

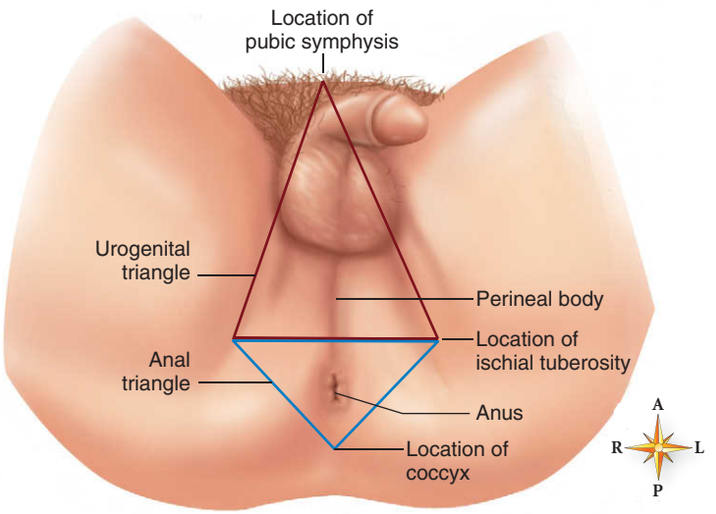

FIGURE 34-2

Male perineum. Sketch showing outline of the urogenital triangle *(red)* and anal triangle *(blue)*.

The accessory organs of reproduction in the male include genital ducts, glands, and supporting structures.

Reproductive ducts convey sperm to the outside of the body. They are also called *genital ducts*. The ducts are a pair of *epididymides* (*singular*, epididymis), the paired *vasa deferentia* (*singular*, vas deferens), a pair of *ejaculatory ducts*, and the *urethra*. *Accessory glands* in the reproductive system produce secretions that serve to nourish, transport, and mature sperm. The glands are a pair of *seminal vesicles*, one *prostate*, and a pair of *bulbourethral glands*.

Supporting structures include the *scrotum*, the *penis*, and a pair of *spermatic cords*.

Perineum

The **perineum** in the male is an area between the thighs shaped roughly like a diamond (Figure 34-2). It extends from the pubic symphysis anteriorly to the coccyx posteriorly. Its most lateral boundary on either side is the ischial tuberosity. A line drawn between the two ischial tuberosities divides the area into a larger *urogenital triangle*, which contains the external genitals (penis and scrotum), and the *anal triangle*, which surrounds the anus.

| QUICK CHECK |

1. How is the normal function of the reproductive system different from the end result of "normal function" in other organ systems?
2. Identify the essential and accessory organs of reproduction.
3. Describe the location, shape, and subdivisions of the perineum.

TESTES

Structure and Location

The **testes** are small, ovoid glands that are somewhat flattened from side to side, measure about 4 or 5 cm in length, and weigh 10 to 15 grams each. They are both located in a supporting sac called the *scrotum*. The left testis is generally located about 1 cm lower in the scrotal sac than the right. Both testes are

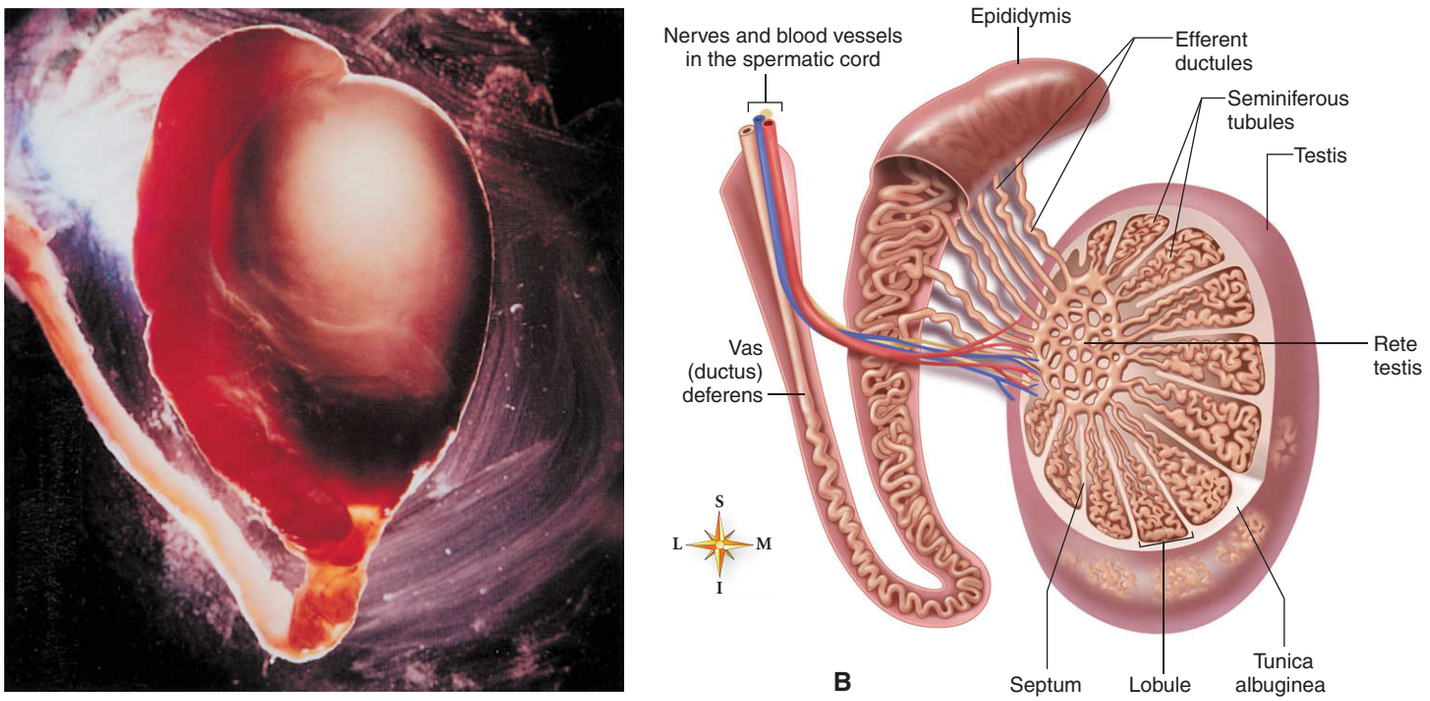

FIGURE 34-3

Tubules of the testis and epididymis. A, Transilluminated photograph; the testis is the darker sphere in the center. **B,** Illustration showing epididymis lifted free of testis. The ducts and tubules are exaggerated in size.

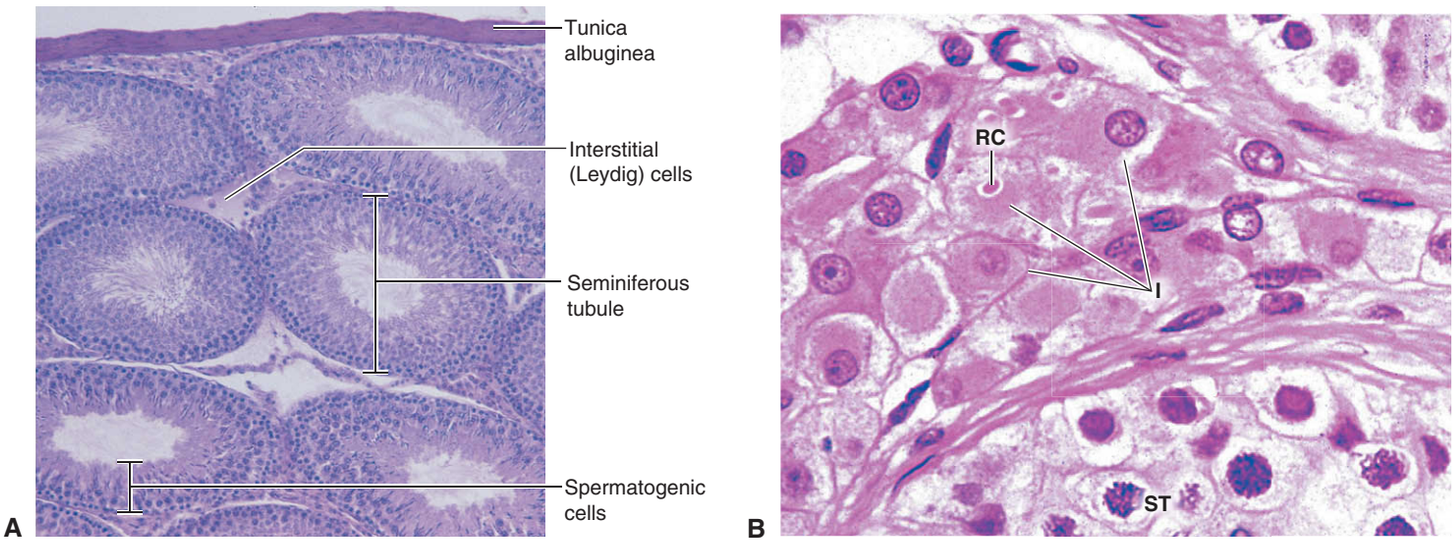

FIGURE 34-4

Testis. A, Low-power view micrograph showing several seminiferous tubules surrounded by septa containing interstitial (Leydig) cells. **B,** High-power micrograph showing a cluster of interstitial cells (I) between seminiferous tubules (ST). Spermatogenic cells can be identified in the wall of a seminiferous tubule. Note the presence of a Reinke crystalloid (RC) in an interstitial cell.

suspended in the pouch by attachment to scrotal tissue and by the spermatic cords (Figure 34-3). Note in Figure 34-3, *B*, that testicular blood vessels reach the testes by passing through the spermatic cord.

A dense, white, fibrous capsule called the **tunica albuginea** encases each testis and then enters the gland, sending out partitions (septa) that radiate through its interior, dividing it into 200 or more cone-shaped *lobules*.

Each lobule of the testis contains scattered *interstitial cells* and one to three tiny, coiled **seminiferous tubules,** which, if unraveled, would measure about 75 cm (more than 2 feet) in length. The tubules from each lobule come together to form a plexus called the *rete testis*. A series of sperm ducts called *efferent ductules* then drain the rete testis and pierce the tunica albuginea to enter the head of the epididymis (see Figure 34-3).

Microscopic Anatomy of the Testis

Figure 34-4, *A* is a low-power (×70) micrograph of testicular tissue showing a number of cut seminiferous tubules and numerous **interstitial cells,** or *Leydig cells*, in the surrounding connective tissue septa. In this figure, maturing sperm appear as dense nuclei with their tails projecting into the lumen of the tubule. The wall of each seminiferous tubule may contain five or more layers of cells. At puberty, when sexual maturity begins, spermatogenic cells in diverse stages of development appear, and the hormone-producing interstitial cells become more prominent in the surrounding septa. Figure 34-4, *B*, is a high-power micrograph showing a group of typically round interstitial cells clustered between seminiferous tubules. A unique cellular feature often visible in interstitial cells is an elongated rectangular-shaped mass called a *crystalloid*. Also called *Reinke crystalloids*, these masses are absent before puberty and then increase in number during the reproductive years into old age. The functional significance of these structures remains uncertain.

Irregular elongated **sustentacular cells** have a supportive and regulatory function important for the developing germ cells. Sustentacular cells of the testis are also called *nurse cells* or *Sertoli cells*. These cells provide mechanical support and protection for spermatids attached to their luminal surface and are visible in Figure 34-5 within a section of seminiferous epithelium.

Sustentacular cells also secrete the hormone *inhibin*, which inhibits gonadotropin-releasing hormone (GnRH) in the hypothalamus and follicle-stimulating hormone (FSH) production in the anterior pituitary. A drop in FSH lowers the rate of sperm production. This sets up a negative feedback mechanism in which the supportive sustentacular cells can slow down sperm production to manageable levels if needed.

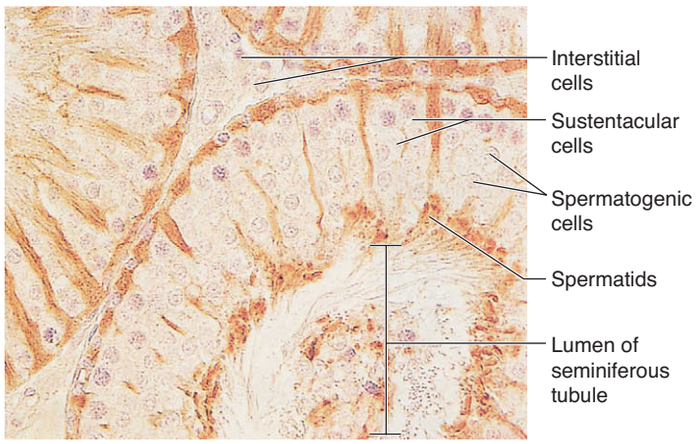

FIGURE 34-5

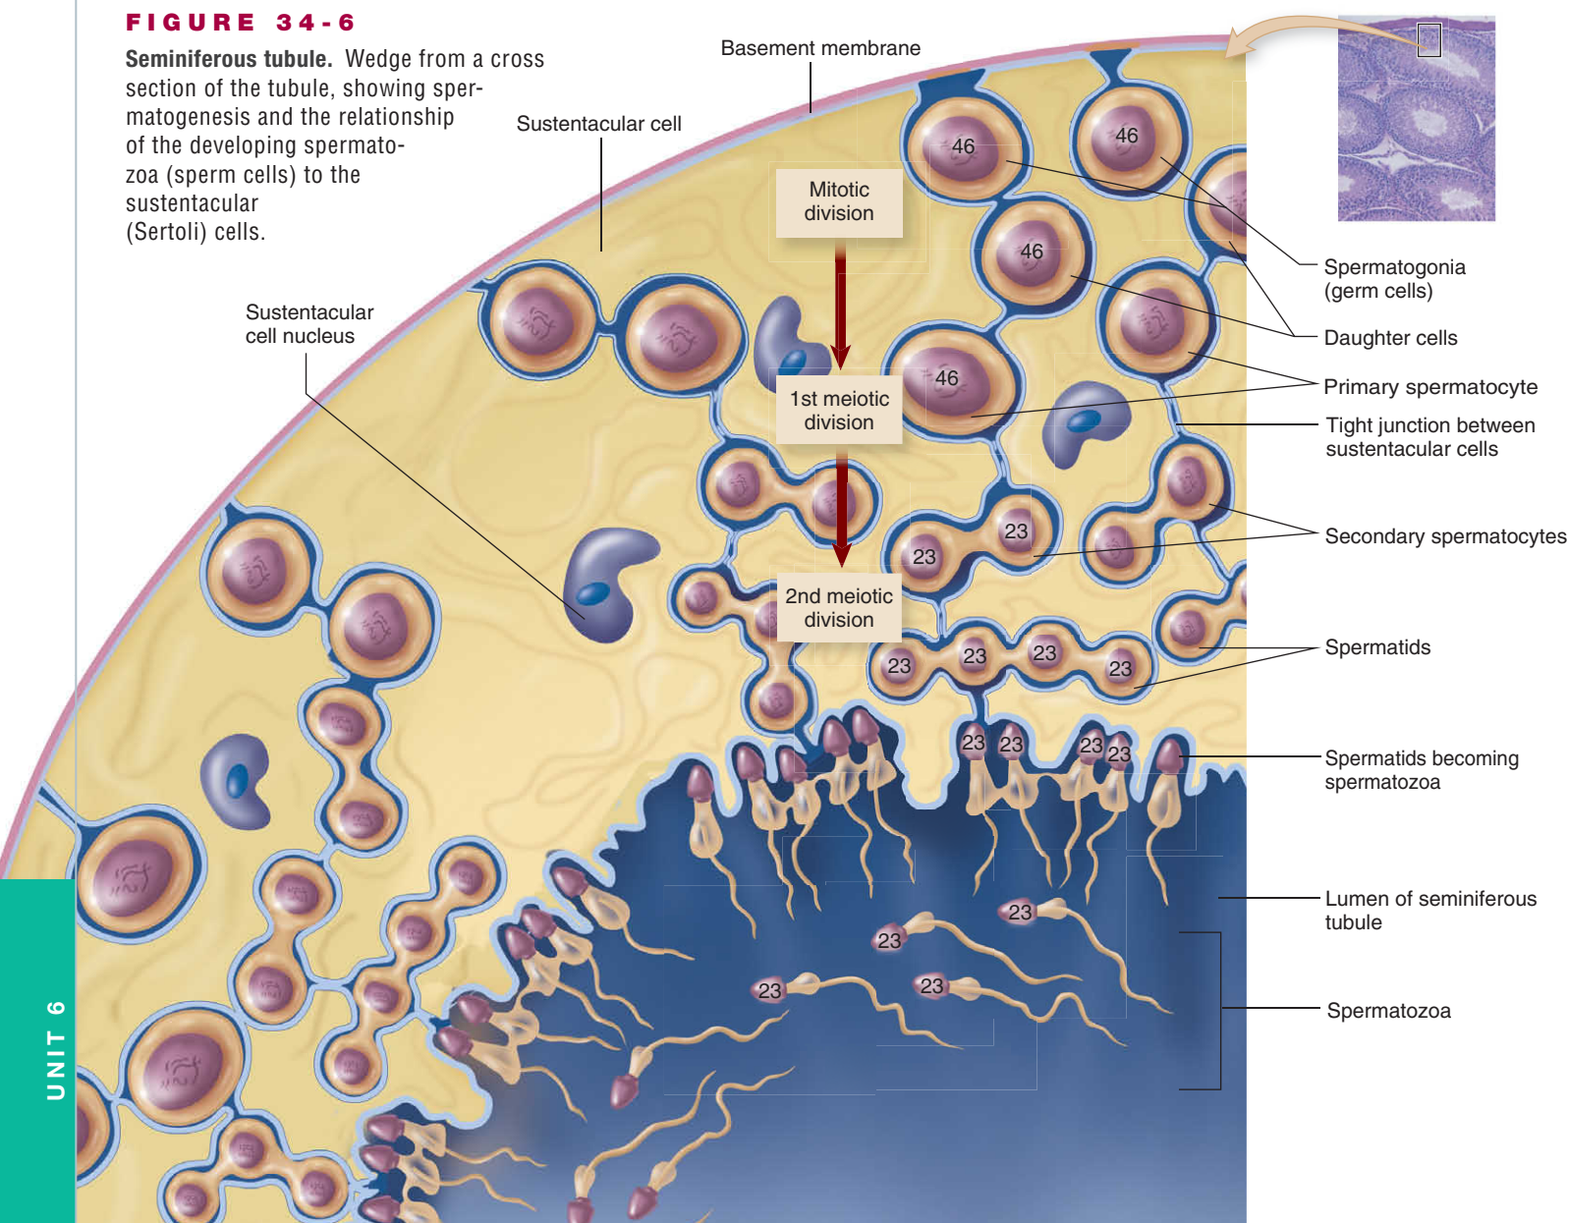
Sustentacular cells within seminiferous epithelium. Sustentacular cells are columnar in shape, extending from basement membrane to lumen of the tubule. Spermatids can be seen attached to the luminal surface of the sustentacular cells. Sustentacular cells are also called *nurse cells* or *Sertoli cells.*

At sexual maturity, sustentacular cells begin to secrete **androgen-binding protein,** or **ABP,** that binds to testosterone, a steroid lipid hormone, to make it more water soluble. This increases the testosterone concentration within the seminiferous tubules. High concentrations of testosterone are required for normal germ cell maturation. Thus sustentacular cells play an important role in spermatogenesis (sperm production).

Sustentacular cells are columnar in shape and extend from the basement membrane to the luminal surface of the seminiferous tubule (Figures 34-5 and 34-6). *Tight junctions* exist between adjacent sustentacular cells and divide the wall of the tubule into two compartments that house either meiotically active cells near the luminal surface or spermatogonia near the basement membrane.

Tight junctions between sustentacular cells form the **blood-testis barrier (BTB).** This structure isolates the developing sperm cells, which have active surface antigens different from somatic body cells, from the body immune system. If these antigens were to escape from the tubule epithelium and enter the bloodstream by breaking through the basement membrane, an autoimmune reaction could occur.

Testes Functions



The testes perform two primary functions: spermatogenesis and secretion of hormones.

Spermatogenesis is the production of spermatozoa (sperm), the male gametes, or reproductive cells. The seminiferous tubules produce the sperm. Figure 34-6 shows a cross section of a seminiferous tubule in which two meiotic divisions result in a reduction of chromosomes from 46 in the spermatogonia to 23 in the spermatids and mature sperm. Details of spermatogenesis are discussed in Chapter 36.

Testosterone is the major **androgen** (masculinizing hormone) produced in humans. Testosterone is a steroid hormone produced by interstitial cells. Another hormone, inhibin, is produced by sustentacular cells of the testis.

FIGURE 34-6

Seminiferous tubule. Wedge from a cross section of the tubule, showing spermatogenesis and the relationship of the developing spermatozoa (sperm cells) to the sustentacular (Sertoli) cells.

Testosterone has several functions. One important group of functions is that it promotes "maleness," or development and maintenance of male secondary sex characteristics, accessory organs such as the prostate, seminal vesicles, and adult male sexual behavior.

Testosterone also helps regulate metabolism. It is usually classified as an anabolic hormone because it stimulates the protein anabolism. By stimulating protein anabolism, testosterone promotes growth of skeletal muscles (responsible for greater male muscular development and strength). This effect has tempted some athletes to take various synthetic versions of testosterone or testosterone promoters to enhance muscular strength. Testosterone also stimulates bone growth and promotes closure of the epiphyses (see Chapter 8, p. 202). Early sexual maturation leads to early epiphyseal closure. The converse also holds true: late sexual maturation, delayed epiphyseal closure, and tallness tend to go together.

Testosterone also plays a part in fluid and electrolyte balance. Testosterone has a mild stimulating effect on kidney tubule reabsorption of sodium and water; it also promotes kidney tubule excretion of potassium.

The anterior pituitary gland controls the testes by means of its gonadotropic hormones—specifically, FSH and luteinizing hormone (LH). FSH stimulates the seminiferous tubules to produce sperm more rapidly. In the male, LH stimulates interstitial cells to increase their secretion of testosterone.

If the blood concentration of testosterone reaches a high level, it will inhibit hypothalamic secretion of gonadotropin-releasing hormone (GnRH). As a result, anterior pituitary secretion of LH will decrease and testosterone levels will return to the normal set point value (Figure 34-7). Increasing blood levels of *inhibin* will selectively decrease GnRH secretion by the hypothalamus and FSH secretion by the anterior pituitary—thus decreasing the rate of sperm production. However, if sperm counts decrease below the normal set point, inhibin secretion will drop, FSH secretion will increase, and sperm numbers will increase to normal levels. Thus a negative feedback mechanism operates between the hypothalamus, the anterior pituitary gland, and the hormone-producing cells of the testes—interstitial cells producing testosterone and sustentacular cells producing inhibin. The end result is homeostatic control of the full range of effects influenced by testosterone levels—including a direct influence on sperm numbers.

Small but measurable amounts of *estrogen* are present in healthy adult males. More research is needed to explore its role in normal male physiology. Some of the estrogen, a steroid hormone derived from testosterone, is made in interstitial cells (see Figure 18-5 on p. 549). However, most of the estrogen in males is probably made in the liver and other tissues. Possible roles for estrogen in men includes regulation of spermatogenesis, feedback inhibition of FSH and LH, and promoting normal male sexual behavior and partner preference.

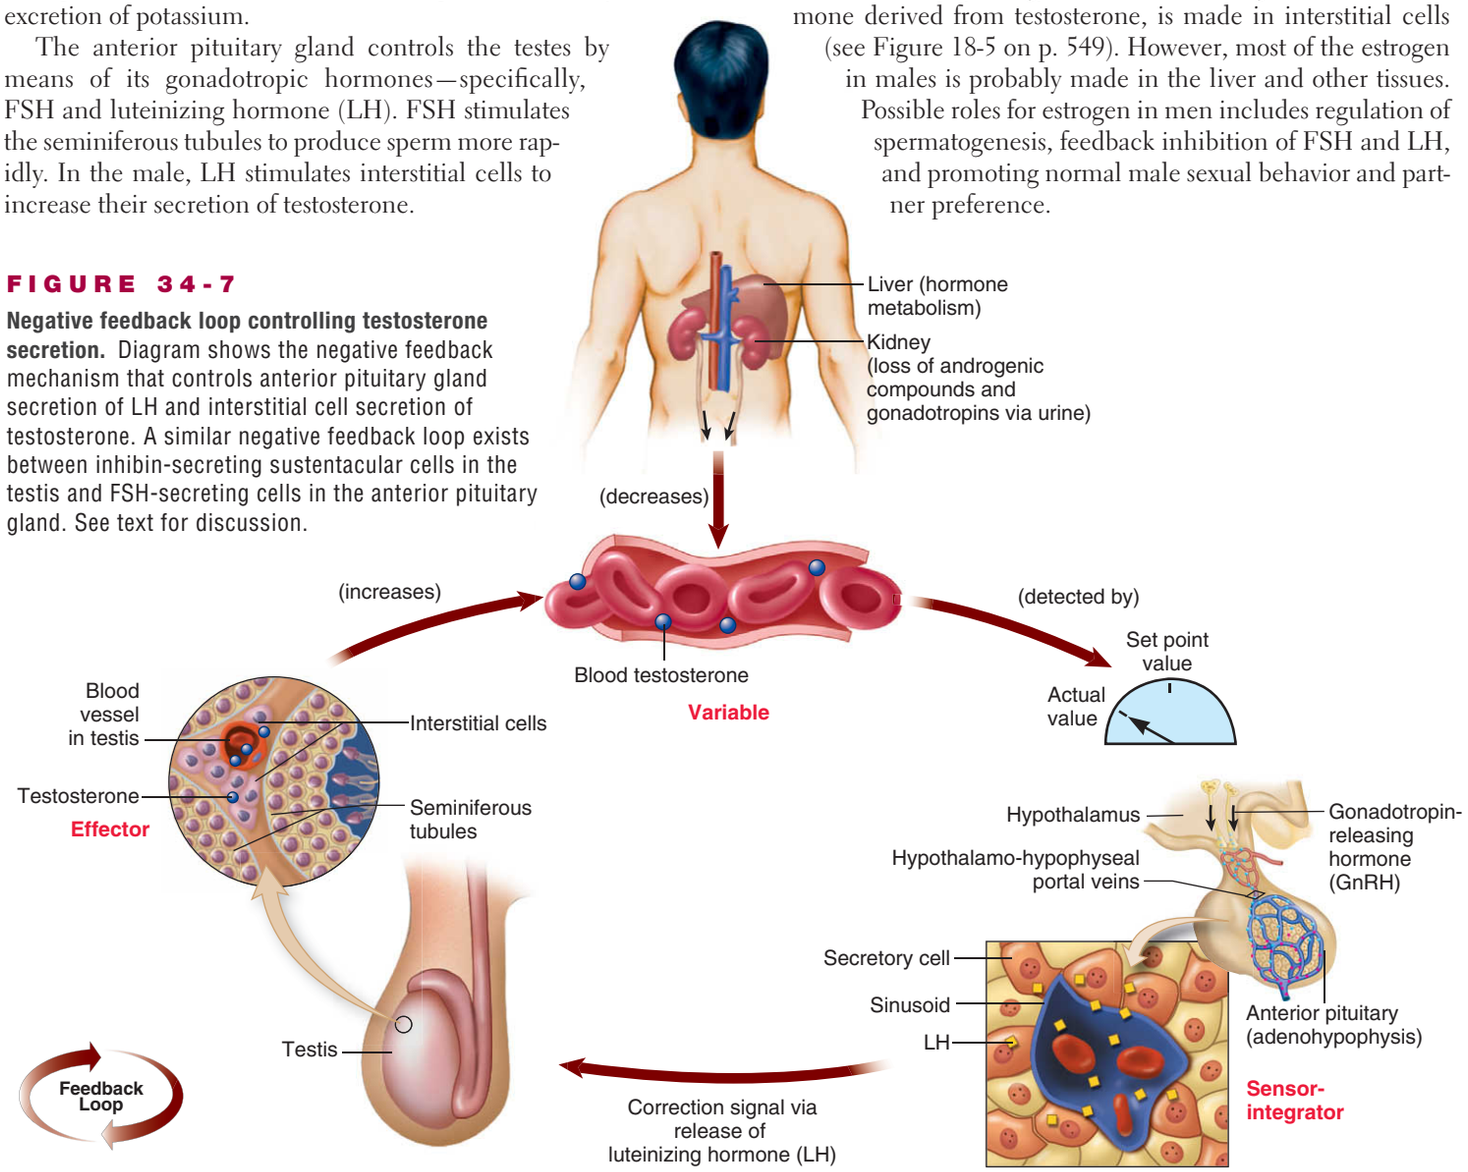


FIGURE 34-7

Negative feedback loop controlling testosterone secretion. Diagram shows the negative feedback mechanism that controls anterior pituitary gland secretion of LH and interstitial cell secretion of testosterone. A similar negative feedback loop exists between inhibin-secreting sustentacular cells in the testis and FSH-secreting cells in the anterior pituitary gland. See text for discussion.

TABLE 34-1 Male Reproductive Hormones

HORMONE	SOURCE	TARGET	ACTION
Dehydroepiandrosterone (DHEA)	Adrenal gland, testis, other tissues	Converted to other hormones	Eventually converted to estrogens, testosterone, or both (see Figure 18-5 on p. 549)
Estrogen	Testis (interstitial cells), liver, other tissues	Testis (spermatogenic tissue), other tissues	Role of estrogen in men is still uncertain; may play role in spermatogenesis, inhibition of gonadotropins, male sexual behavior and partner preference
Follicle-stimulating hormone (FSH)	Anterior pituitary (gonadotroph cells)	Testis (spermatogenic tissue)	Gonadotropin; promotes development of testes and stimulates spermatogenesis
Gonadotropin-releasing hormone (GnRH)	Hypothalamus (neuroendocrine cells)	Anterior pituitary (gonadotroph cells)	Stimulates production and release of gonadotropins (FSH and LH) from anterior pituitary
Inhibin	Testis (sustentacular cells)	Hypothalamus Anterior pituitary (gonadotroph cells)	Inhibits GnRH secretion by the hypothalamus and FSH production in the anterior pituitary
Luteinizing hormone (LH)	Anterior pituitary (gonadotroph cells)	Testis (interstitial cells)	Gonadotropin; stimulates production of testosterone by interstitial cells of testis
Testosterone	Testis (interstitial cells)	Spermatogenic cells, skeletal muscle, bone, other tissues	Stimulates spermatogenesis, stimulates development of primary and secondary sexual characteristics, promotes growth of muscle and bone (anabolic effect)

Table 34-1 summarizes some of the reproductive hormones in males.

Spermatozoa

The elongated tail-bearing **spermatozoa** seen in the seminiferous tubules (Figure 34-8, *B*) appear fully formed. We know, however, that they undergo a process of "ripening," or maturation, as they pass through the genital ducts before ejaculation. Although anatomically complete and highly motile when ejaculated, sperm must still undergo a complex process called **capacitation** before they are actually capable of fertilizing an egg cell or ovum (female gamete). Normally, capacitation occurs in sperm only after they have been introduced into the vagina of the female.

Figure 34-8, *C*, shows the characteristic parts of a spermatozoon: head, middle piece, and elongated, lashlike tail.

The head of a spermatozoon is, in essence, a highly compact package of genetic chromatin material, about 5 µm long, covered by an *acrosome* and *acrosomal (head) cap*. The acrosome contains hydrolytic (splitting) enzymes, which are released during capacitation. During the process of capacitation, the acrosomal enzymes first break down cervical mucus, allowing sperm to pass into the uterus and uterine tubes. If an ovum is present in the female reproductive tract when **semen** is introduced, continued release of acrosomal enzymes assists the sperm cells to digest and penetrate the outer covering of the egg and initiate fertilization. This is the primary reason a high sperm count is essential for male fertility. The process of fertilization is explored further in Chapter 36.

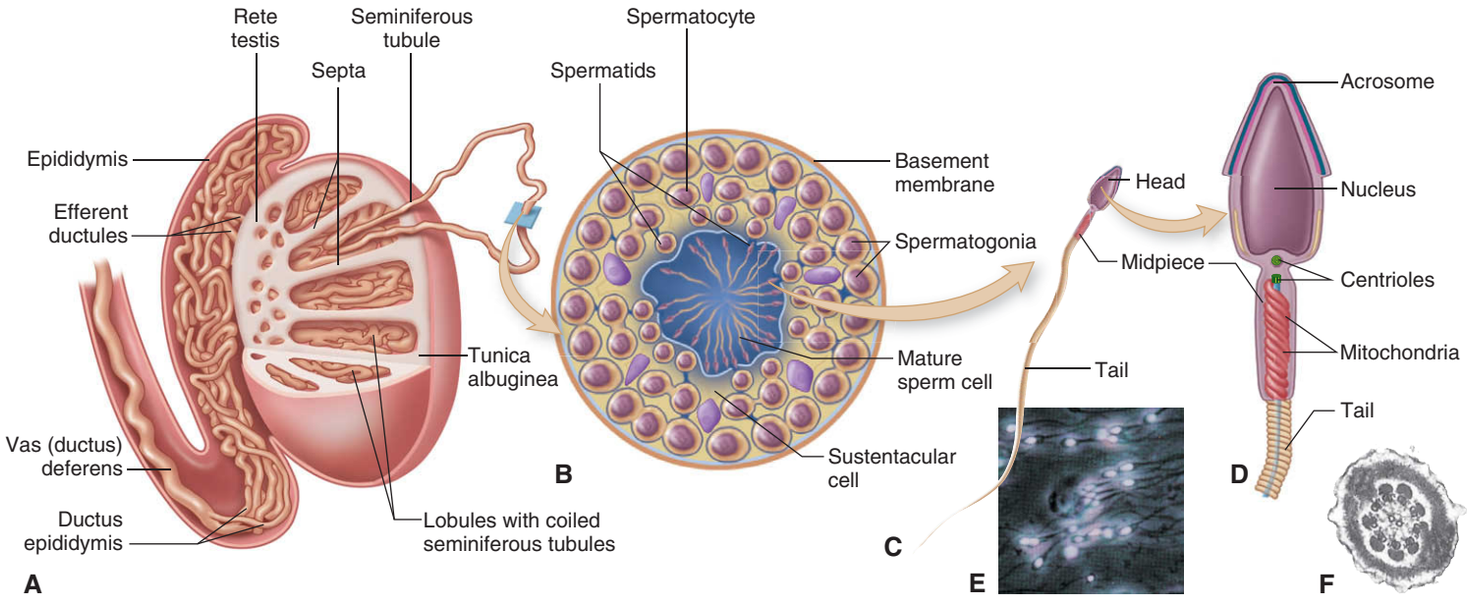

FIGURE 34-8
Development and structure of sperm. A, View of testis and seminiferous tubules. **B,** Spermatid cells in a seminiferous tubule. **C,** Mature sperm. **D,** Enlarged view of head and midpiece. **E,** Micrograph of sperm that shows taken up nuclear material that glows with a fluorescent dye. **F,** Electron micrograph (EM) of a cross section of sperm tail showing nine double microtubules arranged around two single central microtubules.

The sperm nucleus, which takes up most of the room inside the sperm head, is released into the ovum during the process of fertilization. When the genetic material of the sperm nucleus and egg nucleus unite, they form the nucleus of a new offspring cell.

The cylindrical middle piece or *midpiece* of the sperm is connected to the sperm head by a narrow *neck*. The midpiece is about 7 µm long, is characterized by a helical arrangement of mitochondria arranged end to end around a central core. It is this mitochondrial sheath that provides energy for sperm locomotion. Within the core are the ends of the microtubules that extend all the way through the sperm tail. Motor molecules within the core of the midpiece cause the microtubules to move in their typical, propellerlike fashion.

The tail is divided into a principal piece, about 40 µm long, and a short end piece, 5 to 10 mm in length. If the tail portion of a spermatozoon is cut in cross section and viewed with an electron microscope (Figure 34-8, *F*), its microstructure looks like other flagella capable of motility (see Chapter 3, p. 82). Note in Figure 34-8, *F* that the central portion of the sectioned sperm tail is a cylinder composed of nine double microtubules arranged around two single microtubules in the center.

Progesterone and other molecules released by cells that surround the ovum trigger increased sperm motility and attract sperm toward the ovum.

| QUICK CHECK |

4. Describe the location, the size, and the shape of the testes.
5. List the two primary functions of the testes and identify the cell type or structure involved in each function.
6. List the general functions of testosterone.
7. Identify the structural components of a spermatozoon and give the function of each.

REPRODUCTIVE DUCTS

Epididymis

STRUCTURE AND LOCATION

Each **epididymis** consists of a single, tightly coiled tube enclosed in a fibrous casing. The tube has a very small diameter (just barely macroscopic) but measures approximately 6 meters (20 feet) in length. It lies along the top and behind the testis (see Figure 34-3). The comma-shaped epididymis is divided into a blunt superior *head* (which is connected to the testis by the efferent ductules), a central *body*, and a tapered inferior portion that is continuous with the vas deferens, called the *tail*. If the epididymis is cut or sectioned and a slide prepared as in Figure 34-9, the compact and highly coiled nature of the tubule is apparent.

FUNCTIONS

The epididymis serves as one of the ducts through which sperm pass in their journey from the testis to the exterior. Each epididymis stores sperm, which spend from 1 to 3 weeks in this segment of the duct system. While there, the sperm continue to mature with the support of nutrients from the epididymis. The epididymal secretions also eventually become a small part of the seminal fluid (semen) that is eventually ejaculated with the sperm during the male sexual response. After about 3 weeks, any unused sperm break down and are reabsorbed by the body.

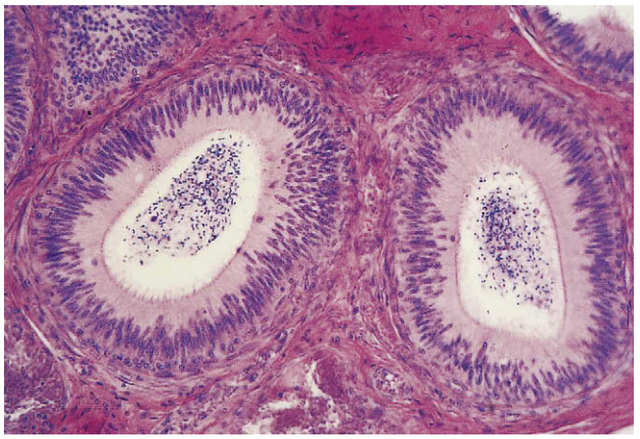

FIGURE 34-9

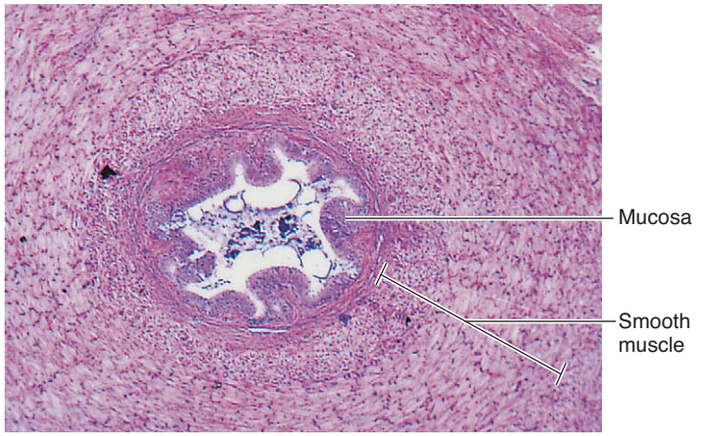
Epididymis section. Two cross sections of this extensively coiled tubule are visible. Note the presence of spermatozoa within the lumina of the tubules.

Vas Deferens

STRUCTURE AND LOCATION

The **vas deferens,** like the epididymis, is a tube. Also called the *ductus deferens*, the vas deferens is a duct that extends from the tail of the epididymis. The vas deferens has thick, muscular walls (Figure 34-10) and can be palpated in the scrotal sac as a smooth, movable cord. Note in Figure 34-10 that the muscular layer of the vas deferens has three layers: a thick intermediate circular layer of muscle fibers and inner and outer longitudinal layers. The muscular layers of the vas deferens help in propelling sperm through the duct system.

The vas deferens from each testis ascends from the scrotum and passes through the inguinal canal as part of the spermatic cord—enclosed by fibrous connective tissue with blood vessels, nerves, and lymphatics—into the abdominal cavity. Here it extends over the top and down the posterior surface of the bladder where an enlarged and tortuous portion called the *ampulla* joins



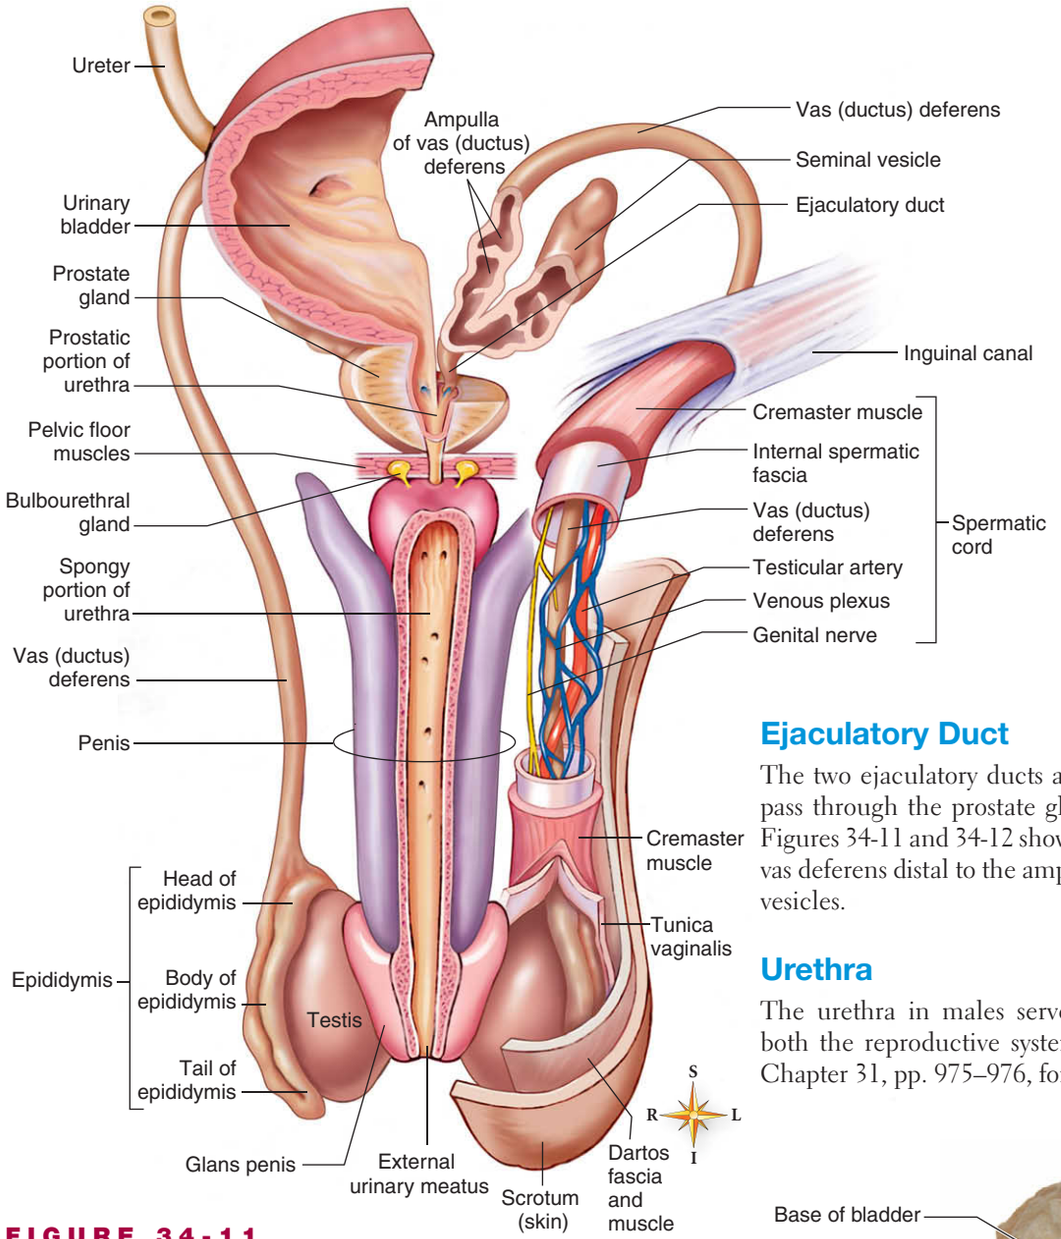


FIGURE 34-10

Transverse section of vas deferens. Mucosa protrudes into the lumen in several low folds. Note the thick muscular coat surrounding the mucosa.

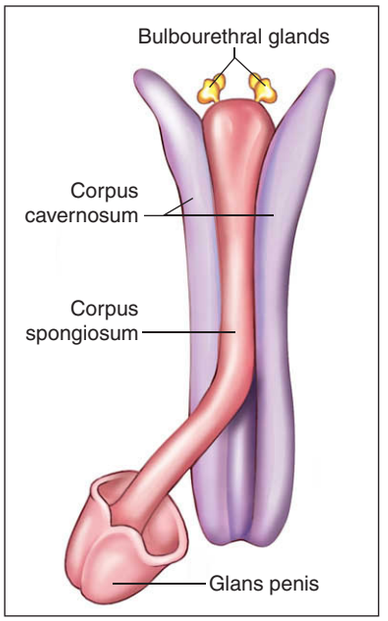

FIGURE 34-11

The male reproductive system. Illustration shows the testes, epididymis, vas (ductus) deferens, and glands of the male reproductive system in an isolation/dissection format.

the duct from the seminal vesicle to form the ejaculatory duct (Figures 34-1, 34-11, and 34-12).

FUNCTION

The vas deferens serves as one of the male genital ducts connecting the epididymis with the ejaculatory duct. Sperm remain in the vas deferens for varying periods of time depending on the degree of sexual activity and frequency of ejaculation. Storage time may exceed 1 month with no loss of fertility.

Severing or clamping off the vas deferens—that is, performing a **vasectomy,** usually done through an incision in the scrotum—makes a man sterile. Why? Because it interrupts the route to the exterior from the epididymis. To leave the body, sperm must journey in succession through the epididymis, vas deferens, ejaculatory duct, and urethra.

Ejaculatory Duct

The two ejaculatory ducts are short tubes about 1 cm long that pass through the prostate gland to terminate in the urethra. As Figures 34-11 and 34-12 show, they are formed by the union of the vas deferens distal to the ampulla with the ducts from the seminal vesicles.

Urethra

The urethra in males serves a dual function, which involves both the reproductive system and the urinary system. Refer to Chapter 31, pp. 975–976, for a discussion of this duct.

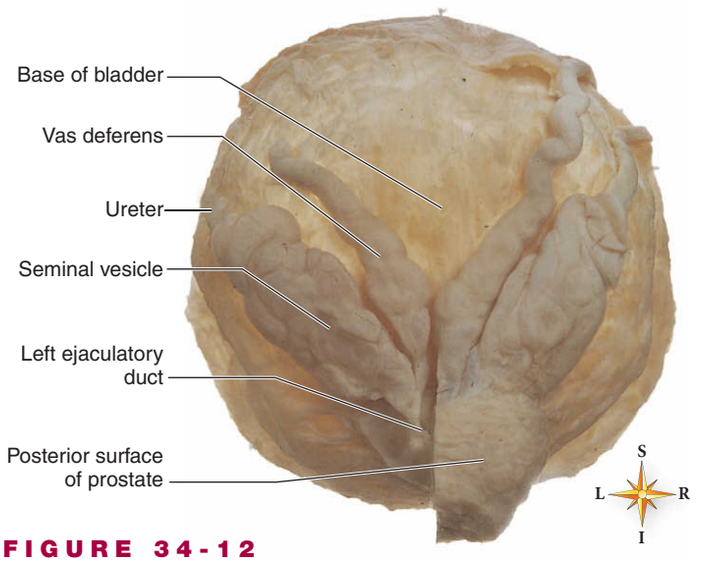

FIGURE 34-12

Prostate and related structures. Cadaver dissection showing the prostate gland and other male reproductive structures viewed from behind. The prostate has been sectioned on the left side to reveal the ejaculatory duct.

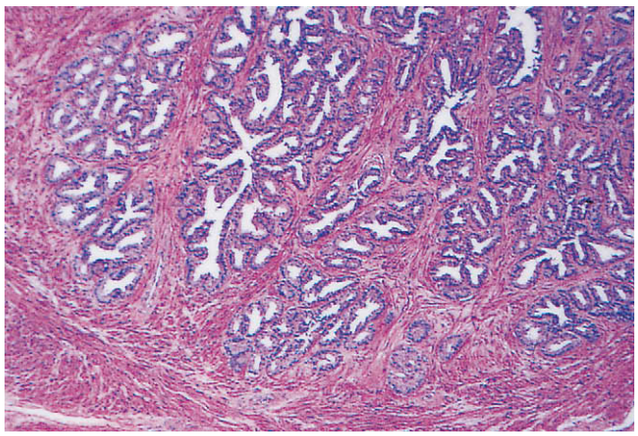

FIGURE 34-13

Seminal vesicle. Note the highly branched and convoluted nature of the secretory epithelium.

ACCESSORY REPRODUCTIVE GLANDS

Seminal Vesicles

STRUCTURE AND LOCATION

The **seminal vesicles** are highly convoluted pouches that, when fully extended, are about 15 cm in length. Each is a tubular diverticulum of the vas deferens on one side and is coiled on itself so that it forms a body about 5 to 7 cm in length. The two vasa deferentia lie along the lower part of the posterior surface of the bladder, directly in front of the rectum (see Figures 34-1, 34-11, and 34-12). Figure 34-12 is an isolated cadaver specimen showing the relationships of a number of the male reproductive structures, including the seminal vesicles, when viewed from behind. The highly branched and convoluted nature of the secretory epithelium filling the lumen of the seminal vesicles is apparent in Figure 34-13.

FUNCTION

The seminal vesicles secrete an alkaline, viscous, creamy-yellow liquid that constitutes about 60% of semen volume. The alkalinity helps neutralize the acid pH environment of the terminal urethra and in the vagina. Fructose found in this component of the semen serves as an energy source for sperm motility after ejaculation. Other components include prostaglandins, which are involved in cyclic AMP formation, and a non–blood type coagulating enzyme called *vesiculase*.

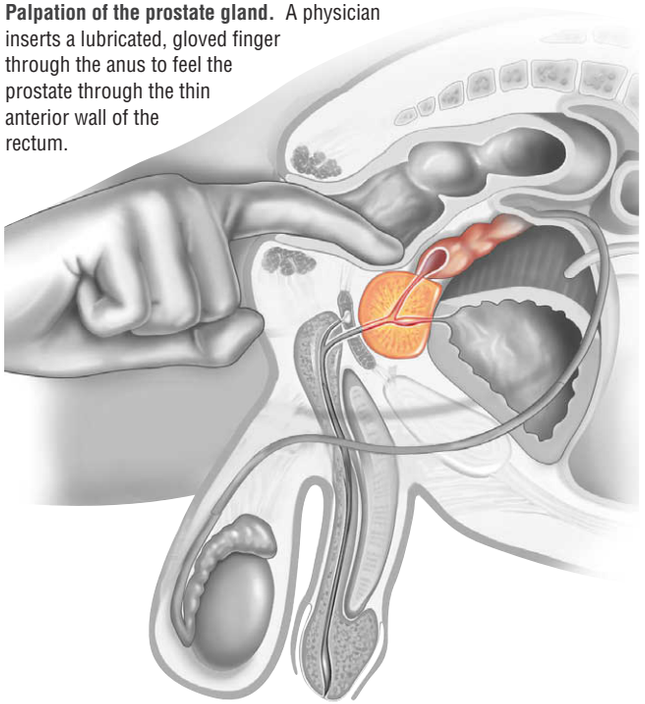
Prostate Gland

STRUCTURE AND LOCATION

The **prostate** is a compound tubuloalveolar gland that lies just below the bladder and is shaped like a doughnut. The fact that the urethra passes through the small hole in the center of the prostate is a matter of considerable clinical significance. Many older men suffer from a noncancerous enlargement of this gland called **benign prostatic hypertrophy** (see p. 1058). As the prostate enlarges, it squeezes the urethra, frequently closing it so completely that urination becomes impossible. Urinary retention results. Surgical removal of the gland (prostatectomy) is required as a cure for this condition when other less radical methods of treatment fail.

FUNCTION

The prostate secretes a watery, milky-looking, and slightly acidic fluid that constitutes about 30% of the seminal fluid volume. Citrate, found in prostatic fluid, serves as a nutrient for sperm. Other constituents include enzymes such as hyaluronidase and *prostate-specific antigen* (PSA) (Box 34-1). Prostatic fluid plays an important role in sperm activation, viability, and motility.



Box 34-1 | DIAGNOSTIC study

Prostate Cancer Screening

Many of the 32,000 men who die each year from prostate cancer—the most common nonskin type of cancer in American men—could be saved if the cancer was detected early enough for effective treatment. Several screening tests are available for the detection of prostate cancer once it develops. Cancerous growths in the gland can often be palpated through the wall of the rectum (figure).

Sometimes, rectal examinations are performed in conjunction with a screening test called the *PSA test.* This test is a type of blood analysis that screens for *prostate-specific antigen (PSA),* a substance sometimes found to be elevated in the blood of men with prostate cancer. Unfortunately, PSA levels may not be elevated with prostate cancer and may be high in some men without prostate cancer. Thus the PSA test is most useful when used with other screening methods.

A nuclear medicine *bone scan* is often used either to exclude metastatic spread of prostate cancer or to locate areas of the body where secondary prostate cancer tumors have already developed. An image of a bone scan showing the metastasis of prostate cancer can be viewed in ***Bone Scans*** online at ***A&P Connect.***

Palpation of the prostate gland. A physician inserts a lubricated, gloved finger through the anus to feel the prostate through the thin anterior wall of the rectum.

Bulbourethral Glands

STRUCTURE AND LOCATION

The two **bulbourethral glands** *(Cowper glands)* resemble peas in size and shape. You can see the location of these compound tubuloalveolar glands in Figure 34-11. A duct approximately 2.5 cm (1 inch) long connects them with the penile portion of the urethra.

FUNCTION

Like the seminal vesicles, the bulbourethral glands secrete an alkaline fluid that is important for counteracting the acid present in the male urethra and the female vagina. Mucus produced in these glands serves to lubricate the urethra and helps protect sperm from friction damage during ejaculation.

| QUICK CHECK |

8. List, in sequence, the reproductive ducts sperm pass through from formation to ejaculation.
9. What is the structural relationship between the prostate gland and the urethra?
10. Compare the volume, viscosity, pH, and composition of the secretions produced by the accessory reproductive glands.

SUPPORTING STRUCTURES

Scrotum

The **scrotum** is a skin-covered pouch suspended from the perineal region. Internally, it is divided into two sacs by a septum, each sac containing a testis, epididymis, and lower part of a spermatic cord.

The *dartos* fascia and muscle are located just below the skin of the scrotum (see Figure 34-11). Contraction of the dartos muscle fibers causes slight elevation of the testes and wrinkling of the scrotal pouch. In addition, contraction of the *cremaster muscle*, also seen in Figure 34-11, causes significant elevation of the testes. The cremaster muscle forms an elongated pouch for each testis within the scrotum. Each pouch containing one testis is lined with a doubled serous membrane called the *tunica vaginalis*, which permits the testis within to slide around. This testicular sliding protects against possible injury by allowing the testes to move out of harm's way when the scrotum is pressed or pinched. When the cremaster muscle contracts, the testes are pulled upward against the perineum. Sexual arousal, cold temperature, and threat of injury provide the stimulus for contraction of both the dartos and cremaster muscles.

The temperature required for optimum sperm formation is about 3° C below normal body temperature. This is the "functional" reason that justifies placement of the testes outside the body cavity where they are exposed and subject to traumatic injury. In a warm environment the scrotum becomes elongated and its skin appears loose and wrinkle free, permitting the testes to descend away from the body. In the cold, the scrotum elevates and becomes heavily wrinkled, effectively pulling the testes upward toward the body wall. Both actions help maintain the temperature of the testes at a more constant level. Factors other than temperature, including blood flow dynamics and tissue oxygen levels, are also suggested as "reasons" for scrotal placement of the testes.

Penis

STRUCTURE

Three cylindrical masses of erectile, or cavernous, tissue, enclosed in separate fibrous coverings and held together by a covering of skin, compose the **penis** (Figure 34-14). The two larger and uppermost of these cylinders are named the **corpora cavernosa,**

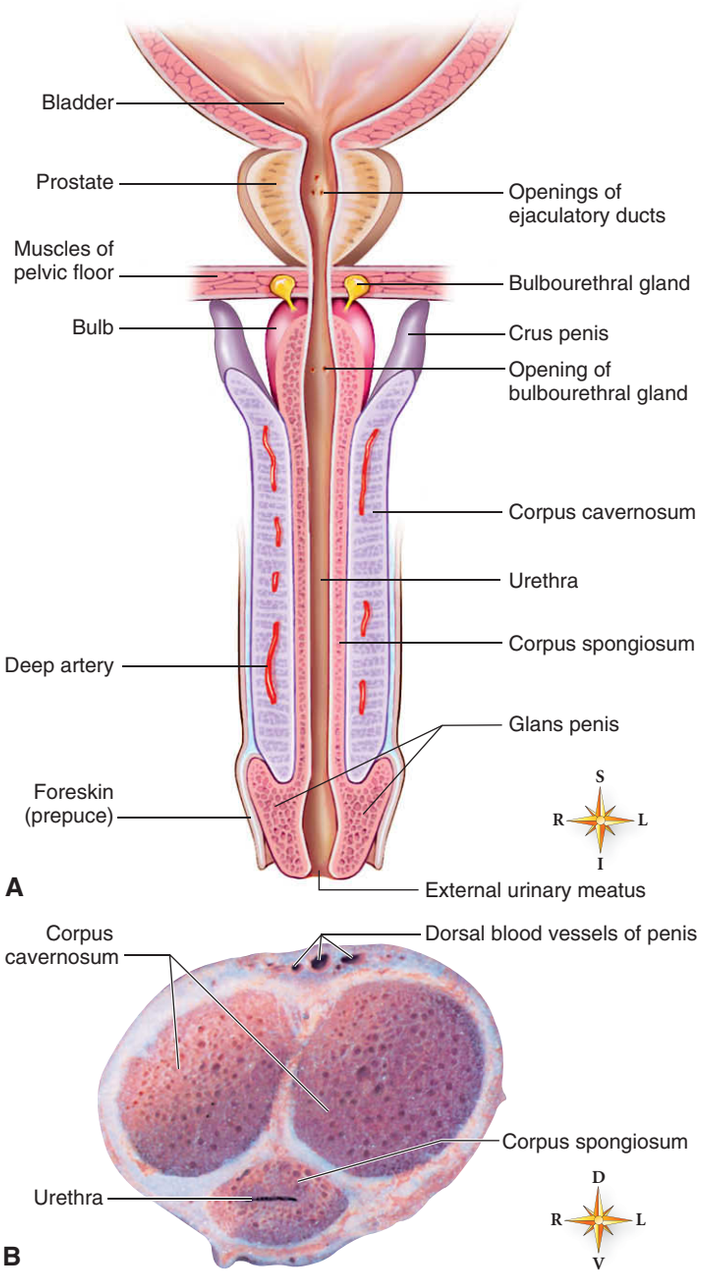


FIGURE 34-14

The penis. A, In this sagittal section of the penis viewed from above, the urethra is exposed throughout its length and can be seen exiting from the bladder and passing through the prostate gland before entering the penis to end at the external urinary meatus (urethral orifice). **B,** Photograph of a cross section of the shaft of the penis showing the three columns of erectile, or cavernous, tissue. Note the urethra within the substance of the corpus spongiosum.

whereas the smaller, lower one, which contains the urethra, is called the **corpus spongiosum.**

The distal part of the corpus spongiosum overlaps the terminal end of the two corpora cavernosa to form a slightly bulging structure, the **glans penis,** over which the skin is folded doubly to form a more or less loose-fitting, retractable casing known as the **prepuce,** or foreskin. The opening of the urethra at the tip of the glans is called the *external urinary meatus.*

| A&P CONNECT |

Removal of the foreskin is called circumcision. Learn more about how and why this procedure is done in ***Male Circumcision*** online at ***A&P Connect.***

evolve

FUNCTIONS

The penis contains the urethra, the terminal duct for both urinary and reproductive tracts. During sexual arousal, the erectile tissue of the penis fills with blood, causing the organ to become rigid and enlarge in both diameter and length. The result, called an **erection,** permits the penis to serve as a penetrating copulatory organ during sexual intercourse. The scrotum and penis constitute the external **genitals**, or *genitalia*, of the male.

Spermatic Cords

The **spermatic cords** are cylindrical casings of white, fibrous tissue located in the inguinal canals between the scrotum and the abdominal cavity. They enclose the vasa deferentia, blood vessels, lymphatics, and nerves (see Figure 34-11).

COMPOSITION AND COURSE OF SEMINAL FLUID

The following structures secrete the substances that, together, make up the *seminal fluid*, or **semen:**

- Testes and epididymis—secretions constitute less than 5% of the seminal fluid volume.
- Seminal vesicles—combined secretions are reported to contribute about 60% of the seminal fluid volume.
- Prostate gland—secretions constitute about 30% of the seminal fluid volume.
- Bulbourethral glands—secretions are said to constitute less than 5% of the seminal fluid volume.

Besides contributing slightly to the seminal fluid, the testes also add hundreds of millions of sperm. In traversing the distance from their place of origin to the exterior, the sperm must pass from the testis through the epididymis, vas deferens, ejaculatory duct, and urethra. Note that sperm originate in the testes, glands located outside the body (that is, not within a body cavity), travel to the inside of the body, and finally are expelled to the outside (external environment) by way of ejaculation.

Box 34-2 summarizes important elements of the male sexual response.

MALE FERTILITY

Male fertility relates to many factors—most of all to the number of sperm ejaculated but also to their size, shape, and motility. Fertile sperm have a uniform size and shape. They are highly motile. Although only one sperm fertilizes an ovum, millions of sperm seem to be necessary for fertilization to occur. According to one estimate, when the sperm count falls below about 25 million/ml of semen, functional sterility results.

One hypothesis suggested to explain this puzzling fact is this: semen that contains an adequate number of sperm also contains enough hyaluronidase and other hydrolytic enzymes to liquefy the intercellular substance between the cells that encase each ovum. Without this, a single sperm cannot penetrate the layers of cells around the ovum and hence cannot fertilize it. Infertility may also be caused by production of antibodies some men make against their own sperm. This type of sperm destruction or inactivation, called "immune infertility," is caused by an antigen-antibody reaction. A sperm surface protein called *fertilization antigen (FA-1)* triggers antibody production, which results in infertility.

Box 34-2 | FYI

Neural Control of the Male Sexual Response

Recall that all body functions but one have the ultimate goal of survival of the individual. Only the function of reproduction serves a different, a longer-range, and no doubt in nature's scheme, a more important purpose—survival of the human species. Male functions in reproduction consist of the production of male sex cells (spermatogenesis) and introduction of these cells into the female body *(coitus, copulation,* or *sexual intercourse).* For coitus to take place, erection of the penis must first occur, and for sperm to enter the female body, both the sex cells and secretions from the accessory glands must be introduced into the urethra (emission) and semen must be ejaculated from the penis.

Erection is a parasympathetic reflex initiated mainly by certain tactile, visual, and mental stimuli. It consists of dilation of the arteries and arterioles of the penis, which in turn floods and distends spaces in its erectile tissue and compresses its veins. Therefore more blood enters the penis through the dilated arteries than leaves it through the constricted veins. Hence it becomes larger and rigid, or in other words, erection occurs.

Emission is the reflex movement of sex cells, or spermatozoa, and secretions from the genital ducts and accessory glands into the prostatic urethra. Once emission has occurred, ejaculation will follow.

Ejaculation of semen is also a reflex response. It is the usual outcome of the same stimuli that initiate erection. Ejaculation and various other responses—notably accelerated heart rate, increased blood pressure, hyperventilation, dilated skin blood vessels, and intense sexual excitement—characterize the male **orgasm,** or sexual climax.

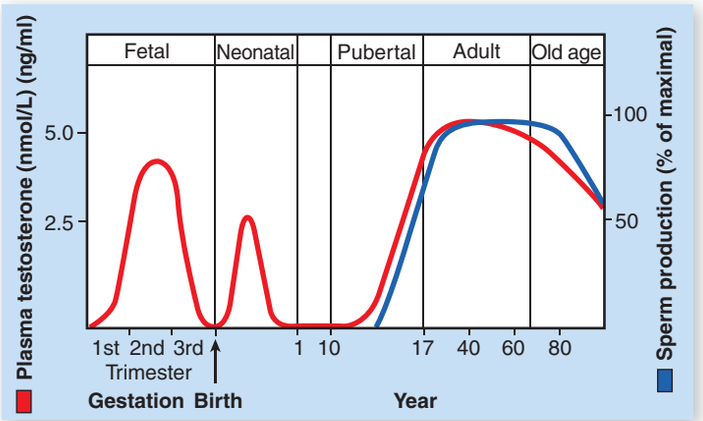

FIGURE 34-15

Testosterone levels and sperm production. Plasma testosterone levels (red line) rise during fetal development, when it stimulates early development of male sexual organs. Testosterone rises again briefly around the time of birth, which facilitates descent of the testes into the scrotum. Then at puberty, testosterone rises enough to support sperm production (blue line) and later tapers off in advanced old age.

Figure 34-15 shows that as average plasma testosterone levels increase during puberty, sperm production begins. Testosterone levels—and thus sperm production—reach a peak in early adulthood and remain high into old age. In advanced old age, testosterone production tapers off—and thus so does fertility, as seen in the dropping sperm count.

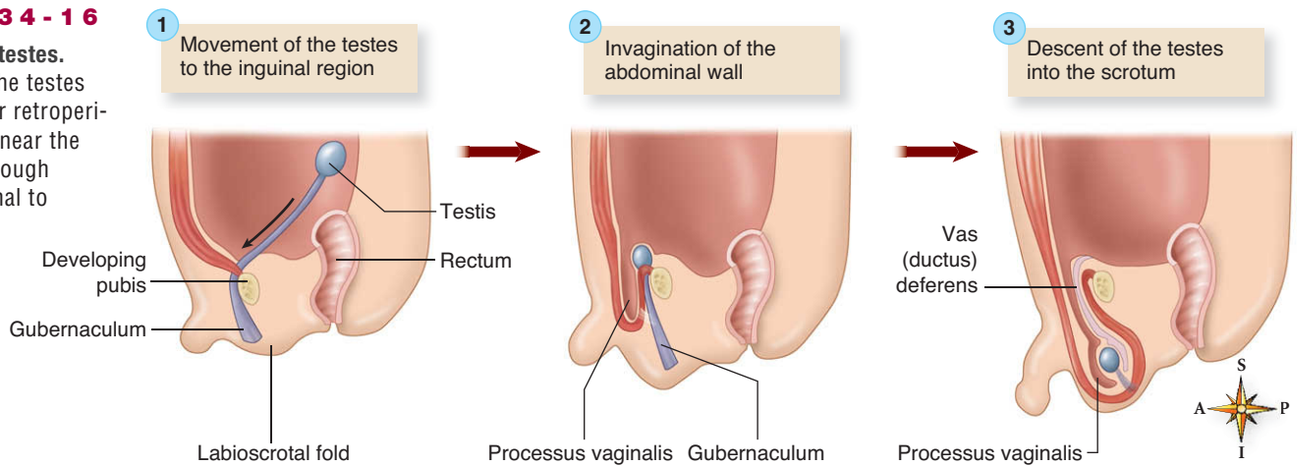
| QUICK CHECK |

11. What two structures constitute the external genitals of the male?
12. What is the function of the dartos and cremaster muscles? How does this function influence fertility?
13. Identify by name the three cylindrical masses of erectile tissue in the penis.
14. What factors influence male fertility?

Cycle of LIFE

Male Reproductive System

The reproductive system is unlike all other systems of the male body with regard to normal changes that occur throughout the life span. All other systems perform their functions from the time they develop in utero until advanced old age, when degeneration may cause loss of function and, perhaps, death. The male reproductive system, however, does not begin to perform its functions until puberty—usually during the early teenage years. Of course, the biological advantage of this "late start" is that a person does not have the biological, psychological, or social maturity to become a parent before that time.



Initial development of the male reproductive organs begins before birth, when the reproductive tract differentiates into the male form rather than the female form (see Figures 36-17 and 36-18 on p. 1112). At about the seventh week of embryonic development, genes in the Y chromosome in males trigger the production of enough testosterone to stimulate the development of male reproductive organs. Without this early spurt of testosterone (see Figure 34-15), the organs would instead develop into the female form.

A couple of months before birth, the immature testes descend behind the parietal peritoneum into the scrotum (Figure 34-16). The testes are guided in their descent by a threadlike, fibrous gubernaculum. It is not uncommon for them to be late in completing the descent, perhaps not arriving in the scrotum until several weeks after birth. Figure 34-15 shows a spurt in testosterone levels around the time of birth that can then stimulate descent of the testes.

The testes and other reproductive organs remain in an immature form—and thus remain incapable of providing reproductive function—until puberty, when high levels of reproductive hormones stimulate the final stages of their development (see Figure 34-15). From puberty until advanced old age the male reproductive system continues to operate efficiently enough to permit successful reproduction. A gradual decline in hormone production during late adulthood may decrease sexual desire and fertility to some degree, but a man may be able to father a child until the time of death.

FIGURE 34-16

Descent of the testes. Prior to birth, the testes move from their retroperitoneal location near the kidneys and through the inguinal canal to the scrotum.

the BIG picture

Male Reproductive System

Propagation of the genes of a species is truly a "big picture" outcome related to functioning of the reproductive system in both sexes.

In males, the reproductive and urinary tracts are partly shared—causing some to group them together as the *genitourinary tract*. Such structural sharing also means functional sharing. For example, the urethra conducts urine during micturition but instead conducts semen during ejaculation. Changes to muscular control of the bladder, urethra, and ejaculatory duct prevent flow of urine—and backflow of semen into the bladder—during the sexual response.

Both the primary and secondary sexual functions in males depend on complex interrelationships involving nervous, endocrine, muscular, urinary, and circulatory system structures. Even the skin is a sexual organ, receiving some of the stimuli needed to produce the sexual response.

MECHANISMS of DISEASE

DISORDERS OF THE MALE REPRODUCTIVE SYSTEM

Several disorders of the male reproductive system cause **infertility**. Infertility is an abnormally low ability to reproduce. If there is a complete inability to reproduce, the condition is called **sterility.** Infertility or sterility involves an abnormally reduced capacity to deliver healthy sperm to the female reproductive tract. Reduced reproductive capacity may result from factors such as a decrease in the testes' production of sperm, structural abnormalities in the sperm, or obstruction of the reproductive ducts.

| A&P CONNECT |

Infections of the reproductive tract, often acquired through sexual contact with infected individuals, can progress into conditions that may cause sterility—or even death. These *sexually transmitted diseases (STDs)* are discussed in ***Sexually Transmitted Diseases*** online at ***A&P Connect.***

evolve

Disorders of the Testes

Disruption of the sperm-producing function of the seminiferous tubules can result in decreased sperm production, a condition called **oligospermia** (ol-i-go-SPER-mee-ah). If the *sperm count* is too low, infertility may result. A large number of sperm is needed to ensure that many sperm will reach the ovum and dissolve its coating—allowing a single sperm to unite with the ovum. Oligospermia can result from factors such as infection, fever, radiation, malnutrition, and high temperature in the testes. In some cases, oligospermia is temporary—as in some acute infections. Oligospermia is a leading cause of infertility. Of course, total absence of sperm production results in sterility.

Early in fetal life the testes are located in the abdominal cavity near the kidneys but normally descend into the scrotum about 2 months before birth (see Figure 34-16). Occasionally a baby is born with undescended testes, a condition called **cryptorchidism** (krip-TOR-ki-diz-em), which is readily observed by palpation of the scrotum at delivery (Figure 34-17). The word *cryptorchidism* is from the Greek words *kryptikos* ("hidden") and *orchis* ("testis"). Failure of the testes to descend may be caused by hormonal imbalances in the developing fetus or by a physical deficiency or obstruction. Regardless of cause, in the cryptorchid infant the testes remain "hidden" in the abdominal cavity. Because the higher temperature inside the body cavity inhibits spermatogenesis, measures must be taken to bring the testes down into the scrotum to prevent permanent sterility. Early treatment of this condition by surgery or by injection of testosterone, which stimulates the testes to descend (see Figure 34-15), may result in normal testicular and sexual development.

Most testicular cancers arise from the sperm-producing cells of the seminiferous tubules. Malignancies of the testes are most common among men 20 to 35 years old. Besides age, this type of cancer is associated with genetic predisposition, trauma or infection of the testis, and cryptorchidism. Treatment of testicular cancer is most effective when the diagnosis is made early in the development of the tumor.

FIGURE 34-17

Screening for cryptorchidism in a newborn infant. Properly descended testes can be palpated easily in the scrotal sac at birth.

| A&P CONNECT |

Many physicians encourage male patients to perform regular self-examination of their testes, especially if they are in a high-risk group. Check out ***Male Genital Self-Examination*** online at ***A&P Connect.***

Disorders of the Prostate

A noncancerous condition called **benign prostatic hypertrophy (BPH)** occurs in 75% of men older than 50 years. As the name suggests, the condition is characterized by an enlargement, or hypertrophy, of the prostate gland. As discussed earlier in the chapter, the fact that the urethra passes through the center of the prostate after exiting from the bladder is a matter of considerable clinical significance. As the prostate enlarges, it squeezes and may distort the normal passage of the urethra, frequently closing it so completely that urination becomes very difficult or even impossible. Often the first area of the prostate to enlarge in BPH involves the so-called *periurethral glandular tissue* surrounding the urethra. Tissue near the periphery of the prostate, called *peripheral zone glandular tissue*, may remain normal even though the gland as a whole increases in size.

Surgical removal of some of the swollen tissue surrounding the urethra in a **transurethral resection (TUR)** will often be effective in reducing symptoms and improving urine flow rates. In this procedure, a tubelike instrument called a *cystoscope*—which contains operative devices, a lighting system, and viewing lenses, is inserted through the penis and into the prostatic urethra to surgically remove (resect) prostatic tissue surrounding the lumen. Alternative procedures using laser therapy, focused ultrasound, or the insertion of urethral stents may also be employed. The use of robotic devices to assist in TURs has helped improve accuracy and thus reduce surgical complications. In severe cases total removal of the gland, a procedure called **prostatectomy** (pros-ta-TEK-toh-mee), may become necessary.

Disorders of the Penis and Scrotum

The penis is subject to numerous sexually transmitted infections, as well as structural abnormalities. One such structural abnormality is **phimosis** (fi-MOH-sis), a condition in which the foreskin fits so tightly over the glans that it cannot retract. The usual treatment for this condition is **circumcision**—a procedure in which the foreskin is cut along the base of the glans and removed. Severe phimosis can obstruct the flow of urine, possibly causing the death of an infant born with this condition. Milder phimosis can result in accumulation of dirt and organic matter under the foreskin, possibly causing severe infections.

Failure to achieve an erection of the penis adequate enough to permit sexual intercourse is called *impotence* or **erectile dysfunction (ED).** ED affects men of all ages but is experienced most often after age 65 years. ED does not affect sperm production, but infertility often results because normal intercourse may not be possible. In the past, psychological problems such as anxiety, depression, and stress were often cited as the most important causes of impotence in sexually active men. There is no doubt that such conditions contribute to ED. However, current research suggests that purely psychological problems account for far fewer cases of impotence than previously thought. We now know that ED is frequently caused by medical problems related to abnormal vascular or neural control of penile blood flow. Arteriosclerosis, diabetes, alcohol abuse, numerous medications, radiation therapy, tumors, spinal cord trauma, and surgery, especially if pelvic organs such as the prostate are involved, may all cause ED.

The most common treatment option is the use of drugs that increase blood flow to the spongy cavernous tissue of the penis, causing it to stiffen and become erect. Most of the ED drugs affect the levels of nitric oxide, a local regulator and neurotransmitter that controls tension of the smooth muscles in the vessels of the penis. Other possible treatments involve vacuum pumps, internal penile supports, and other methods.

Swelling of the scrotum can be caused by various conditions. One of the most common causes of scrotal swelling is an accumulation of fluid called **hydrocele** (HYE-dro-seel). Hydroceles may be congenital, resulting from structural abnormalities present at birth. In adults, hydrocele often occurs when fluid produced by the serous membrane lining the scrotum is not absorbed properly. The cause of adult hydrocele is not always known but, in some cases, it can be linked to trauma or infection.

Swelling of the scrotum may also occur when the intestines push through the weak area of the abdominal wall that separates the abdominopelvic cavity from the scrotum. This condition is a form of **inguinal** (IN-gwi-nal) **hernia** (see ***Hernias*** online at ***A&P Connect***). If the intestines protrude into the scrotum, the digestive tract may become obstructed—resulting in death. Inguinal hernia often occurs while lifting heavy objects because of the high internal pressure generated by the contraction of abdominal muscles. Inguinal hernia may also be congenital. Small inguinal hernias may be treated with external supports that prevent organs from protruding into the scrotum; more serious hernias must be repaired surgically.

CASE study

Carlos and his wife had been trying for years to have a baby with no success. Carlos had always assumed they just had bad timing. But recently they had started tracking Maria's cycle and found everything seemed to be on schedule. Finally, at Maria's request, they made an appointment with an infertility specialist. Carlos was expecting them to order expensive tests. But after the introductions, one of the first things the doctor asked about was what kind of underwear Carlos wore. "What business is that of yours?" Carlos thought. Then the specialist added, "because that may affect the average temperature of the testes."

1. Sperm production occurs optimally at what temperature?
   a. 3° C above body temperature
   b. At body temperature
   c. 3° C below body temperature
   d. Optimal temperature changes with the seasons

Next, Carlos was asked to provide a sperm sample. "We're going to analyze the sperm count and morphology," said the doctor.

2. What number should Carlos' sperm count be above for that factor to be ruled out as a cause of the couple's infertility?
   a. 250 million/ml
   b. 25 million/ml
   c. 2500/ml
   d. 250/ml
3. Which is the correct pathway the sperm would take during ejaculation?
   a. Seminiferous tubules, rete testis, efferent ductules, epididymis, vas deferens, ejaculatory duct, urethra
   b. Rete testis, seminiferous tubules, efferent ductules, epididymis, vas deferens, urethra, ejaculatory duct
   c. Epididymis, vas deferens, seminiferous tubules, rete testis, ejaculatory duct, urethra
   d. Seminiferous tubules, rete testis, epididymis, vas deferens, efferent ductules, urethra, ejaculatory duct
4. What hormone directly stimulates sperm production?
   a. Estrogen
   b. Progesterone
   c. LH
   d. Testosterone

CHAPTER SUMMARY

To download an MP3 version of the chapter summary for use with your iPod or portable media player, access the ***Audio Chapter Summaries*** *online at evolve.elsevier.com.*

HINT

Scan this summary after reading the chapter to help you reinforce the key concepts. Later, use the summary as a quick review before your class or before a test.

SEXUAL REPRODUCTION

A. Functioning of the reproductive system ensures the survival of the genetic characteristics of a species
B. Male reproductive system consists of organs whose functions are to produce, transfer, and introduce mature sperm into the female reproductive tract where fertilization can occur

MALE REPRODUCTIVE ORGANS

A. Classified as essential organs for production of gametes or accessory organs that support the reproductive process (Figure 34-1)
   1. Essential organs—gonads of the male; testes
   2. Accessory organs of reproduction
      a. Reproductive (genital) ducts convey sperm to outside of body; include pair of epididymides, paired vasa deferentia, pair of ejaculatory ducts, and the urethra
      b. Accessory glands produce secretions that nourish, transport, and mature sperm; include pair of seminal vesicles, the prostate, and pair of bulbourethral glands
      c. Supporting structures—scrotum, penis, and pair of spermatic cords
B. Perineum—in males, roughly diamond-shaped area between thighs
   1. Extends anteriorly from pubic symphysis to coccyx posteriorly
   2. Lateral boundary is the ischial tuberosity on either side
   3. Divided into the urogenital triangle and the anal triangle (Figure 34-2)

TESTES

A. Structure and location
   1. Several lobules composed of seminiferous tubules and interstitial cells (Leydig cells), separated by septa, encased in fibrous capsule called the *tunica albuginea* (Figure 34-3)
   2. Seminiferous tubules in testis open into a plexus called *rete testis*, which is drained by a series of efferent ductules that emerge from the top of the organ and enter the head of epididymis
   3. Located in scrotum, one testis in each of two scrotal compartments
B. Microscopic anatomy (Figures 34-4, 34-5, 34-6)
   1. Interstitial (Leydig) cells—endocrine cells between the seminiferous tubules
   2. Seminiferous tubules
      a. Spermatogenic cells produce sperm
      b. Sustentacular cells—also called *nurse* or *Sertoli cells*
         (1) Support and regulate sperm-producing functions of the testis
         (2) Produce androgen-binding protein (ABP) that binds to testosterone to make it more soluble and thus increase its concentration, supporting sperm production
         (3) Inhibin—inhibits release of GnRH by the hypothalamus and FSH by anterior pituitary, thus allowing the testis to have some control over spermatogenesis
         (4) Tight junctions between sustentacular cells form the blood-testis barrier (BTB) that protects developing sperm from the immune system
C. Functions
   1. Spermatogenesis—formation of mature male gametes (spermatozoa) by seminiferous tubules; stimulated by FSH (follicle-stimulating hormone) from the anterior pituitary (and also GnRH from hypothalamus)
   2. Secretion of hormones by interstitial cells (Figure 34-7)
      a. Testosterone
         (1) Type of androgen—maleness hormone
         (2) Multiple functions, including promoting primary and secondary male sexual characteristics, promoting anabolism, affecting fluid and electrolyte balance
         (3) Regulated by LH (luteinizing hormone) from anterior pituitary
      b. Estrogen—small amounts secreted by interstitial cells, liver, and other organs; role in males uncertain but may influence spermatogenesis and other functions
D. Spermatozoa (Figure 34-8)
   1. Structure—consist of a head (covered by acrosome), neck, midpiece, and tail; tail is divided into a principal piece and a short end piece
   2. Function—capacition in the female tract releases acrosomal enzymes that digest barrier around ovum and promotes sperm motility; sperm nucleus unites with egg nucleus to form first cell of new offspring

REPRODUCTIVE DUCTS

A. Epididymis
   1. Structure and location
      a. Single tightly coiled tube enclosed in fibrous casing (Figure 34-9)
      b. Lies along top and side of each testis
      c. Anatomical divisions include head, body, and tail
   2. Functions
      a. Duct for seminal fluid
      b. Also secretes part of seminal fluid
      c. Sperm become capable of motility while they are passing through the epididymis
B. Vas deferens (ductus deferens) (Figures 34-10 and 34-11)
   1. Structure and location
      a. Tube, extension of epididymis
      b. Extends through inguinal canal, into abdominal cavity, over top and down posterior surface of bladder
      c. Enlarged terminal portion called *ampulla*—joins duct of seminal vesicle

2. Function
   a. One of excretory ducts for seminal fluid
   b. Connects epididymis with ejaculatory duct

C. Ejaculatory duct (Figure 34-12)
1. Formed by union of vas deferens with duct from seminal vesicle
2. Passes through prostate gland, terminating in urethra

D. Urethra—serves a dual function (see Chapter 31, pp. 975–976)

ACCESSORY REPRODUCTIVE GLANDS

A. Seminal vesicles (Figure 34-13)
1. Structure and location—convoluted pouches about 5 to 7 cm long on posterior surface of bladder
2. Function—secrete the viscous, nutrient-rich part of seminal fluid (60% of semen volume)

B. Prostate gland (Figure 34-14)
1. Structure and location
   a. Doughnut shaped
   b. Encircles urethra just below bladder
2. Function—adds slightly acidic, watery, milky-looking secretion to seminal fluid (30% of semen volume)

C. Bulbourethral glands
1. Structure and location
   a. Small, pea-shaped structures with about 2.5-cm (1 inch) long ducts leading into urethra
   b. Lie below prostate gland
2. Function—secrete alkaline fluid that is part of semen (5% of semen volume)

SUPPORTING STRUCTURES

A. Scrotum
1. Skin-covered pouch suspended from perineal region into which the testes descend near the time of birth (Figure 34-11)
2. Divided into two compartments
3. Contains testis, epididymis, and lower part of a spermatic cord
4. Dartos and cremaster muscles elevate the scrotal pouch

B. Penis (Figure 34-14)
1. Structure—composed of three cylindrical masses of erectile tissue, one of which contains urethra
2. Functions—penis contains the urethra, the terminal duct for both urinary and reproductive tracts; during sexual arousal, penis becomes erect, serving as a penetrating copulatory organ during sexual intercourse

C. Spermatic cords (internal)
1. Fibrous cylinders located in inguinal canals
2. Enclose seminal ducts, blood vessels, lymphatics, and nerves

COMPOSITION AND COURSE OF SEMINAL FLUID

A. Consists of secretions from testes, epididymides, seminal vesicles, prostate, and bulbourethral glands
B. Each milliliter contains millions of sperm
C. Passes from testes through epididymis, vas deferens, ejaculatory duct, and urethra

MALE FERTILITY

A. Relates to many factors—number of sperm; size, shape, and motility
B. Infertility may be caused by antibodies some men make against their own sperm
C. Male fertility begins at puberty and extends into old age (Figure 34-15)

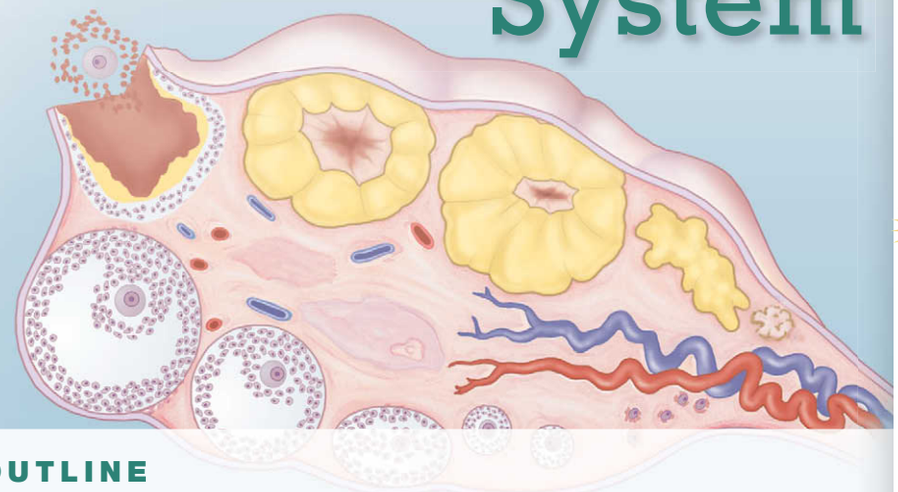
CYCLE OF LIFE: MALE REPRODUCTIVE SYSTEM

A. Reproductive functions begin at time of puberty
B. Development of organs begins before birth; immature testes descend into scrotum before or shortly after birth (Figure 34-16)
C. Puberty—high levels of hormones stimulate final stages of development
D. System operates to permit reproduction until advanced old age
E. Late adulthood—gradual decline in hormone production may decrease sexual appetite and fertility

REVIEW QUESTIONS

Write out the answers to these questions after reading the chapter and reviewing the Chapter Summary. If you simply think through the answer without writing it down, you won't retain much of your new learning.

1. Name the accessory glands of the male reproductive system.
2. List the genital ducts in the male.
3. List the supporting structures of the male reproductive system.
4. What is the tunica albuginea? How does it aid in dividing the testis into lobules?
5. What are the two primary functions of the testes?
6. What are the general functions of testosterone?
7. Discuss the structure of a mature spermatozoon.
8. What is meant by the term *capacitation*?
9. List the three functions of the epididymis.
10. List the anatomical divisions of the epididymis.
11. Discuss the formation of the ejaculatory ducts.
12. Discuss the type of secretion typical of the prostate gland and seminal vesicles.
13. What and where are the bulbourethral glands?
14. Describe the structure, location, and function or functions of the scrotum.
15. Name the three cylindrical masses of erectile, or cavernous, tissue in the penis.
16. What and where is the glans penis? The prepuce, or foreskin?
17. What is the spermatic cord? From what does it extend, and what does it contain?
18. Identify and define the male functions in reproduction.



CRITICAL THINKING QUESTIONS

After finishing the Review Questions, write out the answers to these more in-depth questions to help you apply your new knowledge. Go back to sections of the chapter that relate to concepts that you find difficult.

1. How does the function of reproduction differ from all other body functions?
2. Can you identify the functions of the male reproductive system?
3. What is the relationship between the rete testis, seminiferous tubules, and efferent ductules?
4. How is the prostate gland related to the urethra? What problems can result from this relationship?
5. List the structures in the reproductive system that contribute to the formation of seminal fluid.
6. Trace the course of seminal fluid from its formation to ejaculation.
7. What is the chemical in seminal fluid that is important to fertility? What is its function?
8. How is the structure of the spermatozoa related to its function?

35 Female Reproductive System

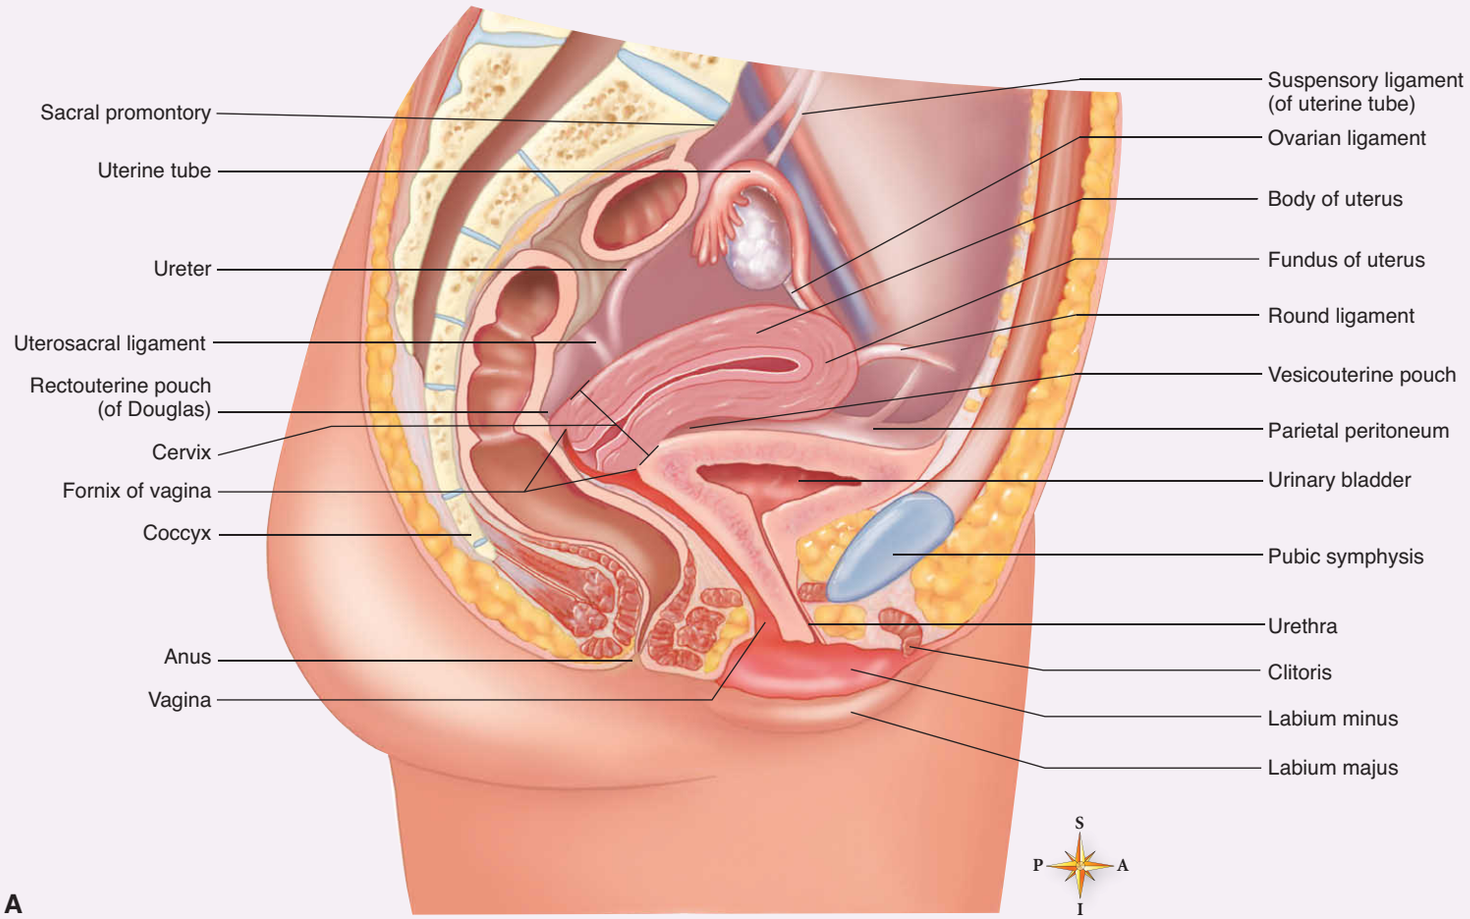
continued on p. 1091

In the previous chapter, we discussed the structure and function of the male reproductive system. In this chapter, we discuss the structure and function of the female reproductive system. As you study this chapter, keep in mind that both systems must function properly if successful reproduction and survival of offspring are to occur. The next chapter explores the processes of development of offspring.

OVERVIEW OF THE FEMALE REPRODUCTIVE SYSTEM

Function of the Female Reproductive System

The physiological importance of the female reproductive system is best understood in terms of its final outcome: production of offspring and continued existence of the genetic code. The female reproductive system produces gametes that may unite with a male gamete to form the first cell of the offspring. The function of conception emphasizes the similarity between the male and female reproductive systems. Unlike the male system, however, the female reproductive system also provides protection and nutrition to the developing offspring for up to several years after conception, as we shall see.



Structural Plan of the Female Reproductive System

So many organs make up the female reproductive system that we need to look first at the structural plan of the system as a whole (Figure 35-1). As we stated in the previous chapter, reproductive organs can be classified as **essential organs** or **accessory organs,** depending on how directly they are involved in producing offspring. The essential organs of reproduction in women, the *gonads*, are the paired **ovaries.** The female gametes, or **ova,** are produced by the ovaries. The accessory organs of reproduction in women consist of the following structures:

- A series of ducts or modified duct structures that extend from near the ovaries to the exterior. This group of organs includes the *uterine tubes*, *uterus*, and *vagina*. Along with the

FIGURE 35-1

Female reproductive organs. A, Diagram (sagittal section) of pelvis showing location of female reproductive organs. **B,** (on following page) Magnetic resonance imaging (MRI) scan (sagittal view) of female pelvic viscera.

A

ovaries, these organs are sometimes collectively called the "internal genitals."

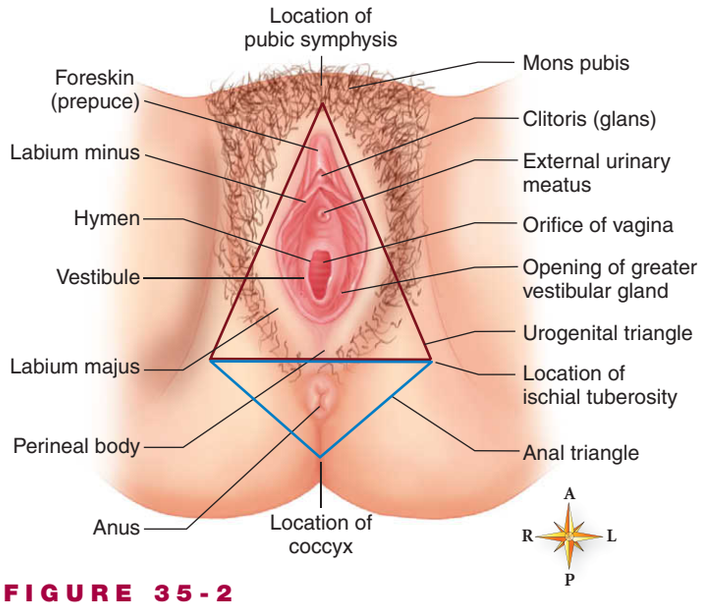
- The *vulva*, or external reproductive organs. These organs are often called the "external genitals" of the female.
- Additional glands, including the *mammary glands*, which secrete milk to provide nourishment for developing offspring.

Most of the essential and accessory organs of the female reproductive system can be seen in Figures 35-1, 35-2, and 35-3. Refer to these illustrations often as you read about each structure in the pages that follow.

Perineum

The perineum is the skin-covered muscular region between the vaginal orifice and the anus (see Figure 35-2). It is a roughly diamond-shaped area between the thighs. The perineum extends from the pubic symphysis anteriorly to the coccyx posteriorly. Its most lateral boundary on either side is the ischial tuberosity. A line drawn between the two ischial tuberosities divides the area into a larger **urogenital triangle,** which contains the external genitals (labia, vaginal orifice, clitoris) and urinary opening, and the **anal triangle,** which surrounds the anus.

The perineum has great clinical importance because of the danger of its being torn during childbirth. Such tears are often deep, have irregular edges, and extend all the way through the perineum, the muscular **perineal body,** and even through the anal sphincter, resulting in involuntary seepage from the rectum until the laceration is repaired. In addition, injuries to the perineal body can result



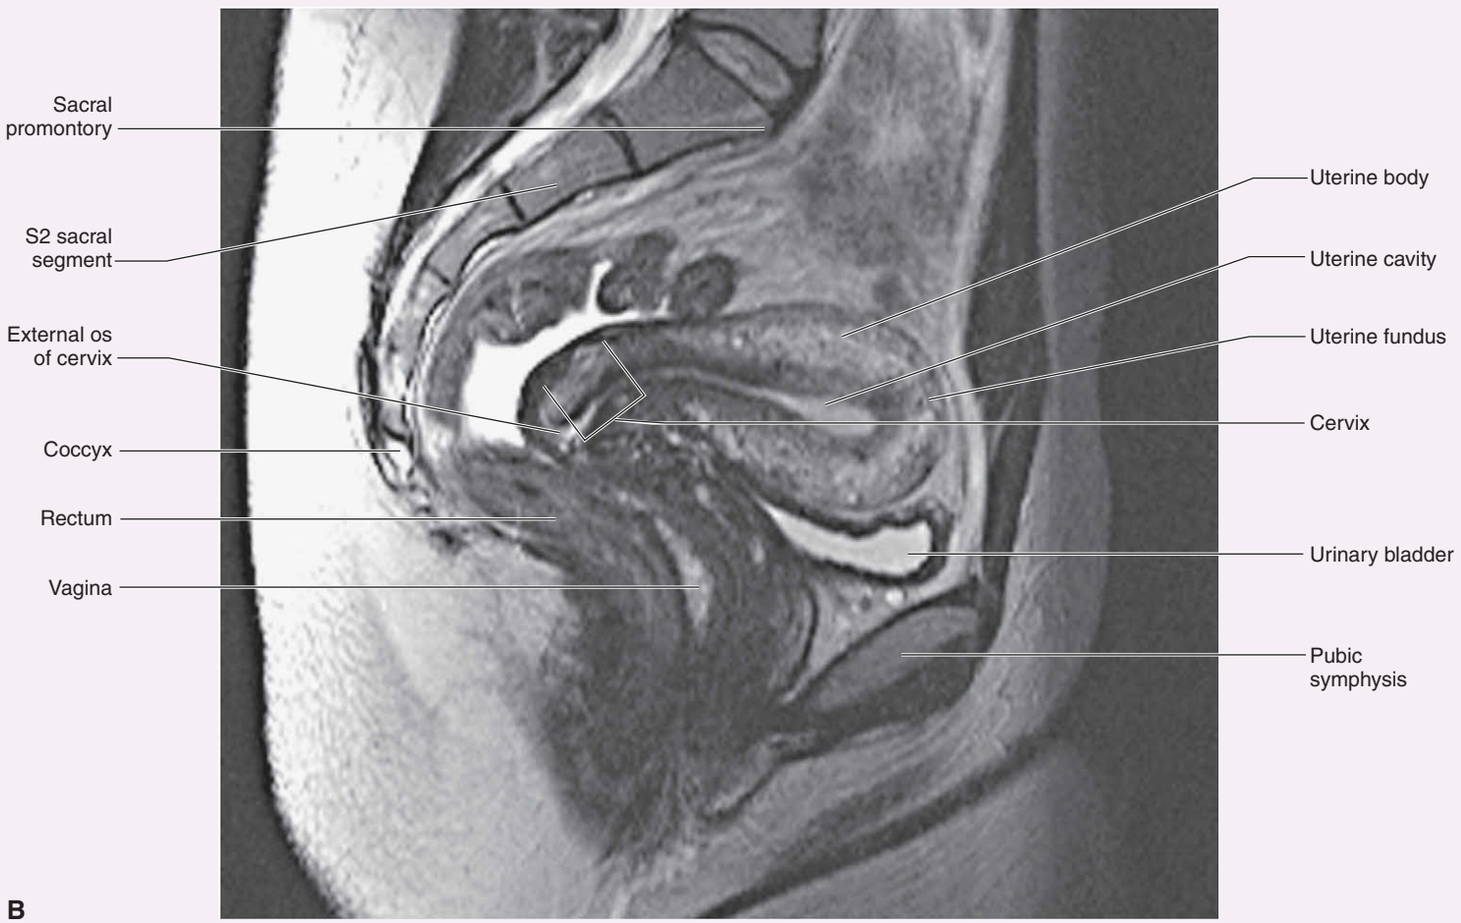


FIGURE 35-2

Female perineum. Inferior view. Sketch showing outline of the urogenital triangle (red) and anal triangle (blue).

in partial uterine or vaginal prolapse if this important support structure is weakened. To avoid these possibilities in a woman prone to such injuries, a surgical incision known as an **episiotomy** may be made in the perineum, particularly at the birth of a first baby. In current medical practice, episiotomy procedures are decreasing in frequency and are no longer performed on a routine basis preceding vaginal delivery of a baby.

| QUICK CHECK |

1. What are the *essential organs* of the female reproductive system?
2. List the *major accessory organs* of the female reproductive system.

OVARIES

Location of the Ovaries

The female gonads, or ovaries, are homologous (similar in origin) to the testes in the male. They are nodular glands that after puberty present a puckered, uneven surface, resemble large almonds in size and shape, and are located one on each side of the uterus, below and behind the uterine tubes. Each ovary weighs about 3 grams and is attached to the posterior surface of the broad ligament by a structure called the *mesovarium*, which contains blood vessels and nerves. The *ovarian ligament* anchors it to the uterus. The distal portion of the uterine tube curves about the ovary in such a way that the fingerlike fimbriae at the end of the uterine tube cup over the ovary, with only one fimbria actually being attached to the ovary (see Figure 35-3, A). This loose configuration makes it possible for a pregnancy to begin in the pelvic cavity instead of in the uterus as is normal. Development of the fetus in a location other than the uterus is referred to as an **ectopic pregnancy** (from the Greek *ektopos*, "displaced"). In the cadaver dissection specimen of the internal female reproductive organs shown in Figure 35-3, *B*, removal of parts of the posterior wall of the body of the uterus and cervix exposes a triangular uterine cavity communicating by way of the internal os with the cervical canal.

Microscopic Structure of the Ovaries

The ovary, like a number of other organs in the body, consists of two major layers of tissue—an outer **cortex** and inner **medulla.** Covering the outer cortex is a surface layer of slightly raised squamous-shaped epithelial cells called the *germinal epithelium.* The term *germinal* is misleading because the epithelial cells of this layer do not give rise to ova. Deep to the surface layer of epithelial cells is a tough gray-white connective tissue layer called the *tunica albuginea* that covers the **ovarian cortex.** Scattered throughout and embedded in the connective tissue matrix of the cortex are

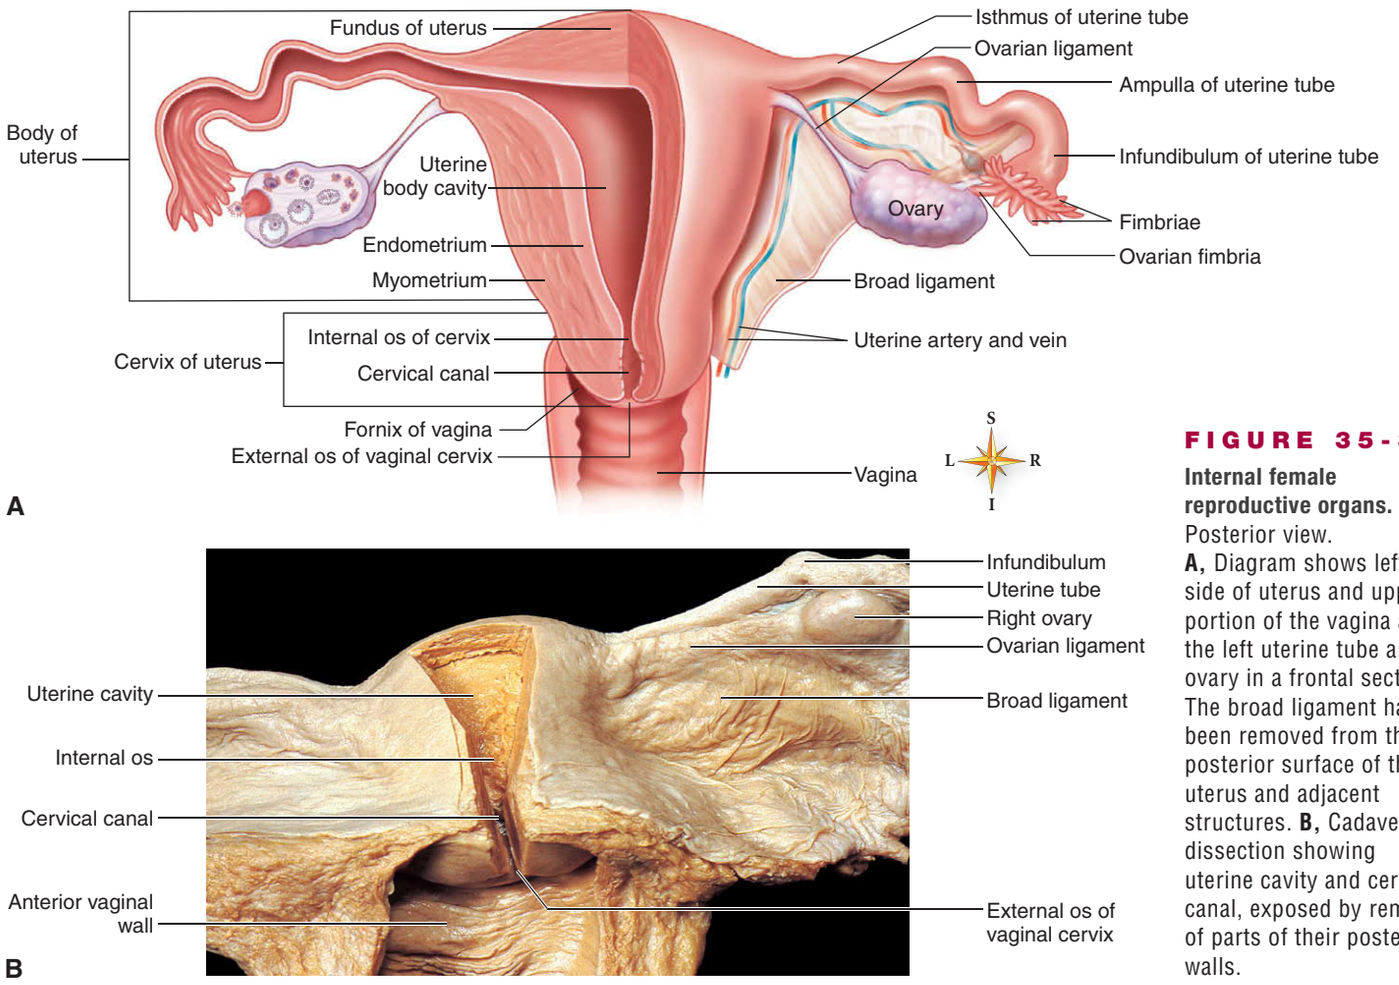

FIGURE 35-3

Internal female reproductive organs. Posterior view. **A,** Diagram shows left side of uterus and upper portion of the vagina and the left uterine tube and ovary in a frontal section. The broad ligament has been removed from the posterior surface of the uterus and adjacent structures. **B,** Cadaver dissection showing uterine cavity and cervical canal, exposed by removal of parts of their posterior walls.

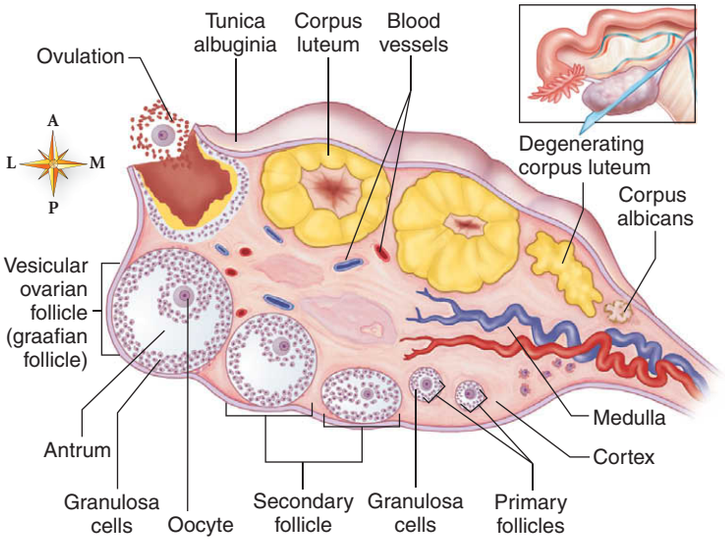

FIGURE 35-4

Stages of ovarian follicle development. Artist's rendition shows the successive stages of ovarian follicle and oocyte development. Begin with the first stage (primary follicle) and follow around clockwise to the final stage that is labeled *degenerating corpus luteum.* Remember, however, that all the stages shown occur over time to a *single* follicle, and the presence of all these stages at a single point in time is an artificial construct for learning purposes only.

thousands of microscopic structures called **ovarian follicles.** Ovarian follicles contain the immature female sex cells, or *oocytes*, and their surrounding cells. After puberty, the oocytes and the specialized cells that surround them are present in varying stages of development. The **ovarian medulla** contains supportive connective tissue cells, blood vessels, nerves, and lymphatics.

Refer to Figure 35-4, and trace the development of a female sex cell from its most primitive state through ovulation. Figure 35-5 shows more detail of the structural differences that appear during follicle maturation. Throughout the process the oocyte grows in size. So, too, does the number of cell layers surrounding it.

Initially, the primary follicle is surrounded by a single layer of *granulosa cells.* As maturation proceeds, the number of granulosa cell layers increases and the cells begin secreting increasing amounts of an estrogen-rich fluid that pools around the oocyte in a space called an *antrum.* The outer layer of granulosa cells in a developing follicle condenses into a layer of *theca cells* (Figure 35-5, A). The theca cell layer soon separates into an outer layer, or *theca externa*, which transforms into a fibrous capsule surrounding the follicle and a *theca interna* layer of cells, which secrete a precursor androgen hormone that granulosa cells ultimately convert into additional estrogen. As the primary follicle matures into a secondary, then eventually into a mature *vesicular ovarian follicle* or **graafian follicle,** a clump of granulosa cells called *cumulus cells* attaches the oocyte to the follicle wall when it is surrounded by fluid in the antrum. This mass of cells continues to cover the mature *ovum*, as it is called, after its release from the follicle. Cumulus cells secrete progesterone, which helps attract sperm cells toward the ovum and promotes sperm motility.

The developing oocyte also secretes the *zona pellucida* (ZP) (see Figure 35-5), a clear gel-like matrix that coats the ovum (underneath the cumulus cells).

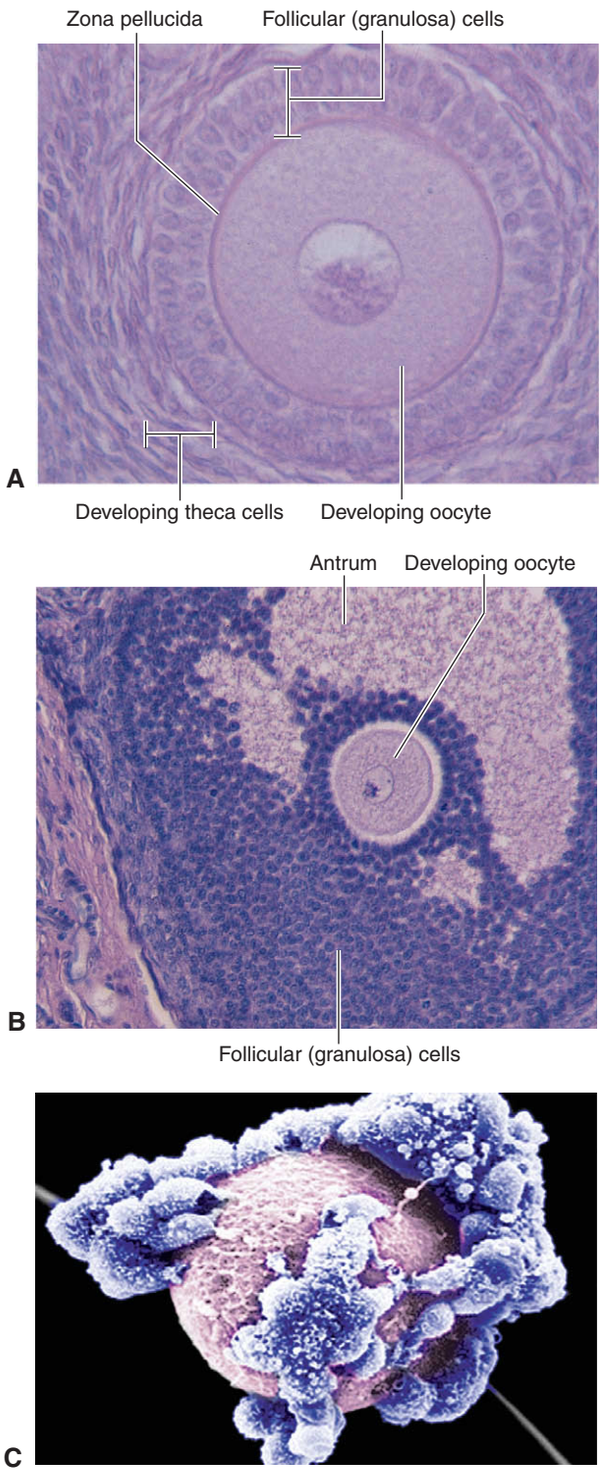

FIGURE 35-5

Developing ova. Female gametes mature within follicles in the outer region of an ovary. Follicles in early stages of development, **A,** and late stages of development, **B,** exhibit a developing oocyte (immature ovum) surrounded by hormone-secreting follicular (granulosa) cells. Notice that the more mature ovarian follicle in **B** has a fluid-filled cavity called the *antrum.* At ovulation, a mature ovum, **C,** is released. The fibers of the gel-like zona pellucida (ZP) can be seen coating the ovum, which also has many cumulus cells clinging to it. At ovulation, the ovum typically has a mass of about 20,000 cumulus cells that slowly slough away.

Box 35-1 | FYI

Mittelschmerz

A few women experience pain within a few hours after ovulation. This is referred to as **mittelschmerz**—German for "middle pain" and generally occurs during days 14 to 16 in a 28-day cycle. It has been ascribed to irritation of the peritoneum by hemorrhage from the ruptured follicle.

The release of an ovum at the end of oogenesis is an event called **ovulation.** When ovulation occurs, blood hemorrhages from the highly vascular theca interna cell layer and fills the antrum. A small quantity of blood may also enter the peritoneal cavity and irritate its pain-sensitive surface, causing the transient lower abdominal pain many women experience at the time of ovulation (Box 35-1). The blood clot filling the antrum, sometimes called the *corpus hemorrhagicum*, is soon replaced by proliferating granulosa and theca interna cells to form a yellow body called the **corpus luteum.** The corpus luteum secretes the hormones progesterone, inhibin, relaxin, and limited amounts of estrogen. Progesterone and inhibin, a peptide hormone, suppress follicle-stimulating hormone (FSH) secretion and prevent the continued development of new follicles during the functional life of the corpus luteum. The small amounts of relaxin secreted by the corpus luteum each month help "quiet" or "calm" uterine contractions, thus improving the chances for successful implantation if fertilization should occur. If pregnancy does occur, larger amounts of these hormones continue to be produced by the placenta.

Functions of the Ovaries

Recall that the ovaries are considered to be the essential organs of the female reproductive system. This means that it is the ovaries that produce female gametes, or ova. The process that culminates in the release of an ovum is called *oogenesis*, a term that literally means "egg production." As Figure 35-4 shows, ovulation involves the rupture of an ovarian follicle and the subsequent release of fluid and an ovum. The ovum, surrounded by a coat of follicular cells, moves into the uterine tube, where it may draw a sperm cell into it and thus become the first cell of an offspring.

The ovaries are also endocrine organs, secreting the female sex hormones. **Estrogens** (chiefly estradiol and estrone) and **progesterone** are secreted by cells of ovarian tissues. These hormones help regulate reproductive function in the female—making the ovaries even more essential to female reproductive function.

More details of oogenesis and fertilization are discussed in Chapter 36. Further discussion of hormonal regulation of reproductive functions, as well as associated changes within the ovaries, appears later in this chapter.

| QUICK CHECK |

3. Briefly describe the location of the ovaries.
4. What are ovarian follicles?
5. List the two major functions of the ovaries.

UTERUS

Structure of the Uterus

SIZE AND SHAPE OF THE UTERUS

In a woman who has never been pregnant, the **uterus** is pear shaped and measures approximately 7.5 cm (3 inches) in length, 5 cm (2 inches) in width at its widest part, and 3 cm (1 inch) in thickness. Note in Figure 35-3 that the uterus has two main parts: a wide, upper portion, the **body,** and a lower, narrow "neck," the **cervix.** Did you notice that the body of the uterus rounds into a bulging prominence above the level at which the uterine tubes enter? This bulging upper component of the body is called the **fundus.**

LOCATION OF THE UTERUS

The uterus is located in the pelvic cavity between the urinary bladder in front and the rectum behind. Age, pregnancy, and distention of related pelvic viscera such as the bladder alter the position of the uterus (see Figure 35-1).

Between birth and puberty the uterus descends gradually from the lower abdomen into the true pelvis. At **menopause** the uterus begins a process of involution that results in a decrease in size and a position deep in the pelvis. Some variation among women in uterine placement within the pelvis is common.

POSITION OF THE UTERUS

Normally the uterus is said to be *anteflexed* between the body and cervix, with the body lying over the superior surface of the bladder, pointing forward and slightly upward (see Figure 35-1). The cervix points downward and backward from the point of flexion, joining the vagina at approximately a right angle (Figure 35-6). Protrusion of the cervix into the lumen of the vagina creates corner spaces called the **anterior fornix** and **posterior fornix** (see Figure 35-6). These corners help increase the probability of reproductive success (fertilization) by retaining and pooling seminal fluid for a brief period following intercourse near the external os—especially if the female remains in a supine position with knees flexed. This in turn helps increase the numbers of spermatozoa that enter the uterus and, ultimately, the uterine tubes where fertilization occurs. Several ligaments hold the uterus in place but allow its body considerable movement, a characteristic that often leads to malpositions of the organ. Fibers from several muscles that form the pelvic floor (see Figure 11-15, p. 321) converge to form a node called the **perineal body** (see Figure 35-2), which also serves an important role in support of the uterus.

The uterus may lie in any one of several abnormal positions. A common one is *retroflexion*, or backward tilting, of the entire organ. Retroflexion may allow the uterus to prolapse, or descend, into the vaginal canal.

Eight *uterine ligaments* (three pairs, two single ones) hold the uterus in its normal position by anchoring it in the pelvic cavity. These ligaments include the broad (paired), uterosacral (paired), posterior (single), anterior (single), and round (paired) ligaments. Six of these so-called ligaments are actually extensions of the parietal peritoneum in different directions. The round ligaments are fibromuscular cords. Many of the structures listed on the next page can be identified in Figures 35-1 and 35-3.

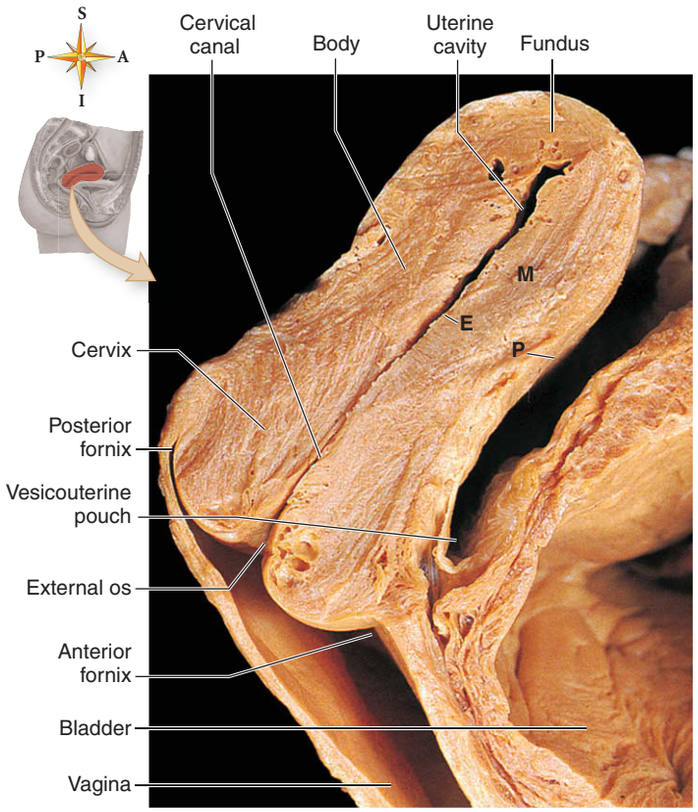

FIGURE 35-6

Uterus and vagina in sagittal section. Note that (1) the body of the uterus is "anteflexed" over the superior surface of the bladder pointing forward and slightly upward, and (2) the cervix protrudes into the vagina at approximately a right angle. *E,* Endometrium; *M,* myometrium; *P,* perimetrium.

- The *two* **broad ligaments** are double folds of parietal peritoneum that form a kind of partition across the pelvic cavity. The uterus is suspended between these two folds.
- The *two* **uterosacral ligaments** are foldlike extensions of the peritoneum from the posterior surface of the uterus to the sacrum, one on each side of the rectum.
- The **posterior ligament** is a fold of peritoneum extending from the posterior surface of the uterus to the rectum. This ligament forms a deep pouch posteriorly known as the **rectouterine pouch (of Douglas),** between the uterus and rectum. Because this is the lowest point in the pelvic cavity, pus collects here when pelvic inflammations develop. To secure drainage, an incision may be made at the top of the posterior wall of the vagina. The procedure is called a *posterior colpotomy.*
- The **anterior ligament** is the fold of peritoneum formed by the extension of the peritoneum on the anterior surface of the uterus to the posterior surface of the bladder. This fold is located anteriorly and forms the **vesicouterine pouch,** which is less deep than the rectouterine pouch (see Figures 35-1 and 35-6).
- The *two* **round ligaments** are fibromuscular cords extending from the upper, outer angles of the uterus through the inguinal canals and terminating in the labia majora.

WALL OF THE UTERUS

Three layers compose the walls of the uterus: the inner endometrium, a middle myometrium, and an outer incomplete layer of parietal peritoneum.

Endometrium

The lining of mucous membrane, called the **endometrium,** is composed of three layers of tissues:

1. *Compact layer*—a compact surface layer of partially ciliated, simple columnar epithelium
2. *Spongy layer*—a spongy middle, or intermediate, layer of loose fibrous connective tissue; also called *functional layer*
3. *Basal layer*—a dense inner layer that attaches the endometrium to the underlying myometrium.

During menstruation and after delivery of a baby, the compact and spongy layers slough off. The endometrium varies in thickness from 0.5 mm just after the menstrual flow to about 5 mm near the end of the endometrial cycle.

The endometrium has a rich supply of blood capillaries, as well as numerous exocrine *uterine glands* that secrete mucus and other substances onto the endometrial surface. The mucous glands in the lining of the cervix produce mucus that changes in consistency during the female reproductive cycle. Most of the time, cervical mucus acts as a barrier to sperm. Around the time of ovulation, however, cervical mucus becomes more slippery and actually facilitates the movement of sperm through the cervix and into the body of the uterus.

Myometrium

The **myometrium** is the thick, middle layer of the uterine wall. It consists of three layers of smooth muscle fibers that extend in all directions, longitudinally, transversely, and obliquely, and give the uterus great strength. The bundles of smooth muscle fibers interlace with elastic and connective tissue components and generally blend into the endometrial lining with no sharp line of demarcation between the two layers. The myometrium is thickest in the fundus and thinnest in the cervix—a good example of the principle of structural adaptation to function. To expel a fetus, that is, move it down and out of the uterus, the fundus must contract more forcibly than the lower part of the uterine wall, and the cervix must be stretched or dilated.

Perimetrium

The **perimetrium** is an external layer of serous membrane. The uterus is *retroperitoneal*; therefore this membrane is part of the *parietal peritoneum.* It is incomplete because it covers none of the cervix and only part of the body (all except the lower one fourth of its anterior surface). The fact that the entire uterus is not covered with peritoneum has clinical significance because it makes it possible to perform operations on this organ without the same risk of infection that occurs in procedures that cut through the peritoneum.

CAVITIES OF THE UTERUS

The cavities of the uterus are small because of the thickness of its walls (see Figure 35-3). The cavity of the body is flat and

triangular. Its apex is directed downward and constitutes the **internal os,** which opens into the **cervical canal.** The cervical canal is constricted on its lower end also, forming the **external os,** which opens into the vagina. The uterine tubes open into the cavity of the uterine body at its upper, outer angles.

BLOOD SUPPLY OF THE UTERUS

The uterus receives a generous supply of blood from uterine arteries, branches of the internal iliac arteries (see Figure 35-3). In addition, blood from the ovarian and vaginal arteries reaches the uterus by anastomosis with the uterine vessels. Tortuous arterial vessels enter the layers of the uterine wall as arterioles and then break up into capillaries between the endometrial glands.

Uterine, ovarian, and vaginal veins return venous blood from the uterus to the internal iliac veins.

Functions of the Uterus

The uterus, or womb, has many functions important to successful reproductive function. The uterus serves as part of the female reproductive tract, permitting sperm from the male to ascend toward the uterine tubes. If fusion of gametes (*fertilization*, or *conception*) occurs, the developing offspring implants in the endometrial lining of the uterus and continues its development during the term of pregnancy (*gestation*). The tiny endometrial glands produce nutrient secretions—sometimes called "uterine milk"—to sustain the developing offspring until a *placenta* can be produced. The placenta is a unique organ that permits the exchange of materials between the offspring's blood and the maternal blood. The rich network of endometrial capillaries promotes efficiency of this exchange function. Rhythmic contractions of the myometrium are inhibited during gestation but are allowed to occur as the time of delivery approaches. Myometrial contractions are the "labor contractions" that help push the offspring out of the mother's body.

If conception or the implantation of the offspring does not occur successfully, the outer layers of the endometrium are shed during *menstruation*. **Menstruation** is a regular event of the female reproductive cycle that permits the endometrium to renew itself in anticipation of conception and implantation during the next cycle. The myometrial contractions seem to aid menstruation by promoting the complete sloughing of the outer endometrial layers. Fatigue of the myometrial muscle tissues may contribute to the abdominal cramping sometimes associated with menstruation.

UTERINE TUBES

The uterine tubes are also sometimes called *fallopian tubes*, or *oviducts*.

Location of the Uterine Tubes

The uterine tubes are about 10 cm (4 inches) long and are attached to the uterus at its upper outer angles (see Figures 35-1 and 35-3). They lie in the upper free margin of the broad ligaments and extend upward and outward toward the sides of the pelvis and then curve downward and backward.

Structure of the Uterine Tubes

WALL OF THE UTERINE TUBES

The same three layers (mucous, smooth muscle, and serous) of the uterus compose the tubes (Figure 35-7). The mucosal lining of the tubes, however, is directly continuous with the peritoneum lining the pelvic cavity. This has great clinical significance because the tubal mucosa is also continuous with that of the uterus and vagina and therefore often becomes infected by gonococci or other organisms introduced into the vagina. Inflammation of the tubes **(salpingitis)** may readily spread to become inflammation of the peritoneum **(peritonitis),** a serious condition. Inflammation of the uterine tubes may also lead to scarring and partial or complete closure of the lumen, even if the original infection is cured with antibiotics (see Mechanisms of Disease, p. 1086). In the male, there is no such direct route by which microorganisms can reach the peritoneum from the exterior.

DIVISIONS OF THE UTERINE TUBES

Each uterine tube consists of three divisions (see Figure 35-3):

1. A medial third that extends from the upper outer angle of the uterus called the **isthmus.**
2. An intermediate dilated portion called the **ampulla** that follows a winding path over the ovary.
3. A funnel-shaped terminal component called the **infundibulum** that lies just above and extends laterally over the ovary and opens directly into the peritoneal cavity. The open outer margin of the infundibulum resembles a fringe in its irregular outline. The fringelike projections are known as **fimbriae** (see Figure 35-3). The *ovarian fimbria* is the only one of the fimbriae of each uterine tube that actually attaches directly to the ovary, helping anchor the distal end of the tube in place.

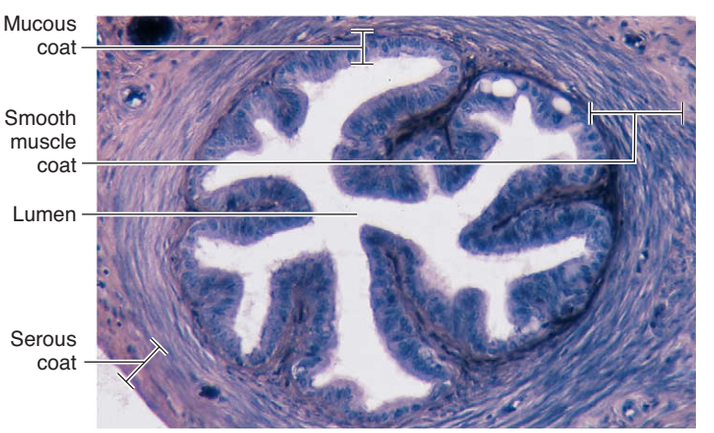

FIGURE 35-7

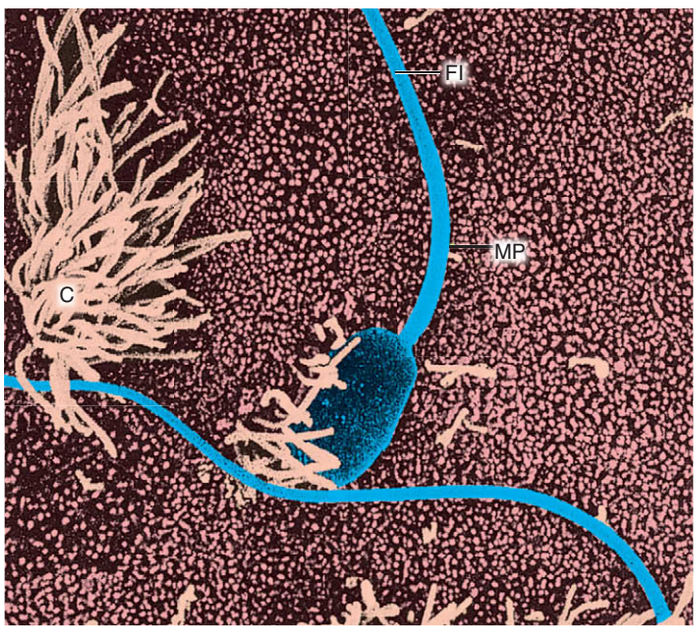
Transverse section of uterine tube. This micrograph shows a section of the uterine (fallopian) tube in the isthmus region. Notice the highly folded nature of the epithelial, mucous lining of the tube. The folding is even more exaggerated in the ampulla region.

HISTOLOGY OF THE UTERINE TUBES

Figure 35-7 is a low-power micrograph that illustrates the mucosal lining of the oviduct cut in cross section. These shapes are typical of the appearance of the mucosal lining throughout most of the duct. Note the extensive folds of mucosa that project as shelves into the lumen of the tube. An area of smooth muscle (muscularis layer) can be seen surrounding the mucosa in this section. Cilia, which are important in maintaining currents within the tube that move the ovum toward the uterus, can be seen projecting from the luminal surface in Figure 35-8.

Function of the Uterine Tubes

The uterine tubes are extensions of the uterus that communicate loosely with the ovaries. This arrangement allows an ovum released from the surface of the ovary to be collected by the fimbriae and swept along the uterine tube toward the body of the uterus by ciliary action. The uterine tubes serve as more than mere transport channels, however. The uterine tube is also the site of fertilization. Sperm and ova most often meet, and fertilization occurs, in the ampulla of the uterine tube. A relatively small number of the sperm deposited in the vagina during sexual intercourse move up the uterine tube, where they meet the ovum traveling toward them. It is generally there, within the ampulla of the uterine tube, that the primary function of human sexual reproduction occurs: recombination of the genetic information from both parents in the first cell of the offspring. Totally blocking the openings into either the distal (abdominal) or proximal (uterine) ends of both uterine tubes, for any reason, results in sterility (Box 35-2).



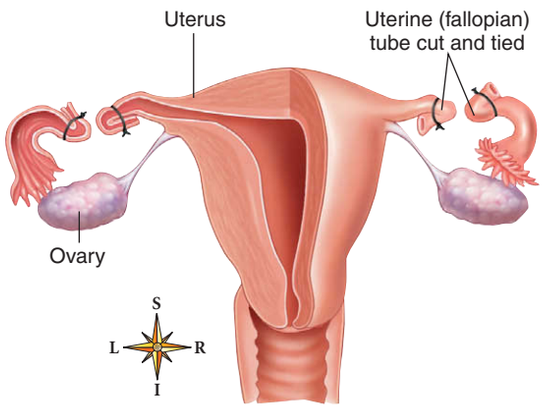


FIGURE 35-8

Luminal surface of the uterine tube. This scanning electron micrograph shows the surface of the uterine tube wall that faces the lumen, as well as some spermatozoa that are present (Fl, flagellum; MP, midpiece). The smaller, raised projections are microvilli, and the larger projections, found in clumps, are cilia (C).

Box 35-2 | FYI

Tubal Ligation

Tubal ligation literally means "tying a tube," and thus this surgical procedure is often referred to as "having one's tubes tied." Tubal ligation involve tying a piece of suture material around each uterine tube in two places, then cutting each tube between these two points (see the figure). Other methods using clips or bands instead of cutting and tying the tubes are also used. Because sperm and eggs are thus blocked from meeting, fertilization and subsequent pregnancy are prevented. For this reason, tubal ligation is also called *surgical sterilization* and is functionally comparable to vasectomy in the male. However, vasectomy can be done under local anesthetic in a medical office and therefore is a minor procedure when compared to tubal ligation.

Tubal Ligation

| QUICK CHECK |

6. Name the three principal layers of the uterine wall.
7. Describe the anatomical position of the uterus. How is it held in place?
8. List the chief functions of the uterus.
9. What are the functions of the uterine (fallopian) tubes?

VAGINA

Location of the Vagina

The vagina is a tubular organ situated between the rectum, which lies posterior to it, and the urethra and bladder, which lie anterior to it (see Figure 35-6). It extends upward and backward from its external orifice in the vestibule between the labia minora of the vulva to the cervix (see Figures 35-1, 35-2, and 35-3).

The right and left *levator ani* muscles (Figure 11-15, p. 307, and Figure 31-8, p. 975) unite at the midline to form a

hammock-shaped muscular sheet often referred to as the "floor of the pelvis." In the female, the anatomical relationships between the various parts of this supportive muscular sheet and the perineal body, vagina, rectum, and urethra have clinical significance. Fibers of the levator ani insert into and become a part of all these structures.

It is not an uncommon occurrence for at least some fibers of the levator ani to become stretched or damaged in women who have experienced vaginal delivery of a full-term infant. The unfortunate result is often the appearance of a number of troublesome and often chronic symptoms. For example, damage to muscle fibers of the levator ani that constitute a part of the urethral or anal sphincters may result in urinary or fecal *incontinence*. If leakage of urine or fecal material following damage to the sphincter is associated with—or precipitated by—an increase in abdominal pressure caused by events such as coughing, laughing, or lifting weight, the condition is called *stress incontinence*.

When muscle fibers in the vagina or perineal body are significantly weakened, the vaginal walls will lose tone and the important role of the perineal body in providing support of pelvic viscera will be affected. The result may involve prolapse of the uterus into the vagina or some degree of rectal prolapse through the anus. In severe cases surgery or other treatments may be required to raise or support the pelvic floor or to repair structural damage. However, in less severe cases where symptoms are limited to occasional leakage of urine, many women benefit from a noninvasive treatment option called *Kegel exercise*. Designed primarily to reduce urinary stress incontinence, Kegel exercises consist of an ongoing exercise program that involves a repetitive series of voluntary contractions of the muscles of the pelvic floor and perineum, similar to that required to stop the flow of urine when voiding. In time, the exercise program will strengthen the external urethral sphincter and improve retention of urine.

Structure of the Vagina

The vagina is a collapsible tube about 7 or 8 cm (about 3 inches) long that is capable of great distention. It is composed mainly of smooth muscle and is lined with mucous membrane arranged in rugae. The vaginal mucosa contains numerous tiny exocrine mucous glands that secrete lubricating fluid during the female sexual response. Box 35-3 discusses the "G spot" on the anterior wall of the vagina.

Note that the anterior wall of the vagina is shorter than the posterior wall because of the way the cervix protrudes into the uppermost portion of the tube (see Figures 35-1 and 35-6). In some cases—especially in young girls—a fold of mucous membrane, the **hymen,** forms a border around the external opening of the vagina, partially closing the orifice. Occasionally, this structure completely covers the vaginal outlet, a condition referred to as **imperforate hymen.** Perforation must be performed at puberty before the menstrual flow can escape.

Functions of the Vagina

The **vagina** is a portion of the female reproductive tract that has several important functions. During sexual intercourse, the lining of the vagina lubricates and stimulates the glans penis, which in turn triggers the ejaculation of semen. Thus the vagina also serves as a receptacle for semen, which often pools in the anterior or posterior fornix of the vagina where it meets the cervix of the uterus (see Figure 35-6). Sperm within the semen may move further into the female reproductive tract by "climbing" along fibrous strands of mucus in the cervical canal.

The vagina also serves as the lower portion of the birth canal. At the time of delivery, the offspring is pushed from the body of the uterus, through the cervical canal, and finally through the vagina and out of the mother's body. The placenta, or "afterbirth," is also expelled through the vagina.

Another important function of the vagina is transport of blood and tissue shed from the lining of the uterus during menstruation.

VULVA

Structure of the Vulva

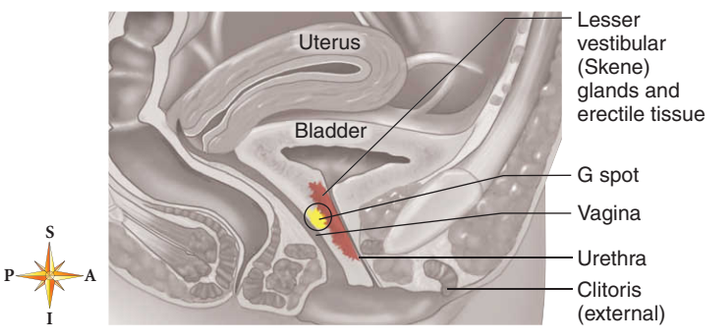

Figure 35-9, *A*, shows the structures that, together, constitute the female external genitals (reproductive organs). Collectively, these structures are called the **vulva** or *pudendum*. They are described in the following paragraphs.

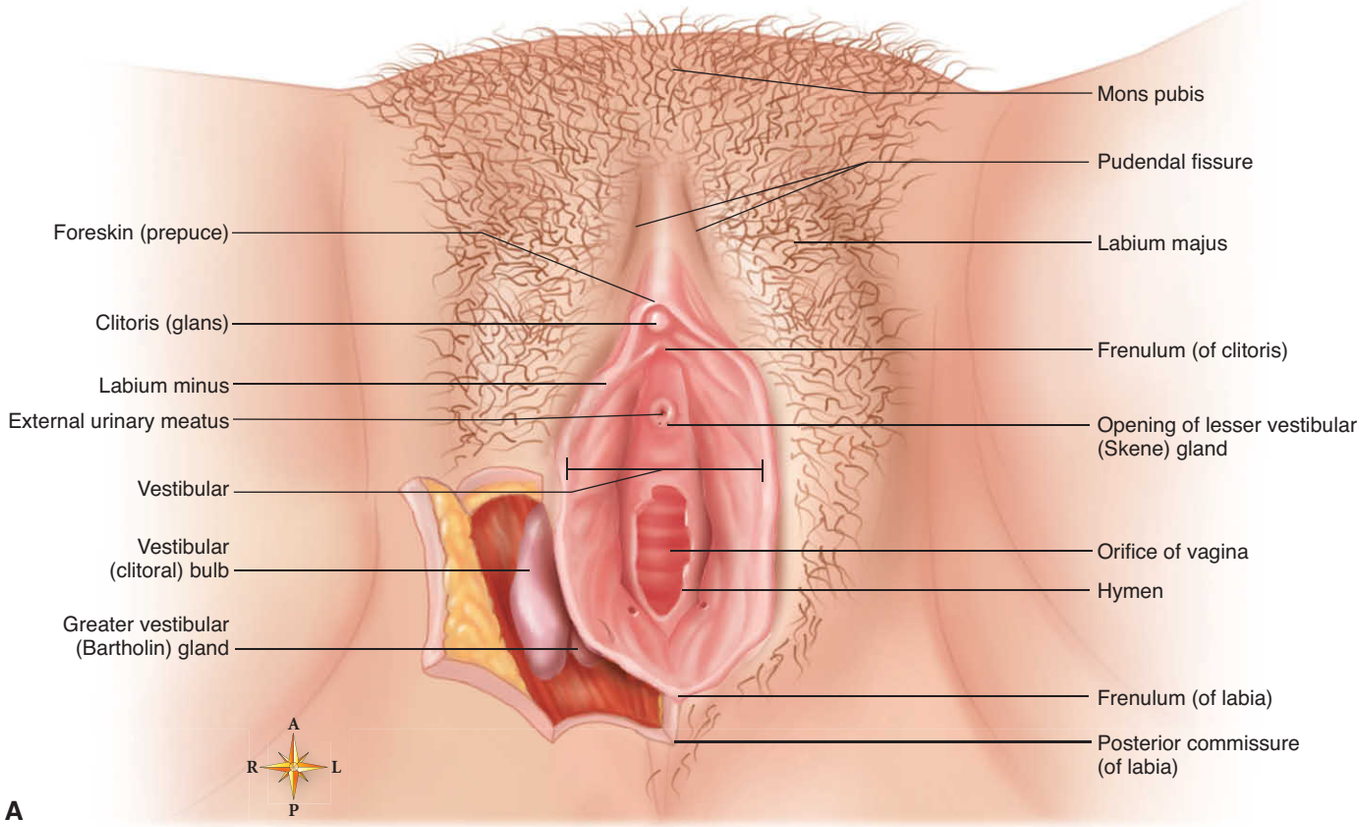
Box 35-3 | FYI



The "G Spot"

In 1950, Dr. Ernest Gräfenberg described what he called an "erotic zone" about the size of a dime on the anterior wall of the vagina midway between the pubic symphysis and cervix (see figure). The area was later named the "Gräfenberg spot," or "G spot." In fact, this was a rediscovery of the "prostatae" in female anatomy originally described by Dutch anatomist Regnier de Graaf in 1672.

The G spot is located at the site of the spongy lesser vestibular (Skene) glands and nearby erectile tissue between the wall of the vagina and the urethra. This set of structures is now often called the *female prostate*. Not all women seem to have the same amount of glandular tissue and not all are equally sensitive in this area of the vaginal wall, so the concept of a G spot continues to be controversial among scientists.

G spot (female prostate).

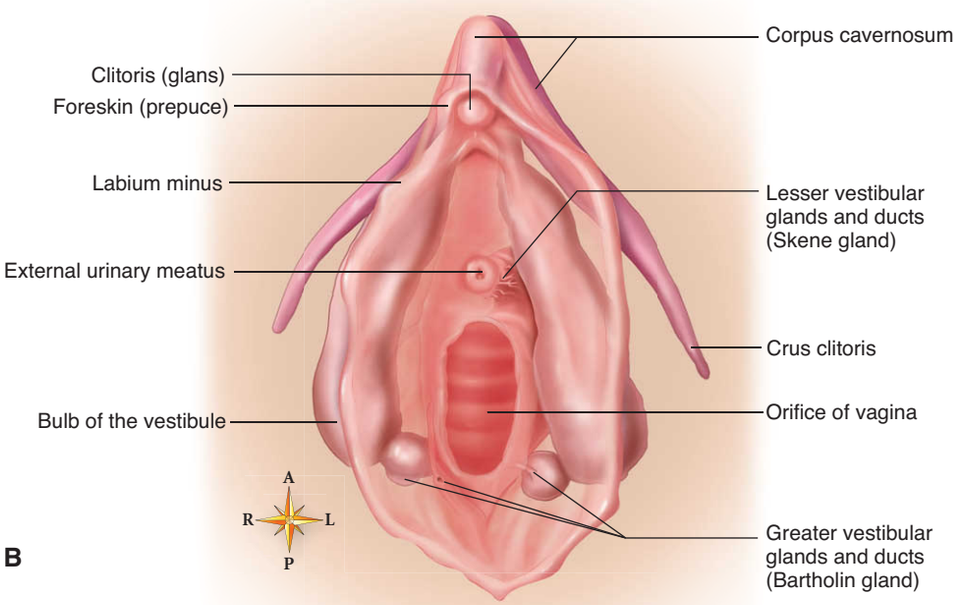


FIGURE 35-9

Vulva (pudendum). A, Sketch showing major features of the external female genitals (genitalia). Compare to Figure 35-2 on p. 1065). **B,** Sketch showing the full structure of the clitoris, which in life is mostly hidden by overlying external tissue.

The **mons pubis** is a skin-covered pad of fat over the pubic symphysis. Coarse pubic hairs appear on this structure at puberty and persist throughout life.

The **labia majora** (Latin, "large lips") are covered with pigmented skin and hair on the outer surface and are smooth and free from hair on the inner surface. Each labium majus is composed mainly of fat and connective tissue with numerous sweat and sebaceous glands on the inner surface. The labia majora are homologous to the scrotum in the male.

The **labia minora** (Latin, "small lips") are located medial to the labia majora. Each labium minus is covered with hairless skin. The two labia minora come together anteriorly in the midline. The area between the labia minora is the **vestibule.**

The **clitoris** is composed of erectile tissue, just a portion of which is visible just behind the junction of the labia minora. The structure of this organ is homologous to penile structure in the male. Look again at Figure 34-11 on p. 1052, and compare the erectile tissues of the penis in that illustration with the sketch

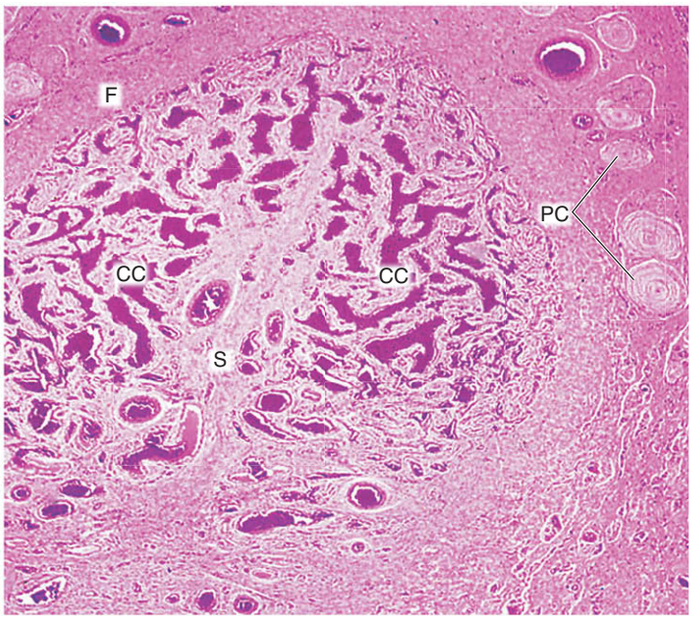

FIGURE 35-10

Micrograph of clitoris. Note the two corpora cavernosa *(CC)* separated by an incomplete central septum *(S)*. Sectioned lamellar (Pacini) corpuscles *(PC)* are visible just outside the surrounding fibrocollagenous sheath *(F)*. (Compare with Figure 34-14, B, on p. 1054.)

of the clitoris shown in Figure 35-9, *B*. The micrograph of the clitoris in Figure 35-10 shows a similar "spongy" structure seen in the erectile tissues of the penis. Like the erectile tissue of the male, the clitoris becomes engorged with blood during the sexual response.

The *glans clitoris* is the only visible part of the erectile structures of the clitoris. The glans clitoris is equivalent to the *glans penis* in the male. The glans clitoris is covered with highly sensitive skin involved in sexual stimulation that produces the female sexual response. In the female, the corpora cavernosa are separated into an inverted Y shape. Underneath each labium majus is a *bulb (of vestibule)* that corresponds to the male corpus spongiosum.

A clitoral *foreskin* or *prepuce* forms a hood over the superior surface of the glans clitoris. On the inferior surface of the glans clitoris there is a thin midline *frenulum* that is the female equivalent of the frenulum visible on the undersurface of the glans of the penis.

The *external urinary meatus* (urethral orifice) is the small opening of the urethra, situated between the clitoris and the vaginal orifice.

The **vaginal orifice** is an opening that is larger than the urinary meatus. It is located posterior to the meatus.

The **greater vestibular glands** are two bean-shaped glands, one on each side of the vaginal orifice. Each gland opens by means of a single, long duct into the space between the hymen and the labium minus. These glands, which are also called *Bartholin glands*, are of clinical importance because they can be infected (bartholinitis or Bartholin abscess), particularly by gonococci. They are homologous to the bulbourethral glands in the male.

Opening into the vestibule near the urinary meatus by way of two small ducts is a group of tiny mucous glands, the **lesser vestibular glands.** Also called *Skene glands*, they have clinical interest because gonococci that lodge there are difficult to eradicate.

Functions of the Vulva

The various components of the external genitals of the female operate alone or separately to accomplish several functions important to successful reproduction. The protective features of the mons pubis and labia help prevent injury to the delicate tissues of the clitoris and vestibule. The clitoris becomes erect during sexual stimulation and, like the male glans, possesses a large number of sensory receptors that feed back information to the sexual response areas of the brain. In Figure 35-10, a number of sectioned lamellar (Pacini) corpuscles, encapsulated touch and pressure receptors (see Chapter 17), can be seen just outside the fibrocollagenous sheath surrounding the clitoris. Of course, the vaginal orifice serves as the boundary between the internal and external female genitals.

12. How are the clitoris of the female and the glans penis of the male similar in structure and function?

FEMALE REPRODUCTIVE CYCLES

Recurring Cycles

Many changes recur periodically in the female during the years between the onset of the menses **(menarche)** and their cessation **(menopause,** or **climacteric).** Most obvious, of course, is menstruation—the outward sign of changes in the endometrium. Most women also note periodic changes in their breasts. But these are only two of many changes that occur over and over again at fairly uniform intervals during the approximately 3 decades of female reproductive maturity.

First we shall describe the major cyclical changes, and then we shall discuss the mechanisms that produce them.

OVARIAN CYCLE

Before a female child is born, precursor cells in her ovarian tissue, called **oogonia,** begin a type of cell division characterized as *meiosis*. Meiotic cell division differs from mitotic cell division in that it reduces the number of chromosomes in the daughter cells by half (recall Chapter 5, p. 125). By the time the child is born, her ovaries contain many primary follicles, each containing an oocyte that has temporarily suspended the meiotic process before it is complete. Once each month, on about the first day of menstruation, the oocytes within several primary follicles resume meiosis. At the same time, the follicular cells surrounding them proliferate and start to secrete estrogens (and tiny amounts of progesterone). Usually, only one of these developing follicles matures

and migrates to the surface of the ovary. Just before **ovulation,** the meiosis within the oocyte of the mature follicle halts again. It is this cell, which has not quite completed meiosis, that is expelled from the ruptured wall of the mature follicle during ovulation. Meiosis is completed only when, and if, the head of a sperm cell is later drawn into the ovum during the process of fertilization.

When does ovulation occur? This is a question of great practical importance and one that in the past was given many answers. Today it is known that ovulation usually occurs 14 days before the next menstrual period begins. (Only in a 28-day menstrual cycle is this also 14 days after the beginning of the preceding menstrual cycle, as explained subsequently.)

Immediately after ovulation, cells of the ruptured follicle enlarge and, because of the appearance of lipoid substances in them, become transformed into a golden-colored body, the **corpus luteum.** The corpus luteum grows for 7 or 8 days. During this time, it secretes progesterone in increasing amounts. Then, provided fertilization of the ovum has not taken place, the size of the corpus luteum and the amount of its secretions gradually diminish. In time, the last components of each nonfunctional corpus luteum are reduced to a white scar called the **corpus albicans,** which moves into the central portion of the ovary and eventually disappears (see Figure 35-4).

ENDOMETRIAL, OR MENSTRUAL, CYCLE

During menstruation, bits of the compact and spongy layers of the endometrium slough off, leaving denuded bleeding areas. The dark menstrual discharge generally does not clot and may vary from about 30 to 100 ml, with a majority lost during the first 3 days of the menses. As with the length of the cycle, considerable variation is considered normal. After menstruation, the cells of these layers proliferate, causing the endometrium to reach a thickness of 2 or 3 mm by the time of ovulation. During this period, endometrial glands and arterioles grow longer and more coiled—two factors that also contribute to the thickening of the endometrium. After ovulation, the endometrium grows still thicker, reaching a maximum of about 4 to 6 mm. Most of this increase, however, is believed to be caused by swelling produced by fluid retention rather than by further proliferation of endometrial cells. The increasingly coiled endometrial glands start to secrete their nutrient fluid during the time between ovulation and the next menses. Then, the day before menstruation starts again, a drop in progesterone causes muscle in the walls of the tightly coiled arterioles to constrict, producing endometrial ischemia. This leads to death of the tissue, sloughing, and once again, menstrual bleeding.

The menstrual cycle is customarily divided into phases, named for major events occurring in each: menses, postmenstrual phase, ovulation, and premenstrual phase.

1. The **menses,** or **menstrual period,** occurs on days 1 to 5 of a new cycle. There is some individual variation, however.
2. The **postmenstrual phase** occurs between the end of the menses and ovulation. Therefore it is the **preovulatory phase,** as well as the postmenstrual phase. In a 28-day cycle, it usually includes cycle days 6 to 13 or 14. However, the length of this phase varies more than the others. It lasts longer in long cycles and ends sooner in short cycles. This phase is also called the **estrogenic phase,** or **follicular phase,** because of the high blood estrogen level resulting from secretion by the developing follicle. Increases in estrogen levels cause predictable changes in the appearance, amount, and consistency of cervical mucus. Collectively, these changes can be used as a fertility sign to predict ovulation (Box 35-4). Increasing estrogen levels cause cervical mucus to become elastic, a property that can be observed by placing the mucus between and then separating two glass microscope slides. The clear, watery cervical mucus found at the time of ovulation will stretch 8 cm or more before the resulting thread will break. This phenomenon is called *spinnbarkeit* (SPIN-bahr-kit). Further, if left to dry on a clean glass slide, cervical mucus produced at or near the time of ovulation will dry in a characteristic featherlike or "fern" pattern. **Proliferative phase** is still another name for this phase because proliferation of endometrial cells occurs at this time.

Box 35-4 | FYI

Fertility Signs Used in Predicting the Time of Ovulation

Many rhythmic and recurring events that a woman may recognize on almost a monthly schedule during her reproductive years are called "fertility signs" and are manifestations of the body changes required for successful reproductive function. They include cyclical changes in the ovaries, in the amount and consistency of the cervical mucus produced during each cycle, in the myometrium, in the vagina, in gonadotropin secretion, in body temperature, and even in mood or "emotional tone." Accurately predicting the time of ovulation in any given menstrual cycle by recognizing one or more of these recurring fertility signs would obviously be of help in either avoiding or achieving conception. However, knowing the length of a previous cycle or even a series of cycles cannot ensure with any degree of accuracy the time of appearance of other fertility signs in a current cycle or how many days the preovulatory phase will last in the next or some future cycle.

Simply put, prior cycle length is not an accurate fertility sign. This fact accounts for most of the unreliability of the *calendar rhythm method* of fertility planning. Other more sophisticated *natural family planning (NFP)* methods are available that are not based on a knowledge of previous cycle lengths to predict the day of ovulation. Instead, such natural methods base their judgments about fertility at any point in a woman's cycle on other changes. For example, measurement of basal body temperature and recognition of cyclical changes in the amount and consistency of cervical mucus, both of which occur in response to changes in circulating hormones that control ovulation. Typically, use of NFP for 1 year to avoid pregnancy will result in approximately 25 of every 100 women becoming pregnant.

The time of ovulation also can be approximated by over-the-counter urine tests that detect the high levels of luteinizing hormone (LH) associated with ovulation (LH surge).

FIGURE 35-11

Ovulation. The rupture of a mature follicle on the surface of an ovary results in the release of an ovum into the pelvic cavity. This process of *ovulation* often occurs on day 14 in a 28-day menstrual cycle, but its exact timing depends on the length of the postmenstrual (preovulatory) phase. Notice in this photograph that the ovum released during ovulation is surrounded by a mass of cells.

3. **Ovulation,** that is, rupture of the mature follicle with expulsion of its ovum into the pelvic cavity (Figure 35-11), occurs most often on cycle day 14 in a 28-day cycle. However, it occurs on different days in different-length cycles, depending on the length of the preovulatory phase. For example, in a 32-day cycle the preovulatory phase probably lasts until cycle day 18, and ovulation would then occur on cycle day 19 instead of 14. In short, because the majority of women show some month-to-month variation in the length of their cycles, the day of ovulation in a current or future cycle cannot be predicted with accuracy based on the length of previous cycles (see Box 35-4). Typically, there is a decrease in basal body temperature just before ovulation and a rise in temperature at the time of ovulation. This constitutes yet another "fertility sign" (see Figure 35-14).
4. The **premenstrual phase,** or **postovulatory phase,** occurs between ovulation and the onset of the menses. This phase is also called the **luteal phase,** or more simply, the **secretory phase,** because the corpus luteum secretes only during this time. It is also called the **progesterone phase** because the corpus luteum secretes mainly this hormone. The length of the premenstrual phase is fairly constant, lasting usually 14 days—or cycle days 15 to 28 in a 28-day cycle. Differences in length of the total menstrual cycle therefore exist mainly because of differences in duration of the postmenstrual rather than of the premenstrual phase.

MYOMETRIAL CYCLE

The myometrium contracts mildly but with increasing frequency during the 2 weeks preceding ovulation. Contractions decrease or disappear between ovulation and the next menses, thereby lessening the probability of expulsion of a fertilized ovum that may have implanted in the endometrium.

GONADOTROPIC CYCLE

The adenohypophysis (anterior pituitary gland) secretes two hormones called *gonadotropins* that influence female reproductive cycles. Their names are **follicle-stimulating hormone (FSH)** and **luteinizing hormone (LH).** The amount of each gonadotropin secreted varies with a rhythmic regularity that can be related, as we shall see, to the rhythmic ovarian and uterine changes just described.

13. What is the function of the corpus luteum?
14. How is the corpus luteum formed?
15. What is the difference between the ovarian cycle and the menstrual (endometrial) cycle?
16. Why is the postmenstrual phase of the menstrual cycle sometimes called the *proliferative phase?*

Control of Female Reproductive Cycles

Physiologists agree that hormones play a major role in producing the cyclical changes characteristic in women during the reproductive years. The development of a method called *radioimmunoassay* has made it possible to measure blood levels of gonadotropins. By correlating these with the monthly ovarian and uterine changes, investigators have worked out the main features of the control mechanism.

A brief description follows of the mechanisms that produce cyclical changes in the ovaries and uterus and in the amounts of gonadotropins secreted.

CONTROL OF CYCLICAL CHANGES IN THE OVARIES

Cyclical changes in the ovaries result from cyclical changes in the amounts of gonadotropins secreted by the anterior pituitary gland. An increasing FSH blood level has two effects: it stimulates one or more primary follicles and their oocytes to start growing, and it stimulates the follicular cells to secrete **estrogens.** (Developing follicles also secrete very small amounts of progesterone.) Because of the influence of FSH on follicle secretion, the level of estrogens in blood increases gradually for a few days during the postmenstrual phase. Then suddenly, on about the twelfth cycle day, it leaps upward to a maximum peak. Scarcely 12 hours after this "estrogen surge," an "LH surge" occurs and presumably triggers ovulation a day or two later. This hormone surge is the basis of the over-the-counter "ovulation test" (see Box 35-4, p. 1075). The control of cyclical ovarian changes by the gonadotropins FSH and LH is summarized in Figure 35-12. As Figure 35-12 shows, LH brings about the following changes:

1. Completion of growth of the follicle and oocyte maturation with increasing secretion of estrogens before ovulation. LH and FSH act as synergists to produce these effects.

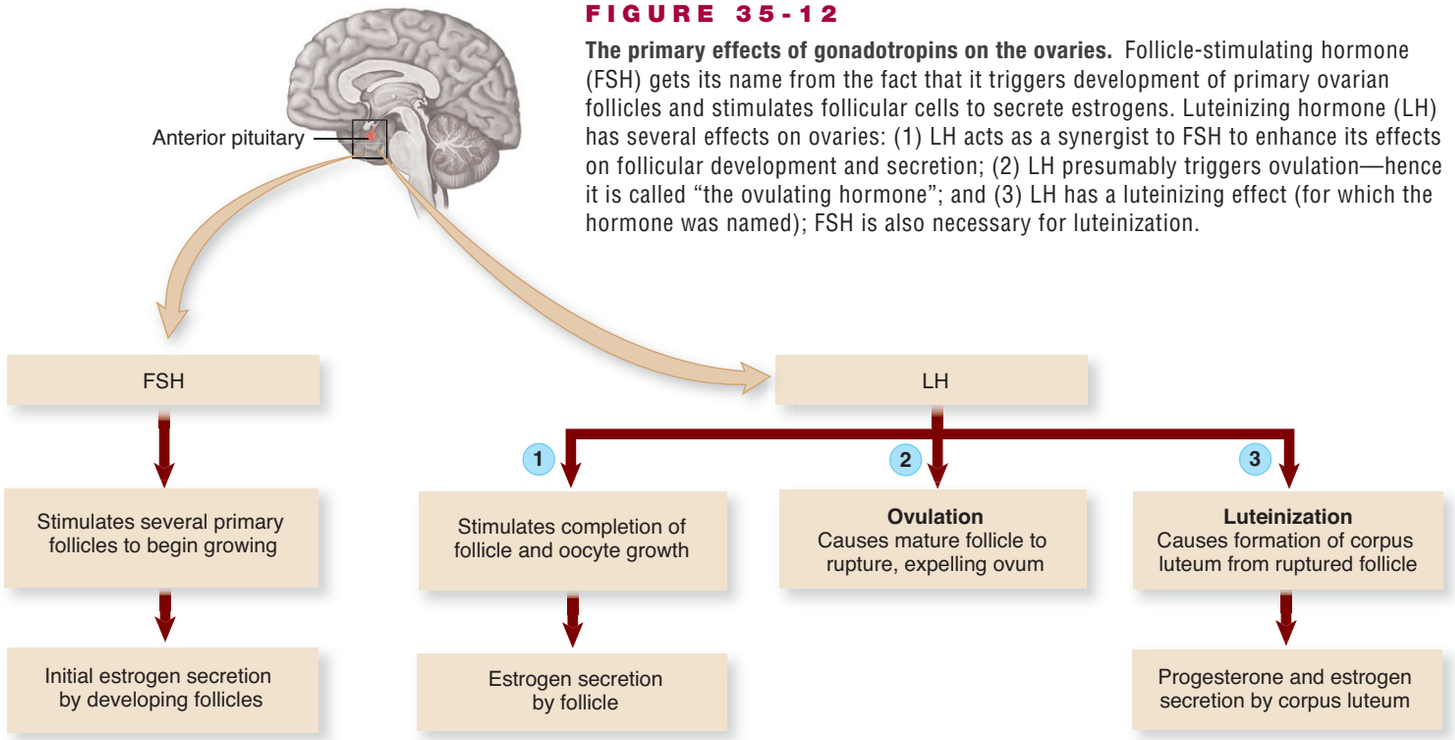

FIGURE 35-12

The primary effects of gonadotropins on the ovaries. Follicle-stimulating hormone (FSH) gets its name from the fact that it triggers development of primary ovarian follicles and stimulates follicular cells to secrete estrogens. Luteinizing hormone (LH) has several effects on ovaries: (1) LH acts as a synergist to FSH to enhance its effects on follicular development and secretion; (2) LH presumably triggers ovulation—hence it is called "the ovulating hormone"; and (3) LH has a luteinizing effect (for which the hormone was named); FSH is also necessary for luteinization.

2. Rupturing of the mature follicle with expulsion of its ovum (ovulation). Because of this function, LH is sometimes also called "the ovulating hormone."
3. Formation of a golden body, the corpus luteum, in the ruptured follicle (process called **luteinization**). The name *luteinizing hormone* refers, obviously, to this LH function—a function to which, experiments have shown, FSH also contributes.

The corpus luteum functions as a temporary endocrine gland. It secretes only during the luteal (postovulatory, or premenstrual) phase of the menstrual cycle. Its hormones are progestins (the important one of which is progesterone) and also estrogens. The blood level of progesterone rises rapidly after the "LH surge" described earlier. It remains at a high level for about a week, then decreases to a very low level approximately 3 days before menstruation begins again. This low blood level of progesterone persists during both the menstrual and the postmenstrual phases. What are its sources? Not the corpus luteum, which secretes only during the luteal phase, but the developing follicles and the adrenal cortex. Blood's estrogen content increases during the luteal phase but to a lower level than develops before ovulation.

If pregnancy does not occur, lack of sufficient LH and FSH causes the corpus luteum to regress in about 14 days. The corpus luteum is then replaced by the corpus albicans. Review Figure 35-4, which shows the cyclical changes in the ovarian follicles.

CONTROL OF CYCLICAL CHANGES IN THE UTERUS

Cyclical changes in the uterus are brought about by changing blood concentrations of estrogens and progesterone. As blood estrogens increase during the postmenstrual phase of the menstrual cycle, they produce the following main changes in the uterus:

- Proliferation of endometrial cells, producing a thickening of the endometrium
- Growth of endometrial glands and of the spiral arteries of the endometrium
- Increase in the water content of the endometrium
- Increased myometrial contractions

Increasing blood progesterone concentration during the premenstrual phase of the menstrual cycle produces progestational changes in the uterus—that is, changes favorable for pregnancy—specifically the following:

- Secretion by endometrial glands, thereby preparing the endometrium for implantation of a fertilized ovum
- Increase in the water content of the endometrium
- Decreased myometrial contractions

As mentioned earlier, low levels of FSH and LH cause regression of the corpus luteum if pregnancy does not occur. This in turn causes a drop in estrogen and progesterone levels, with the result that their maintenance of a thick, vascular endometrium ceases. Thus a drop in estrogen and progesterone levels at the end of the premenstrual phase triggers the endometrial sloughing that characterizes the menstrual phase.

CONTROL OF CYCLICAL CHANGES IN GONADOTROPIN SECRETION

Both negative and positive feedback mechanisms help control anterior pituitary secretion of the gonadotropins FSH and LH. These mechanisms involve the ovaries' secretion of inhibin,

estrogens, and progesterone and secretion of releasing hormones by the hypothalamus. Figure 35-13 describes a negative feedback mechanism that controls gonadotropin secretion. Examine it carefully. Note particularly the effects of a sustained high blood concentration of estrogens and progesterone on anterior pituitary gland secretion and the effect of a low blood concentration of FSH on follicular development: essentially, follicles do not mature and ovulation does not occur.

Several observations and animal experiments strongly suggest that sustained high blood levels of estrogens, progesterone, and inhibin decrease pituitary secretion of FSH and LH. These ovarian hormones appear to inhibit certain neurons of the hypothalamus (part of the central nervous system) from secreting gonadotropin-releasing hormone (GnRH) into the hypophyseal portal vessels (see Figure 35-13). Without the stimulating effects of these releasing hormones, the pituitary's secretion of FSH and LH decreases.

A positive feedback mechanism has also been postulated to control LH secretion. The sudden and marked increase in blood's estrogen content that occurs late in the follicular phase of the menstrual cycle is thought to stimulate the hypothalamus to secrete GnRH into the hypophyseal portal vessels. GnRH stimulates the release of LH by the anterior pituitary, which in turn accounts for the "LH surge" that triggers ovulation. The fact that a part of the brain—the hypothalamus—secretes gonadotropin-releasing hormones has interesting implications. This may be part of the pathway by which changes in a woman's environment or in her emotional state can alter her menstrual cycle. That this occurs is a matter of common observation. Stress, for example—such as intense fear of either becoming or not becoming pregnant—often delays menstruation.

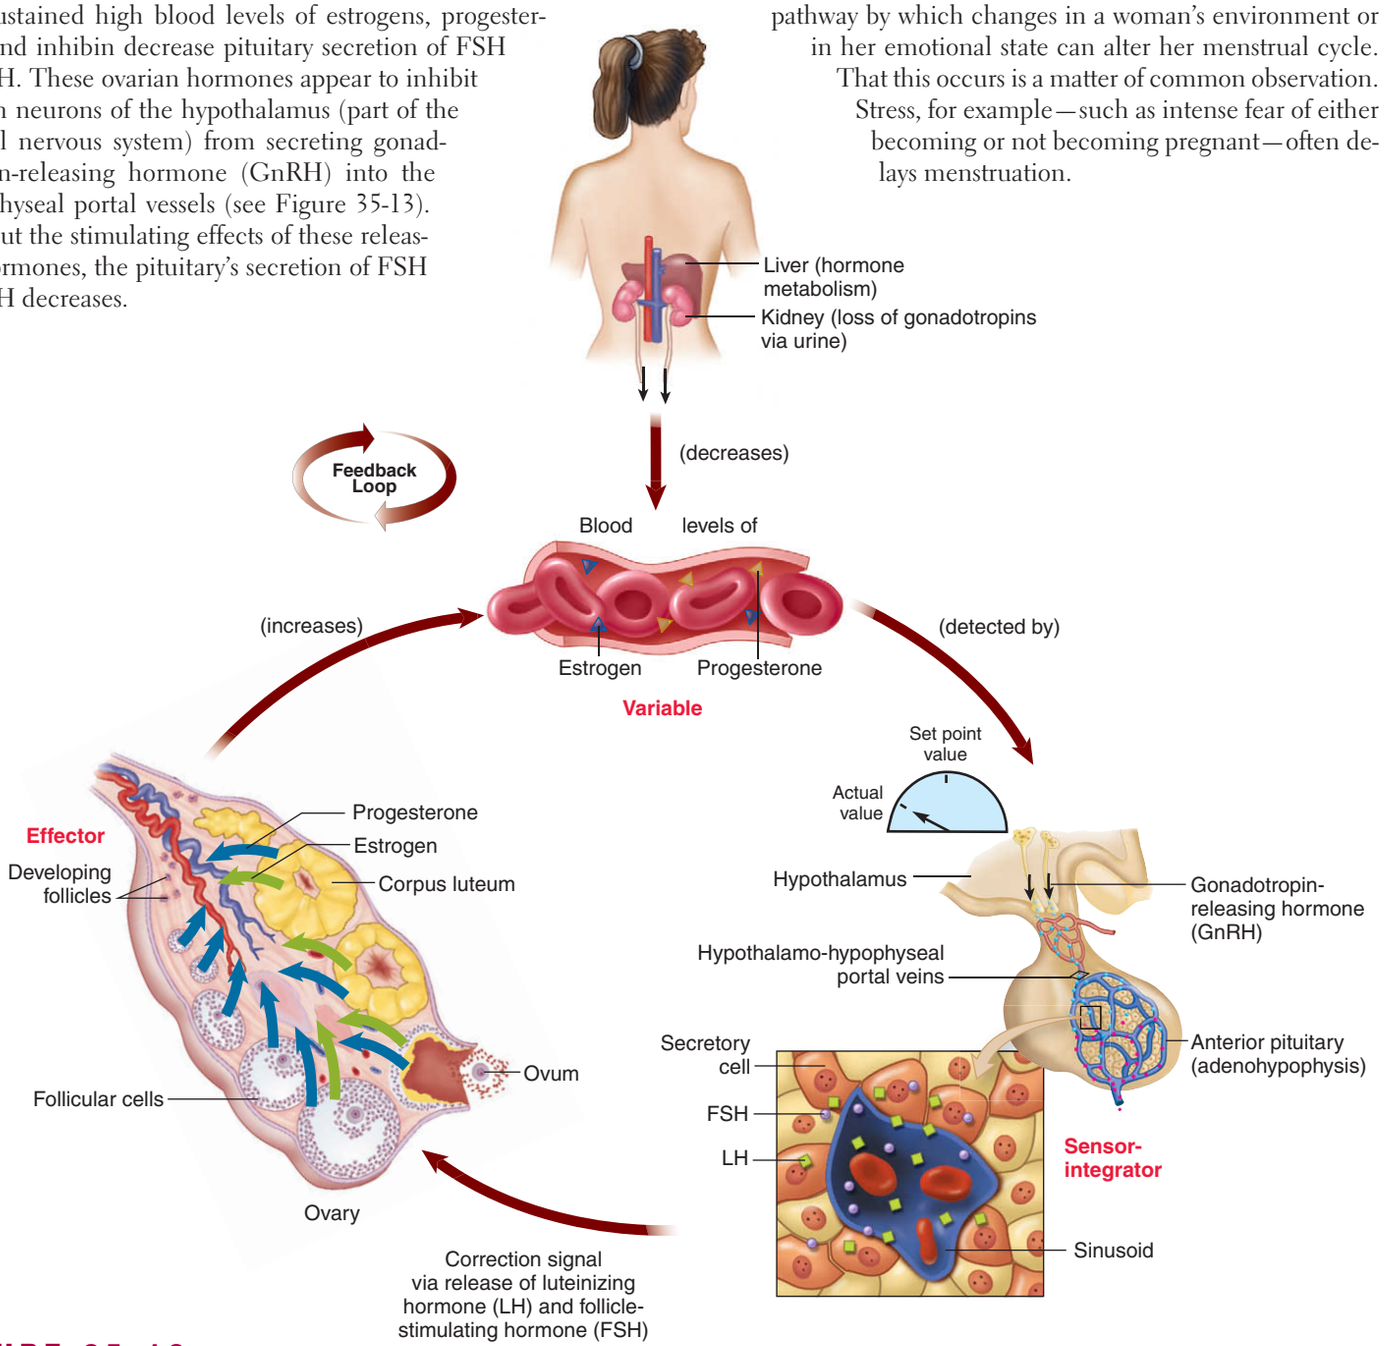

FIGURE 35-13

Control of FSH and estrogen secretion. A negative feedback mechanism controls anterior pituitary secretion of follicle-stimulating hormone (FSH) and ovarian secretion of estrogens. A high blood level of FSH stimulates estrogen secretion, whereas the resulting high estrogen level inhibits FSH secretion. How does this compare with the LH testosterone feedback mechanism in the male? (See Figure 34-7, p. 1049, if you want to check your answer.) According to the diagram, what effect does a high blood concentration of estrogens have on anterior pituitary secretion of FSH? of LH?

Importance of Female Reproductive Cycles

Several important functional roles are played by the female reproductive cycles. As Figure 35-14 shows, the changes associated with the different cycles are all closely interrelated. The primary role of the ovarian cycle, for example, is to produce an ovum at regular enough intervals to make reproductive success likely. The ovarian cycle's secondary role is to regulate the endometrial (menstrual) cycle by means of the sex hormones estrogen and progesterone. The role of the endometrial cycle, in turn, is to ensure that the lining of the uterus is suitable for the implantation of an embryo if fertilization of the ovum occurs. The constant renewal of the endometrium makes successful implantation more likely. The cyclical mechanisms of female reproductive function, and the fact that an ovum must unite with a sperm during the first 24 hours or so after ovulation to reach the uterus at the proper stage of development to implant, result in the fact that a woman is fertile

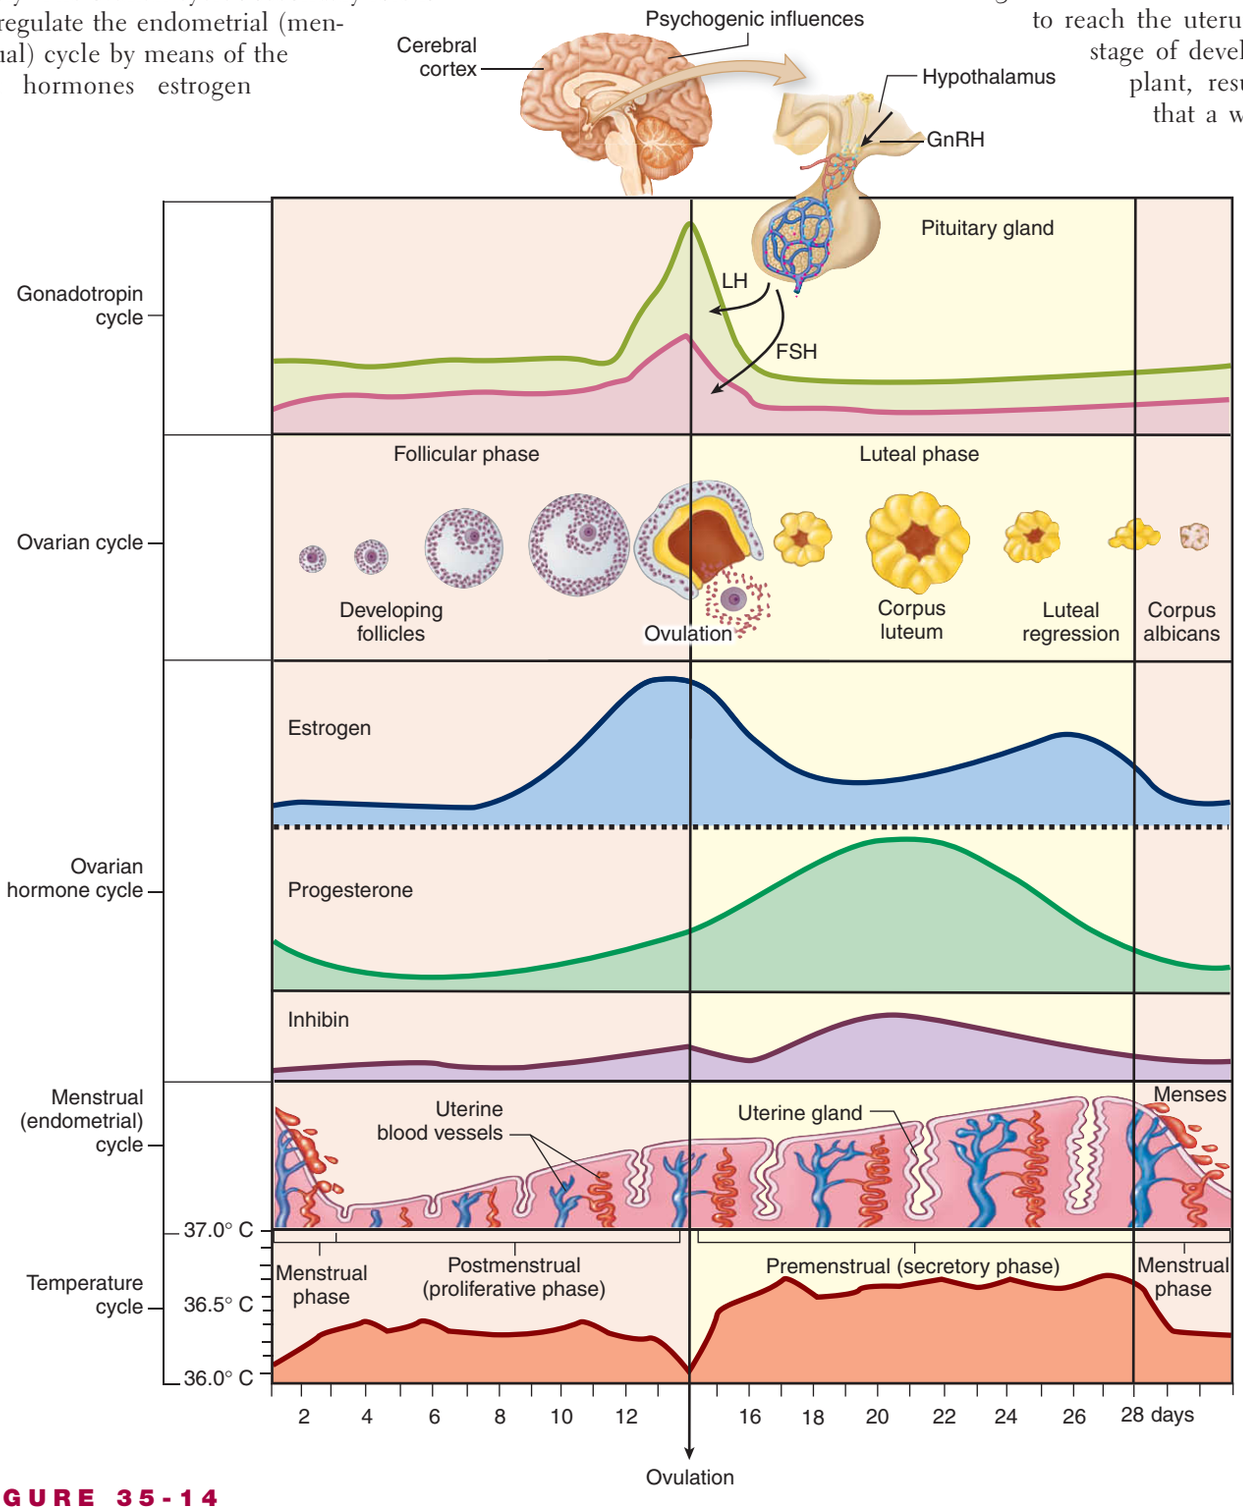

FIGURE 35-14

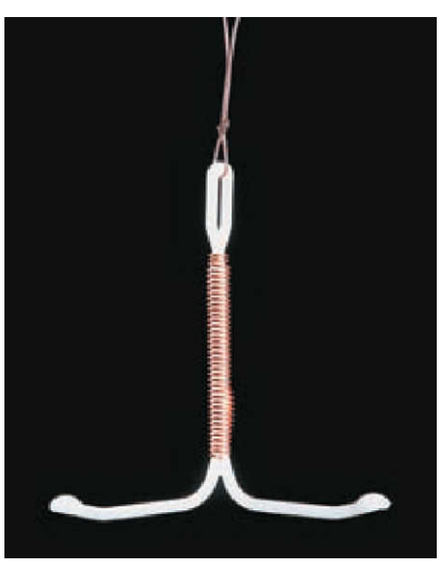
Female reproductive cycles. This diagram illustrates the interrelationships among the cerebral, hypothalamic, pituitary, ovarian, and uterine functions throughout a standard 28-day menstrual cycle. The variations in basal body temperature are also illustrated.

only a few days out of each monthly cycle. Human fertility is further limited by the fact that sperm usually cannot survive in the female reproductive tract for more than a few days. Such limited fertility increases the likelihood that conception will occur only when the woman's body is at its reproductive peak.



Box 35-5 discusses some common methods for managing fertility.

Box 35-5 | HEALTH matters

Methods of Contraception

Hormonal methods of contraception began with establishment of the relationship between sex hormone levels and ovulation. Continuing research in this area led to the development of **oral contraceptives**—often collectively called "the Pill." Numerous oral contraceptive products are now available that contain different types, combinations, and dosages of estrogen and progesterone. The so-called "minipill" contains only synthetic progesterone. Most hormonal contraceptives were developed to prevent pregnancy by initiating negative feedback inhibition of follicle-stimulating hormone (FSH) and luteinizing hormone (LH) secretion. As a result, mature follicles do not develop, and LH levels required to initiate ovulation do not occur. The next menses, however, does take place if the progesterone and estrogen dosage is stopped in time to allow their blood levels to decrease as they normally do near the end of the cycle to bring on menstruation. For this reason, the Pill can be used to regulate the menstrual cycle, as well as prevent pregnancy. If used correctly and consistently, the pill is an extremely effective contraceptive with an unintended pregnancy rate estimated at between 0.1% and 3%. The higher percentage reflects "typical" rather than "ideal" use, and underscores the impact of human error in using any form of birth control.

In addition to oral contraceptives taken in pill form, other types of hormonal birth control "delivery mechanisms" are available in some parts of the world. They include hormone-impregnated vaginal inserts, hormone injections, transcutaneous administration using skin "patches," and surgical insertion of hormone-containing implants under the skin.

Intrauterine device (IUD)

The effects of hormonal contraceptives—indeed, of estrogens and progesterone—are much more complex than our explanation here indicates. They have widespread effects on the body quite independent of their action on the reproductive and endocrine systems and are still not completely understood. Possible side effects—some extremely serious—including stroke and heart attack, may limit or prohibit use of these birth control methods by some women. Side effects of hormonal contraceptives are especially troublesome if these products are used for extended periods, by older women, by women who smoke, and in women with blood clotting problems or cardiovascular disease. On the other hand, long-term use has also been shown to have some beneficial health effects such as protection against uterine and **ovarian cancer.**

In addition to hormonal methods of contraception, many other methods, each with differing rates of effectiveness and unique advantages and disadvantages, are available. For example, *spermicidal methods* involve use of preparations (foams, jellies, and creams) that act to kill sperm, and *mechanical barrier methods* use devices such as condoms, diaphragms, and cervical caps to block sperm from entering the uterus. So-called *surgical methods* such as tubal ligation (see Box 35-1) and male vasectomy result in permanent sterility.

An **intrauterine device** or IUD is usually a small, copper-wrapped object (pictured) inserted into the lumen of the uterine body, where it remains for months or years. IUDs trigger an inflammatory response called the *foreign body reaction,* which is toxic to sperm and probably also ova. By thus inhibiting gametes, the IUD works by preventing fertilization. Some IUDs also release progesterone and thus have an action similar to other hormonal contraceptives. A common misconception not supported by research is that IUDs work by triggering abortions.

Decision making concerning the use of contraceptive methods to regulate reproductive function involves many complex interactions that are uniquely human—and very personal. The decision to use or avoid contraception—or employ any particular contraceptive method—at any point in time is often influenced by differing medical, social, cultural, ethical, and religious factors as well as by the cost, reliability, safety, or ease of use of a particular method. Informed and thoughtful decision making regarding this human behavior is critically important. It will often be necessary for some individuals to seek out a variety of information—from different but credible and knowledgeable sources—in order to make an informed decision that is "right" for those individuals. Regardless, seeking counsel and advice from a trusted health care provider early in the process is always recommended.

Infertility and Use of Fertility Drugs

Infertility is often defined as failure to conceive after 1 year of regular unprotected intercourse. Infertility may be caused by a wide variety of medical, environmental, and even lifestyle factors, such as smoking or alcohol abuse. Causal factors may be traced to various problems in either the male or female partner, each accounting for about 40% of cases. Of the remaining 20% of affected couples, infertility in about 10% is due to problems shared by both partners and in about 10% the reason is never determined. If testing identifies the female member of the couple as infertile, she joins a subset of about 25% of women in the overall population who will experience some period of infertility during their reproductive years. In many cases, infertility results from a failure to ovulate—often caused by a medical condition such as *polycystic ovary syndrome* or *PCOS* (see Mechanisms of Disease). Significant numbers of infertile women experiencing ovulatory dysfunction desire to become pregnant and, after a sometimes long and complex medical "workup" and selection process, become candidates to receive so-called *fertility drugs*—either alone or in combination with other "assisted reproductive procedures" such as artificial insemination.

An orally administered fertility drug called *clomiphene* (Clomid, Serophene) may be used to treat women who have anovulatory cycles. It is an antiestrogen agent that competes with estrogen for estrogen-receptor binding sites. By blocking estrogen it acts as an ovulatory stimulant. How? By effectively "tricking" the pituitary gland into producing FSH and LH. The gonadotropin surge causes normal follicle growth and subsequent ovulation. Clomiphene is given in daily doses of 50 or 100 mg for 5 days, generally starting on day 5 of the menstrual cycle. In a successful treatment program, ovulation most often occurs from 5 to 10 days after a course of the drug. The incidence of multiple births is about 5% to 7% (mostly twins), a percentage much lower than what is observed following direct administration (injection) of FSH and LH, where the intent is to produce multiple follicles before inducing ovulation.

Supraovulation, or simultaneous rupture of multiple mature follicles, is an infertility treatment option that may be employed if clomiphene use proves ineffective or if multiple ova are deemed desirable in assisted reproductive procedures such as **in vitro fertilization (IVF).** It most frequently involves self-administered injections of either (1) drugs called **menotropins** or (2) genetically developed (recombinant) gonadotropins. Menotropins contain high concentrations of FSH and LH that are extracted from the urine of pregnant women or from postmenopausal women. Recombinant gonadotropins include human menopausal gonadotropins (hMGs) and FSH.

Menarche and Menopause

The menstrual flow first occurs **(menarche)** at puberty, at about the age of 13 years, although there is individual variation according to race, nutrition, health, and heredity. Normally, it recurs about every 28 days for about 3 decades, except during pregnancy, and then ceases **(menopause,** or **climacteric).** The average age at which menstruation ceases is reported to have increased markedly—from about age 40 years a few decades ago to between ages 45 and 50 years more recently.

Recall that gonadotropins extracted from the urine of menopausal women (menotropins) are used as fertility drugs. Figure 35-15 shows how the changes just described relate to changes in hormone levels over the life span. Relatively low concentrations of gonadotropins (FSH and LH) sustain a peak of estrogen secretion from menarche to menopause. After menopause, estrogen concentration decreases dramatically—which causes a negative feedback response that increases the gonadotropin levels. Because the follicular cells are no longer sensitive to gonadotropins after menopause, the increased gonadotropin level has no effect on estrogen secretion.

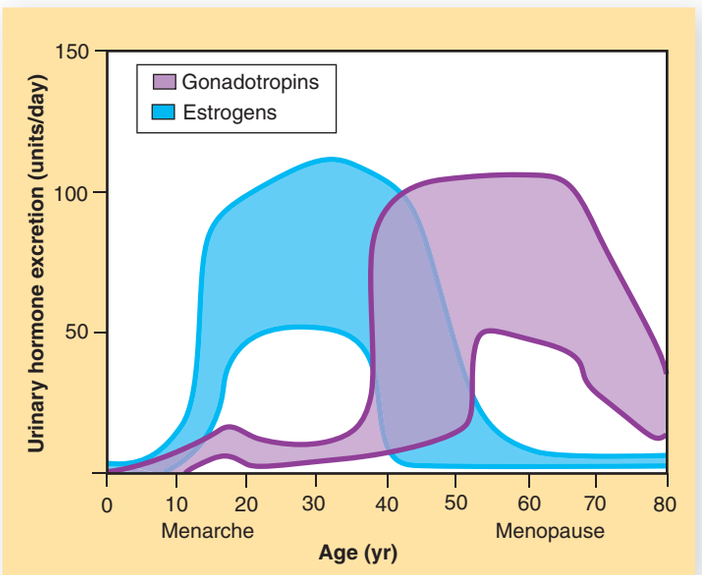


FIGURE 35-15

Gonadotropin and estrogen levels over the life span. This graph shows changes in hormone levels as reflected in urinary excretion rates from birth to advanced old age. Note that an increase in the gonadotropin level at the time of menarche sustains a high but variable level of estrogens until the time of menopause, when ovarian follicular cells cease to respond to gonadotropins. A negative feedback mechanism tries to increase estrogen levels to their former high levels by increasing the gonadotropin levels—a strategy that always fails.

TABLE 35-1 Some Female Reproductive Hormones*

HORMONE	SOURCE	TARGET	ACTION
Dehydroepiandrosterone (DHEA)	Adrenal gland, ovary, other tissues	Converted to other hormones	Eventually converted to estrogens, testosterone, or both (see Figure 18-5 on p. 548)
Estrogens (including estradiol [E_2] and estrone)	Ovary and placenta (small amounts in other tissues)	Uterus, breast, other tissues	Stimulates development of female sexual characteristics, breast development, bone and nervous system maintenance
Follicle-stimulating hormone (FSH)	Anterior pituitary (gonadotroph cells)	Ovary	Gonadotropin; promotes development of ovarian follicle; stimulates estrogen secretion
Gonadotropin-releasing hormone (GnRH)	Hypothalamus (neuroendocrine cells)	Anterior pituitary (gonadotroph cells)	Stimulates production and release of gonadotropins (FSH and LH) from anterior pituitary
Human chorionic gonadotropin (hCG)	Placenta	Ovary	Stimulates secretion of estrogen and progesterone during pregnancy
Inhibin	Ovary	Hypothalamus Anterior pituitary (gonadotroph cells)	Inhibits GnRH production in the hypothalamus and FSH production in the anterior pituitary
Luteinizing hormone (LH)	Anterior pituitary (gonadotroph cells)	Ovary	Gonadotropin; triggers ovulation; promotes development of corpus luteum
Oxytocin (OT)	Posterior pituitary	Uterus and mammary glands	Stimulates uterine contractions; stimulates ejection of milk into ducts of mammary glands; involved in social bonding
Progesterone	Ovary and placenta	Uterus, mammary glands, other tissues	Helps maintain proper conditions for pregnancy
Prolactin (PRL) (lactogenic hormone)	Anterior pituitary (lactotroph cells)	Mammary glands (alveolar secretory cells)	Promotes milk secretion
Relaxin	Placenta	Uterus and joints	Inhibits uterine contractions during pregnancy and softens pelvic joints to facilitate childbirth
Testosterone	Adrenal glands, ovaries	Nervous tissue, bone tissue, other tissues	May affect mood, sex drive, learning, sleep, protein anabolism, other functions

*The role of some hormones related to pregnancy, labor, and delivery are discussed in more detail in the next chapter (Chapter 36, Growth and Development).

Table 35-1 summarizes some of the hormones important in female reproductive function.

| QUICK CHECK |

17. A surge in FSH and LH is associated with what major event of the ovarian cycle?
18. How does an increase in estrogen level affect the uterine lining?
19. What is *menopause?* What causes menopause to occur?

BREASTS

Location and Size of the Breasts

Two breasts lie over the pectoral muscles and are attached to them by a layer of connective tissue (fascia) (Figure 35-16). Breasts are made up of milk-producing **mammary glands,** which are present in all mammals, along with extensive supporting tissues. Breasts are present in both males and females—but only infrequently develop or produce milk in males.

Estrogens and progesterone, two types of ovarian hormones, control breast development during puberty. Estrogens stimulate growth of the ducts of the mammary glands, whereas progesterone stimulates development of the actual secreting cells. Breast size is determined more by the amount of fat around the glandular tissue than by the amount of glandular tissue itself. Hence the size of the breast is not related to its ability to produce milk.

Structure of the Breasts

Each breast consists of several lobes separated by septa (walls) of connective tissue. Each lobe consists of several *lobules*, which, in turn, are composed of connective tissues in which are embedded the pouches of milk-secreting cells. These pouches, or *alveoli*, are arranged in grapelike clusters around the tiny ductule. Figure 35-17 shows one of the mammary alveoli and the milk-producing cells that form its walls. Notice that a special type of epithelial cell called a *myoepithelial cell* is present around the outside of the alveolus. This type of cell contracts slightly, as if it were a muscle cell, thus squeezing milk out into the secretory duct.

The ductules from the various lobules unite, forming a single *lactiferous duct* for each lobe, or between 15 and 20 in each breast. The term lactiferous simply means "milk carrying." These main lactiferous ducts converge toward the nipple, like the spokes of a wheel. They enlarge slightly into small *lactiferous sinuses* before reaching the **nipple** (see Figure 35-16, A). The lactiferous sinuses are positioned to be squeezed by the suckling motion of a baby's jaws during breastfeeding—thus allowing the sinuses to act as little pumping chambers that help move milk out of the breast (Figure 35-18). Each of the main ducts terminates in a tiny opening on the surface of the nipple.

A comparatively large amount of adipose tissue is deposited around the surface of the gland, just under the skin, and between the lobes. *Suspensory ligaments (of Cooper)* throughout the connective tissue of the breast help support the glandular and

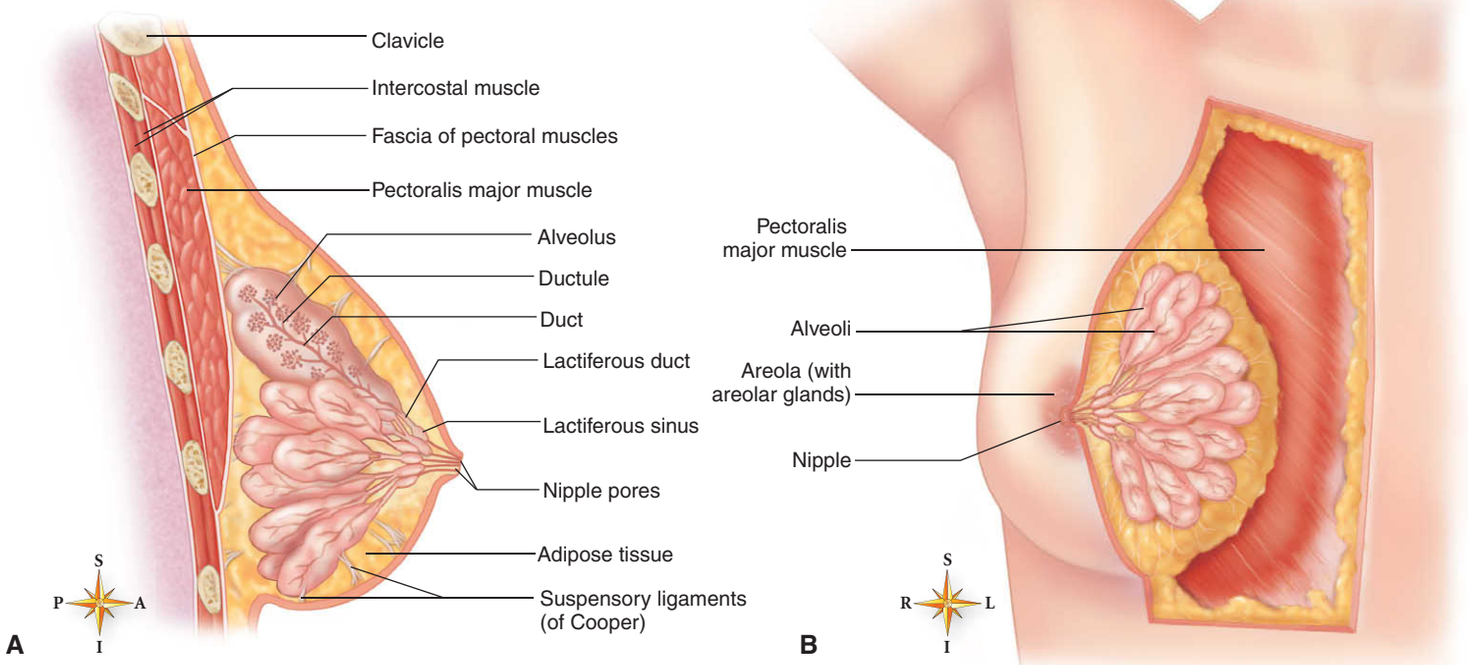

FIGURE 35-16

The female breast. A, Sagittal section of a lactating breast. Notice how the glandular structures are anchored to the overlying skin and to the pectoral muscles by the suspensory ligaments of Cooper. Each lobule of glandular tissue is drained by a lactiferous duct that eventually opens through the nipple. **B,** Anterior view of a lactating breast. Overlying skin and connective tissue have been removed from the medial side to show the internal structure of the breast and underlying skeletal muscle. In nonlactating breasts, the glandular tissue is much less prominent, with adipose tissue making up most of each breast.

connective tissues of the entire structure, anchoring them to the coverings of the underlying pectoral muscles.

The nipples are bordered by a circular pigmented area, the **areola** (see Figure 35-16, *B*). It contains numerous sebaceous glands that appear as small nodules under the skin. Sebum produced by these *areolar glands* helps reduce irritating dryness of the areolar skin associated with nursing. Areolar secretions also contain pheromones that enhance the mother-infant social bond. In some lighter-skinned women, the areola and nipple change color from pink to brown early in pregnancy—a fact of value in diagnosing a first pregnancy. The color decreases

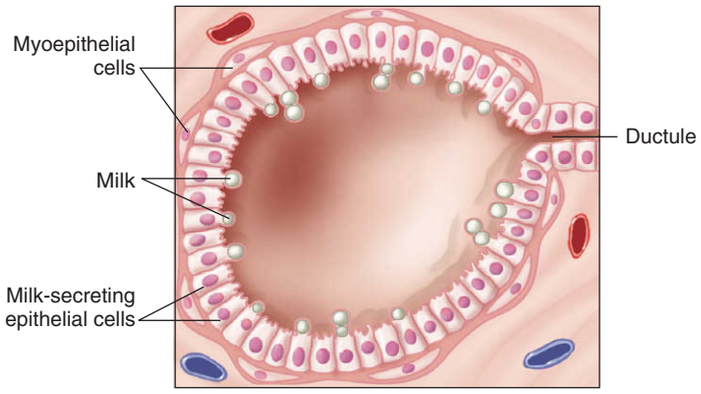

FIGURE 35-17

Alveolus of the mammary gland. Notice the contractile myoepithelial cells that surround the milk-producing cells. Milk is released by apocrine secretion, in which vesicles of fluid pinch off the cell (see Figure 6-12 on p. 142).

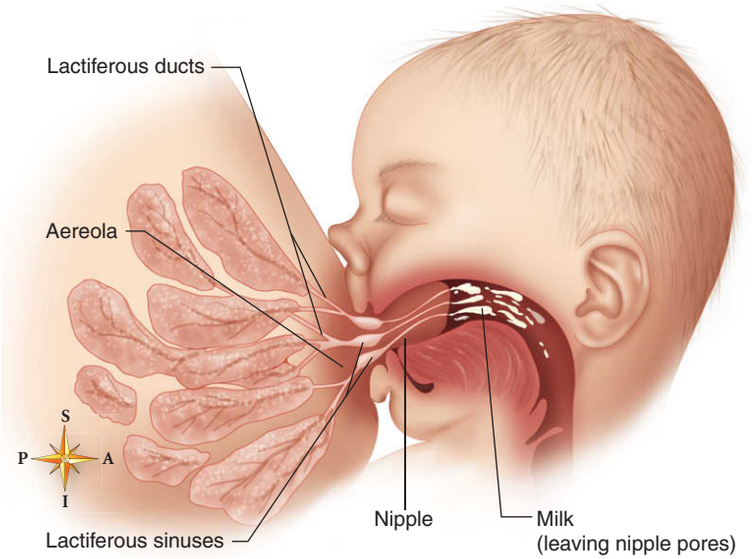

FIGURE 35-18

Function of lactiferous sinuses. When an infant is properly latched on to the breast, its jaws squeeze the lactiferous sinuses rhythmically, thus pumping milk out of the breast and into the back of the infant's mouth.

after lactation has ceased but never entirely returns to the original hue. In some darker-skinned women, no noticeable color change in the areola or nipple heralds the first pregnancy.

Knowledge of the lymphatic drainage of the breast is important in clinical medicine because cancerous cells from malignant breast tumors often spread to other areas of the body through the lymphatics. Lymphatic drainage of the breast is presented in Chapter 23.

Function of the Breasts

The function of the mammary glands is lactation, that is, the secretion of milk for the nourishment of newborn infants.

MECHANISM CONTROLLING LACTATION

Very briefly, **lactation** is controlled as follows and as shown in Figure 35-19:

- The ovarian hormones, estrogens and progesterone, act on the breasts to make them structurally ready to secrete milk. Estrogens promote development of the ducts of the breasts. Progesterone acts on the estrogen-primed breasts to promote completion of the development of the ducts and development of the alveoli, the secreting cells of the breasts. This is an example of hormonal *permissiveness*; estrogen permits progesterone to have its full effect. A high blood concentration of estrogens during pregnancy also inhibits anterior pituitary secretion of prolactin.
- Shedding of the placenta after delivery of the baby cuts off a major source of estrogens. The resulting rapid drop in the blood concentration of estrogens stimulates anterior pituitary secretion of prolactin. Also, the suckling movements of a nursing baby stimulate anterior pituitary secretion of prolactin and posterior pituitary secretion of oxytocin.
- Prolactin stimulates lactation, that is, stimulates alveoli of the mammary glands to secrete milk. Milk secretion starts about the third or fourth day after delivery of a baby, supplanting a thin, yellowish secretion called *colostrum*. With repeated stimulation by the suckling infant, plus various favorable mental and physical conditions, lactation may continue for extended periods.
- Oxytocin stimulates myoepithelial cells in the alveoli of the breasts to eject milk into the ducts, thereby making it accessible for the infant to remove by suckling.

This summary highlights only the major hormonal mechanisms that regulate lactation. Table 35-2 shows that there are *many* hormones that support the processes needed for successful lactation

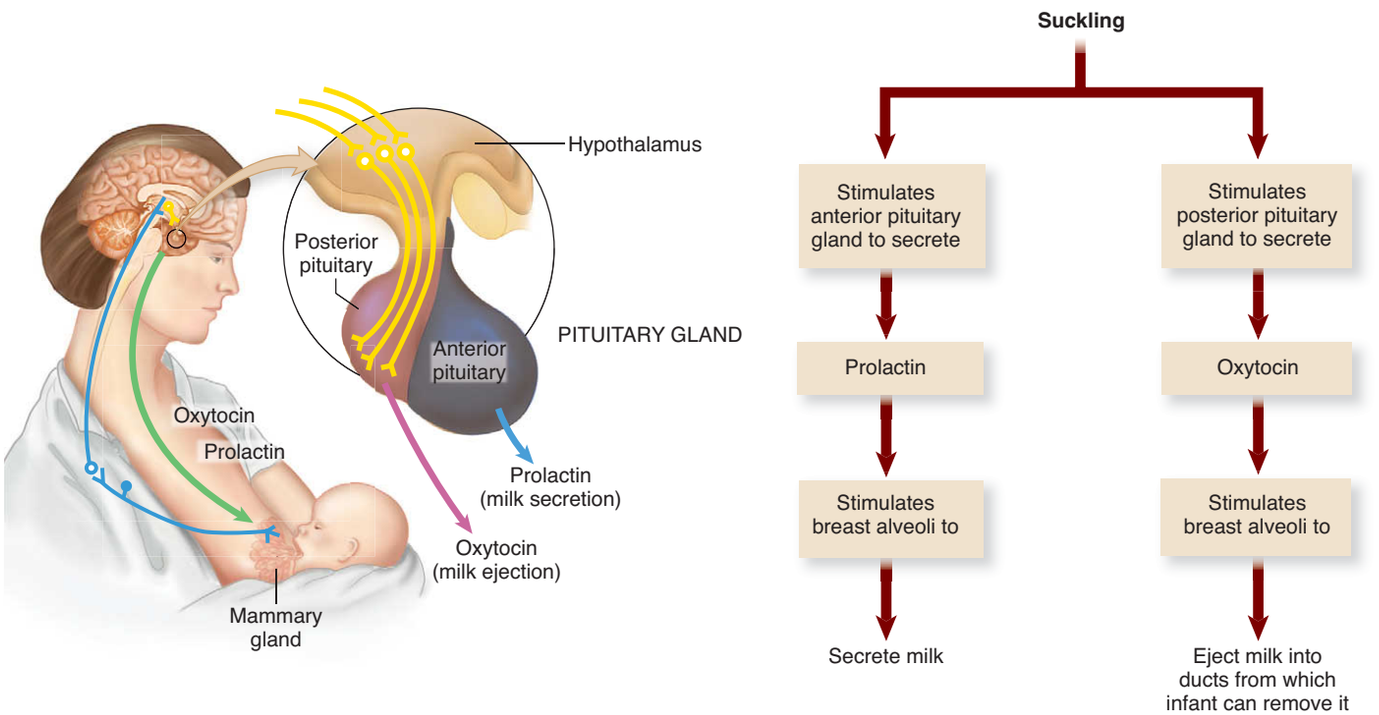

FIGURE 35-19

Lactation. The illustration and accompanying flowchart summarize the mechanisms that control the secretion and ejection of milk.

TABLE 35-2 Hormones That Support Milk Production

CATEGORY	ROLE IN LACTATION	HORMONES
Mammogenic hormones	Promote tissue growth and development	↑ Estrogens ↑ Growth hormone (GH) ↑ Insulin-like growth factor (IGF-1) ↑ Insulin ↑ Cortisol ↑ Prolactin (PRL) ↑ Relaxin ↑ Epidermal growth factor (EGF)
Lactogenic hormones	Initiate milk production by secretory cells of alveolus	↑ Prolactin (PRL) ↑ Placental lactogen (hPL) ↑ Cortisol ↑ Insulin ↑ Insulin-like growth factor (IGF-I) ↑ Thyroid hormones (T_3, T_4) ↑ Growth hormone (GH) ↓ Estrogens ↓ Progesterone
Galactokinetic hormones	Promote milk ejection by stimulating myoepithelial cells surrounding alveoli	↑ Oxytocin (OT) ↑ Antidiuretic hormone (ADH) (vasopressin [AVP])
Galactopoietic hormones	Maintain milk production (after it has already started)	↑ PRL ↑ Cortisol ↑ Insulin ↑ IGF-1 ↑ T_3, T_4

and defines the major roles that these hormones play. Many of these mechanisms are adaptations of hormonal processes discussed earlier, such as insulin's ability to get glucose into cells—a function clearly needed in cells that produce sugar-rich milk.

THE IMPORTANCE OF LACTATION

The process of **lactation** plays an important role in the ultimate success of the reproductive system. The biological goal of human reproduction does not lie solely in delivering a healthy infant—the infant must also survive until reproductive age. If a child does not survive to reproduce, then the genetic code cannot be passed on to successive generations and the ultimate goal of reproduction has not been met. Humans and other mammals help ensure the survival of offspring for up to several years by producing nutrient-rich milk. Nursing from the mother's breast provides several advantages for human offspring, including:

- Milk is a rich source of proteins, fat, calcium, vitamins, and other nutrients in proportions needed by a young, developing body.
- Human milk provides passive immunity to the offspring in the form of maternal antibodies present in both colostrum and the milk.
- Nursing enhances the emotional bond between mother and child. Such bonding fosters healthy psychological development in the child and strengthens family relationships that contribute to successful human development.

| QUICK CHECK |

20. Briefly describe the network of ducts and secreting cells that form the mammary glands.
21. List the hormones that prepare the breast structurally for lactation.
22. Which hormone causes milk to be ejected into the lactiferous ducts?

Cycle of LIFE

Female Reproductive System

As mentioned in Chapter 34, the reproductive system is unlike any other body system with regard to the normal changes that occur during the life span. Unlike other systems, the female reproductive system does not begin to perform its functions until the teenage years (puberty), and unlike the male reproductive system, the female reproductive system ceases its principal functions in middle adulthood.

The female organs begin their initial stages of development in the womb. As a matter of fact, the first stage of meiotic development of all the ova that will ever be produced by a woman is completed by the time she is born. However, full development of the reproductive organs—and the gametes within the ovaries—does not resume until puberty. At puberty, reproductive hormones stimulate the organs of the reproductive tract to become functional and produce a mature ovum one at a time. Reproductive function then continues in a cyclical fashion until menopause. Menopause is an event that is usually marked by the passage of at least 1 full year without menstruation. After that time, a woman may continue to enjoy normal sexual activity, but she cannot produce more offspring.

the BIG picture

Female Reproductive System and the Whole Body

As stated several times in this chapter, the importance of reproductive function lies in the fact that it imparts virtual immortality to our genes. This is important not only to the survival of the human species but also to the survival of life itself. After all, life as we know it could not exist without a genetic code. The "big picture" of human reproduction requires two systems, one reproductive system in each parent. The combined roles of the male and female reproductive systems will be explored as a single topic in the early part of the next chapter.

For now, we will take a closer look at the female reproductive system and its relationships with other systems within a woman's body. As with any system, the female reproductive system cannot function without the maintenance functions of the circulatory, immune, respiratory, digestive, and urinary systems. The female reproductive system shares a special anatomical relationship with the urinary system. These two systems develop in close proximity to each other and thus share a common structure: the vulva. A special anatomical relationship with the skeletal muscular system is evident in the structure known as the *perineum*. Of course the skeletal and muscular systems both support and protect the internal organs of the female reproductive system. An even more special relationship with the integumentary system should be noted. The breasts, containing the milk-producing mammary glands, are actually modifications of the skin. Although structurally the breasts can be thought of as belonging to the integumentary system, functionally they are best considered as a part of the reproductive system. Nervous and endocrine regulation of female reproductive function has been outlined in this chapter and is explored further in the next chapter.

MECHANISMS of DISEASE

DISORDERS OF THE FEMALE REPRODUCTIVE SYSTEM

Hormonal and Menstrual Disorders

Dysmenorrhea (dis-men-oh-REE-ah), meaning "painful menstruation," is the term used to describe *menstrual cramps*, the painful periods that affect 75% to 80% of women at some time during their reproductive years. For significant numbers of those affected, severe lower abdominal cramping and back pain accompanied by headache, nausea, and vomiting will disrupt their school, work, athletic, or other activities. *Primary dysmenorrhea* is the most common type, occurring primarily in adolescents and young women. Symptoms, which can last from hours to days and vary in severity from cycle to cycle, are caused by an abnormally increased concentration of certain prostaglandins produced by the uterine lining. High concentrations of prostaglandin E_2 (PGE_2) and prostaglandin F_2 (PGF_2) cause painful spasms by decreasing blood flow and oxygen delivery to uterine muscle. Fortunately, primary dysmenorrhea is not associated with pelvic disease, such as an infection or tumor, and can generally be treated effectively with over-the-counter antiinflammatory and prostaglandin-inhibiting drugs such as ibuprofen and naproxen. In more severe cases a physician may prescribe more powerful antiinflammatory drugs or certain hormones, including oral contraceptives, to alter menstrual cycle activity or reduce the level or frequency of cyclical uterine contractions.

Secondary dysmenorrhea refers to menstrual-related pain caused by some type of pelvic pathological condition, including inflammatory conditions and cervical stenosis. Treatment of secondary dysmenorrhea conditions and cervical stenosis involves treating the underlying disorder.

Amenorrhea (ah-men-oh-REE-ah) is the absence of normal menstruation. *Primary amenorrhea* is the failure of menstrual cycles to begin and may be caused by various factors, such as hormone imbalances, genetic disorders, brain lesions, or structural deformities of the reproductive organs. *Secondary amenorrhea* occurs when a woman who has previously menstruated slows to three or fewer cycles per year. Secondary amenorrhea may be a symptom of weight loss, pregnancy, lactation, menopause, or disease of the reproductive organs. Treatment of amenorrhea involves treating the underlying disorder or condition. If amenorrhea occurs as a component of the "sports triad" (Box 35-6), treatment may become part of extensive and long-term therapy needed to address a number of complex nutritional, hormonal, and self-image issues.

Dysfunctional uterine bleeding (DUB) is irregular or excessive uterine bleeding that most often results from either a structural problem or some type of hormonal imbalance that causes a disruption of blood supply rather than from an infection or other disease condition. Excessive uterine bleeding from any cause can result in life-threatening anemia. Therefore, DUB is a significant medical problem—one that affects nearly 2 million women in the United States each year. To diagnose the cause, a physician may employ ultrasound or x-ray studies, look directly inside the uterus using a scope inserted through the vagina and cervix, or examine tissue obtained by biopsy to exclude cancer.

Transabdominal pelvic ultrasound is perhaps the most widely used and useful imaging technique to look at the uterus and adjacent reproductive structures. During this procedure a transducer is placed on the lower anterior abdominal wall and high-frequency sound waves are transmitted into the pelvic viscera. The returning echoes are then viewed on a screen similar to that of a sonar receiver or "fish-finder." The resulting image, a "slice picture," may be enhanced by filling the uterus with saline solution (Figure 35-20). Structural problems, such as growth of a uterine malignancy or benign tumor, may cause DUB by injuring

Box 35-6 | SPORTS and FITNESS

The "Sports Triad" in Elite Female Athletes

A disturbing trend among some elite female athletes involves development of a so-called "triad" of undesirable outcomes. In an attempt to improve performance, these athletes couple severe caloric restriction with overtraining. The result is often a flawed sense of body image that equates thinness with athletic potential. The triad involves (1) low energy availability, (2) menstrual disorders, and (3) low bone mineral density.

Low energy availability often results from disordered eating and weight loss. *Amenorrhea* (failure to have a menstrual period) and other menstrual problems are caused by a drastic decrease in estrogen secretion as the body attempts to conserve energy by closing down the reproductive function. It is the decrease in estrogen levels that trigger early loss of bone density—perhaps even *osteoporosis* and permanent skeletal damage. As it progresses, the *sports triad* may also be accompanied by development of other serious and potentially fatal outcomes.

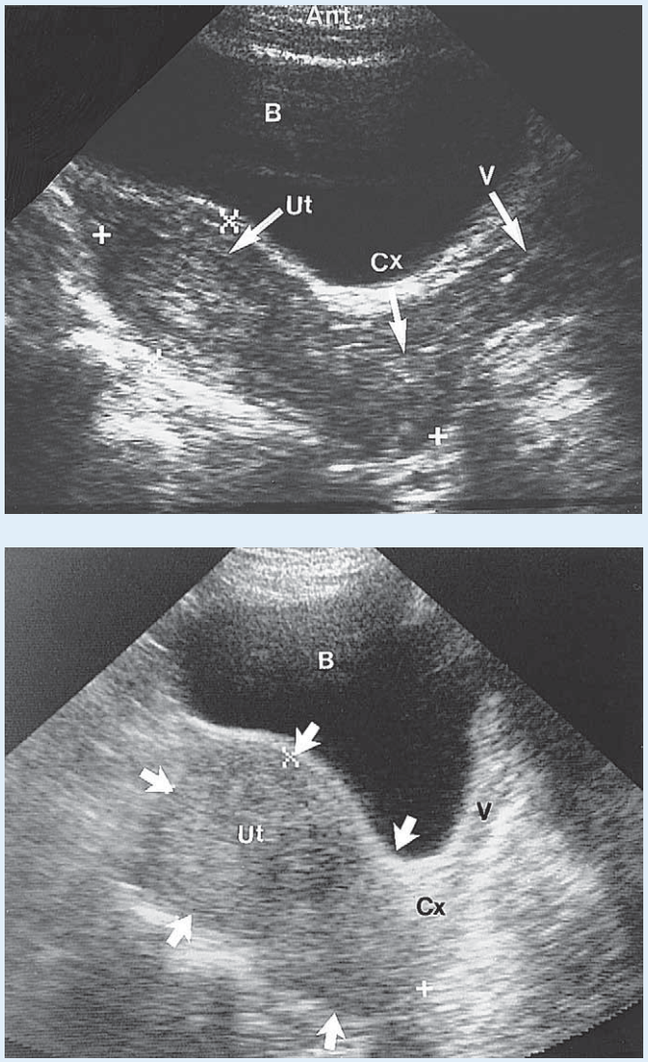

FIGURE 35-20

Female pelvic transabdominal ultrasound. A, Normal longitudinal ultrasound image. The bladder *(B),* uterus *(Ut),* cervix *(Cx),* and vagina *(V),* are visible. **B,** Longitudinal ultrasound image of uterine fibroids causing dysfunctional uterine bleeding *(DUB).* Echo pattern shows an enlarged and "lumpy" appearing (arrows) uterus *(Ut)* protruding into the bladder *(B).* The cervix *(Cx)* and vagina *(V)* are visible.

the blood vessels of the uterine wall or lining as the tissue mass grows in size and the normal contours of the organ are distorted. Figure 35-20, A, shows a normal longitudinal pelvic ultrasound image. It was taken "looking down" through the anterior abdominal wall in the mid portion of the pelvis. Note how the bladder was used as a "window" to view the uterus and adjacent reproductive structures below. The bladder, uterus, contours of the uterine cavity, cervix, and vagina are all visible. Figure 35-20, *B*, shows the appearance of a similar ultrasound image in a patient suffering from DUB caused by a structural problem—abnormal muscular growths called **uterine fibroids** (discussed on pp. 1088–1089). The uterus is enlarged and pushing into the bladder, it appears "lumpy," and the cavity contours are obviously distorted. Surgical removal or treatment to shrink the fibroid growths is usually curative.

If hormonal imbalance is the cause of DUB, it is the excessive growth (hyperplasia) and breakdown of delicate endometrial tissue that results in heavy bleeding. In these cases, treatment generally begins with administration of nonsteroidal antiinflammatory drugs and hormonal manipulation using low-dose birth control pills. If conservative treatment fails to stop the endometrial lining from hemorrhaging, hysterectomy remains one of the most effective curative options. However, less invasive procedures, including *endometrial ablation* techniques, are now being used more frequently to destroy the endometrial lining and halt or permanently reduce excessive menstrual blood loss in many women suffering from DUB. In *thermal ablation*, a balloon is inserted into the uterus and filled with fluid. A heat probe is then inserted into the balloon and the fluid is heated to a temperature that will destroy the endometrium. In *radiofrequency ablation*, a gold-plated mesh fabric is used to fill the uterine cavity and is then charged with radiofrequency energy that destroys the friable and bleeding

endometrial cells. Both procedures carry less risk and have shorter recovery periods than does a hysterectomy.

Premenstrual syndrome (PMS) is a condition that involves a collection of symptoms that regularly occur in many women during the premenstrual phase of their reproductive cycles. Symptoms include headache, irritability, fatigue, nervousness, weight gain, sleep changes, depression, and other problems that are often distressing enough to limit activity and affect personal relationships. Because the cause of PMS is still unclear, current treatments focus on relieving the symptoms.

Infection and Inflammation

Infections of the female reproductive tract are often classified as *exogenous* or *endogenous*. Exogenous infections result from pathogenic organisms transmitted from another person, such as *sexually transmitted diseases (STDs)*. Endogenous infections result from pathogens that normally inhabit the intestines, vulva, or vagina. You may recall from Chapter 1 that many areas of the body are normally inhabited by pathogenic microorganisms but that they cause infection only when there is a change in conditions or they are moved to a new area.

evolve

Pelvic inflammatory disease (PID) occurs as either an acute or chronic inflammatory condition that can be caused by several different pathogens, which usually spread upward from the vagina. PID is a major cause of infertility and sterility and affects more than 800,000 women each year in the United States. It is a common complication following infection by chlamydial and gonococcal STD organisms. Infection involving the uterus, uterine tubes, ovaries, and other pelvic organs often results in development of scar tissue and adhesions. Direct laparoscopic examination is often used to determine the severity of the PID infection and the reproductive organs involved (Figure 35-21).

PID that results in uterine tube inflammation, a condition called **salpingitis** (sal-pin-JYE-tis) is often characterized by obstruction of the lumen and marked dilation at the end of the tube caused by accumulation of fluid that cannot escape—a condition physicians refer to as **hydrosalpinx** (hye-droh-SAL-pinks) (see Figure 35-21, *B*). Because ultrasound images cannot show whether the lumen of the uterine tube is open or obstructed, other imaging techniques are required to make a definitive diagnosis of infertility caused by tubal obstruction. Figure 35-22 shows two x-ray images of the uterus and uterine tubes called **hysterosalpingograms** (his-ter-oh-sal-PING-go-grams). In the x-ray technique used to produce these images, a cannula is inserted into the cervical canal and contrast material is injected into the uterine cavity and allowed to fill the uterine tubes. In the normal image shown in Figure 35-22, *A*, the contrast material has filled the uterine tubes and flowed out into the peritoneal cavity, demonstrating that the tubes are not obstructed.

Figure 35-22, *B*, is an abnormal hysterosalpingogram of a woman who was treated for salpingitis at an earlier date and later

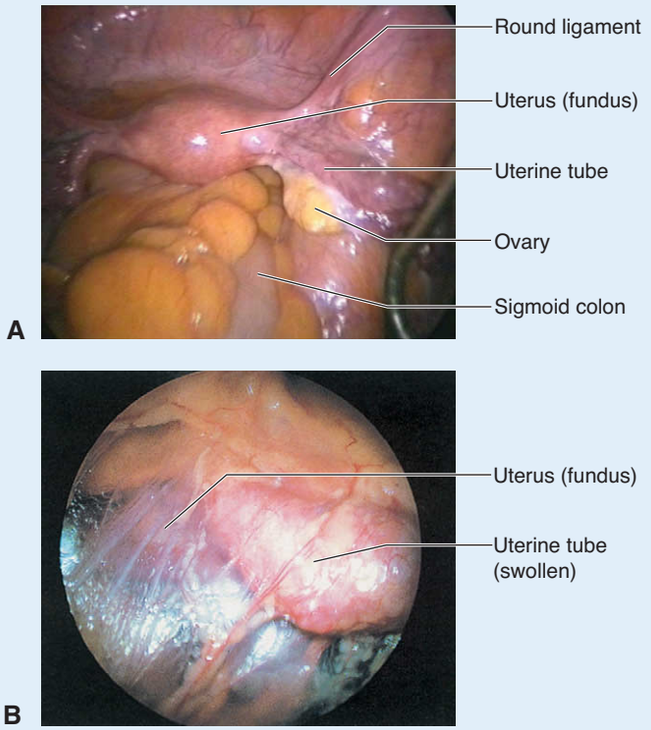

FIGURE 35-21

Laparoscopic views of the female pelvis. A, Laparoscopic image shows normal female pelvic reproductive organs. **B,** Laparoscopic view of pelvic inflammatory disease (PID). Note the clear reddish inflammatory membrane that covers and fixes the ovary, uterine tube, and uterus to the surrounding structures. The inflamed and dilated end of the fluid-filled uterine tube (hydrosalpinx) is clearly visible.

experienced infertility. Note how the contrast material fills and then collects in the dilated portion of the uterine tube (hydrosalpinx) but does not spill into the pelvis. In this case the radiograph allows the physician to make a definitive diagnosis—infertility caused by uterine tube obstruction—and treat it appropriately.

Although some chlamydial infections may not cause symptoms, most cases of PID are accompanied by fever, pelvic tenderness, and pain. Unfortunately, because of scarring and adhesions, pain may continue even after antibiotic therapy has eliminated the active infection. If left untreated, PID infections may spread to other tissues, including the blood, resulting in septic shock and death.

Vaginitis (vaj-i-NYE-tis) is inflammation or infection of the vaginal lining. Vaginitis most often results from STDs or from a "yeast infection." So-called yeast infections are usually opportunistic infections of the fungus *Candida albicans*, producing **candidiasis** (kan-dih-DYE-eh-sis). Candidiasis infections are characterized by a whitish discharge—a symptom known as **leukorrhea** (loo-koh-REE-ah).

Tumors and Related Conditions

Fibroid, myoma (my-OH-mah), and **fibromyoma** (fye-broh-my-OH-mah) are all terms used to describe benign (noncancerous) tumors of uterine fibrous or smooth muscle tissue. Individual fibroids may occur, but multiple growths are not unusual. Fibroids are common in women during their reproductive years and

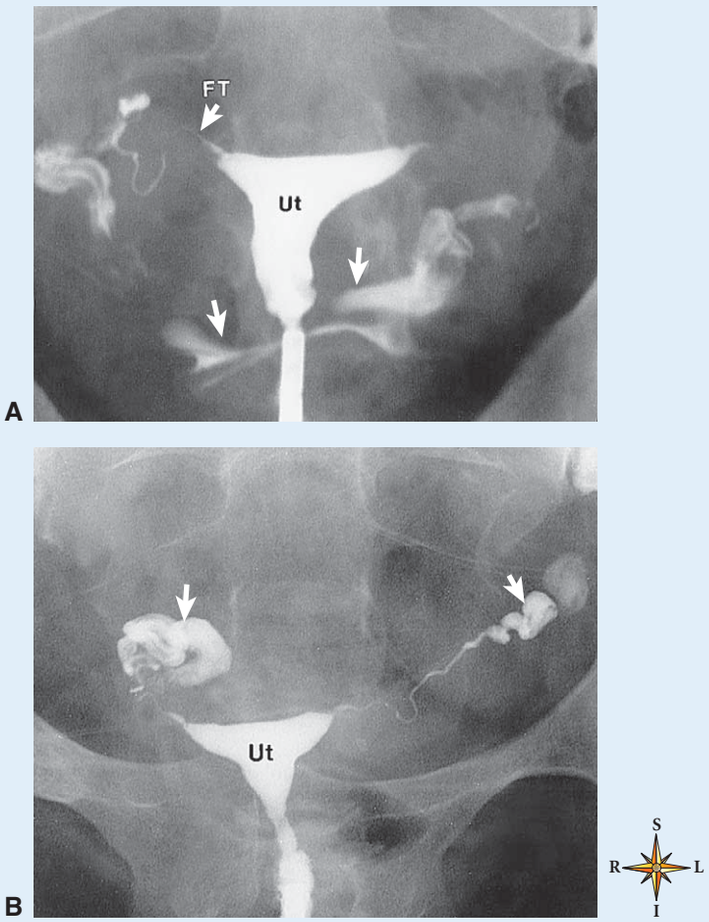

FIGURE 35-22

Hysterosalpingogram. A, Normal image. A tube is inserted in the uterine cervix, and contrast material has filled the uterus *(Ut)* and uterine (fallopian) tubes *(FT). Arrows* indicate contrast material that has flowed out into the peritoneal cavity, indicating that the tubes are not obstructed. **B,** Abnormal image. Contrast material fills the uterine cavity and tubes with no spill into the pelvis. *Arrows* point to the dilated ends of the uterine tubes (hydrosalpinx). Image confirms distal obstruction of the uterine tubes.

develop most often in the myometrium of the uterine body and rarely in the cervix. The fact that they are seldom seen before puberty, increase in size during pregnancy, and tend to shrink in postmenopausal women suggests that age and estrogen levels may play a role in their development. Fibroids range in size from small asymptomatic nodules to massive tumors that may be painful and exert pressure on other pelvic organs. Growth during pregnancy may result in placental hemorrhage or malpresentation of the fetus, complicating labor and delivery. In addition to pain, symptoms will vary depending on the size and location of the tumor. Even small tumors developing beneath the endometrium can cause severe hemorrhage (dysfunctional uterine bleeding, DUB). Tumor size, location, and severity of symptoms will determine treatment options. A technique similar to a heart catheterization, called *uterine artery embolization*, involves snaking a small catheter through an artery in the groin into the arterial vessel supplying blood to the fibroid. Tiny inert pellets are then injected into the artery, blocking the flow of blood. The procedure results in dramatic shrinkage of the treated fibroid and a reduction in symptoms, including hemorrhage. Surgical removal of individual fibroids or, in more severe cases, hysterectomy may be indicated.

Polycystic ovary syndrome (PCOS) is a condition that affects 10% of reproductive-age women but can also affect girls as young as 11 years old. It is characterized by enlarged ovaries that usually are studded with fluid-filled cysts about 0.5 to 1.5 cm in diameter (Figure 35-23). The cysts are found on both ovaries and develop from mature follicles that fail to rupture completely. Corpora lutea are generally absent. Women with PCOS frequently have numerous endocrine abnormalities, including high levels of androgens, infrequent menstrual cycles, and persistent anovulation. PCOS is the most common cause of female infertility.

Ovarian cysts are very common fluid-filled cysts that develop either from follicles that fail to rupture completely *(follicular cysts)* or from corpora lutea that fail to degenerate *(luteal cysts)*. Most women develop a number of these cysts during their reproductive years and their presence does not constitute a diagnosis of polycystic ovary syndrome. Although ovarian cysts are often multiple, they rarely become dangerous. However, on occasion they may become quite large and painful and be diagnosed by palpation or ultrasonography. Luteal cysts are less common than follicular cysts but tend to cause more symptoms, such as pelvic pain, and menstrual irregularities. Rarely, rupture of a large luteal cyst will result in internal bleeding that requires surgical intervention. The vast majority of all ovarian cysts will disappear within a few months of their appearance, most within 60 days.

Endometriosis (en-doh-mee-tree-OH-sis) is a benign but often painful condition that commonly affects the female reproductive tract. It is characterized by the presence of functioning endometrial tissue outside the uterus. The displaced endometrial tissue is most often found attached to an ovary or to the pelvic or abdominal organs and is occasionally found in other places throughout the body. Just how endometrial tissue spreads from the uterine cavity into the peritoneal cavity has not yet been determined. One theory suggests "retrograde menstruation" or backward movement of some endometrial tissue through the uterine tubes into the peritoneal cavity during the menstrual period. Although rare, the almost bizarre appearance of endometrial tissue in the lungs and lymph nodes has led some researchers to speculate that endometrial tissue "seeds"

FIGURE 35-23

Polycystic ovary syndrome (PCOS). The ovary is studded with fluid-filled cysts developed from follicles that have failed to rupture.

pass through vascular or lymphatic channels. Regardless of how the movement occurs, the development of endometriosis is a significant clinical condition that often causes infertility, dysmenorrhea, and severe pain. Symptoms reflect the fact that displaced endometrial tissue reacts to ovarian hormones in the same way as the normal endometrium—exhibiting a cycle of growth and sloughing off. The disorder afflicts approximately 10% of women, a majority between 30 and 45 years of age.

Breast cancer, often a form of adenocarcinoma, is the most common nonskin malignancy in American women. Although heart disease kills more women than any other cause, breast cancer remains the leading cause of death in women ages 40 to 44 years and of all malignancies, only lung cancer kills more women of all ages. The risk of developing breast cancer increases with increasing age, posing a lifetime risk of one in eight for women who reach advanced old age. Fortunately, treatment of breast cancer is often successful if the cancerous tumor is detected early. Because such tumors are often painless, most physicians recommend monthly breast self-examinations and annual mammograms.

| A&P CONNECT |

Self-examination of breasts is a recommended routine to monitor breast health. Learn more in ***Breast Self-Examination*** online at ***A&P Connect.***

Treatments for breast cancer often involve surgery, chemotherapy, and radiation therapy. Surgeries can be very conservative, as with a simple lump removal or **lumpectomy.** If metastasis to surrounding tissue is suspected, a **radical mastectomy** (mas-TEK-toh-mee) may be performed. In this procedure the entire breast, with nearby muscle tissues and lymph nodes, is removed. Just as lumpectomy results in less trauma than radical mastectomy, so-called *limited-field radiation* can provide effective treatment for clearly defined early-stage cancers that have not spread. It does so with shorter treatment cycles and fewer side effects than whole-breast radiation.

In the past, after women had completed their initial treatment for breast cancer they had few options available to lessen the possibility of recurrence. For a number of years the drug *tamoxifen* has been used extensively to prevent the recurrence of breast cancers fueled by estrogen. It does so by blocking the estrogen receptor sites on the cancer cell membrane. Unfortunately, tamoxifen's effectiveness is limited to about 5 years. A relatively new class of drugs called "aromatase inhibitors" (letrozole and others) are now being given to breast cancer patients to prevent recurrence of the disease. Instead of blocking estrogen receptor sites, these drugs block estrogen production. They may replace tamoxifen or be prescribed for use after 5 years of tamoxifen therapy. Other "rational" drugs such as trastuzumab (Herceptin) are now being used to successfully manage recurring forms of breast cancer that in the past were very difficult to treat.

Cancer of the uterus can affect the body of the uterus or the cervix. Cancers of the uterine body most often involve the endometrium (**endometrial cancer**) and mostly affect women beyond childbearing years; a common symptom is postmenopausal uterine bleeding. Risk factors for this type of cancer include obesity, prolonged estrogen therapy, and infertility. **Cervical cancer** occurs most often in women between the ages of 30 and 50 years. *Human papilloma virus (HPV)* infections, for which a vaccine is available, can cause cervical cancer. Cervical cancer is often diagnosed early, through screening tests such as the **Papanicolaou** (pah-peh-nik-oh-LAH-oo) **test (Pap smear)** (Figure 35-24). In this test, cells swabbed from the cervix are smeared on a glass slide, stained, and examined microscopically to determine whether any abnormalities exist. Because screening tests and other early detection methods have been so successful, the death rates for uterine cancers have dropped dramatically over the last few decades.

CASE study

Carlos and his wife had been trying for years to have a baby with no success. After a visit to an infertility specialist, they found that Carlos had a low sperm count. Before suggesting a solution, the physicians will also check Maria's reproductive system. One of the tests they order is a hysterosalpingogram, which will confirm an open pathway for the egg.

1. Assuming no obstruction, which areas should the dye used for the hysterosalpingogram enter?
   a. Cervix, uterus, uterine tube, ovaries
   b. Cervix, uterine tube, uterus, vulva
   c. Cervix, uterine tube, ovaries, peritoneal cavity
   d. Cervix, uterus, uterine tube, peritoneal cavity

Finding no blockage in Maria's reproductive tract, the physicians recommended an intrauterine insemination (IUI). To increase the chances of a sperm encountering an egg, a medication called Clomid (*clomiphene*) was prescribed for Maria. Clomid works as an antiestrogen agent, causing the body to perceive low estrogen levels. It is given on about days 5 to 10 of the menstrual cycle.

2. What effect will Clomid have on FSH production?
   a. Increase FSH production
   b. Decrease FSH production
   c. No change in FSH production
   d. Slight decrease in FSH production followed by a sharp increase

3. After ovulation, the follicular cells first transform into what?
   a. Corpus lucidum
   b. Corpus luteum
   c. Corpus rubrum
   d. Corpus albicans

CASE study (continued)

4. Where in the female reproductive tract should the sperm and the oocyte meet (hopefully completing the process of fertilization)?
   a. In the cervix
   b. In the uterus
   c. In the uterine tubes
   d. In the ovaries

HINT *To solve a case study, you may have to refer to the glossary or index, other chapters in this textbook, **A&P Connect**, and other resources.*

CHAPTER SUMMARY

*To download an MP3 version of the chapter summary for use with your iPod or portable media player, access the **Audio Chapter Summaries** online at evolve.elsevier.com.*

HINT *Scan this summary after reading the chapter to help you reinforce the key concepts. Later, use the summary as a quick review before your class or before a test.*

OVERVIEW OF THE FEMALE REPRODUCTIVE SYSTEM

A. Function of the female reproductive system
   1. To produce offspring and thereby ensure continuity of the genetic code
   2. To produce eggs, or female gametes, each of which has the potential to unite with a male gamete to form the first cell of an offspring
   3. To provide nutrition and protection to the offspring for up to several years after conception

B. Structural plan of the female reproduction system
   1. Reproductive organs are classified as essential or accessory (Figure 35-1)
      a. Essential organs—gonads are the paired ovaries; gametes are ova produced by the ovaries—the ovaries are also internal genitals
      b. Accessory organs
         (1) Internal genitals—uterine tubes, uterus, and vagina—ducts or duct structures that extend from the ovaries to the exterior
         (2) External genitals—the vulva
         (3) Additional sex glands such as the mammary glands

C. Perineum (Figure 35-2)
   1. Skin-covered region between the vaginal orifice and the rectum
   2. Area that may be torn during childbirth

OVARIES

A. Location of the ovaries
   1. Nodular glands located on each side of the uterus, below and behind the uterine tubes (Figure 35-3)
   2. Ectopic pregnancy—development of the fetus in a place other than the uterus

B. Microscopic structure of the ovaries (Figure 35-4)
   1. Surface of the ovaries is covered by the germinal epithelium
   2. Ovarian follicles contain the developing female sex cells
   3. Ovum—an oocyte released from the ovary

C. Functions of the ovaries
   1. Ovaries produce ova—the female gametes
   2. Oogenesis—process that results in formation of a mature egg (Figure 35-5)
   3. Ovaries are endocrine organs that secrete the female sex hormones (estrogens and progesterone)

UTERUS

A. Structure of the uterus (Figure 35-3)
   1. Size and shape of the uterus
      a. Pear-shaped structure with two main parts—the cervix and the body
      b. Bulging upper part of the body called the fundus
   2. Location of the uterus
      a. Located in the pelvic cavity between the urinary bladder and the rectum (Figure 35-1)
      b. Uterus position (Figure 35-6) is altered by age, pregnancy, and distention of related pelvic viscera
      c. Uterus descends, between birth and puberty, from the lower abdomen to the true pelvis
      d. Uterus begins to decrease in size at menopause
   3. Position of the uterus
      a. Body lies flexed over the bladder
      b. Cervix points downward and backward, joining the vagina at a right angle
      c. Several ligaments hold the uterus in place but allow some movement
   4. Wall of the uterus—composed of three layers—the inner endometrium (mucous membrane), the middle myometrium (smooth muscle), and the perimetrium (outer incomplete layer of parietal peritoneum)
   5. Cavities of the uterus—small because of the thickness of the uterine walls
      a. The body cavity's apex constitutes the internal os and opens into the cervical canal
      b. Cervical canal is constricted at its lower end and forms the external os that opens into the vagina
   6. Blood supply of the uterus—supplied by uterine arteries

D. Functions of the uterus
   1. Uterus is part of the reproductive tract and permits sperm to ascend toward the uterine tubes
   2. If conception occurs, an offspring develops in the uterus
      a. Embryo is supplied with nutrients by endometrial glands until the production of the placenta

b. Placenta is an organ that permits the exchange of materials between the mother's blood and the fetal blood but keeps the two circulations separate
c. Myometrial contractions occur during labor and help push the offspring out of the mother's body

3. If conception does not occur, outer layers of endometrium are shed during menstruation—a cyclical event that allows the endometrium to renew itself

UTERINE TUBES

A. Uterine tubes also called fallopian tubes, or oviducts
B. Location of uterine tubes
   1. Attached to the uterus at its upper outer angles
   2. Extend upward and outward toward the sides of the pelvis and then curve downward and backward
C. Structure of the uterine tubes
   1. Uterine tubes consist of mucous, smooth muscle, and serous lining (Figure 35-7)
   2. Mucosal lining is directly continuous with the peritoneum lining the pelvic cavity
      a. Tubal mucosa is continuous with that of the vagina and uterus, which means it may become infected with organisms introduced into the vagina and thereby cause salpingitis or peritonitis
      b. Inflammation of uterine tubes may lead to scarring and partial or complete closure of the lumen
   3. Each uterine tube has three divisions: isthmus, ampulla, and infundibulum
D. Function of the uterine tubes—serve as transport channels for ova and as the site of fertilization (Figure 35-8)

VAGINA

A. Location of the vagina—a tubular organ located between the rectum, urethra, and bladder
B. Structure of the vagina
   1. A collapsible tube capable of distention, composed of smooth muscle, and lined with mucous membrane arranged in rugae
   2. Anterior wall shorter than the posterior wall because the cervix protrudes into its uppermost portion
   3. Hymen—a mucous membrane that typically forms a border around the vagina in young premenstrual girls
C. Functions of the vagina
   1. Lining of the vagina lubricates and stimulates the penis during sexual intercourse and acts as a receptacle for semen
   2. Vagina is the lower portion of the birth canal
   3. Vagina transports tissue and blood shed during menstruation to the exterior

VULVA

A. Structure of the vulva (pudendum; the female external genitals)—mons pubis, labia majora, labia minora, clitoris, urinary meatus, vaginal orifice, and greater vestibular glands (Figure 35-9)
B. Functions of the vulva
   1. Mons pubis and labia protect the clitoris and vestibule
   2. Clitoris contains sensory receptors that send information to the sexual response area of the brain (Figure 35-10)
   3. Vaginal orifice is the boundary between the internal and external genitals

FEMALE REPRODUCTIVE CYCLES

A. Female reproductive system has many cyclical, recurring changes that start with the beginning of menses
   1. Ovarian cycle
      a. Ovaries at time of birth contain oocytes in primary follicles in which the meiotic process has been suspended
      b. At the beginning of menstruation each month, several of the oocytes resume meiosis
      c. Meiosis will stop again just before the cell is released during ovulation (Figure 35-11)
   2. Menstrual cycle (endometrial cycle) is divided into four phases
      a. Menses
      b. Postmenstrual phase
      c. Ovulation
      d. Premenstrual phase
   3. Myometrial cycle
   4. Gonadotropic cycle
B. Control of female reproductive cycles
   1. Hormones control cyclical changes
   2. Cyclical changes in the ovaries result from changes in the gonadotropins secreted by the pituitary gland (Figures 35-12 and 35-13)
   3. Cyclical changes in the uterus are caused by changes in estrogens and progesterone (Figure 35-14)
   4. Low levels of FSH and LH cause regression of the corpus luteum if pregnancy does not occur; this causes a decrease in estrogen and progesterone, which triggers endometrial sloughing of the menstrual phase
   5. Control of cyclical changes in gonadotropin secretion is caused by positive and negative feedback mechanisms and involves estrogens, progesterone, and secretion of releasing hormones by the hypothalamus
C. Importance of the female reproductive cycles
   1. Ovarian cycle
      a. Primary function is to produce ova at regular intervals
      b. Secondary function is to regulate the endometrial cycle through estrogen and progesterone
   2. Endometrial cycle—functions to make the uterus suitable for implantation of a new offspring
   3. Cyclical nature of the reproductive system and the fact that fertilization will occur within 24 hours after ovulation mean that a woman is fertile only a few days of each month
D. Infertility—failure to conceive after 1 year of regular unprotected intercourse
   1. Causes are varied and can involve either or both partners
   2. Fertility drugs and other assisted reproductive procedures such as IVF (in vitro fertilization) are available
E. Menstrual flow begins at puberty, and the menstrual cycle continues for about 3 decades (Figure 35-15)

BREASTS

A. Location and size
   1. Breasts lie over the pectoral muscles
   2. Estrogens and progesterone control breast development
   3. Breast size is determined by the amount of fat around glandular tissue (Figure 35-16)
   4. Alveoli of the mammary gland produce milk (Figure 35-17), and a system of lactiferous ducts carries it to the nipple (Figure 35-18), surrounded by an areola

B. Structure of the breasts
   1. Each consists of several lobes separated by septa of connective tissue
   2. Lobes consist of several lobules, composed of connective tissue embedded with pouches of milk-secreting cells (alveoli)
   3. Lactiferous duct from each lobe converges toward nipple
   4. Suspensory ligaments help support the breast

B. Function of the breasts
   1. Function of mammary glands is lactation
   2. Mechanism of lactation (Figure 35-19)
      a. Ovarian hormones make the breasts structurally ready to produce milk
      b. Shedding of the placenta results in a decrease of estrogens and thus stimulates prolactin
      c. Prolactin stimulates lactation
      d. Additional hormones (e.g., oxytocin) also support lactation (Table 35-2)
   3. Importance of lactation
      a. Can provide nutrient-rich milk to offspring for up to several years from birth
      b. Some advantages of breast milk
         (1) Nutrients
         (2) Passive immunity from antibodies present in the colostrum and milk
         (3) Emotional bonding between mother and child

THE BIG PICTURE: THE FEMALE REPRODUCTIVE SYSTEM AND THE WHOLE BODY

A. Reproductive system imparts immortality to genes and ensures survival of the species

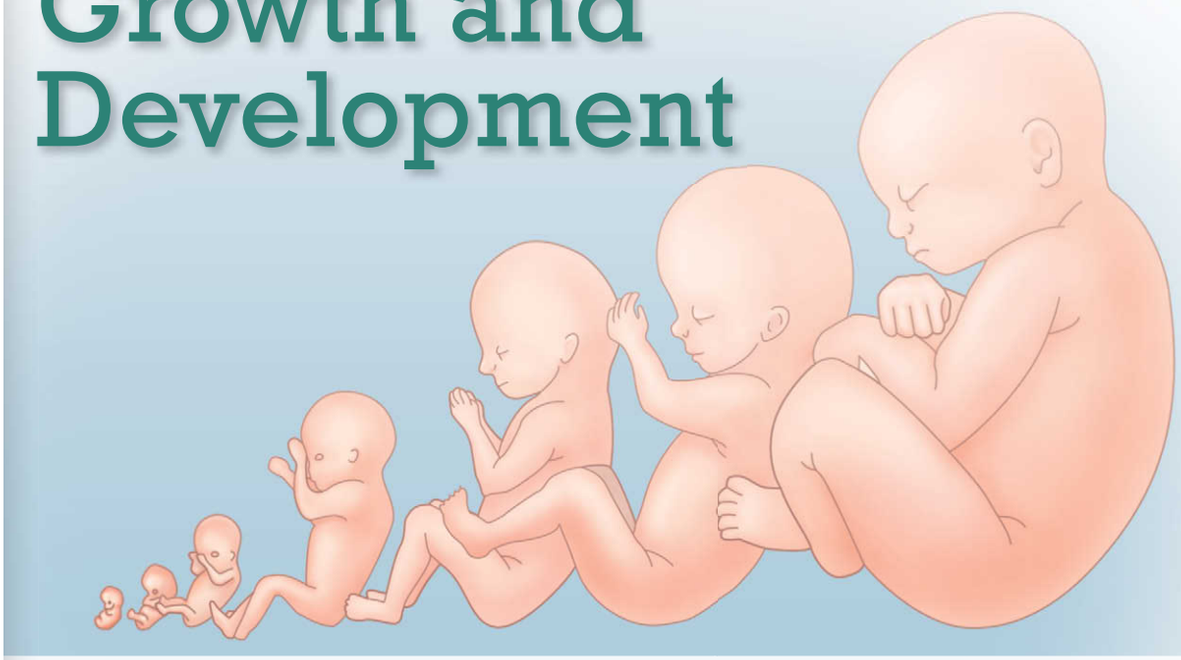
B. Relationship of the female reproductive system with other body systems
   1. Close proximity to the urinary system; share a common structure: the vulva
   2. Anatomical relationship with the skeletal muscles in the perineum
   3. Breasts are actually modifications of the skin in the integumentary system

REVIEW QUESTIONS

Write out the answers to these questions after reading the chapter and reviewing the Chapter Summary. If you simply think through the answer without writing it down, you won't retain much of your new learning.

1. Identify the essential and accessory organs in the female reproductive system.
2. Describe the three layers that compose the wall of the uterus.
3. Identify the vessels that supply blood to the uterus.
4. List the eight ligaments that hold the uterus in a normal position.
5. How does the uterus serve as part of the female reproductive tract?
6. What and where are the uterine tubes? Approximately how long are they? What lines the uterine tubes? Their lining is continuous on their distal ends with what? With what on their proximal ends?
7. Trace the development of a female sex cell from its most primitive state through ovulation.
8. What hormones are secreted by the cells in ovarian tissue?
9. Identify all vaginal functions.
10. List all the structures that make up the female external genitals.
11. Define the term *episiotomy*.
12. Identify the advantages that nursing from the mother's breast provides offspring.
13. What method makes it possible to measure blood levels of gonadotropins?
14. Describe the hormonal changes during menopause.
15. Define the term *mittelschmerz*.

CRITICAL THINKING QUESTIONS



After finishing the Review Questions, write out the answers to these more in-depth questions to help you apply your new knowledge. Go back to sections of the chapter that relate to concepts that you find difficult.

1. Name and explain the function of the various hormones that regulate lactation. Where are they produced, and how would you summarize their function and their influence on lactation?
2. List the phases of the menstrual cycle. Which of these phases shows the most variance in length of time? How do the events in each phase contribute to the overall function of the reproductive system?
3. How would you explain the interaction of the hormones that result in ovulation? From what is the name "luteinizing" hormone derived?
4. State in your own words the control of cyclical ovarian changes brought on by FSH and LH.
5. Explain, in your own words, the control of cyclical uterine changes brought on by the ovarian hormones. The drop in the level of these hormones triggers what event?
6. Regarding hormone functions, what is the reason contraceptive pills and implants are effective in preventing pregnancy?
7. How would you correlate the events of the ovarian cycle with the events of the uterine cycle?
8. It is not uncommon for women with eating disorders, such as anorexia, to develop amenorrhea. Explain the link between these two conditions.
9. Female athletes may experience an undesirable condition called *amenorrhea*. What evidence can you find to support this statement?

Case Study, 1126

Many of your fondest and most vivid memories are probably associated with your birthdays. The day of birth is an important milestone of life. Most people continue to remember their birthday in some special way each year; birthdays are pleasant and convenient reference points to mark periods of transition or change in our lives. The actual day of birth marks the end of one phase of development called the ***prenatal period*** *and the beginning of a second called the* ***postnatal period.*** *The prenatal period begins at conception and ends at birth; the postnatal period begins at birth and continues until death. Although important periods in our lives such as childhood and adolescence often are remembered as a series of individual and isolated events, they are in reality part of an ongoing and continuous process. In reviewing the field of human developmental biology—study of the many changes that occur during the cycle of life from conception to death—it is often convenient to isolate certain periods such as infancy or old age for study. However, the life cycle is not a series of stop-and-start events or individual and isolated periods of time. Instead, it is a biological process that is characterized by continuous modification and change.*

This chapter discusses some of the basic concepts of important events and changes that occur in the ongoing development of the individual from conception to death. Study of development during the prenatal period is followed by a review of changes occurring during infancy and adulthood, and finally, by some of the more important changes that occur in the individual organ systems of the body as a result of aging.

A NEW HUMAN LIFE

Production of Sex Cells

Before a new human life can begin, some preliminary processes must occur. Of utmost importance is the production of mature *gametes*, or sex cells, by each parent. Spermatozoa, gametes of the male parent, are produced by a process called **spermatogenesis.** Ova, gametes of the female parent, are produced by a process called **oogenesis.**

MEIOSIS

Both types of gamete production require a special form of cell division characterized by **meiosis.** Recall from Chapter 5 that meiosis is the orderly arrangement and distribution of chromosomes that, unlike *mitosis*, reduces the number of chromosomes in each daughter cell to half the number present in the parent cell.

The necessity for chromosome reduction as a preliminary step to union of the sex cells is explained by the fact that the cells of each species of living organisms contain a specific number of chromosomes. Human cells, for example, contain 23 pairs, or a total of 46 chromosomes. This total of 46 chromosomes per body cell is known as the **diploid** number of chromosomes. Diploid comes from the Greek *diploos*, meaning "twofold." If the male and female cells united without first halving their respective chromosomes, the resulting cell would contain twice as many chromosomes as is normal for human beings. Mature ova and sperm therefore contain only 23 chromosomes, or half as many, as other human cells. This total of 23 chromosomes per sex cell is known as the **haploid** number of chromosomes (from the Greek *haploos*, meaning "single").

Meiotic division consists of two cell divisions that take place one after the other in succession. They are referred to as meiotic division I and meiotic division II, and in both, prophase, metaphase, anaphase, and telophase occur (Figure 36-1).

In the interphase that precedes prophase I (of meiotic division I) the same events occur as take place in the interphase preceding mitotic division. Specifically, each DNA molecule replicates and thereby becomes a pair of chromatids, attached to each other only at the centromere. The term *chromosome* applies to any condensed chromatin with its own centromere. For simplicity's sake, in both Figures 36-1 and 36-2, only 4 of the 46 chromosomes are shown. Notice that early in meiosis I, homologous pairs of chromosomes are moved together to form groupings called *tetrads.* During anaphase I the tetrads split (recall that in mitosis it is the chromosomes that split during anaphase).

In meiosis I the phenomenon of "*crossing over*" occurs. During crossing over a chromatid segment of each chromosome crosses over and becomes part of the adjacent chromosome in the pair (see Figure 37-4). This is a highly significant event and is discussed in some detail in the next chapter. Because each chromatid segment consists of specific genes, the crossing over of chromatids reshuffles the genes—that is, it transfers some of them from one chromosome to another. This exchange of genetic material can add almost infinite variety to the ultimate genetic makeup of an individual.

Metaphase I follows the last stage of prophase I, and as in mitosis, the chromosomes align themselves along the equator of the spindle fibers, as Figure 36-1 shows. But in anaphase I the two chromatids that make up each chromosome do not separate from each other as they do in mitosis to form two new chromosomes out of each original one. In anaphase I, only one of each pair of chromosomes moves to each pole of the parent cell.

As you can see in Figures 36-1 and 36-2, when the parent cell divides to form two cells in meiotic division I, each daughter cell contains two chromosomes or half as many as the parent cell had. Remember that each chromosome still consists of two sister chromatids joined at the centromere. Thus the daughter cells formed by meiotic division I contain a haploid number of chromosomes, or half as many as the diploid number in the parent cell.

As you can see in Figure 36-1, meiotic division II is essentially the same as mitotic division. In both spermatogenesis and

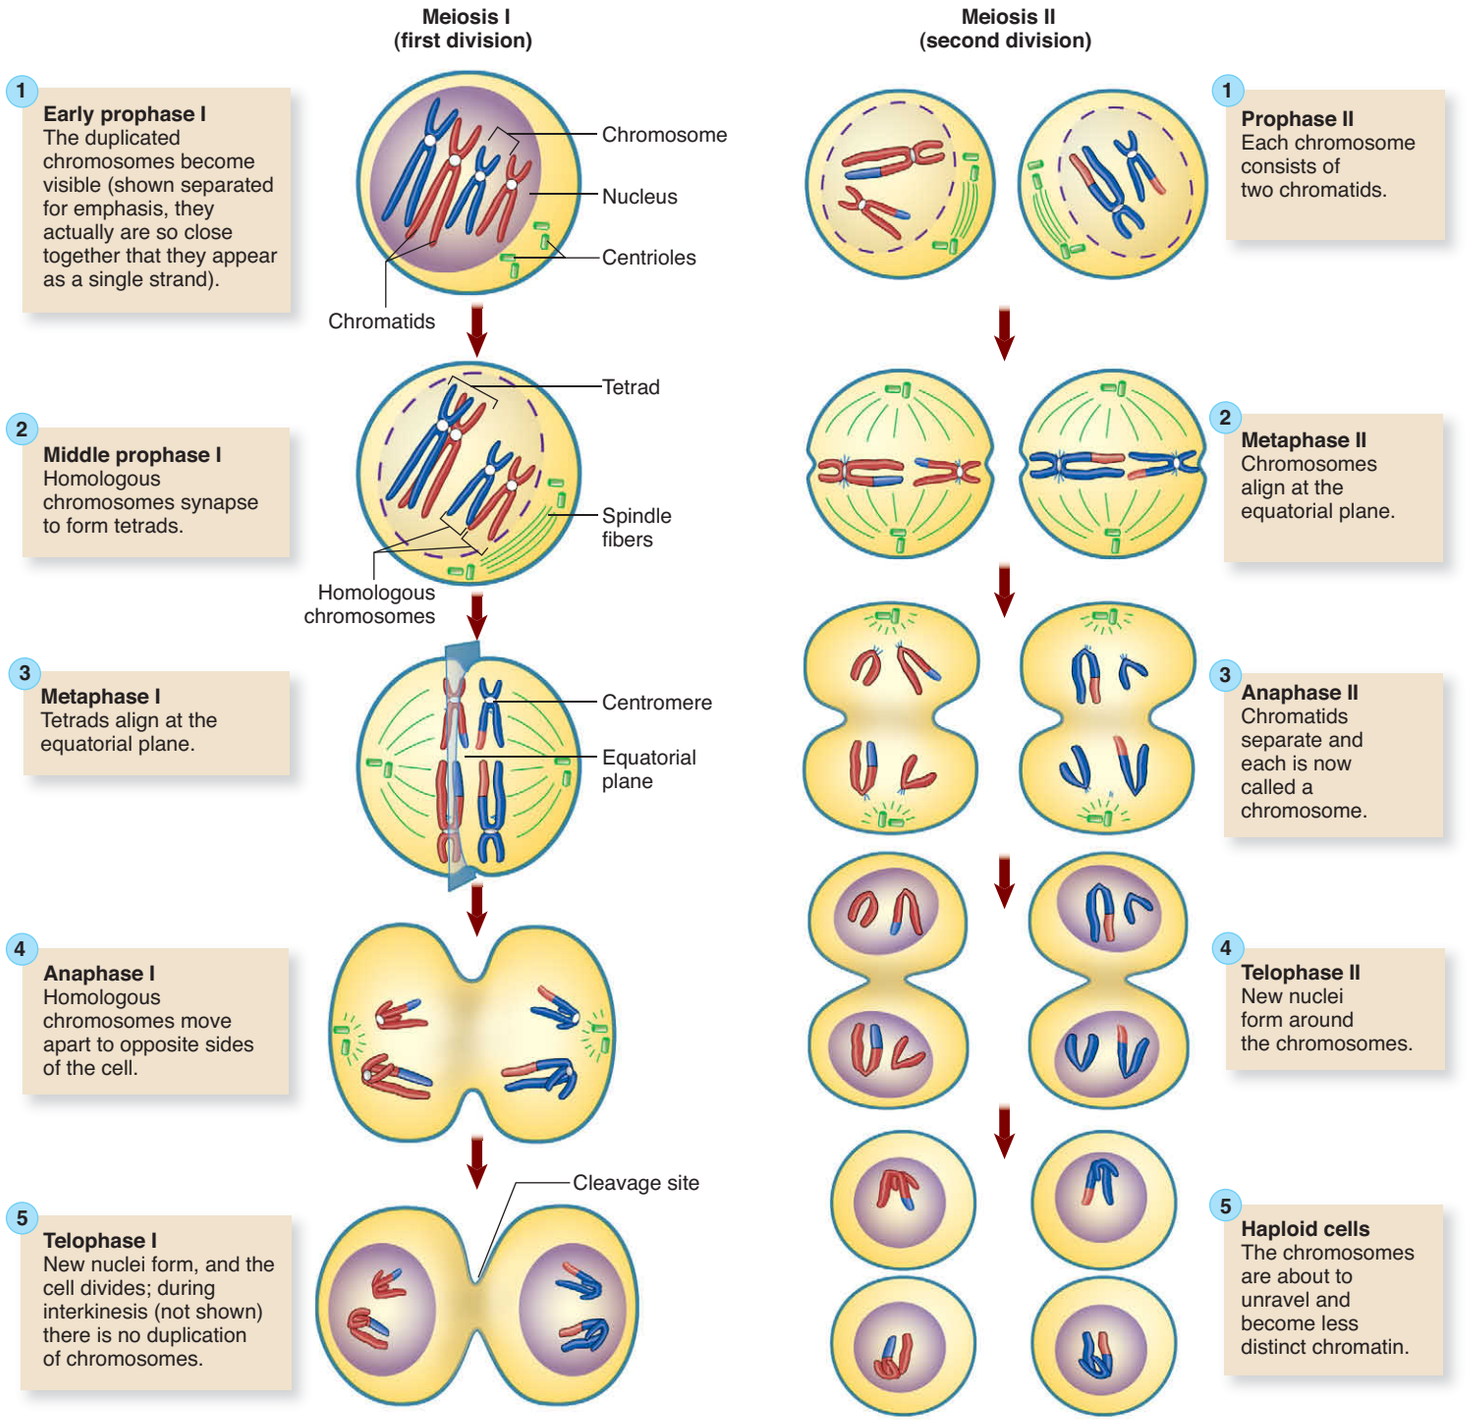

FIGURE 36-1

Meiotic cell division. Meiosis is a series of events that involves two separate division processes called *meiosis I* and *meiosis II*. Notice that four daughter cells, each with the haploid number of chromosomes, are produced from each parent cell that enters meiotic cell division. For simplicity's sake, only four chromosomes are shown in the parent cell instead of the usual 46.

oogenesis, the second meiotic division reproduces each of the two cells formed by meiotic division I and so forms four cells, each with the haploid number of chromosomes.

SPERMATOGENESIS

Spermatogenesis is the process by which the primitive sex cells, or **spermatogonia,** already formed in the seminiferous tubules of a newborn baby boy can later become transformed into mature sperm, or *spermatozoa*. Spermatogenesis begins at about the time of puberty and usually continues throughout a man's life. Figure 36-3 shows some of the major steps of spermatogenesis. Trace each step in this diagram with your finger as you read the following paragraph.

Each primary spermatocyte undergoes meiotic division I to form two secondary spermatocytes, each with a haploid number

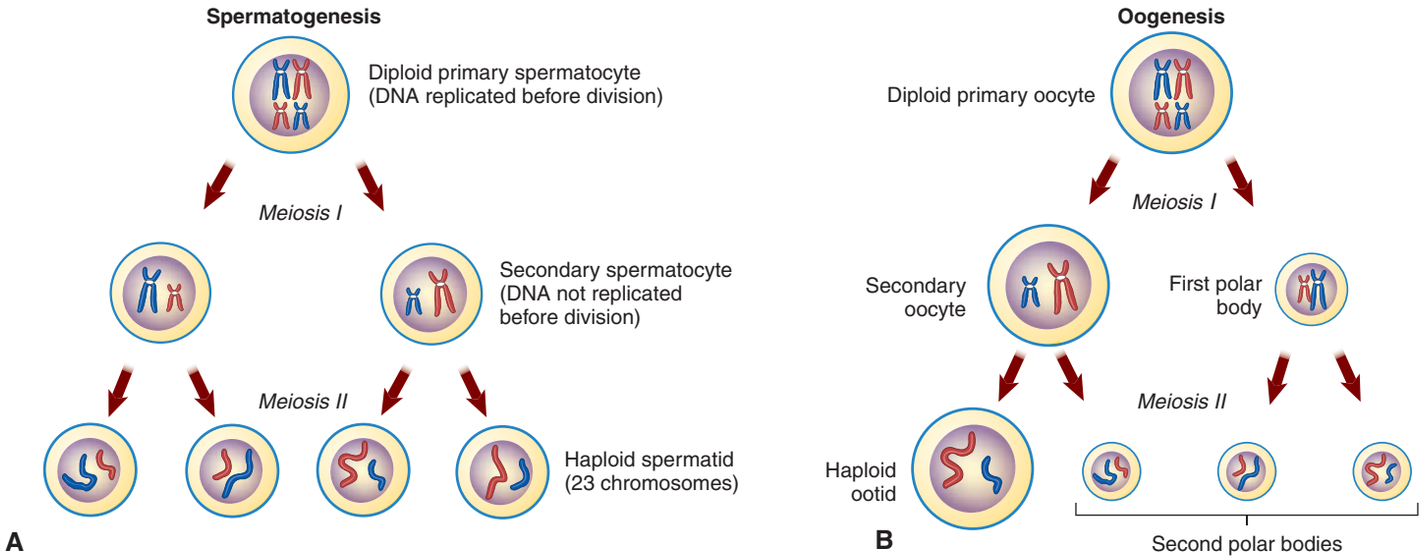

FIGURE 36-2

Overview of gamete production. A, Spermatogenesis. A primary spermatocyte (diploid) undergoes meiotic division to produce four haploid daughter spermatids. **B,** Oogenesis. A primary oocyte undergoes meiotic division to produce a single ovum and three small polar bodies.

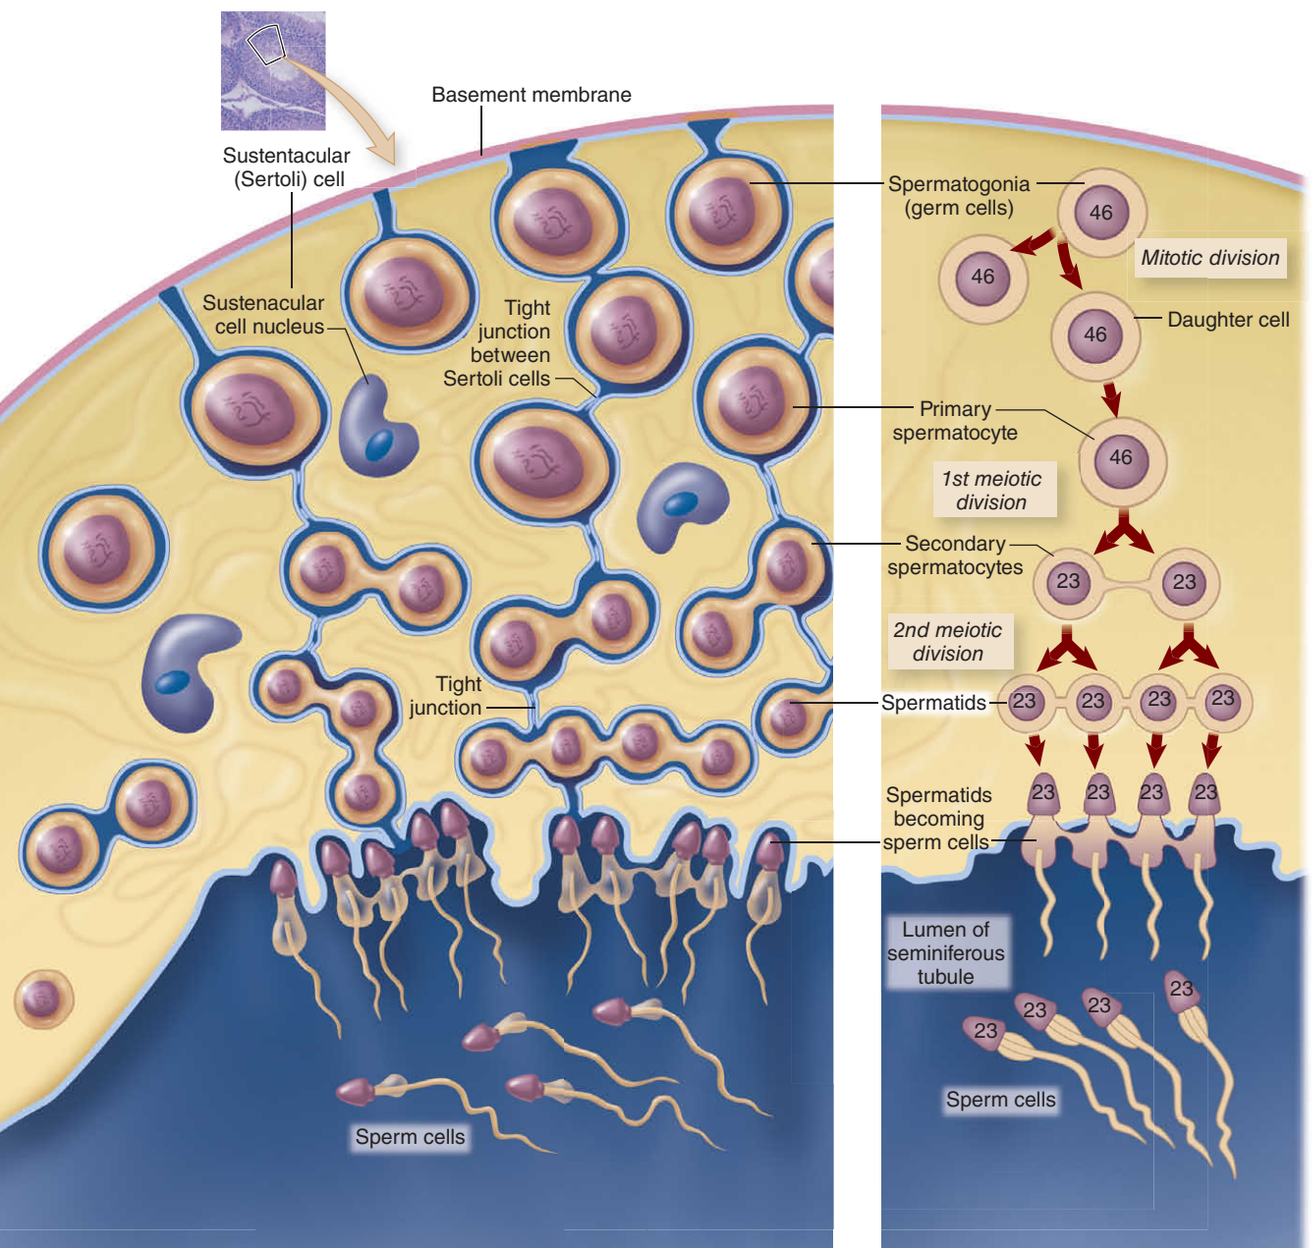

FIGURE 36-3

Spermatogenesis. First, spermatogonia in the outer rim of the seminiferous tubule produce daughter cells by mitotic division. These daughter cells, each with 46 chromosomes, become primary spermatocytes. A primary spermatocyte then undergoes meiotic division I to form two secondary spermatocytes, each with a haploid number of chromosomes (23). Each of the two secondary spermatocytes undergoes meiotic division II to form a total of four spermatids. Spermatids then differentiate to form heads and tails, eventually becoming mature spermatozoa—all with 23 chromosomes. Recall the role of the sustentacular, or Sertoli, cells, which support the developing male gametes structurally (by physically supporting them) and functionally (by releasing nutrients to them and by secretion of the hormone inhibin).

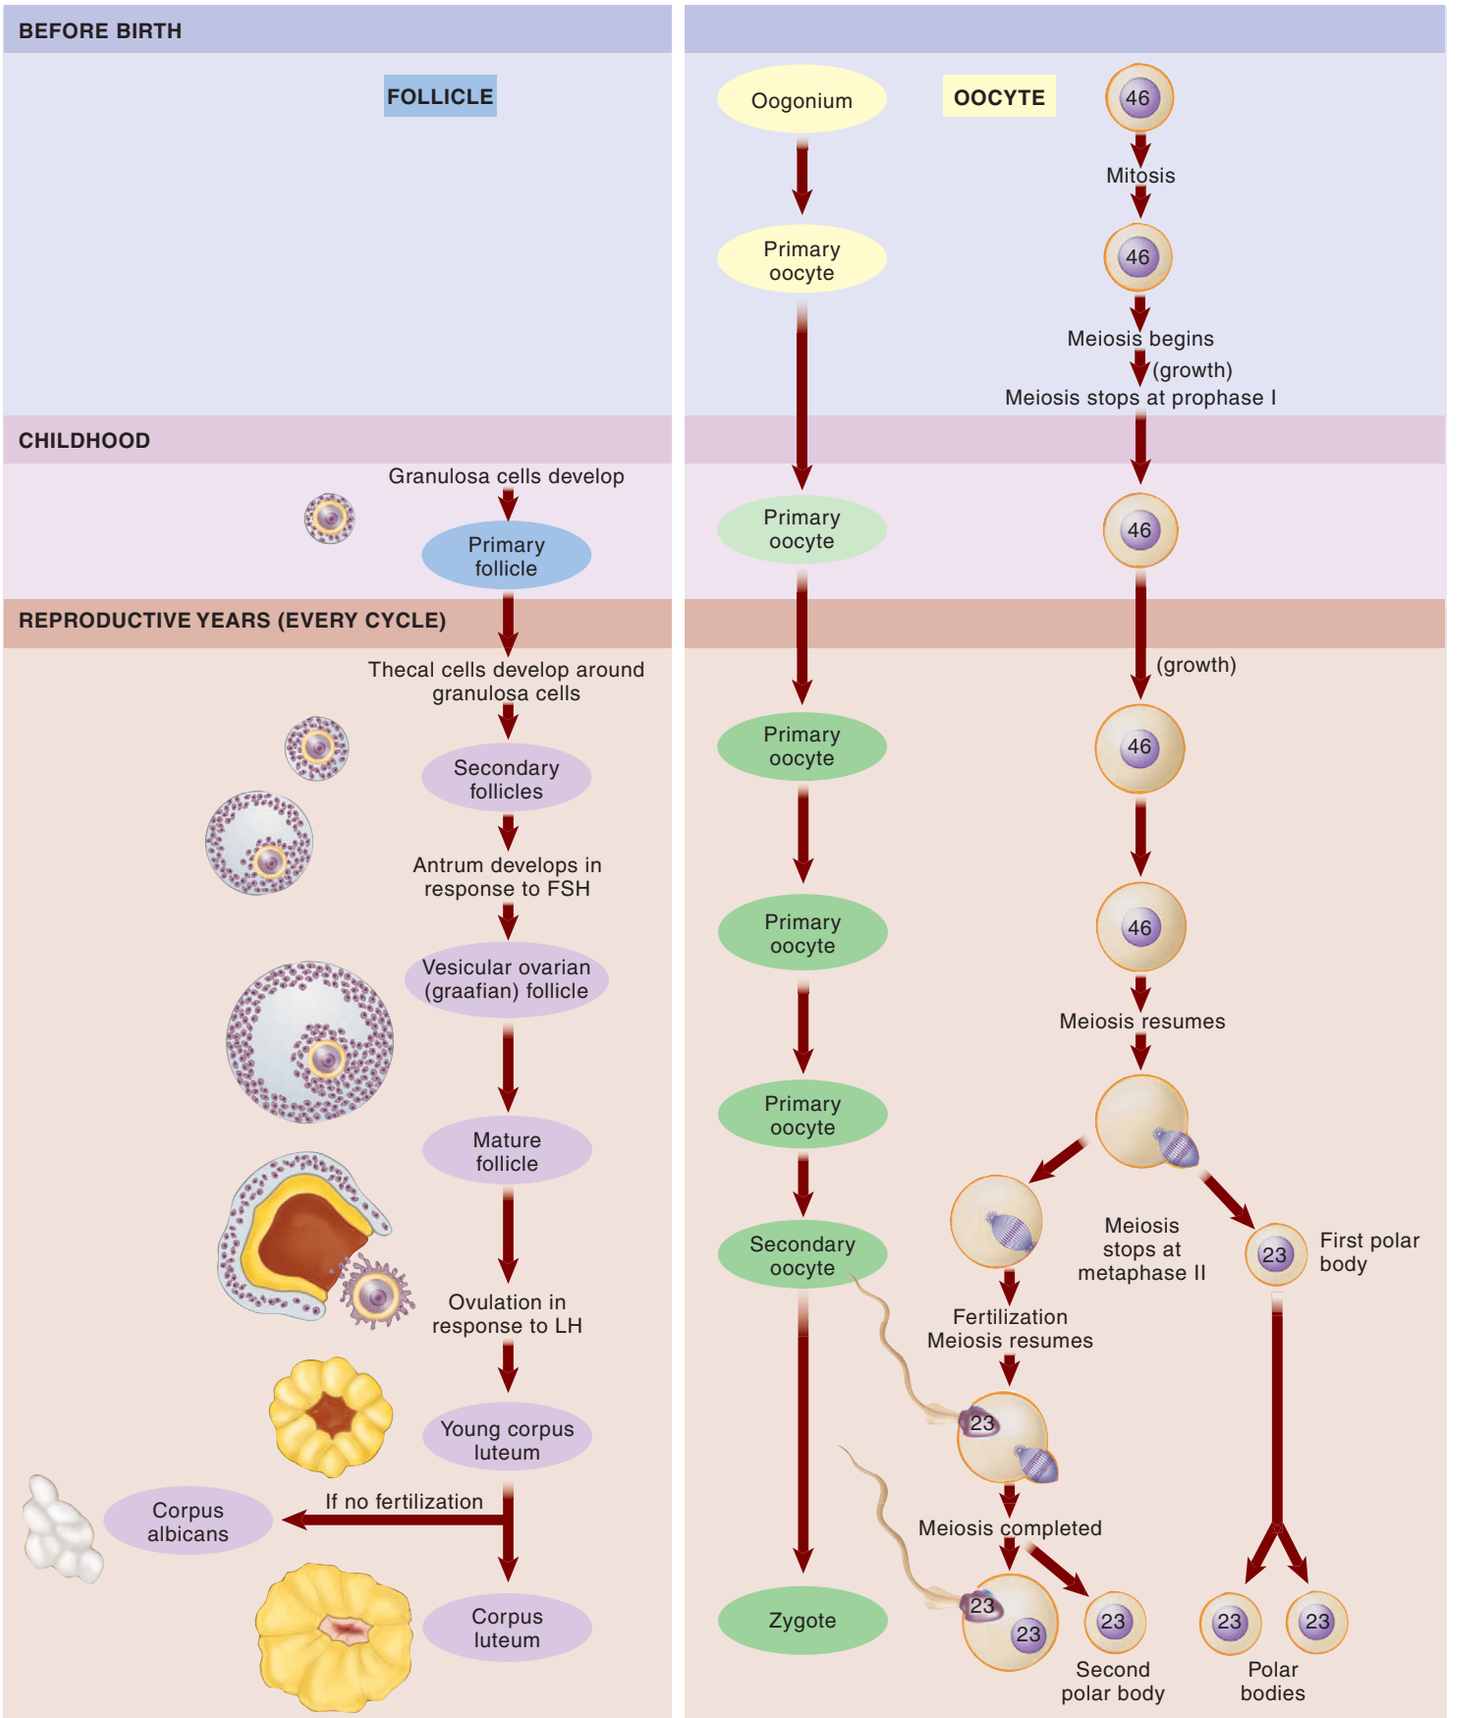

FIGURE 36-4

Oogenesis. Production of a mature ovum (oocyte) and subsequent fertilization are shown on the right as a series of cell divisions and on the left as a series of changes in the ovarian follicle. *FSH,* Follicle-stimulating hormone; *LH,* luteinizing hormone.

of chromosomes (23). Each secondary spermatocyte undergoes meiotic division II to form a total of four spermatids. Spermatids then differentiate to form heads and tails, eventually becoming mature *spermatozoa*. Thus spermatogenesis forms four spermatozoa (singular, *spermatozoon*)—each with only 23 chromosomes—from one primary spermatocyte that had 23 pairs, or 46 total chromosomes.

OOGENESIS

Oogenesis is the process by which primitive female sex cells, or **oogonia,** become mature ova. As you read through the following paragraphs, trace the steps of oogenesis in Figure 36-4.

During the fetal period, oogonia in the ovaries undergo mitotic division to form **primary oocytes**—about a half million of them by the time a baby girl is born. Most of the primary oocytes develop to prophase I of meiosis before birth. There they stay until puberty.

| A&P CONNECT |

What physiological advantage is gained by postponing the completion of meiotic division as an ovum matures? The surprising answer is found in ***Arrest of Oocyte Development*** online at ***A&P Connect.***

evolve

During childhood, **granulosa cells** develop around each primary oocyte, forming a **primary follicle.** Although several thousand primary oocytes do not survive into puberty, by the time a female child reaches sexual maturity, about 400,000 primary oocytes remain.

Beginning at puberty, during each cycle, about a thousand primary oocytes resume meiosis. Their surrounding follicles begin to mature and some of the outer granulosa cells differentiate to become **theca cells.** Theca cells produce *androgen*, a steroid that is converted by granulosa cells into estrogen. At this point, the follicles are known as **secondary follicles.** As the secondary follicles mature, they migrate toward the surface of the ovary—sometimes in several waves during one cycle. Usually only one follicle per cycle survives and matures enough to reach the surface of the ovary, where it can be seen as a fluid-filled bump. The fluid-filled space within each mature follicle is called the *antrum*. A mature *vesicular ovarian follicle* ready to burst open from the ovary's surface is also called a *graafian follicle*.

By that time, meiosis has resumed inside the primary oocyte within the mature follicle. Meiosis I produces a **secondary oocyte** and the **first polar body** (see Figure 36-2, *B*). Just before ovulation, meiosis again halts—this time at metaphase II. Under the influence of LH (luteinizing hormone), ovulation occurs. Ovulation, you may recall, is the release of an oocyte from a burst follicle.

Meiosis II in the released oocyte resumes only when, and if, the head of a sperm cell enters the secondary oocyte (ovum). If fertilization does not occur, then the ovum simply degenerates. If fertilization does occur, however, then meiotic division of the secondary oocyte produces a second polar body and a mature, fertilized ovum called the **zygote** (ZYE-goht).

Note that during oogenesis, the cytoplasm is *not* equally divided among the daughter cells. Of the four daughter cells produced, only one is large enough to survive. Thus each primary oocyte produces only one mature ovum, plus three tiny *polar bodies*. These polar bodies quickly break down and are reabsorbed into nearby cells. A total of four mature sperm cells are formed from each primary spermatocyte in spermatogenesis. This difference may be accounted for by the fact that for reproductive success, an ovum must have a huge store of cytoplasm with all of its organelles, nutrients, and regulatory molecules. In other words, nearly all the cytoplasm is conserved by the one daughter oocyte that survives.

Ovulation and Insemination

After gamete formation, the second preliminary step necessary for conception of a new individual consists of bringing the sperm and ovum into proximity with each other so that the union of the two can take place. Two processes are involved in the accomplishment of this step:

1. Ovulation or expulsion of the mature ovum from the mature ovarian follicle into the abdominopelvic cavity, from which it enters one of the uterine (fallopian) tubes.
2. Insemination or expulsion of the seminal fluid from the male urethra into the female vagina. Recall from Chapter 34 that a process called *capacitation* occurs after ejaculation, and this enables the sperm to eventually unite with an egg. Several million sperm enter the female reproductive tract with each ejaculation of semen. By lashing movements of their flagella-like tails, assisted by various processes in the female reproductive tract, the sperm make their way into the external os of the cervix, through the cervical canal and uterine cavity, and into the uterine (fallopian) tubes.

Fertilization

After ovulation the discharged ovum first enters the abdominopelvic cavity and then soon finds its way into the uterine (fallopian) tubes, where conception, or **fertilization,** may take place (Figure 36-5).

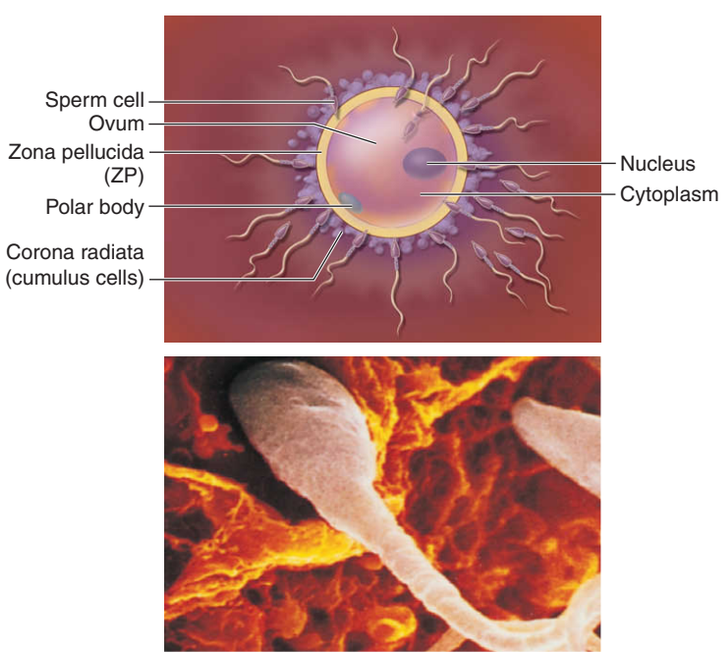

FIGURE 36-5

Fertilization. Fertilization is a specific biological event. It occurs when the male and female sex cells fuse. After union between a sperm cell and the ovum has occurred, the cycle of life begins. The scanning electron micrograph shows spermatozoa beginning to burrow into the surface of the zona pellucida (ZP) layer surrounding the ovum. Only one sperm may enter the ovum.

Sperm cells "swim" up the uterine tubes toward the ovum. Look at the relationship of the ovary, the uterine tube, and the uterus in Figure 36-6. Recall from Chapter 35 that each uterine tube extends outward from the uterus for about 10 cm (4 inches). It then ends in the abdominal cavity near the ovary, as you can see in Figure 36-6, in an opening surrounded by fringelike processes, the fimbriae. Sperm cells that are deposited in the vagina must enter and "swim" through the uterus and then move out of the uterine cavity and through the uterine tube to meet the ovum. Fertilization most often occurs in the outer one third of the oviduct, as shown in Figure 36-6.

| A&P CONNECT |

Artificial fertilization outside the body is sometimes used to enhance reproductive success. Read a brief description of this strategy and other *assisted reproductive technologies (ARTs)* in ***In Vitro Fertilization*** online at ***A&P Connect.***

The process of sperm movement is assisted by mechanisms within the female reproductive tract. For example, mucous strands in the cervical canal guide the sperm on their way into the uterus. Peristaltic contractions of the female reproductive tract and ciliary movement along the lining of the uterine tubes also assist the movement of sperm. Sperm are attracted to the warmer temperatures of the uterine tubes—a process of attraction called **thermotaxis.** Despite all this, however, only a small fraction of the sperm deposited in the vagina ever reach the ovum. Only 50 to 100 sperm out of 250 million to 500 million sperm actually reach their target.

The ovum also takes an active role in the process of fertilization. Experiments show that the ovum and its surrounding layers actually attract nearby sperm with various regulatory molecules. Recall that such movement toward a chemical attractant is called *chemotaxis.* These layers around the ovum include a thick jellylike film called the **zona pellucida (ZP)** with an outer envelope of *cumulus cells* called the **corona radiata.** Receptor molecules on these ovum-surrounding layers bind sperm attracted to the area. Once bound to a receptor, an **acrosome reaction** occurs at the head of the sperm. This acrosome reaction allows the release of enzymes from the acrosome that break down the outer layers surrounding the ovum. The cumulus cells also release progesterone and other molecules that promote increased sperm motility, which aids sperm movement through the outer layers and toward the ovum.

Once the sperm reaches the surface of the ovum, the two plasma membranes fuse and the nucleus of the sperm moves inside the ovum. In addition to the sperm nucleus, RNA and protein molecules from the sperm cell also enter the egg. The RNA molecules apparently code for proteins needed early in development—thus adding to the ovum's cellular resources. RNA molecules involved in "gene silencing" may also be released into the ovum during fertilization (see Box 5-2 on p. 120).

As soon as the head and neck of one spermatozoon fuse with the ovum (the tail degenerates), complex mechanisms in the egg are activated by sperm proteins to ensure that no more sperm enter. Specifically, sperm proteins trigger an increase in calcium concentration that causes vesicles just inside the ovum's plasma membrane to release enzymes that inactivate the sperm receptors on the ZP. This thick film, then, becomes an impenetrable barrier

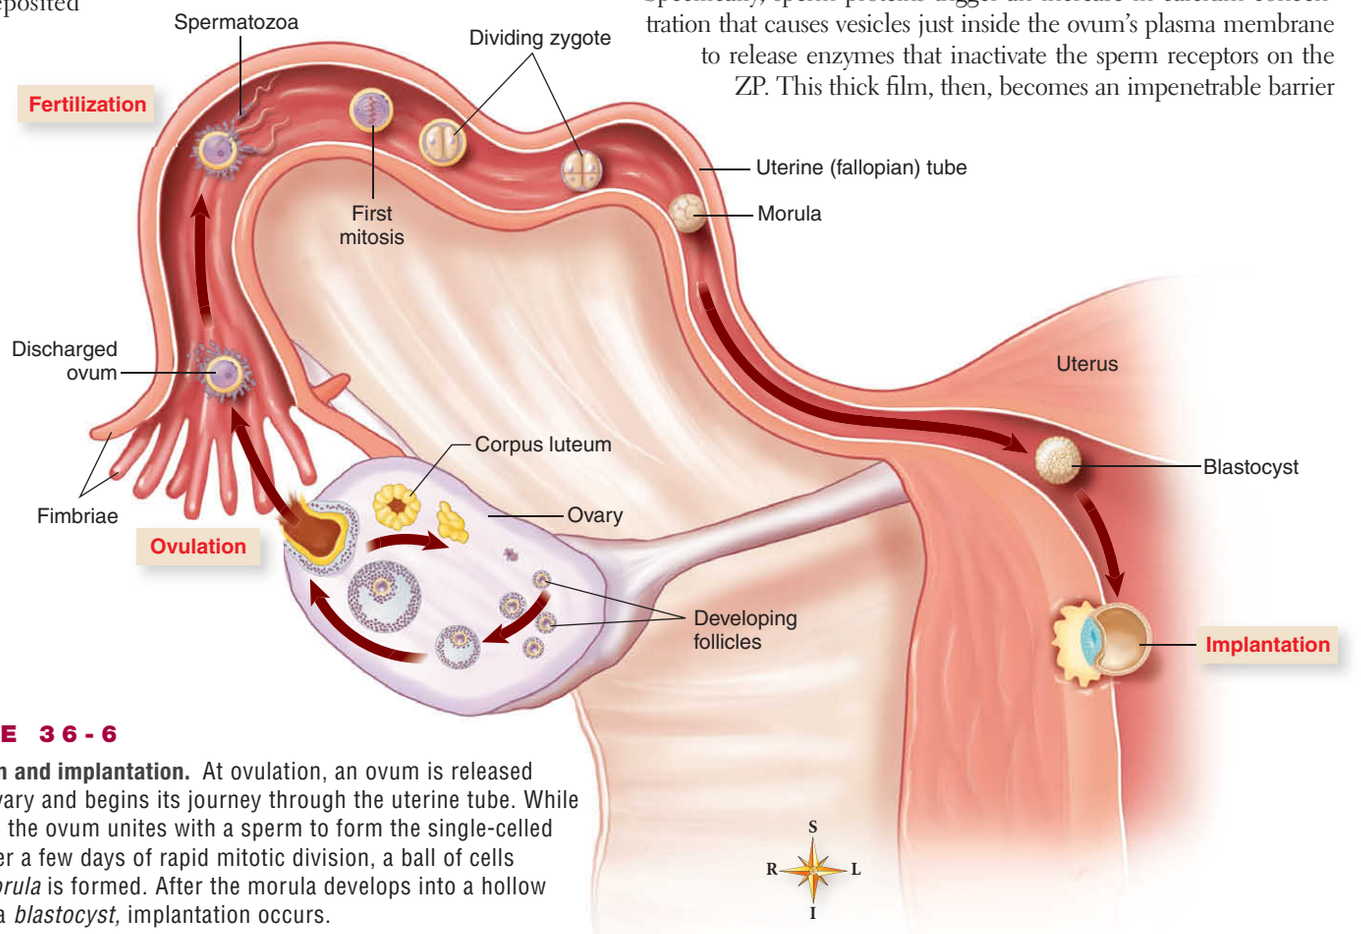

FIGURE 36-6

Fertilization and implantation. At ovulation, an ovum is released from the ovary and begins its journey through the uterine tube. While in the tube, the ovum unites with a sperm to form the single-celled zygote. After a few days of rapid mitotic division, a ball of cells called a *morula* is formed. After the morula develops into a hollow ball called a *blastocyst,* implantation occurs.

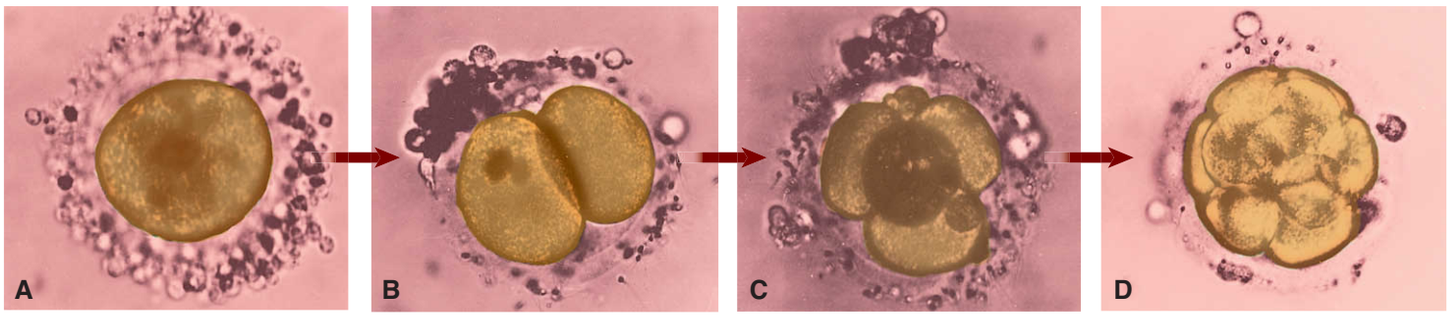

FIGURE 36-7

Initial rapid cell division in human development. **A,** Fertilized ovum, or zygote. **B** to **D,** Early cell divisions produce more and more cells. The solid mass of cells shown in **D** forms the morula—an early stage in embryonic development.

sometimes called the *fertilization membrane.* The 23 chromosomes from the sperm nucleus combine with the 23 chromosomes already in the ovum to restore the diploid number of 46 chromosomes.

In as much as the ovum lives only a short time (probably only a day or so) after leaving the ruptured follicle, the fertilization "window" occurs around the time of ovulation. Because sperm may live up to a few days after entering the female tract, sexual intercourse any time from about 3 days before ovulation to a day or so after ovulation may result in fertilization.

The fertilized ovum, or zygote, is genetically complete; it represents the first cell of a genetically new individual. Time, nourishment, and a proper prenatal environment are all that are needed for expression of characteristics such as sex, hair, and skin color that were determined at the time of fertilization.

| QUICK CHECK |

1. What is the function of meiotic division?
2. How does meiosis differ from mitosis?
3. Where in the female reproductive tract does fertilization usually occur?
4. What is the technical name for the fertilized ovum?

PRENATAL PERIOD

The **prenatal period** of development begins at the time of conception, or fertilization (i.e., at the moment the female ovum and the male sperm cell unite). The period of prenatal development continues until the birth of the child about 39 weeks later. The science of the development of the individual before birth is called **embryology** (em-bree-OL-oh-gee). It is a story of biological marvels, describing the means by which a new human life is begun and the steps by which a single microscopic cell is transformed into a complex human being.

Cleavage and Implantation

As you can see in Figure 36-6, once the zygote is formed, it immediately begins to cleave, or divide, and in about 3 days a solid mass of cells called a **morula** (MOR-yoo-lah) is formed. The cells of the morula begin to form an inner cavity as they continue to divide, and by the time the developing embryo reaches the uterus, it is a hollow ball of cells called a **blastocyst** (BLASS-toh-sist). At about 1 week after fertilization, the process of **implantation** begins. In about 10 days from the time of fertilization, the blastocyst is completely implanted in the uterine lining—before nutrients from the mother are available to nourish it. Of course, problems in development or implantation may occur at any stage—resulting in loss of the offspring and termination of the developmental process.

The rapid cell division taking place up to the blastocyst stage occurs with no significant increase in total mass compared with the zygote (Figure 36-7). One of the specializations of the ovum (and its surrounding layers) is its incredible store of nutrients that support this embryonic development until implantation has occurred.

Note in Figure 36-8 that the blastocyst consists of an outer layer of cells and an **inner cell mass.** The outer wall of the blastocyst is called the **trophoblast** (see Figure 36-8). As the blastocyst develops further, the inner cell mass forms a structure with two cavities called the **yolk sac** and **amniotic** (am-nee-OT-ik) **cavity**

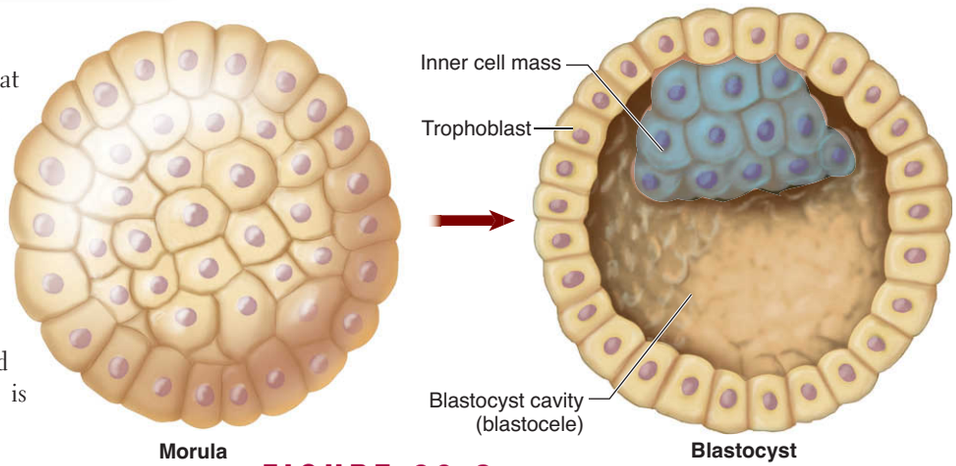

FIGURE 36-8

Early stages in the development of the human embryo. The morula consists of an almost solid spherical mass of cells. The embryo reaches this stage about 3 days after fertilization. The blastocyst (hollowing) stage develops next, before implantation in the uterine lining.

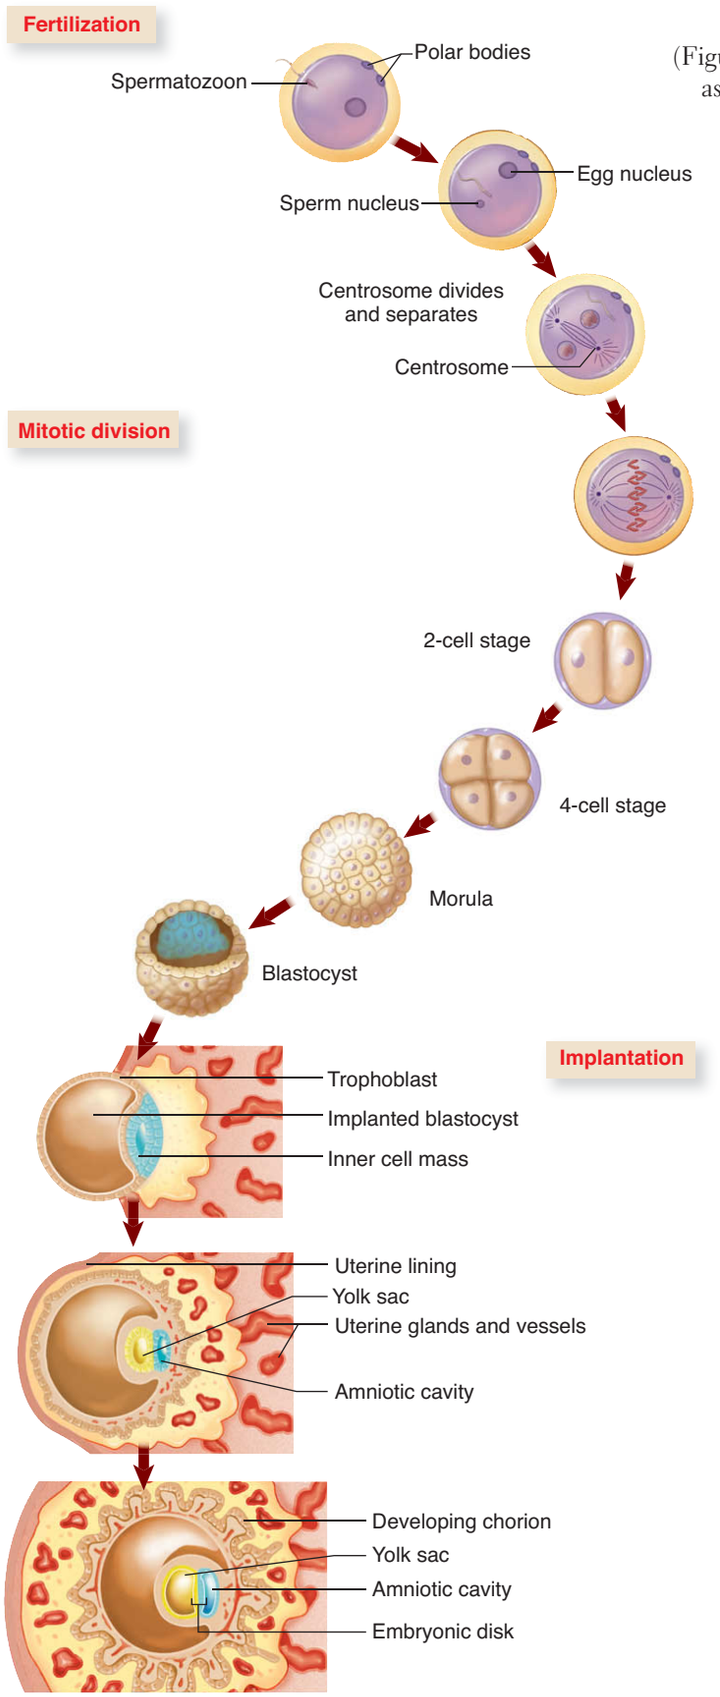

FIGURE 36-9

From fertilization to implantation and development of the yolk sac. Rapid growth of uterine glands and vessels covers the developing blastocyst at the time of implantation.

(Figures 36-9 and 36-10). The yolk sac is most important in animals such as birds that depend heavily on yolk as a nutrient for the developing embryo. In these animals the yolk sac digests the yolk and provides the resulting nutrients to the embryo. Because the uterine lining provides nutrients to the developing embryo in humans, the function of the yolk sac is not a nutritive one. Instead, it has other functions, including production of blood cells. It is the inner cell mass that eventually forms the tissues of the offspring's body. The trophoblast, on the other hand, forms the support

Developmental Biology

Developmental biology is the name given to the branch of life science that studies the process of change over the life cycle. This process of change is called *development.* It is important to realize that in developmental biology, the terms *growth* and *development* do not mean the same thing. Growth is simply an increase in body mass. Development, on the other hand, refers to the complex series of changes that occur at various times of life. Early stages of development—particularly the prenatal stages—are characterized by rapid growth, whereas later stages of development are characterized by little, if any, growth of body tissues.

In this chapter, we briefly discuss various subtopics within the field of human developmental biology. For example, prenatal development is studied by a branch of developmental biology called **embryology.** The biological changes observed during late adulthood are studied by a branch of developmental biology called **gerontology.**

Basic concepts of embryology, gerontology, and other subdisciplines of developmental biology seem to have taken on a greater practical importance during the past few decades than ever before. One reason is the explosion in knowledge of developmental processes and our ability to treat the abnormalities that we can now find. Procedures such as fetal surgery, electrocardiography, and ultrasound permit physicians to diagnose and treat the fetus much like any other patient. Recent discoveries about the processes of aging—as well as the rapidly growing population of aged individuals—have spawned new methods of recognizing and treating physical and psychological problems in the elderly. Another reason developmental biology has taken on great practical importance is that it is a field that serves to unify human biology into a framework that integrates anatomy, physiology, cell biology, molecular biology, medicine, and other disciplines. Thus developmental biology gives us an excellent view of the "big picture" of the human body.

structures described in the following paragraphs. (Box 36-1 discusses the field of *developmental biology.*)

The amniotic cavity becomes a fluid-filled, shock-absorbing sac, sometimes called the "bag of waters," in which the embryo floats during development. The **chorion** (KOH-ree-on), shown in Figures 36-9 to 36-11, develops from the trophoblast to become an important fetal membrane in the **placenta** (plah-SEN-tah). The *chorionic villi* shown in Figures 36-10 and 36-11 are extensions of the blood vessels of the chorion that bring the embryonic circulation to the placenta. The placenta (see Figure 36-11) anchors the developing offspring to the uterus and provides a "bridge" for the exchange of nutrients and waste products between mother and baby.

Placenta

The placenta is a unique structure that has a temporary but very important set of functions during pregnancy. It is composed of tissues from mother and offspring and functions not only as a structural "anchor" and nutritive bridge but also as an excretory, respiratory, and endocrine organ.

Placental tissue normally separates the maternal and fetal blood supplies so that no intermixing occurs. The very thin layer of placental tissue that separates maternal and fetal blood also serves as an effective "barrier" that can protect the developing baby from many harmful substances that may enter the mother's bloodstream. Unfortunately, toxic substances such as alcohol and

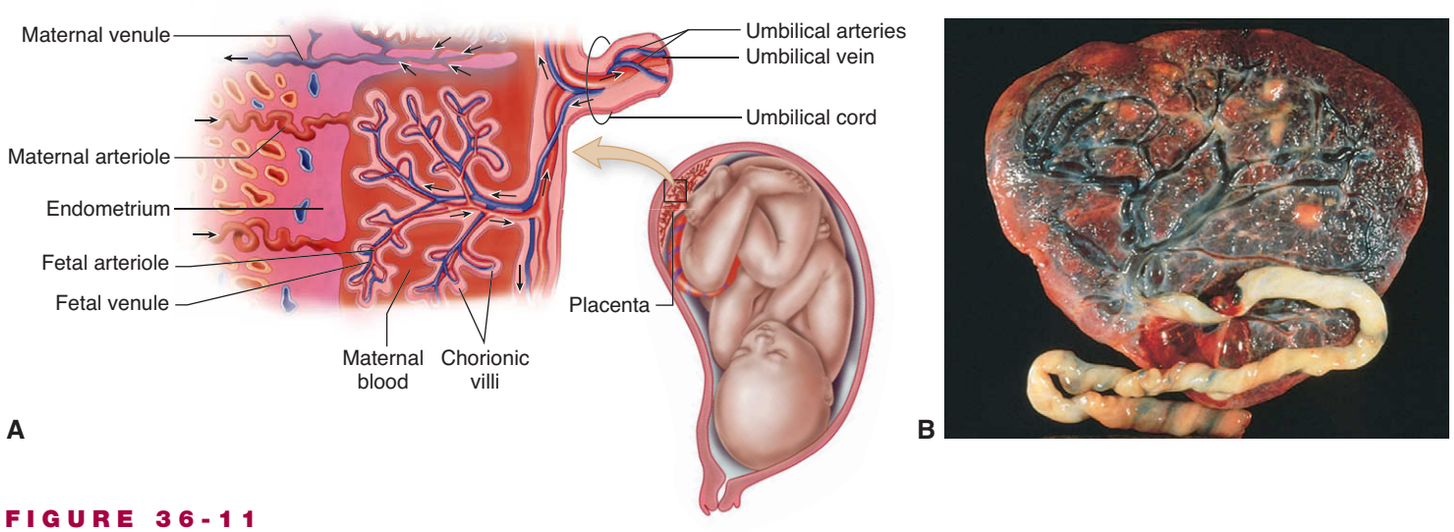

FIGURE 36-11

Structural features of the placenta. The close proximity of the fetal blood supply and the maternal blood supply permits diffusion of nutrients and other substances. The placenta also forms a thin barrier that prevents diffusion of most harmful substances. No mixing of fetal and maternal blood occurs. **A,** Diagram showing a cross section of the placental structure. **B,** Photograph of a normal, full-term placenta (fetal side) showing the branching of the placental blood vessels and umbilical cord.

some infectious organisms may penetrate this protective placental barrier and injure the developing baby (see Box 21-3 on p. 666). The virus responsible for German measles (rubella), for example, can easily pass through the placenta and cause tragic developmental defects in the fetus.

Placental tissue also has important endocrine functions. As Figure 36-12, A, shows, placental tissue secretes large amounts of **human chorionic gonadotropin (hCG)** early in pregnancy. hCG secretion peaks about 8 or 9 weeks after fertilization, then drops to a continuous low level by about week 16. The function of hCG, as its name implies, is to act as a gonadotropin and stimulate the corpus luteum to continue its secretion of estrogen and progesterone. Recall from Chapter 35 (see Figure 35-14 on p. 1079) that reduced levels of the anterior pituitary gonadotropins (FSH and LH) after ovulation normally cause a corresponding reduction in luteal secretion of the estrogen and progesterone needed to sustain the uterine lining. The drop in estrogen and progesterone secretion results from the fact that the FSH and LH needed to maintain the corpus luteum are now in short supply. To prevent menstruation and to allow successful implantation and development of the offspring, the cells of the trophoblast and, later, the placenta secrete enough hCG to maintain the corpus luteum and thus keep luteal estrogen and progesterone levels high.

As the placenta develops, it begins to secrete its own estrogen and progesterone. As Figure 36-12, A, shows, as more estrogen and progesterone are secreted from the placenta, a corresponding decrease in hCG secretion produces a drop in luteal secretion of these hormones. After about 3 months, the corpus luteum has degenerated and the placenta has completely taken over the job of secreting the estrogen and progesterone needed to sustain the pregnancy.

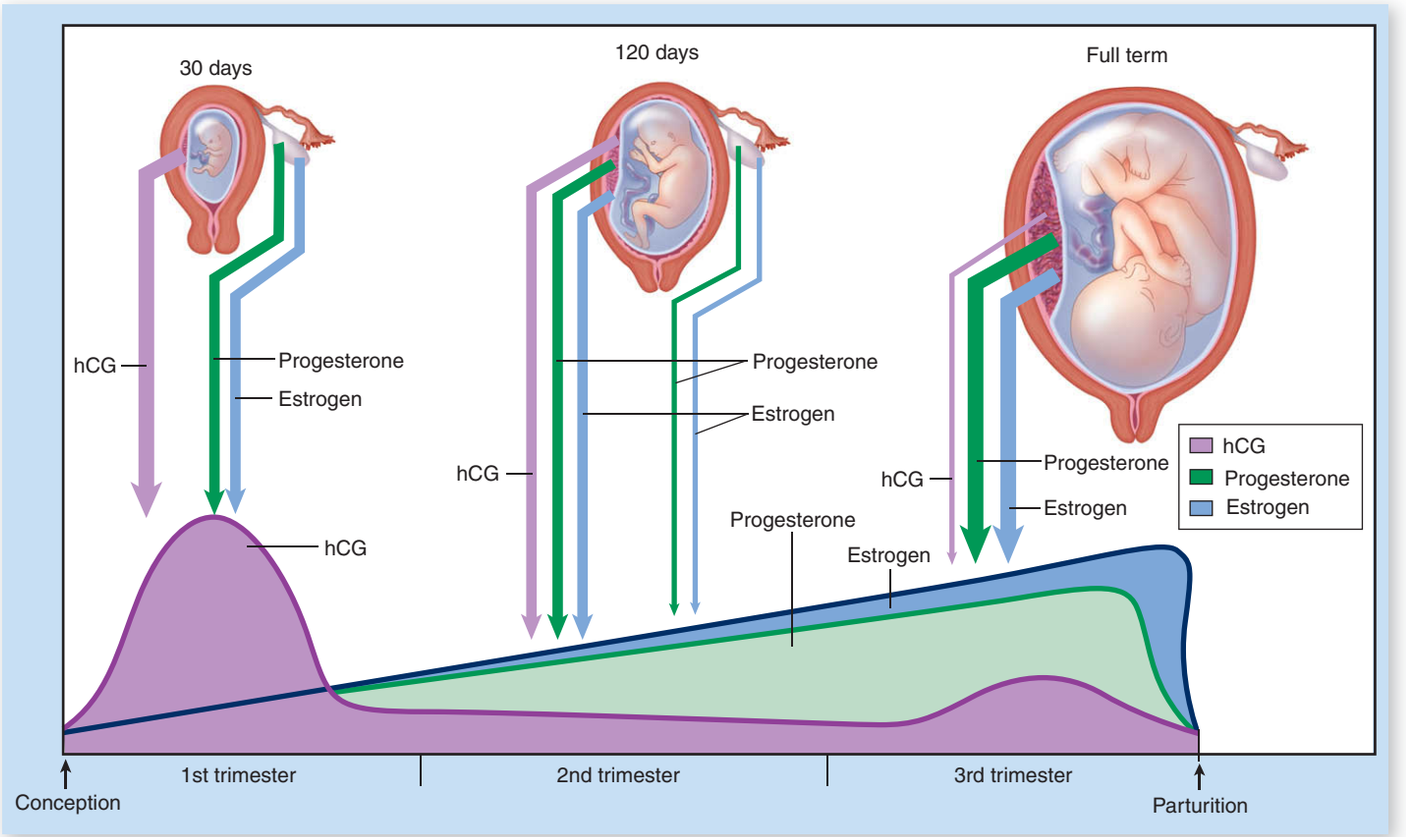

FIGURE 36-12

Hormone levels during pregnancy. A, Diagram showing the changes that occur in the blood concentration of human chorionic gonadotropin (hCG), estrogen, and progesterone during gestation. Note that high hCG levels produced by placental tissue early in pregnancy maintain estrogen and progesterone secretion by the corpus luteum. This prevents menstruation and promotes maintenance of the uterine lining. As the placenta takes over the job of secreting estrogen and progesterone, hCG levels drop, and the corpus luteum subsequently ceases secreting these hormones. **B,** Graph showing other hormones important in supporting pregnancy and lactation. Growth hormone remains stable, as does free T_4 (although total T_4 rises).

Over-the-counter "early pregnancy" tests detect the presence of the hCG that is excreted in the urine during the first couple of months of a pregnancy. Such tests can detect hCG in the urine as early as 1 or 2 days after implantation occurs.

Figure 36-12, *B*, shows some other hormones that help support pregnancy. The functions of these hormones were discussed in previous chapters. During pregnancy some hormones, such as growth hormone (GH), remain stable, but others *increase* during pregnancy. All of these hormones directly or indirectly promote the physiological processes of fetal development and lactation. Cortisol, for example, also helps trigger important events during pregnancy—including the onset of labor.

| QUICK CHECK |

5. What is a morula? What is a blastocyst?
6. What structures are derived from the trophoblast (outer wall) of the blastocyst?
7. What placental hormone maintains the corpus luteum during the early weeks of pregnancy?

Periods of Development

The length of pregnancy (about 39 weeks)—called the **gestation period**—is divided into three approximately 3-month segments called *trimesters*. The first trimester extends from the first day of the last menstrual period to the end of the twelfth week. The second trimester extends from the twelfth to the twenty-eighth week of pregnancy. The third trimester extends from the twenty-eighth week of pregnancy until the baby is delivered. Several terms such as *embryo* and *fetus* are used to describe stages of development during the three trimesters of pregnancy.

During the first trimester, or 3 months, of pregnancy, numerous terms are used. Zygote is used to describe the ovum just after fertilization by a sperm cell. After about 3 days of constant cell division, the solid mass of cells, identified earlier as the morula, enters the uterus. Continued development transforms the morula into the hollow blastocyst, which then implants into the uterine wall (see Figure 36-9).

The embryonic phase of development extends from fertilization until the end of week 8 of gestation. During this period in the first trimester, the term *embryo* is used to describe the developing individual. The fetal phase is used to indicate the development extending from week 8 to 39. During this period, the term *embryo* is replaced by the term *fetus*.

By day 35 of gestation (Figure 36-13, *A*), the heart is beating and, although the embryo is only 8 mm (about 3.8 inch) long, the eyes and so-called *limb buds*, which ultimately form the arms and legs, are clearly visible. Figure 36-13, *C*, shows the stage of development at the end of the first trimester of gestation, when the offspring becomes known as a fetus. Body size is about 7 to 8 cm (3 inches) long (Figure 36-14). The facial features of the fetus

are apparent, the limbs are complete, and sex can be identified. By month 4 (Figure 36-13, *D*), all organ systems are formed and functioning to some extent. Growth of the embryo to 4 months is summarized in the photographs in Figures 36-13 and 36-14; growth to full term is summarized in the graph in Figure 36-15. Box 36-2 discusses methods of diagnosis and treatment in these early developmental stages.

Stem Cells

Stem cells are unspecialized cells that reproduce to form specific lines of specialized cells. At the very beginning of the embryonic stage, all the cells are stem cells. At this stage, they have their highest "stemness" or potency—that is, they are capable of producing many different kinds of cells in the body.

Scientists call the single cell of the zygote *totipotent*, meaning "totally potent," because it is the ancestor to all the body's cell types. After the zygote cell divides, many *pluripotent* cells are formed—cells that can produce many (but not all) kinds of cells. It is these early pluripotent cells that are commonly referred to as *embryonic stem cells*. It is the embryonic stem cells that form the germ layers described in the next section.

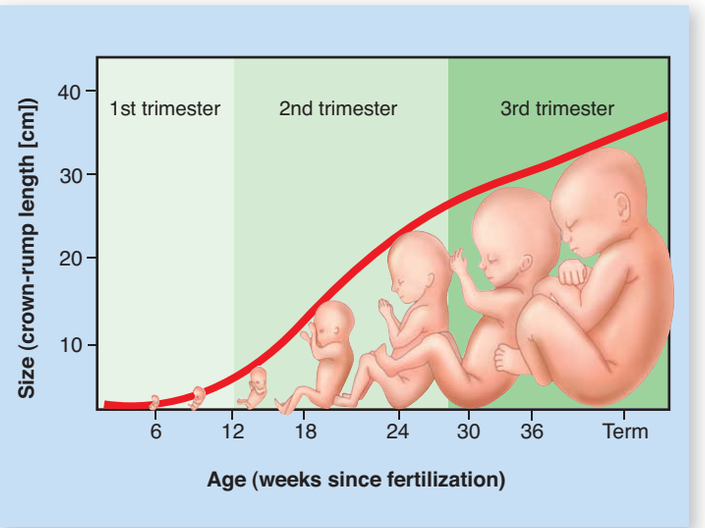

FIGURE 36-15

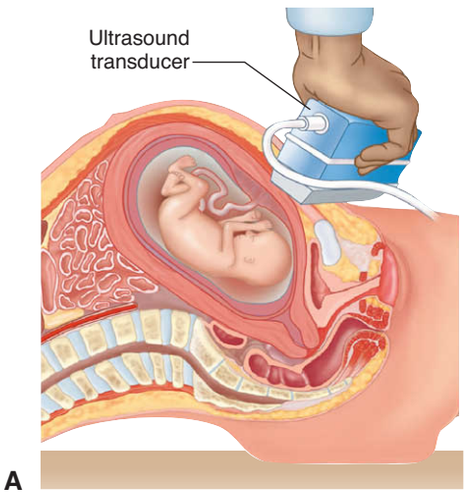
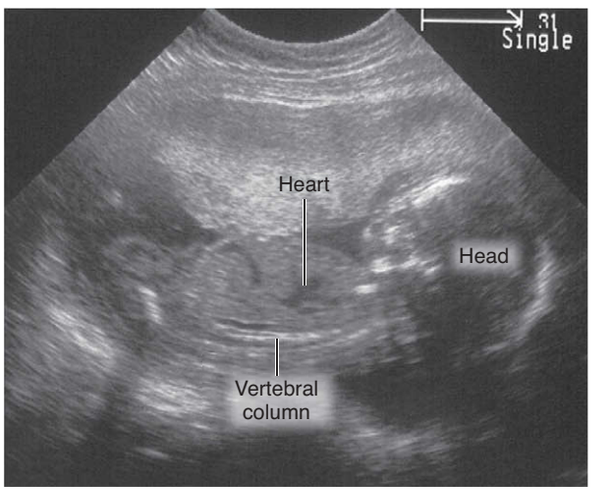
Increase in size during prenatal development. This graph shows the usual progression in size and body shape during the three trimesters of fetal development.



Box 36-2 | DIAGNOSTIC study



Antenatal Diagnosis and Treatment

Advances in **antenatal** (from the Latin *ante-*, "before" and *-natus,* "birth") **medicine** now permit extensive diagnosis and treatment of disease in the fetus much like any other patient. This new dimension in medicine began with techniques by which Rh+ babies could be given transfusions before birth.

Current procedures using images provided by **ultrasonography** equipment (see the figure) allow physicians to prepare for and perform, before the birth of a baby, corrective surgical procedures such as bladder repair. These procedures also allow physicians to monitor the progress of other types of treatment on a developing fetus. Part A of the figure shows placement of the ultrasound transducer on the abdominal wall. The resulting image (see part B of the figure), called an *ultrasonogram,* shows a 20-week-old fetus.

Ultrasonography. A, Placement of the ultrasound transducer on the abdominal wall. **B,** Ultrasonogram showing a midsagittal view of a 20-week-old fetus.

Some stem cells remain throughout development and maturity. These *multipotent* stem cells, such as the hematopoietic stem cells found in adult bone marrow, can only produce a few types of cells. *Adult stem cells*, as these multipotent cells are usually called, are found in many tissues of the body. For example, adult stem cells are found in the skin, many glands, muscles, nerve tissue, bone, and the gastrointestinal (GI) tract. Adult stem cells replace the specialized cells in a tissue and thus ensure stable, functional populations of the cell types needed for survival.

evolve

Formation of the Primary Germ Layers

Early in the first trimester of pregnancy, three layers of unique cells develop that embryologists call the **primary germ layers.** Cells of the *embryonic disk* seen in Figure 36-9 differentiate into distinct types that form each of these three primary germ layers. Pluripotent stem cells in each layer continue to differentiate and thus give rise to the various specific organs and systems of the body, such as the skin, nervous tissue, muscles, or digestive organs (Figure 36-16). As new tissues and organs develop, older cells often die through the process of apoptosis (see Chapter 5) and thus make room for newer, more specialized cells. Each primary germ layer is called, respectively, **endoderm** (EN-dohderm), or inside layer; **ectoderm** (EK-toh-derm), or outside layer; and **mesoderm** (MEZ-oh-derm), or middle layer.

ENDODERM

The inner germ layer, or *endoderm*, forms the linings of various tracts, as well as several glands. For example, the lining of the respiratory tract and GI tract, including some of the accessory structures such as tonsils, is derived from the endoderm. The linings of the pancreatic ducts, hepatic ducts, and urinary tract also have an endodermal origin. The glandular epithelium of the thymus, thyroid, and parathyroid glands is also derived from the endoderm.

ECTODERM

The outer germ layer, or *ectoderm*, forms many of the structures around the periphery of the body. For example, the epidermis of the skin, enamel of the teeth, and cornea and lens of the eye are derived from the ectoderm. Besides these peripheral structures, various components of the nervous system—including the brain and the spinal cord—also have an ectodermal origin.

MESODERM

The middle germ layer, or *mesoderm*, forms most of the organs and other structures between those formed by the endoderm and ectoderm. For example, the dermis of the skin, the skeletal muscles and bones, many of the glands of the body, kidneys, gonads, and components of the circulatory system are derived from the mesoderm. Look carefully at Figure 36-16 to discern the logical pattern exhibited by germ layer development and differentiation.

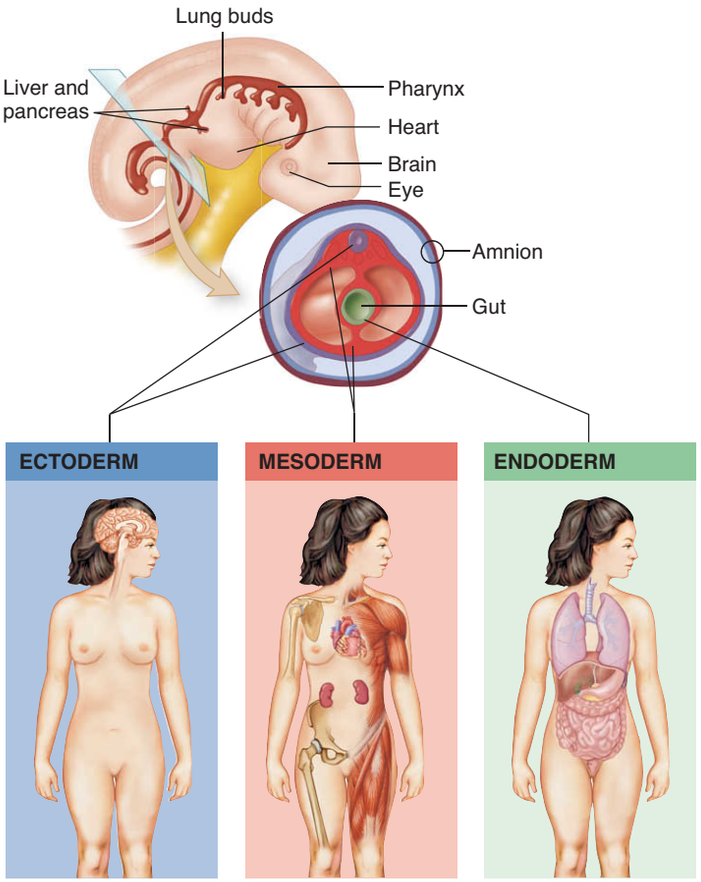

FIGURE 36-16

The primary germ layers. Illustration shows the primary germ layers and the body systems into which they develop.

Histogenesis and Organogenesis

The process by which the primary germ layers develop into many different kinds of tissues is called **histogenesis** (hiss-toh-JEN-eh-sis). The way these tissues arrange themselves into organs is called **organogenesis** (or-gah-no-JEN-eh-sis).

The fascinating story of histogenesis and organogenesis in human development is long and complicated; its telling belongs to the science of embryology. However, a brief example of organogenesis that is particularly useful in our current discussion of reproduction and development is the differentiation and development of the sex organs.

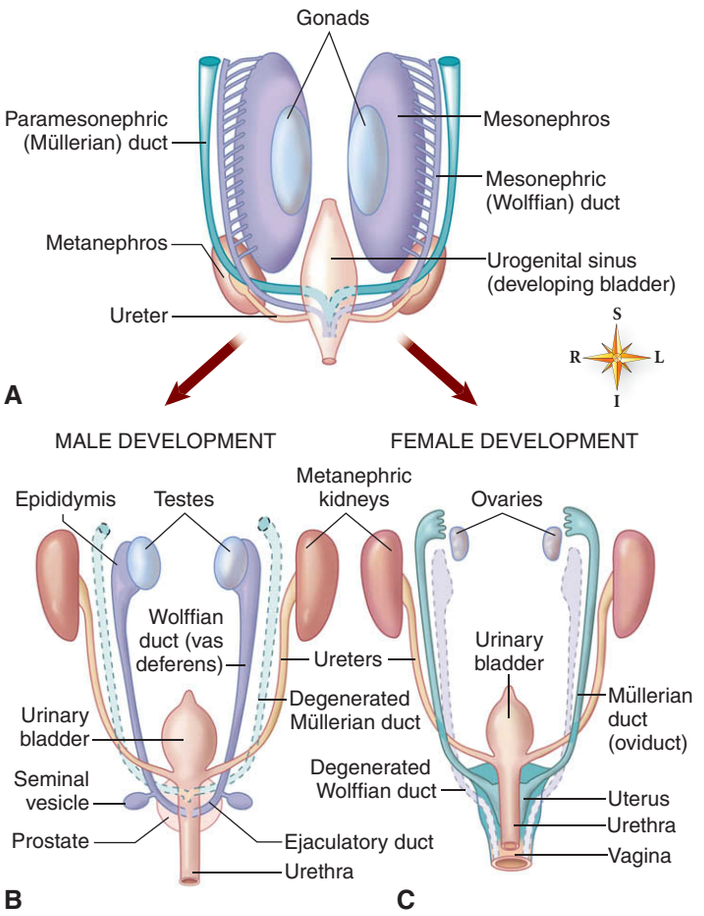

FIGURE 36-17

Development of the reproductive tracts. Both the male and female adult reproductive tracts are similar in their basic outline because they have a shared early development. **A,** Early in embryonic development, an undifferentiated set of gonads and ducts develops in both males and females. **B,** In males, the gonads (now testes) attach to the mesonephric (wolffian) ducts, which develop into the main part of the male reproductive tract. The paramesonephric ducts degenerate in males. **C,** In females, the gonads do not attach directly to a duct. It is the paramesonephric (müllerian) ducts that develop into the female reproductive tract and the mesonephric ducts that degenerate.

As Figure 36-17 shows, the reproductive tracts of both the male and the female begin their development as sets of undifferentiated ducts and gonads. But as embryonic development continues in the male, the gonads attach to the *mesonephric (wolffian) duct*—which along with the urethra develops into the male reproductive tract (Figure 36-17, B). In the female, by contrast, it is the nearby *paramesonephric (müllerian) duct* that instead develops into a female reproductive tract separate from the urinary tract (Figure 36-17, C). Note that the female gonads (ovaries) do not attach to their ducts during development. Figure 36-18 outlines the development of the male and female genitals. Notice how they develop along slightly different paths to eventually become distinct types of structures.

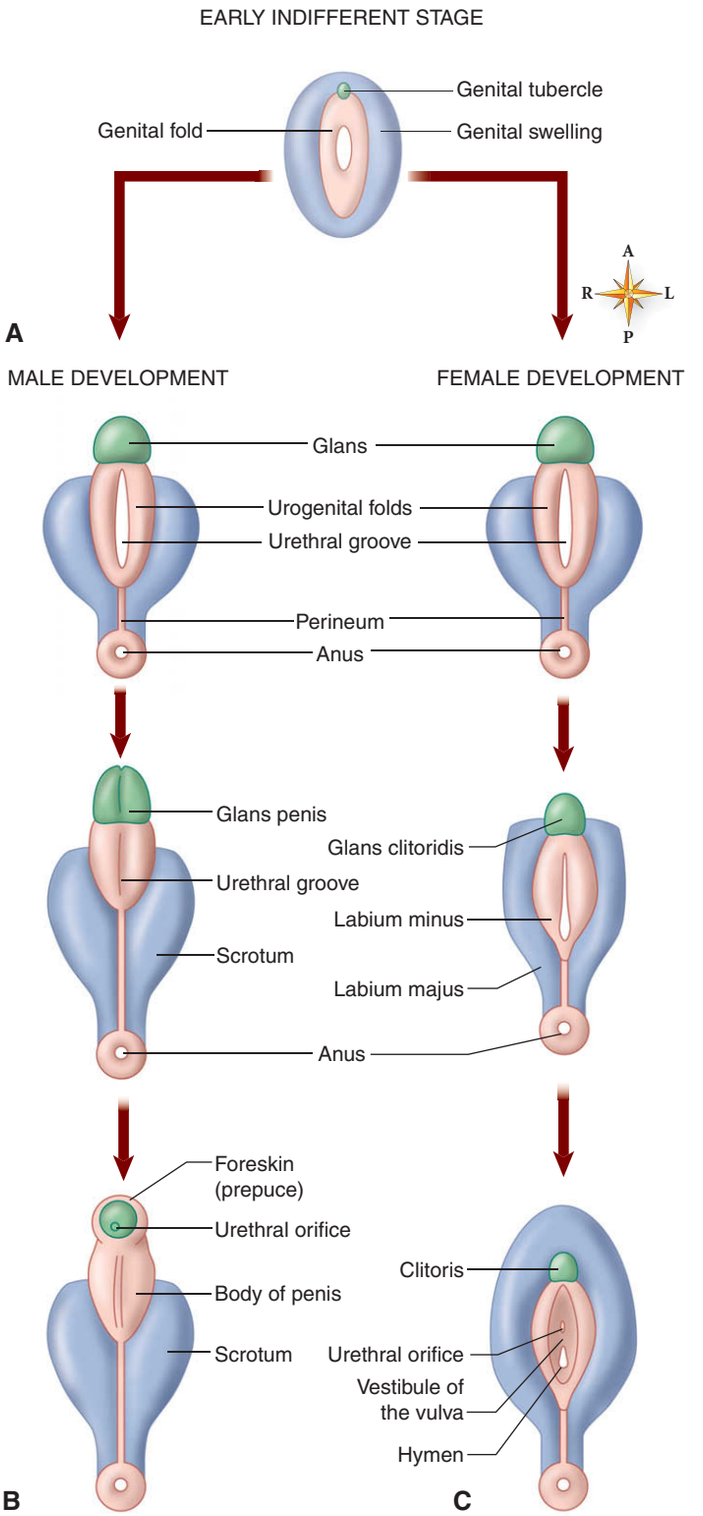

FIGURE 36-18

Development of the genitals. **A,** In early stages of development, the genitals are indifferent (not yet distinguishable). **B,** In the male, the genital tubercle eventually becomes the glans of the penis and the folds become the penis shaft and scrotum. **C,** In the female, the genital tubercle becomes the clitoris and the folds become the labia.

A complete outline of the embryonic development of each organ and system is beyond the scope of this book. For the beginning student of anatomy and physiology, it seems sufficient to appreciate that human development begins when two sex cells unite to form a single-celled zygote and that the new offspring's body evolves by a series of processes consisting of cell differentiation, multiplication, growth, apoptosis, and rearrangement, all of which take place in a definite, orderly sequence. Development of structure and function go hand in hand, and from 4 months of gestation, when every organ system is in place and functioning to some extent, until term (about 280 days), development of the fetus is mainly a matter of growth.

Figure 36-19 shows the normal intrauterine position of a fetus just before birth in a full-term pregnancy. The large size of the pregnant uterus toward the end of pregnancy affects the normal function of the mother's body greatly. For example, you might be able to tell from Figure 36-19 that a woman's center of gravity is shifted forward. This can make walking and other movements of the body difficult—or even hazardous—because the sensory and motor control systems often do not compensate completely for this shift. The pregnant uterus presses on the rectum, sometimes adversely affecting intestinal motility and thus may cause constipation and/or hemorrhoids. Pressure on the bladder reduces its urine-storing capacity, which results in frequent urination. Upward pressure pushes the abdominal organs against the diaphragm, making deep breathing difficult and sometimes causing the stomach to protrude into the thoracic cavity—a condition called *hiatal hernia*.

BIRTH, OR PARTURITION

Birth, or **parturition,** is the point of transition between the prenatal and postnatal periods of life. As the fetus signals the end of pregnancy, the uterus becomes "irritable" and, ultimately, muscular contractions begin and cause the cervix to dilate (open), thus permitting the fetus to move from the uterus through the vagina or "birth canal" to the exterior. The process normally begins with the fetus taking a head-down position fully against the cervix (Figure 36-20, A). When contractions occur, the amniotic sac, or "bag of waters," usually ruptures, and labor begins.

Several hormones help to signal the time of labor and promote the processes needed for successful delivery. High levels of cortisol at the end of pregnancy trigger a drop in hCG, which in turn causes a drop in progesterone levels (see Figure 36-12). Progesterone inhibits the release of oxytocin (OT) earlier in the pregnancy—but at this point, the "brake" on the uterine muscle is

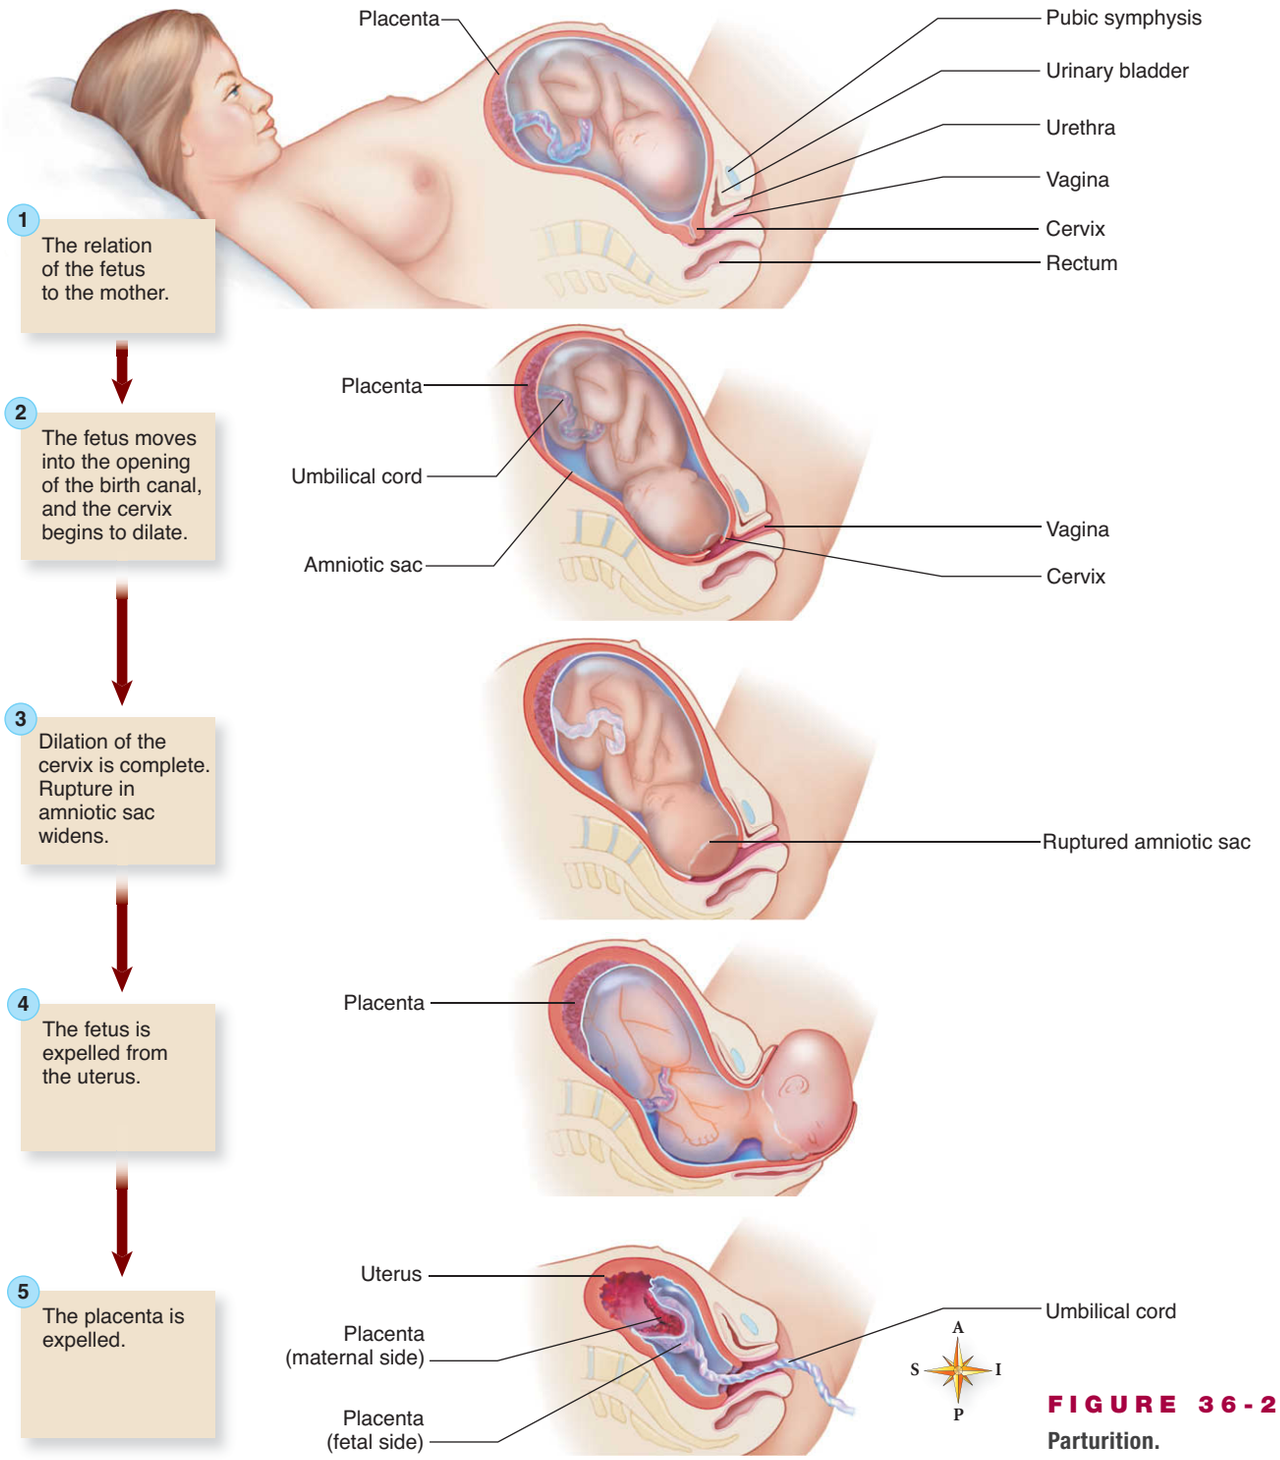

FIGURE 36-20
Parturition.

released. Recall from Chapter 1 that OT is released in a positive feedback mechanism that amplifies the rate and strength of labor contractions (see illustration in Box 1-3 on p. 7). An injection of an OT preparation (Pitocin) can stimulate labor contractions in a difficult or delayed delivery. Prostaglandins E_2 and F_2 (PGE_2, PGF_2) released by the placenta also play a role in the onset of labor by further sensitizing the myometrium of the uterus to OT.

Stages of Labor

Labor is the term used to describe the process that results in the birth of the baby. It is divided into three stages (see Figure 36-20, *B* to *E*):

1. Stage one—period from onset of uterine contractions until dilation of the cervix is complete
2. Stage two—period from the time of maximal cervical dilation until the baby exits through the vagina
3. Stage three—process of expulsion of the placenta through the vagina

The time required for normal vaginal birth varies widely and may be influenced by many variables, including whether the woman has previously had a child. In most cases, stage one of labor lasts from 6 to 24 hours, and stage two lasts from a few minutes to an hour. Delivery of the placenta (stage three) is normally within 15 minutes after the birth of the baby. If abnormal conditions of the mother or fetus (or both) make normal vaginal delivery hazardous or impossible, physicians may suggest a **cesarean** (seh-SAIR-ee-an) **section.** Often called simply a *C-section*, it is a surgical procedure in which the newborn is delivered through an incision in the abdomen and uterine wall.

Immediately after birth, the umbilical cord is cut and clamped. Recall from Chapter 21 that at birth, the circulatory route of the infant changes as the placenta is lost and the lungs begin to function (see Figure 21-37 on p. 668). Eventually, the remainder of the cord sloughs off—leaving the umbilicus or navel as an abdominal landmark.

Blood from the umbilical cord is often saved for future use. Learn what it is used for in ***Freezing Umbilical Cord Blood*** online at ***A&P Connect.***

evolve

Multiple Births

The term *multiple birth* refers to the birth of two or more infants from the same pregnancy. The birth of twins is more common than the birth of triplets, quadruplets, or quintuplets. Multiple-birth babies are often born prematurely, so they are at a greater than normal risk of complications in infancy. However, premature infants that have modern medical care available have a much lower risk of complications than those without such care.

Twinning, or double births, can result from either of two different processes:

1. **Identical twins** result from the splitting of embryonic tissue from the same zygote early in development. One way this happens is that, during the blastocyst stage of development, the inner cell mass divides into two masses. Each inner cell mass thus formed develops into a separate individual. As Figure 36-21, *A*, shows, identical twins usually share the same placenta but have separate umbilical cords. This is not surprising because in this type of twinning there is a single, shared trophoblast. Because they develop from the same fertilized egg, identical twins have the same genetic code. Despite this, identical twins are not absolutely identical in terms of structure and function. Different environmental factors and personal experiences lead to individuality even in genetically identical twins.
2. **Fraternal twins** result from the fertilization of two different ova by two different spermatozoa (Figure 36-21, *B*). Fraternal twinning requires the production of more than one mature ovum during a single menstrual cycle, a trait that is often inherited. Multiple ovulation may also occur in response to certain fertility drugs, especially the gonadotropin preparations. Fraternal twins are no more closely related genetically than any other brother-sister relationship. Because two separate fertilizations must occur, it is even possible for fraternal twins to have different biological fathers. Triplets, quadruplets, and other multiple births may be identical, fraternal, or any combination.

| QUICK CHECK |

12. Briefly describe the three stages of labor.
13. How does identical twinning differ from fraternal twinning?

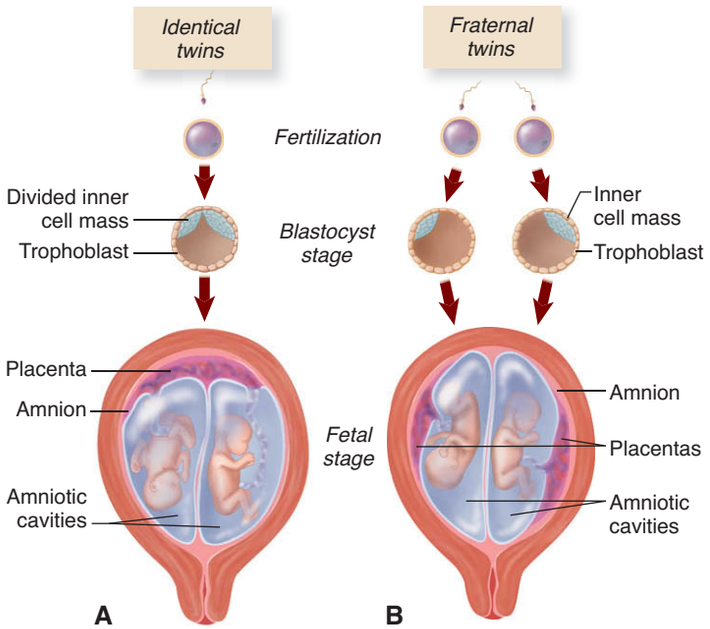

FIGURE 36-21

Multiple births. A, Identical twins develop when embryonic tissue from a single zygote splits to form two individuals. Notice that, because the trophoblast is shared, the placenta and the part of the amnion separating the amniotic cavities are shared by the twins. **B,** Fraternal twins develop when two ova are fertilized at the same time, producing two separate zygotes. Notice that each fraternal twin has its own placenta and amnion.

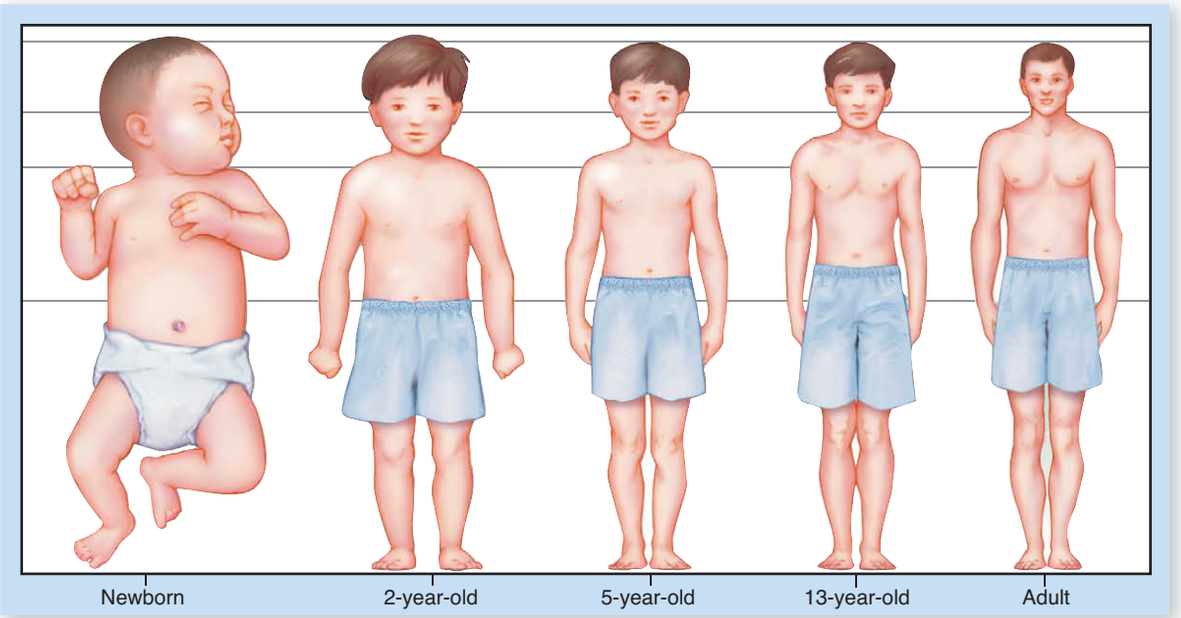

FIGURE 36-22

Changes in the proportions of body parts from birth to maturity. Note the dramatic differences in relative head size.

POSTNATAL PERIOD

The **postnatal period** begins at birth and lasts until death. It is often divided into major periods for study, but people need to understand and appreciate the fact that growth and development are continuous processes that occur throughout the life cycle. Gradual changes in the physical appearance of the body as a whole and in the relative proportions of the head, trunk, and limbs are quite noticeable between birth and adolescence. Note in Figure 36-22 the obvious changes in the size of bones and in the proportionate sizes between different bones and body areas. The head, for example, becomes proportionately smaller. Whereas the infant head is approximately one fourth the total height of the body, the adult head is only about one eighth the total height. The facial bones also show several changes between infancy and adulthood. In an infant the face is one eighth of the skull surface, but in an adult the face is half of the skull surface. Another change in proportion involves the trunk and lower extremities. The legs become proportionately longer and the trunk proportionately shorter. In addition, the thoracic and abdominal contours change from round to elliptical.

Such changes are good examples of the ever-changing and ongoing nature of growth and development. It is unfortunate that many of the changes that occur in the later years of life do not result in an increased function. These degenerative changes are certainly important, however, and will be discussed later in this chapter (see pp. 1118–1122).

The following are the most common postnatal periods: (1) **infancy,** (2) **childhood,** (3) **adolescence** and **adulthood,** and (4) **older adulthood.** Table 36-1 summarizes the projected changes in U.S. population numbers in selected age-groups from 2010 through the year 2050. Notice the proportionally higher rise in older age-groups, particularly those over age 85 years.

Infancy

The period of infancy begins abruptly at birth and lasts about 18 months. The first 4 weeks of infancy are often referred to as the **neonatal period.** Dramatic changes occur at a rapid rate during this short but critical period. **Neonatology** (nee-oh-nay-TOL-oh-jee) is the medical and nursing specialty concerned with the diagnosis and treatment of disorders of the

TABLE 36-1 U.S. Population—Selected Census Bureau Projections 2020–2050*

	2010	2020	2030	2040	2050	PERCENT CHANGE

85+ years	5,571	6,597	8,745	14,198	19,041	242%

*Numbers in thousands.

newborn. Advances in this area have resulted in dramatically reduced infant mortality.

Many of the changes that occur in the cardiovascular and respiratory systems at birth are necessary for survival (see Figures 21-36, p. 667, and Figure 21-37, p. 668). Whereas the fetus totally depended on the mother for life support, the newborn infant, to survive, must become totally self-supporting in terms of blood circulation and respiration immediately after birth. A baby's first breath is deep and forceful. The stimulus to breathe results primarily from the increasing amounts of carbon dioxide (CO_2) that accumulate in the blood after the umbilical cord is cut shortly after delivery.

To assess the general condition of a newborn, a system that scores five health criteria is often used. The criteria are heart rate (HR), respiration, muscle tone, skin color, and response to stimuli. Each aspect is scored as 0, 1, or 2—depending on the condition of the infant. The resulting total score is called the **Apgar score.** The Apgar score in a completely healthy newborn is 10.

Many developmental changes occur between the end of the neonatal period and 18 months of age. Birth weight generally doubles during the first 4 to 6 months and then triples by 1 year. The baby also increases in length by 50% by the twelfth month. The "baby fat" that accumulated under the skin during the first year begins to decrease, and the plump infant becomes leaner.

Early in infancy the baby has only one spinal curvature (Figure 36-23). The cervical curve appears as the infant begins holding up her head. The lumbar curvature appears between 12 and 18 months, as the once-helpless infant becomes a toddler who can stand (Figure 36-24). One of the most striking changes to occur during infancy is the rapid development of the nervous and muscular systems. This permits the infant to follow a moving object with the eyes (2 months); lift the head and raise the chest (3 months); sit when well supported (4 months); crawl (10 months); stand alone (12 months); and run, although a bit stiffly (18 months).

Childhood

Childhood extends from the end of infancy to sexual maturity, or puberty—12 to 14 years in girls and 14 to 16 years in boys. Overall, growth during early childhood continues at a rather rapid pace, but month-to-month gains become less consistent. By the age of 6 years the child appears more like a preadolescent than an infant or toddler. The child becomes less chubby, the potbelly becomes flatter, and the face loses its babyish look. The nervous and muscular systems continue to develop rapidly during the middle years of childhood; by 10 years of age the child has developed numerous motor and coordination skills.

The *deciduous teeth*, which began to appear at about 6 months of age, are lost during childhood, beginning at about 6 years of age. The *permanent teeth*, with the possible exception of the third molars (wisdom teeth), have all erupted by age 14 years.

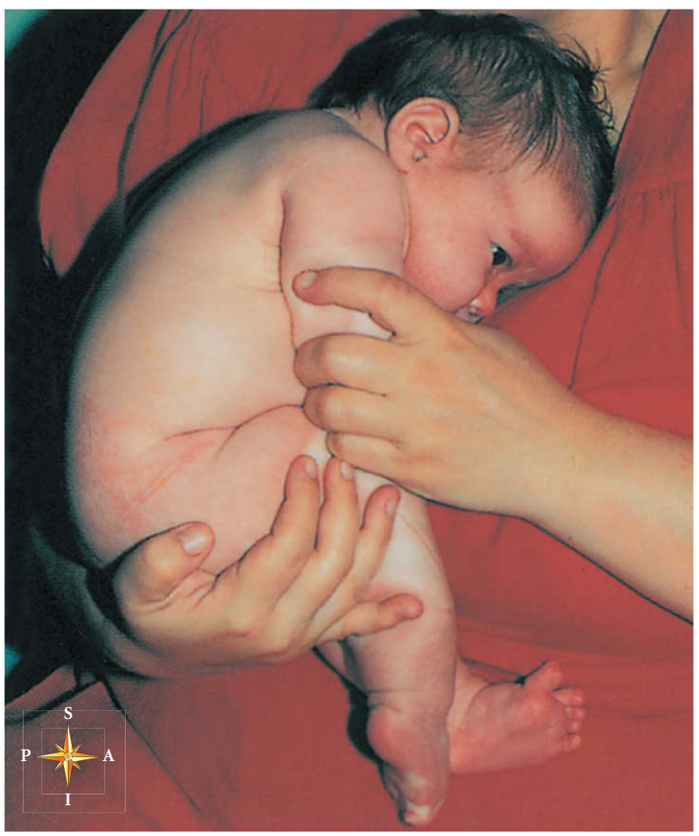

FIGURE 36-23

FIGURE 36-24

The toddler spine. Photograph showing the normal curvature of the vertebral column in a toddler. The dark shadow emphasizes the distinct lumbar curvature that develops with the ability to walk (compare with Figure 36-23).

Adolescence and Adulthood

The average age range of **adolescence** varies but generally the teenage years (13 to 19) are used as the standard age range. The period is marked by rapid and intense physical growth, which ultimately results in sexual maturity.

The stage of adolescence in which a person becomes sexually mature is called **puberty.** Many of the developmental changes that occur during this period are controlled by the secretion of gonadotropins (FSH and LH) and sex hormones such as testosterone and estrogen (Figure 36-25). Some of these changes involve development of the gonads themselves and are called **primary sex characteristics.** However, most of the more visible changes involve development of the **secondary sex characteristics** such as skeletal changes, fat distribution patterns, growth of pubic and body hair, and growth of the larynx.

Breast development is often the first sign of approaching puberty in girls, beginning about age 9 or 10 years. Most girls begin to menstruate at 12 to 14 years of age. In boys the first sign of puberty is often enlargement of the testes, which begins between 10 and 14 years of age. Both sexes show a spurt in height during adolescence (Figure 36-26). In girls the spurt in height begins between the ages of 10 and 12 years and is nearly complete by 14 or 15 years. In boys the period of rapid growth begins between 12 and 13 years and is generally complete by 16 or 17 years.

Many developmental changes that begin early in childhood are not completed until the early or middle years of **adulthood.** Examples include the maturation of bone, resulting in the full closure of the growth plates, and changes in the size and placement of other body components such as the sinuses. Many body traits do not become apparent for years after birth. Normal balding patterns, for example, are determined at the time of fertilization by heredity but do not appear until maturity. As a rule, adulthood is characterized by the maintenance of existing body tissues. With the passage of years the ongoing effort of maintenance and repair of body tissues becomes more and more difficult. As a result, degeneration begins. This is part of the process of aging, and it culminates in death.

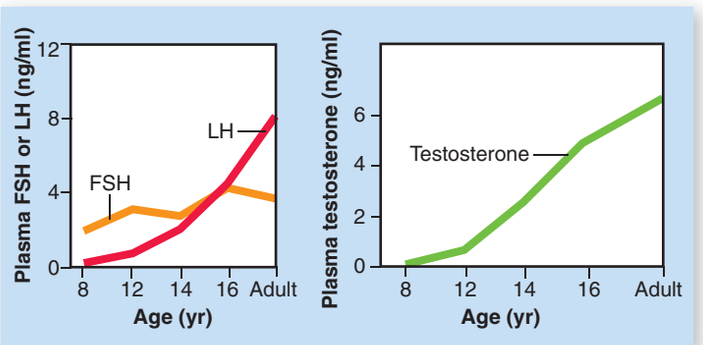

FIGURE 36-25

Hormone changes during puberty. The left graph shows the increase in gonadotropin (LH and FSH) secretion during puberty. The right graph shows changes in testosterone levels (in males) during puberty that result from increased gonadotropin levels. Female hormones show a similar change within a monthly cycle of dramatic highs and lows (see Figures 35-14 and 35-15). *FSH,* Follicle-stimulating hormone; *LH,* luteinizing hormone.

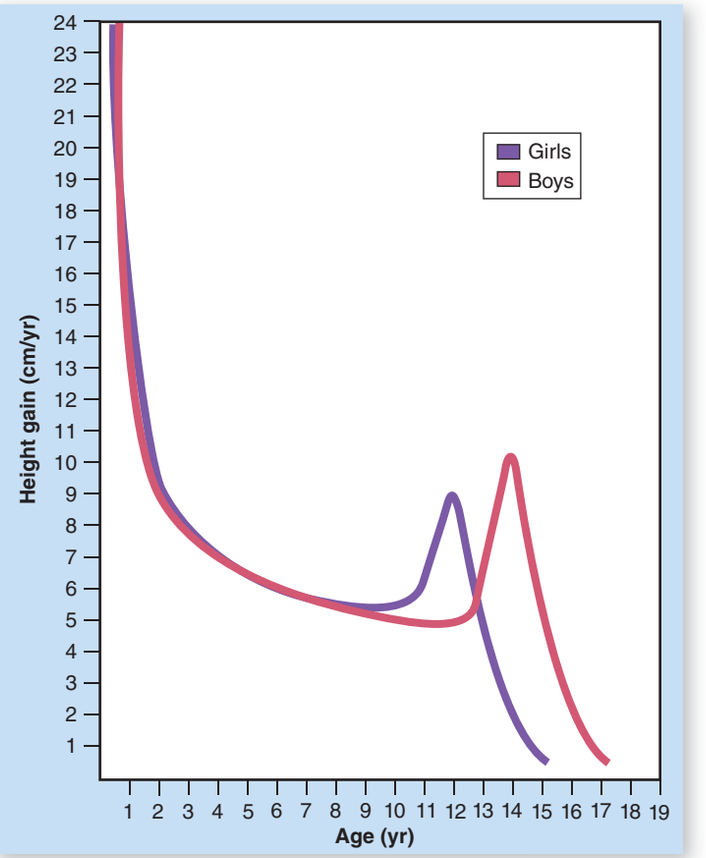

FIGURE 36-26

Growth in height. The graph shows typical patterns of gain in height from birth to adulthood for girls and boys. Notice the rapid gain in height during the first few years, a period of slower growth, then another burst of growth during adolescence—finally ending at the beginning of adulthood.

Older Adulthood and Senescence

Most body systems are in peak condition and function at a high level of efficiency during early adulthood. As a person grows older, a gradual but certain decline takes place in the functioning of every major organ system in the body. The study of aging is called **gerontology.** Unfortunately, the mechanisms and causes of aging are not well understood.

Some gerontologists believe that an important aging mechanism is the limit on cell reproduction. Laboratory experiments show that many types of human cells cannot reproduce more than 50 times—thus limiting the maximum life span. Cells die continually in a process called *apoptosis*, no matter what a person's age, but in older adulthood, many dead cells are not replaced—causing degeneration of tissues. Perhaps the cells are not replaced because the surrounding cells have reached their limit of reproduction. Perhaps differences in each adult's aging process result from differences in the reproductive capacity of cells. This mechanism seems to operate in individuals with **progeria** (pro-JEE-ree-ah), a rare, inherited condition in which a person appears to age rapidly (Box 36-3).

Various factors that affect the rates of cell death and cell reproduction have been cited as causes of aging. Some gerontologists believe that nutrition, injury, disease, and other environmental factors affect the aging process. A few have even proposed that aging

Box 36-3 | DIAGNOSTIC study

Progeria

Progeria, also called *Hutchinson-Gilford disease,* is a rare, inherited condition in which a young child appears to age rapidly. In progeria (*pro-,* "before"; *-ger-,* "old age";*-ia,* "condition") the reproductive capacity of cells seems to be diminished. Thus the tissues of the body fail to maintain or repair themselves normally and many of the degenerative conditions more commonly seen in elderly individuals appear. Many of these conditions can be seen in this photograph of a young boy with progeria: thin, wrinkled skin; hair loss; loss of subcutaneous fat; and arthritis (causing stiff, partially flexed, and swollen joints). Most victims of progeria die of cardiovascular disease within the first or second decade of life.

results from cellular changes caused by slow-acting "aging" viruses found in all living cells. Other gerontologists have proposed that aging is caused by "aging" genes that regulate apoptosis or other cell functions—genes in which aging is "preprogrammed."

Another proposed cause of aging is autoimmunity. You may recall from Chapter 24 that autoimmunity occurs when the immune system attacks a person's own tissues. Yet another theory of aging suggests that as a person ages, mitochondria become less able to shuttle adenosine triphosphate (ATP) out to the cytosol. Decreasing ATP availability renders cells less able to perform their functions and even causes them to degenerate—hallmarks of the aging process. One popular theory of aging states that oxygen *free radicals* play a major role in cellular aging (see Figure 30-24, p. 952). Free radicals are highly reactive forms of oxygen that normally result from mitochondrial activity, but may damage the cell. As a person's cells produce more and more free radicals during the later years, more damage happens to cellular structures and functions. In addition, as free-radical production increases, mitochondrial function decreases and therefore availability of ATP decreases (Figure 36-27)

Many different genes have been put forth as having direct or indirect effects on aging and longevity. Most of them operate in

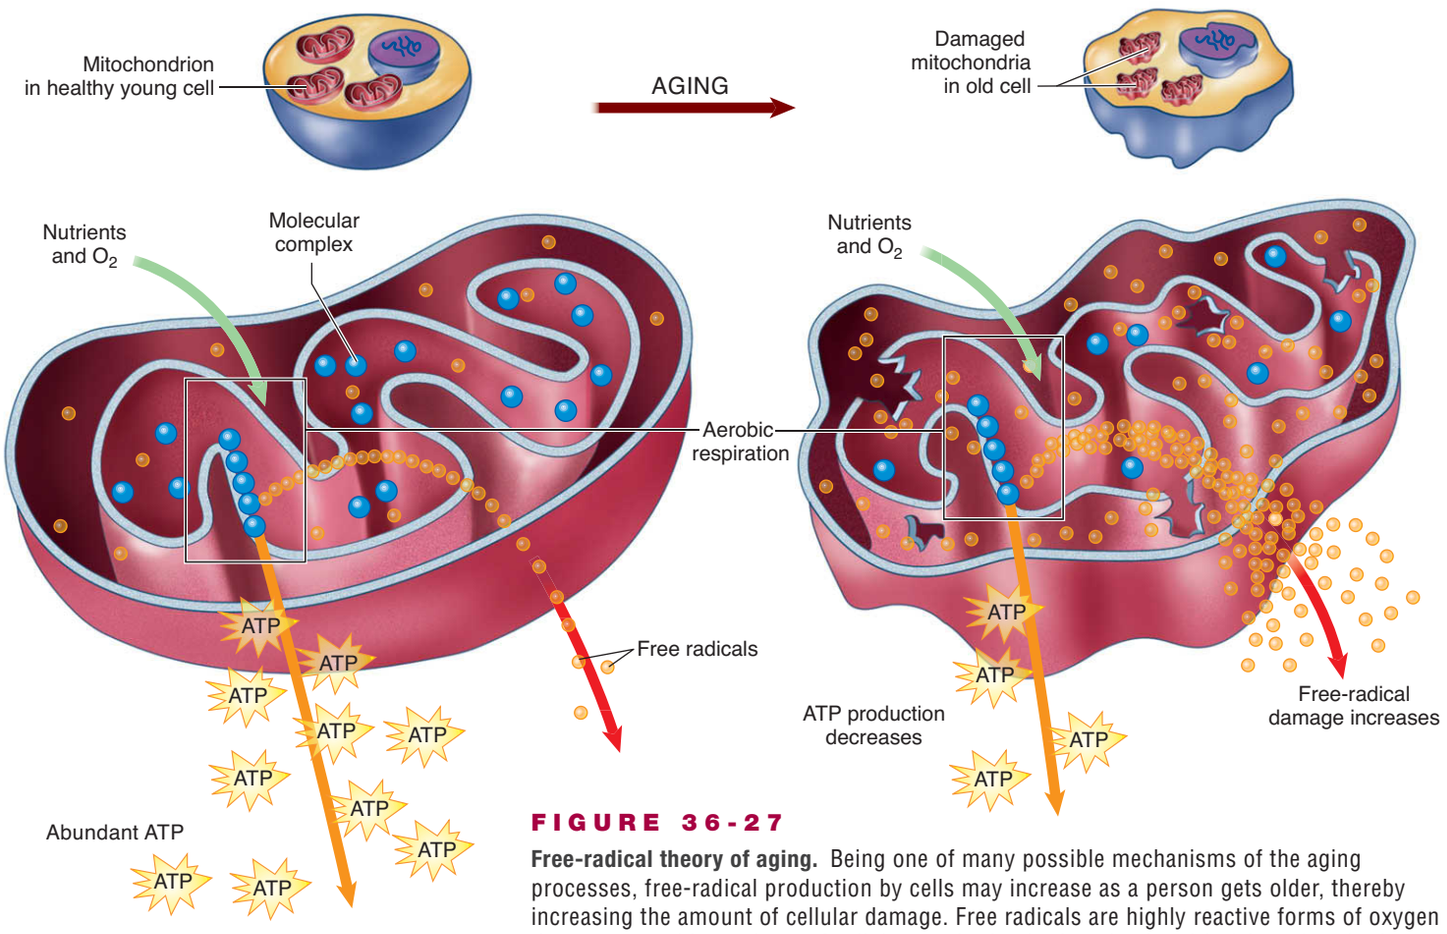

FIGURE 36-27

Free-radical theory of aging. Being one of many possible mechanisms of the aging processes, free-radical production by cells may increase as a person gets older, thereby increasing the amount of cellular damage. Free radicals are highly reactive forms of oxygen that are normal byproducts of cellular respiration in the mitochondria (shown) and other cell processes. As one ages, the number of free radicals increases as cellular efficiency decreases. Thus more cellular damage occurs, especially damage to cellular membranes, causing degeneration of the cell.

one or more of the aging mechanisms already discussed. It is clear that there is a genetic component to how we age and how long we live. However, the mechanisms by which these genes influence aging still remain unclear.

Although the causes and basic mechanisms of aging are yet to be understood, at least many of the signs of aging are obvious. The remainder of this chapter deals with some of the more common degenerative changes that frequently characterize **senescence** (seh-NES-enz), or older adulthood.

| QUICK CHECK |

14. Name the four major phases of the postnatal period.
15. When does the *neonatal period* of human development occur?
16. What signs characterize the *adolescent period* of human development?
17. Briefly describe one of the proposed mechanisms of the aging process.

EFFECTS OF AGING

Aging affects each individual in different ways. Environment, genetics, and perhaps even attitude may affect the degree to which the structure and function of a person's body change through older adulthood. Despite advances in understanding how some of the effects of aging can be minimized or even avoided, one cannot completely avoid the fact that body structures degenerate and functions decrease as we get older. Figure 36-28 summarizes a few of the many biological changes that occur by the time we reach late adulthood.

Skeletal System

In older adulthood, bones undergo changes in texture, degree of calcification, and shape. Instead of clean-cut margins, older bones develop indistinct and shaggy-appearing margins with spurs—a process called *lipping*. This type of degenerative change restricts movement because of the piling up of bone tissue around the joints.

With advancing age, changes in calcification of bones reduce the *bone mineral density (BMD)* as you can see in Figure 36-29, A. This may result in reduction of bone size and in bones that are porous and subject to fracture. The lower cervical and thoracic vertebrae are the site of frequent fractures. The result is curvature of the spine and the shortened stature so typical of late adulthood (Figure 36-29, *B*). The onset of *osteoporosis* and other types of bone loss associated with aging may be avoided—at least to some extent—by maintaining a high BMD through exercise and sufficient calcium in the diet.

Degenerative joint diseases such as **osteoarthritis** (os-tee-oh-ar-THRY-tis) are also common in elderly adults.

| A&P CONNECT |

Bone loss during aging is an important health concern, especially as our life expectancy increases and more people hope to live healthy lives into late adulthood. Explore these issues further in ***Measuring Bone Mineral Density*** and ***Skeletal Variations*** online at ***A&P Connect.***

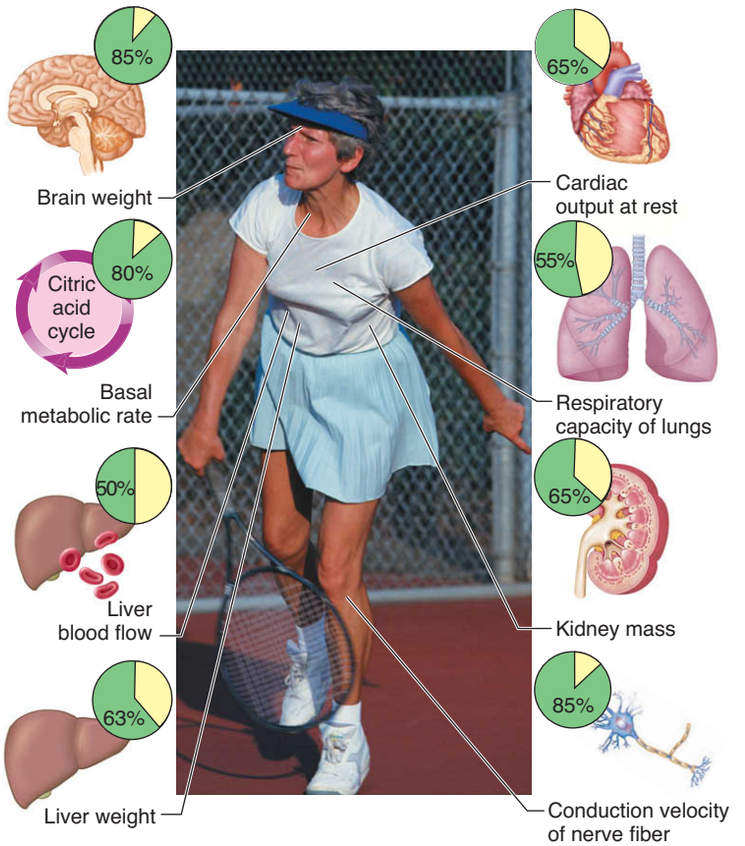

FIGURE 36-28

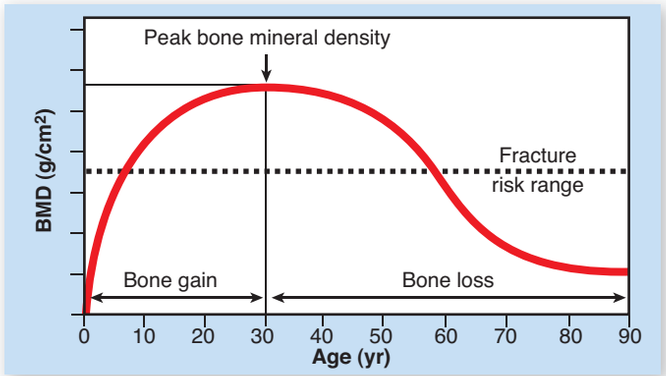
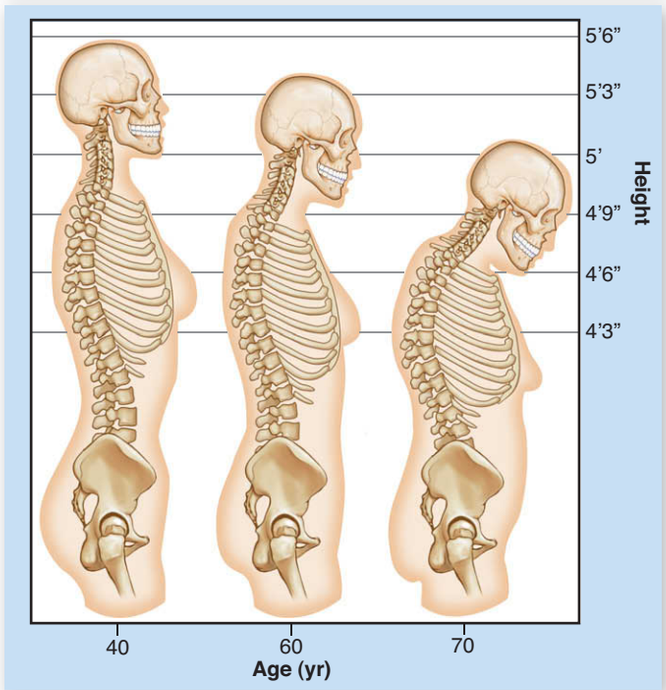
Some biological changes associated with maturity and aging. Insets show proportion of remaining function in the organs of a person in late adulthood compared with a 20-year-old person.



Muscular System

Getting older usually involves losing muscle mass. This can begin as early as age 25 years but does not usually reach 10% loss in muscle mass until 50 years of age or so. By age 80 years, many people have lost about 50% of their skeletal muscle mass. Most of the age-related loss of muscle mass is due to a loss of muscle fibers. However, weight training before and during one's later years can increase the mass of the remaining fibers and thus counteract at least some of the reduction in the number of muscle fibers (Box 36-4).



Another change in our muscles as we age is that many muscle fibers develop into slower type fibers or into an intermediate form between the "fast type" and "slow type" of muscle fiber. This usually means that the overall ratio of "fast" to "slow" function decreases—that is, our muscle function becomes relatively "slower." As Figure 36-30 shows, the different fiber types also begin to group together in bunches and change their shape slightly. These effects seem unavoidable—even with exercise.

Integumentary System (Skin)

With advancing age the skin becomes dry, thin, and inelastic. It "sags" on the body because of increased wrinkling and

A

B

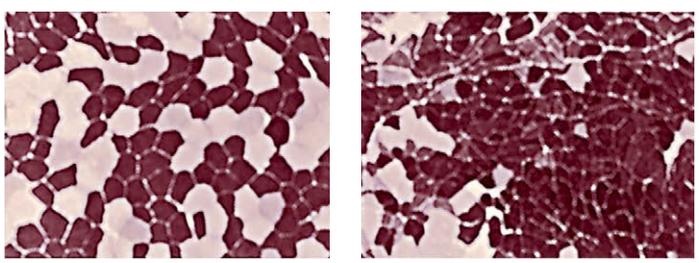
FIGURE 36-29

Loss of bone mineral density (BMD) in late adulthood. A, Graph showing changes in BMD over the life span in females. BMD peaks in young adulthood and decreases in late adulthood to a point at which there is an increased risk of bone fracture. Males also have a decrease in BMD beginning around age 50 years, but the decline is more gradual than in women. **B,** The normal spinal curvatures of young adulthood give way to possible changes later in life because of a decrease in BMD.

skinfolds—as well as a loss of body fat under the skin. Pigmentation changes and the thinning or loss of hair are also common conditions associated with aging.

Urinary System

The number of functioning nephron units in the kidney decreases by almost 50% between the ages of 30 and 75 years. Also, because less blood flows through the kidneys as an individual ages, there is a reduction in overall function and excretory capacity or the ability to produce urine. In the bladder, significant age-related problems often occur because of diminished muscle tone. Muscle atrophy (wasting) in the bladder wall results in decreased capacity and inability to empty, or void, completely.



Box 36-4 | SPORTS and FITNESS

Exercise and Aging

A sound exercise program throughout life can reduce some of the common effects of aging. The improved cardiovascular condition associated with aerobic training can prevent or reduce the effects of several age-related circulatory problems. The loss of bone mass that occurs in older adulthood is less troublesome if one enters this period with a higher than average bone density developed through exercising. Finally, the relatively high ratio of body fat to muscle often seen in the elderly can be reduced or avoided entirely by a lifelong fitness program.

Respiratory System

In older adulthood the costal cartilages that connect the ribs to the sternum become hardened or calcified. This makes it difficult for the rib cage to expand and contract as it normally does during inspiration and expiration. In time the ribs gradually become "fixed" to the sternum, and chest movements become difficult. When this occurs the rib cage remains in a more expanded position, respiratory efficiency decreases, and a condition called "barrel chest" results. With advancing years a generalized atrophy, or wasting, of muscle tissue takes place as the contractile muscle cells are replaced by connective tissue. This loss of muscle cells decreases the strength of the muscles associated with inspiration and expiration.

A B

FIGURE 36-30

Muscle changes in late adulthood. Skeletal muscle tissue changes as we age. **A,** Younger muscle shows a typical "checkerboard" pattern of fast and slow fibers (distinguished by stains here). **B,** However, in the elderly the fast and slow fibers tend to group together rather than remain distributed evenly throughout the muscle organ. Note the overall increase in the slower fibers, which appear darker than the other fibers here. Also, the more angular appearance of each muscle fiber cross section in the young changes to a more rounded cross section in the elderly.

Cardiovascular System

Degenerative heart and blood vessel disease is one of the most common and serious effects of aging. Fatty deposits build up in blood vessel walls and narrow the passageway for the movement of blood, much as the buildup of scale in a water pipe decreases flow and pressure. The resulting condition, called **atherosclerosis** (ath-er-oh-skleh-ROH-sis), often leads to eventual blockage of the coronary arteries and a "heart attack" (myocardial infarction [MI]). If fatty accumulations or other substances in blood vessels calcify, actual hardening of the arteries, or **arteriosclerosis** (ar-tee-ree-oh-skleh-ROH-sis), occurs. Rupture of a hardened vessel in the brain (stroke) is a frequent cause of serious disability or death in the older adult. **Hypertension (HTN),** or high blood pressure, is also more common.

Special Senses

The sense organs, as a group, all show a gradual decline in performance and capacity as a person ages.

Most people are farsighted by age 65 years because eye lenses become hardened and lose elasticity; the lenses cannot become curved to accommodate for near vision. This hardening of the lens is called **presbyopia** (pres-bee-OH-pee-ah), which means "old eye." Many individuals first notice the change at about 40 or 45 years of age, when it becomes difficult to do close-up work or read without holding printed material at arm's length. This explains the increased need, with advancing age, for bifocals (glasses that incorporate two lenses) to automatically accommodate for near and distant vision.

Loss of transparency of the lens or its covering capsule is another common age-related eye change. If the lens actually becomes cloudy and significantly impairs vision, it is called a **cataract** and must be removed surgically. The incidence of **glaucoma** (glaw-KOH-mah), the most serious age-related eye disorder, increases with age. Glaucoma causes an increase in the pressure within the eyeball and, unless treated, often results in blindness.

In many elderly people a very significant loss of hair cells in the organ of Corti (spiral organ of the inner ear) causes a serious decline in the ability to hear certain frequencies. In addition, the eardrum and attached ossicles become more fixed and less able to transmit mechanical sound waves. Some degree of hearing impairment is universally present in the older adult.

The sense of taste is also decreased. Loss of appetite may be caused, at least in part, by the replacement of taste buds with connective tissue cells. Only about 40% of the taste buds present at age 30 years remain fully functional in an individual at age 75 years.

Interestingly, not everything in the sensory system diminishes with age. Evidence shows that older people are much better than younger people at spotting small movements in a visual scene. This is more a matter of interpreting sensory information in the brain than it is a matter of sensory reception. This should not be surprising, as a growing body of evidence supports our longstanding cultural notion that older adults have a sort of "wisdom" or improved thinking abilities that develop over time.

Reproductive Systems

Although most men and women remain sexually active throughout their later years, mechanisms of sexual response may change, and fertility declines. In men, erection may be more difficult to achieve and maintain, and urgency for sex may decline. In women, lubrication of the vagina may decrease. Although men can continue to produce gametes as they age, women experience a cessation of reproductive cycling between the ages of 45 and 60 years—**menopause.** Menopause results from a decrease in the cyclical production of the primary sex hormones, especially estrogen, with advancing age. The decrease in estrogen accounts for the common symptoms of menopause: cessation of menstrual cycles, hot flashes, and thinning of the vaginal wall. The exact mechanism of hot flashes is not clearly understood, but it is related to the hormonal changes that occur during menopause. Rarely serious, hot flashes usually subside over time. Estrogen therapy may be used to relieve menopause symptoms in some cases.

The decrease in estrogen levels associated with menopause may also contribute to *osteoporosis.* This condition is characterized by loss of bone mass (see Chapter 8). Osteoporosis is often treated with short-term, low-dose estrogen replacement therapy (ERT) and nonhormonal bone building drugs. Therapy to restore or maintain bone mineral density may also include high doses of vitamin D, calcium supplements, and weight-bearing exercise.

Benefits of Aging

It is easy to see the "down side" of aging—degradation of structures and loss of functions—but there is an "up side" to aging. For example, studies show that as one ages, anxiety and hostility lessen, control over fear increases, and resistance to happiness decreases. And even though the image quality of vision may decrease as we age, we actually improve in our ability to interpret what we see—such as the ability to detect and track motion in our visual field. Of course, there is the accumulation of learning over time and problem-solving ability often improves. Historically, we have attributed wisdom mainly to our elders—a concept that has been supported by neurological research of the traits that characterize wisdom.

There may be a few social advantages to aging if we live in a culture and a social network that values and provides for the aged.

CAUSES OF DEATH

No matter what your age, death of the individual is also part of the human life cycle. Figure 36-31 shows the leading causes of death in the United States. These figures are consistent with causes of death in other economically developed countries. Notice that some of these causes of death have been diminishing over the years (such as heart diseases and stroke), some have remained roughly stable (such as cancer), and some have increased (such as Alzheimer disease, Parkinson disease, and kidney disease).

| A&P CONNECT |

The human life span has been increasing over time—even more so in developed areas of the world. Read about the role of genetics in this phenomenon in ***Genes and Longevity*** online at ***A&P Connect.***

1. Diseases of heart
2. Malignant neoplasms (cancer)
3. Chronic lower respiratory disease (including COPD)
4. Cerebrovascular diseases (including stroke)
5. Accidents (unintentional injuries)
6. Alzheimer disease (AD)
7. Diabetes mellitus (DM)
8. Influenza and pneumonia
9. Nephritis, nephrotic syndrome, and nephrosis
10. Intentional self-harm (suicide)
11. Septicemia
12. Chronic liver disease and cirrhosis
13. Essential (primary) hypertension (HT) and hypertensive renal disease
14. Parkinson disease (PD)
15. Assault (homicide)

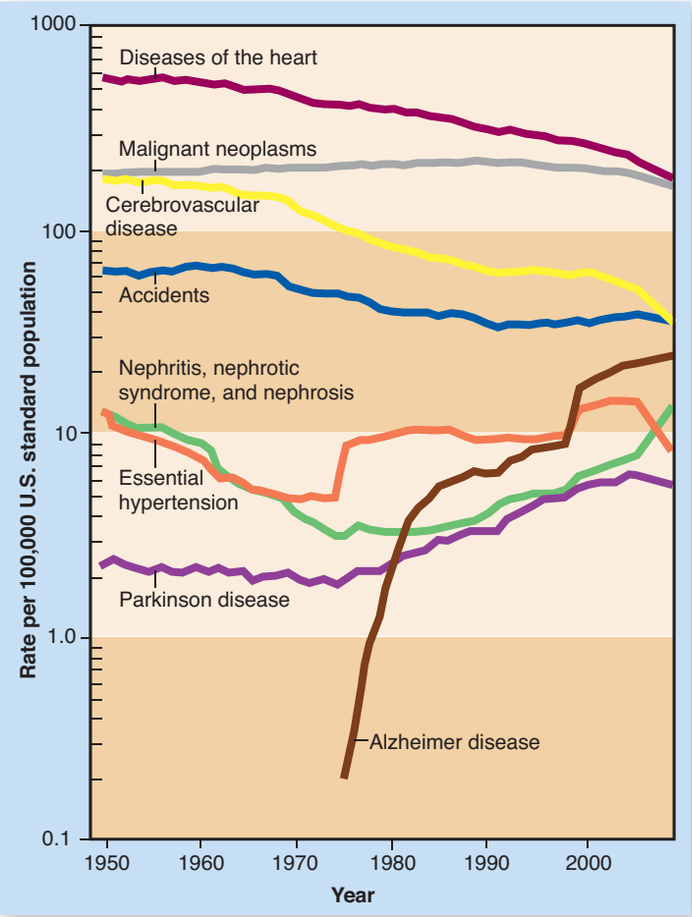


FIGURE 36-31

Leading causes of death. The 15 leading causes of death in the United States are listed in the inset. The trends in some of these causes of death are graphed out on a logarithmic (powers of 10) scale.

Although heart disease, cancer, stroke, and so on are the leading killers in developed nations, it is a somewhat different story among the developing nations. In developing nations around the world, infectious diseases such as HIV/AIDS, diarrheal diseases, malaria, and measles are among the top killers. But even so, in developing areas heart disease and stroke are also near the very top of the list.

the BIG picture

Growth, Development, and the Whole Body

Understanding basic concepts of human growth and development is essential for understanding the dynamic, ever-changing nature of the human body. It is important to remember that life is a biological process characterized by continuous change in the structure and function of our body.

As we discussed in this and earlier chapters, production of offspring is vital to the survival of the genetic code. Many biologists believe that this gives an important biological meaning to life in general—continued flow of genetic information from one generation to the next. Production of offspring in humans is not successful unless and until a person grows and develops for many years—more than a decade—to the point where viable gametes can be produced. Gametogenesis, then, is the first process necessary to ready the genetic material of the parent to be passed along to the offspring.

Once gametes are available, the sexual union of a male and female may result in fusion of the gametes of the two adults to form the first cell of the offspring. Thus genetic information from two different individuals is now united in a new and unique way in the zygote.

The first cell of the offspring—the zygote—quickly divides again and again to eventually produce a mass of cells that will hopefully implant in the wall of the mother's uterus. Then a process unlike any other we have discussed takes over. The offspring and mother biologically connect to each other so that the mother's physiological mechanisms can sustain the offspring until its own systems are developed sufficiently. All the mother's systems alter their function to some degree to maintain the homeostatic balance of both the mother and the offspring.

After many weeks of growth and development—including histogenesis and organogenesis of a full complement of human structures—delivery of the offspring occurs. This event marks the beginning of a continuing series of changes: infancy, childhood, puberty, adolescence, adulthood, senescence, and death.

At some point in adolescence or adulthood many of us have the opportunity to complete the "circle of life" by passing some of the genetic code we received from our parents on to yet another human generation.

MECHANISMS of DISEASE

DISORDERS OF PREGNANCY AND EARLY DEVELOPMENT

Implantation Disorders

A pregnancy has the best chance of a successful outcome, the birth of a healthy baby, if the blastocyst is implanted properly in the uterine wall. However, proper implantation does not always occur. Many offspring are lost before implantation occurs, often for unknown reasons. As mentioned in this chapter and the previous chapter, implantation outside the uterus results in an ectopic pregnancy. If the blastocyst implants in a region of endometriosis or normal peritoneal membrane, the pregnancy may be successful if there is room for the developing fetus to grow. Ectopic pregnancies that do succeed must be delivered by C-section rather than by normal vaginal birth. If an ectopic pregnancy occurs in a uterine tube, which cannot stretch to accommodate the developing offspring, the tube may rupture and cause life-threatening hemorrhaging. So-called **tubal pregnancies** are the most common type of ectopic pregnancy.

Occasionally, the blastocyst implants in the uterine wall near the cervix. This in itself may present no problem, but if the placenta grows too close to the cervical opening a condition called **placenta previa** (PREE-vee-ah) results. The normal dilation and softening of the cervix that occur in the third trimester often cause painless bleeding as the placenta near the cervix separates from the uterine wall. The massive blood loss that may result can be life-threatening for both mother and offspring (Figure 36-32, *A*).

Separation of the placenta from the uterine wall can occur even when implantation takes place in the upper part of the uterus. When this occurs in a pregnancy of 20 weeks or more, the condition is called **abruptio placentae** (ab-RUP-shee-oh plah-SEN-tay). Complete separation of the placenta causes the immediate death of the fetus. The severe hemorrhaging that often results, sometimes hidden in the uterus, may cause circulatory shock and death of the mother within minutes. A cesarean section and perhaps also a hysterectomy must be performed immediately to prevent blood loss and death (Figure 36-32, *B*).

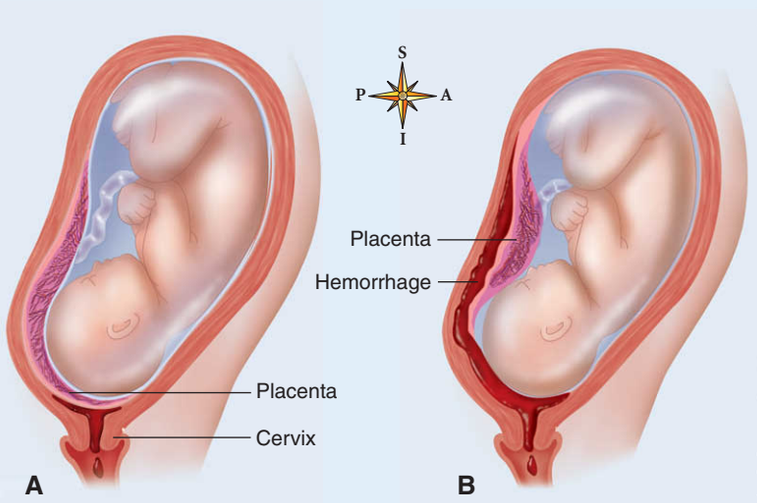

FIGURE 36-32

Implantation disorders. A, Placenta previa. **B,** Abruptio placentae.

PIH and Preeclampsia

It is not uncommon for a woman's blood pressure to rise during pregnancy and remain elevated until the end of pregnancy—a condition often called **pregnancy-induced hypertension (PIH).** In about 6% to 8% of all pregnancies, PIH may progress to a condition called **preeclampsia** (pree-eh-KLAMP-see-ah). Formerly known as *toxemia of pregnancy*, preeclampsia is a serious disorder characterized by the onset of acute hypertension after the twenty-fourth week, accompanied by proteinuria and edema. The causes of PIH and preeclampsia are largely unknown, but intense research efforts have led to the discovery of a gene that regulates how the kidney handles salt and that may also be involved in raising blood pressure during pregnancy. Preeclampsia can result in complications such as abruptio placentae, stroke, hemorrhage, fetal malnutrition, and low birth weight. This condition can progress to **eclampsia,** a life-threatening form of toxemia that causes severe convulsions, coma, kidney failure, and perhaps death of the fetus and mother.

Fetal Death

A **miscarriage** is the loss of an embryo or fetus before the twentieth week (or a fetus weighing less than 500 grams, or 1.1 pounds). Technically known as a **spontaneous abortion,** the most common cause of such a loss is a structural or functional defect in the developing offspring. Abnormalities of the mother, such as hypertension, uterine abnormalities, and hormonal imbalances, can also cause spontaneous abortions. After 20 weeks, delivery of a lifeless infant is termed a **stillbirth.**

Birth Defects

Birth defects, also called **congenital abnormalities,** include any structural or functional abnormality present at birth. Congenital defects may be inherited or may be acquired during gestation or delivery. Inherited defects are discussed in the next chapter. Acquired defects result from agents called **teratogens** (TER-ah-toh-jenz) that disrupt normal histogenesis and organogenesis. Some teratogens are chemicals such as alcohol, antibiotics, and other drugs. Microorganisms, such as those that cause rubella (a viral infection), can also cross the placental barrier and disrupt normal embryonic development. Radiation and other physical factors can also cause birth defects. Some teratogens are mutagens because they do their damage by changing the genetic code in cells of the developing embryo.

Postpartum Disorders

Puerperal (pyoo-ER-per-al) **fever,** or *child-bed fever,* is a syndrome of postpartum mothers characterized by bacterial infection that progresses to septicemia (blood infection) and possibly death. Until the

1930s, puerperal fever was the leading cause of maternal death—claiming the lives of more than 20% of postpartum women. Modern antiseptic techniques prevent most postpartum infections now. Puerperal infections that do occur are usually treated successfully by an immediate and intensive program of antibiotic therapy.

After a child is born, it needs the nourishment of milk to survive. However, several disorders of lactation (milk production) may occur to prevent a mother from nursing her infant. For example, anemia, malnutrition, emotional stress, and structural abnormalities of the breast can all interfere with normal lactation. **Mastitis** (mas-TYE-tis), or breast inflammation, often caused by infection, can result in lactation problems or production of milk contaminated with pathogenic organisms. In many cultures, the availability of other nursing mothers or breast milk substitutes allows proper nourishment of the infant, even when lactation problems develop. Most breast milk substitutes are formulations of milk from another mammal such as the cow. Infants who lack the enzyme *lactase* may not be able to digest the lactose present in human or animal milk, resulting in a condition called **lactose intolerance.** Infants with lactose intolerance are sometimes given a lactose-free milk substitute made from soy or other plant products.

CASE study

Carlos and his wife had been trying for years to have a baby with no success. After a visit to an infertility specialist, they found that Carlos had a low sperm count. After looking at all of their options, they decided to try an intrauterine insemination (IUI). A day or so after the procedure, although they didn't know it yet, Carlos' sperm had indeed found Maria's ova and had fused together, that is, the ova had been fertilized.

1. What is a newly fertilized ovum called?
   a. Zygote
   b. Embryo
   c. Fetus
   d. Blastocyst

2. How much time will elapse from fertilization to full implantation?
   a. 2 days
   b. 4 days
   c. 24 hours
   d. 10 days

At 13 weeks, an ultrasound is performed to make sure everything is going smoothly. Maria is looking at the screen and sees what appears to be two separate images. "Is that what I think it is?" she asks the technician. "Officially, the doctor has to tell you—but I can just let you watch the screen as I measure two heartbeats and make two sets of measurements," says the technician. "One boy and one girl."

3. What type of twins is Maria expecting?
   a. Maternal
   b. Fraternal
   c. Identical
   d. Sibling

At week 37, Maria starts feeling some slight contractions, but she passes them off as indigestion. Later that night though, she notices a thin, watery fluid leaking from her vagina, and the contractions are getting stronger. She wakes up Carlos, and they head to the birthing center.

4. What was the watery fluid Maria noted?
   a. Placental fluid
   b. Chorionic fluid
   c. Amniotic fluid
   d. Urine

INTRODUCTION

A. Prenatal period—period beginning with conception and ending at birth
B. Postnatal period—period beginning with birth and continuing until death
C. Human developmental biology—study of changes occurring during the cycles of life from conception to death

A NEW HUMAN LIFE

A. Production of sex cells—spermatozoa are produced by spermatogenesis; ova are produced by oogenesis
   1. Meiosis (Figures 36-1 and 36-2)
      a. Special form of cell division that reduces the number of chromosomes in each daughter cell to one half of those in the parent cell
      b. Mature ova and sperm contain only 23 chromosomes, half as many as other human cells
      c. Meiotic division—two cell divisions that occur one after another in succession
         (1) Meiotic division I and meiotic division II
         (2) Both divisions made up of an interphase, prophase, metaphase, anaphase, and telophase
      d. During prophase I of meiosis, "crossover" occurs in which genetic material is "shuffled"
      e. Daughter cells formed by meiotic division I contain a haploid number of chromosomes
      f. Meiotic division II—essentially the same as mitotic division; reproduces each of the two cells formed by meiotic division I and forms four cells, each with the haploid number of chromosomes
   2. Spermatogenesis (Figure 36-3)—process by which primitive male sex cells become transformed into mature sperm; begins at approximately puberty and continues throughout a man's life
      a. Meiotic division I—one primary spermatocyte forms two secondary spermatocytes, each with 23 chromosomes
      b. Meiotic division II—each of the two secondary spermatocytes forms a total of four spermatids
   3. Oogenesis (Figure 36-4)—process by which primitive female sex cells become transformed into mature ova
      a. Mitosis—oogonia reproduce to form primary oocytes; most primary oocytes begin meiosis and develop to prophase I before birth; there they stay until puberty
      b. Once during each menstrual cycle, a few primary oocytes resume meiosis and migrate toward the surface of the ovary; usually only one oocyte matures enough for ovulation, and meiosis again halts at metaphase II
      c. Meiosis resumes only if the head of a sperm cell enters the ovum
B. Ovulation and insemination
   1. Ovulation—expulsion of the mature ovum from the mature ovarian follicle, into the abdominopelvic cavity, and then into the uterine (fallopian) tube
   2. Insemination—expulsion of seminal fluid from the male into the female vagina; capacitation renders sperm able to fertilize; sperm travel through the cervix and uterus and into the uterine (fallopian) tubes
C. Fertilization—also known as *conception* (Figure 36-5)
   1. Most often occurs in the outer one third of the uterine tube
   2. Thermotaxis—sperm are attracted to warmth of uterine tubes
   3. Chemotaxis—ovum attracts and "traps" sperm with special molecules
   4. Acrosome reaction permits the release of enzymes that burrow through the outer layers of ovum (zona pellucida and corona radiata)
   5. When one spermatozoon enters the ovum, the ovum stops collecting sperm on its surface
   6. The sperm releases its nuclear chromosomes into the ovum; proteins and RNA from the sperm enter the ovum to assist with early development
   7. 23 chromosomes from the sperm head and 23 chromosomes in the ovum make up a total of 46 chromosomes
   8. Zygote—fertilized ovum; genetically complete

PRENATAL PERIOD

A. Begins with conception and continues until the birth of a child
B. Cleavage and implantation (Figure 36-6)—once zygote is formed, it immediately begins to divide
   1. Morula—solid mass of cells formed from zygote; takes approximately 3 days; continues to divide (Figure 36-7)
   2. Blastocyst—a hollow ball of cells that develops by the time the embryo reaches the uterus, where it implants into the uterine lining (Figure 36-8)
   3. A store of nutrients in the ovum supports embryonic development until implantation has occurred (approximately 10 days from fertilization to implantation)
   4. Blastocyst has an outer layer of cells and an inner cell mass
      a. Trophoblast—outer wall of the blastocyst
      b. Inner cell mass—as blastocyst develops, yolk sac and amniotic cavity are formed (Figure 36-9)
         (1) In humans, yolk sac's functions are largely non-nutritive
         (2) Amniotic cavity becomes a fluid-filled, shock-absorbing sac (bag of waters) in which the embryo floats during development (Figure 36-10)
      c. Chorion develops from trophoblast to become an important fetal membrane in the placenta
   5. Placenta (Figure 36-11)
      a. Anchors fetus to the uterus and provides a "bridge" for the exchange of nutrients and waste products between mother and baby

b. Also serves as an excretory, respiratory, and endocrine organ
c. Placental tissue normally separates maternal and fetal blood supplies
d. Has important endocrine functions—secretes large amounts of hCG, which stimulate the corpus luteum to continue its secretion of estrogen and progesterone (Figure 36-12)

C. Periods of development (Figures 36-13 to 36-15)
1. Gestation period—approximately 39 weeks; divided into three 3-month segments called trimesters
2. Embryonic phase extends from fertilization until the end of week 8 of gestation
3. Fetal phase—weeks 8 to 39

D. Stem cells
1. Stem cell—unspecialized cell that produces lines of specialized cells; has a certain level of potency (range of types it can produce)
2. Totipotent stem cell—can produce any type of cell; found in zygote
3. Pluripotent stem cell—embryonic stem cell that can produce a broad range of cell types; found in embryonic germ layers
4. Multipotent stem cell—adult stem cell found in some tissues can produce a few cell types and thus maintain functional populations of specialized cells

E. Formation of the primary germ layers
1. Three layers of developmental cells arise early in the first trimester of pregnancy
2. Cells of embryonic disk differentiate and form each of the three primary germ layers
3. Each of the three primary germ layers gives rise to specific organs and systems of the body (Figure 36-16)
a. Endoderm—inside layer
b. Ectoderm—outside layer
c. Mesoderm—middle layer

F. Histogenesis and organogenesis (Figure 36-16)
1. Histogenesis—process by which primary germ layers develop into different kinds of tissues
2. Organogenesis—how tissues arrange themselves into organs
3. Differentiation and development of the reproductive systems are an example
a. Reproductive tract (Figure 36-17)
(1) Gonads attach to mesonephric (wolffian) ducts, which become the male reproductive tract
(2) Gonads (unattached) and paramesonephric (müllerian) ducts develop into the female reproductive tract
b. External genitals (Figure 36-18)
(1) In the male, the genital tubercle eventually becomes the glans of the penis and the folds become the penis shaft and scrotum
(2) In the female, the genital tubercle becomes the clitoris and the folds become the labia

BIRTH, OR PARTURITION

A. Transition between prenatal and postnatal periods of life
B. Cortisol triggers labor by reducing hCG and thus also progesterone, removing the "brake" on OT, which stimulates the uterine muscles to produce labor contractions (amplified by a positive feedback effect); PGs enhance OT's effects
C. Stages of labor (Figure 36-20)
1. Stage one—period from onset of uterine contractions until cervical dilation is complete
2. Stage two—period from maximal cervical dilation until the baby exits through the vagina
3. Stage three—process of expulsion of the placenta through the vagina
D. Multiple births—birth of two or more infants from the same pregnancy; twins are most common (Figure 36-21)
1. Identical twins result from the splitting of embryonic tissue from the same zygote early in development
2. Fraternal twins result from the fertilization of two different ova by two different spermatozoa

POSTNATAL PERIOD

A. Begins at birth and continues until death; commonly divided into a number of periods (Figure 36-22)
B. Infancy begins at birth and lasts until approximately 18 months
1. Neonatal period—first 4 weeks of infancy; dramatic changes occur at a rapid rate (Figure 36-23)
2. Changes allow the infant to become totally self-supporting, especially the respiratory and cardiovascular systems (Figure 36-24)
3. Apgar score assesses general condition of a newborn infant
C. Childhood extends from end of infancy to sexual maturity, or puberty
1. Early childhood—growth continues at a rapid pace but month-to-month gains are less consistent
2. By age 6 years, child looks more like a preadolescent than an infant or toddler
3. Nervous and muscular systems develop rapidly during the middle years of childhood
4. Deciduous teeth are lost during childhood, beginning at approximately 6 years of age
5. Permanent teeth have erupted by age 14 years, except for the third molars (wisdom teeth)
D. Adolescence and adulthood
1. Adolescence is considered to be the teenage years (from 13 to 19); marked by rapid and intense physical growth, resulting in sexual maturity
a. Puberty—stage of adolescence during which a person becomes sexually mature
b. Changes triggered by increases in reproductive hormones (Figure 36-25)
c. Primary sexual characteristics—maturation of gonads and reproductive tract
d. Secondary sexual characteristics—fat and hair distribution, skeletal changes, etc. (Figure 36-26)

2. Adulthood—characterized by maintenance of existing body tissues

E. Older adulthood and senescence
1. As a person grows older, a gradual decline occurs in every major organ system in the body
2. Gerontologists theorize a number of different aging mechanisms, all of which may be involved in the processes of aging
   a. Limit on cell reproduction
   b. Environmental factors
   c. Viruses
   d. Aging genes
   e. Degeneration of mitochondria—perhaps associated with progressive damage by oxygen free radicals (Figure 36-27)

EFFECTS OF AGING

A. Common degenerative changes frequently characterize senescence (Figure 36-28)
B. Skeletal system (Figure 36-29)
1. Bones decrease in BMD (bone mineral density) and thus change in texture, degree of calcification, and shape
2. Lipping occurs, which can limit range of motion
3. Decreased bone size and density lead to increased risk of fracture
4. Decreased BMD can be avoided (at least partly) by exercise and adequate calcium intake

C. Muscular system (Figure 36-30)
1. Muscle mass decreases to about 90% by age 50 years and around 50% by age 80 years
2. The number of muscle fibers decreases as we age but can be offset by an increase in muscle fiber size through exercise
3. Ratio of "fast" to "slow" functioning in muscle fibers decreases, slowing the function of muscle organs

D. Integumentary system (skin)
1. Skin becomes dry, thin, and inelastic
2. Pigmentation changes and thinning hair are common problems associated with aging

E. Urinary system
1. Number of nephron units in the kidney decreases by almost 50% between the ages of 30 and 75 years
2. Decreased blood flow through kidneys reduces overall function and excretory capacity
3. Diminished muscle tone in bladder results in decreased capacity and inability to empty, or void, completely

F. Respiratory system
1. Costal cartilages become calcified
2. Respiratory efficiency decreases
3. Decreased strength of respiratory muscles

G. Cardiovascular system
1. Degenerative heart and blood vessel disease—one of the most common and serious effects of aging
2. Atherosclerosis—buildup of fatty deposits on blood vessel walls narrows the passageway for blood
3. Arteriosclerosis—"hardening" of the arteries
4. Hypertension—high blood pressure

H. Special senses
1. Sense organs—gradual decline in performance and capacity with aging
2. Presbyopia—farsightedness caused by hardening of lens
3. Cataract—cloudy lens, which impairs vision
4. Glaucoma—increased pressure within the eyeball; if left untreated, often results in blindness
5. Decreased hearing
6. Decreased taste

I. Reproductive systems
1. Mechanism of sexual response may change
2. Fertility decreases
3. In females, menopause occurs between ages 45 and 60 years

J. Benefits of aging—mostly improved brain functions: less anxious or fearful, less resistant to happiness, better interpretation of visual information, improved problem solving and wisdom

CAUSES OF DEATH

A. In developed countries such as the United States, heart disease, cancer, and stroke (cerebrovascular accident [CVA]) are among the leading causes of death (Figure 36-31)
B. In developing countries, heart disease and stroke are also leading causes of death, along with infectious diseases such as HIV/AIDS, diarrheal disorders, and malaria

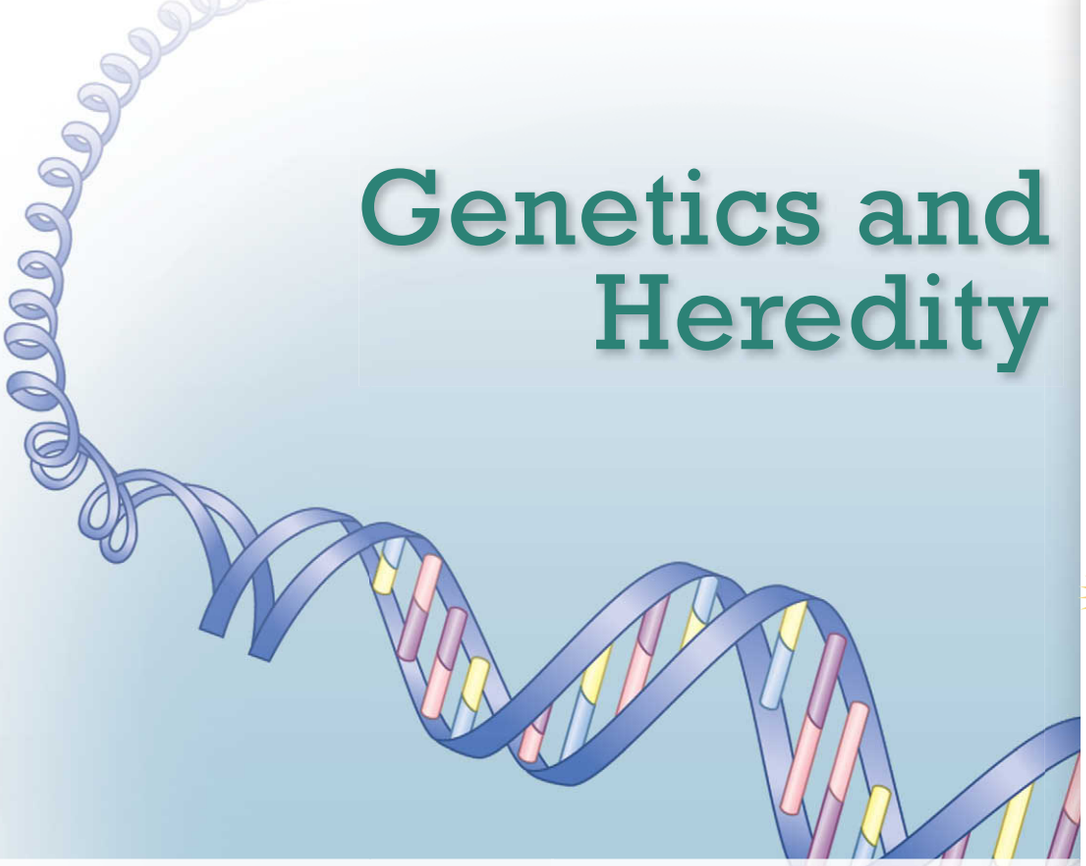
REVIEW QUESTIONS

Write out the answers to these questions after reading the chapter and reviewing the Chapter Summary. If you simply think through the answer without writing it down, you won't retain much of your new learning.

1. Define the terms *developmental biology*, *growth*, and *development*.
2. Outline the major steps in spermatogenesis. Do the same for oogenesis.
3. Identify the two processes necessary to bring the sperm and ovum into proximity with each other.
4. During fertilization, how does the ovum attract sperm?
5. At what developmental stage does implantation occur?
6. Describe the structural differences between a morula and a blastocyst.
7. How does the placenta develop?
8. What functions does the placenta provide?
9. Outline the hormonal levels of human chorionic gonadotropin (hCG), estrogen, and progesterone at various stages during gestation.
10. During what period of growth is the term *embryo* replaced by the term *fetus*?
11. List the various structures derived from each of the three primary germ layers.
12. Explain the three stages of labor.
13. What is the difference between identical and fraternal twins?

14. From birth to maturity, how does the size of the head compare with the rest of the body?
15. What are the time spans of the following postnatal periods: infancy, childhood, adolescence?
16. During what postnatal period do the secondary sex characteristics develop? What initiates this development?
17. What structural changes may result from the changes in bone calcification because of aging?
18. Define the terms *atherosclerosis*, *arteriosclerosis*, and *hypertension*.
19. Identify and describe the most serious age-related eye disorder.

CRITICAL THINKING QUESTIONS



After finishing the Review Questions, write out the answers to these more in-depth questions to help you apply your new knowledge. Go back to sections of the chapter that relate to concepts that you find difficult.

1. How is the process of meiosis different from mitosis?
2. If a diploid cell rather than a haploid cell were used for human reproduction, what would the number of chromosomes per cell be after three generations?
3. How do histogenesis and organogenesis differ? Which of these occurs first in development?
4. Explain the procedure a physician might use if a normal vaginal delivery would be dangerous for the mother or baby.
5. What are the symptoms of the drop in estrogen that occurs during menopause? To what skeletal disorder might this drop be related?
6. Explain the process of in vitro fertilization. What is the probability of the success of this procedure, that is, resulting in a full-term birth?
7. Using physiological principles, explain how a sound exercise program can reduce some of the common effects of aging.

Genetics and Heredity

continued on p. 1149

*It seems that today we are hearing more and more about the importance of **genetics,** the scientific study of inheritance, to all fields of human biology—especially anatomy, physiology, and medicine. Popular news magazines are running story after story on the revolution in treating fatal inherited disorders by using something called gene therapy. Health and science columns in newspapers keep us informed of the latest discoveries of genes involved with disease, human behavior, and even longevity. Television programs outline the progress of the largest coordinated biological quest that anyone can remember: mapping the entire human genetic code and listing all the proteins encoded there. Even commercial ads call attention to genetic health risks. Clearly, one cannot be informed about human biology today without some knowledge of basic genetics and heredity. In this chapter, we briefly review the essential concepts of genetics and explain how heredity affects every structure and function in the body.*

THE SCIENCE OF GENETICS

History shows that humans have been aware of patterns of inheritance—or *heredity*—for thousands of years, but it was not until the 1860s that the scientific study of these patterns—genetics—was born. At that time, a monk living in Brno, Moravia (now the Czech Republic) became the first to discover the basic mechanism by which traits are transmitted from parents to offspring. That man, Gregor Mendel, proved that independent units (which we now call **genes**) are responsible for the inheritance of biological traits.

The science of genetics developed from Mendel's quest to explain how normal biological characteristics are inherited. As time went by and more genetic studies were done, it became clear that certain diseases also have a genetic basis. As you may recall from Chapter 1, some diseases are inherited directly. For example, the group of blood-clotting disorders called *hemophilia* can be inherited by children from parents who have the genetic code for hemophilia. Directly inherited diseases are often called "hereditary diseases." Other diseases are only partly determined by genetics—that is, they involve genetic risk factors (Chapter 1, pp. 25–27). For example, certain forms of skin cancer are thought to have a genetic basis. A person who inherits the genetic code associated with skin cancer will develop the disease only if the skin is also heavily exposed to the ultraviolet radiation in sunlight.

CHROMOSOMES AND GENES

Mechanism of Gene Function

Mendel proposed that the genetic code is transmitted to offspring in discrete, independent units that we now call genes. Recall from Chapters 2 and 4 that each gene is a sequence of nucleotide bases in the deoxyribonucleic acid (DNA) molecule.

Figure 37-1 shows a detailed view of human DNA. Beginning at the left of the diagram, you can see a fully condensed **chromosome** unfold toward the right, where a single double-helix strand of DNA is visible. As the genetic codes of a DNA molecule's genes are being actively transcribed in a cell's nucleus, the DNA is in the threadlike form called **chromatin.** Chromatin, as you can see in Figure 37-1, is actually a thread of DNA wound around little spools made of proteins called **histones.** The chromatin is thus organized into little "thread on spool" subunits called **nucleosomes.**

During cell division, each replicated strand of chromatin coils on itself to form a compact chromosome (see Figure 37-1). Each DNA molecule can be called either a chromatin strand or a chromosome, depending on what form it is in. Throughout this chapter we will use the term *chromosome* for DNA, regardless of its actual form, and the term *gene* for each distinct encoding segment within a DNA molecule.

| A&P CONNECT |

In nondividing cells, chromosomes are found in the form of chromatin strands that occupy specific **chromosome territories (CTs)** within the nucleus. See an example of a CT map in ***Chromosome Territories*** online at ***A&P Connect.***

evolve

Each gene in a chromosome contains a genetic code that the cell transcribes to a ribonucleic acid (RNA) molecule (see Box 5-2 on p. 120). Some RNA molecules do not code for polypeptides but have a functional role—for example, ribosomal RNA (rRNA) and transfer RNA (tRNA). A transcribed messenger RNA (mRNA) molecule, however, associates with a ribosome in which the code is translated to form a specific polypeptide molecule. By way of slight differences in editing of mRNA, one mRNA may perhaps actually produce several specific polypeptides. And the polypeptides may be complete tertiary proteins by themselves—or they may combine with any of several other polypeptides to form several different specific large quaternary proteins (see Figure 2-28 on p. 54).

Many of the protein molecules formed from the polypeptides encoded by genes are *enzymes*, functional proteins that help regulate the various metabolic pathways of the body by catalyzing specific chemical reactions. Because enzymes and other functional proteins such as hemoglobin regulate the biochemistry of the body, they regulate the entire structure and function of the body. Some proteins, such as collagen and keratin, are important structural components of the body—and thus determine important structural characteristics of various body parts.

As you can see, genes determine the structure and function of the human body by producing a set of specific structural proteins, along with many functional proteins and RNA molecules.

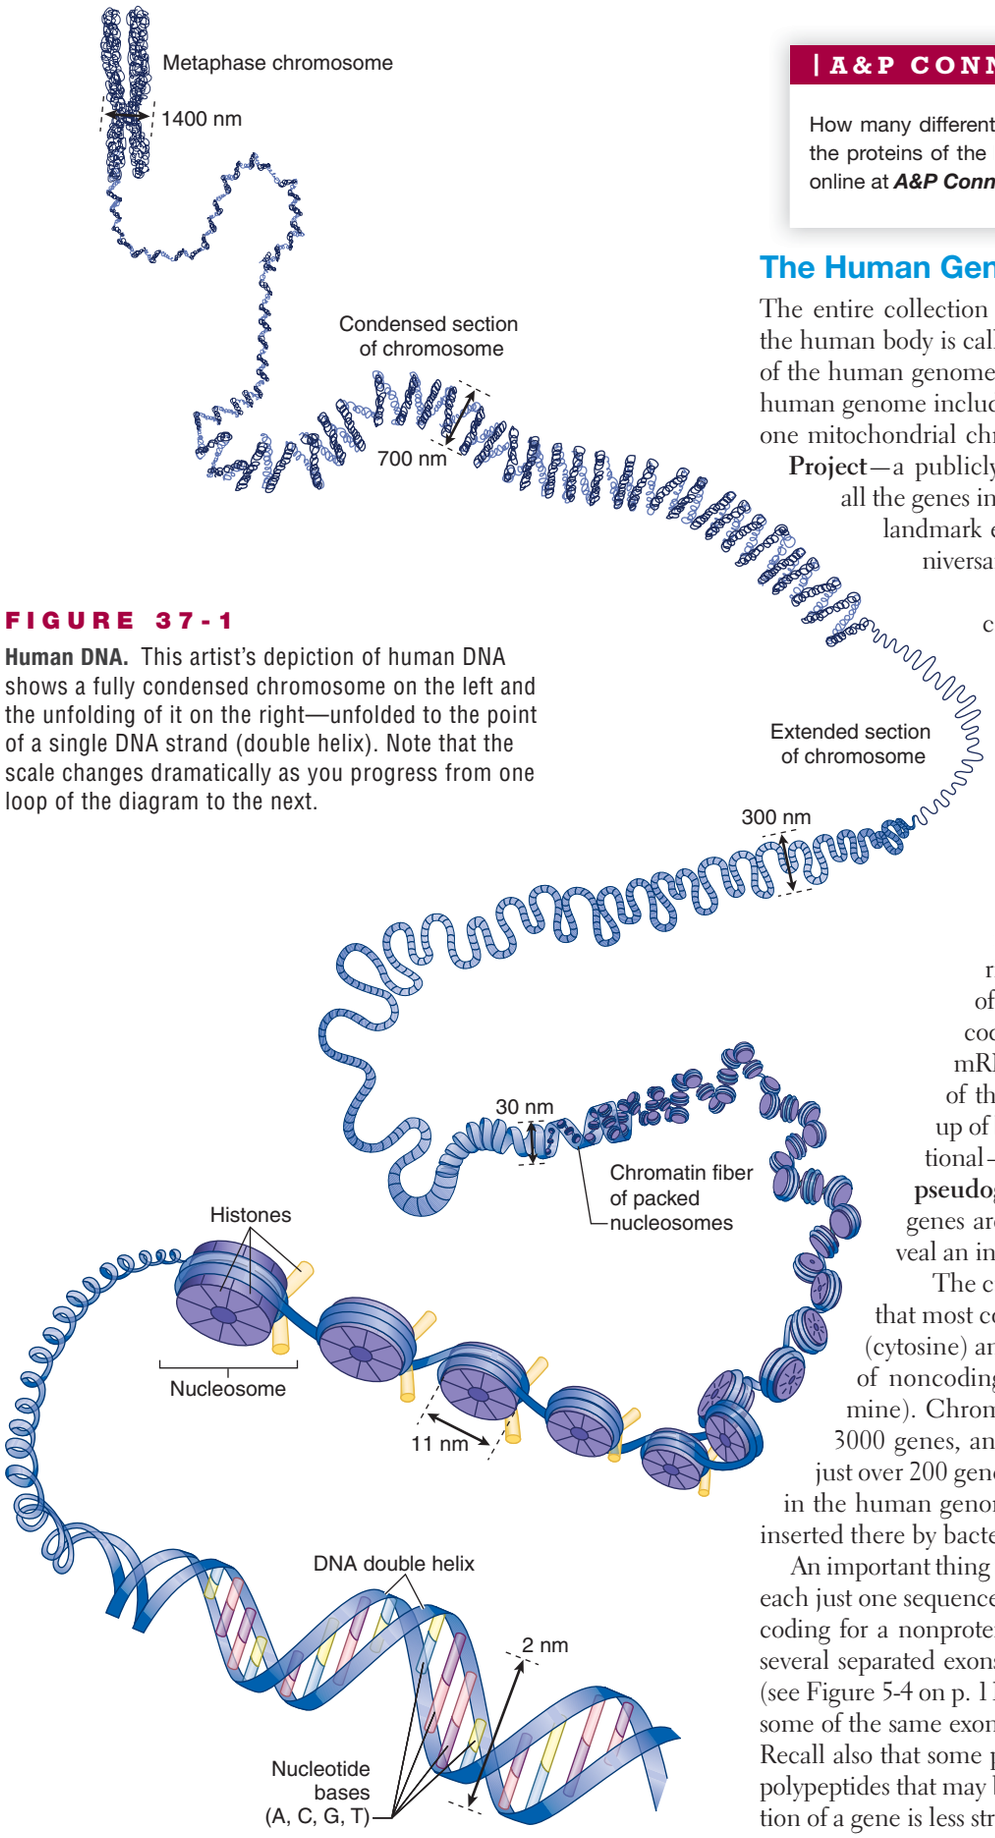

FIGURE 37-1

Human DNA. This artist's depiction of human DNA shows a fully condensed chromosome on the left and the unfolding of it on the right—unfolded to the point of a single DNA strand (double helix). Note that the scale changes dramatically as you progress from one loop of the diagram to the next.

How many different kinds of amino acids are needed to form the proteins of the body? Find out in ***Amazing Amino Acids*** online at ***A&P Connect.***

evolve

The Human Genome

The entire collection of genetic material in each typical cell of the human body is called the **genome** (JEE-nome). The structure of the human genome is summarized in Figure 37-2. The typical human genome includes 46 individual nuclear chromosomes and one mitochondrial chromosome. In 2003, the **Human Genome Project**—a publicly funded, worldwide collaboration to map all the genes in the human genome—was completed. This landmark event coincided exactly with the fiftieth anniversary of the discovery of DNA.

We now know that the human genome contains only about 20,000 to 25,000 genes. This is about one fifth to one quarter of the number originally estimated. Amazingly, it is roughly the same number of genes as in a rat or mouse—and only about one and one-half times as many genes as in a fruit fly!

We also know that less than 2% of the DNA carries protein-coding genes. A bit more of the DNA carries code for functional RNAs, such as rRNA, tRNA, and ribozymes (see Figure 5-2 on p. 115). Most of the rest of the DNA is often called "junk" code that is either not used or is edited out of mRNA before it is used to make proteins. Some of this noncoding DNA may actually be made up of broken bits of genes that are no longer functional—remnants of our evolutionary past. Termed **pseudogenes,** these bits of formerly functional genes are like genetic fossils that have begun to reveal an interesting history of our genetic past.

The current draft of the human genome shows us that most coding genes tend to lie in clusters rich in C (cytosine) and G (guanine), separated by long stretches of noncoding DNA rich in A (adenine) and T (thymine). Chromosome 1 has the most genes, with nearly 3000 genes, and the Y chromosome has the fewest, with just over 200 genes. Hundreds of the newly discovered genes in the human genome seem to be bacterial in origin, perhaps inserted there by bacteria in our distant ancestors.

An important thing to remember about genes is that they are not each just one sequence that codes for one protein. Besides possibly coding for a nonprotein such as RNA, each gene is made up of several separated exons that join together before protein synthesis (see Figure 5-4 on p. 116). In some cases, different combinations of some of the same exons can make up genes for different products. Recall also that some proteins are quaternary proteins made up of polypeptides that may be made from different genes. So the definition of a gene is less straightforward than it first appears!

Although we now have the essential picture of the details of the human genome, much work still lies ahead in the field of **genomics** (jeh-NOM-iks), the analysis of the genome's code. Besides filling in the remaining details of the rough draft, we have much work to do in discovering all the possible mutations that might exist (see the discussion later in this chapter) and all the proteins encoded by the genes that make up the human genome (Box 37-1).

In fact, this quest has generated several other fields related to the genetic code. For example, **transcriptomics** (transkript-OHM-iks) is the analysis of all the mRNA codes actually transcribed from the human genome—the **transcriptome** (tran-SKRIPT-ome). This field may eventually shed light on which genes are expressed and under what conditions.

A field called **proteomics** (pro-tee-OH-miks) is the analysis of the proteins encoded by the genome. The entire group of proteins encoded by the human genome is called the human **proteome** (PRO-tee-ohm). The ultimate goal of proteomics is to understand the role of each protein in the body. Understanding the roles of every single protein in the body will certainly go a long way toward improving our knowledge of the normal function of the body as well as mechanisms for many diseases.

The analysis of the human genome, transcriptome, and proteome has surged forward recently with the widespread use of *RNA interference (RNAi)* techniques that silence particular genes in the laboratory setting as a means to find out what they do in the body—what proteins are transcribed from them.

Another proven technique that "knocks out" individual genes has been used for some time to demonstrate the effects of specific genes. Using embryonic stem cells from laboratory mice in which specific genes are targeted and disabled, a generation of genetically altered "knockout mice" can be produced. The mice are then studied to find out the effects of the gene(s) missing from the mouse genome.

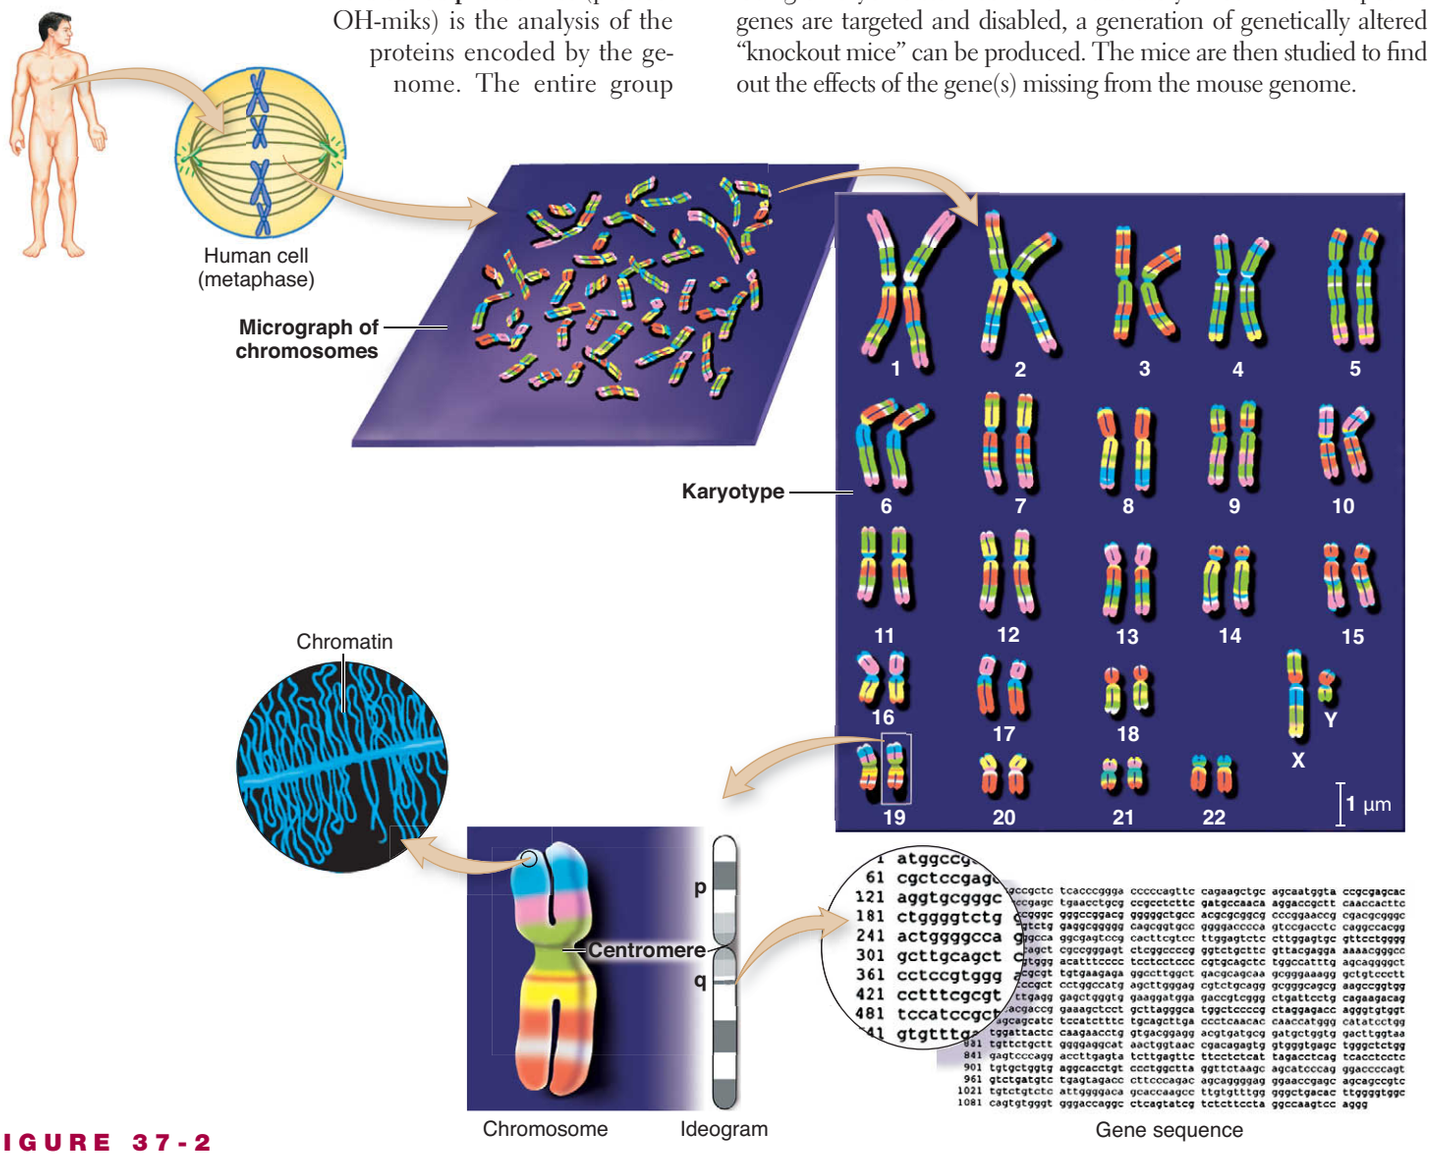

FIGURE 37-2

Human genome. A cell taken from the body is stained and photographed. A photograph of nuclear chromosomes is then cut and pasted, arranging each of the 46 chromosomes into numbered pairs of decreasing size to form a chart called the karyotype. Each chromosome is a coiled mass of chromatin (DNA). In this figure, differentially stained bands in each chromosome appear as different, bright colors. Such bands are useful as reference points when identifying the locations of specific genes within a chromosome. The staining bands are also represented on an ideogram, or simple graph, of the chromosome as reference points to locate specific genes. The genes themselves are usually represented as the actual sequence of nucleotide bases, abbreviated as *a, c, g,* and *t.* In this figure, the sequence of one exon (segment) of a gene called *GPI* from chromosome 19 is shown. Each of the different images in this figure can be thought of as a different type of "genetic map."

Box 37-1 | FYI

1000 Genomes Project

An international research partnership sponsored in part by the United States government is currently building a catalog of at least 1000 individual human genomes. This effort, called the *1000 Genomes Project,* promises to reveal the many variant forms of genes present in the whole human genome. Although over a thousand complete individual genomes have already been cataloged—most notably the genomes of gene pioneers Craig Venter and James Watson—much more information is needed. The initial goal to is study about 2500 individual genomes from 25 different populations. The project catalogs the many small DNA-coding variations called *single nucleotide polymorphisms (SNPs)* as well as the larger structural variations in the human genome. Such information could lead to better understanding of the genetic basis of disease—and ultimately to effective treatments or cures.

Information obtained about the human genome can be expressed in a variety of ways. As you can see in Figure 37-2, an **ideogram** (ID-ee-oh-gram), or simple cartoon of a chromosome, is often used in genomics to show the overall physical structure of a chromosome. The constriction in the ideogram shows the relative position of the chromosome's centromere. The shorter segment of the chromosome is called the **p-arm** and the longer segment is called the **q-arm.**

The bands in an ideogram of a chromosome show staining landmarks and help identify the regions of the chromosome. Sometimes physical maps of genes will show exact positions of individual genes on the p-arm and q-arm of a chromosome. A more detailed representation of a gene would show the actual sequence of nucleotide bases, abbreviated *a*, *c*, *g*, and *t* for *adenine*, *cytosine*, *guanine*, and *thymine*, as shown in Figure 37-2.

Distribution of Chromosomes to Offspring

MEIOSIS

Each cell of the human body contains 46 chromosomes. The only exceptions to this principle are the **gametes**—male *spermatozoa* and female *ova*. Recall from Chapter 36 that a special form of nuclear division called **meiosis** (see Figure 36-1 on p. 1098) produces gametes with only 23 chromosomes—exactly one half the usual number. This number is called the **haploid** number. This process follows a basic principle of genetics first discovered by Gregor Mendel called the **principle of segregation.** This principle simply states that the two members of a pair of chromosomes separate, or *segregate*, during meiosis.

When a sperm (with its 23 chromosomes) unites with an ovum (with its 23 chromosomes) at conception, a *zygote* with 46 chromosomes is formed. Thus the zygote has the same number of chromosomes (46, the **diploid** number) as each typical body cell in the parents.

As the karyotype in Figure 37-2 shows, the 46 human chromosomes can be arranged in 23 pairs according to size. One pair called the **sex chromosomes** may not match, but the remaining 22 pairs of **autosomes** always appear to be nearly identical to each other.

PRINCIPLE OF INDEPENDENT ASSORTMENT

Because one half of an offspring's chromosomes are from the mother and one half are from the father, a unique blend of inherited traits is formed. According to another of Mendel's principles, each chromosome assorts itself independently during meiosis. This **principle of independent assortment** states that as sperm are formed, and chromosome pairs separate (the principle of segregation), the maternal and paternal chromosomes get mixed up and redistribute themselves independently of the other chromosome pairs (Figure 37-3). Thus each sperm is likely to have a *different* set of

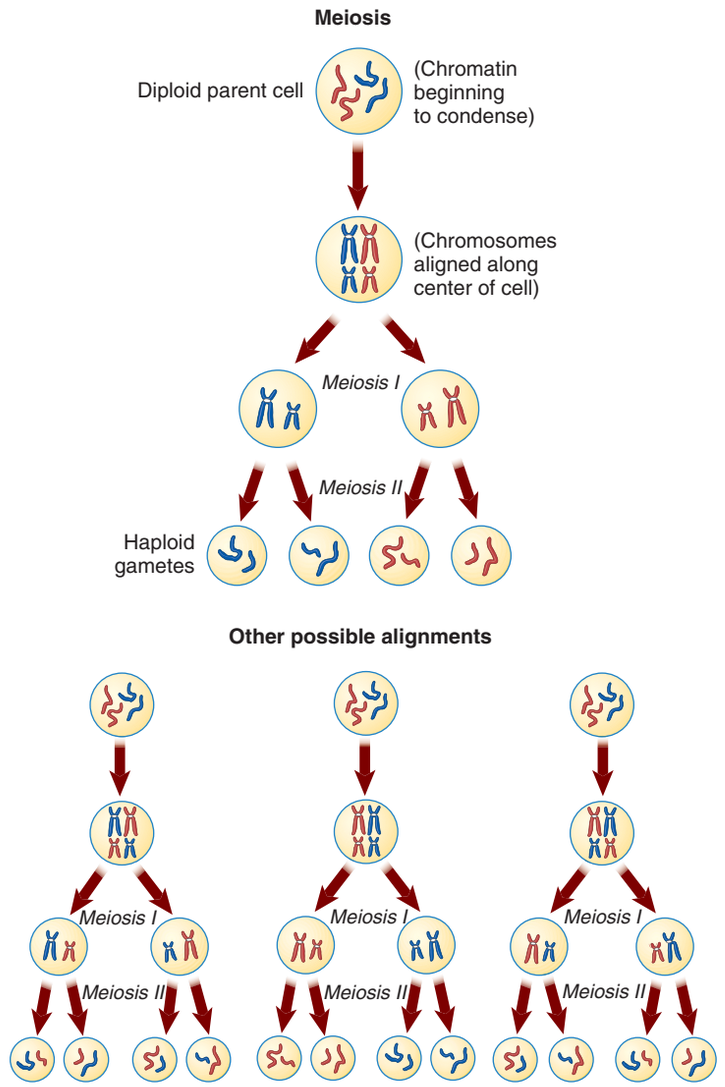

FIGURE 37-3

Meiosis and the principle of independent assortment. In meiosis, a series of two divisions results in the production of gametes with one half the number of chromosomes of the original parent cell. In both meiotic divisions shown here, the original cell has four chromosomes and the gametes each have two chromosomes. During the first division of meiosis, pairs of similar chromosomes line up along the cell's equator for even distribution to daughter cells. Because different pairs assort independently of each other, four (2^2) different alignments of chromosomes can occur. Because human cells have 23 pairs of chromosomes, more than 8 million (2^{23}) different combinations are possible.

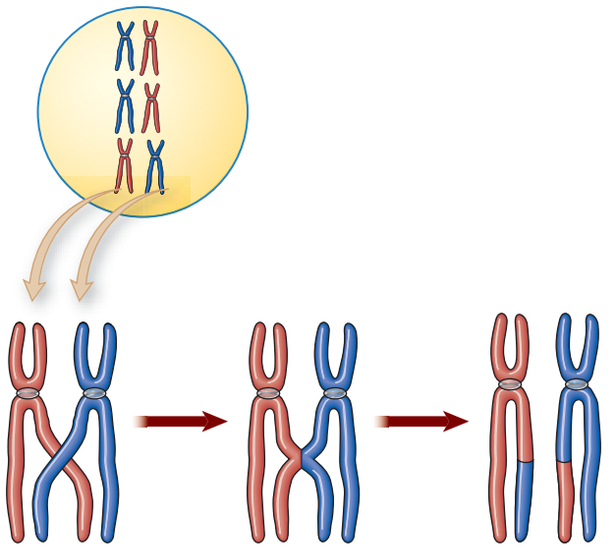

FIGURE 37-4

Crossing over. Genes (or linked groups of genes) from one chromosome are exchanged with matching genes in the other chromosome of a pair during meiosis.

23 chromosomes. Because the ova are formed in the same manner, each ovum is likely to be genetically different from the ovum that preceded it. Independent assortment of chromosomes ensures that each offspring from a single set of parents is very likely to be genetically unique—a phenomenon known as *genetic variation.*

According to the principle of **gene linkage,** genes on an individual chromosome tend to stay together. An important application of this principle occurs during one phase of meiosis, when pairs of matching chromosomes line up along the equator of the cell and exchange genes or groups of linked genes with one another. This process is called **crossing over** because genes from a particular location cross over to the same location on the matching chromosome (Figure 37-4). Crossing over introduces additional opportunities for genetic variation among the offspring of a single set of parents.

When one considers the genetic variation that is produced by independent assortment and crossing over, it is easy to understand the tremendous variation seen in the human population.

| QUICK CHECK |

1. How do genes produce biological traits?
2. Who might be considered the founder of the scientific study of genetics?
3. What is the difference between an autosome and a sex chromosome?
4. List some mechanisms that increase genetic variation among human offspring.

GENE EXPRESSION

Hereditary Traits

DOMINANT AND RECESSIVE TRAITS

Mendel discovered that the genetic units we now call genes may be expressed differently among individual offspring. After rigorous experimentation with pea plants, he discovered that each inherited trait is controlled by two sets of similar genes, one from each parent. Each autosome in a pair matches its partner in the type of genes it contains. In other words, if one autosome has a gene for hair color, its partner will also have a gene for hair color—in the same location on the autosome. Although both genes specify hair color, they may not specify the *same* hair color. Mendel discovered that some genes are *dominant* and some are *recessive.* A **dominant gene** is one whose effects are seen and whose effects are capable of masking the effects of a **recessive gene** for the same trait.

Consider the example of **albinism,** a total lack of melanin pigment in the skin and eyes (Figure 37-5). Because people with this condition lack dark pigmentation, they have difficulty seeing in bright light and must avoid direct sunlight to protect themselves from burns. The genes that cause albinism are recessive; the genes that cause normal melanin production are dominant. By convention, dominant genes are represented by uppercase letters and recessive genes by lowercase letters. One can represent the gene for albinism as *a* and one of the genes for normal skin pigmentation as A. An individual with the gene combination AA has two dominant genes—and so will exhibit a normal skin color. The code AA is called a **genotype.** A person with a genotype of two identical forms of a trait is said to be **homozygous** (from *homo-*, "same," and *-zygo*, "joined") for that trait.

FIGURE 37-5

Albinism. There are several forms of albinism in humans. The type shown here, tyrosinase-negative oculocutaneous albinism, results from the inheritance of two abnormal genes for tyrosinase—the enzymes required to convert tyrosine to melanin pigments. Melanin is normally present in the skin as well as in the eye, where its absence produces vision problems that include sensitivity to light. This African woman would otherwise have dark skin, dark hair, and normal vision. However, as she looks away from the bright camera light as she is photographed, you can see the abnormally light hair and skin typical of this type of albinism.

The manner in which a genotype is expressed is called the **phenotype.** Thus a person who is homozygous dominant (*AA*) for skin color will have a normal phenotype (i.e., normal skin pigmentation). Someone with the gene combination *Aa* will also have normal skin color because the normal gene *A* is dominant over the recessive albinism gene *a*. A person with genotype *Aa* is said to be **heterozygous** (from *hetero-*, "different," and *-zygo*, "joined") and will express the normal phenotype. Only a person with the homozygous recessive genotype of *aa* will have the abnormal phenotype, albinism, because there is no dominant gene to mask the effects of the two recessive genes.

In the example of albinism, a person with the heterozygous genotype of *Aa* is said to be a genetic **carrier** of albinism. This means that the person can transmit the albinism gene, *a*, to offspring. Thus two normal parents, each having the heterozygous genotype *Aa*, can produce both normal children and children who have albinism (Figure 37-6).

POLYGENIC TRAITS

It is important to note that melanin pigmentation in human skin is actually governed by several different pairs of genes. The gene for the form of albinism discussed here, *tyrosinase-negative oculocutaneous albinism*, involves just one of the gene pairs that regulate skin color. Inherited characteristics, such as skin color and height, which are determined by the combined effect of many different gene pairs, are often called **polygenic** ("many genes") traits to distinguish them from **monogenic,** or single-gene, traits.

Polygenic traits are often hard to study in the phenotype because they are so variable. You can think of a polygenic trait as a "combined trait" because it results from the combined activity of several different genes. Each gene may be dominant or recessive in character. Because each gene is only one of several that govern the combined trait, however, the phenotype may be any of a large number of different variations of the trait. Using skin color as an example, the form of albinism described above involved only one of several genes that govern pigmentation of the skin and eyes. But that one gene is critical; it negates the effects of all the other genes that govern skin color. However, if the dominant form of that critical gene is in place, then it is possible for variations in any of the other genes that regulate skin color to exert influence on skin pigmentation.

CODOMINANT TRAITS

What happens if two different dominant genes occur together? Suppose there is a gene A^1 for light skin and a gene A^2 for dark skin. In a form of dominance called **codominance,** they will simply have equal effects, and a person with the heterozygous geno-type A^1A^2 will exhibit a phenotype of skin color that is something between light and dark. Recall from Chapter 20 (Box 20-2, p. 602) that the genes for sickle cell anemia behave this way. A person with two sickle cell genes will have *sickle cell anemia*, whereas a person with one normal gene and one sickle cell gene will have a milder form of the disease called *sickle cell trait*.

The case of sickle cell inheritance is a good example of how the mechanism of codominance works. The hemoglobin molecules within all red blood cells (RBCs) are quaternary proteins that each include four polypeptide chains—two alpha chains and two beta chains (see Figure 20-5 on p. 602). The sickle cell gene is actually an abnormal version of the gene that contains the code for the beta chains of the hemoglobin molecule. Any beta chain that is produced by this code has one (of 146) amino acid replaced by the wrong amino acid—making it different enough to drastically alter its function. The RBCs of a person with one sickle cell gene and one normal beta-chain gene contain hemoglobin in which about one half the total number of beta chains are abnormal and about one half are normal. The RBCs of a person with two sickle cell genes contain hemoglobin in which all the beta chains are abnormal. Thus in sickle cell trait only some hemoglobin molecules are defective, but in sickle cell anemia *all* of the hemoglobin molecules are defective.

The frequency of occurrence of the abnormal sickle cell gene is an example of an interesting epidemiological phenomenon. Because sickle cell trait provides resistance to the parasite that causes the most deadly form of **malaria** (*Plasmodium falciparum* malaria), sickle cell disorders persist in areas of the world in which

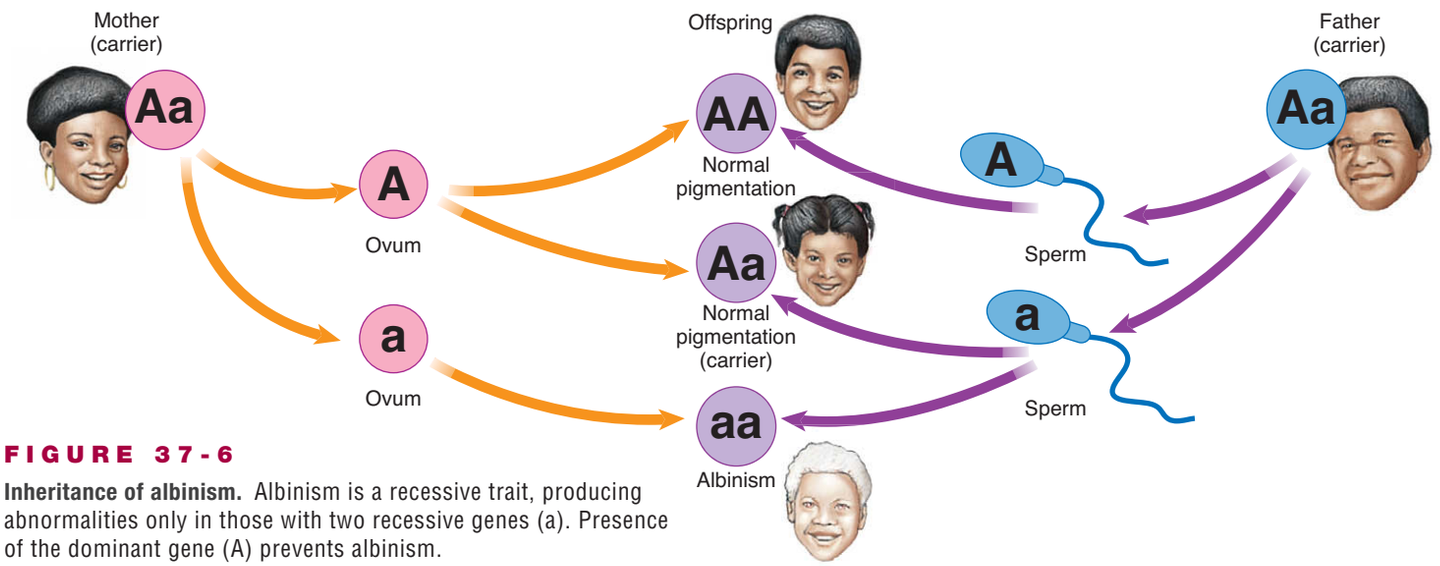

FIGURE 37-6

Inheritance of albinism. Albinism is a recessive trait, producing abnormalities only in those with two recessive genes (a). Presence of the dominant gene (A) prevents albinism.

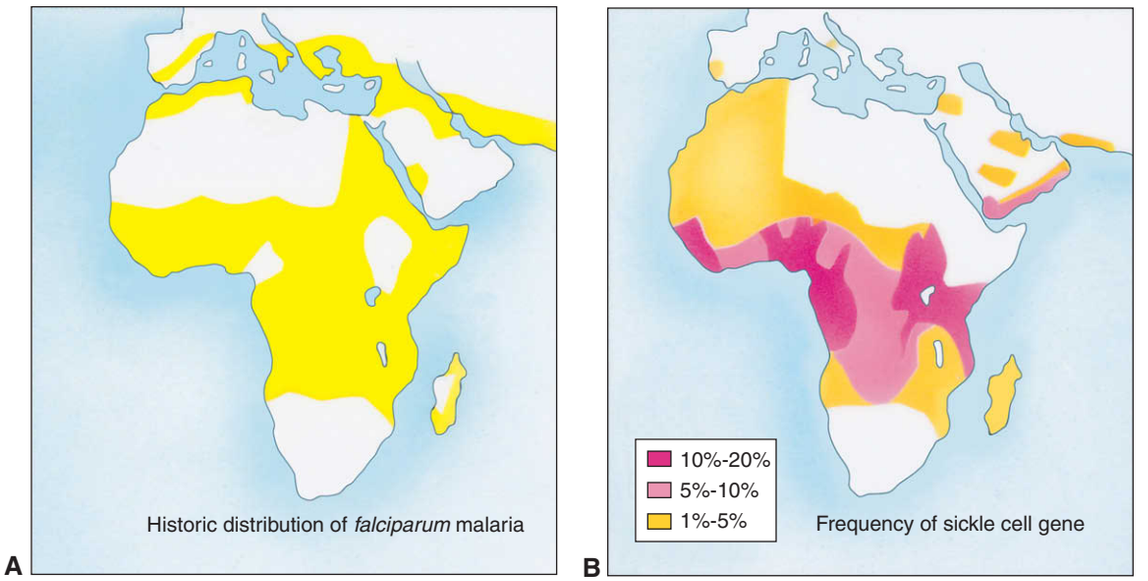

FIGURE 37-7

Relationship between the frequency of sickle cell trait and the distribution of malaria. A, The distribution of the most deadly form of malaria in Africa correlates closely with the frequency of occurrence of the sickle cell gene, **B.** The sickle cell trait provides resistance to malaria, and thus heterozygous individuals are more likely than homozygous individuals to survive and reproduce—spreading the abnormal gene further in the population.

malaria is still prevalent (Figure 37-7). Malaria is a sometimes fatal condition caused by blood cell parasites (*Plasmodium* species) and is characterized by fever, **anemia,** swollen spleen, and possible relapse months or years later. The unique distribution of *P. falciparum* malaria results from the fact that people without sickle cell trait more often die of this condition before producing offspring than those with the malaria-resistant sickle cell trait. Thus the "bad" sickle cell gene is more likely to be transmitted to the next generation than the "good" genes for normal hemoglobin.

The sickle cell/malaria relationship points to an important concept in medical genetics: "disease" genes often provide some biological advantage for a human population in certain circumstances. It is only when circumstances change that the gene is seen to do more harm than good. Genes for many other hereditary diseases (e.g., *thalassemia* and *Tay-Sachs disease*) are now known to impart protection against pathogenic conditions in heterozygous individuals.

Sex-Linked Traits

Recall from our earlier discussion that besides the 22 pairs of autosomes, there is one pair of sex chromosomes. Notice in the lower right portion of the karyotype in Figure 37-2 that the chromosomes of this pair do not have matching structures. The larger sex chromosome is called the X *chromosome*, and the smaller one is called the Y *chromosome*. The X chromosome is sometimes called the "female chromosome" because it includes genes that determine female sexual characteristics. If a person has only X chromosomes, she is genetically a female. The Y chromosome is often called the "male chromosome" because anyone possessing a Y chromosome is genetically a male. Thus all normal females have the sex chromosome combination XX, and all normal males have the combination XY (Box 37-2). Because men produce both X-bearing and Y-bearing sperm, any two parents can produce male or female children (Figure 37-8).

The large X chromosome contains many genes besides those needed for female sexual traits. Genes for producing certain clotting factors, photopigments in the retina of the eye, and many other proteins are also found on the X chromosome. The tiny Y chromosome, on the other hand, contains few genes other than those that determine male sexual characteristics. Thus both males and females need at least one normal X chromosome—otherwise genes for clotting factors and other essential proteins would be missing. Traits carried on sex chromosomes are called **sex-linked traits.** Some sex-linked traits are called *X-linked traits* because they are determined by genes in the large X chromosome. Other sex-linked traits are called *Y-linked traits* because they are determined by genes in the tiny Y chromosome.

Dominant X-linked traits appear in each person, as one would expect for any dominant trait. In females, recessive X-linked genes

Box 37-2 | FYI

Timing and Sex Determination

Research has shown that X-bearing sperm swim more slowly than Y-bearing sperm. An interesting hypothesis stems from this fact. If insemination occurs on the day of ovulation, Y-bearing sperm, being faster than X-bearing sperm, should reach the ovum first. Therefore a Y-bearing sperm would be more apt to fertilize the ovum. And because Y-bearing sperm produce males, there should be a greater probability of having a baby boy when insemination occurs on the day of ovulation. Statistical evidence supports this view.

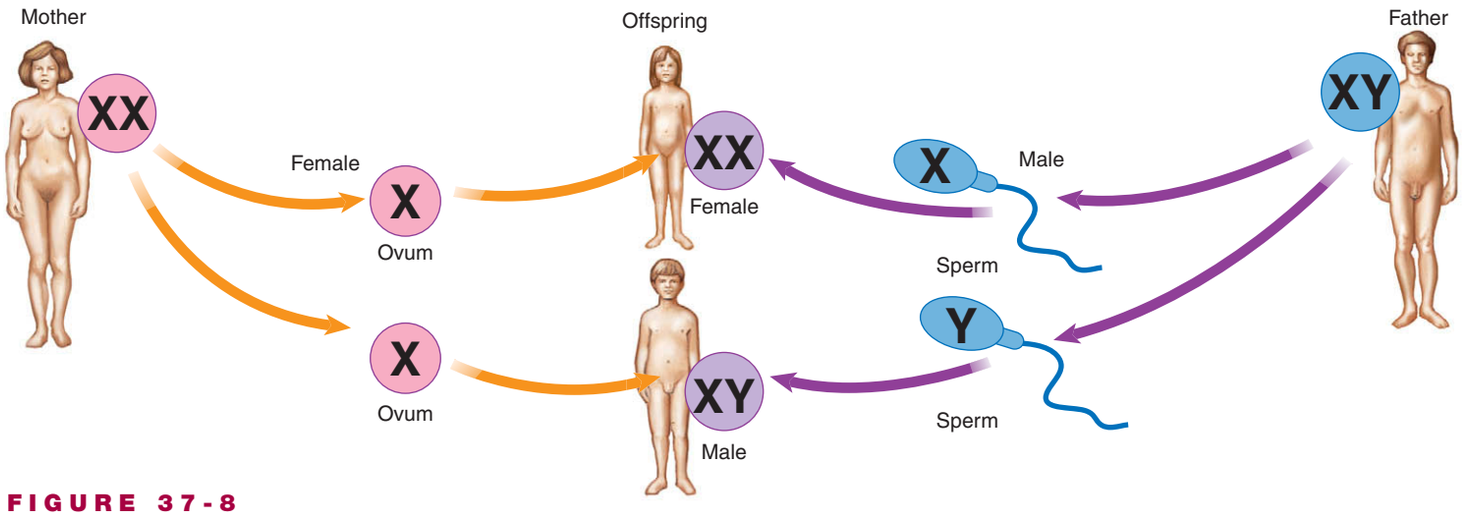

FIGURE 37-8

Sex determination. The presence of the Y chromosome specifies maleness. In the absence of a Y chromosome, an individual develops into a female.

are masked by dominant genes in the other X chromosome. Only females with two recessive X-linked genes can exhibit the recessive trait. Since males inherit only one X chromosome (from the mother), the presence of only one recessive X-linked gene is enough to produce the recessive trait. In short, in males there are no matching genes in the Y chromosome to mask recessive genes in the X chromosome. For this reason, X-linked recessive traits appear much more frequently in males than in females.

An example of a recessive X-linked condition is *red-green color blindness*, which involves a deficiency of normal photopigments in the retina (see Box 17-6, p. 533). In this condition, male children of a parent who carries the recessive abnormal gene on an X chromosome may be color blind (Figure 37-9). A female can inherit this form of color blindness only if her father is color blind *and* her mother is either color blind (homozygous recessive) or a color-blindness carrier (heterozygous). The X chromosome

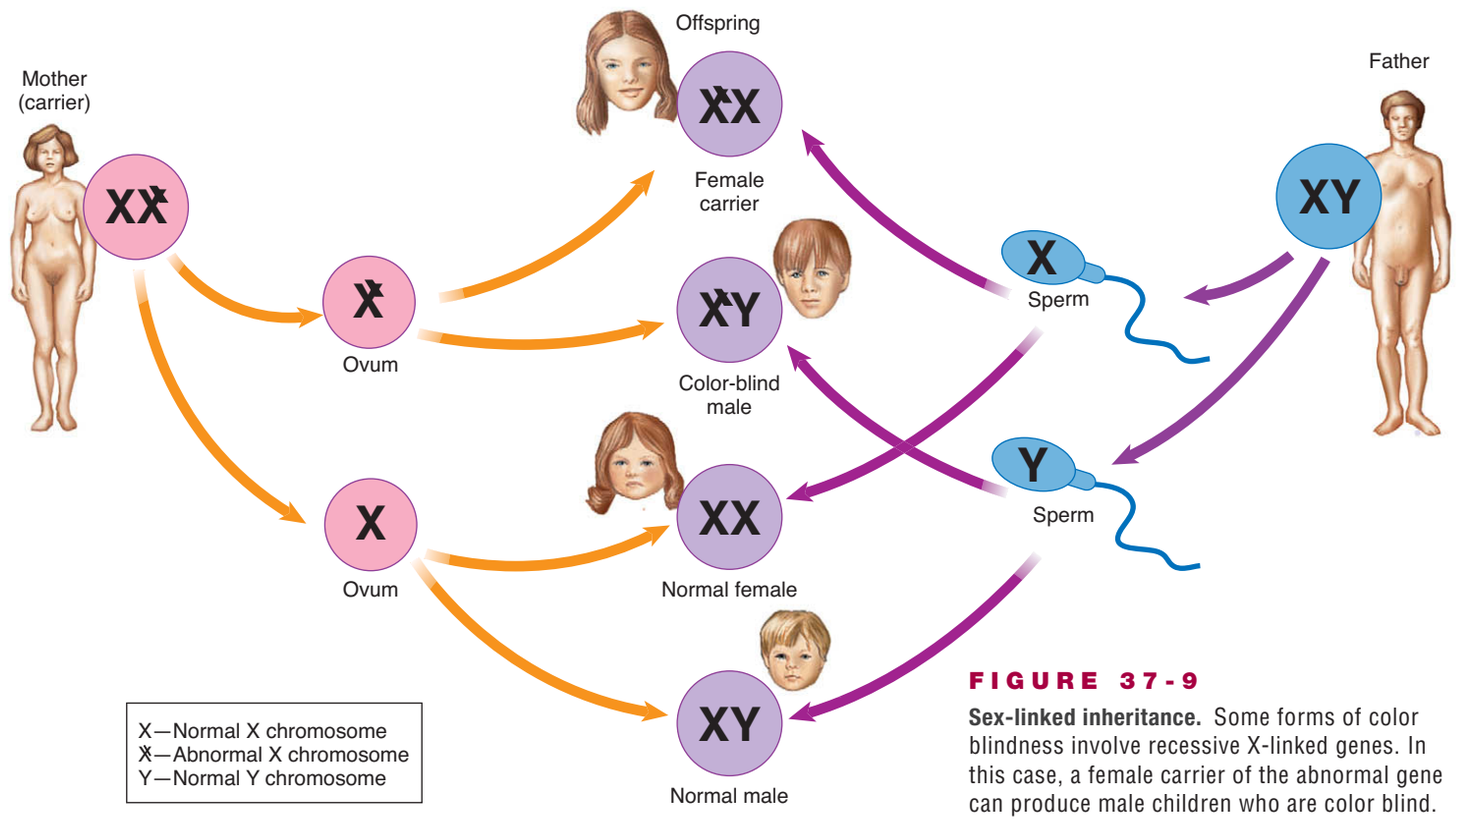

FIGURE 37-9

Sex-linked inheritance. Some forms of color blindness involve recessive X-linked genes. In this case, a female carrier of the abnormal gene can produce male children who are color blind.

has been studied in great detail, and general locations for genes causing dozens of distinct X-linked diseases have been identified (Figure 37-10).

Only one clinically significant Y-linked condition has been identified by geneticists. A missing part of q-arm of the Y chromosome may cause inheritable problems with spermatogenesis—and possible reduced fertility. Such a Y-linked condition may be passed from father to son.

Genetic Mutations

The term *mutation* simply means "change." A **genetic mutation** is a change in an individual's genetic code. Some mutations involve a change in the genetic code within a single gene, perhaps a slight rearrangement of the nucleotide sequence. A mutation called a **deletion** occurs when one or more nucleotide bases in a sequence are missing. An **insertion** mutation occurs when one or more nucleotides appear within the usual sequence of nucleotide bases in a gene. With either type of mutation, the cell cannot read the genetic code normally, and thus the encoded protein cannot be made in its usual form. Other mutations involve damage to a portion of a chromosome or a whole chromosome. For example, a portion of a chromosome may completely break away.

Mutations may occur spontaneously without the influence of factors outside the DNA itself. However, most genetic mutations are believed to be caused by **mutagens**—agents that cause changes in the genetic code by damaging DNA molecules. Genetic mutagens include chemicals, some forms of radiation, and even viruses.

If mutations occur in reproductive cells or their precursors, they may be inherited by offspring. Beneficial mutations allow organisms to adapt to their environments. Because such mutant genes benefit survival, they tend to spread throughout a population over the course of several generations.

Harmful mutations inhibit survival and therefore are not likely to spread widely through the population. Most harmful mutations kill the organism in which they occur or at least prevent successful reproduction—and so are never passed to offspring. Harmful mutations that are recessive, however, may persist at low frequencies in a population indefinitely because they do not cause problems for individuals who inherit just one of these genes. If a harmful dominant mutation is only mildly harmful, it may persist in a population over many generations.

Consider also the case of the mutations that cause sickle cell anemia, thalassemia, and Tay-Sachs disease—the heterozygous genotype produces a phenotype that resists a specific disease, and the homozygous genotype produces a phenotype characterized by emergence of a completely different disease condition.

Effects of nondisjunction. Nondisjunction, failure of a chromosome pair to separate during gamete production, may result in trisomy or monosomy in the offspring.

MEDICAL GENETICS

Mechanisms of Genetic Diseases

As science writer Matt Ridley repeatedly and emphatically stated in his best-selling book *Genome: The Autobiography of a Species in 23 Chapters*, "GENES ARE NOT THERE TO CAUSE DISEASE." Although we often hear of new "disease genes" being discovered—and the pace is rapidly increasing—the function of these genes is not to cause disease any more than the function of an arm is to cause bone fractures. If you break an arm, a normal bone is broken and fails to serve its usual function. In genetic disorders, a normal gene or chromosome is broken (mutated) and fails to serve its usual function. Such a gene is sometimes called a "disease gene" because when it is broken, it is involved in the mechanism of a particular disease. Keep this simple—but often overlooked—principle in mind as you read the following paragraphs.

NUCLEAR INHERITANCE

Single-Gene Diseases

As we just stated, genetic diseases are diseases produced by an abnormality in the genetic code. Many genetic diseases are caused by individual mutant genes in the nuclear DNA that is passed from one generation to the next—making them **single-gene diseases.** In single-gene diseases, the mutant gene may make an abnormal product that causes disease or it may fail to make a product required for normal function. As discussed previously, some disease conditions result from the combined effects of inheritance and environmental factors. Because they are not solely caused by genetic mechanisms, such conditions are not genetic diseases in the usual sense of the word—they are instead said to involve a *genetic predisposition.*

Chromosomal Genetic Diseases

Some genetic diseases do not result from an abnormality in a single gene. Instead, these diseases result from chromosome breakage or from the abnormal presence or absence of entire chromosomes. For example, a condition called **trisomy** may occur in which there is a triplet of autosomes rather than a pair. Trisomy results from a mistake in meiosis called **nondisjunction** when a pair of chromosomes fails to separate. This produces a gamete with two autosomes that are "stuck together" instead of the usual one. When this abnormal gamete joins with a normal gamete to form a zygote, the zygote has a triplet of autosomes (Figure 37-11). Trisomy of any autosome pair is usually fatal. However, if trisomy occurs in autosome pair 13, 15, 18, 21, or 22, a person may survive for a time—but with profound developmental defects. **Monosomy,** the presence of only one autosome instead of a pair, may also result from conception involving a gamete produced by nondisjunction (see Figure 37-11). As with trisomy, monosomy may produce life-threatening abnormalities. Because most trisomic and monosomic individuals die before they can reproduce, these conditions are not usually passed from generation to generation. Trisomy and monosomy are congenital conditions that are sometimes referred to as **chromosomal genetic diseases** (Box 37-3).

Box 37-3 | FYI

Congenital Disorders

A congenital disorder is any pathological condition present at birth. As explained in Chapter 36, congenital disorders may have a genetic cause. For example, one form of a facial deformity known as cleft palate is an X-linked inherited condition (see Figure 37-9). However, some congenital disorders are not inherited. For example, fetal alcohol syndrome is a group of congenital deformities that result from exposing a developing fetus to alcohol consumed by the mother (see Box 21-3, p. 666). Thus not all congenital disorders are inherited disorders.

MITOCHONDRIAL INHERITANCE

Mitochondria are tiny, bacteria-like organelles present in every cell of the body (see Figure 3-11 on p. 77). The major exception, of course, is the red blood cell, which does not reproduce itself. As with a bacterium, each mitochondrion has its own circular DNA molecule, sometimes called **mitochondrial DNA (mDNA** or **mtDNA).** Figure 37-12 shows an ideogram of the structure of a mitochondrial chromosome.

Besides being a simple circle, mtDNA differs slightly from nuclear DNA in other ways. For example, a usual stop codon (UGA) instead codes for the amino acid tryptophan (see Figure 5-6 on p. 118).

Inheritance of mtDNA occurs only through one's mother because the few mitochondria that a sperm may contribute to the ovum during fertilization do not survive. Because mtDNA contains the only genetic code for several important enzymes, it has the potential for carrying mutations that produce disease. *Mitochondrial inheritance* is known to transmit genes for several degenerative nerve and muscle disorders. One such disease is *Leber hereditary optic neuropathy.* In this disease, young adults begin losing their eyesight as the optic nerve degenerates—resulting in total blindness by 30 years of age. Some medical researchers believe that at least some forms of several other diseases are associated with mtDNA mutations. These diseases include **Parkinson disease, Alzheimer disease (AD), diabetes mellitus (DM)** with deafness, and maternally inherited forms of deafness, myopathy, and cardiomyopathy.

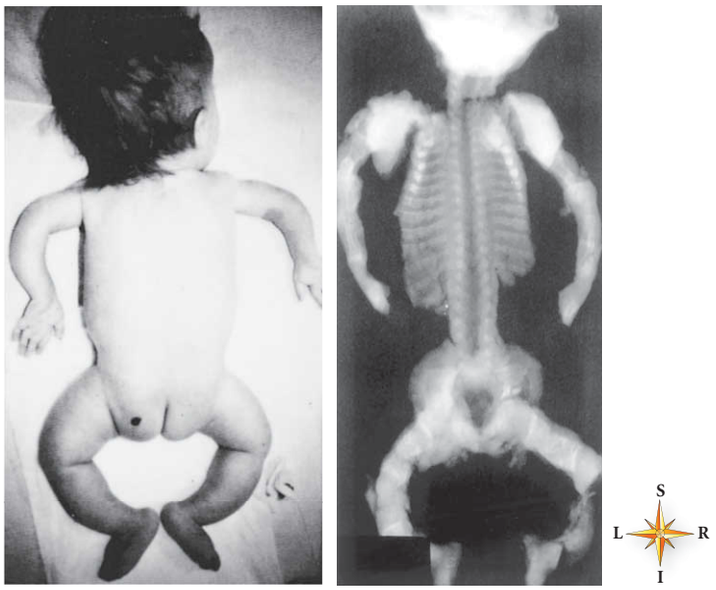
Single-Gene Diseases

There are many examples of single-gene diseases. Only a few of the many single-gene diseases are discussed here and summarized in Table 37-1.

Cystic fibrosis (CF), briefly mentioned in Chapter 4 (pp. 108–109), is caused by a recessive gene in chromosome 7 that codes for *CFTR (CF transmembrane conductance regulator).* CFTR normally regulates the transfer of sodium across cell membranes and serves as a chloride channel. When this gene has a deletion of a single codon, the abnormal version of CFTR causes impairment of chloride ion transport across cell membranes. Disruption of chloride transport causes exocrine cells to secrete thick mucus and concentrated sweat. The thickened mucus is especially troublesome in the gastrointestinal (GI) and respiratory tracts, where it can cause obstruction that leads to death. This condition is often treated by the continuous use of drugs and other therapies that relieve the symptoms. CF occurs most commonly among Caucasians. The mutation that causes CF is thought to protect carriers of the gene from potentially fatal cases of diarrhea, as in cholera and serious *Escherichia coli* infections.

Phenylketonuria (PKU) is caused by a recessive gene that fails to produce the enzyme *phenylalanine hydroxylase.* This enzyme is needed to convert the amino acid phenylalanine into another amino acid, tyrosine. Thus phenylalanine absorbed from ingested food accumulates in the body—resulting in the abnormal presence of phenylketone in the urine (hence the name phenylketonuria). A high concentration of phenylalanine destroys brain tissue; babies born with this condition are at risk of progressive mental retardation and, perhaps, death. Many PKU victims are identified at birth by state-mandated screening tests. After being identified, PKU victims are put on diets low in phenylalanine—thus avoiding a toxic accumulation of this amino acid. You may be familiar with the printed warning for people with phenylketonuria commonly seen on products that contain aspartame (NutraSweet) or other substances made from phenylalanine. The mutant PKU gene may have originated among the Celts in western Europe, where it offered protection against the toxic effects of molds growing on grains stored in cold, damp climates.

Tay-Sachs disease (TSD) is a recessive condition involving failure to make a subunit of an essential lipid-processing enzyme, hexosaminidase. Abnormal lipids accumulate in the brain tissue of Tay-Sachs victims, causing severe retardation and death by 4 years of age. There is currently no specific therapy for this condition.



TSD is most prevalent among certain Jewish populations. Some epidemiologists believe that this ethnic distribution is related to the hypothesis that heterozygous carriers of the Tay-Sachs gene have a higher than normal resistance to tuberculosis (TB)—a potentially fatal disease that once killed millions in the crowded Jewish ghettos of many large cities. Residents of these TB-infested areas who carried the Tay-Sachs gene apparently survived longer—and reproduced more frequently—than noncarriers.

Tay-Sachs is also found in higher than average frequencies in French Canadians in southeastern Quebec and Cajun French families in southern Louisiana—probably due to the gene's presence in several founders of these family groups, rather than natural selection by the threat of TB.

Osteogenesis imperfecta is a dominant genetic disorder of connective tissues. Its name, which means "imperfect bone formation,"

TABLE 37-1 Examples of Genetic Conditions

CHROMOSOME LOCATION	DISEASE	DESCRIPTION
Single-Gene Inheritance (Nuclear DNA)		
Dominant		
1p, or 3p, or 7q, or 17q	Osteogenesis imperfecta	Group of connective tissue disorders is characterized by imperfect skeletal development that produces brittle bones
17q	Neurofibromatosis	Disorder is characterized by multiple, sometimes disfiguring benign tumors of the neuroglia that surround nerve fibers
1p, or 2p, or 19p	Hypercholesterolemia (familial)	High blood cholesterol may lead to atherosclerosis and other cardiovascular problems
4p	Huntington disease (HD)	Degenerative brain disorder is characterized by chorea (purposeless movements) progressing to severe dementia and death generally by age 55 years
4q or 16p	Polycystic kidney disease, autosomal dominant form (ADPKD)	Polycystic kidney disease or PKD (both dominant and recessive forms) is the most common single-gene genetic disorder; clusters of fluid-filled sacs occur in kidneys and other organs, causing kidney failure, hypertension, liver problems, and heart valve problems
Codominant		
11p	Sickle cell anemia Sickle cell trait	Blood disorder in which abnormal hemoglobin causes red blood cells (RBCs) to deform into a sickle shape; sickle cell anemia is the severe form, and sickle cell trait the milder form
11p or 16p	Thalassemia (a or b type)	Group of inherited hemoglobin disorders is characterized by production of hypochromic, abnormal RBCs
Recessive (Autosomal)		
7q	Cystic fibrosis (CF)	Condition is characterized by excessive secretion of thick mucus and concentrated sweat, often causing obstruction of gastrointestinal or respiratory ducts
15q	Tay-Sachs disease (TSD)	Fatal condition in which abnormal lipids accumulate in the brain and cause tissue damage leading to death by age 4 years
12q	Phenylketonuria (PKU)	Excess of phenylketones in the urine is caused by accumulation of phenylalanine in the tissues; it may cause brain injury and death if phenylalanine (amino acid) intake is not restricted
11q	Albinism (total)	Lack of the dark brown pigment *melanin* in the skin and eyes results in vision problems and susceptibility to sunburn and skin cancer
20q	Severe combined immune deficiency (SCID)	Failure of the lymphocytes to develop properly causes failure of the immune system's defense of the body; it is usually caused by adenosine deaminase (ADA) deficiency
6p	Polycystic kidney disease, autosomal recessive form (ARPKD)	See description listed for dominant form of PKD
Recessive (X Linked)		
23(X)q	Hemophilia	Group of blood clotting disorders is caused by failure to form clotting factors VIII, IX, or XI
23(X)p	Duchenne muscular dystrophy (DMD)	Muscle disorder is characterized by progressive atrophy of skeletal muscle without nerve involvement
23(X)q	Red-green color blindness	Inability to distinguish red and green light results from a deficiency of photopigments in the cone cells of the retina
23(X)q	Fragile X syndrome	Mental retardation results from breakage of X chromosome in males
23(X)p	Ocular albinism	Form of albinism in which the pigmented layers of the eyeball lack melanin results in hypersensitivity to light and other problems
23(X)q	Androgen insensitivity	Inherited insensitivity to androgens (steroid sex hormones associated with maleness) results in reduced effects of these hormones
23(X)q	Cleft palate, X-linked form (CPX)	One form of a congenital deformity in which the skull fails to develop properly, characterized by a gap in the palate (plate separating mouth from nasal cavity)
23(X)p	Retinitis pigmentosa (RP, X-1 form)	Condition causes blindness, characterized by clumps of melanin in retina of eyes
Single-Gene Inheritance (Mitochondrial DNA [mtDNA])		
mtDNA	Leber hereditary optic neuropathy	Optic nerve degeneration in young adults results in total blindness by age 30 years
mtDNA	Parkinson disease	Nervous disorder is characterized by involuntary trembling and muscle rigidity

A B

FIGURE 37-13

Osteogenesis imperfecta. A, The infantile form of this inherited disease is characterized by imperfect bone development that results in the appearance of this child: curved, brittle bones in the limbs and a thin, enlarged skull. **B,** This radiograph of a fetus with osteogenesis shows the many bone fractures that produce an accordion-like shortening of the limbs.

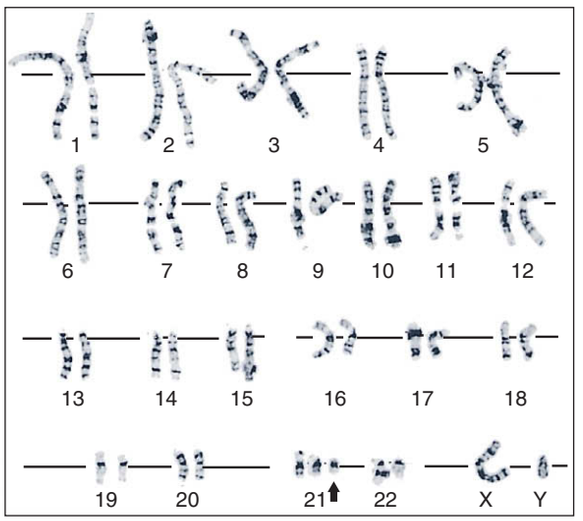
describes its chief characteristic. The bones of people with osteogenesis imperfecta do not have normal collagen and thus are often so brittle that the slightest trauma can result in serious fractures. There are different forms of the disease. In its most severe form, it results in fractures of the fetal skeleton in utero—often progressing to death shortly after birth. In a form seen in infancy, this disease is characterized by short, deformed limbs, a thin, enlarged skull, and easily fractured bones (Figure 37-13). In a less severe form, symptoms appear when a child begins to walk and become milder until after puberty—when the symptoms usually disappear.

Neurofibromatosis is a dominant genetic disorder discussed in Chapter 13 (p. 412). This disorder is characterized by multiple, sometimes disfiguring, skin spots and benign tumors of the glial cells that surround nerve fibers. Although usually inherited, it often arises from spontaneous mutations of DNA—which can then be inherited by offspring.

Other important inherited disorders include **Duchenne muscular dystrophy (DMD), hypercholesterolemia, sickle cell anemia, albinism,** certain forms of **hemophilia,** and **Huntington disease (HD).** These and other conditions are summarized in Table 37-1.

| A&P CONNECT |

Huntington disease (HD) is a dominant inherited disorder that has different forms, depending on whether it was inherited from the mother or the father. This occurs when temporary changes to the DNA expression are passed along to offspring. Such non-DNA inheritance is called **epigenetics.** Find out more about it in ***Epigenetics*** online at ***A&P Connect.***



evolve

Chromosomal Diseases

As described earlier, some genetic disorders are not inherited in the usual sense but result from nondisjunction during formation of the gametes. As Figure 37-11 shows, nondisjunction results in gametes that produce either trisomy or monosomy in the cells of offspring. At least 10% of all human sperm and at least 25% of all mature oocytes have extra, missing, or broken chromosomes. Most zygotes and embryos with chromosomal abnormalities do not survive beyond a few days—and thus the mother is not even aware that conception occurred. Of the pregnancies that last long enough to become aware of, between 15% and 20% are spontaneously aborted (miscarried)—with about one half of those having chromosomal abnormalities.

A few of the major chromosomal disorders are summarized here and in Table 37-1.

The most well-known chromosomal disorder is *trisomy 21,* which produces a group of symptoms called **Down syndrome.** As Figure 37-14, A, shows, in this condition there is a triplet of chromosome 21 rather than the usual pair. In the general population, trisomy 21 occurs in only 1 of every 600 or so live births. After age 35 years, however, a mother's chances of producing a trisomic child increase dramatically—to as high as 1 in 80 births by age 40 years. One hypothesis that explains this phenomenon states that

A

B

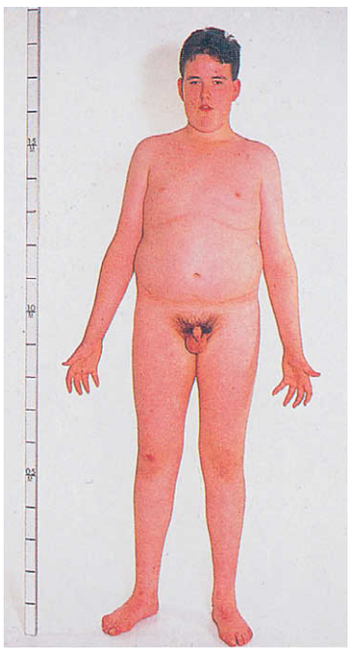


FIGURE 37-14

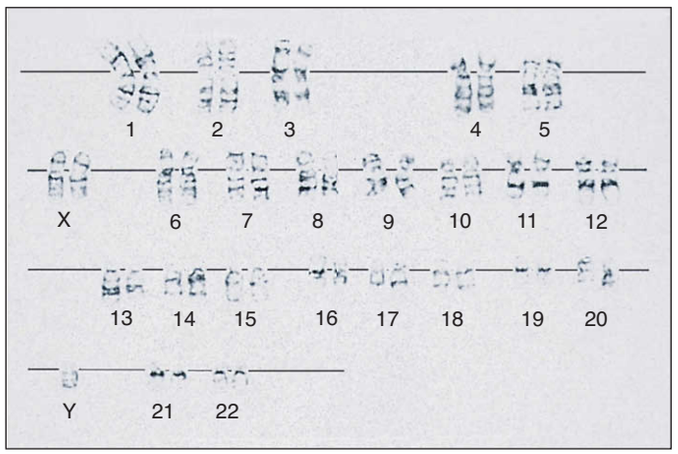
Down syndrome. A, Down syndrome is usually associated with trisomy of chromosome 21 (see Figure 37-11). **B,** A child with Down syndrome sitting on his father's knee. Notice the distinctive anatomical features: exaggerated epicanthal folds around the eyes, flattened nose, round face, and small hands with short fingers.



as a woman ages, her reproductive system becomes less likely to spontaneously abort abnormal blastocysts that have implanted in the endometrium. Thus nondisjunction may occur equally among young and middle-aged women, even though the number of live births may differ.

Down syndrome results from trisomy 21 and rarely from other genetic abnormalities (which can be inherited). This syndrome is characterized by mental retardation (ranging from mild to severe) and multiple defects that include distinctive facial appearance (Figure 37-14, *B*), enlarged tongue, short hands and feet with stubby digits, congenital heart disease, and susceptibility to acute leukemia. People with Down syndrome have a shorter than average life expectancy but can survive to old age.

Klinefelter syndrome is another genetic disorder resulting from nondisjunction of chromosomes. This disorder occurs in males with a Y chromosome and at least two X chromosomes, typically the XXY genotype. Characteristics of Klinefelter syndrome include long legs, enlarged breasts, low intelligence, small testes, sterility, and chronic pulmonary disease (Figure 37-15).

A

B

FIGURE 37-15

Klinefelter syndrome. **A,** This young man exhibits many of the characteristics of Klinefelter syndrome: small testes, some development of the breasts, sparse body hair, and long limbs. **B,** This syndrome results from the presence of two or more X chromosomes with a Y chromosome (genotypes XXY or XXXY, for example).

Turner syndrome, sometimes called *XO syndrome*, occurs in females with a single sex chromosome, X. As with the conditions described previously, the syndrome results from nondisjunction during gamete formation. Turner syndrome is characterized by failure of the ovaries and other sex organs to mature (causing sterility), cardiovascular defects, dwarfism or short stature, a webbed neck, and possible learning disorders (Figure 37-16). Symptoms of Turner syndrome can be reduced by hormone therapy using estrogens and growth hormone. Cardiovascular defects may be repaired surgically.

Genetic Basis of Cancer

Recall from Chapter 6 that some forms of cancer are thought to be caused, at least in part, by abnormal genes called **oncogenes.** Oncogenes are altered (mutated) forms of normal genes.

One hypothesis states that most normal cells contain such cancer-causing genes. However, it is uncertain how these genes become activated and produce cancer. Perhaps oncogenes can

A

B

FIGURE 37-16

Turner syndrome. **A,** This young woman exhibits many of the characteristics of Turner syndrome, including short stature, webbed neck, and sexual immaturity. **B,** As this karyotype shows, Turner syndrome results from monosomy of sex chromosomes (genotype XO).

transform a cell into a cancer cell only when certain environmental conditions occur. It has also been shown that viruses can transmit oncogenes to human cells.

Another hypothesis states that normal cells contain another class of genes, sometimes called **tumor suppressor genes.** According to this hypothesis, such genes regulate cell division so that it proceeds normally. When a tumor suppressor gene is nonfunctional because of a genetic mutation, it then allows cells to divide abnormally (or fail to die)—possibly producing cancer.

Yet another possible genetic basis for cancer relates to the genes that govern the cell's ability to repair damaged DNA. For example, a rare genetic disorder called **xeroderma pigmentosum** is characterized by the inability of skin cells to repair genetic damage caused by the ultraviolet (UV) radiation in sunlight. Individuals with this condition nearly always develop skin cancer when exposed to direct sunlight. In this condition, the genetic abnormality does not cause skin cancer directly but inhibits the cell's cancer-preventing mechanisms.

These three hypotheses regarding the genetic basis of cancer are not mutually exclusive. They are undoubtedly all important factors in the genesis of cancer. Cancer researchers are now working intensely to determine the exact role various genes play in the development of cancer. The more we understand the genetic basis of cancer, the more likely it is that we will find effective treatments—or even cures.

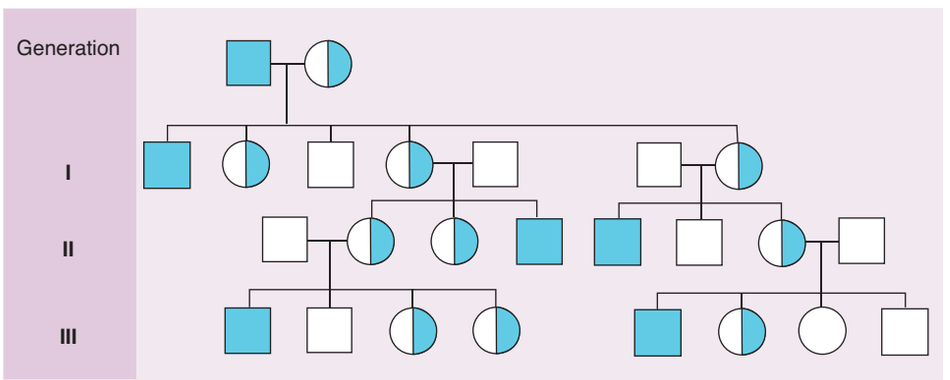
PREVENTION AND TREATMENT OF GENETIC DISEASES

Genetic Counseling

The term *genetic counseling* refers to professional consultations with families regarding genetic diseases. Trained genetic counselors may help a family determine the risk of producing children with genetic diseases.

Genetic counselors may also help evaluate whether any offspring already have a genetic disorder and offer advice on treatment or care. A growing list of tools is available to genetic counselors, some of which are described in the following section.



PEDIGREE

A **pedigree** is a chart that illustrates genetic relationships in a family over several generations (Figure 37-17). Using medical records and family histories, genetic counselors assemble the chart beginning with the client and moving backward through as many generations as are known. Squares represent males; circles represent females. Fully shaded symbols represent affected individuals, and unshaded symbols represent normal individuals. Partially shaded symbols represent carriers of a recessive trait. A horizontal line between symbols designates a sexual relationship that produced offspring.

The pedigree is useful in determining the possibility of producing offspring with certain genetic disorders. It also may tell a person whether he or she might have a genetic disorder that appears late in life, such as Huntington disease. In either case, a family can prepare emotionally, financially, and medically before a crisis occurs.

PUNNETT SQUARE

The **Punnett square,** named after the English geneticist Reginald Punnett, is a grid used to determine the mathematical *probability*

A

B

FIGURE 37-17

Pedigree. A, Pedigrees chart the genetic history of family lines. Squares represent males, and circles represent females. Fully shaded symbols indicate affected individuals, partly shaded symbols indicate carriers, and unshaded symbols indicate unaffected noncarriers. Roman numerals indicate the order of generations. This pedigree reveals the presence of an X-linked recessive trait. **B,** This huge pedigree compiled by Dr. Nancy Wexler of Columbia University and the Hereditary Disease Foundation traces Huntington disease (HD) over several generations of a large family in Venezuela. Dr. Wexler and other researchers collaborated in using information from this pedigree, along with techniques of molecular biology, to find the gene responsible for this disease and develop a test to detect the presence of the gene before the disease becomes apparent. Dr. Wexler became interested in this disease after her mother's death from HD.

of inheriting genetic traits. As Figure 37-18, *A*, shows, genes in the mother's gametes are represented along the horizontal axis of the grid and genes in the father's gametes along the vertical axis. The ratio of different gene combinations in the offspring predicts their probability of occurrence in the next generation. Thus offspring produced by two carriers of PKU (a recessive disorder) have a one in four (25%) chance of inheriting this recessive condition (see Figure 37-18, *A*).

The same grid shows that there is a two in four (50%) chance that a child produced will be a PKU carrier. Figure 37-18, *B*, however, shows that offspring of a carrier and a noncarrier cannot inherit PKU. What is the chance of an individual offspring being a PKU carrier in this case? The grid in Figure 37-18, *C*, shows the probability of producing an affected offspring when a PKU victim and a PKU carrier have children. Figure 37-18, *D*, shows the genetic probability when a PKU victim and a noncarrier produce children.

KARYOTYPE

Disorders that involve trisomy (extra chromosomes), monosomy (missing chromosomes), and broken chromosomes can be detected after a **karyotype** is produced.

The first step in producing a karyotype is getting a sample of cells from the individual to be tested. This can be done by scraping

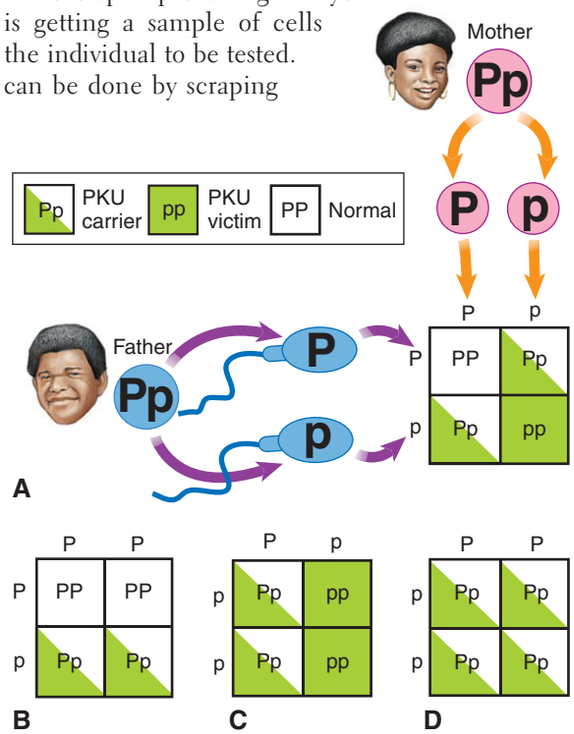


FIGURE 37-18

Punnett square. The Punnett square is a grid used to determine relative probabilities of producing offspring with specific gene combinations. Phenylketonuria (PKU) is a recessive disorder caused by the gene *p*. *P* is the normal gene. **A,** Possible results of cross between two PKU carriers. Because one in four of the offspring represented in the grid have PKU, a genetic counselor would predict a 25% chance that this couple will produce a PKU baby at each birth. **B,** Cross between a PKU carrier and a normal noncarrier. **C,** Cross between a PKU victim and a PKU carrier. **D,** Cross between a PKU victim and a normal noncarrier.

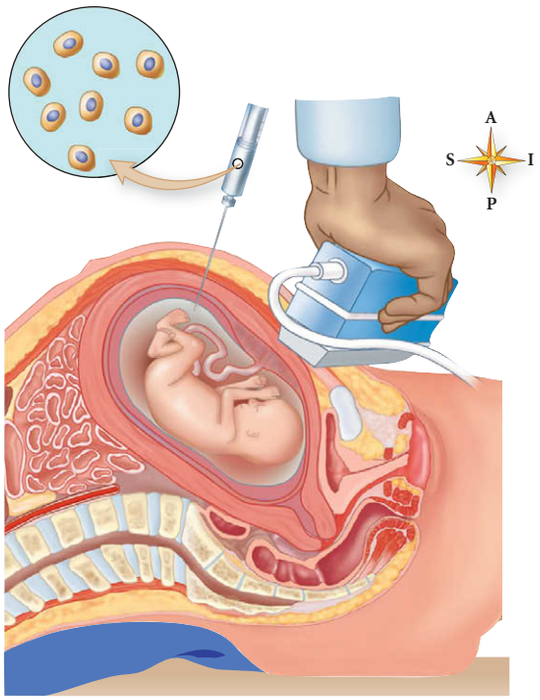

FIGURE 37-19

Amniocentesis. In amniocentesis, a syringe is used to collect amniotic fluid. Ultrasound imaging is used to guide the tip of the syringe needle to prevent damage to the placenta and fetus. Fetal cells in the collected amniotic fluid can then be chemically tested or used to produce a karyotype of the developing baby.

cells from the lining of the cheek or from a blood sample containing white blood cells (WBCs). Fetal tissue can be collected by **amniocentesis,** a procedure in which fetal cells floating in the amniotic fluid are collected with a syringe (Figure 37-19). **Chorionic villus sampling (CVS)** is a newer procedure in which cells from chorionic villi that surround a young embryo (see Chapter 36, p. 1105) are collected through the opening of the cervix.

Collected cells are grown in a special culture medium and allowed to reproduce. Cells in metaphase (when the chromosomes are most distinct) are stained and photographed using a microscope. The chromosomes are cut out of the photo and pasted on a chart in pairs according to size, as in Figures 37-2 and 37-15, *B*. More advanced techniques use digital imaging and computers to automatically generate a karyotype.

Genetic counselors then examine the karyotype, looking for chromosome abnormalities. What chromosome abnormality is visible in Figure 37-15, *B*? Is this a male or female karyotype?

16. What is genetic counseling?
17. How are pedigrees used by genetic counselors?
18. How is a Punnett square used to predict mathematical probabilities of inheriting specific genes?
19. How is a karyotype prepared? What is its purpose?

Treating Genetic Diseases

Until fairly recently, the only hope of treating any genetic disease was to treat the symptoms. In some diseases, such as PKU, this works well. If PKU victims simply avoid large amounts of phenylalanine in their diets, especially during critical stages of development, severe complications can be avoided. In Klinefelter syndrome and Turner syndrome, hormone therapy and surgery can alleviate some symptoms. However, there are no effective treatments for the majority of genetic disorders. Fortunately, medical science now offers us some hope of treating genetic disorders through **gene therapy.**

In a therapy sometimes called **gene replacement,** genes that specify production of abnormal, disease-causing proteins are replaced by normal or "therapeutic" genes. To get the therapeutic genes to cells that need them, researchers are using genetically altered viruses as carriers. Recall that viruses are easily capable of inserting new genes into the human genome. If the therapeutic genes behave as expected, a cure may result. Thus the goal of gene replacement therapy is to genetically alter existing body cells in the hope of eliminating the cause of a genetic disease. Although called "gene replacement," this therapy does not actually replace the defective genes—it instead inserts normal genes so that normal proteins can "replace" abnormal or missing proteins in the body's metabolic pathways.

In a therapy called **gene augmentation,** normal genes are introduced with the hope that they will augment (add to) the production of the needed protein. In one form of gene augmentation, virus-altered cells are injected into the blood or implanted under the skin of a patient to produce increased amounts of the missing protein. Some researchers have proposed grafting synthetic skin containing cells with therapeutic genes. Another approach is to use bacterial DNA rings called **plasmids** that have been altered by recombinant DNA techniques to carry the therapeutic gene or genes. Another approach uses the **human engineered chromosome (HEC).** In the HEC strategy, a set of therapeutic genes is incorporated into a separate strand of DNA that is inserted into a cell's nucleus, thus acting like an extra, or forty-seventh, chromosome. Gene augmentation attempts to add genetically altered cells to the body, rather than change existing body cells, as in gene replacement therapy.

| A&P CONNECT |

Can gene therapy be used to extend the human life span? Check out ***Genes and Longevity*** online at ***A&P Connect.***

There have been tragic setbacks in some clinical trials of gene therapies with the result that there are not yet any approved gene therapies available. Despite setbacks and concerns, there are currently hundreds of ongoing gene therapy trials for diverse genetic disorders, cancer, and even aging. Thousands of laboratory experiments in anticipation of human trials are also currently under way. Hurdles that must be overcome before we will see widespread success of gene therapies include our lack of detailed knowledge regarding many of the "disease genes" and how best to effectively treat multiple-genes diseases—not to mention the high costs and risks involved with these therapies. Currently, gene therapy is experimental—there are no approved treatments available to the general public. It is too early to say for sure, but there may soon come a time when many genetic diseases are routinely treated—or even cured—with gene therapy.

| A&P CONNECT |

Experimentation with gene therapy in humans began as far back as 1990. Learn more about the early efforts at gene therapy in ***Using Gene Therapy*** online at ***A&P Connect.***

RNA interference (RNAi) may also become a weapon against genetic disorders in an approach called **RNAi therapy.** Recall from Box 5-2 (p. 120) that RNAi is a method of silencing particular genes. When harnessed in the laboratory, RNAi can turn off one gene at a time—greatly increasing the chances of figuring out which protein is encoded by that gene and what the function of that protein is.

The possibilities of RNAi therapy are very exciting. Work is already under way to find an effective means of using RNAi for creating antiviral creams containing short interfering RNA (siRNA) to protect against HIV and other viruses. Some researchers are using RNAi to knock out genes that permit permanent tissue damage during heart attacks, kidney failure, and stroke. In one proposal, RNAi would be used to silence the abnormal huntingtin gene that causes Huntington disease (HD). In animal studies, RNAi successfully blocked a gene causing high blood cholesterol—without any apparent side effects. Researchers are also attempting to harness the power of RNAi to treat cancer and many types of infection.

However, developing a large set of RNAi therapies may be thwarted by the possibility that they may also silence genes needed for normal function or trigger unwanted side effects in the body's immune defenses.

20. How are most genetic disorders treated today?
21. How does gene replacement therapy work?

the BIG picture

Genetics, Heredity, and the Whole Body

The study of human genetics and heredity provides an amazingly clear view of the "big picture" of the structure and function of the human body. In fact, the genetic view extends from the molecular level all the way to the context of the whole human species and beyond.

At the molecular level, the genetic perspective reveals the importance of nucleic acids—especially DNA. DNA molecules serve as tiny data storage devices that contain *all* the information needed to manufacture the molecules needed to build and maintain the human body. Each cell, tissue, organ, and system in the body is built of, and directed by, molecules that have been synthesized with recipes contained in the genes of each of our DNA molecules.

At the molecular level, we see that DNA in concert with various forms of RNA directs the synthesis of structural and functional proteins. Some of the functional proteins, in turn, trigger and direct the synthesis of all other biomolecules that form and regulate the body—lipids, carbohydrates, and so on.

This vast collection of different kinds of molecules also includes the enzymes and other molecules needed to gather and assimilate chemicals from the external environment outside the body. These external chemicals include water, oxygen, vitamins, minerals, sugars, starches, amino acids, fats, and other nutrients. Some of the molecules that ultimately owe their existence in the body to DNA also include those that help us rid the body of wastes such as urea, carbon dioxide, and bile.

If DNA directs all the chemical activity of the body, then it certainly directs cellular metabolism. And, of course, cellular metabolism is the foundation of the function of each tissue, organ, and system in the body. Our study of medical genetics has shown us that even one mistake in one codon of a gene can upset the chemistry of the body enough to shut down an entire system—and thus threaten the survival of the entire body.

CASE study

Carlos and Maria were ecstatic to have two healthy babies. Within the first hour, the babies had been cleaned, measured, and their heels pricked for blood samples. These initial blood tests were to assess for PKU (phenylketonuria), thyroid hormone levels, cystic fibrosis, and several other metabolic disorders. To their surprise, their new daughter tested positive for PKU. Neither Carlos nor Maria had PKU.

1. What are the chances that their son will have PKU as well?
   a. 25%
   b. 50%
   c. 75%
   d. 0%

Thankfully, their son tested negative for PKU. But, as they were discussing genetic testing, Maria remembered that her father had been color blind. She wondered whether that meant her son would also be color blind.

2. They couldn't tell yet, but what were the chances that Maria and Carlos' son would be color blind?
   a. 25%
   b. 50%
   c. 75%
   d. 0%

Carlos and Maria were so happy with their new twins. They were thinking about trying to have more children…maybe in a few years.

3. Having had one boy and one girl, what are Carlos and Maria's chances of having another boy?
   a. Depends on the timing of the fertilization
   b. 25%
   c. 50%
   d. 75%

CAREER choices

Genetic Counselor

Genetic counseling is the process of helping people understand and adapt to the medical, psychological, and familial implications of genetic contributions to disease. I work in a private, not-for-profit medical facility. I see prenatal, pediatric, neurology, and cancer patients and their families. For specific details see information from our national support organization (National Society of Genetic Counselors [NSGC]) at nsgc.org).

I have always had an interest in the medical professions. However, genetic counseling was first introduced to me in an "Ethics of Healthcare" course in my undergraduate studies. After this course sparked my interest, I used job-shadowing opportunities to learn more about what is involved in the field. As I learned more about it, I was convinced that genetic counseling was the profession that I wanted to pursue. I now hold a Master of Science in Human Genetics and Genetic Counseling.

The current trends in my field include positions in research and nontraditional areas, such as positions with insurance companies and clinical laboratories. We are learning about genetic contributions to many multifactorial conditions like heart disease, diabetes, high blood pressure. The area of *pharmacogenetics*—the study of inherited responses to drugs—is rapidly expanding. Counselors can develop specialties in many areas, including prenatal, pediatric, oncology, and neurology clinics.

The variety of patients that I see, the challenges of each case, and the fact that I'm always learning are the greatest rewards of my job. I love working with families through difficult situations by helping to provide risk assessments or to establish a diagnosis, and helping them process what this means for themselves and their family. At times, I spend many hours working with one family, which is different from most other medical fields. We focus on not only the presenting problem but also the implications for the family as a whole.

Understanding anatomy and physiology is helpful when working with a clinical geneticist to establish a diagnosis. Genetic conditions are often complex, multisystem disorders, and understanding anatomy and physiology is vital. I recommend using repetition, flash cards, and hands-on laboratory activities for studying anatomy and physiology.

For other careers related to genetics, see ashg.org/education.

HINT

Scan this summary after reading the chapter to help you reinforce the key concepts. Later, use the summary as a quick review before your class or before a test.

THE SCIENCE OF GENETICS

A. Genetics—scientific study of inheritance; developed to explain how normal biological characteristics are inherited
B. Directly inherited diseases are often called *hereditary diseases*

CHROMOSOMES AND GENES

A. Mechanism of gene function
   1. Genetic code transmitted by way of genes, which are segments of DNA
   2. DNA (deoxyribonucleic acid) (Figure 37-1)
      a. Chromosome—compact form of DNA that exists only during cell division
      b. Chromatin—strand form of DNA made up of subunits called *nucleosomes*, which are like small spools of DNA wound around proteins called *histones*
   3. Each gene is a sequence of nucleotide bases in the DNA molecule, which the cell transcribes to an RNA molecule
   4. Each mRNA molecule associates with a ribosome, which translates the code to form one or more specific polypeptide molecules
   5. Genes determine the structure and function of the human body by producing a set of specific regulatory RNA and protein molecules—along with specific structural proteins
B. The human genome (Figure 37-2)
   1. Genome—entire set of human chromosomes (46 in nucleus of each cell, 1 mitochondrial chromosome)
      a. Map of the entire human genome (nearly all nucleotides in sequence) was completed in 2003
      b. Contains about 20,000 to 25,000 genes and large amounts of noncoding DNA
         (1) Genes can encode proteins or other functional products such as tRNA, rRNA, ribozymes
         (2) DNA sequences called *exons* join to form a gene; the same exons may be part of different genes
         (3) Pseudogenes—bits of formerly functional genes that make up part of noncoding "junk" DNA
      c. Less than 2% of genome codes for proteins
         (1) Some DNA codes for regulatory RNAs
         (2) Much of the DNA ("junk DNA") includes pseudogenes that are remnants of functional genes
   2. Genomics—analysis of the sequence contained in the genome
   3. Transcriptomics—analysis of the mRNA codes actually transcribed from genes in the genome
   4. Proteomics—analysis of the entire group of proteins encoded by the genome and transcriptome, a group of proteins called the *human proteome*
   5. Genomic information can be expressed in various ways
      a. Ideogram—cartoon of a chromosome showing the centromere as a constriction and the short segment (p-arm) and long segment (q-arm)
      b. Genes are often represented as their actual sequence of nucleotide bases expressed by the letters a, c, g, and t
C. Distribution of chromosomes to offspring
   1. Meiosis (see Figure 36-1)
      a. Produces gametes with the haploid number of chromosomes (23)
      b. When a sperm and an ovum unite at conception, they form a zygote with 46 chromosomes
   2. Principle of independent assortment
      a. As sperm and ovum are formed during meiosis, two members of a pair of homologous chromosomes separate (the principle of segregation) and the maternal and paternal chromosomes get mixed up and redistributed independently in each gamete, with each thus having a different set of 23 chromosomes (Figure 37-3)
      b. Genetic variation—independent assortment of chromosomes ensures that each offspring from a single set of parents is genetically unique
      c. Applies to individual genes or groups of genes
      d. Crossing over—during one phase of meiosis, pairs of matching chromosomes line up along the equator and exchange genes with one another (Figure 37-4)
      e. Gene linkage—sometimes an entire group of genes stays together and crosses over as a single unit

GENE EXPRESSION

A. Hereditary traits
   1. Dominant and recessive traits
      a. Each inherited trait is controlled by two sets of similar genes, one from each parent
      b. Each autosome in a pair matches its partner in the type of gene it contains
      c. Different types of genes (Figures 37-5 and 37-6)
         (1) Dominant gene—effects are seen; capable of masking the effects of a recessive gene for the same trait
         (2) Recessive gene—effects are masked by the effects of a dominant gene for the same trait
      d. Genotype—combination of genes within the cells of an individual
         (1) Homozygous—genotype with two identical forms of a gene
         (2) Heterozygous—genotype with two different forms of a gene
      e. Phenotype—manner in which genotype is expressed; how an individual looks because of genotype
      f. Carrier—person who possesses the gene for a recessive trait but does not exhibit the trait

2. Polygenic traits—when more than one gene is involved in producing a particular trait; a "combined trait" because it results from a combination of genes
3. Codominant traits—when two different dominant genes occur together, each will have an equal effect
4. Abnormal "disease" genes that persist in a population often provide some biological advantage, as in the case of the sickle gene that protects against malaria (Figure 37-7)

B. Sex-linked traits (Figures 37-8 and 37-9)
1. X chromosome—"female chromosome"; larger than Y chromosome; includes genes that determine female sexual characteristics, as well as nonsexual characteristics (Figure 37-10)
2. Y chromosome—"male chromosome"; smaller than X chromosome; contains few genes other than male sexual characteristics
3. Sex-linked traits—traits carried on sex chromosomes; also known as X-linked traits

C. Genetic mutations
1. Mutation—change in the genetic code
   a. Deletion—missing information in the genetic code
   b. Insertion—extra information in the genetic code
   c. Insertions and deletions result in a failure to make the usual protein encoded by a particular gene
2. Mutations can occur without outside influence
3. Mutagens—agents that cause most genetic mutations

MEDICAL GENETICS

A. Mechanisms of genetic disorders
1. Nuclear inheritance
   a. Single-gene diseases—caused by individual mutant genes in nuclear DNA that pass from one generation to the next
   b. Genetic predisposition—disease occurring because of combined effects of inheritance and environmental factors
   c. Chromosomal genetic diseases—congenital conditions such as trisomy and monosomy that often produce life-threatening abnormalities; trisomic and monosomic individuals may die before they can reproduce (Figure 37-11)
2. Mitochondrial inheritance
   a. Mitochondrial DNA (mtDNA)—each mitochondrion has its own DNA molecule (Figure 37-12)
   b. Inheritance of mtDNA occurs through one's mother because sperm does not contribute mitochondria to the ovum during fertilization
   c. mtDNA contains the only genetic code for several important enzymes

B. Single-gene diseases
1. Cystic fibrosis
   a. Results because of recessive genes in chromosome pair 7
   b. Impairment of chloride ion transport across cell membranes causes exocrine cells to secrete thick mucus and concentrated sweat; thickened mucus may obstruct respiratory and gastrointestinal tracts, leading to death
   c. Treatment—use of drugs and other therapies
2. Phenylketonuria (PKU)
   a. Results from recessive genes that fail to produce phenylalanine hydroxylase
   b. Phenylalanine cannot be converted into tyrosine and thus accumulates
   c. High concentrations of phenylalanine destroy brain tissue
   d. Treatment—diets low in phenylalanine
3. Tay-Sachs disease (TSD)
   a. Recessive condition involving failure to make an essential lipid-processing enzyme; carrying one TSD gene may be protective against TB
   b. Abnormal lipids accumulate in the brain, causing severe retardation and death by 4 years of age
   c. No specific therapy available
4. Osteogenesis imperfecta (Figure 37-13)
   a. Dominant genetic disorder of connective tissues resulting in imperfect bone formation
   b. Bones do not have normal collagen and are very brittle
5. Neurofibromatosis
   a. Group of dominant genetic disorders; often inherited but can result from spontaneous mutations of DNA
   b. Characterized by multiple spots and benign tumors of glial cells that surround nerve fibers

C. Chromosomal diseases—genetic disorders resulting from nondisjunction during formation of the gametes; produce either trisomy or monosomy
1. Trisomy 21—triplet of chromosome 21 rather than a pair; characterized by Down syndrome's mental retardation and multiple defects (Figure 37-14)
2. Klinefelter syndrome—occurs in males with a Y chromosome and at least two X chromosomes; characteristics include long legs, enlarged breasts, low intelligence, small testes, sterility, and chronic pulmonary disease (Figure 37-15)
3. Turner syndrome—XO syndrome; occurs in females with a single X chromosome; characterized by failure of ovaries and other organs to mature, sterility, cardiovascular defects, dwarfism, webbed neck, and learning disorders; symptoms can be reduced by hormone therapy (Figure 37-16)

D. Genetic basis of cancer
1. Oncogenes—abnormal genes thought to cause some forms of cancer
2. Tumor suppressor genes regulate cell division so it proceeds normally; when nonfunctional because of a genetic mutation, it allows cells to divide abnormally
3. Also, genetic abnormalities may inhibit the cell's cancer-preventing mechanisms

PREVENTION AND TREATMENT OF GENETIC DISEASES

A. Genetic counseling—professional consultations with families regarding genetic diseases
1. Pedigree—chart that illustrates genetic relationships in a family over several generations; helpful in determining the possibility of producing offspring with certain genetic disorders (Figure 37-17)

2. Punnett square—grid used to determine the mathematical probability of inheriting genetic traits (Figure 37-18)
3. Karyotype—ordered arrangement of photographs of chromosomes from a single cell; used in genetic counseling to identify chromosomal disorders

B. Treating genetic diseases (Figure 37-20)
1. A few genetic conditions can be alleviated by avoiding triggers or treating symptoms
2. Gene therapy involves changing the genetic code of cells to replace normal proteins that are absent in genetic disorders; still experimental
   a. Gene replacement—abnormal, disease-causing proteins are replaced by "therapeutic" genes; goal is to genetically alter existing body cells in the hope of eliminating the cause of a genetic disease
   b. Gene augmentation—normal genes are introduced to augment the production of the needed protein
3. RNA interference (RNAi) therapy—disease-causing genes can be "silenced" by introducing specific short interfering RNA (siRNA) sequences into the body; still experimental

REVIEW QUESTIONS

Write out the answers to these questions after reading the chapter and reviewing the Chapter Summary. If you simply think through the answer without writing it down, you won't retain much of your new learning.

1. Who was the first person to discover the basic mechanism by which traits are transmitted from parents to offspring?
2. Describe albinism in relation to dominance, recessiveness, and genotype.
3. Explain the difference between a genotype and a phenotype.
4. Define codominance, and give an example of a condition that demonstrates codominance.
5. If a certain trait is identified as X-linked recessive, describe the genotype of a female expressing the given trait.
6. Identify several genetic mutagens.
7. How can mutations be beneficial to a species?
8. What role do environmental factors play in relation to certain genetic diseases?
9. Explain the "mistake" in meiosis that results in the condition called *trisomy*.
10. Describe the genetic inheritance of cystic fibrosis, phenylketonuria (PKU), and Tay-Sachs disease.
11. Identify the chromosomal disorder that involves trisomy 21.
12. Differentiate between oncogenes and tumor suppressor genes.
13. How are gene replacement and gene augmentation therapies used to treat genetic diseases?
14. Define the term *genome*.
15. When is a disorder classified as congenital?

CRITICAL THINKING QUESTIONS

After finishing the Review Questions, write out the answers to these more in-depth questions to help you apply your new knowledge. Go back to sections of the chapter that relate to concepts that you find difficult.

1. Genes regulate protein synthesis. Why is the production of specific proteins so important to the structure and function of the body?
2. Differentiate among the text usage of chromatin, chromosomes, and genes.
3. Explain the processes that increase the variability of the genetic code in the offspring.
4. Explain why the structure of the X and Y chromosomes would predict a greater occurrence of sex-linked disorders in males.
5. Explain what is meant by a pedigree. Explain what is meant by a karyotype. Which of these would be most helpful in the diagnosis of Down syndrome? In the diagnosis of Huntington disease?

Glossary

A

abdominal aorta (ab-DOM-i-nal ay-OR-tah) portion of the descending aorta that passes through the abdominal cavity [*abdomin-* belly, *-al* relating to, *aort-* lifted, *-a* thing] *pl.*, aortae or aortas

abdominal reflex (ab-DOM-i-nal) drawing in of the abdominal wall in response to stroking the side of the abdomen [*abdomin-* belly, *-al* relating to, *re-* again, *-flex* bend]

abdominal thrusts (ab-DOM-i-nal) *see* **Heimlich maneuver** [*abdomin-* belly, *-al* relating to]

abdominopelvic cavity (ab-DOM-i-no-PEL-vik KAV-i-tee) term used to describe the single cavity containing the abdominal and pelvic organs [*abdomin-* belly, *-pelv-* basin, *cav-* hollow, *-ity* state]

abducens nerve (ab-DOO-sens) cranial nerve VI; motor nerve; controls movement of the eye and proprioception [*ab-* away, *-duc-* lead, *-ens* process]

abduction (ab-DUK-shun) moving away from the midline of the body; opposite motion of adduction [*ab-* away, *-duct-* lead, *-tion* process]

abnormal constituent (ab-NOR-mal kon-STICH-yoo-ent) any substance present in a body fluid that is not normally found there [*ab-* away from, *-norma* the rule]

abruptio placentae (ab-RUP-shee-oh plah-SEN-tay) separation of normally positioned placenta from the uterine wall; may result in hemorrhage and death of the fetus and/or mother [*ab-* away from, *-ruptio* rupture, *placentae* of flat cake (placenta)]

abscess (AB-ses) cavity, often pus filled, formed by disintegration of tissues [*ab-* away, *-cess* to go]

absolute refractory period (AB-so-loot ree-FRAK-toh-ree) time during which the local area of the membrane has surpassed the threshold potential and will not respond to any stimulus [*absolut-* unrestricted, *refract-* break apart, *-ory* relating to, *period* circuit]

absorption (ab-SORP-shun) passage of a substance through a membrane such as skin or mucosa; often refers to passage of nutrients into blood [*absorp-* swallow, *-tion* process]

accessory gland (ak-SES-oh-ree) a gland that assists organs in accomplishing their functions [*access-* extra, *-ory* relating to, *gland* acorn]

accessory hemiazygos vein (ak-SES-oh-ree hem-EE-ah-ZYE-gos) connects some of the superior intercostal veins with the azygos vein [*hemi-* half, *-a-* without, *-zygo-* union or yoke]

accessory nerve (ak-SES-oh-ree) cranial nerve XI (motor nerve) [*access-* extra, *-ory* relating to]

accessory organ (ak-SES-oh-ree) an organ that assists other organs in accomplishing their functions [*access-* extra, *-ory* relating to, *organ* instrument]

accessory spleen (ak-SES-oh-ree) a small version of the spleen commonly found in the mesentery that connects the spleen and stomach (the gastrosplenic ligament); *see* **spleen** [*access-* extra, *-ory* relating to]

accommodation (ah-kom-oh-DAY-shun) mechanism that allows the normal eye to focus on objects closer than 20 feet [*accommoda-* adjust, *-ation* process]

acetoacetic acid (ass-ih-toh-ah-SEE-tik ASS-id) an acidic ketone body that accumulates during the incomplete breakdown of fats; influences acid-base balance [*acet-* vinegar, *-acid-* sour, *-ic* relating to]

acetone (ASS-ah-tohn) an acidic ketone body that accumulates during the incomplete breakdown of fats; influences acid-base balance [*acet-* vinegar, *-one* chemical]

acetylcholine (ACh) (ass-ee-til-KOH-leen) type of neurotransmitter used by motor neurons at neuromuscular junctions to stimulate muscle contraction at or in some autonomic synapses (in ganglionic synapses, at all parasympathetic effectors, and at some sympathetic effectors) [*acetyl-* vinegar, *-chole-* bile, *-ine* made of]

acetylcholinesterase (ass-ee-til-koh-lin-ES-ter-ase) enzyme that rapidly inactivates acetylcholine bound to postsynaptic receptors [*acetyl-* vinegar, *-chole-* bile, *-in-* made of, *-ester-* vinegar, *-ase* enzyme]

acid (ASS-id) substance that ionizes in water to release hydrogen ions; substance with a pH of less than 7.0 [*acid* sour]

acid-forming food (ASS-id) any food that lowers the pH after it is absorbed into the body [*acid-* sour]

acidic ketone body (ah-SID-ik KEE-tohn) contributes hydrogen ions to the extracellular fluid; influences acid-base balance [*acid-* sour, *-ic* relating to, *keto-* acetone, *-one* chemical]

acidity (ah-SID-ih-tee) the amount of acid in a solution or the state of having a low pH [*acid-* sour, *-ity* state]

acidophil (ASS-id-oh-fil) cell that stains easily with acid dyes [*acid-* sour, *-phil* love]

acidosis (ass-i-DOH-sis) condition in which there is an excessive proportion of acid in the blood and thus an abnormally low blood pH; opposite of alkalosis [*acid-* sour, *-osis* condition]

acini (ASS-i-nee) any cell of a compound gland that secretes a watery fluid; also called *acinar cells* [*acinus-* grape-like]

acne (AK-nee) *see* **acne vulgaris** [*akme-* point]

acne vulgaris (AK-nee vul-GAR-is) inflammatory skin condition affecting sebaceous gland ducts; occurs most commonly in adolescent years; *see* **comedo** [*akme-* point, *vulgus-* common people]

acoustic nerve (ah-KOOS-tik) cranial nerve VIII; *see* **vestibulocochlear nerve** [*acoust-* hear, *-ic* relating to]

acoustic neuroma (ah-KOOS-tik noo-ROH-mah) glial tumor of the Schwann cells surrounding cranial nerve VIII, causing progressive hearing loss and dizziness [*acoust-* hear, *-ic* relating to, *neuro-* nerve, *-oma* tumor]

acquired cortical color blindness (ah-KWYERD KOHR-tih-kahl) loss of normal color vision caused by damage to the cortex of the cerebrum [*cortic-* bark, *-al* relating to]

acquired immune deficiency syndrome (AIDS) (ah-KWYERD IM-yoon deh-FISH-en-see SIN-drohm) collection of abnormalities caused by advanced HIV infection and characterized by a depression of T-cell immunity [*syn-* together, *-drome* running or (race) course]

acquired immunity (ah-KWYERD i-MYOO-ni-tee) immunity that is obtained after birth through exposure to a specific harmful agent; *see* **adaptive immunity** [*-immun* free, *-ity* state]

acromegaly (ak-roh-MEG-ah-lee) condition caused by hypersecretion of growth hormone after puberty, resulting in enlargement of facial features (e.g., jaw, nose), fingers, and toes [*acro-* extremities, *-mega-* great, *-aly* state]

acrosome (AK-roh-sohm) structure on the tip of the sperm head containing enzymes that break down the covering of the ovum to facilitate conception [*acro-* top or tip, *-some* body]

acrosome reaction (AK-roh-sohm) biochemical reaction that releases digestive enzymes from the sperm head (acrosome) after it attaches to the outer layers of an ovum [*acro-* top or tip, *-some* body]

actin (AK-tin) contractile protein found in the thin myofilaments of skeletal muscle; *see* **sliding filament model** [*act-* act or do, *-in* substance]

action potential (AK-shun poh-TEN-shal) nerve impulse; membrane potential fluctuation of an actively conducting axon [*potent-* power, *-ial* relating to]

active site any location on the surface of a molecule that reacts with another molecule [*actus-* moving]

active transport movement of a substance into or out of a living cell requiring the use of cellular energy [*actus-* moving, *trans-* across, *-portare* carry]

actual osmotic pressure (os-MOT-ik) current osmotic pressure of a solution; *see* **osmotic pressure** [*osmo-* push, *-ic* relating to]

acute (ah-KYOOT) intense; short in duration, as in acute disease [*acut* sharp]

acute anemia (ah-KYOOT ah-NEE-mee-ah) condition of a precipitous drop in the red blood cell count [*acut-* sharp, *an-* without, *-emia* blood condition]

acute bronchitis (ah-KYOOT brong-KYE-tiss) acute form of inflammation of the bronchi of the pulmonary tract [*acut-* sharp, *bronch-* windpipe, *-itis* inflammation]

acute glomerulonephritis (ah-KYOOT gloh-mer-yoo-loh-neh-FRY-tis) most common form of kidney disease; may be caused by a delayed immune response to streptococcal infection [*acut-* sharp, *glomer-* ball, *-ul-* little, *-nephr-* kidney, *-itis* inflammation]

acute lymphocytic leukemia (ALL) (ah-KYOOT LIM-foh-sit-ik loo-KEE-mee-ah) blood cancer that decreases the production of red blood cells, platelets, and nonmalignant lymphocyte cells [*acu-* sharp, *lymph-* water (lymphatic system), *-cyt-* cell, *-ic* relating to, *leuk-* white, *-emia* blood condition]

acute myeloid leukemia (AML) (ah-KYOOT MY-eh-loyd loo-KEE-me-ah) blood cancer that is caused by pathologic transformation of myeloid stem cells [*acu-* sharp, *myel-* marrow, *-oid* like, *leuk-* white, *-emia* blood condition]

acute pain (ah-KYOOT) intense pain [*acut-* sharp]

adaptation (ad-ap-TAY-shun) condition of many sensory receptors in which the magnitude of a receptor potential decreases over a period of time in response to a continuous stimulus [*adapt-* fit to, *-tion* process]

adaptive immunity (ah-DAP-tiv i-MYOO-ni-tee) type of immunity in which specific antigens or particles are recognized, then targeted for destruction; also called *acquired immunity* or *specific immunity* [*adapt-* fit to, *-ive* relating to, *immun-* free, *-ity* state]

Addison disease (AD-i-son) life-threatening condition caused by the hyposecretion of adrenal cortical hormones; caused by tuberculosis, autoimmunity, or other factors [*Thomas Addison* English physician]

adduction (ad-DUK-shun) moving toward the midline of the body; opposite motion of abduction [*ad-* toward, *-duct-* lead, *-tion* process]

adenine (AD-eh-neen) one of the nitrogenous bases of the nucleotides in RNA, DNA, and related molecules [*aden-* gland]

adenocarcinoma (ad-eh-no-kar-si-NO-mah) cancer of glandular epithelium [*adeno-* gland, *-carcin-* cancer, *-oma* tumor]

adenofibroma (ad-eh-no-fye-BROH-mah) benign neoplasm formed in epithelial and connective tissues [*adeno-* gland, *-fibra* fiber, *-oma* tumor]

adenohypophysis (ad-eh-no-hye-POF-i-sis) anterior pituitary gland, which has the structure of an endocrine gland [*adeno-* gland, *-hypo-* under or below, *-physis* growth] *pl.*, adenohypophyses

adenoid (AD-eh-noyd) literally, glandlike; adenoids, or enlarged pharyngeal tonsils, are paired lymphoid structures in the nasopharynx [*adeno-* gland, *-oid* like]

adenoma (ad-eh-NO-mah) benign tumor of glandular epithelium [*adeno-* gland, *-oma* tumor]

adenosine deaminase deficiency (ah-DEN-oh-seen dee-AM-i-nayse) inherited condition that produces immune deficiency [*adenosine* blend of adenine and ribose, *de-* remove, *-amin-* ammonia, *-ase* enzyme]

adenosine triphosphate (ATP) (ah-DEN-oh-seen try-FOS-fayt) chemical compound that provides energy for use by body cells [blend of *adenine* and *ribose*, *tri-* three, *-phosph-* phosphorus, *-ate* oxygen]

adenyl cyclase (AD-eh-nil SYE-klays) enzyme that promotes ATP change into cyclic AMP [*cycl-* recurring, *-ase* enzyme]

adipocyte (AD-i-poh-syte) fat-storing cell [*adipo-* fat, *-cyte* cell]

adipose tissue (AD-i-pohs) fat tissue [*adipo-* fat, *-ose* full of, *tissu-* fabric]

adolescence (ad-oh-LESS-ens) period between puberty (the onset of reproductive maturity) and adulthood [*adolesc-* grow up, *-ence* state]

adrenal (ah-DREE-nal) near the kidney, as in adrenal gland [*ad-* toward, *-ren-* kidney, *-al* relating to]

adrenal cortex (ah-DREE-nal KOR-teks) outer portion of adrenal gland that secretes hormones called *corticoids* [*ad-* toward, *-ren-* kidney, *-al* relating to, *cortex* bark] *pl.*, cortices

adrenal gland (ah-DREE-nal) endocrine gland that rests on the top of each kidney; made up of cortex and medulla regions [*ad-* toward, *-ren-* kidney, *-al* relating to, *gland* acorn]

adrenal medulla (ah-DREE-nal meh-DUL-ah) inner portion of adrenal gland that secretes epinephrine and norepinephrine [*ad-* toward, *-ren-* kidney, *-al* relating to, *medulla* middle] *pl.*, medullae or medullas

adrenaline (ah-DREN-ah-len) *see* **epinephrine** [*ad-* to, *-ren-* kidney, *-al* relating to, *-ine* chemical]

adrenergic (ad-ren-ER-jik) describes axons whose terminals release norepinephrine and epinephrine [*ad-* toward, *-ren-* kidney, *-erg-* work,*-ic* relating to]

adrenocorticotropic hormone (ACTH) (ah-dree-no-kor-teh-koh-TROH-pic HOR-mohn) hormone that stimulates the adrenal cortex to secrete larger amounts of hormones

[*adreno-* gland, *-cortic-* bark, *-trop-* nourish, *-ic* relating to, *hormon-* excite]

adult respiratory distress syndrome (ARDS) (RES-per-ah-tohr-ee dis-TRESS SIN-drohm) syndrome resulting from impairment or removal of surfactant in the alveoli [*re-* again, *-spir-* breathe, *-tory* relating to *syn-* together, *-drome* running or (race) course]

adult stem cell undifferentiated cell found in adults that is capable of producing specialized daughter cells [*adultus-* grown up, *-stem* tree, trunk, *-cell* storeroom]

adulthood (ah-DULT-hood) developmental period after adolescence [*adultus-* grown up]

adventitia (ad-ven-TISH-ah) shortened form of *tunica adventitia* [*adventitia* coming from abroad]

aerobic (air-OH-bik) relating to the use of oxygen, as in aerobic respiration [*aer-* air, *-bi-* life, *-ic* relating to]

aerobic respiration (air-OH-bik res-pi-RAY-shun) catabolic process; the stage of cellular respiration requiring oxygen [*aero-* air, *-b-* (from -bio-) life, *-ic* relating to, *re-* again, *-spir-* breathe, *-tion* process]

aerobic training (air-OH-bik) continuous vigorous exercise requiring the body to increase its consumption of oxygen and develop the muscles' ability to sustain activity over a long time; also known as *endurance training* [*aer-* air, *-bi-* life, *-ic* relating to]

afferent (sensory) neuron (AF-fer-ent NOO-ron) neuron that carries impulses toward the central nervous system from the periphery; sensory neuron [*a[d]-* toward, *-fer-* carry, *-ent* relating to, *neuron-* nerve]

afferent division (AF-fer-ent) sensory division (incoming pathways) of the nervous system [*a[d]-* toward, *-fer-* carry, *-ent* relating to]

afferent impulse (AF-fer-ent IM-pulse) impulse traveling toward the central nervous system [*a[d]-* toward, *-fer-* carry, *-ent* relating to]

afferent nervous system (AF-fer-ent) subdivision of the peripheral nervous system; consists of all incoming sensory nerves [*a[d]-* toward, *-fer-* carry, *-ent* relating to]

agglutinogen (ah-gloo-TIN-oh-jen) substance that stimulates agglutination (clumping), particularly of red blood cells; antigens present on red blood cell membranes [*agglutin-* glue, *-gen* produce]

aggregated lymphoid nodules (ag-rah-GAYT-ed LIM-foyd NOD-yools) isolated nodules of lymphatic tissue in the intestinal wall; also called *Peyer's patches* [*a[d]-* to, *-grega-* collect, *lymph-* water, *-oid* like, *nod-* knot, *-ule* small]

agonist (AG-ah-nist) agent that works like or with (rather than against) another agent [*agon-* struggle, *-ist* agent]

agranulocyte (ah-GRAN-yoo-loh-syte) white blood cells without cytoplasmic granules [*a-* without, *-granul* little grains or granules, *-cyte* cell]

air-contrast barium enema study (BAHR-eeum EN-e-mah) diagnostic study that outlines the bowel with barium and then adds air to enhance the presence of lesions [*contra-* against, *barys-* heavy, *enienai-* to send in]

alarm reaction the initial response to stress [*arma-* to arm, *re-* again, *-agere* to act]

albinism (AL-bi-niz-em) recessive, inherited condition characterized by a lack of the dark brown pigment melanin in the skin, eyes, and hair, resulting in vision problems and susceptibility to sunburn and skin cancer; ocular albinism is a lack of pigment in the layers of the eyeball [*alb-*white, *-in-* characterized by, *-ism* state]

albumin (al-BYOO-min) plasma protein that aids in the regulation of the osmotic concentration of the blood [*alb-* white]

aldosterone (AL-doh-steh-rohn *or* al-DAH-stair-ohn) hormone that stimulates the kidney to retain sodium, ions, and water; only physiologically important mineralocorticoid [*aldo-* aldehyde, *-stero-* solid or steroid derivative, *-one* chemical]

aldosterone mechanism (al-DOS-ter-own MEK-ah-niz-em) homeostatic mechanism that restores normal extracellular fluid volume when it decreases below normal [*aldo-* aldehyde, - *stero-* solid or steroid derivative, *-one* chemical, *mechan-* machine, *-ism* state]

aldosteronism (al-doh-STAIR-on-iz-em) hypersecretion of aldosterone [*aldo-* aldehyde, *-stero-* solid or steroid derivative, *-on-* chemical, *-ism* state]

alimentary canal (al-eh-MEN-tar-ee kah-NAL) the digestive tract as a whole [*aliment-* nourishment, *-ary* relating to]

alkaline (AL-kah-lin) refers to a substance that in solution has a pH of greater than 7.0 [*alkal-* ashes, *-ine* relating to]

alkalinity (al-kah-LIN-ih-tee) state of having a high pH; amount of base or alkaline in a solution [*alkal-* ashes, *-in-* relating to, *-ity* state]

alkalosis (al-kah-LOH-sis) condition in which there is an excessive proportion of alkali (base) in the blood; opposite of acidosis [*alkal-* ashes, *-osis* condition]

allergen (AL-er-jen) any substance that produces an allergic reaction [*all-* other, *-erg-* work, *-gen* produce]

allergy (AL-er-jee) a type of hyperimmunity [*all-* other, *-erg-* work, *-y* state]

allostasis (al-lo-STAY-sis) the physiological processes used by the body to restore homeostasis during stress [*allo-* different, *-stasis* standing still]

allosteric effector (al-oh-STEER-ik ee-FEKT-or) an agent that alters the function of an enzyme by changing the shape of the enzyme's active site [*allo-* another or different, *-ster-* solid, *-ic* relating to, *effect* to accomplish]

alopecia (al-o-PEE-sha) loss of hair; baldness [*alopec-* fox, *-ia* condition]

alpha (α) receptor (AL-fah ree-SEP-tor) adrenergic receptor for norepinephrine [*alpha* first letter of Greek alphabet, *recept-* receive, *-or* agent]

alpha cell (AL-fah) pancreatic islet cell that secretes glucagon; also called *A cell* [*alpha* (α) first letter of Greek alphabet, *cell* storeroom]

alpha motor neuron (AL-fah MOH-tor NOO-ron) generator of efferent impulses that stimulate regular muscle fibers to contract [*alpha* (α) first letter of Greek alphabet, *mot-* movement, *-or* agent, *neuron* nerve]

alpha particle (AL-fah PAR-ti-kul) radioactive particle consisting of two protons plus two neutrons [*alpha* (α) first letter of Greek alphabet]

alpha-fetoprotein (AFP) (AL-fah-fee-toh-PRO-teen) normal fetal protein; presence in adult suggests liver or germ cell cancer [*alpha-* first letter of Greek alphabet (α), *feto-* offspring (fetus)]

alveolar (al-VEE-oh-lar) relating to a small cavity, such as an alveolus of lung [*alveo-hollow, -ola-* little, *-ar* relating to]

alveolar cell (al-VEE-oh-lar) milk-producing cell that releases secretions into ducts of the breast [*alveo- hollow, -ola-* little, *-ar* relating to]

alveolar duct (al-VEE-oh-lar) airway that branches from the smallest bronchioles; alveolar sacs arise from alveolar ducts [*alve-* hollow, *-ol-* little, *-ar* relating to]

alveolar ventilation (al-VEE-oh-lar ven-ti-LAY-shun) volume of inspired air that actually reaches the alveoli [*alve-* hollow, *-ol-* little, *-ar* relating to, *vent-* fan or create wind, *-tion* process]

alveolus (al-VEE-oh-lus) literally, a small cavity; alveoli of lungs are microscopic sac-like dilations of terminal bronchioles; gas exchange in the lungs occurs across the membranes of the alveoli [*alve-* hollow, *-olus* little] *pl.*, alveoli

Alzheimer disease (AD) (AHLZ-hye-mer) syndrome characterized by dementia, usually beginning in mid to late adulthood and caused by a combination of factors, including genetic and environmental [*Alois Alzheimer* German neurologist, *dis-* opposite of, *-ease* comfort]

amenorrhea (ah-men-oh-REE-ah) absence of normal menstruation [*a-* without, *-men-* month, *-rrhea* flow]

amine (AM-een) organic compound containing nitrogen; neurotransmitter synthesized from amino acid molecules [*amine* ammonia compound]

amino acid (ah-MEE-no) type of chemical unit from which proteins are built; also have other functions made up of a carbon atom to which are bonded an amino group and carboxyl group [*amino* NH_2, *acid* sour]

amino acid derivative hormone (ah-MEE-no ASS-id deh-RIV-ah-tiv HOR-mohn) category of nonsteroid hormones; each hormone is derived from a single amino acid molecule [*amino* NH_2, *acid* sour, *hormon-* excite]

amniocentesis (am-nee-oh-sen-TEE-sis) procedure in which a sample of amniotic fluid is removed with a syringe for use in genetic testing, often to produce a karyotype of the fetus [*amnio-* birth membrane, *-centesis* a pricking]

amniotic cavity (am-nee-OT-ik KAV-i-tee) cavity within the blastocyst that eventually becomes a fluid-filled sac in which the embryo will float during development [*amnio-* fetal membrane, *-ic* relating to, *cav-* hollow, *-ity* state]

amphiarthrosis (am-fee-ar-THROH-sis) slightly movable joint such as the one that connects the two pubic bones [*amphi-* both sides, *-arthr-* joint, *-osis* condition] *pl.*, amphiarthroses (am-fee-ar-THROH-seez)

ampulla (am-PUL-ah) saclike dilation of a tube or duct; found at end of each semicircular duct, contains crista ampullaris [*ampu-* flask, *-ulla* little] *pl.*, ampullae

amygdaloid nucleus (ah-MIG-dah-loyd NOO-klee-us) basal nucleus (region of gray matter of the deep cerebrum) at the tip of the caudate nucleus [*amygdal-* almond, *-oid* like] *pl.*, nuclei

amylase (AM-eh-lays) enzyme that digests carbohydrates [*amyl-* starch, *-ase* enzyme]

anabolic hormone (an-ah-BOL-ik HOR-mohn) hormone that stimulates anabolism in the target organ [*anabol-* build up, *-ic* relating to, *hormon-* excite]

anabolic steroid (an-ah-BOL-ik STAYR-oyd) any steroid (lipid) hormone that promotes anabolism, such as testosterone [*anabol-* build up, *-ic* relating to, *stero-* solid, *-oid* like]

anabolism (ah-NAB-oh-liz-em) cells making complex molecules (e.g., hormones) from simpler compounds (e.g., amino acids); opposite of catabolism [*anabol-* build up, *-ism* action]

anaerobic (an-air-OH-bik) relating to a process that requires no oxygen [*an-* without, *-aer-* air, *-bi-* life, *-ic* relating to]

anaerobic pathway (an-air-OH-bik) catabolic process; stage of cellular respiration not requiring oxygen; although it is actually a type of fermentation, it is often called "anaerobic respiration" [*an-* without, *-aero-* air, *-b-* (from *-bio-*) life, *-ic* relating to]

anal canal (AY-nal kah-NAL) passage from the colon to the outside of the body [*an-* ring (anus), *-al* relating to]

anal fissure (AY-nal FISH-ur) minor lacerations in the lining of the anus or anal canal [*an-* ring (anus), *-al* relating to, *fissur-* cleft]

anal fistula (AY-nal FISS-tyoo-lah) passageway that often develops between the rectal wall and skin surrounding the anus [*an-* ring (anus), *-al* relating to, *fistula* pipe] *pl.*, fistulae *or* fistulas

anal triangle (AY-nal TRY-ang-gul) area surrounding anus [*an-* ring (anus), *-al* relating to]

anaphase (AN-ah-fayz) latter stage of mitosis; duplicate chromosomes move to poles of dividing cell [*ana-* apart, *-phase* stage]

anaphylactic shock (an-ah-fih-LAK-tik) type of severe allergic reaction characterized by severe circulatory failure [*ana-* without, *-phylact-* protection, *-ic* relating to]

anaplasia (an-ah-PLAY-zee-ah) growth of abnormal (undifferentiated) cells, as in a tumor or neoplasm [*ana-* without, *-plasia* shape]

anastomosis (ah-nas-toh-MOH-sis) connection between vessels that allows collateral circulation [*ana-* anew, *-stomo-* mouth, *-osis* condition] *pl.*, anastomoses

anatomical dead space (an-ah-TOM-i-kal) air passageways that contain air that does not reach the alveoli [*ana-* apart, *-tom-* cut, *-ical* relating to]

anatomical position (an-ah-TOM-i-kal po-ZISH-un) the standard reference position for the body; standing with arms hanging at sides with palms forward, gives meaning to directional terms [*ana-* apart, *-tom-* cut, *-ical-* relating to, *posit-* place, *-tion* state]

anatomy (ah-NAT-o-mee) study of the structure of an organism and the relationships of its parts [*ana-* apart, *-tom-* cut, *-y* action]

androgen (AN-droh-jen) hormone that promotes development and maintenance of male characteristics [*andro-* male, *-gen* produce]

androgen-binding protein (ABP) (AN-droh-jen-BYND-ing PRO-teen) specialized protein that binds to testosterone and increases concentration within the seminiferous tubules [*andro-* male, *-gen* produce, *prote-* first rank, *-in* substance]

anemia (ah-NEE-me-ah) deficient number of red blood cells, or deficient hemoglobin [*an-* without, *-emia* blood condition]

anemia of chronic disease (ah-NEE-mee-ah KRON-ik) condition of abnormally low hemoglobin secondary to a long-lasting illness [*an-* without, *-emia* blood condition, *chron-* time, *-ic* relating to]

anesthesia (an-es-THEE-zhah) state in which a person lacks the feeling of pain [*an-* absence, *-esthesia* feeling]

anesthetic (an-es-THET-ik) substance that reduces or eliminates the sensation of pain [*an-* absence, *-esthesia* feeling, *-ic* pertaining to]

aneurysm (AN-yoo-riz-em) abnormal widening of the arterial wall; aneurysms promote formation of thrombi and also tend to burst [*aneurysm* widening]

angina pectoris (an-JYE-nah PEK-tor-iss) severe chest pain resulting when the myocardium is deprived of sufficient oxygen [*angina* strangling, *pector-* breast, *-is* relating to]

angiogenesis (an-jee-oh-JEN-es-is) physiological process in which new blood vessels are formed [*angi-* vessel *-genesis* origin]

angiography (an-jee-AH-graf-ee) radiography in which radiopaque contrast medium is injected into a vessel to make it more visible in a medical image (angiogram); in arteries the image is called *arteriogram*; in veins, a *venogram* or *phlebogram*; in lymphatic vessels, a *lymphangiogram* [*angi-* vessel, *-graph-* draw, *-y* process]

angioplasty (AN-jee-oh-plass-tee) medical procedure in which vessels occluded by arteriosclerosis are opened (i.e., the channel for blood flow is widened) [*angio-* vessel, *-plasty* surgical repair]

angiotensin I (an-jee-oh-TEN-sin) substance formed by conversion of angiotensinogen by renin; causes vasoconstriction and an increase in blood pressure [*angio-* vessel,

-tens- pressure or stretch, *-in* substance, *I* Roman numeral one]

angiotensin II (an-jee-oh-TEN-sin) substance formed in the lungs by enzyme conversion of angiotensin I; ultimately stimulates secretion of aldosterone; causes vasoconstriction [*angio-* vessel, *-tens-* pressure or stretch, *-in* substance, *II* Roman numeral two]

angiotensinogen (an-jee-oh-TEN-sin-oh-jen) normal constituent of blood; a precursor to angiotensin [*angio-* vessel, *-tens-* pressure or stretch, *-in-* substance, *-gen* produce]

angular movement (ANG-gyoo-lar) body movement that increases or decreases the angle of a joint [*angulus-* angle, *movere-* to move]

anion (AN-eye-on) negatively charged molecule (negative ion) [*ana-* up, *-ion* to go (ion)]

ankle jerk reflex extension of the foot in response to tapping of the Achilles tendon [*re-* again, *-flex* bend]

annulus fibrosis (AN-yoo-lus fye-BROH-sis) tough outer edge of intervertebral disk; surrounds nucleus pulposus [*annulus* ring, *fibrosis* fibrous]

anorexia (an-oh-REK-see-ah) loss of appetite (a symptom, rather than a distinct disorder) [*an-* without, *-orex-* appetite, *-ia* condition]

anorexia nervosa (an-oh-REK-see-ah ner-VOH-sah) behavioral eating disorder characterized by chronic refusal to eat, often related to an abnormal fear of becoming obese [*an-* without, *-orex-* appetite, *-ia* condition, *nerv-* nerve, *-osa* relating to]

anorexigenic (an-oh-rek-sih-JEN-ik) relating to an agent that reduces appetite [*an-* without, *-orex-* appetite, *-gen-* produce, *-ic* relating to]

anosmia (AN-oz-mee-ah) inability to smell [*an-* without, *-osm-* smell, *-ia* condition]

antagonism (an-TAG-oh-niz-em) situation in which one agent (such as a hormone or muscle) produces the opposite effect of another agent [*ant-* against, *-agon-* struggle, *-ism* condition of]

antagonist (an-TAG-oh-nist) agent that has an opposing effect or works against another agent [*ant-*against, *-agon* struggle, *-ist* agent]

antagonist muscle (an-TAG-oh-nist) muscle that directly opposes prime movers; for example, muscles that flex the arm are antagonists to muscles that extend it [*ant-*against, *agon* struggle, *-ist* agent, *mus-*mouse, *-cle* small]

antenatal medicine (an-tee-NAY-tal) therapy used on an embryo or fetus [*ante-* before, *-nat-* birth, *-al* relating to]

anterior (an-TEER-ee-or) front, or ventral; opposite of posterior, or dorsal [*ante-* front, *-er-* more, *-or* quality]

anterior cavity (of eye) (an-TEER-ee-or) entire space located in front of the lens of the eye; divided into anterior and posterior chambers [*ante-* front, *-er-* more, *-or* quality, *cav-* hollow, *-ity* state]

anterior corticospinal tract (an-TEER-ee-or KOR-ti-koh-spy-nal) coordinates individual or small groups of muscles (hands, fingers, feet, toes) of the same side [*ante-* front, *-er-* more, *-or* quality, *cortic-* bark, *-spin-* backbone, *-al* relating to, *tract-* trail]

anterior cul-de-sac (an-TEER-ee-or kul-deh-sak) space created by the protrusion of the cervix into the lumen of the vagina; formed by the anterior ligament [*ante-* front, *-er-* more, *-or* quality, *cul-de-sac* bottom of the bag] *pl.*, culs-de-sac or cul-de-sacs

anterior fornix (an-TEER-ee-or FOR-niks) space created by the protrusion of the cervix into the lumen of the vagina; increases probability of reproductive success by retaining seminal fluid [*ante-* front, *-er-* more, *-or* quality, *fornix* arch] *pl.*, fornices

anterior ligament (an-TEER-ee-or LIG-ah-ment) fold of peritoneum formed by the extension of the peritoneum on the anterior surface of the uterus to the posterior surface of the bladder [*ante-* front, *-er-* more, *-or* quality, *liga-* bind, *-ment* condition]

anterior spinothalamic tract (an-TEER-ee-or SPY-no-tha-lam-ik) responds to crude touch and pressure [*ante-* front, *-er-* more, *-or* quality, *spino-* backbone, *-thalam-* inner chamber, *-ic* relating to]

anterior tibial vein (an-TEER-ee-or TIB-ee-al) vein along the front of the leg (shin) [*ante-* front, *-er-* more, *-or* quality, *tibia* shin bone, *-al* relating to]

anthrax (AN-thraks) bacterial infection caused by *Bacillus anthracis*, ordinarily affecting herbivores (sheep, cattle, goats, antelope) and often killing them; occurs rarely in humans through accidental or intentional exposure to bacterial spores through inhalation or skin contact; inhalation anthrax is life-threatening but can be treated successfully with drugs; cutaneous anthrax is less serious, characterized by a reddish-brown patch on the skin that ulcerates and then forms a dark, nearly black scab, followed by muscle pain, internal hemorrhage (bleeding), headache, fever, nausea, and vomiting [*anthrax* boil]

antianemic principle (an-tee-an-NEE-mik) factor that maintains a normal number of red blood cells; vitamin B_{12} [*anti-* against, *-an-* without, *-emia-* blood condition, *-ic* relating to]

antiangiogenesis agent (AN-tee-AN-jee-oh-jen-eh-sis) class of chemotherapy drugs used in cancer treatment that inhibits development of new blood vessels in a tumor; *see* **rational drugs** [*anti-* against, *angi-* vessel, *-genesis* origin]

antibody (AN-ti-bod-ee) plasma protein produced by B-lymphocytes that destroys or inactivates a specific substance (antigen) that has entered the body [*anti-* against]

antibody titer (AN-ti-bod-ee TYE-ter) measurement of the amount of antibody in the plasma [*anti-* against, *titer* proportion (in a solution)]

antibody-mediated immunity (AN-ti-bod-ee-MEE-dee-ayt-ed i-MYOO-nih-tee) immunity that is produced when antibodies render antigens unable to harm the body; also called *humoral immunity* [*anti-* against, *medi-* middle, *-ate* process, *immun-* free, *-ity* state]

anticoagulant (an-tee-koh-AG-yoo-lant) agent that opposes blood clotting [*anti-*against, *-coagul-* curdle, *-ant* agent]

anticoagulant drug treatment (an-tee-koh-AG-yoo-lant) therapy involving the use of anticlotting agents in the blood [*anti-*against, *-coagul-* curdle, *-ant* agent]

antidepressant (an-tee-deh-PRESS-ant) drug that inhibits feelings of depression or sadness [*anti-* against, *-de-* down, *-press-* press, *-ant* agent]

antidiuresis (an-tee-dye-yoo-REE-sis) opposing the production of a large urine volume [*anti-* against, *-dia-* through, *-uret-* urination, *-esis* condition]

antidiuretic hormone (ADH) (an-tee-dye-yoo-RET-ik HOR-mohn) hormone produced in the posterior pituitary gland to regulate the balance of water in the body by accelerating reabsorption of water in the kidney tubules; also called *arginine vasopressin (AVP)* [*anti-* against, *-dia-* through, *-uret-* urination, *-ic* relating to, *hormon-* excite]

antigen (AN-ti-jen) substance, usually a protein fragment, that causes an immune response [*anti-* against, *-gen* produce]

antigen-antibody complex (AN-ti-jen-AN-ti-bod-ee KOM-pleks) combination of an antigen with its complementary antibody [*anti-* against, *-gen* produce, *anti-* against, body, *complex* embrace]

antigenic determinant (AN-ti-jen-ik dih-TUR-mah-nant) region of an antibody molecule that binds to an antigen particle [*anti-* against, *-gen* produce, *-ic* relating to, *determin-* limit, *-ant* agent of]

antigen-presenting cell (APC) (AN-ti-jen) any of a variety of immune cells that present protein fragments (antigens) on their surface and thus allow recognition and reaction by other immune system cells; include macrophages and dendritic cells (DCs) and B cells [*anti-* against, *-gen* produce, *presenting*, *cell* storeroom]

antihistamine (an-ti-HISS-tah-meen) agent that inhibits the histamine, an inflammation agent [*anti-* against, *-histo-* tissue, *-amine* ammonia compound]

antioxidant (an-tee-OK-seh-dent) agent that inhibits chemical oxidation [*anti-* against, *-oxi-* sharp (oxygen), *-ant* agent]

antiplatelet drug treatment (an-tee-PLAYT-let) therapy that inhibits platelets [*anti-* against, *-plate-* flat, *-let* small]

anuria (ah-NOO-ree-ah) lack or failure to produce urine [*a-* not, *-ur-* urine, *-ia* condition]

aorta (ay-OR-tah) largest systemic artery; extends directly from the left ventricle [*aort-* lifted, *-a* thing] *pl.*, aortae *or* aortas

aortic arch (ay-OR-tik) 180-degree curve of the aorta, shortly after it leaves the left ventricle [*aort-* lifted, *-ic* relating to]

aortic baroreceptor (ay-OR-tik bar-oh-ree-SEP-tor) stretch receptor located in the aorta that is sensitive to changes in blood pressure [*aort-* lifted, *-ic* relating to, *baro-* pressure, *-recept-* receive, *-or* agent]

aortic body (ay-OR-tik) small cluster of chemosensitive cells that respond to changes in blood levels of carbon dioxide and oxygen [*aort-* lifted, *-ic* relating to]

aortic reflex (ay-OR-tik REE-fleks) increase or decrease in heart rate as a result of sensory nerve fibers in the wall of aorta responding to blood pressure [*aort-* lifted, *-ic* relating to, *re-* back or again, *-flex* bend]

aortic regurgitation (ay-OR-tik ree-gur-jih-TAY-shun) reflux of blood from the aorta to the ventricle [*aort-* lifted, *-ic* relating to, *re-* again, *-gurgit-* flow, *-ation* process]

aortic (semilunar) valve (ay-OR-tic [sem-i-LOO-nar]) valve between the aorta and left ventricle that prevents blood from flowing back into the ventricle [*aort-* lifted, *-ic* relating to]

apatite (AP-ah-tyte) crystals of calcium and phosphate that contribute to the hardness of bone [*apat-* deceit, *-ite* mineral]

Apgar score (AP-gar) system of assessing general health of newborn infant, in which heart rate, respiration, muscle tone, skin color and response to stimuli are scored (a perfect total score is 10) [*Virginia Apgar* American physician]

apex (AY-peks) the point or tip of a structure; *see also* **apical** [*apex* tip] *pl.*, apices

aphasia (ah-FAY-zee-ah) language deficit caused by damage in speech centers of the brain [*a-* without, *-phasia* speech]

apical (AY-pik-al) relating to the apex (tip) of an organ, cell, or other structure; in a cell, often refers to the surface facing the lumen of the organ [*apic-* tip, *-al* relating to]

aplastic anemia (a-PLAS-tik ah-NEE-mee-ah) abnormally low number of red blood cells caused by destruction of bone marrow by drugs, toxic chemicals, or radiation [*a-* without, *-plast-* form, *-ic* relating to, *a-* without, *-nemia* condition of red blood cell deficiency]

apnea (AP-nee-ah) temporary cessation of breathing [*a-* not, *-pne-* breathe, *-a* condition]

apneusis (ap-NYOO-sis) cessation of breathing in the inspiratory position [*a-* not, *-pneu-* breathe, *-sis* condition]

apneustic center (ap-NYOO-stik) regulatory area located in the pons; stimulates the inspiratory center to increase the length and depth of inspiration [*a-* not, *-pneus-* breathing, *-ic* relating to]

apocrine gland (AP-oh-krin) gland that collects its secretions near the apex of the cell and then releases them by pinching off the distended end; for example, mammary gland [*apo-* from, *-crin-* secrete, *gland* acorn]

apocrine sweat gland (AP-oh-krin) sweat glands located in the axillae and genital regions; these glands enlarge and begin to function at puberty [*apo-* from, *-crin-* secrete, *gland* acorn]

aponeurosis (ap-oh-nyoo-ROH-sis) broad, flat sheet of connective tissue [*apo-* from, *-neur-* sinew, *-osis* condition] *pl.*, aponeuroses

apoptosis (app-o-TOH-sis *or* app-op-TOH-sis) nonpathological, programmed cell death in which specific biochemical steps within the cell lead to the fragmentation of the cell and removal of the pieces by phagocytic cells; occurs when cells are no longer needed and is the normal process by which our tissues remodel themselves [*apo-* away, *-ptosis* falling]

appendicitis (ah-pen-di-SYE-tis) inflammation of the vermiform appendix [*appendic-* hang upon, *-itis* inflammation]

appendicolith (ah-pen-DIK-oh-lith) hardened nodule that may form within the appendix [*appendic-* hang upon, *-lith* a stone]

appendicular skeleton (ah-pen-DIK-yoo-lar SKEL-eh-ton) bones of the upper and lower extremities of the body [*append-* hang upon, *-ic-* relating to , *-ul-* little, *-ar* relating to]

appetite center (AP-ah-tyte) cluster of neurons in the lateral hypothalamus whose impulses cause an increase in appetite [*appetere-* to long for]

appositional growth (ap-oh-ZISH-un-al) process by which a flat bone or cartilage grows in size by addition of bony cartilage at its surface; also called *exogenous growth* [*apposit-* to put near, *-ion* process, *-al* relating to]

aqueous humor (AY-kwee-us HYOO-mor) watery fluid that fills the anterior chamber of the eye, in front of the lens [*aqu-* water, *-ous* relating to]

arachnoid (ah-RAK-noyd) weblike; particularly the middle layer of the meninges [*arachn-* spider(web), *-oid* like]

arbor vitae (AR-bor VI-tay) internal white matter of the cerebellum [*arbor* tree, *vitae* of life] *pl.*, arbores vitae

areola (ah-REE-oh-lah) region of skin of the breast that surrounds the nipple [*are-* area or space, *-ola* little] *pl.*, areolae, areoles, *or* areolas

areolar tissue (ah-REE-oh-lar) a type of connective tissue consisting of fibers and a variety of cells embedded in a loose matrix of soft, sticky gel [*are-* open space, *-ola-* little, *-ar* relating to *tissue-* fabric]

arginine vasopressin (AVP) (AHR-jih-neen vas-oh-PRES-in) see **antidiuretic hormone** [*arginine* type of amino acid, *vas-* vessel, *-press-* pressure, *-in* substance]

arrector pili muscle (ah-REK-tor PYE-lye) smooth muscles of the skin, attached to hair follicles; when contraction occurs, the hair stands up, resulting in "goose bumps" [*arrector* raiser, *pili* of hair, *mus-* mouse, *-cle* small]

arrhythmia (ah-RITH-mee-ah) term referring to any abnormality of cardiac rhythm ; also called **dysrhythmia** [*a-* without, *-rhythmos* rhythm, *-ia* condition]

arterial anastomosis (ar-TEER-ee-al ah-nas-toh-MOH-sis) junction between two arteries [*arteria-* vessel, *-al* relating to, *ana-* anew, *-stomo-*mouth, *-osis* condition] *pl.*, anastomoses

arterial blood Po_2 (ar-TEER-ee-al) partial pressure of oxygen in the blood of arteries [*arteri-* airpipe (artery), *-al* relating to; *P* pressure, O_2 oxygen]

arterial blood pressure (ar-TEER-ee-al) hydrostatic pressure of the blood in the arteries [*arteri-* airpipe (artery), *-al* relating to]

arteriogram (ar-TEER-ee-oh-gram) *see* **angiography** [*arteri-* artery, *-gram* drawing]

arteriole (ar-TEER-ee-ohl) small branch of an artery [*arteri-* vessel, *-ole* little]

arteriosclerosis (ar-tee-ree-oh-skleh-ROH-sis) hardening of arteries; materials such as lipids (as in atherosclerosis) accumulate in arterial walls, often becoming hardened via calcification [*arteri-* vessel (artery), *-sclero-* harden, *-osis* condition]

arteriovenous anastomosis (ar-teer-ee-oh-VEE-nus ah-nas-teh-MOH-sis) connection between an artery and a vein [*arteri-* vessel, *-ven-* vein, *-ous* relating to, *ana-* anew, *-stomo-*mouth, *-osis* condition] *pl.*, anastomoses

artery (AR-ter-ee) vessel carrying blood away from the heart [*arteri-* vessel]

arthritis (ar-THRY-tis) inflammation of joint structures [*arthr-* joint, *-itis* inflammation]

arthroplasty (AR-throh-plas-tee) the total or partial replacement of a diseased joint with an artificial device (prosthesis) [*arthr-* joint, *-plasty* surgical repair]

articular cartilage (ar-TIK-yoo-lar KAR-ti-lij) layer of hyaline cartilage covering the joint surfaces of epiphyses [*artic-* joint, *-ul-* little, *-ar* relating to, *cartilag* cartilage]

articulation (ar-tik-yoo-LAY-shun) joint [*artic-* joint, *-ul-* little, *-ation* state]

artificial immunity (ar-ti-FISH-al i-MYOO-ni-tee) immunization; deliberate exposure to potentially harmful antigens; as opposed to natural immunity [*artific-* not natural, *-al* relating to; *immun-* free, *-ity* state of]

artificial pacemaker (ar-ti-FISH-al PAYS-maykers) an electrical device that is implanted into the heart to treat problems with heart conduction [*artific-* not natural, *-al* relating to]

arytenoid (ar-eh-TEH-noyd) either of a pair of cartilages found in the supporting framework of the larynx [*aryten-* ladle, *-oid* like]

ascending aorta (ah-SEND-ing ay-OR-tah) portion of the aorta extending from the aortic valve to the aortic arch [*a[d]-* toward, *-scend-* climb, *aort-* lifted, *-a* thing] *pl.*, aortae *or* aortas

ascending colon (ah-SEND-ing KOH-lon) portion of the colon extending from the cecum to the hepatic flexure [*a[d]-* toward, *-scend-* climb, *colon* large intestine]

ascending tract (ah-SEND-ing) spinal cord tract that conducts impulses up the cord to the brain [*a[d]-* toward, *-scend-* climb,, *tract-* trail]

ascites (ah-SYE-tees) effusion (inflow of watery fluid) in the abdominal cavity; abdominal bloating [*askos-* bag]

aspiration biopsy cytology (ass-pih-RAY-shen BYE-op-see SYE-TOL-oh-jee) procedure that draws myeloid tissue into a syringe; allows for examination of tissue to confirm or reject diagnosis [*a-* act of, *-spir-* breathe, *-ation* process, *bio-* life, *-ops-* view, *-y* act of, *cyt-* cell, *-o-* combining form, *-log-* words (study of), *-y* activity]

assimilation (ah-sim-i-LAY-shun) the process of incorporation of a substance into the body [*assimila-* make alike, *-tion* process]

association tract (ah-so-see-AY-shun) most common cerebral tract; extends from one convolution to another in the same hemisphere [*associare-* to unite; *tractus-* trail]

aster (AS-ter) a starlike formation of microtubules (astral fibers) radiating outward from the centrosome (containing centrioles) during cell division; astral fibers anchor the centrosome and the spindle as chromosomes are pulled apart [*aster*, star]

asthma (AZ-mah) chronic obstructive pulmonary disorder characterized by recurring spasms of muscles in bronchial walls accompanied by edema and mucus production, making breathing difficult [*asthma* panting]

astigmatism (ah-STIG-mah-tiz-em) irregular curvature of the cornea or lens that impairs formation of a well-focused image in the eye [*a-* not, *-stigma-* point, *-ism* condition]

astrocyte (ASS-troh-syte) star-shaped neuroglial cell [*astro-* star shaped, *-cyte* cell]

astrocytoma (ass-troh-sye-TOH-mah) slow-growing neoplasm of astrocyte cells in the central nervous system [*astro-* star, *-cyt-* cell, *-oma* tumor]

atherectomy (ath-er-EK-to-mee) type of percutaneous coronary intervention (PCI) that uses a catheter to introduce lasers, drills, or spinning loops of wire to remove atherosclerotic plaque from an artery and thus clear the way for normal blood flow [*ather-* gruel, *-ec-* out, *-tom-* cut, *-y* action]

atherosclerosis (ath-er-oh-skleh-ROH-sis) type of "hardening of the arteries" in which lipids and other substances build up on the inside wall of blood vessels [*ather-* meal, *-sclero-* harden, -osis condition]

atom (AT-om) smallest particle of a chemical element that retains the properties of that element; particles that combine to form molecules (chemical building blocks) [*atom* indivisible]

atomic force microscopy (AFM) (ah-TOM-ik fors my-KRAH-skah-pee) form of microscopy in which an extremely fine-tipped needle drags over the surface to reveal the outer limits of the atoms and molecules that make up the surface [*atom-* indivisible, *-ic* relating to, *micro-* small, *-scop-* see, *-y* activity]

atomic mass (ah-TOM-ik) number of protons plus the number of neutrons in an atom of an element; also called *mass number* [*atom-* indivisible, *-ic* relating to]

atomic number (ah-TOM-ik) number of protons in an atom of an element [*atom-* indivisible, *-ic* relating to]

atomic weight (ah-TOM-ik) average (or range of) atomic mass of an atom of an element as it is found in nature; atomic weights are usually found in the periodic table of elements [*atom-* indivisible, *-ic* relating to]

ATP synthase (SIN-thays) enzyme that produces ATP molecules [*ATP* adenosine triphosphate, *syn-* together, *-ase* enzyme]

atrial fibrillation (A-fib or AF) (AY-tree-al fibril-LAY-shun) frequent, chaotic premature contractions of the atrium [*atri-* entrance courtyard, *-al* relating to, *fibr-* fiber, *-illa-* little, *-ation* process]

atrial natriuretic hormone (ANH) (AY-tree-al nay-tree-yoo-RET-ik HOR-mohn) hormone produced by the atrium that promotes secretion of sodium into the urine and therefore loss of water from the body [*atria-*entrance courtyard (atrium of heart), *-al* relating to, *natri-* natrium (sodium), *-uret-* urination, *-ic* relating to, *hormon-* excite]

atrioventricular (AV) bundle (ay-tree-oh-ven-TRIK-yoo-lar BUN-del) bundle of specialized cardiac muscle fibers that extend from the AV node to the subendocardial branches (Purkinje fibers); involved in coordination of heart muscle contraction [*atrio-* entrance courtyard, *-ventr-* belly, *-icul-* little, *-ar* relating to]

atrioventricular (AV) node (ay-tree-oh-ven-TRIK-yoo-lar) a small mass of special cardiac muscle tissue; part of the conduction system of the heart [*atrio-* entrance courtyard, *-ventr-* belly, *-icul-* little, *-ar* relating to, *-ar* relating to, *nod-* knot]

atrioventricular (AV) valve (ay-tree-oh-ven-TRIK-yoo-lar) either of two valves that separate the atrial chambers from the ventricles; also called *cuspid valve* [*atrio-* entrance courtyard, *-ventr-* belly, *-icul-* little, *-ar* relating to]

atrium (AY-tree-um) one of the upper chambers of the heart; receives blood from either the systemic or pulmonary circulation [*atrium* entrance courtyard] *pl.*, atria

atrophy (AT-ro-fee) wasting away of tissue; decrease in size of a part; sometimes referred to as *disuse atrophy* [*a-* without, *-troph-* nourishment, *-y* state]

auditory (AW-di-toh-ree) pertaining to hearing or the ear [*audit-* hear, *-ory* relating to]

auditory nerve (AW-di-toh-ree) cranial nerve VIII; *see* **vestibulocochlear nerve** [*audit-* hear, *-ory* relating to]

auditory ossicle (AW-di-toh-ree OS-ik-ul) any of the tiny bones in middle ear: malleus, incus, and stapes; they function to amplify sound waves passing from the eardrum to the membranes of inner ear [*audit-* hear, *-ory* relating to, *os-* bone, *-icle* little]

auditory tube (AW-di-toh-ree) tube that connects the throat with the middle ear and equalizes pressure between the middle ear and the exterior; also known as *Eustachian tube* [*audit-* hear, *-ory* relating to]

augmented lead (AWG-men-ted) one of three electrocardiogram leads based on combinations of the standard (appendicular) cardiogram leads [*augumentare-* to increase]

auricle (AW-ri-kul) part of the ear attached to the side of the head; earlike appendage of each atrium of the heart [*auricula-* little ear]

autocrine (AW-toh-krin) a type of hormone that regulates activity in the secreting cell itself [*auto-* self, *-crin* secrete]

autoimmune disease (aw-toh-i-MYOON) disorder in which the immune system reacts against cells of one's body [*auto-* self, *-immun-* free (immunity), *dis-* opposite of, *-ease* comfort]

autoimmunity (aw-toh-i-MYOO-ni-tee) immune system reaction against normal body structures (self-antigens) [*auto-* self, *-immun-*free, *-ity* state]

autologous transfusion (aw-TAHL-eh-gus) re-infusion of blood into your own body [*auto-* self, *-log-* word or proportion, *-ous* relating to]

autonomic (visceral) reflex (aw-toh-NOM-ik [VISS-er-al] REE-fleks) feedback regulatory mechanism of the autonomic nervous system in which autonomic (visceral) sensory receptors trigger a regulatory response [*auto-* self, *-nomo-* law *-ic* relating to, *viscer-* internal organ, *-al* relating to, *re-* again, *-flex* bend]

autonomic effector (aw-toh-NOM-ik ef-FEK-tor) tissues to which efferent (motor) autonomic neurons conduct impulses [*auto-* self, *-nomo* law, *-ic* relating to, *efficere-* to accomplish]

autonomic nervous system (ANS) (aw-toh-NOM-ik) division of the nervous system that monitors and regulates subconscious (involuntary) functions [*auto-* self, *-nom-* rule, *-ic* relating to, *nerv-* nerves, *-ous* relating to]

autopoiesis (aw-toe-poy-EE-sis) concept of self-organization and self-maintenance as a characteristic of all living organisms [*auto-* self, *-poiesis* making]

autoregulation (aw-toh-reg-yoo-LAY-shun) *see* **intrinsic control** [*auto-* self, *regula-* rule]

autorhythmic (aw-toh-RITH-mic) relating to the characteristic of certain cells (such as involuntary muscle fibers) to display a self-regulated repeating pattern of action, as when heart cells beat in a rhythm without external stimulation [*auto-* self, *-rhythm-* rhythm, *-ic* relating to]

autosome (AW-toh-sohm) one of the 44 (22 pairs) chromosomes in the human genome besides the two sex chromosomes; means "same body," in reference to each member of a pair of autosomes matching the other in size and other structural features [*auto-* self, *-som-* body]

avascular (ah-VAS-kyoo-lar) free of blood vessels [*a-* without, *-vas- vessel*, *-ula-* little, *-ar* relating to]

avitaminosis (ay-vye-tah-mi-NO-sis) general name for any condition resulting from a vitamin deficiency [*a-* without, *-vita-* life, *-amin-* ammonia compound, *-osis* condition]

avulsion fracture (ah-VUL-shun) type of bone fracture in which bone fragments have pulled away from the underlying bone surface or bone is torn completely from the body part [*avuls-* pull away, *-sion* process, *fracture* a breaking]

axial skeleton (AK-see-all SKEL-eh-ton) the bones of the head, neck, and torso [*axi-* axis, *-al* relating to]

axillary lymph node (AK-sil-lair-ee limf nohd) lymph node in the region at or near the armpit [*axilla-* wing, *-ary* relating to, *lymph* water, *nod-* knot]

axillary tail (of Spence) (AK-si-lar-ee tail of Spens) lateral extension of breast tissue that is in physical contact with several very large lymph nodes [*axilla-* wing, *-ary* relating to]

axillary vein (AK-si-lair-ee) vein of the armpit region [*axilla* wing, *-ary* relating to]

axon (AK-son) in a neuron, the single process that extends from the axon hillock and transmits impulses away from the cell body [*axon* axle]

axon collateral (AK-son koh-LAT-er-al) one or more side branches from the axon [*axon-* axle, *co-* with, together, *-lateralis* side]

axon hillock (AK-son HILL-ok) portion of the cell body from which the axon extends [*axon* axle, *hill-* hill *-ock* little]

axonal transport (AK-soh-nal trans-PORT) process of transporting vesicles, small organelles, and other structures along pathways inside the axon of a neuron [*axon* axle, *-al* relating to, *trans-* across, *-port* carry]

azygos vein (AZ-i-gohs) vein in the thorax [*a-* without, *-zygo-* union or yoke]

B

B cell immune system cell that produces antibodies against specific antigens; same as *B lymphocyte* [*B* bursa-equivalent tissue, *cell* storeroom]

B lymphocyte (B LIM-foh-syte) immune system cell that produces antibodies against specific antigens [*B* bursa-equivalent tissue, *lympho-* the lymph, *-cyte* cell]

Babinski reflex (bah-BIN-skee REE-fleks) *see* **plantar reflex** [*Joseph F.F. Babinski* French neurologist, *re-* again, *-flex* bend]

Babinski sign (bah-BIN-skee) extension of the great toe (with or without fanning of the other toes in response to stimulation of the outer margin of the foot, instead of the usual plantar reflex in which the toes curl in flexion; normal in infants but a sign of nerve dysfunction in adults [*Joseph F.F. Babinski* French neurologist]

bacterium (bak-TEE-ree-um) microorganism capable of causing disease; a primitive, single-celled organism without membranous organelles [*bacterium* small staff] *pl.*, bacteria

ball-and-socket joint spheroid joint, such as shoulder or hip joint; most movable type of joint [*soket* spearhead]

balloon angioplasty (AN-jee-oh-plas-tee) medical procedure in which vessels occluded by arteriosclerosis are opened (that is, the channel for blood flow is widened) by use of a balloon at the tip of a catheter (tube) inside the affected vessel; as the balloon is inflated, the blockage is pushed aside; *see* **angioplasty** [*angio-* vessel, *-plasty* surgical repair]

balloon kyphoplasty (KYE-foh-plas-tee) orthopedic procedure used to treat vertebral compression fracture [*kypho-* hump, *-plasty* surgical repair]

Bard endoscopic suturing system (en-doh-SKOP-ic) minimally invasive procedure used for treating serious cases of GERD [*endo-* within, *-scope* to look, *sutura-* a seam, *systema-* complex or organized whole]

baroreceptor (bar-oh-ree-SEP-tor) sensory neuron sensitive to changes in blood pressure [*baro-* pressure, *-recept-* receive, *-or* agent]

baroreflex (bar-oh-REE-fleks) feedback loop in which feedback from pressure receptors in arteries produces a regulatory effect such as a change in heart rate to restore normal blood pressure; also called *pressoreflex* [*baro-* pressure, *re-* again, *-flex* bend]

barrel (BARE-ul) cell organelle that resembles a tiny capsule and is thought to shuttle substances from place to place within a cell; also called *vault* [*barel-* barrel]

Barrett esophagus (eh-SOF-ah-gus) condition related to untreated gastroesophageal reflux disease; may develop precancerous changes in the esophageal lining [*Norman R. Barrett* English surgeon, *es-* will carry, *-phag-* food (eat)] *pl.*, esophagi

basal (BAY-sal) relating to the base or widest part of an organ or other structure; in a cell, pertains to the surface facing away from the lumen of an organ [*bas-* base, *-al* relating to]

basal cell (BAY-sal) cell of the base layer of a structure [*bas-* foundation, *-al* relating to, *cell* storeroom]

basal cell carcinoma (BAY-sal cell kar-si-NOH-mah) one of the most common forms of skin cancer; usually occurs on the upper face [*bas-* base, *-al* relating to, *cell* storeroom, *carcin-* cancer, *-oma* tumor]

basal ganglia (BAY-sal GANG-glee-ah) islands of gray matter located in the cerebrum of the brain that are responsible for automatic movements and postures; now known more properly as *basal nuclei* [*bas-* foundation, *-al* relating to *ganglion-* knot]

basal lamina (BAY-sal LAM-i-nah) glycoprotein material secreted by epithelial cells [*bas-*foundation, *-al* relating to *lamina-* thin plate]

basal metabolic rate (BMR) (BAY-sal met-ah-BAHL-ik) number of calories of heat that must be produced per hour by catabolism to keep the body alive, awake, and comfortably warm [*bas-* basis, *-al* relating to, *metabol-* change, *-ic* relating to]

basal nuclei (BAY-sal NOO-klee-eye) islands of gray matter located in the cerebrum of the brain that are responsible for automatic movements and postures; formerly known as *basal ganglia;* also known as *cerebral nuclei* [*bas-* foundation, *-al* relating to, *nucle-* nut or kernel] *sing.*, nucleus

base substance that ionizes in water to decrease the number of hydrogen ions; also known as *alkaline* [*bas-* foundation]

base pair adenine-thymine or cytosine-guanine; occurs when complementary bases from each helical chain of DNA are held together by hydrogen bonds [*bas-* foundation, *paria-* equal]

base-forming food food that produces a rise in pH inside the body [*bas-* foundation]

basement membrane the connective tissue layer of the serous membrane that holds and supports epithelial cells [*base-* base, *-ment* thing, *membrane* thin skin]

basic residue (BAYS-ick REHZ-ih-doo) remains or product of a chemical process that have a high pH [*bas-* foundation, *-ic* relating to, *residu-* remainder]

basilar membrane (BAYS-i-lar) *see* **spiral membrane** [*bas-* foundation, *-ar* relating to, *membran-* thin skin]

basilic vein (bah-SIL-ik) a vein of the forearm [*bas-* foundation, *-ic* relating to]

basophil (BAY-so-fil) white blood cell that stains readily with basic (alkaline) dyes [*bas-*foundation, *-phil* love]

basophilic erythroblast (BAY-so-fil-ik eh-rith-roh-BLAST) produced during red blood cell formation; results from the mitotic division of proerythroblast [*bas-* foundation, *-phil- love*, *-ic* relating to, *erythro-* red, *-blast* bud]

belly the central portion of a organ, such as a skeletal muscle [*beig-* bag]

benign (bee-NYNE) refers to a tumor, neoplasm, or other condition that does not metastasize (spread to different tissues) or otherwise cause serious harm [*benign* kind]

benign paroxysmal positional vertigo (BPPV) (be-NYNE par-ock-SIZ-mul poh-ZISH-i-nal VER-ti-go) type of vertigo associated with inner ear problems [*benign* kind, *paroxysm-* irritation, *-al* relating to, *vertigo* turning]

benign prostatic hypertrophy (BPH) (be-NYNE pro-STAT-ik hye-PER-troh-fee) a nonmalignant enlargement of the prostate gland [*benign* kind, *pro-* before, *-stat-* set or place, *-ic* relating to, *hyper-* excessive or above, *-troph-* nourishment, *-y* state]

beta blocker (BAY-tah) drug that blocks beta receptors and therefore prevents dilation of blood vessels and increased contraction of heart muscle [*beta* second letter of Greek alphabet]

beta cell (BAY-tah) pancreatic islet cell that secretes insulin; also called *B cell* [*beta* (β) second letter of Greek alphabet, *cell* storeroom]

beta particle (BAY-tah PAR-tih-kul) electrons formed in a radioactive atom's nucleus by a neutron breaking down into a proton and an electron [*beta* (β)- second letter of Greek alphabet, *particula-* small part]

beta (β) receptor (BAY-tah ree-SEP-tor) adrenergic receptor that, when stimulated, causes vessels to dilate and heart muscle to contract faster and stronger [*beta* second letter of Greek alphabet, *recept-* receive, *-or* agent]

beta-adrenergic blocker (BAY-tah-ad-ren-ER-jik) *see* **beta blocker** [*beta* (β) second letter of Greek alphabet, *ad-* toward, *-ren-* kidney, *-erg-* work, -ic relating to]

beta-hydroxybutyric acid (BAY-tah-hye-DROK-see-boo-teh-rik ASS-id) acidic ketone body that accumulates during the incomplete breakdown of fats [*beta* (β) second letter of Greek alphabet, *-hydro-* hydrogen, *-oxy-* oxygen, *-butyr-* butter , *-ic* relating to, *acid-* sour]

biaxial joint (bye-AK-see-al) skeletal articulation that has two axes of movement [*bi-* two, *-axi-* axle, *-al* relating to]

bicarbonate (bye-KAR-boh-nayt) *see* **bicarbonate ion** [*bi-* two, *-carbon*, coal (carbon), *-ate* oxygen compound]

bicarbonate ion (bye-KAR-boh-nayte EYE-on) HCO_3^-; an ion that serves an important role in maintaining normal blood pH [*bi-*twice, *-carbo-* coal, *-ate* oxygen]

bicarbonate loading (bye-KAR-boh-net) practice in which a person ingests bicarbonates to counteract the buildup of acids in the body [*bi-* two, *-carbon-* coal (carbon), *-ate* oxygen]

bicuspid (bye-KUSS-pid) having two cusps [*bi-* double, *-cusp-* point, *-id* characterized by]

bilateral symmetry (bye-LAT-er-al SIM-e-tree) concept of the right and left sides of the body being approximate mirror images of each other [*bi-* two, *-later-* side, *-al* relating to, *sym-* together, *-metr-* measure, *-ry* condition of]

bile (byle) mixture of excretions and secretions produced by the liver and released into the digestive tract [*bilus-* fluid secreted by the liver]

bile salt (byle) an emulsifying agent found in bile [*bilus-* fluid secreted by the liver]

bilirubin (bil-ih-ROO-bin) yellowish pigment formed when the heme group is removed from the hemoglobin molecule and stripped of its iron atom; a product of the breakdown of red blood cells [*bili-* bile, *-rub-* red, *-in* substance]

binge-purge syndrome (binj-purj SIN-drohm) eating disorder in which a person overeats and then induces vomiting [*syn-* together, *-drome* running or (race) course]

biochemistry (bye-oh-KEM-is-tree) science of chemistry of living organisms [*bio-* life, *-chemeia* alchemy]

biofeedback (bye-oh-FEED-bak) method of learning to consciously control autonomic effectors by monitoring autonomic biological functions [*bio-* life]

biological clock (bye-oh-LOJ-i-kal) internal timing mechanism that governs hunger, sleeping, reproduction, and behavior [*bio-*life, *-o-* combining form, *-log-* words (study of), *-ical* relating to]

biopsy (BYE-op-see) procedure in which living tissue is removed from a patient for laboratory examination, as in determining the presence of cancer cells [*bio-* life, *-opsy-* view, *-y* act of]

Biot's breathing (bee-OHS) breathing pattern characterized by repeated sequences of deep gasps and apnea due to increased intracranial pressure [*Camille Biot* French physician]

bioterrorism (bye-oh-TAIR-or-iz-em) act of using biological weapons such as disease pathogens to spread terror among civilian populations for the purpose of creating fear, panic, and general social disruption [*bio-*life, *terrere-* to frighten, *-ism* condition of]

bipolar neuron (bye-POH-lar NOO-ron) neuron with only one dendrite and only one axon [*bi-* two, *-pol-* pole, *-ar* relating to, *neuron* nerves]

blackhead sebum that accumulates, darkens, and enlarges a duct of the sebaceous glands, as in the case of acne; also known as a *comedo* [*blakkr-* dark]

blastocyst (BLASS-toh-sist) stage of developing embryo that implants in uterine wall; consists of hollow ball of cells plus an inner cell mass [*blasto-* bud, *-cyst* pouch]

bleaching (BLEECH-ing) process when opsin and retinal open and separate in the presence of light [*blechen-* bleach]

blepharoplasty (blef-ar-oh-PLAS-tee) surgical procedure that corrects a drooping eyelid [*blepharo-* eyelid or eyelash, *-plasty* surgical repair]

blind spot point on retina where blood vessels and nerves exit the eyeball; "blind" portion of visual field resulting from no photoreceptors present in that portion of retina; also known as *optic disk* [*blesti-* to become dark, *spotte-* speck]

blister (BLIS-ter) fluid-filled skin lesion; *see* **vesicle** [*blestre-* boil]

blood boosting *see* **blood doping**

blood clotting *see* **blood coagulation** [*clott-* lump]

blood coagulation (koh-ag-yoo-LAY-shun) process by which ruptured vessels are plugged up to stop bleeding and prevent loss of precious body fluids [*coagulare-* to curdle]

blood colloid osmotic pressure (BCOP) (blud KOL-loyd os-MOT-ik) filtration pressure that tends to draw fluid back to the capillaries [*coll-* glue, *-oid* like, *osmo-* push, *-ic* relating to]

blood doping (DOH-ping) practice of increasing the hematocrit by transfusing additional blood or by the use of erythropoietin to boost hematocrit [*dyppan-* to dip]

blood hydrostatic pressure (BHP) (hye-droh-STAT-ik) pressure of blood against the wall of a blood vessel [*hydro-* water, *-stat-* standing, *-ic* relating to]

blood loss anemia (ah-NEE-mee-ah) deficiency of red blood cells and hemoglobin caused by a loss of blood from the cardiovascular system [*an-* without, *-emia* blood condition]

blood serum (SEER-um) in a sample of blood, the pale yellowish liquid left after a clot forms [*serum* watery fluid] *pl.*, sera

blood test clinical laboratory examination of blood components [*testum-* test]

blood type one of the four different types of blood; identified by certain antigens on red blood cells (A, B, AB, and O) [*tupos-*impression]

blood urea nitrogen (BUN) test (yoo-REE-ah NYE-troh-jen) clinical laboratory measurement of the amount of nitrogen in urea present in the blood and used as a measure of the efficiency of the kidney's ability to clear urea from the body [*ure-* urine, *nitro-*soda, *-gen* produce]

blood-brain barrier (BBB) structural and functional barrier formed by astrocytes and blood vessel walls in the brain; it prevents some substances from diffusing from the blood into brain tissue [*barrere-* barrier]

blood-testis barrier (BTB) (blud-TES-tis) functional barrier between the testis and the rest of the body, thus protecting developing sperm from attack by the immune system [*testis-* witness (male gonad), *barrere-*barrier]

blowout fracture bone fracture of the eye orbit [*fracture* a breaking]

body the structure of the entire organism; also, the main part of an organ, cell, or other structure [*bodig-* body]

body composition (com-poh-ZISH-un) percentages of the body made of lean tissue and fat tissue [*componere-* to assemble]

body mass index (BMI) method used to assess whether a person's body weight is proportional to height [*indicare-* to make known]

body plane imagined flat surface that cuts through the body at any of various angles; *see* **coronal plane, sagittal plane, transverse plane** [*bodig-* body, *planum-* flat surface]

Bohr effect (BOR) when increased P_{CO_2} decreases the affinity between hemoglobin and oxygen [*Christian Bohr* Danish physiologist]

boil (BOY-el) carbuncle; pus-filled lesion of the skin [from *bile*]

bolus (BOW-lus) rounded mass of food that is swallowed [*bolos-* lump]

bone age method using the number of ossification centers visible on a radiograph to determine the maturation of bone

bone marking specific structural feature on an individual bone

bone marrow transplant (MAIR-oh TRANS-plant) medical procedure in which bone marrow tissue from a donor is placed in a recipient in hopes that it will produce healthy blood cells [*marow-* marrow, *transplantare-* transplant]

bone matrix (MAY-triks) intercellular material of the bone tissue [*matrix* womb] *pl.*, matrices (MAY-trih-seez)

bone scan medical imaging technique in which the density of bone is visualized

bone tamp inflatable balloon-like device used in balloon kyphoplasty; stabilizes and seals fractures [*tamp* pack down]

bone type of connective tissue whose matrix is hard and calcified

bone-seeking isotope (EYE-soh-tohp) radioactive element that will substitute for calcium in apatite crystals of bone; causes damage to red marrow and other tissues by radioactive emissions [*iso-* equal, *-topos* place]

booster shot additional vaccination that boosts the immune response against a particular antigen

Bouchard node (boo-SHAR) swelling deformity of the proximal interphalangeal joint [*Charles J. Bouchard* French physician, *nod-* knot]

bovine spongiform encephalopathy (BOH-vyne SPUNJ-i-form en-SEF-al-ah-path-ee) also known as *BSE* or "mad cow disease"; a

degenerative disease of the central nervous system caused by prions that convert normal proteins of the nervous system into abnormal proteins, causing loss of nervous system function; the abnormal form of the protein also may be inherited; *see* **prion** [*bos-* ox *spongi-* like a sponge, *form* specialized shape *encephal-* brain, *-pathy* disease]

Bowman capsule (BOH-men KAP-sul) in the kidney, the cup-shaped top of a nephron that surrounds the glomerulus; also called *glomerular capsule* [*William Bowman* English anatomist]

Boyle's law (boils) principle of physics that states that the pressure of a gas is proportional to its volume [*Robert Boyle* English scientist]

brachial plexus (BRAY-kee-all PLEK-sus) nerve plexus located deep in the shoulder that innervates the lower part of the shoulder and the entire arm [*brachi-* arm, *-al* relating to, *plexus* network] *pl.*, plexi or plexuses

brachial vein (BRAY-kee-al) vein of the arm [*brachi-* arm, *-al* relating to]

brachiocephalic artery (brayk-ee-oh-seh-FAL-ik AR-ter-ee) artery of the upper thorax [*brachi-* arm, *-cephal-* head, *-ic* relating to, *arteri-*vessel]

brachiocephalic vein (brayk-ee-oh-seh-FAL-ik) vein of the upper thorax [*brachi-* arm, *-cephal-* head, *-ic* relating to]

bradycardia (bray-dee-KAR-dee-ah) slow heart rhythm (below 50 beats/min) [*brady-* slow, *-cardi-* heart, *-ia* condition]

bradykinin (brad-ee-KYE-nin) chemical mediator released after tissue injury and cellular death [*brady-* slow or dull, *-kinin* move]

brain electrical activity map (BEAM) color-coded graphic image of the brain generated on a video screen [*electron-* amber, *acitivus-* active]

brain part of central nervous system contained within the cranium; consists of medulla oblongata, cerebellum, and cerebrum [*bragen-* brain]

brain waves fluctuating electrical activity occurring in the brain [*bragen-* brain]

brainstem part of brain containing the midbrain, pons, and medulla oblongata [*bragen-* brain, *-stem* tree or trunk]

breast cancer malignant neoplasm (tumor) of the breast [*cancer* crab or malignant tumor]

broad ligament (LIG-ah-ment) double fold of parietal peritoneum that forms a partition across the pelvic cavity [*liga-* bind, *-ment* condition]

bronchial tree (BRONG-kee-al) the trachea, two primary bronchi, and their many branches [*bronch-* windpipe, *-al* relating to]

bronchial vein (BRONK-kee-al) vein of the pulmonary airways [*bronch-* windpipe, *-al* relating to]

bronchiole (BRONG-kee-ohl) small branch of a bronchus [*bronch-* windpipe, *-ol-* little]

bronchitis (brong-KYE-tis) inflammation of the bronchi of the lungs, characterized by edema and excessive mucus production that causes coughing and difficulty in breathing (especially expiration) [*bronch-* windpipe, *-itis* inflammation]

bronchogram (BRONG-koh-gram) medical image of the pulmonary airways [*bronch-* windpipe, *-gram* drawing]

bronchopulmonary segment (brong-koh-PUL-moh- nair-ee) region of the lung supplied by a tertiary bronchus [*bronch-* windpipe, *-pulmon-* lung, *-ary* relating to]

bruits (BROO-eez) blood vessel noise caused by turbulence of blood flow [*bruits* noise]

brush border lining of small intestine that resembles bristles of a brush; formed by microvilli [*brusshe-* brush, *border-* to border]

buccal cavity (BUK-al KAV-i-tee) oral cavity [*bucca-* cheek]

buccinator muscle (BUK-si-NAY-tor) muscle of the cheek [*buccinator* trumpeter, *mus-* mouse, *-cle* little]

buffer (BUFF-er) compound that combines with an acid or with a base to form a weaker acid or base, thereby lessening the change in hydrogen ion concentration that would occur without the buffer; often operates as buffer pairs [*buffe-* cushion, *-er* actor]

buffer pair (BUFF-er) a chemical system of two chemicals that together act as a buffer, minimizing changes in pH of a solution [*buffe-* cushion, *-er* agent]

buffy coat found in a centrifuged sample of blood, the thin layer of leukocytes and platelets located at the interface between packed red cells and plasma [*buffe-* cushion]

bulboid corpuscle (BUL-boyd KOR-pus-ul) skin receptor that detects sensations of touch, low-frequency vibration, and texture differences; also known as *Krause end bulb* [*bulb-* swollen root, *-oid* like, *corpus-* body, *-cle* little]

bulbospongiosus muscle (bul-boh-spun-jee-OH-ses) muscle of the base of the penis [*bulbo-* swollen root (bulb), *-spongiosus* spongy, *mus-* mouse, *-cle* little]

bulbourethral gland (BUL-boh-yoo-REE-thral) either of two small glands at the base of the penis that contributes a small amount of fluid to semen; also called *Cowper gland* [*bulb-* swollen root, *-ure-* urine, *-thr-* agent or channel (urethra), *-al* relating to]

bulbous corpuscle (BUL-bus KOR-pus-ul) sensory receptor that senses deep pressure and continuous touch; located in dermis of the skin; also known as *Ruffini corpuscle* [*bulb-* swollen root, *-ous* relating to, *corpus-* body, *-cle* little]

bulimia (boo-LEE-mee-ah) eating disorder characterized by intentional purging of food by induced vomiting, laxatives, or other means [*bu-* ox, *-lim-* hunger, *-ia* condition]

bursa (BER-sah) small, cushion-like sac found between moving body parts, making movement easier [*bursa* purse] *pl.*, bursae (BER-see or BER-say)

bursitis (ber-SYE-tiss) inflammation of a bursa [*bursa-* purse, *-itis* inflammation]

bypass surgery (BYE-pass SUR-jah-ree) *see* **coronary bypass surgery** [*bi-* alongside, *surgery-* treatment of illness or deformity]

C

C cell type of cell of the thyroid gland that produces calcitonin [C for calcitonin, *cell* storeroom]

CA-125 tumor antigen associated with ovarian cancer [C cancer, A antigen]

cachexia (kah-KEKS-ee-ah) syndrome involving loss of weight, loss of appetite, and general weakness; usually associated with cancer [*kakos-* bad, *-hexis* state]

cadaver (kah-DAV-er) corpse preserved for anatomical study [*cadaver* dead body]

calcaneal tendon (kal-KAH-nee-al) connects gastrocnemius to calcaneus; Achilles tendon [*calcane-* heel, *-al* relating to, *tend-* pulled tight, *-on* unit]

calcitonin (CT) (kal-sih-TOH-nin) hormone secreted by the thyroid that decreases calcium levels in the blood [*calci-* lime (calcium), *-ton-* tone, *-in* substance]

calcitriol (kal-SIT-ree-ol) hormone that regulates calcium homeostasis in the body [*calci-* lime (calcium), *-tri-* three, *-ol* alcohol (after *1,25-D*$_3$ or *1,25-dihydroxycholecalciferol*)]

calcium (KAL-see-um) important mineral involved in bone formation, tooth formation, muscle contraction, synaptic transmission, and other vital processes of the body [*calc-*lime, *-um* thing or substance]

calcium channel blocker (KAL-see-um CHAN-al) agent that inhibits the opening of calcium channels in cell membranes [*calc-* lime, *-um* thing or substance]

calcium pump (KAL-see-um) energy-consuming structure embedded in a cell membrane that moves calcium ions through the membrane against their concentration gradient (that is, from an area of low concentration to an area of high concentration) [*calc-*lime, *-um* thing or substance]

calendar rhythm method method of fertility management based on timing of the female reproductive cycle [*calenda-* account book, *meta-* after, *-hodos* journey]

callus (KAL-us) bony tissue that forms a sort of collar around the broken ends of fractured bone during the healing process; in the skin, abnormally thick stratum corneum found at points of friction [*callus* hard skin]

Calorie (C) (KAL-or-ree) heat unit; kilocalorie (kcal); the amount of heat needed to raise the temperature of 1 kilogram of water 1° C [*calor-* heat, *-ie* full of]

calorie (cal) (KAL-or-ee) heat unit; the amount of heat needed to raise the temperature of 1 gram of water 1° C [*calor-* heat, *-ie* full of]

calvarium (kal-VAIR-ee-um) name for the upper dome of the cranium of the skull [*calvarium* skull] *pl.*, calvaria or calvariums

calyx (KAY-liks) cup-shaped branch of the renal pelvis [*calyx* cuplike] *pl.*, calyces (KAY-lis-eez)

canal of Schlemm (kah-NAL of shlem) *see* **scleral venous sinus** [*canal-* channel, *Friedrich Schlemm* German anatomist]

canaliculi (kan-ah-LIK-yoo-lye) an extremely narrow tubular passage or channel in compact bone; radiates from lacunae and connects with other lacunae and the central (Haversian) canal of the osteon [*canal-* channel, *-iculi* little] *sing.*, canaliculus

canaliculus (kan-ah-LIK-yoo-lus) singular of **canaliculi** [*canal-* channel, *-uculus* little]

canalith (KAN-ih-lith) crystalline structure of the semicircular canals of the inner ear [*canal-* channel, *-lith* stone]

canalith repositioning procedure (KAN-ih-lith) procedure to restore the proper position of crystalline structures of the semicircular canals of the ear and thus eliminate balance perception problems such as vertigo [*canal-* channel, *-lith* stone]

cancellous bone (KAN-seh-lus) bone containing tiny, branchlike trabeculae; also known as *spongy bone* or *trabecular bone* [*cancel-* lattice, *-ous* characterized by]

cancellous bone tissue (KAN-seh-lus) *see* **cancellous bone** [*cancel-* lattice, *-ous* characterized by, *tissu-* fabric]

cancer malignant cellular neoplasm (tumor) that invades other cells and often metastasizes to many parts of the body [*cancer* malignant tumor]

cancer of the uterus (YOO-ter-us) malignancy of uterine tissue [*cancer* crab or malignant tumor]

candidiasis (kan-dih-DYE-eh-sis) infection caused by *Candida* yeast [*candid-* white, *-asis* condition]

capacitance (kah-PASS-i-tens) the ease of stretch (distensibility) of a blood vessel wall [*capacit-* space or volume, *-ance* state]

capacitation (kah-pass-i-TAY-shun) process occurring after ejaculation of semen and needed for a mature sperm to become capable of fertilizing an ovum [*capacit-* space or volume, *-tion* process]

capillary (KAP-i-lair-ee) tiny vessels that connect arterioles and venules; gas exchange from blood to tissues occurs in capillaries [*capill-* hair, *-ary* relating to]

capillary exchange (KAP-i-lair-ee) process of moving molecules into and out of the blood of a capillary [*capill-* hair, *-ary* relating to]

capitulum (kah-PITCH-uh-lum) rounded knob on the humerus bone below the lateral epicondyle [*capit-* head, *-ulum* little]

carbaminohemoglobin (kahr-bam-ih-no-hee-moh-GLOH-bin) carbonated form of hemoglobin [*carb-* coal (carbon), *-amino-* ammonia compound (amino acid), *-hemo-* blood, *-glob-* ball, *-in* substance]

carbohydrate (kar-bo-HYE-drate) organic compounds containing carbon, hydrogen, and oxygen in certain specific proportions; for example, sugars, starches, and cellulose [*carbo-* carbon, *-hydr-* hydrogen, *-ate* oxygen]

carbon monoxide (CO) (KAR-bon mon-OKS-ide) molecule made up of one carbon atom and one oxygen atom [*mono-* single, *-ox-* sharp (oxygen), *-ide* chemical]

carbon monoxide poisoning (KAR-bon mon-OK-side POY-son-ing) condition in which exposure to carbon monoxide results in the molecule tightly binding to hemoglobin and thereby preventing oxygen transport by the blood [*carbon* coal, *mono-* single, *-ox* sharp (oxygen)]

carbonic acid (kar-BON-ik ASS-id) product of the reaction between carbon dioxide and water [*carbon-* coal (carbon), *-ic* relating to, *acid* sour]

carbonic anhydrase (CA) (kar-BON-ik an-HYE-drays) the enzyme that converts carbon dioxide into carbonic acid (and also reverses the reaction) [*carbo-* coal, *-ic* relating to, *a-* without, *-hydr-* water, *-ase* enzyme]

carbuncle (KAR-bung-kul) a mass of connected boils, pus-filled lesions associated with hair follicle infections; *see* **furuncle** [*carbunculus-* little coal]

carcinoembryonic antigen (CEA) (kar-sin-oh-em-bree-AHN-ik AN-ti-jen) tumor marker found normally in the fetus and elevated colorectal and other adult cancers [*carcino-* cancer, *-em-* in, *-bryo-* fill to bursting, *-ic* relating to, *anti-* against, *-gen* produce]

carcinogen (kar-SIN-oh-jen) substance that promotes the development of cancer [*carcino-* cancer, *-gen* produce]

carcinoma (kar-si-NO-mah) malignant tumor that arises from epithelial tissue [*carcin-* cancer, *-oma* tumor]

cardia (KAR-dee-ah) small collarlike section of the stomach near the junction with the esophagus, so-called because of its nearness to the heart; also called *cardiac part* or *cardial part* [*cardia* heart]

cardiac cycle (KAR-dee-ak) complete heartbeat consisting of diastole and systole of both atria and both ventricles [*cardi-* heart, *-ac* relating to, *cycle* circle]

cardiac muscle tissue (KAR-dee-ak) muscle tissue type that makes up the heart [*cardia-* heart, *-ac* relating to, *mus-* mouse, *-cle* small, *tissu-* fabric]

cardiac nuclear scanning (KAR-dee-ak NOO-klee-ar) medical image of the heart produced when radioactive materials flow through the coronary vessels [*cardi-* heart, *-ac* relating to, *nucle-* nut or kernel, *-ar* relating to]

cardiac output (CO) (KAR-dee-ak) volume of blood pumped by one ventricle per minute (example, L/min or ml/min) [*cardi-* heart, *-ac* relating to]

cardiac part (KAR-dee-ak) see **cardia** [*cardi-* heart, *-ic* relating to]

cardiac plexus (KAR-dee-ak PLEK-sus) combination of sympathetic and parasympathetic nerves that are located near the aortic arch [*cardi-* heart, *-ac* relating to, *plexus-* network]

cardiac pressoreflex (KAR-dee-ak pres-oh-REE-fleks) feedback regulatory mechanism in which pressure receptors in arteries trigger a change in heart rate to restore normal blood pressure [*cardi-* heart, *-ac* relating to, *press-* pressure, *-re-* back or again, *-flex* bend]

cardiac sphincter (KAR-dee-ak SFINGK-ter) a ring of muscle between the stomach and esophagus that prevents food from

reentering the esophagus when the stomach contracts [*cardi-* heart, *-ic* relating to, *sphinc-*bind tight, *-er* agent]

cardiac tamponade (KAR-dee-ak tam-po-nodd) compression of the heart caused by fluid buildup in the pericardial space, as in pericarditis or mechanical damage to the pericardium [*cardi-* heart, *-ac* relating to, *tampon-* plug, *-ade* process]

caries (KAIR-ees) decay, especially tooth decay [*caries* decay]

cardiogenic shock (kar-dee-oh-JEN-ik) condition characterized by low cardiac output; can result from any type of heart failure [*cardi-* heart, *-gen-* produce, *-ic* relating to]

cardiomyopathy (kar-dee-oh-my-OP-ah-thee) general term for disease of the myocardium (heart muscle) causing enlargement [*cardi-* heart, *-myo-* muscle, *-path-* disease, *-y* state]

cardiopulmonary resuscitation (CPR) (kar-dee-oh-PUL-moh-nair-ree ree-sus-i-TAY-shun) combined external cardiac (heart) massage and artificial respiration [*cardio-* heart, *pulmon-* lung, *resuscitare-* to revive]

caries (KAIR-eez) decay of teeth or of bone [*caries-* decay]

carotene (KAR-oh-teen) yellowish pigment; contributes to skin color [*carota-* carrot]

carotid sinus reflex (kah-ROT-id SYE-nus REE-fleks) homeostatic mechanism that involves baroreceptors that relay feedback information to cardiac control center; maintains blood pressure [*caro-* heavy sleep, *-id* relating to, *sinus* hollow, *re-* back or again, *-flex* bend]

carpal bone (KAR-pul) any of the bones of the wrist [*carp-* wrist, *-al* relating to]

carpal tunnel syndrome (KAR-pul TUN-el SIN-drohm) muscle weakness, pain, and tingling in the radial side (thumb side) of the wrist, hand, and fingers, perhaps radiating to the forearm and shoulder; caused by compression of the median nerve within the carpal tunnel (a passage along the ventral concavity of the wrist) [*carp-* wrist, *-al* relating to, *syn-* together, *-drome* running or (race) course]

carpometacarpal joint (kar-pol-met-ah-KAR-pal) skeletal articulation between a wrist (carpal) bone and hand (metacarpal) bone [*carpo-* wrist, *-meta-* beyond, *-carp-*wrist, *-al* relating to]

carrier (KARE-ee-er) in genetics, a person who possesses the gene for a recessive trait but who does not actually exhibit the trait; in cell biology, a protein structure in the membrane that facilitates transport of ions and other molecules [*carier-* to transport in a vehicle]

carrier-mediated passive transport (KARE-ee-er MEE-dee-ayt-ed PASS-iv TRANS-port) type of facilitated diffusion, in which solutes move down their concentration gradient through carrier mechanisms in the membrane wall [*mediat-* to be in the middle, *passus-* capable of suffering, *trans-* across, *-portare* to carry]

cartilage (KAR-tih-lij) connective tissue type that has the consistency of a firm plastic or gristle-like gel [*cartilag-* cartilage]

cartilaginous joint (kar-tih-LAJ-in-us joynt) articulation between bones that is primarily composed of cartilage [*cartilag-* cartilage, *-in-* substance, *-ous* characterized by]

catabolism (kah-TAB-oh-liz-em) breakdown of food compounds or cytoplasmic constituents into simpler compounds; opposite of anabolism [*cata-* against, *-bol-* to throw, *-ism* condition]

catalyst (KAT-ah-list) chemical that speeds up reactions without being changed itself [*cata-* lower, *-lys-* loosen, *-st* agent]

cataracts (KAT-ah-rakts) areas of opacity in the lens of the eye [*cataract* waterfall]

catecholamine (kat-eh-KOHL-ah-meen) chemical category of neurotransmitters that include norepinephrine, epinephrine, and dopamine [*catech-* melt, *-ol-* alcohol, *-amine* ammonia compound]

catheter (KATH-eh-ter) thin, flexible tube often used in medical procedures [*cathe-* send down, *-er* agent]

catheterization (kath-eh-ter-i-ZAY-shun) passage of a flexible tube (catheter) into the body through an exterior opening (as into the bladder through the urethra for the withdrawal of urine) [*cathe-* send down, *-er* agent, *-tion* process of]

cation (KAT-eye-on) positively charged particle [*cat-* down, *-ion* to go (ion)]

cauda equina (KAW-da eh-KWY-nah) lower end of spinal cord with its attached spinal nerve roots [*caud-* tail, *equina* of a horse] *pl.*, caudae equinae

caudate nucleus (KAW-dayt NOO-klee-us) one of the basal nuclei, gray matter areas in the inner region of the cerebrum of the brain [*caud-* tail, *-ate* of or like, *nucleus* nut or kernel] *pl.*, nuclei

caveola (kav-ee-OH-la) tiny indentation of a raft in the cell's plasma membrane that traps substances and shuttles them into or through the cell [*cave-* hollow, *-ola* little] *pl.*, caveolae

CD system international system for naming surface markers on red blood cells [*C* cluster, *D* differentiation]

celiac ganglion (SEE-lee-ak GANG-glee-on) solar plexus; collateral ganglion that lies just below the diaphragm [*cel-* belly, *-ac* relating to, *ganglion* knot]

cell basic biological and structural unit of the body consisting of a nucleus surrounded by cytoplasm and enclosed by a membrane [*cell* storeroom]

cell agranulocyte (ah-GRAN-yoo-loh-syte) one of two types of white blood cells; lymphocyte or monocyte [*a-* without, *-gran-* grain, *-ul-* little, *-cytes* cells]

cell body the main part of a cell, ordinarily containing the nucleus; in the neuron, the cell body is also called the *soma* or *perikaryon* [*cell* storeroom]

cell cycle *see* **cell life cycle** [*cell-* storeroom, *cycle* circle]

cell life cycle the repeating process of a cell's growth and reproduction, producing successive generations of cells and proceeding through the first growth phase (G1), DNA replication (S), second growth phase (G_2), and mitotic cell division (M); also called *cell cycle* [*cell-* storeroom, *lif-* life, body, *cycle-* circle]

cell theory concept proposed more than 100 years ago that all living organisms are made up of biological units called *cells*; *see* **cell** [*cell* storeroom, *theor-* look at, *-y* act of]

cell-mediated immunity (sell-MEE-dee-ayt-ed i-MYOO-nih-tee) type of adaptive immunity in which T-lymphocytes act directly on antigens to protect the body [*cell* storeroom, *medi-* middle, *-ate* process, *immun-* free, *-ity* state]

cellular immunity (SELL-yoo-lar i-MYOO-ni-tee) see **cell-mediated immunity** [*cell* storeroom, *-ular* relating to, *immun-* free, *-ity* state]

cellular respiration (SELL-yoo-lar res-pih-RAY-shun) set of biochemical reactions of a cell that transfer energy from nutrient molecules to ATP molecules [*cell* storeroom, *-ular* relating to, *respire-* to breathe, *-ation* process]

cellulose (SEL-yoo-lohs) dietary fiber; major component of most plant tissue; nondigestable by humans [*cell-* storeroom (cell), *-ul-* small, *-ose* carbohydrate]

central relating to the center of the body, as in *central nervous system* [*centr-* center, *-al* relating to]

central canal canal in the osteon (Haversian system) of bone that runs parallel to the long axis; contains blood vessels and nerves; also called *osteonal canal* or *Haversian canal* [*centr-* center, *-al* relating to, *canal-* channel]

central nervous system (CNS) the brain and spinal cord [*centr-* center, *-al* relating to, *nerv-* nerves, *-ous* relating to]

central sulcus (fissure of Rolando) (SUL-kus [FISH-ur of roh-LAHN-doh]) groove between frontal and parietal lobes of the cerebrum [*sulcus* trench, *Luigi Rolando* Italian physician] *pl.*, sulci

centriole (SEN-tree-ohl) one of a pair of tiny cylinders in the centrosome of a cell; believed to be involved with the spindle fibers formed during mitosis [*centr-* center, *-ole* small]

centromere (SEN-troh-meer) a beadlike structure that attaches one chromatid to another during the early stages of mitosis [*centro-* center, *-meros* part]

centrosome (SEN-troh-sohm) area of the cytoplasm near the nucleus that coordinates the building and breaking up of microtubules in the cell [*centr-* center, *-som-* body]

cephalic phase (seh-FAL-ik fayz) stage in regulation of stomach secretion in which mental factors stimulate gastric juice secretion [*cephal-* head, *-ic* relating to]

cephalic vein (seh-FAL-ik) vein of the head [*cephal-* head, *-ic* relating to]

cerebellum (sair-eh-BELL-um) second largest part of the human brain; plays an essential role in the production of normal movements [*cereb-* brain, *-ellum* small thing] *pl.*, cerebella or cerebellums

cerebral cortex (seh-REE-bral KOR-teks) thin layer of gray matter made up of neuron dendrites and cell bodies that compose the surface of the cerebrum [*cerebr-* brain (cerebrum), *-al* relating to, *cortex* bark] *pl.*, cortices

cerebral hemisphere (seh-REE-bral HEM-is-feer) either of the two right and left halves of the cerebrum [*cerebr-* brain, *-al* relating to, *hemi-* half, *-sphere* globe]

cerebral localization (seh-REE-bral) principle of brain function that states that specific cerebral functions are likely to be located in the cerebral cortex at specific, often predictable, locations [*cerebr-* brain, *-al* relating to, *loc-* place, *-al-* relating to, *-ization* process]

cerebral nuclei (seh-REE-bral NOO-klee-eye) *see* **basal nuclei** [*cerebr-* brain, *-al* relating to, *nucleus-* nut or kernel]

cerebral palsy (seh-REE-bral PAWL-zee) disorder in which damage to motor control areas of the brain cause abnormally high skeletal muscle tone (and thus, mobility problems) in one or more areas of the body [*cerebr-* brain, *-al* relating to, *palsy* paralysis (*para-* beyond, *-lysis* loosening)]

cerebral peduncle (seh-REE-bral peh-DUNG-kul) white matter tracts in the brain connecting the cerebellum to the cerebrum [*cerebr-*brain, *-al* relating to, *ped-* foot, *-uncl-* little]

cerebral plasticity (seh-REE-bral plas-TIS-i-tee) characteristic of the cerebrum that permits the relocation of functions from one area of the cerebral cortex to another area [*cerebr-* brain, *-al* relating to, *plastic-* moldable, *-ity* state]

cerebrospinal fluid (CSF) (seh-ree-broh-SPY-nal FLOO-id) plasmalike fluid that fills the subarachnoid space in the brain and spinal cord and in the cerebral ventricles [*cerebr-* brain, *-spin-* backbone, *-al* relating to]

cerebrovascular accident (CVA) (SAIR-eh-broh-VAS-kyoo-lar) event in which hemorrhage or cessation of blood flow caused by an embolism or ruptured aneurysm in brain blood vessel results in ischemia of brain tissue and destruction of neurons; commonly called a *stroke* [*cerebr-* brain, *-vas-* vessel, *cul-* little, *-ar* relating to]

cerebrum (SAIR-eh-brum) largest and uppermost part of the human brain that controls consciousness, memory, sensations, emotions, and voluntary movements [*cerebrum* brain] *pl.*, cerebra or cerebrums

cerumen (seh-ROO-men) ear wax [*cera* wax]

ceruminous gland (seh-ROO-mi-nus) gland that produces a waxy substance called *cerumen* (ear wax) [*cera-* wax, *-ous* relating to, *gland* acorn]

cervical cancer (SER-vi-kal) malignancy of the neck (cervix) of the uterus [*cervic-* neck, *-al* relating to, *cancer* crab or malignant tumor]

cervical plexus (SER-vih-kal PLEK-sus) plexus located deep within the neck; innervates muscles and skin of the neck, upper shoulder, and part of the head [*cervic-* neck, *-al* relating to, *plexus* network] *pl.*, plexi or plexuses

cervical vertebra (SER-vi-kal VER-teh-bra) one of the seven spinal (vertebral) bones of the neck [*cervi-* neck, *-al* relating to, *vertebra* that which turns] *pl.*, **vertebrae**

cervix (SER-viks) neck; particularly the inferior necklike portion of the uterus [*cervix* neck] *pl.*, cervices or cervixes

cesarean section (seh-SAIR-ee-an SEK-shun) surgical removal of a fetus through an incision of the skin and uterine wall; also called *C-section* [*Julius Caesar* Roman emperor, *-ean* of]

channel-mediated passive transport (CHAN-al MEE-dee-ayt-ed PASS-iv TRANS-port) any membrane transport mechanism in which molecules move down a concentration gradient through membrane channels

chaperonin (shap-er-OHN-in) any of a group of globular proteins that are present in every body cell and direct the intracellular steps required for other proteins to achieve the often twisted and convoluted shape required for them to function [*chaperon-* hood]

Charles's law (CHARLZ-ez law) gas law that states that volume is directly proportional to temperature when pressure is held constant; sometimes called *Gay-Lussac's law* (gay lus-SAKS law) after French physical scientist Joseph L. Gay-Lussac who first published it, crediting Jacques Charles with its discovery [*Jacques Alexandre César Charles* French physicist]

cheek facial prominence shaped by the underlying zygomatic bone [*cece-* jawbone]

chemical bond energy relationship joining two or more atoms; involves sharing or exchange of electrons [*chemeia-* alchemy]

chemical buffer combines with added acids or alkali in the body; changes hydrogen ion concentration and pH [*chemeia-* alchemy, *buffe-* cushion, *-er* agent]

chemical digestion (dye-JES-chun) changes in chemical composition of food as it passes through the alimentary canal [*chemeia-* alchemy, *digest-* break down, *-tion* process]

chemoreceptor (kee-moh-ree-SEP-tor) receptor that responds to chemicals; responsible for taste and smell and monitoring concentration of specific chemicals in the blood [*chemo-* chemical, *-recept-* receive, *-or* agent]

chemoreceptor reflex (kee-moh-ree-SEP-tor REE-fleks) nerve reflex in which chemical changes such as a change in blood pH trigger a reflexive change in physiology, such as a change in heart rate or respiratory rate, to restore a homeostatic balance [*chemo-* chemical, *-recept-* receive, *-or* agent, *re-* back or again, *-flex* bend]

chemotactic factor (kee-moh-TAK-tik) chemical that attracts a mobile cell such as a neutrophil or macrophage to a specific location, as in an immune response [*chemo-* chemical, *-tact-* movement, *-ic* relating to]

chemotaxin (kee-moh-TAK-sin) chemotactic factor [*chemo-* chemical, *-tax-* movement or reaction, *-in* substance]

chemotaxis (kee-moh-TAK-sis) process by which a substance attracts cells or organisms into (or away from) its vicinity;

for example, when inflammation mediators attract white blood cells; sometimes called *positive chemotaxis*; *see* **chemotactic factor** [*chemo-* chemical, *-taxis* movement or reaction]

chemotherapy (kee-moh-THAYR-ah-pee) technique of using chemicals to treat disease (e.g., infections, cancer) [*chemo-* chemical, *-therapy* treatment]

chest lead (leed) diagnostic procedure that records information about heart function; also called *precordial lead* [*chest-* box]

chest x-ray diagnostic procedure that exams the lungs, mediastinal contents, and bony thorax [*chest-* box]

Cheyne-Stokes respiration (chain stokes respih-RAY-shun) pattern of breathing associated with critical conditions such as brain injury or drug overdose and characterized by cycles of apnea and hyperventilation [*John Cheyne* Scots physician, *William Stokes* Irish physician]

chief cell cells lining the gastric glands of the stomach that secrete pepsinogen and intrinsic factor; also called *zymogenic cell* [*cell*-storeroom]

childhood period of human development from infancy to puberty [*cilde-* child]

chiropractic (kye-roh-PRAK-tik) system of therapy based on principle that alignment of the skeleton promotes healing [*chiro-* hand, *-practic* practical]

chloride channel (KLOR-ide CHAN-nul) a pore in a cell membrane that allows only chloride ions to permeate, or pass through, the membrane [*chlor-* green, *-ide* chemical, *canalis-* pipe]

chloride shift (KLOR-ide) diffusion of chloride ions into red blood cells as bicarbonate ions diffuse out; maintains electrical neutrality of red blood cells [*chlor-* green, *-ide* chemical]

chlorine (KLOR-een) important negative ion surrounding cells; has one unpaired electron plus three paired electrons [*chlor-* green, *-ine* chemical]

cholecystectomy (koh-leh-sis-TEK-toh-mee) surgical removal of the gallbladder [*chole-* bile, *-cyst-* bag, *-ec-* out, *-tom-* cut, *-y* action]

cholecystitis (koh-leh-sis-TYE-tis) inflammation of the gallbladder [*chole-* bile, *-cyst-*bag, *-itis* inflammation]

cholecystokinin (CCK) (koh-lee-sis-toh-KYE-nin) hormone secreted from the intestinal mucosa of the duodenum that stimulates contraction of the gallbladder, resulting in bile flowing into the duodenum [*chole-* bile, *-cyst-*bag, *-kin-* movement, *-in* substance]

cholelithiasis (koh-leh-lih-THEE-ah-sis) gallstone formation [*chole-* bile, *-lith-* stone, *-iasis* condition]

cholera (KAHL-er-ah) potentially fatal, infectious bacterial disease characterized by severe diarrhea, vomiting, cramps, dehydration [*chole-* bile, *-a* state]

cholesterol (koh-LESS-ter-ol) steroid lipid found in many body tissues and in animal fats [*chole-* bile, *-steros* solid, *-ol* oil]

cholinergic (koh-lin-ER-jik) having to do with acetylcholine [*chole-* bile, *-erg* to work, *-ic* relating to]

chondral fracture (KON-dral) fracture of an articular (cartilage) surface in a synovial joint [*condr-* cartilage, *-al* relating to, *fracture* a breaking]

chondrification center (kon-dri-fi-KAY-shun) area of specialized mesenchymal cells; site of future cartilage formation [*chondr-* cartilage, *-fication* to make]

chondrocyte (KON-droh-syte) cartilage cell [*chondro-* cartilage, *-cyte* cell]

chondroitin sulfate (kon-DROY-tin SUHL-fayt) type of proteoglycan that helps thicken and hold together the matrix of connective tissue; *see* **proteoglycan** [*chondr-* cartilage, *-oid* of or like, *-in* substance, *sulf-* sulfur, *-ate* oxygen]

chondroma (kon-DROH-mah) benign tumor of cartilage [*chondr-* cartilage, *-oma* tumor]

chondromalacia patellae (kon-droh-mah-LAY-shee-ah pah-TEL-ee) degenerative process that results in a softening of the articular surface of the patella [*chondro-* cartilage, *-malacia* softening, *pat-* dish, *-ella* small]

chordae tendineae (KOR-dee ten-DIN-ee) stringlike structures that attach the AV valves to the wall of the heart [*chorda* string or cord, *tendinea* pulled tight] *sing.*, chorda tendinea

chorion (KOH-ree-on) outermost fetal membrane; contributes to tissues in the placenta [*chorion* skin]

chorionic villi (koh-ree-ON-ik VIL-eye) connection between blood vessels of the chorion and those of the placenta [*chorion-* skin, *-ic* relating to]

chorionic villus sampling (CVS) (koh-ree-ON-ik VIL-lus) procedure in which a tube is inserted through the (uterine) cervical opening and a sample of the chorionic tissue surrounding a developing embryo is removed for karyotyping [*chorion-* skin, *-ic* relating to, *villus* shaggy hair]

choroid (KOH-royd) middle layer of the eyeball; contains a dark pigment that prevents the scattering of incoming light rays [*chorio-* skin, *-oid* like]

choroid plexus (KOH-royd PLEK-sus) tuft of capillaries in ventricles of the brain that secrete cerebrospinal fluid [*chorio-* skin, *-oid* like, *plexus* network] *pl.*, plexi or plexuses

chromatid (KROH-mah-tid) either of the two DNA strands joined by a centromere existing after DNA has replicated (before cell division) but before the centromere has divided [*chrom-* color, *-id* structure or body]

chromatin (KROH-mah-tin) threadlike form of DNA, making up the genetic material in the nucleus [*chrom-* color, *-in* substance]

chromosomal genetic disease (kroh-moh-SOH-mal jeh-NET-ik) disease that results from chromosomal breakage or from abnormal presence or absence of entire chromosomes [*chrom-* color, *-soma-* body, *-al* relating to, *gen-*produce, *-ic* relating to, *dis-*opposite of, *-ease* comfort]

chromosome (KROH-meh-sohm) compact, barlike bodies of chromatin (DNA) that have coiled to form a compact mass during mitosis or meiosis; each chromosome is composed of regions called *genes*, each of which transmits hereditary information [*chrom-* color, *-som-* body]

chromosome territory (CT) (KROH-meh-sohm TAIR-it-or-ee) defined location within a cell's nucleus for a specific chromosome (chromatin strand) [*chrom-* color, *-som-*body, *terri-* land, *-ory* place]

chronic (KRON-ik) long-lasting, as in "chronic disease" [*chron-* time, *-ic* relating to]

chronic glomerulonephritis (KRON-ik gloh-mer-yoo-loh-neh-FRY-tis) noninfectious glomerular disorder characterized by progressive kidney damage leading to renal failure [*chron-* time, *-ic* relating to, *glomer-*ball, *-ul-*little, *-nephr-* kidney, *-itis* inflammation]

chronic lymphocytic leukemia (CLL) (KRON-ik LIM-foh-sit-ik loo-KEE-mee-ah) white blood cell disorder that produces large numbers of malignant precursor B lymphocytes [*chron-* time, *-ic* relating to, *lymph-* water (lymphatic system), *-cyte* cell, *leuk-*white, *-emia* blood condition]

chronic myeloid leukemia (CML) (KRON-ik MY-eh-loyd loo-KEE-mee-ah) white blood cell disorder that results from cancerous transformation of granulocytic precursor cells in the bone marrow [*chronos-* time, *-ic* relating to, *myel-* bone marrow, *leuk-*white, *-emia* blood condition]

chronic obstructive pulmonary disease (COPD) (KRON-ik ob-STRUK-tiv PUL-moh-nair-ee) general term referring to a group of disorders characterized by progressive, irreversible obstruction of airflow in the lungs; *see* **asthma, bronchitis, emphysema** [*chron-* time, *-ic* relating to, *pulmon-*lung, *-ary* relating to, *dis-* opposite of, *-ease* comfort]

chronic pain (KRON-ik) pain that continues over a prolonged time [*chron-* time, *-ic* relating to]

chronic renal failure (KRON-ik REE-nal FAIL-yoor) slow, progressing condition resulting from gradual loss of nephrons [*chron-* time, *-ic* relating to, *ren-* kidney, *-al* relating to]

chronological age (KRON-ah-lodg-i-kul) age of an individual expressed in years [*chrono-*time, *-logos* reason, *-al* relating to]

chyle (kile) milky fluid; the fat-containing lymph in the lymphatics of the intestine [*chyl-* juice]

chylomicron (kye-loh-MYE-kron) small fat droplet [*chylo-* juice (chyle), *-micro-* small, *-on* particle]

chyme (kyme) partially digested food mixture leaving the stomach [*chym-* juice]

chymotrypsin (kye-moh-TRIP-sin) pancreatic enzyme that digests proteins in the digestive tract [*chymo-* juice, *-tryps-* pound, *-in* substance]

cilia (SIL-ee-ah) hairlike projections of cells [*cili-* eyelid] *sing.*, cilium

ciliary body (SIL-ee-air-ee) thickening of the choroid that is located between the anterior margin of the retina and the posterior margin of the iris [*ciliary* eyelids or eyelashes]

ciliary muscle (SIL-ee-air-ee) smooth muscle in the ciliary body of the eye that suspends the lens and functions in accommodation [*ciliary* eyelids or eyelashes, *mus-* mouse, *-cle* little]

cilium (SIL-ee-um) *see* **cilia** [*cili-* eyelid] *pl.*, cilia

circular movement arclike rotation of structure around an axis [*circulare-* circle]

circular muscle muscle that circles a body tube or opening; sometimes called *sphincter* [*circulare-* circle, *mus-* mouse, *-cle* little]

circulatory shock (SER-kyoo-lah-tor-ee) failure of the circulatory system to adequately deliver oxygen to the tissues [*circulat-* go around, *-ory* relating to]

circulatory system (SER-kyoo-lah-tor-ee) system composed of the heart, blood vessels, and lymphatic vessels; permits transportation of material to and from all the cells of the body [*circulat-* go around, *-ory* relating to]

circumcision (ser-kum-SIH-zhun) surgical removal of the foreskin, or prepuce, of the penis [*circum-* around, *-cision* cutting]

circumduction (ser-kum-DUK-shun) moving a part so its distal end moves in a circle [*circum-* around, *-duct* lead]

circumvallate papilla (ser-kum-VAL-ayt pah-PIL-ah) huge, dome-shaped bumps of the tongue mucosa that form a transverse row near the back of the tongue surface; each one contains thousands of taste buds [*circum-* around, *-vall-* post or stake, *-ate* relating to, *papilla* nipple] *pl.*, papillae

cirrhosis (sih-ROH-sis) degeneration of liver tissue characterized by the replacement of damaged liver tissue with fibrous or fatty connective tissue [*cirrhos-* yellow-orange, *-osis* condition]

cisterna (sis-TER-na) tiny, membranous sacs, such as those that make up the Golgi apparatus [*cisterna* vessel] *pl.*, cisternae

cisterna chyli (sis-TER-nah KYE-lye) an enlarged pouch on the thoracic duct that serves as a storage area for lymph moving toward its point of entry into the venous system [*cisterna* vessel, *chyli* of juice]

citric acid cycle (SIT-rik ASS-id) second series of chemical reactions in the process of glucose metabolism in which carbon dioxide is formed and energy is released; it is an aerobic process; *see* **Krebs cycle** [*citr-* lemony, *-ic* relating to, *acid* sour, *cycle* circle]

clavicle (KLAV-i-kul) collar bone [*clavi-* key, *-cle* little]

cleavage line (KLEEV-ij) pattern of dense bundles of white collagenous fibers that characterize the reticular layers of dermis; also called *Langer lines* [*cleave-* to split]

cleft lip (kleft) a congenital defect that affects the mouth; failure of structures in the upper lip to fuse properly during embryonic development [*cleft-* split]

cleft palate (kleft PAL-ett) facial deformity that is an X-linked inherited condition; when the palatine bones fail to unite completely [*cleft-* split, *palate-* plate]

climacteric (klye-MAK-ter-ik) *see* **menopause** [*climacter-* critical point in life, *-ic* relating to]

clitoris (KLIT-oh-ris) small, erectile body located within the vestibule of the vagina; also called *glans clitoris* [*clitoris-* to shut] *pl.*, clitorides

clonal selection theory (KLOH-nal) process through which a B or T cell, once sensitized through contact with an antigen, divides rapidly to create a colony of clones that destroys the "selecting" antigen [*klon-* a plant cutting, *-al* relating to, *theorein-* to look at]

clone (klohn) any of a family of many identical cells descended from a single "parent" cell [*klon* a plant cutting]

closed fracture *see* **simple fracture** [*fracture-*a breaking]

closed reduction process by which a fracture is properly aligned without the need for surgery [*reducere-* to lead back]

coagulation (koh-ag-yoo-LAY-shen) *see* **blood coagulation** [*coagul-* curdle, *-ation* process]

cocaine (koh-KAYN) drug that blocks the uptake of dopamine (neurotransmitter) by neurons, thus inhibiting pain signals or producing a temporary feeling of well-being [*coca-* type of shrub, *-ine* made of]

coccygeus muscle (kohk-SIJ-ee-us) one of the muscles that form the pelvic floor [*coccygeus* coccyx (cuckoo), *mus-* mouse, *-cle* little]

coccyx (KOK-sis) last bone of the vertebral column, made up of 4 or 5 vertebrae that have fused together [*coccyx* cuckoo (beak)]

cochlea (KOHK-lee-ah) snail shell-like structure in the inner ear that houses the spiral organ (organ of Corti), which is responsible for sense of hearing [*cochlea-* snail shell]

cochlear duct (KOHK-lee-ar membranous tube within the bony cochlea; only part of the internal ear concerned with hearing [*cochlea-* snail shell, *ducere-* to lead]

cochlear nerve (KOHK-lee-ar) part of vestibulocochlear nerve (cranial nerve VIII); sensory nerve responsible for hearing [*cochlea-*snail shell]

codominance (koh-DOM-i-nance) in genetics, a form of dominance in which two dominant versions of a trait are both expressed in the same individual [*co-* together, *-domina-* rule, *-ance* state]

codon (KOH-don) in RNA, a triplet of three base pairs that codes for a particular amino acid [*caudex-* book]

coenzyme (koh-EN-zyme) organic, nonprotein catalyst that acts as molecule carrier [*co-* together, *-en-* in, *-zyme* ferment]

coenzyme A (CoA) (koh-EN-zyme) molecule that is converted from pyruvic acid in cell respiration; allows for the transition to the citric acid cycle from glycolysis [*co-* together, *-en-* in, *-zyme* ferment, A first letter of Roman alphabet]

cofactor (KOH-fak-ter) a nonprotein unit attached to an enzyme molecule than enables the enzyme to function properly [*co-*together, *-factor* maker]

colitis (koh-LYE-tis) any inflammatory condition of the colon and/or rectum [*col-* colon, *-itis* inflammation]

collagen (KAHL-ah-jen) principal organic constituent of connective tissue [*colla-* glue, *-gen* produce]

collagenous dense fibrous tissue (kah-LAJ-eh-nus dense FYE-brus TISH-yoo) flexible but strong connective tissue; for example, tendons [*colla-* glue, *-gen* produce, *dense* thick, *fibro-* fiber, *-ous* relating to, *tissu-* fabric]

collateral ganglion (koh-LAT-er-al GANG-glee-on) sympathetic, prevertebral ganglion; named for nearby blood vessels [*co-* together, *-later-* side, *-al* relating to, *gangli-* knot, *-on* unit] *pl.*, ganglia

collecting duct (koh-LEK-ting) in the kidney, straight tubule joined by the distal tubules of several nephrons [*colligere-* to gather, *ducere-* to lead]

Colles fracture (KOL-ez) fracture of the distal end of the radius [*Abraham Colles*, Irish surgeon, *fracture* a breaking]

colloid (KOL-oyd) dissolved particles that resist separation from the gas, liquid, or solid medium in which they are dissolved [*coll-* glue, *-oid* resembling]

colloid osmotic pressure (KOL-oyd os-MOT-ik) *see* **blood colloid osmotic pressure** [*coll-*glue, *-oid* like, *osmo-* push, *-ic* relating to]

colon (KOH-lon) division of the large intestine; divided into ascending, transverse, descending, and sigmoid portions [*colon* large intestine]

colonoscopy (koh-lon-AH-skah-pee) medical procedure in which the lining of the colon is checked for colorectal cancer or other abnormalities by inserting a flexible scope through the anus and into the colon [*colon* large intestine, *-scop-* **see,** *-y* activity]

color Doppler mapping (DOP-ler) variation of ultrasonography that converts recorded flow frequencies into different colors; color images are then superimposed on M-mode or 2-D echocardiograms [*Christian Doppler* Australian physicist/mathematician]

colorectal cancer (koh-loh-REK-tal) malignancy of the colon or rectum [*colo-* colon, *-rect-* straight, *-al* relating to, *cancer* crab or malignant tumor]

columnar (koh-LUM-nar) cell classification by shape in which cells are higher than they are wide [*column-* column, *-ar* relating to]

coma (KOH-mah) altered state of consciousness from which an individual cannot be aroused [*coma* deep sleep]

combining site two small concave regions on the surface of an antibody molecule [*com-* together, *-bine* two at a time]

comedo (KOM-ee-doh) inflamed, plugged sebaceous gland duct, common in acne conditions; *see also* **blackhead** [*comedere-*to consume]

comminuted fracture (kom-i-NOO-ted) fracture that results in small, crushed bone fragments between or near the broken ends of the bone [*commin-* break into pieces, *-ute* perform action, *fracture* a breaking]

commissural tract (kom-MIS-yoo-ral) nerve tissue that connects the left and right hemispheres of the brain; *see* **corpus callosum** [*commissura-* a connection, *-al* relating to, *tractus-* trail]

common bile duct (KOM-on byle) duct from the liver that empties into the duodenum; made up of the merging of the hepatic duct with the cystic duct [*bilus-* bile, *ducere-* to lead]

common carotid artery (kah-ROT-id AR-ter-ee) blood vessel that supplies the region of the head and neck [*caro-* heavy sleep, *-id* relating to, *arteri-* vessel]

communicable (kom-MYOO-ni-kah-bil) able to spread from one individual to another [*communic* common, *-able* capacity for]

compact bone tissue dense bone; contains structural units called *osteons* or *Haversian systems* [*compact* to put together, *tissu-* fabric]

compensation (kom-pen-SAY-shun) physiological process in which the body's functions compensate, or counterbalance, a deviation from the normal set-point value of a characteristic of the body's internal environment—for example, pH [*compens-* balance, *-tion* process]

complement (KOM-pleh-ment) any of several proteins normally present in blood plasma that when activated kill foreign cells by puncturing them [*comple-* complete, *-ment* result of action]

complementary (base) pairing bonding purines and pyrimidines in DNA; adenine always binds with thymine, and cytosine always binds with guanine [*comple-* complete, *-ment-* process, *-ary* relating to]

complete blood cell count (CBC) clinical blood test that usually includes standard red blood cell, white blood cell, thrombocyte counts, the differential white blood cell count, hematocrit, and hemoglobin content [*complere-* to fill up, *cell-* storeroom]

complete fracture fracture that totally divides a bone into separate pieces [*complere-* to fill up, *fracture* a breaking]

compliance (kahm-PLY-ans) the ease of stretch of a material—as in lung compliance, the ease of stretch of the lung tissues [*compli-* complete, *-ance* act of]

composite cell (kahm-PAH-zit) artistic representation of a cell that includes features from many different types of cells [*composite* to assemble, *cell* storeroom]

compound a chemical combination of two or more elements [*compound* put together]

compound fracture type of bone fracture in which broken bone projects through surrounding tissue and skin, thereby inviting the possibility of osteomyelitis; also called *displaced* or *open fracture* [*compound* to put together, *fracture* a breaking]

computed tomography (CT) (kom-PYOO-ted toh-MOG-rah-fee) x-ray technique that produces an image representing a detailed cross section of a body structure [*tomo-* cut, *-graph-* draw, *-y* process]

concentration gradient (kahn-sen-TRAY-shun GRAY-dee-ent) measurable difference in concentration from one area to another [*con-*together, *-centr-* center, *-ation* process, *gradi-*step, *-ent* state]

concentric contraction (kon-SEN-trik kon-TRAK-shun) contraction in which the movement results in shortening of the muscle; type of isotonic contraction or dynamic tension [*con-* together, *-centr-* center, *-ic* relating to, *con-* together, *-tract-* drag or draw, *-tion* process]

contraction (kon-TRAK-shun) tension of muscle fibers produced by sliding of cytoskeletal filaments and producing either shortening of the muscle fiber, pull on a load, or both [*con-* together, *-tract-* drag or draw, *-tion* process]

concha (KONG-kah) scroll-shaped bone that forms a ledge projecting into the nasal cavity from its lateral wall [*concha* sea shell] *pl.*, conchae

condensation (kon-den-SAY-shun) see **dehydration synthesis** [*con-* together, *-dense-* thick or crowded, *-tion* process]

conduction in human anatomy, the transfer of heat energy to the skin and then the external environment [*con-* with, *duct-* lead, *-tion* process]

conductive keratoplasty (CK) (kon-DUK-tiv ker-ah-toh-PLAS-tee) treatment for the correction of farsightedness [*con-* with, *duct-* lead, *-ive* relating to, *kera-* horn, *-plasty* surgical repair]

conductivity (kon-duk-TIV-uh-tee) ability of living cells and tissues to selectively transmit a wave of excitation from one point to another within the body [*con-* with, *duct-* lead, *-iv-* relating to, *-ity* state]

condyloid joint (KON-di-loyd) ellipsoidal joint [*condylo-* knuckle, *-oid* resembling, *jungere-* to join]

cone receptor cell located in the retina that is stimulated by bright light [*konos-* cone]

congenital abnormality (kon-JEN-i-tall ab-nor- MAL-i-tee) *see* **congenital disorder** [*con-* with, *-genit-* born, *-al* relating to]

congenital disorder (kon-JEN-i-tall) refers to a condition present at birth; congenital conditions may be inherited or may be acquired in the womb or during delivery [*con-* with, *-genit-* born, -al relating to]

congestive heart failure (CHF) (kon-JES-tive) left heart failure; inability of the left ventricle to pump effectively, resulting in congestion in the systemic and pulmonary circulations [*congest-* crowd together, *-ive* relating to]

conjunctiva (kon-junk-TI-vah) mucous membrane that lines the eyelids and covers the sclera (white portion of the eye) [*con-*together, *-junct* join]

conjunctivitis (kon-junk-ti-VYE-tis) inflammation of the conjunctiva, usually caused by irritation, infection, or allergy [*con-* together, *-junct-* join, *-iv-* relating to, *-itis* inflammation]

connective tissue most abundant and widely distributed tissue in the body [*con-* together, *-nect-* bind, *-ive* relating to, *tissu-* fabric]

connective tissue membrane body membrane that lines movable joint cavities; for example, synovial [*con-* together, *-nect-*bind, *-ive* relating to, *tissu-* fabric, *membrane* thin skin]

connectome (kon-NEK-tohm) map of all the neural connections of the brain [*con-* together, *-nect-* bind, *-ome* complete set]

consciousness state of awareness of one's self and environment and other beings [*conscire-* to know wrong]

constipation (kon-sti-PAY-shun) condition that results when extra water is absorbed from the fecal mass, producing a hardened stool [*constipa-* crowd together, *-ation* process]

contact dermatitis (der-mah-TYE-tis) local skin inflammation lasting a few hours or days after being exposed to an antigen [*contingere-* to touch, *derma-* skin, *-itis* inflammation]

contact digestion (dye-JES-chun) when substrates bind onto enzymes located on the surface of the brush border and complete carbohydrate digestion [*contingere-* to touch, *diges*t- break down, *-tion* process]

continuous ambulatory peritoneal dialysis (CAPD) (AM-byoo-lah-tor-ee pair-i-toh-NEE-al dye-AL-i-sis) technique used in the treatment of renal failure [*continuare-* to unite, *ambulat-* walk, *-ory* relating to, *peritone-* peritoneum, *-al* relating to, *dia-*through, *-lysis* loosening]

continuous capillary (KAP-i-lair-ee) capillaries that have a continuous lining of endothelial cells with only small openings between them [*continuare-* to unite, *capill-*hair, *-ary* relating to]

continuous positive airway pressure (CPAP) special type of mechanical respirator used to treat infant respiratory distress syndrome [*continuare-* to unite, *premere-* to press]

contractility (kon-trak-TIL-i-tee) ability, as of muscle cell, to contract or shorten to produce movement [*con-* together, *-tract-* drag or draw, *-il-* of or like, *-ity* quality of]

contralateral (kon-trah-LAT-er-al) on the opposite side of the body [*contra-* against, *lateralis-* side]

contralateral reflex arc (kon-trah-LAT-er-al REE-fleks ark) reflex arc whose receptor and effectors are located on opposite sides of the body [*contra-* against, *lateralis-* side, *re-* again, *-flex* bend]

contusion (kon-TOO-zhun) a bruise; an injury in which the skin or surface of an organ is not broken but underlying blood vessels rupture and leak into interstitial space [*contus-* bruise, *-sion* result]

conus medullaris (KOH-nus MED-yoo-lair-is) tapered end of the spinal cord [*conus* cone, *medulla* middle] *pl.*, coni medullares

convection (kon-VEK-shun) in human anatomy, transfer of heat energy to air that is flowing away from the skin [*convergere-* to bring together]

convergence (kon-VER-jens) a coming together, as in movement of the two eyeballs inward so that their visual axes come together at the same point on the object viewed; also, when more than one presynaptic axon synapses with a single postsynaptic neuron [*con- together, -verg-* incline, *-ence* state]

convergent muscle (kon-VER-jent) muscle that radiates out from a small to a wider point of attachment; for example, pectoralis major [*con-* together, *-verg-* incline, *-ent* state, *mus-* mouse, *-cle* little]

convolution (kon-voh-LOO-shun) *see* **gyrus** [*con-* together, *-volut-* roll, *-tion* process]

convulsion (kon-VUL-shun) abnormal, uncoordinated tetanic contractions of varying groups of muscles; also called *seizure* [*convuls-* pull violently, *-sion* result]

cor pulmonale (kohr pul-mah-NAL-ee) failure of the right atrium and ventricle to pump blood effectively, resulting from obstruction of pulmonary blood flow [*cor* heart, *pulmon-* lung, *-ale* relating to]

cornea (KOR-nee-ah) transparent, anterior portion of the sclera [*corneus-* horny]

corneal reflex (KOR-nee-al) blinking in response to the cornea being touched [*corn-*horn, *-al* relating to, *re-* again, *-flex* bend]

corneocyte (KOR-nee-o-site) dead, flattened keratinocyte (epidermal cell of skin) that has filled with keratin and formed a dense, waterproof epidermal layer called *stratum corneum* [*cornu-* horn, *-cyte* cell]

corona radiata (ko-ROHN-ah ray-dee-AH-tah) layer surrounding ovum and its zona pellucida; made up of cumulus cells derived from the ovarian follicle [*corona* crown, *radiata* radiant (with rays)]

coronal plane (ko-RO-nal) frontal plane; divides the body into front and back portions [*corona-* crown, *-al* relating to]

coronary artery (KOHR-oh-nair-ee AR-ter-ee) blood vessel that provides blood to the myocardial cells [*corona-* crown, *-ary* relating to, *arteri-* vessel]

coronary artery disease (CAD) (KOR-oh-nair-ee AR-ter-ee) condition that results from reduced blood flow to the myocardial tissue [*corona-* crown, *-ary* relating to, *arteri-* vessel, *dis-* opposite of, *-ease* comfort]

coronary bypass surgery (KOR-oh-nair-ee) surgery to relieve severely restricted coronary blood flow; veins are taken from other parts of the body and grafted in to bypass the blockage [*corona-* crown, *-ary* relating to]

coronary sinus (KOR-oh-nair-ee SYE-nus) area that receives deoxygenated blood from the coronary veins and empties into the right atrium [*corona-* crown, *-ary* relating to, *sinus-* hollow]

coronoid fossa (KOR-uh-noyd FOSS-ah) depression at the distal end of the humerus bone, into which the coronoid process of the ulna fits (last part of the humerus-ulna articulation) [*coron-* crown, *-oid* like, *fossa* ditch] *pl.* fossae (FOSS-ee)

corpora cavernosa (KOHR-pohr-ah kav-er-NO-sah) *see* **corpus cavernosum** [*corpora-*bodies, *cavern-* hollow space]

corpora quadrigemina (KOHR-pohr-ah kwod-ri- JEM-i-nah) midbrain landmark composed of inferior and superior colliculi [*corpora* bodies, *quadri-* fourfold, *-gemina* twin]

corpus albicans (KOHR-pus AL-bi-kans) white scar on ovary that replaces the degenerated corpus luteum [*corpus* body, *albli-cans* whitening] *pl.*, corpora albicantia

corpus callosum (KOHR-pus kah-LOH-sum) nerve tissue connecting the right and left cerebral hemispheres; also called *commissural tract* [*corpus* body, *callosum* callous] *pl.*, corpora callosa

corpus cavernosum (KOHR-pus kav-er-NO-sum) either of two columns of erectile tissue in the shaft of the penis [*corpus* body, *cavern-* large hollow, *-os-* relating to, *-um* thing] *pl.*, corpora cavernosa

corpus luteum (KOHR-pus LOO-tee-um) a hormone-secreting glandular structure formed after ovulation at the site of the ruptured follicle; it secretes chiefly progesterone with some estrogen [*corpus* body, *lute-*yellow, *-um* thing] *pl.*, corpora lutea

corpus spongiosum (KOHR-pus spun-jee-OH-sum) a column of erectile tissue surrounding the urethra in the penis [*corpus* body, *spong-* sponge,*-os-* relating to, *-um* thing] *pl.*, corpora spongiosa

correction process in which a function is made to work properly, as in adjusting refraction of light in the eye to improve focusing an image on the retina [*corrigere-* to correct]

corrugator supercilii muscle (COR-uh-gay-tor soo-per-SIL-ee-eye) muscle that draws the eyebrows together [*corrugator* wrinkler, *super-* above, *-cilli-* eyelash, *mus-* mouse, *-cle* little]

cortex (KOHR-teks) outer part of an internal organ; for example, the outer part of the cerebrum or the outer portion of the kidneys [*cortex* bark] *pl.*, cortices

cortical (KOR-tik-al) to the cortex, or outer area of an organ or structure [*cortic-* bark, *-al* relating to]

cortical nephron (KOHR-ti-kal NEF-rons) nephron located in the renal cortex [*cortic-* bark (cortex), *-al* relating to, *nephro-* kidney, *-on* unit]

cortical nodule (KOHR-ti-kal NOD-yool) located within sinuses along the cortex of the lymph node; packed with lymphocytes surrounding the germinal center [*cortic-* bark (cortex), *-al* relating to, *nod-* knot, *-ule* small]

corticoid (KOHR-tih-koyd) hormone secreted by the adrenal cortex [*cortic-* cortex or bark, *-oid* like]

corticosteroid (kohr-ti-koh-STER-royd) glucocorticoid secreted by zona fasciculata of the adrenal cortex [*cortico-* cortex or bark, *stero-* solid, *-oid* resembling]

corticotroph (kohr-tih-koh-TROHF) cell type of the adenohypophysis (anterior pituitary) that secretes ACTH (adrenocorticotropic hormone) and tiny amounts of melanocortins such as α-MSH (alpha melanocyte-stimulating hormone) [*cortic-* bark, *-troph* nourish]

cortisol (KOHR-tih-sol) glucocorticoid secreted by zona fasciculata of the adrenal cortex; also known as *hydrocortisone* [*cortis-* bark, *-ol* alcohol]

cortisone (KOHR-ti-sohn) *see* **cortisol** [*corti-* cortex or bark]

costal cartilage (KOS-tal KAR-ti-lij) cartilage that attaches ribs two through ten to the body of the sternum [*costa-* rib, *-al* relating to, *cartilago-* cartilage]

costal surface (KOS-tal) region of the lungs that lies against the ribs; rounded to match contour of thoracic cavity [*costa-* rib, *-al* relating to]

cotransmission (koh-tranz-MISH-un) theory of efferent autonomic synaptic transmission that states that all or most postganglionic fibers release either norepinephrine or acetylcholine along with NANC (nonadrenergic-noncholinergic) transmitters or modulators and that each substance combines with postsynaptic and/or presynaptic receptors to produce regulatory effects [*co-* together, *-trans-* across, *-miss-* send, *-ion* process]

cotransport (koh-TRANZ-port) carrier that moves two or more solute types across the plasma membrane in the same direction; also called *symport* [*co-* together, *-trans-* across, *-port* carry]

cough reflex epiglottis and glottis close and contract in response to foreign matter in the trachea or bronchi [*re-* back or again, *-flex* bend]

coumarin (KOO-mar-in) compound that retards blood coagulation; often given as medication to prevent heart attacks [*coumarou-* tonka bean tree]

countercurrent mechanism (KON-ter-kerrent MEK-a-niz-em) system in which renal tubule filtrate flows in opposite directions; facilitates urine concentration [*counter-* against, *-current* flow]

countertransport (KON-ter-tranz-port) carrier that moves two different types of molecules in opposite directions across the plasma membrane; also called *antiport* [*counter-*against, *-trans-* across, *-port* carry]

covalent bond (ko-VAYL-ent) chemical bond formed by two atoms sharing one or more pairs of electrons [*co-* with, *-valen-* power, *bond* band]

Cowper gland (KOW-per) *see* **bulbourethral gland** [*William Cowper* English anatomist]

COX inhibitor (KOKS in-HIB-it-or) drug that slows or stops the activity of the COX enzyme, which produces prostaglandins that stimulate an inflammatory response [*COX* acronym for *cycloxygenase*]

coxal bone (KOK-sal) hip bone [*coxa-* hip, *-al* relating to]

CPL (C P L) a submicroscopic vesicle (bubble or membrane) within cells that acts as a "compartment for peptide loading (CPL)," in which proteins are altered in structure [shortened form of *compartment for peptide loading*]

cramps painful muscle spasms (involuntary twitches) that result from irritating stimuli, as in mild inflammation, or from ion imbalances [*crammian-* to fill]

cranial nerve (KRAY-nee-al) any of twelve pairs of nerves that attach to the undersurface of the brain and conduct impulses between the brain and structures in the head, neck, and thorax [*crani-* skull, *-al* relating to]

cranial reflex (KRAY-nee-al REE-fleks) reflex response mediated within the brain [*crani-* skull, *-al* relating to, *re-* again, *-flex* bend]

craniosacral division (kray-nee-oh-SAY-kral) parasympathetic division of the autonomic nervous system [*cranio-* skull, *-sacer* sacred, *-al* relating to, *dividere-* to divide]

cranium (KRAY-nee-um) bony vault, made up of eight bones, that encases the brain [*cranium* skull]

C-reactive protein (CRP) (C re-AK-tiv PRO-teen) blood marker for inflammation; elevated levels suggest cardiac disease [*re-* again, *-agere* to act, *prote-* first rank, *-in* substance]

creatine phosphate (CP) (KREE-ah-tin FOS-fayt) substance found in muscle cells and used for the temporary storage of chemical energy to supply ATP and ultimately for muscle contraction [*creat-* flesh, *-ine* relating to, *phosph-* phosphorus, *-ate* oxygen]

cremaster muscle (kreh-MASS-ter) muscle responsible for elevating the testes [*cremastos-* hanging, *mus-* mouse, *-cle* little]

crepitus (KREP-i-tus) sound of bone fragments rubbing together [*crepitus* crackling]

cretinism (KREE-tin-iz-em) dwarfism caused by hyposecretion of the thyroid gland [*cretin-* idiot, *-ism* condition]

Creutzfeldt-Jakob Disease (CJD) (KROYTS-felt YAH-kobe) *see* **variant Creutzfeldt-Jakob disease (vCJD)** [*Hans G. Cruetzfeldt* German neurologist, *Alfons M. Jakob* German neurologist, *dis-* opposite of, *-ease* comfort]

cribriform plate (KRIB-ri-form) perforated portion of ethmoid bone that separates the nasal and cranial cavities [*cribr-* sieve, *-form* shape]

crista (KRIS-tah) fold, for example, any of the folds of the inner membrane of a mitochondrion [*crista* crest or fold] *pl.*, cristae

crista ampullaris (KRIS-tah am-pyoo-LAIR-iss) fold that serves as a sensory receptor organ located within the ampulla of the semicircular ducts; detects head movements [*crista* ridge, *ampu-* flask, *-ulla-* little, *-aris* relating to] *pl.*, cristae ampulares

Crohn disease (krohn) type of autoimmune colitis affecting the small intestine [*Burrill B. Crohn* American physician, *dis-* opposite of, *-ease* comfort]

cross bridge junction of a thick myofilament with a thin myofilament in the myofibril of a muscle fiber, where the head of a myosin molecule in the thick filament binds to the active site of an actin molecule in the thin filament [*crux-* cross, *brigge-* bridge]

crossing over phenomenon that occurs during meiosis when pairs of homologous chromosomes synapse and exchange genes [*crux-* cross]

croup (kroop) syndrome characterized by labored inspiration and a harsh vibrating cough [*croup* croak]

crown topmost part of an organ or other structure [*corona-* crown]

cruciate ligament (KRU-shee-ayt) either of two crossed ligaments inside the knee joint cavity that connect the tibia to the femur; the *anterior cruciate ligament (ACL)* and the *posterior cruciate ligament (PCL)* [*cruci-* cross, *-ate* of or like]

cryopreservation (krye-oh-prez-er-VAY-shun) deep freezing technique; used for reimplantation of parathyroid tissue [*cryo-* cold, *-preserv-* to keep, *-tion* process]

cryptorchidism (krip-TOR-ki-diz-em) condition resulting in undescended testes [*crypt-* hidden, *-orchid-* testis, *-ism* condition]

cuboidal (KYOO-boyd-al) cell classification by shape in which cells resemble a cube [*cub-* cube, *-oid* like, *-al* relating to]

cupula (KYOO-pyoo-lah) structure found within the crista ampullaris of the semicircular duct; the gelatinous ridge in which the hair cells are embedded [*cup-* tub, *-ula* little] *pl.*, cupulae

Cushing syndrome (KOOSH-ing SIN-drohm) condition caused by hypersecretion of glucocorticoids from the adrenal cortex [*Harvey W. Cushing* American neurosurgeon, *syn-* together, *-drome* running or (race) course]

cuspid valve (KUS-pid) *see* **atrioventricular valve** [*cusp-* point, *-id* characterized by]

cutaneous membrane (kyoo-TAYN-ee-us) primary organ of the integumentary system; the skin [*cut- skin, -aneous* relating to]

cuticle (KYOO-ti-kul) skin fold covering the root of the nail [*cut-* skin, *-icle* little]

cyanosis (sye-ah-NO-sis) condition of blueness, particularly of the skin, resulting from inadequate oxygenation of the blood [*cyan-* blue, *-osis* condition]

cyclic AMP (SIK-lik A M P) one of several second messengers that delivers information inside the cell and thus regulates the cell's activity [*kyklos-* circle, *-ic* relating to]

cyclin (SYE-klin) any of several regulatory proteins in the cell that influence the function of activating enzymes called *cyclin-dependent kinases* that drive the cell forward from phase to phase in the cell life cycle and thus regulate the cell's growth and reproduction [*kyklos-* circle, *-in* neutral substance]

cyclin-dependent kinase (CDK) (SYE-klin dee-PEND-ent KI-nays) any of several activating enzymes that drive the cell through the various phases of its life cycle; "cyclin-dependent" refers to the CDK itself being regulated by cellular proteins called *cyclins* [*kyklos-* circle, *-in* neutral substance, *de-* away, *-pendere* to hang upon, *kinesis-* motion, *-ase* enzyme]

cystic duct (SIS-tik) joins with the common hepatic duct to form the common bile duct [*cyst-* sac, *-ic* relating to, *ducere-* to lead]

cystic fibrosis (CF) (SIS-tik fye-BROH-sis) inherited disease involving abnormal chloride ion (Cl^-) transport (CFTR chloride channel); causes secretion of abnormally thick mucus and other problems [*cyst-* sac, *-ic* relating to *fibr-* fiber, *-osis* condition]

cystitis (sis-TYE-tis) inflammation of a sac-like structure such as the urinary bladder [*cyst-* bag, *-itis* inflammation]

cystoscope (SIS-toh-skohp) device used to look into a bladder, such as the urinary bladder [*cyst-* bag, *-scop-* see]

cytokine (SYE-toh-kyne) chemical released from cells to trigger or regulate innate and adaptive immune responses [*cyto-* cell, *-kine* movement]

cytokinesis (sye-toe-kin-EE-sis) process by which a dividing cell splits its cytoplasm and plasma membrane into two distinct daughter cells; cytokinesis happens along with mitosis (or meiosis) during the cell division process [*cyto-* cell, *-kinesis* movement]

cytology (sye-TOL-oh-jee) study of cells [*cyto-* cell, *-ology* study of]

cytolysis (sye-TOL-i-sis) literally, "cell bursting"; often occurs when ions and water rush into a cell, causing it to burst [*cyto-* cell, *-lysis* loosening]

cytoplasm (SYE-toh-plaz-em) gel-like substance of a cell exclusive of the nucleus and plasma membrane; includes organelles (except nucleus) and cytosol (intracellular fluid) [*cyto-* cell, *-plasm* to mold]

cytoskeleton (sye-toh-SKEL-eh-ton) cell's internal supporting, moving framework [*cyto-* cell, *-skeleto-*dried body]

cytosol (SYE-toh-sawl) solution of water and other substances of a cell (outside the nucleus) in which the organelles and cellular inclusions are suspended; it is the liquid portion of the living cell substance known as *cytoplasm* [*cyto-* cell, *-ol* oil]

cytotoxic T cell (sye-toh-TOK-sik) "cell killing" T cell [*cyto-* cell, *-toxic* poison, *T* thymus gland, *cell* storeroom]

D

Dalton's law (DAL-tenz) gas law that states that the total pressure exerted by a mixture of gases is the sum of the pressure of each individual gas; also called *law of partial pressure* [*John Dalton* English chemist and physicist]

deamination (dee-am-i-NAY-shun) removal of an amino group from an amino acid to form a molecule of ammonia and one of keto acid; occurs in the liver as first step in protein catabolism [*de-* undo, *-amin-* ammonia compound, *-ation* process]

decarboxylase (dee-kar-BOK-si-lays) enzyme that removes carbon dioxide [*de-* undo, *-carbo* carbon, *-oxy* sour, *-ase* enzyme]

deciduous teeth (deh-SID-yoo-us) commonly referred to as "baby teeth"; 20 teeth that are shed at a certain age before development of permanent teeth [*decid-* fall off, *-ous* relating to]

decomposition reaction (dee-KAHM-poh-sih-shun ree-AK-shun) chemical reaction that breaks down a substance into two or more simpler substances [*de-* opposite of, *-compo-* to assemble, *-tion* process, *re-* again, *-action* action]

decubitus ulcer (deh-KYOO-bi-tus UL-ser) area of destroyed tissue resulting from inadequate blood supply that often develops when body lies in one position for prolonged periods [*decubitus* a lying down position, *ulcer* sore]

deep farther away from the body's surface, as opposed to superficial [*deep-* deep]
deep vein vein that is farther away from the surface, as opposed to a superficial vein [*vena-* vein]
defecation (def-eh-KAY-shun) expelling feces from the digestive tract [*de-* remove, *-feca-* waste (feces), *-tion* process]
defibrillation (deh-fib-ri-LAY-shun) application of an electric shock to force cardiac muscle fibers to contract in unison [*de-*undo, *-fibrilla* little thread, *-tion* process of]
deglutition (deg-loo-TISH-un) swallowing [*deglut-* swallow, *-tion* process]
dehydration (dee-hye-DRAY-shun) an abnormal loss of fluid from the body's internal environment [*de-* remove, *-hydro* water, *-ation* process]
dehydration synthesis (dee-hye-DRAY-shun SIN-the-sis) anabolic process by which molecules are joined to form larger molecules; often called *condensation* reaction because it joins molecules together into a denser mass [*de-* from, *-hydrat-* water, *-tion* process, *synthesis* putting together]
deletion (deh-LEE-shun) genetic mutation that occurs within a DNA molecule when one or more nucleotide bases in a sequence are missing, causing a misreading of the genetic code and a failure to produce a normal protein needed for body function [*deletionum-* destruction]
delta cell (DEL-tah) pancreatic islet cell that secretes somatostatin; also called *D cell* [*delta* (δ) fourth letter of Greek alphabet, *cell* storeroom]
deltoid (DEL-toyd) triangular muscle that covers the shoulder joint, abducting the arm [*delta-* triangle, *-oid* like]
dementia (de-MEN-shah) degenerative disease that can result in destruction of neurons in the brain [*de-* off, *-mens-* mind, *-ia* condition of]
denature (de-NAYT-shur) to alter the shape of a protein by a change in pH, heat, or some other manner to change its chemical properties [*de-* remove, *-nature* nature]
dendrite (DEN-dryte) branching or treelike nerve cell process that receives input from other neurons and transmits toward the cell body (or toward the axon in a unipolar neuron) [*dendr-* tree, *-ite* part (branch) of]
dendritic cell (DC) (DEN-dri-tik) phagocytic cells in the skin [*dendrit-* tree branch, *-ic* relating to, *cell* storeroom]
dens (denz) upward projection from the body of the second cervical vertebra that furnishes an axis for rotating the head; also called *odontoid process* [*dens* tooth]
dense fibrous tissue (FYE-brus) tissue consisting of fibers packed densely in the matrix [*dense* thick, *fibro-* fiber, *-ous* relating to, *connect-* bind, *-ive* relating to, *tissu-* fabric]
dentate fracture (DEN-tayt) type of bone fracture in which fracture components are jagged and fit together like teeth on a gear [*dent-* tooth, *-ate* of or like, *fracture* a breaking]
dentate nucleus (DEN-tayt NOO-klee-us) either of paired cerebellar gray matter structures that are connected by tracts with the thalamus, as well as motor areas of the cerebral cortex [*dent-* tooth, *-ate* of or like, *nucleus* nut or kernel] *pl.*, nuclei
deoxyribonucleic acid (DNA) (dee-ok-see-rye-boh-nook-lay-ik ASS-id) genetic material of the cell that carries the chemical "blueprint" of the body [*de-* removed, *-oxy-* oxygen, *-nucle-*nucleus (kernel), *-ic* relating to, *acid* sour]
deoxyribose (dee-ok-see-RYE-bohs) sugar in DNA whose molecules contain only five carbons [*deoxy-* containing a decreased amount of oxygen, *-ribose* 5 carbon sugar]
depolarization (dee-poh-lar-i-ZAY-shun) electrical activity that triggers a contraction of the heart muscle [*de-* opposite, *-pol-* pole, *-ar-* relating to, *-ization* process]
depressed fracture (dee-PREST) type of bone fracture in which skull bone is partly "caved in" from the fracture of skull bones [*de-*down, *-premere* to press, *fracture* a breaking]
depression (dee-PRESH-un) movement that lowers or depresses a part, moving it in the opposite direction from elevation [*de-*down, *-press-* press, *-sion* process]
dermal papilla (DER-mal pah-PIL-ah) any of the many small bumps in the surface of the papillary layer of the dermis and which form the ridges and grooves of fingerprints [*derma-* skin, *-al* relating to, *papilla* nipple] *pl.*, papillae
dermatitis (der-mah-TYE-tis) general term referring to any inflammation of the skin [*derma-* skin, *-itis* inflammation]
dermatology (der-mah-TOL-oh-jee) study of the integument and its diseases [*derma-* skin, *-ology* science of]
dermatome (DER-mah-tohm) skin surface areas supplied by a single spinal nerve [*derma-* skin, *-tome* cut segment or region]
dermatosis (der-mah-TOH-sis) general term meaning "skin condition" [*derma-* skin, *-osis* condition]
dermis (DER-mis) the deeper of the two major layers of the skin, composed of dense fibrous connective tissue interspersed with glands, nerve endings, and blood vessels [*derma* skin]
dermoepidermal junction (DEJ) (DER-mo-EP-i-dermal) thin, gluelike layer that binds the epidermis of the skin to the underlying dermis; also called d*ermal-epidermal junction* [*derma-* skin, *-al* relating to, *epi-* on or upon]
descending aorta (ay-OR-tah) conducts blood downward from the arch of the aorta to the abdominal cavity [*desend-* move downward, *aort-* lifted, *-a* thing] *pl.*, aortae or aortas
descending colon (dih-SEND-ing KOH-lon) portion of the colon that lies in the vertical position, on the left side of the abdomen; extends from below the stomach to the iliac crest [*desend-* move downward, *colon* large intestine]
descending tract (dih-SEND-ing) bundle of axons in the spinal cord that conducts impulses down the cord from the brain [*descend-* move downward, *tract-* trail]
desmosome (DES-moh-sohm) category of cell junction that holds adjacent cells together; consists of dense plate or band of connecting structures at point of adhesion [*desmo-* band, *-som-* body]
desquamation (des-kwah-MAY-shun) shedding of epithelial elements from the skin surface [*de-* to remove, *-squama-* scale, *-tion* process]
detrusor muscle (dee-TROO-sor) smooth muscle tissue making up the wall of the bladder [*detrus-* thrust, *-or* agent, *mus-*mouse, *-cle* little]
developmental anatomy *see* **developmental biology** [*developper-* to unfold, *ana-* not or without, *-tomy* a cut]
developmental biology branch of biology that studies the process of change over the life cycle [*developper-* to unfold, *bio-* life, *-log-* words (study of), *-y* activity]
deviated septum (DEE-vee-ay-ted SEP-tum) abnormal condition in which the nasal septum is far from its normal position, possibly obstructing normal nasal breathing [*devia-*turn aside, *-ate* process, *septum* partition] *pl.*, septa
diabetes insipidus (dye-ah-BEE-teez in-SIP-i-dus) condition resulting from hyposecretion of ADH in which large volumes of urine are formed [*diabetes* siphon, *insipidus* without zest]
diabetes mellitus (DM) (dye-ah-BEE-teez MELL-i- tus) condition resulting when the pancreatic islets secrete too little insulin, resulting in increased levels of blood glucose [*diabetes* passer through or siphon, *mellitus* honey-sweet]
diabetic ketoacidosis (dye-ah-BET-ik kee-toh-ass-i-DOH-sis) results from an accumulation of ketone bodies in the blood [*diabet-* siphon (diabetes mellitus), *-ic* relating to, *keto-* acetone, *-acid-* sour, *-osis* condition]
diabetic neuropathy (dye-ah-BET-ik nyoo-ROP-ah-thee) nerve damage caused by diabetes mellitus [*diabet-* siphon, *-ic* relating to, *neuro-* nerve, *-path-* disease, *-y* state]
diabetic retinopathy (dye-ah-BET-ik ret-in-AH-path-ee) retinal damage caused by diabetes mellitus [*diabet-* siphon, *-ic* relating to, *ret-* net, *-ina* relating to, *-path-* disease, *-y* state]
diad (dye-AD) double structure of sarcoplasmic reticulum and T tubules in cardiac muscle fiber [*diad-* across]
dialysis (dye-AL-i-sis) separation of smaller (diffusible) particles from larger (nondiffusible) particles through a semipermeable membrane [*dia-* apart, *-lysis* loosening]
diapedesis (dye-ah-peh-DEE-sis) passage of any formed elements within blood through the vessel wall, as in movement of white cells into an area of injury and infection [*dia-* apart or through, *-pedesis* oozing]
diaphragm (DYE-ah-fram) the flat muscular sheet that separates the thorax and abdomen; a major muscle of respiration [*dia-* across, *-phrag-* enclose]
diaphysis (dye-AF-i-sis) shaft of a long bone [*dia-* through or apart, *-physis* growth] *pl.*, diaphyses
diarrhea (dye-ah-REE-ah) abnormally frequent defecation of liquid or semi-liquid feces [*dia-* through, *-rrhea* flow]
diarthrosis (dye-ar-THROH-sis) freely movable joint [*dia-* between, *-arthr-* joint, *-osis* condition] *pl.*, diarthroses
diastasis (dye-ASS-tah-sis) reduced ventricular filling of the heart [*diastasis-* separation]
diastole (dye-ASS-toh-lee) relaxation of the heart (especially the ventricles), during which it fills with blood; opposite of systole [*dia-* through, *-stole* contraction]
diastolic blood pressure (dye-ah-STOL-ik) blood pressure in arteries during diastole (relaxation) of the heart; clinically more important than systolic pressure [*dia-* apart or through, *-stol-* contraction, *-ic* relating to]
diencephalon (dye-en-SEF-ah-lon) "between" brain; parts of the brain between the cerebral hemispheres and the mesencephalon, or midbrain [*di-* between, *-en-* within, *-cephalon* head] *pl.*, diencephala or diencephalons
differential white blood cell count (dif-er-EN-shal) percentage enumeration of the different types of leukocytes in a stained blood smear [*different-* difference, *cell-* storeroom]
differentiate (dif-er-EN-shee-ayt) act of *differentiation*, the process of the development of diverse types of cells with specialized structures and functions [*different-* difference, *-iate* act of]
differentiation (dif-er-EN-shee-AY-shun) *see* **differentiate** [*different-* difference, *-ation* process]
diffusion (dih-FYOO-shun) spreading; natural tendency of small particles to spread out evenly within any given space; for example, scattering of dissolved particles [*diffus-*spread out, *-sion* process]
digestion (dye-JES-chun) breakdown of food materials either mechanically (through chewing) or chemically (via digestive enzymes) [*digest-* break down, *-tion* process]
digestive system (dye-JES-tiv) system composed of mouth, pharynx, esophagus, stomach, small intestine, large intestine, rectum, and anal canal
digitalis (dij-i-TAL-is) *see* **digoxin** [*digit-* finger, *-alis* relating to (from finger-shaped flowers of foxglove plant)]
digoxin (di-JOK-sin) drug used to treat atrial fibrillation [*dig-* finger (from digitalis or foxglove), *-oxin* poison or toxin]
diploe (DIP-lo-EE) region of cancellous (spongy) bone within the wall of a flat bone of the cranium; also spelled *diploë* [*diploe* folded over (doubled)]
diploid number (DIP-loyd) normal number of chromosomes per somatic cell (46 in humans) [*diplo-* twofold, *-oid* of or like]
diplopia (di-PLOH-pee-ah) double vision [*di-*double, *-op-* vision, *-ia* condition]
dislocation (dis-low-KAY-shun) condition in which the articular surfaces of bones forming a joint are no longer in proper contact [*dis-* apart, *-locat-* to place, *-tion* process]
displaced fracture *see* **compound fracture** [*displace-* to remove, *fracture-* a breaking]
dissection (di-SEK-shun) cutting technique used to separate body parts for study [*dissect-* to cut apart, *-tion* process]
dissociate (di-SOH-see-ayt) when a compound breaks apart in solution forming ions that are surrounded by solvent molecules [*dis-* apart, *-socia-* unite, *-ate* action]
distal (DIS-tal) toward the end of a structure; opposite of proximal [*dist-* distance, *-al* relating to]
distal convoluted tubule (DCT) (DIS-tall KON-vo-LOO-ted TOO-byool) in the kidney, the part of the tubule distal to the ascending limb of the Henle loop that terminates in a collecting duct; main portion of *distal tubule* [*dist-* distance, *-al* relating to, *con-* together, *-volut-* roll, *tub-* tube, *-ul-* little]
distal interphalangeal (DIP) (DIS-tal in-ter-fah-LAN-gee-al) joint between the middle and distal phalanges [*dist-* distance, *-al* relating to, *inter-* between, *-phalang-* finger bones (ref. from rows of soldiers), *-al* relating to]
distal tubule (DIS-tall TOO-byool) *see* **distal convoluted tubule** [*dist-* distance, *-al* relating to, *tub-* tube, *-ul-* little]
disuse atrophy (DIS-yoos AT-roh-fee) loss of muscle tissue mass after a period of few or no contractions, resulting in weakness [*dis-* absence of, *a-* without, *-troph* nourishment]
diuretic (dye-yoo-RET-ik) substance that promotes or stimulates the production of urine [*dia-* through, *-ure-* urine, *-ic* relating to]
divergence (dye-VER-jens) when a single presynaptic axon synapses with more than one different postsynaptic neuron [*di-* to separate, *-verg-* incline, *-ence* state]
diverticulitis (dye-ver-tik-yoo-LYE-tis) inflammation of diverticula (abnormal outpouchings) of the large intestine, possibly causing constipation [*diverticul-* turn aside, *-itis* inflammation]
diverticulosis (dye-ver-tik-yoo-LOH-sis) condition resulting in the presence of abnormal saclike outpouchings of the intestinal wall [*diverticul-* turn aside, *-osis* condition]
diving reflex (DYE-ving REE-fleks) protective physiological response of the body to cold water immersion [*re-* back or again, *-flex* bend]
DNA fingerprinting technique used to analyze the genetic makeup of individuals; compares nucleotide sequences using electrophoresis [*fingraz-* finger]
dominant (DOM-i-nant) in genetics, term referring to genes that have effects that appear in the offspring (dominant forms of a gene are often represented by upper case letters); *see* **recessive** [*dominant-* to rule]
dopamine (DOH-pah-meen) chemical neurotransmitter
domain (doh-mayn) a specific three-dimensional region within a tertiary protein that acts as a functional unit [*doma-* house or estate]
dominant gene (DOM-i-nant jeen) gene whose effects are seen; capable of masking

the effects of a recessive gene for the same trait [*dominant-* to rule, *gene-* to produce]

dopaminergic (doh-pah-min-ER-jik) relating to a neuron that releases dopamine (neurotransmitter) or to a receptor molecule that is activated by dopamine [*dopa-* amino acid, *-amine* ammonia, *-ic* relating to]

Doppler ultrasonography (ul-trah-son-OG-rah-fee) diagnostic study that uses sound or frequency ultrasound to record the direction of blood flow through the heart [*Christian Doppler* Australian physicist/mathematician, *ultra-* beyond, *-sono-* sound, *-graph-* draw, *-y* process]

dorsal (DOR-sal) pertaining to the back; in a direction toward the back of the body; see **posterior**[*dors-* back, *-al* relating to]

dorsal (posterior) nerve root (DOR-sal) bundle of nerve fibers that carry sensory information into the spinal cord [*dors-* back, *-al* relating to]

dorsal cavities (DOR-sal KAV-ih-teez) body cavities on the dorsal side of the body, which include the cranial cavity and the spinal cavity; not a standard anatomical term, but used here to help organize the body for the beginning student [*dors* back, *-al* relating to, *cav-* hollow, *-ity* state]

dorsal ramus (DOR-sal RAY-mus) branch of spinal nerve that supplies somatic motor and sensory fibers to several smaller nerves [*dors-* the back, *-al* relating to, *ramus* branch] *pl.*, rami

dorsal root (DOR-sal) posterior branch of the attachment of a spinal nerve to the spinal cord [*dors-* the back, *-al* relating to]

dorsal root ganglion (DOR-sal root GANG-glee-on) small region of gray matter in dorsal nerve root made up of cell bodies of unipolar sensory neurons [*dors-* the back, *-al* relating to, *ganglion-* knot]

dorsiflexion (dor-si-FLEK-shun) ankle movement in which the top of the foot is elevated (brought toward the front of the leg) with toes pointing upward [*dorsi-* back, *-flex-* bend, *-ion* process]

double bond covalent chemical bond in which two pairs of electrons are shared [*double-* two, *bond-* to bind]

Down syndrome (SIN-drohm) group of symptoms usually caused by trisomy of chromosome 21; characterized by mental retardation and multiple structural defects, including facial, skeletal, and cardiovascular abnormalities [*John L. Down* English physician, *syn-* together, *-drome* running or (race) course]

down-regulation process in which hormone receptors in a target cell are reduced in number by some stimulus [*regula-* rule, *-tion* process]

Duchenne muscular dystrophy (DMD) (doo-SHEN MUSS-kyoo-lar DISS-troh-fee) common form of muscular dystrophy also called *pseudohypertrophy* (meaning "false muscle growth") because the atrophy of muscle is masked by excessive replacement of muscle by fat and fibrous tissue; characterized by mild leg muscle weakness that progresses rapidly to include the shoulder muscles; caused by mutated gene for dystrophin (needed to hold muscle fiber together during contraction) on the X chromosome, thus making DMD more common in boys than girls [*Duchenne* Guillaume B.A. Duchenne de Boulogne, French neurologist, *muscul-* little mouse (muscle), *-ar* relating to, *dys-* bad, *-troph-* nourishment, *-y* state]

ductus arteriosus (DA) (DUK-tus ar-teer-ee-OH-sus) in the developing fetus, this arterial duct connects the aorta and the pulmonary artery, allowing most blood to bypass the fetus' developing lungs [*ductus* duct, *arteri-*vessel, *-osus* relating to]

ductus deferens (DUK-tus DEF-er-enz) vas deferens [*ductus-* duct, *deferens-* carrying away]

ductus venosus (DUK-tus veh-NO-sus) continuation of the umbilical vein that shunts blood returning from the placenta past the fetus' developing liver directly into the inferior vena cava [*ductus* duct, *ven-* vein, *-osus* relating to]

duodenum (doo-oh-DEE-num) first subdivision of the small intestine; where most chemical digestion occurs [*duodeni-* 12 fingers, shortened from *intestinum duodenum digitorum* intestine of 12 finger-widths] *pl.*, duodena or duodenums

dura mater (DOO-rah MAH-ter) literally "strong" or "hard mother"; outermost layer of the meninges [*durus-* hard, *mater-* mother]

dural sinus (DOO-ral SYE-nus) name for a large vein of cranial cavity [*durus-* hard, *-al* pertaining to, *sinus-* hollow]

dwarfism (DWARF-iz-em) condition of abnormally small stature, sometimes resulting from hyposecretion of growth hormone [*dweraz-* tiny, *-ism* condition]

dynamic equilibrium (dye-NAM-ik ee-kwi-LIB-ree-um) maintaining balance when the head or body is rotated or suddenly moved [*dynam-* power, *-ic* relating to, *equi-* equal, *-libr-* balance]

dynamic tension (dye-NAM-ik TEN-shun) another name for isotonic contraction [*dynam-* power, *-ic* relating to, *tendere-* to stretch]

dysfunctional uterine bleeding (DUB) (dis-FUNK-shun-al YOO-ter-in) irregular or excessive uterine bleeding; results from structural problem or hormonal imbalance [*dys-* difficult, *-function-* performance, *-al* relating to, *uter-* womb, *-ine* relating to]

dysmenorrhea (dis-men-oh-REE-ah) menstrual cramps [*dys-* painful, *-men-* month, *-rhea* flow]

dysplasia (diss-PLAY-zha) abnormal changes in size, shape, and organization of cells in a tissue associated with neoplasms (tumors) [*dys-* disordered, *-plasia* to mold]

dyspnea (DISP-nee-ah) difficult or labored breathing [*dys-* painful, *-pne-* breathe, *-a* condition]

dysrhythmia (dis-RITH-mee-ah) abnormal heart rhythm; also called **arrhythmia** [*dys-* disordered, *-rhythm-*rhythm, *-ia* condition]

dystrophin (DIS-trof-in) protein molecule that forms strands in each skeletal muscle fiber and helps to hold the cytoskeleton to the sarcolemma to keep the muscle fiber from breaking during contractions; normal dystrophin is missing in Duchenne muscular dystrophy (DMD) and related conditions and thus cells break apart more easily, causing the symptoms of DMD [*dys-* bad, *-troph-* nourishment, *-in* substance]

dysuria (dis-YOO-ree-ah) painful urination

E

eardrum *see* **tympanic membrane** [*eare-* ear]

eccentric contraction (ek-SENT-rik kon-TRAK-shun) type of isotonic muscle contraction in which muscle lengthens while it is contracting [*ec-* out of, *-centr-* center, *-ic* relating to, *con-* together, *-tract-* drag or draw, *-tion* process]

eccrine sweat gland (EK-rin) water-producing exocrine sweat glands widely dispersed throughout the skin [*ec-* out, *-crin-* secrete, *gland* acorn]

echocardiography (ek-oh-kar-dee-OG-rah-fee) diagnostic technique that uses ultrasound waves that reflect off the heart to produce images of heart function [*echo-* reflect sound, *-cardi-* heart, *-graph-* draw, *-y* activity]

eclampsia (eh-KLAMP-see-ah) potentially fatal condition associated with toxemia of pregnancy; characterized by convulsions and coma [*ec-* out, *-lamp-* shine forth, *-sia* condition]

ectoderm (EK-toh-derm) outermost of the primary germ layers that develops early in the first trimester of pregnancy; gives rise to the skin and the nervous system [*ecto-* outside, *-derm* skin]

ectomorph (EK-toh-morf) thin, lean body type [*ecto-* outside, *-morph* form]

ectopic pacemaker (ek-TOP-ik PAYS-mayk-er) pacemaker other than the SA node [*ec-* out of, *-top-* place, *-ic* relating to]

ectopic pregnancy (ek-TOP-ik) pregnancy in which the fertilized ovum develops in some place other than in the uterus [*ec-* out of, *-top-* place, *-ic* relating to]

eczema (EK-zeh-mah) inflammatory skin condition associated with various diseases and characterized by erythema, papules, vesicles, and crusts [*eczema* to boil over]

edema (eh-DEE-mah) accumulation of fluid in a tissue, as in inflammation; swelling [*edema* a swelling]

Edmonton protocol (ED-mon-ton PRO-toh-kol) islet cell transplant technique used in the treatment of type 1 diabetes [*Edmonton* city in Canada]

effector B cell (ef-FEK-tor) cell that differentiates from a B cell; synthesizes and secretes huge amounts of antibodies [*effect-* accomplish, *-or* agent, *B* bursa-equivalent tissue, *cell* storeroom]

effector cell (ef-FEK-tor) type of lymphocyte that attacks antigens [*effect-* accomplish, *-or* agent, *cell* storeroom]

effector (ef-FEK-tor) organ, gland, or muscle that responds to a nerve stimulus [*effect-* accomplish, *-or* agent]

effector T cell (ef-FEK-tor) cell that differentiates from a T cell; cause contact killing of a target cell [*effect-* accomplish, *-or* agent, *T* thymus gland, *cell* storeroom]

efferent (motor) neuron (EF-fer-ent NOO-ron) nerve cell that transmits impulses away from the central nervous system to or toward muscles or glands [*e-* away, *-fer-* carry, *-ent* relating to]

efferent division (EF-fer-ent di-VI-shun) the motor division (outgoing pathways) of the nervous system [*e-* away, *-fer-* carry, *-ent* relating to]

efferent ductule (EF-fer-ent DUKT-yool) series of sperm ducts that drain the rete testis and pierce the tunica albuginea [*e-* away, *-fer* carry, *ducere-* to lead, *-ule* small one]

efferent nervous system (EF-fer-ent) subdivision of the peripheral nervous system (PNS) that consists of all outgoing motor nerves [*e-* away, *-fer-* carry, *-ent* relating to, *nerv-* nerve, *-ous* relating to]

efferent neuron (EF-fer-ent NOO-ron) neuron that transmits nerve impulses away from the central nervous system to muscles or glands (effectors) [*e-* away, *-fer-* carry, *-ent* relating to, *neuron-* nerve]

Einthoven's triangle (EYN-to-venz) three-angle view of the heart's electrical activity [*Willem Einthoven* Dutch physiologist]

ejaculation (ee-jak-yoo-LAY-shun) sudden discharging of semen from the body [*e-* out or away, *-jacula-* throw, *-ation* process]

ejaculatory duct (ee-JAK-yoo-lah-toh-ree) duct formed by the joining of the ductus deferens and the duct from the seminal vesicle that allows sperm to enter the urethra [*e-* out or away, *-jacula* throw, *-ory* relating to, *ducere-*to lead]

ejection fraction (EF) (ee-JEK-shun) ratio of stroke volume (SV) of the heart to the end-diastolic volume (EDV); expressed as a percentage: EF = (SV/EDV) × 100; the EF refers to the ejection fraction of the left ventricle, unless specified otherwise, and decreases below 55% as the myocardium fails to contract normally—thus making EF an indicator of heart failure [*eject-* to cast out, *-tion* process, *fract-* a breaking, *-tion* process]

elastic artery (eh-LAS-tik AR-ter-ee) largest artery; includes aorta and some of its branches [*elast-* to drive or beat out, *-ic* relating to, *arteri-* vessel]

elastic cartilage (eh-LAS-tik KAR-ti-lij) cartilage with elastic, as well as collagenous, fibers; provides elasticity and firmness, as in, for example, the cartilage of the external ear [*elast-* drive or beat out, *-ic* relating to, *cartilag* cartilage]

elastic dense fibrous tissue form of dense (regular) fibrous tissue that contains mostly elastic fibers [*elast-* to drive or beat out, *-ic* relating to, *dense* thick, *fibr* fiber, *tissu-* fabric]

elastic filament in muscle fibers, microscopic protein filaments composed of *titin (connectin)* that anchor the ends of the thick filaments to the Z disk and give myofibrils their characteristic elasticity [*elas-* drive or beat out, *-ic* relating to, *fila-* thread, *-ment* thing]

elastic recoil tendency of the thorax and lungs to return to their preinspiration volume [*elast-* drive or propel, *-ic* relating to]

elastin (e-LAS-tin) protein found in elastic fiber [*elast-* to drive or beat out, *-in* substance]

electrocardiogram (ECG or EKG) (eh-lek-troh-KAR-dee-oh-gram) graphic record of the heart's action potentials [*electro-* electricity, *-cardio-* heart, *-gram* drawing]

electrocardiograph (eh-lek-troh-KAR-dee-oh-graf) machine that produces electrocardiograms [*electro-* electricity, *-cardio-* heart, *-graph* draw]

electrocardiography (eh-lek-troh-kar-dee-OG-rah-fee) process or technology that produces electrocardiograms [*electro-* electricity, *-cardio-* heart, *-graph-* draw, *-y* process]

electroencephalogram (EEG) (eh-lek-troh-en-SEF-ah-loh-gram) graphic representation of voltage changes in brain tissue used to evaluate nerve tissue function [*electro-*electricity, *-en-* within, *-cephal-* head, *-gram* drawing]

electroencephalography (eh-lek-troh-en-SEF-ah-log- rah-fee) diagnostic study that measures electrical activity produced by the brain [*electro-* electricity, *-en-* inside, *-cephal-* head, *-graph-* draw, *-y* activity]

electrolyte (eh-LEK-troh-lyte) substance that dissociates into ions in solution, rendering the solution capable of conducting an electric current [*electro-* electricity, *-lyt-* loosening]

electromyography (eh-lek-troh-my-OG-rah-fee) process or technology that records electrical impulses from muscles as they contract [*electro-* electricity, *-myo* muscle, *-graph* draw, *-y* activity]

electron (eh-LEK-tron) small, negatively charged subatomic particle [*electr-* electric, *-on* unit]

electron microscopy (EM) (eh-LEK-tron my-KRAH-skah-pee) technique of observing small structures by either passing a beam of electrons through a specimen (transmission electron microscopy, TEM) or reflecting a beam of electrons off a specimen (scanning electron microscopy, SEM) and focusing the resulting electron beam(s) to form a magnified image of the specimen [*electr-* electric, *-on* unit, *micro-* small, *-scop-* see, *-y* activity]

electron transport system (ETS) (eh-LEK-tron) carrier molecules embedded in the inner membrane of the mitochondria that take high-energy electrons from the citric acid cycle and form water and energy for oxidative phosphorylation; also called *electron transport chain (ETC)* [*electro-* electricity, *-on* subatomic particle, *trans-* across, *-port* carry]

electrophoresis (eh-lek-troh-foh-REE-sis) laboratory procedure in which different types of charged molecules are separated according to molecular weight using a weak electric current [*electro-* electricity, *-phoresis* a movement in a (specified) manner]

eleidin (eh-LEE-din) substance found in the dying cells of the stratum lucidum; transforms to keratin [*elei-* olive tree, *-in* substance]

element substance composed of only one type of atom that cannot be broken into simpler constituents by chemical means [*element* first principle]

elephantiasis (el-eh-fan-TYE-ah-sis) extreme lymphedema (swelling resulting from lymphatic blockage) in the limbs caused by a parasitic worm infestation; so called because the limbs swell to "elephantine proportions" [*elephant-* elephant, *-iasis* condition]

elevation (el-eh-VAY-shun) action that moves a part up [*e(x)-* up, *-lev-* raise, *-at-* perform, *-tion* process]

elimination defecation [*e-* out, *-limen-* threshold, *-ation* process]

embolism (EM-boh-liz-em) condition that results from a moving blood clot circulating in the bloodstream [*embol-* plug, *-ism* condition]

embolus (EM-boh-lus) a moving blood clot circulating in the bloodstream [*embolus* plug]

embryo (EM-bree-oh) animal in early stages of intrauterine development; in humans, the embryonic stage is the first 8 weeks after conception [*em-* in, *-bryo* fill to bursting]

embryology (em-bree-OL-oh-gee) study of the development of an individual from conception to birth [*em-* in, *-bryo-* fill to bursting, *-log-* words (study of), *-y* activity]

embryonic disk (em-bree-ON-ik) cells of the early embryo that differentiate into the three primary germ layers [*em-* in, *bryo* fill to bursting, *-ic* relating to]

embryonic stem cell (em-bree-ON-ik) nondifferentiated cells found in the embryo [*em-* in, *-bryo-* fill to bursting, *-ic* relating to]

emesis (EM-eh-sis) vomiting [*emesis* to vomit]

emission (ee-MISH-un) reflex movement of spermatozoa and secretions from genital ducts and accessory glands into prostatic urethra; precedes ejaculation [*e-* out or away, *-mis-* send, *-sion* process]

emmetropic (em-eh-TROHP-ik) relaxed normal eye [*emmetr-* the correct measure, *-opic* relating to a specific visual condition]

emphysema (em-fi-SEE-mah) abnormal condition characterized by trapping of air in alveoli of the lung that causes them to rupture and fuse to other alveoli; see also **chronic obstructive pulmonary disease** [*em-*in, *-physema* blowing or puffing up]

emulsified (ee-MULL-seh-fyde) dispersed fat molecules formed into tiny droplets before they can be digested [*e-* out, *-muls-* milk, *-i-* combining form, *-fy* process]

end-artery (end-AR-ter-ee) artery that diverges into a capillary [*-arteri-* vessel]

end-diastolic volume (EDV) (end-dye-ASS-toh-lik) the amount of blood in the heart at the end of diastole [*dia-* through, *-stol-* contraction, *-ic* relating to, *volume-* paper roll]

endemic (en-DEM-ik) refers to a disease native to a local region of the world [*en-* in, *-dem-* people, *-ic* relating to]

endocardium (en-doh-KAR-dee-um) thin layer of very smooth tissue lining each chamber of the heart [*endo-* within, *-cardi-* heart, *-um* thing]

endochondral ossification (en-doh-KON-dral os-i-fi-KAY-shun) process by which bones are formed by replacement of cartilage models [*endo-* inward or within, *-chondr-* cartilage, *-al* relating to, *oss-* bone, *-fication* to make]

endocrine (EN-doh-krin) secreting into blood or tissue fluid rather than into a duct; opposite of exocrine [*endo-* within, *-crin-* secrete]

endocrine cell (EN-doh-krin) glandular secretory cells located in the pancreas; found in pancreatic islets [*endo-* within, *-crin-* secrete, *cell* storeroom]

endocrine gland (EN-doh-krin) secretory structure that discharges hormones directly into the blood [*endo-* inward or within, *-crin-* secrete, *gland* acorn]

endocrine hormone (EN-doh-krin HOR-mohn) substance secreted by an endocrine gland into the bloodstream that acts on a specific target tissue to produce a given response [*endo-* inward or within, *-crin-* secrete *hormon-* excite]

endocrine reflex (EN-doh-krin) response that results from feedback loops within the endocrine system [*endo-* within, *-crin-* secrete, *re-* again, *-flex* bend]

endocrine system (EN-doh-krin) system composed of glands that secrete chemicals known as *hormones* directly into the blood [*endo-* inward or within, *-crin-* secrete]

endocrinology (en-doh-krin-OL-oh-jee) study of the endocrine glands and their hormones [*endo-* within, *-crin-* secrete, *re-again*, *-ology* study of]

endocytosis (en-doh-sye-TOH-sis) process that allows extracellular material to enter the cell without actually passing through the plasma membrane [*endo-* inward or within, *-cyto-* cell, *-osis* condition]

endoderm (EN-doh-derm) innermost layer of the primary germ layers that develops early in the first trimester of pregnancy; gives rise to digestive and urinary structures, as well as many other glands and organ parts [*endo-* within, *-derm* skin]

endogenous growth (en-DOJ-en-us) *see* **interstitial growth** [*endo-* within, *-genous* to originate from]

endolymph (EN-doh-limf) clear potassium-rich fluid that fills the membranous labyrinth of the inner ear [*endo-* within, *-lymph* water]

endometrial ablation (en-doh-MEE-tree-al ab-LAY-shun) minimally invasive technique used to destroy the endometrial lining and reduce excessive blood loss among women suffering from dysfunctional uterine bleeding [*endo-* within, *-metr-* womb, *-al* relating to, *ab-* away from, *-lat-* carry, *-tion* process]

endometrial cancer (en-doh-MEE-tree-al) cancer of the endometrium [*endo-* within, *-metr-* womb, *-al* relating to, *cancer* crab or malignant tumor]

endometriosis (en-doh-mee-tree-OH-sis) benign condition that affects the female reproductive tract ; characterized by functioning endometrial tissue outside the uterus [*endo-* within, *-metr-* womb, *-osis* condition]

endometrium (en-doh-MEE-tree-um) mucous membrane lining the uterus [*endo-* within, *-metr-* womb, *-um* thing] *pl.*, endometria

endomorph (EN-doh-morf) body type characterized by excessive fat [*endo-* within, *-morph* shape]

endomysium (en-doh-MEE-see-um) delicate connective tissue membrane covering the skeletal muscle fibers in a skeletal muscle organ [*endo-* within, *-mysium* muscle]

endoneurium (en-doh-NOO-ree-um) thin wrapping of fibrous connective tissue that surrounds each axon in a nerve [*endo-* inward, *-neuri-* nerve, *-um* thing] *pl.*, endoneuria

endoplasm (en-doh-PLAZ-im) material within a cell [*endo-* within, *-plasm* cell or tissue substance]

endoplasmic reticulum (ER) (en-doh-PLAZ-mik reh-TIK-yoo-lum) network of tubules and vesicles in cytoplasm that contributes to cellular protein manufacture (via attached ribosomes) and distribution [*endo-* inward or within, *-plasm-* to mold, *-ic* relating to, *ret-* net, *-ic-* relating to, *-ul-* little, *-um* thing] *pl.*, endoplasmic reticula

endorphin (en-DOR-fin) chemical in central nervous system that influences pain perception; a natural painkiller [*endo-* within, *-morphin* shape]

endoscopic cholangiography (en-doh-SKOP-ik koh-lan-jee-OG-rah-fee) procedure that uses x-rays to visualize the gallbladder and ducts that carry bile [*endo-* within, *-scop-* see, *chol-* bile, *angi-* vessel, *-graph-* draw, *-y* process]

endosteum (en-DOS-tee-um) fibrous membrane that lines the medullary cavity of long bones [*end-* within, *-osteum* bone]

endothelium (en-doh-THEE-lee-um) squamous epithelial cells that line the inner surface of the entire circulatory system and the vessels of the lymphatic system [*endo-* within, *-theli-* nipple, *-um* thing]

endotracheal intubation (en-doh-TRAY-kee-al in-too-BAY-shun) placing a tube in the trachea to ensure an open airway [*endo-* within, *-trache-* rough duct, *-al* relating to, *in-* within, *-tub-* tube, *-ation* process]

end-product inhibition (end-PROD-ukt inhib-ISH-un) process in a biochemical pathway in which the chemical product at the end of the pathway (the end product) becomes an allosteric effector, inhibiting the function of one or more enzymes in the pathway and thus inhibiting further production of the end product [*endo-* within, *producere-* bring forth, *inhibere-* restrain]

endurance training continuous vigorous exercise requiring the body to increase its consumption of oxygen and develop the muscles' ability to sustain activity over a prolonged period [*en-* in, *-durere* harden, *trahere-* to draw]

energy level limited region surrounding the nucleus of an atom at a certain distance containing electrons; also called a *shell* [*en-* in, *-erg-* work, *-y* state]

enkephalin (en-KEF-ah-lin) peptide chemical in the central nervous system that acts as a natural painkiller [*enkepalos-* brain, *-in* substance]

enteric nervous system (ENS) (en-TER-ik) complex arrangement of neurons that are interconnected with the central nervous system and with various divisions of the autonomic nervous system; for example, gastrointestinal muscles and mucous membranes [*enter-* intestine, *-ic* relating to]

enterogastric reflex (en-ter-oh-GAS-trik) nervous reflex causing inhibition of gastric peristalsis in response to the presence of acid and distention of duodenal mucosa; also may inhibit gastric secretion [*entero-* intestine, *-gastr-* stomach, *-ic* relating to, *re-* back or again, *-flex* bend]

enterogastrone (en-ter-oh-GAS-trown) hormone involved with decreasing gastric peristalsis [*entero-* intestine, *-gastr-* stomach]

enterokinase (en-ter-oh-KYE-nays) enzyme that activates trypsin in the intestinal lumen [*entero-* intestine, *-kin-* movement, *-ase* enzyme]

enzyme (EN-zyme) biochemical catalyst that allows chemical reactions to take place; functional proteins that regulate various metabolic pathways of the body [*en-* in, *-zyme* ferment]

eosinophil (ee-oh-SIN-oh-fil) white blood cell, readily stained by eosin (a reddish acid dye), that attacks large parasites and produces some allergic responses [*eosin-* reddish color, *-phil* love]

ependymal cell (eh-PEN-di-mal) cells that line the ventricles of the brain and the central canal of the spinal cord [*ep-* over, *-en-* on, *-dyma-* put, *-al* relating to, *cell* storeroom]

ependymoma (eh-pen-di-MOH-mah) tumor of glial cells called *ependyma* that line fluid spaces of the central nervous system [*ep-* over, *-en-* on, *-dyma-* put, *-oma* tumor]

epicardium (ep-i-KAR-dee-um) inner layer of the pericardium that covers the surface of the heart; it is also called the *visceral pericardium* [*epi-* on or upon, *-cardi-* heart, *-um* thing]

epidemic (ep-i-DEM-ik) refers to a disease that occurs in many individuals at the same time [*epi-* upon, *-dem-* people, *-ic* relating to]

epidemiology (EP-i-dee-mee-OL-o-jee) study of the occurrence, distribution, and transmission of diseases in human populations [*epi-* upon, *-dem-* people, *-o-* combining form, *-log-* words (study of), *-y* activity]

epidermis (ep-i-DER-mis) outermost layer of the skin; sometimes called the "false" skin [*epi-* on or upon, *-dermis* skin]

epididymis (ep-i-DID-i-miss) one of a pair of tightly, coiled male reproductive tubes that carry sperm to the vas deferens [*epi-* upon, *-didymis* pair] *pl.*, epididymes

epidural space (ep-i-DOO-ral) in the brain, the space above the dura mater [*epi-* upon, *-dura-* hard, *-al* relating to]

epigenetics (ep-i-jeh-NET-iks) any process of inheritance other than direct DNA inheritance, sometimes by adding a methyl group (or other chemical) to DNA, as in maternal/paternal imprinting of genes [*epi-* upon, *gen-* produce, *-ic* relating to]

epiglottis (ep-i-GLOT-iss) lidlike cartilage overhanging the entrance to the larynx [*epi-* upon, *-glottis* tongue] *pl.*, epiglottides or epiglottises

epiglottitis (EPP-ih-glaw-tye-tiss) form of laryngeal edema [*epi-* upon, *-glotti-* tongue (glottis), *-itis* inflammation]

epilepsy (EP-i-lep-see) chronic seizure disorder [*epilepsy-* seizure]

epimysium (ep-i-MIS-ee-um) coarse sheet of connective tissue that covers a muscle as a whole [*epi-* upon, *-mysium* muscle]

epinephrine (ep-i-NEF-rin) adrenaline; hormone secreted by the adrenal medulla [*epi-* upon; *-nephr-* kidney, *-ine* substance]

epineurium (ep-i-NOO-ree-um) fibrous coat surrounding a bundle of nerve fibers [tough fibrous sheath that covers the whole nerve [*epi-* upon, *-neuri-* nerve, *-um* thing] *pl.*, epineuria

epiphyseal fracture (ep-i-FEEZ-ee-al) when the epiphyseal plate is separated from the epiphysis or diaphysis; this type of fracture can disrupt normal growth of the bone [*epi-* on, *-phys-*growth, *-al* relating to, *fracture* to break]

epiphyseal plate (ep-i-FEEZ-ee-al) cartilage plate that is between the epiphysis and the diaphysis and allows growth to occur; sometimes referred to as a *growth plate* [*epi-* on, *-phys-* growth, *-al* relating to, *plate* flat]

epiphysis (eh-PIF-i-sis) end of a long bone; also, the pineal body of the brain [*epi-* on, *-physis* growth] *pl.*, epiphyses

episiotomy (eh-piz-ee-OT-oh-mee) surgical procedure used during birth to prevent a laceration of the mother's perineum or the vagina [*episi-* vulva, *-tom-* cut, *-y* action]

epispadias (ep-is-PAY-dee-us) congenital defect that involves the opening of the urethral meatus on the dorsal surface of the glans or penile shaft [*epi-* on or above, *-spad-* rip or split]

epistaxis (ep-i-STAK-sis) clinical term referring to a bloody nose [*epi-* upon, *-staxis* drip]

epithalamus (ep-i-THAL-ah-mus) small nuclei located outside the thalamus and hypothalamus; considered to be one of the structures of the diencephalon [*epi-* upon, *-thalamus* inner chamber] *pl.*, epithalami

epithelial membrane (ep-i-THEE-lee-al) membrane composed of epithelial tissue with an underlying layer of connective tissue [*epi-* on or upon, *-theli* nipple, *-al* relating to, *membrane* thin skin]

epithelial support cell (ep-i-THEE-lee-al) one of the types of cells that makes up the olfactory epithelium [*epi-* upon, *-theli* nipple, *-al* relating to]

epithelial tissue (ep-i-THEE-lee-al) tissue type that covers the body and its parts; lines various parts of the body; forms continuous sheets that contain no blood vessels; classified according to shape and arrangement [*epi-* on or upon, *-theli-* nipple, *-al* relating to, *tissu-* fabric]

epithelium (ep-i-THEE-lee-um) epithelial tissue [*epi-* on or upon, *theli-* nipple, *-um* thing] *pl.*, epithelia

epitope (EP-i-tohp) specific portion of an antigen that elicits an immune response [*epi-* on or upon, *-tope* place]

eponym (EP-o-nim) scientific term based on a person's name, such as *Islets of Langerhans* (equivalent to *pancreatic islets*); eponyms are avoided in modern usage [*epo-* above, *-nym* name]

epsilon cell (EP-sih-lon) type of endocrine cell found in the pancreatic islet and which secretes the hormone ghrelin [*epsilon* (ε) fifth letter of Greek alphabet, *cell* storeroom]

equatorial plate (eh-kwah-TOH-ree-al) plane at the "equator" of a cell during metaphase where the chromosomes align [*equate-* to make equal, *-al* relating to, *plat-* flat dish]

equilibration (eh-kwi-li-BRAY-shun) process of achieving equilibrium, a balance between opposing elements [*equilibr-* equal, *-tion* process]

equilibrium (e-kwi-LIB-ree-um) a balance between opposing elements [*equi-* equal, *-libr-*balance] *pl.*, equilibria [*equilibr-* equal, *-um* state]

erectile dysfunction (ED) (eh-REK-tyle) failure to achieve an erection of the penis adequate enough to permit sexual intercourse [*erect-* set up, *-ile* relating to, *dys-* bad or painful, *-func-*perform, *-tion* process]

erection (eh-REK-shun) condition of erectile tissue when filled with blood; often refers to enlargement of the penis during sexual arousal [*erect-* set up, *-tion* process]

erector spinae muscle (eh-REK-tor SPINE-ee) muscle group in the back consisting of a number of long, thin muscles that travel all the way down the back; the muscles extend (straighten or pull back) the vertebral column and rotate and flex the back laterally [*erector* that which makes rigid or upright, *spinae* of the spine, *mus-* mouse, *-cle* little]

erosive esophagitis (eh-ROH-siv eh-SOF-ah-jye-tis) narrowing or chronic inflammation of the esophagus [*es-* will carry, *-phag-* food (eat), *-itis* inflammation]

erythema (er-i-THEE-mah) reddening of the skin [*erythros-* red]

erythroblastosis fetalis (eh-rith-roh-blas-TOH-sis feh-TAL-is) condition of a fetus or infant caused by the mother's Rh antibodies reacting with the baby's Rh-positive red blood cells, characterized by massive agglutination of the blood and resulting in life-threatening circulatory problems for the infant [*erythro-*red, *-blast-* bud, *-osis* condition]

erythrocyte (eh-RITH-roh-syte) red blood cell [*erythro-* red, *-cyte* cell]

erythrocyte sedimentation rate (ESR) (eh-RITH-roh-syte sed-i-men-TAY-shen) the rate at which formed elements settle in a tube in 1 hour [*erythro-* red, *-cyte* cell]

erythropoiesis (eh-rith-roh-poy-EE-sis) process of red blood cell formation [*erythro-*red, *-poiesis* making]

erythropoietin (eh-RITH-roh-POY-eh-tin) glycoprotein secreted to increase red blood cell production in response to oxygen deficiency [*erythro-* red, *-poiet-* make, *-in* substance]

esophageal endoscope (eh-sof-ah-JEE-ul EN-doh-skohp) flexible tube used to insert and then remove the necessary electrode or suturing device required for treatment of gastroesophageal reflux disease [*es-* will carry, *-phag-* food (eat), *-al* relating to, *endo-* within, *-scop-* see]

esophageal vein (eh-sof-ah-JEE-al) small vein that returns blood from thoracic organs to the superior vena cava or azgos vein [*es-* will carry, *-phag-* food (eat), *-al* relating to]

esophagus (eh-SOF-ah-gus) muscular, mucus-lined tube that connects the pharynx with the stomach; also known as the *food pipe* [*es-*will carry, *-phagus* food] *pl.*, esophagi

essential fatty acid unsaturated fatty acid that must be provided by the diet; serves as a source within the body for prostaglandin synthesis [*acid* sour]

essential hypertension (hye-per-TEN-shun) high blood pressure condition with no identifiable pathological mechanism or reason [*hyper-* excessive, *-tens-* stretch or pull tight, *-sion* state]

essential organ primary organ; organ needed for the essential functions of a system [*organ* instrument]

essential reproductive organ reproductive organ that must be present for reproduction to occur; the gonads [*re-* again, *-producere* to produce, *organ-* instrument]

estrogen (ES-troh-jen) sex hormone secreted by the ovary that causes development and maintenance of female secondary sex characteristics and stimulates growth of the epithelial cells lining the uterus [*estro-* frenzy, *-gen* produce]

estrogenic phase (es-troh-JEN-ik) menstrual cycle phase that occurs between the end of menses and ovulation; also called *postmenstrual, preovulatory phase,* or *follicular phase* [*estr-* frenzy, *-gen-* produce, *-ic* relating to]

ethmoid (ETH-moyd) irregular cranial bone that lies anterior to the sphenoid and posterior to the nasal bones [*ethmo-* sieve, *-oid* like]

etiology (e-tee-OL-o-jee) theory, or study, of the factors involved in causing a disease [*etio-* cause, *-o-* combining form, *-log-* words (study of), *-y* activity]

eumelanin (yoo-MEL-ah-nin) type of melanin pigment that is dark brown in color [*eu-*true, *-melan-* black, *-in* substance]

eupnea (YOOP-nee-ah) normal respiration [*eu-* easily, *-pne-* breathe, *-a* condition]

eustachian tube (yoo-STAY-shun) auditory tube [*Bartolomeo Eustachio* Italian anatomist, *-an* relating to]

evaporation (ee-vap-oh-RAY-shun) in anatomy and physiology, heat lost from the body by vaporization of liquid (sweat) from the skin [*e-* out from, *-vapor* steam, *-ation* process]

eversion (ee-VER-shun) movement that turns the foot outward [*e(x)-* outward, *-ver-* turn, *-sion* process]

evoked potential (EP) measurement of the electrical activity of the brain; information can be analyzed by a computer and generated on a video screen (brain electrical activity map) [*potent-* power, *-ial* relating to]

excess postexercise oxygen consumption (EPOC) *see* **oxygen debt** [*excedere-* to go out, *post-* after, *-exercere* keep busy *oxy-* presence of oxygen, *-gen* produce, *consumere-*use up, *-tion* process]

exchange reaction chemical reaction that breaks down a compound and then synthesizes a new compound by switching portions of the molecules; for example, AB +CD Æ AD+BC [*ex-* from, *-change* to change, *re-* again, *-action* action]

excitability (ek-syte-eh-BIL-i-tee) ability of a muscle to be stimulated; also known as *irritability* [*excit-* arouse, *-abil-* capable, *-ity* state]

excitation (ek-sye-TAY-shun) electrical fluctuation (increase in voltage) occurring when a neuron or muscle fiber is stimulated and additional Na^+ channels open [*excit-*arouse, *-ation* process]

excitatory neurotransmitter (ek-SYE-tah-toh-ree noo-roh-TRANS-mit-er) neurotransmitter that causes excitation (and thus depolarization) of the postsynaptic neuron [*excita-* arouse, *-ory* relating to, *neuro-*nerves, *-trans- across, -mitt-* send, *-er* agent]

excitatory postsynaptic potential (EPSP) (ek-SYE-tah-toh-ree post-si-NAP-tik poh-TEN-shal) temporary depolarization of postsynaptic membrane following stimulation [*excita-* arouse, *-ory* relating to, *post-* after, *-syn-* together, *-apt-* join, *-ic* relating to, *potent-* power, *-ial* relating to]

excretion (eks-KREE-shun) removal of waste products produced during body functions; occurs by defecation, urination, and respiration and through the skin [*excret-* separate, *-tion* process]

exocrine (EKS-oh-krin) secreting into a duct, as in glands that secrete their products via ducts onto a surface or into a cavity; opposite of endocrine [*exo-* outside or outward, *-crin-* secrete]

exocrine gland (EK-soh-krin) secretory structure that discharges products into ducts [*exo-* outside or outward, *-crin-* secrete, *gland* acorn]

exocytosis (eks-o-sye-TOH-sis) process that allows large molecules to leave the cell without actually passing through the plasma membrane [*exo-* outside or outward, *-cyto* cell, *-osis* condition]

exogenous growth (eks-OJ-eh-nus) *see* **appositional growth**

experiment test (or series of tests) of a proposed scientific idea or hypothesis; a controlled experiment is one that accounts for, and eliminates, effects of influences other than those being tested [*exo-* outside, *-gen* produce, *-ous* relating to]

exon (EKS-ahn) segment of a gene in DNA that is used directly for protein synthesis; in the mRNA transcript of a gene, the intervening intron (noncoding) segments are removed and the remaining exon (coding) segments are spliced together to form the final, edited version of the mRNA transcript; *see* **ribonucleic acid (RNA), transcription** [*exo-* outside, *-on* unit]

exophthalmos (ek-soff-THAL-mus) protrusion of the eyeballs resulting, in part, from edema of tissue at the back of the eye socket [*ex-* outside, *-oph-* eye, *-thalm-* inner chamber, *-ic* relating to]

expiration (eks-pih-RAY-shun) exhaling [*ex-*out, *-pir-* breathe, *-tion* process]

expiratory center (eks-PYE-rah-tor-ee) one of the two most important respiratory control centers, located in the medulla [*ex-* out of, *-[s]pir-*breathe, *-tory* relating to, *centrum-*center]

expiratory muscles (eks-PYE-rah-tor-ee) muscles that allow more forceful expiration to increase the rate and depth of ventilation; internal intercostals and abdominal muscles [*ex-* out of, *-[s]pir-* breathe, *-tory* relating to, *musc-* mouse, *-cle* little]

expiratory reserve volume (ERV) (eks-PYE-rah-tor-ee) amount of air that can be forcibly exhaled after expiring the tidal volume (TV) [*ex-* out of, *-[s]pir-* breathe, *-tory* relating to, *volume-* paper roll]

extensibility (ek-STEN-si-BIL-i-tee) ability of a muscle to extend or stretch and return to resting length [*ex- outward, -tens-* stretch, *-abil-* capable, *-ity* state]

extension (ek-STEN-shun) increasing the angle between two bones at a joint; as opposed to flexion [*ex- outward, -tens-* stretch, *-sion* process]

extensor digitorum longus muscle (ek-STEN-ser dij-i-TOH-rum) dorsal flexor muscle on the anterior surface of the foot [*extensor* that which stretches, *digit* of the finger or toe, *longus* long, *mus-* mouse, *-cle* little]

external anal sphincter muscle (AY-nal SFINGK-ter) circular muscle located around the anus [*extern-* outside, *-al* relating to, *an-*ring (anus), *-al* relating to, *sphinc-* bind tight, *-er* agent, *mus-* mouse, *-cle* little]

external acoustic meatus (ak-OOS-tik mee-AY-tus) ear canal; a curved tube (approximately 2.5 cm) extending from the auricle into the temporal bone, ending at the tympanic membrane [*extern-* outside, *acust-*hearing, *-ic* relating to, *meatus-* channel]

external ear outer part of the ear: auricle and external auditory canal [*extern-* outside, *-al* relating to]

external genital (JEN-i-tall) any of the reproductive organs (usually the external organs); penis, scrotum, and related structures in males; vagina, vulva, and related structures in females [*extern-* outside, *-al* relating to, *genit-* birth or reproduction, *-al* relating to]

external iliac vein (IL-ee-ak) vein of the lower extremity [*extern-* outside, *-al* relating to, *ilium* flank]

external intercostal muscle (in-ter-KOS-tal) muscle of the thorax; elevates the ribs [*extern-* outside, *-al* relating to, *inter-* between, *-costa-* rib, *-al* relating to, *mus-* mouse, *-cle* little]

external jugular vein (JUG-yoo-lar) vein of the neck [*extern-* outside, *-al* relating to, *jugul-* neck, *-ar* relating to]

external oblique muscle (oh-BLEEK) muscle of the abdominal wall [*extern-* outside, *-al* relating to, *obliq-* slanted, *mus-* mouse, *-cle* little]

external os constricted end of the uterus [*extern-* outside, *-al* relating to, *os* mouth or opening] *pl.*, ora

external table outer wall of a flat bone of the cranium, made of compact bone; compare to *internal table* [*extern-* outside, *-al* relating to]

exteroceptor (eks-ter-oh-SEP-tor) somatic sense receptor located on the body surface [*exter-* outside, *-cept-* receive, *-or* agent]

extracellular (eks-trah-SELL-yoo-lar) space outside the cell [*extra-* outside, *-cell-* storeroom, *-ular* relating to]

extracellular fluid (ECF) (eks-trah-SELL-yoo-lar) liquid found outside of cells, located in two compartments: between cells (interstitial fluid) and in blood (plasma); lymph, cerebrospinal fluid, and joint fluids are also *extracellular fluids* [*extra-* outside, *-cell-* storeroom, *-ular* relating to]

extracellular matrix (ECM) (eks-trah-SEL-yoo-lar MAY-triks) material between cells in a tissue, made up of water and a variety of proteins and other molecules [*extra-* beyond, *-cell-* storeroom, *-ular* relating to, *matrix* womb] *pl.*, matrices

extrapyramidal tract (eks-trah-pi-RAH-midal) motor tract from the brain to the spinal cord anterior horn motor neurons, except for the corticospinal tract [*extra-* outside, *-pyramid-* pyramid, *-al* relating to, *tract-*trail]

extrinsic clotting pathway (eks-TRIN-sik) clotting mechanism that involves chemicals released from damaged tissue outside of the blood [*extr-* outside, *-sic* beside]

extrinsic control (eks-TRIN-sik) style of physiological regulation in which the control center (regulatory center) is outside, or extrinsic to, the tissue being regulated; for example, the brain's control of a leg muscle or the pituitary gland's regulation of the thyroid gland [*extr-* outside or beyond, *-insic* beside]

extrinsic eye muscle (eks-TRIN-sik) voluntary muscle that attaches the eyeball to the socket and produces movement of the eyeball [*extr-*outside, *-sic* beside, *mus-* mouse, *-cle* small]

extrinsic factor (eks-TRIN-sik) substance secreted in the stomach that allows vitamin B_{12} to be absorbed by the body [*extr-* outside, *-sic* beside]

extrinsic foot muscle (eks-TRIN-sik) leg muscle responsible for movement of the ankle and foot [*extrins-* outside, *-ic* relating to, *mus-* mouse, *-cle* little]

extrinsic muscle (eks-TRIN-sik) muscle originating from outside of the part of the

skeleton moved [*extrins-* outside, *-ic* relating to, *mus-* mouse, *-cle* little]

F

face front of the head [*fac-* appearance]
facet (fah-SET or FASS-et) flat, rounded face on a bone projection (as in vertebrae) [*fac-* appearance (face), *-et* small]
facial nerve (FAY-shal) cranial nerve VII, mixed nerve [*faci-* face, *-al* relating to]
facilitated diffusion (fah-SIL-i-tay-ted di-FYOO-shun) special type of diffusion; when movement of a molecule is made more efficient by action of carrier or channel mechanisms in the plasma membrane [*facili-* easy, *-ate* act of, *diffuse-* spread out, *-sion* process]
fallen arches (flatfoot) condition in which the *tendons* and ligaments of the foot weaken, allowing the normally curved arch to flatten out [*arcus-* arc]
fallopian tube (fal-LOH-pee-an) uterine tube; either of a pair of tubes that conduct the ovum from the ovary to the uterus [*Gabriello Fallopio*]
false pelvis (PEL-vis) structure above the pelvic inlet [*pelvis* basin] *pl.*, pelves (PEL-veez) or pelvises (PEL-vis-ez)
false vocal fold upper pair of folds of mucous membrane in the larynx; also called *vestibular fold* [*voca-* voice, *-al* relating to]
falx cerebelli (falks ser-eh-BEL-lee) small fold in the dura mater in the posterior cranial fossa, between the cerebellum and cerebrum [*falx* sickle, *cerebelli* of the cerebellum (small brain)] *pl.*, falces cerebelli
falx cerebri (falks SER-eh-bree) fold in the dura mater that separates the two cerebral hemispheres [*falx* sickle, *cerebri* of the cerebrum] *pl.*, falces cerebri
farsightedness *see* **hyperopia**
fascicle (FAS-i-kul) small bundle or cluster, especially of groups of skeletal muscle fibers bound together by perimysium [*fasci-* band or bundle, *-cle* small]
fascia (FASH-ee-ah) general name for the fibrous connective tissue masses located throughout the body [*fascia* band or bundle]
fasciculus cuneatus (fah-SIK-yoo-lus KYOO-nee-ay-tus) wedgelike bundle of spinal cord sensory tracts; carries information regarding discrimination touch and conscious sensation of body position and movement [*fasci-* bundles, *-iculus* little, *cuneatus* wedgelike] *pl.*, fasciculi
fasciculus gracilis (fah-SIK-yoo-lus GRAH-sil-iss) thin bundle of spinal cord sensory tracts that carry information for detecting touch and conscious sensation of position and movement of the body [*fasci-* bundles, *-iculus* little, *gracilis* thin]
fast (A) pain type of nerve fiber that carries pain impulses that result in sharp pain; associated with superficial injury or trauma [*fast-* quickly, swiftly, *poena-* punishment]
fast fiber *see* **fast muscle fiber** [*fibra-* fiber]
fast muscle fiber white muscle fiber; primarily relies on anaerobic processes to produce ATP; responds quickly [*mus-* mouse, *-cle* little, *fibra-* fiber]
fatty acid product of fat digestion; building block of fat molecules [*faettian-* fat, *acid-* sour]
fauces (FAW-seez) opening from the mouth into the oropharynx [*faux-* throat]
febrile (FEB-ril) referring to fever [*febris-* fever]
feces (FEE-seez) waste material discharged from the intestines [*feces* waste]
feedback control loop highly complex and integrated communication control network, classified as negative or positive; negative feedback loops are the most important and numerous homeostatic control mechanisms [*control-* to check]
feed-forward concept that information may flow ahead to another process to trigger a change in anticipation of an event that will follow [*fedan-* nourish, *-forward* toward the front]
femoral hernia (FEM-or-all HER-nee-ah) rupture of the lower abdominal wall at the femoral ring [*femor-* femur, *-al* relating to, *hernia* rupture] *pl.*, herniae or hernias
femoral vein (FEM-or-al) vein of the thigh [*femor-* thigh, *-al* relating to]
femur (FEE-mur) thigh bone [*femur* thigh]
fenestrated capillary (fen-es-TRAY-tid KAP-i-lair-ee) type of capillary that has intercellular clefts between their lining of endothelial cells and small holes through the plasma membrane [*fenestra-* window, *-ate* characterized by, *capill-* hair, *-ary* relating to]
fenestration (fen-es-TRAY-shun) perforation in the endothelium of a capillary, as in the glomerulus [*fenestra-* window, *-ation* process]
fertility drug (fer-TIL-i-tee) drug taken to correct ovulatory dysfunction [*fertil-* fruitful, *-ity* state]
fertility sign (fer-TIL-i-tee) structural or functional change in the body used to predict ovulation [*fertil-* fruitful, *-ity* state]
fertilization (FER-ti-li-ZAY-shun) union of an ovum and a sperm; conception [*fertil-* fruitful, *-ation* process]
fetal alcohol syndrome (FAS) (FEE-tal AL-koh-hol SIN-drohm) a condition that may cause congenital abnormalities in a baby; it results from a woman consuming alcohol during pregnancy [*fet-* offspring, *-al* relating to, *syn-* together, *-drome* running or (race) course]
fetal hemoglobin (FEE-tal hee-moh-GLOH-bin) oxygen-binding protein present in the fetus that is made up of two alpha chains and two gamma chains [*fet-* offspring, *-al* relating to, *hemo-* blood, *-glob-* ball, *-in* substance]
fetal programming (FEE-tal) process that refers to the relationship between events occurring during the course of fetal development and the appearance of specific anatomical, physiological, or disease states that develop later in life [*fet-* offspring, *-al* relating to]
fetus (FEE-tus) unborn young, especially in the later stages; in human beings, the fetal stage is from the third month of the intrauterine period until birth [*fetus-* fruitful]
fever unusually high body temperature [*febris-* fever]
fiber (FYE-ber) threadlike structure, as in a muscle fiber (a threadlike cell) or a collagen fiber (a threadlike protein strand) [*fibr-* thread or fiber]
fibrillation (fi-bri-LAY-shun) condition in which individual muscle fibers, or small groups of fibers, contract asynchronously (out of time) with other muscle fibers in an organ (especially the heart), producing no effective movement [*fibril-* small fiber, *-ation* process]
fibrin (FYE-brin) insoluble protein in clotted blood [*fibr-* fiber, *-in* substance]
fibrinogen (fye-BRIN-oh-jen) soluble blood protein that is converted to insoluble fibrin during clotting [*fibr-* fiber, *-gen* produce]
fibrinolysis (fye-brin-OL-i-sis) physiological mechanism that dissolves clots [*fibr-* fiber, *-lysis* loosening]
fibroblast (FYE-broh-blast) connective tissue cell that synthesizes interstitial fibers and gels [*fibro-* fiber, *-blast* bud]
fibrocartilage (fye-broh-KAR-ti-lij) cartilage with the greatest number of collagenous fibers; strongest and most durable type of cartilage [*fibro-* fiber, *-cartilag* cartilage]
fibroid (FYE-broyd) *see* **fibromyoma** [*fibr-* fiber, *-oid* of or like]
fibromyalgia (FM) (fye-broh-my-AL-jah) syndrome of chronic, widespread musculoskeletal pain accompanied by distress and other symptoms; resulting primarily from overamplification of pain in the central nervous system [*fibr-* fiber, *-my-* muscle, *-algia* pain]
fibromyoma (fye-broh-my-OH-mah) benign tumor of uterine fibrous or smooth muscle tissue [*fibro-* fiber, *-my-* muscle, *-oma* tumor]
fibromyositis (fye-broh-my-oh-SYE-tis) tendon inflammation with myositis (muscle inflammation), as in a charley horse [*fibro-* fiber, *-myos-* muscle, *-itis* inflammation]
fibrosarcoma (fye-broh-sar-KOH-mah) cancer of fibrous connective tissue [*fibro-* fiber, *-sarco* flesh, *-oma* tumor]
fibrous connective tissue (FYE-brus) strong, nonstretchable, white collagen fibers that make up tendons [*fibr-* fiber, *-ous* relating to, *connect-* bind, *-ive* relating to, *tissu-* fabric]
fibrous joint (FYE-brus joynt) connection between bones made primarily by bands of fibrous connective tissue [*fibr-* fiber, *-ous* relating to]
fibrous pericardium (FYE-brus pair-i-KAR-dee-um) tough, loose-fitting, and inelastic sac around the heart [*fibr-* fiber, *-ous* relating to, *peri-* around, *-cardi-* heart, *-um* thing]
fibula (FIB-yoo-lah) leg bone; lateral to tibia [*fibula* clasp] *pl.*, fibulae or fibulas
fibular (peroneal) vein (FIB-yoo-lar [per-oh-NEE-al]) vein of the leg [*fibula-* clasp, *-ar* relating to, *perone-* brooch, *-al* relating to]
fibularis tertius muscle (per-oh-NEE-us TER-shee-us) leg muscle that flexes and everts the foot; also **peroneous tertius** [*fibularis* relating to a clasp (fibula), *tertius* third, *mus-* mouse, *-cle* little]
fight-or-flight reaction changes produced by increased sympathetic impulses allowing the body to deal with any type of stress [*feohtan-* fight, *flyhte-* flight, *re-* again, *-action* action]
filaria (fi-LAR-ee-a) taxonomic group of organisms that includes parasitic worms [*fila-* thread, *-ar-* like, *-ia* things] *pl.*, filariae
filiform papilla (FIL-ih-form pah-PIL-ah) bumps of the tongue mucosa with tiny, threadlike projections; these papillae are scattered among the fungiform papillae; they do not contain taste buds but allow us to experience food texture and "feel" [*fili-* thread, *-form* shape, *papilla* nipple] *pl.*, papillae
filtrate (FIL-trayt) substance remaining in a liquid after it has passed through a filter [*filtr-* strain, *-ate* result]
filtration (fil-TRAY-shun) movement of water and solutes through a membrane because of a higher hydrostatic pressure on one side [*filtr-* strain, *-ation* process]
filum terminale (FYE-lum ter-mi-NAL-ee) slender filament formed by the pia mater that blends with the dura mater and then the periosteum of the coccyx [*filum* thread, *termin-* boundary, *-al* relating to] *pl.*, fila terminales
fimbria (FIM-bree-ah) fringe of tiny finger-like projections around the opening of each fallopian (uterine) tube; the projections help move an ovum into the fallopian tube [*fimbria* fringe] *pl.*, fimbriae
first polar body small, nonfunctional cell produced during meiotic divisions in the formation of the female gamete [*pol-* pole, *-ar* relating to]
first-degree burn partial-thickness burn, actual tissue destruction is minimal [*degree-* step or rank]
fissure (FISH-ur) groove [*fissure-* cleft]
fixator muscle (fik-SAY-tor) muscle that functions as a joint stabilizer [*fixator* fastener, *mus-* mouse, *-cle* little]
fixed-membrane-receptor model *see* **second-messenger model** [*figere-* to fasten, *membran-* thin skin, *recept-* receive, *-or* agent]
flaccid muscle (FLAK-sid) muscle with less tone than normal [*flac-* flabby, *-id* structure or body, *mus-* mouse, *-cle* little]
flagellum (flah-JEL-um) single projection extending from the cell surface similar to a cilium; only example in human is the "tail" of the male sperm [*flagellum* whip] *pl.*, flagella
flat bone broad and thin bone with a flattened and often curved surface
flavin adenine dinucleotide (FAD) (FLAY-vin AD-en-een dye-NOO-klee-oh-tyde) molecule that serves as an electron carrier in the electron transport system [*flav-* yellow, *-in* substance, *aden-* gland, *-ine* chemical, *di-*two, *nucleo-* kernel (nucleus), *-t-* combining form, *-ide* chemical]
flexion (FLEK-shun) act of bending; decreasing the angle between two bones at the joint; opposite of extension [*flex-* bend, *-ion* process]
flow-volume loop a type of spirogram (breathing graph) that shows the flow rate (L/min) of breathing along one axis and volume of breathing (L) along the other axis, thus forming a loop or circle with each respiratory cycle
fluid and electrolyte balance (eh-LEK-troh-lyte) constancy of body fluid and electrolyte levels [*electro-* electricity, *-lyt-*loosening]
fluid balance homeostasis of fluids; the volumes of interstitial fluid, intracellular fluid, and plasma and total volume of water remain relatively constant [*fluere-* to flow, *bilancia-* balance]
fluid compartment area in the body where fluid is located; interstitial fluid, plasma, and intracellular fluid compartments are the major fluid compartments of the body [*fluere-* to flow, *com-* together, *partiri-* to share]
fluid mosaic model (moh-ZAY-ik) theory of plasma membrane composition in which molecules of the membrane are bound tightly enough to form a continuous layer but loosely enough so molecules can slip past one another [*fluere-* to flow, *Musa-* mosaic]
fluorescence microscopy (FM) (flor-ESS-ens my-KRAH-skah-pee) type of light microscopy that uses a certain wavelength of light (such as UV) to trigger special fluorescent stains in a microscopic specimen to glow brightly [*fluor-* fluorite (fluorescent mineral), *-escence* state, *micro-* small, *-scop-* see, *-y* activity]
folate deficiency anemia (FOH-layt deh-FISH-en-see ah-NEE-mee-ah) condition in which there is a decrease in the red blood cell count resulting from a vitamin deficiency [*fol-* leaf, *-ate* relating to, *an-* without, *-emia* blood condition]
folia (FOH-lee-ah) thin, delicate gyri (raised ridges) of the surface of the cerebellum [*folia* leaves] *sing.*, folium
foliate papilla (FOL-ee-ayt pah-PIL-ah) red, leaflike ridges of mucosa on the lateral edges of the posterior tongue surface; each contains about a hundred or so taste buds [*foli-* leaf, *-ate* relating to, *papilla* nipple] *pl.*, papillae
follicle (FOL-lih-kul) general name for a pocket or bubble structure; for example, ovarian structure consisting of oocyte surrounded by numerous supporting cells (follicle cells); also, pocketlike structures from which a hair grows; also, a small hollow sphere with a wall of glandular epithelium, found in thyroid tissue [*foll-* bag, *-icle* little]
follicle-stimulating hormone (FSH) (FOL-lih-kul-STIM-yoo-lay-ting HOR-mohn) hormone present in males and females; in males, FSH stimulates the production of sperm; in females, FSH stimulates the ovarian follicles to mature and follicle cells to secrete estrogen [*foll-* bag, *-icle* little, *hormon-* excite]
follicular cell (foh-LIK-yoo-lar) cell that produces thyroid colloid [*foll-* bag, *-icul-* small, *-ar* relating to, *cell* storeroom]

follicular phase (foh-LIK-yoo-lar) postmenstrual phase of the female reproductive cycle; also called *preovulatory* or ***estrogenic phase*** [*foll-* bag, *-icul-* little, *-ar* relating to]
fontanel (FON-tah-nel) "soft spot" where ossification in the cranium is incomplete at birth [*fontam-* fountain, *-el* little]
foot distal extremity of the leg specially adapted to supporting weight [*fot-* foot]
foramen (foh-RAY-men) hole or opening, as in a bone (for blood vessels and nerves) [*foramen* opening] *pl.*, foramina (foh-RAM-in-ah) or foramens (foh-RAY-menz)
foramen ovale (foh-RAY-men oh-VAL-ee) in the developing fetus, opening that shunts blood from the right atrium directly into the left atrium, allowing most blood to bypass the baby's developing lungs [*foramen* opening, *ovale* egg shaped] *pl.*, foramina ovales
forced expiratory volume (FEV) (eks-PYE-rah-tor-ee) maximum volume (mL or L) of air that can be breathed out; also called *forced vital capacity (FVC)* [*ex-* out of, *-[s]pir-* breathe, *-tory* relating to, *volume-* paper roll]
formed element any of the cells of the blood tissue: red blood cells, white blood cells, and platelets in blood [*form-* having a specific shape, *element-* first principle]
fornix (FOR-niks) corner of the vagina where it meets the cervix of the uterus [*fornix-* arch]
fossa (FOSS-ah) slight depression, as in a bone [*fossa* ditch] *pl.*, fossae (FOSS-ee)
fourth-degree burn burn involving underlying muscles, fasciae, or bone [*degree-* step or rank]
fovea centralis (FOH-vee-ah sen-TRAL-is) small depression in the macula lutea where cones are most densely packed; vision is sharpest where light rays focus on the fovea [*fovea* pit, *centralis* center] *pl.*, foveae centrales
fractal geometry (FRAK-tal jee-OM-eh-tree) study of surfaces with a seemingly infinite area, such as the lining of the small intestine [*fract-* a breaking, *-al* relating to, *geometry-* measurement of earth or land]
fundoplication (fun-doh-plih-KAY-shun) surgical procedure performed to strengthen the lower esophageal sphincter [*fundus* bottom, *-plicare* to fold]
fraternal twin (frah-TERN-al) offspring that results from the fertilization of two different ova by two different spermatozoa [*frater-* brother, *-al* relating to, *twin* twofold]
free fatty acid (FFA) fatty acid combined with albumin to be transported by the blood to other cells [*acidus* sour]
free nerve endings sensory receptors in the skin that respond to pain [*freo-* free]
friction ridge raised underlying dermal papillae; form fingerprints [*fric-* rub, *-tion* process]
frontal bone forehead bone [*front-* forehead, *-al* relating to]
frontal plane lengthwise plane running from side to side, dividing the body into anterior and posterior portions [*front-* forehead, *-al* relating to, *plane-* broad]
frostbite local damage to tissues caused by extremely low temperature [*frost-* freezing]
full-thickness burn third-degree burn; skin is severely damaged and nerve endings are destroyed [*thick-* not thin, *-ness* state of]
functional group small cluster of atoms in an organic molecule that gives the molecule particular functional characteristics such as certain chemical binding properties; often represented generically by the letter R [*function-* to perform, *-al* relating to]
functional MRI (fMRI) (procedure that detects which areas of the brain are most active by measuring oxygen consumption by neurons [*MRI* magnetic resonance imaging]
functional protein category of proteins that affect the functional operations of a cell; contrast to *structural protein* [*function-* to perform, *-al* relating to, *prote-* primary, *-in* substance]
functional residual capacity (FRC) amount of air left in the lungs at the end of a normal expiration [*function-* to perform, *-al*, *residu-* left over, *-al* relating to]
fundus (FUN-duss) one of three divisions of the stomach; enlarged portion to the left and above the opening of the esophagus into the stomach [*fundus* bottom] *pl.*, fundi
fungiform papilla (FUN-jih-form pah-PIL-ah) large, mushroom-shaped bumps of the tongue mucosa found in the anterior two thirds of the tongue surface; each one contains one or a few taste buds [*fungi-* mushroom, *-form* shape, *papilla* nipple] *pl.*, papillae
fungus (FUNG-us) organism similar to plants but lacking chlorophyll and capable of producing mycotic (fungal) infections [*fungus* mushroom] *pl.*, fungi (FUNG-eye)
funiculus (fuh-NIK-yoo-lus) large bundle of nerve fibers divided into smaller bundles called *spinal tracts* [*funi-* rope, *-icul-* little] *pl.*, funiculi
furuncle (FUR-un-kul) boil; pus-filled cavity formed by some hair follicle infections; see also **carbuncle** [*furuncle-* little thief]
fusiform muscle (FYOO-si-form) muscle that has fascicles close to parallel in the center of the muscle but converge to a tendon at one or both ends [*fusi-* spindle, *-form* shape, *mus-* mouse, *-cle* little]

G

G protein protein in the plasma membrane of a target cell (such as a postsynaptic cell) involved in signal transduction of a message from outside the cell [G for guanine nucleotide binding, *prote-* first rank, *-in* substance]
G-protein–coupled receptor (GPCR) (jee-PROH-teen–kup-eld ree-SEP-ter) receptor mechanism embedded in plasma membranes of cells that receives chemical messengers (such as neurotransmitters and nonsteroid hormones) and initiates signal transduction to the cell by way of a G protein, which triggers the resulting changes in the cell [G for guanine nucleotide binding, *-prote-* first rank, *-in* substance, *recept-* receive, *-or* agent]
G_0 phase step of the cell life cycle in which a newly formed daughter cell grows in size and then maintains itself for some time, but fails to proceed onward to prepare for later reproduction (cell division); G_0 phase follows the M phase (mitotic division) and represents the cell "opting out" of further reproduction; *see* **cell life cycle** [G- *growth* or *gap*, *phase* appearance]
G_1 phase step of the cell life cycle in which a newly formed daughter cell grows in size, in anticipation of later reproduction (cell division); G_1 phase follows the M phase (mitotic division) and precedes the S phase (DNA replication); *see* **cell life cycle** [G- *growth* or *gap*, *phase* appearance]
G_2 phase step of the cell life cycle in which a cell grows in size after having replicated its DNA and prepares for mitotic reproduction (cell division); G_2 phase follows the S phase (DNA replication) and precedes the M phase (mitotic division); *see* **cell life cycle** [G- *growth* or *gap*, *phase* appearance]
galactokinetic hormone (gal-ak-toh-ki-NET-ik HOR-mohn) any hormone that promotes milk ejection into ducts of the breast by stimulating myoepithelial cells surrounding alveoli [*galact-* milk, *-kinesis* motion, *-ic* relating to, *hormon-* excite]
galactopoietic hormone (gal-ak-toh-poy-ET-ik HOR-mohn) any hormone that maintains milk production in the breast (after it has already started) [*galact-* milk, *-poiet-* make, *-ic* relating to, *hormon-* excite]
gamete (GAM-eet) sex cells; spermatozoa and ova [*gamet-* sexual union or marriage partner]
gamma motor neuron (GAM-mah MOH-tor NOO-roon) stimulate contraction of the striated ends of the muscle spindle fiber (intrafusal fiber) [*gamma (γ)* third letter of Greek alphabet, *mot-* movement, *-or* agent, *neuron* nerve]
gamma ray (GAM-mah) electromagnetic radiation; more penetrating than alpha and beta particles [*gamma (γ)* third letter of Greek alphabet]
ganglion (GANG-lee-on) in peripheral nerves, a region of gray matter made up of unmyelinated fibers [*gangli-* knot, *-on* unit] *pl.*, ganglia
ganglion neuron (GANG-glee-ON) sensory neurons in the retina of the eye that collect information from rods and cones and also act as photoreceptors themselves [*gangli-* knot, *-on* unit *neuron* nerve]
gangrene (GANG-green) tissue death (necrosis) that involves decay of tissue [*gangren-* gnawing sore]
gap junction cell connection formed when membrane channels of adjacent plasma membranes adhere to each other [*junction* to join]
gastric inhibitory peptide (GIP) (GAS-trik in-HIB-i-tor-ee PEP-tyde) hormone produced by the intestinal mucosa that inhibits gastric secretion and motility; because it also enhances pancreatic insulin secretion in the presence of high plasma glucose, it has been more recently called *glucose-dependent insulinotropic polypeptide (GIP)* [*gastr-* stomach, *-ic* relating to, *inhibit-* restrain, *-ory* relating to, *pept-* digest, *-ide* chemical]
gastric juice (GAS-trik) stomach secretion containing acid and enzymes; aids in the digestion of food [*gastr-* stomach, *-ic* relating to]
gastric phase (GAS-trik) during this phase the stomach releases gastrin, which accelerates secretion of gastric juice [*gastr-* stomach, *-ic* relating to]
gastrin (GAS-trin) gastrointestinal (GI) hormone that plays an important regulatory role in the digestive process by stimulating gastric secretion [*gastr-* stomach, *-in* substance]
gastrocnemius muscle (GAS-trok-NEE-mee-us) calf muscle [*gastro-* belly, *-cnemius* leg, *mus-* mouse, *-cle* little]
gastroenteritis (gas-troh-en-ter-EYE-tis) inflammation of the stomach and intestines [*gastr-* stomach, *-enter-* intestine, *-itis* inflammation]
gastroenterology (gas-troh-en-ter-AHL-oh-jee) study of the stomach and intestines and their diseases [*gastr-* stomach, *-entero-* intestine, *-o-* combining form, *-log-* words (study of), *-y* activity]
gastroesophageal reflux disease (GERD) (gas-troh-eh-sof-eh-JEE-all REE-fluks) condition that results when stomach acid enters into the esophagus [*gastro-* stomach, *-es-* will carry, *-phag-* food (eat), *-al* relating to, *re-* again or back, *-flux* flow, *dis-* opposite of, *-ease* comfort]
gastrointestinal (GI) tract (gas-troh-in-TES-ti-nul) alimentary canal; tube formed by the major organs of digestion [*gastr-* stomach, *-intestin-* intestine, *-al* relating to, *tractus* trail]
gastrulation (gas-troo-LAY-shun) process by which blastocyst cells move and then differentiate into the three primary germ layers [*gastr-* belly, *-ula-* little, *-tion* process]
gated channel channel in the plasma membrane that can be opened and closed to alter membrane permeability [*gate-* opening or passage, *chanel-* groove]
gene one of many segments of a chromosome (DNA molecule); each gene contains the genetic code for synthesizing a protein molecule such as an enzyme or hormone or to make a functional RNA molecule such as tRNA or rRNA [*gen-* produce or generate]
gene augmentation (awg-men-TAY-shun) therapeutic technique that introduces genes with the hope that they will add to the production of a needed protein [*gen-* produce or generate]
gene chip DNA analysis technique [*gen-* produce or generate]
gene linkage when a whole group of genes stay together during the crossing-over process [*gen-* produce or generate]
gene replacement therapeutic technique that replaces genes that specify production of abnormal proteins with normal genes [*gen-* produce or generate]
gene therapy manipulation of genes to cure genetic problems; most forms of gene therapy have not yet proven to be effective in humans [*gen-* produce or generate]
general adaptation syndrome (GAS) (ad-ap-TAY-shun SIN-drum) group of changes that make the presence of stress in the body known [*general-* relating to all, *adapt-* fit to, *-tion* process, *syn-* together, *-drome* running or (race) course]
general sense organ structure that consists of microscopic receptors widely distributed throughout the body [*general-* relating to all, *organ-* instrument]
genetic counseling (jeh-NET-ik) professional consultations with families regarding genetic diseases [*genesis-* origin, *council-* plan]
genetic factor (jeh-NET-ik) inherited trait [*genesis* origin]
genetic mutation (jeh-NET-ik myoo-TAY-shun) change in the genetic material within a genome; may occur spontaneously or as a result of mutagens [*gene-* produce, *-ic* relating to, *muta-* change, *-ation* process]
genetic predisposition (jeh-NET-ik pree-dis-poh-ZIH-shun) likelihood due to inherited genes of developing a condition even though the condition itself may not be solely caused by genetic mechanisms [*gene-* produce, *-ic* relating to, *pre-* before, *dispose-* put in order, *-tion* process]
genetics (jeh-NET-iks) scientific study of heredity and the genetic code [*gen-* produce, *-ic* relating to]
geniculate body (jeh-NIK-ye-lit BOD-ee) either of two groups of cerebral nuclei comprising the thalamus; located in posterior region of each lateral mass; play role in processing auditory and visual input [*gen-* knee or knot, *-icul-* small, *-ate* of or like]
genital (JEN-i-tall) reproductive organ [*gen-* produce, *-al* relating to] *pl.*, genitals or genitalia
genital duct (JEN-i-tall) conveys sperm to the outside of the body; also called *reproductive duct* [*gen-* produce, *-al* relating to]
genitalia (jen-i-TAIL-yah) reproductive organs (*see* **genital**) [*gen-* produce, *-al* relating to]
genome (JEE-nohm) entire set of chromosomes in a cell; the *human genome* refers to the entire set of human chromosomes [*gen-* produce (gene), *-ome* entire collection]
genomics (jeh-NO-miks) field of endeavor involving the analysis of the genetic code contained in the human or another species' genome [*gen-* produce (gene), *-om-* entire collection, *-ic* relating to]
genotype (JEN-oh-type) alleles present at one or more specific loci on a chromosome of a given individual; *see* **phenotype** [*gen-* produce (gene), *-type* kind]
germinal epithelium (JER-mi-nal ep-i-TH-EE-lee-um) small epithelial cells that are on the surface of the ovaries [*germ* sprout, *-al* relating to, *epi-* on or upon, *-theli-* nipple, *-al* relating to]
germinal matrix (JER-mi-nal MAY-triks) cap-shaped cluster of cells at the bottom of a

hair follicle [*germ* sprout, *-al* relating to, *matrix* womb] *pl.*, matrices

gerontology (jair-on-TAHL-oh-jee) study of the aging process [*geronto-* old age, *-log-* words (study of), *-y* activity]

gestation period (jes-TAY-shun) length of pregnancy, approximately 9 months in humans [*gesta-* bear, *-tion* process]

ghrelin (GHRL) (GRAY-lin) hormone secreted by epithelial cells lining the stomach; ghrelin boosts appetite, slows metabolism, and reduces fat burning; may be involved in the development of obesity [*ghrel-* grow (also acronym for growth hormone releasing peptide), *-in* substance]

gigantism (jye-GAN-tiz-em) condition produced by hypersecretion of growth hormone during the early years of life; results in a child who grows to gigantic size [*gigant-* great, *-ism* condition]

gingivitis (jin-ji-VYE-tis) inflammation of the gum (gingiva), often as a result of poor oral hygiene [*gingiv-* gum, *-itis* inflammation]

gland secreting structure [*gland* acorn]

glandular (GLAN-dyoo-lar) resembling a gland [*gland-* acorn (gland), *-ula-* little, *-ar* relating to]

glans penis (glans PEE-nis) slightly bulging structure formed by the distal end of the corpus spongiosum; head of the penis; covered by the foreskin in uncircumcised males [*glans* acorn, *penis* male sex organ] *pl.*, glandes penes

glans clitoris (glans KLIT-oh-ris) *see* **clitoris** [*glans* acorn, *clitoris-* to shut]

glaucoma (glaw-KOH-mah) disorder characterized by elevated pressure in the eye; can lead to permanent blindness [*glauco-* gray or silver, *-oma* tumor (growth)]

glia (GLEE-ah) nonexcitable supporting cells of nervous tissue; formerly called *neuroglia* [*glia* glue] *sing.*, glial cell

gliding (movement) movement that results when the articular surface of one bone moves over the articular surface of another without any angular or circular movement [*glidan-* move along smoothly and easily]

glioblastoma multiforme (glye-oh-blas-TOH-ma mul-ti-FOR-mee) malignant tumor of astrocyte cells of the brain [*glio-* glue, *-blasto-*bud, *-oma* tumor, *multi-* many, *-form-* shape]

glioma (glee-OH-mah) any tumor of neuroglia (glial) cells in nerve tissue [*glio-* neuroglia, *-oma* tumor]

globin (GLOH-bin) chain of four proteins; binds to a red pigment (heme) to form hemoglobin [*glob-* ball, *-in* substance]

glomerular capsular membrane (gloh-MER-yoo-lar KAP-soo-lahr) membrane made up of glomerular endothelium, basement membrane, and visceral layer of the Bowman capsule; function is filtration [*glomer-* ball, *-ul-*little, *-ar* relating to, *caps-* box, *-ula-* little, *-ar* relating to, *membran-* thin skin]

glomerular filtration rate (GFR) (gloh-MER-yoo-lar fil-TRAY-shun) the rate of movement of fluid out of the glomerulus and into the capsular space [*glomer-* ball, *-ul-* little, *-ar* relating to, *filtr-* strain, *-ation* process]

glomerulonephritis (gloh-mer-yoo-loh-neh-FRY-tis) inflammatory disease of the glomerular-capsular membranes of the kidney [*glomer-* ball, *-ul-* little, *-nephr-* kidney, *-itis* inflammation]

glomerulus (gloh-MAIR-yoo-lus) compact cluster, particularly when referring to the tuft of capillaries forming part of the nephron [*glomer-* ball, *-ulus* little] *pl.*, glomeruli

glossopharyngeal nerve (glos-oh-fah-RIN-jee-al) cranial nerve IX; mixed nerve [*glosso-* tongue, *-pharyng-* throat, *-al* relating to]

glottis (GLOT-iss) composed of the true vocal cords and the space between them [*glottis* tongue] *pl.*, glottides or glottises

glucagon (GLOO-kah-gon) hormone secreted by alpha cells of the pancreatic islets; increases activity of phosphorylase [*gluca-* sweet (glucose), *-agon* lead or bring]

glucocorticoid (GC) (gloo-koh-KOR-ti-koyd) hormone that influences food metabolism; secreted by the adrenal cortex [*gluco-* sweet (glucose), *-cortic* bark or cortex, *-oid* like]

gluconeogenesis (gloo-koh-nee-oh-JEN-eh-sis) formulation of glucose or glycogen from protein or fat compounds [*gluco-* sweet (glucose), *-neo-* new, *-gen-* produce, *-esis* process]

glucosamine (gloo-KOHS-ah-meen) component of some proteoglycans that thicken and hold together connective tissues such as cartilage [*glucos-* sweetness or glucose, *-amine* ammonia compound]

glucose (GLOO-kohs) monosaccharide, or simple sugar; principal blood sugar used by cells [*gluco-* sweet, *-ose* carbohydrate (sugar)]

glucose-dependent insulinotropic polypeptide (GIP) (GLOO-kohs dih-PEN-dent in-suh-LIN-oh-troph-ik poh-lee-PEP-tyde) *see* **gastric inhibitory peptide** [*gluco-* sweet, *-ose* carbohydrate (sugar), *depend-* to hang upon, *insula-* island, *-troph* nourishment, *-ic* relating to]

glucose phosphorylation (GLOO-kohs fos-for-i-LAY-shun) process of converting glucose to glucose-6-phosphate; prepares glucose for further metabolic reactions [*gluco-* sweet, *-ose* carbohydrate (sugar), *phos-* light, *-phor-*carry, *-yl-* chemical, *-ation* process]

glutamate (GLOO-tah-mayt) glutamic acid; amino acid believed to be responsible for up to 75% of the excitatory signals in the brain [*glutamate-* sticky substance]

gluteal muscle (GLOO-tee-al) buttock muscle; moves the thigh [*glut-* buttocks, *-al* relating to, *mus-* mouse, *-cle* little]

glycerol (GLIS-er-ol) product of fat digestion [*glyce-* sweet, *-ol* alcohol]

glycine (GLYE-seen) amino acid; most widely distributed inhibitory neurotransmitter in the spinal cord [*gly-* sweet, *-amine* ammonia]

glycogen (GLYE-koh-jen) polysaccharide (complex carbohydrate); main carbohydrate stored in animal cells [*glyco-* sweet, *-gen* produce]

glycogenesis (glye-koh-JEN-eh-sis) anabolic pathway of glycogen formation; formation of glycogen from glucose or from other monosaccharides, fructose, or galactose [*glyco-* sweet, *-gen-* produce, *-esis* process]

glycogenolysis (glye-koh-jeh-NOL-ih-sis) hydrolysis of glycogen to glucose-6-phosphate or to glucose [*glyco-* sweet (glucose), *-gen-* produce, *-o-* combining form, *-lysis* loosening]

glycolipid (glye-koh-LIP-id) lipid molecule with attached carbohydrate group [*glyco-* sweet (glucose), *-lipid* fat]

glycolysis (glye-KAHL-i-sis) first series of chemical reactions in carbohydrate catabolism; changes glucose to pyruvic acid in a series of anaerobic reactions [*glyco-* sweet (glucose), *-o-*combining form, *-lysis* loosening]

glycophospholipid (glye-koh-fos-foh-LIP-id) molecule that is part sugar and part phospholipid; formed in epidermal cells of the skin to produce a waterproof barrier [*glyco-* sweet (glucose), *phos-* light, *-pho* to bear, *-lipid* fat]

glycoprotein (glye-koh-PROH-teen) substance made of molecules that are a combined form of carbohydrate and protein [*glyco-* sweet (glucose), *-prote-* first rank, *-in* substance, *hormon-* excite]

glycoprotein hormone (glye-koh-PRO-teen HOR-mohn) hormone made of molecules that are a combined form of carbohydrate and protein [*glyco-* sweet (glucose), *-prote-* first rank, *-in* substance, *hormon-* excite]

glycosuria (glye-koh-SOO-ree-ah) glucose in urine; a sign of diabetes mellitus [*glyco-* sweet (glucose), *-ur-* urine, *-ia* condition]

goblet cell (GOB-let) epithelial cell that produces and secretes large amounts of mucus [*goblet-* small bowl, *cell-* storeroom]

Golgi apparatus (GOL-jee ap-ah-RA-tus) organelle consisting of small sacs stacked on one another near the nucleus that makes carbohydrate compounds, combines them with protein molecules, and packages the product for distribution from the cell [*Camillo Golgi* Italian histologist]

Golgi tendon organ (GOL-jee TEN-don OR-gan) sensory organ imbedded in muscle tendons made up of sensory neurons (Golgi tendon receptors) that are encapsulated with collagen bundles; also called *tendon organ* [*Camillo Golgi* Italian histologist, *tend-* pulled tight, *-on* unit]

Golgi tendon receptor (GOL-jee TEN-don ree-SEP-tor) sensory stretch receptor neuron (part of the Golgi tendon organ) that is responsible for proprioception (muscle tension); stimulated by excessive muscle contraction; also called *tendon receptor* [*Camillo Golgi* Italian histologist, *tend-* pulled tight, *-on* unit, *recept-*receive, *-or* agent]

Golgi tendon reflex (GOL-jee) spinal nerve reflex that protects muscles from tearing internally or pulling away from their tendinous points of attachment to bone because of excessive contractile force by relaxing a muscle when its tension becomes too great; also called *tendon reflex* [*Camillo Golgi* Italian histologist, *tend-* pulled tight, *-on* unit, *re-* back or again, *-flex* bend]

gomphosis (gom-FOH-sis) fibrous joint where a process is inserted into a socket; for example, the joint between the tooth and mandible [*gomphos-* bolt, *-osis* condition] *pl.*, gomphoses

gonad (GO-nad) sex gland in which reproductive cells are formed; ovary in women, testis in men [*gon-* offspring, *-ad* relating to]

gonadotroph (go-NAD-oh-trohf) cell type of the adenohypophysis (anterior pituitary) that secretes the gonadotropins luteinizing hormone (LH) and follicle-stimulating hormone (FSH) [*gon-* offspring, *-ad-* relating to, *-troph* nourish]

gonadotropin (go-nah-doh-TROH-pin) any of the hormones (FSH and LSH) produced by the anterior pituitary or embryonic tissue (hCG) that stimulate growth and maintenance of the testes or ovaries [*gon-* offspring, *-ad-* relating to, *-trop-* nourish, *-in* substance]

goniometer (gon-ee-OM-eh-ter) instrument used to measure range of motion (ROM) angles of a joint [*gonio-* angle, *-meter* measure]

gout (gowt) condition characterized by excessive levels of uric acid in the blood that are deposited in the joints [*gout-* drop]

gouty arthritis (gow-TEE ar-THRY-tis) metabolic disorder in which excess blood levels of uric acid are deposited within the synovial fluid of joints and other tissues [*gout-* drop, *-y* of or like, *arthr-* joint, *-itis* inflammation]

graafian follicle (GRAH-fee-en FOL-li-kul) a secondary follicle; consists of a mature ovum surrounded by granulosa cells at boundary of fluid-filled antrum [*Reijnier de Graaf* Dutch physician, *-an* relating to, *foll-* bag, *-icle* little]

graded potential local potentials that vary according to strength of stimulus and distance on membrane from source [*grade-* step, *potent-* power, *-ial* relating to]

graded strength principle skeletal muscles contract with varying degrees of strength at different times [*grade-* step, *strength-* power, *principle-* beginning, first part]

gradient (GRAY-dee-ent) measurable difference between two points of a given variable such as molecular concentration, pressure, or electrical charge [*grade-* step]

graft-versus-host rejection rejection of grafted tissue that occurs when donated tissue attacks the recipient's human leukocyte antigens [*graft-* stylus, *versus-* turned toward or against, *host-* guest, *re-* again, *-ject* to throw, *ion* process]

granulation tissue (gran-yool-AY-shun TISH-yoo) fibrous connective tissue with a rich blood supply and high number of immune cells that forms in a wound as a blood clot dissolves; it is a normal tissue present during the healing process [*gran-* grain, *-ul-*little, *-ation* process, *tissue* fabric]

granule cell (GRAN-yool) inhibits action potentials in the olfactory bulb [*gran-* grain, *-ule* little, *cell-* storeroom]

granulocyte (GRAN-yoo-loh-syte) leukocyte with granules in cytoplasm [*gran-* grain, *-ul-* little, *-cyte* cell]

granulosa cell (gran-yoo-LOH-sah) develop around each primary oocyte forming a primary follicle [*gran-* grain, *-ul-* little, *-osa* relating to, *cell* storeroom]

Graves disease inherited, possibly autoimmune endocrine disorder characterized by hyperthyroidism accompanied by exophthalmos (protruding eyes) [*Robert J. Graves* Irish physician, *dis-* opposite of, *-ease* comfort]

gray column any one of the three longitudinal areas (anterior, lateral, posterior) of the spinal cord that contain gray matter [*column-* pillar]

gray commissure (KOHM-is-shoor) middle band of gray matter that joins the left and right columns [*commissur-* a joining]

gray fiber unmyelinated nerve fiber; component of gray matter (*fiber-* thread]

gray matter type of nerve tissue characterized by a relative lack of myelin and often includes many neuron cell bodies and synapses that process information; contrast with *white matter* [*materia-* something from which something is made]

gray ramus (RAY-muss) short branch by which some postganglionic axons return to a spinal nerve [*ramus-* branch]

great saphenous vein (sah-FEE-nus) vein of the lower extremity; drains much of the superficial leg and foot [*saphen-* manifest, *-ous* relating to]

greater omentum (oh-MEN-tum) pouch-like extension of the visceral peritoneum extending from greater curvature of the stomach to the transverse colon; often called "the lace apron" [*omentum* fatty covering of intestines] *pl.*, omenta

greater vestibular gland (ves-TIB-yoo-lar) either of the glands on each side of the vaginal orifice that secrete a lubricating fluid; also called *Bartholin's glands* [*vestibul-* entrance hall, *-ar* relating to, *gland* acorn]

greenstick fracture type of incomplete bone fracture in which bone is bent but broken only on one side (common in children) [*fracture* a breaking]

gross anatomy the study of the larger structures of an organism, such as organs and systems, that are large enough to be seen without magnification; also called *macroscopic anatomy*; compare to **microscopic anatomy** [*gross* large, *ana-* apart, *-tom-* cut, *-y* action]

ground substance organic matrix of bone and cartilage [*substancia-* material]

growth hormone (GH) (HOR-mohn) hormone secreted by the anterior pituitary gland that controls the rate of skeletal and visceral growth [*hormon-* excite]

growth normal increase in size or number of cells [*growan-* to grow]

gustatory (GUS-tah-tor-ee) refers to taste [*gusta-* taste, *-ory* relating to]

gustatory cell (GUS-tah-tor-ee s) chemoreceptors in tongue that sense taste [*gusta-* taste, *-ory* relating to, *cell* storeroom]

gustatory hair (GUS-tah-tor-ee) cilia-like structure projecting from gustatory cells and into taste pores [*gusta-* taste, *-ory* relating to]

Guthrie test (GUH-three) blood test to detect phenylketonuria (PKU) [*Robert Guthrie* American microbiologist]

gynecology (gye-neh-KOL-oh-jee) study of the female reproductive system [*gyneco-* woman or female gender, *-logy* study of]

gyrus (JYE-rus) convoluted ridge, usually refers to rounded elevations of the brain surface; also called *convolution* [*gyro-* circle]

H

hair cells mechanoreceptors in the ear that are responsible for balance and hearing [*cell-* storeroom]

hair follicle (FOHL-i-kul) small blind-end tube extending from the dermis through the epidermis that contains the hair root and where hair growth occurs; sebaceous and apocrine skin glands have ducts leading into the follicle [*foll-* bag, *-icle* little]

hair papilla (pah-PIL-ah) small, cap-shaped cluster of cells located at the base of the follicle where hair growth begins [*papilla* nipple] *pl.*, papillae

hairline fracture type of bone fracture common in the skull—fracture components are small and aligned; if the fracture is pushed downward, called a *depressed fracture* [*fracture* a breaking]

Haldane effect (HAWL-dayne) phenomenon that refers to the increased CO_2 loading caused by a decrease in Po_2 [*John Scott Haldane* Scots physiologist]

hangman's fracture bone fracture of the posterior elements in the upper cervical spine, especially the axis [*fracture* a breaking]

haploid (number) (HAP-loyd) halved number of chromosomes in gametes resulting from meiosis; in humans, 23 chromosomes per sex cell [*haplo-* single, *-oid* of or like]

hard palate (PAL-et) portions of four bones (two maxillae and two palatines) that make up the roof of the mouth [*palatum-* roof of the mouth]

Haversian canal (hah-VER-shun) *see* **central canal** (of bone) [*Clopton Havers,* English physician]

Haversian system (hah-VER-shun) *see* **osteon** [*Clopton Havers,* English physician]

heart block blockage of impulse conduction from atria to ventricles so that the heart beats at a slower rate than normal [*block-* solid piece]

heart failure inability of the heart to pump returned blood sufficiently

heart murmur abnormal heart sound that may indicate valvular insufficiency or stenosing of the valve [*murmur* hum]

heart organ of circulatory system that pumps the blood; composed of cardiac muscle tissue [*heorte-* heart]

heat exhaustion condition caused by fluid loss resulting from activity of thermoregulatory mechanisms in a warm external environment [*heat-* hot, *exhaust-* to draw off or out, *-ion* process]

heat stroke life-threatening condition characterized by high body temperature; failure of thermoregulatory mechanisms to maintain homeostasis in a very warm external environment [*heat-* hot, *stroke-* the Stroke of God's hand]

Heberden node (HEB-er-den) swelling deformity of the distal interphalangeal joints [*William Heberden* English physician, *nod-* knot]

Heimlich maneuver (HYME-lik mah-NOO-ver) lifesaving technique that can be used to open a windpipe that suddenly becomes obstructed [*Henry J. Heimlich* American physician]

helper T cell (TH cell) immune system cells that help B cells differentiate into antibody-secreting plasma cells; also help coordinate cellular immunity through direct contact with other immune cells [helper, *T* thymus gland, *cell* storeroom]

hematocrit (hee-MAT-oh-krit) volume percent of blood cells in whole blood; packed cell volume [*hemato-* blood, *-crit* separate]

hematopoiesis (hee-mat-oh-poy-EE-sis) process of blood cell formation [*hemo-*blood, *-poiesis* making]

hematopoietic stem cell (hee-mah-toh-poy-ET-ik) nucleated cell in the red bone marrow that develops into a red blood cell [*hem-* blood, *-poiesis* making, *stem-* tree or trunk, *cell-* storeroom]

hematopoietic tissue (hee-mah-toh-poy-ET-ik) connective tissue type that is responsible for formation of blood cells and lymphatic system cells; in red bone marrow, spleen, tonsils, and lymph nodes [*hema-* blood, *-poie-* to make, *-ic* relating to, *tissu-* fabric]

hematuria (hem-ah-TOO-ree-ah) blood in the urine [*hema-* blood, *-ur-* urine, *-ia* condition]

heme (heem) iron-containing chemical group found in hemoglobin; temporarily binds to oxygen [*hem-* blood]

heme group (heem) *see* **heme** [*hem-* blood]

hemiazygos vein (hem-ee-AZ-i-gohs) vein of the thorax [*hemi-* half, *-a-* without, *-zygo-* union or yoke]

hemiplegia (hem-ee-PLEE-jee-ah) condition that refers to paralysis of one whole side of the body [*hemi-* half, *-plegia* stroke]

hemisphere (HEM-iss-feer) one half of a generally spherical structure, as in the left and right hemispheres of the cerebellum or cerebrum [*hemi-* half, *-sphere* globe]

hemisphericity (HEM-i-sfeer-is-i-tee) different specialization of function in each hemisphere of an organ, as in the cerebral hemispheres [*hemi-* half, *-spher-* globe, *-ic-* relating to, *-ity* state]

hemocytoblast (hee-moh-SYE-toh-blast) bone marrow stem cell from which all formed elements of blood arise [*hemo-* blood, *-cyto* cell, *-blast* embryonic state of development]

hemodialysis (hee-moh-dye-AL-i-sis) therapy involving separation of smaller (diffusible) particles from larger (nondiffusible) particles in blood through a semipermeable membrane, usually employed when a patient's kidneys fail to remove these particles from the blood [*hemo-* blood, *-dia-* through or between, *-lysis* loosening]

hemodynamics (hee-moh-dye-NAM-iks) study of the mechanisms that influence dynamic circulation of blood [*hemo-* blood, *-dynami-* force, *-ic* relating to]

hemoglobin (hee-moh-GLOH-bin) iron-containing protein in red blood cells responsible for their oxygen-carrying capacity [*hemo-*blood, *-glob-* ball, *-in* substance]

hemolytic anemia (hee-moh-LIT-ik ah-NEE-mee-ah) inherited blood disorder that is characterized by abnormal types of hemoglobin [*hemo-* blood, *-lyt-* loosen, *-ic* relating to, *an-* without, *-emia* blood condition]

hemophilia (hee-moh-FIL-ee-ah) X-linked inherited disorder that decreases the production of one or more plasma proteins responsible for blood clotting [*hemo-* blood, *-phil-* love, *-ia* condition]

hemorrhoid (HEM-eh-royd) varicose vein in the rectum; also called *piles* [*hema-* blood, *-rhoi-* flow]

hemostasis (hee-moh-STAY-sis) stoppage of blood flow [*hemo-* blood, *-stasis* standing]

Henle loop (HEN-lee) extension of the proximal tubule of the nephron; also called *loop of Henle* or *nephron loop* [*Friedrich Gustave Henle* German anatomist]

Henry's law gas law that describes how the pressure of a gas relates to the concentration of that gas in a liquid solution [*William Henry* English chemist]

heparin (HEP-ah-rin) substance obtained from the liver; inhibits blood clotting [*hepar-* liver, *-in* substance]

hepatic (heh-PAT-ik) relating to the liver [*hepa-* liver, *-ic* relating to]

hepatic duct (heh-PAT-ik) one of two ducts that drains bile out of the liver [*hepa-* liver, *-ic* relating to, *ducere-* to lead]

hepatic lobule (heh-PAT-ik LOB-yool) anatomical units of the liver [*hepa-* liver, *-ic* relating to, *lob-* pod, *-ule* small]

hepatic portal circulation (heh-PAT-ik PORtal) the route of blood flow through the liver [*hepa-* liver, *-ic* relating to, *port-* doorway, *-al* relating to, *circulat-* go around, *-tion* process]

hepatitis (hep-ah-TYE-tis) inflammation of the liver; may be caused by toxins, viruses (e.g., hepatitis A, hepatitis B), bacteria, or parasites [*hepat-* liver, *-itis* inflammation]

heredity (heh-RED-i-tee) transmission of characteristics from parents to offspring [*heredity-* inheritance]

Hering-Breuer reflex (HER-ing BROO-er REE- fleks) stretch reflex to control respirations—especially rate and rhythmicity [*Heinrich E. Hering* German physiologist, *Joseph Breuer* Australian physician, *re-* back or again, *-flex* bend]

herniated disk (HER-nee-ayt-ed) condition of the vertebral disk when the annulus fibrosis becomes disrupted, allowing the nucleus pulposus to protrude [*hernia-* rupture, *-ate* act of]

herpes zoster (HER-peez ZOS-ter) "shingles," viral infection that affects the skin of a single dermatome [*herpe* creep, *zoster* girdle]

heterozygous (het-er-oh-ZYE-gus) genotype with two different forms of a trait [*hetero-* different, *-zygo-* union or yoke, *-ous* characterized by]

hexose (HEK-sohs) monosaccharide molecule with six carbons [*hex-* six, *-ose* sugar]

hiatal hernia (hye-AY-tal HER-nee-ah) condition in which a portion of the stomach is pushed through the hiatus (opening) of the diaphragm, often weakening or expanding the cardiac sphincter at the inferior end of the esophagus [*hiat-* gap, *-al* relating to, *hernia* rupture] *pl.*, herniae or hernias

hiccup (HIK-up) involuntary spasmodic contraction of the diaphragm [*hiccup* imitation of sound made when hiccupping]

high-density lipoprotein (lip-oh-PROH-teen) a blood lipid fraction (plasma protein) composed of cholesterol, about 50% protein, and triglycerides; often called "good cholesterol" because it carries cholesterol out of the blood to the liver for elimination [*dense-* thick, *-ity* state, *lipo-* fat, *-protein* first rank]

high-energy bond chemical bond that requires an input of energy to form and when broken can result in the transfer of useful energy to cellular processes, as in ATP [*en-* in, *-erg* work, *-y* state, *bond* band]

hilum (HYE-lum) slit on medial surface of each lung where primary bronchi and pulmonary vessels enter; slit on medial surface of each kidney where blood vessels and other structures enter the kidney [*hilum* least bit] *pl.*, hila

hinge joint (hinj joynt) type of diarthrotic synovial joint that allows movement around a single axis in the manner of a hinge

histamine (HIS-tah-meen) inflammatory chemical [*hist-* tissue, *-amine* ammonia compound]

histogenesis (hiss-toh-JEN-eh-sis) formation of tissues from primary germ layers of embryo [*histo-* tissue, *-gen-* produce, *-esis* process]

histology (his-TOL-oh-jee) branch of microscopic anatomy that studies tissues; biology of tissues [*histo-* tissue, *-o-* combining form, *-log-* words (study of), *-y* activity]

histone (HISS-tohn) protein that organizes chromatin into nucleosomes [*histo-* tissue, -one unit]

histophysiology (his-toh-fiz-ee-OL-oh-jee) study of microscopic anatomy of cells and tissues and how structural information correlates with function [*histo-* tissue, *-o-* combining form, *-physio-* nature (function), *-o-* combining form, *-log-* words (study of), *-y* activity]

H-K pump ion pump in the gastric parietal cells [*H* hydrogen, *K* potassium]

Hodgkin disease (HOJ-kin) type of lymphoma (malignant lymph tumor) characterized by painless swelling of lymph nodes in the neck, progressing to other regions [*Thomas Hodgkin* English physician, *dis-* opposite of, *-ease* comfort]

Hodgkin lymphoma (HOJ-kin lim-FOH-mah) *see* **Hodgkin disease** [*Thomas Hodgkin* English physician, *lymph-* water, *-oma* tumor]

holocrine gland (HOH-loh-krin) gland that collects secretory product inside its cells, which then rupture completely to release it; for example, sebaceous glands of the skin [*holo-* whole, *-crine* to secrete]

homeostasis (ho-me-o-STAY-sis) relative constancy of the normal body's internal (fluid) environment [*homeo-* same or equal, *-stasis* standing still]

homeostatic control mechanisms (hoh-mee-oh-STAH-tik) devices for maintaining or restoring homeostasis [*homeo-* same or equal, *-static* relating to standing still]

homologous transfusion (ho-MOL-oh-gus) blood transfused into the body of another individual [*homo-* same, *-log-* word or proportion, *-ous* relating to]

homozygous (hoh-moh-ZYE-gus) genotype with two identical forms of a trait [*homo-* same, *-zygo-* union or yoke, *-ous* characterized by]

horizontal fissure (hor-i-ZON-tal FISH-ur) separates the superior lobe of the right lung from the middle lobe [*fissur-* cleft]

horizontal plane (hor-i-ZON-tal) transverse plane; divides the body into superior and inferior portions [*plane-* flat surface]

hormone (HOR-mohn) substance secreted by an endocrine gland into the bloodstream that acts on a specific target tissue to produce a given response [*hormon-* excite]

hormone-receptor complex (HOR-mohn ree-SEP-tor) when a steroid hormone combines to a receptor site in the target cell and then moves into the nucleus of the target cell [*hormon-* excite, *recept-* receive, *-or* agent, *complex-* surrounding or environment]

host-versus-graft rejection rejection of grafted tissue that occurs when the recipient's immune system recognizes foreign human leukocyte antigens and attacks them, destroying the donated tissue [*host-* guest, *versus-* turned toward or against, *graft-* stylus, *re-* again, *-ject* to throw, *ion* process]

human chorionic gonadotropin (HCG or hCG) (HYOO-man KOH-ri-on-ik go-nad-oh-TROH-pin) hormone secreted early in pregnancy by the placenta that serves to maintain the uterine lining [*human-* of or belonging to a man, *chorion-* skin, *-ic* relating to, *gon-* offspring, *-ad-* relating to, *-trop-* nourish, *-in* substance]

human engineered chromosome (HEC) (KROH-meh-sohm) gene augmentation procedure that inserts therapeutic genes into a separate strand of DNA that is inserted into nucleus of cell [*human-* of or belonging to a man, *chrom-* color, *-som-* body]

Human Genome Project (HGP) (JEE-nome) a worldwide collaborative effort of scientists and others to map out the entire human genome and study the biological, medical, and ethical aspects of their discoveries; the HGP is largely funded by U.S. government sources such as the

DOE (Department of Energy) and the NIH (National Institutes of Health); *see* **genome, genomics** (*human-* of or belonging to a man, *gen-* to produce, *-ome* from chromosome]

human immunodeficiency virus (HIV) (im-yoo-no-deh-FISH-en-see) a retrovirus that contains RNA that produces its own DNA inside infected cells; results in acquired immune deficiency syndrome (AIDS) [*human-* of or belonging to man, *immuno-* free (immunity), *virus* poison]

human leukocyte antigen (HLA) (LOO-koh-syte AN-ti-jen) protein involved in transplant rejection [*human-* of or belonging to man, *leuko-* white, *-cyte* cell, *anti-*against, *-gen* produce]

human placental lactogen (hPL) (plah-SEN-tal lak-TOH-jen) hormone released by the placenta; promotes development of mammary glands during pregnancy and regulates energy balance in fetus [*human-* of or belonging to man, *placenta* flat cake, *-al* relating to, *lacto-* milk, *-gen* produce]

humerus (HYOO-mer-us) arm bone [*humer-us* arm] *pl.*, humeri

humoral immunity (HYOO-mor-al i-MYOO-ni-tee) antibody-mediated immunity occurring within blood plasma and other body fluids [*humor-* liquid, *-al* relating to, *immun-*free, *-ity* state]

huntingtin (HUN-ting-tin) a protein normally present in all cells; an abnormal version of huntingtin is produced in people with Huntington disease (HD), clinging to molecules too tightly in the brain and thus preventing normal function [*George S. Huntington* American physician]

Huntington disease (HD) (HUN-ting-ton) an inherited disease characterized by chorea (involuntary, purposeless movements) that progresses to severe dementia and death; *see* **huntingtin** [*George S. Huntington* American physician, *dis-* opposite of, *-ease* comfort]

hyaline cartilage (HYE-ah-lin KAR-ti-lij) most common type of cartilage; appears gelatinous and glossy [*hyaline* glass, *cartilag* cartilage]

hyaline membrane disease (HMD) (HYE-ah-lin) condition that results from a deficiency of surfactant in premature infants [*hyal-* glass, *-ine* of or like, *membrane-* thin skin, *dis-* opposite of, *-ease* comfort]

hyaluronic acid (hye-al-yoo-RAHN-ik ASS-id) type of proteoglycan that helps thicken and hold together the matrix of connective tissue; *see* **proteoglycan** [*hyal-* glass, *uron-*urine, *-ic* relating to, *acid-* sour]

hybridoma (hye-brid-OH-mah) hybrid cell formed by fusion of cancerous cell with a lymphocyte to mass produce a specific antibody (monoclonal antibodies) [*hybrid-*mixed offspring, *-oma* tumor]

hydrase (HYE-drays) enzyme that adds water to a molecule without splitting it [*ase-*enzyme]

hydrocele (HYE-dro-seel) accumulation of fluid that causes scrotal swelling [*hydro-*water, *-cele* tumor]

hydrocephalus (hye-droh-SEF-ah-lus) condition that results from an accumulation of cerebrospinal fluid in the subarachnoid space around the brain [*hydro-* water, *-cephalus* head]

hydrocortisone (hye-droh-KOHR-ti-zohn) hormone secreted by the adrenal cortex; cortisol; compound [*hydro-* water, *-cortisone* cortex of adrenal gland]

hydrogen bond (HYE-droh-jen) weak chemical bond that occurs between the partial positive charge on a hydrogen atom covalently bound to a nitrogen or oxygen atom and the partial negative charge of another polar molecule [*hyro-* water, *-gen* produce]

hydrogen ion (HYE-droh-jen EYE-on) a proton or a hydrogen atom without its electron; occurs in water and water solutions; produces an acidic solution; has a positive charge (H^+) [*hyro-* water, *-gen* produce, *ion-*to go]

hydrolase (HYE-droh-lays) hydrolyzing enzyme [*hydro-* water, *-ase* enzyme]

hydrolysis (hye-DROHL-i-sis) chemical process in which a compound is split by addition of H^+ and OH^- portions of a water molecule [*hydro-* water, *-lysis* loosening]

hydronephrosis (hye-droh-neh-FROH-sis) condition resulting when urine backs up into the kidney, causing a swelling of the renal pelvis and calyces [*hydro-* water, *-nephr-* kidney, *-osis* condition]

hydrophilic (hye-dro-FIL-ik) "water-loving" [*hydro-* water, *-phil-* love, *-ic* relating to]

hydrophobic (hye-droh-FOH-bik) "water-fearing" [*hydro-* water, *-phob-* fear, *-ic* relating to]

hydrosalpinx (hye-droh-SAL-pinks) condition that results from obstruction of the uterine tube and marked dilation at the end of the tube caused by accumulation of fluid that cannot escape [*hydro-* water, *-salpinx* tube] *pl.*, hydrosalpinges

hydrostatic pressure (hye-droh-STAT-ik) force of a fluid pushing against some surface [*hydro-* water, *-static* relating to standing still, *pressure-* act of pressing]

hydrostatic pressure gradient (hye-droh-STAT-ik PRESH-ur GRAY-dee-ent) situation in which a difference in pressure is caused by the force of a fluid as it moves from one point to another [*hydro-* water, *-static* relating to standing still, *pressure-* act of pressing, *grade-* step]

hymen (HYE-men) Greek for "membrane"; mucous membrane that may partially or entirely occlude the vaginal outlet [*hymen* Greek god of marriage]

hyoid bone (HYE-oyd bohn) U-shaped bone of the neck between the mandible and the larynx [*hy-* Greek letter upsilon (Υ or υ), *-oid* like]

hypercapnia (hye-per-KAP-nee-ah) excessive carbon dioxide in the blood [*hyper-* above, *-capn-* vapor (CO_2), *-ia* condition]

hypercholesterolemia (hye-per-koh-les-ter-ohl-EE-mee-ah) elevated blood cholesterol that my lead to atherosclerosis and other cardiovascular problems [*hyper-* excessive, *-chole-* bile, *-stero-* solid, *-ol-* alcohol, *-emia* blood condition]

hyperchromic (hye-per-KROH-mik) abnormally high hemoglobin content [*hyper-* excessive, *-chrom-* color, *-ic* relating to]

hyperextension (hye-per-ek-STEN-shun) stretching an extended part beyond its anatomical position; may clinically refer to abnormal extension beyond normal range of motion [*hyper-* excessive, *-ex-* out, *-ten-*stretch, *-sion* process]

hyperglycemia (hye-per-glye-SEE-mee-ah) higher than normal blood glucose concentration [*hyper-* excessive, *-glyc-* sweet (glucose), *-emia* blood condition]

hyperkalemia (hye-per-kah-LEE-mee-ah) excessive potassium in the blood [*hyper* excessive, *-kal-* potassium, *-emia* blood condition]

hyperkeratosis (hye-per-ker-ah-TOH-sis) thickening of the horny layer of the skin [*hyper* excessive, *-kera-* horn, *-osis* condition]

hypernatremia (hye-per-nah-TREE-mee-ah) excessive sodium in the blood [*hyper-* excessive, *-natri-* sodium, *-emia* blood condition]

hyperopia (hye-per-OH-pee-ah) refractive disorder of the eye caused by a shorter-than-normal eyeball; results in ability to see objects at a distance better than objects nearer; also called *farsightedness* [*hyper-* excessive or above, *-op-* vision, *-ia* condition]

hyperpituitarism (hye-per-pih-TYOO-i-tar-iz-em) disorder that results from benign tumors in the pituitary gland [*hyper-* excessive, *-pituitar-* phlegm (pituitary gland), *-ism* condition]

hyperplasia (hye-per-PLAY-zee-ah) growth of an abnormally large number of cells at a local site, as in a neoplasm or tumor [*hyper-* excessive, *-plasia* shape]

hyperpnea (hye-PERP-nee-ah) abnormal increase in respiratory rate and depth [*hyper-* excessive, *-pne-* breathe, *-a* condition]

hyperpolarization (hye-per-pol-lar-i-ZAY-shun) increase in electrical charges separated by the cell membrane; causes change further below 0 mV [*hyper-* excessive, *-pol-*pole, *-ar-* relating to, *-ization* process]

hypersecretion (hye-per-seh-KREE-shun) too much secretion of a substance [*hyper-*excessive, *-secret-* separate, *-tion* process]

hypersensitivity (hye-per-SEN-sih-tiv-i-tee) type of inappropriate or excessive response of the immune system [*hyper-* excessive, *sensitiv-* able to feel, *-ity* state]

hypertension (HTN) (hye-per-TEN-shun) abnormally high blood pressure [*hyper-* excessive, *-tens-* stretch or pull tight, *-sion* state]

hyperthyroidism (hye-per-THYE-royd-iz-em) hypersecretion of thyroid hormone [*hyper-*excessive, *-thyr-* shield (thyroid gland), *-oid* like, *-ism* condition]

hypertonic (hye-per-TON-ik) adjective used to describe a solution that has a higher potential osmotic pressure than a solution to which it is being compared; a hypertonic solution tends to have high osmolality and thus tends to gain water (by way of osmosis) from the solution to which it is compared; solution containing a higher level of salt (NaCl) than is found in a living red blood cell (above 0.9% NaCl); causes cells to shrink [*hyper-* excessive, *-ton-* tension, *-ic* relating to]

hypertrophic cardiomyopathy (hye-PER-troh-fik KAR-dee-oh-my-OP-ah-thee) genetic condition that causes an abnormal enlargement of the heart [*hyper-* excessive, *-troph-* nourishment, *-ic* relating to, *cardi-*heart, *-myo-* muscle, *-path-* disease, *-y* state]

hypertrophy (hye-PER-tro-fee) increased size of an organ or part caused by an increase in the size of its cells [*hyper-* excessive, *-troph-*nourishment, *-y* state]

hyperventilation (hye-per-ven-ti-LAY-shun) very rapid, deep respirations [*hyper-* excessive, *-vent-* fan or create wind, *-tion* process]

hypervitaminosis (hye-per-vye-tah-mih-NO-sis) general name for any condition resulting from an abnormally high intake of vitamins [*hyper-* excessive, *-vita-* life, *-amin-*ammonia compound, *-osis* condition]

hypervolemia (hye-per-voh-LEE-mee-ah) abnormally increased blood volume [*hyper-*excessive, *-vol-* volume, *-emia* blood condition]

hypoallergenic (hye-poh-AL-er-jen-ik) refers to having a lower potential for producing allergic reactions [*hypo-* under or below, *-aller-* other, *-gen-* produce, *-ic* relating to]

hypocalcemia (hye-poh-kal-SEE-mee-ah) abnormally low calcium levels in the blood [*hypo-* under or below, *-calc-* lime (calcium), *-emia* blood condition]

hypochloremia (hye-poh-kloh-REE-mee-ah) abnormally low levels of chloride in the blood associated with potassium loss [*hypo-*under or below, *-chlor-* green (chlorine), *-emia* blood condition]

hypodermis (hye-poh-DER-mis) loose layer fascia under the skin, rich in fat and areolar tissue located beneath the dermis; also called *subcutaneous layer* or *superficial fascia* [*hypo-* under or below, *-dermis* skin]

hypoglossal (hye-poh-GLOS-al) under the tongue [*hypo-* under or below, *-gloss-*tongue, *-al* relating to]

hypoglossal nerve (hye-poh-GLOS-al) cranial nerve XII; motor nerve; responsible for tongue movement [*hypo-* under or below, *-gloss-*tongue, *-al* relating to]

hypoglycemia (hye-poh-gly-SEE-mee-ah) lower than normal blood glucose concentration [*hypo-* under or below, *-glyc-* sweet (glucose), *-emia* blood condition]

hypokalemia (hye-poh-kah-LEE-mee-ah) abnormally low serum potassium level [*hypo-*under or below, *-kal-* potassium, *-emia* blood condition]

hyponatremia (hye-poh-nah-TREE-mee-ah) abnormally low sodium levels in the blood [*hypo-* under or below, *-natri-* sodium, *-emia* blood condition]

hypophyseal portal system (hye-poh-FIZ-ee-al POR-tal) complex of small blood vessels through which releasing hormones travel from the hypothalamus to the pituitary [*hypo-* under or below, *-physis-* growth, *-al* relating to, *portal* doorway]

hypophysectomy (hye-poff-i-SEK-toh-mee) surgical removal of the pituitary gland [*hypo-* under or below, *-phys-* growth, *-ec-*out, *-tom-* cut, *-y* action]

hypophysis (hye-POF-i-sis) pituitary gland; also called *hypophysis cerebri* [*hypo-* under or below, *-physis-* growth]

hypopotassemia (hye-poh-poh-tah-SEE-mee-ah) potassium deficit [*hypo-* under or below, *-potass* potassium, *-emia* blood]

hyposecretion (hye-poh-seh-KREE-shun) too little secretion of a substance [*hypo-* under or below, *-secret-* separate, *-tion* process]

hypospadias (hye-poh-SPAY-dee-us) congenital condition that is characterized by the opening of the urethral meatus on the underside or ventral surface of the glans or penile shaft [*hypo-* under or below, *-spad-*rip or split]

hypothalamic-pituitary-adrenal axis (HPA) (hye-poh-THAL-ah-mik pi-TOO-i-tair-ee ah-DREE-nal) process that activates a stress mechanism that stimulates the sympathetic nervous system and pituitary gland [axis axle]

hypothalamus (hye-poh-THAL-ah-muss) important autonomic and neuroendocrine control center located inferior to the thalamus in the brain [*hypo-* under or below, *-thalamus* inner chamber] *pl.*, hypothalami

hypothermia (hye-poh-THER-mee-ah) failure of thermoregulatory mechanisms to maintain homeostasis in a very cold external environment; results in abnormally—sometimes life-threatening—low body temperature [*hypo-* under or below, *-therm-*heat, *-ia* abnormal condition]

hypothesis (hye-POTH-eh-sis) idea or scientific concept, usually based on previous ideas or observations, that is proposed as a possible explanation of nature or a natural process; hypotheses undergo intense testing before being accepted widely in the scientific community; *see* law, science, theory [*hypo-* under or below, *-thesis* placing or proposition] *pl.*, hypotheses (hye-POTH-eh-seez)

hypotonic (hye-poh-TON-ik) adjective used to describe a solution that has a lower potential osmotic pressure than a solution to which it is being compared; a hypotonic solution tends to have low osmolality and thus tends to lose water (by way of osmosis) to the solution to which it is compared [*hypo-* under or below, *-ton-* tension, *-ic* relating to]

hypoventilation (hye-poh-ven-ti-LAY-shun) slow and shallow respirations [*hypo-* under or below, *-vent-* fan or create wind, *-tion* process]

hypovolemia (hye-poh-voh-LEE-mee-ah) inadequate fluid volume in the extracellular compartment; dehydration [*hypo-* under or below, *-vol-* volume, *-emia* blood condition]

hypovolemic shock (hye-poh-voh-LEE-mik) condition when dehydration results in multiple organ failure [*hypo-* under or below, *-vol-* whirl, *-emi(a)-* blood condition, *-ic* relating to]

hypoxia (hye-POK-see-ah) deficiency of oxygen in the blood [*hypo-* under or below, *-ox-* oxygen, *-ia* condition]

hysterosalpingogram (his-ter-oh-sal-PING-go-gram) x-ray technique used to produce images of the uterus and uterine tube [*hyster-* uterus, *-salping-* tube, *-gram* drawing]

I

ideal gas gas whose molecules are so far apart that the molecules rarely collide with one another [*idea-* form, *gas-* empty space]

identical twin one of two siblings born as a result of the splitting of embryonic tissue from the same zygote early in development [*identic-* the same, *-al* relating to, *twin-* twofold]

ideogram (ID-ee-oh-gram) a graphic representation of any idea; in genomics, a simple cartoon of a chromosome often used to show the overall physical structure of a chromosome; *see* chromosome, genomics [*ide-* idea, *-gram* drawing]

idiopathic (id-ee-o-PATH-ik) refers to a disease of undetermined cause [*idio-* peculiar, *-path-* disease, *-ic* relating to]

ileum (IL-ee-um) distal portion of the small intestine [*ileum* groin or flank] *pl.,* ilea

iliac lymph node (ILL-ee-ak limf nohd) pelvic and groin lymph node [*ilia-* loin or gut (ileum), *-ac* relating to, *lymph* water, *nod-* knot]

ilium (IL-ee-um) largest and uppermost coxal bone [*ilium* flank] *pl.,* ilia (IL-ee-ah)

immune deficiency (i-MYOON deh-FISH-en-see) failure of immune system mechanisms to defend against pathogens; also called *immunodeficiency* [*immun-* free (immunity)]

immune system (i-MYOON) body's defense system against disease [*immun-* free (immunity)]

immunization (i-myoo-ni-ZAY-shun) deliberate artificial exposure to disease for the purpose of producing acquired immunity [*immun-* free (immunity), *-tion* process of]

immunoglobulin (Ig) (i-myoo-noh-GLOB-yoo-lin) antibody [*immuno-* free (immunity), *-glob-* ball, *-ul-* small, *-in* substance]

immunological synapse (IS) (i-myoo-no-LOJ-ik-al SIN-aps) temporary junction between an immune cell and another cell, such as another immune cell or a target cell to be destroyed; compare to *synapse* [*immuno-* free (immunity), *-log-* words (study of), *-ical* relating to, *syn-* together, *-aps-* join]

immunology (i-myoo-NOL-oh-jee) study of immune system functions and mechanisms [*immuno-* free (immunity), *-logy* study of]

immunosuppressive drugs (i-myoo-no-soo-PRES-iv) drugs that suppress the immune system's ability to attack the foreign antigens in the donated tissue [*immuno-* free (immunity), *-suppress-* press down, *-ive* relating to]

immunotherapy (im-yoo-no-THAYR-ah-pee) therapeutic technique that bolsters a person's immune system in an attempt to control a disease [*immuno-* free, *-therapy* treatment]

impacted fracture type of bone fracture in which one end of the fracture is driven into the diaphysis of the other fragment [*impact-***to push into,** *fracture* **a breaking**]

imperforate hymen (im-PER-fah-rayt HYE-men) condition in which the hymen completely covers the vaginal outlet [*im-* not, *-perfor-* pierce, *-ate* state, *hymen* Greek god of marriage]

impermeable (im-PERM-ee-ah-bul) adjective used to describe a membrane that does not allow substances to move through (permeate) it [*im-* not, *-permeable* pass through]

impermeant (im-PERM-ee-ent) adjective used to describe a substance that is not able to move through (permeate) a membrane [*im-* not, *-permeable* pass through]

impetigo (im-peh-TYE-go) highly contagious bacterial skin infection that occurs most often in children [*impetigo* an attack]

implantation (im-plan-TAY-shun) process in which developing offspring tissue connects to the uterine wall of the mother [*im-* in, *-planta-* set or place, *-ation* process]

impotence (IM-poh-tense) *see* erectile dysfunction (ED) [*im-* not, *-poten-* power, *-ence* state]

impulse (IM-puls) an electrical signal; *see* action potential [*impulse-* to drive]

in vitro fertilization (IVF) (in VEE-troh FER-ti-li-ZAY-shun) artificial union of sperm and egg "in glass" in a laboratory dish [*in* in, *vitro* glass, *fertil-* fruitful, *-ation* process]

inborn errors of metabolism (IN-born AIR-ors meh-TAB-oh-liz-em) group of genetic conditions involving a deficiency or absence of a particular enzyme [*metabol-* change, *-ism* action]

inborn immunity (IN-born i-MYOO-ni-tee) inherited immunity to disease [*in-* within, *-born* brought forth, *immuno-* free (immunity)]

inclusion an unidentified particle within a cell or other structure [*in-* within, *-clus* to shut, *-ion* process]

incomplete fracture type of bone fracture in which some fracture components are still partially joined [*fracture* a breaking]

incomplete tetanus (TET-ah-nus) tetanus with very short periods of relaxation occurring between peaks of muscle tension [*tetanus-* extreme tension]

incontinence (in-KON-ti-nens) involuntary voiding of urine [*incontinentia-* inability to retain]

incretin (IN-kre-tin) any GI hormone that triggers the release of insulin from the pancreatic islets; examples, glucagon-like peptide 1 (GLP-1) and gastric inhibitory peptide [glucose-dependent insulinotropic peptide] (GIP) [*in-* in, *-cret-* secrete, *-in* substance]

incubation (in-kyoo-BAY-shun) early, latent stage of an infection, during which an infection has begun but signs or symptoms have not yet developed in the host [*in-* in or on, *-cubat-* lie, *-tion* condition of]

indirect calorimetry (kal-oh-RIM-eh-tree) method used to determine body mass index (BMR) [*in-* not, direct, *calor-* heat, *-metr-* measuring, *-y* process]

infancy period of human development from birth to about 18 months of age [*infan-* unable to speak, *-y* state]

infant respiratory distress syndrome (IRDS) (RES-per-ah-toh-ree di-STRESS SIN-drohm) leading cause of death in premature babies, caused by a lack of surfactant in the alveolar air sacs, inferior lower portion; opposite of superior [*infan-* unable to speak, *re-* again, *-spir-* breathe, *-tory* relating to, *distress-* restraint, *syn-* together, *-drome* course]

infectious mononucleosis (in-FEK-shuss mah-noh-noo-klee-OH-sis) a viral (noncancerous) white blood cell (WBC) disorder common in young adults; characterized by leukocytosis of atypical lymphocytes and severe fatigue [*infect-* stain, *-ous* relating to, *mono-* single, *-nucle-* nut, *-osis* condition]

inferior lower; opposite of superior [*infer-* lower, *-or* quality]

inferior cerebellar peduncle (SAIR-eh-bell-ar peh-DUNG-kul) tract that enters the cerebellum from the medulla and cord [*infer-* lower, *-or* quality, *cerebellar* relating to the cerebellum (small brain), *ped-* foot, *-uncl-* little]

inferior colliculi (koh-LIK-yoo-lee) form the posterior, upper part of the midbrain [*infer-* lower, *-or* quality, *colli-* hill, *-iculus* small] *sing.,* colliculus

inferior nasal concha (KONG-ke) *see* concha [*infer-* lower, *-or* quality, *nas-* nose, *-al* relating to, *concha* sea shell] *pl.,* conchae (KONG-kee or KONG-kay)

inferior vena cava (VEE-nah KAY-vah) vein of the thorax; drains blood from the lower trunk and extremity [*infer-* lower, *-or* quality, *vena* vein, *cava* hollow] *pl.,* venae cavae

infertility (in-fer-TIL-i-tee) failure to conceive after 1 year of regular unprotected intercourse [*in-* not, *-fertil-* fruitful, *-ity* state]

inflammation (in-flah-MAY-shun) group of responses to a tissue irritant marked by signs of redness, heat, swelling, and pain [*inflam-* set afire, *-tion* process]

inflammatory exudate (in-FLAM-ah-toh-ree EK-soo-dayt) substance that accumulates in the interstitial spaces as a result of increased permeability of blood vessels, increased blood flow, and migration and accumulation of white blood cells [*inflam-* set afire, *-ory* relating to, *exudate* to sweat out]

inflammatory joint disease (in-FLAM-ah-toh-ree) joint condition that involves inflammation of the synovial fluid [*inflam-* set afire, *-ory* relating to, *dis-* opposite of, *-ease* comfort]

inflammatory response (in-FLAM-ah-toh-ree) specific process involving tissues and blood vessels in response to injury [*inflam-* set afire, *-ory* relating to]

infraspinatus muscle (IN-frah-spy-nah-tus) one of the four rotator cuff muscles around the shoulder joint [*infra-* below, *-spina-* spine, *mus-* mouse, *-cle* little]

infundibulum (in-fun-DIB-yoo-lum) stalk that connects the pituitary gland to the hypothalamus [*infundibulum* funnel] *pl.,* infundibula

ingestion (in-JES-chun) taking in of complex foods, usually by mouth [*in-* within, *-gest-* carry, *-tion* process]

inguinal hernia (ING-gwi-nal HER-nee-ah) rupture of the lower abdominal wall at the inguinal canal [*inguin-* groin, *-al* relating to, *hernia* rupture] *pl.,* herniae or hernias

inguinal lymph node (ING-gwi-nal limf nohd) pelvic and groin lymph node [*inguin-* groin, *-al* relating to, *lymph* water, *-atic* relating to, *nod-* knot]

inherited immunity (in-HAIR-i-ted i-MYOO-ni-tee) inborn immunity; occurs when immune mechanisms are put in place by genetic mechanisms during the early stages of human development [*in-* within, *-herit* to make an heir, *immun-* free (immunity)]

inhibin (in-HIB-in) glycoprotein hormone produced by the ovary to regulate FSH secretion by the anterior pituitary (adenohypophysis) [*inhib-* inhibit, *-in* substance]

inhibitory (in-HIB-i-tor-ee) something that slows or stops a process [*inhib-* to restrain, *-ory* relating to]

inhibitory neurotransmitter (in-HIB-i-tor-ee noo-roh-TRANS-mit-er) neurotransmitter that causes hyperpolarization of the postsynaptic membrane, thereby decreasing chances of impulse propagation [*inhib-* restrain, *-ory* relating to, *neuro-* nerve, *-trans-* across, *-mitt-* send, *-er* agent]

inhibitory postsynaptic potential (IPSP) (in-HIB-i-tor-ee post-si-NAP-tik poh-TEN-shal) temporary hyperpolarization that makes the inside of the membrane even more negative than at the resting potential [*inhib-* restrain, *-ory* relating to, *post-* after, *-syn-* together, *-apt-* join, *-ic* relating to, *potent-* power, *-ial* relating to]

innate immunity (IN-ayt i-MYOO-ni-tee) type of immunity that exists prior to exposure to a specific antigen and that can recognize and destroy a variety of harmful agents or conditions; also called *nonspecific immunity* [*innat-* inborn, *immun-* free, *-ity* state]

inner cell mass layer of cells in the blastocyst [*inner-* within, *cell-* storeroom]

inner ear region of the ear consisting of a bony labyrinth and a membranous labyrinth; also called *labyrinth* [*inner-* within]

inorganic compounds (in-or-GAN-ik) chemical constituents that do not contain both carbon and hydrogen; for example, water, carbon dioxide, and oxygen [*in-* not, *-organic* natural, *compound-* to assemble]

inspiratory capacity (IC) (in-SPY-rah-tor-ee kah-PAS-i-tee) maximal amount of air an individual can inspire following a normal expiration [*in-* in, *-spir* to breathe, *-tory* relating to, *capac-* able to hold much, *-ity* state]

insertion (muscle insertion) attachment of a muscle to the bone that it moves when contraction occurs (as distinguished from its origin); (insertion mutation) a type of genetic mutation that occurs when one or more nucleotide bases appear within the usual sequence of nucleotide bases in a gene; in insertion mutations, the cell cannot read the genetic code normally and thus the encoded protein cannot be made in its usual form; *see* deletion [*in-* in, *-ser-* join, *-tion* process]

inspiration (in-spih-RAY-shun) process of bringing air into the lungs [*in-* in, *-spir-* breathe, *-ation* process]

inspiratory capacity (IC) (in-SPY-rah-tor-ee) maximum amount of air an individual can inspire after a normal expiration [*in-* in, *-spir-* breathe, *-tory* relating to]

inspiratory center (in-SPY-rah-tor-ee) one of the two most important control centers located in the medulla; the other is the expiratory center [*in-* in, *-spir-* breathe, *-tory* relating to]

inspiratory reserve volume (IRV) (in-SPY-rah-tor-ee) amount of air that can be forcibly inspired over and above a normal inspiration [*in-* in, *-spir-* breathe, *-tory* relating to, *volume-* paper roll]

insula (IN-soo-lah) lobe of the cerebral cortex; lies hidden from view in the lateral fissure [*insula* island] *pl.,* insulae

insulin (IN-suh-lin) hormone secreted by beta cells of the pancreatic islets that increases the uptake of glucose and amino acids by most body cells [*insul-* island, *-in* substance]

integral membrane protein (IMP) (IN-tegrel MEM-brayn PROH-teen) any of the numerous kinds of proteins embedded within cellular membranes [*integr-* whole, *-al* relating to, *membran-* thin skin, *prote-* primary, *-in* substance]

integrin (in-TEG-rin) type of protein that acts as a connector to bind structural proteins in a way that connects a cell's cytoskeleton to surrounding structures such as other cells [*integr-* whole, *-in* substance]

integument (in-TEG-yoo-ment) skin; the body's largest organ [*in-* on, *-teg-* cover, *-ment* result of action]

integumentary system (in-teg-yoo-MEN-tar-ee) skin and its related structures [*in-* on, *-teg-* cover, *-ment* result of action, *-ary* relating to]

interatrial bundle (in-ter-AT-tree-al) conducting fibers that facilitate rapid conduction to the left atrium [*inter-* between, *-atri-* entrance courtyard, *-al* relating to]

intercalated disk (in-TER-kah-lay-ted) any of the disk-like connections between ends of adjacent cardiac muscle fibers characterized by gap junctions and often appearing as tiny, darkly stained lines in micrographs [*intercalate-* to insert]

intercarpal joint (in-ter-KAR-pal) articulation between the eight carpal bones [*inter-* between, *-carp-* wrist, *-al* relating to]

interferon (IFN) (in-ter-FEER-on) small protein produced by the immune system that inhibits virus multiplication [*inter-* between, *-fer-* strike, *-on* substance]

interleukin (IL) (in-ter-LOO-kin) any of a class of about a dozen cytokines, regulatory chemicals secreted by leukocytes and other

cells, that are involved in regulating a wide variety of immune functions in different cell types; each interleukin is named by the IL acronym with its number, such as IL-1, IL-2, and so on [*inter-* between, *-leuko-*white (blood cell), *-in* substance]

intermediate fiber (in-ter-MEE-dee-it) muscle fiber exhibiting characteristics between fast and slow fibers [*inter-* between, *-medi-* middle, *-ate* of or like]

intermediate filament (in-ter-MEE-dee-it FIL-ah-ment) twisted strands of protein, slightly larger than microfilaments that make up part of the cell's internal skeleton (the cytoskeleton) [*inter-* between, *-mediate* to divide, *fila-* threadlike *-ment* process]

intermittent claudication (in-ter-MIT-tent klaw-dih-KAY-shen) condition that causes cramplike pain in the calves after walking and is caused by intermittent arterial occlusion by platelet plugs [*inter-* between, *-mitt-* send, *claudica-* limping, *-ation* process]

internal capsule large mass of white matter associated with the basal nuclei [*intern-* inside, *-al* relating to, *caps-* box, *-ul-* little]

internal intercostal muscle (in-ter-KOS-tal) muscle attached to ribs; contraction depresses ribs [*intern-* inside, *-al* relating to, *inter-* between, *-costal-* rib, *-al* relating to, *mus-* mouse, *-cle* little]

internal jugular vein (JUG-yoo-lar) deep vein of the neck [*intern-* inside, *-al* relating to, *jugul-* neck, *-ar* relating to]

internal oblique muscle (oh-BLEEK) abdominal muscle [*intern-* inside, *-al* relating to, *obliq-* slanted, *mus-* mouse, *-cle* little]

internal os cavity of the uterus that opens into the cervical canal [*intern-* inside, *-al* relating to, *os* mouth or opening] *pl.*, ora

internal table inner wall of a flat bone of the cranium, made of compact bone; compare to *external table* [*intern-* inside, *-al* relating to]

interneuron (in-ter-NOO-ron) in a three-neuron reflex arc, nerve cell that conducts impulses from a sensory neuron to a motor neuron [*inter-* between, *-neuron* nerve]

internodal bundle (in-ter-NOH-dal) conducting fibers that allow for complete contraction of both atrial chambers before the impulse reaches the ventricles [*inter-*between, *-nod-* knot, *-al* relating to]

interoceptor (in-ter-oh-SEP-tor) *see* visceroceptor [*inter-* inward, *-cept-* receive, *-or* agent]

interosseous muscle (in-ter-OSS-ee-us) muscle of the hand [*inter-* between, *-os-* bone, *-ous* relating to, *mus-* mouse, *-cle* little]

interphalangeal joint (in-ter-fah-LAN-jee-al) articulation that exists between the heads of the phalanges and the bases of the more distal phalanges [*inter-* between, *-phalang-* finger bones (ref. from rows of soldiers), *-al* relating to]

interphase (IN-ter-fayz) mitotic phase immediately before visible condensation of the chromosomes during which the DNA of each chromosome replicates itself [*inter-* between, *-phase* stage]

interspinales group (in-ter-spy-NAH-leez) group of back muscles that connect one vertebra to the next—also helping to extend the back and neck or flex them to the side [*inter-* between, *-spina-* spine, *-al* relating to]

interstitial (in-ter-STISH-al) in an in-between location, as between tissue cells [*inter-* between, *-stit-* stand, *-al* relating to]

interstitial cell (in-ter-STISH-al) any of the small cells in the testes found between seminiferous tubules and that secrete the male sex hormone, testosterone; also called *Leydig cell* [*inter-* between, *-stit-* stand, *-al* relating to, *cell* storeroom]

interstitial cystitis (in-ter-STISH-al sis-TYE-tis) form of bladder inflammation that occurs without evidence of bacterial infection [*inter-*between, *-stit-* stand, *-al* relating to, *cyst-* bag, *-itis* inflammation]

interstitial fluid (IF) (in-ter-STISH-al) fluid located in microscopic spaces between cells [*inter-* between, *-stit-* stand, *-al* relating to]

interstitial fluid colloid osmotic pressure (IFCOP) (in-ter-STISH-al KOL-oyd os-MAH-tik) one of four types of pressure that serve as a control mechanism for water exchange between plasma and interstitial fluid; draws fluid back out of the capillaries [*inter-* between, *-stit-* stand, *-al* relating to, *coll-* glue, *-oid* like, *osmo-* push, *-ic* relating to]

interstitial fluid hydrostatic pressure (IFHP) (in-ter-STISH-al hye-droh-STAT-ik) one of four types of pressure that serve as a control mechanism for water exchange between plasma and interstitial fluid; tends to force fluid out of the interstitial fluid into the capillaries [*inter-* between, *-stit-* stand, *-al* relating to, *hydro-* water, *-stat-* stand, -ic relating to]

interstitial growth (in-ter-STISH-al) cartilage growth following mitosis and secretion of matrix by chondrocytes; interstitial growth of epiphyseal plate results in growth in length of long bones; also called *endogenous growth* [*inter-* between, *-stit-* stand, *-al* relating to]

intestinal flora (in-TES-ti-nal FLOR-ah) community of various bacterial populations that normally inhabit the colon [*intestin-* intestine, *-al* relating to, *flora-* flowers]

intestinal juice (in-TES-ti-nal) refers to the sum total of intestinal secretions [*intestin-*intestine, *-al* relating to]

intestinal phase (in-TES-ti-nal) stage of gastric secretion triggered when material leaves the stomach and enters the small intestine [*intestin-* intestine, *-al* relating to, *phase* appearance]

intestine (in-TES-tin) part of the digestive tract into which food passes after it leaves the stomach; separated into two segments, the small and the large [*intestin-* intestine]

intracellular (in-trah-SELL-yoo-lar) relating to the interior of the cell [*intra-* occurring within, *-cell-* storeroom, *-ular* relating to]

intracellular control (in-tra-SELL-yoo-lar) level of homeostatic control of body processes that occurs within cells, as in genetic regulation or enzymatic regulation of the cell [*intra-* inside or within, *-cell* storeroom]

intracellular fluid (ICF) (in-trah-SELL-yoo-lar) water inside the cell [*intra-* occurring within, *-cell-* storeroom, *-ular* relating to]

intracellular fluid (ICF) compartment (in-trah-SELL-yoo-lar) fluid located within cells; largest fluid compartment [*intra-* occurring within, *-cell-* storeroom, *-ular* relating to, *com-* together, *-partiri* to share]

intramembranous ossification (in-trah-MEM-brah-nus os-i-fi-KAY-shun) process by which most flat bones are formed within connective tissue membranes [*intra-* within, *-membran-* thin skin, *-ous* characterized by, *os-* bone, *-fication* to make]

intramural plexus (in-trah-MYOO-ral PLEK-sus) complex arrangement of neurons in the gastrointestinal tract [*intra-* within, *-mura-*wall, *-al* relating to, *plexus* network] *pl.*, plexi or plexuses

intramuscular injection (in-trah-MUSS-kyoo-lar in-JEK-shun) administration of medication into the muscle [*intra-* within, *mus-* mouse, *-cle* little, *-ar* relating to]

intratracheal injection (in-trah-TRAY-kee-al in-JEK-shun) administration of surfactant through a tube directly into the airways [*intra-* within, *-trache-* rough duct, *-al* relating to]

Intrauterine device (IUD) (in-trah-YOO-ter-in) contraceptive device that works by inducing an immune response toxic to gametes; some IUDs also release progesterone and thus have an action similar to other hormonal contraceptives [*intra-* inside or within, *-uter-* womb, *-ine* relating to]

intravenous injection (in-trah-VEE-nus in-JEK-shun) administration of medication into veins [*intra-* within, *-ven-* vein, *-ous* relating to, *in-* in, *-ject* throw, *-tion* process]

intrinsic clotting pathway (in-TRIN-sik) series of reactions that begin with factors normally present in the blood [*intr-* within, *-sic* beside]

intrinsic control (in-TRIN-sik) level of homeostatic control of body processes that occurs within a particular tissue or organ, as when local regulators such as prostaglandins regulate local physiology; may be called *local control* or *autoregulation* [*intr-* inside or within, *-insic* beside]

intrinsic eye muscle (in-TRIN-sik) involuntary muscle located within the eye; responsible for size of the iris and shape of the lens [*intr-* within, *-sic* beside, *mus-* mouse, *-cle* small]

intrinsic factor (in-TRIN-sik) binds to molecules of B_{12}, protecting them from the acids and enzymes of the stomach; secreted by parietal cells [*intr-* inside or within, *-insic* beside]

intrinsic foot muscle (in-TRIN-sik) muscle located within the foot [*intrins-* inward, *-ic* relating to, *mus-* mouse, *-cle* little]

intrinsic muscle (in-TRIN-sik) muscle that is actually within the part moved [*instrins-* inward, *-ic* relating to, *mus-* mouse, *-cle* little]

intrinsic rhythm (in-TRIN-sik RITH-em) phenomenon of specialized cells in the sinoatrial (SA) node that produce regular impulses without stimulation from the brain or spinal cord [*instrins-* inward, *-ic* relating to, *rhythm-* measure flow or movement]

intron (IN-trahn) segment of a gene in a DNA molecule that is not used to code for a protein; introns are removed from mRNA transcripts of the gene and the remaining exons are spliced together to form the final, edited version of the mRNA transcript; *see* exon, RNA [*intra-* within, *-on* unit]

inversion (in-VER-shun) movement that turns the sole of the foot inward [*in- inward, -ver-* turn, *-sion* process]

involuntary muscle (in-VOL-un-tair-ee) smooth muscle not under conscious control and found in organs such as the stomach, small intestine, and ureters [*in-* not, *volunt-* will, *mus-* mouse, *-cle* little]

involution (in-voh-LOO-shun) return of an organ to its normal size after enlargement; also after retrograde or degenerative change [*in-* in, *-volu-* roll, *-tion* state]

ion (EYE-on) electrically charged atom or group of atoms [*ion* to go]

ion channel (EYE-on) transport proteins in the plasma membrane that move sodium or potassium ions [*ion* to go, *channel-* water pipe]

ionic bond (eye-ON-ik) electrocovalent bond; bond formed by transferring of electrons from one atom to another [*ion* to go, *bond* band]

ionizing radiation (EYE-on-eyz-ing) form of radioactivity, or radiation energy, resulting from alpha or beta particles or gamma rays emitted from radioactive atoms scoring direct hits on other atoms and thus ionizing the atoms by knocking electrons out of their outer energy levels; the effect of ionization may injure, kill, or change living cells; *see* radiation, radiation sickness

ipsilateral (ip-si-LAT-er-al) on the same side [*ion-* to go, *-ize* to make, *radia-* to shine, *-tion* process]

ipsilateral reflex arc (ip-si-LAT-er-al REE-fleks ark) reflex arc whose receptors and effectors are located on the same side of the body [*ipsi-* same, *-later* side, *-al* relating to, *re-* again, *-flex* bend, *arc-* bow]

iris (EYE-ris) colored portion of the eye [*iris* rainbow]

iron deficiency anemia (deh-FISH-en-see ah-NEE-mee-ah) condition in which there are inadequate levels of iron in the diet causing less hemoglobin to be produced [*iron-* holy metal, *an-* without, *-emia* blood condition]

irregular bone bone that has no particular size or shape [*ir-* not, *-regula-* rule, -ar relating to]

irritability ability of a muscle to be stimulated; *see* excitability [*irrita-* tease, *-ble* able or tending to, *-ity* state]

irritable bowel syndrome (SIN-drohm) common chronic noninflammatory condition that is often caused by stress; characterized by diarrhea or constipation with or without pain [*irrita-* tease, *-ble* able or tending to, *bowel* sausage, *syn-* together, *-drome* running or (race) course]

ischemia (is-KEE-mee-ah) decreased blood supply to a tissue resulting in impairment of cell function [*ische-* hold back, *-emia* blood condition]

ischemic (is-KEE-mik) relating to ischemia [*ischem-* hold back, *-ic* relating to]

ischiocavernosus muscle (iss-kee-oh-KAV-er-no-sus) muscle of the pelvic floor; form the urogenital triangle [*ischio-* hip joint, *-cavern-* hollow space, *-osus* relating to, *mus-* mouse, *-cle* little]

ischium (IS-kee-um) lowermost coxal bone [*ischium* hip joint] *pl.*, ischia (IS-kee-ah)

islets of Langerhans (EYE-lets of lahn-GER-hans) pancreatic islets [*isl-* island, *-et* little, *Paul Langerhans* German pathologist]

isoimmunity (eye-soh-i-MYOO-ni-tee) normal but undesirable reaction of the immune system to antigens from a different individual of the same species [*iso-* equal, *-immun-* free, *-ity* state]

isometric contraction (eye-soh-MET-rik) type of muscle contraction in which muscle does not alter the distance between two bones; *see* isotonic contraction

isotonic (eye-soh-TON-ik) two fluids that have the same potential osmotic pressure [*iso-* equal, *-ton-* tension, *-ic* relating to]

isotonic contraction (eye-soh-TON-ik) type of muscle contraction in which the muscle sustains the same tension or pressure and a change in the distance between two bones occurs [*iso-* equal, *ton-* stretch or tension, *-ic* relating to, *con-* together, *-tract-* drag or draw, *-tion* process]

isotope (EYE-so-tohp) atoms with the same atomic number but different atomic masses [*iso-* equal, *-tope* place]

isthmus (ISS-muss) constriction between two larger parts of an organ; for example, isthmus of thyroid [*isthmus* narrow connection or passage]

J

jaundice (JAWN-dis) abnormal yellowing of skin, mucous membranes, and white of eyes [*jaun-* yellow, *-ice* state]

jejunum (jeh-JOO-num) middle third of the small intestine [*jejun-* empty, *-um* thing]

joint capsule sleevelike extension of the periosteum of each of the bones at an articulation [*joint-* to join, *caps-* box, *-ule* little]

joint cavity small space between articulating surfaces of the two bones of the joint [*joint-* to join, *cavus-* hollow, *-ity* state]

joint junction between two or more bones; articulation [*joint-* to join]

joule (J or j) (jool) unit of measuring energy; *see* calorie [*James Prescott Joule* English physicist]

juvenile rheumatoid arthritis (JRA) (JOO-veh-ney-el ROO-mah-toyd ar-THRY-tis) systemic autoimmune disease that results in severe deterioration and deformity of joints [*juven-* youth, *-ile* of or like, *rheuma-* flow, *-oid* like, *arthr-* joint, *-itis* inflammation]

juxtaglomerular apparatus (juks-tah-gloh-MER-yoo-lar app-ah-RAT-us) in the nephron, the complex of cells from the distal

tubule and the afferent arteriole, which helps regulate blood pressure by secreting renin in response to blood pressure changes in the kidney; located near the glomerulus; also called *juxtaglomular complex* [*juxta-* near or adjoining, *-glomer-* ball, *-ul-*little, *-ar* relating to]

juxtaglomerular (JG) cell (jux-tah-gloh-MER-yoo-lar) cell of the juxtaglomerular apparatus [*juxta-* near or adjoining, *-glomer-* ball, *-ul-*little, *-ar* relating to, *cell* storeroom]

juxtamedullary nephron (jux-tah-MED-oo-lair-ee NEF-ron) region of the nephron that lies near the junction of the cortical and medullary layers of the kidney [*juxta-* near or adjoining, *-medulla-* middle, *-ary* relating to, *nephro-* kidney, *-on* unit]

K

Kaposi sarcoma (KAH-poh-see sar-KOH-mah) rare malignant neoplasm of the skin that often spreads to lymph nodes and internal organs; Kaposi sarcoma is often found in AIDS patients [*Moritz K. Kaposi* Hungarian dermatologist, *sarco-* flesh, *-oma* tumor]

karyotype (KAIR-ee-oh-type) ordered arrangement of photographs of chromosomes from a single cell used in genetic counseling to identify chromosomal disorders such as trisomy or monosomy [*karyo-* nucleus, *-type* kind]

Kegel exercise (KEE-gel) noninvasive treatment used to reduce urinary stress incontinence [*Arnold Kegel* American gynecologist]

keloid (KEE-loyd) unusually thick fibrous scar on the skin [*kel-* claw, *-oid* like]

keratin (KER-ah-tin) tough, fibrous protein substance in hair, nails, outer skin cells, and horny tissues [*kera-* horn, *-in* substance]

keratinization (ker-ah-tin-i-ZAY-shun) process by which cells of the stratum corneum become fitted with keratin and move to the surface [*kera* horn, *-in-* substance, *-iz-* to cause, *-ation* process]

keratinocyte (keh-RAT-i-no-syte) epidermal cell responsible for synthesizing keratin [*kera-* horn, *-in-* substance, *-cyte* cell]

keratohyalin (ker-ah-toh-HYE-ah-lin) staining granules located within the stratum lucidum; required for surface keratin formation [*kera-* horn, *-hyaline* glass]

ketogenesis (kee-toh-JEN-eh-sis) process that produces ketone bodies [*keto-* acetone, *-gen-*produce, *-esis* process]

ketone body (KEE-tohn) acid produced during fat catabolism [*keto-* acetone, *-one* chemical]

ketosis (kee-TOH-sis) large amount of ketone bodies present in the blood of a person with uncontrolled diabetes mellitus [*keto-*acetone, *-osis* condition]

kidney (KID-nee) one of the two organs that cleanses the blood of waste products continually produced by metabolism; the kidneys produce urine [*kidnere-* kidney]

killer T cells cytotoxic T lymphocytes [*kill-*to deprive of life, *cell-* storeroom]

kilocalorie (Kcal) (KIL-oh-kal-oh-ree) 1000 calories; *see* Calorie [*kilo-* one thousand, *-calor* heat]

kinase (KYE-nayz) substance that converts proenzymes to active enzymes [*kin-* motion, *-ase* enzyme]

kinesiopathology (kih-nee-see-oh-PATH-ol-oh-jee) existence of or study of any abnormality of motion of the musculoskeletal system of the body [*kines-* movement, *-path-*disease, *-o-* combining form, *-log-* words (study of), *-y* activity]

kinesthesia (kin-es-THEE-zee-ah) "muscle sense"; that is, sense of position and movement of body parts [*kines-* movement, *-thesia-* seeking]

kinin (KYE-nin) chemical compound that is released from injured tissues; results in vasodilation and increases the permeability of blood vessels [*kin-* move, *-in* substance]

Klinefelter syndrome (KLINE-fel-ter SIN-drohm) genetic disorder caused by the presence of two or more X chromosomes in a male (typically trisomy XXY); characterized by long legs, enlarged breasts, low intelligence, small testes, sterility, and chronic pulmonary disease [*Harry F. Klinefelter* American physician, *syn-* together, *-drome* running or (race) course]

knee jerk reflex extension of the leg in response to tapping of the patellar tendon; also called *patellar reflex* [*re-* again, *-flex* bend]

Korotkoff sound (kor-ROT-koff) sound of blood turbulence heard when measuring arterial blood pressure with a sphygmomanometer [*Nicolai Korotkoff* Russian physician]

Krause end bulb (KROWS) *see* bulboid corpuscle [*Wilhelm J. F. Krause* German anatomist]

Krebs cycle also called *tricarboxylic acid (TCA) cycle*; *see* citric acid cycle [*Sir Hans Adolf Krebs* British biochemist, *cycl-* circle]

Kupffer cell (KOOP-fer) macrophage found in spaces between liver cells [*Karl W. von Kupffer* German surgeon, *cell-* storeroom]

kwashiorkor (kwah-shee-OR-kor) nutritional disorder that results from a protein deficiency in the presence of sufficient calories [*kwashiorkor* one who is displaced (from the breast)]

kyphosis (kye-FOH-sis) abnormally exaggerated thoracic curvature of the vertebral column [*kypho-* hump, *-osis* condition]

L

labia majora (LAY-bee-ah mah-JOH-rah) large lateral folds of the vulva; [*labia* lips, *majora* large] *sing.*, labium majus

labia minora (LAY-bee-ah mih-NO-rah) small medial folds of the vulva [*labia* lips, *minora* small] *sing.*, labium minor

labor process of expulsion of the fetus and the placenta; childbirth [*labor-* work]

labyrinth (LAB-i-rinth) bony cavities and membranes of the inner ear [*labyrinth* maze]

lacrimal apparatus (LAK-ri-mal app-ah-RAT-us) in the eye, the tear (lacrimal) gland plus associated ducts that form tears [*lacrima-*tear, *-al* relating to, *apparatus-* equipment, preparation]

lacrimal bone (LAK-ri-mal) facial bone that joins the maxilla, frontal bone, and ethmoid bone [*lacrima-* tear, *-al* relating to]

lactase (LAK-tayse) enzyme needed to digest lactose [*lact-* milk, *-ase* enzyme]

lactation (lak-TAY-shun) milk production [*lact-* milk, *-ation* process]

lacteal (LAK-tee-al) lymphatic vessel located in each villus of the intestine; serves to absorb fat materials from chyme passing through the small intestine [*lact-* milk, *-al* relating to]

lactic acid (LAK-tik ASS-id) product of anaerobic energy metabolism that accumulates in muscle tissue during exercise and causes a burning sensation [*lac-* milk, *-ic* relating to, *acid* sour]

lactic acidosis (LAK-tik ass-ih-DOH-sis) condition characterized by elevated blood lactate levels, electrolyte imbalances, and decreased blood pH [*lac-* milk, *-ic* relating to, *acid-* sour, *-osis* condition]

lactogenic hormone (lak-toh-JEN-ik HOR-mohn) any hormone that initiates milk production by secretory cells of breast alveoli [*lact-* milk, *-gen-* produce, *-ic* relating to, *hormon-* excite]

lactose intolerance (LAK-tohs in-TOL-er-ans) condition in which one lacks the enzyme lactase, resulting in an inability to digest lactose (a disaccharide in milk and dairy products) [*lact-* milk, *-ose* carbohydrate (sugar), *in-* not, *-toler-* bear, *-ance* state]

lactotroph (lak-toh-TROHF) cell type of the adenohypophysis (anterior pituitary) that secretes prolactin [*lacto-* milk, *-troph* nourish]

lacuna (lah-KOO-nah) space or cavity; for example, lacunae in bone contain bone cells [*lacuna* pit] *pl.*, lacunae

lamella (lah-MEL-ah) thin layer, as of bone [*lam-* plate, *-ella* little] *pl.*, lamellae

lamellar corpuscle (lah-MEL-ar KOR-pus-ul) sensory receptor with a layered encapsulation found deep in the dermis that detects pressure on the skin surface; also known as *Pacini corpuscle* [*lam-* plate, *-ella-* little, *-ar* relating to, *corpus-* body, *-cle* little]

lamina propria (LAM-in-ah PROH-pree-ah) fibrous connective tissue underlying the epithelium in mucous membranes (*lamina* thin plate, *propria* proper]

laminar flow (LAM-i-nar) the manner in which blood flows through a smooth vessel [*lamina-* plate, *-ar* relating to]

Langer lines (LANG-er) pattern of dense bundles of white collagenous fibers that characterize the reticular layers of dermis; also called *cleavage lines* [*Karl Langer-* Austrian anatomist]

Langerhans cell (LAHNG-er-hanz) epidermal dendritic cell; cell that plays a role in immunology of the skin and thus serves as defense mechanism for the body [*Paul Langerhans* German pathologist, *cell* storeroom]

lanugo (lah-NOO-go) extremely fine and soft hair coat on developing fetus [*lanugo* down]

laparoscope (LAP-ah-roh-skope) fiberoptic viewing instrument [*laparo-* abdomen, *-scop-* see]

LaPlace, Law of (lah-PLAHS) *see* Young-LaPlace Law [*Pierre S. de Laplace* French physicist]

laryngitis (lar-in-JYE-tis) inflammation of the mucous tissues of the larynx (voice box) [*laryng-* voice box (larynx), *-itis* inflammation]

laryngopharynx (lah-ring-go-FAIR-inks) lowest part of the pharynx [*laryng-* voice box (larynx), *-pharynx* throat] *pl.*, laryngopharynges or laryngopharynxes

larynx (LAIR-inks) voice box located just below the pharynx; the largest piece of cartilage making up the larynx is the thyroid cartilage, commonly known as the *Adam's apple* [*larynx* voice box] *pl.*, larynges or larynxes

laser therapy (LAY-zer) procedure that uses an intense beam of light to destroy a tumor [*laser* shortened "light amplification by stimulated emission of radiation"]

laser-assisted *in situ* keratomileusis (LASIK) (LAY-zer ah-SIS-ted in-SYE-too kair-at-oh-mill-YOO-sis) refractive eye surgery to correct myopia [*in* in, *situ* place, *kera-* horn, *-mileusis* carving]

latent period (LAY-tent) period between time a muscle fiber is stimulated and when it contracts; precedes the contraction phase [*latent-* to lie hidden]

lateral (LAT-er-al) of or toward the side; opposite of medial [*later* side, *-al* relating to]

lateral corticospinal tract (LAT-er-al kohr-ti-koh-SPY-nal) spinal motor tract that controls the contraction of individual or small group of muscles, particularly those moving hands, fingers, feet, and toes on opposite side of the body [*later-* side, *-al* relating to, *cortico-* bark, *-spin-* backbone, *-al* relating to, *tract-* trail]

lateral fissure (fissure of Sylvius) (LAT-er-al FISH-ur [FISH-ur of SIL-vi-us]) deep groove between the temporal lobe below and the frontal and parietal lobes of the brain [*later-* side, *-al* relating to, *Franciscus Sylvius* German medical professor]

lateral lobe (LAT-er-al) one of two large lobes of the thyroid gland [*later-* side, *-al* relating to]

lateral longitudinal arch (LAT-er-al lon-jih-TOO-di-nal) supportive arch of the foot; shaped by the calcaneus, cuboid tarsals, and the fourth and fifth metacarpals [*later-*side, *-al* relating to, *longitud-* length, *-al* relating to]

lateral spinothalamic tract (LAT-er-al spy-no-tha-LAM-ik) sensory tract that integrates crude touch, pain, and temperature [*later-*side, *-al* relating to, *spino-* backbone, *-thalam-*inner chamber, *-ic* relating to, *tract-* trail]

law scientific idea or explanation that is viewed with a very high degree of confidence or certainty after rigorous testing and observation; compare to hypothesis and theory [*lagu-* law]

law of partial pressures *see* Dalton's law [*pars-*parts, *-al* relating to, *pressure-* to press]

lecithin (LES-i-thin) substance in bile that emulsifies dietary oils, and fats in the lumen of the small intestine [*lecith-* yolk, *-in* substance]

Le Fort fracture (leh-FOHR) bone fracture of the face and/or base of the skull (also called *Guérin fracture*) [*Rene Le Fort* French surgeon, *Alphonse F.M. Guérin*, French surgeon, *fracture* a breaking]

legionnaires' disease (LEE-jen-airs) form of bacterial pneumonia caused by infection with the *Legionella pneumophila* organism [originally named for American Legion, convention location at which first outbreak was noted]

length-tension relationship maximum strength that a muscle can develop bears a direct relationship to the initial length of its fibers [*length-* long, *tens-* stretch, *-ion* process of]

lens refracting mechanism of the eye that is located directly behind the pupil [*lens-* lentil]

lentiform nucleus (LEN-ti-form NOO-klee-us) mass of gray matter in the interior of each cerebral hemisphere; consists of the putamen and the pallidum [*lent-* lentil (lens), *-form* shape, *nucleus* nut or kernel] *pl.*, nuclei

leptin (LEP-tin) a protein hormone produced by fat-storing cells in adipose tissue that plays a role in inhibiting food intake by regulating the satiety center in the hypothalamus; leptin also plays a role in reducing fat storage in nonadipose cells in the liver and skeletal muscles; because of its role in fat storage, it may play a role in future treatments for diabetes, obesity, and other conditions related to fat metabolism; *see* satiety center; leptin also helps regulate some immune and neuroendocrine functions and plays a role in development [*lept-*thin, *-in* substance]

lesser omentum (oh-MEN-tum) extension of the peritoneum that is attached from the liver to the lesser curvature of the stomach and the first part of the duodenum [*omentum* fatty covering of intestines]

lesser vestibular gland (ves-TIB-yoo-lar) tiny mucous gland located near the female's urinary meatus by way of two small ducts; also called *Skene's glands* [*vestibul-* entrance hall, *-ar* relating to, *gland* acorn]

leukemia (loo-KEE-mee-ah) blood cancer; affects white blood cells [*leuk-* white, *-emia* blood condition]

leukocyte (LOO-koh-syte) white blood cell [*leuko-* white, *-cyte* cell]

leukocytosis (loo-koh-SYE-toh-sis) abnormally high white blood cell numbers in the blood [*leuko-* white, *-cyt-* cell, *-osis* condition]

leukocytosis-promoting (LP) factor (look-oh-sye-TOH-sis) substance released by injured tissue; stimulates the release of white cells from storage areas and increases the num-

ber of circulating white blood cells [*leuko-* white, *-cyto-* cell, *-osis* condition]

leukopenia (loo-koh-PEE-nee-ah) abnormally low white blood cell numbers in the blood [*leuko-* white, *-penia* lack]

leukoplakia (loo-koh-PLAY-kee-ah) precancerous change in the mucous membrane characterized by thickened, white, and slightly raised patches of tissue [*leuko-*white, *-plak-* flat area, *-ia* condition]

leukoreduction (loo-koh-ree-DUK-shen) filtering process that removes leukocytes from blood [*leuko-* white, *-reduc-* lead back, *-tion* process]

leukorrhea (loo-koh-REE-ah) whitish vaginal discharge [*leuko-* white, *-rrhea* flow]

leukotriene (loo-koh-TRY-een) cytokine compound that functions as an inflammation mediator [*leuko-* white, *-tri-* three, *-ene* chemical]

levator ani muscle (leh-VAY-tor A-nye) muscle of the pelvic floor [*levator* lifter, *ani* of the anus, *mus-* mouse, *-cle* little]

levator scapulae (leh-VAY-tor SCAP-yoo-lee) shoulder girdle muscle that elevates the scapula [*levator* lifter, *scapulae* of the shoulder blade]

lever (LEV-er) any rigid bar free to turn about a fixed point [*lev-* lift, *-er* agent]

lever system (LEV-er) simple mechanical device that makes the work of moving a weight or other load easier [*lev-* lift, *-er* agent]

levodopa (L-dopa) (LEEV-oh-doh-pah) a molecule derived from tyrosine in neurons that is used to produce the neurotransmitter dopamine [*levo-* left (form of molecule), *-dopa* acronym denoting 3.4- *d*ihydroxy*p*henyl*a*lanine]

Leydig cell (LYE-dig) *see* interstitial cell [*Franz von Leydig* German anatomist, *cell* storeroom]

ligament (LIG-ah-ment) band of white fibrous tissue connecting bones to other bones [*liga-* bind, *-ment* result of action]

light micrograph (LM) (MYK-roh-graf) photographic image of a microscopic structure using a light microscope [*micro-* small, *-graph* drawing]

light microscope (LM) (MYK-roh-skope) magnifying device made of glass lenses that use light transmitted through or reflected from a specimen [*micro-* small, *-scop-* see]

limb lead (lim leed) electrode placed on limbs during electrocardiography [*lim-* limb, branch of tree, *lead-* to go]

limbic system (LIM-bik) parts of the brain involved in emotions and sense of smell; plays key role in coupling sensory inputs to short- and long-term memory; consists of the hippocampus, the hypothalamus, and several other structures [*limb-* edge, *-ic* relating to]

limited-field radiation treatment procedure for early-stage cancers that have not spread [*limes-* limit, *feld-* open land, *radiare-* to shine, *-tion* process]

linea alba (LIN-ee-ah AL-bah) tough band of connective tissue that covers the rectus abdominis muscle [*linea* line, *alba* white]

linear fracture (LIN-ee-ar) type of bone fracture in which fracture line is parallel to the bone's long axis [*linea-* line, *-ar* relating to, *fracture* a breaking]

lingual tonsil (LING-gwal TAHN-sil) tonsil located at the base of the tongue [*lingua-* tongue, *-al* relating to]

lip region that lines the mouth and continues into the oral cavity [*lip-* edge]

lipase (LYE-pays) fat-digesting enzyme [*lip-* fat, *-ase* enzyme]

lipid (LIP-id) class of organic compounds that includes fats, oils, and related substances [*lip-* fat, *-id* form]

lipogenesis (lip-oh-JEN-eh-sis) formation of body fat from food sources [*lipo-* fat, *-gen-* produce, *-esis* process]

lipoma (li-POH-mah) benign tumor of adipose (fat) tissue [*lip-* fat, *-oma* tumor]

lipoprotein (lip-oh-PROH-teen) substance that is part lipid and part protein; produced mainly in the liver [*lipo-* fat, *protein* first rank]

lithotripsy (LITH-oh-trip-see) technique that pulverizes kidney stones [*litho-* stone, *-trips-* pound, *-y* action]

lithotriptor (LITH-oh-trip-tor) ultrasound generator used in lithotripsy; also spelled "lithotripter" [*litho-* stone, *-trip-* pound, *-or* agent]

litmus (LIT-mus) pigment used to test for acidity and alkalinity [*litmus-* colored herb]

lobar (LOH-bar) referring to a lobe [*lob-*lobe, *-ar* relating to]

lobectomy (loh-BEK-toh-mee) surgical removal of a single lobe of an organ, as in the removal of one lobe of a lung [*lob-* lobe, *-ectomy* surgical removal]

local potential (poh-TEN-shal) slight shift from resting membrane potential in a specific region of the plasma membrane [*potent-* power, *-ial* relating to]

lock-and-key model description of how a specific enzyme will fit into only a specific substrate, like a key fits into a lock [*lock-* fastening, *model-* mode]

long bone bone that is characterized by its extended longitudinal axis and unique articular ends

longissimus capitis muscle (lon-JIS-i-mus KAP-i-tis) muscle of the head [*longissumus* longest or very long, *capit-* head, *mus-* mouse, *-cle* little]

longitudinal arch (lon-ji-TOO-dih-nal) two arches, the medial and lateral, that extend lengthwise in the foot [*longitud-* length, *-al* relating to]

longitudinal fissure (lon-ji-TOO-dih-nal FISH-ur) deepest groove in the cerebrum; divides the cerebrum into two hemispheres [*longitud-* length, *-al* relating to]

loose fibrous connective tissue *see* areolar tissue [*loose-*free, *con-* together, *-nect-* bind, *-ive* relating to, *fibr-* thread, *-ous*, characterized by, *tissu-* fabric]

lordosis (lor-DOH-sis) abnormally exaggerated lumbar curvature of the vertebral column [*lordos-* bent backward, *-osis* condition]

low-density lipoprotein (lip-oh-PROH-teen) a blood lipid fraction (plasma protein) composed of relatively more cholesterol and triglycerides than protein; often call "bad cholesterol" because high levels contribute to atherosclerotic plaque formation and arterial wall damage [*lipo-* fat, *-protein* first rank]

lower esophageal sphincter (LES) (eh-SOF-eh-JEE-ul SFINGK-ter) muscle located at the junction between the terminal portion of the esophagus and the stomach; also called *cardiac sphincter* [*es-* will carry, *-phag-* food (eat), *-al* relating to, *sphinc-* bind tight, *-er* agent]

lower respiratory tract (RES-pih-rah-tor-ee) region of the respiratory tract that consists of the trachea, all segments of the bronchial tree, and the lungs [*re-* again, *-spir-* breathe, *-tory* relating to, *tractus* trail]

lumbar plexus (LUM-bar PLEK-sus) spinal nerve plexus located in the low back [*lumb-* loin, *-ar* relating to, *plexus* network] *pl.*, plexi or plexuses

lumbar puncture (LUM-bar) clinical procedure in which some cerebrospinal fluid is withdrawn from the subarachnoid space in the lumbar region of the spinal cord for analysis [*lumb-* loin, *-ar* relating to]

lumbar vertebra (LUM-bar VER-teh-bra) lower five bones of the vertebral column; support the small of the back [*lumb-* loin, *-ar* relating to, *vertebra* that which turns] *pl.*, vertebrae

lumbrical muscle (LUM-bri-kal) intrinsic muscle of the foot [*lumbrical* like a worm, *mus-* mouse, *-cle* little]

lumen (LOO-men) the hollow area of a hollow organ such as the stomach, blood vessel, or urinary bladder; *see also* luminal [*lumen* light] *pl.*, lumina

luminal (LOO-min-al) relating to the hollow part, or lumen, of a hollow organ such as the urinary bladder or small intestine; *see also* lumen [*lumin-* light, *-al* relating to]

lumpectomy (lump-EK-toh-mee) surgical removal of a tumor from breast tissue [*lump-* mass, *-ec-* out, *-tom-* cut, *-y* action]

lung cancer malignancy of pulmonary tissue [*cancer* crab or malignant tumor]

lunula (LOO-nyoo-lah) crescent-shaped white area under the proximal nail bed [*luna-* moon, *-ula* small]

luteal phase (LOO-tee-al) phase of the menstrual cycle that occurs between ovulation and the onset of menses; also called *premenstrual phase*, *postovulatory phase*, or *secretory phase* [*lute-* yellow, *-al* relating to]

luteinization (loo-tee-in-i-ZAY-shun) formation of a golden body (corpus luteum) in the ruptured follicle [*lute-* yellow, *-ization* process]

luteinizing hormone (LH) (loo-tee-in-EYE-zing HOR-mohn) in females, acts in conjunction with follicle-stimulating hormone (FSH) to stimulate follicle and ovum maturation, release of estrogen, and ovulation; known as the *ovulating hormone*; in males, causes testes to develop and secrete testosterone [*lute-* yellow, *-izing* process, *hormon-* excite]

lymph (limf) watery fluid drained from the tissue spaces that returns excess fluid and protein molecules to the blood via the lymphatic vessels [*lymph* water]

lymph node (limf nohd) small structure that performs biological filtration of lymph on its way to the circulatory system [*lymph* water, *nod-* knot]

lymphangiography (lim-fan-jee-OG-reh-fee) method using x-rays and radiopaque material to examine lymphatic vessels [*lymph-* water, *-angi-* vessel, *-graph-* draw, *-y* process]

lymphangitis (lim-fan-JYE-i-tis) inflammation of lymph vessels, usually caused by infection, characterized by fine red streaks extending from the site of infection; may progress to septicemia (blood infection) [*lymph-* water, *-angi-* vessel, *-itis* inflammation]

lymphatic capillary (lim-FAT-ik KAP-i-lair-ee) microscopic blind-end vessels that transport lymph [*lymph-* water, *-atic* relating to, *capill-* hair, *-ary* relating to]

lymphatic vessel (lim-FAT-ik) any vessel of a system of blind-ended vessels that collect lymph and deliver it to the circulatory system via the thoracic duct and the right lymphatic duct [*lymph-* water, *-atic* relating to]

lymphedema (lim-fah-DEE-mah) swelling caused by lymphatic vessel blockage [*lymph-* water, *-edema* swelling]

lymphocyte (LIM-foh-syte) one type of white blood cell; *see* B lymphocyte, T lymphocyte [*lymph-* water (lymphatic system), *-cyte* cell]

lymphokine (LIM-foh-kyne) chemical compounds released by antigen-bound sensitized T cells [*lymph-* water, *-kine* motion]

lymphoid neoplasm (LIM-foyd NEE-oh-plazem) *see* lymphoma [*lymph-* water (lymphatic system), *-oid* like, *neo-* new, *-plasm* substance]

lymphoid tissue (LIM-foyd) type of reticular tissue that contains lymphocytes and other specialized cells [*lymph-* water, *-oid* like, *tissu* fabric]

lymphokinesis (lim-foh-kih-NEE-sis) flow of lymph [*lymph-* water, *-kinesis* activation]

lymphoma (lim-FOH-mah) cancer of lymphatic tissue [*lymph-* water, *-oma* tumor]

lymphotoxin (lim-foh-TAWK-sin) powerful poison that quickly kills any cells it attacks [*lympho-* water (lymphocyte), *-tox-* poison, *-in* substance]

lysosome (LYE-so-sohm) membranous organelle containing various enzymes that can dissolve most cellular compounds; called *digestive bags* or *suicide bags of cell* [*lyso-* dissolution, *-som-* body]

M

M line region of the sarcomere where myosin filaments are held together and stabilized by protein molecules [*M mittel* middle]

M phase step of the cell life cycle in which a cell divides through the process of mitosis (mitotic cell division); M phase follows the G_2 phase (second growth phase) and occurs along with cytokinesis (splitting of the cell's cytoplasm into two daughter cells); *see* cell life cycle [*phase* appearance]

macromolecule (mak-roh-MOL-eh-kyool) large, complex chemical made of combinations of molecules [*macro-* large, *molec-* mass, *-ule* small]

macronutrients (MAK-roh-NOO-tree-ents) nutrients needed in large amounts; carbohydrates, fats, and proteins [*macro-* large, *nutri-* nourish, *-ent* agent]

macrophage (MAK-roh-fayj) phagocytic cell in the immune system [*macro-* large, *-phag-* eat]

macula (MAK-yoo-lah) strip of sensory epithelium in the utricle and saccule; provides information related to head position or acceleration [*macula* spot] *pl.*, maculae or maculas

macula densa (MAK-yoo-lah DEN-sah) distal tubule cells in the juxtaglomerular apparatus that are dense and tightly packed [*macula* spot, *densa* thick] *pl.*, maculae densae

macula lutea (MAK-yoo-lah LOO-tee-ah) yellowish area near center of the retina where cones are densely distributed; also called simply "macula" [*macula* spot, *lutea* yellow] *pl.*, maculae luteae

magnesium (mag-NEE-see-um) element that is a component of many energy-transferring enzymes [*magne-* lodestone, *-um* thing or substance]

magnetic resonance imaging (MRI) (mag-NET-ik REZ-ah-nens IM-ah-jing) scanning technique that uses a magnetic field to induce tissues to emit radio waves that can be used by computer to construct a sectional view of a patient's body [*magnet-* lodestone, *-ic* relating to, *re-* again, *-sona-* sound, *-ance* state]

magnetoencephalography (MEG) (mag-NET-oh-en-sef-eh-LOG-reh-fee) method of measuring brain activity using a sensitivity machine called a *biomagnetometer*; detects very small magnetic fields generated by neural activity [*magneto-* lodestone, *-en-* within, *-cephalo-* head, *-graph-* draw, *-y* activity]

major histocompatibility complex (MHC) (HIST-oh-kom-PAT-ib-il-it-ee) set of genes in chromosome 6 that all code for antigen-presenting proteins and other immune system proteins; proteins produced by MHC genes in class I and class II also are called *human leukocyte antigens (HLAs)*; MHC proteins present different protein fragments (peptides) at the surface of the cell for possible recognition as either self or nonself antigens by immune system cells [*histo-* tissue, *-compatibil-* agreeable, *-ity* state, *complex* embrace]

malabsorption syndrome (mal-ab-SORP-shun SIN-drohm) refers to a group of symptoms resulting from the failure of the small intestine to absorb nutrients properly [*mal-* bad, *-absorp-* swallow, *-tion* process, *syn-* together, *-drome* running or (race) course]

malaria (mah-LAIR-ee-ah) sometimes fatal condition caused by blood parasites [*mal-* bad, *-ar-* air, *-ia* condition]

male pattern baldness common type of baldness that results when the gene for baldness is present and testosterone is present [*pat-*

tern that which is to be copied, *baldness*-balled state]

malignant (mah-LIG-nant) refers to a tumor or neoplasm that is capable of metastasizing, or spreading, to new tissues; cancer [*malign* bad]

malignant hyperthermia (MH) (mah-LIG-nant hye-per-THERM-ee-ah) inherited condition characterized by abnormally increased body temperature and muscle rigidity when exposed to certain anesthetics or muscle relaxants [*malign-* bad, *-ant* state, *hyper-* excessive, *-therm-* heat, *-ia* abnormal condition]

malignant melanoma (mah-LIG-nant mel-ah-NO-mah) most deadly type of skin cancer [*malign-* bad, *-ant* state, *melan*-black, *-oma* tumor]

malignant tumor (mah-LIG-nant TOO-mer) cancer that is not encapsulated and tends to spread to other regions of the body [*malign* bad, *-ant* state, *tumor* swelling]

malocclusion (mal-oh-CLEW-zhun) condition that occurs when missing teeth create wide spaces in the dentition, when teeth overlap, or when one or more teeth prevents correct alignment [*mal-* bad, *-occlu-*close up, *-sion* state]

maltase (MAL-tays) enzyme that catalyzes the final steps of carbohydrate digestion [*malt-* grain, *-ase* enzyme]

mammary gland (MAM-mah-ree) milk-producing glands of the breasts; classified as external accessory sex organs in females [*mamma-* breast, *-ry* relating to, *gland* acorn]

mammogenic hormone (mam-moh-JEN-ik HOR-mohn) any hormone that promotes breast tissue growth and development [*mammo-* breast, *-gen-* produce, *-ic* relating to, *hormon-* excite]

mammography (mam-OG-rah-fee) x-ray photography of the breast [*mammo-* breast, *-graphy* kind of printing or recording]

mandible (MAN-di-bal) jaw bone; largest and strongest bone of the face [*mandere* to chew]

mandibular nerve (man-DIB-yoo-lar) part of the trigeminal nerve [*mandere* to chew, *-lar* relating to]

marasmus (mah-RAZ-mus) form of protein-calorie malnutrition; results from an overall lack of calories and protein [*marasmus* a wasting]

marrow cavity (MAIR-oh KAV-i-tee) *see* medullary cavity [*marrow-* inner most, *cav*-hollow, *-ity* state]

mass number see **atomic mass**

masseter (mah-SEE-ter) facial muscle responsible for chewing [*masseter* chewer]

mast cell immune system cell to which antibodies become attached in early stages of inflammation [*mast* fattening, *cell* storeroom]

mastectomy (mas-TEK-toh-mee) surgical removal of the breast [*mast-* breast, *-ectomy* surgical removal]

mastication (mass-ti-KAY-shun) chewing [*mastica-* chew, *-ation* process]

mastitis (mass-TYE-tis) breast inflammation [*mast-* breast, *-itis* inflammation]

mastoidectomy (mass-toyd-EK-toh-mee) inflammation of the air spaces within the mastoid portion of the temporal bone [*mast-* breast, *-oid-* like, *-ec-* out, *-tom-* cut, *-y* action]

mastoiditis (mas-toyd-EYE-tis) inflammation of the air cells within the mastoid portion of the temporal bone; usually caused by infection [*mast-* breast, *-oid-* like, *-itis* inflammation]

matrix (MAY-triks) extracellular substance of a tissue; for example, the matrix of bone is calcified, whereas that of blood is liquid; *see also* extracellular matrix (ECM) [*matrix* womb] *pl.*, matrices

matter anything that has mass and occupies space [*matter-* something from which something is made]

maxilla (mak-SIH-lah) upper jaw bone [*maxilla* upper jaw] *pl.*, maxillae (mak-SIH-lee)

maxillary nerve (MAK-si-lair-ee) branch of the trigeminal nerve [*maxilla* upper jaw, *-ary* relating to]

McBurney's point (mak-BUR-neez) a point on the abdominal wall midway between the right anterior superior iliac spine and the umbilicus; site of pain in acute appendicitis [*Charles McBurney* American surgeon]

meatus (mee-AYT-us) any tubelike passageway or opening [*meatus* passage]

mechanical digestion process through which food is broken into smaller portions through chewing and movements of the alimentary canal; enables enzymes to act on a larger surface area to accomplish chemical digestion [*diges*t- break down, *-tion* process]

mechanoreceptor (mek-an-oh-ree-SEP-tor) receptors that respond to physical movement in the environment, such as sound waves; for example, equilibrium and balance sensors in the ears [*mechano-* machine (mechanical), *-cept-* receive, *-or* agent]

medial (MEE-dee-al) of or toward the middle; opposite of lateral [*media-* middle, *-al* relating to]

medial lemniscal system (MEE-dee-al lem-NIS-kal) posterior white columns of the spinal cord plus the medial lemniscus; functions in touch sensations and conscious proprioception [*media-* middle, *-al* relating to, *lemmis-* fillet, *cal-* relating to, *system-* arrangement]

medial longitudinal arch (MEE-dee-al lon-ji-TOO-dih-nal) inner lengthwise (anteroposterior) support structure of the foot [*medial* middle, *-al* relating to, *longitudo* length, *-al* relating to]

median cubital vein (KYOO-bi-tall) forearm vein [*medi-* middle, *-an* relating to, *cubit-* elbow, *-al* relating to]

mediastinum (MEE-dee-ass-TI-num) a portion of the thorax cavity in the middle of the thorax [*mediastinus-* midway]

medical imaging techniques that visualize tissues for medical study [*medic-* to heal, *-al* relating to, *image-* picture]

medulla (meh-DUL-ah) Latin for "marrow"; the inner portion of an organ in contrast to the outer portion, or cortex [*medulla* middle] *pl.*, medullae or medullas

medulla oblongata (meh-DUL-ah ob-long-GAH-tah) lowest part of the brainstem; an enlarged extension of the spinal cord; the vital centers are located within this area [*medulla* middle, *oblongata* oblong] *pl.*, medullae oblongatae

medullary (MED-oo-lar-ee) relating to the middle or center of an organ or structure [*medulla-* middle, *-ry* state]

medullary cavity (MED-oo-lair-ee) hollow area inside the diaphysis of the bone that contains yellow bone marrow [*medulla* middle, *cav-* hollow, *-ity* state]

medullary ischemic reflex (MED-uh-lair-ee is-KEE-mik REE-fleks) mechanism that exerts powerful control of blood vessels during emergency situations when blood flow to the brain drops below normal [*medulla-* middle, *-ary* relating to, *ischem-* hold back, *-ic* relating to, *re-* back or again, *-flex* bend]

medullary rhythmicity area (MED-eh-lair-ee rith-MIH-sih-tee) area in the brainstem that generates the basic rhythm of the respiratory cycle of inspiration and expiration [*medulla-* middle, *-ary* relating to, *rhythm*-rhythm, *-ic* relating to, *-ity* condition]

megakaryocyte (meg-ah-KAIR-ee-oh-syte) large cell in the spleen that contributes to formation of platelets [*mega-* huge, *-karyo* nut, *-cyte* cell]

meiosis (my-OH-sis) nuclear division in which the number of chromosomes is reduced to half their original number through separation of homologous pairs; produces gametes [*meiosis* becoming smaller]

Meissner corpuscle (MYZ-ner KOR-pus-ul) *see* tactile corpuscle [*George Meissner* German physiologist]

melacine (MEL-ah-seen) vaccine made from melanoma cancer cells; used for prevention of recurrence of malignant melanoma following initial treatment and as a less toxic alternative to chemotherapy for treatment of advanced melanoma [*mela-* black]

melanin (MEL-ah-nin) brown pigment primarily in skin and hair [*melan-* black, *-in* substance]

melanocyte (MEL-ah-no-syte) cell type in the stratum basale of the skin that produces melanin pigment granules, releasing them to other nearby skin cells [*melan-* black, *-cyte* cell]

melanocyte-stimulating hormone (MSH) (meh-LAN-oh-syte-STIM-yoo-lay-ting HOR-mohn) hormone secreted by the pituitary that increases production of melanin, leading to darker skin color [*melan*-black, *-cyte* cell, *hormon-* excite]

melanoma (mel-ah-NO-mah) cancer of pigmented epithelial cells [*melan-* black, *-oma* tumor]

melanosome (MEL-ah-no-sohm) pigment granule released by melanocytes [*melan-* black, *-som-* body]

melatonin (mel-ah-TOH-nin) important hormone produced by the pineal gland; it is believed to regulate onset of puberty and the menstrual cycle; also referred to as the *third eye* because it responds to levels of light and is thought to be involved with the body's internal clock [*mela-* black, *-ton-* tone, *-in* substance]

membrane thin, sheetlike structure [*membran-* thin skin]

membrane attack complex (MAC) molecules formed by the complement cascade; leads to cell lysis [*membran-* thin skin, *complex* embrace]

membrane bone bone formed within membranous tissues, such as the flat bones of the skull, instead of indirectly through endochondral ossification [*membran-* thin skin]

membrane channel pores within the cell membrane through which specific ions or other small, water-soluble molecules can pass [*membran-* thin skin, *channel-* water pipe]

membrane potential difference in electrical charge between inside and outside of the plasma membrane [*membran-* thin skin, *potent-* power, *-ial* relating to]

membranous (MEM-brah-nus) resembling a membrane [*membran-* thin skin, *-ous* characterized by]

membranous organelle (MEM-brah-nus or-gah-NELL) cell organ that is defined or bordered by a membrane [*membran-* thin skin, *-ous* characterized by, *organ-* instrument, *-ele* small]

memory B cell B cell that has been activated but is not an effector cell producing an active response [*memory-* remembering, *B* bursa-equivalent tissue, *cell* storeroom]

memory cell cell that remains in reserve in the lymph nodes until their ability to secrete antibodies is needed [*memory-* remembering, *cell-* storeroom]

memory T cell T cell that has been activated but is not an effector cell producing an active response [*memory-* remembering, *T* thymus gland, *cell* storeroom]

menarche (meh-NAR-kee) first menses occurring at the onset of puberty [*men-* month, *-arche* beginning]

Ménière disease (men-ee-AIR) chronic inner ear disease of unknown cause [*Prosper Ménière* French physician, *dis-* opposite of, *-ease* comfort]

meninges (meh-NIN-jeez) fluid-containing membranes surrounding the brain and spinal cord [*mening* membrane] *sing.*, meninx

meningitis (men-in-JYE-tis) inflammation of the meninges caused by various factors, including bacterial infection, mycosis, viral infection, and tumors [*mening-* membrane, *-itis* inflammation]

meniscus (meh-NIS-kus) articular cartilage disk [*meniscus* crescent] *pl.*, menisci (meh-NIS-eye or meh-NIS-kye)

menopause (MEN-oh-pawz) termination of menstrual cycles; also called *climacteric* [*men-* month, *-paus-* cease]

menotropin (men-oh-TROHP-in) drug used as an infertility treatment [*men-* month, *-trop*-nourish, *-in* substance]

menses (MEN-seez) periodic shedding of endometrial lining in uterus; occurs in cycles of about 28 days [*menses* months] *pl.*, menses

menstrual cycle (MEN-stroo-al) series of changes that regularly occurs in sexually mature, nonpregnant women that results in shedding of the uterine lining approximately once a month [*mens-* month, *-al* relating to, *cycle* circle]

menstrual period (MEN-stroo-al) *see* menses [*mens-* month, *-al* relating to]

menstruation (men-stroo-AY-shun) menses; regular event of the female reproductive cycle that allows the endometrium to renew itself [*mens-* month, *-ation* process]

Merkel cell (MER-kuhl) *see* tactile epithelial cell [*Friedrich Sigmund Merkel* German anatomist]

merocrine gland (MER-oh-krin) gland that discharges secretions directly through the cell or plasma membrane [*mero-* part, *-crine* to separate]

mesangial cell (mess-AN-jee-al) irregular cell that functions as a support and phagocytic cell; unique to renal corpuscles [*mes-* middle, *-angi-* vessel, *-al* relating to, *cell-*storeroom]

mesentery (MEZ-en-tair-ee) large double fold of peritoneal tissue that anchors the loops of the digestive tract to the posterior wall of the abdominal cavity [*mes-* middle, *-enter-* intestine]

mesoderm (MEZ-oh-derm) middle layer of the primary germ layers; gives rise to such structures as muscle, bones, and blood vessels [*meso-* middle, *-derm* skin]

mesomorph (MEZ-oh-morf) body type characterized by a muscular build [*meso-* middle, *-morph* form]

mesothelium (mez-oh-THEE-lee-um) epithelial lining of the pleura, pericardium, and peritoneum [*meso-* middle or median, *-theli-* nipple, *-um* thing] *pl.*, mesothelia

messenger RNA (mRNA) duplicate copy of a gene sequence on the DNA that passes from the nucleus to the cytoplasm; used by ribosomes to create specific proteins [*RNA*-ribonucleic acid]

metabolic acidosis (met-ah-BOL-ik ass-ih-DOH-sis) disturbance affecting the bicarbonate element of the bicarbonate-carbonic acid buffer pair in the blood; bicarbonate deficit [*metabol-* change, *-ic* relating to, *acid-* sour, *-osis* condition]

metabolic alkalosis (met-ah-BOL-ik al-kah-LOH-sis) disturbance affecting the bicarbonate element of the bicarbonate-carbonic acid buffer pair in the blood; bicarbonate excess [*metabol-* change, *-ic* relating to, *alkal-* ashes, *-osis* condition]

metabolic pathway (met-ah-BOL-ik) sequence of chemical reactions [*metabol-*change, *-ic* relating to]

metabolic rate (met-ah-BOL-ik) amount of energy released by catabolism in the body over a given period [*metabol-* change, *-ic* relating to]

metabolic syndrome (met-ah-BOL-ik SIN-drohm) collection of risk factors that

together increase the risk of coronary heart disease, stroke, and type 2 diabetes mellitus (e.g., central obesity, insulin resistance, high blood lipids, hypertension) [*metabol-* change, *-ic* relating to, *syn-* together, *-drome* running or (race)course]

metabolism (meh-TAB-oh-liz-em) complex, intertwining set of chemical processes by which life is made possible for a living organism; *see* anabolism, catabolism [*metabol-* change, *-ism* condition]

metacarpal bone (met-ah-KAR-pal) bone of the hand [*meta-* beyond,*-carp-* wrist, *-al* relating to]

metacarpophalangeal joint (met-ah-KAR-poh-fah-LAN-jee-al) type of joint with the rounded heads of the metacarpals and the concave bases of the proximal phalanges articulating with each other [*meta-* beyond, *-carpo-* wrist, *-phalang-* finger bones (ref. from rows of soldiers), *-al* relating to]

metaphase (MET-ah-fayz) second stage of mitosis, during which the nuclear membrane and nucleolus disappear and the chromosomes align on the equatorial plane [*meta-* change, *-phase* stage]

metarteriole (met-ar-TEER-ee-ohl) short connecting blood vessel that connects a true arteriole with the proximal end of dozens of capillaries [*meta-* change or exchange, *arteri-*vessel, *-ole* little]

metastasis (meh-TAS-tah-sis) process characteristic of cancer by which malignant tumor cells separate from a primary tumor and then migrate to a new tissue to initiate a secondary tumor [*meta-* change, *-stasis* standing]

micelle (my-SELL) droplet of lipid surrounded by bile salts, which makes the lipid temporarily water-soluble [*mic-* grain, *-elle* small]

microarray (mye-kroh-ar-RAY) DNA biotechnology technique that uses a tiny silicon plate with a grid made up of tiny wells [*micro-* small, *-array* arrangement in rows]

microbiome (mye-kroh-BYE-ohm) all the interacting ecosystems of microbes (bacteria, fungi, etc.) that live on or in the human body [*micro-* small, *-bio-* life, *-ome* entire collection]

microcephaly (my-kroh-SEF-ah-lee) congenital abnormality in which an infant is born with an abnormally small head [*micro-*small, *-ceph* head, *-aly* relating to]

microcirculation (my-kroh-sir-kyoo-LAY-shun) flow of blood through the capillary bed [*micro-* small, *circulat-* go around, *-tion* process]

microfilament (my-kroh-FIL-ah-ment) smallest cell fibers; "cellular muscles" [*micro* small, *-fila-* threadlike, *-ment* thing]

microglia (my-KROG-lee-ah) type of small neuroglial cell of nerve tissue that serves an immune system function by becoming an active phagocyte when stimulated [*micro-*small *-glia* glue] *sing.*, microglial cell

microkeratome (my-kroh-KAR-ah-tohm) surgical device used in automated lamellar keratoplasty (ALK) [*micro-* small, *-kera-*horn, *-tom-* cut]

micronutrient (MYE-kroh-NOO-tree-ent) nutrient needed by the body in very small quantity [*micro-* small, *nutri-* nourish, *-ent* agent]

microscopic anatomy (my-kroh-SKOP-ik ah-NAT-o-mee) the study of the smaller structures of an organism, such as cells and tissues, that are small enough to require significant magnification; compare to gross anatomy [*micro-* small, *-scop-* see, *-ic* relating to, *ana-* apart, *-tom-* cut, *-y* action]

microscopy (my-KRAH-skah-pee) any of several techniques used to visualize structures too small to be seen by the unaided human eye [*micro-* small, *-scop-* see, *-y* activity]

microtubule (my-kroh-TOOB-yool) thick cell fiber (compared to microfilament); hollow tube responsible for movement of substances within the cell or movement of the cell itself [*micro-* small, *-tubule* little tube]

microvillus (my-kroh-VIL-us) brushlike border made up of epithelial cells on each villus in the small intestine; increases the surface area for absorption of nutrients [*micro-* small, *-villi* shaggy hairs] *pl.*, microvilli

micturition (mik-too-RISH-un) urination, voiding [*mictur-* to urinate, *-tion* process]

midbrain region of the brainstem between the pons and the diencephalon [*mid-* middle]

middle cerebellar peduncle (SAIR-eh-bell-ar peh-DUNG-kul) tracts that enter the cerebellum from the pons [*cerebell-*cerebellum (small brain), -ar relating to, *ped- foot*, *-uncl-* little]

middle ear tiny and very thin epithelium-lined cavity in the temporal bone that houses the ossicles; in the middle ear, sound waves are amplified [*mid-* middle]

midsagittal plane (mid-SAJ-i-tal) cut, or plane, that divides the body or any of its parts into two equal (mirror-image) halves

migrating motor complex (MMC) (my-GRAYT-ing) wave of rhythmic contractions of the smooth muscle in the gastrointestinal tract during the fasting state [*migra-* wander, *-at-* process, *motor* move, *complex* embrace]

milliequivalent (mil-i-ee-KWIV-ah-lent) number of ionic charges or electrocovalent bonds in a solution; abbreviated mEq [*milli-* 1/1000 part, *-equi-* equal, *-val-* strength, *-ent* state]

Milwaukee brace (mil-WAWK-ee) supportive brace used to correct scoliosis [*Milwaukee* after the city in Wisconsin, U.S.A.]

mineralocorticoid (MC) (MIN-er-al-oh-KOR-ti-koyd) hormone that influences mineral salt metabolism; secreted by adrenal cortex; aldosterone is the chief mineralocorticoid [*mineral-* mine, *-cortic* bark or cortex, *-oid* like]

mineral inorganic element or salts occurring naturally in the earth, many of which are vital to proper functioning of the body and must be obtained in the diet [*mineral-*mine]

minute volume volume of blood circulating through the body per minute [*minut-* very small, *volume* paper roll]

mirror neuron (MEER-or NOO-ron) type of nerve cell in the cerebral cortex of the brain that is stimulated both when a person performs an action or when *another* person performs an action, thus enabling the brain to "mirror" the activity of another person's brain; may be partly responsible for the ability to imitate actions of others and to empathize with the feelings of others [*mirror-* to look at, *neuron-* nerve]

miscarriage (mis-KARE-ij) loss of an embryo or fetus before the twentieth week of pregnancy; after 20 weeks, the event is termed a *stillbirth* [*mis-* wrongly, *-carriage* carry]

mitochondrial DNA (mDNA, mtDNA) (my-toh-KON-dree-al D N A) DNA specifically in the mitochondrion that has the only genetic code for several important enzymes [*mito-* thread, *-chondrion-* granule, *-al* relating to)

mitochondrion (my-toh-KON-dree-on) organelle in which ATP generation occurs; often termed "powerhouse of cell" [*mito-*thread, *-chondrion* granule] *pl.*, mitochondria

mitosis (my-TOH-sis) complex process in which a cell's DNA is replicated and divided equally between two daughter cells [*mitos-* thread]

mitral valve (MY-tral) located between the left atrium and ventricle, this valve prevents backflow of blood into the left atrium; named for its resemblance to a bishop's hat (miter); also known as the *bicuspid valve* [*mitr-* bishop's hat, *-al* relating to]

mitral valve prolapse (MVP) (MY-tral valv PROH-laps) condition in which the bicuspid (mitral) valve extends into the left atrium, causing incompetence (leaking) of the valve [*mitr-* bishop's hat, *-al* relating to, *pro-*forward, *-laps-* fall]

mittelschmerz (MIT-el-schmertz) abdominal discomfort experienced by many women at the time of ovulation [*mittel-* middle, *-schmerz* pain]

mixed cranial nerve (KRAY-nee-al) bundle of axons that contain both sensory and motor neurons [*crani-* skull, *-al* relating to]

mixed nerve nerve with axons of both sensory and motor neurons [*micere-* to mix]

M-mode echocardiogram (ek-oh-KAR-dee-oh-gram) method of echocardiography that shows motion of the heart walls and valves over time as a transducer is held in a stable position [*M-* motion, *-mode* manner, *echo-*reflected sound, *-cardio-* heart, *-gram* drawing]

mobile-receptor model theory that a hormone enters a target cell where it binds to a free (nonstationary) receptor, thereby activating a gene and thus the beginning of mRNA transcription [*recept-* receive, *-or* agent]

modiolus (moh-DI-oh-lus) cone-shaped core of bone around which the tube of the cochlea is wound [*modiolus-* nave, hub]

molar (MOHL-ar) a tricuspid tooth, which is a relatively flat-topped tooth near the posterior of the jaw; *see also* mole [*mola-* millstone, *-ar* relating to]

mole (mohl) standard unit of measuring amount of a substance; one mole of a substance is made up of 6.02 10^{23} particles of that substance; moles per liter as a concentration of a solute in a solvent is expressed as "molar concentration" or M [*mole-* mass]

molecular genetics (moh-LEK-yoo-lar jeh-NET-iks) branch of genetics that studies DNA and RNA and the mechanisms by which they store and transmit hereditary information [*mole-* mass, *-cul-* small, *-ar* relating to]

molecular motor (mo-LEK-yoo-lar) small structures in the cell made up of one or two molecules and that act as mechanisms of movement [*mole-* mass, *-cul-* small, *-ar* relating to, *mot-* movement, *-or* agent]

molecule (MOL-eh-kyool) formed when two or more atoms join [*mole-* mass, *-cul-*small]

monoamine (mon-oh-ah-MEEN) category of small neurotransmitter molecule derived from a single amino acid [*mono-* single, *-amine* ammonia compound (amino acid)]

monoamine oxidase (MAO) (mon-oh-ah-MEEN OK-si-dase) enzyme located in synaptic knobs of postganglionic neurons; responsible for breaking down neurotransmitters [*mono-* single, *-amine* ammonia compound (amino acid), *oxi-* oxygen, *-ase* enzyme]

monoamine oxidase inhibitor (MAOI) (mon-oh-ah-MEEN OK-si-dase in-HIB-i-tor) class of antidepressant drugs that block the action of monoamine oxidase, the enzyme that inactivates dopamine and serotonin [*mono-* single, *-amine* ammonia compound (amino acid), *oxid-* oxygen compound, *-ase* enzyme, *inhibit-*prevent, *-or* agent]

monoclonal (mon-oh-KLONE-al) genetically identical; member of the same family or clone of cells [*mono-* single, *-clon-* plant cutting, *-al* relating to]

monoclonal antibody (MAb) (mon-oh-KLONE-al AN-ti-bod-ee) specific antibody produced from a population of identical cells; *see* hybridoma [*mono-* single, *-clon-*plant cutting, *-al* relating to, *anti-* against]

monocyte (MON-oh-syte) large white blood cell; an agranular leukocyte [*mono-* single, *-cyte* cell]

monogenic (mon-oh-JEN-ik) single-gene [*mono-* single, *-gen-* produce (gene), *-ic* relating to]

monosaccharide (mon-oh-SAK-ah-ride) simple sugar, such as glucose or fructose; building block of carbohydrates [*mono-* one, *-saccharide* sugar]

monosomy (MON-oh-so-mee) abnormal genetic condition in which cells have only one chromosome instead of a pair; usually caused by nondisjunction (failure of chromosome pairs to separate) during gamete production [*mono-* single, *-som-* body (chromosome), *-y* state]

mons pubis (monz PYOO-bis) skin-covered pad of fat over the pubic symphysis in the female [*mons* mountain, *pubis* groin] *pl.*, montes pubis

morula (MOR-yoo-lah) solid mass of cells formed by the divisions of a fertilized egg [*mor-* mulberry, *-ula* little] *pl.*, morulae

motif (moh-TEEF) specific pattern of structure within the secondary structure of a protein, such as a particular set of helices and/or folds, that imparts certain structural or functional characteristics in each protein where it appears; also called *supersecondary structure* [*motif* theme]

motilin (moh-TIL-in) hormone released from the endocrine cells in the duodenum; triggers the migrating motor complex [*mot-*move, *-il-* relating to, *-in* substance]

motility (moh-TIL-i-tee) ability to move spontaneously [*mot-* move, *-il-* relating to, *-ity* state]

motor cranial nerve (MOH-ter KRAY-nee-al nerv) nerve that consists mainly of motor neurons [*mot-*movement, *-or* agent, *crani-*skull, *-al* relating to]

motor endplate (MOH-ter END-playt) point at which motor neurons connect to the sarcolemma to form the neuromuscular junction [*mot-* movement, *-or* agent]

motor nerve (MOH-ter nerv) nerve containing motor neurons and thus transmits nerve impulses from the brain and spinal cord to muscles and glandular epithelial tissues [*mot-* movement, *-or* agent]

motor neuron (MOH-ter NOO-ron) nerve cell that transmits nerve impulses from the brain and spinal cord to muscles and glandular epithelial tissues [*mot-* movement, *-or* agent, *neuron* nerve]

motor program (MOH-ter PROH-gram) set of coordinated commands that control the programmed muscle activity mediated by extrapyramidal pathways [*mot-* movement, *-or* agent]

motor unit (MOH-ter YOO-nit) functional unit composed of a single motor neuron with the muscle cells it innervates [*mot-*movement, *-or* agent]

mouth oral cavity

mucosa (myoo-KOH-sah) innermost layer of the gastrointestinal wall [*muc-* slime, *-osa* relating to] *pl.*, mucosae

mucosal immune system (myoo-KOH-sal i-MYOON) immune system in the mucous membranes, protecting the external boundaries of the body [*mucos-* slime or mucus, *-al* relating to, *immun-* free]

mucosal-associated lymphoid tissue (MALT) (myoo-KOH-sal-ah-soh-she-AYT-ed LIM-foyd) location of the immune cells that make up the mucosal immune system [*mucos-* slime or mucus, *-al* relating to, *associa-* unite, *-ate* process, *lymph-* water, *-oid* like, *tissue-* fabric]

mucous membrane (MYOO-kus) epithelial membrane that lines body surfaces opening directly to the exterior and secretes mucus [*muc-* slime, *-ous* characterized by, *membran-* thin skin]

mucus (MYOO-kus) thick, slippery material secreted by mucous membranes that keeps the membrane moist and protected [*mucus* slime]

multiaxial joint (mul-tee-AK-see-al) joint that permits movement around three or more axes and in three or more planes [*multi-* many, *-axon* axle]
multicellular gland (mul-tih-SELL-yoo-lar) cluster or group of glandular epithelial cells [*multi-* many, *-cell-* storeroom, *-ular* relating to, *gland* acorn]
multifides group (mul-TIF-i-deez) group of back muscles that each connect one vertebra to the next, also helping to extend the back and neck or flex them to the side [*multi-* many, *-fides* split (into pieces)]
multiple myeloma (my-eh-LOH-mah) cancer of antibody-secreting B lymphocytes [*myel-* marrow, *-oma* tumor]
multiple sclerosis (MS) (skleh-ROH-sis) most common primary disease of the central nervous system, MS leads to demyelination of nerves, which commonly causes problems with vision, muscle control, and incontinence [*multi-* many, *-pl-* fold, *sclera-* hard, *-osis* condition]
multiple wave summation (sum-MAY-shun) condition in which a series of stimuli come in rapid enough succession that the muscle is not able to relax completely, and sustained or more forceful contraction results [*multi-* many, *-pl-* fold, *wave*, *summa-* total, *-tion* process]
multipolar neuron (NOO-rons) neuron with only one axon but several dendrites [*multi-* many, *-pol-* pole, *-ar* relating to, *neuron* nerve]
multiunit smooth muscle type of smooth muscle tissue composed of many independent single-fiber units that does not usually generate its own impulse but rather responds only to nervous input and is often found in bundles [*multi-* many, *mus-* mouse, *-cle* little]
mumps acute viral disease characterized by swelling of the parotid salivary glands [*mumps* grimace]
muscarinic (M) receptor (mus-kah-RIN-ik ree-SEP-tor) type of cholinergic receptor responding to muscarine, as well as acetylcholine [*musca-* fly, *-in-* substance, *-ic* relating to (after the toxic mushroom *A. muscaria*), *recept-* receive, *-or* agent]
muscle fatigue state of exhaustion produced by strenuous muscular activity [*mus-* mouse, *-cle* little, *fatig-* tire]
muscle spindle stretch receptor in muscle cells involved in maintaining muscle tone [*mus-* mouse, *-cle* small]
muscle strain muscle injury resulting from overexertion or trauma and involving overstretching or tearing of muscle fibers [*mus-* mouse, *-cle* small]
muscle tissue tissue type that produces movement [*mus-* mouse, *-cle* small, *tissu-* fabric]
muscle tone tonic contraction; characteristic of muscle of a normal individual who is awake [*mus-* mouse, *-cle* little, *ton-* stretch or tension]
muscular artery (AR-ter-ee) carry blood farther away from the heart to specific organs and areas of the body; also called *distributing artery* [*mus-* mouse, *-cul-* little, *-ar* relating to, *arteri-* vessel]
muscular dystrophy (DISS-troh-fee) group of genetic diseases characterized by atrophy of skeletal muscle tissue [*mus-* mouse, *-cul-* little, *-ar* relating to, *dys-* bad, *-troph-* nourishment, *-y* state]
muscular system the muscles of the body [*mus-* mouse, *-cul-* little, *-ar* relating to]
muscularis (mus-kyoo-LAIR-is) two layers of muscle surrounding the digestive tube that produce wavelike, rhythmic contractions, called *peristalsis,* that move food material along the digestive tract [*mus-* mouse, *-cul-* little, *-aris* relating to] *pl.*, musculares
mutagen (MYOO-tah-jen) agent capable of causing mutation (alteration) of DNA [*muta-* change, *-gen* produce]
mutation (myoo-TAY-shun) change in genetic material within a cell [*mutat-* change, *-tion* state]
myalgia (my-AL-jee-ah) muscle pain [*my-* muscle, *-algia* pain]
myasthenia gravis (my-es-THEE-nee-ah GRAH-vis) chronic autoimmune disease characterized by muscle weakness, especially in the face and throat, caused by immune attacks at the neuromuscular junction [*my-*muscle, *-asthenia* weakness, *gravis* severe]
myelin (MY-eh-lin) lipoprotein substance in the myelin sheath around many nerve fibers that contributes to high-speed conductivity of impulses [*myel-* marrow, *-in* substance]
myelin disorder (MY-eh-lin) any of several disorders characterized by loss or improper development of the myelin sheath that surrounds many axons of the nervous system [*myel-* marrow, *-in* substance]
myelin sheath (MY-eh-lin sheeth) whitish, fatty sheath surrounding nerve fibers; substance produced by Schwann cells [*myel-* marrow, *-in* substance]
myelin sheath gap (MY-eh-lin sheeth *see* node of Ranvier [*myel-* marrow, *-in* substance]
myelinated fiber (MY-eh-li-nay-ted) axon surrounded by a sheath of myelin formed by Schwann cells (PNS) or oligodendrocytes (CNS) [*myel-* marrow, *-in-* substance, *-ate* act of]
myeloid neoplasm (MY-eh-loyd NEE-oh-plaz-em) blood-related cancer [*myel-* marrow, *-oid* like, *neo-* new, *-plasm* substance]
myeloid tissue (MY-eh-loyd) red bone marrow; type of soft, diffuse connective tissue; the site of hematopoiesis [*myel-*marrow, *-oid* of or like, *tissu-* fabric]
myocardial infarction (MI) (my-oh-KAR-dee-al in-FARK-shun) death of cardiac muscle cells resulting from inadequate blood supply, as in coronary thrombosis; also called "heart attack" [*myo-* muscle, *-cardi-*heart, *-al* relating to, *in-* in, *-farc-* stuff]
myocardium (my-oh-KAR-dee-um) muscle of the heart [*myo-* muscle, *-cardi-* heart, *-um* thing] *pl.*, myocardia (my-oh-KAR-dee-ah)
myofascial meridian (my-oh-FAY-shul mer-ID-ee-an) line or chain of force or tension in the body formed by the continuous structures of a group of skeletal muscles and connective tissue (fascia) that are structurally and functionally linked [*myo-* muscle, *-fasci-* bundle, *-al* relating to, *meridi-* midday, *-an* relating to]
myofibril (my-oh-FYE-bril) very fine longitudinal fibers found in skeletal muscle cells; composed of thick and thin filaments [*myo-* muscle, *-fibr-* fiber, *-il* little]
myofilament (my-oh-FIL-ah-ment) ultramicroscopic, threadlike structures found in myofibrils; composed of myosin (thick) and actin (thin) [*myo-* muscle, *-fila-* thread, *-ment* thing]
myogenic mechanism (mye-oh-JEN-ik) smooth muscle autoregulatory mechanism that helps to maintain glomerular filtration rate [*myo-*muscle, *-gen-* produce, *-ic* relating to]
myoglobin (my-oh-GLO-bin) large protein molecule in the sarcoplasm of muscle cells that attracts oxygen and holds it temporarily [*myo-* muscle, *-glob-* ball, *-in* substance]
myography (my-OG-rah-fee) procedure in which the contraction of an isolated muscle is recorded [*myo-* muscle, *-graphy* process of recording]
myoma (my-OH-mah) benign tumor of the uterine fibrous or smooth muscle tissue [*my-* muscle, *-oma* tumor]
myometrium (my-oh-MEE-tree-um) middle muscle layer in the uterus [*myo-* muscle, *-metr-* womb, *-um* thing]
myopathology (mye-oh-PATH-ol-oh-jee) existence of or study of any abnormality of muscle tissue or muscle function [*myo-*muscle, *-path-* disease, *-o-* combining form, *-log-* words (study of), *-y* activity]
myopathy (my-OP-ah-thee) general term referring to any muscle disease [*myo-* muscle, *-path-* disease, *-y* state]
myopia (my-OH-pee-ah) refractive disorder of the eye caused by an elongated eyeball; nearsightedness [*myops-* nearsighted, *-op-*vision, *-ia* condition]
myosin (MY-oh-sin) contractile protein found in the thick filaments of skeletal muscle myofilaments [*myos-* muscle, *-in* substance]
myositis (my-oh-SYE-tis) inflammation of muscle tissue [*myos-* muscle, *-itis* inflammation]
myotome (MY-oh-tohm) skeletal muscle or group of muscles that receives motor axons from a given spinal nerve [*myo-*muscle, *-tome* cut segment or region]
myxedema (mik-seh-DEE-mah) firm swelling (edema) of the skin caused by deficiency of thyroid hormone in adults [*myx-* mucus, *-edema* swelling]

N

nail bed layer of epithelium under the nail [*naegl-* metal pin]
nail body visible part of the nail [*naegl-* metal pin]
nail multilayered, protective structure composed of epithelial cells containing hard keratin; located at the distal ends of fingers and toes [*naegl-* metal pin]
nail root part of the nail hidden by the cuticle [*naegl-* metal pin]
naïve (nye-EVE) refers to a B or T cell that is inactive [*naïve* natural]
naïve B cell (nye-EVE) *see* naïve [*naïve* natural, *B* bursa-equivalent tissue, *cell* storeroom]
nanobody (NAN-oh-bod-ee) antibody fragment [*nano* small]
nasal bone (NAY-zal) bone that gives shape to the nose; forms upper bridge of the nose [*nas-* nose, *-al* relating to]
nasal mucosa (NAY-zal myoo-KOH-sah) mucous membrane in the nose that air passes over [*nas-* nose, *-al* relating to, *mucus* slime] *pl.*, mucosae
nasolacrimal duct (nay-zoh-LAK-rih-mal) tube that extends from lacrimal sac into the inferior meatus of the nose [*naso-* nose, *-lacrim* tear, *-al* relating to, *duct-* to lead]
nasopharynx (nay-zoh-FAIR-inks) uppermost portion of the tube just behind the nasal cavities [*naso-* nose, *-pharynx* throat] *pl.*, nasopharynges or nasopharynxes
native state the final, folded and functional shape of a complete protein molecule [*native-* produced by birth]
natural family planning method of predicting the time of ovulation based upon the woman's cyclical changes [*nature-* free from affectation, *-al* relating to, *family-* household, *-plan* sketch]
natural immunity (i-MYOO-ni-tee) acquired immunity resulting from exposure to disease-causing agents in the course of daily living [*nature-* free from affectation, *-al* relating to, *immun-* free, *-ity* state]
natural killer (NK) cell type of lymphocyte that kills many types of tumor cells [*nature-*free from affectation, *-al* relating to, *kill-* to strike, *cell-* storeroom]
nausea (NAW-zee-ah) unpleasant sensation of the gastrointestinal tract that commonly precedes the urge to vomit; upset stomach [*nausea* seasickness]
near reflex constriction of the pupil for near vision [*re-* again, *-flex* bend]
necrosis (neh-KROH-sis) death of cells in a tissue, often resulting from ischemia (reduced blood flow) [*necr-* death, *-osis* condition]
negative feedback feedback control system in which the level of a variable is changed in the direction opposite to that of the initial stimulus
negative nitrogen balance (NYE-troh-jen) condition in which the amount of nitrogen in the urine exceeds the amount of nitrogen in the protein food ingested [*nitro-*soda, *-gen* produce]
neonatal period (nee-oh-NAY-tal) period of development immediately after birth [*neo-* new, *-nat-* birth, *-al* relating to]
neonatology (nee-oh-nay-TOL-oh-jee) diagnosis and treatment of disorders of the newborn [*neo-* new, *-nat-* born, *-log-* words (study of), *-y* activity]
neoplasm (NEE-oh-plaz-em) tumor or abnormal growth; may be benign or malignant [*neo-* new, *-plasm* formation]
nephritis (neh-FRY-tis) inflammatory kidney disease [*nephr-* kidney, *-itis* inflammation]
nephron (NEF-ron) anatomical and functional unit of the kidney, consisting of the renal corpuscle and the renal tubule [*nephro-* kidney, *-on* unit]
nephrotic syndrome (neh-FROT-ik SIN-drohm) collection of signs and symptoms that accompany various glomerular disorders [*nephr-* kidney, *-ic* relating to, *syn-* together, *-drome* running or (race) course]
nerve bundle of nerve fibers, plus surrounding connective tissue, located outside the brain or spinal cord [*nervus-* nerve]
nerve fiber axon of neuron in the nervous system [*fiber-* filament]
nerve impulse self-propagating wave of electrical depolarization that carries information along nerves; also called *action potential* [*impulse-* to drive]
nerve zero very thin nerve near each olfactory nerve; *see* terminal nerve [*zero-* naught]
nervous system brain, spinal cord, and nerves [*nerv-* nerves, *-ous* relating to]
nervous tissue tissue type consisting of neurons and glia that provides rapid communication and control of body function [*nerv-* nerves, *-ous* relating to, *tissu-* fabric]
neural network (NOOR-al) a network of interconnected neurons in nervous tissue, forming a web of pathways to process information [*neur-* nerves, *-al* relating to]
neuralgia (noo-RAL-jee-ah) general term referring to nerve pain [*neur-* nerve, *-algia* pain]
neurilemma (noo-ri-LEM-mah) sheath of Schwann; formed by the nonmyelinated out layer of the Schwann cell (neurolemmocyte) around the axon of a neuron [*neuri-*neuron, *-lemma* sheath] *pl.*, neurilemmae
neurilemmocyte (noo-ri-LEM-moh-syte) another name for the Schwann cell; also spelled *neurolemmocyte* [*neuro-* nerve, *-lemmo* sheath, *-cyte* cell]
neurobiology (noo-roh-bye-AHL-oh-jee) branch of biology that studies the basic science of the nervous system; compare to neurology [*neuro-* nerve, *-bio* life, *-ology* study of]
neuroblastoma (noo-roh-blas-TOH-mah) malignant tumor of sympathetic nervous tissue, found mainly in young children [*neuro-* nerve, *-blast* germ, *-oma* tumor]
neuroendocrine system (noo-roh-EN-doh-krin) endocrine and nervous systems working in concert to perform communication, integration, and control within the body [*neuro-* nerve, *-endo-* within, *-crin-* secrete]
neurofibril (noo-roh-FYE-bril) fine strands extending through the cytoplasm of each neuron; formed by cell's cytoskeleton [*neuro-* nerves, *-fibr-* fiber, *-il* small]
neurofibromatosis (noo-roh-fye-broh-mah-TOH-sis) group of genetic disorders characterized by multiple, sometimes disfiguring, benign tumors of the glia that surround

nerve fibers [*neuro-* nerves, *-fibr-* fiber, *-oma-* tumor, *-osis* condition]

neurogenic bladder (noor-oh-JEN-ik) disorder of the bladder that results in loss of control of normal voiding; due to disruption of nervous input to the bladder [*neuro-* nerves, *-gen-* produce, *-ic* relating to]

neurogenic shock (noo-roh-JEN-ik) condition that results from widespread dilation of blood vessels caused by an imbalance in autonomic stimulation of smooth muscle in vessel walls [*neuro-* nerve, *-gen-* produce, *-ic* relating to]

neuroglia (noo-ROG-lee-ah) nonexcitable supporting cells of nervous tissue; more properly called *glia* [*neuro-* nerve, *-glia* glue] *sing.*, neuroglial cell

neuroglobin (Ngb) (NOO-roh-gloh-bin) protein in neurons similar to hemoglobin used to temporarily store a "back up" supply of oxygen [neuro- nerves, *-glob-* ball, *-in* substance]

neurohypophysis (noo-roh-hye-POF-i-sis) posterior pituitary gland [*neuro-* nerve, *-hypo-* under or below, *-physis* growth] *pl.*, neurohypophyses

neurology (noo-ROL-oh-jee) branch of medical science that deals with the nervous system, especially its disorders and their treatments; compare to neurobiology [*neur-* nerves, *-ology* study of]

neuroma (noo-ROH-mah) any tumor arising from nervous tissue [*neur-* nerves, *-oma* tumor]

neuromodulator (noo-roh-MOD-yoo-lay-tor) "cotransmitter" that regulates the effects of neurotransmitter(s) released along with it [*neuron-* nerves, *-modul-* regulate, *-ate* act of]

neuromuscular junction (NMJ) (noo-roh-MUSS-kyoo-lar) point of contact between nerve endings and muscle fibers; *see* motor endplate [*neuro-* nerve, *- mus-* mouse, *-cul-* little, *-ar* relating to]

neuron (NOO-ron) nerve cell, including its processes (axons and dendrites) [*neuron* string or nerve]

neuron doctrine (NOO-ron DOK-trin) theory stating that the neuron is the basic structural and functional unit of the nervous system and that neurons are independent units connected by chemical synapses; now includes concepts of a larger neural network [*neuron* string or nerve]

neuropeptide (noo-roh-PEP-tyde) neurotransmitter with short strands of polypeptides [*neuro-* nerves, *-pept-* digest, *-ide* chemical]

neuropeptide Y (NOOR-oh-pep-tyde) type of neuropeptide; enhances blood vessel constriction, regulates energy balance, and learning and memory [*neuro-* nerve, *-pept-* digest, *-ide* chemical]

neurosecretory tissue (noo-roh-SEK-reh-tor-ee) modified neurons that secrete chemical messengers that diffuse into the bloodstream rather than across a synapse; for example, in the hypothalamus [*neuro-* nerve, *-secret-* secretion, *-ory* relating to, *tissu-* fabric]

neurotransmitter (noo-roh-trans-MIT-ter) chemicals by which neurons communicate; the substance is released by a neuron, diffuses across the synapse, and binds to the postsynaptic neuron [*neuro-* nerves, *-trans-* across, *-mitt-* send, *-er* agent]

neurotrophin (noo-roh-TROF-in) nerve growth factor [*neuro-* nerve, *-troph-* nutrition, *-in* substance]

neutron (NOO-tron) neutral subatomic particle located in the nucleus of an atom [*neuter-* neither]

neutrophil (NOO-troh-fil) white blood cell that stains readily with neutral dyes [*neuter-* neither, *-phil* love]

nevus (NEE-vus) small, pigmented benign tumor of the skin; a mole [*nevus-* birthmark]

nicotinamide adenine dinucleotide (NAD) (nik-oh-TIN-ah-myde AD-eh-neen dye-NOO-klee-oh-tyde) molecule that serves as an electron carrier in the electron transport system [*Jacque Nicot* French diplomat (brought tobacco to France), *-in-* substance (after plant genus *Nicotiana*), *-am-* ammonia, *-ide* chemical, *aden-* gland, *-ine* derived substance, *di-* two, *nucleo-* kernel (nucleus), *-t-* combining form, *-ide* chemical]

nicotinic (N) receptor (NIK-oh-tin-ik) type of cholinergic receptor [*Jean Nicot Villemain* French diplomat (brought tobacco to France), *-in-* substance, *-ic* relating to, (after plant genus *Nicotiana*) *recept-* receive, *-or* agent]

nipple small projection at the center of the areola on the anterior surface of the breast where the lactiferous ducts release milk [*nip-* beak, *-le* small]

Nissl bodies (NISS-ul) found in rough endoplasmic reticulum, provide protein molecules needed for transmission of nerve impulses from one neuron to another; also called *Nissl substance* [*Franz Nissl* German neurologist]

nitric oxide (NO) (NYE-trik AWK-side) small gas molecule used as a neurotransmitter that *diffuses backward* from a postsynaptic cell toward the presynaptic neuron, where it has its biochemical effects and gives the opportunity for feedback [*nitr-* nitrogen, *-ic* relating to, *ox-* oxygen, *-ide* chemical]

nitrogen balance (NYE-troh-jen) state in which the amount of nitrogen taken into the body equals the amount of nitrogen excreted [*nitro-* soda, *-gen* produce]

nitrogenous waste (nye-TROJ-i-nes) waste from protein catabolism; for example, urea, uric acid, ammonia, and creatinine [*nitro-* soda, *-gen- produce, -ous* relating to]

nitroglycerin (nye-troh-GLIS-eh-rin) heart medication that dilates coronary blood vessels thus improving supply of oxygen to myocardium [*nitro-* nitrogen, *-glyc-* sweet (sugar), *-in* substance]

nociceptor (noh-see-SEP-tor) receptor activated by intense stimuli of any type that results in tissue damage; pain receptor [*noci-* harm, *-cept-* receive, *-or* agent]

node of Ranvier (node of rahn-vee-AY) short space in the myelin sheath between adjacent Schwann cells; also called *myelin sheath gap* [*nod-* knot, *Louis A. Ranvier* French pathologist]

nonadrenergic-noncholinergic (NANC) transmission (non-AD-ren-er-jik non-KOHL-iner-jik tranz-MISH-un) neural synaptic transmission in the efferent autonomic pathways that involves transmitters other than the classical autonomic neurotransmitters norepinephrine and acetylcholine; NANC transmitters include GABA, ATP, neuropeptide Y, and others [*non-* not, *-ad-* toward, *-ren-* kidney, *-erg-*work, *-ic* relating to, *-non-* not, *-chole-* bile, *-erg-*work, *-ic* relating to]

nondisjunction (non-dis-JUNK-shun) occurs during meiosis when a pair of chromosomes fails to separate [*non-* not, *-dis-*split in two, *-junction* joint]

nondisplaced fracture *see* simple fracture [*non-* not, *-displace* to remove, *fracture-*a breaking]

nonelectrolyte (non-ee-LEK-troh-lyte) compound that does not dissociate in solution; for example, glucose [*non-* not, *-electro-* electricity, *-lyt-* loosening]

noninflammatory joint disease (non-in-FLAM-ah-toh-ree) joint disorder that does not involve inflammation of the synovial membrane [*non-* not, *- inflam-* set afire, *-ory* relating to, *joint-* to join, *dis-* opposite of, *-ease* comfort]

nonmembranous organelle (NON-membran-us or-gah-NELL) cell organ that is not defined or bordered by a membrane [*non-* without, *membran-* thin skin, *organ-* instrument, *-ele* small]

nonpolar describes a covalent chemical bond (or covalently bonded molecule) in which there is equal sharing of electrons and therefore no distinct areas of electrical charge [*non-* not, *-pol-* pole, *-ar* relating to]

nonself antigens (AN-ti-jens) foreign and tumor cell markers that a body's immune cells can recognize as being different from the self; also called *nonself markers* [*non-* not, *-self* one's own person, *anti-* against, *-gen* to produce]

nonself concept in immunology that the immune system agents can recognize certain cell-surface molecules or other molecules as not belonging to that individual and thus being a potential target for destruction or damage by the immune system [*non-* not, *-self* one's own person]

nonspecific immunity (non-speh-SIF-ik i-MYOO-ni-tee) mechanisms that resist various threatening agents or conditions, not just certain specific agents; *see* innate immunity [*non-* not, *-specif-* form or kind, *-ic* relating to, *immun-* free, *-ity* state]

nonsteroid (non-STAYR-oyd) hormone synthesized primarily from amino acids rather than from cholesterol [*non-* not, *-stero-* solid, *-oid* like]

nonsteroidal antiinflammatory drug (NSAID) (non-steh-ROID-al an-tee-in-FLAM-ah-tor- ee [EN-sed]) pain medication; for example, aspirin and ibuprofen [*non-* not, *-stero-* solid, *-oid-* like, *-al* relating to, *anti-*against, *-inflamm-* set afire, *-ory* relating to]

norepinephrine (NE, NR) (nor-ep-i-NEF-rin) hormone secreted by adrenal medulla that increases cardiac output; neurotransmitter released by sympathetic nervous system cells [*nor-* chemical prefix (unbranched C chain), *-epi-* upon, *-nephr-*kidney, *-ine* substance]

norepinephrine reuptake inhibitor (NRI) (nor-ep-i-NEF-rin ree-UP-tayk in-HIB-it-or) type of drug that stops the return of norepinephrine (neurotransmitter) to the presynaptic neuron, thus increasing the baseline amount of norepinephrine in the synapse and restoring the baseline to a normal neurotransmitter level [*nor-* chemical prefix (unbranched C chain), *-epi-* upon, *-nephr-*kidney, *-ine* substance, *re-* again, *inhib-* restrain, *-or* agent]

normal saline (SAY-leen) chloride-containing solution [*norm-* rule, *-al* relating to, *sal-* salt, *-ine* relating to]

nuclear envelope (NOO-klee-ar) the boundary of a cell's nucleus, made up of a double layer of cellular membrane [*nucle-* nucleus, *-ar* relating to]

nuclear magnetic resonance (NMR) (NOO-klee-ar mag-NET-ik REH-son-ans) *see* magnetic resonance imaging [*nucle-* nucleus, *-ar, magnet-* lodestone, *-ic* relating to, *re-* again, *-sona-* sound, *-ance* state]

nuclear pore complex (NPC) (NOO-klee-ar poor KOM-plex) complicated, channel-like structure in the nuclear envelope, the nuclear pore (as it is sometimes called) selectively transports molecules into or out of the nucleus [*nucle-* nucleus, *-ar, pore-*passage, *complex-* surrounding]

nuclease (NOO-klee-ayz) RNA and DNA digesting enzyme [*nucle-* nut or kernel (nucleic acid),*-ase* enzyme]

nucleic acid (noo-KLAY-ik ASS-id) any of the high-molecular-weight organic compounds composed of nucleotides, a ribose or deoxyribose sugar, and a phosphate group. See as examples deoxyribonucleic acid (DNA) and ribonucleic acid (RNA) [*nucle-* nut kernel, *-ic* relating to, *acid* sour]

nucleic acid test (NAT) (noo-KLAY-ik ASS-id) blood-safety screening procedure that detects minute particles of genetic material found in infectious agents [*nucle-* nut or kernel, *-ic* relating to, *acid* sour]

nucleolus (noo-KLEE-oh-lus) dense, well-defined but membraneless body within the nucleus; critical to protein formation because it "programs" the formation of ribosomes in the nucleus [*nucleo-* nucleus (kernel), *-olus* little] *pl.*, nucleoli

nucleoplasm (NOO-klee-oh-plaz-im) substance inside a cell's nucleus [*nucleo-* kernel (nucleus), *-plasm* cell or tissue substance]

nucleosome (NOO-klee-oh-sohm) tightly wound subunit of chromatin and proteins (his-tones) [*nucleo-* kernel (nucleus), *-som-* body]

nucleotide (NOO-klee-oh-tide) monomer made up of three types of chemical groups (sugar, phosphate, nitrogen base) that can act alone or to make up a polymer (nucleic acid) [*nucleo-* nut or kernel, *-ide* chemical]

nucleus (NOO-klee-us) membranous organelle that contains most of the genetic material of the cell; also, group of neuron cell bodies in the brain or spinal cord [*nucleus* kernel] *pl.*, nuclei

nucleus pulposus (NOO-klee-us pul-POH-sus) gel-like center of the intervertebral disk; surrounded by annulus fibrosis [*nucleus* kernel, *pulp-* pith of wood]

nurse cell *see* **Sertoli cell** [*nurse-* that suckles, nourishes, *cell-* storeroom]

nutrition foods we eat and the nutrients they contain [*nutri-* nourish, *-tion* process]

nyctalopia (nik-tah-LOH-pee-ah) disorder of the retina that causes difficulty seeing at night or in dim light; also called *night blindness* [*nyct-* night, *-op-* vision, *-ia* condition]

O

obesity (oh-BEES-i-tee) abnormal increase in the proportion of fat in the body [*obes-* fatness, *-ity* state]

obligatory base pairing (oh-BLIG-ah-tor-ee) same nitrogen bases in the DNA structure pairing off with each other; adenine to thymine and cytosine to guanine [*oblige-* to bind]

oblique fissure (oh-BLEEK FISH-ur) fissure in the lungs that separates the inferior and medial lobes [*obliqu-* slanted, *fissur-* cleft]

oblique fracture (oh-BLEEK) type of bone fracture in which fracture line is slanted or diagonal to the longitudinal axis [*obliq-* slanted, *fracture* a breaking]

occipital bone (awk-SIP-it-al) posterior and inferior bone of the skull [*occipit-* back of head, *-al* relating to]

occipital lobe (ok-SIP-it-al) posterior and inferior lobe of the cerebrum [*occipit-* back of head, *-al* relating to]

occipitofrontalis (ok-sip-i-toh-fron-TAL-is) muscle that covers the frontal bone and occipital bone [*occipit-* back of head, *front-* forehead, *-al* relating to]

octet rule (ok-TET) general principle in chemistry whereby atoms usually form bonds in ways that will provide each atom with an outer shell of eight electrons [*octet* group of eight]

oculomotor nerve (awk-yoo-loh-MOH-tor) cranial nerve III; motor nerve; controls eye movements [*oculo-* eye, *mot-* movement, *-or* agent]

older adulthood postnatal period after adulthood [*adultus-* grown up]

olecranon (oh-LEK-rah-non) scoop-shaped process at distal end of ulna that articulates with the humerus at the elbow joint [*olecranon* elbow]

olecranon bursa (oh-LEK-rah-non BER-sah) cushion-like sac located just under the skin overlying the olecranon of the ulna [*olecranon* elbow, *bursa* purse] *pl.*, bursae

olecranon bursitis (oh-LEK-rah-non ber-SYE-tis) inflammation of the olecranon

bursa [*olecranon* elbow, *burs-* purse, *-itis* inflammation]

olecranon fossa (oh-LEK-rah-non FOSS-ah) depression in the posterior surface of the humerus bone to allow room for the olecranon of the ulna when the elbow joint extends [*olecranon* elbow, *fossa* ditch] *pl.*, fossae (FOSS-ee)

olfactory (ohl-FAK-tor-ee) relating to the sense of smell [*olfact-* smell, *-ory* relating to]

olfactory epithelium (ohl-FAK-tor-ee ep-ih-THEE-lee-um) lining of the upper surface of the nasal cavity [*olfact-* smell, *-ory* relating to, *epi-* upon, *theli-* nipple, *-um* thing] *pl.*, epithelia

olfactory nerve (ol-FAK-tor-ee) cranial nerve I; sensory nerve; responsible for the sense of smell [*olfact-* smell, *-ory* relating to]

olfactory receptor neuron (ol-FAK-tor-ee ree-SEP-tor NOO-ron) *see* olfactory sensory neuron [*olfact-* smell, *-ory* relating to, *re-cept*-receive, *-or* agent, *neuron* nerve]

olfactory sensory neuron (ol-FAK-tor-ee SEN-so-ree NOO-ron) afferent neuron in the roof of the nose mucosa that is adapted to detect odors [*olfact-* smell, *-ory* relating to, *neuron* nerve]

oligodendrocyte (ohl-i-go-DEN-droh-syte) small astrocyte with few cell processes; helps to form myelin sheaths around axons within the central nervous system [*oligo-* few, *-dendr-* part (branch) of, *-cyte* cell]

oligodendroglioma (ohl-i-go-DEN-droh-glee-OH-mah) tumor arising from oligodendrocytes (neuroglia of central nervous tracts) [*oligo-* few, *-dendro-* part (branch) of, *-glio-* glue, *-oma* tumor]

oligospermia (ol-i-go-SPER-mee-ah) disruption of the sperm-producing function of the seminiferous tubules [*oligo-* few or little, *-sperm-* seed, *-ia* condition]

oliguria (ohl-i-GOO-ree-ah) condition of reduced urine production [*olig-* few or little, *-ur-* urine, *-ia* condition]

olive oval projection located lateral to the pyramids [*oliva-* olive]

oncogene (ON-koh-jeen) gene (DNA segment) thought to be responsible for the development of a cancer [*onco-* swelling or mass (cancer), *-gen-* produce or generate]

oncologist (ong-KOL-oh-jist) cancer specialist [*onco-* swelling or mass (cancer), *-ist* practitioner of a science]

onycholysis (ahn-ik-oh-LYE-sis) separation of the nail from the nail bed [*onycho-* nail, *-lysis* loosen]

oocyte (OH-oh-syte) developing female sex cell contained within ovarian follicles [*oo-* egg, *-cyte* cell]

oogenesis (oh-oh-JEN-eh-sis) production of female gametes [*oo-* egg, *-gen-* produce, *-esis* process]

oogonium (oh-oh-GO-nee-um) primitive cell from which oocytes derive meiosis [*oo-*egg, *-gon-* offspring, *-um* thing] *pl.*, oogonia

open fracture *see* **compound fracture** [*open* uncovered, *fracture* a breaking]

open reduction surgical procedure that aligns the broken ends of the bone [*open* uncovered, *reducere-* to lead back]

ophthalmic nerve (op-THAL-mik) part of the trigeminal nerve [*oph-* eye or vision, *-thalm-* inner chamber, *-ic* relating to]

ophthalmology (off-thal-MOL-eh-jee) medical practice specialty concerned with pathologic conditions of the eye and the diagnosis and treatment of eye disorders [*oph-* eye or vision, *-thalm-* inner chamber, *-o-* combining form, *-log-* words (study of), *-y* activity]

ophthalmoscope (off-THAL-mah-skohp) instrument used to examine the retinal surface and internal eye structures [*oph-* eye or vision, *-thalmo-* inner chamber, *-scop-* see]

opponens pollicis muscle (oh-POH-nenz POL-i-cis) thumb muscle [*oppenens* opposing, *pollicis* pole, *mus-* mouse, *-cle* little]

opsin (OP-sin) protein produced by the breakdown of rhodopsin in rods and cones of the retina; involved in a chemical reaction that initiates an impulse that results in interpretation of light energy as vision [*ops-* vision, *-in* substance]

optic chiasma (OP-tik kye-AS-mah) region where right and left optic nerves enter the brain and cross each other, exchanging fibers [*opti-* vision, *-ic* relating to, *chiasma* crossed lines (from Greek letter chi, X)] *pl.*, chiasmata, chiasms, or chiasmas

optic disk (OP-tic) area in the retina where the optic nerve fibers exit the eye and where therefore no rods or cones are present; also known as a *blind spot* [*opti-* vision, *-ic* relating to]

optic nerve (OP-tik) cranial nerve II; sensory nerve; nerves that conduct visual information to the brain [*opt-* vision, *-ic* relating to]

optic tract (OP-tik) bundles of fibers formed after the optic nerves pass through the optic chiasma [*opt-* vision, *-ic* relating to, *tract-* trail]

oral contraceptive (OR-al kon-tra-SEP-tiv) medication that controls sex hormone levels and ovulation [*or-* mouth, *-al* relating to, *contra-* against, *-cept-* take or receive (conception), *-ive* agent]

oral hypoglycemic agent (OR-al hye-poh-glye-SEE-mik) treatment for type 2 diabetes that stimulates beta cells to increase insulin supplies [*or-* mouth, *-al* relating to, *hypo-* under or below, *-glyc-* sweet, *-emia* blood condition]

oral rehydration therapy (ORT) treatment of infant diarrhea by the administration of a liberal dose of sugar and salt solution [*or-* mouth, *-alis* relating to, *re-* back again, *-hydra-* water, *-ation* process]

orbicularis oculi muscle (or-bik-yoo-LAIR-is OK-yoo-lye) muscle that encircles the mouth; "kissing muscle" [*orbi-* circle, *-cul-* little, *-ar* relating to, *ocul-* eye, *mus-* mouse, *-cle* little]

orbicularis oris muscle (or-bik-yoo-LAR-is OR-iss) muscle that encircles and closes the eye [*orbi-* circle, *-cul-* little, *-ar* relating to, *oris* mouth, *mus-* mouse, *-cle* little]

orchitis (or-KYE-tis) testicular inflammation [*orchi-* testis, *-itis* inflammation]

orexigenic (oh-rek-sih-JEN-ik) appetite producing [*orex-* appetite, *-gen-* produce, *-ic* relating to]

orexin (oh-REK-sin) factor that stimulates appetite [*orex-* appetite, *-in* substance]

organ group of several tissue types that together perform a special function [*organ*-tool or instrument]

organ of Corti (KOR-tee) *see* spiral organ [*organ-* tool or instrument, *Alfonso Corti* Italian anatomist]

organelle (or-gah-NELL) any of many cell "organs" or organized structures; for example, a ribosome or mitochondrion [*organ-* tool or instrument, *-elle* small]

organic (or-GAN-ik) referring to chemicals that contain covalently bound carbon and hydrogen atoms and are involved in metabolic reactions [*organ-* tool or instrument, *-ic* relating to]

organism (OR-gah-niz-im) any living entity considered as a whole; may be unicellular (one-celled) or composed of many different cells and body systems working together to maintain life [*organ-* instrument, *-ism* condition]

organogenesis (or-gah-no-JEN-eh-sis) formation of organs from the primary germ layers of the embryo [*organ-* instrument (organ), *-gen*-produce, *-esis* process]

orgasm (OR-gaz-um) sexual climax [*orgasm* excitement]

origin attachment of a muscle to the bone, which does not move when contraction occurs; compare to *insertion* [*origin-* source]

oropharynx (or-oh-FAIR-inks) portion of the pharynx that is located behind the mouth [*oro-* mouth, *-pharynx* throat] *pl.*, oropharynges or oropharynxes

orthodontics (or-thoh-DON-tiks) branch of dentistry that deals with the prevention and correction of positioning irregularities of the teeth and malocclusion [*ortho-* straight or upright, *-odont-* tooth, *-ic* relating to]

orthopedics (or-thoh-PEE-diks) medical specialty dealing with skeletal injury and disease [*ortho-* straight or normal, *-ped-* feet, *-ic* relating to]

orthopnea (or-THOP-nee-ah) dyspnea (difficulty in breathing) that is relieved after moving into an upright or sitting position [*ortho-* straight or upright, *-pne-* breathe, *-a* condition]

orthostatic effect (or-thoh-STAT-ik) shift of the blood reservoir to the veins in the legs when standing [*ortho-* upright, *-stat-* standing, *-ic* relating to]

Osgood-Schlatter disease (OZ-good SCHLAYT-er) avulsion fracture of bone fragments from the surface of the tibial tuberosity [*Robert B. Osgood* American surgeon, *Carl Schlatter* Swiss surgeon]

osmolality (os-moh-LAL-i-tee) osmotic concentration of a solution; the number of moles of a substance per kilogram times the number of particles into which the solute dissociates [*osmo-* push (osmosis), *-al* relating to, *-ity* state]

osmoreceptor (os-moh-ree-SEP-tor) special receptors near the supraoptic nucleus that detect decreased osmotic pressure of blood when the body dehydrates [*osmo-* push (osmosis), *-cept-* receive, *-or* agent]

osmosis (os-MO-sis) movement of a fluid (usually water) through a semipermeable membrane from an area of lesser solute concentration to an area of greater concentration [*osmos-* push, *-osis* condition]

osmotic pressure (os-MOT-ik) water pressure that develops in a solution across a semipermeable membrane as a result of osmosis [*osmo-* push, *-ic* relating to]

osseous tissue (OS-ee-us) bone tissue [*os-* bone, *-ous* relating to]

ossification (os-i-fi-KAY-shun) bone formation [*os-* bone, *-fication* to make]

osteitis fibrosa cystica (os-tee-EYE-tis fye-BROH-sah SIS-ti-kah) bone disease caused by hypercalcemia [*oste-* bone, *-it is* inflammation, *fibr-* fiber, *cyst-* cyst, *-ica* relating to]

osteoarthritis (os-tee-oh-ar-THRY-tis) degenerative joint disease; a noninflammatory disorder of a joint characterized by degeneration of articular cartilage [*osteo-* bone, *-arthr-* joint, *-itis* inflammation]

osteoblast (OS-tee-oh-blast) bone-forming cell [*osteo-* bone, *-blast* bud]

osteoclast (OS-tee-oh-klast) bone-absorbing cell [*osteo-* bone, *-clast* break]

osteocyte (OS-tee-oh-syte) bone cell [*osteo-* bone, *-cyte* cell]

osteogenic stem cell (os-tee-oh-JEN-ik) cell that differentiates to produce different types of bone cells; *see also* stem cell [*osteo-* bone, *-gen-* produce, *-ic* relating to]

osteogenesis (os-tee-oh-JEN-eh-sis) combined action of osteoblasts and osteoclasts to mold bones into adult shape [*osteo-* bone, *-gen-* produce, *-esis* process]

osteogenesis imperfecta (os-tee-oh-JEN-eh-sis im-per-FEK-tah) dominant, inherited disorder of connective tissue characterized by imperfect skeletal development, resulting in brittle bones [*osteo-* bone, *-gen-* produce, *-esis* process, *imperfecta* not perfect]

osteoid (OS-tee-oid) organic matrix of bone [*oste-* bone, *-oid* like]

osteoma (os-tee-OH-mah) benign bone tumor [*oste-* bone, *-oma* tumor]

osteomalacia (os-tee-oh-mah-LAY-shah) metabolic skeletal disease [*osteo-* bone, *-malacia* softening]

osteomyelitis (os-tee-oh-my-eh-LYE-tis) bacterial (usually staphylococcal) infection of bone tissue [*osteo-* bone, *myel-* marrow, *-itis* inflammation]

osteon (AHS-tee-on) unit of compact bone tissue made up of a tapered cylinder with layered, concentric arrangements of calcified matrix and cells around a central canal for nerves and blood vessels; also called *Haversian system* [*osteo-* bone, *-on* unit]

osteonal canal (OS-tee-on) *see* central canal (of bone) [*osteo-* bone, *-on-* unit, *-al* relating to]

osteoporosis (os-tee-oh-poh-ROH-sis) bone disorder characterized by loss of minerals and collagen from bone matrix, reducing the volume and strength of skeletal bone [*osteo-* bone, *-poro-* pore, *-osis* condition]

osteosarcoma (os-tee-oh-sar-KOH-mah) bone cancer [*osteo-* bone, *-sarc* flesh, *-oma* tumor]

otitis (oh-TYE-tis) general term referring to inflammation or infection of the ear [*ot-* ear, *-itis* inflammation]

otitis media (oh-TYE-tis MEE-dee-ah) middle ear infection [*ot-* ear, *-itis* inflammation, *medi-* middle, *-al* relating to]

otolith (OH-toh-lith) tiny "ear stones" composed of protein and calcium carbonate in the maculae of the ear, which, by responding to gravity and changes in body position, trigger hair cells that initiate impulses resulting in sense of balance [*oto-* ear, *-lith* stone]

otosclerosis (oh-toh-skleh-ROH-sis) inherited bone disorder; impairs sound conduction by causing structural irregularities in the stapes; *see also* tinnitus [*oto-* ear, *-sclero-* hard, *-sis* condition]

otoscope (OH-toh-skohp) lighted instrument used to examine the external ear canal and outer surface of the tympanic membrane [*oto-* ear, *-scop-* see]

oval window small, membrane-covered opening that separates the middle and inner ear [*oval-* egg-shaped]

ovarian cancer (oh-VAIR-ee-an) cancer of the ovary [*ovum* egg, *cancer* crab or malignant tumor]

ovarian cortex (oh-VAIR-ee-an KOHR-teks) outer region of the ovary [*ov-* egg, *-arian* relating to, *cortex* bark] *pl.*, cortices

ovarian cyst (oh-VAIR-ee-an SIST) fluid-filled cyst on the ovary that develops from follicles that fail to rupture completely or from corpora lutea that fail to degenerate [*ov-* egg, *-arian* relating to, *cyst-* bag]

ovarian follicle (oh-VAIR-ee-an FOL-i-kul) spherical configuration of cells in the ovary that contains a single oocyte [*ov-* egg, *-arian* relating to, *foll-* bag, *-icle* little]

ovarian medulla (oh-VAIR-ee-an meh-DUL-ah) inner region of the ovary; contains supportive connective tissue cells, blood vessels, nerves, and lymphatics [*ov-* egg, *-arian* relating to, *medulla* middle] *pl.*, medullae or medullas

ovary (OH-var-ee) female gonad that produces ova (sex cells) [*ov-* egg, *-ar-* relating to, *-y* location of process]

overactive bladder refers to frequent urination characterized by urgency and pain [*over-* above, *-actus* active, *bledre-* bladder]

oviduct (OH-vi-dukt) *see* fallopian tube, uterine tube [*ovi-* egg, *-duct* to lead]

ovulation (ov-yoo-LAY-shun) release of an ovum from the ovary at the end of oogenesis [*ov-* egg, *-ation* process]

ovum (OH-vum) female sex cell (gamete) [*ovum* egg] *pl.*, ova

oxidative phosphorylation (ahk-si-DAY-tiv fos-for-i-LAY-shun) reaction that joins a phosphate group to ADP to form ATP [*oxi-* sharp (oxygen), *-id-* chemical (*-ide*), *-at-* action of (*-ate*), *-ive* relating to, *phos-* light, *-phor-* carry, *-yl-* chemical, *-ation* process]

oxygen debt (AHK-si-jen) additional oxygen required for ATP synthesis to remove excess lactic acid following anaerobic exercise; also called *excess postexercise oxygen consumption (EPOC)* [*oxy-* sharp, *-gen* produce, *debt* thing owed]

oxygen-hemoglobin dissociation curve (AHK-sih-jen hee-moh-GLOH-bin) graph representing the relationship between Po_2 and O_2 saturation of hemoglobin [*oxy-* sharp, *-gen* produce, *hemo-* blood, *-glob-* ball, *-in* substance, *dis-* reverse, *-socia-* unite, *-ation* process]

oxyhemoglobin (ahk-see-hee-moh-GLOH-bin) hemoglobin combined with oxygen [*oxy-* sharp (oxygen), *-hemo-* blood, *-glob-* ball, *-in* substance]

oxytocin (OT) (ahk-see-TOH-sin) hormone secreted by the posterior pituitary gland before and after delivering a baby; thought to initiate and maintain labor, as well as cause the release of breast milk into ducts of the mammary glands [*oxy-* oxygen, *-toc-* birth, *-in* substance]

P

P wave electrocardiogram deflection that represents depolarization of the atria [named for letter of Roman alphabet]

pacemaker (PAYS-may-ker) *see* sinoatrial node [*pace-* step; *-maker* to make]

Pacini corpuscle (pah-SIN-ee KOHR-pus-ul) *see* lamellar corpuscle [*Filippo Pacini* Italian anatomist, *corpus-* body, *-cle* little]

packed cell volume (PCV) *see* **hematocrit** [*pack-* bundle, *cell-* storeroom, *volume-* paper roll]

pain control area place in the pain conduction pathway where impulses from pain receptors can be inhibited [*pain-* punishment, *control-* regulate, *area-* open space]

palatine bone (PAL-ah-tine) bone that forms the posterior part of the hard palate and the lateral wall of the posterior part of each nasal cavity [*palat-* palate (roof of mouth), *-ine* relating to]

palatine tonsil (PAL-ah-tine TAHN-sil) tonsils located behind and below the pillars of the fauces [*palat-* palate, *-ine* relating to]

palmar venous arch (PAHL-mar VEE-nus) superficial vein of the hand [*palm-* palm of hand, *-ar* relating to, *ven-* vein, *-ous* relating to]

palpable (PAL-pah-bul) can be identified by touch, such as bony landmarks located beneath the skin [*palp-* touch gently, *-able* capable]

palpebrae (PAL-peh-bree) eyelids [*palpebra-* eyelid]

palpebral fissure (PAL-peh-bral FISH-ur) opening between the two eyelids [*palpebra-* eyelid, *-al* relating to, *fissure-* cleft]

pancreas (PAN-kree-ass) endocrine gland located in the abdominal cavity; contains pancreatic islets that secrete glucagon and insulin [*pan-* all, *-creas* flesh]

pancreatic cancer (pan-kree-AT-ik) cancer of the pancreas; usually a form of adenocarcinoma [*pan-* all, *-creat-* flesh, *-ic* relating to, *cancer* crab or malignant tumor]

pancreatic islet (pan-kree-AT-ik eye-let) endocrine portion of the pancreas; made up of alpha and beta cells, among others; source of insulin and glucagon; *also called* islets of Langerhans [*pan-* all, *-creat-* flesh, *-ic* relating to, *isl-* island, *-et* little]

pancreatic juice (pan-kree-AT-ik) digestive secretion; secreted by the exocrine acinar cells of the pancreas [*pan-* all, *-creat-* flesh, *-ic* relating to]

pancreatic polypeptide (pan-kree-AT-ik pol-ee-PEP-tyde) hormone produced in the periphery of the pancreatic islets; influences digestion and distribution of food molecules [*pan-* all, *-creat-* flesh, *-ic* relating to, *poly-* many, *-pept-* to digest, *-ide* chemical, *cell* storeroom]

pancreatitis (pan-kree-ah-TYE-tiss) inflammation of the pancreas [*pan-* all, *-creat-* flesh, *-itis* inflammation]

pandemic (pan-DEM-ik) refers to a disease that affects many people worldwide [*pan-* all, *-dem-* people, *-ic* relating to]

pannus (PAN-us) aggregation of inflammatory cells, granulation tissue, and fibroblasts that adheres to the articular cartilage; destroys articular cartilage and bridges the opposing bones [*pannus* tattered cloth]

Papanicolaou test (Pap smear) (pah-peh-nik-oh-LAH-oo) cancer-screening test in which cells swabbed from the uterine cervix are smeared on a glass slide and examined for abnormalities; also called *Pap smear* or *Pap test* [*George N. Papanicolaou* Greek physician]

papilla (pah-PIL-ah) small, nipple-shaped elevation [*papilla* nipple] *pl.*, papillae (pah-PIL-ee)

papillary (PAP-i-lair-ee) relating to papillae, as in the papillary layer of the dermis located at the dermal papillae [*papilla-* nipple, *-ary* relating to]

papilloma (pap-i-LOH-mah) benign skin tumor characterized by finger-like projections (e.g., a wart) [papilla- nipple, -oma tumor]

paracrine [agent or hormone] (PAIR-ah-krin) hormone that regulates activity in nearby cells within the same tissue as their source [*para-* beside, *-crin-* secrete]

parallel muscle long straplike muscles with parallel fascicles [*para-* beside, *-llel* one another, *mus-* mouse, *-cle* little]

paralysis (pah-RAL-i-sis) loss of power of motion, especially voluntary motion [*para-* beside, *-lysis* loosening]

paramyxovirus (pair-ah-MIK-soh-VYE-rus) virus responsible for mumps [*para-* beside, *-myx-* mucus, *-virus* poison]

paranasal sinus (pair-ah-NAY-zal SYE-nus) air-containing spaces that are connected by channels to the nasal cavity [*para-* beside, *-nas-*nose, *-al* relating to, *sinus* hollow]

paraplegia (pair-ah-PLEE-jee-ah) spastic paralysis that affects both legs [*para-* beside, *-plegia* stroke]

parasympathetic division (pair-ah-sim-pah-THET-ik) part of the autonomic nervous system; ganglia are connected to the brainstem and the sacral segments of the spinal cord; controls many autonomic effectors under normal ("rest and repair") conditions [*para-* beside, *-sym- together, -pathe-* feel, *-ic* relating to]

parathyroid gland (pair-ah-THYE-royd) endocrine gland located in the neck on the posterior aspect of the thyroid gland; secretes parathyroid hormone [*para-* beside, *-thyr-* shield, *-oid* like, *gland* acorn]

parathyroid hormone (PTH) (pair-ah-THYE-royd HOR-mohn) hormone released by the parathyroid gland that increases concentration of calcium in the blood [*para-* besides, *-thyr-*shield, *-oid* like, *hormon-* excite]

parenteral (therapy) (pah-REN-ter-al) administration of nutrients, special fluids, and/or electrolytes by injection [*par-* beside, *-enter-* intestine, *-al* relating to]

parietal (pah-RYE-ih-tal) refers to the walls of an organ or cavity [*pariet-* wall, *-al* relating to]

parietal bone (pah-RYE-i-tal) cranial bone [*parie-* wall,*-al* relating to]

parietal cell (pah-RYE-i-tal) cell located on the basement membrane of gastric glands of the stomach that secretes hydrochloric acid [*paires-* wall, *-al* relating to, *cell* storeroom]

parietal lobe (pah-RYE-eh-tal) lobe that occupies the lateral and medial surface of the cerebrum [*pariet-* wall, *-al* relating to]

parietal membrane (pah-RYE-i-tal) portion of the serous membrane that lines the wall of a body cavity [*pariet-* wall, *-al* relating to, *membran-* thin skin]

parietal peritoneum (pah-RYE-i-tal pair-i-TOH-nee-um) serous membrane that covers organs of the abdomen, pelvis, and thorax [*parie-* wall, *-al* relating to, *peri-* around, *-tone-* stretched, *-um* thing]

parietal pleura (pah-RYE-i-tal PLOO-rah) serous membrane that lines the entire thoracic cavity [*parie-* wall, *-al* relating to, *pleura* rib] *pl.*, pleurae

parietooccipital sulcus (pah-RYE-eh-toh-ok-SIP-i- tal SUL-kus) groove in the cerebrum that separates the occipital lobe from the parietal lobe; also *parietooccipital fissure* [*parieto-* wall, *-occipit-* back of head, *- al* relating to, *sulcus* trench] *pl.*, sulci

Parkinson disease (PD) (PARK-in-son) nervous disorder characterized by abnormally low levels of the neurotransmitter dopamine in parts of the brain that control voluntary movement—victims usually exhibit involuntary trembling and muscle rigidity [*James Parkinson* English physician]

p-arm the shorter segment of the chromosome, which is divided into two "arms" by the centromere (the longer segment is called the *q-arm*) [*p* petite (small), arm]

parotid (gland) (peh-RAH-tid) largest of the paired salivary glands [*par-* beside, *-ot-* ear, *-id* relating to]

parotitis (pair-oh-TYE-tis) *see* mumps [*par-* beside, *-ot-* ear (parotid salivary gland), *-itis* inflammation]

pars anterior (parz an-TEER-ee-or) major part of the anterior pituitary gland [*pars* part, *ante-* front, *-er-* more, *-or* quality]

pars intermedia (PARS in-ter-MEE-dee-ah) forms a small part of the anterior pituitary gland [*pars* part, *inter-* between, *-media* to divide]

partial pressure (PAR-shal) pressure exerted by any one gas in a mixture of gases or in a liquid [*pars-* part, *-al* relating to, *premere-* to press]

partial-thickness burn (PAR-shal) first-or second-degree burn [*pars-* part, *-al* relating to]

parturition (pahr-too-RIH-shun) act of giving birth [*parturi-* give birth, *-tion* process]

passive transport cellular process in which substances move through a cellular membrane with their own energy supplied directly by the cell or its membrane [*passives* passive, *trans-* across, *-portare* carry]

patella (pah-TEL-ah) knee cap [*pat-* dish, *-ella* small] *pl.*, patellae (pah-TEL-ee)

pathogen (PATH-oh-jen) microorganism that causes disease [*patho-*disease, *-gen* produce]

pathogenesis (path-o-JEN-e-sis) pattern of a disease's development [*patho-* disease, *-genesis* origin]

pathogenic animal (path-o-JEN-ik) animal, such as an insect, that causes disease in humans; *see also* vector [*patho-* disease, *-gen-* produce, *-ic* condition of]

pathological fracture (pah-THOL-lah-jik-al) bone fracture caused by weakening of the bone by a disease, thus making normal movements too stressful for the bone to bear; also called *spontaneous fracture* [*patho-* disease, *-log-* words (study of), *-ical* relating to, *fracture* a breaking]

pathology (pah-THOL-oh-jee) study of diseased body structures [*patho-* disease, *-o-* combining form, *-log-* words (study of), *-y* activity]

pathophysiology (path-o-fiz-ee-OL-o-jee) study of the underlying physiological aspects of disease [*patho-* disease, *-physio-* nature (function), *-o-* combining form, *-log-*words (study of), *-y* activity]

pavementing adherence of neutrophils and other phagocytes to a vessel's endothelial lining [*pavement-* beaten floor]

pectoral girdle (PEK-toh-ral GIRD-el) incomplete ring of bones formed by the scapulae and clavicles and providing structural support for the upper limbs; the shoulder girdle [*pector-* breast, *-al* relating to, *girdle* belt]

pectoralis minor (pek-toh-RAL-is) muscle that pulls the shoulder down and forward [*pector-* breast, *-al* relating to, *minor* lesser]

pedicel (PED-i-cel) branches of the podocytes of the Bowman capsule, packed tightly together with only filtration slits between them [*pedic-* feet, *-el* small]

pedigree (PED-i-gree) chart used in genetic counseling to illustrate genetic relationships over several generations [*pied de grue* crane's foot pattern]

pelvic girdle (PEL-vic GER-dul) bony structure formed by the coxal bones; supports the trunk and attaches the lower extremities to it [*pelvi-* basin, *-ic* relating to]

pelvic inflammatory disease (PID) (PEL-vik in-FLAM-ah-tor-ee) inflammatory condition caused by several pathogens that spreads upward from the vagina [*pelv-* basin, -ic relating to, *inflam-* set afire, *-ory* relating to]

penis (PEE-nis) mass of erectile tissue; forms part of the male genitalia; when sexually aroused, becomes stiff to enable it to enter and deposit sperm in the vagina [*penis* male sex organ] *pl.*, penes (PEE-neez) or penises (PEE-nis-ez)

pennate muscle (PEN-ayt) muscle with fascicle attachments that appear "feather-like" [*penn-* feather, *-ate* of or like, *mus-* mouse, *-cle* little]

pentose (PEN-tohs) five-carbon sugar such as ribose or deoxyribose [*pent-* five, *-ose* sugar]

pepsin (PEP-sin) protein-digesting enzyme [*peps-* digestion, *-in* substance]

pepsinogen (pep-SIN-oh-jen) proenzyme that is converted to pepsin by hydrochloric acid [*peps-* digestion, *-in* substance, *-o-* combining form, *-gen* produce]

peptidase (PEP-tyd-ayz) protease found in the intestinal brush border; hydrolyzes peptides to amino acids [*pept-* digestion, *-ide* chemical, *-ase* enzyme]

peptide (PEP-tyde) compound made of two or more amino acids connected by peptide bonds (compare to polypeptide)

peptide bond (PEP-tyde) bond that forms between the amino group of one amino acid and the carboxyl group of another [*pept-* digest, *-ide* chemical]

peptide hormone (PEP-tyde HOR-mohn) major category of nonsteroid hormones; smaller than protein hormones; made up of a short chain of amino acids; for example, antidiuretic hormone (ADH) [*pept-* to digest, *-ide* chemical, *hormon-* excite]

perception (per-SEP-shun) interpreting a sensation [*percept-* to perceive, *-ion* process]

percutaneous coronary intervention (PCI) (per-kyoo-TAYN-ee-us KOR-oh-nair-ee inter-VEN-shun) a group of procedures in which a catheter is inserted through the skin and along an artery to an atherosclerotic plaque and instruments are then passed along the catheter to push away or remove the plaque; examples include angioplasty and atherectomy [*per-* through, *cut-* skin, *-aneous* relating to, *corona-* crown, *-ary* relating to, *inter-* between, *-ven-* go, *-tion* process]

perfusion pressure (per-FYOO-shun) local pressure gradient needed to maintain blood flow in a tissue [*per-* through, *-fus-*pour, *-sion* process]

pericardial effusion (pair-ih-KAR-dee-all ef-FYOO-shen) accumulation of pericardial fluid, pus, or blood in the space between the two pericardial layers [*peri-* around, *-cardi-* heart, *-al* relating to, *e(x)*-outside, *-fus-* pour, *-sion* process]

pericardial fluid (pair-ih-KAR-dee-al) lubricating fluid secreted by the serous membrane; in pericardial space [*peri-* around, *-cardi-* heart, *-al* relating to]

pericardial space (pair-i-KAR-dee-al) space between the visceral layer and the parietal layer surrounding the heart, filled with pericardial fluid [*peri-* around, *-cardi-* heart, *-al* relating to]

pericardial vein (pair-ih-KAR-dee-al) vein of the thorax [*peri-* around, *-cardi-* heart, *-al* relating to]

pericardiocentesis (pair-ee-KAR-dee-oh-sen-TEE-sis) pericardial drainage [*peri-* around, *-cardi-* heart, *-centesis* pricking]

pericarditis (pair-ih-kar-DYE-tis) inflammation of the pericardium [*peri-* around, *-cardi-* heart, *-itis* inflammation]

pericardium (pair-ih-KAR-dee-um) membrane that surrounds the heart [*peri-* around, *-cardi-* heart, *-um* thing] *pl.*, pericardia

perichondrium (pair-ih-KON-dree-um) fibrous covering of cartilage structures [*peri-* around, *-chondr-* cartilage, *-um* thing] *pl.*, perichondria

perikaryon (pair-ih-KAR-ee-on) *see* cell body [*peri-* around, *-karyon* nut or kernel]

perilymph (PAIR-ih-limf) watery fluid that fills the bony labyrinth of the ear [*peri-* around, *-lymph* water]

perimetrium (pair-ih- MEE-tree-um) serous covering that partly covers the uterus; a portion of the parietal peritoneum [*peri-* around, *-metr-* womb, *-um* thing]

perimysium (pair-ih-MEE-see-um) tough, connective tissue surrounding fascicles [*peri-* around, *-mysium* muscle]

perineal body (pair-ih-NEE-al) node formed by fibers from several muscles that form the pelvic floor [*peri-* around, *-ine-* excrete (perineum), *-al* relating to]

perineum (pair-ih-NEE-um) area between anus and genitals [*peri-* around, *-ine-* excrete, *-um* thing] *pl.*, perinea (pair-IH-nee-ah)

perineurium (pair-ih-NOO-ree-um) connective tissue that encircles a bundle of nerve fibers within a nerve [*peri-* around, *-neuri-* nerve, *-um* thing] *pl.*, perineuria

periodontitis (pair-ee-oh-don-TYE-tis) inflammation of the periodontal membrane that anchors teeth to jaw bone; common cause of tooth loss among adults [*peri-* around, *-odont-* tooth, *-itis* inflammation]

periosteum (pair-ee-OS-tee-um) tough, connective tissue covering the bone [*peri-* around, *-osteum* bone] *pl.*, periostea

peripheral (pe-RIF-er-al) relating to the periphery, or outer boundaries of the body, as in peripheral nervous system [*peri-* around, *-phera-* boundary, *-al* relating to]

peripheral nervous system (PNS) (peh-RIF-er-al) nerves connecting brain and spinal cord to other parts of the body [*peri-* around, *-phera-* boundary, *-al* relating to, *nerv-* nerves, *-ous* relating to]

peripheral neuropathy (peh-RIF-er-al noo-ROP-ah- thee) general term for any disease or disorder that involves damage to peripheral nerves; also called *peripheral neuritis*, or if many nerves are involved, *polyneuropathy* or *polyneuritis* [*peri-* around, *-phera-* boundary, *-al* relating to, *neuro-* nerves, *-path-* disease, *-y* state]

peripheral resistance (peh-RIF-er-al) resistance to blood flow caused by friction of blood passing through blood vessels [*peri-* around, *-phera-* boundary, *-al* relating to]

peripheral vascular disease (PVD) (peh-RIF-er-al VAS-kyoo-lar) decrease in blood flow in the hands, legs, or feet [*peri-* around, *-pher-* boundary, *-al* relating to, *-vas-* vessel, *-ular* relating to, *dis-* opposite of, *-ease* comfort]

peristalsis (pair-i-STAL-sis) wavelike, rhythmic contractions of the stomach and intestines that move food material along the digestive tract [*peri-* around, *-stalsis* contraction]

peritoneum (pair-i-toh-NEE-um) large, moist, slippery sheet of serous membrane that lines the abdominopelvic cavity (parietal layer) and its organs (visceral layer) [*peri-* around, *-tone-* stretched, *-um* thing] *pl.*, peritonea

peritonitis (pair-i-toh-NYE-tis) inflammation of the serous membranes in the abdominopelvic cavity; sometimes a serious complication of an infected appendix [*peri-* around, *-ton-* stretch (peritoneum), *-itis* inflammation]

peritubular capillary (pair-ee-TOOB-yoo-lar KAP-i-lair-ee) capillaries around the tubules in the kidney [*peri-* around, *-tub-* tube, *-ul-* little, *-ar* relating to, *capill-* hair, *-ary* relating to]

permanent teeth set of 32 teeth that replaces deciduous teeth [*permanent-* to endure]

permeable (PERM-ee-ah-bil) adjective used to describe a membrane that allows substances to move through (permeate) it [*permeable-* able to pass through]

permeant (PERM-ee-ent) adjective used to describe a substance that is able to move through (permeate) a membrane [*permeable-* able to pass through]

permeate (PERM-ee-ayt) to move through or soak through, as water moving through the pores of a fabric or molecules diffusing through the pores of a cellular membrane [*permeable-* able to pass through]

permissiveness (per-MISS-iv-ness) hormone action that occurs when a small amount of one hormone allows a second hormone to have its full effect on a target cell [*permissive-* to permit, *-ness* state]

pernicious anemia (per-NISH-us ah-NEE-mee-ah) blood disorder characterized by a low number of red blood cells as a result of a dietary deficiency of vitamin B_{12} [*pernici-* destruction, *-ous* relating to, *an-* without, *-emia* blood condition]

pernicious vomiting (per-NISH-us) severe vomiting [*pernici-* destruction, *-ous* relating to]

peroneus tertius muscle (per-oh-NEE-us TER-shee-us) leg muscle that flexes and everts the foot; also fibularis tertius [*peroneus* relating to a boot, *tertius* third, *mus-* mouse, *-cle* little]

peroxisome (pe-ROKS-i-sohm) organelles that detoxify harmful substances that have entered cells [*peroxi-* hydrogen peroxide, *-soma* body]

perspiration transparent, watery liquid released by glands in the skin that eliminates ammonia and uric acid and helps maintain body temperature; also known as *sweat* [*per-* throughout or completely, *-spire* to breathe, *-ation* process]

pH units by which acid and base concentrations (relative H ion concentrations) are measured; scale ranges from O (extremely acidic; high H concentration) to 14 (extremely basic, or alkaline; low H concentration) [abbreviation for *potenz* power, *hydrogen* hydrogen]

phalanx (fah-LANKS) any of the bones of the fingers or toes [*phalanx* formation of soldiers in rows] *pl.*, phalanges (fah-LAN-jeez)

phagocytes (FAG-oh-sytes) white blood cells that engulf microorganisms and digest them [*phago-* eat, *-cyte-* cell]

phagocytosis (fag-oh-sye-TOH-sis) ingestion and digestion of particles by a cell [*phago-* eat, *-cyte-* cell, *-osis* condition]

pharyngeal tonsil (fah-RIN-jee-al TAHN-sil) tonsil located in the nasopharynx on its posterior wall; when enlarged, referred to as *adenoids* [*pharyng-* throat, *-al* relating to]

pharyngitis (fair-in-JYE-tis) sore throat; inflammation or infection of the pharynx [*pharyng-* throat (pharynx), *-itis* inflammation]

pharynx (FAIR-inks) tubelike structure that extends from the base of the skull to the esophagus; also called *throat* [*pharynx* throat] *pl.*, pharynges or pharynxes

phenotype (FEE-no-type) overt, observable expression of a genotype [*pheno-* appear, *-type* kind]

phenylalanine hydroxylase (fen-il-AL-ah-neen hye-DROK-seh-lays) enzyme needed to convert phenylalanine into tyrosine; its absence causes phenylketonuria [*phen-* shining (phenol), *-yl-* chemical, *-alanine* amino acid, *hydro-* water, *-oxy* oxygen, *-ase* enzyme]

phenylketonuria (PKU) (fen-il-kee-toh-NOO-ree-ah) recessive, inherited condition characterized by excess of phenylketone in the urine, caused by accumulation of phenylalanine (an amino acid) in the tissues; may cause brain injury and death if phenylalanine intake is not managed properly [*phen-* shining (phenol), *-yl-* chemical, *-keton-* acetone, *-ur-* urine, *-ia* condition]

pheomelanin (fee-oh-MEL-ah-nin) type of melanin pigment that is reddish in color [*pheo-* dusky, *-melan-* black, *-in* substance]

pheromone (fair-o-mohn) class of organic molecules found in apocrine sweat (possibly urine and other excretions) and which acts as sexual (or other) signals to other individuals [*pher-* carry, *-mone* hormone (excite)]

phimosis (fi-MOH-sis) condition in which the foreskin of the penis fits so tightly over the glans that it cannot be retracted [*phimosis* muzzle]

phlebitis (fleh-BYE-tis) inflammation of a vein [*phleb-* vein, *-itis* inflammation]

phosphatase (FOS-foh-tayse) enzyme that removes phosphate groups [*phospho-* phosphorus, *-ase* enzyme]

phospholipid (fos-fo-LIP-id) phosphate-containing fat molecule; an important constituent of cell membranes [*phospho-* phosphorus, *-lip-* fat, *-id* form]

phosphoric acid (foss-FOR-ik ASS-id) contributes hydrogen ions to the extracellular fluid; influences acid-base balance [*phos-* light, *-phor-* bear (phosphorus), *-ic* relating to, *acid* sour]

phosphorus (FOS-for-us) element that is the principal component in the backbone of nucleic acids; important in energy transfer [*phos-* light, *-phorus* bearer]

phosphorylase (fos-FOR-i-layse) enzyme that adds phosphate groups [*phos-* light, *-phor-* carry, *-yl-* chemical, *-ase* enzyme]

phosphorylation (fos-for-i-LAY-shun) process of adding a phosphate group to a molecule [*phos-* light, *-phor-* carry, *-yl-* chemical, *-ation* process]

photodynamic therapy (PDT) (foh-toh-dye-NAM-ik) less invasive treatment of certain types of lung cancer [*photo-* light, *-dynam-* force, -ic relating to]

photopigment (foh-toh-PIG-ment) chemicals in retinal cells that are sensitive to light [*photo-* light, *-pigment* paint]

photopupil reflex (foh-toh-PYOO-pul REE-fleks) constriction of the pupil in bright light to protect the retina from too intense or too sudden stimulation; also known as *pupillary light reflex* [*photo-* light, *-pupil* center of eye, *re-* again, *-flex* to bend]

photoreceptor (FOH-toh-ree-sep-tor) receptor only in the eye; responds to light stimuli if the intensity is great enough to generate a receptor potential [*photo-* light, *-cept-* receive, *-or* agent]

photorefractive keratectomy (FOH-toh-ree-frak-tiv kair-ah-TEK-toh-mee) laser surgery that uses a "cool" excimer laser beam to vaporize corneal tissue [*photo-* light, *-refract-* break apart, *-ive* relating to, *kera-* hard, *-ec-*out, *-tom-* cut, *-y* action]

phrenic nerve (FREN-ik) nerve that stimulates the diaphragm to contract [*phren-* mind, *-ic* relating to]

physiological buffer (fiz-ee-o-LOJ-i-kal) secondary defense against harmful shifts in pH of body fluids; comes into play after the chemical buffer system [*physio-* nature (function), *-o-* combining form, *-log-* words (study of), *-ical* relating to, *buffe-* cushion, *-er* agent]

physiological dead space (fiz-ee-oh-LOJ-i-kal) the anatomical dead space (pulmonary airway volume outside the alveoli) plus any alveolar dead space (i.e., obstructed or diseased alveoli); *see* anatomical dead space [*physio-* nature, *-log-* words (study), *-ical* relating to]

physiological fatigue (fiz-ee-oh-LOJ-i-kal fah-TEEG) fatigue caused by a relative lack of ATP, rendering the myosin cross bridges incapable of producing the force required for further muscle contractions [*physio-* nature, *-log-* words (study), *-ical* relating to, *fatigue-* to tire]

physiological polycythemia (fiz-ee-oh-LOJ-i-kal pol-ee-sye-THEE-mee-ah) elevated red blood cell numbers and hematocrit values in healthy individuals who live and work in high altitudes [*physi-* nature, *-o-* combining form, *-log-* words (study of), *-y* activity, *poly-* many, *-cyt-* cell, *-emia* blood condition]

physiology (fiz-ee-OL-o-jee) scientific study of an organism's body function [*physio-* nature (function), *-o-* combining form, *-log-* words (study of), *-y* activity]

physique (fi-ZEEK) body build [*physique-* natural, physics]

pia mater (PEE-ah MAH-ter) vascular innermost covering (meninx) of the brain and spinal cord [*pia-* tender, *mater-* mother]

pigment coloring material produced in the body; for example, melanin [*pigment-* paint]

pimple pustule on the skin, usually associated with acne

pineal body (PIN-ee-al) endocrine gland located in the diencephalon and thought to be involved with regulating the body's biological clock; produces melatonin; also called *pineal gland* [*pine-* pine, *-al* relating to, *gland* acorn]

pineal gland (PIN-ee-al) *see* pineal body [*pine-* pine, *-al* relating to, *gland* acorn]

pinna (PIN-nah) flap of the external ear [*pinna-* peak or point]

pinocytosis (pin-oh-sye-TOE-sis) active transport mechanism used to transfer fluids or dissolved substances into cells [*pino-* drink, *-cyto-* cell, *-osis* condition]

pitch number of sound waves that occur during a specific time unit (frequency) [*picchen-* pitch]

pitting edema (eh-DEE-mah) depressions in swollen subcutaneous tissue [*edema* swelling]

pituitary dwarfism (pih-TOO-i-tair-ee DWARF-iz-em) condition resulting from hyposecretion of growth hormone during the growth years [*pituita-* phlegm, *-ism* condition]

pituitary gland (pih-TOO-i-tair-ee) neuroendocrine gland located near base of the brain that has numerous and important regulatory functions; also called the *hypophysis* [*pituit-* phlegm, *-ary* relating to, *gland* acorn

pivot joint (PIV-it joynt) type of diarthrotic synovial joint in which a projection from one bone articulates with a ring or notch in another bone, allowing rotational movement

placenta (plah-SEN-tah) structure that anchors the developing fetus to the uterus and provides a "bridge" for the exchange of nutrients and waste products between the mother and developing baby [*placenta* flat cake] *pl.*, placentae or placentas

placenta previa (plah-SEN-tah PREE-vee-ah) abnormal condition in which a blastocyst implants in the lower uterus, developing a placenta that approaches or covers the cervical opening; placenta previa involves risk of placental separation and hemorrhage [*placenta* flat cake, *previa* gone before]

plantar flexion (PLAN-tar FLEK-shun) the bottom of the foot is directed downward; this motion allows a person to stand on tiptoe [*planta-* sole, *-ar* relating to, *flex-* bend, *-ion* process]

plantar reflex (PLAN-tar REE-fleks) reflex in which the toes curl in flexion in response to stimulation of the outer margin of the foot; the Babinski sign is extension of the great

toe (with or without fanning of the other toes) instead (normal in infants) [*planta-* sole, *-ar* relating to, *re-* again, *-flex* bend]

plaque (plak) raised skin lesion greater than 1 cm in diameter [*plaque-* patch]

plasma (PLAZ-mah) liquid part of the blood [*plasma* substance]

plasma cell (PLAZ-mah) *see* B lymphocyte [*plasma* something molded (blood plasma), *cell* storeroom]

plasma membrane (PLAZ-mah) membrane that separates the contents of a cell from the tissue fluid, encloses the cytoplasm, and forms the outer boundary of the cell [*plasma* substance, *membrane* thin skin]

plasmid (PLAS-mid) small circular ring of bacterial DNA [*plasmid* something formed]

platelet (PLAYT-let) flattened cell fragment found in the blood that functions in hemostasis; thrombocyte [*plate-* flat, *-let* small]

platelet plug (PLAYT-let) results when platelets undergo a change caused by an encounter with a damaged capillary wall, or with underlying connective tissue fibers; helps to stop the flow of blood into the tissues [*plate-* flat, *-let* small]

pleura (PLOO-rah) serous membrane in the thoracic cavity [*pleura* rib] *pl.*, pleurae

pleurisy (PLOOR-i-see) inflammation of the pleura [*pleur-* rib, *-itis* inflammation]

plexus (PLEK-sus) complex network formed by converging and diverging nerves, blood vessels, or lymphatics [*plexus* network] *pl.*, plexi or plexuses

pneumonectomy (noo-moh-NEK-toh-mee) surgical procedure in which an entire lung is removed [*pneumon-* lung, *-ec-* out, *-tom-* cut, *-y* action]

pneumonia (noo-MOH-nee-ah) abnormal condition characterized by acute inflammation of the lungs in which alveoli and bronchial passages become plugged with thick fluid (exudate) [*pneumon-* lung]

pneumotaxic center (noo-moh-TAK-sik) group of cells in the pons of the brain that affects the rate of respiration by inhibiting the inspiration center [*pneumo-* wind (breath), *-taxi-* movement or reaction, *-ic* relating to]

pneumothorax (noo-moh-THOH-raks) abnormal condition in which air is present in the pleural space surrounding the lung, possibly causing collapse of the lung [*pneumo-* air or wind, *-thorax* chest]

podocyte (POD-oh-syte) special epithelial cells making up the visceral layer of the Bowman capsule [*pod-* foot, *-cyte* cell]

Poiseuille's law (pwah-SWEEZ) volume of blood circulated per minute is directly related to mean arterial pressure minus central venous pressure and inversely related to resistance [*Jean L.M. Poiseuille* French physiologist]

polar molecule (POH-lar MOL-eh-kyool) molecule in which the electrical charge is not evenly distributed, causing one side of the molecule to be more positive or negative than the other [*pol-* pole, *-ar* relating to]

poliomyelitis (pol-ee-oh-my-eh-LYE-tis) viral disease that damages motor nerves, often progressing to paralysis of skeletal muscles [*polio-* gray, *-mye-* marrow, *-itis* inflammation]

polychromatic erythroblast (pahl-ee-kroh-MAT-ik ee-RITH-roh-blast) produced during red blood cell formation; produces hemoglobin [*poly-* many, *-chrom-* color, *-ic* relating to, *erythro-* red, *-blast* bud]

polycystic ovary disease (PCOD) (pahl-ee-SIS-tik OH-var-ee) condition that is characterized by ovaries usually twice the normal size and that are studded with fluid-filled cysts [*poly-* many, *-cyst-* bag, *-ic* relating to, *ov-* egg, *-ar-* relating to, *-y* location of process]

polycythemia (pahl-ee-sye-THEE-mee-ah) excess of red blood cells [*poly-* many, *-cyt-* cell, *-emia* blood condition]

polydipsia (pol-ee-DIP-see-ah) excessive and ongoing thirst [*poly-* many. *-dipsa-* thirst, *-ia* condition]

polygenic (pahl-ee-JEN-ik) refers to traits that are determined by the combined effect of many different pairs of genes [*poly-* many, *-gen-* produce, *-ic* relating to]

polymer (PAHL-i-mer) large molecule made up of many identical smaller molecules joined together in sequence [*poly-* many, *-mer* parts]

polymorphonuclearleukocyte (pahl-ee-mohr-foh-NYOO-klee-er LOO-koh-syte) another name for neutrophil, describing the two, three, or more lobes of their nuclei [*poly-* many, *-morph-* form , *-nucle-* nut or kernel, *-ar* relating to, *leuko-* white, *-cyte* cell]

polynucleotide (pahl-ee-NOOK-lee-oh-tyde) strand of nucleotides bound to each other by chemical bonds, as in the polynucleotide strand that makes up an mRNA molecule [*poly-* many, *nucleo-* nut or kernel, *-ide* chemical]

polypeptide (pahl-ee-PEP-tyde) compound made of many amino acids connected by peptide bonds [*poly-* many, *pept-* digest,*-ide* chemical]

polyphagia (pol-ee-FAY-jee-ah) intense and continuous hunger [*poly-* many, *-phag-* eat, *-ia* condition]

polyribosome (PAHL-ee-RYE-bo-sohm) temporary structure formed within a cell by many ribosomes following one another along a strand of mRNA during the process of translation [*poly-* many, *-som-* body]

polyuria (pahl-ee-YOO-ree-ah) frequent urination [*poly-* many, *-ur-* urine, *-ia* condition]

pons (ponz) part of the brainstem between the medulla oblongata and the midbrain [*pons* bridge] *pl.*, pontes (PON-tees)

popliteal vein (pop-lih-TEE-al) vein that runs behind the knee joint [*poplit-* back of knee, *-al* relating to]

portal system arrangement of blood vessels in which blood exiting one tissue is immediately carried to a second tissue before being returned to the heart and lungs for oxygenation and redistribution [*port-* doorway, *-al* relating to]

positive feedback (mechanism) feedback control system that is stimulatory; tends to amplify or reinforce a change in the internal environment [*positiv-* to place or to amplify]

positive nitrogen balance (NYE-troh-jen) nitrogen intake in foods is greater than nitrogen output in urine [*positiv-* to place or to amplify, *nitro-* soda, *-gen* produce]

positron-emission tomography (PET) (POZ-itron eh-MISH-un toh-MOG-rah-fee) variation of computed tomography scanning; radioactive substance is introduced into the blood supply of the brain projecting a bright spot on the image [*positron* positive electron, *e-* out, *-mission* send, *tomo-* cut, *-graph-* draw, *-y* activity]

posterior (pos-TEER-ee-or) located behind; opposite of anterior [*poster-* behind, *-or* quality]

posterior cavity (of eye) (pohs-TEER-ee-or KAV-i-tee) all the space posterior to the lens of the eye; contains vitreous body [*poster-* behind, *-or* quality, *cav-* hollow, *-ity* state]

posterior chamber (of eye) (pohs-TEER-ee-or CHAM-ber) subdivision of the anterior cavity of the eye; small space behind the iris and anterior to the lens [*poster-* behind, *-or* quality, *chamber-* vaulted enclosure]

posterior cul-de-sac (of Douglas) (pohs-TEER-ee-or kul-deh-sak) a deep pouch between the uterus and the anus; formed by the posterior ligament [*poster-* behind, *-or* quality, *cul-de-sac* end of the pouch, *James Douglas* Scots anatomist] *pl.*, culs-de-sac or cul-de-sacs

posterior fornix (pohs-teer-ee-or FOR-niks) space created by the protrusion of the cervix into the lumen of the vagina; increases probability of reproductive success by retaining seminal fluid [*poster-* behind, *-or* quality, *fornix* arch]

posterior ligament (pohs-TEER-ee-or LIG-ah-ment) fold of peritoneum extending from the posterior surface of the uterus to the rectum [*poster-* behind, *-or* quality, *liga-* bind, *-ment* condition]

posterior tibial vein (pohs-TEER-ee-or TIB-ee-al) deep vein of the leg [*poster-* behind, *-or* quality, *tibia* shin bone, *-al* relating to]

postganglionic neuron (post-gang-glee-ON-ik NOO-ron) efferent autonomic neuron that conducts nerve impulses from a ganglion to effectors such as cardiac or smooth muscle or glandular epithelial tissue [*post-* after, *-ganglion-* knot, *-ic* relating to, *neuron* nerve]

postinfectious glomerulonephritis (post-in-FEK-shus gloh-mer-yoo-loh-neh-FRY-tis) *see* acute glomerulonephritis [*post-* after, *-infec-*stain, *-ous* relating to, *glomer-* ball, *-ul-* little, *-nephr-* kidney, *-itis* inflammation]

postmenstrual phase (post-MEN-stroo-al) phase in the menstrual cycle that occurs between the end of menses and ovulation; also called *preovulatory phase* and *proliferative phase* [*post-* after, *-mens-* month, *-al* relating to]

postnatal period (POST-nay-tal) period after birth, ending at death [*post-* after, *-nat-* birth, *-al* relating to]

postovulatory phase (post-ov-yoo-lah-TOR-ee) *see* premenstrual phase [*post-* after, *-ov-* egg, *-ory* relating to]

postsynaptic (post-si-NAP-tik) adjective describing any structure after a synapse (junction) of one neuron to another or any function that occurs after synaptic transmission [*post-* after, *-syn-* together, *-apt-* join, *-ic* relating to]

postsynaptic neuron (post-si-NAP-tik NOO-ron) in neuron-to-neuron communication, the neuron that receives a stimulus via an adjacent neuron's transmission of neurotransmitters across the synapse [*post-* after, *-syn-* together, *-apt-* join, *-ic* relating to]

postsynaptic potential (post-sih-NAP-tik poh-TEN-shal) local potential produced by opening of ion channels in the postsynaptic membrane [*post-* after, *-syn-* together, *-apt-* join, *-ic* relating to, *potent-* power, *-ial* relating to]

posture position of the body; often refers to the erect position of the body maintained unconsciously [*postur-* position]

potassium (poh-TAS-ee-um) mineral element that forms the ion K [*potass-* potash, *-um* thing or substance]

potassium channel (poh-TASS-ee-um CHAN-el) a pore in a cell membrane that allows only potassium ions to permeate, or pass through, the membrane [*potass-* potash, *-um* thing or substance, *channel-* groove]

potential osmotic pressure (po-TEN-shal os-MOT-ik) maximum osmotic pressure that could develop in a solution when it is separated from pure water by a selectively permeable membrane [*potent-* power, *-ial* relating to, *osmo-* push, *-ic* relating to]

Pott fracture fracture of the lower part of the tibia [*Percival Pott*, English physician, *fracture* a breaking]

preauricular lymph node (pree-ah-RIK-yoo-lar limf nohd) lymphatic tissue located just in front of the ear [*pre-* before, *-auric-* ear, *-ula-*little, *-ar* relating to, *lymph* water, *nod-* knot]

precapillary sphincter (pree-CAP-pi-lair-ee SFINGK-ter) smooth muscle cells that guard the entrance to the capillary [*pre-* before, *-capill-* hair, *-ary* relating to]

precordial lead (pree-KOR-dee-al) *see* chest lead [*pre-* before, *-cordi-* heart, *-al* relating to]

preeclampsia (pree-ee-KLAMP-see-ah) syndrome of abnormal conditions of uncertain cause in pregnancy; symptoms include hypertension, proteinuria, and edema; also called *toxemia of pregnancy*, it may progress to eclampsia—severe toxemia that may cause death [*pre-* before, *-lamp-* shine forth, *-sia* condition]

preganglionic neuron (pree-gang-glee-ON-ik NOO-ron) efferent autonomic neuron that conducts nerve impulses between the spinal cord and a ganglion [*pre-* before, *-ganglion-* knot, *-ic* relating to, *neuron* nerve]

pregnancy-induced hypertension (PIH) (PREG-nan-see-in-DOOST hye-per-TEN-shun) a condition in which a woman's blood pressure rises after the twentieth week of pregnancy and remains elevated until the end of pregnancy; PIH may have a genetic component and may progress to *preeclampsia* [*hyper-* excessive, *-tens-* stretch or pull tight, *-sion* state]

premature contraction contraction that occurs before the next expected contraction in a series of cardiac cycles; also called *extrasystole* [*pre-* before, *-mature* to ripen, *con-* together, *-tract* to draw, *-tion* process]

premenstrual phase (pree-MEN-stroo-al) phase of the menstrual cycle that occurs between ovulation and the onset of the menses; also called *postovulatory phase*, *progesterone phase*, *luteal phase*, or *secretory phase* [*pre-* before, *-mens-* month, *-al* relating to]

premenstrual syndrome (PMS) (pree-MEN-stroo-all SIN-drohm) condition that involves a collection of symptoms that regularly occur in many women during the premenstrual phase [*pre-* before, *-mens-* month, *-al* relating to, *syn-* together, *-drome* running or (race) course]

prenatal period (PREE-nay-tal) developmental period after conception until birth [*pre-* before, *-nat-* birth, *-al* relating to]

preovulatory phase (pree-ov-yoo-lah-TOR-ee) *see* postmenstrual phase [*pre-* before, *-ov-* egg, *-ory* relating to]

prepatellar bursitis (pree-pah-TEL-er ber-SYE-tis) inflammation of the prepatellar bursa; also called "housemaid's knee" [*pre-* in front of, *-pat-* dish, *-ella* small, *-ar* relating to, *bursa-* purse, *-itis* inflammation]

prepuce (PREE-pus) foreskin, especially covering fold of skin over the glans penis [*pre-* before, *-puc-* penis]

presbycusis (pres-bih-KYOO-sis) progressive hearing loss as a result of nerve impairment; common among elderly [*presby-* elderly, *-cusis* hearing]

presbyopia (pres-bee-OH-pee-ah) farsightedness of old age [*presby-* aging, *-op-* vision, *-ia* condition]

pressoreflex (pres-oh-REE-fleks) *see* baroreflex pressure acuity (ah-KYOO-i-tee) sharpness of visual perception [*premere-* to press, *acu-* sharp, *-ity* state]

presynaptic (pree-si-NAP-tik) adjective describing any structure before a synapse (junction) of one neuron to another or any function that occurs before synaptic transmission [*press-* pressure, *-re-* back or again, *-flex* bend]

presynaptic neuron (pree-si-NAP-tik NOO-ron) in neuron-to-neuron communication, the neuron that transmits a signal to an adjacent neuron via release of neurotransmitters that cross the synapse and bind to the postsynaptic neuron [*pre-* before, *-syn-* together, *-apt-* join, *-ic* relating to]

prevertebral ganglion (pree-ver-TEE-bral GANG-glee-on) collateral ganglion; pairs of sympathetic ganglia located a short distance from the spinal cord [*pre-* before, *-vertebra* joint, *-al* relating to, *ganglion-* knot]

primary bronchus (PRY-mair-ee BRONG-kus) either of the two branches of the trachea that enter the lungs [*prim-* first, *-ary* relating to, *bronchus* windpipe] *pl.*, bronchi (BRONG-kye)

primary follicle (PRY-mair-ee FOL-i-kul) follicles present at puberty; formed from granulosa cell [*prim-* first, *-ary* state, *folli-* bag, *-cle* small]

primary germ layer (PRY-mair-ee) any of the three layers of developmental cells that give rise to definite structures as the embryo develops; *see* ectoderm, endoderm, mesoderm [*prim-* first, *-ary* state, *germ* sprout]

primary hyperparathyroidism (PRY-mair-ee hye-per-pair-ah-THY-royd-iz-em) condition that results when parathyroid gland fails to adjust its hormone output to compensate for changes in blood calcium levels [*prim-* first, *-ary* relating to, *hyper-* excessive, *-para-* beside, *-thyr-* shield (thyroid), *-oid* like, *-ism* condition]

primary oocytes (PRY-mair-ee OH-oh-sytes) developmental stage of the ova; formed from oogonia during the fetal period [*prim-* first, *-ary* state, *oo-* egg, *-cyte* cell]

primary ossification center (PRY-mair-ee os-i-fi-KAY-shun) where a blood vessel enters the cartilage of a developing bone at the midpoint of the diaphysis to initiate bone formation [*primary* first order, *os-* bone, *-fication* to make]

primary principle of ventilation (PRY-mair-ee) movement of air in the pulmonary airways from the area where the pressure is higher to the area where the pressure is lower [*prim-* first, *-ary* relating to, *princip-* foundation, *vent-* fan or create wind, *-tion* process]

primary sex characteristics (PRY-mair-ee) changes that involve the development of the gonads [*prim-*first, *-ary* state, *charassein* to engrave]

prime mover main muscle responsible for producing a particular movement [*prime* first order]

principle of independent assortment genetic principle that states as chromosome pairs separate, the maternal and paternal chromosomes redistribute themselves independently of the other chromosome pairs [*princip-* foundation, *in-* not, *-de-* remove entirely, *-pend* to hang upon, *assort-* to match into groups]

principle of segregation genetic principle that states that the two members of a pair of chromosomes separate during meiosis [*princip-* foundation, *segregate-* divide, *-ation* process of]

prion (PREE-ahn) a term that is short for "*pro*teinaceous *in*fectious particles," which are proteins that convert normal proteins of the nervous system into abnormal proteins, causing loss of nervous system function; the abnormal form of the protein also may be inherited; a newly discovered type of pathogen, not much is known about how the prion works; *see* bovine spongiform encephalopathy, variant Creutzfeldt-Jakob Disease (vCJD) [condensed from *proteinaceous infectious particle*]

process (PRAH-ses) 1. A series of actions having a result 2. A projection from a structure such as a bone [*process* advance or project (from)]

product molecules or atoms that result from a chemical reaction [*product-* to bring forth]

proctitis (prok-TYE-tis) inflammation of the rectal mucosa [*proct-* anus, *-itis* inflammation]

proenzyme (pro-EN-zime) inactive form in which many enzymes are synthesized [*pro-* first, *-en-* in, *-zyme* ferment]

proerythroblast (proh-eh-rith-roh-BLAST) maturation stage of the red blood cell; appearance of this cell begins differentiation in red blood cells [*pro-* first, *-erythro-* red, *-blast* bud]

progeria (proh-JEER-ee-ah) rare, inherited condition in which a young child appears to age rapidly, also called *Hutchinson-Gilford disease* [*pro-* early, *-ger-* old age, *-ia* condition]

progesterone (proh-JES-ter-ohn) steroid hormone produced by the ovaries (particularly the corpus luteum) that helps prepare the uterus for implantation; along with estrogen, helps maintain normal uterine and mammary gland function [*pro-* provide for, *-gester-* bearing (pregnancy), *-stero-* solid or steroid derivative, *-one* chemical]

progesterone phase (proh-JES-ter-ohn) *see* premenstrual phase [*pro-* provide for, *-gester-*bearing pregnancy), *-stero-* solid or steroid derivative, *-one* chemical]

prohormone (proh-HOR-mohn) hormone precursor [*pro-* first, *hormon-* excite]

projection tract extension of the sensory spinothalamic tracts and descending corticospinal tracts in the brain [*project-* thrown forward, *-ion* process, *tract-* trail]

prolactin (PRL) (proh-LAK-tin) hormone secreted by the anterior pituitary gland during pregnancy to stimulate the breast development needed for lactation [*pro-* provide for, *-lact-* milk, *-in* substance]

proliferative phase (PROH-lif-er-eh-tiv) *see* postmenstrual phase [*proli-* offspring, *-fer-*bear or carry, *-at-* process, *-ive* relating to]

pronation (proh-NAY- shun) movement that turns the palm of the hand down [*pronat-*bend forward, *-tion* process]

prophase (PRO-fayz) first stage of mitosis during which chromosomes become visible [*pro-* first, *-phase* stage]

proprioception (proh-pree-oh-SEP-shun) perception of movement and position of the body [*propri-* one's own, *-cept-* receive, *-tion* process]

proprioceptor (proh-pree-oh-SEP-tor) receptor located in the muscles, tendons, and joints; allows the body to perceive its position relative to surroundings [*propri-* one's own, *-cept-* receive, *-or* agent]

propulsion (proh-PUL-shen) continual pushing of chyme in the stomach toward the pyloric sphincter by peristaltic contractions [*pro-* in front, *-pul-* drive, *-sion* process]

prostaglandin (PG) (pross-tah-GLAN-din) any of a group of naturally occurring lipid-based substances that act in a hormone-like way to affect many body functions, including vasodilation, uterine smooth muscle contraction, and the inflammatory response [*pro-* before, *-stat-* set or place (prostate), *-gland-* acorn (gland), *-in* substance]

prostate (PROSS-tayt) exocrine gland that lies just below the bladder in the male; secretes a fluid that constitutes about 30% of the seminal fluid volume; helps activate sperm and helps them maintain motility [*pro-* before, *-stat-* set or place]

prostatectomy (pros-tah-TEK-toh-mee) surgical removal of the prostate [*pro-* before, *-stat-* set or place (prostate gland), *-ec-* out, *-tom-* cut, *-y* action]

prostate-specific antigen (PSA) (PROSS-tayt speh-SIF-ik AN-ti-jen) blood protein sometimes associated with prostate cancer [*pro-*before, *-stat-* set or place (prostate gland), *specif-* form, *-ic* relating to, *anti-*against, *-gen* produce]

prosthesis (pros-THEE-sis) artificial device that is used in the partial or total replacement of a diseased joint [*prosthesis* addition] *pl.*, prostheses (pros-THEE-seez)

protease (PRO-tee-ayz) enzyme that catalyzes the hydrolysis of proteins into intermediate compounds (proteoses and peptides) [*prote-*protein, *-ase* enzyme]

proteasome (PRO-tee-ah-sohm) cell structure that breaks down individual proteins [*protea-* protein, *-som-* body]

protein (PRO-teen) large molecules formed by linkage of amino acids by peptide bonds; one of the basic building blocks of the body [*prote-* primary, *-in* substance]

protein balance (PRO-teen) rate of protein anabolism equals or balances the rate of protein catabolism [*prote-* primary, *-in* substance]

protein hormone (PRO-teen HOR-mohn) long, folded chain of amino acids; for example, insulin and parathyroid hormone [*prote-* first rank, *-in* substance, *hormon-* excite]

protein-calorie malnutrition (PCM) (PRO-teen KAHL-ah-ree mal-noo-TRISH-un) abnormal condition resulting from a deficiency of calories in general and protein in particular [*mal-* poor, *-nutri-* nourish, *-tion* process]

proteoglycan (PRO-tee-oh-GLYE-kan) large molecule made up of a protein strand that forms a backbone to which are attached many carbohydrate molecules [*proteo-* protein, *-glycan* polysaccharide (from *-glyc-*sweet)]

proteome (PRO-tee-ohm) the entire group of proteins produced by a cell or by the entire body [*prote-* protein, *-ome* entire collection]

proteomics (proh-tee-OH-miks) the endeavor that involves the analysis of the proteins encoded by the genome, with the ultimate goal of understanding the role of each protein in the body [*prote-* first rank (protein), *-om-* entire collection, *-ic* relating to]

proton (PROH-ton) positively charged subatomic particle [*protos-* first, *-on* elementary atomic particle]

protozoan (pro-toe-ZO-an) single-celled organism with a nucleus and other membranous organelles that can infect humans [*proto-* first, *-zoan* animal] *pl.*, protozoa

protraction (proh-TRAK- shun) movement that moves a part forward [*pro-* forward, *-tract-* drag, *-tion* process]

proximal (PROK-si-mal) next or nearest; located nearest the center of the body or the point of attachment of a structure; opposite of distal [*proxima-* near, *-al* relating to]

proximal convoluted tubule (PROK-si-mal KON-vo-LOO-ted TOO-byool) second part of the nephron and the first segment of a renal tubule; major portion of the *proximal tubule* [*proxima-* near, *-al* relating to, *con-*together, *-volut-* roll, *tub-* tube, *-ul-* little]

proximal interphalangeal (PIP) (PROK-si-mal in-ter-fah-LAN-gee-al) joint between the proximal and middle phalanges [*proxima-* near, *-al* relating to, *inter-* between, *-phalang-* finger bones (ref. from rows of soldiers), *-al* relating to]

proximal tubule (PROK-si-mal TOO-byool) *see* proximal convoluted tubule [*proxima-*near, *-al* relating to, *tub-* tube, *-ul-* little]

pseudogene (SOOD-oh-jeen) nonfunctional "broken" genetic code found in "junk DNA" located between the functioning, coding genes of a DNA molecule; pseudogenes are thought to be genetic "fossils" remaining from our evolutionary past [*pseudo-* false, *gene* produce]

pseudostratified columnar epithelium (SOOD-oh-STRAT-i-fyed KAHL-um-nar ep-i-THEE-lee-um) type of tissue similar to simple columnar epithelium; forms a membrane made up of single layer of cells that are tall and narrow but have been squeezed together in a way that pushes the nuclei into two layers and thus gives the appearance that it is stratified [*pseudo-* false, *-strati-* layer, *-fied* to be made, *column-* column, *-ar* characterized by] *pl.*, epithelia

psoriasis (so-RYE-ah-sis) chronic, inflammatory skin disorder characterized by cutaneous inflammation and scaly plaques [*psor-* itching, *-iasis* condition]

psychological stressor (sye-koh-LOJ-i-kal STRESS-or) anything an individual perceives as a threat [*psycho-* the mind, *-logos-*words (study), *-al* relating to, *stress-* tighten, *-or* agent]

psychophysiology (sye-koh-fiz-ee-OL-oh-jee) scientific discipline that studies physiological responses of individuals being subjected to psychological stressors [*psycho-* the mind, *-physio* nature (function), *-o-* combining form, *-log-* words (study of), *-y* activity]

psychosomatic (sye-koh-so-MAT-ik) mind influencing the body

ptosis (TOH-sis) downward displacement of an organ; for example the lowered kidneys of very thin individuals [*psycho-* the mind, *-soma* body, *-ic* relating to]

pterygoid muscle (TER-i-goid) muscle of mastication; opens and protrudes the mandible while causing sideways movement [*ptery-* wing, *-oid* like, *mus-* mouse, *-cle* little]

puberty (PYOO-ber-tee) stage of adolescence in which a person becomes sexually mature [*pubert-* age of maturity, *-y* state]

pubis (PYOO-biss) most anterior coxal bone [*pubis* groin] *pl.*, pubes (PYOO-beez)

puerperal fever (pyoo-ER-per-al) condition caused by bacterial infection in a woman after delivery of an infant, possibly progressing to septicemia and death; also called "child-bed fever" [*puerp-* childbirth, *-al* relating to]

pulmonary artery (PUL-moh-nair-ee AR-ter-ee) artery that carries deoxygenated blood from the right ventricle of the heart to the lungs; exiting the heart is the trunk of the pulmonary artery (pulmonary trunk), which branches into a left and right pulmonary artery [*pulmon-* lung, *-ary* relating to, *arteri-* vessel]

pulmonary circulation (PUL-moh-nair-ee) blood flow from the right ventricle to the lung and returning to the left atrium [*pulmon-* lung, *-ary* relating to, *circulat-* go around, *-tion* process]

pulmonary edema (PUL-moh-nair-ee eh-DEE-mah) congestion of blood in the pulmonary circulation [*pulmon-* lung, *-ary* relating to, *edema* swelling]

pulmonary embolism (PUL-moh-nair-ee EM-boh-liz- em) blockage of the pulmonary circulation by a thrombus or other matter; may lead to death if blockage of pulmonary blood flow is significant [*pulmon-*lung, *-ary* relating to, *embol-* plug, *-ism* condition]

pulmonary radiology (PUL-moh-nair-ee RAY-dee-ohl-oh-gee) chest x-ray examination [*pulmon-* lung, *-ary* relating to, *radi-* ray or radiation, *-o-* combining form, *-log-* words (study of), *-y* activity]

pulmonary trunk (PUL-moh-nair-ee trunk) initial segment of the pulmonary artery, before it splits into left and right branches [*pulmon-* lung, *-ary* relating to]

pulmonary (semilunar) valve (PUL-moh-nair-ee [semi-LOO-nar]) valve located at the beginning of the pulmonary artery [*pulmon-* lung, *-ary* relating to, *semi-* half, *-luna* moon, *-ar* relating to, *valve-* folding door]

pulmonary vein (PUL-moh-nair-ee) any vein that carries oxygenated blood from the lungs to the left atrium [*pulmon-* lung, *-ary* relating to]

pulmonary ventilation (PUL-moh-nair-ee ven-tih-LAY-shun) breathing; process that moves air in and out of the lungs [*pulmon-*lung, *-ary* relating to, *vent-* fan or create wind, *-tion* process]

pulp cavity cavity in the dentin of a tooth that contains connective tissue, blood and lymphatic vessels, and sensory nerves [*pulp* flesh, *cav-* hollow, *-ity* condition]

pulse point where the pulse can be palpated; that is, wherever an artery lies near the surface and over a bone or other firm background; for example, radial artery [*pulse-* beat]

pulse pressure difference between systolic and diastolic blood pressure [*pulse* beat]

puncta (PUNK-ta) see punctum

punctum (PUNK-tum) opening into the lacrimal canals located at the inner canthus of the eye [*punctum* small point] *pl.*, puncta

Punnett square (PUN-it) grid used in genetic counseling to determine the probability of

inheriting genetic traits [*Reginald C. Punnett* English geneticist]

pupil opening in the center of the iris that regulates the amount of light entering the eye [*pup-* doll, *-il* little]

pupillary light reflex (PYOO-pih-lair-ee) photopupil reflex [*pup-* doll, *-il* little, *-ary* relating to, *re-* again, *-flex* bend]

purine base (PYOO-reen) one of two types of nitrogenous bases that are vital components of DNA derived from purine; adenine and guanine [*pur-* pure, *-ine* chemical]

Purkinje fibers (pur-KIN-jee) *see* subendocardial branches [*Johannes E. Purkinje* Czech physiologist]

pus accumulation of white blood cells, dead bacterial cells, and damaged tissue cells at site of an infection [*pus* corrupt matter]

pustule (PUS-tyool) small, raised skin lesion filled with pus [*pustule-* blister or pimple]

pyelonephritis (pye-eh-loh-neh-FRY-tis) inflammation of the renal pelvis and connective tissues of the kidney [*pyel-* renal pelvis, *-nephr-* kidney, *-itis* inflammation]

pyloric sphincter (pye-LOR-ik SFINGK-ter) sphincter (muscular valve) that prevents food from leaving the stomach and entering the duodenum [*pyl-* gate, *-or-* to guard, *-ic* relating to, *sphinc-* bind tight, *-er* agent]

pyloric stenosis (pye-LOR-ik steh-NO-sis) obstructive narrowing of the pylorus [*pyl-* gate, *-or-* guard, *-ic* relating to, *stenos-* narrow, *-osis* condition] *pl.*, stenoses

pylorospasm (pye-LOHR-oh-spaz-um) condition occurring in infants when the pyloric fibers do not relax normally to allow food to leave the stomach, and the infant vomits food instead of digesting and absorbing it [*pyl-* gate, *-or-* guard, *-spasm* twitch or involuntary contraction]

pylorus (pye-LOR-us) lower part of the stomach [*pyl-* gate, *-orus* guard]

pyramid (PEER-ah-mid) one of two bulges of white matter located on the ventral surface of the medulla [*pyramis-* pyramid]

pyramidal tract (pi-RAM-i-dal) fibers that come together in the medulla to form the pyramids; also called *corticospinal tract* [*pyrami-* pyramid, *-al* relating to, *tract-* trail]

pyramids (PEER-ah-mids) triangular-shaped divisions of the medulla of the kidney [*pyramis-* pyramid]

pyrimidine base (pi-RIM-i-deen) one of two types of nitrogenous bases that are vital components of DNA derived from pyrimidine; cytosine and thymine [*pyrimid-* nitrogen compound, *-ine* chemical]

pyrogen (PYE-roh-jen) systemic inflammatory response chemical that causes the thermostatic control centers of the hypothalamus to produce a fever [*pyro-* heat, *-gen* produce]

pyuria (pye-YOO-ree-ah) pus in urine [*py-* pus, *-ur-* urine, *-ia* condition]

Q

q-arm the longer segment of the chromosome, which is divided into two "arms" by the centromere (the shorter segment is called the p-arm) [*q* follows *p* in Roman alphabet]

QRS complex electrocardiogram deflection that represents depolarization of the ventricles [named for letters of Roman alphabet]

quadriplegia (kwod-ri-PLEE-jee-ah) paralysis that affects all four extremities [*quadri-* fourfold, *-plegia* stroke]

quaternary (KWAH-ter-nair-ee) fourth or relating to the fourth in a series, as in the quaternary structure of a protein, which is the fourth level of complexity in the structure of a protein molecule; a quaternary protein is a protein possessing a fourth level of complexity in its molecular structure [*quarti-* fourth, *-ary* relating to]

R

raccoon eyes (ra-KOON eyes) condition that may occur as a result of the fracture of the fragile bones of the eye orbit [*arocoun-* raccoon]

radial keratotomy (RAY-dee-al KAR-ah-tah-toh-mee) surgical placement of six or more radial slits in a spoke-like pattern around the cornea; flattens cornea and improves focus [*radi-* ray, *-al* relating to, *kera-* horn, *-tom-* cut, *-y* action]

radiation (ray-dee-AY-shun) electromagnetic energy, including light, x-rays, heat; in physiology, often refers to flow of excess heat energy away from the body via the blood [*radia-* send out rays, *-tion* process]

radiation sickness (ray-dee-AY-shun) a condition caused by ionizing radiation that can be mild to severe, or even fatal, depending on the level of radiation exposure and the length of time exposed; exposure at lower doses of radiation can result in headache, nausea and vomiting, appetite loss, and diarrhea; exposure to low doses for a longer period of time or a single high-level exposure may cause sterility, damage to fetal development, cancer (including leukemia), cataracts, hair loss (alopecia), and skin damage (radiation dermatitis); *see* ionizing radiation

radiation therapy (ray-dee-AY-shun) treatment often used to combat cancer; high-intensity (x-ray or gamma) radiation is used to destroy cancer cells; also called *radiotherapy* [*radia-* send out rays, *-tion* process, *therapy* treatment]

radical mastectomy (RAD-i-kal mas-TEK-toh-mee) procedure that removes the entire breast, nearby muscles and lymph nodes [*radic-* root, -al relating to, *mast-* breast, *-ec-* out, *-tom-* cut, *-y* action]

radioactive isotope (ray-dee-oh-AK-tiv EYE-so-tope) unstable isotope that spontaneously emits subatomic particles and electromagnetic radiation [*radio* send out rays, *iso-* equal, *-tope* place]

radioactivity (ray-dee-o-ak-TIV-it-ee) the ongoing process of emitting subatomic particles and electromagnetic radiation [*radio* send out rays]

radiocarpal joint (RAY-dee-oh-KAR-pal) the point of articulation where the radius distally articulates directly with the carpal bones [*radio-* ray, *-carp-* wrist, *-al* relating to]

radiofrequency ablation (RAY-dee-oh-FREE-kwen-see ab-LAY-shun) procedure that uses a gold-plated mesh fabric to fill the uterine cavity, which is then charged with radiofrequency energy to destroy bleeding endometrial cells [*radio-* ray, frequency, *ab-*away from, *-lat-* carry, *-tion* process]

radiography (ray-dee-OG-rah-fee) imaging technique using x-rays that pass through certain tissues more easily than others, allowing an image of tissues to form on a photographic plate [*radio-* ray, frequency, *-graphy* drawing]

radioisotope (ray-dee-oh-EYE-so-tope) an isotope that is unstable and undergoes nuclear breakdown [*radio-* send out rays, *-iso-* equal, *-tope* place]

radiotherapy (ray-dee-oh-THER-ah-pee) radiation therapy [*radio-* send out rays, *-therapy* treatment]

radioulnar joint (RAY-dee-oh-UL-nur) articulation of the head of the radius and the radial notch of the ulna [*radio-* ray, *-ulna-* elbow or arm, *-ar* relating to]

radius (RAY-dee-us) forearm bone; located on thumb side [*radius* ray] *pl.*, radii (RAY-dee-eye)

raft a structure made up of groupings of molecules (cholesterol, certain phospholipids, proteins) within a cell membrane that travel together on the surface of the cell, something like a log raft on a lake; also called *lipid raft* [*raft-* floating platform]

ramus (RAY-mus) large branch of a spinal nerve as it emerges from the spinal cavity [*ramus* branch] *pl.*, rami

range of motion (ROM) extent of movement of a joint [*range-* to place in a row, *motus-* to move, *-ion* process]

rapid eye movement (REM) sleep stage of sleep characterized by rapid movements of the eye; associated with vivid dreaming [*rapid-* hasty, *move-* set in motion]

rate law law of mass action [*ratus-* reckoned]

ratio (RAY-shee-oh) the relationship of one quantity to one or more other quantities expressed as a proportion of one to the others [*ratio* a reckoning]

rational drugs chemotherapy drugs that target only those specific molecules, enzymes, or receptors unique to cancer cells or tumor growth, thereby affecting only the cancer and sparing normal cells, increasing efficiency and reducing side effects [*ratio-* reason, *-al* relating to]

reabsorption (ree-ab-SORP-shun) movement of substances back into the bloodstream, as when bone calcium is dissolved by osteoclasts and diffuses into the bloodstream, or when solutes in renal filtrate (in the nephron) move back into the bloodstream [*re-* back again, *-absorp-* swallow, *-tion* process]

reactant (ree-AK-tant) participant in a chemical reaction that is changed by the reaction [*re-* again, *-actant* to act]

receptor portion of a sensory neuron that responds to an external stimulus; also, any molecule on the surface of a cell that binds specifically to other molecules (such as cell markers, hormones, neurotransmitters) [*recept-* receive, *-or* agent]

receptor potential potential that develops in the receptor's membrane when an adequate stimulus has been received [*recept-* receive, *-or* agent, *potent-* power, *-ial* relating to]

recessive (ree-SES-iv) in genetics, refers to genes that have effects that do not appear in the offspring when they are masked by a dominant gene (recessive forms of a gene are represented by lowercase letters); *see* dominant [*recess-* retreat, *-ive* relating to]

recombinant DNA (ree-KOM-bih-nant D N A) joining together of hereditary material into new, biologically functional combinations [*re-* again, *-comb* together, *-bini* two by two]

recessive gene (ree-SES-iv j) gene that has effects that do not appear in the offspring when they are masked by the dominant gene [*recess-* retreat, *-ive* relating to, *gene* produce]

recruit (ree-KROOT) to supply with new members, as in stimulating additional muscle fibers to contract simultaneously in a muscle in order to strengthen the contraction force [*re-* again, *-cruit* grow]

rectouterine pouch (rek-toh-YOO-ter-in) *see* posterior cul-de-sac (of Douglas) [*recto-* straight, *-uter-* womb, *-ine* relating to]

rectum (REK-tum) distal region of the intestinal tube [*rect-* straight, *-um* thing]

rectus abdominis muscle (REK-tus ab-DOM-i-nus) muscle that runs down the middle of the abdomen; compresses abdomen [*rectus* straight, *abdominis* abdomen, *mus-* mouse, *-cle* little]

rectus sheath (REK-tus sheeth) layer of aponeuroses that cover the rectus abdominis muscle [*rectus* straight]

red fiber muscle fibers that contain large amounts of myoglobin and have a deep red appearance [*fibra-* fiber]

red marrow (MAIR-oh) bone marrow found in the ends of long bones and in flat bones; so named because of its function in the production of red blood cells [*marrow-* inner most]

reduction division meiosis when the diploid chromosome number (46) is reduced to the haploid number (23) [*re-* back, *-duce* bring, *-tion* process of, *divis-* to divide, *-ion* process of]

reduction proper alignment of a fractured bone; in chemistry, the gain of one or more electrons by a molecule (as in oxidation-reduction reactions) [*re-* back, *-duce* bring, *-tion* process of]

referred pain pain felt on or near the surface of the body that results from stimulation of nociceptors in deep structures; for example, experiencing pain in the left arm when heart muscle receptors signal pain, as during a heart attack [*referre-* to bring back, *poena-* punishment]

reflex automatic involuntary reaction to a stimulus resulting from a nerve impulse passing over a reflex arc [*re-* again, *-flex* bend]

reflex arc impulse conduction route to and from the central nervous system; smallest portion of nervous system that can receive a stimulus and generate a response [*re-* back or again, *-flex* bend, *arc* curve]

refraction (ree-FRAK-shun) bending of a ray of light as it passes from a medium of one density to one of a different density; occurs as light rays pass through the eye [*refract-* break apart, *-tion* process]

regeneration (ree-jen-er-AY-shun) process of replacing missing tissue with new tissue by means of cell division [*re-* again, *generat-* produce, *-tion* process]

regulator T cell (T-reg) *see* **suppressor T cell** [*regula-* rule, *T* thymus gland, *cell* storeroom]

Reissner membrane (RYZ-ner) *see* vestibular membrane [*Ernst Reissner* German anatomist, *membran-* thin skin]

rejection syndrome (reh-JEK-shun SIN-drohm) reaction of immune system against foreign antigens in grafted tissue [*re-* again, *-ject* to throw, *-tion* process of, *syn-* together, *-drome* running or (race) course]

relative refractory period (ree-FRAK-tor-ee) in muscle cell contraction, the few milliseconds after the absolute refractory period; time during which the membrane is repolarizing and restoring the resting membrane potential [*refract-* break apart, *-ory* relating to, *period* circuit]

relaxation state of lessened tension [*relax-* to ease, *-ation* process of]

relaxin (reh-LAK-sin) hormone that inhibits contractions during pregnancy and softens pelvic joints to facilitate childbirth [*relax-* relaxation, *-in* substance]

releasing hormone (HOR-mohn) hormone produced by the hypothalamus that causes the pituitary gland to release its hormones [*hormon-* excite]

remission (ree-MISH-un) stage of a disease during which a temporary recovery from symptoms occurs [*re-* back or again, *-miss-* to send, *-sion* condition of]

renal artery (REE-nal AR-ter-ee) large branch of the abdominal aorta that brings blood into each kidney [*ren-* kidney, *-al* relating to, *arteri-* vessel]

renal calculus (REE-nal KAL-kyoo-lus) crystallized mineral chunks that develop in the renal pelvis or calyces; also called *kidney stones* [*ren-* kidney, *-al* relating to, *calculi* little stone] *pl.*, calculi

renal cell carcinoma (REE-nal cell kar-si-NO-mah) malignant neoplasm of the kidney [*ren-* kidney, *-al* relating to, *cell* storeroom, *carcino-* cancer, *-oma* tumor]

renal clearance (REE-nal) amount of a substance removed from the blood by the kidneys per minute [*ren-* kidney, *-al* relating to]

renal columns (REE-nal) within the kidneys, the cortical tissue in the medulla between the pyramids [*ren-* kidney, *-al* relating to]

renal corpuscle (REE-nal KOR-pus-ul) within the nephron, the glomerulus plus the Bowman capsule surrounding it [*ren-* kidney, *-al* relating to, *corpus-* body, *-cle* little]

renal cortex (REE-nal KOR-teks) outer portion of the kidney [*ren-* kidney, *-al* relating to, *cortex* bark] *pl.*, cortices

renal diabetes (REE-nal dye-ah-BEE-teez) when the maximum cotransport capacity of the kidney is greatly reduced and glucose appears in the urine even though the blood sugar level may be normal; also called *renal glycosuria* [*ren-* kidney, *-al* relating to, *diabetes* siphon]

renal failure (REE-nal) failure of the kidney to properly process blood plasma and form urine [*ren-* kidney, *-al* relating to]

renal medulla (REE-nal meh-DUL-ah) inner portion of the kidney [*ren-* kidney, *-al* relating to, *medulla* middle] *pl.*, medullae or medullas

renal pelvis (REE-nal PEL-vis) basin-like upper end of the ureter that is located inside the kidney into which the calyces drain [*ren-* kidney, *-al* relating to, *pelvis* basin] *pl.*, pelves (PEL-veez) or pelvises (PEL-vis-ez)

renal ptosis (REE-nal TOH-sis) condition in which one or both kidneys drop from their normal position [*ren-* kidney, *-al* relating to, *ptosis* falling]

renal pyramid (REE-nal PIR-ah-mid) any of the distinct triangular wedges that make up most of the medullary tissue in the kidney [*ren-* kidney, *-al* relating to]

renal tubule (REE-nal TOOB-yool) a principal part of the nephron; consists of the proximal convoluted tubule, the Henle loop, and the distal tubule; receives filtrate from Bowman capsule and transports it to collecting ducts while filtrate is reabsorbed and additional substances are secreted into it in the process of urine formation [*ren-* kidney, *-al* relating to, *tube-* pipe, *-ule* small]

renal vein (REE-nal) kidney vein [*ren-* kidney, *-al* relating to]

renature (ree-NAYT-shur) to reverse the alteration (denaturation) of a protein and thus restore its normal shape and chemical properties [*re-* again, *-nature* born]

renin (REE-nin) enzyme produced by the juxtaglomerular apparatus of the kidney nephrons that catalyzes the formation of angiotensin, a substance that increases blood pressure; *see* renin-angiotensin-aldosterone system (RAAS) [*ren-* kidney, *-in* substance]

renin-angiotensin mechanism (REE-nin an-jee-oh-TEN-sin) *see* renin-angiotensin-aldosterone system [*ren-* kidney, *-in* substance, *angio-* vessel, *-tens-* pressure or stretch, *-in* substance, *mechan-* machine, *-ism* state]

renin-angiotensin-aldosterone system (RAAS) (REE-nin–an-jee-oh-TEN-sin–al-DAH-stair-ohn) causes changes in blood plasma volume mainly by controlling aldosterone secretion [*ren-* kidney, *-in* substance, *angio-* vessel, *-tens-* pressure or stretch, *-in* substance, *aldo-* aldehyde, *-stero-* solid or steroid derivative, *-one* chemical]

repolarization (ree-poh-lah-ri-ZAY-shun) phase of the action potential in which the membrane potential changes from its maximum degree of depolarization toward the resting state potential [*re-* back or again, *-pol-* pole, *-ar* relating to, *-zation* process]

reproduction formation of a new individual; formation of new cells in the body to permit growth [*re-* again, *-produce* to bring forth, *-tion* process]

reproductive system system in both sexes that is composed of the gonads, genital ducts, accessory glands, and genitals [*re-* again, *-produce* to bring forth, *-tive* relating to]

residual volume (ree-ZID-yoo-al) amount of air that remains in the lungs after the most forceful expiration [*residu-* remainder, *-al* relating to, [*volume-* paper roll]

resistin (reh-SIS-tin) hormone that reduces sensitivity to insulin and thus raises blood glucose levels [*resist-* resistance, *-in* substance]

respiration (res-pi-RAY-shun) processes that result in the absorption, transport, and utilization or exchange of respiratory gases between an organism and its environment [*re-* again, *-spir-* breathe, *-ation* process of]

respiratory acidosis (RES-pih-rah-tor-ee ass-ih-DOH-sis) retention of carbon dioxide in the blood [*re-* again, *-spir-* breathe, *-tory* relating to, *acid-* sour, *-osis* condition]

respiratory alkalosis (RES-pih-rah-tor-ee alkah-LOH-sis) excessive loss of carbonic acid from the blood [*re-* again, *-spir-* breathe, *-tory* relating to, *alkal-* ashes; *-osis* condition]

respiratory arrest (RES-pih-rah-tor-ee ah-REST) cessation of breathing without resumption [*re-* again, *-spir-* breathe, *-tory* relating to]

respiratory center (RES-pih-rah-tor-ee) control center located in the medulla and pons that stimulates muscles of respiration [*re-* again, *-spir-* breathe, *-tory* relating to]

respiratory cycle (RES-pih-rah-tor-ee) the alternating pattern of inspiration and expiration (inhalation/exhalation) of breathing [*re-* again, *-spir-* breathe, *-tory* relating to, *cycle-* circle]

respiratory distress syndrome (RDS) (RES-pih-rah- tor-ee di-STRESS SIN-drohm) difficulty in breathing caused by absence or failure of the surfactant in fluid lining the alveoli of the lung; IRDS is infant respiratory distress syndrome; ARDS is adult respiratory distress syndrome [*re-* again, *-spir-*breathe, *-tory* relating to, *syn-* together, *-drome* running or (race) course]

respiratory membrane (RES-pih-rah-tor-ee) single layer of cells that makes up the wall of the alveoli [*re-* again, *-spir-* breathe, *-tory* relating to, *membran-* thin skin]

respiratory mucosa (RES-pih-rah-tor-ee myoo-KOH-sah) mucus-covered membrane that lines tubes of the respiratory tree [*re-* again, *-spir-* breathe, *-tory* relating to, *mucus* slime]

respiratory physiology (RES-pih-rah-tor-ee fiz-ee-OL-oh-jee) study of the function of the respiratory system [*re-* again, *-spir-* breathe, *-tory* relating to, *physio-* nature, *-log-* words (study), *-y* process]

respiratory portion (of nasal passage) (RES-pih-rah-tor-ee) area within the nasal passage that extends from the inferior meatus to the small funnel-shaped orifices of the *posterior nares* [*re-* again, *-spir-* breathe, *-tory* relating to]

respiratory system (RES-pih-rah-tor-ee) system composed of the nose, pharynx, larynx, trachea, bronchi, and lungs [*re-* again, *-spir-* breathe, *-tory* relating to]

respiratory tract (RES-pih-rah-tor-ee) organs of the respiratory system, divided into lower and upper respiratory tracts [*re-* again, *-spir-* breathe, *-tory* relating to, *tract-* trail]

responsiveness characteristic of life that permits an organism to sense, monitor, and respond to changes in its external environment [*response-* reply, *-ive* relating to, *-ness* state of]

resting membrane potential (RMP) membrane potential maintained by a nonconducting neuron's plasma membrane; approximately 70 mV [*membran-* thin skin, *potent-* power, *-ial* relating to]

retention (ree-TEN-shun) inability to void urine even though the bladder contains an excessive amount of urine [*retent-* to hold, *-ion* process]

reticular (reh-TIK-yoo-lar) resembling a netlike pattern [*ret-* net, *-icul-* little, *-ar* relating to]

reticular activating system (RAS) (reh-TIK-yoo-lar) complex processing system in the neural network (reticular formation) in the brain responsible for maintaining consciousness [*ret-* net, *-ic-* relating to, *-ul-* little, *-ar* characterized by]

reticular formation (reh-TIK-yoo-lar) neural network located in the brainstem where it is involved in arousal (reticular activating system) [*ret-* net, *-ic-* relating to, *-ul-* little, *-ar* characterized by]

reticular theory (reh-TIK-yoo-lar) concept that the nervous system is best understood as a large integrated network—one endless piece [*ret-* net, *-ic-* relating to, *-ul-* little, *-ar* characterized by, *theor-* look at, *-y* act of]

reticular tissue (reh-TIK-yoo-lar) meshwork of netlike tissue that forms the framework of the spleen, lymph nodes, and bone marrow [*ret-* net, *-ic-* relating to, *-ul-* little, *-ar* characterized by, *tissu-* fabric]

reticulin (reh-TIK-yoo-lin) type of collagen found in reticular fibers [*ret-* net, *-ic-* relating to, *-ul-* little, *-in* substance]

reticulocyte (reh-TIK-yoo-loh-syte) immature red blood cells [*ret-* net, *-ic-* relating to, *-ul-* little, *-cyte* cell]

reticulocyte count (reh-TIK-yoo-loh-syte) medical procedure used to determine the rate of erythropoiesis cells [*ret-* net, *-ic-* relating to, *-ul-* little, *-cyte* cell]

reticulospinal tract (reh-TIK-yoo-loh-SPY-nal) spinal cord motor tract that helps maintain posture during skeletal muscle movement [*ret-* net, *-ic-* relating to, *-ul-* little, *-spin-* backbone, *-al* relating to, *tract-* trail]

reticulum (reh-TIK-yoo-lum) intricate network of fibers [*ret-* net, *-ic-* relating to, *-ul-* little, *-um* thing]

retina (RET-i-nah) innermost layer of the eyeball; contains rods and cones and continues posteriorly with the optic nerve [*ret-*net, *-ina* relating to]

retinal (RET-i-nal) light-absorbing portion of all photopigments [*ret-* net, *-ina-* relating to, *-al* relating to]

retinal detachment (RET-ih-nal) condition that occurs when part of the retina falls away from the tissue supporting it [*ret-* net, *-ina-* relating to, *-al* relating to]

retraction movement that moves a part back [*re-* back, *-tract-* drag, *-tion* process]

retrograde pyelogram (RET-roh-grayd PYE-eh-loh-gram) an x-ray image produced as a result of contrast material injected through a catheter [*retro-* backward, *-grad-* step, *pyelo-* renal pelvis, *-gram* drawing]

retrograde signaling (RET-roh-grayd SIG-nah-ling) type of synaptic transmission in which chemical signals are sent from the postsynaptic neuron back to the presynaptic neuron, usually to facilitate or inhibit further presynaptic signals [*retro-* backward, *-grad-* step, *sign-* mark, *-al* relating to]

retroperitoneal (reh-troh-pair-i-toh-NEE-al) area outside of the peritoneum [*retro-* backward, *peri-* around, *-tone-* stretched, *-al* relating to]

retropulsion (ret-roh-PUL-shen) process of chyme being forced to move backward behind a closed pyloric sphincter [*retro-* backward, *-pul-* drive, *-sion* process]

reversible reaction (ree-VER-si-bl ree-AK-shun) when the products of a chemical reaction change back to the original reactants; generally, an equilibrium of products and reactants exists [*re-* again, *-vers-* turn, *-ible* able to, *re-* again, *-action* action]

Rh factor (R h FAK-tor) antigen present on the red blood cells of Rh^+ individuals; so named because it was first studied in the rhesus monkey [*Rh*: rhesus monkey]

rheumatic fever (roo-MAT-ik) delayed inflammatory response to streptococcal infection that, if not properly treated, may allow the cardiac valves to become inflamed [*rheuma-* flow, *-ic* relating to]

rheumatic heart disease (roo-MAT-ik) cardiac damage (especially to the endocardium, including the valves) resulting from a delayed inflammatory response to streptococcal infection; *see* rheumatic fever [*rheuma-* flow, *-ic* relating to, *dis-* opposite of, *-ease* comfort]

rheumatoid arthritis (RA) (ROO-mah-toyd ar-THRY-tis) form of systemic autoimmune disease that involves chronic inflammation of many different tissues and organs of the body [*rheuma-* flow, *-oid* like, *arthr-* joint, *-itis* inflammation]

rhinitis (rye-NYE-tis) inflammation of the nasal mucosa often caused by nasal infections [*rhin-* nose, *-itis* inflammation]

rhodopsin (roh-DOP-sin) photopigment in rods [*rhodo-* red, *-ops-* vision, *-in* substance]

rhomboid major/minor muscle (ROM-boyd) upper limb muscle that adducts and elevates the scapula [*rhombo-* flatfish or equilateral parallelogram (rhombus), *-oid* like, *major* greater, *minor* lesser, *-oid* like, *mus-* mouse, *-cle* little]

ribonucleic acid (RNA) (rye-boh-noo-KLAY-ik ASS-id) nucleic acid found in both nucleus and cytoplasm of cells; involved in transmission of genetic information from nucleus to cytoplasm and in cytoplasmic assembly of proteins [*ribo-* ribose (sugar), *nucle-* nucleus, *-ic* pertaining to, *acid-* sour]

ribose (RYE-bohse) five-carbon sugar; the sugar in RNA [*ribose-* 5 carbon sugar]

ribosome (RYE-boh-sohm) organelle in the cytoplasm of cells that synthesizes proteins; sometimes called "protein factory" [*ribo-* ribose or RNA, *-som-* body]

ribozyme (RYE-boh-zyme) form of RNA (ribonucleic acid) that acts like an enzyme to promote or regulate chemical reactions in the cell [*ribo-* ribose or RNA, *-zyme* enzyme]

rickets (RIK-ets) condition primarily seen in infants and children caused by vitamin D deficiency; disease results in soft, pliable bones and skeletal deformities caused by abnormal calcium metabolism [unknown origin]

right lobe the right portion of an organ, such as the liver [*lob-* pod or hull, husk, or pod]

right lymphatic duct (lim-FAT-ik) main lymphatic duct [*lymph-* water, *-atic* relating to]

righting reflexes muscular responses that restore the body and its parts to their normal position when they have been displaced [*re-* again, *-flex* to bend]

rigor mortis (RIG-or MOR-tis) literally "stiffness of death"; the permanent contraction of muscle tissue after death caused by the depletion of ATP during the actin-myosin reaction, preventing myosin from releasing actin to allow relaxation of the muscle [*rigor* stiffness, *mortis* of death]

RNA *see* **ribonucleic acid** [*RNA-* ribonucleic acid]

RNA interference (RNAi) (RNA in-ter-FEER-enz) a regulatory process of the cell in which a small molecule of dsRNA (double-stranded RNA) called *siRNA* (small interfering RNA) joins with a RISC (RNA-induced silencing complex) protein structure to break down a specific mRNA (messenger RNA) transcript and thus effectively silence the gene encoded by the mRNA; RNAi is a natural regulatory process thought to be involved with regulating gene expression, as in inhibiting viral infections, but is also used as a research technique to study the human genome [*RNA-* ribonucleic acid]

RNAi therapy any medical procedure in which RNAi techniques are used to silence (disable) the effects of a disease-causing gene; *see also* RNA interference [*RNA* ribonucleic acid, *i* interference, *therapy* treatment]

rod photoreceptor cell responsible for night vision [*rod-* pole]

root blunt tip of the tongue; portion of the tooth that fits into the socket of the alveolar process of either the upper or lower jaw [*root-* underground part of plant]

rotation joint movement around a longitudinal axis; for example, shaking your head "no" [*rot-* turn, *-ation* process]
rotator cuff (ROH-tay-tor) musculotendinous cuff resulting from fusion of the tendons of the supraspinatus, infraspinatus, teres minor, and subscapularis (SITS muscles); adds to the stability of the glenohumeral (shoulder) joint [*rot-* turn, *-ator* agent, *mus-* mouse, *-cle* little]
rotator cuff muscle (roh-TAY-tor) a muscle of the rotator cuff group [*rot-* turn, *-ator* agent, *mus-* mouse, *-cle* little]
round ligament (LIG-ah-ment) fibromuscular cord that extends from the upper, outer angles of the uterus through the inquinal canals and terminating in the labia majora [*liga-* bind, *-ment* condition]
round window opening into inner ear; covered by a membrane [*window-* wind, eye]
rubrospinal tract (roo-broh-SPY-nal) spinal cord nerves that transmit impulses that coordinate body movements and maintain posture [*rubro-* red, - *spin-* backbone, *-al* relating to, *tract-* trail]
Ruffini corpuscle (roo-FEE-nee KOR-pus-ul) *see* bulbous corpuscle [*Angelo Ruffini* Italian anatomist, *corpus-* body, *-cle* little]
rule of nines frequently used method to estimate extent of a burn injury in an adult; the body is divided into areas that are multiples and fractions of 9% [*rule-* guide]

S

S phase step of the cell life cycle in which a growing cell synthesizes a second copy of its nuclear DNA molecules, a process also called *DNA replication*, in anticipation of later reproduction (cell division); S phase follows the G_1 phase (first growth phase) and precedes the G_2 phase (second growth phase); *see* cell life cycle [S- synthesis, *phase* appearance]
saccule (SAK-yool) part of the membranous labyrinth in the inner ear; contains sensory structure called a *macula*, which functions in sensation of static equilibrium [*sac-* bag, *-ule* small]
sacral plexus (SAY-kral PLEK-sus) plexus formed by fibers from the fourth and fifth lumbar nerves and the first four sacral nerves [*sacr-* sacred, *-al* relating to (sacrum), *plexus* network] *pl.*, plexi (PLEK-sye) or plexuses (PLEK-sus-ez)
sacrum (SAY-krum) bone of the lower vertebral column between the last lumbar vertebra and the coccyx, formed by the fusion of five sacral vertebrae [*sacr-* sacred, *-um* thing]
sagittal plane (SAJ-i-tal) longitudinal plane that divides the body or a part into left and right sides [*sagitta* arrow, *-al* relating to]
saliva (sah-LYE-vah) secretion of the salivary glands that is made up of water, mucus, amylase, sodium bicarbonate, and lipase [*saliva-* spittle]
salpingitis (sal-pin-JYE-tis) inflammation of the uterine tubes [*salping-* tube, *-itis* inflammation]
saltatory conduction (SAL-tah-tor-ee) process in which a nerve impulse travels along a myelinated fiber by jumping from one node of Ranvier to the next [*salta-* leap, *-ory* relating to]
sarcolemma (sar-koh-LEM-ah) plasma membrane of a striated muscle fiber [*sarco-* flesh, *-lemma* sheath] *pl.*, sarcolemmae
sarcoma (SAR-koh-mah) tumor of muscle tissue [*sarco-* flesh, *-oma* tumor]
sarcomere (SAR-koh-meer) contractile unit of muscle cells; length of a myofibril between two Z disks [*sarco-* flesh, *-mere* part]
sarcoplasm (SAR-koh-plaz-em) cytoplasm of muscle fibers [*sarco-* flesh, *-plasm* substance]
sarcoplasmic reticulum (SR) (sar-koh-PLAZ-mik reh-TIK-yoo-lum) network of tubules and sacs in muscle cells; similar to endoplasmic reticulum of other cells [*sarco-* flesh, *-plasm-* substance, *-ic* relating to, *ret-* net, *-ic-* relating to, *-ul-* little, *-um* thing] *pl.*, reticula
satellite cell a type of Schwann cell (neuroglial cell) that surrounds the cell bodies of neurons of the peripheral nervous system [*satell-* attendant, *-ite* relating to, *cell* storeroom]
satiety center (sah-TYE-eh-tee) cells in the hypothalamus that send impulses to decrease appetite so that an individual feels satisfied; also see leptin [*sati-* enough, *-ety* state]
saturated condition when all available bonds of a hydrocarbon chain are filled with hydrogen atoms [*saturate-* to fill]
saturated fat fats containing triglycerides in which fatty acid chains contain no double bonds (because they are "saturated" with hydrogen atoms) [*saturate-* to fill]
scala tympani (SKAH-lah TIM-pah-nee) lower portion of the cochlear duct lying below the basilar membrane [*scala-* to climb, *tympani-* drum]
scala vestibuli (SKAH-lah ves-TIB-yoo-lye) upper portion of the cochlear duct scar-thickened mass of tissue, usually fibrous connective tissue, that remains after a damaged tissue has been repaired [*scala-* to climb, *vestibuli-* courtyard]
scanning electron microscopy (SEM) (eh-LEK-tron my-KRAH-skah-pee) procedure that uses a beam of electrons to scan the surface of a specimen; the electrons reflected from, or knocked off of, the surface are detected by a special sensor producing an image of the specimen's surface on a video monitor [*electro-* electric, *-on* subatomic particle, *micro-* small, *-scop-* see, *-y* activity]
scapula (SKAP-yoo-lah) upper extremity bone; shoulder blade [*scapula* shoulder blade] *pl.*, scapulae (SKAP-yoo-lee)
scar dense fibrous mass of tissue that remains after a damaged tissue has been repaired [*scar-* scab]
Scheuermann disease (SHOY-er-man) abnormal skeletal condition developing in puberty that is characterized by increased roundness in the thoracic curvature (kyphosis) [*Holger W. Scheuermann*, Danish surgeon]
Schwann cell (shwon *or* shvon) any of the large nucleated cells that form myelin around the axons of neurons; also called *neurilemmocyte* [*Theodor Schwann* German anatomist]
sciatica (sye-AT-i-kah) neuralgia of the sciatic nerve [*sciatica-* of pain in the hip]
science field of inquiry that uses rational or logical methods to determine the nature of the universe; biology is the branch of science that specifically studies the living organisms of the universe [*scientia-* knowledge]
sclera (SKLEH-rah) white outer coat of the eyeball [*scler-* hard]
scleral venous sinus (SLEH-ral VAY-nus SYE-nus) a ring-shaped venous sinus located deep within the anterior portion of the sclera; also called *canal of Schlemm* [*scler-* hard, *-al* relating to, *ven-* vein, *-ous* of or like, *sinus* hollow]
scleroderma (skleer-oh-DER-mah) rare disorder affecting vessels and connective tissue of skin and other tissues, characterized by tissue hardening [*sclero-* hard, *-derma* skin]
scoliosis (skoh-lee-OH-sis) abnormal lateral (side-to-side) curvature of the vertebral column [*scolio-* twisted or crooked, *-osis* condition]
scotoma (skoh-TOH-mah) form of neuritis (nerve inflammation), often associated with multiple sclerosis; can cause loss of only the center of the visual field [*scoto-* darkness, *-oma* tumor]
scrotum (SKROH-tum) pouchlike sac that contains the testes [*scrotum* bag] *pl.*, scrota or scrotums
seasonal affective disorder (SAD) mental disorder in which a patient suffers severe depression only in winter; linked to the pineal gland [*season-* period of year, *-al* relating to, *affect-* act on, *-ive* relating to, *dis-* without, *-order* arrangement]
sebaceous gland (seh-BAY-shus) any of the oil-producing glands in the skin [*seb-* tallow (hard animal fat), *-ous* relating to, *gland* acorn]
sebum (SEE-bum) secretion of sebaceous glands
second messenger model theory of hormone action in which the hormone binds to receptors of the target cell, which then triggers a second molecule within the cell (such as cyclic AMP) to accomplish its function; also called *fixed-membrane receptor model* [*sebum* tallow (hard animal fat)]
secondary bronchi (BRONG-kye) *see* secondary bronchus [*second-* second, *bronch-* windpipe]
secondary bronchus (BRONG-kus) branch of the pulmonary airway formed when the primary bronchus enters the lung on its respective side and immediately splits into smaller bronchioles [*second-* second, *bronchus* windpipe] *pl.*, bronchi
secondary follicle (FOL-i-kul) *see* graafian follicle [*second-* second, *-ary* relating to, *folli-* bag, *-cle* small]
secondary hypertension (hye-per-TEN-shun) high blood pressure resulting from a specific condition [*second-* second, *-ary* relating to, *hyper-* excessive, *-tens-* stretch or pull tight, *-sion* state]
secondary oocyte (OH-oh-site) oocyte that arises from a primary oocyte after it completes Meiosis I [*second-* second, *-ary* relating to, *oo-* egg, *-cyte* cell]
secondary ossification center (os-i-fih-KAY-shun) growth center located in the epiphyses of long bones; *see* primary ossification center [*secondary* second ,*-ary* relating to, *os-* bone, *-fication* to make]
secondary sexual characteristics external physical characteristics of sexual maturity resulting from action of sex hormones; include male and female patterns of body hair and fat distribution, as well as development of external genitals [*secondary-* second, *-ary* relating to, *sexual-* relating to sex, *charassein* to engrave]
second-degree burn burn involving deep epidermal layers of the skin but not causing irreparable damage [*degree-* rank]
second-messenger model model that explains nonsteroid hormone mechanism of action; nonsteroid hormone is "first messenger" acting on cell membrane; intracellular "second messenger"—often cyclic AMP—triggers specific cellular action; also called *fixed-membrane-receptor model*
secretin (seh-KREE-tin) gastrointestinal hormone; first hormone discovered [*secret-* secretion, *-in* substance]
secretion process by which a substance is released outside the cell [*secret-* separate, *-tion* process]
secretory phase (SEEK-reh-toh-ree) *see* premenstrual phase [*secret-* separate, *-ory* relating to, *phase-* appearance]
secretory vesicle (SEEK-reh-toh-ree VES-i-kil) bubble made of cellular membrane; contains products of cell metabolism that moves from inside the cell to the plasma membrane, where it breaks open and secretes the products outside of the cell [*secret-* separate, *-ory* relating to, *vesi-* bladder or blister, *-cle* small]
segmental reflex (seg-MEN-tal) reflex whose mediating reflexes enter and leave the same segment of the spinal cord [*segment-* cut section, *-al* relating to, *re-* again, *-flex* bend]
segmentation (seg-men-TAY-shun) occurs when digestive reflexes cause a forward-and-backward movement within a single region of the GI tract [*segment-* cut section, *-ation* process]
seizure (SEE-zhur) *see* convulsion [*seize-* sudden attack of illness]
selectively permeable (sel-EK-tiv-lee PERM-ee-ah-bil) adjective used to describe a living membrane that allows only certain substances to move through (permeate) it and only at certain times [*select-* to choose, *-ive* relating to, *perme-* to pass through, *-able* ability]
self concept in immunology that proposes the immune system agents can recognize certain cell surface molecules as belonging to that individual, which thus makes them "safe" from destruction or damage from the immune system [*self* one's own person]
self-antigen (AN-ti-jen) molecule located on the plasma membrane of all body cells that identifies all normal cells of the body for the immune system; also called *self-marker* [*self-* one's own person, *anti-* against, *-gen* produce]
self-examination process of looking at one's own body to screen for health abnormalities, as in breast self-examination or testicular self-examination [*self-* one's own person, *exam-* test or try, *-ation* process]
self-tolerance ability of our immune system to attack abnormal or foreign cells but spare our own normal cells [*self-* one's own person, *tolerare-* to endure]
semen (SEE-men) ejaculate from the penis that contains spermatozoa plus fluids from the testes, seminal vesicles, bulbourethral glands, and prostate [*semen* seed]
semicircular canal (sem-i-SIR-kyoo-lar) three bony, tubelike structures located in the temporal bone, making up part of the inner ear; each structure contains a membranous semicircular duct that functions in the sense of equilibrium [*semi-* half, *-circulare* to go around, *-lar* relating to, *canal* channel]
semilunar (SL) valve (sem-i-LOO-nar) valve located between each ventricle and the large artery that carries blood away from it; valves in the veins are sometimes referred to as *semilunar valves* [*semi-* half, *-luna* moon, *valve-* folding door]
seminal vesicle (SEM-i-nal VES-i-kul) highly convoluted pouch that secretes an alkaline, viscous, creamy-yellow liquid that constitutes about 60% of semen volume [*semen-* seed, *-al* relating to, *vesic-* blister, *-cle* little]
seminiferoustubule(seh-mih-NIF-er-usTOOB-yools) long, coiled structure that forms the bulk of the testicular mass and in which spermatozoa develop [*semin-* seed, *-fer-* bear or carry, *-ous* relating to, *tub-*tube, *-ul-* little]
senescence (seh-NES-enz) older adulthood; aging [*senesc-* grow old, *-ence* state]
sensation interpretation of sensory nerve impulses by the brain as an awareness of an internal or external event; for example, feeling pain [*sens-* feel, *-ation* process]
sensory cranial nerve (KRAY-nee-al) cranial nerve that consists of only sensory axons [*sens-* feel, *-ory* relating to, *crani-* skull, *-al* relating to]
sensory nerve nerve that contains primarily sensory neurons [*sens-* feel, *-ory* relating to]
sensory neurons (NOO-rons) neurons that transmit impulses to the spinal cord and brain from all parts of the body [*sens-* feel, *-ory* relating to, *neuron* string or nerve]
sensory projection brain function that pinpoints the area of the body from which a receptor potential was initiated [*sens-* feel, *-ory* relating to, *project-* thrown forward, *-ion* process]
sensory receptor sense organs in the peripheral nervous system that enable the body to respond to stimuli caused by changes in its

internal or external environment [*sens-* feel, *-ory* relating to, *recept-* receive, *-or* agent]

sentinel lymph node (SLN) (SEN-tin-el limf nohd) lymph node that is the first to receive a metastasized cancer cell from a nearby tumor [*sentinel* lookout, *lymph* water, *nod-* knot]

septic shock (SEP-tik) condition that results from complications of septicemia [*septi-* putrid, *-ic* relating to]

septicemia (sep-ti-SEE-mee-ah) blood poisoning [*septic-* putrid, *-emia* blood condition]

septum (SEP-tum) a wall that divides two areas; for example, nasal septum [*septum* wall] *pl.*, septa

serosa (see-ROH-sah) outermost covering of the digestive tract; composed of the parietal pleura in the abdominal cavity [*ser-* watery fluid, *-osa* relating to] *pl.*, serosae

serotonin (sair-oh-TOH-nin) neurotransmitter that belongs to a group of compounds called *catecholamines* [*sero-* watery body fluid, *-ton-* tension, *-in* substance]

serotonin and norepinephrine reuptake inhibitor (SNRI) (sair-oh-TOH-nin and nor-ep-i-NEF-rin ree-UP-tayk in-HIB-it-or) type of drug that stops the return of serotonin and norepinephrine (neurotransmitters) to the presynaptic neuron, thus increasing the baseline amount of serotonin and/or norepinephrine in the synapse and restoring the baseline to a normal neurotransmitter level [*sero-* serum (watery fluid), *-ton-* tension, *-in* substance, *nor-* chemical prefix (unbranched C chain), *-epi-* upon, *-nephr-* kidney, *-ine* substance, *re-* again, *inhib-* restrain, *-or* agent]

serotonin-specific reuptake inhibitor (SSRI) (sair-oh-TOH-nin speh-SIF-ik ree-UP-tayk in-HIB-it-or) type of drug that stops the return of serotonin (neurotransmitter) to the presynaptic neuron, thus increasing the baseline amount of serotonin in the synapse and restoring the baseline to a normal serotonin level [*sero-* serum (watery fluid), *-ton-* tension, *-in* substance, *specif-* kind, *-ic* relating to, *re-* again, *inhib-* restrain, *-or* agent]

serous membrane (SEE-rus) two-layer epithelial membrane that lines body cavities and covers surfaces of organs) [*sero-* watery body fluid, *-ous* characterized by, *membran-* thin skin]

serous pericardium (SEER-us pair-i-KAR-dee-um) part of pericardial coverings of the heart; made up of a parietal layer and a visceral layer [*sero-* watery fluid, *-ous* relating to, *peri-* around, *-cardi-* heart, *-um* thing] *pl.*, pericardia

serratus anterior muscle (ser-RAY-tus) anterior chest wall muscle [*serra-* saw teeth, *ante-* front, *-er-* more, *-or* quality, *mus-* mouse, *-cle* little]

Sertoli cell (ser-TOH-lee) testis cell found within walls of the seminiferous tubules; provides mechanical support and protection for the developing sperm; also called *sustentacular cell* or *nurse cell* [*Enrico Sertoli* Italian histologist, *cell* storeroom]

sesamoid bone (SES-ah-moyd) small seed-shaped bones imbedded in tendons; the patella is the largest and most consistently found in the human skeleton [*sesam-* sesame seed, *-oid* like]

set point normal reading or range of normal [*point-* distinguishing feature]

severe combined immune deficiency (SCID) (i-MYOON deh-FISH-en-see) condition in which stem cells are missing or are unable to grow properly; humoral immunity and cell-mediated immunity are defective [*immun-* free]

sex chromosome (KROH-moh-sohm) pair of chromosomes in the human genome that determine gender; normal males have one X chromosome and one Y chromosome (XY); normal females have two X chromosomes (XX) [*chrom-* color, *-som-* body]

sex hormone (seks HOR-mohn) hormone that targets reproductive tissue; examples include estrogen, progesterone, and testosterone [*hormon-* excite]

sex-linked trait nonsexual, inherited trait governed by genes located in a sex chromosome (X or Y); most known sex-linked traits are X-linked [*link-* joint, *trait-* feature]

sexually transmitted diseases (STDs) any communicable disease that is commonly transmitted through sexual contact [*sexual-* relating to sex, *transmit-* transfer, dis- opposite of, ease]

shaft *see* **diaphysis** [*shaft-* slender rod]

shingles (SHING-guls) *see* herpes zoster [from *cingulum* girdle (inflammation often extends around the middle of the body, like a girdle]

short bone cube- or box-shaped bone that is about as broad as it is long; for example, carpals and tarsals [*short-* stunted]

shoulder girdle clavicle and scapula, which form the only bony attachment of the upper extremity to the trunk [*girdle-* belt or sash]

shunt tube used to drain the flow of a body fluid from one cavity or vessel to another [*shunt-* to shun]

sickle cell anemia (SIK-ul sell ah-NEE-mee-ah) severe, possibly fatal, hereditary disease in which red blood cells become sickle-shaped because of presence of an abnormal type of hemoglobin [*sickle* crescent, *cell* storeroom, *an-* without, *-emia* blood condition]

sickle cell trait (SIK-ul sell trayt) condition that occurs when only one gene for sickle cell is inherited and only a small amount of abnormal hemoglobin is produced [*sickle* crescent, *cell* storeroom, *trait-* feature]

sigmoid colon (SIG-moyd) portion of the large intestine that courses downward below the iliac crest [*sigm-* sigma (Σ or σ)18th letter of Greek alphabet (Roman S), *-oid* like, *colon* colon]

sign objective deviation from normal that marks the presence of a disease [*sign* mark]

signal transduction (tranz-DUK-shen) process of changing a signal such as a hormone or neurotransmitter into another form such as enzymatic reaction within the cell receiving the signal (thus the extracellular hormone signal is transduced, or changed, to an intracellular enzymatic signal) [*trans-* across, *-duc-* transfer, *-tion* process]

signal transduction inhibitor (tranz- DUK-shen in-HIB-ih-tor) any agent that blocks normal processing (transduction) of physiological signaling at a membrane receptor [*trans-* across, *-duc-* transfer, *-tion* process, *inhibit-* prevent, *-or* agent]

silent gallstone gallstone that does not cause a problem [*gall* bile]

simple diffusion movement of molecules through a membrane by means of the natural tendency of the molecules to spread and the ability of the spreading molecules to move through, or permeate [*simple* not mixed, *diffus-* spread out, *-sion* process]

simple epithelium (ep-i-THEE-lee-um) arrangement of epithelial cells in a single layer [*simple* not mixed, *epi-* on, *-theli-* nipple, *-um* thing] *pl.*, epithelia

simple fracture type of bone fracture in which broken bone does not project through surrounding tissue and skin; also called *nondisplaced* or *closed fracture* [*simple* not mixed, *fracture* a breaking]

simple goiter (GOY-ter) condition in which the thyroid enlarges because iodine is lacking in the diet [*simple* not mixed, from *gutter* throat]

single unit smooth muscle most common type of smooth muscle tissue; smooth muscle tissue in which gap junctions join individual smooth muscle fibers into large, continuous sheets that contract together in an autorhythmic fashion; also called *visceral muscle* [*mus-* mouse, *-cle* little]

single-gene disease disease caused by individual mutant genes in nuclear DNA that pass from one generation to the next [*gen-* produce or generate, *dis-* opposite of, *-ease* comfort]

single-photon emission computed tomography (SPECT) (toh-MOG-rah-fee) method of scanning that is used to visualize blood flow patterns in the brain [*photo-* light, *e-* out, *-mission* send, *tomo-* cut, *-graph-* draw, *-y* activity]

sinoatrial (SA) node (sye-no-AY-tree-al) the heart's pacemaker; where the impulse conduction of the heart normally starts; located in the wall of the right atrium near the opening of the superior vena cava [*sin-* hollow (sinus), *atri-* entrance courtyard, *-al* relating to, *nod-* knot]

sinus (SYE-nus) space or cavity [*sinus* hollow]

sinus dysrhythmia (SYE-nus dis-RITH-mee-ah) variation in rhythm of heart rate during the breathing cycle (inspiration and expiration) [*sinus* hollow, *dys-* disordered, *-rhythm-*rhythm, *-ia* condition]

sinusitis (sye-nyoo-SYE-tis) sinus inflammation [*sinus-* hollow, *-itis* inflammation]

sinusoid (SYE-nah-soyd) capillary that has a much larger lumen and more winding or tortuous course than other capillary vessels [*sinus-* hollow, *-oid* like]

Sjögren syndrome (SHOW-grin SIN-drohm) autoimmune disease in which the body's immune system targets salivary and tear glands for destruction [*Henrik S.C. Sjögren* Swedish ophthalmologist, *syn-* together, *-drome* running or (race) course]

skeletal muscle muscle under willed or voluntary control; *see* skeletal muscle tissue [*skeleto-* dried body, *-al* relating to, *mus-* mouse, *-cle* small]

skeletal muscle tissue also known as *voluntary* or *striated voluntary muscle*; includes muscle fibers under willed or voluntary control [*skeleto-* dried body, *-al* relating to, *mus-* mouse, *-cle* small, *tissu-* fabric]

skeletal system bones, cartilage, and ligaments that provide the body with a rigid framework for support and protection [*skeleto-* dried body, *-al* relating to]

skin *see* **cutaneous membrane** [*skin-* animal hide]

sleep apnea (APP-nee-ah) transitional period of sleep characterized by loud snoring to variable periods of complete cessation of breathing [*a-* not, *-pnea* breathe]

sliding filament model theory of muscle contraction in which sliding of thin filaments toward the center of each sarcomere quickly shortens the muscle fiber and thereby the entire muscle

slow (B) pain type of nerve fiber that carries impulses that result in dull, aching pain; originates in deep body structures [*slow-* inactive, sluggish, *poena-* punishment]

slow muscle fiber red muscle fiber; also called *slow-twitch muscle fiber* [*mus-* mouse, *-cle* small, *fiber-* thread]

slow-wave sleep (SWS) stage of sleep that is characterized by slow-frequency, high-voltage delta rays seen in the EEG during deep sleep [*sleep-* repose of death]

small saphenous vein (sah-FEE-nus) superficial vein of the lower extremity [*saphen-* manifest, *-ous* relating to]

smooth muscle muscle fibers that are not under conscious control; also known as *involuntary* or *visceral muscle*; forms the walls of blood vessels and hollow organs [*mus-* mouse, *-cle* small]

smooth muscle tissue *see* **smooth muscle** [*mus-* mouse, *-cle* small, *tissu-* fabric]

sneeze reflex a burst of air directed through the nose and mouth; stimulated by contaminants in the nasal cavity [*re-* back or again, *-flex* bend]

sodium important positive ion surrounding cells [*sod-* soda, *-um* thing or substance]

sodium channel a pore in a cell membrane that allows only sodium ions to permeate, or pass through, the membrane [*sod-* soda, *-um* thing or substance, *channel-* water pipe]

sodium cotransport (koh-TRANS-port) complex transport process in which carriers that bind both sodium ions and glucose molecules passively transport the molecules together out of the GI lumen [*sod-* soda, *-ium* chemical ending, *co-* with, *-trans-* across, *-port* carry]

sodium lactate (LAK-tayt) compound used to treat metabolic and respiratory acidosis [*sod-* soda, -um thing or substance, *lact-* milk, *-ate* chemical]

sodium-potassium pump active transport pump that operates in the plasma membrane of all human cells; transports both sodium ions and potassium ions but in opposite directions and in a 3:2 ratio, thereby maintaining a gradient across the plasma membrane [*sod-* soda, *-um* thing or substance, *potass-* potash, *-um* thing or substance]

soft palate (PAL-et) partition between the mouth and nasopharynx [*palate-* roof of mouth]

soleus muscle (SOH-lee-us) leg muscle that extends the foot [*soleus* sole of foot, *mus-* mouse, *-cle* little]

solubility (sol-yoo-BIL-i-tee) relative ability to dissolve [*solubili-* able to dissolve, *-ity* state]

solute (SOL-yoot) dissolved particles in solution [*solutus-* dissolved]

solution liquid made up of a mixture of molecule types, usually made of solutes (solids) scattered in a solvent (liquid), such as salt in water [*solutus-* dissolved, *-ion* process]

solvent (SOL-vent) liquid portion of a solution in which a solute is dissolved [*solvere-*to dissolve]

soma (SO-mah) body; for example, the body of a neuron; also called *perikaryon* [*soma* body]

somatic (so-MAH-tik) referring to the body [*soma-* body, *-ic* relating to]

somatic motor neuron (so-MAH-tik MOH-tor NOO-ron) motor neuron that stimulates a muscle fiber [*soma-* body, *-ic* relating to, *mot-* movement, *-or* agent, *neuron-* nerve]

somatic nervous system (SNS) (so-MAH-tik) motor neurons that control voluntary actions of skeletal muscles [*soma-* body, *-ic* relating to, *nerv-* nerves, *-ous* relating to]

somatic pain (so-MAH-tik) sharp "take your breath away" type of pain associated with superficial injury or trauma; also called *fast pain* [*soma-* body, *-ic* relating to]

somatic reflex (so-MAH-tik) reflexive contraction of skeletal muscles [*soma-* body, *-ic* relating to, *re-* again, *-flex* bend]

somatic sense (so-MAH-tik) sense that enables an individual to detect sensations such as pain, temperature, and proprioception [*soma-* body, *-ic* relating to, *sens-* feel]

somatic sensory division (so-MAH-tik) division of the nervous system made up of afferent (incoming) pathways from somatic sensory receptors (receptors involved in conscious perception) [*soma-* body, *-ic* relating to, *sens-* feel, *-ory* relating to]

somatopsychic (so-mah-toh-SYE-kik) refers to the body affecting the mind; physical disorder that produces mental symptoms; *see* psychosomatic [*soma-* body, *-psychic* relation between mind and body]

somatostatin (soh-mah-toh-STAT-in) hormone produced by delta cells of the pancreas that inhibits secretion of glucagon, insulin, and pancreatic polypeptide [*soma-* body, *-stat-* stand, *-in* substance]

somatotroph (soh-mah-toh-TROHF) cell type of the adenohypophysis (anterior pituitary) that secretes growth hormone (somatotropin) [*soma-* body, *-troph* nourish]

somatotropin (STH) (soh-mah-toh-TROH-pin) growth hormone [*soma-* body, *-trop-* nourish, *-in* substance]

somatotype (so-MAT-o-type) classification of body type determined on the basis of certain physical characteristics; *see* ectomorph, endomorph, mesomorph [*soma-* body, *-type* kind]

snRNP (snurp) small nuclear ribonucleotide; along with polypeptides, forms subunits of the spliceosome in a cell's nucleus

spastic paralysis (SPAS-tik pah-RAL-i-sis) type of paralysis characterized by involuntary contractions of affected muscles [*spast-* pull, *-ic* relating to, *para-* beyond, *-lysis* loosening]

spatial summation (SPAY-shal sum-MAY-shun) ability of the postsynaptic neuron to add together the inhibitory and stimulatory input received from numerous different presynaptic neurons and produce an action potential based on that collation of information [*spati-* space, -al relating to, *summa-* total, *-tion* process]

special movement unique or unusual movement that occurs only in a very limited number of joints [*species* form or kind, *-al* relating to]

special sense characterized by receptors grouped closely together or grouped in a complex sensory organ; for example, sense of smell, taste, hearing, equilibrium, or vision [*species* form or kind, *-al* relating to]

species resistance (SPEE-sheez ree-SIS-tens) genetic characteristics common to all organisms of a particular species that provide natural inborn immunity to a certain disease [*species* form or kind]

specific heat the amount of heat required to raise 1 gram of substance 1 degree centigrade [*specif-* form or kind, *-ic* relating to]

specific immunity (i-MYOO-ni-tee) protective mechanisms by which the immune system is able to recognize, remember, and destroy specific types of bacteria or toxins; *see* adaptive immunity [*specif-* form or kind, *-ic* relating to, *immun-* free, *-ity* state]

spermatic cord (sper-MAT-ik) cylindrical casings of white fibrous tissue formed by the ductus deferens and located in the inguinal canal between the scrotum and the abdominal cavity [*sperma-* seed, *-ic* relating to]

spectrin (SPEK-trin) unique protein on red blood cells that makes it possible for them to be flexible enough to pass through small blood capillaries [*spect-* look , *-in* substance]

spermatogenesis (sper-mah-toh-JEN-eh-sis) production of sperm cells [*sperm-* seed, *-gen-* produce, *-esis* process]

spermatogonium (sper-mah-toh-GO-nee-um) stem cell of a population that gives rise to sperm cells [*sperm-* seed, *-gonia* offspring] *pl.*, spermatogonia

spermatozoon (sper-mah-tah-ZOH-on) mature male gamete; sperm cell [*sperma-* seed, *-zoon* animal] *pl.*, spermatozoa

sphenoid bone (SFEE-noyd) keystone bone of the cranium; resembles a bat [*spheno-* wedge, *-oid* like]

sphincter urethrae muscle (SFINGK-ter yoo-REE-three) *see* urethral sphincter [*sphinc-* bind tight, *-er* agent, *ure-* urine, *-thr-* agent or channel (urethra), *mus-* mouse, *-cle* little]

sphygmomanometer (sfig-moh-mah-NOM-eh-ter) device for measuring blood pressure in the arteries of a limb [*sphygmo-* pulse, *-mano-* thin, *-meter* measure]

spinal cord portion of central nervous system that provides two-way conduction from the brain; major reflex center [*spin-* backbone, *-al* relating to]

spinal ganglion (GANG-glee-on) enlarged portion of the dorsal root of the spinal cord, where afferent nerve fibers from sensory receptors synapse with associated sensory neurons on their way to the brain or lower reflex centers [*spin-* backbone, *-al* relating to, *ganglion-* knot]

spinal meningitis (men-in-JYE-tis) inflammation of the spinal meninges [*spin-* backbone, *-al* relating to, *meninx-* membrane, *-itis* inflammation]

spinal nerve nerve that connects the spinal cord to peripheral structures such as the skin and skeletal muscles [*spin-* backbone, *-al* relating to]

spinal reflex reflex arc whose center is located in the spinal cord [*spine-* backbone, *-al* relating to, *re-* again, *-flex* bend]

spinal tract white columns of the spinal cord that provide conduction paths to and from the brain; ascending tracts carry information to the brain, whereas descending tracts conduct impulses from the brain [*spin-* backbone, *-al* relating to, *tract-* trail]

spindle fiber (SPIN-dul) network of tubules formed in the cytoplasm between the centrioles as they are moving away from each other during mitosis [*spinel-* to spin, *fiber-* thread]

spinocerebellar tract (SPY-no-sair-eh-BELL-ar) sensory tract that conveys information about subconscious kinesthesia [*spino-* backbone, *-cerebell-* cerebellum (small brain), *-ar* relating to, *tract-* trail]

spinotectal tract (SPY-no-TEK-tal) sensory tract that conveys information about touch that triggers visual reflexes [*spino-* backbone, *-tect-* roof, *-al* relating to, *tract-* trail]

spinothalamic pathway (spy-no-thah-LAM-ik) pathway that conducts impulses that produce sensations of crude touch and pressure [*spino-* backbone, *-thalam-* inner chamber, *-ic* relating to]

spinothalamic tract (spy-no-thah-LAM-ik) ascending tracts of the spinal cord that convey information about pain, temperature, deep pressure, and coarse touch; these tracts cross over in the spinal cord [*spino-* backbone, *-thalam-* inner chamber, *-ic* relating to, *tract-* trail]

spinous process (SPY-nus PRAH-ses) sharp projection from the laminae of vertebral bones, pointing posteriorly and inferiorly [*spino-* backbone, *-ous* relating to, *process* project (from)] *pl.*, processes (PRAH-ses-eez)

spiral fracture type of bone fracture in which fracture line spirals around the long axis [*spir-* coiled, *-al* relating to, *fracture* a breaking]

spiral membrane floor of the cochlear duct, this structure's vibrating response to sound frequencies leads to the transduction of sound waves into nerve impulses; also called *basilar membrane* [*spir-* coiled, *-al* relating, *membran-* thin skin]

spiral muscle muscle that has fibers twisted between their points of attachment; for example, latissimus dorsi [*spir-* coiled, *-al* relating to, *mus-* mouse, *-cle* little]

spiral organ organ of hearing located in the cochlea; consists of membranes and embedded hair cells capable of converting mechanical motion of sound waves into neural impulses; also called *organ of Corti* [*spir-* coiled, *-al* relating to, *organ* tool or instrument]

spirogram (SPY-roh-gram) graphic recording of the changing pulmonary volumes observed during breathing [*spir-* breathe, *-gram* drawing]

spirometer (spih-ROM-eh-ter) instrument used to measure the amount of air exchanged in breathing [*spir-* breathe, *-meter* measurement]

splanchnic nerve (SPLANK-nik) nerve that innervates the viscera [*splanchn-* internal organ, *-ic* relating to]

spleen largest lymphoid organ; filters blood, destroys worn out red blood cells, salvages iron from hemoglobin, and serves as a blood reservoir [*splen-* spleen]

splenectomy (spleh-NEK-toh-mee) surgical removal of the spleen [*splen-* spleen, *-ec-* out, *-tom-* cut, *-y* action]

splenius capitis (SPLEH-nee-us KAP-i-tis) deep muscle of the neck; extends the head [*splen-* patch, *capitis* head]

splenomegaly (spleh-no-MEG-ah-lee) condition of enlargement of the spleen [*splen-* spleen, *-mega* large, *-ly* relating to]

spliceosome (SPLISE-oh-sohm) small structure within the nucleus, about the size of a ribosome and made up of snRNPs (small nuclear ribonucleotides) along with polypeptides; removes introns from mRNA transcript and splices remaining exons into final version of mRNA [*splice-* cut rope and join remaining ends, *-som-* body]

spongy bone net-like arrangement of bone tissue found inside bones and which is often filled with red marrow; also called *cancellous bone* or *trabecular bone* [*spongia-* sponge]

spontaneous abortion (spon-TAY-nee-us ah-BOR-shun) *see* miscarriage [*ab-* away from, *-or-* be born, *-tion* process]

spontaneous fracture (spon-TAY-nee-us) *see* pathological fracture [*fracture-* a breaking]

spore form assumed by a bacterium that is resistant to heat, drying, and chemicals but can later become active to cause infection [*spore-* seed]

sprain injury to ligamentous joint structures often caused by twisting or wrenching movements [unknown origin]

squamous (SKWAY-muss) scalelike [*squam-* scale, *-ous* characterized by]

squamous cell carcinoma (SKWAY-muss sell kar-si-NO-mah) slow-growing skin cancer that arises in the epidermis [*squam-* scale, *-ous* characterized by, *cell* storeroom, *carcin-* cancer, *-oma* tumor]

stage of exhaustion third stage of the general adaptation syndrome; when the body can no longer cope or adapt to stressors [*exhaust-* to drain away, *-ion* process]

stage of resistance second stage of the general adaptation syndrome [*resist-* to withstand, *-ance* state]

staircase phenomenon (feh-NOM-eh-non) *see* treppe [*stair-* single step, *-case* box, *phenomenon-* that which appears or is seen]

standard lead one of three electrodes (lead *I*, lead *II*, or lead *III*) used in electrocardiography [*standard-* stand fast or firm]

Starling's law of the capillaries (STAR-lingz KAP-i-lair-eez) principle that states that a balance between inwardly directed forces and outwardly directed forces will determine whether fluids will move into or out of the plasma in the capillaries at any particular point [*Ernest H. Starling* English physiologist, *capill-* hair, *-ary* relating to]

Starling's law of the heart (STAR-lings) principle stating that as myocardial fibers are stretched, the force of contraction is increased [*Ernest H. Starling* English physiologist]

static equilibrium (ee-kwi-LIB-ree-um) sensing the position of the head relative to gravity; compare with dynamic equilibrium [*stat-* stand, *-ic* relating to, *equi-* equal, *-libr-* balance]

static tension another name for isometric (muscle) contraction [*stat-* stand, *-ic* relating to, *tendere-* to stretch]

steatorrhea (stee-eh-tah-REE-ah) foul-smelling stool as a result of impaired fat absorption [*steat-* fat, *-o-* combining form, *-rrhea* flow]

stem cell cells that have the ability to maintain a constant population of newly differentiating cells [*stem-* tree, trunk, *cell-* storeroom]

stenosed valve (steh-NOSD) valve that is narrower than normal, slowing blood flow from a heart chamber [*stenos-* narrow, *-osis* condition]

stent metal spring or mesh tube inserted into an affected artery to keep it open [*stent-* tube implanted temporarily]

stereognosis (steh-ree-og-NO-sis) awareness of an object's size, shape, and texture [*steros-* solid, *-gnosis* knowledge]

sterility (steh-RIL-i-tee) loss of reproductive function [*steril-* barren, *-ity* state]

sternocleidomastoid muscle (STERN-oh-KLYE-doh-MAS-toyd) muscle that flexes the head; "prayer" muscle [*sterno-* breastbone (sternum), *-cleid-* key (clavicle), *-masto-* breast (mastoid process), *-oid* like, *mus-* mouse, *-cle* little]

sternum (STER-num) breastbone [*sternum* breastbone] *pl.*, sterna or sternums

steroid (STAYR-oid) any of a class of lipids related to sterols and forming numerous reproductive and adrenal hormones [*ster-* sterol, *-oid* like]

steroid hormone (STAYR-oyd HOR-mohn) lipid-soluble hormone that passes intact through the cell membrane of the target cell and influences cell activity by acting on specific genes [*ster-* sterol, *-oid* like, *hormon-* excite]

stillbirth delivery of a dead fetus after the twentieth week of gestation; before 20 weeks it is termed a *spontaneous abortion* [*still-* motionless, *-birth* to bear]

stimulus excitant or irritating agent that induces a response [*stimulus* incitement]

stimulus-gated channel type of cell-membrane channel for the transport of molecules that is controlled by a gate that responds to a stimulus such as a sensory stimulus or chemical (neurotransmitter) stimulus [*stimulus* incitement, *channel-* groove]

stomach organ of the digestive system; an expansion of the digestive tract between the esophagus and small intestine, where some protein digestion begins and where food is churned and mixed with gastric juices before entering the small intestine [*stomach-* gullet]

stomach cancer gastric carcinoma [*stomach-* gullet, *cancer* crab or malignant tumor]

strabismus (strah-BIS-mus) abnormal condition in which lack of coordination of, or weakness in, the muscles that control the eye causes improper focusing of images on the retina, making depth perception difficult [*strab-* squinting, *-ismus* condition]

strain overexertion or trauma-type injury resulting in tearing of skeletal muscle fibers [*strain-* to stretch]

stratified epithelium (STRAT-i-fyde ep-i-THEE-lee-um) epithelial cells layered one on another [*strati-* layer, *epi-* on, *-theli-* nipple, *-um* thing] *pl.*, epithelia

stratum (STRAH-tum) layer [*stratum* layer] *pl.*, strata

stratum basale (STRAH-tum bay-SAH-lee) "base layer"; deepest layer of the epidermis; cells in this layer are able to reproduce themselves [*stratum* layer, *bas-* base, *-ale* relating to] *pl.*, strata

stratum compactum (STRAH-tum kom-PAKT-um) surface layer of the endometrium in the uterus [*stratum* layer, *compact-* concentrated, *-um* thing]

stratum corneum (STRAH-tum KOR-nee-um) tough outer layer of the epidermis; cells are filled with keratin [*stratum* layer *corneum* horn] *pl.*, strata

stratum germinativum (STRAH-tum jer-min-ah-TIV-um) synonym for stratum basale of the skin epidermis; sometimes used to denote stratum basale and stratum spinosum together [*stratum* layer, *germinativum* something that sprouts] *pl.*, strata

stratum granulosum (STRAH-tum gran-yoo-LOH-sum) "granular layer," layer in which the process of keratinization begins [*stratum* layer, *gran-* grain, *-ul-* little, *-osum* thing]

stratum lucidum (STRAH-tum LOO-see-dum) "clear" layer of the epidermis, in thick

skin between the stratum granulosum and the stratum corneum [*stratum* layer, *lucid-* clear, *-um* thing] *pl.*, strata

stratum spinosum (STRAH-tum spi-NO-sum) "spiny layer"; layer of epidermis that is rich in RNA to aid in protein synthesis required for keratin production [*stratum* layer, *spino-* spine, *-um* thing] *pl.*, strata

stratum spongiosum (STRA-tum spon-gee-OH-sum) middle layer of the endometrium (of uterus), composed of loose fibrous connective tissue [*stratum* layer, *spongia-* sponge, *-um* thing]

strength training contracting muscles against resistance to enhance muscle hypertrophy; *see* aerobic training, endurance training [*strength-* power, *train-* instruct]

stress any stimulus that directly or indirectly stimulates neurons of the hypothalamus to release corticotropin-releasing hormone [*stress-* tighten]

stress fracture bone fracture caused by mechanical stress (pressure) [*stress* tighten, *fracture* a breaking]

stress response *see* **stress syndrome** [*stress* tighten, *response* reply]

stress syndrome (SIN-drohm) signs and symptoms associated with the body's frequently maladaptive response to stressors; diverse changes initiated by [*stress* tighten, *syn-* together, *-drome* running or (race) course]

stress triad (TRYE-ad) three changes (hypertrophied adrenals, atrophied lymphatic organs, and bleeding gastrointestinal ulcers) as described by Selye that occur together characterize not any one particular kind of injury but all kinds of harmful stimuli [*stress* tighten, *triad* group of three]

stress-age syndrome (SIN-drohm) refers to a group of anatomical, neurohormonal, and immune system changes related to aging that influence both physiological and psychological stress responses [*stress-* tighten, *syn-* together, *-drome* running or (race) course]

stressor any agent or stimulus that produces stress [*stress-* tighten, *-or* agent]

stress-relaxation effect effect that occurs when overall blood pressure rises and the elastic nature of blood vessels allow them to expand and adapt to the higher pressure to maintain normal blood flow [*stress-* tighten, *relax-* loosen, *-ation* process]

stretch marks tiny silver-white scars resulting when elastic fibers in the dermis are stretched too much; also called *striae* [*stretch-* pull tight, *mark-* appearance]

stretch reflex automatic response in which the muscle reacts and tries to maintain a constancy of muscle length when a load is applied [*re-* again, *-flex* bend]

Stretta procedure (STRETT-ah) procedure for treating serious cases of GERD; uses radiofrequency energy emitted by a special electrode to produce small burns that tighten the muscular wall of the lower esophageal sphincter and reduce acid reflux from the stomach [*stretta* tight]

striated involuntary muscle (STRYE-ay-ted) cardiac muscle [*striated-* striped, *mus-* mouse, *-cle* little]

striated muscle (STRYE-ay-ted) *see* skeletal muscle [*striated-* striped, *mus-* mouse, *-cle* little]

stricture (STRIK-chur) abnormally narrowed passage [*stric-* tighten, *-ture* condition]

stroke event in which hemorrhage or cessation of blood flow caused by an embolism or ruptured aneurysm in brain blood vessel results in ischemia of brain tissue and destruction of neurons; *see* cerebrovascular accident (CVA) [*stroke-* apoplectic seizure (*Stroke of God's Hand*)]

stroke volume (SV) amount of blood that is ejected from the ventricles of the heart with each beat [*stroke* apoplectic seizure (*Stroke of God's Hand*), *volume* paper roll]

structural protein any of a category of proteins with the primary function of forming structures of the cell or tissue; contrast with *functional protein* [*structura-* arrangement, *-al* relating to, *prote-* primary, *-in* substance]

subarachnoid space (sub-ah-RAK-noyd) within the meninges, space under the arachnoid and outside the pia mater [*sub-* beneath, *-arachn-* spider, *-oid* like]

subareolar plexus (sub-ah-REE-oh-lar PLEKS-us) where the cutaneous plexus and large lymphatics that drain the secretory tissue and ducts of the breast come together [*sub-* beneath, *areola-* little space, *-ar* relating to, *plexus* network]

subatomic particles particles that make up atoms; for example, neutrons, protons, and electrons [*sub-* beneath, *-atom* indivisible, *-ic* relating to, *particula-* little bit]

subclavian artery (sub-KLAY-vee-an) artery of the upper extremity [*sub-* below, *-clavi-* key, *-ula* little, *arteri-* vessel]

subclavian vein (sub-KLAY-vee-an) deep vein of the upper extremity [*sub-* below, *-clavi-* key (clavicle bone), *-an* relating to]

subcutaneous injection (sub-kyoo-TAY-nee-us in-JEK-shun) administration of nutrients, special fluids, and/or electrolytes into the spongy and porous subcutaneous layer beneath the skin [*sub-* under, *cut-* skin, *-aneous* relating to, *in-* in, *-ject-* throw, *-tion* process]

subcutaneous layer (sub-kyoo-TAY-nee-us) *see* hypodermis [*sub-* beneath, *-cut-* skin, *-ous* relating to]

subdural space (sub-DOO-ral) within the meninges; the space between the dura mater and the arachnoid membrane [*sub-* beneath, *-dura-* hard or tough, *-al* relating to]

subendocardial branches (sub-en-doh-KAR-dee-al) conductive cardiac muscle fibers located in the walls of the ventricles; relay impulses from the AV node to the ventricles, causing them to contract [*sub-* under, *-endo-* within, *-cardi-* heart, *-al* relating to]

subfornical organ (SFO) (sub-FOR-nih-kal) highly specialized nerve cells located in the roof of the third ventricle in the brain; critical regulator of fluid homeostasis [*sub-* under, *-fornic-* arch, *-al* relating to]

sublingual gland (sub-LING-gwall) smallest of the three major salivary glands; produces a mucous type of saliva [*sub-* under, *-lingua-* tongue, *-al* relating to, *gland* acorn]

submandibular gland (sub-man-DIB-yoo-lar) salivary gland located just below the mandibular angle; contains enzyme and mucus-producing elements [*sub-* under, *-mandibul-* chew (mandible or jawbone), *-ar* relating to, *gland* acorn]

submandibular group (sub-man-DIB-yoo-lar) group of lymph nodes under the mandible [*sub-* beneath, *-mandibul-* chew (mandible or jawbone), *-ar* relating to]

submaxillary group (sub-MAK-sih-lair-ee) alternate name for *submandibular group* [*sub-* beneath, *-maxilla-* upper jaw, *-ary* relating to]

submental group (sub-MEN-tal) group of lymph nodes located in the floor of the mouth; lymph from the nose, lips, and teeth drains through these nodes [*sub-* beneath, *-ment-* chin, *-al* relating to]

submucosa (sub-myoo-KOH-sah) connective tissue layer containing blood vessels and nerves in the wall of the digestive tract [*sub-* under, *-muc-* slime, *-osa* relating to] *pl.*, submucosae

subscapularis muscle (sub-SKAP-yoo-lar-is) one of a group of muscles (rotator cuff) that serve as both a structural and functional cuff around the shoulder joint [*sub-* beneath, *-scapula-* shoulder blades, *-ar* relating to, *mus-* mouse, *-cle* little]

substantia nigra (sub-STAN-shee-ah NYE-grah) midbrain structure that consists of clusters of cell bodies of neurons involved in muscular control [*substantia-* essence, *nigra-* black]

substrate (SUB-strayt) substance on which an enzyme acts [*sub-* below, *-stratum* layer]

subtalar joint (sub-TAY-ler joynt) diarthrotic synovial joint formed by the talus bone of the ankle overlying the calcaneus bone and permits side-to-side motion of the foot [*sub-* below, *-tal-* ankle (talus), *-ar* relating to]

sucrase (soo-krays) enzyme that catalyzes the hydrolysis of sucrose and maltose [*sucr-* sugar, *-ase* enzyme]

sudoriferous gland (soo-doh-RIF-er-us) epidermal sweat glands [*sudo-* sweat, *-fer-* bear or carry, *-ous* relating to, *gland* acorn]

sulcus (SUL-kus) furrow, or groove, often associated with the cerebral cortex [*sulcus-* furrow]

sulfur (SUL-fur) component of many energy-transferring enzymes [*sulfur* brimstone]

sulfuric acid (sul-FYOOR-ik ASS-id) contributes hydrogen ions to the extracellular fluid; influences acid-base balance [*sulfur-* brimstone (sulfur), *-ic* relating to]

superficial near the body surface; opposite of deep [*super-* over or above, *-fici-* face, *-al* relating to]

superficial cervical lymph node (SER-vi-kal limf) lymph node that drains lymph from the head and neck; located in the neck along the sternocleidomastoid muscle [*super-* over or above, *-fici-* face, *-al* relating to, *cervic-* neck, *-al* relating to, *lymph* water, *nod-* knot]

superficial cubital lymph node (KYOO-bi-tal limf) lymph node located just above the bend of the elbow; lymph from the forearm passes through this node [*super-* over or above, *-fici-* face, *-al* relating to, *cubit-* elbow, *-al* relating to, *lymph* water, *nod-* knot]

superficial fascia (FAH-shah) hypodermis; subcutaneous layer beneath the dermis [*super-* over or above, *-fici-* face, *-al* relating to, *fascia* band]

superficial reflex reflexes elicited by stimulation of receptors located in the skin or mucosa [*super-* over or above, *-fici-* face, *-al* relating to, *re-* again, *-flex* bend]

superficial vein vein that lies near the surface [*super-* over or above, *-fici-* face, *-al* relating to]

superior higher; opposite of inferior [*super-* over or above, *-or* quality]

superior cerebellar peduncle (SAIR-eh-bel-lar peh-DUNG-kuls) internal white matter of the cerebellum composed principally of tracts from dentate nuclei in the cerebellum through the red nucleus of the midbrain to the thalamus [*super-* over or above, *-or* quality, *cerebell-* cerebellum (small brain), *-ar* relating to, *ped-* foot, *-uncl-* little]

superior colliculi (koh-LIK-yoo-lee) superior region of the corpora quadrigemina [*super-* over or above, *-or* quality, *colli-* hill, *-iculus* small] *sing.*, colliculus

superior intercostal vein (inter-KOS-tal) vein of the thorax [*super-* over or above, *-or* quality, *inter-* between, *-costa-* rib, *-al* relating to]

superior vena cava (VEE-nah KAY-vah) large vein of the upper extremity; drains blood into the right atrium of the heart [*super-* over or above, *-or* quality, *vena* vein, *cava* hollow] *pl.*, venae cavae

supination (soo-pi-NAY-shun) movement that turns the hand palm side up [*supin-* lying on the back, *-ation* process]

suppressor T cell T lymphocytes of the immune system that suppress B-cell differentiation into plasma cells, allow fine-tuning antibody-mediated immune responses; often called *regulator T cells (T-regs)* [*suppress-* press down, *-or* agent, *T* thymus gland, *cell* storeroom]

supraovulation (soo-prah-o-vyoo-LAY-shun) simultaneous rupture of multiple mature follicles [*supra-* above or over, *-ov-* egg, *-ation* process]

suprarenal (soo-prah-REE-nal) situated above a kidney [*supra-* above or over, *ren-* kidney, *-al* relating to]

suprarenal vein (soo-prah-REE-nal) abdominal vein; drains blood into the adrenal gland [*supra-* above or over, *-ren-* kidney, *-al* relating to]

supraspinatus muscle (SOO-prah-spy-nah-tus) one of a group of muscles (rotator cuff) that serve as both a structural and functional cuff around the shoulder joint [*supra-* above, *-spina-* spine, *mus-* mouse, *-cle* little]

supratrochlear lymph node (soo-prah-TRO-HK-lee-ar limf) *see* superficial cubital lymph node [*supra-* above, *-trochlea-* pulley, *-ar* relating to, *lymph* water, *nod-* knot]

surface film layer on the outer surface of skin made up of a mixture of secretions from sweat and sebaceous glands along with epithelial cells being shed from the epidermis; works as a protective barrier [*sur-* above, *-face* form]

surface tension the force of attraction between water molecules [*sur-* above, *-face* form, *tendere-* to stretch]

surfactant (sur-FAK-tant) substance covering the surface of the respiratory membrane inside the alveolus; it reduces surface tension and prevents the alveoli from collapsing [combination of *surf(ace) act(ive) a(ge)nt]*

surgical neck (SER-jik-el nek) region of the humerus bone of the arm just below the tubercles, so named because of its liability to fracture (*surg-* handwork, *-ical* relating to)

suspensory ligament (sus-PEN-so-ree LIG-ah-ment) fibers attached to the capsule of the lens that help hold it in place [*suspend-ere-* to hang, *-ory* relating to, *ligare-* to bind]

sustentacular cell (sus-ten-TAK-yoo-lar) *see* Sertoli cell [*sustent-* support, *-acular* relating to]

suture (SOO-chur) immovable joint, such as those between the bones of the skull [*sutur-* seam]

sweat gland gland in the skin that produces a transparent, watery liquid that eliminates ammonia and uric acid and helps maintain body temperature [*gland* acorn]

sympathetic division (sim-pah-THET-ik) part of the autonomic nervous system; ganglia are connected to the thoracic and lumbar regions of the spinal cord; functions in "fight-or-flight" response [*sym-* together, *-pathe-* feel, *-ic* relating to]

sympathetic trunk (sim-pah-THET-ik) arrangement of sympathetic axon collaterals that bridge the gap between adjacent ganglia that lie on the same side of the vertebral column [*sym-* together, *-pathe-* feel, *-ic* relating to]

symphysis (SIM-fi-sis) joint characterized by the presence of a pad or disk of fibrocartilage connecting the two bones [*sym-* together, *-physis* growth] *pl.*, symphyses

symptom subjective deviation from normal that marks the presence of a disease; sometimes used synonymously with *sign* [*sym-*together, *-tom* fall]

symptomatic gallstone (simp-toh-MAT-ik) gallstone that produces painful symptoms or other medical complications [*sym-* together, *-tom* fall, *sym-* together, *-tom* fall, *-ic* relating to, *gall* bile]

synapse (SIN-aps) membrane-to-membrane junction between a neuron and another neuron, effector cell, or sensory cell; functions to propagate nerve impulses (via neurotransmitters); two types: electrical and chemical; compare to immunological synapse [*syn-* together, *-aps-* join]

synaptic cleft (si-NAP-tik kleft) space between a synaptic knob and the plasma membrane of a postsynaptic neuron [*syn-* together, *-apt-*join, *-ic* relating to]

synaptic knob (si-NAP-tik nob) tiny bulge at the end of a terminal branch of a presynaptic neuron's axon that contains vesicles with

neurotransmitters [*syn-* together, *-apt-* join, *-ic* relating to]

synarthrosis (sin-ar-THROH-sis) joint in which fibrous connective tissue joins bones and holds them together tightly; commonly called *sutures* [*syn-* together, *-arthr-* joint, *-osis* condition] *pl.*, synarthroses

synchondrosis (SIN-kon-DROH-sis) joint characterized by the presence of hyaline cartilage between articulating bones [*syn-* together, *-chondr-* cartilage, *-osis* condition] *pl.*, synchondroses

syncytium (sin-SISH-ee-em) continuous, electrically coupled mass of cardiac fibers; allows an efficient, coordinated pumping action [*syn-* together, *-cyt-* cell, *-um* a thing] *pl.*, syncytia

syndesmosis (SIN-dez-MO-sis) fibrous joint [*syn-* together, *-desmo-* bond, *-osis* condition] *pl.*, syndesmoses

syndrome (SIN-drome) collection of signs or symptoms, usually with a common cause that defines or gives a clear picture of a pathological condition [*syn-* together, *-drome* running or (race) course]

synergism (SIN-er-jiz-em) with hormones, a combination of hormones has a greater effect on a target than the sum of effects that each would have if acting alone [*syn-* together, *-erg-* work, *-ism* condition of]

synergist (SIN-er-jist) muscle that assists a prime mover [*syn-* together, *-erg-* to work, *-ist* agent]

synovial fluid (si-NO-vee-all) thick, colorless lubricating fluid secreted by the synovial membrane in synovial joints [*syn-* together, *-ovi-* egg (white), *-al* relating to, *fluid* flow]

synovial membrane (si-NO-vee-all) connective tissue membrane lining spaces between bones and joints that secretes synovial fluid [*syn-* together, *-ovi-* egg (white), *-al* relating to, *membran-* thin skin]

synthesis (SIN-the-sis) combination, as in the combination of molecules to form a larger molecule [*synthes-* put together, *-is* process of]

synthesis reaction (SIN-the-sis reaction that combines two or more reactants to form a more complex structure [*synthes-* put together, *-is* process of, *re-* again, *-action* action]

system a group of organs that functions as a coordinated team; also called a *body system* [*system* organized whole]

systemic anatomy (sis-TEM-ik ah-NAT-oh-mee) study of anatomy that focuses on learning about body systems [*system* organized whole, *-ic* relating to, *ana-* apart, *-tom-* cut, *-y* action]

systemic circulation (sis-TEM-ik ser-kyoo-LAY-shun) blood flow from the left ventricle to all parts of the body and back to the right atrium [*system-* organized whole, *-ic* relating to, *circulat-* go around, *-tion* process]

systemic lupus erythematosus (SLE) (sis-TEM-ik LOO-pus er-i-them-ah-TOH-sus) autoimmune disease that affects many tissues in the body; red rash often develops on the faces of those afflicted with SLE [*lupus* wolf, *erythema-* redness, *-osus* condition]

systole (SIS-toh-lee) contraction of heart muscle [*systole* contraction]

systolic blood pressure (sis-TOL-ik) force with which blood pushes against artery walls when ventricles contract [*systole-* contraction, *-ic* relating to]

systolic discharge (sis-TOL-ik) volume of blood pumped by one contraction [*systole-* contraction, *-ic* relating to]

T

T cell *see* **T lymphocyte** [*T* thymus gland, *cell* storeroom]

T lymphocyte (LIM-foh-syte) cells of the immune system that have undergone maturation in the thymus; produce cell-mediated immunity [*T* thymus gland, *lymph-* water (lymphatic system), *-cyte* cell]

T tubule (TOOB-yool) transverse tubules unique to muscle cells; formed by inward extensions of the sarcolemma that allow electrical impulses to move deeper into the cell [*T* transverse, *tub-* tube, *-ul-* little]

T wave electrocardiogram deflection that reflects the repolarization of the ventricles [named for letter of Roman alphabet]

tachycardia (tak-i-KAR-dee-ah) rapid heart rhythm (above 100 beats/min) [*tachy-* rapid, *-cardi-* heart, *-ia* condition]

tactile corpuscle (TAK-tyle KOR-pus-ul) large, encapsulated sensory neuron of the skin for light or discriminative touch; also known as *Meissner corpuscle* [*tact-* touch, *-ile* relating to, *corpus-* body, *-cle* little]

tactile disk (TAK-tyle) flat-ended, unencapsulated sensory neuron of the skin for light or discriminative touch; also known as *Merkel disk* or *tactile meniscus* [*tact-* touch, *-ile* relating to]

tactile epithelial cell (TAK-tyle ep-i-THEE-lee-al) stiff epithelial cell of the epidermis of the skin that passes compression of the skin on to the sensory tactile disk neuron; also known as *Merkel cell* [*tact-* touch, *-ile* relating to, *cell* storeroom]

talus (TAY-lus) bone overlying the calcaneus bone and articulating with the tibia and fibula of the leg to form the ankle joint [*talus* ankle] *pl.*, tali (TAY-lye)

tamoxifen (teh-MOK-seh-fin) drug used extensively to prevent the recurrence of breast cancers fueled by estrogen. [*t-* trans (across), *-am-* amino (ammonia compound), *-oxi-* oxygen, *-fen* phenol (shining)]

target destination of a physiological agent such as a hormone or neurotransmitter [*target* small shield]

target cell cell that, when acted on by a particular hormone, responds because it has receptors to which the hormone can bind [*targuete-* small shield, *cell* storeroom]

target organ organ that is acted on and responds to a particular hormone [*targuete-* small shield, *organ-* instrument]

tarsal bone (TAR-sal bohn) any of the bones of the posterior region of the foot [*tars-* ankle, *-al* relating to]

tarsal plate (TAR-sal) border of thick connective tissue at the free edge of each eyelid [*tarsos-* flat surface, *plate-* flat, or broad]

taste bud chemical receptors in the tongue that generate nerve impulses, resulting in the sense of taste

Tay-Sachs disease (TSD) (TAY-saks) recessive, inherited condition in which abnormal lipids accumulate in the brain and cause tissue damage that leads to death by age 4 years [*Warren Tay* English ophthalmologist, *Bernard Sachs* American neurologist]

tectorial membrane (tek-TOH-ree-al) gelatinous membrane of inner ear that tops hair cells in the spiral organ (organ of Corti) [*tect-* roof, *-or-* quality, *-al* relating to, *membran-* thin skin]

tectospinal tract (tek-toh-SPY-nal) motor tract that conveys messages for head and neck movement related to visual reflexes [*tecto-* roof, *-spin-* backbone, *-al* relating to, *tract-* trail]

telodendrion (tel-oh-DEN-dree-on or tee-loh-DEN-dree-on) any of the distal tips of axons that form branches; each branch terminates in a synaptic knob [*telo-* end, *-dendr-* part (branch) of] *pl.*, telodendria

telomere (TEL-oh-meer or TEE-loh-meer) a strand of additional noncoding nucleotides that can be lost during normal DNA replication without affecting the coding part of the chromosome [*telo-* end, *-mer-* root]

telophase (TEL-oh-fayz or TEE-loh-fayz) last stage of mitosis [*telo-* end, *-phase* stage]

temporal bone (TEM-poh-ral) cranial bone located on lower side of cranium and part of its floor [*tempora-* temple (of head), *-al* relating to]

temporal summation (TEM-poh-ral sum-MAY-shun) when synaptic knobs stimulate a postsynaptic neuron in rapid succession and the effects add up over time to produce an action potential (also spatial summation) [*tempor-* time, *-al* relating to]

temporalis muscle (tem-poh-RAL-is) muscle of mastication; elevates and retracts the mandible [*tempo-* temple of head, *-al* relating to, *mus-* mouse, *-cle* little]

tendon bands or cords of fibrous connective tissue that attach a muscle to a bone or other structure [*tend-* pulled tight, *-on* unit]

tendon organ *see* **Golgi tendon organ** [*tend-* pulled tight, *-on* unit]

tendon receptor *see* **Golgi tendon receptor** [*tend-* pulled tight, *-on* unit, *recept-* receive, *-or* agent]

tendon reflex reflex stimulated by tapping on a tendon; *see also* Golgi tendon reflex [*tend-* pulled tight, *-on* unit, *re-* again, *-flex* bend]

tendon sheath (sheeth) tube-shaped structure lined with synovial membrane that encloses certain tendons [*tend-* pulled tight, *-on* unit]

tenosynovitis (ten-oh-sin-oh-VYE-tis) inflammation of a tendon sheath [*teno-* pulled tight (tendon), *-syn-* together, *-ovi-* egg white (joint fluid), *-itis* inflammation]

tension pressure or force, as in muscle contraction force or osmotic force [*tendere-* to stretch]

tensor fasciae latae muscle (TEN-sor FASH-ee-LAT-tee) muscle that moves the thigh and leg [*tensor* stretcher, *fascia* band or bundle, *lat-* side, *mus-* mouse, *-cle* little]

tentorium cerebelli (ten-TOR-ee-um sair-eh-BEL-lee) inward extension of the dura mater that separates the cerebellum from the cerebrum [*tentorium* tent, *cerebelli* of the cerebellum (small brain)] *pl.*, tentoria cerebelli

teratogen (TER-ah-toh-jen) physical or chemical agent that disrupts normal embryonic development and thus causes congenital defects [*terato-* monster, *-gen* produce]

teres minor (TER-eez) one of four rotator cuff muscles; forms a structural and functional cuff around the shoulder joint [*teres* rounded, *minor* lesser]

terminal ganglion (GANG-glee-on) ganglia that consists of parasympathetic fibers near or in the effectors in the chest and abdomen [*termin-* boundary, *-al* relating to, *ganglio-* knot, *-on* unit] *pl.*, ganglia

terminal hair coarse pubic and axillary hair that develops at puberty [*termin-* boundary, *-al* relating to]

terminal nerve pair of cranial nerves alongside the olfactory nerves, thought to be involved in sensing pheromones (sex signals); often called *nerve zero*, not usually found in the classic list of 12 cranial nerves [*termin-* boundary, *-al* relating to]

Terminologia anatomica (Ta or TA) (ter-mi-no-LOJ-ee-ah an-ah-TOM-ik-ah) literally "Terminology of Anatomy;" the official list of anatomical terms related to gross anatomy sponsored by the International Federation of Associations of Anatomists; lists all terms by number and name (in both Latin and English) as well as general principles of usage

Terminologia histologica (Th or TH) (ter-mi-no-LOJ-ee-ah his-to-LO-jik-ah) literally "Terminology of Histology;" the official list of anatomical terms related to microscopic anatomy sponsored by the International Federation of Associations of Anatomists; lists all terms by number and name (in both Latin and English) as well as general principles of usage

testicular self-examination (tes-TIK-yoo-lar) recommended procedure that involves palpating each testis, preferably after a warm shower or bath when the scrotum is relaxed and the testes are descended and accessible [*testi-* witness (testis), *-cul-* small, *-ar* relating to]

testis (TES-tis) male gonad [*testis* witness (male gonad)] *pl.*, testes

testosterone (tes-TOS-teh-rohn) male sex hormone produced by interstitial cells in the testes; the "masculinizing hormone" [*testo-* witness (testis), *-stero-* solid or steroid derivative, *-one* chemical]

tetanus (TET-ah-nus) smooth, sustained muscular contraction caused by high-frequency stimulation [*tetanus* tension]

tetraiodothyronine (T_4) (tet-rah-eye-oh-doh-THY-roh-neen) one of two hormones that compose the thyroid hormone; also called *thyroxine* [*tetra-* four, *-iodo-* violet (iodine), *-thyro-* shield (thyroid gland), *-ine* chemical]

thalamus (THAL-ah-muss) mass of gray matter located in diencephalon just above the hypothalamus; helps produce sensations, associates sensations with emotions, and plays a part in the arousal mechanism [*thalamus* inner chamber] *pl.*, thalami

thalassemia (thal-ah-SEE-mee-ah) group of inherited hemoglobin disorders characterized by production of abnormal red blood cells [*thalass-* sea, *-emia* blood condition]

theca cell (THEE-kah) specialized cell formed from the outer layer of granulosa cells; transforms into a fibrous capsule that secretes a hormone that ultimately converts into additional estrogen [*theca* sheath, *cell* storeroom]

theory a scientific idea or explanation that has a reasonably high degree of confidence after rigorous testing or observation; compare to hypothesis and law [*theor-* look at, *-y* act of]

thermal ablation (THUR-mal ab-LAY-shun) procedure that is used to treat women who suffer from dysfunctional uterine bleeding (DUB) [*therm-* heat, *-al* relating to, *ab-* away from, *-lat-* carry, *-tion* process]

thermoreceptor (ther-moh-ree-SEP-tor) sensory receptor activated by heat or cold [*thermo-* heat, *-cept-* receive, *-or* agent]

thermotaxis (ther-moh-TAK-sis) process in which a cell, such as a sperm cell, is attracted to heat and moves toward the source of heat [*therm-* heat, *-taxis* movement or reaction]

thick ascending limb (TAL) (thik ah-SEND-ing lim) thick-walled region of the limbs of the hairpin nephron loop (Henle loop) that conducts filtrate toward the distal tubule

thin ascending limb of Henle (tALH) (thin ah-SEND-ing lim ov HEN-lee) thin-walled region of the limbs of the hairpin nephron loop (Henle loop) that conducts filtrate toward the distal tubule

third-degree burn full-thickness burn; most serious of the three degrees of burns [*degree* step or rank]

thirst center region of the hypothalamus containing osmoreceptors that can detect an increase in solute concentration in extracellular fluid caused by water loss [*thurs-* dry]

thoracic aorta (thoh-RASS-ik ay-OR-tah) downward arch of the aorta through the thorax and ending at the diaphragm [*thorac-* chest, *-ic* relating to, *aort-* lifted, *-a* thing] *pl.*, aortae or aortas

thoracic cavity (thoh-RASS-ik KAV-i-tee) hollow space within the larger ventral body cavity that contains the lungs (in pleural cavities) and heart (in the mediastinum) [*thorac-* chest (thorax), *-ic* relating to, *cav-* hollow, *-ity* state]

thoracic duct (thoh-RASS-ik) largest lymphatic vessel in the body [*thorac-* chest (thorax), *-ic* relating to]

thoracic vertebra (thoh-RASS-ik VER-the-bra) vertebral bone located in the posterior part of the chest [*thorac-* chest, *-ic* relating to, *vertebra* that which turns] *pl.*, vertebrae

thoracolumbar division (thoh-rah-koh-LUM-bar) sympathetic division of the

autonomic nervous system [*thoraco-* chest, *lumb-* loin, *-ar* relating to]

thorax (THOH-raks) chest [*thorax* chest] *pl.*, thoraces (THOH-rah-seez)

thoroughfare channel (THUR-oh-fair CHAN-el) the distal end of a metarteriole that is devoid of precapillary sphincters, allowing blood to bypass a capillary bed

threshold potential (THRESH-hold poh-TEN-shal) magnitude of voltage across a membrane at which an action potential, or nerve impulse, is produced [*potent-* power, *-ial* relating to]

threshold stimulus (THRESH-hold STIM-yoo-lus) minimal level of stimulation required to cause a muscle fiber to contract [*stimul-* to excite, *-us* thing] *pl.*, stimuli

thrombocyte (THROM-boh-syte) cell fragments that play a role in blood clotting; also called *platelets* [*thrombo-* clot, *-cyte* cell]

thrombocytopenia (throm-boh-sye-toh-PEE-nee-ah) condition resulting from a decreased platelet count [*thrombo-* clot, *-cyto-*cell, *-penia* lack]

thrombophlebitis (throm-boh-fleh-BYE-tis) vein inflammation (phlebitis) accompanied by clot formation [*thrombo-* clot, *-phleb-*vein, *-itis* inflammation]

thrombopoiesis (throm-boh-poy-EE-sis) formation of platelets [*thromb-* clot, *-poiesis* making]

thrombosis (throm-BOH-sis) condition resulting from a clot (thrombus) that stays in one place [*thrombo-* clot, *-osis* condition]

thromboxane (throm-BOKS-ayne) prostaglandin-like substance in platelets that plays a role in hemostasis and blood clotting [*thrombo-* clot, *-oxa-* oxygen, *-ane* chemical]

thrombus (THROM-bus) a nonmoving or fixed blood clot attached to the lining of a vein or artery [*thrombus* clot] *pl.*, thrombi

thymic corpuscle (THYE-mik KOR-pus-ul) laminated spherical structures found in the thymus; composed of concentric layers of keratinized epithelial cells; also called *Hassall's corpuscles* [*thym-* thyme flower (thymus gland), *-ic* relating to, *corpus-* body, *-cle* little]

thymocyte (THY-moh-syte) cell in the thymus that develops into T lymphocytes [*thymo-* thyme flower (thymus gland), *-cyte* cell]

thymopoietin (thy-moh-POY-eh-tin) peptide that has a critical role in the development of the immune system; thought to stimulate the production of specialized lymphocytes involved in the immune response called *T cells* [*thymo-* thymus gland, *-poiet-* make, *-in* substance]

thymosin (THY-moh-sin) hormone produced by the thymus that is vital to the development and functioning of the body's immune system [*thymos-* thyme flower (thymus gland), *-in* substance]

thymus (THY-muss) endocrine gland located in the mediastinum; vital part of the body's immune system [*thymus* thyme flower] *pl.*, thymuses

thyroglobulin (thy-roh-GLOB-yoo-lin) protein-iodine complex that is a precursor of thyroid hormones [*thyro-* shield (thyroid gland), *-glob-* ball, *-ul-* small, *-in* substance]

thyroid cartilage (THY-royd KAR-ti-lij) largest cartilage of the larynx; Adam's apple [*thyr-* shield, *-oid* like]

thyroid colloid (THY-royd KOL-oyd) thick fluid that fills the interior of thyroid follicles [*thyro-* shield (thyroid gland), *-oid* like, *coll-* glue, *-oid* like]

thyroid gland (THY-royd) endocrine gland located in the neck that stores its hormones until needed; thyroid hormones regulate cellular metabolism [*thyro-* shield, *-oid* like, *gland* acorn]

thyroid hormone (THY-royd HOR-mohn) hormone that accelerates catabolism of glucose [*thyro-* shield, *-oid* like, *hormone-* excite]

thyroid-stimulating hormone (TSH) (THY-royd STIM-yoo-lay-ting HOR-mohn) a tropic hormone secreted by the anterior pituitary gland that stimulates the thyroid gland to increase its secretion of thyroid hormone [*thyro-* shield, *-oid* like, *hormon-* excite]

thyrotroph (thy-roh-TROHF) cell type of the adenohypophysis (anterior pituitary) that secretes thyroid-stimulating hormone (TSH) [*thyro-* shield (thyroid gland), *-troph* nourish]

thyroxine (thy-ROK-sin) thyroid hormone that stimulates cellular metabolism [*thyro-* shield (thyroid gland), *-ox-* oxygen, *-ine* chemical]

tibia (TIB-ee-ah) larger, stronger and more medially and superficially located of the two leg bones [*tibia* shin bone] *pl.*, tibiae (TIB-ee-ee) or tibias (TIB-ee-ahz)

tibialis anterior muscle (tib-ee-AL-is) dorsal flexor muscle of the foot; located on the anterior surface of the leg [*tibia* shinbone, *-al* relating to, *ante-* front, *-er-* more, *-or* quality, *mus-* mouse, *-cle* little]

tic douloureux (tik doo-loo-ROO) *see* trigeminal neuralgia [*tic douloureux-* painful spasm (French)]

tidal volume (TV) (TYE-dal) amount of air breathed in and out with each breath [*tid-* time, *-al* relating to, *volume* paper roll]

tight junction connection between cells in which they are joined by "collars" of tightly fused membrane [*tight-* strong, *junct-* to join, *-ion* process]

tinea (TIN-ee-ah) fungal infection of the skin [*tinea* worm]

tinnitus (tih-NYE-tus or TIN-nit-us) "ringing in the ear"; *see* otosclerosis [*tinnitis* a ringing or tinkling]

tissue group of similar cells that performs a common function [*tissu-* fabric]

tissue plasminogen activator (t-PA) (plaz-MIN-oh-jen) clot dissolving substance [*tissue-* fabric, *plasm-* substance (plasma), *-in-* substance, *-gen* produce]

TMR *see* **transmyocardial laser revascularization** [abbreviation of transmyocardial laser revascularization]

TNF blocker drug used in the treatment of rheumatoid arthritis [*TNF-* tumor necrosis factor]

Toll-like receptor (TLR) family of membrane receptors that act as pattern-recognition receptors in immunity to identify any of a large, nonspecific group of microbial antigen molecules and then trigger an innate immune response [*toll-* weird or amazing, *-like*, *recept-* receive, *-or* agent]

tongue solid mass of skeletal muscle components covered by a mucus membrane; manipulates food in the mouth and contains taste buds [*tunge-* organ of speech]

tonic contraction (TAHN-ik) type of skeletal muscle contraction used to maintain posture [*ton-* to stretch, *-ic* relating to, *con-* together, *-tract-* drag or draw, *-tion* process]

tonicity (toh-NIS-i-tee) potential osmotic pressure [*ton-* stretch or tension, *-ic* relating to, *-ty* state]

tonsillectomy (tahn-sih-LEK-toh-mee) surgical removal of the tonsils [*tonsil-* tonsil, *-ec-* out, *-tom-* cut, *-y* action]

tonsillitis (tahn-sih-LYE-tis) inflammation of the tonsils, usually due to infection [*tonsil-* tonsil, *-itis* inflammation]

tonsil (TAHN-sil) masses of lymphoid tissue; protect against bacteria; three types: palatine tonsils, located on each side of the throat; pharyngeal tonsils (adenoids), near the posterior opening of the nasal cavity; and lingual tonsils, near the base of the tongue [*tonsilla* tonsil]

tophus (TOH-fus) sodium urate crystal deposited within the synovial fluid of joints and in other tissues [*tophus* porous rock] *pl.*, tophi

total lung capacity (TLC) total volume of air a lung can hold [*capax-* able to hold much, *-ity* state]

total metabolic rate (TMR) (met-ah-BOL-ik) total amount of energy used by the body per day [*metabol-* change, *-ic* relating to]

total minute volume rate of pulmonary ventilation per minute [*minute-* sixtieth part of an hour, *volume* paper roll]

total peripheral resistance (TPR) (peh-RIF-er-al) cumulative arterial resistance to blood flow [*peri-* around, *-phera-* boundary, *-al* relating to, *-al* relating to, *resist-* withstand, *-ance* act of]

toxin (TOK-sin) poison; chemical that can cause sickness or damage in the body [*toxin* poison]

toxoid (TOK-soyd) form of bacterial toxin that stimulates production of antibodies [*tox-* poison, *-oid* like]

trabecula (trah-BEK-yoo-la) tiny branch-like threads in a tissue, such as the beams of spongy (cancellous) bone, that surround a network of spaces [*trab-* beam, *-ula* little] *pl.*, trabeculae

trabecula carnea (trah-BEK-yoo-la KAR-nee-ah) any of the branched columns of muscle visible in the lining of the ventricles of the heart [*trab-* beam, *-ula* little, *carne-* flesh (muscle)] *pl.*, trabeculae carneae

trabecular bone (trah-BEK-yoo-lar) *see* spongy bone, cancellous bone [*trab-* beam, *-ula-* little, *-ar* relating to]

trace element elements found in small amounts in the body [*element* first principle]

trachea (TRAY-kee-ah) windpipe; the tube extending from the larynx to the bronchi [*trachea* rough duct] *pl.*, tracheae or tracheas

tracheostomy (tray-kee-OS-toh-mee) surgical procedure in which an opening is cut into the trachea [*trache-* rough duct, *-os-*mouth or opening, *-tom-* cut, *-y* action]

trachoma (trah-KOH-mah) chronic infection of the reproductive tract [*trach-* rough, *-oma* tumor]

tract (trakt) bundle of nerve fibers within the central nervous system; unlike a nerve, a tract does not have connective tissue coverings [*trac-* course]

transabdominal pelvic ultrasound (tranz-ab-DOM-i-nal PEL-vik UL-trah-sound) imaging technique used to look at the uterus and adjacent reproductive structures [*trans-* across, *-abdomin-* belly, *-al* relating to, *pelv-* basin (pelvis), *-ic* relating to, *ultra-* beyond, sound]

transcription (trans-KRIP-shun) process in which DNA molecule is used as template to form mRNA [*trans-* across, *-script-* write, *-tion* process]

transcriptome (tran-SKRIPT-ome) mRNA codes transcribed from the human genome [*trans-* across, *-script-* written document, *-ome* entire collection]

transcriptomics (tran-skript-OHM-iks) analysis of all the mRNA codes actually transcribed from the human genome (transcriptome) [*trans-* across, *-script-* written document, *-om-* entire collection, *-ic* relating to]

transcutaneous electrical nerve stimulation (TENS) unit (trans-kyoo-TAY-nee-us) device used to stimulate skin touch receptors in a painful area; results in closure of the spinal cord pain gate and relief of pain [*trans-* across, *-cutan-* skin, *-ous* relating to]

transduction process of changing one form of energy or other physical event to another form, as when sound energy is changed to electrical energy in a microphone [*trans-* through, *-duct* to lead, *-ion* process]

transfer RNA (tRNA) RNA involved with protein synthesis; tRNA molecules carry amino acids to the ribosome for placement in the sequence prescribed by mRNA [*RNA-* ribonucleic acid]

transfusion reaction fatal event resulting from a mixture of agglutinogens (antigens) and agglutinins (antibodies) resulting in the agglutination of the donor and recipient blood [*trans-* across, *-fus-* pour, *-sion* process]

transitional epithelium (tran-ZISH-en-al epi-THEE-lee-um) stratified tissue typically found in body areas that are subjected to stress and tension changes [*trans-* across, *-tion* process, *epi-* on, *-theli-* nipple, *-um* thing] *pl.*, epithelia

translation process in which mRNA is used by ribosomes in the synthesis of a protein [*translat-* a bringing over, *-tion* process]

transmission electron micrograph (TEM) (MY-kroh-graf) photograph of an image produced by a transmission electron microscope [*trans-* across, *-miss-* send, *-ion* process, *electro-* electric, *-on* subatomic particle, *micro-* small, *-graph* drawing]

transmyocardial laser revascularization (TMR) (tranz-my-oh-KARD-ee-al LAY-zer ree-VAS-kyoo-lar-i-zay-shun) heart surgery used with patients suffering from severe angina (chest/heart pain) in which a laser beam makes toothpick-sized holes in the myocardium, which stimulates the growth of new blood vessels (angiogenesis) that relieves the angina [*trans-* across, *-myo* muscle, *-cardi* heart, *-al* relating to, *laser-* abbreviation for *light amplification by stimulated emission of radiation*, *re-* again, *-vasculum* little vessel, *-ar* relating to, *-ation* process]

transplant medical procedure in which tissue from a donor is surgically grafted into the body of another [*trans-* across, *-plant* plant]

transportation process of carrying essential materials within the body [*trans-* across, *-portare* to carry, *-tion* process]

transpulmonary pressure (trans-PUHL-moh-nair-ee) the pressure difference between the alveolar air pressure in the lungs and the fluid pressure in the intraplural space, that is, the pressure difference across the wall of the lung [*trans-* across, *pulmon-* lung, *-ary* relating to]

transurethral resection (TUR) (tranz-yoor-REE-thral rih-SEK-shun) surgical removal of swollen tissue surrounding the urethra [*trans-* across or through, *-ure-* urine, *-thr-* agent or channel (urethra), *-al* relating to, *re-* again, *-sect-* cut, *-tion* process]

transvenous approach (tranz-VEE-nus) method of inserting a permanent pacemaker [*trans-* across, *-ven-* vein, *-ous* relating to]

transverse canal (tranz-VERS kah-NAL) communicating canal between central (Haversian) canals that contains vessels to carry blood to the osteons; also carries nerves and lymphatic vessels; also called *Volkmann canal* [*trans-* across, *-vers-* turn]

transverse colon (tranz-VERS KOH-len) division of the colon that passes horizontally across the abdomen [*trans-* across, *-vers-* turn, *colon* large intestine]

transverse fracture (tranz-VERS FRAK-sher) type of bone fracture in which fracture line is at a right angle to the long axis of the bone [*trans-* across, *-verse* turn, *fracture* a breaking]

transverse mesocolon (tranz-VERS MEZ-oh-koh-lon) fold of peritoneum that attaches the transverse colon to the posterior abdominal wall [*trans-* across, *-vers-* turn, *meso-* middle, *-colon* large intestine]

transverse plane (tranz-VERS) horizontal plane that divides the body or any of its parts into upper and lower parts [*trans-* across or through, *-vers* turn]

transverse process (tranz-VERS PRAH-ses) any of the lateral projections of a vertebral bone [*trans-* across or through, *-vers* turn, *process* project (from)] *pl.*, processes (PRAH-ses-eez)

transversus abdominis muscle (ab-DAH-min-us) innermost muscle of the

anterolateral wall of the abdomen [*trans-* across, *-vers-* turn, *abdomin-* belly]

trapezius muscle (trah-PEE-zee-us) upper limb muscle that raises or lowers the shoulders and shrugs them [*trapezion* small table, *mus-* mouse, *-cle* little]

treppe (TREP-ee) gradual increase in the extent of muscular contraction following rapidly repeated stimulation; also called *staircase phenomenon* [*treppe* staircase]

triad (TRY-ad) triplet of tubules; allows an electrical impulse traveling along a T tubule to stimulate the membranes of adjacent sacs of the sarcoplasmic reticulum [*triad* group of three]

tricarboxylic acid (TCA) cycle (try-kar-bok-SIL-ik) aerobic metabolic pathway in which acetyl CoA (from other metabolic pathways) is converted into CO_2 and H_2O with the formation of ATP; also known as *citric acid cycle*, or *Krebs cycle* [*tri-* three, *-carbo-* carbon, *-oxy-* sharp(oxygen), *-yl-* chemical, *-ic* relating to, *acid* sour, *cyclo-* circle]

tricuspid valve (try-KUS-pid) heart valve located between right atrium and ventricle [*tri-* three, *-cusp-* point, *-id* characterized by]

trigeminal nerve (try-JEM-i-nal) cranial nerve V; responsible for chewing movements and sensations of the head and face [*tri-* three, *-gemina-* twin or pair, *-al* relating to]

trigeminal neuralgia (try-JEM-i-nal noo-RAL-jee-ah) pain in one or more (of three) branches of the fifth cranial nerve (trigeminal nerve) that runs along the face; also called *tic douloureux* [*tri-* three, *-gemina-* twins or pair, *-al* relating to, *neur-* nerves, *-algia* pain]

triglyceride (try-GLI-ser-ide) lipid that is synthesized from fatty acids and glycerol or from excess glucose or amino acids; stored mainly in adipose tissue cells [*tri-* three, *-glycer-* sweet, *-ide* chemical]

trigone (TRY-gohn) triangular structure, as in the three-cornered floor of the urinary bladder [*tri-* three, *-gon* corner]

triiodothyronine (T_3) (try-eye-oh-doh-THY-roh-neen) thyroid hormone that stimulates cellular metabolism [*tri-* three, *-iodo-* violet (iodine), *-thyro-* shield (thyroid gland), *-nine* chemical]

trimester three-month segments of the gestation period [*trimestris-* three months]

triplegia (try-PLEE-jee-ah) paralysis that affects both legs and one arm [*tri-* three, *-plegia* stroke]

trisomy (TRY-so-mee) abnormal genetic condition in which cells have three chromosomes (a triplet) where there should be a pair; usually caused by nondisjunction (failure of chromosome pairs to separate) during gamete production [*tri-* three, *-som-* body (chromosome), *-y* state]

trochlea (TROK-lee-ah) spool-shaped projection on the distal end of the humerus bone of the arm that articulates with the olecranon of the ulna [*trochlea* pulley] *pl.*, trochleae (TROK-lee-ee)

trochlear nerve (TROK-lee-ar) cranial nerve IV; motor nerve; responsible for eye movements [*trochlea-* pulley, *-al* relating to]

trophoblast (TROH-foh-blast) outer wall of the blastocyst; contributes in formation of the placenta [*tropho-* nourishment, *-blast* sprout]

tropic hormone (TROH-pik HOR-mohn) hormone that stimulates another endocrine gland to secrete its hormones [*trop-* nourish, *-ic* relating to, *hormon-* excite]

tropomyosin (troh-poh-MY-oh-sin) in sliding-filament theory of muscle cell contraction, the long protein molecule that covers the active sites of myosin; myofilament [*tropo-* to turn, *-myo-* muscle, *-in* substance]

troponin (troh-POH-nin) in sliding filament theory of muscle cell contraction, the molecules spaced at intervals along the thin filament that blocks troponin when the myofilament is at rest [*tropo-* turn, *-in* substance]

troponins test (TROH-poh-nins) diagnostic aid used to identify a specific biochemical marker present in cardiac disease [*tropo-* turn, *-in* substance]

true ankle joint (tru ANG-kel joynt) diarthrotic synovial joint formed at the distal ends of the medial malleolus of the tibia and the lateral malleolus of the fibula embracing the underlying talus, allowing up-and-down movement of the foot

true capillary (tru KAP-i-lair-ee) blood vessel that receives blood flowing out of metarterioles or other small arterioles [*capill-* hair, *-ary* relating to]

true pelvis (tru PEL-vis) structure forming a bony ring between the pelvic inlet and the pelvic outlet of the skeleton [pelvis basin] pl., pelves (PEL-veez) or pelvises (PEL-vis-ez)

true vocal cord *see* **vocal fold** [*voca-* voice, *-al* relating to]

trypsin (TRIP-sin) protein-digesting enzyme [*tryps-* pound, *-in* substance]

trypsinogen (trip-SIN-oh-gen) inactive proenzyme that is subsequently converted to active trypsin by enterokinase in the intestinal lumen [*tryps-* pound, *-in* substance, *-o-* combining form, *-gen* produce]

tubal pregnancy (TOO-bal) ectopic pregnancy that occurs in a uterine tube [*tub-* tube, *-al* relating to]

tuberculosis (TB) (too-ber-kyoo-LOH-sis) chronic bacterial (bacillus) infection of the lungs or other tissues caused by *Mycobacterium tuberculosis* organisms [*tuber-* swelling, *-cul-* little, *-osis* condition]

tubular (TOOB-yoo-lar) relating to a tube [*tub-* tube, *-ul-* little, *-ar* relating to]

tubular reabsorption (TOOB-yoo-lar ree-ab-SORP-shun) movement of molecules out of the various segments of the renal tubule and into the peritubular blood [*tub-* tube, *-ul-* little, *-ar* relating to, *re-* back again, *-absorp-* swallow, *-tion* process]

tubular secretion (TOOB-yoo-lar seh-KREE-shun) movement of molecules out of the peritubular blood and into the renal tubule for excretion [*tub-* tube, *-ul-* little, *-ar* relating to, *secret-* separate, *-tion* process]

tubuloglomerular feedback (toob-yoo-loh-glow-MER-yoo-lar) regulatory mechanism that helps protect the kidney from rapid systemic arterial pressure variations [*tub-* tube, *-ul-* little, *-glomer-*ball, *-ul-* little, *-ar* relating to]

tumor growth of tissues in which cell proliferation is uncontrolled and progressive [*tumor* swelling]

tumor marker abnormal antigen on cancer cells; also called *tumor-specific antigen* [*tumor* swelling]

tumor suppressor gene gene that works against the development of cancerous cells [*tumor* swelling, *suppress-* press down, *-or* agent, *gen-* produce or generate]

tumor-specific antigen (AN-ti-jen) *see* tumor marker [*tumor* swelling, *specif-* form, *-ic* relating to, *anti-* against, *-gen* produce]

tunica adventitia (TOO-nih-kah ad-ven-TISH-ah) outermost layer of arteries, veins, lymphatic vessels, and other organs; made of strong, flexible fibrous connective tissue; usually called *tunica externa* or simply *adventitia* [*tunica* tunic or coat, *adventitia* coming from abroad] *pl.*, tunicae adventitia

tunica albuginea (TOO-nih-kah al-byoo-JIN-ee-ah) tough, whitish membrane that surrounds each testis and enters the gland to divide it into lobules [*tunica* tunic or coat, *albuginea* white] *pl.*, tunicae albuginea

tunica externa (TOO-nih-kah ex-TER-nah) outermost layer of arteries, veins, lymphatic vessels, and other organs; made of strong, flexible fibrous connective tissue; sometimes called *tunica adventitia* [*tunica* tunic or coat, *extern-* outside] *pl.*, tunicae externae

tunica interna (TOO-nih-kah ex-TER-nah) *see* tunica intima [*tunica* tunic or coat, *intern-* inside] *pl.*, tunicae internae

tunica intima (TOO-nih-kah IN-tih-mah) layer made up of endothelium that lines blood vessels; also called *tunica interna* [*tunica* tunic or coat, *intima* innermost] *pl.*, tunicae intimae

tunica media (TOO-nih-kah MEE-dee-ah) muscular middle layer in blood vessels; the tunica media of arteries is more muscular than that of veins [*tunica* tunic or coat, *media* middle] *pl.*, tunicae media

turbinate (TUR-bih-nayt) *see* concha [*turbin-* top (spinning toy), *-ate* of or like]

turbulent flow (TER-byoo-lent) flow of blood that occurs normally at heart valves; contributes to the first and second heart sounds [*turbulentus-* full of commotion, restless]

turgor (TUR-ger) resiliency or fluid pressure in the cells of the skin, often lost during dehydration [*turg-* swollen, *-or* condition]

Turner syndrome (TUR-ner SIN-drohm) genetic disorder caused by monosomy of the X chromosome (XO) in females; characterized by immaturity of sex organs (causing sterility), webbed neck, cardiovascular defects, and learning disorders [*Harry H. Turner* American endocrinologist, *syn-* together, *-drome* running or (race) course]

twitch contraction quick jerk of a muscle produced by a single, brief threshold stimulus [*con-* together, *-tract-* drag or draw, *-tion* process]

two-point discrimination test procedure that tests the distribution of touch receptors in the skin [*discriminare-* to divide]

tympanic membrane (tim-PAN-ik) eardrum [*tympan-* drum, *-ic* relating to, *membran-* thin skin]

tympanotomy tube (tim-peh-NOT-eh-mee) surgical tool used to relieve pressure and permit drainage of the ear [*tympan-* drum, *-tom-* cut, *-y* action]

type 1 diabetes mellitus (dye-ah-BEE-teez MELLi-tus) condition resulting when the pancreatic islets secrete too little insulin, resulting in increased blood glucose [*diabetes* siphon, *mellitus* honey sweet]

type 2 diabetes mellitus (dye-ah-BEE-teez MELL-i-tus) condition resulting when cells of the body become less sensitive to the hormone insulin and perhaps the pancreatic islets secrete too little insulin, resulting in increased levels of blood glucose [*diabetes* siphon, *mellitus* honey sweet]

Type A blood type that has antigen A on red blood cells

Type AB blood type that has both antigen A and antigen B on red blood cells

Type B blood type that has antigen B on red blood cells

type II cell produces surfactant in the alveoli [*II* Roman numeral two, *cell-* storeroom]

Type O blood type that has neither antigen A nor antigen B on red blood cells

tyrosine kinase inhibitor (TYE-roh-seen KIN-ayz in-HIB-it-er) class of chemotherapy drugs that inhibit tyrosine-activating enzymes in cancer cells [*tyro-* cheese, *-sine* chemical, *kinesis-* motion, *-ase* enzyme, *inhibit-* restrain, *-or* relating to]

U

U wave electrocardiogram deflection that results from late repolarization of Purkinje fibers in the papillary muscle of the ventricular myocardium, or possibly from different durations of action potential in the ventricular myocardium producing a two-part T wave [named for letter of Roman alphabet]

ubiquitin (yoo-BIK-wit-in) a class of numerous, very small proteins used by the cell to tag proteins for destruction by the proteasome [*ubiqui-* everywhere, *-in* substance]

ulcer (UL-ser) necrotic open sore or lesion [*ulc-* sore]

ulna (UL-nah) forearm bone [*ulna* elbow] *pl.*, ulnae (UL-nee) or ulnas (UL-nahz)

ulnar deviation (UL-nur dee-vee-AY-shun) deformity of the hands as a result of rheumatoid arthritis [*ulna-* elbow, *-ar* relating to, *de-* out of, *-via-* road or path, *-ation* process]

ultrasonography (ul-trah-son-OG-rah-fee) imaging technique in which high-frequency sound waves are reflected off tissue to form an image [*ultra-* beyond, *-sono-* sound, *-graph-* draw, *-y* process]

ultrasound lithotripsy (UL-trah-sound LITH-oh-trip-see) procedure that uses an ultrasound generator to pulverize stones so that they can be flushed out of the urinary tract without surgery [*ultra-* beyond, sound, *litho-*stone, *-trips-* pound, *-y* action]

umbilical artery (um-BIL-i-kul AR-ter-ee) two small arteries that carry oxygen-poor blood from the developing fetus to the placenta [*umbilic-* navel, *-al* relating to, *arteri-* vessel]

umbilical cord (um-BIL-i-kul) flexible structure connecting the fetus with the placenta; contains umbilical arteries and vein [*umbilic-* navel, *-al* relating to]

umbilical hernia (um-BIL-i-kul HER-nee-ah) rupture of the anterior abdominal wall at the navel [*umbilic-* navel, *-al* relating to, *hernia* rupture] *pl.*, herniae or hernias

umbilical vein (um-BIL-i-kul) large vein carrying oxygen-rich blood from the placenta to the developing fetus [*umbilic-* navel, *-al* relating to]

umbilicus (um-BIL-i-kus) navel [*umbilic-*navel, *-us* singular]

uncompensated acidosis (un-KOM-pen-sayted ass-ih-DOH-sis) decrease in the ratio of base to acid; causes a decrease in pH [*acid-* sour, *-osis* condition]

uncompensated alkalosis (un-KOM-pen-sayted al-kah-LOH-sis) increase in the ratio of base to acid; causes an increase in pH [*alkal-* ashes, *-osis* condition]

uniaxial joint (yoo-nee-AK-see-al) synovial joint that permits movement around only one axis and in only one plane [*uni-* one, *-axi-* axle, *-al* relating to]

unicellular gland (yoon-ih-SEL-yoo-lar) single glandular epithelial cell [*uni-* one, *-cell-* storeroom, *-ular* relating to, *gland* acorn]

unipolar (pseudounipolar) neuron (yoo-nee-POH-lar [SOO-doh-yoo-nee-POH-lar] NOO-ron) structural category of neurons made up of cells that appear to have only one extension from the cell body [*uni-* single, *-pol-* pole, *-ar* relating to, *pseudo-* false, *neuron* nerve]

unmyelinated fiber (un-MY-eh-lin-ay-ted) nerve fiber that does not have a myelin sheath; also referred to as *gray fiber* [*un-* not, *-myel-* marrow, *-in-* substance, *-ate* act of, *fiber-* thread]

unsaturated fat (un-SATCH-yoo-ray-ted) fat-containing fatty acid chains in which there are some double bonds, not all sites for hydrogen are filled; usually liquid at room temperature [*un-* not, *-saturate-* to fill, *-ate* act of]

upper esophageal sphincter (UES) (eh-SOF-ah- JEE-ul SFINGK-ter) ring of muscular tissue at proximal end of esophagus; helps prevent air from entering the esophagus during respiration [*es-* will carry, *-phag-* food (eat), *-al* relating to, *sphinc-* bind tight, *-er* agent]

upper respiratory infection (RES-pih-rah-tor-ee) infection localized in the muscosa of the upper respiratory tract [*re-* again, *-spir-* breathe, *-tory* relating to, *infec-* stain, *-tion* process]

upper respiratory tract (RES-pih-rah-tor-ee) respiratory organs that are not contained within the thorax; includes nasal cavity,

pharynx, and associated structures [*re-* again, *-spir-* breathe, *-tory* relating to, *tract-* trail]

up-regulation phenomenon that occurs when a target cell has more receptors and thus can be more sensitive to a hormone [*up-* increase, *regula-* rule, *-tion* process]

urea (yoo-REE-ah) nitrogen-containing waste product [*urea-* urine]

uremia (yoo-REE-mee-ah) condition in which blood urea concentration is abnormally elevated, expressed as a high blood urea nitrogen (BUN) value; uremia is often caused by renal failure; also called *uremic syndrome* [*ur-* urine, *-emia* blood condition]

uremic syndrome (yoo-REE-mik SINdrohm) *see* uremia [*ur-* urine, *-(h)em-* blood, *-ic* relating to, *syn-* together, *-drome* running or (race) course]

ureter (YOOR-eh-ter) long tube that carries urine from kidney to bladder [*ure-* urine, *-ter* agent or channel]

urethra (yoo-REE-thrah) passageway from bladder to exterior; functions in elimination of urine; in males, also acts as a genital duct that carries sperm to the exterior [*ure-* urine, *-thr-* agent or channel]

urethral sphincter (yoo-REE-thral SFINGKter) circular muscle of the pelvic floor that constricts around the urethra, thus regulating urine flow from the bladder and out of the body [*ure-* urine, *-thr-* agent or channel (urethra), *-al* relating to, *sphinc-* bind tight, *-er* agent]

urethral stricture (yoo-REE-thral STRIKchur) narrowing or blockage of the urethra [*ure-* urine, *-thr-* agent or channel (urethra), *-al* relating to, *stric-* tighten, *-ture* condition]

urethritis (yoo-reh-THRY-tis) inflammation or infection of the urethra [*ure-* urine, *-thr-* agent or channel (urethra), *-itis* inflammation]

urinary bladder (YOOR-i-nair-ee) collapsible saclike organ that collects urine from the kidneys and stores it before elimination [*urin-* urine, *-ary* relating to]

urinary meatus (YOOR-i-nair-ee mee-AY-tus) external opening of the urethra [*urin-* urine, *-ary* relating to, *meatus* passage] *pl.*, meatus or meatuses

urinary system (YOOR-i-nair-ee) system responsible for excreting most liquid wastes from the body [*urin-* urine, *-ary* relating to]

urination (yoor-i-NAY-shun) passage of urine from the body; emptying of the bladder; also called *micturition* [*urin-* urine, *-ation* process]

urine (YOOR-in) fluid waste excreted by kidneys [*ur-* urine, *-ine* chemical]

urochrome (YOOR-oh-krohm) pigments from the breakdown of old red blood cells in the liver and elsewhere that are found in the urine [*uro-* urine, *-chroma* color]

urodynamics (yoo-roh-dye-NAM-iks) force of urine flow in the urinary tract [*uro-* urine, *dynam-* force, *-ic* relating to]

urogenital triangle (YOO-roh-JEN-ih-tal) region of the perineum that contains the external genitals (labia, vaginal orifice, clitoris) and urinary opening, and the anal triangle, which surrounds the anus [*uro-* urine, *-genit-* reproduction, *-al* relating to, *tri-*three, *-angle* corner]

urticaria (er-ti-KAIR-ee-ah) hives; allergic or hypersensitive response characterized by raised red lesions [*urtica-* nettle, *-ia* abnormal condition]

uterine artery embolization (YOO-ter-in ARter-ee em-boh-lih-ZAY-shun) technique that involves snaking a small catheter through an artery in the groin into the arterial vessel supplying blood to a fibroid; procedure results in dramatic shrinkage of the treated fibroid and a reduction in symptoms, including hemorrhage [*uter-* womb, *-ine* relating to, *arteri-* vessel, *embol-* plug, *-ation* process]

uterine fibroid (YOO-ter-in FYE-broyd) abnormal muscular growth in the uterus that may result in dysfunctional uterine bleeding [*uter-* womb, *-ine* relating to, *fibr-* fiber, *-oid* of or like]

uterine tube (YOO-ter-in) fallopian tube [*uter-* womb, *-ine* relating to]

uterosacral ligament (yoo-ter-oh-SAK-ral LIG-ah-ment) foldlike extension of the peritoneum from the posterior surface of the uterus to the sacrum [*uter-* womb, *sacr-* sacred (sacrum), *-al* relating to (sacrum), *liga-* bind, *-ment* condition]

uterus (YOO-ter-us) hollow, muscular organ that holds and sustains developing offspring until birth [*uterus* womb]

utricle (YOO-tri-kul) part of membranous labyrinth of inner ear; involved with sensation of static equilibrium [*utricle-* small bag]

uvula (YOO-vyoo-lah) cone-shaped process hanging from the soft palate that helps prevent food and liquid from entering the nasal cavities [*uva-* grape]

V

vaccination (vak-si-NAY-shun) method used to achieve active immunity by triggering the body to form antibodies against specific pathogens [*vaccin-* cow (cowpox), *-ation* process]

vaccine (VAK-seen) application of killed or attenuated (weakened) pathogens (or portions of pathogens) to a patient to stimulate immunity against that pathogen [*vaccin-* cow (cowpox)]

vagina (vah-JYE-nah) internal tube from uterus to vulva [*vagina* sheath]

vaginal orifice (VAH-ji-nal OR-i-fis) opening of the vagina to the outside of the body [*vagina-* sheath, *-al* relating to, *ori-* mouth, *-fice-* something made]

vaginitis (vaj-i-NYE-tis) inflammation of the vagina [*vagin-* sheath (vagina), *-itis* inflammation]

vagus nerve (VAY-gus) cranial nerve X; mixed nerve; sensations and movements of organs [*vagus* wanderer]

valvuloplasty (VAL-vyoo-loh-plas-tee) procedure that replaces damaged or defective cardiac valves [*valv-* folding door (valve), *-plasty* surgical repair]

variant Creutzfeldt-Jakob Disease (vCJD) (VAR-ee-ant KROYTS-felt YAH-kobe) degenerative disease of the central nervous system caused by prions (*pr*oteinaceous *in*fectious particles) that convert normal proteins of the nervous system into abnormal proteins, causing loss of function; *see* prion [*Hans G. Cruetzfeldt* German neurologist, *Alfons M. Jakob* German neurologist]

varicose vein (VAIR-i-kohse) enlarged vein in which blood pools; also called *varix* [*varic-* swollen vein, *-ose* characterized by] *pl.*, varices

varix (VAIR-ix) varicose vein [*varix* swollen vein] *pl.*, varices

vas deferens (vas DEF-er-enz) reproductive duct that extends from the epididymis to the ejaculatory duct; also called *ductus deferens* [*vas* duct or vessel, *deferens* carrying away] *pl.*, vasa deferentia

vasa recta (VAH-sah REK-tah) the long, hairpin-shaped arterioles of the kidney leading from the efferent arteriole and following the nephron loop; also called *straight arterioles (of kidney)* [*vas-* vessel, *rect-* straight] *sing.*, vas rectum

vasa vasorum (VAS-ah vah-SOR-um) tiny blood vessels that supply the smooth muscles that surround the walls of larger blood vessels [*vasa* vessel, *vaso-* vessel or duct, *-um* small one]

vascular anastomosis (VAS-kyoo-lar ah-nastoh-MOH-sis) condition when blood moves from veins to other veins or arteries to other arteries without passing through an intervening capillary network [*vas-* vessel, *-ular* relating to, *ana-* anew, *-stomo-* mouth, *-osis* condition] *pl.*, anatomoses

vasectomy (va-SEK-toh-mee) surgical severing of the vas deferens to render a male sterile [*vas-* vessel (vas deferens), *-ec-* out, *-tom-* cut, *-y* action]

vasoactive intestinal peptide (VIP) (vay-so-AK-tiv in-TES-ti-nal PEP-tyde) hormone involved with controlling intestinal secretion [*vas-* vessel, *-act* to do, drive, *-tive* state, *intestin-* intestine, *-al* relating to, *pept-* digest, *-ide* chemical]

vasoconstriction (vay-soh-kon-STRIK-shun) reduction in vessel diameter caused by increased contraction of the muscular coat [*vas-* vessel, *-constrict-* draw tight, *-tion* state]

vasodilation (vay-soh-DYE-lay-shun) increase in vessel diameter caused by relaxation of vascular muscles [*vaso-* vessel, *-dilat-* widen, *-tion* state]

vasodilator (vay-so-DYE-lay-tor) class of drugs that trigger the smooth muscles of arterial walls to relax, causing the arteries to dilate [*vas-* vessel or duct, *-dilat-* widen, *-or* agent]

vasodilatory shock (vay-soh-DYE-lah-tor-ee) *see* neurogenic shock [*vas-* vessel, *-dilat-* widen, *-ory* relating to]

vasomotor chemoreflex (vay-so-MOH-tor kee-moh-REE-fleks) chemoreceptors located in the aortic and carotid bodies are sensitive to hypercapnia, hypoxia, and decreased arterial blood pH [*vas-* vessel, *-motor* move, *chemo-* chemical, *-re-* back or again, *-flex* bend]

vasomotor mechanism (vay-so-MOH-tor) feedback regulation of the diameter of arterioles [*vas-* vessel, *-motor* move, *mechan-* machine, *-ism* state]

vasomotor pressoreflex (vay-so-MOH-tor press-oh-REE-fleks) reflex that occurs in response to a change in arterial blood pressure [*vas-* vessel, *-motor* move, *press-* pressure, *-re-* back or again, *-flex* bend]

vault *see* **barrel** [*voute* arch]

vector (VEK-tor) arthropod that carries an infectious pathogen from one organism to another [*vector-* carrier]

vein vessel carrying blood from capillaries toward the heart [*vena* blood vessel]

vellus (VEL-us) strong, fine, and less pigmented hair [*vellus* wool]

venous pump (VEE-nus) blood-pumping action of respirations and skeletal muscle contractions facilitate venous return by increasing pressure gradient between peripheral veins and venae cavae [*ven-* vein, *-ous* relating to]

venous return (VEE-nus) amount of blood returned to the heart by the veins [*ven-* vein, *-ous* relating to]

venous sinus (VEE-nus SYE-nus) large specialized venous structures that have very thin endothelial walls [*ven-* vein, *-ous* relating to, *sinus* hollow]

ventilation (ven-tih-LAY-shun) rate and depth of breathing [*vent-* fan or create wind, *-tion* process]

ventral (anterior) nerve root (VEN-tral) bundle of nerve fibers that carry motor information out of the spinal cord [*ventr-* belly, *-al* relating to]

ventral (VEN-tral) of or near the belly; in humans, front or anterior; opposite of dorsal or posterior [*ventr-* belly, *-al* relating to]

ventral cavities (VEN-tral KAV-ih-teez) body cavities on the ventral side of the body, which include the thoracic cavity and abdominopelvic cavity; not a standard anatomical term, but used here to help organize the body for the beginning student [*ventr-* belly, *-al* relating to, *cav-* hollow, *-ity* state]

ventral ramus (VEN-tral RAY-mus) large, complex branch of each spinal nerve [*ventr-* belly, *-al* relating to *ramus* branch] *pl.*, rami

ventral root (VEN-tral) motor branch of a spinal nerve, by which it is attached to the spinal cord [*ventr-* belly, *-al* relating to]

ventricle (VEN-tri-kul) a cavity, such as the large, fluid-filled spaces within the brain or the chambers of the heart [*ventr-* belly, *-icle* little]

ventricular fibrillation (ven-TRIK-yoo-lar fibril-LAY-shun) an immediately life-threatening condition caused by the lack of ventricular pumping suddenly stopping flow of blood to vital organs [*ventr-* belly, *-icul-* little, *-ar* relating to, *fibr-* fiber, *-illa-* little, *-ation* process]

venule (VEN-yool) small blood vessels that collect blood from capillaries and join to form veins [*ven-* vein, *-ule* little]

vermiform appendix (VERM-i-form ah-PEN-diks) hollow, tubular structure attached to the cecum (of the colon) and thought to be a breeding ground for beneficial intestinal bacteria [*vermi-* worm, *-form* shape, *append-* hang upon, -ix thing] *pl.*, appendices

vermis (VER-mis) central section of the cerebellum [*vermis* worm] *pl.*, vermes

vertebra (VER-teh-bra) any of the bones that make up the spinal column [*vertebra* that which turns] *pl.*, vertebrae (VER-the-bray or VER-teh-bree)

vertebral column (ver-TEE-bral) the spinal column, made up of a series of separate vertebrae that form a flexible, curved rod; made up of the cervical, thoracic, lumbar, sacral, and coccygeal segments [*vertebra* that which turns, *-al* relating to, *columna-* pillar]

vertebral foramen (ver-TEE-bral for-AY-men) the central opening in the vertebral column that contains the spinal cord [*vertebra* that which turns, *-al* relating to, *foramen* hole]

vertebroplasty (ver-tee-broh-PLAS-tee) orthopedic procedure used to treat the vertebral compression fractures that occur in osteoporosis; involves injecting bone cement, but without using a balloon [*vertebra* that which turns, *-plasty* surgical repair]

vertigo (VER-ti-go) abnormal sensation of spinning; dizziness [*vertigo* turning]

vesicle (VES-i-kul) any tiny membranous bubble within a cell; clinical term referring to blisters, fluid-filled skin lesions; see also blister [*vesic-* blister, *-cle* little]

vesicouterine pouch (ves-i-koh-YOO-ter-in) *see* anterior cul-de-sac [*vesic-* blister, *-uter-* womb, *-ine* relating to]

vestibular fold (ves-TIB-yoo-lar) either of the lower of two pairs of lateral folds of the mucosa in the larynx, just above the vocal folds; also called *false vocal fold* or *false vocal cord*; compare to vocal fold [*vestibul-* entrance hall, *voca-* voice, *-al* relating to]

vestibular membrane (ves-TIB-yoo-lar) roof of the cochlear duct; also called *Reissner's membrane* [*vestibule-* entrance hall, *-ar* relating to, *membran-* thin skin]

vestibular nerve (ves-TIB-yoo-lar) division of the vestibulocochlear nerve (eighth cranial nerve)

vestibule (VES-ti-byool) located in the bony labyrinth of the inner ear; portion adjacent to the oval window between the semicircular canals and the cochlea [*vestibul-* entrance hall]

vestibulocochlear nerve (ves-TIB-yoo-lohkok-lee-ar) cranial nerve VIII; sensory nerve; responsible for hearing and equilibrium [*vestibulo-* entrance hall, *-cochle-* snail shell, *-ar* relating to]

vestibulospinal tract (ves-TIB-yoo-loh-SPYnal) descending, or motor, tract that conveys neural messages that coordinate posture and balance [*vestibul-* entrance hall, *-spino-* backbone, *-al* relating to, *tract* trail]

vibrissa (VYE-BRISS-ah) coarse hair found in the skin of the vestibule of the nose [*vibrissa* nostril hair] *pl.*, vibrissae

villus (VIL-us) any of the fingerlike folds covering the plicae of the small intestines [*villus* shaggy hair], *pl.*, villi
Vincent infection (VIN-sent) bacterial (spirochete) infection of the gum, producing gingivitis; also called *Vincent angina* and *trench mouth* [*Henri Vincent* French physician]
virion (VYE-ree-on) a complete viral particle (genetic material and protein capsule) [*vir-* poison, *-on* unit]
virus (VYE-rus-ez) microscopic, intracellular parasitic entity consisting of a nucleic acid bound by a protein coat and sometimes a lipoprotein envelope [*virus* poison]
viscera (VISS-er-ah) internal organs [*visc-* internal organ] *sing.*, viscus
visceral (VISS-er-al) relating to the viscera (internal organs); toward or on the internal organs (opposite of parietal) [*viscer-* internal organ, *-al* relating to]
visceral membrane (VISS-er-al) serous membrane that covers the surface of the viscera [*viscer-* internal organ, *-al* relating to, *membran-* thin skin]
visceral pericardium (VISS-er-al pair-i-KAR-dee-um) the serous membrane that adheres to and covers the heart; also called the *epicardium* [*viscer-* internal organ, *-al* relating to, *peri-* around, *-cardi-* heart, *-um* thing]
visceral pleura (VISS-er-al PLOO-rah) the serous membrane that adheres to and covers the lung [*viscer-* internal organ, *-al* relating to, *pleura* rib] *pl.*, pleurae
visceral portion (VISS-er-al) serous membrane that covers the surfaces of organs in the body cavity [*viscer-* internal organ, *-al* relating to]
visceral reflex (VISS-er-al REE-fleks) autonomic reflex; contractions of smooth or cardiac muscles or secretion by glands [*viscer-* internal organ, *-al* relating to, *re-* again, *-flex* bend]
visceral sensory division (VISS-er-al) division of the nervous system made up of afferent (incoming) pathways from autonomic sensory receptors (receptors involved in subconscious perception) of the internal organs (viscera) [*viscer-* internal organs, *-al* relating to, *sens-* feel, *-ory* relating to]
visceroceptor (viss-er-oh-SEP-tors) somatic sense receptors located in the internal visceral organs; also called *interoceptor* [*viscero-* internal organs, *-cept-*receive, *-or* agent]
viscosity (vis-KOS-i-tee) thickness of a fluid [*viscos-* sticky, *-ity* state]
vital capacity (VC) (largest amount of air that can be moved in and out of the lungs in one inspiration and expiration [*vita-* life, *-al* relating to]
vitamin organic molecules needed in small quantities to help enzymes operate effectively [*vita-* life, *-amin* ammonia compound]
vitamin D compound that influences several important chemical reactions in the body; for example, formation of bones and teeth [*vit-* life, *-amine* chemical group]
vitiligo (vit-i-LYE-go) acquired condition that results in loss of pigment in certain areas of the skin [*vitiligo* blemish]
vitreous body (VIT-ree-us) sac filled with jelly-like fluid in the eye, posterior to the lens [*vitre-* glassy, *-ous* of or like]
vocal cord *see* **vocal fold** [*voca-* voice, *-al* relating to]
vocal fold lower pair of lateral folds of mucosa in the larynx, responsible for vocalization; also called *true vocal fold* or *true vocal cord* or *vocal cord*; compare to false vocal fold [*voca-* voice, *-al* relating to]
voiding (VOYD-ing) emptying the bladder [*void-* empty]
volar (VOH-lar) palm of the hand or sole of the foot [*vola-* palm, sole]
Volkmann canal (VOLK-man) *see* transverse canal (of bone) [*Richard von Volk-mann,* German surgeon]
voltage-gated channel type of cell-membrane channel for the transport of molecules that is controlled by a gate that responds to a change in voltage (difference in charge across the cell membrane) [*volt-* unit of electrical force (after *Alessandro Volta* Italian physicist), *-age* amount]
volume measurement of the amount of space taken up by a substance [*volume* paper roll]
voluntary muscle *see* **skeletal muscle** [*mus-* **mouse**, *-cle* **little**]
vomer bone (VOH-mer) bone that forms the lower and posterior part of the nasal septum [*vomer* plowshare]
vomeronasal organ (VNO) (voh-mer-oh-NAY-sal) sensory organ for detecting pheromones (sex signal molecules) located in the muscosa of the nasal septum [*vomer-* plowshare (vomer bone), *nas-* nose, *-al* relating to, *organ* instrument]
vulva (VUL-vah) external genitals of the female [*vulva* wrapper]
vulvitis (vul-VYE-tis) inflammation of the vulva (external female genitals)

W

wart nipplelike neoplasm of the skin; caused by papilloma virus [*wart* swelling]
white fibers muscle fibers containing little myoglobin; also called *fast fibers*; nerve fibers with a thick myelin sheath [*fiber* thread]
white matter nerves covered with white myelin sheath [*materia-* something from which something is made]
white ramus (RAY-mus) small branch of myelinated sympathetic preganglionic fibers [*ramus* branch]
windpipe trachea [*wind-* blowing, *-pipe* small reed]
withdrawal reflex reflex that moves a body part away from an irritating stimulus [*with-* away, *-draw* to draw, *-al* relating to, *re-* again, *-flex* bend]

X

X chromosome (KROH-moh-sohm) sex chromosome, which, in females, is paired with another X chromosome; as opposed to being paired to a Y chromosome as in males [*chromo-* color, *-some* body]
xeroderma pigmentosum (zeer-oh-DER-mah pig-men-TOH-sum) rare genetic disorder characterized by the inability of skin cells to repair genetic damage caused by the ultraviolet (UV) radiation in sunlight [*xero-* dry, *-derma* skin, *pigment-* paint, *-osum* characterized by]
xerostomia (zee-oh-STOH-mee-ah) condition that results from a dramatic reduction of production of saliva and tears; dry mouth [*xero-* dryness, *-stom-* mouth, *-ia* condition]
X-linked trait genetic trait associated with the female (X) chromosome [*trait* trace]
x-ray photography method of noninvasive imaging of internal body structures; uses energy in the x band of the radiation spectrum beamed through the body to photographic film; also called *radiography* [*x* unknown, *photo-* light, *-graph-* draw, *-y* activity]

Y

Y chromosome (KROH-moh-sohm) sex chromosome that contains genes that determine maleness [*chromo-* color, *-some* body]
yawn slow, deep inspiration through an unusually widened mouth [*yawn* gape]
yeast (yeest) single-celled fungus (compared to mold, which is a multicellular fungus) [*yeast* foam, froth]
yellow marrow (MAIR-oh) connective tissue rich in fat that is found in the medullary cavity of the long bones of an adult; inactive in red cell production [*marrow* inner most]
Y-linked trait genetic trait associated with the male (Y) chromosome [*trait* trace]
yolk sac in humans, involved with production of blood cells in the developing embryo [*yoke* joining]
Young-LaPlace law (law of LaPlace) principle that states that air pressure (P) in a bubble is inversely proportional to the radius (r) and directly proportional to the surface tension (T) summarized by the equation P = 2T/r [*Thomas Young* English physician, *Pierre Simon de LaPlace* French physicist]

Z

Z disk also called Z *line*; microscopic structure within the myofibril of a muscle fiber where the thin filaments unite with each other and form a netlike disk; serves as boundary of sarcomere unit [Z *zwischen* between]
zona fasciculata (ZOH-nah fas-sic-yoo-LAY-tah) middle zone of the adrenal cortex that secretes glucocorticoids [*zona* belt, *fasiculata* having little bundles] *pl.*, zona fasciculatae
zona glomerulosa (ZOH-nah gloh-mair-yoo-LOH-sah) outer zone of the adrenal cortex that secretes mineralocorticoids [*zona* belt, *glomerulosa* having small balls] *pl.*, zonae glomerulosae
zona pellucida (ZP) (ZOH-nah pah-LOO-sih-dah) thick, clear jelly-like film surrounding the ovum, beneath the cumulus cells of the corona radiata [*zona* belt or girdle, *pellucida* transparent] *pl.*, zonae pellucidae
zona reticularis (ZOH-nah reh-tik-yoo-LAIR-is) inner zone of the adrenal cortex that secretes small amounts of sex hormones [*zona* belt, *reticularis* having little nets] *pl.*, zonae reticulares
zone of calcification (kal-si-fi-KAY-shun) deepest layer of the epiphyseal plate; composed of cartilage undergoing rapid calcification [*zone-* belt, *calc-* lime, *-fica* to make, *-tion* process]
zone of hypertrophy (hye-PER-troh-fee) third layer of the epiphyseal plate; composed of older, enlarged cartilage cells that are undergoing degenerative changes associated with calcium deposition [*zone-* belt, *hyper-* excessive, *-troph* nourishment, *-y* state]
zone of proliferation (proh-LIF-er-ay-shun) second layer of the epiphyseal plate; composed of cartilage cells undergoing active mitosis [*zone-* belt, *proles-* offspring, *-fera* to bear, *-tion* process]
zygomatic bone (zye-goh-MAT-ik) cheek bone; also called *malar bone* [*zygo-* union or yoke, *-ic* relating to]
zygomaticus major muscle (zye-goh-MAT-ik-us) muscle that elevates corners of the mouth and lips; also known as the "smiling muscle" [*-zygo-* union or yoke, *-ic* relating to, *major* greater, *mus-* mouse, *-cle* little]
zygote (ZYE-goht) original cell of an offspring, formed by the union of an ovum and sperm [*zygot-* union or yoke]
zymogenic cell (zye-moh-JEN-ik) *see* chief cell [*zym-* ferment (enzyme), *-o-* combining form, *-gen-* produce *-ic* relating to, *cell-* storeroom]

Index

A

A bands of muscle cells, 350, 351*b*, 351*f*
Abdomen
  transverse "cut" image of, 16*f*
  veins of, 658*f*, 659*t*, 662, 663*f*
Abdominal aorta, 648*f*, 649*t*, 650*f*, 651, 652, 653, 653*f*
Abdominal cavity, 16*f*
Abdominal quadrants, 14, 14*f*
Abdominal reflex, 482*f*, 483
Abdominal wall
  hernias, 373
  muscles of, 308*f*–309*f*, 309*t*–310*t*, 316–318, 316*f*, 317*f*, 317*t*
Abdominopelvic cavity, 10–11, 11*t*
Abdominopelvic region, 14, 14*f*
Abducens nerve (VI), 473*f*, 473*t*, 476*b*, 476*t*, 477
Abduction
  definition of, 291
  movement examples, 287*f*–291*f*
Abductor muscles
  of arm, wrist and hands, 324*f*, 324*t*, 327*t*, 330*t*, 331*f*
  examples of, 309, 310*t*, 322*t*–340*t*
  of foot and ankle, 308*f*–309*f*, 309, 310*t*, 340, 340*t*, 341*f*
  of shoulder, 308*f*–309*f*, 309*t*–310*t*, 322, 322*t*, 323*f*, 325*b*
Ablation techniques, 1087
ABO system, 609–610, 610*f*, 611*f*, 613*t*
Abruptio placentae, 1124, 1124*f*
Absolute refractory period, 397–398, 397*f*
Absorption
  as characteristic of life, 6*t*
  digestive process, 902, 902*f*, 902*t*, 921–923, 921*f*–923*f*, 923*t*, 925
  function of epithelial tissue, 133*t*, 135, 140*t*, 141–142, 141*f*
  sites in digestive tract, 923*f*
Accessory ducts, of pancreas, 886, 887*f*
Accessory male reproductive glands
  bulbourethral glands, 1045*f*, 1046, 1052*f*, 1054, 1054*f*, 1055
  prostate gland, 1045*f*, 1046, 1052*f*, 1053–1055
  seminal vesicles, 1045*f*, 1046, 1052*f*, 1053, 1053*f*, 1055
Accessory nerves (XI), 473*f*, 473*t*, 480, 480*f*, 480*t*
Accessory organs
  of female reproductive system, 1064–1074
  of male reproductive system, 1045–1046, 1054–1055
Accidents, death rates due to, 1123*f*
Accommodation, 530, 531*f*
ACE inhibitors, 578, 704
Acetylcholine (ACh)
  autonomic neurons release of, 494, 495*f*, 496, 496*f*, 497
  role in muscle excitation, 353, 353*b*, 353*f*, 354*f*
  and somatic motor pathways, 481
  structure and function of, 404, 406, 406*f*, 407*t*
Acetylsalicylic acid, 51*b*
Achilles reflex, 482, 482*f*
Achilles tendon
  anatomy of, 340, 340*t*, 341*f*
  as lever example, 307, 307*f*
Acid-base balance
  acidosis, 60, 1030*f*, 1033*f*, 1037*f*, 1038*f*, 1136–1138
  alkalosis, 60, 1030*f*, 1033*f*, 1037*f*, 1038*f*, 1136–1138
  and carbon dioxide, 846
  case study, 1039
  of cerebrospinal fluid, 850–851, 851*f*
  control systems for
    body fluids, 1026–1032, 1026*f*, 1027*b*, 1027*t*, 1028*f*
    buffer mechanisms, 1027*t*, 1028–1032, 1028*f*–1031*f*
    chemical buffers, 1027–1028, 1027*t*
    physiological buffers, 1027–1028, 1027*t*
    respiratory system, 1028*f*, 1032, 1033*f*
    urinary system, 1028*f*, 1033–1035, 1034*f*, 1035*f*
  definitions associated with, 1026
  effects on enzyme function, 104*f*
  and homeostasis, 1026, 1028*f*, 1033*f*, 1035*f*
  imbalances and disorders, 1036–1038
  role of blood in regulating, 152
  scale and ranges of, 44, 44*b*, 45*f*, 1026*f*, 1028, 1028*f*
  in urine, 992*t*
Acidity, and pH scale, 44, 44*b*, 45*f*, 1026, 1026*f*
Acidosis
  definition of, 60, 1026
  description and types of, 60, 1030*f*, 1033*f*, 1037*f*, 1038*f*, 1136–1138
  and respiratory function, 1032, 1033*f*
Acids
  and base-forming foods, 1026*f*, 1027*f*
  buffers, 1027*t*, 1028–1032, 1028*f*–1031*f*
  definition and ranges of, 44, 1026, 1026*f*
Acinar cells, 886, 887*f*
Acoustic nerve, vestibulocochlear nerve (VIII), 473*f*, 473*t*, 477*f*, 478, 478*b*, 478*t*
Acoustic neuromas, 412
Acquired cortical color blindness, 537
Acquired immunodeficiency syndrome (AIDS)
  causing dementia, 453
  Kaposi sarcoma, 190, 191*f*, 775
  overview and treatments of, 774–775, 774*f*, 775*f*
Acromegaly, 558, 566*b*, 587*t*
Acromioclavicular joint, 284*t*
Acromion, 224*f*–225*f*, 226*t*, 250–251, 250*f*, 251*t*, 259*b*, 284*t*
Acrosome reaction, 1050, 1050*f*, 1101*f*, 1102–1103
Actin, 352–354, 352*f*, 353*b*, 353*f*, 354*f*, 355*f*, 356
Action potentials
  characteristics and actions of, 395–399, 396*f*, 396*t*, 397*t*, 398*f*, 399*f*
  in heart conduction system, 683, 684–687, 685*f*
  production steps, 396–397, 396*f*, 396*t*, 402–403, 402*f*
  summation, 388–389, 389*f*, 403, 403*f*
Active site of enzymes, 102
Active transport processes
  in absorption, 921, 921*f*
  endocytosis, 99–100, 99*f*, 100*f*, 101*t*
  exocytosis, 99*f*, 100–101, 101*t*
  pump transporters, 97–98, 97*f*, 98*b*, 98*f*, 101*t*
  role of, 101, 101*t*
  sodium-potassium pump, 394*f*, 395*t*
  vesicle transporters, 99–101, 99*f*, 101*t*
Actual osmotic pressure, 93–94
Acute anemia, 620
Acute bacterial conjunctivitis, 524, 525*f*, 536
Acute bacterial pneumonia, 817–818, 818*f*
Acute bronchitis, 817, 854
Acute diseases, definition of, 25*b*
Acute lymphocytic leukemia (ALL), 621, 621*f*
Acute myeloid leukemia (AML), 622
Acute otitis media, 519, 534–535, 535*f*, 739
Acute pain fibers, 508
Adam's apple, 804*f*, 805
Adaptation
  of sensory receptors, 506, 506*f*
  to stress, 784–786, 786*f*, 786*t*, 787*f*, 788*f*, 789
Adaptive immunity
  antibodies, 756, 758–762, 759*b*, 763*b*, 763*f*, 769–770, 769*f*, 770*f*
  B-cells, 756, 756*f*–759*f*, 757*b*, 767*t*
  clonal selection theory, 764, 764*f*
  definitions and organization of, 746, 747*f*, 747*t*
  language and terminology, 757*b*
  summary and stages of, 757*f*, 769–770, 769*f*, 770*f*
  synonyms, characteristics and components of, 747*t*
  T-cells, 756, 757*f*, 764–767, 765*b*, 765*f*, 766*b*, 766*f*, 767*t*, 769*f*
  types of, 757*f*, 760*t*, 768–769, 769*f*
Addison disease, 580*b*, 587*t*, 773*t*
Adduction, definition of, 291
Adductor muscles, 308*f*–309*f*, 309, 309*t*–310*t*, 333*t*, 334*f*, 335*f*, 336*f*
Adenocarcinoma, 159, 892, 893, 894
Adenofibromas, 159
Adenohypophysis hormones, 564–571, 564*f*–565*f*, 566*b*, 567*f*–570*f*, 568*t*, 571*t*
Adenoids, 733, 733*f*
Adenomas, 159
Adenosine diphosphate (ADP), 934, 934*f*, 935*f*, 951*f*
Adenosine triphosphate (ATP)
  and active transport processes, 97–98, 97*f*, 98*b*–99*b*, 98*f*
  ATP synthase, 106–107, 107*f*, 939, 939*f*
  as energy sources for muscles, 356–357, 357*b*, 357*f*
  glycolysis, 935–936, 935*f*
  important role in metabolism, 41–42, 47*t*, 105–107, 107*f*, 933–934, 933*b*, 934*f*, 951*f*
  low levels causing muscle fatigue, 363*b*
  in mitochondria, 77, 77*f*, 387
  molecular characteristics of, 47*t*, 58–59, 59*f*
Adenosine triphosphate (ATP) synthase, 106–107, 107*f*, 939, 939*f*
Adipocytes, 144, 144*t*, 146–147, 146*f*, 147*b*, 147*f*, 150, 207–208
Adipose tissue
  autonomic functions of, 489, 489*b*, 489*f*, 491*f*, 498*t*, 500*t*
  characteristics and illustrations of, 144, 144*t*, 146–147, 146*f*, 147*b*, 147*f*
  and fat metabolism, 946–948, 950*t*
  in female breasts, 1082–1083, 1083*f*
  of muscle, 302*t*, 303*f*
  tumors, 159
Adolescence
  growth and development, 1118, 1118*f*
  ossification process in, 210, 210*f*, 211*f*
Adrenal cortex, 577–580, 577*f*, 578*f*, 578*t*, 579*f*, 580*b*, 787*f*
Adrenal glands
  abnormalities and disorders associated with, 580*b*, 587*t*–588*t*
  adrenal cortex hormone secretions, 577–580, 577*f*, 578*f*, 578*t*, 579*f*, 580*b*
  adrenal medulla, 577, 577*f*, 578*f*, 578*t*, 581*f*
  cortisol, 578–579, 578*t*, 579*f*, 580*b*
  glucocorticoids, 578–579, 578*t*, 579*f*
  gonadocorticoids, 578*f*, 580
  mineralocorticoids, 578, 578*t*
  structure and location of, 547*f*, 547*t*, 577–578, 577*f*, 581*f*
Adrenal medulla
  autonomic functions of, 489, 489*b*, 489*f*, 491*f*, 498*t*, 500*t*
  structure and function of, 577, 577*f*, 578*f*, 578*t*, 581*f*
Adrenaline
  during alarm reaction, 785–786, 786*f*, 786*t*, 787*f*
  sources, targets and actions of, 578*t*, 580, 581*f*
Adrenergic receptors, 494, 495*f*, 496, 496*f*, 497
Adrenocorticotropic hormone (ACTH), 565, 565*f*, 567, 571*t*, 788, 789*f*, 944–945, 945*f*
Adult stem cells, 132, 132*b*, 602–604, 603*f*, 608, 1111
Adulthood, 1118, 1118*f*
Adventitia of esophagus, 871*f*
Aerobic exercise; *See also* exercise
  benefits to cardiovascular system, 697–698, 697*f*, 698*b*–699*b*
  effects on skeletal muscles, 364–367, 364*b*, 365*f*–367*f*
  maximum oxygen consumption, 837*b*
  respiration, 105–106, 357
Aerobic pathways
  in glucose catabolism, 936–937, 936*f*, 941*f*
  and muscle energy, 357–359, 358*b*, 359*f*
Aerobic respiration
  definition of, 105–106, 357
  and glucose metabolism, 936–937, 936*f*, 940, 941*f*
Afferent, as directional term, 20, 383
Afferent division of nervous system, 382*f*, 383
Afferent fibers, of spinal nerves, 471–472, 471*f*, 473
Afferent lymphatic vessels, 728–729, 728*f*, 729*f*
Afferent neurons, 390–391, 390*f*
African-Americans, 179*f*
Afterbirth, 668, 1072
Age spots, 179*f*
Agglutination, 609–610, 611*f*, 612*f*
Aggregated lymphoid nodules, 723, 724*f*, 737*t*
Aging
  age spots, 179*f*
  and basal metabolic rate, 957–958
  benefits of, 1122
  biological changes with, 1120–1122
  "bone age" *versus* "chronological age," 263
  bone changes with, 213, 213*b*, 216–217, 263–264, 1120, 1121*f*
  bone density changes with, 213*b*, 1120, 1121*f*
  cataracts, 536, 536*f*, 1122
  defining process of, 24
  effects on
    cardiovascular system, 1122
    integumentary system, 1120–1121
    muscular system, 1120, 1121*f*
    reproductive systems, 1122
    respiratory system, 1121
    skeletal system, 1120, 1121*f*
    special senses, 1122
    urinary system, 1121
  exercise benefits, 1120, 1121*b*
  factors with cancer, 159
  free-radical theory of aging, 1119, 1119*f*
  hair changes with, 185–186, 186*f*
  hearing loss, 535, 1122
  herniated disks with, 285–286, 285*f*
  nervous system changes with, 411
  osteoporosis, 208, 208*f*, 213*b*, 216–217, 217*f*, 263–264, 1120, 1121*f*
  population projections, 1116*t*
  presbyopia, 536, 1120
  as risk factor for disease, 27
  skin changes and wrinkling, 179, 179*f*, 180, 180*f*, 188, 188*f*, 1120–1121
  and stress-age syndrome, 792*b*
  vision changes with, 530, 530*b*, 1122
Aging process, definition of, 24
Agonist muscles, 306, 306*f*
Agranulocytes, 600*f*, 603*f*, 605, 606*t*, 607, 607*f*
Air-contrast barium enema study, 877*b*
Alarm reaction, 785–786, 786*f*, 786*t*, 787*f*
Albinism, 179, 1136–1137, 1136*f*, 1137*f*, 1140*f*, 1143*t*, 1144
Albumins, 613
Alcohol abuse
  and cirrhosis of liver, 894, 895*f*
  fetal alcohol syndrome (FAS), 666, 666*b*, 784, 792, 1141*b*
  causing hepatitis, 894
  and liver detoxification functions, 884, 894
  causing peripheral neuropathy, 464*b*
  and stomach cancer, 892, 892*f*
Aldosterone
  in fluid and electrolyte homeostasis, 1009–1012, 1009*f*, 1011*f*, 1017–1018, 1017*f*, 1018*f*
  functions of, 548*f*, 549*f*, 578, 578*t*, 579*f*, 580*b*
  role in kidney function, 982, 987–992, 988*f*–991*f*
  during stress response, 788, 789*f*
Aldosteronism, 580*b*, 587*t*

Alimentary canal; *See* digestive system
Alkalinity, and pH scale, 44, 44*b*, 45*f*, 1026–1027, 1026*f*
Alkalosis
  description and types of, 60, 1026, 1030*f*, 1033*f*, 1037*f*, 1038*f*, 1136–1138
  and respiratory function, 1032, 1033*f*
Allergens, 772
Allergies
  hay fever and asthma, 146*b*
  as hypersensitive immune disorder, 772
Allosteric effectors, 103–104, 103*f*
Alpha brainwaves, 442*b*
Alpha cells of pancreatic islets, 581, 581*f*, 582*f*, 582*t*, 886, 887*f*
Alpha particles, 38
Alpha receptors (autonomic), 494, 496–497, 496*f*, 497*b*
Alpha-fetoprotein (AFP), 766*b*
Aluminum, 34*f*, 35*t*
Alveolar exocrine glands, 141, 141*f*
Alveolar pressure, 824, 825*f*, 826, 826*b*–827*b*, 827*f*–831*f*, 828–831, 829*t*, 832*b*, 839–840
Alveolar sac and ducts, 800*f*, 808–810, 812*t*
Alveolar ventilation, 834*f*, 835, 852, 853*f*
Alveoli; *See also* pulmonary ventilation
  alveolar pressure, 824, 825*f*, 826, 826*b*–827*b*, 827*f*–831*f*, 828–831, 829*t*, 832*b*, 839–840
  anatomy and functions of, 800*f*, 808–810, 808*f*, 809*f*, 810*f*, 812*f*, 812*t*, 813–814
  of breasts, 1082–1084, 1083*f*
  simple squamous epithelium, 138, 138*f*, 140*t*
Alzheimer disease (AD)
  cellular dysfunction and, 85
  death rate statistics, 1123*f*
  dementia, 452–453
  disease chromosome map, 1140*f*
Amenorrhea, 1086, 1087*b*
American Medical Association (AMA), on eponyms, 6, 25*b*
Amines, structure and function of, 405–407, 406*f*, 407*t*
Amino acid derivative hormones, 548*f*, 549*f*, 550
Amino acids
  absorption of, 921–922, 921*f*, 923*t*
  definition and functions of, 47*t*, 52–55, 52*f*, 53*f*, 54*f*, 55*b*, 405, 406*f*, 407*t*, 408
  derivatives, 548*f*, 549*f*, 550
  digestion, 910, 910*f*, 911*b*
  and disease, 949*b*
  and DNA, 57–58, 57*f*, 58*f*, 60, 114–115, 118*f*, 1132–1135, 1135*b*
  essential and nonessential, 948–949, 949*t*
  and genetic code, 118*f*
  metabolism, 949–950, 949*f*, 950*t*
  as neurotransmitters, 405, 406*f*, 407*t*, 408
  and nucleic acids, 56–58, 58*f*
  and reabsorption, 985–989, 985*f*–988*f*, 989*t*
  sources of, 948–949, 949*f*
  structure and function of, 405, 406*f*, 407*t*, 408
  transfer and binding, 117–118, 117*f*
Ammonia, 1034*f*, 1035
Amniocentesis, 1147, 1147*f*
Amniotic cavity, 1103–1105, 1103*f*, 1104*f*
Amphiarthroses, 272–274, 272*t*, 273*f*, 274*t*, 284*t*
Ampulla
  male, 1051–1052, 1052*f*
  of uterine tubes, 1066*f*, 1070–1071
Amputations, 727*b*
Amygdaloid nucleus, 438, 444*f*
Amylase, 910, 913*t*, 914, 916, 925
Amyloidosis, 1140*f*
Amyotrophic lateral sclerosis, 1140*f*
Anabolic hormones, 547–548, 558
Anabolic steroids, 585*b*
Anabolism
  anabolic hormones, 547–548, 585*b*
  carbohydrates, 934–946
  citric acid cycle, 936–937, 937*f*
  definition and illustration of, 41–42, 41*f*, 932
  of lipids, 947–948, 947*f*, 950*t*
  metabolic pathways, 102, 108
  of proteins, 949–950, 949*f*, 950*t*
Anaerobic body cells, 940, 940*b*
Anaerobic pathways
  of carbohydrate metabolism, 936, 940–941, 940*b*, 941*f*
  in glucose catabolism, 936–937, 936*f*, 941*f*
  and muscle energy, 357–359, 358*b*, 359*f*
Anaerobic respiration, glycosis, 105–106, 105*f*, 358–359, 358*b*
Anal canal, 862*f*, 879, 879*f*, 880*f*
Anal fissures, 894, 894*f*
Anal fistula, 894, 894*f*
Anal sphincter muscles, 320, 321*f*, 321*t*, 894, 894*f*, 924, 924*f*
Anal triangle, 320, 321*f*, 321*t*, 1046*f*, 1065*f*
Anaphase of mitosis, 123–124, 123*t*, 125*f*
Anaphylactic shock, 714, 772
Anaplasia, 159
Anastomosis
  arterial, 648, 651, 652*f*
  arteriovenous, 648
  coronary, 640–641

Anterior, as directional term, 15, 15*f*, 16
Anterior cavity, of eyeball, 527*f*, 529
Anterior corticospinal tracts, 427*f*, 428, 428*t*
Anterior cruciate ligament (ACL), 282, 282*b*, 282*f*
Anterior fornix, 1068, 1069*f*
Anterior spinothalamic tracts, 427*f*, 428, 428*t*
Anterior tibial veins, 658*f*, 659*t*, 664–665, 664*f*
Anterior uterine ligaments, 1064*f*, 1066*f*, 1069
Anthrax, 27
Antianemic principle, 605
Antiangiogenesis agents, 160
Antibodies
  definition, actions and functions of, 756, 758–762, 759*b*, 760*f*–763*f*, 763*b*, 769–770, 769*f*, 770*f*
  diversity and classes of, 760, 760*f*
  glucocorticoids affect on, 579
  molecule structure, 758–760, 759*f*
Antibody titers, 763*b*
Antibody-mediated immunity, 756, 758–762, 759*b*, 760*f*–763*f*, 763*b*, 769–770, 769*f*, 770*f*
Anticoagulants, 617*b*, 673
Anticodon, 58, 58*f*, 117, 117*f*, 118*f*
Antidepressants, 410*b*
Antidiuretic hormone (ADH)
  regulating total blood volume, 704, 704*f*
  role in fluid and electrolyte balance, 1011*f*
  role in kidney function, 982, 987–992, 988*f*–991*f*
  sources, targets and actions of, 570, 570*b*, 571*t*, 788, 789*f*
  during stress response, 788, 789*f*
Antigen-antibody complex, 757*b*
Antigen-antibody reactions, 761, 761*f*
Antigenic determinants, 757*b*
Antigen-presenting cells (APCs), 752, 753*f*, 754*b*
Antigens
  definition of, 746, 747*t*, 757*b*
  major histocompatibility complex (MHC), 754*b*
  tumor-specific, 766*b*
Antihistamines, 772
Antioxidants, 952*f*, 953
Antiporters, 98*b*
Anuria, 994*b*
Anus
  anatomy of, 862*f*, 879, 879*f*, 880*f*
  male and female, 1046*f*, 1065*f*
  role in digestion, 902*f*, 925
Aorta, 648*f*, 649*t*, 650*f*, 651, 652, 653
Aortic arch, 648*f*, 649*t*, 650*f*, 651, 652, 653, 655*f*
Aortic reflexes, 695
Aortic regurgitation, 670
Aortic valves, 631*f*–633*f*, 638–640, 638*f*, 639*f*, 640*f*
Apex of lung, 812–813, 812*f*
Apgar score, 1117
Aphasia, 444
Apical, as organ-related term, 15
Aplastic anemia, 620
Apnea, 836*b*
Apneusis, 836*b*
Apneustic center, 848–849
Apocrine glands, 142, 142*f*, 187–188, 187*f*
Aponeurosis, 302, 312, 316*f*, 317, 317*f*
Apoptosis, 126*b*, 1118
Appendicitis, 880
Appendicular skeleton
  description and illustration of, 12*f*, 13
  lower extremity, 224*f*–225*f*, 226*t*, 255, 255*f*, 256*f*, 256*t*–257*t*, 257, 258*f*, 259, 260*f*, 260*t*–261*t*
  upper extremity, 224*f*–225*f*, 226*t*, 250–251, 250*f*, 251*t*–253*t*, 252*f*–254*f*
Appendix
  peritonitis, 156*b*
  vermiform, 862*f*, 879–880, 881*f*, 894
Appetite center, 958–960, 959*f*, 959*t*
Appositional growth, 209, 212, 212*f*, 215
Aquaporins, 96, 984
Aqueous humor, 529, 529*f*, 529*t*
Arachnoid mater, 421, 421*f*, 422*f*, 423*b*
Arbor vitae, 432, 432*f*
Arch of aorta, 648*f*, 649*t*, 650*f*, 651, 652, 653, 655*f*
Arches of foot, 259, 260*f*, 260*t*–261*t*
Areola of breasts, 177, 1082–1084, 1083*f*, 1084*f*
Areolar tissue, 144, 144*t*, 145–146, 145*f*, 146*f*, 177
Arginine vasopressin (AVP), 570, 571*t*
Arm
  humerus, 200*f*, 201*f*, 224*f*–225*f*, 226*t*, 251, 252*f*, 252*t*, 253*f*, 259*b*
  muscles of, 308*f*–309*f*, 309*t*–310*t*, 324*f*, 324*t*, 325, 325*b*, 326*f*, 328*f*
  radius, 200*f*, 224*f*–225*f*, 226*t*, 251, 252*f*, 253*f*, 253*t*, 254*f*, 259*b*
  ulna, 200*f*, 224*f*–225*f*, 226*t*, 251, 252*f*, 253*f*, 253*t*, 254*f*, 259*b*
Arrector pili muscle, 172*f*, 177, 177*f*
Arterial anastomosis, 648, 651, 652*f*
Arterial blood gases, 838–851, 839*t*, 841*b*
Arterial blood pressure, 688*f*, 691–700, 691*f*–700*f*
  and blood volume, 691, 691*f*
  cardiac output, 691–695, 691*f*–694*f*, 697*f*, 699*b*
  heart rate, 691–693, 693*f*, 694*f*, 699*b*
  local control of arterioles, 699*b*, 700
  peripheral resistance, 695–698, 699*b*, 700
  pressure gradients, 838–839, 839*t*
  stroke volume, 691–693, 691*f*–693*f*, 699*b*
  summary of breathing and, 825*f*, 851
  vasomotor control mechanism, 695, 696–697, 696*f*–698*f*, 699*b*
Arteries
  of abdominal aorta, 648*f*, 649*t*, 650*f*, 651, 652, 653, 653*f*
  anatomic diagram and names of principle, 648*f*, 649*t*
  of brain, 651, 652*f*
  coronary, 633*f*, 634*f*, 640*f*–643*f*, 641*b*, 642–644, 648*f*, 649*t*, 650*f*
  disorders of, 671–672, 672*f*
  fetal, 665–668, 666*f*–668*f*
  general principles concerning, 650–651, 651*f*–653*f*
  of head and neck, 651, 651*f*
  hepatic, 882, 883*f*, 884, 885*f*
  of lower extremities, 656*f*, 657*f*
  renal, 973, 973*f*, 976, 980, 980*f*, 981*f*, 989*t*
  structure of, 646*t*
  systemic, 648, 648*f*, 649*t*, 650–654, 650*f*–657*f*
  of upper extremities, 649*t*, 654, 654*f*, 655*f*
Arteriograms, 641*b*
Arterioles, 643, 643*f*, 644*f*, 699*b*, 700
Arteriosclerosis, 671, 1120
  with hypertension, 707
Arteriovenous anastomosis, 648
Arthrectomy, 672
Arthritis, 293*f*, 294
Arthroscopy, 294, 295*f*
Articular cartilage
  anatomy of, 202–203, 202*f*, 203*f*, 207–208, 207*f*
  definition and illustration of, 274*f*, 275
Articular disks, definition and illustration of, 274*f*, 275
Artificial immunity, 760*t*, 768–769
Artificial kidneys, 997*b*
Arytenoid cartilage, 804*f*, 805, 805*f*
Ascending aorta, 648*f*, 649*t*, 650*f*, 651, 652, 653
Ascending colon, 862*f*, 878–879, 878*f*, 879*f*, 881*f*
Ascending spinal tracts, 427–429, 427*f*, 428*t*
Asians, 179*f*
Aspiration biopsy cytology (ABC), 203, 619
Aspirin, 51*b*, 617, 617*b*, 751
Assimilation, 932
Aster, 81
Asthma, 854–855, 855*f*
Astigmatism, 536
Astrocytes, 384–385, 384*f*, 385*b*
Astrocytomas, 411
Atherosclerosis, 617, 669, 670, 672, 672*f*, 1122, 1123*f*
  and low-density lipoproteins, 946–947, 946*b*
Atherosclerotic plaque
  caveolae, 71*b*, 670, 672
  and low-density lipoproteins, 946–947, 946*b*
Athletes
  female "sports triad," 1087*b*
  vitamins supplements for, 952*b*, 963
Atlantoepistropheal joint, 284*t*
Atlas, 225*f*, 244*t*, 246*f*
Atmospheric pressure, 824, 825*f*, 826, 826*b*–827*b*, 827*f*–831*f*, 828–831, 829*t*, 838–839, 838*f*
Atomic force micrograph (AFM), of cell membrane, 71*f*
Atomic force microscope (AFM), atoms, 36*f*
Atomic mass number, 34*f*, 36
Atomic number, 34*f*, 35*t*, 36
Atoms, 36–38
  atomic force microscope (AFM) image of, 36*f*
  atomic number, 34*f*, 35*t*, 36
  atomic structure, 36, 36*f*
  atomic weights, 34*f*, 38
  as basis of life, 7–8, 7*f*
  Bohr model, 37, 37*f*
  chemical reactions between, 37, 37*f*, 38–39, 39*f*
  energy levels, 36–37, 36*f*, 37*f*
  enzymes that rearrange, 103
  isotopes, 34*f*, 37–38, 38*f*
  mass number, 34*f*, 35*t*, 36
  octet rule, 37, 37*f*, 39
ATP synthase, 106–107, 107*f*, 939, 939*f*
Atria, 631*f*–633*f*, 636, 636*f*–638*f*
Atrial fibrillation, 712, 713*f*

Atrial natriuretic hormone (ANH), 584*t*, 586, 704, 704*f*, 990–991, 991*f*, 992*f*, 1011*f*
Atrial systole, 688*f*, 689
Atrioventricular (AV) nodes, 642, 683, 683*f*
Atrioventricular (AV) valves, 631*f*–633*f*, 638–640, 638*f*, 639*f*, 640*f*
Atrophy
  of cells, 126*b*
  definition of, 24
  disuse, 364–367, 364*b*, 365*f*–367*f*
Attachments, of muscles, 305, 305*f*; *See also* Tables 11–7 to 11–19
Auditory nerve, vestibulocochlear nerve (VIII), 473*f*, 473*t*, 477*f*, 478, 478*b*, 478*t*
Auditory ossicles, 518*f*, 519
Auditory tube, 518*f*, 519
Autocrine hormones, 556*b*
Autoimmune diseases, 772, 773*t*, 888
Autoimmunity
  and aging, 1119
  autoimmune diseases, 772, 773*t*, 888
  definition of, 27
  causing hormone hypersecretion, 558
Automatic external defibrillators (AEDs), 712–713, 713*f*
Autonomic antagonism principle, 498–799
Autonomic efferent pathways, *versus* somatic motor pathways, 490, 491*t*
Autonomic nervous system (ANS)
  big picture, 501
  case study, 502
  effector tissues and organs, 382*f*, 383, 489*b*
  functions of, 498–501, 498*t*, 499*f*, 500*t*
  neurotransmitters and receptors, 494, 495*f*, 496–497, 496*f*, 497*b*
  organization and divisions of, 382*f*, 383, 489*b*, 489*f*, 490, 490*f*
  parasympathetic pathways, 382*f*, 383, 489*f*, 490, 490*f*, 492, 493*f*, 494, 494*t*, 498–499, 498*t*, 499*f*, 501
  role of, 489, 498*t*, 500*t*
  structure of, 382*f*, 383, 490–497, 490*f*, 491*f*, 491*t*, 493*f*, 494*t*
  sympathetic
    "fight-or-flight" reaction, 383, 499–500, 500*t*, 785–786, 786*f*, 786*t*, 787*f*, 788, 789*f*, 943
    functions of, 498–499, 498*t*, 499*f*
    pathways, 382*f*, 383, 489*f*, 490–492, 490*f*, 491*f*, 491*t*, 493*f*, 494*t*
  visceral sensory division, 489, 489*f*
Autonomic reflexes, 481, 489
Autopoiesis, 6
Autoregulation
  of glomerular filtration, 991, 991*f*
  for homeostasis, 23*f*, 24
Autorhythmic heart muscles, 635
Autosomes, 1135
AV bundles, 683, 683*f*
Avascular, as descriptive term, 136
Avitaminosis, 952*b*, 963
Axial skeleton, description and illustration of, 12*f*, 13
Axillary lymph nodes, 730, 730*f*
Axillary veins, 658*f*, 659*t*, 660*f*, 661, 661*f*, 662*f*
Axis (epistropheus), 225*f*, 244*t*, 246*f*
Axon hillock, 387*f*, 388, 389*f*
Axonal transport, 388, 388*f*, 389*f*
Axons
  associated with reflexes, 481–482
  of cranial nerves, 473–474, 476–480
  in epidermal skin cells, 173, 173*f*
  of muscle motor neurons, 303*f*
  myelinated, 388–391, 388*f*
  nervous tissue, 154, 154*f*
  in neurons, 387–391, 387*f*–391*f*
  preganglionic and postganglionic, 490–492, 491*f*, 494*t*, 495*f*
  refractory period, 397–398, 397*f*
  synapses, 400–403.400*f*–403*f*
Azygos veins, 632*f*, 659*t*, 660*f*, 661, 661*f*, 662*f*, 663*f*

B

B cells
  deficiency diseases, 774–775
  development and actions, 756, 756*f*–759*f*, 757*b*, 767*t*
  in lymph nodes, 757–758, 758*f*
  neoplasms, 620
B vitamins, 952–953, 953*t*, 963
Babinski reflexes, 451*b*
Babinski sign, 482*f*, 483
Back
  bones of, 224*f*–225*f*, 226*t*, 244*t*, 245, 245*f*–247*f*, 248*t*, 249*f*
  muscles of, 308*f*–309*f*, 309*t*–310*t*, 318–319, 318*f*–319*f*, 320*t*
Bacteria
  cytolysis, 762, 762*f*
  damaging cells, 127–128, 128*f*
  definition and illustration of, 26, 26*f*
  infecting muscle tissue, 372
  lines of defense against, 748*t*, 749–751
  lymph node filtering of, 730–731, 731*f*
  osteomyelitis, 218
  through connective tissue, 145–146
  urinary tract infections (UTIs), 995–996
Balance
  cerebellar role in, 433–434, 433*f*
  ear hair cells and, 517–524, 519*f*, 521*f*, 522*f*, 523*f*
  sense of, 522–524, 522*f*, 523*f*
  vertigo, 535
Baldness, 186, 186*f*
Ball-and-socket joints, 275*f*, 276, 276*t*, 284*t*
Balloon angioplasty, 672, 672*f*
Balloon kyphoplasty, 264*b*
Balloon model of ventilation, 826, 827*f*
Bard endoscopic suturing system, 890, 891*f*
Barium enema, 872*b*, 875*f*, 877*b*
Barometric pressure, 824, 825*f*, 826, 826*b*–827*b*, 827*f*–831*f*, 828–831, 829*t*
Baroreceptors, cardiac, 693–694, 693*f*, 694*f*, 698*f*
Barrett esophagus, 890
Bartholin gland, 1065*f*, 1073*f*, 1074
Basal, as organ-related term, 15
Basal cell carcinoma, 159, 190, 191*f*
Basal cells, of olfactory epithelium, 513–514
Basal metabolic rate (BMR), 955, 956*b*, 956*f*, 957–958, 957*t*
Basal nuclei, 432, 438, 439*f*, 440*b*, 447*t*
Base of lung, 812–813, 812*f*
Base pairs, in DNA, 57*f*, 57*t*, 114–115
Basement membrane (BM), 135–136, 136*f*, 138*f*–139*f*, 979, 979*f*–982*f*
Bases
  and acid-forming foods, 1026*f*, 1027*f*
  buffers, 1027*t*, 1028–1032, 1028*f*–1031*f*
  definition and ranges of, 44, 1026, 1026*f*
Basilar artery, 651, 652*f*
Basilar membrane, 519*f*, 520
Basilic veins, 658*f*, 659*t*, 660*f*, 661, 661*f*
Basophilic erythroblasts, 603–604, 603*f*
Basophils, 152, 152*f*, 599*f*, 600*f*, 603*f*, 605, 606*t*, 607, 607*f*, 607*t*
Belly of muscles, 306, 307*f*
Belt desmosomes, 83, 84*f*
Benign prostatic hypertrophy, 1053, 1058
Benign tumors, 158–160
  formation with mitosis abnormalities, 126*b*
Bernard, Claude, 18
Beta brainwaves, 442*b*
Beta cells of pancreatic islets, 581, 581*f*, 582*f*, 582*t*, 886, 887*f*, 943–944
Beta particles, 38
Beta receptors, 494, 496–497, 496*f*, 497*b*
Beta-adrenergic blockers, 673
Beta-carotene, 180
Biaxial joints, 275, 275*f*, 276*t*, 284*t*
Bicarbonate
  buffer pairs, 1028
  buffering actions of, 1027, 1031, 1031*b*, 1031*f*
  chemical makeup of, 844–845, 845*f*
  deficit and excess, 1031*f*, 1036, 1037*f*
  role in fluid and electrolyte balance, 1004–1008, 1006*f*
  secretion by pancreatic duct cells, 917*f*
Bicarbonate ions (HCO_3), 602
Bicarbonate loading, 1031*b*
Biceps brachii, 326, 326*f*, 327*f*, 327*t*, 328*f*
Biceps femoris muscles, 308*f*–309*f*, 309*t*–310*t*, 334*f*, 335*f*, 338*f*, 339*f*, 339*t*
Biceps muscles, 308*f*–309*f*, 309*t*–310*t*
Bicuspid valves, 631*f*–633*f*, 638–640, 638*f*, 639*f*, 640*f*
Bilateral symmetry, 10, 10*f*
Bile
  digestive secretion and control, 902*t*, 912*f*, 916–917, 918*t*, 920, 920*t*
  gallbladder, 862*f*, 882*f*, 883*f*, 885–886, 885*f*, 886*f*
  secretion by liver, 883*f*, 884
Bile ducts, 883*f*, 884, 885*f*
Bile salts, 912, 912*f*, 913*t*
Bilirubin, 916–917
Binge-purge syndrome, 962
Biochemistry, science of, 34
Biofeedback, 499*b*
Biological clock, 436–437, 436*f*, 437*f*, 571
Biology, definition of, 5
Biopsy, for cancer detection, 159
Biot's breathing, 836*b*
Bipennate muscles, 304, 304*f*

tissue composition, 133*t*, 149–150, 150*f*, 151*f*, 201, 203–204, 205*f*, 206
types of, 200–203, 200*f*, 201*f*, 202*f*, 203*f*
upper extremity joints, 279–280, 279*f*, 280*f*
Bony labyrinth, 519–520, 519*f*
Bony landmarks, 259*b*
Bony pelvis, male *versus* female, 261–262, 261*f*, 262*t*
Booster shots, 763*b*
Boosting, 604*b*
Boron, 34*f*, 35*t*
Bouchard nodes, 293, 293*f*
Bowman capsule, 976, 976*f*–982*f*, 977–979, 982, 982*f*, 989*t*
Boyle's law, 826, 826*b*–827*b*, 828
Brachial artery pulse point, 710, 711*f*
Brachial plexus, 464, 465*f*, 466, 467*t*, 468, 469*f*
Brachial veins, 658*f*, 659*t*, 660*f*, 661, 661*f*, 662*f*
Brachialis muscles, 308*f*–309*f*, 309*t*–310*t*, 326, 326*f*, 327*f*, 327*t*, 328*f*
Brachiocephalic artery, 648*f*, 649*t*, 650*f*, 651
Brachiocephalic veins, 658*f*, 659*t*, 660*f*, 661, 661*f*, 662*f*, 663*f*
Brachioradialis muscles, 304, 304*f*, 308*f*–309*f*, 309*t*–310*t*, 326, 326*f*, 327*f*, 327*t*, 328*f*
Bradycardia, 712, 713*f*
Brain
arteries of, 651, 652*f*
disorders involving, 452–453
functional overview of, 7*f*, 9*t*
olfactory centers, 513–517, 514*f*, 515*f*
roles of
in breathing, 850–851, 851*f*
in central nervous system (CNS), 381*f*, 382, 382*f*
consciousness, 443–444, 443*f*
emotions, 444–445, 444*f*
language, 444, 444*f*
memory, 445
specimens of, 430*b*
structure and functions of
basal nuclei, 438, 439*f*, 440*b*, 447*t*
brainstem, 429, 429*f*, 430–432, 430*b*, 431*f*, 446*t*
cerebellum, 429*f*, 432–434, 432*f*, 433*f*, 438*b*, 446*t*
cerebral cortex, 437–443, 437*f*, 438*b*, 439*f*, 441*f*, 447*t*
cerebrum, 437–443, 437*f*, 438*b*, 439*f*, 441*f*, 447*t*
diencephalon, 429*f*, 431*f*, 432*f*, 433*f*, 434–437, 435*f*, 447*t*
divisions of, 429*f*, 430*b*, 431–433, 431*f*, 432*f*, 433*f*
hypothalamus, 429*f*, 431*f*, 432*f*, 433*f*, 434–436, 435*f*, 447*t*
pineal gland, 429*f*, 435*f*, 436–437, 436*f*, 447*t*
thalamus, 429*f*, 431*f*, 432*f*, 433*f*, 434, 435*f*, 447*t*
wrinkles and grooves, 437–438, 438*b*
Brain tissue, destruction of, 452
Brainstem, structure and functions, 429, 429*f*, 430–432, 430*b*, 431*f*, 446*t*
Brainwaves, electroencephalograms (EEGs), 442*b*, 453, 453*f*
Breast cancer
disease chromosome map, 1140*f*
genetic factors with, 159
lymphatic drainage and lymphedema, 730, 730*f*, 732–733, 732*f*, 733*b*
risks and treatment of, 1090
Breastfeeding, 570–571, 571*t*, 1082–1085, 1083*f*, 1084*f*, 1085*t*
Breasts
cancer, 1090
changes in puberty, 1118
functions of, 1082*t*, 1083–1085, 1083*f*, 1084*f*, 1085*f*
lactation, 1082*t*, 1083–1085, 1083*f*, 1084*f*, 1085*f*
location, size and structure, 1082–1084, 1083*f*
lymphatic drainage and nodes, 730, 730*f*, 732–733, 732*f*, 733*b*
Breathing; *See also* pulmonary ventilation
definition and overview of, 824, 825*f*, 828*f*
factors that influence, 849–852, 850*f*, 851*f*
inspiration and expiration, 824, 825*f*, 826, 826*b*–827*b*, 827*f*–831*f*, 828–831, 829*t*
mechanism of, 824, 825*f*, 826, 826*b*–827*b*, 827*f*–831*f*, 828–831, 829*t*
negative feedback loop, 850*f*
primary principle of, 824, 825*f*
respiratory cycle, 828–831, 828*f*, 829*t*, 830*f*, 831*f*, 833*f*
types of, 836*b*
Brittle bone disease, 60, 1140*f*, 1142, 1143*t*, 1144, 1144*f*
Broad ligaments, 1064*f*, 1066*f*, 1069
Bronchi, anatomy and functions of, 800*f*, 808–810, 808*f*, 809*f*, 810*f*, 812*f*, 812*t*, 813–814
Bronchial tree, 800*f*, 808, 808*f*, 812*t*, 817–818
Bronchial veins, 658*f*, 659*t*, 660*f*, 661–662, 661*f*
Bronchioles, 800*f*, 808, 808*f*, 812*t*
Bronchitis, 817, 854
Brown fat, 147, 147*f*
Bruising, 179*f*, 180, 181*f*
Bruits, 706, 706*b*

Brush border, 910, 910*f*, 911*b*
Buccinator muscles, 312–313, 312*f*, 312*t*
Buffer pairs, 1028
Buffers, 44–45, 1027*t*, 1028–1032, 1028*f*–1031*f*
Buffy coat, 600*f*, 601, 613*f*
Bulboid corpuscles, 512*t*, 513
Bulbospongiosus muscles, 320, 321*f*, 321*t*
Bulbourethral glands, 1045*f*, 1046, 1052*f*, 1054, 1054*f*, 1055
Bulbous corpuscles, 512*t*, 513
Bulimia, 962
Bundle of His, 683, 683*f*
Burns
  classification of, 192–193, 193*f*
  causing edema, 1015–1016, 1016*f*
  estimating skin body surface area, 192–193, 192*f*
  "rule of nines," 192, 192*f*
Bursae, 157, 157*t*, 274*f*, 275
Bursitis, 278, 278*f*, 282, 293, 293*f*
Buttocks, gluteal muscles, 308*f*–309*f*, 309*f*, 309*t*–310*t*, 333, 333*t*, 337*f*

C

Cartilage
  chondrocytes, 214, 215*f*
  deformities with vitamin D deficiency, 217*b*
  extracellular matrix (ECM), 134, 134*f*, 135*t*, 214, 215*f*
  model of endochondral bone formation, 210, 210*f*
  and nutritional deficiencies, 217, 217*b*
  ossification centers, 210, 210*f*, 211*f*
  perichondrium, 214, 215*f*
  tissue characteristics, 133*t*, 145*t*, 151–152, 151*f*
  tumors, 159
  types and growth of, 214–215, 215*f*
Cartilage matrix, 214–215, 215*f*
Cartilaginous joints, 272–274, 272*t*, 273*f*, 274*t*, 284*t*
Catabolism
  carbohydrate, 934–946
  citric acid cycle, 106, 106*f*, 936–937, 937*f*
  definition and illustration of, 41–42, 41*f*, 932–933
  electron transport system (ETS), 106, 107*f*
  fat, 947–948, 947*f*
  of glucose, 936–937, 936*f*, 937*f*, 939, 939*f*, 940*f*
  glycosis, 105–106, 105*f*, 106*f*
  of lipids, 947–948, 947*f*, 950*t*
  metabolic pathways, 102, 105–107
  of proteins, 949–950, 949*f*, 950*t*
Catalysts, enzymes as, 102–104, 102*f*, 104*f*
Cataracts, 536, 536*f*, 1122
Catecholamines, 406, 406*f*, 407*t*, 408, 410*b*
Catheterization
  heart, 641*b*
  urinary, 995
Catheters, balloon, 672
Cations, 1005–1007, 1006*f*, 1006*t*
Caucasian skin, 179*f*
Cauda equina, 426, 426*f*, 427*f*, 465*f*, 466
Caudate nucleus, 438, 439*f*
Caveolae, description and illustration of, 71*b*
Cavities and humors, of eyes, 529, 529*f*, 529*t*
CD system, 756
Cecum, 862*f*, 878, 878*f*, 879*f*
Cell bodies
  associated with reflexes, 481–482
  of cranial nerves, 473–474, 476–480
  of neurons, 154, 154*f*, 387–391, 387*f*–391*f*
Cell extensions, 82–83, 83*f*
Cell fibers, 68*f*, 69*f*, 79–81, 79*f*, 80*f*
Cell growth and reproduction
  and cancer, 126*b*, 127, 158–160, 158*f*
  cell growth, 121–123, 121*f*, 121*t*, 122*f*
    abnormalities, 126*b*, 127, 158–160
    cytoplasm production, 121–122
    DNA replication, 122–123, 122*f*, 123*t*
  cell reproduction
    cytokinesis, 123
    meiosis, 124–125, 125*f*

mitosis, 123–124, 123*t*, 124*f*, 125*f*
disorders associated with, 126*b*, 127–128, 158–160, 158*f*
as fundamental element of life, 114, 127*b*
life cycle, 121, 121*f*, 121*t*, 125, 126*b*, 127
protein synthesis, 114–120, 117*f*, 119*t*
deoxyribonucleic acid (DNA), 114–115, 114*f*, 115*f*
diagram illustrating, 117*f*
disorders associated with, 127–128
ribonucleic acid (NA), 115–119, 117*f*, 119*t*, 120*b*
summary of, 119*t*
transcription process, 116–117, 116*f*, 117*f*, 119*t*
translation process, 117–118, 117*f*, 119*t*
Cell junctions, characteristics of muscle tissues, 368*t*
Cell layers, of epidermis, 173–174, 175*t*
Cell membranes
active transport processes, 97–101, 97*f*–100*f*, 98*b*–99*b*, 101*t*
endocytosis, 99–100, 99*f*, 100*f*, 101*t*
exocytosis, 99*f*, 100–101, 101*t*
pump transporters, 97–98, 97*f*, 98*b*, 98*f*, 101*t*
role of, 101, 101*t*
vesicle transporters, 99–101, 99*f*, 101*t*
description and illustration of, 68*f*, 69, 69*t*, 70–72, 70*f*, 71*b*, 71*f*, 72*b*
disorders involving, 85
functional anatomy of, 72, 72*t*
neurons, 393–397, 393*f*, 394*f*, 395*f*, 395*t*, 396*t*, 397*t*
passive transport processes, 91–96, 91*f*, 92*t*, 93*f*, 94*b*, 95*f*, 96*f*, 97*b*
diffusion, 91–92, 92*t*, 94*b*
facilitated diffusion, 95–96, 95*f*, 96*f*
filtration, 96
osmosis, 93–95, 93*f*, 94, 95*f*
role of, 96
simple diffusion, 92–93, 92*t*, 93*f*
plasma membrane, 70–72, 70*f*, 72*t*
structure of, 70–72, 70*f*, 71*b*, 71*f*
Cell theory of life, 6
Cell-mediated immunity, 756, 757*f*, 764–767, 765*b*, 765*f*, 766*b*, 766*f*, 767*t*, 769*f*
Cells
active transport processes, 97–101, 97*f*–100*f*, 98*b*–99*b*, 101*t*
endocytosis, 99–100, 99*f*, 100*f*, 101*t*
exocytosis, 99*f*, 100–101, 101*t*
pump transporters, 97–98, 97*f*, 98*b*, 98*f*, 101*t*
role of, 101, 101*t*
vesicle transporters, 99–101, 99*f*, 101*t*
anaerobic body cells, 940, 940*b*
anatomy of, 83–84, 84*f*
anatomy of, 67–70, 67*t*, 68*f*, 69*f*, 69*t*, 84*b*
case study, 86
cell connections, 83–84, 84*f*
cell extensions, 82–83, 83*f*
cell fibers, 68*f*, 69*f*, 79–81, 80*f*
cell membranes, 68*f*, 69, 69*t*, 70–72, 70*f*, 71*b*, 71*f*, 72, 72*b*, 72*t*
centrosome, 80*f*, 81, 81*f*
cytoplasm and organelles, 68*f*, 69*t*, 73–77, 73*f*, 74*f*, 75*f*, 76*f*
cytoskeleton, 8, 67, 79–83, 79*f*
definition of, 8, 67
desmosomes, 83–84, 84*f*
disease mechanisms, 85, 158, 158*f*
endoplasmic reticulum (ER), 68*f*, 73–74, 73*f*
functional anatomy of, 67–70, 67*t*, 68*f*, 69*f*, 69*t*, 84
Golgi apparatus, 68*f*, 73, 74*f*, 75*f*
as level of body organization, 7*f*, 8
lysosomes, 68*f*, 69*t*, 76, 76*f*
mitochondria, 68*f*, 69*t*, 77, 77*f*
molecular motors, 81–82, 82*f*, 83*f*
nucleus, 78–79, 78*f*
peroxisomes, 76–77
plasma membrane, 70–72, 70*f*, 72*t*
proteasomes, 68*f*, 69*t*, 76, 76*f*
protein export system, 68*f*, 69*t*, 74, 75*f*, 76
ribosomes, 68*f*, 73–74, 73*f*, 74*f*
size units, 67*t*
structure of, 67*t*, 68–70, 69*f*, 69*t*, 70–72, 70*f*, 71*b*, 71*f*, 72*t*
typical or composite cells, 67–68, 68*f*
units of size, 67*t*
big picture, 67–84, 84*b*, 84*f*, 108, 127*b*
bone, 133*t*, 149–150, 150*f*, 151*f*, 206–207, 207*f*
bone-forming and bone-eroding, 207*f*, 209–214
cell transport disorders, 108
of epidermis, 173, 173*f*
growth and reproduction (*See* cell growth and reproduction)
hydrophilic *versus* hydrophobic, 50*f*, 70, 70*f*
in major tissues of the body, 132–160, 133*t*
metabolism
anabolism, 102, 108
catabolism, 102, 105–107
cellular respiration, 105–107, 105*f*, 106*f*, 107*f*
enzymes, 102–104, 102*f*, 103*f*, 104*f*
metastasis and cancer, 158–160, 158*f*
muscle tissue, 152–153, 153*f*
osteocytes, 133*t*, 149–150, 150*f*, 151*f*
passive transport processes, 91–96, 91*f*, 92*t*, 93*f*, 94*b*, 95*f*, 96*f*, 97*b*
diffusion, 91–92, 92*t*, 94*b*
facilitated diffusion, 95–96, 95*f*, 96*f*
filtration, 96
osmosis, 93–95, 93*f*, 94, 95*f*
role of, 96
simple diffusion, 92–93, 92*t*, 93*f*
transport disorders of, 108, 109*f*
types of, 67–68, 67*t*
Cellular diseases, examples of, 85
Cellular immunity, 756, 757*f*, 764–767, 765*b*, 765*f*, 766*b*, 766*f*, 767*t*, 769*f*
Cellular respiration, 105–107, 105*f*, 106*f*, 107*f*, 799
citric acid cycle, 106, 106*f*
electron transport system (ETS), 106, 107*f*
glycosis, 105–106, 105*f*, 106*f*
summary of, 107*f*
Cellulose, 934
Cementum, 868, 869*f*, 869*t*
Central
as directional term, 382–383
as organ-related term, 15
Central canal of bone, 204, 205*f*, 212–213, 213*f*
Central nervous system (CNS)
brain
basal nuclei, 438, 439*f*, 440*b*, 447*t*
brainstem, 429, 429*f*, 430–432, 430*b*, 431*f*, 446*t*
cerebellum, 429*f*, 432–434, 432*f*, 433*f*, 438*b*, 446*t*
cerebral cortex, 437–443, 437*f*, 438*b*, 439*f*, 441*f*, 447*t*
cerebrum, 437–443, 437*f*, 438*b*, 439*f*, 441*f*, 447*t*
diencephalon, 429*f*, 431*f*, 432*f*, 433*f*, 434–437, 435*f*, 447*t*
divisions of, 429*f*, 430*b*, 431–433, 431*f*, 432*f*, 433*f*
hypothalamus, 429*f*, 431*f*, 432*f*, 433*f*, 434–436, 435*f*, 447*t*
pineal gland, 429*f*, 435*f*, 436–437, 436*f*, 447*t*
thalamus, 429*f*, 431*f*, 432*f*, 433*f*, 434, 435*f*, 447*t*
cerebrospinal fluid, 424, 424*f*, 425*b*, 425*f*
cycle of life and big picture, 451–452
definition and diagrams illustrating, 381*f*, 382, 382*f*
disorders of, 411–412, 452–453
hierarchy regulating autonomic functions, 498–499, 499*f*
illustration of, 421*f*
neuralgia, 383–385, 384*f*
somatic motor pathways, 441*f*, 443, 449–550, 449*f*, 451*b*, 451*f*
somatic sensory pathways, 441*f*, 442–443, 448–449, 448*f*
spinal cord
coverings, 421–423, 421*f*, 422*f*, 423*f*
structure and functions of, 426–427, 426*f*, 427*f*, 428*t*, 445*t*
stress-related diseases of, 791*t*
tumors in, 411–412
Central sulcus fissure, 437, 437*f*, 438*b*
Centrioles, 81, 81*f*
Centrosome, 68*f*, 69*t*, 80*f*, 81, 81*f*
Cephalic phase of gastric secretion, 918–920, 919*f*
Cephalic veins, 658*f*, 659*t*, 660*f*, 661, 661*f*
Cerebellar nuclei, 432*f*, 438
Cerebellum, structure and functions of, 429*f*, 432–434, 432*f*, 433*f*, 438*b*, 446*t*
Cerebral arterial circle (of Willis), 651, 652*f*
Cerebral cortex
influence on breathing, 850–851, 851*f*
structure and functions of, 437–443, 437*f*, 438*b*, 439*f*, 441*f*, 447*t*
Cerebral fissures, 437, 437*f*, 438*b*
Cerebral hemispheres, 437, 437*f*, 441*f*
Cerebral palsy, 452
Cerebral peduncles, 431, 431*f*
Cerebral plasticity, 440
Cerebral tracts, 438, 439*f*
Cerebrospinal fluid (CSF)
characteristics of, 424, 424*f*, 425*b*, 425*f*
flow and fluid spaces, 424, 425*f*
lumbar puncture, 423*b*, 424, 425*b*
regulatory effect of pH, 850–851, 851*f*
Cerebrovascular accidents (CVAs)
causing acquired cortical color blindness, 537
causes of, 672
death rates due to, 1123*f*
definition and prevalence of, 452, 622
and low-density lipoproteins, 946*b*
paralysis, 450, 451*b*, 452
Cerebrovascular disease, death rates due to, 1123*f*
Cerebrum, structure and functions of, 437–443, 437*f*, 438*b*, 439*f*, 441*f*, 447*t*
Certified registered nurse anesthetist, 1146–1147, 1151
Ceruminous glands, 187*f*, 188, 534
Cervical canal, 1066*f*, 1069*f*, 1070, 1072
Cervical cancer, 1090
Cervical lymph nodes, 730, 730*f*
Cervical nerves, anatomy of, 464, 465*f*, 466, 467*t*, 468, 468*f*
Cervical plexus, 464, 465*f*, 466, 467*t*, 468, 468*f*
Cervical spine
bones of, 225*f*, 226*t*, 244*t*, 245, 245*f*–247*f*
nerves of, 464, 465*f*, 466, 467*t*, 468, 468*f*
Cervical stenosis, 1086
Cervical vertebrae, anatomy of nerves associated with, 464, 465*f*, 466, 467*t*, 468
Cervix
anatomy of, 1064*f*, 1065*f*, 1066*f*, 1068, 1069*f*, 1072
disorders and cancer of, 1086–1087, 1087*f*, 1090, 1090*f*
Cesarean section, 1115
Chambers of heart, 631*f*–633*f*, 636–638, 636*f*–638*f*
Characteristics of life, 6, 6*t*
Charles' law, 826*b*–827*b*
Charnley, Sir John, 294*b*
Cheeks, 865
Chemical agents, definition of, 27
Chemical barriers, immunity functions of, 746, 747*f*, 747*t*, 748–749, 748*t*, 749*t*
Chemical bonds
covalent, 38–39, 39*f*
ionic, 38, 39*f*
Chemical buffers, for pH control, 1027–1028, 1027*t*
Chemical level of body organization, 7–8, 7*f*
Chemical synapses, 399–401, 400*f*–403*f*
Chemicals
digestive process, 902, 902*f*, 902*t*, 908–913, 913*t*
pH-influencing, 1027, 1027*t*
Chemistry
atoms, 36–38
atomic number, 34*f*, 35*t*, 36
atomic structure, 36, 36*f*
atomic weights, 34*f*, 38
Bohr model, 37, 37*f*
energy levels, 36–37, 36*f*, 37*f*
isotopes, 34*f*, 37–38, 38*f*
mass number, 34*f*, 35*t*, 36
octet rule, 37, 37*f*, 39
as basis of life, 7–8, 7*f*, 34–35, 35*f*, 35*t*, 60
case study, 61–62
chemical bonds, ionic and covalent bonds, 38–39, 39*f*
chemical reactions, 40–41
elements and compounds, 34–35, 34*f*, 35*f*, 35*t*
functional chemical groups, 42, 42*f*
inorganic molecules, 42–45
electrolytes, 44–45, 44*b*, 45*f*
oxygen and carbon dioxide, 34*f*, 35*f*, 35*t*, 43–44
water, 42–43, 43*f*, 43*t*
ionic and covalent bonds, 38–39, 39*f*
metabolism, 41–42, 41*f*
anabolism, 41–42, 41*f*
catabolism, 41–42, 41*f*
molecule attraction, 39–40, 40*f*
hydrogen bonds, 39–40, 40*f*
polar molecules, 39–40, 40*f*
organic and inorganic compounds, 42, 42*f*
organic molecules
adenosine triphosphate (ATP), 47*t*, 58–59, 59*f*
carbohydrates, 46, 46*f*, 47*t*, 48, 48*f*
combined forms, 47*t*, 59
DNA and RNA, 47*t*, 56–59, 57*b*, 57*f*–59*f*, 57*t*
lipids, 46*f*, 47*t*, 48–51, 48*t*, 49*f*, 50*f*, 51*b*, 51*f*
nucleic acids, 47*t*, 56–59, 57*b*, 57*f*–59*f*, 57*t*
proteins, 47*t*, 52–56, 52*f*–54*f*, 55*b*, 56*f*, 56*t*, 57*b*
periodic table of elements, 34*f*
rate law of, 844, 845, 845*f*
unbalance and disease, 60–61
Chemoreceptor reflex, 700, 700*f*
Chemoreceptors
affecting breathing, 849–852, 850*f*, 851*f*
description and illustration of, 507, 513–515, 514*f*
macula densa, 976, 976*f*–982*f*, 980, 984, 985*f*
vasomotor, 700, 700*f*
Chemotactic factor, 750, 751*f*
Chemotaxis, 606, 750, 751*f*, 1101*f*, 1102–1103
Chemotherapy, 160, 216
Chest
bony structures of, 806*f*
muscles of, 308*f*–309*f*, 309*t*–310*t*
protection function of, 806*f*, 814–815
Cheyne-Stokes respiration, 836*b*
Chief cells, gastric gland, 874, 874*f*, 914–915, 915*f*
Childbirth; *See* birth
Childhood, 1117, 1118*f*
Children
cartilage growth in, 215
ossification process in, 210, 210*f*, 211*f*
Chiropractors, 591
Chloride
and reabsorption, 985–989, 985*f*–988*f*, 989*t*
role of kidney in balancing, 982
Chloride ions, 982, 983*f*, 1004–1008, 1006*f*
Chloride shift, 844, 845*f*, 1030, 1030*f*

  systemic arteries, 648, 648*f*, 649*t*, 650–654, 650*f*–657*f*
  systemic veins, 658, 658*f*, 659*t*, 660*f*–665*f*, 661–665
  vessel walls and layers, 643*f*, 645–647, 645*f*, 646*t*
Circulatory shock, 714
Circumcision, 1058
Circumduction, 287*f*, 292
Circumvallate papillae, 516, 516*f*, 865–866, 865*f*, 866*f*
Cirrhosis, 894, 895*f*
Cisterna chyli, 724*f*, 725
Cisternae, 74, 75*f*
Citric acid cycle, 106, 106*f*, 936–937, 937*f*, 951*f*
Clavicle
  acromioclavicular joint, 284*t*
  anatomical location of, 200*f*, 224*f*–225*f*, 249*f*, 250*f*
  description of, 226*t*, 250–251, 251*t*, 259*b*
  sternoclavicular joint, 284*t*
Cleavage, and implantation, 1103–1105, 1103*f*, 1104*f*
Cleavage lines, 177, 177*f*
Cleft lip, 889–890, 890*f*
Cleft palate, 799, 889–890, 890*f*, 1140*f*, 1141*b*, 1143*t*
Climacteric; *See* menopause
Clitoris, 1064*f*, 1065*f*, 1073–1074, 1073*f*, 1074*f*
Clonal selection theory, 764, 764*f*
Clone, 757*b*
Closed fractures, 264, 265*f*
Clot dissolution, 618, 618*f*
Clotting; *See* blood clotting
Coagulation, platelet role in, 599–600, 599*f*, 606*t*, 608–609
Coagulation factors, 615–616, 615*t*, 616*f*
Cobalt, 34*f*, 35*t*, 954*t*
Coccygeal nerves, anatomy of, 464, 465*f*, 466, 467*t*, 468, 470
Coccygeal plexus, 464, 465*f*, 466, 467*t*, 468, 470
Coccygeus muscles, 308*f*–309*f*, 309*t*–310*t*
Coccyx
  anatomy of, 224*f*–225*f*, 244*t*, 245, 245*f*, 255*f*, 262*t*
  coccygeus muscles, 308*f*–309*f*, 309*t*–310*t*
  male *versus* female, 261*f*, 262*t*
  nerves associated with, 464, 465*f*, 466, 467*t*, 468
Cochlea, 518*f*, 519*f*, 520, 521*b*, 521*f*
Cochlear implants, 521*b*
Cochlear nerves, vestibulocochlear nerve (VIII), 473*f*, 473*t*, 477*f*, 478, 478*b*, 478*t*
Codominant traits, 1137–1138, 1143*t*
Codon, 58, 58*f*, 117–118, 118*f*
Coenzyme A (CoA), 936–937, 937*f*, 941*f*, 951*f*, 952
Coenzymes, 102, 914, 918*t*, 936–937, 937*f*, 941*f*, 951*f*, 952, 952*f*
Cofactors, 102
Colitis, 893, 893*f*, 894
Collagen
  as component of extracellular matrix (ECM), 134, 134*f*, 135*t*, 136–137
  and osteogenesis imperfecta, 60
Collagen bundles, 142*f*–143*f*, 143–144, 144*t*, 148–149, 148*f*, 149*f*
Collagen fibers
  of blood vessels, 643*f*, 646, 646*t*
  characteristics of connective tissue, 134, 134*f*, 135*t*, 136–137, 142*f*–143*f*, 143–144, 144*t*, 148–149, 148*f*, 149*f*
Collagenous dense regular fibrous tissue, 149, 149*f*
Collateral ganglia, 466, 466*f*, 491*f*, 492, 493*f*
Collecting ducts, 987–989, 988*f*, 989*t*
Colon
  absorption sites, 923*f*
  anatomy of, 862*f*, 863*b*, 878–879, 878*f*–881*f*
  disorders of, 893–894, 893*f*
  irritable bowel syndrome, 893
  role in digestion, 902*f*, 904–908, 908*t*, 925
Colon cancer, 159
Colonoscopy, 891, 893
Color blindness, 532, 532*f*, 533*b*, 537, 1139, 1139*f*, 1143*t*
Colorectal cancer, 893
Colpotomy, 1069
Columnar epithelial cells, 136*f*, 137–139, 138*f*–139*f*, 140*t*
Coma, 444
Comedo, 188, 188*b*
Common carotid artery
  location and functions of, 648*f*, 649*t*, 650*f*, 651, 652, 652*f*, 653
  pulse point, 710, 711*f*
Communicable diseases, definition of, 25*b*
Compact bone, 201, 203, 203*f*, 204, 205*f*
Compact bone tissue, 145*t*, 150, 150*f*
Compensation, 1032
Complement
  and antibody actions, 761–762, 761*f*
  binding sites, 759*f*, 760–762
  definition of, 757*b*
  in innate immunity, 746, 747*f*, 747*t*, 748*t*, 755, 755*f*
Complementarity of structure and function, 17, 67
Complementary pairing, 116
Complete blood cell count (CBC), 607*b*, 607*t*
Complete fractures, 264, 265*f*
Compliance, surfactant and lung, 829–830, 832*b*
Composite cells, functional anatomy of, 67–68, 68*f*
Compound exocrine glands, 141, 141*f*
Compound fractures, 264, 265*f*
Compounds
  definition of, 34
  water as simple, 39–40, 40*f*, 43, 43*f*
Computed tomography (CT scans), for cancer detection, 159
Concentration gradient
  active transport moving against, 97, 98*b*
  principle of diffusion, 91–92, 91*f*, 92*t*
  and simple diffusion, 92–93, 92*t*, 93*f*
Concentric contractions, 366–367, 367*f*
Conception, uterine function in, 1070
Conchae, 800–801, 801*f*, 803*f*, 811*t*
Condensation, 41*f*, 42, 52, 54*f*
Conduction
  autonomic pathways, 490–492, 491*f*, 494*t*, 495*f*
  characteristics of membrane potential, 397*t*, 398, 398*f*, 399*f*
  and heat loss from skin, 183*f*, 184, 184*f*
  nerve impulse, 388–389, 389*f*, 397*t*, 398–399, 399*f*
  system of heart, 683–684, 683*f*
Conductivity
  as characteristic of life, 6*t*
  of neurons, 393–397
Condyloid joints, 275*f*, 276, 276*t*
Cones, 532–533, 532*f*
Congenital disorders
  and birth defects, 889–890, 890*f*, 1124
  congenital adrenal hyperplasia, 1140*f*
  definition and examples of, 1140*f*, 1141, 1141*b*, 1141*f*, 1143*t*
  immune deficiency, 774
Congestive heart failure (CHF), 670, 671*f*, 713–714
Conjunctiva, 524, 525*f*, 536
Connective tissue
  adipose tissue, 144, 144*t*, 146–147, 146*f*, 147*b*, 147*f*
  areolar tissue, 144, 144*t*, 145–146, 145*f*, 146*f*
  blood tissue, 133*t*, 152, 152*f*
  bone tissue, 133*t*, 149–150, 150*f*, 151*f*
  cartilage tissue, 133*t*, 151–152, 151*f*
  characteristics of, 143, 144*t*
  classification of, 144, 144*t*–145*t*
  collagen fibers and bundles, 142*f*–143*f*, 143–144, 144*t*, 148–149, 148*f*, 149*f*
  dense fibrous tissue, 144, 144*t*, 148–149, 148*f*, 149*f*
  description and structure of, 132, 133*t*, 142*f*–143*f*
  elastic fibers, 143, 143*f*, 144*t*, 149, 149*f*, 151, 151*f*
  elastin fibers, 143, 143*f*, 144*t*, 149, 149*f*, 151, 151*f*
  fascia, 148*b*
  fibrous (proper) tissues, 144, 144*t*, 145–146, 145*f*, 146*f*
  functions of, 132, 133*t*, 143
  ligaments, 149, 149*f*
  loose fibrous tissue, 144, 144*t*, 145–146, 145*f*, 146*f*
  membranes, 155, 155*f*, 157, 157*t*
  repair of, 154, 155*f*
  reticular fibers, 143, 144*t*, 148, 148*f*
  tendons, 149, 149*f*
  tumors and cancer, 158–160, 158*f*
Connectome, 438, 439*f*
Consciousness
  electroencephalograms (EEGs), 442*b*, 453, 453*f*
  role of brain in, 443–444, 443*f*
Constipation, 891, 891*f*, 924
Contact dermatitis, 772
Contact digestion, 910
Continuous ambulatory peritoneal dialysis (CAPD), 997*b*
Continuous positive airway pressure (CPAP), 832*b*
Contraception methods, 1052, 1080*b*
Contractility of muscle cells, 348, 349*f*, 351*b*, 351*f*, 352–354, 353*b*, 354*f*, 355*f*, 356
Contractions
  abnormal muscle, 372, 372*b*
  atrial and ventricular, 638–639, 638*f*–640*f*
  energy sources for
    adenosine triphosphate (ATP), 356–357, 357*b*, 357*f*
    creatine phosphate, 356–357, 357*f*
    glucose and oxygen, 357–358, 357*f*
  muscle
    catabolic pathway, 358–359, 359*f*
    contractility of muscle cells, 348, 349*f*, 351*b*, 351*f*, 352–354, 353*b*, 354*f*, 355*f*, 356
    graded strength principle, 364–367, 364*b*, 365*f*, 366*f*, 367*f*
    and heat production, 348, 359–360, 359*f*
    length-tension relationship, 365, 365*f*
    mechanism and relaxation, 352–354, 353*b*, 354*f*, 355*f*, 356–360
    molecular and cellular basis of, 350, 351*b*, 351*f*, 353–354, 354*f*, 355*f*, 356
    smooth *versus* skeletal and cardiac, 368–370, 368*t*, 369*f*, 371*f*
    stretch reflex, 365–366, 366*f*
    styles of muscle tissues, 368*t*, 369*f*
    tonic, 363
  myograms of types of, 362*f*
  premature atrial or ventricular, 712, 713*f*
Contralateral, 10
Contralateral reflex, 391, 482
Contrast media, 641*b*, 872*b*, 875*f*, 877*b*
Controlled experiments, 4, 4*f*
Contusions, 372
Conus medullaris, 426, 426*f*, 427*f*
Convalescence stage, definition of, 25*b*
Convergence
  of eyes, 531
  of neural networks, 409*b*
Convergent muscles, 304, 304*f*
Convulsions, 372, 372*b*, 453
Coordination, cerebellar role in, 433–434, 433*f*
Coping skills, 792*b*
Copper, 34*f*, 35*t*, 954*t*
Cor pulmonale, 714
Coracobrachialis muscles, 308*f*–309*f*, 309*t*–310*t*, 324*f*, 324*t*, 325, 326*f*
Cords of nerves, 469*f*
Cori cycle, 941, 941*f*
Cornea, 526–529, 527*f*, 528*f*, 529*f*
Corneal reflex, 482*f*, 483
Corneal transplants, 526*b*
Corneocytes, 173, 173*f*
Corona radiata, 1101*f*, 1102–1103
Coronal plane, 15–16, 15*f*
Coronary arteries, 633*f*, 634*f*, 640*f*–643*f*, 641*b*, 642–644, 648*f*, 649*t*, 650*f*, 946*b*, 947
Coronary artery disease (CAD), 670, 791*t*, 946*b*, 947
Coronary bypass, 670, 671*f*
Coronary heart disease, 640, 670, 791*t*, 946*b*, 947
Corpora cavernosa, 1052*f*, 1054–1055, 1054*f*
Corpora quadrigemina, 431, 431*f*
Corpus albicans, 1067*f*, 1075
Corpus callosum, 438, 439*f*, 444*f*
Corpus luteum, 1067, 1067*f*, 1068, 1074–1076
Corpus spongiosum, 1052*f*, 1054–1055, 1054*f*
Corrections, acid-base balance, 1032
Corrugator supercilii muscles, 312–313, 312*f*, 312*t*

Cortex
  hair, 185–186, 185*f*
  of lymph node, 729*f*, 734*f*
  ovarian, 1066–1067, 1067*f*
  renal, 972, 972*f*, 976*f*, 981*f*
Cortical, as organ-related term, 15
Cortical nephrons, 981, 981*f*
Corticosteroids, as stress indicator, 790, 790*f*
Corticotrophs, 565, 565*f*
Corticotropin-releasing hormone (CRH), 567–568, 568*t*, 788, 789*f*
Cortisol
  during alarm reaction, 785–786, 786*f*, 786*t*, 787*f*
  chemical structure of, 50*f*
  sources and functions of, 548*f*, 549*f*, 578–579, 578*t*, 579*f*, 580*b*, 959*t*, 1107
Costal surface of lung, 812–813, 812*f*
Co-transmission, 497, 497*b*
Cotransport, 98*b*
Cough reflex, 849*b*
Countercurrent mechanism, 986–987, 986*f*
Countertransport, 98*b*
Covalent bonds, high-energy bonds, 58–59, 59*f*
COX inhibitors, 751
Coxal bone, 200*f*, 224*f*–225*f*, 255, 255*f*, 256*f*, 256*t*, 261*f*
Cramps
  menstrual, 1086
  muscle, 372, 372*b*
Cranial bones
  anatomy of, 200*f*, 226, 226*t*, 229*f*–236*f*, 232, 232*t*–235*t*, 238–240, 239*f*

Dorsal respiratory group (DRG), 848, 848*f*
Dorsal roots of spinal nerves, 465*f*, 466, 466*f*
Dorsal veins, 658*f*, 659*t*, 664–665, 664*f*
Dorsalis pedis artery pulse point, 710, 711*f*
Dorsiflexion, 291, 291*f*
Double helix, 114, 114*f*, 116*f*
Double-strand RNA (dsRNA), 115–119, 115*t*, 117*f*, 119*t*, 120*b*
Down syndrome, 1144–1145, 1144*f*
Down-regulation, 555, 555*f*
Drug neurotoxicity, causing peripheral neuropathy, 464*b*
Drugs
causing hepatitis, 894
and liver detoxification functions, 884, 894
Dry eyes, with Sjögren syndrome, 888
Dry mouth, 888
Duchenne muscular dystrophy (DMD), 85, 373, 1140*f*, 1143*t*, 1144
Ductus arteriosus, 665–668, 666*f*–668*f*
Ductus venosus, 665–668, 666*f*–668*f*
Duodenum, 862*f*, 863*b*, 872*b*, 872*f*, 873*f*, 875, 875*f*, 876*f*, 886, 887*f*, 891
Dura mater
anatomy of, 421–423, 421*f*, 422*f*, 423*f*, 425*f*, 427*f*
nerves associated with, 464, 465*f*, 466, 467*t*, 468
Dwarfism, 566*b*, 573–574, 574*b*, 587*t*–588*t*
Dynamic equilibrium, 91*f*, 92, 522–524, 523*f*
Dynamic tension, 366–367, 367*f*
Dynein, 82*f*
Dysfunctional uterine bleeding (DUB), 1086
Dysmenorrhea, 1086
Dysplasia, with mitosis abnormalities, 126*b*
Dyspnea, 836*b*, 854
Dysrhythmias, 712–713, 713*f*
Dystrophin, deficiency and Duchenne muscular dystrophy (DMD), 85
Dysuria, 994*b*

E

Eardrum, 518*f*, 519
Ears
anatomy of, 517–522, 518*f*, 519*f*
cochlea, 518*f*, 519*f*, 520, 521*b*
disorders of, 534–535
external ear, 518–519, 518*f*
hair cells, 517–524, 519*f*, 521*f*, 522*f*, 523*f*
illustration and examination, 518*f*
inner ear, 518*f*, 519–520, 519*f*
middle ear, 518*f*, 519
and sense of balance, 522–524, 522*f*, 523*f*
sound waves, 520, 521*f*
vestibule and semicircular canals, 519*f*, 522
vestibulocochlear nerve (VIII), 473*f*, 473*t*, 477*f*, 478, 478*b*, 478*t*
Eating disorders, 961–962
Eccentric contractions, 366–367, 367*f*
Eccrine sweat glands, 187, 187*f*
ECG waves and intervals, 684*f*, 686, 686*f*–687*f*, 712, 713*f*
Echocardiography, 639
Eclampsia, 1124
Ectoderm, 132, 132*b*, 1111, 1111*f*
Ectomorph, 18*b*
Ectopic pacemakers, 684
Ectopic pregnancies, 1066, 1124
Eczema, 190, 190*f*
Edema, 1007, 1009*f*, 1015–1016, 1015*f*, 1016*f*
Effective filtration pressure (EFP), 982–983, 983*f*, 984*b*
Effector B cells, 758, 759*f*
Effector cells, definition of, 757*b*
Effector T-cells, 747*f*, 764–767, 765*f*, 769–770, 769*f*, 770*f*
Effector tissues, of autonomic nervous system (ANS), 489*b*
Effectors
autonomic or somatic, 382*f*, 383
definition of, 20–21, 22*f*
diagrams illustrating, 22*f*, 23*b*
in feedback control loop, 20–21, 22*f*
Efferent, as directional term, 20, 383
Efferent division of nervous system, 382*f*, 383
Efferent impulses, hypothalamus sympathetic center, 581*f*
Efferent lymphatic vessels, 728–729, 728*f*, 729*f*
Efferent neurons, 390–391, 390*f*
Efferent pathways
of autonomic nervous system (ANS), 490, 490*f*, 491*f*, 491*t*
versus somatic motor pathways, 490, 491*t*
Ejaculation, 1055*b*
Ejaculatory ducts, 1045*f*, 1046, 1052, 1052*f*, 1054*f*
Ejection fraction, 688*f*, 689, 693, 693*f*, 713
Elastic arteries, 642*f*, 643
Elastic cartilage, 144, 145*t*, 214–215, 215*f*
Elastic dense regular fibrous tissue, 149, 149*f*
Elastic fibers
of blood vessels, 643*f*, 646, 646*t*
in cartilage matrix, 214–215, 215*f*
in connective tissue, 143, 143*f*, 144*t*, 149, 149*f*, 151, 151*f*
Elastic filaments, in sarcomeres, 349*f*, 350, 350*f*, 351*b*, 351*f*, 352
Elastic recoil, 831, 831*f*
Elastin fibers
as component of extracellular matrix (ECM), 134, 134*f*, 135*t*, 136–137
in connective tissue, 143, 143*f*, 144*t*, 149, 149*f*, 151, 151*f*
Elbow
anatomy of, 275*f*, 276*t*, 278–279, 278*f*, 284*t*, 289*f*
as lever example, 307, 307*f*
range of motion (ROM), 289*f*
Electrical synapses, 393–400, 399–401, 400*f*–403*f*
Electrocardiograms (ECGs), 684–687, 684*f*–688*f*, 713*f*
Electrocardiography, 684–687, 684*f*–688*f*, 713*f*
Electroencephalograms (EEGs), 442*b*, 453, 453*f*
Electrolytes
acids and bases, 44
buffers, 44–45
cations and anions, 1005–1007, 1006*f*, 1006*t*
composition in blood plasma, 1006–1007, 1006*t*
definitions and characteristics of, 44, 613, 1004–1007, 1005*f*
electrical and chemical properties of, 1004–1007, 1005*f*
examples of, 613
and fluid homeostasis, 1004, 1009*f*–1012*f*, 1010–1012
imbalances leading to fluid imbalances, 1016–1017, 1017*f*, 1019
measuring reactivity, 1007–1008
molecular characteristics of, 44–45, 44*b*, 45*f*
pH scale, 44, 44*b*, 45*f*
salts, 45, 45*t*
Electromyography, 361, 361*f*
Electron transport system (ETS), 106, 107*f*, 938–940, 938*f*, 951*f*
Electrons
covalent bonds, 38–39, 39*f*
description and illustration of, 36, 36*f*
ionic bonds, 38, 39*f*
isotopes, 37–38
Eleidin, 174
Elements
and compounds, 34–35, 34*f*, 35*f*, 35*t*
periodic table of, 34*f*
Elephantiasis, 738, 738*f*
Elevation, illustration of jaw, 287*f*
Elimination, 902, 902*f*, 902*t*, 924, 925
Ellipsoidal joints, 275*f*, 276, 276*t*
Embolisms, 622, 672
Embryology, 1103, 1105*b*
Embryonic stem cells, 132, 132*b*, 143, 603–604, 603*f*, 1110–1111
Embryos
development of, 1097–1103, 1098*f*–1103*f*
at different development stages, 1107, 1107*f*–1110*f*, 1110
Emergency clinical nurse specialist, 163
Emergency Medical Technician (EMT), 794–795
Emesis, 891, 891*f*, 1030*b*
Emissions, 1055*b*
Emotional brain, limbic system as, 444–445, 444*f*, 788, 789*f*
Emotional disorders, as risk factor for disease, 27
Emotions
and appetite, 959*t*
causing eating disorders and obesity, 961–962
influencing basal metabolic rate, 958
and limbic system, 444–445, 444*f*, 788, 789*f*
Emphysema, 815*b*, 834, 836, 854, 855*f*
Emulsification, 912
Encapsulated nerve endings, 212*t*, 512
End-arteries, 650–651
End-diastolic volume (EDV), 692–693, 692*f*
Endemic diseases, definition of, 25*b*
Endocardium, 634*f*, 636
Endochondral ossification, 150, 150*f*, 209–210, 211*f*, 212
Endocrine cells, gastric gland, 874, 874*f*
Endocrine glands
adrenal glands and hormones, 577–580, 577*f*–579*f*, 578*t*, 580*b*
big picture, 558, 587
and cycle of life, 586
gastric and intestinal mucosa hormone secretions, 584*t*, 586
glandular epithelium, 135, 140*t*, 141–142, 141*f*, 141*t*
gonads/ sex organs
ovaries, 585, 585*t*, 586, 1064–1068, 1064*f*, 1066*f*, 1067*f*, 1074–1076, 1079*f*
testes, 584–585, 585*t*
hormones summary, 584*t*
locations of, 547*f*, 547*t*
pancreas, 886, 887*f*
pancreatic islets, 580–582, 581*f*, 582*t*, 583*f*
parathyroid gland and hormones, 575–576, 575*f*, 575*t*, 576*b*, 576*f*, 588*t*
pineal gland, 571–572
pituitary gland
adenohypophysis hormones, 564–571, 564*f*–565*f*, 566*b*, 567*f*–570*f*, 568*t*
neurohypophysis hormones, 570–571, 570*b*, 571*t*, 587*t*
structure and location of, 564, 564*f*
placenta, 584*t*, 585
thymus, 584*t*, 585
thyroid gland and hormones, 572–575, 572*f*–573*f*, 574*b*, 575*t*
Endocrine system
big picture, 558, 587
diseases of, 555*b*, 558–559
feedback loop, 553–555, 554*f*
glands (*See* endocrine glands)
hormones
classification of, 547–548, 548*f*, 549*f*, 550, 553*t*, 556*b*
definition of, 546–547, 546*t*, 556*b*
local, 556, 556*b*
principles of action, 550–553, 550*f*, 551*f*, 552*f*, 553*t*
regulation of secretion, 553–555, 554*b*, 554*f*, 555*b*
steroidal *versus* nonsteroidal, 547–548, 548*f*, 549*f*, 550–553, 551*f*, 553*t*, 556*b*
target cell sensitivity, 555, 555*b*, 555*f*
versus nervous system, 546*t*
organization of, 546–547, 546*f*, 547*f*, 547*t*
organs and functional overview of, 7*f*, 9*t*
prostaglandins, 556–557, 556*f*, 556*t*, 557*f*
reflexes, 553–555, 554*f*
stress-related diseases of, 791*t*
Endocytosis, as active transport processes, 99–100, 99*f*, 100*f*, 101*t*
Endoderm, 132, 132*b*, 1111, 1111*f*
Endogenous growth, of cartilage, 215
Endolymph, 520
Endometrial ablation techniques, 1087
Endometrial cancer, 1090
Endometrial cycle
cells, 1077
control of, 1067*f*, 1075–1076, 1077*f*, 1079*f*
disorders of, 1086–1088
Endometriosis, 1089–1090

Endometrium, of uterine wall, 1066*f*, 1069, 1069*f*
Endomorph, 18*b*
Endomysium, 302, 302*t*, 303*f*
Endoneurium, 392, 392*f*
Endoplasmic reticulum (ER)
  description, functions and illustration, 68*f*, 69*t*, 73–74, 73*f*
  illustration in cytoskeleton, 79*f*
Endorphins, 405, 407*f*, 408, 408*t*, 410
Endoscopic cholangiography, 884, 885*f*
Endoscopy, 890, 891*f*
Endosteum, 202*f*, 203
Endothelial tissue, 138, 634*f*, 636, 643*f*, 645–646
Endothelium, 138, 634*f*, 636, 643*f*, 645–646
Endotracheal intubation, 808*b*
End-product inhibition, 104, 104*f*
Endurance training, effects on skeletal muscles, 364–367, 364*b*, 365*f*–367*f*
Energy
  balance and metabolic rates, 933*b*, 955*f*, 958
  catabolism/ anabolism, 41–42
  daily expenditures, 955*f*, 958
  extracted from glucose, 939–940, 940*f*
  high-energy bonds, 58–59, 59*f*
  levels of atoms, 36–37, 36*f*, 37*f*
  sources for muscle contraction, 356–360, 357*f*, 359*f*
  transferring chemical, 933*b*
Energy balance, and body weight, 958
Enkephalins, 407*f*, 408, 408*t*, 410
Enteric nervous system (ENS), 903*b*
Enterogastric reflex, 907
Enterokinase, 913*t*, 916
Environmental factors
  and appetite, 959*t*
  as risk factor for disease, 27
Enzyme inhibitors, 160
Enzymes
  as catalysts, 102–104, 102*f*, 104*f*
  chemical structure of, 102–103, 102*f*
  classification and naming of, 103
  digestive, 908–918, 909*f*, 913*t*, 918*t*
  effects of pH and temperature on, 104, 104*f*
  feedback inhibition of, 104, 104*f*
  general functions of, 103–104, 103*f*
  metabolic pathways, 102–104, 102*f*, 103*f*, 104*f*
  properties of digestive, 909–910, 909*f*, 913*t*, 918*t*
Eosinophils, 152*f*, 599*f*, 600*f*, 603*f*, 605, 606*t*, 607, 607*f*, 607*t*
Ependymal cells, 384, 384*f*, 385
Ependymomas, 411–412
Epicardium, 634, 634*f*, 635
Epidemics, definition of, 25*b*
Epidemiology, 25*b*
Epidermal growth factor (EGF), 174
Epidermal proliferating unit (EPU), 175
Epidermis
  cell layers, 173–174, 175*t*
  cell types, 173, 173*f*
  growth and repair, 174–175
  as immunity line of defense, 748*t*, 749
  photomicrograph of, 171*f*
  structure and description of, 175*t*
Epididymis, 1045*f*–1046*f*, 1046, 1051, 1051*f*, 1052*f*
Epidural space, 422*f*, 423
Epigenetics, 1144
Epiglottis, 804–805, 804*f*, 805*f*, 811*t*–812*t*
Epiglottitis, 816–817
Epilepsy, 453
Epimysium, 302, 302*t*, 303*f*
Epinephrine
  during alarm reaction, 785–786, 786*f*, 786*t*, 787*f*
  excretion during stress, 944
  as neurotransmitter, 406, 406*f*, 407*t*, 408, 410*b*
  sources, targets and actions of, 578*t*, 580, 581*f*
Epineurium, 392, 392*f*
Epiphyseal fractures, 212, 212*f*
Epiphyseal plate, 202, 210–212, 210*f*, 211*f*, 212*f*, 263
Epiphyses, 202, 202*f*, 209*f*, 210, 210*f*, 211*f*
Episiotomy, 1065–1066
Epistaxis, 800, 817
Epithalamus, 436
Epithelial cells, tactile, 508*t*, 511–513, 511*f*
Epithelial membranes
  cutaneous membranes, 155*f*, 156, 156*f*, 157*t*
  mucous membranes, 155*f*, 156–157, 156*b*, 156*f*, 157*f*, 157*t*
  serous membranes, 155*f*, 156, 156*b*, 156*f*, 157*t*
  synovial membranes, 155, 155*f*, 156*f*, 157*t*
Epithelial support cells, of olfactory epithelium, 513–514
Epithelial tissue
  cell shape and layers, 137–141, 137*t*, 138*f*, 139*f*, 140*t*
  classification of, 136*f*, 137–142, 138*f*, 139*f*, 140*t*, 141*f*, 141*t*, 142*f*
  cross section diagrams of, 137*b*
  description and structure of, 132, 133*t*
  functions of, 132, 133*t*, 135
  generalizations regarding, 135–137, 136*f*, 137*b*
  glandular epithelium, 140*t*, 141–142, 141*f*, 141*t*, 142*f*
  membranous epithelium, 137–141, 137*t*, 138*f*, 139*f*, 140*t*
  repair of, 154, 155*f*
  tumors, 159*b*
  types and locations, 135, 140*t*
Epithelium, wound healing process, 154–155, 155*f*
Eponyms, and AMA standardization of terminology, 6, 25*b*
Epsilon cells of pancreatic islets, 581, 581*f*, 582*f*, 582*t*
Equilibration, in diffusion process, 91*f*, 92
Equilibrium
  dynamic, 91*f*, 92, 522–524, 523*f*
  ear hair cells and, 517–524, 519*f*, 521*f*, 522*f*, 523*f*
  sense of, 522–524, 522*f*, 523*f*
  vertigo, 535
Erectile dysfunction (ED), 497*b*, 1058
Erections
  clitoris, 1064*f*, 1065*f*, 1073–1074, 1073*f*, 1074*f*
  in males, 1055, 1055*b*
Erector spinae muscle group, 318–319, 318*f*–319*f*, 320*t*
Erosive esophagitis, 890, 891*f*
Erythroblastosis fetalis, 610, 612, 612*t*
Erythrocyte sedimentation rate (ESR), 601*b*
Erythrocytes; *See* red blood cells (RBCs)
Erythropoiesis, 602–604, 603*f*, 604*f*, 982
Erythropoietin (EPO), 604, 604*f*, 982
Esophageal endoscope, 890, 891*f*
Esophageal sphincter, 870*f*, 871
Esophageal veins, 658*f*, 659*t*, 660*f*, 661–662, 661*f*
Esophagitis, erosive, 890, 891*f*
Esophagus
  anatomy of, 862*f*, 870–872, 870*f*, 871*f*, 872*b*
  disorders of, 871–872, 888, 890, 891*f*, 892
  expansion during swallowing, 805, 807*f*, 812*t*
  gastroesophageal reflux disease (GERD), 871–872, 890, 891*f*
  role in digestion, 902*f*, 904–908, 908*t*, 925
  tissue layers of, 864*t*
Esophagus-stomach junction, 871*f*
Essential fatty acids, 948
Essential organs
  of female reproductive system, 1064–1074
  of male reproductive system (*See* testes)
Estradiol, 548*f*, 549*f*, 584*t*
Estrogen
  actions, sources and targets of, 584–585, 584*t*
  adrenal, 578*t*
  changes with menopause, 1122
  chemical structure of, 50*f*
  and contraception, 1080*b*
  hyposecretion and osteoporosis, 588
  in males, 1049, 1050*t*
  and puberty, 1118, 1118*f*
  secretions
    and actions in female reproductive system, 1066–1068, 1067*f*, 1074–1079, 1077*f*, 1078*f*, 1081, 1081*f*, 1082*t*
    during ovulation, 1067–1068, 1067*f*
    by placenta, 1106–1107, 1106*f*
  surge during ovarian cycle, 1075*b*, 1076, 1077*f*
Estrogenic phase, 1075, 1079*f*
Estrone, 548*f*, 549*f*, 584*t*
Ethmoid bone, 227*f*–229*f*, 232*f*, 235*f*, 235*t*, 239–240, 241*b*
Etiology, definition of, 25*b*
Eumelanins, 186
Eupnea, 836*b*
Eustachian tube, 518*f*, 519
Evaporation, and heat loss from skin, 183, 183*f*, 184*f*
Eversion movements, 291*f*, 292
Exchange reactions, 40–41
Excitability
  of muscle cells, 348, 349*f*, 351*b*, 351*f*, 352–354, 353*b*, 354*f*, 355*f*, 356
  of neurons, 393–397
Excitation
  in muscle fiber nerve cells, 353, 353*b*, 353*f*, 354*f*
  of neurons, 393–395, 393*f*, 394*f*, 395*f*, 395*t*, 396*f*, 397*t*, 401
Excitatory neurotransmitters, 400–403, 400*f*, 401*f*, 402*f*, 403*f*, 404–406, 406*f*, 407*t*
Excitatory postsynaptic potential (EPSP), 402–403, 402*f*, 403*f*, 407*t*, 408*t*
Excretion
  as characteristic of life, 6*t*
  digestive system, 971*b*
  functions of epithelial tissue, 133*t*, 135, 140*t*, 141–142, 141*f*, 181*t*, 182
  systems associated with body fluid, 971*b*
Exercise
  aerobic and anaerobic pathways, 358–359, 359*f*
  and aging, 1120, 1121*b*
  benefits to cardiovascular system, 697–698, 697*f*, 698*b*–699*b*
  blood flow changes during, 697, 697*f*, 698*b*
  and dehydration, 1010*f*, 1012, 1012*b*–1013*b*
  effects on skeletal muscles, 364–367, 364*b*, 365*f*–367*f*
  and glucose/ oxygen exchange, 357–358, 357*f*
  maximum oxygen consumption, 837*b*
  and muscle fiber classification, 358*b*
  oxygen unloading during, 846, 847*f*
  rehydration, 907*b*
  respiration control during, 852*b*
  respiratory feedback loop, 850*f*
  skin role in cooling during, 184, 184*b*
  and specific heat of water, 43, 43*f*
  and sympathetic stimulation of skeletal muscle, 489*f*, 500*b*
Exhaustion stage, in general adaptation syndrome (GAS), 786, 786*t*
Exocrine glands
  functional classification of, 142, 142*f*
  glandular epithelium, 135, 140*t*, 141–142, 141*f*, 141*t*
  illustration of stomach, 141*f*
  pancreas, 886, 887*f*
  structural classification of, 141–142, 141*t*
  types in skin, 187–188, 187*f*
Exocytosis, as active transport processes, 99*f*, 100–101, 101*t*
Exogenous growth, of cartilage, 215
Exons, 117, 118*f*
Exophthalmos, 574*b*, 588*t*
Experiments, definition and types of, 4, 4*f*
Expiration
  changes with aging, 1121
  fundamentals of, 824, 825*f*, 826, 826*b*–827*b*, 827*f*–831*f*, 828–831, 829*t*
Expiratory reserve volume (ERV), 834, 834*f*, 835*t*
Extensibility of muscle cells, 348, 349*f*, 351*b*, 351*f*, 352–354, 353*b*, 354*f*, 355*f*, 356
Extension
  definition of, 291
  illustration of neck, 287*f*
  movement examples, 287*f*–291*f*
Extensor digitorum longus muscles, 308*f*–309*f*, 309, 310*t*, 340, 340*t*, 341*f*
Extensor muscles
  examples of, 309, 310*t* (*See also* Tables 11–7 to 11–19)
  moving forearm, 326, 326*f*, 327*f*, 327*t*, 328*f*
Extensor reflex, 482
External ear, 518–519, 518*f*
External genitals
  female, 1064*f*, 1065, 1065*f*, 1066*f*, 1072–1074, 1073*f*
  male, 1045*f*, 1046*f*, 1052*f*, 1054–1055, 1054*f*
External iliac veins, 658*f*, 659*t*, 664–665, 664*f*
External intercostals, 315, 315*f*, 315*t*
External jugular veins, 658*f*, 659*t*, 660*f*, 661, 661*f*, 662*f*
External oblique muscles, 308*f*–309*f*, 309*t*–310*t*, 316–317, 316*f*, 316*t*, 318*f*–319*f*, 320*t*
External os, 1066*f*, 1069*f*, 1070
External table of skull, 203, 203*f*
Exteroceptors, 507–513, 508*t*, 509*f*, 511*f*, 512*t*
Extracellular fluids (ECFs)
  balance principles, 1009–1010, 1009*f*
  chemical and physical structure of, 1005, 1005*f*, 1006–1007, 1006*f*, 1006*t*, 1018*f*
  sodium and potassium level balance, 1017–1018, 1017*f*, 1018*f*
Extracellular matrix (ECM)
  of bone, 203–204
  cartilage, 134, 134*f*, 135*t*, 214, 215*f*
  cell connections, 72, 83, 84*f*
  components and illustrations, 132, 134–135, 134*f*, 135*t*, 143–144, 143*f*
Extrapyramidal tracts, 450–451, 451*f*
Extrinsic clotting pathways, 616, 616*f*
Extrinsic control mechanisms
  for blood homeostasis, 605
  for homeostasis, 23*f*, 24 (*See also* homeostasis)
Extrinsic eye muscles, 525–526, 526*f*
Extrinsic muscles
  of foot and ankle, 340, 340*t*, 341*f*
  of wrist, hand and fingers, 329, 329*f*, 330*t*, 331–332
Eye orbits, 227*f*, 232*f*, 240, 241*t*
Eyeball, layers of, 526–529, 527*f*
Eyelids, 524–526, 525*f*
Eyes
  anatomy and structure of, 524–529, 524*f*–529*f*
  cavities and humors, 529, 529*f*, 529*t*
  changes with age, 536, 536*f*, 1122
  color, 527
  color sensitivity, 532, 532*f*, 533*b*, 537
  cranial nerves associated with
    oculomotor nerve (III), 473*f*, 473*t*, 474, 475*t*
    optic nerve (II), 473*f*, 473*t*, 474, 475*t*
    trochlear nerve (IV), 473*f*, 473*t*, 474, 475*t*
  disorders of, 535–537, 535*f*, 536*f*, 1122
  examining, 528*f*

F

Face
  bones of, 200*f*
  facial expression muscles, 312–313, 312*f*, 312*t*
  facial nerve (VII), 473*f*, 473*t*, 476*t*, 477, 477*f*, 478*b*
  nose as danger area of, 799*b*
Facial artery pulse point, 710, 711*f*
Facial bones, 200*f*, 226, 226*t*, 232, 236*f*–238*f*, 240, 241*t*, 2236*t*–238*t*
Facial expression, muscles of, 312–313, 312*f*, 312*t*
Facial nerve (VII), 473*f*, 473*t*, 476*t*, 477, 477*f*, 478*b*
Facilitated diffusion
  carrier-mediated passive transport, 96, 96*f*
  channel-mediated passive transport, 95–96, 95*f*
  as passive transport processes, 95–96, 95*f*, 96*f*
Fallen arches, 259, 260*f*
Fallopian tubes
  anatomy and functions, 1064, 1064*f*, 1070–1071, 1070*f*, 1071*b*, 1071*f*, 1101, 1102*f*–1103*f*
  ectopic pregnancies, 1066, 1124
False pelvis, 255, 255*f*, 257*t*
False ribs, 248, 248*t*, 249*t*
False vocal cords, 804–805, 804*f*, 805*f*, 811*t*–812*t*
Falx cerebelli, 422, 422*f*, 423*f*
Falx cerebri, 422, 422*f*
Familial colon cancer, 1140*f*
Farsightedness, 535*f*, 536, 1122
Fascia
  definition and illustration of, 148
  surrounding muscle organ, 302, 302*t*, 303*f*

Fascicles, of muscle, 303*f*
Fasciculi gracilis and cuneatus tracts, 427*f*, 428, 428*t*
Fast muscle fibers, 358*b*, 1120
Fast pain fibers, 508
Fatigue, benefits of exercise on preventing, 364*b*
Fats
  absorption of, 922, 922*f*, 923*t*
  adipose tissue, 144, 144*t*, 146–147, 146*f*, 147*b*, 147*f*
  cells, 207–208
  definition and functions of, 47*t*, 48–49, 49*f*, 51*b*
  digestion, 912–913, 912*f*
  distribution diagram, 147, 147*f*
  fecal fat test, 914*b*
  lipids, 946–948, 950*t*, 951*f*
  saturated *versus* unsaturated, 946–947
Fatty acids
  saturated *versus* unsaturated, 946–947
  types and metabolism of, 47*t*, 48–49, 49*f*, 946–948, 947, 950*t*, 951*f*
Febrile state, definition of, 191, 191*f*
Fecal fat test, 914*b*
Fecal incontinence, due to damaged levator ani, 1072
Feces, 902, 902*f*, 902*t*, 913–914, 914*b*, 924, 925
Feedback
  autonomic, 490
  in feedback control loop, 20–21, 22*f*, 23*b*
Feedback control loops
  in body temperature, 359–360, 359*f*
  endocrine system, 553–555, 554*f*
  erythropoiesis, 602–604, 603*f*, 604*f*
  homeostatic control mechanisms
    definition and components of, 20–24, 21*b*, 22*f*, 23*b*, 23*f*
    feed-forward, 22–23
    four basic components of, 20–21, 21*b*, 22*f*
    levels of control, 23–24, 23*f*
    negative feedback mechanisms, 21–22
    positive feedback mechanisms, 22, 23*b*
  negative respiration, 850*f*
Feed-forward homeostatic control, 22–23
Female reproductive system
  anatomy and functional overview, 1064–1066, 1064*f*, 1065*f*, 1066, 1079–1080, 1079*f*, 1088*f*
  big picture, 1086
  breasts
    cancer, 1090
    functions of, 1082*t*, 1083–1085, 1083*f*, 1084*f*, 1085*f*
    lactation, 1082*t*, 1083–1085, 1083*f*, 1084*f*, 1085*f*
    location, size and structure, 1082–1084, 1083*f*
  contraception methods, 1080*b*
  and cycle of life, 1085
  cycles of
    control of gonadotropin secretion, 1077–1078, 1078*f*
    control of ovarian cyclical changes, 1067*f*, 1076–1077, 1077*f*, 1078*f*
    control of uterine cyclical changes, 1077, 1078*f*
    endometrial cycle, 1067*f*, 1075–1076, 1077*f*, 1079*f*
    gonadotropic cycle, 1067*f*, 1076
    importance of, 1064, 1079–1080, 1079*f*, 1085, 1086
    menstrual cycle, 1067*f*, 1075–1076, 1077*f*, 1079*f*
    myometrial cycle, 1076
    ovarian cycle, 1067*f*, 1074–1075, 1075*f*, 1079*f*
  disorders of
    hormonal and menstrual, 1086–1088, 1087*b*, 1087*f*
    infections and inflammation, 1088, 1088*f*
    tumors, cysts and cancer, 1088–1090, 1089*f*, 1090*f*
  hormones important to, 1066–1068, 1067*f*, 1074–1079, 1081, 1081*f*, 1082*t*
  hysterosalpingogram of, 1088, 1089*f*
  infertility, 1081
  laparoscopic view of, 1088*f*
  menarche, 1074, 1081, 1081*f*
  menopause, 1074, 1081, 1081*f*
  ovaries
    anatomy of, 1064, 1064*f*, 1066*f*
    functions of, 1067*f*, 1068
    microscopic structure of, 1066–1068, 1067*f*
  perineum, 1065–1066, 1065*f*
  uterine (fallopian) tubes, 1070–1071, 1070*f*, 1071*b*, 1071*f*
  uterus
    anatomy of, 1064*f*–1066*f*, 1068–1070
    cavities, 1066*f*, 1069–1070
    functions of, 1070
    wall layers, 1066*f*, 1069, 1069*f*
  vagina, 1064*f*, 1065*f*, 1066*f*, 1069*f*, 1071–1072, 1073*f*
  vulva, 1064*f*–1066*f*, 1065, 1072–1074, 1073*f*
Female reproductive tracts, embryonic development of, 1108*f*–1109*f*, 1112–1113, 1112*f*
Females
  basal metabolic rate, 957–958
  bulbospongiosus muscles, 320, 321*f*, 321*t*
  chromosome offspring distribution, 1135–1136, 1135*f*, 1136*f*
  pelvis of, 255, 255*f*, 261–262, 261*f*, 262*t*
  reproductive system (*See* female reproductive system)
  urethra, 974*f*, 975, 975*f*
Femoral artery pulse point, 710, 711*f*
Femoral veins, 658*f*, 659*t*, 664–665, 664*f*
Femur, 200*f*, 224*f*–225*f*, 255, 257, 257*t*, 258*f*
Fenestration, 976*f*, 978*f*, 979, 979*f*
Fermentation, 358–359, 358*b*
Fertility
  drugs, 1081–1082, 1082*f*
  issues in men, 1055–1056, 1056*f*
  ovulation signs for predicting, 1075*b*
Fertilization
  process of, 1101–1103, 1101*f*, 1102*f*, 1103*f*, 1108*f*–1109*f*
  uterine function in, 1070
Fetal alcohol syndrome (FAS), 666, 666*b*, 784, 792, 1141*b*
Fetal programming, 792–793, 793*f*
Fetal skull, bones of, 241*t*, 242–243, 242*f*
Fetuses
  at different development stages, 1107, 1107*f*–1110*f*, 1110
  erythroblastosis fetalis, 610, 612, 612*t*
  fetal circulation, 665–668, 666*f*–668*f*
  fetal death, 1124
  fetal programming, 792–793, 793*f*
  fetal skull bones, 241*t*, 242–243, 242*f*
  illustration of full-term, 1113*f*
  intrauterine stress, 792
  ossification process/centers, 150, 150*f*, 210, 210*f*, 211*f*, 212
  prenatal immunity, 768*b*
Fever
  and aspirin, 51*b*
  and basal metabolic rate, 957–958
  definition of, 191, 191*f*
  innate immunity functions of, 748*t*, 749–752
Fibrillation, skeletal muscle, 372*b*
Fibrin, 614–618, 614*f*–616*f*, 615*t*
Fibrinogen, 613, 614–618, 614*f*–616*f*, 615*t*
Fibroblasts
  in connective tissue, 146, 148*f*, 149*f*
  and scar formation, 154–155, 155*f*
Fibrocartilage, 144, 145*t*, 151, 151*f*, 214–215, 215*f*
Fibroids, 1088–1089
Fibromyalgia (FM), 509
Fibromyomas, 1088–1089
Fibromyositis, 372
Fibronectin, 134, 134*f*, 135*t*, 136–137
Fibrous joints, 272–274, 272*t*, 273*f*, 274*t*
Fibrous pericardium, 634, 634*f*
Fibrous tissues, 144, 144*t*, 145–146, 145*f*, 146*f*
Fibula, 200*f*, 224*f*–225*f*, 226*t*, 257, 257*t*, 258*f*, 259*b*, 260*f*
Fibular veins, 658*f*, 659*t*, 664–665, 664*f*
Fibularis muscles, 308*f*–309*f*, 309, 310*t*, 340, 340*t*, 341*f*
Fibularis tertius, 308*f*–309*f*, 309, 310*t*, 340, 340*t*, 341*f*
Fick's law, 841*b*
"Fight-or-flight" reaction, 383, 499–500, 500*t*, 785–786, 786*f*, 786*t*, 787*f*, 788, 789*f*, 943
Filaria, 738
Filiform papillae, 516, 516*f*
Filtrate, 976*f*–982*f*, 977–978, 982–983, 989*t*
Filtration
  of blood plasma into urine, 982–983, 982*f*, 983*f*, 984*b*, 989*t*
  definition of, 982
  and filtrate forming urine, 976*f*–982*f*, 977–978, 989*t*
  as function of lymph nodes, 730–731, 731*f*, 737*t*
  as passive transport processes, 96
  as urinary system function, 976*f*–979*f*, 982–983, 982*f*, 983*f*, 984*b*, 989*t*
Filtration slits, 978, 979*f*
Filum terminale, 421*f*, 423, 426, 426*f*
  anatomy of nerves associated with, 464, 465*f*, 466, 467*t*, 468
Fimbriae, of uterine tubes, 1066*f*, 1070
Final common path, 481
Fingernails, 186–187, 186*f*, 187*f*
Fingers
  arteries of, 649*t*, 654, 654*f*, 655*f*
  bones, 224*f*–225*f*, 253*t*, 254, 254*f*
  joints of, 279–280, 279*f*, 280*f*, 284*t*, 289*f*
  muscles, 329, 329*f*, 330*t*, 331–332, 331*b*
  ossification centers, 210, 210*f*, 211*f*
  range of motion (ROM), 290*f*
First polar body, 1099*f*, 1100*f*, 1101
First-degree burns, 192–193, 193*f*
Fissures
  anal, 894, 894*f*
  cerebral, 437, 437*f*, 438*b*
  of lungs, 812–813, 812*f*
Fixator muscles, 306, 306*f*
Flaccid muscles, 363, 450
Flagella
  description, functions and illustration, 68*f*, 69*t*, 82–83
  movement patterns and image of, 82, 83*f*, 84*f*
Flat bones, 200*f*, 201, 201*f*, 203, 206*f*
Flatfeet, 259, 260*f*
Flatus, 880
Flavin adenine dinucleotide (FAD), 933*b*
Flexibility, function of skin, 181*t*, 182
Flexion
  definition of, 291
  movement examples, 287*f*–291*f*
Flexor muscles
  examples of, 309, 310*t* (*See also* Tables 11–7 to 11–19)
  of foot and ankle, 308*f*–309*f*, 309, 310*t*, 340, 340*t*, 341*f*
  moving forearm, 326, 326*f*, 327*f*, 327*t*, 328*f*

energy extracted from, 939–940, 940*f*
as energy sources for muscles, 357–358, 357*f*
glycolysis, 105–106, 105*f*
homeostasis, 19, 19*f*, 566, 582, 583*f*
metabolism, 934–939
metabolism control, 941*f*, 943–944
and reabsorption, 985–989, 985*b*, 985*f*–988*f*, 989*t*
structural chemical model of, 46*f*
Glucose transport and phosphorylation, 935, 936*f*
Glucosuria, 994*b*
Glutamate, 405, 406*f*, 407*t*, 408
Gluteal muscles, 308*f*–309*f*, 309*f*, 309*t*–310*t*, 318*f*, 333, 333*t*, 337*f*
Glycerol tricaproate, 48–49, 49*f*
Glycogen, 942, 942*f*
Glycogenesis, 936*f*, 941*f*, 942
Glycogenolysis, 936*f*, 942–943, 943*f*
Glycolipids, 47*t*, 59
Glycolysis, 105–106, 105*f*, 106*f*, 935, 935*f*, 936*f*
Glycoprotein hormones, 548*f*, 549*f*, 550
Glycoproteins
as component of extracellular matrix (ECM), 134, 134*f*, 135*t*, 136–137
definition and functions of, 47*t*, 59, 548*f*, 549*f*, 550
Glycosuria, 985*b*, 994*b*
Goblet cells, 136*f*, 138, 139*f*, 140*t*, 877, 877*f*, 917–918
Goiter, 558, 574*b*, 588*t*
Golgi apparatus
description, functions and illustration, 68*f*, 69*t*, 154, 154*f*, 387–391, 387*f*–391*f*
illustration and role of, 68*f*, 73, 74*f*, 75*f*
Golgi tendon organs, 512*t*, 513
Golgi tendon receptors, 512*t*, 513
Gomphoses, 272, 272*t*, 273*f*, 274*t*
Gonadocorticoids, 578, 578*f*, 580
Gonadotrophs, 565, 565*f*
Gonadotropic cycle, 1067*f*, 1076
Gonadotropin-releasing hormone (GnRH), 567–568, 568*t*, 1047–1049, 1049, 1049*f*, 1050*t*, 1078, 1078*f*, 1082*t*
Gonadotropins
cycle and effects on ovaries, 1067*f*, 1076–1077, 1077*f*
functional overview of, 565*f*, 567, 571*t*
ovarian cycle secretions of, 1075*b*, 1076, 1077*f*
release during puberty, 567, 1118
secretions in females, 1066–1068, 1067*f*, 1074–1079, 1077*f*, 1078*f*, 1081, 1081*f*, 1082*t*
secretions in males, 1049, 1049*f*, 1050*t*
Gonads
embryonic development of, 1108*f*–1109*f*, 1112–1113, 1112*f*
ovaries (*See* ovaries)
puberty, 1045–1046, 1056, 1118, 1118*f*
testes (*See* testes)
Goniometer movement measurement, 286, 286*f*
"Goose bumps," 177
Gout, 994
Gouty arthritis, 293*f*

G-protein-coupled receptor (GPCR), 551–552, 552*f*
Graafian follicles, 1067, 1067*f*, 1099*f*, 1100*f*, 1101
Gracilis muscles, 333*t*, 334*f*, 335*f*, 336*f*
Graded strength principle
  definition and illustration of, 364–366, 364*b*, 365*f*, 366*f*
  isotonic and isometric contractions, 366–367, 367*f*
  length-tension relationship, 365, 365*f*
  stretch reflex, 365–366, 366*f*
  threshold levels, 364–365, 365*f*
Graft-*versus*-host rejection, 773
Granule cells, in olfactory bulbs, 514, 514*f*
Granulocytes, 600*f*, 603*f*, 605–607, 606*t*
Granulosa cells, 1067, 1099*f*, 1100*f*, 1101
Graves disease, 558, 574*b*, 588*t*, 773*t*
Gravity
  influence on blood distribution, 700, 701*f*
  and posture, 341–342
  and sense of balance, 522–524, 522*f*, 523*f*
Gray columns, 426, 426*f*, 427*f*, 445*t*
Gray commissure, 426, 426*f*, 427*f*, 445*t*
Gray hair, 186, 186*f*
Gray matter, 392, 426, 426*f*, 427*f*, 431–436, 438, 438*b*, 445*t*
  associated with reflexes, 481–482
Gray ramus, 492
Great saphenous veins, 658*f*, 659*t*, 664–665, 664*f*
Great vessels, 633*f*, 634*f*, 639–668
Greater omentum, 880*f*, 881, 881*f*
Greater vestibular gland, 1065*f*, 1073*f*, 1074
Gristle, 214–215, 215*f*
Gross anatomy
  definition of, 5–6, 5*f*
  Terminologia Anatomica (TA), 5–6
Ground substances, 204
Growth and development
  aging benefits, 1122
  aging effects on
    cardiovascular system, 1122
    integumentary system, 1120–1121
    muscular system, 1120, 1121*f*
    reproductive systems, 1122
    respiratory system, 1121
    skeletal system, 1120, 1121*f*
    special senses, 1122
    urinary system, 1121
  big picture, 1123
  birth or parturition, 1114–1115, 1114*f*
    labor stages, 1114*f*, 1115
    multiple births, 1115, 1115*f*
  case study, 1126
  as characteristic of life, 6*t*
  death, 1122–1123, 1123*f*
  fertilization, 1101–1103, 1101*f*, 1102*f*, 1103*f*, 1108*f*–1109*f*
  ovulation and insemination, 1101, 1102*f*, 1103*f*, 1108*f*–1109*f*
  postnatal periods
    adolescence, 1118, 1118*f*
    adulthood, 1118, 1118*f*
    childhood, 1117, 1118*f*
    infancy, 1116–1117, 1117*f*
    older adulthood, 1118–1120 (*See also* aging)
  prenatal period
    cleavage and implantation, 1103–1105, 1103*f*, 1104*f*
    histogenesis and organogenesis, 1108*f*–1109*f*, 1111–1113, 1112*f*, 1113*f*
    periods of development, 1107, 1107*f*, 1108*f*–1109*f*, 1110, 1110*f*
    placenta, 1105–1107, 1105*f*–1107*f*
    primary germ layers, 1111, 1111*f*
    stem cells, 1110–1111
  sex cell production
    meiosis, 1097–1098, 1098*f*, 1099*f*
    oogenesis, 1099*f*, 1100*f*, 1101
    spermatogenesis, 1098, 1099*f*, 1101
Growth hormone (GH)
  functions and target organs, 565, 565*f*, 566, 566*b*, 568–569, 569*f*, 571*t*, 948
  role in glucose levels, 945, 945*f*
  and skin growth, 174
  stimulating bone development, 208–209
Growth hormone-inhibiting hormone (GHIH), 567–568, 568*t*
Growth hormone-releasing hormone (GHRH), 567–568, 568*t*
Gustatory cells, 515*f*, 516, 516*f*
Gustatory pathways, 515, 515*f*, 516–517, 517*f*
Gyrus, 432*f*, 437, 437*f*, 438*b*, 441*f*, 442–443

H

H bands of muscle cells, 350, 351*b*, 351*f*, 354*f*
Hair, 55*b*, 172*f*, 173*b*, 185–186, 185*f*, 186*f*
Hair cells (ears), 517–524, 519*f*, 521*f*, 522*f*, 523*f*
Hair follicle, 172*f*, 185–186, 185*f*, 186*f*
Hair papillae, 185–186, 185*f*
Haldane effect, 847, 847*f*
Hamate
  bones, 253*t*, 254, 254*f*
  joints, 279, 279*f*
Hamstring muscles, 308*f*–309*f*, 309*t*–310*t*, 334*f*, 335*f*, 338*f*, 339*f*, 339*t*
Hands
  arteries of, 649*t*, 654, 654*f*, 655*f*
  bones of, 224*f*–225*f*, 253*t*, 254, 254*f*
  carpal tunnel syndrome, 331*b*
  joints of, 279–280, 279*f*, 280*f*, 284*t*, 289*f*, 292
  muscles, 308*f*–309*f*, 310*t*, 329, 329*f*, 330*t*, 331–332, 331*b*
  ossification centers, 210, 210*f*, 211*f*
  range of motion (ROM), 289*f*
Hansen disease, 464*b*
Haploid numbers, 124, 125*f*, 1097–1098, 1098*f*, 1099*f*, 1135
Hard palate, 865, 865*f*
Hartwell, Leland, 125
Hashimoto disease, 574*b*, 588*t*
Haversian systems, 150, 150*f*, 204, 205*f*, 212–213, 213*f*
Head
  arteries of, 651, 651*f*
  facial nerve (VII), 473*f*, 473*t*, 476*t*, 477, 477*f*, 478*b*
  lymphatic drainage, 730*f*
  major veins of, 660*f*, 660*t*, 661
  movement as lever example, 306, 307*f*
  muscles, 308*f*–309*f*, 310*t*, 314, 314*f*, 314*t*, 329, 329*f*, 330*t*, 331–332, 331*b*, 341–342
  skeletal muscles (anatomy)
    facial expression muscles, 312–313, 312*f*, 312*t*
    head movement muscles, 314, 314*f*, 314*t*, 341–342
    mastication muscles, 312*f*, 313
    tongue and pharynx muscles, 313, 313*f*
Hearing; *See also* ears
  and cerebral cortex, 441*f*, 442–443
  disorders, 534–535

    great vessels, 633*f*, 634*f*, 639–668
    heart tissue blood supply, 633*f*, 634*f*, 639–642
    myocardium, 634, 634*f*, 635, 638*f*, 670–671
    pericardium, 632*f*, 634, 634*f*, 669
    valves, 631*f*–633*f*, 637*f*–639*f*, 638–639, 669–670
    ventricles, 631*f*–633*f*, 637–638, 638*f*
    wall of, 631*f*, 632*f*, 634*f*, 635
  transplants, 671
Heart attacks, 51*b*, 622, 635, 635*b*, 641, 641*b*, 670, 672, 946*b*, 947, 1122
Heart block, 712, 713*f*
Heart diseases
  death rates due to, 1123*f*
  and lipoproteins, 946–947, 946*b*
  myocardial infarction (MI), 617*b*, 635, 635*b*, 641, 641*b*, 670, 672, 1122
  types of, 669–672
Heart failure, 713–714, 946–947, 946*b*
Heart murmur, 688*f*, 689
Heart rate
  definition and monitoring of, 691–693, 693*f*, 694*f*, 695, 699*b*
  as stress indicator, 790, 790*f*
Heart sounds, 639, 639*f*, 688*f*, 689
Heart valves, disorders of, 669–670
Heartburn, 871–872, 890, 891*f*, 892
Heat
  mechanisms of loss, 183–184, 183*f*, 184*f*
  metabolism producing, 183, 933–934
  production in muscle cells, 348, 359–360, 359*f*, 947
  of vaporization, 43, 43*f*
Heat exhaustion, 191, 191*f*
Heat stroke, 192
Heberden nodes, 293, 293*f*
Helium, atomic energy levels of, 37, 37*f*
Helper T lymphocytes, 766–767, 767*t*, 769*f*, 770*f*
Hematocrit, 600, 600*f*
Hematoma, fracture, 214, 214*f*
Hematopoiesis, 152, 200, 732, 736, 737*t*, 884
Hematopoietic stem cells, 602–604, 603*f*, 756, 756*f*
Hematoxylin and eosin (H&E) staining, 136*f*
Hematuria, 995, 995*f*
Heme group, 602, 602*f*, 842, 842*f*
Hemiazygos veins, 658*f*, 659*t*, 660*f*, 661, 661*f*, 662*f*, 663*f*
Hemiplegia, 452
Hemispheres, cerebral, 437, 437*f*, 441*f*
Hemocytoblasts, 603*f*, 604*f*, 608
Hemodialysis, 94*b*, 997*b*
Hemodynamics, 682–683, 682*f*
Hemoglobin (Hb)
  buffer pairs, 1028
  disorders of, 620
  molecules
    molecular structure of, 842*f*
    oxygen bound to, 357, 357*f*
    in red blood cells, 601–602, 602*f*
  role in gas transport, 842–846, 842*f*–845*f*
Hemolytic anemia, 620
Hemophilia, 622–623, 1140*f*, 1143*t*, 1144
Hemorrhoids, 673, 894, 894*f*
Hemostasis
  blood clotting process, 613–618
  platelet role in, 599–600, 599*f*, 606*t*, 608–609
  role in infection prevention, 613–614
Henle loop, 976, 976*f*–982*f*, 980, 984, 985*f*, 986–987, 986*f*, 989*t*
Henry's law, 826*b*–827*b*
Heparin, 617, 617*b*
Hepatic ducts, 882, 883*f*, 884, 885*f*
Hepatic lobules, 882, 883*f*, 884, 885*f*
Hepatic portal circulation, 658*f*, 659*t*, 662–664, 664*f*
Hepatitis, 894
Hering-Breuer reflexes, 851
Hernias
  abdominal, 373
  hiatal, 870*f*, 871, 872*b*
  inguinal, 1058
Herniated disks, description and illustration of, 285–286, 285*f*
Herpes zoster, 472*b*
Heterozygous, 1137
Hexoses, definition and function of, 46, 47*t*
Hiatal hernia, 870*f*, 871, 872*b*, 1113
Hiccup, 849*b*
High-density lipoproteins (HDLs), description and benefits of, 51*b*, 946–948, 946*b*, 961
High–energy bonds, 58–59, 59*f*
Highly active antiretroviral therapy (HAART), 775
Hilum
  kidney, 972, 972*f*, 976*f*, 981*f*
  lung, 812
  lymph node, 729*f*, 734*f*
Hip
  bones, 200*f*, 224*f*–225*f*, 255, 255*f*, 256*f*, 256*t*, 261*f*
  joints, 281, 281*f*, 284*t*, 290*f*
  range of motion (ROM), 290*f*
Hippocampus, in limbic system, 444–445, 444*f*
Histamines
  and nasal allergies, 146*b*
  as neurotransmitters, 406, 406*f*, 407*t*, 408, 410*b*
Histogenesis, 132, 132*b*, 1108*f*–1109*f*, 1111–1113, 1112*f*, 1113*f*
Histology, 5, 132
Histones, 1132, 1133*f*, 1134*f*
Hives, 190
H-K pump, 890, 891*f*, 915
Hodgkin disease, 739
Holocrine gland, 142, 142*f*
Homeostasis
  acid-base, 1033*f*, 1035*f*
  of blood gases, 841–852
  blood glucose, 19, 19*f*, 566, 942–944, 943*f*, 944*f*
  body temperature, 18–19, 181*t*, 182–183, 359–360, 359*f*
  bones and, 216
  calcium, 208–209, 208*f*
  chemical imbalance and disease, 60–61
  control mechanisms, 20–24, 21*b*, 22*f*, 23*b*, 23*f*
  definition of, 18–24, 19*f*, 20*f*, 25
  erythropoiesis, 602–604, 603*f*, 604*f*
  feedback control loop, 20–24, 22*f*
  fluid and electrolyte balance, 1004, 1009*f*–1012*f*, 1010–1012, 1019
  of ovarian hormone secretion, 1078, 1078*f*
  pancreas role in nutrient metabolism, 582
  principles of, 18–19, 20*f*
  respiratory system, 824, 825*f*, 853
  role of muscles in, 359–360, 359*f*
  role of skin in, 181*t*, 182–183, 184, 184*f*
  sensory receptor role in, 506
Homeostatic control mechanisms
  definition and components of, 20–24, 21*b*, 22*f*, 23*b*, 23*f*
  feed-forward, 22–23
  four basic components of, 20–21, 21*b*, 22*f*
  levels of control, 23–24, 23*f*
  negative feedback mechanisms, 21–22
  positive feedback mechanisms, 22, 23*b*
Homozygous, 1136
Horizontal fissures of lungs, 812–813, 812*f*
Horizontal plane, 15–16, 15*f*
Hormone-receptor complex, 551–552, 551*f*, 552*f*
Hormones
  adenohypophysis hormones
    adrenocorticotropic hormone (ACTH), 565*f*, 567, 571*t*
    follicle-stimulating hormone (FSH), 565*f*, 567, 571*t*
    growth hormone (GH), 565*f*, 566, 566*b*, 568–569, 569*f*, 571*t*
    luteinizing hormone (LH), 565*f*, 567, 571*t*
    prolactin, 565*f*, 566, 571*t*
    somatotropin (STH), 565*f*, 566
    thyroid-stimulating hormone (TSH), 565*f*, 567, 571*t*
    tropic hormones, 565*f*, 566–567, 566*b*, 571*t*
  chemical structure of certain, 50*f*
  classification of, 547–548, 548*f*, 549*f*, 550, 553*t*, 556*b*
  controlling blood glucose levels, 944–945, 945*f*
  definition of, 546–547, 546*t*, 556*b*
  disorders involving female, 1086–1088, 1087*b*, 1087*f*

feedback control loop, 20
female reproductive system, 1066–1068, 1067*f*, 1074–1079, 1081, 1081*f*, 1082*t*
glandular epithelium, 135, 140*t*, 141–142, 141*f*, 141*t*
hypothalamus release of, 436
lactation, and female breast anatomy, 1082–1084, 1083*f*, 1084*f*, 1085*t*

Intervertebral foramen
  anatomy of, 244*t*, 245, 246*f*, 247*f*
  nerves associated with, 464, 465*f*, 466, 467*t*, 468
Intestinal juices, secretion and secretion control, 902*t*, 913*t*, 917–918, 917*f*, 918*t*, 920, 921*f*
Intestinal motility, 902, 902*t*, 907–908
Intestinal mucosa hormone secretions, 584*t*, 586
Intestinal phase of gastric secretion, 918, 919*f*, 920
Intestinal villi, 921*f*
Intracellular control mechanisms, for homeostasis, 23, 23*f*
Intracellular fluids (ICFs), 69–70, 69*f*, 1005–1007, 1005*f*, 1006*f*, 1006*t*, 1016–1017, 1016*f*, 1018*f*
Intradermal (ID) injections, 178, 178*b*
Intramembranous ossification, 209, 209*f*
Intramural plexus, 863, 863*f*, 903*b*
Intramuscular injections, 337*b*
Intratracheal injections, 832*b*
Intrauterine devices (IUDs), 1080*b*
Intrauterine stress, 792
Intravenous injections, 1007*b*
Intrinsic clotting pathways, 616, 616*f*
Intrinsic control mechanisms, for homeostasis, 23*f*, 24
Intrinsic factors, 916, 916*f*
Intrinsic muscles
  of eyes, 526
  of foot and ankle, 340, 340*t*, 341*f*
  of wrist, hand and fingers, 329, 329*f*, 330*t*, 331–332
Introns, 117, 118*f*
Inversion movements, 291*f*, 292
Involuntary muscle tissue, 152–153, 152*t*
Involution, 734
Iodine
  as human body element, 34*f*, 35*t*
  sources, functions and deficiency, 954*t*
  and thyroid abnormalities, 572, 573*f*, 574*b*, 587*t*–588*t*
Ion channels, 393–397, 393*f*, 394–396, 394*f*, 395*f*, 395*t*, 396*t*, 397*t*
Ionic bonds
  and covalent bonds, 38–39, 39*f*
  and dissociation, 44
Ions
  anions and cations, 1004–1008, 1006*f*
  definition of, 38, 39*f*, 1004
  reabsorption process, 984, 985*f*
  role in fluid and electrolyte balance, 1004–1008, 1006*f*
  role in kidney function, 982–993, 983*f*, 985*f*–988*f*, 989*t*, 990*f*
Ipsilateral, 10
Ipsilateral reflex, 391, 482
Iris, 526–529, 527*f*, 528*f*, 529*f*
Iron
  as human body element, 34*f*, 35*t*
  intake recommendations, 954*f*
  sources, functions and deficiency, 954*t*
Iron deficiency anemia, 620, 620*f*
Irregular bones, 200*f*, 201, 201*f*, 203
Irritable bowel syndrome, 893
Ischemia, 671–672
Ischiocavernosus muscles, 320, 321*f*, 321*t*
Ischium, 224*f*–225*f*, 255, 255*f*, 256*f*, 256*t*, 261*f*, 262*t*
Isoimmunity, 772–773
Isomerases, 103
Isometric contractions, 366–367, 367*f*
Isotonic contractions, 366–367, 367*f*
Isotonic solutions, 94, 95*f*
Isotopes, 34*f*, 37–38, 38*f*
Isovolumetric ventricular contraction/relaxation, 688*f*, 689
Isthmus, of uterine tubes, 1066*f*, 1070
Itch sensation, 510

J

Jaundice, 180, 180*b*, 885–886, 894
Jaw
  bones, 224*f*, 227*f*–228*f*, 230*f*–232*f*, 236*f*, 236*t*, 240
  movements, 287*f*
  teeth, 868, 869*f*, 869*t*
Jejunum, 862*f*, 863*b*, 872*b*, 873*f*, 875, 875*f*, 876*f*
Joint capsules, 274, 274*f*
Joint cavities, definition and illustration of, 274*f*, 275
Joint mice, 293*b*
Joints
  arthroscopy, 294, 295*f*
  in big picture, 292
  cartilaginous, 272–274, 272*t*, 273*f*, 274*t*, 284*t*
  case study regarding, 297
  classification of, 272–276, 272*t*, 273*f*–275*f*, 274*t*, 275*t*, 276*t*, 284*t*, 286
  cycle of life and, 292
  definition of, 272
  fibrocartilage, 144, 145*t*, 151, 151*f*
  fibrous, 272–274, 272*t*, 273*f*, 274*t*
  joint capsules, 274, 274*f*
  mechanisms of disease
    arthritis, 293*f*, 294
    bursitis, 278, 278*f*, 282, 293, 293*f*
    degenerative joint disease (DJD), 293–294, 293*f*
    dislocation, 294
    inflammatory joint disease, 295
    joint disorders, 293
    juvenile rheumatoid arthritis, 293*f*, 295
    noninflammatory joint disease, 293–294, 293*f*
  olecranon bursitis, 293, 293*f*
  osteoarthritis, 293–294, 293*f*
  rheumatoid arthritis, 293*f*, 295
  sprains, 295
  subluxation, 294
  traumatic injuries, 294
nonsteroidal antiinflammatory drugs (NSAIDs), 294
replacement of, 294*b*
summary of, 284*t*
synovial joints
  angular movements, 287*f*–291*f*, 291
  ankle joint, 283–284, 284*t*, 285*f*, 291*f*
  articulating bones and movements, 284*t*
  circular movements, 287*f*–291*f*, 291
  classification of, 275–276, 275*f*, 276*t*, 284*t*, 286
  elbow joint, 275*f*, 276*t*, 278–279, 278*f*, 284*t*, 289*f*
  of forearm, wrist, hand and fingers, 279–280, 279*f*, 280*f*, 284*t*, 289*f*
  goniometer movement measurement, 286, 286*f*
  hip joint, 281, 281*f*, 284*t*, 290*f*
  humeroscapular joint, 275*f*, 276*t*, 277–278, 277*f*, 284*t*, 289*f*
  knee joint, 281–283, 283*b*, 283*f*, 284*t*, 290*f*, 291*f*
  movement of different, 284*t*, 286, 287*f*–291*f*, 291–292
  range of motion (ROM), 286, 286*f*–291*f*
  structure of, 274–275, 274*f*
  and two cartilaginous joint movements, 284*t*
  types of, 275–276, 275*f*, 276*t*, 284*t*, 286
  vertebral joints, 284*t*, 285–286, 285*f*, 288*f*
total hip replacement (THR), 294*b*
Juvenile rheumatoid arthritis, 293*f*, 295
Juxtaglomerular apparatus, 976, 976*f*–982*f*, 980, 984, 985*f*
Juxtaglomerular cells, 977*f*, 980, 981*f*
Juxtamedullary nephrons, 981, 981*f*

  bony structures protecting, 806*f*
  compliance and surfactant, 829–830, 832*b*
  gas exchange structures of, 809–810, 810*f*
  lung cancer, 818–819
  and pleura, 813–814, 814*f*
  pneumonia, 817–818, 818*f*
  simple squamous epithelium, 138, 138*f*, 140*t*
Lunula, 186–187, 186*f*
Lupus, 772, 773*t*
Luteal phase of menstrual cycle, 1076, 1079*f*
Luteinization, 1077, 1077*f*
Luteinizing hormone (LH)
  and contraception, 1080*b*
  functional overview of, 565*f*, 567, 571*t*
  release and puberty, 1118, 1118*f*
  secretions in female reproductive system, 1066–1068, 1067*f*, 1074–1079, 1077*f*, 1078*f*, 1081, 1081*f*, 1082*t*
  secretions in male reproductive system, 1049, 1049*f*, 1050*t*
Lymph
  and interstitial fluid (IF) *versus* plasma, 724, 726, 726*f*
  loss of, 724*b*
  lymphatic vessels, 724–726, 724*f*–727*f*, 737*t*
  lymphedema, 738, 738*f*
Lymph nodes
  associated with breasts, 732–733, 732*f*
  B cells, 757–758, 758*f*
  disorders involving, 738–739
  functions of, 730–732, 731*f*, 737*t*
    defense functions, 730–731, 731*f*, 737*t*
    filtration and phagocytosis, 730–731, 731*f*, 737*t*
    hematopoiesis, 732, 737*t*
  locations and names of, 729–730, 730*f*, 731*f*
  structure of, 728–729, 728*f*, 729*f*, 731*f*, 737*t*
Lymphangiography, 727, 727*f*
Lymphangitis, 738, 739*f*
Lymphatic anastomoses, and breast cancer, 733*b*
Lymphatic capillaries, 724–726, 724*f*, 725*f*, 737*t*
Lymphatic drainage
  and artificial limbs, 727*b*
  breasts, 730, 730*f*, 732–733, 732*f*, 733*b*
  of head and neck, 730*f*
  lymphatic vessels, 724–726, 724*f*–727*f*, 737*t*
Lymphatic system
  breast lymphatic drainage, 730, 730*f*, 732–733, 732*f*, 733*b*
  disorders of, 738–739
  interstitial fluid (IF) *versus* plasma, 724, 726, 726*f*
  lymph
    circulation of, 726–728, 726*f*, 727*f*
    and interstitial fluid (IF), 724, 726, 726*f*
  lymph nodes
    disorders involving, 738–739
    functions of, 730–732, 731*f*, 737*t*
    locations and names of, 729–730, 730*f*, 731*f*
    structure of, 728–729, 728*f*, 729*f*, 731*f*, 737*t*
  lymphatic pump, 727–728, 727*f*
  lymphatic vessels
    anatomy and important functions of, 724–726, 724*f*–727*f*, 737*t*
    disorders of, 738, 738*f*
    lymphedema, 738, 738*f*
  organs and functional overview of, 7*f*, 9*t*, 723, 723*f*, 724*f*, 737*t*
  spleen, 735–736, 735*f*, 736*f*, 737*t*
  thymus
    functions of, 734, 737*t*
    location, structure and appearance of, 734, 734*f*, 737*t*
  tonsils, 733–734, 733*f*, 737*t*
Lymphedema, 732*b*, 738, 738*f*, 739
Lymphocytes
  and adaptive immunity, 754–758
  characteristics and illustrations of, 599*f*, 600*f*, 603*f*, 605, 606*t*, 607, 607*f*, 607*t*
  definition and photomicrograph of, 152, 152*f*
  development in thymus, 734–735, 735*f*, 737*t*
  glucocorticoids affect on, 579
  T cells and B cells, 754–767, 756*f*–759*f*, 758, 765*b*, 766*b*, 767*t*

Messenger RNA (mRNA), 74, 74*f*, 115–119, 115*t*, 117*f*, 118*b*, 119*t*, 120*b*
Metabolic acidosis, 1036, 1037*f*
Metabolic alkalosis, 1030, 1030*b*, 1036–1037, 1037*f*
Metabolic disorders
  bone diseases, 216–217, 217*f*
  inborn errors of metabolism, 127
  types of, 961–963
Metabolic pathways, catabolism and anabolism, 41–42, 41*f*, 932, 950*t*, 951*f*
Metabolic rates, 955–958
Metabolic syndrome, 961
Metabolism; *See* nutrition and metabolism
Metacarpals
  anatomical location of, 200*f*
  description and illustrations of, 224*f*–225*f*, 253*t*, 254, 254*f*
  metacarpophalangeal joints, 280, 280*f*
  ossification centers, 210, 210*f*, 211*f*
Metacarpophalangeal joints, 280, 280*f*
Metaphase of mitosis, 123–124, 123*t*, 125*f*
Metaphysis, 202, 210–212, 210*f*, 211*f*, 212*f*
Metarterioles, 644, 644*f*
Metastasis
  and cancer cells, 158–160, 158*f*
  skin cancer, 190, 191*f*
Metatarsals, 224*f*–225*f*, 259, 259*b*, 260*f*, 260*t*–261*t*
Metformin, 1031*b*
Micelles, 912
Microbes, on skin, 181, 182*b*
Microcephaly, 666*b*
Microcirculation, 644, 644*f*
Microfilaments, in elastin fibers, 143*f*
Microglia, 384, 384*f*, 385, 748
Micronutrients, 932
Microorganisms
  lymph node defense role in, 730–731, 731*f*
  as risk factor for disease, 27
Microscopic anatomy
  definition of, 5
  Terminologia Histologica (TH), 5–6
Microtubule-organizing center (MTOC), 80*f*, 81, 81*f*
Microtubules, 68*f*, 69*f*, 79*f*, 80, 80*f*
Microvilli
  description, functions and illustration, 68*f*, 69*t*
  epithelial tissue, 136*f*, 138, 140*t*
  intestines, 876, 876*f*
  movement patterns and image of, 82, 83*f*, 84*f*
  nephron, 980
Micturition, process and reflexes, 975–976, 975*f*
Midbrain, 429, 429*f*, 430*b*, 431–432, 431*f*, 446*t*
Middle cerebellar peduncles, 432*f*, 433
Middle ear, 518*f*, 519
Migrating motor complex (MMC), 905*b*
Milieu intérieur; *See* internal environment
Milliequivalent (mEq) reactivity, 1007–1008
Milwaukee brace, 266
Mineralocorticoids, 578, 578*f*, 578*t*, 580*b*, 587*t*
Minerals
  sources, functions and deficiencies, 932, 953–954, 954*t*, 955*f*
  storage function of bones, 200, 208–209, 208*f*
Minute volume
  of air flow, 837, 837*f*
  of blood, 707
Mirror neurons, 444*b*
Miscarriages, 1124
Mitochondria
  as cellular "power plants," 68*f*, 69*t*, 77, 77*f*, 939
  energy transport, 936–940, 938*f*, 939*f*, 941*f*
  function and illustration of, 68*f*, 69*t*, 77, 77*f*
  illustration in cytoskeleton, 79*f*
Mitochondrial DNA inheritance (mtDNA), 1142, 1142*f*, 1143*t*
Mitosis
  bone cell, 210, 211*f*
  within cell life cycle, 121*t*
  and nail growth, 186
  phases and illustration of, 123–124, 123*t*, 124*f*, 125*f*
  skin cell, 174–175
Mitral valve prolapse, 670, 670*f*
Mitral valves, 631*f*–633*f*, 638–640, 638*f*, 639*f*, 640*f*
  stenosed, 669–670, 669*f*
Mittelschmerz, 1068*b*
Mixed nerves, 392, 466, 473, 473*t*
Mobile-receptor model, 551, 551*f*
Molecular genetics, 114
Molecular motors
  active transport processes, 97–101, 97*f*–100*f*, 98*b*–99*b*, 101*t*
  and cell movements, 81–82, 82*f*, 83*f*
  passive transport processes, 91–96, 91*f*, 92*t*, 93*f*, 94*b*, 95*f*, 96*f*, 97*b*
Molecular oncology, 160
Molecules
  active transport processes, 97–101, 97*f*–100*f*, 98*b*–99*b*, 101*t*
  attraction, 39–40, 40*f*
  as basis of life, 7–8, 7*f*
  hydrogen bonds, 39–40, 40*f*
  hydrophilic *versus* hydrophobic, 50*f*, 70, 70*f*
  molecular motors moving, 81–82, 82*f*
  passive transport processes, 91–96, 91*f*, 92*t*, 93*f*, 94*b*, 95*f*, 96*f*, 97*b*
  polar molecules, 39–40, 40*f*
  suspended in cytoplasm, 69–70, 69*f*
Molybdenum, 34*f*, 35*t*
Monoamines, 406, 406*f*, 407*t*, 408, 410*b*
Monoclonal antibodies, 160
Monocytes, 599*f*, 600*f*, 603*f*, 605, 606*t*, 607, 607*f*, 607*t*
Monogenic traits, 1137
Monosaccharides, 46, 47*t*, 934, 934*f*
Monosomy, 1141, 1141*f*, 1144, 1147
Mons pubis, 1064*f*, 1065*f*, 1073–1074, 1073*f*
Morula, 1102–1103, 1102*f*, 1103*f*
Motilin, 905*b*
Motility, 902, 902*t*, 906–907, 907*b*, 907*f*
Motor control, cerebellar role in, 433–434, 433*f*
Motor divisions, of peripheral nervous system (PNS), 473*t*, 475*t*–476*t*, 478*t*, 480*t*, 481
Motor endplates, in muscle fiber nerve cells, 353, 353*b*, 353*f*, 354*f*
Motor fibers, of spinal nerves, 466, 466*f*, 467*t*, 471–472, 471*f*, 473
Motor functions, of cerebral cortex, 443
Motor neurons
  function of efferent, 390–391, 390*f*, 392, 392*f*
  in muscle fiber nerve cells, 353, 353*b*, 353*f*, 354*f*
Motor pathways
  of autonomic nervous system (ANS), 490, 490*f*, 491*f*, 491*t*
  injuries, 451*b*
Motor programs, 451, 451*f*
Motor proteins, 81–82, 82*f*
Motor units, muscles as, 360–361, 360*f*
Mouth
  congenital defects of, 889–890, 890*f*
  disorders of, 888–890
  oral cavity, 862*f*, 864–867, 865*f*–869*f*
  role in digestion, 902*f*, 904–908, 908*t*, 925
  salivary glands, 862*f*, 867–868, 867*f*, 888
  teeth, 868, 868*f*, 868*t*
Movement; *See also* skeletal muscles
  as characteristic of life, 302, 342
  function of bones in, 200
  illustration of jaw, 287*f*
  and range of motion (ROM), 286, 287*f*
  types of joint, 284*t*, 286, 287*f*–291*f*, 291–292
Mucosa, of GI tract wall, 863, 863*f*, 864*t*, 873–874, 873*f*, 874*f*
Mucosal immunity, 771*b*
Mucosal-associated lymphoid tissue (MALT), 771*b*
Mucous membranes
  description and functions of, 801–802, 802*f*
  as immunity line of defense, 748*t*, 749
  tissue characteristics of, 155*f*, 156–157, 156*b*, 156*f*, 157*f*, 157*t*
Mucus
  as immunity line of defense, 748*t*, 749
  in saliva, 914
  secretion of, 801–802, 802*f*
Mullerian duct, 1112, 1112*f*
Multiaxial joints, 275*f*, 276, 276*t*

Multicellular glands, 141–142
Multifidus muscle group, 318–319, 318*f*–319*f*, 320*t*
Multipennate muscles, 304, 304*f*
Multiple births, 1115, 1115*f*
Multiple myeloma, 613, 620–621, 621*f*
Multiple sclerosis (MS), 386*b*, 411, 773*t*
Multipolar neurons, 390, 390*f*
Multiunit smooth muscle, 370, 371*f*
Mumps, 868, 887, 888, 889*f*
Muscarinic receptors, 497
Muscle cells
  characteristics and functions of, 348, 349*f*, 350, 351*b*, 351*f*, 352–360, 353*b*, 354*f*, 355*f*
  heat production, 348, 359–360, 359*f*
  structure of, 67*t*, 302, 303*f*
Muscle fatigue
  benefits of exercise on preventing, 364*b*
  causes of, 362, 363*b*
Muscle fibers
  blood supply of, 357–358, 357*f*, 364*b*
  cellular characteristics, 303*f*, 348, 349*f*, 350, 350*f*, 351*b*, 351*f*, 352, 353–354, 353*f*
  connective tissues covering, 302, 302*t*, 303*f*
  effects of aging on, 1120, 1121*f*
  illustration of, 303*f*
  types of, 358*b*
Muscle spindles
  associated with reflexes, 482
  stretch receptors, 512*t*, 513
  and stretch reflex, 364–365, 366*f*
Muscle strength
  assessing, 307*b*
  decrease with age, 1120, 1120*f*
Muscle tissue
  big picture, 371
  cardiac muscle tissue, 152–154, 152*t*, 153*f*
  description and structure of, 132, 133*t*, 302, 303*f*
  extracellular matrix (ECM) in, 134, 134*f*, 135*t*
  location and functions, 132, 133*t*, 152–154, 152*t*, 153*f*, 303*f*
  skeletal muscle tissue, 152–153, 152*t*, 153*f*
  smooth muscle tissue, 152–154, 152*t*, 153*f*
Muscle tone
  benefits of exercise on, 364–367, 364*b*, 365*f*–367*f*
  damaged with motor neuron injuries, 450, 451*b*
  definition of, 341–342, 363
Muscles; *See also* skeletal muscles
  aerobic and anaerobic pathways, 358–359, 359*f*
  attachments, 305, 305*f* (*See also* Tables 11–7 to 11–19)
  big picture, 342
  of breathing, 824, 825*f*, 826, 826*b*–827*b*, 827*f*–831*f*, 828–831, 829*t*
  case study, 344, 374
  characteristics *versus* smooth and cardiac, 368*t*
  contraction and relaxation of, 352–354, 353*b*, 354*f*, 355*f*, 356–360
  and cycle of life, 342
  disorders of, 372–373, 372*f*
  effects of aging on, 1120, 1121*f*
  energy sources, 356–360
  example of actions of, 309*t*, 311
  excitation, 350, 353, 353*b*
  of eyes, 525–526, 526*f*
  functions, characteristics and structure
    as an organ, 348, 349*f*, 360–363, 362*f*
    general functions, 348
    as motor units, 360–361, 360*f*
    muscle cells, 348, 349*f*, 350, 351*b*, 351*f*
    muscle fiber types, 358*b*
    myofibrils, 349*f*, 350, 351*b*, 352, 352*f*
    myofilaments, 349*f*, 350, 351*b*, 352, 352*f*
    myography, 361, 361*f*, 362*f*
    sarcomere, 349*f*, 350, 351*b*, 351*f*, 352

  muscles of, 308*f*–309*f*, 309*t*–310*t*, 318–319, 318*f*–319*f*, 320*t*
Necrosis
  definition of cell, 126*b*
  tissue death, 671–672
Needle biopsy, of kidney, 972*b*
Negative feedback mechanisms, in homeostatic control, 21–22
Negative nitrogen balance, 950
Neon, atomic energy levels of, 37, 37*f*
Neonatal period, 1116–1117
Neonatology, 1116–1117
Neoplasms; *See also* tumors
  benign *versus* malignant, 158–160
  classification of, 158–160
  formation with mitosis abnormalities, 126*b*
  skin, 190, 191*f*
Nephritis, 995, 1123*f*
Nephrons
  blood supply, 973, 973*f*, 976, 980, 980*f*, 981*f*, 989*t*
  cortical, 981, 981*f*
  juxtamedullary, 981, 981*f*
  structure and components of, 976–980, 976*f*–979*f*, 989*t*
  types of, 976, 981, 981*f*, 989*t*
  urine formation processes, 976*f*–979*f*, 982–983, 982*f*, 983*f*, 984*b*
Nephrosis, causing edema, 1015–1016, 1016*f*
Nephrotic syndrome, 1123*f*
Nerve cell bodies, 154, 154*f*
Nerve cells, structure and functions of, 67*t*
Nerve endings
  encapsulated, 212*t*, 512
  in epidermis, 173, 173*f*
  and sense of touch, 507–511, 508*t*, 509*b*, 511*f*, 512*t*
  skin, 172*f*, 175*t*, 177, 177*f*, 508*t*, 510–511, 511*f*, 512*t*
Nerve fibers, 154, 154*f*, 387–391, 387*f*–391*f*
  damage and paralysis, 399*b*
Nerve impulses
  action potentials, 395–399, 396*f*, 396*t*, 398*f*, 399*f*
  conduction, 397*t*, 398–399, 399*f*
  local potentials, 395, 395*f*
  membrane potentials, 393–397, 393*f*, 394*f*, 395*f*, 395*t*, 396*t*, 397*t*
  in muscle fiber nerve cells, 353, 353*b*, 353*f*, 354*f*
  refractory period, 397–398, 397*f*
  resting membrane potentials (RMPs), 394–395, 394*f*, 395*f*, 395*t*, 396*t*
  for smell, 513–517, 514*f*–517*f*
  for taste, 514*f*–517*f*, 516–517
  for vision, 527–528
Nerves
  carpal tunnel syndrome, 331*b*
  components and illustration of, 392, 392*f*
  diagram of nervous system, 381*f*, 382, 382*f*
  of muscles (*See* Tables 11–7 to 11–19)
  and tracts of nervous system, 381*f*, 382*f*, 392, 392*f*
Nervous system; *See also* autonomic; central; peripheral nervous systems
  aging and changes in, 411
  big picture, 382*f*, 383, 411
  cells of
    glia or neuralgia, 383–387, 384*f*, 385*b*, 386*b*, 386*f*
    neurons, 383, 387–390, 387*f*–390*f*
    reflex arc, 390*f*, 391, 391*f*
  and cycle of life, 411
  disorders of, 411–412
  enteric nervous system (ENS), 903*b*
  nerve fiber repair, 392–393, 393*b*, 393*f*
  nerve impulses
    action potentials, 395–399, 396*f*, 396*t*, 398*f*, 399*f*
    conduction, 397*t*, 398–399, 399*f*
    local potentials, 395, 395*f*
    membrane potentials, 393–397, 393*f*, 394*f*, 395*f*, 395*t*, 396*t*, 397*t*
    refractory period, 397–398, 397*f*
    resting membrane potentials (RMPs), 394–395, 394*f*, 395*f*, 395*t*, 396*t*
  nerves and tracts, 381*f*, 382*f*, 392, 392*f*
  neural networks, 409*b*
  neurotransmitters
    acetylcholine (ACh), 404, 406, 406*f*, 407*t*
    amines, 405–407, 406*f*, 407*t*
    amino acids, 405, 406*f*, 407*t*, 408
    classification of, 404–406, 405*f*–407*f*, 407*t*, 408, 410
    large and small-molecule, 405–408, 406*f*, 407*f*, 407*t*, 409*b*, 410
  organization and divisions of, 382–383, 382*f*
    afferent division, 382*f*, 383
    autonomic nervous system (ANS), 381*f*, 382, 382*f*, 489–501, 489*f*
    central nervous system (CNS), 381*f*, 382–384, 384*f*, 411–412, 420–453, 444*t*–447*t*
    efferent division, 382*f*, 383
    peripheral nervous system (PNS), 381*f*, 382, 382*f*, 464–483, 465*f*, 467*t*
    sensory pathways, 382*f*, 383
    somatic nervous system (SNS), 382*f*, 383
    visceral pathways, 382*f*, 383
  organs and functional overview of, 7*f*, 9*t*
  roles of cells of, 410
  synaptic transmission, 399–404, 400*f*–403*f*
    electrical and chemical synapses, 399–401, 400*f*–403*f*
    mechanisms of, 400*f*–403*f*, 401–402
    and memory, 404
    summation, 388–389, 389*f*, 403, 403*f*
    synapse structure and arrangement, 399, 400*f*
  tissue, 132, 133*t*, 152*t*, 154, 154*f*
Neural networks, 409*b*
Neural pathways
  and hearing, 522
  and vision, 533–534, 533*f*, 537

Neuralgia, 383–387, 384*f*, 385*b*, 386*b*, 386*f*, 476*b*
Neurilemma, 384, 386–387, 386*f*, 387*f*
Neuroblastoma, 159
Neuroblastomas, 159
Neuroendocrine system, 546, 546*t*
Neurofibrils, 388, 388*f*
Neurofibromatosis, 412, 412*f*, 1140*f*, 1143*t*, 1144
Neurogenic bladder, 994–995
Neurogenic shock, 714
Neuroglia, 152*t*, 154, 154*f*
Neuroglobin (Ngb), 393*b*
Neurohypophysis hormones, 570–571, 570*b*, 570*f*, 571*t*, 587*t*
Neuroimmunology, 772
Neuromas, 411–412
Neuromodulators, 410
Neuromuscular junction (NMJ), in muscle fiber nerve cells, 353, 353*b*, 353*f*, 354*f*
Neurons
  action potentials, 395–399, 396*f*, 396*t*, 398*f*, 399*f*
  autonomic, 490–492, 491*f*, 494*t*, 495*f*
  as basis of life, 7*f*, 387
  classification of, 390–391, 390*f*
  conduction, 397*t*, 398–399, 399*f*
  of cranial nerves, 473–474, 476–480
  excitation of, 393–395, 393*f*, 394*f*, 395*f*, 395*t*, 396*f*, 397*t*, 401
  function and structure of, 133*t*, 152*t*, 154, 389*f*
  illustration and components, 154, 154*f*
  local potentials, 395, 395*f*
  membrane potentials, 389*f*, 393–397, 393*f*, 394*f*, 395*f*, 395*t*, 396*t*, 397*t*
  mirror, 444*b*
  and nervous system, 383, 387–390, 387*f*–390*f*
  olfactory sensory, 513–515, 514*f*
  preganglionic and postganglionic, 490–492, 491*f*, 494*t*, 495*f*
  refractory period, 397–398, 397*f*
  resting membrane potentials (RMPs), 394–395, 394*f*, 395*f*, 395*t*, 396*t*
  synapses, 399–404, 400*f*–403*f*
Neuropeptide Y, 788
Neuropeptides, 405, 407*f*, 408, 408*t*, 410, 788
Neurosecretory tissue, 547
Neurotransmitters
  excitatory *versus* inhibitory, 400–403, 400*f*, 401*f*, 402*f*, 403*f*, 404–406, 406*f*, 407*t*
  fate of, 401–402, 402*f*
  in muscle fiber nerve cells, 353, 353*b*, 353*f*, 354*f*
  proteins in neurons, 387–391, 387*f*–391*f*
  raising blood calcium levels, 208–209
  and receptors of ANS, 494, 495*f*, 496–497, 496*f*, 497*b*
Neurotrophins, 409*b*, 410
Neutrons
  description and illustration of, 36, 36*f*
  isotopes, 37–38
Neutrophils
  description and functions of, 599*f*, 600*f*, 603*f*, 605–606, 606*f*, 606*t*, 607*t*
  phagocytosis, 752–753, 752*f*
Nevus, 159
Nicotinic adenine dinucleotide (NAD), 47*t*, 59, 59*f*, 933*b*, 937*f*, 938*f*
Nicotinic (N) receptors, 497
Night blindness, 537
Nipples, 1082–1084, 1083*f*, 1084*f*
Nitric acid, 407*t*, 408

  anatomy of, 862*f*, 864–867, 865*f*–869*f*
  cheeks, 865
  disorders of, 888–890, 889*f*, 890*f*
  hard palate, 865, 865*f*
  lips, 864–865, 865*f*, 866*f*
  soft palate, 865, 865*f*
  tongue, 862*f*, 865–867, 865*f*, 866*f*, 867*f*
Oral contraceptives, 1080*b*
Oral rehydration therapy (ORT), 924*b*
Orbicularis oculi muscles, 304, 304*f*, 309*f*, 312–313, 312*f*, 312*t*
Orbicularis oris muscles, 304, 304*f*, 309*f*, 312–313, 312*f*, 312*t*
Orbit, anatomy of, 226*t*, 227*f*
Orchitis, 888
Orexigenic effect, 958–960, 959*f*, 959*t*
Orexins, 959, 959*t*
Organ of Corti, 519*f*, 520
Organ transplants, 773
Organelles
  definition and types of, 8, 69*t*, 73–78, 75*f*
  disorders involving, 85
  endoplasmic reticulum (ER), 68*f*, 73–74, 73*f*
  Golgi apparatus, 68*f*, 73, 74*f*, 75*f*
  as level of body organization, 7*f*, 8
  lysosomes, 68*f*, 69*t*, 76, 76*f*
  membranous *versus* nonmembranous, 69*t*, 73
  mitochondria, 68*f*, 69*t*, 77, 77*f*
  molecular motors moving, 81–82, 82*f*
  peroxisomes, 68*f*, 76–77
  proteasomes, 68*f*, 69*t*, 76, 76*f*
  protein export system, 68*f*, 69*t*, 74, 75*f*, 76
  research on human cell, 71*b*
  ribosomes, 68*f*, 73–74, 73*f*, 74*f*
  suspended in cytoplasm, 69–70, 69*f*
  as vaults, 78, 79*b*
Organic compounds, definition of, 42, 42*f*
Organic matrix, in bone matrix, 204
Organic molecules
  adenosine triphosphate (ATP), 47*t*, 58–59, 59*f*
  carbohydrates, 46, 46*f*, 47*t*, 48, 48*f*
  combined forms, 47*t*, 59
  DNA and RNA, 47*t*, 56–59, 57*b*, 57*f*–59*f*, 57*t*
  lipids, 46*f*, 47*t*, 48–51, 48*t*, 49*f*, 50*f*, 51*b*, 51*f*
  nucleic acids, 47*t*, 56–59, 57*b*, 57*f*–59*f*, 57*t*
  proteins, 47*t*, 52–56, 52*f*–54*f*, 55*b*, 56*f*, 56*t*, 57*b*
Organisms, as level of body organization, 9–10
Organogenesis, 1108*f*–1109*f*, 1111–1113, 1112*f*, 1113*f*
Organ-related terms, 15, 15*f*, 16*f*
Organs
  defining as level of body organization, 7*f*, 8
  functional overview of, 7*f*, 9*t*
  skeletal muscles as, 302–305, 302*t*, 303*f*, 348, 349*f*
  terms related to, 15
Orgasms
  male, 1055*b*
  in women, 1072*b*
Origins, of muscle attachments, 305, 305*f*; *See also* Tables 11–7 to 11–19
Oropharynx, 800*f*, 801*f*, 802–803, 811*t*, 865*f*, 870
Orthodontics, 889
Orthopnea, 836*b*
Orthostatic effects, 701, 701*f*

Osmolarity, 507
Osmoreceptors, 507, 1010
Osmosis
  actual *versus* potential, 93–94
  diagram illustrating, 93*f*
  osmoreceptors, 507
  as passive transport processes, 93–95, 93*f*, 94, 95*f*
  principle of, 985–989, 985*f*–988*f*, 989*t*
Osmotic pressure, 93–94, 93*f*, 507, 982–983, 983*f*, 984*b*, 989*t*
Osseous tissues
  characteristics of, 133*t*, 145*t*, 149–150, 150*f*, 151*f*
  composition of, 203
  extracellular matrix (ECM) in, 134, 134*f*, 135*t*
  tumors, 159
Ossification
  bone remodeling, 212–214, 213*f*, 214*f*
  endochondral ossification, 209–210, 211*f*, 212
  fetal, 150, 150*f*, 209–210, 211*f*, 212, 263
  intramembranous ossification, 209, 209*f*
Ossification centers, 210, 210*f*, 211*f*, 263
Osteitis deformans, 218
Osteoarthritis, 293–294, 293*f*, 1120, 1121
Osteoblasts, 150, 150*f*, 206–207, 209, 209*f*, 212–213, 213*f*
Osteoclasts, 150, 150*f*
Osteocytes, 133*t*, 149–150, 150*f*, 151*f*, 207, 207*f*, 212–213, 213*f*
Osteogenesis imperfecta, 60, 1140*f*, 1142, 1143*t*, 1144, 1144*f*
Osteomalacia, 217, 217*b*, 217*f*
Osteomas, 159
Osteomyelitis, 218
Osteons, 150, 150*f*, 204, 205*f*, 212–213, 213*f*
Osteoporosis
  and aging, 208, 208*f*, 213*b*, 216–217, 217*f*, 263–264, 1120, 1121*f*
  bone mineral density (BMD) loss, 1120, 1121*f*, 1122
  calcitonin to treat, 208, 208*f*, 575*b*
  description and causes of, 264
  and estrogen hyposecretion, 588
  and exercise, 213*b*, 1120, 1121*f*
Osteosarcomas, 159, 216
Otitis, 534–535
Otitis media
  definition and causes, 519, 534–535, 535, 535*f*, 817
  and mastoiditis, 264–265, 265*f*
Otoliths, 522*f*, 523
Otosclerosis, 534
Otoscope, 518*f*, 519
Ova
  23 chromosomes of, 1135, 1138–1140, 1138*b*, 1139
  development and movements of, 1064–1068, 1064*f*, 1066*f*, 1067*f*, 1074–1076, 1079*f*
  and meiosis, 124–125, 125*f*
  stages of development, 1066–1068, 1067*f*
Oval window, 518*f*, 519
Ovarian cancer
  CA-125, 766*b*
  disease chromosome map, 1140*f*
  possible benefits of hormonal contraceptives on, 1080*b*
Ovarian cortex, 1066–1067, 1067*f*
Ovarian cycle, 1067*f*, 1074–1075, 1075*f*, 1076–1077, 1077*f*, 1078*f*, 1079*f*
Ovarian cysts, 1089
Ovarian follicles, 1066–1067, 1067*f*
Ovarian medulla, 1066–1067, 1067*f*
Ovaries
  anatomy of, 1064, 1064*f*, 1066*f*
  cysts and tumors, 1089–1090
  endocrine functions of, 585, 585*t*, 586
  functions of, 1067*f*, 1068
  gonadotropin cycle effects on, 1067*f*, 1076–1077, 1077*f*
  location of, 547*f*, 547*t*
  microscopic structure of, 1066–1068, 1067*f*
  ovulation cycles, 1074–1076, 1075*b*, 1076*f*, 1077*f*
Overactive bladder, 995
Overweight; *See* obesity
Ovulation
  cycles of, 1074–1076, 1075*b*, 1076*f*, 1077*f*
  definition and illustration of, 1076, 1076*f*, 1079
  and insemination, 1101, 1102*f*, 1103*f*, 1108*f*–1109*f*
  ovarian cycle, 1074–1075
  signs for predicting fertility, 1075*b*
Oxidation-reduction enzymes, 103
Oxidative phosphorylation, 938–940, 938*f*
Oxygen
  atomic characteristics and functions, 34*f*, 35*f*, 35*t*, 37, 37*f*, 43–44
  blood oxygen ranges, 846–847, 846*f*, 846*t*
  blood role in transporting, 841–846, 841*f*–845*f*
  and carbon dioxide exchange, 799, 800*f*, 809–810, 810*f*, 812*t*, 814, 838*f*–845*f*, 841–846
  compounds in carbohydrates, 43, 47*t*
  diffusion rates, 839–840, 839*f*, 841*b*
  as energy sources for muscles, 357–358, 357*f*
  as human body element, 34*f*, 35*t*
  maximum oxygen consumption, 837*b*
  molecular characteristics of, 34*f*, 35*f*, 35*t*, 43–44
  partial pressures, 826*b*–827*b*, 838–839, 838*f*, 839*t*
Oxygen debt, 106, 359
Oxygen saturation, 846–847, 846*f*, 846*t*
Oxygen-hemoglobin dissociation curve, 842–843, 843*f*
Oxyhemoglobin, 842, 843*f*, 846–847, 846*f*
Oxytocin, 565*f*, 570–571, 571*t*, 1082*t*, 1084*f*, 1085*t*

P

P waves, 684*f*, 686, 686*f*–687*f*, 712, 713*f*
Pacemakers
  artificial, 712
  sinoatrial (SA) node as, 622, 638–684, 683*f*
Pacini corpuscles, 172*f*, 512*t*, 513
Packed cell volume (PCV), 600, 600*f*
Paget disease, 218
Pain
  control areas, 429
  influence on breathing, 850–851, 851*f*
  referred, 509*b*
  sensory receptors for, 508–509, 508*t*, 509*b*
  trigeminal neuralgia, 476*b*
Palatine bones, 227*f*, 231*f*, 232*f*, 237*f*, 237*t*, 240
Palatine tonsils, 733, 733*f*, 800*f*, 801*f*, 803, 811*t*, 865*f*
Palmar venous arches, 658*f*, 659*t*, 660*f*, 661, 661*f*
Palmitic acid, 48, 49*f*
Palpable bony landmarks, 259*b*
Pancreas
  anatomy of, 862*f*, 880*f*, 881*f*, 886, 887*f*
  autonomic functions of, 489, 489*b*, 489*f*, 491*f*, 498*t*, 500*t*
  disorders of, 894–895
  pancreatic juice secretion and control, 902*t*, 913*t*, 916, 918*t*, 920, 920*t*
  role in nutrient metabolism, 582
  structure and functions of, 580–582, 581*f*, 582*t*, 583*f*, 880*f*, 881*f*, 886, 887*f*
Pancreatic cancer, 895, 1140*f*
Pancreatic islets
  anatomy of, 886, 887*f*
  blood glucose level regulation, 582, 582*t*, 583*f*
  hormones and functions of, 580–582, 581*f*, 582*t*, 583*f*
  location of, 547*f*, 547*t*
Pancreatic juices, secretion and secretion control, 902*t*, 913*t*, 916, 918*t*, 920, 920*t*
Pancreatic polypeptide (PP), 581, 581*f*, 582*f*, 582*t*, 959*t*
Pancreatitis, 894–895
Pandemics, definition of, 25*b*
Papanicolaou test (Pap smear), 1090
Papillae
  circumvallate, 865–866, 865*f*, 866*f*
  renal, 972, 972*f*, 976*f*–982*f*, 980, 984, 985*f*
  tongue, 865–866, 865*f*, 866*f*
Papillary layer
  of dermis, 172*f*, 175*t*, 176
  of hair, 185–186, 185*f*
Paracrine hormones, 556*b*
Parallel muscles, 304, 304*f*
Paralysis
  due to nerve fiber damage, 399*b*, 450, 451*b*
  with poliomyelitis, 450
  spastic, 451*b*, 452
  with stroke, 450, 451*b*, 452
Paranasal sinuses
  anatomy of, 800*f*, 801*f*, 802, 802*b*, 803*f*, 811*t*
  bones of, 238, 239*f*, 240, 241*t*
Paraplegia, 452
Parasites
  definition and illustration of, 25–26, 26*f*
  infecting muscle tissue, 372
Parasympathetic nervous system
  functions of, 498–499, 498*t*, 499*f*, 501
  pathways, 489*f*, 490, 490*f*, 492, 493*f*, 494, 494*t*
Parathyroid gland
  disorders of, 576, 576*b*, 588*t*
  and hormones, 208–209, 575–576, 575*f*, 575*t*, 576*b*, 576*f*, 588*t*
  location of, 547*f*, 547*t*
Parathyroid hormone (PTH)
  functions and targets of, 575*t*, 576, 576*f*
  role in calcium homeostasis, 208–209, 208*f*
Parenteral therapy, 1007*b*
Parietal, definition of, 11
Parietal bone, 226, 227*f*, 229*f*–232*f*, 238, 238*f*
Parietal cells, membranes and secretion, 914–915, 915*f*
Parietal lobe of cerebrum, 437, 437*f*
Parietal pleura, 814, 814*f*
Parietooccipital sulcus, 437, 437*f*, 438*b*
Parkinson disease (PD)
  cellular dysfunction and, 76, 85, 385*b*
  death rates due to, 1123*f*
  and genetics, 1140*f*, 1142, 1143*t*
  importance of basal nuclei in, 440*b*
Parkinsonism, 407*t*, 408, 409*b*
P-arms, 1134*f*, 1135, 1140*f*, 1143*t*
Parotid glands
  anatomy of, 867*f*, 868, 887
  mumps, 868, 887, 888, 889*f*
Partial pressures, 826*b*–827*b*, 838–839, 838*f*, 839*t*
Partial-thickness burns, 193, 193*f*
Parturition, 1114–1115, 1114*f*
Passive transport processes, 91–96, 91*f*, 92*t*, 93*f*, 94*b*, 95*f*, 96*f*, 97*b*
  diffusion, 91–92, 92*t*, 94*b*
  facilitated diffusion, 95–96, 95*f*, 96*f*
  filtration, 96
  osmosis, 93–95, 93*f*, 94, 95*f*
  role of, 96
  simple diffusion, 92–93, 92*t*, 93*f*
Passive ventricular filling, 688*f*, 689
Patella
  anatomy of, 200*f*, 201*f*, 224*f*–225*f*, 226*t*, 257, 257*t*, 258*f*, 259*b*
  chondromalacia patellae, 266*b*
  joints of, 282–283, 283*f*
Patellar reflex, 481–482, 481*f*, 482*f*
Pathogenesis, definition of, 25*b*
Pathogenic organisms, definition and illustration of, 25–26, 26*f*
Pathological anatomy, 5
Pathological fractures, 264
Pathology, definition of, 25*b*
Pathophysiology, definition of, 25
Pavementing, 751*f*, 752
Pectoralis major muscles, 308*f*–309*f*, 309*t*–310*t*, 322, 322*t*, 323*f*, 324*f*, 324*t*, 325, 326*f*
Pedigree, 1146, 1146*f*
Pelvic cavity
  anatomy and organs of, 10–11, 11*f*, 11*t*
  male *versus* female, 261–262, 261*f*, 262*t*
Pelvic floor, muscles, 308*f*–309*f*, 309*t*–310*t*, 320, 321*f*, 321*t*
Pelvic girdle, 224*f*–225*f*, 255, 255*f*, 256*f*, 256*t*, 261*f*
Pelvic inflammatory disease (PID), 1088
Pelvis
  female, 255, 255*f*
  male *versus* female, 261–262, 261*f*, 262*t*
Penis
  anatomy and functions of, 1045*f*, 1052*f*, 1054–1055, 1054*f*
  disorders involving, 1058
Pennate muscles, 304, 304*f*
Pentoses, 46, 47*t*
Pepsin, 908, 910, 913*t*, 914–915
Pepsinogen, 914–915, 915*f*
Peptidases, 910, 913*t*, 914–915
Peptide bonds, 52–55, 54*f*
Peptide hormones, 548*f*, 549*f*, 550
Peptides, 350, 405, 407*f*, 408, 408*t*, 410, 548*f*, 549*f*
Perception, 506
Percutaneous coronary intervention (PCI), 672
Perfusion, and ventilation, 852, 853*f*
Perfusion pressure, 690
Pericardial effusion, 669
Pericardial fluid, 634, 634*f*
Pericardial space, 634, 634*f*
Pericardial veins, 658*f*, 659*t*, 660*f*, 661–662, 661*f*
Pericardiocentesis, 669
Pericarditis, 669
Pericardium, 632*f*, 634, 634*f*, 669
Pericentriolar material (PCM), 81, 81*f*
Perichondrium, 151, 151*f*, 214, 215*f*
Perikaryon, 387–391, 387*f*–391*f*
Perilymph, 520
Perimetrium, of uterine wall, 1066*f*, 1069, 1069*f*
Perimysium, 302, 302*t*, 303*f*
Perineal body, 1065–1066, 1065*f*, 1068
Perineum
  female, 1065–1066, 1065*f*
  male, 1046, 1046*f*
  muscles of, 320, 321*f*, 321*t*
Perineurium, 392, 392*f*
Periodic table of elements, 34*f*
Periodontal membranes, 868, 869*f*, 869*t*
Periodontitis, 889
Periosteum, 202–203, 202*f*, 203*f*, 207–208, 207*f*, 210*f*
Peripheral
  as directional term, 382–383
  as organ-related term, 15
Peripheral arterial disease (PAD), 671
Peripheral axon fibers
  associated with reflexes, 481–482
  repair of, 392, 393*f*
Peripheral nervous system (PNS)
  big picture, 483
  case study, 484
  cranial nerves
    abducens nerve (VI), 473*f*, 473*t*, 476*b*, 476*t*, 477
    accessory nerves (XI), 473*f*, 473*t*, 480, 480*f*, 480*t*
    classification of, 473, 473*t*
    damage to, 478*b*
    facial nerve (VII), 473*f*, 473*t*, 476*t*, 477, 477*f*, 478*b*
    glossopharyngeal nerve (IX), 473*f*, 473*t*, 478*b*, 478*t*, 479, 479*f*
    hypoglossal nerves (XII), 473*f*, 473*t*, 480, 480*f*, 480*t*
    illustration of, 471*f*
    oculomotor nerve (III), 473*f*, 473*t*, 474, 475*t*
    olfactory nerve (I), 473*f*, 473*t*, 474, 474*t*
    optic nerve (II), 473*f*, 473*t*, 474, 475*t*
    sensory, motor or mixed, 473–480, 473*t*, 475*t*–476*t*, 478*t*, 480*t*
    trigeminal nerve (V), 471*f*, 473*f*, 473*t*, 476, 476*b*, 476*t*, 477*f*
    trochlear nerve (IV), 473*f*, 473*t*, 474, 475*t*
    vagus nerves (X), 473*f*, 473*t*, 478*b*, 478*t*, 479, 479*f*
    vestibulocochlear nerve (VIII), 473*f*, 473*t*, 477*f*, 478, 478*b*, 478*t*
  definition and diagrams illustrating, 381*f*, 382, 382*f*
  functional motor/sensory divisions, 473*t*, 475*t*–476*t*, 478*t*, 480*t*, 481
  peripheral neuropathy, 464*b*
  reflexes
    abdominal reflex, 482*f*, 483
    ankle jerk reflex, 482, 482*f*
    corneal reflex, 482*f*, 483
    knee jerk reflex, 481–482, 481*f*, 482*f*
    patellar reflex, 481–482, 481*f*, 482*f*
    plantar reflex, 482–483, 482*f*
    somatic reflexes, 481–482, 481*f*, 482*f*
  somatic motor nervous system, 481–483, 481*f*, 482*f*
  spinal nerves, 464–471

Peripheral nervous system (PNS)—cont'd
anatomy of, 464, 465*f*, 466, 471*f*
brachial plexus, 464, 465*f*, 466, 467*t*, 468, 469*f*
cervical plexus, 464, 465*f*, 466, 467*t*, 468, 468*f*
coccygeal plexus, 464, 465*f*, 466, 467*t*, 470
dermatomes, 471–472, 471*f*, 472*f*
lumbar plexus, 464, 465*f*, 466, 467*t*, 468, 470, 470*f*
lumbosacral plexus, 464, 465*f*, 466, 467*t*, 468, 470, 470*f*
myotomes, 471–472, 471*f*, 472*f*
sacral plexus, 464, 465*f*, 466, 467*t*, 470, 470*f*
segmental distribution of, 471–472, 471*f*
structure of, 468–472, 468*f*–472*f*
Peripheral neuropathy, 464*b*
Peripheral resistance, 695–698, 699*b*, 700, 707
Peripheral vascular disease (PVD), 671
Peristalsis, 905–906, 905*b*, 906*f*
Peritoneal cavity, 11, 12, 16*f*
Peritoneum, 155*f*, 156, 880–881, 880*f*, 881*f*
Peritonitis, 156*b*, 1070, 1088
Peritubular capillaries, 980, 981*f*, 982*f*
Permeability
of neurons, 394–396, 394*f*, 395*t*
and simple diffusion, 92–93, 92*t*
Permissiveness, 550
Pernicious anemia, 620, 773*t*
Pernicious vomiting, 1030*b*
Peroneal veins, 658*f*, 659*t*, 664–665, 664*f*
Peroneus muscles, 308*f*–309*f*, 309, 310*t*, 340, 340*t*, 341*f*
Peroxisome proliferator-activated receptors (PPARs), 948*b*
Peroxisomes
description, functions and illustration, 68*f*, 69*t*
function and illustration of, 76–77
Peyer patches, 723, 724*f*, 737*t*, 864*t*
PH levels
acidosis, 60, 1030*f*, 1033*f*, 1037*f*, 1038*f*, 1136–1138
alkalosis, 60, 1030*f*, 1033*f*, 1037*f*, 1038*f*, 1136–1138
and carbon dioxide, 846
case study, 1039
of cerebrospinal fluid, 850–851, 851*f*
control systems for
body fluids, 1026–1032, 1026*f*, 1027*b*, 1027*t*, 1028*f*
buffer mechanisms, 1027*t*, 1028–1032, 1028*f*–1031*f*
chemical buffers, 1027–1028, 1027*t*
physiological buffers, 1027–1028, 1027*t*
respiratory system, 1028*f*, 1032, 1033*f*
urinary system, 1028*f*, 1033–1035, 1034*f*, 1035*f*
definitions associated with, 1026
and digestive functions, 914–918, 917*f*, 918*t*
effects on enzyme function, 104*f*, 908–910, 909*f*
homeostasis, 1026, 1028*f*, 1033*f*, 1035*f*
imbalances and disorders, 1036–1038
role of blood in regulating, 152
scale and ranges of, 44, 44*b*, 45*f*, 1026*f*, 1028, 1028*f*
in urine, 992*t*
Phagocytes; *See* phagocytosis
Phagocytosis
innate immunity, 746, 747*f*, 747*t*, 748*t*, 749*f*, 752–753, 753*t*
lymph nodes functions in, 730–731, 731*f*, 737*t*
process of, 100, 101*t*, 146
spleen role in, 735–736, 736*f*
Phalanges
foot bones, 224*f*–225*f*, 259, 259*b*, 260*f*, 260*t*–261*t*
hand bones, 200*f*, 224*f*–225*f*, 253*t*, 254, 254*f*
joints, 279, 279*f*
muscles, 329, 329*f*, 330*t*, 331–332, 331*b*
ossification centers, 210, 210*f*, 211*f*
Pharyngeal tonsils, 733, 733*f*, 800*f*, 801*f*, 803, 811*t*
Pharyngitis, 816
Pharynx
anatomy and functions of, 800*f*, 801*f*, 802–803, 811*t*, 862*f*, 870, 870*f*
and glossopharyngeal nerve (IX), 473*f*, 473*t*, 478*b*, 478*t*, 479, 479*f*
role in digestion, 902*f*, 904–908, 908*t*, 925
and tongue muscles, 313, 313*f*
Phenotypes, 1137
Phenylketonuria (PKU), 56, 57*b*, 961, 1140*f*, 1143*t*, 1146–1147, 1147*f*
Pheomelanin, 178
Pheromones, 187
Phimosis, 1058
Phlebitis, 673
Phosphate, buffer pairs, 1028
Phospholipids
bilayer, simple diffusion through, 93*f*
definition and functions of, 47*t*, 49–50, 50*f*, 51*b*, 946–947
molecules
bilayer plasma membrane, 70, 70*f*
hydrophilic *versus* hydrophobic, 50*f*, 70, 70*f*
Phosphorus
as human body element, 34*f*, 35*t*
sources, functions and deficiency, 954*t*
Phosphorylating enzymes, 103
Photodynamic therapy (PDT), 819
Photoreceptors, 507
Phrenic nerves, 467*f*, 468, 468*b*, 468*f*
Physical agents, definition of, 27
Physiological buffers, for pH control, 1027–1028, 1027*t*
Physiological dead space, 836
Physiological polycythemia, 600, 600*f*
Physiology
of cardiovascular system, 682–717
of cells, 91–109
defining branches of, 4
of digestive system, 902–963
divisions of, 5
of muscular system, 347–373
of respiratory system, 823–855
of urinary system, 971–997
Physique, and disease risk, 18*b*
Pia mater, 421, 421*f*, 422*f*, 423*b*
Pigmented nails, 186, 187*f*
Pigments, 178–181, 178*f*, 179*f*, 180*b*, 180*f*, 181*f*
Pimples, 188, 188*b*
Pineal gland, 429*f*, 435*f*, 436–437, 436*f*, 447*t*, 547*f*, 547*t*, 571–572
Pinkeye, 524, 525*f*, 536
Pinocytosis, 100, 101*t*
Piriformis muscles, 309, 310*t*
Pisiform, 254*f*
Pitch of sound, 520, 521*f*
Pitting edema, 1015, 1015*f*
Pituitary dwarfism, 566*b*, 588*t*
Pituitary gland
adenohypophysis hormones, 564–571, 564*f*–565*f*, 566*b*, 567*f*–570*f*, 568*t*, 571*t*
location of, 547*f*, 547*t*
neurohypophysis hormones, 570–571, 570*b*, 571*t*, 587*t*
structure and location of, 564, 564*f*
Pivot joints, 275, 275*f*, 276*t*, 284*t*
Placenta
antibody transport across, 768*b*
circulation, 665–668, 666*f*–668*f*
disorders of, 1124, 1124*f*
endocrine functions of, 584*t*, 585
human chorionic gonadotropin (hCG), 584*t*, 585
location of, 547*f*, 547*t*
structure and growth of, 1105–1107, 1105*f*–1107*f*
unique functions of, 1070
Placenta previa, 1124, 1124*f*
Plantar flexion, 291, 291*f*
Plantar reflex, 482–483, 482*f*
Plaque
atherosclerotic, 71*b*, 670, 672
tooth, 889
Plasma
in body fluid compartments, 1005, 1005*f*, 1006–1007, 1006*f*, 1006*t*, 1018*f*
buffer pairs, 1028
components in blood, 613, 613*f*
fluid and electrolyte balance, 1012–1013, 1014*f*
kidney role in processing, 982–983, 982*f*, 983*f*, 984*b*, 989*t*
liquid fraction matrix, 152, 152*f*
versus lymph and interstitial fluid (IF), 724, 726, 726*f*
percentage of whole blood, 599–600, 599*f*, 600*f*
role in respiration, 841–846, 841*f*–845*f*
total plasma volume, 704–705, 704*f*
tubuloglomerular feedback, 991, 991*f*
Plasma cells
development of, 758, 759*f*
glucocorticoid affect on, 579
Plasma membrane
description, functions and illustration, 68*f*, 69*t*, 393–395, 393*f*, 394*f*, 395*f*
functional regions of neuron, 388–389, 389*f*
illustration in cytoskeleton, 79*f*
Plasmids, 1148
Platelet factor, 614–617, 615*t*
Platelet plug, 606*t*, 608–609, 614*f*
Platelets
characteristics and functions of, 599–600, 599*f*, 600*f*, 603*f*, 606*t*, 608–609
definition and photomicrograph of, 152*f*
filtering by spleen, 736, 736*b*
formation and life span of, 603*f*, 606*t*, 609
role in blood clotting, 606*t*, 608–609, 614*f*, 616*f*
thrombopoiesis, 603*f*, 606*t*, 609
Platys muscles, 309, 310*t*
Pleura, 155*f*, 156, 813–814, 814*f*
Pleural cavities, 10–11, 11*t*
Pleurisy, definition of, 156*b*
Plexuses
anatomy of, 464, 465*f*, 466, 471*f*
brachial plexus, 464, 465*f*, 466, 467*t*, 468, 469*f*
cervical plexus, 464, 465*f*, 466, 467*t*, 468, 468*f*
coccygeal plexus, 464, 465*f*, 466, 467*t*, 470
dermatomes, 471–472, 471*f*, 472*f*
lumbar plexus, 464, 465*f*, 466, 467*t*, 468, 470, 470*f*
lumbosacral plexus, 464, 465*f*, 466, 467*t*, 468, 470, 470*f*
myotomes, 471–472, 471*f*, 472*f*
sacral plexus, 464, 465*f*, 466, 467*t*, 470, 470*f*
segmental distribution of, 471–472, 471*f*
structure of, 468–472, 468*f*–472*f*
Pneumonectomy, 819
Pneumonia, 817–818, 818*f*
Pneumothorax, 834, 835*b*
Podocytes, 976*f*–982*f*, 977–978, 989*t*
Poiseuille's law, 707
Poisoning
blood septicemia, 714, 738, 1123*f*
carbon monoxide, 61, 842, 842*b*
causing peripheral neuropathy, 464*b*
Poisons
detoxification by liver, 884, 885*f*, 894
and disease, 61
Polar body, 1099*f*, 1100*f*, 1101
Polarity
action potential, 397–403, 400*f*, 401*f*, 402*f*, 403*f*, 404–406, 406*f*, 407*t*
membrane potential, 68*f*, 69*t*, 393–395, 393*f*, 394*f*, 395*f*, 397*t*
of molecules, 39–40, 40*f*
of water, 40, 40*f*, 43, 43*f*
Polarization
characteristics of membrane potentials, 397*t*
ECG representation of, 684–687, 684*f*–687*f*
hyperpolarization *versus* depolarization, 396, 396*f*, 396*t*, 397, 397*t*, 401–403, 403*f*
Poliomyelitis, 372–373, 450
Polychromatic erythroblasts, 603–604, 603*f*
Polycystic kidney disease (PKD), 996, 1140*f*, 1143*t*
Polycystic ovary syndrome (PCOS), 1081, 1089, 1089*f*
Polycythemia, 619
Polygenic traits, 1137, 1143*t*
Polymer, DNA molecule as, 114
Polymorphonuclear leukocytes; *See* neutrophils
Polypeptides, 47*t*, 52–55, 52*f*, 53*f*, 54*f*, 55*b*
Polyribosomes, 74, 117*f*, 119
Polysaccharides, 46, 47*t*, 48, 48*f*, 934, 934*f*
Polyuria, 994*b*
Pons, 429, 429*f*, 430*b*, 431–432, 431*f*, 446*t*
Pontine respiratory group (PRG), 848*f*, 849
Popliteal artery pulse point, 710, 711*f*
Popliteal veins, 658*f*, 659*t*, 664–665, 664*f*
Population projections, 1116*t*
Portal system, 647, 647*f*
Positive feedback mechanisms, in homeostatic control, 22, 23*b*
Positive nitrogen balance, 950
Posterior, as directional term, 15, 15*f*, 16
Posterior cavity, of eyeball, 527*f*, 529
Posterior cruciate ligament (PCL), 282, 282*b*, 282*f*
Posterior fornix, 1068, 1069*f*
Posterior tibial artery pulse point, 710, 711*f*
Posterior tibial veins, 658*f*, 659*t*, 664–665, 664*f*
Posterior uterine ligaments, 1064*f*, 1066*f*, 1069
Postinfectious glomerulonephritis, 996
Postmenstrual phase, 1075, 1079*f*
Postnatal periods
adolescence, 1118, 1118*f*
adulthood, 1118, 1118*f*
childhood, 1117, 1118*f*
infancy, 1116–1117, 1117*f*
older adulthood, 1118–1120
Postovulatory phase, 1076, 1079*f*
Postsynaptic cells, 399–401, 400*f*
Postsynaptic potential, 402–403, 402*f*, 403*f*
Postsynaptic receptors, 404–405, 405*f*
Posture
benefits of exercise on, 364*b*
cerebellar role in, 433–434, 433*f*
muscle function and, 341–342, 348
Potassium
as human body element, 34*f*, 35*t*
role of kidney in balancing, 982
and sodium level balance, 1017–1018, 1017*f*, 1018*f*
sources, functions and deficiency, 954*t*
Potassium channels, 393–395, 393*f*, 394*f*, 395*f*, 395*t*, 396*f*, 397*t*, 401
Potassium ions
role in fluid and electrolyte balance, 1004–1008, 1006*f*
role in synaptic transmission, 400–403, 400*f*, 401*f*, 402*f*, 403*f*, 404–406, 406*f*, 407*t*
Potential osmotic pressure, 93–94
"Power plants," mitochondria as cellular, 68*f*, 69*t*, 77, 77*f*, 939
Preeclampsia, 1124
Preexisting conditions, risk factors due to, 27
Preganglionic neurons, 490–492, 491*f*, 494*t*, 495*f*
Pregnancy
at different development stages, 1107, 1107*f*–1110*f*, 1110
disorders of, 1124, 1124*f*
fetal circulation, 665–668, 666*f*–668*f*
hormone levels during, 1106–1107, 1106*f*
hormones associated with, 584*t*, 585
illustration of full-term fetus, 1113*f*
influencing basal metabolic rate, 958
prenatal immunity, 768*b*
and stress hormones, 792–793, 793*f*
stretch marks, 177
tests, 1107
Pregnancy-induced hypertension (PIH), 1124
Premature contractions, 712, 713*f*
Premenstrual phase, 1076, 1079*f*
Premenstrual syndrome (PMS), 1088
Prenatal immunity, 768*b*
Prenatal period
cleavage and implantation, 1103–1105, 1103*f*, 1104*f*
histogenesis and organogenesis, 1108*f*–1109*f*, 1111–1113, 1112*f*, 1113*f*
periods of development, 1107, 1107*f*, 1108*f*–1109*f*, 1110, 1110*f*
placenta, 1105–1107, 1105*f*–1107*f*
primary germ layers, 1111, 1111*f*
stem cells, 1110–1111
time table, 1108*f*–1109*f*
Preovulatory phase, 1075, 1079*f*
Prepatellar bursitis, 282
Prepuce (foreskin)
female, 1073*f*, 1074
male, 1045*f*, 1052*f*, 1054*f*, 1055
Presbycusis, 535
Presbyopia, 535*f*, 536, 1122
Pressoreflexes, 693–694, 693*f*, 694*f*
Pressure control mechanisms, 1013–1015, 1014*f*

Pressure gradients, 824, 826, 826*b*–827*b*, 827*f*
Pressure points, 710, 711*f*
Pressure sores, 190, 190*f*
Pressures
  blood (*See* blood pressure)
  osmotic, 93–94, 93*f*, 507, 982–983, 983*f*, 984*b*, 989*t*
  that control fluid and electrolyte balance, 1013–1015, 1014*f*
Presynaptic cells, 399–401, 400*f*
Primary bronchi, 800*f*, 808, 808*f*, 812*t*
Primary follicles, 1099*f*, 1100*f*, 1101
Primary germ layers, 132, 132*b*, 1111, 1111*f*
Primary hyperparathyroidism, 558
Primary oocytes, 1099*f*, 1100*f*, 1101
Primary osteons, 212–213, 213*f*
Primary sex characteristics, 1118
Prime mover muscles, 306, 306*f*
Principle of segregation, 1135
Prions
  definition and illustration of, 26, 26*f*
  diseases caused by, 453
Probability distributions, 36*f*, 37
Products, in chemistry, 40–41
Proenzymes, 104, 909*f*, 910
Proerythroblasts, 603–604, 603*f*
Progeria, 1118–1119, 1119*b*
Progesterone
  and contraception, 1080*b*
  endocrine functional overview, 548*f*, 549*f*, 584–585, 584*t*
  phase of menstrual cycle, 1076, 1079*f*
  during pregnancy, 1106–1107, 1106*f*
  secreted during ovulation, 1067–1068, 1067*f*
  source, target and actions, 1082*t*, 1084*f*, 1085*t*
Progesterone phase, of menstrual cycle, 1076, 1079*f*
Prolactin, 565, 565*f*, 566, 571*t*, 1082*t*, 1084*f*, 1085*t*
Prolactin-inhibiting hormone (PIH), 567–568, 568*t*
Prolactin-releasing hormone (PRH), 567–568, 568*t*
Proliferating zone, 210, 211*f*
Proliferation phase, 1075, 1079*f*
Promotility agents, 890, 891*f*
Pronation, 289*f*, 292
Pronator teres muscles, 308*f*–309*f*, 309*t*–310*t*
Pronators, 308*f*–309*f*, 309*t*–310*t*, 326, 326*f*, 327*f*, 327*t*, 328*f*
Proper tissues, 144, 144*t*, 145–146, 145*f*, 146*f*
Prophase of mitosis, 123–124, 123*t*, 125*f*
Proprioception, and cerebral cortex, 441*f*, 442–443
Proprioceptors, 507–513, 508*t*, 509*f*, 511*f*, 512*t*
Propulsion, 907
Prostaglandins
  and aspirin, 51*b*
  definition and functions of, 47*t*, 50–51, 50*f*, 51*b*, 51*f*
  and fever reduction, 750–751
  formation and characteristics of, 556–557, 556*f*, 556*t*, 557*f*, 948
  role of kidneys in synthesizing, ?, 982
Prostate cancer, 1053, 1053*b*, 1058
Prostate gland
  anatomy and functions of, 1045*f*, 1046, 1052*f*, 1053–1055
  benign prostatic hypertrophy, 1053, 1058
  disorders of, 1053, 1053*b*, 1058
  "G spot" as female, 1072*b*
  urethra through center of, 971*f*, 974*f*, 975, 975*f*
Prostatectomy, 1058
Prostate-specific antigen (PSA), 766*b*, 1053*b*
Prosthesis, for joint replacement, 294*b*
Proteases, 910, 913*t*, 914–915
Proteasomes
  description, functions and illustration, 68*f*, 69*t*
  function and illustration of, 68*f*, 69*t*, 76, 76*f*
Protection functions
  of bones, 200
  of epithelial tissue, 133*t*, 135, 144*t*, 145*t*
  of ribs, 806*f*, 814–815
  of skin, 181, 181*t*
Protein export system, 68*f*, 69*t*, 74, 75*f*, 76
Protein hormones, 548, 548*f*, 549*f*, 551–553, 552*f*, 553*t*
Protein synthesis, 114–120, 117*f*, 119*t*
  within cell life cycle, 121*t*
  deoxyribonucleic acid (DNA), 114–115, 114*f*, 115*f*
  diagram illustrating, 117*f*
  disorders associated with, 127–128
  ribonucleic acid (NA), 115–119, 117*f*, 119*t*, 120*b*
  summary of, 119*t*, 121*t*, 950*t*, 951*f*
  transcription process, 116–117, 116*f*, 117*f*, 119*t*
  translation process, 117–118, 117*f*, 119*t*
Protein-calorie malnutrition (PCM), 962*f*, 963
Proteins
  absorption of, 921–922, 921*f*, 923*t*
  amino acids, 47*t*, 52–55, 52*f*, 53*f*, 54*f*, 55*b*
  balance, 950
  definition and functions of, 47*t*, 52–56, 56*t*
  denatured, 56, 56*f*, 57*b*
  deoxyribonucleic acid (*See* deoxyribonucleic acid (DNA))
  digestion, 910, 910*f*, 911*b*
  and disease, 127–128, 949*b*
  elements contained in, 52
  enzymes as functional, 102–104, 102*f*–104*f*
  essential and nonessential, 948–949, 949*t*
  in extracellular matrix (ECM), 134, 134*f*, 135*t*, 144
  four structural levels of, 53–55, 54*f*
  function and illustration, in plasma membrane, 70–71, 70*f*, 72–74, 72*t*
  hormones, 548, 548*f*, 549*f*, 551–553, 552*f*, 553*t*
  importance of shape, 55–56, 56*f*, 57*b*
  metabolism, 949–950, 949*f*, 950*t*, 951*f*
  molecular characteristics of, 47*t*, 52–56, 52*f*–54*f*, 55*b*, 56*f*, 56*t*, 57*b*
  molecules and DNA, 78
  motor, 81–83, 82*f*, 83*f*
  proteasomes, 68*f*, 69*t*, 76, 76*f*
  ribosomes as "protein factories," 69*t*
  sources of, 948–949, 949*f*
  strands in cell fibers, 80, 80*f*
  structural *versus* functional, 52–56, 54*f*, 56*f*, 56*t*
  visualizing, 55*b*, 56*f*
Proteoglycans, 47*t*, 59, 134, 134*f*, 135*t*, 144
Proteomes, 119, 1134
Proteomics, 1134
Prothrombin, 614–618, 614*f*–616*f*, 615*t*
Prothrombin time (PT), 633*b*
Protists, 26, 26*f*
Proton donors and acceptors, 43*f*, 44
Proton pump inhibitors, 890, 891*f*, 915
Protons
  description and illustration of, 36, 36*f*
  isotopes, 37–38
Protozoa, 26, 26*f*
Protraction, 287*f*, 292
Proximal, as directional term, 15, 15*f*, 16
Proximal convoluted tubule (PCT), 976, 976*f*–982*f*, 980, 984–985, 985*f*
Proximal interphalangeal (PIP) joints
  Bouchard nodes, 293, 293*f*
  movements of, 280, 290*f*
Pseudostratified columnar epithelial cells, 136*f*, 137–139, 138*f*–139*f*, 140*t*
Psoas major muscles, 333*f*, 333*t*
Psoas minor muscles, 333*f*, 333*t*
Psoriasis, 190, 190*f*
Psychogenic disorders, as risk factor for disease, 27
Psychological disorders, as risk factor for disease, 27
Psychological stressors, 790–792, 791*f*, 791*t*, 792*b*
Pterygoid muscles, 312–313, 312*f*, 312*t*
Puberty
  hormone changes during, 1118, 1118*f*
  menarche, 1081, 1081*f*
  sexual reproduction abilities developing at, 1045, 1056
  skin changes with, 188, 188*b*
Pubic arch, male *versus* female, 261–262, 261*f*, 262*t*
Pubic symphysis
  female, 1065*f*
  female *versus* male, 261*f*, 262*t*
  joints, 151*f*, 272*t*, 273–274, 273*f*, 274*t*
  male, 1046*f*
Pubis, 224*f*–225*f*, 255, 255*f*, 256*f*, 256*t*, 261*f*
Puerperal fever, 1124–1125
Pulmonary air flow, 837–838, 837*f*
Pulmonary circulation, 647, 647*f*
Pulmonary edema, 670, 714
Pulmonary embolism, 673
Pulmonary gas exchange, 841–846
  air velocity, 840*f*
  diagram illustrating, 839*f*
  diffusion rates, 839–840, 839*f*, 841*b*
  exchanges, 839–840, 839*f*
  external-internal barrier, 839, 839*f*
  partial pressures, 826*b*–827*b*, 838–839, 838*f*, 839*t*
  role of blood in, 841–846, 841*f*–845*f*
Pulmonary system; *See* lungs; respiratory system
  stress-related diseases of, 791*t*
Pulmonary valves, 631*f*–633*f*, 638–640, 638*f*, 639*f*, 640*f*
Pulmonary ventilation
  balloon model of, 826, 827*f*
  definition and overview of, 824, 825*f*, 828*f*
  expiration, 824, 825*f*, 826, 826*b*–827*b*, 827*f*–831*f*, 828–831, 829*t*
  gas laws, 824, 826, 826*b*–827*b*, 827*f*
  inspiration, 824, 825*f*, 826, 826*b*–827*b*, 827*f*–831*f*, 828–831, 829*t*
  mechanism of, 824, 825*f*, 826, 826*b*–827*b*, 827*f*–831*f*, 828–831, 829*t*
  pressure gradients, 824, 826, 826*b*–827*b*, 827*f*
  pressures important in, 825*f*
  primary principle of, 824, 825*f*
  pulmonary air flow, 837–838, 837*f*
  respiratory cycle, 828–831, 828*f*, 829*t*, 830*f*, 831*f*, 833*f*
  rhythm of, 831, 833*f*
  types of breathing, 836*b*
  volumes and capacities, 831, 833*t*, 834–836, 834*f*, 835*t*
Pulp cavity, 868, 869*f*, 869*t*
Pulse
  Korotkoff sounds, 705*f*, 706, 706*b*
  locations to feel, 710, 711*f*
  mechanism of, 709, 709*f*
  waves, 709, 709*f*, 710*f*
Pulse points, 710, 711*f*
Pulse pressure, 705*f*, 707
Pump transporters, 97–98, 97*f*, 98*b*, 98*f*, 101*t*
Punnett square, 1146–1147, 1146*f*
Pupils
  constriction, 530–531, 531*f*
  and eye anatomy, 526–529, 527*f*, 528*f*, 529*f*
Purkinje fibers, 683, 683*f*
Pus, 752
Pyelonephritis, 995
Pyloric sphincter, 873, 873*f*
Pyloric stenosis, 892–893
Pylorospasm, 892–893
Pylorus of stomach, 872, 872*b*, 873*f*
Pyramidal tracts, 450
Pyramids
  of medulla, 430*b*, 431, 431*f*
  renal, 972, 972*f*, 973*f*, 976*f*, 981*f*
Pyrogens, 191, 751
Pyruvic acid, 105–106, 105*f*, 106*f*, 936, 936*f*, 937*f*, 940, 940*b*, 941*f*
Pyuria, 994*b*

Q

Q-arms, 1134*f*, 1135, 1140*f*, 1143*t*
QRS complex, 684*f*, 686, 686*f*–687*f*, 712, 713*f*
Quadratus lumborum muscles, 316–317, 316*f*, 316*t*
Quadratus muscles, 309, 310*t*
Quadriceps femoris group muscles, 308*f*–309*f*, 309*t*–310*t*, 334*f*, 335*f*, 338*f*, 339*f*, 339*t*
Quadriplegia, 452

R

Radial artery pulse point, 710, 711*f*
Radiation
  and heat loss from skin, 183, 183*f*, 184*f*
  sickness, 60
Radiation therapy, 160
Radioactivity, 38
Radiocarpal joints, 279–280, 279*f*
Radioisotopes, 38
Radioulnar joints, 279–280, 279*f*
Radius, 200*f*, 224*f*–225*f*, 226*t*, 251, 252*f*, 253*f*, 253*t*, 254*f*, 259*b*
Rafts, 71–72, 71*b*, 71*f*
Rami, 466, 466*f*, 468*f*, 469*f*, 470*f*
Range of motion (ROM)
  definition and measurement of joint, 286, 286*f*–291*f*
  of elbow and shoulder, 289*f*
  illustration of neck, 287*f*
  and shoulder stability, 325, 325*b*, 325*f*
  of thoracic and lumbar spine, 288*f*
Rapid eye movement sleep (REM), 444
Rate law of chemistry, 844, 845, 845*f*
Reabsorption, as urinary system function, 984–989, 985*f*–988*f*, 989*t*
Reactants, in chemistry, 40–41
Reactivity, 1007–1008
Receptor potential, 506
Receptor-mediated endocytosis, 100, 100*f*, 101*t*
Receptors
  chemoreceptors
    affecting breathing, 849–852, 850*f*, 851*f*
    description and illustration of, 507, 513–515, 514*f*
    macula densa, 976, 976*f*–982*f*, 980, 984, 985*f*
    vasomotor, 700, 700*f*
  integral membrane proteins (IMPs) as, 69*t*, 70*f*, 72, 72*t*
  mechanoreceptors, 507, 508*t*, 510–513, 512*t*
  and neurotransmitters of ANS, 494, 495*f*, 496–497, 496*f*, 497*b*
  sensory
    adaptation of, 506, 506*f*
    classification of, 507–513, 508*t*, 512*t*
    distribution of, 506–507
    responses and functions of, 506, 506*f*
Recessive genes and traits, 1136–1137, 1137*f*, 1143*t*
Recovery stage, definition of disease, 25*b*
Recruitment, of motor units, 364–365, 366*f*
Rectouterine pouch (of Douglas), 1064*f*, 1069
Rectum
  absorption sites, 923*f*
  anatomy of, 862*f*, 878*f*, 879, 879*f*
  male and female, 1046*f*, 1065*f*
  rectal bleeding, 894, 894*f*
  role in digestion, 902*f*, 904–908, 908*t*, 924, 924*f*, 925
Rectus abdominis muscles, 304, 304*f*, 316–317, 316*f*, 316*t*
Rectus femoris muscles, 304, 304*f*, 308*f*–309*f*, 309*t*–310*t*, 333*t*, 335*f*, 339*t*
Rectus sheath, 317, 317*f*
Red blood cells (RBCs)
  anaerobic, 940, 940*b*
  buffering of carbonic acid in, 1029–1030, 1029*f*, 1030*f*
  characteristics and functions of, 67*t*, 600–602, 600*f*, 601*f*, 606*t*
  composition in blood, 599–601, 599*f*
  definition and photomicrograph of, 152, 152*f*
  destruction of, 604–605, 605*f*
  disorders of, 619–620, 620*f*
  erythrocyte sedimentation rate (ESR), 601*b*
  filtering by spleen, 736, 736*b*
  formation of (erythropoiesis), 602–604, 603*f*, 604*f*
  hematopoiesis, 152, 200
  hemoglobin molecules in, 601–602, 602*f*
  red bone marrow production of, 202–203, 202*f*, 203*f*, 207–208, 207*f*, 602–604
  role in respiration, 841–846, 841*f*–845*f*
Red bone marrow
  B cells and T cells originating from (*See* B cells; T cells)
  blood cell formation, 608
  definition of, 150, 151*f*, 152
  description and anatomical diagrams, 202–203, 202*f*, 203*f*, 207–208, 207*f*
  hematopoiesis, 152, 200
Red fibers, 357–358, 358*b*
Red-green color blindness, 1139, 1139*f*, 1143*t*

Referred pain, 509*b*
Reflex arc, 390*f*, 391, 391*f*
Reflex center, spinal cord as, 429
Reflex incontinence, 994–995
Reflexes; *See also* individual reflexes
  common clinical tests, 482*f*
  damaged with motor neuron injuries, 451*b*
  endocrine system, 553–555, 554*f*
  knee jerk reflex, 481–482, 481*f*, 482*f*
  peripheral nerve, 481–482, 481*f*, 482*f*
  pupil, 530–531, 531*f*
  righting, 522*f*, 523
  somatic reflexes, 481–482, 481*f*, 482*f*
Refraction
  characteristics, 530, 530*b*
  disorders, 535–536, 535*f*
Refractory period, 397–398, 397*f*
Regeneration
  of damaged tissue, 154, 155*f*
  of epidermis, 174–175
Rehydration
  after exercise, 907*b*
  oral, 924*b*
Reinke crystalloids, 1047, 1047*f*
Rejection syndrome, 773
Relative blood volumes, 696–697, 697*f*
Relative refractory period, 397–398, 397*f*
Relaxation
  atrial and ventricular, 638–639, 638*f*–640*f*
  versus contracted muscle fibers, 370*f*
  and muscle contractions, 352–354, 353*b*, 354*f*, 355*f*, 356–360
Relaxin, 584*t*, 585, 1082*t*, 1085*t*
Releasing hormones, 567–570, 567*f*, 568*f*, 568*t*, 569*f*
Remission, definition of, 25*b*
Remodeling, bone, 212–214, 213*f*, 214*f*
Renal calculi, 976
Renal cancer, 995, 995*f*
Renal cell carcinomas, 995
Renal clearance tests, 993*b*
Renal columns, 972, 972*f*, 973*f*, 976*f*, 981*f*
Renal corpuscles, 976, 976*f*–982*f*, 977–979, 989*t*
Renal cortex, 972, 972*f*, 976*f*, 981*f*
Renal failure, 996, 997*f*
Renal hypertension, 976
Renal insufficiency, 996, 997*f*
Renal medulla, 972, 972*f*, 976*f*, 981*f*
Renal papilla, 972, 972*f*, 976*f*–982*f*, 980, 984, 985*f*
Renal ptosis, 995
Renal pyramids, 972, 972*f*, 973*f*, 976*f*, 981*f*
Renal tubules, 976*f*, 979–980, 980*f*–982*f*, 984, 985*f*
Renal veins, 658*f*, 659*t*, 662, 663*f*, 973, 973*f*, 980, 980*f*, 981*f*, 989*t*
Renatured proteins, 56, 56*f*
Renin, 578, 579*f*, 980, 991*f*
Renin-angiotensin-aldosterone system (RAAS), 578, 579*f*, 704, 704*f*, 1009, 1009*f*
Repolarization
  ECG representation of, 684–687, 684*f*–687*f*
  of membrane potentials, 396*f*, 397, 397*t*
Reproduction
  as characteristic of life, 6*t*
  infertility, 773*t*, 1057–1058, 1081
Reproductive ducts (male)
  ejaculatory duct, 1045*f*, 1046, 1052, 1052*f*, 1054*f*
  epididymis, 1045*f*–1046*f*, 1046, 1051, 1051*f*, 1052*f*
  urethra, 1045*f*, 1046, 1052*f*
  vas deferens, 1045*f*–1046*f*, 1046, 1051–1052, 1051*f*, 1052*f*
Reproductive systems; *See* female and male reproductive systems
  effects of aging on, 1122

  lower respiratory tract (LRT) anatomy
    alveoli, 800*f*, 808–810, 808*f*, 809*f*, 810*f*, 812*f*, 812*t*, 813–814
    bronchi, 800*f*, 808–810, 808*f*, 809*f*, 810*f*, 812*f*, 812*t*, 813–814
    disorders of, 817–819
    lungs, 800*f*, 806*f*, 808*f*–814*f*, 812–814, 812*t*, 815*b*
    thorax, 812*t*, 814–815, 814*f*
    trachea, 800*f*, 801*f*, 807–808, 807*f*, 808*b*, 812*f*, 812*t*
  organs and functional overview of, 7*f*, 9*t*
  and pH control, 1028*f*, 1032, 1033*f*
  physiology of
    big picture, 824, 825*f*, 853
    blood role in transporting gases, 841–846, 841*f*–845*f*
    overview of, 825*f*
    pulmonary function regulation, 848–852, 848*f*–851*f*, 852*b*
    pulmonary gas exchange (*See* pulmonary gas exchange)
    pulmonary ventilation (*See* pulmonary ventilation)
    systemic gas exchange, 846–847, 846*f*, 846*t*, 847*f*
    ventilation and perfusion, 852, 853*f*
  stress-related diseases of, 791*t*
  summary of tract structures, 811*t*–812*t*
  upper respiratory tract (URT) anatomy, 799–806, 800*f*, 801*f*, 811*t*–812*t*
    disorders of, 816–817, 817*f*
    larynx, 800*f*, 801*f*, 803–805, 804*f*, 805*f*, 811*t*–812*t*
    nose, 799–802, 799*b*, 800*f*, 801*f*, 802*b*, 802*f*, 803*f*, 811*t*
    pharynx, 800*f*, 801*f*, 802–803, 811*t*
Responsiveness, 6*t*
Rest, oxygen unloading at, 846, 847*f*
Resting membrane potentials (RMPs), 394–395, 394*f*, 395*f*, 395*t*, 396*t*, 397*t*
Reticular activating system (RAS), 443, 443*f*, 446*t*
Reticular fibers, in connective tissue, 143, 144*t*, 148, 148*f*
Reticular formation, 443, 443*f*, 446*t*
Reticular layer, of dermis, 172*f*, 175*t*, 176–177, 177*f*
Reticulocytes, 603–604, 603*f*
Reticulospinal tracts, 427*f*, 428, 428*t*
Retina, 526–529, 527*f*, 528*f*, 529*f*, 532, 536, 536*f*
Retinal detachment, 536, 536*f*
Retinitis pigmentosa, 1140*f*, 1143*t*
Retinoblastoma, 1140*f*
Retraction, 287*f*, 292
Retropulsion, 907
Retroviruses, 774–775, 774*f*
Reuptake process, 402, 402*f*
Reversible chemical reactions, 41
Rh disease, 1140*f*
Rh system, 610, 612, 612*f*, 613*t*
Rheumatic fever, 670, 773*t*
Rheumatic heart disease, 670
Rheumatoid arthritis, 293*f*, 295, 773*t*
Rhinitis, 816
Rhodopsin cycle, 532, 532*f*, 537
Rhomboid muscles, 308*f*–309*f*, 309, 309*t*–310*t*, 310*t*, 322, 322*t*, 323*f*
Rib cage
  anatomy of, 224*f*–225*f*, 226*t*, 244*t*, 248, 248*t*, 249*f*
  movement during breathing, 829*f*
  protection function of, 806*f*, 814–815
Ribbon model
  of protein molecules, 55*b*
  of RNA molecules, 58*f*
Ribonucleic acid (RNA)
  definition and molecular structure of, 47*t*, 56–57, 58*f*
  and gene function, 1132–1135
  major types of, 115–116, 115*t*
  role in protein synthesis, 115–119, 117*f*, 119*t*
  scientific advances in understanding, 120*b*, 1133
  transcription and editing process, 116–117, 117*f*, 119*t*
Ribonucleoprotein, 47*t*, 59
Ribose, 46, 47*t*
Ribosomal RNA (rRNA), 78–79, 115–119, 115*t*, 117*f*, 119*t*, 120*b*
Ribosomes
  description, functions and illustration, 68*f*, 69*t*, 73–74, 73*f*, 74*f*
  illustration in cytoskeleton, 79*f*
  subunits of, 68*f*, 73, 74*f*
Ribs
  anatomy of, 224*f*–225*f*, 226*t*, 244*t*, 248, 248*t*, 249*f*
  case study on fractures of, 267
  movement during breathing, 829*f*
  protection function of, 806*f*, 814–815
  thoracic joints, 284*t*
Rickets, 217, 217*b*, 217*f*
Right lobe of liver, 882, 883*f*, 884, 885*f*
Right lymphatic duct, 724*f*, 725, 737*t*
Rigor mortis, 357, 357*b*
Ringworm, 189–190, 189*f*
Risk factors
  definitions and summary of, 27
  and somatotypes, 18*b*
RNA interference (RNAi), 119, 120*b*, 1134, 1148
RNAi therapy, 1148
Rods, 532, 532*f*
Rolando fissure, 437, 437*f*, 438*b*
Root
  of hair, 185–186, 186*f*
  of lung, 812–813, 812*f*
  of nail, 186–187, 186*f*
  of tooth, 868, 869*f*, 869*t*
Root hair plexus, 508*t*, 509
Rotation
  description of, 292
  movement examples, 287*f*–291*f*
Rotator cuff, 277*f*, 278
  muscles, 324*t*, 325, 325*b*, 325*f*
Rotatores muscle group, 318–319, 318*f*–319*f*, 320*t*
Rotavirus, 924*b*
Rough endoplasmic reticulum (RER), 73, 73*f*
Round uterine ligaments, 1064*f*, 1066*f*, 1069
Round window, 518*f*, 519
Rubrospinal tracts, 427*f*, 428, 428*t*
Ruffini corpuscles, 512*t*, 513
Rugae, 864*t*, 873–874, 873*f*, 874*f*, 885
"Rule of nines," 192, 192*f*
"Rule of palms," 192

S

Sacral nerves, anatomy of, 464, 465*f*, 466, 467*t*, 468, 470*f*
Sacral plexus, 464, 465*f*, 466, 467*t*, 470, 470*f*
Sacroiliac joints, 284*t*
Sacrum
  bones of, 224*f*–225*f*, 244*t*, 245*f*, 255*f*, 262*t*
  male *versus* female, 261*f*, 262*t*
  nerves, 464, 465*f*, 466, 467*t*, 468
Sacrum vertebrae, anatomy of nerves associated with, 464, 465*f*, 466, 467*t*, 468
Saddle joints, 275–276, 275*f*, 276*t*
Sagittal plane, 15–16, 15*f*
Saliva
  deficiency with Sjögren syndrome, 888
  and dehydration, 1010*f*, 1012, 1012*b*–1013*b*
  and glossopharyngeal nerve (IX), 473*f*, 473*t*, 478*b*, 478*t*, 479, 479*f*
  secretion and secretion control, 902, 902*t*, 913*t*, 914, 918, 918*t*, 925
  and sense of taste, 516–517, 516*f*, 517*f*
Salivary glands
  anatomy of, 862*f*, 867–868, 867*f*, 888
  autonomic functions of, 489, 489*b*, 489*f*, 491*f*, 498*t*, 500*t*
  parotid glands, 867*f*, 868
  role in digestion, 902*f*, 925
  sublingual glands, 867*f*, 868
  submandibular glands, 867*f*, 868
Salpingitis, 1070, 1088
Saltatory conduction, 398, 399*f*
Salts, 45, 45*t*
Saphenous veins, 658*f*, 659*t*, 664–665, 664*f*
Sarcolemma, 303*f*, 348, 349*f*, 350, 350*f*, 353–354, 353*b*, 353*f*, 354*f*
Sarcomas, 159
Sarcomere, 67*t*, 302, 303*f*, 348, 349*f*, 350, 351*b*, 351*f*, 352–360, 353*b*, 354*f*, 355*f*
Sarcoplasm, 303*f*, 348, 349*f*, 350, 350*f*, 353–354, 353*f*
Sarcoplasmic reticulum (SR), 303*f*, 348, 349*f*, 350, 350*f*, 353–354, 353*f*, 368*t*
Sartorius muscles, 308*f*–309*f*, 309*t*–310*t*, 334*f*, 335*f*, 338*f*, 339*f*, 339*t*
Satellite cells, 384*f*, 387, 387*f*
Satiety center, 948, 959
Saturated fats, *versus* unsaturated, 946–947, 946*b*
Saturated fatty acids, definition and illustration of, 48–49, 49*f*
Saturation, of fatty acids, 48–49, 49*f*
Scaphoid
  bones, 253*t*, 254, 254*f*
  joints, 279, 279*f*
Scapula
  acromioclavicular joint, 284*t*
  anatomical location of, 200*f*, 224*f*–225*f*, 249*f*, 250*f*, 259*b*
  description of, 226*t*, 250–251, 251*t*, 259*b*
Scapular muscles, 308*f*–309*f*, 309*t*–310*t*, 324*f*, 324*t*, 325, 326*f*
Scars, process of development, 154, 155*f*
Scheuermann disease, 266
School-age children, ossification process in, 210, 210*f*, 211*f*
Schwann cells, 384, 384*f*, 386–387, 386*f*, 387, 387*f*, 392, 392*f*, 393*f*
Sciatic nerve, 470, 470*f*
Sciatica, 470
Science
  definition of, 4, 4*f*
  development of new principles in, 4–5, 4*f*
Scientific method, flowchart illustrating, 4*f*
Sclera, 526–529, 527*f*, 528*f*, 529*f*
Scleroderma, 190
Scoliosis, description and illustration of, 265*f*, 266
Scotoma, 537
Scrotum
  anatomy and functions of, 1045*f*, 1046–1047, 1052*f*, 1054
  disorders involving, 1058
  endocrine functions of, 584–585
Scurvy, 963*f*
Seasonal affective disorder (SAD), 436–437, 436*f*, 437*f*, 571, 588*t*
Sebaceous glands, 172*f*, 185*f*, 186, 187*f*, 188
Sebum
  as immunity line of defense, 748*t*, 749
  secretion and functions of, 157*t*, 185*f*, 186, 188, 188*b*
Second messenger mechanism, 551–552, 552*f*, 553*f*
Secondary active transport, 921–923, 921*f*
Secondary bronchi, 800*f*, 808, 808*f*, 812*t*
Secondary follicles, 1099*f*, 1100*f*, 1101
Secondary oocytes, 1099*f*, 1100*f*, 1101
Secondary ossification centers, 210, 210*f*, 211*f*
Secondary sex characteristics, 1118
Second-degree burns, 193, 193*f*
Secretin, 584*t*, 585, 919*f*, 920*t*
Secretion
  as characteristic of life, 6*t*
  and digestive secretion control

bile, 902*t*, 912*f*, 916–917, 918*t*, 920, 920*t*
gastric juice, 902*t*, 913*t*, 914–915, 918–920, 918*t*, 919*f*, 920*t*
intestinal juice, 902*t*, 913*t*, 917–918, 917*f*, 918*t*, 920, 921*f*
pancreatic juice, 902*t*, 913*t*, 916, 918*t*, 920, 920*t*
saliva, 902, 902*t*, 913*t*, 914, 918, 918*t*
function of epithelial tissue, 133*t*, 135, 140*t*, 141–142, 141*f*
skin and hair, 186–188, 187*f*, 188*b*
Secretory cells
of connective tissue, 157*t*
gastric gland, 874, 874*f*
Secretory phase of menstrual cycle, 1076, 1079*f*
Secretory vesicles, 74, 75*f*
Segmental reflex, 482
Segmentation, 905–906, 905*b*, 906*f*
Seizure disorders, 453
Selectins, 83
Selenium, 34*f*, 35*t*, 954*t*
Self, as immune system descriptive term, 746
Self-examination techniques, for cancer detection, 159
Self-tolerance, as immune system descriptive term, 746
Semen
functions and path of, 1045*f*, 1046, 1050, 1050*f*, 1052*f*, 1053, 1053*f*, 1055
urethra as pathway for, 971*f*, 974*f*, 975
Semicircular canals, 519*f*, 522
Semilunar (SL) valves, 631*f*–633*f*, 638–640, 638*f*, 639*f*, 640*f*
Semimembranosus muscles, 308*f*–309*f*, 309*t*–310*t*, 334*f*, 335*f*, 338*f*, 339*f*, 339*t*
Seminal fluid, 1045*f*, 1046, 1052*f*, 1053, 1053*f*, 1055, 1101, 1102*f*–1103*f*
Seminal vesicles, 1045*f*, 1046, 1052*f*, 1053, 1053*f*, 1055
Seminiferous tubules, 1047, 1047*f*–1050*f*
Semispinalis capitis muscles, 308*f*–309*f*, 309*t*–310*t*, 314, 314*f*, 314*t*, 318*f*, 320*t*
Semispinalis muscle group, 318–319, 318*f*–319*f*, 320*t*
Semitendinosus muscles, 308*f*–309*f*, 309*t*–310*t*, 334*f*, 335*f*, 338*f*, 339*f*, 339*t*
Senescence, 1118–1120
Sensations, process, 506
Sense of smell
olfactory nerve (I), 473*f*, 473*t*, 474, 474*t*
overview of, 513–515, 514*f*
Sense of taste
and glossopharyngeal nerve (IX), 473*f*, 473*t*, 478*b*, 478*t*, 479, 479*f*
overview of, 515–517, 515*f*, 516*f*, 517*f*
trigeminal nerve (V), 471*f*, 473*f*, 473*t*, 476, 476*b*, 476*t*, 477*f*
Sense organs
and cerebral cortex, 441*f*, 442–443
cycle of life/ big picture, 534
disorders, 534–537
in epithelial tissue, 135, 140*t*
sensory receptors
adaptation of, 506, 506*f*
classification of, 507–513, 508*t*, 512*t*
distribution of, 506–507
responses and functions of, 506, 506*f*
special senses
definition of, 506–507
sense of balance, 522–524, 522*f*, 523*f*
sense of hearing, 517–524, 518*f*
sense of smell, 513–515, 514*f*
sense of taste, 515–517, 515*f*, 516*f*, 517*f*
vision, 524–534, 524*f*–533*f*, 530*b*
Sensory division, of peripheral nervous system (PNS), 473*t*, 475*t*–476*t*, 478*t*, 480*t*, 481
Sensory fibers, of spinal nerves, 466, 466*f*, 467*t*, 471–472, 471*f*, 473
Sensory functions
of cerebral cortex, 441*f*, 442–443
of epithelial tissue, 135, 140*t*
feedback control loop, 20–21, 22*f*, 23*b*, 390*f*, 391
of skin, 172*f*, 175*t*, 177, 177*f*, 181*t*, 182
Sensory neurons, 390–392, 390*f*, 392*f*
Sensory pathways, 382*f*, 383
Sensory receptors
adaptation of, 506, 506*f*
classification of, 507–513, 508*t*, 512*t*
distribution of, 506–507
and reflex arc, 390*f*, 391, 391*f*
responses and functions of, 506, 506*f*
in skin, 177
of spinal nerves, 466, 466*f*, 467*t*, 471–472, 471*f*, 473
Sensory tracts, spinal, 427–429, 427*f*, 428*t*
Sentinel lymph node (SLN), 733
Septal cartilage, 237*f*, 237*t*, 238, 239*f*, 240, 241*t*
Septic shock, 714, 738, 1123*f*
Septicemia, 714, 738
Septum, nasal, 799–801, 800*f*, 801*f*, 803*f*, 811*t*
Serosa, of GI tract wall, 863*f*, 864, 864*t*, 873*f*, 876*f*
Serotonin, 208–209, 404, 406, 406*f*, 407*t*, 408, 410*b*, 571
Serous membranes, tissue characteristics of, 155*f*, 156, 156*b*, 156*f*, 157*t*
Serous pericardium, 634, 634*f*
Serratus muscles, 308*f*–309*f*, 309*t*–310*t*, 322, 322*t*, 323*f*
Sertoli cells, 1047–1048, 1047*f*, 1048*f*
Serum, *versus* plasma, 613, 613*f*, 617
Sesamoid bones, 200*f*, 201, 201*f*, 203
Set point range
body temperature, 20–21, 21*b*
and homeostasis, 19, 19*f*, 20–21, 21*b*
Severe acute respiratory syndrome (SARS), 818
Severe combined immune deficiency (SCID), 774, 1140*f*, 1143*t*
Sex, chromosomes determining male/female, 1138–1140, 1138*b*, 1139*f*
Sex cells
meiosis, 124–125, 125*f*, 1097–1098, 1098*f*, 1099*f*
oogenesis, 1099*f*, 1100*f*, 1101
ova, 124–125, 125*f*, 1064–1068, 1064*f*, 1066*f*, 1067*f*, 1074–1076, 1079*f*
spermatogenesis, 1098, 1099*f*, 1101
spermatozoa, 1045, 1048–1051, 1048*f*, 1049*f*, 1050*f*
Sex chromosomes, and inheritance, 1135, 1138–1140, 1138*b*, 1139*f*
Sex hormones, definition of, 547–548
Sex organs
ovaries, 585, 585*t*, 586
testes, 584–585, 585*t*
Sex-linked traits, 1135, 1138–1140, 1138*b*, 1139*f*
Sexual arousal
female, 1073–1074
"G spot," 1072*b*
in males, 1055, 1055*b*
Sexual intercourse
attractions, 1045
"G spot," 1072*b*
vagina, 1072
Sexual reproduction
female system of, 1064–1086
male system of, 1045–1046, 1045*f*, 1049*f*, 1052*f*, 1056
Seyle's concept of stress
defining stress and stressors, 784
general adaptation syndrome (GAS), 784–786, 786*f*, 786*t*, 787*f*, 788*f*
stages of stress, 785–786, 786*f*, 786*t*
Shaft of hair, 185–186, 185*f*
Shingles, 464*b*, 472*b*
Shock
anaphylactic, 714
circulatory, 714
septic, 714, 738, 1123*f*
toxic shock syndrome (TSS), 714

anatomy and production of, 1045, 1048–1051, 1048*f*, 1049*f*, 1050*f*
and meiosis, 124–125, 125*f*, 1097–1098, 1098*f*, 1099*f*
production levels over life span, 1056*f*
spermatogenesis, 1047*f*, 1048–1049, 1048*f*, 1098, 1099*f*, 1101–1103, 1101*f*, 1102*f*
Sphenoid bone, 225*f*, 226, 227*f*–229*f*, 231*f*–232*f*, 234*f*, 234*t*, 239, 239*f*
Spheroid joints, 275*f*, 276, 276*t*, 284*t*
Sphincters
anal, 320, 321*f*, 321*t*
esophageal, 870*f*, 871
pyloric, 873, 873*f*
stomach, 872–873, 873*f*, 904, 905*b*
urethral, 320, 321*f*, 321*t*, 974*f*, 975–976
Sphygmomanometer, 705, 705*f*, 706*b*
Spina bifida, 244*t*
Spinal cavities, 11, 11*f*
Spinal column
bones of, 224*f*–225*f*, 226*t*, 244*t*, 245, 245*f*–247*f*, 248*t*, 249*f*
case study on fractures of, 267
Spinal cord
anatomy of, 381*f*, 382, 382*f*, 464, 465*f*, 466, 467*t*, 468
divisions and functions of, 424, 424*f*, 425*b*, 425*f*
nerves (*See* spinal nerves)
Spinal cord reflex, 482
Spinal curvatures, 216–217, 244*t*, 245*f*, 265–266, 265*f*
Spinal ganglion, 465*f*, 466, 466*f*
Spinal nerves, 426, 426*f*
origins and illustration of, 381*f*, 382
structure of, 464–471
anatomy of, 464, 465*f*, 466, 471*f*
brachial plexus, 464, 465*f*, 466, 467*t*, 468, 469*f*
cervical plexus, 464, 465*f*, 466, 467*t*, 468, 468*f*
coccygeal plexus, 464, 465*f*, 466, 467*t*, 470
dermatomes, 471–472, 471*f*, 472*f*
lumbar plexus, 464, 465*f*, 466, 467*t*, 468, 470, 470*f*
lumbosacral plexus, 464, 465*f*, 466, 467*t*, 468, 470, 470*f*
myotomes, 471–472, 471*f*, 472*f*
sacral plexus, 464, 465*f*, 466, 467*t*, 470, 470*f*
segmental distribution of, 471–472, 471*f*
Spinal reflexes, 363, 481–483
Spinal tracts, 427–429, 427*f*, 428*t*
Spinalis muscle group, 318–319, 318*f*–319*f*, 320*t*
Spine; *See also* spinal cord; vertebrae
bones of, 224*f*–225*f*, 226*t*, 244*t*, 245, 245*f*–247*f*, 248*t*, 249*f*
case study on fractures of, 267
curvatures, 216–217, 244*t*, 245*f*, 265–266, 265*f*
illustration of infant and toddler, 1117*f*
nerves associated with, 464, 465*f*, 466, 467*t*, 468
Spinnbarkeit, 1075, 1079*f*
Spinocerebellar ataxia, 1140*f*
Spinocerebellar tracts, 427*f*, 428, 428*t*
Spinotectal tracts, 427*f*, 428, 428*t*
Spinothalamic pathways, 448–449, 448*f*
Spinous process, 244*t*, 245, 246*f*, 247*f*
Spiral muscles, 304, 304*f*, 308*f*–309*f*, 309, 310*t*
Spirogram, 831, 833*f*, 834, 834*f*, 836*b*
Spirometer, 831, 833*f*, 834, 834*f*, 836*b*, 837
Splanchnic nerves, 466, 466*f*, 491*f*, 492, 493*f*
Spleen, 735–736, 735*f*, 736*f*, 737*t*
Splenectomy, 736
Splenomegaly, 736, 736*b*
Spliceosomes, 117, 118*b*, 120*b*
Spongy bone, 150, 150*f*, 151*f*, 201, 202, 202*f*, 210, 210*f*, 211*f*
Spontaneous abortion, 1124
Spontaneous fractures, 264
Sports and fitness
aerobic exercise benefits, 699*b*
anabolic steroids, 585*b*
benefits of exercise for cardiovascular system, 697–698, 697*f*, 698*b*–699*b*
blood doping, 604*b*
chondromalacia patellae, 266*b*
and dehydration, 1010*f*, 1012, 1012*b*–1013*b*
exercise benefits with aging, 1120, 1121*b*
knee joint injuries, 283, 283*b*
maximum oxygen consumption, 837*b*
rehydration, 907*b*
respiration control during exercise, 852*b*
"sports triad," 1087*b*
sympathetic skeletal muscle stimulation, 500*b*
total hip replacement (THR), 294*b*
vitamins supplements for athletes, 952*b*, 963
"Sports triad," 1087*b*
Spot desmosomes, 83, 84*f*
Sprains
ankle, 284
definition of, 295
muscle, 372
Squamous cell carcinoma, 190, 191*f*
Squamous epithelial cells, 136*f*, 137–139, 138*f*–139*f*, 140*t*
Stage of exhaustion, in general adaptation syndrome (GAS), 786, 786*t*
Stage of resistance, in general adaptation syndrome (GAS), 786, 786*t*
Staghorn calculi, 994
Staircase phenomenon, 362, 362*f*
Starches, definition and functions of, 46, 47*t*, 48
Starling's law of capillaries, 703, 703*f*, 708*f*, 1012–1015, 1014*f*
Starling's law of the heart, 692, 692*f*
Starvation, 27, 932, 958–959, 959*f*, 961–962, 962*f*, 963
Static equilibrium, 522–523, 522*f*
Static tension, 367
Steatorrhea, 914*b*
Stem cells
adult, 132, 132*b*, 602–604, 603*f*, 608, 1111
embryonic development, 132, 132*b*, 143, 1110–1111
and erythropoiesis, 602–604, 603*f*
lymphocyte development from, 756, 756*f*, 759*f*
research, 4
of small intestine wall, 876–877, 876*f*, 877*f*
Stenosed mitral valve, 669–670, 669*f*
Stents, 672
Sterility
hormone secretion and, 584–585, 588*t*
issues in men, 1057–1058
tubal ligation, 1071*b*
Sternoclavicular joint, 284*t*
Sternocleidomastoid muscles, 308*f*–309*f*, 309*t*–310*t*, 314, 314*f*, 314*t*

Sternum
  anatomical diagram illustrating, 200*f*, 201*f*
  bones of, 224*f*–225*f*, 226*t*, 248, 248*t*, 249*f*
  sternoclavicular joint, 284*t*
Steroidal hormones, classification *versus* nonsteroidal, 547–548, 548*f*, 549*f*, 550–553, 551*f*, 553*t*, 554*b*, 556*b*
Steroids
  anabolic, 585*b*
  classification and functions of, 547–548, 548*f*, 549*f*, 550–553, 551*f*, 553*t*, 554*b*, 556*b*
  definition and functions of, 47*t*, 50, 50*f*, 51*b*
Stethoscope, 705, 705*f*, 706*b*
Sticky platelets, 608, 614*f*, 616–617
Stillbirths, 1124
Stimulus-gated channels, 393–395, 393*f*, 394*f*, 395*f*, 395*t*, 396*f*, 397*t*, 401
Stomach
  absorption sites, 923*f*
  anatomy of, 862*f*, 870*f*–874*f*, 872–874, 872*b*
  disorders of, 891–894, 891*f*–894*f*
  functions of, 874–875
  gastroesophageal reflux disease (GERD), 871–872, 890, 891*f*
  role in digestion, 902*f*, 904–908, 908*t*, 925
  tissue layers of, 864*t*, 873–874, 873*f*
  ulcers, 892, 892*f*
  wall layers of, 864*t*, 873–874, 873*f*
Stomach cancer, 892, 892*f*
Strabismus, 531, 531*f*
Strains, muscle, 372, 372*f*
Strata, of epidermis, 173, 173*f*
Stratified columnar epithelium, 136*f*, 139, 140*t*
Stratified cuboidal epithelium, 136*f*, 139, 140*t*
Stratified squamous epithelium, 138–139, 139*f*, 140*t*
Stratum basale, 174, 175*t*
Stratum corneum, 174, 175*t*
Stratum granulosum, 174, 175*t*
Stratum lucidum, 174, 175*t*
Stratum spinosum, 174, 175*t*
Strength training
  benefits to older adults, 1120, 1120*f*
  effects on skeletal muscles, 364–367, 364*b*, 365*f*–367*f*
Stress
  big picture, 793
  current concepts regarding
    corticoids and resistance, 790
    current definitions, 788
    intrauterine stress, 792
    psychological stressors, 790–792, 791*f*, 791*t*, 792*b*
    stress indicators, 790, 790*f*, 792*b*
    stress response/ syndrome, 788, 789*f*
    stress-age syndrome, 792*b*
    type A behavior and, 792*b*
  as risk factor for disease, 27, 788–789, 791–792, 791*t*, 792*b*
  Seyle's concept of, 783–788
    defining stress and stressors, 784, 785*f*
    general adaptation syndrome (GAS), 784–786, 786*f*, 786*t*, 787*f*, 788*f*
    "stress triad" and stages of, 784–786, 786*f*, 786*t*
Stress fractures, 264
Stress incontinence, due to damaged levator ani, 1072
Stress indicators, 790, 790*f*, 792*b*
Stress response
  current concepts regarding, 788, 789*f*
  glucocorticoid reactions during, 579
  glycogenolysis during, 943–944
Stress syndrome, 788, 789*f*
"Stress triad," 784–785
Stress-age syndrome, 792*b*
Stress-relaxation effect, of blood vessels, 701, 701*f*
Stretch marks, 177
Stretch receptors, 512*t*, 513
Stretch reflex, 365–366, 366*f*, 482
Stretta procedure, 890, 891*f*
Striae, 177
Striated muscle, 350, 351*b*, 351*f*, 368*t*
Striated voluntary muscle, 152–153, 152*t*
Stricture, 995
Stroke; *See* cerebrovascular accidents (CVAs)
Stroke volume, 691–693, 691*f*–693*f*, 699*b*
Structural proteins, *versus* functional, 52–56, 54*f*, 56*f*, 56*t*
Subacute diseases, definition of, 25*b*
Subarachnoid space, 422*f*, 423
Subatomic particles, 36
Subclavian artery, 648*f*, 649*t*, 650*f*, 651, 652, 653
Subclavian artery pressure point, 710, 711*f*
Subclavian veins, 658*f*, 659*t*, 660*f*, 661, 661*f*, 662*f*
Subcutaneous injections, 1007*b*
Subcutaneous skin layer, 178, 178*b*
Subdural space, 422*f*, 423
Subendocardial branches, 683, 683*f*
Subfornical organ (SFO), 1010
Sublingual glands, 867*f*, 868
Subluxation, joint, 294
Submandibular glands, 867*f*, 868
Submucosa, of GI tract wall, 863, 863*f*, 864*t*, 873*f*, 874*f*
Subscapularis muscles, 308*f*–309*f*, 309*t*–310*t*, 324*f*, 324*t*, 325, 326*f*
Substance P, 405, 407*f*, 408, 408*t*, 410
Substantia nigra, 431, 431*f*
Substrates, of enzymes, 102, 102*f*, 103*f*
Suckling, 1082–1085, 1083*f*, 1084*f*, 1085*t*
  and oxytocin, 570–571, 571*t*
Sucrose, formation of, 48, 48*f*
Sudden infant death syndrome (SIDS), 855
Sudoriferous glands, 187, 187*f*
Sugars, definition and functions of, 46, 47*t*
Sulci, 437, 437*f*, 438*b*
Sulfur, 34*f*, 35*t*
Summation, 388–389, 389*f*, 397*t*, 403, 403*f*
Sunburn, 191*f*, 192*b*
Superficial, as directional term, 15, 15*f*, 16
Superficial cervical lymph nodes, 730, 730*f*
Superficial cubital lymph nodes, 730, 730*f*
Superficial fascia, 148, 178, 178*b*, 302, 302*t*, 303*f*
Superficial veins, 658*f*, 659*t*, 660*f*, 661*f*
Superior, as directional term, 15, 15*f*, 16
Superior cerebellar peduncles, 432*f*, 433
Superior colliculi, 431, 431*f*
Superior nasal concha, 227*f*, 231*f*, 235*f*, 235*t*, 237*t*, 239*f*
Superior vena cava, 658*f*, 659*t*, 660*f*, 661–662, 661*f*, 662*f*, 663*f*
Supination, 289*f*, 292
Supinator muscles, 326, 326*f*, 327*f*, 327*t*, 328*f*
Support, function of bones, 200
Suppressor T cells, 767
Supraorbital canal, 227*f*, 229*f*
Supraovulation, 1081
Suprarenal veins, 658*f*, 659*t*, 662, 663*f*
Supraspinatus muscles, 308*f*–309*f*, 309*t*–310*t*, 324*f*, 324*t*, 325, 326*f*
Supratrochlear lymph nodes, 730, 730*f*
Surface film, as protective barrier on skin, 172*f*, 173*b*, 175*t*, 181, 181*t*, 182*b*, 187, 187*f*
Surface tension, 832*b*
Surface-rendering model, of protein molecules, 55*b*
Surfactant, 809, 810*f*, 829–830, 832*b*
Sustentacular cells, 1047–1048, 1047*f*, 1048*f*
Sutures
  cranial bone, 238
  description and illustration of joint, 272, 272*t*, 273*f*, 274*t*
Swallowing
  deglutition, 904–905, 904*f*, 905, 906*f*, 925
  difficulties with Sjögren syndrome, 888
  esophagus expansion during, 805, 807*f*, 812*t*
  and glossopharyngeal nerve (IX), 473*f*, 473*t*, 478*b*, 478*t*, 479, 479*f*
  pharynx role in, 870
  tongue and mouth muscles used in, 867, 867*f*
Sweat glands
  autonomic functions of, 489, 489*b*, 489*f*, 491*f*, 498*t*, 500*t*
  homeostatic roll of, 184, 184*b*
  secretions, 172*f*, 187, 187*f*, 188
Sweating
  and cooling body during exercise, 184, 184*b*
  and dehydration, 1010*f*, 1012, 1012*b*–1013*b*
  rehydration after, 907*b*
Swollen larynx, 805, 817
Sylvius fissure, 437, 437*f*, 438*b*
Sympathetic nervous system
  and alarm reaction, 785–786, 786*f*, 786*t*, 787*f*
  "fight-or-flight" reaction, 383, 499–500, 500*t*, 785–786, 786*f*, 786*t*, 787*f*
  functions of, 498–499, 498*t*, 499*f*, 500*b*
  hypothalamus sympathetic center, 581*f*, 789*f*
  pathways, 489*f*, 490–492, 490*f*, 491*f*, 491*t*, 493*f*, 494*t*
Sympathetic rami, 466, 466*f*
Sympathetic trunk, 491, 491*f*
Symphyses, 273–274, 273*f*, 274*t*
Symporters, 98*b*
Symptoms, definition of, 25*b*
Synapses
  definition and locations of, 391, 391*f*
  in muscle fiber nerve cells, 353, 353*b*, 353*f*, 354*f*
  structure and arrangement, 399, 400*f*
Synaptic cleft
  of chemical synapse, 400, 400*f*
  in muscle fiber nerve cells, 353, 353*b*, 353*f*, 354*f*
Synaptic knob, 387*f*, 388, 389*f*, 400–403, 400*f*, 401*f*, 402*f*
Synaptic transmission, 399–404, 400*f*–403*f*
  electrical and chemical synapses, 399–401, 400*f*–403*f*
  mechanisms of, 400*f*–403*f*, 401–402
  and memory, 404
  summation, 388–389, 389*f*, 403, 403*f*
  synapse structure and arrangement, 399, 400*f*
Synarthroses, 272–274, 272*t*, 273*f*, 274*t*
Synchondroses, 272–273, 272*t*, 273*f*, 274*t*
Syncytium, 368, 369*f*, 635
Syndesmoses, 272, 272*t*, 273*f*, 274*t*
Syndromes, definition of, 25*b*
Synergist muscles, 306, 306*f*
Synovial fluid, secretion of, 157, 157*t*
Synovial joints
  angular movements, 287*f*–291*f*, 291
  ankle joint, 283–284, 284*t*, 285*f*, 291*f*
  articulating bones and movements, 284*t*
  circular movements, 287*f*–291*f*, 291
  classification of, 272, 272*t*, 275–276, 275*f*, 276*t*, 284*t*, 286
  elbow joint, 275*f*, 276*t*, 278–279, 278*f*, 284*t*, 289*f*
  of forearm, wrist, hand and fingers, 279–280, 279*f*, 280*f*, 284*t*, 289*f*
  goniometer movement measurement, 286, 286*f*
  hip joint, 281, 281*f*, 284*t*, 290*f*
  humeroscapular joint, 275*f*, 276*t*, 277–278, 277*f*, 284*t*, 289*f*
  knee joint, 281–283, 283*b*, 283*f*, 284*t*, 290*f*, 291*f*
  movement of different, 284*t*, 286, 287*f*–291*f*, 291–292
  range of motion (ROM), 286, 286*f*–291*f*
  structure of, 274–275, 274*f*
  and two cartilaginous joint movements, 284*t*
  types of, 275–276, 275*f*, 276*t*, 284*t*, 286
  vertebral joints, 284*t*, 285–286, 285*f*, 288*f*
Synovial membranes
  definition and illustration of, 274–275, 274*f*
  tissue characteristics of, 155, 155*f*, 156*f*, 157*t*
Synthesis reactions, 40–41
Systemic anatomy, 5
Systemic arteries, 648, 648*f*, 649*t*, 650–654, 650*f*–657*f*, 846*t*
Systemic gas exchange, 846–847, 846*f*, 846*t*, 847*f*
Systemic lupus erythematosus (SLE), 772, 773*t*
Systemic veins, 658, 658*f*, 659*t*, 660*f*–665*f*, 661–665, 838–839, 839*t*, 846*t*
Systems
  function regulation, 848–852, 848*f*–851*f*, 852*b*
  as level of body organization, 2*b*, 8–9, 9*t*
  organization of body, 2*b*, 5, 8–9, 9*t*
Systole, 687–692, 688*f*, 709, 709*f*
Systolic blood pressure, 705*f*, 706–707

T

T cells
  deficiency diseases and AIDS, 774–775, 774*f*, 775*f*
  development and functions of, 734–735, 756, 757*f*, 764–767, 765*b*, 765*f*, 766*b*, 766*f*, 767*t*, 769*f*
  neoplasms, 620, 774–775
  thymus origins of, 734–735, 735*f*, 737*t*, 764
T tubules, 303*f*, 348, 349*f*, 350, 350*f*, 353–354, 353*f*, 354*f*, 368*t*
T waves, 684*f*, 686–687, 686*f*–687*f*, 712, 713*f*
Tachycardia, 712, 713*f*
Tactile corpuscles, 175*t*, 177*f*, 512–513, 512*t*
Tactile disk, 508*t*, 511–513, 511*f*
Tactile sensations, 508*t*, 510–511, 511*f*, 512*t*
Tanning, 179*f*, 180, 181*f*
Target cells
  in adenohypophysis, 564–571, 564*f*–565*f*, 566*b*, 567*f*–570*f*, 568*t*
  concept, 550–553, 550*f*, 551*f*, 552*f*, 553*f*
  definition and function of endocrine, 546, 546*t*
  endocrine disorders, 559
  hypothalamus sympathetic center, 581*f*
  sensitivity regulation, 555, 555*b*, 555*f*
Tarsal bones, anatomical location of, 200*f*
Taste
  effects of aging on, 1122
  and glossopharyngeal nerve (IX), 473*f*, 473*t*, 478*b*, 478*t*, 479, 479*f*
  sense of, 515*f*, 516–517, 516*f*, 517*f*
  trigeminal nerve (V), 471*f*, 473*f*, 473*t*, 476, 476*b*, 476*t*, 477*f*, 517
Taste buds, 515*f*, 516–517, 516*f*, 517*f*, 865–866, 865*f*, 1122

  Latin-based body regions, 12–13, 12*f*, 13*t*
  of muscles, 308–309, 309*t*–311*t*, 311
  nervous system, 382–383
  organs, 15
  standardization and eponyms, 6, 25*b*
Testes
  descent of, 1056*f*
  disorders of, 1057, 1057*f*
  embryonic development of, 1056, 1108*f*–1109*f*, 1112–1113, 1112*f*
  endocrine functions of, 584–585, 585*t*
  functions of, 1048–1049, 1048*f*, 1049*f*, 1050*t*
  lobules, 1046–1047, 1046*f*–1048*f*, 1050

Testes—cont'd
location of, 547*f*, 547*t*
microscopic anatomy of, 1047–1048, 1047*f*, 1048*f*
spermatozoa, 1045, 1048–1051, 1048*f*, 1049*f*, 1050*f*
structure and location of, 1045*f*, 1046–1047, 1046*f*, 1052*f*
Testicular cancer, 1057
Testosterone
actions, sources and targets, 548*f*, 549*f*, 584–585, 584*t*, 1082*t*
changes in puberty, 1047–1049, 1049*f*, 1118, 1118*f*
chemical structure of, 50*f*
functions of, 1048–1049, 1049*f*, 1050*t*
levels and sperm production during life span, 1056*f*
negative feedback loop controlling, 1049, 1049*f*
Tetanus, 353*b*, 362, 362*f*
Tetraiodothyronine (T_4), 572, 573*f*, 575*t*, 950, 957
Thalamus, structure and functions of, 429*f*, 431*f*, 432*f*, 433*f*, 434, 435*f*, 447*t*
Thalassemia, 620, 1138, 1140, 1140*f*, 1143*t*
Theca cells, 1067, 1099*f*, 1100*f*, 1101
Theory, defining scientific, 4*f*
Thermoreceptors, 507, 508*t*, 509–510, 510*f*
Thermotaxis, 1102
Theta brainwaves, 442*b*
Thick ascending limb (TAL), 976*f*, 989*t*
Thick skin, 172, 172*f*, 173*f*
Thigh
femur, 224*f*–225*f*, 255, 257, 257*t*, 258*f*
muscles, 308*f*–309*f*, 309*t*–310*t*, 333, 333*f*–339*f*, 333*t*, 338
Thin ascending limb, 976*f*, 989*t*
Thin skin, 172, 172*f*, 173*f*
Third-degree burns, 193, 193*f*
Thirst center, 1010
Thoracic aorta, 648*f*, 649*t*, 650*f*, 651, 652, 653
Thoracic cavity, 10–11, 11*t*, 814–815
Thoracic duct, 724*f*, 725, 737*t*
Thoracic joints, 284*t*
Thoracic nerves, anatomy of, 464, 465*f*, 466, 467*t*, 468
Thoracic spine
bones of, 225*f*, 226*t*, 244*t*, 245, 245*f*–247*f*
nerves, 464, 465*f*, 466, 467*t*, 468
range of motion (ROM), 288*f*
Thoracic vertebrae
anatomy of nerves associated with, 464, 465*f*, 466, 467*t*, 468
heart location in relation to, 630, 631*f*, 632*f*, 639*f*
Thoracolumbar division of ANS, 489*f*, 490–492, 490*f*, 491*f*, 491*t*, 493*f*, 494*t*
Thorax
anatomy of, 224*f*–225*f*, 226*t*, 248, 248*t*, 249*f*
heart location in relation to, 630, 632*f*, 639*f*
movement during breathing, 829–830, 829*f*
muscles, 315, 315*f*, 315*t*
respiratory functions of, 812*t*, 814–815, 814*f*
Threshold levels, in graded strength principle, 364–365, 365*f*
Threshold potential, 395*f*, 395*t*, 396–398, 397*t*, 398*f*
Throat
anatomy and functions of, 800*f*, 801*f*, 802–803, 811*t*
and glossopharyngeal nerve (IX), 473*f*, 473*t*, 478*b*, 478*t*, 479, 479*f*
and tongue muscles, 313, 313*f*
Thrombin, 614–618, 614*f*–616*f*, 615*t*
Thrombocytes, definition of, 152
Thrombophlebitis, 673
Thrombopoiesis, 603*f*, 606*t*, 609
Thrombosis, 617–618, 622
Thromboxane, 556*t*, 557, 557*f*
Thrombus, 622
Thumb
carpometacarpal joint, 280, 284*t*, 292
range of motion (ROM), 290*f*
sesamoid bone of, 201*f*
Thymic corpuscles, 734
Thymocytes, 764
Thymopoietin, 584*t*, 585
Thymosin, 584*t*, 585, 734–735, 735*f*, 737*t*
Thymus
functions of, 584*t*, 585, 734, 737*t*
location, structure and appearance of, 547*f*, 547*t*, 734, 734*f*, 737*t*
Thyroglobulins, 572, 573*f*
Thyroid cartilage, 804*f*, 805
Thyroid colloid, 572, 573*f*
Thyroid gland
abnormalities and disorders of, 574*b*, 587*t*–588*t*
and blood glucose levels, 945, 945*f*
calcitonin, 574–575, 575*b*, 575*t*
hormones, 572–575, 572*f*–573*f*, 574*b*, 575*t*, 950
location of, 547*f*, 547*t*
structure and tissue of, 565*f*, 572, 572*f*, 573*f*
tetraiodothyronine (T_4), 572, 573*f*, 575*t*, 950, 957
thyroxine, 572, 573*f*, 575*t*, 950, 957
triiodothyronine (T_3), 572, 573*f*, 575*t*, 950, 957
Thyroid hormones, 572–575, 573*f*, 575*t*, 950, 957
Thyroid-stimulating hormone (TSH), 565*f*, 567, 571*t*, 574*b*
functions and target organs, 565*f*, 567, 571*t*, 574*b*
role in blood glucose levels, 945, 945*f*
Thyrotrophs, 565, 565*f*
Thyrotropin-releasing hormone (TRH), 567–568, 568*t*, 574*b*
Thyroxine, 572, 573*f*, 575*t*, 950, 957
Tibia
anatomy of, 200*f*, 224*f*–225*f*, 226*t*, 257, 257*t*, 258*f*, 259*b*, 260*f*
case study on fractures of, 267
Tibial veins, 658*f*, 659*t*, 664–665, 664*f*
Tibialis anterior, 308*f*–309*f*, 309, 310*t*, 340, 340*t*, 341*f*
Tibiofemoral joint, 281–283, 283*b*, 283*f*, 284*t*
Tic douloureux, 476*b*
Tickle sensation, 510–511, 511*f*
Tidal volume (TV), 834, 834*f*, 835*t*
Tight junctions
in cells, 84, 84*f*
in epithelial tissue, 137
in testes tissue, 1048, 1048*f*
Tin, 34*f*, 35*t*
Tinea, 189–190, 189*f*
Tinnitus, 534
Tissue plasminogen activator (t-PA), 673
Tissues, 132–160
big picture, 158*b*
body membranes, 155–157, 155*f*, 156*b*, 156*f*, 157*f*, 157*t*
cancer and tumors, 158–160, 158*f*
case study, 162
connective tissue
adipose tissue, 144, 144*t*, 146–147, 146*f*, 147*b*, 147*f*
areolar tissue, 144, 144*t*, 145–146, 145*f*, 146*f*
blood tissue, 133*t*, 152, 152*f*
bone tissue, 133*t*, 149–150, 150*f*, 151*f*
cartilage tissue, 133*t*, 151–152, 151*f*
characteristics of, 143, 144*t*
classification of, 144, 144*t*–145*t*
collagen fibers and bundles, 142*f*–143*f*, 143–144, 144*t*, 148–149, 148*f*, 149*f*
dense fibrous tissue, 144, 144*t*, 148–149, 148*f*, 149*f*
description and structure of, 132, 133*t*, 142*f*–143*f*
elastin fibers, 143, 143*f*, 144*t*, 149, 149*f*, 151, 151*f*
fibrous (proper) tissues, 144, 144*t*, 145–146, 145*f*, 146*f*
functions of, 132, 133*t*, 143
ligaments, 149, 149*f*
loose fibrous tissue, 144, 144*t*, 145–146, 145*f*, 146*f*
membranes, 155, 155*f*, 157, 157*t*
repair of, 154, 155*f*
reticular fibers, 143, 144*t*, 148, 148*f*
tendons, 149, 149*f*
tumors and cancer, 158–160, 158*f*
disease mechanisms, 158–160, 158*f*
epithelial membranes, 155–157, 155*f*, 156*f*, 157*t*
cutaneous membranes, 155*f*, 156, 156*f*, 157*t*
mucous membranes, 155*f*, 156–157, 156*b*, 156*f*, 157*f*, 157*t*
serous membranes, 155*f*, 156, 156*b*, 156*f*, 157*t*
synovial membranes, 155, 155*f*, 156*f*, 157*t*
epithelial tissue
classification of, 136*f*, 137–142, 138*f*, 139*f*, 140*t*, 141*f*, 141*t*, 142*f*
description and structure of, 132, 133*t*
functions of, 132, 133*t*, 135
generalizations regarding, 132, 135–137, 136*f*, 137*b*
glandular epithelium, 140*t*, 141–142, 141*f*, 141*t*
membranous epithelium, 137–141, 137*t*, 138*f*, 139*f*, 140*t*
repair of, 154, 155*f*
tumors, 159*b*
types and locations, 135, 140*t*
extracellular matrix (ECM), 132, 134–135, 134*f*, 135*t*, 143–144, 143*f*
four principle types of, 8, 132, 132*b*, 133*t*
and homeostasis, 132, 158*b*
language of science and medicine, 130, 160–162
as level of body organization, 7*f*, 8
muscle tissue
cardiac muscle tissue, 152–154, 152*t*, 153*f*
description and structure of, 132, 133*t*
location and functions, 132, 133*t*, 152–154, 152*t*, 153*f*
skeletal muscle tissue, 152–153, 152*t*, 153*f*
smooth muscle tissue, 152–154, 152*t*, 153*f*
nervous system tissue
function and structure of, 132, 133*t*, 152*t*, 154
illustration of components of, 154*f*
repair of damaged, 154–155, 155*f*
Toddlers
developmental changes in, 1116–1117, 1117*f*
ossification process in, 210, 210*f*, 211*f*
Toll-like receptors, 748*t*, 755
Tongue
anatomy of, 862*f*, 865–867, 865*f*, 866*f*, 867*f*
and glossopharyngeal nerve (IX), 473*f*, 473*t*, 478*b*, 478*t*, 479, 479*f*
hypoglossal nerves (XII), 473*f*, 473*t*, 480, 480*f*, 480*t*
muscles of, 867*f*
and pharynx muscles, 313, 313*f*
taste buds, 515*f*, 516–517, 516*f*, 517*f*
Tonic contractions, 363
Tonicity
definition of, 341–342
and muscle contractions, 363
Tonsillectomy, 734, 739, 817, 817*f*
Tonsillitis, 733–734, 733*f*, 738–739, 817, 817*f*
Tonsils, 733–734, 733*f*, 737*t*, 800*f*, 801*f*, 803, 811*t*
Total blood volume, 702–704, 703*f*, 704*f*
Total body water, 1004, 1004*f*, 1005*f*, 1018*f*
Total hip replacement (THR), 294*b*
Total knee replacement, 294*b*
Total lung capacity (TLC), 834*f*, 835, 835*t*
Total metabolic rate, 955*f*, 958
Total minute volume, 837, 837*f*
Total peripheral resistance (TPR), 696
Touch
and cerebral cortex, 441*f*, 442–443
sensory receptors, 508*t*, 510–512, 511*f*, 512*t*
Toxic shock syndrome (TSS), 714
Toxins
detoxification by liver, 884, 885*f*, 894
and disease, 61
causing hepatitis, 894
peroxisome detoxification, 76–77
Toxoids, 763*b*
Trabeculae
bone, 150, 150*f*, 151*f*, 205*f*, 206, 206*f*, 209, 209*f*
of lymph nodes, 728, 729*f*
Trabeculae carneae, 634*f*, 636, 636*f*
Trabecular bone, 150, 150*f*, 151*f*, 205*f*, 206, 206*f*, 209, 209*f*
Trachea, anatomy and functions of, 800*f*, 801*f*, 807–808, 807*f*, 808*b*, 812*f*, 812*t*
Tracheostomy, 808*b*
Trachoma, 536
Transabdominal pelvic ultrasound, 1086–1087, 1087*f*
Transcription process
in protein synthesis, 116–117, 116*f*, 117*f*, 119*t*
of RNA molecule, 116–117, 117*f*
Transcriptome, 1134
Transcriptomics, 1134
Transcutaneous stimulation, for spinal curvatures, 266
Transduction, across cells, 72
Transfer RNA (tRNA), 58, 58*f*, 74, 74*f*, 115–119, 115*t*, 117*f*, 119*t*, 120*b*
Transfusion reactions, 609–610, 611*f*
Transitional epithelium, 136*f*, 137, 139, 139*t*, 140*t*, 141
Translation process, in protein synthesis, 117–118, 117*f*, 119*t*
Transmission electron micrograph (TEM), 74, 75*f*, 77*f*, 80*f*
Transplants
bone marrow, 208, 619
corneal, 526*b*
heart, 671
kidney, 997*b*
organ, 773
Transport
direction of, 98*b*–99*b*
disorders of cell, 108, 109*f*
Transpulmonary pressure, 831, 833*f*
Transurethral resection (TUR), 1058
Transverse arch of foot, 259, 260*f*, 260*t*–261*t*
Transverse canals, 204, 205*f*, 207*f*
Transverse colon, 862*f*, 878*f*, 879, 879*f*, 881*f*
Transverse mesocolon, 880*f*, 881, 881*f*
Transverse muscles, 308*f*–309*f*, 309, 310*t*
Transverse plane, 15–16, 15*f*, 16*f*
Transversospinalis muscle group, 318–319, 318*f*–319*f*, 320*t*
Transversus abdominis muscles, 316–317, 316*f*, 316*t*
Trapezium
bones, 253*t*, 254, 254*f*
joints, 279, 279*f*
Trapezius muscles, 308*f*–309*f*, 309*t*–310*t*, 322, 322*t*, 323*f*
Trapezoid
bones, 253*t*, 254, 254*f*
joints, 279, 279*f*
Trauma
accident death rates, 1123*f*
injuries
to joints, 294
to muscle, 372
to nose, 799*b*, 817
paralysis due to nerve fiber, 399*b*
Treppe, 362, 362*f*
Triad of muscle cell, 349*f*, 350, 350*f*
Tricarboxylic acid (TCA) cycle, 936–937, 937*f*
Triceps brachii, 326, 326*f*, 327*f*, 327*t*, 328*f*
Triceps muscles, 308*f*–309*f*, 309*t*–310*t*, 326, 326*f*, 327*f*, 327*t*, 328*f*
Tricuspid valves, 631*f*–633*f*, 638–640, 638*f*, 639*f*, 640*f*
Trigeminal nerve (V), 471*f*, 473*f*, 473*t*, 476, 476*b*, 476*t*, 477*f*, 517
Trigeminal neuralgia, 476*b*
Triglycerides
definition and functions of, 47*t*, 48–49, 49*f*, 51*b*, 946–947, 951*f*
formation of, 49, 49*f*
Trigone, 974–975, 974*f*, 975*f*
Triiodothyronine (T_3), 572, 573*f*, 575*t*, 950, 957
Trimesters, 1107, 1108*f*–1109*f*, 1110*f*
Triplegia, 452
Triquetrum
bones, 253*t*, 254, 254*f*
joints, 279, 279*f*
Trisomy, 1141, 1141*f*, 1144–1145, 1144*f*, 1147
Trisomy 21, Down syndrome, 1144–1145, 1144*f*
Trochlear nerve (IV), 473*f*, 473*t*, 474, 475*t*
Trophoblasts, 1103–1105, 1103*f*, 1104*f*
Tropic hormones, 547–548, 565*f*, 566–567, 566*b*, 569*b*, 571*t*

Tropomyosin, 352–354, 352*f*, 353*b*, 353*f*, 354*f*, 355*f*, 356
Troponins, 352–354, 352*f*, 353*b*, 353*f*, 354*f*, 355*f*, 356
Troponins test, 635*b*
True capillaries, 644, 644*f*
True ribs, 248, 248*t*, 249*t*
Trunk
  abdominal wall muscles, 316–318, 316*f*, 317*f*, 317*t*
  back muscles, 318–319, 318*f*, 320*t*
  muscles, 308*f*–309*f*, 310*t*, 315–321, 315*f*–319*f*, 315*t*, 317*t*, 320*t*, 321*t*, 341–342
  of nerve plexuses, 469*f*, 470*f*
  pelvic floor muscles, 320, 321*f*, 321*t*
  sympathetic, 491, 491*f*
  thorax muscles, 315, 315*f*, 315*t*
  trunk muscles, 315–321, 315*f*–319*f*, 315*t*, 317*t*, 320*t*, 321*t*, 341–342
Trypsin, 908, 910, 913*t*, 914–915, 916, 925
Trypsinogen, 913*t*, 916
Tubal pregnancies, 1124
Tuberculosis, 818
Tubular exocrine glands, 141, 141*f*, 141*t*
Tubular reabsorption, definition of, 982–983
Tubular secretion
  definition of, 982–983
  as urinary system function, 985*f*–988*f*, 989, 989*t*
Tubuloglomerular feedback, 991, 991*f*
Tumor markers, 159, 766*b*
Tumor suppressor genes, 159, 1146
Tumors
  benign *versus* malignant, 158–160
  and cancer of connective tissue, 158–160, 158*f*
  classification of, 158–160
  definition of, 27
  epithelial tissue, 159*b*
  female reproductive system, 1088–1090, 1089*f*, 1090*f*
  formation with mitosis abnormalities, 126*b*
  lymphoma, 159, 739
  of nervous system, 411–412
  of urinary system, 995
Tumor-specific antigens, 766*b*
Tunica albuginea, 1046–1047, 1046*f*–1048*f*, 1050
Tunica externa, 643*f*, 643*t*, 646
Tunica intima, 643*f*, 643*t*, 646–647
Tunica media, 643*f*, 643*t*, 646–647
Turbinates, 227*f*, 237*t*, 239*f*, 800–801, 801*f*, 803*f*, 811*t*
Turbulent blood flow, 705–706, 706*b*
Turgor, 1012, 1012*b*
Turner syndrome, 1145, 1145*f*
Turnover time, of epidermis, 174–175
Twins, 1115, 1115*f*
Twitch contraction, 358*b*, 361–362, 361*f*
Two-point discrimination test, 507
Tympanic membrane, 518*f*, 519
Tympanotomy tube, 534–535
Type A behavior, 791*t*, 792*b*
Type II cells, 832*b*
Typical cells, 67–68, 68*f*
Tyrosine kinase inhibitors, 160

U

U waves, 687, 687*f*
Ubiquitins, 76
Ulcerative colitis, 773*t*, 893, 893*f*, 894
Ulcers, 791*t*, 892, 892*f*
Ulna, 200*f*, 224*f*–225*f*, 226*t*, 251, 252*f*, 253*f*, 253*t*, 254*f*, 259*b*
Ultrasonography
  in antenatal medicine, 1110*b*
  for cancer detection, 159
Ultrasound
  lithotripsy, 886, 994
  transabdominal pelvic, 1086–1087, 1087*f*
Ultraviolet (UV) radiation
  melanosomes, 178–179, 178*f*
  tanning, 179*f*, 180
  and vitamin D production, 182, 182*f*
  and xeroderma pigmentosum, 1146
Umbilical arteries, 665–668, 666*f*–668*f*
Umbilical cord, 667*f*, 1105*f*, 1113*f*
Umbilical veins, 665–668, 666*f*–668*f*
Uncompensated acidosis, 1032
Uncompensated alkalosis, 1032
Uniaxial joints, 275, 275*f*, 276*t*, 284*t*
Unicellular glands, 141–142
Unipennate muscles, 304, 304*f*
Unipolar (pseudounipolar) neurons, 390, 390*f*
Uniporter, 98*b*
United States Food Guide Plate, 932*f*
Unsaturated fats, *versus* saturated, 946–947, 946*b*
Unsaturated fatty acids, definition and illustration of, 48–49, 49*f*
Upper esophageal sphincter (UES), 870*f*, 871
Upper extremities
  appendicular bones of, 224*f*–225*f*, 226*t*, 250–251, 250*f*, 251*t*–253*t*, 252*f*–254*f*
  arm movement muscles, 324*f*, 324*t*, 325, 325*b*, 326*f*, 328*f*
  arteries of, 649*t*, 654, 654*f*, 655*f*
  forearm movement muscles, 326, 326*f*, 327*f*, 327*t*, 328*f*, 329*f*, 332*f*
  joints of, 279–280, 279*f*, 280*f*
  mobility in big picture, 292
  muscles of, 322–332, 326*f*
  nerves of, 464–471
  rotator cuff muscles, 324*t*, 325, 325*b*, 325*f*
  shoulder girdle muscles, 322, 322*t*, 323*f*
  wrist, hand, and finger muscles, 329, 329*f*, 330*t*, 331–332, 331*b*
Upper respiratory tract infection (URI), 816
Upper respiratory tract (URT)
  anatomy of, 799–806, 800*f*, 801*f*, 811*t*–812*t*
    larynx, 800*f*, 801*f*, 803–805, 804*f*, 805*f*, 811*t*–812*t*
    nose, 799–802, 799*b*, 800*f*, 801*f*, 802*b*, 802*f*, 803*f*, 811*t*
    pharynx, 800*f*, 801*f*, 802–803, 811*t*
  disorders of, 816–817, 817*f*
Up-regulation, 555, 555*f*
Uranium, 34*f*, 36
Urea
  contents of, 985
  role of kidney in filtering, 982
Uremia, 996, 997*f*
Uremic syndrome, 996, 997*f*
Ureter, 971*f*–975*f*, 973–974
Ureter-bladder junction, 973–974, 974*f*
Urethra, 971*f*, 974*f*, 975–976, 975*f*, 1045*f*, 1046, 1052*f*
Urethral sphincter muscles, 320, 321*f*, 321*t*, 974*f*, 975–976
Urethritis, 995
Urinary bladder
  anatomy of, 971*f*, 974–975, 974*f*
  effects of aging on, 1121
  location in female reproductive area, 1064*f*, 1065*f*
Urinary catheterization, 995
Urinary incontinence, 976
Urinary system; *See also* kidneys; urine
  and acid-base homeostasis, 1035*f*
  big picture, 993
  blood supply, 973, 973*f*, 976, 980, 980*f*, 981*f*, 989*t*
  case study, 999
  disorders of, 994–997
  effects of aging on, 1121
  excretion functions of, 971*b*
  gross anatomy of
    kidneys, 971–973, 971*f*–976*f*, 972*b*, 981*f*
    ureter, 971*f*–975*f*, 973–974
    urethra, 971*f*, 974*f*, 975–976, 975*f*
    urinary bladder, 971*f*, 974–975, 974*f*
  microscopic structure of
    blood supply of nephron, 973, 973*f*, 980, 981*f*, 989*t*, 991*f*
    collecting ducts, 976, 976*f*–982*f*, 980, 989*t*
    nephron types, 976, 981, 981*f*, 989*t*
    nephrons, 976–980, 976*f*–980*f*, 989*t*
  organs and functional overview of, 7*f*, 9*t*, 971–972, 971*f*, 972*f*
  and pH control, 1028*f*, 1033–1035, 1034*f*, 1035*f*
  physiology of
    filtration, 982–983, 982*f*, 989*t*
    glomerular filtration rate (GFR), 983, 983*f*, 984*b*, 989*t*, 991, 991*f*
    kidney functional overview, 971, 982, 982*f*, 989*t*, 993
    reabsorption, 984–989, 985*f*–988*f*, 989*t*
    tubular secretion, 984–989, 985*f*–988*f*, 989*t*
    urine composition, 992
    urine volume regulation, 989–992, 989*f*, 990*f*
Urinary tract infections (UTIs), 995–996
Urination
  effects of aging on, 1121
  filtration, 982–983, 982*f*, 989*t*
  glomerular filtration rate (GFR), 983, 983*f*, 984*b*, 989*t*, 991, 991*f*
  kidney functional overview, 971, 982, 982*f*, 989*t*, 993
  process and reflexes, 975–976, 975*f*
  reabsorption, 984–989, 985*f*–988*f*, 989*t*
  tubular secretion, 984–989, 985*f*–988*f*, 989*t*
  urine composition, 992
  urine volume regulation, 989–992, 989*f*, 990*f*
Urine
  characteristics and composition of, 992, 992*t*
  clinical terms for abnormalities, 994*b*
  filtration process to produce, 976*f*–979*f*, 982–983, 982*f*, 983*f*, 984*b*, 989*t*
  glomerular filtration rate (GFR), 983, 983*f*, 984*b*, 989*t*, 991, 991*f*
  macula densa aiding formation of, 976, 976*f*–982*f*, 980, 984, 985*f*
  pH levels and control, 1028*f*, 1033–1035, 1034*f*, 1035*f*
  production of hypertonic, 988*f*
  urine volume regulation, 989–992, 989*f*, 990*f*
Urogenital triangle, 320, 321*f*, 321*t*, 1046–1047, 1046*f*, 1065*f*
Urticaria, 190
Uterine cancer, 1080*b*, 1090
Uterine fibroids, 1087, 1088–1089
Uterine tubes; *See* fallopian tubes
Uterosacral ligaments, 1064*f*, 1066*f*, 1069
Uterus
  anatomy of, 1064*f*–1066*f*, 1068–1070
  cavities, 1066*f*, 1069–1070
  control of cyclical changes, 1077, 1078*f*
  functions of, 1070
  illustration of full-term fetus in, 1113*f*
  ligaments, 1064*f*, 1068–1069, 1069*f*
  wall layers, 1066*f*, 1069, 1069*f*

Zymogenic cells, 914–915, 915*f*

PLUS: Activate Your 1-Year Access to Netter's 3D Interactive Anatomy

How to Register:

1. Gently scratch off the surface of the sticker at right with the edge of a coin to reveal your PIN code.
2. Visit www.interactelsevier.com.
3. Click on Activate Pin and follow the simple registration.

NOTE: Product cannot be returned once panel is scratched off.

4 Quick Tips to get started:

1. Install 3DVIA. When you first launch the software, you will be prompted to install 3DVIA (www.3dvia.com)
2. You have a MENTOR. When prompted to select either 'new user' or 'experienced user' - select 'new user'. This will automatically open the Mentor tool - a built in help guide.
3. Build Anatomy. You need to select body systems and/or major organs and joints to use most functions of this software.
4. Mouse Controls. The mouse is the easiest way to move your anatomy model.

Videos are available to get you started at http://www.interactelsevier.com/previews

InteractElsevier powered by Cyber-Anatomy

F. Netter M.D.

Activate your PIN today at www.interactelsevier.com

Access to, and online use of, content through the InteractElsevier website is for individual use only; library and institutional access and use are strictly prohibited. For information on products and services available for institutional access, please contact our Account Support Center at (+1) 877-857-1047. **Important note:** Purchase of this product includes access to Netter's 3D Interactive Anatomy for use exclusively by the individual purchaser from the launch of the site. This license and access to Netter's 3D Interactive Anatomy operates strictly on the basis of a single user per PIN number. The sharing of passwords is strictly prohibited, and any attempt to do so will invalidate the password. Access may not be shared, resold, or otherwise circulated, and will terminate 1 year from activation of PIN. Full details and terms of use are available upon registration, and access will be subject to your acceptance of these terms of use.

Contents in Brief

UNIT ONE The Body as a Whole, 1	Introduction	Seeing the Big Picture, 2
	Chapter 1	Organization of the Body, 3
	Chapter 2	The Chemical Basis of Life, 33
	Chapter 3	Anatomy of Cells, 66
	Chapter 4	Physiology of Cells, 90
	Chapter 5	Cell Growth and Reproduction, 113
	Chapter 6	Tissues, 131
UNIT TWO Support and Movement, 169	Chapter 7	Skin and Its Appendages, 170
	Chapter 8	Skeletal Tissues, 199
	Chapter 9	Skeletal System, 223
	Chapter 10	Articulations, 271
	Chapter 11	Anatomy of the Muscular System, 301
	Chapter 12	Physiology of the Muscular System, 347
UNIT THREE Communication, Control, and Integration, 379	Chapter 13	Nervous System Cells, 380
	Chapter 14	Central Nervous System, 420
	Chapter 15	Peripheral Nervous System, 463
	Chapter 16	Autonomic Nervous System, 488
	Chapter 17	Sense Organs, 505
	Chapter 18	Endocrine Regulation, 545
	Chapter 19	Endocrine Glands, 563
UNIT FOUR Transportation and Defense, 597	Chapter 20	Blood, 598
	Chapter 21	Anatomy of the Cardiovascular System, 629
	Chapter 22	Physiology of the Cardiovascular System, 681
	Chapter 23	Lymphatic System, 722
	Chapter 24	Immune System, 745
	Chapter 25	Stress, 782
UNIT FIVE Respiration, Nutrition, and Excretion, 797	Chapter 26	Anatomy of the Respiratory System, 798
	Chapter 27	Physiology of the Respiratory System, 823
	Chapter 28	Anatomy of the Digestive System, 861
	Chapter 29	Physiology of the Digestive System, 901
	Chapter 30	Nutrition and Metabolism, 931
	Chapter 31	Urinary System, 970
	Chapter 32	Fluid and Electrolyte Balance, 1003
	Chapter 33	Acid-Base Balance, 1025
UNIT SIX Reproduction and Development, 1043	Chapter 34	Male Reproductive System, 1044
	Chapter 35	Female Reproductive System, 1063
	Chapter 36	Growth and Development, 1096
	Chapter 37	Genetics and Heredity, 1131

ELSEVIER

YOU'VE JUST PURCHASED MORE THAN A TEXTBOOK

ACTIVATE THE COMPLETE LEARNING EXPERIENCE THAT COMES WITH YOUR BOOK BY REGISTERING AT

http://evolve.elsevier.com/Patton/AP

Once you register, you will have access to your FREE STUDY TOOLS:

- **Anatomy and Physiology Online**
  All body systems are covered in the 24 modules of this course, providing you with animations, interactive exercises, quizzes, and exams, which allow for content review and comprehension.
- **A&P Connect**
  More than 60 supplemental articles referenced throughout the text provide you with bonus material on topics beyond basic A&P studies. Articles such as radioactivity, disease as a weapon, and stem cell research give you easy access to current topics in this area.
- **Audio Chapter Summaries**
  Downloadable MP3s allow you to listen to chapter summaries anywhere, making your A&P studies both convenient and portable!
- **Audio Glossary**
  Definitions and audio pronunciations of more than 1000 terms from the *Anatomy & Physiology* glossary improve your vocabulary comprehension.
- **Online Tutoring**
  Online help from expert mentors gives you support with any questions you may have regarding anatomy and physiology.
- **Post-Test Questions**
  Each chapter has its own multiple choice quiz with instant feedback to help you measure your knowledge—over 500 questions in all!
- **Body Spectrum Electronic Coloring Book**
  With more than 80 illustrations that you can color online or offline, this provides a fun and effective way to reinforce elements from the textbook.
- **Answers to Case Studies**
  All answers and rationales to the case studies in each chapter help you understand real-life A&P scenarios.
- **Answers to Quick Check Questions**
  All answers to the Quick Check questions that appear throughout each chapter help you focus on the most important topics in the book.
- **Frequently Asked Questions**
  Common questions related to the material covered in the textbook with answers from the authors guide you through difficult A&P topics.
- **WebLinks**
  A carefully selected set of websites, organized by chapter, supplement the content of the book.

REGISTER TODAY!

A & P Connect

Connecting A&P topics with current research and bonus material in the field! Visit the Evolve website for full articles: http://evolve.elsevier.com.

Amazing Amino Acids: Summarizes the importance of amino acids in the body by highlighting some of the uses made of them in the body. Clarifies which amino acids are used for protein synthesis.

Arrest of Oocyte Development: Explains the advantage of arresting the development of the oocyte during meiosis and how meiosis resumes.

Artificial Cardiac Pacemakers: Discusses the artificial pacemaker, a device implanted into patients whose own natural pacemakers fail to maintain healthy heart rhythms.

Biomimicry: Describes the research being done in mimicking cell functions in order to efficiently manufacture synthetic versions of natural substances, drugs, and other complex molecules.

Blood Transfusions: Discusses the concepts behind blood transfusions, artificial blood, and converting one type of blood to another.

Bone Fractures: Describes the many types of bone fractures, how they occur, and how are they treated.

Bone Scans: Explains how radioactive compounds can be used in imaging of the bones.

Brain Studies: Discusses medical imaging techniques that can identify brain disorders and can further the studies of the science of the brain.

Breast Self-Examination: Illustrates the process of breast self-examination, something both men and women should perform regularly to detect changes that might indicate mastitis or breast cancer.

Cardiac Nuclear Scanning: Explains the method of evaluating the heart by injecting the patient with a radioactive substance and using a gamma-ray detector to create an image.

Chromosome Territories: Illustrates and summarizes the concept of localization of chromosomes within a cell's nucleus.

Clinical and Laboratory Values: Lists data on substances in the body that are commonly measured and how to convert some of these values into the International System (SI) of units.

Detailed Map of the Nephron: Expands on the simplified scheme of microscopic renal anatomy that is presented in the book, by providing a detailed illustration of the nephron.

Determining the Potential Osmotic Pressure of a Solution: Provides explanations, equations, and examples for calculating the osmotic pressure of a solution.

Diabetes Mellitus: Describes one of the most common endocrine disorders, how it affects a person's health, and how to treat it.

Disease as a Weapon: Describes how the intentional transmission of disease, such as anthrax, can be used as a weapon of terror.

DNA Analysis: Outlines some of the methods available for analyzing the genetic makeup of individuals, including electrophoresis, DNA fingerprinting, and the gene chip.

Echocardiography: Explains how ultrasound beams directed into the patient's chest can be used to evaluate the internal structures and motions of the heart and great vessels.

Electrocardiography: Describes electrocardiography and how different placements of electrodes, or leads, can show electrical activity of the heart from different angles.

Embryonic Development of Tissues: Illustrates the concept of the primary germ layers and what body structures these layers eventually give rise to.

Epigenetics: Explains epigenetics, the inheritance of traits by means other than a DNA sequence, and how it leads to different methods of disease transmission.

Freezing Umbilical Cord Blood: Discusses how freezing umbilical cord blood can have clinical significance because stem cells from this blood can be used in place of bone marrow transplants.

Functional Foods: Explains one of the hottest fields in nutrition, functional foods, which are foods thought to prevent disease.

Gallstones and Weight Loss: Discusses gallstones, how they are formed and treated, and their association with weight loss and dieting.

Genes and Longevity: Discusses the possibility of using the genetic discovery of "longevity genes" to lengthen the lives of people through the use of gene therapy.

Heart Attack!: Illustrates the steps of a heart attack, or myocardial infarction, a common cause of death in middle to late adulthood.

Heimlich Maneuver: Outlines the steps of the Heimlich Maneuver, also called *abdominal thrusts*, for situations in which the patient is standing or lying on the ground, as well as for an infant.

Hernias: Describes the common types of hernias, protrusions of organs through body cavity walls.

How to Trace the Flow of Blood: Outlines how to trace blood flow through the body and provides a diagram for visual reference.

Hydrocephalus: Describes hydrocephalus, a condition in which cerebrospinal fluid produces abnormal fluid pressure in the brain, and how it can be treated.

In Vitro Fertilization: Describes some of the many assistive reproductive techniques, including in vitro fertilization, that are available to promote reproductive success.

Inflammation: Outlines the events of the inflammatory response and its effects on the tissues of the body.

Leverage: Explains the mechanical advantage gained in a lever system and how muscles, joints, and bones form lever systems in the body.

Male Circumcision: Discusses male circumcision, including why it is done, how it is performed, and the controversy that surrounds it.

Male Genital Self-Examination: Explains male genital self-examination, which should be done regularly to check for lumps, changes in size, changes in texture of a testis, or surface abnormalities.

A & P Connect—continued from previous page

Measuring Bone Mineral Density: Describes osteoporosis, a disease characterized by increased bone porosity and reduced mineral density and mass, and explains how to measure bone mineral density.

Measuring Energy: Explains the units of measuring energy, the joule and the calorie, and the energy values of selected nutrients and activites.

Medical Imaging of the Body: Describes medical imaging techniques that allow physicians to visualize internal structures of the body without risking the trauma or other complications associated with extensive surgery.

Meth Mouth: Summarizes the disorder caused by methamphetamine abuse.

Metric Measurements and Their Equivalents: Provides tables showing metric units of measurement, the prefixes used with metric units, and some common conversion factors that can be used in A&P studies.

Monoclonal Antibodies and Nanobodies: Describes how scientists are able to produce large quantities of pure antibodies, monoclonal antibodies, and tiny antibody fragments (nanobodies) that can be used to treat disease.

Nerve Zero: Discusses the very thin nerve discovered after the classic list of 12, the terminal nerve, or nerve zero.

The Nobel Legacy: Lists the major physiology and medicine breakthroughs of the past century that have earned Nobel Prizes.

Oxygen Debt: Outlines the factors that produce the oxygen debt, the excess oxygen needed after anaerobic exercise.

Oxygen Supplements: Explains how oxygen therapy can be used to treat disease and improve athletic performance, and can even be used recreationally at "oxygen bars."

Oxygen-Binding Proteins: Explains the oxygen-binding proteins other than hemoglobin that are important to human physiology.

Pain Control Areas: Discusses pain control areas, areas where pain signals heading toward the conscious brain can be inhibited, and how they have led to pain-reducing therapies.

Pheromones and the Vomeronasal Organ: Describes pheromones, signaling molecules that other individuals detect, and the vomeronasal organ, which is thought to detect them.

Photodynamic Therapy: Outlines this treatment of certain lung cancers, in which photosensitizing drugs are injected into the patient and a laser causes a chemical reaction with the drugs, thereby destroying cancerous cells.

Protective Strategies of the Respiratory Tract: Provides a table summarizing the important protective mechanisms that operate in each segment of the respiratory airways.

Pulmonary Radiology: Explains the types of x-ray studies that can be done to detect bronchial and lung disorders, including standard x-rays, bronchiograms, and arteriograms.

Radioactivity: Describes how radioactivity works and what effects it can have on the human body.

Refractive Eye Surgery: Discusses the common refractive eye surgeries and how they are performed.

Retrograde Signaling: Explains the process of retrograde signaling, or signals being sent backward at a synapse.

Sexually Transmitted Diseases: Illustrates and describes some of the sexually transmitted diseases that occur in both males and females.

Skeletal Radiography: Illustrates skeletal radiography, or x-ray photography, with a description and radiographs of several parts of the body.

Skeletal Variations: Describes the natural variations in the human skeleton, including male and female variations and age-related variations.

Skin Cancer: Explains and illustrates the different types of skin cancer and how they are treated.

Sleep: Outlines the stages of the sleep cycle, including what happens to the body during each of the stages.

Specialization of Cerebral Hemispheres: Explains the specialization of the two hemispheres of the brain and illustrates some of the suggested "special talents" attributed to each side of the brain.

Stem Cell Research: Discusses a controversial topic of scientific research, including the different types of stem cells and how stem cell research could help in cell therapy, the use of special cells to treat disease.

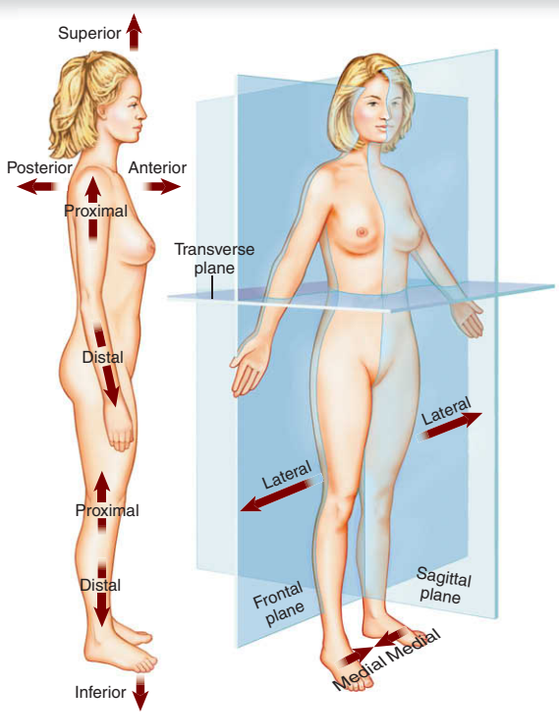
Summary of Gas Exchange: Summarizes some of the essential concepts of gas exchange with a description and a simplified illustration.

Swollen Larynx: Describes and illustrates syndromes that involve a swollen larynx, a potentially lethal condition.

Tools of Microscopic Anatomy: Explains and gives examples of the most common tools in microscopic anatomy: light microscopy, scanning and transmission electron microscopy, and atomic force microscopy.

Tracing Blood Flow in the Kidney: Summarizes the flow of blood in the kidney by providing a simplified flow chart and comparing it to the flow of the blood through the body.

Using Gene Therapy: Summarizes the origins and early history of using gene therapy to treat genetic disorders.



Vertigo and Ear Rocks: Describes the sensation of vertigo, how "ear rocks" can cause this condition, and how to treat them.

Visualizing the Urinary Tract: Explains two methods of medical imaging used to examine the urinary tract: retrograde pyelogram and intravenous pyelogram.

Whole-Body Muscle Mechanics: Discusses how muscles are made up of muscle fibers and many layers of connective tissues, all working together to provide movement and maintain posture.

Anatomical Directions

DIRECTIONAL TERM	DEFINITION	EXAMPLE OF USAGE
Left	To the left of body (not *your* left, the subject's)	The stomach is to the *left* of the liver.
Right	To the right of the body or structure being studied	The *right* kidney is damaged.
Lateral	Toward the side; away from the midsagittal plane	The eyes are *lateral* to the nose.
Medial	Toward the midsagittal plane; away from the side	The eyes are *medial* to the ears.
Anterior	Toward the front of the body	The breastbone (sternum) is *anterior* to the heart.
Posterior	Toward the back (rear) of the body	The heart is *posterior* to the breastbone (sternum).
Superior	Toward the top of the body	The shoulders are *superior* to the hips.
Inferior	Toward the bottom of the body	The stomach is *inferior* to the heart.
Dorsal	Along (or toward) the vertebral surface of the body	Her scar is along the *dorsal* surface.
Ventral	Along (toward) the belly surface of the body	The navel is on the *ventral* surface.
Caudad (caudal)	Toward the tail (used for 4-legged animals)	The neck is *caudad* to the skull.
Cephalad	Toward the head (used for 4-legged animals)	The neck is *cephalad* to the tail.
Proximal	Toward the trunk (describes relative position in a limb or other appendage)	The joint is *proximal* to the toenail.
Distal	Away from the trunk or point of attachment	The hand is *distal* to the elbow.
Visceral	Toward an internal organ; away from the outer wall (describes positions inside a body cavity)	This organ is covered with the *visceral* layer of the membrane.
Parietal	Toward the wall; away from the internal structures	The abdominal cavity is lined with the *parietal* peritoneal membrane.
Deep	Toward the inside of a part; away from the surface	The thigh muscles are *deep* to the skin.
Superficial	Toward the surface of a part; away from the inside	The skin is a *superficial* organ.
Medullary	Refers to an inner region, or medulla	The *medullary* portion contains nerve tissue.
Cortical	Refers to an outer region, or cortex	The *cortical* area produces hormones.
Ipsilateral	On the same side of the body as	The left knee is *ipsilateral* to the left ankle.
Contralateral	On the opposite side of the body	The left knee is *contralateral* to the right knee.

To make the reading of anatomical figures a little easier, an anatomical compass is used throughout this book. On many figures, you will notice a small compass rosette similar to those on geographical maps. Rather than being labeled *N*, *S*, *E*, and *W*, the anatomical rosette is labeled with abbreviated anatomical directions.

A = Anterior	**P** (opposite A) = Posterior
D = Distal	**P** (opposite D) = Proximal
I = Inferior	**S** = Superior
L (opposite M) = Lateral	**M** = Medial
L (opposite R) = Left	**R** = Right

Contents in Brief

UNIT ONE The Body as a Whole, 1	Introduction	Seeing the Big Picture, 2
	Chapter 1	Organization of the Body, 3
	Chapter 2	The Chemical Basis of Life, 33
	Chapter 3	Anatomy of Cells, 66
	Chapter 4	Physiology of Cells, 90
	Chapter 5	Cell Growth and Reproduction, 113
	Chapter 6	Tissues, 131
UNIT TWO Support and Movement, 169	Chapter 7	Skin and Its Appendages, 170
	Chapter 8	Skeletal Tissues, 199
	Chapter 9	Skeletal System, 223
	Chapter 10	Articulations, 271
	Chapter 11	Anatomy of the Muscular System, 301
	Chapter 12	Physiology of the Muscular System, 347
UNIT THREE Communication, Control, and Integration, 379	Chapter 13	Nervous System Cells, 380
	Chapter 14	Central Nervous System, 420
	Chapter 15	Peripheral Nervous System, 463
	Chapter 16	Autonomic Nervous System, 488
	Chapter 17	Sense Organs, 505
	Chapter 18	Endocrine Regulation, 545
	Chapter 19	Endocrine Glands, 563
UNIT FOUR Transportation and Defense, 597	Chapter 20	Blood, 598
	Chapter 21	Anatomy of the Cardiovascular System, 629
	Chapter 22	Physiology of the Cardiovascular System, 681
	Chapter 23	Lymphatic System, 722
	Chapter 24	Immune System, 745
	Chapter 25	Stress, 782
UNIT FIVE Respiration, Nutrition, and Excretion, 797	Chapter 26	Anatomy of the Respiratory System, 798
	Chapter 27	Physiology of the Respiratory System, 823
	Chapter 28	Anatomy of the Digestive System, 861
	Chapter 29	Physiology of the Digestive System, 901
	Chapter 30	Nutrition and Metabolism, 931
	Chapter 31	Urinary System, 970
	Chapter 32	Fluid and Electrolyte Balance, 1003
	Chapter 33	Acid-Base Balance, 1025
UNIT SIX Reproduction and Development, 1043	Chapter 34	Male Reproductive System, 1044
	Chapter 35	Female Reproductive System, 1063
	Chapter 36	Growth and Development, 1096
	Chapter 37	Genetics and Heredity, 1131

ELSEVIER

YOU'VE JUST PURCHASED MORE THAN A TEXTBOOK

ACTIVATE THE COMPLETE LEARNING EXPERIENCE THAT COMES WITH YOUR BOOK BY REGISTERING AT

http://evolve.elsevier.com/Patton/AP

Once you register, you will have access to your FREE STUDY TOOLS:

- **Anatomy and Physiology Online**
  All body systems are covered in the 24 modules of this course, providing you with animations, interactive exercises, quizzes, and exams, which allow for content review and comprehension.
- **A&P Connect**
  More than 60 supplemental articles referenced throughout the text provide you with bonus material on topics beyond basic A&P studies. Articles such as radioactivity, disease as a weapon, and stem cell research give you easy access to current topics in this area.
- **Audio Chapter Summaries**
  Downloadable MP3s allow you to listen to chapter summaries anywhere, making your A&P studies both convenient and portable!
- **Audio Glossary**
  Definitions and audio pronunciations of more than 1000 terms from the *Anatomy & Physiology* glossary improve your vocabulary comprehension.
- **Online Tutoring**
  Online help from expert mentors gives you support with any questions you may have regarding anatomy and physiology.
- **Post-Test Questions**
  Each chapter has its own multiple choice quiz with instant feedback to help you measure your knowledge—over 500 questions in all!
- **Body Spectrum Electronic Coloring Book**
  With more than 80 illustrations that you can color online or offline, this provides a fun and effective way to reinforce elements from the textbook.
- **Answers to Case Studies**
  All answers and rationales to the case studies in each chapter help you understand real-life A&P scenarios.
- **Answers to Quick Check Questions**
  All answers to the Quick Check questions that appear throughout each chapter help you focus on the most important topics in the book.
- **Frequently Asked Questions**
  Common questions related to the material covered in the textbook with answers from the authors guide you through difficult A&P topics.
- **WebLinks**
  A carefully selected set of websites, organized by chapter, supplement the content of the book.

A & P Connect

Connecting A&P topics with current research and bonus material in the field! Visit the Evolve website for full articles: http://evolve.elsevier.com.

Amazing Amino Acids: Summarizes the importance of amino acids in the body by highlighting some of the uses made of them in the body. Clarifies which amino acids are used for protein synthesis.

Arrest of Oocyte Development: Explains the advantage of arresting the development of the oocyte during meiosis and how meiosis resumes.

Artificial Cardiac Pacemakers: Discusses the artificial pacemaker, a device implanted into patients whose own natural pacemakers fail to maintain healthy heart rhythms.

Biomimicry: Describes the research being done in mimicking cell functions in order to efficiently manufacture synthetic versions of natural substances, drugs, and other complex molecules.

Blood Transfusions: Discusses the concepts behind blood transfusions, artificial blood, and converting one type of blood to another.

Bone Fractures: Describes the many types of bone fractures, how they occur, and how are they treated.

Bone Scans: Explains how radioactive compounds can be used in imaging of the bones.

Brain Studies: Discusses medical imaging techniques that can identify brain disorders and can further the studies of the science of the brain.

Breast Self-Examination: Illustrates the process of breast self-examination, something both men and women should perform regularly to detect changes that might indicate mastitis or breast cancer.

Cardiac Nuclear Scanning: Explains the method of evaluating the heart by injecting the patient with a radioactive substance and using a gamma-ray detector to create an image.

Chromosome Territories: Illustrates and summarizes the concept of localization of chromosomes within a cell's nucleus.

Clinical and Laboratory Values: Lists data on substances in the body that are commonly measured and how to convert some of these values into the International System (SI) of units.

Detailed Map of the Nephron: Expands on the simplified scheme of microscopic renal anatomy that is presented in the book, by providing a detailed illustration of the nephron.

Determining the Potential Osmotic Pressure of a Solution: Provides explanations, equations, and examples for calculating the osmotic pressure of a solution.

Diabetes Mellitus: Describes one of the most common endocrine disorders, how it affects a person's health, and how to treat it.

Disease as a Weapon: Describes how the intentional transmission of disease, such as anthrax, can be used as a weapon of terror.

DNA Analysis: Outlines some of the methods available for analyzing the genetic makeup of individuals, including electrophoresis, DNA fingerprinting, and the gene chip.

Echocardiography: Explains how ultrasound beams directed into the patient's chest can be used to evaluate the internal structures and motions of the heart and great vessels.

Electrocardiography: Describes electrocardiography and how different placements of electrodes, or leads, can show electrical activity of the heart from different angles.

Embryonic Development of Tissues: Illustrates the concept of the primary germ layers and what body structures these layers eventually give rise to.

Epigenetics: Explains epigenetics, the inheritance of traits by means other than a DNA sequence, and how it leads to different methods of disease transmission.

Freezing Umbilical Cord Blood: Discusses how freezing umbilical cord blood can have clinical significance because stem cells from this blood can be used in place of bone marrow transplants.

Functional Foods: Explains one of the hottest fields in nutrition, functional foods, which are foods thought to prevent disease.

Gallstones and Weight Loss: Discusses gallstones, how they are formed and treated, and their association with weight loss and dieting.

Genes and Longevity: Discusses the possibility of using the genetic discovery of "longevity genes" to lengthen the lives of people through the use of gene therapy.

Heart Attack!: Illustrates the steps of a heart attack, or myocardial infarction, a common cause of death in middle to late adulthood.

Heimlich Maneuver: Outlines the steps of the Heimlich Maneuver, also called *abdominal thrusts*, for situations in which the patient is standing or lying on the ground, as well as for an infant.

Hernias: Describes the common types of hernias, protrusions of organs through body cavity walls.

How to Trace the Flow of Blood: Outlines how to trace blood flow through the body and provides a diagram for visual reference.

Hydrocephalus: Describes hydrocephalus, a condition in which cerebrospinal fluid produces abnormal fluid pressure in the brain, and how it can be treated.

In Vitro Fertilization: Describes some of the many assistive reproductive techniques, including in vitro fertilization, that are available to promote reproductive success.

Inflammation: Outlines the events of the inflammatory response and its effects on the tissues of the body.

Leverage: Explains the mechanical advantage gained in a lever system and how muscles, joints, and bones form lever systems in the body.

Male Circumcision: Discusses male circumcision, including why it is done, how it is performed, and the controversy that surrounds it.

Male Genital Self-Examination: Explains male genital self-examination, which should be done regularly to check for lumps, changes in size, changes in texture of a testis, or surface abnormalities.

A & P Connect—continued from previous page

Measuring Bone Mineral Density: Describes osteoporosis, a disease characterized by increased bone porosity and reduced mineral density and mass, and explains how to measure bone mineral density.

Measuring Energy: Explains the units of measuring energy, the joule and the calorie, and the energy values of selected nutrients and activites.

Medical Imaging of the Body: Describes medical imaging techniques that allow physicians to visualize internal structures of the body without risking the trauma or other complications associated with extensive surgery.

Meth Mouth: Summarizes the disorder caused by methamphetamine abuse.

Metric Measurements and Their Equivalents: Provides tables showing metric units of measurement, the prefixes used with metric units, and some common conversion factors that can be used in A&P studies.

Monoclonal Antibodies and Nanobodies: Describes how scientists are able to produce large quantities of pure antibodies, monoclonal antibodies, and tiny antibody fragments (nanobodies) that can be used to treat disease.

Nerve Zero: Discusses the very thin nerve discovered after the classic list of 12, the terminal nerve, or nerve zero.

The Nobel Legacy: Lists the major physiology and medicine breakthroughs of the past century that have earned Nobel Prizes.

Oxygen Debt: Outlines the factors that produce the oxygen debt, the excess oxygen needed after anaerobic exercise.

Oxygen Supplements: Explains how oxygen therapy can be used to treat disease and improve athletic performance, and can even be used recreationally at "oxygen bars."

Oxygen-Binding Proteins: Explains the oxygen-binding proteins other than hemoglobin that are important to human physiology.

Pain Control Areas: Discusses pain control areas, areas where pain signals heading toward the conscious brain can be inhibited, and how they have led to pain-reducing therapies.

Pheromones and the Vomeronasal Organ: Describes pheromones, signaling molecules that other individuals detect, and the vomeronasal organ, which is thought to detect them.

Photodynamic Therapy: Outlines this treatment of certain lung cancers, in which photosensitizing drugs are injected into the patient and a laser causes a chemical reaction with the drugs, thereby destroying cancerous cells.

Protective Strategies of the Respiratory Tract: Provides a table summarizing the important protective mechanisms that operate in each segment of the respiratory airways.

Pulmonary Radiology: Explains the types of x-ray studies that can be done to detect bronchial and lung disorders, including standard x-rays, bronchiograms, and arteriograms.

Radioactivity: Describes how radioactivity works and what effects it can have on the human body.

Refractive Eye Surgery: Discusses the common refractive eye surgeries and how they are performed.

Retrograde Signaling: Explains the process of retrograde signaling, or signals being sent backward at a synapse.

Sexually Transmitted Diseases: Illustrates and describes some of the sexually transmitted diseases that occur in both males and females.

Skeletal Radiography: Illustrates skeletal radiography, or x-ray photography, with a description and radiographs of several parts of the body.

Skeletal Variations: Describes the natural variations in the human skeleton, including male and female variations and age-related variations.

Skin Cancer: Explains and illustrates the different types of skin cancer and how they are treated.

Sleep: Outlines the stages of the sleep cycle, including what happens to the body during each of the stages.

Specialization of Cerebral Hemispheres: Explains the specialization of the two hemispheres of the brain and illustrates some of the suggested "special talents" attributed to each side of the brain.

Stem Cell Research: Discusses a controversial topic of scientific research, including the different types of stem cells and how stem cell research could help in cell therapy, the use of special cells to treat disease.

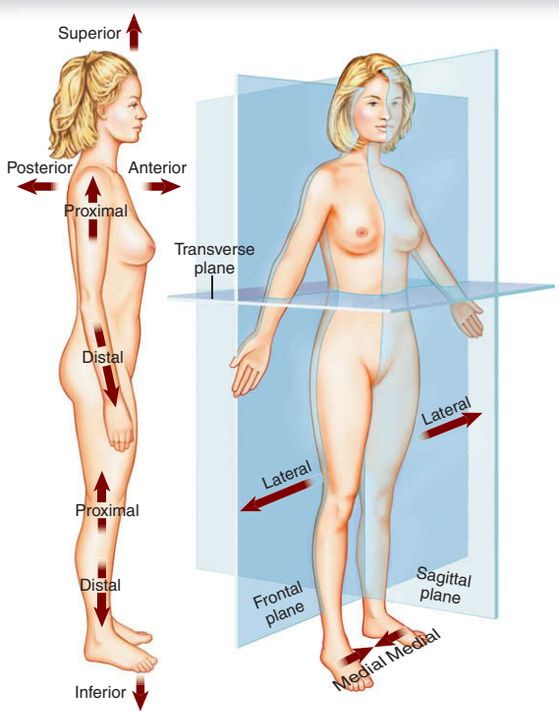
Summary of Gas Exchange: Summarizes some of the essential concepts of gas exchange with a description and a simplified illustration.

Swollen Larynx: Describes and illustrates syndromes that involve a swollen larynx, a potentially lethal condition.

Tools of Microscopic Anatomy: Explains and gives examples of the most common tools in microscopic anatomy: light microscopy, scanning and transmission electron microscopy, and atomic force microscopy.

Tracing Blood Flow in the Kidney: Summarizes the flow of blood in the kidney by providing a simplified flow chart and comparing it to the flow of the blood through the body.

Using Gene Therapy: Summarizes the origins and early history of using gene therapy to treat genetic disorders.



Vertigo and Ear Rocks: Describes the sensation of vertigo, how "ear rocks" can cause this condition, and how to treat them.

Visualizing the Urinary Tract: Explains two methods of medical imaging used to examine the urinary tract: retrograde pyelogram and intravenous pyelogram.

Whole-Body Muscle Mechanics: Discusses how muscles are made up of muscle fibers and many layers of connective tissues, all working together to provide movement and maintain posture.

Anatomical Directions

DIRECTIONAL TERM	DEFINITION	EXAMPLE OF USAGE
Left	To the left of body (not *your* left, the subject's)	The stomach is to the *left* of the liver.
Right	To the right of the body or structure being studied	The *right* kidney is damaged.
Lateral	Toward the side; away from the midsagittal plane	The eyes are *lateral* to the nose.
Medial	Toward the midsagittal plane; away from the side	The eyes are *medial* to the ears.
Anterior	Toward the front of the body	The breastbone (sternum) is *anterior* to the heart.
Posterior	Toward the back (rear) of the body	The heart is *posterior* to the breastbone (sternum).
Superior	Toward the top of the body	The shoulders are *superior* to the hips.
Inferior	Toward the bottom of the body	The stomach is *inferior* to the heart.
Dorsal	Along (or toward) the vertebral surface of the body	Her scar is along the *dorsal* surface.
Ventral	Along (toward) the belly surface of the body	The navel is on the *ventral* surface.
Caudad (caudal)	Toward the tail (used for 4-legged animals)	The neck is *caudad* to the skull.
Cephalad	Toward the head (used for 4-legged animals)	The neck is *cephalad* to the tail.
Proximal	Toward the trunk (describes relative position in a limb or other appendage)	The joint is *proximal* to the toenail.
Distal	Away from the trunk or point of attachment	The hand is *distal* to the elbow.
Visceral	Toward an internal organ; away from the outer wall (describes positions inside a body cavity)	This organ is covered with the *visceral* layer of the membrane.
Parietal	Toward the wall; away from the internal structures	The abdominal cavity is lined with the *parietal* peritoneal membrane.
Deep	Toward the inside of a part; away from the surface	The thigh muscles are *deep* to the skin.
Superficial	Toward the surface of a part; away from the inside	The skin is a *superficial* organ.
Medullary	Refers to an inner region, or medulla	The *medullary* portion contains nerve tissue.
Cortical	Refers to an outer region, or cortex	The *cortical* area produces hormones.
Ipsilateral	On the same side of the body as	The left knee is *ipsilateral* to the left ankle.
Contralateral	On the opposite side of the body	The left knee is *contralateral* to the right knee.

To make the reading of anatomical figures a little easier, an anatomical compass is used throughout this book. On many figures, you will notice a small compass rosette similar to those on geographical maps. Rather than being labeled *N*, *S*, *E*, and *W*, the anatomical rosette is labeled with abbreviated anatomical directions.

A = Anterior	**P** (opposite A) = Posterior
D = Distal	**P** (opposite D) = Proximal
I = Inferior	**S** = Superior
L (opposite M) = Lateral	**M** = Medial
L (opposite R) = Left	**R** = Right
