, or mentoring. Rarely, even now, do programs expand to include more than two members within a single family (typically a parent and a young child) around a set of teaching and learning approaches (see Gadsden, 1994). Programs sometimes are developed around a mix of approaches, but are as likely to be built around a single philosophy or strategy.

Although the populations of programs may include a variety of cultural and ethnic groups, a few programs are designed specifically to support literacy development among certain language and cultural groups (e.g., African-Americans, Mexican Americans, and Asian and Eastern European immigrants). Others may be ecumenical in their programmatic appeal. Many programs attempt to respond to the goals of a small

community network; some are appended to existing adult literacy programs.

Despite growing scholarly interest in intergenerational literacy, striking examples of uncharted possibilities in the field exist. One such example is the exchange of responsibility between parents (particularly limited English-speaking, immigrant parents) and children when parents' low literacy makes them dependent on literate children to complete daily tasks requiring reading and writing (see Weinstein-Shr, 1991). Likewise, little work examines the relationships between parent and child learning when the child assumes a dominant role in supporting the parent's reading (i.e., teaching the parent to read) or what the multiple configurations of parent-child learning are within a home or other social context. That is, how are the different kinds of literacies—oral, writing, reading, and other visual forms—shared, understood, accessed, and used by adult and child learners working together? What are the trade-offs in power, skills, knowledge, practical applications, and the representations of people learning literacy and the processes of learning and teaching themselves?

These questions are related to larger issues about the nature and meaning of intergenerational learning and transfer—primarily whether, how, and under what circumstances behaviors, beliefs, and attitudes are conveyed from one generation to another. Researchers here might examine the degree to which parents and families, in fact, influence children's literacy. They might address how parents convey to children beliefs about their ability to succeed, the value attached to the family itself, the importance of education, and ways of thinking about issues and solving problems; they might explore how to model appropriate behaviors that children use and apply to different situations in their lives. Whatever their origins, these behaviors, beliefs, and attitudes appear to be influenced by a range of life experiences and result in intergenerational family practices and shared expectations (Baydar, Brooks-Gunn & Furstenberg 1993; Kreppner & Lerner, 1989).

Another relatively unexplored area of study centers on a tacit assumption that intergenerational literacy and learning is "women's work." Research studies in K-12 settings and intergenerational and family literacy program efforts focus disproportionately on women and mothers, in part, because women have been the most active participants in adult literacy programs. In addition, women's roles as mothers have positioned them historically as children's first socializers and teachers. Several intergenerational literacy studies examine mother-child reading (Pellegrini, 1991; Pellegrini, Perlmutter, Galda, & Brody, 1989), while mother's education is used typically as the primary predictor of children's academic achievement.

Despite the gender-specific nature of much of intergenerational literacy research, current discourses do not focus on specific issues about gender—either women or men, mothers or fathers, girls or boys. Rather, the discourses on intergenerational literacy have been developed around some basic assumptions about who would learn (children) and who would convey that learning (mothers), with few studies examining questions about father-child literacy or the effect of women's changing role in society on intergenerational learn-

ing. In recent years, however, interest in women's roles, debates about family values, and conversation about fathers' involvement in children's development have begun to transform the substance and form of conceptualizations of intergenerational literacy, and new approaches for studying and working with parents, children, and families.

CURRENT AND HISTORICAL CONTEXT FOR AFRICAN-AMERICAN WOMEN'S LITERACY

Although recent international foci on women and literacy, particularly within home contexts and parent-child relationships, increasingly are being reported (e.g., Mwiria, 1993; Stromquist, 1992; Young & Padilla, 1990), the literature on women learning literacy is impoverished. Like women in many other cultural groups, African-American women as mothers are implicated throughout conversations about literacy and children's achievement; yet their history, literacy contributions, and literacy experiences are rarely a part of the discourses in literacy studies, family literacy efforts, or intergenerational learning. African-American women's literacy and their role in educational movements represent an almost invisible subset of the existing work on women and historical accounts of African-American culture (Morris, 1986). In the accounts that do exist, African-American women's roles have ranged from mothers and teachers in the emancipation of the 4,500,000 African-Americans (almost half of whom were women) from slavery to leadership in the citizenship campaigns of the 1950s and 1960s (see also Harris, 1995).

Morris (1986) and Holt (1990) chronicle the difficult, if not precarious, position in which African-American women found themselves shortly after slavery, having earned their freedom in a society in which women—black and white—were assigned low status and in which blackness was equated with intellectual inferiority. As Anderson (1988) suggests, African-American women in the South who had been teachers in secret learning places during slavery and in classrooms subsequent to slavery existed, acted, and held personal definitions of themselves and their abilities that contrasted with prevailing popular opinion about African-Americans in general and about African-American women in particular.

The absence of a literacy history that provides a comprehensive analysis of the campaigns and movements that occurred within the African-American community explains the still unexplored areas of African-American women's roles in citizenship campaigns. What we know about this history acknowledges the role of women such as Ella Baker whose ideas about galvanizing the black vote by teaching literacy to a potential black electorate sparked efforts leading to the Southern Christian Leadership Conference's citizenship campaign. Critical to the quieted discourses of Baker and other African-American women was a sense of literacy as a tool for citizenship, self-defense, and protection of the group.

The work of Ida B. Wells-Barnett, a journalist and eventually a publisher, is one example of the value assigned to the written word and the ability to execute the word in

self-defense. In the early 1900s, determined to address the postbellum crimes against blacks throughout the country, Wells-Barnett provided a prescriptive, intellectual account of the "social and economic captivity" which was perpetrated against blacks through racism and lynching. In a harsh response to a series of investigations which Wells-Barnett had conducted about lynchings, a white male Southerner wrote: "The Negroes in this country are wholly devoid of morality, the women are prostitutes and all [a]re natural thieves and liars" (see Lerner, 1972, p. 436).

The retort of African-American women was to take the pen and, in a statement published by the National Association of Colored Women (NACW), leaders of the colored women's club movement declared the intergenerational purpose of their work for literacy and education:

Now for the sake of thousands of self-sacrificing young women teaching and preaching in lonely southern backwoods, for the noble army of mothers who have given birth to these girls, mothers whose intelligence is only limited by their opportunity to get at books, for the sake of the fine cultured women who have carried off the honors in school here and often abroad, for the sake of our own dignity, the dignity of the race, and the future good name of our children, it is 'mete, right and our bounden duty' to stand forth and declare ourselves and principles, to teach an ignorant and suspicious world that our aims and interests are identical with those of all good aspiring women. Too long have we been silent. ... (quoted in Lerner, 1972, p. 442).

The legacy represented by this declaration—the culture of African-American women and the intergenerational transmission of beliefs and attitudes about learning that are nurtured within many African-American communities—has been steeped historically in images, perceptions, and illusions about the nature of the black woman. Similar to women from other cultural and ethnic groups, African-American women are often challenged and challenge themselves around questions of who they are or are not, how they have changed or have not changed, and what successes they are capable or not capable of achieving. Unlike the culture of women generally, however, the culture of black women is characterized by a distinctively race-centered perspective in which the social processes of sexism and racism stand not in tandem but in relation to each other. Thus, in many ways the development of views about literacy—together with the contexts in which these views are developed and in which literacy events occur, are created, and are enacted—is not embedded in a natural life discourse but is initiated as a response to or preparation for life (not simply as a woman, but as a black woman) in American society.

The prices that are tagged to this identification, the path less traveled by women outside the African-American community, and the difficult road to accepted and acceptable private and shared discourses are the literacy legacies of many African-American women—what Hill-Collins (1996) has called "visionary pragmatism" or what I refer to as limitless possibilities against guarded hopes. In the next section, I present literacy narratives from case studies with African-American women and girls across two and three generations, focusing on: (1) the complexities of intergenerational communication around literacy, race, and gender, and (2) the

ways in which views of literacy are transmitted and literate activities such as journal and letter writing serve as mediators for difficult topics and familial problems implicated in limitless possibilities and guarded hopes.

INTERGENERATIONAL DISCOURSE: MEETING PLACES FOR WOMEN AND GIRLS

I used to sit and wonder, "What will my children become?" I guess I wasn't like many girls of my time. As a child, I had dreams that seemed so big; they were bigger than anything I had ever known or seen. I wanted to go places and do things that I was made to feel were impossible for a Black girl. I wasn't even sure that the places existed but I thought if I could think of such places, they had to exist. As I grew older, I came to know that such places did exist, that the choices we make sometimes limit whether and when we go to these places and learn new things. I knew that even if I made the choice to do otherwise, the Jim Crow laws would not allow me to enter some places. For the past 60 years, I have argued my case for equity and I have used my teaching of literacy as a way to come to grips with the barriers before me, making sure they would not be obstacles for my children and the other little treasures of this community. I have been happy in this struggle and have wanted my daughters to be happy like me. But I wanted them to have a different kind of happiness. I wanted them to be in a position to ask for what they wanted—to demand it—and be sure that they could be in a position to get it. I wanted them to be wives and mothers, but I wanted them to somehow be the voice of my discontent and the voice of my pleasure and pride as a Black woman... to speak with eloquence and confidence, to be fighters and nurturers, leaders and pursuers of dreams. I guess I still don't understand impossible. I have often spoken of these things and thought it was time to write them for you to remember.

—Ms. Cenia, an 81-year-old mother, grandmother, and teacher

The text has been translated from Gullah to standard English at the request of many of the informants. The realm of possibility mapped against the perception of limitations in intergenerational literacy perhaps is captured most eloquently in this quotation from a self-described perpetual learner and teacher and oft-described ageless entity. The intergenerational nature of learning, as it occurs in families and other contexts, is both inviting and problematic for teachers, learners, and users of literacy. It thrusts into an academic sphere issues that were once the natural preserve of informal discussions and private traditions within families and cultural and ethnic groups. To study intergenerational literacy is to make public, formal, and vulnerable both the processes by which literacy is constructed and conveyed (through oral and recorded messages) and the actual activities associated with learning, understanding, using, and valuing knowledge. Intergenerational literacy research and practice hinge on assumptions that literacy is a critical part of learners' social and cultural evolution, and that whether and how learners choose to use this knowledge connotes or demonstrates the degree to which they have accepted, modified, sustained, or transformed the intergenerational messages about literacy—in short, the degree to which they have "bought into the system."

What genres have been created by women and life texts shared between women and girls, mothers and daughters, sisters and sisters, grandmothers and granddaughters, or teachers and students? Who are the people involved in intergenerational learning? Where do they come to share knowledge and experiences, and with what effects? What are the bounties of knowledge and intricacies of learning in the relationships between learners across generations, and how do they negotiate these relationships? What does it mean to be literate, and what selfhood is disclosed and personal opportunities provided to African-American women who are literate (Gadsden, 1993a)?

The term, "meeting," is used here to label these sharings of discourses. However, the term has a range of meanings and uses. Consider the following common uses:

I can meet you at the corner, to indicate place for gathering.

I will see you at the meeting, that is, a business or social event for a stated cause.

I have always wanted to meet him, for example, a long-awaited introduction.

Then, our eyes met, indicating the preface to romantic possibilities.

It is where the two roads meet—to indicate a convergence of formerly discrete points.

In the text that follows I have conceptualized "meeting" of women and girls in two ways. In the first, the girl in each woman and the woman in each girl attempt to reconcile their common histories and destinies. They grapple with insecurities, aspirations, and expectations—unresolved issues that are sometimes unsuccessfully submerged in the daily acts and demands of being assigned roles by virtue of their race, income or poverty, age, or gender itself. Second, they talk about common and unique strengths.

The narratives are divided into three text groups. Text Group 1 includes a grandmother, mother and daughter who, through written and oral discourse, attempt to unpack the long unspoken questions of gender and race and of intergenerational tensions that overwhelm their caring. Text Group 2 focuses on written conversations about the meaning of persistence. Text Group 3 describes the uses of written literacies as a way to uncover experiences of hardship and fear of failure between mother and daughter.

The narratives are part of two intergenerational literacy studies. Those in Groups 1 and 2 are gleaned from my work with three of four generations of African-American families from rural South Carolina. The informants in this work include 25 families across the four generations: (1) adults who at the beginning of the study were in their 70s and 80s, and (2) their children, grandchildren, and great-grandchildren. Beginning in the second generation, I interviewed the children who had stayed in the small community and those who had moved north. I have attempted to interview a cross-section of informants in each location. Interviews were conducted with the members of the first cohort and with selected children in the second and third cohorts. Over 700 hours of interviewing were conducted in both the rural communities and the northern cities where many of the children now live. In-depth,

follow-up interviews were conducted with a representative group of families for the third and fourth generations. I observed the informants in multiple contexts and examined their written family histories, letters, and stories; listened to their oral histories; and reviewed existing reading texts and materials in the homes. Either as a result or in spite of this work, many of the informants have begun to exchange their written texts with each other and with me.

The narratives in the third text group are lifted from work with African-American and Latino Head Start families in Philadelphia. Supported by a grant to the National Center on Adult Literacy, this study focused on parent literacy and parent learning, particularly examining the family as a system of learning and the role of literacy in that learning. With more than 40 participants over 2 years, the study provided a perspective on how families living in poverty perceive literacy and gain access to literacy and the need to provide literacy. The relationship between the parents' desire to improve their literacy, their intent to ensure their children's success, and their representations of the harshness of poverty in their daily lives threaded the conversations and our work with the Head Start program and the parents.

The commentaries in this paper are from interviews I conducted with eight women. The commentaries centered on three themes (1) the role of literacy and the relationship of literacy to life goals and expectations, (2) purposes and uses of literacy, and (3) incentives and obstacles to literacy. Each commentary and theme connect a variety of life events around issues of womanhood and race.

MEETINGS AROUND GENDER AND RACE: WHERE PRACTICAL REALITIES MEET LIMITLESS POSSIBILITIES

Two kinds of literacy discourses are provided within three generations of Ms. Lannie's family: the oral and written discourses of Ms. Lannie, an 82-year-old mother with eight years of schooling; her daughter, Pat, a 50-year-old teacher with a master's degree; and Melanie, Pat's 16-year-old daughter. Their journal accounts in an intergenerational women's group meet around unspoken love and a common bond in the experiences of race and gender. Ms. Lannie commented:

My dear, reading and writing is the one thing that everybody should want to learn. I always wanted to be a good reader; people give you so much respect when you are learned. There is no substitute, though, for having good old mother sense. But back to this thing about being a woman. You know, Black women always must be ladies. People don't expect that we can be; slavery taught us that. Well, the truth is that I have never known a woman in this community who did not do her best for her children. Women take care of the children. They're the only ones who always know how children are doing in school; they are the protectors of their children. It has always seemed wrong that with all the responsibility that women have, we don't all know how to read.

My most difficult experience was trying to prepare my girls for the challenges. I was caught between wanting them to conquer the world and finding a husband. I bought them books, I read to them

and mostly told them stories. I told them stories often about the great women in the Bible. When I learned about great women who were Black, I didn't tell them much about these women at first—maybe I didn't think I measured up. I wasn't sure that the stories were always true, how the women I had read about made the choices that they did. I didn't know what to tell my daughters about what to expect, but I could tell them that if these women could make it, so could they.

This is a quiet community. Women in this community are strong. I know that if Harriet Tubman could take slaves to freedom, I could make sure my children were prepared to fight the system. Black women are strong women; we survived over 200 years of slavery, not once giving up on our children. No matter how much life challenges us and how much we are denied, we force our way in and make people listen.

Ms. Lannie's daughter, Pat, spoke of the stated valuing of literacy and the images of a woman—her mother—for whom literacy was important but for whom education had not been accessible. We begin to see the respect that defines the relationship, the issues that potentially complicate that relationship, and the shared views and behaviors that have sustained it. In a written journal account, Pat wrote:

My mother is an interesting woman. We had a relationship based on respect . . . and trust. She reinforced the issue of self-pride as a woman and as a Black person. When I was a little girl and I saw her reading, I wanted to read. We rarely left notes to each other; we relied almost always on telling someone else. We practiced the oral tradition in our house. What I remember most fondly is the way she would listen to me read. I would tell her about my plans for being an important, educated person. She used to give me mixed messages. For example, she made a point of telling me that I should get married after college, but seemed relieved when I said I was going on to graduate school. The culture of women, as you call it, was that literacy gave women options, that those options created more problems than they eliminated, that the options had to be used, and that no difference existed between literate and illiterate women. On any given day, you could be assigned the stereotypical images. Learned people were expected to know how to respond to the system in ways that showed off how literate they were, their intellect, to speak for the least of your sisters and brothers.

The greatest impact of my mother's literacy for me and the legacy she gave me is my desire to read things written about and by Black women. By telling me about my responsibility to the community, I understood that learning was more than what I got for myself. It was for generations of women to come. What is shocking to me is to compare my mother's stories of racism with my daughter's stories of racism and sexism and to know that discrimination is here for a long time. I think my mother prepared me for womanhood by making sure I was literate. I think that's what she felt she had to give me and my sisters. I try to give that to my daughter, perhaps less successfully than my mother. The enemies and barriers were more obvious when I was growing up; your place as a woman, as a Black person, and as a literate person was clear. Your decision was whether and how you would rise above the barriers, accept them, or try to remove them. You knew that while you might have the support of women in word, the struggle may have to be yours [alone]. I don't think she [mother] has ever believed that I understand that!

She has always felt that I take the education for granted and that I don't understand how many sacrifices were made. It might be that I have not paid enough dues. But you never know how

much is enough. My mother took a little education and made it count for her children.

After reading her daughter's entry, Ms. Lannie commented not about the personal statements of her daughter but about her own role as a mother, seemingly not as a form of self-centeredness or resistance but as a way to delay a response to Pat or me. She subsequently spoke about how touched she was by her daughter's admissions but did not want to respond to them publicly. In short, she was choosing who the audience would be for her response. Instead, she talks about her valuing of literacy, introducing the commentary with an approving tribute to her daughter:

Pat, smart girl!! But no patience with people sometimes. She was always a good reader and always wanted to read. . . .

I may not be the best reader, but my role as a mother and wife made me want to use the reading that I could do to make sure that opportunities were available for my family and myself. Thank God, I never had to work in a White woman's kitchen. Sometimes, I look at my children, and I can't believe how learned they are. You see what Pat can do. . . . Ah, I need to tell her that.

I wonder what it would have meant for my literacy not to have been Black or a woman, you know, at the time I was. You know, in our little women groups [in the community], we used to get together and talk about what we wanted for our children. Our Sunday School was the Bible reading class. Men always taught the classes, teach the women. You could say that they couldn't trust women with the Word. No telling what we might do. Defrock them!

Probably the thing that makes me downright mad is how strong the prejudice was here. If I had had more grades, what a joy it would have been to read different books to my children, expose them to the fine readings early. My children are wonderful. I tried to teach them not to hate. You know racism is a terrible thing, and Black girls are the victims of so much. How do you say, be strong, fight for your rights, study hard, don't let racism get in your way, and don't let what others think they know about you, whatever the source—research or whatever—make you believe that you are not the best. Pat is a fighter; she is her mother and father's child now. . . . Now we have to work with that Melanie. I just want Melanie to understand the important things in her young life.

Ms. Lannie and Pat shared beliefs and views, but their experiences differed. Although well educated, Pat had never attempted to use the written word as a way to engage or come to seek greater understanding and communication between her mother and herself. Whatever their differences, however, they also shared a common interest—Melanie—the granddaughter and daughter who represented the possibilities for the future. Ms. Lannie sought a shared discourse with Melanie whose experiences were similar to, yet vastly different from, her own. Ms. Lannie and Melanie were able to cohere around many common beliefs and experiences that the absence of an intervening generation allows, a cohering that would not have been possible for Ms. Lannie and Pat. Despite the opportunities that a missing generation of discourse offers, however, Ms. Lannie and Melanie were daunted equally often by the distance created by the missing generation. They suffered from an inability of the first generation to understand the third and of the third to understand the first, reflected in Melanie's journal:

Sometimes Grandma gets on my last nerve! But sometimes what she says makes me feel so much better. She treats me as though I don't think. I guess she has seen so much, she wants the best for me. It's a funny thing. Even though she gets on my nerves sometimes, there is nothing I can't ask her or tell her. She just nods and makes the hardest question seem like an easy thing to answer. I feel so confused sometimes. I tell Grandma. "Girl," she says, "it's the times you're living in. You can't help but be confused. But keep your feet to the ground, believe in yourself, and trust in God. You have a family that loves you, and a strong mama and grandmama."

Like other children, Melanie was more likely to speak about her grandmother in loving rather than negative terms. What was striking was her stated desire to unpack the negative responses that did not allow her to demonstrate caring. After many conversations, Melanie decided to begin writing notes to Ms. Lannie. The first, short note was the beginning of ongoing sharing of literacies and experiences, many of which center around parsing the changing expectations of girls and women within and outside of African-American communities and the implications of racism in the daily life experiences of both:

Dear Grandma,

Although we do not always agree, you are my best friend. There is no problem that I can't share with you. Thank you for being there for me.

Love,

Mel

Ms. Lannie responds:

Dear Melanie,

I wish I could write this better, but I hope you understand what I am trying to say. Your words are beautiful. When I see you, I see all of the things I wanted for myself and never had a chance to do, all the things that I wanted for your mother and she just didn't or couldn't do them. You are so much like me—when you're feisty. You have the weight of all of our hopes and failures. It's a hard road to travel. But I believe in you and love you.

Love,

Grandma Lannie

Both Ms. Lannie and Pat indicated that they had attempted to shelter Melanie from confusion and self-doubt that result from, as Pat suggests, "the insidious nature of racism." Each identified difficulties in helping Melanie both prepare for and balance the problems that each felt Melanie had already begun (and will continue) to confront through harsh experiences in "unlikely places." What each has decided is that at the center of her talk to and with Melanie is the communication of love and caring. Melanie's first short note, thus, became the point of entry for this talk.

Meetings of Respect and Persistence

I have identified two dominant themes in the interviews with the informants. One focuses on the concept of individual and family persistence as a survivalist quality, enabling the individual to continue in the midst of human conflict and strife. As

a motivational/metacognitive variant, persistence encourages the learner to (1) assess, plan, monitor, and continually weigh the potential difficulties of learning and schooling against the opportunities they provide, and (2) develop and use strategies and resources to rise above obstacles.

Relatively little work on African-American families speaks to the issue of persistence outside of motivation within school contexts. In this research, persistence refers to the emotional and human stamina of the individuals studied—stamina to demand education for their children, to insist on learning to read, to cling to a belief in schools and the people in them, and to seek alternatives to human and educational plight. Persistence also refers to the immutability of aspirations associated with literacy beliefs, practices, and strategies despite their transformation within families over time, as a result of migration and a variety of life events. In this work, the need for persistence appears to be inherent in the African-American experience. Ms. Addy, an octogenarian with "high school grades," describes this in a statement of her sense of family life and learning:

Family life isn't just about having children; no, it's about planning for them and them planning for themselves, *too*. Well ... and being Black, a mother, and having children. When I was a child, well, things were a lot harder [than today]. But, despite the hard times, my parents talked about the future as though things were really going to be different for me! They had absolutely no idea as to how it would happen or what it would take exactly, but they knew it would take *hard work*! School was one place where I was going to be prepared, not only to help myself but to help the family.

Here's the thing. You knew you were Black and poor—a given during my young days [and early adulthood]. You knew that the White people in the community were not going to give you a break, and in fact, we made our breaks. So, you had to figure out what you wanted to achieve, how to get there, and what to do when you got there. There was no confusion about the fact that when you learned to read and write and if you became highly educated, you were supposed to share the knowledge and the struggle so that kids and families understood not only that you got to where you were but what it took—that you needed to continue the struggle as a Black person, primarily for your family, and to make sure you were learning what you needed to improve the community. Parents prepared you to think about the struggle in the long-term, prepare for the [hurdles], and for what you needed to do if you didn't jump them. I don't know if you understand what I am talking about! In some ways, what children and parents are experiencing today is not that different from my childhood and my early years as a parent.

Life for Black people has changed as my daughter says in the "quantity" of opportunities or what seems to be quantity, not in the quality of the opportunities. My grandchildren are victims of racism, a different kind, just as I was. But, you know, they don't know how to plan for hard times *and* good times, like we were taught to do. They only plan for the good times.

Sometimes it seems like even the ones who did well in school don't always understand, or may be they just aren't willing [to understand] the next step in the struggle. Not just our children—all of them (Black and White!). Instead of trials and errors, they seem to have a wagonful of errors for every trial! So they are always starting over or picking up where they left off in school or whatever, rather than continuing on their planned course.

Ms. Addy's daughter, Ina, writes:

If there was one thing that my parents taught me, it was to think about what and who I wanted to be: how do you make it; how to hang in the picture long enough to make it. Well, you begin by reading. What made a difference in our little country community was that we knew everybody—you know the principal could just as soon come to your house as your kin. The other thing was that our parents expected us to demonstrate that we were learning something and what we were learning. Educated or not, many parents wanted to hear children read and made them read; they trusted schools in a way that their children find it hard to do. The encouragement they gave us said that we had to persist in the face of difficulty and that persistence was tied to the struggle of . . . not Black people in general but to the values of our small community.

Don't get me wrong, not everything was happy or pleasant, not everyone cared about other to do people. But, I think people who were not successful saw their failures as individual, not family, and kind of kept hope for their sisters and brothers and their own children.

So, educated or not, successful or not, as one informant said, "you had this plan"—sometimes an intuitive sense of the journey of learning and living. Learning was equated with literacy, and living demonstrated the functions and uses of literacy. In learning and living, the individual was expected to persist; the family was the context for crafting and strengthening that persistence.

Meeting of Past and Present: Literacy of Hope and Fear

Increasingly, reports from practitioners indicate that the intensity of problems facing many learners may exceed the ability of programs to support families learning literacy. The intergenerational meeting of children and parents often results in parents attempting to reconcile past hopes and present fears. Letter writing and the act of journal writing often provided safe places for the mothers in a small literacy program to reflect on this push-pull of past and present and its implications for their future. In the renderings that follow, neither speaker is over the age of 30. Both have worked intermittently, both want to improve their literacy, both have children and aspirations for their children, and both live in low-income homes. Although both seek to "make a difference" in their homes and community, neither understands fully what the scope of her rights and responsibilities is or might be in the future. Little in either one's education or experience has exposed her to more than the limits of possibility. Karen, a mother of two wrote:

If I had been a better student, I wouldn't be poor, at least not as poor, I don't think. But you know, my husband finished school, and he has been laid off, laid off more than once, and he is poor. I do think that if you have reading and writing you have a better chance, but if you are poor, no one seems to take you seriously. In school, the way teachers teach make you not want to learn, make reading seem hard. Then [the stories] weren't even interesting. It would have been nice to read that a girl like me made it out of the ghetto and be able to understand what I had read. I am going to go and take some classes to improve my reading—as soon as my baby goes to Head Start. Maybe if they [her children] see me

reading, they will want to read, too, and make it out of this neighborhood. But education gives you one way out, and some people do it.

Alisha, a mother of three, faces the fear for her children's future and her inability to mediate the problems they will confront:

What I would like my children to understand is that they don't have to be poor—that literacy is theirs for the tryin'. The problem isn't that I don't know what to say to them; it's that I don't know how to back up what I'm saying. Old people use to tell us to work hard in school, but [in truth], some of us weren't taught much reading in school. People who are literate and well educated, they run the world, but how many of them started off poor. I don't mean their White grandparents, I mean them. What I am going to tell my children is that they have to do good work in school, and I need to be able to help them. If you are [literate], I think you just know better where to find the things you need. You don't have to be as embarrassed as if you are poor and illiterate.

Desperate to enter into a conversation with her adolescent daughter, Alisha shares in a letter with Lisa her personal disappointment at having gotten pregnant as a teenager and her hopes for Lisa:

I want you to know I love you. I want you be a good student. I want you to make it. I don't want you to become pregnant like me. You do have opportunities. I want you to go to college. I want you to be happy.

Lisa, unwilling to be engaged or to engage her mother about the difficult topic of sexual activity, responds in a letter with an answer to the unasked question about her sexual activity:

Dear Mom,

I love you, but sometimes . . . I get so tired of you not trusting me. I plan to be somebody and I will not get pregnant. You think I am having sex, but I am not. I want to get out of this neighborhood and get you out of here too. I need you to believe in me.

Your daughter,

Lisa

The tradition of letter writing in the families I have studied allowed women to talk about a variety of issues. I have read letters kept by family members—family texts that included letters written between children and parents; siblings and siblings; and among parents, children, and other family members. A few of these letters were written in the early 1900s and typically conveyed the state of the individual's life, rarely mundane details. In volumes such as Gutman's (1976) and Blassingame's (1977) historical works, this purposeful picture of letter writing is presented, for example, letters of slaves both to family members and to white sponsors. These letters provided the context for understanding the travails of the African-American in search of a place to succeed and a time in which to be successful. The women who wrote spoke of both successes and problems, often seeking assistance for their hardship and support for their advancements.

A primary communicative device prior to the advent of telephones, letters for African Americans (as is true of other Americans) were the vehicle to exchange ideas and experiences. Unlike the letters of other Americans, however, many of the letters of African Americans from slavery through recent times have been laced with messages of life in a society where race is still the most prominent and divisive issue. African-American women such as Alisha and Lisa continue to bear a significant burden in this discourse and have begun their own written discourse to unravel the complexities of their lives and to lift the tension between hope and despair.

CONCLUSION: THE EVOLVING INTERGENERATIONAL CONTEXT AND THE CONVERGENCES OF LITERACIES

What does it mean to be a woman and then to be an African-American woman wanting to provide a legacy of hope for the next generation? Responses to this question are riddled with issues about self-definitions, personal analyses, and choices, particularly for mothers who, in aiming to convey to their daughters the possibilities for their future, feel compelled to remind them of a real or perceived limit to their acceptance (Hill-Collins, 1996). The definitions and development of literacy within the lives of these three groups of women and of African-American women historically are centered around the notion of community, including the need to rise above societal obstacles, to chart a course often unlike that of the women's nonblack peers, to be responsive to the collective mission of the group, and to commit to the nurturance of children for an apparent race-unfriendly world. So embedded in the definition of woman is the concept of cultural uplift that the women find it difficult, if not impossible, to separate their identities from the struggle. This message of struggle is a part of the message within each of the legacies of the women described in this chapter—women in search of the freedom to be themselves. The ease with which the message about literacy and access is conveyed is increased when a generation of responsibility is removed (e.g., in the case of Ms. Lannie, Pat, and Melanie) and when each succeeding generation becomes a part of the evolving historical context.

In this chapter, through oral and written literacies the mothers and daughters negotiate limitless possibilities against guarded hopes or Hill-Collins' "notion of visionary pragmatism." The intergenerational context for interpreting, valuing, and assigning purposes to literacy evolves as the possibilities for literacy become apparent for these mothers and daughters who have varying levels of literacy. The narrative texts presented suggest issues that have implications for research and practice.

First, families serve as the most obvious intergenerational context. Although they sometimes impose boundaries, that is, on the ways that individual family members come to define and articulate life needs and goals, they provide in other cases spaces for expansive ways of thinking and exploring possibilities despite obstacles. How literacy can assist families to

remove boundaries and realize opportunity is perhaps the most important question and challenge facing family and intergenerational literacy programs. What are the messages that parents want to convey to their children about literacy, what messages do children hear, and how can programs assist parents and children most effectively in learning literacy? What are the strengths of families? Who are the mothers and fathers in these families, and how do programs build on parents', children's, and families' strengths? How do programs make useful, rather than problematic, the issues of race, class, and gender? Because these issues are common to the experiences of families, intergenerational learning efforts will be affected by them and by learners' perceptions about their importance to the culture of the family itself (Gadsden, 1994).

Second, the life texts of the women and girls suggest that literacy activities also create points of entry for beginning and sustaining discourses that continue throughout the life-span of children and adults. For the mothers and daughters here, the topics that emerge are both complex and difficult to discuss. Yet, the literate activities of reading and writing contribute to their intergenerational learning by offering both a means to create and to continue conversation—that is, written and readable discourses—and a place for the conversations to be inscribed—that is, the family.

Third, literacy activities such as interactive journal writing and letter writing hold much of the same promise as a communicative medium as they do in school-based relationships between teachers and students. Parents and children who have varying levels of literacy have opportunities to reflect on issues critical to them, to share ideas with each other, and to practice their writing and reading. In the work that my research team has done with Head Start parents in Philadelphia, parents comment consistently on the value of the journals and letter writing as activities to "make them write."

For practice, these life texts imply that intergenerational and family literacy efforts have a variety of stimuli upon which to build relationships within families. Journal and letter writing, autobiographical analyses, and biographical writings provide learners with a way to improve their literacy, share life stories, and explore difficult questions with each other. I do not suggest here that parents and children no longer engage in talk but that a richer follow-up to these oral discourses is to be found in the written discourses within families. Activities developed around intergenerational life texts encourage the learner to investigate cultural myths and family legends and to compare these across contexts and storytellers. The mix and match of oral and written tradition within the cultural community of the learner assumes a larger image.

In considering interactive journal and letter writing as approaches to increasing intergenerational literacy, researchers and practitioners might be mindful also that these activities presuppose a level of competence or appreciation of the letter as a familiar document and that the value of this medium may not apply to all families. For example, Purcell-Gates (1995) found letters to be outside the experiences of the mother and son with whom she worked over time. After informing the young mother that her son was unfamiliar with postcards or letters, to Purcell-Gates' surprise, the mother

responded, "No one writes us 'cause they all know we can't read."

By using African-American women's life texts as a context for the discussion of intergenerational literacy, I have attempted to position the issues of gender, culture, and race as powerful influences and sources of shared meaning and literacy—as sources of information which can be used planfully by programs and researchers to understand better the nature

of intergenerational learning, the lives of learners, and appropriate approaches and materials to be used with different populations. Equally important, however, is the need for attention to women's issues in literacy discussions and inquiry into the multiple ways in which mothers and fathers, as women and men, come to influence the literacy development of children as they reconcile their own life options with their literacy and educational goals.

COMMUNITY LITERACY: FROM HOME TO WORK AND BACK

Gary Pharness

HASTINGS INSTITUTE, VANCOUVER, B. C. CANADA

Lee Weinstein

ADULT EDUCATIONAL CONSULTANT

The constant presence of family and community is found in all literacy work that attempts to build, redefine, and nurture learners in settings that draw their strengths from the needs and interactions of their participants. Community literacy is that literacy which reaches out to a defined neighborhood and to those who live and work within its boundaries. Community literacy exists at its best when all interested residents can shape and define the learning opportunities.

In this chapter, we argue not only that an understanding of adult learners' family, community, and workplace contexts is most powerful in literacy learning but that these contexts are best understood through learners' own narratives. It is the singular context that directs each of us as educators to learn afresh what is and is not important to the learner, and it is this story that tells us where we might best step into the learner's life.

Although the authors work in different arenas—community, workplace, and neighborhood-based—our view of literacy shares a common perspective. We believe that all of us have many personal literacies and each literacy has its own texts. These texts are the histories of our families, communities, and workplaces. In creating these texts, we are creating a literature. The use of that literature as curriculum reduces the separations of teacher from learner, curriculum from learner, and both from community. We believe that to teach literacy with this analysis requires the teacher to engage in the same process that he/she asks the learners. In understanding what we do, it is important for us to look at where we as workers come from. As an example, our own stories follow.

GP: Shortly before I turned three my grandfather came to live with us. With the arrival of my grandfather, I was intro-

duced to reading. My grandfather was bald except for a short fringe of hair which seemed to wrap around the sides of his head like a narrow collar. And, although he was bald, he was more than vain about this collar. He dyed it red, using a toothbrush to apply watered-down oxblood shoe polish. Soon after his arrival he taught me the method of applying the polish to his hair. And during the procedure, which usually lasted an hour, he would read to me from either the *Bible* or from Dale Carnegie's *How to Win Friends and Influence People*.

Understandably, these two books are beyond the comprehension of a small child; however, they were exciting to me. My grandfather was a very attentive man. He realized my need for language; and, not only did he read, but he sang. He paused often to repeat a sentence or explain a word. More often than not, he would draw my attention to the sounds of a word and then help me struggle through to what to him was a satisfactory pronunciation. Another habit of his, which was annoying at the time, was the way he enjoyed the cadence of prose by emphasizing sound within a line. I soon learned to associate my grandfather's voice changes with certain meaning within the line. This was my introduction to books, and to reading. My grandfather also introduced me to carpentry. He allowed me to hammer alongside him high on a roof; and, while I missed nails, bent nails, and watched nails roll down the roof and over the eaves, my grandfather shouted, laughed, sang, and talked. My grandfather brought more than books and reading to our house, he brought language.

LW: My Dad, whose first language was Yiddish, was the model for my reading. He taught himself to read at the public library. He was an eclectic and passionate reader. His most

used possession was the library card. My earliest and fondest memory, outside of playing baseball with him, was going to the main branch of the library in New Rochelle, New York.

When I was 8 or 9 years old my mother and father introduced me to independent reading. Now that I look back, it seemed odd that they had certain books that they told me I had to try. It was okay if I didn't like them and I didn't have to finish them, but I had to read twenty or thirty pages. Perhaps the reason it seemed tolerable was that my reading time extended my bedtime by 45 minutes. Another advantage was that my parents didn't check up on me to see if I followed instructions. There were no reports and no time limit to complete the readings. They only asked me to tell them what I thought about the books.

There weren't a lot of books on the "required list," but I knew they were important to my parents and they hoped would be important to me. The overflow books in the house were kept in the bookcase next to my bed. One night, with nothing to read, I found on the shelf a book of Twain's short stories. The first story was "The Jumping Frog," because the stories were not longer than 25 pages, I could read two mini books a night. In each story I walked through a new town filled with characters that I couldn't wait to get to know. What was most important about the books I found in my room was that in a house where no secrets were allowed I had something of my own.

By junior high school I had an interesting outlook on the world. I was conservative in my tastes and politics. My brother had enlisted in the Marines and as he went south, Paris Island became the benchmark of what made a man, that is, until it became clear he didn't quite fit into the Corps. My vocabulary expanded to include the terms: brig, AWOL, M.P., St. Alban's Hospital, and Section 8 discharge. Into that fractured consciousness my radio dial hit WBAI in 1967. With no parental filter, I heard for the first time Phil Ochs, Tom Paxton, Lenny Bruce, and others. The words, songs, and attitude on WBAI were exciting, bordering on the illegal, to me.

While I was on vacation during my junior year in college, my father came downstairs and gave me one of the library books he had checked out that week, E. L. Doctorow's *The Book of Daniel*. It was a fictional account of the Rosenberg children and how they coped with and survived in the world after their parents were executed.

My Dad and I talked about what it was like during the McCarthy era and the earlier memories of his dad, who was an organizer for the Garment Workers' Union. As he talked about his early Post Office union activities and his flirtation with the Abraham Lincoln Brigade, I found myself embarrassed at my arrogance and how little credit I had given him. More important, I realized how much I enjoyed my new found connection with him.

My new respect for him gave my father the permission he needed to tell me stories of his life. Instead of having the dialogue between us based upon my bizarre behavior, politics, and dress, we had a positive reason to be in the same room. As I read *The Book of Daniel*, we talked about the Rosenbergs, the Peekskill riots, and what it was like to hear Paul Robeson live. I told him how happy I was for the book he gave me and I thought Doctorow did me a favor by writing it.

"Call him up," he said, "he just lives in New Rochelle." I laughed and told him that it would be crazy, and he'd hang up. "You're the one who is crazy. He would love to know you liked his book. Every author is happy to know if a reader liked his work." I did call Doctorow, and told him his book helped me connect with my father. He was very gracious and appreciative that I called.

GP: After starting school, I was placed in an adjustment room which had been created for children who demonstrated difficulty in settling down to kindergarten routines. All in all, this was a positive experience for me. It allowed me to look at and to try to read the many books in the room. Of more importance, our teacher, Miss Runberg, read to us for about 2 of the 3 hours we were in school. She read Mother Goose, fairy tales, folktales, and a continuing story of Uncle Wiggly, a story about an old rabbit; and, when reading about this rabbit, she always put long whiskers around her mouth and long fluffy ears on her head and then she would twitch her lips and shake her ears. It was wonderful and it was the last year I ever liked school.

During grade 1, I went to an old Carnegie library after school and on weekends. It had a fireplace which was used during the winter, and a large stage. The story lady read twice a week from a comfortable, overstuffed chair which always was to the side of the fireplace. The story lady read beautifully. In winter, the library staged children's theatre on Saturdays. The entertainers performed with breathtaking grace. By grade 3, the librarians allowed me the run of the place. From that time on, I especially enjoyed the stories of Grimm and Andersen, Harris and Aesop. I also read *Sleeping Beauty*, *The Wizard of Oz*, and *Alice's Adventures in Wonderland*. And, I continued to read about explorers, pirates, gunfighters, Indians, the Civil War, and New York gangsters. Along with these stories I read *Tobacco Road* and *Studs Lonigan*.

Inevitably, at an early age, I was drawn into the human spirit of my family and neighborhood through stories full of sin and hope, violence and joy, sorrow and redemption, hatred and promise and loss and love. It was in the telling of stories that my neighbors and family took on life, and fixed their place as detailed portraits in my memory. Uncle Harold is one such story.

who:	Uncle Harold,
what:	death,
how:	killed on motorcycle,
when:	1939, and
why:	he turned around to kiss his girlfriend.

These were stories about family that seemed to mean a lot to everyone, whether living or dead. And, as much as any living thing, I remember the darkening light and lifeless air of the foundry where my father worked; a loveless misery generated from its heat and noise and strength, then passed on from father to son. However, I was unable to carry for all my working days the burden of being a foundryman, or to hand it down to my own son.

LW: After college I started teaching social studies in an alternative school at Washington Irving High in New York City. The program was on the twelfth floor of a 6,000-student all-girls public school. I taught western civilization for one

period in the regular school and any kind of social studies course that would keep five other classes interested.

Everyday for the first month I wanted to quit. The girls thought I had nothing to offer them and I ended up unsuccessfully pandering to them just to keep their interest. The low point was at 1:00 p.m. everyday when I'd get in the TV and we'd watch a game show. Whatever the mandate of the New York State Department of Education was, it wasn't happening in my room.

Then it struck me to bring in some black American literature that I found exciting. So I ran off some Julius Lester's stories from *Black Folktales* and *Long Journey Home* on an old Gestetner and formed a reading circle in my classes. As the stories spoke to my students and I valued the writings, the classwork assumed an importance it hadn't had before. Friends of my students started cutting out of their school and showing up for class. Students would frantically practice the text to be read during their turn. Discussions were as exciting as the stories they were reading.

What we can learn from our own literacy acquisition and practices allows us to work with others with more integrity. Implicitly or explicitly, our histories as laborers and skilled workers inform us about most facets of working with learners and employees.

SHARING WRITING, SHARING LIVES AT INVERGARRY LEARNING CENTRE

At Invergarry Learning Centre, we experience learners' sharing of their lives through writing. The Centre is unique in that it is a wholly adult learning environment housed in its own building, under the auspices of the Surrey School District. The Centre is staffed by people who favor a writing-process approach to literacy, and the staff and administrator develop funding proposals which access resources to put beliefs into concrete actions. More than anything else, we want to build a sense of community with learners.

The literacy program at Invergarry was founded on the principle that language learning best occurs when learners create their own text from the experiences, competencies, struggles, and triumphs in their lives. Learners are encouraged to write and critique each other's work in small groups. Many of us write side by side with the learners, whose writing is published in our journal, *Voices*. These writings support our literacy philosophy: everyone is a writer and has a story to tell, and through this telling we can better understand our place in the world. Toby, a young man from Mississippi in a class at DeBerry Prison recounts:

So the next day Davie got me into a reading class and the teacher did not mind that I could not read too good. He handed me a book (Harry Crew's *A Childhood: Biography of a Place*) one day and told me to read just a couple of lines out loud to him. So I started to read and something in the book told me that it was a good book and the teacher knew that I liked it. If I like the book I could read it if I would not let no one have it or lose it. So, I left and went back to my unit and started reading it and a week later I was finished with the book and give it back.

The teacher asked me if I like it and to tell him about it. So I began telling about the book. And how it somehow changed me just a little. The teacher then told me that there was a good story inside of me and he wanted me to write a short story for him, so I wrote a story about prison and what I thought about it. And that story came right out of me. It was at the first time I've ever wrote anything like that. So the next day I gave it to my teacher and he liked it and said it was good and that. He said that he thought there was a book in me. And if I keep writing I might get to it. (*Voices*, Fall 1990, pp. 78, 79)

Student writing and other dialogues help make the Invergarry literacy program a place where a sense of community grows and is nurtured.

The consequences of turning memories into text must be recognized and validated in any literacy program. This validation can best occur by printing these texts as elegantly as monies allow and using them as curriculum between like-minded programs. *Voices* grew out of an intent to create a beautiful product which would feature the writing of not just our students, but students around the world. These stories would be accompanied by photographs whose art and composition would add to the text.

We set about writing proposals to the government to get a literacy magazine funded. What we knew, beyond all else, was that this magazine, *Voices*, would treat writing as people read writing in their everyday lives. We wanted a magazine of stories without comprehension questions, spelling lists or myriad exercises subtracting from the joyful experience of recreational reading. We also, in our enthusiasm, wrote teacher/practice articles in the first six issues. While the teacher practice pieces ended by the seventh issue, *Voices* eventually grew to a 3000-subscriber base in 12 countries. We ran stories and photos from Capetown, South Africa; New York City; Chicago; Toronto; and other cities and countries—all without a comprehension question, cloze exercise, or single paid advertisement. As we learned about what issues were present in learners' lives, we subsequently recognized the need to include access to services within the centre's mandate: free legal services, refugee settlement, health care, counseling, day-care services, and work opportunities and training, to name a few, all of which work *against* isolation and *toward* building connections in ways that make sense to learners and practitioners. Acknowledging and addressing these kinds of issues has traditionally been seen as being outside the purview of the classroom teacher and administrator. However, we believe that the separation of learners' issues from prescribed curriculum has only served to perpetuate a larger system which, wanting to appear to address people's needs and concerns, in fact neither allows for real change nor reduces the isolation already experienced by many adult literacy learners and practitioners.

THE VALUE OF WORKERS' STORIES: OVERCOMING THE PREVAILING DISCONNECTEDNESS

Workers' stories take us back to places and people we have known before, remind us of our common roots, and give us

back some of the community we thought we had left behind. Also, employee stories nurture any of us who, after reading the first line or paragraph, want to know, for the sake of shared humanness, what happened to the people in the stories. Through these writings we learned of people's jobs, families, histories, joys, and demons. And, in a more specifically penetrating way, the stories we read today give meaning to many of the kinds of work we had performed but at the time had missed the meaning of, having taken with us only the experiences. It is from our range of work experience and from those who worked alongside that we have come to understand how their language and story have shaped our literacy. Thinking about language in this way instructs us as to how language work can build learning communities from fragmented work environments. Writing groups and peer expectations are important to colearners. Group discussion about reading and writing not only generates mental stimulation between work peers, but it also confirms the importance of peer nurturing. This accords with Deutsch (1982), who suggested that cognitive growth may be the best therapy and the best means of self-realization. Writing about language development, Deutsch and others indicated that it must be continuous, sustained, connected, and relevant. Practiced in the workplace, these ideas significantly change attitudes and relationships, breaking down barriers among employees and slowly transforming fragmented worksites into learning communities.

The following piece by Deborah Lee, formerly a learner and now a consultant in the Vancouver Municipal Workplace Language Program, gives expression to this:

Learning English in the Workplace

Many times I have feelings deep in my mind. I don't know how to tell others, but when I write them down it's easier. From the writing I can find out my mistakes which I couldn't in the past. If I wanted to express something, in this program, but I didn't know how to write in English, I could use my own language and the teachers and I would then translate the words back into English. In this way I learned lots of new words, and I am no longer afraid to express myself. Since beginning, I continue to write and build up my interest and extend my thinking. (*Voices*, Spring 1991, p. 61)

What Deborah experienced in the above passage is experienced by many learners and therefore is not unique to those members of the community having English as an additional language. Crucial to building communities of learners and helping people such as Deborah is the understanding by teachers that literacy issues exist in real life contexts. The lack of literacy skills or confidence in acquiring those skills, often reinforced by the various institutions that propose to develop these skills, can adversely affect adults' self-esteem.

Our approach differs drastically from the following, more typical, scenario:

A corporation acknowledges that a given number of employees are experiencing difficulties with language. Most of this difficulty is in the area of basic literacy skills. Many of the employees are at work at the lower levels of the organization. To mediate this language problem, it is necessary to bring in an educator or "rent a teacher" to do a needs assessment and a task analysis. Many

employees are seen to have English as an additional language or are identified as representing a specific race. Finally, the program is designed, then implemented. Attention is given to the method of program evaluation but seldom to how evaluation fits into company philosophy or how it addresses assessment outside language-related issues.

This approach, in a practical way, views the employee as an individual with language deficits. As such, the work of the program concentrates on filling in the gaps or deficits in employee's language ability. For the most part, classes consist of a number of learners having the same general ability and representative of a particular department or work function within the corporation. In short, employees are brought together for the purpose of remediation. This structure of literacy around what essentially is a class, race, and deficit model serves to further fragment the workplace and to separate employees from one another.

Fundamental to prescribed and dictated workplace programs is subservience to the dictates of the corporation. And, all too often, because they too work in large bureaucracies, educators model this behavior of deference. How many times do we see teachers thrilled to find themselves talking with managers, condescending towards employees, and advocating continuation of the status quo? The kinds of questions we ask determine the responses we get back. If the questions are employer-focused, we exclude employee's participation. This prescriptive focus asks: What specific language skills do our employees need to have? How does our organization use language and what do we need to do to help our employees construct language in the same way as we do? These questions outline the employer's goals but fail to help employees accomplish their full measure of literacy.

The kinds of questions we ask may need to be directed more specifically at employees or to answer questions about how employees interact. For example, what role does literature created by coworkers play in transforming the workplace into a more thoughtful and rewarding experience? Does a more thoughtful and rewarding workplace encourage employees to think about performance in terms of production, and so forth? How does our limited knowledge of how others work and live influence our personal and societal expectations of worker/learners? If we truly understand the dynamics which promote literacy, it is crucial that educators and people who implement literacy programs for any community of learners honestly express the value they place on individual members' literacy. When we fail to extend our own literacies to others, we have missed the opportunity to invite our learners and our employees to participate in and strengthen a literate society.

In the workplace context, writing memos, preparing documents, and filling in forms, along with being able to read and comprehend such materials, are pragmatic needs as well as aids to workplace function. However, these activities sometimes evoke a negative response to the question "Why should I learn to read and write better?" or "Why do I want to become literate?" Many employees, at all levels of the organization, interpret language activity of this kind as forms of employer and union control, worker compensation control, or something over which the boss has ultimate authority. Employees

identify those who have power in the organization as being the same people who control print, revising what is fact and restructuring what is true.

To counteract and change this belief, learners need to have the opportunity to engage themselves with their work peers in the collaborative writing process to begin to practice collaboration in their respective worksites. This writing collaboration, in the form of "Would you take a look at this?" gives back to the presenter not only comment on the writing from the peer but a possible invitation to coffee or lunch, or maybe the discovery that both parties have some common interest. On a day-to-day basis, we see employees sharing life experiences, discussing books and film, getting together for recreational activities and exploring together ways in which work problems can be solved.

Literature is often seen as not having a place in workplace literacy programs. However, it is important for workplace programs to value literature of all kinds for the purpose of promoting literate behaviors. All too often employees are forced to work with safety and health manuals, business and technical writing texts, workplace policy booklets, and everyday workplace documents of memos, reports, and correspondence.

In contrast, at a lumber manufacturing site, MacMillan-Bloedel, Ltd., a growing library is well used. Employees contribute books, magazines, and other print text to the library, and suggest other possible inclusions. This employee interest in books has given rise to many discussions around style, diction, structure, and organization of text. One employee, a shop steward, wrote a piece for the regional International Woodworkers of America paper. After publication, he discovered that an editor had changed some of his vocabulary and slanted some of his meaning to take a harsher union position. At first, the employee questioned his writing, but then set about writing a piece, again for the paper, on how language has the capacity to create positive or negative responses to all union issues.

A program at the City of Vancouver's Manitoba Works Yards illustrates the value of an on-site library and the importance of literature. Here, a class of nine Italian and nine Portuguese males, and one each of male and female natural-born Canadians, made use of literature extensively to enhance and to explore their own personal stories. All males in this group worked in traditional male jobs: laborer, jack hammer and tool operator, heavy equipment operator, engineering, and surveying. The lone female worked as the crew dispatcher within the central engineering complex. Much of their work, although seemingly physical in nature, also required various kinds of thinking. Within the class setting, literacy tasks ranged from letter-sound association work to pronunciation, the writing of simple sentences, preparation of memos and more detailed reports, communicating ideas at a union meeting, and taking minutes in class for the purpose of accessing job postings, listing and minutes taking as a required skill for advanced job status.

A quick look at class ethnicity suggests the importance for instructors to have some general knowledge of world literature. Both English speakers were originally from the Canadian Prairies. W. O. Mitchell's story, "The Painted Door," set in the

Canadian Prairies of the 1930s, spoke of a life and place both learners knew intimately, although they were of different genders.

For the Italians, Silone's *Bread and Wine* proved more than useful when we were looking at City street names. Even after many years on the City's street crews, most of the men still had trouble remembering names of streets. Pronunciation also proved difficult. We took a break from the tedious work of reading the street names on the City map to read the beginning of *Bread and Wine*. Since most of the Italians had been to Rome, they knew the names of the roads leading to Rome. The excitement around this recognition encouraged these learners to continue trying to learn: their visible success and ability to correctly pronounce street names in Italian and the general feeling of knowing a past landscape contributed to their successful outlook. Indeed, the reading of *Bread and Wine* prompted a discussion about how our earliest remembered landscapes are always our points of reference. And, for a brief while, the natural English speakers saw the Italians talking and gesturing animatedly, carried beyond the usual struggle with English by the fluency of their first language.

The literature need not be from the student's homeland. Three of the Portuguese started their lives as fishermen and the sons of fishermen. They loved *The Old Man and the Sea*, parts of *Big Two Hearted River* and passages from *Jaws*. Always, the important consideration is that the story speaks strongly the life of the reader. Literature not only helps employees connect the external world to their personal internal world, but it also serves to reinforce for the learner the whole notion that writing about one's personal life differs little from commercially published literature in either content or significant meaning.

In yet another context, a group of 12 employees are gathered around a large boardroom-like table. All are attending the workplace language program in an on-site classroom provided by their employer. The employer and the six unions support the program which is open to all employees who want to attend the program, based on self-identified need. There are a couple of Vietnamese, three Chinese, four Canadians, a Serbian, a Croatian, and a Greek. Of these learners, other than the Canadians, five are naturalized citizens, and the remainder are immigrants.

The range of formal and informal learning experience found within this group is broad. While two come from rural areas of Asia and one comes from rural Europe, the rest come from large cities. Two of the workers who have rural backgrounds never attended school; however, their thinking is as sharp as any other person in the class. One city-born-and-raised student dropped out of school at age 9 because of family sickness. All in all, these 12 hold nine grade 12 diplomas, six B.A.s, five master's, and four doctorates among them.

A sampling of titles taken from this group's writings reinforces the sense of a range of schooling and, more important, personal interest: "Professions," "Christmas Gifts," "Dreams," "Masks," "Love is Blue," "Overdue It," "Parent/Teacher Meeting," "Rice Cooker," "A Text for my Drawings," "Meeting the Challenge," "My Uncle," "The Despair I Have Fought," "Samos," "The Meaning of Marriage," "Use of Words," "Computer Aided Learning," "Wood Products," and "Canadian

Democracy," to name a few. Learners see how the writing of a story brings about discovery, then gives meaning to one's experience in ways that go beyond routine writing exercises. In the following piece, Guadalupe Aguilar confirms his experience of having educated himself:

Self-Educated Man

I reside in Lockhart, approximately 30 miles south of Austin, the capital of Texas. My hometown is famous for its barbecue and sausage. People come from all over Texas and out of the state to eat at Krus Market.

As a child and as a young man growing up in this town some of the things I remember most are working in the fields, picking cotton, hoeing, and picking corn. Very vividly, I remember those hot summer months. As we went about doing our work, hoeing cotton, a rain cloud would form on the horizon. Always I'd say to myself, "Come on this way rain cloud, I need a rest from this hot sun." Most of the time the rain cloud would just go the other way.

But as hot as those summer months were, and it gets hot in Texas, I was glad to be working in the hot sun rather than attending school. School was a very bad experience for me. I couldn't speak a word of English when I first started the First Grade. I remember standing with my dad, outside the Third grade class, crying, not wanting to go inside the classroom. You would think that by the Third grade a child would be used to attending school, but I wasn't.

I didn't learn English until maybe the Third or Fourth grade. By the time I left school I was 17 years old and I was in the Eighth grade. I had learned practically nothing.

Fortunately I developed a liking for reading. I started by reading newspaper comics. Then I progressed to the front page and the sports page.

Ironically, I think I learned more after I left school, because then I got interested in books. Books fascinated me. They opened a new world to me. I have never been too far away from home, that's why I especially like to read about faraway places. I also like to read about history, religion, and UFO information.

It wasn't easy learning to read. Many times I'd come across a word that I couldn't understand. By taking my time and concentrating on the sentence and the whole paragraph, I could figure out what the word meant. Sometimes I'd use a dictionary or ask somebody what that particular word meant.

I learned to read because I enjoy reading. It was precisely that enjoyment of reading that kept me from being illiterate.

As the years went on, I read more books. Consequently I improved my vocabulary. But I know I still have much to learn. That's why today I attend a reading class at my place of employment, Southwest Texas University, Grounds Department, in San Marcos, Texas.

Even though I can read efficiently enough, I have difficulty writing. That's why I attend this class to learn to write with more proficiency.

My goal is to some day attend college classes at my place of employment. I dare to dream that some day I could obtain a college degree. (*Voices*, Fall 1992, p. 50)

After reading Guadalupe's work, how many of us can say we have given such eloquent clarification to our life experience? Thinking back on work and school, Guadalupe concluded that attending school was a less preferable choice to working in the hot Texas sun. Throughout this short piece the writer's joy of reading and wonder of books balances and minimizes his failure at school. And, speaking of tone, the line, "Come on this way rain cloud, I need a rest from this hot

sun," certainly possesses all the strength of a good blues line and is followed by the timeless resignation of "Most of the time the rain cloud would just go the other way."

In seeing themselves as writers, we have found it important that learners use writing to redefine themselves in the world. Subsequently, programs and learners must value that writing by finding ways to make the writing available to others through publishing, then using it as curriculum. The ability to do these things with print is part of a process which offers learners opportunities to make their own choices and to be more in control of their lives. It is through such a connection with print and dialogue that learners can identify and address educational and social barriers. Moreover, equally as important as the methodology and the materials teachers and learners use for reading and writing are the relationships, trust, and value established between teachers and learners. When we make this part of our collective understanding of literacy, we collaboratively build a community. It seems perverse to claim a desire to make learners feel valued in a program, to encourage them to open up, and to develop personal relationships with colearners and instructors, but not to have the institution and its agents extend to learners their personal educational commitment beyond the language program.

When program providers help employees understand that many work cultures make up their organization and that these work cultures share certain histories, goals, and practices which connect the organization's various operational sections, a more desirable workplace literacy scenario can be imagined. It becomes easier for the employer to see the importance of building the language program so that it reflects the appropriate indigenous curriculum needs of the employees, not the prescribed curriculum which the provider most often brings. Such a program makes itself open to all employees within the corporation who want to attend. Employees then identify their own reasons for attending. The management and the union executive recognize that the program is inclusive and not subject to management and union agenda. Similarly, singular ethnicity, job type, and specific worksite become less than desirable foci upon which to build a program or class. Further, in the interest of achieving more than rhetorical change, the program extends opportunity to employees to make the daily conditions of work congruent with corporate philosophy about literacy, that is, the idea of flattening the workplace now actively translates into the practice of consulting with all or nearly all employees to better understand how to make decisions in the corporate culture.

Where do we draw the line as literacy workers ... in the classroom, home, neighborhood, city hall or workplace? The only reason to stop our analysis in the classroom or with the family is that it saves the trouble of connecting what we do to who we do it to and what happens to them when it is done or because mandates have never been broadened to allow these connections to be made. For the learners with whom we work, the time set aside for class competes with needs such as child care, health care, nutrition, cultural change and heritage language, adequate housing, and networks of support.

How can we say to learners that we want to be their partner, but do not carry this too far and remember that this is only school? If we are going to have integrity in our educational approach, we need to value learning by connecting experiences in the classroom back to the family, work, and community. If a program is going to espouse value and respect for learners, and view their experiences as central to the learning process, then all aspects of that program, from intake to evaluation to curriculum, need to reflect those beliefs. That same pedagogy requires literacy educators to consider issues in learners' lives which extend beyond the classroom to their families and communities.

We are really talking about intergenerational literacy and about using available resources to create authentic connections between different and otherwise isolated groups in our society. Literacy practice can speak to neighborhoods and communities where there is a need for quality child care to be readily available and affordable. It can presume that parents want to help and teach their children, and that parents and other adults have skills and experience that are worthwhile to impart to children (even if as adults they are not confident in their skills with print). Community literacy can allow professionals such as literacy teachers and early childhood educators to facilitate learning in an atmosphere which can encourage the sharing of knowledge and the acquiring of new knowledge. It can mean recognition that all cultures have rich traditions which must and can be affirmed in the literacy process. We envision community literacy as a vehicle through which people can begin to imagine the conditions that would help make and keep a society whole and healthy.

Community literacy models can build upon existing community strengths. Program designers need to explore relationships among individuals in otherwise unrelated groups: the work lies in finding what these relationships may be. The ways in which federal and provincial or state dollars are made available for new initiatives are not always well thought of. Many program administrators wrongfully spend time and limited resources simply getting projects started, whereas those resources can be used to enhance relationships which already exist. Community literacy models could have the potential to be effective because of their emphasis on community strengths. In less tightly connected areas, the dissolution of community, the transient nature of populations, the fear of crime and violence, the suspicion that comes from not knowing one's neighbors and their histories, and increased demographic changes, can all be seen as opportunities to establish community literacy practice. At the same time, there is a need to bring together different generations of different groups in positive, sharing, community-building activities. Community literacy can offer some of the glue to cement these connections.

For the last 2 years, Lee Weinstein and five others have been working in an intergenerational literacy project called Rainmaker in East Vancouver. With federal and provincial funding and an Apple Foundation donation of computers, we established a public space literacy project in a welcoming "inner city" elementary school of about 255 children, of whom 50% are First Nations (native Indian), 40% Asian

(Chinese and Vietnamese), 5% each of Spanish-speaking, and Canadian-born of Northern European origin. The Rainmaker room offers schoolchildren, parents, and community residents the opportunity to identify what they would like to learn with assistance from the Rainmaker staff. Guiding the project is the idea of reducing feelings of isolation and increasing feelings of connection. A parallel goal is to develop a center for learning and educational processes which could be adapted and eventually owned by community stakeholders.

In addition to workplace literacy, Gary Pharness has recently been involved in a community literacy project with a First Nations aboriginal community. People in the community wanted to become literate about who they were and they wanted to reinforce the positive aspects of their cultural heritage and present-day culture. However, the "mission" existed in a fragmented and factionalized state and, like much in public education, did not collectively hold a world view sufficiently strong enough to refashion its membership into a community or to restructure the existing system into a useful and purposeful institution. Fragmentation had resulted because 39 children had been removed from the community and many more members had moved away because living there was so bleak. The Indian leaders looked to bring back their children and encourage the return of their members, to establish independence and self-reliance from the government, to create safe day care and group home environments for the children, to build social structure and create economic development, and to provide schooling and training within the community.

On a day-to-day basis, the development of literacy and the building of community seldom elicited the excited response people need to develop and extend beyond their current position. However, the promise for literacy and the hope for community directed the struggle to emerge from the status quo. The First Nations people began to look at the power of language to describe community and to communicate a shift in power. Questions such as, "Who owns the housing?" and "Who is responsible for housing?" translated easily into illuminating descriptive contrasts: community housing committee versus the Department of Indian Affairs; social services' apprehension of children versus day care, group home and the training of community members for foster parenting; external policing, for example, the Royal Canadian Mounted Police, sheriffs, and Federal Bureau of Investigation versus internal local policing. The descriptive power of language to penetrate the experience of the individual and the community helped to understand the past and marked the beginning of a vision capable of illuminating the future.

This is the stuff of community literacy. It has the ability to develop educational plans which access funding to connect individuals and groups to one another. For some, this awareness may also include challenging the very systems under which we are funded, and working to create more honest and equitable means of supporting community literacy work. Taking a holistic approach which validates participants' strengths, literacy practitioners can assist in introducing groups to one another around those strengths to engage in community building, viewing language and literacy as

paths for exploration and expression. Perhaps then we could, to use Freire's words, begin reading the world in such a way as to rewrite the human story in ways more humanly

satisfying to us all. (Virginia Sauvé, quote written for a focus paper by Lee Weinstein, National Family Literacy Conference, Ottawa, Canada, September 1994).

A GRASS ROOTS THINK TANK: LINKING WRITING AND COMMUNITY BUILDING

Hal Adams

UNIVERSITY OF ILLINOIS AT CHICAGO

In a small wooden structure across the blacktop playground from their children's elementary school, a handful of adults smoke cigarettes, eat doughnuts, drink coffee and talk about their lives. The focus of the discussion is a short piece one of them wrote last weekend.

The author is 23 years old, pregnant with her third child. Her oldest is seven. She has no husband, no job, little formal education and uncertain housing. Because of her situation she thinks she is a failure. Her writing is self-critical. She fears she has violated God's plan for her life. She is weeping as she responds to others' comments, though the comments are gentle. They say it is not God's plan that she has violated, but her own. They say she is following God's plan by preparing for her baby's arrival and providing for her other children as best she can. The conversation alternately focuses on her writing, offering her emotional support, and debating religion. She begins to reconsider her writing and her views.

Sometimes these meetings unfold as literary criticism sessions, other times as church revivals, coffee klatches, therapy groups, or political caucuses. But mostly they are writing workshops, which turn out to be a kaleidoscope of possibilities and enactments. The participants are preparing their work for publication in a magazine that will be distributed in their school and community. The magazine is called the *Journal of Ordinary Thought*.

For 3 years I have been offering a parent writing program in local elementary schools in Chicago. The purpose of the program is to increase community involvement in the schools and demonstrate the link between education and community life. This is the story of that effort in one school. It began as a writing class for parents and grew into a community-building program that called itself a grass roots think tank.

EVERY PERSON IS A PHILOSOPHER

The school is in Austin, a poor black neighborhood on the west side of Chicago. Everybody in the group lives in the neighborhood, most of them all their lives. Two mornings a week we gather, usually 10 or 12 of us, to write and talk about life. It was not always relaxed, especially not the first day. People were anxious then. They had come because they wanted to help their children with their school work. Only a couple viewed themselves as writers, and here I was, the outsider from the university, under scrutiny, asking everyone to write freely about their experiences. I insisted that each of them had stories worth writing. Even strangers would be interested, I told them. They were doubtful, but polite. I persisted.

Every person is a philosopher, I said, thinking of the Italian Marxist, Antonio Gramsci, who thought people with power maintain dominion over ordinary people through the control of ideas as much as through the exertion or threat of force (Gramsci, 1971). If ordinary people develop confidence in their own ideas, Gramsci reasoned, they can challenge the control others hold over them. I was thinking also of the Brazilian educator, Paulo Freire, who thought ordinary people limit themselves by rejecting ideas that grow from personal experience and instead adopt ideas from the class that rules them (Freire, 1964). These ideas tend to justify class and race privilege. If ordinary people learn to recognize the alien ideas they have adopted, they are able to discard them and act in their own interest. Last, I was thinking of the Caribbean revolutionary, C. L. R. James, who thought the artistic expressions of ordinary people contain truths

essential for social change (Buhle, 1988; Grimshaw, 1992). If ordinary people recognize the truths within their art, James concluded, they are more likely to trust their capacity to make a better world.

The ideas of these three thinkers can be summarized like this: Ordinary people hold the key to a better world; experience is the best guide to thinking and action; to achieve social progress people must think for themselves and reach their goals through self-activity rather than rely on outside authority to think or act for them; it is the responsibility of everyone to strive for a better world; those who are not political in this broad sense are illiterate, no matter how well they read and write.

I was in a poor neighborhood on Chicago's west side, facing 10 mothers and grandmothers who had vast experience in raising their families while keeping life and limb together under harsh conditions. Gramsci's, Freire's, and James' emphasis on the experience and thinking of ordinary people was compelling. The parents were intrigued by the idea that it is people leading ordinary lives who understand the world most clearly and create the truest meaning of their situation. Heads began to nod.

Near the end of the first session, having discussed lofty ideas about the importance of experience and the role of the ordinary person in creating a better world, the parents wrote what was on their minds. "Use your own language," I urged, "don't worry about spelling and grammar. If you don't know a word, leave a blank space; we'll figure it out later." Everyone gave me something.

The papers were so brief and cautious I was tempted to dismiss them as shy attempts to "get over" on the first day, to avoid drawing attention to themselves. Perhaps the good stuff would come later. But more was there than immediately apparent. Several papers, for instance, made reference to religious practices and beliefs. Looked at as a whole, they formed a religious theme that could not be denied. I typed all the submissions and distributed them at the next meeting. The group focused its attention on one, which read, in its entirety: *I went to church Sunday. I had a good time.*

If the author were to write more about this topic, I asked, what would you as a reader like to know? They gently began to ask questions aimed partly at the author, partly at the group. Why do you go to church? How did you choose this church? Do your children like it? What happened in church Sunday that made it a "good time?" Each question sparked discussion. People offered opinions on the differences between churches, the role of pastors, how churches have changed, their importance in African-American communities, disputes and disagreements within churches, and so on. They talked about how church communities and religious beliefs had helped them in everyday living and during crises.

From a simple two-sentence piece of writing I had nearly dismissed as "getting over" grew a discussion about how people create institutions to deal with the difficulties they face and how articles of belief influence everyday life. The discussion had its effect. The author had new directions to pursue, and others who were stimulated by the piece began writing ideas of their own.

The lessons were not lost on the group:

1. Even apparently simple writing contains meaning for the group.
2. The group helps develop the meaning in a piece of writing.
3. Writers develop their work by discussing it with others.
4. Writing by one person stimulates writing by another.

PRIMACY OF EXPERIENCE

The writing group was a place to identify questions from the gritty reality of life experience and to address them in discussion and writing. Nothing in these meetings took precedence over the experiences of the members. The parents took to this idea quickly. It was as if it affirmed an approach to learning that they already intuitively had accepted, namely, that life is the best teacher. Within a few months, armed with the confidence that its perspectives on the community were valid, the group would begin to take action on issues raised in the writing.

The meetings were conducted as writing workshops. I collected the writing, commented on it, and photocopied some for the class to read and discuss in future sessions. All discussion started with a member's writing. Discussion often went off in disparate directions, but inevitably it returned to the writing.

Mary was a leader but she was not a confident reader or writer. At each meeting the group would encourage her to write, but to no avail. A tape recorder and individual attention helped, but she still refused to write. One day, months later, she appeared with a piece of writing and proudly distributed it to the group. She had written it over the weekend with help of her teenage daughter and two of her daughter's friends. The four of them were lounging about in Mary's bedroom one night discussing their relationships with men. Mary asked them if they would help her write something summarizing their discussion. Mary spoke while her daughter wrote and the others made suggestions. This grim piece, the result of that cross-generation writing session, clicked immediately with the writing group and brought expressions of understanding that came from places formerly kept secret. An old bond was deepened between Mary and her daughter in the writing of the piece, and a new bond was forged in the group with the reading and the discussion of it:

Males obsession over females. It starts with friendship, then they fall in love. The relationship begins wonderful; the nice secrets they share, gifts, romantic dinners, and the first time they make love. That's when the changes begin. The female is not allowed to have other male companions, no going out with her friends. All she can do is sit at home and wait for him. Then they have children and it really gets bad. The crying and fighting starts. All of a sudden the female loses interest and breaks the relationship off. Some get away, others can't. They are chased, harassed, and some even get killed in the process. Then all the male can say is, "If I can't have her, no one else can." Don't ever think you have made the right choice because you never know.

This story, based upon the experiences of Mary and her young friends, prompted others to tell similar stories about

sexual relationships. A furious discussion followed about the oppressive conditions under which black men and women live in the United States and the stress these conditions place on intimacy between black men and women.

The group members brought new writing every session. They wrote about commonplace and extraordinary experiences: bus rides, kids getting ready for school, funny episodes, scary times, childhood memories, illness, death. The group discussions that followed the reading of these pieces always demonstrated the complexity of experience, including experiences that appeared trivial at first. It became second nature for the group to explore each story for its broader implications.

One mother wrote about taking a summer trip as a teenager with her mother and aunt to the southern United States. She was surprised that life in the rural South was so different from the northern city life she had always known. She disliked being in the South because there was nothing for her to do. After the others read her story they identified words they considered to be essential to it, even words the author did not use: surprised, different, peaceful, safe, friendly, boring, caring, violence, drugs. Using these key words as a point of departure, the parents discussed the difference between northern urban and southern rural life. How did values differ in the two regions? Was life safer in the South than in the North? Were families closer in the South? Was the educational system better? Did it cost less money to live in the South?

The parents' attention was rapt during the reading of these experience-based stories, and the ensuing discussions were intense. The stories rolled on, about family life, raising children, relations between the sexes, living amid violence, finding affordable housing, dealing with the public aid system, and surviving as women. The mothers came first to the writing group because they wanted to learn how to help their children with school work. They returned for the chance to explore the meaning they had gleaned from lives lived under stress of poverty, and because it was comforting to make explicit to each other the common struggle they shared.

PUBLISHING

Inside the front cover of the *Journal of Ordinary Thought* (*JOT*) is its statement of purpose: "The *Journal of Ordinary Thought* publishes reflections people make on their personal histories and everyday experiences. It is founded on the propositions that every person is a philosopher, expressing one's thoughts fosters creativity and change, and taking control of life requires people to think about the world and communicate the thoughts to others. *JOT* strives to be a vehicle for reflection, communication, and change."

It was time to publish writing from the parent group. I previously had published *JOT* in other settings: a public assistance office and a single residency hotel for formerly homeless people. The writing group's response to these earlier issues was positive. They liked the plainly-written style and the stories by people who lived lives similar to their own. They were fascinated by the prospect of seeing their names in print. The decision to publish was unanimous.

A few weeks later the group published an issue of *JOT* featuring writing by its members. The magazine's appearance in the dead of winter must have taken some bite from the Chicago wind because group members were dashing without coats between the school and the little back building where we met, waving copies. It was high drama. They were celebrating having published a magazine that would cast them in a new light in the community, as writers and thinkers to be taken seriously.

The magazine contained several stories about family life and, as a portent of what was to come later, a few about violence in the community. The family, troubled as it may be, was viewed in the writing group as a buffer against the harsh outside world. Charlene's piece reflected both of these themes and, by implication, suggested a relationship between them. She foreshadowed the strong fear of violence that other group members would pursue later in their writing. The security of her home, described in the opening, three-sentence paragraph, allowed her the psychological protection one evening to reflect on this disturbing experience:

I have put my kids to bed, finally. My house is peaceful, quiet. I will do some writing.

Two weeks ago I was standing at the bus stop. I noticed a guy walking up wearing house shoes. There were three other ladies standing there too. He was standing there looking at everyone's purses. He was moving a little closer every second, so I moved up a little closer to the pole at the bus stop. My heart was really pumping hard. I turned to the left to see if the bus was coming. It was, thank God. The bus pulled up and I rushed to the door as it opened. I did not want to be the last person to enter, but the lady behind jumped in front of me. I entered the bus gripping my purse real hard. As I sat at my seat I asked the lady why she jumped in front of me. She told me she too was frightened that she was going to have her purse taken. I finally felt at ease for a while.

The story, interesting in its own right, opened the door for others to write later of experiences more frightening than Charlene's. The group began to explore the violence that, while it surrounded them, did not overwhelm them.

Alberta, like Charlene, introduced a topic that would become a theme for the group as time passed. In only a few lines, she explored tension within the family, between men and women, in particular.

My brother called. He wants some money. I want to give it to him, but he don't work like he could. I wish he could get the right job and clean himself up. He only had one real job, and then didn't do so well. I don't want to give him money to waste up on something else. The world is such a mess, not like it used to be. I know it has to change.

The explicit recognition by the group of the tension between men and women, introduced here by Alberta, was a primary factor in establishing a separate writing group for men within a few months. Starting the men's group and openly discussing the tensions eventually increased the potential for men and women from the neighborhood to collaborate as the group evolved toward community action.

Publishing the magazine changed the group. Commitment to the writing sessions soared and almost nothing took precedence over the writing class. Membership grew. The group

was asked to speak at several university classes. The children's teachers began to take notice of the parents' writing.

Influencing the Classroom

The stories the group published were not primarily about children, nor were they written primarily for children. From the beginning the authors wrote for themselves and each other, which is good because honest self-expression is the best way for adults to win children's respect and attention. Children learned from seeing adults tell stories about lives fully lived. The parents' history was the children's history, and committing it to writing demonstrated the truth in the adage that people are accumulated history. It was good to convey to children that experience counts, and that we are all philosophers interpreting the experience that forms our lives. There was wisdom in the stories for anyone in the community who read them, including children. Children grasped the meaning of some of the stories while the meaning of others eluded them. Even stories beyond their reach, however, made a point with the children: there were stories from the neighborhood worthy of publication and there were adults close to the school who cared enough to write them.

The parents began visiting primary-grade classes as guest authors. The purpose was to show the children that adults familiar to them were writing and publishing, reinforcing the idea that literacy was an everyday, important part of their community. The children enjoyed seeing familiar faces in the magazine, and gave close attention when the mothers read their work. Karen read her piece to her daughter's 1st-grade class.

Let me tell you what a bad day I had. First I woke up late. The kids were hungry. I had to iron. I had washed only one of every sock. Finally we got out the door and wouldn't you know it, we missed the bus. So, I walked to get my check, but the lady said it was not there. My caseworker said I missed my appointment, which I didn't know about, and I had only one day to get my medical card. I got to the doctor, but he was gone for the day. Then I got some money to go to the store only to find that what I wanted was not on sale anymore. So I went home and cooked what I had. There was not enough for me, so I went to bed hungry. Now that's a bad day, but everybody has them.

The first graders gave it a positive review. The children's comments showed an understanding of the subtle message of Karen's story: Bad days are hard, but they can be handled. It was tiring and difficult to run around town with your kids, the children agreed, and scary to go to bed hungry, but at the same time it was pretty funny that only one sock from each pair had been washed. The children emerged from Karen's reading with an understanding that one can survive a bad day with dignity and humor. Equally important, they developed new respect for Karen for having written about her bad day.

A Men's Group

The inclusion of men in the writing group on a regular basis was problematic for several reasons. The school had become the almost exclusive place for the women to meet socially;

men in live-in relationships with women receiving public aid often remained in the background for fear that their known presence would reduce the women's already-meager public aid checks; most important, living in poverty strained the relations between the sexes because men were unable to find decent jobs to support their families, often leaving women with the sole responsibility for raising children.

It was gratifying then, when two young men from the neighborhood asked to start a men's writing group. They had seen *JOT* and thought they could recruit several men to a group to work toward publishing a men's magazine. The women and the school administration enthusiastically agreed to have the men meet at the school once a week. Four men attended the first meeting, but the group quickly grew to 12. All were in their late teens and twenties; some were former or current gang members; most were not employed; and only one had a secure, well-paying job. The group met for a year and published two issues of a magazine called *Through the Eyes of a Villain*.

I objected to the title at first, arguing that it made them sound evil. "That's the point," they explained. "That's the irony. We are seen as evil. Our music strikes people as evil; our appearance strikes people as evil. They have to listen carefully to rap music to discover it is far more complex than 'bitches' and 'hoes' and violence. They will have to read the magazine to see beyond their fears, to realize we are men thinking about the world and how to remake it."

One piece in *Through the Eyes of a Villain* described the author as waking up one morning "unemployed, but not without work to do." It was an important phrase because this author and his writing group were taking a new look at their community. The men approached this task by offering highly personal critiques of two cultures—mainstream U.S. culture and the street culture of their neighborhood. Their critique of the mainstream was angry. Their critique of the street was poignant. Both cultures, the mainstream and the street, have ravaged the young lives of these men. The men expressed surprise that they had survived the racist violence of the mainstream and the street violence of the neighborhood. Here we are, they said with some surprise, in our twenties, still alive and out of jail. Who would have thought? As Derrick put it:

Growing upon the Westside is a task all people can't do. There is a fear of death that haunts the neighborhood. Many people are scared because of drive-by shootings and drug sales on the corner, to come outside or even let their children play in front of their own houses. I can see where they're coming from. Sometimes I feel like that, because I'm a Black man on the Westside of Chicago who has seen about everything from group beat downs, to getting shot, to getting cut, to shooting first, to seeing murder, to kicking it with murderers. I ain't saying that I'm a bad guy or a nice guy, but I came a long way. All the things I did in my life, I'm surprised I didn't go to jail or die, but I know I came a long way. I got a long way to go. Looking back through all the madness, I believe I was possessed, but now I feel peace and blessed and the demons have left and I can start with my self evolution, evolving to a peaceful state.

The men wrote about what most men think about—what does it take to be a man? Existing on the outside of the only

two cultures they knew, they faced a void they sought to fill with their manhood. They recognized the tremendous potential in the world and in their own lives for creativity on the one hand and for barbarism on the other. At this point in their lives, like C. L. R. James, they were seeking an artistic solution to the crisis. Most of them made rap music and they all wrote. It was no escapist art in which they were involved. It was art that told the truth, for them the only path to being human and to manhood. Kevin wrote:

Life, it's a hard subject to talk about because I'm having a hard time dealing with it. A buddy of mine was smoked about a month and a half ago on the South Side. It was gang related. Another one of my homies had his picture taken with a 12 gauge. The last thing he saw was the flash. It was drug related. When I lived in California one of my boys got beat down by some Bloods over his truck... I could go on and on with these types of stories, but it's hard, especially when it's one of your boys. Each time I heard the bad news I wanted to strap up and take care of business. But who gives me the right to kill another muthafucker just cause he killed my boy? Like I said in the beginning, life, it's hard to talk about. We're becoming extinct, being hunted by our own kind. ...

A GRASS ROOTS THINK TANK

Before the men's group was formed, the women had become more active in the school. Writing and group discussion seemed to make them more free to offer public opinions about school policy. Several ran for the local school council, which in Chicago has considerable power in neighborhood schools. As their confidence grew, some parents who previously had viewed their classroom volunteer role as primarily disciplinary began to take a different initiative with students. Linda contributed to the discussion of this process with "Parent Volunteer":

There is a child in the classroom where I volunteer. His name is Marvin. He is so cute. He has a problem reading, but he is trying hard. He also has a problem with adding and subtraction, but he is learning. When the teacher passes out the homework he gets his and puts it in his bag. The next day she asks the kids to bring up their homework, and she asks Marvin for his. He says, "My mom wouldn't help me." So, I suggest, "Marvin, do the best you can. Try by yourself, and if you can't get some part, leave it blank." For a while he wasn't bringing in any homework, but boy, now he's doing it and turning it in....

The discussion of Linda's piece, where members reassessed their roles as parents in the classrooms, was part of a larger discussion about the relationship of neighborhood culture to the educational process. The physical environment, family traditions, educational expectations, child rearing practices, family structure, and community institutions were described in writing from a personal perspective.

Toward the beginning of its second year of existence the writing group began to discuss taking action on issues that had arisen in the writing. As members continued to write about the experience of living in the community, the group expressed an awareness that the community environment was related closely to the quality of education their children received in school. They convened a meeting to discuss the

matter with about 30 neighbors. To get the ball rolling, members of the writing group read selections from writing in progress. Three authors who subsequently published their works in *JOT* caught the attention of the meeting. Paulette went first with a piece she called, "Abandoned Buildings":

I imagine people staying around abandoned buildings. Sometimes you have to pass these buildings. You're actually scared to walk by them because you never know who might be inside. Sometimes you know they are inside watching you come by, but you don't know who is there. It might be a drug addict or someone to kill you. So when you pass these buildings, you have to watch carefully.

Joyce followed with "Dangerous World":

It is a dangerous world today. Something I wonder about a lot is how my children will live in this world. I know it's coming to an end one day. I hope and pray I will live to see my children grow up and make something out of themselves.

So much is happening out there every day of their lives. I see things and hear things—people and deaths, and so many young people killing one another over nothing. That's why I worry about a lot of things. I pray to God every day that nothing will happen to my kids. I tell him, don't forget us down here. Just keep watching over us and everybody in the world.

Theresa read last with an untitled piece:

Most everywhere you go in the 29th ward there is a vacant building. Some are torn halfway down or boarded up. Some were boarded up but the drug dealers have taken the boards down and made the buildings into spots to sell drugs, or they take someone in there to rape or kill.

One night I was going to work. After taking the kids to the babysitter, I was on my way back to Central and Washington to catch the bus when I happened to walk by a vacant building and heard a lady screaming. I did not stop because I was the only one walking on the street that night. I was frightened. I ran fast and prayed—just get me to the bus stop and then, please bus, hurry up!

Each author's story was greeted with nods and murmurs of approval. As it happens, there was a large abandoned apartment building next to the school playground. At the time of the community meeting it was well known as a center for drug activity, and a few years earlier a woman had been raped in the building. It is no wonder the three essays struck a responsive chord.

It was agreed that the group would do something to stop drug activity near the school, but there were no illusions about the limited effect a victory would achieve. Everyone knew if the dealers were removed from the school area they simply would set up shop in another place, but at least parents would not have to worry about their children passing by drug deals on their way to school. People understood the complex nature of the problem. The deeper social and economic problems would not be solved by removing drug activity from the school area or, for that matter, even by eliminating drugs from the entire neighborhood. Many expressed sympathy for the young people selling drugs. There was strong sentiment in the discussion for the group not to take an unalterable position against the desperate people, some of whom were acquaintances, who had turned to selling

drugs as a last resort. What appeared on the surface to be a simplistic solution (get drug sales away from the school) was in fact a solution that took into account complex social factors beyond the comprehension of many people not from the community. The lesson here is that long-term solutions to the complex problems of poor communities cannot be found without the broad, realistic perspectives that can be developed only by community residents.

At least once a month for the next year the writing group met not as a writing group, but as the Austin Grass Roots Think Tank. The Think Tank was an organization committed to planning community action based on ideas that grew from the writing of ordinary citizens who lived in the area. During the Think Tank meetings the group discussed what to do about the abandoned building next door. They took pictures of the many vacant buildings in the area and wrote stories about their experiences with them. They called in the police to discuss increased security (to little avail) and invited the city housing department staff to explain procedures for addressing the matter. They discovered how to do a title search to identify the owners of abandoned buildings. They learned about housing court. They sent representatives to testify in court several times during the year, and on two occasions rented buses to carry groups of people to the downtown courtroom. They invited building owners to meetings to discuss the threat their buildings posed to the children. With pressure from the court and the Think Tank, the owners of the building next to the school agreed to secure their building, post a guard during school hours, clean the area, and report to the school office each day.

The Men's and Women's Groups Unite (Sometimes)

As time passed, the men's writing group joined the Think Tank sessions. The effect was significant as both sexes offered their often differing perspectives on common problems. At one meeting, for instance, Detrich read a piece in which she asserted that black women coped better than men with drugs, poverty and violence. She concluded that it was difficult to find "a good Black man." Joe uncurled his long limbs, reached for a paper of his and said, "Yeah, women go through a lot we don't understand, but we go through things women don't understand. Check this out." He began to read about hanging out with his buddies after a writing group session:

...An hour later I smoked a blunt and drank a couple of brews with my buddies in the alley behind my house. I turned to walk away and there was an unmarked police car flying towards me. In my neighborhood cops like to hit you, so I was hoping they would drive right by. All four doors flew open and the car screeched to a stop. I took a step back and threw my hands up. I was snatched and thrown roughly against the gate alongside my buddies. ... One cop (started yelling), "Hit him, hit him, hit him, hit him! One of you fuckers is going to jail." ... one (of the cops) reached into my underwear looking for dope. My cousin came out of the house to see what was going on. "What the fuck do you want," one of the officers asked. ... "you're going to jail too, motherfucker, put that bag of dope on him. ..."

I got angry at myself. I felt like a sellout. I was afraid. It was five of them with guns, but that was no consolation. I kept quiet

because I was afraid they'd make good on their threats. They left as suddenly as they came. "Get out of the alley," they warned, leaving us spread eagle against the fence.

...I think I've been searched by the police at least a hundred times, but I've never gotten used to it. Each time it's like being raped. Sometimes they even do it with a gun to my head or ribs. I told my mom what happened and she said I shouldn't hang with my friends. My aunt called and told me to stay out of the alley. My alley!...

A heated discussion followed the reading of Detrich's and Joe's papers with all the men and some of the women initially siding with Joe, and most of the women taking the position of Joe's mother and aunt that Joe should not be hanging out in the alley. Eventually the group decided there was an overriding matter that concerned everyone in the room: the tension in the community regarding its diverse expectations of the police. At the time of this writing, the Think Tank is debating a program to address this issue.

By becoming more active in the school as volunteers and policy makers, by addressing community issues that have an impact on education, and by basing these actions on experiential writing, the Grass Roots Think Tank has taken beginning steps toward realizing the visions of Gramsci, Freire, and James who imagined a primary role for ordinary people in changing society. The steps are encouraging when one considers the pressure in contemporary society against such political initiative. (Gramsci would call it self-activity.) Democracy has been reduced in popular consciousness to the occasional casting of a ballot. True community action based upon collective deliberation is rare, and those who engage in it are often viewed cynically as being naive. The Think Tank and the *Journal of Ordinary Thought* are instances of participatory democracy in practice.

Looking Ahead

The Grass Roots Think Tank would like to expand the concept of a writing-based community organization beyond its current location in one school. It would like to establish writing groups around the neighborhood in different settings: housing complexes, churches, libraries, public aid offices, and so on. Each group will be responsible for publishing its writing. Periodically the expanded organization will convene forums where the writing groups will make their work available to each other. Ad hoc action committees with participation from several writing centers will form around shared community concerns. In this way people from several community bases will be working on issues of common interest.

The early success of the Think Tank was largely a function of its nonhierarchical, informal, organizational character. Individual, experiential writing and group discussion drive the Think Tank. Thus, it relies simultaneously on both highly independent and highly collective activity. Any expanded version of the program must preserve this mode of operation to preserve the intimate atmosphere. Otherwise, new, honest writing about personal experience will not be forthcoming.

Moving from writing groups to action groups is both the most promising and problematic aspect of an expanded Grass Roots Think Tank. It is promising because the

movement from writing to action will be based on perceptions of the community by people at its roots, a condition implicit in the ideas of Gramsci, Freire, and James. It is problematic because there will be no central staff to assume responsibility for organizing action programs and moving them forward. But one simultaneously cannot have self-activity by community residents and central control of them. Central control often discourages ordinary citizens and otherwise weakens their initiative. It is the philosophy behind the Think Tank's organizational approach that people will be more likely to take control of their community if they are not expected to hand over their initiatives to a central administrative body.

We propose to set in motion a process where residents of the community can examine with each other the weighty matters of family, community, and economic development. The process will rely heavily on writing and publishing by

community residents. We do this to demonstrate the critical role literacy plays in community development, and because community writing is an effective way to reveal the profound wisdom and understandings residents can develop by examining their community experiences.

The time is ripe for such initiatives in poor communities where people often are discouraged by their chronically limited economic prospects. It is clear that help from the outside is not immediately forthcoming. Self-activity is now the only real alternative. A writing-based community project offers a practical way for citizens to be involved at the center of a process that will address their own futures. The precise direction the community will take in the process is not certain. But that is the nature of self-direction, and it is part of the reason it appeals to people who have long since become skeptical of solutions imposed from the outside.

RESEARCH ON LANGUAGE
TEACHERS: CONDITIONS
AND CONTEXTS

This page intentionally left blank

INTRODUCTION

Dorothy S. Strickland

RUTGERS UNIVERSITY

The scene is a 10-year college reunion. Three friends, all teachers, are renewing their friendships. After comparing vital statistics about marital status and offspring, they begin to talk about their work. They discover that they all work in districts characterized as "difficult." Two complain about being totally burned out. One comments that today's students do not want to learn, lack respect for authority, and are out of control most of the time. Another says that she has little complaint about her students, "After all, many of them come from tough circumstances." Instead, she is fed up with the administrative bureaucracy. She contends that they go out of their way to stifle teacher creativity and effectiveness with onerous paperwork requirements and endless restrictions on what teachers may or may not do in the classroom.

The third concurs that reaching many of her students is difficult and agrees that dealing with the central office bureaucracy is a headache producer. Quite unexpectedly, however, she eagerly begins to share a new innovation that she is trying out in her classroom. She is experimenting with the use of drama in her language arts and social studies programs. With great enthusiasm, she reports, "There seem to be endless ways to link creative drama, literature, history, and writing. The students love to role-play scenes from their reading and to 'perform' poetry. Some have used the computer to collaborate on writing plays. Performances have been videotaped and shared with other classes and at home." Most important, she adds, "Creative dramatics seems to build on the natural expressiveness and creative energy that her students possess." To her amazement, she explains, "Student interest is up and discipline problems down." She wonders if the other two have tried any of these ideas, and seeks their advice and opinion.

One can conjecture about the many reasons these teachers vary so widely in their response to somewhat similar circumstances. The most obvious explanation is that, although similar, their situations are not identical. And certainly, each of these teachers is an individual personality with certain predisposed ways of handling difficult situations. Still, the question of why some teachers and administrators remain resourceful

and optimistic despite difficult conditions is a highly important one. Disgruntled, ineffective educators only exacerbate situations that are difficult to begin with. Their very presence has an adverse effect upon the lives of students and contributes to the public's misimpression of educators as less well trained and effective than other professionals. On the other hand, educators whose professional stance includes a sense of optimism and inquiry are likely to have a positive effect on students and demonstrate a personal commitment to ongoing professional development. These are the types of individuals we want to attract to schools of education. Once there, we need to prepare them well and nurture them as practitioners.

Preservice and inservice educators, associated with a variety of disciplines and working in a variety of contexts, comprise the *WHO* of research on teaching the communicative and visual arts. An examination of issues related to these individuals is key to broadening our professional understanding and interpretation of the ways in which print and visual arts, as well as oral language performance and interpretation, play continuing and changing roles in language education. In this part of the handbook, we examine research on language teachers and the conditions and contexts in which they teach. We discuss the increasing assortment of programs offered at the preservice level and the kinds of inservice support offered to practicing professionals. Special issues are addressed that confront teachers in the current wave of reform. These include the current emphasis on multicultural education and the challenges posed by the ever-increasing diversity of the school population. The need to bring teachers together from various disciplines within the communicative and visual arts to create and implement curriculum is also addressed. The voices of teachers and administrators are heard, including those who teach in traditional as well as nontraditional settings.

Improvement in the conditions and quality of teachers and teaching has been a continuing source of concern to educators from the earliest history of schooling in the United States:

It is undeniably true that for many years the teaching profession has been held in less high regard in the United States than its due; the teachers have been ranked and rated more by their salaries than by their service to public. Teachers' salaries are inadequate, and the professional requirements are correspondingly low. The profession has suffered because almost any kind of amateur can get permission to instruct school children. If it were not that the average public school teacher has given the public much more than he has received, it would have gone hard with the schools and education in our country. (Department of Interior Bureau of Education, 1918, p. 208)

Concern for the status of the teaching profession continues to undergo constant public criticism and the scrutiny of educational researchers. Current reforms in teacher education and at the district and school levels are addressed by several authors in this section. Significant changes in traditional university-based programs as well as alternative certification, programs connected with professional development schools, and the Teach For America initiative. Nearly all of these programs are relatively new and require continued scrutiny. Nevertheless, they are viewed as attempts to be more responsive to needs within schools and classrooms and for that reason they are hailed as innovative and hopeful alternatives to existing programs that are badly in need of reform.

In an attempt to re-create schools as places where students and teachers work together, some school districts are attempting to redefine the roles of teachers. Curricula are being revised and instructional methods altered to reflect more interdisciplinary approaches. The integration of the communicative and visual arts would appear to be natural points of linkage. In general, however, several authors in this section concur that linking the domains of visual and verbal expression continues to be a need both in teacher education programs and in the classroom. Olson laments the lack of communication between art and English language arts teachers, stating that the actual setting of the school frequently works against the formation of a close partnership between the two areas of communication and expression. Mesa argues not only for the integration of the communicative and visual arts, but decries the fact that the arts are often thought of as less intellectual or important as other areas of the curriculum. He reminds us that good art instruction calls for rigorous intellectual skills, imagination, and the ability to conceptualize.

Grossman, Valencia, and Hamel raise a key point of tension as we move toward a more interdisciplinary view of the communicative and visual arts. They remind us that current reforms within literacy education require greater teacher expertise in all aspects of the English language arts. Yet, reforms across and beyond subject matter areas would appear to ask teachers to act as generalists. Providing teachers, especially new teachers, with the fundamental background they need to design and implement integrated curricula will be a growing challenge for teacher education in the future.

Redefining of the role of the teacher is also the thrust of the chapter by Vacca, Vacca, and Bruneau. They encourage the concept of *teaching as a reflective practice* as it is increasingly used to describe both teacher development and the practice of teaching as a thoughtful, highly professional activ-

ity. They call for a high level of problem solving and intellectual inquiry among teachers and state the need for professionals to develop the ability to identify and understand problems of practice as well as to develop the ability to hypothesize alternatives, place new actions into practice, and evaluate the results of their teaching action. They cite examples of individual and collaborative work in which classroom teachers and university teachers and researchers problem-solve together. Grossman, Valencia, and Hamel also call for greater collaboration between faculties in education and in arts and sciences within colleges and universities, and between university-based teacher education programs and schools.

Concern for preparing and supporting teachers who work with students from diverse linguistic and cultural backgrounds is expressed by several authors. As teachers and principals struggle to redesign their schools to meet the challenges of the 21st century, they are faced with the reality that the public schools must educate more children from diverse backgrounds than ever before and that they must do it better than ever before. As an administrator, who is neither an artist nor an art educator, Mesa speaks passionately about art as central to our need to express human experience and thought. He has a special concern for the decreasing role given to art in the education of ethnically and linguistically diverse students. Viewed as far away from the basics, art departments are most likely to suffer from budget cuts. Although Mesa deplores these cuts for all students, he views them as doubly harmful for students in areas of high academic risk where large numbers of ethnically and linguistically diverse students are concentrated. Unlike more advantaged children, these students are not likely to have rich experiences with art outside the classroom.

Teacher education programs that prepare teachers to work with the increasingly diverse populations found in our nation's schools are discussed in the chapter by Tinajero and that of Grossman, Valencia, and Hamel. They are also the focal point of the Willis and Harris chapter. Willis and Harris cite numerous researchers, who stress the belief that improved understandings of the role of culture in literature instruction during preservice education will improve literature instruction for all students. They share some of the instructional techniques they use with preservice students to build community, model instructional strategies, and offer opportunities for students to experience strategies they might eventually use as teachers.

No doubt the diversity among learners and the teaching environments in which they are taught will only increase in the coming years. So too, the modes of communication will continue to expand and change in our society. The concept of what it means to be literate and what teachers must do to support learners in their attempts to acquire knowledge and develop as literate members of our society will also change. Thus, the challenge to attract and nurture teachers, such as the one enthusiastically experimenting with drama described at the beginning of this introduction, will only become greater.

Throughout Part IV, the contributors offer an agenda for research on teachers and teaching that goes well beyond the

collection of evidence regarding best methods, time on task, or stating instructional objectives. Simply modifying the framework within which teachers operate will neither improve teachers nor the teaching of the English language arts. Moreover, it will do little to bring the communicative and visual arts closer together as a unified whole. Teaching is an uncertain and vulnerable activity. The fact that this is unlikely to change, is not all bad. Though the uncertainties make teachers vulnerable, they also invite opportunities to con-

struct effective, dynamic learning environments for everyone involved. We can help counterbalance the uncertainties that teachers face by connecting them to other teachers to lessen the loneliness and lack of support they experience; by allowing them the rewards that come from recognition, accomplishment, and professional control; by enabling them to acquire and generate new knowledge; and by encouraging them to take charge of their own professional development". (Goodwin, 1987, p. 35)

PREPARING LANGUAGE ARTS TEACHERS IN A TIME OF REFORM

Pamela L. Grossman, Sheila W. Valencia, Frederick L. Hamel

UNIVERSITY OF WASHINGTON

INTRODUCTION

Myriad in number and diverse in intent, reform efforts are currently challenging the educational status quo. Some of the reforms are aimed at increasing access to quality education for all students. These reforms include the movements to eliminate tracking in schools and to educate special education students in regular classrooms. Other reforms hope to create greater national consensus on standards for students and teachers alike. Goals 2000 legislation requires that we define what students should learn and make explicit the criteria for acceptable performance. At the same time, the National Board for Professional Teaching Standards has begun to create standards for expertise in teaching. Other reforms are aimed at giving teachers a more active role in determining school policies through site-based management and in assessing student learning through classroom-based and performance assessments. Not surprisingly, language arts has occupied a central role in many of these reform efforts, as the literacy abilities of students continue to concern both educators and the public.

At the same time, the field of language arts itself has undergone a number of reforms. Over the past two decades, basic and applied research in literacy has changed what we teach, how we teach, and how we assess student learning in the language arts (cf. Hillocks, 1986; Pearson & Fielding, 1991; Resnick & Resnick, 1992). For example, reading is now understood as the process of constructing meaning rather than the translation of icons; writing is viewed as a complex series of processes for a variety of purposes and audiences, rather than as a product; and new approaches to literary criticism have challenged the purely text-based models of close reading that defined New Criticism. Literature-based reading instruction, reader response theories, and writing

process have all found their way into classrooms. In addition, the curriculum of language arts has expanded beyond the traditional areas of reading, writing, listening, and speaking to include visual literacy and an emphasis on thematic or interdisciplinary curriculum. Finally, assessment within the language arts has shifted away from sole reliance on standardized tests to include more authentic, performance-based assessments, as well as classroom-based evidence of student growth (Valencia, Hiebert, & Afflerbach, 1994). Taken together, these multiple reform efforts represent a dramatic departure from the language arts curriculum and instruction of the past.

Given the breadth and multifaceted nature of the subject matter, preparing capable and knowledgeable language arts teachers can be a complicated task at any time. The complexity of the task increases during periods of reform. In this chapter, we explore the challenges of preparing language arts teachers both within the specific context of the subject matter, which presents its own unique dilemmas, and within the context of these larger reform efforts.

BREADTH OF SUBJECT MATTER

Any discussion of preparing language arts teachers must confront the breadth of the subject matter and its implications for teacher education. Whether depicted as the traditional tripod of language, literature, and composition, or the four areas of reading, writing, listening, and speaking, the subject matter is extremely broad and ill-defined (Applebee, 1974; Elbow, 1990). This breadth invariably creates dilemmas in preparing teachers to teach language arts.

One dilemma concerns the subject matter preparation for prospective language arts teachers. Because the field is composed of many distinct disciplines, there may be an inevitable

trade-off between breadth and depth of preparation in the content areas of language arts. For example, should we require that prospective elementary school teachers take at least one course in all of the areas that might reasonably be considered part of the language arts curriculum as part of their undergraduate programs? If so, they might be required to take courses in literature, writing, rhetoric, speech communications, drama, and language acquisition. Such a requirement threatens to sacrifice depth of understanding in any one particular area for overall breadth. Similarly, what majors should be recommended for prospective secondary language arts teachers? The traditional English major is likely to focus almost exclusively on literature (Graff, 1987) and give shorter shrift to other components of the language arts. At the same time, prospective teachers who major in communications or journalism may find themselves relatively less well prepared to address the literature component of most secondary language arts classes.

These issues are accentuated, in part, because there is no direct higher education equivalent for "language arts." Instead, a number of university departments overlap the territory encompassed by this school subject, including English, Communications, Speech Communication, Drama, and Comparative Literature. Learning language arts for teaching can thus occur in a wide variety of academic departments, no single one of which captures the entire school subject.

The breadth of the school subject also creates dilemmas for research efforts in English education. For example, researchers have concentrated particularly on elementary teachers' understandings and beliefs about reading, while all but ignoring their knowledge of literature. In contrast, a number of studies have investigated secondary English teachers' knowledge and understanding of literature, but researchers have seldom looked at their knowledge of the reading process. Few studies have attempted to study teachers' understandings of the full spectrum of language arts. As Nancie Atwell's (1987) portrayal of her own development as a teacher suggests, teachers' beliefs about the teaching of writing and the teaching of reading may develop in isolation; changes in teachers' beliefs and practice in teaching writing are not necessarily accompanied by changes in the teaching of reading. These issues of breadth affect not only teacher education and research but language arts classrooms, as teachers must make decisions about what aspects of this many-faceted subject to include in their curriculum. The lack of definition of language arts may create greater autonomy for teachers, which in turn, places greater demands on teachers' individual knowledge and skill (Grossman & Shulman, 1994).

ELEMENTARY AND SECONDARY LANGUAGE ARTS: SEPARATE WORLDS?

Language arts is susceptible to fragmentation not only by the breadth of its content but by grade level as well. Researchers and teacher educators alike have often tended to treat elementary and secondary language arts as separate worlds. Traditionally, elementary teacher educators have focused

more on teachers' knowledge of the processes of language acquisition, reading, and writing. Because elementary teachers have relied in the past upon basal readers, the selection and instruction surrounding particular literature has not been seen, until recently, as the primary responsibility of the individual teacher; the textbooks provided both reading selections and suggestions for instructional strategies. In contrast, secondary teacher educators have focused more on the content of the curriculum. However, with the recent popularity of literature-based instruction at the elementary school, the subject matter preparation of prospective elementary teachers in literature will become increasingly important. Similarly, the numbers of secondary students experiencing difficulty in reading and writing, and the increased emphasis in secondary language arts on the processes of writing and interacting with texts suggest that secondary teachers' understandings of the processes involved in reading and writing will attract more attention as well.

These differences in perspective dependent upon grade level are also reflected in the membership and concerns of national organizations concerned with the teaching and learning of language arts. The National Council of Teachers of English (NCTE) and the International Reading Association (IRA) are the two largest professional organizations associated with language arts education. While the sizes of their memberships are similar, the distribution of members representing elementary and secondary education is reversed. Based on data on journal subscriptions, approximately 70% of IRA members have an elementary focus and 30% a secondary focus, while 30% of NCTE membership represent an elementary emphasis and 70% a secondary emphasis. This suggests that elementary and secondary language arts teachers may be reading different journals, attending different conferences, and generally remaining isolated from one another, making it all the more difficult to ensure an articulated curriculum and shared understandings across the grades. The sequestering of teachers by grade level also closes off opportunities for teachers to learn from one another. Teacher educators may also reflect this division by grade level, as they may belong to different professional organizations and work in different arenas in teacher education programs.

MULTIPLE VERSIONS OF ENGLISH/ LANGUAGE ARTS

Both accounts of actual classroom practice and theoretical analyses suggest that there are multiple, and often conflicting, "versions" of language arts operating within schools (see Applebee, 1974; Barnes, Barnes & Clarke, 1984; Dixon, 1969; Gere, 1992; Grossman, 1993; McEwan, 1992; for discussions of various traditions and versions of language arts and their implications for teaching). Five distinct versions of language arts might include: personal growth version; disciplinary knowledge version; basic skills version; transformative/critical literacy version; and cultural heritage version.

Each of these versions poses somewhat different goals for the teaching of language arts and implies different sets of assumptions about the nature of the subject matter. For

example, a basic skills version may emphasize the acquisition and command of reading and writing skills. Skills may be depicted as discrete and detachable into isolated subskills. In contrast, a personal growth version of the subject matter emphasizes the centrality of the learners' growth as an individual; the purpose of language arts instruction, in this version, is "to enable pupils through reading and writing to change their experience of the world" (Barnes et al., 1984, p. 247). A cultural heritage version of English highlights the importance of literature in conveying common cultural knowledge and values, while a version that focuses on critical literacy might focus on teaching students to use language to critique and transform social inequities. Finally, a disciplinary knowledge version might focus attention instead on helping students acquire the ways of knowing that characterize the disciplines of literature and language arts (Applebee, 1994).

Teachers also possess different theoretical orientations to instruction. Much of the research in elementary literacy teaching and teacher education describes a range of teacher's orientations to instruction (e.g., top-down, bottom-up, interactive), each of which may carry various approaches to curriculum and instruction (e.g., whole language, literature-based, explicit instruction, direct instruction). Adding further to the complexity, the multiple interpretations of approaches such as whole language and literature-based curricula make shared understanding and discussion among teachers difficult at best (e.g., Hiebert & Colt, 1989; Scharer, Freeman, Lehman, & Allen, 1993; Zarrillo, 1989).

The fact that multiple versions of the language arts curriculum exist within actual classrooms creates additional challenges for the preparation of language arts teachers. First, because approaches to language arts instruction have changed dramatically over past two or three decades, prospective teachers have had experiences in learning to read and write during their own educations that differ from what is being advocated in their teacher education programs. Second, because there are always likely to be different versions of language arts instruction operating within different classrooms, prospective teachers are likely to encounter dissonance between the recommendations of their language arts methods courses and the classroom practices they encounter during field experiences and student teaching. Understanding how new teachers position themselves among these competing versions of language arts instruction has become a central focus of research in this area.

As suggested earlier, these specific characteristics of the subject matter of language arts raise dilemmas for the preparation of teachers. Given the breadth of the subject matter and the tendency for the individual components of the larger subject to be treated separately, teacher educators face the challenge of creating coherent programs for prospective language arts teachers. The fragmentation by grade level suggests that programs to prepare language arts teachers may differ rather dramatically, depending upon the level for which teachers are being prepared. Finally, the multiplicity of theoretical orientations to language arts instruction almost guarantees that prospective teachers will encounter conflicts in instructional philosophy among their own experiences as students, their coursework in teacher education, and their experiences in actual classrooms.

RECENT RESEARCH ON PREPARATION OF LANGUAGE ARTS TEACHERS

While language arts educators may disagree on the definition of the content, there is general agreement that learning language arts for teaching requires understanding of both the content of the subject matter and approaches to teaching the subject matter to make it accessible to diverse learners. However, the preparation of language arts teachers has been a relatively unexplored area of research until relatively recently (Alvermann, 1990; Guthrie, Seifert, & Mosberg, 1983; O'Donnell, 1979; Quisenberry, 1981). In the past decade, a number of studies have focused on the development of prospective language arts teachers, focusing particularly on the knowledge and beliefs prospective teachers hold about teaching the language arts and how these beliefs are influenced by their professional preparation. Studies on the preparation of language arts teachers have focused on at least three areas; (1) teachers' subject matter knowledge and understandings in various aspects of language arts (most often, literature, reading, and writing) and how these understandings are acquired during both liberal arts and professional education; (2) teachers' pedagogical content knowledge, or understandings of approaches to teaching language arts and how these understandings are acquired during preservice education; and (3) how teachers' experiences as students and student teachers mediate their efforts to translate their understandings of how to teach language arts into classroom practice.

The Question of Subject Matter Knowledge

Research on teachers' knowledge of the subject matter has tended to concentrate more on the school subjects of math and science than on language arts. In part, this may reflect the difficulty of disentangling knowledge of the content, *per se*, (e.g., knowledge of rhetoric and writing) from knowledge of teaching the content (e.g., knowledge of teaching writing) in the language arts. Another explanation may be the epistemological diversity within the discipline itself. (See Shanahan, 1994, for a discussion of the variety of perspectives on teachers' knowledge in language arts.) Recent changes in approaches to teaching language arts, however, may put even greater demands on teachers' knowledge of literature and of writing. For example, literature-based reading programs in elementary schools presume that teachers have broad knowledge of both high quality literature for children and the pedagogical knowledge of how to use literary texts to promote both basic literacy and literary understanding. Similarly, proposals for classroom-based assessments assume that teachers possess appropriate knowledge of the content and the processes involved in student learning. In order to meet the challenge of these proposed reforms, those concerned with teacher preparation may need to reconsider issues related to prospective teachers' subject-matter backgrounds.

The research on teachers' content knowledge within the language arts has focused particularly on secondary school teachers, although a number of studies have investigated preservice elementary teachers' beliefs and understandings.

As part of a larger study on knowledge growth among beginning secondary teachers, Grossman (1991) explored the knowledge and beliefs two preservice teachers held about literature and how these beliefs affected their classroom practices. Grossman identified distinctive orientations toward literature held by the two teachers—an orientation to the text and an orientation to the reader, which are loosely related to different schools of literary theory. These predominant orientations shaped the teachers' goals, the kinds of activities they planned for students, and the nature of questions they asked during classroom discussions. Other work seems to confirm that preservice secondary teachers enter teaching with specific orientations toward literature that influence their beliefs about teaching (Clift, 1987; Holt-Reynolds & McDiarmid, 1993). Researchers at the National Center for Research on Teacher Learning are currently studying how prospective teachers develop these beliefs and knowledge about literature during their undergraduate courses in English and how these beliefs are affected, in turn, by teacher education.

Clift's (1991) study describes the first 2 years of one young teacher's experiences in learning to teach in a secondary literature class. The study identifies the large gaps that exist in the teacher's knowledge, gaps that make teaching problematic. Clift suggests that knowledge of the subject matter of literature, particularly knowledge of literary analysis plays a significant role as it interacts with knowledge of pedagogy, assessment, management, student diversity, and self-image.

In general, the studies of teacher knowledge at the elementary level have defined subject-matter knowledge as knowledge of the reading process and reading skills—that is, decoding, comprehension, vocabulary, study skills and the like (cf. Alvermann, 1990; Bednar, 1991; Evans & Johnson, 1991). This emphasis on the teaching of reading is understandable at the elementary level, given national reports about students' limited abilities to read and comprehend complicated material (Williams, Reese, Campbell, Mazzeo, & Phillips, 1994), concerns about the quality of reading instruction (Durkin, 1978), and recent metacognitive and cognitive research about the reading process (e.g., Cross & Paris, 1988; Duffy et al., 1987; Palinscar & Brown, 1984). More recently, however, with an emphasis on process writing and literature-based instruction, a few studies have examined teachers' knowledge of literature and writing.

Relatively few studies have looked at elementary teachers' knowledge of literature and its relationship to classroom instruction. A recent study conducted by the National Center for the Learning and Teaching of Literature (Walmsley & Walp, 1989) concluded that although teachers strongly believed that literature should be a major part of the elementary curriculum, their main reason for using literature was to encourage a love of reading and books, and to teach reading skills rather than to "explore literary responses or develop literary knowledge." They had no coherent, articulated philosophy of literature's role in the language arts program, the connections between reading and literature, or the role of writing in literary understanding (Walmsley, 1992). Similarly, other studies (e.g., Scharer et al., 1993) have found that literature-based instruction is used primarily as a vehicle for teaching reading rather than for literary understanding. Fur-

thermore, in the few instances in which teachers' knowledge of literature has been investigated, it is often assessed by having teachers identify the titles and/or the content of children's literature rather than literary understandings (e.g., Cunningham & Stanovich, 1990; Johnston, et al., 1990). Walmsley and Walp conclude that many elementary teachers have limited formal training in literature. Taken together, the limited scope of this line of research on experienced teachers' understanding of literature suggests that we have much to learn about preservice elementary teachers' knowledge and beliefs in this area.

Research on elementary teachers' knowledge of writing is also limited. An early study (Walmsley, 1980) found that elementary preservice teachers knew almost nothing about teaching writing. More recently, Gambell (1991) found that most of the preservice teachers in their study were frustrated and unsure of themselves as writers, knowing little about various approaches to writing or modes of writing. Three studies conducted by researchers at the National Center for Research on Teacher Education add to the concerns. Schmidt and Kennedy (1990) found that preservice, beginning, and experienced elementary teachers held a wide diversity of beliefs about teaching writing, including a process approach, skills approach, and a form/function approach. Teachers did not have a uniform perspective nor did they discriminate among them. They adopted an all inclusive perspective toward writing, believing that being good at writing requires "everything from factual knowledge about the parts of speech to the use of an iterative writing process." The preservice teachers in this study represented this all encompassing view almost twice as often as the more experienced teachers.

Florio-Ruane and Lensmire (1990) looked closely at what prospective elementary teachers learned about writing in a preservice class. Initially, these teachers knew little about how students learned to write and about the forms and functions of writing. They envisioned teaching writing as direct explanation. The course was designed to transform their prior experiences and beliefs about teaching writing by having the prospective teachers redefine and learn about writing and work directly with students. Although the prospective teachers experienced difficulty when the course challenged their visions of teaching or threatened their control, working directly with children and using their acquired subject-matter knowledge helped them to understand students' writing in a new way. The researchers suggest that by focusing on children's writing, relying on subject matter and developmental knowledge, rather than on teaching strategies, these preservice teachers were able to see children and teaching in a new way.

Ball and Mosenthal (1990) examined the impact of the Teacher's Collège Writing Project on preservice and inservice teachers. Although the teacher educators themselves had strong subject-matter knowledge of the writing process, text characteristics, and types of genres, analysis of the program and interviews with the participants revealed that the primary goal of the program was not to develop teachers' subject-matter knowledge. Instead, the goal was to help teachers engage students in writing and to support the concept of students and teachers as colearners. The researchers question

how teachers can facilitate students' learning in writing, without a deeper knowledge of writing.

Process-oriented approaches to teaching writing assume some knowledge about the nature of writing and composing, and the ways in which the demands of writing may vary depending upon the nature of the writing task, the specified audience, and the genre, among other factors. Lack of this knowledge among teachers may help explain why process-oriented writing instruction all too often reduces the complexity of the writing process to a linear, lock-step series of discrete stages (Applebee, 1986). Acquiring beliefs about the appropriateness of process-oriented instruction without also acquiring a deeper understanding of writing may contribute to this pattern among both elementary and secondary language arts teachers.

While research on language arts teachers' understandings of subject matter is still relatively new, initial findings suggest that what teachers both know and believe about the processes of literary interpretation and written composition affect the ways in which they implement curriculum and orchestrate classroom instruction. Given the increasing emphasis on literature-based curriculum at the elementary level, teacher education programs may need to reconsider the kinds of knowledge and experiences prospective elementary teachers may require in order to help students construct their own interpretations of literature. Both elementary and secondary teachers may require greater knowledge of writing in order to provide appropriate instruction for students that honors the complexity of writing for different purposes and audiences. In concentrating primarily on literature and composition, this area of research has neglected to investigate what teachers need to know about oral communication in order to incorporate more opportunities for students to develop their skills and understanding of spoken language. Any consideration of prospective teachers' preparation in these areas would seem to require the collaborative efforts of faculties in both education and the arts and sciences, a point we return to later in this chapter.

The Transition to Pedagogical Reasoning

Research on the preparation of prospective language arts teachers has also examined the development of pedagogical content knowledge among beginning teachers. Shulman (1987) calls such pedagogical reasoning "the capacity of a teacher to transform the content knowledge he or she possesses into forms that are pedagogically powerful and yet adaptive to the variations in ability and background presented by the students ... to think one's way from the subject matter as understood by the teacher into the minds and motivations of learners" (p. 15, 16). In looking at this shift from knowledge of the subject, *per se*, to knowledge of how to represent the subject matter for diverse learners, most research has focused on identifying the importance of subject-specific methods courses in the formation of pedagogical content knowledge for language arts and on the difficulties facing prospective and beginning teachers as they make this shift to a more pedagogical consideration of subject matter.

Recent studies have explicitly resisted the popular notion that subject-matter knowledge, a few generalized pedagogical principles, and classroom experience can suffice as teacher preparation in the language arts. Several studies have demonstrated that understanding of the subject matter alone does not necessarily enable prospective teachers to rethink the content from a pedagogical perspective. Clift (1987) studied six university seniors, three of whom were English majors with no intention to teach and no coursework in education, and three were English majors who were becoming certified in secondary school teaching. Her analysis suggested that the English majors located expertise for textual interpretation with the teacher/professor, while the education students favored the construction of personal understanding. The prospective teachers emphasized the learner's experiences with literature, seeing themselves as educators first and subject-matter specialists second; the English majors cast learners in a more passive role, as consumers of the details of literature brought to them by knowledgeable teachers. As Clift concluded, "English majors ... may develop a schema for teaching and learning English that has a strong orientation to the text ... but virtually no orientation to the reader. Prospective teachers, by contrast, may be guided to develop schema that take the learner into account..." (p. 234). The study suggests that preservice English education programs serve to modify and expand novice's initial orientations to literature and to help them develop pedagogical reasoning.

Another study (Grossman, 1990) looked at first year secondary English teachers, three of whom had completed a teacher education program and three of whom entered teaching without professional preparation. The case studies of these six teachers show important differences between these two groups of beginning teachers with respect to their purposes for teaching English, their understanding of students, and their approaches to selecting and organizing content. The author comments that while "all prospective secondary teachers face the task of rethinking their subject matter from a more pedagogical perspective" (p. 143), teacher education can help beginning teachers establish a framework within which to accomplish this task.

Part of the task of developing pedagogical content knowledge involves confronting one's implicit assumptions about the teaching and learning of language arts. A number of studies have looked at strategies for uncovering preservice teachers' prior assumptions and helping teachers to reflect on them. Many authors point to the power of asking students to engage in autobiographical writing as part of this process. Sperling (1994), for example, asked preservice English teachers to write about their own classroom experiences and to identify the personal metaphors they held for teaching English. Her analysis of student writing suggests that allowing prospective teachers to reflect critically in a social context on their metaphors encourages their ability to imagine alternative choices in teaching and the potential impact of these choices on students' opportunities to learn. In a related study, White and Smith (1994) suggest that English education students' construction of personal teaching metaphors provides an occasion for dialogue as competing ideas, assumptions, and beliefs are revealed. In a series of

qualitative case studies, Fox (1995) provides further evidence supporting the importance of self-reflective examination of preexisting beliefs through the uses of narrative and autobiography in English methods courses. Others have also used literacy histories or reflective journals in preservice reading education classes to help students develop insights into literacy, literacy learning and teaching (Bednar, 1991; Hermann & Sarracino, 1993; Meyer, 1993; Pultorak, 1993; Stansell, 1994). Although all these studies conclude that such reflective experiences are important vehicles for preservice teachers to confront their past experiences, not all have been equally successful at promoting renewed visions. Resistance to change may be a result of confronting negative past experiences or it may be related to the way the journals or autobiographies are supported and used in preservice courses.

From a slightly different perspective, Florio-Ruane (1994) explored how reading and writing autobiographies helped prospective elementary teachers address issues related to teaching culturally and economically diverse students. She found that having prospective teachers read autobiographies of culturally diverse authors elicited personal narratives from preservice teachers which focused on issues of ethnic identity and difference, language and schooling. Such explorations of both their own and others' autobiographies may help preservice teachers acknowledge and investigate the resources that culturally diverse students bring to school.

Other studies have addressed elementary preservice teachers' theoretical orientations, beliefs about, and strategies for teaching reading (cf. DeFord, 1985). For the most part, these studies focus on the changes of teaching beliefs and practices as part of coursework or practicum experiences. Several studies suggest that it is difficult to change preservice teachers' beliefs about teaching reading, even when students are engaged in coursework and a related practicum (Davies, 1990; Evans & Johnson, 1991; Herrmann & Sarracino, 1993; Moore & Harris, 1986; Wallhausen, 1990; Wham, 1993). For example, Wallhausen (1990) used qualitative and quantitative methods to examine preservice elementary teachers' knowledge of reading theory and instructional methods as well as their beliefs. The teachers learned the content knowledge taught in their methods class more rapidly than they were able to change their beliefs or translate knowledge into actual practice. She concludes that teachers' past experiences and the stress of a practicum experience interfere with their ability to mediate theory and practice.

Other researchers suggest that specific strategies used in methods classes may actually promote change in knowledge and in understanding of teaching practices. Some recent studies have documented students' learning in restructured constructivist elementary literacy courses (Hermann & Sarracino, 1993; Hollingsworth, 1989). For example, Hermann and Sarracino restructured their course to engage prospective teachers in reflective inquiry. The content of the course changed from topics about literacy to theories influencing the development of literacy. The structure of the course was altered to include a mentoring program, individual tutoring of children, and professional collaboration partnerships among the preservice teachers and the

instructors. The changes were difficult for both students and instructors but some changes were noted for all students in how they thought about literacy instruction, and the social and emotional aspects of becoming a teacher. At the secondary level, Fox (1995) found that preservice teachers engaged in constructivist coursework, especially recursive inquiry and reflection, made adaptations in their approaches to the teaching and learning of English.

These studies indicate that understanding one's own implicit assumptions and beliefs about the teaching and learning of language arts represents a critical stage in the development of pedagogical content knowledge. Literacy autobiographies, reflective journals, and critical reflection can all help surface these implicit assumptions. Prospective teachers may also need to confront differences between their own experiences as learners in language arts classrooms and the kinds of teaching and learning that are currently being advocated. This disjunction is particularly apparent in the field of writing, in which dramatic shifts in classroom practice have occurred over the past two decades. Experiences in working directly with children can also support the development of pedagogical thinking and the reexamination of theoretical assumptions.

Learning to Teach in Context

A number of studies illustrate the importance of field experiences in shaping prospective teachers' beliefs about the teaching and learning of language arts. As many studies of teacher education have demonstrated (Feiman-Nemser & Buchmann, 1985; Lanier & Little, 1986), student teachers must traverse two worlds—the world of the university and the world of the schools. Student teachers may find it difficult to reconcile the perspectives on teaching the language arts they encounter in teacher education courses with the kinds of activities they observe in classrooms.

Clift (Clift, Merg, & Eggerding, 1994) explored the tensions two student teachers experienced between the goals of their English education program and the pressures of the student teaching context. The student teachers reported that the expectations of their cooperating teachers conflicted with their emerging pedagogical beliefs about English and with their images of teaching. Moreover, Clift found that the teacher education program did little to ease this tension. In following 25 preservice English teachers through their professional preparation, Ritchie and Wilson (1993) found that although students began to revise their views about the teaching and learning of language arts during teacher education, their experiences both as students and as student teachers within more traditional classrooms proved more powerful. The preservice teachers did not totally transform their beliefs about the teaching of writing and literature. Instead, as the researchers conclude, "students were merely adding new, alternative notions to their existing traditional views, and they did so with little apparent sense of tension or conflict" (p. 76). When student teachers entered the classroom, their fragile understandings of new approaches to teaching writing and literature faltered and they often reverted to more traditional practices.

Other research supports the difficulties student teachers and beginning teachers face in implementing new visions of teaching writing in classroom settings (Gomez, 1990; Gomez & Comeaux, 1990). In a study of eight secondary English education students from different universities, Gomez and Comeaux found that these preservice teachers had been taught process-oriented methods of teaching composition and entered their student teaching situations idealistically regarding their ability to carry out these ideas in the classroom. By the end of student teaching with ethnically diverse populations, however, their concerns had shifted away from the subject matter to classroom management and they became disillusioned with their students' ability to succeed in the language arts classroom. The authors conclude that student teachers need more time to reflect on the failure of instructional strategies with particular students. In a related study that followed three graduates into their first year of teaching, Gomez found a similar pattern of idealism followed by disillusionment. This work suggests that as preservice teachers develop new ideas about teaching language arts, they may need help in adapting their ideas and strategies specifically for diverse learners.

Other researchers agree that field experiences play an important role in fostering preservice teachers' learning (Blanton & Moorman, 1985; Evans & Johnson, 1991; Hollingsworth, 1989; Michelson, Duffy, & Lasovage, 1984). Hollingsworth followed preservice teachers before, during, and after a 5th-year teacher education program. Through interviews and observations of 14 elementary and secondary preservice teachers, she found that students' incoming beliefs about reading served as filters for understanding the content they learned and how classrooms functioned. Furthermore, these preservice teachers had to have managerial routines in place before they could focus on learning about reading or teaching reading and they had to have both subject-matter knowledge and managerial routines in place before they could focus on their students' learning. Given the power of field experiences, researchers in this area suggest various models such as early multiple field experiences to foster mediation of beliefs and practices, and greater coordination between field and coursework to insure opportunities to apply new concepts.

As these researchers suggest, prospective teachers may find it difficult to resolve conflicts that arise between visions of language arts instruction encountered in language arts education classes and the realities that confront them in actual classrooms. In order to support prospective teachers' transformed visions of teaching and learning the language arts, teacher educators must work with classroom teachers who share common visions and find settings for student teaching in which new teachers are able to explore what it means to put these ideas into practice.

However, even in supportive settings, prospective teachers are still likely to hold seemingly inconsistent beliefs about the teaching and learning of language arts, particularly if their own experiences as students differ dramatically from the new ideas they are encountering. As studies of student learning have vividly demonstrated, the process of conceptual change is rarely simple or linear, and new understandings are initially

layered upon older and perhaps inconsistent prior beliefs (Smith, diSessa, & Roschelle, 1993/1994). Recent theoretical study suggests that prospective teachers will need opportunities to work out these new ideas in the context of classroom practice and with the support of knowledgeable mentors who can help them identify and explore inconsistencies in their beliefs and practice.

CHALLENGES FOR THE FUTURE

The existing research suggests that much work needs to be done if teacher education is to support current reform efforts. New reforms within the teaching of language arts suggest that more emphasis may need to be given to the subject-matter preparation of prospective language arts teachers. Curriculum frameworks that ask teachers to engage students in active and thoughtful interpretation of literary works place new demands on teachers' own grounding in interpretive frameworks and strategies. The adoption of literature-based instruction at the elementary level puts greater demands on teachers' knowledge of literature. The increasing diversity of students in regular classrooms suggests that secondary school teachers will need to develop a deeper understanding of the teaching of reading to help struggling readers. Similarly, process-oriented writing instruction may assume greater knowledge of writing and composing than did more traditional instruction. In order to create and scaffold appropriate writing assignments (Langer & Applebee, 1986) and to provide instruction that supports students' writing, elementary and secondary teachers may need a deeper understanding of rhetoric and composition processes. Finally, the movement towards classroom-based and performance assessments requires greater subject-matter understandings on the part of teachers.

Teacher education cannot solve the problem of subject-matter knowledge for prospective teachers without the full participation of arts and sciences faculty. Efforts to rethink the subject-matter preparation of elementary teachers in literature or writing must include faculties from both education and English (Tyson, 1994). A number of pilot projects, have tried to develop stronger linkages between education, and arts and sciences faculty (Tyson, 1994).

The movement toward more inclusive schools and classrooms may also place greater demands on teachers' pedagogical content knowledge. As teachers become responsible for meeting the needs of a wider range of students, including special education students and students who speak English as a second language, they will need to increase their instructional repertoire and to develop a better understanding of reading and language acquisition among different populations of students.

At the same time that prospective teachers may need deeper understanding of the individual language arts, they also need help seeing the connections among the various threads that constitute the subject matter. Language arts is an inherently interdisciplinary subject matter. In order to orchestrate a coherent language arts curriculum in the classroom, prospective teachers may need more help in reflecting

on what constitutes the warp and weft of this admittedly diffuse subject.

A curious dilemma arises if we juxtapose the need for prospective teachers to be more deeply prepared in various aspects of the language arts with the current calls for more cross-disciplinary and interdisciplinary curriculum at both the elementary and secondary levels. While reforms within the subject matter would seem to require even greater subject-matter expertise in order to succeed, reforms beyond the subject matter might be interpreted as calling for the preparation of teachers as generalists. Some have even questioned if we should be preparing language arts teachers, *per se*, if our goal is a truly integrated curriculum. This emphasis on the importance of interdisciplinary work and integrated curriculum may undermine the efforts of teacher educators to focus on subject-specific pedagogy within the teacher education curriculum.

However, we know very little about what kinds of understandings are necessary for teachers to design and implement integrated curricula. Some might argue that prospective teachers first need a thorough understanding of a specific discipline before they are able to engage in interdisciplinary work, while others might argue that the emphasis on separate disciplines undermines the focus on integration. Future research will need to look more carefully at the kinds of subject-matter and curricular understandings required for responsible interdisciplinary curriculum (Gardner & Boix-Mansilla, 1994). In short, this tension between the push toward a greater emphasis on subject-specific pedagogy in teacher education and the growing demand for interdisciplinary programs will need to be addressed by teacher educators at both the elementary and secondary levels.

Even if teacher educators succeed in engaging students in new ways of thinking about language arts instruction, they will still need to deal with the difficulties new teachers face in implementing these new visions in more traditional classrooms. The gulf between university exhortations and classroom practices, a perennial problem of teacher education, is unlikely to disappear in the near future. Most public school teachers have been in the classroom on an average of 15 years, and 75% of them plan to remain in teaching as long as they are able (Choy et al., 1994). This suggests that a majority of practicing teachers, the pool of cooperating teachers, was prepared prior to many of the current reforms. The reform of classroom teaching cannot rely on newcomers alone. Much recent work on the reform of teacher education has been devoted to ways of bridging this gulf through professional development schools (Darling-Hammond, 1994; Goodlad, 1990; Holmes, 1990) or various other forms of collaborations between schools and colleges of education. Such collaborations try to connect ongoing professional development with preservice education. However, we have relatively little evidence of how effective professional development schools can be on a large scale.

New research on cognition highlights the importance of context in problem solving and casts new light on apprentice-

ship models of learning (Brown, Collins, & Duguid, 1989; Lave, 1988). Student teaching represents one form of an apprenticeship model. While the apprenticeship form of learning during student teaching in the past has focused primarily on the acquisition of practical knowledge, recasting student teaching as a *cognitive* apprenticeship (Brown, Collins, & Duguid, 1989) could help students wrestle more actively with the theoretical implications of classroom routines and practices and to puzzle over the tensions between what they have been taught at the university and what seems to work, or not work, in the classroom. In order to create this kind of apprenticeship model in student teaching, there will need to be greater mutual understanding on the sides of both university-based and field-based teacher educators. This vision of cognitive apprenticeship seems to underlie the hopes of the professional development school movement (Holmes, 1990).

Even if these collaborations could be created and sustained, however, teacher educators would still face challenges within the apprenticeship model. Apprenticeship models of any kind may be most appropriate when the goal is stability of practice (Dewey, 1904/1965; Grossman, 1992). At a time of dramatic reform, the apprenticeship model can only work if there are enough master teachers who are successfully implementing these reforms with whom to place prospective teachers. Even in these ideal situations, apprenticeship models still provide only a single "case of teaching" for prospective teachers to learn from. Work on knowledge acquisition in complex, uncertain domains illustrates the importance of multiple cases for learning (Spiro, Carlsen, Feltovich, & Anderson, 1988). This need for prospective teachers to encounter variations in practice, to consider how the same theories or ideas can unfold differently in different contexts, argues for any form of field experience to include multiple placements and to be supplemented by some form of case-based teaching in the university curriculum (Grossman & Shulman, 1994).

Current reform efforts cannot succeed without careful attention to the content and processes of both teacher education and continuing professional development. Teacher educators will need to reconsider the subject-matter knowledge and pedagogical content knowledge required in order for language arts teachers to teach for understanding in increasingly diverse classrooms, even as they rethink the structures and experiences through which prospective teachers acquire this knowledge. Such changes will require greater collaboration between faculties in education, and in arts and sciences within colleges and universities, and between university-based teacher education programs and schools. While the obstacles to such collaboration are well known (Sirotnik & Goodlad, 1988), the number of efforts currently underway in the reform of teacher education and professional development provide opportunities to study natural variations among these efforts and to make recommendations about the best ways to sustain collaborative efforts to rethink the preparation of language arts teachers.

BECOMING A MEMBER OF A PROFESSIONAL LANGUAGE LEARNING COMMUNITY

Janet L. Olson

BOSTON UNIVERSITY SCHOOL FOR THE ARTS, CHAIR, ART EDUCATION

INTRODUCTION

It is not easy for a teacher from one discipline to enter the domain of another, especially when one is entering an area viewed as essential to good education from one often viewed as a frill. Such is frequently the case when the value of language and visual arts is assessed, even by experts. When this happens, that is, when one feels judged as an educator by the ability to express oneself with words, art teachers often feel intimidated by both English and language arts teachers. Word people, of course, frequently feel intimidated in the area of studio arts and are often quick to declare that they cannot draw.

Nevertheless, the priority given to each of these subject areas is quite different, both within and without the school setting. For example, the student unable to draw to an acceptable level of accomplishment is rarely viewed as having a learning disability. But the student with artistic skills who has great difficulty with the language arts is frequently labeled as having learning disabilities. Drawing well is viewed as a special gift that requires very little work or practice to improve upon, whereas improvement in language arts is almost always considered essential. Needless to say, such attitudes, when prevalent, can inhibit the building of bridges between the visual and language arts.

Similarities

In spite of these obstacles, art teachers with deep concern for students with good visual skills but who perform poorly in academic subjects, should put their personal insecurities aside in order to make a concerted effort to build connections between these two areas for the sake of learning. By so doing, they will be surprised to discover the natural liaison between

these two domains. Thus, when art teachers find themselves entering the professional language learning community, they should focus first on the many similarities shared by the two areas. Focusing on the similarities is far more productive than dismissing the possibility of a close educational partnership based on differences. Unfortunately, very few art teachers and both English and language arts teachers are aware of how much they have in common.

GOALS

Both the language and visual arts claim to be forms of communication concerned with thinking. Each discipline professes to be a primary means of knowing, experiencing, and understanding the world around them; and each discipline claims to facilitate creativity and self-expression while transmitting a historical and cultural record of human achievement (Greene, & Petty, 1975; National Council of Teachers of English, 1976; Qualley, 1986). Finally, each discipline believes that children have a natural desire to draw (Wilson, & Wilson, 1982) and to write (Calkins, 1986), respectively. It is reasonable to assume, therefore, that if educational goals and beliefs for teaching visual and verbal expression are viewed as being complementary rather than different, mutually supportive rather than both competitive and different, the learner might benefit a great deal.

Verbal and Visual Development

There are many more specific characteristics that the two areas have in common. For example, it is interesting to observe that children develop visual and verbal language in a highly similar sequence. The first babbling sounds that babies make are similar to their very first marks on any surface

(paper, wall, high chair tray) with any marking tool (crayon, fingers, stick). In each case children are experimenting with a range of possibilities. By repeating sounds and marks they discover the ability to control and to be intentional with their actions (see Figure 33-1). When children begin to use a single word referential designator such as "mommy", "daddy" or "chair," it is developmentally similar to what happens when children begin to assign meaning to their marks, such as the 3-year-old who says "snow" after making the white marks around the periphery of her painting (see Figure 33-2). Combining two words to make an early sentence form, such as "me up" or "me go," is similar to visual combines, such as the first "tadpole" people (see Figures 33-3 and 33-4) that children make as they gradually develop their visual language (de Villiers, & de Villiers, 1979; Fein, 1993; Gardner, 1981; Glazer, 1989; Kellogg, 1970).

Active language processing develops gradually, including evidence of more complex talking, vocabulary expansion, increased sensitivity to syntax, sounds, and meaning. This stage of development is similar to what happens when children expand their visual vocabulary to include a range of visual symbols including people, animals, houses, trees, and so on throughout the preschematic stage of visual development. During the preschematic stage, images seem to float in space over the entire picture plane without a sense of gravity (see Figure 33-5). When children progress to the schematic

FIGURE 33-1 Markmaking stage of development.

FIGURE 33-2 Child names white marks "snow" around the periphery.

FIGURE 33-3 First visual combine, a "tadpole" person.

stage of visual development, they show evidence of understanding their place in relationship to the world. Images no longer float, but are placed firmly on a groundline, with the sky at the top of the page (see Figure 33-6). At this stage of development children are able to articulate both visual and

FIGURE 33-4 More developed combine, a "tadpole" person.

FIGURE 33-5 Preschematic stage of visual development, floating images.

verbal stories with confidence. From this point on, students will develop more advanced visual and verbal skills, and realism of expression gradually becomes a critical factor (Goodnow, 1977; Hurwitz, & Day, 1991; Lowenfeld, 1957; Pinker, 1994).

When this happens, self-confidence is challenged and teacher attitudes play an important role if self-confidence is to be enhanced. However, if visual ability is not valued or understood as a vehicle of communication by teachers or parents, students naturally conclude that verbal communication is more important than visual communication and that their so-called "gift" is not really important after all. With this devaluation, the visual and verbal partnerships can breakdown and, as a consequence, the two forms of communication will no longer benefit from their initial, and in my view, quite natural, interactive complementarity. Such a breakdown puts students with stronger visual than verbal skills at a marked disadvantage. No longer are their strengths valued or used as a tool for learning in their area of weakness. Hence a close working relationship between art teachers and language arts teachers is essential to prevent, and cer-

FIGURE 33-6 Schematic stage of visual development, groundline and sky.

tainly to alleviate, such problems if and when they arise (Olson, 1992).

Parts of Speech and Elements of Design

When one probes more deeply into the similarities between visual and verbal expression, one quickly sees obvious connections. For example, both forms of communication have their own basic parts or elements. The eight parts of speech, of course, are the noun, verb, pronoun, adjective, adverb, preposition, conjunction, and interjection. Similarly, depending on how one counts, there are also eight visual elements, including the dot, line, shape, value, texture, color, space, and movement. Artists can feature each of the visual elements individually, even when the subject of an image is the same, such as a shoe, as demonstrated in Figure 33-7.

Authors and artists use these basic parts of speech and visual elements to *compose* or to *construct* either a literary or a visual image. The unique manner in which the author and the artist both compose their work is referred to as *style* (voice or vision). Occasionally terminology separates us, even when the meaning or the intention is very much the same. For example, artists speak of portraits and figure studies, and authors speak of character development. Artists speak of landscapes, interiors and still lifes and authors speak of set-

tings and props. Artists speak of tryptichs, a sequence and/or a body of work, and authors speak of a plot or a sequence of events. And both speak of their own point of view or perspective.

Both the artist and the author communicate their stories or concerns by employing their own chosen art form, and yet the creative process for each is very similar. Both the artist and the author go through a period of rehearsal, preparing their work space and getting ready for the process. Donald Murray (1984) describes the writing process as a sequence of collecting, focusing, ordering, drafting and clarifying, and then returning to any step in the sequence again and again until the author decides that the writing is finished. The visual artist works in a similar manner.

What would happen if a choice between the two forms of communication was never required and students of all ages were encouraged to move naturally between both forms of expression? This natural process would allow insight to be translated from one form to the other as necessity dictates, such as when this 5-year-old practiced writing G's (for girl) and drawing girls in the same image (see Figure 33-8). Is it possible that a higher level of literacy could be achieved if both forms of communication were encouraged, especially for

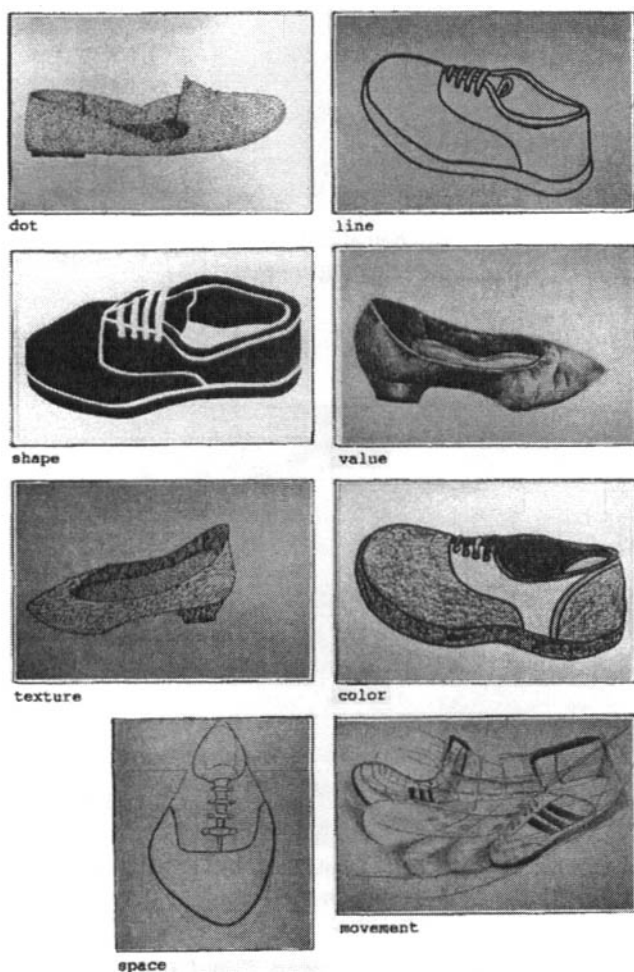

FIGURE 33-7 Eight visual elements.

FIGURE 33-8 Child moves naturally between visual and verbal forms of expression.

those students who have difficulty in expressing themselves with words?

In order to research this possibility, an art teacher decided to explore the potential of such a partnership. Could the writing process be used to draw upon her area of strength (painting) and translate her visual expressions and

FIGURE 33-9 Painting chosen to inspire the writing process.

Process Log

This paper was an enormous challenge to me for three very specific reasons:

1. I have never tried to write fiction before.
2. Even though I have done a lot of work helping children learn how to translate their images into words, I have never tried it myself. That may seem strange, but I think teachers are often guilty of this.
3. Since writing does not come naturally to me, it is an enormous struggle. My skills are still very weak and probably not equal to the goal I set for myself.

My first task was to choose a painting from my portfolio to write about. I wanted both the painting and the writing to be fictional, eliminating other influences as much as possible. I wanted the image and the word to be intimately related, both filtering through the artist/writer. Even at that, fiction is never completely so, it's always influenced greatly by the personal experiences of the creator. I chose Ole Randall, a fictional character to write about.

FIGURE 33-10 Page 1 of the writing process, translating from the visual image to the verbal form of expression.

insights into her area of weakness (writing)? Could one of her paintings (see Figure 33-9) inspire a piece of creative writing? Following Donald Murray's (1984) model of collecting, focusing, ordering, drafting and clarifying, she proceeded to put the visual-verbal partnership to the test. Figures 33-10 through 33-22 describe the entire translation process that was employed and the final piece of writing that was the result of the process (see Figure 33-23). This art teacher concluded that the writing process was definitely effective and served to translate and to inspire a level of creative writing she had never before achieved. She also concluded that without the original visual image, her level of verbal expression would have been inferior by comparison.

As one continues to research the similarities between the two forms of expression and communication, it becomes increasingly obvious that visual and verbal forms of expression have much in common. It is entirely natural for both children and adults to move comfortably between the two forms of communication if impediments are not created that lead to their separation.

AUTHORS AND ARTISTS

Many adults continue the natural inclination to move freely between the visual and verbal forms of expression, as evidenced by viewing the personal letters written by both artists

I started by brainstorming for 10 minutes. By studying the painting, I listed any word that popped into my head:

<i>Ole</i>	<i>calm lake</i>
<i>strong</i>	<i>still water</i>
<i>old</i>	<i>not moving</i>
<i>peering</i>	<i>weathered</i>
<i>looking</i>	<i>tanned</i>
<i>sugged</i>	<i>squinting into sun</i>
<i>solitary</i>	<i>looking back</i>
<i>farmer</i>	<i>at peace</i>
<i>fisherman</i>	<i>strong arms</i>
<i>sensitive</i>	<i>manual work</i>
<i>caring</i>	<i>field work</i>
<i>silent</i>	<i>work clothes</i>
<i>reflective</i>	<i>simple</i>
<i>lake</i>	<i>serenely</i>
<i>Minnesota</i>	
<i>immigrant</i>	<i>new life</i>
<i>Norway</i>	<i>masculine</i>
<i>Viking</i>	<i>simple</i>
<i>ghost</i>	<i>limited palette</i>
<i>seeking</i>	<i>blue</i>
<i>searching</i>	<i>orange</i>
<i>new land</i>	<i>white</i>
	<i>burnt wood</i>
	<i>steel grey hair</i>
	<i>cigar</i>
	<i>half burnt</i>

FIGURE 33-11 Page 2 of the writing process, translating from the visual image to the verbal form of expression.

and writers such as Pablo Picasso, Vincent Van Gogh, Edouard Manet, Mark Twain, Virginia Woolf, Victor Hugo and others (Hamilton, 1987). Numerous authors and writers also recognize the close relationship between writing and the making of art. Unfortunately, art teachers rarely make reference to the artist as writer. William Blake, Edvard Munch, Alexander Calder, Kathe Kollwitz, Piet Mondrian, Paul Klee, Wassily Kandinsky, Egon Schiele are just a few examples of the many artists who have used verbal expression to inform and augment their art (Hayes, 1987; Kandinsky, 1981; Schiele, 1985; Torjusen, 1986), and contemporary artists, such as Jenny Holzer, Jennifer Bartlett or Faith Ringgold, continue to do so (Wallis, 1991; Witzling, 1991). Conversely, language arts teachers are rarely interested in the drawings, paintings or sculptures executed by writers such as Edgar Allen Poe, e. e. cummings, Dylan Thomas, Federico Garcia Lorca, T. S. Eliot, Henry Miller, Gunter Grass and John Updike, just to name a few (Hjerter, 1986; Oppenheimer, 1987; Young, 1973). Such individuals are sensitive to the admonition of Goethe who once said:

We ought to talk less and draw more. I personally should like to remove speech altogether and communicate everything I have to say in sketches. My poor little bit of sketching is priceless to me; it helped my conception of material things; one's mind rises more quickly to general ideas, if one looks at objects more precisely and keenly. (Hjerter, 1986, p. 16)

CURRICULUM CONTENT

It is interesting to note, during these times of educational self-study and evaluation, that the visual and language arts seem to be following an inverse pattern of emphasis regarding instructional methodologies and goals. Historically it has been the case that the visual arts have placed emphasis upon the creative process by focusing on the subject, namely, the child as artist. The language arts, by contrast, have been subject-matter oriented to the extent that students have been encouraged to model their writing on certain classical paradigms of writing. In other words, self-expression has been encouraged in the former case, whereas, in the latter case, the subordination of self-expression to content and correct grammar tended to be the rule.

Now, these priorities in pedagogy are in the process of being reversed. The language arts is placing greater emphasis upon creative writing by attending to whole language approaches to the process of writing with attention to the child as writer. Conversely, art education, in many quarters, is taking a more academic approach to methodology by stressing the elements of design, criticism, art history, and familiarity with classical art objects as prerequisite to the actual making of art objects.

There is great danger, given this exchange of instructional strategies, that the language and visual arts will simply pass

Reviewing the list, I could see that the words could be divided into four categories -- background, character, setting and the act of painting itself:

<u>The Background</u>	<u>The Character</u>	<u>The Setting</u>
immigrant (what is not seen)	Old weathered	lake
Norway	strong tanned	Minnesota
Viking	old looking back	calm lake
found	piercing eyes	still water
new land	looking strong arm	not moving
new life	suggested movement	
	weathered simple	
	farmer field work	
	fisherman work clothes	
	sensitive earthy	
	caring full body	
	silent	
	reflective	
	seeking	
	searching	
	immigrant	
	new land	
	new life	
	masculine	
	simple	
	steel grey hair	
	eyes	
	left hand

might be shown into the rest of the writing rather than a separate part

FIGURE 33-12 Page 3 of the writing process, translating from the visual image to the verbal form of expression.

A third list was devoted only to the character -- his appearance, personality, work and history:

The Character (Ole Randall)

<u>Appearance</u>	<u>Personality</u>	<u>Work</u>
strong	strong	farmer
old	sensitive	fisherman
piecing	aring	manual work
looking	silent	field work
sugged	reflective	
weathered	seeking	
masculine	searching	
steel grey hair	masculine	
eyar	simple	
half burnt	at peace	
not moving	earthly	
squinting into sun		<u>History (background)</u>
weathered		immigrant
tanned		new land
looking back		new life
strong arms		
worn clothes		

FIGURE 33-13 Page 4 of the writing process, translating from the visual image to the verbal form of expression.

this little 'worn photo' wandering who this man was. He gradually became a symbol of mystery. ~~He became the feeling that I had about him.~~ I could see him sailing the Norwegian fjords and struggling for his very existence in a poor country with few opportunities

I finally got to the fictional part, describing the person in my painting. My voice sounded very matter-of-fact and wooden. I was simply reporting.

* Ole ~~was~~ a strong man. He came to this country many years ago seeking a new life, a better life. He would not forget the past but he would look forward to the future. Settling in the lake country of Minnesota he would have daily reminders of the fjords he left behind. He was a hard worker.

1 Ole ~~was~~ one with the land. His weathered body was at peace with the earth. He raises his tanned, muscular arm to squint at the setting sun. He is old now and he can't look back and reflect on a life of honest work and personal fulfillment. He is not

FIGURE 33-15 Page 6 of the writing process, translating from the visual image to the verbal form of expression.

At this point, I thought I was ready to begin the writing.

I wrote in a linear form, beginning with the discovery of a small, forgotten photo. No one knew who the man was, but it became the inspiration for the painting.

I remember when I first layed eyes on him. I was looking through some very old photographs in my in-law's living room. A very small black and white photo fell from the page between the pages of the album. It had been ~~lost~~ but, ~~could~~ and stuffed between the pages long ago. I picked it up and felt a strong ~~presence~~ with this man peering out at me. Who was he? a family member? a friend? Nobody knew. Nobody could remember. I simply put the photo back in the book and returned the album to the shelf. I didn't give the picture much more thought.

But that image came back to me every once in awhile. I found myself thinking about it and I began to wonder if I could do something with it. Could I give it life? Could I give it a past and a future? As an artist ~~and a painter~~ I wanted to try.

It was several months before I was able to look at the photo again. ^{in a moment} I slipped it into my purse and took it home with me. I spent much time looking at

FIGURE 33-14 Page 5 of the writing process, translating from the visual image to the verbal form of expression.

I stopped writing after the character description. I wanted to weave in material about the act of painting, but I needed to return to the image and draw out more information. I made another list specifically focussed on the act of painting. Notice the notation I made to myself.*

The Act of Painting

mixing pigment
matching
smoothing
blending
squinting back
layers
underpainting
shadows
textured
highlights
raw sienna
burnt umber
titanium white
ultramarine blue
planes of his face
dissection of the brushstroke
cast shadow of the arm
proportioned arm
folds in clothing

*The man's face has been easier to do if I had kept notes while I was painting. Sometimes I'll try that.

surface
canvas
stretched
prepare
getting ready
gesso
anticipation

FIGURE 33-16 Page 7 of the writing process, translating from the visual image to the verbal form of expression.

List continues:

creased skin
folds around eyes
skin tones
paint sifter
kill the color
build up the paint
push back the background
pull the figure forward
edges
little blinding
dividing up the plane
shape of color
change of plane

I then proceeded to write a long and detailed description of the painting process.

My stretchers squared up will be 52 square
The new canvas is spread out on the
floor and I begin to pull ~~the canvas~~
taunt and smooth around the stretchers,
starting in the middle and working towards
the corners. It's an exciting time.

FIGURE 33-17 Page 8 of the writing process, translating from the visual image to the verbal form of expression.

List continues:

Immigrant
Reflection
No Regrets
"Morning Mood" (by E. Grieg)
My Roots
Fiddlerman
Back to Basics
Exploring the Frontier
A New Home
Looking Back
A New Life
Seeking a New Life
In Search of a New Life

I also looked up key words in the thesauras to use as a reference during re-writing:

FIGURE 33-19 Page 10 of the writing process, translating from the visual image to the verbal form of expression.

ready for the image). The placement
of the image, size, negative space
considered, focus. The drawing
directly on the canvas creates the
first glimpse of the image. His
size and strength are immediately
present. It's a big, strong canvas

This two page section was then added to what I had written previously. My first draft was complete.

I then made a list of possible titles:

List of Possible Titles

FIGURE 33-18 Page 9 of the writing process, translating from the visual image to the verbal form of expression.

each other by, without ever learning anything from the other. This is extremely unfortunate since, as this chapter has tried to demonstrate, these two fields have so much in common and have much to learn from each other. A greater level of communication between the language and visual arts through a spirit of mutual support will finally benefit the student most of all (Olson, 1992).

It is fair to assume, then, that becoming more fully aware of artists who write and writers who make art can provide profound insights for educators — not just theoretically but in the practice of the classroom. Each art form can benefit enormously when art and language arts form a partnership for the sake of learning. The integration of visual and verbal expression provides a more complete picture of communication and allows each art form to benefit from the special insights of the other. This connection also encourages a higher level of literacy for all students, especially for those students more inclined toward artistic expression — what is called the visual or the spatial learner (Dixon, 1983; Olson, 1992).

For this to happen, art teachers ought to become more involved with the larger educational community, making connections with other subject areas, for the sake of learning. In general, art educators, it seems to me, have been too much concerned with the child-artist and too little concerned with the child-learner. On the other hand, English and language

<u>strong</u> (strength) iron power muscular steel sugar brown courage energy stamina robust force hearty	<u>caring</u> (care) watchfulness help surveillance protect cautious pay attention	<u>peaceful</u> harmony tranquility
<u>old</u> (oldness) maturity frail antique antiquity tradition petrified hoarse faded decay	<u>silent</u> (silence) stillness hush mute voiceless	<u>earthly</u> unrefined vigorous robust

<u>sensitive</u> perceptive alert aware tender tenderhearted	<u>reveling</u> immersed	<u>calm</u> serene composed sedate tranquil still motionless

It seems necessary for me to write my first draft in a very linear, sequential form before I can play around with the parts. I guess I have to "see" it. Insight may then come at the strangest times. While brushing my teeth one morning, I suddenly realized that I was including much more than what was necessary. I didn't need to go into great detail about finding the photo and stretching the canvas. Writing it all out served a good purpose, however. It refreshed my memory concerning the entire creation of the painting, but it was clear that the finished piece of writing would be much more effective if I simply focused on the strength of the character. Then I could gradually weave in the painting descriptions.

The re-writes went through many messy changes:

bright sun is ^{to} become the center of the picture
playful fish or puppy are mischievous child. The mysterious light, the
~~new day,~~ ^{the appearance of the new day} of nature have always been present
one's memory, so many years back, just before I found the
land and joined the labor of his adopted home.

He is ~~a~~^{an} ~~observer~~^{observer}. As yet men ^{are} existing
in small bits of details, ~~dismissing nothing~~^{dismissing nothing} as insignificant.
The last bit of material ^{is left} before he is a simple
^{at some kind of time} man ~~connected~~^{connected} with his environment.

And finally, I closed with Murray's words simply because I thought they were very appropriate.

FIGURE 33-22 Page 13 of the writing process, translating from the visual image to the verbal form of expression.

I worked on possible outlines:

1. Finding the photo
2. Getting ready (stretching the canvas, etc.)
3. The Character
4. Painting
5. Conclusion

1. The Character
2. The Character & painting terminology
3. Rehearsal (anticipation & stretching the canvas)
4. the small photo (replacing it)

1. the character
2. the process
3. the rehearsal
4. the ^{source of the} ~~idea~~ ^{inspiration}

class with Murray's
quote

FIGURE 33-21 Page 12 of the writing process, translating from the visual image to the verbal form of expression.

THE EDUCATION OF TEACHERS OF VISUAL AND LANGUAGE ARTS

Chapters 34 and 36 focus on the preparation and certification requirements for English and language arts teachers. Unfortunately, these programs of study do not often require a visual arts course. If such a course is required, it is generally satisfied with taking an art history course or a studio course, rather than an art education course that would emphasize the artistic development of children. Even when an art education course is required, it is often taught as an art appreciation course rather than an opportunity to build bridges between the two areas of specialization that might ultimately make a significant difference in the classroom.

Art teachers are prepared for state certification in a variety of ways. They are expected to have a broad background in studio art, as well as experience in the history of art, criticism and aesthetics. In addition, art teachers are expected to have background in the artistic growth and development of

FROM MY MIND'S EYE

The air is still. It causes not a single ripple on the clear Minnesota lake. Ole Randall sits quietly. He's a vision of solitude, sensitive to the slightest movement near the opposite shore. Peering into the bright sun, he tries to determine the source of the fleeting gesture. A deer? A frog? A leaping bass? Or maybe a playful child. The mysteries of life and the wonders of nature have oft been revealed to him in such small pieces. Ole is an observer. A quiet, contemplative man, he appreciates the slightest clue to life's many treasures.

Ole is getting on in years. The lake is a soothing reflection of his old Viking past. In his youth he sailed the Nordic fjords imagining a more prosperous land, one of opportunity. He left and never returned, and yet he never forgets. The lake is a daily reminder of the beautiful Norwegian fjords he left years ago.

As a young immigrant farmer, he worked hard, having the advantage of both a strong mind and a strong body. He worked the fields in the scorching summer sun and drilled holes through the frozen lake for fish during the long, intensely cold Minnesota winter. His weathered body adapted to the rigorous demands of each season.

A rare man is he. In tune with his environment, as are the trees and the animals he lovingly observes. He looks straight into the future, not with regret or apprehension, but anticipating the day his beloved earth embraces and protects his tired body in never ending rest.

Ole's strong arm is raised to his forehead, shielding his eyes from the blinding sun. The burnt umber tones are brushed across the strongly defined muscular structure of the arm. The upper arm is foreshortened to create a strong illusion and depth of vision. He squints. Squeezing white pigment into the raw skin tones reveals the brilliant light and the contrasting shadows cast across his weathered face, challenging the artist. His face, the varied textures, the changing planes, minute shapes and lines fitting together like life's puzzle. Nothing can escape the painters' eye. The image is released from the deep crevices of my soul. I am one with my painting. There is no separation, no dividing line. My own history, my own past, my very roots are revealed in its' form. The painting is finished. The struggle is over, the artist has spoken. I stand back to see what hath been wrought -- a new life. A "thing" has been created from mere earthy pigments.

It was only a few short weeks ago that this large, tightly stretched canvas was lovingly prepared in uncertain anticipation. As the writer's blank page, it waited for the first mark, the first stroke of the brush.

Artists make me see what I can write. Reflected light, stillness captured, one simple curved line that leaves out and keeps in. When the writing doesn't come, I look at paintings, and especially drawings. If I could draw I wouldn't have to write. (Murray, 1984, 227)

FIGURE 33-23 Final writing example, inspired by the visual image.

children, classroom management and be able to design developmentally appropriate curriculum. A student attending a liberal arts college either majors in art education or majors in art studio and minors in art education. A student who attends an art school, usually majors in art education after completing an intense studio core program during the first 2 years. Many students choose to fulfill certification requirements at the masters level after devoting their entire undergraduate experience to the study of art. In most cases, freshman English, in order to demonstrate verbal competency, is the only English course required for graduation and certification.

Students in each area proceed on a narrow path of specialization, with little consideration given to how their respective subject relates to the other. If teachers were educated to *recognize* and to *analyze* the close relationship between artistic and verbal development, and communication and expression, children would be the beneficiary of a higher level of respect and understanding. A close partnership between the two areas of *communication* and *expression* could potentially elevate the level of student learning. With so many similarities between the visual and the language arts, I believe each teacher would benefit enormously from taking courses in each area of specialization, in order to solidify the partnership.

The Public School Setting

Communication between art and language arts and English teachers is made difficult by the usual educational setting in the public school. At the elementary level, language arts teachers are generally considered classroom teachers and are responsible for a small group of children for an entire academic year. They usually teach in their own classroom setting and are fully responsible for that environment. Very often, the special areas of instruction, including visual art, provide time in the daily schedule for the classroom teacher to have planning time. Consequently, classroom teachers are rarely involved with the curriculum content in these areas.

Art teachers, on the other hand, either welcome individual classes to their own art rooms, or they move from classroom to classroom, known widely as "art on a cart!" It is not unusual for art teachers to meet as many as 300 to 800 students in a single week. Some hardworking art teachers are able to integrate an individual art lesson with a classroom unit of study, but in many cases the requests are more than one art teacher can accomplish.

At the middle and high school levels, the isolation of one subject from another grows more profound. Some high schools are even designed in such a way that the arts (visual arts, music, theater and dance) are dedicated to their own wing, as though they have no connection whatsoever with the academic subjects. I know of at least two high schools where the arts are even located in their own separate building.

On the surface, this may not seem to be reason for dismay, but it sends a very subtle message that art is separate and different from more serious learning. The physical design of these schools also makes it almost impossible for visual art teachers and language arts teachers to converse about particular students, curriculum design and any kind of possible partnership between the two areas.

No wonder teachers, students, administrators and parents have come to the conclusion that art is a frill, rather than an integral part of the school curriculum. Unfortunately, the students who could benefit most from a close partnership between the visual and language arts are not being well served and consequently, are not reaching their full educational potential.

CONCLUSIONS

In this chapter, a strong case for collaboration between the visual and language arts has been made. Before the beginning of this research project, the visual and language arts areas were viewed as being worlds apart; but after entering the language arts community, enormous similarities and valid educational reasons for ongoing collaboration were found. The fears that were often expressed by both visual and language arts teachers were often based on very early school experiences, and these impressions were frequently reinforced at the college level where specialization is considered both natural and essential. As educators, however, we have a responsibility to serve students by attending to

all aspects of aptitude and potential. Certainly, this is an invitation to build whatever bridges are necessary for the sake of more complete learning.

The American poet e. e. cummings seemed to understand very well the unique and even necessary partnership between

the visual and the verbal modes of expression in the following lines:

Tell me, doesn't your painting interfere with your writing? Quite the contrary: they love each other dearly. (Hjerter, 1986, p. 109)

TEACHER PREPARATION IN THE LANGUAGE ARTS: A SYNTHESIS

Josefina Villamil Tinajero

UNIVERSITY OF TEXAS AT EL PASO

Ana Huerta-Macias

NEW MEXICO STATE UNIVERSITY

INTRODUCTION

Teacher education programs have undergone significant changes in the last few decades as they become more responsive to needs within the schools and classrooms. These changes have impacted teacher preparation programs in all areas of the curriculum including the language arts. This article describes recent developments in the area of teacher preparation with a focus on the language arts. We first present a historical perspective of teacher education programs and then focus on educational reform and renewal.

BRIEF HISTORICAL PERSPECTIVES ON TEACHER EDUCATION

Research indicates that some universities had established their own schools of education in the early 1900s, long before normal schools became teachers colleges and more than half a century before they evolved into universities. These schools of education were supported mainly by male high school teachers who had viewed university training "...as a way to protect themselves from the rising feminization and falling prestige of their calling" (Labaree, 1992, p. 138). However, this move to protect the male orientation of the high school teaching profession failed, and the schools then adapted by preparing the same male high school teachers as educational administrators. The result was that these early, university-based schools of education focused on the

preparation of school administrators as opposed to classroom teachers (Labaree, 1992). Thus, it was the normal schools that carried the major responsibility of formalizing programs for the training of teachers in the United States. It was also predominantly women who were being trained in these schools, as women public school teachers far outnumbered the male teachers. Kline and Dye (1992), for instance, indicated that at the end of the 1870 school year there were 5 male teachers in the Cleveland public schools versus 164 female teachers—a trend that continued into the 20th century. The first normal schools in Cleveland were private and were established in the post civil war period. Public normal schools were then established in response to the growing need to train urban as opposed to rural public school teachers. The urban teachers were dealing with problems in late 19th century Cleveland not encountered by rural teachers such as an "...increasing immigrant population, the dilemma of dual income homes leaving children in many instances to their own devices, the problem of health, sanitation..." (p. 4). Thus, there was a growth of public normal schools that continued into the early 20th century not only in Ohio but in other states as well. Bennie (cited in Warner, 1990) describes the establishment of the first normal schools in Texas:

Barely 30 years after becoming a state, Texas established its first teacher education institution, the Sam Houston Normal Institute at Huntsville in 1879. The importance Texans placed on quality elementary and secondary education is shown by the fact that the Institute was established four years before the opening of the state university. As the population began to expand over the state, other

teacher education facilities were opened. Normal schools were established in Denton 1901; San Marcos in 1903; Canyon in 1910; Commerce in 1917; Nacadoches (sic) in 1918; and Alpine in 1919. (p. 27)

The concept for those schools was borrowed by American reformers from the Prussians, who had a seminary-type school specifically for training teachers. However, as these normal schools were established in the states in the late 19th and early 20th centuries, the plans for them grew increasingly different from the original visions for such schools. Horace Mann, an American educator, had envisioned the ideal for these schools as a center specifically for teacher training. Yet, over time and with a demand for accessibility to higher education, these schools were generally treated as additional centers for advanced education rather than for teacher training (Eisenmann, 1991).

Squire (1991) additionally notes that while most elementary school teachers in the early 20th century had been trained in these 2-year normal schools, they were not trained in the teaching of English as subject matter. This lack of course work in English as subject matter was still apparent, even in universities, in the early decades of this century. A professor at Boston University noted, for instance, that in 1930 when he began teaching "not a single course on teaching reading was offered in the nation's colleges" (p. 6).

During the 1930s and early 1940s, teaching training centers and laboratory schools were established by universities throughout the country as they experimented with progressive education. These centers, which had a strong following, are said to have been responsible for training of an entire generation of teachers. Some of these university centers grew into centers for research and for training teacher educators as well as educational administrators. Teachers College at Columbia University, for example, became a major center for teacher education and research at this time.

It was not until after World War II, however, that with pressure from organizations such as the National Council Teachers of English (NCTE) and International Reading Association (IRA), stronger certification standards were recommended for teachers and that emphasis was laid on preparation for teaching the language arts. In the 1950s and 1960s there was a school reform movement to strengthen academic achievement. This led not only to funding for projects on curriculum development and teaching in English but also to the establishment of summer training institutes for teachers which focused on language, literature, and composition (Squire, 1991).

The centers which were created in the 1930s and 1940s were closed by the 1960s and 1970s as teacher educators moved away from these demonstration centers and laboratory schools to the real world of the classroom. Currently, however, there is a resurgence of centers which are gaining attention in language arts preparation, such as the Center for Study of Writing at Berkeley and the Centers of Excellence Program by NCTE which recognizes exemplary classrooms and schools.

Teacher preparation programs have continued to move toward a "field-based" approach by integrating more actual classroom experience into teacher training. This is evident in

the alternative programs which will be discussed later in this paper. However, before discussing alternative programs it is appropriate here to take a look at those skills and knowledge bases within the area of language arts that are the focus of teacher education programs. Space limitations, however, preclude an explanation of the many areas in which language arts teachers are expected to develop expertise. A listing of some of the general areas of teacher preparation is provided. This list is based on recent trends and issues in the language arts as identified by NCTE.

Teacher Preparation in the Language Arts

Discussions from the Commissions of the NCTE (Suhor, 1993) indicated increased attention to (1) the social and critical aspects of language; (2) multicultural issues within the curriculum (such as gender awareness and sexual orientation in literature selection); (3) a broader understanding of visual language (for example, film, television, graphs and photographs); (4) the teaching of writing as a process with the inclusion of spelling, grammar and vocabulary within the context of the student's writing; (5) the inclusion of reading and writing practices within literature studies; and (6) the combination of books and technology to form a new kind of instruction text. Two areas merit some elaboration: visual arts and technology in teacher preparation.

Teacher Preparation in the Visual Arts. There is a dearth of literature in the area of teacher preparation in the visual arts—to include art, music, drama, film, and dance—as compared to the language arts. Nonetheless, research in this area suggests trends toward postmodernism in art education (MacGregor, 1992); preparation for the teaching of arts within a multinational context (Zimmermann, 1990); and training in the development of a variety to skills such as critical thinking, cooperative work, organization and problem solving, and communication through dance and other comparable visual art forms (Overby, 1992).

The impact of postmodernism on the arts is one where less attention is paid to differences between what is known as high art and popular art, and where the emphasis is on the construction of art forms, each with its own unique interpretation, through social interactions. Thus, as MacGregor (1992) says, educators are now forced "to take note of voices often ignored in the establishment of educational priorities" so that curriculum development is now more "accommodative" and "elastic" (p. 4).

Following along the lines of a postmodern attitude, teacher education in the visual arts is increasingly focused on teaching the arts within a multinational-multicultural context. There is a thrust to internationalize the art curricula, and thus teacher art education, that it is now more global in perspective. Multicultural art programs have been sparse. Nonetheless, there have been a few projects in the past 10 years that have addressed this change to pluralism in the arts. These range, for instance, from a teacher preparation program to prepare in-service and preservice teachers to teach students from three cultural backgrounds to a large school

district curriculum project where art was one of a number of curricular areas incorporated into a multicultural approach to education (Zimmermann, 1990, p. 2). Community-based art education is another aspect of the change in the teaching of the arts within a multicultural context. This involves the presentation of art in such a way that the audience can gain insight into local and global issues and thus relate it to their own lives. These community and global extensions of the visual arts have created an issue in the area of teacher preparation. The issue is that art teachers cannot be expected to have the knowledge that is required about the many different cultures and communities within the United States and internationally to teach the visual arts from a global perspective. Thus, there is a call for the development of practical materials in this area, along with a request for support from school administrators, government policy makers, private foundations and university teacher educators.

The changes which have occurred in dance education typify what is happening within the area of the visual arts, and by extension, within teacher education programs for the visual arts. The more recent guidelines in the area of dance education curriculum include attention to not only specific dance technique and vocabulary but to (1) historical and cultural information, (2) the production of unique, creative, and expressive dance studies, (3) analyses and critical examination of professional and peer performance, and (4) the recognition of the relationship of dance to the arts. Dance elements are also integrated into other subject areas, including for example, physics. In the physics class principles of momentum, force, velocity, and energy are applied to dance to improve dance performance (Overby, 1992, p. 2). Thus, there is a move in dance, as in other forms of visual art, toward greater depth, broader national and international perspectives, and an integration with other subject areas.

Technology in Teacher Preparation. Technology is becoming the focus of much discussion not only within the language arts but in all literacy development across the curriculum. Training in the use of technology for the language arts is increasingly impacting teacher education. In his discussion about the role of computers in teaching the language arts, Bruce (1991) indicates that they can be:

1. A tutor to individualize instruction and record student progress,
2. A tool that can aid in reading, revision of texts and spelling,
3. A way to explore language as they manipulate and interact with it in various ways,
4. A medium which makes possible new forms of communication and "hypertext" which use tables, charts, graphs, pictures, sounds, video and text, and
5. An environment for communication including electronic networks that permit new forms of meaningful interaction.

Griest (1993) further elaborates on how technology is revolutionizing the language arts such that "whole language practices that do not evolve into whole media practices stop way short of a whole classroom" (p. 10). An example of how technology is impacting the language arts in critical and constructive ways is in the areas of reading and literature.

Earlier literary texts were considered static, and the student's role was to appreciate the printed words on the page and giftedness of the author. Now, with technology, texts have become fluid and students analyze texts not in passive but in active ways. Students can deconstruct texts as they move from a single linear channel to one of hypertext. Hypertext, or hypermedia, engages them in the process of text production with all forms of visual art, so that students are no longer just consumers whose role is to admire someone else's print (Griest, 1993). Technology has also made its way into assessment in the language arts as new software allows teachers to use text, images, and sound to document their student's processes and products as they go about using written and oral language (Barrett, 1994).

Teacher preparation programs have begun to integrate technology into their programs of study. Reading courses at New Mexico State University, for instance, include a review and evaluation of a variety of computer software. Preservice teachers are given the opportunity to (1) learn how to use these programs in the classroom; (2) talk about how they might be applied in reading and language arts classrooms in the schools; and (3) evaluate them in terms of usefulness, cost, multicultural perspectives, ease of integration into the curriculum, and so forth (V. D. Thompson, personal communication, May 1995).

The role of technology in teacher preparation, then, is a central one in that it will impact the teaching of all of the traditional language arts—reading, writing, literature—as well as create new areas of teaching—hypertext, telecommunications, visual arts—that we must integrate into our teacher education programs.

As teacher education programs adapt to these evolving areas of instruction, there is yet another change which is affecting preparation in all areas of the curriculum, the language arts, in particular—the increasing diversity in our nation's classrooms.

Preparation for Student Diversity

The major challenge for the future of teacher education programs in the language arts is preparing teachers to work with the increasingly diverse populations found in our nation's schools. Projections are that by the year 2000, almost 50% of the children in our classrooms will be culturally and linguistically different; that is, "minority" (Sosa, 1993). This means that every classroom teacher will be working with SAEs (students acquiring English). The English as a second language (ESL) teacher will no longer be able to take sole responsibility to assist those students who are developing English literacy, for these students will be present in all classes regardless of whether they are designed as ESL, language arts, science, social studies, or math classes. Thus, language arts teachers need some background in second language acquisition, the use of sheltered English, and ESL. How can teacher education programs in the language arts integrate all of the above? That is, how can we best prepare teachers in the language arts who have the skills and knowledge bases required to successfully teach students in the 21st century? The

following sections explore the traditional university-based teacher education programs and take a look at the educational reform movement, including alternative certification programs, Teach for America, and professional development schools.

Traditional University-Based Programs. Although traditional preservice teacher preparation programs differ remarkably from one another in their structure and orientation, they are also remarkably similar in many respects. Until a few years ago, teacher preparation programs were, almost exclusively, university based, with their teacher preparation unit at each institution responsible for program design, for curriculum design, development and implementation and for delivery of instruction with little or no input from practitioners.

With few exceptions, traditional teacher preparation programs in every state established broad academic requirements for the initial teaching certificate which included a college BA or BS degree, general education coursework, studies of subject matter, pedagogical studies and coursework in special education. The majority of teacher preparation units also established assessment requirements such as basic skills, subject matter and general knowledge exams. As recently as 1994, less than one third of the states, however, required assessment of teaching performance for the initial teaching certificate (Andrew, 1994). While most states had requirements for the initial elementary and secondary teaching certificate in the study of teaching and schooling (development of a basic repertoire of teaching strategies, methods of teaching elementary school subjects), only about one third of the states required the study of self (teacher as learner) and knowledge of alternative ways of organizing schools (Andrew, 1994).

In addition, as recently as 1994, almost one third of the states required no field experiences prior to student teaching. For those states which did have a field experience requirement, the requirement ranged from only 40 clock hours to 300 hours of field and clinical experiences, with the majority of states falling in the lower range of the continuum (Andrew, 1994). Among those states requiring field experiences prior to students teaching, only 11 required students to spend some time in multicultural settings, and only one state required videotaped feedback.

While almost all of the states required student teaching experience (which ranged from 8 full-time weeks to 18 full-time weeks), the majority required only 8 to 12 full-time weeks. In addition, seven states required no visit by a supervisor and only 14 states required master teacher training (Andrew, 1994).

In spite of a variety of similarities, traditional preservice teacher education programs do differ from one another in their structure and orientation (Kennedy, 1991). According to Kennedy, some preservice teacher education programs are 4 year programs, with teacher education integrated throughout the 5 years. Fifth-year programs allow undergraduates to major in a liberal arts discipline and then switch to specialized education courses at the graduate level. Five-year teaching programs are becoming the norm, and about 25% of newly

hired teachers hold master's degrees (Teaching Teachers, 1995, p. 70).

Teacher education programs also differ in the number and mix of professional courses they require as well as in the assessment requirements. They also differ in the noneducational requirements for the initial teaching certificate and field experiences. Some programs emphasize liberal arts education, while others emphasize research on teaching. Still others emphasize the craft of teaching. Some programs require basic skills exams in reading, math, and writing, while others include spelling and still others require an assessment of teaching performance (Andrew, 1994; Kennedy, 1991). Programs also differ in the noneducational and special requirements for teaching certificates. Some programs require U.S. citizenship, an oath of allegiance and screening for moral character (Andrew, 1994). They also differ in the kind of teachers they hope to produce and in their tacit theories of how novices can learn to teach (Kennedy, 1991).

Teacher Education Reform. A number of organizations, foundations, and individuals have sought ways in which to change the manner in which teachers are prepared and certified. They have been particularly concerned about teachers' continuing professional development. Although the great majority of the new teaching enthusiasts are graduates of schools of education, more and more are entering the teaching profession through alternate routes, including alternative certification routes, the Teach for America programs, which enlist liberal arts graduates from elite schools. Other programs are attracting military retirees and recently unemployed defense workers to teaching (Teaching Teachers, 1995, p. 69). A small percentage is enrolled in programs at newly restructured, reformed schools of education, which teacher educators, policy makers, and the public hope will produce what past reforms have failed to accomplish: better schools and better teachers through better teacher education (Winitzky, Stoddart & O'Keefe, 1992, p. 3).

Alternative Certification Programs. Certification programs which provide an alternative to the traditional teacher preparation programs in the United States have increased dramatically over the last two decades. In the 1980s only a handful of states provided programs that led to certification without the traditional course of study through a university or college. Yet, this number quadrupled in the late 1980s and by 1990 there were 33 (and possibly as many as 48) states implementing alternative certification programs (Hawley, 1990).

While the first alternative certification (AC) programs were spurred by the long-term teacher shortages, particularly in math, science and specialties such as bilingual education, AC programs which are being implemented currently are not limited to the sole purpose of increasing the supply of available teachers. Among the objectives of some AC programs are minimizing the costs and time for teacher education, encouraging well-qualified professionals to come into the field of education, and providing a model for teacher education reform. In this section, the concept of AC will be discussed and sample programs will be described. Since the literature does

not single out language arts as a specific topic within the area of AC, the authors will here provide a general description of AC programs and concerns. It is safe to assume, we believe, that the information presented applies to preparation for teaching the language arts as well as math, science, and other areas.

At this point, a working definition of AC program is appropriate. While definitions of AC programs vary according to different groups, institutions, and researchers, the American Association of Colleges for Teacher Education (AACTE) generally characterizes these programs as "any significant departure from the traditional undergraduate route through teacher education programs in universities and colleges" (cited in Hutton, Lutz, and Williamson, 1990). Alternative certification programs are to be distinguished from other types of programs which allow teachers to practice without certification, such as teacher certificate or emergency waiver programs. Additionally, AC programs are defined by states and typically include selective admission standards, a supervised internship-mentor supervision program, a streamlined curriculum of formal coursework which may or may not involve a university or college, and an examination to assure competency in the subject to be taught (Baird, 1990; Cornett, 1990; Hawley, 1990).

It was mentioned above that while increasing the supply of teachers is still one of the primary purposes of AC programs, additional objectives include facilitating the entry of professionals into teaching and providing a model for teacher education reform. State models in Texas and Connecticut, which fulfill each of these purposes will be described in the following sections. Another AC program, Teach for America, which is not state based, will also be described.

Alternative Certification Programs in Texas. Texas passed a law in 1985 for licensure of college graduates who had not completed a Teacher Education Program by passing a competency test, serving an internship, taking training in teaching methods and also taking courses from a university program. Three different programs have resulted from this: higher education, educational service center, and school district models. The higher education model includes coursework and supervised in-school training during the intern's first year of teaching. The educational service center programs rely on field-based experiences with mentor supervision. School districts participate in models which they have designed using staff development as the primary basis for preparation (Cornett, 1990).

Since 1989 all AC programs in Texas brought before the State Boards must undergo a developmental process which calls for the participatory involvement of classroom teachers, district administrators, education specialists from education service centers and representatives from higher education faculty and administration. The purpose of this is to strengthen the quality of the program and foster broad-based participation as programs are developed and refined. As an additional effort to maintain quality, interns in AC programs are provided with multiple levels of support. Support is provided by the principal of the school where the intern is

placed, by trained observers, by a program supervisor who serves as a liaison between the program director and the interns, and by mentors who receive training in monitoring, clinical supervision, peer coaching, communication and conferencing skills (Texas Education Agency, 1991-92).

These programs have brought a dramatic increase in the number of AC students. The number of interns jumped from 276 in 1985-86 to 1,965 in 1991-92; likewise, the number of programs went from one (in Houston) in 1985-86 to 21 in 1991-92. Moreover, the Texas program shares characteristics with other programs with respect to the higher numbers of minorities and males being recruited for these programs. In 1991-1992, for example, 34% of the total number of interns in Texas-based AC programs were males and 50% were minorities (Texas Education Agency, 1991-92).

Some highly successful models have introduced AC programs at the post baccalaureate level. Such is the case at the University of Texas at El Paso where students who already have college degrees and work experiences in other fields are recruited. This program requires university coursework over summer, fall and spring semesters. During the fall and spring a student simultaneously works as an entry-level teacher in one of the 10 participating school districts in the area. Interns take the required state certification exams during their second summer in the program. Upon successful completion, students are recommended by the university for a Texas Teacher Certificate (UTEP/ACP, 1995).

Alternative Certification Programs in Connecticut The AC program in Connecticut was instituted in 1987. Its primary objectives were "...To bring exceptionally qualified individuals with diverse backgrounds into the profession ... a secondary agenda ... was to create an external catalyst for change in Connecticut's fourteen standard teacher education programs" (Bliss, 1990, p. 36). Competitive entry for this program is based on minimum criteria which include:

- a Bachelor's degree with a major in the intended teaching field
- GPA of at least B
- an essay describing the desire to become a teacher
- a passing score on the Connecticut's content area exam
- proof of registration for Connecticut's content area exam
- experience in working with children or adolescents

Alternative certification is available in the areas of elementary education (grades 4-8); secondary education (English, foreign language, mathematics, science, history and social studies), and art and music (K-12).

The initial part of the program consists of the successful completion of an 8-week, full-time, noncredit summer program. The curriculum consists of a coherent integrated group of courses which are organized in thematic blocks. These blocks, for instance, include student as learner, teaching the learner and problems of learners. The sessions utilize lecture, small group discussion, case teaching and forums with experienced teachers.

After completing the summer program and after accepting a regular teaching position in a public school, a temporary

90-day teaching certificate is issued to the AC teacher. Once the 90-day period is over, and upon recommendation of the superintendent, an Initial Educator Certificate is issued by the State Department of Education which is enough for 1½ years. At the end of this period, and after the teacher has passed an assessment on the Connecticut teaching competencies, a Provisional Educator Certificate is issued. The teacher must then complete, within 3 to 8 years, 30 credit hours in a planned program beyond the bachelor's degree after which a Professional Educator Certificate is issued. In order to keep this certificate, 90 contact hours of professional development must be taken every 5 years (Bliss, 1990).

The program has resulted in a dramatic increase in the number of teachers (60% of whom entered teaching from another field) and their salaries in the state. In a few years Connecticut moved from seventh place in teacher salaries to second place behind Alaska with an average teacher's salary of \$40,346 in 1990.

The reaction by supervisors to the AC teachers has been highly positive with respect to their personal qualities as well as their teaching. These results have been attributed to the high standards of the program as well as the demanding schedule and heavy workload—all of which have also brought about an esprit de corps among the participants. The strong mentor program—2 years with a state trained mentor and district appointed supervisor—has also been recognized as highly important to the program's success.

The program has also achieved its objective of serving as a catalyst for teacher education reform in Connecticut. Faculty members in some universities have reexamined the curriculum and organizational structure of the courses. In at least one university, the core courses were organized thematically in a highly integrated sequence. Thus, the program is reported as meeting its goals of (1) attracting highly qualified individuals into teaching who demonstrate a heightened sense of professionalism; and (2) serving as a catalyst for change in Connecticut's standard teacher education programs (Bliss, 1990).

Teach for America. Teach for America (TFA) is another popular program which deserves mention here. This program seems to be sweeping the country as a modified Peace Corps program where teachers work toward certification through placement in school districts which already have existing mechanisms for AC. The program which is in part supported by private industry, requires a 2-year commitment on the part of cities and rural areas. The program trains teachers in an 8-week preservice institute held at the University of Southern California in Los Angeles during the summer, prior to their placement. This institute includes a 6-week national component which revolves around student-teaching in Los Angeles' year around schools and 2-week on-site induction into the schools and communities in which corps members will be teaching. The institute is mostly staffed by active teachers from the placement sites who aim to provide corps members with the practical skills as well as a theoretical background which they feel is essential before they go into the classrooms. These novices then enter the schools as 1st-year teachers and are paid entry level salaries. Ongoing professional develop-

ment is provided through support groups, workshops, and university programs. Additionally, TFA has a local office which provides its members with transitional help and ongoing direct support. The program is evaluated internally through its Director of Research and Evaluation who identifies strengths and weakness of the program.

Teach for America program appears to be highly controversial. While some praise the program others feel that this "emergency" type credentialing of teachers leaves them without crucial preparation in the general areas of child growth and development—knowledge essential to effective teaching (Lawton, 1991). The classes at the preservice institute have been criticized as being mostly irrelevant to the daily work of the members in the classroom. The lack of strong mentor teachers who could truly provide guidance by working closely with the corps members has also been cited as a major weaknesses of the program. The frustration from the lack of an adequate mentorship system was expressed by a corps member graduate as he reflected on his training experiences, "many TFA student teachers were consigned to the back of the room, observing the 'master' teacher at work and occasionally making cameo appearances before the class. Other so-called mentors dropped the full load of planning, teaching, and grading on the TFA neophyte, sometimes even leaving the student teacher alone in the room" (Schorr, 1993, p. 316).

Other critics claim that ghetto children are being short-changed by TFA's brief 8-week training (Parker, 1992). Defenders of the program point out that their rigorous screening process (which includes a written essay, two interviews, a sample teaching session, and demonstration of a high-level commitment, academic excellence, leadership, maturity, flexibility and a sensitivity to diversity) allows them to recruit only the most bright and able arts and science graduates, including minorities, who would not otherwise serve the school. Thus, the controversy continues which will provide more insights on its relative strengths and weaknesses.

In brief, the existing research (Baird, 1990; Hawley, 1990; Hutton, et al., 1990; Littleton, Beach, Larmer, & Calahan, 1991) on the effectiveness of alternative certification programs has concluded that these programs have:

- attracted higher numbers of individuals into teaching
- helped to decrease teacher shortages
- increased the available pool of teachers
- prepared individuals who are at least as likely as traditionally prepared teachers to stay in the profession
- attracted higher numbers of minorities, males and matured (ages 25–40) persons into teaching
- prepared teachers who appear to be at least effective as the traditionally prepared teacher (a factor that is difficult to measure due to the weaknesses and inconsistencies of evaluation systems reported in the literature)
- fostered more collaborative relationships between universities and school districts as innovative teacher preparation programs are explored
- served as a catalyst for teacher education reform, par-

ticularly with respect to the importance of field-based experiences which are supervised and mentored

- increased in number due to state mandates to explore alternative ways of preparing teachers. (Baird, 1990; Bliss, 1990; Cornett, 1990; Dial, 1992; Dill, 1990; Hawk & Schmidt, 1989; Hawley, 1990; Hutton et al., 1990; Littleton et al., 1991.)

Fenstermacher (1990) has succinctly identified three issues which continue to be at the core of the discussion around the preparation of teachers and which are best represented not as extremes but as continua: (1) Training which occurs close to practice versus training which occurs far from practice; (2) Training emphasizing pedagogical methods versus training emphasizing academic content; and (3) Training conforming to practice versus training revising practice. However the discussions over the merits of one form of teacher preparation over another will continue until the profession can address the purpose of teacher preparation programs. What does that body of knowledge that is crucial to effective teaching consist of? What are the specific criteria or standards by which we can judge teacher education? What skills can we expect from a novice teacher? What about those skills that we can expect teachers to develop only through the course of the first 5 or 6 years of experience in the classroom such as reflective thinking and change regarding one's practice? Some educators such as Goodlad (1990) have provided a point of departure for these discussions. Fenstermacher (1990) has concluded through his research on teacher education that when done well,

...Initial teacher preparation is a process of preparing teachers who are critically reflective in their practice, teachers who do not simply know and apply operation skills, but who can think through the adjustment of these skills based upon increasing familiarity with context ... to equip the novice teachers to be discerning when considering the purposes, procedures and consequences of teaching. (p. 70)

It is this ability to be discerning and reflective which is central to the discussion of alternative certification versus traditional teacher education programs, and which many feel gives the traditional programs the superiority of reformed programs. There is also debate which surrounds other forms of professional preparation for teachers—including professional development schools to which we now turn to.

EDUCATION REFORM AND RENEWAL

In the last two decades, reformers have been working to change the teaching profession, particularly in the training of new teachers (Goodlad, 1994a, Holmes 1990). Goodlad's Center for Educational Renewal and the Institute for Educational Inquiry have created and sustained one of the most effective movements for the simultaneous renewal of teacher education and public schools in the United States. Currently, 16 settings in 14 states are involved in advancing the Goodlad agenda. In keeping with the basic agenda of simultaneous renewal, each setting consists of one or more institutions of

higher education working in close collaboration with one or more school districts and one or more partner schools within each district (Goodlad, 1994b).

Goodlad and other reformers contend that teacher education must undergo serious renewal in tandem with the reform of public schools and refer to their reform as simultaneous renewal. Goodlad (1994b) has suggested that "teacher candidates intern and practice their skills in exemplary sites and that stronger links be established between universities and schools." The Holmes Group Report (1986) also has suggested that "universities and colleges expand their teacher education programs to include cooperation with school districts to provide demonstration sites for practicum experiences, as well as bring exemplary teachers from the schools to the universities and colleges." (Welch and Kukic, 1988).

Professional Development Schools

According to Winitzky, et al. (1992), of the many reform efforts, "the professional development school (PDS) is particularly promising because its aim is to link the university and the public school and by so doing link theory with practice" (p. 3).

In response to the Goodlad agenda, throughout the country, schools and universities are cooperating in the creation of partner schools in order to enhance the clinical experiences provided for preservice teachers, to improve professional development, and to create settings that can contribute in various ways to improved learning for young people. Sometimes these schools are called professional development schools, sometimes they are referred to as clinical settings. The Center for Educational Renewal headed by Goodlad has chosen to refer to them as "partner schools" in order to emphasize the importance of the roles of both school and university educators as they join in the simultaneous renewal of schooling and the education of educators (Porter, 1994).

These new structures in teacher preparation have been referred to in a number of ways: "Key Schools" (Wise, 1991), "Professional Development Schools" (Holmes Group, 1986, 1990) or "Partner Schools" (Goodlad, 1990). The Wyoming School-University Partnership has chosen its own unique name for partner schools—Center for Teaching and Learning. The University of Texas at El Paso refers to them as Centers for Professional Development. All, however, seem to share a common vision. According to Harris and Harris (1992-93), "all reconceptualize teacher education around a model of professional-school partnerships which link colleges of education and schools or school districts" (p. 1). They are considered the counterpart in education of teaching hospitals in medicine. According to *U.S. News*, "about 200 institutions have established such programs, which provide real-world settings in which prospective teachers and experienced teachers can hone their professional skills, especially classroom techniques. The extended immersion in professional development is a far cry from the traditional training of most of the nation's 2.8 million teachers and most teachers-to-be" (Teaching Teachers, 1995, p. 70).

Harris and Harris (1992-93) define partner schools as places where university and school educators collaborate on

a renewal agenda structured by Partner School functions, such as: (1) preservice education for new teachers; (2) inservice education (staff development) for practicing teachers in the school; (3) curriculum development to improve the learning experiences of pupils; and (4) research and evaluation to foster university and school inquiry.

Goodlad (1990) "believes a wide variety of laboratory settings and exemplary schools must be available to teacher education students for observation, hands-on experiences, internships, and residencies. Clinical arrangements demand close collaboration between the schools and the university, and clearly delineated connections between classwork and fieldwork. For a school to qualify as a clinical site, its teachers and administrators must demonstrate their willingness to engage in constant, critical review and renewal of the school's structure and performance" (Clark, 1990, p. 5).

Research by Harris and Harris (1992-93) has shown that effective collaboration in Partner Schools is distinguished by four attributes:

1. Common goal—The simultaneous renewal of schools and the education of educators are supported by both university and school educators.
2. Participants and participation—Both university and school educators are represented and actively share expertise in all organizational facets.
3. Equity and trust—University and school educators engage in dialogue by which they build on each other's expertise, focus on insights from research and experience, acknowledge legitimacy of different perceptions, and avoid paternalistic or reductionist attitudes.
4. Self-interest and selflessness—Partners seek to improve in their own stewardship roles for the mutual benefit of all without becoming overly concerned with investments.

According to Harris and Harris (1992-1993), "a number of such schools have been established across the country. Typically, they are jointly operated by a university and a school district. Teachers and professors work side by side to induct new teachers into the profession and to engage in ongoing research about teaching. The professional development school not only elevates and enhances the education of future teachers but also offers professional renewal for the teachers employed in the schools" (p. 38).

The professional development schools movement has been supported by various organizations and associations. Among the most well-developed networks are the American Federation of Teachers' Professional Practice Schools, the Ford Foundation's Clinical Schools Project, and John Goodlad's Center for Educational Renewal (Goodlad, 1990; Goodlad, 1994a; Goodlad, 1994b).

Goodlad has also created a coalition to reform teacher education. Through the Center for Educational Renewal, he has established school-university partnerships throughout the United States. His main argument is that we must require teachers to receive their clinical preparation in professional development schools that include teachers and university faculty working together.

Professional development schools have impacted teacher preparation in several important ways. First, it has intensified fieldwork. According to Lawton (1991) "one substantial reform advocated by an increasing number of educators is the creation of new structures in teacher preparation that extends and intensifies student fieldwork. In the mid-1980s two major critical reports, *A Nation Prepared* by the Carnegie Forum on Education and the Economy (1986) and *Tomorrow's Teachers* called for the invention of a new model for teacher education: Professional development or professional practice schools, clinical schools similar to teaching hospitals in the field of medicine." (p. 38).

According to Welch and Kukic (1988), "The value of clinical practicum experience as part of classroom teacher preparation is unquestionable. However, it has been suggested that the extension of practicum teaching experiences be carefully considered" (Holmes Group, 1986). Pugach (1987), while supporting the need for practicum experience, has raised concerns regarding quality control as to the selection of sites, cooperating teachers, and the evaluation process. Consideration also must be given to how school districts select mentor teachers, the frequency of supervision by university supervisors, the number and variety of sites, how to minimize the mere imitation of mentor teacher behaviors rather than the development of individual skills, and how to maximize opportunities for investigation and problem solving (Holmes Group, 1986).

CONCLUSION

In sum, "a new view of teacher education is emerging as university and school educators combine their insights and expertise. This view is that excellent teacher education is more likely to occur when the university and schools form a seamless web of theory and practice. This will be accomplished when university theorists and researchers understand the problems of practice and identify with the demands of real-world teaching and when their university-based courses become relevant and applicable. When practitioners join in supervising, mentoring, evaluating, and recommending new teachers their living laboratories become exemplary sites of excellence in learning and teaching" (Harris & Harris, 1992-93, pp. 7, 8).

EXPLORING VOICES OF THE LANGUAGE ARTS UNIVERSE: FROM TIN CAN TELEPHONES TO SATELLITE MISSIONS

Debra Bayles

SAN DIEGO STATE UNIVERSITY

Nancy Roser

UNIVERSITY OF TEXAS AT AUSTIN

The voices that inform and influence the language arts professional are many and diverse. Melissa, a white female from a middle-class home, attended a large state university, graduating recently as an elementary teacher at the age of 24. When asked how she prepared for the first few days of her first teaching assignment in an inner-city school, she explained:

I felt very unprepared to do first grade . . . I didn't know what the big picture was supposed to look like. Fortunately, my aunts that were living in Houston both had taught first grade before. So, while I was there, I spoke with them a whole lot and that helped me get a better picture of what it was going to be like. And I also called Angie and I asked her if I could look at her journal [from our college methods course]. And I talked to Cindy and Jess. And I started going back over notes from our class, because I felt like my professor had really focused a lot on emergent readers and I felt like, at the time, I was kind of like, "Come on, come on! Get to the third grade and the older stuff!" 'cause that's where I was at in my student teaching. But, now I'm thankful (laughs) I took good notes. I also went through *The Art of Teaching Writing and Invitations*. I read *Transitions* 'cause I knew that would be really helpful because she seems to focus more on first grade in that one. I was just getting a feel for it, because I didn't know, you know? We had the new teacher inservice at the school, and there was this new teacher, and I met her. This was her first year too, but she had done her student teaching in first grade. And, she and I have become extremely close, you know, because we're both going through the exact same thing and I felt very comfortable talking to her because she's my age and um, we just kind of hit it off right away—

Linda, also a white, middle-class woman, was certified as a teacher through an alternative certification program after

completing a Bachelor's degree in another field and working for a year. As she began her fourth teaching year, she talked about the "voices" of influence:

I majored in Interior Design. Worked for a year—that's it—and was not happy. And somehow, I've always liked kids and somehow—I can't remember—I found out about this Alternative Certification Program. I thought about going back to school, [but] it was an extra 60 or 70 hours. So four years ago I trained for a month, and then started teaching. So I have NO background. And I'm just—experimenting. It's just like, I go to a workshop: "Okay, I'll try THAT!" My first year, I taught first grade and that's my FIRST YEAR! I mean, you know, no background, so I can't, I tell you, I can't remember that first year. It was just like every day, hey, it's just a new experience! And then, after that first year, I thought, "Okay, I sort of understand this, maybe, a little." Then they switched me to second. So, the second year I was in the second. And my third year I was in second. And then, this year, my fourth year, they switched me back to first. I'm experimenting. I don't know what's going on in those kids' heads. But I try, you know, I just try to read things and go to workshops, and just try everything I can, and try to just hit the different needs. I mean, I hear that some kids can't read phonetically, that they just have to have the whole word. So I just try to hit it, all aspects, and hope I reach them. And the ones that I don't reach, it's difficult, because you don't know what's wrong with them! You really have to be an expert, and I mean, good grief! You all are studying it still!

Tom is also white and of middle-class background. He completed an anthropology degree at a state university and began work in Mexico. Realizing that his home culture was vastly removed from that where he was working, he returned

to the university, planning to obtain an education degree and teach students from his own culture. Beginning his first year of teaching in an inner-city school, he noted the irony of his placement, and emphasized his lack of knowledge about how to create lessons to which his African-American students could relate:

I make it up. I mean, I've always been that way, and I'm pretty good at just making things up as I go, but, like lesson plans? I mean, I write them absolutely just so that when the principal comes in there, she can look at something and I have something written down. And I don't do it, any of it. I mean, I'm lost. I'm floundering. I don't know what to do. I want to do so many things that I just can't do. I don't know how to do them. We do, response charts, we do response journals; we did that morning journal [as in student teaching].

Melissa, Linda, and Tom all teach 1st- and 2nd-grade students. All three sincerely hope that their students will become lifetime readers and writers, and they try to reflect this goal in their language arts teaching. Yet although the general school populations and grade assignments are similar for these teachers, their conversations about what it means to teach communicative arts suggest interesting differences. For example, when asked where she turned for knowledge in her early days of teaching, Melissa readily listed colleagues, books, and university courses. Linda mentions in passing that she reads for ideas, but offered workshops as her primary information source. And Tom admits he either makes things up or relies upon ideas from his student teaching experience.

In talking with Melissa, Linda, and Tom, (as well as many other teachers) about the ways they select and approach their teaching goals, we have come to believe that regardless of the diversity of the settings or responsibilities, all teachers' experiences influence and are influenced by highly personal views of what it means to teach and "to know." This personal view is akin to a mental environment for teaching—a teacher's mental "place" or personal world view which colors his/her perception of all other environments and experiences. In this chapter, we suggest that inquiry into teaching the visual and communicative arts should explore the mental "environments" from which teachers perceive, select, interpret, and respond to the voices in their worlds.

The question of how we might learn about and from the mental environment of an individual is certainly challenging. However, some researchers and theorists (e.g., Bakhtin, 1993; Connelly & Clandinin, 1985; Elbaz, 1983, 1990; Leont'ev, 1978; Munby, 1987; Vygotsky, 1962, 1978) suggest that patterns in an individual teacher's comments or ways of talking about teaching may offer important insights as to the "voices" teachers rely upon and respond to. Although we use the terms "voice" and "dialogue" throughout this chapter, we do not mean to claim that the "voices" with which teachers interact are predominantly verbal, nor do we wish to suggest that there is a limited number of voices which can be classified and categorized. Rather, we posit that thinking of education as a process of learning to converse with the world may allow us to explore the environments in which

teachers live and work as dialogic interactions with various knowledge sources. From the cacophony of competing "voices" (diverse knowledge sources in numerous representations) teachers are in a constant process of selecting those with which to interact. Interaction with such voices (dialogue) yields knowledge, which then colors all future actions and interpretations.

LEARNING TO TEACH AS LEARNING TO CONVERSE

Melissa, Linda, and Tom's comments demonstrate that the number of voices with which teachers may converse about teaching ideas and practices appears, if not limitless, at least potentially overwhelming. That number grows even larger if other voices such as those of parents, administrators, and students are included. How does a teacher choose which voices to converse with? What consequences do these choices carry? To address these questions, we adopt a simple communications metaphor (spanning from tin can telephones to satellites) to represent an ever-widening and increasingly sophisticated sphere of reach, range, and access to the voices that inform and influence the professional. For us, this metaphor captures a portion of the complexity involved in teaching and learning the visual and communicative arts. It also suggests important considerations (from both research and practical perspectives) for helping teachers and researchers address the responsibilities and challenges involved in the "New Literacy" (Monson & Monson, 1994; Willinsky, 1990) and its evolving postmodern curricula (Doll, 1993).

Beginning to Call and Respond: Talking on a Tin Can Telephone

We live in a universe of discourse (Moffett, 1968). Voices of people and of ideas (e.g., spoken, written, or captured in some other medium) continually compete for our attention—inviting us to engage in dialogue with them toward various ends (Bakhtin, 1981, 1993). However, when a child enters the world, it is likely that his/her early interactions or "conversations" arise primarily from a desire to satisfy physical needs (Leont'ev, 1978). Thus, infants enter the grand conversation of the world by "calling" for help in addressing their personal needs. These calls are met with various responses—from which, over time, the language learner achieves a range of communication strategies. For many young children, the number of voices recognized as available for "dialogue" (Bakhtin, 1981, 1993) may be limited to parents, well-known friends, close relatives, or caregivers. Communication at this stage is relatively simple, concrete, focused, and proximal—much like conversation along the single string of a tin can telephone.

Over time, children participate in a number of routine or similar interactions/dialogues (such as storybook reading, mealtime talk, and religious rituals) in which they learn how more elaborate language events unfold. For example, as a

parent reads aloud to a child, the adult's pauses may signal a space for questions and responses; adult comments model how readers think and talk in a particular circumstance. In these ways, children learn how to enter the conversation, and which responses are valued by other participant(s) (Bruner, 1981; Grice, 1975; Magolda, 1992; Tannen, 1986).

Through opportunity, experimentation, and practice, the tin can user (the young communicator) continues to develop greater communicative competence, becoming aware of an increasing number of voices with which to interact—albeit on a one-to-one or one-at-a-time basis. Similarly, teachers functioning at a “tin can level” of communication may approach the world through a series of simple, two-way conversations. In tin can talk, the teacher as speaker may assume an informing, authority role (with students); at other times, the teacher as listener may assume the receiver's role (with principals, policies, curriculum, or “expert” opinions). As long as the roles, messages, and turns are predictable and clear, tin can communicators are generally comfortable (Belenky, Clinchy, Goldberger, & Tarule, 1986). However, in the interview segments above, Tom expresses the frustration of a tin can telephone stage (and with its limited range and number of informing voices) as he strains toward the “life-line” of his student teaching experience.

Upgrading Communication Equipment to “Direct Dial” and Creating a Personal “Telephone” Directory. Although simple, two-way communication is important, it is limited by both space and time. As children interact with an increasingly broad array of individuals and ideas (through preschool and elementary experiences, community activities, family gatherings), they encounter views and communication patterns which differ from those of their home and immediate surroundings. Suddenly, the world seems filled with voices (friends, books, television, other media), all competing for attention. Of necessity, language users begin to replace the string and tin cans of simple interaction patterns with the wires and receivers of more advanced technology and communication. Now they hear the dial tone of possibilities—recognizing that numerous calls can be made across space and time: books can be read, authorities can be contacted, and conversations can be initiated and terminated over longer distances.

In addition to its enhancement of communicative reach, the “advanced technology” of broadened communicative experience increases the need for decision making on the caller's part. From among an ever-widening range of dialogue possibilities, language learners must decide *whom* to call upon (or respond to) *and for what purposes* (e.g., calls can be made for information, affirmation, or entertainment). Because some “numbers” are called more frequently, they can soon be dialed automatically. These “numbers” may represent developing areas of interest, relationship, and knowledge (e.g., the voice of a favorite book, the advice of an athletic coach, the intrigue of particular hobby pursuits, etc.). Over time, learners of language develop a set of “telephone manners”—characteristic ways of calling upon and responding to others in dialogue (Bakhtin, 1993). Familiar interaction patterns make dialogic roles predictable and

support further learning (Bruner, 1981; Kelly, 1955; Vygotsky, 1978). Conversely, “numbers” called infrequently are less well-known, and thus require the development of some organization system (i.e., a directory, a storage system, or computer menu) to enable the caller to readily retrieve them.

Like all language learners/users, as teachers come to recognize the need to communicate with a more complex array of voices (dealing with groups of students rather than individuals, or interacting with special needs students), they also may desire a “directory” to assist them in contacting and engaging in dialogue with particular voices. Generally speaking, teachers at this “direct-dial level” approach the world from a “look-up-the-number-and-punch-it-in” perspective, viewing one of their roles, for example, as “looking up” diagnoses and “punching in” appropriate prescriptions. Teaching strategies may be committed to memory (or catalogued in one's directory) and then called up in particular settings to address specific situations.

Teachers seem to begin to develop their directories of “numbers” (their teaching strategies, expectations, approaches, and information sources) during their experiences as students (Holt-Reynolds, 1991; Lortie, 1975). They extend their “directories” during their teacher education programs, as instructors emphasize particular perspectives. Across teaching experiences and staff development, still other voices inform and demand inclusion; for example, the voices of administrative authority and of public opinion are rarely, if ever, silent. Further, throughout teacher education and ongoing inservice efforts, the voices of research and good practice are continually extolled. If we think of each voice as a potential source of teacher knowledge—a directory entry—then the task of identifying and organizing the access “numbers” is overwhelming. Given the number of teaching decisions to be made on an almost moment-to-moment basis (Clark & Peterson, 1986), having a complete and organized directory is surely a great boon for a teacher. Fortunately, the task can be simplified by adopting or adapting an existing categorization system. For example, Doyle's (1990) concept of codifiable knowledge provides one helpful way to categorize a directory. Using Doyle's work as a frame, we describe some “directory entries” a teacher might consider building.

Building a Personal Teaching Directory With Doyle's Categories

Doyle (1990) uses the term “codifiable” to describe findings of research studies with relatively clear results. He claims that many specific teaching practices are growing more sophisticated and can be referenced as an array of useful alternatives from which a teacher might choose to achieve specific goals in a given context. Teachers turning to such practices might be considered to be conversing with the “voice” of a particular researcher, or perhaps with the “voice” of a reasoned philosophy. Doyle offers three categories for organizing codifiable research findings: (a) Descriptions of teaching practices, (b) Pedagogical content knowledge, and (c) How classrooms work.

Descriptions of Teaching Practices. Teachers who believe that learning unfolds in logical, predictable ways might organize their directories with codifiable voices that inform their teaching practices. Descriptions of reciprocal teaching / learning, as well as derivatives of the older process-product studies (e.g., allocating time for specific tasks) offer relatively clear-cut, codifiable findings. Such work might be indexed under the name of a particular strategy (K-W-L), under its general focus (levels of questioning), or under the “voice” of the particular researcher with whom it is associated [i.e., Palinscar & Brown (1984) for reciprocal teaching].

Pedagogical Content Knowledge. Doyle (1990) describes pedagogical content knowledge as the knowledge teachers need about a subject in order to represent and convey it to their students. Shulman (1987) suggests that each field of study includes principles of conceptual organization and inquiry—content which influences the methods of presentation teachers should use. Although there is more to learning to teach than acquiring specific content and congruent presentation knowledge, notions of a subject/method match are still reflected in methods courses and textbooks. These “voices” may suggest, for example, specific strategies for teaching within a particular discipline (the scientific method for science experiments or genre studies in English). Teachers who believe that teaching involves matching content and method would probably list “voices” of pedagogical content knowledge prominently in their directories. Prospective teachers in particular often hold the view that a “right way” exists for teaching a given topic in a specific subject area.

How Classrooms Work. Doyle (1990) lists a third area of codifiable knowledge as inquiry into how classrooms work—understanding patterns and rhythms in classrooms and how teacher actions influence student learning. Researchers working in this area act on the notion that the classroom tasks and learning activities a teacher chooses reflect intentional, larger learning goals. Such tasks may enhance or constrain student interaction and achievement—depending upon several factors. Studies in this area include investigation of teacher planning (Clark & Peterson, 1986), teacher use of questioning taxonomies (Bloom, Englehart, Furst, Hill & Krathwohl, 1956), and student–teacher verbal interactions in the classroom (e.g., Cazden, 1988; Mehan, 1985). Teachers may catalog these studies in their personal directories so as to interact more efficiently with “voices” of careful and informed observers.

Direct Dial: Limited Service Area

Although building a directory should be an ongoing process involving a teacher's personal reflections and views of the field, some teachers limit their directory entries by including only those numbers consistent with a particular program bias—or they may fail to update their directories on a regular basis. As a result, they may find themselves with too limited a list—one in which numbers which might have proved helpful in specific settings are missing or inaccessible. The

breadth and accessibility of any teacher's directory of knowledge sources affects students. For example, teachers who habitually call only certain numbers and “speak in inflexible ways” may be approaching their students and their teaching decisions honoring only certain values and knowledge sources. They may expect their students to call and respond to designated numbers in the same manner as they do. If so, the “directory” of teacher knowledge and dialogue may constrain the potential for students' dialogue. Identifying and responding to voices in the language arts universe may mean opportunity to profit from dialing a range of numbers, engaging in conference calls (multiple sources), or completing other “telephone” maneuvers (Au & Kawakami, 1985; Cazden, 1988).

Even with a fairly complete directory, the direct-dial approach still limits the reach, range, and access of communication because it fails to encompass a myriad of connections—particularly those demanded by social context. Further, “direct-dial” teachers, like their tin can telephone counterparts, may tend to complete only one call at a time. As though working a switchboard, they may repeatedly plug in a prerecorded approach to achieve a particular teaching goal, often leaving some student calls waiting. Thus, while clearly an improvement over the single tin can telephone, the direct-dial communicative approach is not without important shortcomings as well.

LAUNCHING SATELLITE MISSIONS: EXPLORING THE UNIVERSE OF DISCOURSE

The concept of codifiable knowledge sources and teaching “directories” suggests several voices with which professional teachers interact. The seemingly clear information delineated by ordered voices can make learning to teach seem like a deceptively simple, direct dialogue, wherein a teacher (as alluded to earlier) memorizes routine steps or relationships as a “number” in a directory and then matches a given routine with an appropriate situation or teaching goal. However, few studies yielding codifiable findings (like those noted in the previous section) address the question of how a teacher comes to know *which* routine or task to use in a given setting or the reasons for altering a routine or task.

Indeed, the whole question of how a teacher interprets classroom scenes and invents solutions to teaching problems has spawned a new area of inquiry in teacher knowledge research, the results of which Doyle (1990) labels as “less codifiable.” “Less codifiable” findings include reports of teachers' personal knowledge, such as the individual meaning teachers attribute to particular events, as well as personal insights and inventions in teaching. This research often includes teachers' views as represented by a researcher, but even more recently, is reported by the teachers themselves (see, for example, Cochran-Smith & LITTLE, 1993; Hudelson & Lindfors, 1993; Patterson, 1993). In spite of its potential contribution to understanding learning to teach, research into less codifiable areas is often labor intensive, relying heavily on case study methods and attempts to make explicit

implicitly held knowledge. Results are often difficult to summarize and directly apply to teacher knowledge bases—as well as difficult to list in teaching “directories.”

The reality of teaching, then, is far more complex than controlled two-party conversations or even ready direct-dial access to extensive, well-organized “directories” of knowledge. The metaphor must be extended; it requires still more reach and range. Even at its best, direct dialing allows communication access only within the earth’s boundaries (or the confines of a particular teacher’s directory). For those who would explore and address the complex influences of individual experience and background learning upon, the communicative arts—something much more sophisticated is required to traverse the “universe of discourse” (Moffett, 1968). It is at this point in considering the development of teacher knowledge and communicative skill that we find it helpful to liken the dialogic process to the detaching of a satellite from a fixed orbit, allowing its communication equipment to send and receive messages from an infinite number of points, as determined by its location (goals and setting) at any particular juncture (time). The perspective broadens, the vantage is unique, new knowledge is constructed.

In this way, each teacher can be viewed as a unique satellite, moving freely to explore the universe of discourse. (Students, too, are individual satellites—able to direct their own communication and exploration, able to interact with others in multiple ways across contexts.) To undertake a mission, however, communication equipment must be developed and installed. The less codifiable research findings reviewed below may be considered as attempts to illuminate the “program” from which a teacher functions as a communication satellite.

Less Codifiable Voices: Interacting With Images

Writing in 1983, Elbaz suggested that teachers’ practical knowledge develops in three areas. The first, termed “rules of practice,” are brief, clearly formulated statements prescribing how to behave in frequently encountered teaching situations. These very explicit rules portend Doyle’s (1990) codifiable category, although it is not clear whether teachers determine these rules by listening to their personal voices of experience, or by turning to other voices to determine the “right” and “wrong” of various behaviors (Belenky, et al., 1986). However, the next two levels identified by Elbaz are clearly representative of less codifiable knowledge. The second level, “practical principles,” includes broader, more inclusive statements of knowledge that embody a rationale, derived from personal values as well as outside influences. Elbaz drew upon the notion of “images” to capture a teacher’s knowledge and purposes at the third or most general level. According to Elbaz, images (values, feelings, needs, beliefs) orient a teacher’s general conduct and may be similar to the notion of “environments” discussed at the beginning of this chapter.

In extending Elbaz’s (1983) work, Clandinin (1985) suggests that *images* refer to a special kind of knowledge teachers develop and use which is “neither theoretical, in the

sense of theories of learning, teaching, and curriculum, nor merely practical, in the sense of knowing children” (p. 361). For Clandinin, “a teacher’s special knowledge is composed of both kinds of knowledge, blended by the personal background and characteristics of the teacher and expressed by her in particular situations” (p. 361). Clandinin posits that images grow out of teachers’ private and personal experience, and sometimes include a detailed visual component. While Clandinin acknowledges that a teacher’s verbal use of an image might indicate its centrality in his or her mental representation of the world, she is careful to note that verbal mention alone is insufficient evidence of an image’s function. Rather, Clandinin holds that a key feature of an image is its *expression in action*. She cautions researchers to go beyond simple interview data in determining teachers’ images, stressing detailed, in-depth discussion, participant observation, and other triangulation techniques as essential for determining actual, influential images teachers hold.

A Linguistic Connection: Expressing World Views in Metaphors. Munby (1986,1987) also drew heavily from Elbaz’s (1983) concept of images in researching teacher knowledge, but in contrast with Clandinin (1985), Munby stresses attention to a teacher’s *verbal* use of metaphor. Munby (1986) claims that a teacher’s persistent use of a metaphor may serve as an important indicator from which to examine his or her world view. While Munby’s work (1986,1987) might appear to contradict Clandinin’s cautions about the importance of metaphor *in action*, he notes that the *persistence* of the metaphor is important. Munby also acknowledges that even in the case of persistent metaphor reference, the actual relationship of an expressed metaphor to a teacher’s world view may not always be clear to the teacher or to the researcher.

Additionally, while Munby (1987) holds that teachers choose particular metaphors for important reasons, he also recognizes that teachers may use a metaphor merely as an aspect of a “folk tradition of ways to speak about the events of school” (p. 397). Thus, it seems that while Munby does not explicitly state the same cautions as Clandinin (1985), he too implies the need for researcher care in interpreting teachers’ metaphors. The exercise of caution in interpreting metaphor/practice links seems particularly germane in light of conflicting results in research aimed at detecting links between teachers’ classroom actions and their articulated beliefs [e.g., as measured on the TORP survey (DeFord, 1981)]. DeFord reported a strong relationship between teachers’ beliefs and their instructional approaches. However, Duffy (1981) and Hoffman and Kugle (1982) failed to confirm a strong link between teachers’ instructional practices and their beliefs as expressed on DeFord’s instrument. Richards, Anders, Tidwell, and Lloyd (1991) found that while the majority of their informants taught reading comprehension in a manner consistent with their beliefs (as determined from a beliefs interview), a change in teacher beliefs tended to precede a change in practice—underlining the need for long-term inquiry in teacher belief research. Thus, although these studies focus on beliefs as expressed through researcher-generated sentences and interview questions as opposed to gathering teachers’ personal metaphors,

the underlying concern of accurately relating beliefs and practices continues in teacher knowledge research.

If, however, teacher metaphors can be reliably linked to actual teaching practice (e.g., Richards, Gipe, & Duffy, 1992), the linguistic focus of Munby's work may provide a link between Bakhtin's dialogic philosophy and actual teaching behavior. If one's knowledge is acquired and altered in part by one's dialogic interactions (Bakhtin, 1993; Vygotsky, 1978), then perhaps a person's dialogic patterns or choices may offer an important foundation from which to explore his or her world view. Nevertheless, we also believe that it is important to exercise caution in limiting exploration of teachers' possible mental environments or world views to strictly verbal indicators. Since the notion of metaphor includes visual as well as verbal connotations, it seems to include possibilities for referencing visual or other tacit influences which should not be overlooked in exploring teacher knowledge. This may be especially important, for as Grossman and Shulman (1994) note, "That we implicitly adopt a theoretical stance when we teach does not necessarily mean that we are explicit about our assumptions or about the limitations inherent in any single critical theory" (p. 7).

It is interesting to note that as researchers attempt to characterize the knowledge teachers develop, the teacher knowledge literature refers to both verbal and visual representations. Researchers and thinkers such as Bruner (1986), Connelly and Clandinin (1990), Gardner (1987), Sternberg (1981), and others suggest that individuals may develop particular ways of knowing which are less verbocentric (Leland & Harste, 1994), or which draw on particular aspects of a given linguistic genre, such as the use of narrative story "to know." This interplay suggests something of the complexity of dealing with the concept of knowledge acquisition and representation, as well as in dealing with questions about how such knowledge might be stored or accessed. At this juncture, we wish to reiterate our view that one's "dialogue" with the world is not limited only to verbal interaction. As mentioned earlier, our use of the terms "dialogue" and "voice" throughout the chapter is meant to extend verbocentric notions to include any interaction between a person and a potential knowledge source, whether predominantly visual or verbal. However, since humans generally do not communicate in visual formats alone, we believe exploration of teachers' mental environments through linguistic patterns may fruitfully begin with verbal information but include attention whenever possible to visual (and other) notions held by particular individuals.

Another important consideration in dealing with teacher knowledge research revolves around the question of defining teacher knowledge as opposed to teacher beliefs. According to Buchmann (1984) something is accepted as knowledge when it can be publicly supported with evidence. "Codifiable" information and research results (Doyle, 1990) would likely fall within this definition of knowledge. It follows then, that ideas not publicly supported would be characterized as beliefs. Yet, the thorny issue of whether a particular belief might function as knowledge within a teacher's thought processes (independent of its public acceptance) remains a matter of

debate. Researchers like Nespor (1987) have written extensive pieces proposing differences between the two concepts. Others, like Kitchener and King (cited in Magolda, 1992) note similarities, suggesting that beliefs may function as knowledge depending upon the certainty a person feels about their truth and usefulness. At this point in teacher knowledge research, the more compelling questions may center on identifying (through exploring dialogic patterns) what ideas particular teachers hold and how those ideas and patterns relate to teaching practice, rather than whether an idea is categorized as a belief or as knowledge.

TEACHER DEVELOPMENT AS SATELLITE MISSIONS: MULTIPLE AND CONSTANT SIGNAL EMISSION AND RECEPTION

If the development of all human activity is goal directed such that a person's motives transform and create anew (Leont'ev, 1978), then it is likely that each teacher/learner is in a continual state of choosing which voices to respond to (as well as which calls to make) from ever-evolving contexts. This constancy of change implies the need for a more distal, flexible, and multifaceted communication scheme—more a moving satellite than the earthbound or more fixed transmission points of the direct-dial telephone system. At any given time, a moving satellite's sensory system may scan incoming data and revise its course to fix on signals which best match immediate motives and goals.

Just as the communication equipment of a satellite must be developed and programmed, so too, might we consider the development and "programming" of teacher communications. Because voices are educative, and education is conversation (Arnett, 1992), the more "conversational" experiences teachers have, the more options they develop for taking part in a still wider set of calls and responses—within a much broader community. Through their conversations, and through their dialogues with knowledge sources, teachers develop more beliefs, build more familiarity with varying conversational conventions, and become increasingly selective in directing attention to voices that inform. Just as person and role are defined through interaction, so is the person/role defined more broadly through increased interaction (Bakhtin, 1993; Leont'ev, 1978; Vygotsky, 1978). And, although language is (and has been) the dominant way of making meaning, it is not necessary that dialogue include only verbal interactions; the "arts" are also ways of "mediating experiences" (Leland & Harste, 1994) and of conversing with the voices of the world.

Satellite System Malfunctions: A Caution

Although the notion of individuals functioning as satellites freed from the earth's gravitational pull, able to communicate from unlimited positions for a myriad of purposes is appealing, the metaphor also presents inherent concerns and challenges. We deliberately chose to couple the term "mission" with the satellite metaphor to suggest the need for

researchers and practitioners alike to view the exploration of teachers' mental environments as new and somewhat tentative. Mission directors surely take great care in interpreting their investigations and discoveries, in making recommendations, and in deriving applications from their explorations. So, too, must researchers of teacher knowledge.

In reviewing teacher knowledge research up to 1990, Kagan (1990) suggests the "Goldilocks principle" to summarize the strengths and weaknesses of the work thus far. She notes that some studies conceptualize teacher knowledge and/or cognition in ways "too small" for reasonable application in teacher education or education in general. In the future, researchers undertaking small-scale studies must clearly articulate their research goals and views to help readers aptly connect study results to related information. Conversely, Kagan also suggests that many teacher knowledge studies are "too big"—too vague, general, or ambiguous to be translated into concrete terms. Again, studies contributing to the "big picture" of teacher knowledge surely have a place in exploring and explicating teachers' mental environments, but it is incumbent upon researchers to communicate how they view their study as contributing to a particular educational conversation.

Kagan (1990) also lists some problems in past research on teacher cognition which future researchers may want to consider. First, research in this area often suffers in clarity since the same term is used, at times, for different concepts or products. If we are to engage in dialogue about knowledge, such a dialogue can surely be enhanced by careful use and definition of particular terms as we view them (Alexander, Schallert, & Hare, 1991). Second, since it is difficult to assess teacher knowledge or beliefs directly, researchers should exercise caution and be extremely clear about the kinds of inferences they make within a given study. This can be difficult, given the time-consuming nature of many methods used to elicit and assess teacher thinking. As a result, advances in this area may depend upon insights derived from case study work and grow in a way that differs from traditional "scientific" theory building. Recognizing this possibility may help researchers and research consumers develop a useful set of expectations from which to interpret and discuss such work. Finally, Kagan notes the difficulty of making comparative judgments among teachers with respect to teacher knowledge and beliefs. Questions such as "What's good?" or "What's bad?" or "Are all self-reflective thoughts helpful and of equal value?" will, of necessity, be raised and require response in future inquiry and dialogue.

EXPLORING THE MENTAL ENVIRONMENT FRONTIER: MISSION POSSIBLE

To explore the mental environments of others, we might first explore our own voices—both the ones to which we attend and the ones in which we speak. As we contemplate the myriad voices in which we speak, for example, we may become more sensitive to characteristics of others' voices. Further sensitized, we become better able to help others investigate their own voices and dialogues. We come to recognize the importance of understanding the goal or motivation of persons with whom we interact. As Nespor (1987) wrote:

If we are interested in why teachers organize and run classrooms as they do we must pay much more attention to the goals they pursue (which may be multiple, conflicting, and not at all related to optimizing student learning) and to their subjective interpretations of classroom processes. (p. 325)

This is particularly important since:

We do not know very much about how beliefs come into being, how they are supported or weakened, how people are converted to them, and so on. Socialization, the social context of the school and other processes and constraints have been suggested as likely sources of beliefs, but just how they operate on beliefs is far from clear. (p. 326)

As teachers come to know their own voices and discover the multitude of voices with which they can interact, they will need, in turn, to learn to call upon and respond to the voices of their students, discovering the discourse patterns from which specific students function and experimenting with options for helping students expand their discourse skills and knowledge. Such exploration has been well established in the work of Mehan (1985), Cazden (1988), Heath (1983), Au and Kawakami (1985), and others. The voices of the teachers at the beginning of this chapter—Melissa's, Linda's, and Tom's—will change and refocus as their points of reference change and they are influenced by a broader knowledge base.

Finally, as we explore the grand conversation of education and all its glorious potentials for dialogic interaction, Arnett (1992) astutely reminds us of the essential qualities of agency and respect within all interaction: "Dialogue is an invitation, not a demand, nourished not so much by the guarantee that it will happen as by patience" (p. 4).

TEACHERS REFLECTING ON PRACTICE

Richard T. Vacca, JoAnne L. Vacca, and Beverly Bruneau

KENT STATE UNIVERSITY

In the foreword to *Teachers Are Researchers*, Nancie Atwell (1993) notes that when she started teaching she was more the “technician” than the reflective teacher that she is today. As a technician, Atwell relied on “outside” expertise—for example, the authors of reading and writing programs—to inform her teaching. She viewed her role as managing the students, the paper work, and the programs that she used. The more she taught, however, the more she became dissatisfied with classroom practice. Gradually, she began to observe and reflect on what literacy learners actually do when they use language to construct meaning; she inquired into the problems and uncertainties of learning and teaching literacy in a classroom context. Reflective teaching allowed her to respond to what students needed to know and do to become effective readers and writers. Rather than relying on outside experts, reflective inquiry allowed Atwell to construct knowledge of literacy learning and teaching inside her head to better inform her practice.

Nancie Atwell’s transformation as a teacher is not unlike others who engage in reflective teaching. The phrase *reflective teaching* is used increasingly to describe both teacher development and the practice of teaching. This chapter begins with an exploration of the meaning of reflective teaching, demonstrates the connection between reflective teaching and best literacy practice, and provides examples of teachers and teacher educators reflecting on their practice.

REFLECTIVE TEACHING

Reflective teaching, the ability of teachers to function as professional problem solvers, has emerged in response to the technical view of teaching developed through the process product research prevalent during the 1970s (Richardson, 1990). Driven by an increasing political emphasis on teacher accountability, researchers focused on identifying teacher competencies that were essential to facilitating the learning of basic skills (Rupley, Wise, & Logan, 1986). During the same period, elementary reading instruction was

dominated by basal readers and their accompanying teacher manuals that prescribed and sequenced instructional activities (Shannon, 1983). Apple (1987) describes the reliance of classroom teachers on experts to prescribe plans as the “deskilling” of teaching. Effective teachers were considered to be good managers of lessons planned by experts.

Important changes occurred during the 1980s which currently challenge the technical view of teaching. Qualitative researchers began to explore the complexities of classroom life (Richardson, 1990) and to validate the importance of classroom teachers’ practical knowledge of interactions with students (Cochran-Smith & Lytle, 1993). The emerging holistic approach toward literacy instruction requires teachers who can create learning opportunities based on observation of student abilities and interests (Goodman, 1990) and encourages teachers to become “active agents” developing their own literacy curriculum (Maguire, 1989). Effective literacy education requires teachers who are empowered, careful thinkers about their day-to-day interactions with students—teachers who are able to reflect on their practice.

Reflective thinking in teaching can be traced to John Dewey who advocated that teachers must be thoughtful students of their own practice rather than followers of prescriptions or routines (LaBoskey, 1994). An important component of reflective teaching is consideration of beliefs, goals, and practice which Dewey (1993) described as “the active, persistent, and careful consideration of any belief or supposed form of knowledge in light of the grounds that support it and the consequence to which it leads” (1933, p. 9). Zeichner and Liston (1987) conclude that the purpose of reflection on practice is to help teachers better understand and control their own teaching and learning.

More recently, Schon (1983, 1987) has described reflection as central to growth and development within all the professions. According to Schon, professional problems are complex, often dilemma ridden in which there is no easy answer, and unique to each particular situation. Professionals need to develop the ability to identify and understand problems of practice as well as to develop the ability to hypothesize

alternatives, place new actions into practice, and evaluate the results of their teaching action.

Critical to this problem-solving process in education is the teacher's own knowledge. In contrast to the belief that experts hold the knowledge necessary to improve teaching, the reflective perspective values the situational knowledge, "Knowledge in action" held by classroom teachers (Richardson, 1990; Schon, 1991). Through the process of reflecting on their own practice, teachers can become aware of their intuitive knowledge as well as engage in problem solving which strengthens teaching ability. Reflection promotes "knowledge on practice," which is the heart of professional growth.

Oberg and Field (1986) have suggested that as teachers begin to describe problems, they have opportunities to articulate why they have engaged in particular actions. This exploration enables teachers to examine their intuitively held beliefs, an understanding which becomes the base for new knowledge and individual control for classroom decision making. Classroom decision making from a reflective viewpoint requires concrete problem solving. The reflective problem-solving process includes: problem identification, problem framing—considering which features to attend to; generating tentative solutions; gathering additional evidence; reframing in light of new evidence; implementing new procedures; and evaluating the implementation (Moore, 1992).

Researchers have described the content of teacher reflections. Van Manen (1977) has identified three levels of reflection: technical, practical, and critical. Technical reflection enables teachers to consider what works within their classrooms as they attempt to solve day-to-day problems. Practical reflection includes the consideration of educational goals and alternative ways of teaching. Critical reflection examines the ethical and political issues of teaching. What are our assumptions and aims? How do these aims affect our students? Most recently, Zeichner (1993) has suggested that we reconsider Van Manen's levels of categories of thinking. Zeichner argues that if we view technical reflection as a lower level than critical reflection, we are in essence "devaluing" teachers' day-to-day thinking. Rather, Zeichner suggests that we view Van Manen's categories as domains of reflection; valuing that all three are important and that, in reality, teachers move among the levels in a reflexive manner.

Along with a problem-solving approach, reflection requires a particular attitude toward teaching as a problem-solving activity. Dewey identified necessary dispositions which Ross (1987) has summarized as: open-mindedness, the ability to suspend judgment to consider alternatives; responsibility, the ownership of consequences for actions; and, whole-heartedness, which includes both feelings of self-efficacy and a commitment to continuous professional development.

Critical to the process of reflecting on practice is the disposition that teaching is "problematic" (Ross, 1987). Teachers need to view their practice as one that involves problem solving and that this problem solving will contain some degree of ambiguity. Teaching is also complex and solving one particular problem often results in the emergence

of related problems (Lambert, 1985). Reflection requires a professional stance which is comfortable with ambiguity, is patient with complex problem solving, and which is open toward multiple sources of information (Kitchener & King, 1981).

More recently, researchers have further emphasized that reflective teaching includes cognitive consideration of classroom problems and also promotes an advocacy for student development. Drawing on the work of Noddings, Valli (1990) describes an ethic of caring as necessary for reflectivity. Noddings' (1984) descriptions of a "caring teacher" in which teachers model the process of concern for others, engage in facilitative dialogue, provide opportunities for students to practice care, concern, and connection, as well as confirm students' abilities fit well with a problem-solving, facilitative approach toward teaching. Reflective teaching from a caring perspective requires teachers to be concerned with students' cognitive and affective development.

Additionally, Valli (1990) describes a critical component of reflection which maintains that knowledge, society, and schools are socially constructed representing the bias of the dominant culture (Giroux & McLaren, 1987). Reflection on teaching from a critical perspective involves an examination of individual, institutional, and societal assumptions which maintain unjust structures and includes an active role of teachers as change agents (Valli, 1990).

Through the process of reflecting on practice teachers are able to better understand their professional thinking and, thereby, better control decisions made within their classrooms. Reflection on practice places a high value on teachers' individual development and knowledge. Reform efforts have emphasized the need for teacher reflection, the consideration of teachers' voices in educational decision and policy making, and the collaborative development of practice in which teachers and researchers together explore how best to educate today's students (The Holmes Group, 1990). Central to this reform are teachers who are able to think carefully about their practice.

THE CONSTRUCTIVIST CONNECTION

Best literacy practice and reflective teaching are grounded in a constructivist view of learning. Constructivism provides a compelling explanatory framework for understanding the way human beings acquire knowledge. Constructivist thinking has powerful links to many fields of inquiry, including psychology (Bruner, 1974; Piaget, 1967; Vygotsky, 1962), linguistics (Halliday, 1977), sociology (Berger & Luckmann, 1966), and philosophy (Polanyi, 1958). From a literacy perspective, children construct knowledge about reading and writing as they interact with people, processes, ideas, and things within a social context that both shapes and constrains that knowledge.

When constructivist principles are applied to the acquisition of knowledge about teaching, teachers are viewed as engaging in a process of seeking and making meaning from personal, practical, and professional experiences (Vacca, Vacca, & Gove, 1995). Best literacy practice and reflective

teaching support the role that inquiry plays in meaning making. Literacy learners and teachers are active participants who engage in literacy events and self-examination to make sense of problematic situations that they encounter on an everyday basis.

In the literacy field, constructivist principles have had a major impact on classroom practice, teachers' beliefs about practice, and their self-perceptions. Research related to children's oral language and literacy development in early childhood, comprehension processes, and reader response represent three areas of theoretical and practical inquiry firmly grounded in a constructivist framework.

Oral Language and Literacy Development

Piaget (1967) theorized that children do not internalize knowledge directly from the outside but construct it from inside their heads as they interact with their environment (Kamii, 1991). From a constructivist perspective, children are not passive learners who wait to be taught, but rather they are producers of knowledge who try to make sense of everything that they encounter in the environment.

Studies of children's language and literacy development have been rooted in Piagetian and Vygotskian cognitive, social constructivist perspectives (Goodman, 1990; Ruddell, Ruddell, & Singer, 1994). Researchers from different cultural contexts have explored, among other things, how children decide what is readable, how children compose and comprehend written language, what knowledge children have about written language, and how their perceptions of knowledge change over time. Ruddell and Ruddell (1994, p. 96) acknowledge that much is still unknown about children's oral language and literacy development, but at least five conclusions can be drawn: (1) children are active participants in their own language and literacy development. Driven by a need to construct meaning and make sense of their worlds, children build theories and test hypotheses about language and literacy as they interact with people, processes, and things in their environment; (2) children exhibit rule-governed behavior that reflects their current understanding of how language works; (3) because they are active constructors of meaning, children develop and use literate activity well before school entry; (4) children's language and literacy development are influenced by their world knowledge, social and cultural interactions, and language environments, and (5) home and community language learning environments are often rich in ways not fully explored or understood.

Comprehension Processes

As children grow as language users, the learning that is essential to their social and cognitive development, Wells and Chang-Wells (1992) argue, is that which is likely to engage children actively in solving problems of increasing levels of difficulty. Flood and Lapp (1991) suggest that contemporary literacy practice, particularly as it manifests itself in comprehension instruction, should be based on constructivist principles. Children who engage in learning literacy and in using literacy to learn, build on their own experiences, knowledge,

and values. That is to say, they use what they already know to give meaning to new events and experiences.

Schema is a term used by constructivists to describe how human beings organize and construct meaning in their heads. Schemata represent elaborate networks of concepts, skills, and procedures that are used to make sense of new stimuli, events, and situations (Neisser, 1976). Schemata, based overwhelmingly on research evidence, play an important role in language comprehension (Anderson, 1994). As a result of a schema-theoretic view of language comprehension, there has been a significant shift in comprehension practice over the past two decades. The shift has been away from an emphasis on skills instruction to process-centered approaches that emphasize inquiry and problem solving among students as teachers scaffold instruction.

Langer and Applebee (1986), for example, suggest that instructional scaffolding is an appropriate metaphor for process-oriented literacy learning supported by constructivist principles. Scaffolding provides learners with the instructional support and guidance that they need to do new things with language. Applebee (1991) notes that the concept of instructional scaffolding can be applied to several dimensions of the environment of teaching and learning language—from classroom dialogue, to texts, to instructional activities. The criteria for effective scaffolding include student *ownership* for learning, *appropriateness* of instructional tasks to build upon the skills that students already have, *support* that guides students' learning and develops strategy awareness and use, *collaboration* in which teachers create environments for exploration that are nonevaluative, and students' *internalization* of strategies for effective problem solving.

Reader Response

Rosenblatt (1938) theorized that human beings bring to the reading act distinctive personality traits, world views, and preoccupations of the moment which influence their understanding of literary texts. Literature study involves an exploration of meaning that underscores a reader's personal interpretations of the text. Literary interpretation, therefore, involves a transaction between reader and text in which the meaning of the literary work does not reside in the text, but is constructed by the reader. As a result, each reader comprehends a literary text differently because every reader will bring unique contributions to the reading act. Several literary theorists, such as Bleich (1975, 1978) and Holland (1975, 1985) assert the total authority of the reader in text interpretation. Bleich (1975) contends that literary response begins in complete subjectivity and is then transformed into judgments that appear to be objective.

From a classroom perspective, reader response practice focuses on eliciting and nurturing students' interactions and transactions with texts. Teachers create classroom environments in which students feel free enough to respond openly to a text and then to explore their responses as they seek to clarify and extend their initial thoughts and feelings. In response-based classrooms, teachers demonstrate that meaning is constructed socially as well as within each individual reader

as students share interpretations with one another and engage in further analysis of the text.

Literacy practice—as exemplified by literacy development in early childhood, comprehension, and reader response practices—and reflective teaching are rooted in constructivist principles. Advances in literacy practice have required teachers to reconceptualize their own professional roles by engaging in a process of reflection and self-examination. How teachers engage in reflective teaching, and the tools that they use for self-examination and problem solving vary from context to context.

HOW TEACHERS ENGAGE IN REFLECTION

Over the last decade, teacher educators and researchers in the College of Education at Kent State University have explored a number of ways in which teachers inquire into their own practice; how teachers become aware of their intuitive knowledge as they problem-solve. They have examined two major means used by classroom teachers to experience meaningful professional development: writing and dialogue.

Writing

Holly, in her 1989 book, *Writing to Grow: Keeping a Personal-Professional Journal*, discusses the use of logs, diaries, and journals by educators “to explore and grow from experience and reflection on practice” (p. 5). She cites the benefits of journal writing that accumulated from analysis of her long-term research with seven classroom teachers who “learned to wonder on paper about themselves, their students, and their profession...” (p. 5). Holly explains how teachers explore links between teaching and professional development, how teachers identify and think about their own circumstances and experiences, and how these influence and shape their teaching and professional development. Holly’s study of seven teachers delved into teachers’ joys and frustrations expressed through their writing in diaries, journaling, and meetings in seminar groups. Manna and Misheff (1987) and Vacca et al. (1995) explore the use of reading autobiographies. According to Smyth (1989), encouraging teachers to develop (in writing) a personal biography and professional history allows them to overcome unwillingness to question where certain teaching practices came from. “Simply asking teachers to reflect on the stories they already tell can provide a natural bridge to a serious inquiry about the very deep layers of value and belief...” (Mattingly, 1991, p. 255). Vacca et al. describe and suggest the development of an autobiographical narrative as a powerful tool to help teachers link their personal histories as readers to their instructional beliefs and practices. Autobiographical narrative helps teachers inquire into the past so as to better understand what they do in the present and what they would like to do in future classroom situations. They suggest asking questions such as, “How did you learn to read?”, “What home reading experiences do you recall?”, “What kinds of instructional activities were you involved in as an elementary school child?”, “Which ones do you recall fondly?” The sharing of

narratives with others is accomplished by asking, “what beliefs, values, and attitudes are an integral part of the various stories?” “How do teachers’ personal histories of reading and learning to read influence where they are philosophically and where they would like to be?”

Group Meetings and Dialogue Sessions

Clemente (1992) studied how teachers developed as meaning makers in an educational change environment over a 2-year period of time. She was a participant in a collaborative university-school district change project, functioning as a participant observer, interacting with teachers during group meetings, both informal and formal. Clemente’s field notes about these meetings revealed data about the impact that teachers’ experience in an educational change project had on them. Among her findings she reports that, as teachers acted and reacted in their working environment to make sense of their experiences, their role perceptions changed. They expanded their own roles and began to take curricular risks. The teachers were supportive of one another in this urban school system as they gained a new perspective on their roles. Furthermore, as the teachers interacted in meetings over time, their personality and people-to-people skills influenced their participation and perception of their roles. Several of the teachers showed movement to the level of introspective questioning. As one teacher said, “Am I doing what I am supposed to be doing? Now I question everything I do.” During the informal meetings where participants gathered to talk about their classroom practice, frustrations were vented. These were sessions where teachers chose to work with others who had similar philosophies as a means of improving their teaching practices. These “situational aspects” were “supportive oases of confidence, trust, rapport, and friendship.”

Where teachers were philosophically similar to one another, there was less confrontation and better communication. “In these situations... communication... went smoothly because there was a basis of trust and confidence in one another” (Clemente, 1992, p. 191). Clemente’s findings corroborate the previous findings of Holly (1989) that the increased opportunity to interact with teachers, regardless of the setting, would be perceived as beneficial by teachers... who viewed their colleagues as valuable resources. Likewise, Lieberman (1988) also found that when teachers meet together their success is enhanced by the collegiality they feel with other teachers and with principals.

In a recent study, Ruttan (1994) observed and interviewed two student teachers over an 8-week period of time, placed in the supportive setting of Professional Development Schools. She concludes that the “supportive stance of the cooperating teachers contributed a secure educational context.” This context enabled the student teachers to problem-solve and to experiment. They were able to demonstrate mature levels of reflection. They both indicated that their journal writing and participation in the study itself, and conversations and interviews with the researcher helped them focus on literacy teaching, learning, and to reflect about their teaching practices. Opportunities to relate their new knowledge to past experiences are important. Again, having similar philosophies

and the opportunity to share perspectives about literacy teaching and learning were important and should be considered when placing a student teacher with a cooperating teacher. Affective issues should be taken into consideration; attempts to make complementary matches between the student teachers and the cooperating teachers are important.

Ambrose, Vacca, and Vacca (1992) describe a long-term university-school district collaboration in teacher education built around an inquiry orientation. Experienced teacher leaders who worked with university preservice interns met once every 2 weeks in a cohort seminar with the project codirectors. These faculty associates reported their role as "professionally rewarding and personally satisfying because of the sustained, intense involvement with interns and their colleagues." Furthermore, the cohesiveness and identification with a select group of peers seemed to "enable the teachers, as it does the interns, to engage in public discourse about existing practice. It provides a much needed sounding board for reflection." This process has also been credited by teachers who are faculty associates for their willingness to assume more responsibility for present and future direction in program development and to replace traditional university supervisors.

In a recent study, Waldron (1994) explores reflective practice in art education using an inquiry model for staff development. She combined journal writing with dialogue sessions to engage five visual art teachers in systematic reflection over a 12-week period of time. Her intent was to describe the processes of reflective teaching and collegial dialogue of inservice art teachers. She described teachers, thinking about their episodes of practice—how they make sense of them and how they learn from them. Teachers were provided with journals, notebooks and supplies to be used for individual reflection and preparation for five seminar sessions, each lasting 90 minutes. Their written entries addressed two major areas: personal concerns about individual practice and reactions to aspects of the collegial dialogue in seminar sharing sessions. According to one experienced teacher, "it has been

good for me to journal about my art teaching and daily ups and downs ... for the conscious awareness it brings. I've found I'm reflecting more carefully and slowing down my high-speed chase through the days." Another reported that she enjoyed the gatherings but, "I still find it hard to find the time to write it all down." Time was a major theme. Waldron found that the journaling process and time were somewhat problematic. Keeping a professional journal is a technique which requires time to cultivate in order for the journaling teacher to be comfortable with the process, to make it a natural habit, and to find a personal style so that the journal can become a meaningful, useful, and professional growth tool. The dialogue sessions were useful in exploring concerns and frustrations and personal or professional issues identified by both early career and veteran art teachers. Frustrations expressed by early career art teachers dealt more often with "constraints they felt to be directed at them personally which infringed upon their time, while veteran art teachers were more often frustrated by outward directed concerns, those that interacted with the school, community, and field" (p. 129). Waldron concludes that changes were evident in teachers' growth in the process of engaging in reflection.

CONCLUSION

This chapter examined reflection on the part of teachers. How teachers engage in reflective teaching was followed by a section in which the constructivist roots of literacy theory and practice were explored. The final section presented examples of individual and collaborative work in which classroom teachers and university teachers and researchers problem-solve together. As LaBoskey concludes, "The charge of the teaching profession is precious—the minds and lives of our children. We cannot afford to have teachers who are unwilling or unable to analyze the sources, meanings, and implications of their beliefs about their students and the learning process..." (1994, p. 122).

PUTTING IT IN PERSPECTIVE: ADMINISTRATING ART EDUCATION FOR LITERACY

Richard P. Mesa

MILLS COLLEGE

I try to tell students, 'You have the eye. You issue your own artistic license.' And then you see them start to make choices in the class. And then you have to back that up by giving them more choices and leeway and materials and by saying, 'Here is the assignment. The assignment is perspective. Or the assignment is symmetry. Meet those two expectations and then you may do it whatever way you want.' And if they didn't meet the expectation of perspective, they did this with a free will. And the consequences are there. It doesn't mean the piece is not beautiful.

—Alice LaTouche, Teacher, Lockwood Elementary School

INTRODUCTION

Several years ago the San Francisco Art Institute hosted a symposium whose theme, *Towards A Culturally Inclusive Art Education*, provided its participants with an excellent opportunity to articulate why art is an essential component of a child's education. This chapter offers my key note address to that symposium as the theoretical rationale for art education, placed in the perspective of furthering literacy in our schools. This rationale is followed by a discussion of three central challenges facing administrators of art education, and suggestions for meeting these challenges from the point of view of a superintendent of schools.

Art: Linking Culture and Literacy

As an educator, as a teacher, particularly one who sees the arts play a very central role in the education of the young, I thought I would comment in a way that may be different from what you are accustomed. What I would like to talk about is the transmission of culture to the young and the increasing

problem that is emerging in our society. I also want to talk about the cultural exclusion we see all around us, including the development of racial ambivalence and of the cultural discontinuity that affects the motivation of young people. I will try to relate this as best as I can to art education and why it is so important in the schools.

To begin with, I know very little about art, at least visual art; I was an English teacher, so I knew the arts from the perspective of literature. But I know that human beings have had a compulsion since the very beginning to commemorate what they feel, experience and see—to record what they have seen and to transmit it to someone who was not at a particular place to see the hunt or the birth of a child or whatever. We know that there are cave drawings and other early recordings of humanity's need to commemorate what it has felt and experienced. We know that art is not a frivolous experience, it is not something one does in one's spare time, but is central to our need to express our experiences and thoughts. Through language, through drawing, through music, that need to commemorate, express and record human experience is very important to human development. Clearly, people in societies and civilizations in different parts of the world have taken different routes, and have fulfilled this need in a variety of ways. Nevertheless, in whatever media human beings have used to express, record and commemorate their feelings, there are clearly universal aspects, as well as differences. I am a little puzzled by the topic of this symposium, which implies a need to be culturally inclusive of the arts. I wonder if true art is not already universally appealing. The first thing a conqueror does is loot to the art treasures of the conquered and take them back home and display them, not only as a symbol of conquest but also of

what is most desirable in victory. I've experienced this personally.

In 1975, I was lucky enough to be asked to teach at the University of Santiago de Compostella in Spain for a summer. My wife and I and two of our children toured Spain, of course, and we found ourselves at a remote little seaport museum. Someone had told me that I should go there because one of Montezuma's headdresses is there. I expected that the museum would be grand, that it would take pride in and somehow feature the headdress of Montezuma, one of the great figures in Mexicaul history. Well, here it was, under a dusty glass covering in this isolated little museum. The headdress obviously had not been featured for a long time. It would have been priceless in Mexico, but it was almost lost in Spain. I asked myself why art invaluable to the heritage and history of conquered people, is taken for casual display by the conquerors. Nevertheless, here it was, surge kept after more than 400 years.

Perhaps "cultural inclusion" is a natural consequence of war trade and coexistence, and what I saw as art was an example of the historical tendency of powerful conquerors to steal the art treasures of the weak. But the distribution, the theft of these treasures is rather selective; selective in the sense that what is stolen is then exhibited to show indirectly that the conquerors in fact conquered, that they had the capacity to take these treasures and exhibit them back in their homelands. Napoleon exemplified this when he brought the ancient Egyptian obelisk back for display on the Paris square as a symbol of his power to conquer. This kind of theft is selective because it tends to feature that which manifests the power of those who have conquered, but perhaps it misses the nuances that can sustain, educate, and enable a people to feel pride in what they have developed and created. These treasures may be literature or art that protests, art that defies, art that expresses dangerous ideas. That kind of art is taken and hidden away, allowed to gather dust and grow shabby; it is not exhibited, not manifest. Through time, for the people who are colonized or conquered, these symbols are lost. This art, this expression of ideas that could revive a spirit, that could cause rebellion, that could cause reaction to oppression, is removed and not allowed to be shown until the conquerors have recast history so that it proves to their own advantage.

I think that this experience of not sharing complete access to the art of a people has a crippling, stunting effect. I do not know about this as an arts educator, because I am not an artist or an art educator, but I do know as an educator that one of the most serious problems we deal with in young people today is the cultural ambivalence they feel. Everyone in this audience has experienced some ambivalence of identity, but an ambivalence of identity as it relates to one's culture or race is deep and serious. We have experienced it if we are Mexican American and do not know whether we should allow ourselves to be more American or stay loyal to being Mexicans. As a consequence of not knowing where we fit, of not knowing where we belong, we go back and forth between being derisive toward the native culture and angry toward the dominant. This anger blinds students to the benefits of society, such as school.

Three years ago, I was asked to help write a curriculum for a Mexican art museum in San José. As part of the process of developing this curriculum, we took some students through to get their reactions, to get some sense of the questions they would ask, to better understand what we might need to teach these young people about art. They walked through in a matter-of-fact way and looked at the art exhibits, not with what we expected to be curiosity and respect for the art, but almost as if they were walking by the food displayed in the latest fast food store on the corner. Then the man who was developing this museum started to ask the young people questions about who they thought had made certain objects. Silence, they did not know. He said, "People from the New World, your ancestors, made these. They were Aztecs, they were Mayans, they were many different Nations, but they were your ancestors." The students kidded around with each other, and their interest grew a little bit.

Then he asked if they had ever heard their parents talk about some of the people he had mentioned. One kid raised his hand and said, "Yes, my mother told us about the Indians who were traveling down through what is now called Mexico, looking for a place to live. She said when the Aztecs saw an eagle perched on a cactus, devouring a snake, that would be the place." That drew a little bit more interest from the students. Then the museum director asked how they thought a certain stone carving was made. "They had tools, chisels and stuff." "Chisels," the director repeated, "Is that what it takes to cut stone?" One kid said, "Well, obviously a steel chisel." When the director explained that there were no metal chisels then, that the people did not know about metals hard enough to cut stone but still carved so exquisitely, so delicately, the kids became really interested. One asked how these people did that without tools harder than the stone. The kids started to guess; they said it must have been a stone harder than this stone. They decided the Aztecs must have been very wise and really wanted to create this carving if they were going to take the trouble to find a stone that could cut a stone.

These students' respect for the Aztecs and Mayans, for ancient art, and teacher lead them to discover answers to their own questions. What was happening, I could see, was a connection between children and art and their heritage though a description of history and a modeling of respect for artistic creation. The connection that was made there led to more curiosity, more interest on the part of these young people, and many of them became active in the establishment of this small art museum.

I use this small example to elaborate several points that I began to make earlier. One is that the deliberate transmission of culture to the young almost never happens, even in the dominant culture. It rarely happens in relationship to a child's home culture. The connection between the culture and these young people began with derision of what they saw; it began with a matter-of-fact disregard until someone began the process of making the connections, of talking about how important these things were to them. It is my opinion that one of the most critical things young people suffer from today is that adults spend so little time with the young; the interaction between adults and young people is decreasing rapidly and it

is cutting down enormously on the opportunity for transmission of culture to take place.

Anyone who teaches the primary grades will tell you that children, in kindergarten especially, behave very differently now than they used to. Many reasons are given; some people blame it on the fact that the parents have been on drugs, and the children are exposed to drugs at a prenatal stage. But I think the one thing we can say about most young people is that, for a variety of reasons, adults spend much less time with them. Prior to World War II, and before television, according to some studies, the typical parent spent upwards of 2½ hours with their children, at dinner, talking, prior to putting them to bed and so on. Since the onset of tract housing and freeways and of homes removed from places of work, where parents often have to commute an hour or more to work; since both parents need to work to survive economically; since television has come along and taken up much of the time that was spent talking, the amount of time that parents or supportive adults spend with children has been incredibly reduced. This was different when I was growing up in a large, migrant family. I first learned about art from my brother.

I think an artistic streak runs in my family. My brother, Louis, was a folk artist who drew beautifully. He made a gallery on a twelve-inch by tenfoot-long plank he found. He brought it into the house, and on it he drew a caricature of each member of the family; it was hilarious. He nailed it up on the wall and it became our family gallery. His son Bob makes money by painting designs on these low rider cars; he also paints beautifully. My son Tom is attending the art school in Oakland. His daughter Justine and my grandson Conor have shown great interest and aptitude in drawing and creating. I do not know where it comes from, but somehow the talent and the need to create, to draw is passed on. But I can remember spending hours with Louis. He would take my younger brother and me (we were the babies of the family and Louis was among the oldest, so 15 years separated us) to the dump before Christmas. We would find things to make toys with, since we could not buy them. The time we spent talking about how to make things both useful and beautiful transmitted values, hopes and ideas to us. He taught us to see beauty and reality in the unlikeliest materials. We also learned who we were; that we were connected to him and our family.

When there is no transmission of culture to the young, the cultural disconnection results in a cultural ambivalence, a loss of identity, a discontinuity that is devastating to the young because they lack confidence in who they are. Worst of all, they do not believe they are as good as someone else who seems secure in a sense of belonging and identity. That loss of confidence, that loss of a sense of who they are is distracting. It creates a dynamic in young people that often has terrible consequences. They can internalize that lack of confidence as the belief that trying is futile, or they can become angry about it and take an opposition stance to a society to which they know they do not belong. Of course, there are those few who do transcend this feeling and go on to do very well. But most do not.

I am convinced that loss of culture also robs young people of the capacity to express themselves, and therefore it erodes

their capacity for language. It is commonly known that one of the reasons we press the arts as being so basic in school—I am trying to do this in the Oakland School District, and I have tried to do it in every district I have led—is that through the arts comes the concrete experience of language. In literature classes, I remember when the teacher talked about the mood of a story. I did not know what she really meant until I heard mood related to music. Of course, I could tell immediately if music was solemn, if it was bright, if it was happy; and then I could relate that concrete experience in music to the more abstract conception of mood in literature. If I am shown what symmetry or texture is in art, then I can take that concrete experience and use it in a metaphorical way to express observations elsewhere, quite apart from that context of art. If I use the term texture to describe an abstract conception, such as the texture of my life, I can communicate what I mean exactly, because we all know textures physically, concretely. Perspective I know visually, from art; when I hear that abstract term perspective applied elsewhere I apply the visual images to the abstraction and understand it. I did not just understand it, I grasped it.

Now let me relate the association between artistic experience and abstract concept to an expression or experience that is close to my own background. If someone says to me that something feels like *un grito de ganas*, how many of you know what this means? When one hears *un grito*, there is no equivalent to it. When the *mariachi* sings so passionately that those listening cannot help but let out this *grito*; those who have experienced it know exactly what I mean. The *grito* expresses a feeling to anyone who has had that experience—*se siente como un grito*, it feels like that cry—it is part anguish, part passion, complete yearning. That is how this cultural experience, artistic because it comes from music, causes you to relate the cry to your own often unarticulated feelings. And because you feel it and there is a word connected to that feeling, you can now use it metaphorically; you can now use the word to convey the emotion metaphorically, like a poet. The definition of a poet is someone who can describe concrete experience in language that evokes memories, thoughts, feelings or ideas. It is art which links the abstract and the concrete, that opens intelligence and thought, that keeps people powerful. If this were not true, why would the conquerors steal it?

PUTTING THEORY INTO PRACTICE: IMPROVING OUR SCHOOLS

As the participants of the San Francisco Art Institute Symposium have discovered, it can be reenergizing to remind ourselves why art education is so important to the young people we serve: it motivates students with its dual offerings of cultural inclusion and the shared human experience; it provides a vehicle for literacy by asking students to express and commemorate feelings and abstract ideas; it possesses the power to revive a spirit.

Even when we are armed with a renewed energy for art education, however, formidable challenges face those of us

who wish to administrate art education in today's schools. For the last 5 years I faced these challenges as the Superintendent of Oakland Unified School District, an urban school district in northern California. As the sixth largest district in the state, it serves over 50,000 students from diverse ethnic, linguistic, and economic backgrounds (OUSD, 1994). The young people who succeed as students and citizens in Oakland schools often do so by successfully navigating very challenging life circumstances. At the same time, however, too many of our students are not able to overcome all of the obstacles facing them to achieve the benefits of an education. While the inner-city crises of violence, poverty, addiction, and racism intensify the challenges to administrating art education discussed in this chapter, three central challenges: (1) Justifying Art Education; (2) Financing Art at Time of Budget Crisis; and (3) Updating Classroom Pedagogy confront school administrators across the country. Though none of these challenges operates independently of the others within the reality of a school district, each does present identifiable elements which justify their perhaps artificial separation in this text.

Challenge: Justifying Art Education

A primary challenge that faces us is ourselves. Public school administrators are lacking in art education. This gap in knowledge is not necessarily the fault of the administrators themselves; art education is rarely included in an administrative job description. From the beginning, Americans have viewed and structured their schools as something Puritanical, no-nonsense, basic skills oriented. In the first published curriculum for the Oakland Public Schools, adopted in 1868, art was included in the elementary curriculum only as it conformed to the rote requirements of the three Rs, only as it could be organized into discreet, verifiable uniform units:

First Grade Course of Study

Printing and Drawing — Printing letters on the blackboard, at least 15 minutes by each division, daily. Printing on the slate, daily, at least 15 minutes. One division shall be sent to the blackboard, while the other is at work on the slates. [See page 26, Wilson's Manual. Drawing, both on the slate and blackboard, as directed in Wilson's Manual, pp. 51–55; Calkin's Manual, 94 to 98(p. 33)].

In schools taking this approach, an education in art hardly seems required of the teacher, let alone the administrator. Instead, the official job descriptions of the Superintendent and principals in 1868 focused exclusively on the administrator's responsibility to maintain strict order and adherence to carefully prescribed norms:

(The Superintendent) shall advise with those through whom, either directly or indirectly, the school appropriations are expended, that there may result greater uniformity in their plans and more economy in their expenditures.

The Principals of the schools shall examine all the class books of the other teachers as often as once a month, and give such direction and assistance as may be necessary to secure accuracy and uniformity (p. 11)

In more recent years, public school administrators have been selected and trained to run their schools and districts according to the principles of corporate management. In their history of public school administration, *Managers of Virtue*, authors Tyack and Hasnot (1982) examine how the turn of the century in America brought with it "a conception of leadership designed to consolidate power in large and centralized organizations, whether steel mills, large department stores, or city school systems". Today a candidate for a superintendency can expect to field substantial questions about budget development, human resource management, mediation of contending political factions, labor relations, statistics, litigation, and so on; in over a dozen interviews for administrative positions, I have never once been asked a question which implied that I should possess or would be valued for possessing knowledge of the arts.

Whether actively discouraging art education by precluding it from administrative job descriptions or discouraging it more passively through the process of elimination, schools sometimes bring together those students and teachers who are enthusiastic about and carefully educated in art with administrators who are not equipped to fully appreciate what they are doing. A teacher of Cantonese bilingual classes in Oakland designed a lesson in which she used 16-fold origami boxes to teach principles of fractions to her first graders. As she was guiding her students through the folding process, an administrator came into the room to observe. The teacher was excited to show off the innovative and challenging work; her students were doing. The observer's response: "Where's the work that goes with this?" A central function of the school administrator is advocacy, and one is not likely to advocate what one does not see or understand.

Beyond advocating, administrators are responsible for justifying educational programs to their many constituents: school board members, teachers, parents, the business community, state and local governments; to ensure the place of art in the curriculum. Without tools to justify arts education as essential to the academic learning of children, they are then also unable to develop plans and policies of operationalization, or the measures by which to evaluate the effects of art education. Without substantive evaluation data, the cycle closes back in on itself as the administrator is left without the proof of educational success.

SOLUTION: LEARN FROM THE TEACHERS AND STUDENTS

Administrators need to see and make clear the connection between art and the academic outcomes for which they are held most strictly accountable: improvements in language, mathematics, science and the social sciences. In urban districts these clear connections are especially hard to come by in the light of the serious and almost insoluble problem of raising the achievement of a disproportionate number of poor and minority students who are now failing in school. District and school administrators would gladly justify and institutionalize art education if they could see the conceptual and

practical connections between art education and the so-called "basics" for which they are held accountable. Fortunately, these connections can be made through art; teachers can teach maths, reading, verbal expression, and writing through and as a part of art lessons.

Beyond the most obvious solution of altering the administrative credentialing requirements and job descriptions to include art education, administrators can draw on the resources already contained within their districts. Administrators who seek, talk with, and observe teachers educated in the arts will be provided with an impressive collection of strong justifications for art education. The information gathered and art lessons learned from teachers and community members of the Oakland Public Schools while writing this article are offered throughout this chapter as proof, in part, of the vast resources available to administrators of art education. While many of the justifications gathered from the classrooms and art studios are included in the Pedagogy Section of this chapter, one justification which received unanimous mention is offered here.

The educators with whom we spoke were careful to emphasize that they see the arts as a natural, if not instinctual means of communication and learning for children. And because art is a natural way of knowing for children, the authority of creation is invested in them, and they become responsible for identifying and sharing their knowledge with others. This field note description of an elementary teacher's plan for teaching writing through art justifies art education as a means of using knowledge that is native to a child to facilitate the acquisition of a new knowledge—literacy:

From the beginning of the year Theresa AuYoung asks first graders to keep a journal. At first they mostly draw what is on their minds and then scribble "pretend writing" or random-looking lettering underneath. The only requirement is that they can share with Mrs. AuYoung and other students in the class what they have recorded in their journals. If they can do this, then they have succeeded in understanding a central purpose of writing - to reveal and make permanent our thoughts. As the year progresses the writing becomes more legible, coherent, and often takes over from the importance of the illustration (although Mrs. AuYoung would prefer that it did not).

Mrs. AuYoung shows parents how the students' writing is improving, and they are impressed. But she tells her students to savor their very first journal entries - to remind themselves of how smart they were before they knew how to write, how rapidly their writing skills developed when their minds were allowed to flow freely, and so that they can share their artistic talent with their children while remembering themselves their first writing experiences and how they developed.

Before children can read and write or add and subtract, they can draw, sing, pretend, act out and tell stories. Before the human race invented reading, writing and arithmetic, they engaged in those endeavors we now call artistic expression. As this teacher shows, using art to precede and set the stage for the "basic" skills is not only natural, but fundamentally important. As this method works as a means of education between teacher and student, so it can work as a means of education between teacher and administrator.

CHALLENGE: FINANCING ART AT A TIME OF BUDGET CRISIS

The budget crisis being suffered by inner city school districts is a magnification of the budget problems facing schools nationwide. A great deal has been written documenting the decline of the public's willingness and ability to fund public schools in the 1990s; in Oakland a most telling statistic is that 460 million have been cut in the last 4 years equaling 20% of our budget and aborting, among many other things, our elementary music program. Quality art education is dependent upon projects, which require primary sources, materials and supplies. While extravagance is not a perquisite of art education, a certain degree of expendability is. A teacher from a year-round inner-city elementary school describes the budgetary Catch-22 which binds her as she tries include art in her class:

The materials are expensive and many of them aren't the usual materials that are ordered for elementary schools and you find it difficult to get the materials. And they're consumables so sometimes they can't even be bought out of the little budget that we try to have to let each teacher go shopping. [Administration] really doesn't want you to buy consumables with it. So while I can buy brushes, I'm discouraged from buying paint. And while I can buy clip boards, I'm discouraged from buying the art paper to go on the clip board.

Damage done by budgetary limitations and questionable priorities increases exponentially in combination with other challenges. For example, because many administrators are unversed in art education, established curriculum in this area is limited or even nonexistent. The burden is then transferred to the teacher to create a curriculum, lesson units and materials. Paradoxically this extra work places art officially outside of the standard curriculum, so that money spent on it is seen as an extra expense, to be paid when there is money left over. If only one or a few teachers within a school community are trained in art pedagogy, the special supplies are being purchased for a select group and liable to be viewed as favoritism.

Comparisons between corporate management and school management suggest that the departments which maintain the greatest financial stability and are most clearly linked with profit-proven (or, in the language of schools, basic skills) output are the most important. Viewed as far away from the academic "basics," art departments in schools are routinely appropriated less funding—whether it be through dollars in a budget to spend or through faculty appointments, materials, and time in the master schedule. Even while such a utilitarian means of evaluation relegates art departments to stepchild status, schools are highly aware of how important student art work is to their image. Back-to-school nights, assemblies, bulletin boards, newsletters, classroom parties and school-wide celebrations—none of these aspects of school life would be complete without the artwork of students and teachers. However, money and time are rarely budgeted to pay for these projects and displays in the formal way that it is made available to pay a coach, fund a field trip or finance a department. One elementary teacher

with extensive formal training in art confessed that she purposely avoids revealing to her colleagues the extent of her experience in art: "Cheap labor," she commented matter-of-factly.

SOLUTION: TAP INTO COMMUNITY RESOURCES

The problems facing schools today, financial and otherwise, require the cooperation of local and extended communities for valid and lasting solutions. The California High School Task Force acknowledged this need for new kinds of symbiotic community-school relationships when it proposed that the high school become "the center of a network of community services that might include government, health and youth organizations" (California Department of Education, 1993, p. 1). This cogent advice sheds some light on the task of funding art education as well—turn to the community. Many schools have already discovered and implemented artists-in-residence programs which bring professional poets, dancers, theater technicians, and artists of all kinds into classrooms to supplement the teachers' knowledge with their expertise. In addition, many of the country's urban public school districts have established magnet schools organized around a theme of the arts (Fliegel, 1993) in partnership with artists' unions, professional performance organizations and nonprofit art agencies.

Community collaboration toward art education can take place on a smaller scale as well. A pair of local business owners brought a straightforward and mutually beneficial idea to the Oakland's public schools in 1993 when they offered to display and sell student artwork from the walls of their jewelry gallery (White, 1993, p. x). Each class displaying its work is then responsible for deciding how their profits will be spent. Jan Christiansen-Heller remembers the development of the project's fiscal philosophy from the initial thought was that students could be empowered to direct funds into things they themselves wanted, perhaps field trips more art supplies. But without, she cautions to add, "Getting hooked into the entrepreneurship of it. That is, we didn't want the money to benefit them only. It had to benefit a larger group." Several of the classes which have displayed their work have opted to donate the proceeds from their work to various community charities, and the project now includes a more organized means of sharing with students the wide range of charities available to receive their donations.

This business-community-school collaboration is reaping a number of benefits. It promotes appreciation of art within the community. It demands that students take themselves and their art seriously, by working hard to create a finished product that is worthy of display, by discussing their work with opening night gallery audience, and by making decisions about how their profits will be spent. Christiansen-Heller likes the way the project brings parents in closer touch with their children, and with their children as artists:

The kids come in and their folks have made them dress up a little nicer than normal. And they're pleased to see their artwork up. I'll never forget one woman came in with her son, who was in junior

high, and said, "Oh my God, I didn't realize he was an artist."

While extolling the social benefits of the program, Christiansen-Heller is careful to point out that the project continues because, and only as long as it benefits her business. "We all need to make a living. Obviously people come into the shop because their children are having an art show. And hopefully they'll make a connection, and want to support this kind of business." Rather than discrediting business owners as anti-school or anti-charity, Christiansen-Heller's words prove that there is a beneficial and lasting future in community-based support for art education.

SOLUTION: USING ART AS A PREVENTATIVE MEASURE

The cost of dealing with those students who are not able to succeed in school is a problem which extends beyond campus boundaries to society-at-large. Angry and alienated because of racial prejudice, unemployable because they lack the literacy and technical skills increasingly required by the modern job market, they often turn to crime. In Oakland today, school age children are currently incarcerated in juvenile detention facilities, where it costs a great deal a year to house each inmate. The problems of financing school failures can also be viewed as a justification for art education. Studies of the problems of incarcerated youth show that the great majority did poorly in school, often because of their inability find a place where they could feel accepted and establish an identity. Students who fail classes, fight with peers, act out in class and drop out of school, can also be characterized as students who have not been made to feel welcome in school. In addition to fostering a sense of community, the arts, as much as any other academic or athletic activity, integrate students. Students' interests in the arts cross racial or ethnic foundations. In Oakland, the ethnic and racial composition of bands, orchestras, art projects and performing groups is as varied as are our student bodies. Working together in friendship and with common interests, students drawn to art projects are offered a way to participate in and contribute to their school community.

CHALLENGE: UPDATING CLASSROOM PEDAGOGY

The epidemic of failure in inner city schools, with dropout rates as high as 70% between the seventh and twelfth grades in urban schools and test scores in the lowest quartile, begs us to take a frank and self-critical look at what we are doing in the classroom. Our charge to educate children from a variety of ethnic, linguistic, and economic backgrounds is forcing us to acknowledge where standard classroom practices are failing. We are in real need of classroom practices which do not depend on authority models that feed off of, or worse yet, create feelings of being devalued, and which do not present didactic teacher-centered instruction as the only way to learn. If there is an insidious effect on students' self-conception

when they are cast as passive learners who must receive knowledge as presented and interpreted by higher authority, then conversely, there must be a sense of liberation and empowerment when students come to realize that they do not have to depend on higher authority for their own discoveries in making sense of the world.

A study conducted by the Oakland School District designed to evaluate the kind of instruction that students receive, found that while equal amounts of classroom time were devoted to instruction across the educational and socioeconomic levels, this instruction was too often teacher directed. As a result, less than 2% of classroom time was spent on such important matters as open-ended problem solving, debate of moral and ethical issues, and interactive collaboration (Institute for Effective Leadership, 1990). These findings reached across all schools and student ability levels, reminding us that all children require improved pedagogy which casts them as active learners, learners who want to take responsibility for creating and using knowledge.

In Oakland we know first hand that working with ethnically diverse students also means working with linguistically diverse students and this fact has led to the realization of how language-dependent instruction in our classrooms is. While interviewing art teachers for this article it was not uncommon to hear classroom situations such as the following described: a bilingual primary class with 30 students, 28 of whom spoke Cantonese as their primary language, one who spoke Russian and one who spoke a West African language; or, a class of 27 5th/6th grade Limited English Proficient students combined at a year-round school, with one student arriving two thirds of the way through the year speaking no English whatsoever. The students in these classes will and do fail if their only avenue for instruction is through the English language. They rightfully become frustrated when instruction is lowered in its intellectual content because of their limitations in English—they need to continue to take on learning challenges as they learn a second language, rather than having to wait until after they learn the second language. We cannot rely solely on bilingual teachers and ESL departments to handle this demand in our classrooms; this year the State of California alone is thousands of teachers short of the projected number of credentialed bilingual teachers needed by the public schools.

A direct extension of inadequate pedagogy is the standardized testing we have relied upon to evaluate our students' learning. Art educators have long felt the inadequacies of standardized testing. With its reliance on items which can be met with discreet, quantifiable answers, standardized testing has left them and their discipline completely out of the evaluation picture. The fact that art has not been testable is often extended to mean that it cannot be evaluated nor can it be put on the same level of importance as other subjects which can be tested in this standardized way. The truth is that good art instruction calls for equally if not more rigorous intellectual skills than standardized tests. Art calls for the ability to conceptualize. It requires the student to visualize a creation before creating it. It calls for imagination; the imagination of places, times, scenes perhaps never before experienced. We all know what a fine job science fiction has done of predicting most of today's technology. Artists

compose, communicate, express and evoke feelings far beyond the quality of expression test items can possibly reflect. What collection of multiple choice questions could prove a student's knowledge of perspective as well as the drawings illustrating this article?

Solution: Design a curriculum around concepts and values

The purpose and design of curriculum plays an important part in determining the status of the arts. If the curriculum is intended to drill students in basic skills and to teach by rote the rules and facts related to a subject matter, there will be no place for the arts in the classroom. If, on the other hand, the purpose of the curriculum is to give students access to powerful ideas, the arts have a central place. Powerful ideas consist of important concepts, insightful theories, values, and issues in a discipline. They embrace the ethical and moral questions with which all of us struggle. In rewriting our curriculum in Oakland, we formed representative committees for each academic subject, and asked the teachers within each to identify the powerful ideas of their disciplines. These ideas became both the foundation and framework for Core Curriculum, which advocates learning powerful ideas from an early age and transferring them across the disciplines.

"Learning," art educator Elliot Eisner tells us, "Takes place when the abstract idea can be connected to an image in our experience" (1990). Eisner's words remind us that the arts not only contribute their own powerful ideas to the curriculum, they also provide concrete experiences by which students can understand the abstract ideas of other academic subject matters. The perspective art assignment which illustrates this chapter was designed by a teacher looking for learning objectives which could link the two grade levels combined within her elementary classroom. The assignment's requirement that the students visualize and draw perspective in railroad tracks disappearing into the horizon offers students the opportunity, through the concrete experience of drawing, to experiment with new knowledge. The children know that their drawings need to look like what they see in the real world. They know that things look smaller as distance increases, and they know they have to learn certain techniques to create the illusion of nearness and distance. In creating perspective, they have learned that how reality looks depends on where you stand, and that what you see is partly what your mind creates, that perspective is subjective. While the children may not yet have words to express these sophisticated ideas, they will know them experientially.

The following excerpt from an interview with the teacher of the perspective exercise illustrates how important ideas and experience come together in the rigorous work of learning through art. When asked what she felt were the most difficult concepts for students to learn in this assignment, Ms. LaTouche identified the creation of an illusion of reality - both in perspective and color:

*I'm very particular about insisting that they understand that the further the ties get away not only the more narrow they are (*she points to the width of the individual railroad ties*) but they're*

more narrow this way (*she points to the distance in between the individual ties*)... Because they would make every line the same thickness all the way up. So, I did a lot of nagging. I know they can do it. Before I give them this lesson I've known my kids a long time and I've given them a lot of opportunities to use rulers. I put a big piece of paper up on the wall and I say the directions are not to draw your first horizontal line in the middle, but to draw it closer to a third of the way from the top. And so they have to have some experience with a ruler before you even get here ... I also tell them that when they're looking at a field you never see one color. And we spread all our crayons out and we look at all the colors that could possibly be used. And of course I have some students that refuse to listen to me. But there are some students that say, "OK. I could use green but I could use more than one green and I could make some darker and some lighter and I could put some yellow in there." And what you're doing, you're just expanding their minds to accept another idea.

As the children respond to the assignment, they calculate the placements of objects, the ratio of size to location of the object to create the illusion of distance, the point from which the audience or observer of the drawing viewing the scene, the composition of color, so that in one project they work with several powerful ideas: illusion, ratio and audience, to name just three. The opportunities for discussion and explication of these ideas is where art is a powerful vehicle for "expanding minds" to accept new ideas.

Art is well suited to furthering a curriculum designed around powerful ideas and values even when it is not being taught as the focal academic subject. In a bilingual primary grade classroom, a teacher uses art as one of many tools in planning a class party. The teacher has deftly designed party planning into a lesson which asks the young students to read, write, discuss and debate, and calculate. But it is when the students are asked to illustrate their party lists that important issues surface for discussion and decision. The following is an excerpt from field note observations of the party planning lesson:

When students are asked what they would like to eat at their party they call out suggestions which the teacher records on the board. Students are asked to illustrate the list to prove that they understand the translations between English and Cantonese. The students' pictures spark a conversation about the difference between Chinese, American, and African party food. Once the list is complete, a survey is conducted: How many people would like each item listed? Cookies—only 3 people raise their hands. Three out of 30 students want cookies - is the percentage high enough to justify bringing in cookies? If one person brings in a batch or box of cookies that will be at least 20 cookies, how many cookies would each of the 3 cookie people need to eat in order to finish all the cookies? How does the class feel wasting food?

SOLUTION: USE ART TO OVERCOME THE LIMITATIONS OF LANGUAGE

In addition to raising and illustrating powerful ideas, art is an excellent means of sheltering instruction of any academic subject for English language learners. The following excerpt

from an interview with a middle school teacher demonstrates how the use of an art project can allow teachers to maintain the depth of their subject area when working with students of varying levels of proficiency in the English language .

You'll get that occasional child that just comes right here, right from another country and can't say "Hello" even. That's the student that I had. And he was totally coached by his Vietnamese-speaking peers in the class. I didn't know how much he could take and transfer. And use. And that was the real assessment. His assessment was the construction of the module. He was able to demonstrate through that module his understanding of a self-supporting structure up in space that would be run solely on the solar light it would capture. This told me a lot. Where the children in my class have a lot of social language, I wasn't quite sure where their academic level of fluency in Vietnamese was until I could see it expressed ... To the child that's different art may be the only means of assessing- in math and science and social studies and in reading. That may be it.

This teacher's approach to teaching science through art sheltered, and enriched, her students' learning on several levels: it enabled the brand new English learner to express his sophisticated knowledge of science and space; it honored the talents of her bilingual students; it encouraged her more advanced English learners to use their knowledge of English and school to enrich their native language; it provided both herself and her students with a genuine, multileveled assessment of all the powerful ideas and skills learned in this lesson.

CONCLUSION

Art transmits culture to the young, to the generations that follow. Many children today are cut off from the many avenues by which it comes to children. Conquest, colonization and its deliberate efforts to disconnect conquered people from language, art and culture, erosion of the extended family and radical changes in family composition, and the economic necessity of the salaries of two working parents, as well as other factors have greatly reduced the amount of time adults and children have together, and with that the opportunities for children to feel connected to their heritage.

The arts play an essential and powerful role in passing on the culture, values and hopes they embody. Whether the arts be the masterworks of a people or the humble folk tales and family craftings, they embody and ideas, images in concrete ways upon which children build language, concepts and understandings, and other abstractions. Art is a way to provide the image to which learners later connect the idea to be grasped.

It is imperative that superintendents and other educational leaders be aware of the powerful role the arts can play in helping them achieve the goals for which they are held accountable: academic learning and basic skills. We who have these responsibilities can learn from teachers who teach the arts not only for their intrinsic worth, but also for their powerful promise they carry for other valuable learning.

PREPARING PRESERVICE TEACHERS TO TEACH MULTICULTURAL LITERATURE

Arlette Ingram Willis and Violet J. Harris

UNIVERSITY OF ILLINOIS AT URBANA-CHAMPAIGN

Several years ago during a final field experience a prospective teacher wrote:

Both Willie and Elisha are the stereotypical "scary" African-American male(s). They are very tall, muscular, and dark. However, it has been wonderful for me, as a person with very little contact with African-Americans, to have these two young men in class.

This statement was made by one of our "top" students. A student who had excelled during her academic undergraduate education and one who received an uncontested "high rating" as a prospective teacher educator from her supervisors and cooperating teachers. The student is not a "bad" person. However, her journal entry reacquaints us with the notion that understandings of race, culture, and ethnicity are ever present in our consciousness. Until recently, it has been considered "polite not to notice" incidents of racism in education (hooks & West, 1991). As bell hooks (1992) has observed in similar instances, "For my colleagues, racism expressed in everyday encounters ... is only an unpleasantness to be avoided, not something to be confronted or challenged. It is just something negative disrupting the good time, better not to notice and pretend it's not there" (p. 61). However, racism is here as an ugly unfortunate part of life in American society. Racist acts, unintentionally committed by well-intended folk, are a part of the lived reality, in and out of school, for culturally and linguistically diverse children. How can we better educate preservice teachers to understand the relationship among language, culture, and literacy as they prepare to teach all of our children?

The student's entry served as a wake-up call for us. First, the student has described the men, all the important ones, in our lives – fathers, friends, husband, brothers, and sons. She has also revealed that she suffers greatly from stereotypical notions – notions perpetuated in media about African-American males. What other stereotypical notions might she harbor:

African Americans are poor students? Or worse, African-American parents are not interested in the education of their children? Do we want someone whose limited and biased understanding of African-Americans teaching our children? No. Second, we were prompted to consider whether or not other students in our classes also held similar viewpoints and stereotypical notions about culturally and linguistically diverse groups. Finally, we were encouraged to examine the stereotypical notions of race that all of us carry.

As unpleasant as the student's journal entry was, it has challenged us to confront the necessity of preparing teacher educators for the rapidly changing public school population. Current estimates of school populations reveal a rising number of children from African, Asian, and Latino backgrounds and speculate that by the year 2000 (only 4 years from now) one out of every three Americans will be a person of color (*The Nation Prepared*, 1986). By way of comparison, recent statistics of preservice educators suggest that they are: European American (92%), female (75%), and middle class (80%) (Fuller, 1992; Ross & Smith, 1992). What should students learn in their undergraduate training that will predispose them to have a more democratic approach and less racialized attitude toward all their future students?

Our university, like many throughout the country (Bulter & Schmitz, 1992) requires that all undergraduate students take at least one non Western course. The intent of the legislation was to help diversify the students experiences and to help them acknowledge and respect differing perspectives. In addition, there was the tacit assumption that students would also want to investigate more closely the domestic minority groups in this country. However, conversations with undergraduates reveal that they have taken anything from Chinese painting to Chilean basket weaving. While not the intent of the requirement, students are often able to skirt the requirement by taking such courses. The intent of the require-

ment is to prepare students for diversity within their future careers; currently, the requirement is unenforceable. It is clear that such feeble attempts to broaden student knowledge bases are not what students need as they move from collegiate life to the work force. They need more than a surface acquaintance with issues of diversity. They need a series of courses that would help them understand the domestic minority and new immigrant populations that are appearing in growing numbers in America's public schools (Ross & Smith, 1992).

In teacher education we cannot trust the responsibility to anyone else or any other course; the responsibility is ours. We are obligated to make changes in our courses that will better prepare all students to meet the changing demographics of America's classrooms with high expectations for all students, literature that would validate the life experiences of all students, and instructional methods that are culturally sensitive and responsive. We believe that the most effective way to reform and improve literacy education begins in our colleges and universities by better informing and preparing prospective teacher educators to address their own ethnicity, learn the historical and social experiences of domestic minority groups, construct new understandings of the role of culture in language, literacy, literature, and empowerment in schooling (Barrera, 1992). Therefore, it becomes imperative that multicultural teacher education courses, and multicultural literature courses, not merely *teach* about multicultural education, but that they *become* multicultural environments.

THEORETICAL PERSPECTIVE

In this chapter we will review three distinct but interrelated areas of research: multicultural teacher education, social constructivist theories of school based literacy, and multicultural literature. Each area has received considerable attention in the professional literature and may serve as frameworks for developing courses to better educate preservice teachers for the changing student populations. Recent census projections of a growing culturally and linguistically diverse school population by the year 2000 have sounded an alarm to teacher educators to begin to better prepare prospective teachers for a changing student body. Educators have noticed that while the school population is growing increasingly diverse (linguistically and culturally), the teacher education population continues to be dominated by European American females. The university and college faculties instructing them are also predominantly (94%) European American and middle class (Fuller, 1992). Second, the concerns of educators are framed in discussions of teacher/student understandings and interactions (Au, 1993; Delpit, 1988), the cultural gap between the school and communities (Au, 1980; Cook-Gumprez, Gumprez, & Simons, 1981; Heath, 1983), and effective instructional strategies for children in multicultural settings (Au, 1993; Barrera, 1992). Popular and professional literature on the need for improved multicultural education programs, in its varying forms – cultural awareness, cultural sensitivity, human understanding,

and ethnic studies – as part of teacher education programs is filled with discussions of knowledge bases and understandings necessary to improve the education of culturally and linguistically diverse students. Yet, the professional literature lacks a framework for preservice course design, instruction, and evaluation. This chapter will provide readers with a glance into the complexity of conjoining the work of several theorists from various domains into a workable course that trains teachers to use and teach multicultural literature as one response to meeting the challenge of teacher preparation. As a way of organizing the many theoretical positions that supply the underlying structure of multicultural literature we will offer a brief review of three broad domains: multicultural education, school-based literacy, and the changing role of the canon.

Theoretical Notions About What Constitutes Multicultural Teacher Education

It is important to understand that multicultural literature is a subset of a broader domain of knowledge: multicultural education. Three particularly influential theorists have offered insight into different ways of thinking about multicultural education and how it is conceived and taught. First, Sleeter and Grant (1988/1993) have suggested five different ways educators can think about multicultural education. They suggest (a) teaching the exceptional and culturally different, (b) human relations, (c) single-group studies, (d) multicultural education, and (e) education that is multicultural and social reconstructionist.

Second, the work of McCarthy (1993) has also described different ways of thinking about multicultural education. He argues that there are three general approaches: “*cultural understanding* suggests that all cultural groups have parity and cultural differences are recognized, *cultural competence* suggests that cultural pluralism should have a central place in the school curriculum, and *cultural emancipation* suggests that a reformist multicultural curriculum can boost school success and economic futures of minority youth” (pp. 291–293). McCarthy maintains that to deny the importance of race, as central to the debate of multicultural education, is to hinder real progress toward change.

Third, James Banks (1994), a noted authority on multicultural education, reacquaints his readers with his 1988 outline of approaches to multicultural curriculum reform. The approaches are: “*the contributions approach*—that focuses on heroes, holidays, and discrete cultural elements; *the additive approach*—that adds content, concepts, themes, and perspectives to the curriculum without changing its structure; *the transformation approach*—where the structure of the curriculum is changed to enable students to view concepts, issues, events, and themes from the perspective of diverse ethnic and cultural groups; and *the social action approach*—where students make decisions on important social issues and take actions to help solve them” (p. 25).

Importantly, in his 1994 text, Banks identifies two opposing groups that have debated over the content of school literacy instruction. The groups are known as the traditional-

ist and the multiculturalist. Simply stated, the traditionalist refers to those individuals who wish to retain the literary canon. The multiculturalist refers to those individuals who wish to broaden the canon to include the works of women and people of color. We, too, will use these terms for ease of reference throughout this chapter.

The body of literature that addresses the teaching of multicultural education courses to preservice teachers is also an important consideration to include in this review. It is to this body of research that we will now turn.

Theoretical Notions About Teaching Multicultural Education Courses to Preservice Teachers

As noted by Willis and Meachem (in press) the majority of the empirical research on multicultural teacher preparation has emphasized the description and evaluation of curricular innovations designed to improve the multicultural preparedness of predominantly white preservice teachers (Burstein & Cabello, 1989; Cooper, Beare, & Thorman, 1990; Ladson-Billings, 1991; Larke, Wiseman, & Bradely, 1990). The research focuses on either expanding the multicultural knowledge base of preservice teachers or increasing the receptivity of white preservice teachers to the task of teaching children of color. Of interest to researchers has also been the assessment of attitudes of preservice teachers related to issues of race, culture, and inequality (Ginsburg & Newman, 1985; King, 1991; Watson & Roberts, 1988). Several noted researchers and cultural theorists (hooks, 1992; Ladson-Billings, 1994; Sleeter, 1994) have commented that the issue of race must not be ignored, dismissed, or subsumed under the multicultural label. Race, when discussed has usually focused on people of color. This discursive slant has the effect of concealing the concept of white identity or "whiteness" from critical indention into the discourse of multicultural education (Willis & Meacham, in press). Consequently, white preservice teachers are not provided with the opportunity to examine their own racial and cultural identities and to investigate the influences of such identities on their efforts to teach children from different racial, class, cultural and linguistic backgrounds. McIntosh (1990) asserts that, the absence of a racial discourse on whiteness reinforces the widely accepted myth that whiteness is "morally neutral, normal, and average, and also ideal" (p. 32). Nieto (1992) argues the same point in a somewhat different manner. She states "white people, as the majority of U.S. society, do not often think of themselves as ethnic which is a term they reserve for other, more easily identifiable groups. ... Whiteness is an important factor, but it is not an exclusively determining one in defining a group. The term European American also implies culture, something that many European Americans lament they do not have" (p. 16).

The ethnographic research of Christine Sleeter (1993), among others, with in-service teachers suggests the need for more extensive training at the preservice level. Sleeter's 2-year study documents the voluntary involvement of in-service teachers in multicultural education workshops. During the 2-year study she observed the following: teachers' exposure to

multicultural education workshops and activities, teachers in their classrooms, and individual interviews (p. 159). Her data reveal that there is little apparent transfer of multicultural knowledge gained or activities to classroom practice by in-service teachers (p. 160). Therefore, Sleeter argues that preservice teacher education programs may offer the optimal conditions for effecting change in teacher understanding and knowledge of multicultural education (p. 160).

A second domain of knowledge that is helpful to review when considering the teaching of multicultural literature courses is the research on literacy, more specifically school-based literacy.

Theoretical Notions of School-Based Literacy

Several contemporary positions on literacy serve to enlighten our understanding of how literacy is defined in the field and how it is defined in practice. In this section we will offer a brief look at several definitions. First, Cook-Gumprez (1986) describes two competing definitions of school literacy that are useful in our discussion of the role of literacy training during preservice education. She states, "inherent in our contemporary attitude to literacy and schooling is a confusion between a prescriptive view of literacy, as a statement about the values and uses of knowledge, and a descriptive view of literacy, as cognitive abilities which are promoted and assessed through schooling" (p. 14). Second, a more expansive definition of how literacy is conceptualized is offered by Freire and Macedo (1987). They suggest that, "literacy becomes a meaningful construct to the degree that it is viewed as a set of practices that functions to either empower or disempower people. In the larger sense, literacy is analyzed according to whether it serves a set of cultural practices that promotes democratic and emancipatory change" (p. 141). Further, they clarify their position on literacy by noting that, "for the notion of literacy to become meaningful it has to be situated within a theory of cultural production and viewed as an integral part of the way in which people produce, transform, and reproduce meaning (p. 142). Third, more general discussions of literacy define literacy as *functional*, *cultural*, or *critical*. Each of these concepts also refers to very different ways of thinking about literacy. *Functional literacy* refers to mastery of the skills needed to read and write as measured by standardized forms of assessment. This view of literacy is similar to Cook-Gumprez's notion of a descriptive view of literacy. The functional view promotes literacy as a cognitive set of skills that is universal, culturally neutral, and equally accessible through schooling and based on a positivistic ideology of learning. Further, this view is heavily dependent on the use of standardized testing measures as a proving ground for literacy acquisition. Most basal reading series and programmed reading approaches embrace the functional/descriptive view of literacy.

Cultural literacy is a term that is most often associated with E. D. Hirsch's 1987 book, *Cultural Literacy: What every American needs to know*. Hirsch defines cultural literacy as "the network of information that all competent readers possess. It is the background information, stored in their minds,

that enables them to take the point, grasping the implications, relating what they read to the unstated context which alone gives meaning to what they read" (p. 2). Cook-Gumpertz (1986) labeled this form of literacy "prescriptive." In effect, this form of cultural literacy validates language forms, experiences, literature, and histories of some and marginalizes or ignores the language forms, experiences, literature, and histories of others. In the United States, the prescriptive view can be seen in the use of standard English, Eurocentric ways of knowing and learning, a Eurocentric literary canon, and a conventional unproblematic rendering of U.S. history. This form of the cultural/prescriptivist view marginalizes the pluralistic composition of American society by devaluing the language, contributions, and histories of some groups. Traditional or conventional approaches to school-based literacy take this form. McLaren (1988) argues that there is a second form of cultural literacy. He writes that this form of cultural literacy "advocates using the language standards and cultural information students bring into the classroom as legitimate and important constituents of learning" (p. 214). Cultural literacy, thus described, suggests that the language and experiences of each student who enters the classroom should be respected and nurtured. This form of cultural literacy recognizes that there are differences in language forms, experiences, literature, and histories of students that will affect literacy learning. Social constructivist theories fall into this prescriptive/cultural literacy category. These approaches to literacy emphasize the active engagement of learners in making meaning from print, the social context of literacy learning, and the importance in recognizing individual and cultural differences.

Critical literacy refers to the ideologies that underlie the relationship between power and knowledge in society. The work of Brazilian educator Paulo Freire has been influential to U.S. efforts to adopt a critical literacy position. Freire, among others, suggest that literacy is more than constructing meaning from print. Literacy also must include the ability to understand oneself and one's relationship in the world. Giroux's (1987a) discussion is worth quoting here at length:

As Paulo Freire and others have pointed out, schools are not merely instructional sites designed to transmit knowledge; they are also cultural sites. As sites, they generate and embody support for particular forms of culture as is evident in the school's support for specific ways of speaking, the legitimating of distinct forms of knowledge, the privileging of certain histories and patterns of authority, and the confirmation of particular ways of experiencing and seeing the world. Schools often give the appearance of transmitting a common culture, but they, in fact, more often than not, legitimate what can be called a dominant culture (p. 176).

Giroux goes on to state that:

At issue here is understanding that student experience has to be understood as part of an interlocking web of power relations in which some groups of students are often privileged over others. But if we are to view this insight in an important way, we must understand that it is imperative for teachers to critically examine the cultural backgrounds and social formations out of which their students produce the categories they use to give meaning to the world. For teachers are not merely dealing with students who have individual interests, they are dealing primarily with individuals

whose stories, memories, narratives, and readings of the world are inextricably related to wider social and cultural formations and categories. This issue here is not merely one of relevance but one of power (1987a, p. 177).

Similarly, Apple (1992) has argued for nearly a decade that, "...it is naive to think of the school curriculum as neutral knowledge. ... Rather, what counts as legitimate knowledge is the result of complex power relations and struggles among identifiable class, race, gender, and religious groups" (p. 4). Critical literacy draws attention to the historical, political, cultural, and social dimensions of literacy. Most important, this form of literacy focuses on power relations in society and how knowledge and power are interrelated. Educationalists, practitioners in particular, have not yet fully grasped this position of literacy. The other forms of literacy, functional/descriptive and cultural/prescriptive do not include, among other things, the notion of power relations in literacy instruction.

Philosophically, social constructivist notions (a form of prescriptive/cultural literacy) may be seen as comparable to those espoused by critical literacy. From the schema theorists of the early 1980s to the social constructivist theories of the 1990s, literacy development is understood to be a "meaning making process" — that is, socially mediated (Meek, 1982). Drawing primarily on the work of Goodman (1989; Halliday 1975; Vygotsky, 1978), a number of literacy researchers have stressed the universality of language learning. For example, Goodman's discussion of the philosophical stance of whole language is that:

At the same time that whole language sees common strengths and universals in human learning, it expects and recognizes differences among learners in culture, value systems, experience, needs, interests and language. Some of these differences are personal, reflecting the ethnic, cultural, and belief systems of the social groups pupils represent. Thus teachers of whole language programs value differences among learners as they come to school and differences in objectives and outcome as students progress through school (p. 209).

However, we would argue that the role of culture in social constructivist theories is not as well defined as it needs to be in a pluralistic or multicultural society. While it is fair to say that unidimensional views of culture would not be supported by social constructivist, it is also fair to say that the multilayered complexity of culture, especially the cultures of historically oppressed groups, is not explicitly addressed by them either. By way of example, we will examine the prescriptive/cultural literacy foundation of whole language.

Goodman (1986) argues that "language begins as means of communication between members of the group. Through it, however, each developing child acquires the life view, the cultural perspective, the ways of meaning particular to its own culture" (p. 11). But this definition fails to acknowledge that in addition to acquiring culturally "neutral" knowledge, some children must also acquire a Eurocentric cultural perspective to be successful in school. It is not sufficient to suggest that the language and culture of every student is welcomed, supported, and nurtured in school without explicitly addressing the power relations in institutions, social practice, and litera-

ture that advantage some and hinder others (Delpit, 1988; Reyes, 1992). School-based literacy, in its varying forms, fails to acknowledge explicitly the richness of the cultural ways of knowing, forms of language other than standard English, and the interwoven relationship among power, language, and literacy that silences many children of color (Fine, 1987). To fail to attend to the plurality of diversity within the United States—and to fail to take seriously the historic past and the social and political contexts that have sustained it—is to dismiss the cultural ways of knowing, language, experiences and voices of children from diverse linguistic and cultural backgrounds. This is not to imply that programs not based on such theories need to be scrapped. It does mean that social constructivist theories need to be reworked to include the complexities of culture that are currently absent. It will also mean that teacher education will need to: (1) make explicit the relationship among culture, language, literacy, and power; and (2) train teachers to use cultural information to support and nurture the literacy development of all the students who enter their classrooms.

It is important to note that both multiculturalist and those who endorse holistic notions of literacy point to the social construction of knowledge and the importance of the role of culture in school-based literacy. There is an important difference, however, in how each group of theorists defines culture. Research by Delpit (1988), among others, suggest that culturally and linguistically diverse children must adopt a knowledge and proficiency in “school-literacy” which differs from their knowledge of the home and community understandings of language. Multiculturalists argue, that is not sufficient for holistic programs to merely acknowledge that children bring to school with them cultural and linguistic differences. Nor is it sufficient to suggest that the language and culture of every student is welcomed, supported, and nurtured in school without also explicitly addressing the power relations in institutions, social practice, and literature that advantage some and hinder others (Delpit, 1988; Reyes, 1992). Recent ethnographic literacy research studies of the role of culture in elementary school and community environments of linguistically and culturally diverse groups have suggested that traditional and new approaches to literacy instruction have not prepared teachers for linguistic and cultural difference (Barrera, 1992; Gutierrez, 1992; Reyes, 1992; Willis, 1995).

Preservice literacy teachers need more than knowledge of cultural and linguistic differences of U.S. populations. It is important that teachers understand the cultural and linguistic differences in ways that are affirming and supportive. Moreover, it is crucial that teachers know how to support cultural and linguistic differences toward literacy development. They also need experiences and skills to take with them into their classes (Banks, 1994).

Multiculturalists have adopted more inclusive notions of culture that explicitly include the cultures of the dominant as well as domestic minority groups. They consider gender, language, social class, age and sexual preference in definitions of each cultural group. Moreover, multiculturalists acknowledge the diversity within all domestic minority groups and within European American culture.

ADOPTING A MULTICULTURAL PERSPECTIVE

Jackson and Solis' (1995) have observed that “in the discourse on multiculturalism that has emerged since the mid-1970s, the primary focus of the literature and research has been on the curriculum and the canon” (p. 6). So too, research efforts toward a better understanding of multicultural education have focused on the canon and the curriculum and instructional strategies. We will briefly explore each area as it relates to the teaching of multicultural literature.

The Canon and the Curriculum

The content of the high school English curriculum has been the subject of many heated debates, conferences and journals in the last few years. The battle is being waged by two opposing groups. The first group consists of supporters of the canon (Bloom, 1987; D' Sousa, 1991; Hirsch, 1987). The second group consists of those who wish to see the canon reconceptualized (Gates, 1992; McCarthy, 1993; Morrison, 1992).

At issue is the retention of the traditional canon or the expansion of the canon to include works by women and authors of color. Retention of the canon means the continued use of the same “classic” literature that has been the staple for nearly a century. Reconceptualization of the canon means, among other things, the inclusion of what is commonly defined as multicultural literature. Harris (1992) defines multicultural literature as “...literature that focuses on people of color (such as African-Americans, Asian Americans, Hispanic Americans and Native Americans), on religious minorities (such as the Amish or Jewish), on regional cultures (such as Appalachian and Cajun), or the disabled, and on the aged” (p. 175). One can read most discussions of the debate, however, as centering on the inclusion of literature written by women and authors from diverse backgrounds as part of the set of works that are important for study.

Karen Peterson (1994) reports on a recent survey by The College Board citing the following top 20 books as those most frequently recommended for high school seniors and college freshmen: *The Scarlet Letter*, *Huckleberry Finn*, *The Great Gatsby*, *Lord of the Flies*, *Great Expectations*, *Hamlet*, *To Kill a Mockingbird*, *The Grapes of Wrath*, *The Odyssey*, *Wuthering Heights*, *The Catcher in the Rye*, *The Crucible*, *Gulliver's Travels*, *Julius Caesar*, *Of Mice and Men*, *The Old Man and the Sea*, *Pride and Prejudice*, *The Red Badge of Courage*, *Romeo and Juliet*, and *Death of a Salesman* (USA Today, 1994, December 27). According to spokesman Fred Moreno, The College Board examined curriculum guides, private school reading lists, research surveys, federal reports and other sources in conducting the survey. A review of the titles notes that the list favors the literature of European or European American males and includes only three titles by women authors. The list does not include any works by authors from historically underrepresented groups. The marginalization of the works by women and people of color prompted traditionalist E. D. Hirsch to observe that “This is a very traditional list that doesn't reflect new thinking. ... It is

clearly defective in not including books such as *Black Boy* (Richard Wright), *Song of Solomon* (Toni Morrison) and *I Know Why the Caged Bird Sings* (Maya Angelou)." He later predicted that it may take another decade before the list is more representative.

The most comprehensive look at secondary literature curricula is offered by Arthur Applebee (1993) in his paper "Literature in the secondary school: Studies of curriculum and instruction in the United States." In this paper he examines literature and literature instruction in public and private schools. Applebee notes that literature instruction includes a variety of facets, but none so important as the book-length works used to convey a sense of who and what literature is important to study.

Applebee's (1989, 1992) nationwide survey reports the consistent use of canonical literature in our nation's high schools. He cites the continual use of works by Shakespeare, Steinbeck, Dickens and Twain, yet few works by women and minority authors. [Applebee cites, similar traditional approaches to high school literature had been observed by Tanner (1903) and Anderson (1963)]. Further analysis by Applebee reveals only one European American female author and two African-American authors (one female, one male) among the top 50 listed authors. Applebee (1992) draws some important conclusions from his study:

- (1) a comparison of the studies reveals little change in the nature of the selections in the 25-year period,
- (2) marginal increases in titles by women and diverse authors, and
- (3) few book-length works by women and diverse authors have entered the canon.

If Applebee's conclusion about the importance of book-length works is correct, students are receiving a very narrow view of what literature, values, and people are important. As Applebee (1991) puts it, "Whether intentional or not, schools have chosen to ignore diversity and assimilate everyone to the 'classical' culture that found its way into schools before the turn of the century" (p. 235). He goes on to state that "we are failing in a fundamental way to open the gates of literacy to the majority of the students we teach." (p. 235). His suggestions for change include the challenge of expanding the canon to be more reflective of the history, life experiences, culture, and literature of all Americans. Applebee argues that the expansion of canon begins with preservice programs that require students to read and discuss book-length works written by authors of underrepresented groups. Moreover, Applebee suggests that preservice English courses may help students develop a repertoire of effective teaching strategies to use when teaching the literature.

Applebee's suggestion for canon expansion does not acknowledge the need for increased understandings of the role of culture and language in multicultural literature instruction. It is important to expand the canon, but expansion without sufficient understandings of the role of culture and language in the literature of diverse groups, will give preservice teachers inadequate knowledge by which to instruct students. Preservice teachers need more than a list of multicultural books to read and discuss, they need to under-

stand the histories and cultures that support the writing of the literature. In addition, they need instructional strategies to help students understand, appreciate, and enjoy each work.

Graff's (1992) findings of the undergraduate English curricula offered nationwide suggest that there has been little substantive change in the literature offered to English majors. Generally, the literature that dominates college and high school English curriculum offers a very narrow view of the world; one that is not part of the cultural schema of every student. In addition, research by Au (1993) notes that most preservice teacher education courses are dominated by traditional transmission models of literacy instruction that support a mainstream middle-class perspective of literacy and inadequately address the needs of culturally or linguistically diverse students. Preservice teachers need to be taught strategies to make the implicit knowledge about the culture described in literature explicit to learners of different cultures. Giovanni (1994) declares that, "In the universities we have seen white men declare time and time again that they cannot teach women, they cannot teach Blacks, they cannot teach Native Americans, because they do not have any 'experience' in this area. Yet we who are Black and women and not white males are expected to teach literature written by them because it is 'universal'? I think not. It is called education because it is learned. You do not have to have had an experience in order to sympathize or empathize with the subject" (p. 109). Research on cultural schema has documented improved understanding, enjoyment and memory of literature that acknowledges and supports the cultural knowledge of readers (LeSound, 1988).

An important caveat is worth mentioning. Simply adding materials to the curriculum, without reforming the curriculum or training teachers, legitimates the continued use of the dominant cultural perspectives and paradigms in schools. Apple (1992) notes that "controversies over 'official knowledge' that usually center around what is included and excluded in textbooks really signify more profound political, economic, and cultural relations and histories. Conflicts over texts are often proxies for wider questions of power relations" (p. 5).

Instructional Strategies

Recent research on school literacy either ignores or minimizes the need to broaden teacher knowledge and understanding of cultural variables inherent in literacy programs (Garcia, Pearson, & Jimenez, 1994). Researchers and practitioners of school literacy approaches tend to discuss literacy with vague, muddled notions of the role and importance of cultural knowledge.

Au (1993) offers a theoretical framework for preservice elementary teachers founded on social constructivist notions of literacy instruction. The theoretical framework is based on field-based research conducted by several researchers in linguistically and culturally diverse settings including Au's (1980) work with Hawaiian children; Heath's (1983) research with working class African-American and European

American communities, schools, parents, children and teachers; and the Spindler and Spindler (1990) research among Menominee (Native American) people. An analysis of the findings of these researchers and others has led Au to conclude that what is needed is a redefinition of school literacy. Specifically she suggests that school literacy be redefined through types of texts; instruction centered on meaning; writing based on students experiences; culturally responsive instruction; and critical literacy (p. 30). Au argues that perhaps the most effective time to train teachers to think differently about the culture, language, and literacy development of culturally and linguistically diverse children and to learn how to create culturally responsive strategies and culturally sensitive interactional responses is during their preservice training.

Barrera's (1992) observation of elementary (K-6) classroom teachers' literacy instruction in culturally and linguistically diverse communities finds that in-service teachers exhibit "cultural gaps" in knowledge necessary for successful literacy development. She defines a "cultural gap" as a "void in teachers' knowledge bases about culture as it relates to literacy and literature" (p. 227). Her discovery of the "cultural gaps" exhibited by teachers in content selection and communication patterns and interactions has sounded an alarm in literacy theory and praxis. For example, Barrera reports content and communication "gaps in cultural knowledge" exhibited by the teachers. In content, she notes, the language and literature used in the classroom do not reflect the culture, language, histories and lives of the children but are dominated by literature written by European Americans that reflected themes, characters and experiences from the mainstream culture (p. 230). In the area of communication she has observed teachers' failure to understand the interactional patterns and shared meanings of the language of the children. Failure in this area has resulted in literacy activities that are more reflective of mainstream or "school" culture and literature than the culture, language and literature of the children in the classroom. Barrera explains that "The school culture can be seen to reflect the dominant class and, so too, the cultures of literacy and literature embedded within the school culture. For this reason, the teaching of literacy and literature are considered to be neither acultural nor neutral, but cultural and political" (p. 236).

Barrera's research reveals that in-service teachers are often unaware of the need to address cultural and linguistic difference in their selection of instructional strategies, interaction patterns and materials. She offers a theoretical framework for teaching about culture arguing for improved understandings in three knowledge dimensions (cultural, cross-cultural, and multicultural). Barrera defines each of the knowledge dimensions as: "*cultural knowledge*—meaning making is culturally mediated and human meaning is cultural meaning; *cross-cultural knowledge*—literacy and literature are cultural phenomena and practices in literacy and literature differ across cultures; *multicultural knowledge*—cultures involve relations power and literacy teaching is culturally mediated" (p. 232). Finally, she points out that theories that guide teacher education programs need to make explicit the role of culture in literacy and to

train teachers to be culturally sensitive and responsive and seldom has the impact of the cultural knowledge of the teacher in decision making been considered. We suggest that an ideal place to begin is in preservice teacher education courses.

Some very interesting work is being conducted by Richard Beach (1994), Spears-Bunton (1992), Jordan and Purves (1993), and Willis (1995), among others, as researchers seek to understand how the use of multicultural literature affects teacher educators and students. Some research studies suggest that: (a) white high school and college students may be unaware of their biases toward multicultural literature, and (b) there may be a tacit resistance on the part of white high school, college and university students to multicultural literature. While others suggest that: (a) reading multicultural literature can improve understanding of self and others, and (b) discussion of multicultural literature can lead to behavioral and attitudinal change.

What appears clear to us from our work in the area is that new knowledge bases are needed by students in which they can begin to understand a more inclusive sociohistorical view of education, the role of literacy attainment in the United States, the role of culture in language and literacy acquisition and use, and the role of multicultural understandings of power relations within school settings and how these are practiced, intentionally or unintentionally by classroom teachers. Then, students can take their newly acquired knowledge into the classroom in terms of praxis, from the creation of an atmosphere of tolerance, high expectations for all students, the sensitive and careful selection of materials, informed choices of instruction and student-teacher interactions that welcome, respect, and acknowledge all learners. It is simply unacceptable to claim "I didn't know," there is an obligation to learn if you do not know.

In summary, researchers in each area of literacy above have suggested specific improvements in teacher education programs to better prepare prospective teachers for a culturally and linguistically diverse student body of the future. Moreover, a common notion expressed in each area is the belief that improved understanding(s) of the role of culture in literature instruction, during preservice education will improve the literature instruction for all students. As Reyes has pointed out, "one size does not fit all." Reyes (1992) argues that teachers use theories and strategies based upon research with mainstream populations, hoping that "...the high rate of success with process instruction reported for mainstream students will magically happen for culturally and linguistically diverse learners" (pp. 436-437). How can we build upon the theories of multicultural education and school-based literacy so that they enhance the literacy development of all children? We believe that teacher training in multicultural literature is one response.

We believe that courses in multicultural literature are an excellent starting point to develop the understandings preservice teachers need in multicultural education and literature. In such courses prospective teachers can learn to examine their own cultural and linguistic assumptions, confront their biases, and learn skills and practices that will enable them to respond to the literacy needs of all children in

culturally sensitive and responsive ways. Banks (1994) describes the exposure of a multicultural perspective during preservice training as a way "to examine and clarify their recall and ethnic attitudes, and to develop the pedagogical knowledge and skills needed to work effectively with students from diverse cultural and ethnic groups" (p. vi).

EDUCATIONAL IMPLICATIONS

Several theoretical positions have proven influential in helping us design courses that address multicultural education, the social construction of knowledge (especially its role in literacy development), and multicultural literature. Philosophically, we have grounded our work on notions found in the critical literacy paradigm. In keeping with the critical literacy theory, we are not suggesting any set "how-to" rules. Later, in this section we will suggest several activities that have proven helpful to encouraging our students to adopt a more critical understanding of literacy. However, at this point it is important that we offer some contextualizing of critical literacy as it is being applied in U.S. contexts.

A starting point for a corresponding critical literacy pedagogy in U.S. schools is offered by Giroux (1987b):

The type of critical pedagogy being proposed here is fundamentally concerned with student experience; it takes the problems and needs of the students themselves as its starting point. This suggests both confirming and legitimating the knowledge and experiences through which students give meaning to their lives. Most obviously, this means replacing the authoritative discourse of imposition and recitation with a voice capable of listening, retelling, and challenging the very grounds of knowledge and power.... It is important to stress that a critical pedagogy of literacy and voice must be attentive to the contradictory nature of student experience and voice and therefore established the grounds whereby such experience can be interrogated and analyzed with respect to both strengths and weaknesses. (p. 43)

Critical literacy, so defined, strongly supports current socioconstructivist theories espoused in new holistic approaches to school-based literacy programs. Most important, however, critical literacy theory goes beyond generic references to culture, and specifically acknowledges the historical and social contexts that have given rise to domestic minority cultures' language, literature, and experiences in the United States. Many have experimented with adopting Freire's pedagogical style to U.S. contexts (Shor, 1987).

In what follows we will describe how we have melded multicultural notions of knowledge about the role of history, language, and literacy, social constructivist notions of literacy and Freireian techniques in preservice English/Language Arts courses. At the onset let us state that we use literature, particularly the literature written by members of underrepresented domestic minority groups which has historically been minimized in schools and universities, as an avenue to discuss deeper issues of the affects of historical contexts on relationships of power, language, and literature. As Banks (1994) suggests:

The most meaningful and effective way to prepare teachers to involve students in multicultural experiences that will enable

them to know, care, and to participate in democratic action is to involve teachers in multicultural experiences that focus on these goals. When teachers have gained knowledge about cultural and ethnic diversity themselves, looked at that knowledge from different ethnic and cultural perspectives, and taken action to make their own lives and communities more culturally sensitive and diverse, they will have the knowledge and skills needed to help transform the curriculum canon as well as the hearts and minds of their students. (p. 28)

Several course experiences/activities illustrate how we have approached the task of teaching and using multicultural literature.

(1) We begin by creating atmospheres where it is safe to share who and what you believe without fear of punishment or reprisal. Next, there is a sense of colearning within the classrooms. Our roles as teacher, colearner, and listener are best described as one of facilitation. Although we do relinquish a total nonauthoritative stance, in reality we do not completely relinquish our roles as teacher/educator because we constantly serve as sources of information in and outside of class. However, throughout our courses we do gradually transfer much of the responsibility for class content and discussions to the students. Thus, students become active critical constructors of our multicultural community. Our success has been enhanced by the enrollment of students who represent linguistic and cultural groups outside of the mainstream. In addition, we have called upon our colleagues, former students, staff, and community people to speak to our classes. It is important that our students hear many different voices speak about their life experiences, educational roadblocks, and engagement with literature. The firsthand experiences help our students better understand the complexity of multiculturalism and the importance of offering a balanced literary diet to their future students.

Students must, however, begin by participating in the course. Beginning the first moment they step into the classroom they are called upon to participate in some fashion, from learning the names of their classmates to moving furniture. Each student is required to participate in all activities. Great effort is made to create a safe, comfortable atmosphere during the first few weeks so that students can share with one another in an environment in which all listen and can respond in supportive manners.

(2) With Hansen-Krening's (1992) permission students respond to the following question on the first day of class, "How do your cultural perspectives affect the students you teach?" Following Hansen-Krening's technique, students are asked to respond to the same question on the final day of class. The responses are compared to graph changes in perspective as a result of participation in the course.

(3) Students are asked to explore their own ethnicity through the writing of an autobiographic essay which becomes part of classroom discussions over the next few weeks. Research by Britzman (1986) and Hansen-Krening (1992), among others, has shown that many preservice teachers are unaware of the cultural values, beliefs, and perspectives they bring to teaching. Several researchers have noted the importance of beginning by helping students acknowledge their

own cultural heritage and perspectives (Barrera, 1992; Britzman, 1986; Hansen-Krening, 1992).

(4) Students are asked to individually define commonly used, yet often misunderstood terms regarding multicultural education. This activity is followed by small group and large group discussions of the terms. Students are required to canvass the campus seeking the "person on the street" response to the same words. Finally, all responses are read, compared and contrasted to those offered by experts in the field.

(5) Students select a 'popular' text on issues of race, culture, or multicultural education. Students are asked to write a response to the reading that will be shared in the class. It is during the small group discussions that most students encounter perspectives that vary from their own. Small group discussions are followed by large group discussions where students share their perspectives with one another. Students may rethink their initial response after hearing the viewpoints of others.

(6) After writing, reading, talking, and viewing issues of diversity we move into theoretical discussions of teaching literature. The work of Rosenblatt (1933/1995) and Atwell (1987) forms the core of our discussions. However, we also read Au to balance our understanding of how to implement social constructivist theories in multicultural settings.

(7) We begin our wide reading of the multicultural literature section of the course with the selection of novels for grades 6–12. The novels are selected by small groups of students and represent each domestic minority group and European Americans. In an effort to share multicultural literature it is important not to dismiss the diversity within the European American community. Students select novels from

a predetermined list created by the instructor.

(8) Each small group reads and responses to their novel. The members of the group are responsible for creating a packet of information on the novel that consists of a summary, a biography of the author, a list of pertinent historical facts and events which occurred when the novel was written and that cover the time period discussed in the novel, a lesson about the novel and supporting materials, and at least two reviews of the article. The novel packets will become a quick resource of activities and information for the students in the future.

In our courses we attempt to nurture the ability to think critically and reflectively about the integrated nature of knowledge, language, and literature. Our roles (teacher, colearner, and facilitator), the gradual release of power, and the voices and experiences of others help empower our students to make culturally sensitive and responsible instructional decisions, as well as to feel a deeper sense of commitment to the course and the subject matter.

Multicultural literature becomes a bridge we transverse to better understandings of ourselves, our history, and our society. Learning about multicultural literature requires that students read widely the literature of each domestic minority group. In addition, it is equally important that students are given opportunities to discuss their responses to the readings with others who have read the same novel. The discussions allow students to share their growing understandings, misunderstandings, and knowledge of different cultures. The in-class discussions allow students to hear one another's perspectives and revisit their own. The class, in effect, is socially constructing knowledge about culture and literature.

INTRODUCTION

Nancy Roser

UNIVERSITY OF TEXAS AT AUSTIN

Not so very long ago, establishing an “instructional environment” meant ensuring a comfortable classroom temperature or arranging desks so that natural light traveled over the students’ left shoulders and perhaps even placing a green plant or a poetry anthology on each teacher’s desk. Things have changed. As Tway (1991) indicated in her chapter in the *Handbook on Research in Teaching the English Language Arts* (Flood, Jensen, Lapp, & Squire), the classroom environment is an instructional tool, and “...can be set up in such a way that it issues ... invitation[s] to learning” (p. 427). Although the physical environment of the classrooms has lost none of its importance, teachers and researchers have broadened their notions of instructional environments and now consider the social, psychological, technical, spatial, aesthetic, management (and still other) aspects of teaching and learning both inside and outside of traditional schooling.

The authors in this part of the handbook also paint the instructional environment with broader strokes, as they describe both the teaching and learning opportunities that occur within redefined classrooms as well as those that exist in the “real world” of work, technology, and the arts.

First, Morrow and Tracey build a theoretical and research base for creating classroom environments that support elementary children’s literacy learning. Pellegrini describes ways in which different instructional contexts are accompanied by specific sorts of dramatic play and oral language. Wolf, Edmiston, and Enciso describe the place of drama in classrooms as a vehicle for exploring meanings beyond print, and for making classrooms places for the integration and expression of ideas. In addition to addressing storytelling and the importance of narrative in the environment, Scala and Schroder, in their chapter describe a specific aesthetic

educational program at The Lincoln Center for the Performing Arts. Wells and Chang-Wells address how problem-solving discussion (within an inquiry-based science curriculum) can be viewed as part of group processing—movement toward building shared, coconstructed understanding of individual meanings.

Venezky recounts and critiques innovations that extend and change students’ experiences with text and predicts even greater changes for the text itself. The changes he describes are of text as a multimedia, participatory experience—including custom publishing, hypertext, and interactive fiction. Sticht’s chapter focuses on the language and literacy learning of diverse adult learners—including the immigrant, the job-seeker, and the incarcerated.

Chapters by Baines and by Butler also stretch the contexts for literacy learning to show (respectively) the history and uses of film as a component of media literacy, and the potential of electronic discourse communities as instructional environments. Shiring reviews the effects of students’ television viewing habits, and offers classroom innovations with television as well. Wood and Nicholson consider newspapers, magazines, and on-line text as new essentials of the classroom literacy environment. The last chapter by Farr and Jongsma, includes research on metacognition as a means of understanding the learner’s self-assessment within the instructional context, as well as a preview of multimedia assessments.

Altogether, the chapters contribute to an increasingly complex display of teachers’ and researchers’ roles as creators, inhabitants, participants, and observers of newly defined instructional environments. From library corners to virtual classrooms, the challenge grows.

INSTRUCTIONAL ENVIRONMENTS FOR LANGUAGE AND LEARNING: CONSIDERATIONS FOR YOUNG CHILDREN

Lesley Mandel Morrow

RUTGERS UNIVERSITY

Diane H. Tracey

KEAN COLLEGE OF NEW JERSEY

Given a choice of topics to study—animals, plants, or space—the students in Mrs. Martinez's first grade selected animals. They decided to design a veterinarian's office in the dramatic play area of their classroom. The class visited a veterinarian to gain some background knowledge to help with their plan. They agreed that there should be a waiting room with chairs and a table filled with magazines and books. Mrs. Martinez suggested hanging some posters and pamphlets about good health practices for pets, which she had obtained from the veterinarian. The children placed reading materials in the waiting room and made posters that listed the doctors' hours, a "No Smoking" sign, and a sign that read, "Check In With The Nurse When You Arrive." The nurse's table contained forms for patients to fill out, as well as a telephone, telephone books, appointment cards, and a calendar. The veterinarian's office was supplied with patient folders, prescription pads, white coats, masks, gloves, cotton swabs, a toy doctor's kit, and stuffed animals. Blank paper, a stapler, pencils, markers, colored pencils, and crayons were placed in the area as well. The classroom computer was relocated to the dramatic play area for the purpose of keeping patient records and other files in the veterinarian's office. The center design was a collaborative effort on the part of the teacher and children.

After preparing the environment with the children, Mrs. Martinez discussed and modeled the use of the various materials. She said: "You can read to pets in the waiting area and

there are materials to write with. The nurse can ask you to fill out forms while waiting for your turn to see the doctor. The doctor can fill out forms about the condition of a patient or prescriptions for medicine. The nurse can fill out appointment cards. She might like to talk to patients on the phone about problems their pets are having, and schedule appointments. She can write bills for visits, accept payments, and give receipts."

The following is an observation of a thematic dramatic play episode that occurred in this center and included literacy activity.

Tiffany sat in the waiting room reading the story, "Are You My Mother," to her pet monkey. Tyshell joined her with her cat and listened. She asked if she could have her turn in reading. Before they finished, the nurse called Tiffany to answer some questions about her monkey's problems. Tiffany asked Tyshell if she would watch her monkey while she talked to the nurse. Tyshell agreed, and read to her cat and the monkey. When Tiffany finished filling out forms for the nurse, she watched the two pets for Tyshell while she spoke with the nurse. To occupy the stuffed animal pets, Tiffany decided to draw a picture for them. She described her illustration as she composed it.

This anecdote from a study by Morrow (1990) describes a classroom environment that provides an atmosphere that motivates the desire to read and write. The teacher along with the children prepared the physical environment. The teacher

described and modeled the use of materials in the literacy-enriched play area. After this initial guidance she acted as a facilitator with students in need of direction. Shortly thereafter she allowed the play to take place on its own, and she took the role of a participator. The children were given time to work in a social collaborative setting, and engage in dramatic role-playing that was integrated with a content area theme. In the dramatic play children participated in real-life behaviors concerning the care of pets, visiting a veterinarian's office, and were involved in meaningful and functional literacy activities. The environment contained challenges for children, opportunity for choice, activities at which they could succeed, and a setting in which social collaborative literacy activities could take place. The teacher in this classroom is aware that the visual presentation of her room will have a dramatic effect upon motivating children to participate in communication of varied kinds.

OVERVIEW

The purpose of the present chapter is to describe instructional environments, and factors within instructional environments, which promote language and literacy learning in young children. As the topic of environment is so broad, it is often recommended that one should focus on specific dimensions of the concept (Tway, 1991). Therefore, for the purpose of this discussion, the term environment will be viewed as the physical environment (the visual presentation of materials and the arrangement of classroom space) and the social behaviors within the classroom.

The chapter begins with a broad discussion of philosophical and theoretical beliefs related to the relationship between young children's literacy learning and their environment. These include the emergent literacy philosophy, the integrated language arts perspective, the National Reading Research Center's engagement perspective and a discussion of motivation theory. Following the theoretical and philosophical foundations, the chapter focuses more specifically on research findings and practical information related to creating physical and social environments which facilitate literacy learning in young children.

PHILOSOPHICAL AND THEORETICAL INFLUENCES FOR THE DESIGN OF EARLY LITERACY INSTRUCTIONAL ENVIRONMENTS

Early Literacy Constructs

A conceptual change regarding children's early reading and writing development has taken place over the past two decades. The term *emergent literacy* is now used to describe the development of literacy as a continuous experience, "emerging" from birth onward (Clay, 1966). In this philosophy, children at all ages possess certain literacy skills, though the skills are not fully developed nor conventional as we recognize mature reading and writing (Teale, 1986). Emergent literacy acknowledges children's scribble marks on a page as

rudimentary writing, even if characters are not discernible. Similarly, a child is involved in legitimate literacy behavior when he or she narrates a familiar storybook while looking at the pictures and occasionally at the print. Although the reading is not conventional, the child gives the impression of reading through tone of voice, attention to print, illustrations, and following left-to-right progression (Sulzby, 1985). The emergent literacy perspective allows us to recognize that children come to school with a background of experiences which they use to understand the functions of oral and written language (International Reading Association, 1989). For example, many children can read environmental print, such as familiar signs and labels, and can differentiate between drawing and writing. Similarly, many children associate books with reading and expect that written text communicates a sensible message. Children's background experiences, including their cultural and language environments, become the stepping-stones for further literacy development.

Emergent literacy is not tantamount to the concepts of pre-reading or reading readiness, which are both traditional conceptions of children's literacy development prior to their ability to read conventionally. The reading readiness model implies that children know little about literacy before coming to school. In this model prescribed reading readiness skills are taught systematically with the assumption that all children are at fairly similar levels of development when they come to preschool or kindergarten. The activities that have taken place under this rubric are typically not authentic reading or writing. Rather, reading readiness skills focus on relatively abstract and isolated activities, and mastering these skills has been seen as necessary before formal reading can begin. Many of these activities have little meaning or function for the child (Teale & Sulzby, 1986).

In contrast to the reading readiness model, research in the area of emergent literacy has studied young children's literacy development in the home, prior to children's entry into school. For example, in her seminal work, Durkin (1966) studied the home and family background variables of early readers, children reading prior to their entrance into first grade. Her results indicated that early readers had been read to since a very young age, they had their questions regarding reading and writing answered, they had come from homes in which parents themselves were avid readers and in which reading was a frequent source of pleasure and relaxation. These children expressed fascination with early writing, and subsequently, were given access to writing materials and encouraged to explore with these materials. Other studies have found strong relationships between the home environment and levels of emergent literacy development as well (Anbar, 1986; Clark, 1976; Schickedanz, 1986, 1993). Studies of emergent literacy behaviors related to invented spelling, writing, and print conventions have also been completed (Clay, 1987; Sulzby, 1986).

The social aspect of the home environment, as well as the physical environment as described above, has been documented as being significant in children's emergent literacy development. Teale (1982) views the development of early literacy as the result of children's involvement in reading and writing activities mediated by more literate others. According

to this view, it is the social interaction in these activities that makes them so significant to the child's development. Not only do interactive events teach children the societal function and convention of reading and writing; they also link reading with enjoyment and satisfaction and thus increase children's desire to engage in literacy activities. Teale's emphasis on the social aspects of reading development reflects Vygotsky's (1978) more general theory of intellectual development, that higher mental functions really are internalized social relationships. It also reflects Piaget's (Piaget & Inhelder, 1969) theory that literacy learning happens best in an atmosphere that encourages social, collaborative interactions in which youngsters interact with their environment and peers through exploration, experimentation, and social negotiation.

Language Arts Perspective

The language arts perspective, like the emergent literacy perspective, contributes to the foundation of our knowledge regarding the relationship between the classroom environment and children's early literacy development. The language arts perspective suggests that reading and writing will result from a concerted series of authentic, meaningful, and functional experiences that use varied genres of children's literature as their main source for actively involving children in reading and writing. Those experiences take place within rich literacy environments created specifically to encourage social collaboration during periods set aside for independent reading and writing where children practice skills that they have been taught. Instruction includes a conscious effort to integrate literacy learning throughout the school day within different content areas, and it emphasizes learning that is self-regulated with self-selection and student choice. Teachers and children become responsible for deciding instructional strategies, organizations, activities, and materials. The overall goal of the language arts perspective is to develop not only competent strategic readers, but readers who are motivated to read for pleasure and for information. Learning theories undergirding the approach have been described by Dewey (1966), Piaget and Inhelder (1969), and Vygotsky (1978), as well as in philosophies and viewpoints identified more generally as integrated language arts, literature-based instruction, whole language, language experience, and the writing process approach (Bergeron, 1990; Goodman, 1989; Graves, 1975; Stauffer, 1970).

The Engagement Perspective on Reading

The concept of engagement, as defined by the National Reading Research Center (1991), also contributes to the foundation of knowledge on which the relationship between children's environment and their literacy development is understood. Engaged readers are *strategic* readers who possess multiple skills which enable them to read independently and comprehend what they read. Engaged readers become *knowledgeable* from information they learn through reading. These readers are able to transfer and apply their knowledge into new contexts. Engaged readers are *motivated* to read

voluntarily for pleasure and for information, and are *social* in their approach to learning and using literacy.

The engagement perspective on reading suggests that children need to be actively involved with the reading materials in their environment to achieve optimal literacy success. Recently, educators and researchers have begun to use concepts such as children's theater, music, art, film, and creative movement to increase and enhance children's engagement with literacy materials (Moore & Caldwell, 1993). Other modes of increasing children's engagement with literature, such as storytellings and retellings, use of flannel boards, roll movie stories, audiocassettes, chalk talks, prop stories, puppets, slides, photographs, computers, and videos have been well documented by Morrow (1993). Clearly, the engagement perspective holds strong implications for designing educational environments for young children's literacy development.

Motivation Theory

In a survey of classroom teachers concerning priorities for research in the 1990s, motivating children to read and write was ranked high on the list of suggestions (O'Flahavan, Gambrell, Guthrie, Stahl, & Alverman, 1992). Teachers recognize the importance of motivation in the development of children's literacy skills, and are most interested in learning new ways to motivate their students. Motivation theory, the engagement perspective, emergent literacy constructs, and the language arts perspective, all contribute to the knowledge base on which our understanding of the relationship between children's early literacy learning and their environment is based.

Motivation is defined as initiating and sustaining a particular activity. It is considered the tendency to return to and continue working on a task with sustained engagement (Maehr, 1976; Wittrock, 1986). A motivated reader chooses to read on a regular basis, and for many different reasons. Researchers have found that experiences which afford students the opportunity for (1) success, (2) challenge, (3) choice, and (4) collaboration, are likely to promote motivation.

When providing an environment that will foster *success*, a student must perceive that there is some *challenge* to the activity at hand, but it is one that he/she can accomplish. When the task is complete the student must perceive success (Ford, 1992; McCombs, 1989; Spaulding, 1992; Turner, 1992). Tasks are only appropriate if perceived to be challenging, that is, not too hard, and not too easy. When tasks are viewed as too easy, children become disinterested, if they are too difficult they become frustrated. Intrinsic motivation is enhanced when one perceives oneself to be competent or successful in challenging situations (Rodin, Rennert, & Solomon, 1980; Spaulding, 1992).

Providing children with the opportunity to make *choices* about the literacy tasks to participate in, offers students responsibility, and empowers them with control over the situation. Choice needs to involve multiple modalities for learning such as more traditional avenues with pencil and paper experiences as well as developing literacy skills through

the use of technology, drama, or the visual arts. Choices like challenge and success instill intrinsic motivation (Lepper, 1988; Morrow, 1992; & Turner, 1992). Finally, motivation is increased through activities which offer opportunities for social *collaboration*. It has been found that when children have the opportunity to engage in learning through social situations involving collaboration with the teacher or peers, they are likely to get more done together than they could do alone, and are more intrinsically motivated to participate than when they work alone (Brandt, 1990; Oldfather, 1993). Recent investigations by Gambrell, Palmer, and Coding (1993) and Gambrell, Almasi, Xie, and Heland (1995) support the findings of the research reported here that success, challenge, choice, and collaboration are indeed elements that promote motivation for reading and writing in children.

CREATING ENVIRONMENTS THAT SUPPORT LITERACY LEARNING AMONG YOUNG CHILDREN

The emergent literacy perspective, the language arts perspective, engagement theory and motivation theory all suggest compatible factors which contribute to creating high quality environments for children's literacy learning. Emergent literacy constructs and the language arts perspective both describe strategies that encourage *Literacy Rich Physical Environments* in classrooms. The perspectives of emergent literacy, language arts, and engagement all suggest the importance of *Social Cooperative Learning*, whether they are experiences in which teachers scaffold and model behavior for children, engage in interactive mediation with children, or when children work with peers. Finally, the engagement perspective speaks of *motivation* as a construct to be nurtured within the literacy environment. The remaining sections of the chapter apply the philosophical and theoretical information presented thus far, to the actual creation of environments that promote reading and writing for young children.

Research Concerning Literacy Rich Physical Environments that Motivate Reading and Writing

As mentioned earlier, observations of homes where children learned to read without direct instruction before coming to school have taught us much about literacy rich environments. Parents in these homes read to their children, often read themselves, were supportive of their children's literacy activities, and had reading and writing materials in their homes (Durkin, 1966; Morrow, 1983; Taylor, 1983; Teale, 1984).

Historically, theorists and philosophers who studied early childhood development emphasized the importance of the physical environment in learning and literacy development. Pestalozzi (Rusk & Scotland, 1979) and Froebel (1889) described real-life environments in which young children's learning could flourish. Both described the preparation of manipulative materials that would foster literacy development. Montessori (1965) described a carefully prepared

classroom environment intended to promote independent learning and recommended that every material in the environment has its specific learning objective. The objectives and materials she recommended were more highly structured than those of Pestalozzi and Froebel, who allowed for more natural learning situations in which children explored and experimented with materials in their environment.

Piaget (Piaget & Inhelder, 1969) found that children acquire knowledge by interacting with the world or the environment. Those who interpret his theories into educational practice involve children in problem-solving situations where they can assimilate new experiences into what they already know. Learning takes place as the child interacts with peers and adults in social settings, and conducive environments (Vygotsky, 1978). Ideal settings are oriented to real-life situations, and materials are chosen to provide opportunities for children to explore and experiment. Dewey (1966) probably would have agreed with the educational settings described by Piagetians. In addition, Dewey believed in an interdisciplinary approach. In other words, learning takes place through the integration of content areas. He believed that storing materials in subject area centers encouraged interest and learning.

Based on these discussions, any classroom designed to provide a literacy rich environment and optimum literacy development will offer an abundant supply of materials for reading, writing, and oral language. These materials will be housed in a literacy center. Literacy development will be integrated with content area teaching reflected in materials provided in content area learning centers. Materials and settings throughout the classroom will be designed to emulate real-life experiences and make literacy meaningful to children. They will be based on information children already possess, and will be functional so that children can see a need and purpose for using literacy. Careful attention to a classroom's visual and physical design contributes to the success of an instructional program. Preparing a classroom's physical environment is often overlooked in planning instruction. Teachers and curriculum developers tend to concentrate on pedagogical and interpersonal factors, but give little consideration to the visual and spatial context in which teaching and learning occur. They direct their energies toward varying teaching strategies while the classroom setting remains relatively unchanged. When program and environment are not coordinated, "Setting Deprivation" often results, a situation in which the physical environment fails to support the activities and needs of students (Spivak, 1973).

While the learning environment is often viewed as background or scenery for teaching and learning, there is another way to view the physical environment and the teacher's role in creating it. This view recognizes that by purposefully arranging the environment, teachers acknowledge the physical setting as an active and pervasive influence on their own activities and attitudes, as well as those of the children in their classrooms. Appropriate physical arrangement of furniture, material selection, and the visual aesthetic quality of a room provide a setting that contributes to teaching and learning (Loughlin & Martin, 1987; Morrow, 1990; Phyfe-Perkins, 1979; Rivlin & Weinstein, 1984; Sutfin, 1980). For example, design of spatial arrangements alone affects

children's behavior in the classroom. Field (1980) observed that rooms partitioned into smaller spaces facilitated such behaviors as peer and verbal interaction, fantasy, associative, and cooperative play more than did rooms with large open spaces. Nash (1981) and Moore (1986) found that children in carefully arranged rooms showed more creative productivity and greater use of language-related activities than did children in randomly arranged rooms. Children in these carefully arranged rooms also demonstrated more engaged and exploratory behavior and more social interaction and cooperation than did children in moderately or poorly defined settings.

In another example of the effects of the physical environment on children's behavior, combining the block and housekeeping areas of a classroom increased mixed-sex grouping among 3- and 4-year-olds, as well as relevant, constructive use of the block area by girls (Kinsman & Berk, 1979). Montes and Risley (1975) found that storing toys on open shelves rather than in boxes led to easier selection, more time spent playing, and more immediate involvement. The introduction of thematic play materials into the dramatic play area of a laboratory playroom and of a preschool classroom, led children to more elaborate and longer dramatic play sequences (Dodge & Frost, 1986; Woodward, 1984). Studies that investigated the role of literacy-enriched dramatic play areas based on themes being used in the classroom stimulated increased use of literacy activity and the enhancement of literacy skills (Morrow, 1990; Neuman & Roskos, 1990, 1992). Other researchers have found that dramatic play with story props has improved story production and comprehension, including recall of details and ability to sequence and interpret (Mandler & Johnson, 1977; Saltz & Johnson, 1974).

Preparing Literacy Rich Physical Environments that Motivate Reading and Writing

The research that investigates the physical design of classrooms strongly suggests that by purposefully arranging the space and materials, teachers can use physical environments as an active, positive and pervasive influence on instruction. Educators must think of their classrooms as places to project a visual atmosphere that communicates a definitive message. The following describes the visual presentation of a literacy rich physical environment to motivate reading and writing based on the research discussed in the previous section.

Literacy rich classrooms are filled with visually prominent functional print—labels on classroom items and areas; signs communicating functional information and directions, such as *Quiet Please*, and *Please Put Materials Away After Using Them*; and charts labeled *Helpers*, *Daily Routines*, *Attendants*, and *Calendar* to name a few (Morrow, 1993; Schickedanz, 1986). A notice board in a prominent place in the room can be used to communicate with the children in writing. Experience charts are used to display new words generated from themes, recipes used in the classroom, and science experiments conducted.

Each classroom has a literacy center which includes space and materials for writing, reading, oral language, and listening. The center is positioned in a portion of the classroom that

is visible. It should be visually attractive and physically accessible. The effort of creating an inviting atmosphere for a classroom literacy center is rewarded by an increased interest of children in participating in activities offered. This center is essential for children to enjoy immediate access to literature. Researchers have found that children in classrooms with literacy centers read and write more often than do children whose classrooms do not have such materials (Morrow & Weinstein, 1982, 1986).

Although the literacy center needs to be visible and inviting, it should also have some privacy and physical definition for its users with partitions. Five or six children should be able to work in the center at a time. All children should be able to take materials from the center to use in other parts of the room.

Literacy centers should have pillows, rugs, and a rocking chair for comfort and softness. Books are stored in open-faced bookshelves for displaying titles about themes being studied. Regular bookshelves are also available to house five to eight books per child at three to four grade levels. Books are color coded by categories, and represent different genres of children's literature such as picture storybooks, poetry, informational books, magazines, biographies, fairy tales, novels, realistic literature, cookbooks, joke books, craft books, and so forth. Books are rotated on and off the shelves regularly.

There is a system for children to check books out of the classroom literacy center to take home and read. Logs are provided to record books read and tasks completed during periods of independent reading and writing. There is a writing area or "Author's Spot," with a computer, various types of writing paper, blank booklets, and writing utensils such as markers and pencils for creating original stories and books. There are posters displayed to point out the joys and importance of reading and writing and a bulletin board that provides a place for children to display their work. Literacy manipulatives such as felt boards with story characters from pieces of children's literature are included. These manipulatives have been found to motivate children to engage in storytelling, storybook reading, and writing, providing a means for active involvement (Morrow & Weinstein, 1982, 1986). These materials include puppets, taped stories with headsets, chalk-talks, roll stories, prop stories, and so forth. These materials encourage the use of communicative and visual arts.

Programs that motivate early literacy development require literacy rich environments that recognize the need for an integrated approach to literacy learning and recognition of individual differences and levels of development. Classrooms that use the philosophies and theories outlined earlier in this chapter are arranged in centers with sections dedicated to content areas, such as social studies, science, art, music, math, literacy, dramatic play and block play. Centers contain materials pertinent to the content area and materials that are added are specific to the themes being studied such as nutrition or animals. Each subject-specific center is equipped with materials devoted to that content, but includes literacy materials as well. They contain things to read, materials with which to write, things to listen to and talk about. These materials create interest, new vocabulary and concepts, and a reason for

participating in literacy activities. With each new theme studied, additional books, posters, artifacts, music, art projects, dramatic-play materials, and scientific objects can be added to create new interest. The materials are often activity oriented, and designed so that children can use them independently or in small groups. The classroom floorplan in Figure 2, provides an illustration of this type of learning environment.

When preparing the centers for a Nutrition unit, for example, a teacher may add to existing center materials in the following way:

Art Center. Include play dough for making play food, and a recipe poster for making the dough; include cooking and health magazines, dry foods to make collages (macaroni, peas, seeds), fruit and vegetables for printing with paint.

Music Center. Various songs on nutritional topics can be added to this center, such as "Chicken Soup with Rice." All tapes should be accompanied by lyrics.

Dramatic Play Center. Turn this area into different ethnic restaurants and include menus, receipts, order-taking slips, recipes, and 3 × 5 cards for new recipes, cookbooks, baking utensils, empty food boxes, signs commonly seen in restaurants, a cash register, play money, food posters, cooking magazines, and waiter and waitress clothing.

Block Center. In order to create places that food comes from, such as farms and supermarkets, the following items can be added: farm props (animals and plants), supermarket props (empty food boxes, receipts, play money, and bags), environmental print signs and posters displaying food information.

Outdoor Play. When providing for role-playing at a lemonade stand the following items can be added: tables, signs with prices, play money, a cash register, receipts, recipe charts with directions for making lemonade, paper and pencils.

Math Center. Various foods can be used as counters, such as macaroni or wrapped hard candies. Include counting books that contain foods and blank books for children to create their own number book of different foods.

Science Center. Materials for nutrition projects may be added: planting equipment, recipes and the ingredients needed, foods to be classified into food groups, seed packages, and foods to be tasted. There should be charts and journals to record progress of growing plants. There should be informational books about food and good nutrition.

Social Studies Center. Pictures of food from the different food groups can be placed on maps to show where they are produced. Recipe books and recipes from home representing different cultures should be added.

Literacy Center. Books and magazines about good nutrition need to be added and pamphlets about good nutrition. The Author's Spot can add an index card box for sharing recipes.

Centers are separated by furniture that holds their materials and serves as partitions. Center materials can be stored on tables, in shelves, or in boxes that are labeled and the area often includes a bulletin board for displays. The equipment in the centers is accessible for children and has a designated spot for storage, so that children can find them easily and return

them easily. The number of items in each center increases as the year progresses and is introduced by the teacher according to its purpose and use (Montessori, 1965).

In addition to generating a literacy rich environment, and an interdisciplinary approach, the room is designed to cater to different teaching methods, organizational strategies, and grouping procedures so that the individual differences in instructional needs of all children can be accommodated. The centers provide space for independent or social collaborative learning, exploration, choice, and self-direction. There is place for whole-class instruction, small-group meetings, and individualized learning. The materials in this center provide for choice, challenge, success, and for use alone or collaboratively. They involve the children in communicative and visual arts.

Research Concerning Social Contexts as Environments that Motivate Reading and Writing

Emergent literacy constructs, the language arts perspective, the engagement perspective, and research on motivation theory, all discuss the importance of social collaboration and interaction with adults and peers as an important factor for literacy learning. Therefore it is necessary to translate this theoretical construct into practice and include it as an environmental context to promote literacy in classrooms.

When children work in small groups in which social interactions are cooperative, their achievement and productivity increase (Johnson & Johnson, 1987; Slavin, 1983). Yager, Johnson and Johnson (1985) posit two important elements in the dynamics of cooperative learning: (a) oral interaction among students, and (b) heterogeneity among group members. According to their findings, cooperative learning succeeds because it allows children to explain material to each other, to listen to each others's explanations, and to arrive at joint understandings of what they have shared. The cooperative learning setting enables "more capable peers" to offer support to others. Cazden (1986) points out that peer interaction allows students to attempt a range of roles they would be denied by traditional student-teacher participant structures. Forman and Cazden (1985) also indicate that Vygotsky's theory (1978) led them to conclude that an interactional transformation can occur among peers when one student is observing, guiding, and correcting as another performs a task. The students accomplish more together than either could accomplish alone. Working in peer dyads allows for similar learning opportunities as tutoring. Forman and Cazden's discussion reflects both Dewey's (1966) argument that children engaged in task-oriented dialogue with peers can reach higher levels of understanding than they do when teachers present information didactically, and Piaget's (Piaget & Inhelder 1969) suggestion that childhood peers serve as resources for one another in cognitive development.

With less dependence on the teacher for instance, learning appears to be more intrinsically motivated (Wood, 1990). Children who ordinarily work alone choose to collaborate in cooperative settings—even forming friendships—and there is greater acceptance of differences among students (Slavin,

1990). High and low achievers work together in cooperative learning settings, and positive relations increase among children from varied racial and ethnic backgrounds (Kagan, Zahn, Widaman, Schwarzwald, & Tyrell, 1985; Morrow, 1992). Finally children with special problems such as physical disabilities, emotional handicaps, and learning difficulties are more likely to be accepted by other children in cooperative learning settings than in traditional classrooms (Johnson & Johnson, 1981; Lew, Mesch, Johnson, & Johnson, 1986; Morrow, 1992).

Research has confirmed the importance of providing children with daily opportunities for storybook reading. Many of these studies have illustrated that with a strong emphasis on storybook reading children learn concepts about books and print, they become more sophisticated in the form and structure of written language, they develop vocabulary, comprehension, and a sense of story structure (Feitelson, Kita, & Goldstein, 1986; Snow & Pearlman, 1985; Wells, 1985). It has been found however, it is not simply the reading aloud that provides beneficial outcomes, but the verbal interaction that occurs between adult and child during this experience (Morrow, O'Connor, & Smith, 1990). A read-aloud event involves social relationships among people: teachers and students, parents and children, authors and readers. Because reading stories to children is a social activity, children almost never encounter simply an oral rendering of text. Rather, the author's words are augmented and shaped by the interpretation and social interaction of the adult reader and the child as they cooperatively negotiate and reconstruct meaning from text (Morrow, 1988). Researchers agree that what the adult and child talk about in the interaction holds the key to the effect of storybook reading. Vygotsky (1978) describes cognitive development as growing out of social interactions. From that perspective, the importance of read-aloud events is their social interactiveness, with the adult serving initially as mediator between text and child and providing the opportunity for both adult and child to make or take meaning from the text.

Experiences with children's literature, however, need to go beyond storybook reading. Studies have confirmed the importance of providing children with frequent literature experiences in active and pleasurable ways by reading and telling stories to children, dealing with stories through literal, interpretive, and critical discussions, integrating literature into themes being studied throughout the curriculum, having children share books they have read, responding to literature through written and oral language, and participating in independent reading and writing periods (Heath, 1980; Hoffman, Roser, & Farest, 1988; Roser & Martinez, 1985). Additional experiences that provide challenge, choice, success, and collaboration are participating in literature experiences using manipulatives described in the physical environment section for story retellings, and rewritings (Gambrell, Kapinus, & Koskinen, 1991; Sulzby, 1985).

The importance of the social context as an environmental factor that positively affects the literacy learning of children from diverse backgrounds and ability, has been positively documented for those identified as at-risk, average achievers, and the gifted, as well as children from diverse races and cultures. For example, in studies with at-risk kindergartners

and children from diverse backgrounds in first, second, and third grade, several interactive social strategies were used, including daily storybook reading, story retelling, use of literature manipulatives, and periods of independent reading and writing (Morrow, 1992; Morrow et al., 1990). The investigators found that the experimental groups scored better than the control group on measures of comprehension, retelling, and extent of voluntary participation in literacy activities during independent reading and writing. In these investigations, as well as in others, the social interaction that occurred between adult and child and among the children themselves seems to be a major factor responsible for the positive outcomes.

Preparing the Environment for Social Interaction During Literacy Events

The nature of social interaction between adults and children during storybook reading, and between children during work in independent small groups, has been studied to determine what actually occurs. Several studies have suggested that a child's literacy development is influenced by the type and amount of verbal interaction that takes place between an adult and a child during story reading. By imitating the model provided by an adult reader and reenacting a story-reading event, a child can vicariously experience independent reading (Flood, 1977; Pellegrini & Galda, 1982). Studies in school settings indicate that eliciting children's active responses to literature enables them to integrate information and relate various parts of a story. A teacher's reading style can also have an effect on how well children comprehend stories (Dunning & Mason, 1984; Peterman, Dunning, & Mason, 1985). Story-reading interactions should be flexible and develop over time; adults tend to change their interactive styles as children change the nature of their responses. Several investigators have identified adult initiated verbal interactions during storybook reading that appear to be beneficial in enhancing literacy development. These social interactive behaviors include adults acting initially as *managers*, introducing the story by providing background information about the book. Adults act as *prompters*, inviting children to ask questions or comment about the story. They also *scaffold* responses for children when they are not responding. As *supporters and informers*, adults invite children to respond, they share reactions, they explain, answer questions, provide information, relate comments to real-life experiences, and offer positive reinforcement for children's participation. The number of words used and questions asked or answered by children, the number of pre- and poststory evaluative questions asked by the adult, the number of instances of positive reinforcement by adults, and the number of references to the child's own experiences, are predictors of success in early literacy development (Flood, 1977; Martinez & Teale, 1993; Morrow & Smith, 1990; Roser & Martinez, 1985).

When investigating the size of group and the type of interaction that takes place, it appears as if whole group, small group, and one-to-one storybook-reading settings all have their pros and cons. However, reading to children in small

groups was found to be more socially active than the other two settings. The children responded quickly to adult prompts. The small-group atmosphere was lively. The children interacted with the teacher and among themselves. They offered comments, repeated what others had said, or elaborated on the responses of their peers. Children acted as a team, often responding in unison. The children took over the discussion of the story, and each child participated equally in the conversation (Morrow & Smith, 1990).

Under what circumstances do young children socially interact in the most productive way when participating in periods of independent reading and writing? What is the nature of the literacy and social activity that occurs? Most research on cooperative group learning has been done with elementary school children (Johnson & Johnson, 1987; Slavin, 1983). Not as much attention has been paid to environmental contexts that promote cooperative endeavors with young children. The research that has been completed suggests that the ultimate goal for periods set aside for independent reading and writing is for students to learn to direct their own behavior, make decisions, work together, stay on task, and be accountable for completing tasks. After many years of investigating with informal, moderate, and formal structures, it has been found that initially children need more formal guidelines to begin cooperative activities, and after practicing can participate with less formal structures. Students need guidelines for participating in periods of independent reading and writing such as: (1) Decide who you will work with; (2) Choose a reading or writing activity from the literacy center; (3) Do only one or two activities in a given period; (4) Use materials in or outside of the literacy center; (5) All activities must include reading and writing; (6) Handle materials carefully; (7) Speak in soft voices; (8) Put materials back in their place before taking more; (9) Try new activities you have not done before; (10) Work with people you have not worked with before; (11) Stay with a group to complete tasks; (12) Record completed tasks in your log; (13) Be ready to share completed tasks with the class.

In addition to general guidelines, rules for cooperating may include:

When Working in Groups

Select a leader to help the group get started
Give everyone a job
Share materials
Take turns in talking
Listen to your friends when they talk
Respect what others have to say
Stay with your group.

Helpful Things to Say to Group Member

Can I help you?
I like your work.
You did a good job.

Check How Well You Cooperated and Check Your Work

Did you say helpful things?
Did you help each other?

Did you share materials?
Did you take turns?
Did you all have jobs?
How well did your jobs get done?
What can we do better next time?

When first initiating periods of independent reading and writing, some teachers assign children to groups, decide which activity they will participate in, and select leaders to organize the activity. Other teachers have children sign up for activities and groups before the period begins. After participating in assigned groups with assigned activities, children can eventually make these decisions themselves, that is, choose people with whom to work, pick leaders, and select tasks. To help children select activities, a list of things to do during periods of independent reading and writing can be posted such as: (1) Read a book, a magazine, or a newspaper; (2) Read to a friend; (3) Listen to someone read to you; (4) Listen to a taped story and follow the words in the book; (5) Use the felt board with storybook and felt characters; (6) Use the roll movie with its storybook; (7) Write a story; (8) Draw a picture about a story you read; (9) Make a story you wrote into a book; (10) Make a felt story for a book you read or story you wrote; (11) Write a puppet show and perform it; (12) Make a taped story for a book you read or story you wrote; (13) Check out books to take home and read; (14) Use Activity Cards for projects you select to do.

Activity cards containing steps for carrying out the activities help children organize their work. The role of the teacher during this time is to model behavior and act as a facilitator in the classroom.

During periods of independent reading and writing children engage in a variety of literacy activities that are both social and collaborative in nature. For example, children may write their own stories, and then prepare felt characters, or a roll movie for presenting them. Children demonstrate comprehension of stories read by retelling them onto a tape for others to listen to, retelling it with puppets, or through dramatic presentations. The manipulative literacy materials in the literacy center allow the children to read and write through many different modalities. Children also engage in specific social behaviors that help the literacy activity to occur. They collaborate on tasks which helps to get them completed more quickly. There is peer tutoring when youngsters help each other with reading words, coming up with ideas, or spelling. Social conflicts also occur when students have difficulty deciding about taking turns, and sharing materials, as well as cognitive conflicts, when youngsters disagree about spelling a word, or what should happen next in a story they are writing. According to Piaget and Inhelder (1969) conflict enables children to study the options and negotiate a compromise or problem solve until a joint decision can be reached (Morrow, Sharkey, & Firestone, 1993).

The following episodes describe children participating in literacy activities in an environment that provides physical and social contexts that promote motivation to read and write. Children are involved in social cooperative literacy activities using materials from a literacy rich environ-

ment which includes books, writing utensils, and multimedia activities that foster the use of communicative and visual arts.

Rodney and Kirtus were sitting comfortably on the carpet, leaning against pillows, and sharing a book about snakes. Rodney said to Kirtus, "Yo! Look at this!" as he held out the page for Kirtus to see. Rodney and Kirtus were fascinated as they continued to read and look at the pictures. They discussed as they went along.

Sholanda and Kendra, squeezed tightly into one rocking chair, were also sharing and reading the same book. Marcel, Kimba, and Terrence snuggled under a shelf—a private spot filled with stuffed animals—taking turns reading together.

In the Author's Spot, Ramon and Kira were writing a Rebus story on the computer. They found just the right graphics on the computer for specific words they chose to illustrate.

Elvira, Emily, and Howard had just finished cooperatively writing their own original episode for the "Reading Rainbow" television program. They featured the book *Petunia*, for the farm unit they had been learning about. They wanted to produce a video of the episode and sought help from the teacher on how they might proceed.

Tashiba and Angela decided to read the story *The Mitten*. Occasionally Angela helped Tashiba with a word when she had difficulty. After Tashiba read it, the two girls acted it out with stick puppets and a large mitten prop. They hoped to perform it for the class during sharing time.

Terrence was writing a story with Charlene about the "Old West" and how buffaloes were a source of clothing and food. Terrence spelled buffalo with one *f* and Charlene argued that there were two. Terrence said he was sure there was only one. They talked back and forth for a while, getting a bit angry with each other and then decided to look it up in the book where they had read about the animals. They found that Charlene was correct that there were two *f*'s not one. After settling their conflict, they continued writing their story. After it was edited, they made their story into an illustrated book.

At the end of this period of independent reading and writing some of the children were given the opportunity to perform for the class. Some simply described the project they were working on. Others acted out a puppet show, while reading a story from a book read, or telling a story that was read. Another group presented a play about a story they had written.

CONCLUDING REMARKS

Environments to motivate reading and writing in early childhood classrooms have been discussed. Ideas have been drawn from emergent literacy constructs, the language arts perspective, the engagement perspective on reading, and motivation theory to demonstrate how these philosophies and theories can be transformed into practice. The environments that were described included physical and social contexts. Holdaway's theory (1979) of developmental learning has been utilized in this discussion. (1) Children would be able to *observe* literacy behavior, such as being read to or seeing peers and teachers engaged in reading and writing, (2) Children would be engaged in collaboration and cooperation through sharing materials with peers, and working on joint projects, as well as interacting with adults who provide models for literacy activity, encouragement, motivation, and help, (3) Children would be involved in *practicing* skills they had been learning during periods of independent reading and writing, and (4) Children would be involved in *performance* by sharing completed reading and writing activities with others. In addition, through the physical environments described and the social contexts for shared storybook experiences and independent reading and writing, they are provided with a motivating atmosphere that encourages the use of communicative and visual arts. There are *challenging* materials, and activities that involve children in *social collaboration*, with *choices* of what they would like to do and with whom, and the opportunity for *success* in the literacy activities undertaken.

DRAMATIC PLAY, CONTEXT, AND CHILDREN'S COMMUNICATIVE BEHAVIOR

A. D. Pellegrini

UNIVERSITY OF GEORGIA

Over the past decade or so researchers have renewed their interest in the role of dramatic play in the lives of children, particularly as it relates to children's performance in school. Dramatic play is defined as fantasy, or pretense, play where children enact, either socially or alone, some make-believe theme. The commonality among these different labels is that children suspend reality in their interactions with peers, adults, and props. While recognized as a hallmark of the preschool period, dramatic play can be observed from the toddler period, throughout childhood, and into adulthood (see Fagen, 1996). Researchers, however, have been most interested in the ways in which aspects of young children's dramatic play, such as the oral language that accompanies dramatic play, relate to various educational and developmental outcomes, such as literacy. To this end, a number of integrative reviews have been written on the role of dramatic play in children's social and cognitive development (e.g., Christie & Johnsen, 1983; Rubin, Fein, & Vandenberg, 1983; Smith, 1982) and in oral language and literacy development (Fein, 1980; Garvey, 1984; Pellegrini, 1985a; Pellegrini & Galda, 1993; Wagner, 1992). The reader interested in general reviews of the role of dramatic play on aspects of children's development is referred to these excellent pieces.

In addition to the current interest in dramatic play, researchers are also currently interested in the various "contexts" of development and education. Much effort has been expended on exploring the influence of aspects of social context on children's development and learning. Students of children's play, too, have examined the role of social context, as well as physical context, in children's pretend play, language, and literacy (Haight & Miller, 1992; Morrow & Rand,

1991, this handbook; Neuman & Roskos, 1991; Vukelich, 1991) and social behavior (Howes, 1992).

In this chapter, I will attempt to extend the current research traditions in dramatic play and contextual influences on development and education. Specifically, I will first, and briefly, define what I mean by dramatic, or pretend, play. Second, I will outline my conceptualization of context. In this section, I will stress the transactional nature of context, or the ways in which children and the social and physical environments affect each other. Third, I will review the ways in which different contextual arrangements are accompanied by specific sorts of dramatic play and oral language.

DRAMATIC PLAY

For the purpose of this chapter, dramatic play will not be differentiated from fantasy, pretense, or symbolic play. Dramatic play is defined as the nonliteral (or symbolic) behavior that children use to transform (or change) the identities of objects, actions, and people (Fein, 1981; Garvey & Kramer, 1989). Children engage in dramatic play in many different social configurations: alone, with a parent, or with a peer, and with a variety of physical props, ranging from no props to explicitly defined theme, or replica, toys, such as Barbie dolls. Further, dramatic play, like other forms of play (see Fagen, 1981; Pellegrini & Boyd, 1993; Rubin, Fein, & Vandenberg, 1983), follows an inverted developmental U-function, first appearing around 1½ years of age, peaking during the late preschool/early primary school period, and then declining (Fein, 1981).

For the purposes of this chapter, dramatic play is interesting because of the types of oral language that children use when playing. Specific design features of social dramatic play relate to the forms of language which children use in a variety of important situations, such as school literacy events. In this section I will outline some of these design features of dramatic play and note the accompanying forms of oral language.

Fein (1981) analyzed pretense play in terms of the following design features: decontextualization, object substitution, and role-playing. Decontextualization involves framing realistic events in fantasy; for example, pretending to eat dinner. Object substitution involves having one thing (e.g., a prop, gesture, or utterance) to represent something else; for example, a child verbally defines a stick as "my sword." Role-playing has players enacting real and pretend roles.

In one of those earlier reviews referenced above, I showed the ways in which these features of play related to children's language and literacy (Pellegrini, 1985). Suffice it to say that social dramatic play is characterized by a very specific sort of oral language. As Halliday (1969–70) noted 25 years ago, the "Imaginative Function" of language, or that form of language used when children engaged in social pretense, is elaborated, or decontextualized. In this register linguistic meaning is verbally encoded through cohesive ties (Halliday & Hasan, 1976), such as endophora and conjunctions. Others (e.g., Bernstein, 1960; Cook-Gumperz, 1977; Olson, 1977; Snow 1983) have also pointed out that the features of this register are similar to the register of school, and more specifically to the language of literacy (Olson, 1977).

As they engage in social dramatic play, children are learning to use this register while they are simultaneously learning other pragmatic and discourse level skills; thus, pretense may be a practice or learning venue for these important language skills (Garvey & Kramer, 1989).

I will briefly review those linguistic forms which correspond to the design features of pretend play. Of course these designs features co-occur; consequently, linguistic forms will also co-occur. So, for example, decontextualization, role-play, and object substitution often co-occur as, for example, when children pretend to build a "fort," each child dramatizes a different role, using pretend tools. Decontextualization is often realized linguistically with temporal (e.g., *and then*) and causal (e.g., *'cause*) conjunctions; thus, decontextualized drama often has a narrative structure (Wolf & Grollman, 1982).

Role-play is typically realized through the use of explicit linguistic reference, such as *I'll be the boss*. In this case the pronoun *I* is linguistically defined by its tie to *boss*, thus minimizing ambiguity. Similarly, such explicit reference is used with object substitutions. Indeed, such explicit definitions as, *Here's my hammer*, to transform a real stick into a pretend hammer, are not only used referentially in fantasy, but they are also used to signal other children that the event they are participating in is fantasy. Each of these language forms, in turn, has important implications for children's early school-based literacy and the interested reader is referred to numerous reviews on the topic (Christie, 1991; Pellegrini, 1985a,b; Pellegrini & Galda, 1993).

Recently, Catherine Garvey (Garvey & Kramer, 1989) analyzed the forms of language that young children (i.e., preschoolers) used to announce to their partners that "*This is play*." Announcing "*This is play*" was labelled metacommunication, by Bateson (1956), and has been thoroughly studied (e.g., Auwarter, 1986; Giffin, 1984) since that time. Metacommunication is observed in dramatic play because of the communicative problems inherent in social pretending: enacting a decontextualized event; coordinating, negotiating, and clarifying the multiple meaning inherent in pretend scenes; and entering and terminating the pretend frame (Garvey & Kramer, 1989). Children use a specific register, marked by specific verb tenses, modal auxiliaries, and sentence/discourse complexity to metacommunicate in pretend play.

Past tense is used to "set the stage", or provide the background for the upcoming play episode, while present tense is used to enact the episode (Garvey & Kramer, 1989); for example, "*Once there was a little boy and he lost in the woods*." Future tense is often used to plan the upcoming episode (Pellegrini, 1985b); for example, "*Let's pretend that you're gonna fall in the hole*." Children more frequently use past and future tense verbs when they engage in fantasy play compared to nonpretend peer discourse (Pellegrini, 1986). This is commonsensical to the extent that in fantasy children are talking about things that are not there; past and future tense verbs also mark nonpresence. Further, the planning, assignment, and negotiation of pretend episodes necessitates using past tense.

Modal auxiliaries are used to mark mood, such as obligation (e.g., *You have'ta*), often at the onset of an episode (Garvey & Kramer, 1989). Regarding linguistic complexity, it is well documented that children use complex language during social pretense. As noted above, verbal explication is necessary in pretend because of its inherent ambiguity. At the utterance level, we know that in children's fantasy, compared with nonfantasy, language is functionally more diverse (Pellegrini, 1982). Similarly, children's choice of verbs is more diverse in fantasy than in nonfantasy (Wolf, Goldfield, Beeghly, & Cardona, 1985, cited in Garvey & Kramer, 1989). The actual verbs used in fantasy are often those that encode verbal and mental processes (Pellegrini & Galda, 1993).

By extension, complexity at the discourse level is another characteristic of pretend discourse. Just as sentence level complexity is the realization of explicit meaning, so too, at the discourse level. In fantasy, as noted above, children define potentially ambiguous terms, such as pronouns, with cross-sentential ties and use a variety of conjunctions to organize ideas across the play discourse (Pellegrini, 1982, 1986).

Garvey and Kramer (1989) raise an obvious, but often overlooked, point. The development of these language features, which we assume develop in the context of fantasy, is also developing in children's nonpretend discourse. Indeed, for some features, such as the use of adjectives to elaborate meaning (Pellegrini, 1986), there is no difference between fantasy and nonfantasy; children's use of these terms increases across the preschool period. Rather than minimizing

the role of pretend play in learning and developing these forms, I would argue that pretend play is a vital part of children's everyday life which they delve in and out to learn and practice all sorts of new behaviors. I will also argue that pretend, or dramatic, play is one of the most important contexts for learning and development during the early childhood period. As part of this argument, I must first define context.

What is Context?

Context is a term very frequently used in educational, psychological, and anthropological research. Context is often defined in terms of social dimensions and physical dimensions (e.g., Caldwell & Bradley, 1984; Wachs, 1990). Social dimensions of context can be further refined by considering the number of participants, as in social network theory (e.g., Cochran & Riley, 1988), the status of the participants, as in peer versus adult interaction (e.g., Tudge & Rogoff, 1989), or the specific relationships between participants, such as friends versus nonfriends (Hartup, 1996). Physical dimensions of context can be proximal, such as the props in the dramatic play center of a classroom, or distal, the number of books read to a child across the school year.

Many conceptualizations of context, as noted by Bronfenbrenner (1979) and Hinde (1980), share two unfortunate, and interrelated, features. First, many dichotomize social and physical contexts by looking at the ways in which variables in each, independent of the other, relate to children's behavior. Second, context is often conceptualized in unidirectional terms; that is, the environments are sometimes seen as "coercing" (Barker, 1968) behaviors in children. Examples of this sort of work include looking at "effects" of classroom structure on children's behavior (see Minuchin & Shapiro, 1983, for a review) and the role of activity centers on children's pretend play and literate behavior. The assumption behind these conceptions, not unlike those of S-R psychologists, is that social and physical aspects of context shape children's behavior; the organism is a passive recipient of environmental stimuli.

Again evoking Bronfenbrenner (1979) and Hinde (1980), we know that contexts and persons are transactional; that is, they affect each other. Specifically, children often self-select themselves into desirable contexts and then interact with the contexts in such a way as to make it most suitable for them. For example, certain children may choose to engage in dramatic play on the playground, enacting Power Rangers; these children choose other like-minded individuals; individuals' behavior, in turn, influences others' behavior (e.g., cooperative acts are reciprocated). Additionally, individuals influence aspects of the physical context of the playground (e.g., a slide becomes a launching pad). In this latter case, it is important to recognize that individuals also change physical aspects of their environment to suit their needs.

Even in cases where children are not free to choose the location or their playmates for activities, as is the case in many academic settings, children can choose how they define that context; they can read, clandestinely, daydream, or act out. To

ethologists, such as Hinde (1980), and ethnographers, such as Erickson and Shultz (1977), it is assumed that people choose their "niche" and "furnish" it in their own ways: People affect context and contexts affect people.

In this section I review research on a more specific level of context—social participation in dramatic play. I argue that social participants, who may be superficially similar (such as peers), often play differential roles in children's play, depending on their relationships. By relationships I mean, the interactional history between two people (Hinde, 1980). Interactional history, as noted above, is affected in a dialectical way, by individual and situational variables. This history, in turn, influences future interactions. For example, children in a classroom may be assigned by their teacher to "play" at the same center. Because of similar interests and repeated interactions, these children become friends; their friendship, in turn, affects their play. The specific relationships that I will be concerned include, from the peer world, sibling and friendship relationships and, from the adult-child world, attachment relationships.

The importance of examining context in terms of relationships, I think, is that it specifies more exactly the social arrangements that relate to learning and development. For example, conceptualizing context in terms of peer interaction or adult-child interaction is often too global because there are different sorts of relationships within each of these configurations, each of which relates differentially to children's dramatic play and language.

My examination of social contexts and the specific types of relationships that comprise social context, begins with descriptions of naturalistic studies of children playing with a parent, or more exactly, mother, and siblings. The value of examining naturally occurring dramatic play, especially if it is embedded in a longitudinal research design, is straightforward enough, at least for me: It provides insight into the ways in which pretense play and language *actually* develop across childhood. By contrast, laboratory studies of these sorts of interactions, while useful at later stages of theory testing, inform us as to what *can* develop (McCall, 1977).

The paucity of naturalistic, longitudinal research on children's play is quite surprising, especially in light of the popularity of dramatic play and language in the child development and educational literatures. There are two noteworthy exceptions, Wendy Haight and Judy Dunn. Both researchers have spent substantial amounts of time in homes observing and recording the play and language between children and their parents, siblings, and peers. Haight's (Haight & Miller, 1992) longitudinal study of the pretend play of middle-class children from 12–48 months of age found that children's primary playmate was mother until 36 months, after which children played with siblings and peers, thus supporting the notion that pretend develops in an interpersonal context (Vygotsky, 1978). Also in support of Vygotskian theory, children appropriated responsibility from mother (e.g., more frequently initiating play) with age. By the time children were 48 months, their play with peers and siblings was more involved (i.e., longer episodes) than their play with mothers. Thus, mothers seem to introduce children to social fantasy by initiating play themes and modeling fantasy language; by their

third birthday children were able to use these strategies with other children.

Dunn's (Dunn, 1988; Dunn & Dale, 1984) observations of young children in their homes point to clear differences in the ways in which mothers and older children play with the younger sibling. While mothers' play with children is very supportive it is often not as active as the play with an older sibling. For example, mothers are frequently observers of their children's pretend while older siblings often take a complementary pretend role (Dunn, 1988). Further, mothers' play with 2-year-olds often involves replica toys or objects whereas play with older siblings was less object-oriented and more frequently involved young children using language to sustain the pretend (Dunn & Dale, 1984). It may be that youngsters enjoy playing with an older sibling more than with mother; thus, they are more willing to comply with the demands of the older child (Dunn, 1988) and engage in a form of social pretend that is rather cognitively demanding.

MOTHER-CHILD PRETEND PLAY AND ATTACHMENT RELATIONSHIPS

In these two instances I have sketched differences in the pretend play of young children when they play with an adult (in the form of mother) and other children, including siblings. Taking a relationship, perspective, I would expect there to be different sorts of play exhibited between mothers and children as a function of their relationships history. Most research in this area utilizes attachment theory as a measure of the mother-child relationship. Generally, attachment is a measure of the degree to which children and their mothers have a secure or insecure relationship. Attachment relationships are thought to provide the basis for children's interactions with parents, other adults, and peers. Secure, compared to insecure, attachment relationships are characterized by more synchronous and flexible interactions between mothers and children (see Bretherton & Waters, 1985, for a summary).

The pretend play of securely attached children is more frequent and more synchronous (e.g., positive and responsive) with their mothers and with their peers, compared to their insecurely attached counterparts (Howes, 1992). Correspondingly, securely attached children, compared to insecurely attached, are more successful at initiating play with their mothers (Roggman & Langlois, 1987) and engaging in longer and more complex forms of fantasy (Slade, 1987a, 1987b).

This brief foray into attachment relationships was meant to be an illustrative, rather than exhaustive, discussion of the ways in which one aspect of social context, mother-child interaction, can be more clearly specified in terms of their relationships history. If this variable were to be disregarded, and only mother-child interaction were to be studied, an interesting and important aspect of social context would be missed. In the next section I will illustrate the ways in which different sorts of peer relationships relate to children's pretend play and language.

PEER PLAY, SIBLINGS, AND FRIENDSHIPS

Peer play has received much attention in the educational and developmental literature. Attachment theorists, for example, have discussed children's peer relations, friendship, and play patterns as an outgrowth of the attachment relationships (Howes, 1992). Other theorists have contrasted peer interaction with adult-child interaction as a venue for stimulating children's social cognitive development. Providing the foundation for the facilitative role of peers on development, Piaget's (1983) theory stressed the role of conceptual conflict and resulting reequilibration that typifies the reciprocal roles that peers take with each other. This is contrasted with the more subordinate, and complementary roles that children take when interacting with adults. While the contrastive role of peers and adults in children's cognitive development has yielded some very interesting findings and brought us closer to explicating the role of social context in development (e.g., Tudge & Rogoff, 1989), not all peer interactions are alike. Just as attachment history influences the quality of mother-child play, so too with peer interactions.

At a very basic level, it is illustrative to note that children's pretend play differs as a function of their playmates. For example, Kramer, Bukowski, and Garvey (1989) found that the language of preschoolers varied significantly across different triadic partners. By way of explanation for the seemingly unreliable behavior of play behavior, researchers have explored a number of avenues. Doyle (1982), for example, has suggested that preschool children's familiarity with each other has an important impact on their pretend play. When comparing the social and cognitive dimensions of the preschoolers play, Doyle found that children's interactions were more cooperative, active (i.e., involved), and dramatic in familiar dyads, compared to interactions with unfamiliar peers. Familiar children were also more willing to imitate their peers' play than the play of unfamiliar peers.

Familiarity is necessary, but not sufficient, for another important dimension of peer interaction: friendship. By friendship I mean dyadic groupings that make reciprocal choices of each other. So friends would nominate each other as friends and would also be observed interacting with each other. Obviously, children must be familiar with each other before they can be friends. Indeed, the degree to which children are familiar with each other, in terms of spending time in proximity to each other and sharing similar play preferences, is a very good predictor of their becoming friends (Hartup, 1983). Thus, friends, like other familiar peers, know, (usually) trust, and reinforce each other.

The level of trust between preschoolers who are friends, compared to nonfriends, is indicated by the high levels of self disclosure during social pretend play (Howes, 1992). Not surprisingly, the play between preschoolers who are friends, compared to nonfriends, is longer and more harmonious (Gottman, 1983). When conflicts do arise, friends are more likely to resolve the conflicts and resolve them equitably (Hartup, 1996). Play for friends, because of these features, tends to reinforce the strength of the friendship. Children enjoy playing with their friends and consequently they exert

many cognitive resources to maintain it, the end result being complex and sustained interaction.

Another close relationship, like attachment and friendship, is the sibling relationship. Siblings are, generally, very familiar and trusting of each other (Dunn, 1988). Younger siblings, specifically, tend to follow the lead of older siblings in pretend play. Indeed, Dunn suggests that older siblings are more able than mothers to elicit sophisticated levels of pretend from their younger siblings; for example, fantasy of siblings is more symbolic than the mother-child play. Further, siblings maintain fantasy more frequently through linguistic interaction, while mothers and children's play is more directly tied to physically present objects.

CONCLUSION

To sum up, I have illustrated the ways in which particular aspects of context affect the pretend play and accompanying oral language of young children. I focused on one dimension of the social groupings of pretend—the nature of children's relationships with their playmates. Examining specific relationships between children and the age-mates and adults enables us to more clearly understand the actual processes of social interaction responsible for learning and develop-

ment. The brief review presented here suggests that trust, modeling, and mutual reinforcement are important aspects of close relationships which are important for children's development. The trust and enjoyment typical of play between children and others with whom they have a close relationship allows them to express themselves, imitate and disagree with others, as well as compromise, all in the service of maintaining enjoyable social interaction.

That these sophisticated language forms and social behaviors occur in pretend play probably has something to do with the fact that children, and adults, enjoy this activity. This is not to say, of course, that there are other equally enjoyable events which may have enriching effects on children's language and representational capacity. Another likely candidate, of course, is joint book reading. Parents and children enjoy this activity and children may learn similar linguistic forms here as they do in pretend. (For contrasting data see Goelman, 1996; Snow et al., 1976). It would be interesting to compare the ways in which children listen to books read by siblings and friends.

The goal of research in pretend play, from my perspective, is to identify the places where and participants with whom children play. This should be done in a variety of situations, including home, playground, and school; of course, the situations must be studied across time.

DRAMA WORLDS: PLACES OF THE HEART, HEAD, VOICE, AND HAND IN DRAMATIC INTERPRETATION

Shelby Wolf

UNIVERSITY OF COLORADO AT BOULDER

Brian Edmiston & Patricia Enciso

OHIO STATE UNIVERSITY

We accept the fact that the actor infuses his [sic] own voice, his own body, his own gestures—in short his own interpretation—into the words of the text. Is he not simply carrying to its ultimate manifestation what each of us as readers of the text must do? (Rosenblatt, 1978, p. 13)

The combination of reading with dramatic interpretation—infusing text with the lively play of voice, body, and gesture—is a notion that seems to hover in America’s literacy education and goes in and out of focus depending on the historical period (Robinson, Faraone, Hittleman, & Unruh, 1990). As Martin (1992) suggests, “perhaps at one time in American history our country could afford schools that severed heads from hands and hearts,” but this is no longer the case. Instead, she reminds us that schools should be places where “mind and body, thought and action, reason and emotion are all being educated” (pp. 86, 87). Yet, how do we build a place in school where integration rather than separation is the norm? Rosenblatt’s (1978) metaphor for the connections between drama and reading can be a powerful reminder of possibilities, for it invites us to establish new connections among students’ textual experiences and the social and imaginative worlds students create together.

In advocating classroom drama, we support literacy which shifts meaning and control from teachers and texts to stu-

dents and teachers who create meaning together as they interpret, dramatize, and dialogue with texts. We regard literacy as much more than reading, writing and speaking, and listening. Literacy is “reading the world” (Freire, 1972) and “working the world” (Willinsky, 1990) as much as it is reading or working a text. The classroom that uses drama for alternative modes of meaning making is a place where “students and teachers can also be empowered to rethink the world-in-progress and their place in it” (Apple, 1990, p. xii). It is a place that deliberately constructs and reconstructs spaces for learning that can include students’ multiple social, cultural, and expressive knowledge. Thus, drama educates for a freedom of the imagination in which students of diverse cultural backgrounds can connect with and transform texts in dramatic interpretations and thereby “surpass the given and look at things as if they could be otherwise” (Greene, 1988, p. 3).

This chapter is designed to serve as a map to places where the integration of drama with literacy exists—places of the heart, head, voice, and hand—all of which lie in the realm of what Stanislavski (*My Life in Art*, cited in Cole & Chinoy, 1970) terms “the magic if”:

I came to understand that creativeness begins from that moment when in the soul and imagination of the actor there appears the

magical, creative *if* ... that is, the imagined truth which the actor can believe as sincerely and with greater enthusiasm than he believes practical truth, just as the child believes in the existence of its doll and of all life in it and around it. From the moment of the appearance of *if* the actor passes from the plane of actual reality into the plane of another life, created and imagined by himself. Believing in this life, the actor can begin to create. (pp. 494, 495)

It is the notion of shifting planes and altering perspectives by entering a conditional world that is important for players reading, writing, or enacting a piece of literature or exposition. To be able to cast themselves in the space and time of others, to walk between the pages of a book and imagine "what would happen if ...," not simply to mouth the lines and mimic the motions, but to understand, create, and convey meaning—this echoes Rosenblatt's (1978) description of the "ultimate manifestation" that readers as well as actors must do.

As children read and enact their interpretations, they express not only the possible worlds of other characters in time and space but the actual minds and imaginative possibilities of their own reality. Writers, too, must be able to see their work as more than "dummy runs" (Britton, 1972); as they create stories, letters, documents, scientific or historical reports they also engage in "social work" (Dyson, 1993). Writers in schools use situations to complete both the official work of the classroom and the unofficial work of negotiating their social positions with teachers and peers. Drama experiences, like children's play, can enable students to construct purposes and audiences for their writing. Thus, they simultaneously accomplish the official work of the classroom curriculum, while they move across perspectives and positions to "place" themselves in multiple social roles both within and outside the world of the classroom.

We begin this chapter by discussing two kinds of classroom drama—each of which encompasses a variety of specific dramatic forms—for commonalities and contrasts. We then look at these two kinds across the body of dramatic enactment. We first explore the heart and the head of drama, combining them to emphasize their integration. We then carry these concepts into the voice and ultimately the hand to show how drama fuses emotion and intellect through communicative channels and action. Throughout these sections, we emphasize Heathcote's (1984) notion of "framing." We suggest that children in drama not only try on particular roles, but experience feelings of commitment and responsibility to dramatic encounters as they interact with new perspectives.

KINDS OF DRAMA

Although drama appears in multiple forms, here we explore two perspectives on drama—one which pays close attention to the text on the page and one that emphasizes text as a starting point for exploring meanings beyond the page. The first entails dramatizing at the *center of text* and the second involves dramatizing at the *edges of text*. Yet, rather than dichotomize these two dramatic forms, we emphasize that

both are art forms and both are learning processes. Hughes (1991) has clarified that there is actually "a complex dialectic" between "drama as an art form" and "drama as a learning process." The first focuses on "actor/audience relationship and the semiotics of performance" while the second "accentuates the paradoxical nature of play in which the child can be engaged in a fictional world while simultaneously reflecting upon its symbolic significance" (p. 1). He goes on to say:

The debate, between those supporting Drama as a learning medium and those proclaiming the primacy of the art form, has led to a wide variation in teaching practice. There are some who say *I teach for art*; others see the extension of human empathy as essential. In Australia, the majority of educational Drama teachers seem to view both concerns as important. (p. 1)

In this chapter, we take the relationship of drama with written literary text—particularly the proximal distance between the two—to be a productive focus for understanding drama and literacy education and research. Yet, like literary genres which Fowler (1982) suggests are "not permanent classes but ... families subject to change" (p. v), the lines between different dramatic forms often blur. More important, the distance between literary text and dramatic enactment often works in accordion-like fashion—shrinking and stretching to meet the needs of the moment. Our point here is not to set up definitive categories, but rather to look at two large families of drama as they exist in classrooms today.

Dramatizing at the Center of Text

Dramatizing at the center of the text places the written piece of literature or exposition at center stage. Children read, interpret, and negotiate the enactment of text adhering (more or less) to the characters, dialogue, and plot written on the page. Even when written texts are adapted for various forms of production, McCaslin (1990) suggests that playwrights "must make every effort to retain the essential elements of the source material so as not to disappoint or offend the audience" (p. 161). Many teachers rely on professional playwrights and published suggestions (Wills, 1989), while others prefer to transform tradebook texts with their children, enacting particular scenes or transforming entire pieces for the classroom stage. No matter who serves as playwright—teachers, children, or professional playwrights—there is a sense of remaining "true" to the text on the page.

There are multiple forms that emphasize dramatizing at the center. Table 41-1 lists and defines three current forms:

Although Siks (1983) suggests that in story theatre "players are guided to *tell the story*, to be true to its intent, rather than to aim to elaborate, digress, or change its theme" (p. 48), her description could apply to all three of the forms above. As McCaslin (1990) explains, in all of these forms "the primary virtue is the text" (p. 280).

Dramatizing at the Edges of Text

When dramatizing at the edges of text, the players do not have a script, though a story may become a "narrative prop"

TABLE 41-1. Dramatizing at the Center of Text

Story Theatre
In story theatre, a narrator (usually the classroom teacher) tells or reads a story with children seated in a semicircle. Siks (1983) tells us that there are three basic rules to follow: (a) <i>the rule of the theatre</i> —in which children take on character or scenic roles and move on stage to enact a part and off to be an audience for other roles, (b) <i>the rule of instant action</i> —the children must move the instant a role is called for and then quickly exit, and (c) <i>the rule of instant cooperation</i> —since roles are not assigned, children must cooperate to allow individuals to take on specific parts, though at times, parts can be taken by more than one player. This last rule also emphasizes the equal distribution of roles so the play is not dominated by a few eager volunteers (p. 48).
Readers Theatre
Readers theatre is "a form of group storytelling in which two or more readers present a piece of literature by reading aloud from hand-held scripts" (Robertson, 1990, p. 2). Children (a) read a story, (b) make selective and analytical choices in transforming the story into a script through social negotiation, (c) formulate, practice, and refine their interpretations, (d) perform for an audience, and (e) evaluate their performance (Shanklin & Rhodes, 1989). Readers theatre is often defined by its emphasis on language; performances involve no use of costumes or props; actors face the audience rather than each other; characters are brought to life through choices in voice and minimal gestures (Busching, 1981; Landy, 1982; Robertson, 1990; Sloyer, 1982).
Classroom Theatre
Classroom theatre is a blend of creative drama and readers theatre that ultimately has much in common with regular theatre. Classroom theatre takes and reshapes the best from both worlds—offering children opportunities to (a) participate in theatre games to exercise their voices and bodies as well as build concentration, and (b) collaboratively produce theatrical interpretations of selected scenes in published texts (Wolf, 1994, 1995). Children are encouraged to think like actors, using the technical vocabulary of the theatre and the strategies of those on the stage—marking their scripts to note body movement and intonation, arranging for a prompter if needed, and running their lines repeatedly, though they can enact the final performance with hand-held scripts.

(Heath & Branscombe, 1986) around which students and teacher raise questions and enact possible situations. Rather than providing students with words to interpret and enact, the whole or parts of the narrative become a prop or "pretext" for creating a play world which intersects and interacts with both the world of the story and the actual world of the students. The pretext, as defined by Rogers and O'Neill (1993), is the shared beginning point for wide-ranging explorations of human relations and interpretations. Students' interpretive actions and discussions around the pretext will be informed by their personal and social experiences, their ideas of cultural norms and expectations, and the imaginative power they bring to experiencing, rethinking and transforming human dilemmas. Students' interpretations and creations of texts arise through improvised encounters which enable them to explore the ambiguities and possibilities of the text. Though at various points in the work some students may watch as others show or demonstrate, no

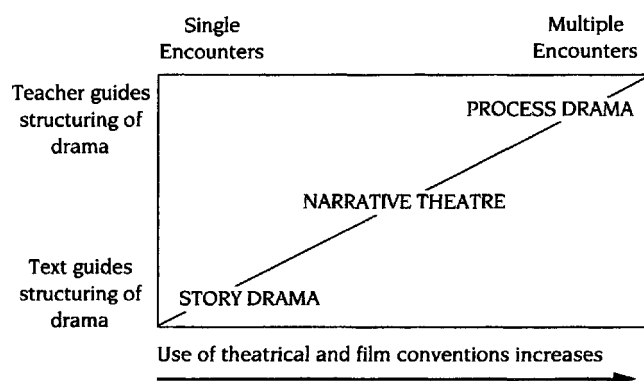

FIGURE 41-1 Features of Dramatizing at the Edges of Text

final performance is being prepared: the process is the product. In a sense, by dramatizing at the edges of the text, children's interpretive processes and perspectives, as well as the teacher's role in structuring those processes and perspectives are drawn into the center. As Heathcote (1984) stresses, "When it comes to the interpretation of ideas it is the child's viewpoint which is important ... he [sic] is offering a viewpoint and in return the teacher may offer another one" (p. 85).

Dramatizing at the edges of the text may take many forms and be referred to by various names. The terms drama in education and educational drama (Bolton, 1979; Heathcote, 1984) are used more generically. Story drama (Booth, 1985, 1994, 1995), narrative theatre (Edmiston, Enciso, & King, 1987), and process drama (O'Neill, 1991; O'Toole, 1992) are three other descriptive terms. These forms of drama are not distinctive and in practice overlap. However, all of these forms of drama are distinguished by their attention to process and the teacher's selection of and participation in encounters that may be actually evident in a text or only implied.

As seen in Figure 41-1, the teacher may focus on one encounter with children that is fairly close to the actual text. The teacher may make dramatizing at the edges of the text more complex in two ways: (1) increase the number of encounters, and (2) rely less on encounters in the actual text and more on his or her own aesthetic structuring of the drama.

There are many forms that emphasize dramatizing at the edge of text. Table 41-2 lists and defines three current forms, although it is important to remember that the lines between these kinds of dramatizing are often blurred. These approaches to drama, particularly process drama, may seem to require considerable skills and knowledge related to theatre and playwriting. Although "doing drama" in these ways may seem daunting, very rich, accessible drama experiences can be created with reference to some widely known conventions and principles of sociodramatic play. The following touchstones may be useful to a beginning drama and literacy educator:

(1) The source for creating dramatic images and encounters is as limitless as the whole array of theatrical and film

TABLE 41-2. Dramatizing at the Edges of Text

Story Drama
<p>Story dramas (Booth, 1995) are generally very focused on a single encounter or several brief encounters that are elaborated on and interpreted over time. As teachers work in this way, they use the text as a basis for determining which characters will be encountered, what problems inherent in the story are of concern, and what decisions and actions need to be taken. The players, in turn, interpret the story in ways which are meaningful to them—an interpretation which may ignore subtle details of the story or alter the story in substantive ways (e.g., changing the ending). Although their personal interpretations are elicited, players are also working within a shared social context. Thus, the story becomes a pretext to involve the children in ways of negotiating and dealing with imagining alternative possibilities beyond those in the text as well as those which they encounter in their actual lives.</p>
Narrative Theatre
<p>In narrative theatre (Edmiston et al., 1987), the teacher also relies on the text, and may actually read from it. He or she does so initially to guide students' actions and interpretations of the words of the characters or narrator in a story. However, in narrative theatre, students may be involved in numerous encounters covering the full chronology of the story while the teacher or students read excerpts from the text to set the scene or, as in readers theatre, devise possible interpretations of a character's meaning. Narrative theatre could be located at the midpoint of the continua in Figure 41-1. Dramatic encounters will be shaped by both the text and the teacher. The characters and the author's words can be used, as well as the students' own writings and interpretations. The teacher will both structure encounters and participate in imaginary interactions with the students. The students could be engaged in encounters implied by the circumstances of the story but also in encounters imagined by the students and teacher.</p>
Process Drama
<p>Process drama relies more on the teacher's knowledge of aesthetic structuring through improvisation and the use of theatrical and film processes and conventions in order to create multiple and carefully sequenced ways of creating dramatic art with students (O'Neill, 1991, 1994). As with story drama and narrative theatre the teacher can enter into the fictional world of a text. The text can provide them with an initial dilemma or situation. However, the original text will soon be supplemented by the texts which arise among students and teacher as they interact (Enciso & Edmiston, in press). It is not that a text is absent from this approach to dramatizing, instead it is "under construction."</p>

conventions (e.g., tableaux, dreams, multiple 'selves' speaking across time and space, etc.). Nearly every film uses time shifts, overheard conversations, or setting changes. Teachers who begin to pay attention to the ways in which filmmakers and theatre directors create situations or encounters among characters may try these out with students as they read, interpret, and write texts. A number of excellent publications are also available that fully describe a series of drama encounters and/or describe theatrical and film conventions that can be used in drama (Bolton, 1992; Morgan & Saxton, 1987; Neelands, 1990; O'Neill & Lambert, 1983; O'Neill, Lambert, Linnell, & Warr-Wood, 1976; O'Toole & Haseman, 1988; Swartz, 1988; Tarlington & Verriour, 1991).

(2) Following the reading of a story or some part of a story, drama can begin with the simple invitation, "Let's imagine that. ..." Just as children often initiate play by entering into an imaginary situation from a book and assign themselves and their friends various roles (Wolf & Heath, 1992), so also students in supportive classrooms will adopt imaginary perspectives. Students' involvement in these encounters is often generated and guided by the features of play that have always attracted children: They are invited to "be a head taller" (Vygotsky, 1978), to imagine themselves as participants in a world where they have power to make choices, to take action, and to interpret circumstances. In drama, adults and students speak and interact together with the understanding that the students have an urgent responsibility to find out, make decisions, or interpret data. As in play, students are thinking through situations while they are in the midst of them, as participants who have the authority to act. They are not talking about what they would do if they were a certain character—they are doing it and finding out what it means to *be* in a situation and experience the consequences of actions.

(3) Students may adopt and shift perspectives as a group rather than as individual actors. For example, children can imagine they are the parents of children who live near Red Riding Hood's family and are concerned about Little Red Riding Hood's late return from her grandmother's house. They can also shift perspectives to test out possible meanings or thematic directions implied by the story. For example, if they shift to the perspective of wolves' parents, they entertain a completely different view of 'wolfish' behavior than that portrayed in the folktale. Having taken both parental views (and other possible perspectives related to the story), students are in a position to advise community members on safety or animal-human coexistence.

(4) Teachers enter the drama world and adopt positions alongside or in opposition to the students. Evaluative statements and questions are raised as possibilities that can be considered rather than regarded as authoritative judgments that must be accepted. In the scenario described above, for example, the teacher could adopt the position of a forest ranger who raises questions about the students' proposed standards for safety or planned education of young animals and humans. The teacher could shift to another perspective, such as an editor of the local newspaper who sends the students/reporters to conduct interviews about safety practices.

(5) In a drama world the teacher can always place herself in a position of relative (and often fictional) incompetence. She needs their help or she needs to know something from them. She can become very inept; for example, she could represent Red Riding Hood's parent who has no idea how to track wolves. In addition, the students can often be cast as "experts" so that they interact from positions of strength and competence. Students could be expert planners who create a wildlife refuge. They could be journalists who are expert at writing for a newspaper or creating a newspaper layout. The teacher can still "teach" but now she can do so indirectly and in response to students' needs. Extended uses of this strategy, called "mantle of the expert" by Dorothy Heathcote, are

described in Bolton (1992), Heathcote and Bolton (1995), Heathcote and Herbert (1985), and Wagner (1985).

DRAMA WORLDS

Blurred and at times extinguished by standardized expectations for response, Rosenblatt's (1978) image of reader as active interpreter through multiple channels of communication is more often a metaphor for reading than a reality. Yet, dramatizing at the center and at the edges of the text creates places that bring the vision to actuality. These places exist in the hearts, heads, voices, and hands of children and their teachers as they interpret and integrate the texts on the page and the texts of their lives.

Places of the Heart and Head

Rather than separate intellect from affect, drama, like life, weaves the two together—integrating mind and emotion within the experience and action of specific situations. As Dewey (1934) noted, the arts are experienced intellectually, emotionally, and consciously in a “union of sense, need, impulse and action” (p. 25). Vygotsky (1986) also emphasized this union by suggesting that thought is not individual and detached, but socially and emotionally constructed:

Thought is not begotten by thought; it is engendered by motivation, i.e., by our desires and needs, our interests and emotions. Behind every thought there is an affective-volitional tendency, which holds the answer to the last “why” in the analysis of thinking. A true and full understanding of another's thought is possible only when we understand its affective-volitional basis (p. 252).

Many of Vygotsky's examples of the emotional motivation behind thought come from his discussions of the dramatic interpretation of literature. Vygotsky's interest in theatre was one that began in childhood and extended throughout his life. As Vygotsky's sister explained, “I don't think there was any period in his life when he did not think or write about the theatre” (Levitin, 1982, cited in Wertsch, 1985, p. 4). Leaning on the work of Constantin Stanislavski, actor and artistic director of the Moscow Art Theatre, Vygotsky suggests that underneath the written or spoken text lies the subtext of thought and emotion. An understanding of the subtext or the “inner life” of the text is critical to actors in the theatre (Stanislavski, 1961). They need not only deliver lines on stage, but also create hypothetical affective worlds of their characters off stage by negotiating among actors, for the “full person” has to interact with other characters/players. The collaborative and often conditional nature of the construction of meaning brings actors away from the isolated roles of fixed characters. Instead, they must play off each other's roles, listen to the sounds of other's emotional subtexts, and respond to meet or question interpretations.

For Dorothy Heathcote (1980), the dramatic intersection of heart and head occurs when children in classrooms learn to “read implications”—to discover the meanings which lie

behind words, meanings which affect the lives of human beings. She dramatizes predominately at the edges of texts, as children create characters, scenes, and interactions which *will* be structured by the teacher and *may* be structured by a text. Heathcote pioneered the strategy of “teacher-in-role” — the practice of teacher structuring from within the drama by participating in fictional encounters alongside the students. Johnson and O'Neill (1984) explain Heathcote's position: “...the teacher, as the most mature member of the group, has not merely a right but a responsibility to intervene, since learning is the product of intervention” (p. 12).

In order to help children and their teachers learn to listen to and talk with implication, Heathcote and Horda (1980) led teachers and upper elementary school students in a variety of interpretations surrounding Percy Bysshe Shelley's famous sonnet *Ozymandias*—a tale of a tyrant's power and his lost civilization. In one activity, the children constructed a museum with waxworks that captured events they believed would “show the slow fall of the dynasty of Ozymandias to the strangers who finally conquered” (p. 13). The children then explained their exhibits to museum visitors:

- Ch. 1 (As Ozymandias) I see the ships on the horizon and I know deep within my heart that the end has come.
- Ch. 2 (The attacker) With pride I hold this dagger in my hand to kill the King of Kings, Ozymandias King of Kings.
- Ch. 3 (servant of the King) Oh the agony that I could not save my king. (p. 22)

The words the children used reveal mental states which are much dependent on emotional interpretation. As *Ozymandias*, the child uses the words “deep within my heart” to suggest that although the mental leap from ships on the horizon to certain doom is a feat of cognitive problem solving, it is sparked by a highly intuitive emotional reaction. The attacker holds his dagger “with pride” transforming a violent act into a moment of intense patriotism for his own country. And the servant does not distantly discuss the events that occurred after the King's death, but the “agony” that he felt. As Heathcote suggests,

Attitudes shape happenings, and events are their result. Each event, which is the result of attitudes, creates another shift in attitude (either by change or by refusal to change) and so creates another event. So the story is what we find we have made, as a result of the seesawing between attitude producing action, and action changing attitude (p. 5).

Thus, the stories of *Ozymandias* that these children *made* highlight both the emotional motivation of thought and their effect on other people. People in their events stress what Vygotsky (1986) calls “the personal needs and interests, the inclinations and impulses, of the thinker” (p. 10).

Yet, the intersection of head and heart is more intriguing when we consider not only individual motivations, but what happens when the motivations of one meet those of another. One can easily imagine the scene between *Ozymandias*, his attacker, and his protective servant. Lovers are not the only characters on the stage or in life who are “star crossed,” for intentions conflict and/or merge through events, solidifying

or transforming subsequent attitudes. Still, the issue here is not whether Ozymandias and his attacker could ever agree, but whether the children in these encounters can see another's point of view. Through the revelation of their highly emotional motivations, can players hear the *implications* of the others' lines? Heathcote believes that they can for "the point of view we have in life often cannot be changed, but in play and art we can adapt different ways of involving ourselves in the occasion" (pp. 4, 5).

A more recent study of drama and reading was developed by Jeffrey Wilhelm (1994, in press) for his 6th grade 'resistant' readers, who tended to read only for explicitly stated or plot information. In an effort to enable his students to recognize their authorial power relative to literature, he involved them in improvisations of brief episodes from *The Incredible Journey* (Burnford, 1961). Students spoke as if they were characters, creating responses that were replete with implications, innuendo, and possible motivations. They explored meanings implied by the text and, at the same time, began to reinvent the meaning of reading. As one boy stated, "If you're not there, in the story, you're not even reading."

Whether working at the edges or at the center of text, children learn to read and enact implications. In a study of text-centered classroom theatre (Wolf, 1993, 1994), one group of children prepared a production of *Tikki Tikki Tembo* (Mosel, 1968)—the story of two brothers who unwittingly take turns falling into the local well. Because of the brevity of his name, Chang is quickly rescued, though he is long-suffering for the accident of birth order which relegates him to secondary status. However, "Tikki tikki tembo—no sa rembo—chari bari ruchi—pip peri pembo" lies long at the bottom of the well while Chang rushes about in an effort to save him and simultaneously speak his brother's great long name with reverence. A key *implication* of this text is the relationship between Chang and his mother—for she gives Chang little credit and much grief as she dotes on her oldest son.

Two of the children who worked on this production explored the emotions behind the actions in their journals. Henry, who played Chang, wrote, "I am an unwanted boy. I act smart." This brief but telling description captures the cyclical nature of attitudes shaping action and action constructing attitudes. Chang is unloved and "unwanted" so he attempts to capture his mother's attention by "act[ing] smart." From the many discussions that surrounded this production, Henry let it be known that he well understood how children could be ignored and perhaps abused. In one interpretation of the scene, the mother was supposed to yell loudly at Chang, "*Tiresome child, what are you trying to say?*" After shrinking away from the intense eye gaze and loud shouts of his "mother," Henry stopped the scene explaining, "Cause I have enough of that at home." Perhaps because all the players could appreciate Henry's position, they offered a substitute for menacing violence with a world-weary voice of a mother burdened with daily duties as well as an incessantly tiresome boy jabbering at her side.

In his own journal entry, Bobby (who played the "mother") reflected on the nature of unwanted boys, but he wrote from the parental point of view expressing the overall disappoint-

ment that became the essence of his character:

Have you rea[d] Tikki tiki tebo? No then I will tell you all abawt it. it is abawt a mother and two boys in cinu [China] the two boys wer stopied [stupid] din't lisiin to thary [their] Mother thay [they] are lucke thay are alive.

He supplemented his words with an illustration of himself as parent looming over his two sons floating in the well. The words that appear in the bubble extending from his mouth are "I told yoo so." Never a part of the original script, these four words capture the tiredly bitter denunciation of two disobedient sons, and are reflective of the analytical conversation of the mind and heart. To get inside another character, speak her speech and think her thoughts, Bobby attempted to explain action through intention. The mother had a hard life, taking care of two relatively disobedient sons. Bobby did not see her anger directed at Chang as much as at her "favorite son" Tikki Tikki Tembo who proved to be just as disobedient when he too tumbled into the well.

As the production progressed, the boys decided to change the "mother" into a "father" and Bobby was able to understand the parental perspective even more by thinking about his own father:

Bobby: Well, ... just because like if you're a father and your favorite son is like on a baseball team ... and you expect him to do very, very good ... and you tell him like [deep voice] "Okay, now go and strike out this guy and make a big home run" [normal voice] and—you don't and it gets him really upset and he's like [deep voice] "you coulda done better than that." [Returning to the story] He's my most honored son and he does almost whatever I tell him to do and [then] he disobeys me and he goes in and he nearly DROWNS himself. So you know.

Shelby: So you're /irritated./

Bobby: /That. Ya./Ya. Just like my father sometimes.

Bobby's choices reveal the disappointment of a father whose instructions were ignored. As Bobby explained his reasoning, he moved in and out of the role of the character through pronoun shifts, speaking as both character ("He's *my* most honored son and he does almost whatever *I* tell him to do") and as self ("Just like *my* father sometimes"). Shifting from the textual scene to a hypothetical and metaphorical situation ("like if you're a father and your favorite son is like on a baseball team") allowed Bobby to enter into the thoughts and emotions of his character—to analyze and to feel the irritation of a father whose son had let him down.

When shifting into the character's world, children's analyses often fall into the hypothetical realm as they justify their decisions based on details they notice in illustration or word, on understandings they have about similar characters in real life, and on their own motivations and intentions. In the world of drama, children may or may not *identify* with the character, but they come to *believe* in the possibility of their character. They construct a narrative world for their characters, imbuing them with intentions, motivations, and reasoning that is often not explicit on the page. The performance is only the surface level; through their decisions the children

build a narrative foundation for what occurs on the surface. However, new understandings of alternative perspectives are not simply confined to the moment of performance or even postperformance reflection. Often, there are hints that the understandings children have gained in drama will become a part of what they know about the world. As they learn to read the subtext of particular situations, they come to see the implications for their own lives.

Fifth-grade students working with Brian Edmiston (1993a) engaged their hearts and heads as they dramatized at the edges of *The Journey: Japanese Americans, racism and renewal* (Hamanaka, 1990), a picture book about the experience of Japanese Americans who had been interned during World War II. The children's teacher read and discussed the text and then Edmiston worked in process drama to set up a series of dramatic encounters at the edges of the text. His goal was to bring the children to a decisive point in U.S. history when Japanese-American citizens had to decide whether or not to sign a Loyalty Questionnaire. Those who signed renounced their allegiance to the Japanese emperor and effectively to Japanese culture but were faced with conscription into the U.S. Army. Those who refused faced being branded as traitors and being sentenced to prison. Drawing on details of the book, the students first created "photographs from family albums" which illustrated both their Japanese and American heritage. Then Edmiston briefed some students playing the role of FBI agents about the Presidential decree which required them to arrest the Japanese Americans. Finally, in pairs, with one as an FBI agent and the other as a Japanese American the arrests took place.

In the so-called "relocation centers," the internees recalled what happened to them and shared their inner thoughts. One said, "There must be some mistake, we are Americans." Another replied, "I don't want to be American if they treat us like this." The FBI agents advised the soldiers at the camp that, for example, "They need to accept the facts ... this is not their country." Then the students shifted perspective to their future and spoke their thoughts as they looked back on their memory of those events. An FBI agent said, "I didn't realize it would be like this; I'm so sorry."

Edmiston next asked them to return to the internment camps and also adopted the position of an internee. He told them that he had heard that they would be let out of the camp if they all signed a piece of paper and renounced allegiance to Japan. There followed a heated and insightful discussion among the students which was intensified when Edmiston repositioned himself as the camp commander demanding a response. Their comments ranged from the boy who said, "I am proud to be Japanese. I will not say I am not Japanese just to get out of this place" to the girl who lamented, "I have to sign, my poor little baby and when she was born in the concentration camp she would die and if I sign I can never speak of my homeland again but my baby will live to tell the truth about the foolish Americans so it won't happen again."

Finally, the students concluded their work by depicting a sculpture which would show what the Japanese Americans wanted all Americans to know. The students became statues with inscriptions which they spoke aloud. One girl stated,

I've been in concentration camps, my sister's died and my daughter's gone away, but I know one thing after living through all I've gone through, you've got to be good to yourself and when doing that you can't be bad to anyone else. You try to be the best person you can be and in doing that you don't hurt anyone else.

Another said simply, "We're all different and we should be proud of all of our cultures."

The 5th-grade students were not only thinking about the experiences of Japanese Americans, they were affectively engaged as they imagined they were involved and implicated in the events of the 1940s. While dramatizing at the edges of the text, the students thought and felt deeply about the themes of the book. Their interpretations of the situations described, illustrated and implied in the original text were placed at the center of the classroom interactions as the teacher structured a sequence of encounters.

The students described above, who were dramatizing at the center and at the edges of texts, all readily adopted and switched perspectives several times. They experienced and explored attitudes as much as they adopted points of view. They also made connections between the people described in the texts and their own experiences—webs of feeling and thought which were inextricably bound together. These students' interpretations endorse the position of Ellen Langer (1989) who categorically rejected any artificial separation of feeling from thought: "Neither separating these two functions, nor trying to reduce one to the other, seems to me to make sense. Nor is it enough to see them as simply related. [We should view] them instead as part of one total simultaneous reaction" (p. 174).

Places of the Voice

In this section we discuss three definitions of voice: (a) one of vocal interpretation, marked by stress, tone, accent, and characterization; (b) one of perspective and the facility with which children and teachers shift perspectives to explore their perceptions and attitudes within situations; and (c) one of voice in terms of whose voices are heard in the classroom.

In dramatizing at the center of the text, voice is most often seen as vocal interpretation. Anger, affection, threat, tristeza, excitement, and ennui all emerge in the voice. As Bakhtin (1986) suggests, an utterance is a complex integration of word choice, emphasis, and attitude which the voice can either hide or reveal. The voice puts life to words, reflecting or obscuring the context, the manner, and the intent of the speaker. The phrase, "It's all right," for example, can be the soothing voice of a mother to a crying child, the art critic's sarcastic dismissal of a less than stunning painting, the suppressed frustration of a host to a guest who has just broken a favored momento, or the injured athlete's anxious assurance to a coach in the hopes of returning to the field. In each interpretation of the phrase, decisions in vocal attitude and emphasis highlight or shadow the inner thoughts or subtext of the speaker's meaning. A similar multifaceted construction of a phrase is described by Roman Jakobson (1960):

A former actor of Stanislavski's Moscow Theater told me how at his audition he was asked by the famous director to make forty

different messages from the phrase *Segodnja vecerom* 'This evening,' by diversifying its expressive tint. He made a list of some forty emotional situations, then emitted the given phrase in accordance with each of these situations, which his audience had to recognize only from the changes in the sound shape of the same two words. For our research work in the description and analysis of contemporary Standard Russian ... this actor was asked to repeat Stanislavski's test. He wrote down some fifty situations framing the same elliptic sentence and made of it fifty corresponding messages for a tape record. Most of the messages were correctly and circumstantially decoded by Muscovite listeners (pp. 354, 355).

A dictionary definition of the phrase 'This evening' does little to enlighten the listener; it is the vocal shaping of the context which provides the sense, not simply the meaning (Vygotsky, 1986).

Similarly, in text-centered drama, changes in tone mark the students' adoption of the external features of their characters as well as the internal features as they voice inner speech to demonstrate the thinking of their characters in their analyses, stage whispers, and asides. In exploring voice in classroom theatre, Wolf (1995) followed the vocal interpretation of three children—Bart, Stella, and Tomás—as they enacted William Steig's (1982) *Dr. De Soto*—the story of a mouse dentist with a problem. While Dr. De Soto ordinarily refuses to treat animals dangerous to mice, he and his wife decide to treat a fox in a moment of weakness. Under the influence of gas, the dapper but devious fox reveals his plan for the ultimate demise of his helpers. In the face of such a threat, the De Sotos spend a worrisome night wondering how they will be able to insert a new gold tooth without self-sacrifice. They devise a marvelous plan, affixing the tooth and resolving their problems by offering the fox a secret formula which will rid the patient of further toothaches. The fox quickly agrees and his teeth are painted with the secret formula. However, after he is told to hold his teeth together tightly for a full minute, he discovers that he cannot open his jaws. His teeth are glued together! The De Sotos smile victoriously as the fox stumbles away.

In the final performance of their play, Bart (as the fox) swaggered onto the classroom stage, his top hat tipped recklessly to the side. Tomás (as Dr. De Soto) wore a white coat and was in the midst of organizing his "instruments" (a child's toy doctor kit) when Bart entered. Tomás immediately began to pace back and forth, shooting nervous glances in Bart's direction. He then hid under the desks to create the effect of having disappeared into the fox's mouth. Bart pretended to snap his jaws shut and then chortled loudly at his own humor. But Tomás emerged from the desk and said "*Be serious*" in an authoritative "get down to business" tone. After the operation, Bart ran his tongue over his teeth and exclaimed "*My it feels good, honey!*" Then he tucked his head down and lowered his voice to a stage whisper, "*I really shouldn't eat them. On the other hand, how can I resist? Ya!*" Later while applying the "secret formula," Tomás painted Bart's fake fox teeth carefully with a paintbrush, while Bart leaned in to accommodate the process. Yet, when he realized that his teeth were stuck together, Bart leapt off the stool and turned in amazement to face the clever doctor and his wife. As Stella,

who played both wife and narrator read the lines: "*The fox was stunned. He stared at Doctor De Soto, then at his wife. They smiled, and waited,*" she looked up from her script and joined Tomás in a heartfelt grin, their eyes, all the while, on Bart. The eye gaze, touch, tone, and intonation all combined to join the characters in the time, space, and relationships of the play. While Bart's eyes registered stunned disbelief, his actions and those of the successful De Sotos, created a believable scene.

Each of the children leaned on the language in the play to communicate their character and scene. Very early in rehearsals, Bart began to add "cocky" additions such as "honey" and "baby" to the end of his lines. He only added one or at most two words to the entire script and the additions appeared at different points in different rehearsals. In discussions with fellow players, he did not appear to have a fixed plan of where these additions should fall, only that they should be inserted at some point. In the final performance, however, he added the word "honey" to his first line, and this addition, combined with his "jive" tone, set the entire audience into giggles. Their reaction seemed to trigger an alternative decision in Bart, for he then abandoned his more conservative plan of only one or two additions and instead added *six* new endings which included one "baby," two uses of "honey," and three supplementary expressions of either "Ya!" or "Ah!" The audience went wild. Through cocky endearments slurred carelessly over the tongue, Bart copped an attitude with his character—a fox who was sly and sinister but humorous as well.

The character of the dentist was less dramatic, and Tomás played it accordingly. He adopted a professional air—though he did appear to be extremely nervous at first sight of the fox. His face was set in a serious expression, and his vocal interpretation was a careful match—deep-voiced and dignified. Stella, too, was more serious. She played the part of Mrs. De Soto but had no character lines. Instead, she read all the narrator's lines, emphasizing the words with a slight increase in volume. After Tomás, her husband, succeeded in gluing the fox's teeth together, Stella read, "*The fox was stunned*" elongating the vowels with a musical lilt. Her choice emphasized a key word to show that the De Sotos' trick had worked, and her musical tone highlighted the pleasure of her character's success. Had she been able to express her character's inner thoughts, they would no doubt be striking a triumphant chord.

In dramatizing at the edges of text, students adopt multiple perspectives and speak in many voices. In their interactions, their discourse becomes what Bakhtin (1981) calls "multivoiced", if they talk about different concerns from varied points of view. Their voices are not only vocal interpretations of imaginary people's expressions, but a montage of multiple positions and perspectives on the world. As Carroll (1980) has shown, in such dramatizing students use different genres and also shift among different registers and modes as they use language for multiple purposes and varied audiences.

Working at the edge of the *Dr. De Soto* (Steig, 1982) text, Edmiston (1988) led 1st-grade students to imagine they were all mice dentists wondering what to do about foxes and other dangerous animals in need of dental care. The De Sotos had

come to them for advice asking whether they should help the suspicious fox who needed a new tooth. As the children wondered about dangerous animals, they made signs for their offices (some consulted the text for their words while others wrote their own), they made a television commercial advertising their offices for all “nice animals,” and they practiced what to do if a fox came to their offices. They gave varied vocal interpretations and used language in multiple ways.

If with Vygotsky (1986) we connect language with thought and feeling, we realize that as students talk they do more than use words, they explore alternative ways of thinking and feeling about the world. The possible worlds created in dramatizing at the edge of the text open up limitless opportunities for social interactions and explorations in multiple dramatic encounters. In every encounter, students adopt positions or points of view from which they can voice their reactions and thereby create new meanings and understandings. As they find new voices, they also see the world in new ways. The mice dentists in Edmiston’s study (1988) were not only talking as animals, they were thinking and feeling about multiple ways of reacting to dangerous situations where they could keep enemies out, warn them to stay away, attack them, ignore the danger, be clever and outwit them, talk nicely to them, and so forth.

As students engage in dialogue, their voices intermingle and their meanings and understandings continue to develop and change. For Bakhtin (1981), genuine dialogue is much more than a conversation; in dialogue we listen to each other, exploring social and cultural references and experiences, and change the way we think in doing so. A script contains repeated encounters where students can see how characters do (or do not) listen to each other and react to what others say and do. Plays are concerned with how characters change or resist change in the situations they find themselves. The De Sotos in the text considered but did not agree with those who refused to help foxes—they changed their ideas and came up with a novel way of protecting themselves and the fox from his desires to eat mice. In dramatizing at the edge of the text, each encounter between teacher and students or among the students is an opportunity for dialogue and change in understanding. Although students in improvised dramatic encounters may talk but not listen, the 1st-grade mice dentists dialogued with each other and considered multiple ways of dealing with danger—some agreed, some disagreed, and many changed from their original positions.

The teacher, who functions as playwright, stage manager, director, and actor (Edmiston, 1993b) is critical in promoting dialogue through both external and internal facilitations. Structuring externally is what good teachers do all day long as they help students create limits for their work together. This is essential in dramatizing at the edges of texts to ensure that encounters or tasks do not end before they have begun. It is also critical that students explore possibilities with others as well as express themselves. The teacher can be clear about choices and about a task’s purpose or outcome. For example, at one point, the 1st-grade students chose what to work on—the dentist office notices, the letters, or the commercial. All knew who their audiences were, the purpose of their task,

and what to do when they had finished. The teacher can also set up encounters with dramatic constraints (Bolton, 1992) or other obstacles which increase dramatic conflict but create spaces where students can interact with each other. Students may, for example, interact in pairs, make a tableau in small groups, or collectively demonstrate an event. For a few minutes in the text-edged *Dr. De Soto* work, half the students were foxes and the others were mice hiding to watch them. They were all constrained by their physical separation; the foxes could not eat the mice even if they wanted to and the mice had to watch and listen if they wanted to try to figure out if all foxes were dangerous. Since some foxes behaved like dogs and others were planning to eat chickens or Little Red Riding Hood some children were still unsure whether or not to trust the one who had come to Dr. De Soto.

Structuring internally the teacher enters the drama world and encounters the students. The 1st-grade students talked with their teacher—she was a fox with a toothache and they decided that they were mice pretending to be wolves. Some children were unsure whether or not to trust the fox. They asked her about what she liked to eat and whether she liked to eat mice. She drew on the original text and said that she would not want to eat a mouse dentist, but she did love mice and licked her lips. In reflection, the children all agreed that they had to be cautious. Recognizing that the power relations among teacher and students can become malleable in fictional encounters, the teacher may construct various positions of power relative to the students—higher, equal to, or lower (Morgan & Saxton, 1987). She does so in order to present students with other voices with which they can dialogue and discover new perspectives, create new understandings and find new voices in reaction. When the teacher was a mouse dentist she and the children had an equitable power relationship so the children could more easily agree or disagree with her. When the teacher was the fox being interviewed, in one sense she was more physically powerful since she could have attacked them. Still, in another sense the children could exercise more power since they were outwitting the fox. The children were, however, listening intently to what the fox was saying and to one another’s ideas—they wondered together about trusting foxes and about the nature and meaning of trust. The multiple encounters possible in dramatizing at the edges of the text allow students to adopt and shift perspectives many times. In doing so, students’ interpretations and understandings can become more complex. Some 1st-grade students who were very trusting became more cautious by the end of the drama, others who had been ready to kill all foxes came up with a plan similar to the De Sotos—they decided to give him more gas and then lead him outside when he was half asleep.

In these dramas, students’ ideas are given a platform or stage that enables them to test their voices through perspectives and situations that are quite unlike the ones they encounter in typical classroom contexts. As Delpit (1988) and others have argued, power differentials are inherent in classroom interactions; and these differentials can be used to silence children who are uncertain about the purposes of the teacher’s instructions, who do not accept the premises of the approach to teaching and learning in the classroom, or who

recognize that their voice, because of their race, ethnicity, class, or gender is not going to be heard. Dramatizing encourages teachers to use and shift their power in a way that may make our beliefs and practices relative to our students more explicit and open to change. As described above, in dramatizing at the edge or at the center of texts, teachers must create openings for dialogue, and then they must listen. It is the kind of listening Delpit describes that requires:

...not only open eyes and ears, but open hearts and minds. We do not really see through our eyes or hear through our ears, but through our beliefs. To put our beliefs on hold is to cease to exist as ourselves for a moment—and that is not easy.... it means turning yourself inside out, giving up your own sense of who you are ... but it is the only way to learn what it might feel like to be someone else and the only way to start the dialogue" eliminated quick work (p. 297).

Places of the Hand

In this section, the "hand" serves as a metaphor for the integration of all that players do to take a text into action and create their own interpretive stances. Though we do not wish to dichotomize, we find it useful to distinguish between two kinds of stance—physical movement and mental action. The first stance is the physical attitude demonstrated by the player through body movement and orientation, gesture, eye gaze, facial expression, and the use of props. The second stance is the mental attitude and action that is aroused by physically shifting into the possibilities of a play world, and by allowing interactions in that world to affect and change the players' understandings and attitudes. Wertsch (1991) explains:

When action is given analytic priority, human beings are viewed as coming into contact with, and creating, their surroundings as well as themselves through the actions in which they engage. ... This contrasts ... with approaches that treat the individual primarily as a passive recipient of information from the environment (p. 8).

In stressing action, we move from the transmission of meaning to the generation of meaning, for mental action is "often socially distributed and it is connected to the notion of mediation" (p. 14). In stressing dramatic action, we note that students not only discover new possibilities, they also transform *themselves* in the process of transforming the words or situations of a text. Maxine Greene (1988) states it succinctly: "It is, actually, in the process of effecting transformations that the human self is created and recreated" (p. 21).

As Kenneth Burke (1969) noted, dramatic action can be contrasted with movement—action is consciously willed and the result of a choice, whereas movement can be reactive and instinctual. Vygotsky (1978) argued that paradoxically in play we are more in conscious control than we are in non-play situations because in play every action becomes significant. Thus in drama, students tend to be more deliberate and conscious of their actions especially as symbolic meanings are generated during a sequence of encounters.

In text-centered drama, the focus is often on the body or the first stance. Physicalization calls for the player to embody the emotion of the words in the text into the motion of the

character. Stanislavski argues that the gesture can often contain the key to meaning: "If the intellect can inhibit, and the emotions are fickle where can an actor begin in his exploration of a role? The answer is with what is most immediately available to him [sic], what responds most easily to his wishes—his body" (Benedetti, 1982, p. 67). Langer (1953) explains that each utterance must spring from thought and feeling which begins inside the speaker's body, "so the actor has to create the illusion of an inward activity issuing in spontaneous speech, if his [sic] words are to make a dramatic and not a rhetorical effect" (pp. 315, 316).

Wolf (1994) followed three children—Jewel, Catalina, and Maia—as they enacted *Mirandy and Brother Wind* (McKissack, 1988)—a story about an African-American girl who persuades the wind to instill his spirit into her friend Ezel, and together the two children high step their way to first prize at their community cakewalk. The physical movements the children chose were carefully planned. Maia, in her role as Mirandy, for example, incorporated a number of movements which she designed in rehearsal and repeated in the final performance. When she warned Orlinda not to tease about Ezel, Maia approached Jewel with her hands on her hips, flung back her head, and walked away. When she was in the barn, supposedly regretting a foolish mistake, she paced back and forth with her finger to her cheek, as though in studied concentration. When she danced across the floor, she kicked her thin legs high at the fan that Jewel held out to her. And when she was presented with the cake, she turned proudly toward the audience, holding the cake up like a well-earned prize.

Weeks after the final performance, the girls were able to hold on to the physical patterns they established for their characters. When Wolf asked them to pose in character for a photograph, they immediately chose the scene of the confrontation between Mirandy and Orlinda when Mirandy boldly announces that she and Ezel will win the cakewalk, while Orlinda and her friend look skeptically on. As Jewel, Catalina, and Maia took up their own positions, Jewel who played Orlinda adopted the hands-on-hips stance of Mirandy, leaning toward Maia with a smirk on her face. Maia did not take the stance offered by the text but instead folded her arms in stubborn defiance. Still, the thrust of Maia's chin was a mirror image of Mirandy's and revealed the determination that was strong in the character as well as in the child. Just as the character of Mirandy in the story captured Brother Wind, Maia captured the character in the thrust of her chin. The girls' body positions demonstrated an understanding and internalization of the story's central mood and the primary attitude of the characters that helped establish this mood. Such perceptions did not receive specific labeling in their talk before the photo. These understandings emerged from extended discussion as well as physical exploration of the story. Through their positionings, the girls expressed their textual understandings of character both in posture and in facial expression.

Enciso (1990, 1991, 1996) shows that as readers, we may go "inside" a book as we adopt the perspectives of characters, empathize with them, spy on them, argue with them, and even try to lend them our help and advice. However, when we *talk*

about literature, we are always outside the world of the story and are no longer experiencing it except in retrospect (Edmiston, 1993a). In drama, however, we can enter the world of the story with others. Our private world of literature can become a drama world, a public shared world of the text in which we can walk around and interact with other people in role. Heathcote (1984) uses the phrase "now and imminent time" to describe the feeling that an experience is happening now rather than in the past. In drama, we feel we are in the middle of events that concern us or are happening to us because in our imaginations we are in the same world as in the story. What we say and do within the drama is not just a detached comment about the world of the story. On the contrary, every action and inaction affects that world directly and affects the person we imagine ourselves to be in the drama world.

Working at the center of text often spreads out to the edges. In other words, *physical stance* within an interpretive text action can sometimes motivate a *mental stance* that leads to a highly personal reaction. This is exemplified in the work of Nancy King (1981) who often uses drama to move from literature to life. Working with the text of *The Big Wave* (Buck, 1948), she asked students to enact scenes in the book that affected them most deeply. One group formed a huge wave and swept everything up in its path. King (1981) explains:

The villagers tried to flee, to protect themselves as best they could, but the power of the wave was too much. Soon everything was swept away and nothing remained but an empty, silent space.

As the lone child returned to the quieted waters she looked around in horror at the emptiness. Slowly the full meaning of what had happened penetrated her being, and she sank to her knees and rocked with despair. Clutching her small toy to her chest, she crooned a chant that was half sound, half sob. Then there was only silence.

... The group was preparing to discuss their feelings about the book when one member of the class who had been watching, an eight-year-old boy, suddenly got up from his seat. Without paying any attention to anyone else, he ran to the girl, knelt down in front of her, took her face in his hands, and said, "Come with me. You can live with me and my family. We will help you." The girl looked at the boy as if not fully understanding his words. "Come," he repeated. "Come with me to my family in the mountains. There you will be safe." The girl followed the boy, still holding on to his hand. She left the space in the middle of the room and sat down in a seat next to his (p. 165).

The physical stance of one child—sinking to her knees, rocking in anguish, grasping a toy as if it could save her—led to a mental stance in another child—a boy who thought he *could* save her by offering her a place to stay, taking her hand, and leading her away from the scene of her pain. Later, in a discussion of times when he himself had felt terribly alone, he explained his actions, "When I saw [her] all alone, it reminded me of how I feel, and I just wanted her to know that she still had a friend" (p. 165).

In dramatizing at the edges of the text, players also consciously use and link their "hands": their bodies demonstrate physical attitudes which others interpret and they take actions

in dramatic encounters which transform texts, situations and themselves. Gavin Bolton (1981) describes a particularly vivid example. At the resolution of process drama work which took place in South Africa several years ago with black school students, Bolton positioned them as old people looking back on the changes which had taken place during the imaginary time of their lives. They imagined that apartheid had ended. One student extended his hand to Bolton—a white teacher. Bolton read his gesture and shook hands as the student said with confidence and dignity, "Now we are equal."

Throughout the Japanese American work (Edmiston 1991, 1993a), players demonstrated their mental and emotional attitudes through physical action. For example, some of those who were arrested initially resisted—their bodies struggling against the arresting agents. Others were stoically still as they packed their belongings with dignity. In the internment camp as they deliberated over whether or not to sign the loyalty statement some sat hunched over in despair, while others sat upright as they refused to reject their cultural heritage. Players repeatedly took action to express their reactions. They had many choices—how to react to racist remarks, how to act when arrested, whether or not to sign. Their actions and reactions also affected each other and led to further reactions. When some were resisting arrest, others argued that they should not behave in such an undignified way. When one wanted to join the army, others tried to talk her out of this decision. When one jumped up and cried out that they were being denied justice, others leapt to their feet as well.

The "hand" or the active mental and physical stances represented in the body cannot be separated from the heart, head, or voice. Instead, they intersect and influence each other within the individual and among individuals. Eisner (1985) is highly critical of the discourse of separate "domains" of knowing—cognitive, affective and psychomotor—for it tends to reify distinctions and privilege discursive and logical thinking, rather than emphasize that processes of meaning making involve all modes of being and interacting. In drama, we understand through shaping and reading movements and actions as much as through our words and emotions. In other words, we cannot extend our hand without putting heart, mind, and voice behind it.

CONCLUSION: DRAMA WORLDS IN SEARCH OF A CLASSROOM

In the 1920s, Pirandello wrote a play in which six characters unexpectedly appeared in a theatre rehearsal to tell their stories. They described themselves as unused creations of the author's imagination and performed key scenes which, though never written, contained the content of their lives. Their search for an author stemmed from their desire to play their parts not for eternity, but "only for a moment." As the lead character explains, "The drama is in us, and we are the drama. We are impatient to play it" (1922, p. 219).

In much the same way, dramatizing at the center and at the edges of text are rarely used creations searching for classrooms that will make room for the integration and expression

of the head, heart, voice, and hand. The “places” that we have described in this chapter have no borders. Instead, thought and emotion, articulation and gesture all merge in environments where children and teachers act together to negotiate the dramatic interpretation of texts through multiple voices, perspectives, and symbolic systems. While the voice of written texts is stronger in text-centered forms, children’s individual and negotiated needs and narratives are heard throughout.

In literacy instruction we often focus on children’s identification of discrete elements, but we ignore the possibilities of discrete elements in other symbolic systems and their potential for use of metaphor, emphasis, and parallelism. Moreover, we ignore uses of pause, nonverbal gestures, and facial expressions or eye gaze as symbolic elements to underscore, complement, or negate verbal meanings. The enactments described here combine the verbal with the nonverbal to create a theatre in the round of children’s interpretations of texts and their needs to express these interpretations. The texts they ultimately enact are rich orchestrations of multiple symbolic systems which simultaneously analyze the action of the story with a call for action in the real world.

Much of the current work in restructuring and rethinking education, particularly in literacy education, is on putting theory into practice—taking into account the multiplicity of voices and perspectives in text interpretation, reminding teachers of the power of negotiated action through group work and peer discussion, as well as reflecting on the possibilities for mental action through alternative symbolic systems; but we continue to measure new theories with old practices. We test students, but we do not carefully examine the breadth or depth of their knowledge. We do not acknowledge authentic deeds accomplished by verbal displays of knowledge as well as by other symbolic systems.

As teacher education programs introduce these issues to beginning teachers, there is a tendency to ignore the students in the cycle (Wolf, Carey, & Mieras, 1996). Much of the discussion in education is about teachers as reflective practitioners and stresses theories into practice in terms of interpretation of text, movement into action, with action by teachers to create a context for learning given analytic priority. Yet it is critical to remember that students are reflective practitioners as well (Edmiston & Wilhelm, *in press*). The students described here immersed themselves in written story in order to tell a number of stories about who they were and what they knew. These children were not passive recipients of knowledge, but active participants who were able to generate, negotiate, and enact their own understandings. Moreover, the children were given opportunities to reflect on their learning and their creation of a learning environ-

ment in their actions, their writing, and their talk. They played and worked not only in “now and imminent time” (Heathcote, 1984), but beyond the vivid immediacy of the moment to make decisions for how they would live their lives.

The negotiation and interpretation of text is a living, protean, and richly varied creation in a classroom of children. Children of different linguistic, cultural, social backgrounds bring diverse gifts, symbols, and methods of accomplishing tasks in language, art, music, and drama. While some children leap to the director’s role seeing the scene as a unified whole, others add the much needed creative details, while still others provide stability, decoding expertise, humor, artistic advice, or practical experience about the way things work in the real world. In traditional classrooms, children’s individual thoughts and talents are often separated from their peers as children work in isolation and through uniform symbolic systems for expression. But in the collaborative work of dramatic interpretation, individuals come together to create new understandings. In the enactments of seemingly simple scenes, multiple sources of knowledge meet together; individual stories, voices, dialects, accents, resources, and reflections flow into a rich representation of a community of learners. The multiplicity and diversity of contributions represented here offer just a glimpse into the resources available when children have opportunities to call on personal experiences, narratives, and ways of working in the world. In such an atmosphere, cultural preferences as well as individual learning styles, find room for expression.

Nearly 60 years ago, Rosenblatt (1978) reminded us of the links between literacy and drama. Yet, drama still hovers outside of classrooms and rarely appears in the research literature (Wagner, *in preparation*; Wolf & Enciso, 1994). Although there is much anecdotal information on the “benefits” of drama, teachers and researchers need to more formally substantiate and carefully describe the transformations that occur when children meet drama. The research studies we have presented here will hopefully serve as a spark to fire the imaginations of teachers and researchers willing to offer children more room for expression and eager to think in new ways about how meaning is created in the world. As teachers and researchers of drama, we find ourselves in much the same position as Pirandello’s (1922) lead character, for we are impatient to see drama play its role in more and more classrooms. The drama worlds that we have described here offer children and their teachers much needed room for interpretation and expression. Is this not simply carrying to its ultimate manifestation what each of us as teachers and researchers of literacy must do?

FROM STORYTELLING TO GOING ON-LINE: LANGUAGE AND LITERACY OPPORTUNITIES IN THE ELEMENTARY SCHOOL

Marilyn C. Scala and Virginia C. Schroder

MUNSEY PARK ELEMENTARY SCHOOL, MANHASSET, NY

Literacy thrives in environments rich in conversation, so that educators constantly seek innovative methods to foster meaningful conversations within curricula boundaries, without increasing the burden of content to be taught.

Two tools for encouraging literate conversations are storytelling and technology—the old and the new. Storytelling encompasses personal narratives, myths and fables, and the performing arts, while technology assumes a broad definition that embraces television, video, and computer use. Both can be woven into the fabric of existing subject matter, offering new venues from which to see and explore content, and new opportunities for language growth and exchange.

The intellectual, social, and aesthetic values of literacy are learned individually, in small groups, and in whole class settings. However, storytelling and technology are best used in interactive settings where students are exposed to multiple perspectives and global understandings.

In this chapter storytelling and technology are examined in light of their effectiveness as aids to literacy and language development.

STORYTELLING: RATIONALE FOR USE

The telling of stories is part of our daily lives and provides a natural environment for teaching language and literacy. Storytelling is a universal experience, encompassing that which is oral and written. Originally, storytelling was an oral tradition and the means for elders to pass down a culture's values to their young. Families for generations have told stories to entertain, express hopes and fears, instill values,

and pass on family traditions. Now storytelling is valued not only for its family traditions but for its benefits to children's literacy. It is a natural link between home and school. It is listening to a parent, teacher, or librarian read a wonderful book. It is family and personal stories told in unique narratives. As Heather Forest, a professional storyteller for over 20 years, says, "Storytelling is a root of language" (Shedden, 1990, p. 11).

Learning history through journals and letters is history by storytelling. The telling of stories includes myths, folktales, legends, fairy tales, tall tales, and fables of all cultures so that:

students begin to know the stories that people everywhere, throughout time, use to teach their young the rules for human conduct, through metaphors for bravery, greed, faithfulness, envy, change, pride.... Children can look deeply into myths, see themselves, and make connections between themselves and all the people who live and have lived (Reinehr, 1987, p. 7).

Storytelling enriches existing curriculum with aesthetic principles. Aesthetic knowing is a synthesis of cognitive, affective, intellectual, and emotive skills (Sienkiewicz, 1986). While listening to and telling stories in an endless variety of ways, students develop language skills, gain confidence, and learn how to think inventively and take appropriate risks. When students and teachers create stories about their experiences, they include their interpretation of that experience. By listening to the perspectives of others, students expand their ability to make sense of the world through more generalized knowledge and understanding. Developing skills of perception affects their lives as citizens in a global community. Aesthetic education is not an enrichment of academic programs but an integral part. Storytelling is not a separate entity

but a part of the curriculum in reading, writing, show and tell, and much that teachers already do.

Storytelling embraces all that is communicative and visual. It is appropriate for all grade levels. It fosters cognitive, language, and social development in students, and connects reading, writing, listening, and speaking with performing arts skills.

Research shows that storytelling improves retention. "Stories are more easily remembered and recalled than a series of unrelated 'facts'. For example information is more readily retained when reading a journal of a Civil War soldier or watching parts of the Civil War film series by Ken Burns. Rudyard Kipling said that if history were taught in the form of stories it would never be forgotten (Hamilton, & Weiss, 1990, p.132). All students benefit from storytelling, and it is especially an important resource for students with reading difficulties. Hamilton and Weiss (1990) found that listening skills, comprehension, and confidence improve with these activities.

WAYS TO USE STORYTELLING

Several types of storytelling for classroom use are discussed in this chapter. Teachers encourage family stories; they retell myths and fables; and they incorporate literature into readers' theater and story theater. Partnerships with cultural institutions offer another resource for communication and literacy.

Family Stories

Shelley Harwayne, in a class in New York City's P.S. 149, gathered students in a comfortable circle to share stories, memories, and moments. She told her class:

In every family there are stories we tell over and over. These are stories that hold us together as a family; stories of coming to America, of how one child got his name, of the day we found a turtle on the highway, or named our dog, or got stuck in a rainstorm (Calkins, 1991, p.28).

Then she told a story of her own. This warm-up and the intimacy of the group experience released a flow of stories from the students. Classrooms are turned into communities by shared stories (Calkins, 1991).

When listeners are actively involved, there is more intense focus between teller and audience, whether between teacher and students or student and student. Teachers find students very supportive of each other as they coach one another in their storytelling skills.

Family stories give teachers insight into how families interpret their experiences. They are also good beginnings for research skills. Gathering family stories requires interviewing, note-taking, oral storytelling, and writing. Children become involved in this type of research because they are writing about events close to them and about which they have knowledge (Harste, Short, & Burke, 1988).

Ralph Fletcher (1993), in conducting reading and writing workshops for teachers, intersperses his classes with personal stories and poems as well as trade books. These stories trigger

ideas, helping teachers connect with their own stories. Teachers who on Monday felt they were not writers and had no stories to tell, by Friday had formed an intimate community as they shared their narratives. They left the group experience trusting their personal voices and respecting the stories of the others. Teachers also gained insight from their experiences confronting the empty page in this workshop as "students." Nancie Atwell, in her book *In the Middle*, (1987), shares valuable techniques on how to confer with students so that they can discover what is significant in their everyday lives.

Readiness to write often comes from storytelling, shared responses to literature, and journals and writers' notebooks. After sharing thoughts and stories, it is natural to record the memories and moments in writing (Calkins, 1991, p. 31).

Professional Storytelling as a Resource

Marni Schwartz, a storyteller, also believes that telling personal narratives is the way to introduce children to storytelling. Her students find their stories by searching for story memories from books read, movies, TV, and family experiences, and sharing them in what she terms "a fabulous 'jam session' of tellers" (Schwartz, 1987, p. 605). When children choose myths and fables to learn, they need to prepare and work on them as they would a piece of writing to make it their own. Schwartz stresses that students need a variety of models and time to bring them to life. Her students research versions of a story or film to find the way they want to present it. They draft a telling much as they would a piece of writing, experimenting with introductions and endings.

In storytelling, as opposed to plays, students are encouraged to visualize the story in scenes rather than memorize a script. Heather Forest says she creates a story by putting the motion picture image in her mind into words (Shedden, 1990, p.12). It is important to retain key phrases, though, because the impact lies in the language such as, "Then I'll huff and I'll puff and I'll blow your house down" (Cullinan, 1989, p. 63). Drawing story sequences and story mapping are effective ways to visualize the story while learning it. By not memorizing, students are encouraged to make the story their own and are released from the constraints of a right or wrong way. Since children are exposed to powerful visual sources—television, movies, picture books—it is important to let them rely on their own visual imaginations in storytelling so that they can trust in their own ability to form images.

When children are read to, they learn about story structures. When they tell stories, they learn to manipulate and control them. As they internalize these structures, comprehension improves considerably. Listening skills improve. When a story is told rather than read, the bond between teller and audience facilitates a more focused listening. In storytelling children are more involved and more likely to use imagination to create alternative solutions to problems. The classroom, as a storytelling community, becomes a safe environment in which to take risks, elaborate, invent, explore and grow (Trousedale, 1990, p. 173).

Just as a piece of writing enables teachers to know a child better, storytelling helps the teacher to see a child in a different way. Children bring to storytelling the authority of

personal information and knowledge, imagination, and problem-solving strategies. The process provides ways to construct meaning and to verbalize experiences. Much of the power is in the sharing, the relationship and interaction established between teller and the audience through body language and eye contact. When teachers assess students' growth after storytelling activities, they find that the experiences improve self-esteem as well as language and aesthetic perceptions. Children of all abilities are enthusiastic in their comments after storytelling experiences. Many especially express pride in overcoming their anxiety of speaking in front of a group (Hamilton, & Weiss, 1990, p.15). Becoming a confident and competent speaker is a lifelong skill.

When children tell stories of their own experiences, as well as historical and fictional ones, they become more socially aware and responsible (Dyson, 1990, p. 194). Learning is the process of connecting current experiences to past stories. Through discourse and reflection across ethnic and religious lines students and teachers reach new understandings. Storytelling takes students from their personal environment to more global understandings.

Maxine Greene, Professor of Education and Philosophy at Teachers College, Columbia University, states that stories encourage reflection on the diversity of human experience and help us recognize that there are always multiple perspectives (Dyson, 1990, p.194). Reinehr believes in the power of a story to fill children with hope. She states that we need stories of every genre, "told and retold by every culture throughout time, because we all need redefinitions of what it means to arrive safely after difficult journeys" (Reinehr, 1987, p. 1). She uses *The Lion, the Witch and the Wardrobe* by C. S. Lewis (1950), *Harriet the Spy* by Louise Fitzhugh (1964), *The Hobbit* by J. R. R. Tolkien (1937), fairy tales, myths, and legends of Native Americans as examples of literacy journeys. Although vocabularies are enriched, of equal importance is the fact that these stories provide a medium in which diverse people can stay in tune with each other. Through stories—oral, written, sung, performed—teachers can promote an increased understanding of the past and present.

Readers' and Story Theater

Readers' theater is a kind of oral storytelling in which literature is the focus. Students read orally from scripts adapted from selections of literature. Voice and some facial expressions and gestures make the characters and narration come alive. Stories with dialogue and a strong plot work best. Students and teachers can adapt scenes from a book to discover the various points of view of the characters. When groups give different readings of the same story, children realize that reading is an open process of constructing meaning and that there are many interpretations of texts. (Harste et al., 1988) Like storytelling, there is an audience. Unlike plays, there are no costumes, sets, or memorized lines.

Story theater is another way to extend meaning through storytelling. In story theater, a narrator reads while players perform the action described. Simple poems, folktales, and stories with plenty of action and less dialogue work best.

Teacher Training in Aesthetic Education

School districts across the country are working collaboratively with performing arts institutions to enhance their curriculum with the philosophy of aesthetic education. The Lincoln Center Institute was created in 1975 by Lincoln Center for the Performing Arts in New York City. Its goal was to further a commitment to education by providing aesthetic education programs to teachers and students. The Institute is associated with Teachers College of Columbia University and Dr. Maxine Greene, and also with the education department of The Museum of Modern Art. Dr. Greene describes aesthetic education and authentic learning as a matter of going beyond. "Is it not exploration generated by wonder, curiosity, open questions?... And is there not a special pleasure, a delight found in the discovery, in the sometimes startling realization that what is being learned affects the manner in which we make sense of our world?" (Greene, 1980, p. 9, 10.) She goes on to say that the more informed we are, the more sensitive we are to the complexity of the world.

Lincoln Center teaching-artists work directly with teachers during summer sessions and with teachers and students during the school year with the work of art as the text. Mark Schubart, President of the Institute, states that its purpose is to enhance children's perceptions and their ability to express themselves and communicate creatively, not to train a generation of professional artists. It is an interdisciplinary process with the goal of teaching aesthetic perception and how these understandings relate to other aspects of life, not the acquisition of knowledge about a specific body of literature or specific performance skill (Schubart, 1972). It is in this philosophy that aesthetic education and literacy as well as aesthetic education and curricula become natural partners in our schools.

Teachers and students explore aesthetic issues in dance, music, theater, and visual arts. The workshops include hands-on activities such as movement exercises and improvisation with professional artists as well as attendance at performances in the various art forms. Within this structure, teachers find ways to relate dance, music, drama, and visual arts to areas of the curriculum. For example, in their classrooms teachers and children collaborate in small groups creating movements to discover how choreographers use dance as an expression of the social issues of a time. Baroque style dance is examined for the political/social/musical climate in which it was developed. Poetry and drama combine in a workshop with the theme, youth and democracy, as explored by Paul Lawrence Dunbar, Langston Hughes, Alice Walker and others. Jazz is studied to learn how this conversational music reflects the America in which it developed. The Greek myth of Orpheus and the Andean mountain tale of Delgadina are examined through language, movement, dance, and improvisation. Educators and artists adapt fairy tales, fables, and legends into contemporary lessons evoking insight and identification. Teachers "learn how artists make aesthetic choices; how to develop skills of perception, communication, and understanding applicable to other curriculum subjects and to other aspects of life" (Summer Session Bulletin, 1994). In workshops, the use of observation, questioning, and studio projects fosters

awareness of diverse cultures. Literature as an art form is explored through active engagements in the same way teachers explore literature in their classrooms through reader responses.

Key elements in the Lincoln Center philosophy of aesthetic education are collaborative and interactive teaching and learning. Teaching is seen as a lifetime journey of personal and professional growth. Teachers are asked to integrate new information into their teaching, to approach their jobs in new ways, and to recognize that everyone is a learner, adults and children alike (Sienkiewicz, 1986, pp.146, 147).

Exploration is done within small groups in a nonjudgmental environment. Sensorimotor skills are unified with cognitive skills. In 1993–94, 1,500 teachers from 260 schools participated in the Lincoln Center Institute partnership. Teachers and teaching artists made aesthetic education part of the classroom experience for 100,000 students. The Institute's model is being developed in other cities across the country. Partnerships of school districts, colleges, cultural institutions, and artists are fostering aesthetic education as a significant component of education today.

There are many ways and reasons to tell a story. The pleasures of stories are obvious. But the importance lies in their educational value. Using storytelling as a tool across curriculum areas teaches not only the components of reading, writing, listening, and speaking but also aesthetic understanding and collaboration which will provide today's students with the balance they need for the 21st century. When asked how they implement various aspects of storytelling in their classrooms, teachers report that networking with colleagues and sharing expertise are the most valuable and time-efficient ways to branch out into new delivery methods.

TELEVISION AND VIDEO: RATIONALE FOR USE

About 30 years ago, educational television joined the ranks of filmstrips and movies as one of the technological tools available for classroom use. When videos were developed the scope of television use in education became even broader. Teachers could purchase preprogrammed videos to augment the curriculum, or tape programs from commercial TV to use in the classroom (Wilson, & Tally, 1991, p. 9). Many educators believe that the promise of these innovative tools has never been fulfilled. Indeed, it is estimated that as of 1992, only about half of the nation's teachers had experienced using television and technology in their teaching (Texaco / Thirteen: National Teacher Training Institute 1991–92).

Television as an entertainment medium has sometimes been blamed for a decline in literacy, language use, and curiosity about the real world. Studies have shown that a steady diet of solitary TV viewing results in a reduced ability to form oral sentences or solve verbal problems (Cheney, 1983, pp. 54–58). Other studies, however, conclude that although television viewing does not augment vocabulary development in young children, it does not adversely affect it either. The impact of television viewing on children seems to depend on what is viewed, who is doing the viewing, and what precedes or follows the viewing. For every study made, other studies

show reverse findings. It is agreed, however, that television could exert a more powerful influence on social and language growth than it has (Comstock, 1991).

While there is still much to learn about the most effective ways to integrate TV, film, and video into existing classroom programs, progress has been made in understanding their potential. Knowledgeable teachers recognize that today's technology can bring the real world into the learning environment, and take students where they could not otherwise go—beyond classroom walls. As a result, TV and videos expand students' horizons while they close the gap between those students who are well traveled and experienced, and those whose experiences are limited. Language skills and vocabulary develop as children discuss programs, analyze issues, compare information, and construct their own understandings through further inquiry and exploration (Peterson, 1992, pp. 75, 76).

WAYS OF USING TELEVISION AND VIDEO

Using what they have learned about the media, students can prepare their own televised or taped presentations for their classmates to critique. For example, in an upper elementary classroom, students analyze commercials taped from television. They look for examples of various types of advertising, comparing them and discussing their effectiveness. These students then create their own commercials, defending choice of media and style, and evaluating the effectiveness of their presentations. Here, TV and video are being used as interactive tools that enhance literacy. They support the teacher's goals of language development as students become aware of the power of their words. Working with television in this way also creates sensitive viewers who are aware of the "programming" that commercial television imposes on its public. These students are learning to question both the value and the integrity of the televised message. The commercials can be rerun, segments can be reviewed, and viewing can be stopped so that students can ask and answer questions or discuss what they have seen.

When a classroom of students is operating from within a framework of language and experience, cooperation in problem solving is facilitated and increased. As students begin to make connections between the immediate worlds of home, classroom, and community, and the world that television portrays, they move in their thinking from the particular to the general, from a "self" view to a global view. With guidance and experimentation, they learn to interpret what they see and hear—to analyze, synthesize, and evaluate. The group mix is enriched by the variety of approaches, interests, and abilities that each member brings (Peterson, 1992, p. 80).

The creative use of television and video as technological tools also recognizes the individual learning styles of students. As teachers move away from lecture-based instruction toward multimedia classrooms, they are reaching those students who need more than written or auditory signals to become engaged. Moreover, when students work within a learning community as members of a team, the learning is increased and retained (Peterson, 1992). The teacher, as

guide, allows time for each student to work at a comfortable pace. The teacher also arranges a schedule that encourages cooperative group work as well as individual investigation and research.

Television programs are linear; they have beginnings, middles, and endings. But taped programs can be manipulated to suit classroom needs. They can be stopped and started at will. They can be edited so that only certain information or sequences are viewed and reviewed. Different programs can be spliced together to highlight particular content. Programs can be viewed alone, in small groups, or as a whole class.

Videos and television programs motivate students. They can be used as the primary content deliverer, or to review and assess information. Through television, teachers can bring into the classroom specialists and experts in a given field of study. Television used in this way expands the classroom experience beyond the printed page. The content is more likely to be relevant, current, and interdisciplinary. A program about math can also involve the world of art. A program about the art world can include content about history. Video equipment can be paused or stopped to allow the teacher to check for comprehension, discuss new vocabulary, or to introduce some hands-on activities. Since television and videos used interactively work well for many learning styles, all students experience success.

TEACHER TRAINING FOR TELEVISION AND VIDEO USE

The National Teacher Training Institute (NTTI) is one organization working to educate teachers regarding the best use of television and video. Founded in 1990, the Institute recognizes the power and duty of the media to bring teachers beyond the use of TV as a passive activity. Through the facilities of public television networks nationwide, NTTI trains teachers to work with their colleagues creating video-enhanced lessons through a series of seminars and workshops. The authors of the training videos are teachers working hand-in-hand with instructional designers and media specialists. Together, they create and tape effective lessons plans that are accompanied by written teachers' guides (Texaco / Thirteen NTTI, 1991-92).

Four basic steps for opting to use television and videos as part of a lesson are taught:

- Think about the topics to be taught, then investigate the kinds of videos that are available. Survey what is available. The curriculum is the basis for choice, not the other way around.
- Develop lead-in activities.
- Determine when to use the video, or segments of it.
- Decide how much to use, but do not overuse it.

Utilization strategies are also taught, including:

- Selecting segment(s) to be targeted.

- Providing a focus or task for viewing.
- Using pausing techniques for predicting or analyzing.
- Checking for vocabulary and comprehension.
- Fostering interaction by using an acetate sheet over the screen so that students can write on it.
- Using only the video portion when the sound track is either too sophisticated or too elementary, or to encourage students to predict the content.
- Providing hands-on activities to reinforce the content and insure students' understanding. (Texaco / Thirteen NTTI, 1991-92.)

In the New York metropolitan area, once NTTI training is completed, teachers can count on support from Learning Links, an electronic communication and information service sponsored by the New York Tri State Public Broadcasting System. Learning Links provides teachers and students with a multitude of services, including program listings, database resources, discussion forums, and classroom activities for all aspects of the curriculum. This service is especially valuable, since the response to problems and questions is rapid, and the information is current. There are replicas of the NTTI and Learning Links networks throughout the United States, and a national consortium located in Chicago which provides technical and content support to all local networks. (Texaco / Thirteen NTTI, 1991-92.)

RATIONALE FOR COMPUTER USE

In a Long Island, New York 5th-grade science classroom, groups of students are busily working. One group is gathered around the computer drafting a letter to fellow students in Seattle, Washington. They are using notes from interviews and readings about their Long Island community, its history, population, habits of energy use, and power sources. Another group is formulating questions that they will use in a telephone interview with the local power plants public relations office. They refer to an outline that they have received from a team of researchers and scientists investigating patterns of acid rain throughout the Americas. The teacher is helping other students add to a map of the community, locating small factories, bus routes, and points of interest that the students want to include. The completed map will be sent to a classroom in southern California, which will, in turn, send their community map to Long Island. Still another group of students is discussing the designs of several sample rain collectors that they have built. They are concerned with stability, ease of use, and freedom from contamination. They glance at questions about these issues on the chalkboard near them, to keep their focus clear.

This class is involved with National Geographic's Kids Network Acid Rain Program, designed to help students explore an environmental issue through authentic research and a series of hands-on experiments. Once the students have constructed their rain collectors, they will learn to read the pH scale and use pH paper to measure the acidity of local rainwater. Students investigate the possible causes of acid rain

locally by noting commuter habits as well as access to and use of mass transit. They also investigate the presence of such potential polluters as factories and fossil-fuel burning power plants. They share their findings with like groups in other parts of the continent through a central command location. Then they analyze the geographic patterns they have observed, and make predictions and recommendations based on their findings (National Geographic Society, 1989).

When computers first entered the educational scene, they were used primarily as managerial tools by teachers, or to provide skills practice and drill. Increasingly, computer systems are supporting the instructional process in ways that are interactive and collaborative.

There are vast differences between "electronic classrooms," depending upon how teacher and students interact with the computer and its components, and upon the function of the technology within the curriculum. In some instances, interaction is limited because the teacher retains total control of the equipment and the scope for its use is narrow. In these situations, CD-ROM resources and laser discs are used predominantly to provide yet another view of material that has traditionally been retrieved from books. Although there is movement and sound as well as printed material, the students are passive viewers and receptors of information. Here, the advantages of technology use lie in its motivational aspects and the immediacy of the data received. What is missing is the opportunity for building language and communication skills.

In other electronic classrooms, however, the curriculum is designed to move away from lecture-based instruction toward discovery learning that fosters creative and critical thinking and personal involvement with the content. Telecommunication networks such as America On-line's National Geographic services and the many student forums and bulletin boards offered by AOL, CompuServe and the Internet are used to promote deeper investigations and inspire cooperative learning and teaching. Communication among students is encouraged as small groups work together at computers. Since students both learn and help others learn, skills and information are retained.

Today's teaching involves using technology to inspire students to investigate within the classroom and beyond it as well. For example, after viewing a program about a threatened species, students might set up an investigation of a species within their own surroundings. The computer can assist them in locating research about the subject, organizing data within a database or on a spreadsheet, and collating the findings into a report. Through a computer networking program, students might contact other students similarly engaged, sharing information, examining theories, and generating new questions to be explored. The flexibility of interaction between user and computer allows it to be manipulated in ways that go beyond the limitations of books and lectures (Thornburg, 1989). This implies that hands-on science and textbook science are not enough for today's classrooms. But neither can technological tools stand alone; each must be integrated.

When the goal is language growth, the ideal computer programs will include problem solving, collaboration, and networking with others. The gathering, sorting, analyzing,

synthesizing, evaluating, and reporting that is done will be for real reasons that validate writing, reading, and communicating. Part of the learning must include an opportunity for critical analysis of the information itself. Authentic engagement means that students need to question their sources as they research, rather than accept all computer or television-generated data as accurate. Becoming a critical consumer is part of technology's challenge (Dipinto, & Turner, 1994; Kinnaman, 1994).

It is the teacher who must select this software with curricula objectives and the needs of the students in mind. As with the traditional components of any unit of study, the teacher will consider the purpose for using the technology, who will be using it, and whether it will effectively satisfy the users' needs (Hirschbuhl, 1994). With the proliferation of computer software programs, this is not an easy task. To complicate the issue further, it is likely that the teacher has never been educated to consider the best qualities of interactive media.

TEACHER TRAINING FOR COMPUTER USE

In-service teacher training for computer literacy should be a feature in every school district budget. As teachers are trained to use visual and interactive media with planning and thoughtfulness, students will also be instructed to see more than just the content that programs offer. They will learn to see the background, the people involved, the larger view. As much as possible, the teachers capitalize on the ability of computers to capture the students' attention, to make them curious and keep them curious. In other words, teachers go beyond the program as simply another source of information. By monitoring and tailoring programs for specific purposes, teachers encourage students to construct their own knowledge, and to validate what they hypothesize, so that content is truly learned and remembered. They can delete non-essentials, and add components that necessitate group work and conversation. They can use technology to bridge curriculum areas, encouraging thematic work and connections between traditional disciplines so that relationships are emphasized and content is seen as relevant to the real world (Kari, & Nojd, 1991).

The involvement and interest of students provide the impetus for growth in the use of technology in the classroom. But teachers must provide the structure within which the initial exploration takes place, and the scheduling that allows it to continue. This means a change in the roles of the teachers. There is no longer a need for the "sage on the stage" approach. What is needed is the "guide on the side," a partner in the learning process (Wilson, & Tally, 1991). Having studied and selected beforehand those components best suited for the students and the learning objectives, the teachers develop a way to use technology as part of the curriculum (Thornburg, 1989). Technology does not take the place of hands-on activities, or reading and writing, but supports them and gives richer meaning to them.

The inescapable necessity of technological tools offers a real challenge to teacher preparatory institutions. By the year

2000, an estimated 75% of today's teachers will no longer be teaching. Unfortunately, the recruits that are being educated to replace this retiring group will be no better equipped to deal with the tools of technology than their predecessors of 30 years ago (Dipinto, & Turner, 1994). In most preparatory schools, technological training consists of word processing skills, with some database and spreadsheet instruction included. When television, films, and videos are used in teacher training courses, they are not perceived as interactive tools.

Teachers can learn through workshops, but they also profit from an opportunity to build supportive networks with other teachers. The teachers with whom we spoke credited their expertise with technological tools to conferences, peer networking, professional journals and magazines, as well as in-service course work. Each believed that without this support, they would have grown more slowly. As with young students, learning is best done when it is collegial. Teachers, as students, need to talk with others who are exploring new ideas. Together, they can trouble shoot, imagine, create, publish, and spread the wealth. It is easier for a teacher to be a guide through new terrain in the classroom when there are others available to give ongoing support.

Funding for teacher in-service training and purchasing the technological tools needed to keep abreast of today's fast-paced information explosion places an onerous burden on school districts. Some districts are involving their surrounding business communities as partners in educational endeavors. In addition to providing potential financial assistance, such a partnership establishes a vehicle for communication about the education of tomorrow's employees and a network for mutual growth. Just as schools need to take their cues about what is needed for the business world of the future, businesses need to be informed about what today's students

have to offer them. Public relations are improved as barriers between home, schools, and businesses are breached. Other school districts are seeking funding through grants to foundations supporting educational advances. The NTTI manual and periodicals such as *Technology and Learning* offer suggestions for funding and grant proposals.

CONCLUSION

In trying to meet the expanding needs of today's classrooms, teachers must find unifying tools to facilitate learning. From storytelling to technology, teachers and students explore and expand literacy and communicative skills.

Major implications for classrooms of the future are:

1. Storytelling, used throughout the curriculum, promotes historical and personal understanding.
2. Students of the future must be proficient in interactive technology.
3. Aesthetic education, with its emphasis on respecting multiple perspectives, is a critical component in classrooms that are global in outlook.
4. Students must be able to work collaboratively in a team environment.
5. Learning tasks must be relevant and authentic, connecting students to problems, situations, and issues that affect them and their world.
6. The teacher is less an information transmitter and more a partner/facilitator in the learning process.
7. To build and maintain links to new expertise, teachers must network through conferences, collegial workshops and seminars, and telecommunications.

"WHAT HAVE YOU LEARNED?": CO-CONSTRUCTING THE MEANING OF TIME

Gordon Wells

ONTARIO INSTITUTE FOR STUDIES IN EDUCATION

Gen Ling Chang-Wells

TORONTO BOARD OF EDUCATION

Have you ever tried making a water clock from pieces of wood left over from renovation, a plastic spoon, a yogurt carton and bits and pieces of string? At the suggestion of their teacher, the first author constructed such a device—with the help of the directions in a junior science guide—and took it to the combined grade three and four class in which the two authors were collaborating in a study of the grade three students as they worked on the theme of time. When it was finally set up, the teacher asked some of the children who had been watching to demonstrate how it worked to the rest of the class. Unfortunately, it failed to work as expected. However, suggestions for fixing it were not slow in coming and soon an animated discussion was in full swing, as competing proposals were put forward, justified and evaluated. By the end of the day, some of the most enthusiastic engineers had succeeded in making it work.

We want to hold on to this event for a moment, and say a little more about its significance, as we perceive it. For it has come to function as an icon for us as we have thought about

the actuality of classroom activity from the perspective of its role in bringing the resources of the past to bear in equipping each new generation of students to meet the challenges of their future. As we shall try to show, this unplanned situation epitomized many of the characteristics of the social constructivist model of learning-and-teaching which we wish to explore through a more detailed examination of some of the episodes that occurred during the course of these students' study of time.

During the preceding weeks, the children we had been observing had engaged in a variety of activities designed to help them understand the need for a standard method of measuring time. They had also learned about some of the earliest timing devices by constructing simple versions for themselves and then using them to measure how long it took them to perform an activity such as walking round the room. The model water clock, complete with its striking mechanism, was intended to add a further dimension to their study, by showing how the problem of marking the passage of time in a

The observations and analysis which form the major part of this paper, arose from an ongoing collaborative project between Gen Ling Chang-Wells, a teacher with the Toronto Board of Education, and Gordon Wells, a researcher at the Ontario Institute for Studies in Education. Earlier versions were presented at the Annual Conference of the Canadian Council of Teachers of English, Calgary, April 29, 1992, under the conference theme "Remembering the Past; Remembering the future," and at the First Conference for Sociocultural Research, held in Madrid, September 1992. The preparation of the paper was made possible, in part, by a grant from the Spencer Foundation to the Ontario Institute for Studies in Education.

We should like to express our gratitude to Miriam DiGiuseppe, the former Principal of Orde St. Public School in Toronto, for allowing us to conduct the research, and the grade three children for their enthusiastic participation. Without their collaboration and their reflections on what they had been doing, the writing of this paper would not have been possible. We should also like to acknowledge the helpful comments we received in the preparation of the paper from Patrick Allen and Myriam Shechter.

regular manner could be solved by the use of a number of simple mechanical principles in combination. It was, one might say, a way of reconstructing the past with the intention that the children should grasp the principles involved in order to be able to use them in solving problems in the future.

However, as it transpired, the imperfect workmanship succeeded in teaching another lesson. Instead of serving merely as a demonstration of how the problem might have been solved in the past, the water clock became a problem in its own right. To it the children brought their own original and creative solutions, testing them in debate and subsequently in action, until they had created a functioning device that was better than the one the adult had originally constructed. What they demonstrated in the process was that the most effective way to foster children's thinking and problem-solving ability is to present them with a challenge that engages their interest and invites them to create their own solutions. They certainly benefited from the experience, but probably the person who learned most from this incident was the one who had designed the model as no more than a demonstration.

Before going on to look at further episodes from these children's study of time, therefore, we should like to develop these ideas a little further by presenting a brief account of recent work in sociocultural theory, as it applies to learning and teaching in schools. We believe that the insights that this theory offers can help us understand, and perhaps reinterpret, some of the most enduring characteristics of classroom practice.

BRINGING THE PAST INTO THE FUTURE

Let us start with a quotation from Leont'ev, who, with Vygotsky, is one of the founders of sociocultural psychology. Describing the cultural continuity which makes human society uniquely different from that of all other species, he writes: "a special form of transmitting the achievement of preceding generations to the next takes place in human society; that is, the achievements are embodied in the material and spiritual products of human activities and specific human psychological abilities can be developed through the mastery of these products by each person" (quoted in Amano, 1991). More recently, Michael Cole has made a similar point: "Human beings live in an environment transformed by the artifacts of prior generations ... the basic function [of which] is to coordinate [them] with the physical world and each other" (1991, p. 6).

Central to the thinking of this school, then, is the idea that the artifacts that were invented in the past to solve the problems that were encountered then can serve as a sort of external cultural memory, encoding the interactions of which they were previously a part and carrying their potential for solving similar problems into the present and future. In order to benefit from this legacy, however, each new generation has to be inducted into the cultural practices in which they are used and be able to recognize when and how they are relevant.

But it is not simply to physical tools that these writers refer, nor to such social practices as marriage customs or legal

procedures. More important is the recognition that language, both spoken and written, and the uses we make of it for remembering, reasoning, evaluating, as well as communicating, are also cultural artifacts and practices, and that these, too, have to be learned and mastered through social interaction in the context of joint activity. Thus all the higher mental functions, as Vygotsky (1978, 1981) called them, first exist and are encountered *inter-mentally*, in interactions between people; only when they are appropriated and internalized do they function *intra-mentally*, as a resource for individual thinking and problem solving.

Inspired by this theory, a considerable amount of research has taken place in recent years into the forms of adult-child interaction that facilitate children's cognitive and linguistic development (e.g., Newman, Griffin, & Cole, 1989; Rogoff, 1990, 1992; Wells, 1986; Wells & Chang-Wells, 1992; Wertsch, Minick, & Arns, 1984). Vygotsky described this contingently responsive tutorial behavior as "working in the learner's zone of proximal development;" more recently it has been variously described as "scaffolding" (Wood, Bruner, & Ross, 1976) or "prolepsis" (Wertsch & Stone, 1985). Whatever the term used, what is emphasized in all these accounts is the way in which the tutor (whether parent or teacher) takes the learner's attempt to perform some part of the task and appropriates it into her or his more mature version, thereby giving it a significance which it does not yet have for the learner. In so doing, the tutor both enables the learner to contribute as much as he or she is able to the performance of the task and, at the same time, to become aware of the functional relationship between the constituent actions and the goal of the task as a whole. From participation in such shared task performances, the learner in turn appropriates the tutor's version and, having internalized it, is eventually able to perform it on his or her own. In this way, knowledge, both substantive and procedural, that is first encountered and mastered in social interaction, becomes an intellectual "tool-kit" for thinking and problem solving carried out by the individual alone.

Thus far, we have concentrated on learning as the remembering of the past through the taking over of the achievements of previous generations. But, as the metaphors of "scaffolding" and "prolepsis" make clear, this theory also involves a kind of remembering of the future, as the teacher, based on his or her own past experiences, projects a more complete version of a task than the learner is currently able to achieve and assists and guides the learner's performance in such a way as to bring that future about (Cole, 1991). Indeed, on a larger time-scale, education can be seen as a form of apprenticeship, as more mature members of a culture—parents, teachers and educational policy makers—drawing on their interpretations of their own remembered past experiences, project expectations about the future lives of the children in their care, and create opportunities for them to appropriate the cultural resources of knowledge and skills that they themselves have found important.

However, to place the emphasis almost exclusively on reconstructing the past for an imagined future has serious limitations. First, there is increasing likelihood that the future today's students actually encounter will be very different from

that which we imagine; by equipping them only with the resources of the past, therefore, we will render them less able to solve the problems, unforeseen by us, with which they will actually have to cope. Equally important, if we emphasize tradition and authority at the expense of originality and creativity, we shall fail to do justice to the transformative nature of learning and to the possibility that this implies for change and improvement, both for the individual and for society as a whole.

Two further points must therefore be added to provide a more balanced account. First, it must be emphasized that internalization does not imply a simple copying from the outside in. In all cases, in taking over, or appropriating, a cultural artifact or practice, the learner necessarily constructs a new internal version, which builds upon and is shaped by what he or she can already do and understand. At the same time, in the process of internalization, the learner also "grows into" the organizing cognitive structures associated with the artifact or practice; this results in a modification of the individual's own cognitive organization and thus changes the way in which he or she perceives, interprets and organizes the world (Nicolopoulou, 1991; Rogoff, 1992). In other words, the outcome of the process of internalization is a transformation of the way in which an individual participates in a social practice, such that he or she is able to engage more effectively in the relevant activities.

Secondly, it is important to recognize that all action is creative, in the sense that each occasion of interaction with the social and material world is different from all previous occasions and demands a response which is unique to the particularities of the present moment. It may also be creative in the further sense that the solutions constructed for the problems encountered often go beyond previous achievements to create new artifacts which, in turn, have the potential to enhance the cultural resources to be used in solving future problems. Thus, just as the learner is transformed by appropriating the problem-solving resources inherited from the past, so can present problems be transformed by the new insights that learners are able to bring to bear on them.

Therefore, if we are to make good use of the insights to be derived from sociocultural theory to enhance our understanding of the goals and means of education, a concern with cultural reproduction and continuity needs to be complemented by an equal concern with cultural renewal and an encouragement of the creativity that makes this possible.

The remainder of this chapter explores what these ideas might look like in practice, through a collaborative investigation undertaken by both authors into the learning and teaching that took place in one unit of work in science—the study of time which was referred to in the introduction. However, because of the limits of space, we shall focus mainly on a single event—the discussion which occurred at the end of the unit, in which the teacher and children reviewed the work they had done in the preceding weeks. As we have argued elsewhere (Wells, 1995), of all the components of an inquiry-based curriculum approach, the final retrospective review is probably the most important—for both students and teacher—in the opportunities it provides for them jointly to construct a common understanding of what has been achieved, and how,

and to identify topics and issues that are recognized as needing further investigation. But before turning to the discussion, we must first provide some context by saying a little about the participants in the discussion and about their classroom environment.

The School and Classroom Context of the Investigation

The school in which this investigation took place is situated in an inner-city area in Toronto. Due to its location, close to Chinatown and also to a number of large corporate office buildings and hospitals, the students come from a wide variety of backgrounds. Some are children of relatively recent immigrants, who work in service jobs nearby; others are children of doctors, lawyers, and other professionals, who have chosen the school because of its reputation and because of the day-care facilities that it provides. It should also be noted that this school is one of the few that offers heritage language instruction, in Chinese and in Spanish, as part of its regular program; in the last few years, it has also included a black studies program as part of its curriculum. The makeup of the combined grade three and grade four class is fairly typical of the school as a whole. Children of Caucasian descent, for whom English is the first language, are in a minority, although most of those who are bilingual in English and another language have been resident in Canada since birth, or at least since they began to attend school. There are, however, several children who have arrived in the last year or two, and they are still receiving special help in learning English as a second language. The class also has several children who are withdrawn for additional help in literacy or with other special needs.

Although the class includes children from two grades, whose current levels of attainment span a very wide range, the teacher tries to create a single community in which each child is challenged to address the topic being studied at a level appropriate to her or his ability. For much of the time children work in groups, sometimes self-selected and sometimes chosen by the teacher. In all cases, the groups are encouraged to develop their own ways of working cooperatively, but with the requirement that each child play a part in achieving the goal that is jointly negotiated. On the present occasion, as an experiment, the teacher has decided to divide the class, with one half engaging in a unit on forensic science and the other half making a study of time.

Since this study took place in January and February, the children already had some experience of engaging in sustained inquiry. In the previous term, they had done work in science on sound and on light and color, and in social studies they had carried out library-based research on a Canadian province or a foreign country. Concurrently with the work on time, they were also studying endangered species and species. Evidence of the resources they had used and of the meanings they had made with them was to be seen on shelves and tables in all parts of the classroom and displayed on bulletin boards around the walls and in the adjoining corridor. From these same sources it was evident that, wherever possible, connections were also made between these topics of inquiry and the children's work in math, literature,

art and drama. The study of time should be seen, therefore, against the background of a curriculum that was both integrated and challenging.

Co-constructing the Meaning of Time

The discussion which is the focus of this chapter occurred at the end of the unit of study on time and served as an occasion for the children and their teacher to make connections among the various activities in which they had engaged and the artifacts of various kinds that had mediated both their practical activity and the sense that they had made of what they were doing. It started with the teacher gathering the children on the rug and inviting them to think about what they had learned during the preceding 5 weeks. Almost all the topics that were considered in the following 40 minutes were generated from this initial invitation. They are summarized in Table 43-1. The duration of each topic, in number of exchanges, is shown in parentheses in the final column.

Set out like this, the discussion can be seen to have had an impressive agenda, one that very few teachers would consider possible to treat in any depth with 8- and 9-year-olds. What was it, then, that enabled this group of children to remain interested and involved from beginning to end of this long and challenging discussion?

The first part of the explanation, we believe, is to be found in the rich variety of practical work that the children had engaged in, from which they had acquired first hand knowledge about several of the topics that were raised. Through the activities of attempting to invent a method of measuring time, experimenting with pendulums, and constructing either a

"water-clock" or a "rolling-ball-clock," they had experienced, in practice, what it is to "do science." They had also found themselves faced with problems they had attempted to solve in a (relatively) principled and systematic manner. Personal experiences from outside the classroom provided a further source of information on which they could draw.

However, that is to tell only part of the story. As Driver (1983) argues, on the basis of observation of many classrooms in which children engage in practical activities in science, "hands-on" activities do not lead to the development of an understanding of scientific principles unless they are accompanied by "minds-on" activities as well. In this unit, numerous instances of such sense making occurred in the conferences that took place while the activities were being planned and in progress, and in class discussions that occurred after each one to underline the significance of what had been done. Limitations of space make it difficult to do more here than hint at the richness of these continuing discussions. Mention must also be made of the various books the teacher had assembled, which the children had been encouraged to consult for specific purposes and to browse through more generally. Equally important were the science logs that the children kept, for these were another tool for sense making. Rather than simply using them to report what they had done, the children were encouraged to write in their logs about what they had learned and about their reflections on the experience; they were also encouraged to note questions to which they wished to obtain answers. Finally, mention must be made of the connections that were noted in passing between their science investigations and the work they were doing in mathematics.

This review discussion was not an isolated event, therefore, but a part of this teacher's overall approach to the learning and teaching of science in her classroom and, indeed, to learning and teaching in all areas of the curriculum. As she explained, there are three aspects of doing science that she wishes the children to gain from the work that they do in each unit: the concepts appropriate to the topic, the processes of observation and experimentation and of making sense of the results, and the language for talking, reading and writing about the topics that they study. One of the overall purposes of this discussion, then, was to continue to weave connections among all the three.

However, an equally important aim was to bring together the meanings that individual children had been making, both alone and in their separate groups, and to construct a shared understanding of what had been done and found. By bringing her own more systematic knowledge of the various topics associated with the theme of time to this co-constructive process, the teacher also wanted the children to have an opportunity to take over some of the ways of talking and thinking about these matters that are practiced in the wider culture.

What we wish to explore, then, is the way in which these various aims were achieved in the moment-by-moment unfolding of this particular discussion. In the process, we hope to show how collaborative talk of this kind makes possible the co-constructive and transformative knowledge building that was described in the introductory section of this chapter. Furthermore, since discourse is itself a cultural artifact, which

TABLE 43-1. An Overview of the Review Discussion

Episode	Topic	Initiator	No. of Exchanges
1	Introduction: personal responses	Teacher	(3)
2	Accuracy: need for standard measurement—comparing various methods used by groups	Auritto	(10)
3	"Processes of science": fair test, variables—reviewing experiments on pendulums	Bianca	(20)

8	Time differences between time zones—exploring personal anecdotes, using globe	Bianca	(40)

learners have to appropriate through participation in actual occasions of use, a close examination of selected episodes from this particular classroom discussion should enable us to gain a better understanding of how this process of appropriation takes place.

The Need for a Standard Method of Measuring Time

The teacher opens the discussion with a very general question: "What have you learned about time?" Tema, Emily, and Jamilla obviously hear the question as a request to tell about what they have personally learned, and each contributes an interesting idea.

(Note: In this and the following transcripts, . = 1 second of pause; * = a word that was inaudible; < > enclose segments where the transcription is uncertain; underlining indicates segments that were spoken simultaneously; CAPS = a segment spoken with emphasis.)

- 1 Tema: It's not just everything is the same thing . some people might want to set their clocks faster or slower or right on time
- 2 Teacher: Emily
- 3 Emily: Time does not have to be telled by clocks and watches we can—we also * it can also have different sort of timers
- 4 Teacher: OK, we learned about different . types . of timers (writing on board) . clocks or even watches, right?
And I think what Tema said I would rephrase it as time is a form of measurement, right? (writing) a . form . of . measurement, right? just as distance is a form of measurement . What else did you learn about time? . anything else?
Jamilla?
- 5 Jamilla: We learned that it um— you don't necessarily have the um— the coo— the watches like um the, minute hand, the hour hand, the second hand, you can also— you can also use water and <things like that> construct watches and um . construct clocks and it doesn't have to be um um someone— someone special makes them to be *
- 6 Teacher: Uh-hmm, right (accepting)
So a timing device like a clock or watch may not have the minute or hour hand, you can use the water . to represent the- the minute hand for example . or use something else to represent it . Yes, what else did we study in the whole unit of time?
- 7 Auritro: Counting isn't always accurate
- 8 Teacher: Counting is not accurate, so there are certain ways of . timing that some are more accurate and some are less accurate, for example like counting . What is more accurate than counting?
- 9 Bianca: Using the stop-watch
- 10 Teacher: Using stop-watches .
What about the things you made? . . of the various things you've made what are some of the timing devices you all made?

In their idiosyncratic detail, these answers are not untypical of children, or even of adults, who lack experience of engaging in metacognitive talk. In these circumstances,

they tend to provide answers which are at the "local and specific level." As is apparent here, an invitation to reflect does not in itself enable reflection. More has to be done. In fact, as is suggested by the research on adult-child interaction (Bruner, 1983; Cross, 1977; Wells, 1986), it is the follow-up to a child's contribution that is crucial for the development of a conversation; it is also this move, in particular, that makes a qualitative difference to what the child learns from the interaction as a whole (Wells, 1996). Here, in the teacher's follow-up moves in turns 4 and 6, it is evident that, as she echoes back what the children have said, she is doing three things. First, she is providing an opportunity for the children to discover how their contributions have been understood and giving them a chance to make a repair if needed. Second, whilst accepting the child's idea, she introduces an alternative way of articulating the response, thereby bringing it closer to the register conventionally used in the wider culture for "talking science" (Lemke, 1990). Third, and perhaps most important from the metacognitive perspective, she "steps up" the children's responses to a level of talking about their personal experiences in a way that reflects a principled understanding of the topic rather than a simple telling of what they have personally learned. In other words, she is encouraging talk which requires transformation of their personal knowledge rather than merely knowledge-telling (Bereiter & Scardamalia, 1985).

In such sequences, the teacher uses her follow-up moves to model this complex but powerful thinking skill; that is, she takes the child's contribution and, in her response to it, demonstrates how one can extrapolate from a range of specific experiences a principle which applies to those past experiences and possibly to similar future ones as well. An obvious example of this occurs in turn 4, where Tema's observation is utilized to form the basis for the introduction of the scientific "thematic formation" (Lemke, 1990) "x is a form of y."

In the next sequence, Auritro, the fourth child to offer a personal response to the original question, not only picks up on the teacher's intervening amplification of time as a form of measurement, but extends it by tacitly juxtaposing standard and nonstandard methods of measurement. Counting belongs to the latter class, which "isn't always accurate" (7). Comparing Auritro's contribution to those of the preceding three children, it is clear that he is expressing an idea that has wider application and one which evidences an ability to extrapolate and articulate a principled understanding from particular physical experiences. To provide a bedrock of such experiences is, in fact, one of the teacher's priorities, as she believes that it is a necessary basis for engaging the children in talk which has the potential for knowledge transformation. In Auritro's case, he and a few other children had chosen to investigate the use of nonstandard methods of measuring time, such as counting, clapping, and pouring an agreed amount of water out of a pop bottle, in order to measure the duration of activities such as walking from one end of the hallway to the other. In so doing, they had confronted the issue of these methods' reliability.

In her follow-up to Auritro's introduction of the topic of accuracy of measurement, the teacher makes explicit Auritro's

tacit comparison by reposing it in the form of a question: "what is more accurate than counting?" (8). This question enables those children who have investigated time by using standard measurements, or those who constructed devices such as a salt timer, to bring in their expertise. Thus, the topic is extended both in "depth and breadth," as the teacher put it, and the children are provoked to think beyond the local level or the single case as they draw upon their collective experiences to arrive at understandings which will have wider and future applications.

Following the request for specific examples (10), the next 20 turns are spent in recalling the various devices that different children had experimented with. Then, in turn 31, the teacher poses a question which is in some ways the obverse of the one asked earlier: "Of all that you have done ... which are the ones that are the least accurate as a kind of . timing device?" Her intention here is to invite the children to go beyond the devices themselves to a consideration of their relative accuracy. Then, in the following sequence, as she follows up their suggestions with a request for a justification (33), a new issue is brought into the discussion.

33 Teacher: Counting or stamping your feet and using your heart-beat or walking round the room . that is the least accurate
Why? Why is it least accurate?

34 Bianca: If you < use > your heart-beat sometimes your heart-beat gets faster, like fai- um- like you've- like you've been- you've got um so many- like a lot of energy and then <you're trained> to get your heart-beat and then because you've got a lot of energy you feel like running around, and then you start running around- your heart-beat's going to get faster < so it changes >

35 Teacher: And I think er Bianca is bringing things to another part of this science unit <that you have learned about> . "the processes of science" (writing on board) .

Once again, it is a child's contribution which provides an entry to the new topic. For although, in itself, Bianca's answer is largely anecdotal in intention, the teacher recognizes in it an opportunity to bring into the discussion a fundamental principle to be observed in carrying out experiments, and one that the children have encountered in several of the earlier activities. In her follow-up move, the teacher makes this connection (attributing it to Bianca) and announces this new topic, writing it on the board to underline its importance, "The Processes of Science." Then, following the lead provided by Bianca's reference to the variability of the heart-beat as a measure, she reminds the children of how they have talked about the need to control the variables in an experiment and, in turn 40, she poses the question: "Why must we control our variables?"

The first answer she receives shows that Tema has at least a partial understanding of what is at issue and so, to signal this, the teacher repeats the key word "accurate" in the follow-up move. However, since this is not a fully adequate answer, she asks a probe question to elicit an alternative within the frame that Tema and she have jointly provided: "if we don't control our variables, x is not accurate." This is obviously a

difficult question for 8-year-olds to answer in that form. However, Bianca finds an alternative, but appropriate, solution by repeating a phrase that has been used on a number of previous occasions: "It's not a fair test" (43).

40 Teacher: OK . why must we control our variables?

41 Tema: Because if we don't, the time won't be accurate and so you won't get the correct timing

42 Teacher: Not so much the time is not accurate, what is not accurate?

43 Bianca: It's not a fair test

THE PRINCIPLE OF "A FAIR TEST"

The problem of how to make sure that their experiments were "fair tests" had been introduced in the very first activity of the unit. Some had chosen to try to construct a salt timer that would measure exactly 30 seconds. Emily, Veronica and Lily had chosen to invent a way of measuring how long it took to empty a bottle of water. In a conference with their teacher when they had gathered their materials, the teacher had presented them with two problems to solve: the first was to invent a method of measuring how long the emptying took, and the second was "to make sure your test is fair." To help them understand what was meant by a fair test, she had discussed a number of possible variables with them:

Teacher: The meaning of "fair test" is if you empty a bottle-say if you fill the bottle half . and Veronica fills her bottle full . would it be a fair test?

Veronica: No

Emily: No . you have to- if I filled my bottle half and to make that a fair test she would fill her bottle half

Teacher: That's right . and what about Lily's bottle?

Emily: She would fill her bottle half

Teacher: half

So all your three bottles must have the same amount of water

Now how do you ensure the same amount of water?

Emily: Well.

Teacher: Do you just estimate?

E and V: No

A few minutes later, after they had considered possible solutions to these problems, the children returned to their corner of the classroom and carried out the first trial, clapping plastic cups together to mark the beat and counting the number of claps that were made before the bottle was completely emptied. In the first trial, Lily's bottle was only half full, so the trial was aborted and they returned to the bucket to fill all their identical FiveAlive bottles "to the brim." Then they took it in turns to empty their bottles, with one child clapping and the third counting the number of claps. Lily, who went first, took four claps. Emily and Veronica each emptied theirs in a count of three. Emily, who has assumed the role of group leader, pauses for a moment's reflection:

Emily: I know, me and Veronica are tied
Do you know why you were slow? (to Lily)

When Lily does not answer, she puts the question again in a different form:

- Emily: What we did- . what we did was we . did a method by timing
Now, d'you guys think it was a fair match?
- Veronica: Yeh
- Emily: Do you? (doubtfully)
- Veronica: Cos we each used the same . <thing>

At this point, Emily goes to fetch their science logs so that they can record their results. But the problem of the discrepant results is obviously still bothering her for, when they have finished writing, she returns to it again.

- Emily: I want to ask you some questions before we do something
Why do you think it was a fair match?
- Veronica: Cos the bottles were filled to the exact same amount . because exactly the same *
- Emily: Yeah, like we counted EXACTLY . ‡
- Veronica: Yeh like I **** -
- Emily: Now . why d'you think . she lost? (referring to Lily) Why?
- Veronica: Cos she was -
- Emily: Probably she poured it- probably she poured it slow
- Veronica: Like she goes like this (demonstrating) and then she -

While Veronica is speaking, the teacher joins the group to find out how they are getting on. Emily and Veronica describe what they have been doing, ending with a summary of their recent conversation. The teacher's follow-up question prompts Emily into a statement that recognizes that, for the test to be fair, the angle of pouring must also be controlled.

- Teacher: OK, so you- so that is a good observation- you observed . that Lily's count . was more . than both of you . and you figure that it's because of the way she poured it . Now, how can you make sure . that it's a fair test between all three of you?
- Emily: Well . a fair test- well I don't really think it's fair now because . it was fair we put it the same size of the cup by the measuring cup, but I don't think it was fair because we poured it- we turned it right over . and Lily just poured it like this, kind of so I don't think it was fair . (T:Uh-huh) I that- I think that's why she um- . was slow

Writing in her log book later, Emily included the following observation:

Test 1

It wasn't a fair match because Lily tilted her bottle sideways.
Our method was claping.
and for the activity as a whole:

What I learn

I learned that if the bottle has a small mouth the water will come out slower than a wide mouth bottle.

From the episode that we have just summarized, it seems clear that Emily, at least, has developed some understanding of the principle of a fair test and, as leader of the group, she has also drawn the other two girls into using this principle in the consideration of their results. However, it is worth noting

that, in her original posing of the question to her friends, she uses the expression "a fair match." In taking over the teacher's concept, it seems, she has assimilated it to her own concept of a competition and, as a result, she has recast the results of their first trial in terms of Lily having "lost."

There are various ways in which this might be viewed: as an indication of a discrepancy between Emily's understanding of the principle and the more conventional interpretation; as evidence of the connections she has made between a new idea and a domain which is both familiar and significant to her; or as a novel application of the principle of a fair test. All of these would, we think, be valid interpretations. But what seems most important to us about this episode is the clear evidence it provides for the way in which the children are actively making sense of what they observed in the trial, using the concept of "a fair test" as a tool to help them do so, and gaining a greater understanding in the process.

In fact, in the next activity, in which the children had experimented to discover which variables affected a pendulum's period of swing, there was further opportunity to appreciate the importance of changing only one variable at a time in order to ensure that the test was fair. It is to a collaborative reconstruction of the different groups' experiences with pendulums that the teacher now turns in the review discussion.

- 44 Teacher: Remember when you did the pendulum, when one group did the bob . changing the weight of the bob, one group changing the type of bob, one group changing the release height . and all of us did changing the length . that- what- when you want to change the release height what was constant? What was the variable we held constant?

Emily's group, which on this occasion also included Bianca and Jamilla, had tested the effect of changing the weight of the bob. Over a period of some 30 minutes, they had systematically added one washer at a time to their string pendulum and timed the number of complete swings in 30 seconds. The following extract captures something of the quality of their engagement in the task.

Lily has just added the fourth washer and Emily, who is responsible for timing each trial with the stopwatch, prepares to start.

- Emily: OK, ready?
- Bianca: No . . we've got to measure it to forty-four [B takes the tape-measure and, while V holds the pendulum horizontally, she measures its length]
- Veronica: Forty-four?
- Bianca: Yes
- Emily: On your marks . . get set, go!
- ALL: One, two, three . . . (continue counting)
[Veronica sways from side to side with the pendulum, making as if to push it on each swing]
. . nineteen, twenty, twenty-one
- Emily: Stop!
- B and V: Twenty-one (laughing)
- Bianca: Look, twenty-two, twenty-two, twenty-one, twenty-one (reading the results from the chart on which Jamilla is entering them after each trial)

Emily: Five (instructing them to make the bob up to 5 washers)

While Lily is adding the next washer, Emily has nothing to do and she idly swings the stopwatch by its carrying strap. As she is watching it swing, she suddenly sees the significance of what she is doing and announces: "I've got a pendulum." Jamilla immediately picks this up and starts to swing the kiss-curl on her forehead, announcing that she too has a pendulum. She is followed by Bianca, who swings her ponytail as a pendulum, and finally by Veronica who, not to be outdone, shakes her whole head to make her loose hair swing as a pendulum. They all laugh with pleasure at the discovery of this extension of their understanding of what may function as a pendulum.

By now, the extra washer has been added and Emily is keen to proceed. But there is a problem. The knot is not secure.

Veronica: No wait
Lily: Uh-oh . that not way to tie it on
Veronica: I started to hold them and they ***
Bianca: I'm wonderful at tying knots, I love them
I mean I like tying them

While Bianca is retying the knot, the teacher approaches to check on how they are progressing.

Teacher: What did you get, guys?
Bianca: We got a pattern of twenty-two, twenty-two, twenty-one, twenty-one
Jamilla: two, twenty-one, twenty-one
Bianca: We want to see what it's going to be this time
Emily: I predict the more washers there, the less * swing
Bianca: I think this time maybe we'll get something like nineteen, eighteen or twenty . something like that
Jamilla: Maybe
Bianca: Maybe
Emily: I predict twenty dead . bet you have twenty

As the teacher walks away, they prepare to start the next trial. But first Bianca insists that they must measure the string to make sure that it is still the right length. As she does so, she notices that, with all the tying and untying, the string is fraying.

Bianca: Cos it's actually . . it's actually the string that's breaking . see
Veronica: Yeah, it's the string
Bianca: So what we have to do is- the string's probably getting shorter by the minute
Emily: I don't get it
Bianca: Because it's breaking, you know these things are getting heavy on the string and if they're all unpleating . next thing you know it'll be tearing off

Finally, however, the knot is firmly tied, the length of the pendulum checked, and the trial completed. The result is as before: twenty-one swings. After considerable further discussion, they decide that changing the weight of the bob does not systematically affect the period of swing. This is captured in the following extracts from Emily's journal. The first entry was written before she carried out this activity:

My Observation

I found out that the longer the string is, the less swings.

The shorter the string is, the more swings.
I think I know why! Because if you have a long string you can make it sway more. If you sway it more it will take longer to sway so it will have less swings. But if you have a short string it will go fast because it cannot sway so much. Probably it is also the wight.

This second entry was written when the group had finished the trials involving changing the weight:

My Observation

I learned that adding more washers make no difference.
Not even the count of swings.
I thought it would put more wight on the string so it will go slower each time. Our score was all 21.

When it is their turn to report, then, there is a wealth of shared experience within the group on which to draw. However, for Veronica, who is chosen to speak for the group, it is still a difficult task to express what she knows in a form that is explicit enough for others to understand. Nevertheless, with prompting questions from the teacher and contributions from other members of the group, a satisfactory account is constructed. Finally, after the last group has reported in similar vein, the teacher invites the whole class to join with her in drawing a conclusion about the principle's more general applicability:

72 Teacher: So that is an example of what we mean by "a fair test"
... it's very important in science
Those are some of the science processes you have to think about . OK?

"What Time is it in Scotland?"

At this point, we want to move on more rapidly to an episode that occurred some 10 minutes later. In the interim, the group had reviewed the designing and making of water timers and rolling ball timers as further instances of the "science processes you have to think about" (72). Then the teacher had reopened the more general discussion of what they had learned about time and, on the basis of Tema's contribution—

91 Tema: I learned that time may not only be in seconds, you may, see it as a minute, a second—and a second is made up of . quite a few fast counts

she had spent a few minutes in checking that the children knew the constituency relations among seconds, minutes, hours, days, weeks, months and years (92–129).

Next followed another opportunity for students to talk about what they had learned (130–159), which the teacher followed with an episode of more direct teaching about the basis for the different units of time in the movement of the earth on its axis, and in its orbit around the sun. This latter topic was also developed dialogically, but interspersed with longer turns by the teacher, in which she accompanied her explanation with demonstration, using two of the balls from the rolling ball timer to represent the earth and the sun.

The episode to be examined next followed directly from the one just described, and was originated by Bianca. In a

pause that occurred while two children were going to fetch the globe, she raised her hand to indicate that she had a contribution to make.

204 Teacher: Yes . while . somebody's doing it (= fetching the globe), Bianca you have a question?

205 Bianca: Well, um, you know last night I was going to bed something like quarter to ten— I can't exactly remember but um my sister said that um— I asked her um "guess how lo— guess what time it is in Scotland" (Bianca has recently arrived in Toronto from Scotland) and she goes "I think it's um about ten o'clock" and I go "But it's only ten o'clock here it can't be ten o'clock over there" (T: Mm) . so I counted back five for the time difference and I said "It's actually four thirty um in the afternoon and they're just about to have their cookies"

206 Teacher: Very good . Now Bianca's bringing up another point

Given the point at which she makes this contribution, it is likely that Bianca has already made the connection between the time differences between different countries and the rotation of the earth in relation to the sun. However, because other children may not have followed this implicit connection, the teacher makes it explicit by relating the anecdote to her previous explanation and by once again demonstrating the two movements of the earth, this time using the globe to represent the earth and Angeline, who is sitting at one end of the semicircle of children, to represent the sun. Then, against this general background, she goes on to consider Bianca's example in detail, correcting, in passing, the error that Bianca had made in carrying out the rather difficult operations involved in calculating the time difference between the two countries.

Although the teacher had not embarked on the discussion with a preplanned agenda of her own, the topic of time zones would obviously have been a candidate item for inclusion on such a list. Therefore, when Bianca presents an opportunity to bring it into the discussion, the teacher is pleased to take it up. Once again, what the teacher later described as "a teachable moment," has arisen. This is made particularly clear in her focusing move, "Now, Bianca's bringing up another point" (206), in which she deftly accomplishes two purposes, first, that of authorizing the relevance of Bianca's anecdote and, second, that of signaling that the topic is one of general importance, that merits further discussion.

In fact, this topic is pursued for the remainder of the lesson, as it is one that is of personal significance to many of the children. Drawing on anecdotes similar to Bianca's, contributed by children with relatives in Hong Kong, the Philippines and other countries, the teacher is able to help the children to attach real-life significance to the concept of time zones, and the differences in time between them, which might otherwise have been too abstract for them to grasp. One of these anecdotes, in particular, is worth quoting in full.

The class contains quite a number of Chinese Canadian children, and Emily, whose family comes from Hong Kong, has just been recounting a conversation with her father about the time difference between Hong Kong and Toronto:

258 Emily: ...say it was nine o'clock and I asked Dad "What's it like in Hong Kong now?" and he said "It's— it's the same time but it's the morning, nine o'clock in the morning"

As the teacher recaps and makes the connection with Bianca's example, Lily, another Chinese Canadian girl, raises her hand. As the teacher immediately recognizes, this is an important moment. Lily has only been living in Canada for just over a year, and is usually very reticent about speaking in front of the whole class. On this occasion, however, she clearly feels her story is sufficiently important for her to request an opportunity to tell it.

266 Teacher: ...that's why your Dad says Hong Kong to here is a twelve hour difference, that's exactly . half way round for time whereas . Scotland to here is five hours difference

Yes, Lily

267 Lily: When I was in China . my Mum always called me at the night and er— and I— I don't like— I don't er I don't want to wake up and my— my Grand-mother say You have to wake up, your mother on— in the phone."

So I have to listen to him

268 Teacher: That's right . she says— Lily says that when she was in China . where's China? you show me (to Lily) [Lily points to the position of China on the globe]

269 Auritro: Er you just —

270 Teacher: There, China's over here . (pointing) and her Mum was in .

Canada

271 Lily: Canada

272 Teacher: —her Mum called at say two o'clock in the afternoon, say now, cos the sun is there two o'clock I would say it's roughly here . is she still asleep?

273 Children: Yeh

274 Bianca: Two in the morning, **

275 Teacher: Now, it's really not as much as Hong Kong, * slightly less, but she's still asleep . so that's why she was telling us her grandmother said "Your mum is on the phone, get up! Your Mum is calling you"— which means phoning for you— and she says "Why does she phone me at night?" But is it night for your Mum?

276 Lily: No

277 Children: No

278 Teacher: No, it's daytime . and say if Lily comes over— the earth moves here and it's daytime (i.e. in China) and Lily calls her Mum . Lily phones her Mum, would her Mum be awake or asleep?

279 Children: (laugh) Asleep

280 Teacher: See now why? do you see it now with the globe and the sun

281 Children: Yes

As in learning their first language, what prompts children to take risks in using the linguistic resources they are learning in a second language is so often the combination of having something they feel it is important to say and an audience who will be interested to hear it. This is what happens here. As with other children's contributions, the teacher picks up Lily's

anecdote and retells it to give it added effect, using it at the same time as a particular case of the more general principle that is under discussion. Whilst illustrating the rich resource for developing understanding that is to be found in multicultural classrooms such as this, this episode also exemplifies very clearly just what is meant by the co-construction of meaning.

LEARNING FROM THE PAST: LEARNING FOR THE FUTURE

In the introductory section of this chapter, we outlined a way of thinking about education in which teaching was characterized as the provision of opportunities for learners to appropriate the achievements of past generations—as these are embodied in cultural tools and their associated practices—and to transform them into a personal resource for individual thinking and problem solving now and in the future. This discussion, we want to suggest, is an excellent exemplification of this process in action. In order to justify this claim, we should like to revisit the section of the discussion concerned with “the processes of science,” in order to consider it from this point of view.

The principle of “a fair test” is just such an intellectual artifact—or tool—and one which is of central importance for the way in which scientific understanding is advanced in our culture. Indeed, it is so central that it is easy to ignore its artifactual nature. Yet this principle, which is taken for granted as necessary in any experimental attempt to understand relationships of cause and effect in the material world, was developed in the course of practical activity by our forebears over many generations in the past. That it is a tool that has to be learned in action was made very clear in the course of the activities in which the children engaged and in the accompanying discourse.

We have already seen how Emily and her friends grappled with the problem, as they reflected on the probable reason for Lily “losing the match.” Now we want to consider the experience of Auritro and his group as they tested the effect of changing the type of bob on their pendulum and in the subsequent discussions.

In the class discussion which was held at the end of the experimental work on pendulums, it was finally agreed that it was only changing the length of the pendulum that changed its rate of swing, and a rhyming slogan was coined to make this finding memorable: “The longer the string, the slower the swing.” However, earlier in this session, when the groups described what they had done and reported their results, Auritro’s group had reported results that were anything but conclusive. The problem, it transpired, was that, in changing the type of bob, they had been unsuccessful in keeping the length of the string constant. Now, compared with the results obtained by the other groups, who had been more successful in changing only one variable, theirs were impossible to interpret. Asked to comment on them, he described them as “pretty wacky,” and when they were displayed using another artifact—that of graphing—it was clear that, as he put it, they

were “all over the board.” This evaluation is confirmed by the entry he had already written in his log:

Topic: Swing time
 Question: Will the type of bob change the swings?
 Well it was confeswing for us wich is Me, Kelvin, Benjamin and Tsz-yeung. We made another pendeleum and testing lots of things. First we checked the lengths. The first and second time the lengths where different. The last time it was same but counts were different. Heres the chart:
 We used Nails, washers, screws and a cup

Nail	=	24	going back and fourth
Washer	=	23	"
Screw	=	21	"
Cup	=	23	"

 going back and fourth counts as one swing.
 I think what we had observed was right but was wrong. We had done something wrong with Nail and screw. I dont how that happend but it did. I think our counting was wrong.

However, in the second section of the present review discussion, in which the experiment with pendulums was reviewed from the perspective of “the processes of science,” these difficulties were no longer alluded to. Instead, it was the principle of a fair test that was emphasized, with its operationalization in the controlling of variables. Through the successive sequences of discourse, the experiences of the separate groups were jointly reconstructed as instances of carrying out a fair test. As the teacher explained afterwards, since the children now knew that only length affected the rate, what in her view was important to emphasize in the discussion was not whether they had succeeded in holding all but the experimental variable constant, but the fact *that* they had attempted to do so and understood why this was important.

Another way of looking at this episode is as a particularly clear example of the general principle of cultural learning, discussed earlier, in which the learner is enabled to take over the culturally accepted practice by being taught to use an artifact or tool in which the outcome of past achievement is encoded. Here it is the meaning of a fair test that the teacher wishes the students to take from their practical work and the accompanying discussions. Therefore, by appropriating what actually happened in Auritro’s group and reinterpreting it in terms of what would have happened if they had followed the cultural practice associated with the use of this principle, the teacher is helping the children to take over the practice, together with the understanding that it embodies, as a tool that they can use in all future scientific experiments.

Overall, then, one of the teacher’s intentions for this discussion is that the children should draw on their various group experiences of practical work and on other relevant information to construct a *shared* understanding, but one that is also informed by the publicly accepted account of the phenomena that they have been investigating. The children are certainly willing and able to play their part: following the initial “macro” question asking what they had learned, they eagerly offer a wide range of important topics for discussion (cf. Table 43–1). However, as might be expected of children of this age, these are largely in the form of observations and

anecdotes drawn from personal experience; therefore, in order to create what Edwards and Mercer (1987) refer to as culturally appropriate "common knowledge," a considerable amount of "follow-up" work is required on the part of the teacher. On each topic, this is achieved, first, by eliciting similar observations and recollections from other members of the group so that, together, their contributions are built into a shared account, and then by extending and reinterpreting their contributions, drawing on the linguistic register that is more generally used to talk about the related activity in the culture. In this way, while encouraging and valuing the ideas and experiences that the children are keen to contribute, the teacher, as "an authoritative representative of the educated culture" (Edwards & Mercer, 1989, p. 97), provides an opportunity for the children to take over and internalize her organizing cognitive structures and associated language so that, in the future, they will be able to deploy these resources when engaging in further activities for which they are relevant.

Learning About Time: Through the Children's Eyes

The emphasis in the chapter so far has been on an exploration of what the children had learned from their study of time, as seen through the lens of the collaborative meaning making that occurred in the final discussion. However, as will be clear by now, this discussion was itself an occasion of learning, as important as any of the activities that were reviewed during its course. For, as well as clarifying and extending the science concepts associated with those activities, the discourse that the teacher and children co-constructed itself provided a model, on the intermental plane of public discourse, for the intramental dialogue of inner speech in which individual thinking and problem solving is conducted.

In *Thinking and Speech*, Vygotsky (1987) hypothesized a developmental progression in the learning of any aspect of cultural knowledge, from adult-assisted interpersonal interaction, through interaction with peers, to a stage when the individual is able to function autonomously under the control of the discourse structures internalized from social interaction. In this section, we shall look again at what the children were learning, focusing here on how they were appropriating the concepts and processes of science as evidenced in their talk and writing.

One very clear example of this developmental process in action was seen in the episode quoted earlier, in which Emily initiated a review of the results of the bottle-emptying task. Attempting to explain to herself and her friends why Lily had taken longer than Veronica and herself to empty her bottle, she drew upon her interpretation of the language that she had just recently encountered in the conference with the teacher and couched her questions in terms of "a fair match," in which Lily "lost." Interestingly, Emily's conflation of "a fair test" with a fairly conducted competition came into play again in the final practical activity, when she and her group designed and made their own water clock. However, they were not content to make just one; at Emily's suggestion, they decided to make two identical water clocks so that, in addition to making sure that their experiment constituted "a fair test," they could also have races between them.

Two years later, however, her understanding had changed. In an interview at the end of her grade five year, she was asked about things she had learned it was important to do when "doing science." Without hesitation she replied:

I think you have to be . um . consistent and do fair tests for everything.

And when asked what she understood by "a fair test," she replied:

You have to keep everything the same and if you change a thing you have to change it all

In the intervening years, Emily had continued in the same class with the same teacher and many of the same children. During that time many other science topics had been investigated, always with opportunity for practical work and often involving experiments. Certainly the issue of fair tests had been discussed on more than one occasion and, from taking part in these activities and discussions, Emily's understanding had gradually been transformed until it approximated more closely the conventional version.

Here, the value of collecting longitudinal data is particularly clear, for it allows us to see that, as Vygotsky (1987) pointed out, concepts are not learned instantaneously in their mature form, but are appropriated and modified over numerous occasions of use in settings in which they are relevant to the task in hand.

A second feature of Emily's discussion with her peers that is worth commenting on is its reflective nature. This stance was almost certainly taken over from the review discussions with which the teacher ended most activities, and from her repeated injunctions to the children to use the writing of entries in their science logs to reflect on what they had learned.

We have already quoted Auritro's log entry, in which he tried to explain to himself why his group's testing of different types of bob had been unsuccessful. Here is another reflective entry that attempts to draw conclusions from a series of experiments involving pendulums. It was written by Jamilla, who had been the record keeper for the group that tested changing the weight of the bob. After each child had made a pendulum with a washer and a randomly cut length of string and counted the number of swings it completed in 30 seconds, the pendulums were arranged on a chart in the order of the number of swings completed. From the resulting display, it was clearly apparent that "the longer the string, the slower the swing."

I noticed that when we made a chart, the person who had the longest string had the smallest amount of counts.
Why? I think it was the length of which the string was.
Why? The release height does not matter, and the weight of the bob does not matter.
Why? Bianca, Veronica, Emily, and I did a test on weight of the bob. Other groups did tests and it did not matter. Only the length matters because it takes a longer or shorter time.

In all these entries, it is a personal observation or discovery that provides the point of departure and the writing serves not

only to communicate that information but also acts as a "tool" with which to make sense of its significance.

Not all the children were able to make such sophisticated use of their writing, of course, and some relied more on pictures and diagrams than on written text. The teacher deliberately encouraged such "picture writing" by those children for whom the writing of text was a painful struggle. She was more concerned that every child should experience the value of recording and reflecting than that they should produce conventional text. For example, Lily, the newly-arrived Chinese girl, put considerable effort into drawing and labeling the materials that her group had used in constructing a timer that would measure 30 seconds, based on the design of an hour-glass, but using salt instead of sand. Nevertheless, despite her limited command of English, she also wrote the following account of what, for her, was either the most memorable aspect of the experiment or the aspect that she felt most able to write about. In any event, she succeeds in giving a graphic account of how the teacher helped them to solve the "parbom" (problem) they encountered in trying to make the right-sized aperture in the paper diaphragm between the two pop bottles that, taped together, formed the two parts of the "hour-glass."

Emily Veronica and I try to maked good but every time we do tat we has a little parbom, first time the hole is very bag only 7 secon and tn we try to do it slowly so Emily pat in sum salt and this time we taked 25 sicon and the last time we do that Emily pat in sum salt and only 27 and Mrs X. was come in and she tell us how to do it she take a bag funnel a madm funnel and a little funnel and she sad the bag one is father the madm one is mom and the little one is baby. So Mrs X take the baby and count to 30 and she take the mom the mom is 20 agn Mrs X take the father the father is 14 now Mrs X and us know the baby is the roret (correct) one so we copy the hole forkm baby funnel wnet we finisht we trn (try) this time we got 30.

Even at the age of eight or nine, then, many of the children in this class were capable of reflecting, in speech and writing, on what they were doing, and were able to understand the relationship between the "hands-on" practical work, which they enjoyed so much, and the "minds-on" spoken and written discourse in which they planned and reflected on what they were doing and learning. Through these interrelated activities, carried out jointly with their peers and with their teacher, they were taking over the knowledge and artifacts of previous generations and using them to make and communicate their own sense of the puzzles and problems they encountered in the present.

At the end of the year—some months after the end of the unit on time—we interviewed two groups, one of boys and the other of girls, to ask, once more, "what have you learned?" The answers they gave confirmed our expectations. Although none of those interviewed recalled the episode with the malfunctioning water clock, with which we introduced this chapter, they did remember many of the activities they had carried out, and they referred to their logbooks to make sure they got the details right.

Asked which they considered most important—practical activities, reading, writing or talking—the girls responded as follows:

Veronica: I think the writing—

Bianca: All of them

Emily: Yeh all of them, but I think one thing um very important is that we all discussed about it, like talked

Veronica: What I think is because um you need to write for er— and you need to read to get the idea and then you need to talk to get the— er talk to the other person to get the idea of what you're going to do and who's going to do what so that you don't get into a big fight when you're doing it

Bianca: Yeh and I think the fun activities are important cos you can also have some fun doing your science and the writing's good because it builds up your * and your language your brain and also discussing about it it builds up your confidence to talk about things and also your- er your language skills and things like that and I also think the reading's very good because in most jobs you do have to know how to read and to write

Jamilla: You also learn about math sort of because you're doing um— . science is a lot of patterns and things like that and math is also patterns and things like that so you get a lot of everything just by doing science

Emily: And you learn a LOT

Asked the same questions, the boys gave very similar answers. They, too, had enjoyed the practical activities and could recall many of them in considerable detail. Auritro and Benjamin, for example, explained very clearly why their salt timer had taken longer to run through in one direction than in the other. The problem, they were convinced, was that, in piercing the hole in the paper diaphragm, they had created the equivalent of a valve: the pierced paper opened up to let the salt pass through easily in one direction but, when the timer was inverted, the weight of the salt tended to push the paper back into its original, unpierced position, thereby slowing down the rate at which the salt passed through. However, because this reasoning took place only after the pop bottles had been securely taped together, they had not had the opportunity to empirically verify their hypothesized explanation.

The boys also recognized the value of the reading and writing. In fact, they tended to place more emphasis on reading than the girls had done. But reading, writing, and talking were all seen as complementary activities which, when carried out in a collaborative group, enabled real progress to be made in the construction of group and individual knowledge. This is how Auritro put it:

If you know something that— you know something that somebody else doesn't know, somebody else knows something that you don't know, then you can add those ideas together

And, on the role of reading and writing, the group had this to say:

Auritro: You read the— once you do the science experiment, you experiment about it, then if there's a book about that animal— that creature, you could read about it and then you could write about it and you could make a whole new thing of it .

- Benjamin: And you can er- like if there is a book on flower- on a flower-certain kind of flower and you're um you're experimenting with it you can mix the breeds and then like and then write er write down what you've experimented with .
- Steven: After you've finished an experiment you should always write it up in the science log. Because if you want to do that experiment again you might forget how to do it
- Teacher: So that's one good reason for writing, so that you have a record of what you've done. Are there any other reasons you can think of for writing?
- Steven: Writing books to help others to understand
- Auritro: Yeh, understand the **
- Teacher: You mean you write to help other people understand or you write to help yourself understand?
- A and S: Both
- Auritro: You help yourself by reading and then you write it down so other people can understand
- Steven: Well wouldn't that be copying the book?
- Auritro: No . . . you have to read from a book because once . . . you read the book and you know- and you know a little bit and you read the book and you get a little bit more. You can write your own book, some more, and then you could like publish it and then give it to a science fair and then people could read it. If you know something little, and that book doesn't have it in there, you could add it up together and then you get another book.

Auritro, it appears, already has a well-developed, if intuitive, understanding of the intertextual nature of reading and writing and of the way in which knowledge is collaboratively and progressively constructed through reading, writing, and talking.

CONCLUSION

In presenting an analysis of the review discussion with which the unit culminated and of some of the activities on which it was based, we have tried to show how learning in science—or in any other curricular area—can be seen as part of a continuing cultural process of appropriating the achievements of the past and transforming them into a resource for creative and innovative problem solving in the present and future. In the episodes selected from the discussion, we have seen how the experiences of the immediately preceding few weeks were collaboratively reviewed and their meaning reinterpreted in terms of principles and practices that previous generations had invented to make sense of the phenomena in question. Similar discussions had also occurred in relation to the various activities in which the children had engaged throughout the unit; however, this one had particular importance in that it was used as an occasion for making connections among these individual topics in order to achieve a more integrated understanding of the theme of time.

Such opportunities to synthesize and reflect on what has been learned occur all too rarely under the pressure that many teachers feel to hurry on in order to cover the recommended curriculum. Yet they constitute an essential element of any curricular unit, if school learning is to be more than the

accumulation and memorization of isolated bits of information (Wells, 1995).

But it has also been one of our aims to show how, in appropriating the knowledge and artifacts from the past, children use them for their own purposes and put their own stamp upon them. The episode in the review discussion in which the basis for the different time zones is explored provides a clear example of the former. For Lily, who has rarely spoken in the whole class group, the new understanding she has achieved of the personal experience of being phoned by her mother in the middle of the night is significant enough for her to break her silence with a brief story that enables her to become a fully participating member of the classroom community. In a different vein, Emily's personal interpretation of a fair test as involving competition ("a fair match") is an example of the latter. But perhaps more significant than either of these rather specific examples is the tenor of the discussion as a whole, with its numerous examples of the children's ability to infuse general concepts with their own personal and particular meanings and at the same time to reframe those personal meanings in more public terms that make them relevant and, therefore, worthy of sharing.

A second theme of the chapter has been the dual role of discourse in the learning and teaching of science. On the one hand, "doing science" is to a considerable degree a matter of participating in the various discourses by means of which the scientific community addresses the problems of current concern and creates and debates novel solutions that have the possibility of transforming and extending previous knowledge; therefore, one of the major goals of the science curriculum must be to enable students to gain sufficient control of these specialist discourses to be able to use them in constructing their own knowledge. On the other hand, as we have seen, it is also in the ongoing discourse of the classroom that the teacher and students create the forum for co-constructing the meanings in terms of which they make their own sense of these specialist discourses and of the situations to which they apply.

The same arguments could be made for the other subjects in the school curriculum. In all areas, one of the major goals of education is for students to appropriate the modes of discourse that are specific to the different discipline-based ways of doing and knowing so that they are able to take part in those practices and, in so doing, to make them part of their own resources which they can use for their own purposes. At the same time, it is in the more familiar patterns of classroom discourse with their peers and teachers that students are enabled to build bridges between these specialist discourses and those with which they are familiar from their experiences at home and in the larger community. It is, therefore, in providing them with opportunities for apprenticeship into the discourses of the disciplines, we believe, that teachers will most fully achieve the aims that are captured in the phrase "language across the curriculum" (Wells, 1994).

Despite the theme of the volume in which this chapter occurs, as may have been noticed, we have not singled out literacy for special attention. This is because, like the children, we see it as an integral component of any unit of study. To do science—or history, or mathematics—is necessarily to engage

in reading and writing, along with doing and talking—in order to formulate and address the problems and issues that seem worthy of sustained attention with respect to the topic under investigation. As we argued earlier, language and literacy are cultural tools for thinking, feeling, and communicating with. Like other tools, they are best mastered, not through decontextualized exercises, but through appropriate use in situations of significance to the user.

This chapter started with an account of just such a situation, in which the real problem posed by the malfunctioning water clock led to a creative solution which required the integration and application of a variety of cultural tools, including logical reasoning, reading of the junior science guide, and talk for coordinating joint activity. In this situation, perhaps more than in any other we have described, the children really showed what they had learned.

We should, therefore, like to end this chapter by quoting Emily's insightful conclusions about the year's work. In the end-of-year discussion referred to above, the children were asked how they, if they were responsible, would plan the work for the next year's students. This is Emily's reply:

We should give the children—the grade threes that came—to go through the "Innovations" [the resource book they had used]⁴ and then I would ask them questions, like what we did or what we remember, like "What is science?" "What did I think of it?" and I would— I think I would start them by um— giving-start with projects— not projects but making things, and then I think I would um— few days later I would gather them on the carpet and they all share what they observed and then see they'll become like us, just writing them in our books...

THE LITERARY TEXT: ITS FUTURE IN THE CLASSROOM

Richard L. Venezky

UNIVERSITY OF DELAWARE

The literary text is under siege on several fronts. First, as a subclassification of *books* it is viewed by some as a dying remnant of the age of paper, a time period that, like the stone age and the bronze age, will be viewed primarily as a transition to a higher and more satisfying form of life. Enthusiasts of the electronic age have forecast the doom of books (and other forms of print) since at least the late 1970s (e.g., Lancaster, 1978). One member of the publishing trade predicted about 10 years ago that the how-to-book would be the first printed genre to reach extinction, driven "the way of the buffalo" by the videodisk (Goodrum & Dalrymple, 1987, p. 160). That both buffalo and how-to-books are plentiful today is a testament to more than the difficulties of prediction.

Just 9 years ago, in a paper entitled "The paperless society revisited," F.W. Lancaster found the decline of paper accelerating. Of books in particular, he claimed, "...the printed book will be replaced by something quite different from anything we have yet seen, and this will occur because the medium replacing it will be widely perceived to be better" (Lancaster, 1987, p. 217). At the same time, various gatherings of scholars, educators, librarians, computer scientists, lexicographers, and the like have pondered the future of the book, generally finding cause for concern over the future of printed materials. The U.S. Congress in 1983, concerned over the impact of new technologies on books, authorized the Library of Congress to do a study of the "changing role of the book in the future" (Senate Concurrent Resolution 59, approved November 18, 1983). Although the publications that resulted from this study (The Book in the Future Project) revealed no consensus on the impact of technology on book production, a sense of inevitable change permeated the various contributions (Cole, 1987; Joint Committee on the Library, 1984). More recently, the 10th Annual Conference of the University of Waterloo Centre for the New Oxford English Dictionary and Text Research selected as its title "Reflections on the Future of Text,"

with papers scheduled on a variety of topics, including speculations on the nature of the electronic text.

Ironically, the electronic publishing explosion, with a laser printer and a page composition program on every desk, has led not to a decline in the sale of paper but to a noticeable increase. According to the latest edition of the *Statistical Abstract of the United States*, the total quantity of books sold in the United States has continued to increase roughly at the same rate as the population has increased. Elementary, high school, and college textbook sales did decline slightly from 1990 to 1991, but trade books (both juvenile and adult) made larger gains. Thus, while more and more material is being issued on CD-ROM and more and more archives are popping up on the Internet and the World Wide Web, total book production continues at a steady pace.

The potential replacement of the paper-based literary text by glowing images on a screen does not within itself alter the text itself. *The Name of the Rose* is *The Name of the Rose*, appearing as Mr. Ecco planned and published it, whether on paper, CD-ROM, diskette, or any other delivery medium. However, an even larger threat to the survival of printed fiction is envisioned through the deployment of hypertext. Robert Coover, who directs the Brown University Hypertext Fiction Workshop, calls hypertext fiction "a potentially revolutionary space, capable, exactly as advertised, of transforming the very art of fiction" (Coover, 1992, p. 24). George Landow, author and editor of a number of (printed) texts on hypermedia, hypertext, and literary studies, posits (with no apologies to Vico) three ages in the history of literacy, corresponding to (1) the invention of writing, (2) the invention of movable type printing, and (3) the invention of hypertext (Landow, 1992).

Hypertext derives from ideas first advanced in the 1940s but not developed until the 1960s (Conklin, 1987). In its most general form, hypertext is a scheme for creating a web or net

composed of nodes and links between nodes. The nodes might be patches of text, as in a novel, or discrete facts, pictures, charts, or any other two-dimensional form. Links can be given any labels desired: definition, pronunciation, comment, history, biography, and so forth. They function to connect one node to another so that the label given signals to the reader / navigator what might be expected if a particular link is followed. Hypermedia extends hypertext to another dimension, allowing video, sound, and potentially any other media to occur at the nodes. Otherwise, however, the basic plan of nodes and links is the same as for hypertext.

Hypertext could be used to supplement a text through the addition of links from words, sentences, sections, and so forth to explanations, definitions, alternate wordings, and other supporting comments, or to alter the linear transversal of the text through links that allow alternate paths for the reader. For example, the lines for a character in a play might be linked so that the reader could progress through a single role without encountering scenes in which the character was absent.

Confronted with these two challenges—a movement toward electronic delivery of texts and the potential of hypertext and hypermedia, what future does the literary text have in the classroom? What follows is one view of this future, derived from working in both the literary and the technological sides of the house.

THE EVOLUTION OF TEXTBOOKS

Modern American textbooks are a creation of the second half of the 19th century when the common school movement created a large market for textbooks, and new canals and roads allowed national distribution of materials at low costs. Large speciality printing houses like Truman & Smith in Cincinnati, Ohio could do a multimillion dollar business in textbooks by marketing across the entire country. Ray's *Practical Arithmetic* and the *McGuffey Readers* were successful not just because of their intrinsic merits as pedagogical materials but also because of the distribution and marketing skills of their publishers (Sutton, 1961). The evolution of the textbook, however, has extended over several thousand years.

Within Western education, most historians trace textbook usage to the Greek schools prior to the Golden Age of Greece. "Homer was the first and the great reading book of the Greeks. . . Then followed Hesiod, Theognis, the Greek poets, and the fables of Aesop" (Cubberley, 1920). In the Golden Age, which followed the defeat of the Persian army at Plataea in 479 B.C.E., the arts curriculum first emerged, combining the contrasting views of Plato and the orator Isocrates. For Plato, subjects such as grammar, arithmetic, geometry, and music were preparatory for philosophy. For Isocrates, rhetoric not philosophy was the peak of intellectual and moral development. The resulting curriculum (*enkyklios paideia*), which the Romans eventually inherited, consisted of seven "liberal arts": grammar, rhetoric, dialectic, arithmetic, geometry, astronomy, and music. The texts that supported this curriculum were the original works in these areas by Plato, Aristotle, Isocrates, Ptolemy and others.

By the end of the Roman Empire, various writers, including Capella, Cassiodorus, Isidore of Seville, Augustine, and Boethius had synthesized and summarized the knowledge of the ancient world, usually in a single text. The seven liberal arts, as presented in these works, constituted the standard curriculum, and therefore the required preparation for theology until the 13th century (Chall & Mirsky, 1978). The three verbal arts (grammar, dialectic, rhetoric) were the introductory curriculum, known as the *trivium*, while the four mathematical arts (arithmetic, geometry, astronomy, music) defined the advanced curriculum and were collectively known as the *quadrivium*.

After Rome was sacked in 410 C.E., European learning continued in the monasteries, which also took on the work of preserving and copying manuscripts. Many secular writers like Caesar, Cicero, and Virgil were retained originally as models for Latin prose, but by the later Middle Ages were read for their own content. The authors of the church and ancient classics (*auctores*) were treated in the classrooms as authorities and were revered by students. "Students read *auctores* under a master who dictated explanatory notes of his own, themselves usually derived from earlier authorities" (Thomson & Perraud, 1990).

Textbooks were circulated as manuscripts, generally equivalent in to a modern text of 70–137 pages, and were sometimes in catechetical (question–answer) form (Cubberley, 1920). The catechism, whether for religious or secular subjects, was the primary instructional device evidenced in early textbooks. Through the Dark Ages, instruction was based mostly upon religious texts, including the Bible and the writings of the church fathers, but with the awakening of intellectual life in Europe in the 13th century, classical works were rediscovered, primarily through contact with Moslem learning in Spain. Within a century Aristotle, Euclid, Ptolemy, Cicero, Galen, Hippocrates, and other classical writers were standard fare in the European universities, where they remained until the mid-18th century. Although most textbooks up to the 16th century were written in Latin, the Protestant Reformation initiated a flood of vernacular materials. By 1529 Martin Luther published in German his translation of the New Testament, the *Greater* and *Smaller Catechisms*, and his own version of a primer. By the end of the 16th century, primers in vernacular languages contained the alphabet, syllable tables, and even occasional secular material, all oriented toward teaching children to read and to know the primary church rituals (Davies, 1974).

Although the primer began as a religious text, it evolved over several hundred years into a secular introduction to reading. It was for most of this time, however, a dour repository of the prayers and other basic church materials that children were expected to know by rote. The first illustrated schoolbook was Comenius's *Orbis Pictus*, issued in 1654. This became the model for primers like the *New England Primer*, and eventually the ABC books and secular primers. However, well into the 18th century in England, schooling for young children was based upon the primary religious texts. John Locke, born in 1632, described his first school books as "The Horn Book, Primer, Psalter, Testament, and Bible" (cited in Cubberley, 1920, p. 439).

The colonial settlers in North America brought with them English textbooks and continued to import textbooks from England until well into the 19th century. But textbooks were also published in the Colonies, beginning with the first press established in Cambridge, Massachusetts in the mid-17th century. Primers and ABC books were among the staples of the Colonial and early National Period press. Textbooks were also among the first books to receive copyright protection in the United States when the first copyright law was adopted in 1790. John Barry's *Philadelphia Spelling Book*, Jedidiah Morse's *American Geography*, and Samuel Freeman's *Columbian Primer* were among the first materials to be protected. For several centuries elementary textbooks were undifferentiated by age or grade level and gave little, if any, pedagogical advice to the teacher. Complex prose and an adult vocabulary were common until the 1820s and 1830s when the ideas of Rousseau and Pestalozzi began to influence American educational thought and practice.

Textbook Sales

With the common school movement came a rapid expansion in school attendance, encouraged by tax supported schools and compulsory attendance laws. In parallel with this enrollment increase came an equally rapid increase in textbook publication. The total value of book production in the United States increased through the second quarter of the 19th century at nearly twice the rate of increase in the total U.S. population, growing from \$2.5 million in 1820 to \$5.5 million in 1840 and \$12.5 million in 1850, with textbook sales accounting for almost a third of these totals (Trübner, 1859). School materials were purchased not only by parents and individual schools but more and more by school districts. With the introduction of age-graded schools, textbooks for the elementary grades began to be issued in graded series, with a separate book designated for each grade level. Earlier graded series had been published, particularly for reading, but the widespread development of graded series for reading and mathematics did not occur until the second quarter of the 19th century (Venezky, 1990).

Elementary and secondary textbook sales in the United States totaled \$1.974 billion in 1991, up just slightly over sales in 1990 (U.S. Bureau of the Census, 1993). However, increases over the past decade in total dollar volume have been created by price increases and not by expanded sales. From 1982 until 1991, textbook expenditures increased by 85% while the quantity of books sold declined by 11.6%.

Authorship

Sullivan (1927, p. 9) noted that "When people could not read, who wrote the ballads of a nation may have been more important than who made the laws. After literacy and schools became general, the authorship of school text-books became important." Authorship of elementary textbooks has shifted since the 17th century from the single writer who truly wrote and edited the work to committees of authors, selected as much for their name, gender, or race appeal as for their

abilities to write instructional materials. Modern elementary textbooks are most often not written by the people listed as authors, but by writing houses that specialize in the development of textbook series, or by in-house editors / writers.

Textbooks today, however, are assembled more than they are written, leading to what Jacques Barzun described as the impersonal voice. "The truth drones on with the muffled sound of one who is indeed speaking from a well" (Barzun, 1945). With some texts, especially those created through the electronic contributions of large numbers of people, the notion of authorship may not apply. The National Library of Medicine, for example, has created a hepatitis data base through consensus of experts. Perhaps we have finally arrived at virtual authorship.

THE LITERARY TEXT

The modern literary text used in the classroom generally takes one of three forms: either a published work of fiction as presented by the author, or a published work accompanied by a critical apparatus or pedagogical notes, or an anthology with pedagogical accompaniments. Although anthologies and excerpted works have been declared "ineffable trash" by at least one college president, they remain popular in both elementary and secondary classrooms, mainly because of their instructional value. A typical high school anthology presents a wide range of literary genres—short stories, poems, speeches, biographies, essays, plays, and so forth, usually organized around major themes; for example, the American dream, transitions, the individual. Also included are pedagogical materials: explanations of metaphors, historical references, discussion questions, vocabulary notes, and so on. Elementary readers are reduced versions of the high school texts, generally with tighter lesson plans and more student activities.

As more and more school districts move away from basal reading series, teachers will more and more be required to create their own anthologies and to develop or borrow the instructional materials to accompany the readings they select. But no matter where the lessons originate, they will no doubt continue to be composed of both literary works and instructional aids. That is, the content of the literary text in the elementary and secondary classroom is not a function of the medium through which the text is realized, but the developmental levels of the students, the goals of literature instruction, the context of classroom instruction, and the interests and abilities of teachers. Limitations of cost and of bulk force the setting of priorities in what to include in an anthology or in the number of paperback novels to buy for a class, but these do not shape the balance of different contents so much as limit the total quantity of material made available for instruction.

FORMS OF TEXT DELIVERY

Strengthening of Printed Texts

Given the nature of the literary text, how might it change as a

result of electronic technologies? First, it is worthwhile to consider technological advancements that would further entrench printed works. Although most speculation about the future of the book is done within the context of electronic delivery of text, two sets of advancements have begun to alter the cost and convenience of book production. One set has simplified the printing process by allowing printing directly from computer files without the need for film negatives and metal plates (Anonymous, 1994). Besides reducing the complexity of the printing process, this technique enables printing on demand, thus reducing the publisher's need to carry costly inventories of books, and increasing the ability to issue revised editions at a low cost.

A second set of advancements, consisting of both technological and production changes, facilitates custom publishing of texts and textbooks. A system introduced in 1989 combined editing, formatting, pagination, indexing, printing, and binding in a single device (McDowell, 1989). With such a system, an instructor could add or subtract readings in a literary anthology, incorporate different explanatory notes, questions, suggestions for projects, and references to local events, places, and people. The desired number of texts would then be printed and bound, with the instructor's name and class imprinted on the cover and the title page.

Of course, copyright restrictions place serious limitations on the extent of customizing possible. Some customized book services are restricting changes to materials on which they own the copyrights. Other services are developing large data bases for particular areas, with public domain materials, materials for which they own the copyright, and materials for which they have gained permission for use (Cairns & Feinstein, 1982). Costs are still relatively high for custom textbooks and some publishers require instructors to guarantee sales of 150 or more copies, thus limiting the process primarily to high enrollment college courses. Nevertheless, a number of major publishers, including McGraw-Hill, Addison-Wesley, Harcourt Brace, and Prentice-Hall, have entered this rapidly expanding market and others are expected to offer the same services soon.

As custom publishing costs decrease, school districts will find advantages in producing their own reading and literature materials. For publishers of basal readers, one opportunity for retaining market share may be to develop data banks of different reading materials along with supporting instructional components, and to offer custom design of anthologies. Customization could extend not just to the selection of readings, but also to the format and content of the lesson plans for the readings. Whether new vocabulary is presented before or after a reading selection, the extent of background information included, the type of extension activities, and other instructional decisions could be left as options for the purchaser.

The Electronic Supplement to the Text

The digital press and custom publishing may increase the viability of printed literary texts. Nevertheless, technological advances in data storage and transmission, along with the

continued decline in prices for multimedia systems, will make certain types of electronic delivery attractive. Most of this advantage, however, is for the materials that supplement literary selections and not for the selections themselves. It is instructive, nevertheless, to consider different levels of electronic texts, progressing from supplementary materials to total on-line delivery of readings and everything that might accompany them.

To begin, consider a printed anthology of readings with a companion CD-ROM that contained background information on the selections and their authors, vocabulary lessons, suggestions for projects, and self-evaluation questions along with answers and explanations. Students might begin a lesson with a whole class discussion on the selection to be read. Then, working in small groups, students would access specific directions from assigned sections of the CD-ROM, including questions or issues to guide their reading. After reading all or part of the selection, the groups would return to the computer system to assess their understanding, obtain further information on the selection, or receive further assignments. Also contained on the CD-ROM could be excerpts from other works by the authors in the anthology, oral presentations of some of the selections, and discussions with the authors.

Teachers could use the electronic resource imagined here in several ways. As a teacher resource the CD-ROM could guide the development of lessons around each reading selection, provide models for teaching particular concepts, perhaps through short film clips of expert teachers doing lessons, and present specific student materials that could be selected and edited for printing. Alternatively, the teacher could select portions (film clips, readings, etc.) for presentation to the whole class through a projection system.

The Electronic Textbook

At the opposite end of the spectrum is the fully electronic textbook. This is clearly a possibility now, but not a particularly desirable one yet. Portable (i.e., laptop) computers of the power required for sustained reading by students are still too expensive, too heavy, and too limited in screen quality to be considered as replacements for printed books. But what if these barriers were removed? What if, over the next decade or two, a device were developed with the same or better resolution as modern books (including color illustrations), weighing no more than a hardback novel, and costing no more than a dinner for two at a four-star New York City restaurant? We should assume that by the time such a device were available, it would also have the ability through wireless communication to access large data banks anywhere in the world, send and receive voice and mail messages, and link directly to similar machines of classmates and teachers. Would we welcome such a device as a replacement for printed books or would nostalgia lead us, like the scent of flowers, back to printed texts?

For many books, particularly those of limited permanence such as school textbooks, such a device might be welcomed. But would we forsake our shelves of treasured volumes, our

hardback editions of Shakespeare, Milton, and Chaucer, and our original editions of Nabakov, Cather, Rhys, and Firbank? For many, books are not just for reading; they are also a physical statement of who we are and what we value. An electronic book could reflect images of words and lines onto the retina as well as a printed book but may not substitute so well for its physical presence. Perhaps the printed textbook and the electronic textbook will coexist, the former restricted to elegantly bound volumes that mark the cultural qualifications of their owners, and the latter to everything else. But the resolution of this issue does not depend upon hardware alone, as the next section suggests.

THE TEXTBOOK AS NETWORK

Whatever the delivery mechanism, printed page or electronically activated surface, the textbook might still be a linear sequence of pages. Hypertext, which is dependent upon software and not any particular hardware, offers a possibility for altering this linear arrangement. As noted above, hypertext represents for some a revolution comparable to that created by the invention of writing itself. It is further claimed that by incorporating the reader into the creative process of writing, humanity will be released from the confining grasp of single authored works and passive reading (Bolton, 1991). Interactive fiction is not only a revolution in our time, it also "restores a theoretical innocence to the making of literary texts" and will require "a simpler, more positive literary theory" (p. 147).

Removing the "hype" from hypertext is not an easy job, given such exaggerated claims swaddled in the mushy lexicon of politicized literary theory, but hypertext has been used in enough applications to have its virtues and drawbacks made evident. To understand what hypertext (or hypermedia) is and what it might do to change the literary textbook, I will present four levels or types of hypertext structures as they might be applied to literary textbooks and comment on the advantages and disadvantages of each.

The Annotated Text

Simplest of all hypertext structures both to understand and to create is the annotated text. Imagine an anthology of readings for a classroom, any anthology, with table of contents, index, introductory remarks, reading selections, footnotes, glossary, and all the other appendages of a classroom text. Now transform the textbook into electronic form with all the nonlinear elements—table of contents, index, footnotes, etc.—accessible directly from where they apply. For visual convenience, assume that the existence of such supporting material is signaled by particular graphic devices: background color of a word in context, labeled button or other icon in a margin, and so forth. Navigation through the text is by "point and click," that is, by moving a cursor or other pointing image to a specific location on the computer screen and clicking a specified button, as on a computer mouse.

Within the text certain words are highlighted, indicating that information about these words is available. In a row below the text window are located various icons or buttons. Some, like the left and right arrows, allow linear sequencing forward or backwards in the main body of the text. Other buttons access specific sections of the text (e.g., table of contents, index, glossary) or resources (e.g., pronunciation, note pad). To open the text, the student selects the text title from a list or points and clicks on the representation of the book on a bookshelf. However selected, the initiating process brings to the screen a title page, followed by a table of contents. A student might point and click on a specific title to bring that selection to the screen, or select some other part of the text or one of the on-line resources.

As the text is read, various branches can be taken by a student. A definition for an unfamiliar word might be requested from a general dictionary which is available for any word in the text, or, if a word is highlighted, specific information on that word might be obtained. In these and in most other cases where specific assistance is requested, a text window appears on the screen, overlaying the main text window. Once the new information is read, the student closes the extra window by pointing to and clicking on a *close* button, or moves the window to where it does not interfere with the main text being displayed. When this is done, attention is returned to the point from which the last branch was taken.

From the index, pointing and clicking on an entry brings to the screen the text in which the selected term or phrase occurs. That is, instead of page numbers, the index entries have (invisible) links to not only the appropriate pages, but the places on the page where they occur. Other resources might be added that do not typically occur in a printed text, such as a speech system that will pronounce index or dictionary words or even read the text aloud, but otherwise this option makes an annotated textbook more accessible without changing its basic form. It has many advantages over a printed text, especially in navigation and in modification.

A student can move back and forth easily from literary text to author and editor notes, definitions, and the like. An on-line note pad can allow copying of small portions of text and the recording of student notes, all of which could be printed. The addition of teacher or student notes to the main system, either as a supplement to the notes provided by the editor or as a replacement, is also a possibility. If the appropriate software is provided, such changes would be easy to make and would allow adaptation or customization of a textbook by an individual teacher or by a school district.

The primary drawback of such a plan is the cost of providing a sufficient number of computers so that an entire class could be reading a textbook at the same time. Furthermore, if no printed editions are available, then students will need portable computers so that they can read away from class. Nevertheless, if the present exercise is a reverie about what might be, then cost should not be allowed to interrupt it. First we need to determine what benefits might accrue from new technologies; then the costs can be considered against these outcomes.

Hopscotching Through the Linear Text

A second level of hypertext is created by threading alternate pathways through a linear text such as a story or play. Events described nonchronologically in a story might be linked so that a reader could encounter them in either chronological order or reverse chronological order, that is from the most recent back to the most distant in time, or in the order selected by the author. Descriptions of characters, their thoughts and activities, could be linked so that a reader could follow a single character at a time, returning to pick up another after completing the text portions for one. For plays the linkages could create pathways based on characters, locales, or any other property of the plot, characters, or action.

This is a rather weak and limited use of hypertext but one which might serve didactic purposes. Pathways in this context could be viewed as study aids, much like a keyword in context index. They do not create a new text so much as they provide convenient access for study purposes of an existing text. Therefore, the best pathways will be those that allow discovery of the writer's mechanisms for character and plot development, description, and other elements of style. There is, furthermore, no limitation on where such pathways might extend so that different works by the same author might be linked as might works by different authors. Portrayals of Shakespeare's women—Desdemona, Cordelia, Gertrude, Lady Macbeth, and others—might be linked as might Shakespeare's Shylock and Christopher Marlowe's equivalent character, Barabas.

Extending this idea to its current limits creates Mosaic, World Wide Web, and other Internet resources that link through key words to archived documents all over the world. Imagine electronic demons that wander day and night throughout the Internet, seeking on-line documents and indexing important words within them. From a master index the equivalent of pathways is created so that, for example, a patient navigator of the network could flit from one occurrence of "lexicography" to another, encountering the Oxford Text Archives in Oxford, England, the Hebrew Dictionary Project in Jerusalem, the Dictionary of Old English Archives in Toronto, and dozens more document collections and sites. At this point the literary textbook becomes a small stitch in a larger, multicolored fabric.

Interconnectivity of the type described here, whether within a single text or across texts, does not ipso facto yield an interesting or useful resource. For example, random connections within a text would have no particular value, nor would those generated by someone with limited insight into the significance of the story, its method of construction, and its stylistic merits. Although a few such pathways might lead to the discovery of interesting relationships, most would be dead ends, and in time the reader would learn that following the nonlinear links was a waste of time. Only pathways created by an experienced critic or instructor would, in general, be useful for students, and these could be used either to supplement and automate (in some sense) what a critic or instructor typically writes about a literary text, or they could be structured to lead a reader to discover particular relationships.

What is critical here is the understanding that the value of the linkages is dependent upon the insights of the critic / instructor and not on some magical properties of the hypertext system. Dull, unimaginative analyses of a work, rendered into hypertext, remain dull and unimaginative. If anything changes with the hypertext version, it is that the lack of imagination becomes evident more rapidly. This means that so long as literary works are to be taught in the classroom, the need for human insight into these works will remain. Furthermore, although hypertext systems like those described here may be valuable for classroom instruction, students will still need access to the literary works themselves, and this requires either high quality, inexpensive portable computers or printed texts.

Interactive Fiction

The first step toward a form of fiction that is not based on a traditional, linear text is what is now called "interactive fiction." In this genre, brief episodes are written and linked so that the readers can thread their own pathways through the episodes. Navigation is either through overt choices that are offered at the end of an episode or through branching that links particular words, clauses, and so forth across episodes. In a novel by Michael Joyce, one of the first examples of interactive fiction, episodes correspond roughly to the amount of text that can appear in a single screen window. The reader can follow a default path through the episodes, or select alternate paths by responding to queries at the ends of episodes. Alternatively, some words within episodes are linked to other episodes and can be selected, thus bringing the linked episode into the main reading window.

It is possible in an interactive fiction work to return to the same episode many times or to follow a constrained path, if the author provided one, such that the story becomes linear. Two readers of the same interactive work may have little overlap in what they encountered. There is, therefore, no fixed work that can be analyzed, criticized, or in other ways treated as a linear work might be treated. Yet, contrary to the sense of infinite paths, an interactive fiction work with a finite number of episodes will have a finite number of realizations, if loops are not allowed. A clever author could develop alternate interpretations of characters, alternate plots, and alternate outcomes, expanding dramatically what has been realized in the past with interactive movies where the audience decides at a few specified junctures which of a small number of options will occur next.

The question of importance here is whether or not this form of hypertext will render obsolete the literary textbook as it exists today or even as it might exist as annotated or hopscotched hypertext. As interesting as interactive fiction might appear to be, it faces a highly uncertain future as a literary form. The most charitable statement that could be made is that the literary world would welcome a new approach to the construction of fiction if its best products possessed the richness and depth that the best of linear fiction possesses. Whether we subscribe to Bloom's (1973) "Anxiety of Influence" or to some other criterion of quality for fiction,

we continue to judge each work on some set of merits. Even though what we include in classroom anthologies is not based strictly upon merit, as the temperament of the times demands something else, we still resist inclusion of works that are without aesthetic merit, regardless of their authorship. So far the interactive fiction oeuvre has been competition for video games but not for serious fiction.

One particular problem with interactive fiction is the complexity of maintaining coherence. To write an interesting story that is original in the sense of the unexpected is a nontrivial task that few writers succeed at. To expect success at this task with multiple pathways is perhaps to expect the impossible unless the pathways are severely constrained. A well crafted story requires an extraordinary effort on the part of the writer, as the *Paris Review* interviews with famous writers have often demonstrated. To expect that each of a series of alternative pathways through a story will exhibit high aesthetic quality is to expect too much. Perhaps the initial challenge for interactive fiction writers should be simplified: to produce a work with only a few paths, but with each possible traversal yielding a work of merit by some generally acceptable set of standards.

A second concern with interactive fiction is with the role of the reader. Beyond the hype of liberating the reader from the viewpoint and perspective of a single author lies a question of what the reader seeks in serious fiction. Is it an opportunity to superimpose one's own will on the work or is it to discover the will of the author, to be engaged by her or his craft, and to discover something new and unexpected? Does a serious reader, on learning of the father's perfidy in *A Thousand Acres*, want to dictate what the daughters should do next or even choose among alternative actions, or does the reader want to see where the author goes next? I do not read Jane Smiley or any other serious writer with the intent of altering their presentation; I read to be absorbed in what they choose to present and in the order they present it. An author might suggest skipping a particular chapter, as Maugham does in *The Razor's Edge*, but even this is more a device to engage the reader than it is a serious invitation to alter the order of the text or to take an active role in the creation of the story. Transforming reading into a quasi-literary form of Dungeons and Dragons may, in the end, be neither a threat to serious linear fiction nor to video games.

Beyond Interactive Fiction

If the future for interactive fiction may not be so certain, are there alternative forms of electronic texts that might be more successful? One possibility is the mixing of print, voice, music, and video. Texts on tape exist now, as do musical works with narrative voice (e.g., Schünberg's *A Survivor of Warsaw*), and many movies have used text to convey information to the viewer, although usually as an introduction or coda, but no work that I am familiar with has intermixed major stretches of printed text with voice, music, and video. What I imagine is still linear: a text dissolves into music, voice, or video, and then returns to text. Segments or pages of text are displayed at a rate controlled by the reader. At some point, rather than

the next page appearing, a voice begins to speak. Perhaps it is the author, explaining in a bygone "gentle reader" style something about the text. Perhaps it is one or more of the characters talking. Or a video might begin. Imagine, for example, *Rashomon*, where each character's tale is presented as a video clip. This is multimedia of a special type and it presents many of the compositional problems of interactive fiction, but perhaps teams of writers, composers, and film directors will collaborate on such works.

CONCLUSIONS

More speculations might be offered on combining electronic media to create new types of fiction. But none imagined so far invalidates or replaces the basic function of fiction, that of a private conversation between author and reader. Electronic technologies hold great promise for expediting the study of literary texts through the linking of multimedia resources to the text itself. Having the author's voice and the voices of insightful critics readily available, to have immediate access to definitions, alternate readings, earlier editions, and all the other components of a critical apparatus will open opportunities to both the instructor and the reader that are not available now. But the literary textbook is a long way from being replaced by electronic text delivery. When computers are so inexpensive, so portable, and possess such high quality display devices that they do everything that a printed textbook now does, we probably will welcome them as replacements for some texts and as alternate means for reading, particularly in traveling about when we do not wish to transport a briefcase full of books. This replacement of the printed textbook by electronic devices will occur gradually over time as the quality of computer systems improves and their costs decline. By the time that textbooks are fully replaced, whether this be in 10 years or 500 years, we will have already accepted the electronic substitute as an obvious improvement.

We have no memory today of the time when textbooks were made of clay tablets or quires of papyrus, nor do we lament their passing, even though they lasted nearly a thousand years. There will probably be a time in the future when memory of books printed on paper sheets gathered between covers will disappear. Audiences in theaters, should there still be such assembly places, will express mild surprise and benign amusement when viewing videos of reading in the 20th century, and librarians (or their equivalents) will puzzle over the tactical problems in our time of providing space for so many millions of printed volumes. Yet we have no reason to believe that the cognitive processes involved in writing or reading of good fiction will change dramatically in the near or distant future, nor the need to teach plot, character, author intent, or any other component of the fictive process. In other words, there is no imminent threat to the content of the literary textbook from technology. Its future continues to lie within the hands of educators who select the canon and the methods for its presentation. Whether the aesthetics of literature will continue to be appreciated, even by a few, depends more on the backbone of the language arts educators than it

does on how many pixels can be packed onto a delimited surface or how cheaply solid state devices can be manufactured.

But however safe the literary textbook may be for the immediate future, the technologies described here offer opportunities for advancing literary instruction that should not be ignored. All of them place more resources in the hands of teachers and students than ever before, and require, for full utilization, more independent exploration and testing by students than is common now in language arts classrooms. Students will need encouragement and instruction in how to use on-line information, such as author comments, instructor

interpretations, definitions, and so on, to improve their understanding and appreciation of works of fiction. Perhaps even interactive fiction will prove useful as a writing tool, allowing testing of alternative plots, characterizations, and so forth, much as computer simulations of new car designs are used today. We are far beyond the era of computer-as-threat; each new technology can be evaluated for its potential in enhancing literary instruction, as well as for its potential drawbacks. In a world in which only a small proportion of even the college-educated adults read serious fiction, we can use all the help we can get in making reading enjoyable, rewarding, and enhancing.

INSTRUCTIONAL ENVIRONMENTS FOR LANGUAGE AND LITERACY: CONSIDERATIONS FOR THE ADULT LEARNER

Thomas G. Sticht

PRESIDENT, APPLIED BEHAVIORAL AND COGNITIVE SCIENCES, INC.

The design of instructional environments for language and literacy learning by adults is made difficult by the great diversity of adults as individuals and by the situational and organizational contexts in which adults are found. Because of this diversity, adult educators need to possess an extensive body of knowledge and professional expertise that goes well beyond what is typically the case today. These three topics, the diversity of adult learners, the diversity of learning contexts, and the professional education of adult educators, are discussed in this chapter.

THE DIVERSITY OF ADULT LEARNERS

Adult language and literacy learners form a breathtakingly diverse group. Among others, it includes college students taking English courses at the university; new immigrants who need to learn the English language as a second language, out of school; native born adults who are seeking to develop basic and intermediate language and literacy skills, and mature adult employees who need to upgrade their language and literacy skills in the wake of changes in their work environments.

Immigrants / Foreign Born

In this chapter, attention will focus on the language and literacy development of adults who are not enrolled in higher education at the postsecondary level. This narrows the field somewhat but still includes a great diversity of adults, including immigrants.

Immigrants arriving in the United States frequently enroll in English as a second language (ESL) programs. The diversity of educational backgrounds among these new arrivals is extensive; some have higher education degrees; others are without formal education and are totally illiterate in any language, and thousands of others fall in between these extremes. They are all grouped together by their need and desire to learn to speak, read and write the English language of their newly adopted homeland.

A U.S. Department of Education (1993, pp. 15–22) study reports that during 1991–92, federally funded adult education programs enrolled about 756,000 adults in ESL. Almost all of these adults were foreign-born, and about half had arrived in the United States after 1990. Sixty-seven percent of the ESL enrollees were Hispanic, 22% Asian/Pacific Islander, 8% White, non-Hispanic, 2% black, non-Hispanic, and slightly less than 1% were American Indian/Alaskan Native.

Over half (53%) of ESL enrollees had attained at least a high school education, another 23% had completed a postsecondary (4-year college) degree, and 47% had no high school diploma. About 92% said they read “well” or “very well” in their native language, while 8% said they read “not at all” or “not well” in their native language. The ability to read in their native language was directly and positively related to their ability to speak English.

Sixty-two percent were under age 30, and only 11% were over age 40. Most (51%) had never married and 63% had no children living in the household. About one third of the ESL students with young children in the household reported that they provided some intergenerational transfer of literacy by reading with their children nearly every day.

Committed as they must be to meeting the demands of daily living while still spending precious hours in learning the English language, these new citizens-to-be pursue this study openly, with the admiration and encouragement of their families, friends, and, for those lucky enough to find work, their employers.

Native Born Adult Learners

The undereducated, native born citizens of the United States include those for whom life has been rough, for whom learning in school may have been very difficult, leading to a decision to drop out of school without having achieved higher levels of language or literacy, those for whom decisions made in the passions of youth brought early parenthood and an existence on welfare, or those engaged in jobs where new ways of work have upgraded the demands for language and literacy skills. These are the adult learners who are stigmatized in the mass media as the "functionally illiterate."

For these learners there is frequently little joy in "going back to school." Unlike those studying ESL, the native-born who seek basic literacy education often feel that there is nothing to be proud of in going for "remedial" education. Too often for these adults, language and literacy learning is an embarrassment—an activity to be concealed. In these cases, the design of the instructional environment may include changing loss-of-face names like "adult literacy program" to face-saving names like "job skills enhancement program." Participation in these adult education programs is often clandestine, and not to be divulged to one's families, friends, or employers.

The U.S. Department of Education (1993, pp. 22–29) reported that, in federally funded adult education programs, about 414,000 adults enrolled in Adult Basic Education (ABE) and 612,000 in Adult Secondary Education (ASE) during fiscal year 1991–92. Over 90% of these enrollees were U.S. citizens by birth, most (61%) were white, non-Hispanic; black, non-Hispanic (22%), Hispanic (12%), American Indian/Alaskan Native (3%) and Asian / Pacific Islander (2%) made up the remainder of the ethnic distribution of the enrollees.

For 82% of the ABE / ASE adult students, English was the language spoken at home, with Spanish the next most frequent language spoken at home. Over two thirds (68%) of the ABE/ASE students were under age 30, and only 8% were over age 45. Most (61%) were women, most (52%) had never been married, and most (63%) had no children in the house under the age of 6. Those with young children (about 37%) said that they read with their children about once a week on average.

The typical ABE / ASE adult student dropped out of school after completing 10 years of schooling. Eighty-nine percent had no high school diploma, 8% had a diploma, and 3% had a postsecondary degree.

A local perspective. In San Diego, research is under way to better understand the education of adults in an inner-city, economically depressed area served by four continuing education centers that are part of the San Diego Community College District, Continuing Education Division (McDonald, Huie, Sticht, & Grimes, 1994). District data indicate that of

28,822 adult students served from 1992–93, 90% were ESL students and only 10% were ABE students. This may reflect the negative feelings that frequently accompany "going back to school" that many native-born adult students report (McDonald, et al., 1994, pp. 35, 36).

The diversity of ESL clients in the San Diego study sites is much greater than that suggested by the U.S. Department of Education report. At just one of the four adult continuing education centers where research is underway, enrollment data show that there are learners from 108 different nations, speaking over 70 languages. At the centers involved in the study, there are large enrollments in beginning ESL, and then enrollments plummet and very few adults are found in advanced ESL, possibly because they are able to gain employment with lower levels of language skills (McDonald et al., 1994, pp. 25–34). Whatever be the case, these new immigrants are an inspiration to adult educators. Many are here in the United States studying to become citizens, "American-style" parents, workers, and friends with their new neighbors. Many have survived the horrifying experiences of famine, floods, war, genocide, infanticide, wife-burning, and extreme poverty in their native lands.

In San Diego, as in the rest of the nation, the awesome task of the adult educator is to design instructional environments that will serve well this diverse population of language and literacy learners.

THE DIVERSITY OF INSTRUCTIONAL CONTEXTS

The adult educator's task is made even more difficult because diversity is also constituted by the contexts in which adults learn. Unlike children, who face compulsory education demands by attending more or less homogeneous public schools for 12 to 13 years, adult language and literacy learners are not typically faced with compulsory education, nor are they neatly housed in schools. The various situational and institutional contexts in which adult learners may be found constrain the types of instructional environments that adult educators can provide.

Self-instructional Programs

Adults may choose to learn in a variety of contexts. They may study alone at home, using language tapes, computer software, books, or even products such as *Hooked on Phonics™* with *SRA™* kits ("used by over 62 million people around the world") that rely on the mass media of television and radio to bombard the airwaves with advertising aimed at the adult learner/consumer.

Adult learners may be attracted to such products because they offer flexibility in terms of time of use, number of repetitions of a lesson, and, perhaps most important, anonymity. Adult educators may be engaged in developing these types of products for self-study. With such materials, it is important to keep the operating instructions as simple as possible, so that non-English speaking or less literate adults are able to use the

products. In language learning, there must be special attention given to providing information feedback to the learners so that they can know how well they are doing and whether they are proceeding correctly in areas such as pronunciation and appropriateness of syntax and vocabulary.

Military Contexts

Educators working in military contexts are strictly bound by the amount of time that is provided for instruction. Such time pressures may be even greater under a major mobilization like the Vietnam war. Military management may provide as little as 45 hours or as much as 3 months for an instructional program in reading or mathematics, depending upon the circumstances. Socialist, Marxist or "critical literacy" aimed at overthrowing the hegemony of the governing classes through revolution are notions that are not typically valued as goals of military literacy programs. Instead, it is generally expected by military management that the program will produce measurable improvements in job tasks requiring reading or mathematics.

In such cases, the adult educator may have to work with adult learners whose participation in the program is mandatory, who are excused from their daily job and whose full time is dedicated to learning in the program. They may often be exhausted from overnight training activities. The educator may have to develop or use existing job-related materials to accomplish a significant amount of literacy development in a fairly narrow domain in a short amount of time. Nationally normed and job-related tests may have to be administered to document learning gains in the programs.

In 1980–81, when the military was enlisting only volunteers and spending billions of dollars to recruit higher ability personnel, they were still providing basic skills instruction to over 220,000 service personnel, which was equivalent to all the basic skills enrollments in 25 states (Sticht, 1982, Table 16, p. 47). With the end of the cold war and the downsizing of the military services, there were fewer enrollments in basic skills courses, but as recently as 1990 the military provided literacy instruction for over 75,000 adults (Villanueva, Lamb, & Chin, 1991, appendix). Adult educators need preparation for work in military contexts that serve the needs of both the service members and their organizations.

Jails and Prisons

As sad as it is to say, one of the "growth" areas for adult language and literacy providers are the thousands of city jails and state and federal prisons, so-called "correctional" institutions, that have and continue to proliferate throughout the United States. With over a million prisoners behind bars, perhaps most of whom are undereducated, adult educators must understand the cultural contexts of institutions that many view as existing to punish, not rehabilitate (Newman, Lewis, & Beverstock, 1993, p. vii).

In jails, the prisoners may be highly transient, shuffled among different facilities, and released and readmitted repeatedly. They may be able to grab only a few hours of

instruction at one facility before being moved elsewhere. Guards and other personnel may resent the educational opportunities to prisoners, taunt them and discourage learning. The prevalence of violent gangs may limit the work of the adult educator because gang leaders may discourage participation in education (Newman et al., 1993).

Unlike the military, where specific organizational outcomes in the form of improved job-related reading and math skills are expected, many correctional institutions have no particular institutional goals for education, but rather a less direct outcome in mind—lowered recidivism. Toward this end, institutions are likely to look more favorably on those programs that help prisoners make successful transitions into civilian life than those oriented toward "improving one's potential" in some more abstract sense.

Adult educators must be prepared to work in correctional institutions under conditions of what is often heavy-handed security, including censorship of materials, that limit what they teach and how they teach. In jails, brief, self-contained lessons, perhaps computer-based, focused on a particular topic may be useful in working among the highly transient inmates. In prisons, where long-term programs may be possible, programs aimed at improving self-image, such as high school completion, or integrated basic skills, life skills, and vocational skills may be desired and developed by the adult educator to help improve each prisoner's personal potential, contributing to a more successful transition to civilian life and lowered recidivism (Newman et al., 1993, p. 37). In accomplishing the latter, it is essential that adult educators coordinate "inside" educational programs with "outside" programs that aid in prisoner re-entry into civilian life.

The Job Corps

The War on Poverty of the 1960s produced many intervention programs for youth and adults. Vocational training was the major focus of many youth programs, with some attention to remedial academic education, and attainment of a high school equivalency degree. The most prominent and enduring of these programs was the Job Corps, which is still in operation.

Adult educators who wish to work in Job Corps centers teaching literacy skills must be prepared to follow a highly systematized, competency-based, computer-managed instructional (CMI) program developed, in part, to meet the demands of the "open entry / open exit" policy of the Job Corps that permits students to start or leave the program whenever they want. The CMI system tests students and analyzes their needs for basic skills instruction. Teachers assign instructional materials according to this computer test analysis. For instance, based on a student's reading level, appropriate math instructional materials can be assigned. Progress tests are scored and recorded automatically by the CMI system so that students can progress rapidly through the program. With the CMI system, it is expected that teachers can spend less time on record keeping and more on working with students individually or in small groups.

In 1991–92, participants in the Job Corps were economically disadvantaged, mostly male ($\frac{2}{3}$), high school dropouts

(80%), minorities ($\frac{2}{3}$) who had never been employed. Reading skills on entry were around the 7th-grade level. Students improved on average length of stay of 7.6 months to around the 8.4 grade level (U.S. Department of Labor, 1992). By contemporary standards of having literacy skills at or above Level 3 of the National Adult Literacy Survey, this would leave the majority of Job Corps "graduates" functionally illiterate (National Education Goals Panel, 1995, p. 8).

Workplace Learning Contexts

The U.S. Department of Education funds partnerships of educational providers and various businesses to develop and conduct basic skills (English as a second language, reading, writing, mathematics) programs for employees. As in the military, socialist-Marxist ideas that are sometimes part of "critical literacy" are not usually valued in workplace programs. Rather, literacy instruction in workplace programs generally conforms to traditional values of "the American work ethic" and is consistent with the concepts of capitalism, competitiveness and private enterprise. The programs may be expected to produce changes not only in employees' basic skills, but also in one or more aspects of productivity on their job. Indeed, the federal regulations that govern program development generally require that the language and literacy programs be developed using materials relevant to the jobs done in the workplace, though this does not apply to programs for completing the General Educational Development (GED), high school equivalency certificate.

In workplace-based programs, if the education is on duty time, the adult educator will frequently have to develop brief (20–50 hour) programs because employers cannot afford to spare employees off a production line or from another position for long periods of time. Classes may be run on or off duty from midnight to eight in the morning or at other odd hours to match the shifts that employees are working. Classes may be held in well-furnished and quiet offices, noisy, makeshift space in the company cafeteria, or specially designed learning centers fully equipped with text, video and audio materials, computers, and audiovisual equipment.

Recent research on workplace literacy programs suggests that such programs may indeed contribute, not only to improving adults' literacy and numeracy skills, but also to improving productivity on the job. In one recent study, six manufacturing companies in Chicago, making products ranging from hydraulic valves to bubble gum, provided basic English language, reading, and mathematics education for over 700 employees (Sticht, 1994a). In evaluation studies conducted in the companies, supervisors reported that the programs had a variety of positive effects on organizational effectiveness, including improvements in job training, on the job performance, promotability of participants, and productivity, such as scrap reduction, reduced paperwork, less waste, and other efficiencies. In turn, employees reported that the language and literacy programs had helped them on their job, at home, and in their communities. Some were stimulated to continue their education at local community colleges.

Community Colleges and Adult High Schools (Local Education Agencies)

Approximately 1.8 million adults enrolled in 1991–92 in federally-funded ESL, ABE, or ASE programs. Ninety-four percent of ESL and 85% of ABE / ASE adult learners enroll in public school systems (local education agencies) or community colleges (U.S. Department of Education, 1993, pp. i, 21, 28).

Community colleges and adult high schools are typically state-funded bureaucracies which scramble to get Full Time Equivalents—FTEs. The FTEs are the number of student contact hours that would be obtained with a full time student. The FTEs are typically based on average daily attendance, and because adults are not usually full-time students it may take quite a few adults to accumulate enough hours to make up one FTE.

In a "teacher as researcher" study conducted in the San Diego continuing education centers mentioned above, over 80 adult students in one classroom came and went during a semester to make up an average daily attendance of 22 students (Bundy, 1995). The latter was the number required to conduct the class and if there were not 22 students enrolled at the outset of class, the class would be canceled and the teacher would have been out of a job for the semester.

This uncertainty of enrollments and availability of funds for classes has led many institutions to hire part-time teachers who work without health or retirement benefits. In the San Diego continuing education centers where research is underway, in 1993 there were 63 full-time and 523 part-time teachers. The uncertainty inherent in this system leads to staff morale problems and frequent hardships for teachers who may have to work at two or three jobs to support their families. This may detract from the quality of education that can be delivered, and it makes it difficult to get many of these adjunct teachers to attend staff development activities on a voluntary basis.

Because of the transient nature of many adult students, due to work schedules, problems with transportation and child care, and other personal problems, many community colleges and adult schools run what are known as "open entry / open exit" classrooms in which adults may enroll at any time and drop out at any time (as in the Job Corps). Needless to say, this demands a great deal of flexibility on the part of the teacher and the students to constantly accommodate newcomers. It may limit the propensity to engage in cooperative group or team projects. It has also led to the development of "learning centers" in which teachers may act more as facilitators of self-study activities by directing students to appropriate workbooks, audiotapes, videos, or computer programs.

Community-Based Organizations (CBOs)

There are a large number of community-based groups that are typically nonprofit, charitable organizations that provide a variety of services to community residents, often including ESL, ABE, and ASE programs. About 4% of ESL and 5% of ABE / ASE adult students funded by the Adult Education program of

the U.S. Department of Education enrolled in CBOs in 1991–92 (U.S. Department of Education, 1993, pp. 21, 28).

Many of these organizations have sprung up to serve the educational needs of particular segments of the adult population for whom special laws, policies and funding have been provided by various government agencies. For instance, the Association of Farmworker Opportunity Programs includes 37 CBOs in 48 states and Puerto Rico which provide disadvantaged migrant and seasonal farmworkers with education, training, and employment opportunities. These organizations are funded through the Department of Labor's Job Training Partnership Act (JTPA), Title IV §402 (Association of Farmworker Opportunity Programs, 1991, p. iv). In program year 1991, some 50,000 farmworkers were served in the program. About 45% of these workers received classroom training (Strong et al., 1993, p. 1–6).

While CBOs that receive federal and state funds are typically constrained in various ways by the rules and regulations governing their funding sources, many CBOs exist that are completely independent of any government agencies and operate with the extensive use of volunteers and funding by public donations. Organizations such as Laubach Literacy Action and Literacy Volunteers of America (LVA) may sometimes work with government grants, but in principle they are independent, charitable organizations funded through memberships and the benevolence of individuals, businesses, and private foundations. In 1992, Laubach served some 147,000 students with 98,000 tutors, while LVA served 65,000 adults with 55,000 tutors and administrators (Business Council for Effective Literacy, 1993, No. 34, pp. 6, 7).

While organizations like Laubach and LVA have their established teaching methods and materials that each new tutor must learn to use, other CBOs may follow their own lead and permit greater or lesser initiative on the part of individual teachers for conducting their classrooms the way they want. Still others are constrained by the federal, state, and local regulations that their funding sources impose with regard to amount of time for education, the focus of the education (e.g., high school completion; employability), the contents of education (e.g., programs funded by the JTPA are being directed to incorporate the competencies developed by the Secretary of Labor's Commission on Achieving Necessary Skills, (SCANS) 1991, p. vii), and methods of program evaluation (e.g., use of nationally normed, standardized tests of English, reading, or mathematics).

Many CBOs are involved in the new family literacy initiatives of the federal government's Even Start legislation or the work of the National Center for Family Literacy (Sticht, 1994b). Such programs bring a new dimension to adult education because adult educators must work with and learn about early childhood education to promote the intergenerational transfer of new language and literacy skills from parents to their children (Sticht, Beeler, & McDonald, 1992a, b).

NEW DIRECTIONS FOR THE PROFESSIONAL EDUCATION OF ADULT EDUCATORS

Designing instructional environments that are conducive to

sustained and effective learning is not a simple matter, considering the diversity of adult learners. Across contexts, mostly part-time adult educators are asked to promote learning among some of the most difficult-to-teach learners in the nation under substandard and generally underfunded circumstances. Still, in 1991, in a national survey of schools of education, no higher education programs were found that were designed to produce professional adult educators who could serve the broad diversity of adult learners in the different organizational and intergenerational contexts reviewed above (Sticht, McDonald, & Huie, 1992).

There are many indicators that the programs offered for adult ESL and literacy education in many institutional settings are not working very well. It is instructive to review a few items that illustrate certain beliefs and practices that are widespread which seriously reduce the effectiveness of educational programs for youth and adult learners. This is necessary to counter the claims of those who would argue that there is no need for professional development of adult educators or research on adult instruction and learning because, "We already know what to do; what we need is more money with which to do it."

The items below do not form an exhaustive listing of educational problems plaguing adult education, but rather a sampling of beliefs, practices, and outcomes which indicate that, indeed, many times people, even experienced professionals, do *not* know what to do, and in fact many may harbor beliefs that actually detract from the development of excellent programs for youth and adults. These are beliefs and practices that an adult educator must learn about and be prepared to overcome.

Cultural Beliefs That Hinder Adult Education

Item 1: On Sunday, October 13, 1991 The San Diego Union newspaper reprinted an article by Joan Beck, columnist for the *Chicago Tribune* that argued for early childhood education because, "Half of adult intellectual capacity is already present by age 4 and 80 percent by age 8. The great education researcher Dr. Benjamin Bloom reported in scholarly studies in the 1960s that helped establish the importance of early learning. No matter how good schools are, how capable and caring the teachers, they will not have as much effect on a child's permanent level of intelligence as has the environment in which he has lived before he started to first grade. A school may teach him a zillion facts and inspire him to use the mental capacity he has, but the opportunity to influence his basic intelligence—considered to be a stable characteristic by age 17—is greatest in early life."

The influence of such beliefs was illustrated a year earlier in the same newspaper on October 14, 1990, in an article in which a staff member of the California state library system was interviewed. The staff member, in charge of the library's family literacy programs, was quoted as justifying the importance of family literacy (in which parents' literacy skills increase and are transferred to their children) in this way "Between the ages of zero to 4 we have learned half of everything we'll ever learn in our lives. Most of that has to do with language, imagination, and inquisitiveness." What hope,

then, does that leave for improving the parent's language or literacy skills?

Item 2: A December, 1989, report summarized a study of how recruits designated as "low aptitude" on the basis of their scores on basic skills (reading and mathematics) tests fared some 20 years after military service. Researchers funded by the Department of Defense stated in the report that, "Military training for marginal youth may be too little, too late. To compensate for the deficits which the underprivileged bring with them would require more than a little extra training, and maybe a complete restructuring of current pedagogical practices." On February 24, 1990, the Director of Accession Policy of the Department of Defense commented on the report in the *Washington Post*. "The lesson is that low-aptitude people, whether in the military or not, are always going to be at a disadvantage. That's a sad conclusion." Then on April 8, 1990, Jack Anderson's column in the *Washington Post*, quoted one of the researchers as saying, "...by the age of 18 or 19, it's too late. The school system in early childhood is the only place to really help, and that involves heavy participation by the parents."

Neither the articles about intellectual development in early childhood nor the Department of Defense study elicited responses from the adult (or any other) education field challenging these conclusions and beliefs about human cognitive development. Yet, if true, these beliefs about intellectual, linguistic, and literacy development would have dire implications for the achievement of Goal 6 of the National Education Goals, which states that by the year 2000 all adults will be literate. Further, these beliefs denigrate as nearly futile the work of those involved in the language and literacy education of youth and adults in any setting, including the military, job training, corrections, adult basic education, workplace literacy, and even family literacy.

Educational "Malpractice"

Item 3: In the late 1980s and early 1990s, a major international corporation acted to improve its competitiveness by improving the quality of its products. As one part of its strategy for quality improvement, it moved to improve its employees' basic skills. It made a commitment of \$25 million to this effort. In a decentralized manner, various plants implemented their own basic skills programs. One purchased computers worth thousands of dollars and subscribed to a telecommunications network that claimed to make 1 year's improvement in basic skills for every 10 hours of instruction. Another plant contracted with a major learning center company that stated that it would increase basic skills by 1 year for every 60 hours of instruction. Other plants contracted with community colleges that simply offered to teach basic skills, with no guarantees of gains.

No one wondered how people who had not learned basic skills well in their school days, could now be expected to learn in 10 or 60 hours what the normal child takes a full year to learn in and outside school. No one knew what the basic skills that were used on the job actually were and how the training in the basic skills programs was supposed to be transferred to

the worksite. No one understood standardized testing and how test artifacts such as regression to the mean could produce a year of gain with no basic skills training at all. No one evaluated the effects of basic skills training on work quality and productivity. Following critiques of their programs, the corporation initiated activities to develop "functional context" workplace literacy programs that taught basic skills contextualized within work tasks requiring those skills.

Item 4: An adult basic skills program in the Appalachian region applied to the U.S. Department of Education for recognition as an "exemplary" program. In its application, the program operators noted that they administered the Tests of Adult Basic Education as pre- and posttest measures. To give the adult learners the opportunity to really show what they could do, the tests were administered ignoring the time limits. Additionally, because so much improvement was typically made, the easy form of the test was generally given as the pretest and a more difficult form as the posttest.

No one noted that by ignoring the time limits, the test was no longer "standardized," and therefore the raw scores had no meaning when converted to "grade levels." Hence adult learners were misinformed about their literacy skills. No one paid attention to the fact that random marking of the easy version of the test could produce nothing less than a grade 1.0 score, while random marking of the more difficult test, frequently given as the posttest could produce nothing less than a grade 3.0 score. Hence, random marking of the different forms as pre- and posttests could produce a gain of 2 years. The U.S. Department of Education designated the program as "exemplary."

The items above indicate that many educational program providers are so untutored and inept with respect to the use of instruments such as standardized tests that, if in the practice of medicine professionals misused medical test instruments the way adult educator misuse cognitive test instruments, they would be sued for malpractice.

Limited Outcomes

Item 5: Although 1.8 million new adult learners enrolled in federally funded adult ESL and ABE / ASE programs in 1991-92, 17% (300,000) dropped out before receiving any instruction, about 36% left their programs before completing 12 hours of instruction, and 50% of all new starters were no longer active after 16 weeks. The median hours of instruction completed were 43 (U.S. Department of Education, 1993, pp. i, ii). This is not enough time to become proficient in English as a second language or to overcome years of educational problems.

Item 6: In the mid 1960s, when the Adult Education Act was first passed, "functional literacy" was designated as having reading and mathematics skills equivalent to those of a typical grade school student who had completed the eighth grade (i.e., who had reading skills at the 8.9 grade level). In the national survey of young adult literacy in 1985 it was found that one out of five (20%) young adults read with skills below that of typical eighth graders (Kirsch & Jungblut, 1986, p. 40). Further studies have shown that (1) for 1991-92,

56,000 Job Corps learners entered reading on the average with 7th grade skills and left reading at the mid 8th-grade level (Sticht & Armstrong, 1994, p. 150); (2) averaged over 7 years from 1985 to 1992, adults in California's adult basic education programs who are assessed by the Comprehensive Adult Student Assessment System entered adult basic education reading at the mid 6th-grade level and left reading at the mid 7th-grade level (p. 144); (3) in New York city, data for 5 years from 1985 to 1990 showed that adults who entered programs at around the 2nd grade level left reading at about the 3rd grade level, those entering at the 4th-, 6th or 8th-grade levels also made about 1 year of gain on the Tests of Adult Basic Education. Data available for some 788 learners who had been enrolled in these New York city adult basic education programs for 3 years showed that 93% entered reading below the 6.9 grade level and two thirds of these learners read below the 4.9 grade level at entry. On average, these 3-year learners made a gain of around 16 months to about the mid 6th-grade level. (pp. 147, 152).

In general, studies of adult basic education indicate that most students enter reading at levels that would define them as functionally illiterate and leave at levels that would still define them as functionally illiterate by most contemporary standards. Given the dearth of research on adult literacy learning, it is difficult to estimate how much gain adult students retain after leaving their programs.

THE WELL SPECIALIST

The items reviewed above indicate the beliefs and practices that hinder the development and implementation of programs of excellence for underserved youth and adults. They illustrate widely held beliefs about human intelligence and cognitive abilities, and their development that are, most simply put, wrong. They reveal widespread ignorance about the nature and use of instructional tools such as standardized tests. They indicate that many programs are not, in fact, attractive enough to retain adults for long periods of time and

they do not make adults broadly literate in the relatively brief periods of time that adults remain in the programs.

In 1991, a project was initiated to address the need for a new breed of adult educators which could meet the challenges of adult education across the life-span and from one generation to the next (Sticht et al., 1992). Called the Workforce Education and Lifelong Learning Specialist (WELLS), the degree program was established at the San Diego State University, College of Education, Department of Educational Technology, to produce adult educators specializing in the education and training of underserved youth and adults to prepare them for productive, well-paying work, responsible parenting, participatory citizenship, and community development.

The WELLS' Domains of Competence

The items cited above clearly indicate the need for adult education specialists who are professionally educated and trained to engage in their educational practice. A summary description of the contents of the WELLS curriculum to educate such specialists is presented in Table 45-1.

By studying the cognitive science foundations of education, the educational arts and sciences, and culture and human resources policies and practices, the WELLS is prepared with the broad knowledge base needed to work in an adaptive mode in any institutional context and with the diversity of adult learners discussed above.

While the WELLS' preparation includes considerable classroom instruction, much of it is laboratory work in developing instructional materials, and field work to learn about adult cognition, language, and literacy in home, work, and community settings, and adult education in real instructional settings (although many of the first generation of WELLS students are already working in adult education settings and want to develop a greater degree of professional competence).

To provide a field setting for research and internships by WELLS students, the San Diego State University, Department of Educational Technology joined forces with a local non-

TABLE 45-1. Domains of knowledge and skill for the Workforce Education and Lifelong Learning Specialist (WELLS).

Cognitive Science Foundations of Education Develops an understanding of human growth and cognitive development within a framework based on research from studies in anthropology, sociology, psychology, linguistics, philosophy, and computer sciences. Integrates biological, cultural & social foundations of cognition and the intergenerational transfer of cognitive abilities (knowledge; thinking skills); oral and written language; graphic tools of thought; academic bodies of knowledge (math; science; history; geography; etc.) workforce bodies of knowledge; and the applications of knowledge in the everyday world. Develops an integrated understanding of learning in childhood and adulthood as influ-

enced by culture and other context factors. **Educational Arts and Technology** Develops competence in using a variety of problem solving methods (including qualitative and quantitative research methods); technologies for instructional development, delivery & evaluation; methods for teaching basic academic skills, workforce skills, personal management skills in various contexts; multicultural education for ethnic, gender, age and organizational diversity; learner-centered, participatory education methods for empowering youth and adults in the education process; aiding the teacher as inquirer in action research to improve the delivery of education programs; functional context education.

Culture and Human Resources Policies and Practices Develops an understanding of cultural beliefs about cognitive development and how these beliefs are translated into policies and practices; federal, state, and local policies and laws regarding various funding "streams" such as the Job Training Partnership Act (JTPA) the Family Support Act and JOBS; the Adult Education Act, etc. and how to obtain funding for programs from these sources. Methods of work analysis to establish cognitive, social, and technical skills for work for counseling youth and adults for employment and for curriculum development. The cultures of various work organizations and organizational development. Methods for community development.

TABLE 45-2. An article about teacher-research project in the *Community Exchange* newspaper

SDCCD Teachers Become Researchers

To Improve Adult Basic Education

Teachers in the San Diego Community College District (SDCCD) are also becoming researchers. They are studying in adult basic education.

Begun in March 1993, ten Teacher as Researcher projects are underway. These projects are sponsored by the CWELL Action Research Center.

In one project, "Families Learning English Together," Marjorie Howe, SDCCD Home Economics Resource Instructor and Esther Garcia, SDCCD ESL / Child Development Instructor have joined forces.

They are developing new course curriculum and instructional materials to help Limited English Proficient (LEP) parents, especially mothers, and their preschool children integrate better into the community by: 1) developing their skills in accessing community resources, locating and using medical services, using the library, shopping for family necessities, and communicating at a basic level with school personnel at their child's school; and 2) expanding their basic survival English in the context of family situations.

In another project, "Intergenerational Transfer in the GAIN / ABE Classroom," Instructor Judy Quinton is documenting the intergenerational transfer of cognitive skills from parent to child in her classroom.

Judy is documenting this phenomenon through a literature review of the topic; various surveys, journal writing by students directed towards how their own attendance at school affects their children, and encouraging parents to participate with their children in various activities.

More innovative and exciting Teacher as Researcher projects will be featured in future editions of *The Community Exchange*!

profit educational R&D organization, the Applied Behavioral & Cognitive Sciences, Inc. and the San Diego Community College District, Continuing Education Division (SDCCD / CE) to create the San Diego Consortium for Workforce Education and Lifelong Learning (CWELL). The CWELL established an Action Research Center (ARC) which, among other things, has stimulated over a dozen teachers in four continuing education centers to engage in what is called the "teacher as researcher" project. In this project, teachers participate in Friday or Saturday seminars, conferences and one-on-one meetings with staff researchers in the ARC. They develop, carry out, and report research projects. In some cases they engage adult learners as researchers to help adult learners develop critical thinking skills along with language and literacy skills.

To encourage and recognize the work of the teacher researchers, stories are printed in the *Community Exchange*, a newspaper published three times a year by the CWELL Action Research Center. Four thousand copies of the newspaper are distributed locally and nationally. Table 45-2 shows an article from the first issue of the *Community Exchange* that recognized the work of three of the teacher researchers.

The specialists are expected to participate in the activities of the research center and learn how to participate in action research. They also learn how to help other adult education teachers engage in action research projects as a form of staff development aimed at improving instructional environments for language and literacy learning by adults across the lifespan, from one generation to the next, and in any of the diverse contexts in which adults engage in learning.

FILM, VIDEO, AND BOOKS: SOME CONSIDERATIONS FOR LEARNING AND TEACHING

Lawrence Baines

FLORIDA STATE UNIVERSITY

I remember, when I was a boy, Douglas Fairbanks was the model for me. Adolphe Menjou was the model for my brother. Of course those men were playing the roles of mythic figures. They were educators toward life. (Campbell; in Campbell & Moyers, 1988, p. 15)

It has been a 100 years since the Lumiere brothers charged admission in the basement of the Grand Cafe in Paris, France to show features such as *La Sortie des Usines Lumiere (Workers Leaving the Lumiere Factory)*. It has been almost as long that film has been under consideration for use in public schools. Film has never managed to gain a permanent foothold in the American secondary school curriculum but has somehow managed to stay alive through the years on the fringe of respectability as a subject worthy of academic study. Once upon a time (before World War II), using film in the classroom was considered the cutting edge of technology in American education. With the introduction into schools of the computer (and the mass of technological apparatus that has come with it) film's central position as the medium of choice for the technologically-minded teacher has been lost.

Yet, the value of film has never resided in its technological novelty, arresting as it must have seemed to the first spectators who witnessed those life-like images flicker across the bedsheet screen in the basement of the Grand Cafe. As books transport us through a "lived-through" experience with words (Rosenblatt, 1978), so films offer an aesthetic "lived-through" experience with pictures (Amelio, 1972; Durgnat, 1967; Eidsvik, 1978; Lacey, 1972; Miller, H., 1979; Smith, 1969). But, there is something more in films—something that invites us to lose ourselves to its vicarious world of image and sound. Perhaps because "a picture is irrefutable" (Postman, 1985),

film has the feel of authenticity and truth. Film's convincing veracity is one reason some educators have been clamoring for the inclusion of film studies in the curriculum for the past 100 years.

FILM AS A HYBRID ART

With the spread of newer electronic media such as CD-ROM, laser discs, cable television, and interactive computers, the boundaries of media have become quite blurred. Accurate conclusions cannot be drawn about the content of moving pictures based upon the devices used in conveying them. One could see *Citizen Kane* on a cable television station during "Orson Welles Week"; rent the tape at a local video rental store, take it home and play it on a home VCR; or attend a screening of the film at a local art-house movie theater (if one still exists in your neighborhood). Indeed, the makers of interactive video computer systems are beginning to use clips from the movies as basic components of their programs.

Since the parameters of what constitutes film are ever-expanding, a more encompassing definition of film study is being developed. Nichols (1992) writes that contemporary film studies programs "very often include an examination of television or other media, and many television or mass media programs include courses in aspects of film" (p. xi). However, for purposes of this chapter, film will refer to all productions shot with a movie camera (camcorders included) that were *not* shot specifically for, and limited to, television.

In reality, the convergence of media makes it difficult to define where film ends and television begins. Some of the top-

grossing commercial films of 1993, are based upon old television series—*The Addams Family Values* (\$44.4 million), *The Beverly Hillbillies* (\$41.6 million), and *The Fugitive* (\$179 million) (Klady, 1994). The 1976 commercial network showing of the film *Gone with the Wind* (in two parts) garnered a viewership of almost 34 million Americans, making it the seventh and eighth most watched television programs of all time. Videos of television series (such as the complete *Star Trek* and *Star Trek Next Generation*) sell on the shelves of video stores alongside *Apocalypse Now*.

Representative of the confusion over content and medium is the case of *The Teenage Mutant Ninja Turtles*. Initially a Saturday morning show for children, the Turtles quickly became the subjects of some of the best-selling books and most lucrative films of the decade. The number one children's best seller in 1990 was the initial offering in a long series to come, *Teenage Mutant Ninja Turtles*, by B. B. Hiller, which sold about 1.8 million copies. In fact, eight of the ten best-selling children's books of 1990 were books about Michaelangelo and the gang. The Turtles' third, and least financially rewarding big screen adaptation (the first film grossed over \$133 million), *The Teenage Mutant Ninja Turtles 3*, grossed \$42.3 million in 1993 (the thirty-first highest grossing film of the year). By comparison, the award-winning film *The Piano* grossed about \$15.5 million (Klady, 1994, p. 14).

The money that Americans spend on recreation and entertainment has been steadily increasing over time, with expenditures on electronic media constituting the lion's share (Kaestle, Damon-Moore, Stedman, Teisley, & Trolluiger, 1991, pp. 153–166). Using data from the Bureau of Labor Statistics, employment experts at *Business Week* calculated that 12% of all new jobs in 1993 were generated by firms in the fields of entertainment and recreation, eclipsing the number of employees hired by the health-care industry (Mandel et al., 1994).

In 1993, Americans spent more on entertainment than ever before, including \$58 billion on VCRs, TVs and prerecorded music and videotapes; \$19 billion on cable television; and \$13 billion on movie admissions and video rentals. In total, Americans spent \$341 billion on ways to have fun. By comparison, \$270 billion was spent on all the secondary and elementary schools in the country, public and private combined (Landler, 1994, p. 66).

THE INTRODUCTION OF VIDEO

In 1978, R.C.A. introduced the first programmable VCR into the American market and the first video rental store franchises sprang up around the country. By 1987, Americans were spending more on renting videos than on going to see films in theaters (Barry, Butterworth, Clark, Korman, & Pinkwas, 1993). Videocassette rentals boomed from 200 million units in 1982 to 3.6 billion rentals in 1992 (Bennett, 1994, p. 109). Network television, video, and cable have negatively affected the absolute number of ticket sales, in America and abroad, for some time. In fact, for the past 40

years, the number of theater patrons has been steadily declining in the United States, Great Britain, Japan, Italy, West Germany, and France (Doherty, Morrison, & Tracey, 1987; Ganley & Ganley, 1987).

The college campus used to be the progressive show place for the cinema, and film societies often sponsored festivals and offered subscriptions to screenings on campus. Byrne writes that "at the height of the film-society expansion in the late 1960s there were more than 4,000 individual societies functioning actively" (1971, p. 2). But, video has moved film events from the theater near campus to the dorm room of the student who has television with the 45-inch screen, 4-head VCR, Dolby stereophonic sound, and a refrigerator full of beer. At Yale University, the number of film clubs on campus dropped from seven to one between 1986 and 1990 (Hickenlooper, 1991, p. 364).

Surprisingly, despite video's penetration into the American market, revenue from films has managed to rise. In 1993, films generated over \$5 billion in sales and, for the first time in 5 years, the number of ticket sales climbed to 1.1 billion tickets (from 924 million in 1992), (Klady, 1994, p. 3).

Ninety-seven percent of American have at least one television, 23% own personal computers, 73% own VCRs (Brower, 1994, p. 17), and 62% of American households subscribe to cable television (*World Almanac*, 1993, p. 295). To be sure, of the 18–27 hours a week that students watch television (Bennett, 1994, p. 103; Csikszentmihalyi & Larson, 1984, p. 8), many hours involve watching films. In a recent study of talented teens, it was found that watching television occupied 9.2% of a gifted teenager's waking hours, attending media events or concerts about 1%, and reading accounted for 3% (Csikszentmihalyi, Rathunde, & Whalen, 1993, p. 220).

FILM AND HUMAN RESPONSE

A short video, taken by nonprofessional camera operator George Holliday on his Sony camcorder, is a contemporary example that helps illustrate the power of film. On March 3, 1991, Holliday happened to record a scene in which Los Angeles police officers repeatedly beat a motorist, Rodney King, whose automobile they had stopped. Holliday's video was the focal point of an ensuing trial, which resulted in the acquittal of the four police officers, and precipitated a reign of violence and brutality in areas in Los Angeles and around the country. King and his attorneys eventually sued the city of Los Angeles and collected over \$38 million.

Undoubtedly, film has the capability to foster intense emotional responses (Cantor, 1991, Zillmann & Bryant, 1986). Film and the visual media have been integral in electing government officials, determining the success or failure of a business, helping shape world opinion. Leni Reifenstahl, the head of film propaganda for Nazi Germany, was vital in elevating Hitler to the level of popularity and power that gave him reign to create the Germany of the 1930s. Expert speculate that the Berlin Wall may never have fallen if it were not for the impact of film, video, and television (Murray-Brown, 1991).

Since film has the capacity to provide a pictorial representation of lived experience (Langdorf, 1991), the moving image will almost always be more convincing than words. Consider the effects of films such as *Jaws* (1975), *Easy Rider*, (1969), *Boyz 'n the Hood*, (1992), and *Schindler's List*, (1993) on American attitudes toward sharks, hippies, urban neighborhoods, and the treatment of Jews in Nazi Germany. In the same year that *Schindler's List* (1993) was released, the legislature of the state of Florida mandated that the Holocaust be covered in every school in the state.

The poet Richard Wilbur (1970) writes, "Even the worst movie has much of the authority of the actual, and quite without knowing it one comes out of the theater brainwashed into scanning the world through the norms of the camera" (p. 167). Kraft, Cantor, & Gottdiener (1991) hypothesize that one reason that the film seems so much like actual experience is that film's structure mimics human interaction with the natural world. Viewers understand that when a scene cuts to a high angle camera shot, the characters being filmed will appear small and insignificant because they have previously looked down upon people from an elevated position (such as a tall building) and seen the same kind of image.

The trend in research on media effects has been away from the concept of viewer as passive agent to the reformulation of the viewer as active communicator (Anderson & Anderson, 1993; Rubin, 1993; Scholle, 1991). The uses and gratifications model, which assumes that certain human behaviors are motivated by the satisfaction of perceived needs, has quite a bit of empirical evidence in its favor (Blumler & Katz, 1974; Rosengren, Wenner, & Palmgreen, 1985). According to the uses and gratifications model, a young man who has become disconcerted when he notices that he is gradually losing hair, will be receptive to products that he perceives as remedia for his baldness.

The uses and gratifications model has been recently supplemented by examination of the complex web of processes that transpire within viewers which serve to motivate them to think and behave in certain ways, sometimes called audience activity research (Kellerman, 1985; Levy & Windahl, 1984; Lin, 1993; Wenner, 1986). For example, say the balding young man mentioned earlier happened to see a product advertised on television that promised to relieve his hair loss, and he immediately went to the drug store to purchase it. Audience activity research would examine the mental processes of the young man during different phases of the process—from the factors that contributed to his receptiveness to the advertisement to his selection of the product at the drugstore.

Through the analyses of uses and gratifications and audience activity research, one begins to understand the complexities involved in characterizing how an individual responds to film.

The Payne Fund studies, a series of 12 experiments carried out between 1929 and 1932, represent one of the first important investigations into the effects of watching movies on the behavior and attitudes of children. Some film scholars have justly criticized the Payne Studies for the lack of rigor in some experiments, for using a strong moralistic tone in reporting the results of the experiments, and for the conception of

children as passive receivers of information. Yet, few media educators today would quarrel with the three major conclusions from the studies: (a) Motion pictures serve as a potent medium of education; (b) The subject matter of many motion pictures may not be appropriate for children; and (c) The motion picture is only one influence in the complicated, ever-changing worlds of children (Charters, 1933; Holaday & Stoddard, 1933).

In the 1960s, Bandura studied how children responded to watching certain violent images on television and found that prolonged exposure to images of violence "tends to reduce the child's inhibitions against acting in a violent, aggressive manner" (Bandura, 1968, p. 126). Greeson and Williams (1986) found that junior and senior high school students were less inhibited about violence after viewing selected videos from M.T.V. A host of studies (Bandura, 1986; Hansen & Hansen, 1990a, 1990b, 1991; Sherman & Dominick, 1986) have found exposure to videos with extreme amounts of sex or violence may affect the social judgments and the personal value systems of viewers.

Eisenman, Girdner, Burroughs, and Routman (1993) found that even showing a single, short film can alter human perceptions and behavior. In their experiment, 211 college students in Mississippi were shown a film *Who is David Duke?* which provided evidence that Duke was anti-black, anti-Semitic, and pro-Nazi. Before the film was shown, 35 of the 211 students perceived Duke as anti-Semitic. After the film, 129 students perceived Duke as anti-Semitic. Before the film, 47 students said they would vote for Duke and after the film, only 33 students kept their pro-Duke position.

The viewing of specific films has also been linked experimentally with childhood phobias, traumas, and nightmares (Cantor, 1991; Cantor & Reilly, 1982; Sarafino, 1986), sensual arousal (Hansen & Krygowski, 1994), empathy (Davis, Hull, Young, & Warren, 1987; Tamborini, Salomonson, & Bahk, 1993), the use of preventive measures to combat AIDS (Maibach & Flora, 1993), the desensitization to portrayals of sexualized violence and rape (Linz, 1989; Linz, Donnerstein, & Penrod, 1988; Oliver, M., 1993) and other effects.

In a recent study of the role of the cinema in urban poor areas of Southern India, Dickey (1993) found that films served as powerful factors in the shaping of moral codes of viewers and that much of the structure of social interaction in the Indian urban community under study revolved around attending and discussing movies. In the city of Madurai (Tamil Nadu, India), where "cinema is everywhere" (p. 3), 85% of adults went to the movies at least three times a month and the state's last five Chief Ministers have been either film actors or directors.

Schneller (1988) found that small town youth in Israel spent large amounts of time watching video as compared with their central city peers. Schneller suggests that video watching in this particular rural community had become so prevalent among small town youth that it greatly reduced the time spent in person-to-person socializing activities.

Boorstin (1962), Kernan (1990), Ong (1967, 1982), and McLuhan (1962, 1964, 1967) have alerted us to the truth that politics has been forever changed by film, videotape, and television. Most candidates for major political offices today

have multiple media advisors on staff to keep them apprised of modulations in public opinion. Attors for Ivan Boesky (charged with insider trading) and William Kennedy-Smith (charged with rape) both hired public relations agents to help represent their client's case to the media. In the confirmation hearings of Supreme Court Justice Clarence Thomas in 1991, both Thomas and the woman who accused him of sexual harassment, Anita Hill, were represented by public relations specialists (Schlesinger & Tumber, 1994).

Media researchers and public relations professionals have come to realize that the moving picture has an impact on audiences not only at the moment of exposure, but also potentially in any subsequent communicative transaction. (Alexander, 1993; Fry, Alexander, & Fry, 1990).

FILM STUDY IN SCHOOL—VERY BRIEF HISTORY

Robert Neal (1913) was perhaps the first to suggest that the study of film be integrated into the language arts curriculum, though he did so with much ambivalence. Neal wrote, "The moving picture is not an invention of the devil. There is a great deal in it, at the present stage of its development, that we have to think of with all the optimistic faith summonable, in order not to regard it as excessively satanic" (p. 68).

Once film was established as a mass medium, a small contingent of educators has seemingly always been around to lobby on its behalf. But, these groups have never been large enough or organized enough to affect permanent alterations in the school curriculum. The film study movement enjoyed the peak of its popularity during two periods — the 1930s and the late 1960s. In 1930, movie houses sold almost 5 billion tickets in the United States (compared to 1.1 billion in 1993) (Golenpaul, 1994). In the 1930s, the sheer popularity of cinema helped propel the film study movement into prominence for a period of time before it was abruptly cut off by the beginning of World War II. In the 1970s, it was the "Back to Basics" movement that eventually drove most of the film study movement's contributions to the curriculum (which were put in place in the middle to late 1960s) into quiet oblivion.

The passages below will give a brief idea of the dialogue that has ensued over the years regarding the study and use of film in school.

1915

Moving pictures everywhere will become a valuable adjunct in the mastery of skill in English composition. (Gerrish, 1915, p. 230)

1923

It is useless to condemn moving pictures; we may as well condemn all novels. ... Why not bring the movies into the schoolroom? (Cunningham, 1923, p. 490).

1936

I submit now that motion-picture appreciation is here to stay. The momentum it has created will insure its adoption, gradually but surely, not only into the high schools, but also into teacher-training institutions. (Dale, 1936, p. 113).

1948

The next ten years should show a great increase in the intelligent use of films and in the establishing of motion picture appreciation units by English teachers. (Finch, 1948, p. 170)

1952

It may properly be said that virtually every state supports to some degree a film program because every state has one or more libraries which provide films on a rental basis to the schools. (Meierhenry, 1952, p. 188)

In motion pictures the spurt of interest that occurred about fifteen years ago has died down. (Boutwell, 1952, p. 131)

1964

One believes that with the continually growing enthusiasm for film among young intellectuals, good film teachers will be easier to find in the future. ... One concludes that the future is bright for the study of film. (Selby, 1968, 226, 227).

1970

Movies are moving into the high school. The proliferation of film societies on the college level is now commonplace. (Carrico, 1970, p. 97)

1978

(In retrospect regarding his 1964 study) Looking backward, I would say that my optimism for the importance of the film as an art form in secondary school was unfounded. (Selby, 1978, p. viii)

1981

No one doubts that language, reading, and writing are central to school programs or that they are the proper business of English language arts teachers; but most people, teachers included, have strong reservations about media studies. (Karl, 1981, p. 139)

1992

With research that suggests how effective film can be, why does the medium continue to be regarded critically by school administrators, school board members, and the general public? (Lankford, 1992, p. 3)

The ebb and flow of film studies have always been tied to the social and economic climate of the nation as a whole. When times get tough, "frills" such as film study are the first courses to get cut. In this, the American educational system is not alone. Media studies, once mandated as a core subject in the English language curriculum in England, has been recently removed (Coughlan, 1993).

CURRENT AVAILABILITY / USAGE OF VIDEO AND FILM IN SCHOOLS

As early as 1982, 40% of all public school districts had VCRs. By 1985, 95% of all districts of over 1,000 students had VCRs (Quality Education Data, 1986). Today virtually every public elementary and secondary school in America, regardless of size or relative wealth, has access to VCRs (Digest of Education Statistics, 1993; Ely & Minor, 1993).

Although it is known that VCRs, computers, and audiovisual equipment are available in almost all schools, the degree to which teachers use video and film in instruction remains a mystery and must be inferred from surveys revealing the types and amounts of equipment available or from usage

data from schools' regional service center (Boone, Marak, & Wilkins, 1989; Digest of Education Statistics, 1993; Main & Roberts, 1990; Quality Education Data, 1993). In one of the few studies of film use in schools, Lynch (1986) found that 60% of English teachers at the secondary level classify themselves a low or nonusers of film and that few teachers "teach film as film" (p. 250). Due to the dearth of data on film use in schools, little can be said with certainty about the ways in which teachers routinely use films or their overall effectiveness in using them.

FILM AND VIDEO COPYRIGHT LAWS AND THE CLASSROOM TEACHER

The Copyright Revision Act of 1976 was enacted to enforce long-standing copyright laws that previously had no enforcement provisions. Section 110 of the law authorizes the use of copyrighted work, such as videotapes, for use in educational settings (Miller, J., 1988). A teacher may use prerecorded videotapes and films provided certain criteria are met: (a) The film is shown in a face-to-face teaching situation; (b) a teacher, student, or guest speaker shows the film in an educational setting (such as a classroom or an auditorium) as part of an instructional plan; (c) the film is shown only to students, the teacher, and the guest speaker; (d) the copy of the film or videotape is a legal one.

Actually, very few lawsuits have ever been brought against teachers or educational institutions for copyright violations of videotapes or films. When lawsuits have been instigated, the guilty parties have exhibited blatant copyright abuses, such as the mass distribution of pirated videotapes. One of the landmark cases in copyright legislation has to do with an educational services company (called BOCES) operating out of Buffalo, New York. BOCES regularly taped programs from cable television programs without permission, made copies of them, then circulated them throughout the school district. The judge ruled against BOCES and fined them \$63,500 in statutory damages (Resch & Schicker, 1992, p. 134).

Technically, the Copyright Revision Law of 1976 makes it illegal to show movies that serve as pure entertainment to students. According to the law, the film needs to be part of the instructional plan of the teacher.

FUNCTIONS OF FILM AND VIDEO IN THE CONTEMPORARY CLASSROOM

Suhor (1986) analyzed the number of articles concerning nonprint media appearing in the journals *College English*, *College Composition and Communication*, *English Journal*, and *Elementary English* (later, *Language Arts*) during the period 1961–78. Suhor found that of the 1799 articles about nonprint media, all but 55 could be classified as falling into one of six groups: theoretical, practical, referential, analytical, mechanical, and qualitative.

I have chosen to sort film into five categories based upon how a teacher might use it in the classroom. The categories

are as follows: (a) film as a teaching tool, (b) film as a component of media literacy, (c) film as art and artifact, (d) film as student project, and (e) film as a supplement to the study of literature.

Film as a Teaching Tool

Perhaps the least controversial use of film in the secondary classroom has been its use as an instructional tool to bolster student achievement. Many studies since the 1940s, including a good deal of research performed by the offices of the U.S. armed forces, have tested the effectiveness of film in helping to educate students, workers, and soldiers. The results of such tests often yielded bold praise for the medium of film as a tool for instruction. However, as Clark (1983, 1985, 1991, 1992) has repeatedly pointed out, media comparison studies that find greater learning gains in the newer media often fail to consider "novelty effects." In addition, the failure of researchers to maintain adequate control over aspects of the instructional design sometimes translates into unequal presentation of content to participants. Thus, when Clark writes, "During the early days of the motion picture, studies tended to favor movies over teachers" (1992, p. 806), he means that the superiority shown by films was due to differences in content in the studies, not due to some mystical, enriching power of the medium of film.

Conversely, Ullmer (1994) and Kay (1991) contend that the differential content in studies that find superior achievement in newer media might instead be the result of a natural propensity of the newer medium. That is, each medium possesses its own strengths, some of which make it more appropriate than other media for particular kinds of learning. In the medium-driven configuration, results are thought to be traceable to the inherent advantages and appeals of the delivery systems themselves. Such a philosophical stance would seem to substantiate one of McLuhan's infamous convictions, that "the medium is the message."

Researchers in the field of educational technology (Cennamo, 1993a, 1993b; Krendl, 1986; Saloman, 1983, 1984, 1992; Saloman & Leigh, 1984) have found that humans perceive learning to be easier from the moving image (using media such as film, video, interactive video, and television) than from books. Perhaps its reputation as an "easy" medium and its consistent record of educational gains are two reasons for the endurance of film as a teaching tool in a variety of fields. This is not to say that the use of film has become ubiquitous across subject areas, but that a small group of educators in a variety of subject areas regularly use film.

A glance at recent publications reveals that film is being used to teach about madness (Fleming, Piedmont, & Hiam, 1990), mathematics (Kelly, Wiebe, & Hynes, 1993), critical thinking skills (Guista, 1992; Remender, 1992), the German language and culture (Flippo, 1993), children's social development (Boyatzis, 1994), law (Anderson, 1992), race relations (Loewen, 1991), popular culture (Groce, 1992), sociology (Berg, 1992; Tipton, 1993), propaganda (Rhiel, 1993), attitude toward the elderly (Cross, 1989), race relations (Manley, 1994), biology (Faulkner, 1993) and, of course literature.

Film as a Component of Media Literacy

One could reasonably argue that the birth of the media literacy movement in America began shortly after the invention of the motion picture. Today, media literacy (also known as “visual literacy” or “critical viewing skills”) occupies a space inclusive of cultural and anthropological studies, pop culture, television, advertising, radio, music, newspapers, news reporting, computers, interactive video, virtual reality, photography, and film. According to the National Telemedia Council, media literacy is “the ability to access, analyze, evaluate and create information in a variety of media formats including print and non-print” (Telemedium, 1994, p. 28).

Deconstruction, once a literary term for literary analysis, serves as a major theme throughout the literature on media literacy. According to Considine and Haley (1992), “Media literacy means evaluating and analyzing the form, content, origin, and impact of media messages” (p. 19). The techniques of the French literary postmodernists (such as Baudrillard, 1983; Derrida, 1992; Lyotard, 1984) are invoked in the deconstruction of media messages in advertising (Glasgow, 1994), feature films (Palmer, 1989), and other media, though they are not often mentioned by name.

There is some evidence that the media literacy movement is gaining some momentum. Portions of *The Goals 2000: Educate America Act*, signed by President Clinton in April 1994, contain provisions for the establishment of standards for media literacy at the elementary and secondary levels. Interestingly, the standards are recommended within the standards for arts, not English. The states of North Carolina, Florida, and New Mexico already have provisions promoting the teaching of media literacy in school, while Hawaii and California were considering its addition in 1994. Brown (1991) and Bazalgette, Sevoty, & Savino (1993) have chronicled the rise of media education worldwide. Some evidence exists that film education may even be on the ascent in the new Russia (Drobashenko & Sadchikov, 1992).

In 1934, William Lewin wrote, “The contemporary movie, like the contemporary novel, the contemporary drama, the newspaper, the magazine, the radio... is something to enjoy, to discuss, to analyze, to think about, something to use as a starting point from which to move toward an appreciation of the best things that life and literature have to offer” (p. 38). Such a critical stance would seem as apt for media literacy today as it was for the film study movement of 1934.

Film as Art and Artifact

One of the strengths of film is its ability to capture and preserve moments in time. Most of us remember certain events, places, and persons with more clarity if we have photographs or movies to help jar our recollections. With film, as with literature, newer words do not replace older works, but are annexed into the domain’s cumulative archives. Zeffirelli’s *Hamlet* (1990, starring Mel Gibson) does not supplant Kline’s *Hamlet* (1990, starring Kevin Kline), which does not supplant Richardson’s *Hamlet* (1969, starring an elderly Nicol Williamson), which does not supplant Kozintsev’s *Hamlet* (1964, a Russian film starring Innokenti

Smoktunovsky), which does not supplant Gielgud’s *Hamlet* (1964, starring Richard Burton), which does not supplant Kurosawa’s *The Bad Sleep Well* (an adaptation of *Hamlet* set in modern Japan, 1960, starring Tohiro Mifune) which does not supplant Olivier’s *Hamlet* (1948, starring Laurence Olivier), or any of the 10 other versions of *Hamlet* made since 1915 (Esner, 1985; McMurtry, 1994).

The body of work that is “film” is continually expanding. Kaes (1992) writes that, “Film constitutes a collective memory that, however much it splinters into innumerable individually remembered images, forgets nothing.” (p. 317).

Since film is generally accepted as an authentic record of events, some anthropologists have argued against the use of film in describing customs or cultures. The fear is that documenting events by using film may actually inhibit objective discussion and analysis (Raymond, 1991). Certainly, there is a grain of truth in the statement that film is an unwitting part “of and ideological conspiracy in which we are invited to look back at our past through the distortions of our present culture” (Giddings, Selby, & Wensley, 1990, p. xi).

Semiotics, or the science of signs, allows scholars to examine the ways in which media images represent reality and ideology (Gibson, 1979; McArthur, 1992; McGinty, 1987; Rank, 1991; Scholes, 1982). In studying the semiotics of the mass media, critics such as George Gerbner (1988, 1992), assert that the film presented by personalities of the mass media often reinforces stereotypes and reduces the complexities of real life. Truly, the mass media are often blamed for creating conflict, fabricating (or prefabricating) history, and manipulating interpretation of world events in such a manner as to bolster its audience share. It is not uncommon for contemporary analysis of media to hold film responsible for oppressing or suppressing a particular segment of society. One recent study (Everett, 1994) blamed the American mass media for damaging the self-esteem of all ethnic minority children through the uniform portrayal of a unicultural world.

Works such as *Teaching the Sixties* (Workman, 1992), *Projections of War* (Doherty, 1993), *Hollywood as Historian* (Rollins, 1983), and *American History / American Film* (O’Connor & Jackson, 1980) advocate analysis of film as a document of social history as well as its value as an artistic creation. Knight (1972) claims that “the most interesting use of film in English teaching is its use to increase an understanding of the formal qualities of art” (p. 36). In an earlier study of film at the secondary level, Selby (1968) found that schools rarely, if ever, considered the aesthetic properties of film.

Cocteau called film “a petrified fountain of thought” (in Plimpton, 1989, p. 248). In terms of diversity and ubiquity, film offers semioticians and aesthetes a resource for analysis unrivaled in the world of art.

Film as Student Project

The portability and affordability of the camcorder has democratized film and video and allowed teachers and students the luxury of considering its use for the classroom. Steinman (1993) has described how a video camera might be

used in a science class to monitor experiments. Beasley (1994), Berwick (1994), Brown (1993), Catron (1991), Faulkner (1993), Hannafin (1991), Lang (1986), Turner (1989), and others have discussed the advantages of using video camcorders to enhance the student's learning experience in a variety of fields. Baines (1995) and Lasky (1990) have contended that use of the camcorder helps students attain a deeper sense of media literacy than that attained through simply studying media messages.

Using the camcorder as a format for creative endeavors by students would seem to be an obvious match with some educational reform efforts aimed at "empowering students" and getting the teacher "off the stage as a sage." Higgins (1991) views the camcorder as an opportunity to implement the philosophies of Freire in the classroom. Higgins writes, "If one does not work actively against the canons of visual representation, or at a minimum question them, one is working to support the existing methods of shaping reality. . . . The education of students in video production is a political activity" (p. 26).

Burns (1991) has even suggested that using the camcorder to shoot videos should be the equivalent of publishing works in print for faculty under consideration for tenure at the post-secondary level. The camcorder opens the possibility for a permanent record of individual progress and activity. Some states, such as Vermont, already advocate the inclusion of videotape in the state-mandated portfolio for each student in public school.

Film as a Supplement to the Study of Literature

A teacher of English is most likely to use a film when it relates directly to a literary work covered in class (Lynch, 1983). The most popular techniques of teachers who use film with literature involve either asking students to compare a film with a recently completed novel or showing the film as a sort of reward for getting through the book. Although students tend to enjoy watching films without having to think about them or discuss them much, allowing the student to remain passive viewers has probably drawn the strongest criticism in the literature (Considine & Haley, 1992; Gardner, P., 1992; Watson, 1990).

A growing sect of educators has shown interest in the use of filmed adaptations as a device for improving the comprehension skills of low-achieving students. Goldman (1990), McKenzie (1993), Shiring (1990), and Squires (1990) have found filmed adaptations effective in filling in gaps for reluctant readers or special populations, such as students designated as "at-risk." McDonald (1983) suggests using film to improve the language skills of students. Bottge and Hasselbring (1993) argue that videos may help low-achieving students to construct mental models that are richer than those derived solely from text (in Skolnik & Smith, 1993, p. 23).

The differences and similarities between film and the novel have been debated at length (Admussen, 1978; Aycock & Schoenecke, 1988; Beja, 1979; Biro, 1982; Bluestone, 1957; Boyum, 1985; Cohen, 1979; Costanzo, 1985, 1992; Cox & Many, 1989; Esner, 1985; Fadiman, 1978; Gardner, P.,

1991; Giddings et al., 1990; Harrington, 1977; Hulesberg, 1978; Jinks, 1974; Kawin, 1977; Kittridge & Krauser, 1979; Klein & Parker, 1981; Knight, 1972; Magill, 1976; Magney, 1972; Manchel, 1990; Marcus, 1971, 1977; Maynard, 1971; McConnell, 1979; McDougal, 1985; Miller, G. 1980; Miller, J., 1986; Millichap, 1983; Murray, 1972; Oliver, 1989; Peary & Shatzkin, 1977, 1978; Richardson, 1969; Ross, 1991; Self, 1987; Sheridan, Owen, Macrorie, & Marcus, 1965; Sinyard, 1986; Sohn, 1970; Speigel, 1976; Street, 1983; Wagner, 1975; Weinberg, 1973; and others).

When discussing the similarities in the two media (film and the novel), scholars usually conclude that both film and literature are narrative arts—both exist to tell a story. Miller (1986) asserts that the two media share the capability to create an invisible structure to which the viewer or reader responds. Like a reader who must ignore the construction of the text in order to continually derive meaning from it (Iser, 1989), the viewer is rarely conscious of every cut or change in camera angle. Yet, it is the cut and the angle of the camera that give much of film its meaning (Kraft, 1986, 1987).

A third similarity is that much of the jargon of literary criticism is equally applicable to film. Plot, symbolism, theme, tone, characterization, foreshadowing, and setting are terms as applicable to film as text.

Despite the similarities, most writers agree with Bluestone (1957), that "the film and the novel remain separate institutions, each achieving its best results by exploring unique and specific properties" (p. 218). The differences between the film and the novel noted most often in the literature are these: (a) Film is dominated by the image, while literature is bound by the word. (b) Time constraints limit what films can and cannot do. (c) Novels are usually produced by an individual working alone for a limited audience, while films are made by group of individuals for a larger audience. (d) With film, star power almost always wins out over storyline if the two should ever collide (Baines, 1993).

An intriguing area of exploration is the degree to which writers of novels have been influenced by films and other mass media. Hamilton (1990) chronicled the efforts of Faulkner, Fitzgerald, Chandler, and others who dabbled in screenwriting for Hollywood. Hamilton found that the lure of money and steady work was irresistible to writers, famous or not, who usually had to eke out a living on the paltry royalties from books.

Others who have examined the effects of film and nonprint media on the literary achievements of writers have found a certain symbiosis between writers and filmmaking. For example, Millichap (1983) asserts that Steinbeck drew his documentary style "from the photography and films of the period" (p. 176). Early filmmaker D.W. Griffith is said to have often consulted the work of Charles Dickens in the making of his films. It was also through Dickens' novels that Russian director Eisenstein uncovered the ideas of montage, dissolve, and close-up (Eisenstein, 1949).

It is probable that popular novelists such as Grisham, Crichton, and Walker consider the possibility of screen adaptations before they even pick up their pens or turn on their computers. Certainly, a writer would find it difficult to ignore that a filmed adaptation earned \$350 million or so at

the box office in a year (as Crichton's *Jurassic Park* did in 1993).

FILM AS FILLER

The view of film as "trash culture" persists as the dominant image that many educators hold today toward motion pictures. Even though teachers cannot legally show students rented films as entertainment (because it is a violation of copyright laws), administrators still view the use of films as somehow taking time away from other areas of "more serious study" (Perry & Gluckman, 1990). It is not uncommon for a teacher who uses film often to be viewed as lazy or incompetent by fellow teachers and administrators, regardless of the benefit students may reap in their interactions with film. When the Education Secretary for England, John Patten, was asked why he was considering the elimination of media studies in English schools, Patten replied that media studies were a "cultural Disneyland for the weaker-minded" (*Clipboard*, 1994, p. 15).

One of the biggest obstacles to the use of film in school has always been its identification with "light entertainment." Gutenberg created movable type so that mankind could read and understand the Word of God (the *Bible*). On the other hand, the Lumiere brothers created film to astound and entertain a paying audience. Perhaps the different circumstances involved in the inception of print and film help account for some of our lingering sentiments about them.

FILM, VIDEO, AND LINGUISTICS

In a study of the language of novels and the films adapted from them, Baines (1993) found a dramatic difference in how language is employed in novels and in film. In brief, a novel exhibited a greater variety of words, more polysyllabic words, and significantly longer, more complex sentences than did its film adaptation. Language in film tended toward repetition, simplicity, and the use of short, direct sentences.

Obviously, in its current manifestation, film does not come close to the richness of the linguistic environment available through books. Critics of nonprint media are correct when they note that entrance into undergraduate or graduate study at the postsecondary level still requires satisfactory scores on standard tests such as the Scholastic Aptitude Test (SAT) and Graduate Record Exam (GRE), which lean heavily on linguistic and logical assessments of intelligence. However, film's strong points are not words, but accessibility, immediacy, and the ability to communicate visually and aurally at the same time. Only the most bookish of us would rather read a five-page description of a sunset than view its Technicolor glory on the big screen while listening to Samuel Barber's *Adagio for Strings*.

Many educational reformers (Gardner, H., 1983, 1991, 1993 among the most prominent) have recommended that schools broaden their concept of literacy. Whether or not schools will undertake such a transformative view of literacy

remains to be seen. Two things are indisputable—film cannot do what books can; books cannot do what film can.

THE FUTURE OF FILM AND VIDEO

The field of data compression has the potential to change film and video as they currently exist. Technologies utilizing data compression procedures are currently being used in relation to the development of High Density Television (HDTV), the transference of motion pictures to compact disc, and the further advancements of interactive technologies. Media will continue to converge, as telephone companies experiment with video communications, and video companies play with the possibilities of digital technology. Tele-Communications Inc., the largest cable operator in the United States will have lain \$2 billion worth of fiber-optic cable by 1996 (Beachum, 1993). Meanwhile, the world's largest entertainment company, Time Warner, is building a fully interactive experimental cable television system in Orlando, Florida, and scientists promise that virtual reality will alter the human conception of "visualization" and "experience" (Auld & Pantelidis, 1994; Helsel, 1992).

In the current milieu of exploding technologies, those who advocate film study in school find themselves in the awkward position of advocating the use of a medium that is no longer considered technologically advanced. The film study movement of the 1930s was the result of the public perception of film as a high-tech medium, as well as the movie house's central position in the social lives of students. Research over the past 30 years has shown overwhelmingly that it is television that occupies the central position in the social lives of students today. Also, as we venture into the next millennium, the obsession of forward-thinking educators is with computers and telecommunications, not with film.

While trends in technology and education would seem to warrant a bleak forecast for film study in the classroom, two factors militate against such negativism. First, many newer electronic technologies are based upon the moving image. The motion picture, now with a history of more than 100 years, is in the unique position of being the most established electronic communications medium of the day still in widespread use. As Culkin (1972) has noted, "A lot of things have happened since 1900 and most of them plug into the wall" (p. 88). Knowledge of how and why we create meaning through viewing a film is the kind of literacy that is transferable to the real world, a world inundated with visual and aural stimuli.

Second, because film study has become subsumed under the mantle of mass media (which includes the computer, CD-ROM, interactive video, and other electronic devices), its fortunes have become inextricable with those of other, newer media. Thus, as the push for the infusion of technology in schools grows, the acceptability of mass media including film also grows.

Unlike most elementary and secondary schools, other factions of American society have shown a genuine willingness to work with film. Today, police officers use videotape to record evidence at the scene of a crime, doctors probe

with tiny cameras to observe and record the workings of a patient's internal organs, mom and dad use video to record the development of their child, beginning with the baby's first movements in utero.

Over 50 years ago, Hoban wrote, "Motion pictures have all

the vital ability to influence and improve education that the printing press had five hundred years ago" (1942, p. 4). While film has never reached the pinnacle of influence predicted by Hoban, no other medium has better represented life in the 20th century.

ELECTRONIC DISCOURSE COMMUNITIES: THEORY, PRACTICE, AND RESEARCH

Wayne M. Butler

UNIVERSITY OF MICHIGAN

Some contemporary literacy educators might be startled if they were to walk into one of the hundreds of university, college, and high school classrooms where students learn literacy on-line. They would see a score of students sitting in front of personal computer monitors, their hands alternately perched over keyboards and reaching reflexively for mouses, their fingers flailing away at keyboards in a flourish, pausing intermittently to read off their monitors not only the words they are writing but those of their peers as well. The relative lack of human voices would be underscored by the clackity clack of keys. Although these students might, during certain class meetings anyway, seem mute and silent, they are anything but isolated and alone; they are linked, through their networked computers, into a literate learning community in which more of them will participate in the class's meaning-making discourse than they typically would in traditional classrooms, they will contribute to a textual conversation made up of more diversity in voices and perspectives than would be possible in other settings, and they will be more engaged and active learners than they might be in more traditional literacy environments.

Major shifts in the ways in which we conceive of literacy—the acts of reading, writing, and meaning making through text—parallel the advances in technology. More important, perhaps, than the changes in the physical conditions under which texts are produced, and perhaps even more important than the way in which literacy is taught, is the effect of literacy technologies on language itself and what it means to be literate. The confluence of language and literacy theories, pedagogical practice, and technology have resulted in what might be called electronic discourse communities; ones founded on contemporary social views of language, literacy and education; ones bulwarked by the new network technologies that become both simpler to use and offer greater access within and across networks; and ones that already are

reaching out beyond classrooms and school buildings and into a site where virtual communities exist in cyberspace.

Before embarking on a physical description of pedagogy in and research concerning electronic discourse communities, it is important to define what might be meant by “literacy” for the purpose of this chapter. We have long abandoned a narrow vision of literacy as the ability to decode and encode texts. Most theorists and researchers agree on a broader view of literacy, one that, of course, requires encoding and decoding, skills but goes beyond to what James Boyd White describes as more than

the capacity to understand the conceptual content of writings and utterances but the ability to participate fully in a set of social and intellectual practices. [Literacy] is not passive but active, not imitative but creative, for participation in the speaking and writing of language includes participation in the activities it makes possible. (Robinson, 1990, p. 17)

And, just as the definition of literacy has moved from the ability to read and write to the ability to participate in and contribute to the social and intellectual practices of a literate culture, the notion of computer literacy, one that began with the idea that it was enough to know how to operate a computer, has taken on broader ramifications as technology has ushered in the information age. This chapter does not address how computers might be used to help readers and writers learn the decontextualized skills that are thought to contribute to literacy but rather how computer technology creates a means of literate communication wherein students learn to read and to write by reading and writing within a community, albeit a virtual one, of other readers and writers.

Computer technology is an encompassing term that includes hardware, such as mainframes, PC compatibles, Macintoshes and CD-ROM players, and sundry software applications, such as drill and practice, word processing, and

hypertext programs, each of which might deserve separate discussions on their effects on literacy. Furthermore, the various developmental stages at which readers and writers might use technology each suggests different possible effects. What follows, however, is a description, analysis, and discussion of one way in which technology, in the form of local (LAN) and wide (WAN) networks, is affecting how more and more students at a growing number of institutions are learning how to write. Since such electronic writing is being done within a community of writers, members of the community are readers, too.

WHAT IS AN ELECTRONIC DISCOURSE COMMUNITY?

On one level, an electronic discourse community can be housed in a physical place, a classroom, perhaps one designed exclusively for the English department, with a dozen to thirty personal computers. Another setting might be a library with a bank of personal computers or a general purpose computer lab of a dozen or so computers in which teachers reserve times for classroom meetings or individual students drop in during study halls, lunch hours, between classes, or after school. In such places, the desks, tables, and carrels on which the machines sit may be arranged in rows as in a traditional classroom. In other places the tables might be arranged around the perimeter of the room, the monitors facing inward, with a large conference table in the middle. While yet in other settings the furniture may be clustered in pods, with four or five computers per pod and four to five pods per room. On another level, the electronic discourse community is not a physical space at all. Instead, members of the community may be sitting at home, in a classroom, or in a public library at a personal computer, one with a modem connecting the computer to the telephone line that links them with a virtual community, one that exists in cyberspace.

The physical relationship among the computers, though each configuration can create different dynamics (Boiarsky, 1990), is less important than the technological relationship among the machines. The computers in an electronic discourse community are not stand-alone machines running software based on behavioristic notions of programmed learning and electronic workbooks or word-processing programs with spell and style checkers. Such stand-alone configurations, after all, suggest individualistic models of learning, ones in which writers and readers interact with the machine and interface with software in attempts to master literacy skills, often in the absence of authentic communication. The electronic discourse community comes to being in one of two ways. In one scenario, the computers are linked together by cables and network software into a local area network (LAN) that allows applications, such as word processors, and files, ones consisting of both student and professionally produced texts, to be shared among those on the network. While the LAN links anywhere from several to a hundred microcomputers through a local server, other networks can be created through mainframes or powerful personal computers linked together over vast geographical

areas into wide area networks (WAN), such as the Internet, that expands the infrastructure of electronic discourse communities from the classroom to the truly global level.

In addition to electronic literacy tools such as word processing, desktop publishing and, in the truly cutting edge environments, hypermedia and hypertext programs, the network will include computer-mediated conferencing programs such as e-mail and synchronous or "real-time" conferencing. E-mail can support one-to-one messaging and can offer discussion lists where participants broadcast their messages to all those subscribed to the discussion group or list. Whereas e-mail operates asynchronously, that is, allowing participants to send and receive messages at their leisure, synchronous conferencing programs, ones that operate in real time, require participants to be logged onto the network at the same time so they can participate in text-based discussions with other members of the discourse community. In such programs, participants have access to both a text editor with which they compose their contributions and a communal transcript to which their contributions are appended, thus allowing all members of the community to engage in a discussion. At the local level, community members include both classmates and teachers; at the WAN level, community members include millions of potential participants.

Merely buying computers and linking them together into a local area network is not enough, however, to build an electronic discourse community. As Gail Hawisher and Cynthia Selfe (1991) have pointed out, network technology can and has been used to promote top-down, teacher-centered pedagogies and behavioristic models of skills acquisition. Underlying the technological infrastructure of electronic discourse communities are social theories of language, literacy, and pedagogy.

Theoretical Basis for Electronic Discourse Communities

During the last several decades a number of strands running through the fabric of what we call literacy education have recognized that language—its acquisition and its use—though comprised, perhaps, of discrete skills and used by individuals, is essentially a social act. For Lev Vygotsky, "Development in thinking is not from the individual to the socialized, but from the social to the individual" (Gere, 1987, p. 81). Dialogue models of language acquisition theorize that the construction of meaning through language is an interactive process between language producers and language perceivers. When discussing the prelingual stage of a child's language acquisition, Jerome Bruner (1981) explains that "formats," cognitive schemata that language learners must develop in order to manipulate the conventions of conversation, are developed through the interaction of the child with its environment and caretakers (p. 44). A number of contemporary rhetorical theorists have focused on the social aspects of language and communities. Lester Faigley's (1986) "social view," Kenneth Bruffee's (1986) "social constructionism," and James Berlin's (1988) "social-epistemic," are related, as Berlin notes, "because they share a notion of rhetoric as a political act involving a dialectical interaction engaging the material, the social, and the individual writer, with language

as the agency of mediation" (p. 488). Contemporary literary critics also recognize the role "community" plays in the meaning making process. Stanley Fish (1980) and David Bleich (1975) both contribute to the notion that "it is interpretive communities, rather than the text or the reader, that produce meaning and are responsible for the emergence of formal features" (p. 14). Bleich, when discussing his conception of the interpretive community, writes.

Interpretation is always a group activity, since the individual interpreter is creating his statement in large part with an eye towards who is going to hear it. That is his community, whether it is of students, teachers, reviewers, or critics. ... For this reason interpretation is a communal act. (pp. 94, 95)

PEDAGOGY IN NETWORKED LITERACY CLASSROOMS

What teachers and students actually do in networked classrooms grows out of the collaborative learning pedagogies that model social views of language. At the outset of her book, *Writing Groups: History, Theory, and Implications*, Anne Ruggles Gere (1987) lists the various names and phrases from "writing groups" to "intensive peer review" that have been applied to pedagogical practices modeling social views of cognition, language, and literacy. To these could be added James Moffet's (1968) "naturalistic curriculum," Robert Slavin's (1983) "cooperative learning," and George Hillocks (1986) "environmental mode" pedagogy. What all these techniques have in common, of course, is the recognition of social dynamics in any learning situation which asks students to work together to solve problems. "Collaborative learning," a specific version of group work, "assumes a socially derived view of knowledge and opposes a fixed and hierarchical one" (Gere, p. 75). In practice, the role of the teacher is to create "conditions in which students engage in conversation, both face-to-face conversation and conversation displaced into writing" and "social structures in which students can learn to take over the authority of learning as they gain the ability and confidence to do so" (Bruffee, 1985, pp. 8, 13).

The types of pedagogical practices often employed in the networked classroom, those based on collaborative learning, have been explained by Thomas Barker and Fred Kemp (1990) in an essay entitled, "Network Theory: A Postmodern Pedagogy for the Writing Classroom." They argue that the computer-based collaborative-learning classroom places social constructivist learning theory at the very center of pedagogy, thereby undermining the proscenium style of teaching that places the teacher on the stage and the students in the audience. The proscenium classroom, according to Barker and Kemp, enforces notions of the teacher as sole authority and arbiter of knowledge, a model in direct opposition to contemporary learning, pedagogical, and critical theories that view knowledge as a social construct. Writing in the computer-networked setting becomes a tool for communication, not simply a product for an evaluator. Furthermore, students' texts rather than instructors' evaluations become the focus of class activity. Barker and Kemp write, "Network

theory ... empowers the student writer ... [and] rejects elitist epistemologies which support an 'information transfusion' or teacher-centered model of instruction in favor of social constructivist models which privilege a communal process of knowledge making" (1990, p. 26).

Attempts to separate the acts of reading and writing in the networked classroom create a false dichotomy because members of the electronic discourse community are bound to one another through text. What they write is always to be read by others in the community; what they read has been written, for the most part, by others in the community. What follows is a survey of how literacy educators have used network pedagogy to help students gain what Robert Scholes (1985) calls "textual power," by helping them

to see that every poem, play, and story is a text related to others, both verbal pre-texts and social sub-texts, and all manner of post-texts including their own responses, whether in speech, writing, or action ... (to understand) the web (of interaction and intertextuality), to make it real and visible..., to cast their own strands of thought and text into this network so that they will feel its power and understand both how to use it. ... (pp. 20, 21)

Teaching Critical Reading and Literary Interpretation

In those courses in which, critical reading & texts represents the content, a typical instructional sequence begins with students reading the text. The "discussion" of the text can then be conducted in one of several ways. For example, students might compose on a word processor a response-statement to the poem or short story under study. If the focus text is nonfiction, students write on their word processor a critical analysis of the piece, focusing on the main ideas, the mode of development, the line of argument or other salient features. These response statements are then copied to an e-mail conference or a real-time electronic conference, a procedure which allows students to publish their readings for the entire community.

Once these initial reactions are posted, on-line discussions about both the focus text and the community's responses to the text ensue. Students are offered time (class time if using a LAN with limited nonclass time access; nonclass time if students have access to the LAN after hours or if working on a WAN) to read the responses written by others in the community (students may read all classmates' reactions or just those of some predefined subgroup, depending on the class size) and engage in on-line discussions that focus on the range of possible readings inspired by the focus text as evidenced by the range of readings offered by community members. Students describe and analyze the differences among the various readings and their interactions with one another to negotiate for "best" or "strong" readings (Butler, 1992).

During such negotiations, those whose readings are challenged are placed in the rhetorical situation of having to argue for their reading by further explicating the focus text and supporting their argument with details from the reading selection. Those mounting the challenges then need to offer, in response to the writer's argument for her reading, counter arguments. Such interaction forces the critic to offer more

detail about the stimulus text and the writer's response to it. Students often are asked to postulate how and why a single text can lead to the multiple interpretations that inevitably arise during such activities. Throughout these on-line discussions of readings, students are using language in a social setting to communicate, express, analyze, and argue about language. And, each member of the community is not only writing with a purpose, but reading in an intensive literacy environment in which their communication with peers is all through text. In such settings, participants learn literacy "from the class of discourses, ... through engaging in discourse" (Cooper & Selfe, 1990, p. 867).

The on-line instructional sequence described above can be applied to various learning situations by changing the stimulus for the discussion. In the rhetoric classroom, the stimulus might be an important text which tackles a controversial issue, such as George Wald's treatment of the creationism versus evolutionism debate in "The Origin of Life" (Butler & Kinneavy, 1991). In other composition classrooms focusing on cultural criticism through ethnographic writing, ethnographies become the sites of electronic interaction (Faigley, 1992). Socially constructing knowledge through networks, furthermore, need not be confined to the English classroom. In history classrooms, for instance, where on-line writing-to-learn is used as a vehicle to study history, the stimulus might be an historical text or issue such as "Should the U.S. participate in WWI?" an activity in which students, who have researched various positions from the points of view of historical figures from the period, argue the issue by taking on the personas of these historical figures (Wax & Butler, 1993).

Teaching Writing On-Line

In the writing classroom, the stimuli for text-based social interaction can be student drafts. The traditional activities of peer editing and critiquing take on a new dynamic when students submit their drafts electronically to the community and the community members offer on-line critiques through real-time electronic conferencing or e-mail. Because using e-mail or electronic conferencing does not support the writing of marginalia or intratextual commentary, peer critics are encouraged to comment on the communicative rather than surface features of drafts. And, since the on-line peer critique process is interactive, writers are engaged with their readers in the discussions of their texts.

Stimuli for on-line discussions need not be only published or student-drafted formal texts. Since, for example, many electronic conferencing programs allow participants to compile and print transcripts, these records of the discussions can be used as stimuli for follow-up discussions or sources for writers. In the composition classroom in which argumentation is the focus, transcripts capturing on-line debates about a controversial issue can provide writers evidence of the various points of view surrounding the issue. In the history classroom in which students have argued an issue on-line from the various perspectives of historical personas, students use the transcripts as sources for research papers. Such uses of electronic conference transcripts serve

the purpose of validating and privileging the language and socially constructed knowledge of the electronic discourse community and thus permitting students to use their language to study their language.

RESEARCH ON ELECTRONIC DISCOURSE COMMUNITIES

Electronic discourse communities are relatively new literacy sites and those who have taught in, researched, and written about them have articulated a diverse, if not always unified, set of observations and questions. Using various research methods including linguistic analysis, discourse analysis, ethnography, and experimental studies, researchers have described the characteristics of language used in electronic conferences, analyzed how electronic conferencing fosters environments considered crucial in the learning and teaching of reading and writing, and studied the effects of writers' participation in electronic discourse communities on writing achievement. Despite what Hawisher and Selfe (1991) have called the "rhetoric of technology," that is, discourse about technology and literacy characterized "uncritical enthusiasm" (p. 56), caveats, critiques, and contradictory findings abound.

Characteristics of Language On-Line

Investigators of electronic conferencing have argued that interactive writing serves to bridge some of the gaps between speaking and of writing, bringing reading, writing, and speaking closer together than previously believed possible. Faigley (1992), for example, notes, "The result is a truly hybrid form of discourse, something between oral and written, where the conventions of turn-taking and topical coherence are altered. Another difference from oral discussion is that students can move back and forth in the emerging transcript to check what was 'said' earlier" (p. 168). Murray (1985), who analyzed discourse features of two computer scientists using electronic conferencing, concludes that the language of electronic conferencing is semipermanent, can be partly planned, is subject to time delays, and lacks visual paralinguistic and nonlinguistic cues. To avoid ambiguity, users articulate topic shifts and gloss reference items. The electronic discourse reveals less fragmentation than oral discourse, change of voice is handled through pronoun use and choice of diction, and the interaction of these characteristics results in complex turn-taking, with conventional turn-taking principles of oral discourse being violated.

Perceived Benefits

Perhaps more important than the effect of electronic conferencing on language itself are the cultural aspects of electronic discourse communities, that is, how participating in such environments affects how literacy is learned and taught and how it affects members of the communities. A number of researchers have commented on how electronic conferencing can create conditions believed to be conducive

to the learning of writing. When discussing the possible advantages of synchronous communication with basic writers, Thompson (1988) notes that electronic conferencing is "promising for basic writers because it offers them a link between their generally adequate oral language skills and their weak, reluctant writing" (p. 17). Joy Kreeft Peyton and Trent Batson (1986) claim that "the network provides the conditions now considered crucial for writing development: a close relationship between reading and writing activities; writing with a strong sense of context with a known and present audience" (p. 6). According to Schriner and Rice (1989), electronic conferencing "promotes a new sense of community, rather than isolated study" (p. 478).

Electronic discourse communities provide not only environments considered crucial for writing development, but they also tend to undermine the authority structures of traditional academic discourse, ones in which teachers dominate, a minority of students control what little student talk there is (Karp & Yoels, 1983), and women and minorities are marginalized. Such shifts in who contributes when and how are crucial in electronic communities built on social constructivist assumptions that such learning sites must encourage and privilege student to student interaction in meaningful ways to negotiate problems concerning the creation, comprehension, and interpretation of texts. Various studies have confirmed, that within electronic communities not only does student discourse take an equal or more dominant place as compared to teachers' discourse (Butler, 1992; Butler & Kinneavy, 1991; Faigley, 1992), but females (Bump, 1989; Selfe, 1990) and minorities (Butler, 1992; Faigley, 1992) have better opportunity to participate in meaning-making discourse. In an ethnographic study of a college writing-intensive literature classroom, for example, Butler found that over the course of four real-time electronic conferences throughout a 15-week semester, 100% of the students participated in each session and student turns accounted for 89% of the classroom discourse, with the teacher and participant observer accounting for the rest of the turns. During those four, 1-hour sessions the average student took 4.4 turns per session. The most active student (a Caucasian female) took 6.25 turns per session while the least active (an Asian-American male) took 1.5 turns per session. The males, who comprised 60% of the class population, accounted for 59% of the turns with the females accounting for 41% of the turns.

A number of reasons exist as to why the traditionally marginalized find more space in electronic discourse than they do in the oral discourse of traditional classrooms. Hiltz and Turoff (1978) and Faigley (1992) note that because within electronic conferences all participants can contribute simultaneously, it becomes more difficult for one person to dominate (including the teacher), and no one can be interrupted. Also, because only participants' words are transmitted, computer conferencing is less intimate and self-exposing than face-to-face verbal interaction and therefore nonverbal cues such as personal mannerisms and handicaps do not influence the message. Thus, write Hiltz and Turoff, participants "can feel more free to express disagreements or suggest potentially unpopular ideas. In addition, statements

may be considered on their merit rather than by the status of their proponents" (p. 27). Kiesler, Siegal, and McGuire have speculated that "charismatic and high status people may have less influence, and group members may participate more equally in computer communication" (Hawisher, 1992, p. 88). As a result of more participants contributing to community discourse than might otherwise be possible in traditional educational settings, members are exposed to a greater diversity of ideas (Langston & Batson, 1990; Schwartz, 1990).

Participants in electronic discourse communities have demonstrated and reported positive attitudes and behaviors toward membership and participation in networked environments. Faigley (1990) describes the phenomena of his students arriving early to and leaving late from his networked computer classroom. Schriner and Rice (1989) report that most of their students who used electronic conferencing as a supplement to their normal class activities, often logged on everyday while some logged on more than once a day, and Hiltz (1990) writes of electronic conference participants perceiving electronic conferencing as "fun."

Butler (1992) reports that college students who had just completed a writing-intensive literature course in a networked classroom using electronic conferencing attested to differences between their learning styles and attitudes as compared with other courses taken across the university, including previous English courses. When asked to compare their learning styles in the electronic discourse community with those of other courses in the university, 84% claimed they were more active learners. When asked to compare their learning styles in the networked course with those of previous English courses, 92% felt they were more active. And, when compared to previous English classes in traditional academic settings, 100% claimed that they enjoyed the computer-based course more. When asked how much they learned about language, literature, and writing in the electronic discourse community as compared with in previous English courses, 69% felt that they had learned more. A similar anonymous survey completed by at-risk high school students studying American History in a networked writing classroom revealed that 71% felt working with the networked computers improved their classroom behavior, 81% claimed they were more engaged in learning, and 90% felt they learned more about history than they had in other history classes completed during high school (Wax & Butler, 1993).

Gail Hawisher (1992) draws upon Erving Goffman's terms "absorption" and "engrossment" to label the increased levels of participant involvement reported by those studying electronic conferencing. Citing Andrew Feenberg's analogy between conferencing and game playing, that "we are drawn in by interest in the next step in the process of interaction more than by any other motive," Hawisher surmises:

Such gaming intrigues participants and probably in part accounts for why students remain after class to continue both asynchronous and synchronous on-line discussions: They want to see what happens next. Since the entire game consists of reading and writing, we might say that participants are involved in a game of literacy. . . . (p. 88)

Caveats, Criticism, and Contradictions

Electronic discourse communities, however, are not utopian literacy sites. What some researchers have considered the benefits of electronic conferencing, that is, the increased amounts of electronic text students produce (Butler & Kinneavy, 1991; Schriener & Rice, 1989), can also lead to communication anxiety (Hawisher, 1992) and sensory overload (Butler, 1992; Hawisher, 1992) as a result of technostress (Bump, 1990) and the seemingly incoherent and disunified discourse. Neuwirth et al. (1993) add to the list of disadvantages, including "concurrent network interaction," lower communication efficiency, less effective discourse production, emotionality and uninhibited remarks (flaming) because of the written medium and "less reflective responses because of the pressures of interactive communication" (p. 207). A number of studies suggest that despite the more egalitarian access to meaning-making discourse provided by electronic conferencing, true equality may not always be achievable. And, the several studies that have looked for significant gains in writing achievement of those students working within electronic discourse communities as compared to those working in traditional classrooms have found little.

Much of the criticism of networked interaction comes from those who have experienced the downside of the kinds of conversations that mask writers' identities. Within these electronic discourse communities in which more candid contributions by participants whose identities can be masked by pseudonyms or by the lack of paralinguistic cues and social markers, candor can turn into rancor. Susan Romano (1993), in a critique of what she calls the "egalitarianism narrative," studied the content of Mexican-American students' electronic conference messages looking for evidence of not merely more turn-taking but if their words concerning a play, *Los Vendidos*, had any impact on influencing the stereotypes of Mexican-Americans held by their Anglo classmates. What she found, however, was despite the fact that the nine Hispanic students (out of a class of 19 students) contributed nearly half the text within a real-time electronic conference, "university-educated Mexican-Americans are mentioned only five times" (p. 24). What Romano observed made clear to her "that because opportunity exists for the marginalized to either center themselves or validate the margins does not mean they will welcome that opportunity" (p. 10). Alison Regan (1993), in her study of networked discourse in a class debating current gay rights issues, writes

the voices of gay and lesbian students and instructors are at least as silenced in the networked classroom as in the traditional classroom, and may in fact be more silenced, for the electronic medium provides homophobic students with the space to express themselves in ways that serve to further suppress gay and lesbian voices. (p. 13)

In the study cited earlier in which Butler (1992) found certain egalitarianism in quantitative terms, a content analysis of students' electronic messages and an interaction analysis of whose messages were actually read, considered, and integrated into the communal knowledge of the discourse community revealed much to support Romano's critique of

the egalitarianism narrative. More access and participation in the written conversations did not necessarily lead to more power for females, nonnative speakers of English, and those whose literacy skills, in terms of reading ability and writing fluency, lagged behind those of their more influential classmates. By the end of a 15-week semester, once students' identities were both constructed by themselves and by their classmates, those who most influenced topic strands, communally negotiated interpretations of literary texts, and were most often identified by their peers as intellectual leaders demonstrated characteristics of traditional academic discourse. The leaders wrote well, were assertive rather than qualifying, and "spoke" in teacherly, authoritative tones. English as a second language students whose impromptu online contributions were often ungrammatical and difficult to comprehend, those with poor typing skills who felt handicapped by the velocity of the real-time conferencing, and those with most problems comprehending, reflecting upon, and writing about the literary selections and their peers' online texts were read less often and were taken less seriously by others. Based on his observations Butler concludes, "when given the opportunity to restructure the discourse of education, the community relied on the old blueprints to build new walls" (p. 391).

Several researchers have measured growth in the writing achievement of students participating in electronic discourse communities. Although many proponents of on-line literacy surmise that students become better writers because they write more text more often, entertain a more diverse range of perspectives and ideas, develop a better sense of audience, and write for real purposes, several studies that have looked systematically at writing achievement cannot demonstrate that students writing on networks outperform those who do not. Gail Hawisher (1992) reports on studies by Hiltz (1990) and Neuwirth et al. (1993) that found no improvement in student writing, but Hawisher notes that Hiltz attributed her lack of positive findings to possible shortcomings in the holistic scoring system.

More extensive and thorough studies, however, have also failed to demonstrate that students writing on networks, in comparison with students learning to write in traditional settings, produce significantly better formal, academic texts. David Bartholomae (1993), in his role as outside evaluator for the Electronic Networks for Interaction (ENFI) Consortium, collected essays from the beginning, middle, and end of both ENFI and non ENFI basic writing classes at three postsecondary institutions. His analysis of almost 3,000 pages of text from both groups led Bartholomae to conclude, "I do not believe that the ENFI writers write any better than the non-ENFI writers" (p. 259). He did not notice, moreover, significant interdraft revisions in either group. His descriptions of ENFI produced texts as compared to non-ENFI produced texts revealed that "ENFI essays were less formal, more colloquial, less predictable, more individualized, less likely to present themselves as texts, and more likely to imagine a direct form of address" (p. 240). He tempered his findings, however, by noting that even though the ENFI essays were less formal and less predictable, "to my mind this is an advantage" (p. 261). He recommends:

For teachers who are eager for students to see the effects of a conversational style, for teachers who are eager for students to talk back to experts or break the format of the book report of the term paper, the networks could be seen as beneficial. (p. 261)

In another type of analysis of ENFI writing, Mary Fowles (1993) administered to 228 ENFI and 230 non-ENFI students from five ENFI Consortium sites writing prompts derived from the Educational Testing Service's Pre-Professional Skills Test. Students wrote pretests at the beginning of the semester and posttests at the end. A team of nine trained readers evaluated the essays following the ETS's Guidelines for Free-Response Scoring. Interreader discrepancy rate was 3.45%, which Fowles characterizes as "respectable" (p. 271). The results revealed that both groups improved slightly from pre- to posttest, but "since gains were nearly the same for both groups, the use of the ENFI network did not appear to contribute significantly to student writing ability" (p. 271).

CONCLUSION

What emerges, then, from the research on writing and reading in electronic discourse communities are theoretical perspectives from which to view these new sites and contradictory findings concerning the efficacy of learning to write well with the aid of networked computers. This latter fact, however, must not deter literacy educators from pursuing, indeed embracing, these new technologies for a number of reasons.

First and foremost is the fact that for better or for worse, electronic conferencing has gone beyond a novel way to teach students how to write. Local area networks now serve as hamlets connecting to wide area networks, which have

expanded from military to university communication networks, growing presently into the Internet, that vast web of interconnected networks on which the Information Superhighway will be based. In many educational settings today, students sitting at their personal computers on local area networks have instant and transparent access to the millions of people worldwide who have become part of what Howard Rheingold (1993) has called the virtual community. Conservative estimates consider 5,000 the number of "attached regional, state, federal, campus, and corporate networks" (Fraase, 1993, p. 10) consisting of 750,000 computers. Others estimate 25 million people have access to the Internet alone (Elmer-Dewitt, 1994), excluding those who interact textually on local area networks and the commercial networks like America On-Line and Prodigy. Estimated Internet growth is as much as 10% a month (Fraase, 1993). Whereas in the early days of networked communication relatively few government and educational scientists and researchers populated virtual space, the educational, political, commercial, and recreational worlds are now on-line. The Internet includes on-line publications, retail services, access to local and national politicians, and recreational newsgroups. The Internet is a vast textual space, one in which the ability to read and write for civic, corporate, and personal reasons becomes increasingly crucial.

If we return for a moment to James Boyd White's definition of literacy as "the ability to participate fully in a set of social and intellectual practices" and understand that those practices are, or at least will become, inseparable from computer-mediated communication, we as literacy educators would be remiss not to usher our students into the age of on-line literacy.

THE FUTURE OF TELEVISION IN THE HOME AND IN THE CLASSROOM: EVIDENCE FOR IMPACT

Joan M. Shiring

UNIVERSITY OF TEXAS AT AUSTIN

For good or for ill, television has become an integral part of Americans' lives. This ubiquitous medium can be a treasure chest offering viewers *Sesame Street*, Ken Burns' *The Civil War*, and Alex Haley's *Roots*, or a Pandora's box unleashing *Let's Make a Deal*, *Beavis and Butt-Head*, and "professional" wrestling. At its best, television informs, entertains, enhances global communications, provides companionship, and offers time-saving services (e.g., college courses, exercise classes, home shopping). At its worst, it bores, perpetuates stereotypes, wastes valuable time, isolates family members, and prevents people from engaging in more meaningful activities.

So where does this situation leave viewers now, on the brink of the 21st century? Chances are great that in the years to come television will remain a double-edged sword to society. Before speculating on possible future roles of television in the home and classroom, though, it would be wise to examine some general trends associated with the medium today. As Igor Stravinsky astutely noted in his autobiography, "I cannot know what tomorrow will bring forth. I can know only what the truth is for me today" (1936, p. 10). Consequently, this chapter presents a brief, introductory overview of research in four areas related to television viewing: (a) typical habits of children and teenagers; (b) possible effects on family dynamics; (c) general effects on vocabulary growth and reading achievement; and (d) interesting uses of television in classroom settings.

One caveat: this chapter's length obviously precludes an in-depth analysis of any of these complex issues. Rather, information presented here offers readers a broad, general picture of television as it affects many young people today. For more detailed, thorough treatments of topics and research

related to television and its effects on children and teenagers see Berry and Asamen (1993), Bryant (1990), Comstock and Paik (1991), and Zillman, Bryant, and Huston (1994).

TYPICAL VIEWING HABITS OF CHILDREN AND TEENAGERS

During the Watergate and Iran-Contra hearings, the American public heard two questions repeatedly: "What did the President know?" and "When did he know it?" Similarly, where television viewing is concerned, parents, educators, advertisers, and A. C. Nielsen pollsters want to know the answers to two key questions: "What are young people watching?" and "When are they watching it?" The answers are neither easy nor readily accessible. At the most basic level, the term "television viewing" lacks a precise definition among researchers. With 98% of American households in the 1990s owning television sets, and two thirds having two or more sets, the television tends to be on much of the time in millions of households (Comstock & Paik, 1991). People wander in and out of the room while the set is on, chat, eat, do homework, play with games and toys, read the newspaper, talk on the phone, cook, work on hobbies, and attend to myriad chores. Consequently, some family members may be truly concentrating on programs, other members may be virtually ignoring the TV set, or (most likely) the viewers will experience a range of engagement levels over the course of several hours.

Given that key limitation, researchers have nevertheless gathered data at different times and in different studies that suggest some significant patterns and habits. For example,

kids and cartoons go together like peanut butter and jelly. The Saturday morning audience at its peak includes more than half of all children aged 2–11 years. Even so, 95% of the average child's viewing during the week is of programs not specifically produced for youngsters (Comstock & Paik, 1991). Clearly, children are watching adult-oriented programs on the "boob tube" in record numbers—morning, noon, and night. In fact, one of the most quoted statistics on young people's habits asserts that by high-school graduation, the average student will have spent more hours viewing television than in the classroom: 16,000–20,000 versus 14,000 (Fosarelli, 1986).

Other researchers similarly attest to the fact that television is one of the major components in children's and teenagers' lives. Several studies tracking young people's television viewing (Comstock, Chaffee, Katzman, McCombs, & Roberts, 1978; Robinson, 1990; Tangney & Feshbach, 1988; Timmer, Eccles, & O'Brien, 1985) conclude:

- Television occupies more time than any other out-of-school activity;
- Television accounts for half or more of all leisure time;
- Television occupies proportionately more free or leisure time among children than adults; and
- The amount of television viewed by teenagers, while less than consumed by children, ensures that the medium occupies a similar position of prominence in their lives.

Although millions of American children and teenagers are obviously enamored of television, some differences in viewing habits do emerge which depend on the young person's socioeconomic status, race, and intellectual ability. Not too surprisingly, several major studies reveal that generally, as a family's socioeconomic level increases, the members' television viewing decreases (Anderson, Mead, & Sullivan, 1986; California Assessment Program, 1988; Keith, Reimers, Fehrmann, Pottebaum, & Aubrey, 1986; Neuman, 1988). Additionally, these researchers note that often, as family income increases, the parents' assessment of television as a worthy educational tool decreases. Educators should not leap to the conclusion, though, that greater viewing in impoverished families is necessarily a bad thing. As researchers point out, young people not fluent in English or coming from homes with few printed educational materials (e.g., books, newspapers, encyclopedias, magazines) can benefit greatly from television's rich resources.

One exception to the inverse relationship between income level and amount of television viewed occurs within African-American families. Several studies conducted during the past two decades suggest that at every social stratum, African Americans tend to watch more television and to have more positive attitudes toward the medium than do their Anglo counterparts (Anderson et al., 1986; Anderson & Williams, 1983; Bogart, 1972; Greenberg & Dervin, 1973; Medrich Roizen, Rubin, & Buckley, 1982; Tangney & Feshbach, 1988).

Along with the factors of socioeconomic status and ethnicity, a young person's intellectual abilities will often affect both the amount of television watched and the nature of the programs selected. Robert Abelman, in his article

"Television and Gifted Children: What the Research Says" (1992), summarizes some important findings on bright children's interactions with the medium. He notes that intellectually gifted 4- and 5-year-olds actually spend more hours in front of the television set than other children of their age. Television, however, does not displace reading. As Schramm, Lyle and Parker (1961) similarly observed, "[These gifted youngsters] have an almost inexhaustible fund of energy for mental activities. They did *more* of everything—more television, more movies, more reading, more discussing, more investigating on their own" (p. 79). Abelman also notes that very young gifted children today are more inclined to seek out educational programs (e.g., *Sesame Street*, *Reading Rainbow*, *Carmen San Diego*) than cartoons, and to watch them with greater devotion than other children. In turn, these children rapidly outgrow the programs, moving on to adult-oriented comedies and action-adventure shows. During adolescence, intellectually gifted teens tend to be drawn toward more sophisticated fare (e.g., the evening news, adult educational programs, reality-based shows).

This pattern is markedly different from that of children and teens at the other end of the intellectual spectrum. In general, the lower the youngsters' mental abilities, the more likely they are to be heavy viewers (6 or more hours a day) who prefer shows emphasizing fantasy, comedy, cartoons, and violence. These contrasting viewing patterns for the gifted and those of lower mental ability have held true across four decades of research on British and American viewers, with the preferences continuing throughout adulthood (Beentjes & van der Voort, 1988; Himmelweit & Swift, 1976; Maccoby, 1954; Schramm et al., 1961; Sprafkin & Gadow, 1986; Williams, 1986). One exception to these patterns occurs when gifted young people and those financially well off experience a great deal of conflict in their social relationships (e.g., with parents, siblings, peers). In such cases, television viewing can become quite heavy, serving as an escape from unpleasant reality (Abelman, 1992; Maccoby, 1954; Schramm et al., 1961).

Related Video Media: Videocassettes, Video Games, and Music Videos

By the late 1980s videocassette recorders (VCRs) were in more than half of all American homes; experts predict that at the end of this century VCRs will be in nine out of ten households (Klopfenstein, 1989). That is the good news—and the bad news. Today's youngsters clearly feel at ease with VCRs, seeing the machine not as something separate or added onto their TV, but rather an essential part of it. Jokes abound concerning adults' inability to program their VCRs to tape a show, but American youngsters do not appear to be similarly "VCR-impaired." A study by Sims (1989) examining the viewing habits of more than 2,500 persons aged 2 years and above resulted in three major findings: (a) children and teenagers use VCRs much more than adults—approximately 3 to 5 hours per week, (b) young people use VCRs primarily for prerecorded tapes (e.g., rented movies), and (c) young viewers rarely look at taped TV shows more than once. Cohen and Cohen (1989) arrived at a similar conclusion concerning

adolescents' familiarity with VCRs (e.g., 90% of the teenagers knew the functions of all the buttons vs. 40% of the adults).

Other researchers reiterate the finding that young people in households with VCRs typically see more movies per week, and more rented movies with restrictive ratings (PG-13 and R). One might expect that parents in households with access to VCRs, basic cable, and premium services (e.g., HBO, Cinemax, pay-per-view) would actively exert restrictions on their child's or teen's viewing, but this does not appear to be the case (Atkin, Heeter, & Baldwin, 1989; Greenberg & Heeter, 1987; Kim, Baran, & Massey, 1988; Lin & Atkin, 1989). Occasionally parents express a slight concern over their sons' viewing choices (apparently fearing that adolescent males will seek out more violent or sexually explicit materials) than will females. In general, though, households with the most diverse media access seem to opt for a laissez-faire attitude toward youngsters' television and movie selections.

Acknowledging children's and teenagers' fondness for VCRs and rented movies, television viewing of both commercial and cable channels still accounts for more time than all other media combined. Video games, for instance, do not appear to consume a significant chunk of most youngsters' free time. Although little formal research has been done on this topic, Kubey and Larson (1990) conclude that young people (especially boys) enjoy using the television on occasion for video games, but find the sophisticated arcade games more arousing and emotionally gratifying. Studies by Dominick (1984) and Selnow (1984) concur with these general findings.

As children move into adolescence, though, music begins to compete with television for teenagers' attention. Adolescents typically spend less media time supervised by their parents, preferring instead to watch television and listen to music either alone or with peers. With the advent of Music Television Video (MTV) in 1981, teenagers could watch the tube and listen to their favorite songs at the same time. Today, MTV appears to be a significant part of adolescent culture, influencing teenagers' speech, fashions, attitudes, and dances (Seidman, 1985).

Teenagers with access to MTV typically watch 30 minutes a day, with males apparently enjoying the station more than females. Several studies provide explanations for this male preference for rock videos (Brown, Campbell, & Fisher, 1986; Greenfield et al., 1987; Kubey & Larson, 1990; Zillman & Mundorf, 1987). Female viewers complain that music videos tend to be pitched more to males' desires than their own, frequently presenting women as sex objects, often in various states of undress. In turn, this male-oriented sexual imagery can be threatening to young girls trying to come to terms with their own sexuality. Finally, female viewers are more likely to enjoy just listening to songs, preferring to create their own imaginative scenarios rather than view the visuals on MTV. Having said that, the young women concede that rock videos are here to stay. (It is rather ironic that MTV should end up being the first serious effort by the television industry to provide regular programming for adolescents.) Ultimately, teenagers in the 1990s—like young people in previous generations—find music in all its forms to be a significant part of their lives.

TV VIEWING AND EFFECTS ON FAMILY DYNAMICS

As mentioned earlier, television is America's most ubiquitous medium, reaching 98% of the nation's households. With two thirds of these homes enjoying the luxury of two or more television sets, some changes in family behavior patterns are bound to occur (Comstock & Paik, 1991). During the first half of this century and the early days of television, mothers usually stayed home and families often sat down to an evening meal together. Obviously, many societal factors besides television's proliferation have influenced today's changing family patterns (e.g., rising divorce rates, two-career families, expanded extracurricular activities for kids, more after-school jobs for teens). For all these reasons, many parents find themselves caught up daily in an exhausting whirlwind of career demands—carpooling, household chores, shopping, cooking, and child care. With schedules so hectic and varied, individual family members often resort to popping something in the microwave for dinner, then heading to the nearest TV set to eat, view, and relax—each at his or her own convenience. When parents do fix dinner for everyone or attend to household chores, television often serves a custodial function, keeping the kids out of the parents' way so that the adults can work more efficiently. For example, in one survey of mothers by Gantz and Masland (1986), the subjects interviewed estimated that most mothers of children aged 2 to 12 used television as a babysitter for about 3.5 hours a day.

Studies in recent years on families' viewing habits have noted several important trends. In the 1950s and early 1960s families tended to gather around one television set to watch their favorite programs, often chatting and exchanging comments and opinions about the shows and advertisements. For today's families who own only one set, such joint viewing and conversation continue to be typical behaviors (Bower, 1985). With the nation's tremendous increase in households with multiple sets, cable systems, and VCRs, however, this viewing tradition has become the exception rather than the norm. For example, Bower points out that for about 50% of all viewing time, children and adults watch television separately. Other researchers concur with these general findings and offer some additional conclusions (Baron, 1985; Kubey & Czikszentmihalyi, 1990; Lawrence & Wozniak, 1989; McDonald, 1986):

- As multiple sets increase, whole-family viewing decreases; this effect is especially strong in low socioeconomic households;
- Most covieing occurs among persons within the same general age range, whether children, teenagers, or adults; and
- When parents and children watch programs together, both groups perceive the experience as a positive one, although not as rewarding as other shared family time (e.g., playing games, doing arts and crafts projects, cooking, eating outside, going to social and cultural events).

Clearly, television viewing as an activity is becoming more individualized and intragenerational, rather than intergenerational, not only in America but worldwide. For example, in 1992 Jude Collins investigated 300 adolescents in a working class district of Belfast, Ireland. Surprisingly, more than two thirds of the teenagers had TV sets in their bedrooms, with 70% of these young people stating that they preferred to watch alone versus viewing programs in the company of others. Similarly, a study in Beijing, China (Ekblad, 1986) noted that even young children often preferred to be alone when watching television, especially when the home was rife with conflict.

Given the norm in American culture of quasi-harried adults, hectic schedules, youngsters with strong viewing preferences, and multiple-media homes, educators should not be surprised that parents are not as effective as they could or should be in controlling their kids' television habits. Reviews of studies on parental control, mediation, and program selection conclude the following (Alexander, 1994; Comstock & Paik, 1991; Dorr, Kovacic, & Doubleday, 1989; McLeod, Fitzpatrick, Glynn, & Fallis, 1982; Winn, 1985):

- Television habits are very difficult to break;
- Parents acknowledge the need to restrict their children's viewing and to discuss programs, yet parent-child covieing occurs least often with younger children who need it the most;
- Multiple TV sets make it more difficult for parents to limit hours watched and shows seen;
- Parents' involvement with children's and teenagers' television viewing ranges from at best moderate to all too often nonexistent.

Clearly, television plays a key role in family life today. On the positive side, family viewing can be a quick, easy, inexpensive way for parents and children to share time with each other. The medium can provide topics for discussion, offer common experiences, suggest valuable moral lessons, and encourage physical intimacy (e.g., snuggling, touching, hugging, stroking). On the negative side, television can become an "in loco parentis" black box, exposing children daily to a steady stream of inane, violent, and inappropriate material. At its most damaging, the "boob tube" can serve to fragment families, driving children, teenagers, and parents into different rooms for hours, days, and weeks of isolated viewing and noncommunication. (Note: The subject of television violence and its possible effects on children is an exceedingly complex one, far beyond the limited scope of this chapter. For further reading on research related to television violence and aggression, see Zillmann et al., 1994, Chap. 3.)

EFFECTS ON VOCABULARY GROWTH AND READING ACHIEVEMENT

For over 30 years researchers have examined youngsters' television viewing in order to determine possible effects on vocabulary development and reading scores. This section highlights some recent reviews of research and summarizes major findings.

Vocabulary Growth

A good place to start might be with *Sesame Street*, first aired in 1970 and now America's most extensively researched children's educational program. The show is viewed regularly (i.e., four or more times weekly) by an estimated 50–60% of all children between the ages of 2 and 5 (Comstock & Paik, 1991). Some critics worry that the program's rapid pace and visually complex graphics may gain children's attention but could interfere with real learning. The research, though, suggests that such concerns are unfounded (e.g., Anderson & Collins, 1988; Davies, 1989). In 1989, Children's Television Workshop compiled an exhaustive '*Sesame Street*' *Research Bibliography*, concluding that the show's format was good not only for attracting and holding a child audience, but for transmitting information as well.

A sampling of some of the bibliography's studies illustrates this point. Ball and Bogatz (1970), for example, noted that young children's viewing of the show led to improvements in letter recognition, word recall, number skills, and cognitive reasoning. A 2-year longitudinal study conducted in the 1980s also demonstrated that the more time children spent watching *Sesame Street* between the ages of 3 and 5, the more their vocabulary scores improved over time (Rice, Huston, Truglio, & Wright, 1990). Even when factors such as parent's education, preschool experience, and birth order were controlled, *Sesame Street* viewing made an independent contribution to vocabulary development. Two other studies revealed additional vocabulary growth when mothers in the United States and Israel actively watched and discussed *Sesame Street* with their preschool children (Lemish & Rice, 1986; Salomon, 1977).

Several researchers have noted that whereas regular viewing of *Sesame Street* typically leads to increased vocabulary growth in preschoolers, the viewing of animated cartoons results in no such positive effect (Harrison & Williams, 1986; Rice et al., 1990). Thus, many shows designed merely for young children's entertainment do not apparently yield the same positive effects as quality educational programming does.

Reading Achievement

Once children enter school and begin to read and write, the youngsters' language and learning processes become increasingly difficult to isolate and analyze in controlled settings. Similarly, the relationship between television viewing and reading achievement is an exceedingly complex one for researchers to evaluate. Many interpenetrating factors contribute to children's and adolescents' viewing and reading patterns: time devoted to television and reading, type and quality of programs watched and materials read, age, socioeconomic and educational levels of family members, attitudes and behaviors modeled by adults, accessibility to television and print materials, and youngsters' innate interests and ability levels, to name a few. For more detailed information on this topic, see, Comstock and Paik (1991) and Reinking and Wu (1990).

In general, reviewers of research conducted prior to 1980 did not find television wielding a pervasive negative effect on reading achievement (Hornik, 1981; Morgan, 1980). Some of the earlier studies that had suggested a negative correlation (e.g., Childers & Ross, 1973) tended to be dismissed in later years because sample sizes were small and the investigators had not controlled for such critical variables as intelligence, socioeconomic status, and availability of educational resources. Consequently, many researchers in the decades between 1950 and 1980 concluded that either a negative effect did not exist, or that their methodologies were not sophisticated enough to discern more subtle patterns.

With advanced statistical analyses and major national studies such as the National Assessment of Educational Progress (NAEP), some of these research liabilities have begun to be addressed. Given larger data bases and additional opportunities for in-depth secondary analyses of interrelated factors, researchers have noted some significant trends emerging. Perhaps the most important finding is that the relationship between television viewing and reading achievement appears to be curvilinear (Fetler, 1983; Mullins, 1992; Neuman, 1988; Roberts, Bachen, Hornby, & Hernandez-Ramos, 1984; Searls, Mead, & Ward, 1985; Williams, Haertel, Haertel, & Walberg, 1982). Specifically, moderate television viewing (i.e., 2 to 3 hours a day) is linked with an increase in reading achievement. In turn, children and teenagers who are heavy viewers (4 or more hours a day) tend to have appreciably lower reading scores.

This general pattern appears consistent regardless of the sex or age of the young person. Some researchers conjecture that watching television a few hours a day may enhance students' reading abilities by providing helpful background knowledge, piquing interest in various subjects for further reading, encouraging imaginative role-playing, and stimulating discussions with peers and adults about issues raised. For students in homes where English is not the first language, television can also help develop a more extensive vocabulary. To explain the decline in reading scores for heavy viewers, Williams (1986) posits his "displacement" theory. That is, for youngsters in first and second grade who experience difficulties when learning to read (e.g., those with lower mental abilities or learning disabilities), television can become an easy, pleasurable escape from their daily, anxious school environment. Thus the vicious cycle begins. The children can not read, so they do not enjoy the activity. Since they do not enjoy it, they often refuse to do out-of-class reading, choosing instead to relieve their stress by watching television. The more they watch, the less they practice—and the farther they fall behind in their reading proficiency with each successive year.

Out-of-class reading is a type of homework, and it might be worthwhile to cite a few salient studies exploring television's general impact on young people's homework. Somewhat surprisingly, when Fetler (1984) looked at his sample of almost 10,600 eighth graders tested through the California Assessment Program, he discovered only a minute negative association between homework done while watching television and scholastic achievement. Keith et al. (1986) echoed these findings when they looked at 28,000 seniors and the time these teens spent watching television and doing

homework. According to these researchers, no strong relationship exists between television viewing and homework because they do not apparently compete for the same blocks of time. The investigators note that these two activities do not seriously conflict with each another to affect students' grades because the amount of homework demanded of the teenagers is so modest. Mullins' (1992) more recent analysis of NAEP data from 1982 to 1990 offers a similar conclusion. In 1990, most 9-year-olds reported doing less than 1 hour of homework each night; at ages 13 and 17, only about one third spent as much as 1 hour per night on homework. Clearly, long hours spent struggling over homework assignments seems to be rare.

TELEVISION IN CLASSROOM SETTINGS

In the 1980s, the great proliferation of satellite systems, cable networks, VCRs, and videocassettes resulted in television's real birth as a convenient, effective tool in many classrooms around the world. Although the medium's educational potential has only begun to be tapped, television can serve many functions in today's schools. For example, teachers use television, videodiscs, and VCRs to introduce classroom topics and extend the traditional curriculum, concretize difficult concepts with engaging visuals, tape students' performances for feedback and evaluation, connect reading materials with related films, link students in remote sites to faculty and educational resources, and provide teachers with helpful in-service training (e.g., demonstrations of innovative teaching practices conducted in real classroom settings). With so many options to explore, therefore, this section focuses on research in three areas related to educational television: (a) postsecondary television courses in the United States, (b) the "Channel One" controversy, and (c) some innovative uses of television in elementary and secondary schools.

Postsecondary Television Courses in the United States

Given America's obvious love affair with television, educators might assume that the United States would lead the world in the educational use of this medium. But they would be wrong. In 1991, Titti Forsslund, head of the Research Division of the Swedish Educational Broadcasting Company, compiled a bibliography of international studies on educational-television use. Based on this research (conducted mainly in the 1980s), she concluded that elementary and secondary teachers in the United States use educational television (e.g., educational videos, educational series shown on commercial and cable channels) far less than their colleagues in many industrialized nations. Japan and Great Britain lead the list, followed by the Netherlands, Israel, Australia, Sweden, Canada, and Belgium. According to her data, only 54% of the teachers in America incorporate educational videos / programs in any consistent manner into their classrooms. Obviously, the use of educational television by teachers is dependent on many factors, a critical one being the number of quality series broadcast for students. In Japan and Britain, for example, where almost every elementary school relies regularly on educational

television, 30-40 educational series are produced. By contrast, only 10 series are typically available to Sweden's teachers, with many shows being repeats.

In terms of educational television, the United States does lead the way in one area, though: televised courses for postsecondary students. Many colleges and universities are relying increasingly on multichannel cable systems as an inexpensive, convenient way to disseminating information to students. Although no reliable, national agency tabulates data on enrollments and drop-out statistics for televised college courses, Zigerell, O'Rourke, and Pohrte (1980) reviewed research on instructional television in postsecondary institutions. According to their findings, more than 1,800 of the nation's 3,000 colleges and universities offered about 2,300 televised courses. Half a million students were enrolled in these courses—300,000 in closed-circuit courses on campuses and 200,000 in courses designed for home viewing.

What exactly constitutes an instructional-television course or "telecourse"? Although no precise definition exists, the term often describes a sequenced learning system comprising 30–60 minute video programs (borrowed; rented; or viewed on closed-circuit campus, commercial, or cable channels), textbooks, and additional resources (e.g., study guides, maps, suggestions for further reading). Evaluation materials—tests, papers, projects—can be mailed to the institution or handled on campus. Typically, people use these televised programs as a convenient way to (a) earn credits for college courses; (b) update their professional skills in such areas as law, real estate, the health sciences, and teaching; and (c) enjoy "general interest," informal courses. Thus, anyone with access to a television might, on any given Saturday morning, be able to delve into the mysteries of Chemistry 101, grapple with the intricacies of the latest tax laws, or appreciate the subtleties of Japanese flower-arranging.

Some universities, however, have envisioned even greater opportunities for students taking telecourses. Wayne State, Ohio, for example, acknowledging the many barriers employed adults contend with when trying to earn degrees (e.g., limited time, jobs far from classroom sites, excessive costs for student fees) developed a consortium entitled "To Educate the People." This special program allows adults employed full time to earn a bachelor's degree by combining telecourses with weekly conferences and periodic on-campus weekends (Feinstein & Angelo, 1977). In turn, several other universities, colleges, and community colleges have adapted Wayne State's videos and curricula to fit their own local needs (Lynch, 1980). In 1980, the Walter Annenberg Foundation, in conjunction with the Corporation for Public Broadcasting, committed over \$150 million for a 15-year project focusing on the development of college telecommunication materials (Zigerell et al., 1980).

Telecourses, however, are not for everyone. As Zigerell et al. (1980) note in their summary of research, up to 50% of university students enrolled in telecourses drop out, with rates even higher in community colleges and open-admission schools. Clearly, telecourses require high levels of maturity, discipline, and self-motivation—qualities often dormant in postsecondary students who have just left high school. These researchers also lament the distressingly low numbers

of African Americans and Hispanics enrolled in American telecourses. They comment too, that in the United Kingdom, very few blue-collar students participate in telecourses; most people taking the courses are middle-class teachers and technicians seeking additional qualifications.

For students who do complete university telecourses, though, their level of satisfaction with the course is often equal to that of students in parallel "live" sections (i.e., with professors teaching directly to students in the room). Researchers at Michigan State University—a pioneering school in telecommunications—have tracked student satisfaction with telecourses since the 1950s. In the 1980s, Michigan State offered over 400 such courses to 62,000 students across campus (Creswell, 1986). Typically, these courses consist of videotapes showing professors lecturing and conducting demonstrations in front of a live student audience. The tapes are then fed to a multichannel, closed-circuit cable system, which in turn runs the tapes at different times throughout the week in dormitories, classrooms, and campus centers. In order to survey students' opinions over the years, each semester researchers conduct phone interviews with random samples of students from both the live and taped class sections. Topics of inquiry include opinions on course quality, organization, methods of evaluation, and impact of audiovisual aids, in conjunction with information on student demographics (e.g., age, major, grade point average, grade expected in the course). In his overview of Michigan State's research on instructional television, Creswell concludes that the professor's personality and knowledge are the keystones to student satisfaction. The actual method of information delivery—taped or live—is not really a crucial factor. In fact, many students prefer the flexibility that comes with taped lectures and the opportunity for repeated viewings of tapes.

According to Creswell, students who have completed telecourses are typically quite positive when asked if they would take another telecourse. Not too surprisingly, the medium's biggest drawback focuses on the students' inability to ask questions and discuss issues with professors. This key disadvantage, of course, gets to the core of a basic, unspoken assumption about undergraduate teaching at many major institutions—that somehow the timeworn format of large-hall, lecture / demonstration classes with little student interaction (whether taped or not) is the best way to cover material in core courses. For administrators, telecourses are certainly cost effective, since hundreds of students can be enrolled in one course with few concerns about room-capacity limits. Admittedly, some courses do offer weekly "discussion" sections, typically led by graduate students. However, these graduate students who serve as teaching assistants often have no formal training in pedagogy, and the weekly meetings still offer fewer opportunities for discussion than if students met in smaller groups with a professor for each class.

In order to overcome the problem of student passivity in traditional telecourses, some high schools and post-secondary institutions have turned to two-way interactive telecourses to encourage student participation. Since this mode of instruction is still in its infancy for many school districts and universities, relatively little in-depth, formal research has been conducted on two-way telecourses. One

investigator who has assessed the effectiveness of several two-way telecourses is Jerry McClelland (1987) at the University of Minnesota, St. Paul. In the mid-1980s the university used two-way television to connect multiple sites for four interactive telecourses. Two of the four courses linked a primary-site high school with several smaller high schools in order to give students in the sparsely populated areas access to a foreign language class and a vocational education class. The other two telecourses linked university professors teaching a professional education course and a food preservation course on the main campus with adults in classrooms at distant sites. Video cameras and monitors were set up so that all the teachers could send views of themselves, students, or visual aids to students at remote sites by pressing buttons on a panel beside them. The technology was simple enough that no technician was needed to manage the equipment.

After analyzing videotapes of class sessions and interviewing teachers and learners, McClelland arrived at two major conclusions. The good news is that the instructional-television technology did not appear to be a significant intrusion on the flow of lessons in any of the telecourses. That is, the teachers—with practice—demonstrated a good deal of skill in coordinating the technology and class activities so that students at distant sites could see and hear content to be learned. On the downside, though, all the teachers tended to focus on the class before them and to ignore pupils at the remote sites. Rarely did teachers call the distanced students by name or direct questions or comments to them. In McClelland's words, the remote sites became "invisible classrooms." Additionally, at the secondary level, a social hierarchy developed. For example, a student at one primary site joked to a new exchange student that their class was linked up with another class "in the boon-docks." Later, students at the remote site referred to themselves as "boonies" (p. 2). These and other comments over a period of time created a contrast between the "in" school at the primary site and the "out" school at the remote site. In sum, telecourses in the future could provide top quality, specialized instruction to students across the nation, regardless of their school's location or size. Still, teachers conducting these courses must make a concerted effort to create a truly balanced, supportive community of learners among all the students linked electronically.

The Channel One Controversy

Virtually all teachers and principals in the 1990s would like their students to be educated consumers and thoughtful media critics as the world barrels into the "Telecommunication Age." Unfortunately, the cost of setting up a good school video system for hands-on student experiences (e.g., with adequate television monitors, videocassette recorders, a closed-circuit cable system, satellite dish, installation and technical assistance) frequently daunts administrators, especially when their schools may still lack basic textbooks, desks, and classrooms. In the late 1980s, Chris Whittle of Whittle Communications, recognizing both schools' need for technical equipment and advertisers' desire for access to a large teenage audience, developed his controversial "Channel One" project (Wulfemeyer & Mueller, 1990). Beginning in

1990, Whittle Communications agreed to donate video hardware and software worth \$50,000 to a secondary school to use as the faculty saw fit, if one condition were met. Each day, at a designated time, all teachers would show their students the 12-minute "Channel One" program. Students would watch a 10-minute summary of current events featuring attractive young news readers, state-of-the-art graphics, and attention-getting "fast facts" and pop quizzes. However, students would also be exposed to a mandatory 2 minutes of commercials pitching products specifically targeted to teens (e.g., Clearasil, Levi's jeans, Nike tennis shoes). At the end of a 3-year period, schools could either continue the program or they could cancel the contract and return the equipment.

And therein lies the heart of the controversy. Critics argue that commercials have no place in the daily curriculum, that advertisers are taking advantage of a captive audience, and that administrators are being seduced by the lure of needed video equipment (N.Y. rejects, 1989; Rudinow, 1989 / 90). In truth, the Channel One program—now in over 8,000 schools with more than seven million student viewers—does give Madison Avenue executives their largest captive teenage audience ever (Reilly, 1989). Corporate giants apparently have no qualms about paying \$150,000 for a 30-second commercial and, as of 1994, Chris Whittle claims a 99% renewal rate for schools and advertisers (Elson, 1994). Additionally, reviews of research on adults' and students' reactions to "Channel One" reveal basically positive attitudes (Carlin, Quinones, & Yonker, 1992; Knupfer, 1993; Wulfemeyer & Mueller, 1990). In general, researchers conclude the following:

- Channel One appears to be accomplishing its primary instructional goal. Most students' knowledge of current events increases after watching the program.
- Most secondary students and their teachers feel that their schools should continue showing Channel One.
- Students seem to enjoy the program's fast-paced format. In turn, the teenagers tend to watch more television news than they did before Channel One came to their schools. However, the show does not seem to create an increased interest in newspaper reading.
- In most cases, Channel One information is not consciously integrated into the daily lesson. Little discussion typically occurs before or after the program. Whittle Communications does offer instructional materials to teachers, but these resources receive little use in the classroom.
- Students viewing Channel One do not pay too much attention to the commercials, commenting that the ads are really no different from the ones they see at home. Approximately 80% of the characters in commercials are Caucasian; African-American, Hispanic, and Asian characters are not well represented.
- Public-service ads constitute 15% of Channel One's 2-minute commercial segment, a significantly higher percentage than that on most commercial television stations in the United States.
- Many schools are using the video equipment for more than Channel One viewing. For example, some schools use the system for video school announcements; other schools

extend that idea to include support for community events.

Innovative Uses of Television in Elementary and Secondary Schools

Nancy Signorelli, in an article for the *Journal of Early Adolescence*, reflects on the critical role commercial television plays in today's society: "For the first time in human history a centralized commercial institution rather than parents, church, or school tells most of the stories most of the time" (1987, p. 255). As mentioned earlier, research suggests that many parents are not actively mediating their children's television viewing. Consequently, young people can grow up with the misbegotten notion that all life's problems are easily solvable (usually within a 30-minute time frame) by wise-cracking kids or fallible adults who may squabble with each other, but ultimately do the right thing and love each other unconditionally. For many of today's youngsters, especially those who grapple with poverty, stressful life events, and unstable parents, television can serve as a poorly woven safety net, temporarily distracting them from their daily pain with fantasy-world settings, facile stereotypes, glib advice, and quick solutions to complex problems. And what happens when the television is turned off and reality hits? Children and adolescents are often left feeling confused, frustrated, and somehow betrayed.

All is not lost, however. When the right medium—in this case, television—is wed to the right message, good things can happen in the classroom. Several researchers, for example, have observed that quality programming geared toward adolescents (e.g., the *Freestyle* series, after-school specials), when accompanied by teachers' guides and discussion, can produce positive changes in students' attitudes (Johnston & Ettema, 1982; Singer, 1979; Williams, LaRose, & Frost, 1981). For years, teachers and students have benefited from PBS' broadcasts and instructional materials for productions such as *A Tale of Two Cities*, *Henry V*, *Middlemarch*, *The Power of the Word*, and *Voices and Visions*. Unfortunately, the dearth of quality programming on a regular basis leaves students in the lurch much of the time.

One recent study that reveals the positive effects quality programming can have on teenagers is the "Degrassi Junior High" research intervention conducted by Yale professors Dorothy Singer and Jerome Singer (1994). In the late 1980s a joint United States–Canadian television series was developed for PBS entitled *Degrassi Junior High*. First aired in 1988, the program ran for four seasons, two as *Degrassi Junior High* and two as *Degrassi High*. Targeted at an 11- to 15-year-old audience, the series attempted to portray realistically the complex problems contemporary adolescents face. Topics for episodes included sexual awareness, pregnancy, shoplifting, alcoholism, drugs, illness, and death, along with the more common teen issues of popularity, friendships, grades, and parent–child relationships. According to the series' producer, Kate Taylor, the writers made a point not to offer easy solutions; instead, myriad options for problem solving were presented.

In the Singer study, 284 students in grades 5 through 8 in

two Connecticut communities were selected to participate. The students came from ethnically diverse, blue- and white-collar family backgrounds. For the study, videotapes of five episodes were shown in class to the students; topics for these particular episodes included lying, dating, jealousy, peer pressure, self-image, alcoholism, and latch-key kids. Some viewings were accompanied by class discussion, others were not. At the conclusion of the study, Singer and Singer noted that students' and teachers' overall responses to the episodes were extremely positive. Teachers reported that after viewing the shows, youngsters were significantly more open about discussing general issues, personal problems, and effective coping strategies than they had been before the study started. The participants found the class discussions very helpful and asked for additional tapes to watch. In fact, home viewing of the "Degrassi" series by students in the study was seven to eight times greater than that done by students not in the study. It is a sad side note, therefore, that the series was cancelled after the 1991 spring season, due to low ratings and funding problems. Perhaps if more teachers had information about and access to well-written programs such as this, more series could be produced for use in the classroom.

Several other researchers have also studied the effects of using videotapes to depict both realistic problems young people encounter and possible coping strategies for handling these situations. As Yale psychologists Robin Harwood and Roger Weissberg explain, "Unlike live modeling, [videomodeling] has the capacity to focus the observer's attention on relevant aspects of an interaction, replaying and analyzing important details, and depicting them again as a whole. This capacity may be particularly important for children with social skills deficits" (1987, p. 354). Some studies, for example, have focused on the use of videomodeling in and out of school to help juvenile delinquents acquire needed behavioral and social skills. In general, the investigators conclude that the combination of videomodeling, role-playing, and discussion is a very helpful technique for producing behavioral changes (Goodwin & Mahoney, 1975; Kennedy, 1984). Other researchers and educators have used videomodeling and feedback to help teenagers deal with contraceptives (Gilchrist & Schinke, 1983), alcohol (Baker Udin, & Vogler, 1975), and cigarettes (Botvin, Renick, & Baker, 1983). Finally, this strategy of videomodeling and coaching appears to work equally well with younger children who are extremely shy, fearful, and withdrawn at school (Kendall & Morison, 1984).

Another exciting, innovative way for teachers to use videotapes in the classroom focuses on the teaching of reading via taped, closed-captioned television programs. In 1983, the National Captioning Institute funded a collaborative effort among researchers at their institute, education professors at the University of Maryland, and reading specialists in Washington, DC's public schools to help hearing students improve their reading skills (Jensema, Koskinen, & Wilson, 1984). After a pilot study and subsequent program modifications, the researchers selected 10 capable, experienced teachers (all master's and doctoral students) and 35 students in grades 2 through 6 for the project's second study. Seventy-five percent of the students were remedial readers who read below the

3rd-grade level. Teachers were given videotapes of closed-captioned, high-interest programs (e.g., cartoons, situation comedies), along with scripts of the telecasts' subtitles and a packet of instructional materials (e.g., ideas for reading activities, sample lesson plans, possible topics for discussion). Teachers were asked to teach two lessons per week for a 3-week period.

Although these two studies were brief and exploratory in nature, the results were nevertheless extremely encouraging. All the teachers indicated that they would like to use captioned TV in their regular classrooms at least once a week. Additionally, every teacher rated the quality of students' learning as "good" or above. In turn, students obviously found the taped shows and scripts highly motivating. For example, 90% of the children stated that they would like to learn with closed-captioned TV in school; several students reported that reading with these tapes was their favorite time of the day. This finding is especially significant, since almost all students in the study were considered reluctant learners. Clearly, the use of closed-captioned videotapes to promote vocabulary growth and reading fluency in poor readers and nonfluent, English-language speakers remains a potentially rich area for future research.

As educators increasingly experiment with video technology in all subjects and grade levels, the future will also assuredly bring new periodicals and magazines for sharing classroom ideas and instructional strategies. One current resource highly recommended by Susan Mernit, a senior editor of *Instructor*, is *Cable in the Classroom Magazine*, a guide to listings and teaching materials that accompany public broadcast and cable television shows. [For more information on this monthly, call 1-800-216-2225 or write to *Cable in the Classroom Magazine*, 86 Elm St., Peterborough, NH 03458.] Mernit endorses this particular magazine in an article she wrote for *Instructor* entitled "Get with the Program: Teach with TV" (1991). The author kindles her readers' imaginations by sharing eight creative teachers' innovative ideas for giving students hands-on learning experiences with video technology. Across the nation children and teenagers are bustling around with television monitors, VCRs, and video-cameras to integrate reading, writing, listening, and speaking. For example, some of the ideas described in the article include the following: scripting and preforming video book reviews for the local cable station; writing weather forecasts; researching and debating current events seen on *CNN Newsroom*; making storyboards and videotapes of major curriculum projects; and producing an hour-long cable show called *Homework Helpline*, a fast-paced teen show filled with music, interviews, study tips, and craft activities. As one teacher explains, "The visual immediacy of television can really help students make connections between what they know and what they watch. It's a mighty big world out there, and television brings it right into my classroom" (p. 44).

CONCLUSION

So, what lies ahead for Americans on the brink of the Telecommunication Age? Whether consumers are ready or not,

construction on the infamous "information superhighway" has begun, and pondering its effects on daily life can be a fruitful—if somewhat frightening—endeavor. The recent confluence on technologies (e.g., the digitalizing and compressed storage of audio and video communication, combined cable / fiber-optic wiring, computer-controlled selecting and patching mechanisms for meshing relayed information) virtually assures video's expanded influence in homes of the 21st century.

Telephone, computer, and cable systems—once separate entities—now are merging to form unified "mega-information" networks. For example, Tele-Communications, Inc., is now marketing a cable decoder capable of providing access to 540 channels (Elmer-Dewitt, 1993). To date, the content of most of these channels remains undetermined. However, given corporations' penchant for profit, odds are long that educational programming for children and teens will be a scheduling priority. Fortunately for kids, Michael Eisner, chairman of Walt Disney Company, recently teamed up with Ameritech, BellSouth, and Southwestern Bell to distribute movies, interactive games, and other programs via two-way video systems (Greenwald, 1994). Not to be outdone, Bell Atlantic recently spent \$11 billion for cable systems and equipment to bring two-way television to eight million homes by the year 2000 (Greenwald, 1994).

Nicknamed "smart TVs," these new two-way television sets combining audio, video, and computer information will offer virtually limitless services to American homes and businesses. People will be able to bank, pay bills, make travel reservations, play interactive games, shop in video malls, work at home, select movies (and change the endings, if desired), access libraries, order business materials, receive health care, communicate with government officials, and possibly even vote (Hight, 1994). Young people will be able to study any subject at any level of difficulty, given the right teacher and the right technology.

So far, so good. But is there a downside to this surfeit of channels, information, and services? Will America become a wired nation of people "cocooning" in homes—paradoxically linked electronically yet isolated physically, unified technologically yet fragmented communally? Will television in the future really make people smart, or will it become, in Marie Winn's words, the "plug-in drug," used much like alcohol and drugs to fend off depression, loneliness, anxiety, and conflict? Since no one knows what the future holds, Neil Postman (1992) suggests that the final word should go to Stephen Vincent Benet. In *John Brown's Body* the author, musing upon the effects of new technologies in the 20th century, ends his poem thus:

If you at last must have a word to say,
Say neither, in their way,
"It is a deadly magic and accursed,"
Nor "It is blest," but only "It is here."

(1927, p. 377)

NEWSPAPERS AND ON-LINE TEXT: ESSENTIALS OF THE LITERACY ENVIRONMENT

Karen D. Wood

UNIVERSITY OF NORTH CAROLINA AT CHARLOTTE

Jim Nicholson

PHILADELPHIA DAILY NEWS

According to Sullivan (1993), it was the French historian de Tocqueville who, upon visiting the United States, observed that newspapers are not just a means to preserve freedom, they are a means to preserve civilization. Apparently, more than a century ago, the press was recognized as an educative institution, and as this chapter reveals, the emphasis on the role newspapers can play in educating society has steadily increased.

Newspapers constitute the material most read by adults. Data from the Newspapers Publishers Association reveal that more than 113 million adults read the newspaper on a daily basis. The average reader spends 62 minutes reading the Sunday newspaper and 45 minutes reading one or more daily newspapers (Cheyney, 1992). Since newspaper reading is viewed as largely an adult activity, it is an extremely motivating instructional medium for students of all age levels. The purpose of this chapter is to review existing research on the benefits of using newspapers in the classroom, to trace the history of the Newspapers in Education Program and, to look at present and future uses of the newspaper as advances in technology continue to make dramatic changes in our lifestyles.

HISTORY OF THE NEWSPAPER IN EDUCATION PROGRAM

It was in the 1930s that the *New York Times* began the first newspaper in education program (Wilson, 1994), but it was not until 1952 that a communications milestone became

marketable and radically altered the environment. This new environment provided a fertile seedbed for a formal, nationwide program.

Television, an experimental medium from the late 1930s through the 1940s, suddenly showered the American landscape with hundreds of thousands of incandescent specks that landed in the living rooms. The infant medium quickly demonstrated its awesome power to tether and transfix entire families, irrespective of generational lines.

In 1952 the circulation manager at the *Des Moines Register* became concerned about the impact television was having on reducing newspaper reading nationwide. C. Ken Jefferson, with the help of the International Circulation Managers Association, initiated a program designed to encourage future readership by providing schools with newspapers to distribute to their students. Thus, the Newspaper in Education (NIE) program was born. It officially assumed the name "NIE" in 1976. Since 1958 it has functioned under the auspices of the American Newspaper Publishers Association Foundation (ANPA) (Wanta and Brierton, 1992).

By the early 1990s, NIE had encompassed more than 62,000 teachers and two million students in almost 26,000 schools (Wanta and Brierton, 1992). Editors and publishers agreed that, as circulation of newspapers continued to plummet through the 1960s, part of their agenda included capturing a future market while there was still time. The newspaper industry became "alarmed by long-term declines in readership" and realized that they had to do more to "woo the audience critical to their future, children and teenagers" (Walsh, 1991). *USA Today*, for example, began offering a

20-page catalogue of educational products designed to help teachers use the splashy national newspaper in the classroom. Among its products was a guide titled "How to Teach Math with USA Today" (Walsh, 1991).

Currently, NIE programs offer a wealth and a variety of resources for teachers, students, and the community in general. The results of surveys by the ANPA Foundation and the International Newspaper Promotion Association, as reported by DeRoche (1991), along with the most recent findings of Media General Research (1993), revealed the following:

1. Eighty-nine percent of respondents reported offering an NIE program through the year in 1992 versus 81 percent in 1989.
2. The number of teachers and students served by NIE programs has increased significantly since 1989.
3. Elementary schools are the most frequent participants in NIE programs.
4. More newspapers are evaluating the effectiveness of their NIE programs usually via surveys and feedback.
5. More than half of the respondents publish features geared specifically to youth.
6. The major purposes of NIE programs were to increase readership, serve the community and promote awareness of freedom of the press.
7. Most of the NIE programs offered curriculum materials such as filmstrips, video and other instructional aids in addition to newspaper tours and outside speakers and promotional presentations.
8. The majority of the newspapers' publishers offer the paper at a reduced rate to schools.
9. More than one-third of the newspapers reported offering an adult literacy program.
10. Majority of the programs conducted workshops for teachers and / or parents with many offering college or in-service credit.

In major studies conducted by the Newspaper Advertising Bureau (NAB 1977; 1980), it was concluded that the Newspaper in Education program can provide many of the prerequisites for later adult newspaper reading (Wanta & Brierton, 1992).

However, a 1992 study (Stone & Grusin) submitted to the American Newspaper Publishers Association Foundation, found that NIE exposure by itself is a lesser influence on later newspaper use than is the quality of the NIE experience. How many times per week or minutes per day is not as significant as the extent to which the students found the experience enjoyable. It was also found that receiving the newspaper in the classroom can compensate in some respects for not having one in the home.

The search for a quick, easy fix to declining newspaper readership is what Jack D. Lail, (1995) metro editor of the *Knoxville News-Sentinel*, terms "protecting the franchise, instead of developing the franchise" by supporting mediums beyond newprint and thus enhancing the newspaper's name and credibility as an information source.

But the failure to confirm any latent benefits of NIE pro-

grams in no way deterred the enthusiasm of NIE advocates or impeded the program's growth, which would indicate a widespread and popular response to the more immediate benefits (DeRoche, 1991; DeRoche & Skover, 1983).

The NIE programs, which can vary from locale to locale, have received high marks from educators, journalists, students and parents alike (NAB, 1980). NIE-type programs have since spread to countries which include England, New Zealand, and South Africa.

Gwen Kirk, who manages the national program for the Newspaper Foundation of America, commented that, "Our goal is to enhance a cooperative relationship between the press and the schools to provide educational opportunities for students" (Wilson 1994).

The *Commercial Appeal* in Memphis, Tennessee, which has one of the oldest NIE programs in the country, has distributed newspapers to classrooms for the past 27 years and has encouraged teachers to use the newspapers as a "teaching tool by providing creative curriculum, teacher workshops and credit courses at Mid-South Universities" (Flanagan, 1995).

Tennessee was tied with four other states (Mississippi, New York, Louisiana and Texas) and the District of Columbia, for the highest illiteracy rate (16% of the population) in the United States (U.S. Office of Education Research and Improvement, 1993). This newspaper provides a snapshot of how an aggressive NIE program can reach out to the inhabitants of its circulation area.

In the 1994-95 school year, 550 schools in the Mid-South participated in the *Commercial Appeal's* NIE program. More than 20,000 newspapers were provided each week to the schools at a discount, involving more than 16,500 students in NIE program topics such as reading, math, economics, and geography (Flanagan, 1995).

More than a decade ago (1983), DeRoche and Skover observed that "research and evaluation experts should study the impact of this instructional tool on reading achievement, habits and attitudes over the long term. Teachers, administrators, reading specialists, parents, and others should examine existing research, talk to teachers and students who have used newspapers in their classroom and decide for themselves whether this medium will help students learn to read and, equally important, read to learn" (p. 19).

Unfortunately, research since 1983 has remained sparse. But now the technological revolution threatens to overtake events and make any academic research on the current use of newspapers as a learning tool, well, academic.

The computer age has pushed this classroom learning tool, the newspaper, to the precipice of change and uncertainty. The "newspaper" of the 21st century, say some media futurists, may not even vaguely resemble what the teacher is passing out to the class today.

The following sections will examine the research on the benefits of using the newspaper in more detail, including its value for elementary, middle/secondary, and special needs students. The last section of this chapter speculates about the role of the newspaper in education in the 21st century.

THE VALUE OF NEWSPAPERS IN THE CLASSROOM: WHAT RESEARCH REVEALS

According to DeRoche (1991), newspaper in education research has been termed interesting to read about, in need of more comprehensive study with greater control of variables, and sparse and irrelevant. While ideas abound for using the newspaper in the classroom, it is evident that the research supporting its use is indeed sparse, though not necessarily irrelevant. One of the reasons offered for the paucity of current research is that in the late 1970s, leaders from the American Newspaper Publishers Association Foundation and school administrators called for evidence that newspapers in classrooms will pay off in terms of increased reading achievement, reading habits and attitudes toward reading. As newspapers in education programs throughout the nation have steadily grown, along with teacher testimony supporting their value, the research interest dissipated in the 1980s (DeRoche, 1991). This section will report on some of the studies and major findings.

Research has shown that the more students are exposed to the newspaper, the more their attitudes about its value to them as involved, concerned citizens increases. Whitaker (1969) used newspapers to teach a unit on laws affecting our youth with sixth graders and found that such a unit can improve students' attitude toward the law. Verner and Murphy (1977) found that using the newspaper as an instructional resource increased students' attitudes toward their city, community, school, and nation.

In a study conducted by West (1979), students exposed to newspapers for instruction versus those students exposed to textbooks only reported more belief in the newspaper as an exciting, responsible, and valuable means of learning about events around them. The researcher reported that using newspapers in the classroom may establish a daily newspaper reading habit and that students learned the benefits of all media.

Research has also shown that students who use newspapers in their classes tend to be more socially and politically aware of current events, have more positive attitudes toward newspapers, read newspapers outside of school, and interact with parents and other adults about the content of newspapers (Dubuque Telegraph Herald, 1984; Newspaper Advertising Bureau, 1980; Rhoades, 1982; Stone, 1988).

A survey conducted by the Oklahoma Newspaper Advertising Bureau shows that those who read the newspaper regularly tend to be more active voters. The survey revealed that voters read more national, state, and local news and were more inclined to read the editorial page than nonvoters. This research suggests that getting students to stay more informed on social issues via the newspaper will incline them to want to have a voice in political issues.

NIE coordinators from the *Dubuque Telegraph Herald* (1984) surveyed fourth and fifth graders to determine their awareness, usage, and attitudes toward the local newspaper. They compared one school in which the newspaper was used weekly throughout the year to another school (the control group) which did not use the newspaper. Their findings

showed that the experimental group read more local and national news and demonstrated a greater interest in local government, neighborhood events, current issues, and foreign affairs. Both the experimental and control groups reported difficulty on the pretest administered prior to the study but twice as many control group students reported having problems on the posttest.

Windhauser and Stone (1981) examined the reading habits of 738 college students to determine if exposure to newspapers in elementary or high school resulted in increased newspaper use in college. Their findings showed that students exposed to newspaper programs in school reported more daily reading and that parental interaction with children about the newspaper had a positive effect on readership.

A similar study of college students by Rhoades (1982) used newspaper in education students (NIE) and nonnewspaper in education students (non-NIE). The study found that the NIE group spent more time reading the newspaper and acquiring news from all major news media, expressed a greater interest in the news and were more informed about current events.

An examination of the later reading habits of students exposed to the Newspaper in Education program was undertaken by Wanta and Brierton (1992). A total of 235 respondents was included in the survey. The results showed that students involved in the NIE program were more likely to cultivate the newspaper reading habit than others. Statistically significant results were found for most, but not all, of the variables examined in the study. For example, the researchers concluded that activities with high student involvement and teacher-student interaction were more highly correlated to later reading frequency. Specifically, those activities associated with newspaper use involved taking current events quizzes, clipping and saving articles, discussing articles in class, and analyzing newspaper contents. Those activities not associated with higher newspaper reading use involved merely delivering newspapers to a classroom and allowing class time to read them.

Research synthesized from a number of studies offers the following conclusions regarding the value of using newspapers in the classroom (DeRoche, 1991; DeRoche and Skover, 1983; Newspaper Advertisers Bureau, 1977; 1980; Ringler & Rhodes, 1990; Stone & Grusin, 1992; Wanta & Brierton, 1992):

1. Daily newspapers are a valuable and useful instructional tool.
2. Daily newspapers are a useful aid in helping young and adult learners master the skills of reading and writing.
3. Using newspapers on a regular basis in classrooms improves the reading interests and the newspaper reading habits of learners.
4. Instruction in using the newspaper helps students have less trouble reading the newspaper.
5. Newspaper use seems to influence classroom verbal interactions, student motivation, school attendance, and student behavior.
6. The use of the newspaper has been demonstrated to increase students' interest and knowledge of world affairs and current events.

7. Newspaper use helps students to become more involved in political issues in the community and the world at large.
8. Exposure to a newspaper in education program is associated with higher levels of newspaper use by young adults.
9. The long-term effects of the exposure are strongest for minorities.
10. Parents, teachers and students, alike, tend to respond positively to the use of the newspaper.

The next three sections will examine the research more thoroughly by citing studies done on newspaper use in the elementary grades, middle and secondary grades and with special needs students.

NEWSPAPER USE IN THE ELEMENTARY GRADES

Measuring the impact of newspaper use in education is difficult because of the inability to control the many variables involved. Many studies reported were action research conducted by teachers in their own classrooms. These and other studies varied in terms of duration of the treatment period, type of instruction, variables examined, and use of a control group, to name a few. As mentioned previously, the bulk of such research that is available took place nearly two decades ago.

Update NIE (1977) conducted a study on 442 low-income first graders who participated in an experimental reading and writing project employing newspapers and other reading materials. The results showed that the project group outperformed the control group on the posttest.

The *Commercial Appeal* (1980) reported a school-wide study which revealed gains in reading comprehension and vocabulary on a standardized reading test for classes using the newspaper.

One of the most comprehensive studies on the use of the newspaper to teach reading was conducted over a 3-year period in Stockholm, Sweden (Edfelt, 1990). Called Project NewRead, the study involved nine experimental classrooms in grades one through nine, and 7,515 students in the same grades comprised the control group. The newspaper was used as the sole reading text by the experimental group for two years.

The researcher reported "stunning" results with the experimental groups surpassing the control group one-half to a full year in reading development. Specific findings included an increased respect for the opinions of others, highly developed metalinguistic ability, increased capacity for listening, and an increased motivation to read and learn independently.

The Newspaper Advertising Bureau (1982) examined the effects of newspaper use in the school on newspaper readership when the students become adults. Based upon interviews of over 3,000 adults, the results showed that the influence of school use of newspapers was greatest among minorities who did not have a newspaper at home. Apparently, childhood exposure to newspapers fosters adult newspaper reading.

Stone and Grusin (1992) conducted focus groups with

individuals who had attended one of 50 schools with extensive NIE programs. Their 2-year study involved interviews with 644 young adults. Similar to the previous study (NAB, 1982), they reported that the impact of the newspaper in education program on cultivating black young adult readers was "formidable." They also concluded that merely having the newspaper available in the classroom is not sufficient. The experience must be enjoyable, positive, interactive, and involve effective instructional methods.

Recognizing the paucity and limitations of existing research, Ringler and Rhodes (1990) investigated the relationship between classroom newspaper reading and students' reading habits, comprehension, and ability to write a newspaper article. A total of twenty classes in grades 4-6 participated in the study with 239 students assigned to the experimental group and 188 students in the control group. A curriculum based upon the whole language philosophy integrated with the newspaper was employed for the school year. In addition to the positive reactions of both teachers and students, participants outperformed nonparticipants in terms of writing ability and reading performance. Not only did students show higher scores in newspaper writing but their scores in general writing improved as well. The researchers concluded that "reading newspapers should become a regular part of the classroom instructional program" (p. 38).

NEWSPAPER USE IN THE MIDDLE AND SECONDARY LEVEL

Studies with upper-level students have examined the effects of newspaper instruction on students' reading achievement, comprehension, vocabulary, writing performance, verbal interaction, political participation, knowledge of government, and on newspaper reading skills in general.

In order to more accurately assess the effectiveness of the newspaper in education program, the American Newspaper Publishers Association (ANPA) commissioned the Educational Testing Service to develop the Newspaper Reading Test. The first research study which used that test was conducted by Diederich in 1971. The participants included 13,000 students in grades seven through twelve who were divided into groups: one in which the newspaper in education program was used and one in which newspapers were not used. The data revealed that 13% more students in the newspaper group scored above the national norm on the test than in the control group. Diederich reported that gains this large are rarely observed in typical reading improvement programs.

Wardell's (1973) study of 300 ninth graders showed improvements in various reading-related skills such as differentiating main ideas from details, distinguishing fact from opinion, locating information and ability to read the newspaper using specially prepared newspaper exercises.

Adams and Cook's (1977) study used seventh graders enrolled in a 26-lesson program designed to increase their reading skills. Each student was given a newspaper each day, along with a study guide to assist their reading. The researchers reported that the reading ability of the students did improve over the 12-week period.

A study by Norman (1978) and one sponsored by the *Milwaukee Journal / Milwaukee Sentinel* (1980) both found increased verbal interaction by students involved in using the newspaper instructionally. The latter study reported that eighth graders who used newspapers were superior to the nonnewspaper group in verbal skills, newspaper knowledge, and current events.

The Flanders Interaction Analysis Scale was used in the Norman study which revealed significant changes in the amount and quality of student talk in the experimental classes (newspaper use) versus the control group classes.

The NIE Information Service (1987) examined the effects of newspaper use on the writing performance of students in grades eight through twelve over a 6-month period. The results showed that all of the experimental groups that used the newspaper with related instruction made gains in writing skills, whereas the group not using the newspaper showed no improvement.

A 1989 investigation by Palmer examined the effects of using the newspapers in combination with normal class instruction. The study involved 627 at-risk students in middle and secondary schools. An analysis of the pre- and posttest scores revealed increased improvement in reading vocabulary and comprehension, and in writing performance.

Although empirical research is scant, practical publications abound illustrating the many ways in which the newspaper can be applied to the study of any discipline. One of the most popular of these publications is Cheyney's (1992) third edition of *Teaching Reading Skills through the Newspaper*. In addition to suggestions for how to read the newspaper with skill and comprehension, each of the chapters focuses on integrating the newspaper with the teaching of social studies, science, language arts, and mathematics.

THE USE OF THE NEWSPAPER WITH SPECIAL NEEDS STUDENTS

The limited number of studies on the effectiveness of newspaper use with special needs students involved mostly upper-level students. In one 9-week study (Stetson, 1970) including 107 special needs students, a standardized test was used to measure pre- and posttest gains. Results revealed that students in a teacher-directed newspaper use group experienced greater gains in reading skills than those students who used the newspaper on their own. The central group showed no gains in reading scores. Similarly Vernor and Siedow (1978) wanted to determine if the newspaper can be used as the sole instructional material for improving the reading achievement of high school-level special education students. One group used the newspaper as a resource while another received instruction in the parts and organization of a newspaper. Both groups showed gains in reading achievement in addition to more positive attitudes toward politics and newspapers in general.

Curtis and Shaver (1980) used as sample of 22 special needs students drawn from eight secondary schools to determine what effect exploration of contemporary social problems would have on students' attitudes toward funda-

mental freedoms, critical thinking abilities, self-esteem, reading comprehension, and school attendance. The program spanned a 5-month period and incorporated a wide variety of print materials such as newspapers, magazines, government reports, and books. The researchers used an inquiry-problem identification model of instruction requiring students to collect and analyze information, take a position on certain issues and develop a plan of action. Based on their findings, the researchers concluded that appropriate and interesting social studies content for special needs students can increase interest in contemporary problems. No significant differences were found for the other variables under study.

Clearly, empirical data on newspaper use with special needs students are sparse and limited largely to the 1970s and 1980s. However, numerous practitioner-oriented publications have addressed its many benefits for special populations. Vail, Monda and Koorland (1989) advocate the use of the newspaper with Behaviorally Disordered (BD) students who they say are often unmotivated by traditional classroom materials. Since the newspaper is living history, it can be used to help students deal with problems in their own lives. For example, students can develop graphs of various job opportunities in the classfield ads, make checklists of job requirements and design charts comparing projected earnings with monthly expenditures.

In a previous article, Monda, Vail and Koorland (1988) recommend using the newspaper with Learning Disabled (LD) students who often experience failure with traditional content area methods and materials. Such students may be characterized as passive participants who need direct involvement in motivating activities. They suggest that the newspaper be used as a supplement for LD students, focusing on specific skills in reading / language arts, and mathematics.

Since the newspaper is largely an adult medium, LD and BD students do not feel embarrassed by its use as when they are assigned lower-level materials different from their peers. Everyone in a heterogeneous classroom may be working on the newspaper, while the activities assigned to the special needs students can be adapted to meet varying ability levels.

The newspaper is a recognized instructional tool for teaching English as a second language (ESL) learners. The recently published book, *Using the Newspaper to Teach ESL Learners* (Olivares, 1993) builds on a foundation of sound pedagogical theory and includes numerous suggestions for practitioners. Olivares advocates including ESL learners in cooperative groups while using the newspaper to foster interpersonal communication skills. With the help of peers, students identify, label and categorize information in a meaningful language and print context.

NEWSPAPER IN THE 21ST CENTURY

It does not take a futurist or visionary to see that the electronic superhighway will be a dominant force in the lives of Americans in the next century. The blueprints are already off the drawing board and the surveyor stakes have been driven

for the route that this information mega-transitway will take into the year 2000; right through the center of the average citizen's life.

And as a significant portion of the older generation tentatively steps out into the computer net traffic, the younger generation is already crowding the lanes that have been paved by present technology and are running wide open.

This younger generation are also school children whose reading and other learning skills have been enhanced considerably by using the newspaper as a classroom teaching tool. So how does the Newspaper in Education program, whose success has steadily escalated in the past four decades, not only keep up, but keep from getting run over especially if newspapers are in the twilight of their history as some critics contend? "Newspapers, more and more, are coming on-line with computers. The idea of using newspapers as a teaching tool in schools won't change that rapidly. They'll still be using printed material. A lot of teachers are print oriented" (DeRoche, 1995).

Jack Lail, metro editor of the *Knoxville News-Sentinel* noted that "In the 21st Century, newspapers will still be using NIE programs. A strong NIE program is a big plus." But he is clear in his view that newspapers, like any other life form, must adapt or perish.

"Newspapers have to get into the game. They have to do more than put day-old copy on the street. They have to get connected. We have to look at educational resources. Newspapers generally react for the wrong reasons," said Lail (1995). "They are trying to protect their franchise instead of developing it." Lail went on to explain that "protecting" the franchise is simply the short-sighted view of trying to corner readers and corral new ones by beating them over the head with a rolled up newspaper. He said the long-term goal should be to employ advanced technology with the newspaper which will enhance the overall credibility of the newspaper and support programs which will associate newspapers in the public mind with being a knowledge center.

Some newspapers such as *Raleigh, North Carolina* are giving an 800 telephone number out and have a bulletin board with special areas for kids where resources are attainable. He cited the CIA Worldbook, which features in-depth area studies of countries. Lail's own paper has an aggressive NIE program.

Even the publisher of *Tomorrow's Morning*, a nationally distributed children's newspaper, has a strong sense that the massive daily information flow's future cannot be bound inside six or eight columns of newsprint. Publisher Adam Linter said that he wants to make his business more of a literary company, not just a newspaper. He said a lot of companies do not understand that the "digital highway" is here and that kids are more comfortable with the computer. In fact, they would rather send a message over a computer than a telephone (Boneberg, 1994).

A year ago his company started working on a book, a television show, and a CD-Rom game. They also have news spots on local radio and had planned to join the America On-Line computer network with forums and uploading / downloading capabilities. The potential for on-line networking with schools is overwhelming.

There are more than 1.2 million users of the Prodigy network and its feature, Homework Helper. Reviewers are calling this database an "impressive industrial-strength research tool that parents will want as much as their kids" (Healy, USA Today, 1995). There is no need to look for news articles in the library archives. The built-in intelligence allows students to pose a question in plain English. The features allow students to narrow or extend their searches, retrieve information appropriate to their reading levels, copy maps, charts, photos and click on a definition for unknown words (Healy, 1995). Similarly, Knight Ridder, Inc. has developed "media-line," an on-line computer service that provides teachers with lesson plans, current events texts, and graphics to aid their instruction. Students, too, can log-on to the system to access information for research papers.

Jan Vincens Steen (1992), NIE project supervisor in Norway, conducted a survey to determine: (a) Will NIE have any value in the 21st century and, (b) What effect will the use of NIE have in the next century?

He asked these two questions of three groups: the Newspapers circulation leaders at a circulation conference in Bergen, Norway on May 9, 1992; NIE specialists from all over Norway at the National NIE Conference in Nesbyen held May 11 to 13, 1992; and an international conference of NIE specialists which convened in San Francisco on May 19, 1992. He found that everyone believed NIE would have a value in the next century "with only one noting that this is actually dependent on the credibility maintained by newspapers in the future." It was mentioned that newspapers have the "advantage that you can bring them with you again and again" and that children learn better through the use of printed words than through the use of computers and television.

Regarding the effect NIE will have in the 21st century, the respondents made comments such as the following:

- Because of rapid changes in the world (new governments, independent states) newspapers will be the textbook that tells pupils about these changes.
- It will be good for democracy (this is if all newspapers are not controlled by too few words).
- We need to develop critical readers of the media.
- The "return to reading" will produce individuals who have far greater depth concerning knowledge and its appreciation.

Steen further offered that in the 21st century, instead of newspapers in print, there could well be computer versions where the readers only print out what they want to read, and only pay for these pages. Family members, and schools alike, might choose pages appropriate to their objectives.

One prototype of this 21st century newspaper is here and is being developed by Roger Fidler, director, Knight Ridder Inc., Information Design Laboratory in Boulder, Colorado.

This "newspaper" is a portable, battery-operated flat-panel screen some nine inches wide, a foot high and an half-inch thick similar to the size of a typical magazine. The device would weigh a little over a pound, far less than the Sunday edition of the local newspaper. Fidler calls it a "personal

information appliance" or it could be termed a newspanel. It could contain a trove of news, graphics, audio and even video, representing more than a year of Sunday papers. Through fiber-optic lines and radio links, it might connect to databases of news and entertainment from around the world (Gilder, 1993).

On the face of this tablet is something that looks a lot like the page of a newspaper. It contains headlines for featured stories followed by their first few paragraphs and a jump to an inner page. The jump, unlike the usual newspaper, is electronic and immediate with the click of an arrow or a mouse. Discreetly placed ads are at the bottom of the page (Gilder, 1993). The electronic tablet, as conceived by Fidler, has no keyboard, but instead enables the user to touch an icon with a pen or a finger to page through it. Eventually, a voice command will be used in this capacity.

Fidler has said that the first generation tablets could begin appearing by 1996 for \$1500 to \$2500 and drop in price to \$500 by the year 2000 (Aumente, 1994).

Fidler has been active since 1981 in developments which would be the transformation of print media from pigmented ink on paper to digital ink displayed on portable information appliances (Fidler, in press).

According to Gilder (1993), computers will soon "blow away the broadcast television industry, but they pose no such threat to newspapers. Indeed, the computer is a perfect complement to the newspaper. It enables the existing news industry to deliver its product in real time. It hugely increases the quantity of information that can be made available, including archives, maps, charts and other supporting material. ...It

empowers the reader to use the 'paper' in the same way they do today." (p. 142)

Computer newspapers, traditional newspapers, on-line services, are the medium, but it may be the message—and credibility of that message—which determines the 21st century role of Newspapers in Education.

Fidler (1995) commented, "I think newspapers are in a strong position to go into the 21st Century. The future is not so much will they publish, but who will publish. There will be a shaking out in the industry of newspapers too disconnected from their communities. Credibility will be an important factor."

SUMMARY

Even though the Newspapers in Education program has not been encompassed by academic scrutiny and evolution and, despite the less than certain latent benefits the newspaper industry may garner in terms of lifelong readership, NIE has stood the populist test of time. It is a program which has shown immediate and obvious benefits to hundreds of thousands of children and provided teachers with an instructional device which can transcend the tedium of blackboards and books. The overwhelming consensus is that "News" In Education, even if the medium is not columns of newsprint, will be with us through the next century. The reportage of current events shaping and re-shaping the world appears to be just as important to the youngsters who also inhabit that world; and they have responded well to the stimuli.

READING COMICS, THE INVISIBLE ART

Shirley Brice Heath and Vikram Bhagat

STANFORD UNIVERSITY

Ask any youngster about reading comic books or newspaper comic strips, and you are sure to meet with mixed reactions, ranging from vigorous justification to outright denial. Kids seem to know instinctively that comic books are “forbidden fruit” or “light reading”—a highly marginalized art form that suggests frivolous interests and low abilities (Dorrell & Carroll, 1981; Krashen, 1989). Everywhere, print-only books hold the highest position for literacy achievement; art forms that mix words with stylized pictures in bold colors receive attention primarily as commercial trivia.

Yet around the world, concerned educators use comics to invite new readers into literacy habits, to teach English, to explore science and literature, and to carry out political education. Some countries, such as Mexico, have a well-established tradition of comic books, and city street vendors count them among their best-selling wares. Indian families whose children can read English give them comics in English that feature Hindu mythology and tales of historical figures, political and social. Since the 1940s, comic strip artists in Australia have used their medium to characterize foreigners and to represent language varieties as well as to poke fun occasionally at habits seen as peculiarly Australian (Foster, 1991). Within the United States, cartoonists receive hundreds of letters weekly from young readers, asking questions, protesting changes in characters, and offering ideas. Many adults develop a love of comics as children and later collect old comics, check garage sales for caches of particular favorites, and readily offer their opinions about new comic figures that come not only in comic books but also in an array of commercial products. Children's clothing, as well as toys, board games, and television programs, expand print versions of cartoon characters' lives within the United States.

What then are comics, and what do they share with art and literature? What challenges to cognitive processing do they offer, and how do these differ from those of literature that

are filled only with words? What do we know about comics and their use in different settings and for various purposes in different parts of the world? Answers to these questions suggest that by exploring comics, we can understand more deeply the combination of the visual and the communicative that underlies this entire volume, for within comics, the verbal and pictorial communicate in tight combination through word and picture. This combination seems to be one that comes naturally in early stages of children's art. Numerous studies of children's early interpretations of picture books, as well as illustrated texts with words, and their own drawings, indicate the extent to which picture and word work together as children develop their initial concepts of literacy (Winner, 1982, especially chap. 5; Wolf & Heath, 1992).

Yet academics who study reading habits and literacy development have given relatively little attention to children's interest in combinations of pictures and words in the stylized forms of comics. However, scholars interested in popular culture and cognitive processing of visual images with written words have devoted considerable attention to the ebb and flow of the popularity of comics since World War II. Regarded as popular literature in a “hybrid form of narrative art,” comic books and comic strips interact extensively with other forms of literature. For example, Dick Tracy was inspired by Sherlock Holmes (Inge, 1989, p. 196). Superheroes in American comics have much in common with folk tales of frontiersmen such as Davy Crockett and Paul Bunyan (Inge, 1989). Many of the trappings around comics resemble those of literature: secondary texts document the history of cartoon creators' lives as well as offer deconstructions of their pictorial and verbal representations (Schmitt, 1992); deluxe editions of favorites are available, and collectors prize early originals in good condition (see, for example, Cahn, 1986 and other texts listed in Inge, 1988, 1989).

Vikram Bhagat is a junior at Stanford University with an undeclared major. In 1990, he was named a “Promising Young Writer” by the National Council of Teachers of English. He hopes to study economics and enjoys reading comics of all sorts, especially “Garfield” by Jim Davis.

In the 1990s major figures in the art world of comics, such as Will Eisner and Scott McCloud, began to encourage serious consideration of cognitive issues as well as recognition of the long history of "juxtaposed pictorial and other images in deliberate sequence, intended to convey information and / or produce an aesthetic response in the viewer" (McCloud, 1993, p. 9). Messages conveyed in ancient hieroglyphics in several parts of the world depended on stylized pictorial representations. Illuminated manuscripts incorporated the pictorial with written text. Comics produced as early as the 1400s separated stylized pictures from words, the former conveying resemblance and the other meaning. This division became increasingly strict for the next 500 years, until artists' disillusionment following World War I led them to Dadaism and caricatures emphasizing unpredictability and the symbolic in both pictorial and verbal representations. Ambiguity and confusion, often masked as naivete, marked pre-World War II comic book characters, such as Krazy Kat, and Mutt and Jeff in the United States. These characters became known to Americans first in comic strips and only later were these strips collated and reprinted into hardcover bound "comic books." The first glossy full-color softback ancestor of the comic book so familiar today was issued in 1933 as *Funnies on Parade*, and in 1934 *Famous Funnies* became the first monthly comic magazine and continued publication for over 20 years (Berger, 1973; Inge, 1988, 1989; Kunzle, 1973).

By World War II, popular culture unabashedly combined words and pictures as authors flaunted a disregard for the status quo and advocacy of alternative "superhero" approaches.

Comic art took off, drawing from and interpreting current societal issues as well as celebrating particular types of characters and action. During and following World War II, Action Comics brought several superheroes into circulation—heroes who would still be known at the end of the century. *Superman* (1938) was followed by *Batman* (1939) and *Wonder Woman* (1941), characters who used their superhuman powers to bring about good and order in the world around them. Numerous imitators and kinsmen developed over the next two decades with Captain America and the short-lived competition of Captain Marvel from Fawcett Comics.

During the 1950s and 1960s, satire surfaced in characters such as Beetle Bailey and Pogo. Teen romance in characters such as Archie and his friends spoke directly to adolescent interests, as did the continuation of old favorites such as Donald Duck and Mickey Mouse for the very youngest readers and those who had come to know these characters in movie cartoons of Looney Tunes. Marvel Comics created an overnight sensation in the United States with Spider Man, a hero, but one with numerous human characteristics and foibles. Additional genres that emerged during these decades were crime comics, inspired by gangster movies, and bearing some resemblance to the horror tales of Edgar Allen Poe. Titles such as *Tales from the Crypt* vied with *Crime Suspense Stories* (Inge, 1988, 1989).

Comics of political satire as well as promotion of new themes, such as feminism, children's dominance over their parents, and the bizarre and yet human characteristics of animals, came to be increasingly popular in the late 1970s.

New titles, such as *Amazing Spider Man*, were now possible, because a code of censorship established in 1954 banning any treatment of crime, violence, drugs, or sexual innuendo in comics was considerably softened in 1971. The absolute divide between good and bad, right and wrong, that had clearly defined superheroes as supergood came down, and comic heroes were portrayed as facing ambiguities and succumbing to temptation from societal forces.

COMICS AS EDUCATIONAL INFLUENCE AND SOCIAL COMMENTARY

Librarians and other educators interested centrally in motivating the habit of reading, as well as linguists eager to promote development of vocabulary not easily acquired through vocabulary workbooks, agree that comics develop both literacy and language competency. Repeatedly, studies have shown that "nonreaders" are attracted to comic books and that many adults with firm habits of reading attribute their continuing enthusiasm for reading to their early devotion to forms of light reading that often included comic books. During the 1970s, literacy advocates from libraries and language classrooms flooded journals such as *The Reading Teacher*, *School Library Journal*, and the *Journal of Reading* with articles offering both research and programmatic statements about the merits of comic books. In the 1980s, several scholars in second language acquisition and literacy research reminded educators of the proved potential of comics for advancing educational goals (Dorrell, 1987; Krashen, 1989).

But comics in the 1990s seem to do more than these educators advocated and to address in numerous ways some fundamentals of reader response theory and literary interpretation. Marvel Comics leads the way in both its comic books and collected comics in making clear the links between literature and life, as well as the ties between themes addressed in the late 1990s and those taken up as far back as the Classics. Moreover, the view that their editors express is that their literature can appeal to all ages. A recent survey of comic book stores in a West coast university town revealed that anywhere from 25% to 50% of comic book buyers are under the age of 18, but all clients purchased comic books for their own reading and not primarily for collecting. Most stores cited *X-men* as being by far the most popular among younger customers, although the list of high-sales image comics for those in the age range 18–28 included such titles as *Cyberforce*, *Sandman*, *Spawn*, *Wildcats*, *X-force* and *X-man*. Japanese animation comics were in high demand as well, particularly ones such as *Sanctuary*. Youth and adults explained that for them, comics convey "real-life" adventures and issues. Many other readers across the nation must agree, for Marvel sells 3 million comic books a year to those between the ages of 6 and 11, another 3 million to those aged 11 to 17, and about a million to readers over 17, with over 90% of these male readers. In 1991, retail sales reached \$400 million in the 5,000 specialty comics shops in the United States. Data on national sales and buying trends came from *American Demographics* (1991, May, p. 16).

X-men, a publication of comic-book giant Marvel Comics under the editorship of Bob Harras, enjoys extremely high readership in the 15–18 range. A Saturday morning cartoon show features the same characters, as do numerous video games. Animated adventure games of the same name have been developed for both the Sega and Nintendo home entertainment systems as well as entertainment systems found in many video arcades. Introductions to the comic books link readers with complex political issues and speak of their texts as “modern fables” that address such matters as the “evils of unreasonable prejudice and insensitive government policy.” Such comments directly address the combined helplessness and urge for political resistance in their comic characters, linking their feelings with those of people who feel a sense of powerlessness to overcome what some have called “mindless bureaucratic constraints on their lives.”

An analysis of the September 1995 issue of *The Uncanny X-men*, titled “Deadly Messengers,” reveals two features rarely addressed in the literature on comic books. Words and not pictures dominate its pages. Graphic and colorful illustrations abound, but often only a single visual image appears on a page. Often pages contain multiple drawings placed at random and multiply layered. The clues that readers must use to understand the mass of visual images are the words. Instead of being incidental to understanding the storyline, as some critics of comics allege, words give the dominant portions of the storyline. With the text deleted, this comic book would be incomprehensible, but if the dialogue were retained and the illustrations omitted, the story would make sense. Illustrations appear to link the dialogue to its appropriate speaker, much as “he said” and “she said” phrases do in literature.

A second observation regarding this issue of *X-men* relates to the advanced level of the language used. Not only do readers need to understand the words of the dialogues, but many of these vocabulary items compare favorably with the most advanced vocabulary-building lists prepared for the Scholastic Assessment Tests. Within only the first three pages of the comic book, words such as the following appear: *justifiably*, *traipsing*, *foreboding*, *telepathically*, *subterfuge*, and *estrangement*. This level of vocabulary continues throughout the work. The bulk of the readership for *X-men* consists of 15–18-year-olds who count this as “light reading,” while groaning over vocabulary drills and SAT-preparation classes. The language of *X-men* characters also features “sound” words, such as *klik*, *blam*, *wham*, *kreasb*, *bam*, and *whoosh*. These interjections appear mixed with dialogue that makes use of both high-level vocabulary and high-tech or sci-fi jargon. For example, one character states: “My Mutant ability allows me to siphon psionic and even physical residue from the recently deceased.” This statement is followed by *bam* when he strikes a rival character. The speaker proceeds “Remnant energy that I can transmute into raw physical power!”

The *X-men* comic books, therefore, defy traditional assumptions regarding the nature of comic books and the “low-level” skills necessary to read them. Yet certain features also echo trends in language use in comic books, such as the reflection of social dialects. For example, this particular issue

features a female who says “Ah reckon this is the place t’be if’n ah need a bite.” Colloquialisms such as “y’ll” appear throughout the issue, perhaps reminding older readers of the rendering of southern dialect in *Li’l Abner* comics. Bold type and numerous punctuation marks break the text in each speech bubble, and rectangular boxes often provide background narrative information.

THE ART OF CREATING AND READING COMICS

To create comics, artists have a wide range of choices: linear sequence of blocks of pictures and words, whole-page or large-block single cartoons, or whole-page mixed layouts of blocks, circles, and other pictorial presentations (Eisner, 1992). Within comic books produced in the United States, the linear sequence of blocks has been dominant, with covers generally displaying the superhero or primary characters in a whole-page portrayal of action. Within the line-up of blocks, artists select not only their ways of portraying characters’ actions and emotions, but also patterns of key word choices. “Bam!” came to be associated early with the first superheroes of Buck Rogers, Dick Tracy, and Wonder Woman, many of whom became television and motion picture characters as well. Later comics, such as those of the Marvel Comics Group, expanded vocabulary level and created more complex plots, many of which were linked to social issues.

To understand this sequential art of comics, readers must process the meanings of the staccato rhythm of unconnected moments that come between the panels of comics—the empty space that comic arts call “the gutter.” The imagination of the reader fills the visual gaps, just as it does the verbal gaps in literary language. Abstract representations, as well as pictorial renderings of parts for the whole, enable readers to follow the sequence of actions, emotions, and development of complication, because they tap into the reader’s stored experiences and competence with imagination. To understand *Archie* takes some experience with the culture dominant among young people during its years of creation from the 1940s onward. Today, to grasp *X-Men* requires considerable knowledge of the vocabulary linked to the science of space and computer and artillery technology. Vocabulary recognition and inferencing come through contextual clues hidden in pictorial details and linked to experiential knowledge of readers who are often also viewers of these same types of episodes on television or in video games.

Some artists create their cartoons or strips in response to gaps that young readers themselves report in their knowledge or experience, particularly in science. Here the artist’s success depends on responding appropriately and not didactically to the curiosity and creativity of readers. For example, Jok Church, creator of the comic, *You can with Beakman & Jax*, a syndicated feature that responds to science questions from middle childhood readers (between the ages of 6 and 12), uses his comics to answer questions such as what fingernails are made of or what snot is. Each segment frames a question and takes readers through the answer, giving a story that involves Beakman and Jax, the comic’s characters. Humor,

information, eye-catching graphics, and a related experiment draw readers to the comic, as well as to its weekly television counterpart *Beakman's World*. In 1995, the comic characters went on the World Wide Web to answer young readers' science questions, supplementing the letters received from more than 100 youngsters each week who follow the antics of Beakman and Jax. [Data for this discussion came from Heath's interviews with Jok Church and joint participation with him in a 1994 conference sponsored by the Poynter Media Institute of Reading in America.]

Several countries similarly depend on young readers' attraction to comics to teach science. For example, in South Africa in 1990, the Storyteller Group began publishing *99 Sharp St.*, a series of comics that depended on young readers in workshop sessions to let artists know their interests. Taking great care to launch this medium, relatively unknown in South Africa, the Storyteller Group workshopped with numerous groups to create characters and language that would reach the bulk of middle and secondary school students. The multilingual population of South Africa, as well as regional variation in cultural values and habits, and general unfamiliarity with reading as a habit made such workshops necessary. Throughout these interactive sessions, editors and artists worked directly with young people and watched and listened as they acted out what they would do in particular segments of action plots. Teachers helped the artists create images of sufficient detail and general familiarity to meet the experiences and comprehension level of most South African students. The resulting uses of colloquial language, detailed artwork, and adventuresome characters won praise, not only from young readers but also from educators and adult literacy instructors as well as English as a second language program personnel. By the end of its first 2 years, the comic series reached a circulation of more than 750,000. Educators began thinking seriously about visual literacy and the ways in which readers interpreted diagrams, sketches, and abstract and fragmented pictures to create their sense of story. Within the next 5 years, several additional series, stressing not only science but also public health concerns and literature by black South African writers, reached learners across the age span. In preparation for the national elections in the spring of 1994, the Storyteller Group prepared posters and polling booth displays to help South Africans understand details of the voting process.

The results of research on the impact of comics for a variety of uses, from schools to savings programs, indicated that readers saw the pictorial and verbal representations of their own experiences as strong motivation not only to read but to extend what were for many narrow ways of using textbooks—often the only written text in their previous experience. Moreover, many students talked of the personal value that the comic books had for them, echoing a point made by a young township South African writer in the mid-1980s who had access to American comic books through his grandmother's employer. In his autobiography he wrote that comic books went with him everywhere until his English reached a level where he could read extensive literary writings (Mathabane, 1986). Today comic books, puppets, drama, and discussion of the variety of meanings that texts and pictures hold, have

entered numerous classrooms for the first time. Practice teachers and experienced teacher trainers use comics in their demonstration projects for rural teachers and other educators unfamiliar with reader response theories and active classroom discussion. A series for television on science concepts began to supplement the comic books in 1994, reinforcing and expanding the idea of finding and testing scientific and mathematical ideas in everyday practice. [Information given here on The Storyteller Group is drawn from interviews Heath held with staff members and educators in late 1994 and early 1995, as well as publications of the Group (see especially Bahr & Rifkin, 1992). Special thanks go to Peter Esterhuysen, editor, and Patricia Watson, researcher and staff member of The Storyteller Group, for their discussions of visual literacy and their experiences in numerous workshops throughout South Africa.]

In numerous countries, comic books appear when all else seems to fail to motivate reading or to alter attitudes and behaviors—for either the good or ill of society. In the late 1970s, German educators tried to use the comic medium to educate school children about the Third Reich. Censors not yet ready to expose some of the darkest chapters of the period shut down the effort. However, in the early 1990s, in the face of growing right-wing extremism among young Germans, the government's Centre for Political Education and the Reading Foundation combined to prepare a 200-page comic book biography of Adolph Hitler for 15- to 17-year-olds that teachers in several subject areas used to combat the Hitler-inspired racism, and anti-foreigner attitudes some youth in this age group found increasingly attractive. Ironically, in the 1930s and 1940s cartoon broadsides as well as posters and pamphlets, had spread Nazi propaganda and exploited mythic superhero figures to generate acceptance of Hitler as a dictator.

Fifty years later, the same medium embedded within political education efforts once again tried to offer a realistic portrayal of the events of World War II and the activities of the Third Reich. Research carried out in pilot studies in the early 1990s to compare the amount of information retained from comic books and standard history books indicated greater retention of information from the comic book as well as more vigorous discussion and debate that expanded concepts of the comic book presentation. Development of the comic book depended in large part on documentary sources, so that the speech balloons contained original statements by actual characters. Artists, historians, and youth policy experts teamed up to spread use of the comic book and its accompanying media package in schools and youth organizations. These comic book materials (like many in the United States) are complemented by a computer game entitled *Der Diktator* in which players receive points for successfully resisting various stages of a political leader's ascension to dictatorship (Bendelow, 1993).

ENVISIONING AND ENCODING INFORMATION

Interpretation of both the words and pictures of comic books depends on gaps and fill-in, on absences and presences.

Readers understand them by bringing to bear both their real-world information and creativity in image building and meaning making. By the 1970s, European scholars began to describe a theory of aesthetic response (Ingarden, 1973; Iser, 1978) that gave readers new kinds of credit as interpreters and as sense makers whose views of the meanings of literary art need not match those of literary critics. Any notion of a single meaning of artistic works or literary texts now met with strong resistance as theorists celebrated the power of readers to interpret texts and fill in their indeterminacies by image building and intersubjective communication of meaning.

Scholars interested in the relationship between visual images and real-world appearances debated similar issues. With particular attention to interpretation of films and photographs, some argued that viewers had to develop special conceptual categories and processing strategies to understand pictures (Snyder, 1980). Others gave more credence to the dominance of real-world informational cues in understanding visual images in the media and art (Messaris, 1994, especially chap. 1).

From time to time since the 1950s, when educators launched an intense struggle to discredit comic books (Wertham, 1954), scholars have debated the relevance of reading comics to "actual" reading skills and cognitive processing. For example, a common sense approach by proponents of comic books asserts that the linear dimensions of comic reading gives practice in left-to-right eye movements necessary for reading printed text. But close study of eye movements in reading comics indicates that the eye moves between words and pictures rapidly, so that neither the word nor the picture text remains linear in a left-to-right pattern (Barker, 1989). Instead, readers often, at the very least, do a double reading—following the multiple readings of pictures and sometimes their "sound words" (such as "Wham!"). This following of several narratives at a time parallels the mental activities of youngsters channel surfing and following several television programs while also doing homework or playing a card or board game with a friend. While adults tend to ask learners to have a single focus of attention, comics—especially comic books—promote multiple layers of attention and habituate readers to relating such layers to one another.

In addition, comics employ archetypal symbols as a kind of vocabulary of "design language" to support verbal messages. Dark colors, places of height and of hiding, and contrasts of small and large sizes convey patterns of repetition and sequence that parallel in many ways the patterning of folktales revealed by Propp (1975; Brent, 1991). Spatial patternings also indicate concepts such as the divergence between what a character is saying and what he or she is thinking. Marvel Comics often achieves this effect either by layering the same character in such a dual state or by including the overt action in the regular sequence and separating the covert thoughts of the character in another location on the page. Youngsters who report on their reading of comics often reveal how well they know just what is going on in the complexities of human emotion in the characters they read (see, for example, such testimonies in Krashen, 1989).

It is clear that neither presentation nor plot line in comics is straight; it is often by no means obvious. Adult readers often

turn to youngsters to explain the humor in *Garfield* or the message of *Doonesbury* or *Calvin and Hobbes*. Increasingly, comic strips and books leave open endings, relate to current events, and call for a breadth of types of experiential knowledge that adult readers will not have. The "flash of meaning" approach found in MTV and animated films also appears in comics, where only a hint of something that has passed or of something to come appears. This approach may, for example, allow some readers to employ a one-character-after-another reading of speech balloons. In the Marvel Comics, these balloons appear in small parts, cutting the image; hence, some readers follow a single character's words through a full page and then return to another's, and so on, for the full page.

The conventions of reading *visual* images in comics as elsewhere in art, rather than being a separate arbitrary set, depend on readers making use of not only their experiences with similar techniques of other media, but also their understanding of conflicts of power, matching of wits, and access to special technologies that characters (and readers) may have or imagine to be possible. At its most basic level, the encoding of visual images follows unmediated experience for many young readers, making it unnecessary for them to acquire a particular set of conceptual categories or analytical strategies to understand what is going on (Messaris, 1994). But it is important to remember that visual displays encourage a diversity of individual viewing styles as well as rates of reasoning, understanding, and personalizing what is being seen: to borrow an analogy from broadcasting, "visual displays are simultaneously a wideband and a perceiver-controllable channel" (Tufte, 1990, p. 31). Sighted individuals have the capacities to edit, structure, feature, ignore, classify, scan, or integrate visual information; they can either take in, reject, or reshape visual information through experiential, attitudinal, and situational stimuli. "Seeing is believing," not because everyone sees the same image, but because seeing is strongly influenced by human capacities to integrate visual information with other kinds of knowledge and context-shifting abilities. It is difficult, if not impossible, for neurologically normal human beings not to layer information from a variety of sense sources (eyes, smell, touch), as well as cognitive and affective dimensions. All of these combinations, plus their context sensitivity to the moment of reading, contribute to the multiple meanings that words and pictures give in the visual displays of comics. Anecdotal evidence of this phenomenon often appears when adults who were devoted to comics as children recall their small intricate drawings, the gloss of covers, and the warm cozy hiding places in which they used to steal away to read them. Little of their plots or conventions is remembered, but certain visuals in the books and sensual responses to reading them flood back from memory.

At the end of the 20th century, the term *comic* for comic books is probably more inappropriate than at any time in their history. Most of those preferred by today's young readers have little that is directly comic. They speak to readers about loss of control, struggles with parents and bullies, and the contradictions of women as nurturers and as superheroes. In Marvel's *The Fantastic Four*, for example, Susan Richards as Invisible Woman faces a son who wonders why his parents are not at home more often. She suffers a miscarriage as a result of her

superheroine-like activities. Vietnam veterans write about their war in *Nam*, done for Marvel Comics, and teenage titans move about the world facing famine, political intrigue, and floods. Family obligations, education, drugs, crime, and political and philosophical debates enter their texts. Editors defend the trend away from adventurist humorous stories by pointing to the maturing experiences many young people face early in life today. In addition, they argue that these are issues and concepts that other reading materials for young people often ignore or treat in didactic ways. Comics give voice to parts of young readers' experience and imagination;

they play a key role in cross-media theme development, and they illustrate multiple ways of presenting information—verbal, visual, and graphic. In the words of Stan Lee, publisher of Marvel Comics, “the illustrated format of comic books favorably competes with *any* and *every* form of literature.” In an era when literary texts and age-old literary themes enter new forms every year—from films to adventure games in arcades to hypertext—the visual and verbal powers of comics may be one of the most powerful and productive forms of preparation and motivation available to invite new readers into literacy habits.

LANGUAGE-RELATED ASSESSMENT ON THE THRESHOLD OF A NEW CENTURY

The widespread demand for educational accountability has been reviewed and analyzed many times (e.g., Farr, & Olshavsky, 1980). At the same time that this demand to endorse and promote the use of traditional forms of assessment appeared, the development of theory about how people think, learn, and express themselves has called for the development of assessments that reflect the processes those theories describe (Anderson, & Pearson, 1984; Johnston, 1986).

Emerging theory has been highly convincing and persuasive as it defines language use as a *thinking process* (Williamson, 1983), and acceptance of this description has led to the questioning of assessment that attempts to break meaning-making down into a list of skills that can be measured with a host of tests. This attention to theory-practice mismatch has become a major criticism of assessment (Farr, Carey, & Tone, 1986; Froese, 1987; Valencia, & Pearson, 1987).

Most tests that have been mandated in a majority of the states in recent decades are of this type (Afflerbach, 1990), and concern about being accountable to them has tended to recommend teaching strategies that present learning and thinking with language as isolated skills that can be drilled in very short and inauthentic meaning bites. Across schools and teachers, this has curtailed instructional emphases that meet individual student needs for comprehending and expressing oneself. Thus standardized tests have not mod-

eled or measured the emerging definitions of the meaning-making process in any convincing way.

Current models of literacy begin with the user's reasons for making meaning, with an examination of how those reasons combine with the user's understanding of author purpose or any audience involved, with the user's application of personal background, and with adjustments and revisions made as the user self-evaluates how well the process is meeting his or her needs. All this is meshed in a process within the so far impenetrable "black box" of language and thinking (Hambrick, 1991), a highly complex behavior that seems to defy stratification and any attempt to describe it with ordered sets of prioritized skills (Farr, & Tone, 1982).

We now understand that processes like reading operate in ways that extend far beyond a single language mode. People make meaning using a rich mixture of signs and expressions. These include complex semiotic input and communication (Suhor, 1982), including dance and body language (Beyond words..., 1988; Leung, 1986) and extensive use of drama (Fiala, 1979). They can involve appreciation and response to music as well as its expression; and they tap a host of visual environments and expressions (Siegel, & Carey, 1989). Golson and Kirscht (1983) discuss Langer's explanation of how *presentational* and *discursive symbolism* fuse art and knowledge and recommend an increasingly attractive instructional approach (Harp, 1987).

This goes beyond the intention of teaching language development across the curriculum to a genuine integration of disciplines (Duke, 1987; Kaltsounis, 1990; Rabson, & Warshaw, 1980). It stresses the interactive nature of the arts

with special attention given to broad-based learning and language development (Hoyt, 1992; Spillane, 1987).

Criticism of standardized testing has rightly focused on its attention to isolated behaviors measured in unrealistic (invalid and inauthentic) ways (primarily with responses to multiple-choice items). This does not necessarily condemn the norm-referenced, multiple-choice testing of reading, for example, as valueless; but it certainly challenges the use of its data as the sole or even primary basis of broad-based educational decision making. Such tests produce but one type of information that helps underline the need for assessment that can indicate how well students make meaning of topics that cross many disciplines (as comprehenders and expressers) from the access they have to an incredibly rich mix of various media.

That is what life is like, especially in a world served by newly developed technologies; and that is what we are supposedly eager to prepare students for, so that development of these meaning-making processes is presumably what we would like to assess. It is a challenge, but the technologies that provide an ever-richer environment for learners have also begun to provide the means to attempt to do this.

The long time span over which this realization about educational assessment needs gained force would suggest that test makers have not been highly responsive to criticism or theory development; yet given the traditionally cautious and conservative tendency of assessment designers and publishers, criticism of reading assessment in particular and of assessment of language development in general has indeed served as analysis that has had some impact on assessment over the years (Farr, & Tone, 1994a):

- Standardized testing of reading, which has continued to draw the most prevailing criticism, has responded by attempting to provide and promote diagnostic applications of its results, by increasing the length of passages, and by using title-like questions that attempt to establish a purpose for reading. The criticisms of such issues and responses were discussed by Farr and Beck (1994).
- The new understanding of how thinking processes appear to work developed during decades of theory making that has emerged at the same time that public concern—even panic—about the quality of education has grown dramatically (Afflerbach, 1990). Ironically, the latter has reinforced a dependency on and demand for the kinds of assessment that the new theories question. While the ever-increasing cost of our schools is an enduring motivation for public demand for educational accountability, the widely reported decline of scores on tests such as *The Scholastic Achievement Tests*, an instrument used to screen college applicants, was the primary factor for many years. That the college-bound students taking such tests had grown and changed dramatically—in number, background, and attitudes—did not assuage the public clamor for more effective, and usually rigid, instructional objectives. To the general public this would be evident in improved test scores. Thus criterion testing matched more directly to instructional objectives has gained considerable popularity among educators and other citizens who are interested in

customizing assessments to show if particular students have mastered particular objectives they believe are important. While this coverage of numerous subskills may have customized the faith that many have in a skill-drill approach to instruction, it has flown in the face of 30 years of developing theory about how people construct meaning by using language and other means of expression.

- Schools have been as conservative as test makers in implementing alternative assessment (Cawelti, 1994), but in recent years, new *performance assessments* have been developed in response to emerging theory about language use and development (Farr, & Greene, 1993; Farr, & Tone, 1994b; Smith, 1991). In response to this broader concept of literacy, these instruments examine student products as well as the processes, which created them; and integrate different language behaviors. As the description of recently developed performance reading and writing tests will show, once one depends on student expression to demonstrate comprehension, the integration of similar language processes can occur naturally. Such assessments also facilitate cross-curricular integration, for the subject matter selected can come from science, social studies, or other disciplines.
- The brief description of *portfolio assessment* later in this chapter suggests how other forms of expression can be integrated with the assessment of reading and writing (Farr, 1990). In such collections, artwork is frequently as important as written expressions, which may be lyrics set to music or critical and appreciative descriptions of art, music, dance, and other forms of expression.
- Finally, the extended description near the end of this chapter of an assessment instrument under development demonstrates how *multimedia technologies* now available in some schools can link the comprehension of various types of text, audio, and video sources of information. The new instrument suggests much potential for assessing responses to different expressions, such as the written word, music, the graphic and other arts, and the dramatic arts with interactive activities that respond to a meaningful task.

Such trends in assessment development are responses to our growing understanding of how people learn, think, and express themselves.

Portfolio Assessment is a Promising Response to Concerns About Validity

If a major concern about language testing is that it invalidly reflects the behavior or behaviors it measures—that it does not provide or consider genuine purposes for reading, writing, speaking, listening, or drawing that relate realistically to student backgrounds and interests—the growing popularity of *portfolio assessment* is an encouraging response (Tierney, Carter, & Desai, 1991; Valencia, 1990; Valencia, Pearson, Peters, & Wixson, 1989). Simply described, portfolio assessment is the practice of keeping lots of specimens of student writing, drawing, and thinking together so that they can be analyzed by both the student and teacher over time to improve learning and instruction.

Portfolios can also be used quite effectively to demonstrate student performance to parents, administrators, and others. Since the contents are usually so uniquely personal, each portfolio requires special attention that places considerable demands on such viewers; but the effort frequently rewards the assessor with a perspective on the student as a thinker and language user that cannot easily be acquired in other ways. The literature of language education includes a growing number of testimonies to this effect (Johns, & Leirsburg, 1992; McRobbie, 1992; Miller, 1992; Wiggins, 1989; Wolf, 1992). This approach to accountability assessment, however, is still evolving. A report by Gentile (1992) of the analysis of 4,000 student portfolios showed that they had promise for informing audiences interested in accountability. Similarly, the NAEP 1992 Writing Portfolio Study (Gentile, Martin-Rehrman, & Kennedy, 1995) showed that writing portfolios can be valuable supplements to other forms of assessment.

Portfolios do not facilitate the kind of quantifiable comparisons that those demanding school and student accountability have come to expect, and they challenge the objective evaluator to define the educational outcomes that are the basis of his or her criticism and/or concerns (Tierney et al., 1991; Russavage, 1992).

There are, however, numerous considerations that help insure the success of portfolio assessment for both instruction and accountability, (Farr, & Tone, 1994b):

- It is vital in such a system, that the collection center as much as possible on reaction to, and uses of, texts that the student has read; but the portfolio should contain a mix of multiple kinds of expression and interests. It can include different kinds of journal entries, notes, clippings, favorite pictures, audio- and videotapes of student thoughts and projects, records and other information on computer discs, and reactions of the journal keeper, his or her peers, parents, the teacher, and others.
- The collection should include numerous specimens of student thinking and notes and drafts reflective of language and thinking processes. It needs to be more than just the student's best work.
- The student should have primary control of the collection, have ready and regular access to it, and be guided and even be required to evaluate, analyze, and reorganize it frequently and regularly. A good portfolio system usually provides some printed aids to guide the student in that direction. At the same time, the student is aware that his or her teacher, parents, school administrators, and even fellow students may be looking at it and evaluating it informally from time to time.
- Regular and relatively frequent teacher-student conferences are essential to assure that the portfolio supports and promotes self-assessment strategies that can guide future reading, writing, and other expression (Farr, & Tone, 1994b, chap. 5).

Basically, portfolio assessment appears to restore faith in trained teacher judgment; but many critics question its dependability as an accountability measure, arguing that with ongoing teacher and student control of the collection, it could

be manipulated to suggest better performance than that which exists. Teachers who cull student collections to leave just the best pieces for outside inspection may have little faith in the outside observer to use a fuller collection to consider student's thinking, expressions, and interests as a process. Teachers who limit the collection to just final drafts of student writing (and even particular types of writing) are denying its potential to reflect the multimedia that surely influences the student's thoughts.

Due to of its potential to reflect student thinking more validly, the portfolio is being considered in some places as assessment that reports on school and teacher accountability; but this practice works only when the audience understands the importance of assessing student meaning-making as a process. Educating those who would examine portfolios for accountability, as well as those who guide their development, and developing the mutual trust among all who examine them is an apparent problem yet to be adequately solved (Kemp, Cooper, & Davies, 1991).

In an attempt to conduct broad assessment using portfolios one approach pulls random samples from the universe in a classroom to show a supervisor, in a school to show to the press, or in a school system or state for accountability purposes. A principal or supervisor, for example, may be invited to select six or ten student portfolios at random to examine. It is important in such a practice, to make sure that the persons inspecting the random collection know what to look for (as those in studies of the potential of portfolios are trained to do); and teachers can make sure that the viewers know how the collections were gathered and are maintained and can make some suggestions for things to look for. The importance of tapes, drawings, pictures, and even student-made models of settings, situations, and other creative ideas needs to be understood. It is especially important that viewers know when they are looking at portfolios whose owners have been encouraged to be "inclusive," keeping notes, drafts, and ideas for future expressions and reading.

Generally, however, use of portfolios in broad accountability programs, such as those that have been used in some states (Kapinus et al., 1994; Koretz et al., 1992; New Mexico, 1991-92; Snider et al., 1994) tends to structure portfolio content in a fashion that may limit the inclusion of multimedia materials. Yet the value of miscellaneous contents to support a student's language development is too important to let limitations that may appear necessary for accountability uses influence portfolio assessment in the classroom.

Other approaches attempting to make portfolios more usable for accountability purposes have supported comparison among students and have specified the kinds of reading and writing students should be able to do. They have dictated particular contents—a practice which can limit use of the portfolio by the student for self-assessment. This is problematic: If the ultimate purpose of educational assessment—in language use, for example—is to develop more effective language users, then its primary purpose ought to be to contribute to developing the students as self-assessors. Teachers, school systems, and critics cannot be following people around all their lives to see if they are using language effectively and advising them on how to improve their language

processes. The only sure source of that ongoing, personal guidance is the student himself or herself!

Self-Assessment is Promoted by a Growing Emphasis on Metacognition

Whether metacognition is by definition and necessity a conscious effort as theorists such as Brown (1975), Paris Wasik and Van der Westhuizen (1988) and Wagoner (1983) contend; an active control of a hidden process, as suggested by Block (1992), or a broader, more generic kind of knowledge about comprehension that can for example, have an automatic impact on one's processing of text, (Flavell, 1979)—it is, nonetheless, the essence of the development of a reader. It is certainly an indication that a language user has some idea of how he or she comprehends and of what to do when comprehension is not taking place. Both researchers and educators have begun to take more notice of it.

As researchers have focused on metacognition (Paris, & Oka, 1986); (Paris et al., 1988), (Wagoner, 1983); strategies for collecting data on the mental processes it employs have been developed as questioning either during or after a text is read (Olshavsky, 1976–77; Powell, 1989). Related techniques have been devised for instruction. "Think-alongs" are running verbal or written stream-of-conscious reports that can be used to gather data on student processing of texts while they read (Farr, & Greene, 1992). Researchers get students to report aloud about their ongoing reactions to texts by modeling the process for the subjects. This modeling is used not only for research, but primarily as a teaching device in which the teacher reveals what she or he is thinking as a text is read. It invariably demonstrates how background is called up by texts and contributes to the comprehension of it. It reveals problems with diction and language structures. At the same time, the process becomes a model for students to follow. As they think aloud about their reactions and the various thoughts that a text provokes, the experience promotes and develops student metacognition.

Standardized tests have added items that purport to measure metacognition, and basal series offer activities to build it and explanations of how it can be developed to teachers (Farr, 1989). There are many classifications of reading strategies that suggest metacognitive questions a reader can ask himself or herself, but generally they can be grouped with eight icons that help a reader remember them:

1. Do I have a specific purpose as I read this story/book/text? What do I want to know after reading this? What is my specific purpose for writing this? What do I want my audience I am writing to know?

2. Have I thought about what I already know about this topic before I begin to read or write (or as I am reading or writing)?

3. Have I thought about the ideas I will probably find in reading this or that I intend to write? Have I done this before I began to read and write? What do the title, the pictures, and other clues tell me to expect?

4. As I am reading or writing, do I think about what is coming next? What predictions can I make?

5. Do I picture in my mind what I am reading or writing? Am I able to visualize this?

6. Do I ask myself as I read and write, "Is this making good sense?" How do the ideas fit together?

7. Do I change my mind and revise the meaning I am making if necessary? Do I make changes if things don't make sense? Do I need to change direction in my thinking?

8. Do I need to reach out for help from other things I have read or written? from my classmates? from my parents? from my teachers? from classroom resources?

FIGURES 51-1

This metacognitive checklist is not all-inclusive, and individual teachers and readers may easily think of other questions they want to ask themselves each time they read and write. But the strategic self-questioning prompted by these icons does demonstrate the simplicity and common sense of useful metacognitive behavior. They can be adapted easily for meaning-making using any kind of communication, including music, motion, and drawing. If young learners were to remember and ask just these, they would be in the practice mode to develop metacognitive strategies that could strengthen their ability to communicate and to comprehend by processing ideas, descriptions, and other information more effectively.

Much of the work by researchers on metacognition appears to be on efforts to test theoretical definitions of it, to analyze it in terms of types and types of strategies that it involves to help define it, and to come to grips with it by reviewing the theory and research that have helped create a broader understanding of literacy.

While all this is a useful and potentially valuable emphasis,

the technical distinction between a definition of *cognition* and *metacognition* becomes somewhat academic; although it seems possible that a part of the complex interactions involved in meaning-making might include self-questioning habits and approaches to dealing with difficult text, that operate without deliberate commitment or attention but which can be developed and incorporated by classroom and self-instruction.

Portfolio assessment, conducted effectively, is the ideal tool to promote student self-assessment (Berter, 1993; Sunstein, 1992). It structures the comparison of current to past efforts while providing the incentive to plan for future reading, writing, and other expression. It can incorporate the reactions of teachers, fellow students, and parents to its contents and be a concrete and wholly valid demonstration of strengths and areas that need attention. Indications of reactions to larger portfolio projects, however, indicate that while critics and the public may find portfolios fascinating and enlightening about student thinking and processes, they still seek assessments that show how a student's performance compares to that of other students, or how it compares to accepted benchmarks or standards.

Performance Tests and Portfolio Assessment Appear to be Valid Assessment

One response in recent years to the criticism of the validity of tests that assess language use has been the development of *performance assessments* by several publishers, states, consortia, districts, and individual schools (Beaverton... District, 1984; Coley, 1990; Farr et al., 1989; Ferretti, 1991; O'Neil, 1992). They are also in use in England (Luttrick, 1991). They aim at capturing genuine reasons for reading and writing. Like the portfolio, performance assessments can provide a more valid assessment of language behaviors, and they can easily incorporate other kinds of input and expression. At the same time, they can best be prepared through an implementation of field tryout results that are actually used in structuring them. This procedure can provide a framework and extensive samples for comparison of results to the performance of students deemed typical of the age tested.

These tests vary in format and scoring. Some, for example, ask students to complete open-ended questions after reading a selection, while others require students to produce longer, extended responses. Extended performance assessments generally include the following characteristics:

- *A passage (or a group of texts) related to a particular topic or problem as a "prompt" to promote student writing.* Across a basal reader, for example, or a test publisher's system, these problems will encompass numerous genres, subject content areas, graphic format, and styles. Some may be charts, maps, lists, photos, or other graphic materials. Many such prompts are as generously illustrated as typical reading materials that the students might frequently encounter.
- *An assigned task for responding to the textual prompt, usually in writing.* These tasks establish a purpose for

writing that would seem appropriate for the grade level, and they identify the audience for whom the student is writing. The types or styles of writing required of the student vary across different assessment prompts, from personal letters or journal entries to reports to employers or school administrators. They can be as simple—in a basal unit assessment, for example—as writing a conclusion for an unfinished story, or as complex as analyzing and synthesizing opposing arguments, charts, letters, speeches, and technical articles related to a societal problem (a college competency measure). They can be designed for kindergartners or beginning first graders as the request for an original captioned picture, or for elementary children as letters of advice to characters with problems or directions-based descriptions provided.

- *A brief, but relatively complete explanation to the student about how the response will be evaluated.* This scheme is often presented to the student in outline or bulleted form.
- *A prewriting guide that the student can use in preparing to write the response.* These are designed to logically serve the assigned task and are often relatively simple. They may suggest a chart (for comparisons, for example) or a form of an outline. These are usually optional and the student is advised that he or she can organize and prepare to write using any other system that seems effective and comfortable.
- *A self-evaluation guide to direct revision and other polishing and checking.* This component may be as simple as a short set of questions that the student can ask himself or herself about the first draft. While these questions focus on content and always encourage the student to review the task and audience and to self-evaluate from that perspective, they frequently also remind the writer to look for clarity and mechanical errors. Almost all performance assessment instruments encourage the student to revise as a final draft and give the student the time to allow for that. Depending on the use that will be made of the student response, the planning notes and early drafts may or may not be kept with the final draft. An example of how the full response can be useful is its inclusion in a student's portfolio. These sets of notes, draft, and final draft provide the student with an excellent record of her or his processing of information using language.
- *A scoring system expanded as a rubric that the rater of responses can follow.* These systems are often quite simple: the response may be rated on as few as two, and often just three, general categories, such as *Reading* (understanding / comprehension of the text), *Writing* (organization, mechanics), and *Accomplishment of Task* (consideration of audience in terms of the assigned task and content). Seldom does such a scheme include more than four general categories, and although the categories may be defined or expanded as subfactors, these are not rated separately. A general category called *Reading*, for example, may be described in terms of accuracy of details reported, completeness of details in terms of those needed to complete the task effectively, understanding of relationships, or other subfactors. These are explained in a very simple chart.

- *A simple rating scheme that seldom ranges more than 1–5 (with 1 usually low) and are frequently rated 1, 2, or 3.* A description of each rating usually appears in a table with each number described or defined for each general category. An expanded rubric may explain each general rating in terms of each subfactor. The authors are not aware of any such system which encourages raters to average or subsume the ratings for the categories into a single score for a particular student's response as an overall, and overriding rating.
- *A full set of "model" or "anchor" papers as examples of ones that would get a particular score in each particular major category.* Since this component of the performance assessment package can be the most important scoring aid in it, it should include at least two samples or anchors for each score within each category. These should be drawn from responses acquired through a sizable tryout of the assessment, should be selected by a group of scorers who are in agreement about them, and should be significantly different in some aspect that was suggested by the complete set of responses in the tryout.

A vital part of this collection should be a very carefully written annotation that accompanies each sample paper, explaining what the scorers who rated it with the number it represents saw in it. Some authors and publishers of such tests strongly advise that rating be done primarily by matching student responses to these anchor papers and that if this were done with genuine care, the rubric could often be laid aside.

A published series of performance assessment instruments that contains all of these components is described by Werner (1992). As the description of the multimedia assessment project below indicates, components including sound, moving videos, and other media can be added to various types of print in creating performance assessment prompts of the future.

That administrators, parents, and other members of the community, such as journalists with an educational beat, appear to readily accept performance assessment should not come as a great surprise. Why shouldn't a chance to look at a paper based on a seemingly valid experience and rated in several key ways be more meaningful to such an audience than the statistical data provided by nationally administered norm-referenced tests? Meyer, Schuman, and Angello, (1990) explain how aggregated analyses of portfolios can meet the needs of audiences that have depended on standardized test results, and Simmons (1990) reports research indicating that they can be adapted to serve accountability needs. Moss, et al. (1992) suggests how the assessment information should be reported.

What a school relying on performance testing to account should do is to explain how their scoring system has been developed, so that a 4 in Writing does indeed represent an excellent performance—compared to the broad sample of like-aged students used to develop the test (if it is from a major publisher) or a large sample of local students (if developed locally). In the latter case, it can be explained that the score also reflects the judgment of a panel of teachers who

cooperated to develop the test. At the same time, a truly interested reporter, administrator, or critic can be introduced to the anchor samples and rubric and be invited to assess a sample of papers.

Why Should we Feel the Need to Rely on a Single Type of Assessment?

Why should our educational system and society be obligated to rely on any single approach to assessment? In truth, and in current practice, we do not. Standardized testing can afford the kind of comparison to the norming sample that many citizens seeking educational accountability seem to appreciate and demand. But while relying on and reporting it, educators (and journalists, too) would do well to explain that the multiple-choice format of standardized testing is criticized by many educators and theorists as a far cry from the actual reading process. Multiple-choice items on standardized writing tests may call for editorial recognition of correct mechanical form but are only that—an indication that a student can recognize correct usage (spelling, punctuation, diction, number agreement, etc.) when presented with an isolated focus. *Such tests are hardly a valid representation of whether students can write with a genuine purpose for a particular audience!*

If you want a comparison of how your students do as copy editors of canned, limited, and isolated text (an admittedly a typical language behavior) when their performance is compared to a national sample used to norm that test, the results of a standardized instrument can be useful. If you can get scores on the same test of students from other locales, you are provided some more comparisons—on those multiple-choice responses to very isolated skills and fragmented focus on meaning-making. Many of the critics who demand such scores may not understand them well, but they should be encouraged to press publishers for clear descriptions of the norming populations they are comparing their students to. Teachers inclined to rely on the diagnostic aspects of those tests, should be reminded that a limited number of items on a particular skill can serve only as an initial indication; the standardization of the instrument does not make them any more useful than that. *If you want to know if your students can write, you had better look to other assessments!*

Teachers have always created criterion-referenced tests for their individual classrooms and have based grades and instructional emphasis on the results. Students can identify prescribed, if limited, objectives that they have not yet mastered. The primary advantage of criterion-referenced tests is that they can be tailored for particular students in a specific classroom in any one year. Their highly prevalent use in wider educational arenas, as state competency exams, for example, is a phenomenon that began over 20 years ago and then virtually swept the nation (Farr, & Olshavsky, 1980). Results from these tests are of use to teachers who support or are obligated to support the criteria (particular performance objectives) used to prepare them. In that regard, they can be diagnostic, as well as dictatorial.

If such tests and the administration of them do not change

significantly over time, scores on them can be used to compare student performance to that of students who have taken them previously. Any critics who have helped articulate the objectives will surely use the scores on them to judge the schools' accountability, but everyone should be aware that these instruments are rarely normed before use and that whatever percentages are purported as "acceptable," "excellent," or whatever are arbitrarily established. Furthermore, people who rely on reports of scores on criterion-referenced tests should examine the test's content and the objectives that dictate it.

Most significantly, like the nationally standardized test, they are almost certainly made up of multiple-choice items that can be challenged as an invalid representation of the way that students are expected to use—and actually do use—language. While they are used, and misused, by other assessment audiences, they are of most value to the teacher who teaches to a rather specific and lengthy set of objectives.

In the 1990s, some schools are using performance assessment—often in addition to standardized and criterion-referenced tests (Hansen, 1992). While portfolios and other approaches are generally and correctly classified as assessment of performance (Feuer, & Fulton, 1993), the discussion here centers on a more particular approach that uses textual prompts to generate student writing (Farr, 1993; Farr, & Farr, 1990; *Indiana Performance Assessment '92*).

The results of such assessments are highly useful to both teachers and students! and representatives of these schools can add: "If you would like to see how our students performed while actually reading and writing for what we hope you will believe is a meaningful purpose, we have something else to show you. Our students read and used a particular text to complete a particular task. Their responses were scored in several key ways, and those scores can be related to carefully articulated criteria and sample papers that were written by real students of equivalent ages and that got similar scores from a panel of teachers and educators who read them and agreed about their merit. We invite you to react to how useful or meaningful you think the tasks assigned are for our students and how appropriate the texts are for the students and the tasks."

If those interested in educational accountability can get score percentages for other locales, they can make that comparison as well. Interestingly, such users are apt to become so interested in the task, the text, and the individual student responses that they may forget about the need for numbers to tell them how the students are reading and writing. If that happens, the performance assessment test has lived up to its very valuable potential to link the various assessment audiences in order to demonstrate student performance in a far more valid manner than standardized tests have or can.

It would be misleading to ignore the concerns of some test experts about the use of tests such as performance assessments and portfolios (Beck, 1991). The features of developing performance assessments that can be argued to be a form of standardization rely on the subjective judgment of the raters involved in the procedure. Even if that judgment is unanimous, that degree of subjectivity, such experts' advice, does

not recommend making wide-sweeping educational decisions on the basis of score reports that they produce. Even the most enthusiastic supporters of portfolio assessment note problematic issues that need to be considered and addressed (Valencia, & Calfee, 1991).

Others look on developments like portfolio assessment as opportunities but express concerns about how effectively the collections will be used (Calfee, & Perfumo, 1993). Grant Wiggins expects much of such assessment reforms but expresses concerns that they may fail if the high stakes attached to them force too heavy a reliance on them before problems such as task validity, score reliability, methods of portfolio sampling, and those related to the generalizability of results are solved (Brandt, 1992).

Such concerns reflect the emphasis on formal assessment that has come about in the past several decades and on its use in holding schools more accountable. This has developed as a response to criticism of the schools, which in turn has intensified as scores dropped on tests like those used to predict how well students will do in college. Few standardized tests were administered evenly and widely enough over the years to make comparison of widespread student performance across time periods very dependable, but the general interpretation of the media, public, and educational decision makers was to confirm the criticism and to demand more accountability reported in test scores (Farr, & Fay, 1982).

The increase in reliance on standardized tests led, in turn, to reasonable concerns about how well tests can measure educational accomplishments without narrowly beginning to dictate the curricula they purported to measure. So, more and more tests were constructed by states and local school districts to match their particular educational goals and curricula and to measure minimally acceptable results (Farr, & Olshavsky, 1980). These criterion-referenced measures are now in place in a majority of states and schools systems and have tended to be administered in addition to, not in place of, standardized testing. Many educators became alarmed about the narrowing influence of the testing phenomenon on what is taught, noting that teachers will tend to emphasize what is on tests holding them accountable at the expense whatever the tests do not cover.

All this occurred as slowly emerging theory began to explain language development, as one example, as meaning-making that responds to individual student needs, interests, and backgrounds. This perspective invariable integrates different language behaviors, thinking, and learning in complex ways that defy skill stratification and sequencing. So, it was that newer forms of assessment have attempted to examine student efforts in performing real tasks that integrate these abilities (Farr, & Tone, 1982; Pikulski, 1989).

At the same time that performance assessment has developed, both standardized and criterion-referenced testings have continued. The interlocking purposes of the different forms of assessment serve a variety of audiences. (See Farr, & Tone, 1994b, chap. 6).

So we are left with the seemingly sensible conclusion that most information is useful and that different types of assessment produce different kinds of information that may be useful to different assessment audiences but that are, depend-

ing on the type, more useful to some audiences than to others (Farr, 1992). To clarify this issue adequately, we need first to rethink and to carefully articulate what it is that we expect to achieve with instruction and what we want to learn from assessment. Such an effort could reasonably be tied to a study of how assessment results are and have been used and misused.

Any contention that most assessment should be useful to someone must yet face the long-held and sensible objection that testing uses up two valuable educational commodities: time and money. An increased emphasis on assessment means that more time is being spent on test taking and less on learning. If we are to endorse all types of assessment as of value and each type as the best suited for a particular audience or two, aren't we contributing to the overuse of testing?

This argument seemed particularly acceptable as states and schools added rather massive testing programs that theory could not endorse as very valid. But alternative performance assessments in use today, and most certainly portfolio assessment, are practice of the very processes they assess. Analysis of student efforts from both types serve instruction in potentially highly effective ways. Above all, they promote self-evaluation and develop metacognition. In short, this type of assessment has to reflect instruction so directly that it is rather meaningless to try to tell them apart or to fret about how much time is used (Paulson, Paulson, and Meyer, 1991). Both the class time and the portion of the instructional budget dedicated to them are serving double duty.

The Time has Arrived to Assess Student Ability to use Multimedia

Concerns about how literate our students are constitute a vital issue that can certainly be informed by assessment. We are at the doorstep of the 21st century, and it is time to acknowledge that the best way to assess students' ability to think is to see if they can apply the meaning they make. In doing that, we recognize that the various language behaviors are complexly linked as thinking processes. And we know that people make meaning in more ways than just reading, listening, speaking, and listening. They observe or view things, and they visualize. They communicate with body movements, and structure that into dance. They listen to more than words. They respond to and make nonlanguage sounds using all kinds of instruments.

None of this input and output is isolated, the way that tests try to do. Varied responses come from a synthesis of all kinds of perceptions. Midway into the 1990s we can demonstrate all of this on our home computers, which give us the printed word, moving videos, graphic stills, a host of sounds including the human voice, animated games and stories, and almost unlimited access to information. We store an encyclopedia on a tiny silver disc, and we can go on-line to great libraries near and far and to a host of specialized information sources.

Are we interested in knowing how well our students can function in such an almost unbelievably rich multimedia

environment? If the development of assessment moves with the tortoise-like caution and deliberation of the past, all the stimuli our students must process everywhere else may make school itself seem obsolete. *If assessment has seemed a peculiarly unrealistic experience before, it could seem humorously esoteric to them in the near future!*

Does it seem unreasonable then that some assessment specialists are developing instruments that exploit the *multimedia* stimuli that many school computers will soon be capable of providing.

Technology is Suggesting new Formats

Multimedia is a difficult term to define because it means so many things to so many people. Generally, "multimedia means that more than one medium of communication is employed to deliver a message" (Kanning, 1994, p. 40). Advances in computer technology have enabled developers to integrate the presentation of text, still images, animation, video, and audio into a single program or product. CD-ROM has become the primary source of delivering multimedia, but videodiscs, slide shows, digitized sound sources, illustrative libraries, scanners, and the developing information highway are examples of other means of delivery.

Multimedia is clearly the technology trend of the 1990s (Owens, 1992). Two million CD-ROM discs were sold in 1993. That number is expected to climb to 64 million by 1997 (Betts, 1994). The number of CD-ROM drives (the devices that play CD-ROM discs) is expected to increase by 260% between 1991 and 1996 (The New Multimedia, 1994). By the end of 1992, there were about 900,000 CD-ROM drives in use. In one year, that number had surged to 10.5 million (Shields, 1994). With prices of computer hardware dropping relatively dramatically, many school districts are acting quickly to acquire multimedia, raising their technology standards to require a CD-ROM drive in any new computer that is purchased.

What has captured the imagination of educators and developers is the interactive capability of multimedia. Interactive multimedia requires the user to be an active participant, not a passive bystander as in so many early skill-and-drill software programs. Interactivity is made possible through the use of *hypermedia* software systems. These allow users to create, annotate, and link information from a variety of media sources.

These systems possess three characteristics that differentiate them from past "linking" systems. First, information does not have to be linked sequentially. Associations can be created across a variety of dimensions. Second, the systems are not limited to text. Links can be established between multiple types of media (text, video, and still images, for example). Third, navigational systems can be created to guide users, or users are free to create their own navigational systems.

Interactive Multimedia Software can Present Powerful Assessment

In the past few years, hypermedia, or multimedia authoring systems have become more sophisticated, more powerful,

and yet easier to use. This surely accounts for the surge of interest in, and creation of, multimedia products (Pryor, 1992). Interactive multimedia software has several promising characteristics that make it a powerful tool for both learning and assessment. The presence of these characteristics and the degree to which they are operative varies from application to application. Nonetheless, proponents usually cite the following as characteristics of the genre:

- Because multimedia presentations can link various types of media, they can create *rich learning environments*. For example, in addition to just reading about a tropical rain forest, a student may be able to view a video of cutter ants at work, hear an audio clip of the nocturnal sounds heard there, and watch an animation sequence that shows how rain forest plants decay and provide a source of nutrients for the next generation. This mix of information can be presented as a real-world context, and it quickly engages the genuine interest of most students.
- Interactive multimedia presentations emphasize self-direction and thus provide *learner control*. That is, they allow the learner to determine the path of his/her study. This "inquiry-driven" approach encourages, and even requires in many instances, students to ask questions, seek out information, and solve problems. Learning takes place on the student's terms, not the terms of the teacher or the product developer. Inherent in this learner control is self-pacing and multiple routes to the same information.
- By providing information in a variety of formats (such as text, video, and images), and by allowing multiple paths through that information, interactive multimedia is accessible to *multiple modalities*. It accommodates different learning styles and makes itself more available to children with special needs. For example, a second-language track has become fairly standard on many multimedia programs, so the learner has a choice as to which language to use.

The technology that presents and supports multimedia is still in its infancy, but the amount of literature describing it is increasing (Cannings, & Finkel, 1993). Much of the research that has been conducted has focused on conceptualizing the design features of multimedia presentations and investigating their effectiveness:

Ferretti (1993) conducted a Delphi study to identify research questions that could guide the study of interactive multimedia with special education populations. He found the most frequently cited topics to be (1) design issues affecting the efficacy of interactive multimedia; (2) the multimedia environments, (3) navigational tools; and (4) strategies for promoting the transfer of learning.

In a comprehensive review of the literature, Litchfield (1993) focused on four areas: (1) instructional strategies (including cooperative learning); (2) branching (navigation and learner control); (3) affective features (learning styles and motivation); and (4) types of media (interactive videodiscs, hypermedia and hypertext).

Some investigators (Park, & Hannafin, 1993) have tried to shape a conceptual framework for organizing research and learning theory as they relate to interactive multimedia.

Schwier (1993) has created a classification scheme for multimedia interaction based on the degree of control and type of cognitive engagement experienced by learners. Allred and Locatis (1988) compared the effectiveness of three methods of designing interactive multimedia.

One of the few studies that investigated assessment issues related to multimedia was conducted by Baird and Silvern (1992). They investigated the interaction between instructional mode (computer vs. paper/pencil) and testing mode.

Cates (1992) predicted that the new interactive hyper- and multimedia technologies will have promising potential to evaluate metacognition.

An Exploratory Project Suggests the Potential of Multimedia Assessment

The authors have been exploring the potential of multimedia for assessing important language arts outcomes. They have created a prototype software program called "Lost in a Storm" for use with upper elementary students.

The program presents a simulation activity in which students play the role of a newspaper reporter for a small local paper. They are told that two children participating in a cross-country skiing event have disappeared due to a bad snow-storm. The local sheriff and rescue teams have been searching for them. The task for the students using this program is to gather background information and write a newspaper story about the incident for the morning edition.

To help them accomplish their task, students are provided with tools commonly used by newspaper reporters—a telephone, a tape recorder for recording interviews, and a reporter's notebook for recording information that is collected. These tools are presented as icons which the student can activate with the computer mouse when needed.

While working through the simulation activity, students engage in a variety of activities designed to tap their reading, writing, listening, and organizational skills. They read background information about the incident, generate interview questions, conduct a phone interview with the sheriff and an interview with one of the rescued boys at the local hospital, and generate planning questions for their news report. During these activities, they can record information they gather in their reporter's notebook, use their tape recorder to check the accuracy of their notes, and read verbatim transcripts of their interviews as an additional check on their notetaking.

When students feel they have collected enough information, they may begin drafting their newspaper account. A window interface is provided for entering text. Students have the option of opening their reporter's notebook, which appears in a window adjacent to the writing/drafting window. They may also retrieve their tape recorder and replay any of the interviews to verify their notes. Two other tools they may access while they are drafting their article are a dictionary and a book of instructional tips on writing newspaper stories. Students may print their notes and drafts for use off-line as well as save their work for access through the program later.

This activity yields different types of assessment information. Several different kinds of information are tracked and

saved as separate files to be used for evaluative purposes after the student has completed the activity. The program is structured to provide teachers with the opportunity to assess student process as meaning is made from the program. Teachers can ask the following revealing questions:

- *What kinds of interview questions did the student generate?*

The quality of the interview questions gives insights into the student's comprehension of the incident. They reveal, for example, what the student recognizes as important and what he or she feels needs to be reported (as a response to the assigned task).

- *Did the student take notes of the interviews?*

The student's notetaking reveals his or her engagement with the program and grasp of individual study skills.

- *If the student did take notes, how accurate and complete were they?*

The quality of the student's notes reflects both listening skills and notetaking ability.

- *Did the student check the accuracy of the notes?*

This observation enables teachers to evaluate the student's self-assessment and self-monitoring ability.

- *What type of planning questions did the student generate?*

The quality of the planning questions provides additional clues to the student's comprehension and his or her ability to differentiate important details from trivial information.

- *Did the student make revisions to his/her initial draft of the news report? If so, what types of revisions were made?*

Each draft of the news report is saved as a separate file so that the teacher is able to trace the student's thinking and revision strategies over multiple drafts. These insights provide valuable information for guiding future instruction.

- *What does the final news report reveal about the student's reading comprehension? writing ability? and ability to accomplish the task?*

A 4-point rubric is used to score the final report for the three-dimensions listed above. Benchmark responses help teachers apply the rubric.

Using instruments that have interactive multimedia, such as the sample described above, to assess the language arts offers several promising features. First, it allows the assessment to occur in a more naturalistic context. Assessing listening skills by having students take notes of a phone interview, for example, is much more realistic than traditional paper/pencil tests of listening ability.

Second, the assessment focuses more on process than product. Because interactive multimedia authoring systems enable educators to compare a wide array of behaviors and performances, emphasis can be placed on examining the processes the student is using rather than on judging only the final product of his or her work.

Third, the results of the assessment are not effected because the assessing process is transparent to the student; for he or she becomes involved in it as an inquiry-driven activity that has been designed in an attempt to make it enjoyable. By

opting for particular media, the student moves behind the scenes of the incident to gather important information. These options built into the multimedia instrument also provide the student with a chance to customize the assessment to match his or her meaning-making strengths. For example, it permits students to listen to an audio version of texts that can also be read or to complete the program in a language other than English.

All of the discussion thus far has centered on the student as a "receiver" or "participant" in a multimedia program created by others. But there is another side of multimedia assessment that may make it even more powerful. It is now possible for students themselves to create and produce interactive multimedia presentations of their responses. Language arts teachers have traditionally relied on the representation of knowledge through the written and spoken word. But multimedia authoring tools will allow students to represent knowledge in vastly different ways—through films, through art, through music and a host of combinations of text and media. This will come as a blessing to many students who feel ill-equipped or disinclined to use the traditional ways of expressing what they have learned. Student-created multimedia presentations will offer teachers a completely new vehicle for evaluating student performance. We are only beginning to explore this possibility.

Multimedia Should Lead the way to Future Assessments

In recent years, the concept of literacy has been broadened beyond reading and writing. Many people now talk of "visual literacy," "computational literacy," "computer literacy," "scientific literacy," and more. Each of these types of literacy has traditionally been viewed by most educators in isolation with its own vocabulary and conventions. Interactive multimedia holds the promise of bringing many of these "literacies" under a single umbrella. As they are combined—or allowed to interact as they do in reality—they will promote assessment of the combined uses.

Some have called this comprehensive concept "information literacy" (Hancock, 1993). Information literacy is defined by an individual's ability to:

- recognize a need for information;
- identify and locate appropriate information sources;
- know how to gain access to the information contained in those sources;
- evaluate the quality of information obtained; organize the information; and
- use the information effectively.

Proponents of this *information literacy* perspective envision a literate-rich environment in which students engage in active, self-directed learning activities; pose questions about the content being learned; reflect on and assess their own learning; and take responsibility for their own learning. In such an environment, the role of the teacher changes from teller and dispenser of knowledge to facilitator, mentor, and coach.

In a very real sense, this is already happening with the development of performance assessment and the increasing reliance on portfolios, which virtually rely on the student's involvement as a self-assessor. As interactive multimedia contributes to our valuing of information literacy, our

view of literacy assessment will continue to change and expand. Technology will change what we assess and how we assess it just as an increasing understanding of language and thinking processes has already done that to a significant degree.

RESEARCH PERSPECTIVES
ON CURRICULAR,
EXTRACURRICULAR, AND
POLICY PERSPECTIVES

This page intentionally left blank

INTRODUCTION

James R. Squire

HARVARD GRADUATE SCHOOL OF EDUCATION

Research findings alone do not determine policy decisions. As the discussions in this part indicate, policy decisions are influenced by political, economic, and professional considerations as the leading edge of the profession seems to move continuously from one major thrust to another.

Too often, in American schools at least, the partisans of one approach or the other become so emotionally committed that they seem not to admit compromise. Thus, during recent years, the advocates of whole language and the leading "phonickers" seem more intent on scoring points on one another than on seeking a reasonable balance between skill and instruction in reading, writing, and literature experience. Yet some of the experimental programs discussed in this part have achieved their own balance over the course of their development. The Benchmark School model, for example, as discussed in this part by Irene Gaskins, demonstrates the success of a widely varied, eclectic approach in the instruction of delayed readers. The Reading Recovery program also targets the delayed reader with a wide spectrum of strategies; Maric Clay and Gay Su Pinnell's chapters describe the program's attempts to balance those strategies in a manner that is consistent with the specific needs of each learner. Kathryn Au and Claire Asam contribute a description of the integration of a process approach to literacy into the mastery-driven Kamehameha Elementary Education Program. California underwent a similar transformation in creating its Literature-Based curriculum. The state's attempts to infuse literature into a skill-based curriculum are chronicled by Phillip Gonzales and Mel Grubb.

This is an active, energetic time for curriculum reformers in every state. Strong reform efforts began particularly after the publication of the federal report on *A Nation at Risk* in 1984 and presently show no sign of abating. These efforts are typically realized in the creation of curricular standards. The purpose and parameters of the modern vehicle of reform are explored in the chapter by P. David Pearson. C. Jane Hydrick contributes a paractical view of this approach to reform, acknowledging pragmatic obstacles in her chapter "Setting Opportunity-to-Learn Standards." The paramount role of assessment in the movement to reform literacy education is

explored by Louise Wilkinson and Elaine Silliman's chapter "Alternative Assessment, Literacy Education, and School Reform."

The current dynamic climate necessitates discussions of where the accountability for change will ultimately rest. Robert Shafer's chapter discusses the various social and political institutions vying for the right to determine policy and set standards while Richard Allington and Sherry Guice examine the issues which define each contender. Sharon O'Neal and Susan Streeker investigate the potential effects of their efforts on textbook and instructional materials.

Presently, educators at many levels are attempting to standardize curriculum. The case study conducted by Karen Wixson, Charles Peters, and Sheila Potter, provides a keen portrait of this process at the state level in describing Michigan's development of its curricular standards. By contrast, John Richmond's chapter, which describes the United Kingdom's implementation of its curriculum, portrays a national approach to standardization. Should national standardization become a reality, cross-national studies of literacy achievement, such as the one presented here by Warwick Elley, may serve as our most indispensable design resources.

Despite the likelihood of such a movement, some of the major statements interpreting research emerging from the national curriculum study centers could have even greater long range impact. For example, the National Reading Research Center (NRRC) has investigated approaches to creating self-determined, motivated readers. Relying on the NRRC's extensive research, John T. Guthrie, Ann McCann, Cyndie Hynd and Steve Stahl describe classroom contexts which will promote life long literacy engagement. Similarly, 10 years of research support Sarah Warshauer Freedman, Linda Flower, Glynda Hull, and J. R. Hayes' report on the classroom implications of studies at the National Center for the Study of Writing. The pioneering collaboration of university and classroom described by Jeanne Paratore and Roselmina Indrisano in their chapter on the Boston University-Chelsea Project also promises to influence profoundly future instructional practices.

WHO DETERMINES POLICY, POWER AND POLITICS AND WHAT ARE THEIR ATTITUDES?

Robert E. Shafer

ARIZONA STATE UNIVERSITY

The answer to the above question is a complex one. If one looks at case studies of changes in policies affecting literacy education in a comparative way, the answer becomes complicated to the point that any unified answer may not be possible. The question may be answered only in a particularized way. The social and political forces that determine power and therefore influence policy in the United States in 1995, are different from those that determined power and influenced policy in 1965, or in 1945. Similarly, in the UK, New Zealand or South Africa differing social, political or ideological forces determine varying clusters of power that effect or determine policy on educational matters. The particular decision makers involved also carry attitudes that shape their decisions. It seems a simple proposition, although complex in the process of analyzing any individual policy change or determination. But is it a simple matter at all? Policy changes or determinations are made by human beings, individually or collectively and human beings are knowledgeable about matters of language and literacy in varying degrees, but all have attitudes about language—attitudes that may strongly affect their decisions. Politicians are no different from anyone when it comes to attitudes toward language. Their attitudes toward language influence their policy decisions relating to standards in the English Language Arts.

THE STUDY OF LANGUAGE ATTITUDES

The study of language attitudes became important in the sociolinguistic research of the 1960s. In Labov's (1966) well-known study of the social stratification of English in New York City, varieties of language attitudes of New Yorkers and "outsiders" were revealed toward New York City speech. These attitudes were pervasive throughout the social structure.

Labov reasoned that certain phonological variables could be cues to a person's social status; that is, when one heard these cues, attitudes emerged in the listener concerning the type of person who was speaking. In testing this hypothesis, Labov presented various samples of speech, each of which contained one of the variables found for a certain social class, to listeners who were then asked to make an estimate of the probable occupation of the speaker. The occupations ranged on a social scale from "television personality," which was presumed to have the highest social status speech, to "factory worker," which was presumed to have the lowest social status speech. Labov (1966) also found that in general, these judgments made were good predictors of the speaker's social class. Social stratification then, he concluded, exists not only with respect to the various elements of language, it also exists in the attitudes people have concerning these elements. There is further evidence that such attitudes toward dialects on the part of a given individual may not only reflect his attitudes toward the social class of a person speaking a particular dialect, but that his reactions may also include a whole set of other attitudes relating to the qualities of the dialect itself or more broadly, also concerned with those persons who speak that dialect. Apparently, language attitudes group themselves across and among various ethnic groups and social strata as well as sex, age and other factors. As Shuy and Williams (1973) have pointed out:

In the broadest sense, such attitudes, if they be defined, may begin to reveal the affective dimensions of dialect stereo-typing. (p. 18)

Considerable research has already been done on the effect language attitudes have on stereotyping teachers' attitudes and behavior regarding the speech of their pupils. Little research has been done on the attitudes of politicians and other policy makers and decision makers—outside the teaching profession—whose attitudes and behavior affect

educational policy. Such language attitudes seem to have affected policy decisions in the past to the extent that they have swayed national policy and have resulted in significant policy changes in the English speaking world. Often these attitudes are masked as “philosophical differences” and are therefore present in the realm of values and ideology. One of the possibilities explored in this chapter is the extent to which language attitudes may be used to pursue a social agenda. Actually, they extend not only to language but to the learning and teaching of language and seem to be particularly concerned with the learning and teaching of the mother tongue at least in the English speaking world.

The IRA/NCTE Standards Matter

When Janice Anderson, Interim Director of the Office of Educational Research and Improvements' Fund for the Improvement and Reform of Schools and Teaching (FIRST), quoted in *The Council Chronicle* (NCTE / IRA, 1994), notified the National Council of Teachers of English (NCTE) and the International Reading Association (IRA) that the funds for their Standards Project were being cut off after the first 6 months, one of her objections was that the proposed standards “focused too much on process” rather than “content” and did not address “issues” of a particular canon for children’s literature and “standard spelling” versus “invented spelling.” Although other reasons were also given, these, in particular, reveal attitudes which, although they may be characterized as stemming from “philosophical differences”, are more rightly to be seen as language attitudes. These attitudes reveal a lack of professional knowledge which today is part of the preparation to teach and is therefore specialized knowledge which is not held by legislators, bureaucrats, school board members, many school administrators, and other citizens unless they have had recent training which involves this particular knowledge. A “particular canon” for children’s literature, for example, means specified books which would be required for children to read and study in every school district in the country. Most teachers do not want such a “canon” because they know that most of the literature-based reading programs used in today’s schools draw upon the plethora of high quality children’s books of a wide diversity which they can tailor to individual children, classes, schools and communities. They already know that this literature exists and they are using it. Of what use would an unchangeable list of books prepared by someone in a far off place be to them?

The objection to “too much process” and not enough “content” reveals an attitude stemming from a lack of professional knowledge that educators have developed through their own experience as teachers and writers and through research. Many years ago, teachers concentrated almost exclusively on the written product, believing that the processes by which students achieve that product were largely unknown. As the decades passed and studies of creative processes and cognitive processes multiplied and ethno-methodological ways of studying writing were applied to students’ writing in schools and colleges, many teachers began to become aware of this research and certainly by the beginning of this decade, many teachers had not only heard of the writing process and

“process writing” but had incorporated it into their teaching. A term like “writing process” or process writing carries with it to those who have been made aware of the implications of hundreds of studies conducted over the last several decades. To those who have not yet been made aware of this exploration of the processes involved in writing, the term may sound like jargon.

“Standard spelling” versus “invented spelling” to the uninitiated, sounds as though it cannot really be an issue at all. Obviously, the logic probably goes—there is only one correct way to spell—the standard way. Why would any group of teachers want to invent another?

Although teachers have noticed the invented spelling of their young pupils for decades, a recent scientific investigation of inventive spelling was done by Charles Read (1975). His book, *Children’s Categorization of Speech Sounds in English*, was published as Research Monograph #17 in 1975. Read studied the ways in which children categorize distinct speech in which sounds based on phonetic similarities and differences. He found that children recognize specific and sometimes subtle phonetic relationships and proposed that these judgments may influence children’s initial encounters with spelling and reading. For one aspect of his research, he studied the invented spellings created by children in preschool and early elementary school grades and inferred from their spellings, aspects of their categorization of speech sounds. The invented spellings indicated how children group sounds together for spelling purposes in certain specific situations:

...These can be regarded as ‘forced choice’ situations in that the children sought to spell messages at will, using a limited set of known spellings. That is when the children wished a phone whose spelling is not suggested by the letter-names, they typically chose a known spelling for what seemed to them to be a similar sound. Ordinarily, they knew spellings for several phones, each related to the target phone in different ways, so that the direction in which the children typically made their choice suggests which similarities are most prominent. (p. 15)

Read (1975) found that many of his nonstandard spellings occurred regularly, when the same general principle seems to have been applied in the spelling of different sounds. It usually turned out that there was a plausible explanation in terms of the phonetic similarity, and rarely any other. Read noted further:

...Many parents may quite unknowingly pass along to their children, even at the scribbling stage, the belief that English spelling is governed by a standard of correctness, and that it is hazardous to predict the spelling of words. This attitude is probably a prevailing one in our society. (p. 19)

Here, Read (1975) points out a significant language attitude about spelling which clearly affects not only parents but certainly legislators, bureaucrats, school board members and school administrators as they act in their various professional roles. Read went on to show that “children in kindergarten and first grade often share some of the categorical judgments seen in the invented spellings.” This results in the “spontaneous linguistic performance” of invented spelling, “the phonetic basis of which is quite clear in certain cases” (p. 20).

Perhaps the most significant implication of Read's research is that children's grouping of speech sounds into phonemes allows them to make up an orthography which may initially ignore phonetic or even phonemic distinctions, but that they will make up a system of invented spelling which will not at once be standard spelling, is inevitable. But such a system will reflect their own organization of speech sounds and by continued exposure to standard orthography through reading and writing in a continuously encouraging and accepting atmosphere, standard spelling will appear. That this is *not* done through memorizing lists of "spelling demons" or reading red-penciled incorrectly spelled words over and over again has become obvious to many teachers in the past decades. Teachers expect "invented spelling" on the part of their elementary school pupils and know, as a result of Read's research, and other similar scholarly work in this area, that the first invented spellings will contain consonants alone. The vowels appear later. Read's research also indicates:

... It appeared that none of these children had any special difficulty in adopting standard spelling.... It seems more adequate to regard their spelling as based on tacit hypotheses based on phonetic relationships and sound spelling correspondences, which the child modifies readily as he or she encounters new information about standard spelling. (p. 30)

Many teachers have come in the past decade since Read's research to expect the phenomenon of invented spelling on the part of their first, second and even their 3rd-grade students and many parents are familiar with it in their children's writing during preschool years. There are still some principals who refuse to allow teachers to post children's writing which involves invented spelling on bulletin boards for fear that parents will see it. But many teachers have used children's writing with invented spellings as an opportunity to explain the phenomenon to parents so that they will not censor children at home for doing invented spellings, but regard their appearance as a natural step toward learning standard spelling and the conventions of writing.

But we cannot expect legislators, school board members and other citizens, all of whom influence educational policy and may, indeed, write and review standards, curriculum documents and new policies in the English Language Arts, to know of Read's (1975) research or its implications. We can expect them to listen carefully to teachers, researchers and curriculum workers on matters of curriculum and educational policy—or can we?

A NATIONAL CURRICULUM IN ENGLAND AND WALES

In his book, *English Teaching Since 1965: How Much Growth?*, David Allen (1980) describes his mood as an English teacher in the England of the early 1960s:

It was an exhilarating, buoyant time of high hopes, of great ferment. Each new book seemed to stretch the boundaries of my subject. There was a confidence that we English teachers were doing a vital job. To subscribe to the *Use Of English* was to draw on a source of energy. This vigorous enthusiasm was sometimes

lifted to the level of crusade, to the humor of teachers of more workaday subjects.... One of the critical centres was the belief that children should be more involved, that lessons should have more give and take, that what children brought to their learning was important. For that reason alone, conversation and discussion were important; many remembered their own passive learning and encouraged children to talk round experience, exchange views. Above all, English should be enjoyable, for joy was seen as a great mover and an admirable stirring of mind and heart together. Drama made a deep contribution and literature, an indispensable part of our work, was the main source of enjoyment. (pp. 1, 2)

This model of teaching and learning described elsewhere as a "personal experience model" (Shafer, 1983) had been developing in England (and other countries as well) since the 1930s. The model had been refined over several decades and except for a small conservative group, had achieved acceptance by most teachers and by most segments of the British public. During the 1940s and 1950s, the British primary school had become widely recognized as a model of excellence in education. The Education Act of 1944 extended the movement of "informal education" into the postwar period. The focus continued on the use of personal experience and activity as the basis for classroom organization, teaching and learning, giving shape to an integrated primary curriculum, in which reading and writing were used as a means of learning and were not taught as ends in themselves. Visitors came from a variety of countries to see these schools in action, and in the 1960s, many Americans visited them. British teachers came to the United States to give workshops in "open education" and many schools were built on the open model.

In August 1963, the Minister of Education, Edward Boyle, asked the Central Advisory Council for Education in England to review primary education in England in all its aspects and also to consider the transition to secondary education. The report of this review, *Children and Their Primary Schools* (more widely known as the Plowden Report), was released on October 28, 1966. The recommendations of this report for children's writing were entirely consistent with the personal experience model and proposed that the primary schools continue in that tradition:

What is most remarkable now in many infant schools is the variety of writing: writing rising out of dramatic play, writing associated with and explaining the models that are made, writing which reflects the sharpening of senses.... Much of the writing derives from the experience of individual children. (p. 218)

It seems clear that the Plowden Report cemented many of the practices of primary education which had developed during the child-centered decade from 1930 onward, and which had become known as "open education" or "informal education" or the "unified curriculum." Such educational practices also came to be called the "integrated day" or simply the "informal approach" to education. Using personal experience in writing and reading was a substantial part of education theory and practice arising from this position, placing value on using children's interests and experiences in all areas of schooling.

The concepts of personal experience and informal education were tested again in the 1970s, when the then Secretary of State for Education, Margaret Thatcher, set up a committee under the chairmanship of the noted Oxford University historian, Sir Alan Bullock, to inquire into the teaching of reading and other uses of English. The Committee report (1975), *A Language for Life*, proved to be another endorsement of the personal experience model. In the recommendations devoted to writing, the Bullock Report came out strongly in favor of writing as an activity integrated with other language experiences and not as a separate subject. The report commented on the fact that writing in the secondary schools had traditionally been used to assess the students' knowledge of the subject matter, but noted that there had been an increase in the amount of personal writing in recent years. In acknowledging the necessity to encourage personal, spontaneous writing, and also noting the teacher's desire to foster growth of technique in writing, the report recommended attention to "the fact that the writer's intention is prior to his need for technique.... The teacher who aims to extend the pupil's power as a writer must therefore work first upon his intentions and *then* upon the techniques appropriate to them" (p. 164). Such statements served not only as a confirmation of the personal experience model of reading and writing within the British educational tradition, but also as validation of the efficacy of the model in education practice in primary and secondary schools.

The 1960s saw a growing debate between teachers and others within the education professions and a small group of conservatives, who in 1969 began "the Black Papers," a series of attacks on educational practices of the day—including calls for a "return" to using only standard English in schools and increasing the teaching of formal grammar. In their recent history of the teaching of English in England, Burgess and Martin (1996) put it this way:

We think the story goes like this. Through to the beginnings of the 1960's, a new progressive framework was being constructed in which the central elements were comprehensive schooling, an altered examination system, the emergence of new subject teaching associations and the steady accumulation of agreed lines of a common English teaching practice. How deeply this was founded it is hard to tell. It is possible to overestimate the depth and degree of agreement but also to underestimate the durability. The 1960's and early 1970's look like years of consolidation of this framework as well as of development and innovation. A central element in this was the emergence of the School's Council with something like general acceptance of a role for professional, teacher responsibility in curriculum and examinations reform. (p. 9)

As criticisms mounted, and teachers spent more time on the defensive, an attack came from one whom teachers considered their friend—a Labour prime minister. In 1976, at Ruskin College of Oxford University, James Callaghan called for a new demand for efficiency and value for money and a "relevant" curriculum. He agreed, surprisingly, with the conservative right that "lowered school standards" were supposedly somehow responsible for the country's dire economic plight.

Margaret Thatcher became Prime Minister in 1979, with the advent of a new conservative government. During her

first two terms poverty and unemployment both increased and affected the atmosphere of most schools as the stresses pressed hard on the teachers. There were increased legislative attacks on unions which served to increase the tensions between the government and the main teachers' organizations, leading to a growing politicization of previously politically neutral teachers' associations. Ignoring the improvement and achievement as measured by examination results, Thatcher declared that education was "a disaster area" and for this, she blamed teachers, teacher educators, and the local education authorities.

In the 1980s there had been any number of government reports dealing with curriculum matters. There was also a plethora of inspectorate reports on individualized schools and colleges. By the mid-1980s, government interest and concern for matters of curriculum were firmly established in the public mind. It now became quite normal for ministers and inspectors to make detailed comments on questions of curriculum; for example, matters of teaching grammar and the place of various works of literature in the school program.

Kenneth Baker succeeded Sir Keith Joseph as Minister of Education in 1985, and began immediately to make pronouncements concerning a national curriculum. These were made to appear as though they were natural extensions of previous policies and development. They were all made to fit neatly together—the importance of education for the economy, the need to ensure basic educational standards, the desirability of putting curbs on the power of the teaching profession over curriculum matters.

Prime Minister James Callaghan's call for the making of a "strong case for the so-called core curriculum of basic knowledge" was answered in the Education Reform Act of 1988. A 10-subject curriculum was approved and a National Curriculum Council based in York was appointed with the staff to develop the attainment targets within the "key stages." A separate Examinations and Assessment Council was created for evaluation purposes. Pupils were to be tested at ages 7, 11, 14, and 16.

The working group on school subject English took as its starting point the report of the Kingman Committee (1988) which was still sitting when the national curriculum was introduced so that the English working group got a late start because Baker did not wish to appoint it until the Committee had made its report. The Kingman Committee (chaired by Sir John Kingman, Vice-Chancellor of Bristol University) was supposed to recommend a model of the English language, whether spoken or written, which would serve as the basis of how teachers are trained to understand how the English language works and which would also inform professional discussion of all aspects of English teaching; recommend and guide teachers on how far and in what ways the model should be explicit to pupils, to make them conscious of how language is used in a range of contexts; and to recommend what, in general terms, pupils need to know about how the English language works and consequently, what they should know and be able to do involving the workings of the language. But this charge masked the government's real intention and their language attitudes. Duncan Graham, First Director of the

National Curriculum Council notes the government's "feelings" and those of the right-wing conservatives about the state of English teaching (Graham & Tyler, 1993):

A more fundamental problem was the growing feeling that teachers should no longer correct mistakes in spelling or punctuation such as the use of full stops and capital letters, because it obstructed children in their creative writing. Formal grammar teaching had largely disappeared as a part of the philosophy that had been seen in mathematics: children could only learn through enjoyment and should not be inhibited by the use of such words as noun, pronoun, and verb. They would learn the structure of language through use. The same arguments dictated that children should never be asked to learn a list of spellings (sic) because it was mechanistic, with the words being used out of context. Children should learn spelling by putting their own thoughts on paper and then being gently reminded when a word was misspelt (sic) in context. Too many teachers did not even do that. (p. 45)

The "feeling" that Graham cites, which was extensively referred to in the press and on TV, indicated the language attitudes of journalists and of the "mandarins" as the top government ministers in the Conservative Party were referred to—confusing invented spelling with "mistakes," referring to identifying parts of speech in the peer editing of student's papers as unwillingness to teach formal grammar and describing using peer editing by pupils as "teacher unwillingness" to "correct mistakes." These attitudes, undoubtedly, came from the Minister's own memories of schooling and a lack of knowledge of current research and practice.

Certainly the same attitudes were widely held by many members of the public and by many top government officials. The Kingman Committee (1988) recommended a model which involved:

1. The forms of the English language, e.g., sounds, letters, words, and how these relate to meaning,
2. Communication and comprehension—how speakers and writers communicate and how listeners and readers understand them,
3. Acquisition and development—how the child acquires and develops language, and
4. Historical and geographical variation—how language changes over time, and how languages which are spread over territories differentiate into dialects or, indeed, into separate languages. (p. 17)

The Committee rejected the teaching of formal grammar but took a position for the teaching of Standard English. The Kingman Report (1988) was something of an embarrassment to the government because it was expected that the Committee would strongly recommend the teaching of formal grammar, which they did not. The Committee had both English teachers and linguists as members. They took both oral and written testimony from a number of specialists in language teaching and referred to many recent studies of the teaching of grammar. Their position on grammar was stated as follows:

Widely divergent views are now held on the value of the formal elements of knowledge about language. Many people believe that standards in our use of English would rise dramatically if we

return to the formal teaching of grammar which was normal practice in most classrooms before 1960. Others believe that explicit teaching or learning of language structure is unnecessary. We believe that both these extreme viewpoints are misguided. Research evidence suggests that old-fashioned formal teaching of grammar had a negligible, or because it replaced some instruction and practice in composition, even, a harmful effect on the development of original writing. We do not recommend a return to that kind of grammar teaching. It was based on a model of language derived from Latin rather than from English. However, we believe that for children not to be taught anything about language is seriously to their disadvantage. (p. 12)

Professor Brian Cox of Manchester University had been an author of one of the Black Papers. He had also been a member of the Kingman Committee. Undoubtedly, when the Minister of Education at the time, Kenneth Baker, appointed him Head of the Working Group to prepare proposals for English in the National Curriculum, he considered him a "safe" appointment, leaning to the conservative position on the teaching of English.

In the primary and secondary proposals which the Working Group developed, specific knowledge about language, for example, grammatical knowledge, was considered an integral part of work in English, and not a separate body of knowledge to be added on to the traditional English curriculum. The notion was that as pupils extend their skills, abilities, and understandings in speaking, listening, reading and writing, the teacher's role is to highlight those aspects that will lead to a greater awareness of the nature and functions of language. This awareness should in turn, contribute to the pupils' own sensitivity as language users. For this reason the Working Group did not propose that knowledge of language should have its own profile component. To treat it separately, they thought, would be to risk giving rise to the misconception that it should be separately taught, and evaluated, rather than integrated within the speaking, listening, reading and writing activities of the English curriculum. Accordingly, the content they saw as essential to knowledge of language was incorporated in the three profile components, speaking and listening, reading, and writing, both in the statements of attainment and in the programs of study. Although the Working Group report showed a number of ways in which grammar could be taught inductively, including a long illustrative account of such a practice in a classroom dialogue, the reception of the final report by the press and the ministers was to the effect that grammar had been neglected completely. In his book, *Cox on Cox*, Brian Cox describes the reception of his Committee's proposals by the Minister and the press:

When our first report on the primary stages was submitted to Mr. Baker at the end of September 1988, he felt that we had given insufficient emphasis to the teaching of grammar. In his proposals, printed at the front of the report, he asked that "the programs of study for writing should be strengthened to give greater emphasis to the place of grammatical structure and terminology within the matters, skills and processes otherwise covered. This was seized upon by the press, which in headlines proclaimed that the Report was weak on grammar. . . . The *Mall On Sunday's* headlines (13 November, 1988) were: 'Thatcher Furious With Trendy Experts' and 'English Report Fails The Test.' The article began: 'A report telling schools to ignore English teaching in favor

of trendy methods has infuriated Mrs. Thatcher,' and continued by saying that the lengthy report "dismisses grammar in a few paragraphs." (p. 7)

In his books, *Cox on Cox: An English Curriculum for the 1990s* (1991) and *The Great Betrayal* (1992), Brian Cox details the various pressures on the Working Group as they struggled to prepare the "statements of attainment" and "programs of study" for subject English in the National Curriculum. Unfortunately, the greatest travail for English teachers dealing with the National Curriculum was yet to come.

The years 1991 and 1992 saw the Working Group's proposals tried out in many schools. In July 1992, the government, through a report of the National Curriculum Council (*National Curriculum English: The Case for Revising the Order*) indicated its intention to rewrite the Orders that the Cox Committee had so carefully developed. As the government pushed on with its plans to revise the "attainment targets" in English through late 1992 and early 1993, the various government proposals began to leak out to the press. In the February 3, 1993 *Independent*, a number of these changes to the original recommendations of the Cox Committee was described as follows:

...Teachers will have to correct six and seven year olds who speak dialect and persuade them to speak "standard" or grammatically correct English. They must wait until the pupils are about sixteen before explaining that the use of split infinitives in speech is sometimes socially acceptable. Critics say the proposals, which are expected to be approved by the National Curriculum Council tomorrow, are a triumph for traditionalists. They will anger English teachers, who are already threatening a boycott of national testing at fourteen. The document shows that the English curriculum for all state school pupils, age five to sixteen, will be laid down in unprecedented detail and that the way teachers teach is to be prescribed in the National Curriculum for the first time. At about age thirteen, pupils will be taught to use apostrophes and speech marks accurately. Sixteen year olds will be required to learn how to use a semicolon and a colon. Eleven year olds should be taught to use commas. Seven year olds will have to use capital letters and full stops (periods) in most sentences and sound out letters in an unfamiliar word to show they have been taught to read partly by the phonics method favored by the traditionalists. (p. 1)

Other similar strictures dealt with the use of Standard English, defined as "grammatically correct English spoken in any accent." The document also proposed that according to the account of the February 3, 1993 *Independent*, 7-year-olds should be "sensitively" introduced to Standard English, to use sentences in which the subject and verb agree, the syntax is logical and verb tenses are correctly used. Most 9-year-olds should say "isn't" and "haven't" rather than "ain't" and most 11-year-olds should use negatives, comparatives and superlatives correctly, as in "we haven't seen anybody" and "the smaller of the two but the smallest of the three" (p. 3).

These and similar proposals were continuously leaked out to the press during the Spring of 1993, and there was much discussion among teachers and school administrators. It became clear that civil servants, acting at the behest of John Patten, then Minister of Education, had rewritten the English "attainment targets" and tests without the approval of Profes-

sor Cox or any of his Committee members, or consultation with any teachers' groups. On June 1, 1993 over 93% of the teachers and school administrators in England and Wales successfully refused to give the tests and only "a handful" of schools actually gave them.

An analysis of the revised proposals which ultimately became the actual Orders was carried out by the National Association of Teachers of English (NATE) and reported on by its past chairperson, Henrietta Dombey (1993), at the organization's conference at the University of Brighton. Though it is not possible to cite her complete report, certain aspects of her presentation are quoted in their entirety since they clearly reveal the language attitudes of those who did the revisions:

The linguistic trip wires, the concern with the niceties of Standard English, and with form at the expense of function, are there in Writing too, and make an even heavier presence now that spelling and handwriting have been brought back into the Writing fold. The very first statement requires the average five year old to "identify where full stops (periods) should go in their own writing." At age seven, "children should write sentences in which," as in their spoken language, "subject and verb agree." The theme continues. At age nine, they must "use correctly and understand the function of nouns, pronouns, adjectives and adverbs." At age eleven, "they must write in complex sentences, controlling syntax and connectives and spell correctly polysyllabic words (such as accommodate and irrelevant) that do not conform to regular patterns." As we go up the levels, these formal niceties are increasingly accompanied by more substantial requirements to do with conveying ideas and themes, writing with conviction and clarity, until at sixteen, the pupil is required to "write confidently in a personal style." But an impersonal style is required much earlier, at age eleven. Pupils must now achieve the impersonal before the personal, running counter to all we know of writing development. And again, we need to be aware of what has been lost. All reference to audience and purpose have disappeared, as has the word "appropriate." So much for our substantial body of research into writing development, started by James Britton's research team at the London Institute over twenty years ago. Story structure has gone too, apart from the sequencing of events. So much for the work on narrative over the last fifteen years. Gone too are revising and redrafting, never mind all the work on this, largely inspired by Donald Graves, carried out on both sides of the Atlantic in the last two decades, an awareness of the differences between spoken and written English has, of course, completely disappeared. Learning to write has been reduced to little more than a matter of learning correct forms and to use these on demand. (p. 10)

After the boycott, which attracted international attention, the School Evaluation and Assessment Authority was merged with the National Curriculum Council to form the School Curriculum and Assessment Authority and a reevaluation of English in the National Curriculum was undertaken. A new English Order was produced in 1995 and sent out for consultations. At present, the Conservative government's attempts to influence the content of the English curriculum to suit the language attitudes of a few of those in the highest circles of government, do not seem to be evident in the new proposals. A further study by Professor Ronald Carter (1993) of the University of Nottingham indicates how far the government proposals went, how deeply embedded their procedures

were to change the tests and what their ultimate political goals may have been.

During the past few years, a number of linguists and English language specialists, myself included, have found ourselves at the centre of cultural debates about the English language, its teaching, and its formation as a subject in the new National Curriculum. It has been a fascinating, if somewhat enervating exercise. ... The fascination comes from interrogating and attempting to understand better the ways in which the very terms of debate are rooted in ideologies, in the relationship between language and power, and in particular, in the different understandings of what is the *proper* in Proper English. ... This will provide the main focus. This article is not about the rights and wrongs of split infinitives or subject verb agreements, but rather about the attitudes to such matters which the discourses about them reveal. (p. 4)

Carter begins his article with a much quoted statement by the British heir to the throne, Prince Charles, which he deems a useful starting point: The statement was made in 1989, one week after the publication of the Cox Report:

We've got to produce people who can write proper English. It's a fundamental problem. All the people I have in my office, they can't speak English properly, they can't write English properly. All the letters sent from my office, I have to correct myself, and that is because English is taught so bloody badly. They want people who write good English in right place for the future, it cannot be done with the present system and all the nonsense academics come up with. It is a fundamental problem. We must educate for character. This matters a great deal. The whole way schools are operating is not right. I do not believe English is being taught properly. You cannot educate people properly unless you do it on a basic framework and drilling system. (Prince Charles, 28 June, 1989)

Prince Charles also made pleas for the centrality of Shakespeare in the curriculum and in a subsequent speech on the degeneracy of the modern English language, particularly in relation to the *Book of Common Prayer*. He also argued with great conviction that God speaks English (Carter, 1993, p. 5). The keyword "proper" used by Prince Charles is also revealing of an attitude—an attitude concerning the views of English and English teaching encoded in terms of social propriety. Also the word "drill" reveals an attitude toward teaching which is that teachers instruct pupils in the correct forms of the language—using techniques which allow pupils regular practice in these forms. The word "drill" is especially revealing in that it derives from a militaristic context, in fact from the army parade ground. It seems to reveal an attitude toward the relationship of the individual pupil or student who is required to be in step with a series of instructions issued by someone invested with authority. Language drills provide the all-important framework within which differences are, albeit superficially, eradicated and order established.

Carter also points out that the word "standards" must be noted as revealing of an attitude. He points out that "especially in the discourses of many politicians and their media allies, there is a constant slippage from the word 'standard' to educational, behavioral and social *standards*." To illustrate this, he cites an example provided by the former Chairman of the British Conservative Party, now a television personality and a past member of the Kingman Committee:

... We've allowed so many standards to slip.... Teachers weren't bothering to teach kids to spell and to punctuate properly.... If you allow standards to slip to the stage where good English is no better than bad English, where people turn up filthy—all those things cause people to have no standards at all, and once you lose standards then there's no imperative to stay out of crime. (Norman Tebbit, Radio Four, 1985)

Here we have standards for language use magically transformed into standards for behavior. The language attitudes become attitudes toward persons exhibiting antisocial behavior. Antisocial or criminal behavior is associated with speakers of incorrect language and English teachers are at fault because they allow this to happen. The whole process illustrates the unambiguous connection between standard language and social and political power and helps explain the much quoted statement that any standard language is no more than a dialect with an army and a navy. In the history of the English language, such a process accelerated during the 18th century, in particular, coinciding with the economic growth of a centralized nation state linguistically based on the East Midlands' dialect of the southeast of the country. Ann Shreeve (1993) comments on Carter's (1993) article in her editorial in *English in Education*:

He comments on what we know about language—that it is subject to change; that it reflects and encodes social and cultural patterns; and that it is rooted in texts and context. He juxtaposes this with a government whose aim is to control a culturally diverse society by imposing national unity through a monocultural national curriculum. Imposing "proper language" is one way in which the government has sought to do this—a sort of "ethnic cleansing through language" which could silence many groups in society by undermining their confidence to speak out.

Decision making about school matters—particularly curriculum matters in England and Wales—had largely been done in the years before the establishment of the national curriculum by the appointment of national committees or commissions which were given a specific charge. These committees made a thorough study of the issue using the testimony of experts, professional associations, and scholarly leaders. The committees' recommendations are then formalized in a report to the key government official who may or may not accept it in part or on the whole. It is then translated into official policy. Until the advent of the National Curriculum, specific matters of curriculum content such as the teaching of grammar had rarely been dealt with by the government and were left to the local education authorities and individual schools. The advent of the National Curriculum in 1988 represented a complete change in national policy. In contrast, in the American system where the power for educational policy decision making is centered in the 50 states, the federal government historically has had only the power to initiate, recommend, and fund (usually a key incentive) programs. The recent move by the federal government to fund national content standards in the various subject fields, perhaps in the hope of establishing a national testing program, may signal an attempt to change national policy on curriculum development by shifting power to the federal government through a national testing program.

As we see from a recent bill introduced to Congress to make English our national language, we need to recognize that every time the question of language surfaces, as it has in this bill, we must consider Gramsci's words:

...It means that a series of other problems are coming to the fore: the formation and enlargement of the governing class, the need to establish more intimate and secure relationships between the governing groups and the national "popular mass," in other words, to reorganize the cultural hegemony. (Gramsci, 1985)

The cutting off of funds to the NCTE / IRA Standards

Project may be viewed as a signal that the issue of language may well be coming to the fore again in our country and it may well be, in Gramsci's words revealing of a change in our own social and political relationships. We would do well to examine the language attitudes of our own educational policy makers and decision makers whether on local district school boards, in state legislatures, or the Congress of the United States. When the critical question came before British teachers and educators, they acted with a unified, professional perspective. Will we do likewise?

ALTERNATIVE ASSESSMENT, LITERACY EDUCATION, AND SCHOOL REFORM

Louise C. Wilkinson

RUTGERS UNIVERSITY

Elaine R. Silliman

UNIVERSITY OF SOUTH FLORIDA

LITERACY AND THE ROLE OF LITERACY EDUCATION

Literacy is more than learning to read and write. Listening, speaking, reading, writing, and spelling are interrelated, since all are communicative processes. Literacy includes both oral and written communications. At one level, being literate is a confirmation of the social identity as a full participant in a community. In addition, since language transcends immediate temporal and spatial constraints, it is a potentially powerful metacognitive tool for creating, understanding, and revising ideas about the world. This chapter presents an analysis of literacy and its assessment in the context of American education reform, particularly with regard to the systemic school reform movement.

Integrated perspectives about the relationships between language and learning share the view that integrating communicative processes—listening, reading, speaking, and writing—is the route to literacy. This view undergirds the *emergent literacy* and *whole language* educational approaches, have been applied in regular education settings (Weaver, 1991) and in special education settings with students described as learning disabled (Rhodes & Dudley-Marling, 1988). This perspective is consistent with recent research on the *writing-process* or *authoring* approaches (e.g., Sulzby, 1990), including integration into *whole literacy* programs involving cultural minority children (Au, Scheu, Kawakami, & Herman, 1990; Bloome, Harris, & Ludlum, 1991; Kawakami-Arakaki, Oshiro, & Farran, 1988; Shuy, 1988; Staton, 1988; Teale & Martinez, 1989). The

communication-process perspective in language learning disabilities is similar, with its emphasis on the integration of language intervention into regular and special education classrooms (Silliman & Wilkinson, 1991).

Being literate can be seen as a continuum that transcends the oral and written media of communication, with different discourse styles overlapping both media (Wallach, 1990).

Consider the following example. Across the oral and written media, one can select more literate styles—styles that are more linguistically explicit, content-focused, and impersonal; alternatively, one can use a more personal, communication-focused, and less explicit oral style. The selection of a style is dependent on several factors including:

- the purposes for communicating,
- the role relationships between discourse partners,
- the temporal and spatial aspects of the discourse, and
- the medium of communication.

Because communication is purposeful, the selection of a style is heavily influenced by the first factor—the goal or purpose.

The Purposes of Communication

It is interesting to note that the functional nature of classroom communication has not been a major focus in past research on literacy learning.

Understanding the purpose of communication is relevant regardless of whether the task is one of comprehending or producing narrative and expository discourse in either the

oral or written domain (Brown & Palincsar, 1987; Palincsar & Brown, 1984, 1987).

In the next section, other important aspects of verbal communication are considered, including: (a) the relationships between speakers, (b) constraints imposed by temporal and spatial elements, and (c) the choice of the medium (oral versus written). Adequate understanding of these aspects of communication is a necessary background for connecting literacy to learning.

Speakers' Roles

During conversations, speakers and listeners constantly monitor and negotiate the use of language as interaction unfolds (Biber, 1988; Horowitz & Samuels, 1987). Social and cultural experiences influence the selection of discourse style and particular choices of words. Consider the following example of an individual presenting a lecture. In this situation, the speaker cannot assume that the audience is familiar with basic definitions and applications; thus, the speaker must organize discourse in a more linguistically explicit, or literate, manner. But, the speaker can still monitor whether listeners seem to understand and be interested in the topic and how it is being presented. As a result, the speaker has opportunities to clarify what is being said or revise how it is being said as these active feedback signals are processed and interpreted. The audience must also select more literate comprehension strategies because selective attention to essential information is crucial, as is continuous monitoring by each participant of his or her state of comprehension (Horowitz & Samuels, 1987; Sternberg, 1987).

Alternatively, when the relationship is one of reader-author, direct feedback is not possible, but variation does exist. Harste, Short, and Burke (1988) and Meyer (1987) note that writing, during its production, involves speaking to a real or imagined audience. The actions of reading and listening, in turn, are dependent on inferring the speaker-author's plans, or underlying purposes, for communicating the message. Thus, identical to the speaker-listener role relationship, the author-reader relationship is foremost of all social interactions (Anders & Pearson, 1987; Meyer, 1987). It involves the construction of dialogue between the author and reader in which the reader acts as an interpreter of the author's purposes and meanings. The reader, in turn, becomes an interpreter of his or her own intentions and meanings when these are written down for others to interpret (Tierney, Lazansky, Raphael, & Cohen, 1987).

Temporal and Spatial Aspects of Communication

Temporal and spatial factors affect communication to a great extent. For example, in the case of one family member writing to another, the presumption is that a high degree of shared knowledge exists about family members. This familiarity forces the choice of a more oral and personal style of communication. Also, when communication takes place in a shared physical setting within the same temporal framework, the need for linguistic explicitness is reduced. In contrast, when

the speaker is giving a lecture and visual aids (transparencies and videotapes) are used as referents, the style becomes more literate. When communication is displaced in time and space, as is the case when the speaker is an author and the listener is a reader who is unfamiliar with the topic, then the entire communicative context of interaction must be reconstructed using verbal means alone. This reconstructive process is the recreation of what an audience needs to know in order to meet the purposes of communication (Cazden, 1988).

The Medium of Communication

Differences between the oral and written media influence comprehension and production. When discourse is written down, it has permanency. The reader can work with an understanding at his/her own rate and use different metacomprehension strategies (Anders & Pearson, 1987; Baker & Brown, 1984a, 1984b; Biber, 1988; Gavelek & Raphael, 1985). Metacomprehension strategies are concerned with how cognitive activity is modified in order to facilitate and monitor one's state of comprehension (Gavelek & Raphael, 1985; Palincsar & Brown, 1984; Paris, 1991). For example, the selection of metacomprehension strategies depends on how the purposes of reading are understood and the type and complexity of discourse structure, such as narrative versus expository structures. Comprehension breakdowns may be intentionally repaired by rereading, looking up unfamiliar words, self-questioning, or, even, asking another for assistance. Essential information may be identified by skimming content, underlining, outlining, or note-taking for subsequent summarization.

Similar to the more skillful reader, the skillful author also can engage in a more controlled way in planning, organizing, editing, and revising the content to be communicated, as well as the linguistic forms of communication, over a period of time (Raphael, Englert, & Kirschner, 1989). As a literate mode of communication, writing is more integrative than the oral mode. Large amounts of information can be condensed into the discourse through such linguistic devices as subordination, nominalization, adverbial (Biber, 1988; Scott, 1988, 1989), and other cohesive devices that tie meaning together semantically within-and-across sentence boundaries (Hasan, 1984a). Hasan (1984b) has refined the notion of cohesion into one of cohesive harmony, the process by which chains of reference thematically unite semantic and syntactic information. A working knowledge of "cohesive harmony" influences knowledge of literacy, including children's developing metastrategies for becoming more effective speaker-authors or listener-readers of narrative and expository discourse (Cox, Shanahan, & Sulzby, 1990; DeStefano & Kantor, 1988; Eller, 1989).

Finally, regardless of the style of communication, the oral medium places a premium on "speed of production and comprehension" (Biber, 1988, p. 42). Speaking is bounded in time and is often fragmented in character because of transient breakdowns in planning or executing what to say. False starts, silent and filled pauses, revisions, and word and phrase repetitions are common. As a consequence, listeners must also

work under the pressure of time in order to understand what is being said, as anyone knows who has ever sat in a classroom trying to make sense of the vast array of information being communicated.

In sum, this brief discussion has provided an expanded perspective on literacy, to include both oral and written domains. At the broadest level, being literate is a confirmation of the social identity as a full participant in a community. In addition, since written language can transcend immediate temporal and spatial constraints, it is a potentially powerful metacognitive tool for creating, understanding, and revising ideas about the world. We will now discuss some recent changes in education policy in the United States that may powerfully affect classrooms and the roles of literacy educators.

CURRENT TRENDS AND NEW DIRECTIONS IN AMERICAN EDUCATION: SCHOOL REFORM

Recently, the concept of systemic school reform (SSR) has been introduced into the public debate about education in the United States, as a way to improve schooling throughout the country (Consortium for Policy Research in Education, 1991). Its introduction will change American classrooms and have profound consequences for the ways in which language and literacy are taught, learned, and assessed.

The importance of the *systemic school reform* is exemplified by recent legislation introduced by the Clinton administration's major school reform bill, *Improving America's Schools Act of 1993* (Goals 2000). The SSR is the foundation for the legislation.

The SSR refers to the process of making and implementing educational policy; the notion is to make it more like effective teaching and learning in classrooms and less like a top-down "teaching is telling" mandate from high level administrators and legislators (Elmore, 1993). The SSR emphasizes the need to find ways of communicating more effectively, so that making educational policy is a good process for all involved.

The concept incorporates a design for a systemic state structure that supports school-site efforts to improve classroom learning and instruction. The idea is that the structure be based on clear and challenging standards for students' learning; policy components would be tied directly to standards that support each other and guide classroom teachers and building administrators about how to optimize instruction. Thus, the states are seen as the critical providers of two fundamental aspects for universal educational excellence: (a) a unifying vision and set of goals, and (b) a coherent system of instructional guidance.

Common Vision of SSR

Regarding the first aspect, each state must provide coherent direction for educational reform throughout the state and each state must have a common vision of what schools should be like. The value of providing an intellectually stimulating and engaging education for all students is at the heart of the

matter. Equity and equality reign here. Both coherence and a point of view must be accommodated.

Elements

Regarding the second aspect, the elements of SSR address how to provide a coherent system of instructional guidance. These elements include the following:

1. *Curriculum frameworks and materials:* Curriculum frameworks set out the best consensus in thinking in a field about the knowledge, processes, and skills that students need to know in each core curriculum area. The emphasis is on in-depth understanding, higher-order thinking, problem solving, hands-on experiences, and the integration of content and pedagogy. One often cited successful example of a curricular framework is the *National Council of Teachers of Mathematics* (NCTM, 1989) mathematics standards. Schools will select specific curriculum materials that support the instruction guided by the frameworks.
2. *Teacher education and professional development:* States should ensure that both new and continuing teachers have both the knowledge of subject matter, pedagogy, and instructional skills so that they can teach the content specified by the frameworks. States must support excellent programs to prepare teachers and exhibit a commitment to the continuing professional development of teachers.
3. *Accountability assessment:* States must develop a system to measure and report what students know, which is tied to what the curriculum frameworks specify. Assessment instruments require attention and support commensurate with the significant role they play in the system. Instruments must be developed that reveal the knowledge assumed to have been learned; exclusively relying on paper-and-pencil multiple choice tests will not address this need.
4. *Governance:* For SSR to work, the responsibilities and accountability must be clearly specified. The literature suggests that three critical ingredients are necessary for instructional success: a staff of well-trained professionals who use their knowledge with their students to meet goals; an internal governance structure that allows teachers to be decision makers; a well-supported and flexible infrastructure that supports teachers in this work.
5. *Finance:* States must ensure that schools have sufficient resources to implement the other elements in a high quality way.

The SSR dictates a focus on outcomes, where students' performance on learning tasks is the product to be measured (not processes, thinking, talking). The focus is on teaching and learning subject matter, not affective development, emotional well-being, social adjustment.

Blueprint for Action

What does this imply in terms of an immediate blueprint for action? Elmore (1993) has argued that for SSR to succeed, the action focus should be on deploying resources against stu-

dents' performance, that is, to achieve the greatest percentage of children performing at the highest possible levels. To do this, educational administrators need to act as managers of performance, and not the role of power brokers whose main aim is to protect their turf and their budget. In terms of policy, the philosophy of "less is more" reigns; that is, less bureaucratization and rigid rules allow more flexible and creative problem solving by teachers and administrators to attain the goal of maximizing students' learning. Teachers must be seen by themselves and by others as the individuals mainly responsible for problem solving and should be given maximum autonomy to achieve their goals. Schools, in turn, are seen as performance centers, where the most important task is to achieve increased student learning and performance. The notion of the school as a cog in the wheel or unit in a big bureaucracy must be abandoned. Finally, there must be an emphasis on the professionalization of teachers, as exemplified in the NCTM frameworks, where the concept is of the teacher at the leading edge of problem solving. The focus is on developing the knowledge of the child and consistent improvement in the child's demonstration of that growing knowledge by his/her performance on assessment instruments.

Unanswered Questions

The SSR emphasizes a focus on teaching and learning content matter as demonstrated in performance assessments, which are often synonymous with the notorious "high stakes" exams. The focus is on outcomes, not processes. The SSR takes the point of view that all American children are to be included in this new plan; little is said about individual differences and diversity among children. The emphasis is on empowering teachers, which is typically heard as "regular education" teachers. There is no mention of other educational professionals.

These issues raise certain questions about the utility of the SSR approach. The first question is what does the curriculum framework really mean? How can it be adapted to address diverse populations of children? How are teachers equipped to do this well and be fair to each child? Second, the assumption that educators can just focus on learning of content, and ignore all the distractions—such as affective, emotional, and social factors—is naive. If learning were that simple, then we would have approached it without needless interference from these other psychological factors. Children do differ in their readiness to learn, their motivation to learn, their ability to focus and sustain learning in classrooms—and in countless other ways. Do we just assume that the same presentation of materials stage-managed by one regular education teacher will be sufficient for all children in her classroom? What about class size? Further, is school just for learning content matter—or should it include learning about how to get along with each other, citizenship, sharing, and other values that undergird our democracy.

The inclusion of the professional development of teachers is laudable and essential; the implication from the SSR discussions is that this constitutes professional development

only for regular education teachers. Where do special educators, school psychologists, speech and language pathologists, school counselors, among other specialists, fit in? How will their expertise with special populations of children best be used—if at all? How can regular education teachers optimally deal with the increased diversity of the student body in their classes without assistance of these experts? Doesn't professional development include ways for all educational professionals who can assist students in finding ways to work together for the benefit of children?

Finally, about assessment, the critiques of "high stakes" standard examinations have permeated recent debates on American education. It is important that the SSR supports implications of alternative assessment.

THE ROLE OF ALTERNATIVE ASSESSMENT FOR LITERACY EDUCATION IN SCHOOL REFORM

The combined effects of the SSR movement, with its emphasis on standards and assessments and the implementation of the full inclusion mandates (increasing with class variation among students) will change American classrooms substantially, and therefore significantly affect teachers' work with children. Several competencies will be essential for teachers to develop and expand, including alternative assessment, instructional technique, and strategies for interdisciplinary collaboration among education professionals.

In this chapter, we focus on one of these key new competencies for literacy educators—alternative assessment, particularly the use of observational methods to reveal children's literacy competencies and the critical importance of interdisciplinary collaboration in assessment, so that a full picture of the child's strengths and weaknesses may emerge.

Classroom teachers are faced with the challenge of variability among students in their language and literacy skills and how best to assess and promote the development of these skills. The variability among students within the same grade has increased in many cases due to two reasons. One concerns changes in the cultural diversity of American schools. The other source of variability arises from recent efforts to include more students with learning disabilities in regular classrooms. As a result, teachers, clinicians, and others are looking for alternatives to standardized tests, which are limited in the information provided, particularly about the progress of individual children. Thus, teachers need to be aware of specific ways to support students' development of competence in language and literacy. Additionally, teachers have to have adequate means for assessing children's progress.

In a previous work, we presented an approach for adequately assessing growth in the language and literacy skills of school-age children, with focus on: print-awareness, word recognition, vocabulary acquisition, sound-symbol connections, and comprehension (Wilkinson & Silliman, 1994). Our approach, using the *Observational Lens Model*, is a qualitative one, in which the actual language and literacy behaviors of students are described over time and students' progress

is documented. Our perspective emphasizes the need for careful and frequent monitoring of students' development of these and other key language and literacy behaviors. This perspective is also compatible with the integrated language arts view. We believe that adequate assessment must include the collection of actual performance samples, observations of classroom interaction, and interviews with children and teachers.

Previous work by the authors illustrates the critical importance of teachers' developing and applying knowledge of alternative assessment techniques. To develop this point of view, we provide some background on one student, Jamie, who had attended a regular education classroom, but was subsequently referred to a combination inclusion and regular education program. The goal of the program for Jamie was to support her development of the essential literacy skills needed so that she could return to a regular classroom.

Jamie

The focus of this discussion is Jamie, a child with a language learning disability (LLD). She has been selected because her language learning and literacy problems are typical of many children with an LLD.

Jamie was born following a normal pregnancy and delivery on November 6, 1984. She is the second of two daughters in a working-class family. All developmental milestones, with the exception of speech and language development were reported to be within normal limits. She did not begin to combine two words together until age 4 and had a significant phonological process disorder. In April 1991, Jamie was 6½ years old and enrolled in a half-day kindergarten program. She was receiving pull-out speech and language services. Her school system referred her to the Communication Development Program, a cooperative public school program, for a full case study evaluation. The speech-language pathologist providing her services in kindergarten found significant language comprehension and production problems in combination with the phonological disorder. Jamie's mother viewed her difficulties as primarily involving articulation. She also wanted Jamie to be able to recite the alphabet and to be able to read and write simple sentences. Despite her communication problems, Jamie showed persistence in trying to make herself understood. She fully used what she had available to be an active participant in conversation, a quality she still displays.

Because of her developmental and educational difficulties, Jamie was eligible for placement in the Communication Development Program, publicly funded special education program in the Chicago area. She has attended this program since September 1991 when she was 6 years 10 months old. This program is specifically designed for students with LLD from kindergarten through high school. Its philosophy is grounded to the integration of communication and students' communication goals across all areas of the curriculum. The approach is transdisciplinary and theme-based. Speech-language pathologists are also classroom teachers and collaborate with special education teachers, social workers, occupational therapists, and career educators, among

others. Instructional principles are translated into practices in which speaking, listening, reading, writing, and spelling are integrated across the curriculum for two purposes: (a) to support the development of literacy and (2) to support the development of metacognitive and metalinguistic strategies for becoming active, reflective, and successful learners. Jamie remained in the program for 3 years and has been a participant in a longitudinal study on the assessment of her progress. One focus in the assessment of her progress has been her increasing ability to attend in more intentional and analytical ways to the phonological structure of oral language, what we all refer to as changing levels of phonological awareness. Jamie has been supported in learning strategies for word recognition in both reading and spelling. At the same time, through immersion in multipurpose literacy activities, Jamie has been supported in understanding that print, whether read or written, has communicative functions and meaning. She now reads, writes, and spells with some proficiency. Standardized tests failed to reveal the nature of her progress or describe her strategies and her difficulties as a "non-comprehending" reader and writer.

Observation for Assessment

We used the observational approach to document and assess the changes that Jamie underwent during the past 3 years in the Communication Development program; this approach is incorporated within our *Observational Lens Model* (Wilkinson & Silliman, 1994).

The plan for the assessment of progress was developed collaboratively in order to incorporate multiple perspectives — those of the teacher / clinician, the program supervisors, the researchers, and Jamie. A combination of observational techniques was used to implement the plan. For example, using video as a narrative tool, the teacher / clinician videotaped at least three times during a unit, including an end-of-unit assessment activity ("What Was Learned"). She also used a variety of other narrative tools to document ongoing progress. These included: (a) systematic, daily, on-line observations of significant behaviors that Jamie demonstrated (summarized weekly); (b) the development of a language / literacy portfolio collection (with Jamie's assistance); and (c) written evaluations of changes observed in Jamie and in herself as a teacher. To illustrate the use of observation for assessment, we have selected a 2-month period, when Jamie was placed in the special program described above. This analysis shows the utility of the approach that we suggest teachers take when attempting to understand a child's strengths and weaknesses.

Analysis of the videotapes proceeded in three phases. First, running records were prepared of the videotaped activities (approximately 2 hours). Running records represent an example of a narrative tool. Their purpose is to obtain a chronological record of the activities that occurred. These records were then verified for accuracy by the teacher / clinician and the program supervisors. During analysis, a question arose regarding the nature and scope of Jamie's phonological awareness in the oral domain and its relationship to her awareness that print serves a variety of communicative

functions. This question stimulated the second phase of assessment and led to the application of another narrative tool, the critical incident. Five critical incidents were identified, with two each in November and December and one from January. The designation of critical incidents was a joint decision of both the teacher/clinician and the program supervisors. Finally, using observational tools, the critical incidents were transcribed so that the dynamics of actual verbal interaction could be closely examined. These tools include: Running records, critical incidents, and transcribed critical incidents.

Steps for Observational Assessment

As teachers plan literacy activities and curricula, they may want to consider using observational methods as a way to document and better understand the progress made by individual children in their acquisition of key language and literacy skills. Observation as one method of assessment is becoming more popular in both regular and special education classrooms for two reasons. First, the limitations of formal standardized assessment procedures have been recognized. Second, systematic observation links together assessment and instruction (Wilkinson & Silliman, 1990). We offer four suggestions as general guidelines for teachers and speech-language clinicians. Readers need to draw on their own experiences and apply any of these ideas to their own particular classroom situations.

Formulate the question and select the appropriate kinds of observation. The first step in using observational assessment successfully is often the most difficult. This step requires one to define the focus of observation; that is, teachers and other educational staff need to consider the purpose of assessment and formulate the question to be asked clearly and specifically. An important point to remember in question formulation is that not all levels of communicative behaviors can be observed simultaneously. Also, defining in advance the behaviors to be observed is essential. Unless workable definitions are agreed on, observers will be less reliable in identifying particular instances of these behaviors.

In the case of Jamie, a specific purpose of observations was to assess the nature of progress that she made in developing strategies for word recognition. This focus involved relationships among phonological awareness, print awareness, and spelling as these were implemented within a classroom approach that emphasized literacy functions and learning-how-to-learn. Another purpose concerned how the teacher used discourse scaffolding to support Jamie's efforts to progress from being a novice with these key language and literacy skills to becoming more of an expert. It is clear from the kind of strategies being cultivated for phonological awareness, print awareness, and spelling that a fairly fine degree of detail would have to be captured by the observations; thus, the application of regular, close-up, and even microclose-up lenses seemed appropriate. The choice of running records, critical incidents, and transcriptions followed from the decisions made about the level of detail

needed to see progress in strategy use for cultivating these essential skills.

Recognize key language and literacy skills in real-time usage. A second step for teachers is to look for specific examples of language and literacy skills as they *actually occur in classroom activities*, such as the reading activities observed with Jamie. Campione and Brown (1987) suggest that, in documenting progress, the teacher should not be concerned with how much overall improvement can be demonstrated in a child's performance. Rather, the focus should be maintained on how much discourse support a child needs from the teacher to attain a specific level of learning and, as a next step, be able to apply that learning to new situations that increasingly diverge from the original situation. Another way of stating this concept is to think of helping the child move along a continuum where the child starts as a novice and becomes more of an expert within a specific domain.

Over the 2-month period of observation, Jamie continued to need relatively high levels of discourse assistance from the teacher/clinician to be able to participate in classroom activity. For example, at the end of the 2-month period, Jamie still required external guidance for the more complex word recognition activities, such as reading of the "What We Want to Know" questions in the dinosaur activity. Although high levels of discourse support from her teacher were still necessary, Jamie increasingly took on more responsibility for her own learning with less assistance. For example, in different activities, she began to use some self-monitoring strategies more effectively and to retrieve some spelling forms on her own or with minimal guidance. However, Nelson (1989) reminds us that simply noticing an increased frequency of occurrence of a particular behavior is insufficient evidence that the child has actually learned (internalized) that behavior. Documentation of authentic progress must provide ample and convincing evidence that the key language or literacy skill is firmly under the control of the child, who can now use it functionally and appropriately.

Document progress clearly and with ongoing observations. Documenting progress for a particular child needs to be ongoing, a kind of formative assessment, and includes quantitative and qualitative data. Some of the specific methods that can be used were outlined in the discussion on Jamie.

There are, however, literally thousands of specific observational methods available. Howell and Morehead (1987) discuss a wide variety of charting procedures for assessing changes on a daily, weekly, or monthly basis. However tempting it may be to reduce the assessment of progress to a set of neat charts, lines, or tables with frequency counts, teachers should not succumb! These kinds of "categorical" data have some limited utility, but cannot be sufficient for documenting progress of key language and literacy skills (see Silliman & Wilkinson, 1991, for a more complete discussion on advantages and disadvantages of categorical systems). In developing a broad framework for the assessment of progress, teachers will need to rethink assessment data "...as any

recordable data from which inferences about learning and teaching can be drawn" (Weaver, 1991, p. 212).

A broad framework must include other methods, such as narrative ones, if adequate understanding is to result. Portfolios (a narrative method) can be maintained for each child. Dialogue journals (also a narrative method) help children make transitions from more oral styles of communication to more literate styles of communication. They also provide a written record over time that can be evaluated for evidence of real change in communicative strategies for the expression of purpose and meaning. Categorical methods, such as rating scales, can add to the richness of assessment if constructed with appropriate items. Watson and Crowley (in Weaver, 1988) offer several suggestions that can be included in rating scales: (a) the types of assistance sought for problem solving (e.g., child seeks assistance only from teacher, seeks assistance from others, etc.); (b) the extent of risk taking (e.g., the child contributes his or her own topics, tries to paraphrase what has been read, attempts to invent best-fit predictions for an unfamiliar word, etc.); and (c) the attitude toward reading and writing (child prefers books with predictable structure, enjoys shared writing, etc.).

The guiding concept is for teachers to use whatever kinds of specific observational methods that seem most appropriate in order to capture what the child knows about language-literacy connections at that time. This information will assist the teacher in designing the most appropriate curriculum and learning activity, one that builds on existing knowledge and challenges the child to reach for the next level. For example, the broad assessment framework used with Jamie allowed her teacher / clinician to revise teaching strategies. These revisions included building in more systematic and developmentally appropriate phonological awareness activities, providing Jamie with more encouragement to take risks in applying invented spellings, and altering the nature of discourse scaffolding to give Jamie (and the other students) increased responsibility for collaborating in decision making. *Use the observational data as a way to share insights.* Finally, teachers and speech-language clinicians can consider using the metaphor of the *Observational Lens Model* as a way to talk about what they see and how they interpret the significance of those observations. A shared frame of reference made possible through systematic observation facilitates teachers being able to talk with each other and other educational professionals.

It is no small matter how classroom teachers, speech-language clinicians, special educators, and other specialists learn to communicate with one another in order to attain proficiency in the use of observational assessment. Teachers and clinicians can move to new professional competencies as they collaborate more effectively in ongoing assessment and intervention. In a real sense, new professional communicative competencies are required for this kind of collaboration to happen. The focus of collaboration would be the child, the classroom, and how to design the most effective instruction to maximize children's acquisition and applications of key language and literacy skills. Examples of successful collaboration in both the regular and special education settings are found in Silliman and Wilkinson (1991).

TABLE 53-1. Jamie's case evaluation in November 1993

Jamie's Evaluation

Jamie was referred for a case study evaluation by her educational team in November 1993. The reason for the case study was to update information on her levels of functioning in order to assist her educational programming. Assessments consisted of: (1) Speech and language assessment; (2) educational assessment; (3) psychological assessment; and (4) a social developmental study. An integrated set of programming and educational objectives was then prepared. The actual assessments were conducted by members of Jamie's educational team for the 1993-94 school year. These team members included her classroom teachers (a speech-language pathologist and educator), the school psychologist, and a school social worker.

Team Recommendations

The educational team concluded that Jamie relied on her strengths in socialization, including her emerging discourse skills. For example, she now initiated conversation with adults and peers and attempted to assist her classmates. She had also begun developing metacognitive skills as demonstrated through an emerging ability to identify activities that were easy or hard for her and attempting to apply strategies to assist herself with difficult tasks. In mathematics Jamie independently used strategies and showed an interest in the further development of skills. Her overall profile indicated continued need for the support of her communication, including all aspects of literacy learning. High levels of scaffolding support remained necessary for Jamie to engage in more complex cognitive, communicative, and linguistic activities and to attempt applications to novel situations. Moreover, the team believed that her decoding difficulties seemed to hamper her text comprehension. Integrated educational and communication goals included: (1) continued use of verbal and nonverbal cues and comprehension facilitating strategies, such as clarification requests and revisions, to support language comprehension; (2) use of editing strategies, dictionaries, word charts, and sound patterns to support more conventional spelling and the composition of written expression; (3) use of phonemic segmentation and blending strategies to aid in recognizing unfamiliar words and to increase sight vocabulary; and (4) enhancement of problem-solving abilities by supporting increased responsibility for practical decision making.

CONCLUSION

The analysis of Jamie's literary skills presented above is an illustration of how careful observation of a child's behavior in the classroom can reveal literary competencies and areas that need to be targeted for growth. After 3 years in the special Communication Development program, Jamie made substantial progress in developing the requisite literacy skills in the academic and social domains. Table 53-1 shows the summary recommendation by the interdisciplinary team which has overseen her case in her third year.

The integration of the information gathered from alternative assessments, specifically observational methods, is clear and significant. Such careful documentation of Jamie's actual literacy usage is essential for successfully implementing the team's recommendations.

In sum, using observation as one component for assessing progress in children's language and literacy development is becoming more popular in American elementary schools. The

model and specific techniques presented here illustrate the utility of such an approach. Documenting progress through observational methods can be a vehicle for teachers to optimize their understanding of children's knowledge and how

that knowledge changes over time, sometimes in subtle ways. Observational methods can thus provide crucial information on the relative success of choices made about curriculum, learning activities, and teaching strategies.

SETTING OPPORTUNITY-TO-LEARN STANDARDS

C. Jane Hydrick

CLASSROOM TEACHER

There are too many variables in the human experience that cannot be leveled with money alone. Yet consider the challenge to a level playing field by this range in expenditure per pupil: in one metropolitan area, one school with a per pupil expenditure of \$1732 is 15 miles away from a school where the per pupil expenditure is over \$15,000. You can imagine the disparity in opportunities to teach and opportunities to learn. Even within a single district, every school may be operated under the same per pupil expenditure, but the schools' physical plants, environments, resources and climates of support are very different. The standards on the property manifests may be exact in terms of expenditure and number, but the realities for the teachers and students vary greatly.

Each day, schools, teachers and students deal in greatly varying degrees with hurdles such as class size, quality and appropriateness of teacher preparation and ongoing teacher in service, inequitable access to resources, lack of vigorous involvement of all learners in decision making, little parental and community support, and funding formulas and voucher systems that exacerbate the inequities. Kozol's 1991 book, *Savage Inequalities*, presented the classroom realities of teachers and students whose daily classroom experiences characterize the disheartening, angering, shameful extreme of inequity of opportunities; and provided a focus for advocates of equitable funding and opportunities for teachers and students.

Gonzalez (1993) reports that in 1991 the National Coalition of Advocates for Students offered a set of 10 basic rights that it felt comprised equal opportunities for all students:

1. Children are entitled to have parents, advocates, and concerned educators included in all decisions affecting their education.
2. Children are entitled to learn in an integrated, heterogeneous setting responsive to different learning styles and abilities.
3. Children are entitled to comprehensible, culturally

supportive, and developmentally appropriate curriculum and teaching strategies.

4. Children are entitled access to a common body of knowledge and the opportunity to acquire higher-order skills.
5. Children are entitled to a broadly-based assessment of their academic progress and grading structures that enhance individual strengths and potential.
6. Children are entitled to a broad range of support services that address individual needs.
7. Children are entitled to attend schools that are safe, attractive and free of prejudice.
8. Children are entitled to attend school unless they pose a danger to other children and school staff.
9. Children are entitled to instruction by teachers who hold high expectations for all students and who are fully prepared to meet the challenge of diverse classrooms.
10. Children are entitled to equal educational opportunity supported by the provision of greater resources to schools serving students most vulnerable to school failure: low income, minority, or immigrant students. (p. 24)

The notion of delivery standards catapulted into public debate with the January 24, 1992 report from the National Council on Education Standards and Testing, which separated delivery standards from content and performance standards. "School delivery standards should provide a metric for determining whether a school 'delivers' to students the 'opportunity to learn' well the material in the content standards" (p. E-5). Content standards developed by the National Council of Teachers of Mathematics (NCTM) became the prototype for content standards developed in other subject-matter areas, and spawned projects and programs that had as their focus student and teacher performance and assessment in terms of the content standards.

As a result of the ensuing political debate on delivery standards, the notion of delivery standards became law as

opportunities to learn in Section 213 of the March, 1994, Goals 2000: Educate America Act. Opportunity-to-Learn standards, formerly delivery standards, were defined as ones "that will establish a basis for providing all students a fair opportunity to achieve the knowledge and skills set out in the voluntary national content standards." Specific elements designated in Section 213 as opportunities to learn were:

(A) the quality and availability to all students of curricula, instructional materials, and technologies, including distance learning; (B) the capability of teachers to provide high-quality instruction to meet diverse learning needs in each content area to all students; (C) the extent to which teachers, principals, and administrators have ready and continuing access to professional development, including the best knowledge about teaching, learning, and school improvement; (D) the extent to which curriculum, instructional practices, and assessments are aligned to voluntary national content standards; (E) the extent to which school facilities provide a safe and secure environment for learning and instruction and have the requisite libraries, laboratories, and other resources necessary to provide an opportunity to learn; (F) the extent to which schools utilize policies, curricula, and instructional practices which ensure nondiscrimination on the basis of gender; and (G) other factors that the Council deems appropriate to ensure that all students receive a fair opportunity to achieve the knowledge and skills described in the voluntary national content standards and the voluntary national student performance standards certified by the Council.

The voluntary national content standards which are referenced in Goals 2000 are currently being written for many subject-matter areas and some, such as those completed by the NCTM and the Music Educators National Conference (MENC), are published and available now. In the preface to the music standards, it states that students cannot be expected to meet the standards unless they are "given reasonable opportunities to learn the skills and knowledge specified" (p. vi). To that end, the music opportunity-to-learn standards include standards for every aspect affecting the classroom from staffing, curriculum and scheduling, to facilities, materials and equipment. The MENC document (1994) concludes from practice and history that there exists a "high correlation between effective student learning in music and the existence of the favorable conditions specified in the opportunity-to-learn standards" (p. vii).

The belief that opportunities for achievement must precede fair assessment is articulated further in the New Standards Project statement of principles. The New Standards Project, originally a joint program of two organizations (The National Center on Education and the Economy, Rochester, New York, and the Learning Research and Development Center at the University of Pittsburgh), and continuing as a partnership with states and local school districts to design and administer a new system of standards and assessments, has termed its tenth project principle "The Social Compact." It is essentially an acknowledgment of the high stakes involved with assessment of student performance, and a pledge, in view of those high stakes, by the New Standards Project to

students' performance on the new assessments from being used as the basis for awarding a diploma or any other form of credential unless all students in the jurisdiction awarding the credential have had an opportunity to prepare themselves well. This means that they will be taught a curriculum that will prepare them for the assessments, their teachers will have the preparation to enable them to teach it well, and there will be an equitable distribution of the resources the students and their teachers need to succeed. (p. 11)

The Social Compact states that, although educators ought to be held accountable for bringing each child up to world-class standards, educators cannot accomplish the tasks on their own. The Social Compact lists several elements as necessary support for educators: "the support of families, high quality early childhood programs, health care and other resources to make it possible for all our children to succeed in school" (p. 11).

It was a presidential agenda priority of National Council of Teachers of English (NCTE) President Hydrick that NCTE assume a national leadership position in delivery standards, and lead other associations in ensuring that the debates, efforts and works in standards projects serve at least as catalysts for declaring as untenable the de facto standards in opportunities to teach and learn which have dominated too many of our schools and classrooms: de facto delivery standards that, if not recognized, addressed and corrected, would, Hydrick believed, effectively countermand any possibilities or hope that may have resided in the content standards efforts.

To reconfirm NCTE's national leadership in learner advocacy and delivery standards, Hydrick held an Invitational Conference on Opportunities-to-Learn / Delivery Standards, July 29–31, 1994 in Washington, DC. Representatives from subject-matter organizations, educational policy and advocacy groups attended. Although it was the first time that many of the groups had collaborated, particularly on the issue of opportunity-to-learn standards, at the conclusion of almost three days participants agreed that opportunity-to-learn standards have relevance to the missions of all represented organizations, and that the organizations shared a common vision of teaching and learning environments which provide equal opportunities to learn.

Representative organizations included the NCTE, Teachers of English to Speakers of Other Languages, Speech Communication Association, Brooks Associates, National Middle School Association, National Board for Professional Teaching Standards, National Parent Teachers Association, College Language Association, National Association for Bilingual Education, National Science Teachers Association, National Council of Teachers of Mathematics, National Council for the Social Studies, Music Educators National Conference, Alliance for Curriculum Reform, National Council for Geographic Education, International Reading Association, and the American Association of Colleges for Teacher Education.

Conference participants drafted four documents, three of which pertain specifically to collaborative efforts in opportunities to learn. The first document, a summary report of the conference, has been endorsed by the conference participants.

do everything in [their] power to ensure all students a fair shot at reaching the new performance standards, and to prevent

SUMMARY REPORT

An invitational conference on Opportunities-to-Learn / Delivery Standards sponsored by the National Council of Teachers of English was convened in Washington, DC, July 29–31, 1994. Participants in the conference included representatives (listed above) of subject-matter organizations, educational policy, and advocacy groups.

Participants agreed that Opportunities-to-Learn / Delivery Standards (OTL standards) have relevance to the missions of all represented organizations, and that we share a common vision of teaching and learning environments which provide quality opportunities to learn.

Recognizing the strength of a collective voice and a shared plan of actions, the participants proposed the following actions to guide our efforts to impact the OTL standards debate and to influence the implementation of OTL standards at local, state and national levels—

- develop a statement of principles for OTL standards and invite endorsement from a wide range of subject-matter organizations, educational policy, and advocacy groups
- prepare a proposal for participation by subject-matter organizations in consortia which apply for an OTL Standards Development Grant as provided for in Section 219, Goals 2000 legislation; to invite other subject-matter organizations to join in this proposal to submit the unique expertises of the subject-matter organizations as a vital component of any consortium developing OTL standards
- participate individually and collectively in public hearings, state panels, and other such forums which address OTL standards
- present collective views regarding OTL standards to the National Education Standards and Improvement Council (NESIC), which is authorized to certify voluntary, national OTL standards (Section 213 c1, Goals 2000 legislation)
- contribute individually and collaboratively to the development of state models for OTL standards
- promote public awareness of OTL standards legislation and its implications for national education standards; engage in an education process to make the public aware of the value of OTL standards (increase public awareness of the effects of opportunities to learn on each member and facet of our local, state and national communities)
- maintain open communications within and among all participating organizations regarding OTL standards.

The participants of this conference proposed the above actions which each participant's organization(s) could adopt and implement either individually or collaboratively in a variety of ways and in varying degrees.

The second document, a statement of principles regarding opportunity-to-learn standards, has passed a first-stage endorsement by the subject-matter organizations, educational policy, and advocacy groups who participated as well as some that were unable to attend.

Opportunity-To-Learn Standards Statement of Principles

At a 1994 conference on Opportunity-to-Learn Standards, sponsored by the National Council of Teachers of English, participants agreed that opportunity-to-learn standards provide a framework that makes it possible for all students to have equitable access to high quality education.

Why are opportunity-to-learn standards necessary?

The opportunity to learn is the inherent right of every student in America. Educators, parents and other members of a student's many communities share a common interest in the educational success of each student and in the role of education in our democratic society. Full, positive participation in democracy is contingent upon every student's access to quality education. Such access to high quality education should not be dependent upon the specific community in which a student lives. By focusing and building upon the strengths of learners, opportunity-to-learn standards can help insure equitable access to high quality education for all students in America.

What should opportunity-to-learn standards do?

Opportunity-to-Learn standards should

- enable all students to achieve high content standards and to learn to their full potential
- be directly tied to students' learning and performance in content standards
- consider the diverse, multiple ways students learn
- enable all teachers to teach all students
- be supported by the best classroom practice and research
- include on-going professional development of educators
- be based on research on how effectively schools use resources
- address necessary conditions and resources for successful learning in our schools, as well as effective use of resources including safe, secure environments free of prejudice and violence; attractive, comfortable environments that invite learning, risk taking and problem solving; updated library, media centers and technologies
- consider opportunities for preschool and beyond school learning

Opportunity-to-learn standards at their best should reflect America's commitment to equitable access to high quality education for all students. States and schools that meet opportunity-to-learn standards will enable students to become lifelong learners and lead productive, rewarding lives.

SUMMARY

Opportunity-to-learn standards should provide:

- time for students to learn and reflect
- time for teachers to plan, learn, teach and reflect
- appropriate learning resources
- resources from the community

The third document is a proposal for participation by subject-matter organizations in consortia which apply for an opportunity-to-learn standards development grant as provided for in Section 219, Goals 2000 legislation. The consortia are defined as groups which include the participation of

- (a) state-level policy makers, such as Governors, State legislators, chief state school officers, and State school board members;
- (b) local policy makers and administrators, such as local school board members, superintendents, and principals;
- (c) teachers (especially teachers involved in the development of content standards) and related services personnel;
- (d) parents and individuals with experience in promoting parental involvement in education;
- (e) representatives of business;
- (f) experts in vocational-technical education;
- (g) representatives of regional accrediting associations;
- (h) individuals with expertise in school finance and equity, the education of at-risk students, and the preparation and training of teachers and school administrators;
- (i) curriculum and school reform experts;
- (j) representatives of advocacy groups, including student and civil rights advocacy groups;
- (k) representatives of higher education; and
- (l) secondary school students.

Section 219 also includes a statement of the purposes and uses for the opportunity-to-learn standards.

- (a) provide all students with an opportunity to learn;
- (b) assess the capacity and performance of individual schools; and
- (c) develop appropriate actions to be taken in the event that the schools fail to achieve such standards.

Additionally, all consortia are directed to

- (a) draw upon current research about student achievement and the necessary conditions for effective teaching and learning; and
- (b) provide for the development of more than one draft of standards which incorporates the comments and recommendations of educators and other knowledgeable individuals across the nation.

Although he cautioned that opportunity-to-learn (OTL) standards were still at the "emerging idea stage," Andrew Porter (1994), a leading writer on opportunities to learn, shared an optimism about the potential helpfulness of Goals 2000 and NESIC:

From my perspective, the concept of OTL standards seems headed in about the right direction. Clearly, OTL standards are not going to become a major new form of school-by-school accountability. If they are to have any influence on school improvement, it will be through persuasion provided by visions of good education practice and information from OTL indicators on progress toward school improvement. (p. 31)

The keynote speaker at the OTL conference was Judge Eugene Reese, Circuit Judge in Montgomery (Alabama)

county. The April 6, 1993 *Wall Street Journal* printed the surprising news that Judge Reese, in a March 1993 ruling, had declared the Alabama state's entire public school system unconstitutional because it did not give students an adequate education. Prior to Reese's ruling, courts in other states had based their decisions on school financing procedures, ruling that there existed discrimination against poor students, that children had a right to an equitable education. In the *Wall Street Journal*, Helen Hershkoff, "a lawyer for the American Civil Liberties Union, termed Reese's decision "a landmark because it recognizes that children have a right not only to an equitable education but also to an adequate education" (p. B1). The article credited lawyers and education specialists with agreeing that the most controversial part of the decision was that it "specifies criteria necessary for schools to meet constitutional muster." Although Alabama's state constitution was quoted in the judge's ruling, other states have similar constitutions and would, therefore, be subject to similar rulings.

Reese began his keynote address with a quote from another landmark decision almost 40 years earlier, *Brown vs. Board of Education*:

Today, education is perhaps the most important function of state and local governments. Compulsory school attendance laws and great expenditures for education both demonstrate our recognition of the importance of education to our democratic society. It is required in the performance of our most basic public responsibilities, even service with the armed services. It is the very foundation of good citizenship. Today, it is a principal instrument in awakening the child to cultural values, in preparing him for later professional training and in helping him to adjust normally to his environment. In these days, it is doubtful that any child may reasonably be expected to succeed in life if he is denied the opportunity of an education. Such an opportunity where the state has undertaken to provide it, is a right which must be made available to all on equal terms. (p. 3)

In the conclusion of the court case document, Reese acknowledged Alabama Governor Hunt's admission that "deficiencies exist in Alabama's public school system and that additional funds are needed to remedy some of the unsatisfactory conditions" (p. 122). Reese stated further, however, that "The real issue here is whether these deficiencies and conditions rise to the level of deprivations of constitutional and statutory rights. In the opinion of the court, they do" (p. 122). Reese invoked the Alabama state constitution to substantiate that Alabama's school-age children should be provided with "substantially equitable and adequate educational opportunities."

In a 1993 National Governors' Association publication, *The Debate on Opportunity-To-Learn Standards*, author Traiman suggested that the debates surrounding opportunities to learn focus on several general areas: defining opportunities to learn; the purposes and uses of opportunity-to-learn standards; when, how, and by whom should opportunity-to-learn standards be developed; and the appropriate federal role in opportunity-to-learn standards. Since that publication, the language of Goals 2000: Educate America Act has provided the guidelines for all those once-debated general areas.

What remain to be hotly debated, of course, are the implementation and effects, both short-term and long-term, of the Goals 2000 legislation. Common sense and perhaps a single trip to a classroom would tell us that every item in the Goals 2000 laundry list of opportunity-to-learn standards comes with a price tag. We know that a large part of every school district's budget is designated to support curriculum, instructional materials and resources, capable teachers, professional development, and safe and secure facilities. Common sense and perhaps a single trip to a classroom would also tell us that not every child in any one school district, much less in all American districts, has equitable access to opportunity-to-learn standards.

Research studies will continue to deliver conflicting analyses on the effectiveness of class size, per-pupil spending, and all the other necessary conditions for effective teaching and learning. Research data are helpful, yet in Alabama alone, Judge Reese reported a \$55,000 disparity between the highest and the lowest classroom annual expenditures; schools with no playground equipment; textbooks not available or several decades old; and unsafe buses. Kozol's report of the disparity in America's schools is equally depressing and portrays schools and districts across the country. It takes money to fix toilets so that they flush, to buy books, to make buses safe, to provide professional development for teachers, to patch holes in floors and ceilings, and to repair furnaces. Alabama's and America's schools have problems that need money, not data, to solve. Money alone is not the solution, but without money, opportunities to learn cannot improve.

There is Goals 2000 funding to develop opportunity-to-learn standards, but there are no funds to support opportunities to learn. Our National Education Goals are for school readiness; school completion; student achievement and citizenship; teacher education and professional develop-

ment; world leadership in mathematics and science; adult literacy and lifelong learning; safe, disciplined, and alcohol- and drug-free schools; and parental participation. Consortia will be funded to deliberate how we might achieve these goals. We will have our destinations and our road maps, but no cars!

United States Representative Major R. Owens of New York, Chairperson of the House Education and Labor Subcommittee on Select Education and Civil Rights, held great promise for opportunities to learn and made this statement for the March 23, 1994 *Education Week*:

If it does not cost a penny or require elected officials to do anything differently than they did the day before, we have embraced it. And, as a result, urgently needed education reform has begun and ended with a stream of photo opportunities and press releases. Opportunity-to-learn standards are an antidote to this consuming, vacant chatter, a font of truth that promises to set out for parents, teachers, and communities a more practical projection of what must be done to achieve educational excellence. To end the cynical swindling of the children of America, opportunity standards must be a component of any education-reform package. (p. 35)

The participants of the July 1994 Conference on Opportunities-to-Learn / Delivery Standards in Washington, DC, also held great promise for opportunities to learn. Opportunities to learn are now, through Goals 2000, a component of our currently legislated education-reform package. We cannot know yet if opportunity-to-learn standards will be the harbinger of realized opportunities for students who have had limited or no access to those opportunities, or if opportunity-to-learn standards will be the harbinger of more vacant chatter. We can know, however, that unless equitable opportunities to learn are realized for all students, our National Education Goals will never be realized.

STATE CURRICULAR FRAMEWORKS AND STANDARDS IN THE COMMUNICATIVE ARTS

Sharon O'Neal

TEXAS EDUCATION AGENCY

Susan Strecker

UNIVERSITY OF TEXAS AT AUSTIN

The ideal school is an earnest, cheerful, hard-working community without any internal strife or discord. To bring about and maintain such a condition the community, the school board, the teacher and the pupils must all work in harmony, to the end that the school may accomplish its proper work of developing character training, intelligence, and giving skill in using knowledge that is of most value in every-day life. (*Course of Study for Elementary Grades: Public Schools of Texas*, 1927).

To examine this excerpt in light of today's cry to establish standards in public education is to be struck with the similarity of the goals in 1927 and today. The focus on a common set of content standards has been the centerpiece of the 1990s national educational reform movement. This 1927 report to public schools asked the community, the school board, the teacher and the pupils to work in "harmony" toward a common set of goals. These goals were to provide students with useful strategies and information for use in their everyday life. Educators and communities are still struggling with these same issues. Today reformers ask teachers, administrators, and communities to work together toward a common set of content and performance standards so that students might be successful in the world outside of school. For teachers of the communicative arts, the goal seems simple enough: establish what all students should know and be able to do as they read, write, listen, and speak and describe what quality performance in each of those areas would look like. But language arts educators, like those in the other content areas, have faced serious questions as they proceed in this effort. For example, who decides what is contained in these content and performance standards? If the standards are rigorous, will resources be made available so that teachers might teach

those standards and students might learn them? Should the standards be global or specific?

An examination of standard setting efforts indicates that the path to accomplishing such harmonious goals as the development of content and performance standards is riddled with complex and difficult issues for all involved. The purpose of this chapter is to examine the complexity of standard setting in the communicative arts and draw conclusions and implications for schools and states engaged in similar efforts.

WHAT COUNTED YESTERDAY

In the spring of 1937 the president of the Vidrine, Louisiana school board made his annual recruiting trip to the colleges and universities in the area. He succeeded in recruiting several young women, one of whom, Miss Curl, became a third grade teacher the following fall. At the time of her hiring she was told she had been selected because she was single, did not speak French, and did not have a Cajun surname.

Most of the children in Vidrine came from monolingual French-speaking homes and the president of the school board, even though he was of Cajun heritage, was interested in immersing the students in English as quickly as possible. Miss Curl's students loved talking to one another during class and passing notes. They often preferred recess to spelling practice. These students also enjoyed hearing a good story read aloud, and were willing to work hard for their teacher when they were reasonably sure of success and were interested in the topic at hand. Miss Curl's students came from

various home backgrounds, some better able to provide for their children's well-being than others. She never knew the parents of her students well. The parents were uncomfortable coming to school because they spoke little or no English and in many cases, had never experienced school themselves.

Obviously the president of the school board in that small town in south Louisiana in 1937 had very explicit content and delivery standards. Clearly he felt that the children should leave his district speaking English, and toward that end, instruction should be delivered in English only.

Sixty years later Ms. Curl's class sounds familiar. Today's teachers of the language arts find themselves in classes with students whose first language is not English. Whether the students come from well-heeled suburbs or public housing projects, some of their parents and guardians are better able to provide nurturing home environments than others. Today's third grade classrooms still have students who love to talk and pass notes. Students are still begging their teacher to read just one more page of classics such as *To Kill a Mockingbird* (Lee, 1988) or such lighthearted texts as *The Twinkie Squad* (Korman, 1992).

But were those district "standards" in harmony with Miss Curl's goals? Were her goals in harmony with the broader community of Vidrine? Were her goals shaped in any way by state laws or rules and regulations? Did they influence student assessment, instruction and textbook selection? More important, did her goals promote life long readers and writers?

WHAT COUNTS TODAY

The Current Standards Movement

National attention has illuminated both the perils and merits of standards. In 1989, at an education summit in Charlottesville, Virginia, then president George Bush met with the nation's governors. Together they set national education goals that emphasized an increase in school readiness, high school graduation rates, and school safety, as well as calling for rigorous academic standards across the subject areas. (U.S. Department of Education, 1990). In January 1990, President Bush presented these goals in his State of the Union Address, and in February that year the National Governor's Association endorsed the goals. By April 1991, the Bush Administration proposed the "America 2000" legislation. Two key components of that legislative effort were implementation of national voluntary academic standards and development of a national achievement test.

President Clinton's new administration also embraced America 2000, and with minor changes the initiative was renamed "Goals 2000." In *Goals 2000* the national achievement test has been de-emphasized, but the debate over the development of rigorous national standards in each of the disciplines continues. At the same time the Education Department, in an effort to move the standard discussion to a more local level, has awarded more than \$ 3 million for six states to develop content standards in the English language arts. Other states have received funding to examine English language arts

in a multidisciplinary context (McNeeley, 1995). Thus, the impetus for state and local standards development has come in response to national dialogue and resulting legislation.

The Role of National and State Standards

Based on the United States Constitution, traditionally states have had responsibility for public school education—what public school students are taught and what subject matter is tested, which books and materials are used, and how teachers are trained. But the American public has of late been disappointed with the work of the states in the public schools. Both the America 2000 and Goals 2000 reports reprimanded public education for the mediocre and undemanding work required of students (U.S. Department of Education, 1990, 1994). Establishing national content standards was an effort to make public schools more challenging and to make students more academically and economically competitive.

Language arts educators have not yet had the opportunity to examine national standards, because thus far, none exist. In 1992, the Standards Project for English Language Arts (SPELA) was federally funded for a brief time by the Education Department, but funding was withdrawn after the first year of activity. SPELA was criticized for including too much attention to settings in which language arts education was successful and not providing enough specificity about skills and knowledge in the English language arts. The SPELA language played well among those serving disenfranchised children who felt discussions of resources needed to achieve standards might entice more money into poor schools. Conservatives, however, found language about resources to be an attempt to micromanage English language arts education at a national level (DiegmueLLer, 1994). Currently, both the National Council of Teachers of English and the International Reading Association have continued national standards work.

The intent was for national content standards to establish a consistent framework to guide public education in the states. The framework would then initiate sweeping systemic changes. For example, once states embraced rigorous goals in each content area, changes in student and teacher assessment programs, professional development efforts, and instructional materials would be aligned with the content standards. (See Figure 55-1)

Even without national standards, states have always articulated goals implicitly in the curriculum documents they publish, the tests they require, or the textbooks they adopt. In states with no mandates, textbooks have been the de facto required curriculum. With the first wave of reform in the early 1980s many states employed sanctions regarding promotion, retention, high school graduation tied to statewide testing programs. In these states, test results also became the basis of teachers' evaluations and thus, became performance standards for both teachers and students. Teachers began to teach toward the test, regardless of its integrity, because the results were part of their own evaluation. Therefore, both in states where reform has been a top-down effort and in states where the effort has been more respectful of the individual teacher in the classroom, standards have existed.

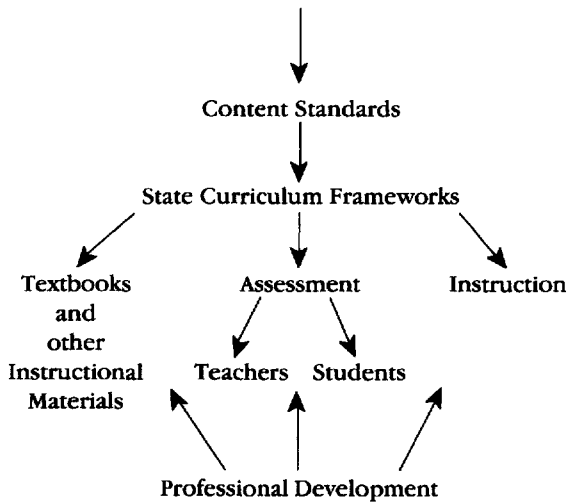

FIGURE 55-1 Relationship between and among content standards, state curriculum frameworks, and state level decisions

States often explicitly lay out the what, when, and how of the delivery of content in documents known as frameworks. These frameworks, however, serve differing purposes. In Texas, frameworks serve as guides for local districts while in California they also serve as directives to publishers wishing to participate in state textbook adoptions. Still other states use frameworks as a rationale for certain types of instruction. Perusal of these frameworks provides an overview of what is perceived by state departments to be the critical elements in the language arts.

Common Threads in State Frameworks

In 1991 state supervisors of reading and English language arts met to determine the role of content standards and their impact on such state work as curriculum development, textbook and materials adoption, student and teacher assessment, and professional development guidelines. The supervisors chose to collect all state frameworks in reading and literacy and determine their points of agreement. Four common threads were identified (Kapinus, 1995).

First, all state documents agreed on the definition of reading as a strategic process during which meaning is constructed through dynamic interaction among the reader's background knowledge, the ideas suggested by the written language of the text, and the context of the reading situation. Documents also agreed that practiced readers draw from a number of resources as they read in order to comprehend text. These resources include semantic, syntactic, structural, and phonemic cues of written language, as well as the reader's experiences and beliefs.

Second, all the documents reviewed predicted that the literacy demands of the world beyond the classroom will become increasingly complex. The global economy will require students to work with diverse groups of individuals. Since future workers must be able to contribute to and draw from group efforts within organizations and across conti-

nents, the document stressed the need for students to practice working with others toward a common goal. In addition, technologies were noted in all documents as becoming more an everyday part of a worker's life. Students engaged in the language arts must learn to access and produce information via technology. State documents clearly emphasized that future employers will seek individuals with the ability to gather, process, synthesize, analyze, apply, and represent information in varied formats and for various purposes. Such analysis will be required of workers at all levels. Thus, students of the language arts must be asked to generate their own understandings and develop unique approaches for completing tasks and solving problems. Such changing conditions were reported by every state.

States also reported increased student achievement in reading, writing, and oral communication. At the same time, however, states noted a widening gap between the knowledge and skills that students needed for classroom success and the knowledge and skills necessary for success in the world outside of school. This disparity influenced all state efforts in the development of critical content standards.

Third, all documents agreed that literate individuals must not only possess an array of strategies and knowledge, but also use them in flexible ways. Good readers were defined as those who could monitor their use of strategies and check their effectiveness by interrogating both themselves (Am I understanding this?) and the author (Is this making sense? Can she say that?) as they read. Therefore, state frameworks recommended that instruction include strategies to assist readers in becoming flexible thinkers who could generate hypotheses and sound theories. All documents concluded that students must not only be able to read well, but must also be able to use language in all its forms to communicate and solve problems.

Finally, the state documents expressed the belief that all children need to reach their full potential as readers, writers and communicators. Since that potential was noted as highly influenced by the context in which instruction occurs, teachers were asked to vary the nature of instruction and the amount of instruction according to the needs of individual students. All states stressed the importance of building on each student's unique cultural background.

Current State Standards Projects

Currently many states are pursuing the development of content and performance standards in addition to their work in the area of curriculum frameworks. Like the frameworks, the standards contain points of agreement. For example, states agree that reading, writing, listening and speaking (and sometimes viewing) should be practiced in various contexts and for a variety of purposes. However, the formats of the state standards documents and the level of detail vary significantly. Some documents provide prescriptive "standards" at various grade levels, while others offer general content standards that span the grades.

For example, Virginia provides the following standard at grade six:

The student will ... employ standard written English: subject-verb and pronoun antecedent agreement, consistent tense inflections, adverb inflections and comparison inflections. (Virginia Department of Education, 1995, p. 20)

The document from Delaware is less directive, providing standards for grade-level clusters. For example, in Delaware in grades 6 through 8, the standard addressing conventions of language read as follows:

Students will use written and oral English appropriate for various purposes and audiences. (Delaware Department of Public Instruction, 1995, p. 10)

Unlike the Virginia document, the standard articulated in Delaware describes "appropriate" conventions in its section on performance indicators rather than in the standard itself.

Vermont approaches standards differently from both Virginia and Delaware. While Vermont does not yet have a final standards document, current drafts include language arts standards in an interdisciplinary document. Vermont curriculum standards are categorized as "Transdisciplinary Content Standards" or "Field of Knowledge Content Standards." Standards attending to listening, speaking, reading, writing, and viewing are seen embedded across both categories. These standards are intended for all students of grades K-12. Such skills as "communication" are part of the Transdisciplinary Content Standards. The content standard addressing conventions of language reads as follows:

Each student with a common core of knowledge and skills writes effectively for a variety of purposes and skills.... Evaluates both process and product with regard to conventions (spelling, usage, and punctuation), forms of expression (style and voice), process (drafting, revising, and editing), and tools (technology and media). (The State of Vermont Department of Education, 1995, pp. 6-7)

Struggling with how to format these language arts standards is only one of the challenges before the states. Additionally, states wrestle with how to provide clear and common terminology, as well as with conflicting purposes.

Language Arts Standards: Common Definitions or Multiple Meanings?

A clear understanding of the terms used to describe standards is critical to the success of reform. Multiple definitions of terms such as content standards, performance standards, opportunity to learn standards, delivery standards, and assessment standards add to the confusion. If those terms are not clearly defined, the task of reform can become unmanageable. As Pearson (1993) noted in his analysis, the standards movement originally involved two concepts: content standards and performance standards. A Standards Glossary provided by *Education Week* (Wolk, Edwards, & Olson, 1995) stated that *content standards* spell out the subject-specific knowledge and skills that schools are expected to teach and students are expected to learn. The term *performance standard*, on the other hand, is most often defined as the parameters that determine the quality of student performance (Pearson, 1993). The *Education Week* Glossary noted that

performance standards gauge the degree to which students have met the content standards. Such standards specify how students will demonstrate their skill. In other words, how good is good enough on any given content standard? *Education Week's* Glossary also defined opportunity to learn standards as those standards which specify the materials, environments and resources students need to meet the performance standard. Other standards terms exist, including delivery standards, evaluation standards, instructional standards; but content and performance, seem to be at the heart of the major efforts taking place at both the state and the national level. While the opportunity to learn standards are addressed in many state documents in the form of vignettes or examples, most decisions regarding students' opportunities to learn are being made at local levels where funds for resources are appropriated.

The Purpose of Standards in Elevating Instruction

Even more problematic than the debate over terminology are differences in perception about what constitutes the elevation of standards or content rigor. While most have agreed that content standards define what students should know and be able to do in a given subject area, the "standard" descriptor can vary from meaning "basic" or "adequate" to "superior" (Eisner, 1995). Each definition significantly alters the substance of content standards.

The American public seems to view content standards as the basic skills and strategies that students need for adequate performance in and out of school. As reported in *First Things First: What Americans Expect From Public Schools* (1994), a "report card" from the public on the educational reform movement, respondents perceived standards as a way to raise the level of basic skills. Surveys indicated that 88% of the American people felt that raising "standards" should include requiring students to speak correct English in order to receive a high school diploma; 82% felt that all children at the end of first grade should have knowledge of punctuation and spelling. Tougher standards for promotion and retention were also overwhelmingly endorsed. Such findings were also supported by recent Gallup polls which tapped public opinion regarding school reform. These polls found the public highly interested in insuring that all students received a firm knowledge of "the basics" (Elam, Rose, & Gallup, 1994). Furthermore, those responding felt strongly that promotion and high school graduation should be tied to "basic subject matter" tests. At the June 1995 meeting of the Texas State Board of Education, board members called for specific attention to spelling, grammar, and phonics in their long-range plan for education in the state (Texas Education Agency, 1995). The popular press is filled with examples of the public equating a return to basics as a means of raising the standards in American education (Henry, 1994; Will, 1995).

The view held by the general public is significantly different from that of professional educators. The Council of Chief State School Officers surveyed educators and found that written composition and higher level comprehension and thinking skills were their top priorities for language arts standards

(Kapinus, & Verrico, 1995). These different perceptions of standards have resulted in conflicts at the state level (Flanagan, 1995). For example, in the spring of 1995, the Michigan State Board of Education reported dissatisfaction with the Michigan English Language Arts Framework. This framework was criticized for lack of attention to basic skills and a denial of Western culture. When Idaho produced a draft framework in that same year (Flanagan, 1995, pp. 1, 8) which focused on holistic, student-centered language arts classrooms, their new commissioner of education initially banned its distribution. The California Department of Education has revamped its 1986 framework for teaching the language arts through child-centered and literature-based instruction. California is now developing a document which includes more structured phonics and a basic skills approach (Diegmüller, 1995).

ONGOING ISSUES

Is the public demanding one thing and the academic community providing another in standards documents? In other words, are educators' goals in harmony with the broader community? Public pressure has led state legislatures to demand more rigorous academic standards for all students in public schools. However, the task, of defining those standards is the responsibility of the state departments of education. Traditionally the states have turned to their colleagues in the field, that is, groups of highly qualified teachers, representative of a variety of school districts, who debate and ultimately prescribe the nature of those standards. Even though the teachers' views are diverse, they may not represent the public views as to what should count in classrooms. Conflicts then arise between the public and the academic community regarding the quality of the specified outcomes or standards. For standards to work, the public at large, as well as educators, must have a say in setting standards. Otherwise, educators may produce standards for which there is no market (Manno, 1995).

Perhaps, as recommended in the 1927 course of study, successful teachers have always worked in harmony with others in their educational community, just as Miss Curl was working in harmony with her school board president. Moreover, successful teachers have always expected the most from their students. Rigorous standards can move more teachers toward higher expectations of all students.

Today in Vidrine, Louisiana, another third grade teacher, Mrs. Monier, has taken Miss Curl's place. Her children no longer come from monolingual French-speaking homes. The parents of her children are comfortable at school and are actively involved in school functions. While Miss Curl was expected to teach all children English, Mrs. Monier is expected to provide instruction such that all her third graders pass the criterion-referenced test that accompanies the basal reader.

When asked what she considered the most essential language arts goal for her third graders, Mrs. Monier stated without hesitation, "To love reading!" Mrs. Monier surrounds

her third graders with language that appeals to them, such as humorous poetry and award-winning trade books. She noted that, although standardized test scores are important, she evaluates her professional worth using other criteria. "It means more to me when the librarian tells me my students ask for authors by name, or when I see them carrying a book to read on the bus, or when they ask me for recommendations about what to read over a school holiday." Like many master teachers of the language arts, Mrs. Monier views reading and writing skills as critical tools that all children must have. Equally important, however, is her clear expectation that her students will read interesting and challenging texts and become expert users and lovers of the language arts. If language arts standards are adopted at state and national levels, will Mrs. Monier be limited or liberated in her work with third graders?

YESTERDAY AND TODAY: SIMILAR CHALLENGES

Effective communication may be the most critical skill a teacher can impart to her students. An individual skilled in the language arts can bring diverse groups together to achieve loftier goals than either side could have accomplished alone. The general public and educators are united in their desire to raise both content and performance standards in this area. Yet, the path to harmonious goals and standards is filled with complex and difficult issues. Clear and common terminology, understandable formats, and unity of purpose are just some of the challenges in the development of standards at both national and state levels. Nonetheless, standards development holds promise for systemic educational reform in the language arts.

The challenges of the past and the issues facing language arts educators today are similar. In 1934, a report from the Division of Supervision (Texas State Department of Education, 1934) offered these words:

Standardization has its perils as well as its distinctive merits, but at present we know of no better way to meet the general problems of unification and orderly procedure in the interrelated units of a public school system than through the development and promulgation of definite and rather arbitrary standards. It is to be hoped, however, that no standard fixed by the State Department of Education will interfere with any real freedom belonging to a local school system in connection with its own school problems.

Many questions remain as language arts educators not only decide how to participate in the development of standards, but whether to participate. Some scholars and educators have advised against participation, fearing that the "perils" would outweigh the "merits" of the efforts. Yet educators are increasingly accountable to the public. Content and performance standards will be at the heart of the assessment instruments and systems used for that accountability. Rigorous, well-conceived standards, tied to robust and valid accountability measures, may raise expectations in a positive way for both teachers and students. Such standards could, in fact, serve to liberate rather than limit the teacher of the language arts.

READING RECOVERY: A SUMMARY OF RESEARCH

Gay Su Pinnell

OHIO STATE UNIVERSITY

Reading Recovery demonstrates what is possible when we put into action current knowledge about how young children learn literacy; in doing so, it challenges present systems and prompts both visionary thinking and problem solving. Briefly defined, Reading Recovery (RR) is a tutorial for children who are having difficulty in learning to read and write after approximately one year of school. It is usually described as an early intervention program; however, RR defies a simple definition. This systematically designed program involves layers of intersecting variables and integrated components, many of which are not obvious even to those who teach children in RR or who have studied it intensively. Teaching procedures, adjustment of instruction to learners, instructional decision-making, training and self-reflection on the part of teachers, ongoing evaluation and research, as well as a collegial network of support and expectations—all contribute to RR's success.

Unique features and results of RR have captured public attention in a way unprecedented for a "program." In this chapter I summarize what we know about RR and what we have learned through research connected with the program. First, RR is briefly described. Then, research on program success, on teaching and learning, and on teacher development is reviewed. Finally, research related to implementation is presented. Where they are available, sound critical reviews are noted.

READING RECOVERY AS AN EARLY INTERVENTION PROGRAM

Since RR has been described in numerous publications, no attempt will be made here to describe the program in detail (for further information see Clay, 1993a, 1993b; Clay, in press; DeFord, Lyons, & Pinnell, 1991; Lyons, Pinnell, & DeFord, 1993; Pinnell, 1989 and Pinnell, Fried, & Estice, 1991). The program is designed to help lowest achieving 1st-grade children develop effective strategies for reading

and writing. In RR, these initially struggling children make accelerated progress, reaching average levels of their particular class or group. The goal is to assist children in constructing the inner control that will enable them to continue to learn independently as they read more difficult and varied texts (Clay, 1991a). The ability to learn more about reading through reading is characteristic of good readers.

The program in the United States involves first graders only, although when full coverage (defined as approximately 20% of the age cohort or all children who need one-to-one help) is achieved and more resources become available, continuing instruction at the beginning of second grade is recommended for those children who enter RR late in their 1st-grade year. Children are selected for RR through a combination of teacher judgment and independently administered assessments (Clay, 1993a, 1993b); they receive individual tutoring until they show evidence of independent, strategic reading of texts and can demonstrate ability to participate in classroom reading instruction at average levels for their class or school. Then, the program is "discontinued" for that student and another enters the program.

Materials

Books are considered the key material for RR. Little existing research focuses on the texts themselves. Peterson's (1991) analysis of the texts used in the program indicates that the twenty levels of difficulty into which the books are organized serve several purposes for teachers, including tracking progress of children and book selection for individual children. The levels, however, serve only as a rough guide for selection; there is no prescribed sequence. Peterson states that in selecting the easiest books for children at the beginning of their programs, teachers look at both text characteristics (the layout of text, predictability, knowledge required to understand concepts, and so on) and student characteristics. She also cautions teachers that books in RR are selected for individual children's needs in learning to

read; classroom literacy programs require a much broader range of difficulty and type of text.

Reading Recovery Teacher Training

Reading Recovery operates within an educational system through four key programs: (1) intensive, daily, one-to-one, 30-minute instruction for children; (2) an in-service program through which educators are instructed in teaching; (3) a network of professional support for teachers and administrators involved in the program; and (4) a research program to continuously monitor program results and provide support for participating teachers and institutions (see Clay & Watson, 1982; Gaffney & Anderson, 1991).

The in-service program for teachers is a yearlong experience during which teachers meet in weekly classes taught by a trainer (called "teacher leader" in the United States, "tutor" in New Zealand, Australia, and England, with both terms used in Canada). Extensive use is made of a one-way glass screen to view live lessons. Teachers in the class take turns teaching behind the screen while their peers observe, and, guided by the leader, talk aloud about the lesson. This process of articulating observations is a hallmark of initial training. Trained teachers participate continuously in professional development as long as they are involved in RR. The program also provides continued training at conferences for teachers and an annual institute for teacher leaders.

Implementation and Quality Control

A structured process guides the dissemination and expansion of RR. School districts enter a long-term planning process beginning with preparation of a leader who is specially prepared to train teachers and oversee the program. Pursuing a full year course of study, teacher leaders are prepared at university training sites. At the same time, a "site coordinator" undertakes administrative leadership for the program in a given school district or consortium of districts. As part of the agreement with the regional training center, the sponsoring agency (school district or consortium), agrees to follow the *Guidelines and Standards for the North American Reading Recovery Council* (1993). The guidelines contain standards that are essential for assuring quality services to children.

The name "Reading Recovery" was designated a trademark and/or service mark of The Ohio State University in December 18, 1990, an action taken to identify sites that meet the essential criteria as defined in the guidelines for an RR program. On an annual basis, programs are granted a *royalty free* license to use the name. Every district that has an RR program is reviewed annually to determine which district has met the standards and guidelines. Reading Recovery is a nonprofit program; training is a university function, not a business venture.

Current Status in North America

Reading Recovery was piloted in the United States in 1984–85 and has been adapted and tested across sites that vary by

region, economic group, culture, and linguistic background. In 1994, 22 regional training centers existed to prepare the key personnel in the United States, teacher leaders. Reading Recovery programs are supported by a network of 388 RR sites, representing 7,784 schools that span North America. Personnel at sites within this network provide training and continuing education, coordinate the collection of research data on RR children, disseminate awareness information and develop program guidelines. Over 11 years, from 1984 through 1995, 519 RR teacher leaders and 12,084 RR teachers have served a total of 229,254 "at-risk" 1st-grade students in 2,543 United States school districts. In 1994–95, 46,637, or 81% of all 1st graders who completed the program, met the stringent discontinuing criteria after an average of 17 weeks of daily lessons. It is estimated that the program will serve more than 100,000 children during the 1995–96 academic year.

Evidence of Program Effectiveness

A body of research and program evaluation illuminates both the achievements of RR and the interacting factors contributing to success. This section presents the research that provides evidence of success. Critics of the program (Hiebert, 1995; Shanahan & Barr, 1995) suggest that research does not go far enough; indeed, traditionally designed empirical studies are few in number and scope because of the limitations involved in large scale field research. Longitudinal studies have been limited by loss of subjects and lack of resources to conduct exhaustive testing programs, and almost all have been conducted on new implementations during their first year. Most system implementers want to study the program from its onset even though we know that it takes about three years to pick up pace and deliver quality intervention. Nevertheless, the body of evidence is considerable, particularly if one considers the range and variety of settings within which the program has been tested. For example, extensive information on individuals has been collected in New Zealand (Kerslake, 1992), the United States (The Ohio State University, 1994), and England (Hobsbaum, 1994). At this point in time, RR has gone farther than any other early intervention program to collect data on every subject involved.

Early Research and Continuing Data Collection in New Zealand

Clay's initial research in New Zealand was conducted in several phases, from a development project (1976–77), to field trial research (1978), to one-year follow-up research and replication studies (1979), and a three-year follow-up, completed in 1981 (reported in Clay, 1993b). Now, the Ministry of Education undertakes national monitoring annually (Kerslake, 1992). To answer the question, "How do these children compare with all their classmates?" Clay compared RR children with a nonequivalent control group consisting of all the children who had not been selected for RR. She found that children who were tutored in RR and successfully discontinued made accelerated progress and scored, even several years after tutoring, within the average band. In addition

to confirming RR's positive impact on children, Clay's first research indicated that children with incomplete programs (not enough time) did not spontaneously shift into the average group. She recommended that time be provided the following school year for children to complete their programs and that is now the practice in New Zealand.

Clay replicated her original study in 48 schools and found similar results; it was also clear from this research that lower entry scores implied more individual tutoring time for students. Her research documented the successful delivery of the program at locations distant from the original university development area. It confirmed the success of RR with varying populations and led to the adoption and maintenance of RR as a national program. Monitoring of the program by the New Zealand Ministry of Education indicates that with more than 20% of the age group receiving RR, fewer than 1% of the age cohort is referred for further services (see Clay, 1993b; Kerslake, 1992). Two British school inspectors (Frater & Staniland, 1994) who visited New Zealand to make a careful evaluation before recommending RR for adoption, suggested that the low and generally stable figures for the proportions of pupils referred on for longer term help prompt further thought. Most prominently perhaps, they suggest that the scheme may have told us something fundamental about the remedial nature of much of the incidence of early reading difficulty encountered not only in New Zealand but in similarly long-established education systems in other advanced industrial societies (HMSO, 1993, p. 12).

Recent research from New Zealand focused on children for whom English is a second language (Smith, 1987, 1988, 1994). The study addressed the question of the suitability and long term benefit of the program for this population. From 1986 to 1991, ESOL and non-ESOL children were compared on entry and exit data and postprogram progress. A measure of average book level indicated that statistically significant progress was made ($p < .001$) by both groups in their RR programs. At the third year follow-up more than 50% of children in both categories (ESOL=21, 57%; non-ESOL=26, 70%) were reading material at a difficulty level 13+ months beyond their chronological age. The study confirmed previous longitudinal studies indicating immediate and long-term success for children who receive RR programs; it also indicated that these findings are applicable to ESOL children in New Zealand.

Empirical Studies in the United States

Although the New Zealand research was impressive, it was necessary to test the program's potential for success in the United States. Two empirical studies were undertaken during the first years of the project in Ohio.

The purposes of the Ohio longitudinal study (Pinnell, 1989), initiated during the first full year of RR in the United States, were to explore: (1) whether the program could succeed with low-achieving children; and, (2) whether those children maintained their gains. The study used standard empirical design to demonstrate RR's impact when compared to existing (and typical) programs. The results of the study were positive for RR. Effect sizes were substantial in the first

year's comparison but diminished by the fourth year after the treatment period, a phenomenon that may be explained by dwindling sample size and increasing variability. Nevertheless, the study confirmed RR's immediate and long-term positive effects.

Zutell and DeFord (1994) used the same sample of subjects ($n=54$) to take a focused look at abilities and strategies. They compared the remaining RR students, 23 control students, and a randomly selected group ($n=53$) of fourth grade students on responses to the *Qualitative Inventory of Word Knowledge* (Schlagal, 1989). They found that while statistical analyses indicated no significant differences among groups, clear trends did emerge from the data. Reading Recovery students, on an average, performed noticeably closer to children in the general population than did students who had received the other form of instructional support. Over 20% of the control group performed at frustration level. Comparisons of percentages of misspellings indicated that a lower proportion of the control group students produced misspellings that followed "logical" patterns. They concluded that in spelling ability, the profile of the RR group was similar to that of the random sample group while the control group data indicated a higher percentage of students performing at lower levels.

The second study (see Pinnell, Lyons, DeFord, Bryk, & Seltzer, 1993) was designed in response to challenges about the delivery system of RR. This study was designed to address specific questions by comparing RR with:

- (1) other one-on-one interventions;
- (2) traditional RR teacher training with a condensed program that did not utilize key teacher training procedures; and
- (3) group instruction based on RR principles.

The study again confirmed the program's successful instruction with effect sizes of 1.5 in the first year and 0.75 in the second year when groups were compared on text reading level. The analysis provided evidence that success was related to several interacting factors. One-on-one setting, a lesson framework with intensive experiences in reading and writing, and long-term teacher training were all necessary but not sufficient to explain RR's success. The nature of training provided by teachers emerged as a factor of critical importance. This research prompted more detailed examinations of the subtle differences in the instructional program provided by the teachers.

Replications of the Process

Over the last 10 years RR has accomplished what it is designed to do. A total of 88,187 individuals made accelerated progress, caught up with their grade-level peers and became independent readers and writers. In each single case we can be sure of this because what happens to each individual provides the data on which the success of the program is judged. Reading Recovery records the proportion of individuals who meet the tough exit criteria. The large majority of children provided at least 60 days of RR tutoring become independent readers at grade level (as measured by an outside examiner).

In addition to the extensive data collected to document children's 1st-grade year and their success in the program, follow-up studies are conducted at many RR sites. Three examples are presented here. Researchers at Texas Woman's University (1994) examined the literacy performance of previously discontinued RR children two and three years beyond the 1st-grade intervention. They compared discontinued RR children with a random sample of classroom peers. The data included performance on a test of oral reading as well as information about the perceptions of classroom teachers of literacy. Former RR children performed well above grade-level placement on oral reading and compared well with their classroom peers. Classroom teachers perceived these former RR children to be within average range in terms of literacy and classroom behaviors.

The University of Arkansas (1994) reports a comparison of formerly discontinued RR children with a random sample of children. Second-grade follow-up studies indicate that children continued to make gains with no need for remedial reading instruction and, on average, exceeded the achievement of a random sample of 2nd-grade children on measures of spelling, dictation, and oral reading. A third-grade follow-up study of 53 formerly discontinued children indicated that their average exceeded the achievement of a random sample of 3rd-grade children on measures of spelling, dictation, and text reading. At the East Baton Rouge Parish Reading Recovery site, researchers (Elliott, 1995) administered spelling, dictation, and oral reading measures individually to discontinued RR students (N=43) and a random sample of 3rd-grade students. They also administered the Louisiana Educational Assessment Program (LEAP). In third grade, former RR students scored slightly higher than those of the random sample group on spelling, dictation and oral reading. Results of an analysis of the language arts component of LEAP indicated that 85% of formerly discontinued RR students achieved the performance standard. These students, by the selection criteria, had been in the lowest achieving group in first grade.

Long-term Benefits

Any analysis of long-term benefits must acknowledge that intervening variables make it difficult to accurately determine the value of an approach. Over a period of years, systemic factors such as subsequent instruction, promotion and disciplinary policies, special education, and individual life circumstances, act as intervening variables affecting a student's progress, despite a successful early intervention. Studies in New Zealand and the United States indicated long-term benefit from early tutoring in RR. An Australian study, not designed to look for a continuing effect on the progress of individuals involved in RR, discovered such an effect as a serendipitous outcome (Rowe, 1988).

Preventative efforts make sense but are difficult to measure. For example, it is hard to convince the public of the value of preventative health care because when we look at healthy individuals we cannot know with certainty that they would have required expensive services without the intervention. We cannot calculate the true cash value of RR by figuring

the cost per test point gained or even by reducing numbers in remediation. In some areas of high need, so many children qualify for Title 1 that without full coverage and an orchestrated range of interventions, including enhanced opportunities and dynamic teaching in classrooms, the effect will not be noticeable.

One benefit may be reduction of the need for some kinds of special education services. One district in Massachusetts (Moriarty, 1995) reports reduction in retention and a drop from approximately 18% to 3% in referrals to special education in the primary grades. Much has been written about the misclassification of children as handicapped (see Allington & McGill-Franzen, 1990). Classification, according to researchers like Allington and McGill-Franzen, may result in a "blame-the-victim" mentality that ultimately deprives the student of the instruction needed to achieve. It is time, they say, to stop "focusing on the unnecessary labeling of children as a prerequisite to their receiving instructional support." Clay (1990) advocates using RR as a period of diagnostic teaching before labeling children in any way as requiring longer-term individual help. She writes,

If we accepted an open definition of learning difficulties, we would diminish the need to debate what constitutes learning disabilities. This would encourage researchers, educators, and policy makers to provide early intervention for all low-achieving children, based on specialized teaching responsive to individual behaviors. (p. 16)

Intervention prior to labeling is taken seriously in Canada. A recent Royal Commission Report on Learning from Canada (1995) recommends:

...that no child who shows difficulty or who lags behind peers in learning to read be labeled "learning disabled" unless and until he or she has received intensive individual assistance in learning to read which has not resulted in improved academic performance. (Vol. G, Recommendation 33)

Reading Recovery, which is designed to adjust to the individual, is an example of an early intervention approach that has potential for reducing the numbers of children ultimately diagnosed as learning disabled. At this time, "learning disabled" can refer to a variety of problems, and behavioral characteristics may be dependent on the diagnostic measures used to identify children. In a study comparing children classified as learning disabled with RR children not so identified, Lyons (1989) found that at the beginning of their programs, classified children had a greater tendency to rely on visual information, neglecting meaning and language cues. By the end of their programs, the two groups became more alike, using a balanced set of strategies to read. Both groups were highly successful readers. Differences in children's behavior patterns required teachers to conclude that the study provided evidence that RR was an effective approach whether or not children had been previously classified as learning disabled. Different studies might find other kinds of imbalance, but individually constructed programs can help children use their strengths in different ways to become flexible, fluent readers.

The Ohio State University (Pinnell, Lyons & Jones, 1995) reports that of 40,493 RR program children (selected as the

lowest achieving children) in 1993–1994, 457 (1.1%) were later referred for Learning Disability (LD) screening. Of 5,466 program children in Ohio that same year, only 0.9% were referred for LD screening. There is no way to know how many would have been referred without RR; but experts suggest much higher proportions. This is at such a time when the United States Department of Education (1990) reports that the LD population has doubled. Coopers and Lybrand (1994) recently found that in New York City the cost is \$23,598 for full time special education students. Providing extra services to students who remain in classrooms creates an add-on cost of \$5,059 per student in addition to the base of \$5,149 each year. As a “first net,” RR has the potential to reduce special education referrals, retention, and the need for remedial services with consequent savings (see Lyons, 1994; Lyons & Beaver, 1995).

Success in Diverse Settings

Reading Recovery has been shown to be successful in a wide range of urban, rural, and suburban school settings. Hiebert (1994), in a critique of the program, has suggested that RR is effective in suburban districts, but questions whether it is worthwhile to provide it for poor children in urban districts where it is harder to achieve full coverage for children who need extra help. Children who enter the program with less knowledge will have longer programs in RR, but they do succeed. Areas of high need usually require more problem solving and greater efforts on the part of administrators. More time is required to move the greater distance to full implementation (serving approximately 20%) in such districts. But, success has been demonstrated, establishing a reason for making this extra effort.

In a study of children who were served by RR in the New York area in 1990–91, Jaggar and Smith-Burke (1994) compared RR children with a group of children drawn from the “waiting list.” These children had scored low but were not the lowest scorers in their schools. The schools in the study, however, for economic and other reasons, had high numbers of children who qualified for RR and low resources to provide the program. Thus, the “waiting list” children were considered by teachers in the school to need extra help. Of RR children who received at least 60 lessons and / or were discontinued ($n=328$), 78% were successful in the program, meaning that they achieved at least grade level status (defined by average band) for their class or school and showed evidence of a self-extending system for reading (see discontinuing criteria in Clay, 1993). Of the comparison group, 71% were reading below grade level even though many received some type of supplementary instruction. Higher coverage in RR could have benefited the “waiting list” children.

District #2, New York City, (see Jaggar & Smith-Burke, 1994) an area of economic disadvantage that has a highly diverse population, reports a steady increase in the percentage of children who successfully discontinued the program (from 57% in 1990 to 95% in 1994). This progress can be attributed to increased coverage and analysis of the system over time. A June 1994 follow-up study of 198 second graders showed that at the end of second grade, 86% of the RR

children who successfully discontinued from the program in first grade scored within or above the grade-level average band in text reading (20.33–30.27; equivalent to a range between end of second grade to grade 6) compared to 75% of a random sample of children not selected for RR. As a group, the RR children had a mean text reading score of 27.06 (equivalent to grade 4) while the random sample mean score was 25.3 (equivalent to grade 3). A small number ($n=27$) of formerly discontinued third graders followed. At the end of third grade, 82% of the RR children, compared to 87% of the random sample children scored within or above the average band (29.88–34.34; grades 5–8). As a group, these RR third graders had a mean text reading score of 31.56 (grade 6) which is similar to the random sample (32.11; grade 7). There appear to be variations from year to year, however these results indicate a remarkable achievement for these initially struggling children. The District #2 project demonstrates what can be achieved with continuous effort in an urban setting.

In Boston and surrounding areas, Lesley College reported that 93.3% of second graders who were RR children in first grade were reading materials identified by classroom teachers as at grade level or above. Of second graders who participated in RR ($N=146$), 94.9% read materials at or above grade level, with 92.3% reading at above average grade level (Fountas, 1994). As the British inspectors stated, “The essential conditions for the success of RR, as a system, lie in the coherence, the resourcing, and the reach of the support and quality assurance structures which are put in place for its implementation” (HMSO Report, p. 23).

Some educators have combined RR with other approaches to meet the demands in high-need areas. Dorn (1994), with a colleague, Allen, reports the simultaneous implementation of RR with a specially designed small group model in the state of Arkansas. The small group program was similar to that described by Pinnell and McCarrier (1994), although adapted at the local level. Extensive staff development was provided for RR teachers; they taught small groups of low achieving children during half of the day, devoting the rest of their time to tutoring four RR students daily in individual lessons. Each small group lesson was approximately 45 minutes in length.

The program was based on an organizational structure suggested for areas that serve large numbers of at-risk children. Based on a combination of teacher ranking (by kindergarten teachers and first grade teachers in collaboration), classroom observation, standardized test, and observation survey (Clay, 1993a), the lowest ranking children were selected. Of those students the lowest achieving were selected to receive RR and the remaining children were placed in a small group program, five students per group. When a child exited the RR program (through moving or discontinuing), the lowest achieving student in the group was placed in RR. It is important to note that prior small group membership was not a criterion for selection if, at the point of vacancy, another child were more in need. A priority was placed on reserving the individual tutoring for the children who needed it most.

Intervention services for a total of 231 children were analyzed. Of this number, 95 (41%) received RR tutoring only; 93

(40%) received group services only; and 43 (19%) received a combination of group service and RR, although not simultaneously. Of the 95 children who received RR services with no prior experiences in a group program, 72 (76%) were discontinued in an average of 65 lessons. Of the 93 children who received only small group instruction, 28 (30%) reached successful levels of reading achievement at an average of 48.5 lessons. Of the 43 children who were served by the group prior to entering RR, 24 (55%) were successfully discontinued from RR in an average of 25 lessons. This group had received an average of 40 group lessons prior to entry. A higher percentage of children probably would have reached average reading levels with more time in the school year. The 11 teachers involved in this study each served an average of 21 low achieving children in some type of intervention during the first grade year and an average of 11.3 children per teacher reached average reading levels for their schools. Dorn raised several cautions in interpreting these data. First, she recognized that the confusions of the lowest achieving children are diverse and that multiple assessment must be used in assigning children to the appropriate level of intervention. Second, she affirmed RR as the most effective program for the lowest children, who must have individually tailored lessons. The group provided support but could not reach the high discontinuing rates yielded by RR. It was, however, an added benefit that 30% reached average levels without requiring RR. Third, 19 (6% of the at-risk population) children were served first in the group and then entered into RR but were not discontinued. These children, however, made notable gains in all areas when compared with a state random sample of first grade students. Dorn concluded that this model has efficacy for serving larger numbers of children *during the first grade year*.

Contextual Factors in the Implementation of Reading Recovery

It is not enough to design effective procedures for tutoring children. Any successful program must have a way of delivering the program. In the guidebook for teachers, Clay stated that "the plan of operation must allow for teachers to differ" (Clay, 1993b, p. 62). At the same time, processes must be in place to assure quality service. Program implementers give particular attention to contextual factors that may influence the delivery system. For example, in the United States, RR is seen as a school and district commitment rather than one of a single teacher. An important contextual factor is the partnership that exists between classroom teachers and RR teachers.

In a study of RR in 12 schools situated in Auckland, Otago, and Southland, New Zealand during 1986 and 1987, special attention was given to context (Glynn & McNaughton, 1992). The sample represented a range of schools but was neither a random sample nor a systematical representation of possible schools. The subjects were 42 individual children who were entered in RR and 41 children of similar age who did not experience RR. Data were gathered over a 2-year period. In each school when an RR child (called "target") entered the program, a comparison child of approximately the same age

was also selected. Neither the research team nor the schools wanted to prevent children who might need RR from being selected; therefore, comparison children were chosen who were of similar age and scored toward the lower end of the distribution but for whom a place in RR was not available. Thus, comparisons were among initially unequal groups in schools where coverage provided for service to all children who needed intervention.

Glynn and his team found that while participating in RR, target children made substantially more progress than comparison children, gaining over four levels more than those who began at the same reading levels. After release from RR, the rate of gain decreased (a typical circumstance since children are no longer expected to make accelerated progress without one-to-one teaching), and the control subjects were allowed to catch up. The explanation that researchers gave for the slower progress after release from RR was that students were generally placed in classrooms reading in book levels lower than what they could read; therefore "it appears that in effect many target children made little progress until their reading groups caught up with the level they had attained some months earlier at discontinuation" (p. 124). They hypothesized that this practice was to allow children to consolidate skills, but that children might not be challenged enough by this practice. They also noted extreme variations in the attitudes of classroom teachers towards target children. The researchers found greatest benefit for the children entering RR with the lowest text reading levels. Caution must be observed in the interpretation of this study. Two unequal groups were compared and membership of the sample groups varied markedly from one testing time to another. This factor is compounded because the sample was small and not randomly selected.

Glynn recommended a conservative cut-off point, considering text reading only, for entry into RR with the idea that fixed criteria would prevent children from receiving tutoring when they do not need it. There are two arguments against this recommendation. First, in beginning reading it is critical to use multiple measures. Children are acquiring knowledge along several dimensions and have not yet been integrated; therefore, using one task will not give us a true picture of who the children in difficulty are. Literacy involves a complex interrelationship of abilities; to measure only one aspect of reading may provide a false picture. Writing skill is as important for literacy learning as reading skill.

Second, any prevention program inherently runs the risk of serving some children who might succeed without it; but at the entry point we cannot predict in any satisfactory way which individuals will make good progress. Provision of the program to approximately 20% of the first graders will be the best compromise between risk and cost. In low economic areas with high need, children's programs may be longer; therefore, more resources will be needed and coverage may need to be extended into second grade.

What we can derive from Glynn's study is a recognition of classroom factors as important in the continued progress of RR children. A United States study by White (1992) indicates the complexity and impact of the school context and confirms the importance of partnership between the RR and classroom

teachers in helping children transfer their skills from individual lessons to classroom work. White found that even so seemingly insignificant a factor as proximity of the classroom and the instructional space for RR can have facilitative or negative effects. The study revealed contextual factors that can affect the delivery of the program as well as the different perspectives and decision-making styles of local educators. In another New Zealand study, Smith (1984, 1988) also found that factors involving subsequent instruction were the single strongest influence on children's post RR progress.

Schnug (1991) studied RR from the point of view of the student. In a 2½ month case study of two male students, Schnug examined the patterns of instructional activities that occurred over time in RR lessons and in the classroom setting. A unique aspect of his study is the descriptions of students' self-reports. Schnug was interested in students' perceptions of their performance and abilities as they learned to read. The researcher found that both students were highly influenced by the context. While opportunities were available in both settings, RR provided more routines that required a sustained and open-ended reading or writing response. Routines in classroom reading generally produced more close-ended responses as imposed by instructional materials such as worksheets. One subject's more active participation appeared to work to the other one's advantage; the more hesitant child was allowed to turn down invitations to participate in the classroom. Schnug's study reveals how an active teacher in RR can create opportunities for children who might be reluctant to participate in classroom settings. Both students became more active in the classroom over time, and both saw themselves as good readers.

Askew and Frasier (1994) have suggested that teachers' perceptions of children's abilities figure heavily in their continued progress and opportunities to learn beyond the 1st-grade year. Their study of the program's sustained effects on the cognitive behaviors of 2nd-grade children suggested that former RR children, when compared to a randomly selected average group that did not receive the intervention, were more overtly signaling their problem-solving strategies while reading text. This factor did not appear to affect reading ability in general, and may have been an artifact of the researchers' observational skills and sensitivity to subtle aspects of behavior. Former RR children also compared well with their peers in oral retelling tasks designed to measure comprehension of text. The researchers noted problems with retelling as a measure since both groups, random sample and former RR students, appeared to see the task as socially inappropriate without a logical audience.

Additionally, Askew and Frasier found that former RR children compared well with their 2nd-grade peers on fluency indicators. They noted, however, that in many instances for both groups, teachers' perceptions did not match actual student performance, suggesting that either teachers were making their judgments on a broad range of classroom behaviors rather than on specific reading behaviors or that they were using a comparative scale, ranking some students as "low" even if most were well within average range.

Reading Recovery has been implemented with remarkable fidelity in all five countries of implementation; yet,

different problems and dilemmas continue to arise. For example, in New Zealand children enter school on their fifth birthday and encounter a print-rich environment in classrooms. By their sixth birthday they have had a year of literacy experience. In the United States and Canada, children enter kindergarten anywhere between ages 4 and 7, and kindergartens vary widely. This circumstance prompts continuous problem solving, which is assisted by the program's guidelines and standards. This document also acknowledges, however, that "no set of guidelines will ever address the range of issues that will arise" (Reading Recovery Council of North America, 1993, p. iii). The guidelines are intended to be used as a guide by educators who have been trained in the rationales behind their use rather than as an arbitrary set of rules.

Research on Reading Recovery and Home Relations

In a unique descriptive study of RR children's home experiences, Holland (1991) discovered that the achievements children made in school tutoring carried over to the home environment. Through interviews and observation, Holland studied the family literacy experiences of 13 children for a period of 1 year. Families were, in general, in economically depressed circumstances. She found that parents, siblings, and other caregivers supported and appreciated children's efforts in a variety of ways, for example, by listening to them read and talking with them. These families tended to depend on the school for writing materials. Early in children's programs, the cut up sentence was highly valued, but, increasingly, both parents and children depended on the little books that came home everyday. Holland reports that "during the year, more than seven hundred RR books were taken home by these thirteen first-grade children, but only one child lost a book" (p. 157).

Children tended to initiate reading sessions at home; usually they captured more than one family member. Holland described the book as a "literacy tool that drew the whole family together to support the young reader's need to share reading ... when no one was available, children read the books to themselves or to dolls, stuffed animals, and family pets" (1991, p. 157). The study demonstrated that parents, formerly concerned about their children's progress, were able to observe their children successfully reading and writing. By the third interview most parents believed that their children were good readers. Holland's research indicates the power of sending into homes literacy materials that children can control themselves.

English researchers (Moore & Wade, 1994) interviewed a group of parents (N=47) from diverse socioeconomic and ethnic backgrounds. They report that parents had been invited to observe reading sessions and that this experience influenced the kind of help they gave their children at home; for example, they were more aware of the importance of praise. These parents were impressed with their children's enthusiasm for the stories they encountered in RR and stated that progress had extended into other areas of the school curriculum and that their children read more on their own

time. Twelve of the 47 children whose parents were interviewed were second-language learners; and these parents were as positive about the program as were the single-language parents.

Descubriendo la Lectura: Reading Recovery in Spanish

One of the most interesting and exciting new developments in RR is the reconstruction of the program in Spanish (Escamilla, 1994). In consultation and with the permission of Clay, teachers and administrators in Tucson, Arizona, made the commitment to develop and study the application of RR in Spanish. This reconstruction of the program is designed to serve native speakers of Spanish who are having difficulty in learning to read in their first language. From a theoretical standpoint, this study is significant for three reasons. First, it utilizes the knowledge base and theoretical framework from two important fields (bilingual education and RR) for the purpose of addressing a large and growing need in our country. This need is how to assist Spanish-speaking children who are having difficulty in learning to read without prematurely submerging them in English and without permanently placing them in classes for slow learners (p. 59). Second, the study provides a model for constructing RR programs in other languages. Third, it demonstrates learning and teaching processes across languages.

Descubriendo la Lectura (DLL), as the reconstructed program was called, is equivalent in all major aspects to the program designed by Clay. Escamilla (1994) studied 180 1st-grade, Spanish language dominant students from six elementary schools. She compared three groups: (1) the lowest achieving children, identified by teacher ranking and the six observational measures (Clay, 1993a), who were entered in DLL ($n=23$); (2) control group students ($n=23$) who were selected on the same basis and could have benefited from DLL but were from two schools that had no DLL program; and (3) a comparison group ($n=134$) composed of all 1st-grade students who were from the six schools in the study and were not identified as needing DLL (that is, not in the lower 20% of the class).

Subjects were tested at the beginning of 1991 and again at the end of the year. In addition to Clay's measures, Escamilla used the *Aprénda* Spanish Achievement Test (1991). Although several tests favored the control group in the fall, Escamilla found the DLL group and control group to be similar at the year end. There were statistically significant differences between those two groups and the comparison group ($p < .01$) in the fall. Spring measures indicated that the DLL group significantly outperformed the control group ($p < .05$) on all measures. Mean scores of the comparison group (Fall and Spring) provided a picture of what average progress meant in first-grade. By the spring testing, DLL students had reached average levels for the class on all measurement task. This was not true of the control group, which remained far behind the comparison group. "In fact, on all measurement criteria used in the study, DLL students not only caught up with their average peers, but surpassed them at statistically significant levels" (p. 86). Escamilla concluded that "the data

reported establish that the DLL program achieved acceleration with Spanish-speaking students who were struggling while learning to read in Spanish" (p. 86). This research provides evidence of the promise of *Descubriendo la Lectura*; however, as Escamilla notes, the numbers of children were small. It is also the case that DLL is still under careful development and scrutiny by its implementers. More research is needed to determine effectiveness and also to provide information about the ways in which teachers and children work together, and the differences in emphasis that will be related to the differences between English and Spanish. The DLL continues to be an integral part of the North American RR effort.

Research on Teaching and Learning

The statewide experimental study referred to above (Pinnell, et al., 1993) showed superior results for one-to-one instruction using RR procedures by trained teachers. Researchers were interested to note that the alternatively trained teachers (two initial weeks and some follow-up) provided lessons that on the surface were almost identical to RR lessons in that approximately the same amount of time was spent on each element of the framework. Materials were the same for RR and the alternative program. Clearly there was a need to look beyond the surface elements uncovered by the statewide study.

The Nature of Teaching in Reading Recovery

Reading Recovery is an individual program in that the teacher works from the child's responses and knowledge base. The theory on which RR is based (see Clay, 1991a) suggests that support for individuals' learning is provided from moment to moment teacher-child interactions. The power of the program lies in the teacher's ability, in the context of continuous text, to direct the child's attention to "the clearest, easiest, most memorable examples with which to establish a new response, skill, principle or procedure" (Clay, 1993b, p. 8). This powerful teaching occurs throughout the 30-minute lesson, which is structured around six general components that must be present everyday:

- (1) reading many known stories;
- (2) independently reading a story that was read once the previous day while the teacher observes and assesses progress;
- (3) writing a message or story, with support by the teacher for the construction of words;
- (4) working with letter and "making and breaking" words to learn how they work (using magnetic letters);
- (5) putting together a cut-up sentence (from the story above); and
- (6) reading a new book introduced by the teacher.

In the RR lesson, children have the opportunity to connect reading and writing and to engage in problem solving while reading. Children work out problems by searching for and using information from a variety of sources such as experi-

ence, knowledge of language, and visual information from print. Although challenge is inherent in the activity, the RR teacher is also concerned with ease and fluency. Text selection and instructional support make it possible for children to see themselves as doing what good readers do (DeFord, 1991). DeFord suggests that RR children's rereading of texts helps them to orchestrate strategies more effectively and focus on meaning while becoming more fluent.

The RR lesson has been described as "a highly organized, intensive, and, it must be stressed, enjoyable occasion. Moreover, it is not confined to reading alone—writing and good deal of speaking and listening also features strongly" (HMSO, 1993, p. 5). The activities of the lesson put the child in control of his / her learning. The teacher's goal is to help children to become independent, strategic users of literacy. Only by engaging in the use of strategies, with the support of another with greater expertise, will the child be able to take over the learning. Although not developed using Vygotsky's theory, RR has been interpreted as an example of an apprenticeship model, in which the child works alongside a more expert writer and reader who demonstrates and supports the novice's efforts. The teacher identifies the child's areas of strength and existing knowledge and assists in the use and extension of that knowledge (Clay & Cazden, 1990; Gaffney & Anderson, 1991). "Acceleration is achieved as the child takes over the learning process and works independently, discovering new things for himself inside and outside the lessons. He comes to push the boundaries of his own knowledge, and not only during his lessons" (Clay, 1993b, p. 9)

Studies of Teacher Behavior and Student Outcomes

Studies of RR have documented teacher-child interactions that appear to be related to successful student outcomes. These studies involved the detailed analysis and categorization of the types of interactions that were observed in taped lessons. Several studies of instruction (see Lyons, 1991; Lyons, 1993; Lyons & White, 1990) provided a pattern of evidence suggesting that successful teachers help children become flexible problem solvers who focus on meaning. Teachers' comments during lessons supported children's use of the full range of information needed for reading (e.g. meaning, picture clues, syntax, and visual detail). Lower student outcomes were associated with an overemphasis on one source of such information. Videotaped lessons, taken at two points in time, were analyzed to determine the prompting and reinforcing statements made by teachers. The analysis indicated that higher student progress was associated with consistent balance between attention to text-level strategies and letter-, or word-level strategies. Successful teachers appeared to be helping students analyze words using larger chunks of information and they were more specific and more responsive to specific child behaviors that indicated problem solving (Pinnell, 1993). These studies were conducted on quite small samples of teachers. Further investigations are needed involving larger numbers of RR teachers.

Frasier (1991) observed two RR students with differing profiles of progress for a period of 6 months. Based on

behavioral evidence, Frasier compared the use of strategies by the two readers and also examined the teacher's prompting for strategy use. One child made accelerated progress in RR and the other was not successful. This research indicated that while both readers made progress in learning and evidenced the development of strategies, the two readers differed in several ways: for example, oral language behaviors, print awareness behaviors, linking behaviors and risk-taking behaviors as well as the way in which they interacted with the teacher. The high progress student had more initial control of oral language and more readily noticed and used visual information in print. The slow progress child required more prompting from the teacher to take on every new behavior. Consistent with Glynn's recommendations (Glynn, et al., 1989), Frasier concluded that the slow progress child required more time in the program. These results, however, should not be generalized to indicate that children who come into the program with low scores will make slow progress; many children who initially have a low knowledge base make accelerated progress. More research is needed, such as that undertaken by Clay and Tuck (1991), that looks closely at children who do not make accelerated progress in RR.

As an alternative to defining success in terms of student outcome measures, Handerhan (1990) conducted a qualitative investigation using multiple ways of viewing success. She contended that success can also be defined through perceptions of students and teachers and through observed actions. In her study of successful teachers, using this multifaceted definition, Handerhan found that while the four teachers she studied structured their lessons in similar ways, there were variations across teachers in use of time, choices of materials and instructional actions. Interactions between the student-teacher pair who consistently fell at the higher end of the success continuum were varied and represented a wide repertoire of strategies. Children were invited to "play" with language in many different ways and for different purposes. Handerhan described a narrower range of interactions for the dyad at the lower end of the continuum. Iversen and Tunmer (1993) report results of a quasi-experimental study in which two nonstandard versions of RR were compared. Three matched groups of RR children were compared:

- (1) one group received an RR program designed by the researchers to include explicit code instruction involving phonograms;
- (2) the second group received "traditional" RR instruction that did not include recent refinements; and
- (3) the third group received a "standard intervention," defined as either Chapter 1 or a state-supported program called Literacy.

Both RR groups were superior in performance to the third group and achieved equal levels of reading performance; however, the group receiving the modified program made quicker progress, resulting in somewhat shorter programs. While the researchers concluded that the more rapid progress in the program was strongly related to the development of phonological skills, two things must be noted. First, what was described as the "traditional group" (group 2) was equal to or better than the special program group on the phonological

test assessments at the end of the RR program; and second, the special program group (group 1) had a full RR program within which to learn their phonological skills.

Several factors make it important to exercise caution in interpreting the study. The RR groups were selected for convenience (two teacher classes) rather than using random assignment or other techniques for matching; therefore, we cannot assume that they were equivalent. One of the researchers, a New Zealand tutor, conducted both RR classes making experimenter bias a possibility. Since the same teacher educator had not participated in RR for several years, the experiment was conducted without access to refinements in the program that had taken place in the preceding 3 to 4 years. So, RR in this experiment did not have the benefit of the in-depth work on words, called "making and breaking," which now features more prominently in RR lessons. Revisions in the program are related to recent research on phonological awareness, onset and rhyme, and analogy (see Clay, 1993b, p. 44). The major focus of the program, however, is still on meaning and on reading and writing extended text. In any study of variations on a program, it is a dangerous assumption to conclude that the variant produces good outcomes. It may be that the program is sustaining the progress despite the variant. Nevertheless, the work of these researchers confirms the power of the lesson framework and raises important issues related to the role of phonological awareness in reading progress.

DeFord (1994) examined differences among high and low progress students. In a comparative descriptive study she selected students ($n=12$) and teachers ($n=8$) half of whom represented higher and lower outcomes in the program. Her analysis of videotapes of lessons, student writing books, pre- and post-test measures, and lesson records indicated marked patterns of interactions across the beginning, middle, and end of program designations. This analysis focused on the writing section of the RR lesson. In this section of the lesson, teachers and children collaborate to write a message on one page of a writing book while using a "practice" page for word construction and other kinds of practice and analysis. Teachers watch for appropriate opportunities to use scaffolding tools such as "hearing sounds in words," in which the teacher draws squares for each phoneme (and for each letter, as the child becomes more advanced) and invites the child to say the word slowly to identify sounds and construct the word. Teachers also find opportunities to help children construct unfamiliar words from words they know and see patterns and relationships in word clusters. The whole process, with the goal of producing a message composed by the child, offers chances for children to examine the links between oral language and written symbols.

DeFord suggested that higher outcomes were related to teachers' supporting efforts at independent problem solving and making decisions about how to use tools such as hearing and recording sounds in words and analogies across the child's program. Copying had little value; independent phonological analysis (using hearing sounds in words techniques), generating new words from known examples, and fluent word writing facilitated rapid progress. This analysis confirms the importance of writing in the lesson framework.

DeFord found that the most effective teachers allocated more time to writing and concluded that writing is especially helpful early in the child's program. By taking advantage of and fostering the reciprocity between reading and writing, teachers helped children build networks of understanding "until the systems of knowledge held in reading and writing converge" (DeFord, 1994, p. 53). These networks, she hypothesized, would be powerful sources of personal knowledge for children's continued learning in classrooms.

Studies of Teacher-Student Interactions

Studies of teaching, while helpful to program developers in refining teacher training, fall short of explaining the dynamic and interacting processes that lead to student learning in RR. With the consistent lesson framework and emphasis on conversation as a support for learning (Kelly, Klein, & Pinnell, 1994), RR has been viewed by some researchers as an ideal setting for examining teacher-child interactions and their relationship to learning.

A number of studies have used RR as the setting to study interactions between children and teachers. Askew (1993) analyzed taped interactions between children and their teachers across four readings of the same text. This study of repeated readings revealed that children's behaviors indicating monitoring, error detection, and self-correction increased as texts became more familiar. These familiar texts do not represent "memorized" renditions but strong linguistic resources which the reader can access when cued by print. Fluent reading also increased and teacher intervention decreased. Askew's analyses support the inclusion of multiple readings of the same text because they provide a chance to engage in fluent reading and independent problem solving.

Using a sociocultural framework, a group of researchers (Wong, Groth, & O'Flahavan, 1994), analyzed five RR teachers' interactions with children in two contexts, familiar reading of known stories and reading new stories. They characterized teacher-student interactions using five categories for teacher behavior:

- (1) telling—to provide the word or an explanation;
- (2) modeling—to explicitly demonstrate an act;
- (3) prompting—to focus attention on visual, structural, or meaning cues available in the text;
- (4) coaching—to take the reader outside the reading act to focus on how the student performs or responds; and
- (5) discussing—to talk about the text in a way that focuses attention on the meaning of the story.

The researchers found that teachers were less directive when students reread familiar texts and tended to behave as "coaches" to support students' attempts. In new texts, however, there was an increase in teacher behaviors such as modeling, prompting, and discussing comments that fostered efficient processing of continuous texts. The researchers stated that "teachers trained in RR seem to know from moment to moment what text to focus on, when and how to prompt, when to tell, when to coach, and when to allow

readers to direct their own reading" (p. 23). These comments capture the goal of RR teaching, toward which both initial training and continuing teacher development are directed.

Case studies of teachers have further illuminated the decision-making process. Elliott (1994) employed a qualitative case study approach to examine decision making by one effective RR teacher. Her study reveals that the teacher's knowledge was built upon multiple sources of information—knowledge of the child, pedagogical content knowledge, and knowledge of content. Pedagogical content referred to the teacher's understanding of her role in assisting children to read and write. Knowledge of content referred to understandings specific to the ideas, facts and concepts associated with emergent literacy; that is, the teachers's personal theory. These knowledge sources intricately linked to the kind of reasoning the teacher used to make decisions for individual children. Elliott described what she observed as "responsive teaching," a process of observing and interpreting information about one child's reading / writing behaviors forming a transaction with the teacher's knowledge base and the process of making decisions. That is, the process is not one of applying a particular teaching move to a particular response but of constantly synthesizing and analyzing relative to the individual.

Dorn (1994) examined the types of conversations that occurred between the teacher and child during the period of a child's program called "Roaming around the Known." Teachers are directed by the RR guidebook as follows:

For the first two weeks of the tutoring programme stay with what the child already knows. Do not introduce any new items of learning...

Go over what he knows in different ways until your ingenuity runs out, and until he is moving fluently around this personal corpus of responses, the letters, words and messages that he knows how to read and write. [MR1]... the most important reason for roaming around the known is that it requires the teacher to stop teaching from her preconceived ideas. This will be her focus throughout the programme. (Clay, 1993b, pp. 12, 13).

Dorn suggests that this context is comparable to the mother-child dyad. She conducted case studies of one teacher and two African-American male students in a small rural school; all "roaming" sessions were audiotaped and video recorded; sessions were observed and written productions were collected.

To analyze the data, Dorn identified a series of nested contexts: literacy events, literacy episodes, literacy conversations, and literacy statements. She found that three types of talk worked together to support the child's development of inner control:

- (1) child talk;
- (2) teacher feedback talk, in which the teacher responded to the child's demonstrations of literacy use; and
- (3) teacher feed-forward talk, in which the teacher tried to activate the child's preexisting knowledge for use in a new situation.

Her analysis of the language in sessions suggested that both kinds of teacher talk facilitated children's literacy growth. Teachers took the opportunity to talk aloud, describing the child's accomplishments with regard to reading and writing. Children also began to articulate specific knowledge about literacy, providing the teacher with further overt evidence of understanding; however, Dorn concluded that the teacher's responses to the child's demonstrations of literacy were of greater importance than the child's ability to articulate. The teacher skillfully used language in a mediating way to help the child access prior knowledge. As children gained experience, they tended to exercise greater control in the reading activity and the teacher's role of assistance varied in response to the behaviors signaling children's knowledge; for example, Dorn observed transitions from teacher-regulation to child-regulation in literacy events. Dorn's study confirms the central role of observation in RR teaching. After entry to the program, some children find it hard to make accelerated progress a circumstance that provides additional challenges for RR teachers. If a child is making slow progress, teachers must assume that they have not adequately adapted the program to meet the student's needs. A reexamination of teaching is required (Clay, 1993b). To meet these idiosyncratic needs, teachers must reexamine their teaching behavior and their analyses of the child's difficulties. The goal is to gain new or additional insights into what may be interfering with progress. Lyons' (1994) case study is of an effective RR teacher working with a hard-to-teach child who was successfully discontinued. The study revealed that this excellent teacher could:

- (1) describe specific behaviors that suggested where, when, and under what conditions the student's processing was breaking down;
- (2) use the student's behaviors to infer the cognitive and perceptual processing going on "inside the head" to build a theoretical rationale for *why* the breakdown might be occurring; and, then
- (3) determine a course of action and specific teaching procedures to help the student learn how to help him / herself acquire and use effective reading and writing strategies.

The RR lesson provides an intimate setting within which teacher and child are collaboratively immersed in reading and writing. Wong et al's (1994) analysis reveals that teachers' scaffolding comments occurred not in isolation but "dynamically as the teachers attempted to find the appropriate support for the student at the right time" (1994, p. 21). It is the spontaneous nature of the interaction that is so difficult for research to capture and press into a formula that may be directly taught to teachers and transferred to other situations or programs. As they interact, the teacher structures behaviors to meet the student where he or she is in learning. In times past, this kind of powerful teaching might have been described as an "art" or something that a "born teacher" might do. We know from RR that teachers can learn to interact with students to promote learning and that this skill can be refined and extended over time, given a high quality professional development program.

Research on Teacher Learning

Reading Recovery training has been described (Alverman, 1990; Pinnell, 1994) as an inquiry-oriented model for teacher education, an appropriate description because all components of the staff development model involve teachers in searching and reflection. Each young student represents an individual investigation through which teachers learn as they “follow” the child’s progress and make hypotheses about the nature of his or her learning. The teacher uses opportunities that arise from several sources:

- the texts children encounter
- their responses to those texts
- the conversations in which they engage
- the messages composed and written.

From those sources, teachers learn to craft teachable moments; their learning is supported by the leader’s guidance and their talk with others. According to Clay and Watson (1988), “the key word in the development and implementation of this inservice program was ... observation, and the unique feature was the potential for multilevel observation and learning that was embedded in the situation” (p. 192). Two components—talking while observing and the reflective discussion—make up the major part of the teacher education program. Each case, example, or demonstration presented gives every teacher a chance to reflect on his / her own teaching. This reflective / analytic experience helps teachers construct and refine their theoretical explanations and go beyond procedures. Through shared experiences, a culture is created that supports teachers’ learning.

Impact of Reading Recovery on Teachers

Every study of teachers involved in RR has revealed a powerful impact on individuals. In the United States, researchers followed one group’s shifts through recording informal discussions held every two weeks (see Lyons et al., 1993). Teachers moved from a focus on mechanics and logistics to a willingness to examine theory. However, the study revealed that learning, even with weekly classes and support, took time. An Australian study (Geeke, 1988) provided evidence that the RR training course had a strong impact on teachers’ views. Teachers valued the learning that occurred. In both United States and Australian studies, teachers commented on the intensity of the training and the anxiety connected with teaching “behind the screen.” A more recent Australian study from a different state was entitled *Changing Lives* (Power & Sawkins, 1991). The results confirmed the potential of the program for teacher change and yielded comments that the in-service sessions were “intense,” “exhausting,” and “stressful.” As in the initial United States study, teachers were concerned about teaching loads and scheduling. In all three studies there was an initial desire on the part of teachers to be told “the answers” and frustration that points were turned back to the group for decision making.

Shannon (1990) undertook a year-long study of a 12-member RR teacher class. Her objective was to study the role

of verbal challenge and teacher response during live demonstrations. Shannon identified 19 categories of verbal challenge and 21 categories of response. She particularly noted the role of exploratory questions, for which the leader had no specific response in mind. She found generally stable patterns of questioning and response across the 8 months of the study; however, changes in focus and changes in teacher acquisition of knowledge were evident in their ability to evaluate, describe and explain behavior. The researcher hypothesized that the opportunity to observe authentic lessons is a key factor in teachers’ ability to interpret and transfer learning to their own teaching.

Two other studies focused on the nature of interactions during in-service sessions. In an year-long study of one teacher group, Wilson (1988) recorded and analyzed behind-the-screen and discussion sessions. She found that over the course of the year teachers increased in their interactions, grew in their ability to describe specific behavior, and were more likely to challenge each other’s statements. Rentel and Pinnell’s (1987) study of teachers’ language focused on growth in ability to provide evidence or “grounds” for statements. They found that teachers grew in their ability to make statements that were supported by specific evidence from student behavior.

Teacher Learning Over Time

Research is needed that goes beyond the training year to discover whether teachers can sustain ongoing development without continuous support. Woolsey’s (1991) case study of one teacher indicated the difficulty she experienced in coping with the internal and external forces that impinged on her learning and on the changes she wanted to make in her classroom teaching. (This teacher taught RR for one half the day and a 1st-grade classroom the rest of the day.) School district requirements, other teachers’ expectations and opinions, and her own built-in fears were all barriers to continued growth for this teacher. It was only during the second year after training that she was able to change her classroom practice to be more consistent with the theoretical shifts she had made during RR training. Another interpretation of Woolsey’s research is that theoretical concepts deepen and become more generalizable in the years after initial RR training.

Teacher Learning Over Time

Using an interpretive case study approach, Lyons (1991) examined the development of one RR teacher’s understanding and questioning practices over time. Videotapes of teaching were first analyzed by experts and then discussed with the case study teacher while viewing the videotape. Lyons recorded the teacher’s comments. Over a 3-year period the teacher continued to grow in her understanding of how to prompt and / or ask questions that enabled a student to construct learning. Her approach to instruction became more skillful and complex throughout the investigation period. Lyons identified Phase 1 as “trying out” the prompts and

questions suggested by RR training, Phase 2 as using prompts and questions to test her hypotheses about the child's behavior and then to support the student's problem solving, and Phase 3 as prompting and questioning in response to students' behaviors. The teacher moved from the first phase, in which, by her own account, she was "parroting questions according to the book," to the third phase when she demonstrated her ability to respond to unexpected answers, to reframe the situation, to step out of her original perspective to take into account the student's perspective. The study also indicated the value of this teacher's opportunity to talk about her own work with others. With system support and an inquiry approach learning is continuous. Lyons (1991) replicated this study with six RR teachers leaders in training. The teachers collected and analyzed observational notes of student behavior, running records of oral reading and writing samples to determine shifts in student learning. Subjects also used journals to record personal reflections about the effects of their teaching decisions on student learning, and they tape-recorded, analyzed, and evaluated their interactions (verbal and nonverbal) with students throughout the in-service course. The teachers and the researcher met weekly to analyze and evaluate the consequences of their instruction. Lyons' analysis of the audiotaped lessons and of teachers' personal reactions as documented in journals and conversations with colleagues, indicated that as teachers became more sensitive to emerging behaviors signaling student change, they began to tailor their own behaviors to meet the students' developing abilities. The study suggested five general principles of learning and teaching:

- (1) assisted performance by another more expert helps individuals—both students and teachers—expand and reorganize their understandings;
- (2) the language that surrounds events within an RR lesson mediates performance and creates systems of change;
- (3) conversation has an important role in teachers' learning; ongoing discussions provide a scaffold for the growth of understandings and a way to mediate performance by providing bridges between what the teacher already knows and what he / she needs to know to teach effectively;
- (4) collaboration enables teachers to develop theoretical and practical knowledge; and,
- (5) the major shifts in teacher theory development are given impetus by learning the RR teaching procedures and are greatly influenced by the in-service course.

Lyons (1993) concluded that this model enables teachers to internalize and transform psychological processes. This incorporated a way of "learning how to learn" into their own instructional repertoires. Lifelong learning is a result of the process. It appears that the idea of social construction of knowledge applies not only to children but to teachers as well. The teacher's construction of his / her own knowledge is a critical factor in RR teaching.

Another study (Lyons, 1994b) focused on thirteen RR teachers in training at three and again at six months. In training sessions these teachers assisted one another to en-

gage in thinking about their instructional decision-making, called "pedagogical reasoning" in this study. Support took the form of "chains of reasoning" cooperatively built by the group. Teachers reported that this process increased their decision-making power in individual teaching. Lyons (1994) claims that an important factor in RR teaching is how "teachers consult with each other to develop a theoretical base that is grounded in action. They are encouraged to approximate, to generate hypotheses about what the student has learned and controls, to challenge one another, and to provide alternative explanations for the student's behavior with supporting evidence for their hypotheses" (p. 285). Peer consultation is a requirement from the beginning of training and throughout a teacher's participation in the program. This study also showed the powerful role of the RR teacher leader in guiding the process.

Studies of teacher learning represent a relatively unexplored yet significant dimension of RR. More research, with larger numbers, is needed; yet, an open-ended survey of 205 RR teacher leaders supports the findings of case studies. In a lengthy questionnaire, teacher leaders revealed their perspectives on their own training and their role as teacher leaders (Pinnell, Lyons, Constable & Jennings, 1994). The value of talk with colleagues emerged as a major factor in their learning. During the first year of training, and in subsequent years, respondents reported that reflection, dialogue, and the opportunity to articulate new understanding increased learning. The support of colleagues was valued by teacher leaders, especially after the training year. For these leaders, learning to teach is facilitated through talk with others who share their mission and vision.

Research on Implementation

Most innovations are confined to small demonstrations that are described in the literature but not taken to a large scale because dissemination processes are not in place. RR has reached a large scale by replicating the innovation in new settings (Wilson & Daviss, 1994). Hiebert (1994) says that "once a program is in place, there appears to be considerable fidelity in the results. Even when the number of tutees jumps 100% as it did at OSU from 1986–87 to 1987–88, similar levels of oral reading were maintained with the same percentage of the cohort" (p. 21). Clay (1994) has recognized systemic factors in the design and implementation system for RR.

...my personal orientation in developing RR was to take account of the complex interdependence among parts of the system.... In an effective intervention the interdependence of variables demands a systemic plan, for an innovation cannot move into an education system merely on the merits of what it can do for children (p. 128).

Innovators must see change "as a problem of instructional linkage in which there is likely to be conflict about issues which will affect the survival of new programs" (p. 128).

Education experts not directly associated with the program (for example, Adams, 1990; Allington & Walmsley, 1995; Slavin & Madden, 1987) have recognized the potential of RR and encouraged dissemination. Consistent success rates across hundreds of school districts, in urban, rural, and subur-

ban settings, serving “at risk” students in multiethnic and multilingual classrooms, indicate that the current method of implementing, disseminating, evaluating and ensuring program quality has been maintained over the decade that RR has been in existence in North America.

Adapting and Changing Reading Recovery

In each new adoption systemic variables require changes in RR in order to deliver the program to the new system. Delivery systems must be devised to ease the transition without eliminating essential components of the program. For example, assessment procedures were tailored to the United States system; books had to vary to reflect local groups and cultures; incentives such as university credit were devised to reward teachers and maintain quality; and new administrative and financial structures were created. Reading Recovery now has a range of alternative structures that are responding to local conditions. Survival requires that the program must continue to be cohesive. Adaptations must preserve integrity (Dunkeld, 1991).

In the 12 years since its introduction in the United States, RR itself has changed in response to the growing body of knowledge about how children learn to read and write. Based on Clay’s 1963–66 research (reported in Clay, 1982), hearing sounds in words and visual analysis were included in the RR program from the beginning, well in advance of the field’s recognition of the importance of these factors. Changes occurred in the training over a period of years in response to new published research. More attention was given to children’s learning of how to work at the subword level of analysis. Minor changes were gradually incorporated into the RR training. Differences between the second and third editions of *The Early Detection of Reading Difficulties* (Clay, 1979, 1985) reveal refinements in the procedures that had just been made when the program was first tested in the United States. A stronger theoretical statement informed teaching as *Becoming Literate: The Construction of Inner Control* (Clay, 1991) was published; experienced teachers and teacher leaders studied this volume intensively during the following year. A comprehensive review of research and publication about onset and rhyme and analogy contributed to revision of a new edition of RR teaching procedures, *Reading Recovery: A Guidebook for Teachers in Training* (Clay, 1993b). This volume separated the *Observation Survey* (Clay, 1993a) from the RR program; teachers in training use both documents. Space here does not permit a detailed analysis of the changes in RR; however, procedures for working with words are presented with more elaboration than in previous editions. The focus of the program remained on whole text, with meaning as the center; but teachers learned to help children learn how “words work” to assist their problem solving while reading and writing. Changes in practice are in the process of gradual assimilation.

A dynamically changing theory is valued in RR. The system of implementation and teaching practice are constantly examined in search of the most effective procedures. Individuals have tried applying the principles of the program for other purposes, for example, Bradley’s (1991) work with adult

emergent readers. Investigation regarding children who do not succeed in the program is continuous (see Clay & Tuck, 1991). Research projects are underway at many of the regional training centers; in addition, adjustments in implementation are investigated whenever necessary.

Moreover, systems are in place to assure that both teachers and teacher leaders receive up-to-date knowledge of new developments in the program. Continued training for teachers takes place on a regular basis; there are also professional development opportunities for teacher leaders. Reading Recovery has developed a self-renewing system, one that accommodates changes, which result from sound research and from carefully monitored developments. Otherwise it would become outdated as society and theory changed around it.

Intangibles in the Implementation of Reading Recovery

Weaving these elements together are the intangibles revealed in the survey of teacher leaders (Lyons, et al., 1994). The 205 responding teacher leaders, trained at 16 different regional sites and representing differing years of experience, were articulate in their descriptions of how much they had learned in RR training and how they had grown in their professional roles. These teacher leaders responded in terms of their roles both as teachers of children and as teacher educators, since this duality is a feature of their position.

Becoming Part of a Community. They supported the “sense of community” that they felt through interactions with their colleagues. Indeed, discussion with colleagues was seen as a principle element in learning during the training year, but experienced teachers were even more enthusiastic about the role of colleagues in their continued learning. As part of the initial training, teacher leaders (as well as teachers) learn a common language that they can use to talk with one other about their teaching; this conversation continues across sites, regions, and continents, as evidenced by the communication among teachers at international institutes.

Working Closely with Children. Teacher leaders valued their continued work with children. Reading Recovery teacher leadership is different from other staff development roles in that the teacher educator also practices daily through work with children. Leaders reported that they continue to learn from their own experience of teaching children.

Continuing to Learn. Everyone involved in RR sees him/herself as a learner. Teachers do not have to be defensive about “less than perfect” lessons. Everyone knows that individuals are developing their skills and learn from one another. Reading Recovery contributes to the creation of learning so that improvement is a constant goal.

Holding a Common Vision. Everyone involved in RR shares a vision that is built through case after case of success on the part of students who were the lowest achievers in reading. It is a vision of what is possible. British inspectors suggested that the results of RR “show what can be achieved by the combination of decisive policy and professional will” (Frater & Staniland, 1994, p. 149).

Among others, intangible characteristics such as sense of community, closeness to children, continued learning, and common vision form the foundation that makes RR a cohesive

system. In the implementation of the program, varied patterns emerge, but the whole is a disciplined piece of work that is focused on student success (Clay, 1994).

INTERNATIONAL PERSPECTIVES ON THE READING RECOVERY PROGRAM *

Marie M. Clay

UNIVERSITY OF AUCKLAND

THE OPPORTUNITY

I used to just throw my book down because it was too hard to read but now I can read any book in the world.

—A Reading Recovery student

That is what Reading Recovery (RR) does. It puts a limited number of children who might have been confused by early literacy instruction back in touch with the communicative arts. It is an early literacy intervention program designed for children who clearly show that they have already become at-risk in literacy learning in their classroom program. Two of Her Majesty's Inspectors in Britain studied RR in operation across New Zealand and reported that, "It is much more than a set of procedures to be used with a child. It is a way of establishing an early intervention program in an education system in order to reduce reading and writing difficulties in the primary school" (Frater & Staniland, 1994). Any child entering the program is taken from where he is to somewhere else, working up from what he already knows, using his strengths and what he does well. The lessons are individually designed, differ from day to day, and emphases change according to individual need across the series of lessons.

Analogies can be misleading but let me try one. The instruction is not a packaged recipe for all learners and it cannot work for a whole class of children. It is more like a dose of antibiotics, taken only when essential, after professional appraisal, given as a full course of treatment, and varied to suit the precise condition of each individual.

We aim to minimize a seemingly chronic problem found in every country with universal education—reading difficulties. To cope with this problem in the past, education systems have expanded legitimate labels like learning disability and dyslexia to cover children who do not need those labels, and administrators have tried remedial approaches one after another with extremely limited results. Societies have come to accept literacy difficulties as always being with us but have settled for much greater numbers than are necessary.

Reading Recovery research presents a challenge to this state of affairs, suggesting only 1–2% of an age cohort in school will require assistance with literacy learning which starts early and continues for several years. Other lowest achievers between 6 and 7 years can become readers and writers. The special situations that allow the lowest achievers to learn quickly and catch up with their classmates involve teaching them one at a time, and not in a prescribed sequence such as occurs in class or group instruction. If we problem-solve each individual case we are able to hand over literate 7-year-olds to the education systems with an inner control over literacy learning which enables them, in a good classroom program, to continue to learn within the average band.

Across the world RR is a target for copyists who want to help more children. These innovators modify, simplify, and design cheaper versions that make the very compromises that have led to weak solutions to this problem in the past. They advocate, but they do not observe, develop, try out, research, check, and provide data. They live by assurances or single demonstration with a case or small group. It seems that few people are prepared to consider "a different program for

* The Auckland College of Education has hosted the Reading Recovery National Centre in New Zealand for many years now, and the National Trainer-Co-ordinators have trained Australian, British, Canadian, and some United States trainers and tutors to lead programs back home. Many New Zealand tutors and trainers have by now served a period overseas to our benefit as well as to the benefit of their host country and such exchanges will be of value as new theories and future circumstances bring continuing adjustments.

every child" in this hard-to-teach group, even though most people would expect their doctors to treat them as individuals, and most teachers of writing, art and drama would plan for individual creativity to thrive. Such respect for individual learning also applies to seemingly low achievers when the foundation of later learning is being laid down.

Literacy, defined here as performance in reading and writing, could be likened to an individual sport like golf or swimming; a personal coach can teach to the strengths of an individual, go around his weaknesses, and gradually lift the challenge. Reading Recovery designs individual solutions, from its theory and research to its delivery and daily instruction, and results appear in a relatively short period of time! A mother, having just consented to her child joining the program, said, "I doubt that they can do it in such a short time but I'll keep an open mind. It ought to take longer," than about 12–20 weeks to get to average levels of the class.

One-to-one teaching is not merely a convenient or privileged delivery tactic; it is the only delivery system that could arise from a theory which says that the causes of the difficulties are multiple, they differ from child to child, and each child has a different profile of strengths. This is heretical in an academic world that spends much energy searching for one explanation for reading difficulties; therefore RR's approach stands somewhat in isolation. Many who admit it works still do not accept our explanations of why it works, and the practice will not survive unless its supporting theories are understood. Our challenge is simple: we have to enable children who are hard-to-teach able to read and write in ways that make it possible for them to learn in class without any further special help.

Reading Recovery can have three positive outcomes, which create a win-win-win situation:

- (1) We aim to get about 90% (of those who enter) to work independently in the average group of their classrooms without further extra help.
- (2) Some children need to complete this treatment in the next school year because they entered too late in the year to have a full program.
- (3) We provide diagnostic teaching which identifies about 1% of the age group (or up to about 10% of the intake group) for referral for a specialist report and appropriate longer-term help, after their time in Reading Recovery.

These outcomes are replicated by individual cases daily, in New Zealand probably 40–50 children complete their program each school day and in the United States RR may be completing programs at the rate of 500 children per school day.

The lowest achieving children in the 6-year-old group are selected not excluding any child for any reason in an ordinary classroom, a challenging position adopted to ensure reliability of teacher judgement. It also takes care of other values like children's rights, fairness and equality, and social, cultural and linguistic inequities (Sylva & Hurry 1995).

Most children are flexible learners and can learn in classrooms with very different reading programs. Reading Recovery switches from group instruction to the child's own competencies and provides a second chance to learn literacy

for those who make a struggling beginning. However, at the end of an individual program a child must have regained the flexibility required to work with any classroom program.

In time, RR gets "good press" for surprisingly good results in different countries and finds its way into important documents at country level. In England press comment moved from 3-inch high headlines in the *Sunday Times* claiming, "This Program Fails" in February 1992 to part of a main editorial in the *Independent* in February 1995 which read:

...To most people outside educational politics it (Reading Recovery) sounds like a simple idea. Six year olds who are lagging behind in their reading are given half-an hour of individual tuition every school day for 16 weeks by a highly trained teacher... Expensive? Of course. But the cost for each child is less than the cost of administration alone for a child who requires 'a statement' for special needs...

By 1995 an independent academic research appraisal funded by politicians had reported the success of children in some tough urban settings in England (Sylva & Hurry, 1995).

The idea is simple but the program is complex; it calls for shifts in the thinking of those who train to be RR teachers; and it is hard for researchers and evaluators to understand a program which breaks with so many established parameters. This program aims to get rid of literacy difficulties, to accept an hypothesis of multiple causation, and has a theory to explain why it succeeds even when it flies in the face of much experience and established practice.

Reading Recovery professionals have to solve problems about children's learning, about teachers' learning and about making the program work in education systems, which I graph as three concentric circles. Trainers and tutors train to become specialists in these three areas of problem solving.

A PERSONAL VIEW OF HISTORY

My contacts with reading difficulties date from the 1940s when I entered teachers college and university and set out to complete a case study of one child. I was on teaching practice in a class of 11-year-olds and selected a child having difficulty with reading. I was given no framework for my study, no books to read, and no prescription of what to do and how to do it. I was required to give instructional help which I did but as I have no memory of the outcome I wonder what either of us learned. My university courses about atypical children were heavily influenced by child psychologists in Britain like Burt and Schonell, and by Professor Ralph Winterbourn who developed the psychological service for the New Zealand Department of Education and the counseling service for New Zealand secondary schools. I was appointed to teach a special class for mildly mentally retarded children, which was Winterbourn's special area at that time. I taught most of them to read with some success, was surprised at their progress, and wrote a paper about it. The literature review discussed the work of Monroe, Fernald, Gates, Burt, Schonell, and Helen M. Robinson, most of whom referred in some limited way to spelling and writing as well as reading. Winterbourn

trained two reading specialists, Ruth Trevor who established reading clinics in New Zealand over the next 20 years, and Yvonne Malcolm, known especially for bringing the International Reading Association to New Zealand.

My plans in 1949 to study with Schonell in Britain were thwarted by his move to the University of Queensland, Australia and I went instead to the University of Minnesota and studied with Guy Bond (a student of Arthur Gates, whose "Improvement of Reading" is still on my bookshelf). Under Bond's supervision, I taught children with reading difficulties in my minor courses, completing my major in developmental child psychology. The courses I had planned to take in special education no longer existed, so I talked my way into the Institute of Child Welfare, and studied research on children and clinical child psychology. For personal interest I took "Theater for Children" in 1951 and still have my production script for a Chinese play with full stage design and costumes for three dragons, an interest never allowed to flourish.

The concepts of brain damage, brain dysfunction and learning disability were on the rise; Strauss and Lehtinen had published two challenging books, and Sam Kirk was in Chicago beginning his work in this area. Clinics were seen as the answer to severe reading difficulties from 1950-70 and psychological tests for assessment included the Illinois Test of Psycholinguistic Abilities and the Frostig Test of Visual Perception, new instruments designed to produce definitive diagnoses leading to prescriptions for instruction. With them came countermovements, weak by comparison, but destined to oust the clinical, diagnostic test approach in due course (Wiederholt, 1977).

While at home with my own preschool children in the 1950s I taught remedial reading at my kitchen table overlooking the Rangitoto channel and particularly remember two interesting 11-year-old boys. After a slow start each made alarming progress, alarming because it was unexplainable by existing theories about learning to read. It is food for thought when one's theories do not explain one's successes!

Schonell's research from Australia was widely read in the British Commonwealth. Canada had a strong group of academics leading clinical and classroom programs, and the research of people like Daniels and Diack (1956) was influencing approaches to reading problems in the United Kingdom. Led by medical advocates the concept of dyslexia and the teaching programs it spawned spread across the globe in this period.

At this time in New Zealand the Chief Inspector of Primary Schools, Brian Pinder, concluded that the existence of reading clinics diminished the responsibility of classroom teachers for literacy instruction and defined every teacher as a teacher of reading, which was, perhaps the origin of the sound and pervasive literacy teaching of classroom teachers in the New Zealand Primary School today.

By the mid-1970s the critique of the special psychological tests gained ground, followed in the 1980s by the sociologists' strident attack on the concept of learning disability and how it was being overgeneralized to populations to whom it probably did not apply. Psychological publications stressed that the numbers of people being labeled as having difficulties

increased but programs did not demonstrate a reduction in the size of the problem (Gittleman, 1985).

I published my first critique of the learning disability concept in Clay, 1972 and I was ready to put the brake hard down on the overgeneralization of legitimate conditions to children who did not need the labels. I began what I describe as my long and lonely swim against the accepted tide of theory and practice. In Clay, 1987 I published a stronger statement called "Learning to be learning disabled" presenting arguments about the definition problem, the diagnostic tools and the failure of this path of research to provide programs which reduced the size of the problem. Reports appeared showing that increasing numbers of people were being labeled in this way. Bluntly, I wanted to remove as many of these potentially learning disabled children from that category as I could. Today RR's challenge to teachers in the first year of school is "Take as many of the potential Reading Recovery children away from Reading Recovery as you can by teaching them well" and the appeal to psychologists and administrators is, "Give as many children as need it a second chance at literacy learning before you categorize or label them as special kinds of learners."

A growing disenchantment with learning disability gave way to a new popular diagnosis of attention deficit disorder (ADD) with questioning articles now appearing in major psychological journals.

Country by country. Briefly, what was happening in the countries where RR is now being tried out? (See Pinnell, this volume, pp. 638-654 for the situation in the United States.) New Zealand had high expectations from classroom teachers, and a diminishing number of reading clinics. The education system never adopted learning disability or dyslexia concepts but instead appointed Reading Resource Teachers to provide itinerant assistance to children with reading difficulties. These teachers supported and supplemented the classroom teachers' work. A voice for learning disability was maintained by the Specific Learning Disability (SPELD) organization of parents and interested public, who brought authorities from dyslexia or learning disability programs in the United States, Britain and Australia to annual conferences in New Zealand.

In Australia the position was similar with greater diversity from state to state, a stronger learning disability movement, and exploration of new teaching strategies at different sites by people like Kemp, Elkins and members of the staff of Macquarie University. A strong countermovement toward improving classroom teaching grew up with an emphasis on books, language, messages and writing, an example of a defiant call encountered in several countries that quality classroom teaching was the way to reduce and eliminate reading difficulties. In part they were right.

In Canada the movement to improve classroom teaching was supported by authorities in the reading field like Robertson, Jenkinson, Downing, and innovative academics at the Ontario Institute for Educational Studies like Smith, Wallach, Wells, and Olson, with support from visiting British authorities on literature and writing like Meek, Britton, and Wilkinson. In each province there was strong clinical leadership from many people like Grace Walby in Manitoba.

In England opposing theories flourished side by side. Dyslexia still has a strong hold today in the treatment of reading difficulties drawing new energy from research in neurological science. Research from Oxford and Cambridge by Bryant, Bradley, and Goswami led many to design programs on a most-important-single-variable assumption that reading difficulties would be overcome by increasing phonemic awareness. This nudged a long-overdue revision of unsound practices in the teaching of “phonics” as if English had a regular orthography. On the other hand the ideas of those with a literary theory of learning to read encouraged a faith in children’s ability to learn if they were read to, from good trade storybooks, a move which became linked with a goal of working with each child individually until she or he became a reader and writer. This confused the essential need for “individual teaching for some” with the difficulty of delivering it effectively to all. Most children do not need it; some do. For some people psychological theories and psychologists were seen as the problem, perhaps the cause, behind reading difficulties. Therefore an admirable advocacy for reading stories which was needed in classroom programs became confused with the need of some learners to get extra and special help. Good classroom teaching will never suit every learner and something extra should be available for some.

The combined effects of teaching practices, theories, academic endeavour, and public and political awareness lead countries to travel along different paths in evolving improved literacy programs. Some cross-fertilization of ideas is accompanied by serious doubts that what works in one place could work in another but there have been strong movements driven by the assumptions of teachers and teacher educators, each emphasizing their own “significant variables” for primary school literacy learning. Notable is the doggedness with which Australia, New Zealand, and Canada, while strongly influenced by British and American practices and publications, have striven for the local integrity of what they do, evolving programs which do not mimic the perplexing diversity of practices in England, or the polarity and pendulum swings of change that occur in the United States.

Reading Recovery’s History

In New Zealand. It was 25 years after my time in Minnesota before I began on RR. I taught Developmental Psychology and clinical child psychology for 30 years to educators and educational psychologists, and carried out a variety of research projects, some directed toward early literacy. I became involved with the International Reading Association in Auckland, and was elected President of this Association 30 years later in 1992–93. My connections with the United States were rewarding because I learned a lot about my own country during my stay there, and about cultural differences, and how to switch from culture to culture. This prepared me in small ways for my recent challenges.

Reading Recovery started in 1976 at the University of Auckland in a lean-to behind an old house in Wynyard Street with one teacher teaching hard-to-teach children behind a one-way screen and myself observing and recording. We

discarded what did not work, related what worked to existing theoretical writing, enlarged the team in 1977 to seven, continued the sifting process, wrote a teachers’ manual and felt that we had “something that worked.” We got permission to carry out field trials in schools with five teachers paid by the National Department of Education. We selected schools in average to poor areas, varying in size and in organization, avoiding the advantaged districts. Principals released their best teachers for the job and we began the development of our several levels of training for RR professionals.

By the end of 1977, we had a well-documented miracle full of surprises. The research design had been carefully selected not in ignorance of traditional research designs but to answer the relevant questions at that point in time. Five issues were considered.

- (1) The questions were: “What was possible for the lowest achievers? What percentage could learn to read? Could any children reach average levels for class? and if so what percentage could reach such levels?” The theoretical question was “Could we take children who were falling further and further behind their age / class peers and teach them to do what competent children were learning to do” as described by Clay (1966, 1972)?
- (2) No competing programs existed. Therefore, research designs comparing programs (such as a quasi-experimental design with randomized groups) would only answer the question, “Was it better than an alternative program?” We needed to ask, “How do the outcomes compare (a) with the individual’s past record of progress?” and (b) “Where were individuals in relation to the class group?” Such questions continue to be critical in evaluations of RR.
- (3) At that time the experimental designs were not recommended as appropriate for an extreme tail-end segment of the total population.
- (4) Success could not be judged by standardized tests in New Zealand at the time of the initial research (a) because none were available for the age group and (b) because RR is directed toward schools managing their own programs in the interests of their local population and not necessarily matching national norms. All the other children in the same classes, that is, all the better performers, create the school-based relative standard for entry and outcome against which the program’s effectiveness in practice was judged.
- (5) Statistical analyses of changes across groups would be mere approximations of success which could not guide the clinical treatments of individuals, so real-world differences recorded as data for individual cases were essential.

In this first study we were also investigating the way the program might work in schools and we deliberately placed as few organizational constraints as possible on the RR teachers’ decisions; we asked them to tell us how to make the program work in schools of different sizes and populations.

The results of every child who entered the program, not excluding anyone, were published in the manual for teachers (Clay, 1979, pp. 74–79) contrary to misreporting in many

reviews. Three group results were reported—Discontinued from the program, Not Discontinued, and the Comparison group for age/class peers in the same school. The Not Discontinued group included the seven children who were referred to psychologists (reported in Clay, 1979, p. 80), the children who had short, incomplete programs which were continued in the next year, and four children who left the schools before their programs were completed. Thus the tables account for all children in the study. In a later study Clay and Tuck (1993b), showed that “carried over” children took the same time and had the same discontinuing rates as children who completed their programs within the school year.

The first research design apparently addressed administrators’ questions about children’s progress and demonstrated that they could have discontinued children in high numbers, with low numbers of referrable children, and that children who entered late in the school year would need to complete their programs in the subsequent year. Within a month the Director-General of Education called for a seminar to discuss the report’s implications for the development and expansion of the program across the country. Where was this surprising solution which defied traditional parameters supposed to go? The notes I prepared for that seminar were pretty much on target for the next 10 years. I missed some of the problems but I had a pretty good view of what could happen in our small country, and anything beyond these shores was not to be dreamed of.

The snowball began to roll. One hundred teachers were trained in Auckland in 1979–80, the program began a slow expansion throughout New Zealand with national implementation across the country during 1983–88 (Clay, 1990) and the analysis set the model for an economical, national monitoring system based, not on a sample, but on the total population served and discontinuing rates (Kerslake, 1993). From a birth cohort of 50,000 6-year-olds in 1994 a prevention program was provided for 14,500 each year, about 9,000 of them became independent readers and writers, 3,400 were identified for completion of their lessons in the following school year and 1043 were referred for specialist reports (Kerslake, 1994). The efficiency of this implementation has had a good press (Frater & Staniland, 1994).

The emigration of Reading Recovery. In 1983 came the challenge to transfer RR first to Victoria, Australia and 18 months later to Columbus, Ohio. Could what worked in New Zealand be replicated in another country? Education is usually not considered to be exportable as education systems are organized and managed differently with different political agendas and a superior result from a program on home ground did not justify the optimism about replication in another education system. Thirty years after my experiences in Minnesota I was still deeply impressed with how different education is in different countries.

My talk on RR at the Darwin Reading Conference of the Australian Reading Association triggered developments in Victoria and Canberra. A Bendigo administrator, Peter Hunt, thought RR worth trialling. Joan Smith trained in Auckland, returning to Bendigo in 1984 with Jeanette Methven, a New Zealand tutor. Hints that this program would only work under

the close guidance of Marie Clay had to be laid to rest and I did not visit Victoria until the end of the year, leaving guidance of the development to the Director of Reading Recovery in New Zealand, Barbara Watson. Peter Geekie (1992) with Brian Cambourne studied the initial year of the program in Bendigo from the point of view of how teachers, school staff, parents and the community saw the program.

In sequence three trial training programs for tutors were initiated, in Victoria at the Bendigo College of Advanced Education, at La Trobe University, and at Melbourne University. Victoria did not train a RR trainer until 1994 but in some years tutors were sent to the Auckland College of Education for training. Parallel developments occurred in the Catholic schools, and in other Australian states—sometimes the lead has been taken by Catholic education and sometimes by the state system.

The Canberra system sent two tutors to New Zealand for training in 1986 and has run a system-wide implementation for 8 years in almost all its schools but only serving about 13% of its hard-to-teach children. This is called partial implementation when a school does not deliver the program to all who need it and this leads to a questioning of the program if the problems are not cleared by expansion of the coverage. Another early stronghold was established in Wagga Wagga. The New South Wales program began to expand in the late 1980s with help from the New Zealand National Trainer, and tutors on leave from New Zealand served both the State and Catholic education systems. Queensland now has an expanding program and Australia now has three RR trainers.

Australia made a unique contribution to RR by having a member speaking in the Federal Parliament sufficiently well-briefed by an alert tutor to have a description of the program entered into Hansard, the parliamentary record. Representations were also made to a Federal Parliamentary Commission which recommended two literacy programs, Reading Recovery and First Steps, and suggested that states might select one or the other! This was strange since if First Steps were to be directed to classrooms RR would still be useful as a backup supplementary program for those with literacy learning difficulties.

Note that early initiatives by educators came to the notice of State and national administrators by first making the program work in schools rather than by academic argument or espousal. This was probably the only possibility since the program turns its back on so much past thinking and practice.

From the early Australian experience we learned to adjust to some education system differences: different policies for entry to school, use of the first year of school as a preparatory program in contrast to the expectation that 5-year-olds would learn to read and write, variation of curriculum and materials with nothing like the many little story books in New Zealand classrooms, and concern that the program’s assessment tasks for selection and progress checks might perform differently on “new soil.”

In the United States and Australia we faced the challenge of getting teachers to teach differently, to use a theory predicated on the constructive child, and to hold complex variables in mind when making teaching decisions at all times.

The insistence that the teacher should be very observant of the learner's behavior made some Australian teachers uncomfortable, as if this were an intrusion on privacy to peer into and discuss the detail of a child's response but being observant has become accepted as essential in a program that helps children proceed along idiosyncratic paths.

By May 1984 colleagues in the United States were asking how to prepare for a September start when we had only just begun in Victoria. (The extensive research from the United States is reviewed in this volume by Pinnell, pp. 638–654.) In the United States the program faced a new variable, the existence of established provisions for children with reading difficulties at this age level. There were "reading teachers," and federally-funded programs for socially disadvantaged children, and programs for the "learning disabled," and a common practice of schools to employ paraprofessionals to work with children needing "extra help." Reading Recovery had to compete for the same pool of resources, and for the children to be served. The conflict emerged early in Ohio in one district with a strong skills-based program for children with literacy difficulties. Reading Recovery was criticized for not delivering success to every child, and the existing program claimed superior results.

In 1995 in the United States, "Over the last 10 years in 1,905 school districts and 5,523 schools Reading Recovery has accomplished what it was designed to do. A total of 88,323 individuals have ... caught up to their grade-level peers..." (Pinnell, Lyons, & Jones, 1995). The program continues to expand and has a place in current discussions in the United States about special services in least restrictive environments for special needs children (Lyons, 1994, 1995).

Canada, benefiting from the proximity of Ohio State University, had tutors trained for British Columbia, Manitoba, Newfoundland, Nova Scotia, and Scarborough, Ontario which led to the creation of a Canadian National Training Institute in 1993, backed by sterling efforts from administrators. Canada had three trainers by 1996. The Canadian Royal Commission on Learning recently reported to the Minister of Education and Training, with recommendation 33 being:

That no child who shows difficulty or who lags behind peers in learning to read be labelled 'learning disabled' unless and until he or she has received intensive individual assistance in learning to read, which had not resulted in improved academic performance (1994).

This is what we would like to see in all countries; give children a second chance for literacy learning in an individual program before they are labeled.

England's interest began later in 1989, starting in Surrey after several talks given in England between 1981 and 1989. Surrey found funds to train a tutor in New Zealand, who returned to set up a successful local implementation model backed by strong administrators in tough economic times (Wright, 1992). A training for tutors began in the UK in 1991, and over 2 years nine New Zealand Reading Recovery personnel helped the Institute of Education, University of London to mount training programs for teachers and tutors for geographically-spread sites in boroughs and counties. The Institute trained further tutors in 1993–94, and completed 3 pilot

years with temporary support from the central government. The HMI report on the New Zealand program was an independent document of importance to developments in England and the program found its place in the National Commission on Education report "Learning to Succeed." Northern Ireland and Jersey have new programs and the first class of teachers for Wales have trained for English-medium schools. The Government also commissioned an independent research study (Sylva & Hurry, 1995).

On my computer I have copies of most of the United Kingdom press reports which have on the whole made our task difficult, but with the publication of the research commissioned by the government, RR's press in England has become positive. It took 3 years.

Politics in the United Kingdom induced a twist into the implementation of this program. It was delivered mostly to inner city schools recording the lowest scores, where many children had free lunches. Together politicians, economic issues and the predominant message of the press over 4 years pushed out of sight the fact that as almost every school has its children who have difficulties, almost every school requires a make-up program. *Resourcing should not be linked to poverty*; it should be based on learning need and all schools should have access according to demonstrated best learning needs, not socioeconomic need. The English counties like Surrey and Cheshire which have introduced Reading Recovery without government assistance will be free to demonstrate what the program can do for young children's literacy difficulties. The lowest achievers in any school, in any sector of society, need access to this supplementary program.

Reading Recovery operates in a window of opportunity through which an individual child passes only once, and that window has nothing to do with needing a free lunch. When RR is new, it is fragile and does not demonstrate clearly what it can achieve. It needs administrative leadership, and planful political support for best results in an education system.

The cutting edge of the research for RR is delivery in Spanish for Hispanic children in various parts of the United States and interest has been shown for other language adaptations, such as French for Canada. It is not possible to deliver this program immediately in another language as redevelopment is required to suit the characteristics of that language, and this involves much more than mere translation and takes about 3 years of trials. The Spanish experience has demonstrated that redevelopment takes time and must be done with care. But it is interesting because we can expect to get another level of understanding about the reading process across languages. Full translations into Spanish of the teachers' manuals are a current development and would open the doors to trials in Mexico, Central and South America led by bilingual tutors from the United States. Rather belatedly I have come to understand what we are struggling with in trying to make this program work in different countries. I think of each country, or state or province as a young river, on a course of development that is undergoing changes of a complex kind, and our early intervention is like a standard boat tossed into several different turbulent rivers and struggling to master the rapids and stay afloat in each of them. The central tenets of teaching

on this program, "tentativeness, flexibility and problem-solving," are necessary.

THREE CONCENTRIC CIRCLES: IMPLEMENTING, TEACHING AND LEARNING

Evaluation studies of new educational developments do not necessarily arise from a theoretical hypothesis. Discovering what was workable in RR led to the construction of a theory to explain this, the reverse of most academic inquiry. On the one hand teachers had children they could not teach, and on the other, educational psychologists had too many referrals and few effective treatments for the hard-to-teach literacy problems. I worked with a team to find a research-based solution to these problems. The program was constructed by a problem-solving approach to an unstructured problem (although Robinson's (1993) authoritative work in this area is critical of the path we took). Theory did not drive practice; rather there was a circle of influence from practice to theory, and back to practice, informed and altered by data from day-by-day documentation of changes in children and an imperative that it must be workable in schools. No particular school of thought on literacy learning drove the exploration, but new work at the time included Bruner (1957, 1973), Cazden (1972), Chomsky (1972), Donaldson (1978), Graves (1978), Miller (1967), Read (1975), Smith (1971), the Russian school of developmental psychologists, and information processing psychologists like Rumelhart (1994).

A typical research review assumes that theory comes first, and is subsequently applied to practice, and we gamble on whether teachers and education systems can work from the theoretical account. I recommend that a critique of RR should reverse the cycle, start with the outer circle and ask:

- (1) Can this education system put the program in place? and
- (2) Can teachers be trained to teach children and achieve change? before asking the question from the inner circle,
- (3) What theoretical assumptions do the data on children's learning support or challenge? Critiques usually try to answer question (3) but this is only relevant if the first two questions can be answered affirmatively. Readers of reviews should first be assured that the conditions in questions (1) and (2) have been met. Therefore, I will comment with this approach in mind.

The Outer Circle: Working in Schools Systems

At what age should RR be available? The general statement would be that selection should occur as soon after entry to school as we can reliably identify children falling behind their same age peers in the new classroom, and the timing has to be problem-solved in each education system. In New Zealand it is after 1 year of school (i.e., around the sixth birthday), after a fair chance to settle in the school, to adjust to demands, and to begin to learn. Two reasons for this timing are that (1) reviews of research reiterate that we cannot predict literacy problems well enough before instruction begins, and (2) a "multiple causation" theory includes lack of learning opportunities in life or school contexts as well as

problematic learning histories, and does not relate only to a child's potential for learning. Reliable prediction of which individuals will fail or succeed is not achieved before the onset of instruction.

Across the world further questions are raised. Should entry be earlier in places in the United Kingdom where the school entrant could enter school at just over 4 years of age? or do we wait until after 7 years for the child who begins schooling at 6 years? What could be recommended for countries which begin school at 7 years? In the United States does the kindergarten count as school and what about half-day kindergarten?

Age of entry is an example of how implementation of the program must be problem-solved in every country because of differences in societies, in populations and in education systems, as well as politics, economic theories, social problems and religions. On the other hand a country's theories of child development and learning, of literacy learning, and of early intervention must also be taken into account. Surprisingly, about 6 years is a practical compromise and we have enough experience on the ground to show that this works. The factors to be weighed are age, time at school, general preparedness and some things about child development. We had to have learners with two qualities: first, what they knew had to be woven into a fabric of interacting response systems which they controlled (for islands of knowledge about specific aspects of literacy processing would not make an effective reader or writer) and second, the learners had to become relatively independent of teachers so that they could work well in classrooms.

The negative consequence of starting too early is giving individual teaching that would not have been needed if we had waited longer, and the negative results of waiting too long are that the time it takes to deliver an effective program lengthens the longer the children have been in formal instruction, and therefore fewer children can be served for the same teaching resource.

Absence of Teacher or Learner from Daily Lessons. This threatens the accelerative learning needed for children to catch up with their classmates. The difficulty of getting children to school every day requires attention but getting parental permission for the child to join the program offers an opportunity to negotiate for special help from the family to have the child at school. After several research studies the variable "teacher not available to teach" emerged as a bigger problem than child absence. Despite excellent reasons why the trained teacher should perform other duties in school or in society it is absolutely necessary for the RR children to receive a lesson a day. This frequent contact allows yesterday's responding to be still clear in the minds of both teacher and child. For schools this means release of an effective teacher for 2 hours a day (varied according to training status and the school's need) and without pulling that person off their allotted task. The potential for accelerated learning is reduced if the teacher is not available to teach daily. The lessons must occur in an intensive series and the same number of lessons spaced out over time is a poor substitute resulting in poorer learning.

The Length of the School Year. This determines how many days the teacher has to teach. Different models for three or four terms, and all-year-round schools can create difficulties with the “a lesson every day” demand.

The learning needs of individual children do not align with the school year of teaching. In New Zealand schools it was easy to continue to teach the children who were not yet ready to leave RR in the next school year, until they reached one of two outcomes, discontinued or referred. (Teacher leaders in the United States and Canada are called Tutors of Teachers in New Zealand, Australia, and the United Kingdom.) An incomplete series of lessons occurs only when a child leaves the school and attends a new school which does not provide RR assistance, a very rare occurrence in New Zealand. In some other countries like the United States with a shorter school year and different promotion practices it is often unworkable to continue RR help in the next school year, but solutions to this problem are being formulated.

How Long Does This Supplementary Program Take? The time in the program is surprisingly brief. With consistency across the world the time in an efficient program averages from 12 to 20 weeks thus providing a guideline within which to shape our expectancies and policies. The fact that individuals spend different lengths of time in the program is irritating for researchers and administrators; they would like a fixed number of treatments for all, a prescribed turnover point, “all change here,” but the discontinuing criteria require a teacher to ensure, as best as she can, that a child is now sufficiently independent to survive in the classroom without further help. Reviewers also find it difficult to understand the flexibility with which this program adapts to individual learners so that time in the program was reported as 15 weeks for research convenience in one study (Center, Wheldall, Freeman, Outhred, McNaught, 1995) and 20–26 weeks in another (Sylva & Hurry, 1995). Unfortunately figures in reviews can become the reference for new research or implementations. The capacity of the program to adapt in length to the learning needs of individuals is critical to (a) learning and (b) effective implementation.

Discontinuing Rates Across Different Countries. Comparisons of the rate at which children leave this program at average levels of performance can be made within an education system but must be handled cautiously across countries. It is now clear that they depend on program delivery factors such as the average number of children passing through a half-hour teaching slot in the year, the length of the school year, and whether daily lessons are delivered. If the question is, “What percentage of the intake group will be discontinued?” then in the real world the following statistics apply.

No. of children a teacher serves in a year in a 30 min. teaching slot	No. of children with a full programme	Possible Discontinuing Rate
1	1	100%
2	1	50%
2	2	100%
3	2	67%

In each 30 minute teaching ‘slot’ New Zealand teachers tend to get two children out of the program and take a third child in, to be continued in the next school year. This is considered “best practice” and results in about 67% discontinued per calendar year! The Ministry of Education Research Division’s annual figures published and available on request show, that in New Zealand 0.2–1.5% of the age cohort is referred for longer-term assistance in a calendar year (Clay, 1993b, p. 84).

This sampling of some of the implementation issues illustrates why a sound approach to evaluating the children’s learning would be to start an evaluation by satisfying oneself and one’s readers that the implementation of the RR program to be studied was an effective one.

The Second Circle: Training Teachers For Problem Solving

The training course for RR teachers is a year-long period of change. Change during that year is a unit of learning in itself. Geekie (1992) reported a shift over a year from widespread scepticism to obvious commitment among RR teachers and among schools. Teaching improves after training and more children are discontinued in less time. Research reports need to record how long a program has been in place together with details of teaching experience beyond training.

In all countries teachers bring to their teaching, assumptions which are sometimes country-specific and sometimes more general. Such assumptions call for small adjustments in training courses in each country, but because RR must not limit the progress of any child by its practices and policies all teachers are required to open up their local clusters of assumptions to new alternatives.

- (1) Some assumptions are about *curriculum sequences* that should occur, including inflexible beliefs that a child must know (A) before she or he can try to do (B)! Assumptions like this underpin programs which teach a letter a day for a whole year in some kindergartens, or require children to know all letter-sound relationships before they try to read, or insist that children read before they try to write.
- (2) Some assumptions are about *task difficulty* and the *assumed limitations for learning that children have*. There are assumptions about “*hard things*” that must be left until later (such as comprehension), or “*things that must come first*,” or “*things that will require many repetitions*.” Teachers think, “It will be hard and I will have to help you,” or “I will have to simplify it for you,” or “I will have to instruct you until you can learn for yourself.” A RR teacher must invite learners to deal with *complex texts*, to *learn at a faster rate than average*, and to become independent learners who initiate, process, monitor, and self-correct, expanding their own literacy processing system while reading and writing independently.

These assumptions of curriculum sequence or teaching sequence are inappropriate in RR; they are assumptions devised for group instruction, and are not suited to individual learning, looking for a fast track to success and

taking different paths to common outcomes. To accelerate the progress of a child with a low repertoire a teacher must find any route to the desired outcome and allow for the entire range of idiosyncratic competencies to support the struggling learner. A teacher must monitor her own assumptions about learning and about an individual child to take advantage of every incipient opportunity to "leap forward."

- (3) On the other hand there are sets of assumptions which limit progress because they take for granted that all competencies needed for literacy behaviors will emerge in some natural way when the learner is ready, causing a teacher to wait for these emerging competencies to reveal themselves. Some teachers do not want to govern the amount of challenge in a reading text, nor consider a gradient of difficulty, nor think about how a new competency can be helped to emerge from what is already known. This is not the place to debate this matter in relation to classroom learning but these things are not true for those learners who, by definition and selection, are finding learning extremely difficult.

The challenges in training teachers lie in uncovering hidden assumptions made by teachers in each country that are antagonistic to the progress of hard-to-teach children. We need them to become more flexible and tentative, to observe constantly and alter their assumptions in line with what they record as the children work. They need to challenge their own thinking continually. Such change begins during their training year but teachers discontinue more children in the next 2 years as they become familiar with the program and how it can work. They learn to use the rationales for decision making which make the teaching and the organization of the program run more effectively. Due to the complexity of what is being learned, the individual learning trajectories of the children and the incomplete theory out of which teachers work, there will always be problems to solve. Teachers need to recognize that they start with diverse assumptions about learning to read and write and these differences are a strength within their collegial network.

In different countries there have been differing degrees of willingness to consult peers, and for tutors or trainers to form networks, to seek a second opinion, and to overcome the unreliability of one person's decision by pooling knowledge in network decision-making. Such consultation is self-correction behavior aimed at catching the errors in individual judgments; it is essential.

Sometimes the emphasis during training in sessions behind the one-way-screen is on putting what you see into words, but equally important is the articulation of how what you see conflicts with what you had assumed. Bringing the implicit, whether observed or assumed, into a verbal form which allows discussion and revision is an essential part of training in each country. As a College of Education Dean said to his peers,

Reading Recovery has managed to operationalize that vague notion that teachers ought to reflect on their own practice. That behind the glass play by play analysis and the collegial debriefing with the teacher after her teaching session represent some of the

best teacher education I have witnessed in my 28 year history in the field (Pearson, 1994).

The Inner Circle: The Learning of the Children

Children's learning has not shown clear differences across countries, except for those created by different classroom programs (i.e., different learning opportunities) or associated with age. Culture and language have created interesting questions but no big problems.

Independent reviewers from the United States and the United Kingdom who are not involved in devising or delivering RR, provide the following characterizations of the program's background theory. Both reviews say that Clay (1979) describes reading as "a message-gaining, problem-solving activity which increases in power and flexibility the more that it is practised." Wasik and Slavin (1993) list the components of the reading model as perceptual analysis, knowledge of print conventions, decoding, oral language proficiency, prior knowledge, inference making, reading strategies, metacognition, and error detection and correction strategies. They omit "visual" from perceptual analysis, translate phonemic awareness into decoding and create an unexplained metacognition component, all of which are imprecise and could mislead. They select three major theoretical principles for mention: (1) that reading is considered a strategic process that requires the integrating of letter-sound relationships, features of print, and language which is derived from the interaction of the reader's unique background and the print; (2) reading and writing are interconnected and the child must make the connections; and (3) children learn to read by reading and only by reading frequently can the child come to detect regularities and redundancies present in written language. I would not quarrel with the words used above or with the following. "There is no systematic presentation of phonics yet during the reading and writing activities letter-sound relationships are taught as one of the basic strategies for solving problems" (p. 183).

Sylva and Hurry (1995) reiterate the message-getting, problem-solving activity quoted above and add that children make use of a variety of strategies to help them in this problem-solving activity, the most central of which are: (1) their understanding of the concepts of print, (2) their phonological awareness of sounds in words and letters and letter strings on the page, (3) their understanding of the meaning of the text; and (4) their knowledge of syntax. "Meaning is not derived from the print alone but also from the knowledge of the world that readers bring to the task, for example, their knowledge of the language of books and language in general, their prior knowledge of the subject matter of the text, their ability to make inferences." The goal of RR is to help children to use all the skills and strategies that they have at their disposal (and to) "encourage children to monitor their own reading, detecting and correcting errors by checking responses against all possible strategies." This improves children's reading and writing "over a wide range of skills," described as a broad spectrum approach.

Against that reporting one can set less accurate accounts of RR's theory given by Center et al. (1995), Hiebert (1994),

Iversen and Tunmer (1993), Razinski (1995), Shanahan & Barr (1995). Center et al., for example report the theory in this way: "reading is viewed as a psycho-linguistic process in which the reader constructs meaning from print," and most readers would then place it in the wrong theoretical camp with psycho-linguistics rather than information processing.

Variants Within the Learning Theory. To be an effective program RR must be responsive to the discourse of new research and theory and not be locked into the theory of the late 1970s when it was developed (Pearson, 1994). In the early 1970's its practices may have appeared ahead of research in some areas but as more information and new theory becomes available, areas of uncertainty should be informed and practices should change. Three examples illustrate past or potential changes:

- (1) Recent research on phonemic awareness called for little change in actual procedures because in 1976-77 we observed that children who had extreme difficulty with "hearing sounds in words" needed effective teaching which was built into the program from the beginning, an example of practice ahead of theory. New information confirmed that practice; it changed what teachers read during training, and it led to an increase in emphasis on the reciprocity of reading and writing (see Wasik & Slavin, 1993).
- (2) In one area of uncertainty we still search for a stronger theoretical basis for how the child weaves visual perception learning into his early construction of inner control over literacy and recent eye movement research inches us closer to this possibility (Rayner & Pollatsek, 1989). The reader cannot use his phonemic awareness in the service of reading or writing without some new visual perception operations!
- (3) A thorough review of the arguments about onset and rime, and analogy clarified how children can develop effective procedures for handling three different categories of spelling clusters in English that are phonologically regular, orthographically regular, or irregular, with the same cognitive strategy. This allowed for better teaching in the "making and breaking" segment of the lesson (which existed in the first edition of the procedures manual) and without either a prescriptive teaching sequence or an undue stress upon regularity and word families that would be inappropriate for the English language.

The dynamically changing theory is concerned with how we understand the sequence of changes in ways in which children process complex arrays of information as they learn to read and write. A multivariate theory of such changes (rather than a single causal theory) forces an openness to new knowledge. If "Reading Recovery helps children to integrate a wide range of skills involved in reading and writing" (Sylva & Hurry, 1995) then there are a myriad of unknowns hidden in the verb "to integrate" when it is combined with a developmentalist's interest in "change over time." Much of it has to do with how and what the constructive learner learns

from his own decision processes when problem-solving continuous text. What is challenging for theory construction is that during the time of reading and writing acquisition each one of the multivariate processes is in a formative stage.

New editions of teachers' text covering theory (Clay, 1991), assessments (Clay, 1993a), and teaching procedures (Clay, 1993b) are essential for a program that is evaluating, and responding to shifts in available knowledge.

Variants from Outside the Program. When variants which are theoretically incompatible with the program are introduced into the program as research variables and good results reported, it is not acceptable merely to claim that the variant produced the good outcomes for it is plausible to suppose that the broad program may have sustained progress despite the variant. Hatcher (1994) for example, introduced a systematic, detailed and prescriptive phonological training into his recommended program and, unless we are shown otherwise, one might hypothesize that the wrap-around RR program carried the variant to its success.

Children with English as a Second Language. It has been reported that these children are, or should be excluded from selection (Hiebert, 1994). This does not happen in the five countries where their progress has been watched. They are probably the group of children who derive most benefit in subsequent years from having had this supplement early because language was the major block to their learning and they had 30 minutes every day with a teacher who increased their time for talking and personalized their instruction. Hobsbaum's study (1995) from England reported satisfactory progress for children who spoke more than one language.

Reading Recovery in Another Language. If special care is taken to redevelop the observation (assessment) tasks and the instructional procedures then the "window of opportunity" for an early intervention in literacy learning appears able to cross language barriers and remain effective. For children learning to read and write English no important differences appear in what it is the children need to learn to do in different countries. However, since teaching began in Spanish (Escamilla, 1994) we have had to consider that there is more involved than theoretical concepts and assessment tasks. The timing in acquisition and the emphases during instruction for effective processing in another language might change. After an early discovery in studies of early writing that English-speaking children hear the consonants of the language easily and have problems with hearing the vowels and by contrast, Spanish-speaking children hear the vowels and miss out the consonants at first (Ferreiro & Teberosky, 1982) our current questions are about (a) the role of the syllable in Spanish literacy acquisition, (b) whether the linguistic discovery of onset and rime applies to Spanish? (c) how to help beginning readers cope with many long words in their first books? and (d) for languages with much more regular letter-sound relationships than English (Spanish, Maori, and German, for example) how might RR teachers tell whether the learner who has become a rapid decoder of regular phoneme-letter relationships is taking full account of meaning and language

structure? These aspects of processing may be more readily observed in the oral reading of English than in more regular languages.

A Possible Neglect of Writing. Progress in RR is measured in terms of both reading and writing progress and the child is expected to survive back in the classroom in both curriculum areas. A large body of research shows that readers and writers have to develop phonemic awareness, and build the use of the sound system of their spoken dialect and language into their developing network of strategies for two similar but different processing systems, reading and writing. Researchers who continue to separate reading and writing and their respective theories, do not model the actual or potential links between these two activities, and reviewers tend to skip over the writing in RR and its contributions. If children can use their knowledge about reading and writing to support each other then these two activities have reciprocal effects on each other. Teachers with very different assumptions can retard the progress of children in reading when they skip the writing or give it minimal attention, assuming that they should and can give priority to reading and attend to writing as a later learning task.

CONCLUSIONS

A good review will be referred to when the original studies are forgotten; it summarizes the position to date and acts as a bulwark saving readers from the need to return to original sources. Reviewers therefore have a responsibility to understand and report previous research accurately before biasing the subsequent course of practice, research, and theory with their conclusions. Whether we like it or not Herber (1994) has shown that we do not usually review back more than 21 years and it is 19 years since RR began its development and 16 years since the first reports were available. Already the decade of the 1970s is outside the reviewer's ken; therefore, while this is not the place for a meta-analysis of reviews it is important to stress that, internationally, accurate reviewing is very important and seldom achieved.

To take just one example, several reviews echo the claim that RR only used in-program tests and had no standardized test as a beyond-program measure (Center et al., 1995) but that problem was recognized from the beginning. Training sites have used local standardized instruments; the Burt test from NZCER in New Zealand; in the United States the most successful being the Woodcock Reading test; and in England the British Intelligence Scale (Reading), although this test is not available for use by teachers. Outside the United States some favor the Neale Reading Test but as it has four unconnected and not comparable standardizations at this time, a reader needs to be told clearly which editions and which norms are being reported.

In research studies across the world measurement instruments are added to the RR measures for several reasons: (1) to test alternative theories; (2) to measure outcomes on standardized measures which were designed usually with different theories in mind; (3) because new instruments become

available; and (4) to allow for comparisons across populations and even countries. What the researcher, administrator, and teacher understand by the test labels will depend on the theory they are committed to, the implementation question they have in mind, or the practices they have experience with. One can "read" the phrase "a test of explicit phonics" in nine or ten different ways depending on one's professional role (theorist, teacher or administrator) and if there is no explicit specification of what is taught, how it is taught, and how it is embedded and used in the acts of reading and writing one is left to one's own constructed interpretation. Is the achievement the memorizing of words (Sylva & Hurry, 1995), or a metacognitive awareness that makes sense of phenomena like down / blown or light / bite in English, or a set for diversity, or elaborate teaching sequences (Hatcher, 1994)? Could this be abstracted to the principle of knowing how to use analogy with the flexibility to say, "If it is not like this word I know then it might be like that one," a simple tactic to achieve many complicated solutions (Clay, 1993b)?

One-to-one tutoring as reviewed by Allington (1994), Pikulski (1994), and Wasik and Slavin (1993), is a potentially effective means of preventing student reading failure. It deserves an important place in discussions of reform in preventive, compensatory, remedial, and special education strategies. "If we know how to ensure that students will learn to read in the early grades, we have an ethical and perhaps legal responsibility to see that they do so. Preventive tutoring can be an alternative for providing a reliable means of abolishing illiteracy among young children who are at risk for school failure" (Wasik & Slavin, 1993, p.158).

High rates of success for RR have encouraged a frequent error in education, the error of over-extension of its potential and consequential misapplications. It would be unfortunate to lose the specialist solution because of this. No one claimed that RR would be an effective solution to anything but the learning problems of the lowest achievers in the second year of school; no one claimed it would improve the *mean scores* of the age cohort; no one claimed that it would provide the answers to all literacy difficulties; no one claimed its theory to hold for all literacy learning.

Complex issues require specialist solutions. An educational treatment finely tuned to a particular challenge should not be expected to solve all literacy problems. Its success is captured in the Sylva and Hurry synopsis "...a powerful intervention over a broad spectrum in the short term, and for the most disadvantaged and the lowest achieving children.... Reading Recovery was more powerful even one year after the end of the intervention for the disadvantaged children and it is highly effective (also) in changing the behaviours of those who fail to discontinue." This demonstrates something more like "a change of status theory" of literacy acquisition, the child going through the door into the world of written language rather than a theory which emphasizes a slow accumulation of knowledge, and that change of status might be considered a citizen's right. We want to know much more about how tutoring works and how to maximize its effectiveness (and minimize its cost).

The explorations of teacher training and support, the delivery of teaching, the management at the school, district

and state / country level of the program demonstrate that any further research on RR should, for economy's sake, study the outcomes in learning only in places where it can be established that: (1) the teachers are in or beyond their second year of teaching after training and are part of the recommended support system offered by tutors / teacher leaders, and (2) the program is implemented according to state or national guidelines. The schools should follow the local guidelines for program delivery and the implementation should be in its fourth year. I am still inclined to the opinion that a follow-up study should follow the children over time together with the age / class group in their school for that is the valid comparison group against whom their entry and exit criteria are judged. Under the above conditions it would be good judgment to carry out a cost effectiveness study.

With that approach in place and with any other qualifications appropriate for real-world research, academic researchers might be justified in using the changes in learning to shape and evaluate theoretical constructs about literacy learning.

Such choice conditions are unlikely for, as the then Dean of the College of Education, University of Illinois, David Pearson (1994) reported, he searched with others for 2 years for financial and / or political support to conduct a substantive and effective cost-benefit analysis of RR to "alleviate the lingering doubts of sympathetic supporters and to disarm opponents," but without success. An alternative model used

in the Rowe (1995) study from Victoria, Australia provides an example of a well designed follow-up study.

In this early intervention program 6-year-olds become competent 7-year-old readers and writers. It will not help older children become anything but 7-year-old readers. Therefore sound school reading programs for 8–18-year-olds are still necessary to take full advantage of the foundation skills that RR establishes.

Reading Recovery must have what Wilson and Daviss (1994) call "the power of the redesign process in industry":

- capitalizing on success
- improving quality
- expanding usefulness and
- keeping the selling price of each unit as affordable as possible for as many consumers as possible.

They warn that the redesign process does not develop without normal growing pains.

One thing we have learned internationally. Children do not have to be slow learners. We have created and categorized slow learning children by the ways in which we package and deliver our age-bound cohort structure for instruction. Reading Recovery set out to deliver learning opportunities differently. And that perhaps is the general message which this paper can contribute to the topic of this volume.

CHANGE THROUGH COLLABORATION: THE BOSTON UNIVERSITY–CHELSEA PUBLIC SCHOOLS PARTNERSHIP IN LITERACY

Jeanne R. Paratore and Roselmina Indrisano

BOSTON UNIVERSITY

In 1989, Boston University entered into a historic contract with the Chelsea Public Schools, agreeing to manage all aspects of its educational system for the next 10 years. Under the agreement, elected officials delegated the authority granted to them by the city charter to a university appointed management team through June 1998. The school committee retained the right to review all actions of the management team, and by a two-thirds vote, to override any action of the management team. Also, by a simple majority, the agreement established the school committee's right to terminate the partnership. Further, the governor established an oversight panel for monitoring the university's compliance with laws governing the management of the public school systems.

As described in a report to the legislature (Sears, 1994), 17 long-term goals, listed in Table 56C–1, were identified for the partnership. Initiatives and activities designed to achieve these goals are many and varied. Several articles and reports describing specific programs have been published (see, for example, Indrisano, & Paratore, 1994). This chapter will address activities of the partnership only as they relate to teaching and learning in literacy.

WHAT DID WE KNOW AS THE PARTNERSHIP BEGAN?

In 1987 one year before the signed agreement between the Chelsea Public Schools and Boston University, an evaluation team from Boston University conducted a comprehensive

review of educational opportunities in the city of Chelsea. As part of this process, a team of literacy professionals, including Boston University faculty, graduate students and in-service teachers from area urban and suburban schools, visited 55 elementary classrooms and interviewed 21 teachers, gathering information about instructional practices in reading and writing. In its final report, the literacy study team concluded that the children of Chelsea were members of a caring and concerned educational community; most classrooms were organized and serious, and children were clearly aware of instructional routines; transitions from one activity to another were generally orderly and efficient. At the same time, however, it was clear that instructional practices in literacy had not kept pace with current research and theory. Among the many observations, three major concerns emerged. First, in almost every classroom, children were tracked in three reading groups, each instructed with a different level of the basal reading program, with substantially more than half of the children placed in below-grade-level texts. Overwhelming research evidence suggested that this practice was harmful for many children (Allington, 1984; Good, & Marshall, 1984; Slavin, 1986). The negative findings reported so frequently in professional literature were on display in most of the classrooms: when compared to their higher performing peers, children in low-ability groups spent far more time reading words in isolation, spent more time reading workbook pages and less time reading connected text, and spent more time answering low-level questions.

Second, reading instruction was centered on assignment of selections from the reading anthology, followed by oral

TABLE 56C-1. Boston University-Chelsea partnership goals

1. Revitalize the curriculum of the city's school system.
2. Establish programs for the professional development of school personnel and for the expansion of learning opportunities for parents.
3. Improve test scores of students in the school system.
4. Decrease the dropout rate for students in the school system.
5. Increase the average daily student attendance rate for the school system.
6. Increase the number of high school graduates from the school system.
7. Increase the number of high school graduates from the school system that go on to attend four-year colleges.
8. Increase the number of job placements for graduates of the school system.
9. Develop a community school program through which before-school, afterschool, and summer programs are offered to students in the school system and through which adult education classes for inhabitants of the city are offered.
10. Identify and encourage the utilization of community resources.
11. Establish programs that link the home to the school system.
12. Decrease teacher absenteeism in the school system.
13. Improve the financial management of the school system and expand the range of operating funds available to the school system.
14. Increase salaries and benefits for all staff, including raising the teacher salary average to make it competitive with the statewide average.
15. Construct effective recruiting, hiring, and retention procedures for all staff members.
16. Establish student assessment designs and procedures that are of assistance in monitoring programs and that act as incentives for staff members in each school.
17. Seek to expand and modernize physical facilities in the school system.

short-answer responses and the completion of workbook pages. Opportunities for students to work independently consisted primarily of workbook pages and worksheets; children rarely had opportunities to talk, and were seldom encouraged to build on their knowledge as a way to prepare for reading or as a bridge to written composition; they had few opportunities to write and virtually no instruction in the writing process. These practices were inconsistent with evidence that children learn best in classrooms where they are provided with regular and sustained instruction in the processes that will lead them toward independence in reading and writing (e.g., Graves, 1983; Tierney, & Cunningham, 1984).

Third, classrooms were generally not "print-rich" environments. The primary, and often the only, text the children read was a basal reader. With very few exceptions, when classroom bookshelves were available at all, they held instructional textbooks, usually outdated. There were few books for recreational reading, and those that were available were typically very old and usually not appropriate with regard to either students' reading or interest levels. In many classrooms, books were stacked on top of each other, suggesting that students were not invited or encouraged to select from even the few available titles. Outside of the classroom, the school

libraries held limited resources with few high-quality, multicultural children's books. It was clear that children lacked environments that would demonstrate how books and print could entertain and sustain them and how reading and writing could be used to help meet social needs in and out of school.

While these observations were clearly discouraging, interviews with teachers were encouraging. In interview after interview, teachers cited lack of opportunity for professional development as a major concern. These were not teachers who were resistant to change. Rather, these were teachers whose professional setting had offered them few opportunities and resources to explore new educational practices. They were eager to examine instructional issues and to explore ways to improve their students' achievement.

To begin the work, teachers and university faculty identified and planned frequent, systematic, school-based opportunities in collegial settings to explore effective instructional practices in literacy. Then, within these settings, the instructional issues that caused the greatest immediate concern were explored.

HOW DID WE WORK TOGETHER?

...no innovation has a realistic chance of succeeding unless teachers are thoroughly involved in the process, unless teachers are able to express, define, and address problems as they see them, unless teachers come to see the innovation or the change as theirs. The ultimate outcome of the innovation (or of a replication, we could add) depends on when and how teachers become part of the decision to initiate change. (Moll, 1992, p. 229)

From the beginning it was understood that the success of the partnership would depend upon a true collaboration between classroom teachers and university faculty. It must be said that the unprecedented nature of the partnership and the resulting confusion over roles and responsibilities made it difficult, at first, for teachers to trust that collaboration was the goal. However, 5 years later, teachers and faculty involved in classroom change in literacy agreed that the work is best described as coteaching.

Guiding Principles

Steps toward change in literacy instruction were built on a set of principles that guided initial efforts and that continued to be important to the partnership. First, the goals for professional development were set collaboratively. The concerns of teachers and university faculty were discussed openly; priorities were agreed upon and a plan of action was negotiated. Second, it was understood that the collaboration between Chelsea teachers and university faculty would be long-term; the 10-year term of the university-school partnership established by the contractual agreement ensured an ongoing commitment of resources and time. Third, as described by Goldenberg and Gallimore (1991), effective change is based on an "interplay between research knowledge and local knowledge," (p. 2), the latter defined as the

understanding that comes from direct experience in the classroom and community. The instructional models that became the basis for classroom literacy instruction emerged from examination and discussion of current research and theory, and the reality of the classrooms in which they would be implemented.

Professional Development Opportunities

Few of the early efforts toward professional development were comprehensive, system-wide efforts. In an attempt to diminish the widespread belief that Boston University was involved in a "takeover" of the schools, initial meetings grew out of specific invitations from either individuals or small groups of teachers or from an administrator. As a result, in the beginning years of the partnership, the professional development initiatives in literacy were sometimes unevenly distributed throughout the city, since teachers and administrators in some buildings simply initiated more requests for assistance than those in others did. This is not to suggest that the beginnings were unproductive. In fact, concerted efforts in a smaller number of grades and classrooms led to the development and refinement of instructional models and to the emergence of teachers who quickly became viewed as "resident-experts" by their colleagues. By the beginning of the fifth year, administrators, teachers, and university faculty codeveloped a systematic, sustained, district-wide plan for introducing effective instructional practices in literacy.

The progress from individual or small group to system-wide efforts was marked by a series of professional development opportunities. They included: summer institutes; classroom demonstrations; city-wide in-service sessions; courses offered on-site and at the university, the latter often supported by scholarships; school-based seminars; curriculum committees; internships in the university's assessment center; institutes for administrators; participation and presentations at local, regional and international conferences; and city-wide grade-level bimonthly seminars. It is not possible to provide a detailed description of all these activities, therefore only those that have been most productive will be described.

The first professional development opportunity offered to the teachers was a summer institute in literacy, one of four planned for the core curriculum areas. This opportunity was offered on a voluntary basis. A major goal of the literacy institute was to discuss current research and its application to the classroom. To implement these understandings, teachers prepared a series of model lessons at kindergarten, primary and intermediate grade levels for teaching fiction and exposition. At the end of the institute, the teachers wrote to their colleagues to introduce the lessons that would be distributed to the entire staff.

Following this introductory session, a group of 1st- and 2nd-grade teachers from one building asked if they could continue to meet with university faculty during the school year to explore issues and concerns in literacy instruction. Of particular interest was developing an integrated model for regular and Chapter 1 instruction and connecting instruction

and assessment. Careful planning and scheduling by the building principal permitted all 1st- and 2nd-grade classroom and Chapter 1 teachers to be released at the same time to attend weekly seminars on topics of concern. This series continued for 2 full years.

During the same time period, in all elementary schools and in the middle school, university faculty and doctoral students responded to teachers' and administrators' requests for demonstration teaching. Teachers and university faculty agreed that a demonstration teacher would be assigned to two classrooms in each of the buildings for the academic year. Demonstration lessons occurred once each week and were coplanned and cotaught by the university and local teachers. Teachers throughout the buildings were released to observe the demonstrations, and to participate in a discussion group that met immediately following the lesson.

These two professional development activities represented the most comprehensive and successful efforts during the initial years. The insights that were gained guided the planning for the most recent and most ambitious activity, city-wide, grade-level, biweekly seminars, initiated in the fifth year of the partnership. At the end of the 2-year implementation period, every teacher in grades 1 through 8 completed a minimum of at least six sessions on literacy instruction.

The format of the sessions varied with the topic and included: presentations and demonstrations by university faculty and Chelsea teachers; discussion groups and workshops. Each seminar ended with a plan for classroom implementation, and began the next week with a critical analysis of the implementation. The discussion often resulted in suggestions for revising the instructional plan based on the teachers' experiences.

Focus of Professional Development Opportunities

Since the start of the partnership, the focus of professional development initiatives has been threefold: (1) classroom contexts (2) instructional strategies and (3) classroom assessment.

Classroom Contexts. Seminars, courses and meetings related to this topic address the ways in which classroom organization influences students' access to and opportunities for reading and writing. Teachers explore ways in which to organize classrooms so that children are explicitly invited to read and write during both instructional and independent learning periods of the day. Emphasis is placed on the selection of high-quality children's literature that is diverse in subject matter, literary genres, and cultural and ethnic representation. Also, discussion addresses ways in which to organize classroom reading centers where books and magazines are displayed so that children are invited to read, and ways in which to organize writing centers where tools to support the writing process are readily available.

Teachers also investigate flexible-grouping practices. The full range of grouping options is presented and discussed, including whole-class, teacher-led and student-led small groups; small, cooperative groups; peer dyads; and

individual learning. Emphasis is placed on keeping the grade-level curriculum constant for all students, while using various grouping options to provide some students with additional challenge and others with additional help. Two particular grouping models are emphasized, one for use when students are reading a common text (Paratore, 1991) and one when students are reading multiple texts (Reutzel, & Cooter, 1991).

Finally, in order to support implementation of an in-class Chapter 1 instructional model in which Chapter 1 teachers and regular education teachers team-teach for 60–90 minutes per day, strategies for coteaching were explored.

Instructional Strategies. Demonstration lessons, seminars, courses, and discussion focus on understanding and applying current research and theory in literacy instruction to classroom practice.

First- and second-grade teachers explore research-based strategies for teaching phonics and other decoding strategies within meaningful contexts. Building on the work of several researchers, most particularly Adams (1990), they develop and implement daily classroom routines for engaging students in word-building activities and the compilation of personal dictionaries. Also, they engage students in writing from the start, emphasizing invented spellings and drawings as a way to respond to reading. Teachers use choral readings and rereadings as a way to give every child access to books on the first day and every subsequent day of the school year.

In every grade, emphasis is placed on creating authentic situations for reading and writing in which the reading and writing tasks assigned to students represent activities that students encounter both inside and outside of school. As teachers plan literacy activities, they consider and incorporate into the lesson plan practices that mature readers routinely use. This principle affects long-held beliefs about how children learn to read. For example, instead of admonishing students “not to look ahead” prior to reading a story, teachers encourage students to preview the text and talk with a student near them, making predictions and formulating questions. After reading, student-centered book talks and discussions replace the question-and-answer periods that for many years characterized teachers’ interactions with students after they had read a selection. Also, the practice of using workbook pages and worksheets for practice in reading and writing has been abandoned in favor of having children keep reading journals. Students’ written responses are guided by a reader response model that emphasizes three types of response: aesthetic—how does the selection make the reader feel, think, act? strategic—what particular reading strategy will help the reader comprehend more fully, and generative—how can the reader relate the text to other texts and experiences in order to formulate new hypotheses, plans or ideas (Indrisano, & Paratore, 1992).

Finally, while skill instruction remains an integral part of the teaching of reading, teachers have abandoned the practice of following a rigid “scope and sequence” for one in which skills and strategies are selected to be relevant to the type of text the students are reading. Teachers examine the selected text and choose the comprehension skill or strategy

that would most likely support comprehension and critical thinking. For example, understanding cause and effect is introduced and practiced when children are reading myths, since so many episodes and event sequences in mythology are dependent on understanding causal relationships. Understanding time order is introduced when students read historical fiction, since the sequence of events over time has particular significance in understanding prose of this type.

When planning skill instruction, teachers consider and explicitly teach three levels of knowledge (Paris, 1984) and implement an instructional model which emphasizes gradual release of responsibility from teacher to student (Pearson, & Gallagher, 1983).

Classroom Assessment. This topic has been the least comprehensively addressed and implemented. At the end of the fifth year, no district-wide, in-service sessions or meetings had yet focused on literacy assessment. On the other hand, there had been numerous opportunities for teachers to join on-site courses and seminars on assessment, and approximately 30 elementary school teachers chose to participate in these over the course of several semesters.

Assessment courses have focused on classroom assessment for the purposes of informing instructional decision making. Building on research and theory in literacy assessment (e.g., Johnston, 1992), the following principles have been emphasized: (1) Routine instructional settings provide the most authentic, and therefore the most valid, opportunities for assessment; (2) Multiple sources of data should be used to judge students’ literacy knowledge, including samples from different types of literacy tasks and different curricular areas; (3) Literacy assessment should include systematic and routine opportunities for students to reflect on their own work and assess their performances; (4) Assessment tasks should provide varying levels and types of teacher interventions (i.e., demonstration, guided practice and independent practice), enabling teachers to make judgments about the instructional conditions under which students are most successful.

WHAT HAVE WE LEARNED?

Teaching and learning in Chelsea have changed. It is, however, important to acknowledge at the beginning of this discussion that only now are “hard data” being collected to validate this claim. When an unprecedented partnership between a large, private university and a small, impoverished, urban school district is widely described as a takeover, professors of good will have a serious choice. They can come to the partnership as researchers, with all the attending requirements of science, or as colleagues, constrained only by a commitment to the teachers and to the children. The latter course was chosen. Now, in the sixth year of the project, many local teachers and university faculty have joined together as coresearcher teams, and more scientific evidence will be gathered. Until those data are available, observations and samples of the children’s work are offered as evidence of the changes in literacy instruction and learning.

The Teachers and the Classrooms

A walk through the nearly century-old school buildings in Chelsea in 1994 makes visible the changes in the classroom environment. From the physical arrangements that encourage collaboration as well as independence; to classroom libraries where books are exhibited on shelves or in brightly colored crates, arranged by topic and theme; to writing centers where books authored by the children themselves are widely displayed beside child-created dictionaries and thesaurus, the classroom invites the children to join a community of learners.

The most important educational outcome of the physical changes in the classrooms is the resulting change in the ways literacy is taught. Visits to classrooms reveal scenes such as the following: children reading grade-appropriate books of high literary quality or award-winning selections from literature anthologies; children reading a story with a partner, helping each other as they come to difficult words or challenging ideas; children working in pairs and small groups, collaborating, explaining, clarifying and defending their ideas about the stories and books they read and write; children keeping reading journals in which they record their individual responses to the books and selections they read; children meeting in small, student-led groups to discuss the books they are reading and the stories they are writing; teachers actively engaged with children, sometimes leading an introductory lesson in front of the whole class, other times meeting with a small group of students to provide additional instruction or practice on a specific skill or strategy, sometimes listening to individual children read or having a conference to discuss a child's recent piece of writing.

In connection with various professional development activities, teachers have offered written reflections of how the recommended changes have influenced their teaching actions and children's opportunities to learn. Samples from a few teachers provide some indication of teachers' response to the instructional changes. One teacher commented on the practice of keeping writing folders and reviewing children's work over time:

I was able to expect more writing from my students and was able to be on top of their strengths and weaknesses. Often, I did not demand as much writing from my second language students. In the past, my students kept a writing folder in which their work went home daily. I had no way to compare their September writing with their June writing. In keeping a portfolio, I know exactly what the children need help in. With my Chapter 1 co-teacher, we can make extra help groups and be successful with them.

Another teacher considered the gradual release model of instruction and the emphasis placed on demonstration, guided practice and application as an instructional model:

I am less afraid to stop and seize the moment of a student faltering and turn it into a strategy session, modeling for everyone so we appreciate each other's attempts to "figure it out" and learn more.

Another teacher commented on the ways the recommended literacy practices had influenced the opportunities she provides the students:

I have been attempting to build in more opportunity for the students to reflect on their own writing and to help them become aware of their own personal literate growth. Daily, the children are engaged in peer conferencing and editing with frequent teacher modeling to keep them on track ... we have been exposing the children to a variety of authors, tapes and interviews to familiarize them with a model to show the importance of experiences and ideas that spark writing ... the children are writing more and even asking for writing time. Using a response journal has definitely given them the knowledge that their literate opinions are valued and important.

Another teacher commented on the coteaching model and on its influence on her own teaching:

I had a wonderful experience in working with [a colleague]. I learned many things from her. Her idea of having the children do their story map and then highlighting with a yellow crayon the points that they wanted to include in their summary was very beneficial to me. The children found that this method helped them organize their thoughts and the summary was written with less difficulty. The extra help groups were able to take their group map and then write individual stories. A feeling of accomplishment was [evident] throughout the room.

In these examples and in the many other written comments, there are a few common themes: teachers emphasize purposeful and meaningful reading and writing tasks and consistently provide students more time to read and write; teachers provide students more scaffolding and support, and engage in daily activities that give some students extra help and others additional challenge; teachers routinely involve students in the process of assessment and emphasize the development of self-motivated, self-directed learners.

Importantly, the isolation that is too often the accepted condition for elementary teachers has given way to consultation during the challenging task of implementing innovations. These conversations often result in invitations to visit colleagues' classrooms and ultimately, to additional discussion, enriched by shared experience. The professional development seminars that follow these activities are enhanced by the pragmatic insights and probing questions that result from the teachers' experiences in collaboration.

Among the most personally satisfying milestones has been the teachers' interest in and commitment to join Boston University faculty as coresearchers and copresenters. Teachers are eager to share their experiences in this effort toward school reform and have joined in preparing and delivering papers at local, regional and international conferences.

Children's Classroom Performance in Reading and Writing

At this point, data from students are only anecdotal, emerging from portfolio samples and classroom observations that teachers have chosen to share. As limited as these are, they do provide some preliminary information about how children are performing in literacy.

Are Children Learning to Read and Write Words? When the work in Chelsea classrooms began, more than half the students simply did not have the opportunity to read grade-appropriate text. Judged to be low-performing readers, they were tracked in below-grade-level text and rarely moved beyond it. One of our major goals was to change this practice. To do so, teachers were asked to assume that, given enough teacher intervention and practice, all children would be able to successfully read grade-appropriate text. How has this worked? Interviews with regular classroom teachers, demonstration teachers and lead teachers suggest that with very few exceptions, children are successfully reading grade-appropriate text. One lead teacher reported that during her visits to elementary and secondary classrooms, she consistently observed that one-half to three-quarters of the students could read, without any help, grade-appropriate tradebooks on the very first reading; the remaining students could read the text successfully following teacher and student support activities such as read-alouds, choral-readings and partner-readings.

Evidence of children's developing fluency at the word level can also be derived from students' writing samples. Are students able to use their knowledge of sound / symbol relationships to spell words? Samples displayed in Figures 56C-1-56C-3 are typical of the growth children demonstrated in one 1st-grade classroom.

This child, who is bilingual, was reluctant to write more than two sentences at the beginning of the year. In September, she represented words using their initial sound only and she was able to copy the word "duck" from the chalkboard (Figure 56C-1). In January, she was writing substantially more, but still struggling with word-sound associations, as her invented spellings reveal: "He pat [put] on his cos

[clothes]" (Figure 56C-2). In June, although her writing still contained spelling errors, her errors were either consistent with the sounds in the English language (e.g. "mayd" for "made") or indicative of an emerging awareness of irregularly spelled words ("seid" for "said", Figure 56C-3). Further, her June sample was well-organized, accurate and complete in detail, suggesting strong story comprehension.

Are Children Able to Comprehend and Talk About Books?

Perhaps the best measure of students' ability to build meaning and understanding as they read, and to relate and connect the texts they are reading to their own lives comes from students' book talks. In the sample presented in Table 56C-2, a heterogeneous group of 3rd-grade children discussed the book, *Knots on a Counting Rope*. Although the teacher was present in this group, she played a minor role; the children, directed the discussion themselves. The students' awareness of classroom routines in reading was evident when one student asked: "Should I do a quick summary?" Further, the value of understanding the process for getting an answer, not just the answer itself, was evident when another student asked: "...about the summary ... did you just get that summary up in your mind or something?" The first child responded by describing the steps he followed: "Ya, I like this story a lot so I just paid a lot of attention to the story. And then I got a lot of pictures in my mind and so I made up words and put it in the summary." The other student is still not satisfied, so she says: "Can I ask one more question?".... "How do you get these good stories up in your mind?" And the first child responds, "I just—when I read those sentences I get a lot of pictures in my mind so I put it in words." As the discussion continues, other children offer their ideas for summarizing as they read. Of importance is not just the children's interest in and

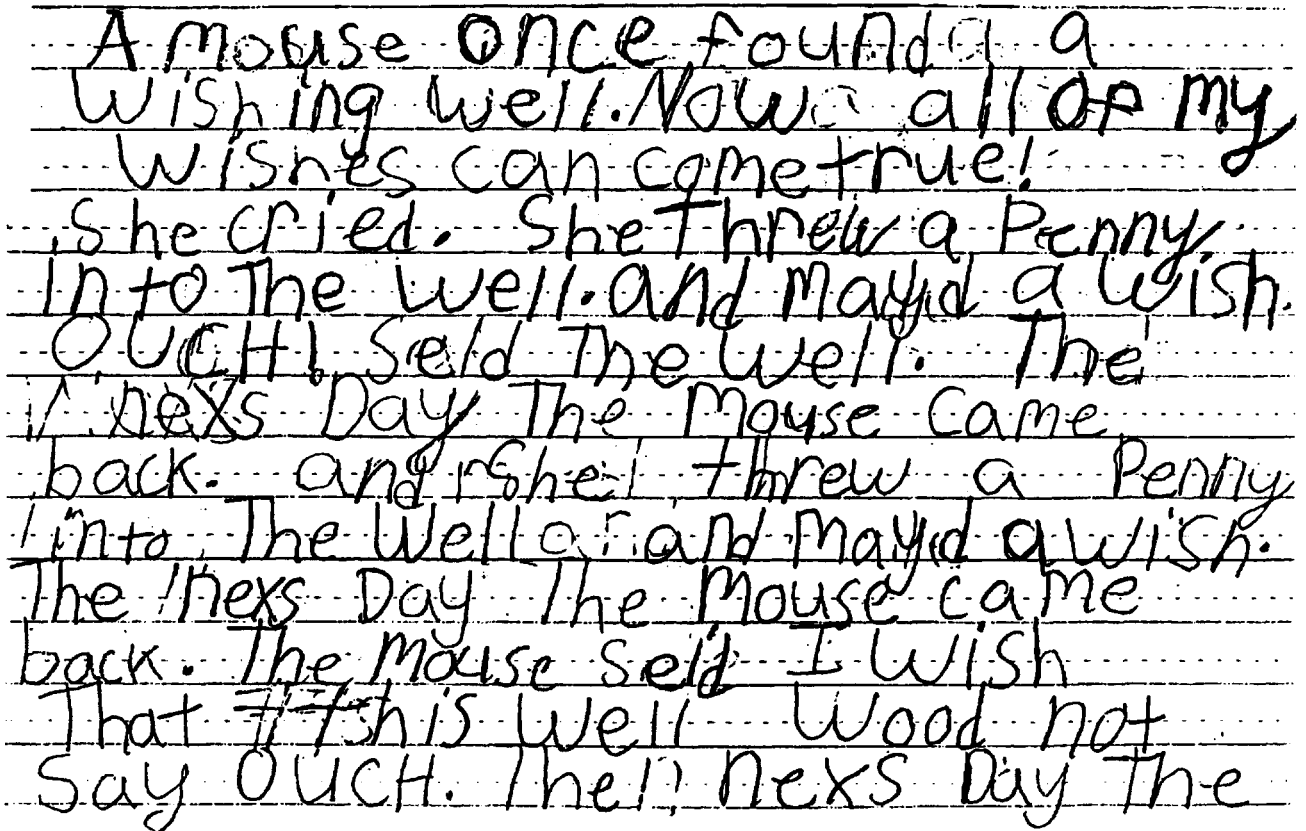

FIGURE 56C-1

 came up and the snow/boy
 met it.

FIGURE 56C-2

TABLE 56C-2. Knots on a Counting Rope Discussion

- M. He learned how to ride horses. He didn't know what the color blue was and now he knows what the color blue is.
 T. How did he learn about the color blue?
 M. Because he could picture it in his heart.
 T. Anyone have any questions they want to ask?
 S. How did he picture it? He didn't know blue so how did he picture it?
 M. He could see by his heart.
 S. What does that mean, by his heart?
 M. He could see by his heart.
 T. Can you see in your heart or can you...
 M. Feel, you feel in your heart.
 S. Should I do a quick summary?
 T. If you'd like.
 S. In the beginning the wind was going boyeee. Then they said, "A boy was going to be born and he had a dark curtain over his eyes" and the grandfather took him out to see morning. And two great blue horses rode up and looked at him and he reached his arms out to the blue horses. And they said that gave him the strength to live. And that's why they called him Boy-Strength-of-Blue-Horses.
 T. Can you tell us something he learned?
 S. He learned to ride a horse. I learned he could do the same thing people who aren't blind could do. He learned to ride a horse in a race like people who can see.
 T. Do you want to ask anyone anything? Does any one want to ask Stephen anything?
 M. I have something. About the summary... did you just get that summary up in your mind or something?
 S. Ya, I like this story a lot so I just paid a lot of attention to the story. And then I got a lot of pictures in my mind and so I made up words and put it in the summary.
 M. Can I say one more question?
 S. O.K.
 M. How do you get these good stories up in your mind?
 S. I just—when I read those sentences I get a lot of pictures in my mind so I put it in words.

A mouse ONCE found a

understanding of the details of the story, but their awareness and discussion of the strategies that are helpful to them in constructing meaning as they read and their ability to share their understanding with their peers. Such explicit discussion also provides teachers with a “window” on the children’s thinking processes, in this case leading the teacher to reteach and review strategies for summarization, as it became apparent that children had insufficient understanding.

CONCLUSION

Achieving reform through a university–school collaboration has been a significant challenge. The unprecedented nature of the partnership, the scope of responsibility, the sometimes ineffective lines of communication, have caused local teachers and university faculty alike to, at times, question the

likelihood that the agreement could have positive outcomes. Yet, on reflection, most conclude that efforts that are being made will make a difference in the lives of the children who are the primary concern. As the partnership continues, the words of one teacher are instructive in defining its purpose:

I think when you want to change something, you really don’t want to change it, but you want to make it grow. And, instead of change, we should talk more about growth, and start from what really exists and make that better... A good leader, I think, empowers the people, and then guides the growth... It’s not just a professor or a superintendent, but a good teacher who’s a leader of the classroom who empowers the children and guides their growth. I was thinking that Boston University faculty have brought me information, inspiration and support. I’ve started to think that is really what we want to bring to our children: information, inspiration, and support. So it really is much more basic than people think. It’s more empowering to guide growth, than to enforce change.

TEACHING THE DELAYED READER: THE BENCHMARK SCHOOL MODEL

Irene W. Gaskins

BENCHMARK SCHOOL, MEDIA, PA

There are various ways in which children learn the processes needed to be readers. We know this because most children learn to read and they learn in very different programs. For many it does not seem to matter where the program starts, nor what order it follows. These students apparently are able to add for themselves what teachers leave unsaid. All students, however, are not able to learn despite the program or to fill in the gaps when procedures are not explicitly explained. Some children must have a program that starts where they are, proceeds according to the competencies they develop, and teaches explicitly what they do not figure out on their own.

For these children, learning to read was placed in jeopardy by theoretical assumptions about how reading is acquired and the specific curriculum built around those assumptions (Clay, 1991). Even if a program has a strong record of achievement with most children, it may still be a bad match for the way in which some children learn. In such cases, the children who are not flexible enough to adapt their way of learning to the school's curriculum develop reading competencies at a slower rate than their classmates and slip further and further behind. These children need the opportunity to begin again in a rich literacy environment conducive to the way in which they learn and where a high percentage of student time is spent on task, engaged in meaningful reading and writing activities (R. W. Gaskins, 1988). Benchmark School was founded to provide that opportunity.

Benchmark School is a day school with a full elementary curriculum for 6- to 14-year-old children in grades 1-8. The children who attend Benchmark have experienced difficulty in learning to read, despite average or above intelligence, and their difficulties are not attributable to primary emotional or neurological difficulties. Most of the 175 students who attend the school each year enter the school as 7- to 9-year-old beginning readers, although some enter when they are as old as 11, reading several years below their grade placement, and have a history of reading difficulties dating back to first grade. At the root of these children's difficulties in learning to read seems to be a mismatch between the way they learn and the way they were taught.

For some, pacing seems to have been an issue, thus they fell behind others for whom the pace of instruction was more appropriate. These delayed readers may have needed instruction characterized by more frequent teacher mediation, smaller units of instruction, and much repetition. For other delayed readers, initial instruction assumed prerequisite skills that the students did not yet possess, such as the ability to segment words into individual sounds or to notice visual patterns in words. These students might have experienced more success had the program capitalized on the considerable background of knowledge and love of a good story that they brought to literacy learning. For still others, the major difficulty at the time they entered Benchmark did not lie in acquiring a beginning-level sight vocabulary. They could

The final draft of this chapter is the result of weekly small-group discussions of earlier drafts with the extraordinary teachers and supervisors of Benchmark School who over the past years have implemented the principles and practices elaborated in this chapter. The helpful suggestions and editing of Benchmark Board of Directors' Deputy President Robert Gaskins and the following members of the staff are gratefully acknowledged: Susan Audley, Anita Bair, Cheryl Cress, Betsy Cunicelli, Joan Davidson, Katie Donnelly, Marjorie Downer, Thorne Elliot, Renee Erickson, Eleanor Gensemer, Tom Hurster, Lisa Kascavage, Sally Laird, Helen Lawrence, Eric MacDonald, Dorothy O'Donnell, Colleen O'Hara, Mika Okawa, Joyce Ostertag, Nancy Powell, Melissa Radico, Pam Rappolt, Sharon Rauch, Theresa Scott, Jackie Sheridan, Linda Six, Marianne Smith, Jean Stakias, and Beth Wahl.

memorize or sound out words. However, these children seemed not to attend to the text for the purpose of constructing meaning. Some were stranded at the word level of processing text, others relied too heavily on background knowledge, seeming to arbitrarily disregard text. Most demonstrated cognitive styles and temperaments such as impulsivity, rigidity, and passivity that interfered with their ability to figure out strategies for effectively dealing with print and constructing understanding. Instruction was needed to help these students develop the notion that reading is a process of making meaning that is based on the constraints of contiguous text. They also needed to develop an awareness of their styles and the value of reflection, flexibility, and active mental processing, and learn how to take control of style, temperament, and tasks.

These examples of mismatches between learner characteristics and learning environments illustrate just a few of the learning differences exhibited by Benchmark students. The characteristic these students share is that, despite being bright, they were among the few in their pre-Benchmark classes who did not respond successfully to the reading programs that seemed to work for their classmates. (Those who repeated kindergarten or first grade also did not respond to a second chance to learn to read in the program.) In addition to delayed reading achievement and learning style differences, Benchmark students often exhibit an overlay of emotional responses to their reading difficulties as well as maladaptive strategies for coping with the confusions they encounter in reading.

Teaching Benchmark's delayed readers to read at a level commensurate with their age and potential is a slow process, perhaps because there is more to achieving success in reading than learning how to read (I. W. Gaskins, 1984). Students also need to learn how to orchestrate and apply strategies for the completion of real-life tasks and those assigned across the curriculum (Gaskins, Guthrie, et al., 1994; Gaskins, Satlow, Hyson, Ostertag, & Six, 1994), as well as how to take charge of the styles and temperaments that got in the way of their learning in the first place (Gaskins & Baron, 1985).

Benchmark teachers strive to help these delayed readers become proficient, self-regulated, and life-long readers by creating a learning environment in which students can capitalize on their strengths and develop inner control over knowledge, strategies, and motivation across the curriculum (Gaskins & Gaskins, in press). The challenge is to plan and deliver instruction that matches the many combinations of pace, developmental level, style, temperament, and feelings that exist in a class, as well as to guide students to substitute more functional strategies for those that have not proved productive. Success for Benchmark students depends on teachers who understand the factors that make reading difficult, know their students well, and meet students where they are with respect to pace, developmental level, cognitive style, temperament, and feelings.

In order to provide appropriate instruction for Benchmark's delayed readers both professional development and program development are ongoing. (See I. W. Gaskins, 1994a, for a discussion of professional development at Benchmark, and Pressley, Gaskins, et al., 1991, for an inter-

view study about staff reactions to program development for strategy instruction.) As a result of staff collaboration, reflection on practice, and research, a few basic principles of instruction have evolved during the school's 25-year history. These principles, however, as well as the total program, are continually fine-tuned, adapted, and changed as the staff learns more about teaching delayed readers. (I. W. Gaskins, 1988; I. W. Gaskins, Cunicelli, & Satlow, 1992). Six of these guiding principles are: (1) understand students as individuals and let their strengths and needs dictate what methods might work and how instruction will proceed; (2) determine the desired outcomes of instruction and explicitly teach students how to accomplish these outcomes, then scaffold instruction and gradually release responsibility to the students; (3) create a safe environment for risk taking where learning from errors and problem solving are celebrated; (4) plan, yet be dynamic and flexible, being conscious of creating a high degree of student time on task; (5) teach reading skills and strategies actively and responsively across the curriculum; and (6) encourage extensive reading and sharing (I. W. Gaskins, 1980; Gaskins & Elliot, 1983; Gaskins & Gaskins, in press).

The remainder of the chapter outlines some of the approaches Benchmark teachers use to help students understand not only what they read but also the reading processes, and how to take control of styles, temperaments, emotions, and tasks. The program is based on the belief that delayed readers need a variety of reading and writing experiences, as well as explicit instruction in strategies for both identifying words and constructing meaning. Waiting for development to occur or immersing students in literacy activities without appropriate mediation does not foster development (Cunningham & Allington, 1994).

The Benchmark program has been described as a whole language program by some experts (I. W. Gaskins, 1994b) because of the richness of literacy experiences and the responsiveness of teachers to individual students. Yet, contrary to many whole language programs, explicit instruction in decoding, comprehension, and writing is a hallmark of Benchmark instruction because Benchmark's delayed readers, as well as many other students, demonstrate time and again that they need instruction that explains what they are learning, why it is important, when they can use it, and how to do it (Chall & Squire, 1991; Hiebert, 1991; McCaslin, 1989; Pearson & Fielding, 1991). Explanations and teacher responsiveness are the distinguishing characteristics of teacher-student interactions at Benchmark (Gaskins, Anderson, Pressley, Cunicelli, & Satlow, 1993).

Similar to Pearson (1993), the Benchmark staff believes that instruction should emphasize: (a) the structure and patterns in words, text, and knowledge, (b) inferences based on the text and the reader's background knowledge, and (c) monitoring for meaning making. In addition, Benchmark students profit from explicit guidance in analyzing the components of a task and matching those components with appropriate strategies to control task, text, situation, and person variables (I. W. Gaskins, 1994a). The key to achieving these goals is meaningful interactions between teachers and students.

UNDERSTANDING READING AND WRITING PROCESSES AND TEXT

In this section instructional procedures that Benchmark teachers use to guide students in their understanding of reading and writing processes and text are described. These include repeated readings, reading group instruction, word identification lessons, writing lessons, independent reading, and literature lessons. Benchmark teachers have found that, regardless of age or reading level, new-to-Benchmark students need guidance to make sense of the reading and writing processes. As part of frequent teacher-student interactions, teachers mediate students' learning experiences so that they become aware that the construction of meaning should guide what they do as they read and write. Teachers discuss with students why making sense of what they read and write is important, emphasizing that reading and writing are done for a purpose. They are meant to serve a function, such as to entertain or to help complete a task. If students are not able to create meaning, they will not achieve their purpose.

Strategies are explicitly taught that place students in control of problem solving and meaning making. These include monitoring (such as stating what they have read in their own words to check understanding) and fix up strategies for detecting and correcting errors and for clarifying fuzzy comprehension (such as rereading or discussing their confusion with a peer). Teachers model aloud their own thinking processes for error detection and meaning making, then guide students as they practice these strategies in their own text. Catching students in the act of applying appropriate meaning-making strategies, and expressing the connection between the processes they used and the results they achieved, reinforces for students the fact that improvement in reading and writing is linked to recognizing, correcting, and learning from errors, as well as to asking questions when attempts at problem solving do not result in the construction of meaning.

Repeated Readings

Echo reading and choral reading of predictable books are frequently used methods for introducing reading as a meaning-making process to Benchmark's beginning readers. In implementing this technique, the teacher first reads a section to students, engaging them, as he reads, in eliciting background knowledge and making predictions. The teacher next reads the selection a second time as students point and follow in their books. Next, the teacher reads the selection one line at a time with students echo reading after each line. This is followed by choral reading. The teacher may also read only parts of the text, allowing students to supply what would make sense in the predictable sections. In addition, he may allow a few students to read the text together, but he will chime in when needed to ask how they might solve a meaning-making problem. Finally, he may ask volunteers to read portions, again chiming in to support when necessary, often asking a student how he or she could solve the dilemma of meaning making. Throughout this process the pace is lively and a spirit of fun prevails. Young children love reading

the stories they have memorized from repeated readings to anyone who will listen and as often as they will listen.

Students may also listen repeatedly to taped books. Older delayed readers find this particularly helpful because it provides an opportunity to experience books written at a level that matches more closely their conceptual, rather than their reading, level. They read a portion of the text repeatedly until they reach a criterion of 99–100% accuracy when reading the text without the tape. Not only are books for independent reading taped, but content-area books used in middle school may also be taped. These repeated-reading procedures (echo reading, choral reading, and taped books), can occur many times a day for as many days, months, or years as is deemed necessary to develop a confident, independent reader.

In addition to supporting students in the reading of text, repeated-reading procedures benefit students affectively. Students experience what it feels like to read like a good reader, feel good about experiencing success, and begin to believe again that they can become successful readers.

Reading Group Instruction

Instruction about meaning making takes place daily in reading groups of generally two to four students. The materials vary for these groups, for just as there is no one right reading method for all children, there is also no one best text. Basal readers with controlled vocabularies allow some students to feel most successful, while for other students trade books seem more motivating and appropriate. Teachers are free to use whatever texts seem to work for individual children. Students are grouped for instruction based on the instructional needs they share and the text the teacher determines is the best match for them.

During the 40-minute reading-group lessons, students are explicitly taught strategies for detecting and processing print information to construct meaning. The outcome teachers seek is that students will demonstrate active involvement in reading by using such strategies as surveying, accessing background knowledge, predicting, reading for a purpose, self-monitoring, changing a prediction based on information in the text, integrating new information with prior knowledge, and implementing decoding strategies to unlock unknown words. Beginning with the youngest students and for several years thereafter, each process is explicitly taught one at a time, with the teacher providing instruction, guided practice, and gradual release of responsibility to the students for one strategy over a period of at least 6–8 weeks before a new strategy is introduced. As each new strategy is introduced, instruction includes daily guidance, practice, feedback, and cuing in orchestrating all the strategies that students have learned to date. The goal is that over time, with this kind of daily scaffolding, students will gradually assume executive control and the disposition to apply these strategies on their own. The experience of the Benchmark staff is that it takes from 4–7 years for most of Benchmark's delayed readers to learn to orchestrate and apply appropriate strategies to match a learning situation.

Problem Solving for Words. Prior to reading a new selection, students are introduced to three to five words from the selection that they may not have encountered previously in the text which provide opportunities for working on print by applying a variety of problem-solving strategies. Before the lesson begins, the teacher of beginning readers places on sentence strips sentences from the text containing the target words for the day. Teachers of more advanced readers may place the target words on word cards. On one side of the word card is written in large type and below that the word is written in context. In the right-hand corner the word is written again and has beneath it known words that will help decode the spelling patterns in the word. On the other side of the card the word may be written in isolation to allow practice toward developing automaticity. When the procedure for introducing new words is first introduced, the teacher initiates a discussion about the value of applying problem-solving strategies to unknown words and why problem solving to figure out new words will be part of each lesson. He explains that it is important that the reader determine the sense the author is trying to convey; thus when a reader encounters an unknown word that interferes with making meaning she must use problem-solving strategies to figure out its pronunciation. The teacher brainstorms with students how they might solve the problem of an unknown word, then adds and teaches a few problem-solving strategies of his own, such as decoding unknown words by using known words with the same spelling pattern as the unknown word or using the initial consonant and context. Next, the teacher models the process of problem solving when an unknown word is encountered.

Explicit explanations of decoding processes are followed by guided practice during which the teacher provides feedback to students about their application of decoding strategies. With beginning readers the teacher or a student reads a sentence on a sentence strip saying “blank” for the target word. Students are asked what clues they can use to pronounce the word. At this point students would not pronounce the word even if it is in their sight vocabulary, rather they would share with their classmates the strategies they could use to decode the word and make sense of the text. One student may suggest that she would read on and see if the text provided additional clues, while another might suggest that he would guess what the unknown word is based on the initial consonant and what makes sense. A third student might say that the word has the same group of letters at the end that are found in a word he already knows, thus he would use the word he knows to decode the unknown word (e.g., being able to decode “mouse” because “house” is a known word). Still another student might point out that the identity of the word is obvious because of the predictable rhyming pattern in the text. All these suggestions are regarded as equally acceptable and high praise is given by the teacher as each student exhibits these good problem-solving strategies. Of course, when the students’ decoding suggestions are not as functional as they might be, the teacher asks for more information and gently guides the student to an appropriate problem-solving strategy. The goal is to help students acquire a network of effective strategies for operating on

the text, with the ultimate goal being automatic use of analogous word patterns as found among good readers (Stanovitch, 1984). For beginning readers, teachers often introduce new words a few days before they will be encountered in the reading group selection and place the words on word-ring cards similar to the word cards described above. These are reviewed nightly as part of homework. When word-ring words are recognized instantly as sight words, they are removed from a student’s word ring.

Strategies for Meaning Making. Next, the teacher discusses the need to be active processors and constructive learners beyond the word level. The group is taught explicitly how to implement an active-reader strategy and why using strategies to be actively involved in processing text is important. During reading-group lessons for the first month of school the focus strategy for beginning readers may be making predictions by surveying the title and pictures of a selection and relating this text information to their background knowledge. As students become somewhat independent in applying one strategy, additional active-reader strategies are introduced. The gradual introduction of meaning-making strategies continues through the grades and includes setting purposes; making inferences about relationships in the story based on background knowledge, such as the relationship between character traits and the resolution of the story problem; and analyzing the structure of the text for story elements, theme, evidence of genre, and organizational characteristics of exposition. (See Gaskins & Elliot, 1991, for additional details about strategy instruction at Benchmark.)

Each day the teacher leads a discussion of the what, why, when, and how of the strategy, then models, by thinking out loud, the process for implementing the strategy. In later lessons, once a strategy is introduced, students are encouraged to share their ideas about the why, when, and how of implementing the strategy, with modeling alternating between the students and the teacher as circumstances dictate.

Talk about words and text processing is the focus for the first 10–15 minutes of the 40-minute reading group. The remainder of the time is devoted to silent reading and discussion, although talk about words and text processing goes on continually as teachers cue students to orchestrate specific active-reader strategies to construct understanding.

Monitoring Silent Reading. In classes where students are in the early stages of learning to read, students remain at the reading table with the teacher for silent reading so that the teacher can support students in their reading, as well as gather information about how each student learns. Observing the silent reading of two to four beginning readers who are reading the same selection is usually quite easy because most of these students whisper read; however, observing true silent readers is also possible by watching students as they proceed down a page and by initiating mini-conferences with them as they read. As students read silently, Benchmark teachers act as facilitators and consultants who quietly interact with individual students to discuss strategies and information and to observe students’ attention to print and how they process information.

An important part of the teacher's job is to assess and record the operations each student attempts to implement and the kinds of operations that are not yet employed (Clay, 1991). These observations determine the next steps in instruction. The teacher is also interested in whether or not students are aware of their own reading behaviors and can assess accurately their progress toward meaning making. In addition, the teacher wants to discourage students from practicing inefficient or ineffective habits that remain from their early struggles in learning to read.

As the teacher listens and observes, he may follow students' eyes and note how their markers move down the page. In doing so, he may discover a student who is skimming, apparently more intent on looking like a speedy reader than reading for meaning. He engages the student in a brief conversation about the text, perhaps initiated by, "I was surprised by the things that happened on this page; was there anything that surprised you when you read it?" If, after a follow-up comment or two, it is clear that the child is confused about the information on the page, the teacher tries to lighten the moment by saying something like, "No problem, I often catch myself daydreaming when I'm reading. What do you think I do when I discover that I don't know what I've read?" On another occasion, the teacher may see a twinkle in a child's eye or hear a muffled giggle. He might comment to the child, "I can tell you are really actively involved in what you are reading; I laughed when I read that part, too." Another child may have come to a dead stop in her reading with her finger under a word. Noticing this, the teacher may ask, "What are you thinking?" If the child confirms that she is stuck on a word, the teacher praises her for monitoring her reading and asks what problem-solving strategies she has already tried, then he guides her in applying a strategy for decoding the word.

As a general rule, students are encouraged first to attempt to problem solve on their own when meaning making breaks down, then ask for assistance if confusions persist. A frequent teacher response to requests for assistance is, "What have you already tried?" Students enjoy these brief mini-conferences with the teacher and quickly learn that admissions of confusions and tales of successful problem solving earn praise and respect from both teacher and classmates. Even more important to students, is the realization that they are on the road to establishing inner control over important reading processes.

Students tend to complete the silent reading of a selection at different times. In some classes, as they finish, they take a card and pencil from the middle of the table and jot down notes (sometimes using invented spelling) to use during discussion. These notes are usually related to their purpose for reading. Some hold the card and pencil for a few seconds, then realizing that confusions exist they turn back to the text and reread. During this process, the teacher may discuss notes individually with a student or praise someone for being a good detector of fuzzy comprehension. In other classes, teachers may give those who finish first cards on which questions have been written that necessitate students returning to the text to gather information. Students generally enjoy the opportunity to become an expert on one of the interpretative or critical-thinking questions that the teacher plans to ask during discussion.

Collaborative Construction of Meaning. Discussions of the selection that the group read silently often begin by a teacher asking if anyone needs clarification or with students sharing what they have written on cards, most often something that relates to their purposes for reading or the objective of the lesson. Personal, affective responses are also shared, as well as the strategies students used to construct understanding. During an explanation in response to a student's request for clarification, students may refer to a chart in the classroom where Benchmark's framework for learning and understanding is displayed as a reminder for students to analyze the task, monitor for sense, look for patterns, and make inferences. Emphasis is often placed on practicing the strategy that was the objective of the lesson and sharing how the strategy was used.

In contrast to the traditional Initiate Respond Evaluate (IRE) pattern of teacher initiating a question, having a student respond, and evaluating the student's response, Benchmark teachers encourage group members to initiate the topics for discussion and to respond to one another's requests for clarification and to what others share. A common response made by a Benchmark teacher when students do not comment spontaneously after a student shares is, "Susan seems to be saying... what do the rest of you think?" Responsiveness, rather than passing judgment, facilitates a collaborative effort toward constructing meaning (Gaskins, Anderson, et al., 1993). In such discussions, meaning is jointly negotiated with each participant constructing a meaning a little different from what would have been constructed individually (Pressley, El-Dinary, et al., 1992).

Word Identification Lessons

Most students who attend Benchmark (including students who have acquired a sight vocabulary that enables them to read books at early-reader levels) have failed to construct a dependable means of decoding unknown words. Thus, a word identification program was developed to meet this need (Gaskins, Downer, et al., 1988; Gaskins, Gaskins, & Gaskins, 1991, 1992). In fast-paced, game-like, 20-minute group lessons students are guided to see patterns in words and to develop an awareness of concepts about print that is essential to independent and automatic decoding. Students are taught easily visualized concrete key words (e.g., tent, rain, ship, frog, skunk) that contain high-frequency phonograms (spelling patterns) and, in the early grades, they use these words to construct structured language experience stories collaboratively. As students explore the key words visually and play games with them that reinforce relationships between sounds and symbols, they become increasingly sensitive to the discriminating features of words and the predictability of letter sequences. Key words are prominently displayed on the classroom word wall and throughout the day students use those words to pronounce unknown words that have similar spelling patterns to words on the wall. For example, when a student encounters "bent" as an unknown word, she might use the known word "tent" from the word wall to decode it. She might also use "can" and "her" to decode

"banter." This practice of using known words to decode unknown words is further enhanced by extensive reading of simple predictable books that provide additional words to be used in identifying unknown words by analogy (Adams, 1990; Cunningham & Allington, 1994).

Writing

For many of Benchmark's beginning readers, writing is the breakthrough to reading. At least this has often been the case when students use invented spelling and write on topics about which they are very familiar (I. W. Gaskins, 1982; 1991). Benchmark's writing program is a process approach that guides students through the recursive steps from rehearsal to publication. Students engage in daily sustained writing wherein they choose their own topics and are taught to plan, organize, and elaborate ideas. By writing about what they know and receiving explicit instruction about how to improve their writing, students tend to become enthusiastic writers who learn to view writing as communicating ideas.

Writing at Benchmark begins with planning. For some Benchmark students, planning for writing is begun at home as homework. Students brainstorm about a topic of their choice and about which they know a lot, then jot a few notes in preparation for the next day's writing. As they brainstorm ideas, they may discover that they do not know enough, thus part of the planning process becomes reading to gather information. For beginning readers the planning process is slightly different. They often draw a picture to illustrate their ideas, then with the assistance of parents label their pictures with some of the words they will need to write their piece in class the next day. Throughout the school during the daily 40-minute writing period, students in collaboration with teachers and/or peers discuss what they plan to write before they write.

The daily writing period often begins with the teacher explicitly teaching some aspect of the writing process (it might even be planning) that the previous day's writing suggested needs emphasis. Teachers may also model their thought processes as they write part of a piece on the chalkboard to illustrate a particular point. In the primary classes, students may be explicitly taught how to construct a paragraph and how to write letters, especially a thank-you note and a friendly letter. Intermediate-level classes may learn how to put paragraphs together with transition sentences, as well as how to write introductory and concluding paragraphs. As students progress through the school, many genres of writing are taught. For example, both mini-lessons and large-group instruction are provided to explicitly teach the skills and strategies needed for writing responses to what has been read, such as summaries, character sketches, and research reports. Students are also taught how to write pieces patterned after various forms of literature and expository text and how to use writing to learn concepts, especially those taught in social studies and science.

Once a piece is planned, the focus during writing is, first, on getting one's ideas on paper, then on making sure that

the ideas are organized and clearly presented. The mechanics of writing are a major concern only when the piece is in the last stages of development and headed for publication. Almost all entering-Benchmark students are overly concerned about correct spelling. To discourage a preoccupation with spelling at the early stages of the composing process, teachers give a consistent response to requests for how to spell a word, "Write down the sounds that you hear; right now we are interested in getting your good ideas on paper." Students are also encouraged to use their word-wall words to encode words with spelling patterns that are being learned in word identification lessons. For example, to spell "that", a student would be encouraged to use the key word "cat".

Throughout the school first to eighth graders can be seen collaborating with others as they write. At Benchmark students are encouraged to use other students as resources, thus they frequently write in groups of three or four where they share plans for their pieces, as well as seek feedback on drafts and collaborate about revisions. The process of sharing and giving feedback has been modeled by teachers, thus students know how to make good use of their time collaborating with peers. If they become "stuck" for something to write, students read what they have written to one or more of those in the group and request suggestions either for ways to elaborate on ideas in the composition or for additional information (or clarification) that might interest a reader. In addition, checklists are often posted in classrooms that provide criteria for components of a well-written selection. The processes of sharing and collaborating seem to help students develop a sense of audience and reinforce the fact that meaning is at the core of writing, as it is in reading.

After spending the majority of the writing period engaged in putting ideas on paper, the class or writing group may reconvene to share. Several students usually volunteer to read their compositions aloud and request feedback. Feedback begins with a comment telling the author what the listener liked about the piece and often is followed by a question about additional information that the listener would like to learn about the topic. The following day students may choose to revise their compositions based on feedback and thus begin to take the composition through the editing-revision process to publication, or they may choose to write a new piece.

Writing instruction for beginning readers at Benchmark is adapted to accommodate their limited encoding ability. Each day after the teacher's brief instruction, students spend a few minutes discussing their notes, drawing, and discussing ideas with those in their group, then each writes a composition on every other line in a journal. As these beginners complete a line or sentence, the teacher asks them to share quietly what they have written. As the child shares, the teacher writes in standard spelling above the invented spelling what the child shared (initially students' writing may be only a series of consonants, plus lines that designate that the rest of the word's spelling was unknown). After a few days of journal writing, it is common to see the beginning readers turning back in their journals to copy the teacher's correct spelling of a word that was used on a previous occasion. In doing so, they learn not only to discriminate carefully the individual features

of the word, but also to group sequences of letters together to expedite the painstaking copying of words into their new composition. Drawing a picture and having a teacher write on the lines above the invented spellings are phased out as soon as students demonstrate that these supports are no longer needed.

In the process of writing and sharing, Benchmark's delayed readers have multiple occasions to think about relationships between sounds and symbols and to read and reread their compositions. Writing, as a result, becomes another opportunity for students to articulate their awareness of phonology and print, to construct meaning, and for the teacher to hold back and let students use what they know. Writing becomes an opportunity to read!

Independent Reading and Literature Lessons

Few would dispute that children learn to read by reading and being read to, yet in catch-up programs these are often missing ingredients (Allington & McGill-Franzen, 1989). However, even when the intent is to include independent reading and teacher read-aloud opportunities, convincing delayed readers to read or listen for pleasure is not always as straightforward as putting books in their hands or reading to them. Other factors must be considered; for example, the fact that reading cannot be separated from a reader's purposes, prior knowledge, and feelings (Smith, 1994). Without the intent to either enjoy or learn from what is read and the expectation that enjoyment or learning is possible, looking at a page of words may be little more than a mindless passing of the reader's eyes over text. Engagement based on intent and positive expectations is crucial to meaning making. And meaning making is what reading is all about.

Clearly, the more students read, the more they will learn about the processes they can use to become better readers. Thus, it is crucial that teachers provide an approach to reading that addresses or counteracts the negative feelings and attitudes that may have become a habitual response to the delayed reader's difficulties in learning to read. These responses may include expectations for failure, the belief that reading is too effortful in view of the return, and the preferred self-image of a nonreader. Dealing with these issues includes providing a safe environment where teachers mediate understanding and enjoyment as students read texts that interest them and about which teachers desire only honest personal responses.

Independent Reading During School. There are many occasions during the day when students practice reading. As discussed above, they practice reading as part of reading-group lessons, writing instruction, and repeated reading. In addition, Benchmark students are allotted time to practice reading while the teacher is with their classmates for reading-group instruction. During this silent-reading time students read stories in basal readers and trade books that are written at their independent level (the level at which they can accurately read 99–100% of the words). When they complete reading a book or selection, they respond to what they have read by choosing from a menu of possible responses that have

been introduced one at a time and taught explicitly. Some students choose to write a review, others a summary, while still others prefer to write answers to questions related to the teacher's instructional objective or to discuss what they read with peers or the teacher. Active engagement with lots of easy-reading text is the goal of independent reading time. Benchmark teachers have discovered that the number of words read correlates with progress in reading, a conclusion supported by research (Guthrie & Greaney, 1991; Taylor, Frye, & Maruyama, 1990); thus, they strive to have students engaged in reading for 80% of their seatwork time.

Independent Reading at Home. Benchmark students also read at home. As part of their homework, they are required to read independently for a minimum of 30 minutes each day. For beginning readers this often means reading aloud the predictable books they have practiced at school. Teachers of beginners also send home teacher-composed stories that feature words from stories read in reading group. As readers establish competency as beginning readers, they begin to select books from the school library for their 30 minutes of home reading. Books in the library are color coded to roughly approximate traditional basal reader levels. For example, all books that could be read easily by a child reading at preprimer level are coded red, primer level is coded yellow, and so forth. Students have the opportunity to visit the library daily to select books for home reading at their independent level, although in some classes, students in one reading group may elect to read the same trade book in order to support one another and enjoy discussion of the same book. Students may also choose books that interest them that are above their independent level, but these are to be read after 30 minutes of independent reading is completed. Books that students read independently are not intended to be challenging. Instead, independent books are to be books that students can read effortlessly, so that reading will be a successful experience, motivating students to accomplish the volumes of reading that lead to progress in reading. With the exception of beginning readers, most independent home reading is silent reading. An alternative to reading at one's independent level is to select a taped book and to follow along as the book is read on tape for as many times as necessary to be able to read a section fluently to a teacher the following day.

Students often write book notes or summaries about their home reading. Often these notes or summaries are used as a way to foster practice of the strategy being taught in reading group. Books (or chapters in books) read at home each evening are discussed at school the next day. Sometimes these discussions take place in a conference with the teacher, sometimes with a peer, and on other occasions books read at home are discussed in small groups. One of the students' favorite activities for responding to books is to present 2-minute book commercials. Students, especially those who read taped books, are often asked to choose a section of the book to read aloud to a teacher or peer as a means of monitoring fluency.

Parent Read Aloud. While students are in the library, they also select a book for a parent to read aloud. Each evening parents are asked to read to their Benchmark student for a

minimum of 15 minutes. In the primary grades the parent-read-aloud book is almost always good literature at the child's conceptual level. However, as Benchmark students reach the higher grades and are engrossed in Benchmark's grade-level-appropriate social studies and science programs, parents often spend the 15-minute parent-read-aloud time reading nonfiction selections related to the concepts being taught in social studies or science.

Benchmark Literature Program. Benchmark also has designed a read-aloud literature program, originally based on *A Curriculum for English* (1966), but which has been modified, reorganized, and updated by the staff. The program is implemented daily by classroom teachers and language specialists (Gaskins & Elliot, 1983) for the purpose of both enjoyment and helping students become aware of the characteristics of various genres. As part of this 20-minute-a-day program, approximately 10 genres are presented, one during each month of the school year (e.g., realistic fiction, folktales, historical fiction, myths, etc.). Examples of each genre of literature are read to students and patterns found in each are discussed and become part of the background knowledge students use to predict and understand other texts. Discussions of these literature patterns are also part of the discussion of the trade books and stories read in reading group and at home.

In their many mediated encounters with text throughout the school day, Benchmark students become aware of structure and patterns in texts, make inferences between the text and their background knowledge, and monitor their reading for sense making. However, the job of helping delayed readers does not stop with mediating these processes. Students also must be taught to orchestrate these strategies to complete real-world and school tasks and to overcome the maladaptive nonreading factors that often coexist with delayed reading, such as disorganization, inattention, passivity, rigidity, impulsivity, and nonpersistence (I. W. Gaskins, 1984). These issues are discussed in the next section.

TAKING CONTROL OF STYLES, TEMPERAMENTS, EMOTIONS, AND TASKS

Follow up of Benchmark students over 25 years suggests that teaching students to read well is not enough. Unless teachers address the styles, temperaments, beliefs, and behaviors that initially contributed to students' difficulties in learning to read, delayed readers may return to the mainstream only to experience difficulty again, despite being able to read at or near grade level. The significant results of Benchmark's year-long cognitive training project (Gaskins & Baron, 1985) highlighted the benefits of making students aware of personal characteristics that can impede learning and flexible problem-solving and teaching them *how* to manage them. To accomplish the goal of helping Benchmark students control styles, temperaments, emotions, and tasks both stand-alone and embedded programs are provided.

Stand-Alone Programs

Programs both to support students in achieving awareness and control over issues that may interfere with their achieving well in academic or social situations and to support teachers in endeavoring to guide students to take charge of styles, temperaments, emotions, and tasks are part of Benchmark's across-the-curriculum program for delayed readers. These programs include a Support Services department staffed by psychologists, counselors, and social workers who serve as classroom consultants to teachers, conduct weekly class meetings, see students individually or in small groups for problem-solving sessions, address emotional overlay and resulting emotional issues, and lead parent groups. In addition, a team of placement counselors work with parents and graduating students to place students in schools that are an appropriate academic match for their abilities and the way they learn. This team also follows and supports former Benchmark students throughout their school years. Additional special programs for dealing with styles, temperaments, emotions, and tasks include a mentor program (R. W. Gaskins, 1992), courses in how the brain works (Psych 101 and LAT; Gaskins & Elliot, 1991), after-school guided study, and an Outward Bound-type program, to mention only a few. In addition to the programs outlined above, teachers address issues of control over style, temperament, emotion, and task as part of their daily teaching.

Embedded Programs

Goal Setting. Regular weekly goal-setting conferences are a key factor in helping students deal with style issues and are one of the cornerstones of the Benchmark program. Students from the youngest to the oldest take part in conferences with their teachers to set goals and review progress. The first goal-setting conference of the year often includes not only the teacher and student, but also the student's parents. During these weekly conferences a style, temperament, feeling, or task issue that needs to be changed or adapted is identified, then those attending the conference clarify and refine a contract stating in measurable, observable terms what the student will accomplish during a specified period of time and how the student, teacher, and parents will collaborate to achieve these goals.

For example, a teacher may open a conference by inviting the student (and parents, if present) to share the student's strengths. Next, an issue that seems to be interfering with the student's academic progress may be addressed. After some discussion, those present may agree that attention and active involvement in learning are major concerns. The teacher might ask the student and others to describe how they would expect the student's behavior to look when she is attending and actively involved. What behavior would they be able to observe? Next, those present might brainstorm to determine the observable behaviors that would count as attentiveness and active involvement and conclude that these behaviors are: having eyes on the speaker for discussion or instruction and eyes on the text when that is the expectation, as well as

contributing ideas to group discussion, summarizing what has been learned, and / or critiquing what was in the text or contributed by others. Some or all of these behaviors would become the agreed upon goals. The teacher would next ask the student what the expectancy for meeting the goals should be and over what time period, as well as what support she would like in meeting her goals. A contract is then drawn up that includes the terms discussed. Sometimes parents promise a reward, such as lunch at McDonalds, if the student achieves five consecutive days with pluses on the goal card.

Initially teachers attempt to make the goals easily attainable, and increase expectations over time. Thus, the goal for the first week might be for the teacher to catch the student with eyes on the speaker more times than not during reading-group prereading activities, with the expectation several weeks later that eyes must be on the speaker 9 out of 10 times that the teacher observes the student and that the student participates three times during reading group discussion. For monitoring attentive behavior, the teacher may use a card or bookmark on which the goal is written. As the lesson proceeds he tells the student to make check marks on the card whenever he observed the student with eyes on the speaker. At the end of reading group the student would receive a plus on her goal card if there were a certain amount of marks on the card. Eyes on the text may be monitored similarly with the teacher marking the card as the student reads. As part of the collaborative agreement, the student may ask the teacher to help her focus by cuing her on the first occasion of inattentiveness.

Teachers regularly cue students to remember their goals and suggest strategies that students might implement in a particular situation to achieve their goals. Student progress is monitored daily, usually using a goal card taped to the student's desk or, for older students, a goal sheet placed in front of a student's notebook. At the weekly goal conference the student and teacher discuss progress and determine if any changes need to be made in goals or the collaborative roles of those involved. The goal card or goal sheet is often sent home as a means of communicating with parents about the student's progress. Parents sign the goal card or goal sheet, often adding comments, and return it to the teacher.

Task Analysis. Analyzing a task is important, whether the task is reading to gain ideas or reading for pleasure. However, as students move out of the beginning stages of reading, they discover that the tasks of reading to participate in a discussion or for pleasure are relatively uncomplicated when compared to most life or school tasks. For one thing, they often receive considerably more adult mediation as they accomplish these short-term, daily school tasks. On the other hand, delayed readers often experience a different situation when they encounter tasks that require planning for events over time, such as the need to write a report for a Scout meeting or complete a written list of directives left by a parent that need to be completed prior to his arrival from work. Even when they can read the text involved, Benchmark's delayed readers often find such tasks frustrating and to be avoided, usually because they are unaware of how to analyze the task into

component parts or make and execute a plan of action to complete each part systematically.

Tasks involving reading are complicated because they necessitate individuals being aware of, and taking control over, at least four variables: task, text, situation, and person (Gaskins & Elliot, 1991). The complexity of a task is further compounded by the parts into which each of these variables can be broken. Tasks that teachers assign are often much more complicated than most teachers realize and are usually not accompanied by the explicit explanations and the scaffolding delayed readers need to meet with success. Having experienced the fact that delayed readers usually do not fill in the gaps for the procedures that a teacher leaves unstated, the Benchmark staff has designed a number of procedures to teach delayed readers how to navigate the complexities of task completion.

Analyzing the task is often introduced to students as a problem-solving task, followed by an explicit explanation of the what, why, when, and how of task analysis. For example, a teacher might posit, "What would you do if you had the task of taking care of your neighbor's house while she was on vacation?" Through brainstorming, the teacher would take students through the process of breaking the job into parts and making a plan for the completion of each part in light of situation and person variables, such as the situation of having soccer practice and homework responsibilities most evenings and the personal characteristic of procrastination. The teacher might continue the strategy discussion something like this:

During the next 4 or 5 years at Benchmark you will be hearing a great deal about analyzing the task. The reason this goal is important is that many school and life tasks seem overwhelming, not because they are too difficult to achieve, rather because we do not break them into manageable parts and work on them a little at a time. It is sort of like eating an elephant; you have to eat it one bite at a time. Just as you wouldn't eat an elephant in one sitting without getting pretty sick, you also cannot complete a science project the night before it is due and expect not to experience some problems. The good thing about task analysis strategies is that you can use them for tasks in and out of school. They are a means of problem solving, a way to accomplish any job you have to tackle.

The teacher working with older students might continue the explicit explanation of task analysis as explained below, writing the steps for task analysis on a chart or the chalkboard, underlining the first letter of the action word, and grouping the steps into categories of task, plan, and do.

Here are some general steps you might use in analyzing a task. First, put the task in your own words to be sure that you really understand what the task is. If you have any doubts about your interpretation of the task, it is a good idea to check your interpretation with someone you know who has a good track record for interpreting tasks correctly. Once you get straight what it is you need to accomplish, break the task into small manageable parts and make a plan for how you will accomplish each part. Next you need to analyze text, situation, and personal characteristics that could cause difficulties in completing

the task and add to your plan strategies for dealing with these factors. Once you have completed the planning stage by making a list of all the parts of the task, as well as how and when you will accomplish each part, you are ready to implement your plan.

The chart the teacher constructed to explain the process would include: Put task in own words; Check understanding with someone; Break task into parts; Make a plan for each part; Analyze text, situation, and person; Add to the plan; Do it. These steps remain visible in the classroom throughout the year, with students often devising a mnemonic to aid in remembering the steps. (PCB the task and MAA a plan, then do it.)

Students are explicitly taught how to employ each part of the process before they tackle applying the entire process on their own. For example, a class may have the task of preparing for an essay test in social studies that will be given when the class completes a unit in 4 or 5 weeks. The part of the task on which the teacher may choose to focus for this unit of instruction is how to answer an essay question. The teacher would walk students through the process of analyzing the task (being prepared to take an essay test in 4 or 5 weeks) and scaffold instruction so that as a class the plan would be accomplished, with perhaps the difference from most school situations being that the students would know from the beginning what the one or two essay questions would be. In addition to teaching the social studies concepts for the unit, the teacher would explicitly teach students how to gather the information they will need to answer the essay questions. Near the completion of the unit, the teacher would provide explicit instructions and guided practice in how to answer an essay question. The strategy is one that during the past few years Benchmark students have dubbed A-NOW. The letters of the acronym stand for: Analyze the question and write it in your own words; brainstorm Notes listing everything you can

think of that is related to the question; Organize your notes; and Write your essay. For an excellent description of how a teacher guides students through the process of completing a task, see a case study of Sharon Rauch's reading group instruction in Gaskins and Elliot (1991).

CONCLUDING REMARKS

Benchmark's program is designed for children who must have a program that starts where they are, proceeds according to the competencies they develop, and teaches explicitly what they do not figure out on their own. To provide this, the staff must understand the factors that make reading difficult, know their students well, and meet students where they are. The program is based on the belief that delayed readers need a variety of reading and writing experiences, instruction using a variety of methods and materials that are eclectic and flexible, and a lot of reading in easy material. Benchmark students also need explicit instruction in strategies for identifying words, constructing meaning, and dealing with styles, temperaments, emotions, and tasks. During instruction, Benchmark teachers emphasize: the structure and patterns in words, text, and knowledge; inferences between the text and the reader's background knowledge, and monitoring for meaning making. In addition, the staff provides stand-alone and embedded programs to help students deal with styles, temperaments, emotions, and tasks. The emphasis is on goal setting and task analysis as the staff guides students in analyzing the components of a task or situation and how to match those components with appropriate strategies to control task, text, situation, and person variables. The program works because of caring, knowledgeable staff members who know how to initiate and sustain meaningful interactions with students and their families.

EFFECTIVE LITERACY INSTRUCTION: FINDINGS OF THE KAMEHAMEHA ELEMENTARY EDUCATION PROGRAM

Kathryn H. Au and Claire L. Asam

UNIVERSITY OF HAWAII

For 23 years, members of the staff at the Kamehameha Elementary Education Program (KEEP) carried out research and development efforts aimed at improving the school literacy achievement of students of Native Hawaiian ancestry. In this chapter we discuss lessons learned during the last 5 years of KEEP's work, which focused on the development and implementation of a whole literacy curriculum, including a system of portfolio assessment tied to standards. Detailed accounts of KEEP's earlier work are available elsewhere (Au, Crowell, et al., 1986; Tharp & Gallimore, 1988).

BACKGROUND OF KEEP

In general, Hawaiian students tend to have low scores on standardized achievement tests, especially in reading (Kamehameha Schools, 1993). KEEP was established in 1971 with the goal of bringing Hawaiian students in the elementary grades to parity with national norms in the language arts.

KEEP's initial program development work took place in a laboratory school, where both of us served as teachers. Under the influence of behaviorism, the curriculum that evolved in KEEP's early years, the Kamehameha Reading Objectives System (KROS; Crowell, 1981), took a mastery learning approach to skills. This curriculum, however, differed from others of the time in emphasizing comprehension, even at kindergarten and 1st-grade levels.

In 1978, after the comprehension-oriented curriculum showed promising results, KEEP began disseminating to public school classrooms. The strategy was to improve students' reading achievement by developing the instructional expertise of classroom teachers. The members of the staff of

KEEP, known as consultants, were based in public schools to provide in-service support to teachers.

Over a 16-year period, KEEP expanded steadily to schools on three islands. In 1994, the last year of its operation, KEEP's curriculum was being used by 176 teachers, affecting 3,476 students in 9 elementary schools. Most of KEEP's students were Native Hawaiians; from low-income families, including many families on welfare; and speakers of Hawaii Creole English, a nonmainstream variety of English.

CURRICULUM AND ASSESSMENT

From 1978 to 1989 we continued to use the comprehension-oriented curriculum. Students also received systematic instruction in skills such as word identification and sight vocabulary, and their progress was charted using criterion-referenced tests. Beginning in 1984, teachers were introduced to the process approach to writing, although students' progress in writing was not systematically evaluated.

In the spring of 1989, due to internal and external evaluations that showed low levels of reading achievement in KEEP classrooms, we came under pressure to overhaul the program. We decided to develop a whole literacy curriculum, drawing upon the social constructivist perspective (Au & Asam, 1994).

Six Aspects of Literacy

The curriculum we designed addressed six aspects of literacy (Au, Scheu, Kawakami, & Herman, 1990):

- (1) ownership,
- (2) reading comprehension,
- (3) the writing process,
- (4) language and vocabulary knowledge,
- (5) word reading strategies and spelling, and
- (6) voluntary reading.

The first aspect of literacy, ownership, also served as the overall goal of the curriculum. Ownership has to do with students valuing their own ability to read and write (Au, Scheu, & Kawakami, 1990). Students who have ownership of literacy have a positive attitude toward reading and writing and make literacy a part of their everyday lives.

The second aspect of literacy was reading comprehension. In the whole literacy curriculum, comprehension was seen to involve a dynamic interaction among the reader, the text, and the situation or social context in which reading took place (Wixson, Peters, Weber, & Roeber, 1987). Drawing on reader response theory, the curriculum gave equal attention to the aesthetic and efferent stances (Rosenblatt, 1978).

Use of the term *writing process* for the third aspect of literacy conveyed a view of writing as dynamic and nonlinear, including such activities as planning, drafting, revising, editing, and publishing (Graves, 1983).

Language and vocabulary knowledge, the fourth aspect of literacy, involves the ability to understand and use appropriate terms and structures in both spoken and printed English. It includes the ability to learn the meanings of new words encountered during reading (Herman & Weaver, 1988).

In the fifth aspect of literacy, word reading strategies and spelling, the curriculum drew on Clay's (1985) notion that effective word identification requires the simultaneous use of information from different cue systems: meaning (i.e., passage and sentence context), structural, and visual.

In voluntary reading, the final aspect of literacy, students select the materials they wish to read, either for information or pleasure. Ideally, students also choose the times when they will read (Spiegel, 1981). In short, the whole literacy curriculum brought writing to the same level of importance as reading and gave equal attention to the affective and cognitive dimensions of literacy, in keeping with a social constructivist perspective.

Cultural Responsiveness

The commitment of KEEP to cultural responsiveness in instruction remained unchanged in the shift to the whole literacy curriculum. Culturally responsive instruction allows students to achieve academic goals through means consistent with the values and standards of behavior of the home culture (Au, 1993). For example, many Hawaiian families attach great value to the well-being of the extended family or *'ohana* (Gallimore, Boggs, & Jordan, 1974). The ability to work with others for the good of the family is judged more important than a person's individual achievements. In contrast, schools typically place greater value on individual achievement. Three specific aspects of culturally responsive instruction played a prominent part in both KEEP's old and new curricula: peer teaching-learning interactions (Jordan, 1985), a style of

classroom management described as "a smile with teeth" (D'Amato, 1988), and the talk story style of discussion (Au & Mason, 1983). All three build on students' preferences for cooperative, group activities as opposed to competitive, individualistic ones.

Writers' and Readers' Workshops

Instruction in the whole literacy curriculum occurred in two blocks of time called the writers' workshop and the readers' workshop. The writers' workshop typically began with a mini-lesson and teacher and student sharing, followed by a period when students did their own writing (Calkins, 1991; Graves, 1983). Teacher and peer conferences occurred during this time. Near the end of the workshop, the teacher generally gathered the students together for the author's chair (Graves & Hansen, 1983), a time when one or two students read their drafts or published books aloud to the class and received feedback about their piece.

The organization of the readers' workshop varied more than that of the writers' workshop, due primarily to the teacher's decision about when to schedule sustained silent reading and teacher read-alouds. The workshop often began with the teacher reading aloud or conducting a mini-lesson. Then the teacher met with students in small groups to discuss works of literature. Teachers used different approaches to grouping. In the primary grades, students were grouped by ability about half the time, and by interest (for example, in reading a particular book, or in doing research on a particular topic) the rest of the time. In the upper grades, students were usually grouped by interest. Small-group discussions generally began with students sharing their writing in response to literature. When not with the teacher, students read independently or with a partner, wrote in their literature response logs, and worked on individual and small-group projects.

Benchmarks and Portfolio Assessment

The portfolio assessment system designed as part of the whole literacy curriculum was anchored to standards, which we termed grade-level benchmarks. The benchmarks described the desired achievements of the hypothetical average student at the end of each grade. The sources for the benchmarks were (1) the state department of education's language arts curriculum guide, (2) the reading objectives of the National Assessment of Educational Progress (1989), (3) a well-known standardized test series used in the state's evaluation program, and (4) recently published basal reading, language arts, and literature programs. In areas not traditionally evaluated, such as ownership and voluntary reading, we developed benchmarks based on available research and our observations in classrooms.

In keeping with the spirit of the whole literacy curriculum, the benchmarks were stated holistically yet with wording specific enough to guide the efforts of teachers and students. Examples of benchmarks for ownership of writing at the 3rd-grade level included the following:

- Shows interest in others' writing
- Writes outside of school
- Third-grade benchmarks for the writing process included:
- Selects own topics for writing
- Tries to make writing interesting for the reader

Among the reading comprehension benchmarks at third grade were the following:

- Shares written responses to literature in a small group
- Comprehends and writes about theme / author's message

Many of the benchmarks reflected our concern with process, but we were concerned with product as well (cf. Delpit, 1988). For example, we included a benchmark indicating that the holistic quality of students' writing samples had to be judged at grade level with respect to an anchor piece.

Students' performance in the six aspects of literacy could be measured against the benchmarks and their performance rated as above, at, or below grade level. This made it possible to report program results in terms of the number or percentage of students above, at, or below grade level for each aspect of literacy (for a full discussion of the portfolio assessment system, refer to Au, 1994; Carroll, 1993).

Although its primary purpose was program evaluation, KEEP's portfolio assessment system also provided teachers with detailed information about students' progress. Teachers could use this information to guide and improve instruction in the six aspects of literacy. In addition, the system allowed students to become aware of the expectations for their grade level, to set their own goals, and to monitor their own progress.

Approach to Teacher Development

Once a school elected to become involved with KEEP, teachers volunteered to participate in the program. Each volunteer was assigned to a KEEP consultant, who usually worked with 8 to 10 teachers. The consultants were experienced teachers who had completed a one-year course of study to become proficient both in the KEEP curriculum and in approaches to supporting teacher development.

The consultants' work centered on classroom observations, followed by individual meetings for the purpose of feedback and discussion with the teacher. Consultants also conducted demonstration lessons and held workshops. As in most traditional teacher education approaches, the consultants usually spent more time informing and less time working with teachers on collaborative problem solving. Although the teacher-consultant relationship was generally a positive and supportive one, it did not tend to foster feelings of equality or to promote teachers' sense of responsibility for their own professional development (Giuli, 1985).

Consultants tended to devote the greatest amount of time to teachers with the lowest levels of expertise. Most of the KEEP schools experienced high levels of teacher turnover. The rate could be as high as 33% in a given school and averaged 20% per year across all KEEP schools. Many new teachers were recent college graduates who wanted help with

the basics of classroom organization and management. Consultants seemed to work effectively with new teachers, who accepted a rather directive form of assistance. However, most consultants seemed uncertain about how to work effectively with highly experienced teachers. As discussed below, consultants had to overcome a reluctance to work intensively with experienced teachers.

Implementation of the Whole Literacy Curriculum

Year 1. We developed the whole literacy curriculum rapidly, under pressure to make changes in KEEP and to show better student achievement results. As a result, when the curriculum was introduced in the fall of 1989, teachers and consultants had not had a chance to contribute to its development. The KEEP consultants and public school teachers alike spent Year 1 struggling with the change in philosophy, from a behavioral, mastery learning curriculum to a constructivist, holistic one. Many consultants and teachers liked the new philosophy but felt unsure about how to translate the ideas into practice. Few changes took place in classroom organization and instruction, and no attempt was made to implement portfolio assessment.

Years 2 and 3. During Years 2 and 3, we intensified staff development efforts for both consultants and teachers. With the philosophical changes well underway, we felt we could focus on the details of the readers' and the writers' workshop. In the readers' workshop, most teachers began to use children's literature in place of basal readers. In kindergarten and first grade, big books and shared reading became common. In the writers' workshop, students wrote and published pieces on topics of their own choice. Observers noted a high level of student engagement in authentic literacy activities, and teachers expressed enthusiasm about students' positive attitudes toward reading and writing. Most teachers did not yet feel comfortable with portfolio assessment, so consultants took the responsibility for managing the portfolios and collecting the benchmark data in classrooms.

Despite signs of change, the achievement results during Years 2 and 3 proved disappointing (Au, 1994). Results for ownership, voluntary reading, and word reading strategies looked promising, but results were poor for the aspects of literacy demanding higher level cognitive processing: reading comprehension, the writing process, and language and vocabulary knowledge. In these aspects, about two thirds of the students scored below grade level.

At this point, we had to address the question of why the whole literacy curriculum had not proved effective with Hawaiian children. One possibility was that the design of the curriculum could not meet the needs of Hawaiian students in learning to read and write. Another possibility was that the curriculum had not shown a positive effect because it had not been adequately implemented. We thought the second possibility was more likely.

Years 4 and 5. At the beginning of Year 4, to test the possibility that inadequate implementation was the problem, we undertook the Demonstration Classroom Project (DCP). The purpose of the project was to show that the whole literacy

curriculum, when fully implemented, could make a measurable difference in the students' literacy achievement. In order to assess implementation, we devised classroom checklists, one for the readers' workshop and one for the writers' workshop, listing items central to our vision of classrooms.

The KEEP staff worked with a small group of demonstration teachers, those judged most willing and able to achieve full implementation of the whole literacy curriculum in their classrooms. The project involved 13 teachers and 281 students during Year 4, increasing to 29 teachers and 608 students in Year 5. The demonstration teachers were asked to select a focus, either the readers' workshop or the writers' workshop. Both years, the vast majority of teachers chose to focus on writing (11 in Year 4 and 26 in Year 5).

Demonstration teachers entered into a rigorous process of staff development. Once a month, the consultant and an outside observer took detailed notes on events in the classroom during the writers' or the readers' workshop. On the basis of their observations, they noted the classroom checklist items present and absent and met with the teacher to discuss the results. The teacher then set goals for the coming month. During both Years 4 and 5, the demonstration teachers enjoyed extraordinary success in fully implementing their chosen workshop. While they started with about 50% of the items in place, they had implemented about 90% by the end of the school year.

The DCP led to a dramatic turnabout in student achievement. In the writing process in particular, student achievement reversed the pattern shown in the previous 2 years. Now, two thirds of the students showed achievement at or above grade level. This pattern of achievement held across the board, in upper grade as well as primary classrooms. Results for reading comprehension showed improvement as well. However, with only two classes focusing on the readers' workshop in Year 4, and only three in Year 5, these results were not considered robust. Portfolio results for Years 2 and 3 were available for a subset of teachers, and comparisons showed that these teachers achieved better results with their students in Years 4 and 5 (for full reports of implementation and achievement results, refer to Asam, Au, et al., 1994; Asam, Blake, et al., 1993).

Go with the Goers

Prior to the DCP, KEEP consultants had tried to achieve across-the-board implementation of the whole literacy curriculum by working with all teachers, including those with little or no experience in the profession. Consultants appeared to believe that teachers experiencing the greatest difficulty implementing the curriculum should receive the most help. Consequently, consultants did not spend much time with the teachers most capable of implementing the curriculum at a high level.

We knew consultants would need to organize their time differently to ensure that some teachers would achieve full implementation of the whole literacy curriculum. We adopted a strategy described by Peters and Waterman (1982) as that of small wins, building from a small group of people most likely to be successful. During a visit to KEEP, Jan

Turbill and Brian Cambourne, educators experienced in assisting teachers in the transition to whole language, described the process to us succinctly: Go with the goers. That became our motto.

At the start of Year 4, we asked each consultant to think about her pool of teachers and to commit herself to working intensively with just one teacher who had the potential of achieving full implementation of either the writers' or the readers' workshop by the end of the school year. We used the term *demonstration teachers* to describe these candidates for full implementation. The demonstration teachers were generally implementing about half to three fourths of the items in the writers' or the readers' workshop (as indicated by the classroom checklist) and ready to work toward implementing all or nearly all the items.

We referred to the other teachers receiving KEEP's services as either *emergent* or *recruitment* teachers. Emergent teachers could be expected to become demonstration teachers in 1–2 years, with the consultant's support. An emergent teacher was implementing about one fourth to one half of the features of the curriculum and was ready to work toward implementing about three fourths of the features. Recruitment teachers could be expected to become demonstration teachers in 3–4 years and were implementing relatively few features of the curriculum.

In collaboration with their consultant, teachers analyzed their teaching and identified their current level of program implementation, according to the classroom checklist. Teachers determined their level of involvement with KEEP, whether they wished to become demonstration, emergent, or recruitment teachers. Most of the demonstration and emergent teachers had been associated with KEEP for several years and had similar levels of knowledge of the curriculum. Demonstration teachers often differed from emergent teachers, not just at the level of program implementation but in the time and effort they were willing to commit to their professional development at that particular juncture. Recruitment teachers generally had not previously been associated with KEEP and / or were new to the teaching profession.

Most consultants found it difficult to accept the logic of going with the goers, of working intensively with just the demonstration teachers. Some consultants had become comfortable serving in the role of answer-givers with new teachers, and they were uncomfortable with their new role, which required that they work collaboratively with expert teachers who knew as much (and sometimes more) about instruction in the whole literacy curriculum. Some consultants believed that giving a great deal of support to a small group of teachers would contribute to a perception of favoritism at their schools, since teachers had the expectation that everyone would receive the same services.

We replied to these concerns by advising the consultants that KEEP's resources needed to be distributed on the basis of potential benefit to students. We reminded consultants that the practice of working with all teachers had not resulted in gains in student achievement. We argued that resources should go to the teachers who had the best chance, at that point, of fully implementing the curriculum and improving students' achievement.

The small-wins strategy differs from the usual approach to curriculum change. Often, a district mandates the change, with the expectation that all teachers will move forward at the same time. Resources to support the change effort are scattered rather than focused, and the effort fails. The small-wins strategy is based on the expectation that change will be initiated by a small group of highly committed goers. Resources are directed toward the goers to ensure their success. In the case of KEEP we found that the first wave of goers (demonstration teachers who began in Year 4) managed to succeed at a level exceeding our expectations. Year 5 went more smoothly than Year 4, in part because the first group of goers served as examples and advisors to the second group.

Give Teachers Different Kinds of Support

Published reports suggest that many teachers require 5 years or more to complete the paradigm shift from a behavioral, skills orientation to a holistic, constructivist orientation (e.g., Routman, 1991). Our work at KEEP supports this estimate. It took 4–5 years for most of the KEEP consultants, as well as the teachers, to make the shift. In the model of professional development we followed in the DCP, we looked at the development of teachers, expertise in the whole literacy curriculum as a process taking 4–5 years. Services to teachers' differed depending on their decision to assume the role of recruitment, emergent, or demonstration teacher.

Services to recruitment teachers centered on workshops, both large- and small-group events. Consultants held meetings with small groups of recruitment teachers and made arrangements for them to visit demonstration teachers. However, consultants seldom observed recruitment teachers or provided them with individual feedback. Consultants referred to these efforts as "planting the seeds" to develop the teacher's knowledge of the whole literacy curriculum and to establish a working relationship with KEEP. Recruitment teachers tried to implement what they learned in workshops, using their more experienced colleagues as resources.

With emergent teachers, consultants increased their focus on the classroom checklist. They worked with emergent teachers to assess their current level of implementation and identify goals for improving implementation. Consultants engaged in activities such as conducting demonstration lessons, observing in classrooms, and holding individual meetings with these teachers. Teachers and consultants planned lessons together and began to engage in collaborative problem solving.

With demonstration teachers, consultants worked on the same activities but in a more fast-paced and exacting manner. A monthly cycle of teacher goal setting, consultant support for meeting goals, and feedback to the teacher was established and maintained throughout the school year. Consultants also took steps to involve 2nd-year demonstration teachers in staff development activities for 1st-year demonstration teachers and others.

In staff development programs in some districts, the approach is to give all teachers the same information and types of support. Our experience suggests that such an undifferentiated approach does not work. We found it more

effective to rely on teachers' judgments of their own level of expertise and desire to engage in professional development activities. We tailored professional development activities to the teachers' needs and interests in becoming expert at holistic, constructivist forms of instruction.

Outsiders, such as the KEEP consultants, can act as catalysts for change. Over the long term, however, change is best sustained through a steadily expanding network of demonstration teachers within each school. With both instructional expertise and knowledge of the school context, these teachers are in the best position to prepare other teachers to become skilled in an innovative curriculum so as to sustain change.

Bolster a Holistic Curriculum with Systematic Instruction and Benchmarks

The results of the DCP showed us that the whole literacy curriculum could make a difference in students' achievement. However, we learned that positive results were obtained with only full, not partial, implementation of the curriculum. There were striking differences between students' achievement in Years 2 and 3 versus Years 4 and 5.

During Years 2 and 3, we saw promising results in ownership, voluntary reading, and word reading strategies. These results seemed to be related to changes in classrooms as teachers began to adopt portions of the whole literacy curriculum, becoming more student-centered in their teaching and giving students more choice during literacy activities. Students developed positive attitudes toward literacy, they did more reading on their own, and by doing more reading they improved their word reading strategies.

Yet during Years 2 and 3, achievement in reading comprehension, the writing process, and language and vocabulary knowledge lagged. With the KEEP students, we found that building a positive attitude toward literacy was not sufficient. Improvements in these aspects of literacy apparently depended upon teachers providing students not just with choice but with systematic instruction.

During Years 4 and 5, teachers learned about the aspects of literacy that needed improvement, and the demonstration teachers in particular received considerable support for improving their instruction. For example, they learned to provide mini-lessons to meet specific needs and to demonstrate writing techniques by sharing their own writing with students.

We asked teachers and consultants to concentrate on implementing portfolio assessment, paying special attention to the grade level benchmarks. Interestingly, the benchmarks themselves provoked little discussion. Teachers agreed from the start that the benchmarks reflected important and appropriate outcomes for students at those grade levels. However, they questioned whether it was realistic to expect their students to reach the benchmarks.

During Years 4 and 5, in order to implement portfolio assessment, the demonstration teachers had to become thoroughly familiar with the grade-level benchmarks. They learned to provide instruction to enable students to meet the benchmarks. They became aware of the benefits of

introducing students to the benchmarks as well. To the teachers' surprise, the majority of students showed that they could meet the grade-level benchmarks. Several teachers even asked us to change the grade-level benchmarks to make them more difficult. For example, we were asked to move a benchmark for research report writing from third to second grade.

Our experience with the use of grade-level benchmarks suggests that standards can be useful in raising teachers' expectations of student achievement. However, we know that the process of instituting standards will not make a difference in the absence of a high level of support for teacher development. Our studies of the implementation of the KEEP whole literacy curriculum suggest that teachers must first become comfortable with the new philosophy and the instructional practices associated with it. Once changes in instruction are underway, teachers can turn their attention to changes in assessment. Assessment may drive instruction in the sense that assessment associated with benchmarks or standards gives teachers a sense of direction. But as our work at KEEP demonstrates, changes in assessment, including the introduction of benchmarks, do not automatically lead to changes in instruction.

We learned during Years 2 and 3 that it was easy to be distracted by rather superficial changes in classrooms that did not lead to meaningful changes in students' literacy achievement. Therefore, during Years 4 and 5, we paid close attention to cognitive dimensions of performance. We looked not just at whether students were writing, but at how well they were writing; not just at whether students were reading, but at how well they were reading.

During Years 4 and 5 we emphasized accountability for students' achievement. For one thing, we conducted an audit of the portfolio assessment results for each classroom. Knowing that the results would be audited, consultants and teachers took extra care to document students' progress on each of the benchmarks. Many teachers taught their students to identify evidence of their own achievement, and this

process heightened students' awareness of the benchmarks and their own progress as literacy learners.

We asked the consultants to prepare brief presentations on each of their demonstration classrooms, for discussion at retreats held in the middle and at the end of the school year. We had the consultants focus on the changes teachers had made to improve implementation in their classrooms and student achievement results. The presentations had the effect of making consultants and teachers closely monitor both classroom implementation and student achievement, because they knew that others were following their work with interest.

Summary

Work during KEEP's last 5 years demonstrated that a whole literacy curriculum could have a positive effect on the achievement of students of diverse cultural and linguistic backgrounds. However, we learned that holistic, constructivist curricula will only have positive effects under certain conditions. First, full implementation of holistic curricula may depend on the use of a strategy of going with the goers. Change did not come about until we focused on the goers and had them focus either on the writers' workshop or the readers' workshop. Second, holistic curricula probably need to be supported by professional development efforts tailored to teachers' needs and interests. To bring about change, resources should be committed to demonstration teachers who can eventually serve as mentors for other teachers at their schools. Third, holistic curricula are more likely to be effective if they include benchmarks or standards to raise teachers' expectations and guide instruction. Finally, systematic instruction tied to benchmarks appears to be needed to improve achievement in the writing process and reading comprehension, the most cognitively demanding aspects of literacy.

CALIFORNIA'S LITERATURE-BASED CURRICULUM AND THE CALIFORNIA LITERATURE PROJECT

Phillip C. Gonzales

CALIFORNIA STATE UNIVERSITY, DOMINGUEZ HILLS

Mel Grubb

LOS ANGELES COUNTY OFFICE OF EDUCATION

INTRODUCTION

With the publication of the *English-Language Arts Framework* in 1987, California began a reform effort that is revolutionizing both its schools as well as many throughout the United States. The *Framework* brought together research on effective schooling practices and newer notions regarding literacy. Major changes resulted in the language arts school programs both in content and the way in which instruction is delivered. This reform effort took place at several levels. It affected the State curriculum review process, textbook adoption criteria, local school district staff development, assessment procedures, and university teacher training. Most instrumental in this reform effort has been the California Literature Project.

Educational reform is never easy. It calls upon teachers, administrators, parents, business and the entire educational community to reexamine and revamp current educational ideals and practices and to replace them with rethought curriculum and educational strategies and activities. While sometimes change for change's sake can revitalize our profession, reasoned change based on the current thinking in a profession is difficult to affect, much less to sustain. In California, educational reform was seen as a change that was to take place over time and to include multiple facets and principles for it to be effective. This chapter will discuss the California literature / language arts program that is part of this reform effort and the California Literature Project, its principal change agent.

CHARACTERISTICS OF THE CALIFORNIA LITERATURE-BASED PROGRAM

Before the 1987 *Framework*, California's language arts curriculum had students experiencing instruction that was teacher centered and textbook dependent. It used literature only to support direct instruction and practice of those discrete and isolated skills presumed to result in better readers and writers. Reading and writing processes were taught in isolation, not in the service of constructing meaning, and with little relation to what was understood about learning and teaching. Tests involved multiple-choice questions focusing often on low-level facts from a short reading selection. Writing in response to literature was virtually a nonexistent practice. Writing assessment was a multiple-choice test measuring student understanding of standard American edited English.

Moving a state as large as California away from such a skills-based language arts curriculum was a major undertaking. The earliest agreement among *Framework* developers was the establishment of literature as the core of the language arts curriculum. Major changes called for by the California *English-Language Arts Framework* included:

- | A move to | and away from |
|--------------------------------|----------------------------------|
| • literature-based instruction | • isolated skills instruction |
| • integrated language arts | • fragmented reading and writing |

- meaning-centered / thinking curriculum
- strategic constructivist experiences
- skills taught in the service of meaning
- phonics in context, concluded by grade 3
- student-centered curriculum
- collaborative learning
- quality programs for ALL students
- authentic/performance assessment
- mastery learning
- information banking
- scope and sequence of skills
- phonics taught in isolation
- teacher-centered curriculum
- competitive ranking
- tracking with differentiated programs
- multiple-choice testing

Language arts became a discipline concerned with major universal themes, the human condition, exploring life experiences, and social agendas introduced through quality literature. Whole works of quality literature, unabridged or unaltered in any manner that varied from the original, replaced shortened, language-changed versions of well-known selections. The teacher continued to introduce and facilitate lessons, but students now became the workers, collaborating in their meaning-seeking and sense-making generation of new insights and interpretations. Instruction became student-centered. It honored student voices and encouraged critical and thoughtful exploration of literature in the supportive environment of the classroom.

A TYPICAL LESSON

The traditional passive language arts lesson in which teachers assigned readings, students answered textbook questions and then completed dittoed worksheets was replaced by a lesson in which students collaborated in making sense and seeking personal meaning in response to literature.

In a typical literature-based lesson, the teacher begins by focusing student attention on the important issue central to literature to be read. Students draw on prior knowledge and experiences, often share related anecdotes, express opinions through anticipation response activities, and begin to speculate on what the literature may be presenting as an additional experience or interpretation.

The new selection is introduced and the reading begins. The teacher guides students as they experiment with ideas, think divergently by sharing personal experiences related to the text, and question character motivation. Students learn to take risks in expressing opinions and challenging the text. They visualize characters or scenes and express these interpretations through active performances. Alternative scenarios are explored and questions are raised regarding how the story and its characters evolved. Students in groups and individually are challenged to generate and honor different and possible multiple meanings in interpretations. The teacher creates situations where the impact of cultural and / or psy-

chological nuances displayed in the literature can be discussed. Ideas, interpretations, and opinions are encouraged but are not allowed to be shared without challenge or support. Students are taught to use clues and evidence both from the passage to draw conclusions as well as from their personal experience. Students are encouraged to consider how the author led them to believe as they do about the literature's issues and social situations.

Frequently, the lesson culminates in some project, demonstration, performance, or exhibition developed by students working collaboratively and assuming primary responsibility for its planning and delivery. Typical activities may involve a change in genre, a revision of the story to tell it from another's point of view, a change of time frame or culture, or comparison with current events or related literature.

Although the specifics of lessons may vary considerably, there are common elements found in most:

- Focus is on the story
- Students are encouraged to explore the issues within the selection of literature
- Creative, reasoned ideas are tested
- Students create their own understandings
- The literature is revisited several times each for a different reason
- All students have a common experience but their interpretations may vary
- Skills are introduced in context and serve the meaning-focus of the lesson

Although literature study often continues over an extended period of time, it is dynamic, students are excited when involved in it, and motivation is high. In all cases, this construction of meaning has been built upon the student's prior experiences and results with the student leaving experiences with the text knowing more about himself, his peers and his world.

While individual lessons may vary considerably, the following are offered as examples of the type of development that results in a literature-based program:

Example I

In kindergarten through second grade, children are learning to read and write as they read and respond to entertaining works of literature. Students reading and rereading literature become so familiar with the meaning and language of stories and poetry that they begin to associate sound-symbol associations with print and to anticipate and recognize the language of texts. Their attention is focused on the story or poem and its meaning. They are led to see personal connections between the literature and their own lives. They begin to practice the behaviors of literate readers and writers under the guidance of the teacher.

In a primary classroom, children begin a lesson by relating personal experiences regarding their own 'horrible, terrible, no good, bad day' to others prior to engaging with *Alexander's Terrible, Horrible, No Good, Bad Day*. The story

is read. Students act out parts of the story using realia and reader's theater speaking parts. Lines from the story are reread in a pair-share format and students talk about how they would have felt if they had experienced what Alexander suffered in the story. Students continue their meaning search by speculating about the characteristics of the very bad days that their teacher, parents, friends, and so forth, may experience. Relating this issue to their own lives, students visually depict what their own bad day might include. Finally, the story is rewritten to tell about Alexander's wonderful terrific, very good day.

Example II

In grades 3–6, students refine literate behaviors and are encouraged to increase their reading and writing fluency through practice and selective feedback. Students explore multiple possibilities of meaning and experiment with their personal interpretations as they write responses to the literature or plan enactments of the story.

In an intermediate language arts lesson, students may interview neighbors, friends or family members who may have been victims of a robbery regarding that experience. Selected life experiences are enacted by groups of students who plan out the drama, create the dialogue, and present the performance after rehearsal. Students may poll communities regarding the incidence of crime in their area, if community members believe adolescent law breakers may be punished or rehabilitated, and potential preventive measures. All these activities precede the reading of Langston Hughes' *Thank You, M'am*. In the reading of this short story, students interview both the boy and Mrs. Washington regarding their role in the story. Students learn to dialogue with the text by entering sentences or phrases from the story in one column of a dialectic journal and their own response in the second column. They speculate on what a meeting 20 years later might be like between the two main characters in the story. Then, the whole class may decide to put the boy on trial with class members serving as jurors, prosecutors, witnesses, judge, and defense attorneys. Finally, students record through newspaper formats and news broadcasts, a retelling of events of the story.

Example III

In grades 6–9, students are led to formulate and express opinions based on evidence and support from the text or their personal experiences. They consider how the story might have been different if presented from the perspective of a different culture or time period. Ambiguities in the text are examined and students are taught how to 'read against the cultural grain' by taking issue with the author's message. Clarity in student discussion or response in writing is sought.

Middle school students reading Gary Soto's *Pacific Crossings* come to understand how culture helps determine why we behave the way we do. This literary selection is used as a study of the differences between Japanese and American

cultural groups. They begin by dramatizing culture capsules (aspects of culture such as behavior, language, values, use of language, etc., different in two or more cultural groups) depicting some difference among groups for the purpose of discussion and analysis. They explore differences among class members in dress, use of language, preferences, behavior, and so forth, to see how perceptions are formed. In a 'quickwrite,' students write about a time they visited a new area where the people acted and talked in ways that were different from their own. As final preparation for the story, students explore stereotypes they hold about Japanese behavior, gender roles, their work ethic, and so forth. In the first reading of the story *Pacific Crossings*, students compare table manners of the Japanese with their own, gender and age roles and status, dress and statements of values. Their own homes and those of the Japanese family in the story are similarly compared regarding possessions, construction, and so forth. Rituals such as greetings, sitting down to eat, coming of age, and ceremonies of the Japanese family are analyzed and dramatized as well. This cultural comparison culminates by having groups of students perform aspects of culture that were in the story but were different from their own. Finally, students write a short story about someone from a foreign country coming to visit them in their city.

Example IV

High school students begin to analyze the structure of the text and its language to understand how the author produced his / her effect. The social complexities of a story are unraveled and differing cultural options are explored. Additionally, aesthetic appreciation of stories and poems are developed.

In a secondary language arts classroom, students read Zora Neal Hurston's *Their Eyes Were Watching God* to explore the struggles people face in trying to find happiness. Students begin the lesson by speculating on the differences between the lives of the poor and the more affluent, the rural and the urban, and the people in the 1920s and today. Students explore what life would have been like, what the concerns would have been, how vital their lives would have been. In reading the novel, students would be guided to challenge and reflect critically on the text by agreeing or disagreeing, arguing, endorsing, questioning, and/or wondering about the relationship of this story to today's world and whether rural America was similar to or different from urban America in the 1990s, to conjecture whether that life exists today as it did in the 1920s in rural America, and whether the values that motivate the characters are like the values of people in the students' experiences. This exploration of story set in time and place and its relationship to the universality of humanity and its concerns would be highlighted using mini dramatizations of story parts, creating poetry to express emotions felt in various parts of the story, character interpretation papers, use of talk show formats, recording in dialectical journals, biographical writing, and chronicling the changes and growth of character in the story as she moved from a

young lady to an older woman. In students looking for the life's lessons in the text, its essential story line would be re-presented but in a different time period and using a different culture. They explore it metaphorically and in terms of a rich tapestry of life. Students would explore how writers from the Harlem Renaissance have much to say to the reader today. By analyzing the language of the dialogue, we would want students to come to understand and perhaps appreciate the speech patterns that added a rich texture to the reading. Parallels between the story and the experiences of students are explored through writing of a reflection paper in which students consider the lessons from the literature and its relationship to their own lives.

ASSESSMENT

Realizing that a new language arts curricular program obviously required a newer understanding of reading, the California Learning Assessment System (CLAS) (Early Reading Instruction, 1993) defined reading for California schools as follows:

Reading is the process of constructing meaning through transactions with the text. In this view of reading, the individual reader assumes the responsibility for interpreting the text, guided not only by the language of the text but also by the personal experiences, cultural experiences, and prior knowledge that the reader brings to the task. Rather than believing that the meaning resides solely within the words on the page, this view of reading emphasizes the role of the individual reader in making meaning through a process that brings together textual and contextual evidence and the distinctive experience and perspective of the reader as meaning-maker.

The CLAS was designed to authentically evaluate the success of the new language arts curriculum. The CLAS had the following characteristics:

(a) It resembled what good language arts teachers did in their classroom. Good assessment was believed to be indistinguishable from good teaching. The assessment was to involve a multiday format including sections for reading, discussion, and writing.

(b) It was constructivist, allowing students to have common experiences but to respond to them idiosyncratically. While understandings and interpretations were based on the literature read, individual connections were encouraged.

(c) Opportunities for collaboration abounded in the middle section of the test that was not scored. Collaboration involved layering of ideas, some developed in earlier exercises of the assessment, added to by continued thought later, refined through discussion with peers, and finally, was used as prewriting for the third section of the assessment, an extended writing in response to or related to the literature selection,

(d) Multiple opportunities were present for students to demonstrate what they were thinking and coming to know. The assessment offered visualization possibilities, use of symbolization, expression of metaphorical thinking, writing to generate, further develop and clarify thoughts,

collaborative talk to encourage students to develop insights and layer interpretations together, to find connections between the work of literature and their personal lives and experiences.

(e) Assessment scales examine not whether the students arrive at the 'correct answer' but rather the quality of thinking their responses show in response to the text. Teacher / assessors allow for divergence of response and multiple reasoning routes that support the students' conclusions.

(f) Assessment allows districts and schools to understand the success of their language arts program as well as how well students are internalizing the strategies of the constructivist approach that encourage them to construct understandings beyond the school setting. As noted in CLAS training materials (1993) for scorers, these strategies include:

1. Demonstrate intellectual engagement with the text:
—experiment with ideas, think divergently—share personal experiences related to the text, question a character's motivation, take risks, express opinions, speculate, hypothesize, visualize characters or scenes, explore alternative scenarios, raise questions, make predictions, and think metaphorically.
2. Explore multiple possibilities of meaning:
—consider cultural and / or psychological nuances and complexities in the text.
3. Fill-in gaps:
—use clues and evidence in the passage to draw conclusions, make warranted and plausible interpretations of ideas, facts, concepts, and / or arguments.
4. Recognize and deal with ambiguities in the text:
—Give specific examples from the story that do not make sense to you, look at polar opposites, report conclusions to the class.
5. Revise, reshape, and / or deepen early interpretations.
6. Evaluate, examine the degree of fit between the author's ideas or information and the reader's prior knowledge or experience.
7. Challenge and reflect critically on the text by agreeing or disagreeing, arguing, endorsing, questioning, and / or wondering.
8. Demonstrate an understanding of the work as a whole.
9. Attend to the structure of the text:
show how the parts work together; how characters and / or other elements of the work are related and change—freeze frame; sequence the events of the text through graphics, visual demonstrations, role-playing, charts, graphs, posters, murals, storyboards.
10. Show aesthetic appreciation of the text; consider linguistic and structural complexities.
11. Allude to and / or retell specific passage(s) to validate and / or expand ideas.

CLAS as a statewide evaluation system helped focus educator attention on the importance of the reform effort. Translating the intents of the *English Language Arts Framework* continued through additional California Department of Education documents published since 1987.

SPECIAL PUBLICATIONS

The California Department of Education has also published additional papers supporting the intents of the *English-Language Arts Framework*. Among these publications are:

California Department of Education, Bilingual Education Office. 1990. *Bilingual Education Handbook: Designing Instruction for LEP Students*. Sacramento, CA: California State Department of education.

California Department of Education, Bilingual Education Office. (1990). *Caught in the Middle*. Sacramento, CA: California Department of education.

California Department of Education, Bilingual Education Office. (1991). *It's Elementary*. Sacramento, CA: California Department of education.

California Department of Education, Bilingual Education Office. (1991). *Second to None*. Sacramento, CA: California Department of education.

Gonzales, P. C. (1988). *Equity and Access in a Language Arts Program for ALL Students*. Sierra Madre, CA: The Kaw Company and the California State Department of Education.

Gonzales, P. C., & Melvin H. G. (1993). *Grouping Students for Effective Language Arts Instruction*. Sacramento, CA: California State Department of Education.

California Department of Education, Bilingual Education Office. (1993). *The Framework in Focus*, Sacramento, CA: California Department of education.

TEACHER CREDENTIALING

To promote conformity in preservice teacher training, California's Commission on Teacher Credentialing has established standards for the regular evaluation of teacher education programs. To be approved to offer a credential program, school of education programs must help its preservice teachers learn how to deliver *Framework* consistent instruction. At California State University, Dominguez Hills, for example, all teachers in training learn how to provide whole language instruction, writing as a process, emergent literacy planning for elementary through high school levels—all in a language arts teacher training program that focuses on literature study. Methods classes in English language arts teach a constructivist pedagogy. English as a second language, and Sheltered and Specially Designed Academic Instruction (SDAI) are also embedded into all courses. Multicultural concerns such as cultural matching, socialized and culturally dependent learning orientations, and culturally determined content-embedded cognitive development are regularly addressed in the Teacher Education Department credential courses.

Thus, the California literature-based language arts reform effort trumpeted changes in the manner in which instruction

was to be provided in the State. However, announcements of change will never by themselves result in wholesome differences in curriculum nor instruction. A vehicle for helping teachers both understand and implement the new language arts program was needed.

THE CALIFORNIA LITERATURE PROJECTS ROLE IN THE FORMULATION OF THE CALIFORNIA LITERATURE-BASED CURRICULUM

In California, the reform effort established a philosophical *Framework* calling for changes in language arts instruction, program quality review criteria employed by State officials as they approved curriculum programs throughout California, textbook adoption review criteria and procedures, and initiated a new Statewide assessment system. The Department of Education through legislated funding established the California Literature Project (CLP) to provide training for teachers expected to guide and effect these changes. The CLP was designed to focus directly on classroom instruction, the rejuvenation of teachers, and the establishment of a rigorous language arts program for every student.

The CLP was established in 1985 as a staff development effort to help train English / language arts teachers to teach a literature-based, meaning-centered curriculum. In 10 years, it has evolved into a major instrument for change in language arts instruction. The CLP began with an institute held on one university campus for approximately 100 teachers from throughout California. After two additional years of similar statewide institutes, the project moved to five State University campuses throughout California. Today, there are nine regions housing the CLP. Some of these regions support institutes at more than one satellite site. In the summer of 1993 a statewide residential California Spanish Literature Project was offered with all literature and pedagogy read and discussed in Spanish. In 1994, Spanish CLP institutes were offered at two locations in California. At present, a Japanese CLP institute is under development.

The primary mechanisms for the staff development effort of the CLP are its summer institutes offered through the CLP. These institutes are designed to model some of the best current thinking on the teaching of language arts. Articles written by such well-known academicians as Rosenblatt, Langer, Vygotsky, Squire, Wells, Greene, Pearson, Scholes, Wittrock, Freire, and many others provide much of the basis for the CLP pedagogy. The goal of the institutes is to help English / language arts teachers understand constructivist pedagogy and learn curricular and instructional strategies for implementing a literature-based, student-centered program for all students.

CLP SUMMER Institutes

In the CLP Summer Institute, each of the 4 weeks has an instructional theme tied to planned outcomes. Week one is titled *Literature as Experience* and looks at the "Teacher as Reader." During this week teachers explore literature as active

constructors of meaning. The four objectives for the week are that teachers will

1. discover, interpret, and apply insights into meaning of selected literature,
2. experience the impact of visualization, writing, and enactment on comprehension,
3. read and respond orally and in writing to adult works of prose and poetry, and
4. define a problem in implementing a literature-based curriculum and pedagogy of tolerance and inclusion for their own students.

For week two, *Using Language to Learn*, focuses on the "Teacher as Learner." During this week teachers reflect on their personal learning processes. The four objectives for this week are:

1. collaborate with other teacher-learners to strengthen the understanding that differences in background experience are not learning deficits but do contribute to the achievement of all students,
2. participate in core, extended (nonfiction) and recreational reading program of instruction to focus on organizational and inventional strategies for encouraging wide, sustained reading and writing,
3. use written and oral language to deepen engagement in learning, and
4. refine insights into individual teaching / learning problems.

Week three, *Affirming What is Known*, looks at the "Teacher as Professional." During this week teachers come to understand more about the teacher as decision maker. The four objectives for this week are:

1. assess your classroom needs for learning in language arts,
2. examine a variety of materials and strategies appropriate to the needs of particular students,
3. use technology in ways that may help provide access to the core curriculum for particular students, and
4. review relevant California Department of Education documents.

Week four, *Exploring Solutions*, is concerned with the "Teacher as Practitioner." This week focuses on establishing the role of instructional architect. The two objectives for this week are:

1. reflect on the ways in which the experience of literature can increase multicultural tolerance and inclusion, and
2. develop an instructional plan to field test in the first two months after the teachers return to their classrooms.

In this approach to teacher education, the learner is not told how to teach, he / she experiences the model eventually to be put into place in the classroom. This new teacher-learner has an 'honored voice' actively creating ideas testing hypotheses, and generating insights about teaching and learning. The learners construct personal understandings and individual realities. Participants engage in directive experience, collaborative invention, personal insight, individual reflection, and academic application. The partici-

pating teachers assume responsibility for their learning. They learn to approach discussions with an attitude of trust. They assume others have something to say. Teachers engage in open-ended investigation of life's issues in selections of literature. Teachers come to realize that their purpose is not to judge but to understand. Teachers become a community of learners. New and experienced teachers are immersed in environments where they actively question, hypothesize, investigate, imagine, and debate substantive topics in a manner that could be replicated in their classrooms.

Teachers leave the 4-week institute with a tentative "Curriculum Action Plan" that they use with their students when they return to their classroom. On six different occasions during each of the following two years, the teacher-participants return to a CLP follow-up day. They bring student work that reflects what is occurring in their classroom. During the follow-up, they interact with their CLP Institute peers exploring what is working and where they need help and guidance in implementing their Action Plans. They reflect upon their successes noting student performances and growth. During the second year of follow-up, CLP teachers develop staff development workshops based on their classroom experiences using literature-based lessons.

ONE SITE

In 1994, approximately 1,000 teachers attended a 4-week CLP Institute at 12 sites throughout the State and read, discussed, and learned more about the teaching in a literature-based classroom. In one region, California State University, Dominguez Hills (CSUDH) and its satellite sites at CSU Northridge and Cal-Poly Pomona, over 200 teachers participated.

Using "Crossing Borders" as the theme, and inclusion and tolerance as organizing concepts, teacher participants experienced a "constructivist" approach to language arts education. Although the term *constructivist pedagogy* was relatively new, its influence and philosophy had always underwritten the California *English-Language Arts Framework*. The CLP teacher-leaders coached the CLP participants as they assumed responsibility for their learning. One teacher participant wrote: "We approached our discussions with an attitude of trust. We assumed others had something to say. We didn't measure the contributions of our fellow teachers by some impersonal standard. We engaged in open-ended investigation of life's issues in selections of literature. Our purpose was not to judge but to understand. We became a community of learners."

The 4-week CLP Institutes in 1994 used *Palace Walk*, *Tracks*, and *M Butterfly* as the core texts read by the teacher participants. In addition, grade-alike books and picture books were read. Pedagogical articles emphasizing themes of inclusion and access written by Banks, Greene, and others along with California State Documents were also examined. One journal entry at the CSUDH CLP Summer Institute read: "I expected a traditional 'tell me / show me' summer program where CLP teacher-leader-experts led us to 'truths' and 'facts' through lectures and step-by-step cookie-cutter instruction."

Instead, what occurred was participants were asked to examine and understand themselves as learners and how they come to make meaning. Participants learned what it was like to feel confused when they encountered situations where a peer's ideas contradicted their own. They explored how they were similar to and different from other individuals in the teaching community. In the end, they came to comprehend firsthand the 'constructivist pedagogy' they experienced for 4 weeks.

Speakers are limited to only those who could add to the experience of the text. Two provocative speakers, Dr. Terry Tafoya, a native American psychologist, and Dr. Amir El-Araf, Vice President at CSU Dominguez Hills, shared cultural background that provided insight into *Tracks* and *Palace Walk*, respectively. One teacher reported that he better understood the notion that literature was written in a cultural context with its societal norms and that considerations of behavioral expectations are time bound and not necessarily reflecting today's reality in the same area with today's populations.

How successful was the 4-week CLP Institute? One elementary bilingual teacher said, "What a treat. I love this summer. . . . I was able to read books and discuss them with other adults. It's so intellectual. And I can see how to do this in my classroom. . . ."

To provide a working CLP classroom model, 43 middle school students and three teachers who would be their English teachers the following fall attended a 4-week CLP Student Academy held on the CSUDH campus. Led by CLP teacher-leaders, these students read literature, they composed poetry, discussed issues related to multiculturalism, tolerance and inclusion, and learned firsthand what it was like to construct and test their own meaning in response to literature. In the Student Academy, an anthology of multicultural literature served as the core text. The mother of one of the participants said, "I can't thank you enough for the experience my son had this summer. He never wanted to miss class, he read at night instead of watching television, and his experience going to the Simon Wisenthall Museum of Tolerance will never be forgotten." Another parent reported, "At first, my daughter fought the idea of attending the CLP. I had to bribe her to attend the first day. By the end of the 4 weeks, she was thanking me for having sent her and she cried because it was over." A CLP teacher who worked with many of the previous year's Student Academy participants during the past school year reported that she could not believe how much more confident her students were in school. They wrote better and wanted to read. Their discussions were more thoughtful. She went on, "In my case, I can't tell how much my experience working the Student Academy meant to me. I am a changed teacher. I expect and get more from my students. Their work was much improved. My teaching is also better. I thank you."

CLP PROVIDES LEADERSHIP

Teachers from the CLP have for 10 years been expected to assume leadership roles in the reform of language arts cur-

riculum and instruction in the State. Their involvement is varied:

(1) The CLP teachers provide *staff development* services for schools and districts throughout the State. Typically, each workshop guides teachers through an exploration of literature where new understandings are constructed in a manner resembling how a similar process can be enacted with teachers' students back in their classrooms. Some of these topics include: the role of phonics in a literature-based program, performance assessment in a literature-based program, teaching skills in context, writing to learn and writing in response to text, interdisciplinary teaching and the role of literature in other disciplines, using technology in a literature-based classroom, literature in an ESL classroom, among others.

(2) The CLP teachers were among the developers of the California statewide performance assessments for language arts called California Learning Assessment System (CLAS). They worked directly with testing companies and assessment consultants in the development of a literature-based assessment reflective of a meaning-centered approach. Staff-development sessions for teachers and administrators related to the instructional practices resembling the new assessment system were also conducted by CLP teachers.

(3) The State has a *recommended literature list* for K-8 and for 9-12 as well as for K-8 for books in Spanish developed in part by CLP teachers. These recommended lists were offered in districts and schools as guides to be used in the construction of their own list. The CLP teachers also serve as a resource to districts and schools as they update their literature selections.

(4) Schools and districts have come to rely on CLP teachers who teach in *bilingual* settings to assist their teachers to provide literature-based programs in the primary language of their students. This is not only because they believe that literature-based programs are good but because they have come to see that the strategies used for assisting students in constructing meaning from the text provide for better users of language and more skilled readers and writers than when taught in tracked linguistic programs.

(5) A core group of CLP teachers from throughout California has taken the philosophy and practices of the *Primary Language Record* (developed by the London Education Authority) and adapted them for local classroom use as the *California Learning Record*. This student observation system has become more and more in use as teachers put into place a literature-based program along with performance assessment. CLP teachers have developed a 7th- through 12th-grade version of the record that is being used more frequently as student portfolios are being used throughout California schools. Parents' support for the *California Learning Record* results from their involvement in gathering initial information and the value of the data collected to show growth that is used in parent conferences.

(6) The CLP teachers are also involved in a satellite transmitted staff development program received throughout California. This service called the Educational Telecommunications Network (ETN) is transmitted out of the Los Angeles

County Office of Education CLP and shows CLP teachers presenting lessons consistent with the *English Language Arts Framework*. Viewing teachers throughout California interact with teachers in the studio regarding the classroom scenes shown. To date, over 100 hours of language arts programming have been broadcast. Beginning in 1995, actual language arts classroom instruction in 4th- to 6th-grade CLP classrooms will be broadcast to schools throughout the United States as part of a Federally funded Star Schools project.

(7) Additional *special projects* involving CLP teachers include programs such as Reading Recovery, the Language Arts Middle School Demonstration Project, California Restructuring and other State initiatives. Additionally, CLP teachers are responsible for curriculum workshops, conference presentations, and site-based new teacher mentoring. Many CLP teachers teach education methods courses offered in teacher credential programs in State universities. A significant number of CLP teachers are now in doctoral programs throughout the United States.

(8) Special *study groups* have been sponsored to investigate topics of concern to smaller groups of CLP teachers. At CSUDH, for example, groups of teachers have established "Teacher as Researcher" groups, Multimedia Media Institutes, Literature for Gangs, ESL / Bilingual Literature Approaches, Emergent Literacy in Middle School, Parent Education, CLP for Administrators, CLP for College Professors, Portfolio Assessment, Interdisciplinary Instruction, Multicultural Literature, Beginning Literacy, and others. Each group meets for one or more weeks during the summer and during two to three follow-up dates during the academic year.

(9) Realizing that nothing drives educational reform better than an *assessment* system, in 1986 California Department of Education began designing its authentic language arts assessment program in writing. This was followed by the California Learning Assessment System (CLAS) in language arts in 1992. The CLP teachers were among those selected to develop, field test, revise, and score these tests.

The legislation to refund the CLAS was vetoed by Governor Wilson in 1994 after yielding to pressure from conservative fundamentalist Christian groups. Yet, the impact of the training and widespread use of the assessment prototypes are still felt throughout the State.

(10) The final piece of the reform puzzle was that of teacher training conducted by universities in California. California Literature Projects are located at *teacher-training* institutions throughout California. Usually, an English or Education professor involved in teacher training or some well-known and respected teacher from the region serves as the site director. The summer institutes, follow-up meetings, and much of the training of the CLP occur at university sites. At several university sites, CLP teachers teach methods courses for students in preliminary teaching credential programs. Often, CLP teachers are master teachers helping new student teachers. At CSUDH, for example, 25 CLP teachers have taught part-time in the Teacher Credential Program—primarily in the area of English language arts methodology. Faculty members frequently work with CLP Institutes as featured speakers, with CLP staff development providers functioning as coaches, and as participants in varied CLP activities.

HOW STUDENTS AND TEACHERS FARE

Much of the evaluative information regarding the results of the reform effort in California is anecdotal since the defunding of the CLAS in a recent legislative session. Nevertheless, educators have found changes in English language arts instruction to be remarkable. Typical of California teachers employing a student-centered, literature-based, meaning-seeking, constructivist approach to language arts instruction are classroom environments alive with student work in progress and products that reflect new learning. Interactions within lessons bring students together as pairs or small groups coming to better understand the works of literature they are reading. These students share insights, they test ideas, explore issues and opinions with their peers, and transmediate metacognitively in planning and enacting performances, demonstrations, or exhibitions in which the results of their literature study are displayed.

The inclusion of ALL students (ESL, gifted, average, remedial, and Title I) was found by many teachers to result in richer discussions, introduction of different perspectives, and a sharing of a multitude of prior experiences that contributed to a more dynamic construction of meaning. Detracking was one of the more complex efforts in the language arts reform. Districts and schools were successful when they involved students, teachers, and most important, the parents. Today, school districts are beginning to see an overall improvement of students who often would have dropped out of school and at the same time no decrease in student achievement for the students who would have been placed in advanced classes.

Informal surveys tell us that students are more willing to take risks with new ideas, they tend to be more creative in generating ways of demonstrating their understanding, they are more motivated to respond to writing prompts assigned to elicit a response to text, they become more independent, sometimes impatient with teachers who spend too much time explaining how to do assignments, and they develop closer relationships with their peers. One student reported, "I feel stronger. I hear myself think and want to share my ideas with others. I enjoy hearing what others believe and challenge them to find support for these opinions in the literature or from their own lives."

Some teachers have difficulty letting go of 'control' in the classroom. Coming from an education approach in which the teacher was central to all that occurred in the room, some teachers are reluctant and slow to turn over responsibility for learning to the students. These same teachers hold on to the format of questioning for correct answers, linguistic study, and testing protocols even as they begin to experiment with constructivist literature-based instruction. At times, teachers dislike the up-front planning for their lessons—but realize its payoff and power when students begin to operate more independently. Finally, teachers accustomed to 'grading' the work of students struggle with how to evaluate the more collaborative, generative, and organic learning that occurs in constructivist literature-based lessons.

CONCLUSIONS

The publication of the California English-Language Arts Framework heralded the beginning of education reform in California. Today's language arts education in the State incorporates effective schooling practices and new notions of literacy. It replaced a skill's curriculum with a literature-based, meaning-centered program. It resulted in improvement of the literature selections available to students. The *Framework* helped alter what was a teacher-centered program to one that has become more student-centered. And,

it spurred the development of an assessment instrument that more closely reflected how well language arts teachers taught. Assisting this effort are the new assessment system and the new teacher training credential programs. The California Literature Project as a State initiated staff development program has been central to the change in the teaching and learning in language arts introduced by the *Framework*. By engaging a teacher-centered change agent and by enlisting successful teachers from throughout the State in a consistent effort, California is now leading the language arts curricular reform in the United States.

THE INTRODUCTION OF THE NATIONAL CURRICULUM FOR ENGLISH

John Richmond

UNIVERSITY OF NOTTINGHAM

THE HISTORY OF THE LEGISLATION

In 1988 the government of the United Kingdom passed the Education Reform Act. Among other measures, the Act announced the introduction of a national curriculum, with an assessment and testing system, for children between the ages of 5 and 16 in state schools in England and Wales. (Private schools are not obliged to follow the national curriculum.) Parallel arrangements introduced a statutory curriculum in Northern Ireland. In Scotland, the authorities decided to pursue the goal of a national consensus on the curriculum without legislation, and this has been achieved. The national curriculum in England and Wales includes nine subjects. Three of these subjects, English, mathematics and science, are described as core subjects.

This chapter intends to explain something of the experience of the design and implementation of the national curriculum for English. The curriculum orders for English are substantially the work of a committee established by the government in 1988 and chaired by Professor Brian Cox. The Cox Committee's Report (Department of Education and Science, 1989a) drew on the work of another committee established by the government in 1987 and chaired by Sir John Kingman, which had published a report the previous year (Department of Education and Science, 1988) offering a model of the English language for teachers and attempting to answer the question, "What do teachers need to know about language?" The national curriculum for English (Department of Education and Science, 1989b) and its assessment arrangements took effect in schools from September 1989. In 1992, the government ordered a revision of the curriculum orders for English. In 1993 it ordered a further revision of the orders for all national curriculum subjects. The further revised orders will, when published in January 1995, apply in schools from September of that year. The government currently

promises that there will be no further revision to the national curriculum for 5 years from 1995.

WHERE WE HAVE BEEN AS LANGUAGE EDUCATORS

In order to set these bald facts in the context of language teaching and learning, I am going to offer a summary, using headlines only, of the main lines of progress in language education, as I see them, in the UK over 25 years. The ideas in the summary will, I guess, be familiar to most readers; 25 years ago, they were new to all but a few pioneering language educators in the English-speaking world. In the intervening time, there has been a constant dual effort among inquiring English teachers: both to generate new insights and, as important and in recent years more important, to defend those insights and their practical outworkings against ignorant and destructive attacks.

The energies we have brought to language education have moved us beyond:

the exercise of language as a set of drills and routines, divorced from real acts of communication and comprehension;

the idea that language is in itself neutral, value-free;

a curriculum of short tasks, each apparently unconnected with what had preceded or would follow;

the setting of tasks within which the student had little or no control;

a tendency to value the written language over the spoken; classrooms of isolated individuals performing competitively against each other and only for the teacher;

the assumption that the teacher's role is simply to issue

instructions to students to do things with language, and then make judgements on what they have done;
 an overriding preoccupation with correctness;
 a narrow range of formats and purposes for language use; and
 monocultural, monolingual assumptions.

By the same token, our energies have taken us toward:

the use of language as an expression of the desire to mean, and achieve in real acts of communication and comprehension;

an awareness of what social purposes people use language for, and what representations of the world are constructed for them through language;

a curriculum with a shape and sequence to it, understood by teachers and learners;

the setting of tasks within which students have the opportunity to make decisions about what to say, read, and write, and how best to plan their work;

a recognition that speech, as language in its primary mode, is inherently valuable and must be the basis on which competence in reading and writing is built;

classrooms where students can collaborate with one another, and criticize and admire each other's work;

the assumption that the teacher is involved in the work of the classroom as a user of language, albeit with special expertise, and is prepared to write, read, listen and talk along with the students;

a primary concern with the substance of what students say, read and write, and how they apprehend the meaning of what others say, read and write, with a concern for control of conventions following from that;

a broad variety of formats and purposes for language use; and

multicultural and multilingual expectations.

It is easy to abuse the past. The past is not here to answer back. Since language education began, there have been teachers who have helped their students to a confident control of their language and to a sense of how to use it to interpret and affect the world, whether or not those teachers would have described what they did in terms quite like those of my second list. However, I do think that the understandings in the second list have been achieved much more widely now than a generation ago.

ENGLISH AS A POLITICAL INSTRUMENT

Despite this progress, there are still numerous classrooms and schools that have not moved far away from the kinds of practices on my first list. The reason is not that there has been no recent activity in curriculum development in English on the part of government, teachers, and other professionals in language education; there has been much. Part of the reason

is that language education has been, in the last decade, the subject of conflict between government and professionals, between those with power but without much knowledge and those with knowledge but without much power. I am sorry to say that the government in the UK has used the teaching of English—and in particular its ability through the media to manipulate public perceptions of how effectively English is taught in the schools—as a political instrument.

I am a supporter of the principle of a national curriculum, which I think should apply both to state and to private schools. Government and professionals should be able to agree upon the broad framework of knowledge, understanding, and skill within which teaching and learning should take place. For one thing, we teachers know more than we did about language learning, and if those fundamental insights are evident in the broad framework, they have a powerful capacity to encourage better teaching and discourage worse. For another thing, I believe that all our students have a common right to the kinds of activities and experiences which a curriculum based on those fundamental insights can provide, though to put something into a piece of law does not in itself guarantee that common right.

In the mid-1980s, however, when the government first had the idea of a national curriculum, it had no intention of promoting what I will call “a meaning-making approach” to language learning. It wanted a back-to-basics curriculum, with an admixture of great literature for the older students, which it hoped would sweep aside what it regarded as a dubious progressivism which had infected all areas of the curriculum, but most particularly English. It had neither respect for, nor understanding of, the fundamental insights about language learning. (As an aside, it is fascinating to see how the words “fundamental” and “basic” have acquired such different connotations in education.) The government usually preferred to listen to a tiny group of unofficial voices given considerable influence on educational policy making, through an overlapping network of think tanks and policy units whose musings went into pamphlets which had privileged access to ministers' desks and to the front pages of newspapers.

Let me give examples. All the English teachers I have met believe, as does the government, that students should be introduced to magnificent literature. The phrase “magnificent literature” is a category which will sometimes overlap with a conventional definition of the literary canon, while also including material which governments are unlikely to have heard of. Like the government, English teachers believe that students should be helped to a confident control of the conventions of written language. But in the UK, English teachers have come to the realization that all the topics of genuine debate within English—for example, the question of what counts as literature, or of how to foster students' developing control of the writing system, or of what constitutes effective initial teaching of reading, or of the variety of accents, dialects, and languages spoken by students and the special role of standard English amid that variety, or of the extent to which English teaching should consider media texts, including some of the products of popular culture, or of the use of grammatical terminology in teaching—are regularly parodied

and sloganized with a constant eye to the political advantage of striking a particular public posture, regardless of its truth value.

THE NATIONAL CURRICULUM FOR ENGLISH IN BRIEF

Despite this, the requirements of the national curriculum for English currently in force do, on the whole, promote a meaning-making approach to language learning—something not dissimilar in principle to the points on my second list—although there are numerous detailed criticisms to be made of omissions, contradictions and inconsistencies. Here is a summary (necessarily very selective) of the requirements of the national curriculum for English in England.

KEY STAGE 1 (5–7-YEAR-OLDS)

Speaking and Listening

Offer a variety of planned situations and activities which:

encourage the development of pupils' ability to describe experiences, state information, express opinions, articulate feelings;

encourage the development of pupils' powers of concentration and sense of appropriate response—their grasp of how speakers and listeners behave toward each other.

Use a full range of groupings and audiences, from pairs to large groups, involving adults as well as pupils.

Reading

Show children how to make sense of texts using the whole range of psycholinguistic cues. Emphasize meaning.

Make available the widest possible range of engaging and appropriate reading material.

Develop the partnership between home and school.

Show children how reading and writing develop interdependently. Use reading to enrich oral work and drama.

Encourage the beginnings of explicit understanding of structure and conventions in written texts.

Writing

Make connections between children's spoken language and their developing sense of the nature of writing.

Give children an understanding of the composition process: planning, drafting, changing, polishing.

Give children models of, and invite them to try for themselves, a wide variety of kinds of writing. See that writing reaches a varied readership.

Pay attention to spelling, punctuation and layout in the context of children's own writing.

Foster a comfortable and legible handwriting style.

Encourage an awareness of some of the functions of writing. Encourage play with written language. Teach some grammatical terms in the context of discussion of children's writing.

KEY STAGE 2 (8–11-YEAR-OLDS)

Speaking and Listening

Provide opportunities for children to increase the complexity, clarity, and precision of their spoken language in situations and activities across the whole curriculum.

Develop children's spoken responses to fiction, nonfiction, poetry, and plays.

Give children a more developed understanding of the possibilities for and demands on spoken language brought about by working in groups.

Give children opportunities to reflect on their own effectiveness in the use of spoken language.

Discuss variations of accent and dialect in English. Teach about the forms and functions of standard English.

Reading

Show children how to read different kinds of texts (e.g. fiction, poetry, databases, information books) in different ways. Encourage active research reading of information texts.

Continue to provide a widening repertoire of reading material.

Provide guidance for children in reflecting, in speech, and in writing, on their reading.

Encourage different kinds of performance reading.

Discuss texts with children which make playful or imaginative use of language (e.g., advertisements, word games, graffiti).

Writing

Help children to develop a firmer control of structure and organization in the different kinds of writing they attempt.

Provide contexts for the use of writing as a tool of learning across the whole curriculum.

See that children's writing reaches a varied readership.

Teach about the special role of standard English in writing, and about occasions on which writers will deliberately use nonstandard forms. Teach something about the history of writing.

Help children to develop a more advanced understanding and control of spelling, punctuation and layout in the context

of their own writing.

Foster a comfortable, legible, and fluent handwriting style.

KEY STAGES 3 AND 4 (12–16-YEAR-OLDS)

Speaking and Listening

Give students opportunities to develop sophistication and skill in using, interpreting and responding to spoken language in a wide range of social and cognitive situations.

Give students increasing opportunities to develop proficiency in spoken standard English.

Give students opportunities to reflect on their own effectiveness in the use of the spoken word. Encourage them to respect their own language(s) and dialect(s) and those of others.

Teach about some of the range of styles and registers of spoken language.

Reading

Help students to develop as critical readers who form judgements about authors, characters, viewpoints, textual structures.

Help students to develop as skillful researchers who know how to use texts to advance their learning and who understand something of the range of information texts employed in the modern world.

Introduce students to the richness of contemporary writing and to some pre-20th century literature including Shakespeare.

Introduce students to a range of media texts and to a discussion of their purposes, effects, and intended audiences.

Teach about some of the main characteristics of literary language.

Teach about some aspects of historical change in English.

Writing

Help students take control of the process of composition (drafting, redrafting, revising, proof-reading) to an advanced stage.

Foster in students a more conscious sense of the choices and techniques available to a writer in aiming at particular effects and in appealing to particular audiences.

Foster in students an understanding of a wide range of the purposes and formats for writing in the adult world.

Help students take control of all aspects of the writing system (spelling, punctuation, layout) to an advanced stage.

Encourage students to reflect on and talk about the activity of writing.

Teach about some of the main differences between speech and writing.

MAKING ECCENTRIC PROPOSITIONS INTO COMMON SENSE

We have various individuals and organizations to thank for the fact that so much has been salvaged from the intellectual struggle which preceded the publication of the national curriculum for English. The most important group is the Cox Committee itself. Its members argued for a description of English which most English teachers share, and turned those arguments into firm proposals despite considerable pressure to abandon them. They then, with persistent determination and some cunning, saw to it that the proposals became law with the minimum compromise necessary. They were helped in this by some members of Her Majesty's Inspectorate—an independent body which advises the government on the content of the curriculum and the quality of schools and which, as a result of the independence of much of its advice in recent years, has had its numbers and its power drastically reduced. Numerous teachers' organizations, including the National Association for the Teaching of English, submitted evidence, suggested draft sections, offered ideas and advice.

But there is a wider acknowledgment than that to be made, and one whose lessons are longer lasting. It has to do with creating common sense. If enough people consistently and open-mindedly develop, promote, and practice a certain understanding of language education; if enough people have a shared view about the kinds of societies which classrooms should be, and the kind of influence on society which they want its future citizens to exert; and if they manage to articulate that, then they feed a process whereby the daring insight, the eccentric proposition, becomes, over time, the major body of common sense. Thus when a destructive and retrogressive power attempts to impose itself, it discovers, for one thing, that it is hard to assemble and vet committees which can be required to do its exact bidding. Further, it discovers that out there among professional educators, by far the largest body of articulated thought (whatever differences of emphasis on specifics there may be within that body) represents a vision of the subject, the teacher, and the learner which is too dynamic and too confident to be quashed easily.

In all the topics of debate within English mentioned earlier, there are stories to be told in detail about the progress of the argument. I will tell stories belonging to two of the areas. The first belongs to the area of grammar and the second, knowledge about language.

The Kingman Report

The question which the government gave the Kingman Committee when it was established in 1987, 'What do teachers need to know about language?', is a legitimate and important one. The difficulty lay in the fact that it wished the Committee to arrive at one simple answer to the question: an answer which it had in its mind before the Committee began its work. It wished the Committee to decide that teachers need to know, above all, about the grammar of sentences. The decline

in old-fashioned grammar teaching was, the government believed, both a cause of and a metaphor for a decline in educational standards generally. In the more extreme versions of this position, informality of dress, lack of respect for authority, and even the occasionally disappointing performance of our national cricket team were attributed by politicians, journalists and other social commentators to the collapse of parsing and clause analysis.

The Kingman Report profoundly disappointed those who had commissioned it. It was against old-fashioned grammar teaching and learning by rote, and proposed that teachers should develop a wide range of perspectives on language, including attention to some formal aspects of written and spoken language (one of which, it acknowledged, is sentence grammar) but also introduce the social context of language use: how speakers and listeners, readers and writers behave toward each other and change that behavior according to situation and purpose, both interpersonally and in mass uses of language. The Report offered some thoughts on early language acquisition and on historical and geographical variation in English.

The model of the English language by which the Kingman Report represented these ideas is deeply imperfect. Some of its details are simply wrong. There is no reference to social variation in accents and dialects of English; there is no attention to language learning beyond the early acquisition of speech. However, the Report was sufficiently unsatisfactory from the government's point of view for the Secretary of State at the time to describe it, on the day of its publication, as an "interesting" report; code for "not what we wanted to hear".

The Language in the National Curriculum Project

Despite its disappointment, the government decided to spend £21 million on a 3-year project, the Language in the National Curriculum (LINC) project, to disseminate the Kingman model to all primary teachers and all secondary English teachers in England and Wales. Having so publicly got itself on to a hook, it needed to be equally public about getting itself off. It was determined, at least, to exercise tight control over the project, and directed that there would be a scheduled training program using an approved training package. The package would be produced by an eminent linguist in a few weeks of his spare time. A giant piece of educational pyramid selling would ensue, with close supervision being maintained for 3 years to see that the package went down the line without being damaged or dropped.

Eighteen months later, the sadder and wiser senior civil servant in charge of the project told me: "We lost control of LINC after three weeks." I will say some more about this piece of carelessness in a moment. By this time (late 1988), however, the Cox Committee was well into its work and the government instructed it to ignore the complexities of Kingman's model, and to concentrate, so far as knowledge about language was concerned, simply on sentence grammar. There was to be a separate section of the English orders, called knowledge about language, which would mean sentence grammar. Teachers would teach grammar using pieces of

great literature as models; students would learn how the English stylists handled subordination, modifiers, pronouns and complements; naturally, as a result, they would once again (as had happened in the past) be able to handle these things properly themselves.

I have already said that the English orders were hammered out over a period of months of tense negotiation and compromise between members of the Cox Committee, civil servants and ministers, amid threats of resignation and rumors of dismissal. The orders had no separate section on grammar. It was agreed, rightly, that metalanguage—including the metalanguage of sentence structure, appropriately treated—is one of the tools of the English teacher's trade. The requirements for knowledge about language are divided among the three sections on speaking and listening, reading, and writing. Six aspects of language are required to be studied: accent, dialect and standard English; the functions, registers, and styles of speech; historical change in English; the nature of literary language; the functions, registers, and styles of writing; and some of the characteristic differences between speech and writing. That these aspects of language study, however partial and uneven they may seem, gained admittance to the curriculum orders, represents a significant political achievement in the circumstances. Much of this territory was unfamiliar, in a teaching sense, to teachers. The nature of literary language is obviously, at first glance, the most familiar topic; in a timely way this requirement invited discussion of newer literary theories and their application to reading texts in classrooms.

Once the national curriculum for English became law, the government asked the LINC project, as an additional and complementary responsibility to that which it already had, to help teachers approach the knowledge about language elements in the orders. A group of 25 people, of whom I was one, under the direction of Professor Ronald Carter of the University of Nottingham, wrote a collection of professional development materials between September 1989 and July 1990, when they were delivered to the Department of Education and Science (Professor Carter having persuaded the Department that more than a few weeks of his spare time were needed to do the job properly). The materials fulfilled the promise of the outline plan which had been approved in autumn 1989 by the project's steering committee. In the interim, suggestions and criticisms made by the committee had been accepted by writers of the materials, parts of which had been revised accordingly. It was therefore a surprise to be told a few days after delivery that the materials would not be acceptable to the government without substantial further revision (dissenting voices on the steering committee having been overruled). The materials were further revised over the next 7 months, but in May 1991 were finally rejected.

LANGUAGE STUDY OR GRAMMAR EXERCISES

What was the problem? The LINC project's interpretation of the model of the English language in the Kingman Report generated a set of linked perspectives on language study which I will summarize under five headings. We recom-

mended that, whether in the course of other activities within the English curriculum or as specific investigations, teachers might look explicitly at language as follows:

- (1) Language Variety: between speech and writing; of accents and dialects; of functions, registers, and genres in speech and writing, including those of literature; as evident in differences and similarities between languages, including comparisons of words and scripts;
- (2) Language as Social Construct and Constructor: as evident in speaker-listener, reader-writer relationships, for both interpersonal and mass uses of language, and including a particular concern for the ways in which social power is constructed and challenged through language;
- (3) Language Acquisition and Development: as evident in babies learning to talk; in children learning to read and write; in the potentially lifelong expansion of all our language repertoires;
- (4) History of Languages: as evident in historical change in English, and in some of the world's other languages, ancient and contemporary—ephemeral as well as long-term change;
- (5) Language as System: as evident in vocabulary—connotations, definitions and origins of words; in grammar—the functions and forms of words in groups; in phonology—the sound systems of spoken language; in graphology—the systems of marks that give us written language (including spelling, punctuation, layout, and handwriting); in the structure of longer pieces of text (e.g., conversations, stories, arguments, descriptions, reports).

The problem was that genuine attempts, such as this one, to interpret the Kingman model in ways which would help teachers address with their pupils the knowledge about language elements of the national curriculum, was not what the government really wanted, even though that was what it had officially asked for. What it really wanted was that which the Kingman and Cox Committees had been expected to deliver, but had not: a primer of grammar exercises. The fact that the LINC materials contained more attention to grammar, in the course of trying to fulfill the brief their writers had actually been given, than any materials produced by a major curriculum development project in the UK so far, was not the point.

There is a happy ending to this story. The government's letter of final rejection of the materials did contain the minor consolation that the government was:

content for the latest versions of the LINC units to continue to be used for the purpose of in-service training of teachers.

Whether or not it was truly content we cannot say; but the government could not help the fact that thousands of photocopies of the draft materials, in whole or in part, were circulating in the country. The leaders of the LINC project decided to produce a visually more attractive version of them, looking in fact remarkably like a published book (or rather the insides of a ring-binder folder) except for the lack of a publisher's name and an ISBN. A designer and printer worked speedily on this version of the materials for us, and two copies were delivered

to each of the local education authorities in England and Wales in October and November 1991. It is impossible to say how many further copies of *Language in the National Curriculum—Professional Development Materials* (University of Nottingham, 1991) have since been made; 30,000 would be a minimum. About 1,000 copies have so far been sold outside of the UK, and copies are still available from Professor Carter at the University of Nottingham.

The LINC project generated two official publications. *Knowledge about Language and the Curriculum: The LINC Reader* (Carter, 1990) has sold very well, largely because local education authorities, enraged by the censorship of the professional development materials, spent some of the money allocated to them for the LINC project in 1991 and 1992 on bulk orders. Equally successful has been *Looking into Language: Classroom Approaches to Knowledge about Language* (Bain, Fitzgerald, & Taylor, 1992), a collection of case studies of knowledge about language drawn from the huge harvest of records of work done within the project.

As a result of the work of the LINC project, there is now a much more developed understanding of the ways of studying language than there was in 1989. With that understanding, many teachers have designed sequences of work which address the requirements for knowledge about language in the national curriculum, and have seen how opportunities can be taken to reveal and extend children's knowledge about language throughout the English curriculum and beyond. There is every reason to suppose that this learning will continue.

READING STANDARDS: HARD TO MEASURE, EASY TO EXPLOIT

The second of my stories belongs in the area of the teaching of reading, and to get a proper sense of the political significance of this debate in the UK, we need to go back to a time long before a national curriculum was thought of: to the early 1970s. It was a time of widespread national concern about reading standards. They had fallen sharply in recent years, according to press reports of a study of some 11- and 15-year-old readers by two educational psychologists (Start & Wells, 1972). The government decided to act. It set up a committee, chaired by Sir Alan Bullock, to investigate the problem. The Bullock Committee examined the findings of the study, and in its Report, *A Language for Life* (Department of Education and Science, 1975), urged great caution in interpreting them. One reason for this advice was that the Committee was critical of the testing methods that had been used:

We do not regard these tests as adequate measures of reading ability. What they measure is a narrow aspect of silent reading comprehension.

A second reason for caution was that the test results actually underestimated what many 15-year-olds could do as readers. They were too easy for them, so there was a "ceiling effect," with more successful 15-year-old readers bunched together at the top of the available scale. Third, the Committee pointed

out that the sample of children which the researchers had intended to test was not large enough to have national significance:

If national standards are under discussion, then one needs either a national sample or a collection of a large number of local surveys which taken together represent accurately the national population. Such a collection does not exist....

Fourth, some of the language used in the tests had aged since they were originally devised. The researchers themselves pointed out the limitations of phrases like “mannequin parade” and “pacific settlement of disputes” as items on the basis of which to measure present-day children’s meaningful recognition of written language.

There were other drawbacks as well. Nonetheless, the Committee squared up to the findings of the survey as they stood. Contrary to the unequivocal reports whose urgency had been the spur to the setting up of the committee in the first place, it summarized:

There is no evidence of a decline in attainment over the years in the lowest achievers among 15-year-olds. Since national surveys were instituted in 1948 the standards of the poorest readers have risen, and the gap between the most able and least able has narrowed. This reflects upon the capacity of existing tests to measure the achievement of the most able readers; [Conclusion 14]

and

There was no significant change in the reading standards of 11-year-olds over the decade 1960–1970, but such movement as took place after 1964 was in all probability slightly downwards. [Conclusion 15]

What the Bullock Report Recommended

The Report then went far beyond the narrow definition of its brief, to make a comprehensive statement about language and learning, including the teaching of reading. The Report’s conclusions and recommendations about the teaching of reading include the following:

7. The level of reading skill required for participation in the affairs of modern society is far above that implied in earlier definitions of literacy.
56. There is no one method, medium, approach, device or philosophy that holds the key to the process of learning to read.
58. A detailed understanding of the reading process should inform decisions about the organization of teaching, the initial and in-service education of teachers, and the use of resources.
62. The learning of sound–symbol correspondences should take place in the context of whole word recognition and reading for meaning. It is important ... that children should ... have had a full range of pre-reading experiences.
66. The most effective teaching of reading is that which gives the pupil the various skills he or she needs to make the fullest possible use of context cues in search for meaning.
73. It should be established from the beginning in the mind of the child that reading is primarily a thinking process, not simply an exercise in identifying shapes and sounds.
79. Reading schemes which use contrived and unnatural language prevent children from developing the ability to detect

sequential probability in linguistic structure.

83. The difference in [teachers’] effectiveness lies not in their allegiance to any one method but in (a) the quality of their relationships with children, (b) their degree of expert knowledge, and (c) their sensitivity in matching their teaching with each child’s current learning needs.

The Report’s great achievement was to place on official record the complexity of the job that teachers of language do; in the area of reading, it ought not to have been possible for any responsible person to suggest again that one-dimensional quick fixes using some kind of transmissional rote would be the salvation of any teacher or learner; it ought not to have been possible ever again to escape the Report’s emphasis on the multiskilled, meaning-making nature of all language learning. The Report shifted official support away from the set of practices summarized in my first list above, and toward that in my second. When the members of the Cox Committee came to formulate their proposals on the teaching of reading for the national curriculum, they drew on the professional consensus which the Bullock Report had done so much to establish, as can be seen by comparing the conclusions and recommendations just quoted with the reading sections of the national curriculum summarized earlier.

Short Memory and Malicious Intent

Nonetheless, in 1991, 16 years after the publication of the Report, with the national curriculum already passed into law and being taught in the schools, a violent argument about reading standards, complete with corrupt news management and vitriolic reporting of that news, broke out in the UK. A pamphlet entitled *Sponsored Reading Failure* (Turner, 1991), was seized on by the government and most of the popular newspapers as clear proof of a disastrous fall in reading standards. “Trendy” teachers using “progressive” methods of teaching reading were to blame. The teaching of reading was presented as offering a simple choice of two (and only two) methods. Either teachers used phonics, or they used “real books.” Those who chose to use real books, so the pamphlet said and, much more important, so the press reportage ran, had abrogated their responsibility to teach. Children stumbled from one confused encounter with a book, unaided by the teacher, to the next. Hence the national decline.

Those who obtained a copy of the pamphlet discovered that its findings had been reported on the basis of a tiny, statistically utterly insignificant sample of children, using a discredited test administered in highly artificial circumstances. That did not matter. The pamphlet’s destructive political purpose had been achieved so far as its authors were concerned. The attempt to offer phonics as an idea in opposition to real books; to suggest that if the St George of the former could slay the dragon of the latter, all would be well in the fair land of Albion; such banality plumbed great depths. Every government document on the subject of reading, from the Bullock Report up to and including the sections on reading in the national curriculum for English, had agreed that phonics, the apprehension of symbol-to-sound correspondences, is one but only one of the range of cues by which

readers apprehend meaning in texts. The material which children read has to be apprehended using the whole range of cues which generate meaning in the reader's brain, including the vitally important semantic and syntactic cues. There was equally strong agreement in all the documents that the reading material which children are offered should encompass a wide range of appropriate and engaging literature and information texts.

The government commissioned an investigation by Her Majesty's Inspectorate into the scandal which the pamphlet had uncovered. Predictably, the Inspectorate rejected the pamphlet's findings. No single method of teaching reading had taken the country by storm, it said. Almost 95% of the schools in its sample made at least some use of reading schemes, and did not rely entirely on real books. It was critical in equal measure of fundamentalist phonics teaching which pays no attention to meaning, and of a misunderstanding of the "real books method" which imagines that their use equals giving no guidance to young readers at all.

It is sobering to go back to the Bullock Report's list of conclusions and recommendations, and see it carefully picking its way through the discussion after, no doubt, listening to the same dissonant collection of voices. English teachers have made so much actual progress, in so many directions, since 1975. But in spite of that progress, so far as a widespread lay opinion has it, they are still blundering around in a large field of factionalism and ignorance. Those who help maliciously to form that lay opinion carry a heavy weight of responsibility for the time and effort wasted, the damage done.

THE FIRST REVISION OF THE ENGLISH CURRICULUM ORDERS

In 1992, the government decided on a major revision of the national curriculum for English, despite the fact that the curriculum orders had only recently been agreed upon after intensive debate and negotiation. (Indeed, there were still at that time some years within the 5 to 16 range which the national curriculum had not yet formally touched, since it was introduced as a rolling program intended to take 5 years to complete.) It used controversies such as the two which I have recounted to justify a public position that there was an intellectual and pedagogical need to change the orders significantly. The decision went against the wishes of the great majority of teachers, who had been getting accustomed to the orders, and who thought that, on the whole, they offered a framework for promoting effective teaching, allowing the right amount of professional autonomy and choice, and based on a thoughtful consensus on how children best learn to use English and to study its use. There was widespread agreement on the desirability of a number of detailed changes, but a strong feeling that the essential spirit of the orders should be preserved. Unfortunately, it was precisely the spirit of the orders which the government did not like. It found it galling that its own legislation had produced a document so distant from what it had intended 7 years previously. The areas in which it insisted on change were those which we had identified earlier: it wanted more insistence on standard English

from the earliest age, and less tolerance of nonstandard forms, even in the speech of very young children; it wished to exclude any reference to the needs and abilities of bilingual children learning English (except in Wales); it wanted more mechanistic approaches to the teaching of reading, and especially an emphasis on phonics; it wanted sentence grammar to be the only element of knowledge about language to which students were introduced; it wanted to remove media education from the statutory curriculum; it wanted less drama; it wanted children principally to read the works of authors in a literary canon which it established.

The publication of the government's new proposals in April 1993 was greeted with deep resentment by most teachers, though the reaction was tempered by a recognition that, in some aspects of presentation and layout, the proposals were clearer. At this point, however, something unexpected happened.

Dispute Over Assessment

A dispute, parallel with that over the curriculum, broke out between the government and language educators over the assessment and testing system for the national curriculum. In order to understand this dispute properly, we need to know something about the history of the national examination system in the UK.

Students have for many years taken a national examination at 16. Before the national curriculum, examination syllabuses exercised a decisive effect on the curriculum in secondary schools, particularly in the upper years. From 1963 to 1987, a dual system operated, in which higher-attaining students took the General Certificate of Education at Ordinary Level and lower-attaining students took the Certificate of Secondary Education. In 1988, this was replaced by a common system known as the General Certificate of Secondary Education (GCSE), which aimed to test students at 16 across virtually the whole attainment range. The GCSE was widely welcomed by teachers, parents, and students. Under the dual system in the 1970s and 1980s, English teachers had conducted a long campaign in support of coursework methods of assessment. This action had the effect of establishing the GCSE in English as an examination which could be taken partly or wholly by coursework methods. More than 70% of schools chose 100% coursework examination syllabuses in 1991. National standards of attainment in English at 16 have risen significantly since 1988, although there have been some who have liked to suggest, despite the evidence from the annual research carried out by examination boards and the government's advisory agency on assessment, that it has been easier to get good grades through coursework than in an end-of-course examination.

When it introduced the national curriculum, the government had decided to establish a 10-level scale, which would encompass the range of attainment likely to be reached in each national curriculum subject by the great majority of students from age 5 to age 16. It took the end of the school years in which students turned 7, 11, 14 and 16 as the moments in their career when they would be tested and given a level. Teachers and students were familiar with

examinations at age 16. However, national testing at 7, 11 and 14 was a complete innovation. The 10-level scale in English produced numerous theoretical and pedagogical absurdities and inexactitudes, as the scale's linear set of discrete criteria came face to face with the essentially recursive nature of language development. To quote one example from among many, in order to gain level 6 for writing, a student must, among other things, be able to:

recognize when redrafting and revising are appropriate and act accordingly, either on paper or on a computer screen.

In order to gain level 7, students must be able to:

demonstrate an increased awareness that a first draft may be changed, amended and reordered in a variety of ways.

It is unclear how the second set of criteria is describing an essentially more advanced group of attainments than the first. Nonetheless, English teachers scratched their heads and made the best of it. The pilot tests for children at age 7 and 14 could broadly be defined as good pieces of language education. They provided opportunities for a broad range of speaking and listening, reading and writing activities, appropriate to the attainment range for the age in question, to be assessed over a period of 3 or 4 weeks. (The first 11-year-olds were not due to be tested until 1994, and so no one had then thought in detail about the nature of their tests.)

The dispute, when it came, was not over the need, in principle, to have an assessment system: an organized way of making judgments on which teachers and learners can act, and a reliable record of achievement. There was general agreement, whatever teachers' views about the shortcomings of levels, that every student should have some sort of accumulating record of progress. The dispute was over the government's decision in 1992 to exclude from its testing system at 7, 11 and 14 all elements other than short, timed, externally set tests, and to severely limit the proportion of the GCSE examination which could be assessed by coursework. This decision seemed likely to cause particular difficulties for English, where achievement can only properly be assessed by using whole examples of reading, writing, and speech produced in a range of purposeful communicative contexts, and where English teachers, as we have seen, greatly valued coursework methods of assessment at 16, and were glad when it seemed that they were to be adopted at the lower ages.

To make matters worse, the decision then influenced the curriculum revision, with the government arguing that the curriculum must be simplified so as to justify simpler tests. If the national curriculum had made it a requirement that students should be tested on a wider range of knowledge, understanding, and skill than any short, timed test could measure, the government reasoned that the curriculum must change. It would not recognize that old-style tests were not up to the new job.

Revision of the Revision

The moment of publication of the revised proposals for English coincided with a unanimous boycott by teachers of

the new tests for 14-year-olds. This was a shocking humiliation for a government which had assumed, a few years previously, that it could always drive through its reforms, however unpopular. Up to this point, the government had had two advisory agencies, one for the curriculum and one for assessment. It combined these into one, and appointed Sir Ronald Dearing, an open-minded civil servant with some sympathy for the teachers' case, as chairman of the new School Curriculum and Assessment Authority. Sir Ronald rapidly announced a further full-scale review of the national curriculum and its assessment system, whose aim was to achieve a degree of professional consensus and industrial peace. Strange to recount, the revised proposals for English were themselves revised only months after their publication. Once again, there has been impassioned debate, tense negotiation and cunning maneuver, with clear evidence of the government intervening to reverse specific recommendations made by the writing group it appointed through its own advisory agency. These reversals were, of course, in the familiar ideological battlegrounds mentioned throughout this chapter. The departure from the (renamed) Department for Education in July 1994 of two government ministers most intransigently opposed to the view of the majority of English teachers means, I understand, that the final form of the re-revised curriculum orders, to be published in January 1995, will represent more closely a meaning-making definition of language education than would otherwise have been the case. A compromise over testing, with teacher assessment and short external tests both playing a part in the system, looks likely to be accepted though not welcomed by teachers.

CONCLUSION

This has been an account of a few highlights only of an extraordinary political battle over curriculum reform in language education. The destructiveness of the battle has, mostly, been unnecessary. It would have been perfectly possible, had the government wished to, for it to introduce a rational set of curriculum orders and assessment arrangements for English which were properly demanding, were likely to promote the best teaching and discourage the worst, were informative to parents, employers, the interested general public, and to itself, without the bitterness, the mess, the exhaustion on all sides. Actually, language educators want what the government officially also wants: confidently literate, articulate children and young people, broadly cultured, excited by knowledge, proud of their own achievements as users and students of language and appreciative of the achievements of others. History seems to show that it is difficult for major change to occur without some degree of struggle, and no doubt that would have been true in the present case, even with a more cooperative and trusting relationship between government and professionals. The sadness is that very often the government chose to adopt a discourse of derision, slandering and parodying English teachers' work, both in its private discussions and in its public statements. The price paid for this decision has been the confusion and low morale which English teachers have

suffered as they have seen themselves traduced in the media as “a national problem” which heroic government intends to solve; as they have seen one “definitive” set of instructions superseded before they have barely had a chance to interpret them in the classroom; and as their intellectual energy has been distracted from long-term learning for the benefit of their students to the rearguard defense of fundamental understandings which they thought, wrongly, had been established beyond doubt.

Despite all this, a true report on the national curriculum and its testing system must record that the great majority of

language educators accept that they have come to stay. Few want to go back to a time when responsibility for the content, methodology, and assessment of language education lay with the individual school and teacher, heavily influenced in the upper years of secondary education by examination syllabuses. Most English teachers agree that, whatever contests the future holds, curriculum reform in language education should be conducted within a framework of the entitlement of all students to a common language curriculum which government and professionals construct for them, however painfully.

CROSS-NATIONAL STUDIES OF LITERACY

Warwick Elley

UNIVERSITY OF CANTERBURY, NEW ZEALAND

There are many reasons why comparative studies of student achievement in literacy, across educational systems, might prove fruitful for policy makers. Educators around the world vary in their policies and theories concerning the optimum strategies for teaching children to read and write. What is traditional in one country is regarded as eccentric in another. If there are differences in the effectiveness of their instructional strategies, resources, and policies, then cross-national empirical studies have the potential to identify the most and least successful, and to explore the correlates of various approaches. Curriculum specialists and teachers in each country also appreciate having hard data on the relative strengths and weaknesses of their reading and writing programs, when viewed in an international perspective. The achievement levels of comparable samples of students in similar countries provide a useful framework within which their school systems can be evaluated.

A study involving many countries also has the opportunity to separate the effects of factors that are similar across systems, and those that are different. For instance, if the age at which instruction is begun varies from one country to the next, but is uniform within countries, then it takes a cross-national study to determine whether it is a key factor or not. In this sense, the world represents a huge "educational laboratory."

Among the variables that do vary markedly across countries are the level of per student funding; the amount of teacher education; the age at which children are introduced to literacy; the length of the school year; the amount and type of homework; the extent to which phonics is stressed in reading programs; the emphasis placed on real literature versus graded texts; the extent of grouping and reading around the class; the typical size of the class; the amount of reading done in school; the involvement of parents; the availability of books; and the complexity of the orthography of the language. If such factors are really important, international studies should confirm it for us. Literacy educators in all countries have much to learn from one another.

CHALLENGES IN CROSS-NATIONAL STUDIES

It takes but little reflection, however, to reveal a host of obstacles that the would-be international researcher faces. Literacy, more so than numeracy or scientific abilities, is firmly embedded in the culture and language in which it is encountered (Levine, 1986; Purves, 1992). For instance, the prestige accorded to imaginative literature, as opposed to oral eloquence or clarity of exposition, varies across cultures; the value of taking a critical perspective is cherished in some countries, while the need to respect and honor the written word is more important in others. Furthermore, many reading and writing tasks surely differ in their significance and their difficulty level across languages, and translation from one to the next may well distort differences in achievement levels, and in the impact of instructional variables. How then, can tests be developed that are equally unbiased for all? How can such tests reflect differences in curricular emphases across countries? How can the researchers accommodate differences in traditions of test format?

Comparison of student samples across countries is also fraught with problems, especially when educators follow different policies of school entry ages, promotion and retention policies, curriculum sequencing, drop-out rates, and mainstreaming of handicapped students and immigrants from other cultures. Under such circumstances the selection of truly representative samples, comparable across many countries, is no easy task. It is no wonder that many are sceptical about the viability and validity of international comparisons (Jaeger, 1994; Moses, 1991; Westbury, 1992).

THE INTERNATIONAL ASSOCIATION FOR THE EVALUATION OF EDUCATIONAL ACHIEVEMENT

One organization that has attempted to meet these linguistic and technical challenges is the International Association for

the Evaluation of Educational Achievement (IEA). Since the early 1960s this association of educational researchers has been conducting surveys of student achievement in its member countries, with increasing levels of sophistication in procedures.

Founded in a small way in 1959, IEA has developed into a federation of committed researchers from some 50 countries, and now has a full-time Secretariat located in The Hague, the Netherlands. The IEA Assembly, or governing body, meets annually in order to plan and discuss its projects. Surveys of large representative samples of students have now been conducted, at two or three age levels, in subjects as diverse as reading, mathematics, science, foreign language, civics, writing, computers, literature, and preprimary education. Also, student attitudes, teaching practices, and local policies are put under the researchers' microscope.

The main purpose of this chapter is to review the methodologies and interpret some of the salient findings of the cross-national studies of reading, writing, and literature. How helpful have these enormous surveys been in clarifying policy issues in IEA member countries? The recent work of American researcher Harold Stevenson and his colleagues comparing U.S. and Asian students and policies will also be included. There are other organizations that plan and conduct international surveys of student achievement (e.g., The International Assessment of Educational Progress [IAEP] associated with Educational Testing Service in the United States) but they have not focused on the measurement of literacy. There are also a number of cross-national collaborative surveys under way in adult literacy, but they are not yet far enough advanced to warrant inclusion in this article. Small studies that compare local samples in only two countries have also been excluded.

Pioneering Studies

The first reported attempt to conduct an international survey of literacy across several countries and languages was the pilot study of reading comprehension which was incorporated in a series of surveys conducted by IEA in the early 1960s (Foshay, 1962). Twelve countries, all European except Israel, participated in this exploratory study. Achievement tests of reading, along with tests of mathematics, science, and geography were administered to cross-sectional samples of 13-year-olds in each country. Resources for the study were slim, no precedents were available, no clear hypotheses were set, and it is not surprising that serious problems arose in the comparability of the samples and the suitability of the tests. Many of the challenges outlined above became painfully obvious to the researchers.

The desired samples of 600–1000 pupils were intended to be chosen by community rather than by school, and were to be based on the researchers' judgment of representativeness, guided by results of previous local surveys. In the event, some countries produced socioeconomically biased and/or numerically inadequate samples making comparisons of mean scores questionable. Furthermore, in spite of some pilot testing of the tests, the translation procedures adopted for the

reading tests were too haphazard to escape the criticism that the tests were not equivalent across countries (Downing, 1973).

The final form of the reading test consisted of five passages and 33 multiple-choice questions, but no time limit was imposed, so that the conditions of testing were not well standardized. To overcome differences in students' test sophistication across countries, a practice test was devised and administered before the main testing and opportunities were provided for pupils to discuss the nature of the task.

Despite the looseness of translation (undertaken by one researcher, and without back translation), it is important to note that the items appeared to "behave" in similar fashion in each country, as indicated by a median correlation of 0.87 between the difficulty indices of the reading test across the 12 nations. Surprisingly, this was a higher figure than was found in the other subjects. Thorndike's optimistic conclusion, in the final report, is worthy of note. A difficult item is a difficult item "regardless of the school system in which the pupil has been educated, or the language in which his schooling has been couched" (Thorndike, in Foshay, 1962, p. 33).

Numerous analyses were attempted to explore the patterns of results. Boys' scores were superior to girls', on all tests except reading, where the girls performed consistently better; the distribution of scores was wider in the UK than in other countries; and the differences in mean scores in reading, relative to nonverbal ability, provided some evidence of the relative success of the school systems in reading instruction. However, such findings should have been regarded as tentative, in view of the inadequate samples. Perhaps the firmest conclusion that could be drawn was an encouraging one, that a cross-national study of this sort was considered feasible in reading. The researchers believed that the cultural and technical challenges could be met, and overcome.

The IEA Survey of Reading Comprehension in 15 Countries

The next international survey of reading comprehension was the 15-nation survey at three age levels, conducted by IEA under the direction of Robert Thorndike (1973). This study, which was one of the IEA six-subject survey of 1970–71, capitalized on the experience gained in the earlier study, (Foshay, 1962), and was itself the source of a number of lessons for future studies.

In order to ensure maximum collaboration and minimal bias in the project, an international steering committee was established, which collaborated with national advisory committees in each of the 15 participating countries. Plans were developed to test representative samples of pupils at ages 10, 14, and the final year of school in each country. This proved to be a mammoth enterprise, which finally led to the testing of over 103,000 students. After discussion of various options, the committees prepared tests of reading comprehension of the traditional kind—self-contained paragraphs of continuous prose, followed by multiple-choice questions which could be answered by referring back to the passage as required. All countries were invited to contribute items and passages, so

that cultural bias would be kept to a minimum. The tests were developed and trialled in several countries, and only those items were selected which were felt to be appropriate by the advisory committees of each country. At each population level the final reading tests contained about 50 items, which were administered to students in two testing sessions of between 25 minutes (age 10) and 50 minutes (age 17–18).

Short tests of word knowledge and reading speed were also administered, but these were given less weight in the international analyses as they did not show satisfactory equivalence across languages. (Thorndike, 1973, pp. 29–36; 131–132; Walker, 1976, p. 114). Neither skill proved to be easy to translate without affecting difficulty levels substantially. It was learned that whenever the translation depends considerably on a single key word, the potential for change in difficulty level as a result of the translation was too large. Languages differ too much in their potential for providing synonyms of similar levels of familiarity, and usage.

Background questionnaires designed to elicit information on the circumstances of the students' home and school were also completed by the students and their teachers, with a view to testing hypotheses about the influence on achievement of home environment, book resources, instructional policies, teacher variables and the like.

Despite meticulous planning for obtaining good representative samples of students at each level, several countries were unable to meet the requirements, and their results therefore had to be regarded with some caution. As the target population at the 10- and 14-year levels was an age group rather than a grade group, many pupils were omitted in some countries because they fell outside the typical grade for their age. In five countries these omissions represented more than 10% for at least one age level (Thorndike, 1973, pp. 47, 48).

Reliability checks on the reading comprehension tests showed respectable coefficients (0.75 to 0.85) in most cases, although they were generally low in the developing countries. From 20% to 40% of items in two such countries showed correct answers no higher than chance levels, which makes identification of significant patterns of correlations problematic. Attempts to identify reading subskills were unsuccessful, as the correlations between the hypothesized subscores were generally as high as their respective reliability coefficients, so that most analysis was carried out on total comprehension score. A comparison of difficulty indices across countries showed very similar patterns in English-speaking countries, and a median correlation of 0.75 across different languages. This is a respectable figure, but considerably lower than that found in the Foshay (1962) study. Thorndike attributed the discrepancies to translation problems, and cultural differences, but concluded that the figures were high enough to indicate "a substantial core of similarity in the reading comprehension task as one goes from country to country" (Thorndike, 1973, p. 164).

Numerous statistical analyses were conducted on the results, including comparisons of country means and standard deviations, and multiple regression analyses with background variables. The former comparisons showed predictably large differences in mean scores between developed and lesser-developed countries, but less predictable small differences

within those groups. At the highest age level, a correlation of -0.60 between mean score and percentage of students still in school complicated the interpretation, and this retentivity factor also affected the spread of scores. At the two lower age levels, however, retentivity was much less of a problem in this respect. Table 57–1 shows the mean scores for each country for each population.

The correlations with home background variables showed consistently significant relationships with two composite variables—socioeconomic status, and level of reading resources—but only modest relationships with parental help, and level of parental interest. When combined in multiple regression analyses, the "home factors block" produced correlations of 0.38 and 0.40 for 10- and 14-year-olds respectively. However, once this amount of variance was removed, school type and instructional variables produced disappointingly small improvements in the prediction of students' scores, at the individual level, and not much more at the school level. Where correlations were strong in one country, they were weak in the next. Thorndike was forced to conclude that "little emerges that helps to understand what a school can do to foster better achievement in its students" (Thorndike, 1973, p. 117).

When national mean scores in reading were lined up alongside national means on other variables, highest correlations were found with availability of reading materials, hours of instruction in the mother tongue, parental education and hours reading for pleasure. These findings were in line with prediction.

The major benefits of this mammoth exercise were the confirmation of the belief that it could be done, and the consequent lessons for those who would try again. The so-called "Olympic Games" aspect of the mean scores also generated considerable interest, exchange of ideas, and revisions of policy in some countries. The potential for drawing conclusions about effective instruction, however, was largely unrealized.

TABLE 57–1. Mean Scores in Reading Comprehension for 15 Education Systems (from Thorndike, 1973)

Country	Pop I (10 Yrs)	Pop II (14 Yrs)	Pop IV (17–18 Yrs)
Belgium (Fl)	17.5	24.6	25.0
Belgium (Fr)	17.9	27.2	27.6
Chile	9.1	14.1	16.0
England	18.5	25.3	33.6
Finland	19.4	27.1	30.0
Hungary	14.0	25.5	23.8
India	8.5	5.2	3.5
Iran	3.7	7.8	4.4
Israel	13.8	22.6	25.2
Italy	19.9	27.9	23.9
The Netherlands	17.7	25.2	31.2
New Zealand	—	29.3	35.4
Scotland	18.4	27.0	34.4
Sweden	21.5	25.6	26.8
United States	16.8	27.3	21.8
Median	17.6	25.5	25.2

Amongst the chief reasons for this disappointment were those acknowledged by Thorndike himself. Without a survey below age 10, it was difficult to throw light on the major influences on reading acquisition, as the critical stage in this enterprise is probably between 6 and 9 years in most countries. However, the group administration of tests and questionnaires to whole classes in many schools was widely felt to be problematic at these tender ages. Questionnaires to teachers also have distinct limitations in capturing key differences in classroom processes, especially when they put questions which can be answered only by Yes or No answers.

Another problem concerned the unit of analysis. Since the sampling was done by schools, students' scores and teachers' responses were averaged for schools, not self-contained classes, so that any variation in teacher effectiveness within a school was neutralized. The link between student and teacher was lost in this enterprise, making the identification of important teacher influences less likely. Furthermore, the effects of teaching are subtle and elusive. The kinds of questions that can be asked in questionnaires to students are bound to miss many of them, and the fact that reading is a cumulative skill, depending much on early training and experience, makes the identification of significant influences in the current school year of 10- and 14-year-olds rather improbable. Only a good pretest could avoid this weakness, but none was used in the study.

Added to this is the fact that schools vary much less than homes in their quality (Thorndike, 1973, p. 99). Teachers require certificates of competence, and governments usually attempt to standardize much of the learning which occurs in schools. Parents are not subjected to these constraints, and family backgrounds vary much more in consequence. It should not be surprising, then, that little variance in student performance was attributable to schools. This is not to say that they do not contribute much to student learning. They clearly do. But the model of analysis in the IEA studies focused on contributions made by different agencies to student variance, not to changes in student means. The fact that all variance associated with the home was removed first in the analyses, without calculation of joint and unique variance for home and school, only served to reduce further the apparent contribution of the school.

Another possible weakness of the study was revealed by an analysis of the test questions themselves. At all three levels, 75% to 80% of the items measured inferential reading skills. It is possible that the emphasis placed on such basic reasoning ability, as opposed to literal reading skills, made it difficult to measure the impact of different teaching methods. The survival of inferential items, after item analyses, may of course be a result of the translation requirement. Other items may be more affected by a change of language.

Other commentators on this IEA survey of reading comprehension identified different problems. Downing and Dalrymple-Alford (1974-75) pointed to the weaknesses in sampling and the lack of clear-cut hypotheses to test, while Theisen, Achola and Boakari (1986) were concerned with the neglect of "within-country factors" in the measurement. Many education systems are far from uniform in their cultural and curricular emphases.

Nevertheless, the exercise was a distinct step forward in bringing an empirical dimension to the study of comparative reading, and provided the world with a clear example of what might be achieved with some modifications in design and procedure. Furthermore, many participating countries found specific benefits in the results. National reports of the findings, when viewed in relation to those of other countries, gave rise to more informed debates about methods and policies. In Hungary, for instance, the relatively low scores were "like a bolt from the blue" (Bathory & Kadar-Fulop, 1974). Professional educators and the general public reacted strongly, methods of teaching were reexamined, silent reading was given greater emphasis, and a diverse range of innovations were developed and evaluated.

By contrast, New Zealand educators gained much in confidence from the knowledge that their students achieved at relatively high levels. Closer analyses of the reasons for these findings were stimulated (Guthrie, 1981; Purves, 1979) and many educators and researchers visited New Zealand to study their reading programs.

Swedish authorities also gained strong reassurance from the IEA studies that their educational reforms had been successful in reducing inequalities between schools and districts. The between-school variance in Sweden was very low, relative to that of other countries.

Researchers also made good use of the IEA data base to test new models (Bulcock, Clifton, & Beebe, 1978; Munck, 1979) and many participants reported improvements in their national research and test development skills.

The IEA Survey of Literature in 10 Education Systems

An IEA study of achievement in literature provided even greater challenges than the one of reading. However, preliminary studies of literature response of 13- and 17-year-olds were conducted during the mid- 1960s (Purves & Rippere, 1968), and the results were promising. While some elements of literature proved too diverse across cultures to make for common assessment, other elements were clearly possible candidates for assessment. So IEA resolved to conduct a larger study with special focus on literary responses to specific texts and on attitudes toward, and interest in, literature. This survey was conducted at secondary school level only, on populations of 14-year-olds and students in their preuniversity year (Purves, 1973). Poetry works proved to be unsuitable across cultures, as was knowledge of works and literary terms, so attention focused on self-contained short stories. In a preliminary study of item format in literature testing, Choppin and Purves (1969) had shown that multiple-choice tests measured essentially the same literary abilities as were measured by open-ended items on the same literature passages. They therefore recommended the use of multiple-choice items in the final study.

In line with IEA procedures, an international steering committee was established and countries were asked to submit test materials. Four countries provided passages for pretesting and six countries undertook pilot testing on their students. Four long passages were eventually selected as

suitable in all 10 countries that participated: "The Sea," "I See You Never," "The Use of Force," and the "Man by the Fountain." Each passage gave rise to about 18 questions. Measures of response preference were also devised, pre-tested, and revised. Eventually, a format was agreed to, where students were asked to rank the five most important questions (out of 20) that one should ask about each passage. Attitude and interest scales were also prepared, along with questionnaires for students, teachers and schools. Not all of these proved successful, or as reliable as had been hoped, and some of the findings were accordingly regarded with uncertainty. Nevertheless, the achievement tests proved sufficiently reliable (around 0.7 to 0.8), to identify large group differences.

The results of the literature tests for each country are given in Table 57-2 broken down into Interpretation and Comprehension categories. It should be noted that the student samples were substantially the same as those participating in the reading comprehension survey, and were subject to the same limitations.

As in the Reading Comprehension Survey, New Zealand students showed the highest achievement levels at both 14 and 18 years, but the results for the older group must be interpreted in the light of the low retention rates for students in New Zealand (13%), as well as those of England (20%) and Italy (16%). By contrast, 75% of U.S. students stayed at school until grade 12. In order to compensate for these differences in retention rates at age 17, the researchers attempted a further analysis, in which they compared the mean scores of the top 9% of Population IV students in each country. The result was that the rank order changed to produce the highest mean for England, followed closely by the United States, Sweden, and New Zealand, but with little change in the others. However, the adjustment probably overcorrects, as the assumption underlying it, that only less able students (in Literature) drop out of school, is a debatable one. For the older age groups, national differences in retention rates will continue to complicate interpretation of relative performance levels.

Student achievement in literature is partly a function of the traditional curricular emphasis given to different aspects of

literary study by teachers—historical, linguistic, moralistic, critical, or psychological. Students in all countries did tend to read texts and then to discuss them in class, followed by some form of writing. However, the nature of the talk differed across countries, and these differences were believed to be reflected in the students' ranking of response preferences. Students in most countries rated highly such questions as "What happened in this story?" and "Has anything in this story a hidden meaning?" However, they differed in their rating of the remaining questions. Students in Belgium and Italy emphasized the formal and impersonal; students in Chile, England, and Iran the personal and content-oriented responses. Again, others stressed historical or moral interpretations. Interestingly, there was a substantial correlation between teachers' ranking of the response questions and those of their students. The researchers concluded that teachers do "succeed in imparting to their students a preferred way of approaching literary works" (Purves, 1973). One cannot, of course, rule out the general influence of community or parental expectations.

Reading interests were found to differ more between genders and age groups than they did across countries. In all countries, books of humor tended to be most popular at age 14, followed by adventure, sports, romance, and mystery, while poetry, art, science, and politics attracted very few. The older age group added current events, history, and biography to the popular category—again consistently across countries. The youth culture for teenagers is virtually universal—apparently more biological than cultural.

There were some clear-cut gender differences, of course—boys opting for sports and mystery, and girls for romance and sometimes poetry—but these too were remarkably consistent across cultures.

As in the case of reading, the chief conclusions drawn were that the enterprise of assessing groups of students in many diverse countries on a common test is possible, but only in a limited set of literary outcomes: comprehension and interpretation of literary texts, and stated responses to such texts. As before, the major sources of variance were found at home and in the community rather than in the school, "...the differences between high-achieving and low-achieving schools are explained by the culture that they serve." (Purves, 1973, p. 312). However, as in the reading study, a great deal of variance was unexplained.

In another analysis, the degree of gain which occurred in student mean scores from Population II to IV shows that 17-year-old students achieve at much higher levels than 14-year-olds on the same literary exercises. Girls also achieved at higher levels than boys in literature (Walker, 1976). The patterns in student response to literature were interesting, as they appeared to reflect differences in instruction but were also sufficiently consistent across countries to show differences according to the text read. "Response to literature is a learned behavior" (Purves, 1973, p. 315). It is modified by what the student reads and is affected by the students' culture and school. Curriculum developers and teachers have to make choices, and their choices appear to make a real difference in students' literary responses, if not in their abilities.

TABLE 57-2. Mean Scores in Literature for 10 Education Systems (from Purves, 1973)

Country	INTERPRETATION		COMPREHENSION	
	Pop II (14 Yrs)	Pop IV (17-18 Yrs)	Pop II (14 Yrs)	Pop IV (17-18 Yrs)
New Zealand	10.0	14.9	8.7	11.9
Finland	9.0	13.3	8.2	10.5
USA	8.8	12.1	7.7	9.8
Belgium (Fr)	8.3	11.6	7.6	9.8
England	8.3	14.7	7.8	11.7
Sweden	8.3	12.7	7.6	10.7
Italy	7.8	10.7	8.6	10.3
Belgium (Fl)	6.8	10.9	7.1	9.3
Chile	4.1	8.8	5.3	9.4
Iran	2.1	3.1	3.9	5.0

The IEA Written Composition Survey

While the challenge of assessing reading and literature across languages and cultures was found to be daunting, the cooperative methods used to develop and screen the tests produced results which appeared to largely meet the challenge. The test questions tended to operate in similar fashion in all countries. However, the challenge presented by a cross-national study of writing was even greater. Writing educators recognize that most acts of writing are culturally determined, and that even when teachers claim to be stressing clarity and organization, for instance, their interpretation of these actions may well vary across countries (Purves, 1993, p. 17).

Nevertheless, IEA set out to explore such complexities in a survey of performance in written composition in 14 countries (Gorman, Purves, & Degenhart 1988; Purves, 1992). Three populations A, B and C participated at ages 12–13, 15–16, and 17–18 respectively, but the main focus of attention was given to Population B (15–16 years).

After useful cross-national discussions of an appropriate model of school writing the researchers settled on a diverse range of writing tasks to use in their surveys. Students in each country were selected by stratified random probability procedures, and those selected wrote on three tasks rotated from a set of nine. Each wrote a functional task, a descriptive-expository letter and one of either an argument, a narrative or a reflective essay. The finished products were graded on a 5-point scale by internationally trained marking panels, but major differences in teachers' values emerged during this task, differences which effectively prevented any meaningful cross-national comparisons of relative achievement levels. Some marking juries emphasised product in their judgment of quality, while others focused more on aspects of form, with the result that discrepancies in means and variance amongst markers were unusually large, and correlations amongst grades across individual tasks were too low to justify combining of tasks into reliable total scores (Lehmann, 1992). This was a disappointment to the researchers, but a finding which may not have surprised those who stress the role of culture in students' composing processes.

Nevertheless, Purves (1992) reports a number of findings of interest which can only be interpreted within a cross-cultural context. Although the tasks did vary in difficulty, the order of difficulty was not the same across countries. Narrative tasks tend to be easier at age 15, but the functional task was better done in New Zealand and the Netherlands, and the expository task in Hungary. Reflective compositions were not well done in most countries, especially New Zealand, but Hungarian students had most difficulty with argument, Dutch students with narrative, and Finnish and German students with exposition. Such variations mirrored well the curricular emphases placed on such tasks in the school. Student performance in writing is related to instruction and "the ease or difficulty appears to depend on practice or exposure" (p. 152).

Another clear cut finding is that girls achieve at higher levels than boys at all ages and in all writing tasks (in 113 out of 114 comparisons), especially in Finland, Sweden, and New Zealand, but much less so in the United States, Germany and

several developing countries. At the younger ages the girls' superiority showed up more in narrative, at the older ages in expository and reflective writing.

As predicted, there was clear evidence of growth in writing performance with age, and the influence of the home was consistently evident in the various multiple-regressional analyses that were undertaken. However, little more emerged from the international study of predictor variables in home, school, and community, as the reliability of the measures used did not favor such analysis (Lehmann, 1992).

More interesting was an analysis of the content of one of the writing tasks in nine countries—that which asked students to write a letter of advice to a younger pupil who was soon to enrol at the school. How could such students improve their marks in writing when they attended this school? (Taukala & Degenhart, 1992, p. 126).

In all countries (at Population B level) students' priority advice referred to matters of presentation, especially to handwriting, format, spelling and punctuation. Either these are the features that their teachers are most likely to mark, or those that most readily come to mind—perhaps because of parental expressed expectations, as well as those of their teachers. Such a finding is inconsistent with the priorities of many teachers, especially those who value process writing. The researchers did note, however, that these presentation factors tended to be stressed more by less able writers.

Presentation factors accounted for 37% of the variance in student advice, and was especially strong in Chile, the Netherlands, England, and Germany. Next in order of importance was advice relating to content, especially about relevance, amount, and fact (Finland and Germany), or interest, imagination, originality (New Zealand). Process factors—planning, revision, topic choice—figured prominently in Chile, Sweden, and New Zealand, and organizational factors in Thailand, Finland, the Netherlands, and England. Style and general classroom tactics received little attention in any country.

Across countries, there were clearly strong common threads running through the students' perceptions of good writing, but there were enough differences in emphasis to give educators in each country pause for thought.

IEA Study of Reading-Literacy in 32 Countries

The most recent cross-national study of literacy undertaken by IEA was the Reading-Literacy survey of 32 countries (Elley, 1992, 1994) which took place in 1990–91. Building on the lessons learned from earlier surveys, the International Steering Committee for the project consulted widely, invited many national centers to participate, and worked cooperatively to ensure that all countries contributed to the study's design and to the measuring instruments.

The essential differences in design between the Thorndike survey of reading comprehension in 1970–71, and that of 1990–91 were:

1. The younger age levels were changed from 10 years to 9 years to improve the chances of identifying key factors in the reading acquisition phases.

2. A wider range of test materials was trialled and used, including narrative, expository, and documents (charts, maps, and graphs). Some were brief, others were over 1,000 words.
3. A greater variety of test items was used, including multiple-choice, completion and some sentence answers.
4. Students were tested in intact classes, with a view to clarifying teacher effects on student achievement.
5. Greater efforts were made to assess the volume and character of students' voluntary reading activities.
6. A systematic attempt was made to relate a country's test scores to community expectations, and to the level of economic and social development of each country.
7. Technical advances included the use of Rasch analyses for item selection and scaling, and Lisrel path analyses and other multivariate analyses of the completed data.

Other improvements were proposed, such as the use of pre- and posttests, the testing at adjacent class levels, and the use of more performance type tests, but logistical and financial constraints made them impracticable in many countries. Some countries made use of "national options" to augment the international core of literacy tasks and questions set.

After consensus had been reached by national representatives on the overall design and variables to include in the study, 20 countries contributed test materials for screening. These were sifted and revised by the Steering Committee, and duly studied and rated for suitability by national committees in each country. The surviving materials were pilot tested in over 30 school systems, on judgment samples of 9- and 14-year-olds. After scoring, coding, and analysis by Rasch procedures, the final items were selected and approved in joint consultation sessions. Only those items which were acceptable in all countries, were of appropriate difficulty level, and conformed to the Rasch criteria of "good fit" in and across all countries, were selected. Many items were dropped because they could not be translated fairly, or were culturally unsuitable in one or more countries. Participating countries also contributed to the formulating of hypotheses to test, and worked collaboratively on the tasks of developing the questionnaires for principals, teachers, and students and on the measures of voluntary reading activities. (For further details, see Elley, 1993.)

Representative samples of students for the final testing (in the eighth month of the school year) were selected in a two-stage or three-stage randomly stratified sampling strategy, supervised by an independent sampling judge, and strict rules were laid down for ensuring that the samples were as comparable as possible. Nevertheless, a few countries tested samples of students who turned out to be somewhat older or younger than those of other countries, largely because of differences in retention and promotion policies. These discrepancies were identified, and their effects estimated for fairer interpretation of differences among national means. For instance, the results for the Netherlands and Canada (BC) were underestimated for Population A (9 years); and those of Canada (BC), Italy, Hungary, Spain, and Belgium (Fr) for Population B (14 years). For future studies it was felt important that adjacent age groups be assessed to make

better provision for such discrepancies.

Guidelines for translation of test materials built on those of earlier IEA studies, requiring parallel translation by two experts, and some back translation. The Rasch analyses and correlational studies were also undertaken to identify any distortions, and to check on the effects of any translation problems. As in the earlier studies of reading, these proved to be manageable, and the differences in rank order of difficulty between items were very similar for countries which tested in English and those which translated the measuring instruments. Correlations clustering around 0.93 were found. This was an encouraging sign, indicating that, once again, the items behaved in similar fashion across countries and languages. However, many items measuring vocabulary, beginning reading skills, and comprehension had already been dropped in the development phases.

More problematic was the case of several countries whose 9-year-olds had difficulty in handling the formal timed test situation (e.g., Denmark, the Netherlands, and Germany) and whose scores are probably underestimated at the younger age. There also was some concern that the response rates for schools were below 85% of the planned samples in the United States, Zimbabwe, Nigeria, and Thailand—which may have somewhat inflated their scores.

MAIN FINDINGS OF THE IEA READING-LITERACY SURVEY

In the light of such cautions, what can be concluded from the 1990–91 IEA Survey of Reading-Literacy? First, as Table 57–3 shows, the mean achievement scores highlighted the superiority of Finnish students in all aspects of reading, clearly ahead of the other high achievers, Sweden, France, and New Zealand—at both age levels. Students in the United States and Italy showed high levels of achievement at the 9-year level, but their 14-year-olds did not match these levels. The consistently high achievement shown by Finnish students, across all domains, again raised the question of the importance of their transparent orthography (Kyostio, 1980; Linnakyla, 1993). The Finnish language is, more than any other language, phonetically very regular. However, the benefits of any such regularity were not obvious in the case of other countries, as the correlation between the rated phonetic regularity of the language and a country's achievement levels was near zero. This issue was raised again, and also dismissed, by Lee, Stigler and Stevenson (1982) (see below). Other explanatory factors, such as the strength of Finland's literacy traditions, its linguistic homogeneity, its well endowed school system, and the high status of teachers were probably all supporting factors (Elley, 1992; Linnakyla, 1993).

Another clear-cut finding which emerged from the comparison of mean scores was the size of the gulf between developed and developing countries. Without exception, countries with low economic indicators have large literacy problems, and no country had students who achieved at high levels which did not also fund its school system generously. Quality education does not come cheaply anywhere.

TABLE 57-3. Mean Scores in Total Reading Literacy Achievement for 32 Education Systems (from Elley, 1994)

Country	Pop A (9 Yrs)	Pop B (14 Yrs)
Belgium (Fr)	507	481

^a Underestimated due to differences in age of sample.

Third, the gender differences favoring girls at age 9, although not unexpected, were impressive in their consistency. Girls excelled in virtually every country in narrative and expository reading, and in most cases in document reading. However, by age 14 the gender gap had narrowed substantially in most countries, except in narrative reading (Wagemaker, 1996). The explanations for consistent female superiority at the younger age are not yet final, but probably reflect the influence of predominantly female teaching forces, and the slower rate at which young boys are attracted to book-related activities. Boys report reading fewer books at this age in most countries (Guthrie & Greaney, 1991). Interestingly, countries which started reading instruction earlier tended to have longer and persisting gender gaps. An early start for later maturing boys may well be counterproductive (Elley, 1992).

Other consistent findings across countries were seen in the reading difficulties experienced by students whose mother tongue was different from that of the school, except for the interesting case of Singapore. Here, the fact that three-quarters of their students learned to read first in English, which was not the language of the home, did not prevent them from achieving at high levels, at both age levels.

As expected, urban children generally outshone rural pupils in reading, although the differences were negligible in Scandinavia, New Zealand, and several wealthy OECD countries. One unexpected finding was the discovery that age of beginning instruction does not show a clear relationship with reading performance, even at age 9. Indeed, four of the highest achieving 10 countries in Population A (age 9) delayed formal instruction until age 7, and only one began at age 5. This counterintuitive phenomenon deserves closer scrutiny.

Another surprise emerged from the effects of TV viewing. Predictably, at age 9, heavy TV viewers scored lower in most countries, but in Scandinavian countries as well as Portugal and Italy, the best readers were found to be heavy viewers, at 3 to 4 hours each day (Elley 1992, p. 72). Closer examination revealed an interesting lesson for reading researchers. Children in these countries observe many imported TV films with subtitles in their own language. The regular experience these children had of reading captions at high speed, with genuine motivation and plentiful cues, is apparently an important ingredient in promoting fluent reading skill. No other interpretation is readily available, and there is both anecdotal and experimental evidence to support it (Neuman & Koskinen, 1992).

As in earlier surveys, the pervasive influence of the home was demonstrated in national and international analyses, whether indicated by parents' education, reading materials at home, or material possessions. Access to books was a salient factor in the international analyses—whether at home, school or community. While causal interpretations are always uncertain, the data are certainly consistent with the conclusion that an abundance of classroom book corners, school libraries, and community libraries are key ingredients in making for a healthy national literacy level.

As for instructional factors, the findings were not as clear as the researchers had hoped. Once again, the limitations of questionnaire data in surveys describing teaching processes were all too apparent (Lundberg & Linnakyla, 1992; Postlethwaite & Ross, 1992). Nevertheless, a few outcomes deserve special mention. In most countries, students of female teachers showed higher achievement levels than those of male teachers; better educated teachers also tended to produce students with higher scores. Viewed internationally, countries with smaller classes produced better results, but this variable is not easily entangled from other positive factors associated with greater wealth. Countries which allocated more time to silent reading in class, more reading aloud by the teacher, and more assigned homework tended to produce better results, other things being equal (Elley, 1992). However, there was no support for the view that countries with longer school years, or more formal testing of students will achieve at higher levels.

A question to pupils about "the best way to become a good reader" in each country produced some interesting contrasts, especially amongst those students who actually qualified as good readers (the highest 20%). While most such pupils supported the view that it is important to like reading, and to have ample time to read, good readers in the higher scoring nations more often stressed such factors as having many good books around, having a lively imagination, and developing an

extensive vocabulary. By contrast, good readers in low-scoring nations more often stressed the value of learning to sound out the words and having lots of drill at the hard things. The causal links in these contrasting perceptions of good students clearly deserve more study.

Within countries, many other findings emerged which were valued by policy makers. For many nations, it was the first time a national assessment had been undertaken, and it was thus a valuable indication of their relative status and a useful experience for their researchers.

Finnish educators were encouraged by the clear-cut indications of the success of their reading programs, and the evidence that their standards had clearly improved since the first IEA reading study, on those tasks common to the tests used both in 1971 and in 1991 (Linnakyla, 1993). By contrast, Venezuelan and Belgian authorities, amongst others, planned wholesale investigations and revisions of their reading programs, as their achievement levels were less impressive. The Danish Ministry of Education allocated an extra U.S. \$1.8 million to improve the teaching of reading following their disappointing results. Policy makers in Singapore have gained in confidence about the effectiveness of their recent liberal reforms in reading instruction. Hungarian educators have also received some comfort about their improved achievement levels between the two IEA surveys. New Zealand educators gained some support for particular practices (building up classroom libraries, devoting more time to silent reading, teacher reading aloud, gaining parental support), and a reassurance about the performance levels of Maori students, relative to other indigenous peoples in other countries. However, the findings about the relatively low performance of many 9-year-old boys and Pacific Islanders, and the comparatively high TV viewing hours, for instance, have caused concern and policy investigations. Further follow-up studies of high-achieving schools, relative to socioeconomic background, promise to produce richer interpretations—and more issues to investigate.

Internationally, the IEA results have been incorporated in the OECD international data base, and reported as a key indicator of educational performance (OECD, 1993).

HAROLD STEVENSON'S CROSS-NATIONAL STUDIES OF ACHIEVEMENT

Traditionally the IEA surveys have focused on the achievement levels of nationally representative samples of students, in a wide range of education systems. By contrast, Harold Stevenson and James Stigler, psychologists at the University of Michigan have undertaken, with their colleagues, a series of cross-cultural studies of American and Asian students in selected cities, assumed to be representative of each country. With smaller samples, and fewer countries, Stevenson has been able to study the students' learning contexts in greater depth, using interviews and observational techniques, in addition to teacher questionnaires.

In their first study, Stevenson, Stigler, Lucker, and Lee (1982) investigated the relative frequency of reading disability in grade 1 and grade 5 pupils in Minneapolis (USA),

Taipei (Taiwan) and Sendai (Japan). The researchers began by making an intensive analysis of the reading curricula of each country, and devised tests which were believed to be equivalent in language demands and conceptual load in English, Chinese and Japanese. The tests covered the letters of the alphabet, vocabulary, reading aloud and reading comprehension of phrases, sentences and paragraphs—assessed by multiple-choice and true–false items.

The investigators deliberately avoided direct translation, choosing instead to select items which were deemed to be functionally equivalent in each country. A passage about the Statue of Liberty for American children was equated with a similar passage about the Great Wall for Chinese pupils. This approach enabled the researchers to use items which depended for their difficulty on single letters, words or phrases, as well as on longer texts.

Children from two classes in each of 10 judiciously selected schools in each city were tested, individually, on each of the reading tests. In addition, a number of other cognitive tasks (memory, spatial ability, coding) and tests of general knowledge and mathematics were given. The tests were designed and administered at progressively more advanced grade levels, so that students stopped when they reached their upper limit. Four years later, the grade 1 sample was retested on the same tests.

The predicted differences in rates of reading disability among the three countries did not occur. Indeed, the incidence figures for severe disability (2 grades below classmates) were very similar across all three national groups. For grade 5 children they were 3%, 2% and 8% for American, Taipei and Japanese children respectively. When judged by the criterion of one standard deviation below estimated IQ, the figures were 6.3%, 7.5% and 5.4% respectively. There was no support here for the widespread belief that the orthographic systems of Chinese and Japanese prevented the development of reading disabilities. The differences which did occur in the patterns of reading scores were better explained by differences in learning contexts than in orthography.

Nevertheless, when judged by the number of grade 5 students who failed to reach a standard one grade below their own in reading, the Taiwanese students achieved best (only 12% below), followed by Japanese (21%) and American (31%). Paradoxically, the American students also had more students scoring *above* grade level (40% vs. 33% and 29% respectively). The greater variability in U.S. classes was attributed in part to such classroom effects as grouping and teacher beliefs in native ability, as well as one orthographic advantage, that which enabled high-achieving American children to sound out unfamiliar words. The researchers found clear-cut differences favoring the Taipei children at both grade levels, yet there were no such differences in the cognitive tests. Closer analysis showed that the achievement differences could best be explained in terms of both the quantity and the quality of time spent on reading. For instance, Taiwanese grade 1 students were in school for 240 days; American students for only 178 days. Moreover, Taiwanese students spent an average of 77 minutes each weekday on their homework, while American students

devoted only 14 minutes. At grade 5 level, the mean times spent on homework were 13 hours per week in Taipei, compared with 6 hours in Sendai and 4 hours in Minneapolis.

Observational studies of the students at work furthermore showed that while American children spent much more time "off-task," wandering about, talking, asking irrelevant questions and the like, Chinese students tended to stay on task, most of the time. Other factors which were ruled out as explanatory factors were the educational level of the children's parents and their teachers (which favored Americans), or the relative amounts of time devoted to reading and language in the daily timetable. As for the orthographic factors, the researchers concluded that learning to read in Chinese requires more cognitive demands than English—some 3,000 individual characters and many thousands of words that are formed by combining them (Stevenson, & Stigler, 1992). Japanese also requires the mastering of four different scripts. By contrast English is relatively straightforward.

Despite the overall superiority of the Chinese reading scores (see Table 57-4), American parents expressed much higher levels of satisfaction with their children's schooling than Chinese parents. Adult expectations of student achievement appears to be much higher in Asia. Lapointe, Mead and Phillips (1989) found similar trends in their surveys of mathematics and science.

Finally, interviews with parents revealed that American grade 5 children spent much more time at play per week (20 hours vs. 8 hours) and watching TV (14 hours vs. 11 hours) and fewer children regularly read the newspaper (24% vs. 56%). Education is clearly taken more seriously in Taiwanese homes.

CONCLUSIONS

At the outset, the question was posed whether the enterprise of conducting cross-national studies of literacy was profitable—or even possible.

On balance, this reviewer believes that the outcomes of these studies to date are themselves strong evidence that the enterprise is worth the cost and effort. Indeed, international organizations such as OECD and World Bank have made extensive use of IEA results, and national governments are quoting IEA findings increasingly, to inform local debates on academic standards. Many other findings, of greater or lesser certainty have emerged, findings which could not have been arrived at any other way, findings which could only be inter-

preted against the backdrop of an international study. Moreover there are benefits for the participants when undertaking cross-national collaborative research studies, in mounting first-time surveys in many countries, and in gaining access to useful measuring instruments for local and cross-cultural studies. Traditions have been questioned and new policies considered as researchers talk through the many issues that arise in conducting a joint project. More policy makers are learning the valuable lesson that it is possible to gain empirical data to inform decisions which have previously been settled by tradition, or by the force of personalities. Findings about relative achievement levels, about age of entry, gender differences, influence of TV, or orthography, minority languages, access to books, and the value of distinctive methods have all been elaborated above.

As for the question of feasibility across all the literacy domains, the evidence to date is mixed. There is little doubt amongst those who participated in the recent IEA Reading-Literacy Survey, that one can assess reading competence across cultures. The iterative processes involved in meeting together to plan projects, and discuss criteria, in item writing, in collaborative reviewing, in rating for suitability, in trialling, analyzing, and checking for unsuitability, ensures that cultural biases are reduced to an absolute minimum. The fact that the resultant items behaved in such a similar way statistically across cultures and languages, regardless of topic, skill, and format in the final tests, confirms Thorndike's dictum (1973) that a typical reading item does measure comprehension. After all these precautionary measures are taken, a difficult item in one country turns out to be a difficult item in all countries, and the rank order of difficulty is virtually the same—in reading comprehension. Such an outcome is reassuring. It is possible, then, to assess reading across countries, well enough to draw useful conclusions.

The evidence in measuring achievement in literature, in the home language, is less secure, but some aspects of interpretation and response to specific literary texts did produce enough promise to warrant the effort. Educators in individual countries did learn something about their programs. For cross-cultural writing, however, the findings were not as comparable across countries, as the researchers had hoped. Consensus was persistently lacking in the qualities that make up a good piece of writing. While there were numerous perceived benefits on the part of the participants, the implications for policy or practice were less obvious than in the case of reading.

One of the virtues of cross-national studies often proclaimed by IEA supporters is that multivariate analyses can help identify factors which contribute to better instruction. While there have been numerous hints and hypotheses emerging from the IEA data bases, it must be conceded that this aspect of the cross-national surveys of literacy has been disappointing to date. As long as information about instruction is collected by questionnaires—with their acknowledged weaknesses of exaggeration, distortion, and social desirability effects, many crucial variables will go untapped. The more intensive data-gathering strategies employed by Stevenson, Stigler and colleagues, as outlined above, have clearly been more productive in teasing out critical variables.

TABLE 57-4. Mean Performance of Children on Reading and Mathematics Tests (adapted from Stevenson et al.; 1985, p.731)

		JAPAN	TAIWAN	USA
GRADE 1	Vocabulary	7.2	10.8	10.0
	Comprehension	22.8	25.7	21.3
	Mathematics	20.1	21.2	17.1
GRADE 5	Vocabulary	47.0	49.8	48.4
	Comprehension	82.5	84.6	82.7
	Mathematics	53.3	50.8	44.4

Few who have tried it think that cross-national studies are easy. Apart from the challenges posed by different languages, and different traditions in educational policies and testing procedures, there are frequently problems of funding, communication, variations in sampling, and limited control over test administration—not to mention frustrations caused by social desirability responses. However, when a determined

steering committee has the support of talented organizers and computer processors, widespread cooperation and plausible outcomes can be generated. Not all objectives may have been achieved, but enough has been learned to inform future studies, and to help build up a more comprehensive knowledge base in literacy education.

LITERATURE CURRICULUM: ISSUES OF DEFINITION AND CONTROL

Richard L. Allington and Sherry Guice

STATE UNIVERSITY OF NEW YORK AT ALBANY

The National Research Center for Literature Teaching and Learning opened its doors in 1987 (as the Center for Literature Teaching and Learning), funded primarily “to stimulate reform in the teaching of literature” (Langer, 1992). The original mission focused largely on literature curriculum and instruction in American high schools. With reauthorization, as the National Research Center for Literature Teaching and Learning (NRCLTL) in 1990, the scope of inquiry was broadened to include the literature curriculum pre-Kindergarten through grade 12. This broader scope was needed because literature was earning an increasingly important role in the elementary school curriculum as schools engaged in a fairly rapid curricular shift—away from a mastery-focused, skills-based, and hierarchical curriculum plan for reading and language arts lessons and toward a more literature-based, integrated, and process-oriented curriculum (Pearson, 1993).

The NRCLTL has supported a variety of studies of the elementary, middle, and secondary literature curriculum (although the elementary literature curriculum is usually firmly imbedded in the reading and language arts curriculum). In this report, we discuss one theme that has routinely emerged across a significant number of the NRCLTL investigations: How is a literature curriculum defined? We also explore a second theme that has emerged, primarily, from our own NRCLTL research: Who controls the curriculum? While the discussion of these two themes does not adequately represent either the scope or the nature of the work completed at the NRCLTL, we believe these themes represent important and recurring questions that have been too little discussed in the literacy teaching and research communities.

HOW IS A LITERATURE CURRICULUM DEFINED?

As a first step in studying curriculum, we must decide which sort of curriculum will become the focus. Following a tradition in curriculum studies we can talk of the planned (or formal) curriculum, the delivered (or enacted) curriculum, and the experienced (or received) curriculum. At the NRCLTL studies have been carried out that locate the primary research questions in each of the three curricula (and most studies do focus primarily on a single curriculum type). Thus we will briefly review major findings of relevant studies following the three-type scheme.

The Planned Curriculum

Applebee reported on the texts most frequently named for use in high school English courses. The analysis suggested “a curriculum dominated by familiar selections drawn primarily from a white, male, Anglo-Saxon tradition” (Applebee, 1992, p. 7). Most schools relied on literature anthologies as well as lists of individual books as instructional materials. Applebee (1993b) also studied a collection (n=42) of high school literature anthologies. He reported that anthologies seemed to be narrowing their collections with the number of unique works declining substantially over the past 30 years. At the same time, the representation of alternative literary traditions has improved with the inclusion of works by women and ethnic minority authors. In fact, for many students, it seemed that the anthologies used might offer the best hope for

exposure to nontraditional literatures since the book-length literary works most commonly assigned in American high schools were authored, overwhelmingly, by males of an Anglo-Saxon heritage (48 of the 50 most frequently used texts).

More recently, Applebee (1993a, 1996) has noted that there seem to be only few basic schemes for structuring a curriculum. The simplest, and surprisingly common, device is a *catalog* of items within a domain but without any cumulative structure. He notes that a catalog approach to spelling or vocabulary might entail simply listing words by orthographic pattern or simple frequency of use. Likewise, a K-12 literature curriculum that simply listed age-appropriate core books to be read would also fit the catalog classification. A key facet of catalog structure is the lack of any strong conceptual links among the various elements.

A second structuring device is the *collection*. In this case, the elements form a "set" identified from some center or focus. Applebee identifies the Great Books plan as a collection curriculum as well as other curriculum formed around reasonably well-defined topics (e.g., modes of discourse). A third device is a *sequential* plan; perhaps organizing literature by date of publication or a social studies curriculum that follows historical eras. A fourth device, the *episodic* structure, relates elements to each other and to a central focus or idea. Chronologically organized sets of texts, for instance, might have as a focus literature as representative of the historical era. The final device, *integrated* curricular structure, might be illustrated by a curriculum that had students read "a cross-cultural collection of stories illuminating culturally different assumptions about the relationships among old age, wisdom, and respect" (Applebee, 1993a, p. 17).

While Applebee originally presented these organizing structures in a reconsideration of curriculum as conversational domains, he also reports on a study of how such devices mediate the conversations that occur in the classroom (Applebee, Burroughs, & Stevens, 1994). In that study of high school English instruction, it was noted that the most common organizing devices were catalog and sequential curriculum plans with few collection, episodic, or integrated curriculum plans evident. The curriculum plans varied from a simple listing of a collection of novels deemed age-appropriate for different grade levels to carefully integrated English and World Cultures courses where the literature read focused on developing an understanding of a variety of specific cultural groups.

Thus, the studies of the planned literature curriculum in American high schools provide us with reasonably good evidence that few school systems have developed complex curriculum schemes and few have developed curriculum that fosters much linkage between the literature studied in the various courses or between literature and other curriculum areas. Literature anthologies still form the backbone of the literature curriculum at many high schools and the instructional plans that accompany these materials offer little integration or linkage among selections included, much less other texts teachers might use alongside the anthology or in other English courses.

Several NRCLTL studies have reported on the planned literature curriculum in elementary schools, although here literature is usually firmly embedded in the reading and language arts curriculum. Allington, Guice, Michelson, Baker and Li (1996) report that few elementary teachers articulated a clear role for literature beyond developing an enjoyment of reading or teaching and practicing reading skills. In addition, literature was only rarely and loosely linked to writing activities and rarely integrated with other subject areas.

The planned curriculum of several school districts was characterized (Allington, 1994a) as falling generally into one of four broad classification schemes focusing on the curriculum materials selected and the roles the materials played. The *basal* curriculum plan was organized around commercial anthologies that provided an array of literary selections along with more traditional reading and writing skills lessons. In this scheme, full-length literature was rarely declared part of the curriculum although such works might be read aloud to students by the teacher or be read independently by children (e.g., requiring book reports). The *basal and books* scheme placed literature anthologies at the center of the curriculum with full-length books at the periphery, but still included. This curriculum plan might offer a list of core books for each grade level or simply designate books to a separate independent, but daily, reading experience. The *books and basal* plan placed full-length children's literature at the center of the curriculum with literature anthologies available but not a requisite. In some books and basal plans a core reading list had been developed for each grade, in others particular themes had been identified for different grade levels, and in others individual teachers simply selected books for classroom collections that students might draw from. In this plan the anthologies were most often to be used to provide greater variety of literature as well as a selection of skills lessons that teachers might draw from. In the *books* scheme, full-length children's literature was the curriculum focus. Again, as with the books and basal scheme, there was a variety of patterns for organizing the selected children's literature. In some schools, students seemed to have much greater choice in the selection of the books to be read, while in others the choice of books was either determined by a district-wide committee of teachers or by individual teachers themselves. In the six districts studied, there were variations from teacher to teacher on how the same curriculum framework was interpreted and enacted. The curriculum plans of only a few teachers in any district were classified as books plans.

Strickland, Walmsley, Bronk, and Weiss (1994) reported on a much larger and geographically diverse sample of elementary school teachers but with similar results. In this case the curriculum schemes were broken down into finer, but comparable, segments. Only 2% of the teachers reported using a basal anthology solely, while 39% reported using an anthology supplemented by trade books, 24% reported a balanced use of an anthology and trade books, 18% reported using trade books supplemented by basal anthologies, and 18% reported using trade books exclusively. These two studies suggest that the elementary literature curriculum is largely undefined although it seems as though catalog and

collection schemes dominate in those schools that have attempted to define a literature curriculum.

While Applebee's classifications of curriculum structures provide one way of thinking about the literature curriculum, we might also use the three-part classification scheme adapted by Farrell (1991) to attempt to categorize the curriculum located in schools. The descriptors—mastery models, heritage models, and process models—offer a sort of shorthand for describing broad emphases that differentiate one curriculum from another. He suggests that *mastery* models are typified by lists of component skills, thought to be ordered by complexity, to be mastered sequentially. Such lists are at the root of diagnostic-prescriptive teaching, the dominant model in reading and language arts instruction over the past 30 years (1965–95) and, to a lesser extent, a traditional model for English instruction at the secondary level. The *heritage* models reflect a cultural transmission emphasis and often, in the case of literacy education, include lists of important literary works that students will read. Proponents include E. D. Hirsch, Diane Ravitch, and Allan Bloom, just to name a few authors of recent works evangelizing heritage models of literature curriculum. The *process* models are characterized by a student-centeredness with an emphasis on the interests, curiosity, and motivations of learners and a rejection, largely, of reliance on adult-constructed curriculum frameworks. Process models fill academic journals and recent teacher training textbooks and are promoted especially by whole language theorists and advocates such as Ken Goodman, Yetta Goodman, Lucy Calkins, Nancie Atwell, and Jane Hansen.

No matter how we examine the reports, the preponderance of evidence suggests that both the high school and the elementary school literature curricula are typically organized around lists of skills to be mastered or books to be read—either mastery or heritage models of curriculum—usually organized around a catalog structure. While process approaches to curriculum and instruction have wide popularity in the professional journals and books, there is but a smattering of evidence that process approaches have yet substantially altered the planned curriculum in most American schools or classrooms.

Schools do seem to be struggling with redefining curriculum, especially the role of literature in the literacy curriculum (Walmsley, 1991). But the historical emphasis on skills-based scope and sequence charts and the prevailing influence of assessment programs based on those models have created a difficult transition period. Walmsley and Walp (1989) argued that elementary schools “seem to have made more progress in articulating specific teaching routines and book lists than they have in resolving such issues as the relationship between reading skills and literary strategies, between reading achievement and literary knowledge, and between reading experiences and literary experiences” (p. 37). Freeman (1994) contrasts the elementary literature curriculum with the elementary literature-based curriculum noting that few schools have a literature curriculum though many have implemented literature-based instruction. As Applebee (1993a) notes, “None of these [popular] approaches sits in comfortable relationships to a constructivist framework, primarily because each ultimately turns the curriculum into a body of knowl-

edge and skills that must be imparted. Such a vision trivializes the role of the learner as an active participant in a socially constructed world, and distorts the ways that skills develop in the process of mastering complex tasks” (p. 5).

One primary finding of the various NRCLTL studies is the difficulty schools have in articulating any coherent literature curriculum for K–12 much less a comprehensive curriculum that fosters thoughtful, integrated teaching and learning. But the difficulty is not simply one faced by schools since there is rather little evidence, as Applebee points out, that the profession has resolved this issue in any satisfactory way. In addition, as Farrell (1991) suggests, we know little about the effects of different curricula on learners and learning, especially the effects of a particular curriculum across a school career (K–12). However, given the scant evidence that school districts typically adopt a single literature curriculum framework, K–12, coupled with the impatience of those supporting a school reform agenda, it seems unlikely that such studies will ever be conducted. That is perhaps the sort of goal that now seems to be such a perfect choice for a large-scale, longitudinally-funded research effort. But it is also the sort of study that probably could not be carried out naturalistically, since schools with a coherent K–12 literature curriculum even now exist only in the visions of a very few folks.

The Delivered Curriculum

Perhaps predictably, the NRCLTL studies of instruction indicate that rather few of the classroom environments studied are well captured by the phrase “thoughtful literacy.” Whether reading Applebee et al. (1994), Allington et al. (1996), Walmsley and Walp (1989), Walmsley, Fielding, and Walp (1991), McGill-Franzen and Lanford (1994), Purves (1992), or Afflerbach and Johnston (1993), one comes away with a pervasive feeling that most students are told what to read and given a series of questions to answer, either orally or in writing, with few opportunities to discuss, explore, or expand meanings. While there are exceptions to this generalization in these reports, such classrooms still seem rare.

Langer (1992, 1995a, 1995b) and Miller (1993) perhaps best describe alternative pedagogies and the difficulty of developing those pedagogies within the existing curriculum frameworks and classroom contexts, although Stayter and Close (1991) provide a moving and detailed accounting of one teacher's journey in that direction. If nothing else, the various NRCLTL research reports suggest both how much remains to be done to foster classrooms where thoughtful literacy is the goal and how large that task will be in terms of time and effort.

Received Curriculum

Fewer NRCLTL reports present analyses of the received curriculum, although studies such as those reported by Langer (1991), Applebee et al. (1994), McGill-Franzen and Lanford (1994), and Walmsley et al. (1991) offer some evidence on student literary experience. But we know less than we could about how different literature curriculum schemes effect the

learners who might experience them. This is, in part, because we found a slim variety of literature curriculum emphases and structures in both elementary and secondary schools and found much common in the way students experienced the literature curriculum. Still, the NRCLTL reports noted above do offer us glimpses of what sort of classrooms might be created from the descriptions of those rare classrooms where the literature curriculum provided rich, thoughtful, and integrated experiences for children and adolescents.

WHO CONTROLS THE LITERATURE CURRICULUM?

Given the findings of the various NRCLTL studies concerning the nature of the literature curriculum, many will see a need for some sort of immediate action; some immediate reform. In fact, as noted earlier, a central mission of the NRCLTL was to stimulate reform in the teaching of literature. But the hard question is: How best can we stimulate what kind of reform? While there seems to be general agreement among the various researchers at the NRCLTL that a more thoughtful approach to literature teaching is needed, there would likely be substantially less agreement on what sort of reforms are most needed and on how best such reforms might be stimulated. In this section, we explore some issues related to initiating reforms in literature curriculum and instruction with a particular emphasis on issues of authority, power, and influence in educational policy making.

Recently, there has been much debate about the effects of the various reform initiatives that were implemented, often with much fanfare, during the past decade or so. Much opinion and some evidence has been amassed that suggests that the increasing centralization of educational decision making has failed to achieve the sorts of effects on classroom practice that optimistic policy makers had hoped for. In other words, increased mandates have not resulted in substantial improvements in American education. As a result, there has been much discussion about giving teachers more authority in curriculum decisions often under the broadly construed term "empowerment." This approach would undo much of the centralization of educational decision making and would, advocates argue, give teachers more authority, power, and influence in educational processes. However, there is yet little evidence that such moves would foster the development of more thoughtful curriculum, especially curriculum that presented a coherent plan for the use of literature across a school career, K-12.

Rowan (1990) contrasts these two current, but often conflicting, approaches to educational reform activities. *Control* strategies, he argues, attempt to shape reform through mandated practices. The mandates may come from federal, state, district, or building levels, usually issued by an education agency official or a school district or building administrator. Examples of mandates might include educational arenas as diverse as student attendance, assessment of achievement, salary structure, teacher professional development, as well as curriculum mandates and textbook mandates. While federal

education agencies are largely barred from the latter two areas, state-, district-, and building-level mandates concerning curriculum and textbooks have been widely practiced. Activities such as state textbook adoption, state curriculum mandates, district textbook mandates, district or school textbook coverage schedules and monitoring schemes, all seem examples of control strategies found fairly commonly in American elementary schools today.

Commitment strategies, according to Rowan, work to foster educational reform by enhancing the commitment and expertise of educators for improving practice. One aspect of commitment strategies has been to attempt to increase teacher participation in the educational decision-making process. Most proposals for "shared decision-making" or "site-based management", focus on decentralizing the decisions about curriculum, budget, and staffing. In addition, many advocates also emphasize enhancing teacher collegiality and reducing the professional isolation of teachers from their colleagues.

However, studies of implementations of "shared decision-making" and "site-based management" do not consistently report that participating teachers realize enhanced autonomy (Smylie, 1994). Instead, participation may lead to increased pressure for compliance to local norms and increased administrative monitoring of such compliance. Similarly, efforts to enhance teacher collaboration in planning instruction may actually work to restrict perceived autonomy as teachers feel more compelled to adopt group norms.

Within the literacy education community, there has been widespread criticism of the use of control strategies and a chorus of voices calling for increased use of commitment strategies. A particular focus has been on decentralizing curriculum decisions (e.g., Freeman, 1988; Shannon, 1991)—returning to teachers the authority to make many decisions, including those about the texts used in the classroom. But the issue seems not quite so straightforward given the power structure currently found in most K-12 educational settings.

Ruth (1991) distinguishes *power* from *influence* in educational policy making. Power involves having the legal authority to make demands and set constraints upon people. Influence, while related to power, involves a different sort of relationship between those participating in decision-making events. But both power and influence play important roles in constraining curriculum determinations.

Currently, teachers report that they have little influence on curriculum decisions, at least as far as text selection is concerned. In a recent large-scale federal study, only about one third of elementary school teachers reported that they thought they had a great deal of influence in the process of establishing curriculum for goals. Teachers in "central city" schools were the least likely to report influence on curriculum. Only about a quarter of central city elementary teachers felt curriculum was an area in which they exerted a great deal of influence. Teachers in rural and small town schools were most likely to report feeling influential (38.5%) but even here the majority of elementary teachers felt establishing curriculum goals was an area in which they exerted little influence. More teachers working in schools with few minority students reported that they had a "great deal of influence"

on curriculum matters compared to teachers working in elementary schools with more minority students (greater than 20% of enrollment). In addition, more teachers working in small elementary schools, regardless of community, reported the feeling that they had a great deal of influence compared to teachers in the largest schools. Thus, teachers working in large (enrolling over 750 students), central city schools with a significant minority enrollment (over 20%), were the teachers least likely to report exerting a great deal of influence on curriculum matters (National Center for Educational Statistics, 1993).

These findings suggest that curriculum decisions are largely made by someone other than teachers, usually someone distant from the classroom. The situation varies by size of the school district and by region, with some states exercising greater authority over curriculum decisions than others. Many of the NRCLTL studies have been conducted in New York state, where there is a state curriculum plan for English / Language Arts which must be reflected in district curriculum but no mandate to adopt the state plan. There is no state textbook adoption and no state textbook committee (save one for referrals of materials charged as containing "seditions" or "disloyal" content). The authority for the selection of textbooks lies with local school boards (Rockmuller, 1993), as do most curriculum decisions, save the distribution of courses required to earn a Regent's diploma (New York State School Boards Association, 1992). While some other states do feature state textbook selection committees and state mandated curriculum, it is still most often the case that considerable latitude is allowed to schools in both selection and implementation of curriculum, more so at the elementary school levels.

Generally the authority of state legislatures to establish curriculum standards has been upheld by the federal courts as have the implied powers of local school boards in these areas. In fact, local boards have considerable discretion in the curriculum decisions. "Probably in no area of school operation have the courts been more liberal in interpreting implied powers of local boards than in curriculum matters" (Reutter & Hamilton, 1976, p. 128). This includes the power to make textbook decisions.

This power would be revoked or restricted by many reformers. As Freeman (1988) argues, concerning the California English / Language Arts Framework, "The potential for change is enormous but only if teachers and students are empowered by the reforms ... when teachers are allowed to develop curricula based on their understanding of the research and on the needs of students, then the revolution called for in the Framework can become a reality" (pp. 241, 242). Comments such as these have become increasingly common in some of the educational reform literature, especially those addressing reform of literacy and literature instruction in American schools (K. S. Goodman, 1989; Y. Goodman, 1989; Jones, 1990; Shannon, 1991). However, the authority, or control, over curriculum is currently set, by law and regulation, outside classroom walls and the recent movement toward establishing national standards seems to suggest a shifting influence and power away from local and state education agency offices, even further removed from classrooms and teachers and their students.

In our own work at the NRCLTL we have found that an important influence on curriculum decisions is what we have dubbed "a press for standardization" of the curriculum (Allington et al., 1996). This press is exerted from a number of sources both within a school and from outside. Regardless of the source, however, a common feature of this pressure is the constraints teachers feel over control of the curriculum.

Within the School Press

The press for standardization from within can stem from the negotiations that accompany the selection of literature to be used in a classroom. For instance, it has been common in the schools we have studied for groups of teachers to work to define a curriculum around a set of core books to be read in a particular course (World Literature) or at a particular grade level (3rd-grade core books). During one focus group meeting a new 4th-grade teacher told us of having several books unknowingly displayed in her room that were included on the 5th-grade core books list. Another teacher noticed these books, and then proceeded to remove them from her display, noting that fourth graders were not allowed to read those books.

In another school we studied, the discussion of children's books in a Teachers as Readers group led to reconsideration of the use of a tradebook in some classrooms. The particular book in this case was Cynthia Rylant's (1989) autobiography, *But I'll be Back Again*. The discussion was initiated around commonalities in her autobiography and Rylant's (1992) novel *Missing May*. However, the conversation drifted toward the appropriateness of the autobiography for elementary school children since she included references to an emerging sexuality, menstruation, undergarments, and her first elementary school kiss. The strong feelings of inappropriateness of these topics held by some teachers were vigorously debated by others. In the end, however, those arguing for using the autobiography seemed to give in to the opponents as a general agreement about recommending its use in the middle school or high school emerged. Proponents of the book were uncomfortable with the end result, but seemed less comfortable using the book over the objections of colleagues.

Finally, we have reported on the experiences of one of our teacher collaborators who felt enormous pressure from colleagues (and union officials) to conform to tradition and resist the implementation of a literature-based curriculum (Michelson, 1994). Krissa (a pseudonym at her request) did ultimately end her resistance and incorporated more traditional aspects of reading and language curriculum into her lessons. As Barksdale-Ladd (1994) notes, such social influences are powerful in schools and teachers regularly reported succumbing to compliant agreement just to get along with other teachers. One of her participating teachers noted, "I want everybody to be happy."

In each of the four school districts we studied, there existed similar sorts of press for standardizing the literature curriculum. Even when no formal core book list had been developed, teachers talked to us about "fourth grade books,"

for instance, and noted that individual teachers protected certain titles they used in their classrooms and restricted the use of other titles deemed inappropriate by colleagues for other reasons.

Press From Outside the School

In another school district, a school board member wondered aloud what was so difficult about delineating which books children would be reading on which days at any grade level. In his view, an adequate curriculum plan would provide a detailed framework for literature selections including a common pacing schedule for completing those books. He evidenced little concern about the specific books to be included but argued for a standard plan across all schools.

In another report (Allington, 1994b) we discuss a communication from a state education agency that noted, "the nature of the educational support services program . . . requires that there be some consistency of implementation on a district-wide basis." The communication goes on to recommend that programs "be supervised and coordinated from the central office to ensure a consistent philosophy of instruction, congruence and articulation across the program, and uniform record keeping" (p.12). This occurred in a context of state education agency mandate for shared decision making in local education agencies!

We heard several rationales for standardization from administrators in the schools we studied. One argument concerned intradistrict student mobility, a common situation, especially in school districts that enroll many children from low-income families. The more standardized curriculum, it was argued, allows for an easier transition for students moving from School A to School B within the district. While no one seems to have gathered any sort of data to support this hypothesis, it was a most common rationale for a common curriculum district-wide.

A second argument we heard stemmed more from concerns about monitoring teacher performance. In this case, the more standard curriculum was viewed as ensuring a more equitable instructional environment for students. The common curriculum would work to provide all students with similar high-quality experiences. Without a common curriculum plan, administrators feared increased variation in the nature and quality of instruction offered across classrooms. Again, we know of little research to support this contention.

A third argument for standardization was related to the one just above, but it was argued more from a parent / citizen perspective. In this case, the standard curriculum was seen as one way of reducing parental / citizen concerns about variations in instructional quality across classrooms in the district. One administrator noted that standardization reduced the number of questions parents had about, "Why Johnny isn't reading *Charlotte's Web* in his third grade classroom, while their neighbor's child, Katie, is reading it in her third grade classroom." It was felt that when curriculum plans were more standardized across a district, both administrators and teachers were less open to criticism of differential

quality and had to less often explain variation in curriculum opportunities.

Albert Shanker (1994), head of the American Federation of Teachers, echoes many of these arguments as he argues for national curriculum content standards:

We generally agree, for example, that students in high school should study English . . . but we have not tried to come to any agreement about what those courses should include or what students who take them should know or be able to do. State curriculum guidelines are usually broad recommendations rather than specific curricula. In principle, this leaves decisions about exactly what our students will be taught to our 15,000 school districts. In practice, this decision is often left to individual teachers, who are encouraged to select on the basis of their own interests or the interests of their students. We are accustomed to this relaxed, take-your-pick attitude towards curriculum and standards, but we pay heavily for it. It means we have no way of making sure that all our students have the advantage of a first-rate curriculum. . . . Successful learning to some extent depends on continuity, and our ad hoc standards and curriculum mean that there can be enormous variations, even within a school. Teachers can never be sure of what students entering their class in September have already covered. (p. 7)

Shanker's arguments for national standards, like those of others, would reduce the influence of teachers and administrators, local and state boards of education, superintendents and chief state school officers, and set curriculum content standards nationally.

Though a long-held tradition, local control of curriculum seems almost surely to be on the decline. Chester Finn (1991), only one of the policy makers that initiated the national standards movement, argues that the "antiquated devotion to 'local control' of schools" must be rejected. "We must," he says, "recognize that local control today is indistinguishable from maintenance of the status quo. . ." (p. 234). He goes on to suggest that if local control (here meaning nonfederal control) were the solution, then our schools would already have adapted to the societal shifts that demand a more demanding curriculum. He notes that the almost 100,000 local school board members are simply not up to the task of reforming American education.

While one can view all of this rhetoric about national curriculum content standards with substantial skepticism (as we do), support for standardization of curriculum experiences seems to come from many quarters—administrators, parents, legislators, and the head of a major teacher union. While advocates for personalized, child-centered and teacher-developed curriculum abound in the education profession (and especially in colleges and universities), both inside and outside of the profession there is more talk about curriculum standards and standardization than talk of teacher empowerment and child-centered educational practice.

SUMMARY

Our intent in this chapter has not been to specify the nature of an ideal literature curriculum nor to suggest who should

control that curriculum. Rather, we have sought to raise what seem to us to be especially pertinent, current issues about the teaching of literature in American schools. While advocates often argue around issues of curriculum, too often the arguments seem, to us at least, to miss the critical marks. Hardly anyone that we are aware of argues that infusing the school curriculum with literature is a bad idea. So we can leave those arguments behind.

But how should a literature curriculum be defined and who should control the definition and delineation of the

curriculum? While many literacy educators would place children and teachers more directly in control of which literature is read in our schools, such plans seem to garner little support among school administrators, state education agency personnel, legislators, parents, citizens, and federal policy makers. As we near the turn of the century, it may be time for a broader-based discussion of just what roles literature can play in the education of children and youth (Langer, 1995b) and just how we will decide who determines those roles and which texts are used to fulfill them.

Writing matters—for what people learn, for how they grow and develop and for how they function in society. It also matters for society as a whole—for our position in the global marketplace and for the transmission and transformation of our culture. Writing is the active side of literacy, the side that allows us to contribute to change, to protect our rights, to take control of our lives. Clearly, what we know about writing development in our schools, our communities and our workplaces is essential to our individual and cultural well-being. Over the past 10 years the National Center for the Study of Writing and Literacy has focused its attention on how literacy,

and in particular, writing, functions in our society and how it is taught, used, and learned in schools, communities, and workplaces. Our goal has been to contribute to higher levels of writing achievement for an increasing proportion of our population.

It is important to state from the outset that within the area of literacy, writing is a young area of study and indeed has been the forgotten one of the three Rs. Writing research only began to develop in the 1970s, and there was no significant federal investment in writing research until the Center was first funded in 1985. Reading and literacy are often

Although this report is authored by the four Center co-directors, all the Center project directors have made substantial contributions. Summaries of projects are drawn from reports and other documents authored by the researchers themselves. Much gratitude also goes to all project assistants as well as to Andrew Bouman. The authors thank Julie Kalnin for providing a first draft of the section on the M-CLASS research.

The publication of this report was supported under the Educational Research and Development Center Program (Grant No. R117G10036 for the National Center for the Study of Writing) as administered by the Office of Educational Research and Improvement, U.S. Department of Education. The findings and opinions expressed in this report do not reflect the position or policies of the Office of Educational Research and Improvement or the U.S. Department of Education. In addition to the U.S. Dept. of Education, research was supported by the Bingham Trust, the British National Foundation for Research in Education (NFER), Carnegie Mellon University, The Howard Heinz Endowment, National Center for Research in Vocational Education, Oakland Unified School District, Rockefeller Foundation, Spencer Foundation, University of California, and University of London Institute of Education.

considered synonymous terms, with writing left out of the equation. Given the newness of writing as a field of research, much remains to be done; we know much less about learning to write than we know about learning to read or learning to do mathematics.

Having said that, given 10 years of sustained research, the Center has been able to reach large numbers of practicing teachers because from its start, the Center joined forces with the National Writing Project, an already well-established network which has trained 1,318,174 teachers of writing to date, with 163 sites representing every state in the nation and many foreign countries. Since both the Writing Project and the Center have been based at the University of California at Berkeley, collaboration has been natural, intense, and ongoing. Writing Project teachers now depend on the work of the Center as a significant part of their professional development. The Center's research agenda was shaped from the start by what teachers wanted to know, by the knowledge that they felt would help them do their jobs better. To be certain that Center research projects remained focused on teachers' needs, the projects have involved important collaborations with teachers. In addition, the Center has reached beyond the National Writing Project network, to administrators, policy makers, and others interested in literacy education in general and writing in particular—from the Chief State School Officers to the national PTA, from the American Society for Curriculum Development to the National Association of Elementary School Principals, from the Council of Great City Schools to teachers' organizations such as the National Education Association, the National Council of Teachers of English, the National Council of Teachers of Social Studies, the International Reading Association, and Teachers of English to Speakers of Other Languages. Above all, the Center has aimed to fund "practice-sensitive research" while at the same time to promote "research-sensitive practice."

Center research projects and activities have been tied together to address three interlocking sets of questions:

1. **ABOUT WRITING:** What writing demands are made upon students in key educational, family, community, and workplace settings?
 - What relationships exist between the writing practices of schools as compared to families, communities, and workplaces?
 - How do these writing practices both support and require higher-order thinking and learning across the curriculum and across the grades?
2. **ABOUT LEARNING:** How do students meet these demands?
 - What variation exists in students' ways of writing? How is this variation related to familial and community experiences? to language background?
 - How do students' ways of writing—their strategies—change over time? How do students adapt what they know and negotiate new literacy practices?
 - How does students' writing figure into the language life of these settings, that is, what is its interrelationship
3. **ABOUT INSTRUCTION:** How do teachers help students meet these demands? How can student progress be measured?
 - What challenges do teachers in varied settings face as they work amidst a diversity of literacy practices, of learners, and of technological tools? What is the nature of helpful teacher behavior in writing instruction across settings? What institutional structures are needed to support important instructional changes?
 - What instructional strategies promote both writing and learning across the curriculum and across the grades?
 - What purposes does writing assessment serve—at the level of the classroom, school, district, state, and nation? What is involved in creating assessments designed to fulfill varied purposes?
 - How does assessment influence instruction, both in terms of how and what students are taught and in terms of how the results affect the school site?
 - How does writing assessment relate to the assessment of reading and oral language development? (Dyson & Freedman 1991, pp. 2, 3)

Answers to these questions are designed to help teachers and public officials deal with the most pressing literacy issues we face as we strive to reach national goals and set high standards for the next generation and as we strive to advance the position of the United States in the global economy.

To address these questions Center research projects have been broadly conceived to cover many areas and represent varied constituents and points of view. Projects have first of all focused on a range of settings—the schools from kindergarten through twelfth grade, community colleges, universities, community centers, home and family settings, workplaces. Center projects have also focused on the learning of varied types of writing—from academic arguments to writing pamphlets for community distribution; from stories, poems, and plays to historical narratives to learn about history and logs to learn about science; from personal autobiographies and college admissions essays to instructions in a manufacturing plant. Projects have further examined how computer technology affects writing and also how writing growth is related to growth in reading and oral language. Center researchers have studied the work of prize-winning college students, students labeled "remedial" at the high school and college levels, young children just learning to put pencil to paper, and second language learners—from child immigrants to immigrant workers. Center researchers also have looked comparatively at how writing is learned in Britain, where there is a long history of writing in the schools. In addition, Center projects have focused on how to assess writing, determining how to get reliable scores for something as inherently subjective as judgments of writing quality, and at the same time projects have explored the movement toward portfolio assessment, from both practical and policy angles. To conduct our research, we have relied on the expertise not only of

teachers in the schools but also of an interdisciplinary team of scholars—from education, linguistics, English, history, anthropology, and psychology. We have designed many types of studies—large-scale projects that look nationally and internationally at how writing is taught and learned, longitudinal studies of individual development across time, and case studies to understand how writing functions in the workplace. Our methods have included ethnographies and other forms of descriptive research to develop theories, traditional experiments to test theories, and large-scale surveys to provide information about the status of the field.

Results from 10 years of research on writing, learning, and instruction have led us to conclude that written language, which is fundamentally active in nature (compared to the usually more reactive quality of reading), has the potential to have significant effects on performance in most areas of the curriculum, in many community-based endeavors, and in the high-performance workplace. Through conducting our research, we have located five areas in which writing and knowledge about writing are essential: (a) in communities of teacher researchers, where writing and reflection can help build a professional teaching force; (b) in multicultural and multiracial learning communities where writing can provide the base for motivating student achievement; (c) in the increasing range of settings populated by large numbers of nonnative speakers of English; (d) in the high-performance workplace, if employees are to become maximally productive; and (e) in the variety of settings where evaluating written language is essential. In the following sections, we provide examples of the impact of our work in these five critical areas.

TEACHER RESEARCH, TEACHER REFLECTION: BUILDING A BASE FOR THE ACHIEVEMENT OF LEARNERS

In the Center's projects that involve teacher research, we find a striking role for writing in the professional development of teachers, based on reflection and inquiry that grows out of various forms of teacher research. This includes Freedman and Simon's M-CLASS (Multicultural Collaborative for Literacy and Secondary Schools) project, Dyson's project with elementary teachers, Schecter's project with Writing Project teacher researchers, Flower's MTV (Making Thinking Visible) Project, and also efforts of the National Writing Project (NWP) through the Urban Sites Network and other teacher research activities. The national teacher-research agenda has mobilized a teacher movement, creating a new cadre of professional teachers who better understand their students and their students' learning needs and who are well positioned to serve as leaders in the educational reform movement. Writing offers these teachers the necessary tools for inquiry and reflection and makes this proactive form of teacher development and educational reform possible. Reform projects such as the Coalition of Essential Schools, as well as other major reform efforts that rely on

teacher leadership, report that the teacher leaders are usually those who have developed their skills of reflection and inquiry through writing; many have been involved in teacher professionalization programs that stress writing and teacher research.

The central purpose of the Center's M-CLASS teacher-research project was to explore what is involved in literacy learning and using literacy to learn in 8th-, 9th-, and 10th-grade, urban, multicultural classrooms (Freedman, 1994b; Freedman, 1996; Freedman, Simons, & Kalnin, in preparation). The 24 participating English and social studies teachers, six from each of four sites (Boston, Chicago, New Orleans, and San Francisco), worked for 2 years to think through and articulate the underlying tensions in their schools, classrooms, and communities; to explore their theories of teaching and learning; and to understand the opportunities before them. In the course of their work, the teacher researchers discovered the importance of writing in helping them reflect on and better understand their students. By writing about and reflecting on their students and their teaching, this multicultural group of teacher researchers delved into the issues that make life in their classrooms both challenging and interesting.

For example, in Boston, Roberta Logan, an experienced teacher researcher with the NWP Urban Sites Network and leader of the Boston M-CLASS site, encouraged her colleagues to write in order to reflect on their practice. Recognizing that the teachers were not used to writing about their work, she pushed them to write regularly early on in their process:

I guess the one thing I should say is, the piece of advice I can share is, try to begin to write. Just write about your classroom in some way or another even if it is not focused on your particular [research] question... Try and write about it with some amount of regularity, even if it's just a little bit just to get started, because I'm sure there are highlights or things that you want to begin to record now.

She continued by emphasizing the importance of journals and stream of consciousness writing to help ideas flow:

Once you get in the habit of writing, it will flow easier. Not everybody keeps a journal, but it's a good way to start. I'm a journal druggie. I've kept journals for a really long time just personally, but in reality, journals are really unfocused. They are real stream-of-consciousness writing.

Tom and Kathy Daniels, teacher researchers from the Chicago group, illustrate the benefits of advice like Roberta's as they explain how regular journal writing for their research projects led them to new understandings about their students:

For both of us, the act of writing a daily journal, focusing on our Introduction to H. S. English classes, was especially important. Each day we looked back at each student in the class, noted what he or she did, and looked back at interactions between students and teachers. Occasionally we re-read entries from the previous week or month. Both of us took more time for reflection than ever before. We began to see patterns.... Our students began to emerge as separate and distinct persons in a way that helped us better understand their outlook on life, their method of operating in school, their view of themselves, and how they thought others saw them. (Daniels, & Daniels, 1994, p. 10)

Tom then explains that his growing understanding led him to improve his teaching:

Based on that information, I began treating each one in a way I thought would help them. I always did that before, but now I had much better information.

Kathy adds:

I don't think I have ever been so aware of individual students as I was last year. I came to know them all, not just the "stars" or the problems. Through their writing, I shared all the ups and downs of that rather chaotic freshman year, and I became acutely aware of the need to provide a kind of safe haven.

Tom next tells how the act of writing helped him clarify his thinking, leading him to a new level of awareness about his role in the classroom:

I'm the kind of person who really doesn't become conscious of his thinking until he writes it down. This year I did much more writing about what I thought. As a result, I understood my strengths and weaknesses much better. I could observe myself when I was slipping back into the old ways of teaching or thinking. (p. 10)

Like Tom and Kathy, other M-CLASS teachers had similar experiences: writing consistently helped them reflect on and then improve their classroom practice.

Using another approach to teacher reflection, Dyson collaborated with skilled primary teachers in urban schools to examine the language resources for literacy learning that young children bring to school, particularly as members of various ethnic and cultural communities. (Dyson, in press). She worked with the teachers to examine the ways in which those resources influence the teaching and learning of written language in classrooms. The teachers in her project met with her to present case studies of children from their classroom, which included general introductions to each child and specific information about the children's participation in writing activities. The teachers reflected on such issues as (a) with whom children interacted during writing; (b) the themes, structures, and styles that figured in children's writing; (c) the responses that the children benefited from—or offered—others about texts; (d) any links between children's texts and their in-school relationships and their out-of-school lives. The teachers also talked about (e) their relationship with the child's family and, at times, with other teachers who worked with (or had worked with) the child. These reports led to ongoing analytic discussion of the students across classrooms and to joint writing with Dyson. In this way the teachers brought together their constructions of children's actions and their own responses to those actions. The descriptions reveal the teachers' understandings of literacy learning as articulated in their day-to-day experiences with children. This joint analysis of commonalities and differences in the teachers' constructions or narratives of everyday teaching led the teachers to formulate understandings of what difference sociocultural difference makes in the daily work of teaching.

Flower's MTV (Making Thinking Visible) classroom research project involved teachers and students in using collaborative planning, a technique in which a writer works with a planning partner to generate ideas for writing. Col-

laborative planning provides a window through which to view the processes of thinking and writing. In Flower's MTV, project, a team of 14 teacher researchers worked together for 4-years to implement collaborative planning strategies in their classrooms, to examine how students collaborated, and to write about what they observed. A full report of this project is contained in Flower, Wallace, Norris, and Burnett (1994).

The purposes of the MTV project were threefold: (a) to help students develop a repertoire of strategies for planning and writing; (b) to encourage students to reflect on their own problem-solving strategies and become more aware of themselves as thinkers; and (c) to discover ways in which classroom inquiry conducted by teachers and students can enhance teaching and help make the processes of thinking, planning, and writing more visible.

As the MTV teachers worked to understand their students' thinking processes and to help their students develop and become aware of their strategies for writing, they depended on their own writing and discussions of their writing to help them understand their students. They wrote a series of brief discovery memos that were shared with other members of the project. These memos recorded and commented on classroom observations, giving everyone an ongoing story of the students. Later, these memos were combined into extended papers that documented the kinds of thinking and reflection that were happening in many different contexts—for example, in developmental writing classes at a community college, in teacher education courses, in remedial and gifted high school programs, in community literacy projects, and in programs for technical and professional writers in the workplace.

Unlike the Center's other teacher-research projects, Schecter's study did not form a new teacher-research group but rather studied how a well-established group functioned. She focused on a teacher-led group sponsored by a National Writing Project site and was especially concerned with the kinds of support teachers need if they are to conduct classroom research; the effects of becoming researchers on teachers' views of classroom practice and their self-images as professionals; the kinds of knowledge that research by teachers can contribute to the field of composition study; and the forms used to present this knowledge in written texts.

In the course of doing research, the teachers routinely shared their writing with their colleagues. Schecter found that the amount and kinds of writing the teachers did depended on their purposes for engaging in teacher research: some were interested in using teacher research to empower other teachers, others hoped to stimulate social change, while others hoped mainly for personal professional development. For all of them, however, writing was a central part of the teacher research enterprise and was valued as a prime method of reflection. Marilyn, who hoped her teacher research would empower others, says, "Writing is essential ... It's not just thinking about teaching and thinking about some changes or even the process of research. Looking at your kids and the data through writing forces you to consider other hypotheses." Moreover, according to Marilyn, writing is also a sign that a teacher believes that what she is doing is important, that "this matters to me and I want it to be good" (Schecter & Parkhurst, 1993, p. 780). Kate, who cared most about social

change, hoped to use writing to reach people in positions of power who could affect life in schools. Paula, who was involved in the group for her own professional development, had the most ambivalent attitude toward writing, but even she used journal writing to help her reflect on her teaching.

Across all of the Center's teacher-research efforts, regardless of the goal of the project or the structure of the teacher research group, writing played a powerful role. Creating a cadre of highly reflective teachers is essential to improving instruction, and teacher writing drives the reflective process. As school reform efforts are demonstrating, we must depend on reflective teachers as essential contributors to any national effort aimed at improving student achievement. Further, if schools are to become professional workplaces, writing will have to become integral to teachers' work and to their identities as professionals.

INTERCULTURAL COLLABORATION THROUGH GROWTH IN WRITING

One of the biggest challenges facing the United States today is finding ways for varied cultural groups to come together in multicultural classrooms and communities. Research at the Center has not only shown several ways in which writing and instruction in writing can be organized to promote writing growth in the multicultural classroom but has also helped students and teachers move beyond multicultural awareness to new forms of intercultural collaboration. First, research at the Center is helping teachers understand and teach to the logic of learners, especially those at risk. Second, writing makes the tacit expectations of different discourses and literate practices in our society more explicit, as students are expected to move from acts of personal reflection, to problem analysis, to reasoned argument. In teaching strategies for writing, we are also teaching students the strategies for intercultural collaboration, for reading and communicating across differences. Finally, writing and writing instruction can unlock the door to personal and social empowerment for students by first letting people bring their voice to the table in a way that informs, reasons, moves, and persuades. Writing also supports the larger goals of social civility, bringing people into collaboration and community building, by giving them the tools to cross the boundaries of race, class, culture, or discourse and the power to be full participants in a range of settings in our literate world.

The Logic of Learners

Teachers become more effective when they understand the logic of learners: when they know why some students seem to be walking to a different drummer, appear to misunderstand instructions, or even choose to resist learning that conflicts with other values or habits of mind at home or in their community of peers. Motivating at-risk children to learn is one of the keys to success, and understanding students' assumptions and their approaches to school or their interpretation of

writing tasks lets teachers give students the help they really need.

Ogbu and Simons lay some valuable groundwork for understanding students' worlds through a 2-year study of the ways in which knowledge about minority communities can inform the teaching of writing. Data for the study are a subset of the data collected for John Ogbu's Community Forces and Minority Education Strategies Project. The Community Forces Project looks at the cultural models and educational strategies of what Ogbu has described as "voluntary" minority groups (Chinese American) and "involuntary" minority groups (African-American, Mexican American) to identify those models and strategies which contribute to success in school and those which are less useful.

The Ogbu and Simons study shows that the cultural models (assumptions and values) and the educational strategies that minority groups bring to school can help explain educational differences. In a survey of 2,285 African-American, Asian American, and Mexican American students, Ogbu saw that while the adult community strongly supported success in school and did not see it as a threat to ethnic identity, African-American and Mexican American students stigmatized their peers who got good grades for "acting white." Although all three communities see education as necessary to "making it" in life, the African-American community and its students see that road littered with barriers of prejudice and discrimination. Moreover, they believe that experience and common sense, as opposed to book learning, play a relatively larger role in making it than the other groups report.

However, when one looks at students' oppositional behavior in school, there seems to be a discrepancy between what African-American and to a lesser degree Mexican American students say and what they do. Ogbu and Simons reveal an opportunity for learning that writing instruction is ideally suited to exploit: in both the quantitative and ethnographic dimensions of this study these students revealed their ambivalence about crossing cultural boundaries and adopting mainstream values and strategies for success in life—ambivalence they may not even be consciously aware of. Our attempts to teach writing (including the conventions of mainstream English) will be more effective if we address the reasons that students that have to resist such learning as well as the reasons they have to perform. On top of that, writing is the tool which lets students themselves address their own ambivalence and examine the cultural models and assumptions that they hold.

Anne Haas Dyson's (1993) study of elementary school writers (kindergarten–grade 3) shows how children's socio-cultural experience—of growing up as a person of a particular race, class, and gender—shapes their growth in literacy. The project focused on young school children from low-income, minority homes and examined how children's diverse cultural resources—their experiences with literary, popular, and folk traditions—figure into their learning to write; the various ways they use those resources in composing activities; and how they use writing to negotiate their complex social identities in their interactions with teachers, peers, and community members. Dyson's project confronts the difficulties of teaching the social act of writing to children from different social

backgrounds and it also deepens our understandings of good writing instruction. One of the recent signal improvements in instruction has been the growing use of research-based teaching techniques focusing on the writing process and on writing as a social and cognitive event. As elementary school teachers follow the suggestions of this recent writing research, they begin to direct children to write to real audiences, with a genuine reason to share ideas, and to rely on audiences, such as classmates and teachers, for feedback and evaluation regarding successive drafts.

Not surprisingly, these curricula lead children to practice an unfamiliar set of social skills for relating to a general reading audience. But as Dyson shows us, individual children respond quite differently to this set of goals for writing and communication. For example, children are taught that these reading audiences have new expectations for clarity, interest, and informativeness, and teachers try to embody these expectations for their students. These are important goals, but they are not the only goals that people bring to writing, and in practice Dyson finds that these challenge the assumptions that individual children already have about how to relate to an audience through language.

In a 1-year-long case study, a part of the larger project, Dyson observed a verbally gifted, African-American 1st-grader struggle to understand why audiences for his writing should be "allowed" to make demands for clarity and the like. He often wrote compositions that had a musical quality and relied on plays-on-words, verbal imagery, and rhyming to delight his peers. While he felt that a written piece should be performed and appreciated like artwork, some of his classmates insisted instead that a written piece needed to communicate information.

This case study, like the project as a whole, shows that children's cultural knowledge may often be at odds with the best educational practices. In teaching young children to write, teachers must integrate their instruction with children's individual expectations for how a written piece should be evaluated, what it should achieve, and how real audiences play a role in its successive drafts. When writing teachers successfully mediate these forums, they win the enthusiasm and participation of their students. Dyson showed how the gifted teacher of these students was able to lead them to appreciate and practice both the performative and communicative aspects of their writing.

This research helps elementary school teachers foster their students' abilities to express themselves and cooperate socially in a multicultural classroom. It shows how writing can develop children's audience-sensitivities—to help them accept different points of view and share ideas. In the innovative writing classrooms that Dyson studied, teachers arranged their lesson plans so that children relied on their peers for feedback about their compositions and ideas for new compositions. Not only did children share ideas about writing, they also shared opposing ideas on important topics. But this atmosphere of learning is only possible when teachers also recognize the different kinds of language experience and practices (especially those valued in the child's home and community) that individual children bring with them. When teachers see all these styles as resources, learning flourishes.

Dyson's study also shows how writing teachers have a unique opportunity to motivate children to follow their directions. Writing teachers can win children's trust and cooperation by encouraging children's own ideas of how readers and audiences relate to one another. Writing teachers also have a unique opportunity to learn about their students' differing ways of sharing and communicating ideas. In an innovative writing classroom, children can find an audience in the skilled writing teacher for self-expression and for guidance in addressing other important audiences.

Understanding the logic of learners is equally important when older students are attempting a difficult task. In the *Writing of Arguments across Diverse Contexts* Flower and her colleagues (Flower, 1994; Flower et al., 1990; Flower, & Petraglia, 1992; Higgins, 1992); studied the construction of arguments in school and out by inner city teenagers, precollege minority freshmen, returning women in community college, college student mentors, and a multicultural neighborhood group. Flower and her team found that when college students are asked to take on demanding writing tasks and to juggle a number of competing goals, they may make choices and set priorities that differ from what the teachers expect. And teachers, blind to that logic, miss the opportunity to teach the students real questions, difficulties, and needs.

One part of Flower's study takes us into a college dorm room where freshmen minority students work together to plan their essays on issues of minority students and education. Their course in argument writing asked them to plan collaboratively, defining an open question and taking a rival hypothesis stance to their question—that is, a stance that considered genuine alternative hypotheses or different perspectives on the problem and the evidence for each hypothesis before coming to a resolution. The essays that these students wrote suggested that they had difficulty with generating genuine rival hypotheses (as opposed to simply asserting a claim or thesis), and also with presenting adequate evidence to evaluate any of their claims.

However, an analysis of each student's planning sessions also suggests that a significant part of their problem solving was devoted to other problems that the teacher did not anticipate, did not see, and did not address in her teaching or comments. In particular, the analysis of the conflict episodes in students' planning processes pointed to three concerns. First was the problem of creating and using evidence. The second involved students' desires to address real readers with their arguments. The final area of concern for these minority students involved questions of their own identity and their place in this new, largely white institution. These concerns led to conflicting goals for writing.

For instance, one student produced a well-written paper that failed to meet the goals of the assignment. Instead of recognizing some of the valid arguments various writers in their source material were making, she took a single position. What happened? Why did she fail to take a rival hypothesis stance? The tapes of her collaboration revealed two important things: her own experiences as an African-American led her to question what she viewed as faulty generalizations about African-Americans in what she had read for the assignment. For this student, the most important goal in writing this paper

was to speak loudly and clearly to the research community which she believed perpetuated such generalizations. The second point to note about this student's apparent "failure" to carry out the assignment was that she was in fact doing what many teachers long to promote—imagining herself as a person with a purpose writing to a real audience—and in this case to the intimidating world of the research community. The logic of her performance was the logic of a mature and committed writer. But all that the teacher saw was a paper that failed to use the assigned argument structure.

The ways in which students negotiated their conflicting goals often led them to make choices dictated by problems the teacher never saw. Their negotiations led to a logic and a text that apparently "failed" to meet some assignment demands, when in fact students were choosing to negotiate a different, and to them, more compelling problem. Both sets of goals are necessary, but when teachers uncover the logic of these negotiations, they become more effective at diagnosing the students' writing problems and teaching to students' real needs. Understanding a student's logic does not mean replacing the instructional goals of a class with those of each student. However, it does mean teaching to the genuine conflicts that students face and to the process of negotiating multiple voices, expectations, and demands that all writers must juggle (Flower, 1994).

Making Literate Practices and Strategies Explicit

The responsibility for intercultural understanding is not only the job of teachers but of students as well. Yet how can students be expected to negotiate the maze of American culture and its multiple discourse communities, each with their conventions, roles, and appropriate languages? Such negotiation can become even more complex when it involves understanding multiple perspectives from the past, which normally occurs in history instruction. One answer is provided by writing, which helps students take part in intercultural collaboration by making different ways of talking, thinking, and being explicit. It prepares students for productive work across differences in disciplines and discourses.

Downey's project (1996) takes us to 3rd-, 4th-, and 5th-grade social studies classes where writing is the key to helping students think like historians. Data were collected in urban classrooms in the San Francisco Bay Area with a diversity of students, including recent immigrants from Central America and Asia. Students in the study used a wide-ranging collection of historical materials and participated in a curriculum that included different kinds of writing (such as personal narratives, biography, historical fiction, and expository writing).

Instead of memorizing names and dates, these children learned about the context of life in other times and places through engaging in historical perspective taking, which involved them in understanding the values, assumptions, and everyday habits of people who lived in the past. In particular, they engaged in historical imagination about people's lives and actions in ways that replaced historical stereotypes with a more accurate understanding of historical people and events. In the process, students learned to make causal connections

between events over time. Writing played a central part of learning to think like historians.

For example, the third graders in this project had trouble sorting out whether Columbus, the Indians or the Pilgrims came first—of seeing a logical order to past events. An even harder task for the fifth graders was to imagine the life of American Indians, their food gathering and life style, in a way that distinguished it from going out to play or shoot deer, with a handy berry drink. Narrative writing was the place where students worked on such historical thinking, by writing about events such as a story of what was happening and trying to make their events make sense given what they had learned about the past. It was also the place where they learned how to discern and build causal connections between historical "facts" and the artifacts and context of life—that is, what it could mean in terms of survival if you did not find berries or missed your deer. Although students wrote from the perspectives of historical characters and cultural groups, they did not adopt their values but rather worked to understand how differences in cultures and traditions can shape identity and action—a sophisticated thinking skill. Thus, when the fifth graders took the role of Spanish colonists writing a letter to a cousin in Spain about their perception of the Indians and the struggle for land, they had to make the radical transition from an Indian point of view, to attitudes that made "Spanish sense."

It is important to note that the historical thinking that Downey is studying does not come easily—many students had difficulty with perspective taking and then with taking the more sophisticated step of building causal links and making "historical" sense. Teaching history through writing is powerful because it goes directly to the heart of historical thinking, and it lets teachers not only give explicit instruction but gain a new insight into the historical worlds students are constructing. Through this research Downey discovered ways by which to make the writing assignments and instruction more acutely attuned to the difficulties that children have, especially those who are not native speakers of English. In particular, Downey found that student conferences, a key feature of process-based writing instruction, were also important in history instruction. These conferences became the place where teachers not only noted writing problems, and checked for historical understanding, but helped students make these historical thinking-writing connections. Downey's work shows the advantages and challenges of integrating history with the language arts in the intermediate grades.

Sometimes making strategies explicit has a large impact because students already know a great deal—and need to figure out how the new literate practices of school are different. Higgins (1992) worked with nontraditional students—low-income returning women students who came to community college with significant life experience in making arguments for themselves and their children to institutions and social agencies.

The nontraditional students in this study do indeed use written argument in their nonacademic lives. However, such arguments typically depend on external factual evidence or "proofs"; hence, this experience did not prepare the women

to produce the warrants and extended reasoning that academic argument requires, nor did it prepare them for the different patterns of reasoning expected in their required course. Their academic writing forced them to deal with the (often conflicting) expectations of their teacher, a departmental review board at the community college, and the other members of the class.

For instance, all three groups shared a number of criteria (such as the appropriate use of organizational conventions); however, a close look at the goals and strategies of each group showed that students and teacher gave high priority to additional goals, such as influencing certain readers or using writing to explore charged issues in their own lives. Juggling all these goals—and the strategies to carry them out in the same text—is a significant problem for many inexperienced (and experienced) writers. Although the teacher offered students standard patterns for organizing an argument, what they needed more were strategies for making their own path of personal reasoning explicit.

Where could instruction make a difference? Higgins, study suggests that, first, teachers need to address these conflicts directly in their teaching—learning to negotiate competing goals is a necessary part of learning to write. Second, the standard practice of teaching argument often assumes that students will “find” evidence and support from outside authorities and organize it into a paper. But, in fact, college writing typically asks students not to find but to create a line of reasoning that supports claims with evidence, inferences, and good arguments. This study revealed that students are indeed doing this kind of reasoning in their planning—but not in their papers. The instruction that these students need is how to lay out their reasoning in text, how to make their own path of personal case building explicit in the text.

Community Building and Collaboration

As the traditional promises of education and advancement begin to ring hollow, educators are seeking ways by which to make learning count both in school and in the workplace and community. Writing—especially strategic training in writing—unlocks the door to rhetorical empowerment, to participation in community building, to bringing a stronger voice to the table. Center projects have shown how to make this process a reality. One did it by creating an international exchange of writing that motivated students to write to be understood and that allowed for comparisons of learning to write in different countries. Another project has made writing and collaboration a tool for making changes in inner-city neighborhoods by adapting the Center’s research-based strategies to support collaboration among mixed groups of residents. In doing so, it has shown how school/community/university partnerships can be linked to community building in urban centers.

In Freedman’s project (Freedman, 1994a, 1995) writing exchanges between paired classes of British and American students in grades six through nine not only motivated students to make their writing work; it revealed some important differences in how teachers in both countries looked at motivation. The writing exchanges showed the kinds of

classrooms that led students to higher levels of achievement. In particular, students who achieved the most were in classes where the teacher expected them to produce lengthy academic pieces and where they were given several months to craft each one. In order to get young adolescents excited about producing such extended work, these teachers worked together with their students to form a classroom community where writing activities kept the students’ interest while at the same time pushed them to meet demanding academic challenges. This new kind of research-sensitive practice, which we call a negotiated curriculum, moves beyond fixed programs aimed at an idealized whole class. It also moves beyond the individualized “learner-centered” curriculum of the 1960s which is inadequate since it carries the implication that teachers concern themselves only with individuals and not with the community as a whole. A negotiated curriculum incorporates ways of leading discussions, and building activities, and frequently writing which emerge from the interests of the community of students in the classroom.

In Peter Ross’ class students at the equivalent of 8th-grade level worked for 2 months on short stories, which they put together as a class anthology to send to students in the United States. Peter’s students wanted more time to do a better job. As one of his female students explained, “He [the teacher] gave us about two months or more,” but “he said it had to go on a particular Tuesday and I said I needed some more time.” In the end one of the young men, who wanted more time, wrote a spy story of over 5,000 words, packed with action and compelling detail.

As another example of an extended activity, Peter’s class worked collaboratively for several months to put together a 119-page book about the school. The book contained photographs of the students in Peter’s class, of the school secretaries, the cooks, and the library. It also included a copy of the school rules, a written piece on form tutors and the “head of year,” and a weekly schedule of classes. In addition, there was an entry on the physical structure of the school, what classes there were, who taught what, and uniforms. Following these general items was a series of chapters on each subject taught at the school and final chapters on such topics as community activities, trips, and a recounting of a bomb scare at the school. After completing this project, the class produced a 183-page book about the community surrounding the school.

In classrooms like Peter’s teachers worked with their students to decide on writing activities, routinely bringing in issues close to the students’ home communities and social and political issues that affected their lives. These teachers saw their job as setting motivating contexts for a particular group of students that would generate enthusiasm for writing in a variety of ways, for a variety of audiences. They understood that not all their students will be motivated by the same activity. When certain students were not motivated, the teachers helped them find something more motivating but equally academically challenging. Students experienced no stigma if they chose a different activity than the majority of the group. In the end, however, the teachers expected their students to master a variety of types of writing and to stretch beyond immediate and concrete concerns to consider more abstract

issues and ideas. If students did not practice and master certain types of writing, the teacher considered it his or her failure in setting motivating contexts. This approach, which was more common in Britain than in the United States, provided an extremely powerful frame which allows students flexibility while giving both teachers and students important responsibilities.

In fact, this same finding was supported in Freedman and Simon's M-CLASS teacher research project. In the M-CLASS schools, mostly located in poverty-stricken, violence-ridden areas where drop-out rates and low-test scores are daily news, most Americans seem to doubt the possibility for academic achievement. However, Freedman and Simons are finding that community building through negotiation over important and substantive issues is a key to the M-CLASS teachers' successes. Still, their road is often a rocky one as Brenda Landau's story illustrates.

An African-American herself, Brenda teaches high school social studies in one of the toughest areas of Chicago. When she first attempted to open up the curriculum of her African-American history course to student negotiation, her students, many of whom were also African-American, were reluctant to accept her invitation. On the second day of class, Brenda asked the students to write a journal entry telling her what they wanted the class to cover. Only a few students responded. As Brenda reports, "Most of the students did not do the assignment. I asked them why and several said that they did not know what I wanted them to say. We discussed the fact that the class was not going to be what I wanted them to say, but that we were going to try to identify and express things they were concerned about, their conflicts about multicultural issues and conflicts about their own identities."

After this discussion Brenda tried a second time, asking students to describe where the study of African-American history should begin. Again students failed to respond. Brenda then laid out a general structure for the class, including time for student input through journals and discussions and launched into a 3-week lesson on Ancient African kingdoms. The students were not particularly responsive in class until a well-publicized shooting of a 7-year-old child who was walking from his Cabrini-Green (a Chicago public housing project) apartment to his school nearby. One student responded angrily in his journal:

As I got off the bus at Kimball and Lawrence, I saw these two ladies reading the front page of the Sun Times. I glanced at what it said, and to see what was in there. There was a picture of Cabrini Green with the headline that read The Killing Ground. I thought to myself, why is it now that the media makes a big deal about a killing of a boy. Little kids get killed everyday and there aren't any big headlines! I thought why now, why not earlier?

From this journal entry and the discussion which followed the shooting, Brenda saw that when the class linked African-American history to current events, the students had a lot to say. Soon afterward, one student commented in her journal: "This class is not long enough. I need more time to express myself and for the rest of the students to express themselves. We have some pretty important stuff to say." This comment

struck Brenda as a significant clue to how she might redesign her course curriculum. She decided to allow students to bring the world outside into the classroom, where they could safely discuss and write about how current events related to African-American history and to their own lives.

As a result, Brenda writes, the class altered its rules of operation. The students decided that the group needed at least one class period, per week, to discuss whatever they wanted. They made three basic rules: that students respect one another's rights and opinions, that students could only speak when recognized, and that the teacher would only answer questions directed at her. The group also decided to watch the evening news daily and to take 15-minutes of each class period to discuss current events.

While the students had not responded to Brenda's earlier invitations for their participation, she found that when she was more open about the ways by which they could participate, a negotiated curriculum began to emerge. Asking students to outline the course curriculum in journal entries did not spark collaboration, but students' desire to discuss and write about contemporary African-American issues led them to reshape the curriculum. Brenda was flexible enough to turn over one day a week, and 15-minutes each day to issues which the students wanted to raise, despite her own full agenda of African-American history. She relinquished that position of power, but in order to do so, ironically, she had to draw on her reputation for "toughness" to manage the intense discussions which ensued in her multicultural classroom:

I told them that there are rules in here to guide you. And I am an authoritarian. Otherwise, there would be no way I could hold those two classes together. They are predominantly male, predominantly gang (with emphasis). If I didn't have a very strong personality and if my reputation was not throughout the school that you know, "She's tough. I don't fool around, but she's fair. Okay?", they would be really at each other's throats.

Brenda's experiences reveal a true balance between a classroom in which the teacher is in total control and one in which there is a complete partnership with students. She used her authority quite deliberately to allow students space in the curriculum, not free rein. The careful balance of power yielded impressive changes in Brenda's classroom. When she opened up the discussion to students, not only was Brenda able to teach more effectively, but she learned a great deal also. She discovered, for instance, through their journal entries and classroom talk that some of her students were ardent racial separatists. In her opinion, their interpretations of current events were distorted by a lack of information about African-American history:

I listened to all of this and then when they got into the separatist bit I asked them, "Well how many of you are old enough to vote?" Well only maybe one or two.

And I said, "If you were old enough to vote, would you participate?"

And they said, "No."

And I said, "You wouldn't?"

And they said, "No."

And I said, "Why?"

"Because it's not going to change anything in the Black community. It's not going to change the poverty. It's not going to change

the crime. It's not going to change the drugs. It's not going to change the gangs."

I was active in the Civil Rights Movement and I've spent maybe ten years in Social Services working with gangs. Let me tell ya, I had to sit and listen, and I mean I learned a lot in that one session.

Brenda felt compelled to propose an alternative position to students and did so in response to the students' strong opinions. She states her goal:

My goal is to get them to the point where they realize that the only way they can make a difference is that they have to participate to a certain point. They have to. And one of the ways that you have to, is that you have to exercise that voting right. If I don't teach them anything more than that, then I will have accomplished something.

Brenda knew she needed to work to counteract the ignorance of African-American history which she believed led to her students' tendency to live in "the here and now." Students no longer could ask Brenda what she wanted them to write, but they had identified and now began to express their concerns and their conflicts about multicultural issues and about their identities. If Brenda had retained tight control of the curriculum, she may never have learned that many of her students held beliefs which she felt needed to be argued openly in an African-American history course; she might never have been able to help students confront and examine the rationale for and the consequences of a separatist ideology.

Later in the year, when she was reflecting on the changes that took place in her classroom, Brenda commented that until students began to take part in the curriculum, it was as if they were not physically present. She spoke clearly of the importance of creating an atmosphere in which students bring their interests and concerns to the teaching-learning process:

These kids have taught me something. When I walked in, the first thing I learned—these were kids who had self-esteem which was on the floor and we were walking with it. And when we began to interact, and I began to earn their trust—that was the main thing, they had been so done in for so long that when I finally began to earn their trust, behind this defensive mechanism of rebellion were the wonderful minds. They had some knowledge which had been picked up in the street which was totally crazy in relationship to African-American History and multiculturalism and in addition to that that they weren't succeeding because nobody was tuning in to what they wanted to discuss. It was back to the 1950s where they weren't in the classrooms, basically. They weren't there. And all of a sudden you're given this opportunity to be there and to participate. For me, it was when I saw that light behind their eyes—that this was a beginning.

By encouraging students to share their "street knowledge" and by offering her own experiences and those of other African-Americans, as well as her "book" knowledge, Brenda allowed her students to enter into the African-American history curriculum in meaningful ways. The students had something important to think about and something important to read and write about.

In Flower's study of argument writing in diverse contexts, writing crosses the boundaries between schools and communities, and it takes the results of educational research with it

into inner-city neighborhoods. Collaborative planning is a problem-solving strategy for writing that developed out of the Center's initial research into an educational practice that high schools and college teachers adapted to a wide range of students (Flower, et al., 1994). This study takes us to an inner-city neighborhood where adults on different sides of a controversial issue learned collaborative planning and used writing to deal with multiple viewpoints. The members of the multicultural Landlords and Tenants project at Pittsburgh's Community Literacy Center met to construct a memorandum of understanding that would define the problem from both perspectives and at the same time it offered guidance to both groups in resolving conflicts.

The success of this initial project led to collaboration with Pittsburgh's major community development organization and another partnership with a neighborhood-based planning group. It showed, first of all, that the Center's research-based educational strategies for collaborative planning are translating well to community settings where people are using writing to draft better understandings and plans of action. An educational approach to community issues and research-based literacy instruction is proving its power in these nontraditional settings.

The study also revealed why attempts to build consensual arguments and texts in such contexts can falter. In tracing the points of conflict and negotiation in these planning and writing sessions, Flower observed how a group comes to premature agreement over a concept, even though the analysis showed that each member held a very different set of meanings and goals associated with that concept—differences which later surfaced as conflict. Although many theories of argument assume that persuasion must lead to consensus and agreement, this study showed how community members designed a written document, based on problem scenarios and "what if" alternatives and solutions, that let them maintain different, often conflicting, values and perspectives, and still come to consensus through shared action. In this case the action they took was a written guidebook that honored differences while it resolved conflict.

In another study within the multi-context project, Flower looked at what a growing number of community service projects have recognized: literacy is a powerful link between our colleges and communities. Mentoring younger students is a way to address urgent social needs, benefiting marginalized teenagers who need intellectual strategies for negotiating their worlds more constructively as well as college students who often feel alienated from public life. However, Flower's study of community literacy—based on collaborative planning, problem solving and writing—offers a model that goes well beyond traditional tutoring. College students worked as collaborative planning partners with inner-city teenagers at the Community Literacy Center, helped the younger writers address issues that affect their lives, from risk and respect, to violence and school reform. Each semester, high school age writers not only published a written document but planned and held a public community conversation to present their arguments.

In this context we see the teenage writers move from a rhetoric of complaint and blame to collaborative problem

solving as they learn strategies for defining and analyzing problems, for taking rival points of view, and for articulating issues. Community literacy motivates students on the margins of school to seize writing as a tool for making themselves valued and heard. At the same time, the college students embark on a vigorous course of mutual learning as they understand and respond to an intercultural discourse. Tracking the conflicts and negotiations behind students' reading and writing showed them how to work hard to integrate their "academic" knowledge of literacy and intercultural communication with their experiential knowledge as a writing mentor. One such conflict, for instance, stems from students' commitment to respecting and supporting the perspectives of their teenage writer (rather than dictating what they might say), while at the same time wanting to exercise the authority of their own expertise as a writer / mentor and help teens produce an effective public document.

This study documented a process of mutual learning in which both groups of students not only developed their own skills as writers, but used writing to cross barriers of race, culture, socioeconomic status, and discourse. This is not a trivial crossing: multicultural education can build awareness of difference, but raise the question of how to respond to it in productive ways. Writing and planning together—as a collaborative process focused on community issues—creates a productive relationship in which students can move beyond the awareness of cultural difference to the practice of intercultural collaboration.

LEARNING TO WRITE IN ENGLISH: A STUDY OF NEW IMMIGRANT ADOLESCENTS

Elisa is 13 years old, small and dark-complexioned, her high cheekbones and very straight black hair reflecting her Indian heritage. A newly arrived immigrant from Honduras and a village girl, she and her sister lived with their grandmother for 8 years until their mother, who had immigrated earlier to the United States, was able to send for them. Upon arriving in the United States, Elisa was literate in Spanish, having completed the 6th grade, although her writing was not as developed as her reading. She knew very little English, although she could respond to questions like "what is your name?" She knew, however, that English was very important to her mother, who was an energetic and ambitious single woman who worked two jobs, and who insisted that her daughters watch only English language television.

Lilian at 12 is big for her age, blond and blue-eyed, and a new immigrant from a small village in Mexico. Before coming to the United States, Lilian had yet to travel even to the country seat a few miles away from her village. Here she lives in an urban area in a three-bedroom apartment that is shared by two families and other relatives; her family was struggling to keep food on the table and pay the rent. Her English abilities were close to zero when she arrived; she knew a few words like dog, cat, and ice cream, but she could read and write in Spanish. She confides that she had not been a very good student in Mexico.

Martin was born in Shanghai in the People's Republic of

China. His father was a technician, and his mother, a primary school teacher of English. After coming to the United States as tourists and then staying on illegally, they both took jobs in a Chinese grocery store, and his mother also worked cleaning houses. Martin began studying English in the 4th grade in China; he was 13 when he arrived in the United States. He scored quite low for oral English skills and "0" for reading and writing when he was tested, but he knew some basic English. Lively, outgoing, confident, and aggressive, Martin says one of his priorities in school is studying English. When asked about his future, he said he wanted to *churen toudi*, or "rise head and shoulders above other people."

Audrey's father is a pastor who moved to the United States when he was offered a position in a Chinese community church. Born in Taipei, Audrey is 12 and had completed elementary school in Taipei and had gone to "night school" for training in English. She reported having plenty of opportunities to speak English at home and with kids in the neighborhood, but she also spoke Taiwanese and Mandarin. Audrey is not very motivated to learn English or to do well in school, and a year after moving to the United States her written Chinese was beginning to deteriorate. But Audrey is an accomplished musician, playing the cello, the piano, and singing in the choir, and she says she would like to be a music teacher.

These young people have something in common with many children in many countries all over the world: they are just in the process of learning, often from scratch, the language in which they are to receive the bulk of their schooling. For these students learning to write in a language other than their first presents big hurdles, partly because we know relatively little about how writing ability in a second language develops. Educators often assume that non-English-background students must acquire a certain level of English before they can profit from the instructional approaches used with native English-speaking students (though this level remains undefined). It is also often assumed that when such students exit from ESL (English as a second language) tracks, they should write like native-speaking students, and conversely, when they do not, then they are not ready for "mainstream" classes.

Guadalupe Valdés (Valdés, 1993; Valdés & Sanders, in press) and Sau-ling Wong (Wong & Zou, 1993; McKay & Wong, 1996) complicate and challenge these assumptions in their Center project, *The Writing of Non-English Background Students*. Conducting detailed case studies of Latino-background and Chinese-background students, including those introduced above, they describe the acquisition of writing abilities by eight young people over a 2-year period. They also create fine-grained portraits of writing instruction within ESL or "sheltered English" classes, illustrating writing assignments and describing instructional practices. They finally take us into students' communities and homes, reminding us how performance in school often takes its cue from social, economic, and cultural circumstances that originate beyond the schoolhouse door.

One important contribution of the part of the study led by Valdés, focusing on the Latino-background students, is a detailed description of students' language development

across 2 years. To trace students' growth, a total of four English language assessments and one Spanish language assessment were carried out. At the outset all students were literate in Spanish, being able to read aloud confidently from a 6th-grade level book and to answer comprehension questions. All students were also able to write a bit about themselves in Spanish, although their abilities varied widely. Students' listening comprehension abilities in English were shown to be developing more rapidly than their speaking abilities, though they were generally unsuccessful at the outset in taking part in the assessment activities. Finally, in general, students' writing abilities in English were nonexistent.

From this modest beginning, Valdés traces students' growth; for some students the progress was remarkable indeed.

Here is a sample of what Elisa, 13, was able to write about her family on the first assessment:

thes tha paper
door
window
mesuring spoon
spatula o turner
postre
measurins cup
teacher
sister
brother
granmother
name
period

And here is the writing sample that she produced for her last assessment 2-years later:

I woke up on Saturday morning, it was cold and dark. I had breakfast with my sister, mom and dad. I knew that that day I was going to have fun. My mom and dad were getting read to go to work and my sister to go out with her friends.

When everybody had already left it was about six-thirty a.m. I started getting read. I went in the shower and spent 30 minutes. When I got out of the shower it was about 7:00 AM. I put lotion all over my body and put on my favorite underwear, pair of jeans, T-shirt, jacket and pair of shoes, I was feeling fresh and clean, I guess I was ready

I phoned my friend Rolando to tell him that I was ready. I wait for him for ten minutes. When I saw him coming, I saw a big limousine too. He asked me; "do you want to come in"? I said yes.

We went to San Francisco, we stay there for almost two hours. There we ate another funer breakfast.

I asked him if he wanted to go shopping with me. He answer yes. We went to almost all the malls in San Francisco. We spent almost all morning and part of the afternoon shopping then we went for a big dinner at Sizzler.

At this point Elisa was able to meet practical writing needs, to take notes on familiar topics and to respond in writing to personal questions. She could write simple letters, brief synopses and paraphrases, and accounts of work and school experience. She demonstrated an ability to describe and to narrate in paragraphs. Though she had not yet learned to use

cohesive devices and some of her verb inflections were inaccurate, her writing was generally comprehensible. She had a way to go before she would write on a par with her native English counterparts, but her growth was nonetheless impressive.

Valdés points out that not all Latino-background students fared so well; indeed, after 2 years of schooling, the four Latino focal students demonstrated different levels of English language development and different rates of growth in the four language modalities. All four students started at almost zero English, but two became fluent speakers, while two others acquired little spoken English during the 2-year period. The two fluent speakers, including Elisa, learned to write well enough to participate in selected mainstream classes, while the other two students developed very little ability to write in English. The different levels of development were influenced by a complex web of factors: the students' different responses to instruction, teachers' perceptions of their abilities, students' family backgrounds, their psycho-social development as adolescents, the circumstances which surrounded their immigration, and their hopes about what they could accomplish in the United States.

Valdés's studies of the Latino students suggest a strong relationship between the development of oral productive skills and the development of writing abilities. This, however, was not always the case for the Chinese-background students that Wong studied. For example, Martin, who is described earlier, started out with the highest proficiency (among those students who were studied) in English writing, and throughout the 2 year period he did better at writing English than speaking or comprehending it. Similarly, another student in the cohort made terrific strides in writing, but had difficulty even with everyday listening comprehension after 2 years. This finding contradicts the widely held notion that development in English always proceeds from listening to speaking to reading to writing, and that students who do not speak English well are not ready to tackle writing. It is also important to note here that for both Latino- and Chinese-background students, the development of writing ability may depend on the development of productive—oral or written—skills as opposed to receptive skills. Again, the importance of writing as the proactive branch of literacy comes to the fore.

Perhaps the most important contribution of Valdés and Wong's work is that they began the big and significant task of illustrating and analyzing levels and stages of writing development among Latino- and Chinese-background students. Such research is rare and time consuming, but it is necessary if we are to give teachers a much-needed sense of what is possible for non-English-background students, for how quickly some such students can be expected to develop, and what their writing can be expected to look like and when. Valdes and Wong's work can also help mainstream teachers to be more comfortable with the writing that non-English-background students produce, being assured that non native-like syntax does not mean that students cannot benefit from instruction in mainstream classes, and that such students who still make mechanical errors in their writing can nonetheless exhibit and acquire sophistication in other areas

of writing. In short, Valdés and Wong's work goes some distance in helping teachers to be more hopeful in their dealings with ESL students and more helpful in assisting those students with the considerable challenge of getting an education in English.

CHANGING WORK, CHANGING LITERACY? HIGH PERFORMANCE WORKPLACES AND SKILL REQUIREMENTS

Most of the Center's projects have naturally taken place within the context of schools (and other educational institutions or organizations). But recent global economic developments and widespread national concerns about the future of work and the transition from school to work made it critical to study literacy and writing requirements and practices outside school as well. Flower's work with community organizations is an important step in this direction, as is Schriver's research on assessing drug-education literature. Hull, however, has focused squarely on the workplace.

During the past 10 years the way we think about work has changed and changed radically. Gone are the days, it is said, when North Americans (as well as citizens in virtually all industrialized countries) were expected to check their heads at the factory door and settle in for 8 hours of repetitive, routine, perhaps physically demanding or even debilitating but certainly mind-numbing labor. The claim is that, in order to be nationally and globally competitive, North American industries must adopt new technologies and new forms of work organization often labeled "high performance." Although definitions of what constitutes a "high performance" workplace do vary, these freshly organized workplaces are usually said to push responsibility and authority to lower levels of the organization, to reduce or even eliminate middle management in order to increase the flow of information, and to create cross-functional teams that can respond more rapidly to customers and that can suggest ways to improve work processes continuously. A recent article titled, "The New World of Work" in *Business Week* captures something of the public perception of the extent and severity of the change: "Mobility. Empowerment. Teams. Cross-training. Virtual offices. Telecommuting. Reengineering. Restructuring. Delaying. Outsourcing. Contingency. If the buzzwords do not sound familiar, they should: They are changing your life. The last decade, perhaps more than any other time since the advent of mass production, has witnessed a profound redefinition of the way we work" (Hammonds, Kelly, & Thurston, p. 76).

The question becomes, what do people need to know and to be able to do in order to function well in the new world of work—both those adult workers who now hold entry-level industrial and service sector jobs, and the young people who will hopefully move into these jobs in the future? More particularly, what is the role of written literacy in these factories of tomorrow? Hull's project is showing specifically how writing and reading are used in changing workplaces and how the

knowledge and skill of workers, especially immigrants and minorities, might be drawn upon more effectively to help workplaces reach constantly sought, higher levels of productivity. But this project is also shedding light on the nature of high performance work organizations, illustrating the difficulties that companies experience as they attempt cultural and structural change and the ways in which old practices and modes of organization die hard. Most significantly, Hull and her colleagues (Hull, Jury, Ziv, & Katz, 1996; Hull, in press; Gee, Hull & Lankshear, in press) suggest that literacy practices might be a good measure of high performance work systems. That is, an audit of writing and reading requirements, responsibilities, and rights and their distribution across a workforce can provide an important indication of the extent to which a company offers workers the chance to participate in decision-making and the authority to do so.

To illustrate these themes from Hull's project, let us turn to an evening during the second shift at an electronics factory in the Silicon Valley of Northern California. This circuit board assembly plant is a Fortune 500 company with annual revenues in excess of \$1 billion. It represents "high end" manufacturing, focusing on high quality and the full range of services—design, assembly, quality checks, testing, and packaging of circuit boards for diverse products, from helicopters to elevators to computers. The plant has also adopted practices associated with "high performance," such as self-directed work teams and decentralized decision making and continuous improvement and the use of flexible technologies. According to the plant manager, in order to become a high performance workplace, "First you have to create a culture, where people believe that they can make decisions without being put in a penalty box." As will become apparent, however, this factory is closer to traditional rather than high performance work organizations, despite the fact that it has tried to adopt certain high performance practices.

Ernie, a lead assembler in the hardware and wave solder department, is an immigrant from the Philippines with an interest in new management ideas such as quality circles and self-directed work teams. On this evening Ernie is facing a problem that is not uncommon among contract manufacturers in the circuit board industry. His department has received some old circuit boards from a customer, and the workers are supposed to update those boards by soldering some components onto them. Ernie's job is to figure out, by reading all the documents and examining the sample board and checking the kit, exactly what is to be done to the old boards, with what parts, in what order. Significantly, he is the only frontline worker in his group who is required to read the MPI (manufacturing process instructions), which makes him a literacy broker of sorts. After he has deciphered the problem, he will, as the lead worker, explain it to the rest.

To carry out this task, Ernie has, as he soon realizes, some inadequate written instructions, an outdated drawing (the numbers on the drawing have changed, and so have the shapes), and a bill of materials. As is his usual procedure, Ernie compares the written texts with the components in the kit, poring over a variety of forms of representation for a while, and it is then that he realizes that they do not match:

that is, the components do not look like what the drawing says they should look like, and in fact, attaching them to the board presents some technical problems. At this point Ernie tries to flag down the engineer, who is on his way out of the door, to ask him about the discrepancy. But the engineer gives Ernie short shrift, simply telling him to "lap solder" a wire, a solution that Ernie believes would not provide the most reliable connection. Next Ernie goes to another part of the factory where parts for old boards are stored to see if the customer had provided a sample board to go by. And sure enough, there is a sample board, but it is plugged into a system, and Ernie is told that he will need to get permission from the person who oversees that area to take the board. That person is unavailable. Thus, Ernie looks at the sample board without taking it out of the system that it is connected to, and he constructs his own drawing of it, and he writes his own parts list as best as he can.

He then goes to his supervisor's office, a woman named Margie, spreads out all the drawings and components, kneels down beside her, and they both hold the board that needs to be modified and talk their way through the problem. They were very concerned with how to get that component soldered on properly, and they go back and forth about whether it would be all right to tilt it so as not to have to attach such a long lead line; they both disagree with the engineer's solution of a lap solder. The supervisor keeps pressing Ernie toward a particular solution to the problem, but he persistently doubts that it will work—partly because he is unsure of the drawing he had made so quickly, and partly because he feels that he does not have the written authority through MPI to proceed. Finally, after manipulating the component, situating it this way and that on the board for about six pages of transcript, the supervisor asks to see the official documentation, realizes how inadequate it is, and joins Ernie in complaining about the engineer who should have updated the drawing and provided sufficient instructions and thereby given them the authority to do their work, but did not.

Margie finally decides that Ernie should go ahead and put the components on; they will curve the lead to get more length out of it, but as Ernie argued, they will not tilt the component. But just to be sure, because they do not have written authorization—a deviation approval to alter the board in this way—they will contact the program administrator, Ron, whose name the supervisor notices on one of the documents. This administrator is assumed not to know anything about production, but to have the authority needed to deviate from the MPI. "I hope my eyes serves me right when I look at this part," Ernie says a little nervously as they wait for the program administrator to appear.

The program administrator arrives with an enormous red three-ring binder in his arms; it contains every single document about this project, its history, all the communications with the customer, the MPIs, the material transfers, the deviations, and so forth. With Margie's permission Ernie explains the problem, and then Ron flips through his big notebook to see, in his words, "If I have anything in writing on this." Ron cannot find permission from the customer to change the board in the ways Ernie has outlined, but he says he may have seen such a letter on someone's desk, and that therefore they

should go ahead with the work. Ernie asks if he can look one more time at the sample board that is now in a locked department, and Ron agrees. Everyone walks to the department where old parts are stored, the security guard opens the door, and Ernie looks at the board and says immediately, "I did the right drawings." He makes a new sample board, using the new parts and based on the earlier discussion, his drawings, and the customer's sample board. He then proceeds to instruct the other workers as to how they should alter the board. Almost an hour has elapsed since Ernie first identified the problem.

This "work event" and millions similar to it—where the smooth flow of production is interrupted and an employee joins collaboratively with others to use texts and talk and problem solving to set it in motion again—are played out in factories across the United States everyday. Literacy plays a big role in the event narrated above, as it does in the work life of most high performance companies. A great deal of this literacy comes about as a result of international certification standards, which require that every single procedure for every action in an entire factory, as well as every deviation from those instructions, and deviations from the deviations of the instructions, and so on, be documented—be written down, distributed, and referred to as necessary. Other literacy requirements arise because of the nature of the work in new industries. In contract manufacturing, for example, a company survives by making products for its customers quickly, accurately, and cheaply, and by doing so again and again, over time, as was the case with the old boards that Ernie had to alter. These relationships require a thick paper trail—witness the three-ring binder in the previous example—and adherence to a literacy-driven notion of "traceability." In many factories the ante for literacy is also raised when workers are required to take in-house courses on how to participate in self-directed work teams or are asked to enroll in specialized study to upgrade their skills, as in "pay-for-knowledge" systems.

The texts that saturate new workplaces are accompanied by rules of use, rules that are often complex, that grow out of social relations in particular companies and the history of industries, and that participants must decipher and master if they are to be considered fully literate at work. Much previous research on workplace literacy has consisted of readability analyses of work-related texts done in an effort to determine the grade level needed to comprehend them. Hull's research has begun to suggest how much more we need to understand about how texts are used in factories and other workplaces and about the rules and strategies that govern who constructs, reads, and uses these texts and how and for what purpose. In the above example, Ernie was quite aware of how tightly authority was wedded to MPI where his own work activities were concerned, and both he and his supervisor knew better than to ignore these instructions, even when they recognized them to be incomplete and inaccurate. Rules of use for literate activity will differ from workplace to workplace and from industry to industry, but the existence of the rules will not, especially as literacy demands grow in frequency and complexity and as workplaces change. This project suggests that one challenge for teachers of writing and English is to find

ways to teach prospective workers how to size up a given work environment's literacy practices.

An analysis of the literate practices and the rules that govern the use of texts in a given workplace also provides a window on the extent to which a factory has achieved the "high performance" ideal of shared decision making and worker empowerment. It is clear from Hull's project and other research that the majority of workers want a voice in their companies' operations, and it is also clear that most workers experience a big gap between their desire to participate and the reality of opportunities to do so. Ernie, for example, talked again and again to the researchers about his interest in participating in team meetings, a high performance practice that his company reserved for managers, engineers, and supervisors. Ironically, many of these upper-end employees also complained about not being heard, albeit in a different way. One engineer said, "The five white guys [in top management] want to 'empower' us, but they don't want to give us full control." Significantly, not being heard in team meetings was paralleled by constraints on literacy. As a lead in his work area, Ernie was expected to read manufacturing process instructions and explain them verbally to the others in his group, who were not expected to read (because they were assumed, on the basis of their immigrant and ethnic status, not to be able to). His reading served certain functions, most often identification, verification, and receiving instructions. But he was not authorized to alter existing texts, even if outdated or otherwise erroneous, or to create texts which instruct others, even when he had the knowledge to do so and his superiors had dropped the ball. The texts that Ernie did create were unofficial ones, texts that he wrote on scraps of paper pulled from his pocket nervously, texts that were not sanctioned by the company and that had no authority.

Hull's research suggests that as more and more companies recognize the good sense of moving toward "high performance" work organizations, it would also make good sense for these companies to examine and reconceive the literate practices that weave throughout the work that gets done. Is literacy set up to control? Are writing and reading practices strictly meted out, with certain workers having the authority to produce texts of particular sorts, and others having the responsibility to read them, and still others denied the right and responsibility of either? Then you probably have a traditionally organized workplace. Are writing and reading responsibilities—but especially writing—distributed across the workforce, with line workers able to participate in the writing and revision as well as the reading of manufacturing process instructions? Do they have access to the big red binders which hold the history of products? Do they have access to whatever training they need to make participation a right and reality? Then you are probably moving more in the direction of the high performance ideal.

WRITING ASSESSMENT

Where do students stand in relation to their individual growth, to their peers in the United States, and to children in other countries? This is a question that is increasingly on the

minds of parents, teachers, policy makers, and the public at large; writing assessment plays an essential role in answering it. Writing assessment also helps give us clues about whether our instructional practices are working. As a field, writing assessment is necessarily diverse as it aims to set national educational policy or to help a single child in one classroom, as it is used for placement, diagnosis, or grading. It may involve objective tests, holistically evaluated essays, personal journals, or all of these. It may be limited to a single 20-minute writing sample or it may encompass a whole year's work. Because of the diversity of the field and the urgency of the questions, the Center has taken a strategic approach to the study of assessment by concentrating on just three central topics. The first is the highly visible but poorly defined topic of portfolio assessment, which is being widely promoted in schools across the country. The second topic concerns the validity of holistically scored writing samples; such samples are widely used for assessment, but their validity is rarely questioned. The third topic concerns the impact of often hidden cultural differences between readers and writers that influence how we routinely assess the writing we read.

Portfolio Assessment

Although portfolio assessment enjoys great popularity among educators nationwide, there is little agreement about its goals or the methods by which it should be carried out. To find out what people mean when they say that they are "doing portfolios," Center researcher Robert Calfee surveyed 150 sources, including states, school districts, schools, and individual teachers. The survey focused on four questions: How did you get into portfolios? What does the concept mean in practice? How do you do it? and What do you see as the effect of portfolios for your students and for you? In addition, Calfee and his team conducted a 2-day working conference with 24 respondents to obtain information in more depth (Calfee & Perfumo, in press).

Calfee learned first that teachers involved in the portfolio movement feel a strong sense of commitment and personal renewal. Teachers feel ownership of this "bottom-up" movement and report that the movement has provided them with the opportunity to rethink the meaning of their work and their relation with their students. This kind of rethinking enables them to act in ways that affirm their status as professionals.

Although Calfee's respondents claimed that an important purpose of portfolios was to assess students' progress, they did not provide a clear account of how progress was to be measured. In fact, across the varied classrooms the portfolio concept amounts to a virtual anarchy in which "anything goes" in deciding what to include in a portfolio and how to evaluate it. At the classroom level, then, the reliability of the assessment was simply not discussed.

Teachers also showed a definite aversion to evaluation and to the assigning of grades. Teachers were willing to judge individual compositions but were uncomfortable about assessing an entire portfolio. The following comment was typical: "I wish grades would just go away."

Calfee's research demonstrates how important the portfolio assessment movement has been for the personal and professional development of many teachers. It has stimulated a great deal of reflection on fundamental issues of teaching and has afforded teachers a satisfying way to express their professionalism. Calfee further shows that for some teachers portfolios may be most important as a teaching tool—a focus for student–teacher discussions of writing. But it is not as yet clear what role the portfolio movement will play in assessment. The teachers in Calfee's study who “do portfolios” do not seem inclined to use them for grading nor is their attention focused on measurement issues.

Holistic Scoring of Writing Samples

Holistically scored writing samples are widely used to assess students' writing skills and to predict later writing performance. For example, a single holistically scored essay may be used to decide whether a student should be placed in one writing course or another, the underlying assumption being that a student's performance on one holistically graded essay is a useful predictor of how that student will do on later essays such as those that the student writes in school. Further, in some forms of portfolio assessment, it has been proposed that holistically graded essays be used to track students' development over the course of a semester or a school year. The underlying assumption here is that students' performance on such tasks is stable enough that developmental changes would be evident. Given the importance of these applications, it is surprising that the reliability of holistically graded essays for serving these purposes has not been clearly established. Although considerable attention has been paid to rater reliability, that is, the extent to which two raters can agree in evaluating the same essay, very little has been devoted to validity, or the extent to which the student's performance on one essay is related to that student's performance on another. If the validity of holistically scored essays is low, then great caution should be exercised in using them for placement or the assessment of student writing development.

To explore this important issue, the Center sponsored a study designed by J. R. Hayes (Hayes, Hatch, & Silk, 1996) to obtain estimates of the validity of holistically scored writing samples. The data for this study are derived from about 1000 essays, written by 250 students in 13 writing classes at two universities. The essays were selected by the classroom teacher as representing the most important assignments in the course.

In this study, the objective was to answer the question, “To what extent is student writing performance consistent across successive essays?” The basic measure in this study was the correlation between a judge's rating of students' performance on one essay and that same judge's rating of the same students' performance on another essay. If the students who performed well on one essay also performed well on the second, then these correlations, which are measures of validity, would tend to be high.

Averaged over all classes and all judges, the correlation between students' performance on one essay and their performance on another was 16, which is extremely low. Such

low correlations suggest that placement tests based on single holistically scored essays are hazardous. Further, they suggest that holistically scored essays are not likely to be effective if used to track students' development over the course of a semester or a year. These results call into question the widespread reliance that the writing community has placed on holistically scored essays and suggests that we need to look for measures of writing skill that have greater validity.

In response to these findings, Hayes and his colleagues are now assessing the validity of a variety of measures of writing skill which could provide teachers with reliable information that they could use to shape instruction for individual student's needs.

Cultural Differences between Readers and Writers

Understanding the nature of cultural differences is an important first step in developing methods for helping writers—both in school and in the workplace—to avoid communications that misfire from the audience's perspective. Research at the Center is helping writers respond to readers' needs in positive ways that reflect their understanding of their audience's culture and values.

In one project Schriver (in press) explored how 11- to 21-year-old students, drawn both from inner-city and suburban schools, responded to drug education literature. This literature was representative of over 100 brochures, handouts, and fact sheets that the researchers collected from national and local drug prevention agencies. The writers who design the literature, employed both by government and private agencies, differ from their audiences in age and point of view and, often, in race and social class as well. These differences were frequently evident in the students' responses to the brochures.

Although the students who evaluated the brochure represented the age range for which this literature was designed, many students felt “talked down to.” Both the language and graphics suggested to the students that the materials were meant for a much younger audience. One junior high school student felt that the pictures made the brochure seem “...too kiddy [meaning childish] ... it is something you would give to sixth graders.” A 9th-grade student complained, “If I saw this on a rack, I wouldn't read it. If I looked at the picture I'd think it was for 8 year olds and I wouldn't read it.” Another felt that “the author thinks the reader is naive and isn't smart enough to make her own decisions.”

Some students found the brochures racially offensive. For example, one student questioned the significance of a line drawing of a black youth in one of the brochures, “Why is a black man on the inside? Why are black people in all these brochures? I resent this crap!”

Many comments reflected the social distance that the students perceived between themselves and the authors of the brochures. One student remarked, “Well, it seems it's just the facts, and it's goody-goody. You know, ‘Don't do this, don't do that.’” Another said she thought the author was “The establishment. You know, the system.” Others described the author of the brochures as “a person who is definitely NOT street smart.” In fact, one person said, “Oh he's so-o-o-o street

CONCLUSION

smart" to which another student shouted "NOT!" Still another characterized the author as "Someone who would never come to my neighborhood." Schriver's study shows that even when writers have the best intentions, cultural differences can still have an important impact on readers when communication crosses cultural lines.

A second Center project focused on another instance in which readers misinterpreted writers' intentions, but in this case the salient difference was age. Schriver and her colleagues found significant differences in the way college applicants and faculty and admissions counselors judged the applicants' essays. In particular, essays that the students judged to be creative, intelligent, and mature were often perceived by university staff as pretentious, pedestrian, or naive. Such negative judgments significantly reduced the probability that counselors would recommend that the student be admitted.

Presumably, cultural differences of the sort that influence the assessment of college applications as well as drug education literature can also influence the assessment of applications for employment or for bank loans as well as the evaluation of student writing in school. Such research can do more than describe the negative effects of cultural difference; it can also point to ways of enhancing communication across varied types of cultural boundaries.

Center research has shown, not that writing per se is the solution to all our educational difficulties—there is no magic—but rather that writing education and writing-centered activities—from teacher research to partnerships in the schools, the workplace, and the community—can deliver something unique. Writing-based literacy develops social and intellectual capacities in learners and promotes powerful literate practices and skills that can unlock the door to higher levels of performance and success. Ultimately, writing-based literacy is a major factor in solving some of the most pressing problems in education and in our society at large.

We know that research priorities often change as public interests shift. But if there is anything we have learned from our intense and long-term studies at the Center over the past 10 years, it is the centrality of writing and literacy for an individual's success in school and the workplace and its importance to the effective functioning of the larger community. In the future we will need to identify and continue to learn more about the key sites in schools, workplaces, and communities where writing matters most.

CLASSROOM CONTEXTS PROMOTING LITERACY ENGAGEMENT

BACKGROUND

This chapter is based on investigations at the National Reading Research Center (NRRC) that are related to the growth of literacy engagement in elementary school children. At the NRRC, our overarching goal is to study how to cultivate self-determining readers who are the architects of their own learning. Our research is unified by an *engagement perspective* which suggests that productive learners are: motivated, strategic, knowledgeable, and collaborative. Engaged students participate in literacy activities to gain knowledge, perform tasks, and enjoy literary experiences. Motivated by a variety of purposes, they use higher-order strategies such as searching, summarizing, and connecting ideas across genres. Engaged readers are knowledgeable, using what they already know to gain new understandings through text, and they collaborate by socially constructing meanings with peers. Within the NRRC, there are five divisions of research, one of which is related to literacy in conceptual areas such as science and social studies. Within this division we are examining the question: What classroom contexts are associated with growth of literacy engagement in integrated learning situations? To address this question, we are designing and implementing classroom contexts that are intended to promote literacy engagement.

LITERACY ENGAGEMENT IS AN AIM OF INSTRUCTION

Helping students become lifelong readers is a goal shared by most literacy educators. When students learn to enjoy a variety of genres, teachers feel a genuine sense of accomplishment. However, too few students develop into interested, involved readers. Diary studies, surveys, and the 1992 National Assessment of Educational Progress, document that a shocking number of students are alliterate, choosing not to read despite their cognitive ability. For example, 25% of grade 4 and 50% of grade 8 students report reading once a month or less for their own interest. This lack of voluntary reading is problematic, considering that wide reading is associated with recreational enjoyment, reading achievement and general knowledge (Stanovich & Cunningham, 1993), as well as community participation and workplace productivity (Guthrie, Schafer, & Hutchinson, 1991). People extend their minds, their sense of self and their social experience through reading widely and frequently.

Although comprehension has been the primary goal of elementary reading instruction in the past (Pearson & Fielding, 1991), this goal is insufficient. We should not assume that students who can comprehend texts will choose to do so. Developing students' basic skills does not assure that they will

The work reported is a National Reading Research Center project of the University of Maryland and the University of Georgia. It was supported under the Educational Research and Development Centers Program (PR/AWARD No. 117A20007) as administered by the Office of Educational Research and Improvement, U.S. Department of Education. The findings and opinions expressed in this report do not reflect the position or policies of the National Reading Research Center, The Office of Education Research and Improvement, or the U.S. Department of Education.

be inclined select books, read at appropriate times, persist through difficult material, and gain satisfaction from reading. Comprehension must be supplemented by motivation for reading as an objective of instruction. The construct of engagement enables us to join the motivational with the strategic and conceptual aspects of literacy.

To address the development of reading, we emphasize the importance of *literacy engagement*. An engaged reader chooses to read frequently for a variety of reasons, and comprehends the texts appropriately within their context. Comprehending a book entails the deliberate use of prior knowledge and meaning-making strategies (Dole, Duffy, Roehler, & Pearson, 1991), but intrinsic motivation is needed to develop these higher-order strategies and extend them to critical evaluation and the synthesis of diverse sources of information. Intrinsic motivation empowers students to become self-regulating readers who direct their own knowledge acquisition and personal development (Deci, Vallerand, Pelletier, & Ryan, 1991). In brief, engaged readers and writers are strategic, motivated and knowledgeable about the content of their literacy activities.

Strategies for Reading

We believe that a few, broad strategies are useful in higher-order literacy. First, the ability to search for books, resources, and information within texts, is increasingly important to students (Armbruster & Armstrong, 1993) as well as adults (Dreher, 1993). Second, strategies for comprehending texts, including inferring, summarizing, and self-monitoring are indispensable (Dole et al., 1991). Third, students need to be able to synthesize ideas from multiple texts that contain illustrations and documents (Mayer, 1993). Fourth, higher-order problem-solving processes such as clarifying ideas, using analogies, shifting frames of reference, establishing criteria for judging ideas in text, analyzing text structure, and identifying themes in literature are valuable (Collins-Block, 1992). Fifth, strategies for composing should be targeted in instruction, particularly when students are "reading to write" (Flower et al., 1990). Planning, note-taking, organizing, illustrating, integrating, composing and evaluating woven into a network surround student self-expression related to learning from text.

Motivations for Strategic Reading

In our perspective, motivations are internalized goals that lead to reading behavior and strategies (Pintrich & Schrauben, 1992). In this goal-oriented view, motivations are "reasons for reading." One basic distinction drawn in the literature on motivation is between the intrinsic and the extrinsic motivation. Intrinsic motivation refers to the performance of activities for their own sake. Pleasure is inherent in the activity itself (Gottfried, 1985). Extrinsic motivation refers to reasons that originate from outside the learner, such as rewards and recognition.

The richness of motivation for reading is being explored by Wigfield (1994) with a combination of methods includ-

ing open-ended interviews with students, and factor analysis of self-report data on student questionnaires. He reported clear distinctions among several intrinsic motivations including: (1) curiosity, (2) aesthetic involvement, (3) social interaction, (4) challenge, and (5) self-efficacy, and several more extrinsic motivations such as: (6) recognition, (7) grades, (8) competition, (9) compliance, and (10) work avoidance (Wigfield, 1994). Studies show that intrinsic motivations generally tend to decrease during elementary school (Harter, Whitesell, & Kowalski, 1992), although intrinsic motivations increase strategy learning (Corno & Kanfer, 1993), and accelerate students' amount and breadth of reading (Guthrie, Van Meter, Dacey, & Wigfield, 1994).

Conceptual Learning from Text

Although the motivational literature has established a link between intrinsic motivations and the use of higher-order cognitive strategies, the use of a strategy is not usually the endpoint of a literacy activity. Most frequently, school-based literacy is a vehicle for gaining knowledge, which consists of a richly interconnected set of concepts and relations among concepts. Consistent with previous research, we view concepts as rule-based mental representations (Holland, Holyoak, Nisbett, & Thagard, 1986). For young children and adults (Neisser, 1987), concepts expand through the acquisition and differentiation of particular features and the elaboration of relations among the features. Concepts are not usually formed from a single exposure to information, nor are they memorized, like facts. Concepts need to be constructed; that is, people need to create a personal understanding of a concept. Spiro, Coulson, Feltovic, and Anderson (1994) suggest that people form concepts by viewing the same topic from different angles to get a full understanding. Learners construct more elaborate concepts by assimilating or accommodating new information into already existing knowledge structures. When new information fits well with existing knowledge, learners add the new piece of information to the schema. When new information contradicts existing schema, then some sort of reorganization takes place. Therefore, the construction of richly elaborated concepts requires active thinking about new information and how it fits with what one already knows.

To foster higher-order thinking during reading, use of multiple texts may be critical. Wineburg (1991a, 1991b) and Perfetti, Britt, Rouet, Mason, and Georgi (1993) assert that the use of multiple sources offering different perspectives on the same topic can foster the development of more elaborate concepts in all students. Stahl, Hynd, McNish, and Bosquet (in progress), note that high school students who read multiple documents about an incident in history go through a process of integration that is not possible for students who read one text. Because intrinsic motivation is necessary for the formation of richly elaborated, coherent concepts (Pintrich, Marx, & Boyle, 1993), education should support conceptual learning from multiple texts by undergirding students' intrinsic motivations for reading (Head, & Sutton, 1985).

RATIONALE FOR INTEGRATED INSTRUCTION

Many teachers embrace the integration of reading instruction. According to 1992 NAEP data, 97% of a national sample of grade 4 teachers reported that they placed at least a moderate emphasis on integrating reading and writing (Mullis, Campbell, & Farstrup, 1993). In states with standards-oriented reform programs, such as California, Connecticut, Kentucky, and Maryland, instructional integrations were especially prominent. An NRRC study of the systemic reform program of Maryland, which highlights higher-order reading, showed that district-level policies emphasized new goals for incorporating "real-world" reading (trade books rather than text books) and integrations into the curriculum. The largest single policy impact of the Maryland School Performance Assessment program has been to integrate the curriculum (Guthrie, Schafer, Afflerbach, & Almasi, 1994).

Integrations of reading instruction, however, are not always successful. The 1992 NAEP data showed that integrating reading and writing did not show positive effects on achievement (Mullis et al., 1993). Furthermore, researchers rarely investigate other types of integration, such as the integration of language arts and content subjects, although depictions of instructional practices are beginning to be available (Calfee, 1994; Lapp & Flood, 1994; Stevenson & Carr, 1993). Although Meece, Blumenfeld, and Hoyle (1988) are optimistic that project-based teaching in science can help students "think like a scientist," and Brown (1992) found that conceptual knowledge of science was accelerated in integrated instruction, these findings have not addressed reading and language arts.

A few integrated instructional approaches in reading and language arts are designed to foster selected cognitive or social processes besides basic reading comprehension. For example, some programs emphasize the metacognitive strategies involved in problem solving, integrating, and decision making (Collins-Block, 1992). Other programs focus on the social collaboration in peer-led literature discussion groups (Almasi & Gambrell, 1994). Self-expression through the arts and drama and also writing is underscored in many literature-based programs (Lapp & Flood, 1994); critical thinking is highlighted in inquiry-oriented approaches (Brown, 1992; Calfee, 1994); whereas conceptual knowledge learning is foregrounded in secondary school content area literacy (Hynd, McNish, Qian, Keith, & Lay, 1994). Although these approaches are innovative, they are not as fully comprehensive as we believe they could be. We need to find frameworks that include these themes in order to support the development of all of the diverse aspects of literacy engagement.

The instructional framework that we are evolving is consistent with reviews of the motivational literature (Ames, 1992; Ford, 1992; Maehr & Fyans, 1989). Our framework portrays engaging classroom contexts as: (1) *observational*, encouraging students to initiate learning with "real-world" problems and observations (Lepper, 1988; Newby, 1991); (2) *conceptual*, with a focus on substantive topics rather than rewards or skills (Maehr & Fyans, 1989); (3) *self-directed*, supporting

student autonomy and choice of topics, books and peers (Skinner & Belmont, 1993); (4) *metacognitive*, with explicit teaching of reading strategies, problem solving and composing (Collins-Block, 1992); (5) *collaborative*, emphasizing social construction of meaning in communities of readers and learners (Almasi & Gambrell, 1994); (6) *expressive*, creating opportunities for self-expression thorough writing, debating and group work (Oldfather & Dahl, 1994); and (7) *coherent*, containing connections between classroom activities and tasks across the day, week and month (Gamoran & Nystrand, 1992). Our theoretical expectation is that the salience of each of the following classroom qualities will influence the development of literacy engagement.

Inquiries into Integrated Instruction—Elementary

A collaborative team of teachers, reading specialists and University-based researchers at the National Reading Research Center is studying a comprehensive form of instruction that we describe as Concept-Oriented Reading Instruction. At present, three schools near College Park, Maryland, are setting up this instructional approach in year-long programs, and we are charting remarkable growth in children's literacy engagement. To capture the aspects of the classroom context that nurture this enhanced literacy engagement, we videotaped one grade 3 and one grade 5 classroom during the Fall of 1993, obtaining multiple samples of the classroom interactions that were representative of the instructional program. Teachers identified lessons or days that they expected to be characteristic of the program. Thirty-minute portions of classroom interaction were videotaped on eight different occasions for grade 3; 30 minutes of classroom interaction on eight different occasions were taped for both grades 3 and 5 separately. These tapes were analyzed holistically by the first author to identify recurring themes using an analytic inductive method (LeCompte, & Priessle, 1993), revealing seven dimensions. These results were triangulated with the participating teachers. At the end of the academic year, the teachers wrote retrospective accounts of their instruction excerpted here to illustrate each dimension. The findings will be described in concert with findings from inquiries at the secondary level.

Inquiries into Integrated Instruction—Secondary

What does integrated education look like at the high school level? By the time students get to high school, curriculum has been departmentalized. Although integrations are more difficult to accomplish in these conditions, we observed integrations occurring naturally in our studies at the high school level. Our observations of integrations were made as part of a study of the effect of text in helping students learn counterintuitive ideas in science. In this study, students and teachers were videotaped and interviewed during instruction. Field note transcriptions and analysis of videotapes and interviews provided us with not only a view of student learning, but also a view of integrated curriculum.

At our target school, integrations occurred in two ways. In one, content teachers included instruction in areas like

reading, writing, discussion, math, science, and history as part of their course curriculum. A physics teacher, for example, taught students to take advantage of the organized structure of the textbook in order to search for information in a research project. Students learned the value of peer discussion, because they are given time to discuss scientific ideas among themselves before they shared their ideas with the teacher and a wider range of students. Finally, they learned the history of science (e.g., the evolution of thinking from Aristotle, Galileo, Newton, and Einstein). Later, we describe portions of a unit where students integrate several subject areas into the learning of a physics topic.

In another type of integration, teachers followed what has become known as the “middle-school model.” The particular application of the model we observed, teachers in English, science and social science shared the same students. Throughout the school year, teachers planned thematic units that integrated the three subjects. In English, students learned to engage in scientific writing such as is needed in lab reports and learned to report historical research, as well. They read literature that was tied to the theme and discussed the relation between their reading and the topics they were investigating in the other classes. They took field trips with all three teachers attending, so that they could help students observe phenomena from several perspectives. In order for this type of integration to be successful, a team of teachers must work well together and be committed to the extra planning and preparation time. The principal must also be committed to the concept of integration, as was the case in the school we studied. He was interested in developing many options for schooling in the same building—schools-within-schools—and increasing the number of integrations that occur.

Both kinds of integrations embody the characteristics of integrated instruction observed at the elementary school level. That is, the classroom contexts were: observational, conceptual, self-directive, metacognitive, collaborative, self-expressive, and coherent. We will organize our descriptions around these themes.

QUALITIES OF CLASSROOM CONTEXTS

Observational

Elementary School Level. Students receiving Concept-Oriented Reading Instruction began their literacy experience with observations of the “real world” around them. Observing the natural environment, such as trees, grass, and plants, or the social environment, including friends, politicians, or homeless people, was intrinsically motivating, and thought provoking. Students personalized their observations by noticing features that were intriguing and important to them. These personal interests formed the basis for questions and a point of departure for instructional units. Teachers returned to observational activities to enable students to integrate the knowledge gained through literacy and to rekindle their curiosities. One grade 5 teacher summarized the observational dimension of instruction by saying:

Instruction in reading/language arts and science began with firsthand experiences that raised awareness levels in students. From examining the components of a habitat firsthand, to observing crickets up close, to dissecting owl pellets, students developed a springboard that led to further questioning and interest. As interest developed through these experiences books available to the students became the tools necessary to complete the process.

In the Concept-Oriented Reading Instruction we studied, students explored objects and events in their world. After experiencing an initial fascination with tangible objects, students began to wonder and ask conceptual questions. Students brainstormed and explicitly stated the questions they wanted to explore with additional observations, data collecting, reading, writing and discussion. Observing the “real world” was a point of departure for extended literacy, and it provided a frame of reference that enabled students to select reading and writing activities and to self-monitor their pursuits.

Grade 3 classrooms studied the adaptation of animals to their environments beginning with a unit on birds. By observing bird nests, attempting to build their own bird nest, drawing feathers, recording behavior at feeding stations, simulating the gizzard in a classroom experiment, and visiting a display of stuffed birds, students gained knowledge and long-lived curiosity. Students kept journals of their observations and one student reported that:

We built our nest with leaves, grass sticks and twigs. Mud too. But first we looked for each of these things at the playground. Clay was to stick our nest together because if we didn't have clay our nest would break. We called the clay mud. I learned that it's hard to make a nest unless you really try to. I learned that birds have a hard time making nests but we read a book that helped us learn and I found out that if you try with a group it might be easy. And you might make a lot of friends.

Grade 5 teachers initiated the year with a unit on adaptation of plants and animals to the environment. One classroom explored insects beginning with crickets and another explored plants beginning with flowers. To observe insects and life cycles, students collected crickets from the backyard of the school and collected data on the location in the school wildlife habitat area in which they were found, leading to classroom aggregations of individual data. Students brainstormed different ways to learn more about crickets including classroom observations and experiments, additional field observations, reading, and discussing. Students selected an area of interest to them about crickets: habitat or food preference, habits of movement, and interest groups chose a method of study and pursued the approach for approximately two weeks. Grade 5 science goals consisted of habitat, food webs, life cycles and breeding, feeding and shelter as aspects of adaptations.

Secondary School Level. Instruction in high school physics classes was grounded in students' observations of “real-world” tangible objects and events. Students used their observations to give their learning a personal direction. In a gravity unit, the students began with a laboratory investigation. Students brought eggs they had placed in “safe” cartons and dropped them out of the window to observe and time

how they fell. Before they engaged in the drop, students were asked to speculate what weight and different shapes of containers would do to the fall and to write about that. One student, M. B., bragged that he was making his heavier “to make sure it will drop fast and break”. (He had the nonscientific conception that gravity pulls objects of greater weight to the ground at greater speed) and put nails in the bottom of his carton, making it the heaviest in the class. When he actually dropped the egg, he was astounded that his carton did not fall any faster than others that were much lighter. “How did you make yours go so fast?!” he asked another student. Later on this observation gave him motivation to read about and discuss the problem with other students.

In the three-subject integration, students studied the Greeks in history and Aristotelian classification systems in science class. In English, they studied Greek literature. Because the city in which the school was located, near Athens, Georgia, had many examples of Greek architecture, students took a walk to observe examples of Greek culture. Each teacher accompanied these students and helped them pay attention to aspects of Greek architecture and other Greek influences (in education and art, for example). Students took notes on their observations and wrote a journal on the experience.

Conceptual

Elementary School Level. The leading edge of the typical integrated instructional unit in Concept-Oriented Reading Instruction was conceptual. As ways of representing and understanding the world, concepts can be learned through a variety of observations, literacy activities, discussions, and contemplation. Teachers continually reintroduced higher-order conceptual orientations such as the adaptation of plants to the environment, or the relationships of structure, form, and function in the life of a bird or animal. Growth of conceptual understanding was the recurring purpose for many classroom activities, serving as the basis for explaining the observations about an object, and providing a motivation for the students to exercise critical judgment during reading, writing, and discussion. One grade 3 teacher noted that:

“The lines between each ‘subject’ became so blurred that it would have sometimes been difficult to discern what to call it.” “We might be reading content books about birds and writing to extend thoughts and concepts. Our daily schedule was far less tied to the clock than before. Reading time blended into science, and language occurred at all times. Planning became less concerned with preparation of specific lessons and discreet skills and more concerned with the ideas we were seeking today, this week, and this month.”

For example, grade 3 students in Concept-Oriented Reading Instruction focused on learning about birds and their environments. Student questions were placed on the classroom walls, forming the cornerstone of a coherent sequence of learning activities that connected science with language/arts activities. Students were excited and gratified by having their questions legitimated and publicly displayed. Grade 3 conceptual goals included understanding structural charac-

teristics of birds such as beaks and feathers, and functional characteristics such as flying, feeding, and breeding that aid survival.

Secondary School Level. Teachers in both types of integration focused on conceptual development. The goal of each unit was developing understanding of concepts related to that unit, and students were persistent in finding answers to their personal questions about each topic. In the physics integration, W. J. rolled two balls down a ramp and timed them. One was made of wood and the other steel, and he was confused when the time was the same. “I know that all objects are supposed to fall at the same rate. I learned that a long time ago. But no one ever told me why. I need to know why.” Several other students in the class told him that they had read an explanation of gravity earlier. The teacher showed him a copy of the text and he read the explanation. This vignette shows the need for students to understand the phenomena they observe. Because they were focused on learning, these students could use the resources of the classroom, including other students, the teacher, and texts, to help them.

In the three-subject integration, the same emphasis held. One teacher explained,

In everything we did, the goal was conceptual development. While students learned about early times in history, for instance, they learned about archeology and the tools archaeologists used to uncover evidence of early times in science. We tried to focus on that level of integration of learning in every unit.

Self-directive

Elementary School Level. Teachers encouraged students to assume responsibility for their own learning by providing them with a series of bounded choices. Teachers created options from which students could select, and students were encouraged to generate their own plans and preferences wherever possible. Group sets of different folktales were made available to students. Folktales were from different cultures around the world, including Native America. Topics were related to earth-man, or animal-man relationships. Students chose a folktale of interest and worked in pairs, or groups to read. Story elements were discussed, written in journals, and shared on posters in the room. Students directed their learning by choosing subtopics within the conceptual domain, identifying books and resources useful for pursuing those subtopics, working with peers who shared the same subtopics, and developing their internal standards for judging their own literacy. One grade 5 teacher noted that:

Students were most enthusiastic when they had ownership of learning tasks. Tremendous interest and selection of books from the classroom library occurred when students were working on self-selected topics. Many times students read books they were using in their project during free time reading and recorded them on their book logs.

Secondary School Level. Teachers encouraged students to be independent learners and to direct their own learning. One way in which this was done in the physics class was to have students create their own science experiment. After coming

up with a topic for the study, students gathered resources, planned, implemented, and wrote about their research, with the teachers' direction in strategies for conducting the research. In the three-subject integration, students were also taught strategies for writing and studying that would make them more independent learners. Students were given several ways to control their own learning. One teacher commented:

A big part of our curriculum project is that the students choose topics for writing and research that relate to what we're studying. Students work together on projects of their choosing, and they decide what the final product will look like.

Metacognitive

Elementary School Level. Teachers emphasized strategy development. For example, summarizing and note-taking were taught explicitly through modeling, scaffolding, and coaching. Whole class discussions and peer-led conversational groups were conducted to enhance verbal awareness and shared consciousness of strategies for reading and writing. Explicit strategy teaching was one of the basic distinctions between concept-oriented reading instruction and most forms of whole language instruction. As one grade 3 teacher noted:

I spent a lot of time in situated reading strategy instruction. Together we would compare fiction and non-fiction books and how to enjoy them. We discussed parts of a book, how to read the information, note taking strategies, and compiling information. With narrative selections we often talked about common literary elements—character analysis, figurative language, setting and authors' style or purpose. We compared these to the facts, ideas, and explanations that might be included in a good summary of an information book.

In Concept-Oriented Reading Instruction, teaching students how to search was fundamental to enabling them to pursue their interests and answer the questions generated from their observational activities. Students were encouraged to choose subtopics for learning, and to search for books, resources, references, pictures, and explanations of the topics they chose. Initial searches began with a question formulated by each student after firsthand observations keyed-off new ideas. Students began to wonder about new concepts they had not considered before. They found their answers in the classroom books. Students were taught how to search for books in the school library, locate books in the classroom, collect, and use the table of contents, index, headings, and pictures as guides to discovering answers to their questions. Strategies for searching were taught explicitly through teacher modeling, peer modeling, teacher scaffolding, guided practice, and team work. Typically, teachers presented a directed lesson using a class set of one book for all students, emphasizing book organization, relevance of information, appropriateness of detail, extensiveness of the search, and distinguishing among facts, explanations, and opinions.

Grades 3 and 5 students were taught four fundamental processes of search that have been identified by previous investigators (Armbruster, & Armstrong, 1993), including:

- (1) Goal formation, which refers to knowing what you want to find or having an objective for the search activity;
- (2) Categorizing, which refers to understanding how things are organized;
- (3) Extracting, which refers to finding critical details, note-taking, paraphrasing, and summarizing, within a book or resource; and
- (4) Abstracting, which refers to putting ideas together and forming a general understanding. Teachers modeled each of these stages, students discussed them in groups and recorded progress toward each of them in their journals.

To help students in fully comprehending and integrating the texts they found during their search activities, teachers emphasized: determining the topic of a text selection, detecting critical details, summarizing the text, making comparisons between texts, relating illustrations to text, developing criteria for evaluating a book, and critically reflecting on the organization of information and the author's point of view. In thematic units, students become aware of how different narrative and informational texts help us understand a theme in different ways.

Teachers used multiple trade books for all aspects of instruction. Grade 3 students began the year by reading *Owl Moon* by Yolen. At later points in the unit they read *White Bird* by Bulla and *Wingman* by Pinkwater, as well as poetry on birds. Within these books teachers' emphasized imagery, aesthetics of language, and characterization, as well as the traditional constituents of setting, plot, conflict, and resolution. Third graders were taught to use information books to pursue the interests they formulated during the observing and personalizing phase of instruction. "Practice Searches" were conducted, first using teacher-generated questions and later students formulated their own questions and found appropriate informational texts. To help students comprehend books such as *Birds: How to Watch and Understand the Fascinating World of Birds*, teachers provided explicit instruction in identifying topic, details, and writing summaries. Through teacher modeling, peer modeling, and small group discussion students were provided instruction in "fix-up" strategies, enabling students to: (a) use pictures, illustrations, diagrams, and graphs; (b) refer back to their own questions; (c) look up vocabulary in an index glossary or dictionary; (d) break text into parts and put it back together; (e) ask peers and teams; (f) form images about what they know; (g) reread the text in a new way; (h) slow down or speed up; and (i) consult their own background knowledge. In addition to comprehension strategies, students' were taught note-taking and critical reflection on information from expository books. Students learned to critique books using their own questions, interests, and topical knowledge as criteria for judgement.

Grade 5 students who were studying adaptation of plants and animals to the environment read narratives of *Song of the Trees* by Taylor, *Tuck Everlasting* by Babbitt, *Top Secret* and *The Gift of the Tree* by Tresselt. Informational books were interwoven with these narrative books about the theme. For example, *Animal Adaptations* by Penny, was used extensively in one grade 5 classroom to convey the concept of adaptation and to provide a context for instruction in reading strategies. With these materials, teachers emphasized

metacognitive strategies of identifying topics, determining important details, and summarizing sections of texts. They helped students to interpret illustrations, relate text to illustrations, and integrate information across texts. In grade 5 “fix-up” strategies were also taught including referring text against their questions, looking up vocabulary and index glossary and dictionary, subdividing and reuniting portions of texts, consulting peers, forming images, and adjusting speed of reading. Instruction in these cognitive strategies began with an appraisal of strategies students currently possessed, through class discussion and student written statements of strategies they favored. While avoiding strategies that most students already possessed, teachers provided modeling, scaffolding, and guided practice in learning new strategies within the conceptual domain of instruction. When strategies were situated within concepts, their usefulness became apparent to students.

Secondary School Level. As in the integrated instruction at younger levels, teachers in the high school also emphasized strategies. For example, searching for resources and writing reports were explicitly taught. In the very first unit of the three-subject integration, the English teacher started teaching the kids research skills. She taught them about library usage, how to use the computer to search for resources, use the word processor and hypercard, and the conventions for writing in history as opposed to writing in science. They used these skills to complete projects such as the Greek cultural project.

In the physics classroom, the teacher taught students to use journals and logs to keep track of their thinking processes as they completed research projects. She met with students individually as well as with the whole class to explicitly teach students the writing skills necessary for reporting science projects.

Collaborative

Elementary School Level. Teachers created opportunities for students to participate in five different types of social structures, including whole class, collaborative teams, pairs, idea circles, and individual work. Whole-class discussions were held to give directions, organize teams, model strategies, read aloud and entertain or group reports. Time for individual work was provided daily for reading, writing, and reflection. Pairs of students and collaborative teams worked on all phases of instruction. At the outset of the instructional unit the teacher assigned students to teams, but during the middle of a unit students formed interest groups for particular aspects of projects. Within teams students combined their observations, collected data, discussed strategies, and prepared their displays of writing for other student teams. A fourth form of social interaction was idea circles. This structure was designed to enable students to articulate their ideas with a new group of students. In idea circles, students synthesized what they had been learning recently in their project. It was a challenge for students to share conceptual understandings, and perceptions of their own literacy strategies with classmates who are not on their team. Participating in varied social structures was motivating, and it fostered interest in the

books and writing activities that were the subject of collaborative activities. One grade 5 teacher noted that:

Students have learned a lot more about analyzing their reading through idea circles and have enjoyed reading more because of it. The group dynamics of the reading group are different this year and help students to be better readers than usual. In idea circles students who usually do nothing are persuaded by others to do the reading and thinking necessary for a grid group discussion—much better than me bugging them. Most of the students are learning to look for different things in stories and books especially motives of characters and authors’ techniques for organizing information to keep you interested.

Secondary School Level. Teachers in both the physics course and the three-subject integration provided a number of opportunities for students to work collaboratively. Students in science classes worked with partners or in groups of three to complete laboratory explorations. Later, they joined with other lab groups to share data. In these collaborations, students helped one another with both procedural and conceptual parts of their tasks. The following vignette shows how this collaboration helped one student learn a concept.

M. B. (the student who made his egg carton heavier so that it would fall faster) recorded other students’ data on a data table. As he looked at the data he said to the person sitting next to him, “That means that mass doesn’t make a difference. That can’t be. Mass has to make a difference!” Another student who was listening said that it didn’t. M. replied, “I believe it does. I don’t care what anyone else thinks.” Still another student then said, “M, there was this guy named Galileo. He proved that things fell at the same rate.” Others joined in to explain the concept to him. At that point, M. made another comment about how he was not going to change his mind and fell silent. Later he read a text about gravity. When another student expressed disbelief, M. was the first one to point out the fact that objects of differing masses fall at the same rate.

Students in this class also relied on peer tutors to help them with problem solving. Students were often the ones who spoke up during whole group discussion to explain concepts to other students who were having difficulty. When the teacher posed a question, she had students discuss it together before they answered. In these ways, students learned the value of teamwork and sharing ideas. In the three-subject integration, students also collaborated in a variety of ways. For instance, they worked together on projects about Greek culture in groups and formed study groups in English as a way of helping them prepare for tests in English, history and science.

Self-expressive

Elementary School Level. A prominent dimension of the classroom context was student self-expression. From the outset of the instructional units when students posed and published their own questions, to the end of the units when students presented their books to other students, self-expression was honored. Not only were students delighted when their thoughts were accepted in class discussion or

posted on classroom displays, they also aspired to be good at explaining their poems, experiments or written descriptions of invented animals. Particularly as they gained in-depth knowledge of concepts students felt compelled to express their expertise to others. As one grade 3 teacher noted:

They made posters, wrote stories, and yes, reports they presented to other classes. But the important point here is that the motivation to communicate was started by the observation and was an outgrowth of that engagement. Observation led to reading motivation, but we also got motivation for writing that surprised us.

In Concept-Oriented Reading Instruction, students became experts on the topic they had chosen to learn about. As they gained knowledge, and the self-efficacy that accompanies it, students wanted to express their understandings to others. To foster this self-expression, teachers provided instruction that enabled students to present their understanding in many forms, including a written report, a class-authored book, dioramas, charts, and informational stories. Teachers coached students in identifying their audience, organizing their message to the audience, identifying critical details, and elaborating their writing. Students were encouraged to express their understandings about the topics of personal interest in a variety of coherent, persuasive and accurate communications to classmates or other audiences of their choosing.

Grade 3 teachers invited students to make charts about their observations of birds. One class created wall displays of the materials found in bird nests. Another class created charts of adaptive features such as beaks and feet. Students wrote journals which were shared with other students, and small classroom teams composed books on their favorite bird which were illustrated, covered, and shared with other teams. In a book about humming birds, the "chapter" on beaks was entitled *Beaks about Humming Birds*:

The humming bird beaks are very sharp. Their beaks are big as a glue top and long as a glue stick. Their beaks are sharp like a needle and shaped like a "v". A humming bird's beak is small. The parents' beaks are four inches long. Humming birds poke thin beaks into a flower to find out whether it is sweet. They pick hay, grass, and strings with their beaks. Their beaks are good because they can protect themselves by their beaks and they know how to make nests using their beaks.

Grade 5 students communicated their understanding of adaptation of plants and animals to the environment through writing journals, reporting experiments, exhibiting their interpretations of class data, and engaging in two synthesis projects. The first synthesis consisted of inventing an animal, in which each student team selected a habitat, such as the desert. Each student invented an animal and wrote an essay describing the animal and what adaptations enabled this creature to survive in its environment. A second synthesis project consisted of writing informational stories in which each student selected an animal that she was interested in learning more about. They read and discussed their ideas with other students, and composed a narrative about their animal in a form of informational fiction. One story was entitled

"Through the Pearl Colored Eyes of the Snow Leopard." It began:

As the sun rose high above the mountain-filled land of Asia, there in the cliff side two bright eyes appeared. Beautifully and half awake an Asian snow leopard walked out tiredly. Its broad paws, like snow pads, supported the mother snow leopard as she walked down the mountain side.

The warm climate took over all coldness from last night's rainstorm. Her mate lay restlessly in their cave home on the mountainside resting with babies. The male snow leopard, as all do, weight around 100 to 160 pounds. The mother snow leopard set out to find food. Snow leopards eat monkeys, antelope, muntjacs, jackals, peacocks, snakes, sheep, goats, and dogs. 'What should we eat today?' thought mama snow leopard." [Eight pages and six illustrations later this story ends, as follows:]. "At the beginning of November they were ready for the long winter. The mother and father checked to make sure they had all of their food. Then they put their young ones to bed. She had already eaten. They sat to watch the last leaves falling off the trees. Her mate stared into her eyes and saw the reflection on the pearl colored eyes of the snow leopard!"

Students composed imaginative, knowledge-rich tales about a day gecko, praying mantis, wild horse, squirrel, and other creatures. To support their writing, students read descriptive and figurative language in books such as *Tuck Everlasting*, *Moon of the Chickapee*. They were encouraged to apply these writing styles in their books. Informational stories were a popular form of art for expressing interests and exchanging expertise.

Secondary School Level. Students expressed themselves in varied forms. In the three-subject integration, for example, they learned debate techniques in English, studied the origins of debating in history as a topic related to learning about Roman culture, and engaged in debates about medical issues in their science class. This formal method of expression was counterbalanced by more subjective and personal forms such as journal writing, discussion, and informal presentations of their project work to other members in class. In the history class, too, they made portfolios that represented their personal development as a form of self-expression. In the physics integration, students expressed themselves through laboratory explorations, discussion of their interpretations, and a variety of writing activities.

Coherence

Elementary School Level. The instructional framework for enhancing literacy engagement contained interconnected student activities across the day, week and month. As students observed phenomena, read about the topic, wrote about their related experiences, and learned literacy strategies within the theme, students integrated their school life. *Coherence* refers to connections across activities on many levels, including substantive topical linkages, and parallels between the processes of reading and writing. For example, as students learned to support broad principles with details in describing their experience narratively, they began to write up simple science experiments using the same processes. One grade 3 teacher reported that:

Interested students went beyond the classroom to the library and to newspapers, anyplace, for more information on the subjects they were studying in class. My children learned that you don't have to have the same book to explore, investigate, enjoy personal experiences, and gather information. Tradebooks enable students to learn to read, establish strategies, and continue to gain knowledge about their own goal.

In one grade 5, Concept-Oriented Reading Instruction classroom, students experienced coherence through the concept of adaptation. In their initial observational activities, students considered the adaptive characteristics of a hillside behind the school. Gathering plants and insects provided opportunities for exciting, hands-on observations. Questions that children inevitably posed became the basis for concept learning. Self-directed learning began with permitting students to ask their own questions and keep their own journals. Metacognitive strategies for literacy, including finding books, searching for information, comprehending text and enjoying folktales were linked to the theme of adaptation of animals to the environment. When the texts were fused with the observational activities, and reading/writing merged with learning about the hillside behind the school, students unified their school experience. Collaborative teams that shared books about the common theme of adaptation, learned about the useful portions of the books; and they also learned about the processes of constructive social interaction. Finally, when students gained command of the concepts they were exploring, and they gained a sense of competence with the tools of literacy, they became expressive. Ideas about mutual adaptation of plant and animal worlds that emerge from observations, questions, reading, and discussion were synthesized through a variety of communicative arts. Coherence culminates in the integration of literacy as an avenue of engagement between self, the social and the natural worlds.

Secondary School Level. We observed highly interconnected learning activities in both types of integrations. The fabric of reading, writing, discussion, and content learning appeared to be seamless. Literacy was situated in specific tasks related to

students' learning of content, making them relevant and purposeful. In the physics class students read texts to help them explain their lab observations. They wrote journal entries about their thinking process, and discussed their thoughts with peers. In the three-subject integration, students read literature learning about theme, figurative language, and political conflict at the same time. Connections between the literature they were reading and the time period they were studying in history were abundant. These interconnections afforded students with ways of looking at the world that encouraged critical thinking.

CONCLUSION

The notion of engagement moves teachers and researchers beyond models of literacy as a language process or a set of cognitive competencies. An engaged reader, of any age, possesses a desire for literacy. Her intrinsic motivation powers her conceptual understanding and aesthetic enjoyment, which foster a lifelong disposition for reading. However, literacy engagement does not spontaneously arise for all students, and engagement is not sustained for long periods unless teachers nurture it. Our collaborative inquiries reveal that the tapestry of literacy engagement is best supported in classroom contexts that contain integrated instruction. Because engagement unites motivations with strategies and conceptual learning, it is sensible that classroom integrations of conceptual, strategic and motivational themes should be particularly promising. Many questions arise from our view of engaging classrooms: Does integrated instruction work well for multicultural populations? Can it be instituted school-wide? What are the professional development experiences needed to support teachers in these classrooms? What are the costs? Although not all these questions are addressed yet, we are optimistic that answers will be forthcoming as an increasing number of literacy professionals build integrations into the classrooms for which they are responsible.

STANDARDS IN THE LANGUAGE ARTS

P. David Pearson

MICHIGAN STATE UNIVERSITY

Beginning in 1989 when the governors blessed the concept of standards as a major tool of educational reform in our nation, the public rhetoric about high and rigorous standards has gathered momentum steadily throughout the early 1990s. Encouraged by the success of the curriculum standards in mathematics (NCTM, 1989) federal and state policy makers supported the development of standards in other curriculum areas. The early 1990s saw federally sponsored curriculum standards projects funded in the arts, civics, English, geography, history, science, and foreign language (even if not all met with uniformly high success, including the Standards Project in English Language Arts). In an even earlier effort, the National Board for Professional Teaching Standards (NBPTS, 1990) began the process of developing standards to guide the creation of assessments for the advanced certification of teachers. States got into the standards business very early, some even before the watershed governor's conference of 1989 (e.g., California, 1989), and the momentum for state and local standards development was enhanced by federal legislation promoting their development and mandating their use.

The purpose of this chapter is to acquaint the reader with the state of standards in the English language arts as the profession readies itself to enter a new century of curriculum development, debate, and reform. In accomplishing this purpose, I hope to provide insight on several issues:

- (1) What are standards?
- (2) What does (did) the standards terrain in English language arts look like in the middle of the last decade of the 20th century?
- (3) What sorts of standards are possible? likely to be set?
- (4) What are the dangers in this whole process?
- (5) What, if anything, do we as a professional community have to gain by participating in a standards setting effort?

DEFINING STANDARDS

The dictionary definition

The dictionary is an informative starting point in our quest to understand standards (Merriam-Webster, 1983). These four definitions are instructive for our efforts because they capture the variety of meanings that people in our field extend to the term:

standard (stan' derd): (1) something that is established by authority, custom, or general consent as a model or example to be followed; (2) a definite level or degree of quality that is proper or adequate for a specific purpose; (3) a carefully thought-out method of performing a task; (4) any measure by which one judges a thing good, authentic, or adequate. Synonyms: criterion, gauge, yardstick, touchstone, test.

The first definition captures the idea of standards as a vision of what we are about, what we stand for, and what we want to encourage in curriculum reform. Definitions 2 and 4 are more likely to become operationalized as tests or assessments; taken together, they could specify *what counts as evidence of meeting a standard* as well as "*how much*" of that evidence is required for meeting it. Definition 3 is a little different since it deals more with process than outcome. The clearest example is the "standard" routine one has to follow to receive high marks in a ice-skating or gymnastics competition; the closest example in teaching and learning might be meeting a standard for working one's way out of a math problem or a writing difficulty by employing a problem-solving heuristic.

Metaphors from the field

Dictionaries are not our only source of insight about the meaning of standards. Based upon an inspiration by Elizabeth

Stage (1992), my colleague Lizanne DeStefano and I (DeStefano, & Pearson, 1994) have been collecting metaphors from different speakers and writers—metaphors they have used to explain what they mean by standards. Our search for metaphors has been fascinating and instructive, especially when we attempt to attach them to the four dictionary definitions we have found.

Group 1. Identity, priorities, and core values—this is the essence of these metaphors. Consistent with dictionary definition #1, they deal with issues such as what we stand for, who we are, and what constitutes our essence. We have found:

- a banner on a pole (carried by a standard bearer, the leader of the parade)
- a foundation or platform (on which we stand)
- a vision (a dream of the possible)
- a framework or a blueprint (from which we will fashion our entire effort)

These “identity” metaphors tend to show up in broad goal and missions statements. The 1989 Mathematics standards (NCTM, 1989), for example, intentionally incorporated the standard bearer metaphor to characterize what the whole movement was about. Romberg (1993), writing about the math standards, reiterated this metaphor in the title of his article, “NCTM Standards: A Rallying Flag for Mathematics Teachers.” Sizer and Rogers (1993) talk about standards as “images of excellence.” It is largely this metaphor that stands behind the standards effort of the NBPTS, most notable when they talk about standards as a way of enhancing the professional stature of teachers (NBPTS, 1990).

Group 2. This set connotes *direction* or *momentum*. Consistent with the first definition, they address the question, Where are we headed? Our search through the standards literature revealed many:

- an engine (of reform)
- a mountain to be climbed (with many routes to the top)
- target
- milestone
- guidance system

Stage (1992; 1993), in discussing the standards work in science, has demonstrated just how richly one can extend these metaphors. The mountain, for example, permits many extensions: We all want to get to the top, but there are many routes. Some go straight up the slope while others meander along a less acute angle of ascent. Some stop to take stock or appreciate the journey itself while others wear blinders that limit vision to nothing but the goal. Some do it on their own while others assemble considerable assistance in the form of maps, machinery and guides.

The engine metaphor has been used by leaders of the New Standards Project (Simmons, & Resnick, 1993) to emphasize the critical role that standards and, even more important, the assessments that accompany them will play in stimulating real reform in our nation’s schools. As far as a dictionary match goes, the metaphors in Group 2 are most consistent with

definitions 1 (identity) and 3 (processes); while they do address, at least implicitly, issues of identity, they can also specify procedures and methods of accomplishing goals.

Group 3. The metaphors in Group 3 connote either the *type* or *the level of performance* involved in gathering evidence about meeting standards. They provide answers to one of two questions: (1) What counts as evidence (definition 4) that a person has achieved a standard? or (2) How high a score or level (definition 2) do you have to achieve on a particular measure to demonstrate that you have mastered the standard? These metaphors include...

- high jump bar
- hurdle
- thermometer
- boundaries
- test itself
- litmus test
- rubric

These performance-oriented metaphors, which identify either the measure of a standard or the degree of achievement on that measure needed to meet a standard, are probably the most common meaning of standard in everyday discourse. When people talk about meeting a standard, this is the meaning that underlies their use of the term. It is certainly the meaning that underlies the use of standards, for example, in athletics; each spring, our sports pages report the list of college athletes who have *qualified* for the National Collegiate Athletic Association finals because they have reached the standard. The qualification dimension is critical in the standards conversation. It emerges in the form of certification for teachers (NBPTS, 1990 or INTASC, 1993), initial mastery (as in the New Standards Project) for students, and a host of other gatekeeping functions.

Test, litmus test, and rubric foreshadow one of the stickiest of all issues in the standards conversation—the relationship between standards and assessment. In the minds of many, there is no substantial difference between standards and assessment because assessments are means that the field will use to evaluate whether students, teachers, or schools have met the standards. It is a small step from this observation to the conclusion that standards will become just one more tool to alienate those groups of students who are not currently well served by our schools and therefore do not perform well on those indices typically used to evaluate performance. The rubric metaphor, because it comes from recent developments in performance and portfolio assessment, raises the possibility of greater equity. Whether these new traditions prove any more empowering and useful to those populations traditionally marginalized by our schools is an open question, one that can be answered only by observing their impact.

Group 4. The metaphors in Group 4 connote transactions among individuals and / or politics about meeting particular responsibilities. They include

- responsibilities (of students, teachers, and schools)
- rights (that students or parents or teachers possess)

- opportunities (that schools and teachers are obligated to provide to students and parents)

These metaphors are related to none of the definitions found in the dictionary. This is not surprising because these metaphors are relatively new in the national standards dialogue. These metaphors have arisen because some groups have come to regard standards as a way of ensuring that the clients they represent get a fair shake from the educational system.

Within this set of metaphors, standards become a compact: "We will hold our kids accountable to achieving particular performance standards if you will guarantee resources (plant facilities, materials, and teacher expertise) and curriculum that will gain them access to the higher literacies." New labels such as delivery standards and opportunity to learn standards have arisen to accommodate these transactional relationships. They represent a twist on the use of concept of standards that even our lexicographers have not yet discerned. But, they are likely to dominate the standards discussion in the future. The fact that between 1993 and 1995 an increasing number of sessions on the annual program of American Educational Research Association addressed these transactional standards, suggests that they have captured the attention of the educational research and policy community.

In a very broad sense, professions, including teacher education, have always recognized this transaction between accountability and resources. While one may argue about the appropriateness or rigor behind accreditation standards, such as those of the NCATE (National Council of Accreditation in Teacher Education, 1994), colleges that hold themselves accountable to these standards are promising to provide a level of resources and curricular opportunity sufficient to allow their students to meet licensure or certification requirements. High schools that submit themselves to accreditation by regional bodies make a similar implicit contract with their students. Those who currently favor delivery and opportunity to learn standards as the quid pro quo for content and performance standards would probably agree with the goal of accreditation efforts but criticize them for their predisposition toward compliance rather than vision and their privileging minimal over high and rigorous standards.

As a political phenomenon, opportunity to learn standards have proved the most controversial to implement. While logic of the argument seems self-evident—that individual entities, be they persons, teachers, schools, or states, ought not to be held accountable to performance standards unless the authorities holding them to account provide resources and opportunity, the politics are anything but self-evident. In fact, many politicians fought hard to either eradicate or dilute the opportunity to learn language when standards bills went through the Congress in 1994.

Types of Standards

As the standards movement has gathered momentum through the early 1990s, the typology of standards expanded correspondingly (NCEST, 1992). We began with basically two concepts, content standards (what students should know

and be able to do) and performance standards (how much is enough on any given content standard), and now we have expanded the category to include delivery standards, opportunity to learn standards, assessment standards, instructional standards, and standards for the process by which standards are created, discussed, adopted, and adapted (National Educational Goals Panel, 1993).

Content Standards. In the national lingo, content standards (what some call curriculum standards) answer the question, What should students know and be able to do? Not surprisingly, they also answer the question, What should teachers teach? They can be very broad:

Students will construct meaning from written text, moderately broad:

Students in grades K–4 will respond effectively and cognitively to significant aspects of narrative, such as character, mood, tone, plot, and authorial craft,

or very specific:

Students in grade 9 will demonstrate mastery over the essay form of writing by composing a tightly organized, grammatically acceptable, compelling essay of 500–600 words detailing the costs and benefits of environmental legislation.

Depending on the language used and the curricular grain size used, they can resemble the well-worn (worn out?) behavioral objectives of the mastery learning movement of the 1960s and 1970s or broad statements of goals or curricular intent. While some have focused on statements implying student accountability, others (e.g., Marshall, 1993) have focused on curricular opportunity in redefining content standards as the curricular experiences in which every student has a right to participate. For example,

Students should experience multiple opportunities to read complete, authentic texts in a variety of genres.

The early versions of the federally defunded Standards Project for English Language Arts (SPELA) had settled, at least tentatively, on standards for teaching and learning, standards that implied both opportunity and student knowledge. For example,

Students make active use of what they already know, what they learn through inquiry, and their reflections on learning to become more sophisticated at making meaning, solving problems, and constructing new knowledge.

The principle of the SPELA was to create standards that implied accountability for both students (growth in constructing meaning and solutions) and teaching (providing a classroom ecology in which students are encouraged to integrate rather than compartmentalize knowledge). Hence, the SPELA dual commitment to standards for *teaching and learning*.

Performance Standards. In the national lingo performance standards answer the question, How much is good enough? They describe and prescribe the specific levels of performance on specific tasks that students need to achieve in order for schools and society to conclude that they have met a standard. The achievement levels sponsored by National Assessment

Governing Board for the 1992 National Assessment of Educational Progress state-by-state trial are prototype performance standards; they define the precise cut score that a student must achieve in order to be classified in the basic, proficient, and advanced levels of achievement. If one had access to a rubric for scoring a writing prompt accompanied by anchor papers illustrating each score point in the rubric, one would have a clear picture of the performance standards for at least that particular task.

The Arts Standards project (Consortium of National Arts Education Associations, 1994) took an interesting approach on performance standards. At least for the higher grades, their current plan is to present a fairly broad content standard, such as:

Standard: Understanding how music relates to the other arts, followed by "achievement" standards, at both proficient and advanced levels.

Proficient: Students describe both common and unique features of two or more arts within a particular historical period, style, or culture (e.g., Baroque, African-American, Japanese).

Advanced: Students describe the similarities and differences in the use of elements, processes, and organizational principles among the arts in the 18th, 19th, and 20th centuries.

It is at the interface between content standards and performance standards that we would expect both the professional and the public debates to become heated. In the language arts, for example, it is one thing to hold a national conversation about the literacy curriculum—debating the type of tasks, contexts, and collaboration that students ought to experience, but it is quite another to pinpoint a specific score on a specific exam that students must achieve or a specific set of criteria that students must meet before we can declare them literate. Experience bears out this expectation. During the development of tools for the New Standards Project, it was always the specification of "how much is enough" that kindled the most vehement debates. For example, we had no trouble agreeing that students should "read widely", but the process of agreeing on a performance standard which specified a certain number of books per year (see New Standards, 1995) proved to be quite contentious within our ranks.

Delivery Standards. Delivery standards are included as a historical footnote only. They entered the standards dialogue fairly early on in the conversation. As groups such as the National Governor's Conference, the National Council on Standards and Testing, and the National Goals Panel debated the question of how to invest schools in content and performance standards, those who worried about the plight of teachers, especially teachers who had to cope in underfunded urban and rural schools, began to argue that schools, teachers, and students could and should not be held accountable to higher standards unless they could be assured that they would receive the resources needed to achieve them. Delivery standards soon became the "quid pro quo" in the standards dialogue; the bargain seems to be transparent: Give us more and better schools, materials, and professional staff, and we will give you students who achieve higher scores on tougher

standards. Now that the term opportunity standards is being extended to embrace resources, the term delivery standards has fallen into disfavor.

Opportunity to Learn Standards. This has been the very latest entry into the standards dialogue. While related to delivery standards in the sense that they both represent the allocation of resources to teaching and learning, opportunity to learn standards emphasize curricular opportunity more than material resources. They provide an answer to the question, What evidence is there that students have had an opportunity to participate in a curriculum that would help develop the skills, understandings, and dispositions that would enable them meet the standards to which they are being held accountable? Opportunity standards can be viewed as the obligations that schools have to their clients, the students and parents of our country. The logic of opportunity standards can be extended upward in the political hierarchy: schools are obliged to provide opportunities to students and parents; districts are obliged to provide opportunities (or at least the resources that make it possible to create opportunities) to schools; states to districts; and the federal government to the states. The concept is, in principle, quite useful, especially in contrast to the notion of delivery standards. It allows us to point out, for example, that even though two groups of students may have equal material resources, they may be receiving vastly different, and hence inequitable, curricula. Starting in 1994, the terms delivery standards and opportunity to learn standards came to be used interchangeably, thus denying us the capacity to distinguish among notions such as material resources (buildings, teaching materials), teaching capacity (better student to teacher ratios) and curricular opportunity. By 1995, the term delivery standards had been subsumed under opportunity to learn.

Assessment Standards. These are the standards that we use to evaluate the quality and validity of our assessment tools. Assessment standards are not new. For about the last 3 decades, the American Educational Research Association (AERA), the American Psychological Association (APA), and the National Council on Measurement in Education (NCME) have collaborated to define, elaborate, and disseminate standards for the productive use of a variety of measurements of human behavior (1985). These standards, intended to guide test constructors and test users in the application of assessment, deal with a wide range of technical, epistemological, and ethical issues in the construction and use of data from a wide range of types of tests, assessments, and evaluation procedures, including many informal and clinical procedures. More typical of recent entries into this effort are the assessment standards developed jointly by the National Council of Teachers of English (NCTE) and the International Reading Association (IRA) or the assessment standards evolving from the effort to develop national standards in science. The NCTE / IRA joint statement on *Standards for the assessment of reading and writing* (1994 cf., p. 2452) is a prototype for these sorts of standards. The standards are provided, according to the task force that drafted them, "to guide decisions about assessing the teaching and learning of reading and

writing.” Unlike the AERA / APA / NCME statement, the NCTE / IRA standards de-emphasize technical aspects of assessment in deference to their epistemological bases, ethical characteristics, and political uses. The literacy assessment standards are much more likely to discuss under whose aegis the assessment was created and the consequences of their use. More on this document is given later in this chapter.

Also interesting are the assessment standards for the science standards movement. As of early 1995, they were working on five standards, which taken as a unit, examine most of the types of decisions for which assessment data are used in our culture:

- Assessment in the service of teaching and learning (teacher perspective—what teachers have to know in order to deliver instruction).
- Assessment in the service of learning (student perspective—what students have to know to evaluate their own learning).
- Assessment for decisions about individuals (the importance of fairness and equity for high stakes assessment).
- Assessment in the service of policy (how to help policy makers make good decisions).
- Assessment to monitor the system (how to balance the assessment of attainment [student achievement] and opportunity to learn [holding the system to account]).

Standards for Standards. As redundant as it may sound, we do have standards by which to judge the validity and efficacy of standards that are created by various groups. In 1993, the National Educational Goals Panel commissioned a committee of distinguished Americans to develop standards that could be used to evaluate standards that are currently being developed by the various national standards movements as well as standards developed by the states. In summary form, these are the standards they developed.

“For subject-specific standards to be judged worthy of certification (p. iv),” they must be

1. world class
2. important and focused
3. useful
4. reflective of broad consensus-building
5. balanced between competing requirements for depth versus breadth, specific versus flexible, theory versus fact-driven, knowledge versus application, forward-looking versus traditional
6. accurate and sound, clear and usable
7. assessable
8. adaptable
9. developmentally appropriate

NAVIGATING THE CURRENT STANDARDS TERRAIN

It is no mean feat to keep straight the various standards movements currently active in the field of the English language arts, let alone the field of education more broadly

construed. Not only do their names contain many overlapping terms and phrases, but their purposes and conceptual structures are often intertwined. In the ensuing section, I attempt to describe these various standards setting efforts in the hope that all of us, including myself, can ferret out commonalities and uniquenesses among the projects.

National Standards Projects within the English Language Arts Field

The English Standards Project. The English Standards Project experienced a rocky beginning. It started as a federally funded collaborative project of the Center for the Study of Reading, the IRA and the NCTE to set standards for the teaching and learning of the English language arts, K–12. The SPELA agreed to set content standards for the teaching and learning of the English language arts. The project tried to describe what students “should know and be able to do” at various stages of their school careers.

The project began in October 1992 and was slated for federal funding until October 1995. It was obligated to deliver a set of curriculum standards to the Office of Educational Research and Improvement by the October 1995 ending date. The primary governing body was a National Board which bore the responsibility for setting broad policy directions for the project and receiving, reviewing, critiquing and endorsing the standards developed by the project. The actual writing of the standards was to have been completed by three task forces, one each for Early School, Middle School, and Secondary School. These three task forces were to have met approximately twice yearly in weeklong retreats to draft and revise standards in response to review by the profession. Each of these task forces was supported by a staff member and an Executive Secretary, whose responsibility was to translate the work of the Task Force at these retreats into language that could be shared broadly for review, critique, and consensus.

Between Task Force meetings, IRA and NCTE were to engage in broad-based critique and consensus processes within their organizations. Additionally by working through state departments, other professional organizations, and other interested groups, the project was to have extended this critique and consensus process as far and wide as possible. There was even a process by which *any* group of interested individuals could bid to become a task force charged with “official” review responsibilities.

That I talk about this project in the past tense should not be dismissed as a grammatical error; the project no longer exists, at least under federal sponsorship. On March 18, 1994, the University of Illinois received a letter from officials within the Department of Education terminating the project as of March 20, 1994. Specifically, the Department of Education officials criticized the project on two counts: (1) introducing process criteria and opportunity to learn standards into what they (the Department) said should be exclusively content standards, and (2) failing to address key issues in the field, such as invented spelling (it was not clear which side they wished us to take) and the “canon” in children’s literature.

Diane Ravitch, in her recent book on Standards (Ravitch, 1995) commented that the project could not even agree on whether English should be taught, referring no doubt to the fact that in its guiding principles, SPELA came out foresquare for supporting and honoring students' primary languages and cultures while they were in the process of developing competence in all aspects of English.

Shortly after the demise of the federally sponsored project, IRA and NCTE each committed \$500,000 of organizational resources to completing the project with federal support, and, of course, without federal oversight. At one point, the Department of Education considered funding a second English standards project; however, they received so many letters from schools, local organizations, and individual teachers of reading, language arts, and English, that they decided to "leave it to the profession." During the period from Fall, 1994 until March, 1996, at which point the Standards were released, committees comprised of IRA and NCTE members worked feverishly to complete the document and to negotiate the political support within the organizations and the broader profession of language arts educators to guarantee their acceptance upon release. Initial public reaction to the standards was decidedly mixed. Many commentators from the news media (e.g., the *New York Times* and the *Washington Post*) responded quite negatively, calling the standards vague and useless and accusing the project of a variety of sins, ranging from the overuse of educational jargon to a disregard for the importance of learning standard English to abandoning traditional values in English in favor of promoting cultural relativism. Others, however, praised the standards for avoiding the very temptation (cited as a weakness by the press) to provide standards that were so specific as to marginalize the role of states, districts, schools, communities, and individual teachers in crafting local standards and curriculum frameworks and for creating an inclusive net that recognizes and celebrates the cultural and linguistic contributions of the myriad ethnic groups that comprise our national heritage. Their ultimate impact, I believe, will only be known a decade from now.

There are many lessons to be learned from SPELA, most of which are inappropriate for an encyclopedia entry. Two, however, are fundamental, and should never be forgotten by the profession. First, professional groups may be better off without federal entanglements. What we gain in dollars to get the work done may not be worth the potential loss of our professional efficacy and independence. Second, history, I believe, will demonstrate that we were right to link teaching and learning as seamless and complementary constructs. Even though in the process of linking them, we were accused of infusing opportunity to learn into content standards, that is, and most of us believe this to be true, the only defensible ethical position to take. It is unethical to create standards for student performance or teacher performance without providing for delivery standards (resources) and opportunity to learn (access to the curriculum).

The New Standards Project. This assessment-driven reform effort, headed by Lauren Resnick of the Learning Research and Development Center at the University of Pittsburgh and

Mark Tucker of the National Center for Education and the Economy, is a consortium of 17 states and 7 major cities which has taken on the task of developing a system of alternative examination procedures (portfolios and instructionally embedded performance exams) as the cornerstone of curriculum reform in schools. A basic assumption is that our current crop of norm-referenced standardized tests and criterion-referenced curriculum tests are responsible for much of the narrow, irrelevant, and uninteresting curriculum that our teachers and students have to endure. Therefore, the argument goes, if we could only create an examination system that was thoughtful, challenging, relevant, and interesting, we would spawn a whole new generation of curricula. These new curricula would at once satisfy students' needs for relevance, teachers' needs for efficacy, parents' needs for assurance, and the needs of business and industry for a workforce of literate, collaborative, internationally competitive problem solvers. In short, since bad assessments got us into our current curricular troubles, good assessments can jolly well get us out!

About 5,000 K-12 teachers across the country, at one time or another, have been involved in the work of the New Standards Project, attending national or local workshops and/or experimenting with NSP materials and processes in the classroom. The NSP Literacy Unit, housed at the NCTE from 1991-1996, has had a three-stage history. In the first stage (1992), teachers from NSP partners were brought together to score integrated English language arts tasks for writing and response to a reading. This initial work introduced performance assessment, including scoring rubrics, anchor papers, and performance standards, to thousands of teachers who had not previously been involved in performance scoring and established the NSP goal and message as a serious endeavor.

Thousands of teachers across the country were brought together to develop a second batch of (hopefully) more sophisticated language arts performance tasks—tasks which would provide students with the opportunity to read and respond to entire pieces of worthwhile literature and write to thematic related prompts which would respect the basic principles of process writing as it has evolved over the last quarter century. Task development required that teachers find reading selections which would elicit engagement from 4th, 8th, and 10th graders; develop and pilot questions on these selections, questions which would challenge the reader to think about the reading selection at several different levels of cognitive and aesthetic engagement; develop rubrics and scoring procedures for piloted tasks, including experiments with both holistic and analytic scoring procedures; and prepare interpretative commentaries on scored tasks, complete with examples of student responses at each score level. During the development of tasks, there were experiments with various types of scoring and with a process for certifying various kinds of scores. The goal in stage 2 task development was to develop a large pool of tasks sampling all parts of English and the English language arts curriculum. These tasks were accompanied by scoring guide consisting of rubrics, benchmark papers representing various score points in the rubric, and interpretive summaries describing how the rubric

was applied to each benchmark paper. The basic idea was to make available to teachers in New Standards partners a large set of assessment tools from which they could select those most relevant and appropriate to their situation. What would set these tasks apart from others is the broad-based consensus underlying their development (thousands of teachers from all around the country would have agreed upon their efficacy and validity) and the availability of nationally constituted benchmarks for calibrating the performance of students, schools, or even districts.

Stage 2, the portfolio stage, began in 1993 and has continued to progress ever since. Based upon the advice of experienced portfolio users, New Standards developed agreements with 21 teams of teachers around the country to craft a New Standards portfolio system during the 1993–94 school year. The long-range goal was to develop the materials, procedures, and staff development resources needed to implement a real portfolio assessment system, one that would have consequences for individual students and schools, by the 1998–99 school year. The short range goal was to build the materials and expertise within New Standards partners to implement a portfolio tryout in the 1994–95 school year. Working closely with our 21 portfolio consultant teams (3 teams at each of the elementary, middle and high school levels), they developed—through a process of successive iterations—outlines, menus, rubrics, handbooks (for students and teachers) and standards for our portfolio system. After a year of experimentation, they settled on a standards-based approach for a 1994–95 tryout. In the standard based system, teachers and students are provided with a menu of standards, along with examples of the range of entries that might be used to demonstrate mastery of each standard, as targets to guide the development of New Standards portfolios for each student. The key information is provided in the form of a student portfolio handbook in which the standards and the guidelines for portfolio preparation are presented in language that is (hopefully) accessible to the target student audience. The challenge here is that if the student is the client for the assessment system (and the audience for the materials developed), communication with other key stakeholders (teachers, parents, and policy makers) will be transparent. During 1994–95 school year, about 2,000 teachers in the NSP Project piloted this process and participated in partner scoring conferences in the spring and the first national benchmarking of portfolios during the summer of 1995.

Performance tasks developed in stage 2 were added to the portfolio as a “common tool” (Valencia & Place, 1994) and an audit mechanism. Teachers at each NSP site included a commonly scored integrated language arts performance task. The inclusion of this task, along with the appropriate scoring materials, permitted NSP to evaluate scoring consistency across sites. The utility of this common tool in calibrating between site scoring is critical. Clearly, a system in which individuals from different sites come together for direct moderation of scoring practices is preferable but also more expensive. If it can be demonstrated that one or two commonly scored tasks can be used to compare scoring tendencies across sites, then the profession may have a cost-effective way of establishing statewide, national, or even

international benchmarks.

Stage 3 of New Standards will come after this portfolio pilot / tryout phase, when the assessment system (some combination of portfolios, on-demand performance tasks, and / or projects) is used to make decisions of consequence about individual students (for example, does the evidence presented support a decision to award a diploma or a certificate on initial mastery?) or schools or districts (does the program provide evidence of promoting accomplishment among its students OR does the program offer students the opportunity to learn the knowledge and skills they will need to demonstrate mastery?). The assumption that New Standards is making, of course, is that when schools have in place assessment systems that are challenging, engaging, and based upon completely open and transparent standards, all the stakeholders (students, teachers, parents, and policy makers) will—perhaps even collaboratively—build, support, and participate in high quality curricular programs.

NAEP Achievement Level Standards. The National Assessment Governing Board (NAGB), for the 1992 trial state-by-state assessment in reading, writing, and mathematics (and for the 1994 trial assessment in reading), decided to develop a new, more publicly accessible system of reporting NAEP results. In the previous system, the proportion of students who perform at or above key 50 point intervals (e.g., 250, 300, 350, etc.) on the NAEP scale is reported; these 50 point intervals are anchored by items judged by experts to be prototypical of those intervals. In the system proposed by NAGB, these 50 point intervals and the items representing them would be replaced by categories based upon standards defining broad performance levels (below basic, proficient, and advanced) accompanied by items that typify those levels. In order to anchor these levels within the set of items and tasks within the NAEP framework, NAGB proposed a process of using the judgments of representatives from the professional and lay communities to set cut scores for basic, proficient, and advanced levels of performance. As of the summer of 1993, American College Testing Company, the contractor for NAGB had completed the process, using the modified Angoff procedure, in which professional and lay judges predict the proportion of students at each performance level who will answer each item correctly or who will perform each task (e.g., a writing prompt or an open-ended response to literature probe) at a given level of sophistication. From these judgments, cut scores are established for the borderlines among below basic, basic, proficient, and advanced levels of performance. The net result of all this effort is the capacity to report the percentage of students who perform at each of these performance levels.

Without question, this is the most wide-scale attempt in the United States to use performance standards to report student achievement data. The attempt has been met with considerable criticism, both from the English Language Arts community and the broader assessment community. The nature of the criticisms range from the basic invalidity involved in trying to reduce something as complex as reading or writing to a cut score on a test, to problems with the Angoff procedure as a means of setting cut scores (DeStefano, &

Pearson, 1994), to the construct validity of the entire NAEP operation (Bruce, Osborn, Commeyras, 1993)

The Joint NCTE / IRA Task Force on Standards for the Assessment of Reading and Writing. In 1994, the governing boards of NCTE and IRA approved a set of standards for evaluating literacy assessments; they were developed by a joint task force that had worked on the project since 1991. These are *not* performance standards that, once applied to assessments, could be used to evaluate whether students had met a standard. Instead they are standards that can be used to evaluate *tools* that we use to assess language and literacy. In essence, they hold assessments to account:

1. The interests of the student are paramount.
2. The primary purpose of assessment is to improve teaching and learning.
3. Assessment must reflect and allow for critical inquiry into curriculum and instruction.
4. Assessments must recognize and reflect the intellectually and socially complex nature of reading and writing and the important roles of school, home, and society in literacy development.
5. Assessment must be fair and equitable.
6. The consequences of an assessment procedure are the first, and most important, consideration in establishing the validity of the assessment.
7. The teacher is the most important agent of assessment.
8. Assessment process should involve multiple perspectives and sources of data.
9. Assessment must be based in the school community.
10. All members of the educational community—students, parents, teachers, administrators, policy makers, and the public—must have a voice in the development, interpretation, and reporting of the assessment.
11. Parents must be involved as active, essential participants in the assessment process.

These are radical assessment standards. If taken seriously, they would lead to a complete overturn of our current assessment systems, at least in the United States. The requirements for involving teachers, students, parents, and the community in the assessment process would lead to a major alteration of the very process of developing assessment procedures, not to mention a significant change in the way data are reported to various constituencies.

The Pacesetter Initiative of the College Board. With strong representation from the English language arts profession, the College Board has embarked upon a new curriculum development initiative that has major implications for the teaching and learning of the English language arts at the secondary level. Building on the success and popularity of its advanced placement syllabi and assessments, the College Board is trying to build a rigorous, thoughtful, and inviting curriculum for all students, not just those who are bound for college (see Payzant, & Wolf, 1993; Wolf, 1988). The controlling metaphor is, “entering the cultural conversation,” and the basic idea is to challenge all students with the best and most interesting of classic and contemporary texts; relevant,

lively, collaborative discussions; and thoughtful writing opportunities. While this effort is not a standards setting effort per se, it will unquestionably influence other standards setting efforts by providing compelling models of the kind of curricular outcomes and performance assessments we could expect as students near the close of their formal school experience.

The National Board for Professional Teaching Standards. The NBPTS is a national, broad-based movement to create a system for the *voluntary advanced certification* of teachers at all levels and in all fields. It often gets confused with English standards efforts because the very first project out of the chute was to create a set of standards and accompanying assessments to evaluate teachers of the English language arts at the early adolescent level. The NBPTS selected a committee of teachers and English language arts professionals from around the country to create these standards. At the very same time, they created an Assessment Development Laboratory at the University of Pittsburgh to create an assessment system capable of evaluating the “certifiability” of English language arts teachers; in other words, the system was designed to evaluate whether teachers met the standards developed by the national advisory committee. When one examines the standards that the committee developed for evaluating whether teachers meet “high and rigorous” standards, it is easy to see how they might get confused with standards for curricula that students receive. Many of the standards used to describe what teachers should know and be able to do could, with minor rewording, be used to describe what students should know and be able to do. For example, Standard VI, for Reading, reads,

Accomplished Early Adolescent / English Language Arts teachers engage their students in reading and responding to literature, and in interpreting, and thinking deeply about literature and other texts.

It is not too difficult to move from this standard about teaching to a standard about learning; it might read something like,

Accomplished adolescent readers engage texts thoroughly, respond openly to literature, interpret what they read, and think deeply about literature and other texts.

Granted that each needs considerable unpacking (which, by the way, is accomplished in a section entitled, *Elaboration* in the NBPTS document), but the commitment to high and rigorous standards and literature-based approaches to the teaching of reading is clear.

Over the past several years, the initiatives to build a teacher assessment based upon these standards have been provocative and controversial. In 1993, the Assessment Development Laboratory at the University of Pittsburgh implemented a substantial field trial of its exercises for the Early Adolescence / English Language Arts effort. The reaction of the teachers who volunteered to be a part of the trial was overwhelmingly enthusiastic; even though they viewed the process as time-consuming, intrusive, and difficult, they found it to be a professionally challenging and rewarding experience. Nonetheless, grave concerns about the reliability, equity, and

cost of the process prompted NBPTS to issue a second contract to the Educational Testing Service (ETS) to develop an assessment process that met these concerns. At the time this chapter was written, the NBPTS was in the process of evaluating the process developed by ETS. This set of events underscores another deeper debate in the field of assessment. At issue is whether assessment is conducted within a measurement or an interpretive (Delandshre, & Petrosky, 1994; Moss, 1994) framework. Within a measurement framework, privilege is accorded to concepts such as reliability, generalizability, and utility. Within an interpretive framework, the privileged constructs are difference, multiple perspectives, and the public presentation of rationales underlying decisions and judgments (much in the spirit of legal judicial opinions). Another factor which will ultimately determine the success of the NBPTS is cost, both monetary cost and energy costs. As indicated, the individual investment of candidate time and energy is enormous, well beyond anything currently at work in the teaching profession. Equally as expensive is the assessment process. Conducted by peers who have successfully stood for certification themselves and who have received many days of training for the complex scoring procedures, the assessment and scoring will conspire with other factors to drive the examination costs to a very high, perhaps prohibitive level. In the early years, NBPTS has underwritten the training and examination costs; it remains to be seen whether the system can stand on its own in a marketplace economy.

The NBPTS effort shares much in common with the curriculum standards movements in the various subject matter areas. What all these efforts seem to have in common is the development of fairly broad and theoretically grounded guiding principles that are rendered increasingly more specific until they provide some guidance to answer the question. What would count as evidence that the student (or teacher) had met the standard? Equally clear, even though it is not always explicitly stated, is a commitment to a broad notion of assessment that goes beyond multiple-choice tests to include long-term, environmentally situated, client-centered assessments.

DANGERS

The arguments against standards are grave, familiar, and convincing, and they should be taken seriously by all members of the profession, including those who are strong advocates for standards. The common theme uniting the criticisms is the concern for the loss or erosion of local and individual autonomy and voice in the name of global consensus (or intrusion, as is often implied).

Standards will Create a National Curriculum. No discussion of standards omits the obligatory critique that standards will lead to a national curriculum. And no amount of repetition of the "Why can't national standards accommodate a wide range of local curricula?" seems to quell this criticism. In truth, we should not be surprised at the ubiquity of this concern; in a nation so committed to local control of educa-

tion, what is more surprising is that a national discussion is tolerated at all. Two factors, I believe, account for our tolerance of a national discussion. First, the educational community has been so badly battered by the accusation that our workforce has lost its competitive edge that we are more willing than ever to consider national solutions (NCEST, 1992). Second, and more positive in tone, many educators believe that a national framework with lots of room for local variation and adaptation is not a bad idea. I suspect that many of us yearn for some shared national values; this yearning is captured in the appeal of phrases such as "entering the cultural conversation," the current theme of the Pacesetter effort sponsored by the College Board. Many of us appear to want to be a part of a "variations on a theme" enterprise in which there is room for both common and unique curricular elements.

They will Spawn a National Test. They could easily do this, and many policy observers in Washington have suspected that the movement toward state-by-state NAEP was the first step toward a national test. Those who advocate assessment as the engine of school reform (e.g., Simmons, & Resnick, 1993) are likely to prefer a national system of assessments to a national test. Such a system, they argue, would permit states, districts, and schools to develop and maintain their own assessment tools; through a system of benchmarking across schools, states, and even nations, the various tools would be benchmarked to a common set of standards. The portfolio, defined as a cumulative record of individual accomplishment, is the most commonly mentioned framework for such a system.

Whether such a system is viewed as a contentious instance of top-down intrusion or as an opportunity for schools, teachers, and students to show their mettle in a national forum is as much a matter of perception as reality. To one educator, national standards will constrict the range of assessment tasks to a myopic view of student achievement and, in the process, narrow the range of instructional possibilities in classrooms. To another they paint an exemplary portrait of what a literate person can do and invite students to paint their own personal portraits of achievement. The central question is whether a national system of assessment, benchmarked to permit substantial variation in assessment tools, is any less intrusive than a national test. That question is at present only answerable in the abstract.

They will become minimal standards. This criticism of standards appears to have little merit in the current debate. To the contrary, the rhetoric focuses on creating high and rigorous standards, albeit standards that are within the reach of all students.

They Represent Federal Intrusion. Until the death of the National Education Standards and Improvement Council (NESIC) in the 1995 Congress, federal control of standards remained a genuine concern. Among other functions, NESIC was to have reviewed national and state standards and assessments to ensure their compliance with nationally developed criteria. The professions and the public have to be vigilant to make sure that even when the federal government

supports standards development financially, it refrains from exerting any direct or indirect control over the direction that standards take. If standards are to achieve any sort of credibility among teachers, they must be viewed as a professional activity, one in which classroom teachers are fully vested and invested. The negative experience of the English standards underscores the need for this sort of vigilance. Perhaps the positive side of the losing of federal support for the English standards will be the independence the profession gains by funding the project with its own resources.

They Will Become Just Another Tool of Exclusion and Marginalization. Any savvy member of a minority group should be suspicious about the current standards movement. Based upon previous incarnations of standards, be they labeled standards, objectives, competencies, goals, or outcomes, they have every right to assume that the current standards effort will continue to exclude and marginalize minority students. When standards are instantiated as test scores, the negative consequences for minority group members can be quite severe and are well-documented (see Chachkin, 1989; Durán, 1983; Garcia, & Pearson, 1994).

However, the metaphors of transaction (cf. Group 4 on p. 2-3) should they be realized as a part of our current reform movement, may give minority group-members reason to anticipate change. These transactional standards are causing us, as a profession, to rethink our notion of equity. With Brown versus The Board of Education, we adopted equal access as the basic criterion of equity; separate schools were viewed as inherently unequal, and the path to equality consisted of providing access to all. With the affirmative action movement of the 1970s, the equity criterion shifted to opportunity; every individual deserves an equal opportunity to compete for the good life, the good job, or the good educational experience. With the current standards movement, we have moved to an equity at the outcomes level; equality is not achieved until all students are able to achieve high standards. This implicit equity is captured in Simmons' statement, as quoted in an interview by O'Neil (1993):

We have to shift the discussion away from whether we should hold students to high standards and toward what resources we need to get everybody to meet these high standards. This is where the delivery standards come in. They focus attention on whether or not students have had the opportunity to meet high standards. In the past, I think we mistakenly decided to wait until we got the resources to hold the students to high standards. The students are paying a price for that delay. (p. 20)

Irrespective of types of standards we are referring to, they must be inclusionary rather than exclusionary. They must invite people into the conversation rather than keeping them out. I know of no sure fire way to guarantee inclusion; but the most important safeguard is to keep the process open so that we can all see what is being valued and privileged in the standards that we set.

They Will Hurt Students. The "standards are bad for kids" position is most often an extension of either the "narrowing the curriculum" or the "standards exclude" argument. It is hard to argue with this position. Standards, especially as they

are instantiated in tests, have been responsible for narrowing curriculum. While this restriction function is especially true for minimal competencies and the tests that accompany them, it is also true for tests designed for students at the high end of the performance scale. For example, each year, thousands of students spend millions of hours and dollars practicing for the SAT or ACT entrance examinations; while their scores surely improve, it is not certain that they have actually acquired any worthwhile knowledge.

Standards, under the guise of entrance or qualifying exams, have served to exclude students from particular schools, universities, or programs. The consequences of low scores on high stakes tests are familiar to all of us, and their impact is exacerbated by the fact that all too often, a single test is the sole criterion used to make the decision.

I know of no way to eliminate completely the potential harm of standards. If standards exist and if meeting them or failing to meet them bears consequences for individuals, then some students will experience the "joy of victory" and others, the "agony of defeat." Perhaps the best we can hope for is to make the standards completely transparent so that everyone will be able to see what we mean by them. By opening our values to public scrutiny, we permit evaluation of their potential for harm; standards and assessments that are left unseen and unstated are more likely to be arbitrary and harmful.

They Will Become Fixed and Static. Of all the concerns raised about standards, their potential for orthodoxy concerns me most. Eisner (1993) in a recent essay raising concerns about the standards movement, expressed this concern eloquently:

...I cannot help but wonder whether this emphasis on standards is likely to move schools in the direction that I value. I do not value schools that regard children as an army marching toward fixed and uniform goals. Standardization is already too pervasive in our culture. We need to celebrate diversity and to cultivate the idiosyncratic aptitudes our students possess. (p. 23)

The danger of orthodoxy will be all the greater if and when many in the profession have worked very hard to develop an initial consensus. Those who come late to the party will be reluctant to undo or overturn the work of their colleagues. I hope that we can overcome this conservative disposition. Nothing has greater potential to destroy the professional and instructional value of standards than reverence for their quality and elegance or respect for the process that spawned them. We must demand generativity and dynamism for the standards and the process by which they are created. Review and revision should be continuous. Only partly in jest, some in the English standards project have suggested that they always bear a DRAFT stamp emblazoned boldly across each page; others have suggested that only disc copies (perhaps with an embedded time-released virus) be distributed for fear that the printed page will elicit too much respect.

The Impact of Standards as an Approach to Reform

The beguilingly simple logic of standards-based reform and assessment (set clear and transparent outcomes, establish equally clear assessment tools and criteria for meeting

standards, and develop instructional programs that lead to mastery of the standards) is not new. In adopting standards-based reform for the teaching profession we would be returning to something like the logic of the competency based movement of the 1970s. Standards, competencies, and criteria bear a strong family resemblance to one another, the common thread being the early establishment of expected outcomes as the basis for evaluating both individual progress and institutional capacity to deliver quality instruction. The most notable difference is that standards, in contrast to the earlier competency-based movement of the early 1970s, are likely to bite off pretty big "competency chunks." In contrast to earlier movements, current efforts may truly represent "high and rigorous" standards of performance. So we may avoid the proliferation of minute behavioral precision so prevalent in the objectives of the competency-based movement.

The logic of standards, as well as other outcomes-based efforts, is that if you hold folks accountable for standards at the end of the process, you can eliminate the compliance mentality of our current certification systems and give both individuals and institutions lots of latitude in deciding how to "get there." This sort of logic places a high premium on performance standards and the assessments that accompany them. One wonders if our current crop of certification assessments are up to the challenge. To raise this point as a concern is to suggest the possibility, which is proving accurate in content standards efforts and teaching standards movements, that the biggest impact may be in the area of assessment. In privileging portfolios and exhibitions at the expense of test scores as evidence of competence, licensibility, and certifiability, we may leave an indelible mark on teacher education. If assessment becomes something future teachers do to and for themselves (rather than something we do to them), we, as teacher educators, may find ourselves in a whole different power relationship with our students.

WHY SUPPORT STANDARDS?

The concerns and the dangers notwithstanding, I believe there are several compelling reasons for us as a field of professional educators to engage in this process.

We could create a forum for a national conversation about what we value in teaching and learning. While local conversations about what we value are more likely to impact instruction, a grand national conversation is also needed. First, equity concerns demand that local groups become aware of the array of curricular possibilities that they might consult in building their own curriculum. Second, a national conversation is needed to celebrate the best practices of our nation's teachers. As Hoffman and Stage (1993) point out in discussion the movement in science standards,

We need national standards to highlight and promote the best practices of these heroes. We must make their curriculums the exemplars—the core of teacher preparation programs, the models for instructional materials and assessments, and the basis on which science programs are judged. (p. 29)

Third, a national conversation will allow all of us in the profession to embrace a larger notion of community and encounter a larger pool of professional colleagues.

We could create an expectation that all of those of us who call ourselves teachers are willing to expose our real standards to public scrutiny. It is my strong conviction that our educational worlds are full of standards. We give grades, we set cut points for entry into special programs and institutions, and we track students. And for each of these decisions, we have implicit (occasionally explicit) standards of performance. The problem in most of these situations is that no one knows what the standards really are. As a result, they end up as the special property of those students (and parents) who manage to figure out what the real rules of the game are; the remainder of the students (and parents), in order to maintain their self-esteem, develop a sense of cynicism about the nature and futility of schooling. The current standards movement, with its emphasis on public discussions of values and student work, could put an end to this unequal distribution of privilege. Standards which are publicly displayed and discussed are much less likely to remain the special property of the privileged few who get told or figure out what the rules are.

We might influence both public and professional investment of time and resources. We need greater investment in education at all levels—national, state, and local—in our attempts to improve education and to promote challenging expectations of all students. Our public bodies—school boards, trustees, legislatures, and Congress—must *invest* in and be *invested* in the educational enterprise. Increased public awareness and increased public support may be the most important lesson to be learned from our colleagues in mathematics.

We can create a healthy tension between commonality and diversity within the field. We could provide a clear statement of our common values and an equally clear commitment to diversity and variation within that common frame. We want to be in a position to honor both local knowledge and national values. And we do not want the tension to disappear because, if and when it does, we may find ourselves on the verge of either a national orthodoxy or a large set of local orthodoxies. If standards can perform this function, they can be a catalyst for local curriculum reform. Sizer and Rogers express the sentiment that I am searching for quite concisely in discussing ways to achieve a balance between "civic virtue and individual liberty":

Achieving a balance depends upon our ability to honor the individual school as the proper locus of accountability while also acknowledging that the school cannot manage this responsibility in isolation. (p. 25)

We could ensure a challenging, supportive, and thoughtful curriculum for all students. One of the greatest challenges to the standards movement is inclusivity. Earlier incarnations of standards movements have often excluded "special" students from mandates to meet a particular standard. The notion of *special* is usually extended to students who fit one of the categories of special education, students who speak English as a second language, and students who qualify for

compensatory programs or assistance, such as Title 1. In fact, many current mandatory assessment programs allow schools to excuse particular categories of students from the assessment. If we truly believe in the transactional ideas expressed earlier in this chapter (cf, p. 2–3, see also Simmons, & Resnick, 1993), then we will extend high and rigorous standards to all students as we seek the resources needed for each and every student to achieve them. If we do this right, and if we can find the resources we need, we might reduce the likelihood that the quality of the education a student received could be an accident of residence, curriculum, or teacher expertise.

We could create a process for using standards. The balance between national vision and local knowledge will be difficult to maintain. If we fail to create expectations about how local conversations on standards and curriculum might proceed, we may fail to realize the variations on a theme metaphor. In some instances the national standards may be adopted rather than adapted, in which case local ownership is not likely to occur. The short history of the impact of the mathematics standards suggests that in some districts, the school board members examine a one-page summary of the standards, vote to adopt them, and go on to the next item of business, fully expecting teachers to regard them with the same cynicism they accord to other curricular documents. To prevent this, we might, for example, suggest that local groups engage in the same sort of public discourse that created the standards document in the first place. We might make recommendations such as, a diverse representation of stakeholders at the table, teams to craft their own local vision, widespread distribution and public discussion of any document.

We could establish a symbiotic relationship between standards and scholarship. I see two possible relationships between standards and scholarship: (1) the influence of research on the development of standards, and (2) the research opportunities that might be provided by the standards movement.

Our standards for the teaching and learning of any subject matter or process, including teacher education, ought to be as well grounded in theory and research as they are in best practice. Whether they are or not depend primarily upon three factors. First, if those involved in writing, reviewing, and approving are positively disposed toward research, then the standards are likely to reflect what research has taught us about the teaching and learning of various subjects. Perhaps we ought to examine the roster of task force members and board members in all standards projects to evaluate commitment to evidence rather than tradition, ideology, or political position. Second, if we rely equally on best practice and research for our ideas about standards, then they will reflect research to the degree that best practice also reflects research. Those of us who have been active in research about school curriculum are likely to be vain enough to conclude that *best practice* reflects research more than does practice per se. But there could be significant discontinuities. Whether best prac-

tice and research map onto each other well is open to question, and I think we will have to see what emerges from the consensus process that will guide the development of the standards. Third, to the degree that members of the various research communities demand a strong voice in the standards setting effort, the standards will reflect our best and most current research. We tried, in the Standards Project for the English Language Arts, to provide multiple paths and opportunities for involvement, response, and critique. And members of our research community did avail themselves of those paths and opportunities until, that is, the project was scrapped.

As members of the research community, we have an incredible opportunity to conduct research about standards. There are several levels and types of research that ought to be conducted as this process plays itself out in various venues. Here is just a sampling of research studies that someone ought to conduct

1. Ethnographies of the process by which standards are set within the various standards efforts, including analyses of the political role played by various individuals and constituencies.
2. Sociological analyses of the source and impact of ideas on the standards that are set as well as the impact of standards on practice.
3. The role and influence of the feedback (critique and consensus) process on standards development and revision.
4. Literary analyses of the form and content of the standards, including critical studies of the power relations implicit in the language of the standards and the symbolic role of the metaphors that undergird them.
5. Studies focused on the impact of standards on groups that have been marginalized by previous standards efforts.
6. Analyses of the relationship between standards and assessment. It will be especially interesting to see if the rhetoric of alternative assessment that pervades the movement will persist after content standards have been developed and schools try to establish performance standards to determine whether students have met them. What will happen once we become aware of the high cost of portfolios and performance assessments and are reminded of the efficiency and cost-effectiveness of standardized tests?

Regardless of the label we get saddled with—researcher, teacher educator, practitioner, client of the educational system—there is much work to be done in the standards arena. In fact, it is a unique venue in the sense that all of us can lay claim to a significant stake in the outcomes. I would like to think that we all hope they turn out to be a positive force for improving life for students and teachers in our schools and universities. I would also like to think that we all know that hoping will not make it so. If we want standards to have a positive impact, then we—collectively and individually—will have to shape their destiny.

DEVELOPING STATE STANDARDS IN ENGLISH LANGUAGE ARTS: A CASE STUDY

Karen K. Wixson

UNIVERSITY OF MICHIGAN

Charles W. Peters

OAKLAND SCHOOLS

Sheila A. Potter

MICHIGAN DEPARTMENT OF EDUCATION

State standards setting initiatives are the result of factors such as the role of state standards and assessments in the 1994 Elementary and Secondary Education Act (ESEA) reauthorization, the availability of federal support for state standards projects, and the passage of Goals 2000 legislation which calls for competency in areas such as English language arts and establishes the National Education Standards Improvement Council (NESIC) to certify voluntary national standards in these subject areas. Curriculum development activities similar to these state standard setting initiatives are not new, but the level of scrutiny and direction from the national level is much higher than ever before.

The process of developing standards in English language arts is complicated by the fact that this area is an amalgam of the fields of reading, writing, listening and speaking, and literature which have a long tradition of operating fairly independently of one another. The separation of the fields comprising the English language arts is evident in everything from professional organizations and publications, to teacher preparation programs, to national and state level objectives and assessments. The history of separation made the process of developing integrated, K-12 English language arts standards extremely difficult. This situation was made even more complex by the lack of national standards in English language arts to serve as a model for state standards development projects until 1996.

This chapter describes the process, emerging content, and some of the problems encountered within the Michigan English Language Arts Framework project, a state standards development effort funded by the U.S. Department of Education in 1993. This information is provided in an effort to help others embarking on similar efforts at the local, state, or national level.

AN OVERVIEW OF MELAF

The Michigan English Language Arts Framework (MELAF) project was a 3-year grant to the Michigan Department of Education in collaboration with the University of Michigan. The major purposes of this project were to bring state goals and objectives in the areas of listening and speaking, reading, writing, and literature together into a unified framework that integrated curriculum, instruction, and assessment through specific content, opportunity-to-learn, and performance standards, and benchmarks for early elementary, later elementary, middle, and high school levels.

The organizational structure of the MELAF project included project Codirectors Karen Wixson (University of Michigan) and Sheila Potter (Michigan Department of Education), Demonstration Project Manager Charles Peters (Oakland Schools), a Steering Committee comprised of

representatives from business, labor, government, and education, an Equity Advisory Panel, Grade Level Task Forces, a Teacher Education Task Force, an Evaluation Advisory Panel, and Demonstration Districts to assist the project in piloting standards and developing sample instructional units and classroom assessment procedures.

The first year of the MELAF project, 1993–94, was devoted to developing drafts of a vision statement, content standards and grade level benchmarks. These drafts were approved by the Michigan State Board of Education in August 1994 for public hearings and field review. Following an 18-month review period, the revised content standards in English language arts and the other areas of the academic core curriculum were to be written into law—a first in Michigan.

The activities for the second year of the MELAF project (1994–95) focused on reviewing and revising the vision statement, content standards, and benchmarks, developing drafts of opportunity-to-learn standards, and designing guidelines for in-service and preservice teacher education. In addition, Demonstration Districts worked to implement the draft content standards and benchmarks, develop district level guidelines for curriculum and instruction, and create sample units of instruction.

The final phase of the MELAF project (1995–96) focused on developing and piloting informal classroom assessment procedures and performance standards, reviewing and revising opportunity-to-learn standards, and piloting, reviewing, and revising teacher education guidelines and recommendations. The standards were finalized as part of the larger framework, and both the content and the process used for development were disseminated to other states. The completed content standards were then used as the basis for revisions in statewide assessments of student progress and high school proficiency examinations.

The National Context

To understand state standards projects, it is important to be aware of the larger national and state contexts in which they have been operating. The larger context for current curricular reform efforts in Michigan and in many other states can be linked to the Governors' Education Summit convened by President Bush in Charlottesville in 1989. Stimulated by a series of reports in the early to mid-1980s such as *Nation at Risk: The Imperative for Education Reform* (1983), summit participants resolved to set National Education Goals and to invest energy toward their realization by the year 2000. Six goals were announced in early 1990 by a bipartisan task force led by then Governor Clinton, and a National Education Goals Panel was established to measure progress toward the goals in 1991.

Although two of the goals focused on improving student achievement in challenging subject matter, there was little consensus on the knowledge, skills, and abilities worthy of being taught and assessed. In 1991, Congress and the National Education Goals Panel created the National Council on Education Standards and Testing (NCEST) to consider establishing, for the first time, national academic standards

in the United States. The report of the *Council, Raising Standards for American Education* (1992), revealed that such standards were desirable and feasible and recommended the creation of voluntary nationwide education standards that would clearly identify what "all students should know and be able to do to live and work in the 21st century."

In 1994, President Clinton signed into law the *Goals 2000: Educate America Act*, which modified the six national goals and expanded them to include two new goals for teacher development and parent involvement. Goal Three is most pertinent to the MELAF project because it calls for "competency in English, mathematics, science, foreign languages, civics and government, economics, arts, history and geography." Goals 2000 also established the National Education Standards Improvement Council (NESIC) which was intended to monitor progress toward goals and work with appropriate organizations to determine the criteria for certifying voluntary national standards.

The first voluntary national standards were developed by the National Council of Teachers of Mathematics in 1988 and the U.S. Department of Education has since funded professional groups for the development of national standards in the other areas identified in Goal Three. Grants such as the one awarded to the MELAF project have also been made available for states to develop their own versions of voluntary national standards. Although funding was discontinued for the national standards project in English language arts in 1994, the International Reading Association and the National Council of Teachers of English continued to work on this project with their own resources. Although the federal government had announced an upcoming competition for a national standards project in English language arts, no request for proposals was ever issued. The result of this situation was that MELAF and other state standards projects had no national standards in English language arts with which to work until the NCTE / IRA standards were issued in 1996.

The State Context

Educational reform was mandated in Michigan with the passage of Public Act 25 of 1990 by the state legislature. Known as the Quality Issues Package, this law was aimed at raising standards for public schools by providing financial incentives for schools to develop a school improvement plan, to engage in an accreditation process, to produce an annual report for the community, and to provide a core curriculum for all students. In 1991, the State Board of Education published the *Model Core Curriculum Outcomes* document designed to guide local districts in establishing a core curriculum as required by Public Act 25. This document was based on the *Michigan K–12 Program Standards of Quality* (1984) and the *Essential Goals and Objectives* in each subject area developed between 1984 and 1991. The language arts section contained a total of 144 outcomes listed separately for reading, writing, listening and speaking, and literature.

The legislation passed in 1991 directed the Michigan Department of Education to develop graduation proficiency exams in communication arts, mathematics, and science

based on the Model Core Curriculum Outcomes. Students in the high school graduating class of 1997 and beyond are required to pass these assessments to qualify for a state endorsement on their diploma. The high school proficiency test in the area of communication arts was defined as separate reading and writing assessments because the Model Core Curriculum Outcomes had been developed separately in reading and writing. Frameworks for the high school proficiency tests in reading and writing were developed independently by the Michigan Reading Association and the Michigan Council of Teachers of English respectively. As the frameworks were being developed for the high school proficiency tests in reading and writing, work began on the MELAF proposal to integrate state curriculum and assessment in reading, writing, listening and speaking, and literature.

Prior to MELAF, the Michigan Department of Education (MDE) had been unsuccessful in its attempts to get the state professional organizations in the separate areas of English language arts to work toward an integrated set of objectives in communication arts. The availability of federal funds to develop English language arts standards provided an opportunity for MDE to achieve this goal. As a result of the MELAF project, the reading and writing components of the communication arts high school proficiency test are administered at the same time and students must pass both assessments to receive the communication arts endorsement. There are also plans to develop and implement new, integrated English language arts assessments to replace the current, unintegrated Michigan Education Assessment Program (MEAP) tests and high school proficiency tests by 1999.

The MELAF project grant was awarded to the MDE along with two other curriculum frameworks projects in mathematics/science and geography in 1993, and a fourth grant was awarded in the area of social studies in 1994. Subsequent to the start of MELAF and the other curriculum frameworks projects, Public Acts 335, 336, and 339 were signed into law in December 1993. Public Act 336 altered the entire funding structure of public education in Michigan, while Public Acts 335 and 339 expanded Public Act 25 to include additional quality measures, the most notable of which was a required State Board of Education Core *Academic* Curriculum. For schools to be accredited, they were required to provide Core Academic Curriculum to the State Board of Education in the areas of mathematics, science, reading, history, geography, economics, American government, and writing.

The State Board of Education used the five curriculum frameworks projects to develop Michigan's new Core Academic Curriculum content standards in the areas designated in Public Act 335, and to assist with the creation of pupil performance standards and opportunity-to-learn standards. The initial work of these projects was approved by the State Board of Education in August, 1994 as the draft *Core Academic Curriculum Standards* document. Following an 18-month period of review and public hearings and approval of the revised document by the State Board of Education, the revised Core Academic Curriculum Standards were to be forwarded to the Joint Committee on Administrative Rules of the Michigan legislature. With the approval of

the Joint Legislative Committee, the content standards in the areas of the Core Academic Curriculum were to be written into law.

Several of the factors just described made the MELAF project significantly more complex than originally planned. Specifically, the work of the project was complicated by the need to work together with the other curriculum framework grant projects and legislative action to mandate an academic core curriculum. Although these factors made the project more difficult, they also increased its potential impact—for good or for ill.

THE MELAF PROJECT

The ultimate goal of the MELAF project was substantive change in English language arts instruction that enabled *all* students to become responsible, productive, literate citizens in the 21st century. Our experience in Michigan with reform in the area of literacy education (cf. Peters, Wixson, Valencia, & Pearson, 1993) had taught us that nothing less than an inclusive process leading to systemic change at district, school, and classroom levels would be sufficient to achieve this goal. Keeping this in mind, the primary objective of the MELAF project was to develop a statewide framework that integrated the English language arts through:

- (a) a vision statement for English language arts;
- (b) K–12 content, opportunity-to-learn, and performance standards;
- (c) grade-level benchmarks for K–3, 3–6, 6–9, and 9–12;
- (d) guidelines for curriculum, instruction, assessment, and professional development; and
- (e) sample units of instruction.

In addition, the MELAF project was designed to: develop an inclusive process that worked from both the top-down and the bottom-up to develop a framework that aligned curriculum, instruction, and assessment; support and develop demonstration projects for implementing the framework at the local level; incorporate the framework into teacher preparation programs and certification standards; and, finally, to inform the development of statewide assessments and proficiency tests.

How MELAF Works

Perhaps it is easier to understand the process that was used to accomplish the MELAF objectives through a description of the key groups within the project (see Figure 58E–1).

Michigan Department of Education Codirector's Group. The opportunity to coordinate standards development in several major areas of the curriculum was created when MDE received more than one curriculum framework grant. To facilitate this coordination, the codirectors of the various curriculum standards projects met regularly. Although this added another layer of meetings and administration to each of the projects, all have benefited from the opportunity to share with others engaged in similar efforts.

Figure 58E-1. Organizational chart of Michigan English Language Arts Framework project

The codirectors' group became even more important with the passage of legislation mandating the academic core curriculum in the areas of the curriculum standards projects. Through the efforts of the codirectors, we have been able to present a consistent portrait of the constructivist perspective on teaching and learning promoted by the standards in each of the core curriculum areas. This was the first time, at least in recent history, that there had been a coordinated effort to develop and represent state standards or goals in the major areas of the curriculum, and it has made a significant difference in how these standards were promoted through professional development and translated into local curriculum.

Joint Steering Committee. Each of the curriculum framework grant projects was required to establish a Steering Committee comprised of educators, business leaders, and representatives of government and labor to oversee the state standards projects. When Michigan was awarded more than one curriculum framework grant, MDE established a Joint Steering Committee to oversee the work of these frameworks grants in the areas of English language arts, social studies, geography, mathematics, and science. This Joint Steering Committee was in the unique position of being able to respond to the activities of these projects in a manner that ensured consistency and coherence in the resulting curriculum frameworks across subject areas. Ultimately, the Joint Steering Committee reviewed the curriculum framework documents for each subject area before they were submitted to the State Board of Education for final approval.

Broad-based steering committees are intended to involve representatives of those segments of society with an abiding interest in quality education in the standards development process. The support and input of the Joint Steering Committee was invaluable to the work of the curriculum standards

projects. They raised key questions that were likely to be raised by other noneducators and offered helpful advice about both the content and process of the standards development effort.

Management Team. The MELAF Management Team was the central cog in the wheel of this project. Because MELAF was so large and complex, this was the one mechanism where representatives of all the components of the project came together to coordinate their efforts. The Management Team consisted of the Codirectors, Demonstration Project Manager, and Task Force Cochair. The Management Team also created an Equity Advisory Panel to join them in their work and ensure that equity issues were dealt with substantively at every step of the development and dissemination process.

As the primary decision-making body of MELAF, the Management Team was responsible for activities such as selecting the members of the Task Forces, deciding about the direction of the project, preparing draft documents, and planning for meeting agendas. This group was ultimately responsible for the final revisions of all documents submitted by the MELAF project to the State Board of Education for approval.

Equity Advisory Panel. The Equity Advisory Panel was formed to ensure attention to issues of diversity in all project discussions and in the development of all written documents. Members of this group were experienced with a wide range of equity issues in education including gender, racial, and ethnic bias, and the needs of bilingual / LEP, special education, and Title 1 populations.

The charge to the Equity Advisory Panel was twofold. First, they were expected to participate directly with the Management Team and Grade Level Task Forces in the development of the various types of standards at the heart of the final framework document. Their second charge was to review thoroughly all documents as they were prepared for

distribution to the field with an eye toward equity concerns. Panel members also provided other project members with relevant reading materials and made presentations on specific equity issues when appropriate.

Grade Level Task Forces. The Grade Level Task Forces were focused on four developmental levels, early elementary, later elementary, middle, and high school. As the primary document writing groups within MELAF, it was important that they represent as broad a group of educators from as many regions in the state as possible. The Grade Level Task Force members were selected by the Management Team through a process involving the solicitation of nominations through the newsletters of the Michigan Council of Teachers of English, Michigan Reading Association, and Michigan Association of Speech Communication.

The eight members of each Grade Level Task Force were selected according to the following guidelines: Each task force was comprised of a majority of classroom teachers, at least one administrator, at least one individual who worked with special populations, a balance between individuals whose primary perspective was reading and those who focused more on writing, at least one person who worked in the area of listening and speaking, individuals from districts who represented a balance of geographic and demographic characteristics, and individuals who represented a variety of racial and ethnic backgrounds. In addition, where possible, we were interested in selecting individuals with expertise in working with bilingual and limited English proficient students and people with experience using technology in English language arts. A state grant also allowed us to include an additional member on each task force from the Upper Peninsula.

The four Grade Level Task Forces met on the same day and in the same location approximately six times during the first two years allowing for both within level and across level discussions. During the first year of the project, the Grade Level Task Forces developed the draft content standards and grade-level benchmarks that were presented to the Joint Steering Committee and approved by the State Board of Education for field review and public hearings.

During the period of review and public hearings, the Grade Level Task Force members served as facilitators in statewide field reviews of the content standards and benchmarks. At each meeting educators, community members, parents, and others were invited to respond to the standards and benchmarks. Unlike previous statewide field review activities in Michigan, the current effort viewed the involvement of larger segments of the community from the earliest stages of the process as critical to the overall success of curricular reform.

The Grade Level Task Force members were also responsible for analyzing the results of field reviews and public hearings, revising the content standards and benchmarks, and drafting performance and opportunity-to-learn standards. In addition, they worked with the Demonstration District personnel, the Management Team, and the Teacher Education Task Force to develop a Framework Guidebook that included guidelines for and examples of local curriculum, instruction, and assessment and professional development activities.

In the final phase of the project, the Grade Level Task Forces were reorganized into a series of work groups focused on specific tasks related to completing the larger set of framework documents and activities. These groups focused on a variety of development activities such as creating performance standards, conducting workshops and preparing materials related to public education, describing a curriculum planning process for use by local districts, developing parent support materials, and coordinating publications of writings by project members.

Teacher Education Task Force. A Teacher Education Task Force was an essential piece of the curricular reform effort, because standards can never be realized fully without appropriate in-service and preservice education. The primary work of the Teacher Education Task Force focused on developing guidelines for teacher education and state certification consistent with the content standards and benchmarks and assisting local districts in planning for appropriate staff development. The Teacher Education Task Force also worked together with the Grade Level Task Forces and Demonstration Districts to develop a network of teacher researchers engaged in reflective practices that included implementing content standards and benchmarks. This type of network was essential for validating the work of the writing groups and provided models for implementing the standards at the local level.

The development of guidelines for teacher preparation included an examination of existing guidelines such as those published by the National Council of Teachers of English, the International Reading Association, the Entry-Level Standards for Michigan Teachers, and the National Board of Professional Teaching Standards and considering them in light of the MELAF content standards and benchmarks. The Teacher Education Task Force then developed models appropriate for preparing Michigan English language arts teachers and conducted discussions of these guidelines with representatives of teacher education programs throughout the state.

Demonstration Districts. A unique feature of the MELAF project was the role played by the local districts that served as Demonstration Districts (Fleischer, Koch, Lewis, & Roop, 1996). The work of these districts provided a critical perspective that has long been absent from curricular reform efforts in Michigan—the classroom perspective. Although MDE has a long history of collaborating with professional organizations in the development of goals and objectives for each of the language arts areas, the goals and objectives were never tried out in the classroom prior to statewide dissemination and adoption. It was essential that teachers have an opportunity to try out the proposed content standards and benchmarks so that their experiences could inform the review process and provide new models for developing local K–12 English language arts curricula (Casteel, Roop, & Schiller, 1996).

The local districts that were part of the MELAF project represented different demographic regions of the state including small rural districts and large urban and suburban districts, districts with above average socioeconomic indicators and districts with below average socioeconomic status, districts with homogenous populations and districts with racially and ethnically mixed populations. These districts

were selected because they had already started to develop their own K–12, integrated English language arts curricula prior to their involvement with MELAF. As a result, these sites provide other local districts and teachers with a place to observe best practices in operation.

Work with Demonstration Districts provided models for the professional development activities that are essential for the successful implementation of the new standards. As part of the professional development activities in these districts, teachers and administrators from all of the sites attended one or two, week-long summer workshops for three consecutive summers that provided opportunities for in-depth exploration of topics and issues related to integrated English language arts. Participants studied the content standards, worked on instructional units that incorporated the content standards and benchmarks, and investigated topics for teacher-research projects related to the standards. During the second and third summers, teachers articulated the implications of the standards for their district curriculum and explored the creation of classroom assessment procedures consistent with district curricula and state content standards as a means of developing performance standards.

Participants in each of the Demonstration Districts also kept journals that served as the basis for a case study for each of their districts. The case studies were designed to help other districts in the process of translating the new standards, benchmarks, and performance standards into local curricula. Throughout the project, Demonstration District participants continued to meet regularly both within and across their districts to bring the standards and benchmarks to life in real classrooms and to provide much needed models for how to accomplish this type of curricular reform.

Evaluation Advisory Panel / Case Study Evaluator. The Evaluation Advisory Panel was formed in recognition of the importance of ongoing evaluation in curriculum reform projects such as MELAF. This group consisted of five members, two from Michigan and three from outside the state, with combined expertise in policy, literacy, and multiple forms of evaluation.

The Evaluation Advisory Panel was convened by phone or in person at least two or three times each year to advise the Codirectors and Management Team on opportunities and methods for continuous evaluation. This group also assisted in the hiring of a case study evaluator and in advising this individual as he constructed an in-depth case study analysis of the project. In addition to the first year report of the case study evaluator, evaluative information included data from minutes, transcripts of meetings, reflective writings, focus group reflections, and questionnaires.

Resource Groups. Several different types of organizations served as resource groups for MELAF. First, the Boards of Directors of the Michigan Reading Association, the Michigan Association of Speech Communication and the Michigan Council of Teachers of English provided feedback and input to the project. In addition, these professional organizations joined together to reactivate a Literacy Consortium which was formed in 1983, but was inactive for many years. The Literacy Consortium is working together with the MDE to plan and

develop professional development activities related to the new reading and writing high school proficiency tests and the emerging integrated English language arts curriculum.

The MELAF Network was another resource group formed from the nominees who were not selected as members of the Task Forces and other local educators who expressed an interest in the work of the project. This group assisted the Management Team in reviewing draft documents and was called on periodically to provide information about related activities in their area of the state and to disseminate information at the local level.

Vision and Content Standards

The vision statement and content standards for English language arts accepted by the State Board of Education on April 18, 1995 are presented in Tables 58E–1 and 58E–2. Generally, the response to the draft content standards presented at public hearings and review sessions in the fall of 1994 was quite favorable. Of the 2,439 comments received regarding the proposed English language arts standards, 58%

TABLE 58E–1. English Language Arts

Vision Statement and Goals

The English language arts are the vehicle of communication by which we live, work, share, and build ideas and understandings, for the past, present and future. Through the English language arts skills, we learn to appreciate, integrate, and apply what is learned for real purposes in our homes, schools, communities, and workplaces.

The English language arts encompass how people communicate as well as *what* they communicate. The *process* includes skill and strategies used in listening, speaking, reading, writing, and viewing. The *content* includes the ideas, themes, issues, problems, and conflicts found in classical and contemporary literature and other texts, such as technical manuals, periodicals, speeches, and videos. Ideas, experiences, and cultural perspectives we discover in texts help us shape our vision of the world. The insights we gain help us understand our cultural, linguistic and literary heritages.

The ultimate goal for all English language arts learners is personal, social, occupational, and civic literacy. A literate individual:

- communicates skillfully and effectively through printed, visual, auditory, and technological media in the home, school, and workplace;
- thinks analytically and creatively about important themes, concepts, and ideas;
- uses the English language arts to identify and solve problems;
- uses the English language arts to understand and appreciate the commonalities and differences within social, cultural, and linguistic communities;
- understands and appreciates the aesthetic elements of oral, visual, and written texts;
- uses the English language arts to develop insights about human experiences;
- uses the English language arts to develop the characteristics of lifelong learners and workers, such as curiosity, persistence, flexibility and reflection;
- connects knowledge from all curriculum areas to increase understanding.

avored acceptance as written, 31% supported acceptance with revision, and 11% were opposed.

The specific comments received were very helpful to MELAF in revising the standards. In several instances, comments revealed misunderstanding of the intent of specific standards suggesting that the language of the standards was not clear enough. For example, the proposed content standard 2, entitled Language, read: *All students will understand and make thoughtful use of the forms and features of the English language that vary within and across different linguistic communities and contexts.* This standard was interpreted to mean that students who did not speak a dialect would be taught to do so. Feedback regarding this misunderstanding enabled MELAF to revise this standard to make clear its intent (see Table 58E-2).

Some critics argued that the proposed standards did not attend to classic literature or basic skills and that the intention was to disregard all things traditional. Although this was not the intent, the failure to mention these items specifically in the proposed standards allowed for this misinterpretation. This feedback allowed MELAF to understand better the concerns of others and to clarify the intent of the proposed standards. Of course there were and are some who did not and will not support the more holistic, social-constructivist bent of these standards and would prefer a more traditional, basic skills curriculum. As one State Board member put it, "I don't doubt the quality of the work. It's just that you've built a colonial, and I want a ranch." At present, however, there is widespread support of the revised content standards in Michigan and beyond.

WHAT WE HAVE LEARNED

As the field moves toward developing integrated, K-12 English language arts standards, there are numerous conceptual, procedural, and political issues that must be addressed. These include ideological and philosophical differences that exist within and across the various areas of English language arts, issues of turf and tradition that work against collaboration among professional organizations, and issues of community involvement, project management, and politics. These critical components in the reform process must be attended to if integrated English language arts standards are to serve as a positive influence on curriculum, instruction, and assessment.

Conceptual Issues

While those involved in the development of the MELAF standards share a social-constructivist perspective on English language arts, philosophical and ideological differences about the best practices associated with this perspective still exist. These differences manifest themselves in critical, and sometimes acrimonious, discussions about who controls the curriculum, how and when skills are taught, and what are desirable assessment practices.

In MELAF, philosophical differences have been apparent in a number of conversations about topics such as how

TABLE 58E-2. Michigan Core Curriculum Content Standards for English Language Arts

Revised April 18, 1995

Content Standard 1: Meaning and Communication

Focus on meaning and communication as they listen, speak, view, read, and write in personal, social, occupational, and civic contexts.

Content Standard 2: Language

Use the English language effectively in formal situations within schools, communities, and workplaces by building upon an understanding of their own and other language patterns.

Content Standard 3: Literature

Interact with a wide variety of classic and contemporary literature and other texts for information, ideas, enjoyment, and understanding of their individuality, our common humanity, and the rich diversity in our society.

Content Standard 4: Voice

View themselves as effective speakers and writers and demonstrate their expressive abilities by creating oral, written, and visual texts that engage their audiences.

Content Standard 5: Skills and Processes

Demonstrate, monitor, and reflect upon the skills and processes used to communicate through listening, speaking, viewing, reading, and writing.

Content Standard 6: Genre and Craft of Language

Explore and use the characteristics of different types of texts, aesthetic elements, and mechanics—including text structure, figurative and descriptive language, spelling, punctuation, and grammar—to construct and convey meaning.

Content Standard 7: Depth of Understanding

Demonstrate understanding of the complexity of enduring issues and recurring problems by making connections and generating themes within and across texts.

Content Standard 8: Ideas in Action

Apply ideas and issues drawn from texts to their lives and the lives of others.

Content Standard 9: Inquiry and Research

Define and investigate important issues and problems using a variety of resources, including technology, to explore and create texts.

Content Standard 10: Critical Standards

Develop and apply personal, shared, and academic criteria for the enjoyment, appreciation, and evaluation of their own and others' oral, written, and visual texts.

specific the grade-level benchmarks should be; whether there is a content in English language arts or it is primarily a process; what terms best communicate the intent of the content standards, for example, metacognition versus reflection, meaning making or meaning; whether literature or text should be the focus of English language arts; and how decisions are made about the canon. Discussions that focus on such issues are at the heart of what constitutes an integrated English language arts curriculum and should lead to clarification and understanding of the different perspectives that exist in the field. However, overly dogmatic positions can lead to paralysis and paradigm zealots can frustrate the process.

If we believe in respect for diverse perspectives, then we must accommodate a range of viewpoints in our collaborations to produce an integrated English language arts curriculum. Compromise in these situations does not mean violating beliefs and principles; it means learning where the commonality exists. In the end, compromise must prevail if the development and implementation of the framework is to go forward.

Professional Collaboration

Successful integration requires working closely with all the key professional organizations that are directly affected by the new integrated English language arts framework. In Michigan these professional organizations include the Michigan Council of Teachers of English (MCTE), the Michigan Reading Association (MRA), and the Michigan Association of Speech Communication Association (MASC). Although a Literacy Consortium was formed among these groups in 1983, these groups do not have a history of working together closely on important curricular issues.

For example, when the existing Michigan Educational Assessment Program (MEAP) reading test was substantially changed in the mid- to late 1980s, only MRA was involved in the process (Peters et al., 1993). Or, when new literature objectives were developed recently, MCTE took full responsibility for developing them. While these efforts had major implications for the English language arts curriculum, collaboration among the relevant professional organizations did not occur. Even at the national level where the International Reading Association (IRA) and the National Council of Teachers of English (NCTE) worked on national English language arts standards, integration was difficult to accomplish and the national speech and communication organization was not even involved.

In statewide projects such as MELAF where territorial boundaries of professional organizations are blurred to achieve integration of the English language arts, there are some who perceive this blurring as a loss of control that threatens the existence of a particular organization or professional identity. Consequently, tensions develop and become more important than the lofty goals of the framework. For example, not all professional organizations were involved in selecting the members of the MELAF Management Team. Although there was no intention to exclude leaders from any professional organization in selecting the Management Team, the perception was that one organization was trying to control the Management Team membership and, as a result, the decisions that would be made about integration. Projects such as MELAF need to think carefully about the implications of any decision on all groups. Past approaches to reform did not require this type of collaboration; current ones do.

A sometimes overlooked contributor to issues of collaboration among professional organizations in English language arts is the current state of preservice teacher preparation programs and certification requirements. It is not uncommon to have entirely separate groups of faculty, sometimes in different departments, oversee the preparation of elementary

teachers focusing on language arts and secondary English teachers. There is rarely any overlap in either course content or practica experiences, which virtually eliminates any possibility of providing prospective teachers with an integrated, K-12 perspective on English language arts. Certification requirements usually reflect this separation, rather than lead the field in another direction. This is another example of why reform efforts such as MELAF need to address a whole array of concerns simultaneously. If the entire system is not brought into alignment, standards projects designed to promote systemic reform are not likely to succeed.

Community Involvement

Community members, parents, and business leaders are seeking a more prominent role in curricular reform initiatives than in the past. As important stakeholders in the educational system, policy makers expect individuals and groups representing these constituencies to be involved in curricular reform efforts. The Joint Steering Committee (see above) addressed this need directly. Business leaders, government officials, and community members were given active decision-making responsibilities as the standards were being developed instead of perfunctory roles of reviewing finished products with little chance for input. Another constituent group that was not included in the Joint Steering Committee, but must not be overlooked, is parents. Partially as a result of feedback from public hearings and review sessions, MELAF now has parents directly involved in the development of dissemination materials. The lesson here is that the support of the community at large is necessary for curricular reform and that this requires direct input from all relevant constituencies into the process itself.

The concept of community support should also be extended to include members of the educational community not directly involved in the particular curricular reform effort. It is very easy for the educators involved in a project such as MELAF to be viewed by their colleagues as an "elite" group that has special opportunities that do not apply to everyone. MELAF worked very hard to address these concerns through activities such as the MELAF Network (see above), updates in organization newsletters, special teacher-to-teacher publications, and interactive sessions at regional and state conferences.

Project Management

No matter how well intended or conceived, curriculum development projects are not likely to succeed without management procedures that promote the collaboration, communication, and consensus necessary to produce acceptance and support. Among the lessons we have learned in this area is the importance of coordination and communication at multiple levels of organization. For example, the Codirectors' Group and the Joint Steering Committee (see above) coordinated the activities of the curriculum frameworks projects in all the areas of the academic core curriculum. Within MELAF, the Management Team coordinated the activities of

the different Task Forces and the Demonstration Districts and a group of facilitators both internal and external to the Demonstration Districts coordinated activities across districts. Other examples of coordinated activities within MELAF include the Equity and Evaluation Advisory Panels (see above).

We have also learned some things about the planning of various large group meetings and work sessions. For example, an advantage of having the different Grade Level Task Forces meet in the same location and on the same day was that it promoted a K-12 perspective on curriculum development. However, we also found that "writing by committee" with groups of 10-12 or more was not the best use of the expertise provided by the Task Forces. Rather, the experiences of the members of these groups provided an excellent base for a small writing team to develop draft materials to which Task Force members could then respond. In addition, it worked well to subdivide the larger group into small, cross-grade, working groups focused on preparing materials on specific topics to be presented to the entire group for feedback and revision.

Political Considerations

There is a new political context in which educators must operate. If we do not get involved, we are likely to have new English language arts standards imposed on us. This means we must deal with a process that can be both unpredictable and inflexible. We have learned that, although we cannot control the process, we can anticipate problems and develop appropriate responses. Two examples in Michigan will help illustrate how we need to be prepared to respond to this new political context.

Timelines always seem to be an issue in curricular reform projects, but the problems were compounded in Michigan with the state legislature's mandated changes in the state curriculum. The completion date for the content standards and benchmarks had to be accelerated because public hearings and legislative dates had to be accommodated. Legislators share educators concern for improving the quality of education, but have different timelines and approaches for solving the problems. What we learned was to be flexible in responding to these mandates, and to "let go" of our work before we are completely satisfied with it so that it can be examined critically by all the stakeholders in the process.

Another important political consideration is the changing role of community groups and their desire to monitor closely proposed changes to the curriculum. Groups from both ends of the political spectrum want control over the content of the curriculum. Each has developed a certain litmus test for the appropriateness of proposed curricula, and one of them is the language used in documents such as the content standards. Certain terms act as lightning rods (e.g., multiculturalism, values, respect for diversity, attitudes) and produce immediate response because they suggest a "political" agenda to certain individuals and groups. Such groups will sometimes mount an assault on the entire process that puts the entire framework in jeopardy. Many of these groups are well orga-

nized and very sophisticated when it comes to finessing the political system. What we have learned is to avoid certain types of language, study well the concerns of the opposition, and be prepared to respond to specific issues in public forums.

For example, in Michigan the content standards were required to go before a series of public hearings where all people were invited to respond. We knew that if we did not actively work to get parents and other community members who supported the direction the framework was taking out to these hearings, the only voices policy makers would have heard were those in opposition. Policy makers look more to the public than ever before and if conscious efforts are not made to provide them with a more representative view, they may infer that the public speaks with one voice.

SUMMARY AND CONCLUSIONS

The hallmark of the MELAF project is the process used to develop the components of the framework. The process is inclusive; it involves multiple levels and cycles of review and revision, working from both the "bottom-up" and the "top-down" to impact districts, classrooms, and individual students. Both the substance of the resulting framework and the processes used for development provide direction to districts within Michigan as well as to other states in creating systemic change and improving teaching and learning in the English language arts.

State standards development activities should not be undertaken lightly. Because they must transcend special interests for the broader purposes of the effort, they are extremely difficult to create and sustain. Even when the many levels of organization and aspects of curriculum development are negotiated successfully, there are no assurances that these projects will result in the expected changes. Although these projects are well intended, it is best to be prepared for unanticipated consequences (cf. Linn, Baker, & Dunbar, 1991).

EPILOGUE

Several significant events have occurred since we wrote this chapter. Most notably, the election of more conservative policy makers in the fall of 1994 resulted in less support for systemic reform initiatives such as standards development at both the state and national levels. In Michigan, this trend was evident in the change from a *mandated* academic core curriculum to *voluntary* standards and benchmarks. The move from mandated to voluntary standards encouraged the State Board of Education to make changes in the English language arts content standards appearing in Table 58E-2 before approving them in July 1995, despite the fact that these were the standards that had resulted from the public hearing process described previously.

The State Board of Education also required the MELAF project to pursue alternative instructional approaches to implementing the content standards—with an emphasis on

the role of phonics in beginning reading instruction. As a result of this charge, we identified a group of K-2 teachers who use a variety of instructional practices from elementary schools that have demonstrated success by achieving state accreditation. These teachers wrote a series of mini case studies describing their instructional practices for inclusion in and dissemination with the final set of project materials.

A noteworthy conclusion to the MELAF project was the dissemination conference being held in July 1996. Forty district teams were selected from applications from around the state to participate in a 3-day conference intended to initiate professional development activities around Michigan similar to those developed in collaboration with the Demonstration Districts. A MELAF participant was assigned to each

district team as a facilitator in developing district plans for professional development. In addition, district teams were grouped into regions and worked together with a coordinator from their region to plan cross-district professional development activities. Regional proposals received small seed grants to initiate these professional development activities in 1996-97.

The final framework documents were to be presented to the State Board of Education in the fall of 1996 for their approval and subsequent dissemination to local districts. Despite the decreased support for systemic reform initiatives such as this one in Michigan, these efforts are continuing and promise to have a significant impact on the way we go about the business of teaching and learning in this country.

INTRODUCTION

Lee Galda

UNIVERSITY OF GEORGIA

Bernice E. Cullinan

NEW YORK UNIVERSITY

Literacy is no longer just knowing how to read and write—it encompasses much more: critical viewing and listening, using technology, and recognizing persuasive techniques in political campaigns or advertising, for example. When a game changes, the players on the field must change. Therefore, to obtain a broad perspective on the contemporary literacy game, we invited contributions from long-standing literacy developers, such as teachers, and also from writers of children's books, and people who work in publishing, television, technology, art, and music. The chorus of voices from the literacy field grows large.

Our chorus of voices from the field includes writers, artists, illustrators, publishers, filmmakers, television producers, art critics, art educators, computer programmers, and children. Children, the primary focus of our work, have ideas about reading, writing, listening to music, watching films, or looking at book illustrations and art. Six-year-old Arianna Rubin responded with this note:

Dear Lee: I would really like to be in this. I think it is very cool. I'm talking about your book. from Arianna Rubin.
P.S. Thanks

Arianna's gracious words and thumbs up signal demonstrate the range of her communicative repertoire; she includes both visual and verbal systems to express delight. Her message, illustrative of young children, combines art and words to convey meaning. Later, she sent this explanation:

Sometimes I don't look at the pictures in the book. I try to make my own up. For example, when they talk about mermaids in the sea I think about The Little Mermaid and try to get pictures from movies.

When I write I also draw pictures. The pictures show my readers what things look like. For example, I wrote a story called Jim and Jan and I drew pictures of where they were, not just what they were doing.

For Arianna, as for many children, writing and drawing are parts of a communication system that works together to convey meaning and emotion. Her older sister, Aviva, says she sees pictures in her head when she reads and she prefers her visions of characters to the ones artists draw.

Five-year-old Adam, a child frequently towed along through art galleries by his parents, began to look actively at paintings when he saw several Van Gogh self-portraits hung side by side and discovered they were quite different. An astonished and bemused cluster of adults nearby listened as he blurted: "Look, Mommy! This one looks smooth up close and kinda like skin and this one has speckles and this one has lots of color dots unless you get far away." Although he did not have a sophisticated vocabulary to describe the evolution of Van Gogh's technique, he was making meaning from paintings and beginning to read the language of art. His understanding of the language of music causes him to beg, with tears in his eyes, that anything played in a minor key be turned "Off! Off!"

Today's children are media alert. They learn early how to "read" the genre of children's magazines; they figure out a magazine's consistent format and turn to their favorite part rapidly. They develop a preference for art and artists in their picture books and gradually recognize the writing

style of the authors they read. Some children outdistance adults around them in using the language of computers, especially for computer games. Many manage to channel surf across several television stations to keep track of five different programs at the same time. Some notice how cameramen use light and angle to frighten or startle them in the films they see. Some notice that advertisers try to manipulate them to buy their products. Children learn to play the communication game quickly.

Those of us involved in education, writing, illustrating, filmmaking, television, publishing, technology, music, and art recognize the virtual explosion in communicative possibilities available to us. We recognize, however, that among the possibilities there also lie perils.

VOICES FROM THE WORLD OF THE CLASSROOM

Children come to school today with far more information than those who came 10 years earlier. Today's children grow up with Sesame Street, Barney, magnetic ABCs on the refrigerator, interactive computer games, newspapers, magazines, and cassette players at their fingertips. They hear about social problems in their world through television newscasts and, although some part of their knowledge is only surface level, they sound glib in their pronouncements about a variety of social issues.

Students often have an overload of superficial information and questionable news from the street: this creates new challenges for teachers who want them to make sense of what they know and to think critically about real-world issues. In this regard, Ann Alejandro describes how visual arts play a crucial role in her Hispanic students' language learning in southwest Texas. Sometimes their real world is overwhelmingly ever present and numbing. Alejandro makes a powerful case for bringing beauty into all children's lives so that they can create worlds like happy dreams.

Teachers help students become aware of the ways in which symbols influence our thinking and create belief systems. Michelle Carey, for example, shows how her 3rd-grade students move from exploring visual symbols to examining literary symbols in imaginative literature. Richard Kerper questions the kinds of meaning making he sees valued in schools and looks carefully at the types of information students can gain from illustrations in nonfiction texts. A poet, Michael Strickland, guides students to explore poetry, music, and words as they create their own symbols. He includes performance as a natural part of every session so that students learn how to express themselves verbally. Teachers work along with their students to probe new definitions of literacy—they learn to master new aspects of technology without being controlled or misled by it.

VOICES FROM THE WORLD OF CHILDREN'S BOOKS

Current definitions of literacy incorporate visual as well as

verbal formats; educational issues surround both formats and are similar. Mental processes that underlie all forms of literacy involve thinking, expressing ideas, evaluating ideas, and making connections. Fortunately, learning in one medium contributes to understanding in others. Voices to speak from this domain include writers, illustrators, a teacher of aesthetics, and art critics.

Master storyteller and poet Jane Yolen addresses differences between a tale apprehended by ear and one taken in by the eye. Acknowledging that although print may intimidate some, Yolen believes that the eye and the ear are different listeners. Good storytellers hold listeners through a magical combination of art and word weaving. Jan Greenberg, aesthetics teacher, concentrates on perception in the arts and believes art should be integrated into classrooms. In *The Painter's Eye* and *The Sculptor's Eye*, Greenberg introduces basic principles of art along with the language to talk about them. She argues convincingly that we appreciate more fully what we know best and understand well.

Two-time Newbery Award winner Katherine Paterson discusses her role as a storyteller who writes novels; she says novels are 'stories in the flesh.' Paterson tries to involve basic human senses (sight, hearing, taste, touch, and smell) in her words because readers must use them to create their own images; that is how readers make Paterson's stories come to life. W. Nikola-Lisa writes picture books, which is quite a different process from writing novels. Instead of describing every sensual detail, he must allow illustrators to tell the rest of his story. He continues to be pleasantly surprised as artists extend his texts and enrich his stories. Barbara Kiefer uses picture books to help children and adults learn about art. She encourages learners to consider artists as meaning makers who make visual choices; she asks students to make connections between art in picture books and art in their wider world. Steve Tozer and Victoria Chou examine a book, *The Stinky Cheese Man*, that plays against literary and artistic conventions for the sake of humor. Wildly popular with students and teachers, this book is both subtle and blatant in story, art, and design.

It is clear to teachers that students accept art as a way to make meaning. Beginning writers often draw first and write later. One day when asked what he was going to write about, Billy answered, "How do I know? I haven't drawn it yet!" Students use their notebooks as a place to think, plan, draw, discover, reflect, develop ideas, and sketch plans for drawings they will make and poems they will write. Teachers also see students use writing to express meaning in artists' workshop (Ernst, 1994). Ernst shows that students in kindergarten to grade 4 use writing in artists' workshop to express their thinking, to show meanings in their pictures, to assess and revise their work, to describe their process, to plan ahead, and to reflect on their learning and thinking (p. 45). She compares art exhibits to publishing in that both help students celebrate their work, find an audience, and receive encouragement to become better writers and artists.

Visual literacy and print literacy may be reciprocal: we use pictures to make meaning about text and we use text to make meaning about pictures. Certainly, parallels exist in the interplay between words and pictures. One teacher said, "My

kids don't know where writing ends and art begins." The truth may be that writing and art are on a continuum as part of the same thing—a way to express meaning about our world. The issue remains unresolved: Will school curricula include instruction in critical viewing as well as in critical reading and listening?

VOICES FROM THE WORLD OF FILM AND TELEVISION

The ability to create images, to see things in our mind's eye, and to visualize objects and events not physically present is a major function of the human mind. We could never have our great cathedrals, skyscrapers, or the Golden Gate Bridge if someone had not imagined them first. Television and films spell out images on screens. They make images explicit; viewers do not need to work hard to create their own mental images. Healy (1990) believes that good learning and good problem solving require active involvement, persistence, and imagination. She fears that a great deal of television watching creates passive learners who give up easily (p. 201).

Studies show that the amount of information presented on television news is minimal compared to the amount presented in a newspaper such as the *New York Times*, *The Wall Street Journal*, or *The Washington Post*. The entire transcript of a 1 hour telecast fills less than half a page in a newspaper. The telecast includes pictures—which some say are worth a thousand words—but the depth of coverage is minimal.

Television reports the news and moves on—it does not hold still for reexamination, questioning, or looking at alternate explanations. A critical reader goes back to examine statements, the level of documentation, the sources of information. Critical readers assess the credibility of information, and the qualifications of a writer. This kind of checking is extremely difficult with a telecast. Readers determine the length of time print remains visible for its reanalysis, or evaluation. But television directors and cameramen control what we see and how long we see it. Can we teach students to be critical viewers of the media? Is our imagination stunted in its growth from watching a lot of television, computer screens and films?

Educators work in the field of film and television to make it responsive to learners. At the same time people who create media programs consider their audience and adapt their work to function effectively in a democratic society. Voices from this section of the field include artistic creators and producers of film and visual media. Marc Brown, creator of picture books, tells how he adapted his book character Arthur to the screen and interactive CDs. The childlike Arthur in aardvark form faces the same kind of emotional and social problems that any human child faces. Vulnerable and lovable, Arthur serves as a model for viewers who see possible ways to face their own life problems. Kathy Waugh, senior editor of children's programming, explains why she features the Arthur stories on a television series. Viewing the films leads to reading the books and she sees books as the key

to understanding one's own life, one's history, and one's place in the larger world. Twila Liggett, one of the first to present high quality literature on television, describes the research and development of the notable series *Reading Rainbow*. She also reports the dramatic effects that the series has on children as readers. Lauren Wohl, from Disney Press and Hyperion Books, transcribes comments from a session in which children under age 9 view the film *Bambi*. She observes that indeed children *do* read images on a screen that become new dimensions to explore in books. Victoria Chou and Steve Tozer, professors of education, interview Steven James, a filmmaker, who created *Hoop Dreams*. The filmmaker talks about how the film evolved, who he considers its audience, and what he hopes the film will accomplish.

VOICES FROM THE WORLD OF ART AND MUSIC

Children's development of aesthetic taste hinges on their experience with art and music. In this section, we let two people speak for themselves—one through his writing and the other through a personal interview. Philip Yenawine, art educator, describes his work with children at the Metropolitan Museum of Art and the Museum of Modern Art in New York City. Yenawine believes that children develop visual literacy when they have an informed guide to help them explore art. The guide also models a vocabulary to talk about art. Josephine Peyton Young interviews (her cousin) songwriter Caroline Peyton who discusses how she selects topics and creates images to convey her message. The popular songwriter tries to capture experiences that are gone and turn them into something tangible through her song lyrics.

VOICES FROM THE WORLD OF PUBLISHING AND TECHNOLOGY

Publishers have reason to be concerned that readers are an endangered species. The number of daily newspapers has declined steadily during the past decade. Book sales in the United States rank only twenty-fourth worldwide. Although publishers are necessarily concerned about making return to stay in business, they are also concerned about the intellectual level required to maintain an informed citizenry. A democracy cannot survive without active, engaged, and knowledgeable participating citizens.

Reading provides more than information; it has a cumulative effect on all language related skills. More reading results in better reading comprehension, writing style, vocabulary, spelling, and grammatical development. People who read know more about their world than those who do not. They are more curious, have greater understanding, and make more informed choices. Active citizens need to read to stay informed.

Students who use computers have advantages over those who do not. McDermott (1989) found that daily use of computer software programs helped kindergarten children learn to write and read better than children taught through traditional methods. Children who have access to computers excel because they can manipulate a mouse better than a pencil, and it is easier for them to recognize a letter rather than having to draw it from scratch again and again. Older students who use computers write more willingly, research more extensively and read voraciously, than students who do not have access to computers. Computer access seems to be necessary to remain an informed citizen.

In the final section, publishers speak about magazines, textbooks, trade books, and computer graphics. Tamara Hanneman Rubin is editor of *Storyworks*, a classroom magazine for students in grades 4, 5, and 6. Hanneman Rubin explains the considerations she has in choosing the content and illustrations for each issue. Joy Chu, a talented book designer, reviews her thoughts as she works with a manuscript and an illustrator to create a design for a picture book that flows, urges a reader to turn the pages, and holds together as a unified experience. You can always spot a book that Joy Chu designs; it is elegant, breathtaking, and a work of art. Roger Rogalin, formerly with the American Association of Publishers and currently with Macmillan Publishers, discusses political implications of publishing in regard to developments in literacy and technology. Anthony Lucki, Harcourt Brace Publishers, describes the effect of technology on publishing. He recognizes the impact of technology on

the way we now define literacy to indicate its fluidity or flexible nature: we negotiate meaning, we write as a recursive process. Suzanne Singleton, curriculum consultant, describes the process of creating a basal reading program, a collaborative process involving hundreds of people over a 3-year time span. Program authors, selected on a variety of criteria—area of expertise, gender, geographical location, and cultural background—shape the philosophy and much of the content of a program. Finally, Barbara Baskin, computer program writer and professor of education, explains the role of computer graphics in literacy attainment. She recognizes that some students are more comfortable and literate in microworlds than their teachers and addresses the issue of whether the intrinsic quality of the medium or the information obtained draws students to its use.

As literacy educators, we dare not be too enamored with the possibilities of technology: easy access to information, attractive media displays, and appealing interactive elements—that we ignore its potential dangers. Possibly students will think less critically, some may be less imaginative, and some may be influenced by advertising and its attendant materialism. Who controls the news we hear and the information we receive determines the direction our lives take. The overwhelming appeal of progress forces us directly into accepting these challenges. Schools must give students access to books, newspapers, magazines, computers, and all other available sources of information. We must also educate students in the processes of critical evaluation; only then can we guarantee a viable democracy.

LIKE HAPPY DREAMS: INTEGRATING VISUAL ARTS, WRITING, AND READING

Ann Alejandro

RIO GRANDE RIVER VALLEY SCHOOL DISTRICT

I have taught in southwest Texas for 15 or 16 years. In 1991–92 and 1992–93 I built two reading–writing communities with primary students in two districts. I have been their teacher, and they have been mine as we have worked together to create worlds “like happy dreams.” This is our story.

TWENTY MILES SOUTH: THIRD GRADE, 1992–93

This year, we are 33 third graders in two language arts blocs, 12 of whom began the current school year reading at the readiness or 1st-grade levels. We are all Hispanic: 26 are classified as “at risk”; 19, limited English speakers; 17, the children of migrant farm workers; 2, learning disabled; 1, emotionally disturbed; and 31 are receiving public assistance. According to the 1990 census, 60% of the community respondents said that they did not speak English “very well,” 76% of those 25 or older did not graduate from high school, nearly 65% of school-aged children lived below the poverty line, and 16.4% of the adult population are unemployed.

Once a week for the last 3 weeks, someone in our community has been killed. We have a population of 1,500, three gas stations, one cafe, no public library, and a postage-stamp-sized post office that opens from 9:00 a.m. until 10:30 a.m. and 11:30 a.m. until 4:00 p.m. All you can see from anywhere you stand in our town are farmed fields, tumbledown shacks and implement sheds, a cotton gin, a chemical supply, and an airstrip for the crop dusters. Our families have worked on these farms and ranches, sometimes for generations, and now the jobs are fewer and farther between.

We work together in this state that has threatened to close its public schools unless compromises can be reached about how to distribute education funding fairly and, for the last few years, has demanded that public schools address and fix the crises of high drop-out rates, gang violence, and terrible standardized test scores, particularly among minorities. When

our local administrators responded to the threats of the governing state education agency (both of which demanded that we get “back to basics”), we were nearly denied the privilege of out-of-town field trips (for which we ourselves had already raised the money at school fairs and carnivals) because such a reward, our administration felt, should be earned by performing well on the TAAS tests.

“Art” has been relegated to a nonbudgeted craft activity involving paper plates and Popsicle sticks. For music, the children sing to records once a week for 25 minutes. Since we do not have sinks in our classrooms, painting is trouble and cleanup impossible, especially on the days we have no running water. Since our district lives under the gun of what the Education Agency will do to us unless we get our scores up in reading, writing, and math and “cover” all the test objectives, art and beauty are frivolities in which we just cannot indulge our students.

When I began working with primary-age children in our area, I doubted whether any of them had really seen, heard, or read anything truly beautiful in their lives. They had missed it, even when it was around them, because nobody had shown them how to see it. Sometimes a crop flowering or ready to harvest is beautiful, and a scraggly rose bush in a grandmother’s yard or even the chickens bred for cock-fighting can be beautiful. But the students did not recognize the beauty. The school library has many beautiful art books, but most of them stay on the shelves. At the beginning of the school year, none of my students has ever seen a real painting or sculpture or stained-glass window, and most have never seen a real Christmas tree.

TWENTY MILES EAST: SECOND GRADE, 1991–92

I had begun to use art extensively in my language arts instruction the previous year with second graders in a different

district, 20 miles from the district where I work now, but with parallel populations and situations of difficulty. Because I believe that most writing is visually dependent, I am convinced of the parallels between teaching children how to draw and teaching them how to read and write. In all cases, students need to learn *how to see*, to interpret data from the world, the canvas, and the page. We see whole texts in paintings, in the scenes of life around us, and in the books we read. I believe children can understand thematic wholes as they look back on the events of books, the composition of paintings, and the unfolding autobiographies of their own lives. Conversely, I recognize that when we analyze the small components of paintings—dots, circles, curved lines, straight lines, texture, angles, genre or media, use of color, mood, atmosphere, and even conflict of character or plot—we use thought processes similar to those involved in creating or analyzing components of the texts we read and write. Sounds, words, sentences, punctuation, spelling conventions, genre, paragraphs, poetic language, metaphor, character development, and style provide an interplay of parts that contribute to a harmonic, full-blown whole. I believe that immersion in art can parallel and enhance immersion in text: When we read and write, we use the same critical thinking and decision-making brain power that we use when we paint or respond to paintings. Probably the same comparisons among musical, sculptural, and printed compositions can be made; it is a theory I have not had time to test yet.

Ironically, my art-centered classroom began as a direct response to the state-mandated reading, writing, and math test that these second graders would be taking in October of their 3rd-grade year, a test which would measure their 2nd-grade “skills mastery.” Every teacher in the state was given enough worksheet preparation materials for this test to reforest the Amazon River Basin. The idea of the writing test was simple: Students would be given a “prompt” and would then generate a draft of a process analysis, a description, or a narrative from that prompt. Their papers would then be scored holistically by two or more state-trained readers. Based on these writing samples, combined with scores on the objective (bubble-dot) components of the writing portion of the test—capitalization, punctuation, spelling—students would have either “mastered” or “failed to master” the test objectives, and their teachers and districts would be held accountable for the results. A student could compose a decent writing sample and still fail the writing test; likewise, it was very possible to master the objective component but freeze up or compose “off the prompt” on the writing sample and fail. My students would be all of 8 years old when they took it, after months of summer vacation and then 7 weeks of cramming for it, in another grade, with another teacher.

The Lure of Paintings

These writing “prompts” consisted of cartoon line drawings, the quality of which was disgusting to the imagination of any child who had ever held a crayon. As I thought about inviting the children to write descriptively, I threw away the prompts and invested in a set of slides and transparencies of famous paintings and a set of slim, inexpensive paperbacks in the *Art*

for Children series (Raboff, 1988a, 1988b, 1988c, 1988d). I also stole all my mother’s art books, set them in stacks on the tables in our classroom, and watched my students change. During small-group reading sessions, I shared little bits of two lovely books by Gladys S. Blizzard: *Come Look With Me—Enjoying Art With Children* (1990), a volume of portraits accompanied by engaging, thought-provoking questions like, “What do you think the little girl is staring at so intently?” and *Come Look With Me—Exploring Landscape Art with Children* (1992), with similar questions and situations inviting children to imagine, pretend, and immerse themselves in the landscapes. As all these treasure books were out on the tables all the time, my students came to the classroom early and stayed late, gathering around the books, laughing, talking, showing, and exclaiming, or sneaking off to corners to look at books all by themselves. They could not wait to finish assignments to explore the books in the free time I gave them, and for several days, I mostly watched, listened, and offered a few comments when students brought me pictures to look at.

When it was time to become art critics, we began looking at slides in whole-group settings, observing colors, background, foreground, different media, and mood. The children began to observe character and plot, and we talked about how “every picture tells a story.” Brainstorming, we imagined names, feelings, and relationships among the subjects painted. They noticed that each painting had its own time of day, source of light, and weather, and they soon made comparisons between paintings and artistic styles. Quickly, they observed contrasts between cool and warm colors; and they made comments like, “It’s very hot in this scene, and the men are very tired” (in response to a Frederic Remington desert scene) and, “Renoir likes to paint in the springtime.”

They had no interest in relying on the text descriptions even when they could read them; nobody needed to explain these pictures to any of these little people. On the day I decided it was time to let them choose their favorite painting to describe, no child could be dissuaded from the painting he had chosen, the one that elicited the strongest emotional response. Although some of my cowboys would have no truck with anything but Remingtons, and most girls grabbed for the books of Renoir, Cassatt, and Monet, I was very pleased that many boys were drawn to Da Vinci portraits of women and Millais’s drowning “Ophelia,” and several girls loved Van Gogh’s portraits of peasant men and the “Bedroom at Arles.”

The 7-year-olds drafted their descriptions, and, that night, when I read them to my mother, she was able to identify each artist whose work the children had described. They had enabled an adult to “see” what they had described in words.

Children as Art Critics

In the following days, we revised our drafts for correctness only because the students had already found plenty to say. We prepared our descriptions for publication. Responding to Michelangelo’s stylized, early “Doni Tondo,” Cynthia, whose only pair of shoes were so tight that they make her cry, wrote in her final draft:

This is a round picture. Joseph is holding God. And God is pulling Mary's hair and she is reaching to get God. Mary and Joseph are very proud of baby Jesus. Baby Jesus has curly hair and he is looking at Mary and Mary is looking at baby God. Mary has an oval chin and an oval face, and Mary has on pink and blue and green. Joseph has orange and gray and a mustache. And there are some men fighting in the background. There are some mountains in the background.

It was the most she ever wrote in the entire year and one of two discourses she ever completed.

Lorraine, an award-winning artist who turned all she read, wrote, or painted into love stories, was especially drawn to the rich colors and fairy-tale qualities of the paintings of Marc Chagall. She combined two rough drafts as she completed her interpretation of Chagall's "The Three Candles":

A Description of the Tree Candles

In this painting there is a woman and a man getting married. It seems like they like each other. In the background there are green leaves and three candles and a goat and two people are out of the house that is red. This is a picture of angels flying in the sky. There is six houses and one car and flowers are by the angels. White rings are floating around. There is a clown standing on the fountains. The people at the bottom of the bride have a magic wone and that point it to the air. And the air is red. And that is earth all over. The magic angel is floating in the sky making dreams come true for the woman and a groom. And they lived happily ever after.

The End

Responding to the same painting, "The Cowboy," by Remington, Rigo and Daniel took different angles. Remembering to describe in detail, Rigo wrote:

I see a wonderful picture by Frederic Remington. I see one man riding on a strong horse and I see 46 rocks on the ground. The horse is slipping off a mountain and I can see 4 horses, and the man has a hat on his head and he has a gun and bullets and he is wearing brown. He has a brown hat and brown short pants. The shadow is brown and the background is blue, brown, and gray and I see that it is in the even. . . .

Daniel really was a cowboy who worked on a ranch with horses and cattle everyday after school, and he had had a few spills and close calls that became part of his description-turned-narrative: "This is a picture of a man riding as fast as he can on his horse on a very hot day. He's very tired. He is hitting his horse with all his fears. He doesn't care if he falls down...." Daniel was a talented clay sculptor of horses and cowboys. Later in the year, he also won an award for one of his paintings in the annual area-wide creative arts contest sponsored by our junior college. All dressed up in a western suit, he showed up at the awards ceremony at the college with his parents, who spoke very little English, beaming for him, shaking my hand, and asking, "Es good boy? He give you no trouble?" Yes, I said, he was a very good boy and never any trouble. A few days after school let out for the summer, Daniel's parents got into an argument, and his father killed himself in front of the children. I have no idea what became of Daniel. There was speculation that his mother may have moved the family back to her people in Mexico. I am holding on to the arts magazine in which his painting was printed, in case I ever see him again.

Dana had a twin sister in the other 2nd-grade classroom, and they were always dressed exactly alike—like princesses. Dana also had a younger sister, and her narratives were always characterized by beautiful girls or young women who had, specifically, no brothers, sisters, husbands, or children. Although she had not read any of the written description of the painting, her final copy appeared on my desk like this:

A Description of Diego Rodriguez De Silva y Velasquez's "The Infanta Margarita" by Dana Tristan.

This is a painting of a beautiful little girl. She is wearing a beautiful blue dress. She looks like a princess. She has a white face and a silver necklace on her neck. She has an olive green bow on her hair. The background is mostly black. She has a blue bow in front of her dress. She has gold on her dress, too. She feels so wonderful that she is a princess. It looks like she lives in a beautiful red orange castle. She is rich. She has black beautiful eyes. She has long light blond hair. She made that beautiful leathered dress that she worked on it for several days. She is in a dark room that there's no light in. She is not married. She does not have any kids or brothers or sisters.

She has a lot of jewels. She is sweet and thoughtful. She wears a lot of gold on her dress every day. She wears a little bit of makeup and lipstick. She cares for everybody. She is always happy. She looks like she lives in France.

I copied all the pictures, typed all the text, made book covers, and bound our volume of art criticism to present as Mothers' Day gifts. All year long, the children were more excited on "Authors' Day," when their bound books come to the room hot off my presses, than they were at Christmas parties or Easter egg hunts. They were just as delighted to read their classmates' words in print as they were their own, a consistent response each time I brought completed copies of one of the seven class sets of chapbooks we published that year. After the children pored over their anthologies for a long time, we had Author's Chair in the reading circle, and each author read his own contributions. Then they autographed copies for one another, the school library, the principal, and the superintendent.

Combining Paintings to Tell Stories

A few days later, I cut out quality artwork from calendars, magazines, old date books, catalogues, and journals; and I laminated them for the next series of "prompts," the narratives. Before school, I covered all the desks and much of the floor with these prints of paintings and sculptures. The students already knew that narrative structure required characters, a setting, a problem to solve, and the solution to the characters' problem; but before we began using paintings and sculpture as the stimulus for writing, all these elements had to come out of their own heads, and some of the stories had an uninspired sameness as the young writers borrowed ideas from each other. When they walked into the room filled with art, I asked them to pretend to be in an art gallery, looking quietly and carefully at each print, taking plenty of time, and then choosing four prints to incorporate into a story. I instructed the students to pick one or two character pictures; a setting picture; an event picture (if they had only picked one

character picture); and one picture they absolutely did not like because it bothered them, scared them, or made them feel uneasy.

They chose their four pictures with great care, frequently changing their minds. The room stayed very quiet as they frowned, walked, picked, rejected, and finally chose. For prewriting, they began to take notes and wanted me to come to their assistance: "What do you think his name could be, Miss?" "Where do you think this picture is?" "Why don't this person's eyes match?" "Is this a lady or a man?" I answered all of them, "You decide." The resulting narratives were rich and complex, and I am convinced that the element of tension created by the one "disturbing" picture lifted these stories out of the trite, bland, and predictable. The students truly had wrangled with the resultant conflicts, and not one "formula" story came out of this assignment. We were all convinced that we were wizards.

Test Results

My principal resigned under pressure due to the campus' previous years' low state-test scores, and over the summer, the administration hired a new principal who would whip us all into shape and make those scores come up. After spending 20 minutes with him and hearing his plans to push me back into basal readers and "preparing for the tests," I resigned. The second graders from that school came back as third graders and, 7 weeks into the new school year, took the all-important state test, the results of which were published in December. Third grade writing had moved from 38 mastery the previous year to 88 mastery. Reading scores went up from 28 student mastery in 1991 to 80 in 1992. The school received a \$30,000 bonus from the state for significant improvement, and the superintendent attributed the gains to the strong new campus leadership. Nobody knew that, in second grade, my students had hardly ever heard a mention of that test. I had never told them that we were preparing to "master test objectives. We had been too busy loving what we read and what we wrote.

COMING HOME

I applied to teach elementary school in my own home district, where I had always attended school and previously had taught at the high school before moving to our junior college to work in the writing lab. My criteria for teaching assignments were exclusive: My students could not consider themselves too big to sit in my lap or hold my hand, and they had to believe in Santa Claus. When no calls came, I prepared to home-school my own children and those of my relatives and a few friends who, like me, felt our kids were being robbed by the district's emphasis on mastery of basic skills and test-taking practice. But 2 days before in-service for the academic year began, the principal from the school where I now work called. (The campus was 20 miles from me in the other direction, 4 miles from the farm and ranch which had more or less supported my father's family all through my childhood, and less than 300 yards from some of my brother's cotton fields. I was, in

many ways, back home.) This tiny community is part of our local school district and has one school serving grades Pre-K through 8. The principal offered me kindergarten but asked me to take third grade, which I did, taking all my art books, posters, slides, videos, prints, paintbrushes, and clay with me to the new classroom where I would be obliged to prepare the incoming third graders for their early October testing.

Boot Camp Art and Writing

Astonished and overwhelmed by my students' "deficiencies," their lack of experience in reading, writing, and especially *seeing* (connecting language to visual stimuli and sensory experience), I began the same processes of using the art slides and prints, having 7 weeks to give the children the tools with which to compose narratives, descriptions, or process analyses. This did not include reading "skills" measured by the test, so we dived deeply and hardly came up for air as we struggled for words, descriptors, sense, rudimentary organizations, and structures for ordering language. I only remember four things about those 7 boot camp weeks: I brought huge buckets for watering horses to use as sinks, and we filled them with water from the hose outside, passing it through the window whenever we needed water for painting, making, or cleanup, and for our process analysis. Instead of describing "How I Clean Up My Room" or "How I Get Ready for School in the Mornings," we cooked clay dough on hot plates and colored it with dry tempera powder. As their hands turned wonderfully red and green and purple while they squeezed and kneaded the magic goo, the students did not know they were prewriting. The next day, our hall bulletin board was covered with baggies of brightly colored play clay and sentence strips completed by small groups describing the process stages for "How to Make Your Own Clay Dough and Enjoy it With Your Friends." My principal said, "I see," and asked some of my students to write down the recipe so that he could make the clay with his preschool daughter.

Pope Julius and the Texas Education Agency Have Their Standards

I showed the students pencil-sketch studies (prepainting?) and the resulting Sistine Chapel frescoes, asking the children to make the connection between vision—the beginning work, the germinating idea from the artist's eye—and revision—literally, seeing again, making the final product ready for the eyes of an audience. We talked about the kinds of changes we must make as we move from writer to reader of what is written. Using transparencies of their own writing, I taught them how to score writing holistically, using the same measures which their test evaluators would use. Within hours, they could evaluate accurately the strengths and weaknesses of their discourses. "See it in your head," I kept telling them. "When you read, don't depend on looking at somebody else's pictures of what you're reading. There won't be any pictures on the reading test. When you write, see it in your head like it was a movie or a painting. Let your readers know exactly how

you see what you see. Don't leave any white spaces on your canvas."

It's Not Cute. It's Messy. It Has Misspelled Words.

When I look back, I think the most important part of those first weeks stemmed, once again, from my aversion to "canned" methodology. It seems to be a necessity that an elementary school bulletin board, usually teacher-made, must be "cute," the product of some pre-prepared activity from a cute teacher magazine, with little precise worksheets to duplicate, color, cut out, and write in response to seasonal or thematic caricatures about "spring" or "puppy love." Grown-ups walk down the halls and say, "Oh, isn't that a cute idea?" Most cute ideas make for lousy reading and writing experiences, completely lacking in authenticity of students' voices and passions. I think groups of students should design, make, and caption their own messy, error-plagued, crooked bulletin boards. Because I honestly felt that about a third of my students stood a chance of mastering their reading and writing test objectives, I took that third to the library during our enrichment period at the end of the day, as my miracle-working, full-time aide kept the others for reading or completing final copies of their writing; pulled out the grown-up art books and set them beside my own collection; invited small groups of students to research their favorite artists and compile examples of their work from magazines (again, stolen from my mother, who parted with them for the good cause); and directed the groups to compose teaching bulletin boards for the rest of the students in the classroom and the school. When the bulletin boards were complete, each member of the different groups would explain different aspects of the artists' lives and work to the rest of the class.

The groups chose Michelangelo and Da Vinci (spin-offs of which resulted in brief studies of scientific invention, Biblical history, architecture, and the Renaissance), Georgia O'Keeffe, and Marc Chagall. The resulting scratched-out, messy bulletin boards that they made were the project's crowning glory, and little Debbie Gauna, who is almost too shy to speak above a whisper and who has shingles activated by the stress of major state-mandated tests, concluded her part of her group's bulletin board caption with the statement, "Marc Chagall's paintings look like happy dreams."

Deliverance

All Texas students took the same standardized tests on the same days. I felt riding on me the hopes of my last year's students, now third graders, and my new group, with whom I had worked these 7 weeks. Our school's third graders' reading scores rose from 48% of the students passing the previous year to 66% passing. Writing rose from 20 to 55%. The district thought the achievement was significant. Having read the results of what my last year's 7-year-olds in the other district had accomplished, I did not. We had merely done the best we could, limited by our ill-prepared circumstances, in 7 weeks that left me bone-weary. I was furious at a state that measured my 8-year-olds' skills and my own teaching ability by the

standard of one yardstick which had little or nothing to do with the real, always emerging literacy experiences that my students and I needed, wanted, and loved.

The Consequences of a Day

The pressure of that test off, the real fun and authentic learning could begin. Preparing for our upcoming field trip to the San Antonio Museum of Art where our students could view one of the best Hispanic folk-art collections in the nation, we spent a few weeks looking at and talking about the difference between the artistic expressions and media of everyday people from cultures all over the world and those of the trained artists, Michelangelo and Da Vinci. We talked about flatness versus real, three-dimensional perspective; about the differences between painted wood and polished marble; and about children's toys compared to hammered gilt altar pieces. Our generous librarian supplied us with carts of Post-It tagged books showing the masks, weavings, furniture, and religious idols from cultures all over the world. When we went to the museum, we had a context that ranged from Hispanic folk art to masterful, prized examples of Phoenician glass and pottery; Greek and Roman statuary; Native American ceremonial robes; stone-carved Mayan and Aztec cooking utensils ("My grandma has a *molca jete* just like that for grinding her chiles"); and pioneer American quilts and crocheted bedspreads. The Lure of The Mummies hit them hardest (and me, too). The children kept gravitating back to the second coffin of some minor Pharaoh's third cousin, wanting to touch it, to open it, to understand the hieroglyphs, and to see the mummy, which was not there.

For lunch, we went to the Japanese Sunken Gardens, where the children, in the rain, raced, screaming among the secret paths, pagodas, bridges, waterfalls, and ponds in which giant goldfish went into bread-crumbs feeding frenzies. A lady asked me if I was a sponsor of a Christian school because the children, even in the ecstasy of exploration, had remembered to say, "Excuse me, ma'am." She had even overheard one of them chanting to herself, "Oh, thank you, Jesus, for letting us come here"—somewhere beautiful, away from the sheds, the windblown grit, the tin sheds, the Quonset hut cotton gin, the flat fields, and the thorny mesquite trees.

The day never left us as we continued to read and write all year long; the students continually made connections between what they saw that day and the material we explored and made back in the classroom. For Halloween, their three-dimensional papier-mache masks harkened back to the ceremonial masks they had seen either in books supplied by the library or on the field trip to the art museum; and it was clear that their own sculptures drew from those they had seen as examples of the masks of China, India, Africa, Native America, South America, and Mexico. These creations were of such high quality that they drew crowds to the lobby of one of our biggest area banks, where they were displayed for several weeks. As we spent weeks in January and February reading the myths and creation stories of various worldwide cultures and religions, the students reminded me of the Buddhas, urns, *retablos*, totems, and carvings of gods and goddesses they had seen during their 2-hour tour of the art museum. When we

read "Pygmalion and Galatea," several reminded me of the memorable marble sculptures from the classical age. Our observation of the quiet textures and description of the small hospital courtyard, so valuable because of its comfort to the protagonist of *Sadako and the Thousand Paper Cranes* (Coerr, 1977), led the students to make comparisons with the serene composition of the Japanese Sunken Gardens they had visited. And, finally, when we read *The Day of Ahmed's Secret* (Heide & Gilliland, 1990), the children were able to identify the setting (country and city—illustrated in water colors with teeming, emotive detail) when they recognized the pyramids of Giza in the background of one of the pages.

Phrases like, "It looks like ..." and, "It reminds me of ..." consistently appeared in their oral language and descriptions of their own story settings, which became more descriptive and visual. Their handmade Big Books became rich volumes of detailed print and vividly painted illustrations. Without my teaching them the literary definitions of schemes and tropes, many students began using poetic language in their journal responses to the questions I had posed, as well as in their own descriptions and stories. Natural-born metaphor makers, the children now had fairly rich artistic backgrounds to draw from as they painted with words—and with color.

Painting and Writing Who We Are

Throughout the year, I have periodically used lessons from *Drawing With Children* by Mona Brookes (1986) to give my students formal, sequenced instruction in the use of line, color, perspective, and drawing what they really see. I am hard to please. I never saw blue clouds shaped like wads of cotton candy, I know that trees are not rectangles topped off by loopy ovals, birds are not upside down letter m's, people's bodies are not shaped like sticks, and houses do not float on spaces of white air. To teach my children to draw what they see instead of careless, dim representations of what they vaguely remember having seen, I have had temper tantrums: "You go outside, and you look at those cars, and you break them up into lines and ovals and circles and dots, and you make me a car that looks like a car!" "Look out there at that playground and that sky! Do you see any white spaces? Does the sky start 7 inches above the ground? Is all the grass one flat color, like a carpet? Give me a background!"

Challenged by people who have wondered if I interfere with my students' personal creativity by giving them formal art instruction with high critical standards, I have answered that creativity, like any natural potential, is a capacity that either levels off and becomes ordinary or is challenged to achieve higher and higher planes of expression. Some creativity survives in some rare children in spite of the ways in which schools attempt to kill it; but most creativity in most children has to be elicited and then channeled toward a set of culturally accepted standards. (Why else do we teach?) Otherwise, our language would not have any conventions of spelling, punctuation, semantics, or pronunciation, and nobody would understand anything anyone else ever said or wrote.

In other words, I know my students are geniuses, but I will not tell them that until they show me that they are. Our whole academic year works toward their recognition of

genius in themselves and their ability to go out independently like the people in the Nike commercials, and "Just do it." Approaching the end of this school year, most of them have taken on the attitude of, "Sure. I can do that. What do you want next?"

To make memories of who we are right now, we read an English-Spanish book written and illustrated by a young woman raised not 200 miles from us, who experienced almost exactly the same childhood traditions as ours—county fairs, eating *nopalitos*, cakewalks at parish festivals, religious pilgrimages to the Rio Grande Valley, *posadas* at Christmas, *pinatas* for *cumpleaños*, *sandia* on summer evenings, and *tamaladas* for New Year's Eve. Using Carmen Lomas Garza's *Family Pictures Cuadros de Familia* (1990) as their springboard, my students painted and then wrote vignettes describing their favorite family and cultural traditions. We displayed them all over the room and out in the hall. "This lady's from Kingsville, Miss? I been to Kingsville. We went to the beach, too. Just like that author."

We will wrap up this 3rd-grade year with one more reading-writing-art book that we will make ourselves after reading and thinking about Leila Ward's (1978) lyrical portrait of the inherent wonders in the life a Kenyan child who opens her eyes upon every day: *I Am Eyes / Ni Macho*. With simple, subdued illustrations by Nonny Hogrogian, a two-time Caldecott medalist, *I Am Eyes* teaches *seeing* as well as classifying beginning, ending, or rhyming sounds of words with pages that read, "I see sunflowers and skies, ... stars and starlings, ... donkeys and monkeys, ... kites and Kilimanjaro, ... And everywhere / where I am eyes, I see butterflies."

This past summer, my "at-risk" exiting third graders responded to *I Am Eyes* by describing either the world they inhabited or the one they want to inhabit someday, covering their pages with tempera-paint illustrations and leaving just enough unpainted space to print their final copies of "I see." From the perspective of being in the starry purple space and looking down on the blue-and-brown planet earth, partly covered with swirls of white clouds, Efrain wrote:

I See a Lot of Things

I see my family at the river.
I see my brother and me playing in the backyard.
I see my brothers and sisters swimming.
I see the earth from out space.
I see the Milky Way.
I see my whole family at the beach.
I see the sky turning into blue berries.
I see the trees at my house so beautiful.
I see my mom baking a cake for my teachers.
I see New York City turnin into popsides.
I see my teachers famous.
I see my whole friends and teachers singing at school in the library.

POSTSCRIPT: DWELLING IN POSSIBILITY

Reform continues. The future of public education in our state is out there and looking pretty ragged. Our district, with a capital base of per-pupil wealth at \$65,523 compared to the state average of \$178,277, has just lost more than a million

dollars in state funding and fired 43 of its support personnel—many of whom worked everyday in the classrooms with us, with our students. They were vital. Eight people on our campus lost their jobs, and probably more will have to go next year. The legislature removed the possibility of merit pay raises for all teachers who had not already achieved “career-ladder” status. On the last day of work on our campus, everybody cried as we waited and watched our coworkers get axed. Our principal, red-eyed, said that it was the worst day of his life. We left the campus for summer vacation feeling kicked in the teeth.

In response to these worst-case events and data like the classroom profile that I received at the beginning of this year (the statistics compiled by the census bureau, the lice, the impetigo, the handicaps, the single parents and poverty levels, the simultaneous mandates for change and back-to-basics, the insanity and threats over district- and statewide scores, the programs piled on programs, the goal of minimal

skills proficiencies), I take comfort from the knowledge that my students and I can always fall back on Botticelli and Picasso, on tribal masks and Homer.

We can always keep the quest for understanding beauty and making beauty at the heart of our curriculum, as long as we do not tell anybody that is what we are doing, and we can always strive for meaning that matters to us. I can keep throwing away most of those practice test worksheets, or using them for rough sketches or drafts; and at least for the time being, we can still take one field trip that transports us from where we are, where we live. We can imagine anything for ourselves. I can keep screaming at my district, “*Never* remediate. *Always* enrich. Treat students as if they were all gifted and talented, and they will show you that in some way, or in many ways, they are.” Maybe someday, somebody will believe me. Meanwhile, like Debbie Gauna, we can think about reading and writing and painting a world that we can make “like happy dreams.”

SYMBOLISM: A THIRD-GRADE EXPERIENCE

Michelle Carey Clark

TEACHER, SHORT HILLS, NEW JERSEY

As an educator I believe that it is my responsibility to empower my students to internalize the world around them. For this reason, we explore symbolism in our world, community, and in literature. Although symbolism and literary images can be difficult concepts for many children, I have found that my students allow their experiences and personal knowledge to guide them in understanding visual and literary imagery.

I feel that it is essential that students are taught to break away from traditional "literal" interpretations. When we begin discussing symbolism, I usually find that my students have very generic responses for visual symbols and few students, if any, can derive symbolism in literature. As we embark upon our exploration of symbols and images I always find it easiest to start the unit with visual, tangible symbols. Symbols such as monuments, safety signs, flags, national symbols, and so forth, are always easiest for the students to recognize. They are able to attach meaning to these common symbols with ease. Once the students become aware of the visual symbols around them in their community, school, home, and so forth, I ask them to create a visual symbol for themselves. I have found that my students come up with very sophisticated and thoughtful "self symbols." For example, one student put a book to display his love of reading, another student drew a heart with animals inside the heart symbolizing her love of animals, and another student drew himself holding hands with a group of people showing the importance of his friends and family in his life.

After a series of activities such as community walks, school searches, "self symbols," and numerous class discussions the children begin to pick up on symbolism in literature. The move from visual to literary symbolism is student driven. It is the student who starts to see beyond the literature. The students naturally take what we have learned about symbols and images and apply it to the nontangible references in literature. I have found that some of my students and classes take it further than others. The class described below took it much further than I had ever anticipated.

For several months my third graders explored the meaning of symbols in our world and symbolism in literature. Many of

my students were unaware of the symbols around them and initially had difficulty in differentiating symbolic meaning.

We initially discussed the concept of symbols when we began a unit on people and places in our community. The children actively generated lists of relevant community symbols such as statue, flags, monuments, and safety signs (stop, danger, etc.) The students listed the symbols and went on to connect various meanings to each symbol. The chart remained in the room and as students identified symbols in the community they were added to the list.

Some of the symbols that were eventually added to the list were national symbols, ceremonial symbols, religious symbols, family symbols, and symbols of self. Lisa suggested, "...a symbol gives meaning to something." Tyler contributed, "...a symbol represents something." Thomas added "without symbols things would all be the same." After sharing the responses I asked students if a symbol always means the same thing? After a long pause, Sam stated "...of course not, people are all different, so the way that they think of a symbol will be different."

The students worked in groups to generate webs of different types of symbols. The groups dealt with national symbols, school symbols, and symbols of holidays / celebrations. The students' responses were very sophisticated. (See Figure 59B-1). When the groups shared their responses and interpretations of the symbols it became clear that they had a firm understanding of what supports a symbol. They were realizing that there is meaning behind a symbol!

As we began to explore various themes and images in literature I asked the children to think about symbolism in each novel that we had read. I wanted the children to connect what we had learned about symbols and the literature that we shared.

Using *Sadako and the Thousand Paper Cranes* (Coerr, 1977), we generated a list of symbols that the children had noticed when reading. Brian shared, "the paper crane is a symbol of friendship." Michele added, "...the paper crane becomes a symbol of world peace." Patrick said, "the paper crane is a symbol of courage that brought all the characters

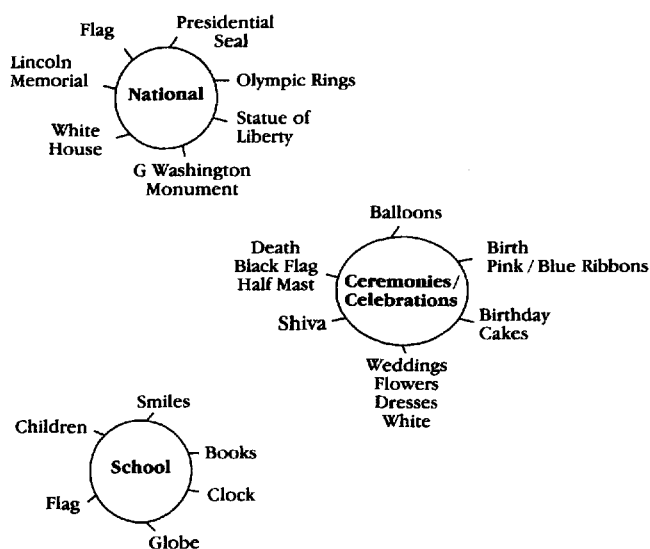

FIGURE 59B-1

together and gave them something in common.” Erin reminded the class that “the paper crane was also a symbol of death, because Sadako was dying and hoping to stay alive.”

The students discussed the importance of the paper crane and how it became a national symbol of peace, and a constant reminder of the bombing of Hiroshima. This particular story has many “hidden messages,” but what struck me was that the children were able to interpret the symbolic meaning of the paper crane in such different ways.

At the conclusion of the discussion the students made paper cranes and wrote their own symbolic interpretations to accompany them. The children shared responses and the cranes were mailed to the Peace Park in Hiroshima as our symbols of peace to be shared on August 15.

Several children reflected upon *A Taste of Blackberries*. (Smith, 1973). Patrick recalled that, “the blackberries are a symbol of everlasting friendship.” He went on to explain that without the blackberries, Jamie would have been dead forever. Jamie is kept alive for the narrator through the blackberries. Michele felt that whenever the narrator saw blackberries, he would be reminded of his friend, even in 50 years.

The concept of symbolism and imagery started to come alive for the children. The students began to make connections between symbols and different aspects of literature. For example, Erin and Chris both made the connection that images of color in a story can create the mood or embellish the setting. Chris supported this with an example from: *From The Mixed-Up Files of Mrs. Basil E. Frankweiler* (Koningsburg, 1973). He stated that the images of dark curtains and lighting in the museum create an element of fear and adventure for the reader. Erin elaborated and said that dark colors are symbols of danger and anger.

Monisha brought up a wonderful example from *Molly's*

Pilgrim (Cohen, 1983). Monisha is an English as a second language student who struggles for expressive language. She explained that the pilgrim doll that Molly made is a symbol of her heritage; “The doll that Molly made told us about where she came from. We could imagine what the doll looked like and it told more about the land (Russia) where she was from.” This response from Monisha proved to me that she was internalizing and connecting with the literature she read.

When discussing *The Hundred Penny Box* (Mathis, 1975), the class generated many thoughtful responses to symbolism and imagery. The pennies were described as symbols of life, death, friendship, age, fear, past, history, and crying. The students brainstormed the list and had a meaningful example for each symbolic representation. The pennies were seen as symbols of life and death because Aunt Dew claimed that without her penny box she could not live. The pennies symbolized a special friendship between Michael and Aunt Dew. The penny box symbolized history because each year of Aunt Dew’s life represented history. Fear and crying are also images associated with the box, because whenever Aunt Dew spoke of losing her box, she cried. The children were very insightful in all their responses to this particular piece of literature. They identified with the dilemma that Aunt Dew and Michael faced and the anxiety that surrounded the hundred penny box.

As a culminating activity, the students designed their own penny boxes and “penny books.” They brought in symbols representing each year of their life to put into their boxes. Children brought in pictures, teddy bears, letters, and so forth. The penny book explained why each symbol was important and representative of the child. This particular activity allowed the children to reflect on their own lives and incorporate symbolism in their world.

Gary Paulsen’s *Hatchet* lent itself nicely to further investigation of symbolism and imagery. Only a few students read this particular book; however, the whole class benefited from what they shared. The students drew wonderful images of nature and survival from the text. The children saw the hatchet as a symbol of survival. Erin went on to support this: “The hatchet becomes survival for Brian. He uses the hatchet as a symbol of hope that maybe one day he’ll get out of the wilderness.” John elaborated that “the hatchet is also a symbol of courage.”

Jason, a student with enormous learning problems, made a remarkable contribution to the *Hatchet* discussion when he connected our exploration of art history and remarked that “the statue of David in Florence is also a symbol of courage and bravery.”

These are isolated examples of a year-long exploration of symbolism in literature. It is clear from the students’ responses and interaction that it is not too sophisticated a concept for children to internalize. My third graders took it much further than I thought they could.

The work with symbolism is some of the most exciting and beneficial that the students do. We do it because it helps us reach a higher level of understanding and thinking in every part of the curriculum.

VOICES FROM THE FIELD: CONSTRUCTING MEANING FROM ILLUSTRATIONS

Richard M. Kerper

MILLERSVILLE UNIVERSITY

Young children in our school classrooms bring a wide range of experiences with visual images to the activities in which they engage. They have spent many hours watching programs and commercials on television, viewing images on product labels, and looking at pictures in catalogues. But, how do these experiences prepare children to understand the illustrations that they encounter in informational trade books?

As David Considine (1987) states, children are "given no guidance in how to read, interpret, and critically evaluate the images and information that they are exposed to" (p. 635). Yet, as a teacher, I often assumed that my students would understand what they saw. The representational nature of pictures in books lured me into complacency. I dealt with pictures as though they conveyed meaning. While my instructional practices demonstrated a belief that young children need guided and supported experiences with print to learn cultural conventions as they became readers, my practices did not treat illustration in the same way. I expected my students to *be* viewers, not to *become* viewers. Now, as I study the ways in which children construct meaning from illustrations, I consider many issues that I did not face early in my teaching.

At home and at school, children learn the language and conventions of print holistically as page after page of words, sentences, paragraphs, and stories are read. Parents and teachers explore their meanings and their structures with children. Often these experiences include references to pictures. But are they talked about in the same way? Do parents and teachers possess the language to talk about the conventions of illustration? As an inexperienced teacher many years ago, I did not challenge my students' thinking about pictures because I lacked the language to think about them. My students left my classroom after one academic year with no greater ability to construct meaning from illustration than when they walked through the door on the first day of school.

I fear that my story is not unique. It is one that could be retold by many teachers.

Pliny the Elder states that "the mind is the real instrument of sight and observation" (p. 552). Similarly, Betty Bacon (1981) describes engagement with informational books as "an eye / mind experience that endows the subject with a kind of tangible life" (p. 11). Each focuses on the apperceptive dimension of viewing. For them prior experience frames the meaning that viewers make from illustrations. But, in what ways is viewing a solitary cognitive experience versus a social one? Margaret Meek (1998) contends that children learn through what she calls "private lessons." Through engagement with informational books, children expose themselves to the conventions and implied directions of illustrations. Meek suggests that "understanding ... illustration and iconic interpretation are part of the ontogenesis of 'literary competences'" (p. 10). However, she does not see this activity as a solitary act. It occurs in a social context. Often, the meanings that children construct from what they see are in part someone else's. Interactions with peers and with adults contribute to the meanings made, meanings that are sensed as one's own (Bakhtin, 1986).

In my observations of young children viewing informational books, each child's intentions have been critical to the meanings constructed. These intentions relative to the qualities of the illustrations afford opportunities to make meaning (Heft, 1989). While some children realize the affordance to count and to draw, other children realize opportunities to play and to socialize (Kerper, 1994). These affordances frame the meaning-making process, a process that may be similar in some respects to constructing meaning from print. My observations of children's viewing point to the importance of moving, gesturing, connecting and speculating found by Cox and Many (1992), Hickman (1979, 1981), Hepler (1982), and Harvey (1993) in children's transactions with print. Thus, I

wonder about other ways in which meaning making with illustrations and with print are similar and about ways in which each is unique.

The assumption is often made that the illustrations in informational books are intended to communicate facts and that viewers use those pictures to gain information for use in other situations. My observations of children's viewing causes me to challenge this idea. Just as children naturally approach written text with varying purposes, they deal with illustrations in a similar way. Sometimes they will adopt a stance that focuses on information, but at other times they will revel in the virtual reality that the pictures offer (Kerper, 1994). I fear, however, that classroom practice valorizes the former stance over the latter. Teachers may validate what Louise Rosenblatt (1986) refers to as an "efferent stance," a focus on public meaning, and discount the importance of an "aesthetic stance" focusing on personal responses.

In recent years teachers have used and children have explored more and more informational trade books as the integration of instruction has become increasingly popular. This trend may present a real and present danger to

children's opportunity to respond aesthetically to illustrations. The potential for subordination of aesthetic experiences to content-based, curricular-driven ones and of visual experiences to verbal ones is clearly present. The pressures of accountability may impel many teachers to focus on the public meaning of print and to ignore the personal meaning of illustrations. My observation of young children points to the importance of aesthetic experience in their meaning making. Often initial engagement with the virtual reality of pictures leads to children's interest in the more public aspects of meaning, in the content-based information (Kerper, 1994).

As I continue to watch children make meaning with illustrations, I face new questions daily. However, one overarching question about children and book illustrations endures: a question that demands exploration. In varied real-life settings when, if at all, and how do children use illustrations? The answers to this question could provide teachers with valuable information as they plan instruction within their classrooms and as they focus on the often-ignored area of visual literacy.

WE ARE THE MUSIC MAKERS: HELPING CHILDREN EXPRESS THEMSELVES THROUGH THE MAGIC OF POETRY

Michael R. Strickland

JERSEY CITY STATE COLLEGE

I walk down the hall at Oberlin, Ohio's Prospect School and hear a fourth grader yell, "Here he comes! Let's clap for him." I skip into the large classroom, waving at the students as they cheer, as if I had just been named most valuable player in a sports championship.

I hope that the magic and music of poetry come across to students as soon as I walk into the room. Before the workshop, the students have usually seen my anthologies, *Poems That Sing To You* and *Families: Poems Celebrating The African American Experience* (Strickland & Strickland, 1994). The books have my picture on the inside, back covers. The closest that children usually come to what they consider a "real poet" is seeing his or her picture on the back of the book, but the workshop is "live."

At the end of my 45-minute workshops, students (some with minimal experience with the art form) produce work that includes elements such as: meter, irony, story, humor, and creative stanza forms; rhyme, refrain, onomatopoeia, alliteration, consonance, and other devices of sound; metaphor, hyperbole, personification, and other devices of sense. Many teachers have told me that my methods have produced good writing, including many of these fundamentals of poetry, even from students who have had trouble writing a few sentences in the past. I think that linking poetry and music, utilizing the sound of poetry and its performance, helps students become involved with poetry in meaningful ways.

T.S. Eliot coined the phrase "the auditory imagination" to describe the sound and rhythm of poetry. I tell children that master poets sometimes write and rewrite their pieces 1,000 times before they get the exact pattern of words on a page, and the precise rhythm. The auditory elements of poetry make them like songs. I repeat the phrase "poetry and music have a lot in common and are often one in the same" many

times in my workshops. There are two song lyrics as poems in *Poems That Sing To You*. The book begins with the words to "Dancing in the Street" as recorded by Martha and the Vandellas and ends with Stevie Wonder's "Sir Duke."

To illustrate the power of the link between musical elements and learning, try this experiment: ask a group of students how many of them remember the words of ten poems. See how many hands go up. Then ask them how many remember the words of ten songs. My experience has been that many more hands go up the second time. Tell the students that in the songs, they actually know ten poems by heart.

Poetry is meant to be performed. Any teacher can utilize its oral tradition to engage students in an experience with literature that capitalizes on young people's enthusiasm. All students and teachers are real poets; poetry is a great medium to make them better writers, readers, and speakers as well.

I try through dramatic readings of pieces from the serious to the silly, the ancient to the modern, my own works to those of Walt Whitman, to communicate that poets and poetry are alive. Poets do not have to be dead, or old for that matter. Nor do they have to be people who only live in the forest and write about weeping willow trees.

I use several techniques to create this celebration of language, attempting to help children hear the links between poetry and music. First, variations in inflection, rate, tone, pitch, and volume help make a poem come alive for students. The theme of *Poems That Sing To You* is poetry about music that is musical in its own language. The book includes Eve Merriam's "Advice from a Visiting Poet," in which she says, "Always read a poem twice, once for the words and then for the music of the words."

Using and discussing voice variations, or paralanguage, is another link between poetry and the enjoyment of music. Teachers know how children love to hear works read with expression, and love to be told that they are good readers because they know how to read this way.

Before I have the boys and girls trade off stanzas in a choral reading of Shel Silverstein's "Rock 'n' Roll Band," I perform the piece, saying, "this is an example of how to read with expression." I vary my voice qualities to emphasize the elements of the story in each stanza. A tone of hope enlivens the line, "If we were a rock and roll band / we'd travel *all over* the land (italics added)." Higher volume, quicker rate, and a tone of deep enthusiasm join the second line, "We'd play, and we'd sing and wear spangly things." Giggling and laughing onomatopoeically, I perform the line, "We'd giggle and laugh and sign autographs." Slower rate, lower volume, and a tone of sadness find the line, "but we ain't no Rock 'n' Roll Band." The students are told to listen to their harmony; that "choral" is a form of the word "chorus", and that by reading together they are like the chorus that harmonizes for a piece of music.

The first section of the book is entitled, "Poems That Dance." Kinesically speaking, poems can dance. The kinesics, or body movements that I perform, range from group clapping as I read Eloise Greenfield's "Nathaniel's Rap" to facial expressions of frustration during David Harrison's "Practice." The poem details a child who hates how much his mother makes him play the horn, and I grimace as I say "practice, practice, practice." Poems were meant to be performed over and over with increasing pleasure. When I read "Practice" the second time, the students repeat the refrain in unison, with enthusiasm. In another example, during my composition, "Compact Disk," I pout, sticking out my lower lip at the line "Mom says I'm too young to keep the mall in business, so I only have one."

The visual of a poem is like a symphony that is written in notes on a page; it possesses the potential to come alive when performed. I use free verse poems as visual aids to describe that form of poetry. I show the students the text of a poem to describe a rhyme scheme, saying that one could draw a blueprint for the rhymes in the poem.

The craft of poetry is like building a house. The poet has to visualize the poem, or house, playing with words for a main idea. He or she must lay a foundation on which the structure stands, charting out meter to determine its rhythm and flow. A well-crafted poem looks like a skeletal house structure at first, with words all over the page, being moved, changed, added, deleted, and built upon. Just as a newly built home's bricks, mortar and wood grow prettier and prettier until this construction actually becomes a lovely house the persistent rearranging of words into poetic music involves crafting an

architectural vision into a beautiful structure.

On the adjoining page to "Rock 'n' Roll Band" is Nikki Giovanni's "Kidnap Poem." The children see how she wrote a 19-line love poem in one stanza, with no rhyming, no punctuation, and only one capital letter. In the line "wrap you in the red Black green," African-American colors are seen as something to be cloaked in, with a capital "B" for the color of our skin. At the end the students can see how she plays with words: "yeah if i were a poet i'd kid / nap you," and how that visual splitting up of the word kidnap adds a playful, childish tone to the poem.

My responsibility as a teacher is to carry the message that each child is a poet. Each one has a song inside him or her, the child's self-esteem waiting to be expressed. The children write and perform their works at the end of my workshops.

To reinforce the link between poetry and music, I frequently end with this writing assignment: complete the phrase, "When I hear music" The students are told to write whatever they think or feel when tunes are played. Writing in this relaxed mode, with no rules, often produces great poems. Children pick up on the musical theme with creativity, alacrity, and pleasure. The student becomes an instant composer and performer. The fun of being a rap artist, rock star, or a modern day Mozart is blended with reading, writing, and oral presentation.

As I engage them, students get in touch with the music inside themselves and express it through writing—painting a verbal picture of their own song and performing it for the class.

Adrienne Gonzalez, while a fourth grader at School 18, Paterson, NJ, wrote:

When I hear music ...
I jump up and boggie
When I hear music
I pick up a jar of cokies
and shake um and eat um
When I hear music my ears get numb
When I hear music I jump up and run

Joseph Vogel, while a second grader at Shelter Rock School, Manhasset, NY, wrote:

When I hear music I think of people,
famous people, important people. When
I hear music I think of colors,
dark colors, bright colors, light colors,
dull colors. When I hear music,
I think of books, long books, short books,
Big books, little books. When I hear
music I think

THE EYE AND THE EAR

Jane Yolen

CHILDREN'S AUTHOR, *Owl Moon* AND OTHER BOOKS

Once upon a time, a long time ago, there was a child who loved to listen to stories. And one summer night, in a cottage in Maine, the child sat in an audience of other children and adults while a storyteller recounted the history of a Greek hero named Perseus.

And when the storyteller came to the part where the hero held up the head of the gorgon Medusa, she held her own hand aloft. I could have sworn then—as I can swear now that I saw snakes from the gorgon's head curling and uncurling around the storyteller's arm.

At that moment I and all the other listeners around me were unable to move. It was as if we, and not Medusa's intended victims, had been turned to stone.

It could have been a trick of the firelight behind the storyteller. It might have been the hot dogs I had hastily consumed before trotting over from our cottage, my little sandals slip-slapping on the stony beach walk. It might have been the lateness of the hour or my overactive imagination. But I know that it was none of these. It was simply the power of the teller and the tale.

We were there, all of us, caught up in the centrifugal force of the spinning story. And we would not be let go until the teller finished and the tale was done.

Of course the story in the mouth is different from the one on the page. The tale apprehended by the ear is different from the one taken in by the eye.

Critic Jack Schaefer (1968) states baldly: "Literature is a maimed art, crippled by being printed in books." Though it is true that there is a silent intimidation of print that frightens some children and some adults, I would rather say it this way: *The eye and the ear are different listeners.*

What sounds well at night by a listening child's bed does not read as well on the page. What lies perfectly formed in Bodoni Bold on the white sheet may stutter on the tongue tomorrow. I could never write down and make a book of the stories of the absurd "Silly Gorilly" which entertained my three children through years of bedtime telling. How can I recapture my own lumbering gallop around the room, the infection of giggles shared, the pauses, the tickles, the rolling

of eyes? On the other hand, how does one deal with sight rhymes like rain / again or wind / kind, rhymes that resonate to the eye but do not work well on a 20th-century American tongue? In bookmaking, one must try to please the ear as well as the eye, but it is often a compromise.

There is a subtle play of text and type, illustrations and design, that can change a story just as surely as a new telling. In science, when one puts a specimen on a slide, there is a change in the specimen. Similarly, putting a tale onto a page and dressing it up with full-color illustrations provokes a transformation.

Some critics, like Bruno Bettelheim (1976), would have us do without any pictures for the fairy tales. But illustrations are well within the tradition of storytelling. Shamans and seers often accompanied their tellings with drawings, dolls, or puppets. In countries where oral tellings still exist, remnants of picture tales exist, too. In Brazil, storytellers in villages often hang appropriate pictures on a clothesline to illustrate their story. In Arab bazaars, tale tellers make paintings of colored sand as they recite. And while it is true that pictures can change a listener's understanding of a story, so have centuries of retellers.

How much can an illustration change our hearing of a tale? Just look at three different versions of *Snow White* and it is easy to see.

Randall Jarrell's (1972) retelling of the Grimm story has full-color pictures by Nancy Ekholm Burkert. They emphasize the medieval setting. Her queen is a professional necromancer, a potent potion-maker, whose *grimoire* is filled with evil recipes. The queen's picture is set about with crucibles, tarot cards, hanging herbs. But we never see her face. And so the old prototype of faceless evil is presented to us.

In Burkert's *Snow White*, on the other hand, we see the heroine's full face on the jacket and beyond. She is so fair of face as to be translucent, other-worldly, reminiscent of the Victorian child saints. Yet she is healthy enough, light-footed and sure with the forest animals; housewifely (almost homely) in her turban as she cooks and cleans for the dwarves. She is

seen as saint, as child, as homemaker, the three faces of archetypal woman.

The backgrounds are millefleurs tapestries, recalling the wall hangings of the period.

The dwarves are fully human and therefore pitiable in their role as deformed humanity. The prince and Snow White are innocents, with the faces of children but the bodies of adults. The dwarves have adult faces on which the loss of innocence shows, but they are small and childlike, too. They are midway between the full-face innocence of Snow White and the faceless evil of the queen.

No words intrude upon Nancy Burkert's allegorical presentation. The text is set apart by itself: two pages of text, two pages of illustration. It is fascinating bookmaking, capturing the penumbral side of the tale. It asks questions rather than answers them. It enunciates the archetypes.

Trina Scharf Hyman's "Snow White" (Heins, 1974), on the other hand, is firmly rooted in humanity. The faces she pictures are real faces: Snow White is her own daughter Katrin. The Queen is an old friend. Hyman is one of the dwarves herself, the others include her ex-husband and her neighbors in New Hampshire. Portraiture is Hyman's forte.

Her prince is bearded, hawk-nosed, strong-featured, in his thirties. He is the only prince in *Snow White* illustrations who looks as though he knows how to run a kingdom and deal with wicked stepmothers, and he is just waiting for his chance. No beardless adolescent this, no sweet-faced youth just out of knickers. The red-hot iron shoes at the end of the story must be *his* idea.

From the opening scene in Trina Hyman's *Snow White*, where the girl is seen in a flash-forward hanging out dwarf-sized shirts to dry on the line, this is a less regal, more human book. Ms. Hyman is fascinated not by archetypes but by the play of light and dark, good and evil in faces. Even the queen's mirror is ringed with them, faces that shift and direct mood for the reader. Hyman's precursors are the Pre-Raphaelites, Wyeth, and Pyle, and she combines sweetness and toughness to offer an illustrated tale. The text, translated by Paul Heins, is incorporated into the pictures.

Hyman's concerns are immediate, human, sensual. The queen radiates a power that is sexual in nature. The story told by Trina Hyman is the Electra story. We can see it in the faces, we can see the palpable sexuality in the form of the mandrake root that hangs symbolically from the queen's wall. The laces that the queen binds around the innocent Snow White bind her into a caricature of a full-bosomed peasant girl and the dwarves look at the sleeping girl, so bound, with a hint of carnality. Quite simply, Ms. Hyman makes you hear the tale anew.

Walt Disney, on the other hand, sentimentalizes everything in his version of the story, flattens out both the text and the illustrations to cartoon caricatures. His wicked queen is neither the faceless sorceress of legend nor the decaying beauty, but a cartoon witch, with nose and chin threatening to meet. She loses depth, motive, individuality, and so never achieves the power of Burkert's herbalist or Hyman's voluptuary, and she does not die but merely disappears conveniently, in a Perils-of-Pauline ending, "into a bottomless gulf."

Similarly, the dwarves lose their power and place in the Disney story by becoming cute, providing that measure of "adorableness" that, as critic Richard Schickel puts it, was the most persistent problem of Disney's work.

With both her nemesis and her collective alter egos robbed of their power and depth, Snow White herself is left with nothing to resound against. Without true evil, there is little excitement, no contrasting background against which to dramatize virtue. The story becomes, in this telling, a hollow tale. The Disney version illustrates with finality folklorist Mircea Eliade's contention that, "Man's concept of the absolute can never be uprooted; it can only be debased."

Disney was a man who believed that we "recognize [good and evil] instinctively..." and he supposed that any retellings of fairy tales could be approached in this simplistic manner (Schickel, 1968). But the power of the tales is that they are not that simple after all. They are as evocative, as sensual, as many-faceted, as disturbing, as slippery as dreams. They offer a moral, they speak to the human condition, but it is not always the condition or the moral that one immediately sees.

That is why a fine artist can bring to an old tale a new approach, a new direction. Nancy Ekholm Burkert's *Snow White* is a different story from Trina Scharf Hyman's. And they are both completely different tales from Walt Disney's oversimplification. If a story was rewritten in succession by John Gardener, Isaac Bashevis Singer, and Dr. Seuss how different each story would be.

The eye and the ear are different listeners. Each storyteller has the ability to select: to select those characters that are just right, to select those details that set the stage, to select the glass mountain that must be climbed, the thorny bush that must be passed or the ring or sword or crown to be won. The storyteller is an artist, and selection is essential to art. There are thousands upon thousands of characters, thousands upon thousands of details, thousands upon thousands of motifs. To know which one to choose requires a kind of magical touch, and that is what characterizes the great storytellers.

But the eye and the ear are different listeners. The modern audience is not the same as the ancient one, and for good reason. Ancient man took in the world mainly by listening, and listening meant remembering. Thus humans both shaped and were shaped by the oral tradition. The passage of culture went from mouth to ear to mouth. The person who did not listen well, who was tone deaf to the universe, was soon dead. The finest rememberers and the most attuned listeners were valued: the poets, the storytellers, the shamans, the seers. In culture after culture, community after community, the carriers of the oral tradition were honored. For example, in ancient Ireland the *ollabms*, the poet-singers, were more highly thought of than the king. The king was only given importance in times of war (Moray, 1965).

An anthropologist once observed that people in preliterate cultures that are still more of the ear than the eye say, "hear you" when they mean they understand something. But we say, "I see." We modern listeners see life more clearly through pictures. We trust the picture more than the spoken word. A picture, we are told, is worth a thousand words. In this century we created the moving picture and credit it, more than anything else, with shaping our children's thoughts.

But the eye and the ear are different listeners, are different audiences. And the literary storyteller is one who must try to bring eye and ear into synchronization. But it is a subtle art. Just as the art of typography has been called "the art invisible," subliminal in the sense that it changes or manipulates a

reader's perceptions without advertising its own presence, so, too, the art of storytelling in the printed book must persuade and captivate. It must hold the reader as the spoken tale holds the listener, turning the *body* to stone but not the mind or the heart.

BOOKS ABOUT ART: A JOYOUS VISION

Jan Greenberg

AUTHOR, *The Painter's Eye: Learning to Look at Contemporary American Art*

Since the 1970s there has been a movement to broaden the base for teaching the visual arts in schools. The ultimate outcome for teaching art appreciation by classroom teachers is to engage the student in developing an appreciation and knowledge of art objects. Along with the established idea of talking about art to stimulate emotion and pleasure, skills of observation and critical judgment are now being emphasized.

Given this new direction in art education in the schools, what kinds of books about art are most effective to enhance this goal? In this chapter the focus will be on identifying recent books about art for young people that go beyond biographies of artists, which focus on anecdotal material rather than the ways in which an artist's life and work intertwine, or art historical surveys, or books that offer ways to make art. These approaches abound in the literature and certainly have value, as children are interested in the many contexts of art. But recent books about art for young people that explore a new realm of perception open the door to a different means of developing response and are now available to the student as well as the teacher.

These books offer students a language to talk about art, a system of looking, which stresses going beyond the psychological response of "I like it" or "I don't like it" to value judgments supported by arguments of evidence. The critical process is examined so that the reader or viewer of the art object engages in an analytic method by which they perceive the work, describe it, become conscious of the formal properties of the work and how it is composed, and finally understand the meaning or expressive content of the art object. It is hoped that they will go on to look at the real works of art in museums and galleries and begin to make aesthetic judgments about the merit of the work. They will become both appreciators, as well as critics, and enjoy a lifelong dialogue with art.

An additional method for teaching art, widely practiced in museum education, involves children with artworks using a multisensory approach. The idea of sensory interaction invites the children to react through their senses and goes

beyond descriptive or analytic language to become more metaphoric, poetic and personally expressive, that is, using body movements to parallel the movement in a sculpture. This approach can be appropriate for the primary grades, where language level may not allow for the analytic method. Books that invite children to respond to artworks in terms of sight, smell, movement and touch can also be of interest to teachers and are included in this chapter.

I will begin by discussing my recent books about 20th century art, followed by a bibliography of other titles that lead students to explore art using a descriptive/analytic method and / or a multisensory approach.

In both *The Painter's Eye: Learning to Look at Contemporary American Art* and *The Sculptor's Eye: Looking at Contemporary American Art* (Greenberg & Jordan, 1991, 1993), artworks by 20th century artists are chosen to introduce a system of looking at art based on my research (and others) in arts and education.

In both *The Painter's Eye* and *The Sculptor's Eye* post-World War II American art has been chosen to introduce the basic principles of art for several reasons. An anecdote might serve to illustrate them.

Last year a segment was aired on the television program *Sixty Minutes* entitled "Yes...but is it art?" The program began with Morley Safer attributing the following quote to P.T. Barnum, "A sucker is born every minute." Safer went on to say that most contemporary art is "worthless junk." Shown with a group of school children at the Whitney Museum in front of a painting by graffiti artist Jean Michel Basquiat, Safer asked, "Do you think you could do as well?" Set up in this manner, a boy responded, "I could do better than that." Unfortunately many people share Safer's point of view.

New art, be it sculpture or painting, bewilders and frustrates a lot of people. These books help demystify new art and help viewers come to contemporary works with open minds and an enhanced vocabulary. In addition contemporary art is accessible to young people and is timely in that it refers to what is happening in our own time and culture. In choosing examples for the text, we were guided by principles of clarity,

variety, and personal interest. Although the illustrations do not provide a comprehensive view of contemporary art, they suggest a variety of experiences and styles in this period. All of the artists, from the most celebrated to those more recently emerging, have been recognized and exhibited widely in museums. This provides the reader with quality works against which new experiences with art can be tried.

Although the focus in *The Painter's Eye* and *The Sculptor's Eye* is on contemporary art, the same language can be used to talk about most Western art from the ancient Greeks to the present. Many of the artworks in these books concentrate on color, line, shape, and / or texture without reference to a recognizable image, thus highlighting certain points we wanted to make in the text. The elements of color, shape, line, and texture remain constant, and by learning something about these constants the viewer comes to all paintings and sculptures with greater understanding. Interviews with artists concentrating on where they get their ideas were also included. Teachers often ask how to respond to a student who says, "I do not like it" when shown a contemporary artwork, especially one that is abstract.

The answer to that question might be that the artwork is unchangeable but the students' transactions with it are unlimited, filled with variety. It is the teacher's function to help the student understand that his or her response, negative or positive, depends not only on the artwork but on himself/herself. An introduction to modern art is one way to encourage children to be receptive to new ideas. This is especially necessary in the middle grades, where there is so much pressure to conform.

By looking at individual paintings, one part at a time, children begin a dialogue with art. As they learn the language and develop a method of looking at art, they will feel comfortable exploring different styles of both painting and sculpture.

A passage quoted from *The Sculptor's Eye* demonstrates how the language of art is used to analyze or discuss the formal properties of a sculpture.

This bronze sculpture *Untitled* by Joel Shapiro is abstract; yet we are reminded of a figure balanced precariously in space. How do we know it's a figure? Despite the simplicity of form, the sculpture appears figural with limbs flying out in four directions from the blocky torso. Suspended in motion, he is involved in a struggle, balanced on one leg like an exclamation point. How would you move if you slipped on a banana peel or tripped on a rock? Follow the path of movement with your arms. What sensory words come to mind—*vertical, jerky, explosive, open, jutting, angular*? We have referred to *Untitled* as "he." If Shapiro had wanted this figure to be feminine, might he have chosen different shapes?"

In this passage the reader is encouraged to respond to the photograph of the sculpture metaphorically and physically. Sensory words lead the reader to view the artwork through the five senses—qualities that are vivid in terms of sight, sound, touch, and so on. Questions are asked to elicit an interpretive response based on the form or shape of the sculpture. Art terms such as *abstract* or *balance* have been

introduced in an earlier chapter of the book and are explored further by a discussion of *Untitled*. The organization of the books is cumulative, progressing from the simple to the complex, yet never losing sight of clarity. Repeating many of the same artworks as the information unfolds allows the viewer to build on prior experience.

In my most recent book (Greenberg & Jordan, 1995), *The American Eye: Eleven Artists in the Twentieth Century*, the emphasis is on the ways in which the lives and times of the artists have shaped their art. In this narrative or anecdotal approach, the reader responds to works of art through the stories behind them. We were interested in examining what is American about American art in the 20th century. We chose artists, such as Arthur Dove, Georgia O'Keefe, Romare Bearden, Jackson Pollock and Andy Warhol, whose works contributed to the modern movement in the United States and whose lives offer such a diversity in terms of personal and artistic styles. The book builds on the previous two books by integrating the method of looking at artworks introduced in *The Painter's Eye* and *The Sculptor's Eye*. This gives the series a sense of clarity and consistency.

Finally the goal of the books about art for young people is to help them feel more confident and more open to future interactions with art in museums, galleries, or anywhere else that art is experienced throughout their lives. Art exists as a unique creative endeavor on the part of the artist, as well as an enriching experience that is unique to each viewer.

The following is a bibliography, along with a brief summary, of some recent books for young readers that emphasize aesthetic perception in the visual arts and architecture. Biographies of artists that stress understanding of the artists' works are also included.

Beneduce, A. K. (1993). *A Weekend with Winslow Homer*. New York: Rizzoli.

Middle Grades. Through the imagined voice of the artist, this book (part of an excellent series) invites the reader to visit his home and studio for the weekend.

Blizzard, G. S. (1992). *Come Look with Me: Exploring Landscape Art with Children*. Thomasson-Grant. Ages 6–10.

Blizzard, G. S. (1993). *Worlds of Play*. Charlottesville, VA: Thomasson-Grant. Ages 6–10.

In this series of books about art, the author discusses a number of paintings that prompt a discussion about theme and style of works, both traditional and contemporary.

Boulton, A. O. (1993). *Frank Lloyd Wright, Architect: An Illustrated Biography*. New York: Rizzoli. Ages 12 and above.

A well-designed book that uses drawings, photos, and text to explore the life and work of this major American architect.

Davidson R. (1994). *Take a Look*. New York: Viking. Ages 12 and above.

Theme and style in a variety of artworks are introduced with well-chosen reproductions.

SOUND AND RESOUND

Katherine Paterson

AUTHOR, *Bridge to Terabithia* AND OTHER BOOKS

When the person sitting next to me on the airplane asks politely, "What do you do?" I answer: "I write novels for children and young people." My seatmate rarely goes on to ask me what I mean by such a statement, but if she did, I would answer something like this.

Well, basically, I am a storyteller, but a novel is a special kind of story. It is story with meat on its bones. The novel, as Flannery O'Connor has pointed out, is incarnational art [literally *in flesh*]. A novel is about human experience. Our first experiences as human beings are very sensual. Most human beings can see, hear, taste, touch, and smell. Novels, then, must involve these basic human senses. Human experience also involves thinking, feeling and acting. It involves relationships among human beings and between humankind and nature. Human beings think—they reflect and imagine, they compute and observe. They act, usually rashly and selfishly, but sometimes with extraordinary wisdom and miraculous compassion.

People talk—they use words to make sense of experience and to communicate with others. Sometimes they talk inside their own heads, sometimes they speak with others, but words are always important, even to newborns, who will turn at the sound of their mother's voice and try before too many months have passed to offer a language of their own.

A novel, a story in the flesh, builds a world from words (and in English every word is an arrangement of symbols which we call letters and we have only 26 of these from which to choose. I feel poor sometimes when I compare my meaningless symbols to the rich images that a word written in the picture language of the East instantly conjures up for the Chinese or Japanese reader).

With words the writer attempts to woo the reader into the world she has created in her own mind. She evokes all the reader's senses. She tries to capture the reader's feelings. She must have (or she will utterly fail) the reader's intellectual ability and will to read what she has written. Her story in the flesh will not come to life unless a living reader brings it to life.

When I am talking to children I often ask them how many of them sing or play a musical instrument. Many do, so they understand immediately the difference between a musical score and music itself. The musical score may be magnificent, but even the genius of Beethoven cannot make it music unless living musicians take his score and play it or sing it. Without musicians, the Ninth Symphony is only black squiggles on a white page.

Without readers who are willing to bring their own lives to my story in the flesh, my book will never come to life. It will only be black marks on pages, bound between covers, gathering dust. Although "it's a wonderful feeling when readers hear what I thought I was trying to say . . . it is even more thrilling for a reader to find something in my writing that I had not until that moment known was there. But this happens because of who the reader is, not simply because of who I am or what I have done" (Paterson, 1981, p. 24).

I am constantly grateful for the readers who bring my stories to life—those who send me pictures of Terabithia, transformed into a turreted castle complete with portcullis and moat, or portraits of a great, smiling Maime Trotter who is unmistakably African-American. When I talk to children about *Bridge to Terabithia*,

I find that something has happened for which I cannot take credit. They have taken my bare-bones Terabithia and supplied their own fantasies I could not count the number of people who have told me that Terabithia is exactly like a magical place they have or had when they were children. But, of course, what has happened is that they have made Terabithia in their own image. I didn't write the book. They did. It's an absolutely wonderful experience for a writer to have people do this. (Paterson, 1981, p. 70)

When people ask me what I like best about being a writer, it is this intimate connection with readers—this sound from the depths of my being which resounds in their hearts and makes a music neither of us has ever heard before.

AN AUTHOR CELEBRATES THE UNPREDICTABLE WAYS OF THE ILLUSTRATOR

W. Nikola-Lisa

NATIONAL-LOUIS UNIVERSITY

As an author of picture books, I am in the unique position of initiating an idea but not seeing it through to the end. As a writer, I do most of my work at the beginning stages of the publication process. It is the illustrator—working with the editor and art director, rather than directly with me—who brings the elements of my idea to fruition. In this pseudo-collaborative partnership, it is sheer trust in this oddly constructed creative process rather than good communicative skills which propel the relationship forward. But I do not mind. After going through this process now some half dozen times, I have come to marvel at it, especially the unpredictable ways of the illustrator whose job it is to communicate directly—vis-a-vis visual images—with a young and lively reading audience rather than with me.

Illustrators—as the name indicates—bring to a manuscript an entirely different language, a language of visual representation. With a plethora of approaches (as well as a variety of media), illustrators can shape a text in innumerable ways: they can interpret a text literally, or extend it symbolically; they can embellish a text in pleasing ways, or subvert it with unexpected humor. No matter what approach they take, it is still their job to deepen our understanding and appreciation of the text by building a visual plane upon which the text moves. In short, illustrators “see into the text” in ways an author sometimes never imagined.

Although my long-standing interest in the relationship between text and image in the young child's picture book is primarily academic, it is my recent practical experience as an author of picture books from which I presently write. Reflecting upon the picture books I have published in the last several years, one thing repeatedly stands out: over and over again the illustrator brings to the text a fresh perspective, sometimes predictable, sometimes not.

In *Night is Coming* (Nikola-Lisa, 1991) Jamichael Henterly surprised me not with a radically new interpretation, but with

his masterful full-color illustrations. His richly detailed images brought to the text a nostalgia for the countryside. Every textual image was brought more sharply into focus to ponder and to reminisce about. And, yet, his personalization of the text was still his own. The Dutch Pennsylvania countryside, for instance, which he renders throughout the book is not an element of my experience; it is, I suppose, a facet of Henterly's own imagination that is at best suggested by the text. What he created visually, however, is not only appropriate, but an incredibly close match to the visual representation of the text I carried in my own head (even down to the Jersey cows queuing up to come home which is a facet of my own childhood experience having grown up in a small ranching community in the south).

In *Storm* (Nikola-Lisa, 1993), although the end result intimates a certain consonance between text and illustrations, the process involved some intervention on the part of editor Marcia Marshall. In the early stages of developing a dummy for the text, illustrator Michael Hays included “sky gods” in the clouds, figureheads that anthropomorphized the story. Marcia rejected such attempts, steering Michael more toward an impressionistic interpretation of the text with an emphasis on the play of light in the sky, trees and land. Ultimately, Michael's atmospheric paintings radiate precisely because of the quality of light he captures. Faces painted in the sky—gods or not—would have detracted from his refined sensitivity to light and lessened the overall effect of his illustrations.

Perhaps the only illustrations I have been totally surprised by have been those for *Bein' With You This Way* (Nikola-Lisa, 1994a). It is easy for me to say this because it is one of the few manuscripts for which I had little or no visual image in the first place. The text evoked in me only the vague image of children dancing. Beyond this, I had no other visual image (which for me is odd in that I am a very visual person). What

illustrator Michael Bryant did in creating a cast of multicultural characters at play in a city park was brilliant. Not only did he give the text a setting—and a narrator—but he gave the story an appropriate visual representation, keying off the dynamics of the text's upbeat rhythmical structure. When I first saw his illustrations (a year or more after I had finished revising the text, which is fairly standard), I revelled in his interpretation—even though I had no idea what to expect.

In my latest book, *No Babies Asleep* (Nikola-Lisa, 1994b), although the outcome was similar, the process was quite different. For this text I had a very firm sense of what I wanted visually, but illustrator Peter Palagonia saw things differently. Where I saw the beaches of southern California, he saw a neighborhood carnival. Where I saw an extended family on a weekend outing, he saw a nanny taking care of napping infants. Where I saw babies crawling wildly across the sand, he saw babies playing contentedly with animals on carnival rides. Where I had written twelve stanzas, he used only ten. In the end, however, what I saw did not matter because Peter's vision of the text was stronger and—upon reflection—more densely visual.

The fact that the author does not work closely with the illustrator surprises most audiences. (It certainly did me at first.) Viewing a picture book, you would think that the author and the illustrator work in a tight-knit fashion. But in most cases they do not. Whatever the reason, in my experience it seems to work—almost every time now! Several years ago I heard Richard Jackson, a senior editor at Orchard Books,

explaining in convincing terms the separate roles of the author, illustrator and editor. A picture book is truly the product of these three—if not more—personalities, but the process is not necessarily collaborative.

Over time I have come to accept this without consternation because I have come to trust the illustrator (and the editor and art director). A picture book, in the end, is a specialized format somewhat akin to film in that it demands a team of experts (all of whom contribute their specific expertise and sensitivities) to bring it—frame by frame—to fruition. And, like a good film, a picture book communicates on multiple levels (textual, visual, formal, etc.). It is in this way that a picture book is able to reach a wide audience (including nonreaders), for, as a meaningful set of symbols made up of words, images, and formal (i.e., design-oriented) considerations, it offers readers multiple entry points from which to make sense of its closely patterned and carefully-layered meanings.

Such multiple entry points provide readers with structural supports enabling them to weave their own experience, images, and textual ideas into the reading of a book. The role the illustrator plays is crucial to this reading as he provides not only a visual interpretation of the author's textual ideas, but also his own unique lexicon of visual images, which often deepen and extend the author's stated and implied meanings. At the intersection of these two points of view is the reader, who brings to the reading his or her own set of experiences and understandings making the reading of a picture book a truly unique and enjoyable experience.

THE VISUAL ARTS MADE ACCESSIBLE THROUGH PICTURE BOOKS

Barbara Kiefer

TEACHERS COLLEGE, COLUMBIA UNIVERSITY

In this century picture books have been found largely in the world of the nursery. However, they have a longer history in the world of art. If we imagine an audience sitting enthralled before the cave paintings at Lascaux, picture a group of medieval worshippers entranced by illuminations in a holy manuscript, or share in a young child's pleasure in a favorite picture book, we are considering an aesthetic engagement with a visual art form. In each of these instances the participant is called upon to engage in interchange of intellect and emotion in a context that allows for both individual and communal response.

The importance of this type of visual / verbal experience is no less powerful today because it is mainly experienced by children in Western culture. The long tradition of the picture book grows out of some essential human characteristic that includes an artist's need to convey meaning through visual symbols. Over the centuries this need has resulted in representations of basic aspects of the individual and society through image and story.

Over the course of its long history the content of the picture book and its designated audience has altered as a result of the changing needs of society. In addition, technological advances have allowed the medium of the picture book to expand beyond the wall of a cave or the floor of the desert to reproductions of all manner of original works, bound in paper between the covers of a book. However, the experience that results from engagement with picture books in their many forms is essentially an aesthetic one that engages the viewer in attempts to make meaning from complex emotional, intellectual and critical reactions. Moreover, just as the cave paintings of Lascaux and the illuminated manuscripts of the middle ages are usually the province of art historians, I would argue that today's picture books rely as much or more on visual meaning as they do on verbal meaning. Thus as art objects, rather than literary works, picture books should be

subject to analysis that takes into consideration the meaning making potential of visual art.

This meaning making potential can be realized by elements unique to visual art in general and to picture book design in particular. That is, elements of art such as color, line, shape, value, and texture have the ability to convey meaning and evoke emotion—colors can seem cool or warm, convey anger or serenity, lines and shapes carry weight, convey tension or calm. In addition principles of composition such as balance, rhythm, variety and unity can convey feelings of excitement, agitation, comfort, or dignity. Knowing the basic theme of the book, the motifs and moods, the characters, the setting, and the events that are part of the verbal text (if there is one), the illustrator makes choices about how to express meaning using these artistic elements and how to organize them on each page. Then, in addition to choices of original media, for example, oil or acrylic, the illustrator must consider certain technical choices inherent in the reproduction of the work within the covers of a book. These technical choices may also be expressive of meaning and add to or detract from the overall aesthetic experience possible with a given book. The combination of these artistic choices made by an illustrator can provide the essence of the aesthetic experience possible as a result of a good picture book, one that would be fundamentally and profoundly different if the book's meaning were conveyed only in words.

The effectiveness of these artistic choices will determine the book's excellence and also its impact on the audience. Essentially however, the artist's first responsibility in making these choices is to the meaning of the book rather than to some generic child. In being faithful to the book's meaning, the illustrator, in fact, implies the reader / viewer, and the right child will find his or her way to the book. Because artists, editors, and publishers seem to understand this, we find that at the end of the 20th century the picture book appeals to a

much wider audience than it did at the century's beginning—a return, I would hope, to a world in which picture books are meant for all, adults and children alike.

As adults who hope to develop and deepen aesthetic understanding for ourselves and for our students, we must consider the range of choices available to the artist in expressing the meaning of a particular picture book. We can look at elements such as color, line, and shape and consider how they add to the meaning and affect our feelings about the book. We can think about principles of composition and ask how these affect our understanding of a given page and how they move us through the book from beginning to end. We can look carefully at the technical choices, such as endpaper design or typeface, and consider their contribution to our emotional and intellectual response. Our evaluation of the picture book as an art object should lie in our awareness of the artist's choices in conveying meaning.

As we deepen our own understanding of the art of the picture book we can invite children to explore picture books in a variety of ways that will help extend their aesthetic response to both art and literature. I do not believe that we have to teach formal methods in art or literary criticism to children. Nor am I overly concerned with children's visual literacy. I believe that, too often, an emphasis on literacies, both verbal and visual, results in scope and sequences of literal, inferential, or critical skills and not in an exploration of the child's aesthetic response to a picture book.

Instead, I believe teachers can create child-centered classroom contexts that will give children opportunities to explore picture books in ways that build upon their feelings as well as their ideas during encounters with picture books. Teachers can collect picture books in many genres and styles and take time to read and talk about books with children. They can help children come back to the books often to look at them carefully and to explore them fully through more talk, writing, and art making. Teachers can ask children to share their reactions and responses with others and consider how these encounters affect their subsequent understandings. They can help children consider the artist as a meaning maker, asking why artists make visual choices and how these choices affect their responses to books. They can explore other art forms with children and encourage them to make connections between the art of the picture book and the art of the wider world. Finally, teachers can help children consider how their experience with a work of art has changed the way they look at and experience their own world.

I am convinced that, given these experiences, children will become visually literate. More important, however, they will grow in their understanding and appreciation of the world of visual and verbal art. In the 21st century children will not leave behind the powerful attachments to picture books that characterize their younger years. Rather the picture book will serve as a lifelong connection to deeply felt experiences with all the arts.

PLAYING AGAINST CONVENTIONS: THE TRUE STORY OF THE STINKY CHEESE MAN

Steve Tozer and Victoria Chou

COLLEGE OF EDUCATION, UNIVERSITY OF ILLINOIS AT CHICAGO

Jon was an elementary school teacher who liked stories. He wrote stories in his Master of Fine Arts program at an eastern university. He told stories to his students. He had his students rewrite favorite fairy tales in their own words. He wrote stories of his own, too, though magazines like *The New Yorker* and *Esquire* did not seem as interested in his stories as his students were. He wrote columns for a sports magazine, but that was not the same as writing stories. Finally, like his students, he rewrote a fairy tale. He tried to have it published but, again, no publishers seemed interested.

Molly liked art, but she was not an artist. She graduated from a midwest university with a liberal arts degree and a road map to New York City. First she worked there as a proofreader for the sports magazine where Jon occasionally wrote. She was not very good at proofreading. She started helping out in the art department, where she learned about designing magazines. Soon, Molly was in charge of the artwork for the whole magazine. Later, she was asked by other big magazines, in sports, fashion, and business, to design for them. She had been a proofreader, but now she was an editorial designer. Soon Molly met Lane, who drew pictures for magazines.

Lane liked art and films, and he was a painter. At art school, he tried to major in film and in illustration. Only one major was allowed at a time, so Lane chose illustration. He made a film anyway. After art school, Lane drew dark, colorful pictures for *The New York Times* and *Rolling Stone* and many other magazines. Just for fun, Lane illustrated each of the letters of the alphabet, and a large children's book company found an author to write some text for the pictures and called the book *Halloween ABC*. The publisher began selling it in November. Since Halloween was over, not too many copies were sold, but it was named by *The New York Times* as one of the Ten Best Illustrated Books of the Year. Still, Lane thought, "Man, I coulda done films."

Soon, Molly the designer introduced Lane the illustrator to Jon the author. Jon had words for a rewritten fairy tale, but

no pictures and no publisher. Lane drew pictures to go with the tale, but it still did not get published. Publishers said it was too unusual—people would not buy it for their children. Some publishers did not like the story. Some did not like the artwork. Finally, in 1989, Viking decided to publish the book. Since then, it has sold a million copies and has been translated into seven languages. It is called *The True Story of the Three Little Pigs*. It was so successful that Jon and Lane were allowed to do anything they wanted with their next book. What they wanted was for Molly to design it. And that is a later story.

"OUR BOOKS AREN'T LIKE THE OTHER
BOOKS, AND WE DON'T WANT THEM TO
LOOK LIKE THE OTHER BOOKS"

Readers of children's books will recognize two of the main characters above as Jon Scieszka and Lane Smith, who have worked together and separately on several unique, usually very funny, and hugely commercially successful children's books. Less readily recognized is Molly Leach, who, in addition to her editorial design career, has designed two books with Lane and Jon, three more with Lane, and another with a group of illustrators. Each of these three established a career outside of children's literature, and each has done significant children's work in his or her own right. The story of most interest here, however, is their collaboration. It is a collaboration in which three people, playing with words and images and getting silly with the creative process itself, effectively resist several prevailing conventions in children's story book publishing. The resulting originality is grounded not only in the considerable individual talents of the three coconspirators, but also in the way in which they work together.

The True Story of the Three Little Pigs (Scieszka, & Smith, 1989) was the first collaborative effort by Jon and Lane, and

it presents some of the convention-challenging components that appear in more striking form in their succeeding picture book collaborations, *The Stinky Cheese Man and Other Fairly Stupid Tales* and *Math Curse* (Scieszka, & Smith, 1995). Building on *The Three Little Pigs*, *The Stinky Cheese Man* has added something immediately evident: Molly Leach's approach to design unifies and extends Jon and Lane's pervasive flaunting of children's book conventions with an inventive and irreverent integration of text and illustrations. Her departures from the conventions of children's book design contribute an overall "look" that is as distinctive as are Jon and Lane's departures from conventions in text and pictures. The combined effect of the three collaborators sets their work apart from even the most successful and innovative of children's books that preceded theirs.

While *The Three Little Pigs* is Lane and Jon's book, Molly was not entirely absent from its final design. A difficulty with the publisher arose over the book's cover, which looks like the front page of a newspaper, *The Daily Wolf*, in which the blaring headline THE TRUE STORY OF THE THREE LITTLE PIGS appears over the byline "A. Wolf." In addition to a newspaper-style illustration of A. Wolf himself, the front and back of the book are covered with reproductions of actual newsprint.

Overlapping yellowed columns from the Wilson administration, the Nixon administration, and random points in between compete for the limited space on the cover. But the design caused problems the solution to which introduces Molly into the mix as it illustrates something about conventions in children's books publishing. As Lane tells it:

So with this cover, we fought, and Jon and I said we really wanted a newspaper cover because it fit the book. They just hated the idea and said they did a book a couple of years before that had a newspaper cover which they said bombed, and they showed it to us and we said, "Yeah, but that's a hideous newspaper cover. Of course it bombed; it's ugly." So we thought we'd do a good newspaper cover. They finally said okay, but they weren't sure how it should be done, so I said, "Well, Molly, what'll we do?" She said, "Well, I'll just get you press type and you can glue it on to your painting and paint around it, just give it to them as is. So this cover was a finished piece of art work; all this type is on the art work, not designed by the publisher. So with this cover, we fought, and Jon and I said we really wanted a newspaper cover. And that was one of the reasons we finally got Molly in there.

... They said, "Well, we'll make a deal: we have to hire this art director because he's the best there is, and you guys can design your own books. I said "Great."

One obvious feature of this anecdote is its reminder that publishing is a business seeking to minimize risks and maximize profitability. It should be no surprise that Lane and Jon and, as it turns out, Molly, had to prove themselves as a commodity before the publisher would later be willing to grant them relative autonomy in their work.

Less obvious, however, is the conventional publisher's practice of supplying its own design director for each of the books they publish. Again, this minimizes risk: although a good director may apply the same aesthetic and technical sensibilities to 20 or even 40 books in a single year, at least the publisher can be sure that these book designs will fall within

the bounds of what works in the marketplace. It is relatively rare for an author and an illustrator to provide their own designer, and when they do, they have to be prepared to deal with the art director anyway. Lane explains:

In the kids' book industry a big publisher can do like 50 titles each season, or more, and they just have one art director. They all look alike because it's the easiest thing to do to put an image and a square on the cover and throw some type around it and we, Jon and I, thought, "Our books aren't like the other books, and we don't want them to look like the other books because if they look like the other books, then they will be more like the other books." So we got Molly in there, and there was some resistance.... I think a lot of it was budgetary, they just—"why should we shell out money when we have an art director?" And even to this day.... It's kind of like our books, we're always trying to get her to put her name on there bigger if only so that there won't be such a struggle next time.

Why should it make a significant difference in the book if the publisher allows another designer on board? How many options are there, really, once the author and illustrator have done their work? One source of difference is Molly's lack of familiarity with the conventions of the children's book industry. Instead, her approach has been shaped by her work in adult editorial design.

I never paid attention to kids' books and I think that's another reason our books look different. I just do what I think seems appropriate or right for Jon and Lane's style.... They're always trying to make pages lively and then the story is so silly that if you did something straight it would be, seems to me, completely inappropriate.... I think a lot of the kids' books are designed the way they are because they just have these rules and if you go to school and they tell you this is the way kids' books look and if you get A's for using the little rounded borders and sweet little typefaces, you know.... It just would never occur to me to use those queer little borders and all the things they do. To me, that's just bad design. What I do is like my editorial work. I design to grab people's attention, so each page will be interesting to read or intense in some way. I don't think anything should fade into the background.

"I DON'T KNOW HOW THIS BIG BAD WOLF THING GOT STARTED, BUT IT'S ALL WRONG"

The creators of *The Stinky Cheese Man* are well aware that other artists, too, have challenged conventions within the children's picture book industry. Jon conjectured that part of his own inspiration may have come from the contrast between what he was reading in elementary school in the early 1960s—basal readers with tame, humorless stories and uniform lines of typeface beneath standardized pastel illustrations—and the surprising, colorful, and comparatively goofy Dr. Seuss books. The Dr. Seuss design artists were breaking conventions by splashing their colors and drawings right to the edge of the page, instead of maintaining the even margins that printers prefer, and the resultant design served to integrate words and text in a way that pulled readers headlong into an expansive world in each double-page spread, rather than setting that world apart from the reader by borders and boundaries. Yet,

even in Dr. Seuss's *Green Eggs and Ham* (Seuss, 1960), for example, the text is presented in standardized blocks of type against a white background on the page, more like the basal reader than not. It remains today a prevalent way of integrating text with pictures, with the standard variant of blocking the text within the colored backgrounds of the illustrations themselves.

Later in the 1960s and into the 1970s and beyond, author-illustrators like Maurice Sendak challenged conventions by trying to represent the fantasies of children from their own points of view and through illustrations unique in their mood, artistic merit, and dark imagination. With Caldecott Medal Winner *Where the Wild Things Are* (Sendak, 1964) and Caldecott Honor Book *In the Night Kitchen* (Sendak, 1970), however, Harper and Row's designers stuck to standard conventions of uniform text, inset in light background against darker illustrations which were framed in full- or half-page rectangles. The enchanting stories and the broad, rounded characters in surreal settings were consequently much more innovative than the design itself.

While imaginative stories and rich illustrations won critical acclaim and popular audiences throughout the 1970s and 1980s, certain fundamental design features remained largely unchallenged. For example, *Strega Nona* (de Paola, 1975) and *The Garden of Abdul Gasazi* (Van Allsburg, 1979) were both designated Caldecott Honor Books on the basis of the compelling fantasies they built in text and illustration, yet their design followed traditions of rectangular art displays accompanied by standard lines and blocks of copy in adjacent white panels. In the 1980s, in *Round Trip* (Jonas, 1987) and again in *Reflections* (Jonas, 1987), Ann Jonas used the relatively distinctive design feature of a book that is flipped over at its end, which is only the midpoint of the story. The tale continues back to the book's beginning, revealing that the illustrations used in the first pass through the book can now be viewed upside down to illustrate formerly upside down text on the return trip. Both volumes won American Library Association Notable Book awards. Both observe the standard design conventions of uniform typeface in its panel, illustrations in theirs.

More innovative still, a book like *Black and White* (Macaulay, 1990) won a Caldecott Medal in 1990. The bold label WARNING on the title page and dust jacket gives some indication of the design challenge Macaulay created:

"Warning: This book appears to contain a number of stories that do not necessarily occur at the same time. Then again, it may contain only one story. In any event, careful inspection of both words and pictures is recommended." In this book, four panels appear on each double-page spread, and each of the four panels connects directly with its position-mate on the next double-page spread, so that four stories simultaneously unfold throughout the text. While these four stories intertwine, a slightly different typeface and a different art style for each separates one from the other. The design of *Black and White* also challenges conventional separations of illustration and text, integrating them in imaginative ways. Text is written in clouds, balloon letters appear in white against dark panels, puns are made that reflect a self-conscious recognition of the complicated, multiple storyline

approach (as in one illustration of "udder chaos"). Such innovations as words on scraps of paper, drawn fluttering from one story into the next, help the stories intermingle. More than in most other popular books one is likely to see before 1990, the design of *Black and White* becomes a significant part of its message.

It is this self-consciousness about book design that Jon and Lane asserted so irreverently in the text and illustrations of *The True Story of the Three Little Pigs*, and which Molly helped them push to a new level in *The Stinky Cheese Man*. Despite the evident richness of imagination in text and illustrations, nearly all children's books that have passed through the standardizing process of publisher's art directing have emerged with features that most authors and illustrators would not be likely to question in the first place: a title that straightforwardly represents something about the book's content; a title page that presents the author and publisher; a dedication; sometimes a table of contents; a story with characters in a narrative that has a beginning, a middle, and an end; text that stays in its place adjacent to illustrations that stay in theirs; a dust jacket with information about the authors; and so on—standard features that make a book a book, and which only the most juvenile mind would use as a target for spoof and mockery. Or worse, three juvenile minds.

Silliness seems to be the unique root of *Three Little Pigs* that later blossoms in *The Stinky Cheese Man*. The playful humor of *Three Little Pigs* is reflected in the title: this is *The True Story*, and adults have got it wrong. Kids are being let in on the "true" story at the same time that they are being let in on the joke that such events could have happened at all. They are given credit for being able to understand a pretty sophisticated irony. The familiar conventions of the fairy tale are being contested, while at the same time these familiarities are exactly what allow young readers to appreciate the rebellion. These twists on the familiar draw young readers into the inner circle of *those who know*. As A. Wolf tells them, "I'll let you in on a little secret. Nobody knows the real story (Scieszka, & Smith, p. 1)." And soon after, the storyteller deepens his intimacy with the reader: "I'm the wolf. Alexander T. Wolf. You can call me Al" (p. 2).

Young readers are then treated to "the real story," in which the Wolf concludes, "I was framed." But the evidence in the wolf's own story seems to implicate his guilt, despite his protestations, creating an irony rare among children's picture books. Children are invited to employ disbelief or at least suspicion, on the one hand, recognizing that the narrator has tried to mislead them throughout, while on the other hand they must suspend disbelief to accept the fact that the wolf is narrating at all. To be suspicious of the wolf's story is to accept that he is telling it in the first place, which, of course, is untrue at its own level. The effectiveness of the fantasy, this fundamental suspension of disbelief, is heightened by a diversionary tactic that keeps children busily suspicious about something else.

The illustrations deepen the reader's suspicions about A. Wolf. While he is claiming innocence, the vivid paintings suggest otherwise. He claims to have sneezed at inopportune moments, "huffing and snuffing," until the pigs' flimsy houses

fell down, rather than intentionally huffing and puffing them down. Yet the pictures expose a purposeful puffer of a wolf, and his claims of “wolf’s honor” seem flimsier than the sticks and straw in the pictures.

The design feature that most integrates the front and back covers with illustrations and text is newsprint. It, too, serves the irony of the story, because it is clearly authentic newsprint that is reproduced, but the wolf uses it in a transparently inauthentic alibi: he was framed by news reporters, who “jazzed up the story with all of that ‘Huff and puff and blow your house down.’ And they made me the Big Bad Wolf.” *The True Story of the Three Little Pigs* is given the verity of a newspaper headline on the cover, but it proves in the end to be more untrue than fairy tales typically are.

With text, pictures, and design, Lane and Jon (and to a lesser extent Molly) began to establish their *modus operandi* in *The Three Little Pigs*. They challenged the convention of a well-known fairy tale by turning it on its head, presenting it from the villain’s point of view. They conspiratorially encouraged rebellion against conventional fairy tale tropes, inviting children in on a secret that others seemed not to know. By appealing to the children’s allusionary base, they credited young readers with being able to get the logic of jokes, unexpected twists, and improvisations that were simply the product of adults at play with traditional ideas and images (play which also yields side jokes that only adults are likely to follow, like the newsprint headline, Little Red Riding Hood Settles Dispute Out of Court).

In fact, playful, silly humor permeates *Three Little Pigs*. To say much more than that would require the deconstruction of what is meant by jokes. One is reminded of the film, *Mr. Saturday Night*, in which Billy Crystal’s character repeatedly tries to explain what makes a joke work: “First you get ‘em going one way, then—you take ‘em the other way.” For the creators of *The True Story of the Three Little Pigs*, children’s familiarity with the traditional story and its conventions is the set-up, and the book itself is the extended punch line—an exercise in “take ‘em the other way.”

“IT REALLY WAS COLLABORATIVE, CUTTING UP DRAWINGS ON THE BOARD AND CUTTING UP THE TEXT”

The author, illustrator, and designer of *The Stinky Cheese Man* believe that their collaborative working relationship is critical to the uniqueness of the book itself. Molly contrasts this collaboration to the typical book design process, offering her view of the impact of their success on the industry:

Usually a writer writes the book and then passes that along to an illustrator and a lot of times the writer and the illustrator never get together. Then the designer gets the text and art and there’s really not much he can do. But if I’m talking to Lane, and he’s sitting right here, I’ll say well, let’s do a full-page spread and then have copy over on this page. You find you can just look and then when you turn the page, it will be clear whether it works or not. But the industry still works in its usual ways. Our collaboration really hasn’t changed things. Most writers and illustrators still don’t know each other and never will. I think that’s so that the publisher

will have more power to direct things to where they want them to go.

The publisher, of course, succeeds or fails partly on the basis of his ability to predict what will find a market. Molly is not convinced, however, of the value of the industry’s techniques for predicting sales success, particularly as these predictions interfere with new ideas:

They just say such and such didn’t sell. Or they get these focus groups that are jazzed that they’ve paid so much money for and they just destroy all creative, you know, thinking, and it’s unbelievable—they make these sweeping comments about stuff and you say, well, okay, then we can’t do that.

It is an old marketing story in any field that industry convictions about what sells can stymie new approaches. Lane first saw *The True Story of the Three Little Pigs* after Jon had encountered publishers’ resistance to the initial text. Lane felt that the addition of strong illustrations would make publishers take another look.

I said, “Well, I really like this a lot, let’s do it together. I’ll do up a book dummy and insert your text and it will look just like a makeshift children’s book and I’ll take it around for you and we’ll get it published, because you’re getting rejected.” So I took it around and I got rejected everywhere.

Ultimately, Viking saw potential that others did not, and *The Three Little Pigs* went to market. Lane describes how the collaborative process differed for their next book together.

When we did *The Three Little Pigs*, Jon just gave it to me and I spent a couple of weeks doing all the paintings and then he said, “Oh, that looks good,” and then it just came out. But with *Stinky Cheese Man*, it really was collaborative, cutting drawings up on the board and cutting the text up, and Molly would come in say, “Well, wait a second, you have an extra page here”, and then Jon would say, “Well, we’ll just throw that story out.”

Although Jon generates the original story lines and text for their books, he has a great deal of respect for the talents of his collaborators, and he encourages and responds to their editorial judgments. He describes how, after “honing the voice of a story,” he makes no effort to influence how Lane will interpret that story in his artwork.

It’s really exciting to see what Lane will do with it. It’s sheer brilliance. He has a filmmaker’s sense of storytelling with images. I’m a cheerleader at that point. I might goof around with design issues, like whether there’s too much text for what Molly wants to do, and I’ll say, “Here, I’ll rewrite that,” and she’ll say, “No, let me see what I can do.” Molly enhances that dramatic quality of the page-to-page-ness of a story. She gives it its organic quality.

Lane, too, observes the unifying effect of Molly’s design work, but in a counterintuitive way. Rather than follow the industry practice of using the same size and style of typeface throughout a book, *Stinky Cheese Man* uses too many to bother counting (in “Jack’s Bean Problem,” for example, using six font sizes in three words that are being squashed by the giant’s boot). In one story, 23 words are blown up large enough to fill an entire page with text, while another story squeezes 25 lines of much smaller type onto the page. This move is repeated throughout the text, the variation creating a theme, as Lane explains:

Molly's other concept for the book too, was that on those full pages, no matter how many words, they would fill the page—so if you had a hundred words or if you just had five words, it would fill the page. It's just kind of nice, since the book is so chaotic, that just brought a nice structure to it. It somehow becomes somewhat unified.

Molly confesses to a greater need for such order than either of her partners display. She often portrays them as clowning around while she strives to make sense of the component parts.

Well, in part, that's an organizational thing. You know, I just can't work until I know every little bit of information I have to have it all on the wall, have it all clear and clean in my head, and these guys are just telling jokes.

But the jokes are at the core of what makes *Stinky Cheese Man* work, as Molly knows. Her different sensibilities seem to expand what is possible for the final integration of words and pictures. If each story in *Stinky Cheese Man* presents a different design innovation, each also has a story of its own behind it, usually one involving two or three of the artists solving a problem together. In "Jack's Story," for example, (different from "Jack's Bean Problem"), the Giant tells Jack that when Jack finishes telling him a story, he will grind Jack's bones into flour for bread. So Jack tells the Giant this very story of the Giant's threat, ending with, "Jack cleared his throat, and then began his story." He retells the story, ending with the same line, and so on recursively, in tinier and tinier print, until it simply runs off the page. Molly recalls this story in illustrating why she values the collaborative style of working:

It's just much better having all three of us together, able to work together. Something like *The Stinky Cheese Man* we could never have done separately because half the stuff I don't even get. It's like, what do you mean, Jon, the story never ends? What's that all about? After he explained, Lane said it would be cool if the story went around and around and around, but I thought it'd be better if the text got smaller and smaller and then just went off the page completely, which Jon liked.

Lane recounts another instance of the collaboration adding up to more than the sum of its parts. In this case, as in others, an intended innovation surpassed the limits of what the industry would allow.

Jon and I originally wanted to have the page actually flop and the page actually melting here and do a dye cut and then on the other page have a cow eating that part of the book—but they said it costs too much money. So that was our concession. We ran it to Molly and said, "Ooh, if we do this kind of melting, then can you make the type melting also?" She said, "Well it's a pain in the ass, but..."

But, in effect, let's see what we can do. The collaborative relationship and its striking results, in which a unique designer has become a full partner in the creative process, are nothing less than a triumph over business as usual in the children's picture book industry.

"RELUCTANT READERS WILL LOOK FOR OTHER BOOKS WITH 'CHEESE' IN THE TITLE"

In, *Stinky Cheese Man*, no chance to "take 'em the other way"

goes unexploited. The mockery of convention is almost relentless. Even the subtitle, *And Other Fairly Stupid Tales*, undermines its content. The front dust jacket flap parodies the commercialism of the children's book market and sales pitches in general, proclaiming "ONLY \$16.00! 56 action packed pages, 75% more than those old 32-page Brand-X books." A mock seal of approval exhorts: NEW! IMPROVED! FUNNY! GOOD! BUY! NOW! The joke here, as Molly and Lane tell it, is also that they were being urged by the publisher to stay within the standard printers' page-number increments. "Kids' books are either 32 pages, 40, 48 or 64 pages," explains Lane, "and this book is 56, which just isn't done." Adds Molly: "So, if we came through with 56 they really wanted to put something on there to say it was a bigger than usual book so we made a joke out of it—only \$16.00 for 56 pages."

Scholarly and popular reviewers have analyzed *Stinky Cheese Man* in terms of its postmodern sensibilities, one approving critic observing that, "The visuals do not merely further interrogate the self-questioning text, but also engage in their own artistic irony and pastiche" (Stevenson, 1992). Perhaps more significantly, and certainly more simply, the mood and moves of *Stinky Cheese Man* are grounded first in Jon's style as a teacher. He first developed his approach to writing such stories in the elementary school classroom, and he believes that the same orientation to children that informed his teaching continues to inform his writing. Not surprisingly, the communication with children is often two-way.

One thing that my writing takes from my teaching is respect for kids, a belief in their intelligence. Another is the play element. As a teacher, I tried to put humor in almost everything we did. By that I mean a joyful humor, not take-it-apart funny. And I think this works for kids in the books. They get it. And I get great letters from kids telling me they do.

Lane, too, believes that the work of Jon the writer is very close to the work of Jon the teacher, and that his ability to arouse the interest of a broad spectrum of children is one of Jon's strengths in both capacities.

Even though they are big crossover books, we do write them with third grade mentality in mind. That was the grade that Jon was teaching when he wrote *The Three Little Pigs* and a lot of the adults who thought the book was too sophisticated hadn't been in a classroom in years. If you go in there and you read them, you know, the little bitty bunny, you're gonna lose 'em. But if you read them *The Stinky Cheese Man*, they're rollin' in the aisles and the reluctant readers will go ahead and look for other books with cheese in the title.

Lane's illustrations, similar to Jon's writing, seem to aim high. They are sophisticated paintings that seem to capture childish fantasy with a decidedly adult, but surreal, technique. Lane describes his approach:

Well, I think it's just not trying to dumb it down for the third graders. The problem with a lot of kids' books in their writing and in their art work is that they, adults, are writing or illustrating what they think kids should read or see, and Jon and I have never felt that way. Even my work for adults was always weird, distorted, and dark, but it was never gratuitously sexual or violent in any way. And then the stuff I do for kids is the same way. If it didn't have the

stinky cheese man in it, the background could be exactly the same but have Richard Nixon's head in there and it'd be just fine. So, I mean, I guess I don't really think, "Oh, a third grader would love this." We don't try to water it down. Kids are watching MTV and they're riding these skateboards with all these cool skulls and neon colors on, and then the adults give them these, you know, pink and blue books and they're going, "What are you, crazy?"

Given their combination of a child's sense of play and adult's command of language and images, the collaborators produce a level of humor interesting to children and adults alike. In the middle of one story, Jack the Narrator's premature telling of "Little Red Riding Shorts" leaves the Wolf and Red Riding Shorts in such a snit that they refuse to narrate their tale. The resulting blank page was again an idea not readily welcomed by the publisher. Lane's account of this reveals something of the adult sensibilities at play in the creation of comedy that succeeds with children:

We got flack early on when the publisher said, "Well, can't we add a squished bug on there or a thumbprint or something?" Jon was real insistent on "No, if we're gonna do the gag, let's do the gag." It's similar to Ernie Kovacs; I heard a story about how he would have his TV show going and then he would just have a marching band march through the stage and then that would be it. And the sponsor would say "we're paying all this money for the marching band, let's bring them back again for the endup," and Ernie would say, "No, just let's do it once and it's funny that way." That was kind of what we thought about the blank page too; if we're gonna do this, then just make it blank. But we're always tempted to sign our names there when people ask us to sign the books.

But here the defiance of convention goes one step further, and it is this step, only foreshadowed in *Three Little Pigs*, that marks the sharpest break from the unexpected: not only does the book challenge storybook traditions, but the characters themselves draw readers' attention to these departures, sometimes lauding them and other times becoming upset by them. After the blank page appears, for example, the Little Red Hen makes an unexpected and unexplained reappearance from earlier in the book:

Say, what's going on here? Why is that page blank? Is that my page? Do they expect me to tell the whole story by myself? Where is that lazy narrator? Where is that lazy illustrator? Where is that lazy author?

By calling attention to format conventions, Little Red Hen is only continuing what started even before the book's title page, which reads, of course, in letters that fill the entire page:

TITLE PAGE
(for The Stinky
Cheese Man & Other
Fairly Stupid Tales)

Before that page, however, the creators have already begun storytelling on the endpaper, dislodging the title page as a marker for a book's beginning. While Little Red Hen tries to try to begin her story, Jack the Narrator struggles to keep order, interrupting her: "Wait a minute. Hold everything. You can't tell your story right here. This is the endpaper. The book hasn't even started yet." Before the book has started, characters are arguing over how the book should begin, and they are

doing so in typeface of contrasting size and color (red and black), creating just the "grab your attention" effect that Molly seeks in her design. Before the book has started, the very notion of a book having a beginning is undermined. The young reader, like the characters, is immediately compelled to attend to structural elements of the book, not just to its story and pictures.

The defiance of convention redoubles as the characters begin to discuss it with the reader. The dedication is written upside down in huge typeface, ostensibly on a white sheet of paper held by the narrator against the slim margin of a dark landscape. "I know. I know," snaps the narrator. "The page is upside down. I meant to do that. Who ever looks at that dedication stuff anyhow?" But just so it is not too hostile, the upside down dedication leaves a place for a child to write in a space labeled "your name here," once again including the child in the rebellion against adult conventions.

And so on throughout the book. The Table of Contents, which instead of the proverbial falling sky comes crashing down on Chicken Licken with such force that the page numbers are jarred loose from the story titles and one story title is dislodged from the Table altogether. No matter: pages are not numbered in this book, and the story bumped from the Table of Contents ("The Boy Who Cried Cow Patty") is bumped from the book, too. Even the ISBN number and bar code on the back cover cause trouble. Chicken Licken returns for one last appearance on the back cover, ranting about the intrusion of the ISBN and bar code. Molly's recollection is one more illustration of the collaborative process at work, even if the final words of the book, "blah, blah, blah, blah," may not themselves seem to be the height of creativity:

We wanted to shrink the ISBN code. On cassettes and stuff, they're just itty bitty little things. But they wouldn't let us, so Jon and Lane decided to make fun of that too. One time we were gonna make it just really big—just fill the whole back cover with it—but they said that would blow up their scanners, so it's the same size and in the same position on the book as all the rest of the books. But we decided since they wouldn't let us change it that we'd have to do something else. So Lane and Jon came up with something about just having the chicken back there saying, "What is this doing here? It's ugly!" But when I positioned the chicken on the page, I didn't have enough copy, so I just wrote in "blah, blah, blah, blah, blah, blah, blah." It's like dummy copy, but then it just stayed there.

Life After Cheese Man

Molly, Lane and Jon continue to work independently and together on new projects. In 1994, Molly completed work on the redesign of *Business Week*, perhaps as far from *Stinky Cheese Man* as editorial design can get. In that same year, Viking published *The Book that Jack Wrote*, written by Jon, illustrated by award-winning painter and magazine illustrator Daniel Adel, and designed not by Viking Press but by Jeri Hansen, Jon's wife. And also in 1994, Lane wrote, directed and co-produced *Water Ride*, a half hour film marked by fantasy, surrealism, and humor. Not a mass market film, *Water Ride* has been shown at several film festivals. This work, together with Lane's success in illustration, has led to bigger things:

They're doing a film version of *James and the Giant Peach*, Roald Dahl's story. Disney is distributing it, Tim Burton is producing it and Henry Sellick is directing it. He's the same director that did the *Nightmare Before Christmas*, another Tim Burton film. It's all stop-motion animation except with James it'll start out in live action and then, evolve into the kid—actually sort of metamorphose into this cartoon character. I'm designing all the characters. I just thought it would be a really fun project and then, independent of that, Disney saw my books, *Happy Hockey Family* and *Stinky Cheese* and stuff, and then they also saw a screenplay that I did for my own little half hour film, and then they hired me to write a feature live action film.

Meanwhile, the collaboration continues. Last fall, *Math Curse* was released by Viking. Calling it, "A Stinky Cheese treatment of mathematics," Jon remarks that the trio has resisted the call to produce more parodies of well-known fairy tales. "We've already done that," says Jon. "In *Math Curse*, a girl wakes up and everything she experiences is a mathematics problem, starting with the number of socks in her drawer, and each problem has a multiple-choice answer. We put mathematics into everything we could in *Math Curse*, including its price."

And the collaboration expands. Most recently, the three artists have been experimenting with the possibilities of CD-ROM production of their stories. Lane tells what by now is becoming a familiar story.

Well, the technology was so hard to grasp, we had so many options this time.

I mean, with *Stinky Cheese Man* we were going crazy and Molly kind of came in and said, "Well, listen, you gotta have some structure," so with CD-ROM, it's gone this far for several months

with us just going all over the place, and Microsoft hired Molly to sort of put this into shape. They just assigned us some designer person there who had no design background and she just used the same typeface every time, this sort of typewriter type that comes with the computer ("And it just kills all the jokes," Molly interjects. "It's just so flat.") So we got Molly in there to work and they just look at it and said, "Whoa, this is great, this is like an old medicine show circus poster," and we said, "Yeah, that's what we've been telling you."

Just as they had been dissatisfied with many of the conventions of children's books, the team has found that the CD-ROM technology has not yet caught up to what they would like to accomplish. Lane explains:

With kids' books, the only ones we've seen so far have been, basically, they would just put the book on the CD-ROM and then you'd be able to click on this cow and it'd go "Moooooooooooo." Or you'd be able to click on the word and it'd go "No," "No," "No." And Jon and I said, "this is boring," and then we flipped a page and it would take forever for the artwork to load up. So, we just decided, well, we're not gonna do any of the books yet. We will, but, you know, the technology is getting closer and closer and better and better, so we're just gonna sit on *Stinky Cheese Man* probably for another couple of years.

And in the meantime, they will not be idle. Jon, Lane, and Molly are continuing to play at the borders of CD-ROM technology, just as they will continue to play with the conventions of children's books. Their work together represents the coming together of three people with remarkable individual talents, who together reach beyond what any one of them can do alone.

REFLECTIONS: ARTHUR MOVES TO TV AND CDS

Marc Brown

AUTHOR, *Arthur* AND OTHER BOOKS

Children's books are among the most carefully controlled and highly scrutinized media to reach a child's hands. Gatekeepers selecting books for children care deeply about the quality of what they choose. I create children's books for a number of reasons. First, creating them allows me to use both my theatrical and artistic background. I can write the script, cast the characters, design the sets and costumes, and direct the story. I like to think of my eye as a television movie camera, moving in, watching the scenes progress.

Now Arthur is appearing on TV and interactive CDs. As I think about that I feel like any parent whose child goes off to live a life of his own. I am a bit concerned that he will be on his best behavior and I hope the world is kind to him. Arthur is probably nervous, too, and perhaps a bit intimidated by all the cameras, lights, and technology. He must feel the warmth of children's love and respect, however, because it comes to him in great bundles. I know children must sense the great respect I have for them because they express their love for Arthur through their letters and by reading his books. I know that respect and love for the Arthur books transfer to the television series and the interactive CD-ROMs. As the ways of telling a story change, so must Arthur and I if we want to reach children.

When my three sisters and I were growing up in Pennsylvania, our grandmother Thora told us the most wonderful stories. Back then I never dreamed that one day I would grow up to tell stories of my own. But when my first son, Tolon, was born, I started telling him stories before he went to sleep. One night Tolon wanted to hear about a weird animal and our story was about an aardvark who hated his nose. The aardvark, of course, was Arthur. Later, I took the manuscript to Emilie McLeod, an editor at Atlantic Monthly Press. She saw something in my work and was willing to invest time and energy in me. She gave me direction and showed me how I was stuck with a technique I had learned in art school. When

I showed her the manuscript for *Arthur's Nose*, she thought it needed a lot of work, but she was willing to help. The hardest thing for me at the beginning was to learn how to say something in a sentence or in a few words. I thought I needed three paragraphs. Emilie helped me understand how to use the picture and how to use the words to do what the picture could not do.

Even now, when I originate an idea and I am writing a new book, I always struggle with the writing and I mean *struggle*. Writing is a necessary chore for me to get through in order to do the pictures and see the whole idea happen. I will write a story at least 30 times before I show it to anyone. Sometimes I put the book away for a year before I feel I can even finish it. I do not type or use a word processor. I use pencil and paper. I cut up the paper and move things around with scotch tape and make a long strip of these ideas. I then put the ideas into a proper sequence. I am always conscious of the picture possibilities right from the start, thinking about which words I can replace with pictures. Thumbnail sketches sometimes obscure the words on many drafts.

When I feel that I have a text that is solid, I show it to my editor, and she usually reacts to it and will point out areas that are weak or strong. I then do a dummy, and last turn these ideas into full-size drawings. I work hard to make my drawings seem free and effortless.

I want the art to feel light. A very exciting part for me is adding color. At this point, I allow myself to play music. This is the fun part. By this point I feel both elements have come together; it is going to be a book.

The limitations of camera, paper, and printing are constantly in my mind as I create my art. I consider materials that I can and cannot use to get a certain effect. For instance, certain paints, because of their chemical qualities, do not reproduce well. That is something I have learned to accept over the years.

In my Arthur books I am always working for a tone of humor and informality so that children can fall into the books and have fun reading them. I want children to have the opportunity to feel their feelings, and discharge feeling from within them, whether it be fear, grief, hate, or wonder. I feel this as an adult, as a parent, as an author, and as an illustrator. What I try to do in my books is to provide a mirror for children to explore what is inside of them.

The main reason for moving Arthur to TV and CDs is that more children will be drawn to reading. We know that when children see a book dramatized on television thousands go to get the book. Visual media presentations and reading do not compete with each other; they enliven and enrich the other.

For me the most satisfying part of the process is how children feel about these books. They like what I am doing. I never get tired of knowing that.

BRINGING ARTHUR TO TELEVISION

Kathy Waugh

WGBH EDUCATIONAL FOUNDATION

The idea for an ARTHUR television series was born, appropriately enough, in a library. Some years back, our Director of Development, Carol Greenwald, heard Marc Brown speak at the Medford, Massachusetts, public library. Marc Brown's warmth and rapport with his audience, coupled with the sight of enthusiastic children carrying home piles of *Arthur* books, left an indelible impression. So in 1993, when the National Endowment for Children's Educational Television announced its intention to fund new programs for 6- to 8-year-olds, Arthur seemed a natural fit.

Our interest in bringing Arthur to television is predicated on the belief that stories are one of the most effective ways to inspire and educate children. Go to any classroom, any library during story hour, and you will find children riveted by the telling of stories. Aidan Chambers puts it beautifully in his book, *Introducing Books to Children*, (1983, p. 13) observing that children think and feel with the images and ideas that stories offer, holding them in the "museums of their minds," for later use. The more images stored, the greater the number of resources children have to draw on.

Stories also have important instructional applications. Not only has it been demonstrated that being read to helps children in their later efforts to read and write, but stories provide an early introduction to the traditional structure of narratives, the use of fictional characters and events, and such literary conventions as motivation and conflict. Stories can illuminate important values and behaviors, and give children positive role models to follow. Serialized stories, like the *Arthur* books, have the additional advantage of deepening a child's understanding of what it means to be human. As children encounter characters who evolve and grow over time, they learn that people are complex beings—never static and predictable, but wonderfully changeable.

Perhaps most important, stories help instill in children a passion for reading. Children who are read to, who identify with storybook characters, who associate books with pleasure, tend to become lifelong readers. One thing that struck us, as we were researching and writing the first ARTHUR proposal, was how many children credited the *Arthur* books with a new, or renewed, interest in reading. A typical letter to Marc Brown from a 7-year-old named Jonah proclaimed, "I love *Arthur* books. They teach you to like how we look, and like ourselves. I didn't like to read, but when my tetcher (sic) brought your books, I read every one of your books, and joined the fan club."

But as statistics on literacy reveal, too many children never experience the desire to read. Television can help reverse this trend by presenting significant book-based series targeted to young children and their families. The notion that television and books are necessarily at odds, that children who watch TV will not read books, has been disproved by a number of studies showing that reading, and library use, increase when books are dramatized on television. Daniel Boorstein, a former Librarian of Congress recognized this symbiosis when he wrote, "The book made it possible to send messages across the centuries, but television made it possible to send messages across the continent. . . . Now we should bring these two technologies together to prove that there is not a competition between them, but that each has the power to enrich and enliven the other." (Charren, & Hulsizer, 1990, p. 2.)

But will a televised ARTHUR actually incite children to read? We think so, based on our experience with a previous storybook series, LONG AGO & FAR AWAY, as well as a related literacy outreach program, the Family Literacy Alliance. LONG AGO offered high-quality adaptations of such classic stories as

The Wind in the Willows and *The Man Who Planted Trees*, which were popular with parents and older siblings as well as young children. Book-based programs that encourage such family viewing can lead to an interest in reading, for through them thoughtful discussions on character, motivation, and perspective can be sparked and nurtured. And of course, parents can lead their children to the books on which such programs are based. This, in fact, was the rationale behind the Family Literacy Alliance (FLA), which draws from three book-based series—LONG AGO & FAR AWAY, WONDERWORKS and READING RAINBOW—to motivate family reading. Parents and children who participate in the FLA (now operating nationwide in homeless shelters, prisons, hospitals and after-school programs) watch stories on television, then read the books and engage in a variety of activities—from drawing pictures to writing in diaries—that emphasize the pleasure to be found in books. What the FLA has demonstrated most clearly is that children—and parents—who see wonderful, inspiring, book-based television *want* to recapture that experience in books.

There are several ways in which WGBH is using ARTHUR to affirm this connection between television and books. We are producing a library tag, which will air at the end of each ARTHUR program and remind children and parents that *Arthur* books are as “near as their local library.” We are also developing and implementing a strong, literacy-based outreach plan for the series. In addition to posters for libraries and prebroadcast brochures for teachers, we are developing an ARTHUR “story writing kit,” which will encourage students to read the *Arthur* books and then create new Arthur stories

based on their own experiences. The kits will be sent to 2nd-grade teachers who request them, and contain books, bookmarks, and pencils, as well as strategies and suggestions for age-appropriate writing activities. The culminating activity will be the creation of a classroom story to be sent back to WGBH.

We are also conscious of all the subtle ways in which ARTHUR can help instill a love of language and literature. For example, the ARTHUR characters are often seen reading, or being read to, visiting the library, playing word games, turning to books for advice or information, making up stories, engaging in imaginary play, enjoying school, and using words, instead of fists, to resolve their differences. Marc Brown created this “book friendly” environment in the *Arthur* books; if you look closely at his illustrations, you will notice that Arthur and his little sister, D.W., have bookshelves—and books—in their rooms, that their parents read, and that adults and children alike turn to books when they have questions, concerns or free time.

The ARTHUR television series is building on all these subtle and overt messages to demonstrate that reading and writing are not only pleasurable, but life-enhancing, activities. Books are, after all, the key to understanding one’s own life, one’s history, one’s place in a larger world. Without them children are locked into experiences and perceptions too narrow for real growth and insight. Decrying the growing problem of illiteracy and the lack of stories in too many children’s lives, Action for Children’s Television in 1990 called upon television producers to send the message that books *matter*. ARTHUR is our answer to that call.

READING RAINBOW AND THE JOY OF READING

Twila C. Liggett

EXECUTIVE DIRECTOR, READING RAINBOW

Reading Rainbow is a well-established PBS children's series designed to bring the fun of good books, reading and learning for the *sheer joy* of the experience to our young viewers (targeting 5- to 8-year-olds). Centering each theme around a feature book, the programs use on-location segments to engage children in enriching adventures related to the book's theme. Three books are reviewed and promoted by young readers who entice the viewers with more book choices. The series first was aired in 1983.

It has become a cliché to talk about the power of television, but much of the research (Comstock, 1991) indicates that young children, especially in our target age range are mesmerized by television. They implicitly accept and even embrace television's messages, especially visually. Children are always "learning" from television whether it be negative ideas or even dangerous ones, and can either be stimulated mentally or turned into "couch potatoes" (Van Evra, 1990).

Thus, in addition to establishing *Reading Rainbow's* primary goal of conveying the fun of reading and books, we also felt a strong responsibility to present positive role models that were multicultural, nonsexist, and inclusive of the broad range in age and physical abilities in our society. A strong key to positive role modeling was in the selection of our host, LeVar Burton (then best known for his role as Kunta Kinte in *Roots*).

As the *Reading Rainbow* team carefully developed a pilot program, we paid close attention to our evaluators, RMC Research, who gave us helpful feedback regarding these goals as well as that of the technical decisions that influence young children's *understanding* of what they are watching. For example, while the MTV technique of fast cuts and nonsequential images may capture a child's attention, young children have absolutely no sense of *what* occurred or the *why* of what they saw. Therefore, as a result of our work with RMC, in our approach to books and the theme-related "real life" extensions (our on-location segments), we chose to enhance an important element of literacy, that is, the sense of story. Thus, the notion of logical sequence, and the ability to then relate what happened (the beginning of com-

prehension skills) is a key element of *Reading Rainbow's* design.

Has our approach worked? We think so. Based on 10 years of formative research, RMC developed a summary for the project staff of their key findings in five categories: (1) Contributions to literacy; (2) LeVar Burton as host; (3) Book treatments; (4) Outlook on life / primary messages; and, (5) Entertainment value.

Contributions to Literacy

What makes *Reading Rainbow* different from other series is our primary focus on encouraging independent reading for enjoyment and interest and the more subtle message of locating information applicable to one's own life. This focus makes *Reading Rainbow* different from other "literacy" programs such as *Sesame Street*, with its emphasis on the symbol systems that precede reading, *Ghostwriter*, which centers on using reading and writing strategies to interpret information, or instructional programs that focus on how to decode and comprehend. By overtly sending the message to seek and read the books featured, *Reading Rainbow* consistently achieves this goal. Our unique literacy purpose has been affirmed consistently by parents, librarians, teachers and children themselves when they discuss their understanding of the series and identify reasons for wanting to read particular titles.

LeVar Burton as Host

Although a serendipitous outcome, happily, LeVar Burton has become synonymous with the series—and a unique presence in children's television. (Younger viewers often refer to LeVar as the "Rainbow Man.") Children value LeVar's ability to explain complicated issues and to ask the most interesting questions. They relate to his sense of fun in learning and see him as a great teacher. As a learner, LeVar seems to be a role model for all viewers across all cultures;

there is also some evidence that African-American parents value LeVar as a minority role model.

Book Treatments

Much of our research has been about book treatment; that is, how best to present, position, and reference books in ways that children understand that they are accessible, readable, and meaningful. The subtleties of different approaches to feature and review book treatments are documented in every evaluation from the earliest challenges of ensuring that child viewers do *not* mistake the featured book for a cartoon, but understand that what they are seeing is a “real” book—a concept we have come to call the “bookness” of a book. We implement the “bookness” (in part) by beginning each book presentation with the title page, using actual illustrations with slight camera movement (“iconographic” animation), and superimposing the words “The End” at the book’s conclusion. As a result, our evaluations show that children definitely understand that what they saw *on* television *is* a real book. This understanding is most often reflected in children’s requests to parents, teachers, and librarians for the books they see on *Reading Rainbow* or in their absolute delight in realizing that the very book they are holding is appearing (or has appeared) on the TV screen.

Outlook on Life-Primary Messages.

A fortuitous finding of our evaluations has been that children understand and believe *Reading Rainbow’s* positive messages about their capabilities, values, and options. LeVar also contributes to this perception by conveying to children a sense of the limitless potential of the world that can be obtained through curiosity and openness. We have been gratified to find that while our evaluations have included a range of children across ethnic groups, the delivery of key messages / ideas or entertainment value is accessible to all children and is not diminished in any way based on a child’s ethnicity or gender. Our evaluators concluded that the series’ elements and design have apparently rendered such potential barriers transparent so that all children enjoy *Reading Rainbow* at a number of levels.

Entertainment Value

As part of the evaluation of a given *Reading Rainbow* episode, the evaluators conduct an observation that gives a sense of children’s attention. The series has consistently delivered attention rates of 95–100% over as many as 30 discrete segments within an episode. This attention rate has held true for the episodes evaluated since its inception. Analysis of other responses from children indicates that several factors contribute to this high attention rate, including the program’s production style, which gives children

time to think, its productive use of “seen and said” in which visual and aural information are closely matched, careful attention to transitions between segments and the affinity that the viewers have for LeVar. The design of *Reading Rainbow* also recognizes that entertainment value and effectiveness of idea delivery are not a function of surface elements such as the use of music or rapid pacing; rather it is a function of how elements are crafted and combined to stimulate opportunities for children to think and respond to information cognitively. RMC’S evaluations have strongly indicated that children are engaged with *Reading Rainbow* when elements are combined to assist and encourage their process of reflecting upon, remembering, and making use of information.

As stated at the outset, careful design and formative evaluation have been and continue to be incorporated into the production of this series. We feel that not only have we achieved the goals we had set originally, but that we also continue to grow. Over the past 10 years, we have created a “science” strand of shows based on delightful science picture books for children; recently we incorporated a “literature-based math” strand to the series. In addition, we find that *Reading Rainbow* is used in classrooms in multiple, interdisciplinary ways. In a recent, informal survey, for example, teachers responded that they were using the series for whole language, storytelling, science, art, social studies, cultural studies, geography, holiday and seasonal topics, parenting workshops, and teacher in-service. One teacher answered, “for pure enjoyment.”

And it is this enjoyment factor that tells us that we were achieving our goals, one that is reflected in letters from our young viewers and the adults around them—the true “voices from the field.”

Hi, *Reading Rainbow*. I love your show. Reading is the best thing in the whole world. Say Hi to LeVar for me. When I go to the library, I go to the *Reading Rainbow* part first. I get lots of books there. I even got my own library card. Frank, age 7, Niagara Falls, NY

Dear LeVar, I am eight years old. I like to read the books ... [and] I also like to watch the story that you show. I really liked when you went to the cave. It is cool when you go to different places. [She then closes with the theme song, “Take a look, it’s in a book...”] Kayla, Spokane, WA

I have discovered another joy of reading—*Reading Rainbow*. You have helped develop my [four year old] son’s passion for reading. He watches the show faithfully and we have purchased several of the books.... He astounds his grandparents with his vocabulary, which consists of words like “microscope”—even “embalmed!” The show has increased his creativity and his desire to learn. Mother, Bellflower, CA

Reading Rainbow is one of the best ideas to come along in a long time. In an age of “steady video” kids are encouraged to read ... explore their horizons and expand their world. Librarian, from *Reading Rainbow’s* 1994 National Librarian Survey.

VISUAL LITERACY GOES TO THE MOVIES

Lauren L. Wohl

DISNEY PRESS AND HYPERION BOOKS FOR CHILDREN

There are six of us in a cozy living room, settled in front of the television set, a big bowl of popcorn for sharing. Five of us are under nine. Five of us have never seen *BAMBI* before. Five of us have been invited to watch a movie and talk about it. One of us (the one older than nine; the one who has seen *BAMBI*) is there to test a hypothesis: do children really *read* pictures? Do they apply the same kinds of skills and thinking when they look at images (in a book or on the screen) as they do when they listen to words or read text? Is visual literacy for real?

Now, the six of us are excited—and ready.

I push the play button and the title appears.

“Bambi,” Chloe (age 8) reads aloud, so that the younger viewers will know what it says. But, as the rest of the credits appear, she does not bother announcing them. She knows the little kids would not care much what they say.

We watch the opening scene. It is nearly 4 minutes before there is any real dialogue in the film. I push the stop button.

What’s going on?

“Robyn (age 4) tells us: “A new baby deer is just born and everyone comes to meet him.”

“Because he’s a prince,” Beth (age 7) adds.

I ask where, when, how?

“In the forest,” Robyn knows.

“Early in the morning,” Alyson (age 6) says. She can tell because the little mouse washes his face with a dew drop and because the owl is trying to go to sleep.

“And because it’s all grey. The sun hasn’t come up yet,” Chloe points out.

Beth: “The animals know about Bambi because the bird tells them and shows them where Bambi is.”

Jason (age 5): “Bambi’s mother is proud. And the other animals like Bambi. They know he’s the Prince. Like in *THE LION KING*.”

I push play and do not stop the film until the sounds of gun shots chase Bambi and all the animals from the meadow.

Now what’s happened?

Jason: “Bambi learned to walk. He kept falling.”

Robyn: “And he learned to talk.”

Beth: “Bir-d-d-d.”

They all laugh.

Alyson: “And he has friends. Thumper and Flower.”

Chloe: “And a girlfriend. Faline.”

Beth: “It’s the summertime. When Bambi falls into the water, he isn’t cold.”

Jason: “But he looks silly.”

Beth: “Hunters are in the forest, and the animals have to run away and hide.”

Chloe: “I think the hunters stay and wait for the animals to come back.”

Why do you think that?

Chloe: “Because they didn’t kill anyone, and that’s why they came. And because Bambi’s mother still looks worried.”

I push the play button. Leaves are swirling by on the screen.

Alyson: “It’s Fall now. The leaves are falling off the trees.”

And, a few minutes later, when Winter arrives, before Bambi tells his mother, Jason tells us that Bambi and his mother have run out of food and they are hungry. Jason is the one most relieved when Spring arrives and the deer find new grass to eat.

Chloe: “Why are they going back to the meadow? The hunters could still be there.”

Three children cry when Bambi’s mother is killed. Alyson climbs on my lap when Bambi and Ronno fight. It is Robyn on my lap during the forest fire. And the six of us applaud at the end of the movie.

There is lots to talk about, and it is soon clear from their

questions and comments that these five youngsters have done a lot more than just follow the story line of this classic film.

Walt Disney's *BAMBI* is a 70-minute animated film with no narration and minimal dialogue. Viewers must take their clues from what they see—filling in information based on prior knowledge and experience, imagination, and comparison.

Chloe, Robyn, Beth, Jason, and Alyson have each done just that. On the skills level, they have made inferences, predicted actions and anticipated outcomes. On the comprehension level, they have enriched the plot with details gathered from the images on the screen, discerned character from the action and from the poses that they watched, and realized themes largely from visuals. On the critical level, they have made comparisons. In short—and to my surprise and delight—they've been *reading the pictures* of this movie.

Robyn: "My favorite part was when Thumper and Bambi go skating on the lake."

How did you know it was a lake?

"Robyn: "Because it's frozen, and it's big, and it's in the forest. In winter, lakes get frozen."

Beth: "My favorite character is Flower. He's shy, but he has two best friends."

Jason: "Bambi's mother died because of hunters. And the fire started because of hunters. People should stay out of the forest."

Chloe: "My favorite part was how the forest looked in different seasons. And how the animals had to change in different seasons. No matter what else happened, the seasons changed. Even after Bambi's mother died."

Alyson: "I liked the whole movie. It's my favorite."

Jason: "I like THE LION KING better. It's better to be a king than a Prince. "

I give each child a copy of the Disney Press Illustrated Classic book, *BAMBI*. They turn to different illustrations, each one remembering the scene pictured. Each tells me just

where in the movie the picture came from—what happened before, what happened next—always filling in with some "extras."

Jason: "This is when Bambi meets the skunk. He calls him Flower, and the skunk likes that name. Flowers smell nice and skunks don't. Skunks don't like the way they smell either."

How do you know that?

Jason: "No one likes to smell bad. Besides, when Flower meets his girlfriend, she's hiding in a flower bush, too. So if skunks hang out in flower bushes, it's because they like things that smell nice."

Oh.

This time I am amazed. Jason is 5, and his mother had warned me: he is not much of a talker.

I take the tape out of the VCR player and begin to make preparations to leave. But the children are still settled in. Chloe is reading to them from the book. She does not bother showing the pictures. The words are all the children need to recall the images from the film and to create pictures of their own.

I have come to some conclusions. Visual literacy is indeed real; viewing a movie can be—is!—a terrific literacy exercise, one that can be even further enhanced with a book. For, when a child enjoys a movie, and then the pictures she has "read" on the screen become the paintings and words of a book, she has a new dimension to explore. Because the images are transformed, first by the illustrator and author/adaptor, then by the reading or listening child, the child becomes aware of her importance in the process. She learns that her perceptions and her imagination are vital to the story. She is able to go deeper into the book—not just to enjoy the story and characters again (although this is certainly valuable)—but to test her comprehension, her visions, her memory, and to find new understandings .

The experience is simply twice as good.

"HOOP DREAMS": AN INTERVIEW WITH STEVEN JAMES—PRODUCER, DIRECTOR, CO-EDITOR

Victoria Chou and Steve Tozer

COLLEGE OF EDUCATION, UNIVERSITY OF ILLINOIS AT CHICAGO

This edited transcript is part of a longer text and comes from an interview with Steven James conducted by Victoria Chou and Steve Tozer on January 18, 1995.

I ...Tell us about the purpose of Kartemquin films and its structure as well. This is not a big Hollywood film place, is it?

SJ No. Kartemquin films has been around for nearly 30 years producing social issue documentaries. It started as a collective of filmmakers back in the '60s. Kartemquin for 30 years has been making these social issue documentaries and the way in which they have stayed in business was to also, while they were doing those kinds of films, produce industrials, usually for a good cause—educational films, and things of that nature.

Frederick Marx and I, back in '86, approached Kartemquin to serve as the production company for our film because we had both seen their work at festivals and they have a national reputation. We said that we had an idea for this short, half-hour film on street basketball and the dream of success. What we were going to do was take a snapshot of the dream on a playground court in Chicago. We would be there for a few weeks, we would find a young kid, like an Arthur or William, we would find a washed-up player who'd been through the system, like Curtis ends up being in the film, and we would try and get a pro player, like an Isaiah Thomas who came from that neighborhood and succeeded. And we would just try and sort of check these three different vantage points of the dream, from a young kid who has great hope, a person whose dream went awry, and one whose dream happened. Anyway, we approached Gordon [at Kartemquin] with this idea and he liked the idea, so he agreed to take this project on, even though we had no funding. The reason we went to Kartemquin is that Frederick and I had

left graduate school at Southern Illinois University where we'd made films, but we had no real track record to speak of, especially in this kind of documentary filmmaking. And, for us to try and launch a project like this, it made sense to go to an established company that has an established track record and has a similar aesthetic in terms of what they're about, so Kartemquin was a perfect fit.

I And what are some of the kinds of recognition the film has gotten to date?

SJ It started at Sundance in January 1994 in terms of its developing a national reputation. The film was accepted into the Sundance Film Festival, which is probably the most influential film festival in the world, certainly in the United States. It's dedicated to promoting independent filmmaking, started by Robert Redford. So getting *Hoop Dreams* into the competition section of Sundance was a major victory. And then, to go to Sundance and find that the film truly was the buzz of the entire festival, not just the documentary side. It was the one film that everyone said you must see while you're there, and all our shows were sold out. We've gotten an enormous amount of support from the press and it's been reported repeatedly in the press by reviewers and feature writers that they really think *Hoop Dreams* has a shot at Best Picture.

I What's accounting for this success?

SJ What accounts for it? Well, I think a number of things account for what has happened. I mean, *Hoop Dreams* has become a phenomenon. It's no longer just a film. It has defied virtually every bit of conventional wisdom in its success. It is nearly three hours long, it is a documentary, it is about black inner city families, and it was shot on video, not on film, even.

I I didn't know that.

SJ It looks remarkably good for that fact, but that is a

liability. If it had been shot on at least 16 mm, that would have made some distributors more interested at certain stages. So, that right there is four strikes against the film, yet all of this has happened and I think that some of the reasons why is that, number one, it's a very interesting story. The story that we document is extremely interesting; it's dramatic. It has a lot of plot twists and turns. Amy Taubin in the *Village Voice* said something like, "*Hoop Dreams* has more plot twists and turns than any screenwriter would dare. You'd be thrown out of the pitch meeting on your ear if you went in and suggested a story like this from fiction." So, I think that has accounted in some measure for its success, that it's so dramatic. Everyone who sees it who likes it tells us that it sucks them right in and they're on the edge of their seat.

Beyond that, it also is a story that resonates about something I think America is interested in, at least some part of America is interested in, and that is the American Dream itself, which is such a crucial part of our mythology and our everyday experience, both for good and for bad. I think it's also a film about race and it's a film about the lack of opportunities in certain neighborhoods. It's about America as a place of business, but also a place of opportunity. It's about all of these things, and it's all put in a dramatic context in story. The film doesn't beat you over the head with a polemical or political viewpoint and I think that is also part of its appeal. I think it's because the film doesn't pull punches, take cheap shots. It doesn't have an agenda in that kind of overt way that a lot of documentaries have, that turn off a lot of viewers. I think that the film is incredibly emotional. The most successful films in America, unlike Europe, are films that grab at your heart and *Hoop Dreams* seems to do that. People feel like they really get to know these characters in the film, these subjects of our film, and come to care about them.

When you get to that point with an audience member, the fact that the film is real, that it's not fiction, makes it that much more powerful because you don't have the comfort of at least pulling back on some intellectual level and saying, "Oh, it's not real. It's only a movie." In this case you can't, you don't have that comfort, and people have told us that there are times in the film where they forget on some level that it's real, because of the way it's told; for instance, when William goes to the free throw line to shoot those shots that he misses. They don't ever fully forget it, but they get caught up in the drama and then a moment like that happens and it hits them in the gut that this is real life and that Hollywood is not going to rescue them by having him make the free throws.

- I What were you first trying to achieve? Can you talk a little bit about how that changed, how what you wanted to do with the film changed? Your description of your first intention doesn't describe the film any longer, exactly.
- SJ The original intention was to try and get at some of what that game means culturally to players, black players from the inner city and at some of the complexity of how they feel about the game and the dream. That was the initial

thrust of what the film was going to be about. It was in a sense almost going to be like an anthropological film by taking a playground and some guys that play there and trying to understand what this game meant to them. And we would deal with the language, the dress, some of the codes, and the rules of a pickup game itself, of a street game. I finally got a small fellowship grant for this film, and we took that \$2,000 and a \$500 personal contribution by friends of Frederick and instead of shooting film which was our original intention, we shot video because we didn't have any money. And that's where Peter Gilbert entered the picture. We initially pulled Peter in as a cameraman because of his extensive experience shooting documentary films, but also because he was a basketball junkie, to boot.

And so that very first week when we headed out and started to film, the conception of the film changed. When we met Arthur through Earl Smith (just as you see it in the film, that's how we discovered Arthur), and we followed Arthur out to St. Joe's for that recruiting visit, the whole notion of his being recruited was fascinating. We had no intention when we began that we would document that process. We knew of that process, but that wasn't going to be our focus. We were going to stay on the playground, but Arthur left the playground with Earl to go out to this school and we would have been fools not to document that. And when we got out there and Coach Pingatore said, if you work hard at the grades and you work hard at basketball, I can help you get to college. It hit us then that it would be great if we could follow this kid and then later William, when we found out about William from Coach Pingatore—to follow these two kids over time to find out, at the end of four years, if basketball was able to achieve that for them.

Also, it suddenly was much more interesting to us to want to take viewers inside the experience of the dream itself as it's lived, not to have kids report on what it feels like for them, not, as I said earlier, to take a snapshot of the dream, but to make a book about the dream: a long film about the dream where viewers are thrust into their lives day-to-day and see how it changes, how it grows, how it's diminished, whatever happens to the dream. But at that point, the focus was still very much on the dream. Even then, we were going to focus mostly on the dream itself and we expected to encounter some of the realities of inner city life because that's part of the dream; part of the whole attractiveness of the dream is to escape those realities. So, we weren't ignorant to those realities and we certainly expected them to play a role in the film, but we didn't really have an idea just how broad the story was going to carry us. In other words, we didn't, at that time, anticipate that the other family members' stories would become very important to the film and that the film would have a whole other life to document outside of basketball. And that was the thing that happened from a content standpoint. The project grew not only in size, but it grew in scope. Suddenly, more and more of this film seemed to be about the American Dream, not the basketball dream. The more we worked on the film, the more

basketball became a metaphor for the plight of families in the inner city, that they face incredible odds, that it takes tremendous determination for them to succeed, and that they don't always succeed. And a lot of times the system is set up for them not to succeed. And so the basketball dream more and more came to be almost a metaphor for that plight than the actual subject of the film itself.

One of the things in the original conception, when Frederick, Peter, and I would talk about the film and what we saw the film looking like, we saw a film that was going to be much more of an aesthetic statement too, as a work. That it was going to have a lot of very interesting camera angles and it would just be a much more overtly aesthetic and crafted kind of piece. We didn't want it to just be a documentary. We wanted it to really be a very interesting film to watch. That changed for me, considerably, and I think you see the result in the film. It's not that kind of film. The more we got involved with filming these stories and involved in these people's lives, the more I felt strongly that we shouldn't try and attempt to make that kind of film, that we should try and make a film that was very direct in its style and approach. And, I think that was a wise decision, because we increasingly felt like that's where the power of this film lay, in telling it through the eyes and experiences of the families and as directly as we could. And I felt, if anything, that it would be presumptuous to try and turn it into some kind of aesthetic statement. It took a long time for that earlier vision of the film to be jettisoned, but finally it was.

I There's a sense in which one looks at the title and gets the buzz about what the film is about and makes an assumption that the film is about the dreams of the boys.

SJ Right.

I But it becomes pretty clear pretty quickly that the film is also about the dreams of many people.

SJ Right.

I And that a championship dream for the coach is a different kind of a hoop dream than Curtis' dream of basketball for himself.

SJ Right.

I It's a different kind of a dream from Bo's dream about basketball for his son, and so on. One of the things that seemed to come through strongly in the film is the way in which *Hoop Dreams* played a role in so many different ways. Is this something that emerged for you as a group, as the film went on?

SJ That's an excellent point. There are so many dreams at work in this film and these kids bear the burdens of their family's dreams. And, those dreams are always at some level selfish, but they're not always bad because we all have them. Even the coach. I understand that dream. He's been a successful coach all these years, he's had great teams, he's been very close. I wouldn't begrudge him having that dream. Curtis, too. At one point in the course of the filming, we were feeling pretty critical toward Curtis, as I think a lot of people watching the film did. There's a tendency to want to shake Curtis and say,

"Leave him alone. Just be supportive." At one point during the filming when William blew his knee out and the dream of possibly being the next Isaiah Thomas was cast into serious doubt, we found ourselves, at some level, feeling like Curtis did.

I When you want to communicate a story, you always have some thoughts about the audience, you always have some assumptions about the audience in terms of their ability to make sense of what you are doing.

SJ Right.

I And here in this medium, you've got to have some ideas about the audience's ability to make sense of visual images as well as verbal narration. Can you talk a little about that? What thoughts did the three of you, or you personally, have about the audience you were trying to reach and what you can assume about that audience?

SJ Audience is always a tough one, in film. I think that from the start, and I think it remained a goal, we saw this primarily as being a film for white America, for white, middle-class America. We saw this as a chance to speak to them about a lot of things that they don't normally listen to. We figured that by having basketball and the drama of basketball be part of the story, that would be a way to speak to that segment of America about much broader things. That basketball would be the hook. And it wasn't all that calculated either. I mean, we love basketball and that part of the story intrigued us too and so it intrinsically had a lot of attraction to us. But we also thought that it would serve as a very good hook to get an audience of sports enthusiasts, for example, that maybe would never watch a PBS documentary, but would watch a sports story. And that remained a guiding principle, really through the entire film. We were always careful in the editing to try and make sure that a white audience would be able to follow what people were saying, so we did shy away from certain scenes where there was a lot of banter that maybe would be very hard for a white audience to understand.

I think our hope was that even though we saw a white audience as the primary audience, a black audience would relate to this in a different way. That a black audience, particularly an inner city audience, would come to this film and they would see, they would identify with the film more. That it wouldn't be as educational for them as it would be for a white audience, it would be more one of identifying, of seeing something of their life and experience on the screen.

I Confirmation and affirmation.

SJ Yeah.

I Let's push the audience question a little bit and then turn to the educational mission of the film, in a sense. What were your assumptions about what the audience could pick up on, what they could follow? You mentioned that you were concerned about audience being able to catch some of the dialogue if in fact it were a certain kind of a dialogue.

SJ Right.

I And so you stayed away from some of that. What other concerns did you have about the audience's ability to get what you were putting out there?

SJ This certainly comes up all the time, especially in the editing. You want to strike a balance between giving people enough to get it, but not beating them over the head with it or have them get the wrong thing. I mean, it's almost like there are a number of right things to get out of it, any one of which is fine. There are certain wrong things you don't want people to get the wrong impression about. For instance, when William comes back to practice after having suffered a slight knee injury before his knee really goes out, he's playing, he's running in the drills and stuff and the coach is making them run. That's an example where we were very careful so that the audience didn't get the sense that because the coach made him run, he reinjured his knee, which is what people would have assumed. Your default inference would be, if you see the coach making William run a bunch of sprints, then, of course, that's how he hurt his knee. And that would have been wrong.

So there are certain kinds of wrong things you clearly don't want to communicate, but there's more of a multitude of right things. I think it's been remarkable how many people have "gotten" the film, in that sense. Not only do they understand the story just on a plot level. There's a certain amount of clarity that you need to establish when you're telling a story. But they also seem to get the deeper implications of what the story is trying to address. I've seen it in virtually all the reviews, I've heard it from people at the end of screenings when they come up and talk about what it is that they felt like they got from the film. And that is a rare thing, I think, for filmmakers, because you don't often get that experience where you feel like what this film was about for you, it was about that for the audience as well.

I I want to get specifically to that in a moment. Before we do, just a technical question in passing. One of the things that helped the audience get what you were after, particularly in terms of mood, I mean—because in the mood of the film, the look of the film, there's a sense in which you want to affect the audience's mood—what helped was the soundtrack.

SJ Sure.

I Was that a late decision? How did you think about bringing in music to affect mood, to affect your ability to communicate what you wanted to communicate to the audience?

SJ Well, my feeling is that music is an incredibly powerful tool and because it is so powerful you have to be very careful with it if you're going to use it responsibly. So we always were planning to have music in the film. How much is always a question, and I think that we probably ended up with slightly more music than we had originally planned. But we wanted the music to be evocative), not to be the source of the emotion in the scene, but to just try and underscore something that's really there. Too often in Hollywood films, the emotional content of the

film is coming almost exclusively from the music. As an audience member I bristle at that and it backfires, because I reject the film if I feel that the music is the source of the emotional content of the film. And, so we just tried to walk that line and it's an aesthetic choice.

I haven't heard any complaints about the music. Most people don't even comment on the music and in many respects, I think that that's good. The music is there, it seems to serve its purpose, but it's not there in such a way that it causes people to go, hey, I really loved the music. If we were getting a lot of comments about the music, I would actually be more concerned because it would mean that it was standing out from the story too much. The same is true with narration. A lot of people, in their recollection of it, don't think of this film as having any narration in it. In fact, it has a lot of narration. It's hardly ever even mentioned that it was narrated. I think that's because its purpose was more functional than the music, the music tended to be more evocative, but they both serve a similar role.

I What were you counting on your audience to be able to understand or do that you didn't have to then worry about?

SJ One of the things that we did not want to do was to lay out in excruciating detail the poverty of the inner city. We felt like, number one, there's a lot of that. In fact, that's all you hear about. And that stuff is very powerful imagery and we were very judicious about how much of that we wanted to use. If we gave the audience a lot of that it could overpower everything else. And we felt like part of our mission with this film was for it to be a corrective to those stereotypical perceptions about life in the inner city. We did not want to whitewash the inner city, but we felt like it could be put in in judicious amounts to just, in essence, push the buttons that are already there for the viewer about those things.

I You've made it clear that the film succeeded, and it's clear to anybody who sits in an audience and watches the film, that the film succeeds at an evocative level. It does pull the audience in deep ways. There's another level at which you wanted the film to succeed and that's what might be called the "message level," or the pedagogical level, when you say you are gratified when you see that people got what you wanted them to get. What else did you want people to get out of the film, you might say, in terms of what do you want them to learn?

SJ Well, I think there were a number of things we wanted them to learn. I think some we succeeded at more than others, but I think we succeeded on some level with most of them. One is that I think we wanted people to realize that kids like Arthur and William are not stupid for having this dream. They often hear that in different ways through the media and through teachers, that you'd have to be a fool, you'd have to be "not all there" to believe that you can use sports to get to the NBA. And I think one of the things we wanted to show was that the dream is about a lot more than just getting to the NBA. It's about having a sense of identity in a community where there's so few

things for kids to have a positive identity about. It's about having a sense of pride, getting your name in the paper, not because you shot somebody or died, but because you scored the winning basket. It's about living up to the dreams of others, family and otherwise, and being a receptacle for those dreams. It's about getting the advantages of being treated differently in communities where there are so few resources.

Basketball got William to a private Catholic school for an education that he would never have gotten without basketball. He could have gone to St. Joe's if his family had known about St. Joe's and took him out there and sought financial aid, but the reality is it never would have happened. Basketball got him that education, which eventually got him to Marquette. And even though Arthur left St. Joe's, in a public school like Marshall, where the guidance counselor is in charge of 350 students, he stood out among the 350. And not just because he was in a movie, but because he was the starting guard on the basketball team, and so he got more attention. Basketball got William a summer job. Basketball took him out into a larger, white world. Basketball got William's brother off unemployment and got him a job because of his connection to Encyclopedia Britannica and the President. So there's a million ways in which these kids recognize early on that basketball can serve them, that we as a society don't give credence to because we think that all they're focused on is making it to the NBA and that they must be kind of stupid for believing that it can actually do that for them.

I And yet these two were still singled out?

SJ And they both got to college, too. So that was one of the messages, I think, that the film tried to convey. Some people, because they have such a knee jerk reaction to the dream as wrong, in fact, miss that. A lot of people say, "Isn't it tragic that these kids want this dream so badly." I say, "No, it isn't." Yes, there is a tragic aspect to it and you see it in Curtis. Curtis was a guy whose greatest moments of triumph in his life were due to basketball and his worst moments of despair were due to basketball. He was like a yoyo to basketball in his life, and that's where you see the

tragic dimensions of this. You see it in our kids' stories, too, but I'm saying that it's not all tragedy. If you asked Arthur and William today are they glad they went through that system and did it the way they did it, they would say yes. They would say that yes, they paid some prices and there were some ups and some downs, and they took their lumps, but hey, look at where I'm at. So that was one of the messages.

I think the other sort of big message of the film is, in fact, to give people a much more three-dimensional portrait of life in the inner city and on that one I think it has succeeded swimmingly because we've had more people come up to us and say that they never realized how much they had in common with these kinds of families until they saw this film.

I With these mothers who wanted the most for their children?

SJ Exactly, just like what your mom wanted for you and my mom wanted for me and what I want for my kids.

I What kind of look, visual look were you trying to achieve in the film, and to what degree do you think you achieved it?

SJ Well, I think that the look we tried to achieve was really one of just a very direct and honest straightforward approach, what you might call an artless style. In other words, I feel about the film visually like I feel about it in terms of the music and all the other components. If people are spending too much time talking about the look of the film, either in person or in print, then that's probably not a good thing. It may be a flattering thing on some level, for me as the director and for Peter who shot the film, but we're more interested in what furthers the story and takes you closer to the subject than anything. There are a lot of great shots that never found their way into the film, but if we were coming at it from that point of view, we would have found a way to put those shots in the film. There are a lot of shots that are marginal that are in the film because they said something to us, and so that became the guiding principle in terms of the look of the film.

THOUGHTS ON VISUAL LITERACY

Philip Yenawine

METROPOLITAN MUSEUM OF ART

Visual literacy is the ability to find meaning in imagery. It involves a set of skills ranging from simple identification—naming what one sees—to complex interpretation at contextual, metaphoric and philosophical levels. Many aspects of cognition are called upon, such as personal association, questioning, speculating, analyzing, fact-finding, and categorizing. Objective understanding is the premise of much of this literacy, but subjective and affective aspects of knowing are equally important. Visual literacy usually begins to develop as a viewer finds his / her own relative understanding of what he /she confronts, usually based on concrete and circumstantial evidence. It eventually involves considering the intentions of the maker, applying systems for thinking and rethinking one's opinions, and acquiring a body of information to support conclusions and judgments. The expert will also express these understandings in a specialized vocabulary.

Different skills are called upon to construct meaning from the huge variety of images in contemporary culture: a straightforward news photo requires fewer, simpler operations than a psychologically manipulative ad; an illustration engages the viewer differently from abstract painting; a kitchen chair looks different from a 19th-century farm implement, as does a street sign from a road map; a snapshot from television, a building model from a diagram or plan, and so on. Some images are to be understood at face value. Others have greater built-in complexity, including the possibility of symbolic, implied, and mysterious meanings. Presumably, the visually literate person can comprehend at various levels whatever he or she chooses.

There are, however, degrees of visual literacy. For example, a young person can construct meaning from both simple (e.g., comics) and complex (e.g., art objects) visual materials. An older person, having greater experience and breadth of thinking skills in general, may glean more possibilities from the same images—for example, symbols or implications. An art historian will have acquired a factual base and competence at schemes of visual analysis and can additionally place a work in time and categories by technique, style, and iconography.

The literalness and constant presence of some types of imagery builds a certain perceptual and mental development in most people, but it is incorrect to assume that we learn to negotiate meaning in imagery simply by exposure. Increased capacities require both time and broad exposure as well as educational interventions of various sorts. For example, by studying the way in which people respond to art, we see that beginning viewers apply what they have learned from constant exposure to television, newspapers, magazines and books to art, but this preparation only allows them to deal easily with images that follow well-known conventions or are narrative in a traditional sense, not unpredictable ones nor those in which the story is hard to figure out.

There is virtually no instruction in visual literacy either in schools or out, nor even recognition that learning to look is, like reading, a process of stages. There is no accepted system by which to teach it either—that is, strategies sequenced to address the needs and abilities of an individual at a given moment, strategies that eventually allow one to come to terms with complex images.

It is useful to refer to reading to help illuminate what is missing in visual arts instruction that would help build visual literacy. For example, we still need to understand the long period comparable to “reading readiness” that predates skillful construction of meaning from images. We need to find the turning point which might be called “functional literacy.” We need to assess the equivalent of “reading for comprehension” and to be able to describe other observable, measurable stages or phenomena, at least for professionals in the field. Reading levels are understood as gradual and slowly evolving, allowing for large and small developmental changes in skills, understanding, and involvement. Visual literacy should be seen as a similarly slow-developing set of skills and understandings that progress unevenly, each step building on earlier ones, each dependent on certain kinds of exposure and instruction.

The concern for the development of visual literacy comes from two main sources—museum educators who daily face audiences admittedly limited in their ability to find meaning

in works of art, and others who witness with alarm the uncritical nature of the public-at-large regarding media. As the head of programs for high school students at The Metropolitan Museum of Art in New York, my own use of the term began around 1970 as a result of facing the realities of young people looking at art. Usually relying on art history, various analytical strategies, and many sorts of hands-on activities, my colleagues across the country and I have experimented over the last 3 decades with devices and content intended to advance viewers' aesthetic understandings to the point where complex visual structures are meaningful and pleasurable, but with little evidence of success.

There is, however, reason to expect progress at this point because of the research and theories of Abigail Housen, the most reliable source of data concerning aesthetic development (for more on Housen's research and theories, see Housen, 1987, 1992). For almost 20 years, Housen has conducted and reviewed thousands of open-ended interviews regarding works of art, studying these responses from both statistical and clinical bases. She has field-tested measurement tools and refined a system of drawing conclusions, as well as seen what and how interventions affect change. From this she has developed a very robust theory, applying it to the spectrum of experience with regard to art. Her conclusions are empirical, and given that her theory makes no assumptions except its commitment to the overall notion of cognitive development as a process involving time and exposure, it reliably supports the creation and measurement of actual teaching strategies.

One of the things that she tells us is that individuals at each of five stages of aesthetic development can have a strong connection to art just as people have strong connections to literature regardless of how well they read personally. During Housen's Stage I and much of Stage II, people might be called "pre-literate."

At the earliest stage, viewers' strength can be characterized as storytelling—that is, relating what they see to what they know by strings of personal anecdotal responses. They see things through their own life experiences—and not through a framework of aesthetic associations as experts do. Teaching effectively to this stage involves presenting the viewer with works that encourage a narrative reading, and relate to familiar contexts and activities. Ask them to look and think about what they see, then to look again, and to share and compare their perceptions and responses with others. The viewers can quickly learn to observe more and ground their stories in evidence within the picture rather than simply in their memories or imaginations. This capacity itself represents growth,

essential for moving to later stages.

At Stage II, people begin to distrust their own judgment; if they see something they think is "weird," they do not believe that the answers to "why" are within them. If the work in question is in a museum, it dawns on them that others recognize some value that they do not perceive; they often want an explanation of that value, but, even more, they want to be able to make more informed, less subjective judgments on their own. This is an immensely "educable" stage. They have developed a curiosity and drive that will help make information stick in their memories. At this point, they can add strategies, comparing and contrasting, for example, or breaking down what they see to determine how colors or materials contribute to meaning. They can be taught to ferret out the decisions of an artist—choices artists make in selecting subjects, for example, or ways of creating space.

By the end of the long course of Stage II, people have developed basic skills, learned essential concepts, and have a small information base. They can comprehend much of what they encounter in art—albeit at a simple level, still mostly on their own terms—but they are equipped to pursue further study if they so choose. They can select what art interests them and decide to develop their interest beyond merely "functioning"; in reading terms again, this might be called "functional literacy."

Housen's Stages III, IV, and V (and the transition stages that she has also described) are ones in which visual literacy is in place. In Stage III, the goals are to acquire and retain information about art and to classify it according to the systems of art historical scholarship. Appropriate instruction exists to address the needs and interests of Stage III viewers: the teaching of art history and criticism as well as varied programs teaching studio practices. The final stages—attained by having made art one's major focus in life, usually one's profession—require no intervention from "educators." Further learning is ongoing and self-guided.

In order to advance in aesthetic understandings and the set of skills which broaden them—visual literacy—viewers need long term, graduated support, like that provided to readers. Instruction for the early stages particularly needs attention. But, given experimentation based on Housen's work, there is evidence that learning to interpret and discuss works of art promotes thinking critically and creatively as well. It is also likely that developing this literacy can enhance the development of other meaning-making systems. We can hope that there is, at the very least, more research in this area in the near future.

"SONGS CAPTURE SOMETHING THAT'S GONE
AND MAKE IT INTO SOMETHING TANGIBLE":
AN INTERVIEW WITH SONGWRITER
CAROLINE PEYTON

Josephine Peyton Young

UNIVERSITY OF GEORGIA

We use words to represent our innermost thoughts, emotions, beliefs, and what we know about the world. They represent our private thoughts and what we choose to make public. Our choice of words, how we put them together, and the intonations we use to express them create images allowing others to interpret our messages and come to know us. We learn and derive pleasure from reading, listening to, and using words. As a literacy educator, I believe in the power and beauty of words. I talked with my cousin Caroline Peyton, who is a songwriter, singer, and guitarist about how she views words and the images she creates with words and melodies when she writes songs.

Throughout our conversations Caroline talked about how she chose song topics and selected words to create the images that would best represent her message. Our discussion of "Happy Home" (Figure 62B-1) illustrates how these are realized. "Happy Home" is a song Caroline wrote for our grandmother, whom we fondly called Gammama.

Josephine Caroline, you created the images that characterized Gammama's house for me so well and also expressed your own memories in the song "Happy Home." You said, "it's like capturing your childhood or capturing something that's gone and making it into something tangible." How do you do that?

Caroline "Happy Home" is based on childhood memories, and it's something that I personally experienced. It doesn't work for me to think about how the song's going to affect or draw people. I just

have to do what comes naturally and then maybe someone will find something in it for them, instead of trying to appeal to what you think somebody wants.

Josephine In "Happy Home" you mention whistle stop, lilacs and Whitehouse coffee. What made you pick those things to characterize Gammama's house?

Caroline I used "whistle stop" because Crozet is a very small town in the country and a train went through every night. That train was real haunting to me as a child. I'd be going to sleep and I'd hear the train go by. And you know, instead of putting all those words in, you get all that into two words and you say—it's a whistle stop indicating that it's just a small town and that it has a train going through it. The lilac tree is a sort of symbolic of Gammama. Because she loved the smell of lilacs, and she had lilac wallpaper in the bathroom. So that was kind of poetry, kind of an encapsulating thing. But the memories, I got a pad and just jotted down a lot of things that I remembered about childhood visits to Crozet and whatever I could find a rhyme for ended up in the song.

Josephine Why did you write "Happy Home"?

Caroline It was for some occasion, I don't remember. Well, actually the thing that sort of inspired that song was a tiny little picture that I keep in

Happy Home

Words and Music by
CAROLINE PEYTON

Verse

Oh at the foot — of the Blue Ridge Moun - tains — O - ver the riv -
er — and through the woods — There's a whis - tle stop —
— Cro - zet, Vir - gin - ia — Where I am bound —
— to go — for good. — To my Hap - py Home, —
— Hap - py Home — O - pen your arms my Hap - py
Home — Dogs a' bark - ing at the gates — White House Cof - fee per - co - lates —
— That's where my Gam - ma - ma waits — At Hap - py Home. —

2. Oh I was more than six months old when
My Daddy came home from the Marines
He'd fought the war out in Korea
And his baby daughter he had never seen.
So he took me out to get acquainted
Under the lilacs blooming in the sun
Mama said a prayer out on the front porch
"Thank God at last our family is one."

At Happy Home, Happy Home
Open your arms my Happy Home
Daddy's portrait's on the wall
Grouse and hominy for all
The living's easy I recall
At Happy Home.

3. So the years rolled by, two sisters came along
We grew up too fast and went our separate ways
Carrying dreams of Old Virginia
And of heading back to the good old days.

At Happy Home, Happy Home
Open your arms my happy home
Place a flower on the cross
Have a picnic on the moss
Love was n'ere an albatross
At HAPPY HOME!

*Chords in parenthesis should be used on the first half of the second verse before repeating first the 16 bars of music.

FIGURE 62B-1

my wallet. It is a tiny little black and white picture. But it's a picture of Daddy out in Gammama's front yard. He is holding me up under the lilac trees which are in bloom. Mama just told me recently that it was probably on my christening day. It is in black and white and you can barely see anything, but it's just this, fuzzy, black, gray and white image that somehow evoked the whole period for me, my whole childhood. And the whole song is kind of built up around that, around him taking me out in the yard and holding me up under the lilacs.

But I find, as hard as writing is, I think it's much harder if you don't pick something that comes out of your own wellspring of experience. And I think when you are writing songs, they come out better if you talk about or write about something that you know about, that's out of your own personal experience rather than an observation or something out of a newspaper. Songs need to come out of you. That's when the best stuff happens. The question is, does that do anything for anybody else outside of your little circle? So, somehow you have to make your own experiences universal.

FIGURE 62B-2

Josephine All the music for your songs is so different. How did you decide what the song, "Happy Home" would sound like?

Caroline The music for "Happy Home" came out of the poetry, it sort of just flowed out of me. I wouldn't put the words to the song about the hooker to the music for "Happy Home." Different melodies and different chord changes definitely evoke different feelings and emotions in people.

Josephine How does writing songs make you feel?

Caroline Expressing yourself through music is extremely gratifying. I've recorded a lot of other people's songs. But when you record one of your own songs, when we start with something really rough, my chords, my melody and my words, and then it comes out really sounding good—it is just the most gratifying thing in the whole world.

"Happy Home" represents Caroline's innermost thoughts, emotions, and memories. Yet "Happy Home" also evokes vivid personal images of feelings, smells, and the happy times that I had with Gammama. For me, Caroline's choice of words and melody was able to "capture something that's gone and make it into something tangible." I am grateful that by listening to "Happy Home" I am able to return to a time I remember fondly and do not wish to forget. Caroline's experiences in writing and performing her songs and the emotions I feel each time I listen to "Happy Home" exemplify the power and beauty of words. The conversations between Caroline and me have renewed my desire to invite students to express their thoughts, feelings, and experiences. By extending this invitation to students, I hope they will discover the power, beauty, and personal satisfaction of reading, listening to and using words.

JUDGING BY THE COVER: HOW A MAGAZINE PROMOTES COMMUNICATIVE LITERACY

Tamara Hanneman Rubin

EDITORIAL DIRECTOR, SCHOLASTIC MAGAZINE

Don't judge a book by its cover, the old saying goes, but a magazine...

As the editor of *Storyworks*, Scholastic Inc.'s literature magazine for children, I see the cover of our magazine as an invitation to the world of literature. Our cover is the overt but refined communicator of our mission. Open the magazine and appearance also plays a big role. We are enticing children to read, and we have to show them—communicate to them in any and all ways that we can—that reading is exciting, fun, and interesting.

Storyworks has taken on a lofty mission—to turn kids on to the world of literature, to make them critical consumers of what they read and see, to encourage them to be authors and artists of their own creative works, and to inspire in them a lifelong love of literature. The fact is, our mission fails before we begin if our magazine does not look good enough to make a child want to pick it up and read.

Since *Storyworks* is a magazine all about literacy, both visual and verbal, creating a cover and a “look” for the magazine is an experience in what we might call *metaliteracy*. When we create a cover or work on the inside of the magazine, we read, think, talk, write, draw, and paint about reading, thinking, talking, writing, drawing, and painting! And we hope we are making it fun and interesting.

We launched *Storyworks* in 1993. The product and the process that creates it are still evolving. However, I am happy to share both how we think about our covers, our content, and the visual presentation of both.

THE MAGAZINE

Each issue of *Storyworks* gives kids a variety of literary genres: fiction, nonfiction, poetry, and plays. The stories and features are written and illustrated by top children's authors and

artists working in a variety of genres and styles. We want children to develop knowledge of a variety of literary and artistic styles, an appreciation for what each style can do, and a personal preference for particular styles.

Author interviews and profiles give our readers a behind-the-scenes view of the creative process. But true insight comes from experience. Therefore, the magazine also gives kids easy-to-follow hands-on literary projects that really get them involved in creative writing, illustration, drama, or any other communicative art.

Each issue of the magazine also features news and gossip about books—what books would become movies, what celebrities read, the story behind the publication of a certain book, and other news to make kids feel like literary insiders. Students get a chance to have their opinions heard in our “Reviews by You” column.

The *Storyworks* teacher's edition is full of ideas for using literature to inspire a love of reading, writing, drawing, discussing—communicating—in classrooms. We try to keep teachers in tune with the best literature-based teaching ideas in a timely way, so that they do not have to wait to hear about them in textbooks.

What is in a Name—and a Type Style

When we were launching the magazine and the magazine's identity began to take shape, we asked ourselves: How can we broadcast this identity on our cover? What should the magazine be called? What should it look like, both inside and out?

We created the title *Storyworks* for our magazine because it communicated both the idea of literature, “Story,” and the idea of interaction and creation, “works.” Some students told us that they read our title and think of a factory where people make stories. We liked that. We knew we had been successful in getting kids to think of the creative process. This is a

magazine about creating literature and art and the literature and art that kids create is important.

We designed the magazine's logo to emphasize our interactive identity. "Story" is presented in bold block letters of a common printer's typeface, but "works" is handwritten in stylized letters that suggest action and personal creativity.

We also decided to create covers that were about the overall message and mission of *Storyworks*, as opposed to being connected to one topic or article covered in the magazine. We wanted our covers to be able to express the wide, wonderful, varied, and exciting experiences of reading, writing, and creating.

Over the course of a year, we present a variety of artistic styles on our cover. We try to entice the best from the children's book illustration community to work on our covers. We hope our young readers will come to know and recognize these artists and their work.

When we commission an artist to create our cover, we start by explaining the mission of the magazine. Sometimes we have a specific idea of what we want on the cover, but more often we like to get the artist involved in brainstorming and conceptualizing cover ideas. We tell our artists that we want them to communicate the joy and excitement that reading can bring. We encourage them to show how reading can take you places, how it can open worlds of wonder and surprise, how it is something you can share with others and get excited about—not something that is a solitary, static experience. We might ask an artist to give us a painting that represents or expresses the creative process. We might look for a visual metaphor—a factory, a workshop—that could represent the creative process.

The artists come back to us with sketches and we begin to push ideas around. Together, we come up with a concept that works. Then the artist "goes to final" and presents us with a finished painting. Wow! That is one of the most exciting days on the job!

Cover Art: Start-to-Finish

Our November–December 1994 cover provides a good example of how we conceive of and create our covers. The artist, Kimberly Bulcken Root, also illustrated *Billy Beg and His Bull*, *Boots and His Brothers*, *Hugh Can Do*, and *If I'd Known Then What I Know Now*. We love Kimberly's color palette of rich greens, blues, and reds and her softer yellows and pinks. She uses water colors over black line ink drawings in a style that reminds us of Arthur Rackham, Kate Greenaway and other artists of the turn of the century. We thought this would make a good contrast with our previous cover, which was a highly realistic painting by Wendell Minor, whose credits include *Sierra*, *Mojave*, and *Heartland*.

We discussed with Kimberly the mission of the magazine and she came to us with a charming sketch of a Florentine village enchanted by books (Figure 63A-1). We loved its fairytale quality and all the different creatures who were involved with books in some way, but we had one small problem. The six main figures in the sketch—four people, a pig carrying one of the people, and a dog—were all of ap-

proximately equal size and were lost in their own private relationship with a book. How is the viewer supposed to "get into" this picture? Well, it is hard to get into it. It is rather still and everyone is looking away; no one is inviting you in. Which of these characters would the viewer relate to? Well, it seems hard to relate to any of them since they are all off doing their own thing, and unless you already love reading, you may not be intrigued. No single character seems more important than the others. If one character somehow caught the viewers and hooked them in, then we would have a great cover.

We discussed these concerns with Kimberly and she presented us with a second sketch that became the basis of the finished cover (Figure 63A-2). In the final painting, the girl riding the pig is brought to the foreground and she no longer is reading. As Kimberly puts it, "This girl has just come into this town. She's never been here before. Everybody is reading—even the lizard! The girl's next step would be to try to get a book to see what the attraction is all about. At this second, though, we're catching her awe. Also, I like showing the books as giving delight and surprise. A book is such a treasure that a dog might want to steal and bury it."

This was fantastic. Now, we felt, our readers would relate to the girl. They would wonder: "What is she looking at? What's all the excitement? Why, it's a lizard reading! In fact everyone reads in this town, even the statues!" In other words: Reading is all the rage; it is exciting; it is a treasure. *That* is the message we want to give to our young viewers. A bold cover line, "Discover the Fun" invites our audience to turn the page and begin an adventure in literature.

As an aside, Kimberly told us she wanted to show a girl riding a pig because it is something she had always wondered about as a child. On a school field trip, she had visited a farm. There, she saw big black-and-white pigs that had just been scrubbed clean. "Their big round backs, low to the ground, were strong but less frightening than a horse's. I wondered how many kids could sit on one of those backs. Riding a pig was an idea I carried around for years," she told us. Often, the best inspiration comes remembering what the world looked like when you were a child.

Inside the Edition

We want the inside of our magazine to be as exciting and inviting as the cover. We want the literature and artwork in the magazine to be engaging—to grab young readers' interest and to inspire them. However, we want children to be able to get into the experience comfortably and easily. In other words, the ideas expressed in our stories and artwork should be challenging, but it should be easy to page through the magazine and find something you really want to read or look at.

For example, our September 1994 issue features a short story by Matt Christopher (Figure 63A-3), perhaps the most popular sports fiction writer for children—ever! We knew we could hook some of the most reluctant readers with this story about an exciting baseball game and a young pitcher's struggle with his conscience.

We chose an illustrator for the story who could give us slightly exaggerated expressions to reflect the strain of a close

(Continued on p. 861)

Fiction

**Illustrated for Storyworks
by Craig Nelson**

T

HE CHERRY PARK REDBIRDS, JAY'S TEAM, batted first and got lucky. Even Jay, who was twelve and a lefty, had to admit it. Lennie Gross, the Redbirds' shortstop—looking tough in his white uniform with black and red trim—led off and drew a walk. Then Dale Robin, who seldom hit one beyond the infield, poked a skyscraper over the left-field fence for a two-run homer. Redbirds 2, Knights 0.

The Marcellus Knights were one of the most dreaded opponents in the Junior Baseball League for twelve- and thirteen-year-olds. When the Knights were up, power-sluggger Marc Wallace came to the plate. He looked more like eighteen than thirteen. The bases were bare so Jay decided he wouldn't throw any inside pitches to him yet. With two outs, Marc couldn't do much damage anyway.

FIGURE 63A-3A.

***Jay was a good Little League pitcher,
maybe even a great one.
But how far would he go to win?***

But he did get a hit. A smashing drive between left and center for a single.

Now to keep him there, Jay thought.

He struck out the next batter and the teams exchanged sides.

The next two-and-a-half innings went by with no runs scored by either team. The Cherry Park Redbirds still led, 2-0. Jay couldn't believe it. Getting ahead of the Knights right off the bat was a feat in itself.

Then, in the fourth, Jay walked the leadoff batter, Marc, and then was pounded for two hits. One was a double, scoring a run. An error on the third baseman gave the Knights another run. An overthrow at first base gave them another, and the inning ended with the Knights going into the lead, 3-2.

"Just like that, they lead us," Jay mumbled half to himself as he headed off the mound.

"Right," said Lennie, as he trotted up beside Jay. "But hang

in there. Just don't let Marc tag onto one."

"Not if I can help it," Jay promised.

Marc Wallace was the Knights' long-ball hitter, a threat every time he stepped up to the plate. Jay wondered if he should try his "brush-'im-back" pitch. Well, he'd see.

It wasn't until the top of the fifth that the Redbirds scored again. Jason Phelps came to bat and stroked a hit over the left-field fence for a home run, tying the score, 3-3. The

Cherry Park Redbirds fans went crazy yelling, shouting, and whistling.

The next two batters, Marty Allan and Juke Gillian, flied out, bringing up Jay. So far all he had done at bat was a big fat nothing.

He swung at the first pitch and ➡

FIGURE 63A-3B.

lined it over third.

"Okay! Send 'im around!" yelled Coach Don Foley from the third-base coaching box.

Lennie, the leadoff batter, was up. He tapped the fat end of his bat against the plate a couple of times, then lifted the wood, snuggled his spikes into the dirt, and waited for Rick McCall's pitch.

Another long clout! But this time it didn't go over the fence. It hit the fence and bounced back. Jay raced around the bases and Lennie stopped on second for a double. Redbirds 4, Knights 3.

The next batter popped up for the third out, and Jay ran out to the mound with a mile-wide smile on his face.

Maybe, he thought, just maybe he wouldn't have to use that brush-'im-back strategy on Marc after all. It wouldn't be necessary, not if the Redbirds remained in the lead.

Then, going into the sixth and last inning, the Knights came up for their last chance to win, and the leadoff batter pulled a fast one. He bunted Jay's first pitch down the third-base line, catching Jay and the third baseman off guard, and made it to first base without trouble.

"Keep your eyes open, Jay!" shouted Coach Foley. "Gary! On the line!"

Gary Marsh, the third baseman, moved up alongside third base and crouched into position. Underneath his lowered hat brim his eyes looked like needle points.

Jay felt the heat on his face. By now he could remember, from previous batters, who followed who. He pitched to the next batter, who poked one just over short for a single. The

next batter hit into a double play. Two out!

Jay wasn't out of the woods yet. Another walk, and an error by the shortstop, loaded the bases! And who was up but the mighty Marc Wallace! He filled up his brown uniform like meat filled up sausage skin.

The Knights fans went crazy. "Blast it, Marc!" one cried.

"Out of the lot, Marc!" cried another.

If Marc had never really gotten moral support from his fans before, he was sure getting it now.

"Get 'im outa there, Jay!" third baseman Gary Marsh yelled.

"Strike 'im out, Jay!" Dale Robin cried. "Show 'im you can do it! STRIKE HIM OUT!"

JAY'S HEART POUNDED. SWEAT rolled down his cheeks. All Marc had to do was get a hit, then a run—or maybe two runs—would score, tying the game or winning it. Jay thought about the brush-'im-back pitch. He stood off the mound, thinking about it. Once, not too long ago, that pitch had been used against him. It not only had brushed him back. It had hit him.

That hit had earned him a walk, but it had also forced him to leave the game with a bruised shoulder.

Afterward, all the little-league coaches had warned their players that trying to scare, or even hit, a batter was unsportsmanlike—and dangerous!

FIGURE 63A-3C.

Jay had thought a lot about that pitch afterward. Was it really the pitcher's fault that he had pitched the ball so close to Jay that it hit him? Or was it Jay's fault that he hadn't stepped back fast enough? The more he thought about it the more he blamed himself for not stepping back fast enough.

Anyway, he could throw the same pitch to Marc. Pitch close ones to him, scare him. "Brush 'im back." How would the coaches know whether he'd done it on purpose or not?

Another thing: Was it really dirty?

It depended on how you looked at it, Jay thought. Anyway, wasn't that baseball? Didn't they do it in the major leagues? Didn't Sid Finch make a name for himself by throwing "brush-'im-back" pitches? He was one of the majors' top left-handed pitchers and Jay's hero. If a major-league pitcher did it, why couldn't a kid in the little league do it? Scaring Marc, then throwing some over-the-plate pitches, resulting in a strikeout, would be something Jay would always remember. Always. Marc would never forget it either.

Jay stepped onto the mound. He watched Marc step into the batting box, lift the bat over his left shoulder, and look back at him.

But, as Jay kept looking at him, a strange feeling began to crawl over him. A not-too-good feeling. No, his mind said. No. You can't do it. Marc might not step back fast enough from a brush-'im back pitch either. And he'd get hit, probably badly. Even badly enough not to ever play baseball anymore.

No, he told himself. He couldn't take that chance.

He stretched, delivered, and sent the ball streaking toward the outside corner of the plate.

"Strike!" boomed the umpire.

Jay pegged in another one in almost the same spot.

"Strike two!" the umpire boomed again as enthusiastic shouts exploded from the Redbirds fans.

I can't believe this, Jay thought. But it's true. I guess he's just as nervous as I am!

Two strikes, no balls. Now what?

Jay stood on the rubber, pondering where to try to place the next pitch. All he knew was that he wasn't going to brush Marc back. He just had to find a spot he thought was vulnerable, and hope for the best.

He stretched, came down with the ball, and delivered. A slightly high, outside pitch that Marc probably feared would be a strike.

He swung. He missed! A strikeout!

The fans roared. It was over! The Cherry Park Redbirds won, 4-3! Jay had struck out the mighty Marc Wallace!

He walked off the mound amidst the whistles and cheers. The guys gave him high

fives. The coach hugged him.

And there came his mother and father, both smiling, both holding out their arms.

"Pitched like a big-leaguer, son. Just like your hero, Sid Finch," Mr. Miller said. "I'm proud of you."

"No, Dad," corrected Jay. "Pitched just like me, Jay Miller."

The End

What was the most exciting game you ever played in? It could be a baseball game or any other sport or game you enjoy. What happened in the game? Who were the best players? Write a story about the game. Draw pictures that show how the players felt at the most exciting moments.

Matt Christopher

Author at Bat

Matt Christopher was a semiprofessional baseball player in the 1930s. Now, he's a professional story writer. What's his favorite subject to write about? Sports! He's written more than 93 books. *Storyworks* asked Matt about both of his careers.

How do you start writing a story?

If I'm writing about a baseball game, I always make up a box score before I start. It shows what each character does in each inning. Then I put my box score beside my computer and I work right from that. I'm pretty sure I'd get fouled up otherwise.

For a book about a sport I have never played, I start by doing a lot of research. I talk to kids who play the sport.

Do you rewrite a lot?

Oh yes. I go quite rapidly on the first draft, which is the hardest. Then I set the story aside for two or three weeks. When I go back to it, I can see things that need to be improved.

Matt made up this box score for the Cherry Park Redbirds before he wrote the story "Brush 'im Back."

Why do you like sports?

For me, playing sports has always meant camaraderie—a special friendship with the guys on your team and sometimes with the guys on the other team.

Why do you like to write about sports?

I love writing about exciting plays and the suspenseful moments in close games. Every sport has its own very colorful and inventive slang.

It's a real pleasure.

Book cover for Undercover Tailback by Matt Christopher

Book cover for Red-Hot Hightops by Matt Christopher

CHECK IT OUT!

Books by Matt Christopher

In *Red-Hot Hightops*, Kelly freezes when she plays basketball in front of a crowd. Then she finds red hightops in

her locker. After that, she plays like a star. Are the hightops magic? 148 pages

Return of the Homerun Kid is one of Matt's favorites. It's about a boy who is stuck on the bench until a mysterious ex-baseball player named Cheeko

teaches him a few things. Who is Cheeko and where did he come from? 168 pages

Undercover Tailback is about Parker Nolan, a known liar who has to fix his reputation or the whole football season is ruined. 160 pages

game and the stress of the main character's difficult choice between right and wrong. We hope these expressions provoke understanding and empathy. At another level, the Norman Rockwell flavor of the drawings call up ideas of good citizenship and determination, and even a suggestion of American heroism. It was a good match for our main character, who struggles with a moral dilemma and comes out on the side of good.

The designer chose a bold type style for the headline and placed it on a graphic of a team pennant. The type style is repeated throughout the fiction package to give it a unified feel. We use it for the big capital letters or "drop caps" that break the story into easy-to-manage sections and again in the headline of the author interview that accompanies the story. The pennant graphic is used again with the author interview. The choice of color and type style unifies the story and the interview and broadcasts the message: These are sports stories!

However, some parts of this package do not "stand out" in the context of the magazine. They are consistent with the way every other story is treated in the magazine. For example, when you turn to the first page of the story, the "slug" or boldface header at the top clearly labels the piece "fiction." A "deck" or introduction tells kids in a nutshell what to expect from the story. The story itself is printed in a classic, easy to read type face called Goudy. These features are predictable. They give readers a framework or context in which they know they can easily navigate to find a great literature or art experience.

If you were to page through the issue, you would find a photo realistic painting illustrating Nikki Giovanni's poem, "two friends." A combination of children's artwork and photo-journalism illustrate excerpts from *Zlata's Diary: A Child's Life in Sarajevo*. A contest based on The Magic School Bus book series borrows artwork and design concepts from those books. Characters talk in speech bubbles and facts and directions are reported in side stories that look like school

reports. Finally, still photographs from a movie set illustrate the play, *Black Beauty*, adapted from the classic novel by Anna Sewell and the Warner Brothers film. Each story has its own distinctive typeface in the headlines and subheads, and its own illustration style. However, they all share the consistent elements mentioned above—each is clearly labeled; each has an introduction; the story itself is in the same classic, easy-to-read type.

Getting Readers to See

This explains what goes on in an editor's or designer's mind. But what happens in the minds of the children who read us? That is a much more important question.

At the very least, our readers gain exposure to a wide variety of artistic and literary styles. By seeing *Storyworks* every month, they are beginning to develop their own mental framework for how a magazine works and how pictures and words work together.

Ideally, our readers are talking among themselves about their impressions and opinions as they read the magazine. They are learning what they like and do not like; what they think works and what does not. We know some teachers are leading students down this very important path to literacy. They ask students to describe what they see in the magazine. They ask children to guess why a certain picture was put in the magazine or why a certain headline was made to look the way it does. They ask children to notice the differences between one story and another or one painter's style and another's. Most important, they ask students to judge for themselves whether what they read and see is informative, interesting, or important.

If *Storyworks* sparks these kinds of conversations, then it is going a long way toward achieving its mission. For it is by having these conversations that children begin to incorporate literature and art into their life.

WORDS + PICTURES = MAGIC: A DESIGNER LOOKS AT PICTURE BOOKS

Joy Chu

GRAPHIC ARTIST AND BOOK DESIGNER

Recently, people have come up to me and congratulated me on how well I illustrated *Bitter Bananas* (Olaleye, 1994), illustrated by Ed Young. I want to set something straight right now. I am not an illustrator. I am not an artist. I am not a writer. What I am, as a designer, is a *facilitator*. I work directly with the illustrator. I am much like a cinematography film editor. I work with artists to help them pace their books. First, I read a story “inside and out.” I get to know the background. I work with the artist in terms of getting the story to fit just right into those 32 pages—and have it flow just right, so that there are not awkward jumps from one scene to another.

The most successful picture books work without words. You do need those words, but they should work just as well without words. It is very much like watching TV: You can turn the sound off and make up a story. If a picture book has that quality, then visually it is a successfully executed picture book. The best kind of manuscript for a picture book has a lot of action, has a strong main character, perhaps dialogue, and a lot of development.

Publishers like to use illustrators *they* select; therefore when a manuscript is accepted, an illustrator is found and the project is assigned to a designer who works with the illustrator and the editor to see the book to completion.

The dummy is the most important stage in the development of a picture book. The dummy is the stage where the artist renders sketches. The text is broken up into sequential pages, with an allowance for the usual front matter, such as title page, copyright, acknowledgements, and dedications. It shows the artist exactly where and how much space the typography will take up. It also serves as the master plan for the overall pacing of the story.

Some books go through several dummies, based on the feedback among the artist, designer and editor. *Bitter Ba-*

nanas went through several rough dummies because Ed Young wanted his art to be fully integrated with the text. In the final book, type weaves in and out of nighttime scenes. We made the type large and translucent, echoing the creepy sounds of the rain forest. The text contains repeated refrains, “Oh yes! Oh yes!” and “Oh no! Oh no!” reflecting the emotions of our young protagonist. Ed Young was so enchanted by the sing-song rhythms of the refrains that he wanted to encourage the reader to chant them through the typography. Thus, these phrases are large, and in bright colors to complement the ebullience of Ed’s artwork. To capitalize on the visual rhythms created by this, the editor made extra sure that there was an even sprinkling of “Oh yeses!” and “Oh noes!” running throughout the book. The finished book is one of Ed Young’s finest achievements, all because he was so inspired by the charm of the written text by Isaac Olaleye, a writer from Nigeria.

It is important to check the pacing of the book dummy. Designers make sure that the scenes move smoothly in and out, as if a camcorder were moving around. Designers also supply illustrators with a template (called a grid) so that they can see the parameters they have in case the text needs to be moved around to make more room for an illustration. Text and pictures should be well-integrated—in other words, the text is reckoned with as part of the overall composition of the illustration. Books should never look like subtitled foreign movies.

Length is usually set at 32 pages, standard for a picture book. Why not 34? The answer is that we are dealing with established trim sizes, and only certain machinery can handle a certain number of pages. Most picture books are 32 pages, and the endpapers are a separate piece of paper. It costs a little bit more to have art on the endpapers.

Size is an important consideration. Libraries and bookstores do not have 12-inch shelves. That size is deadly. You want a book to appear face-out or spine-out. When it is too small, it will be placed bottom-edge-out, doomed to anonymity. The tallest we ever go on a picture book is 11 inches. You can fool around with the width a little, but not the height. The designer usually suggests a trim size for the book (the actual size dimensions of the book page) based on the amount of the

text, the illustrator's style, whatever suits the subject matter of the book. Sometimes it is best to go with whatever feels right, as long as the costs work out.

When everyone works together the result is a picture book in which text and pictures work together in a seamless whole to produce a picture book that allows readers to make meaning—verbally *and* visually.

THE CHANGING FACE OF LITERACY: A PUBLISHER'S PERSPECTIVE

Roger R. Rogalin

SENIOR VICE PRESIDENT AND PUBLISHER, MACMILLAN / MCGRAW-HILL

Publishers as United States citizens have a stake in a literate voter population. Publishing as an industry has a stake in a literate workforce. In addition, publishers have a further compelling reason to appreciate a literate population and thereby ensure an expanded market for their works. Many publishers play an active role in the literary development of the children both for direct commercial opportunity and to facilitate the development of a future population of literate adults. For those who have had a role in developing successful elementary school reading programs, the sheer pleasure of seeing children get excited about reading good books may be motivation enough.

The journey toward developing literate children has taken several directions in prior decades, and one might expect that several more directions will be taken in succeeding decades. Educational trends vary with research findings, the popular promotion of those findings, and the acceptability of those methods to classroom practitioners. The seminal event in the most recent change in the national understanding of English language literacy, from a publishing perspective, was the 1988–89 California Reading / Language Arts adoption.

California, with 11% of the student population of the United States, represents a large market for textbook publishers. Adding to the impact of its large population, California is one of 21 “adoption” states. Adoption states screen submitted instructional materials at the state level and provide funds to the local districts for the purchase of those programs. Local districts across the state often purchase state-adopted materials in a specific discipline in a focused period of time. This results in a large, focused window of opportunity for publishers developing and marketing materials in a specific discipline. In 1988 California accepted bids from publishers for their reading adoption. Programs approved by the state board of education could be purchased with state funds in the summer of 1989 for use in the schools for at least the next 6 years.

Obviously, the California framework for reading / language arts had the potential for profound impact on the form and content of newly published basal reading programs. State Superintendent of Public Instruction, Bill Honig, understood the purchasing power of the state and determined that he would affect reform through instructional materials. His publicly stated intent was to limit the state adopted list to programs that provided an integrated language approach and thereby “encourage” teachers to reform their classroom methodology.

Previously, the dominant approach to teaching reading favored a concentration on discrete decoding skills. Indeed, many reading programs applied these skills in separate worksheets that bore little direct relationship with the recommended literature selections. Selections were abridged and the language was modified to match vocabulary lists that researchers had compiled as developmentally appropriate to particular grade levels. This focus on early reading instruction could be described as “scientific” since it was based on statistically correlated research on the acquisition of deconstructed, discrete skills such as decoding the *schwa* sound.

Around this time, the oppositional philosophy was gaining in favor and, as is always the case in educational practice, threatened to throw the baby out with the bath water. Under Honig’s direction, the state framework promulgated an integrated and whole language approach. “Authentic” literature selections, in all their natural richness, were to be included in original and unabridged form. Children would learn the richness of language and the pleasure of reading without being overly concerned about the deconstruction of discrete skills research. In addition, the Framework framers eschewed much of the traditional canon of literature in favor of the politics of inclusion. “Authentic” literature must reflect a diversity of cultures (i.e., written by natives of those cultures).

Phonics, although mentioned, was assigned a weighted value of zero in the state scoring rubric used to evaluate the submitted programs. Therefore phonics was literally without value in consideration of what California's children would use to learn to read. Spelling programs were specifically dismissed in favor of supporting creativity through "invented" spelling. The mechanics of spelling and grammar would be dealt with later in the curriculum. With the exception of bemoaning the loss of revenue from spelling and English grammar books, many publishers embraced the new order and submitted programs that to varying degrees met the basic precepts of the California Framework.

The whole language approach was not unappealing to teachers or parents. How could one argue with the power of great literature in the author's original form? Would not the literacy of our students be enhanced by appreciation of great works that have been tied to the students' own experience? This California adoption, unlike some before or after, was successful in changing the vision of teaching English language literacy held by California educators. The vision spread across the country redefining how literacy would be interpreted. Reading literacy would no longer mean the mere mechanical decoding of word and sound symbols; it would now mean appreciation of meaning and nuance.

The most obvious physical change to commercially available reading programs was the inclusion of "real literature" in the form of trade books. (Trade books are the books you buy in the local bookstore vs. the curriculum-oriented textbooks you find in schools.) It was not enough to include unabridged selections in the basal reading anthologies, the reading packages had to include honest-to-goodness, real-life paperback books.

Not surprisingly, the new approach soon met with resistance. Public schools are paid for by taxpayers. Tax-paying parents have obvious emotional interests in the particulars of what is taught to their children. Two major areas of concern caused parents to question the new approach to teaching literacy to California's school children: social content and the lack of so-called basic skills.

The first backlash came as parents reacted to some of the content in the now unabridged passages. The world was not always "politically correct" as we define that concept today. Mark Twain included racist words and content in his portrayal of 19th-century life along the Mississippi River. Judy Blume described young girls' curiosity about brassieres in novels for middle school readers. The myriad special interests had specific concerns about specific passages or artwork included in programs. These concerns were often in direct conflict with each other, placing publishers squarely in the middle of contentious arguments based on some people's strong personal values and opinions. Although textbook scrutiny and protest had existed for decades before this time, the advent of the requirement for authentic and diverse literature selections opened the door for increased and more highly visible protest.

An equally grave and growing concern of parents was the lack of direct instruction on basic skills like spelling and grammar. The California model eliminated spelling as a separate discipline and suggested that a focus on spell-

ing and grammar rules inhibited creative writing. Children in the early grades were to be evaluated on content and creativity while the technical aspects of spelling, grammar, and syntax would be dealt with in later grades. When parents began to perceive an apparent disregard for spelling and grammar in the wonderfully creative papers that children brought home, the doubts about this new approach began to surface.

The backlash that followed was like a slow pressure cooker. Many parents who were dubious in the beginning but who were willing to accede to the "experts" lost patience when standardized test scores in the state dropped. There were many possible reasons for the drop in reading test scores, including demographics, the newness of the test, and so forth. However, the controversies over the social content in the new test and the existing skepticism about the new framework worked to obscure any mitigating circumstances for the poor results. The change in climate that resulted in the voter revolution of November 1994 fomented political response from the Governor and state legislators that supported the subsequent suspicion of progressive curricula in all disciplines.

Will the current political climate and backlash against progressive curricula result in a new, or even retrograde, view of what constitutes good literacy education? In all likelihood, given past educational patterns, the pendulum will swing back the other way. Are we headed for the "Dick and Jane" approach of the 1950s and 1960s? Not likely. The pendulum swings in educational practice tend to spiral rather than remain in a strictly repetitive path. After all, we do learn, if somewhat imperfectly, from our mistakes. The good news in these events is that parents took interest in their children's literacy. It is possible that this parental interest will lead to behavioral changes at home that would result in more reading and less television.

How will future technologies affect literacy? Broadly defined, "literacy" includes more than the notion of the ability to read and write. It connotes an ability to decode and communicate information in a form that can be decoded and communicated by other individuals in a respective community. Scientific literacy, for example, requires a specific set of decoding, analyzing, and communicating skills. Mathematics literacy demands yet another "language" and thought process. This broader context becomes important when one considers the possibilities for literate communication in the future. Decoding printed words may be only one aspect of the literacy required to "troll the internet" and access appropriate information from the NII (National Information Infrastructure) in coming generations.

Publishers of so-called traditional book materials are redefining their roles as content providers so as to prepare for the digital age. Textbook publishers have long-established expertise in pedagogical literacy and the importance of communicating information in a variety of formats. Determining what to read and when, interpreting diagrams and illustrations in context, and identifying main ideas are as much a part of literacy as decoding word symbols. Although the book is likely to remain a major source of education and entertainment for generations

to come, technologies based on visual literacies will provide education and information that print media cannot deliver.

It is said that:

The sum total of humankind's knowledge doubled from 1750–1900. It doubled again from 1900–1950. It doubled again from 1950–1960. Again from 1960–1965. It is estimated that the sum total of humankind's knowledge has doubled at least once every 5 years since then.... It has been further projected that by

the year 2020, knowledge will double every 73 days! (Appleberry, 1992).

How does one remain literate in such an overwhelming tidal wave of information? It will remain for publishers, in one form or the other, to provide a vehicle for sorting the wheat from the chaff, for organizing information in easily retrievable formats and delivering it to people when and where it is needed, for providing education on the use of these systems, for providing peer review... in other words to continue to do what they do so well today.

NEW DIRECTIONS IN LITERACY INSTRUCTION

Anthony Lucki

SENIOR VICE PRESIDENT AND PUBLISHER, HARCOURT BRACE AND COMPANY

The role of technology in literacy instruction in the United States is rapidly changing. These changes challenge educational publishers to be:

- leaders in developing and integrating appropriate, high-quality technology products with their printed instructional materials.
- responsive to the demand from teachers, administrators, and parents for quality technology that correlates to and genuinely enhances each curriculum area program.

As technology for home and school use grows, it is vital that school publishers meet this demand—not only meet their public's current needs but anticipate their future needs as well. Since audiocassette and videocassette players are found in most schools and homes, publishers continue to provide materials in those formats, often in conjunction with corresponding print materials. With CD-ROM possibly replacing videodisc and videocassette technology, current and future instructional needs will also be affected.

Teachers and parents seek out products that contain activities that are meaningful, exciting, interactive, and fun for children and that address their higher-order thinking skills. The products they demand must go beyond the capabilities of the print medium to expand and enhance instructional opportunities.

Technology has the added advantage of being able to meet many of the individual needs of learners, such as second-language learners, students-at-risk, students with special needs, or gifted and talented students. Products customized to accommodate students with languages other than English promote self-confidence and self-esteem.

Technology is motivating for children. Students are enthusiastic about learning because the activities are engaging. They are less likely to be distracted and more likely to stay on task.

The use of technology helps educators meet special needs. Use of alternate input devices such as the touch screen and mouse enhance children's motor skills. Sound effects provide second-language and at-risk learners with clues to meaning.

Adult set-up options allow for the customizing of products to meet the individual needs of children.

Technology also encourages cooperative learning. Technological products stimulate student-teacher and student-student interaction and provide support for comprehension and learning.

TECHNOLOGY IN THE LANGUAGE ARTS CLASSROOM

What does the presence of advanced technology in the classroom mean to literacy educators? It is interesting to note that both the proponents and opponents of technology in language arts instruction agree on one thing: technology will mean the end of literacy as it is currently defined. Technology in language arts instruction will bring about a whole new notion of literacy—one that gives terms such as "e-mail" or "menu" the same weight as "reader response" or "writing process."

Perhaps one reason that technology and literacy instruction complement one another as well as they do is that our notion of literacy has broadened in the past few years, even for print-based materials. Literacy theorists and researchers have led us—especially over the last decade—to the conclusion that print-based materials are not static. We now use terms such as "negotiate meaning" to describe the process that readers use and "recursive process" to describe writing. It has become widely recognized that the concept of interacting with media is the core to the definition of literacy. The broadening of educators' definitions of literacy is very much in line with the availability of technology.

Take, for example, reading instruction. The notion that print-based books may involve transactions between the writer and the reader—transitions naturally to the concept of "interactive" electronic books. We have only begun to investigate how technology can help reading instruction, and that investigation is yielding rich results.

With existing CD-ROM and laser disc technology, in a matter of seconds a teacher can call up still, video, or animated images of carnivorous plants to show a group of students before they read a difficult expository piece on the topic. Just think of the possibilities for building schema for reading! Minutes later, the same teacher can apply similar technology to help a small group of limited-English proficient students view 10 objects that all begin with the digraph *ch*. At the same time, individual students working on computers may be reading electronic books, having difficult passages read aloud to them or exploring and investigating unfamiliar objects in the art. While it is a natural expectation that technology will provide more access to remediation, it has also proved to be quite useful for increasing students' exposure to enrichment activities.

Writing instruction is also taking on new dimensions. Parallel with the movements toward inquiry-based learning, self-assessment, and cooperative groups, the nature of writing instruction has changed. The use of technology may be the single most significant factor in promoting these aspects of writing instruction and in redefining our perception of the classroom.

Students' research capabilities are infinitely multiplied through their newly found ability to access databases and primary sources outside the confines of the classroom. Immediate access through e-mail to experts in every imaginable field provides a rich resource for student writing. On-line services and e-mail present a whole new universe of publishing possibilities for students. Student "works in progress," still at the drafting stage, look remarkably like published pieces, yet both student and teacher are aware that the content is still malleable. Aside from the obvious advantages of word processing programs in the writing process, technology affords students the opportunity to vary the mode of presentation. Access to images and voice recording technologies has given even the youngest students the tools necessary to produce multimedia presentations. Our students' published pieces will never look the same.

It is interesting that while speaking and listening development were the focus of early technology in the schools

(phonographs, cassette recorders, language masters), listening and speaking were not part of initial offerings of digital technology. The initial applications of digital technology to language arts instruction focused first on print media; however, the use of technology to enhance the speaking and listening strands of the curriculum is not far behind. Already we have seen speech become an integral part of electronic books. But that is just the beginning. Text-to-speech technology offers amazing possibilities for individualizing instruction in reading. Even some of today's technology allows students to hear what they write. The modeling of oral language, along with the ability to record students' speaking will provide unprecedented opportunities for promoting oral fluency.

Professional development is one area that has already been significantly affected by technology advances. In these days of shrinking staff development dollars, video technology has become a mainstay of staff development programs. Through video, presenters can model effective techniques in authentic classroom settings. Video has already revolutionized teacher preparation programs, allowing instructors and prospective teachers to review and analyze teaching behaviors. The advent of live teleconferences makes professional collaboration cost effective. On-line services and bulletin boards have made it possible for teachers around the world to share ideas and lesson plans with each other.

The widespread use of technology has also had some unpredicted effects on teaching. The availability and ease-of-use of desktop publishing software has made it reasonable for schools and teachers to produce attractive and effective means of communication with parents. Inexpensive programs give teachers all the tools they need to quickly produce professional-looking banners, posters, and bulletin boards.

The advanced technology that students are being exposed to in the classroom will prepare them for the truly authentic application of their learning—using the technology that will be in place when they enter the workforce. This application may well be the ultimate goal of literacy learned in school.

THE CREATION OF A BASAL PROGRAM: A COLLABORATIVE EFFORT

Susanne Singleton

FORMER VICE PRESIDENT, MACMILLAN / MCGRAW-HILL SCHOOL DIVISION

THE PEOPLE

The creation of a basal *program* is a *process* involving hundreds of *people*, working together in a collaborative atmosphere on what is probably close to a three-year timeline. The process is creative in nature, and as is the case with any creative endeavor, it is time-intensive and fraught with rethinking, reflection, and reconsideration. The people involved in the process are program authors, consultants, editors, writers, teacher advisors, student advisors, designers and artists, technology developers, and the publisher's sales representatives and consultants.

Program authors, who are selected based on a variety of criteria—area of curricular expertise, gender, geographical location, and cultural background, for example—bring the research base to the program. They shape the philosophy, provide the rationale, articulate the scope and sequence, and create the program's pedagogical framework. Since balance of viewpoints is critical on an authorship team, it is not unusual for a comprehensive program, such as a reading / language arts program, to have an authorship team of 15–20 members.

Various educational consultants, whose area of expertise may range from multicultural literature to cooperative learning to problem solving to primary sources, contribute to the creation of a basal program by offering advice, resources, and review. Each of the consultants or group of consultants becomes responsible for developing guidelines for and reviewing a particular strand or feature. Editors, most of whom have teaching experience, create prototype units that follow author's suggestions, create guidelines for writers, and hire educational writers to write the program. They also review manuscript to be sure that student material is appropriate for interest and developmental level and that teacher materials are clear and manageable. Educational writers, many of

whom are teachers currently in the classroom, write the program under the direction of editors and program authors.

Teacher advisors are crucial to the process and are involved early in program development. Initial, broad-based teacher input may be solicited through questionnaires, which are sent to teachers across the nation at the beginning of the process. Questionnaires seek to elicit information from teachers about such things, for example, as what they like in their current programs, what curricular areas are difficult for their students, what areas of instruction are most important to them, and what new trends and issues are emerging. Publishers also conduct one-on-one teacher visits—sometimes to interview teachers about their thoughts and preferences and sometimes to sit in on classes to observe classroom practices that will inform their decisions about what to publish. Classroom visits are invaluable to publishers for they afford an opportunity for publishers to see how materials are used with children and how children respond to materials.

Student advisors are helpful as reviewers of literature, creators of materials, such as original writing, artwork, and mathematical problems to be used in the programs, and as participants in field testing. Field testing occurs at critical stages during program development to make sure that the materials under development actually work effectively in the classroom.

Designers and artists play an important role in the development of basals, particularly now since the visual is such an integral part of instruction. Students benefit from visual support for the text, improve their visual literacy when exposed to a variety of images, and are motivated by colorful and intriguing illustrations and photographs. Consequently, the work of the designers and illustrators is subject to the same scrutiny and review as the text.

Technology developers work hand-in-hand with the developers of the print program to make sure that technology, such as laser discs, CD-ROMs, and videos are seamlessly integrated.

Finally, a publisher's sales representatives and consultants offer advice and suggestions for program development based on their expertise and involvement with teachers and supervisors across the country. Since they call daily on schools and speak with educators on a regular basis, sales representatives and consultants can offer ongoing input during program development.

THE PROCESS

The identification of the people to be involved in the creation of the program occurs early on in the process. Market research also occurs at this time, although it continues throughout the development process to assure that new issues and trends are addressed in the program. After the people are selected and initial information is gathered through market research, the process to involve the specific requirements of the curricular area under development begins. In reading / language arts, for example, the identification of themes and literature selections would occur at this point. Market research has indicated that teachers today seem to like to teach thematically, and although many choose to select their own themes, sometimes with the assistance of their students, they seem to appreciate the efforts of publishers to organize units thematically. Literature selection is a labor- and time-intensive task involving program authors, editors, teachers, students, and consultants. Literally thousands of books are read and reviewed as a multitude of sources is consulted. Some common sources of quality literature that publishers consult include—

<i>The Horn Book</i>	<i>School Library Journal</i>
<i>Publisher's Weekly</i>	<i>Kirkus Reviews</i>
The Reading Teacher	Children's Book Council
• Teacher's Choice List	• Best Social Studies Books
• Children's Choice List	• Best Science Books
Newbery and Caldecott Lists	ALA Notable Books
<i>New York Times</i> Reviews	Various State Book Lists
Coretta Scott King Award Books	Reading Rainbow Books

Balance is extremely important in a reading / language arts program; thus, publishers take care to make sure literature is balanced in terms of such things as ethnicity (characters and authors); genre; geographic location (settings); gender (authors and characters); language usage (characters); socioeconomic situation (characters); age (characters); social role (characters); abilities (characters); and family situation.

While the literature search is occurring, the program authors and editors are designing the instructional apparatus around prototypical units of instruction. Prototypes are usually created for a primary unit, an intermediate unit, and a middle-school unit. Units are developed according to the instructional design and philosophy set forth by the program authors and with features suggested by early market research and teacher input. For reading / language arts programs, for example, authors bring to bear the latest research on such topics as emergent literacy, background building, vocabulary and comprehension strategy instruction, reader response, visual literacy, and writing process. Teachers ask for the latest

research translated into manageable classroom practice. They ask for instructional designs that are clear, concise, and easy to follow and for options that allow them flexibility and decision-making power. The publisher's job is to create instructional plans that translate theory into practice effectively.

Once the initial prototypes have been created, it is time once again to involve all the people who are so important to the process. The prototypes are subjected to intensive review and field testing, and the contributions and responses of all the reviewers are evaluated and incorporated. Prototypes are revised and the review process continues until such time as the prototypes are approved. Then program development begins in earnest. On the program timeline, approximately 12–16 months have elapsed at this time.

During the next 9–12 months that it takes for the program to be written, reviewers continue to offer input, and program authors and consultants continue to offer advice. Adjustments are made. Permission might not be granted for a piece of literature, and a substitution must be found. A literature consultant finds a just-published piece of literature that is far superior to one previously chosen. Adjustments are made. A class of 4th-graders says a story is too hard and not very interesting. Adjustments are made. And so it goes.

While the core program is being written, the support materials for the program are finalized, and the creation and review process for them begins. Such components as audio-cassettes, posters, transparency sets, practice books, big books, little books, trade book libraries, and sentence strips, to name just a few of the components currently part of basal reading / language arts programs, are developed.

During the 9–12 months that it takes to produce the program—get art designed, get type set, go through various proofing stages and additional review stages, the publisher's marketing department is making plans to package and launch the program.

THE PROGRAM

By the time the program is completed, the publisher has already made extensive plans to launch it. The launch usually occurs at the appropriate national professional convention—IRA, for a new reading / language arts program. The program launch is often surrounded by much celebratory activity as the program is shown for the first time to a larger public audience.

Shortly after the program is finished, the publisher must train the sales representatives and consultants who will sell it. Representatives and consultants must not only be familiar with the program, but they must also know the issues that have informed the decisions that have been made about the philosophy and structure of the program. The program authors are sometimes involved in this training, and they also begin to go out to talk to teachers about the program. Authors support the program by giving workshops, speaking at awareness sessions, and making professional speeches to school districts.

During the first year that the program is out, extensive efforts are made to market and sell the program and to define

its place in the marketplace. These efforts involve sales representatives, program authors, editors, and consultants, who present the program to those districts interested in purchasing new materials. Once the program has been purchased by a district, in-servicing begins. It is during in-services that the publisher begins to collect information about how the program is working—what is effective about it and what is not so effective. This user feedback provides the basis for revision

plans that the publisher must have since revisions must occur with great regularity to assure that content remains up-to-date and new trends and issues are addressed.

Thus do *people* engage in a *process* to create a *program*. When the process is working effectively, there is a feeling of collaboration that is quite extraordinary, as people with diverse talents come together to produce something they can all call their own.

THE ROLE OF COMPUTER GRAPHICS IN LITERACY ATTAINMENT

Barbara Holland Baskin

STATE UNIVERSITY OF NEW YORK AT STONY BROOK

The state of graphic development has accelerated at cometary velocity during the last 30 years, and that speed has generated vast gaps between those who are and are not literate in such environments. In many instances, some youngsters are more sophisticated and comfortable in microworlds than adults, including many of their teachers. Being literate involves bilateral communication and understanding of material in graphic format. It therefore means being able to decode information and encode it, manipulating the material to understand or to shape subtle and/or multiple meanings after the original meanings have been absorbed. It means the acquisition and application of new vocabulary (cyan, pixel, hypercard); alternate meanings for words (primitives, icons); symbols in different contexts and formulations (@, \$init); and perplexing new concepts (virtual reality, cyberspace). Some knowledge about semiotics will be required as youngsters translate symbols to operationalize the computer to paint, paste or clip. Even now at the elementary school level, knowledgeable students are able to access and scan a series of images in encyclopedia databases, evaluate their informational content and visual complementarity, select appropriate images, and print them to illustrate their research. Those students with well-equipped technology labs will have access to such resources as Internet and thus be able to connect with print and graphics databases around the world!

Heated arguments are presently dividing the community of professionals engaged in evaluating the impact of the media on learning (Clark, 1994; Kozma, 1994; Ullmer, 1994). This debate revolves around the issue of whether it is the intrinsic quality of the medium itself that impels the learning or whether the context, the curriculum, and use factors are the most important in utilizing technology for cognitive growth. As in the print media, certain picture books have been identified as having extraordinary qualities and may be profitably read independently of an academic context. Yet, excellent teachers can make the literacy experience more

potent by dramatizing, pointed questioning and other well-known pedagogical practices. Computer graphics should be similarly assessed. "In the final instructional unit, the strategy and the media are so interdependent it is impossible to separate them" (Morrison, 1994, p. 42).

Nevertheless, serious concerns exist about the quality and applications of computer programs. Will "razzle-dazzle" aspects of these media degrade their educational goals? Will sophisticated visual formats be emphasized to the disadvantage of the instructional content? For example, will some of the new software, which allows the user to "enter" stories and amend them, retard or facilitate literacy, particularly in relation to fiction considered part of the "literary canon"? Will teachers associate graphics solely with games and ignore their classroom potential? How will educational leaders inform staff and train them about the extent of potential applications and instructional power of graphics-aided software?

Technologically "illiterate" staff may not be able to devise circumstances that in turn would promote student opportunities to do complicated research, make useful associations, think analogically, increase vocabulary, undertake innovative analyses, experiment with creative undertakings, readily perceive visual variables, solve problems and participate in other forms of advanced cognitive behaviors related to literacy. Further, how will the educational community bridge the already vast gulf between technologically advantaged schools that have easy access to computers and those that do not? The long-term consequences are serious for children who are already educationally disadvantaged.

Computer graphics, when used judiciously, directly contribute to literacy: A high school science class was recently able to access the same visual database as professional astronomers and could, in real time, use the collision between a comet and Jupiter as an unparalleled science lesson. Graphics can also function instrumentally: These

pictorial materials clarify, simplify, and model concepts. They are able to motivate, dramatize, and empower the user. They facilitate tool use, exploration, experimentation, and problem solving. The future possibilities of graphics as learning tools are an unknowable and tantalizing enigma as technological breakthroughs occur at an unbelievably rapid rate, inevitably ahead of awareness of classroom applications.

In conventional schools, faculty can profitably use graphics in virtually every area of the K through 12 curriculum. Health teachers can use graphics to demonstrate bodily processes changing over time, such as gestation or digestion. Math specialists teaching geometry can enrich comprehension as forms under study can be readily rotated, changed in scale, and compared. Graphs take on new meaning as students redraw them to accommodate new data. Graphics in the art curriculum obviously has a central role as students play with color variations or manipulate perspective. Technology teachers are able to use CAD software that controls scale, ratio, and other elements of design as pupils design and construct various objects to meet certain criteria (The State University of New York at Stony Brook, 1994). Extensively illustrated nonfiction, such as Macaulay's masterpiece, has been converted to computer format, also titled *The Way Things Work* (undated).

Science teachers have an incredibly rich body of material to choose from designed by knowledgeable developers. The National Geographic Society has published *Mammals*, (undated), a multimedia encyclopedia which contains essays, captioned photographs, authentic sound reproductions, maps, and video clips of over 200 animals. Another history program widely used, according to Holtzberg (1994), is *U.S. History* on CD-ROM. Its database of over 100 history books, 1000 photos, numerous maps and tables of historical events can be a powerful resource. Microsoft's *Encarta* (1994), containing maps, pictures, charts and graphs, is another excellent resource for the social studies teacher. After searches for relevant print and graphic material, it is simple for students to retrieve appropriate material and develop their own comprehensive, illustrated report.

These examples of graphics applications are described by discipline but graphics lend themselves particularly well to interdisciplinary study. An old, but excellent example is Liao's *Colortrope* (1983), an interactive program wherein children simultaneously learn art and science concepts by analyzing, experimenting and "making" colors directly on the screen. This program works especially well using cooperative learning approaches: children discuss decisions jointly and share the use of a special ball which acts as a form of prism through which the spectrum can be analyzed.

The teacher may use text and graphics to encourage writing: in a program entitled *The Little Planet Literacy Series* by Applied Learning Technologies (undated), youthful users can compose their own original multimedia books (aided by visual storyboards) and select accompanying

sound tracks. Other teachers may wish to introduce Broderbund's *Myst* (1993), facilitating problem solving in a graphics context. Another program with similar objectives is *Thinkin' Things #2*, (Stanger et al., 1993) in which users employ tools to examine depth and perspective. In another one of the five activities, children play with optical illusions and toy with images in three-dimensional presentations.

But what if we hypothesize an unconventional setting in the future? Visualize a classroom where educators do not specify a standard pathway for learning a given subject. What if teachers actually adopted the credo of individualization and student interests and operationalized open-ended learning where individuals or student groups pursued their inquiries through Internet or other resources presently being developed? For example, if students were interested in art, they might access the database of a museum in London and call to their screen such requests as a list or biographies of all the impressionists in the collection, all those born in France, all who used oils, all born before or after a given date, all who used certain themes ... or any inquiry a user wished. The viewer may request an example of a segment of an artist's work, may enlarge it and compare it with that of others all on the screen simultaneously. The user may "play around" pleasurably as new associations and possibilities emerge in this graphic web. As can be imagined, such tools have the enormous potential, not only to revolutionize the classroom and the library, but to radically affect our understanding of the dimensions of literacy.

The response to an old joke about how to make chicken soup is: "First catch the chicken!" Research on computers, especially those with graphics components, has generated reams of results attesting to the power of computers to magnetize children and keep them attending to the stimulus. Multimedia programs with their digitized photos, animation, transferable photos, not to mention excellent vocal narrations and even musical backgrounds are contemporary tools to "catch" youngsters who have grown up in visual environments—heavy television viewers, experienced mall game players, and those who have had exposure to home computers. Increasingly, youngsters entering schools will be at ease in such environments.

Some critics (Sinatra, 1986), have asserted that schools have "eliminated ... experiences which develop youngsters' perceptual, imaginative, and visualizing abilities," (pp. 312). While this is somewhat extreme, it is clear that schools in general have been slow to see the potential of graphics software programs, often using them for motivation or reinforcement, or low-level visual information dissemination. In the distant future, when students enter the world of virtual reality, create sophisticated graphics themselves, or manipulate sophisticated visual data, a revolution will occur in terms of how children "see" their world. Will contemporary educators see how such utilization can make to the literacy goals of the schools? Accepting such innovations could lead to profound educational reform in how and what we teach.

CURRENT ISSUES AND FUTURE DIRECTIONS

Bertram C. Bruce

UNIVERSITY OF ILLINOIS

The word “literacy” never seems to stand still. It makes its appearance in the discourses of history as well as those of comparative linguistics. It shows up in debates about economics and literature. It mediates interdisciplinary conversations among scholars from history, sociology, anthropology, political science, linguistics, education, literature (Keller-Cohen, 1994). It also participates in public debates about schooling, employment, and public values. It is one of the ways in which we now talk about the visual arts and new electronic media. As it appears in these areas, it assumes different guises and enacts different purposes. The diverse array of meanings and connotations for literacy that we see today provide perverse evidence for Humpty Dumpty’s view that a word can mean “just what [we] choose it to mean—neither more nor less.”

If we want to survey current issues in literacy, we soon find that any attempt at a fixed definition of literacy quickly becomes enmeshed in larger discussions of language, thought, society, culture, and values. And the situation becomes hopeless when we begin to examine future directions for literacy. Accordingly, in this chapter I will make some working assumptions to keep the word within some bounds, even if it cannot be fully reined in. First, literacy means control over discourses that use and communicate complex forms of knowledge. Since there are many such discourses, there can be multiple literacies. Second, that literacy is so embedded in our daily practices that it can scarcely be conceived as an activity separate from any of them. Third, the changing technologies of literacy provide a window into literacy practices, both because they are the tools through which literacy is enacted and because their construction reveals our conceptions of our basic humanity.

There are five broad areas in which important and dramatic changes are occurring today. The first concerns *democracy*, and in particular, the movement toward univer-

sal literacy; the second relates to *work*, with a focus on changing demands for literacy in the workplace; the third takes us to *social relations*, and especially, the creation of a global society; the fourth concerns *language*, and how our language(s) are evolving; and the fifth relates to *technology*, with an emphasis on the way our literacy practices are becoming immersed in new technologies. Although the areas of democracy, work, social relations, language, and technology cover much ground, I hope to show that trends in these areas exhibit some convergence. Given the many facets of literacy that pervade our lives, these speculations will necessarily be abbreviated, and like all such imaginings, their naiveté will become most apparent as reality actually unfolds.

THE MOVEMENT TOWARD UNIVERSAL LITERACY

Politically, the “literacy crisis,” and its cousins, the crises in mathematics and science education, the breakdown of the schools, and so on, serve as a bulwark for arguments from conservative, middle of the road, and liberal perspectives. Some see the lack of literacy skills as an explanation for inequities in the distribution of social power and social goods. They argue that illiteracy accounts for high unemployment or underemployment, and by implication for poverty, crime, substance abuse, and other social ills. After all, they say, if a person does not have the skills demanded by today’s employers, how can he or she expect to be hired for a good job?

Others see the lack of opportunities to develop literacy as itself an example of social injustice—an effect rather than a cause of inequities. Class inequities in access to jobs, health care, and housing outside of the school system are reflected in the literacy problems within the schools. One striking

I would like to acknowledge the help of many people in thinking through these issues, including, in an incomplete list, Kevin Leander, Paul Prior, Jim Squire, Cheris Kramarae, Nick Burbules, Gail Hawisher, Jim Levin, Marsha Woodbury, Taku Sugimoto, and Elizabeth Easley.

example is that 40 years after the Brown versus Board of Education decision, which said that separate schooling by race was inherently unequal, many school systems are still effectively segregated, and many of the rest still practice segregation and unequal distribution of resources within schools and individual classrooms.

Interestingly, commentators from all parts of the political spectrum seem to agree that literacy is not what it should be, and that the schools are much to blame. This universal dismal view persists in good economic times and bad. But major long-term trends run counter to it. For example, high school graduation rates in the United States at the turn of the century were around 6–8%; by the 1920s they had reached 17–29%; and by the 1940s had climbed to 51–59%. For the last 25 years they have remained steady at or above 80%, and are among the highest in the world (Green, 1994; Marable, 1993; National Center for Education Statistics, 1995; White, 1987). Another indicator is the purchase of books and magazines. Annual sales of books and academic journals are at an all-time high in the United States, and are growing (Leslie, 1994; McGuire, 1995). There are also many indications that more people use more reading and writing in their work and leisure than ever before and that the rates are rising despite television (Newman, 1991), alleged inadequate schools, and the so-called breakdown of the social order.

This is not to say that schools should not be improved. There are many schools with inadequate resources and appalling physical conditions. Nearly all could improve their record at providing excellent learning opportunities for all children. And, perhaps most important, what was good education a generation ago may not prove even adequate for tomorrow.

Meanwhile, the students in our schools are changing. More children remain in school, and for most, the consequences of not succeeding may be more severe than ever before. Whether illiteracy causes social distress or is itself a consequence of that distress, it is certainly true that they are closely linked, especially in the inner cities. We are also more aware than ever of the diverse cultures that children bring to school. Although it is debatable how much the degree of cultural diversity within schools has increased compared to earlier periods in our history, there is no doubt that accommodating diversity, and using it as a resource, rather than seeing it only as a problem, is a major concern for future literacy developments.

Developments in technology pose interesting challenges for universal literacy. In principle, new technologies—ranging from crank-up radios to digital video on the Internet—could provide access to texts and tools for writing for all people throughout the world. For example, Project Gutenberg, the On-Line Book Initiative, the Oxford Text Archive, and related projects are making thousands of documents—the complete works of Shakespeare, Beethoven's Fifth Symphony (audio), Supreme Court decisions, the Apollo lunar landing (video)—available through the Internet (Harris, 1994; Krol, 1992; LaQuey, 1994).

Using a \$1000 computer system, a classroom anywhere in the world can have access to a library totally unaffordable in conventional print form, one containing resources available to no single library in the world, unless, of course, that

library has an equivalent computer system. Moreover, democracy movements in many countries are using fax machines and e-mail in lieu of printing presses hitherto out of reach.

But despite these promising new tools, there are many indications that inequities in access to new technologies are enormous and increasing rapidly. Because of the rapid evolution of information and communication technologies, society is increasingly stratified in terms of "generations" of technology. Even within a single community, people living physically side by side live within different ages of cyberspace. In a country in which the top 1% of families has more wealth than the bottom 90% (Schreibman, 1994), there is little reason to think that information technology resources will be equitably distributed.

This is already evident with computer use in schools. Wealthier countries and wealthier schools within those countries have greater access to new technologies. Moreover, students in wealthier schools more often use computers for open-ended learning activities, such as writing, art, science simulations, and global communication. In contrast, students in other settings, such as inner-city schools, may experience only drill on basic skills (Boruta, et al., 1983). Even within a single classroom there is evidence that the distribution of access to computer tools and information "follows the well-trodden battle-lines of social conflict" (Foucault, 1972, p. 227). Students with computers at home typically become classroom experts, receiving special attention and opportunities. In contrast, students in "remedial programs" fall farther behind when they miss the introduction to the computer because of being pulled out of class (Michaels, Cazden, & Bruce, 1985). There are also large gender inequities. Most Internet users are male, and across wide ranges of computer use in schools, girls have less involvement with new technologies than do boys. The metaphors of use are predominately male, and often, explicitly antifemale (Bryson, & de Castell, in press; Kramarae, & Kramer, 1995; Taylor, Kramarae, & Ebben, 1993). Thus, technological innovations often exacerbate underlying inequities, despite the optimistic visions of change. If "knowledge work" becomes the norm, does that mean that everyone will develop advanced literacy skills?

A similar situation is occurring with the "information highway." This was originally conceived as auguring a new age of two-way communication to empower people of all classes by giving them both information and voice in decision making. But the highway sometimes looks more like a shopping mall or a high-tech medium for the one-way delivery of information. Will the global hypertext mean that for the first time in history all people will have convenient access to all forms of encoded knowledge and the associated empowerment? Or, does it mean that access to knowledge and the use of information tools will become prized commodities, controlled and regimented according to one's wealth and social position?

Will 21st-century literacy be the "the practice of freedom" as Freire says, or will it become commoditized and stratified as never before? Worse still, will the same information tools be used to monitor and control, to imprison us within the technology? As Crawford (1994) says, "The road to freedom

via a two-way Information Highway may turn into a one-way Surveillance Street, used to condition people's thoughts and control their behavior." Video surveillance is now so ubiquitous that we may be on television more than we watch it (Patton, 1994).

Events are occurring so rapidly that it is difficult to answer any of these questions. But it is equally clear that discussions of literacy cannot ignore them, because literacy itself cannot be separated from the larger social and political issues. If we are to influence the direction of change, we need to understand the processes better and to grapple directly with the underlying contexts in which decisions are being made. For students of today, universal literacy is dependent upon democratic schooling, and simultaneously, a prerequisite for future democracy.

CHANGING DEMANDS FOR LITERACY IN THE WORKPLACE

In the workplace, literacy is assuming an ever more central role. This is a new kind of literacy, which entails not only basic reading and writing, but the ability to use reading and writing to solve problems and to communicate complex information. It is necessary for "knowledge work," the new modal form of work: "By the end of this century knowledge workers will make up a third or more of the work force in the United States—as large a proportion as manufacturing workers ever made up, except in wartime" (Drucker, 1994, p. 62).

The shift to knowledge work can be seen in more than just a changing proportion of workers who do it. One indication that has a direct bearing on literacy concerns is that there are now tens of thousands of scholarly journals; American libraries alone subscribe to 50,000 of them (Leslie, 1994). No person could ever read all the journals now published, or even all the journals in a major discipline. Sociology, for example, may have 3,000 or more journals. While the need for careful reading does not go away, the sheer mass of writing implies the desperate need for other important reading skills, such as learning how to find materials, how to judge them critically, and how to select from among the abundance available. But, a glance at most published curricular materials shows that they operate on a very different model, one in which students are presented with a few preselected texts, and never given an option to decide that the texts they have been assigned are inappropriate for their needs.

The number of scholarly journals marks more than an issue of quantity: each of these journals reflects a specialized discourse, a way of interpreting the world and making meaning. Control over that discourse means a kind of literacy (Gee, 1990). There are thus thousands of variants in the meanings of literacy reflected in these scholarly journals alone. Moreover, many of these journals correspond to different modes of (knowledge) work, to different ways that literacy is employed in work practices: the way a chemical engineer represents meaning, relates language to the world, and communicates with others is not the same as the way in which a banker does. The proliferation of these multiple literacies is a special challenge for 21st century literacy development.

Along with the profusion of literacies, reflecting the extreme specialization of work, there is a trend toward instability in the characterizations of these literacies. Universities are increasingly finding that the traditional categorization of the disciplines bears little relation to the use of disciplinary knowledge in the workplace. In many work settings, workers must find ways to solve problems in conditions that change rapidly and require collaboration among people with diverse sources of knowledge. This puts a premium on the ability to communicate across differences and to work cooperatively. As an example, faculty in an electrical engineering department have discovered that their graduates rarely need to know how to solve a classic EE problem, which rarely arises neatly in a practical setting. Instead, they need to know how to talk with a physician with whom they are collaborating on a space shuttle project, or with a marketing person about the design of a new piece of software. Ironically hyper-specialization and the technologizing of work has highlighted more than ever the need for the classic liberal arts of tolerance, communication, understanding the perspectives of others, consideration of values, and holistic understanding.

Workers in the 21st century will need to acquire and apply formal knowledge in ways very different from those required in agricultural, manufacturing, and service jobs of the past. They will not be able to get all the information they need from one text or manual but will need to integrate knowledge from multiple sources, most likely obtained in diverse media through electronic resources such as the World Wide Web. There will be too much information for any given task, just the opposite of what has been true in the past. Workers will need to cope with an abundance of information, to select critically considering the source and the relation to what else is known. None of these skills is new, but the 21st century workplace foregrounds them in a way never known before.

Workers will also need to collaborate with others, and to use both oral and written language to facilitate that collaboration. Working together, always an important skill, will become ever more important. The forms of these collaborations may also change. New technologies are creating new social matrices. Many people are already collaborating with others through the Internet and through the use of groupware (multiuser software). In the future, more and more people may collaborate through virtual reality environments. Can we say that a MUD (multiuser dungeons), MOO (MUD object-oriented), or MUSH (multiuser shared hallucination) is only a game, and not a forerunner of the workplace of tomorrow? Even today, there are text-based virtual reality communities. For example, teachers of composition now meet regularly in Media-MOO (at telnet://purple-crayon.media.mit.edu 8888/) to discuss issues related to writing pedagogy. The jargon of the cyber-age is incomprehensible to many, and it changes so rapidly that only an electronic dictionary is of much help in decoding it. I could turn this article into a glossary or I could completely omit technical terms; neither choice seems satisfactory. I chose instead to use a few, hoping that the reader for whom they are unfamiliar will know that the discussion can proceed without every word being fully understood, just as might occur between people who only partially know each other's languages.

These tools are already changing education. For example, the Teaching Teleapprentices Project (Levin, et al., 1994) is a nationally known effort exploring the use of Internet resources, the World Wide Web, and e-mail by children, teachers, future teachers, and university scientists. In this project, electronic communication links children with student teachers, student teachers with their cooperating teachers, university education professors, and scientists. In related projects, experienced teachers engage in reflection on their own practice through an e-mail network (e.g., DiMauro, & Gal, 1994).

Schools have been moderately effective in teaching students how to solve problems that are presented in a familiar, well-structured way. But increasingly, computers are able to solve these well-structured problems, leaving totally untouched the more complex problems that must be addressed in order to get a job done (Spiro, et al., 1992). To take an extreme case, the entire traditional mathematics curriculum from grades 1 through 8 has been dubbed the "\$5 curriculum," because most of what was taught could be done by a \$5 calculator. But the harder problems of estimating and approximating, selecting which operations are appropriate, relating results to the tasks at hand, evaluating a solution and so on, are left untouched. Other major elements of the standard curriculum, from spelling to history dates need to be rethought in the context of new tools. In the workplace of the future, workers will need to be able to find problems, not just solve them, that is, to look at a complex situation and turn it into a structured problem that has a solution.

Perhaps most important, the ability to learn will be not just a helpful, but a necessary condition of productive work. Lifelong learning will become an integral part of more and more careers. Already, spending on industrial training rivals that of the entire public school system. This is but one tangible realization of the adage that schooling is but a beginning to life. In the future workplace, education will be a continuing focus throughout.

THE CREATION OF A GLOBAL SOCIETY

Whether we accept the dismal or the optimistic view of literacy trends, many questions arise regarding what may happen next. We now live in a global society, one that is changing everyday. Increasingly, the work we do, the products we use, and the people we interact with represent languages and cultures throughout the world. What sorts of literacy are needed in this new world? Just as the last remnants of geography are being swept out of schools and universities, it suddenly seems to matter how the rest of the world lives and thinks. Just as high schools, colleges, and universities have all but eliminated foreign language requirements, we begin to understand why it is important to be able to communicate in more than one language and to understand different ways of thinking. Just as we proudly put forth new standards for learning in various subject areas, we begin to see ways in which the traditional concept of the disciplines—English, mathematics, science, social studies may be inadequate for future needs. New standards documents call

for more integration of learning across the disciplines, yet they and the corresponding new forms of assessment reify the separateness of the traditional categories. Our plans for literacy development seem to be solving yesterday's problems, while the world is changing around us.

The global society is now a permanent part of our workplaces, schools and neighborhoods. As large corporations become ever more multinational, people may find themselves working with people who inhabit other cultures and speak other languages. For example: A man who has lived his entire life within 10 miles of his birthplace in Texas suddenly finds that his company has been purchased by a company based in Germany. He now needs to learn to speak German, to travel to Germany, and to work with people from Germany. He soon finds, of course, that many of the people he meets in Germany are from yet a third country. Similarly, his children attend a school with children from all parts of the world, something he did not experience. All these changes are but the beginning of a new kind of world in which we will all soon be living at the border.

Among other changes we need to consider is the emergence of the World Wide Web (December, & Randall, 1994; Krol 1992). The Web is a vast sea of documents, including text, graphics, tables of numbers, software, video, and audio. These materials are all linked in a global hypertext (Barrett, 1989). Any information resource that can be put into digital form can be made available to computer users throughout the world. These documents are easily accessible. They are also linked together so that they become, in effect, not just a library, but a single gigantic book, that has been called the "docuverse," or the universe of knowledge.

The World Wide Web started in 1991 at the European Laboratory for Particle Physics (CERN) in Geneva. As the Web began to take shape, easy-to-use interface programs, or web browsers, began to appear, including Mosaic, Netscape, MacWeb, and Lynx. The category of browsers has already become a basic application comparable to word processors, spreadsheets, e-mail, or graphics programs. Today, users can access an amazing array of resources from the home, classroom, or workplace (see Table 64-1). Many people believe that it will become the dominant medium for information exchange in the 21st century.

The growth in the use of the Web is already difficult to comprehend, or even to assess accurately. By the end of 1995, there were over 10 million host computers sharing information through the Web, and several times that many users. Available information resources and information traffic on the Web are now measured in terabytes—trillions of characters—equivalent to millions of books. Commercial on-line services, such as America On-line, telecommunications companies, such as MCI and software makers, such as Microsoft, are all now making substantial investments in the expansion of Web access.

The Web is but a tangible manifestation of the interconnectedness of human knowledge and social practices. Once upon a time, it may have made sense to imagine that we could be satisfied knowing only the history of our region or country, or that our literature was a complete and uncontaminated collection of all the texts we needed to know. In

TABLE 64-1. A Small Sampling of Internet Resources

Activity	World Wide Web Location
See the "Home page" of the White House; listen to Socks the cat meow	www.whitehouse.gov
Get the latest medical information	cancer.med.upenn.edu:3000
Connect with Santa Claus	northpole.net , or www.neosoft.com/citylink
Plan a trip	www.travelweb.com
Look for a job	www.careermosaic.com
Find resources for education	www.ed.uiuc.edu
Attend an art exhibit	gertrude.art.uiuc.edu
Tour the solar system	www.c3.lanl.gov/~cjhamil/SolarSystem/homepage.html
Obtain government information; read Nelson Mandela's speech to Congress; examine corporate filings before the Securities and Exchange Commission	thomas.loc.gov
View paintings at the Louvre; tour Paris while there	sunsite.unc.edu/louvre
Visit the Electronic Frontier Foundation; become involved with the politics of the Internet	www.eff.org
Sample the latest music releases	sunsite.unc.edu/ianc/index.html
Read <i>Wired</i> magazine; meet with contributors and other readers	www.hotwired.com
Visit the Exploratorium in San Francisco	www.exploratorium.edu

that time, we might also have believed that our religion, politics, social values, language, work, and daily practices could go on without concern for what others "far away" might do. But today, it is evident that everything we know and do is but a small thread in a larger social fabric that we cannot escape, even if we wished to do so. For these reasons, debates about multiculturalism often play out in an imagined past. We worry about whether there will be enough time for Shakespeare if students read Confucius, or whether they should study African history. These are questions about what would happen if we made changes to the curriculum. But the changes *have already occurred*.

This is because the meaning of school practices can never be separated from the larger social life. Ideas that once were at the periphery of educated discourse are now at the center, not by anyone's choice, not by a desire for inclusiveness, not to prepare students for a changing world, but because the world itself is not the same. Formal education, of course, influences educated discourse, but it does not determine it. Confucius, and Mao Tse-tung, are effectively part of the curriculum now, because no study of history, economics, language, politics, and technology can ignore the history of 1.2 billion people. Similarly, African history is part of history. It always was; only in that isolated past could some people

imagine that it was not part of their history.

Reader response criticism provides a case in point. Classic theories (Fish, 1980; Rosenblatt, 1978) of reader response have emphasized the situated nature of response in contrast to the primacy of the text. In so doing, these theories opened the door to a reinterpretation of canonical texts, and to a rethinking of the canon, curriculum, literature, and the act of reading itself. Ironically, though, early reader response theorizing was centered within a Eurocentric and male-dominated domain. Thus, the radical potential of the theories was concealed by the fact that the text examples, the readers, and the interpretive communities were all drawn from one small corner of the social fabric. More recently, response studies have encompassed much more of the fabric. Studies of gender and reading have brought about a reconceptualization of the meaning of many texts, and of the very processes of reading and writing (Flynn, 1988; Flynn, & Schweickart, 1986). Similarly, textual and response studies of African literature have expanded our vision, not only by adding new texts to consider, but by revealing a richness in language and in the processes of meaning making (Gates, 1988).

The emergence of the global society means that literacy is changing. It encompasses more than it ever had before in terms of both content and form. More kinds of knowledge are accessible and more kinds are needed. Discussions of literacy will have to expand to reflect this globalization.

EVOLUTION OF LANGUAGE

Literacy is intimately bound up with language. We need to learn a language before we can become literate users of it and we use literacy as a way to learn other things through language. This connection is so obvious that we often overlook its significance. Often, it is only when reading a text from long ago, such as *Beowulf*, that we become aware of the complex relations between literacy and language. But the evolution of languages will undoubtedly make us much more aware of these relations.

One factor contributing to increased awareness is the changing composition of public school classrooms. In many schools today, students bring not just one or two, but dozens of different languages from their homes. There is now a commitment, to educate students whose home language is other than standard English. This means that the notion of progressing from oral to written language has assumed a significantly new meaning for literacy development. We must consider that students learn not simply a new form for the same language (an oversimplification, even in that case), but new forms and new languages at the same time.

Meanwhile, the definition of English is itself changing. English has always been a paradigm case of an amalgamated language, with roots in Anglo-Saxon and Latin, through French. Speech in English is filled with words from Spanish, Italian, and German, as well as Native American, Scandinavian, Asian, and African languages. But as global communication expands at an exponential pace and as people travel and move from country to country, the mix of language influences on English will undoubtedly increase.

To add to the changes, people all over the world are learning English. There are probably more speakers of English in China today (for most, it is a second or third language), than there are in the United States. There has emerged the concept of world Englishes, to describe the variety of versions of English spoken throughout the world. As more people speak English, and use it in trade, science, and cultural exchange, it will inevitably expand and change to accommodate their experiences and linguistic backgrounds.

Thus, English is no longer the language we thought it was last year, and it will be a different one next year. This cannot but have profound implications for our idea of literacy in English and for promoting literacy development. At the same time, other languages are also changing, many in the same ways that English is changing, and others in very different directions. Hundreds of other languages are dying out as the last speakers themselves die or assimilate into dominant cultures. Many of these languages are being preserved, but only in a curatorial sense, on videotapes and in dictionaries and folklore collections. They thus become accessible for study to everyone at the same time as they become spoken by no one.

In addition, advances in science and technology are producing new words everyday. The ways we describe phenomena in areas of health, communication, transportation, and more, change as we develop new procedures and new understandings. People who market products add to the changes as they strive to develop ever new ways of distinguishing their products or services.

Other technological influences shape the things we can do with language. For example, multimedia systems integrate oral and written language in a hybrid that is causing us to rethink the great dichotomies between oral and literate culture. Also, the ability to manipulate fonts, formats, colors, and other presentational aspects of texts may fundamentally change how we conceive of writing. As everyone who has used e-mail soon becomes aware, dialects of electronic communication are proliferating, with characteristic abbreviations ("BTW" for "by the way") and emotions (such as the smiling face: ":-)").

The nature of publishing is also undergoing rapid changes. Writers are now producing hypermedia texts. For example, Art Spiegelman, the author of *Maus*, and now, *The Complete Maus*, on CD-ROM, says, "I think CD-ROMs imply a new kind of narrative.... Instead of just moving through time, all of a sudden stories now move through space, so that architecture becomes the reigning metaphor" (Voyager, 1994). Academic publishing is also assuming new forms. There are now thousands of electronic journals and newsletters listed in the archives of *NewJour*, itself an active electronic forum for exchanging information about electronic publications, maintained by the Association of Research Libraries. Much scholarly work is now conducted via e-mail and on-line conferences. These trends may fundamentally alter basic aspects of scholarship including copyright laws, academic tenure, concepts of collaboration, the nature of research, and the definition of publishing (Burbules, & Bruce, 1994; Cherniak, et al., 1993).

Meanwhile, e-mail has become a normal part of the daily literacy practice for many people. The Electronic Messaging

Association estimates that in 1993 there were 16 million e-mail users in the business sector alone. These users sent the equivalent of 10,000 manuscripts length (not the quality), of *War and Peace*, everyday that year (Leslie, 1993). This indicates two things. First, literacy, at least in the form of reading and writing e-mail, is active and growing rapidly. The advent of computer technology has certainly not eliminated the practice of literacy. Second, the amount of text in the world is astounding. If 10,000 manuscripts length of *War and Peace* appears everyday, the problem may no longer be to finish reading the book, but to find it in the first place. As discussed above, the skills of finding, selecting, and evaluating have become more critical than ever before.

It remains to be seen whether these expanded conceptions of language will lead to better communication. New forms can become obstacles, rather than opportunities. In the final analysis, the human capacity to make meaning and to communicate must take precedence over the characteristics of any medium. We do well to remember Thoreau's (1951, pp. 66, 67) caution, which is more a propos today than when he wrote in the mid-19th century: "Our inventions are wont to be pretty toys, which distract our attention from serious things.... We are in great haste to construct a magnetic telegraph from Maine to Texas; but Maine and Texas, it may be, have nothing important to communicate." Despite this caution, we do have a magnetic telegraph, and much more besides—expanded print publications, radio, video, e-mail, the World Wide Web. As a result, our language has changed, is changing, and will change, perhaps even more rapidly in the future.

These changes raise many questions, with few easy answers: What is English, and what will it become? How do our notions of English literature or of the literatures of the world change in light of the changes in languages and the forms we use for communicating? How do our ideas of the relations between language and inquiry or language and collaboration have to change? What do these changes mean for our concept of literacy? What are the implications for the teaching of writing and reading?

IMMERSIVE TECHNOLOGIES

There has also been an evolution in our views of information and communication technologies for literacy development. If we consider stages in this evolution we can see not only different kinds of hardware and software, but also different visions of literacy and of ourselves. We are now changing our conceptions of literacy further because of our immersion in new forms of knowing and communicating.

In the beginning, we constructed computer technology as an exotic, and marginal, method for teaching. We did this by designing hardware and software to function as an automated tutor for skills and concepts. But we also constructed it in the way we conceived it, as a tool for systematically teaching concepts, presenting problems to solve, and administering drills and practice lessons. In the process, we also constructed our own teaching role as analogous to that of the tutors we designed.

Later, in a second stage, we saw that cybertechnology represents information in new ways. The computer as medium, or cybermedia became our construction. At that time we saw how the computer could offer greater user choice in the presentation of materials, could integrate the text, audio, and video media provided through separate components (slide projectors, audiotapes, television, etc.) in earlier technologies.

Then, in a third stage, we began to understand the information tool potential of cybertechnology; we saw that it provides new tools for learning. Thus, we talked about word processing, desktop publishing, finding information in data bases, making graphs and pictures, and performing calculations in the course of problem solving.

As students began to use cybertools in their own ways for learning, the communication aspect became more central. We moved to a fourth stage, one in which we saw that cybertechnology could do more than represent someone else's information; it could also be a way to share one's own ideas (Bruce, & Rubin, 1993). This naturally led to the view that cybertechnology could create new environments for communication and learning, in which students working together could share their processes of learning (Bruce, et al., 1993). Moreover, they could be connected to a world beyond the classroom, that included experts in every field (Levin, et al., 1987). That view in turn begins to connect with a vision of the augmented human mind and of collective thought whose reach extends beyond that of any individual.

Today, we are entering a fifth stage, in which we merge, for better or worse, with our own inventions. The extent to which this has happened can be seen in the realm of science fiction. Producers of television shows and movies are now using techniques to create science fiction that only a short while ago were the content of sci-fi. Tools such as morphing, in which images are transformed, computer animation, virtual reality, and robotics are current technologies used to create the illusion of a future world in which these very technologies will come into being. Recently, for example, the creator of the television show, *X-Files* used the sci-fi technique of an on-line forum with fans to discuss the direction of the show (Kim, 1994). As Ray Bradbury says, "Science fiction itself has remained the same. We have caught up to it. . . . We are a science-fiction generation." Science fiction screenwriter Ron Shusett (*Alien, Total Recall*) echoes this sentiment: "We can't think far enough ahead anymore." (Both quotes from Kim, 1994.)

Consider just a few other examples. There is now a commercial music accompaniment system called *Vivace*, which plays along with a student learning an instrument. Like the old *Music Minus One* records, the system plays the other parts of a composition, but it does so responsively. If the student wants to play *allegro*, so will *Vivace*. Moreover, it changes the tempo when he does, *ritards* when he does, and waits when he falters on a note. It learns characteristics of his style and accommodates appropriately at the next practice session. Even its degree of responsiveness can be adjusted, anywhere from the rigidity of a metronome to a humanly impossible total accommodation. Research is underway now on the effects of interacting with systems like this. It is not at all obvious what these will be, but the experience is com-

pletely unlike that of the (first-stage) tutor model. Instead of interacting with a device, the student somehow merges with it.

Multimedia software developments present other aspects of the changes underway (see Voyager, 1994). For example, a CD-ROM called *In the Deserts* (Heath, 1995) takes a student on a virtual field trip, starting with a 360 degree panorama of the Sonoran desert. She can click on a plant or animal to see an animation or video segment. Carrying along (a computer simulation of) a computer notebook, she can write about what she discovers and take photographs of anything she sees. She can also access multimedia texts to meet a Native American potter, a storyteller, a naturalist, or other children. Exploratory environments such as this create opportunities for integrated learning through immersion in another world.

Moving a step further, full virtual reality systems (Helsel, 1992; Helsel, & Roth, 1991; Pantelidis, 1993; Pimentel, & Teixeira, 1993) reveal in a tangible way our immersion in technology. Psotka (1994) suggests that virtual reality

...provides a fundamentally different mode of communication between computer and person, between symbolic form and mental representation; and between collaborators in conceptual worlds. VR replaces interaction with immersion; it replaces the desktop metaphor with a world metaphor; and it replaces direct manipulation with symbiosis. The magnitude of these changes needs to be experienced to be understood

One of the most sophisticated VR systems is the CAVE (CAVE Automated Visualization Environment). It is a "virtual reality theater" in which several people can share a virtual reality experience, without the need for goggles (users must wear light plastic glasses to perceive the 3-D effect). It is a high-resolution 3-D visual image and audio environment, with correct perspective and stereo projections updated in real time, and images that move with and surround the immersed viewer(s). In one application within the CAVE, the participants feel that they have entered a computer screen saver program, with fish swimming all around them. They can drop pellets for the fish and watch them swim over to eat. One has the feeling of a fundamental shift from spectator to participant. Researchers are only beginning to explore the forms of learning that this technology might enable in areas of mathematics, astronomy, geography, physiology, history, and more.

One other example is an entire new industry, bioengineering. This field hardly existed a generation ago, but has been born of a combination of new technologies. First, there are technologies such as ultrasound, X-ray, EEG, EKG, electron microscopy, fiber optics, and magnetic resonance imaging that have provided new ways to see the human body and its inner workings. These imaging techniques are amplified by the use of laser discs to store images and high-speed networks to distribute them. There are also new kinds of prosthetic devices, such as artificial knees, and new tools, such as microsurgery, for treating dysfunctions in the body. Finally, there are simulation and virtual reality systems to facilitate exploration of our newly constructed knowledge about the body. Together, these tools are creating an entirely

new image of our physical existence, one in which we see ourselves through the technologies we have created, modify the functioning of our bodies through other technologies, and express our understanding through yet other technologies. We may celebrate this new world, fear it, or curse it, but what seems unavoidable is that we already inhabit it. We have redefined part of what it means to be human by establishing a symbiosis with new technologies.

Our discourse about technology, including great debates about whether it is good or bad for teaching, is built upon the myth that we can stand apart from technology. As Suchman (1988, p. 174) says, "We are taught to view the political and the technological as separate spheres, the former having to do with values, ideology, power, and the like, the latter having to do with physical artifacts exempt from such vagaries of social life." Thus, we conceive a set of doors into alternate futures, reflecting a free choice among new technologies, and ask "whether" we should pass through.

What we fail to see is that we and our technologies constitute indivisible entities (see Bijker, et al., 1987). We are already cyborgs in the sense defined by Haraway, part fiction, part social reality (1991, p. 149). Our technology part has been constructed out of our beliefs, values, and extant practices, and in turn, it has brought us through the door to the future. Thus, we are already operating within the future that we believe we must prepare ourselves for.

Cybertechnology is not something that some people will choose to adopt; it is already a part of our literacy practices regardless of what we do. One small example: In many libraries, it is not possible to find recent books in the (paper) card catalogue, because only the computer data base is updated. I once tried to find the location of the *Scientific American* collection in the University of Illinois library. The computer told me "No Entries Found", because, as I learned later, it deletes "unimportant words" in a search request, words such as "the", "and", "of" and sadly for me, both "scientific" and "American". Since I could not believe that the university had no subscription to this magazine, I checked the obsolete card catalog, which had not been updated for 10 years, and discovered that there were at least 14 collections of *Scientific American* on the campus. The choice was not whether to use the computer or traditional cards, but whether to use the computer to find a book or not find it at all.

LITERACY ARTIFACTS

Far off in the future, archaeologists interested in literacy might uncover artifacts representative of our literacy practices. Let us consider two artifacts they might find that would call forth contrasting images. The first artifact they might examine is the famous Rosetta Stone. The tablet was discovered in 1799, near the town of Rosetta in the Nile River delta. It was made out of basalt and inscribed with the same text in three different scripts: hieroglyphic demotic, and Greek. It was produced during the reign of Ptolemy V, who ruled Egypt from 205–180 B.C. As this slab had the same text in three scripts, it became a key to deciphering the previously cryptic Egyptian hieroglyphics. It had been preserved for over 2,000 years, and was

still readable. Moreover, it provided clues to reading other ancient texts that would enrich our understanding of our cultural past.

This famous tablet would evoke for the future archaeologists the metaphor of "permanence." They would think of ancient hieroglyphics or cuneiform preserved in stone for thousands of years; of monks laboriously copying sacred texts, preserving them for all time; or of a canon of received great literature, to be memorized, studied, and cherished. These thoughts would index the cultural assumptions we hold about connections between literacy and education—our beliefs that education is the process whereby new generations connect with prior human experience; that education is the "means of this social continuity of life" (Dewey, 1966, p. 2); and that literacy gives us access to the permanent record of social life.

The second artifact presents a contrasting image of literacy: there is no stone tablet, not even a book made of paper. Instead, there is a pattern in cyberspace, a string of bits, which could be portrayed on a video screen, printed out on bond paper, or sent through the air as spoken words. The text in this second artifact was constructed collaboratively, by people who lived in different parts of the world and spoke different languages. Individual document pieces are linked to one another and to myriad other texts in the worldwide web of knowledge. Many of these texts contain scripts, like those of the Rosetta Stone, but others have pictures, diagrams, music, voices, and full-motion video. It has holographic images of objects that could be explored from any perspective, with commentary by the creators of the objects and the critics.

This text, like other well-written texts, has a distinctive style, even a voice, that conveys meaning beyond the literal. As do the great classics, it calls for a deep connection between authors and readers, a stretching of horizons. But in contrast to the Rosetta Stone's evocation of history and permanence, this text points the archaeologists toward an image of literacy as a practice enmeshed in change. It suggests radically different ways of thinking and an altered conception of education.

The two artifacts also show the future scientists how our concepts of literacy were inextricable from the literacy technologies we created. The technologies shaped the sorts of literacy we practiced, and in turn, the technologies we created were a function of our evolving conceptions of literacy.

The aspect of change in literacy practices would not trouble the archaeologists; indeed, they would be seeking to understand how the changes in literacy that they knew had actually come about. For people of today the task is more difficult, because we do not know what the literacy artifacts of tomorrow will be. As is the case in many areas of change (Andrews, 1994; Malone, & Rockart, 1991), we will undoubtedly overestimate the short-term effects of current trends, while we underestimate their long-term impact. Nevertheless, the trends described above raise many questions that we cannot afford to ignore regarding literacy development, how to promote it, what it means for schooling and life, and even what literacy is?

Whatever we say about literacy, it is not separable from democracy, work, social relations, language, or technology; instead, these are mutually-constituted practices. As we

examine these areas, we see trends and countertrends, major and minor themes, puzzles and contradictions. But there are some consistent, recurring ideas that may help make sense of all the complexity:

1. Future literacy needs will demand a continual rethinking of the purposes of schooling in relation to society, and in particular, an ongoing critical analysis of the ways in which access to societal resources changes in response to changing concepts of literacy.
2. Literacy practices in the future may become highly collaborative enterprises, corresponding to an intensification of emphasis on coordination and communication. The traditional separations among disciplines of study and types of work are in question, implying the need for more integrated conceptions of literacy and literacy development.
3. The globalization of cultural and social relations, is not an option, but a fact in the process of becoming ever more established and articulated. This is inevitably reconstituting and expanding our conceptions of literacy.
4. Literacy is changing along with changes in our languages.
5. Literacy is inextricable from our conceptions and uses of information and communication technologies, including

both new technologies, like the Internet, and older ones, like the book. Questions of curriculum are not eliminated by the availability of new tools and greater access to resources, but rather are made much more vital than ever before.

There are basic questions that we once thought we could answer, which need to be asked all over again, among them: What is literacy? What is learning? What is teaching? What does it mean to be human? The issue of who controls the development of literacy technologies and what values are applied in making decisions is critical, but all too often ignored in the discourse about literacy.

It seems inevitable that dramatic changes will occur, have already occurred, in our literacy practices. But whether these changes will lead to a greater access to information and tools, to more liberatory education, to multicultural understanding, to improved social relations, or to a more democratic society remains to be seen. Many forces operate to prevent progressive changes, and we know well that technology alone cannot bring them about. If we are to achieve the possibilities that new literacy holds, we must work to understand both what it is, and what it can be. There is much work to be done.

- ADD, 657
- Additive approach to multicultural education curriculum, 461
- Adult Basic Education (ABE), 537
- Adult Education Act, 541
- Adult high schools, 539
- Adult Secondary Education (ASE), 537
- Advanced Placement Studio Art Portfolio, 279
- Advertising, television, 27, 29, 66
- "Advice from a Visiting Poet" (Merriam), 806
- AERA, 766
- Aesthetic education, 434, 508–509
- African American English. *See* Black English
- African American women, 378–384
 - culture, 378–384
 - literacy, current and historical context for, 378–379
 - meeting places of, 379–384
- Aggression, television and, 27, 29
- AIME, 17, 24, 28
- Alternative certification (AC) programs, 431–433
- Amazing Spider Man* comics, 587
- "America 2000" legislation, 632
- American Association of Colleges for Teacher Education (AACTE), 432
- American Educational Research Association (AERA), 766
- American English. *See* English
- The American Eye* (Greenberg and Jordan), 814
- American Federation of Teachers' Professional Practice Schools, 435
- American Geography* (Morse), 530
- American History / American Film* (O'Connor and Jackson), 550
- American Newspaper Publishers Association Foundation (ANPA), 578–581
- American Psychological Association (APA), 766
- American Sign Language (ASL), 301, 314–321
- America Online's National Geographic services, 511
- Amount of invested mental effort (AIME), 17, 24, 28
- Analogical thinking
 - defined, 5
 - intelligence and, 53
 - visual intelligence and, 48–53
- Analysis process of literacy, 8
- Angels in America* (play), 69
- ANPA, 578–581
- APA, 766
- Apple Classroom of Tomorrow (ACOT), 291–292, 294–295
- ARC, 543
- Art. *See also* The Birthday (*Chagall*) ; Visual arts
 - books, 813–814
 - internal description of, 244–245
 - interpretations of, 243
 - misunderstanding, 243
 - understanding, 242
 - voices from field of, 791, 845–849
- Art education, 451–459
 - alternative programs, 254
 - assessment, 239–255
 - alternative, 247–248
 - Diagnostic Profile and, 248–255
 - implications for, 255
 - knowledge base of learner and, 239–241, 244–246
 - knowledge seeking strategies and, 241–242
 - learning outcomes and, 243–247
 - methodology, 247–248
 - national, 278–279
 - theoretical foundations in, 239–241
 - transfer and, 242–243
- Art for Children series, 795
- ARTHUR series, 830–833
- Artifacts, literacy, 882–883
- Arts Education Research Agenda for the Future* (report), 277–278
- ARTS PROPEL project, 275, 279
- Arts Standards project, 766
- ASE, 537
- ASL, 301, 314–321
- Assessment, 144–163. *See also* specific tests
 - accountability through, 592–602
 - achievement measurement, 152–154
 - art education, 239–255
 - alternative, 247–248
 - Diagnostic Profile and, 248–255
 - implications for, 255
 - knowledge base of learner and, 239–241, 244–246
 - knowledge seeking strategies and, 241–242
 - learning outcomes and, 243–247
 - methodology, 247–248
 - national, 278–279
 - theoretical foundations in, 239–241
 - transfer and, 242–243
 - Benchmark School model and, 12
 - bias in testing and, 150
 - California Assessment Program, 570
 - California Literature Program, 698, 702
 - connection of research and practice in, 161–163

Assessment (Cont.)

- constructs, 145–152
 - curriculum, 145–152
 - epistemology, 150, 161
 - equity and, 167
 - framework for, 144–145, 161–162
 - goal of, 12
 - implications for, 255
 - interactive multimedia software and, 599–602
 - issues around, 162–163
 - judgments and, 149–150, 153–154
 - Kamehameha Elementary Education Program, 688–693
 - language related, 592–602
 - for literacy education, alternative, 620–623
 - Louisiana Educational Assessment Program, 641
 - multimedia, 599
 - National Curriculum for English and, 711–712
 - new forms of, 12
 - observation for, 621–623
 - Observation Lens Model and, 620–621
 - performance, 593, 596–597
 - portfolio, 593–596, 623, 689–690, 749–750
 - practice versus research and, 147–148
 - professional judgment, 149
 - progress and, 154–157
 - Project Spectrum and, 305–307, 310–312
 - qualitative, 150
 - ratings and, 149–150, 154
 - reading, 278–279
 - reliability and, 147, 157, 160–161
 - standards, 157, 766–767
 - task analysis, 685–686
 - teacher validation of, 157–161
 - technology, 599, 602
 - testing psychometrics, 147–149
 - validity and, 147, 157–161
 - writing, 278–279, 749–751
- Assessment, Neale Reading Test, 665**

B

- "Back to Basics" movement, 548
- Bar graph, 251–252
- Basal programs, 728, 869–871
- Batman* comics, 587
- BD students, 582
- Beakman & Jax* comics, 588–589
- Behaviorally Disordered (BD) students, 582
- Bein' With You This Way* (Nikola Lisa), 818
- Benchmarks, 689–690, 692–693
- Benchmark School model, 677–686
 - assessment and, 12
 - described, 677–678
 - literature and, 683–684
 - reading and, 677, 679–682
 - styles, temperaments, emotions, and behaviors of students and, 684–686
 - writing and, 682–683
- Bias, testing, 150
- The Big Wave* (Buck), 502
- Bilingualism, 11, 315–316
- The Birthday* (Chagall), 239–250
 - form and, 244

- interpretations of, multiple, 243
- knowledge base of learner and, 239–241, 244–246
- knowledge seeking strategies and, 241–242
- learning outcomes and, 243–247
- misunderstanding, 243
- selection of, for study, 239
- transfer and, 242–243
- understanding, 242–243
- Black and White* (Macaulay), 824
- Black Beauty* (Sewell adaptation), 861
- Black English, 35–36, 334–338
- Black Papers, 612
- Blue horizon, 273
- Body language, 37
- Boogie boarding, 287–289
- Books, 528, 530–531. *See also specific titles;*
 - Textbooks
 - ABC, 537
 - art, 813–814
 - ARTHUR series, 830–833
 - audiocassettes, 867
 - illustrations in, 804–805
 - illustrators and, 818–819, 862–863
 - picture, 820–821, 862–863
 - primers, 529–530
 - readers and, 816
 - videocassettes, 867
- Boston University-Chelsea Public Schools Partnership, 668–675
 - principles of, guiding, 669–670
 - professional development opportunities and, 670–671
 - results of, 671–675
 - situation prior to, 668–669
- Bread and Water* (Silone), 390
- Bridge to Terabithia*, 816
- British Intelligence Scale, 665
- Broderbund software, 873
- Brown, Murphy (television character), 42
- Brown University Hypertext Fiction Workshop, 528
