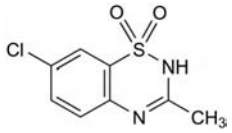
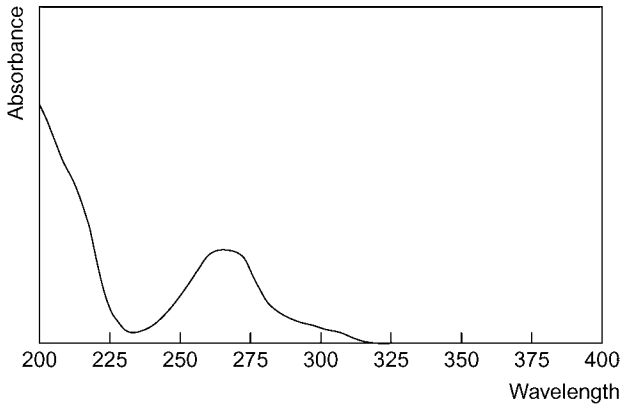
Diazoxide

Antihypertensive, Hyperglycaemic
$C_8H_7ClN_2O_2S = 230.7$
CAS—364-98-7

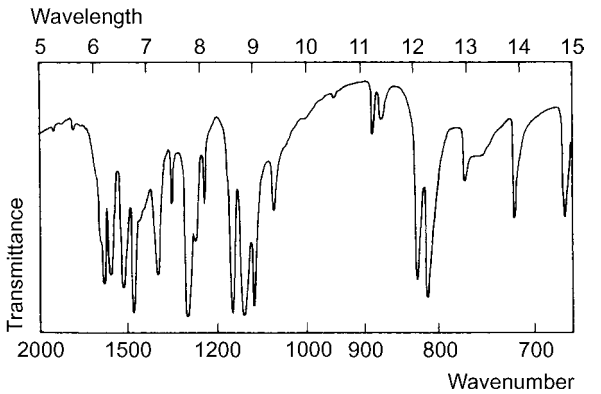
IUPAC Name 7-Chloro-3-methyl-2*H*-1,2,4-benzothiadiazine 1,1-dioxide
Synonym SRG-95213
Proprietary Names *Eudemine*; *Hyperstat*; *Hypertonalum*; *Proglicem*; *Proglycem*.



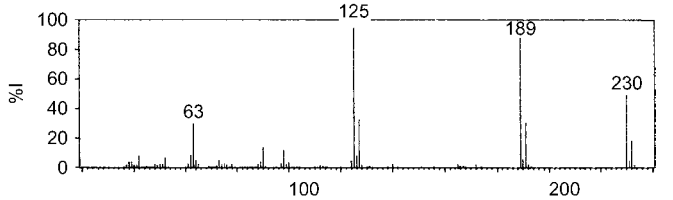
Chemical Properties A white or creamy-white crystalline powder. Mp 330° to 331°. Practically insoluble in water, chloroform and ether; soluble 1 in 250 of ethanol; very soluble in solutions of alkali hydroxides; freely soluble in dimethylformamide. pK_a 8.7. Log *P* (octanol/water), 1.2.
Thin-layer Chromatography System TA—R_f 0.82; system TB—R_f 0.01; system TC—R_f 0.28; system TE—R_f 0.20; system TL—R_f 0.41; system TAE—R_f 0.84; system TAJ—R_f 0.37; system TAK—R_f 0.13; system TAL—R_f 0.75.
Gas Chromatography System GA—not eluted; system GB—not eluted.
High Performance Liquid Chromatography System HA—*k* 0.1; system HX—RI 368; system HY—RI 299.
Ultraviolet Spectrum Aqueous alkali—280 nm (A^1_1=585a).



Infrared Spectrum Principal peaks at wavenumbers 1139, 1294, 1166, 1495, 1112, 812 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 125, 189, 230, 127, 191, 63, 232, 90.



Quantification
Plasma **TLC** UV detection. For method for diazoxide and metabolites, see Pruitt *et al.* [1974].
GC–MS Limit of detection, 10 µg/L [Sadee *et al.* 1973].
HPLC UV detection. Limit of detection, 100 µg/L [Vree *et al.* 1979].
Urine **TLC** See Plasma [Pruitt *et al.* 1974].
GC–MS See Plasma [Sadee *et al.* 1973].
HPLC See Plasma [Vree *et al.* 1979].
Faeces **TLC** See Plasma [Pruitt *et al.* 1974].
Disposition in the Body Readily absorbed after oral administration. Metabolised by oxidation to the 3-hydroxymethyl derivative which is conjugated with sulfate or further metabolised to the 3-carboxy derivative. About 90% of a dose is excreted in the urine in 5 to 6 days, of which 6 to 50% is unchanged drug; the 3-hydroxymethyl and 3-carboxy metabolites each account for about 20 to 30% of the excreted material; the amount of unchanged drug excreted in the urine appears to be reduced in hypertensive patients; about 2% of a dose is eliminated in the faeces.
Therapeutic Concentration In plasma, usually in the range 15 to 50 mg/L. Following a single oral dose of 300 mg to 2 subjects, peak plasma concentrations of about 15 to 20 mg/L were attained in 3 to 6 h [Pruitt *et al.* 1973].
Toxicity Toxic effects may be associated with plasma concentrations greater than 100 mg/L.
Half-life Plasma half-life, adults, about 20 to 70 h; appears to be lower in children.
Volume of Distribution About 0.2 to 0.3 L/kg.
Clearance Plasma clearance, about 0.1 mL/min/kg.
Distribution in Blood Plasma : whole blood ratio, about 1.7.
Protein Binding About 90%; decreased in subjects with renal impairment.
Note For a review of the pharmacokinetics of diazoxide, see Pearson [1977].
Dose In the treatment of intractable hypoglycaemia: initially 5 mg/kg daily, orally. In hypertensive crises: 300 mg intravenously.

Pearson RM (1977). Pharmacokinetics and response to diazoxide in renal failure. *Clin Pharmacokinet* 2: 198–204.

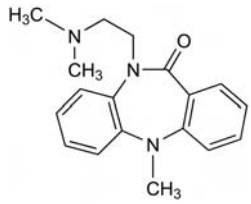
Dibenzepin

Antidepressant
$C_{18}H_{21}N_3O$ = 295.4
CAS—4498-32-2

IUPAC Name 5-(2-Dimethylaminoethyl)-11-methylbenzo[*b*][1,4]benzodiazepin-6-one
Synonym 10-[2-(Dimethylamino)ethyl]-5,10-dihydro-5-methyl-11*H*-dibenzo[*b*,*e*]-[1,4]diazepin-11-one

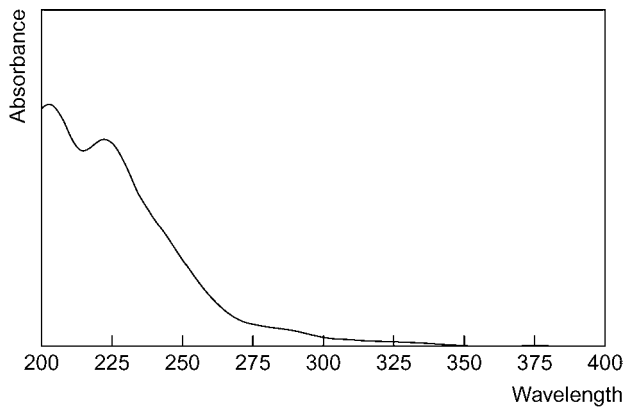


Chemical Properties Mp 116° to 117°. Log *P* (octanol/pH 7.4), 1.7. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

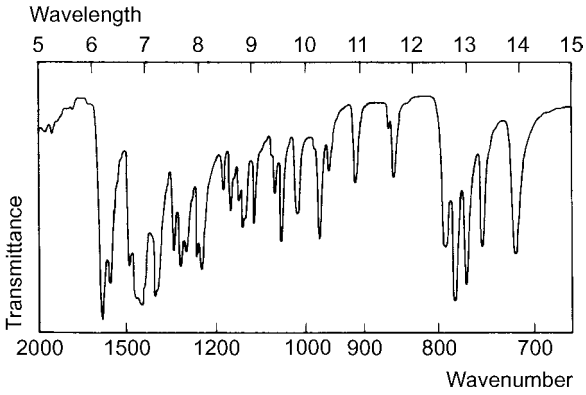
Dibenzepin Hydrochloride

$C_{18}H_{21}N_3O$,HCl = 331.8
CAS—315-80-0
Proprietary Names *Deprex*; *Écatril*; *Noveril*. Deprex is also used as a proprietary name for amitriptyline hydrochloride.

Chemical Properties A colourless, fine crystalline powder. Mp 238°. Soluble 1 in 16 of water; soluble in ethanol and chloroform.
Colour Test Mandelin's test—green.
Thin-layer Chromatography System TA—R_f 0.54; system TB—R_f 0.22; system TC—R_f 0.35; system TE—R_f 0.55; system TL—R_f 0.14; system TAE—R_f 0.38; system TAF—R_f 0.22 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—dibenzepin RI 2450, M (nor-) RI 2449, M (di-nor) RI 2406, M (ter-nor-) RI 2680, M (N_5-desmethyl-) RI 2455, M (OH-) isomer-1-AC RI 2600, M (OH-) isomer-2-AC RI 2770; system GB—dibenzepin RI 2566; system GF—RI 2885; system GM—dibenzepin RRT 1.735 (relative to iprindole).
High Performance Liquid Chromatography System HA—*k* 2.8; system HF—*k* 0.50; system HX—RI 361; system HY—RI 300.
Ultraviolet Spectrum Aqueous acid—203, 223 nm.



Infrared Spectrum Principal peaks at wavenumbers 1639, 775, 761, 1603, 1250, 1316 cm^{-1} (dibenzepin hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 58, 224, 209, 71, 225, 72, 210, 180.
Quantification
Blood **GC** AFID. Limit of detection, 300 ng/g, dibenzepin and desmethyl metabolites [Schlicht, Gelbke 1978].

UV Spectrophotometry Limit of detection, 500 ng/g, dibenzepin and desmethyl metabolites [Christensen, Felby 1975].
Plasma **HPLC** MS-MS detection. For method, see Kollroser and Schober [2002].
Urine **GC** See Blood [Schlicht, Gelbke 1978].

UV spectrophotometry See Blood [Christensen, Felby 1975].
Tissues **GC** See Blood [Schlicht, Gelbke 1978].

UV spectrophotometry See Blood [Christensen, Felby 1975].
Disposition in the Body Readily absorbed after oral administration; rapidly and extensively metabolised, mainly by *N*-demethylation. About 20 to 30% of a dose is excreted in the urine as free and conjugated desmethyl metabolites in 24 h, together with about 1% of the dose as unchanged drug.
Therapeutic Concentration

During daily oral treatment with doses of 8 mg/kg of dibenzepin hydrochloride given to 12 patients for 22 days, mean plasma concentrations of 0.18 mg/L of dibenzepin and 0.28 mg/L of *N*-monodesmethyldibenzepin (demethylated in the side-chain) were reported, determined 4 h after a dose. Plasma concentrations declined slightly during therapy [Gauch, Modestin 1973].

Toxicity The estimated minimum lethal dose is about 3 g; doses greater than 1.5 g may result in serious poisoning. Patients liable to arrhythmias are particularly susceptible to toxic effects.

The following tissue disposition of total dibenzepin and metabolites was reported in 6 suicides due to the ingestion of dibenzepin: blood 23 to 147 µg/g (mean 73), liver 255 to 566 µg/g (mean 386), urine 63 to 695 µg/g (mean 230, 4 cases) [Christensen, Felby 1975].

In a fatality due to the ingestion of 3.6 g of dibenzepin, the following postmortem tissue concentrations were reported for dibenzepin and total desmethyl metabolites, respectively: blood 23, – mg/L; bile 113, 137 mg/L; brain 42, 12 µg/g; kidney 63, 38 µg/g; liver 130, 134 µg/g; urine 350, 258 mg/L [Schlicht, Gelbke 1978].

Half-life Plasma half-life, about 4 h (dibenzepin plus desmethyl metabolites).
Dose 240 to 560 mg of dibenzepin hydrochloride daily.

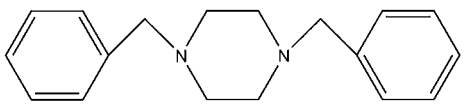
Dibenzylpiperazine

Arylpiperazine, Drug of Abuse
$C_{18}H_{22}N_2 = 266.4$
CAS—2298-55-7
IUPAC Name 1,4-Dibenzylpiperazine
Synonym DBZP

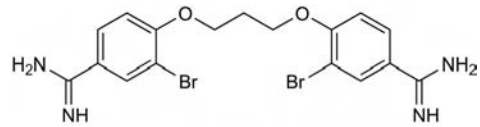


Chemical Properties Log *P* (octanol/water), 3.1 [National Institutes of Health 2005]. Dibenzylpiperazine is usually found as an impurity in samples of the recreational stimulant benzylpiperazine (BZP). Its presence is indicative of low quality or badly manufactured BZP, either because the synthesis reaction temperature is too high or because of an excess of benzyl chloride in the reaction mixture.
Disposition in the Body
Toxicity At the time of writing, there are no reports of DBZP use (or abuse). It is not believed to have any stimulant effects although this has not been confirmed through appropriate testing.

National Institutes of Health (2005). *PubChem Compound: Dibenzylpiperazine*. Bethesda, MD: National Institutes of Health and US National Library of Medicine. http://pubchem.ncbi.nlm.nih.gov/summary/summary.cgi?cid=200601 (accessed 15 November 2009).

Dibrompropamidine

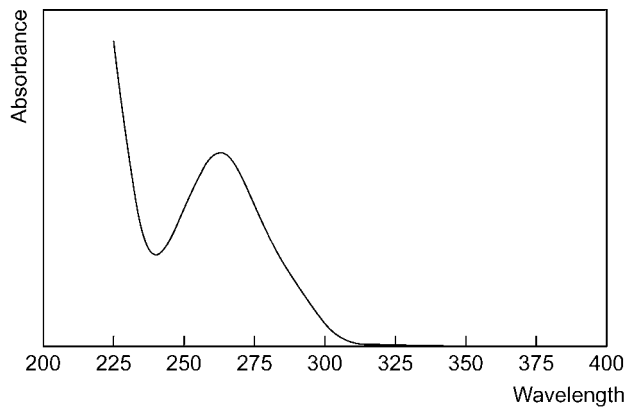
Antibacterial, Antifungal
$C_{17}H_{18}Br_2N_4O_2 = 470.2$
CAS—496-00-4
IUPAC Name 3-Bromo-4-[3-(2-bromo-4-carbamimidoylphenoxy)propoxy] benzenecarboximidamide
Synonym 4,4′-[1,3-Propanediylbis(oxy)]bis(3-bromobenzenecarboximidamide)



Dibrompropamidine Isetionate

$C_{17}H_{18}Br_2N_4O_2,2C_2H_6O_4S = 722.4$
CAS—614-87-9
Proprietary Names *Brolene* (eye ointment); *Brulidine*.
Chemical Properties A white crystalline powder. Mp 226°. Soluble 1 in 2 of water and 1 in 60 of ethanol; soluble in glycerol; practically insoluble in chloroform and ether.

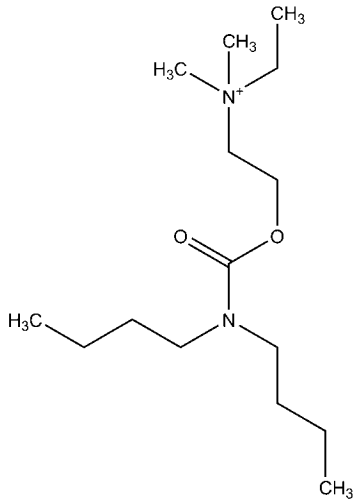
Colour Tests Aromaticity (method 2)—yellow/brown; Liebermann's reagent—black.
Thin-layer Chromatography System TA—R_f 0.01 (acidified iodoplatinate solution, positive).
Ultraviolet Spectrum Aqueous acid—261 nm (A^{1}_{1}=512a).



Infrared Spectrum Principal peaks at wavenumbers 1190, 1654, 1266, 1047, 1600, 1306 cm^{-1} (dibrompropamidine isetionate, KBr disk).
Use Dibrompropamidine isetionate is used in a concentration of 0.15%.

Dibutoline

Quaternary Ammonium, Parasympatholytic, Antispasmodic
$(C_{15}H_{33}N_2O_2)_2 = 546.8$
CAS—21962-82-3
IUPAC Name (2-Dibutylcarbamoyloxy)ethyl-ethyl-dimethylammonium

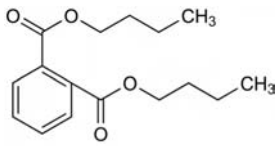


Dibutoline Sulfate
$(C_{15}H_{33}N_2O_2)_2,SO_4 = 642.9$
IUPAC Name 2-(Dibutylcarbamoyloxy)ethyl-ethyl-dimethylazanium sulfate
Synonym (Ethyl(2-hydroxyethyl)dimethylammonium) sulfate bis (dibutylcarbamate)
Proprietary Name *Dibuline sulfate*
Chemical Properties Extremely hygroscopic powder. Aqueous solutions decompose on heating at 100°. Soluble in water and benzene.

Colour Tests Ammonium molybdate test—faint blue-grey (limit of detection, 1.0 µg); sulfuric acid–formaldehyde test—red (limit of detection, 1.0 µg); Vitali's test—faint yellow (limit of detection, 1.0 µg).
Thin-layer Chromatography System T1—R_f 0.02 (location reagent acidified iodoplatinate spray, positive reaction).
Disposition in the Body Poorly absorbed from the gastrointestinal tract.
Toxicity The lethal dose in humans is probably between 10 and 100 mg/kg. Its effect is weaker and of shorter duration than that of atropine.
Dose Up to 100 mg daily, IM or SC.

Dibutyl Phthalate

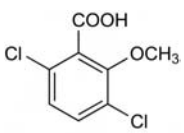
Insect Repellent
$C_{16}H_{22}O_4 = 278.3$
CAS—84-74-2
IUPAC Name Dibutyl benzene-1,2-dicarboxylate
Synonyms 1,2-Benzenedicarboxylic acid dibutyl ester; butyl phthalate; DBP.



Chemical Properties A clear, colourless or faintly yellow, somewhat viscous liquid. Mass per mL about 1.045 g. Bp 340°. Refractive index 1.492 to 1.495. Soluble 1 in 2500 of water; very soluble in ethanol, ether, acetone and benzene. Log *P* (octanol/water), 4.5.
Gas Chromatography System GA—RI 1913.
Ultraviolet Spectrum Methanol—274 nm (A^{1}_{1}=45b).
Mass Spectrum Principal ions at *m/z* 149, 41, 29, 57, 56, 104, 32, 65.

Dicamba

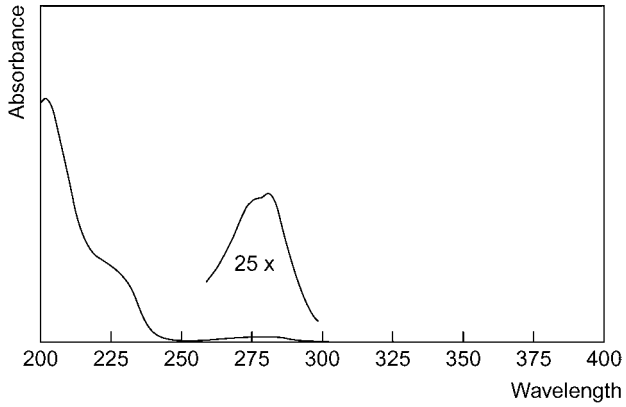
Herbicide
$C_8H_6Cl_2O_3 = 221.0$
CAS—1918-00-9
IUPAC Name 3,6-Dichloro-2-methoxybenzoic acid.
Synonym Dianat
Proprietary Names *Banfel*; *Banvel*; *Banvel-CST*; *Banvel-D*; *Banvel XG*; *Dianat*; *Dicazin*; *Fallowmaster*; *Killes*; *Mediben*; *Metambane*; *Tracker*; *Trooper*; *Velsicol*. It is also an ingredient in *Banlene* and *Cambilene*.



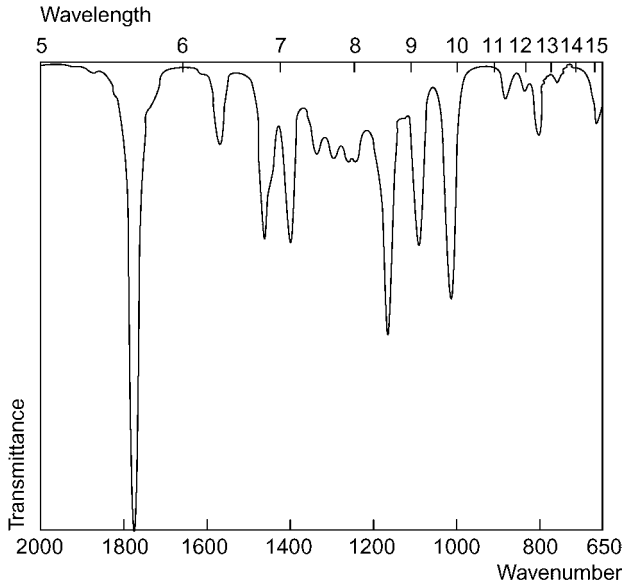
Chemical Properties Pure dicamba is a white crystalline solid and the technical acid is a pale buff crystalline solid. Mp 114° to 116°. Soluble in ethanol (922 g/L at 25°), cyclohexane (916 g/L at 25°), acetone (810 g/L at 25°), dichloromethane (260 g/L at 25°), toluene (130 g/L at 25°) and xylene (78 g/L at 25°); very slightly soluble in dioxane and water (8.3 g/L at 25°). pK_a 1.97 (also reported as 1.90 and 1.87 at 25°). Log *P* (octanol/water), 2.21.
Thin-layer Chromatography System TX—R_f 0.41; system TY—R_f 0.70; system TAB—R_f 0.04; system TAC—R_f 0.05.
Gas Chromatography System GA—dicamba RI 1795, 2,5-dichloromethoxybenzene RI 1200, dicamba-Me RI 1525; system GK—dicamba RRT 0.49 (relative to caffeine).

Column: DB-1 (2.0 m × 0.25 mm i.d., 0.25 µm). Temperature programme: 120°, held for 0.3 min, to 180° at 15°/min. Carrier gas: H_2, 1.9 mL/min. FID. Retention time: 1.3 min [Liu *et al.* 1994].

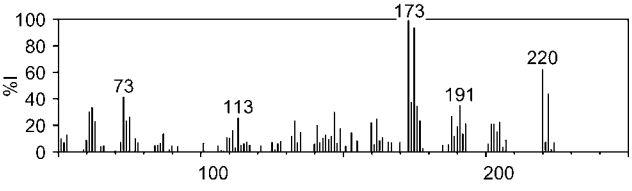
High Performance Liquid Chromatography Column: RP C_{18} Econosphere (150 × 4.6 mm i.d., 5 µm). Mobile phase: (A:B) acetonitrile : acetic acid solution (2%). Elution programme: (A:B) (25:75) for 5 min, to (40:60) over 10 min, held 5 min, flow rate 1.5 mL/min. Retention time: 6.1 min [Larson, Houglum 1991].
Ultraviolet Spectrum Aqueous solution (neutral)—274; acetonitrile—205, 230, 278 nm.



Infrared Spectrum Principal peaks at wavenumber 1778, 1169, 1019, 1094, 1402 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 173, 175, 220, 73, 222, 174, 191, 62.



Quantification
Urine **GC** ECD. Limit of detection of dicamba, 0.017 mg/L [Grover *et al.* 1985].

Solution **HPLC** UV detection (λ=274 nm). Limit of detection, <1 mg/L [Fogarty *et al.* 1994].

Disposition in the Body Dicamba is rapidly and almost completely absorbed into the bloodstream from the gastro-intestinal tract. It is distributed to tissues around the body and does not bioaccumulate. There is no evidence that it is absorbed through the skin. Dicamba is excreted mainly in urine as the unmetabolised state but can also be detected in faeces.

Toxicity Dicamba is moderately toxic by ingestion and slightly toxic by inhalation and dermal exposure. It can be irritating, corrosive and cause severe and permanent damage to the eyes. The Environmental Protection Agency (EPA) has established a Lifetime Health Advisory (LHA) level of 200 µg/L of dicamba in drinking water.

A 61-year-old woman committed suicide by ingesting an unknown quantity of Killes, containing 9 g/L dicamba. Postmortem toxicological analysis showed that the woman's blood dicamba concentration was 170 mg/L, 140 mg/L in her bile, and in her liver a concentration of <100 mg/kg was found. (2,4-Dichlorophenoxy) acetic acid and mecoprop were also detected [Fraser *et al.* 1984].

Protein Binding Dicamba is highly protein bound in plasma.

Fogarty AM *et al.* (1994). Determination of dicamba by reverse-phase HPLC. *J Liq Chromatogr* 17 (12): 2667–2674.

Fraser AD *et al.* (1984). Toxicologic studies in a fatal overdose of 2,4-D, mecoprop, and dicamba. *J Forensic Sci* 29(4): 1237–1241.

Grover R *et al.* (1985). Procedure for the determination of 2,4-D and dicamba in inhalation, dermal, hand-wash, and urine samples from spray applicators. *J Environ Sci Health B* 20(1): 113–128.

Dichloralphenazone

Hypnotic, Sedative

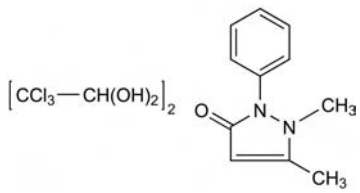
$C_{15}H_{18}Cl_6N_2O_5$ = 519.0

CAS—480-30-8

IUPAC Name 1,5-Dimethyl-2-phenylpyrazol-3-one; 2,2,2-trichloroethane-1,1-diol

Synonym Dichloralantipyrine

Proprietary Names *Bonadorm*; *Chloralol*; *Welldorm*. It is an ingredient of *Midrid* and *Paedo-Sed*.



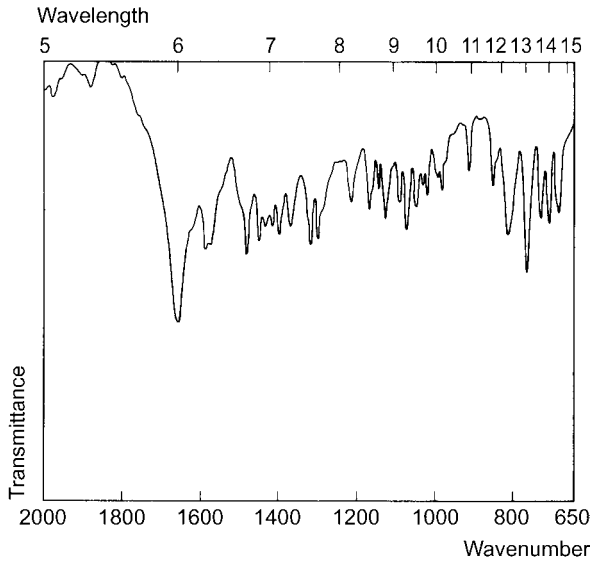
Chemical Properties A complex of cloral hydrate and phenazone. A white microcrystalline powder. Mp 64° to 67°. Soluble 1 in 10 of water, 1 in 1 of ethanol and 1 in 2 of chloroform; soluble in dilute acids. Log *P* (octanol/water), 0.6.

Note It is decomposed by dilute alkalis with the liberation of chloroform. In aqueous and ethanolic solutions it dissociates into cloral hydrate and phenazone.

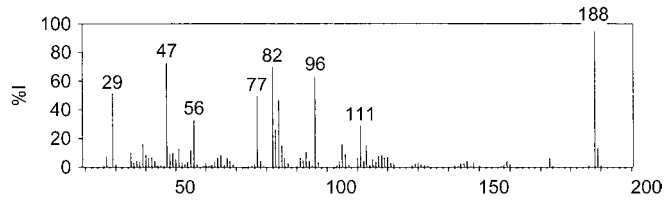
Gas Chromatography System GA—dichloralphenazone RI 1855, M (4-OH-phenazone) RI 1855.

Ultraviolet Spectrum Phenazone: aqueous acid—230 nm (A_1^1=590b); aqueous alkali—242 (A_1^1=494a), 256 nm.

Infrared Spectrum Principal peaks at wavenumbers 1656, 767, 1587, 1562, 1315, 1298 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 188, 47, 82, 96, 29, 77, 84, 56.



Quantification See under Chloral Hydrate and Phenazone.

Disposition in the Body After administration, dichloralphenazone acts as a mixture of cloral hydrate and phenazone and reference should be made to the entries under these substances.

Toxicity

Blood concentrations of 20 mg/L of trichloroethanol and 40 mg/L of phenazone were reported in a comatose subject following an overdose of dichloralphenazone; the subject eventually recovered [Armstrong, Stone 1972].

Dose 0.65 to 1.95 g daily.

Armstrong RJ, Stone HM (1972). *Bull Int Assoc Forensic Toxicol* 8(4): 8–9.

Dichlorodifluoromethane

Aerosol Propellent, Refrigerant

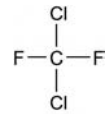
CCl_2F_2 = 120.9

CAS—75-71-8

IUPAC Name Dichloro(difluoro)methane

Synonyms Difluorodichloromethane; propellent 12; refrigerant 12.

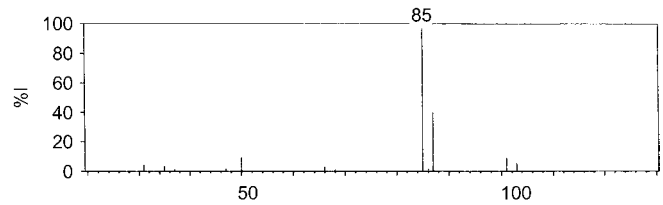
Proprietary Names *Arcton 12*. It is an ingredient of *PR Spray* and *Skefron*.



Chemical Properties A colourless non-flammable gas which, when liquefied by compression, forms a clear colourless liquid. Fp −155°. Bp about −29.8°. Log *P* (octanol/water), 2.2.

Gas Chromatography System GA—RI 305; system GI—retention time 0.9 min.

Mass Spectrum Principal ions at *m/z* 85, 87, 101, 50, 103, 31, 66, 35.



Dichlorophen

Anthelmintic

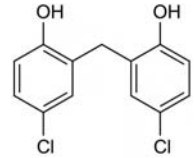
$C_{13}H_{10}Cl_2O_2$ = 269.1

CAS—97-23-4

IUPAC Name 4-Chloro-2-[(5-chloro-2-hydroxyphenyl)methyl]phenol

Synonyms Di-phenthane-70; 2,2′-methylenebis[4-chlorophenol].

Proprietary Names *Anthiphen*; *Dicestal (vet.)*; *Ovis*; *Plath-Lyse*; *Wespuril*.



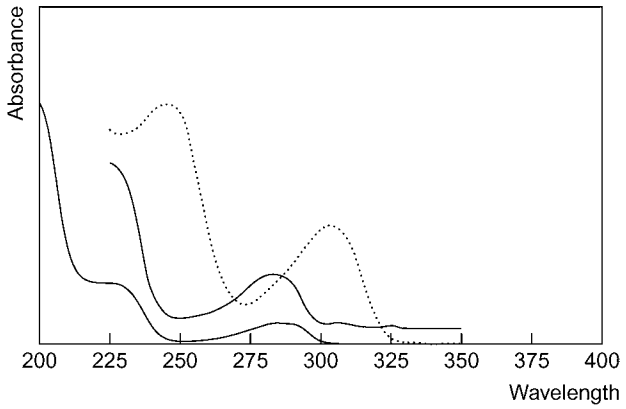
Chemical Properties A white or slightly cream-coloured powder. Mp about 175°. Practically insoluble in water; soluble 1 in 1 of ethanol and 1 in less than 1 of ether; soluble in methanol, isopropyl ether and petroleum ether; sparingly soluble in toluene. pK_a 7.6. Log *P* (octanol/water), 4.3.

Colour Tests Aromaticity (method 2)—yellow/brown; Folin–Ciocalteu reagent—blue; Liebermann's reagent—violet-brown; Millon's reagent—red.

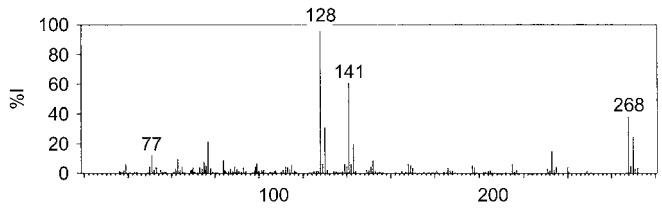
Thin-layer Chromatography System TD—R_f 0.59; system TE—R_f 0.34; system TF—R_f 0.67; system TX—R_f 0.12; system TY—R_f 0.16; system TAD—R_f 0.57; system TAE—R_f 0.91.

Gas Chromatography System GA—dichlorophen RI 2140, dichlorophen-AC_2 RI 2250, dichlorophen-Et_2 RI 2225, dichlorophen-Me_2 RI 2245.

High Performance Liquid Chromatography System HY—RI 591.
Ultraviolet Spectrum Aqueous acid—282 nm; aqueous alkali—245 (A^1_1=650a), 304 nm.



Infrared Spectrum Principal peaks at wavenumbers 1226, 817, 1111, 1162, 1245, 1170 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 128, 141, 268, 130, 270, 77, 143, 233.



Disposition in the Body

Toxicity

An acute fatality was reported with a blood concentration of 9.77 mg/L dichlorophen. No other drugs or alcohol were detected [Kintz *et al.* 1997].

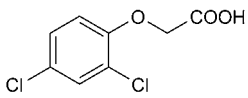
Dose Usually 6 g daily for 2 or 3 days; a single dose of 9 g has also been given.

Kintz P *et al.* (1997). Acute fatal poisoning with dichlorophen. *Int J Legal Med* 110(2): 95–96.

Dichlorophenoxyacetic Acid

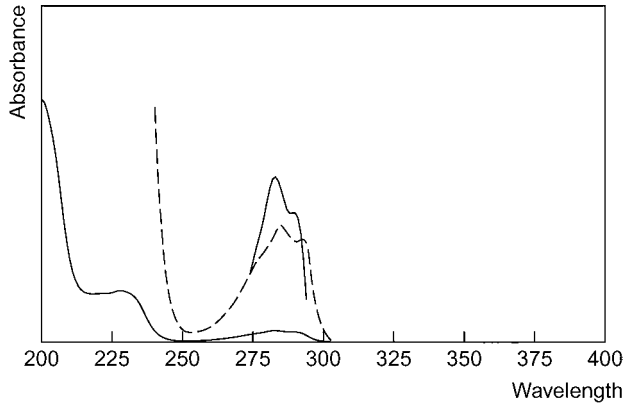
Herbicide
$C_8H_6Cl_2O_3$ = 221.0
CAS—94-75-7

IUPAC Name 2-(2,4-Dichlorophenoxy)acetic acid
Synonym 2,4-D
Proprietary Names *Animex*; *Cornox D*; *Destox*; *Dicotox*; *Dioweed*; *Dormone*; *Fernimine*; *For-ester*; *Iso-planatox*; *Palormone D*; *Silvapron D*; *Syford*; *Verdone*; *Vigon-DC*. It is an ingredient of *Econal*; *Herbatox*; *Killex*; *Nettle Ban*; *Selex*; *Spontox*; *Stancide BWK 75*; *Tributon*.

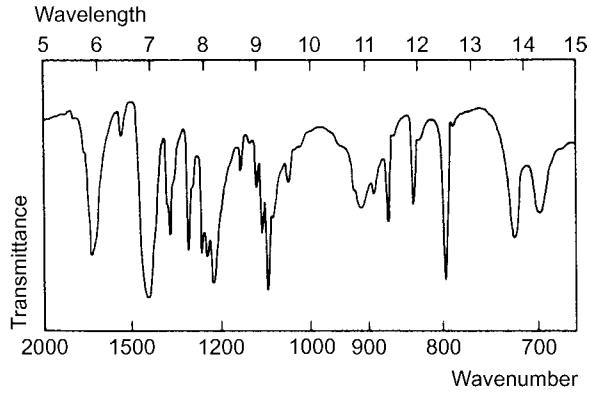


Chemical Properties Corrosive white powder. Mp ≈140°. Almost insoluble in water; soluble in aqueous solutions of alkalis and in alcohols. pK_a 3.3 [Baselt 2008; Prescott *et al.* 1979], 2.6 [Flanagan, Ruprah 1989], 2.7. Log *P* (octanol/water) 2.8 [Hansch *et al.* 1995]. Stable in urine at ambient temperature for 48 h [Hughes *et al.* 2001]. Stable in diluted urine samples when kept at –20° for 6 months [Baker *et al.* 2000]. Standard solutions in deionised water or methanol (1 : 1) show some decomposition after 5–6 weeks at room temperature. This can be overcome by preparing the solutions in Tris buffer : methanol (1 : 1). Standard equine-serum-matrix solutions were stable for at least a year at –5° to –20° [Flanagan, Ruprah 1989].
Thin-layer Chromatography System TD—R_f 0.04; system TE—R_f 0.04; system TF—R_f 0.06; system TX—R_f 0.00; system TY—R_f 0.02; system TAB—R_f 0.02; system TAC—R_f 0.03.
Gas Chromatography System GA—2,4-D RI 1800, M (2,4-dichlorophenol)RI 1320, 2,4-D-Me RI 1593, 2,4-D-butyl ester RI 1840, 2,4-D-isobutyl ester RI 1805, 2,4-D-isopropyl ester RI 1700, 2,4-Dichlorophenoxybutyric acid-Me RI 1835; system GK—RT 0.65 relative to caffeine. system GK—dichlorophenoxyacetic acid iso-ocitol ester RT 1.12, dichlorophenoxyacetic acid iso-ocitol ester RT 1.18, both relative to caffeine.

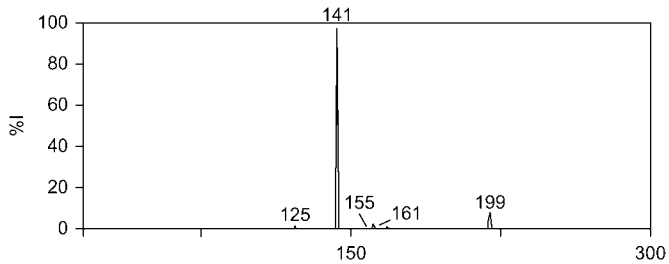
Ultraviolet Spectrum Ethanol—284 (A^1_1 = 95b), 292 nm.



Infrared Spectrum Principal peaks at wavenumbers 1090, 1230, 795, 1264, 1247, 1724 cm^{-1} (Nujol mull).



Mass Spectrum Principal ions at *m/z* 199, 45, 175, 145, 111, 109, 234, 133 (dichlorophenoxyacetic acid methyl ester).



Quantification

Blood **GC-MS** Column: DB-5 capillary (30 m × 0.53 mm i.d.). Carrier gas: He, 20.0 mL/min. EI ionisation at 70 eV. Limit of detection not reported [Jorens *et al.* 1995].

HPLC Column: Spherisorb S5 Phenyl (250 × 5 mm i.d.). Mobile phase: 0.05 mol/L potassium dihydrogen phosphate (pH 3.5) : acetonitrile (3 : 1), flow rate 1.8 mL/min. UV detection (λ = 240 nm). *k'*: 0.8. Limit of detection, 20 mg/L [Flanagan, Ruprah 1989]. Column: RP-8 (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.01 mol/L potassium dihydrogen phosphate (pH 3.2) : acetonitrile : *n*-nonylamine (550 : 450 : 0.6), flow rate 1.6 mL/min. UV detection (λ = 280 nm). Limit of quantification, 0.5 mg/L [Fraser *et al.* 1984]. Column: Ultrasphere ODS (250 × 4.6 mm i.d.). Mobile phase: acetonitrile : methanol : phosphate buffer (pH 6.8; 14 : 10 : 76), flow rate 1.7 mL/min. UV detection (λ = 227 nm). Retention time: 6.08 min. Limit of detection, 1 mg/L [Osterloh *et al.* 1983].

Plasma **GC** Column: 10% OV17 Gaschrom Q (4′ × .025"). Carrier gas: N_2, 60 mL/min. Temperature: 200°. Limit of detection not reported [Prescott *et al.* 1979]. Column: 3% SE-30 on 100/120 varaport 30 (150 × 3.2mm i.d.). Temperature: 175°. FID. Retention time: 9 min. Limit of detection not reported [Kohli *et al.* 1974].

HPLC Column Supersphere 100 reversed phase (125 × 4 mm i.d.). Mobile phase: acetonitrile : triethylammonium phosphate buffer (40 : 60), flow rate 1.0 mL/min. UV detection (λ = 284 nm). *k'*: 5.18. Limit of detection, 0.5 mg/L [Keller *et al.* 1994]. See Blood [Flanagan, Ruprah 1989].

Urine **GC** Column: Chromopak CP Sil 5 (30 m × 0.32 mm i.d., 0.4 μm) or Chromopack CP Sil 8 (50 m × 0.32 mm i.d., 0.4 μm). Carrier gas: He, 2.0 mL/min. Temperature programme: 50° for 1 min to 200° at 30°/min for 5 min to 250° at 5°/min for 10 min (first column) or 50° for 1 min to 270° at 25°/min for 30 min. Limit of detection, 1.0 μg/L [Aprea *et al.* 1997]. Column: 5% Dexil 300 on 80/100 Chromosorb W HP mesh (1.83 m × 4 mm i.d.). Carrier gas: Ar : CH_4 (95 : 5), 40 mL/min. Temperature: 210°. ECD. Retention time: 4.0 min for the methyl ester. Limit of detection, 50 μg/L [Grover *et al.* 1985]. Column: 4% SE-30 and 6% QF1 on Chromsorb W 80/100 mesh (150 × 0.6 cm o.d.). Carrier gas: N_2, 30 mL/mi. Temperature: 190°. ECD. Limit of detection, 30 μg/L [Vural, Burgaz 1984]. Column: 100/120 mesh Ultra-Bond 20 M (1.5 m × 4 mm i.d.). Carrier gas: Ar : CH_4 (95 : 5), 40 mL/min. Temperature: 150°. ECD. Retention time: 3.5 and 4.0 min for the methyl and *n*-butyl ester, respectively. Limit of detection, 100 μg/L [Smith, Hayden 1979]. See Plasma. Temperature: 160°. Retention time: 19 min [Kohli *et al.* 1974]. Column: 20% OV-101 Gas-Chrom Q 60/80 mesh. Carrier gas: N_2, 60 mL/min. Temperature: 175°. Retention time: ≈5 min. Limit of detection, 3.75 ng/g [Shafik *et al.* 1971].

GC-MS Column: HP-5 5% diphenol 95% dimethylpolysiloxane (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1 mL/min. Temperature programme: 90° for 1 min to 280° at 8°/min. MSD, SIM acquisition mode. Limit of quantification, 5 μg/L [Hughes *et al.* 2001]. Column: DB-5MS (15 m × 0.25 mm i.d., 0.25 μm). Temperature programme: 120° to 300° at 10°/min for 5 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, 0.75 μg/L [Thompson, Treble 1996]. See Blood [Jorens *et al.* 1995].

HPLC Column: Hypersil C_{18} BDS (15 cm × 300 μm i.d., 3 μm). Mobile phase: 0.8% aqueous phosphoric acid solution : methanol (60 : 40 for 15 min to 30:70 for 30 min), flow rate 0.8 μL/min. DAD (λ = 232 nm). Limit of quantification, 19.3 μg/L, limit of detection, 5.8 μg/L [Rosales-Conrado *et al.* 2008]. Column: Supelco LC8 (25 cm × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : phosphate buffer (pH 3.2; 25 : 75 to 33 : 67 at 1.14%/min twice for 5 min to 25 : 75 at 2.67%/min), flow rate 2.0 mL/min. DAD (λ = 230 nm). Limit of detection, 15 μg/L [Aprea *et al.* 1997]. See Blood [Flanagan, Ruprah 1989]. See Blood [Fraser *et al.* 1984].

LC-MS Column: C_{18} (50 × 2.1 mm i.d., 4 μm). Mobile phase: 0.5% acetic acid : 0.5% acetic acid in methanol (80 : 20 to 5 : 95 in 6 min for 0.5 min to 80 : 20 for 2 min), flow rate 0.2 mL/min. ESI, SRM acquisition mode. Limit of detection, 0.05 μg/L [Lindh *et al.* 2008]. Column: Betasil hexylphenyl (100 × 4.6 mm i.d., 3 μm). Mobile phase: 0.1% acetic acid in water : 0.1% acetic acid in acetonitrile (47 : 53 for 5 min to 15 : 85 at 6 min to 0 : 100 at 7 min for 2 min to 47 : 53 for 3 min), flow rate 0.5 mL/min. MRM acquisition mode, negative ion mode. Limit of detection, 54 ng/L [Norrgran *et al.* 2006]. Column: Aquasil C_8 (100 × 4.6 mm i.d., 5 μm). Mobile phase: 0.1% acetic acid : 0.1% acetic acid in methanol (70 : 30 to 0 : 100 at 8.1 min), flow rate 1.0 mL/min. APCI, positive and negative ion mode. Limit of detection, 0.29 μg/L [Baker *et al.* 2000]. Column: Partisil 5 ODS-3 (25 cm × 4.6 mm). Mobile phase: acetonitrile : 0.2% glacial acetic acid (60 : 40), flow rate 1.0 mL/min. APCI, negative ion mode. Limit of detection, 0.43 μg/L [Beeson *et al.* 1999].

Bile **HPLC** See Blood [Fraser *et al.* 1984]. See Blood [Osterloh *et al.* 1983].

CSF **HPLC** See Blood [Osterloh *et al.* 1983].

Brain **HPLC** See Plasma [Keller *et al.* 1994]. See Blood [Osterloh *et al.* 1983].

Diaphragm **HPLC** See Blood [Osterloh *et al.* 1983].

Heart **HPLC** See Plasma [Keller *et al.* 1994]. See Blood [Osterloh *et al.* 1983].

Kidney **HPLC** See Plasma [Keller *et al.* 1994]. See Blood [Osterloh *et al.* 1983].

Liver **HPLC** See Plasma [Keller *et al.* 1994]. See Blood [Fraser *et al.* 1984]. See Blood [Osterloh *et al.* 1983].

Lung See Plasma [Keller *et al.* 1994].

Muscle See Plasma [Keller *et al.* 1994].

Pancreas See Plasma [Keller *et al.* 1994].

Other **LC-MS** Solid Media. Column: Zorbax Eclipse XDB C_8 (50 × 2.1 mm i.d., 5 μm). Mobile phase: 0.2% acetic acid in water : 0.2% acetic acid in methanol (90 : 10 to 10 : 90 to 90 : 10), flow rate, 0.3 mL/min. TSI, MRM acquisition mode, negative ion mode. Limit of detection, 2.9 μg/L [Gardner *et al.* 2005].

Disposition in the Body Poorly absorbed through the skin. Readily absorbed, distributed and excreted without metabolism. After ingestion, ~80% is excreted in the urine unchanged in 4 days, and ~13% is excreted as conjugates [Kancir *et al.* 1988].

Blood Concentration

After ingestion of 5 mg/kg by 6 subjects, average peak plasma concentrations of ≈35 mg/L were attained in 7 to 24 h [Kohli *et al.* 1974].

A 26-year-old male ingested ~75 mL of Verdone ~10 h before admission to hospital. Serum and urine 2,4-D concentrations were as shown in the table below.

Hours post-ingestion	*Serum concentration (mg/L)*	*24-h Urine excretion (mg)*	*Renal clearance (mL/min)*
11	79.6		
35	50.5	1460	0.2
59	31.0	770	0.17
83	15	900	0.41
107	11	630	0.39
131	7	1380	1.40

[Wells *et al.* 1981].

A 39-year-old deliberately ingested the contents of a lemonade bottle that was later shown to contain 10% 2,4-D and 20% mecoprop. Plasma concentration on admission was 400 mg/L and there was no appreciable decline over the next 2 days. Renal clearance of 2,4-D ranged from 0.14 mL/min at a urine pH of 5.1 to 63 mL/min at pH 8.3 [Prescott *et al.* 1979].

Toxicity The estimated minimum lethal dose is 7 g. The maximum permissible atmospheric concentration is 10 mg/m^3 and the maximum acceptable daily intake is 300 μg/kg. Di-chlorophenoxyacetic acid is very irritating to the eyes, nose and throat.

The following postmortem tissue concentrations have been reported in 4 fatalities involving ingestion of dichlorophenoxyacetic acid: blood 126 to 826 mg/L (mean 447, 4 cases), bile 573 mg/L (1 case), brain 13 and 66 μg/g (2 cases), kidney 62 to 82 μg/g (mean 69, 3 cases), liver 21 to 183 μg/g (mean 134, 4 cases), urine 111 and 264 mg/L (2 cases) [Coutselinis *et al.* 1977; Nielsen *et al.* 1965]; [Ryall, 1978]; [M. Watson, 1978].

A 35-year-old male ingested 50 g Celatox Gazon (100 g/L 2,4-D and 400 g/L MCPP). Total serum chlorophenoxy herbicide concentrations were 605 and 155 mg/L at 4 and 41 h postadmission, respectively. He made a full recovery [Berthelot-Moritz *et al.* 1997].

A 60-year-old male drank 0.5 L of 'Animex' (480 g/L 2,4-D) and died 5.5 h later. Blood and urine concentrations of 2,4-D were 192 and 3.8 mg/L, respectively [Jorens *et al.* 1995].

A 49-year-old male ingested an unknown amount of dichlorophenoxyacetic acid solution (500 g/L) and later died after hospital treatment. The concentrations of the herbicide in lung, liver, kidney, heart, pancreas, muscle, brain and stomach contents were 533, 386, 370, 361, 298, 273 and 185 mg/kg and 125 mg/L, respectively. The herbicide was detected in blood before treatment at a concentration of 389 mg/L and in plasma at 750 mg/L. [Keller *et al.* 1994].

A 61-year-old female ingested an unknown quantity of Killex (100 g/L 2,4-D, 50 g/L mecoprop and 9 g/L dicamba). At postmortem, her blood, urine and bile concentrations of 2,4-D were 520, 70, and 340 mg/L and her liver concentration was 540 mg/kg [Fraser *et al.* 1984].

A 26-year-old male ingested ~360 mL Dexol (6.7% chloropyrifos in 76.8% distillates), 360 mL of Ortho Weed-B-Gone M (10.8% diethylamine salts of 2,4-D, 11.6% MCPP and 77.6% aqueous inert ingredients), and a few granules of D-Con concentrate (0.025% warfarin). On admission the gastric aspirate contained 108.2 μg/g 2,4-D. At postmortem 2,4-D tissue concentrations (μg/g) were as detailed below.

Tissue	*2,4-D*
CSF	96.7
Brain grey matter (frontal lobe)	186.4
Brain white matter (frontal lobe)	298.5
Brain stem	254.8
Whole blood	389.5
Bile	154.8
Liver	293.5
Pancreas	220.9
Left ventricle	301.2
Diaphragm	283.1
Kidney	315.0

[Osterloh *et al.* 1983].

Note For 3 cases of survival following serum concentrations of 0.37 to 1.77 μg/L, see Durakovic *et al.* [1992].

For reviews of poisoning due to chlorophenoxy herbicides, see Bradberry *et al.* [2004] or Bradberry *et al.* [2000].

Half-life Plasma half-life, ≈12 to 33 h.

Volume of Distribution 0.1 to 0.2 L/kg [Bradberry *et al.* 2004].

Clearance Urine pH-dependent [Prescott *et al.* 1979].

Distribution in Blood Plasma : whole blood ratio, 1.80 to 2.27 [Flanagan, Ruprah 1989].

Protein Binding Extensive to albumin [Bradberry *et al.* 2004].

Dichlorvos

Insecticide

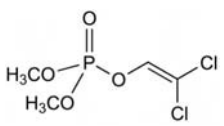
$C_4H_7Cl_2O_4P$ = 221.0

CAS—62-73-7

IUPAC Name 2,2-Dichloroethenyl dimethyl phosphate

Synonyms DDVP; dichlorfos; dichlorophos; 2,2-dichlorovinyl dimethyl phosphate; dichlorovos; ENT-20738; NSC-6738; OMS-14; SD-1750.

Proprietary Names *Astrobat*; *Atgard*; *Canogard*; *Dedevap*; *Dichlorman*; *Divipan*; *Doom*; *Equigard*; *Equigal*; *Estrosol*; *Herkol*; *Nogos*; *Nuvan*; *Prosvit*; *Task*; *Vapona*; *Verdisol.*



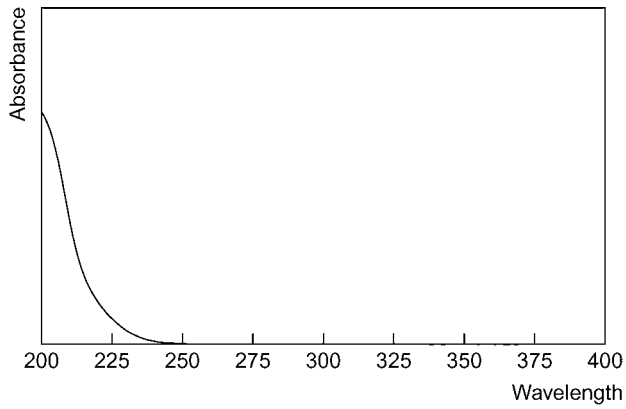
Chemical Properties A colourless to amber, oily liquid. Mp <25°. Bp 140° at 20 mmHg. It is soluble in water (8000 mg/L at 20°) and glycerol (0.5 g/100 mL); very soluble in dichloromethane, propan-2-ol and toluene; soluble in ethanol, chloroform, acetone and kerosene; miscible with many organic solvents and aerosol propellents; moderately soluble in diesel oil, kerosene, isoparaffinic hydrocarbons and mineral oils. Log *P* (octanol/water), 1.47. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Thin-layer Chromatography System TE—R_f 0.83; system TX—R_f 0.20; system TY—R_f 0.20; system TZ—R_f 0.75; system TAA—R_f 0.36; system TAB—R_f 0.00; system TAC—R_f 0.00.

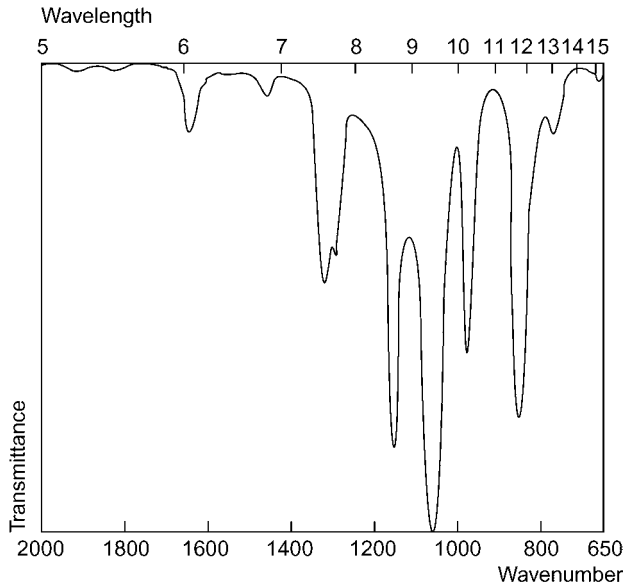
Gas Chromatography System GA—RI 1275; system GK—RRT 0.23 (relative to caffeine).

High Performance Liquid Chromatography System HAO—*k* 5.22; system HAP—*k* 0.86.

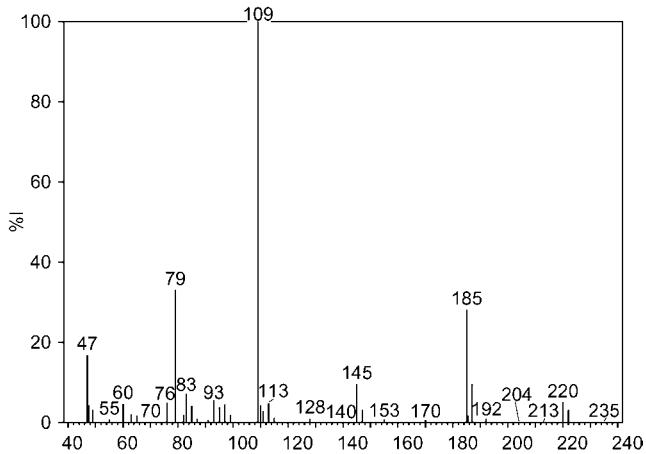
Ultraviolet Spectrum



Infrared Spectrum Principal peaks at wavenumber 1061, 1158, 850, 978, 1320, 2971 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 109, 185, 15, 79, 47, 145, 187, 29.



Quantification

Blood **GC-MS** Column: Supelco PTE 5 5% phenylsiloxane 95% methylsiloxane (30 m × 0.25 mm i.d.). Carrier gas: He, 70 kPa. Temperature programme: 60° for 2 min to 90° at 40°/min to 250° at 15°/min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 1 mg/L, limit of detection, 0.275 mg/L [Abe *et al.* 2008]. Column: HP-5-MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 120° for 1 min to 290° at 10°/min for 1 min. EI ionisation, SIM acquisition mode. Limit of quantification, >0.025 mg/g, limit of detection, 0.1 µg/g [Musshoff *et al.* 2002]. Limit of detection, 150 µg/L [Takayasu *et al.* 2001]. Column: Ultra-1 (25 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 45 kPa.

Temperature programme: 80° for 1 min to 100° at 50°/min for 0.3 min to 113° at 1.5°/min for 0 min to 300° at 70°/min for 2.0 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 1 μg/L [Heinig *et al.* 2000]. Column: 5% phenylsiloxane 95% dimethylsilixane (12.5 m × 0.32 mm i.d.). Carrier gas: He, 5 mL/min. Temperature programme: 80° for 30 s to 130° at 70°/min. NPD. Limit of detection, 50 nmol/L [Villén *et al.* 1990].

Plasma **HPLC** Column: C_{18} (300 × 3.9 mm i.d., 10 μm). Mobile phase: 1 mmol/L OSA : methanol (70 : 30; pH 3.0), flow rate 1.5 mL/min. UV detection (λ = 210 nm). Retention time: 44.2 min. Limit of detection, 40 μg/L [Unni *et al.* 1992].

Serum **HPTLC** Dichlorvos and other pesticides [Yan *et al.* 2006].

GC-MS Column: HP-5 MS (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 70 kPa. Temperature programme: 60° for 2 min to 110° at 40°/min to 170° at 12°/min to 300° at 40°/min for 3.5 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, <0.06 mg/L [Tarbah *et al.* 2004]. Limit of detection, 60 μg/L for the metabolite dimethylphosphate [Tarbah *et al.* 1998].

HPLC Column: C_{18}. Mobile phase: acetonitrile : water. DAD (λ = 230 nm). Limit of detection, 0.05–6.8 mg/L for dichlorvos and other organophosphorus pesticides [Cho *et al.* 1997].

LC-MS Column: C_{18}. Mobile phase: 10 mmol/L ammonium formate : methanol. Limit of quantification, 0.25–1.25 mg/L for dichlorvos and other organophosphorus pesticides [Inoue *et al.* 2007].

Urine **GC-MS** See Blood [Abe *et al.* 2008; Heinig *et al.* 2000; Takayasu *et al.* 2001].

HPLC See Serum [Cho *et al.* 1997].

Stomach Contents **GC-MS** See Blood [Abe *et al.* 2008].

Kidney **GC-MS** See Blood [Abe *et al.* 2008].

Liver **GC-MS** See Blood [Abe *et al.* 2008].

Lung **GC-MS** See Blood [Abe *et al.* 2008].

Disposition in the Body Dichlorvos is easily absorbed through the skin. It is absorbed after ingestion and rapidly moves to the liver where it is quickly detoxified by degrading enzymes found in tissues and blood plasma. It is distributed in tissues, especially kidneys, liver, stomach and intestines. It is rapidly metabolised and eliminated from the body via expired air and urine. One metabolite is dimethylphosphate, which is common for some of the organophosphate compounds, and another is dichloroacetaldehyde. It does not accumulate in tissues.

Toxicity Dichlorvos is highly toxic by inhalation, dermal absorption and ingestion. Severe poisoning will affect the CNS. A lethal oral dose of 400 mg/kg bodyweight has been reported and a toxic dose of 300 mg/kg. The allowed daily intake is 0.04 mg/kg.

A 72-year-old woman was found dead after ingesting dichlorvos. A 500 mL bottle of dichlorvos was found beside the body (concentration 75%). There was 250 mL of a volatile fluid in the stomach, which was equivalent to 300 g dichlorvos. Dichlorvos was detected in the spleen (3340 μg/g), heart (815 μg/g), urine (4.5 mg/L), blood (29 mg/L), brain (9.7 μg/g), lung (81 μg/g), kidney (80 μg/g) and liver (20 μg/g) [Shimizu *et al.* 1996].

A 54-year-old man was found dead after ingesting dichlorvos (possibly 82 g; 1 g/kg). Levels of dichlorvos in cardiac blood was ~4 times higher than in peripheral blood. Levels in the kidneys and lungs were lower and it was not found in the liver. The stomach contents was 38 g [Abe *et al.* 2008].

Thirteen patients were admitted to hospital after eating wheat bagels that had been deliberately contaminated with dichlorvos. Mean serum acetylcholinesterase levels were 2945 U/L (range, 470–7830) [Kavalci *et al.* 2009].

For other reports of poisoning with dichlorvos, see Güloglu *et al.* [2004], Kumar *et al.* [2009], and Yucel *et al.* [2008].

Half-life ~25 min.

Clearance Oral clearance in healthy volunteers is ~1558 L/h.

Diclofenac

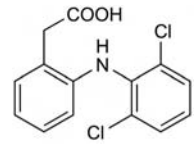
Analgesic, Antiinflammatory, Antipyretic

$C_{14}H_{11}Cl_2NO_2$ = 296.2

CAS—15307-86-5

IUPAC Name 2-[(2,6-Dichlorophenyl)amino]benzeneacetic acid

Synonyms Diclophenac; [*o*-(2,6-Dichloroanilino)phenyl]acetic acid.



Chemical Properties Crystals. Mp 156° to 158°. pK_a 4.2. Log *P* (octanol/water), 4.5. Extraction yield (chlorobutane), 0.2 [Demme *et al* 2005].

Diclofenac Sodium

$C_{14}H_{10}Cl_2NNaO_2$ = 318.1

CAS—15307-79-6

Synonyms Diclofenacum natricum; GP-45840.

Proprietary Names *Acoflam*; *Arthrotec*; *Cataflam*; *Dicloflex*; *Diclomax*; *Diclotard*; *Diclovol*; *Diclozip*; *Econac*; *Flamatak*; *Flamrase*; *Flexotard*; *Isclofen*; *Lofensaid*; *Motifene*; *Pennsaid*; *Rheumatac*; *Rhumalgan*; *Slofenac*; *Solaraze*; *Volraman*; *Volsaid*; *Voltaren(e)*; *Voltarol*.

Chemical Properties Crystals. Mp 283° to 285°. Solubility at 25° (mg/mL): deionised water (pH 5.2) >9; methanol >24; acetone 6; acetonitrile <1; cyclohexane <1.

Colour Tests Liebermann's reagent—red-brown; Mandelin's test—red-brown; Marquis test—brown (slow).

Thin-layer Chromatography System TA—R_f 0.90; system TD—R_f 0.25; system TE—R_f 0.12; system TF—R_f 0.27; system TG—R_f 0.29; system TAD—R_f 0.47; system TAE—R_f 0.90; system TAJ—R_f 0.40; system TAK—R_f 0.64; system TAL—R_f 0.84 (chromic acid solution—red).

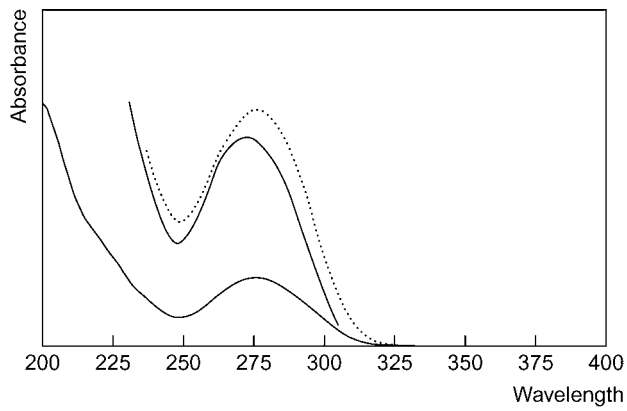
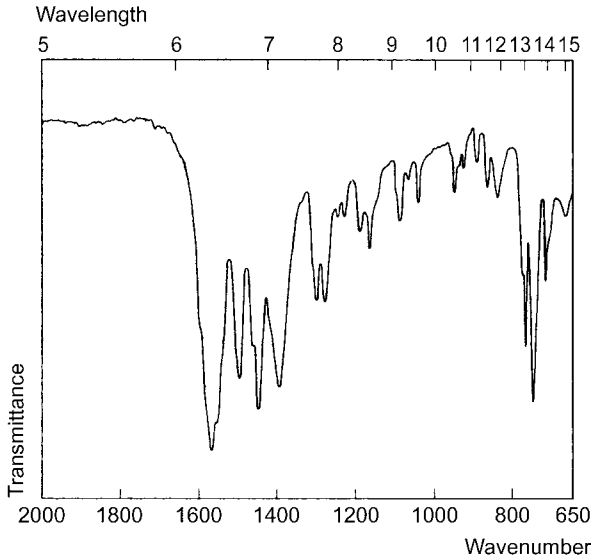
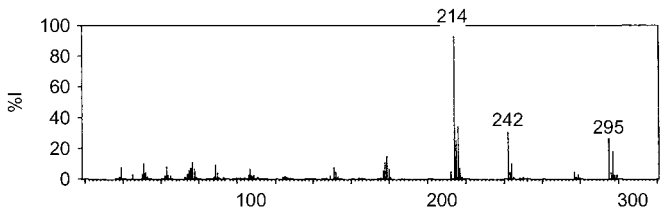
Ultraviolet Spectrum Aqueous acid—273 nm (A_1^1 = 309b); aqueous alkali—275 nm (A_1^1 = 351b)



Infrared Spectrum Principal peaks at wavenumbers 1572, 756, 1504, 775, 1286, 1308 cm^{-1} (diclofenac sodium, KBr disk).



Mass Spectrum Principal ions at *m/z* 214, 216, 242, 295, 215, 297, 179, 178.



Quantification

Plasma **GC** ECD. Limit of detection, 100 µg/L [Ikeda *et al.* 1980].

GC-MS Column: HP-1. Carrier gas: He. SIM acquisition mode. Limit of quantification, 1 µg/L, limit of detection, 0.2 µg/L [Borenstein *et al.* 1996]. SIM acquisition mode. Limit of detection, 2 µg/L [Del Puppo *et al.* 1991]. Limit of detection, 100 ng/L [Sioufi *et al.* 1991].

HPLC UV detection (λ= 276 nm). Limit of quantification, 50 µg/L [Rigato *et al.* 2009]. Limit of detection, 5 µg/L [Arcelloni *et al.* 2001]. Column: Capcell Pak MF Ph-1 (35 × 2 mm i.d.) and phenylhexyl column (100 × 2 mm i.d.). Mobile phase: acetonitrile : 0.02 mol/L potassium phosphate (pH 7; 33 : 67). Limit of detection, 10 µg/L [Lee *et al.* 2000]. UV detection (λ= 282 nm). Limit of detection, 3 µg/L [Hanses *et al.* 1995]. Column: C_{18} Spherisorb. Mobile phase: acetonitrile : 0.1 mol/L sodium acetate (pH 6.3, 35 : 65,). UV detection (λ= 278 nm). Retention time, 2.8 min. Limit of detection, 20 µg/L [Avgerinos *et al.* 1993]. See also Blagbrough *et al.* [1992], Brunner, Luders [1991], Chan *et al.* [1982]<Query: Chan ref missing; please add>, Giagoudakis, Markantonis [1998], Miller [1993], Santos *et al.* [1992], Wiese, Hermansson [1991], Zecca *et al.* [1991].

Serum **HPLC** Column: Regis SPS 100 RP-8 (150 × 4.6 mm i.d., 5 µm) and LiChrospher 100 RP_{18} (5 µm). Fluorescence detection (λ_{ex}=286 nm, λ_{em}= 360 nm). Limit of detection, 1 µg/L [Kuhlmann, Krauss 1997]. Limit of detection, 10 µg/L [Zhang *et al.* 1994]. Column: Spherisorb S5 ODS-2. Mobile phase: methanol : 0.05 mol/L phosphate buffer (43 : 57). Fluorescence detection (λ_{ex}= 282 nm, λ_{em}= 365 nm). Limit of quantification, 20 µg/L [Moncrieff 1992].

Urine **GC-MS** Limit of detection, 10–50 µg/L [Maurer *et al.* 2001]. See Plasma [el Haj *et al.* 1999; Sioufi *et al.* 1991]. ECD [Schneider, Degen 1981].

HPLC Column: reversed phase ODS. Mobile phase: 10 mmol/L acetate buffer (pH 4.0) : acetonitrile (58 : 42). UV detection (λ= 210 nm). Limit of quantification, 20 µg/L, limit of detection, <7 µg/L [Bakkali *et al.* 1999]. Column: reversed phase Inertsil ODS-2. Mobile phase: phosphate buffer : acetonitrile (pH 5.0). UV detection (λ= 230 or 320 nm). Limit of quantification, 50 µg/L [Hirai *et al.* 1997]. Column: reversed phase. Mobile phase: ascorbic acid. Limit of quantification, 400 µg/L [Sawchuk *et al.* 1995].

Aqueous Humour **HPLC** Column: Regis SPS 100 RP_8 (150 × 4.6 mm i.d., 5 µm). ECD. Limit of detection, 500 ng/L [Kuhlmann *et al.* 1998]. Column: reversed phase octyl. Mobile phase: acetic acid : acetonitrile : TEA. UV detection. Limit of detection, 0.3 ng [Riegel, Ellis 1994]. See Serum [Kuhlmann, Krauss 1997].

CSF **HPLC** See Plasma [Zecca *et al.* 1991].

Sinovial Fluid **HPLC** See Plasma [Blagbrough *et al.* 1992].

Disposition in the Body Diclofenac is well absorbed after oral administration but undergoes significant first-pass metabolism. Up to approx. 70% of a dose is excreted in the urine in 3 days, including 20–40% as glucuronide and sulfate conjugates of the major metabolite 4′-hydroxydiclofenac (active) and up to ~15% as conjugates of unchanged diclofenac. Other metabolites identified in the urine include 5-hydroxydiclofenac (~12% of the dose), 3′-hydroxydiclofenac and 4′,5-dihydroxydiclofenac. Approximately 10–20% of a dose is excreted in the bile as 4′-hydroxydiclofenac and <5% as unchanged drug. Diclofenac enters synovial fluid, where peak levels are attained ~2–4 h after peak plasma levels. Diclofenac is excreted in breast milk but in quantities so small that no adverse effects on breast-fed infants would be expected.

Therapeutic Concentration

Following oral administration of 50 mg diclofenac sodium three times a day to four subjects, peak plasma concentrations of 0.1 to 2.2 mg/L (mean 0.8) diclofenac and 0.3 to 2.0 mg/L (mean 1.2) 4′-hydroxydiclofenac were reported 3 h after a dose; peak concentrations in synovial fluid of 0.1 to 0.6 mg/L (mean 0.3) diclofenac and 0.2 to 1.0 mg/L (mean 0.6) 4′-hydroxydiclofenac were attained in 3 h; concentrations in synovial fluid exceeded those in plasma after 4 h [Fowler *et al.* 1983].

Diclofenac was administered as a single oral 150 mg dose to 6 healthy subjects, 6 patients with chronic active hepatitis and 6 patients with alcoholic cirrhosis. Peak plasma concentrations of diclofenac, 3′-hydroxydiclofenac, 4′-hydroxydiclofenac and 3′-hydroxy-4′,5-methoxydiclofenac of 5.699, 0.412, 2.613 and 0.385 mg/L, respectively, were attained at 0.63, 0.79, 0.88 and 5.8 h, respectively, in the healthy subjects. The equivalent respective values in patients with hepatitis were 6.574, 0.392, 2.786 and 0.306 mg/L at 0.42, 0.58, 0.50 and 4.0 h; in patients with cirrhosis, they were 11.59, 0.264, 2.481 and 0.191 mg/L at 0.33, 1.04, 0.75 and 7.0 h [Lill *et al.* 2000].

In 20 healthy subjects given a single oral dose of diclofenac 100 mg as two different sustained-release tablets, peak plasma concentrations of 1.161 and 0.799 mg/L were attained in 4.2 and 4.5 h [Zmeili *et al.* 1996].

Toxicity

A 19-year-old man was admitted to hospital following the ingestion of 1.5 g diclofenac sodium and 4 g chlormezanone. Plasma diclofenac concentrations of 60.1 mg/L and 0.19 mg/L were reported at 7 and 15 h, respectively; chlormezanone could not be determined. The subject recovered after ~2 days [Netter *et al.* 1984].

Bioavailability ~50–60%.

Half-life Plasma half-life, ~1–2 h; synovial fluid half-life 3–6 h.

Volume of Distribution 0.17 L/kg.

Clearance ~4 mL/min/kg from plasma.

Protein Binding >99%.

Note For reviews of diclofenac see Brogden *et al.* [1980], Davies, Anderson [1997] and Shintaku *et al.* [2009].

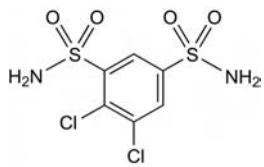
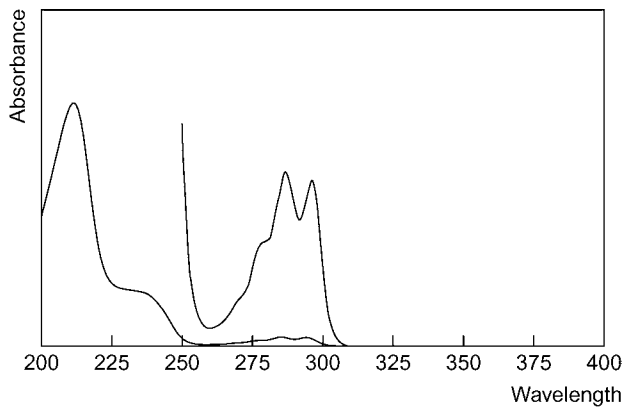
Diclofenamide

Carbonic Anhydrase Inhibitor
$C_6H_6Cl_2N_2O_4S_2$ = 305.2
CAS—120-97-8

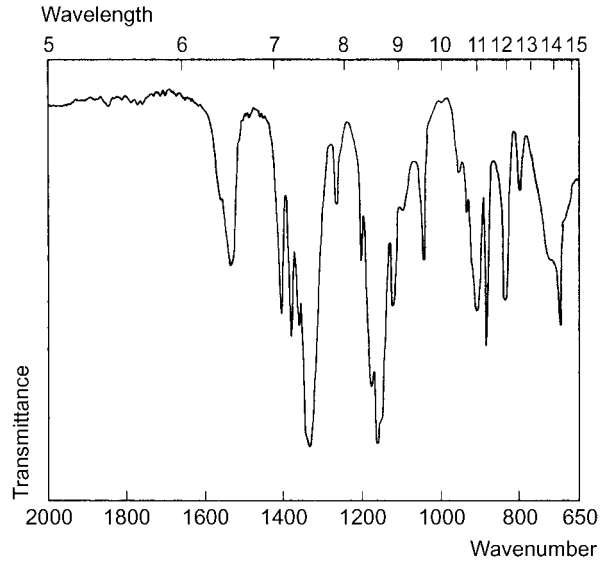
IUPAC Name 4,5-Dichloro-1,3-benzenedisulfonamide
Synonyms DCPA; dichlorophenamide; dichlorphenamide.
Proprietary Names *Daranide*; *Oralcon*; *Oratrol*.



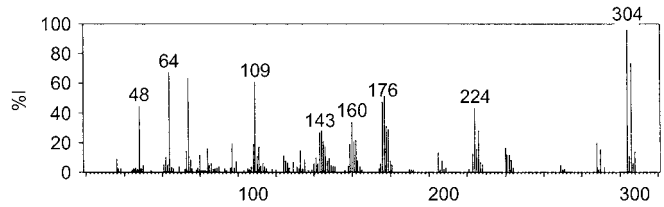
Chemical Properties A white crystalline powder. Mp about 240°. Practically insoluble in water and chloroform; soluble 1 in 30 of ethanol; slightly soluble in ether; freely soluble in pyridine; soluble in solutions of alkali hydroxides and carbonates. pK_a 7.4, 8.6. Log *P* (ether/pH 7.4), 1.0.
Colour Test Koppanyi-Zwikker test—violet.
Thin-layer Chromatography System TA—R_f 0.82; system TD—R_f 0.14; system TE—R_f 0.33; system TF—R_f 0.64; system TAD—R_f 0.23 (acidified iodoplatinate solution, positive).
Ultraviolet Spectrum Aqueous acid—286 (A_1^1=60a), 296 nm.



Infrared Spectrum Principal peaks at wavenumbers 1162, 1176, 882, 702, 907, 1123 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 304, 306, 64, 74, 109, 177, 176, 48.



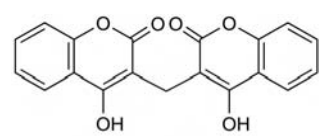
Quantification
Serum (rabbit) **GC** ECD. Limit of detection, 20 µg/L [Schmitt *et al.* 1979].
Dose 100 to 200 mg daily in the treatment of glaucoma.

Schmitt C *et al.* (1979). Electron-capture GLC assay of dichlorphenamide. *J Pharm Sci* 68: 381–383.

Dicoumarol

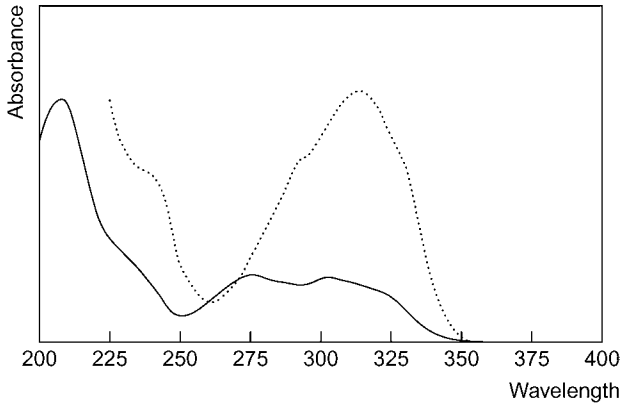
Anticoagulant
$C_{19}H_{12}O_6$ = 336.3
CAS—66-76-2

IUPAC Name 2-Hydroxy-3-[(2-hydroxy-4-oxochromen-3-yl)methyl]chromen-4-one
Synonyms Bishydroxycoumarin; dicoumarin; dicumarol; melitoxin; 3,3′-methylenebis[4-hydroxy-2*H*-1-benzopyran-2-one].
Proprietary Name *Dufalone*

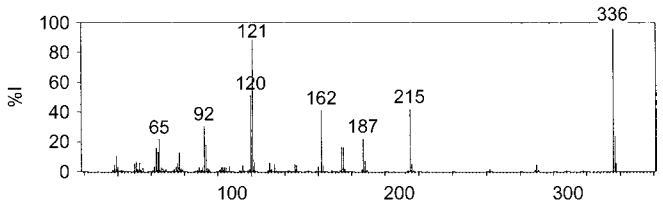


Chemical Properties A white or creamy-white crystalline powder. Mp 287° to 293°. Practically insoluble in water, ethanol and ether; slightly soluble in benzene and chloroform; freely soluble in solutions of alkali hydroxides. pK_a 4.4, 8.0. Log *P* (octanol/water), 2.1.
Thin-layer Chromatography System TB—R_f 0.00; system TD—R_f 0.18; system TE—R_f 0.30; system TF—R_f 0.32; System TAD—R_f 0.33; system TAE—R_f 0.88; system TAJ—R_f 0.60; system TAK—R_f 0.80; system TAL—R_f 0.96 (acidified potassium permanganate solution, positive).
Gas Chromatography System GA—not eluted.
High Performance Liquid Chromatography System HX—RI 599.

Ultraviolet Spectrum Aqueous alkali—314 nm (A^1_1=756a).



Mass Spectrum Principal ions at *m/z* 336, 121, 120, 215, 162, 92, 337, 187.



Quantification

Plasma **UV spectrophotometry** Limit of detection, 2 mg/L [Nagashima *et al.* 1968].

Disposition in the Body Slowly and irregularly absorbed after oral administration. It is extensively metabolised with <1% of a dose being excreted in the urine as unchanged drug.

Therapeutic Concentration

After a single oral dose of 150 mg to 8 subjects, a mean peak plasma concentration of 16.7 mg/L was attained in 12 h [Solomon, Schrogie 1967].

Following daily oral administration of 2 mg/kg to 3 subjects, plasma concentrations of 44 to 59 mg/L (mean 53) were reported on the 6th day [Vesell, Page 1968].

Toxicity Fatalities, usually due to severe haemorrhage, have been reported following daily oral doses of 100 mg or more.

Half-life Plasma half-life, dose-dependent and may range from 7 to 100 h.

Protein Binding >99%.

Dose Maintenance, 25 to 150 mg daily.

Dicycloverine

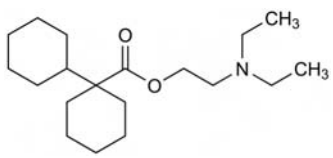
Anticholinergic

$C_{19}H_{35}NO_2$ = 309.5

CAS—77-19-0

IUPAC Name 2-Diethylaminoethyl 1-cyclohexylcyclohexane-1-carboxylate

Synonyms [1,1′-Bicyclohexyl]-1-carboxylic acid 2-(diethylamino)ethyl ester; dicyclomine.



Chemical Properties Log *P* (octanol/water), 3.98 (hydrochloride).

Dicycloverine Hydrochloride

$C_{19}H_{35}NO_2$,HCl = 346.0

CAS—67-92-5

Proprietary Names *Antispas*; *Bentyl*; *Bentylol*; *Byclomine*; *Clomin*; *Dibent*; *Diclomin*; *Dicomin*; *Dilomine*; *Formulex*; *Lomine*; *Medicyclomine*; *Merbentyl*; *Notensyl*; *Optimal*; *Or-Tyl*; *Wyovin*. It is an ingredient of *Anacidron*, *Diarrest*, *Kolanticon*, *Kolantyl* and *Ovol*.

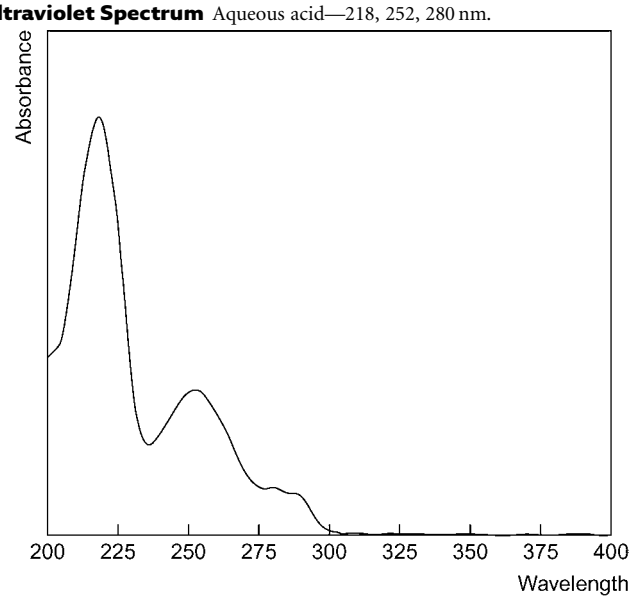
Chemical Properties A white crystalline powder. Mp 164° to 166° (from butanone). Soluble 1 in 20 of water, 1 in 5 of ethanol and 1 in 2 of chloroform; very slightly soluble in ether.

Thin-layer Chromatography System TA—R_f 0.68; system TB—R_f 0.67; system TC—R_f 0.64; system TE—R_f 0.84; system TL—R_f 0.54; system TAE—R_f 0.55; system TAJ—R_f 0.42; system TAK—R_f 0.25; system TAL—R_f 0.84 (acidified iodoplatinate solution, positive).

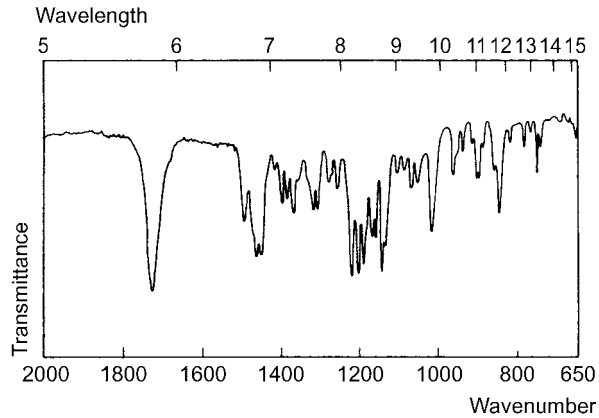
Gas Chromatography System GA—RI 2111; system GB—RI 2175; system GF—RI 2265.

High Performance Liquid Chromatography System HA—*k* 1.1; system HY—RI 575.

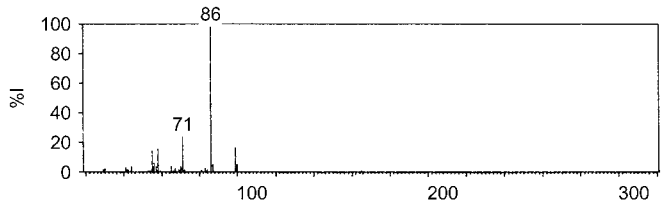
Ultraviolet Spectrum Aqueous acid—218, 252, 280 nm.



Infrared Spectrum Principal peaks at wavenumbers 1714, 1214, 1136, 1197, 1184, 1155 cm^{-1} (dicycloverine hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 86, 71, 99, 58, 55, 56, 100, 87.



Quantification

Plasma **GC** NSD. For method, see Walker *et al.* [1987]. AFID. Limit of detection, 1 µg/L [Meffin *et al.* 1973].

Disposition in the Body Rapidly absorbed after oral administration. About 80% of a dose is excreted in the urine and 10% is eliminated in the faeces.

Therapeutic Concentration

After a single oral dose of 20 mg to 1 subject, a peak plasma concentration of about 0.02 mg/L was attained in about 1.5 h; following administration of 40 mg to the same subject as a sustained-release preparation, a maximum plasma concentration of about 0.08 mg/L was reported after about 2.5 h [Meffin *et al.* 1973].

Toxicity Fatalities have been reported in children after the ingestion of about 0.2 g of a sustained-release preparation.

A blood concentration of 0.505 mg/L (nearly 10 times the reported adult therapeutic level) was reported in a fatality involving an infant [Garriott *et al.* 1984].

Half-life Plasma half-life, about 5 h.

Dose 30 to 80 mg of dicycloverine hydrochloride daily; in the USA doses of up to 160 mg daily in divided doses have been recommended.

Didanosine

Antiviral

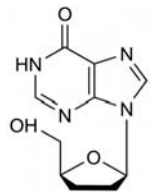
$C_{10}H_{12}N_4O_3 = 236.2$

CAS—69655-05-6

IUPAC Name 9-[(2*R*,5*S*)-5-(Hydroxymethyl)oxolan-2-yl]-3*H*-purin-6-one

Synonyms DDI; ddI; ddIno; 2′,3′-dideoxyinosine; dideoxyinosine; NSC-612049; BMY-40900.

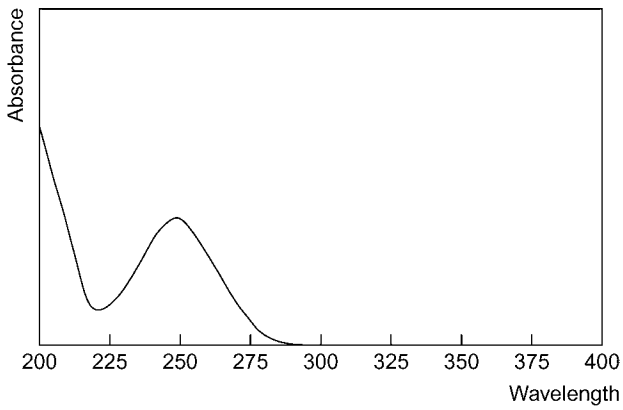
Proprietary Name *Videx*



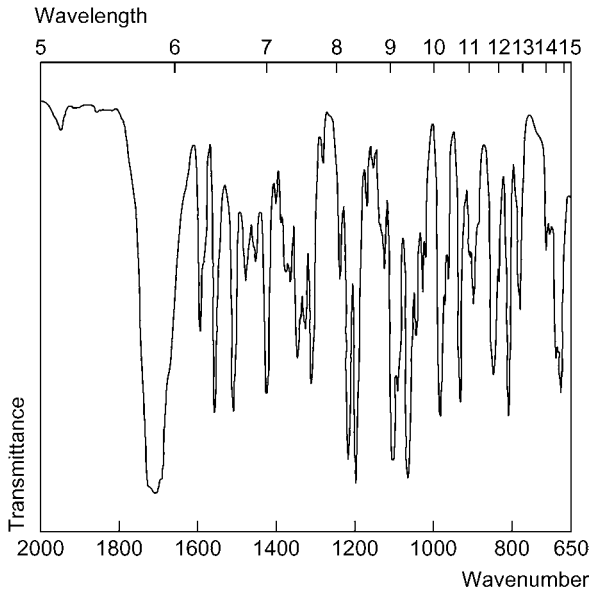
Chemical Properties A white crystalline powder. Mp 160° to 163°. Unstable in acidic solutions. pK_a 9.12. Log *P* (octanol/water), −1.24.

High Performance Liquid Chromatography System HAD—*k* 3.20.

Ultraviolet Spectrum Aqueous acid (pH 2)—248 nm; (ethanol)—246, 250 nm; aqueous alkali (pH 12)—254 nm.



Infrared Spectrum



Quantification

Plasma **HPLC** Limit of quantification, 10 μg/L [Aymard *et al.* 2000]. Column: NovaPak (100 × 8 mm, i.d., 4 μm). Mobile phase: 5% acetonitrile in 0.1% heptafluorobutyric acid in deionised, distilled water, flow rate 2.0 mL/min. UV detection (λ=252 and 260 nm). Retention time: 8.4 min. Limit of detection, 0.1 μg/L [Carpen *et al.* 1990]. UV detection. Limit of detection, 50 μg/L [Frijus-Plessen *et al.* 1990]. Column: ODS Ultrasphere (250 × 4.6 mm, 5 μm); (urine) C_8 Zorbax (250 × 4.6 mm, 5 μm). Mobile phase (plasma): 15% methanol in 50 mmol/L potassium phosphate buffer containing 0.05% TEA (pH 4.0), flow rate 0.7 mL/min; (urine) 3.9% methoxyethanol in 18.3 mmol/L potassium phosphate buffer (pH 7.2), 1.0 mL/min. UV detection (λ=254 nm). Retention time: (plasma) 11.2 min; (urine) 15.3 min. Limit of detection, 25 μg/L [Knupp *et al.* 1990].

Serum **HPLC** UV detection. Limit of detection, 120 μg/L [Simon *et al.* 2001]. UV detection. Limit of detection, 25 μg/L, free didanosine [Rosell-Rovira *et al.* 1996].

Urine **HPLC** See Plasma [Carpen *et al.* 1990]. See Plasma. Limit of detection, 1000 μg/L [Knupp *et al.* 1990].

Cerebrospinal Fluid **HPLC** See Plasma [Carpen *et al.* 1990].

Disposition in the Body Didanosine is rapidly absorbed and reduced by 50% in the presence of food. It is hydrolysed in the acid medium of the stomach and is therefore given orally with pH buffers or antacids. Concentrations in CSF are about 20% of those in plasma 1 h after IV infusion. It crosses the placenta; is detected in amniotic fluid and fetal blood and crosses the blood–brain barrier. The drug is extensively metabolised to the active antiviral metabolite dideoxyadenosine triphosphate, as well as uric acid. Acid hydrolysis may also occur to produce hypoxanthine. About 35 to 60% of a dose is excreted unchanged in urine by glomerular filtration and active tubular secretion. It is partially cleared by haemodialysis but not by peritoneal dialysis.

Therapeutic Concentration Mean peak plasma concentrations of 1.6 mg/L (range 0.6 to 2.9 mg/L) are produced after a single dose of 375 mg of a buffered powder for oral solution. Mean peak plasma concentrations of 1.6 mg/L (range 0.5 to 2.6 mg/L) are produced after administration of a single dose of 300 mg of a buffered chewable/dispersible tablet.

Groups of 3 to 4 patients diagnosed having AIDS (acquired immunodeficiency syndrome) or poor-prognosis AIDS-related complex were administered 0.2, 0.4, 0.8, 1.6, 3.2 or 6.4 mg/kg IV doses over 90 min or the equivalent oral doses. Peak concentrations were 0.6, 1.5, 1.8, 4.6, 10.5 and 18.5 μmol/L for the IV doses and 0.3, 0.8, 1.2, 2.8, 6.2 and 9.2 μmol/L for the oral doses, respectively [Hartman *et al.* 1990].

Toxicity

In phase I clinical studies, 12 out of 92 patients suffered from peripheral neuropathy (the most frequent serious toxic effect), which is dose related, when administered doses of 12 mg/kg daily for 6 weeks. This is believed to be due to accumulation of the drug above concentrations of 1250 mg/kg. Pancreatitis, in some cases fatal, has developed during therapy with didanosine; 8 out of 92 patients being treated with >12.5 mg/kg daily for 5 to 8.5 months suffered from pancreatitis [Faulds, Brogden 1992].

A 36-year-old man with Gilbert Syndrome, AIDS and a history of severe myelosuppression when administered with zidovudine was treated with 12 mg/kg once daily didanosine instead. Treatment was stopped after 15 weeks owing to side effects but was resumed after 6 weeks. Three months after treatment was restarted, the man was admitted to hospital with nausea, anorexia and abdominal pain. A CT scan showed he had a fatty liver with an enlarged globular pancreas. Renal dysfunction was observed the day before he died, caused by fulminent hepatic failure (a complication of treatment) [Lai *et al.* 1991].

Bioavailability Bioavailability is substantially reduced by administration with or after food and varies considerably between patients; it is reported to range from 20 to 40% depending on the formulation used.

Half-life Plasma, didanosine, 30 min to 4 h; dideoxyadenosine triphosphate, more than 12 h; increased in patients with renal impairment.

Volume of Distribution Mean, 1.01 L/kg in adults (range 0.76 to 1.29 L/kg); 24 L/m^2 in children.

Clearance Plasma clearance, 600 to 800 mL/min in adults; 510 mL/min/m^2 in children. Total body, 0.08 L/kg/h.

Protein Binding <5%.

Note For reviews of didanosine, see Shelton *et al.* [1992], Faulds and Brogden [1992], Lipsky [1993], and Perry and Balfour [1996].

For a review of the pharmacokinetics of antiviral nucleoside analogues, see Morse *et al.* [1993].

Dose Adults with body weight ≥60 kg: 200 mg (tablets) or 250 mg (solution) every 12 h; ≤60 kg: 125 mg (tablets) or 167 mg (solution). Children: 25 to 100 mg (tablet) or 31 to 125 mg (powder formulation) twice daily, depending on body surface area.

Dieldrin

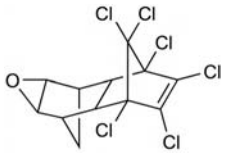
Insecticide

$C_{12}H_8Cl_6O$ = 380.9

CAS—60-57-1 (HEOD)

Proprietary Name *Dilstan EC-15*

Note Dieldrin contains about 85% of HEOD, (1aα,2β,2aα,3β,6β,6aα,7β,7aα)-3,4,5,6,9,9-hexachloro-1a,2,2a,3,6,6a,7,7a-octahydro-2,7 : 3,6-dimethanonaphth[2,3-*b*]oxirene, the remaining 15% being mainly chlorinated organic compounds related to HEOD.



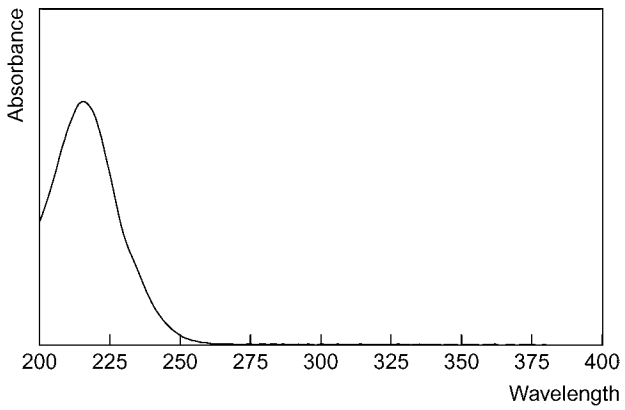
Chemical Properties A light-tan, flaky, crystalline solid. Mp 176° to 177°. Practically insoluble in water; soluble 1 in 4 of ethanol, 1 in 40 of carbon tetrachloride and 1 in 1 of methanol; moderately soluble in chloroform. Log *P* (octanol/water), 5.4.

Colour Tests Nitric–sulfuric acid (Erdman's reagent)—pink; sulfuric acid–fuming sulfuric acid—red.

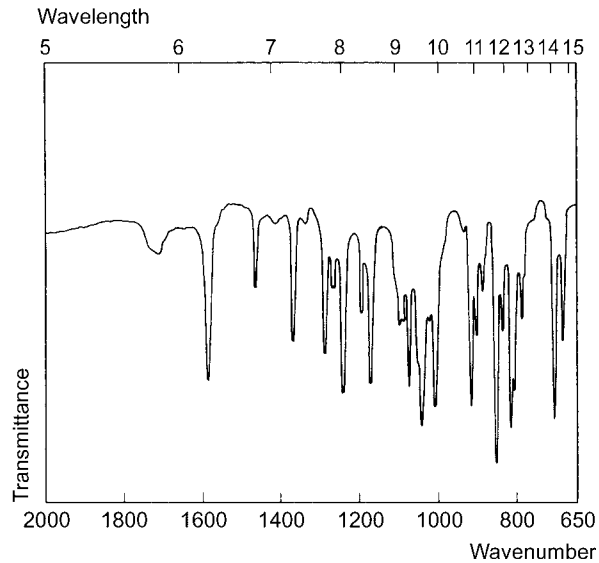
Thin-layer Chromatography System TB—R_f 0.60; system TE—R_f 0.89; system TF—R_f 0.74; system TX—R_f 0.65; system TY—R_f 0.87; system TAB—R_f 0.51; system TAC—R_f 0.27; system TAE—R_f 0.89.

Gas Chromatography System GA—RI 2110; system GK—RRT 1.13(relative to caffeine).

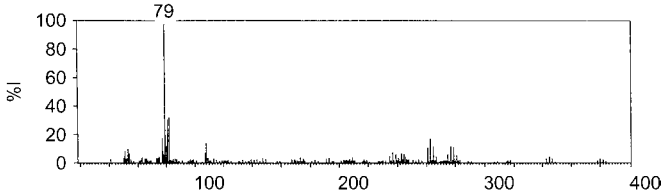
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.



Infrared Spectrum Principal peaks at wavenumbers 848, 811, 1038, 700, 1005, 912 cm^{-1} (KCl disk).



Mass Spectrum Principal ions at *m/z* 79, 82, 81, 263, 77, 108, 265, 80.



Quantification

***Blood* GC** ECD. For method, see Steentoft [1979].

***Plasma* GC** ECD. Limit of detection, 0.1 to 0.7 µg/L [Saady, Poklis 1990].

***Serum* GC** See Plasma [Saady, Poklis 1990].

GC–MS For method, see Dmitrovic *et al.* [2002].

***Tissues* GC** See Blood [Steentoft 1979].

Disposition in the Body Both dieldrin powder and solutions are readily absorbed after oral administration, through the lungs and through intact skin. Dieldrin is selectively stored in body fat and persists for several weeks after cessation of exposure. It is eliminated in the faeces mainly as unknown hydrophilic metabolites; a small amount is excreted in the urine as metabolites but very little as unchanged dieldrin.

Dieldrin is a metabolite of aldrin.

Blood Concentration Blood concentrations averaging 0.001 mg/L have been reported in subjects with no occupational exposure to dieldrin.

Serum concentrations ranging from 0.001 to 0.137 mg/L (mean 0.02) were reported in 71 industrially exposed workers, and fat concentrations of 0.6 to 32 µg/g (mean 6) were reported in 28 of these subjects [Hayes, Curley 1968].

Steady-state blood concentrations of about 0.007 and 0.02 mg/L were reported in 2 groups of 3 subjects who received doses of 0.05 mg and 0.21 mg daily for 2 years; maximum fat concentrations of 1.3 to 1.6 µg/g and 2.2 to 4.9 µg/g were reported in the same subjects [Hunter *et al.* 1969].

Fat residues in 236 non-exposed subjects were reported to be in the range <0.01 to 0.5 µg/g (mean 0.1) [Abbott *et al.* 1981].

Toxicity The estimated minimum lethal dose is 5 g; ingestion of 10 mg/kg may produce toxic effects. The maximum permissible atmospheric concentration is 0.25 mg/m^3 and the maximum acceptable daily intake is 0.1 µg/kg. Blood concentrations greater than 0.15 µg/mL are usually toxic. Several fatalities due to accidental or deliberate ingestion of dieldrin have been reported.

A serum concentration of 0.27 mg/L and a fat concentration of 47 µg/g were reported 3 days after ingestion of dieldrin by a 4-year-old boy who survived [Garrettson and Curley 1969].

In a fatality due to the ingestion of dieldrin, postmortem blood and liver concentrations of 0.5 mg/L and 29 µg/g, respectively, were reported [Steentoft 1979].

Half-life Blood half-life, 50 to 170 days (mean 97).

Distribution in Blood Plasma : whole blood ratio, about 1.5.

Protein Binding >99%.

Dienestrol

Oestrogen

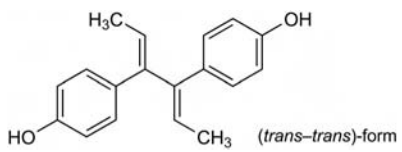
$C_{18}H_{18}O_2$ = 266.3

CAS—84-17-3; 13029-44-2 (*E*,*E*-)

IUPAC Name 4-[(2*E*,4*E*)-4-(4-Hydroxyphenyl)hexa-2,4-dien-3-yl]phenol

Synonyms Dehydrostilbestrol; dienoestrol; 4,4′-(1,2-diethylidene-1,2-ethanediyl)bisphenol; oestrodienolum.

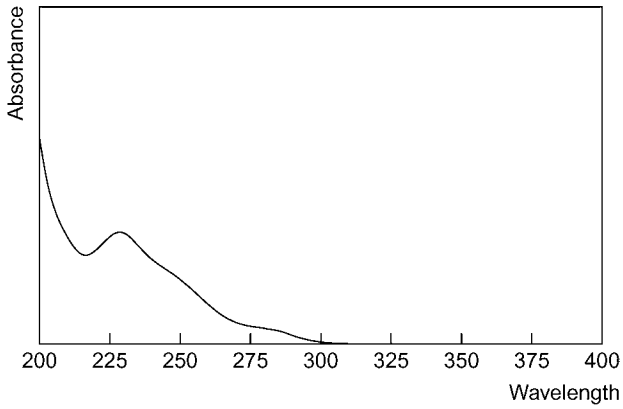
Proprietary Names *Cycladiene*; *DV*; *Estraguard*; *Hormofemin*.



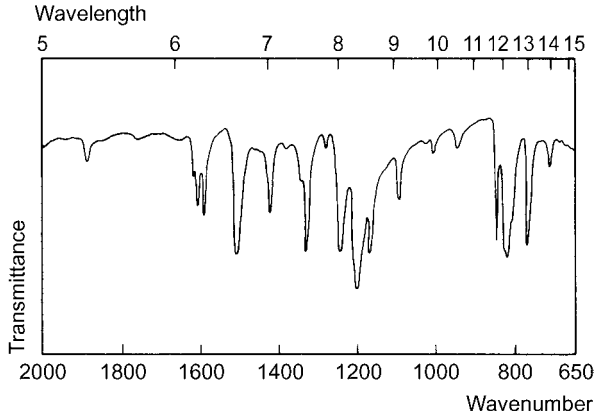
Chemical Properties White crystals or crystalline powder. Mp 227° to 234°. Practically insoluble in water; soluble 1 in 8 of ethanol, 1 in 5 of acetone and 1 in 15 of ether; freely soluble in propylene glycol; soluble in chloroform and aqueous solutions of alkali hydroxides. Log *P* (octanol/water), 5.3.

Caution Dienestrol is a powerful oestrogen. Contact with the skin or inhalation should be avoided.

Colour Tests Antimony pentachloride—red; naphthol–sulfuric acid—orange-brown/yellow; sulfuric acid—orange-red; dissolve about 0.5 mg in 0.2 mL of acetic acid, add 1 mL of phosphoric acid, and heat on a water-bath for 3 min—violet, becoming slightly more blue on dilution with 3 mL of acetic acid (this test distinguishes dienestrol from diethylstilbestrol, which produces a yellow colour).
Thin-layer Chromatography System TP—R_f 0.72; system TQ—R_f 0.25; system TR—R_f 0.34; system TS—R_f 0.05, streaking may occur.
High Performance Liquid Chromatography System HY—RI 535.
Ultraviolet Spectrum Principal peak at 230 nm.



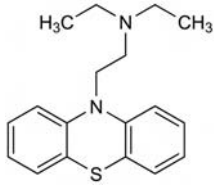
Infrared Spectrum Principal peaks at wavenumbers 1206, 827, 1173, 1510, 1248, 775 cm^{-1} (KBr disk).



Disposition in the Body Readily absorbed after oral administration. It is excreted in the urine mainly as a glucuronide conjugate.
Dose Dienestrol has been given orally in doses of 0.5 to 30 mg daily. It is used as a 0.01 to 0.025% vaginal cream.

Diethazine

Anticholinergic
$C_{18}H_{22}N_2S$ = 298.4
CAS—60-91-3
IUPAC Name *N*,*N*-Diethyl-10*H*-phenothiazine-10-ethanamine
Synonyms Eazamine; RP-2987.

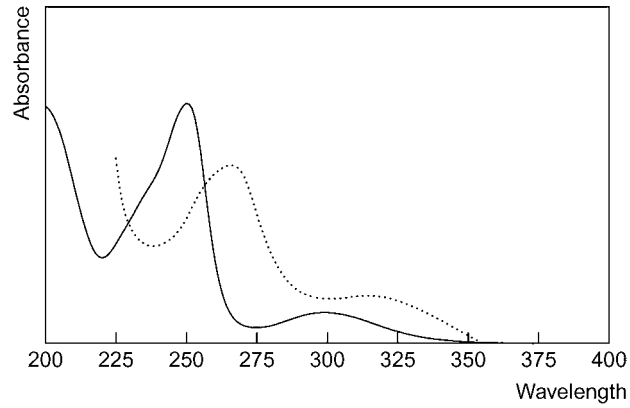


Chemical Properties An oily liquid. pK_a 9.1 (20°). Log *P* (octanol/water), 5.9.

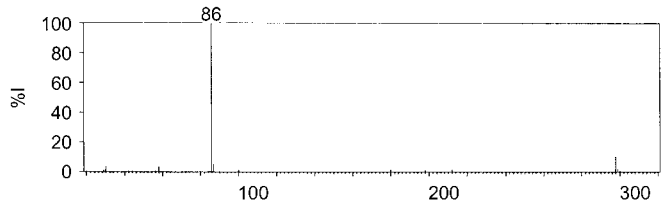
Diethazine Hydrochloride
$C_{18}H_{22}N_2S$,HCl = 334.9
CAS—341-70-8

Chemical Properties A white or slightly cream-coloured crystalline powder. Mp 184° to 186°. Soluble 1 in 5 of water, 1 in 6 of ethanol and 1 in 5 of chloroform; practically insoluble in ether.

Colour Tests Formaldehyde–sulfuric acid—red-violet; Forrest reagent—red; FPN reagent—orange; Mandelin's test—green→violet (excess reagent); Marquis test—violet-brown.
Thin-layer Chromatography System TA—R_f 0.58; system TB—R_f 0.57; system TC—R_f 0.51; system TE—R_f 0.77; system TL—R_f 0.39; system TAE—R_f 0.33; system TAF—R_f 0.54 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2377.
High Performance Liquid Chromatography System HA—*k* 3.4; system HAX—retention time 15.1 min; system HAY—retention time 7.4 min.
Ultraviolet Spectrum Aqueous acid—250 (A^1_1=1200b), 298 nm; aqueous alkali—265 nm.



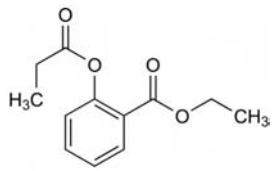
Infrared Spectrum Principal peaks at wavenumbers 748, 1245, 1587, 1282, 1562, 1219 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 86, 298, 87, 30, 58, 299, 212, 180.



Dose Diethazine hydrochloride has been given in doses of 0.15 to 1.5 g daily.

Diethyl Phthalate

Plasticiser, Solvent
$C_{12}H_{14}O_4$ = 222.2
CAS—84-66-2
IUPAC Name Diethyl-1,2-benzenedicarboxylate
Synonym Ethyl phthalate

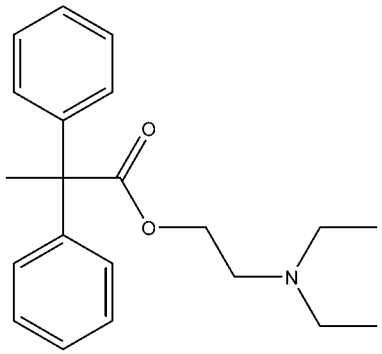


Chemical Properties A clear, colourless, somewhat viscous liquid. Mass per mL about 1.117 g. Bp about 295°. Refractive index 1.500 to 1.505. Practically insoluble in water; miscible with ethanol and ether. Log *P* (octanol/water), 2.4.
Gas Chromatography System GA—RI 1564.
Infrared Spectrum Principal peaks at wavenumbers 1733, 1287, 1086, 1132, 744, 1044 cm^{-1} (thin film).
Mass Spectrum Principal ions at *m/z* 149, 177, 150, 65, 76, 105, 176, 104.

Diethylaminoethyl Diphenylpropionate

Parasympatholytic
$C_{21}H_{27}NO_2$ = 325.5

IUPAC Name 2-diethylaminoethyl 2,2-diphenylpropanoate
Synonyms Aprophen; diethylaminoethyl diphenylpropionate; 2-diethylaminoethyl αβ-diphenylpropionate.



Diethylaminoethyl Diphenylpropionate Hydrochloride

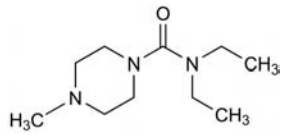
Proprietary Names *Spasmadryl*. It is an ingredient of *Sedalby tablets*.
Chemical Properties White crystalline powder. Mp 111° to 112°. Very soluble in water, soluble in ethanol, and sparingly soluble in ether.

Colour Test Vitali's test— -/-/purple (limit of detection, 0.1 µg).
Thin-layer Chromatography System T1—R_f 0.64 (location reagent acidified iodoplatinate spray, positive reaction).
Ultraviolet Spectrum 0.1 N sulfuric acid, maxima at 252 (E1%, 1 cm 4.3) and 264.5 nm (E1%, 1 cm 3.2).
Disposition in the Body In rats, intravenously administered aprophen is rapidly cleared from the blood, and with a half-life of 4 min [Brown *et al.* 1993].

Brown ND *et al.* (1993). Synthesis and antimuscarinic activity of 2-[*N*-(ethyl)-(*N*-beta-hydroxyethyl)]aminoethyl 2,2-diphenylpropionate, a metabolite of aprophen. *J Pharm Sci* 82: 563–564.

Diethylcarbamazine

Antifilarial
$C_{10}H_{21}N_3O$ = 199.3
CAS—90-89-1
IUPAC Name *N*,*N*-Diethyl-4-methyl-1-piperazinecarboxamide

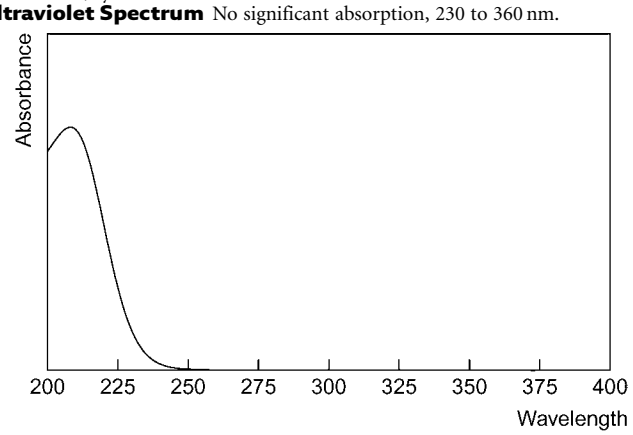


Chemical Properties A crystalline powder. Mp 47° to 49°. Soluble in water, ethanol, chloroform and ether. pK_a 7.7 (20°). Log *P* (octanol/water), 0.4.

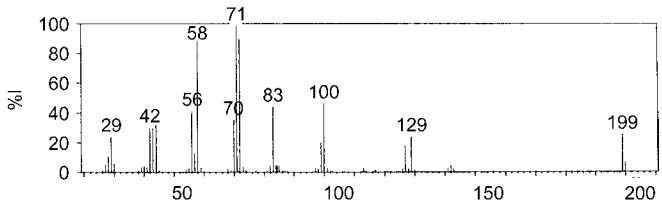
Diethylcarbamazine Citrate

$C_{10}H_{21}N_3O,C_6H_8O_7$ = 391.4
CAS—1642-54-2
Synonyms Diethylcarbamazine acid citrate; ditrazini citras.
Proprietary Names *Banocide*; *Hetrazan*; *Notézine*.
Chemical Properties A white, crystalline, slightly hygroscopic powder. Mp 141° to 143°. Freely soluble in water; soluble 1 in 35 of ethanol; practically insoluble in acetone, benzene, chloroform and ether.

Thin-layer Chromatography System TA—R_f 0.52; system TB—R_f 0.17; system TC—R_f 0.26; system TL—R_f 0.05 (Dragendorff spray, positive).
Gas Chromatography System GA—RI 1497.
High Performance Liquid Chromatography System HA—*k* 1.4; system HX—RI 219; system HY—RI 192.
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.



Infrared Spectrum Principal peaks at wavenumbers 1618, 1258, 1217, 1712, 1105, 1149 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 71, 72, 58, 100, 83, 56, 70, 44.



Quantification

Plasma **GC** FID. Limit of quantification, 70 µg/L, limit of detection, 60 µg/L [Miller, Fleckenstein 2001]. NSD. Limit of detection, 4 µg/L [Lee *et al.* 1997]. AFID. Limit of detection, 10 µg/L [Allen *et al.* 1979].
Urine **GC** See Plasma [Allen *et al.* 1979].
Biological fluids **Immunoassay** For method, see Mitsui *et al.* [1996].
Disposition in the Body Readily absorbed after oral administration. About 50% of a dose is excreted in the urine as unchanged drug and 10% as the *N*-oxide metabolite in 48 h; the excretion of unchanged drug is pH-dependent, being increased in acidic urine (pH 5) but decreasing to less than 10% in alkaline urine (pH 8).
Therapeutic Concentration
Following a single oral dose of 50 mg to 5 subjects, peak plasma concentrations of 0.08 to 0.20 mg/L were attained in about 1 to 2 h; a secondary rise in plasma concentrations was observed at 3 to 9 h [Edwards *et al.* 1981].
Half-life Plasma half-life, about 10 h under alkaline urinary pH conditions or 3 h if an acidic urinary pH is maintained.
Protein Binding Not significantly bound.
Dose 1 to 6 mg/kg of diethylcarbamazine citrate daily, orally.

Allen GD *et al.* (1979). Determination of 1-diethylcarbamoyl-4-methylpiperazine (diethylcarbamazine) in human plasma and urine. *J Chromatogr* 164(4): 521–526.

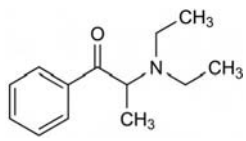
Diethylpropion

Anorectic
$C_{13}H_{19}NO$ = 205.3
CAS—90-84-6
IUPAC Name 2-(Diethylamino)-1-phenyl-1-propanone
Synonym Amfepramone



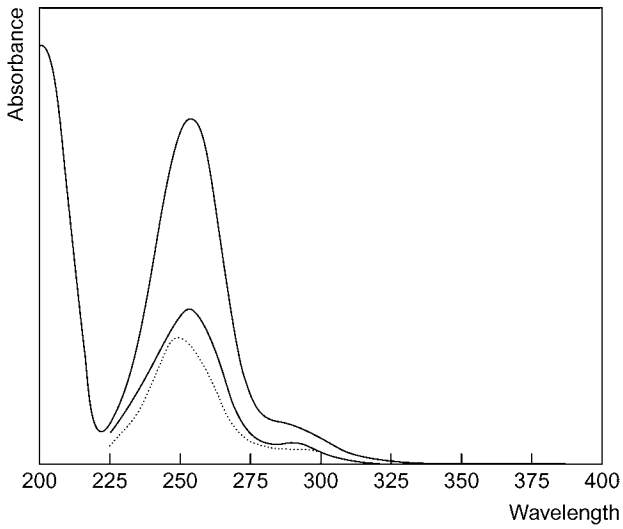
Chemical Properties Log *P* (octanol/water), 3.04. A white to off-white, fine, crystalline powder. Mp 168°, with decomposition. Soluble 1 in 0.5 of water, 1 in 3 of ethanol, and 1 in 3 of chloroform; practically insoluble in ether.

Diethylpropion Hydrochloride

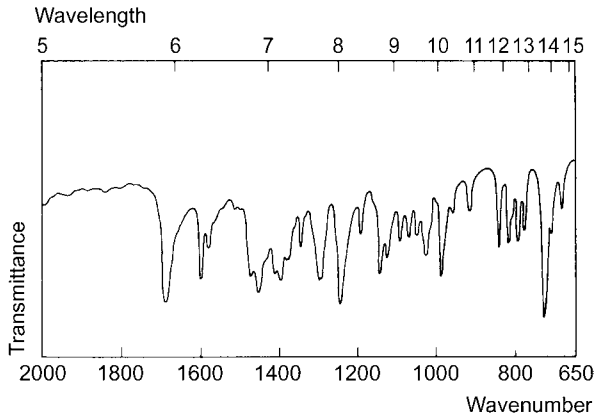
$C_{13}H_{19}NO,HCl$ = 241.8
CAS—134-80-5
Proprietary Names *Anorex*; *Atractil*; *Dobesin*; *Dietec*; *D.I.P.*; *Dualid S*; *Hipofagin S*; *Ifa Norex*; *Inibex S*; *Moderatan Diffucap*; *Neobes*; *Prefamone*; *Regenon*; *Tenuate Dospan*. The name *Tepanil* is also applied to phenylpropanolamine hydrochloride.

Colour Test Liebermann's reagent—yellow.
Thin-layer Chromatography System TA—R_f 0.76; system TB—R_f 0.62; system TC—R_f 0.63; system TE—R_f 0.85; system TL—R_f 0.64; system TAE—R_f 0.55; system TAF—R_f 0.56; system TAJ—R_f 0.44; system TAK—R_f 0.02; system TAL—R_f 0.35 (Dragendorff spray, positive; FPN reagent, pink; acidified iodoplatinate solution, positive; Marquis reagent, violet-brown).
Gas Chromatography System GA—diethylpropion RI 1486, M (phenylpropanolamine) RI 1360; system GB—diethylpropion RI 1532, M (phenylpropanolamine) RI 1352, M (diethylnorephedrine) RI 1599, M (ethylnorephedrine) RI 1457, M (*N*-desethyl-) RI 1423, M (*N*-didesethyl-) RI 1338; system GC—diethylpropion RI 1715, M (norephedrine) RI 1383; system GF—diethylpropion RI 1655.
High Performance Liquid Chromatography System HA—diethylpropion *k* 1.7, M (norephedrine) *k* 0.9; system HC—diethylpropion *k* 0.16, M (norephedrine) *k* 0.70; system HY—RI 230; system HZ—retention time 2.8 min.

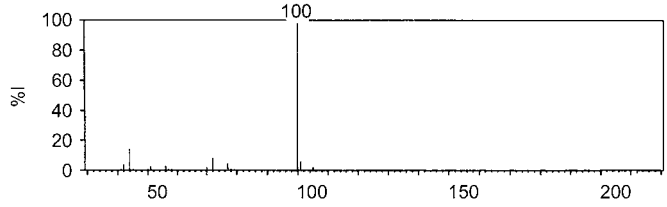
Ultraviolet Spectrum Aqueous acid—253 nm (A_1^1=673a); aqueous alkali—246 nm.



Infrared Spectrum Principal peaks at wavenumbers 701, 1230, 1682, 1287, 973, 1594 cm^{-1} (diethylpropion hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 100, 44, 72, 101, 77, 56, 42, 105 (no peaks above 110); norephedrine 44, 77, 79, 51, 45, 42, 107, 105.



Quantification

Plasma **GC–MS** Limit of detection, 600 ng/L [Wright *et al.* 1975].

HPLC For method of quantification for diethylpropion enantiomers, see Mey *et al.* [1998].

Urine **GC** FID. Limit of detection, 300 µg/L, diethylpropion and metabolites [Testa, Beckett 1972].

Disposition in the Body Readily absorbed after oral administration. Metabolised by *N*-dealkylation, reduction, deamination and *N*-hydroxylation primarily to active metabolites; keto reduction is stereoselective, resulting in the formation of *threo*-hydroxylated metabolites; glucuronide formation also occurs along with the formation of hippuric and mandelic acids. About 80 to 90% of a dose is excreted in the urine. The amount excreted in the urine is reduced when the urine is alkaline. Of the urinary excreted material, *N*-ethylaminopropiophenone, norephedrine (phenylpropanolamine) and hippuric acid are the main metabolites together with small amounts of unchanged drug, aminopropiophenone, *N*-diethylnorephedrine and *N*-ethylnorephedrine. Diethylpropion crosses the blood–brain barrier and the placenta. The drug and its metabolites are distributed into breast milk.

Therapeutic Concentration

Following a single oral dose of 75 mg to 5 subjects, a mean peak plasma concentration of 0.007 mg/L was attained in 0.5 h; total concentrations of the monodesethyl and didesethyl metabolites reached an average peak of 0.19 mg/L at 2 h [Wright *et al.* 1975].

Toxicity The estimated minimum lethal doses are 200 mg for a child and 2 g for an adult.

The following disposition was reported in a case of fatal overdose resulting from the injection of illicit diethylpropion tablets: blood 5.4 mg/L, bile 14.4 mg/L, kidney 0.9 µg/g, liver 0.9 µg/g, injection site 43.2 µg/g [Fysh, Taylor 1978].

Half-life Derived from urinary excretion data, 1.5 to 3 h in subjects whose urine is acidic.

Dose Usually 75 mg of diethylpropion hydrochloride daily.

Diethylstilbestrol

Antineoplastic (Hormonal)

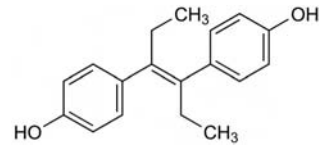
$C_{18}H_{20}O_2$ = 268.4

CAS—56-53-1

IUPAC Name 4-[(*E*)-4-(4-Hydroxyphenyl)hex-3-en-3-yl]phenol

Synonyms DES; 4,4′[(*1E*)-1,2-diethyl-1,2-ethenediyl]bisphenol; diethylstilboestrol; stilbol.

Proprietary Names *Apstil*; *Distilbene*.



Chemical Properties A white crystalline powder. Mp 169° to 172°. Practically insoluble in water; soluble 1 in 5 of ethanol, 1 in 200 of chloroform and 1 in 3 of ether; soluble in acetone and methanol; soluble in fatty oils and alkali hydroxides.

Caution Diethylstilbestrol is a powerful oestrogen. Contact with the skin or inhalation should be avoided.

Diethylstilbestrol Diphosphate

$C_{18}H_{22}O_8P_2$ = 428.3

CAS—522-40-7

Synonyms Fosfestrol; Phosphoestrolum.

Proprietary Names *Honvan*; *Stilphostrol (tablets)*.

Note Fosfestrol Sodium (the tetra-sodium salt of diethylstilbestrol diphosphate) is available under the proprietary names *Honvan*, *Honvol*, *Ronvan*, *ST-52* and *Stilphostrol* (injection).

Chemical Properties An off-white crystalline powder which decomposes at about 204° to 206°. Sparingly soluble in water; soluble in ethanol and dilute alkalis. Log *P* (octanol/water), 5.1.

Diethylstilbestrol Dipropionate

$C_{24}H_{28}O_4$ = 380.5

CAS—130-80-3

Proprietary Names *Cyren B*; *Dibestil*.

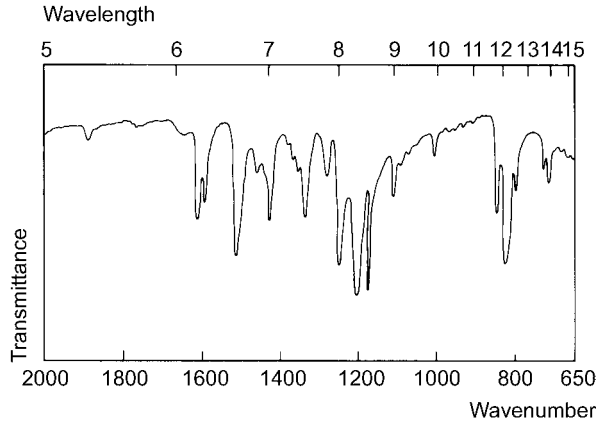
Chemical Properties Colourless crystals or white crystalline powder. Mp 104°. Slightly soluble in water and dilute mineral acids; soluble 1 in 100 of ethanol (90%) and 1 in 6 of ether; freely soluble in acetone and chloroform.

Colour Tests Antimony pentachloride—red; naphthol–sulfuric acid—yellow/orange; sulfuric acid—orange; dissolve about 0.5 mg in 0.2 mL of acetic acid, add 1 mL of phosphoric acid acid, and heat on a water-bath for 3 min—yellow, disappearing on dilution with 3 mL of acetic acid. (This test distinguishes diethylstilbestrol from dienestrol, which produces a violet colour.)

Thin-layer Chromatography System TB—R_f 0.03; system TE—R_f 0.73; system TF—R_f 0.68; system TP—R_f 0.65, streaking may occur; system TQ—R_f 0.10, streaking may occur; system TR—R_f 0.18, streaking may occur; system TS—R_f 0.03; system TAE—R_f 0.92; system TAF—R_f 0.92.

Gas Chromatography System GA—RI 2298.

High Performance Liquid Chromatography System HX— 592; system HY—RI 559; system HAA—retention time 20.9 min.
Ultraviolet Spectrum Ethanol—241 nm (A^1_1=600a).
Infrared Spectrum Principal peaks at wavenumbers 1205, 1176, 833, 1250, 1512, 1610 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 107, 145, 268, 238, 121, 133, 159, 224.
Quantification
Blood **GC** FID. For method, see Kohrman and MacGee [1977].

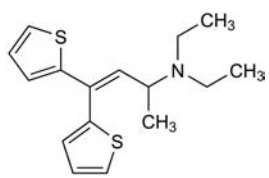
Diethylthiambutene

Narcotic Analgesic (Veterinary)
$C_{16}H_{21}NS_2$ = 291.5
CAS—86-14-6
IUPAC Name 7-[Pyridin-1-ium-3-yl(pyrrolidin-1-ium-1-yl)methyl]quinolin-1-ium-8-ol
Synonyms *N*,*N*-Diethyl-1-methyl-3,3-di-2-thienylallylamine; thiambutene; 191C49.

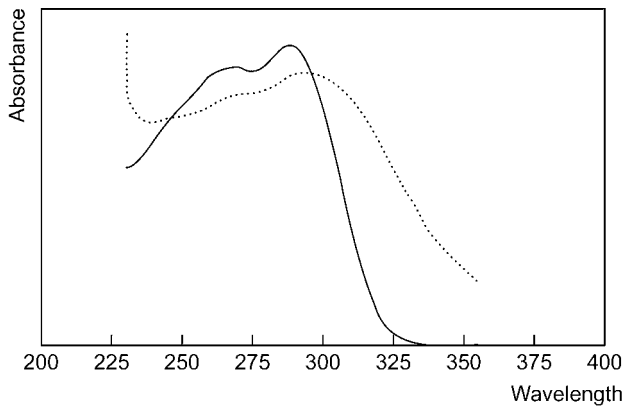


Chemical Properties Log *P* (octanol/water), 4.5.

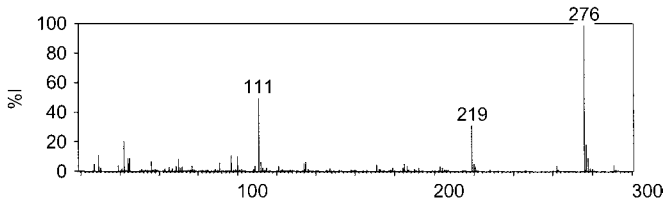
Diethylthiambutene Hydrochloride

$C_{16}H_{21}NS_2$,HCl = 327.9
CAS—132-19-4
Chemical Properties A white crystalline powder. Mp 152° to 153°. Soluble 1 in 2 of water and 1 in 1 of ethanol; practically insoluble in ether.

Colour Tests Liebermann's reagent (100°)—orange; Mandelin's test—green→ green-blue; Marquis test—violet; sulfuric acid—orange; cold nitric acid gives a pink-brown colour changing to green.
Thin-layer Chromatography System TA—R_f 0.70; system TB—R_f 0.60; system TC—R_f 0.43; system TE—R_f 0.81; system TL—R_f 0.43; system TAE—R_f 0.40 (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, red-violet).
Gas Chromatography System GA—RI 2008.
High Performance Liquid Chromatography System HA—*k* 2.0.
Ultraviolet Spectrum Aqueous acid—268, 288 nm (A^1_1=362a); aqueous alkali—295 nm.

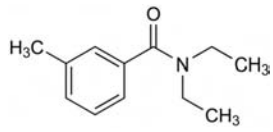


Infrared Spectrum Principal peaks at wavenumbers 716, 743, 851, 833, 1244, 1618 cm^{-1} (diethylthiambutene hydrochloride, KBr disk).
Mass Spectrum Principal ions at *m/z* 276, 111, 219, 42, 277, 97, 29, 100.



Diethyltoluamide

Insect Repellent
$C_{12}H_{17}NO$ = 191.3
CAS—134-62-3
IUPAC Name *N*,*N*-Diethyl-3-methylbenzamide
Synonym DEET
Proprietary Names *Autan*; *Detamide*; *Dieltamid*; *Flypel*; *Metadelphene*; *Off*; *Repel*.



Chemical Properties A colourless or faintly yellow liquid. Weight per mL 0.997 to 1.000 g. Practically insoluble in water; freely soluble in ethanol, benzene, chloroform and ether; sparingly soluble in petroleum ether. Log *P* (octanol/water), 2.2.
Thin-layer Chromatography System TA—R_f 0.73 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1583.
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.
Infrared Spectrum Principal peaks at wavenumbers 1629, 1284, 794, 1305, 1581, 1095 cm^{-1} (KBr disk).
Quantification
Urine **GC–MS** For method for quantification of diethyltoluamide and metabolites, see Wu *et al.* [1979].
Disposition in the Body
Toxicity
Two patients ingested large amounts of a concentrated (between 47.5 and 95%) insect repellent containing DEET. Serum concentrations were 168 mg/L and 240 mg/L [Tenenbein 1987].
Use As a 50 to 75% solution.

Tenenbein M (1987). Severe toxic reactions and death following the ingestion of diethyltoluamide-containing insect repellents. *JAMA* 258(11): 1509–1511.

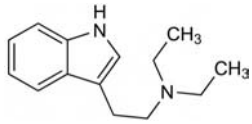
Diethyltryptamine

Hallucinogen
$C_{14}H_{20}N_2 = 216.3$
CAS—61-51-8

IUPAC Name *N*,*N*-Diethyl-2-(1*H*-indol-3-yl)ethanamine
Synonyms DET; *N*,*N*-diethyl-1*H*-indole-3-ethanamine; *N*,*N*-diethyltryptamine.

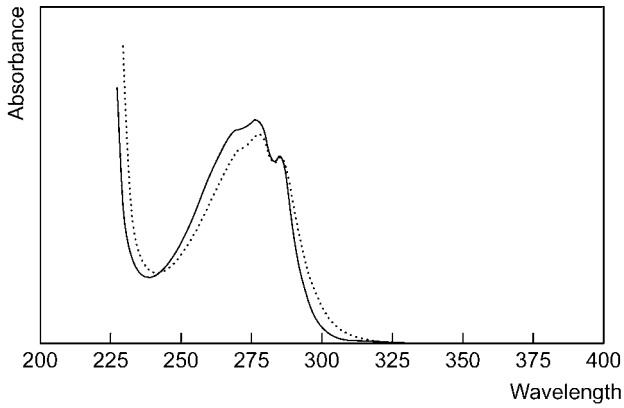


Chemical Properties An orange oily liquid. Soluble in ethanol and chloroform.

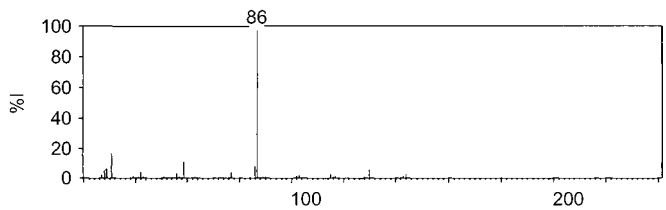
Diethyltryptamine Hydrochloride

Chemical Properties A white crystalline powder. Mp 87° to 89°. Soluble in water.

Colour Tests Mandelin's test—grey-green→yellow; Marquis test—yellow→brown.
Thin-layer Chromatography System TA—R_f 0.46; system TB—R_f 0.15; system TC—R_f 0.10; system TE—R_f 0.63; system TL—R_f 0.11; system TAE—R_f 0.14; system TAF—R_f 0.56; system TAJ—R_f 0.02; system TAK—R_f 0.03; system TAL—R_f 0.41 (acidified iodoplatinate solution—positive; Dragendorff spray—positive; Marquis test—brown).
Gas Chromatography System GA—RI 1910.
High Performance Liquid Chromatography System HY—RI 276.
Ultraviolet Spectrum Aqueous acid—278 (A^1_1= 270a), 287 nm.

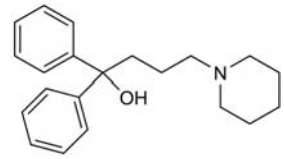


Infrared Spectrum Principal peaks at wavenumbers 740, 1111, 1063, 1086, 1234, 724 cm^{-1}.
Mass Spectrum Principal ions at *m*/*z* 86, 30, 58, 29, 130, 87, 77, 42



Note For a report on the effects and metabolism of diethyltryptamine, see Szara *et al.* [1966]. For a method of separating and detecting tryptamines in urine including diethyltryptamine, see Wang *et al.* [2009].

Szara S *et al.* (1966). Psychological effects and metabolism of *N*,*N*-diethyltryptamine in man. *Arch Gen Psychiatry* 15: 320–329.
Wang MJ *et al.* (2009). Optimization of separation and online sample concentration of *N*,*N*-dimethyltryptamine and related compounds using MEKC. *J Sep Sci* 32: 441–445.

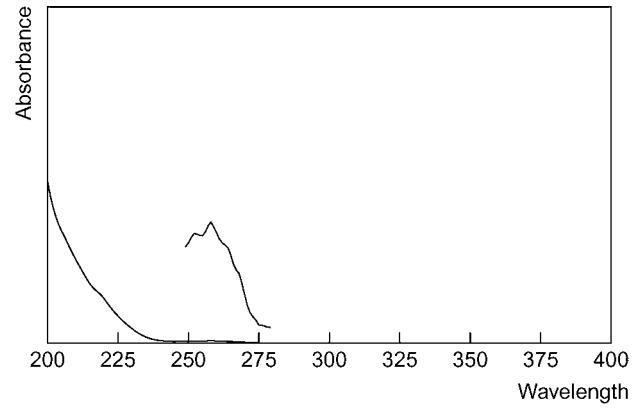


Chemical Properties Mp 103° to 104°. Log *P* (octanol/water), 4.7.

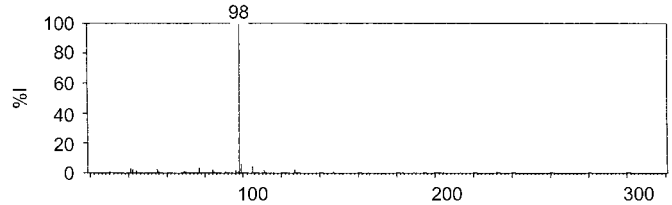
Difenidol Hydrochloride

$C_{21}H_{27}NO,HCl = 345.9$
CAS—3254-89-5
Proprietary Names *Cephadol*; *Normavom*; *Vontril*; *Vontrol*.
Chemical Properties A white crystalline powder. Mp 214° to 221°, with decomposition. Soluble in water, ethanol, and chloroform; freely soluble in methanol; practically insoluble in ether, benzene, and petroleum ether.

Colour Tests Liebermann's reagent—brown; Mandelin's test—yellow; Marquis test—yellow; sulfuric acid—orange.
Thin-layer Chromatography System TA—R_f 0.61; system TB—R_f 0.56; system TC—R_f 0.45; system TE—R_f 0.91; system TL—R_f 0.51; system TAJ—R_f 0.24; system TAK—R_f 0.13; system TAL—R_f 0.67 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2384.
High Performance Liquid Chromatography System HAX—retention time 12.1 min; system HAY—retention time 6.1 min.
Ultraviolet Spectrum Aqueous acid—252, 258 nm.



Infrared Spectrum Principal peaks at wavenumbers 697, 701, 749, 773, 1123, 1219 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m*/*z* 98, 99, 105, 77, 55, 41, 127, 111.



Disposition in the Body Absorbed from the gastro-intestinal tract; peak blood concentrations are attained in 1.5 to 3 h. It is excreted in the urine and faeces.
Toxicity

Analysis of 21 cases of difenidol overdose showed that the average amount ingested was 222.5 mg (range, 25 to 800); adults ingested 150 to 700 mg, children ingested 25 to 800 mg. Toxicity was severe in 4 children, one of whom died (a $2^1/_2$-year-old boy who ingested 225 mg (15 mg/kg)) [Yang, Deng 1998.]

Dose The equivalent of 25 to 50 mg of difenidol every 4 h; maximum of 300 mg daily.

Yang CC, Deng JF (1998). Clinical experience in acute overdosage of diphenidol. *J Toxicol Clin Toxicol* 36: 33–39.

Difenidol

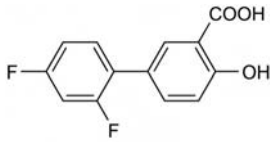
Antiemetic
$C_{21}H_{27}NO = 309.4$
CAS—972-02-1

IUPAC Name α,α-Diphenyl-1-piperidinebutanol
Synonym Diphenidol
Proprietary Names *Dicavin*; *Hemitiken*; *Laudifen*; *Nautrol*; *Normitrol*; *Serratol*; *Vernausin*.

Diflunisal

Analgesic
$C_{13}H_8F_2O_3 = 250.2$
CAS—22494-42-4

IUPAC Name 5-(2,4-Difluorophenyl)-2-hydroxybenzoic acid
Synonym 2′,4′-Difluoro-4-hydroxy-[1,1′-biphenyl]-3-carboxylic acid
Proprietary Names *Aflogos*; *Artrodol*; *Biartac*; *Difludol*; *Diflusal*; *Dolobid*; *Dolobis*; *Donobid*; *Fluniget*.



Chemical Properties White crystals or crystalline powder. Mp about 212°. Sparingly soluble in water; soluble in ethanol, ether, and dilute alkalis. Log *P* (octanol/water), 4.4.

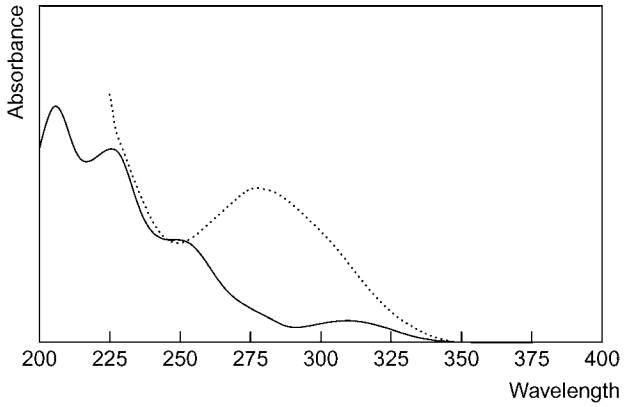
Colour Tests Ferric chloride—violet; Folin–Ciocalteu reagent—blue; McNally's test—violet

Thin-layer Chromatography System TD—R_f 0.08; system TE—R_f 0.16; system TF—R_f 0.05; system TG—R_f 0.37; system TAD—R_f 0.18; system TAE—R_f 0.89; system TAJ—R_f 0.06; system TAK—R_f 0.69; system TAL—R_f 0.69 (chromic acid solution, blue-grey).

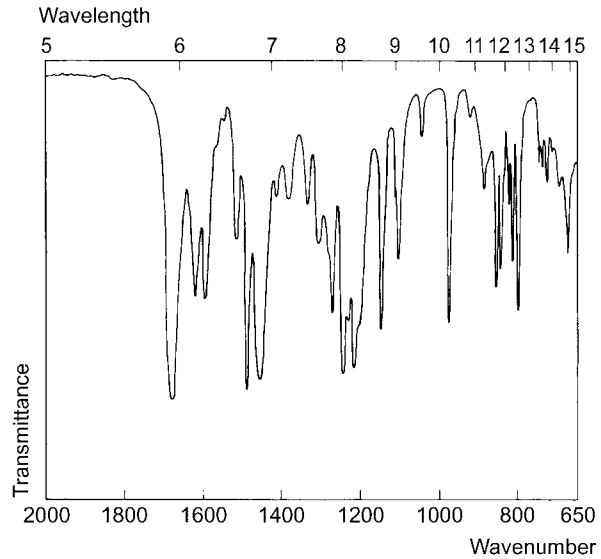
Gas Chromatography System GA—diflunisal RI 2095, diflunisal-Me RI 2050, diflunisal-Me_2 RI 1990; system GD—RRT 1.20 of methyl derivative (relative to n-$C_{16}H_{34}$).

High Performance Liquid Chromatography System HD—*k* 4.1; system HV—RRT 0.77 (relative to meclofenamic acid); system HX—RI 508; system HY—RI 583; system HZ—retention time 5.4 min; system HAX—retention time 5.9 min; system HAY—retention time 6.0 min.

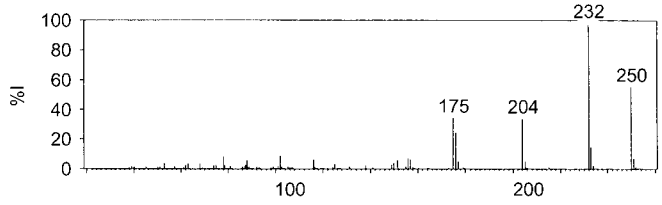
Ultraviolet Spectrum Acid methanol—251 (A^1_1=560a), 315 nm (A^1_1=130a); aqueous alkali—277 nm.



Infrared Spectrum Principal peaks at wavenumbers 1683, 1492, 1248, 1220, 1150, 978 cm^{-1} (KBr disk). Two polymorphic forms may occur.



Mass Spectrum Principal ions at *m/z* 232, 250, 175, 204, 176, 233, 102, 78.



Quantification

Plasma **GC** FID. Limit of detection, 1 mg/L [Tocco *et al.* 1975].

HPLC UV detection. For method for quantification of diflunisal and other NSAIDs in overdose, see Streete [1989]. Fluorescence detection. Limit of detection, 50 µg/L [Ray, Day 1983].

Spectrofluorimetry Limit of detection, 500 ng [Tocco *et al.* 1975].

Serum **HPLC** See Plasma [Streete 1989]. For method for quantification of diflunisal and its glucuronides, see Hansen-Moller *et al.* [1987].

Urine **GC** See Plasma [Tocco *et al.* 1975].

GC–MS For method for quantification of diflunisal and some NSAIDs, see el Haj *et al.* [1999].

HPLC Fluorescence detection. Diflunisal and its glucuronide and sulfate conjugates. Limit of detection, 0.1 mg/L for diflunisal [Loewen *et al.* 1989]. See Serum [Hansen-Moller *et al.* 1987]. For method for quantification of diflunisal glucuronides, see Musson *et al.* [1985]. See Plasma [Ray, Day 1983].

Disposition in the Body Well absorbed after oral administration. Up to about 80% of a dose is excreted in the urine in 24 h, mostly as the ester and ether glucuronides. <3% of a dose is eliminated in the faeces.

Therapeutic Concentration

After a single oral dose of 500 mg given to 5 subjects, peak plasma concentrations of 58 to 92 mg/L (mean 77) were attained in 2 h [Verbeeck *et al.* 1979].

Following oral administration of 500 mg twice daily to 6 subjects, steady-state plasma concentrations of 66 to 183 mg/L were reported [Wählin-Boll *et al.* 1981].

After administration of diflunisal as either a single oral dose of 1000 mg daily or two doses of 500 mg daily to 13 subjects, mean peak plasma concentrations of 186 and 150 mg/L, respectively, were achieved in 2.5 and 1.9 h. Steady-state plasma concentrations were 118 and 116 mg/L in the respective groups [Mojaverian *et al.* 1985].

Toxicity Diflunisal appears to be relatively non-toxic.

A 47-year-old woman went into a coma after ingesting 29 g of diflunisal but subsequently recovered uneventfully [Upadhyay, Gupta 1978].

In a fatality involving the ingestion of diflunisal, the following postmortem tissue concentrations were reported: blood 260 mg/L, bile 71 mg/L, kidney 350 µg/g, liver 400 µg/g, stomach contents 34 g, urine 78 mg/L [Levine *et al.* 1987].

Half-life Plasma half-life, about 5 to 12 h (dose-dependent).

Volume of Distribution About 0.1 L/kg.

Clearance Plasma clearance, about 0.1 mL/min/kg.

Protein Binding About 99%.

Note For a review of the pharmacokinetics of diflunisal, see Brogden *et al.* [1980].

Dose 0.5 to 1 g daily.

Digitoxin

Cardiac Glycoside

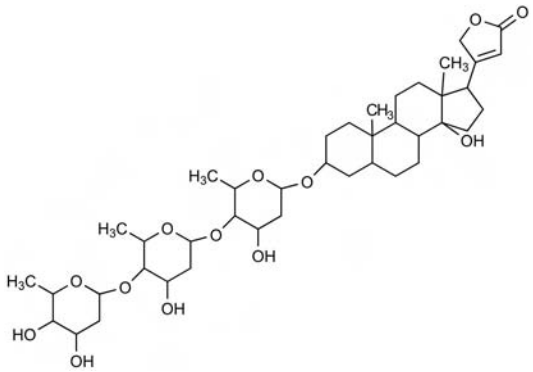
$C_{41}H_{64}O_{13}$ = 764.9

CAS—71-63-6

IUPAC Name (3β,5β)-3-[(*O*-2,6-Dideoxy-β-D-ribo-hexopyranosyl-(1→4)-*O*-2,6-dideoxy-β-D-ribo-hexopyranosyl-(1→4)-2,6-dideoxy-β-D-ribo-hexopyranosyl)oxy]-14-hydroxycard-20(22)-enolide

Synonyms Digitaline cristallisée; digitoxoside.

Proprietary Names *Asthenthilo*; *Coramedan*; *Crystodigin*; *Digimerck*; *Digitaline*; *Digitox*; *Digitrin*; *Ditaven*; *Nativelle*; *Purodigin*; *Tardigal*; *Variplastic*



Chemical Properties A glycoside obtained from suitable species of the genus *Digitalis* (Scrophulariaceae). A white or pale buff-coloured, microcrystalline powder. Mp ~256°. Practically insoluble in water; soluble 1 in 60 of ethanol, 1 in 40 of chloroform, 1 in 400 of ethyl acetate; sparingly soluble in ether, petroleum ether and methanol; freely soluble in a mixture of equal volumes of chloroform and methanol. Log *P* (octanol/water), 1.8.

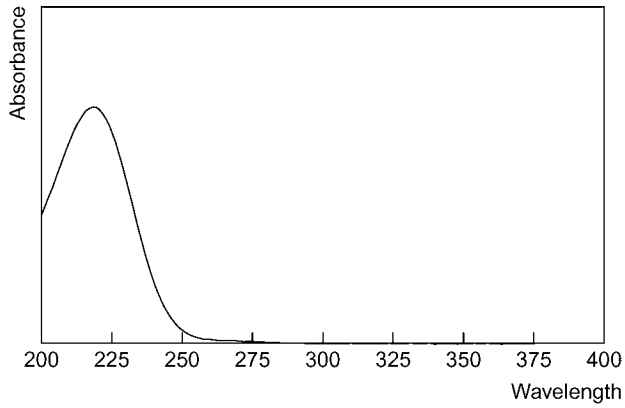
Colour Test Antimony pentachloride—yellow-brown-black-violet.

Thin-layer Chromatography System TAD—R_f 0.42; system TAE—R_f 0.88; system TD—R_f 0.03; system TE—R_f 0.36; system T_f—R_f 0.10; system TK—R_f 0.72 (perchloric acid solution, followed by examination under UV light, red fluorescence; *p*-anisaldehyde reagent, blue).

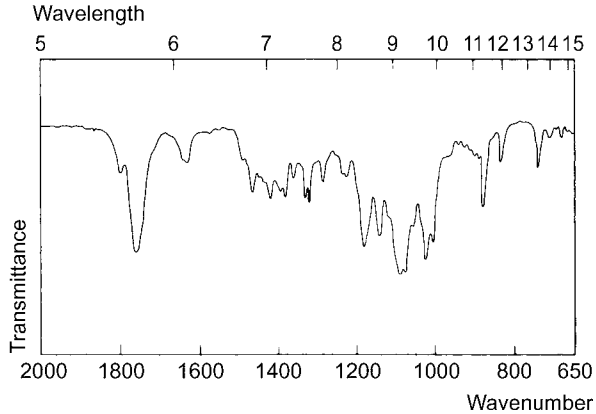
Gas Chromatography System GA—RI 1902.

High Performance Liquid Chromatography System HAA—RT 18.7 min; system HM—*k* 5.40; system HY—RI 468.

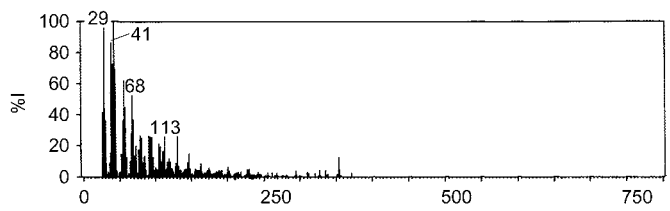
Ultraviolet Spectrum



Infrared Spectrum Principal peaks at wavenumbers 1072, 1058, 1010, 1740, 1168, 990 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 43, 29, 39, 41, 45, 57, 68, 58.



Quantification

Blood **HPLC** Column: Atlantis dC_{18} (50 × 2.1 mm i.d., 3 µm). Mobile phase: 10 mmol/L aqueous ammonium formate (pH 3.1) and acetonitrile (100%), flow rate 0.3 mL/min [Oiestad *et al.* 2009]. Digoxin and other cardiac glycosides [Guan *et al.* 1999].

Plasma **HPLC** Colum: NovaPak C_{18} (150 × 2.0 mm i.d., 4 µm). Mobile phase: acetonitrile : 2 mmol/L ammonium acetate (pH 3.0, 1 : 3), flow rate 200 µL/min. Limit of detection, 0.15–0.6 µg/L [Tracqui *et al.* 1997].

Serum **TLC** Limit of detection, 1–2 ng [Faber 1977].

Note For a radioimmunoassay for the detection of digitoxin, see Nore *et al.* [1980]; for a fluoroimmunoassay, see Al Hakiem *et al.* [1982].

Urine **HPLC** Column: Nucleosil RP-5C_{18} (250 × 4 mm i.d., 5 µm). Mobile phase: methanol : water containing PIC B7 reagent (66 : 34 increasing the methanol by 0.4%/min for 5 min followed by 0.58%/min for 12 min followed by 75 : 25 for 8 min). UV detection (λ = 222 nm). Limit of detection, 0.5 mg/L [Santos *et al.* 1987]. See Blood [Guan *et al.* 1999].

Tissues **HPLC** Column: Nucleosil C_{18} (250 × 4.0 mm i.d., 10 µm). Mobile phase: acetonitrile : methanol : water (20 : 20 : 60), flow rate 1.0 mL/min. UV detection (λ = 220 nm). Retention time: ~12 min. Limit of detection, 10 ng [Plum, Daldrup 1986].

Disposition in the Body Digitoxin is readily absorbed after oral administration; bioavailability is >90%. High concentrations are found in the kidney, ventricular myocardium, liver and skeletal muscle. It is extensively metabolised by hydrolysis to digitoxigenin bisdigitoxoside, digitoxigenin monodigitoxoside and digitoxigenin, and by hydroxylation to digoxin and the corresponding digoxigenin derivatives, all of which are active. Epimerisation to the inactive metabolites epidigitoxigenin and epidigoxigenin, followed by glucuronide conjugation, also occurs; dihydrodigitoxin has also been detected in plasma. Approximately 60–80% of a single dose is excreted in the urine over a period of 3 weeks, mainly as metabolites, and up to 20% is eliminated in the faeces. The excretion of digitoxin and its active and inactive metabolites is very variable and is independent of dose and route of administration. Approximately 20–50% of a dose appears to be excreted as unchanged drug in urine and faeces in variable proportions, and the amount of unchanged drug in the urine has been reported to be greater during maintenance treatment than in single-dose studies. Digitoxin is a metabolite of acetyldigitoxin.

Therapeutic Concentration In serum, usually in the range 0.01–0.03 mg/L.

After a single oral dose of 20 µg/kg, given to 6 children, peak serum concentrations of 0.02–0.05 mg/L were attained in 1.5–2.5 h [Larsen, Storstein 1983].

Following daily oral doses of 0.1 mg to 7 subjects, steady-state serum concentrations of 0.009–0.026 mg/L (mean 0.017–mg/L) were reported [Haustein 1981].

Toxicity The estimated minimum lethal dose is 3 mg. Toxic effects are usually associated with serum concentrations of ~0.03 mg/L or more.

In a 65-year-old woman who died almost 15 h after ingesting 7 mg digitoxin, the plasma concentration just before death was 0.212 mg/L [Krappweis *et al.* 1996].

Following a massive digitoxin overdose in a 20-month-old girl, an initial serum level of 0.629 mg/L was reported. After 6 doses of digoxin-specific antibody fragments, digitoxin was undetectable in the serum but reappeared on days 6 and 7 [Schmitt *et al.* 1994].

A subject who ingested 10 mg digitoxin recovered following treatment with activated charcoal; a plasma concentration of 0.26 mg/L was reported 4 h after the dose, decreasing to 0.027 mg/L at 80 h [Pond *et al.* 1981].

Half-life Plasma half-life, 3–16 days (mean 7 days).

Volume of Distribution 0.4–0.8 L/kg (mean 0.6 L/kg); increased in children.

Clearance ≈0.04 mL/min/kg from plasma; increased in children.

Distribution in Blood Plasma : whole blood ratio, ~1.7.

Protein Binding ≈95%.

Note For a review of the clinical pharmacokinetics of digitoxin see Perrier *et al.* [1977].

Dose Maximum initial total dose of 1.6 mg over 1–2 days; maintenance, 50 to 200 µg daily.

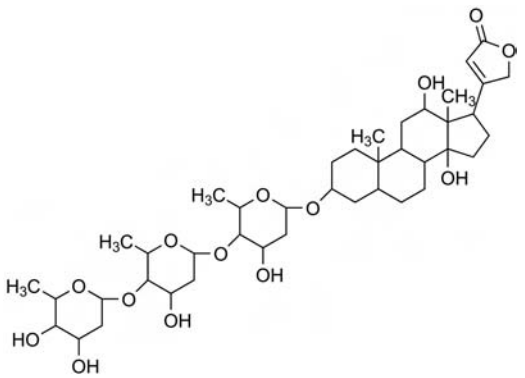
Digoxin

Cardiac Glycoside
$C_{41}H_{64}O_{14}$ = 780.9
CAS—20830-75-5

IUPAC Name 3-[(3*S*,5*R*,8*R*,9*S*,10*S*,12*R*,13*S*,14*S*,17*R*)-3-[(2*R*,4*S*,5*S*,6*R*)-5-[(2*S*,4*S*,5*S*,6*R*)-5-[(2*S*,4*S*,5*S*,6*R*)-4,5-Dihydroxy-6-methyloxan-2-yl]oxy-4-hydroxy-6-methyloxan-2-yl]oxy-4-hydroxy-6-methyloxan-2-yl]oxy-12,14-dihydroxy-10,13-dimethyl-1,2,3,4,5,6,7,8,9,11,12,15,16,17-tetradecahydrocyclopenta[a]phenanthren-17-yl]-2*H*-furan-5-one

Synonyms 3β-[(*O*-2,6-Dideoxy-β-D-*ribo*-hexopyranosyl-(1→4)-O-2,6-dideoxy-β-D-*ribo*-hexopyranosyl-(1→4)-2,6-dideoxy-β-D-*ribo*-hexopyranosyl) oxy]-12β,14β-dihydroxy-5β-card-20(22)-enolide, digoxinum; digoxosidum.

Proprietary Names *Digacin*; *Digomal*; *Digosin*; *Digoxin(e) Nativelle*; *Dilanacin*; *Dogoxine*; *Eudigox*; *Grexin*; *Hemigoxine Nativelle*; *Lanacardin*; *Lanacrist*; *Lanicor*; *Lanoxin(e)*; *Lanoxicaps*; *Lenoxin*; *Malpluxin*; *Neo-Dioxanin*; *Novodigal*; *Prodigox*; *Purgoxin*; *Rougoxin*; *Toloxin*.



Chemical Properties Crystals. A glycoside obtained from the leaves of *Digitalis lanata* (Scrophulariaceae). Colourless crystals or a white powder. Mp ~240°, with decomposition. Practically insoluble in water, dehydrated alcohol, ether, acetone and ethyl acetate; soluble 1 in 122 of ethanol (80%) and 1 in 4 of pyridine; slightly soluble in chloroform; freely soluble in a mixture of equal volumes of chloroform and methanol. Log*P* (octanol/water), 1.26.

Metildigoxin

$C_{42}H_{66}O_{14}$ = 795.0
CAS—30685-43-9

IUPAC Name 3-[(3*S*,5*R*,8*R*,9*S*,10*S*,12*R*,13*S*,14*S*,17*R*)-12,14-Dihydroxy-3-[(2*R*,4*S*,5*S*, 6*R*)-4-hydroxy-5-[(2*S*,4*S*,5*S*,6*R*)-4-hydroxy-5-[(2*S*,4*S*,5*S*, 6*R*)-4-hydroxy-5-methoxy-6-methyloxan-2-yl]oxy-6-methyloxan-2-yl]oxy-6- methyloxan-2-yl]oxy-10,13-dimethyl-1,2,3,4,5,6,7,8,9,11,12,15,16, 17-tetradecahydrocyclopenta[a]phenanthren-17-yl]-2*H*-furan-5-one

Synonyms 3β,5β,12β)-3-{[2,6-Dideoxy-4-*O*-methyl-β-D-*ribo*-hexopyranosyl-(1→4)-2,6-dideoxy-β-D-*ribo*-hexopyranosyl-(1→4)-2,6-dideoxy-β-D-*ribo*-hexopyranosyl]oxy}-12,14-dihydroxycard-20(22)-enolide; medigoxin; β-methyldigoxin, 4-*O*-methyldigoxin.

Proprietary Names *Cardiolan*; *Lanirapid*; *Lanitop*; *Miopat*.

Chemical Properties Crystals. Mp 227° to 231°.

α-Acetyldigoxin

$C_{43}H_{66}O_{15}$ = 823.0
CAS—5511-98-8

Proprietary Names *Lanatilin*; *Sandolanid*.

Chemical Properties Prisms. Mp 225° with decomposition. Very sparingly soluble in ethyl acetate.

β-Acetyldigoxin

CAS—5355-48-6

Proprietary Names *Corotal*; *Digostad*; *Digotab*; *Digox*; *Gladixol N*; *Kardiamed*; *Longdigox*; *Novodigal* (β-acetyldigoxin or digoxin); *Stillacor*.

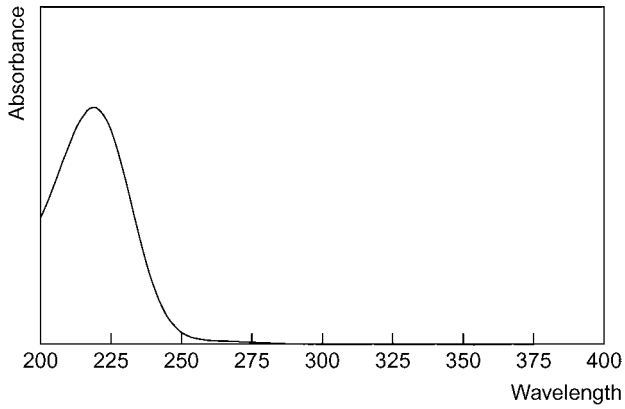
Chemical Properties Needles. Sparingly soluble in ethyl acetate.

Colour Test Antimony pentachloride—yellow→brown→black-violet.

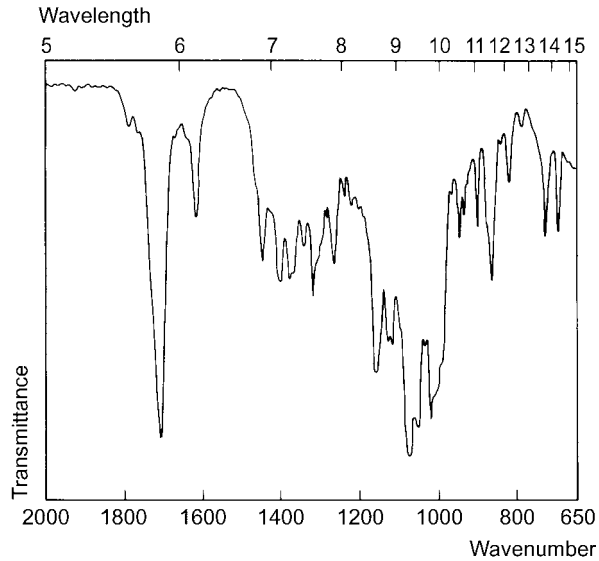
Thin-layer Chromatography System TD—R_f 0.01; system TE—R_f 0.33; system TF—R_f 0.05; system TAD—R_f 0.28; system TAE—R_f 0.85 (perchloric acid solution, followed by examination under UV light, blue fluorescence; *p*-anisaldehyde reagent, blue).

High Performance Liquid Chromatography System HM—*k* 11.3; system HY—RI 347; system HAA—RT 13.9 min.

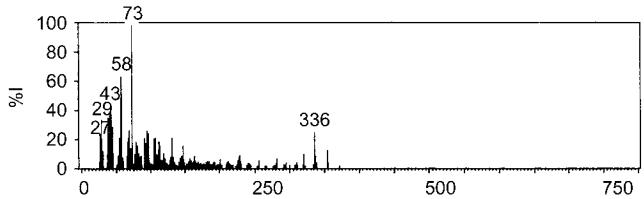
Ultraviolet Spectrum



Infrared Spectrum Principal peaks at wavenumbers 1075, 1709, 1055, 1020, 1160, 1110 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m*/z 73, 58, 57, 43, 41, 39, 29, 45 (no peaks above 360).



Quantification

Blood **LC-MS** Column: Mightysil RP-18 (150 × 2.0 mm i.d., 5 µm). Mobile phase: acetonitrile-2 mmol/L ammonium acetate (20 : 80) : acetonitrile-2 mmol/L ammonium acetate (80 : 20; 100 : 0 for 2 min to 0 : 100 at 12 min for 3 min to 100 : 0 at 20 min), flow rate 0.2 mL/min. ESI or APCI, positive ion mode, TIC or SIM acquisition mode. Limit of quantification, 0.05 µg/L [Guan *et al.* 1999].

Note For a radioimmunoassay, see Fletcher *et al.* [1979].

Plasma **LC-MS** Column: Zorbax SB-$C_{18.}$ Mobile phase: methanol : 0.1 % formic acid in 10 µmol/L sodium acetate (55 : 45), flow rate 1.0 mL/min. ESI. Retention time: 1.9 min. Limit of quantification, 0.5 µg/L [Vlase *et al.* 2009]. Column: Nova-Pak C_{18} (150 mm × 2.0 mm i.d., 4 µm). Mobile phase: acetonitrile : 2 mmol/L ammonium acetate (pH 3.0, 1 : 3), flow rate 200 µL/min. Retention time: 8.08 min. Limit of detection, 0.15–0.6 µg/L [Tracqui *et al.* 1997].

Note For a radioimmunoassay, see Nelson *et al.* [1979].

Serum **HPLC** Column: Spherisorb (150 × 4.6 mm i.d., 3 µm). Mobile phase: hexane : methylene chloride : acetonitrile : methanol (36 : 6.3 : 5.2 : 0.2), flow rate

1.6 mL/min. Fluorescence detection (λ_{ex}= 217 nm, λ_{em}= 340 nm). Limit of detection, 0.25 µg/L [Tzou *et al.* 1995]. Immunochemical detection. Limit of detection, 160 pg/mL [Oosterkamp *et al.* 1994].

Note For a radioimmunoassay, see Butler *et al.* [1982].

Urine **HPLC** Column: Partisil 10 ODS (250 × 4.6 mm i.d.). Mobile phase: methanol : water (35 : 65 to 45 : 55), flow rate 2.0 mL/min. UV detection (λ= 220 nm). Retention time: 21.9 min. Limit of detection, 278 ng [Gault *et al.* 1980]

LC-MS See Blood [Guan *et al.* 1999].

Disposition in the Body The absorption of digoxin after oral administration is variable and subject to bioavailability differences. Absorption occurs mainly in the small intestine and is delayed in the presence of food. Digoxin is rapidly distributed throughout the body and <20% of the total digoxin in the body is located in blood. High concentrations are found in the heart, brain and kidneys, but the skeletal muscles form the largest digoxin store. Concentrations in the myocardium are higher than in plasma. Digoxin is also found in the CSF and it crosses the placenta. Small amounts of digoxin are excreted in breast milk. Digoxin is metabolised by stepwise removal of the sugar moieties to form digoxigenin, which is further metabolised to inactive metabolites and these may be excreted in the free or conjugated form. Reduction to dihydrodigoxin, which is relatively inactive, also occurs. Up to 80% of a dose is excreted in the urine in 7 days, with 27% of the dose in the first 24 h; the remainder is eliminated in the faeces via the bile. In most patients, 80–90% of the material excreted in the urine is unchanged, up to 10% is in the dihydro form, and a small amount includes digoxigenin and the mono- and bisdigitoxosides. In ~10% of patients, however, between 20 and 55% is excreted as metabolites, mainly dihydrodigoxin. Of the material excreted in the bile, ~50% is unchanged, ~25% is digoxin bisdigitoxoside, ~25% is digoxin monodigitoxoside and ~1% is digoxigenin.

Digoxin is a metabolite of deslanoside, digitoxin, lanatoside C and metildigoxin.

Therapeutic Concentration In serum, usually in the range 0.001–0.0025 mg/L. Blood concentrations are significantly lower in hyperthyroidism but increased in hypothyroidism and in patients with renal failure; children tolerate higher serum concentrations than adults.

In a post-hoc analysis of a trial involving 3782 subjects, a serum digoxin concentration in the range 0.0005–0.0008 mg/L was found to be optimal for treating heart failure in men with a left ventricular ejection fraction of 45% or less; the daily dose of digoxin was in the range 0.125–0.500 mg, with 75% of subjects receiving 0.250 mg daily [Rathore *et al.* 2003].

Steady-state plasma concentrations of 0.0004–0.0021 mg/L (mean 0.0011) were reported in 14 patients on an oral daily dosage of 0.125–0.25 mg [Gayes *et al.* 1978].

Following a single oral dose of 0.25 mg to 6 subjects, a mean peak serum concentration of 0.001 mg/L was attained in 1 h [Panisset *et al.* 1973].

Toxicity Toxic effects are usually associated with serum concentrations of 1.4–7.0 µg/L (mean 2.8) and fatalities with concentrations of 1.5–30 µg/L (mean 10).

In an overdose fatality involving digoxin in a suicidal 82-year-old man, blood concentrations of 0.0122–0.0132 mg/L were reported approximately 2.5 h after ingestion of the drug [Rodriguez-Calvo *et al.* 2002].

Total and free serum digoxin concentrations of 0.0171 and 0.0124 mg/L, respectively, were reported in a 2-year-old child 4 h after ingestion of 22.5–23 mg digoxin. Following gastrointestinal decontamination and treatment with digoxin-specific Fab fragments, serum levels reduced to 0.00011 mg/L within 40 min [Kearns *et al.* 1989].

The following distribution was observed in a 3-day-old child who received a total of 4 mg digoxin and died several hours later: blood 0.03 mg/L, brain 0.0009 µg/g, kidney 0.13 µg/g and liver 0.034 µg/g [Selesky *et al.* 1977].

In 7 deaths involving ingestion of digoxin, postmortem 'serum' concentrations of 0.007–0.024 mg/L (mean 0.013) were reported [Moffat 1974].

In a fatality involving IM injection of 1 mg digoxin in an infant, a postmortem 'serum' concentration of 0.071 mg/L was reported [Moffat 1974].

Half-life Plasma half-life, ~20–50 h, prolonged in subjects with renal impairment.

Bioavailability Approximately 70% from tablets BP or USP specifications, 80% from elixirs, and over 90% from liquid-filled soft gelatin capsules.

Volume of Distribution ~5–10 L/kg.

Clearance Plasma clearance, ~1–4 mL/min/kg.

Distribution in Blood Plasma : whole blood ratio: 0.93.

Protein Binding ~22–30%.

Note For reviews of the pharmacokinetics of digoxin, see Aronson [1980], Iisalo [1977], Mooradian [1988] and van der Vijgh, Oe [1977].

Dose 125 to 500 µg daily. For rapid digitalisation, an initial dose of 0.75 to 1.5 mg may be given.

Dihydralazine

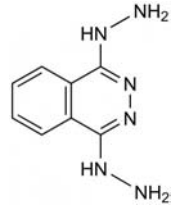
Antihypertensive

$C_8H_{10}N_6$ = 190.2

CAS—484-23-1

IUPAC Name (4-Hydrazinylphthalazin-1-yl)hydrazine

Synonyms Dihydrallazine; 2,3-dihydro-1,4-phthalazinedione dihydrazone.



Chemical Properties Orange crystalline needles. Mp about 180° with decomposition. Log *P* (octanol/water), −1.8.

Dihydralazine Sulfate

$C_8H_{10}N_6,H_2SO_4$ = 288.3

CAS—7327-87-9

Proprietary Names *Depressan*; *Dihyzin*; *Nepresol*; *Nepressol*.

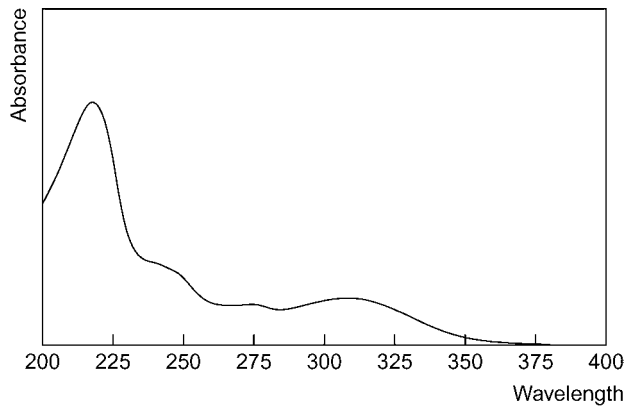
Chemical Properties A white to slightly yellow crystalline powder. Mp 233° with decomposition. Slightly soluble in water; practically insoluble in ethanol, chloroform and methanol.

Colour Tests Mandelin's test—yellow; Nessler's reagent—black.

Thin-layer Chromatography System TA—R_f 0.55; system TB—R_f 0.34; system TC—R_f 0.02; system TE—R_f 0.18; system TL—R_f 0.01; system TAE—R_f 0.00.

High Performance Liquid Chromatography System HX—RI 39.

Ultraviolet Spectrum Aqueous acid—240, 274, 306 nm (A^1_1=323a).



Infrared Spectrum Principal peaks at wavenumbers 1608, 1575, 1537, 1136, 769, 1100 cm^{-1} (KBr disk).

Quantification

Plasma **GC** ECD. Limit of detection, 5 µg/L, dihydralazine plus acid-labile hydrazones [Degen *et al.* 1982].

Dose Dihydralazine sulfate has been given in doses of 12.5 to 150 mg daily.

Degen PH *et al.* (1982). Determination of apparent dihydralazine in plasma by gas–liquid chromatography and electron-capture detection. *J Chromatogr* 233: 375–380.

Dihydrocodeine

Narcotic Analgesic

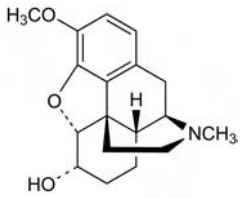
$C_{18}H_{23}NO_3 = 301.4$

CAS—125-28-0

IUPAC Name (5α,6α)-4,5-Epoxy-3-methoxy-17-methylmorphinan-6-ol

Synonyms Dihydroneopine; drocode; hydrocodeine.

Proprietary Names *Remedacen*; *Dihydrocodeine*; *Polistirex*



Chemical Properties Crystals. Mp 112° to 113°. Extraction yield (chlorobutane), 0.7 [Demme *et al.* 2005].

Dihydrocodeine Phosphate

$C_{18}H_{23}NO_3,H_3PO_4 = 399.4$

CAS—24204-13-5

Chemical Properties A white to yellowish-white crystalline powder. Soluble 1 in 3 of water; slightly soluble in ethanol.

Dihydrocodeine Tartrate

$C_{18}H_{23}NO_3,C_4H_6O_6 = 451.5$

CAS—5965-13-9

Synonyms Dihydrocodeine acid tartrate; dihydrocodeine bitartrate; drocode bitartrate; hydrocodeine bitartrate.

Proprietary Names *Codicontin*; *Codilol*; *Contugesic*; *DF 118*; *DHC*; *Dicodin*; *Didor*; *Fortuss*; *Hydol*; *Hydrocodeinon*; *Paracodin(a)*; *Paracodine*; *Rikodeine*; *Tiamon Mono*; *Tosidrin*. It is an ingredient of *DHC Plus*, *Galake*, *Panlor DC*, *Paramol*, *Remedeine* and *Synalgos-DC*.

Chemical Properties Colourless crystals or white crystalline powder. Mp 192° to 193° (anhydrous), 186° to 190° (commercial medicinal grade). Soluble 1 in 4.5 of water; sparingly soluble in ethanol; practically insoluble in ether. pK_a 8.8 (25°). Log *P* (ether/pH 7.0), −1.5.

Colour Test Mandelin's test—grey-green; Marquis test—violet.

Thin-layer Chromatography System TA—R_f 0.26; system TB—R_f 0.08; system TC—R_f 0.13; system TE—R_f 0.29; system TL—R_f 0.02; system TAE—R_f 0.11; system TAF—R_f 0.19; system TAJ—R_f 0.06; system TAK—R_f 0.00; system TAL—R_f 0.38 (acidified iodoplatinate solution—positive; Dragendorff spray—positive; Marquis reagent—blue-violet.)

Gas Chromatography System GA—RI 2390, dihydrocodeine-AC RI 2445, dihydrocodeine-PFP RI 2360, dihydrocodeine-TFA RI 2265, dihydrocodeine-TMS RI 2480, M (nor-)-AC_2 RI 2750; system GB—RI 2511, dihydrocodeine-TMS RI 2496, M (nor-) RI 2599, M (nor-)-TMS_2 RI 2559; system GC—RI 2702; system GF—RI 2840 system GM—RRT 1.493 (relative to iprindole).

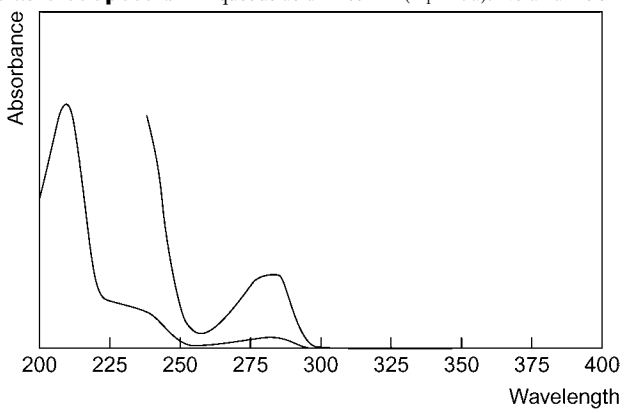
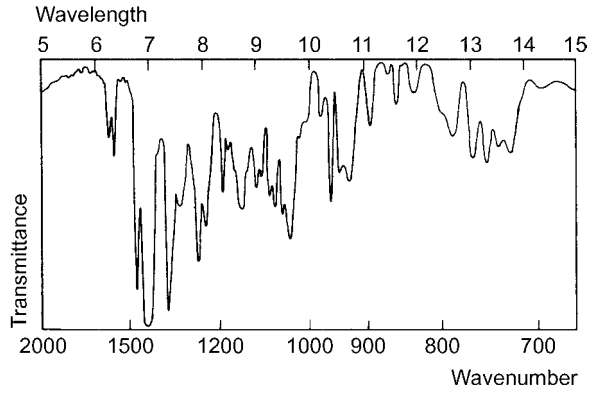
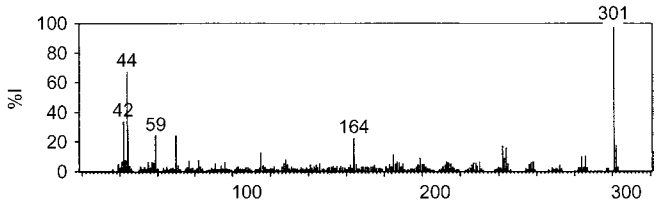
Ultraviolet Spectrum Aqueous acid—283 nm (A_1^1 = 47a). No alkaline shift.



Infrared Spectrum Principal ions at wave numbers 1495, 1271, 1040, 1250, 1055, 1149 cm^{-1} (Nujol mull).



Mass Spectrum Principal ions at *m/z* 301, 44, 42, 59, 164, 70, 302, 242.



Quantification

Blood **GC** Column: HP-5 (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: H_2, 0.7 mL/min. Temperature: 320°. EI ionisation. Limit of quantification, 10 ng/mL [Mykkänen *et al.* 2000]. Column: 3% SE-30 on Gas Chrom Q (1.8 m × 0.63 mm (6 ft × 0.25 in) o.d.) or 3% OV-17 on Gas Chrom Q (1.2 m × 0.63 mm (4 ft × 0.25 in) o.d.) or 3% OV-1 on Gas chrom Q (1.2 m × 0.63 mm (4 ft × 0.25 in) o.d.) or 4% XE-60 on Gas Chrom Q (1.2 m × 0.63 mm (4 ft × 0.25 in) o.d.). Carrier gas: 30, 50, 40 and 40 mL/min, respectively. Temperature: 220°, 235°, 200° and 240°, respectively. FID. Retention time: 8.8, 10.1, 4.0, and 3.6 min, respectively. Limit of detection, 0.8 mg/L [Peat, Sengupta 1977].

GC-MS Column: DB-1 fused silica column (30 m × 25 mm i.d., 0.25 µm). Carrier gas: H_2, 30 mL/min. Temperature: 300°. Limit of detection, <5 ng/mL [Geier *et al.* 1996]. Column: OV1 (12 m × 0.2 mm i.d.). Temperature programme: 150° for 2 min to 220° at 40°/min for 6 min. EI ionisation, SIM acquisition mode. Retention time: 7.92 min. Limit of detection, <1 µg/L [Musshoff, Daldrup 1993].

HPLC Column: Nucleosil 100-5 C_{18} (250 × 4.6 mm i.d.). Mobile phase: acetonitrile : 25 mmol/L TEA phosphate (4 : 96), flow rate 1 mL/min. Fluorescence detection (λ= 220 nm) [Klinder *et al.* 1999].

LC-MS Column: Synergi Polar (150 × 2 mm i.d). Mobile phase: 1 mmol/L ammonium formate and 0.1% formic acid (pH 2.7) : 70% acetonitrile-1 mmol/L ammonium formate and 0.1% formic acid (pH 3.8). ESI, positive ion mode, MRM acquisition mode. Limit of detection not reported [Taylor, Elliott 2009]. Column: Phenomenex Synergi. Mobile phase: 10 mmol/L ammonium formate : acetonitrile (pH 3). Limit of quantification 0.5–4.09 ng/mL, limit of detection 0.16–1.2 ng/mL [Al Asmari, Anderson 2007]

Plasma **GC** Column: DB-17 fused silica capillary column (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: H_2, 22 cm/s. Temperature: 280°. SID (comparison with NPD). Limit of detection, 2.5 µg/L [Seno *et al.* 1995]. Column: 3% OV-17 on 80/100 mesh Chromosorb W-HP (2 m × 2 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature: 260°. Limit of quantification, 20 µg/L [Cowan *et al.* 1988]

LC-MS See Blood [Taylor, Elliott 2009].

GC-MS See Blood [Geier *et al.* 1996].

Serum **GC-MS** Column: DB-5 capillary column (25 m × 0.25 mm i.d., 0.25 µm). Carrier gas: H_2. Temperature: 300°. Limit of quantification, 2 µg/L for dihydrocodeine and 40 ng/L for dihydromorphine [Hofmann *et al.* 1995]. See Blood [Musshoff, Daldrup 1993].

Urine **HPLC** Colum: Hypersil (200 × 2 mm i.d., 3 µm). Mobile phase: dichloromethane : pentane : methanol : diethylamine (29.8 : 65 : 5.5 : 0.5), flow rate 0.4 mL/min. UV detection (λ= 280 nm,). Limit of detection, 4–20 µg/L (comparison with enzyme immunoassay) [Low, Taylor 1995]. Limit of quantification, 2 mg/L[Cowan *et al.* 1988].

GC See Plasma [Seno *et al.* 1995]. See Blood [Peat, Sengupta 1977].

GC-MS Column: HP5MS capillary column (30 m × 0.25 mm i.d., 0.25 m). Carier gas: H_2, 1.5 mL/min. Temperature: 200° to 300° [Meadway *et al.* 2002]

Bile **GC** See Blood [Peat, Sengupta 1977].

Liver **GC** See Blood [Peat, Sengupta 1977].

Hair **HPLC** Column: C_{18} silica-based (150 × 4.6 mm i.d., 3 µm). Mobile phase: 20 mmol/L monobasic sodium phosphate-acetonitrile (pH 7.0; 90 : 10) : 20 mmol/L monobasic sodium phosphate-acetonitrile (pH 7.0; 50 : 50) (93 : 7 for 11.5 min to 50 : 50 at 19.5 min for 5 min to 90 : 10 at 34.5 min), flow rate 0.8 mL/min. Electrochemical detection. Limit of detection, 48 pg [Achilli *et al.* 1996].

GC-MS Column: Ultra-2 cross-linked 5% phenylmethylsiloxane (12 m × 0.2 mm i.d., 0.33 μm). Temperature programme: 250° to 280° at 5°/min. Limit of detection, 30 pg [Sachs *et al.* 1993].

Note For methods of quantification of biological samples by HPLC for dihydrocodeine and drugs of abuse and their metabolites, see Moeller *et al.* [1998].

Disposition in the Body Dihydrocodeine undergoes extensive first-pass metabolism in the gut wall or liver. Metabolism includes *N*-demethylation to form nordihydrocodeine, *O*-demethylation producing dihydromorphine, 6-keto reduction and conjugation. After an oral dose of 52 mg, 20–30% is excreted in the urine in 24 h; this is increased to ≈35% when the urine is acid. After an IM dose of ≈43 mg under conditions of controlled acidic urinary pH, 40–60% is excreted in the urine in 24 h. Approximately 30–45% of the urinary excreted material is conjugated.

Therapeutic Concentration

Following a single oral dose of 60 mg dihydrocodeine to 12 subjects, mean peak plasma concentrations of dihydrocodeine of 341 nmol/L (range, 312–370) and of dihydromorphine of 4.7 nmol/L (range, 3.7–5.8) were attained in ≈5 h; multiple dosing at 60 mg twice daily for 2 days, then 90 mg twice daily for 2 days, and then 120 mg twice daily for 2 days produced minimum mean steady-state dihydrocodeine concentrations of 186 nmol/L (range, 157–215), 203 nmol/L (range, 242–345) and 443 nmol/L (range, 367–518), respectively [Ammon *et al.* 1999].

Following single oral doses of 30 mg and 60 mg to 7 subjects, mean peak plasma concentrations of 0.072 and 0.146 mg/L, were attained in 1.7 h respectively; the corresponding peak plasma concentrations of acidic metabolites were 0.56 and 1.48 mg/L, respectively [Rowell *et al.* 1983].

Toxicity The estimated minimum lethal dose is 0.5 g, but addicts may be able to tolerate up to 10 times as much, whereas 25 mg may be fatal in children.

In a 16-year-old man who died from drowning and cold exposure following a drug overdose, the following concentrations of diphenhydramine, free dihydrocodeine and total dihydrocodeine, respectively, were found ≈9 days after death: femoral venous blood 1.89, 3.27 and 3.30 mg/L, right cardiac chamber blood 0.294, 0.237 and 0.240 mg/L, urine 22.6, 37.3 and 43.1 mg/L, stomach 0.029, 0.018 and 0.024 mg and femoral muscle 0.270, 0.246 and 0.314 μg/g [Moriya, Hashimoto 2001].

In 3 deaths involving dihydrocodeine, the femoral blood concentrations of dihydrocodeine and its metabolites at postmortem were: dihydrocodeine 18.45, 1.92 and 2.36 mg/L; dihydrocodeine 6-glucuronide 7.18, 2.68 and 1.61 mg/L; nordihydrocodeine 2.21, 0.27 and 0.12 mg/L; dihydromorphine 0.21, 0.18 and 0.16 mg/L; dihydromorphine 3-glucuronide 1.08, 1.04 and 0.31 mg/L; and dihydromorphine 6-glucuronide 0.08, 0.08 and 0.07 mg/L. In the first 2 cases, diazepam and nordiazepam were also detected and in the third chloral hydrate and trichlorethanol had also been ingested [Klinder *et al.* 1999].

A 30-year-old man who had been undergoing long-term substitution therapy with dihydrocodeine died of unkown causes. At postmortem, 3.5 h after death, the following tissue concentrations were found (in addition to diazepam and nordazepam)

In 4 deaths caused by ingestion of dihydrocodeine, postmortem blood concentrations of 7.2–12.0 mg/L (mean, 9.0) were reported [Paterson 1985].

In a death attributed to an oral overdose of dihydrocodeine, the following postmortem tissue concentrations were reported: blood 12 mg/L, bile 5340 mg/L, liver 620 μg/g and urine 570 mg/L; chlordiazepoxide was also detected. In a second case in which the death of an addict occurred rapidly after an IV overdose of dihydrocodeine, the postmortem concentrations were blood 720 mg/L, bile 3 mg/L, liver blood 364 mg/L, and urine 7 mg/L; pentobarbital and paracetamol were also detected [Peat, Sengupta 1977].

Half-life Plasma half-life, ≈4 h.

Bioavailability ≈20%

Volume of Distribution ≈1 L/kg.

Clearance Plasma clearance, ≈4 mL/min/kg.

Dose 30 to 60 mg of dihydrocodeine tartrate every 4 to 6 h up to maximum of 240 mg daily.

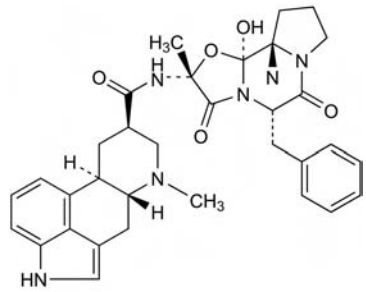
Dihydroergotamine

Treatment of Migraine

$C_{33}H_{37}N_5O_5 = 583.7$

CAS—5111-12-6

Synonym 9,10-Dihydro-12′-hydroxy-2′-methyl-5′-(phenylmethyl)ergotaman-3′,6′,18-trione



Chemical Properties White crystals. Mp 239°. Practically insoluble in water; sparingly soluble in ethanol, methanol, benzene and chloroform. pK_a 6.9 (24°).

Dihydroergotamine Mesilate

$C_{33}H_{37}N_5O_5,CH_3SO_3H = 679.8$

CAS—6190-39-2

	Left femoral vein (whole blood) (mg/L)	*Left ventricle (whole blood) (mg/L)*	*Liver (μg/g)*	*Kidney (μg/g)*	*Cerebrum (μg/g)*

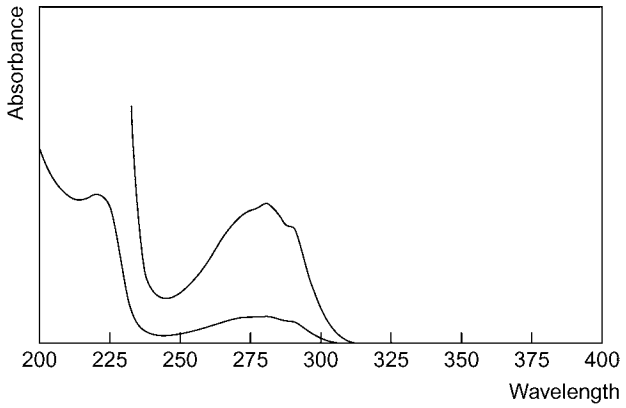
[a]*In serum [Skopp *et al.* 1998].

Synonym Dihydroergotamine methanesulphonate
Proprietary Names *DET MS*; *D.H.E. 45*; *Dihydergot*; *Ikaran*; *Séglor*; *Tonopres*.
Chemical Properties A white to slightly yellowish, or an off-white to slightly red, microcrystalline powder. Soluble 1 in 125 of water, 1 in 90 of ethanol, 1 in 175 of chloroform and 1 in 2600 of ether; soluble in acetone.

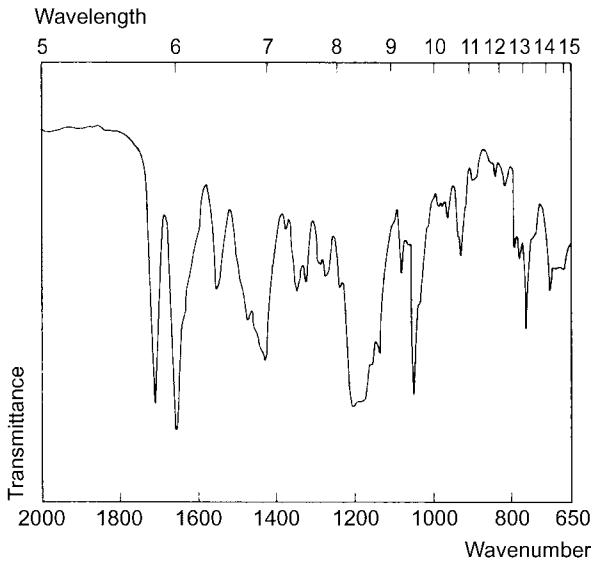
Dihydroergotamine Tartrate

$(C_{33}H_{37}N_5O_5)_2,C_4H_6O_6 = 1317.4$
CAS—5989-77-5
Chemical Properties Colourless crystals or a white crystalline powder. Mp about 203°, with decomposition. Very slightly soluble in water; sparingly soluble in ethanol; soluble in pyridine.

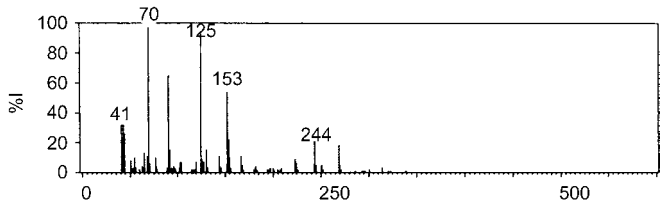
Colour Tests *p*-Dimethylaminobenzaldehyde—violet; Mandelin's test—violet-brown; Marquis test—grey-brown.
Thin-layer Chromatography System TA—R_f 0.60; system TB—R_f 0.01; system TC—R_f 0.28; system TE—R_f 0.42; system TL—R_f 0.14; system TM—R_f 0.40; system TAE—R_f 0.58; system TAJ—R_f 0.33; system TAK—R_f 0.03; system TAL—R_f 0.84 (Van Urk reagent, blue).
Gas Chromatography System GA—RI 2315.
High Performance Liquid Chromatography System HA—*k* 0.6; system HP—*k* 11.4; system HX—RI 411; system HZ—retention time 3.4 min.
Ultraviolet Spectrum Aqueous acid—280 nm (A_1^1=108a). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1660, 1210, 1712, 1053, 1140, 768 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 70, 125, 91, 153, 43, 41, 44, 244 (no peaks above 340).



Quantification

Plasma **HPLC** Fluorescence detection. Limit of quantification, 0.1 µg/L [Murday *et al.* 1999]. Fluorescence detection (λ_{ex}=277 nm, λ_{em}=348 nm). Limit of detection, 0.08 µg/L [Romeijn *et al.* 1997]. Fluorescence detection. Limit of detection, 0.1 mg/L, dihydroergotamine and metabolites [Humbert *et al.* 1987].
Radioimmunoassay For method, see Rosenthaler and Munzer [1979].
Urine **HPLC** See Plasma [Humbert *et al.* 1987].
Disposition in the Body Poorly absorbed after oral administration and undergoes extensive first-pass metabolism with considerable intersubject variation. After oral administration <5% of a dose is excreted in the urine unchanged in 24 h, compared to about 11% after intravenous administration. The major metabolite is the 8′-hydroxy derivative, which is active.
Therapeutic Concentration
Following single oral doses of 10, 20 and 30 mg to 6 subjects, mean plasma concentrations of about 0.0002, 0.0006 and 0.001 mg/L, respectively, were attained in about 0.5 to 1 h [Little *et al.* 1982].
Note For a study of the pharmacokinetics of dihydroergotamine administered by nasal spray, see Humbert *et al.* [1996].
Bioavailability <5%.
Half-life Plasma half-life, about 2 to 4 h; a longer terminal elimination half-life of about 20 to 30 h has also been reported.
Volume of Distribution 6 to 23 L/kg (mean 14).
Clearance Plasma clearance, 7 to 22 mL/min/kg (mean 15).
Note For a review of the current uses of ergotamine and dihydroergotamine, see Tfelt-Hansen [2001].
Dose 1 to 3 mg of dihydroergotamine mesilate, repeated if necessary to a maximum of 10 mg daily.

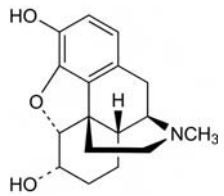
Dihydromorphine

Narcotic Analgesic
$C_{17}H_{21}NO_3 = 287.4$
CAS—509-60-4
Synonym (5α,6α)-4,5-Epoxy-17-methylmorphinan-3,6-diol

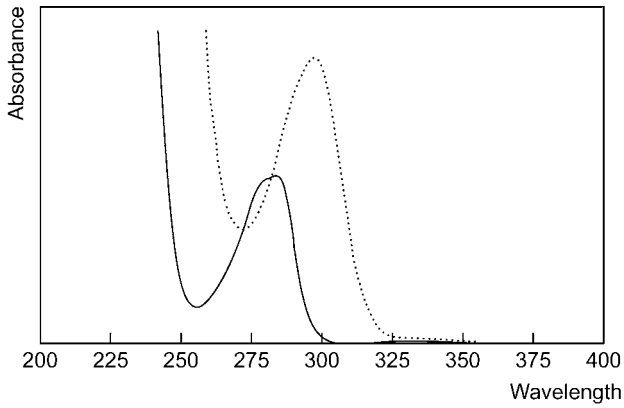


Chemical Properties Crystals. White crystals. Mp of the hydrated compound, 157°, with decomposition. Practically insoluble in water; soluble in acetone, ethanol and chloroform.

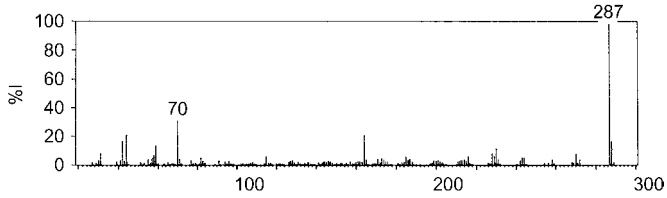
Dihydromorphine Hydrochloride

$C_{17}H_{21}NO_3,HCl = 323.8$
CAS—1421-28-9
Chemical Properties Crystals. Very soluble in water; sparingly soluble in ethanol. pK_a 8.6. Log *P* (octanol/water pH 7.4), −1.0.

Colour Tests Mandelin's test—grey; Marquis test—red-violet.
Thin-layer Chromatography System TA—R_f 0.25; system TB—R_f 0.02; system TC—R_f 0.03; system TE—R_f 0.18; system TL—R_f 0.01; system TAE—R_f 0.12 (acidified iodoplatinate solution—positive; Dragendorff spray—positive; Marquis test—violet).
Gas Chromatography System GA—dihydromorphine RI 2400, dihydromorphine-AC_2 RI 2545, dihydromorphine-PFP_2 RI 2330, dihydromorphine-TMS_2 RI 2520, M (nor-)-AC_3 RI 2790; system GB—dihydromorphine RI 2527, dihydromorphine-TMS_2 RI 2518; system GC—RI 2504.
High Performance Liquid Chromatography System HA—*k* 5.7 (tailing peak); system HC—*k* 2.75; system HX—RI 237; system HY—RI 156.
Ultraviolet Spectrum Aqueous acid—283 nm (A_1^1 = 45a); aqueous alkali—297 nm (A_1^1 = 82b).



Infrared Spectrum Principal peaks at wavenumbers 1245, 760, 940, 747, 1085, 1145 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 287, 70, 44, 164, 42, 288, 59, 230.



Quantification
Blood **LC-MS** Column: Phenomenex Synergi. Mobile phase: 10 mmol/L ammonium formate: acetonitrile (pH 3). Limit of quantification, 0.5–4.09 ng/mL, limit of detection, 0.16–1.2 ng/mL [Al Asmari, Anderson 2007].
Serum **GC-MS** Column: DB-5 capillary column (25 m × 0.25 mm i.d., 0.25 µm). Carrier gas: H_2. Temperature: 300°. Limit of quantification, 2 ng/mL for dihydrocodeine and 40 pg/mL for dihydromorphine [Hofmann *et al.* 1995].

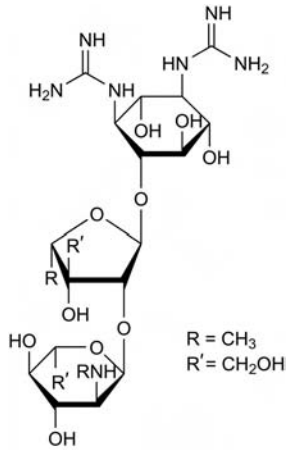
Dihydrostreptomycin

Antibiotic
$C_{21}H_{41}N_7O_{12}$ = 583.6
CAS—128-46-1

IUPAC Name 2-[(1*R*,2*R*,3*S*,5*R*,6*S*)-3-(Diaminomethylideneamino)-4-[(2*R*,3*R*,4*R*,5*S*)-3-[(2*S*,3*S*,4*S*,5*R*,6*S*)-4,5-dihydroxy-6-(hydroxymethyl)-3-(methylamino)oxan-2-yl]oxy-4-hydroxy-4-(hydroxymethyl)-5-methyloxolan-2-yl]oxy-2,5,6-trihydroxycyclohexyl]guanidine
Synonym *O*-2-Deoxy-2-(methylamino)-α-L-glucopyranosyl-(1→2)-*O*-5-deoxy-3-*C*-(hydroxymethyl)-α-L-lyxofuranosyl-(1→4)-*N*,*N*′-bis-(aminoimino-methyl)-D-streptamine



Chemical Properties pK_a 7.8. Log *P* (octanol/water), −7.5.

Dihydrostreptomycin Sulfate
$(C_{21}H_{41}N_7O_{12})_2,3H_2SO_4$ = 1461.4
CAS—5490-27-7

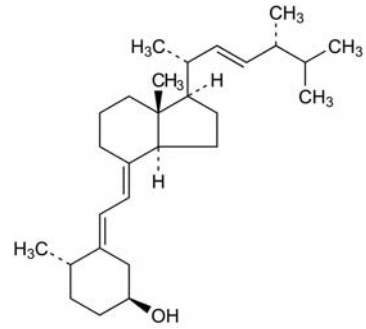
Proprietary Names It is an ingredient of *Citrocil*, *Cilinafosal DHD Estrep*, *Estrefen*, *Estreptoenterol*, *Fluocal com Pectina*, *Salitanol Estreptomicina* and *Sulfintestin Neomicina*.
Chemical Properties A white hygroscopic solid. Mp 255° to 265° with decomposition. Very soluble in water; practically insoluble in ethanol, chloroform and ether.

Colour Tests Nessler's reagent—yellow→brown; palladium chloride—brown (slow).
Thin-layer Chromatography System TA—R_f 0.01; system TAE—R_f 0.00 (acidified potassium permanganate solution, positive).
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.
Infrared Spectrum Principal peaks at wavenumbers 1111, 1666, 1052, 1724, 1250, 1515 cm^{-1}.
Dose The equivalent of 0.5 to 1 g of dihydrostreptomycin has been given daily, intramuscularly.

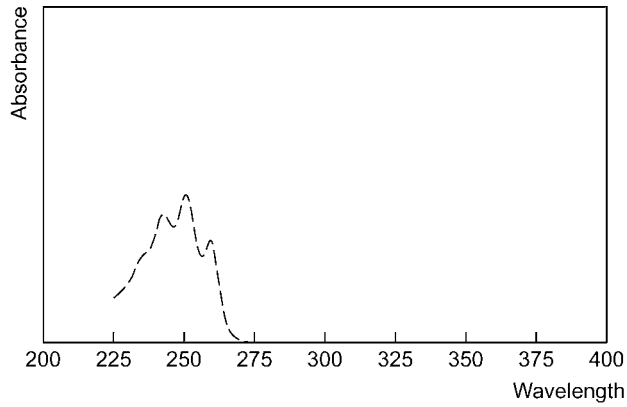
Dihydrotachysterol

Vitamin D Activity
$C_{28}H_{46}O$ = 398.7
CAS—67-96-9

IUPAC Name 3-[2-[1-(5,6-Dimethylhept-3-en-2-yl)-7*a*-methyl-2,3,3*a*,5,6,7-hexahydro-1*H*-inden-4-ylidene]ethylidene]-4-methylcyclohexan-1-ol
Synonyms Dichysterol; (3β,5*E*,7*E*,10α,22*E*)-9,10-secoergosta-5,7,22-trien-3-ol.
Proprietary Names *AT 10*; *Calcamine*; *Dihydral*; *Dygratyl*; *Hytakerol*; *Parterol*; *Tachyrol*.



Chemical Properties Colourless crystals or white crystalline powder. Mp 123° to 129°. May also occur in a form melting at about 113°. Practically insoluble in water; soluble 1 in 20 of ethanol, 1 in 0.7 of chloroform and 1 in 3 of ether. Log *P* (octanol/water), 10.4.
Ultraviolet Spectrum Methanol—242, 251 (A_1^1=990a), 261 nm.



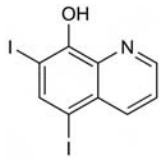
Infrared Spectrum Principal peaks at wavenumbers 1056, 967, 1018, 1009, 870, 980 cm^{-1} (KBr disk).
Dose Initially 0.25 to 2.5 mg daily.

Diiodohydroxyquinoline

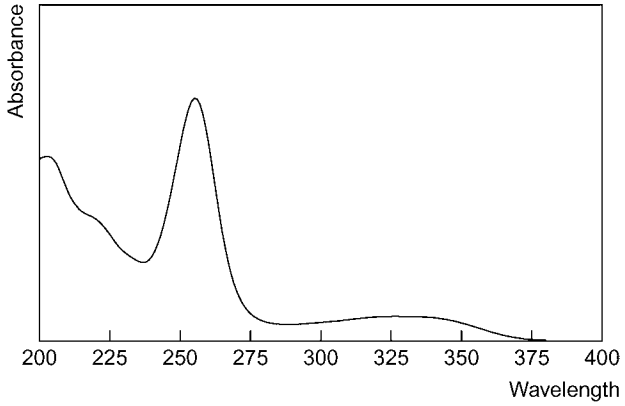
Antiamoebic
$C_9H_5I_2NO$ = 397.0
CAS—83-73-8

IUPAC Name 5,7-Diiodo-8-quinolinol
Synonyms Diiodohydroxyquin; diodoxyquinoléine; iodoquinol.
Proprietary Names *Amabagyl*; *Antidifar*; *Carsuquin*; *Diameb*; *Diodolina*; *Diodoquin*; *Direxiode*; *Diyomex*; *Diyosul*; *Diyowil*; *Drioquilen*; *Dysetrin*; *Embequin*;

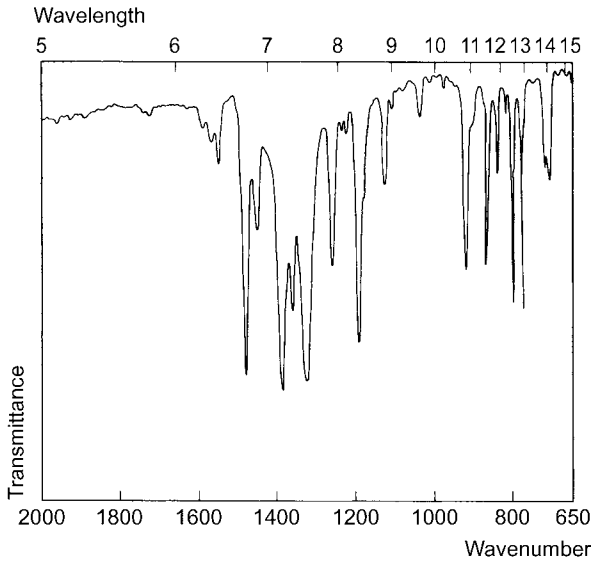
Entero-Diyod; *Entodiba*; *Flanoquin*; *Floraquin*; *Moebiquin*; *Sebaquin*; *Versamiv*; *Yodoxin*; *Yopin*.



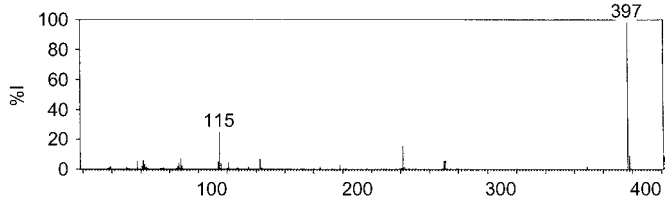
Chemical Properties A light yellowish to tan-coloured microcrystalline powder, not readily wetted in water. Mp 200° to 215°, with decomposition. Almost insoluble in water; sparingly soluble in ethanol, acetone and ether; soluble in hot pyridine and hot dioxane. Log *P* (octanol/water), 4.0.
Colour Test Heat a few crystals with 1 mL of sulfuric acid—violet iodine vapour.
Thin-layer Chromatography System TD—R_f 0.17; system TE—R_f 0.28; system TF—R_f 0.19; system TAD—R_f 0.72.
Ultraviolet Spectrum Dilute 5 mL of a 0.01% solution in dioxan to 100 mL with dehydrated alcohol—258 nm (A_1^1=1060b).



Infrared Spectrum Principal peaks at wavenumbers 1204, 781, 806, 920, 1265, 869 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 397, 115, 242, 398, 88, 143, 271, 62.



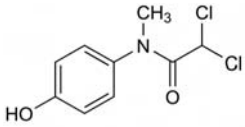
Quantification
Urine **Colorimetry** Limit of detection, 10 mg/L [Berggren, Hansson 1968].
Disposition in the Body Incompletely and irregularly absorbed from the small intestine. About 5% of a dose is excreted in the urine as the glucuronide conjugate in 10 h.

Dose Usually 1.8 g daily.

Berggren L, Hansson O (1968). Absorption of intestinal antiseptics derived from 8-hydroxyquinolines. *Clin Pharmacol Ther* 9: 67–70.

Diloxanide

Antiamoebic
$C_9H_9Cl_2NO_2$ = 234.1
CAS—579-38-4
IUPAC Name 2,2-Dichloro-*N*-(4-hydroxyphenyl)-*N*-methylacetamide
Synonym Diloxan

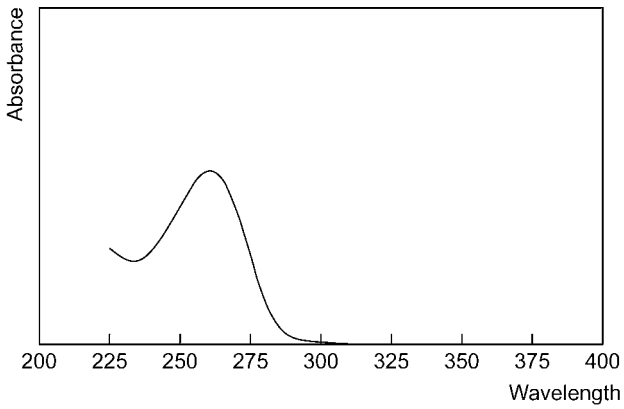


Chemical Properties A white crystalline powder. Mp 175°. Slightly soluble in water; soluble 1 in 8 of ethanol, 1 in 35 of chloroform and 1 in 66 of ether. Log *P* (octanol/water), 1.8.

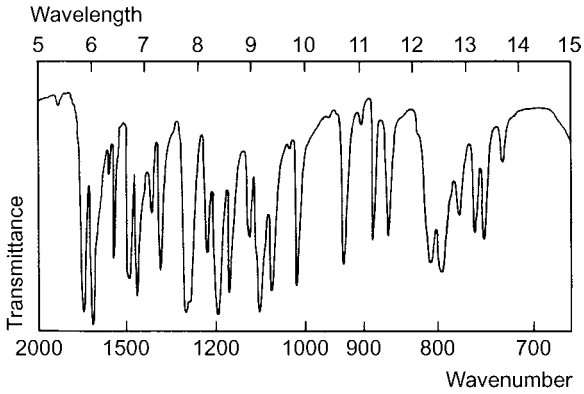
Diloxanide Furoate

$C_{14}H_{11}Cl_2NO_4$ = 328.2
CAS—3736-81-0
Proprietary Names *Furamid(e)*. It is an ingredient of *Entamizole*.
Chemical Properties A white crystalline powder. Mp 114° to 116°. Very slightly soluble in water; soluble 1 in 100 of ethanol, 1 in 2.5 of chloroform and 1 in 130 of ether.

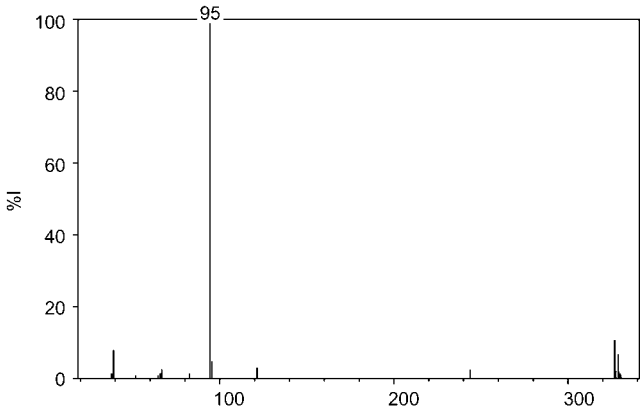
Colour Tests Folin–Ciocalteu reagent—blue; Liebermann's reagent—yellow.
Thin-layer Chromatography System TA—R_f 0.66; system TB—R_f 0.16; system TC—R_f 0.74; system TL—R_f 0.67 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2420.
High Performance Liquid Chromatography System HY—RI 500.
Ultraviolet Spectrum Diloxanide furoate: aqueous acid—262 nm (A_1^1=224b); ethanol—258 nm (A_1^1=705a). Diloxanide: ethanol—278 nm (A_1^1=104a).



Infrared Spectrum Principal peaks at wavenumbers 1678, 1197, 1093, 1290, 1727, 1167 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 95, 327, 39, 329, 96, 122, 244, 67 (diloxanide furoate).

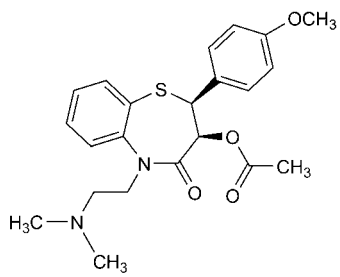


Disposition in the Body After oral administration diloxanide furoate is hydrolysed to diloxanide and then readily absorbed; it is excreted in the urine and faeces.
Dose 1.5 g of diloxanide furoate daily.

Diltiazem

Antianginal, Antiarrhythmic, Antihypertensive, Calcium Channel Blocker
$C_{22}H_{26}N_2O_4S = 414.5$
CAS—42399-41-7

IUPAC Name [(2*S*,3*S*)-5-(2-Dimethylaminoethyl)-2-(4-methoxyphenyl)-4-oxo-2,3-dihydro-1,5-benzothiazepin-3-yl] acetate
Synonyms (2*S*-*cis*)-3-(Acetyloxy)-5-[2-(dimethylamino)ethyl]-2,3-dihydro-2-(4-methoxyphenyl)-1,5-benzothiazepin-4-(5*H*)-one; (+)-*cis*-5-[2-(dimethylamino)-ethyl]2,3-dihydro-3-hydroxy-2-(*p*-methoxyphenyl)-1,5-benzothiazepin-4(5*H*)-one acetate (ester).
Proprietary Names *Dilzem*; *Surecaps*.



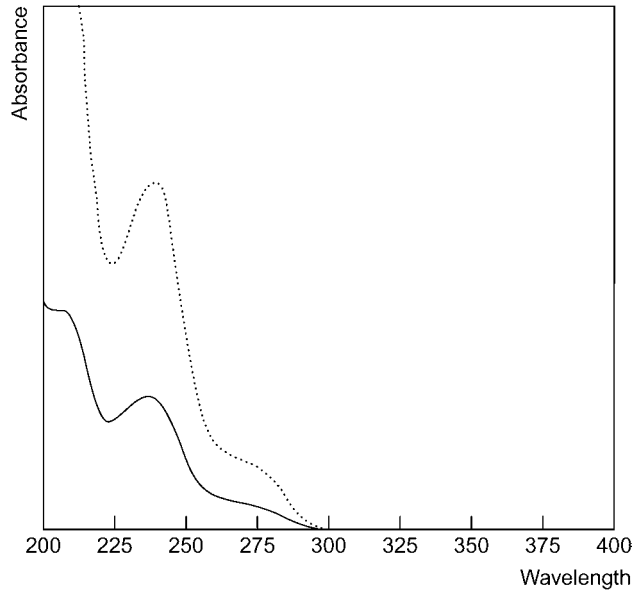
Chemical Properties pK_a ≈8.0 [Rutledge *et al.* 1993], 7.7 [Rosell *et al.* 1993; Ververs *et al.* 1990]. Log *P* (octanol/water) 2.79 [Meylan, Howard 1995]. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005]. Diltiazem is stable in whole blood at room temperature for 4 h, at –20° for 1 month, and after 3 freeze-thaw cycles [Li *et al.* 2008]. Plasma samples were stable after 5 freeze-thaw cycles, after 4 months at –20° and for 48 h at room temperature [Georgita *et al.* 2008]. Stock solutions in methanol were stable at –20° for 1 month. Plasma samples were stable at 4° for 24 h, at room temperature for 24 h and after 3 freeze-thaw cycles [Li *et al.* 2007]. Plasma samples were stable in the autosampler for 2, 12, and 24 h, after 1 and 2 freeze-thaw cycles, and after 1 month at –20° [Zendelovska *et al.* 2003]. Stable in plasma after 2 freeze-thaw cycles [Quiroga *et al.* 2001]. Plasma sample extracts were stable for at least 3 days at room temperature. Spiked plasma samples and *ex-vivo* samples were stable at –80° for 16 months and 31 months, respectively [Carignan *et al.* 1995]. Diltiazem and desacetyldiltiazem were found to be stable in serum for up to 8 weeks at –20°, whereas some degradation was observed after 7 days at 4° [Paczkowski *et al.* 1995]. Diltiazem and metabolites were stable in plasma for at least 24 h in the autosampler [Ascalone *et al.* 1994]. Stable in plasma at –20° for 30 days [Rutledge *et al.* 1994]. Stock solutions stored at –25° were stable for 6 months [Rustum 1989]. There was no degradation in spiked plasma samples until day 7 when stored at 4°. Diltiazem was very stable in plasma frozen at –20° for at least 6 weeks [Dubé *et al.* 1988]. Samples stored in bovine plasma were stable for at least 3 months at –20° in the dark [Bhamra *et al.* 1987].
Note For a study of stability of diltiazem and its metabolites in plasma during storage, see Yeung *et al.* [1991] and in different biological fluids, see McLean *et al.* [1991]. For a study of diltiazem stability in whole blood, see Koves *et al.* [1998].

Diltiazem Hydrochloride

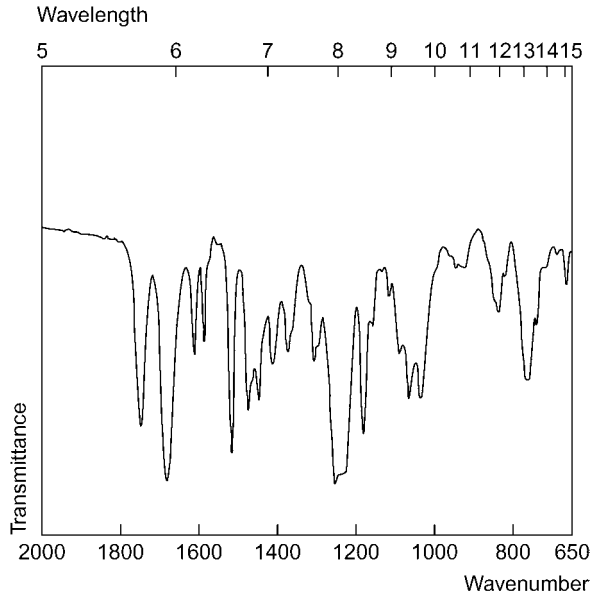
$C_{22}H_{26}N_2O_4S,HCl = 451.0$
CAS—33286-22-5
Synonyms CRD-401; diltiazem hydrochloridum; latiazem hydrochloride; MK-793.

Proprietary Names *Adizem*; *Altiazem*; *Angiozem*; *Angitil*; *Calazem*; *Calcicard*; *Cardizem*; *Dilacar*; *Dilcardia*; *Herbesser*; *Slozem*; *Tiazac*; *Tildiem*; *Viazam*; *Zemtard*.
Chemical Properties White, odourless, crystalline powder or small crystals. It is freely soluble in water, chloroform, dichloromethane, formic acid and methyl alcohol; sparingly soluble in dehydrated alcohol; practically insoluble in ether. Mp 207.5° to 212.0°. Log *P* (octanol/water) 19.4 [Cassidy *et al.* 1988].

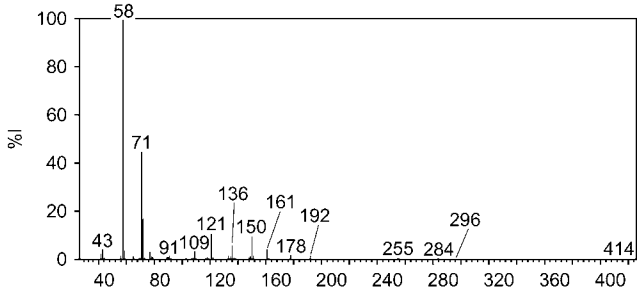
Thin-layer Chromatography System TAE—R_f 0.47; system TE—R_f 0.56.
Plates: Silica (Merck 60). Mobile phase: ethyl acetate : methanol : ammonia (80 : 10 : 10). Reference compound: diltiazem hydrochloride R_f 0.54 [Devarajan, Dhavse 1998].
Gas Chromatography System GA—diltiazem RI 2949, M (desacetyl-) RI 2990, M (*O*-desmethyl-) RI 3050; system GB—diltiazem RI 3076, M (desacetyl-) RI 3092, M (*O*-desmethyl-) RI 3147, M (*N*-desmethyl-) RI 3114.
High Performance Liquid Chromatography System HAV—diltiazem *k* 6.1, deacetyldiltiazem *k* 3.6, desmethyldiltiazem *k* 5.1; system HAA—RT 14.0 min; system HAX—diltiazem RT 11.1 min, desacetyldiltiazem RT 9.3 min; system HAY—diltiazem RT 5.4 min, desacetyldiltiazem RT 4.6 min; system HY—RI 361; system HZ—RT 4.5 min.
Ultraviolet Spectrum Aqueous acid (0.2 mol/L NH_2SO_4)—236 nm; basic—237 nm.



Infrared Spectrum Principal peaks at 2393, 1679, 1743, 839, 781, 3056 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 58, 71, 414, 284, 296, 150, 121, 344.



Quantification

Blood **GC** Column: TC-5 5% phenyl methyl silicone (15 m × 0.53 mm, 1.5 µm). Carrier gas: He, 15 kPa. Temperature programme: 150° for 2 min to 300° at 20°/min for 10.5 min. FTD. Limit of detection, 0.01 mg/L [Moriya, Hashimoto 2004]. Column: Restek RTX-50 (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 1.3 mL/min for 12 min to 3 mL/min over 0.5 min for 3.5 min. Temperature programme: 220° for 3 min to 280° at 10°/min for 2 min to 300° at 40°/min for 5.5 min. NPD. Limit of detection, 60 µg/L [Engelhart *et al.* 1997].

GC-MS Column: HP Ultra-2 cross-linked fused silica capillary (12 m × 0.2 mm i.d., 0.33 mm). Carrier gas: He, 1.0 mL/min. Temperature programme: 70° for 2 min to 200° at 50°/min to 260° at 5°/min to 290° at 10°/min for 2 min. MSD. Limit of detection not reported [Romano *et al.* 2002].

HPLC Column: Supelcosil LC-DP (250 × 4.6 mm i.d.,). Mobile phase: acetonitrile : tetraethylammonium buffer (pH 3.4) : 3.7 mmol/L potassium phosphate (25 : 5 : 10), flow rate 0.6 mL/min. UV detection (λ= 229 nm). Limit of detection, 0.02 mg/L [Koves *et al.* 1998]. Column: Partisil 10 ODS C_{18}. Mobile phase: acetonitrile : 0.01 mol/L phosphate buffer (pH 3.2; 60 : 40), flow rate 3.0 mL/min. UV detection (λ = 230 nm). Retention time: 4.8 min. Limit of detection not reported [Kaliciak *et al.* 1992]. Column: PRP-1 (150 × 4.1 mm i.d., 10 µm). Mobile phase: acetonitrile : 0.01 mol/L dibasic potassium phosphate and 5.0 mmol/L tetrabutylammonium hydroxide (40 : 60), flow rate 1.0 mL/min. UV detection (λ = 254 nm). Limit of detection, 10 µg/L [Rustum 1989].

LC-MS Column: Hypersil BDS C_{18} (50 × 2.1 mm i.d., 3 µm). Mobile phase: methanol : 2 mmol/L ammonium acetate (95 : 5), flow rate 200 µL/min. ESI, positive ion mode, MRM acquisition mode. Retention time: 1.16 min. Limit of quantification, 2 µg/L, limit of detection, 0.5 µg/L [Li *et al.* 2008]. Column: Atlantis dC_{18} (150 × 2.1 mm i.d., 3.0 µm). Mobile phase: 10 mmol/L ammonium formate (pH 3.1) : acetonitrile (90 : 10 to 10 : 90 at 10 min for 3 min), flow rate, 0.3 mL/min. ESI, positive ion mode, SIM acquisition mode. Limit of quantification, 0.015 µmol/L, limit of detection, 0.005 µmol/L [Kristoffersen *et al.* 2007].

Plasma **GC** Column: 5% phenyl polymethylsiloxane (30 m × 0.25 mm i.d.). Carrier gas: He, 1.0 mL/min. Temperature: 265°. ECD. Limit of detection, 3 µg/L [Grech-Belanger *et al.* 1987]. Column: 3% OV 7 on Gas Chrom Q 80/100 (2 m × 2 mm i.d.). Carrier gas: Ar : CH_4, 60 mL/min. Temperature: 245°. ECD. Limit of detection, 2 µg/L [Clozel *et al.* 1984a]. Column: Chromosorb W 80/100 mesh 1% OV-17 (2 m × 4 mm i.d.). Carrier gas: He, 50 mL/min. NPD. Retention time: 7.20 min. Limit of detection, 10 µg/L [Rovei *et al.* 1977].

GC-MS Column: 20% OV-17 on Chromosorb WHP (1.5 m). Carrier gas; Ar : CH_4 (95 : 5), 120 mL/min. Temperature: 320°. Retention time: 3.5 min. Limit of detection, 5 µg/L [Ochs, Knüchel 1984].

HPLC Column: Spherisorb C_{18} (250 × 4.6 mm i.d., 10 µm). Mobile phase: methanol : 2.8 mmol/L triethylamine (80 : 20), flow rate 1.2 mL/min. UV detection (λ= 239 nm). Limit of detection, 3 µg/L [Li *et al.* 2003]. Column: Lichrospher 60 RP-select B (125 × 4.0 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.025 mol/L potassium dihydrogen phosphate (pH 5.5; 35 : 65), flow rate 1.5 mL/min. UV detection (λ= 215 nm). Limit of quantification, 20 µg/L, limit of detection, 5 µg/L [Zendelovska *et al.* 2003]. Column: Lichrocart RP-18 (125 × 4 mm i.d., 5 µm). Mobile phase: methanol : 0.04 mol/L ammonium acetate : acetonitrile (29 : 38 : 23) with 0.04% triethylamine (pH 7.4), flow rate 1.2 mL/min. UV detection (λ= 240 nm). Limit of quantification, 20 µg/L [Quiroga *et al.* 2001]. Column: Hypersil BDS C8 (20 cm × 4.0 mm i.d., 5 µm). Mobile phase: 0.05 mol/L potassium dihydrogen phosphate (pH 2.9) : triethylamine : acetonitrile : methanol (600 : 2 : 280 : 90), flow rate 1.0 mL/min. UV detection (λ= 238 nm). Retention time: 13.7, 7.5, 6.4 and 3.9 min for diltiazem, M_1, M_A, and M_2, respectively. Limit of detection, 5 µg/L for diltiazem, 2.5 µg/L for M_A, M_1 and M_2, respectively [Christensen *et al.* 1999]. Column: Lichrospher 60-5 select B. Mobile phase: methanol : ethanol : water (5:3 : 2). Limit of quantification, 5 µg/L [Scheiwe *et al.* 1996]. Column: Supelcosil C_{18} R-P (250 × 4.6 mm, i.d., 5 µm). Mobile phase: methanol : 0.04 mol/L ammonium acetate buffer : acetonitrile (38 : 36 : 26), containing 0.08% triethylamine (pH 7.5), flow rate 1.2 mL/min. UV detection (λ= 237 nm). Retention time: 3.6, 4.1, 4.7, 5.6, 7.8, 9.4 and 10.6 min for metabolites M_6, M_B, M_4, M_X, M_2, M_A and M_1:, respectively, diltiazem, 13.1 min. Limit of detection, <10 mg/L [Yeung *et al.* 1996].

See also [Carignan *et al.* 1995], [Fauville *et al.* 1995], [Ascalone *et al.* 1994], [Rutledge *et al.* 1994], [Sigusch *et al.* 1994], [Rosell *et al.* 1993], [Rutledge *et al.* 1993], [Hussain *et al.* 1992], [Christrup *et al.* 1992], [De Bernardis *et al.* 1992], [Jensen, Larsen 1991], [Ververs *et al.* 1990], [Boulieu *et al.* 1990], [Ascalone, Flaminio 1989], [Yeung *et al.* 1989], [Dubé *et al.* 1988], [Boucher *et al.* 1989], [Zhao, Chow 1989].

LC-MS Column: Zorbax Eclipse XDB-C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: 0.2% triethylamine (pH 3.5) : acetonitrile (75 : 25), flow rate 0.8 mL/min. ESI, positive ion mode. Limit of quantification, 1.0 µg/L [Georgita *et al.* 2008]. Column: Capcell Pak C_{18} (50 × 2.0 mm i.d., 5 µm). Mobile phase: acetonitrile : water both containing 0.02% formic acid (5 : 95 to 50 : 50 at 3.5 min to 95 : 5 in 0.5 min to 5 : 95 in 0.5 min for 3 min), flow rate 0.3 mL/min. TIS, positive ion mode. Retention time: 4.1 min. Limit of quantification, 1 µg/L [Li *et al.* 2007]. Column: Inertsil C_8 (50 × 3 mm i.d., 50 µm). Mobile phase: methanol-10 mmol/L ammonia (pH 2.75; 20 : 80) : methanol-10 mmol/L ammonia (pH 2.75; 85, 15, 100 : 0 to 0 : 100 at 6 min to 0 : 100 at 7 min to 100 : 0 over 0.5 s), flow rate 0.4 mL/min. APCI, SIM acquisition mode. Limit of quantification, 1 µg/L [Molden *et al.* 2003]. Column: Inertsil C_8 (50 × 3 mm i.d., 5 µm). Mobile phase: methanol : 10 mmol/L ammonia (pH 2.75; 20 : 80 to 85 : 15 at 6 min. APCI, SIM acquisition mode. Limit of quantification, 1 µg/L [Molden *et al.* 2002b].

Serum **GC-MS** Column: HP-17 (12 m). Carrier gas: 15 mL/min. Temperature: 280°. NPD. Retention time: 4.9 min. Limit of detection, 0.2 mg/L [Beno, Nemeth 1991]. Column: 1% OV-17 on 100-120 mesh Chromosorb W (glass, 2 m × 3 mm, i.d.). Temperature: 280°. Carrier gas: N_2, 50 mL/min. Reference compound: flurazepam. ECD. Retention time: 4.2 min. Limit of detection, 2 mg/L [Alebic-Kolbah, Plavšic 1990].

HPLC Column: Supelcosil LC-CN (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water: 0.5 mol/L potassium dihydrogen phosphate buffer (pH 4.8; 400 : 584 : 16), flow rate 1.6 mL/min. UV detection (λ = 240 nm). Limit of detection, 3 µg/L [Paczkowski *et al.* 1995]. Column: Nucleosil C_{18} (120 × 4 mm i.d., 5 µm). Mobile phase: 50 mmol/L dihydrogen ammonium phosphate : acetonitrile (pH 5; 40 : 60) with 0.25% trietilamine, flow rate 1.0 mL/min. Limit of quantification, 8 µg/L [Saenz-Campos *et al.* 1995]. Column: LiChrosorb RP-8 (300 × 4.1 mm i.d., 10 µm). Mobile phase: 40% acetonitrile in 0.01 mol/L dibasic sodium phosphate and 0.1% triethanolamine dissolved in ultra-pure deionised water (pH 3), flow rate, 1.2 mL/min. UV detection (λ= 237 nm). Retention time: 5.6 min. Limit of detection, 2.5 mg/L [Chaudhary *et al.* 1993]. Column: Shimpak-CLS-ODS/H (25 cm × 4.6 mm, 5 µm). Mobile phase: acetonitrile : 0.1% triethylamine (1 : 1), flow rate 1.5 mL/min. UV detection (λ= 254 nm). Retention time: 6.0 min. Limit of detection not reported [Sarveswar Rao, Rambhau 1993]. Column: Spherisorb S5W (250 × 5 mm i.d., 5 µm). Mobile phase: 10 mmol/L ammonium perchlorate in methanol (pH 7.6), flow rate 2.0 mL/min. UV detection (λ= 240 nm). Limit of detection, 10 µg/L for diltiazem, 20 µg/L for desacetyldiltiazem [Bhamra *et al.* 1987].

Urine **GC** See Blood [Moriya, Hashimoto 2004]. See Blood [Engelhart *et al.* 1997].

GC-MS Column: HP-1 (12.5 m × 0.2 mm, 0.33 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 50° for 1 min to 190° at 25°/min for 3 min to 280° at 10°/min for 12 min. FID. Retention time: 18.9 min. Limit of quantification, 0.1 mg/L [Kalin *et al.* 1994]. See Serum [Beno, Nemeth 1991]. Column: HP capillary cross-linked methylsilicone (12 m × 0.2 mm i.d., 330 nm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 3 min to 310° at 30°/min for 5 min. EI ionisation at 70 eV, scan mode. Limit of detection not reported [Maurer 1990]. Column: Durabond-1 (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 0.5 kg/cm^2. Temperature: 280°. PIEI or NICI. Limit of detection not reported [Sugawara *et al.* 1988a].

HPLC See Blood [Kaliciak *et al.* 1992]. Column: C_{18} (10 cm × 8 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.15 mol/L phosphate buffer (pH 6.0) : water (10 : 90 : 0 to 25 : 25 : 50 at 15 min to 40 : 20 : 40 at 30 min to 60 : 13.3 : 26.7 at 40 min), flow rate 2.0 mL/min. UV detection (λ = 238 nm). Limit of detection not reported [Sugawara *et al.* 1988b]. Column: Spherisorb ODS C_{18} (25 × 0.46 cm i.d., 5 µm). Mobile phase: acetonitrile : 0.01 mol/L phosphate buffer (pH 3; 72 : 28), flow rate 2.5 mL/min for 5.5 min to 3.0 mL/min until 13 min. Retention time: 10.09 min. Limit of detection, 0.1 mg/L [Clozel *et al.* 1984b].

Disposition in the Body After oral administration, diltiazem is rapidly absorbed (~90%) from the gastrointestinal tract and undergoes extensive first-pass hepatic metabolism via deacetylation, *N*-demethylation, *O*-demethylation and oxidative deamination. *O*- and *N*-demethylation are mediated by CYP2D6 and CYP3A4, respectively [Molden *et al.* 2002a]. Pharmacologically active diltiazem metabolites are markedly accumulated in individuals with a deficient CYP2D6-metabolising phenotype [Molden *et al.* 2002b]. Metabolites are A_1, M_A, M_B, M_X, M_1, M_2, M_4 and M_6. 2–4% of the administered dose appears unchanged in the urine. Metabolites are excreted via bile, urine and the faeces, and it can be found in breast milk.

Therapeutic Concentration Average optimum dose 180–360 mg daily with a blood therapeutic level 0.05–0.20 mg/L [Erickson *et al.* 1991]. The serum therapeutic concentration range is 0.05–0.4 mg/L.

Twenty-four healthy volunteers were administered a single oral dose of 120 mg diltiazem. A mean peak plasma concentration of 179.8 µg/L was reached in 2.3 h [Georgita *et al.* 2008].

Eight healthy male Chinese volunteers were administered a single oral dose of 60 mg diltazem hydrochloride slow-release formulation. The mean peak plasma concentration of 118.5 µg/L was reached in 3.1 h [Li *et al.* 2003].

Sixteen healthy men were divided into 2 groups. After 2 days of placebo, Group A received 240 mg diltiazem once daily for 7 days, 480 mg diltiazem once daily for 7 days, then 720 mg diltiazem once daily for 7 days. Group B received 180 mg diltiazem once daily for 7 days, 360 mg once daily for 7 days, then 720 mg for 7 days. The daily diltiazem dose was given as a combination of 120 mg cardizem CD capsules and matching placebo while group B received a combination of 180 mg Cardizem CD tablets and matching placebo. Mean pharmacokinetic parameters were as shown below.

Six healthy males and 6 females were orally administered a single 120 mg dose of diltiazem. Peak serum levels reached 0.194 ± 0.094 and 0.181 ± 0.048 mg/L for male and females, respectively, within 2.2 ± 0.8 h [Saenz-Campos *et al.* 1995].

A healthy volunteer was administered a single oral dose of 60 mg diltazem. The maximal concentration of diltazem was 53 µg/L reached at 2 h [Paczkowski *et al.* 1995].

Pharmacokinetic analysis of a study in which cirrhotic patients and controls received long-term diltiazem, 30 or 60 mg thrice daily, showed no change in absorption but a decrease in elimination, probably due to impaired oxidative metabolism in cirrhotic patients [Kurosawa *et al.* 1990].

Toxicity The toxic dose for adults is 2 g and 6 mg/kg for children, and affects the skin, for example, rashes [Scherschun *et al.* 2001]. It is a poison by SC, IV and IP routes and moderately toxic by ingestion. Overdose is associated with bradycardia with or without atrioventricular conduction defects and hypotension. A toxic serum concentration is 0.8 mg/L and a concentration of 2–6 mg/L has been associated with fatalities, although survival after ingestion of doses as large as 12 g have been reported [Fauville *et al.* 1995].

A 19-year-old male ingested an unknown quantity of drugs amongst which 3.6 g of diltiazem was unaccounted for. The maximum concentration of diltiazem was 577 µg/L at ≈7 h postingestion. This coincided with the start of haemodialysis. He made a full recovery [Roberts *et al.* 2008].

A 65-year-old male accidentally ingested 6 of his 360 mg diltiazem sustained-release tablets (2160 mg). An antemortem blood sample drawn at 11.5 h post-ingestion had a concentration of 2.9 mg/L. He was pronounced dead 17 h post-ingestion and postmortem central blood had a concentration of 6 mg/L and the peripheral blood had 5 mg/L [Cantrell, Williams 2005].

A 54-year-old female with intracerebral haemorrhage received 30 mg diltazem hydrochloride per day. She died 1.5 years later. A 48-year-old male with cerebral haemorrhage received a Herbesser injection of 50 mg diltazem hydrochloride. He died 38 h later. Postmortem concentrations were as shown above.

	Diltiazem concentration (mg/L or mg/kg)	
Sample	***Case 1***	***Case 2***
Blood		
Pulmonary arteries	2.12	1.04
Pulmonary veins	1.89	1.42
Left cardiac chambers	NA	0.908
Right cardiac chambers	0.253	0.592
Aorta	0.703	1.01

Right femoral muscle	NA	0.548
Gastric contents	108	5.04

[Moriya, Hashimoto 2004]

A 16-year-old female ingested 12 g of sustained-release diltiazem tablets. The peak concentration of diltiazem was approximately 5750 mg/L at 20 h post-ingestion. The girl made a full recovery [Durward *et al.* 2003].

A 60-year-old male ingested 40 slow-release 200 mg diltiazem tablets. Postmortem concentrations (mg/mL or mg/g) of diltiazem and M_1 were as shown below.

Sample	***Diltiazem***	***Desacetyldiltiazem***
Blood	31	9.7
Brain	33.1	13.7
Lung	179.5	47.5
Heart	41.8	10
Liver	182	47.3
Kidney	49.2	22.6
Bile	294.9	29.4

[Romano *et al.* 2002]

A 54-year-old angina sufferer self-medicated with six 180 mg diltiazem slow-release tablets. He was admitted to hospital with sinus bradycardia and cardiogenic shock. He developed acidosis, anuria, type-I respiratory failure and persistent hypotension. His diltiazem serum concentration 23 h after admission was 1.23 mg/L [Satchithananda *et al.* 2000].

A 38-year-old white male was found comatose. His peak serum diltiazem concentration was 3.7 mg/L measured at 8.8 h after admission to hospital [Snook *et al.* 2000].

A 78-year-old female was found dead. Diltiazem concentrations in her blood, urine, bile, and gastric contents were 5.9, 11.7, 4.0, and 2.8 mg/L, respectively [Engelhart *et al.* 1997].

A 22-year-old female ingested 7.2 g of slow-release diltiazem (30 Dilzem 240 mg depot capsules). The maximum serum concentration of diltiazem was 3171 µg/L reached 16.5 h post-ingestion. She made a full recovery [Luomanmäki *et al.* 1997].

	Group A			***Group B***		
Parameter	240 mg (n= 8)	480 mg (n= 8)	720 mg (n= 6)	180 mg (n= 8)	360 mg (n= 8)	720 mg (n= 6)
C_{max} (µg/L)	166.4 (54)	361.8 (32)	608.3 (38)	73.2 (25)	176.6 (36)	529.2 (32)

[Robbins-Weilert *et al.* 1999]

A 63-year-old male was admitted to hospital because of pain extending from his right groin to the toes and shortness of breath. On day 5 after admission his urine diltiazem was 9 times the therapeutic amount at 12.7 mg/L. He made a full recovery [Chan *et al.* 1996].

After the ingestion of 4.2 g diltiazem, a 30-year-old male had a plasma diltiazem concentration of 2.32 mg/L at ≈5 h following ingestion. By 70 h post-ingestion the plasma diltiazem concentration had fallen to 0.316 mg/L [Fauville *et al.* 1995].

A suicidal 39-year-old male was found dead and the coroner decided it was due to cardiac failure. Toxicological analysis of urine and blood from around his heart was requested because he had been threatening to commit suicide the previous night. Analysis showed that he had >30-times the recommended therapeutic dose of diltiazem: 6.9 and 4.7 mg/L in blood and urine, respectively. [Kalin *et al.* 1994].

A 51-year-old took an overdose of 150 60 mg diltiazem tablets (≈9000 mg). Diltiazem and M_1 concentrations were as shown below.

Time (h)	*Diltiazem (μg/L)*	*Desacetyldiltiazem (μg/L)*
2.5	4528	954
10.5	3577	872
18.5	2348	802
26.5	1520	434
34.5	923	288

[Connolly *et al.* 1993]

Case 1: A 21-year-old male took 25 diltiazem 60 mg tablets in combination with propranolol. At postmortem his diltiazem blood concentration was 1.5 mg/L. Case 2: A 68-year-old male was found dead in bed. At postmortem he had 5400 mg in his stomach and a blood concentration of 2.5 mg/L. Case 3: A woman was found dead in bed. She had 3300 mg diltiazem in her stomach and a blood concentration of 4.0 mg/L. Case 4: A 58-year-old male was found dead in bed. Postmortem examination revealed stomach contents of 650 mg with a blood concentration of 8.0 mg/L [Roper *et al.* 1993].

An elderly female was found dead having committed suicide. Ditiazem concentrations were: blood (inferior vena cava), 6.7 mg/L, urine, 5.4 mg/L, vitreous humour, 5.5 mg/L and liver, 79 mg/kg [Kaliciak *et al.* 1992].

A 25-year-old female with a history of cocaine and alcohol abuse ingested an unknown quantity of diltiazem and metoclopramide. Serum and urine dialtiazem concentrations were as shown below.

Time post-admission (h)	*Diltiazem (mg/L)*
Serum	
1.0	8.49
3.0	7.18
5.5	5.34
8.25	3.57
14.5	1.91
Urine	
1.0	4.48

[Beno, Nemeth 1991]

A 38-year-old female ingested 900 mg diltiazem. The peak plasma diltiazem concentration was 1.72 mg/L at 7 h, with an elimination half-life of 10.2 h [Roberts *et al.* 1991].

A 50-year-old took 98 60 mg diltiazem tablets with alcohol. The peak plasma diltiazem concentration reached 6090 μg/L at 4 h after admission to hospital [Ferner *et al.* 1989].

A 58-year-old took 10.8 g diltiazem and was admitted with hypotension and complete heart block. Dopamine, isoprenaline and calcium chloride were required to maintain blood pressure. ECG converted to sinus rhythm after 31 h. Plasma concentrations were 1.67 mg/L 43 h after oral administration and decreased to 0.012 mg/L over the following 55 h [Malcolm *et al.* 1986].

Note For a case of IV diltiazem for the treatment of hyperkalaemia resulting in a fatal outcome, see Moser *et al.* [1996]. For a case of rhabdomyolysis as a result of concomitant diltiazem with atorvastatin, see Lewin III *et al.* [2002].

Half-life 2–12 h [Caillé *et al.* 1991], 13.3 h [Luomanmäki *et al.* 1997], 24–48 h [Durward *et al.* 2003].

Bioavailability ≈30–40% [Bianchetti *et al.* 1991]. Lower after early-morning administration [Sarveswar Rao, Rambhau 1993].

Volume of Distribution 3–13 L/kg [Caillé *et al.* 1991], 11.1 L/kg [Ochs, Knüchel 1984]. Mean apparent volume of distribution at steady state also reported as 360–391 L.

Clearance Total clearance, 12–21 mL/min/kg after oral administration and 16 mL/min/kg after IV injection; also reported as 65 L/h.

Distribution in Blood 14–23% unbound drug in serum.

Protein Binding 77–93%, mainly to α_1-acid glycoprotein [Caillé *et al.* 1991], 30–40% to albumin.

Note For a review of the pharmacology, pharmacokinetics and efficacy of diltiazem, see Chaffman and Brogden [1985].

Dose For angina pectoris: initial dose of 60 mg diltiazem hydrochloride 3 times a day, which can be increased to 360 mg a day if necessary (Reduced to 60 mg twice daily for the elderly). For hypertension: initial dose of 60 to 120 mg twice daily, which can be increased, if necessary, to 360 mg/kg daily. For cardiac arrhythmia: 0.25 mg/kg body weight followed by 0.35 mg/kg, after 15 min, if required.

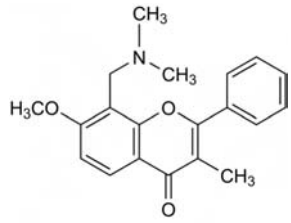
Dimefline

Respiratory Stimulant
$C_{20}H_{21}NO_3 = 323.4$
CAS—1165-48-6
IUPAC Name 8-[(Dimethylamino)methyl]-7-methoxy-3-methyl-2-phenyl-4*H*-1-benzopyran-4-one

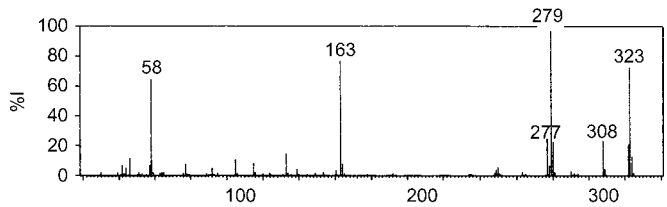


Chemical Properties Log *P* (octanol/water), 3.6.

Dimefline Hydrochloride

$C_{20}H_{21}NO_3,HCl = 359.9$
CAS—2740-04-7
Proprietary Name *Remeflin*
Chemical Properties A white crystalline powder. 213° with decomposition. Soluble in water and ethanol; practically insoluble in chloroform and ether.

Colour Test Liebermann's reagent—orange.
Thin-layer Chromatography System TA—R_f 0.59; system TB—R_f 0.15; system TC—R_f 0.48; system TL—R_f 0.24 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2555.
Ultraviolet Spectrum Aqueous acid—309 nm (A_1^1=950b).
Infrared Spectrum Principal peaks at wavenumbers 1637, 1278, 1602, 1081, 699, 1136 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 279, 163, 323, 58, 277, 308, 280, 322.

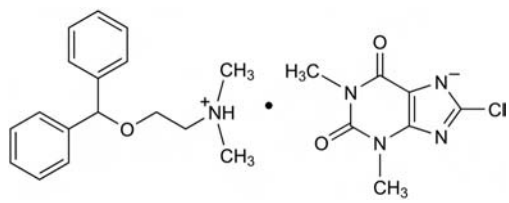


Quantification
Urine **GC** Nitrogen specific detection. Limit of detection, 10 µg/L [Delbeke, Debackere 1991].
Dose Dimefline hydrochloride has been given in doses of 16 to 48 mg daily.

Delbeke FT, Debackere M (1991). The influence of diuretics on the excretion and metabolism of doping agents–V. Dimefline. *J Pharm Biomed Anal* 9: 23–28.

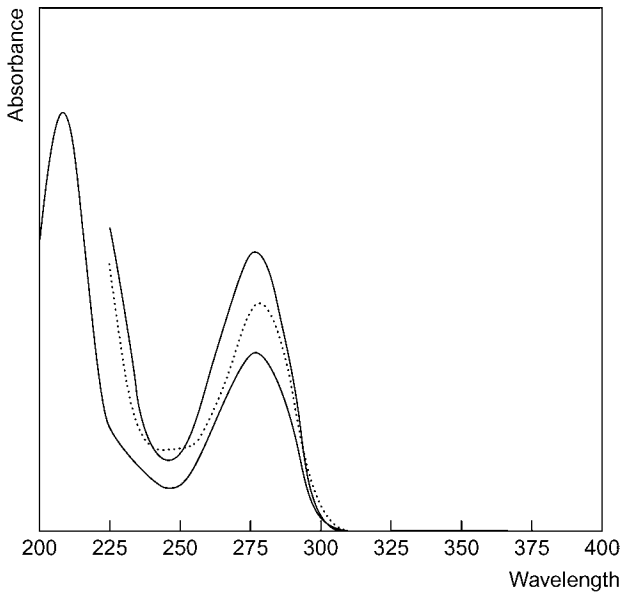
Dimenhydrinate

Antihistamine
$C_{17}H_{21}NO,C_7H_7ClN_4O_2 = 470.0$
CAS—523-87-5
IUPAC Name 8-Chloro-3,7-dihydro-1,3-dimethyl-1*H*-purine-2,6-dione compound with 2-(diphenylmethoxy)-*N*,*N*-dimethylethanamine (1:1)
Synonyms Chloranautine; diphenhydramine teoclate; diphenhydramine theoclate; dimenhydrinatum.
Proprietary Names *Amosyt*; *Antemin*; *Calm-X*; *Dimen*; *Dimetabs*; *Dinate*; *Dramamine*; *Dramanate*; *Dramilin*; *Dymenate*; *Emedyl*; *Gravol*; *Hydrate*; *Lomarin*; *Marmine*; *Motozina*; *Nauseatol*; *Nausex*; *Nausicalm*; *Reisegold*; *Reisetabletten-ratiopharm*; *RubieMen*; *Superpep*; *Tega-Vert*; *Travamine*; *Travel-Gum*; *Trawell*; *Triptone*; *Vagomine*; *Valontan*; *Vertab*; *Vertigo-Vomex*; *Vertirosan*; *Vomacur*; *Xamamina*.

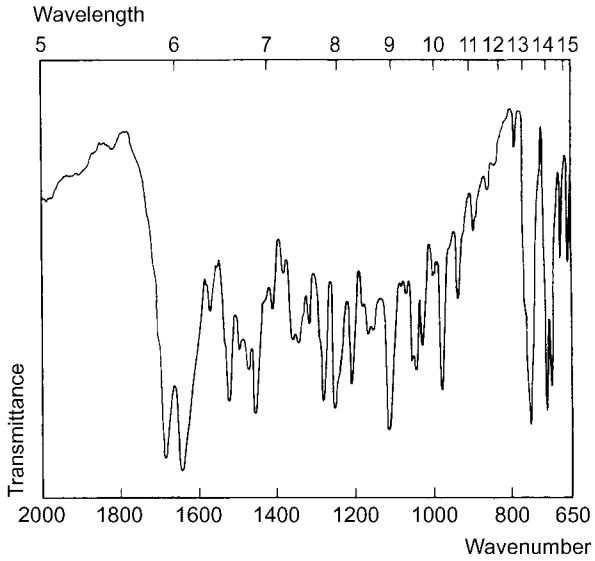


Chemical Properties A white crystalline powder. Mp 102° to 107°. Solubility

in water about 3 mg/mL; soluble 1 in 2 of ethanol and 1 in 2 of chloroform; soluble in benzene; almost insoluble in ether. Log *P* (octanol/water), −0.4.
Thin-layer Chromatography System TA—R_f 0.55 and R_f 0.88; system TB—R_f 0.45 and R_f 0.00; system TC—R_f 0.33 and R_f 0.10; system TE—R_f 0.68 and R_f 0.02; system TL—R_f 0.15 and R_f 0.10; system TAE—R_f 0.28 and R_f 0.87; system TAF—R_f 0.48 and R_f 0.46.
Gas Chromatography System GA—RI 1844.
High Performance Liquid Chromatography System HY—RI 182.
Ultraviolet Spectrum Aqueous acid—208, 276 nm ($A^{1\%}_{1cm}$=268a); aqueous alkali—278 nm.



Infrared Spectrum Principal peaks at wavenumbers 1640, 1685, 1118, 755, 712, 1255 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 58, 73, 45, 43, 57, 167, 44, 165.
Quantification
Serum **HPLC** UV detection. Limit of detection, 50 µg/mL [Skofitsch, Lembeck 1983].
Toxicity

A 19-year-old female died after ingesting 5 g of dimenhydrinate in a suicidal gesture; within an hour of the ingestion, status epilepticus and ventricular dysrhythmias presented. Diphenhydramine concentrations in the urine were 10.8 mg/L [Winn, McDonnell 1993].

Dose 50 to 100 mg three or four times daily.

Farrell M *et al.* (1991). Response of life threatening dimenhydrinate intoxication to sodium bicarbonate administration. *J Toxicol Clin Toxicol* 29: 527–535.
Skofitsch G, Lembeck F (1983). Serum levels of dimenhydrinate. Determination by HPLC with UV detection after intake of dimenhydrinate in a coated chewing gum dragee. *Arzneimittelforschung* 33: 1674–1676.
Winn RE, McDonnell KP (1993). Fatality secondary to massive overdose of dimenhydrinate. *Ann Emerg Med* 22: 1481–1484.

Dimenoxadole

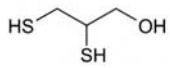
Diphenylacetic Acid Derivative, Narcotic Analgesic
$C_{20}H_{25}NO_3$ = 327.4
CAS—509-78-4

IUPAC Name 2-Dimethylaminoethyl α-ethoxy-α,α-diphenylacetate
Synonym Dimenoxadol
Proprietary Name *Estocin*
Chemical Properties Mp 170° to 172°.
Colour Tests Ammonium molybdate test—orange→dull purple (limit of detection, 0.1 µg); ammonium vanadate test—orange→dull purple (limit of detection, 0.1 µg); sulfuric acid–formaldehyde test—orange→greenish-blue (limit of detection, 0.1 µg).
Thin-layer Chromatography System T1—R_f 0.60 (location reagent acidified iodoplatinate spray, positive reaction).
Toxicity LD_{50} (oral): in mice 700 to 800 mg/kg.

Dimercaprol

Chelating Agent
$C_3H_8OS_2$ = 124.2
CAS—59-52-9

IUPAC Name 2,3-Dimercapto-1-propanol
Synonyms BAL; British anti-lewisite; dimercaptopropanol.
Proprietary Name *Sulfactin*

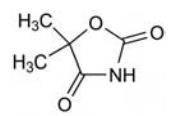


Chemical Properties A clear, colourless, or slightly yellow liquid. Relative density 1.239 to 1.259. Refractive index 1.568 to 1.574. Soluble 1 in 20 of water; miscible with ethanol, ether and methanol; soluble in vegetable oils. pK_a 8.6 (25°). Log *P* (octanol/water), 0.2.
Colour Test Palladium chloride—yellow.
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.
Infrared Spectrum Principal peaks at wavenumbers 1022, 1050, 990, 1270, 1235, 1170 cm^{-1} (thin film).
Dose 2.5 to 4 mg/kg, intramuscularly, up to 6 times daily as an antidote to arsenic, gold and mercury poisoning.

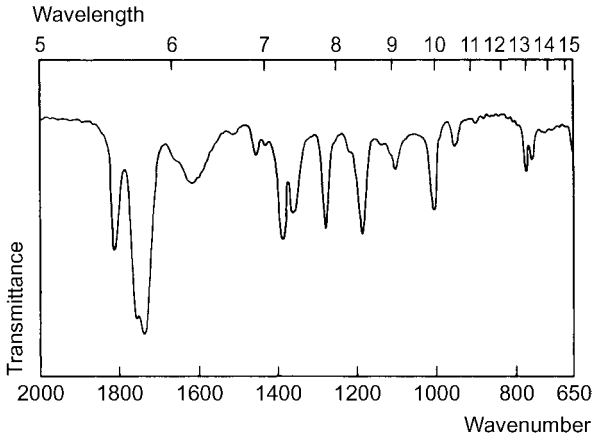
Dimethadione

Anticonvulsant
$C_5H_7NO_3$ = 129.1
CAS—695-53-4

IUPAC Name 5,5-Dimethyl-2,4-oxazolidinedione



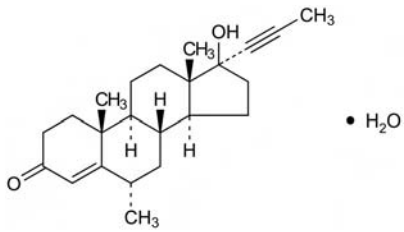
Chemical Properties Crystals. Mp 76° to 77°. pK_a 6.1 (37°). Log *P* (octanol/water), 0.2.
Colour Tests Koppanyi–Zwikker test—violet; mercurous nitrate—black.
Gas Chromatography System GA—RI 1060.
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.
Infrared Spectrum Principal peaks at wavenumbers 1740, 1760, 1815, 1188, 1280, 1007 cm^{-1}.



Quantification See under Trimethadione.
Disposition in the Body Dimethadione is the active metabolite of trimethadione. It is very slowly excreted in the urine over a period of several days, the rate of excretion being increased in alkaline urine.
Toxicity Toxic effects may be associated with plasma concentrations greater than 1 g/L.
Half-life Derived from urinary excretion data, 6 to 13 days.

Dimethisterone

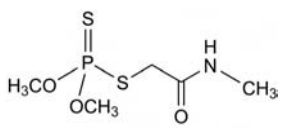
Progestational Steroid
$C_{23}H_{32}O_2,H_2O = 358.5$
CAS—79-64-1 (anhydrous); 41354-30-7 (monohydrate)
IUPAC Name (6*S*,8*R*,9*S*,10*R*,13*S*,14*S*,17*S*)-17-Hydroxy-6,10,13-trimethyl-17-prop-1-ynyl-2,6,7,8,9,11,12,14,15,16-decahydro-1*H*-cyclopenta[*a*]phenanthren-3-one hydrate
Synonyms 6α,21-Dimethylethisterone; (6α,17β)-17-hydroxy-6-methyl-17-(1-propynyl)androst-4-en-3-one monohydrate.



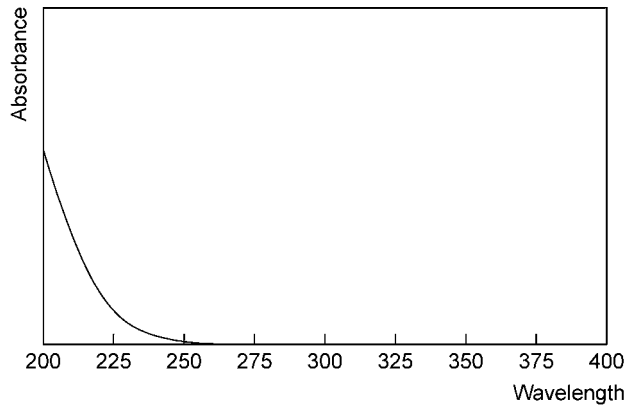
Chemical Properties A white crystalline powder. Mp 102°. Practically insoluble in water; soluble 1 in 3 of ethanol, 1 in 0.7 of chloroform and 1 in 1 of pyridine; slightly soluble in acetone. Log *P* (octanol/water), 4.4.
Colour Tests Antimony pentachloride—brown; naphthol–sulfuric acid—red-brown/brown-green; sulfuric acid—orange-red.
Thin-layer Chromatography System TP—R_f 0.80; system TQ—R_f 0.42; system TR—R_f 0.91; system TS—R_f 0.95.
Ultraviolet Spectrum Dimethisterone anhydrous: dehydrated alcohol—240 nm (A_1^1=467a).
Infrared Spectrum Principal peaks at wavenumbers 1658, 1605, 1275, 876, 1281, 1241 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 67, 137, 91, 138, 55, 79, 41, 95.
Dose Dimethisterone has been given in doses of 15 mg daily.

Dimethoate

Insecticide
$C_5H_{12}NO_3PS_2 = 229.3$
CAS—60-51-5
IUPAC Name 2-Dimethoxyphosphinothioylsulfanyl-*N*-methylacetamide
Synonyms Fosfamid; phosphorodithioic acid *O*,*O*-dimethyl-*S*-[2-(methylamino)-2-oxoethyl] ester.
Proprietary Names *Cygon*; *Fostion MM*; *Rogor E*; *Roxion*.



Chemical Properties A white solid. Mp 52° to 52.5°. Soluble 1 in 40 of water; freely soluble in most organic solvents except saturated hydrocarbons. Log *P* (octanol/water), 0.8. Extraction yield (chlorobutane), 0.7 [Demme *et al.* 2005].
Colour Tests Palladium chloride—yellow; phosphorus test—yellow.
Thin-layer Chromatography System TE—R_f 0.99; system TL—R_f 0.01; system TW—R_f 0.19; system TX—R_f 0.04; system TY—R_f 0.04; system TZ—R_f 0.37; system TAA—R_f 0.08; system TAB—R_f 0.03; system TAE—R_f 0.80.
Gas Chromatography System GA—dimethoate RI 1725, M (OH-) RI 1430, M (COOH-)-Me RI 1400; system GK—dimethoate RRT 0.86 (relative to caffeine).
High Performance Liquid Chromatography System HY—RI 289; system HZ—retention time 2.8 min.
Ultraviolet Spectrum

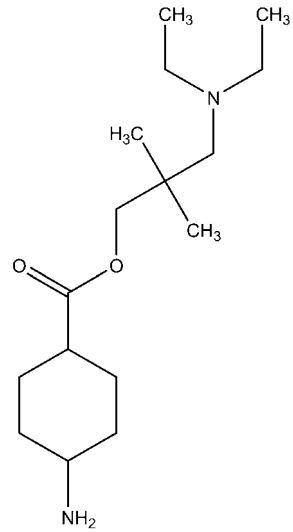


Infrared Spectrum Principal peaks at wavenumbers 1010, 1666, 819, 666, 1538, 1176 cm^{-1}.
Mass Spectrum Principal ions at *m/z* 87, 93, 125, 58, 47, 63, 79, 42.
Quantification
Blood **GC** FPD. For method, see Kojima *et al.* [1990].
Disposition in the Body
Toxicity
In a 57-year-old male who became semi-comatose after ingesting not more than 22 g of formothion, blood levels of dimethoate at ~1.5 and 6 h after ingestion were 21.4 and 12.7 μg/g, respectively [Kojima *et al.* 1990].

Demme U *et al.* (2005). Systematic evaluation of 1-chlorobutane for liquid-liquid extraction of drugs. *Proceedings of the 12th TIAFT*, Seoul: 481–486.
Kojima T *et al.* (1990). Determination of dimethoate in blood and hemoperfusion cartridge following ingestion of formothion: a case study. *Forensic Sci Int* 48: 79–88.

Dimethocaine

Anaesthetic (Local)
$C_{16}H_{26}N_2O_2 = 278.4$
CAS—94-15-5
IUPAC Name [3-(Diethylamino)-2,2-dimethylpropyl] 4-aminobenzoate
Synonym 3-*ρ*-Aminobenzoyloxy-*N*,*N*-diethyl-2,2-dimethyl-propylamine



Chemical Properties A white crystalline powder.

Dimethocaine Hydrochloride
Proprietary Name *Larocain(e)*

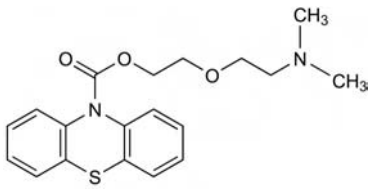
Chemical Properties Minute crystals or powder. Mp 196° to 197°. Soluble 1 in 3 of water and 1 in 10 of ethanol; insoluble in ether. Dimethocaine is extracted by chloroform from alkaline solutions.

Colour Tests Ammonium vanadate test—faint grey rim (limit of detection, 0.1 µg); Vitali's test—pale yellow/bright yellow (limit of detection, 0.25 µg). Dimethocaine may be diazotised and coupled with alkaline β-naphthol to give a red colour.
Thin-layer Chromatography System T1—R_f 0.69 (location reagent acidified iodoplatinate spray, positive reaction).
Gas Chromatography System G2/225—retention time 2.00 relative to diphenhydramine; retention time 0.48 relative to codeine; System G4/225—retention time 1.29 relative to diphenhydramine; retention time 0.13 relative to codeine.
Toxicity LD_{50} (SC): in mice 300 mg/kg.

Dimethoxanate

Cough Suppressant
$C_{19}H_{22}N_2O_3S = 358.5$
CAS—477-93-0

IUPAC Name 2-(2-Dimethylaminoethyloxy)ethyl phenothiazine-10-carboxylate
Synonym 10*H*-Phenothiazine-10-carboxylic acid 2-[2-(dimethylamino)ethoxy] ethyl ester

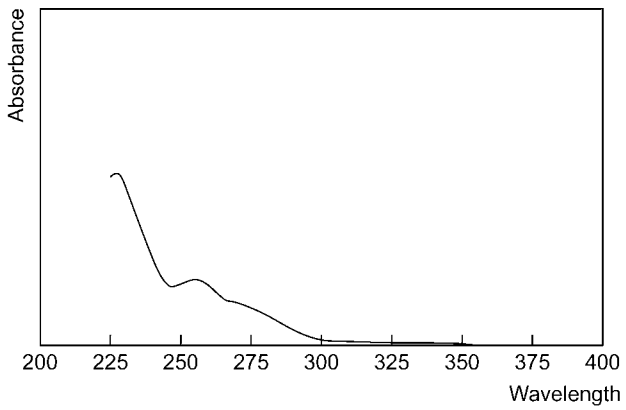


Chemical Properties Log *P* (octanol/water), 4.1.

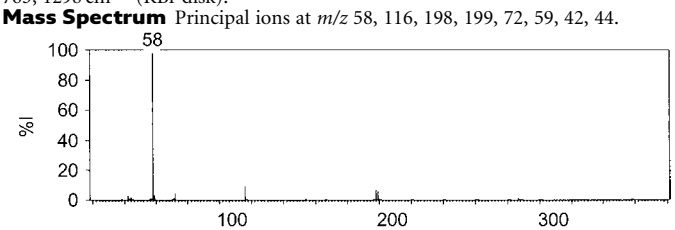
Dimethoxanate Hydrochloride

$C_{19}H_{22}N_2O_3S,HCl = 394.9$
CAS—518-63-8
Proprietary Name *Cotrane*
Chemical Properties Crystals. Mp 161° to 163°, with decomposition.

Colour Tests Mandelin's test—green→brown; Marquis test—violet.
Thin-layer Chromatography System TA—R_f 0.39; system TB—R_f 0.18; system TC—R_f 0.24; system TE—R_f 0.49; system TL—R_f 0.06; system TAE—R_f 0.21; system TAF—R_f 0.38; system TAJ—R_f 0.10; system TAK—R_f 0.84; system TAL—R_f 0.49 (Dragendorff spray, positive; FPN reagent, violet; acidified iodoplatinate solution, positive; Marquis reagent, brown; ninhydrin spray, positive).
Gas Chromatography System GA—RI 2029.
High Performance Liquid Chromatography System HA—*k* 5.8 (tailing peak).
Ultraviolet Spectrum Aqueous acid—254 nm (A_1^1=24b). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1718, 1317, 1217, 1250, 763, 1298 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 58, 116, 198, 199, 72, 59, 42, 44.

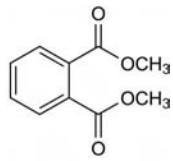


Dose Dimethoxanate hydrochloride has been given in doses of 75 to 200 mg daily.

Dimethyl Phthalate

Insect Repellent
$C_{10}H_{10}O_4 = 194.2$
CAS—131-11-3

IUPAC Name Dimethyl benzene-1,2-dicarboxylate
Synonyms 1,2-Benzenedicarboxylic acid dimethyl ester; DMP; methyl phthalate.
Proprietary Names *Avolin*; *Fermine*; *Mipax*; *Palitinol M*.

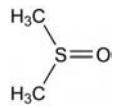


Chemical Properties A colourless liquid. Mass per mL 1.186 to 1.192 g. Bp about 280°, with decomposition. Refractive index 1.515 to 1.517. Soluble 1 in 250 of water; miscible with ethanol, ether, chloroform and most organic solvents; practically insoluble in petroleum ether and other paraffin hydrocarbons. Log *P* (octanol/water), 1.6.
Gas Chromatography System GA—RI 1406.
High Performance Liquid Chromatography System HAA—retention time 17.0 min.
Ultraviolet Spectrum Ethanol—275 nm (A_1^1=75b).
Mass Spectrum Principal ions at *m/z* 163, 77, 164, 135, 194, 76, 92, 50.
Use Topically in concentrations of at least 40%.

Dimethyl Sulfoxide

Solvent
C_2H_6OS=78.13
CAS—67-68-5

IUPAC Name Methylsulfinylmethane
Synonyms Dimethyl sulphoxide; dimexide; DMSO; methyl sulfoxide.
Proprietary Names *Deltan*; *Dolicur*; *Dolmoso*; *Kemsol*; *Rheumabene*; *Rimso-50*. It is an ingredient of *Herpid* and *Iduridin*.



Chemical Properties A colourless, hygroscopic, viscous liquid. Mp not lower than 18.3°. Bp 189° to 192°. Refractive index 1.478 to 1.479. Soluble in water, ethanol, acetone, benzene, chloroform, ether and most organic solvents. Log *P* (octanol/water), −1.4.
Colour Test 1% Potassium Permanganate Solution—decolourises; cautiously add 1.5 mL dropwise to 2.5 mL of hydriodic acid cooled in ice and filter rapidly—unstable violet residue that is soluble in chloroform giving a red solution.
Gas Chromatography System GAA—RI 784.
Ultraviolet Spectrum No significant absorption, 230–360 nm.
Mass Spectrum Principal ions at m/z 63, 78, 45, 61, 46, 62, 48, 47.
Quantification
Plasma **GC** FID detection [Paulin *et al.* 1966]. Column: (640 × 0.2 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature programme: 155° for 3 min to 170° at 30°/min for 3.5 min. FID. Limit of detection, 10 mg/L [Garretson, Aitchison 1982]. FID detection [Mehta *et al.* 1986].

GC-MS Column: (1.07 m × 2.0 mm i.d.) Temperature: 170°. SIM acquisition mode [Garretson, Aitchison 1982].
Serum **GC** See Plasma [Garretson, Aitchison 1982]. FID detection [Hucker *et al.* 1967].
CSF **GC** See Plasma [Garretson, Aitchison 1982]. See Plasma [Paulin *et al.* 1966].
Urine **GC** See Serum [Hucker *et al.* 1967]. See Plasma [Garretson, Aitchison 1982; Mehta *et al.* 1986].

GC-MS See Plasma [Garretson, Aitchison 1982]. Column: DB-WAX (30 m × 0.25 mm i.d., 0.5 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 40° for 1 min to 230° at 10°/min. Limit of detection, 0.04 mg/L [Takeuchi *et al.* 2010].
Disposition in the Body Dimethyl sulfoxide is readily absorbed after injection or after oral or percutaneous administration and widely distributed throughout the body. It is oxidised to dimethyl sulfone. After an oral dose, ~30–70% is excreted in the urine unchanged and ~20% as the sulfone; after percutaneous administration, ~13% is excreted unchanged and ~18% as the sulfone; ~3% of a dose is eliminated through the lungs as dimethyl sulfide.
Therapeutic Concentration
After an oral dose of 1 g/kg to 6 subjects, peak serum concentrations of dimethyl sulfoxide of 1029–3380 mg/L (mean, 2200) were attained in 1–4 h, and peak concentrations of the sulfone metabolite of 260–600 mg/L were reported after ~72 h [Hucker *et al.* 1967].

After percutaneous administration of 1 g/kg to 2 subjects, peak serum concentrations of ~500 mg/L dimethyl sulfoxide and 350 mg/L of the sulfone metabolite were reported after 4–8 h and 36–72 h, respectively [Hucker *et al.* 1967].

The mean peak plasma dimethyl sulfoxide concentration in 10 subjects undergoing peripheral blood stem cell transplants (cryopreserved with 10% DMSO v/v; patients received infusions containing 254–824 mmol (over 20–120 min)) was 19.1 mmol/L (0.5 mg/L) 5 min after the end of the infusion. Plasma dimethyl sulfone concentrations increased during the first 24 h, plateaued at 4.4 mmol/L and remained at this level until 48 h. Dimethyl sulfoxide concentrations were at steady state by 5 min and remained between 3 and 5 mmol/L for 48 h [Egorin *et al.* 1998].

Toxicity Dimethyl sulfoxide has low systemic toxicity but gives local toxic effects.
Half-life Plasma: dimethyl sulfoxide ~10–20 h, sulfone metabolite ~70 h.

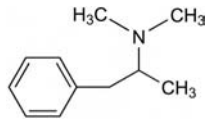
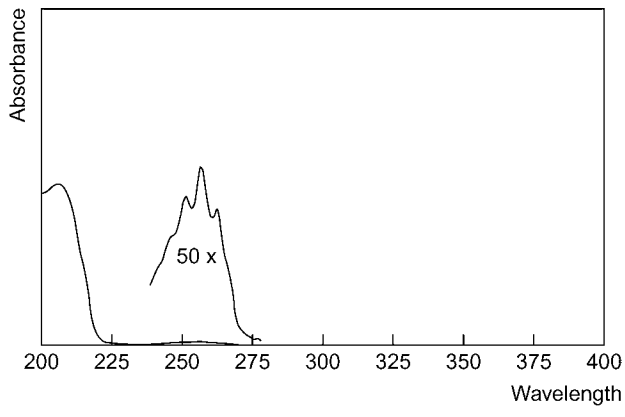
Dimethylamfetamine

Central Stimulant, Phenethylamine
$C_{11}H_{17}N$ = 163.3
CAS—4075-96-1

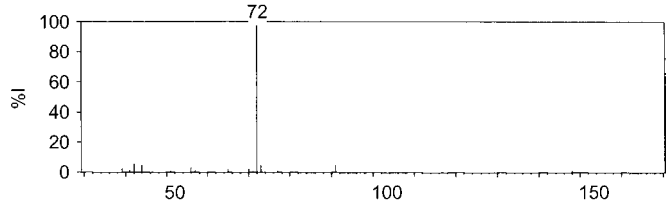
IUPAC Name *N,N*-Dimethyl-2-phenylpropan-1-amine
Synonyms Dimethylamphetamine; *N,N,*α-trimethylphenethylamine.



Chemical Properties pK_a 9.8.
Gas Chromatography System GA—RI 1235; system GC—RI 1429.
High Performance Liquid Chromatography System HB—*k* 11.08; system HC—*k* 1.89.
Ultraviolet Spectrum



Mass Spectrum Principal ions at *m/z* 72, 91, 73, 44, 42, 56, 70, 65.



Quantification
Urine **LC-MS** Column: CAPCELL PAK C_{18} MG II (150 × 2 mm, 5 µm). Mobile phase: 5 mmol/L ammonium formate (pH 4.0) : acetonitrile, flow rate 230 µL/min. Limit of detection, <1.95 µg/L for dimethylamfetamine and other amfetamines [Kim *et al.* 2008]. Column: Alltech Platinum EPS C_{18}. Mobile phase: 0.01 mol/L ammonium formate (pH 3.0) : acetonitrile (77 : 23), flow rate 0.2 mL/min. Dimethylamfetamine, metamfetamine and their metabolites [Cheng *et al.* 2007]. Column: Asahipak GS-320HQ (300 × 7.6 mm i.d., 1 µm). Mobile phase: acetonitrile : 20 mmol/L ammonium acetate buffer (pH 8.5, 30 : 70), flow rate 0.6 mL/min. ESI, SIM acquisition mode. Limit of detection, 1 µg/L for dimethylamfetamine, dimethylamfetamine *N*-oxide and metamfetamine and 3 µg/L for amfetamine [Sato *et al.* 2002]. Column: SCX (150 × 2.0 mm i.d.). Mobile phase: acetonitrile : 5 mmol/L ammonium acetate (pH 4; 65 : 35), flow rate 0.2 mL/min. Limit of detection, 5 µg/L for dimethylamfetamine *N*-oxide, 5 µg/L for dimethylamfetamine, 50 µg/L for amfetamine, and 10 µg/L for metamfetamine [Katagi *et al.* 2000].
Disposition in the Body Dimethylamfetamine is metabolised to metamfetamine. For a study on the metabolism of dimethylamfetamine, see Inoue, Suzuki [1987].

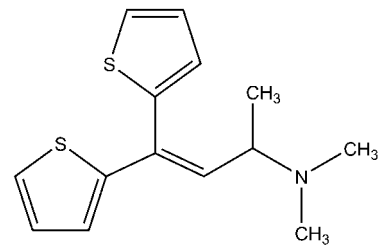
Dimethylthiambutene

Thienyl Opioid Derivative, Narcotic
$C_{14}H_{17}NS_2$ = 263.4
CAS—524-84-5

IUPAC Name *N,N*-Dimethyl-1-methyl-3,3-di-2-thienylallylamine
Synonyms 338C48; 3-dimethylamino-1,1-bis(2-thienyl)-1-butene; 3-dimethylamino-1,1-di(2′-thienyl)but-1-ene; *N,N*-dimethyl-4,4-di-2-thienyl-3-buten-2-amine; NIH-4542; *N,N,*1-trimethyl-3,3-di-2-thienylallylamine.



Chemical Properties Viscous oil. $Bp_{0.05}$ 123° to 125°. Bp_3 157° to 158°. Soluble in ether and chloroform [O'Neil *et al.* 2006]. Log *P* (octanol/water) 3.53 [Meylan, Howard 1995]. Extracted by organic solvents from aqueous alkaline solutions.

Dimethylthiambutene Hydrochloride

$C_{14}H_{17}NS_2$,HCl = 299.9
Proprietary Names *Aminobutene*; *Dimethibutin*; *Kobaton*; *Ohton*; *Takaton*.
Chemical Properties Mp 168° to 169°. Soluble in water and chloroform.

Colour Tests Ammonium molybdate test—orange-brown→pale green (limit of detection, 0.1 µg); ammonium vanadate test—brown→blue-green (limit of detection, 0.1 µg); sulfuric acid–formaldehyde test—purple→brown (limit of detection, 0.1 µg); Vitali's test—red→green/brown/dark brown (limit of detection, 0.5 µg).
Thin-layer Chromatography System T1—R_f 0.55 (location reagent acidified iodoplatinate spray, positive reaction).
Gas Chromatography System G2/225—retention time 1.10 relative to diphenhydramine; system G4—retention time 0.74 relative to diphenhydramine.
Ultraviolet Spectrum Aqueous acid (0.1 N sulfuric acid)—286, 268, 227 nm.
Disposition in the Body
Toxicity LD_{50} (oral): in mice 199 mg/kg.
Dose Most often used in veterinary medicine.

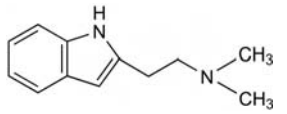
Meylan WM, Howard PH (1995). Atom/fragment contribution method for estimating octanol-water partition coefficients. *J Pharm Sci* 84: 83–92.
O'Neil MJ *et al.* (2006). *The Merck Index: An Encyclopedia of Chemicals, Drugs and Biologicals,* 14th edn. Whitehouse Station, NJ: Merck & Co., Inc.

Dimethyltryptamine

Hallucinogen
$C_{12}H_{16}N_2$ = 188.3
CAS—61-50-7

IUPAC Name *N,N*-Dimethyl-1*H*-indole-3-ethanamine

Synonyms Businessman's trip; *N,N*-dimethyltryptamine; DMT.

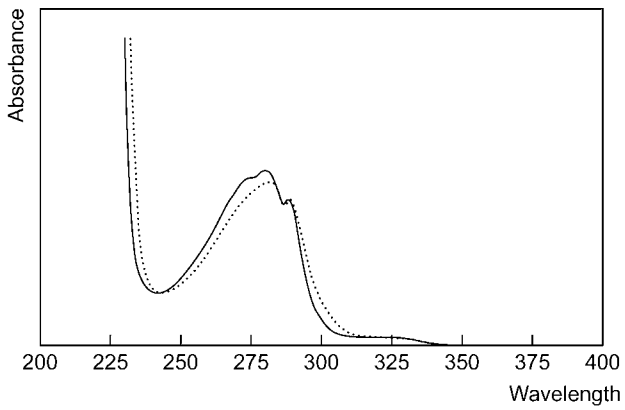


Chemical Properties Crystals. An active principle obtained from the seeds and leaves of *Piptadenia peregrina* (Mimosaceae). Mp 44.6° to 46.8°. Freely soluble in dilute acetic acid and dilute mineral acid.

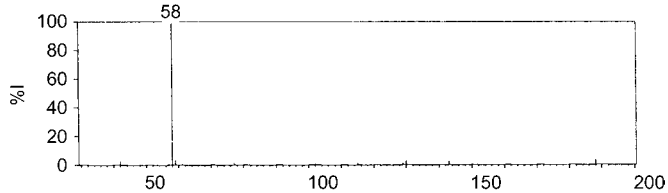
Dimethyltryptamine Hydrochloride

Chemical Properties A white crystalline powder. Mp 165° to 168°. Soluble in water. pK_a 8.7 (ethanol–water). Log *P* (octanol/water), 1.9.

Colour Test Marquis test—orange.
Thin-layer Chromatography System TA—R_f 0.40; system TB—R_f 0.09; system TC—R_f 0.09; system TE—R_f 0.50; system TL—R_f 0.06; system TAE—R_f 0.14; system TAF—R_f 0.39 (acidified iodoplatinate solution, positive; Dragendorff spray, positive; Marquis test, grey-brown; Van Urk reagent, blue).
Gas Chromatography System GA—RI 1753.
High Performance Liquid Chromatography System HY—RI 228.
Ultraviolet Spectrum Aqueous acid—279 nm (A^1_1 = 327a), 288 nm.



Infrared Spectrum Principal peaks at wavenumbers 743, 1113, 1235, 1050, 812, 1010 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 58, 188, 130, 59, 42, 143, 129, 115.



Quantification

Blood **GC** Column: DB-1 fused silica capillary (30 m × 0.32 mm i.d., 0.2 µm). Carrier gas: H_2, 3 or 3.5 mL/min. Temperature: 230° and 280°. SID. Limit of detection, 0.5 µg/L [Ishii *et al.* 1997].

GC-MS Column: SE-30 (18 m × 0.33 mm i.d.). Carrier gas: He, 2 mL/min. Temperature: 200°. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, 10 ng/L [Walker *et al.* 1979].

Plasma **GC** Column: 5% phenyl methyl silicone capillary (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: H_2, 0.7 mL/min. Temperature programme: 70° for 1 min to 120° at 30°/min to 280° at 20°/min. Limit of quantification, 1.6 µg/L [Yritia *et al.* 2002].

HPLC Column: Supelcosil LC-DB-8 (150 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : acetonitrile : 0.1 mol/L ammonium acetate (pH 6.9, 20 : 20 : 60), flow rate 2.0 mL/min. Fluorescence detection (λ_{ex} = 232 nm, λ_{em} = 351 nm or λ_{ex} = 340 nm, λ_{em} = 495 nm). Limit of quantification, 2 µg/L [Callaway *et al.* 1996].

Urine **GC** See Blood [Ishii *et al.* 1997].

GC-MS Column: 1% OV-101 on 80/100 mesh Gas-Chrom Q. Temperature: 190°. EI ionisation, MID. Limit of detection, 100 ng/L [Räisänen, Kärkkäinen 1979].

LC-MS EI ionisation at 70 eV. SRM acquisition mode. Limit of detection, 2–10 µg/L [Björnstad *et al.* 2009]. Column: Brownlee O Spheri-5 RP-18 (100 × 1.0 mm i.d., 5 µm). Mobile phase: methanol : water (50 : 50) with 0.2% formic acid, flow rate 40 µL/min. ESI, MRM acquisition mode. Limit of detection, 0.1 µg/L [Forsström *et al.* 2001].

Disposition in the Body Dimethyltryptamine is inactive when taken orally. After IM injection it is rapidly and extensively metabolised, primarily to indol-3-ylacetic acid. Approximately 33% of a dose is excreted in the urine in 6 h as free and conjugated (glucuronide) indol-3-ylacetic acid; <0.1% of a dose is excreted unchanged in the urine in 24 h.

Plasma concentrations of endogenous dimethyltryptamine are generally <0.001 mg/L.

Fifteen male volunteers, between the ages of 26 and 48 years, were administered 2 mL/kg of hoasca tea, an Amazonian sacramental beverage. The tea alkaloid content was determined to be as follows: DMT 0.24 mg/mL, harmine 1.70 mg/mL, harmaline 0.20 mg/mL and tetrahydroharmine 1.07 mg/mL. The mean peak plasma concentration of dimethyltryptamine was 15.8 µg/L, reached after 107.5 min, which coincided with peak times of psychoactivity [Callaway *et al.* 1999].

After IM injection of 0.7 mg/kg to 11 subjects, peak blood concentrations averaged 0.1 mg/L at 0.17 h, coinciding with the maximum psychoactive effects [Kaplan *et al.* 1974].

Toxicity Dimethyltryptamine produces hallucinations and perceptual distortion similar to the effects of lysergide.

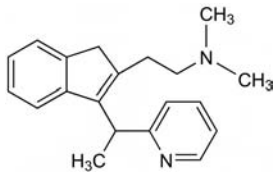
Dimetindene

Antihistamine
$C_{20}H_{24}N_2$ = 292.4
CAS—5636-83-9
IUPAC Name *N,N*-Dimethyl-3-[1-(2-pyridinyl)ethyl]-1*H*-indene-2-ethanamine
Synonyms Dimethindene; dimethpyrindene; dimethylpyrindene.

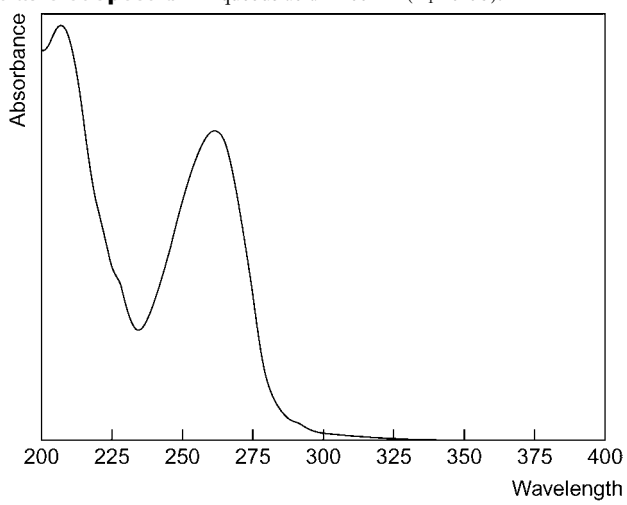


Chemical Properties Log *P* (octanol/water), 5.0. Extraction yield (chlorobutane), 0.98 [Demme *et al.* 2005].

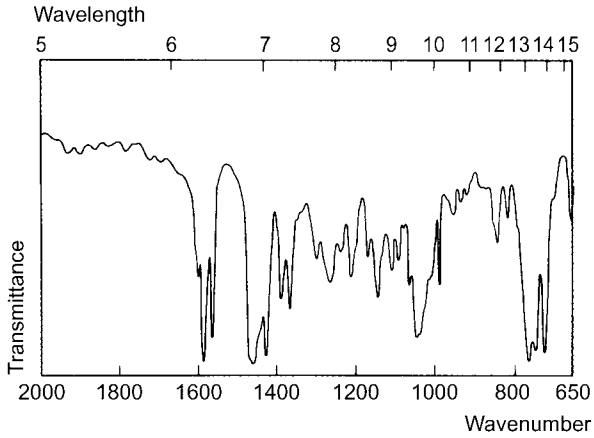
Dimetindene Maleate

$C_{20}H_{24}N_2,C_4H_4O_4$ = 408.5
CAS—3614-69-5
Proprietary Names *Fenistil*; *Neostil*. It is an ingredient of *Vibrocil*.
Chemical Properties A white to off-white crystalline powder. Mp 159° to 161°. Soluble 1 in 63 of water, 1 in 185 of ethanol and 1 in 10 of chloroform; practically insoluble in ether.

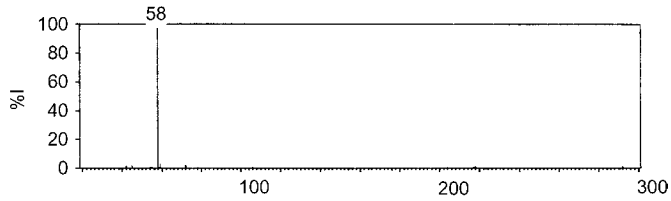
Colour Tests Cyanogen bromide—orange-pink; Mandelin's test—green; Marquis test—violet→blue.
Thin-layer Chromatography System TA—R_f 0.42; system TB—R_f 0.36; system TC—R_f 0.13; system TE—R_f 0.47; system TL—R_f 0.06; system TAE—R_f 0.10; system TAJ—R_f 0.04; system TAK—R_f 0.00; system TAL—R_f 0.40 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2275; system GB—RI 2376; system GC—RI 2669.
High Performance Liquid Chromatography System HA—*k* 5.1; system HX—RI 338; system HY—RI 288.
Ultraviolet Spectrum Aqueous acid—260 nm (A^1_1=613b).



Infrared Spectrum Principal peaks at wavenumbers 763, 1590, 724, 747, 1570, 1050 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 58, 59, 72, 45, 292, 218, 42.



Quantification

Plasma **GC–MS** For method, see Kauert *et al.* [1993].
Serum **GC** FID. Limit of detection, 10 µg/L [Wermeille, Huber 1982].
Urine **GC** FID. Limit of detection, 10 µg/L [Wermeille, Huber 1982].

HPLC For method for quantification of dimetindene and its major metabolites, see Prien and Blaschke [1997]. Limit of detection, <5 nmol/L [Chollet *et al.* 1993]. For method for quantification of dimetindene and *N*-desmethyldimetindene, see Radler and Blaschke [1991].
Tears **HPLC** Limit of detection, <12 µg/L [Chollet *et al.* 1998].
Dose Up to 6 mg of dimetindene maleate daily.

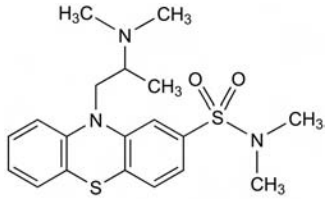
Dimetotiazine

Antihistamine
$C_{19}H_{25}N_3O_2S_2$ = 391.6
CAS—7456-24-8

IUPAC Name 10-[2-(Dimethylamino)propyl]-*N*,*N*-dimethyl-10*H*-phenothiazine-2-sulfonamide
Synonyms Dimethiotazine; dimethothiazine; fonazine.



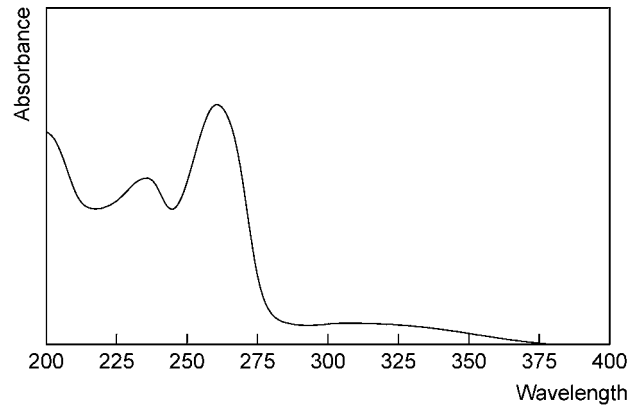
Chemical Properties Log *P* (octanol/water), 3.5.

Dimetotiazine Mesilate

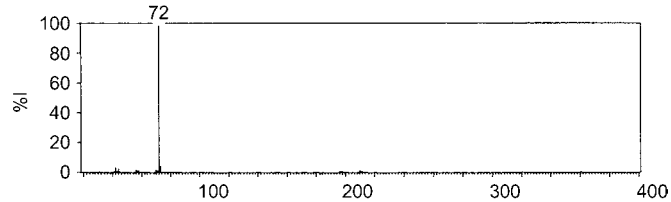
$C_{19}H_{25}N_3O_2S_2,CH_3SO_3H$ = 487.7
CAS—7455-39-2; 13115-40-7

Proprietary Names *Banistyl*; *Bonpac*; *Calsekin*; *Migristene*; *Neomestine*; *Promaquid*; *Yoristen*.
Chemical Properties A white crystalline powder. Mp about 175°. Very soluble in water; practically insoluble in ether.

Colour Tests Formaldehyde–sulfuric acid—yellow; Forrest reagent—red; FPN reagent—red; Mandelin's test—red-violet; Marquis test—red.
Thin-layer Chromatography System TA—R_f 0.56; system TB—R_f 0.13; system TC—R_f 0.48; system TL—R_f 0.28; system TAE—R_f 0.43 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—dimetotiazine RI 3060, M (nor-) RI 3150, M (OH-)-AC RI 3200, M (bis-nor-)-AC RI 3380, M (nor-)-AC RI 3360; system GB—RI 3096.
High Performance Liquid Chromatography System HA—*k* 2.1.
Ultraviolet Spectrum Aqueous acid—235, 262 nm (A^1_1=675a); aqueous alkali—268 nm (A^1_1=808b).



Infrared Spectrum Principal peaks at wavenumbers 1205, 1190, 1057, 1160, 1220, 717 cm^{-1} (dimetotiazine mesilate, KBr disk).
Mass Spectrum Principal ions at *m/z* 72, 73, 320, 71, 70, 56, 210, 198.

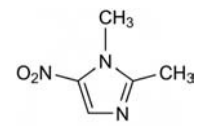


Dose Usually the equivalent of 60 to 120 mg of dimetotiazine daily.

Dimetridazole

Antiprotozoal (Veterinary)
$C_5H_7N_3O_2$ = 141.1
CAS—551-92-8

IUPAC Name 1,2-Dimethyl-5-nitro-1*H*-imidazole
Proprietary Names *Dimetrasol*; *Emtryl*; *Unizole*.



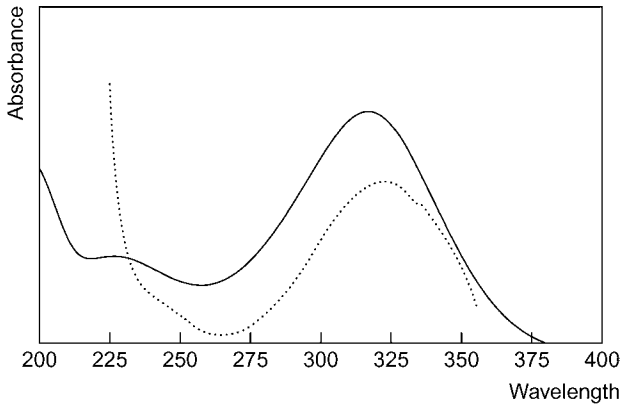
Chemical Properties An almost white to brownish-yellow powder, which darkens on exposure to light. Mp 138° to 141°. Sparingly soluble in cold water; soluble 1 in 30 of ethanol, 1 in 5 of chloroform and 1 in 170 of ether. Log *P* (octanol/water), 0.3.

Dimetridazole Hydrochloride

$C_5H_7N_3O_2$,HCl = 177.6
CAS—25332-20-1
Chemical Properties Crystals. Mp 195°. Freely soluble in water and ethanol; sparingly soluble in acetone.

Colour Test Methanolic potassium hydroxide—violet (when boiled).
Thin-layer Chromatography System TA—R_f 0.63 (acidified potassium permanganate solution, strong reaction).
Gas Chromatography System GA—RI 1353.
High Performance Liquid Chromatography System HAA—retention time 10.0 min andretention time 10.1 min.

Ultraviolet Spectrum Aqueous acid—317, 226 nm; aqueous alkali—322 nm (A_1^1=500b).

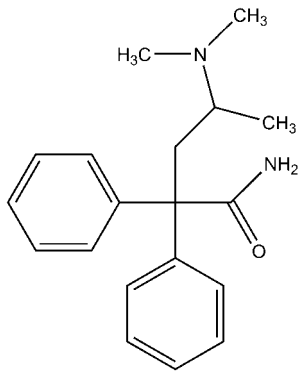


Infrared Spectrum Principal peaks at wavenumbers 1181, 1258, 1515, 825, 746, 1119 cm^{-1} (KBr disk).

Dimevamide

Acetamide, Antimuscarinic
$C_{19}H_{24}N_2O$ = 296.4
CAS—60-46-8

IUPAC Name α-[2-(Dimetylamino)propyl]-α-phenylbenzeneacetamide
Synonyms Aminopentamide; BL 139; valemeramide.
Proprietary Name *Kantrexil*



Chemical Properties The racemate crystallises as long prisms from dilute ethanol. Mp 183° to 184°. Practically insoluble in water. Extracted by organic solvents from aqueous alkaline solutions. Log *P* (octanol/water) 2.75 [Meylan, Howard 1995].

Dimevamide Sulfate

$C_{19}H_{24}N_2O,H_2SO_4$ = 394.5
CAS—35144-63-9 (xH_2SO_4)
Proprietary Name *Centrine*
Chemical Properties White crystalline powder. Mp 178° to 181°. The racemate is usually employed in medicine. Soluble in water and ethanol.

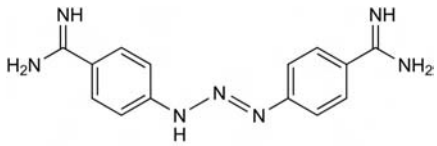
Thin-layer Chromatography System T1—R_f 0.30 (location reagent acidified iodoplatinate spray, positive reaction).
Ultraviolet Spectrum Aqueous acid (0.1 N sulfuric acid)—253, 259, 265 nm.
Infrared Spectrum Principal peaks at wavenumbers 695, 750 or 1370 cm^{-1} (KBr disk).
Quantification
Urine **GC** Columns: glass column packed with 3% SE 30 or 3% OV17 on Chromosorb 750 (1 m × 2.0 mm i.d.). Carrier gas: N, 40 mL/min, H, 25 mL/min, air, 350 mL/min. Temperature: 230°. FID. Limit of detection 5 µg/L [Serfontein, de Villiers 1976].
Disposition in the Body
Therapeutic Concentration
Five adult male volunteers were administered 300 µg dimevamide in tablets of 100 µg. Dimevamide was detected (but not quantified) in the urine of all volunteers when tested 24 h post-administration [Serfontein, de Villiers 1976].
Dose Up to 2 g daily.

Meylan WM, Howard PH (1995). Atom/fragment contribution method for estimating octanol-water partition coefficients. *J Pharm Sci* 84: 83–92.
Serfontein WJ, deVilliers LS (1976). Monitoring aminopentamide urinary excretion by means of multiple 'microphase' extraction - a rapid method for the extraction and concentration of small amounts of lipophilic drugs from large volumes of biological fluids without distillation. *S Afr J Med Sci* 41: 221–228.

Diminazene

Antiprotozoal, Antibacterial
$C_{14}H_{15}N_7$ = 281.3
CAS—536-71-0

IUPAC Name 4-[2-(4-Carbamimidoylphenyl)iminohydrazinyl]benzenecarboximidamide
Synonym 4,4′-(1-Triazene-1,3-diyl)bis(benzenecarboximidamide)

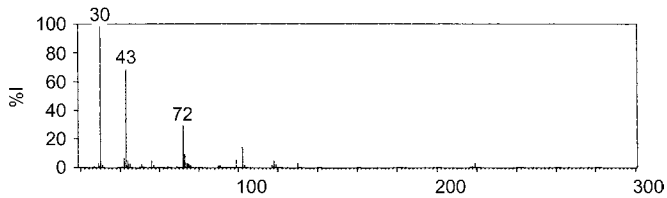


Chemical Properties Log *P* (octanol/water), 1.5 (aceturate).

Diminazene Aceturate

$C_{22}H_{29}N_9O_6,4H_2O$ = 587.6
CAS—908-54-3 (anhydrous)
Proprietary Names *Azidin*; *Berenil*; *Ganasag*; *Pirocide*.
Chemical Properties A yellow powder. Mp 217°, with decomposition. Soluble 1 in 14 of water; slightly soluble in ethanol; very slightly soluble in chloroform and ether.

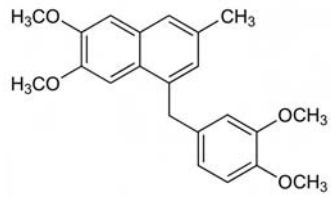
Thin-layer Chromatography System TA—R_f 0.00; system TB—R_f 0.00; system TC—R_f 0.00; system TL—R_f 0.00 (aceturate) (acidified iodoplatinate solution, positive).
Ultraviolet Spectrum Diminazene aceturate: aqueous acid—257 nm (A_1^1=305a); aqueous alkali—247 nm (broad) (A_1^1=239b).
Infrared Spectrum Principal peaks at wavenumbers 1610, 1635, 1588, 1171, 1267, 1198 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 30, 43, 72, 102, 73, 42, 118, 99.



Dimoxyline

Antispasmodic
$C_{22}H_{25}NO_4$ = 367.4
CAS—147-27-3

IUPAC Name 1-(4-Ethoxy-3-methoxybenzyl)-6,7-dimethoxy-3-methylisoquinoline
Synonym Dioxyline



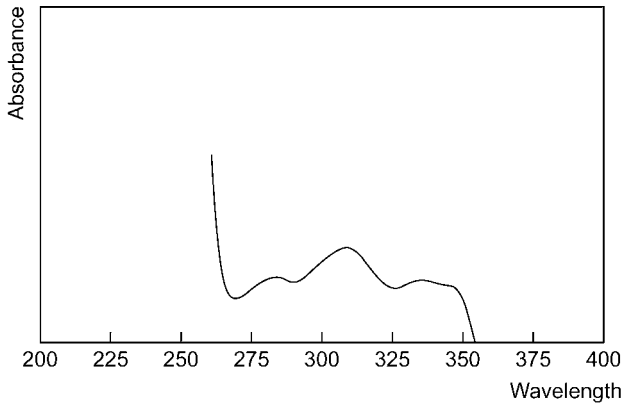
Chemical Properties Crystals. Mp 124° to 125°. Log *P* (octanol/water), 4.7.

Dimoxyline Phosphate

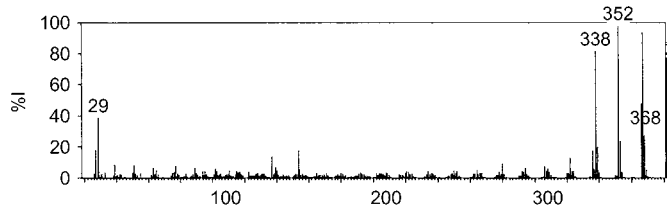
$C_{22}H_{25}NO_4,H_3PO_4$ = 465.4
CAS—5667-46-9
Proprietary Names *Paveril Phosphate*; *Paverona*.
Chemical Properties A white crystalline powder. Mp about 198°, with decomposition. Soluble 1 in 25 of water and 1 in 320 of ethanol.

Colour Tests Mandelin's test—green; Marquis test—brown.
Thin-layer Chromatography System TA—R_f 0.68; system TB—R_f 0.16; system TC—R_f 0.75; system TE—R_f 0.87; system TL—R_f 0.58; system TAJ—R_f 0.64; system TAK—R_f 0.10; system TAL—R_f 0.93 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 2895.
Ultraviolet Spectrum Aqueous acid—285, 309 (A_1^1=179b), 335 nm.



Infrared Spectrum Principal peaks at wavenumbers 1504, 1247, 1208, 1145, 1225, 865 cm^{-1} (KCl disk).
Mass Spectrum Principal ions at *m/z* 352, 367, 338, 366, 29, 368, 353, 339.

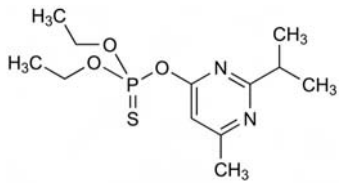


Disposition in the Body Absorbed from the gastrointestinal tract. Metabolised in the liver and excreted in the urine.
Dose 0.3 to 1.6 g of dimoxyline phosphate daily.

Dimpylate

Insecticide
$C_{12}H_{21}N_2O_3PS$ = 304.4
CAS—333-41-5

IUPAC Name Diethoxy-(6-methyl-2-propan-2-ylpyrimidin-4-yl)oxy-sulfanylidene-λ^5-phosphane
Synonyms Diazinon; phosphorothioic acid *O,O*-diethyl *O*-[6-methyl-2-(1-methylethyl)-4-pyrimidinyl]ester.
Proprietary Names *Basudin*; *Diazitol*.



Chemical Properties The pure compound is a colourless liquid; the technical grade is a pale to dark brown liquid. It is stable in alkaline solutions, but is slowly hydrolysed in water and dilute acids. Slightly soluble in water; miscible with ethanol, ether and petroleum oils. Log *P* (octanol/water), 3.8.
Colour Tests Palladium chloride—orange-brown; phosphorus test—yellow.
Thin-layer Chromatography System TE—R_f 0.39; system TF—R_f 0.64; system TW—R_f 0.82; system TX—R_f 0.47; system TY—R_f 0.50; system TZ—R_f 0.76; system TAA—R_f 0.21; system TAB—R_f 0.30; system TAC—R_f 0.20; system TAE—R_f 0.81.
Gas Chromatography System GA—RI 1760; system GK—RRT 0.79(relative to caffeine).
High Performance Liquid Chromatography System HAA—retention time 25.8 min; system HX—RI 618; system HY—RI 628; system HZ—retention time 33.2 min.
Ultraviolet Spectrum Hexane—248 nm (A_1^1=170b).
Infrared Spectrum Principal peaks at wavenumbers 1020, 1587, 971, 1562, 823, 1159 cm^{-1}.
Mass Spectrum Principal ions at *m/z* 137, 179, 152, 93, 153, 199, 97, 43.
Quantification
Postmortem Tissues **GC** FID or ECD. For method of quantification, see Poklis *et al.* [1980].
Disposition in the Body Rapidly absorbed from the lungs and through the skin.
Toxicity The estimated minimum lethal dose is 25 g.

In 2 fatalities due to dimpylate ingestion, postmortem tissue concentrations were: blood 0.7, 33 mg/L, brain 12, 62 µg/g, kidney 3 - µg/g, liver 30, 345 µg/g, adipose tissue 37 - µg/g [Wall 1981].

In a fatality attributed to dimpylate, the following postmortem tissue concentrations were reported: blood 277 mg/L, bile 200 mg/L, brain 2 µg/g, kidney 0.1 µg/g, liver 4 µg/g [Poklis *et al.* 1980].

Poklis A *et al.* (1980). A fatal diazinon poisoning. *Forensic Sci Int* 15: 135–140.

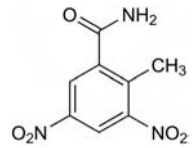
Dinitolmide

Coccidiostat (Veterinary)
$C_8H_7N_3O_5$ = 225.2
CAS—148-01-6

IUPAC Name 2-Methyl-3,5-dinitrobenzamide
Synonyms Dinitrotoluamide; methyldinitrobenzamide; zoalene.
Proprietary Name *Zoamix*

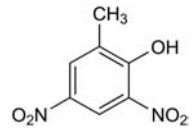


Chemical Properties A cream-coloured to light tan-coloured powder. Mp 177° to 181°. Practically insoluble in water; soluble 1 in 100 of ethanol, 1 in 15 of acetone, 1 in 650 of chloroform and 1 in 850 of ether. Log *P* (octanol/water), 0.2.
Colour Tests Methanolic potassium hydroxide—green; Nessler's reagent—brown-orange.
Thin-layer Chromatography System TA—R_f 0.75 (acidified iodoplatinate solution, positive, developing slowly).
Infrared Spectrum Principal peaks at wavenumbers 1527, 1672, 1612, 738, 1595, 1289 cm^{-1} (KBr disk).

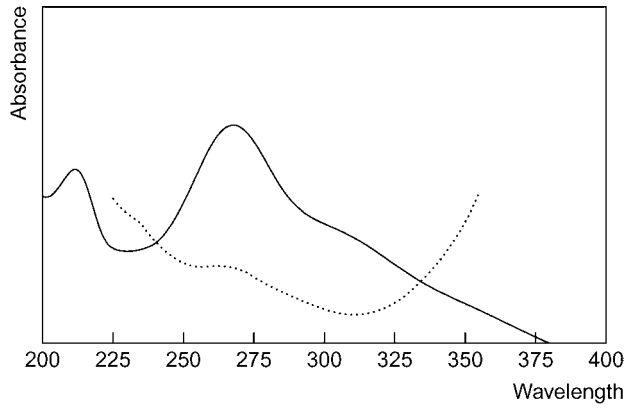
Dinitro-orthocresol

Insecticide, Herbicide
$C_7H_6N_2O_5$ = 198.1
CAS—534-52-1

IUPAC Name 2-Methyl-4,6-dinitrophenol
Synonyms Dinitrocresol; dinitrol; ditrosol; DN; DNC; DNOC; KIII; KIV.
Proprietary Names *Effusan*; *Lipan*; *Selinon*; *Sinox*.



Chemical Properties Yellowish crystals. Mp 86°. Soluble 1 in 7500 of water; readily soluble in alkaline aqueous solutions, ether, acetone, ethanol and most organic solvents; sparingly soluble in petroleum ether. pK_a 4.3 (21°). Log *P* (octanol/water), 2.1.
Caution It is explosive and is usually moistened with up to 10% of water to reduce the hazard.
Colour Test Methanolic potassium hydroxide—orange (100°).
Thin-layer Chromatography System TF—R_f 0.25; system TX—R_f 0.06; system TY—R_f 0.38.
Gas Chromatography System GA—RI 1660. system GK—RRT 0.74, Dinitro-orthocresol methyl ether (relative to caffeine).
Ultraviolet Spectrum Aqueous acid—271 nm (A_1^1=631b); aqueous alkali—265 nm (A_1^1=251b).



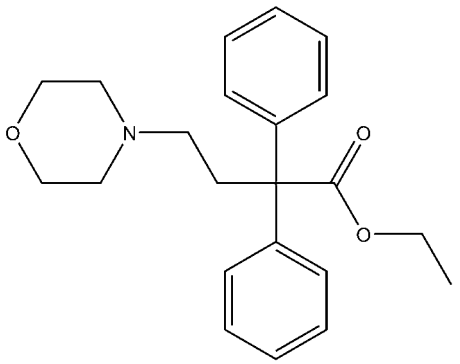
Infrared Spectrum Principal peaks at wavenumbers 1605, 1232, 1090, 1218, 1546, 1156 cm^{-1} (Nujol mull).
Mass Spectrum Principal ions at *m/z* 182, 165, 89, 90, 212, 51, 65, 91 (dinitro-orthocresol methyl ether).

Quantification
Blood **Colorimetry** For method, see Fenwick and Parker [1955].
Tissues **Colorimetry** See Blood [Fenwick, Parker 1955].
Disposition in the Body Absorbed through the skin, by inhalation, or by accidental ingestion. It acts as a cumulative poison causing an increase in the metabolic rate, and it is eliminated slowly over a period of weeks. After ingestion, <5% is excreted unchanged in the urine.
Toxicity The acute toxic dose is about 200 mg and the maximum permissible atmospheric concentration is 0.2 mg/m^3. Blood concentrations greater than about 50 mg/L are associated with severe toxicity.
Note For a review of poisoning by dinitro-orthocresol, see Bidstrup *et al.* [1952].

Bidstrup PL *et al.* (1952). *Lancet* 1: 794–795.
Fenwick ML, Parker VH (1955). *Analyst* 80: 774–776.

Dioxaphetyl Butyrate

Narcotic Analgesic
$C_{22}H_{27}NO_3$ = 353.3
CAS—467-86-7
IUPAC Name Ethyl 4-morpholino-4-yl-2,2-di(phenyl)butanoate
Synonym Ethyl γ-morpholino-α,α-diphenylbutyrate



Chemical Properties Mp 68.5° to 70°. Bp 170° to 180°. Soluble in water (24.5 mg/L). Log *P* (octanol/water) 3.97 [Meylan, Howard 1995]. Extracted by organic solvents from aqueous alkaline solutions.

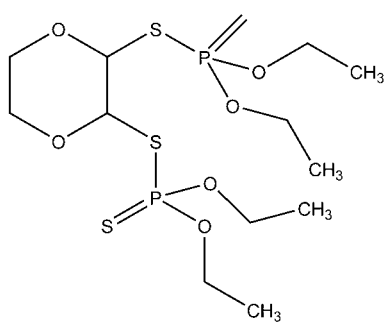
Dioxaphetyl Butyrate Hydrochloride
Synonym Amigalon
Proprietary Name *Spasmoxale*
Chemical Properties Mp 167.5° to 168.5°.

Thin-layer Chromatography System T1—R_f 0.72 (location reagent acidified iodoplatinate spray, positive reaction).

Meylan WM, Howard PH (1995). Atom/fragment contribution method for estimating octanol-water partition coefficients. *J Pharm Sci* 84: 83–92.

Dioxathion

Organophosphate, Insecticide, Acaricide
$C_{12}H_{26}O_6P_2S_4$ = 456.5
CAS—78-34-2
IUPAC Name (3-Diethoxyphosphinothioylsulfanyl-1,4-dioxan-2-yl)sulfanyl-diethoxy-sulfanylidenephosphorane
Synonyms *S*,*S*′-1,4-Dioxane-2,3-diyl O,O,O′,O′-tetraethyl bis(dithiophosphate); *S*,*S*″-1,4-dioxane-2,3-diylbis(O,O-diethylphosphorothiolothionate); phosphorodithoic acid.
Proprietary Names *Bercotox*; *Delnav*; *Hercules AC 528*; *Kavadel*; *Navadel*; *Polythion*.



Chemical Properties Dark amber-coloured liquid or powder with a garlic odour which should be stored in well-closed containers in a cool place. Mp −20°. Miscible with ethanol, acetone, benzene, and xylene. Practically insoluble in water (1.55 mg/L). Log *P* (octanol/water) 3.45 [Meylan, Howard 1995]. Dioxathion undergoes photo-oxidation on silica gel surfaces to form corresponding oxons and various cleavage products from the phosphorus- and non-phosphorus-containing moieties [Harned, Casida 1976]. Extracted by organic solvents from aqueous acid solutions.
Thin-layer Chromatography Plates: precoated silica gel 60F254 (20 × 20 cm, 0.25 mm). Solvents systems: A) benzene : hexane (17 : 3); B) isopropyl ether : ethanol (19 : 1); C) hexane : ethyl acetate : methanol (12 : 5 : 2); D) ethyl acetate : methanol : water. Location reagents: 4-(*p*-nitrobenzyl)pyridine; 2,6-dibromo-*N*-chloro-p-benzoquinone imine. R_f values: trans-dioxathion A) 0.31, B) 0.62, C) 0.62, D) 0.84; cis-dioxathion A) 0.26, B) 0.59, C) 0.61, D) 0.84. Limit of quantification not reported [Harned, Casida 1976].
Quantification
Other **TLC** Rat Urine and Faeces. Plates: precoated silica gel $60F_{254}$ (20 × 20 cm, 0.25 mm). Solvents systems: A) benzene : hexane (17 : 3); B) isopropyl ether : ethanol (19 : 1); C) hexane : ethyl acetate : methanol (12 : 5 : 2); D) ethyl acetate : methanol : water. R_f values: *trans*-dioxathion A) 0.31, B) 0.62, C) 0.62, D) 0.84; *cis*-dioxathion A) 0.26, B) 0.59, C) 0.61, D) 0.84. Limit of quantification not reported [Harned, Casida 1976].
Disposition in the Body Dioxathion depresses cholinesterase activity in mammals but, if applied externally in the recommended concentrations, it has a good margin of safety. When dioxathion is absorbed, it is rapidly metabolised and leaves insignificant residues in tissues.
Toxicity Very toxic when inhaled, swallowed, or spilled on the skin. The recommended strength of washes for weekly dipping or spraying of infested cattle is 0.05%. LD_{50} (IP, mg/kg): mice *trans*-dioxathion >125; *cis*-dioxathion 38 to 75 [Harned, Casida 1976].

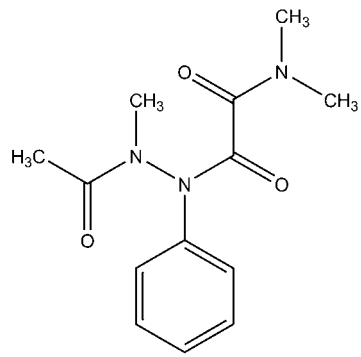
Dioxyamidopyrine

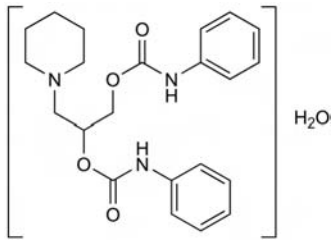
Analgesic
$C_{13}H_{17}N_3O_3$ = 263.3
IUPAC Name 2-[(Acetyl-methylamino)-phenylamino]-*N*,*N*-dimethyl-2-oxoacetamide
Synonyms β-Acetyl-β-methyl-α-dimethyloxamoylphenylhydrazine; dioxoaminopyrine; dioxyaminopyrine; dioxypyramidon.
Proprietary Name *Triamid*



Chemical Properties A translucent crystalline powder. Mp 105° to 106°. Soluble 1 in 2 of water; soluble in ethanol and chloroform. Dioxyamidopyrine is extracted by chloroform from aqueous alkaline solutions.
Colour Test Vitali's test—orange (limit of detection, 1.0 µg).
Thin-layer Chromatography System T1—R_f 0.69 (location reagent acidified iodoplatinate spray, positive reaction).
Gas Chromatography System G2/225—retention time 1.60 relative to diphenhydramine, retention time 0.36 relative to codeine; system G4/225—retention time 5.00 relative to diphenhydamine, retention time 0.51 relative to codeine.
Ultraviolet Spectrum Methanol—236 nm (E1%, 1cm 264).

Diperodon

Anaesthetic (Local)
$C_{22}H_{27}N_3O_4,H_2O$ = 415.5
CAS—101-08-6 (anhydrous); 51552-99-9 (monohydrate)
IUPAC Name [2-(Phenylcarbamoyloxy)-3-piperidin-1-ylpropyl] *N*-phenylcarbamate
Synonyms Diperocaine; 3-piperidinopropylene bis(phenylcarbamate) monohydrate.
Proprietary Name *Diothane*



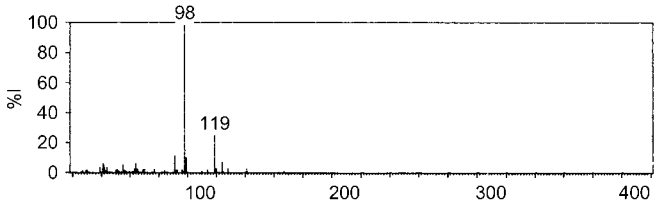
Chemical Properties A white to cream-coloured powder. Practically insoluble in water; soluble 1 in 3 of ethanol, 1 in 10 of chloroform, 1 in 4 of ether and 1 in 1 of methanol. Log *P* (octanol/water), 2.6 (hydrochloride).

Diperodon Hydrochloride

$C_{22}H_{27}N_3O_4,HCl = 433.9$
CAS—537-12-2

Chemical Properties A white crystalline powder. Mp about 198°. Soluble 1 in 100 of water; soluble in ethanol; slightly soluble in acetone; practically insoluble in ether.

Colour Tests Liebermann's reagent—brown; Mandelin's test—red→green.
Thin-layer Chromatography System TA—R_f 0.70; system TB—R_f 0.15; system TC—R_f 0.58; system TL—R_f 0.66 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2370.
High Performance Liquid Chromatography System HR—*k* 2.48.
Ultraviolet Spectrum Aqueous acid—232 nm (A^1_1=1320b).
Infrared Spectrum Principal peaks at wavenumbers 1210, 1705, 1530, 1600, 1305, 1050 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 98, 119, 91, 99, 124, 64, 41, 55.



Quantification

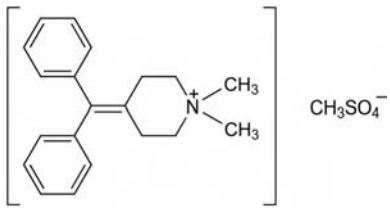
Blood **HPLC** Limit of detection, 5 µg/mL [Cizmarik *et al.* 1996].
Use Diperodon has been applied topically in a concentration of 1%.

Cizmarik J *et al.* (1996). Study of local anaesthetics. Part 133. Determination of diperodon in blood serum in vitro by the HPLC method. *Acta Pol Pharm* 53: 167–169.

Diphemanil Metilsulfate

Anticholinergic
$C_{20}H_{24}N,CH_3SO_4 = 389.5$
CAS—62-97-5

IUPAC Name 4-(Diphenylmethylene)-1,1-dimethylpiperidinium methyl sulfate
Synonyms Diphemanil methylsulfate; diphenmethanil methylsulfate; vagophemanil methylsulfate.
Proprietary Name *Prantal*

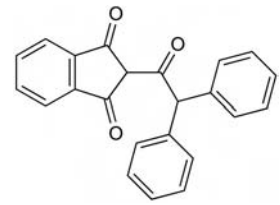


Chemical Properties A white, hygroscopic, crystalline powder. Mp 194° to 195°. Soluble 1 in 33 of water, 1 in 33 of ethanol and 1 in 33 of chloroform; very slightly soluble in ether. Log *P* (octanol/water), 2.6.
Colour Tests Liebermann's reagent—brown; Mandelin's test—brown; Marquis test—orange-red; sulfuric acid—orange.
Thin-layer Chromatography System TA—R_f 0.02 (acidified iodoplatinate solution, positive).
Infrared Spectrum Principal peaks at wavenumbers 708, 1250, 1230, 1010, 765, 699 cm^{-1} (KBr disk).
Dose 400 to 800 mg daily.

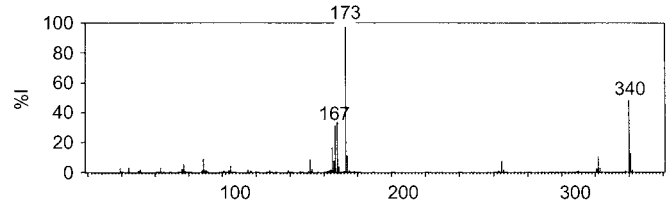
Diphenadione

Anticoagulant, Rodenticide
$C_{23}H_{16}O_3 = 340.4$
CAS—82-66-6

IUPAC Name 2-(Diphenylacetyl)-1*H*-indene-1,3(2*H*)-dione
Synonym Diphacinone
Proprietary Name *Diphacin (rodenticide)*



Chemical Properties Yellow crystals or crystalline powder. Mp 144° to 150°. Practically insoluble in water; soluble 1 in less than 100 of ethanol and chloroform; soluble in ether, acetone and glacial acetic acid; slightly soluble in benzene. Log *P* (octanol/water), 4.8.
Colour Tests Liebermann's reagent—orange-brown; methanolic potassium hydroxide—yellow; sulfuric acid—yellow.
Thin-layer Chromatography System TD—R_f 0.11; system TE—R_f 0.46; system TF—R_f 0.33; system TAD—R_f 0.53; system TAJ—R_f 0.51; system TAK—R_f 0.74; system TAL—R_f 0.91 (acidified potassium permanganate solution, positive).
Gas Chromatography System GA—RI 2934.
Ultraviolet Spectrum Aqueous acid—336 nm (A^1_1=675b). No alkaline shift.
Mass Spectrum Principal ions at *m/z* 173, 340, 168, 167, 165, 341, 174, 322.

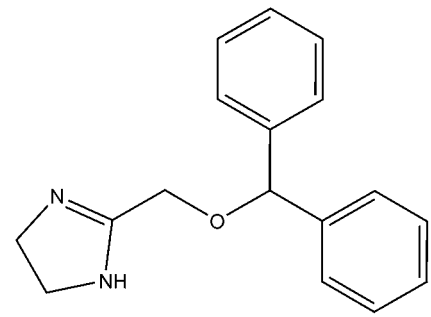


Dose Maintenance, 2.5 to 5 mg daily.

Diphenazoline

Antihistamine
$C_{17}H_{18}N_2O = 266.3$

IUPAC Name 2-[Di(phenyl)methoxymethyl]-4,5-dihydro-1*H*-imidazole
Synonyms 2-Diphenylmethoxymethyl-2-imidazoline; MG 322.



Chemical Properties Mp 102° to 103°. Soluble in chloroform. Diphenazoline is extracted by chloroform from aqueous alkaline solutions.

Diphenazoline Hydrochloride

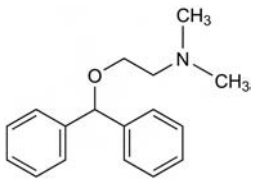
Proprietary Names *Antadril*; *Antadryl*; *Anthradil.*
Chemical Properties A white crystalline powder. Mp 205° to 207°. Soluble in water and ethanol.

Colour Tests Ammonium molybdate test—bright yellow (limit of detection, 0.1 µg); ammonium vanadate test—bright yellow (limit of detection, 0.1 µg); formaldehyde test—bright yellow (limit of detection, 0.1 µg); sulfuric acid test—bright yellow (limit of detection, 0.1 µg).
Thin-layer Chromatography System T1—R_f 0.27 (location reagent acidified iodoplatinate spray, positive reaction).
Gas Chromatography System G2/225—retention time 3.33 relative to diphenhydramine, retention time 0.75 relative to codeine; system G4/225—retention time 0.85 relative to codeine.

Diphenhydramine

Antihistamine
$C_{17}H_{21}NO = 255.4$
CAS—58-73-1

IUPAC Name 2-Diphenylmethoxy-*N*,*N*-dimethylethanamine
Synonym Benzhydramine



Note Diphenhydramine is an isomer of phenyltoloxamine.
Chemical Properties pK_a 8.98 [Sangster 1997]. Log *P* (octanol/water), 3.27 [Hansch *et al.* 1995]. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

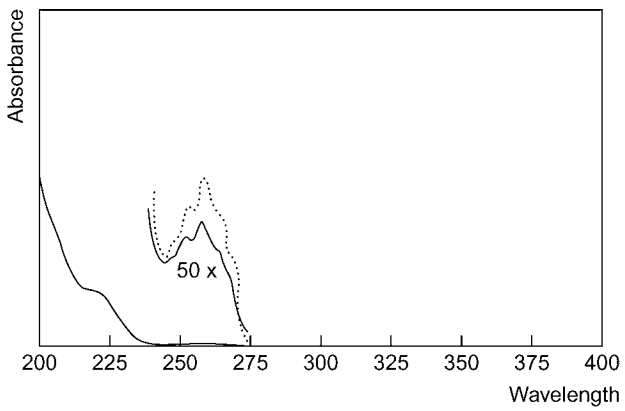
Diphenhydramine Acefyllinate

$C_{17}H_{21}NO,2C_9H_{10}N_4O_4 = 731.8$
CAS—6888-11-5
Synonyms Benzhydramine di(acefyllinate); bietanautine.
Proprietary Name *Nautamine*

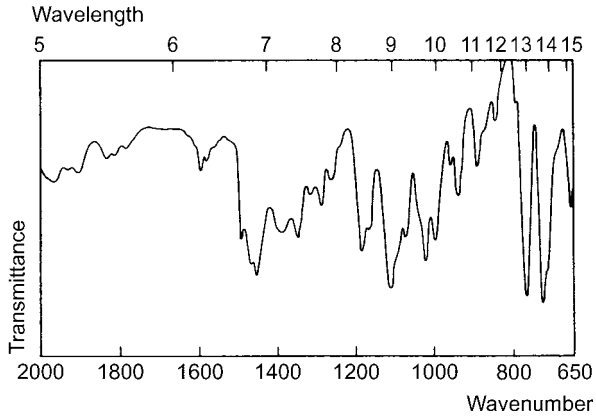
Diphenhydramine Hydrochloride

$C_{17}H_{21}NO,HCl = 291.8$
CAS—147-24-0
Synonyms Benzhydramine hydrochloride; dimedrolum.
Proprietary Names *Aller-Dryl*; *Aller-eze*; *Allermax*; *Banophen Allergy*; *Benadryl*; *Bidramine*; *Dermamycin*; *Diphen*; *Diphenhist*; *Dormin*; *Dreemon*; *Dytuss*; *Genahist*; *Histergan*; *Hyrexin*; *Medinex*; *Nightcalm*; *Nytol*; *Paxidorm*; *Pheramin*; *Siladryl*; *Silphen*; *Sleep Aid*; *Sleepeaze*; *Sleepia*; *Sominex*; *Somnium*; *Tusstat*; *Twilite*. It is an ingredient of many proprietary preparations [Sweetman 2007].
Chemical Properties A white crystalline powder that slowly darkens on exposure to light. Mp 166° to 170°. Soluble 1 in 1 of water, 1 in 2 of ethanol, 1 in 50 of acetone, and 1 in 2 of chloroform; very slightly soluble in benzene and in ether. Log *P* (octanol/water), 3.11 [Meylan, Howard 1995].

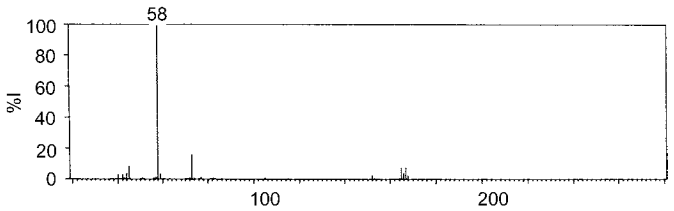
Colour Test Liebermann's reagent—brown-orange; Mandelin's test—yellow; Marquis test—yellow; sulfuric acid—orange.
Thin-layer Chromatography System TA—R_f 0.55; system TB—R_f 0.44; system TC—R_f 0.33; system TE—R_f 0.65; system TL—R_f 0.15; system TAE—R_f 0.27; system TAF—R_f 0.48 (acidified iodoplatinate solution, positive; Dragendorff spray, positive; FPN reagent, pink; Marquis test, yellow; ninhydrin spray, positive).
Gas Chromatography System GA—diphenhydramine RI 1870, M (nor-) RI 1520, M (nor-acetyl-) RI 2265, M (di-nor-acetyl) RI 2240, M (methoxy-) RI 2010, M (diphenylmethanol) RI 1645, M (OH-) RI 1890, M (di-OH-) RI 1895, M (desamino-OH-) RI 1760, M (benzophenone) (BPH) RI 1610, M (OH-BPH isomer 1) RI 2065, M (OH-BPH) isomer 2 RI 2080, M (OH-BPH isomer 1) RI 2050, M (OH-methoxy-BPH) isomer 2 RI 2070; system GB—diphenhydramine RI 1928, M (nor-) RI 1922, M (nor-acetyl-) RI 2360, M (di-nor-acetyl-) RI 2240, M (desamino-) RI 1883, M (methoxy-) RI 2239, M (diphenylmethane) RI 1465, M (diphenylmethanol) RI 1645, M (4-phenylmethylphenol) RI 1780; system GC—RI 2378; system GF—RI 2105.
High Performance Liquid Chromatography System HA—*k* 3.3; system HX—RI 393; system HY—RI 336; system HAX—RT 12.2 min; system HAY—RT 6.0 min.
Ultraviolet Spectrum Aqueous acid—252, 257 nm ($A_1^1 = 17a$).



Infrared Spectrum Principal peaks at wavenumbers 713, 754, 1103, 1017, 1180, 991 cm^{-1} (diphenhydramine hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 58, 73, 45, 167, 165, 166, 44, 152 (no peaks above 200); didesmethyldiphenhydramine 30, 167, 45, 168, 165, 183, 166, 152; monodesmethyldiphenhydramine 44, 167, 168, 165, 183, 105, 152, 77.



Quantification

Blood **GC** Column: DB-1 (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 3 mL/min. Temperature programme: 170° for 1 min to 280° at 10°/min. FID. Limit of detection, 100 µg/L [Nishikawa *et al.* 1997].Column: DB-1 fused silica capillary (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 22 cm/s. Temperature programme: 100° to 280° at 8/min. NPD. Retention time: 13.7 min. Limit of detection, 100–250 ng/L [Hattori *et al.* 1992]. FID [Backer *et al.* 1977].
Serum **GC** AFID. Limit of detection, 2.5 µg/L [Lutz *et al.* 1983].
Urine **HPLC** See Fischer, Breyer-Pfaff [1995].
GC See Blood. Limit of detection, 62 µg/L [Nishikawa *et al.* 1997]. See Blood [Backer *et al.* 1977; Hattori *et al.* 1992].
Tissues See Blood [Backer *et al.* 1977].
Disposition in the Body Diphenhydramine is readily absorbed after oral administration but undergoes extensive first-pass metabolism by *N*-dealkylation and oxidative deamination to form monodesmethyl and didesmethyl metabolites and diphenylmethoxyacetic acid, which may be conjugated with glutamine or glycine. Up to 65% of a dose is excreted in the urine in 96 h. The major urinary metabolite appears to be diphenylmethoxyacetic acid in free or conjugated form; very little is excreted as unchanged drug. Diphenhydramine crosses the placenta and is excreted in breast milk.
Therapeutic Concentration In plasma, usually in the range 0.1–1.0 µg/mL.
Following a single oral dose of 100 mg diphenhydramine hydrochloride to 4 subjects, peak plasma concentrations of 0.08–0.16 mg/L (mean 0.11) were obtained 2–4 h after administration; total amine concentrations were ~50% higher because of the presence of *N*-dealkylated metabolites. After single oral doses of 100 mg to a further 4 subjects, the concentration of acidic metabolites increased over a period of 24 h to ~2 mg/L. After multiple oral doses of 50 mg diphenhydramine hydrochloride 4 times daily to 4 subjects, maximum steady-state plasma diphenhydramine concentrations of 0.10–0.27 mgL were reported; the maximum steady-state amine concentrations were between 0.17 and 0.37 mg/L [Glazko *et al.* 1974].
Toxicity The estimated minimum lethal dose is 3 g. Toxic effects may be produced by plasma concentrations >1 mg/L.
In a 16-year-old male who died from drowning and cold exposure following a drug overdose, the following concentrations of diphenhydramine, free dihydrocodeine and total dihydrocodeine, respectively, were found ~9 days after death: femoral venous blood 1.89, 3.27 and 3.30 mg/L; right cardiac chamber blood 0.294, 0.237 and 0.240 mg/L; urine 22.6, 37.3 and 43.1 mg/L; stomach 0.029, 0.018 and 0.024 mg; and femoral muscle 0.270, 0.246 and 0.314 µg/g [Moriya, Hashimoto 2001].
A 35-year-old woman who underwent emergency charcoal haemoperfusion and haemodialysis 4.5 h after ingesting 16 g (~20 mg/kg) diphenhydramine, had blood concentrations of 3.3 mg/L immediately before haemoperfusion and 2.56 mg/L immediately after [Mullins *et al.* 1999].
In 2 fatalities attributed to diphenhydramine, the following postmortem tissue concentrations were reported (mg/L or µg/g):

	Diphenhydramine	*Diphenylmethoxyacetic acid*
Blood	19.7, 6.9	3.0, 15.3
Heart blood	50, 14.7	3.6, 19
Kidney	114, –	–, –
Liver	260, –	–, –
Lung	460, –	–, –
Urine	34.9, 376	0.3, 20.4

D

In the first case death occurred within 3 h whereas the second subject survived for 12 h after ingestion [Aderjan *et al.* 1982].

In 4 cases of suicidal diphenhydramine overdose, blood levels ranged from 5–35 mg/L [Karch 1998].

In 4 deaths from diphenhydramine overdose, the following postmortem concentrations were obtained: blood 8–31 mg/L (mean 20), brain 8 and 32 µg/g (2 cases), kidney 13 µg/g (1 case), liver 23–47 µg/g (mean 34), urine 40 and 6.4 mg/L (2 cases) [Backer *et al.* 1977; Baselt, Cravey 1977; Peclet *et al.* 1981].

Half-life Plasma half-life, 2.4–9.3 h.
Bioavailability ~50–70%.
Volume of Distribution 4.5–8 L/kg.
Clearance Plasma clearance, ~6–10 mL/min/kg.
Distribution in Blood Plasma : whole blood ratio, ~1.3.
Saliva Plasma : saliva ratio, ~3.
Protein Binding ~80%.
Dose Diphenhydramine hydrochloride 75 to 200 mg daily in divided doses.

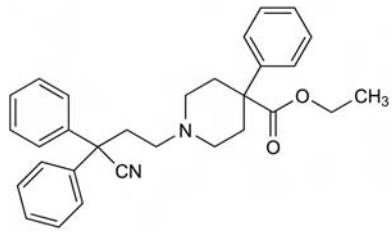
Diphenoxylate

Narcotic Antidiarrhoeal
$C_{30}H_{32}N_2O_2$ = 452.6
CAS—915-30-0

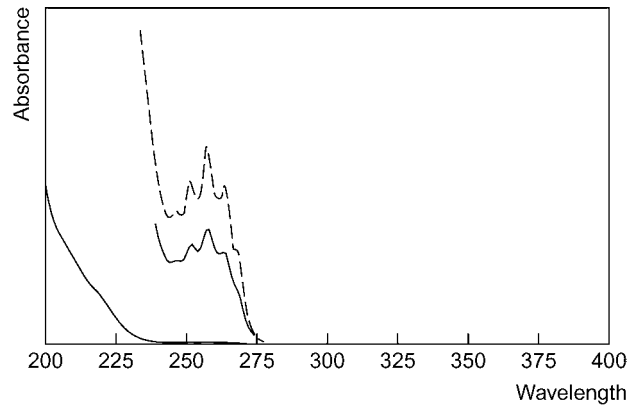
IUPAC Name Ethyl 1-(3-cyano-3,3-diphenylpropyl)-4-phenylpiperidine-4-carboxylate
Synonym 1-(3-Cyano-3,3-diphenylpropyl)-4-phenyl-4-piperidinecarboxylic acid ethyl ester



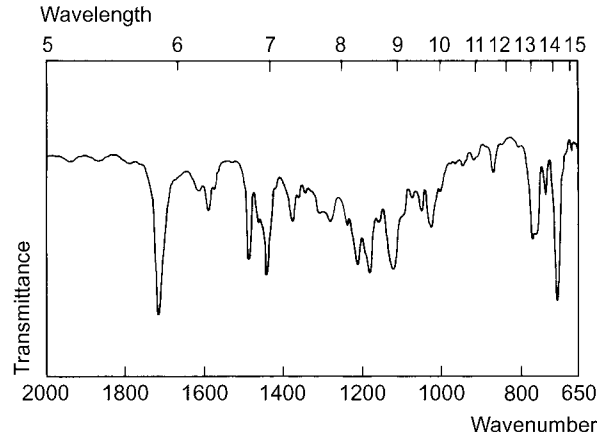
Diphenoxylate Hydrochloride
$C_{30}H_{32}N_2O_2$,HCl = 489.1
CAS—3810-80-8

Proprietary Names *Dhamotil*; *Diarphen*; *Diarsed*; *Diastop*; *Dilomil*; *Eldox*; *Erlotyl*; *Intard*; *Lofenoxal*; *Logen*, *Lomotil*; *Lonox*; *Lotharin*; *Reasec*; *Remodil*; *Retardin*; *Tropergen*.
Note Preparations of diphenoxylate hydrochloride usually contain subclinical amounts of atropine sulfate in an attempt to prevent abuse by deliberate overdosage.
Chemical Properties A white crystalline powder. Mp 220.5° to 222°. Sparingly soluble in water; soluble 1 in 50 of ethanol and 1 in 2.5 of chloroform; soluble in methanol; practically insoluble in ether.

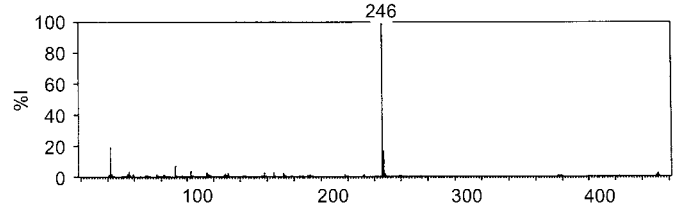
Chemical Properties pK_a 7.1. Log *P* (octanol/water), 6.3.
Colour Test Sodium picrate (Steyn test)—orange.
Thin-layer Chromatography System TA—R_f 0.74; system TB—R_f 0.42; system TC—R_f 0.84; system TE—R_f 0.87; system TL—R_f 0.70; system TAE—R_f 0.90; system TAF—R_f 0.92 (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, orange).
Gas Chromatography System GA—RI 3514; system GB—RI 3670; system GM—not eluted.
High Performance Liquid Chromatography System HA—diphenoxylate *k* 0.2, diphenoxylic acid *k* 0.6 (tailing peak); system HY—RI 385; system HZ—retention time 27.4 min; system HAY—retention time 14.1 min.
Ultraviolet Spectrum Methanol—252, 258 (A_1^1=14a), 264 nm.



Infrared Spectrum Principal peaks at wavenumbers 1728, 697, 1183, 1120, 1215, 1495 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 246, 42, 247, 91, 103, 165, 115, 56; diphenoxylic acid 218, 42, 219, 91, 165, 155, 193, 115.



Quantification
Plasma **GC** TCD. For method, see Al Ragheb *et al.* [1982].
GC–MS Limit of detection, 20 mg/L diphenoxylic acid [Ford *et al.* 1976].
Urine **GC** See Plasma [Al Ragheb *et al.* 1982].
Disposition in the Body Rapidly absorbed after oral administration but it is usually administered together with a small quantity of atropine and this may delay absorption, especially with high doses. It is extensively metabolised by hydrolysis,

hydroxylation and conjugation with glucuronic acid. The major metabolites are diphenoxylic acid (difenoxin), which is active, and hydroxydiphenoxylic acid in both free and conjugated forms. About 14% and 50% of a dose, respectively, is excreted in the urine and faeces in 96 h; <0.1% of a dose is excreted in the urine as unchanged drug in 24 h.

Therapeutic Concentration

After an oral dose of 5 mg, peak plasma concentrations of diphenoxylate of about 0.01 mg/L were attained in 2 h and peak concentrations of diphenoxylic acid of about 0.04 mg/L were attained in the same period [Karim *et al.* 1972].

Toxicity Diphenoxylate has addiction-producing properties. The estimated minimum lethal dose is 0.2 g although recovery has occurred after the ingestion of 0.75 g.

A postmortem blood concentration of 0.34 µg/mL was reported in a $3^1/_2$-year-old child who died after ingesting diphenoxylate [Al Ragheb *et al.* 1982].

Half-life Plasma half-life, diphenoxylate about 2.5 h, diphenoxylic acid about 4 h.

Volume of Distribution About 4 L/kg.

Dose Initially 10 mg of diphenoxylate hydrochloride, followed by 5 mg every 6 h.

Al Ragheb SA *et al.* (1982). A case of fatal Lomotil overdosage. *Med Sci Law* 22(3): 210–214.

Diphenyl

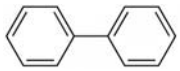
Fungistatic

$C_{12}H_{10}$ = 154.2

CAS—92-52-4

IUPAC Name 1,1′-Biphenyl

Synonym Phenylbenzene



Chemical Properties A white crystalline powder. Mp 69° to 71°. Bp 254° to 255°. Practically insoluble in water; soluble in ethanol and ether. Log *P* (octanol/water), 4.0.

Gas Chromatography System GA—RI 1389.

Infrared Spectrum Principal peaks at wavenumbers 740, 710, 1573, 1175, 1018, 918 cm^{-1} (KBr disk).

Diphenylprolinol

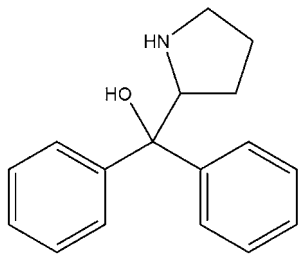
Dopamine and Noradrenaline Reuptake Inhibitor

$C_{17}H_{19}NO_2$ = 253.3

CAS—22348-32-9

IUPAC Name Diphenyl(pyrrolidin-2-yl)methanol

Synonym CID204386; D2PM; (*S*)-(−)-1,1-diphenylprolinol; diphenyl-pyrrolidin-2-ylmethanol; diphenyl(2-pyrrolidinyl)methanol; diphenyl(pyrrolidin-2-yl) methanol; HMS1439N22; Maybridge3_003124; JFD 01912; MolPort-002-041-205; Oprea1_549580.



Disposition in the Body

Toxicity A 21-year-old man ingested 3 tablets of 'Head Candy' and presented with chest pain. His serum concentration of diphenylprolinol was 0.17 mg/L while his glaucine levels were 0.1 mg/L [Lidder *et al.* 2008]

Lidder S *et al.* (2008). Cardiovascular toxicity associated with recreational use of diphenylprolinol (diphenyl-2-pyrrolidinemethanol [D2PM]). *J Med Toxicol* 4: 167–169.

Diphenylpyraline

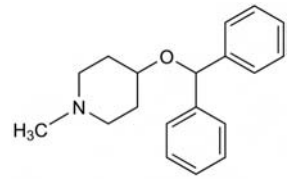
Antihistamine

$C_{19}H_{23}NO$ = 281.4

CAS—147-20-6

IUPAC Name 4-Benzhydryloxy-1-methylpiperidine

Synonyms 4-(Diphenylmethoxy)-1-methylpiperidine; diphenylpyrilene.



Chemical Properties Log *P* (octanol/water), 3.9.

Diphenylpyraline Hydrochloride

$C_{19}H_{23}NO,HCl$ = 317.9

CAS—132-18-3

Proprietary Names *Arbid-N*; *Dayfen*; *Diafen*; *Hispril*; *Histryl*; *Histyn*; *Kolton (gel)*; *Lergoban*; *Lergobine*. It is an ingredient of *Eskornade*.

Chemical Properties A white crystalline powder. Mp 204° to 209°. Soluble 1 in 1 of water, 1 in 3 of ethanol and 1 in 2 of chloroform; soluble in isopropanol; practically insoluble in ether and benzene.

Diphenylpyraline Hydrobromide

$C_{19}H_{23}NO,HBr$ = 362.3

CAS—132-18-3

Chemical Properties Crystals Mp 201° to 202°. Soluble in water and ethanol

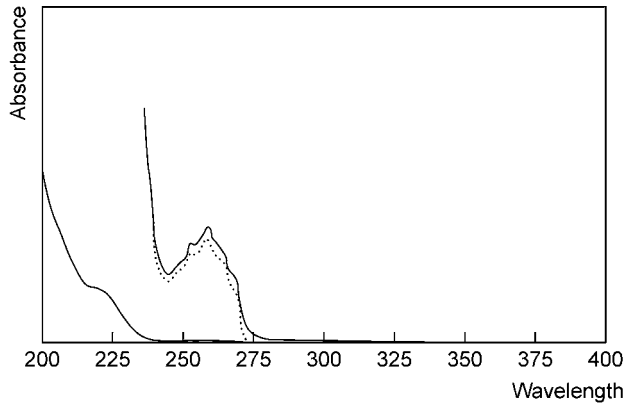
Colour Tests Liebermann's reagent—red-orange; Mandelin's test—yellow; Marquis test—yellow.

Thin-layer Chromatography System TA—R_f 0.46; system TB—R_f 0.42; system TC—R_f 0.28; system TE—R_f 0.68; system TL—R_f 0.08; system TAE—R_f 0.23; system TAF—R_f 0.49; system TAJ—R_f 0.61; system TAK—R_f 0.50; system TAL—R_f 0.92 (Dragendorff spray, positive; FPN reagent, pink; acidified iodoplatinate solution, positive; Marquis reagent, brown; ninhydrin spray, positive).

Gas Chromatography System GA—diphenylpyraline RI 2100, M (benzophenone) (BPH) RI 1610, M (OH-benzophenone-) isomer-1 RI 2065, M (OH-benzophenone-) isomer 2 RI 2080, M (OH-methoxy-benzophenone-) isomer-1 RI 2050, M (OH-methoxy-benzophenone-) isomer-2 RI 2070; system GB—RI 2128; system GC—RI 2447; system GF—RI 2405.

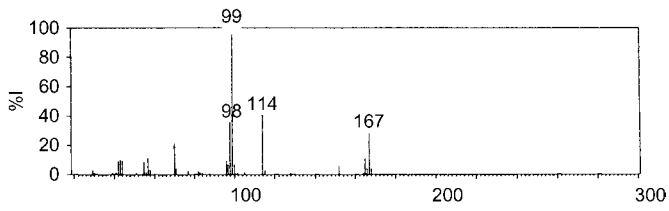
High Performance Liquid Chromatography System HA—*k* 3.3 (tailing peak); system HX—RI 401.

Ultraviolet Spectrum Aqueous acid—253, 258 nm (A^1_1=17a).



Infrared Spectrum Principal peaks at wavenumbers 1070, 709, 1050, 696, 765, 1101 cm^{-1} (diphenylpyraline hydrochloride, KCl disk).

Mass Spectrum Principal ions at *m/z* 99, 114, 98, 167, 70, 165, 57, 43.



Quantification

Blood **GC** FID. Limit of detection, 76–473 mg/L, diphenylpyraline and other antihistamines [Nishikawa *et al.* 1997].

Plasma **HPLC** UV detection. Limit of detection, 15 mg/L [Ebete, Koundourellis 1996].

Urine **GC** Limit of detection, 13–186 mg/L, see Blood [Nishikawa *et al.* 1997]. FID. For method, see Graham and Bolt [1974].

HPLC See Plasma [Ebete, Koundourellis 1996].

Disposition in the Body Absorbed after oral administration. <10% of a dose is excreted in the urine as unchanged drug. Possible metabolites include the *N*-oxide and *N*-desmethyldiphenylpyraline.
Half-life Derived from urinary excretion data, 24 to 40 h.
Dose 10 to 20 mg of diphenylpyraline hydrochloride daily.

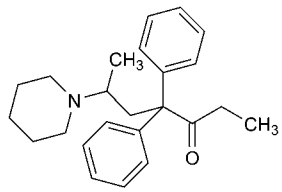
Dipipanone

Narcotic Analgesic
$C_{24}H_{31}NO = 349.5$
CAS—467-83-4

IUPAC Name 4,4-Di(phenyl)-6-piperidin-1-ylheptan-3-one
Synonyms 4,4-Diphenyl-6-(1-piperidinyl)-3-heptanone; phenylpiperone; piperidyl methadone; piperidylamidone.



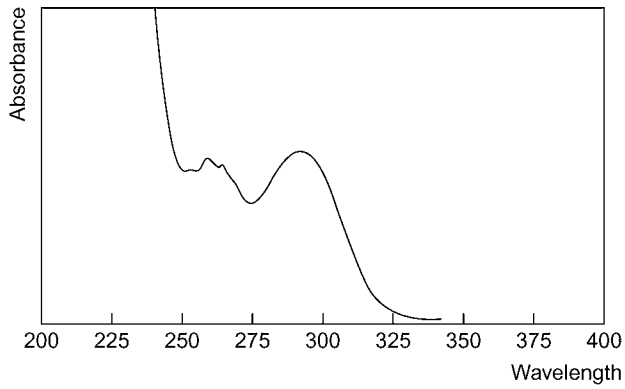
Chemical Properties pK_a 8.5(25°). Log *P* (octanol/water) 5.5 [Meylan, Howard 1995].

Dipipanone Hydrochloride

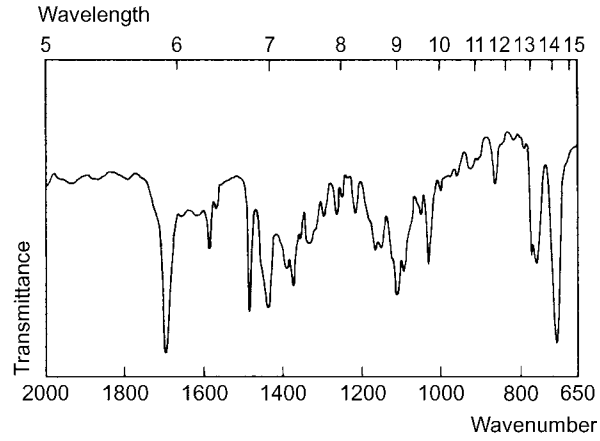
$C_{24}H_{31}NO,HCl,H_2O = 404.0$
CAS—856-87-1
Proprietary Names It is an ingredient of *Diconal*; *Wellconal*.
Chemical Properties White crystalline powder. Mp 123° to 126° (also reported to be 126° to 127°). Soluble 1 in 40 of water, 1 in 1.5 of ethanol, and 1 in 6 of acetone; practically insoluble in ether.

Colour Test Mandelin's test—green→blue.
Thin-layer Chromatography System TA—R_f 0.66; system TB—R_f 0.67; system TC—R_f 0.33; system TE—R_f 0.87; system TL—R_f 0.70; system TAE—R_f 0.27; system TAF—R_f 0.72 (Dragendorff spray, positive; acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2474; system GB—RI 2586; system GC—RI 2894; system GF—RI 2710; system GM—RRT 1.309 (relative to iprindole).
High Performance Liquid Chromatography System HA—*k* 2.2; system HC—*k* 1.61; system HX—RI 500; system HY—RI 363.

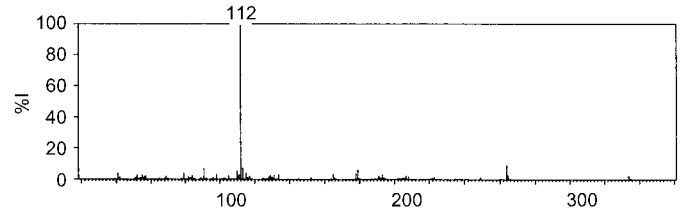
Column: SGE CPS-Hypersil (100 × 2.1 mm i.d., 5 µm). Mobile phase: 0.025 mol/L phosphate buffer (pH 4.0)-isopropyl alcohol-acetonitrile (94 : 3 : 3) : 0.025 mol/L phosphate buffer (pH 4.0)-isopropyl alcohol-acetonitrile (50 : 25 : 25, 80 : 20 for 5 min to 55 : 45 at 5.1 min until 20 min to 80 : 20 at 21 min for 9 min), flow rate 0.2 mL/min. UV detection (λ = 205 nm). Limit of detection, 2 ng on column [Roy, Jefferies 1990].
Ultraviolet Spectrum Aqueous acid—259, 265, 293 nm ($A_1^1 = 15.6$a).



Infrared Spectrum Principal peaks at wavenumbers 1708, 698, 1491, 1110, 1092, 1030 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 112, 264, 113, 91, 179, 110, 178, 115.



Quantification

Plasma **GC** Column: SPB5 fused silica capillary (15 m × 0.25 mm i.d., 1 µm). Carrier gas: N_2, 1 mL/min. Temperature: 250°. NPD. Limit of detection, 1 µg/L [Cathapermal, Caddy 1988]. Column: BP-1 dimethylsiloxane (15 m × 0.32 mm i.d., 0.5 µm). Carrier gas: He, 60 cm/s. Temperature programme: 80° for 2.5 min to 230° at 40°/min to 250° at 5°/min for 1.5 min. TSD. Retention time: 10.11 min. Limit of detection, 1 mg/L [Paterson 1988].
Urine **GC** See Plasma [Cathapermal, Caddy 1988]. See Plasma [Paterson 1988].
Disposition in the Body Absorbed after oral administration with rapid onset of action. It is metabolised in the liver and excreted in the urine and faeces. Prolonged use of dipipanone may produce dependence of the morphine type.
Toxicity The estimated minimum lethal dose is 0.1 g.

In 2 fatalities after IV injection of Diconal (dipipanone with cyclizine), the postmortem tissue concentrations (mg/L or µg/g) shown below were reported.

	Cyclizine	*Dipipanone*
Blood	2.0, 0.5	6.2, 0.5
Bile	20, –	–, –
Liver	3.0, –	5.2, –
Urine	0.5, 9.5	–, 18.5

In 34 addicts, urinary concentrations of free dipipanone ranged from 0 to 5.2 mg/L (mean 1.6) [Sheehan *et al.* 1979].
Dose 10 to 30 mg of dipipanone hydrochloride every 6 h.

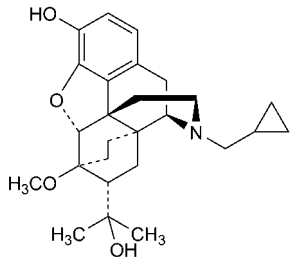
Diprenorphine

Narcotic Antagonist (Veterinary)
$C_{26}H_{35}NO_4$ = 425.6
CAS—14357-78-9

Synonym (5α,7α-17-(Cyclopropylmethyl)-4,5-epoxy-18,19-dihydro-3-hydroxy-6-methoxy-α-dimethyl-6,14-ethenomorphinan-7-methanol

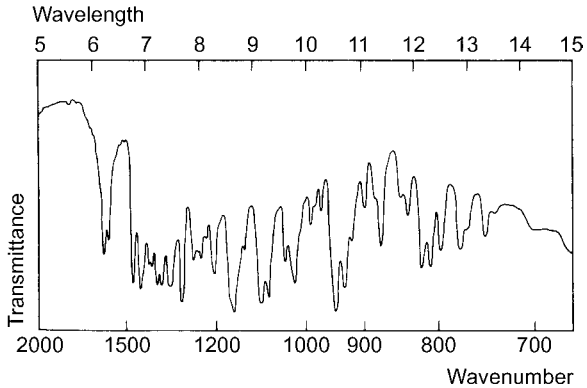


Chemical Properties White microcrystalline powder. Mp 190° to 192°.

Diprenorphine Hydrochloride

$C_{26}H_{35}NO_4$,HCl = 462.0
CAS—16808-86-9
Proprietary Name *Revivon*
Chemical Properties White crystalline powder. Soluble 1 in 30 of water, 1 in 160 of ethanol and 1 in 2500 of chloroform; practically insoluble in ether.

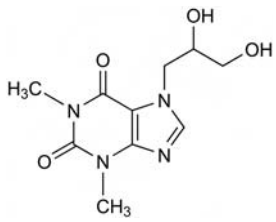
Colour Tests Liebermann's reagent—black; Mandelin's test—grey; Marquis test—grey-violet.
Thin-layer Chromatography System TA—R_f 0.70 (acidified iodoplatinate solution, positive).
Gas Chromatography System GB—RI 3385; system GM—not eluted.
High Performance Liquid Chromatography System HA—*k* 0.6; system HY—RI 301.
Ultraviolet Spectrum Aqueous acid—230 (A^1_1 = 158b), 286 nm (A^1_1 = 36a); aqueous alkali—246 (A^1_1 = 184b), 299 nm (A^1_1 = 58a).
Infrared Spectrum Principal peaks at wavenumbers 1160, 947, 1311, 1092, 1078, 934 cm^{-1} (KBr disk).



Diprophylline

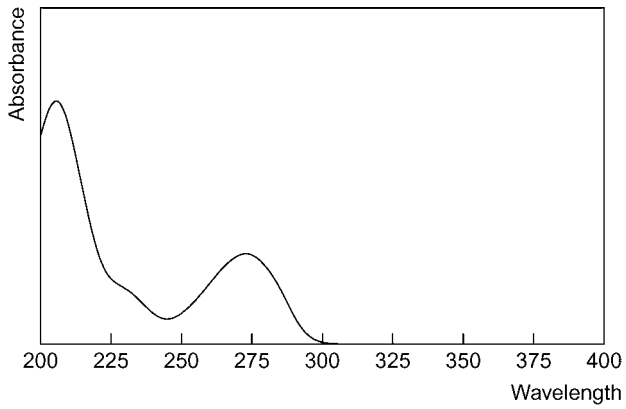
Xanthine Bronchodilator
$C_{10}H_{14}N_4O_4$ = 254.2
CAS—479-18-5

IUPAC Name 7-(2,3-Dihydroxypropyl)-1,3-dimethylpurine-2,6-dione
Synonyms 7-(2,3-Dihydroxypropyl)-3,7-dihydro-1,3-dimethyl-1*H*-purine-2,6-dione; dihydroxypropyltheophyllinum; diprophyllinum; dyphylline; glyphyllinum; hyphylline.
Proprietary Names *Asthmolysin*; *Austrophyllin*; *Dilor*; *Droxine*; *Dyflex*; *Dylix*; *Isophyllen*; *Katasma*; *Lufyllin*; *Neothyllin(e)*; *Neufil*.

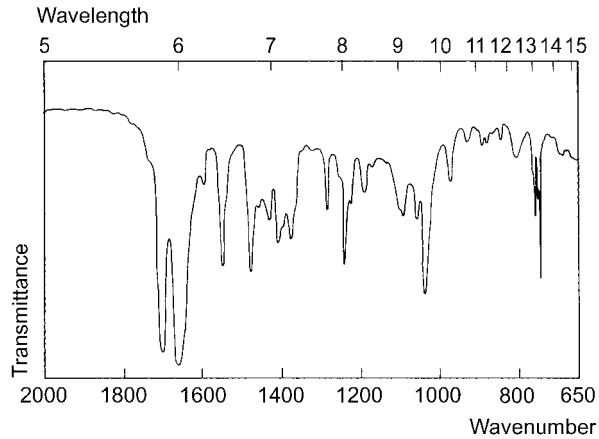


Chemical Properties A white crystalline powder. Mp 158°. Soluble 1 in 3 of water and 1 in 50 of ethanol; slightly soluble in chloroform; practically insoluble in ether. Log *P* (octanol/water), −1.5.

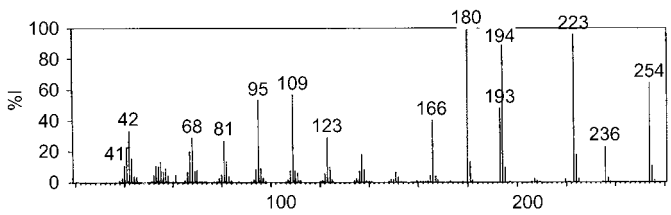
Colour Test Amalic acid test—yellow/violet.
Thin-layer Chromatography System TA—R_f 0.48; system TB—R_f 0.00; system TC—R_f 0.12; system TE—R_f 0.25; system TL—R_f 0.12; system TAE—R_f 0.70; system TAF—R_f 0.59 (acidified potassium permanganate solution, positive).
Gas Chromatography System GA—diprophylline RI 2280, diprophylline-AC_2 RI 2455.
High Performance Liquid Chromatography System HX—RI 275; system HY—RI 227; system HAA—retention time 3.6 min.
Ultraviolet Spectrum Aqueous acid—206, 273 nm (A^1_1=380a). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1660, 1700, 1039, 747, 1562, 1234 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 180, 223, 194, 254, 109, 95, 193, 166.



Quantification

Plasma **HPLC** Limit of detection, 25 µg/L [Gisclon *et al.* 1979a].
Serum **GC** FID. For method, see Shihabi and Dave [1977].
HPLC UV detection. For method for quantification of diprophylline and doxophylline, see Tagliaro *et al.* [1990]. UV detection. Limit of detection, 0.25 mg/L, diprophylline and theophylline [Kester *et al.* 1987]. UV detection. Limit of detection, 1 mg/L [Paterson 1982].
Urine **HPLC** For method, see Gisclon *et al.* [1979a].
Saliva **GC** See Plasma [Shihabi, Dave 1977].
HPLC Limit of detection, 50 µg/L [Gisclon *et al.* 1979a].
Disposition in the Body Rapidly and almost completely absorbed after oral administration. About 83% of a dose is excreted in the urine as unchanged drug in 24 h; <1% of a dose is eliminated in the faeces. It is also rapidly absorbed from IM injection sites. Diprophylline is excreted in breast milk.
Therapeutic Concentration In plasma, usually in the range 10 to 20 mg/L. After a single oral dose of 1.2 g to 6 subjects, peak plasma concentrations of 18 to 29 mg/L (mean 22) were attained in about 0.5 h and peak saliva concentrations of 7 to 17 mg/L (mean 12) were reported at 0.7 h [Gisclon *et al.* 1979b].
Toxicity Plasma concentrations greater than 20 µg/mL may produce toxic effects.
Bioavailability About 90%.
Half-life Plasma half-life, about 2 h.

Volume of Distribution About 0.8 L/kg.
Clearance Plasma clearance, about 5 mL/min/kg.
Dose 15 mg/kg body weight every 6 h.

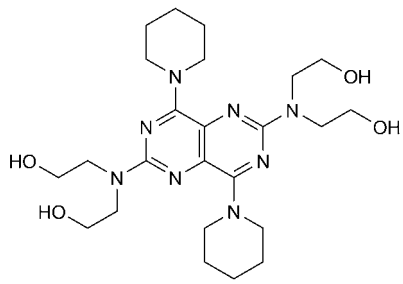
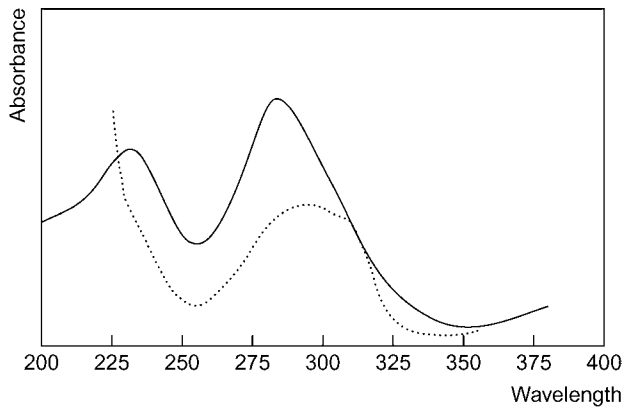
Dipyridamole

Antithrombotic, Antianginal Vasodilator, Phosphodiesterase Inhibitor
$C_{24}H_{40}N_8O_4 = 504.6$
CAS—58-32-2

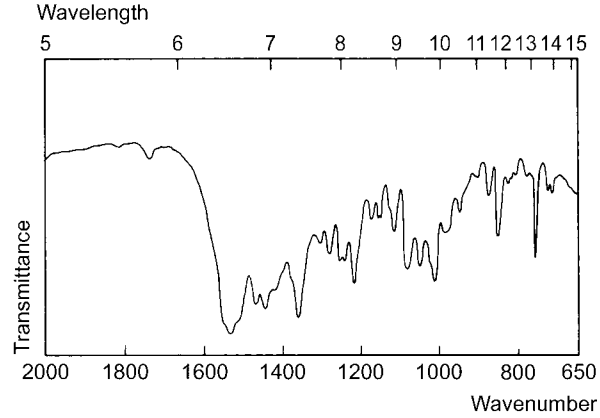
IUPAC Name 2-[[2-[Bis(2-hydroxyethyl)amino]-4,8-di(piperidin-1-yl)pyrimido[5,4-*d*]pyrimidin-6-yl]-(2-hydroxyethyl)amino]ethanol
Synonym 2,2′,2″,2‴-[(4,8-Di-1-piperidinylpyrimido[5,4-*d*]pyrimidine-2,6-diyl)dinitrilo]tetrakisethanol
Proprietary Names *Agremol*; *Atrombin*; *Cardoxin*; *Cerebrovase*; *Cleridium*; *Coronarine*; *Corosan*; *Curantyl N*; *Dipyridan*; *Dipyrin*; *Fluxocor*; *Miosen*; *Modaplate*; *Natyl*; *Novo-Dipiradol*; *Perkod*; *Persantin(e)*; *Plato*; *Posanin*; *Procardin*; *Procor*; *Protangix*; *Pytazen*.



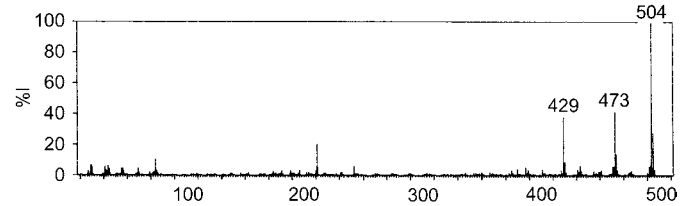
Chemical Properties Intensely yellow crystalline powder. Solutions have a yellowish-blue fluorescence. Mp 164° to 167°. Slightly soluble in water; very soluble in methanol, ethanol, and chloroform; soluble in dilute acids; practically insoluble in ether. pK_a 6.4 [Wolfram, Bjornsson 1980]. Log *P* (octanol/water) 2.7. Stock solutions and plasma samples were stable at room temperature for 6 h, at –20° for 15 days, in the autosampler (15°) for 24 h and after 3 freeze-thaw cycles [Wang *et al.* 2008]. Stock solutions were stable at room temperature and 2 to 8° for a minimum of 8 h and 6 days, respectively. Dipyridamole in control human plasma was stable for at least 7.5 h at room temperature and for a minimum of 3 freeze-thaw cycles. Spiked plasma samples were stable at –20° and –70° for a minimum of 93 days. Stability in the autosampler (5°) was determined to be 23.5 h [Yadav *et al.* 2008]. Freshly prepared standard solutions degrade in daylight. Samples prepared with deproteinised serum were stable for several days [Pedersen 1979].
Colour Tests Mandelin's test—violet; Marquis test—orange.
Thin-layer Chromatography System TA—R_f 0.68; system TB—R_f 0.00; system TC—R_f 0.37; system TE—R_f 0.44; system TL—R_f 0.42; system TAE—R_f 0.82; system TAF—R_f 0.87 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1640.
High Performance Liquid Chromatography System HA—*k* 0.2; system HAA—RT 13.2 min; system HX—RI 393; system HY—RI 335; system HZ—RT 3.0 min.
Ultraviolet Spectrum Acid methanol—230, 285 nm ($A_1^1 = 650a$); aqueous alkali—295 nm.



Infrared Spectrum Principal peaks at wavenumbers 1526, 1214, 1010, 1076, 1041, 1251 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 504, 473, 429, 505, 221, 474, 84, 430.



Quantification

Blood **HPLC** Column: μBondapak C_{18} (30 × 0.39 cm i.d., 10 μm). Mobile phase: methanol : water (65 : 35) both containing 0.005 mol/L 1-heptanesulfonic acid sodium salt and 0.1% acetic acid, flow rate 2.0 mL/min. Fluorescence detection (λ_{ex} = 285 nm, λ_{em} = 470 nm). Retention time: 5.1 min. Limit of detection not reported [Wolfram, Bjornsson 1980].
Plasma **HPLC** Column: Ultrasphere XL ODS (70 × 4.6 mm i.d., 3 μm). Mobile phase: methanol : 0.02 mol/L ammonium acetate buffer (pH 5.0; 65 : 35), flow rate 1.5 mL/min. UV detection (λ = 280 nm). Retention time: 4.57 min. Limit of detection, 10 μg/L [Barberi *et al.* 1991]. Column: Merck C_{18} (10 × 3 mm i.d., 5 μm). Mobile phase: acetonitrile : 0.01 mol/L monobasic potassium buffer (pH 7) with 0.1 N sodium hydroxide (45 : 55), flow rate 0.6 mL/min. Fluorescence detection (λ_{ex} = 285 nm, λ_{em} = 470 nm). Retention time: 3.5 min. Limit of detection, 5 μg/L [Ricevuti *et al.* 1991]. Column: ODS Hypersil. Mobile phase: methanol : 0.01 mol/L tris hydrochloride buffer (pH 8.6; 85 : 15). Fluorescence detection (λ_{ex} = 360 nm, λ_{em} = 460 nm). Retention time: 6 min. Limit of detection, 0.01 mg/L [Dresse *et al.* 1982]. Column: μBondapak C_{18} (30 × 0.39 cm i.d., 10 μm). Mobile phase: acetonitrile : 0.01 mol/L sodium phosphate buffer (pH 7.0; 50 : 50), flow rate 1.5 mL/min. UV detection (λ = 285 nm). Retention time: 5.5 min. Limit of detection, 5 μg/L [Williams *et al.* 1981]. Column: Ultrasphere C_{18} (25 cm × 0.46 mm i.d., 5 μm). Mobile phase: acetonitrile : 0.02 mol/L phosphate buffer containing 0.01 mol/L *N,N,N,N*-tetramethylethylene diamine (33 : 67), flow rate 2.5 mL/min. UV detection (λ = 280 nm). Retention time: 7.5 min. Limit of detection, 2 μg/L [Rosenfeld *et al.* 1982]. See Blood [Wolfram, Bjornsson 1980]. Column: Lichrosorb RP-18 (125 × 4.6 mm i.d., 5 μm). Mobile phase: methanol : 0.2 mol/L Tris hydrochloride buffer (80 : 20), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 415 nm, λ_{em} = 478 nm). Limit of detection, <5 μg/L [Schmid *et al.* 1979].
LC-MS Column: Shimadzu VP-ODS-C_{18} (150 × 2.0 mm i.d., 5 μm). Mobile phase: methanol : water (pH 4.25; 70 : 30), flow rate 2.0 mL/min. ESI, negative ion mode. Retention time: 5.7 min. Limit of quantification, 10 μg/L, limit of detection, 1 μg/L [Wang *et al.* 2008]. Column: Gemini C_{18} (50 × 4.6 mm i.d., 5 μm). Mobile phase: methanol : water (90 : 10) containing 0.1% formic acid, flow rate 1.0 mLmin. ESI, TIS, positive ion mode, MRM acquisition mode. Limit of detection, 5.1 μg/L [Yadav *et al.* 2008].
Serum **HPLC** Column: μBondapak C_{18} (30 × 0.39 cm i.d., 10 μm). Mobile phase: methanol : 0.02 mol/L sodium acetate (pH 4.0; 75 : 25), flow rate 2.0 mL/min. UV detection (λ = 280 nm). Retention time: ≈7.5 min. Limit of detection, 8 μg/L [Pedersen 1979].
Note For a spectrofluorimetic method for the detection of dipyridamole, see Steyn [1979].

Disposition in the Body Readily absorbed after oral administration. Eliminated mainly in the faeces; excretion may be delayed due to enterohepatic circulation. Small amounts are excreted in the urine as the glucuronide conjugate.

Therapeutic Concentration

After the administration of 75 mg dipyridamole to 67 healthy male subjects a mean maximum plasma concentration of 2000 ± 764 μg/L was reached at 0.77 ± 0.3 h [Yadav *et al.* 2008].

After oral administration of 50 mg three times a day to 10 subjects, maximum steady-state plasma concentrations of 0.4–2.6 mg/L (mean 1.4) were reported; trough concentrations were 0.1–1.5 mg/L (mean 0.7). In 10 subjects given 75 mg twice daily, the corresponding maximum and minimum steady-state concentrations were 0.5–4 mg/L (mean 1.7) and 0.1–2.6 mg/L (mean 0.9) [Mahony *et al.* 1983].

Two healthy male volunteers were administered 2 × 25 mg Persantine tablets following a 12 h fast. Mean peak plasma concentrations reached ≈517 µg/L at ≈1 h [Williams *et al.* 1981].

A healthy volunteer was administered a single oral dose of 25 mg dipyridamole. The peak plasma concentration of ≈300 µg/L was reached after ≈1 h [Schmid *et al.* 1979].

After a single oral dose of 100 mg given to 4 subjects, peak serum concentrations of ≈2 mg/L were attained in 1 h [Nielsen-Kudsk, Pedersen 1979].

Toxicity

A 23-year-old female who suffered profound shock after deliberately ingesting 1750 mg of dipyridamole was successfully treated with aminophylline and dopamine [Chen *et al.* 1994].

Half-life Plasma half-life, ≈12 h.

Volume of Distribution ≈2.5 L/kg.

Clearance Plasma clearance, ≈2 mL/min/kg. Gastric pH has an impact on gastric emptying in elderly patients with a higher pH resulting in a slower emptying [Russell *et al.* 1994].

Protein Binding >90% [Szebeni, Weinstein 1991].

Dose 300 to 600 mg daily (antithrombotic); 150 mg daily (antianginal).

Dipyrone

Analgesic, Antiinflammatory, Antipyretic

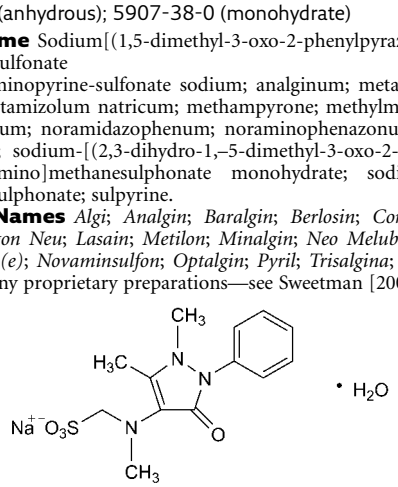
$C_{13}H_{16}N_3NaO_4S,H_2O = 351.4$

CAS—68-89-3 (anhydrous); 5907-38-0 (monohydrate)

IUPAC Name Sodium[(1,5-dimethyl-3-oxo-2-phenylpyrazol-4-yl)-methylamino]methanesulfonate

Synonyms Aminopyrine-sulfonate sodium; analginum; metamizole; metamizole sodium; metamizolum natricum; methampyrone; methylmelubrin; natrium novaminsulfonicum; noramidazophenum; noraminophenazonum; novamidazofen; NSC-73205; sodium-[(2,3-dihydro-1,–5-dimethyl-3-oxo-2-phenyl-1*H*-pyrazol-4-yl)methylamino]methanesulphonate monohydrate; sodium noramidopyrine methanesulphonate; sulpyrine.

Proprietary Names *Algi*; *Analgin*; *Baralgin*; *Berlosin*; *Conmel*; *Dolemicin*; *Dolocalma*; *Inalgon Neu*; *Lasain*; *Metilon*; *Minalgin*; *Neo Melubrina*; *Nevralgina*; *Nolotil*; *Novalgin(e)*; *Novaminsulfon*; *Optalgin*; *Pyril*; *Trisalgina*; *Unagen*. It is an ingredient of many proprietary preparations—see Sweetman [2007].



Chemical Properties White or yellowish-white crystalline powder. Mp 172°. Soluble 1 in 1.5 of water and 1 in 30 of ethanol; practically insoluble in ether, acetone, benzene and chloroform.

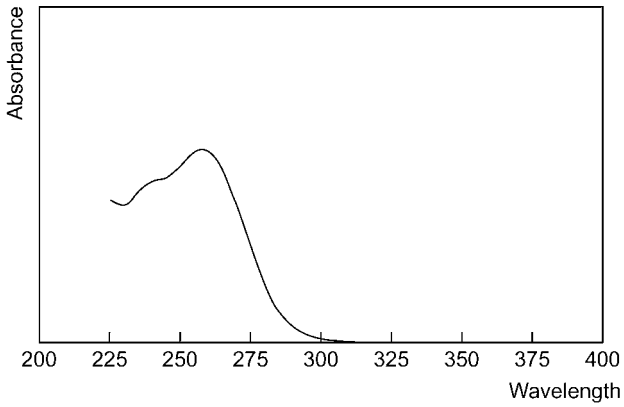
Colour Tests Ferric chloride—violet; Folin–Ciocalteu reagent—blue; Liebermann's reagent (100°)—blue; Mandelin's test—brown; nitrous acid—transient blue.

Thin-layer Chromatography System TA—R_f 0.84; system TB—R_f 0.00; system TC—R_f 0.01; system TD—R_f 0.00; system TE—R_f 0.02; system TF—R_f 0.00; system TL—R_f 0.02; system TAD—R_f 0.02; system TAE—R_f 0.85; system TAF—R_f 0.59 (acidified iodoplatinate solution, white).

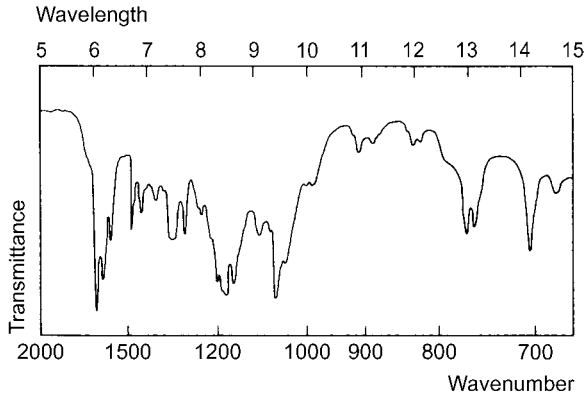
Gas Chromatography System GA—M (bis-desalkyl-) RI 1955, M (desalkyl-)-AC RI 2395; system GB—dipyrone RI 2069.

High Performance Liquid Chromatography System HD—*k* 0.1; system HW—*k* 0.45; system HX—RI 316; system HY—RI 194; system HZ—RT 1.4 min.

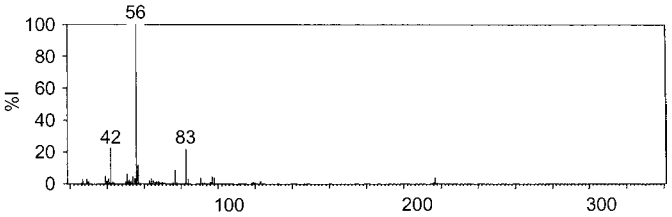
Ultraviolet Spectrum Aqueous acid—258 nm (A^1_1 = 266a).



Infrared Spectrum Principal peaks at wavenumbers 1672, 1064, 1179, 1163, 1208, 1639 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 56, 42, 83, 57, 77, 51, 97, 54.



Quantification

Plasma **HPLC** Column: OD-MP Spheri-5 RP-18 (10 cm × 4.6 mm i.d.). Mobile phase: 0.1 mol/L SDS with 2.5% pentanol, flow rate 1.0 mL/min. UV detection (λ = 262 nm). Limit of detection, 14.4 and 18 mg/L for FAA and AA, respectively [Carretero *et al.* 1995]. Column: Spherisorb ODS (125 × 4.5 mm i.d., 5 µm). Mobile phase: 0.05 mol/L TEAP buffer (pH 2.8) : acetonitrile : methanol (100 : 10 : 8), flow rate 1.1 mL/min. UV detection (λ = 265 nm). Limit of detection, 0.1 mg/L [Damm 1989]. Column: µBondapak C_{18} (300 × 3.9 mm i.d., 10 µm). Mobile phase: methanol : 0.01 mol/L sodium acetate (pH 3.0; 8 : 92), flow rate 1.6 mL/min. UV detection (λ = 257 nm). Retention time: 14, 17, 21, and 25 min for MAA, AA, FAA and AAA, respectively. Limit of detection, 0.1 mg/L [Katz *et al.* 1984]. Column: µBondapak C_{18} (30 cm × 3.9 mm i.d., 10 µm). Mobile phase: water : methanol : acetic acid (75 : 20 : 5), flow rate 1.0 mL/min. UV detection (λ = 254 and 280 nm). Limit of quantification, 1 mg/L for dipyrone and 250 ng/mL for 4-methylaminophenazone Asmardi, Jamali 1983].

Urine **HPLC** See Plasma. Limit of detection, 2 mg/L [Damm 1989]. Column: Spherisorb ODS (250 × 4.6 mm i.d., 5 µm). Mobile phase: water : methnol : triethylamine : acetic acid (70.9 : 27.7 : 0.9 : 0.5), flow rate 1.0 mL/min. UV detection

($\lambda = 254$ nm). Retention time: 22.2 min for MMA. Limit of detection, 30 µg/L [Agúndez *et al.* 1994]. See Plasma [Asmardi, Jamali 1983].

***Other* HPLC** Human Liver Microsomes. Column: Lichrospher 60 RP (125 × 3.0 mm i.d., 5 µm). Mobile phase: methanol : 0.05 mol/L sodium acetate buffer (pH 2.2; 1 : 99 to 4 : 96 at 6 min to 7 : 93 at 13 min to 9 : 91 at 18 min for 8 min to 1 : 99 at 27 min), flow rate 0.9 mL/min. UV detection ($\lambda = 257$ nm). Limit of quantification, 50 µg/L for all metabolites [Geisslinger *et al.* 1996].

Disposition in the Body Rapidly hydrolysed by desmethane-sulfonation in the gastrointestinal tract after oral administration to the active metabolite 4-methylamino-antipyrine (MMA). MMA undergoes incomplete oxidative demethylation to 4-formylamino-antipyrine (FAA) and demethylation to 4-amino-antipyrine (AA), which in turn is acetylated to form 4-acetylamino-antipyrine (AAA). About 70% of a dose is excreted in the urine in 24 h as metabolites. Dipyrone metabolites are excreted in breast milk.

Therapeutic Concentration

In 12 subjects given single oral doses of a test and reference preparation of dipyrone 1 g, the mean peak plasma concentrations of 4-methylamino-antipyrine, 4-formylamino-antipyrine, 4-amino-antipyrine, and 4-acetylamino-antipyrine were 17.19 and 16.92 mg/L (test and reference), 1.6 and 1.84 mg/L, 2.94 and 2.89 mg/L, and 1.93 and 1.86 mg/L at 1.42 and 1.46 h, 6.2 and 7.0 h, 4.4 and 4.4 h, and 11.3 and 11.6 h, respectively. Four of the subjects were rapid and 8 were slow acetylators; the peak plasma concentration (or the test preparation) differed significantly between the 2 acetylator types only for 4 amino-antipyrine (16.98 vs 18.52 for slow vs rapid acetylators) and 4-acetyl-amino-antipyrine (1.38 vs 4.38 mg/L) [Bacracheva *et al.* 1995].

The formation and urinary excretion of dipyrone metabolites was measured in 12 healthy volunteers following a single oral 1.0 g dose of dipyrone. The group consisted of 3 slow and 9 rapid acetylators. Renal clearance of all metabolites was similar for both phenotypes. Formation of the metabolites AA and AAA were significantly different between the 2 phenotypes: AA, 0.25 (slow) vs 0.1 mL/min/kg (rapid) AAA, 0.75 vs 7.53 mL/min/kg (rapid) [Zylber-Katz *et al.* 1992].

A single oral dose of 1 g dipyrone sodium was administered to 12 healthy volunteers. Pharmacokinetic values for the main metabolites are shown below.

	MAA	*AA*	*FAA*	*AAA*
C_{max} (mg/L)	12.2 ± 1.4	1.5 ± 0.8	2.4 ± 0.5	1.8 ± 0.6
t_{max} (h)	1.3 ± 0.4	4.4 ± 0.9	5.8 ± 1.3	15.0 + 6.4
$t_{1/2}$(h)	2.7 ± 0.5	3.7 ± 1.3	11.2 ± 1.5	9.5 + 1.5
CL_{ren} (mL/min)	5.0 ± 1.8	37.8 ± 12.8	48.5 ± 4.5	60.6 + 8.3

[Damm 1989].

After a single oral dose of 1 g given to 12 slow acetylators and 11 rapid acetylators (determined with reference to dapsone), the mean peak plasma concentrations (mg/L, time in hours) were as shown below.

	Slow acetylators	*Rapid acetylators*
4-Acetylaminophenazone	1.6 (16.1)	4.4 (10.0)
4-Aminophenazone	2.7 (6.7)	1.6 (3.2)
4-Formylaminophenazone	1.8 (7.7)	2.5 (6.6)
4-Methylaminophenazone	10.0 (1.6)	11.0 (1.2)

[Levy *et al.* 1984]

Toxicity Dipyrone is rarely used in the US due to an association with agranulocytosis. Other adverse reactions include skin rashes, anaphylaxis, thrombocytopaenia, hepatocellular damage, and CNS symptoms. The estimated minimum lethal dose is 5 g, but fatalities from acute poisoning are rare.

A 56-year-old male died after ingesting up to 20 g dipyrone, 2 g baclofen and 0.15 g oxybutynin; terazosin, aspirin, defibrotide, and laxatives also may have been ingested. Postmortem, carried out a few hours after death, revealed dipyrone, baclofen and oxybutynin concentrations, respectively, of 106, 669 and 0.1 mg/L in the blood and 774 mg/L, 215 mg/L, and trace amounts in the urine [De Giovanni, d'Aloja 2001].

Note For a case of a death after the IV administration of Avafortan (24 mg/mL avapyrazone and 240 mg/mL dipyrone) see Fosseus and Straughan [1983].

Half-life Plasma half-life, 4-acetylamino-antipyrine about 10.6 h, 4-amino-antipyrine ≈5 h, 4-formylamino-antipyrine ≈10 h, and 4-methylamino-antipyrine ≈3.3 h.

Dose 0.5 to 4 g daily in divided doses.

Diquat

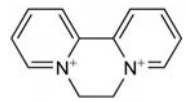
Herbicide

$C_{12}H_{12}N_2 = 184.2$

CAS—2764-72-9

IUPAC Name 6,7-Dihydrodipyrido[1,2-*a*:2′,1′-*c*]pyrazinediium ion

Synonym Deiquat



Note Unless otherwise stated, the analytical information given below refers to diquat dibromide. For information on the monoene and diene reduction products for GC-MS analysis, see under Quaternary ammonium herbicides in Chapter 16.

Diquat Dibromide

$C_{12}H_{12}Br_2N_2 = 344.0$

CAS—85-00-7

Proprietary Names *Aquacide*; *Reglone*. It is an ingredient of *Pathclear* and *Weedol*.

Chemical Properties Yellow crystals. Mp ~335°. Soluble in water. Log *P* (octanol/water), 2.4.

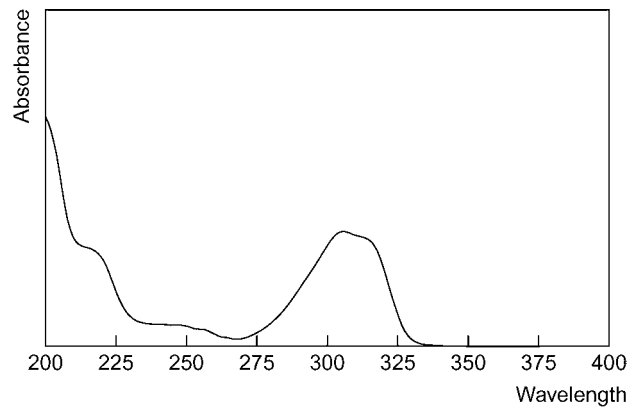
Colour Test Sodium dithionite—green.

Thin-layer Chromatography System TA—R_f 0.00; system TAB—R_f 0.00; system TAC—R_f 0.00; system TAE—R_f 0.00; system TAF—R_f 0.00; system TL—R_f 0.00 (acidified iodoplatinate solution, positive).

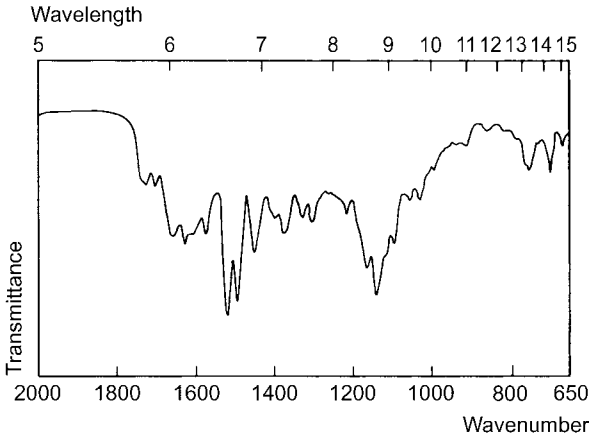
Gas Chromatography System GA—diquat dibromide not eluted; system GK—monoene reduction product RT 0.40 min; diene reduction product RT 0.49 min (both relative to caffeine).

High Performance Liquid Chromatography System HX—RI 00; system HAO—diquat dibromide*k* 99.9; system HAP—diquat dibromide *k* 0.00.

Ultraviolet Spectrum Aqueous acid—310 nm (A^1_1 = 518b)



Infrared Spectrum Principal peaks at wavenumbers 1522, 1498, 1140, 1166, 1097, 1632 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* (monoene reduction product) 83, 108, 96, 54, 111, 192, 84, 55; (diene reduction product) 54, 108, 81, 190, 111, 135, 83, 80 .

Quantification

Blood **HPLC** Column: μ-Bondapack C_{18} (300 × 3.8 mm). Mobile phase: deionised water : octane sulfonic acid : acetonitrile : orthophosphoric acid : diethylamine : tetrahydrofuran, flow rate 1.0 mL/min. UV detection (λ = 315 nm) [Madhu *et al.* 1995].

GC FID [Kawase *et al.* 1984].

Serum **HPLC** UV detection (λ = 391 nm). Limit of quantification, 100 μg/L [Hara *et al.* 2007]. Quantification of paraquat and diquat [Nakagiri *et al.* 1989].

Urine **HPLC** See Blood [Madhu *et al.* 1995]. See Serum [Nakagiri *et al.* 1989]. UV detection. Limit of detection, <1 mg/L [Gill *et al.* 1983].

GC See Blood [Kawase *et al.* 1984].

Bile **HPLC** See Blood [Madhu *et al.* 1995].

Kidney **HPLC** See Blood [Madhu *et al.* 1995].

Liver **HPLC** See Blood [Madhu *et al.* 1995].

Biological Materials **HPLC** Column: Sep-Pak C_{18}. Mobile phase: 0.5% potassium bromide : 5% methanol solution : TEA (1 mL/L). UV detection (λ = 310 nm). Limit of detection, 0.05 μg/g [Ito *et al.* 1993].

Disposition in the Body Diquat is absorbed from the gastrointestinal tract and slightly absorbed through the skin.

Toxicity Diquat produces similar adverse effects to those of paraquat except that it does not seem to cause the progressive fibrosis in the lungs. A fatality after ingestion of ≈2 g has been reported and the ingestion of ≈20–50 mL of a 20% concentrate has caused death within 2–7 days. The maximum permissible atmospheric concentration is 0.5 mg/m^3 (as the dibromide) and the maximum acceptable daily intake (as the dichloride) is 5 μg/kg.

A 37-year-old man died 26 h after ingesting 300 mL diquat solution (equivalent to 60 g diquat ion) in a suicide attempt. Four hours after ingestion, the concentration of diquat in the serum was 64 mg/L. Postmortem tissue concentrations were (μg/g): kidney 4.5, lung 3.4, liver 2.3, brain 1.6, heart 1.1 [Hantson *et al.* 2000].

A 44-year-old woman ingested an unknown quantity of diquat and died ≈16 h after being found. The following postmortem concentrations were reported: kidney 11.6 μg/g and liver 5.1 μg/g [Pannell, Thomson 1981].

A young man drank several mouthfuls of a 20% concentrate of diquat and died 7 days later. The following postmortem concentrations were reported: blood 0.6 mg/L, heart 0.11 μg/g, kidney 1.19 μg/g, liver 0.33 μg/g, lung 0.56 μg/g and spleen 1.04 μg/g [Schönborn *et al.* 1971].

Dirithromycin

Antibacterial, Macrolide

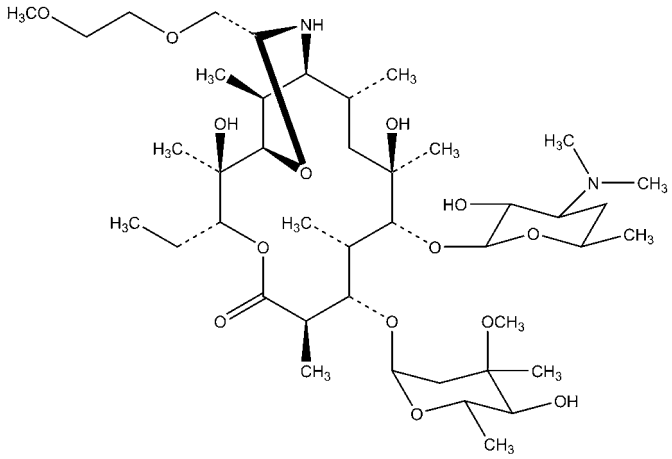
$C_{42}H_{78}N_2O_{14}$ = 835.1

CAS—62013-04-1

IUPAC Name (1*S*,2*R*,4*R*,5*R*,6*S*,7*S*,8*R*,11*R*,12*R*,15*R*,17*S*)-5-[(2*S*,3*R*,4*S*,6*R*)-4-Dimethylamino-3-hydroxy-6-methyloxan-2-yl]oxy-11-ethyl-4,12-dihydroxy-7-[(2*R*,4*R*,5*S*,6*S*)-5-hydroxy-4-methoxy-4,6-dimethyloxan-2-yl]oxy-15-(2-methoxyethoxymethyl)-2,4,6,8,12,17-hexamethyl-10,14-dioxa-16-azabicyclo[11.3.1]heptadecan-9-one

Synonyms AS-E 136; [9*S*(*R*)]-9-Deoxo-11-deoxy-9,11-[imino[2-(2-methoxyethoxy)ethylidene]oxy]erythromycin; (1*R*,2*R*,3*R*,6*R*,7*S*,8*S*,9*R*,10*R*,12*R*,13*S*,15*R*,17*S*)-7-[(2,6-dideoxy-3-C-methyl-3-*O*-methyl-α-L-ribo-hexopyranosyl)oxy]-3-ethyl-2,10-dihydroxy-15-[(2-methoxyethoxy)methyl]-2,6,8,10,12,17-hexamethyl-9-[[3,4,6-trideoxy-3-(dimethylamino)-β-D-xylo-hexopyranosyl]oxy]-4,16-dioxa-14-azabicyclo[11.3.1]heptadecan-5-one; LY-237216.

Proprietary Names *Dimac*; *Dynabac*; *Noriclan*; *Nortron*; *Unibac*; *Valodin*.



Chemical Properties Crystals. Mp 186° to 189°. pK_a 9.0 in 66% aqueous dimethyl fluoride [O'Neil *et al.* 2006].

Thin-layer Chromatography Plates: Silica gel 60F_{254}. Mobile phase: *n*-pentane : dichloromethane : methanol : concentrated ammonia (40 : 60 : 10 : 0.6). UV detection (λ = 254 nm) or molybdatophosphoric acid hydrate spray with oven at 120° for 7 min [Firl *et al.* 1990].

Liquid Chromatography-Mass Spectrometry Column: C_{18} (250 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : propan-2-ol : 0.2 mol/L ammonium acetate buffer (pH 8.5): water (160 : 165 : 50 : 625), flow rate 1.0 mL/min. ESI, positive ion mode, CI . Limit of quantification or detection not reported [Diana *et al.* 2006].

Disposition in the Body Readily absorbed following oral administration and undergoes non-enzymatic hydrolysis to its active metabolite, erythromycylamine within 35 min of administration. It does not induce or inhibit CYP-dependent oxidative metabolism of other drugs [Jain, Danziger 2004]. Erythromycylamine accumulates in polymorphonuclear leucocytes to a greater extent than does erythromycin [Geerdes-Fenge *et al.* 1997]. Approximately 62 to 81% of an orally administered dose is eliminated in the faeces, predominantly as erythromycylamine, with ≈1.2 to 2.9% recovered in urine. The concentration of biologically active products in lung tissue, bronchial mucosa and bronchial secretions is 20 to 40 times the simultaneous plasma concentration. This has also been reported in samples of nasal mucosa, and tonsillar and prostatic tissue.

Therapeutic Concentration Following daily doses of 500 mg dirithromycin for 5 days the mean concentration in the bronchial mucosa was 1.7 ± 0.8 mg/kg [Bergogne-Berezin 1993]. Multiple 500 mg doses resulted in mean nasal mucosa concentrations of 1.86 ± 0.54 mg/kg. A mean concentration of 1.06 ± 0.48 mg/kg was found in tonsillar tissue 12 h after a 500 mg dose had been administered: 56% of this concentration was maintained for 24 h after the last dose [Benson *et al.* 1996].

Twelve healthy male volunteers received 4 single oral doses of 250, 500, 750 and 1000 mg dirithromycin on separate occasions. Peak plasma concentrations were not detected following an oral dose of 250 mg but measured 0.29 ± 0.21, 0.64 ± 0.44 and 0.41 ± 0.24 mg/L for the 500, 750 and 1000 mg doses, respectively, attained at 4 h independent of dose. After the IV administration of 100 mg to the same volunteers, the peak plasma concentration was 2.37 ± 0.28 mg/L [Sides *et al.* 1993].

Following oral administration of a single 500 mg dose of dirithromycin to 8 healthy volunteers and to 16 patients with cirrhosis (8 with class A (mild) and 8 with class B (moderate) cirrhosis according to Pugh's and Child's classification), mean peak serum concentrations obtained 3 to 4 h after administration were as follows:

Twenty patients suffering from an acute exacerbation of mild chronic obstructive pulmonary disease were administered 500 mg oral dirithromycin daily for 5 days. Dirithromycin concentrations in bronchial

Group	*C_{max} (mg/L)*	*Half-life (h)*
Healthy	0.29	23.3
Class A patients	0.48	35.2
Class B patients	0.52	39.5

[Mazzei *et al.* 1999].

secretions, bronchial mucosa and epithelial lining fluid were 2.67, 2.71 and 2.37 mg/L, respectively, measured 4 h after the final dose. At all time periods, concentrations of dirithromycin in secretions, bronchial mucosa, and epithelial lining fluid were greater than the concentration in serum [Matera *et al.* 1997].

Forty-six patients suffering from chronic bronchitis were administered 500 mg oral dirithromycin for 5 days. Dirithromycin concentrations in several sample types were measured at 24, 48, and 72 h after the last dose and were reported as follows:

Sample	*24 h*	*48 h*	*72 h*
Serum (mg/L)	0.17	0.05	0.05
Bronchial mucosa (mg/kg)	6.51	6.61	5.67
Bronchial secretions (mg/L)	1.26	0.64	0.84

[Leroyer *et al.* 1998].

Bioavailability Approximately 6 to 14%.
Half-life Dirithromycin, ~23 h; erythromycylamine, 30 to 44 h.
Volume of Distribution Erythromycylamine, 800 to 7500 L.
Clearance Erythromycylamine, 15 to 30 L/h.
Protein Binding Approximately 19%, principally to α_1-acid glycoprotein.
Dose 500 mg once daily by mouth.

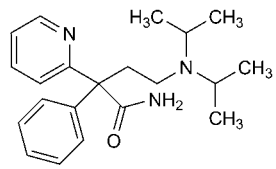
Disopyramide

Antiarrhythmic
$C_{21}H_{29}N_3O = 339.5$
CAS—3737-09-5

IUPAC Name 4-[Di(propan-2-yl)amino]-2-phenyl-2-pyridin-2-ylbutanamide
Synonyms α-2-[Bis(1-methylethyl)amino]ethyl]-α-phenyl-2-pyridineacetamide; DP.
Proprietary Names *Dicorynan*; *Dimodan*; *Disofarin*; *Disonorm*; *Durbis* (capsules); *Isomide*; *Isorythm*; *Ritmodan*; *Rythmodan* (capsules).



Chemical Properties White powder. Mp ≈95°. Soluble 1 in 200 of water, 1 in 10 of ethanol, 1 in 5 of chloroform and 1 in 5 of ether. pK_a 10.4 [Karim *et al.* 1982], 8.4. Log P (chloroform/water), 3.1 (pH 7.2) [Karim *et al.* 1982], (octanol/water),2.6. Extraction yield (chlorobutane), 0.8 [Demme *et al.* 2005]. Stock racemic DP and MND solutions prepared in methanol containing 0.01 mol/L HCl in the concentration range 1 to 500 mg/L were stable for at least 3 months if stored at –20° [Jabor *et al.* 2001]. Stable in plasma for at least 1 month if stored at –20° and 4° [Charette *et al.* 1983]. Stable if incubated at 37° for 1 h or stored in human plasma at –20° for 86 days [Karim *et al.* 1982]. Stable in plasma for at least 48 h [Johnston, McHaffie 1978].

Disopyramide Phosphate

$C_{21}H_{29}N_3O,H_3PO_4 = 437.5$
CAS—22059-60-5
Proprietary Names *Dicorantil*; *Dirythmin*; *Dirytmin*; *Diso-Duriles*; *Disomet*; *Disonorm*; *Durbis (injection)*; *Isomide*; *Isorythm*; *Norpace*; *Ritmodan*; *Ritmoforine*; *Rythmical*; *Rythmodan* (injection and tablets); *Rythmodul*.
Chemical Properties White powder. Mp ≈205°, with decomposition. Soluble 1 in 20 of water and 1 in 50 of ethanol; practically insoluble in chloroform and ether.

Thin-layer Chromatography System TA—R_f 0.45; system TB—R_f 0.07; system TC—R_f 0.08; system TE—R_f 0.60; system TL—R_f 0.13; system TAE—R_f 0.09; system TAF—R_f 0.07.

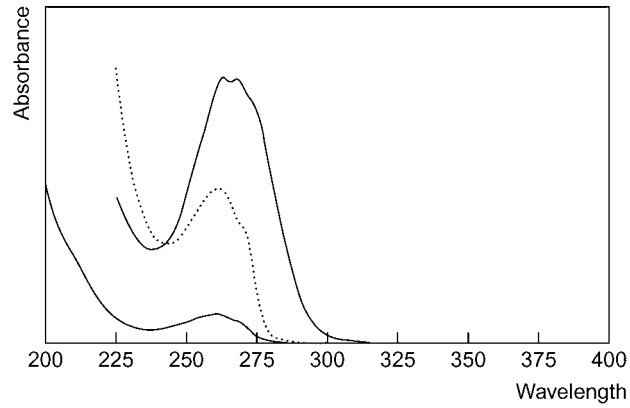
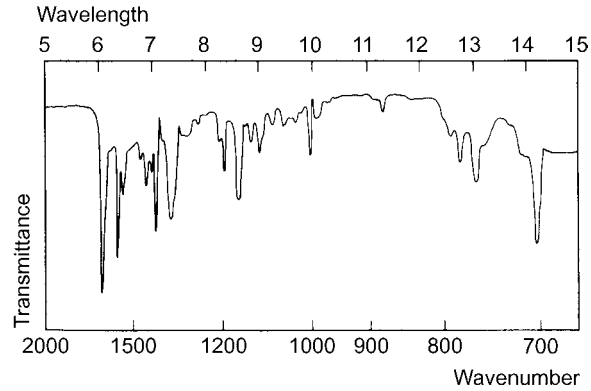
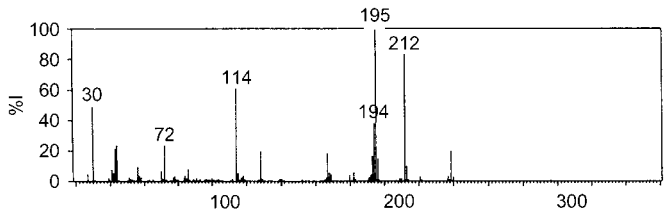
Ultraviolet Spectrum Aqueous acid—263, 269 (A_1^1 = 199a); aqueous alkali—261 nm.



Infrared Spectrum Principal peaks at wavenumbers 1664, 1585, 697, 1163, 1562, 760 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 195, 212, 114, 30, 194, 72, 44, 43 (no peaks above 240) See Anderson *et al.* [1980].



Quantification

Blood **GC** Column: SE-54 fused silica capillary (12 m × 0.32 mm i.d.). Carrier gas: He, 4.0 mL/min. Temperature programme: 80° for 1 min to 300° at 20°/min for 5 min. NPD, positive ion mode. Limit of detection, 1 mg/L [Singer, Mozayani 1995]. Column: 50% phenyl methyl silicone fused silica capillary (10 m × 0.54 mm i.d.). Carrier gas: He, 30 mL/min. Temperature programme: 200° for 0.5 min to 280° at 10°/min for 5 min. NPD. Limit of detection, 0.3 mg/L [Sathyavagiswaran 1987]. Column: 3% OV-17 on Chromosorb W-HP 80/100 mesh (2′ × 4 mm i.d.). Carrier gas: He, 50 mL/min. Temperature: 230°. FID. Limit of detection not reported [Michalek *et al.* 1982]. Column: 3% OV-17 on 100/120 mesh Gas-Chrom Q (60 cm × 2 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature: 260°. Retention time: ≈1.5 min. Limit of detection, 5 mg/L [Doedens, Forney 1978].

HPLC Column: Vydac TP 101 (30 cm × 4.6 mm i.d.). Mobile phase: methylene chloride : methanol : ammonium hydroxide (85 : 15 : 0.5), flow rate 1.0 mL/min. Limit of detection, 0.5 mg/L [Anderson *et al.* 1980].

Plasma **GC** Column: 3% OV7 phenylmethyl silicone on HP Chrom W 100/120 mesh (2 m × 2 mm i.d.). Carrier gas: N_2, 35 mL/min. Temperature programme: 190° for 3 min to 280° at 3°/min for 10 min. FID. Limit of detection, 25 µg/L [Quaglio *et al.* 1995]. Column: 3% OV-17 (1 m × 3 mm i.d.). Carrier gas: He, 40 mL/min. Temperature programme: 190° to 250° at 4°/min. FID. Retention time ≈23 min. Limit of detection not reported [Sakata *et al.* 1988]. Column: 5% phenylmethyl silicone (25 m × 0.31 mm i.d., 0.17 µm). Carrier gas: He, 1 mL/min. Temperature programme: 160° to 195° at 5°/min. NPD Retention time: 10.1 min. Limit of detection, 0.05 mg/L [Kapil *et al.* 1984; Kapil *et al.* 1985]. Column: 3% SE 30 Supelcoport 80/100 mesh (1 m × 6 mm i.d.). Carrier gas: N_2, 40 mL/min. Temperature: 260°. Retention time: 1.6 min. Limit of detection not reported [Johnston, Hamer 1981].

See also Bredesen [1980]; Aitio [1979]; Foster, Reid [1979]; Hayler, Flanagan [1978]; Johnston, McHaffie [1978].

HPLC Column: Chiralpak AD (250 × 4.6 mm i.d., 10 µm). Mobile phase: hexane : ethanol (91 : 9), with 0.1% diethylamine, flow rate 1.2 mL/min. UV detection (λ = 270 nm). Limit of quantification, 12.5 µg/L [Bortocan *et al.* 2000]. Column: Capcell Pak CN (25 cm × 4.6 mm i.d., 5 µm). Mobile phase: 0.05 mol/L phosphate buffer (pH 2.5) : acetonitrile (80 : 20), flow rate 1.0 mL/min. UV detection (261 nm). Retention time: 8.8 min. Limit of detection, 0.03 mg/L [Sagawa *et al.* 1997]. Column: LiChrosorb RP-18 (250 × 4 mm i.d., 10 µm). Mobile phase: acetonitrile : methanol : phosphate buffer (pH 3.2; 6 : 1 : 3), flow rate 1.0 mL/min. UV detecton (λ = 269 nm). Retention time: 6.08 min. Limit of detection not reported [Witek *et al.* 1994]. Column: Chiralcel OF (50 × 4.6 mm i.d.). Mobile phase: *n*-hexane : 2-propanol : diethylamine (80 : 20 : 0.1), flow rate 0.6 mL/min. UV detection (λ = 261 nm). Limit of detection, 0.01 and 0.025 mg/L for S-DP and other analytes, respectively [Echizen *et al.* 1991]. Column: Spherisorb hexyl (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 15 mmol/L potassium dihydrogen phosphate (pH 4.0; 40 : 60), flow rate 1.5mL/min. UV detection (λ = 254 nm). Limit of quantification, 0.5 mg/L [Verbesselt *et al.* 1991]. Column: chiral cellulose triphenylcarbamate (50 × 4.6 mm i.d.). Mobile phase: *n*-hexane : 2-propanol (80 : 20) with diethylamine, flow rate 0.6 mL/min. UV detection (λ = 261 nm). Retention time: 5.6 min for *S*(+)disopyramide. Limit of detection, 0.01 mg/L for *S*(+)disopyramide [Echizen *et al.* 1990].

See also Takahashi *et al.* [1990]; Enquist, Hermansson [1989]; Le Corre *et al.* [1988]; Dusci, Hackett [1985]; Bridges, Jennison [1983]; Charette *et al.* [1983]; Ahokas *et al.* [1980]; Draper *et al.* [1979]; Nygard *et al.* [1979]; Ilett *et al.* [1978]; Meffin *et al.* [1977].

CE Column: fused silica capillary (42 cm × 75 µm i.d.). Buffer: 20 mmol/L sodium acetate buffer (pH 5.0) containing 0.2% sulfated β-CD. UV detection (λ = 214 nm). Limit of quantification, 62.5 µg/L for (–)-(*R*)-DP, (+)-(*S*)-DP and (–)-(*R*)-MND, 125 µg/L for (+)-(*S*)-MND [Jabor *et al.* 2001].

Serum **GC** Column: 3% OV-17 on 100/120 mesh Gas Chrom Q (1.8 m × 2 mm i.d.) or 2% SP-2250 or 2% OV-101 on Chromosorb W-HP 100/120 mesh (1.2 m × 2 mm i.d.). Carrier gas: He, 40 mL/min for 3% OV-17, N_2, 30 mL/min for 2% OV-101 and SP-2250. Temperature: 260°, 230° and 250° for each column, respectively. NPD. Limit of detection not reported [Vasiliades *et al.* 1979a]. Column: 2% SP-2250 on Chromosorb W-HP 100/120 mesh (1.2 m × 2 mm i.d.). Carrier gas: He, 40 mL/min. Temperature: 250°. NSD. Limit of detection, <0.25 mg/L [Vasiliades *et al.* 1979b]. Column: 3% OV-17 on 100/120 mesh Gas Chrom Q (0.6 m × 2 mm i.d.). Carrier gas: He, 30 mL/min. Temperature: 250°. NSD. Retention time: 0.9 min. Limit of quantification, 0.25 mg/L [Brien *et al.* 1983]. See Blood [Hayler, Flanagan 1978]. Column: 3% OV-17 on Gas-Chrom Q on 100/120 mesh (3′ × 2 mm i.d.). Carrier gas: N_2, 30mL/min. Temperature: 255°. NPD. Limit of detection, 0.5 mg/L [Duchateau *et al.* 1975].

GC-MS Column: Column: 2% SP-2250 on Chromosorb W-HP 100/120 mesh (1.2 m × 2 mm i.d). Temperature programme: 240° for 3.5 min to 260° at 20°/min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, <0.25 mg/L [Vasiliades *et al.* 1979b; Vasiliades *et al.* 1979a]

HPLC Column: Shim-Pack CLD-ODS. Mobile phase: 0.044 mol/L phosphate buffer (pH 2.6)-0.5% triethylamine : acetonitrile (70 : 30), flow rate 1.2 mL/min. Retention time: 5.5 min. Limit of detection, 50 µg/L [Tsuchishita *et al.* 2008]. Column: Finepac $SILC_{18}$ (150 × 4.6mm i.d.). Mobile phase: acetonitrile : 0.03 mol/L potassium dihydrogen phosphate (pH 3.0) : methanol (35 : 59 : 5), flow rate 1.0 mL/min. UV detection (λ = 260 nm). Retention time: ≈8 min. Limit of detection, 0.1 and 0.05 mg/L for DP and MND, respectively [Masuhara *et al.* 1995]. Column: Shandon ODS reversed phase (125 × 4.6 mm i.d., 5 µm). Mobile phase: water-PIC-B8 reagent-triethylamine (974 : 25 : 1) with 0.0125 mol/L 1-octanesulfonic acid : acetonitrile (70 : 30), flow rate 1.0 mL/min. UV detection (λ = 254 nm). Limit of detection, 0.05 mg/L for disopyramide and its active metabolite mono-*N*-dealkylated disopyramide [Mayer *et al.* 1991]. Column: cyanopropyl (10 µm). Mobile phase: 5 mmol/L disodium hydrogenphosphate (pH 7.9) : acetonitrile : methanol (5 : 12 : 3), flow rate 3.0 mL/min. Limit of detection, 5 mg/L [Chen *et al.* 1987]. Column: Supelcosil CN (25 cm × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 25 mmol/L sodium phosphate (pH 6.8), flow rate 2.0 mL/min. UV detection (λ = 215 nm). Limit of detection, 0.3 µmol/L for disopyramide, lidocaine and their active monodealkylated metabolites [Angelo *et al.* 1986].

Disposition in the Body

Rapidly and almost completely absorbed after oral administration and widely distributed throughout the body; bioavailability about 80% [Taylor, Pappas 1986]. The major metabolite, mono-*N*-dealkyldisopyramide (MND), is about one-half as active as disopyramide. Conversion of disopyramide to MND is mainly catalysed by CYP3A4. Up to about 50 to 60% of a dose is excreted in the urine in 5 days as unchanged drug, with about 20 to 30% as the desalkyl metabolite; about 10 to 15% of a dose is eliminated in the faeces.

Therapeutic Concentration In plasma, usually in the range 2.8 to 7.5 mg/L.

After the administration of a 100 mg racemic mixture of DP and MND to a healthy volunteer, the pharmacokinetic values shown below were measured.

Parameter	*(+)-(S)-DP*	*(–)-(R)-DP*	*(+)-(S)-MND*	*(–)-(R)-MND*
C_{max}(mg/L)	1.41	0.81	0.06	0.05
t_{max}(h)	2.00	2.00	3.00	4.00
$t_{1/2}$ (h)	9.10	12.10	11.00	9.00

[Bortocan *et al.* 2000]

After daily oral doses averaging 6 mg/kg to 63 subjects, mean steady-state plasma concentrations of 3.3 mg/L for disopyramide and 0.99 mg/L for the desalkyl metabolite were reported; plasma concentrations were higher in 17 subjects with renal dysfunction (mean 4.3), but lower in subjects concurrently taking enzyme-inducing drugs [Aitio 1981].

After a single oral dose of 100 mg of disopyramide phosphate to 6 subjects, peak plasma concentrations of 1.8 to 3.6 mg/L (mean 2.4) were attained in about 2 h [Ranney *et al.* 1971].

Toxicity Toxic effects are usually associated with plasma concentrations >8 mg/L. Case 1: A 16-year-old ingested an unknown quantity of Rythmodan tablets. The plasma disopyramide concentration was 4.3 mg/L 9 h post-ingestion. Case 2: A 26-year-old female ingested ~40 × 150 mg Norpace capsules. Postmortem blood contained 114 mg/L. Case 3: A 24-year-old female ingested an unknown quantity of Rythmodan. After ~3 h the plasma concentration was 35 mg/L. Case 4: A 17-year-old male took an unknown amount of disopyramide. The plasma concentration 10 h before death was 25.5 mg/L. At postmortem blood and stomach contents contained 34 mg/L and 2.3 g/L, respectively. Case 5: A 35-year-old male ingested an estimated 68 capsules of 100 mg rythmodan. His plasma concentration 2 h before death was 8.3 mg/L and at postmortem it was 8.5 mg/L [Hayler *et al.* 1978].

A 19-year-old female deliberately ingested 25 capsules of disopyramide phosphate 150 mg (Norpace). Despite intensive resuscitation the patient died. Plasma disopyramide concentration on admission was 29 mg/L [Powell *et al.* 1978].

A 44-year-old female took an overdose of disopyramide. Concentrations in her blood, liver, kidney and bile were 26.6, 35.8, 147, and 349 mg/L, respectively [Anderson *et al.* 1980].

In a fatality due to the ingestion of about 15 g of disopyramide, the following postmortem tissue concentrations were reported: blood 57 mg/L, brain 29 µg/g, liver 115 µg/g, urine 1500 mg/L [Michalek *et al.* 1982].

In 2 cases of suicide by means of disopyramide ingestion, the postmortem blood concentrations were 146 mg/L (amount ingested unknown) and 63 mg/L (3.6 g apparently ingested) [Sathyavagiswaran 1987].

An 11-year-old feamle was anaesthetised with lidocaine. Shortly afterwards she suffered respiratory arrest. Ten hours after the spinal anaesthesia she died. At postmortem the concentrations of disopyramide shown below were found.

	Concentration (mg/L or µg/g)
Plasma	15.5
CSF	3.6
Brain	2.8
Lung	18.0
Heart	14.6
Liver	22.9
Spleen	17.8
Kidney	57.7

[Sakata *et al.* 1988]

In a 4-year-old child who died after accidental ingestion of disopyramide and sulindac, postmortem tissue concentrations were (for disopyramide and sulindac, respectively): blood 41.3 and 12.2 mg/L, bile 435 and 1251 mg/L, liver 98.2 and 12.4 µg/g, gastric content 15 and 70 mg, urine 430 and 29.8 mg/L [Singer, Mozayani 1995].

Note For a case of acute hepatotoxicity after disopyramide, see Antonelli *et al.* [1984].

Half-life Plasma half-life, disopyramide 3 to 11 h (dose-dependent), increased in subjects with renal [Nagura *et al.* 1991] or hepatic impairment [Baselt 2008]; desalkyl metabolite about 13 h.

Volume of Distribution ≈0.6 L/kg (dose-dependent); unbound drug ≈2 L/kg [Giacomini *et al.* 1982].

Distribution Milk : plasma ratio 0.9 [Barnett *et al.* 1982].

Clearance Plasma clearance, ≈0.5 to 2 mL/min/kg (dose-dependent); unbound drug ≈6 mL/min/kg [Giacomini *et al.* 1982].

Protein Binding Dominated by α_1-acid glycoprotein and to some extent abumin [Echizen *et al.* 1991; Lima 1987]. In plasma, disopyramide ≈35 to 82% (concentration-dependent), desalkyl metabolite ≈30 to 70% (concentration-dependent); considerable intersubject genetic variation occurs [Hervé *et al.* 1996; Kuroda *et al.* 2001].

Note For reviews of disopyramide, see Heel *et al.* [1978]and Karim *et al.* [1982].

Dose 300 to 800 mg daily.

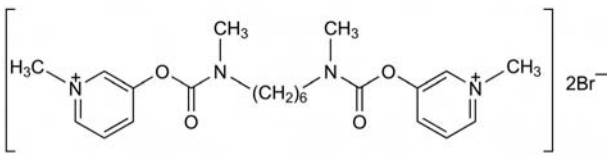
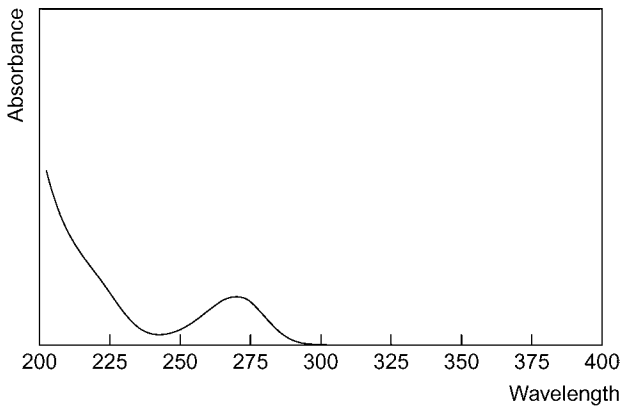
Distigmine Bromide

Anticholinesterase
$C_{22}H_{32}Br_2N_4O_4 = 576.3$
CAS—15876-67-2

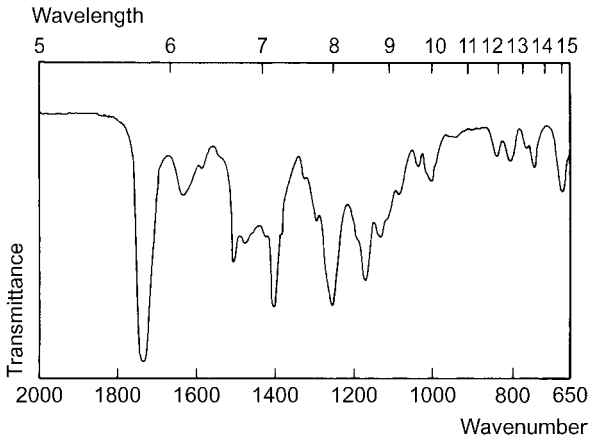
Synonyms Bispyridostigmine bromide; hexamarium bromide; 3,3′-[1,6-hexanediylbis[(methylimino)carbonyl]oxy]bis[1-methylpyridinium]dibromide.
Proprietary Names *Tonus*; *Ubretid*.



Chemical Properties A crystalline powder. Decomposes at 149°. Freely soluble in water. Log *P* (octanol/water), −0.4.
Thin-layer Chromatography System TA—R_f 0.00; system TE—R_f 0.03; system TAE—R_f 0.02 (acidified iodoplatinate solution, positive).
Ultraviolet Spectrum Aqueous acid—270 nm (A^1_1=160a).



Infrared Spectrum Principal peaks at wavenumbers 1735, 1255, 1170, 1507, 1135, 1295 cm^{-1} (KBr disk).

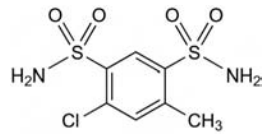


Disposition in the Body Poorly absorbed after oral administration. <5% of an oral dose is excreted in the urine in 24 h, compared to 50% of an IM dose.
Dose 5 to 20 mg daily, orally.

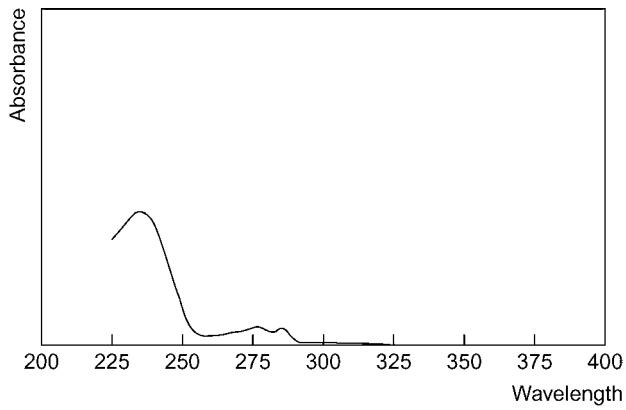
Disulfamide

Diuretic
$C_7H_9ClN_2O_4S_2 = 284.7$
CAS—671-88-5

IUPAC Name 4-Chloro-6-methyl-1,3-benzenedisulfonamide
Synonym Disulphamide
Proprietary Names *Disamide*; *Natirene*.



Chemical Properties A white or creamy-white crystalline powder. Mp 260°. Soluble 1 in 500 of cold water, 1 in 50 of boiling water, 1 in 50 of ethanol and 1 in 1000 of ether; slightly soluble in chloroform. Log *P* (octanol/water), 1.0.
Ultraviolet Spectrum Aqueous acid—235 (A^1_1=336b), 276, 285 nm.

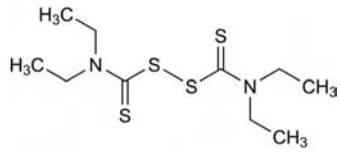


Infrared Spectrum Principal peaks at wavenumbers 1320, 1172, 1552, 965, 675, 1550 cm^{-1} (KBr disk).
Dose Disulfamide has been given in doses of 100 to 200 mg daily.

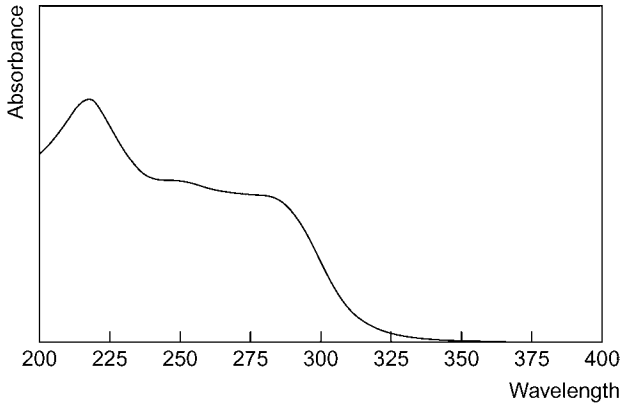
Disulfiram

Alcohol Deterrent
$C_{10}H_{20}N_2S_4 = 296.5$
CAS—97-77-8

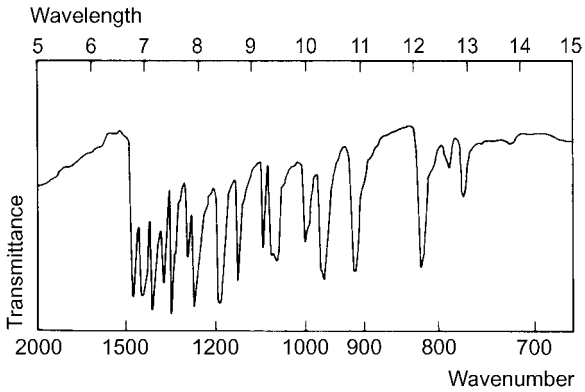
IUPAC Name Diethylcarbamothioylsulfanyl *N*,*N*-diethylcarbamodithioate
Synonyms Éthyldithiourame; tetraethylthioperoxydicarbonic diamide; TTD.
Proprietary Names *Antabus(e)*; *Difaram*; *Esperal*; *Etabus*; *Etiltox*; *Refusal*; *Tetradin*.



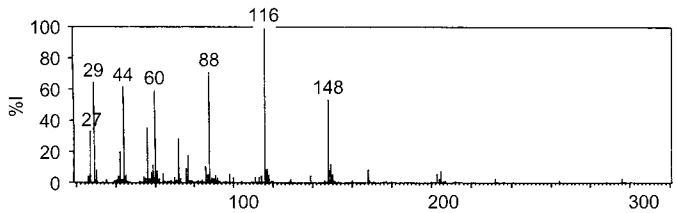
Chemical Properties A white powder. Mp 70°. Practically insoluble in water; soluble 1 in 65 of ethanol, 1 in 2 of chloroform and 1 in 20 of ether; soluble in acetone, benzene and carbon disulfide. Log *P* (octanol/water), 3.9.
Colour Tests Palladium chloride—orange; Dissolve 50 mg in 5 mL of ethanol and add 1 mL of potassium cyanide solution—yellow→green→blue-green.
Thin-layer Chromatography System TA—R_f 0.71; system TB—R_f 0.21; system TC—R_f 0.78; system TE—R_f 0.78; system TL—R_f 0.69; system TAE—R_f 0.78; system TAF—R_f 0.81.
Gas Chromatography System GA—RI 2141(on packed column, not eluted on capillary column).
High Performance Liquid Chromatography System HX—RI 741; system HY—RI 734; system HAA—retention time 25.1 min.
Ultraviolet Spectrum Principal peak at 219 nm.



Infrared Spectrum Principal peaks at wavenumbers 1267, 1193, 1492, 1147, 966, 913 cm^{-1} (Nujol mull).



Mass Spectrum Principal ions at *m/z* 116, 88, 29, 44, 60, 148, 56, 27.



Quantification

Blood **GC** Head-space analysis and FPD. Limit of detection, 10 µg/L, disulfiram and metabolites [Sauter, von Wartburg 1977].

Plasma **HPLC** For method for quantification of disulfiram and its metabolites, see Johansson [1986]. UV detection. Limit of detection, 50 µg/L, disulfiram and dithiocarbamate metabolites [Masso, Kramer 1981]. UV detection. Limit of detection, 200 µg/L, disulfiram and metabolites [Jensen, Faiman 1980].

Urine **HPLC** See Plasma [Jensen, Faiman 1980].

Disposition in the Body Disulfiram produces hypersensitivity to alcohol by inhibiting the oxidation of acetaldehyde, the primary metabolite of alcohol; the concentrations of acetaldehyde in the blood and expired air are increased by 5 to 10 times. Disulfiram is incompletely absorbed after oral administration; the maximum effect usually occurs about 12 h after ingestion, possibly because it is highly lipid soluble and is likely to be initially localised in fat. The metabolites include diethyldithiocarbamic acid, methyl diethyldithiocarbamate, diethylamine, carbon disulfide and inorganic sulfate; glucuronide conjugation may occur. Up to about 20% of a dose is eliminated unchanged in the faeces, up to 50% of a dose may be excreted from the lungs as carbon disulfide, and the remainder is slowly excreted as metabolites in the urine; about 20% of a dose is still present in the body up to 7 days after ingestion.

Therapeutic Concentration

Following a single oral dose of 250 mg to 15 subjects, mean peak plasma concentrations of 0.38 mg/L of disulfiram, 0.77 mg/L of diethyldithiocarbamic acid, 0.30 mg/L of methyl diethyldithiocarbamate, and 1.7 mg/L of diethylamine were attained in about 9 h; a mean peak plasma concentration of 22 mg/L of carbon disulfide was reported at 6 h; there was considerable intersubject variability in the plasma concentrations [Faiman *et al.* 1984].

Toxicity Severe toxic reactions may occur after administration of disulfiram if the blood concentration of acetaldehyde is greater than 5 mg/L; with very high concentrations of alcohol in the blood the administration of as little as 0.5 to 1 g of disulfiram has proved fatal in some cases. Fatalities due to disulfiram-induced hepatitis have been reported and there have also been reports of severe phenytoin intoxication after simultaneous administration.

In a fatality due to ingestion of disulfiram and alcohol, postmortem blood concentrations of 8 mg/L of sodium diethyldithiocarbamate and 9600 mg/L of ethanol were reported [Martens, Heyndrickx 1975].

Half-life Plasma half-life, disulfiram about 7 h, diethyldithiocarbamic acid about 15 h, carbon disulfide about 9 h.

Note For a review of disulfiram, see Brien and Loomis [1983] and Johansson [1992].

Dose 800 mg on the first day, reducing to a maintenance dose of 100 to 200 mg daily.

Disulfoton

Insecticide

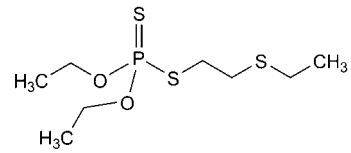
$C_8H_{19}O_2PS_3 = 274.4$

CAS—298-04-4

IUPAC Name Diethoxy-(2-ethylsulfanylethylsulfanyl)-sulfanylidene-λ^5-phosphane

Synonyms Bay-19639; Bay-S276; *O,O*-diethyl-*S*-ethylmercaptoethyldithiophosphate; dithiodemeton; ENT-23347; ethylthiodemeton; thiodemeton; thiometon-ethyl.

Proprietary Names *Dimaz*; *Disipton*; *Dithiosystox*; *Di-syston*; *Disystox*; *Ekatin TD*; *Frumen AL*; *Frumin G*; *Frumin AL*; *Solvigram*; *Solvirex*; *Terraclor Super-X*.



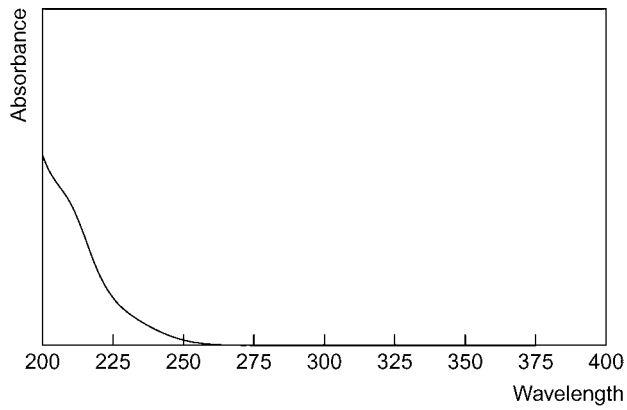
Chemical Properties Pale-yellow liquid or solid. Mp 108°. Bp 62° at 0.01 mm Hg. Insoluble in water (25 mg/L at 23°, 16.3 mg/L at 20°); soluble in most organic solvents and fatty oils. Log *P* (octanol/water) 4.02 [Hansch *et al.* 1995].

Thin-layer Chromatography System TX—R_f 0.58; system TY—R_f 0.89; system TAB—R_f 0.52; system TAC—R_f 0.35.

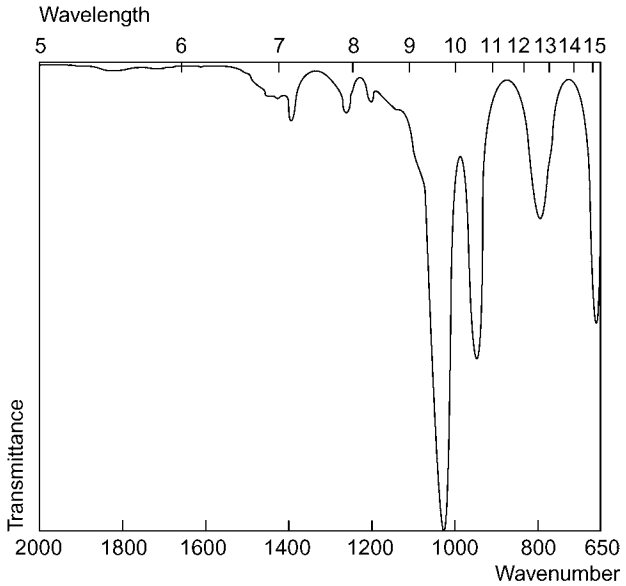
Gas Chromatography System GA—disulfoton RI 2749, M (sulphone) RI 2077, M (sulphoxide) RI 1303; system GK—disulfoton RRT 0.86 (relative to caffeine); system GC1—RI 1776; system GC2—RI 1906; system GC3—RI 2080.

High Performance Liquid Chromatography System HAO—*k* 0.10; system HAP—*k* 6.48; system HY—RI 691.

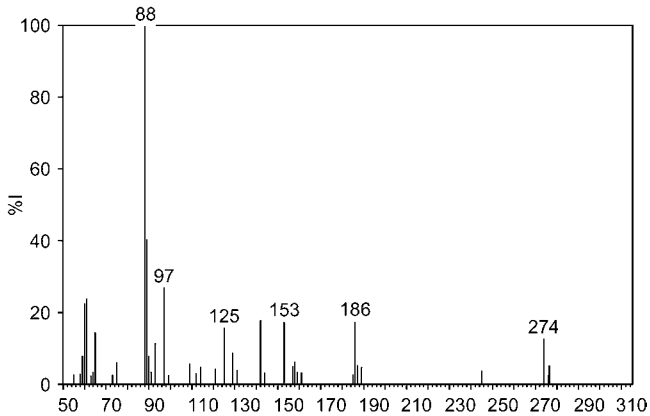
Ultraviolet Spectrum



Infrared Spectrum Principal peaks at wavenumber 1031, 952, 666, 798, 2983, 2941 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 89, 29, 97, 60, 61, 27, 65, 125.



Quantification

Blood **GC** Column: NEUTRA BOND-1 fused silica capillary (15 m × 0.53 mm i.d., 2.0 µm). Carrier gas: N_2, 25 mL/min. Temperature: 200°. FPD. Limit of detection, 0.2 ng [Yashiki *et al.* 1990].

GC-MS Column: HP-5MS fused silica capillary (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 120° for 1 min to 290° at 10°/min for 1 min. EI ionisation, SIM acquisition mode. Limit of detection, 0.01 µg/g [Musshoff *et al.* 2002]. Column: NEUTRA BOND-1 fused silica capillary (15 m × 0.53 mm i.d., 2.0 µm). Carrier gas: He, 20 mL/min. Temperature programme: 0° to 280° at 8°/min. EI ionisation at 70 eV. Retention time: 13.1 min. Limit of detection not reported [Yashiki *et al.* 1990].

Plasma **GC** Column: 10% Apiezon Grease L on Chromosorb W AW DMCS 60/80 mesh (1.5 m × 3.4 mm i.d.). Carrier gas: He, 66 mL/min. Temperature: 220°. Retention time: 4.0 min. FTD. Limit of detection not reported [Futagami *et al.* 1995].

Urine **GC** See Blood [Yashiki *et al.* 1990].

Stomach Contents **GC** See Blood [Yashiki *et al.* 1990].

GC-MS See Blood [Yashiki *et al.* 1990].

Disposition in the Body Disulfoton is rapidly absorbed after oral ingestion from the gastrointestinal tract. It is metabolised to the sulfoxide and sulfone metabolites, and corresponding phosphorothioate metabolites and derivatives of *O,O*-diethylhydrophosphate and 2-ethylthioethylmercaptan. It is excreted mainly via urine (≈80%) and also via the faeces and expired air.

Toxicity Disulfoton is very highly toxic by all routes of exposure. The allowed daily intake is 0.002 mg/kg body weight and a blood disulfoton level of 1.45 nmol/g is associated with fatality. A lethal adult dose is estimated to be between 500 mg and 4 g.

A 75-year-old female was admitted to hospital after an attempted suicide. She had ingested a large amount of granular Di-syston, containing 5% disulfoton (an organophosphate). On admission, the total disulfoton and metabolites plasma concentration was 1.095 mg/L which decreased to 505 µg/L after gastric lavage. A peak concentration (1.322 mg/L) was not reached, however, until 56 h post-ingestion, because of the prolonged absorption of the organophosphate from the granules present in the stomach. These concentrations indicate a severe level of disulfoton intoxication [Futagami *et al.* 1995].

An 87-year-old male was admitted to hospital after ingesting three or four heaped tablespoonfuls of Di-Syston (disulfoton) dissolved in water. He was unconscious, had difficulty breathing and did not respond well to painful stimuli, but made a full recovery after treatment. The concentration of disulfoton in his blood was 25.4 ng/g and the total of metabolites was 4.92 nmol/g (corresponding to 1.35 µg/g disulfoton), indicating a severe level of disulfoton intoxication. The concentration of the pesticide in the stomach contents on admission to hospital was 32.9 µg/g [Yashiki *et al.* 1990].

Dithiazanine Iodide

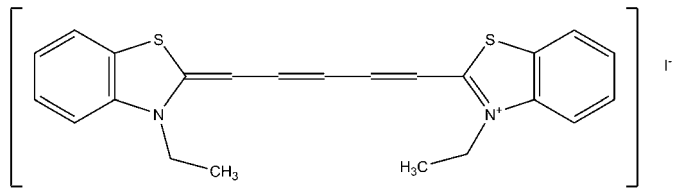
Anthelmintic, Organocyanide

$C_{23}H_{23}N_2S_2,I = 518.5$

CAS—541-73-8

IUPAC Name 3-Ethyl-2-[(3E,5Z)-5-(3-ethyl-1,3-benzothiazol-2-ylidene)penta-1,3-dienyl]-1,3-benzothiazol-3-ium iodide

Synonyms 3,3′-Diethylthiadicarbocyanine iodide; DTDCI; 3-ethyl-2-[5-(3-ethylbenzothiazolidin-2-ylidene)penta-1,3-dienyl]benzothiazolium iodide.



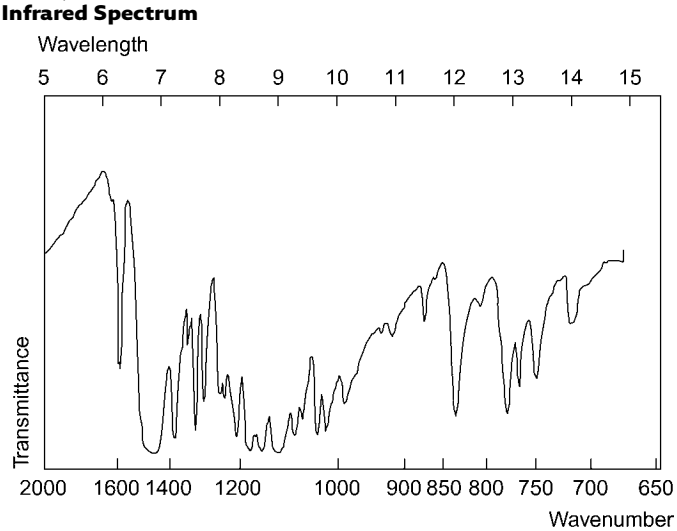
Proprietary Names *Delvex*; *Telmid*.

Chemical Properties Dark-greenish crystalline powder. Mp 248° with decomposition. Almost insoluble in water; very slightly soluble in ethanol; insoluble in ether.

High Performance Liquid Chromatography Column: TSKgel ODS $80T_M$ (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 25 mmol/L imidazole buffer (pH 6.5; 60 : 40) containing 10 mmol/L sodium 1-propanesulfonate, flow rate 1.0 mL/min. Peroxyoxalate chemiluminescence detection. Retention times: DTDCI ≈15 min, methylene blue ≈2 min, pyridine ≈3 min, oxazine ≈5 min. Limit of detection, 0.19 fmol [Kimoto *et al.* 1996].

Ultraviolet Spectrum Ethanol—327, 276 nm with inflexions at about 255 and 364 nm; methanol—652 nm.

Infrared Spectrum



Disposition in the Body Not readily absorbed from the gastrointestinal tract. An effective concentration level of the dye may be attained in the faeces, which it stains a bluish-green colour.

Toxicity Dithiazanine is very toxic when absorbed from the gastrointestinal tract. Its use should be discontinued if the skin or sclera become blue. LD_{50} (oral, mg/kg): in dogs 200, in mice 4 to 6, and in rats 165 to 192.

A 3-year-old girl who was given 150 mg of dithiazanine daily for 5 days died on the sixth day. Dithiazanine was shown spectrophotometrically to be present in the liver in a concentration of 0.1 mg% (1 μg/g) but none was demonstrated in the blood. The intestinal mucosa and contents, and the surface of the kidney, were green; the heart and liver showed some green discolouration [Abadie, Samuels 1965].

Dose Up to 600 mg daily, also used as a near-infrared dye.

Abadie SH, Samuels M (1965). A fatality associated with dithiazine iodide therapy. *JAMA* 192: 326–327.

Kimoto K *et al.* (1996). Sensitive detection of near-infrared fluorescent dyes using high-performance liquid chromatography with peroxyoxalate chemiluminescence detection system. *Biomed Chromatogr* 10: 189–190.

Dithranol

Dermatological Agent

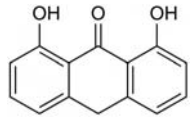
$C_{14}H_{10}O_3$ = 226.2

CAS—1143-38-0

IUPAC Name 1,8-Dihydroxy-9(10*H*)-anthracenone

Synonyms Anthralin; dioxyanthranol.

Proprietary Names *Anthra-Derm*; *Anthraforte*; *Anthrascalp*; *Anthranol*; *Antranol*; *Desmoline*; *Dithrocream*; *Drithocreme*; *Dritho-Scalp*; *Lasan*; *Micanol*; *Psoricreme*; *Psoriderm*; *Timicolid*. It is an ingredient of *Psoradrate* and *Psorin*.



Chemical Properties A yellow to yellowish-brown crystalline powder. Mp 176° to 181°. Practically insoluble in water; slightly soluble in ethanol, glacial acetic acid and ether; soluble in acetone, benzene and chloroform. Log *P* (octanol/water), 4.4.

Caution Dithranol is a powerful irritant and should be kept away from the eyes and tender parts of the skin.

Dithranol Triacetate

$C_{20}H_{16}O_6$ = 352.3

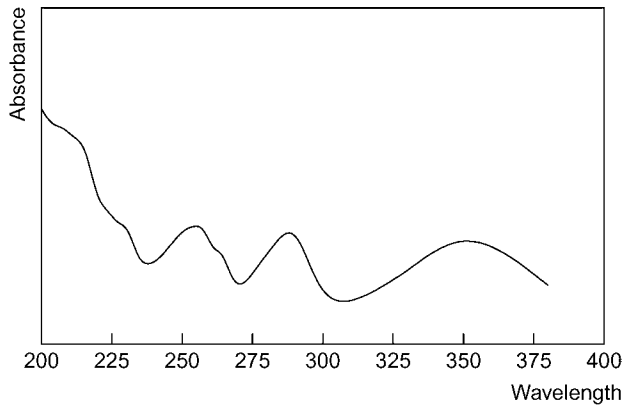
CAS—16203-97-7

Synonym Dithranol acetate

Proprietary Name *Exolan (cream)*

High Performance Liquid Chromatography System HY—RI 703.

Ultraviolet Spectrum Aqueous alkali—276 nm (A^1_1=490b); methanol—256 (A^1_1=467b), 288 (A^1_1=358b), 360 nm (A^1_1=418b).



Infrared Spectrum Principal peaks at wavenumbers 1598, 1278, 1615, 1222, 1168, 1635 cm^{-1} (KCl disk).

Use Topically in concentrations of 0.05 to 1%.

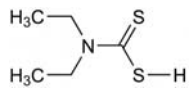
Ditiocarb

Immunomodulator, Chelating Agent

$C_5H_{10}NS_2$ = 148.3

IUPAC Name Diethyldithiocarbamic acid

Synonyms Dithiocarb; diethylcarbamodithioc acid.



Chemical Properties Log *P* (octanol/water), −1.43.

Ditiocarb Sodium

$C_5H_{10}NNaS_2$ = 171.3

CAS—148-18-5

Synonyms ACS; DEDC; DEDK; DeDTC; DDTC; DTC; diethylcarbamodithioc acid sodium salt; dithiocarb sodium; DRG-0066; SDDC; sodium diethyldithiocarbamate; dithiocarb.

Proprietary Name *Imuthiol*

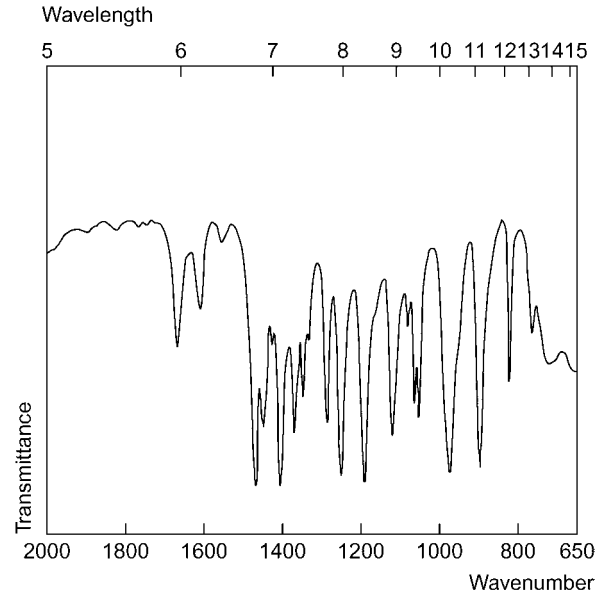
Chemical Properties A white, slightly brown or slightly pink crystalline powder. Mp 95°. Soluble in water (≥10 g/100 mL at 14°).

Ditiocarb Sodium Trihydrate

$C_5H_{10}NNaS_2.3H_2O$ = 225.3

Chemical Properties A powder comprising thin, irregular, plate-like crystals. Mp 94° to 102°. Freely soluble in water; soluble in ethanol, methanol and acetone; insoluble in ether and benzene.

Infrared Spectrum (Ditiocarb sodium) Principal peaks at wavenumbers 1477, 1202, 984, 914 cm^{-1} (KBr pellets).



Quantification

***Plasma* HPLC** Limit of detection, 0.5 mg/L [Awni *et al.* 1994].

Disposition in the Body Ditiocarb is well absorbed and metabolised in the liver to its glucuronide, methyl ester and diethylamine metabolites, carbon disulfide and sulfate ions. Excretion is via urine with carbon disulfide being excreted in exhaled breath. Approximately 80% of an oral dose is detected in plasma 20 min after administration. Ditiocarb is eliminated rapidly from the body with 60% of a dose being excreted within 3 h.

Therapeutic Concentration

Eighteen healthy male volunteers, aged between 18 and 35 years, of white, black and Native American origin were administered with either a 200 mg/m^2/h dose of DDTC or 400 mg/m^2/h, over 4 h. Mean steady state concentrations of diethyldithiocarbamate were 0.027 mg/L for the lower dose and 0.075 mg/L for the higher dose [Awni *et al.* 1994].

Half-life Approximately 20 min.

Volume of Distribution Mean, 0.287 L/kg (200 mg/m^2/h dose); 0.211 L/kg (400 mg/m^2/h dose).

Clearance Mean plasma clearance, 25.5 mL/min/kg (200 mg/m^2/h dose); 16.9 mL/min/kg (400 mg/m^2/h dose).

Awni WM *et al.* (1994). A dose-ranging pharmacokinetics study of sodium diethyldithiocarbamate in normal healthy volunteers. *J Clin Pharmacol* 34: 1183–1190.

Diuron

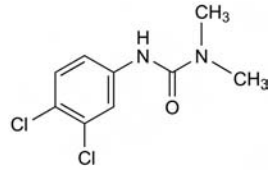
Herbicide

$C_9H_{10}Cl_2N_2O$ = 233.1

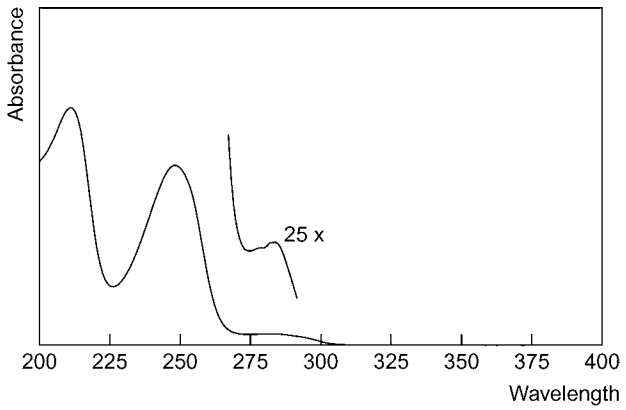
CAS—330-54-1

IUPAC Name *N*′-(3,4-Dichlorophenyl)-*N*,*N*-dimethylurea

Proprietary Names *Karmex*; *Urox D*. It is an ingredient of *Dexuron* and *Krovar*.



Chemical Properties Crystals. Mp 158° to 159°. Practically insoluble in water; soluble in acetone; sparingly soluble in hydrocarbon solvents. Log *P* (octanol/water), 2.7.
Colour Tests Liebermann's reagent—orange; Marquis test—pink-orange.
Gas Chromatography System GA—diuron RI 1850, diuron-ME RI 1880, 3,4-dichloroaniline RI 1405; system GK—3,4-dichloroaniline RRT 0.36 and 3,4-dichlorophenyl isocyanate RRT 0.13 (both relative to caffeine).
High Performance Liquid Chromatography System HY—RI 417; system HZ—retention time 5.8 min; system HAA—retention time 18.5 min.
Ultraviolet Spectrum Ethanol—250 (A^1_1=1124b), 287 nm.



Mass Spectrum Principal ions at *m/z* 72, 44, 73, 42, 232, 187, 124, 45.
Quantification
Blood **HPLC** For method for quantification of diuron and its metabolites, see Van Boven *et al.* [1990].
Urine **GC** MS detection. Limit of detection, 0.03 µg/L, dichloroanilines as markers for diuron and other herbicides, some pesticides and fungicides [Wittke *et al.* 2001]. ECD detection. Limit of detection, 0.05 µg/L, dichloroanilines as markers for diuron and other herbicides, some pesticides, and fungicides [Wittke *et al.* 2001].
HPLC See Blood [Van Boven *et al.* 1990].

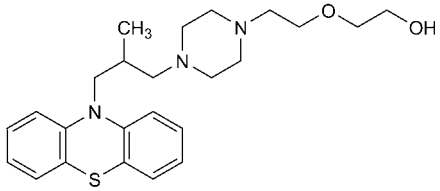
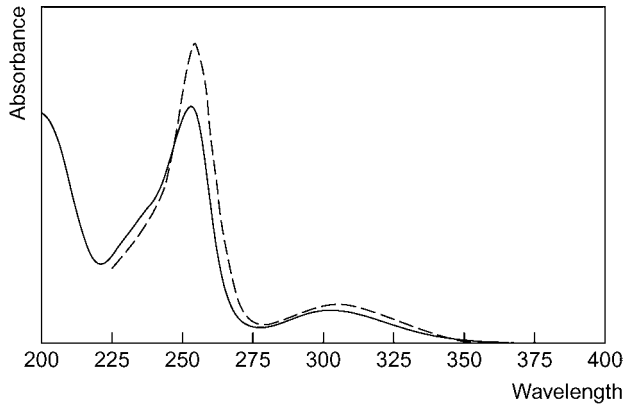
Dixyrazine

Tranquilliser
$C_{24}H_{33}N_3O_2S$ = 427.6
CAS—2470-73-7
IUPAC Name 2-[2-[4-(2-Methyl-3-phenothiazin-10-ylpropyl)piperazin-1-yl]ethoxy]ethanol
Synonyms 2-(2-{4-[2-Methyl-3-(10*H*-phenothiazin-10-yl)propyl]-1-piperazinyl}ethoxy)ethanol; UCB-3412.
Proprietary Name *Esucos*



Chemical Properties White to slightly greyish or yellowish powder. Very slightly soluble in water; soluble in ethanol, chloroform and ether. pK_a 7.8 (25°). Log *P* (octanol/water), 3.3 [Meylan, Howard 1995].
Thin-layer Chromatography System TAE—R_f 0.47; system TE—R_f 0.49.
Gas Chromatography System GA—dixyrazine RI 3220, M (phenothiazine) RI 2020, dixyrazine-AC RI 3530, M (*N*-desalkyl-)-AC RI 3355, M (*O*-desalkyl-)-AC RI 3350, M (amino-)-AC RI 2765.
Ultraviolet Spectrum Methanol—255 (A^1_1 = 980b), 305 nm.



Mass Spectrum Principal ions at *m/z* 212, 42, 187, 45, 70, 180, 56, 98.
Quantification
Plasma **GC-MS** Column: SE-30 glass capillary (7 m). Carrier gas: He, 3.5 mL/min. Temperature: 280°. EI ionisation at 70 eV. Limit of detection, 400 ng/L [Brante *et al.* 1981].
Serum **GC-MS** See Plasma [Brante *et al.* 1981].
HPLC Column: Sphere-5 C_{18} (25 cm × 2.1 mm i.d., 5 µm). Mobile phase: acetonitrile : water : 1.0% triethylamine-phosphate buffer (pH 4.5; 37 : 13 : 50), flow rate 0.6 mL/min. UV detection (λ = 254 nm). Retention time: 4.5 min. Limit of detection, 1.0 nmol/L [Liedholm *et al.* 1985].
Bioavailability Low in the fasting state, increased to 2 to 29% following food [Liedholm *et al.* 1985].
Half-life 3.4 h after IV administration.
Volume of Distribution 5.9 L/kg.
Clearance >1200 mL/min.
Dose 20 to 75 mg daily.

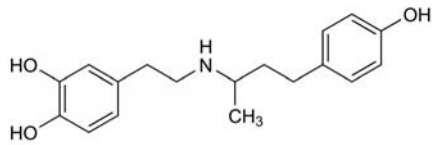
Dobutamine

Sympathomimetic
$C_{18}H_{23}NO_3$ = 301.4
CAS—34368-04-2
IUPAC Name 4-[2-[[3-(4-Hydroxyphenyl)-1-methylpropyl]amino]ethyl]-1,2-benzenediol

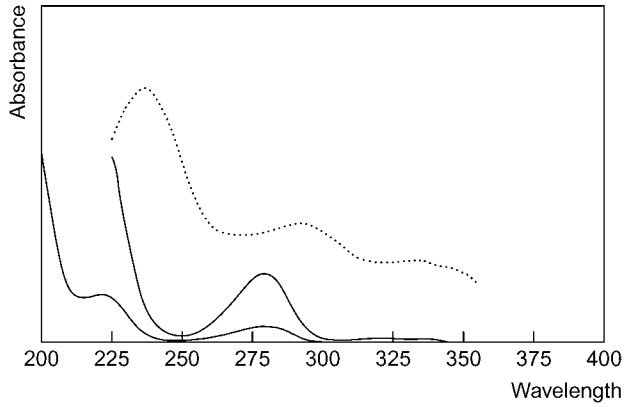


Chemical Properties pK_a 9.5.

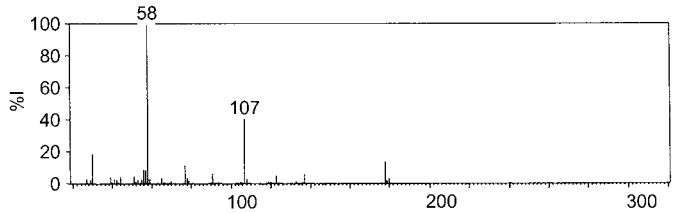
Dobutamine Hydrochloride

$C_{18}H_{23}NO_3$,HCl = 337.8
CAS—49745-95-1
Proprietary Names *Butamine*; *Cryobutol*; *Dobucard*; *Dobuject*; *Dobutam*; *Dobutina*; *Dobutrex*; *Inotrex*; *Kardion*; *Oxiken*; *Posiject*.
Chemical Properties A white powder. Mp 184° to 186°. Sparingly soluble in water and ethanol; soluble in methanol and pyridine.

Colour Tests Ammoniacal silver nitrate—black; *p*-dimethylaminobenzaldehyde—orange/violet; ferric chloride—green; folin–ciocalteu reagent—blue; methanolic potassium hydroxide—brown-pink; Millon's reagent—red; Nessler's reagent—black; palladium chloride—orange→brown; potassium dichromate—green-brown.
Thin-layer Chromatography System TA—R_f 0.52; system TB—R_f 0.00; system TC—R_f 0.01; system TE—R_f 0.49; system TL—R_f 0.03; system TAE—R_f 0.87.
Gas Chromatography System GA—dobutamine-AC_4 RI 3495, M (*N*-desalkyl-*O*-methyl-)-AC_2 RI 2070, M (*N*-desalkyl-*O*-methyl-)-AC RI 2330, M (*O*-methyl-) RI 3200, M (*O*-methyl-)-AC_2 RI 3100, M (*O*-methyl-)-AC_3 RI 3350.
High Performance Liquid Chromatography System HX—RI 308; system HAX—retention time 6.6 min; system HAY—retention time 3.8 min.
Ultraviolet Spectrum Aqueous acid—279 nm (A^1_1=131b); aqueous alkali—236, 292 nm.



Infrared Spectrum Principal peaks at wavenumbers 1520, 1280, 1266, 1190, 1200, 1220 cm^{-1} (dobutamine hydrochloride, KBr disk).
Mass Spectrum Principal ions at *m/z* 58, 107, 30, 178, 77, 56, 57, 137.



Quantification
Plasma **HPLC** Fluorescence detection. Limit of detection, 5 µg/L [Leflour *et al.* 1994]. Electrochemical detection. Limit of detection, <0.1 µg/L [Husseini *et al.* 1993]. Fluorescence detection. Limit of detection, 0.3 to 0.8 pg [Alberts *et al.* 1992]. Fluorescence detection. For method, see Knoll and Brandl [1986]. Electrochemical detection. Limit of detection, 1 µg/L [Dixon *et al.* 1985].
Urine **HPLC** See Plasma [Alberts *et al.* 1992].
Disposition in the Body Inactive after oral administration. After IV administration, it is rapidly metabolised by glucuronide conjugation and 3-*O*-methylation to inactive metabolites which are excreted in the urine, mostly in the first 2 h.
Half-life Plasma half-life, about 2 min.
Dose Usually 2.5 to 10 µg/kg/min of dobutamine hydrochloride, by IV infusion.

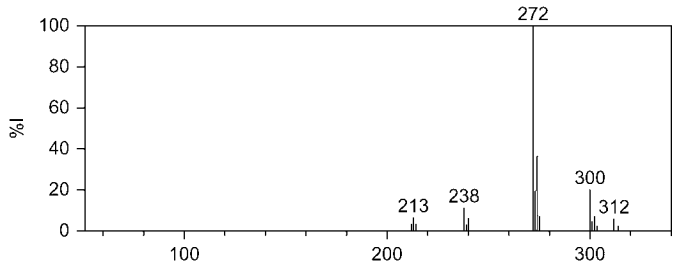
DOC

Psychedelic
$C_{11}H_{17}ClNO_2 = 230.7$
IUPAC Name 4-Chloro-2,5-dimethoxyamfetamine
Synonyms 4-Chloro-2,5-DMA; 2,5-dimethoxy-4-chloroamfetamine.
Chemical Properties DOC has a stereocentre and *R*(−)-DOC is reported to be the more active stereoisomer.
Mass Spectrum Principal peaks at *m/z* 212, 86, 271, 197, 185, 156 (AC) [Ewald *et al.* 2008].



Quantification
Other **GC-MS** Rat Urine. Column: HP-1 cross-linked methyl silicone capillary (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 3 min to 310° at 30°/min. EI ionisation at 70 eV, positive ion mode, full scan mode; CI, positive ion mode. Retention index: 2055 (acetyl derivative). Limit of quantification not reported [Ewald *et al.* 2008].
Disposition in the Body Studies in rats have shown that DOC is metabolised by *O*-demethylation at position 2 or 5 of the phenyl ring and subsequently by glucuronidation and/or sulfation.
Toxicity Typically, entheogenic effects of DOC in humans are reported to last between 12–24 h. Onset of the drug is relatively long, developing over a period of 3–5 h. After several more hours, effects begin to decline, but residual stimulation is sometimes observed [Shulgin, Shulgin 1991].
Note For a study of the metabolism and detection of DOC in rats, see Ewald *et al.* [2008].
Dose Reported as 1.5 to 3 mg.

Ewald AH *et al.* (2008). Metabolism and toxicological detection of the designer drug 4-chloro-2,5-dimethoxyamphetamine in rat urine using gas chromatography-mass spectrometry. *Anal Bioanal Chem* 390: 1837–1842.

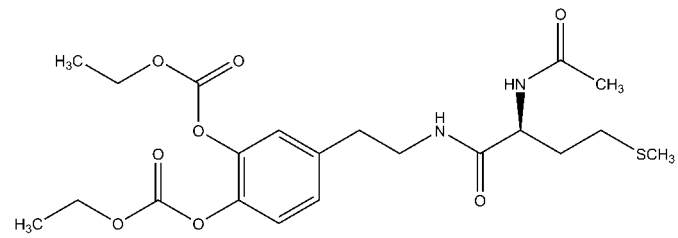
Docarpamine

Cardiotonic, Dopaminergic Agent, Dopamine Prodrug
$C_{21}H_{30}N_2O_8S = 470.5$
CAS—74639-40-0
IUPAC Name [5-[2-[[(2*S*)-2-Acetamido-4-methylsulfanylbutanoyl]amino] ethyl]-2-ethoxycarbonyloxyphenyl] ethyl carbonate
Synonyms (−)-(*S*)-2-Acetamido-*N*-(3,4-dihydroxyphenethyl)-4-(methylthio) butyramide bis(ethyl carbonate) ester; 4-[2-[[(2*S*)-2-(acetylamino)-4-(methylthio)-1-oxobutyl]amino]ethyl]-1,2-phenylene diethyl ester; TA-870; TA-8704.
Proprietary Name *Tanadopa*



Chemical Properties Crystals. Mp 85° to 90°. Crystalline powder. Mp 105° to 108°. Slightly soluble in water; readily soluble in ethanol.
High Performance Liquid Chromatography Column: Cosmosil 5C-18-MS (250 × 4.6 mm i.d., 10 µm). Mobile phase: acetonitrile : 10 mmol/L potassium phosphate buffer (pH 4.2; 0 : 100 for 2 min to 75 : 25 over 7.5 min for 5.5 min or 40 : 60), flow rate 1.5 mL/min. UV detection. Retention times: 11.4 min (gradient) or 6.5 min (isocratic) [Sugiyama *et al.* 2000].
Quantification
Plasma **HPLC** Desethoxy metabolite. Column: ODS (250 × 4.6 mm i.d.). Mobile phase: 0.1 mol/L phosphate buffer (pH 3.0) containing 0.1 mmol/L sodium EDTA : methanol : acetonitrile (70 : 25 : 5), flow rate 1.2 mL/min. Electrochemical detection (700 mV). Limit of detection not reported [Yoshikawa *et al.* 1990a].
Other **HPLC** Dog Blood. Column switching method. Electrochemical detection. Limit of quantification, 2 µg/L [Yoshikawa *et al.* 1990b].
Disposition in the Body Readily absorbed following IM or oral administration. It appears to be rapidly metabolised to its desethoxy form in plasma, which is then converted to dopamine. Dopamine is known to be metabolised by MAO and catechol *O*-methyltransferase to form 3,4-dihydroxyphenylacetic acid and homovanillic acid as well as other metabolites.
Therapeutic Concentration
Ten infants (age 1–4 months, weight 2.95–5.16 kg) with symptoms of CHF were administered 3 doses of oral docarpamine (range 15.0–20.4 mg/kg) at intervals of 8 h. Plasma concentrations of free dopamine were measured at 1, 2, and 3 h after the first dose; mean values reported were 37.9, 37.8, and 11.5 µg/L, respectively [Tomita *et al.* 1996].

In an adult clinical study, a single oral dose administration of 750 mg docarpamine resulted in a peak plasma concentration of free dopamine of 54.1 µg/L [Ogawa *et al.* 1991].

Two groups of 3 volunteers were administered either 0.75 or 1.5 g oral docarpamine. A third group was administered IV dopamine at 1 and 3 µg/kg/min for 20 min successively. Mean peak plasma concentrations of free dopamine in the 0.75 and 1.5 g oral dosage groups were reported as 63 and 127 µg/L, respectively, after 1.6 h. Free dopamine levels in the IV group were reported as 8.4, 31.3 and 0.8 µg/L at 20, 40 and 60 min, respectively. In the 0.75 g oral docarpamine group, the mean peak plasma concentration of the desethoxy form of docarpamine was 176 µg/L after 1.4 h [Yoshikawa *et al.* 1990a].

Dose Usual oral dose of 2.25 g daily, in three divided doses.

Docetaxel

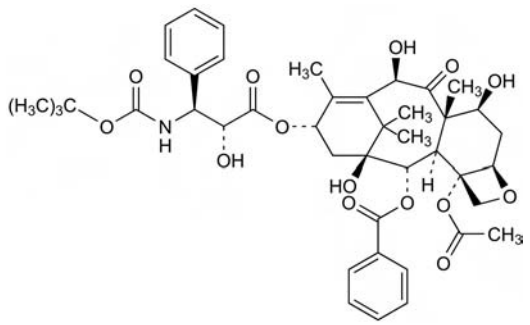
Antineoplastic

$C_{43}H_{53}NO_{14}$ = 807.9

CAS—114977-28-5

Synonyms RP-56976; *N*-debenzoyl-*N*-*tert*-butoxycarbonyl-10-deacetyl taxol; (α*R*,β*S*)-β-[[(1,1-dimethylethoxy)carbonyl]amino]-α-hydrobenzenepropanoic acid (2*aR*,4*S*,4a*S*,6*R*,9*S*,11*S*,12*S*,12a*R*,12b*S*)-12b-(acetyloxy)-12-(benzoyloxy)-2a,3,4,4a,5,6,9,10,11,12,12a,12b-dodecahydro-4,6,11-trihydroxy-4a,8,13,13-tetramethyl-5-oxo-7,11-methano-1*H*-cyclodeca[3,4]benz[1,2-*b*]oxet-9-yl ester.

Proprietary Name *Taxotere*



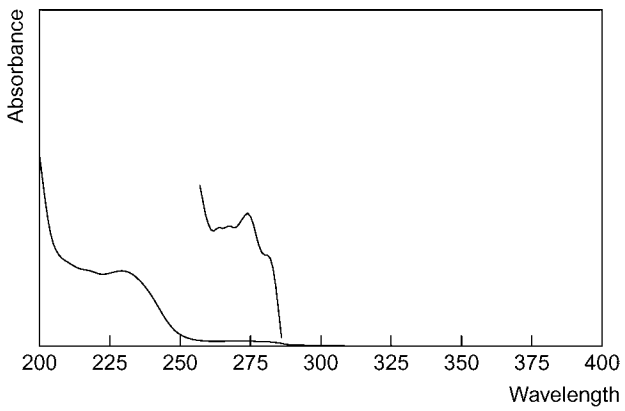
Chemical Properties A white to almost white powder. Mp 232°.

Docetaxel Trihydrate

$C_{43}H_{59}NO_{17}$ = 861.9

CAS—148408-66-6

Ultraviolet Spectrum Aqueous acid (ethanol)—230, 275, 283 nm.



Quantification

Plasma **HPLC** Column: RP-CSC-C_8 Nucleosil (150 × 4.6 mm i.d., 5 µm). Mobile phase: 30 mmol/L phosphate buffer (pH 3.0) : acetonitrile (47:53), flow rate 1.3 mL/min. UV detection (λ=227 nm). Retention time: 7.2 min. Limit of quantification, 5 µg/L, limit of detection, 2.5 µg/L [Rouini *et al.* 1998].Column: Inertsil ODS-80A (150 × 4.6 mm i.d., 5 µm). Mobile phase: water : methanol : tetrahydrofuran : ammonium hydroxide (37.5 : 60: 2.5 : 0.1, pH 6.0), flow rate 1.0 mL/min. UV detection (λ=230 nm). Retention time: 8.5 min. Limit of quantification, 10 µg/L [Loos *et al.* 1997].

Disposition in the Body Docetaxel is rapidly distributed throughout the body into body tissue and is extensively metabolised by the hepatic cytochromes of the CYP3A group. Excretion is mainly in faeces (75%) as 1 major and 3 minor inactive metabolites and a very low amount of the unchanged drug.

Therapeutic Concentration

Four patients with solid tumours, both male and female, were administered with an IV dose of 100 mg/m^2 docetaxel over 1–2 h. A peak plasma concentration of 2.41 mg/L was reached by the end of infusion [Extra *et al.* 1993].

In another study, 7 patients administered with a 100 mg/m^2 dose reached peak plasma concentrations of 3.67 mg/L [da Costa*et al.* 1992].

Toxicity The maximum tolerated dose is 90 mg/m^2 as a 24-h infusion. Development of severe peripheral neurotoxicity has been observed in 4.1% of patients.

Half-life Approximately 11 h.

Volume of Distribution 95–150 L/m^2 (from various studies), also reported as 113 L.

Clearance 17–22 L/h/m^2 (as reported in various literature).

Distribution in Blood Little interaction with red blood cells.

Protein Binding >95%.

Dose Doses between 55 and 100 mg/m^2 body surface are administered for 1 h every 3 weeks; the greater dose is the usual dose. Lower doses are given if adverse reactions are observed during treatment. Patients with hepatic impairment: 75 mg/m^2.

Docusate Sodium

Anionic Surfactant

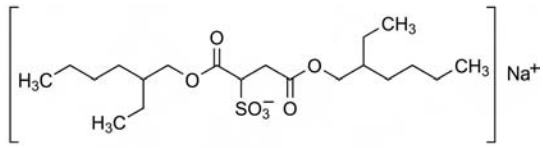
$C_{20}H_{37}NaO_7S$ = 444.6

CAS—10041-19-7 [1,4-bis(2-ethylhexyl) sulfosuccinate]; 577-11-7

IUPAC Name Sodium 1,4-bis(2-ethylhexoxy)-1,4-dioxobutane-2-sulfonate

Synonyms Dioctyl sodium sulfosuccinate; DSS; sodium 1,4–bis(2–ethylhexyl) sulfosuccinate; sodium dioctyl sulphosuccinate.

Proprietary Names *Colace*; *Coloxyl*; *Dialose*; *Dioctyl*; *Disonate*; *Docusoft*; *Docusol*; *DOK*; *Modane Soft*; *Molcer*; *Norgalax*; *Regulex*; *Silace*; *Waxsol*. It is an ingredient of *Capsuvac*, *Klyx*, *Migraleve*and *Normax*.



Chemical Properties White, hygroscopic, waxy masses or flakes. Slowly soluble 1 in 70 of water, higher concentrations forming a thick gel; soluble 1 in 3 of ethanol, 1 in 1 of chloroform and 1 in 1 of ether; soluble in carbon tetrachloride, petroleum ether, naphtha, xylene, dibutyl phthalate, liquid petrolatum, acetone and vegetable oils. Log *P* (octanol/water), 6.1.

Docusate Calcium

$C_{40}H_{74}CaO_{14}S_2$ = 883.2

CAS—128-49-4

Synonym Dioctyl calcium sulfosuccinate

Proprietary Names *Surfak*. It is an ingredient of *Doxidan*.

Chemical Properties A white amorphous solid. Soluble 1 in 3300 of water; freely soluble in ethanol, chloroform and ether; soluble in mineral and vegetable oils and liquid polyethylene glycol; practically insoluble in glycerol.

Docusate Potassium

$C_{20}H_{37}KO_7S$ = 460.7

CAS—7491-09-0

Synonym Dioctyl potassium sulfosuccinate

Proprietary Names *Dialose*; *Kasof*.

Chemical Properties A white amorphous solid. Sparingly soluble in water; soluble in ethanol; very soluble in light petroleum.

Colour Tests To 5 mL of a 0.1% solution add 1 mL of dilute sulfuric acid, 10 mL of chloroform and 0.2 mL of dimethyl yellow solution and shake—the chloroform layer is coloured red. Add 50 mg of cetrimide and shake—the colour of the chloroform layer changes to yellow.

Infrared Spectrum Principal peaks at wavenumbers 1724, 1250, 1052, 1020, 1612, 1086 cm^{-1}.

Disposition in the Body Absorbed after oral administration and excreted in the bile. It is excreted in breast milk.

Dose 50 to 500 mg daily as a laxative.

Dodecyl Gallate

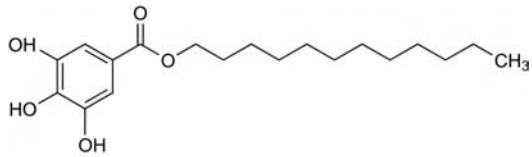
Antioxidant

$C_{19}H_{30}O_5$ = 338.4

CAS—1166-52-5

IUPAC Name Dodecyl 3,4,5-trihydroxybenzoate

Synonym Lauril gallate
Proprietary Names *Progallin LA*. It is an ingredient of *Embanox 7*.

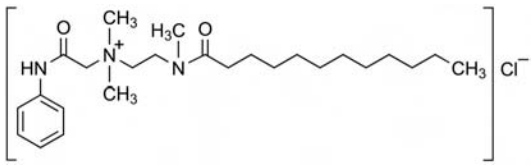


Chemical Properties A white or creamy-white powder. Mp 96° to 97.5°. Practically insoluble in water; soluble 1 in 3.5 of ethanol, 1 in 60 of chloroform and 1 in 4 of ether.
Colour Tests Ammoniacal silver nitrate—black; ferric chloride—blue; Folin–Ciocalteau reagent—blue; methanolic potassium hydroxide—orange; Nessler's reagent—black.
Ultraviolet Spectrum Methanol—275 nm (A_1^1=300b).

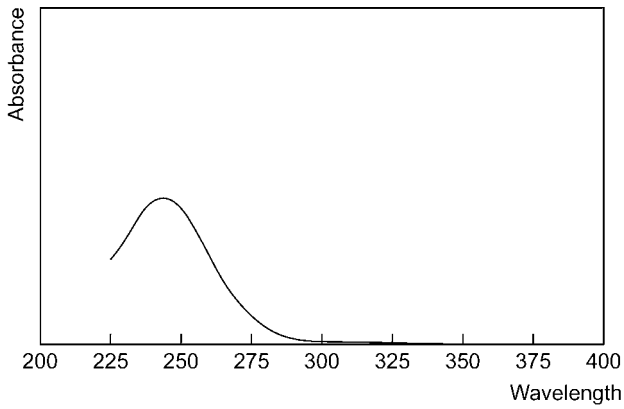
Dofamium Chloride

Cationic Disinfectant
$C_{25}H_{44}ClN_3O_2$ = 454.1
CAS—54063-35-3

IUPAC Name (2-Anilino-2-oxoethyl)-[2-[dodecanoyl(methyl)amino]ethyl]-dimethylazanium chloride
Synonyms Dimethyl [2-(*N*-methyldodecanamido)ethyl][(phenylcarbamoyl) methyl]ammonium chloride; phenamylium chloride.



Chemical Properties A white crystalline powder. Soluble in water.
Colour Test Mandelin's test—red→brown.
Thin-layer Chromatography System TA—R_f 0.03 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1676, RI 1898 and RI 1974.
Ultraviolet Spectrum Aqueous acid—244 nm (A_1^1=242b).

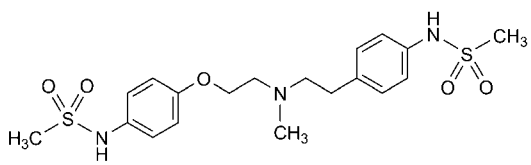


Infrared Spectrum Principal peaks at wavenumbers 1670, 1626, 760, 1538, 1592, 1298 cm^{-1}.

Dofetilide

Antiarrhythmic
$C_{19}H_{27}N_3O_5S$ = 441.6
CAS—115256-11-6

IUPAC Name *N*-[4-[2-[2-[4-(Methanesulfonamido)phenyl]ethyl-methyl-amino]ethoxy]phenyl]methanesulfonamide
Synonyms 1-(4-methanesulfonamidophenoxy)-2-[*N*-(4-methanesulfonamido-phenethyl)-*N*-methylamino]ethane; *N*-[4-[2-[Methyl[2-[4-[(methylsulfonyl)amino]-phenoxy]ethyl]amino]ethyl]phenyl]methanesulfonamide; UK-68798.
Proprietary Name *Tikosyn*



Chemical Properties White to off-white crystalline solid. Mp 161°. Very slightly soluble in water and propan-2-ol; soluble in 0.1 mol/L sodium hydroxide, acetone and 0.1 mol/L hydrochloric acid. pK_a 7.0; 9.0; 9.6. Log *P* (pH 7.4) 0.96.
Quantification
Urine **HPLC** Column: Spherisorb (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : ammonium phosphate buffer (pH 7.0; 35 : 65), flow rate 1.0 mL/min. UV detection (λ = 230 nm). Retention time: dofetilide, 8.5 min; *N*-desmethyl metabolite, 7.5 min. Limit of detection, 2.5 µgL [Walker *et al.* 1991].
Disposition in the Body Dofetilide is almost completely absorbed after oral administration and peak plasma concentrations are observed after 3 h. The presence of food increases the time taken to reach these concentrations but does not alter the oral bioavailability. Steady-state concentrations are reached within 2 to 3 days. It is metabolised in the liver, by *N*-oxidation and *N*-deakylation, to essentially inactive metabolites. Approximately 80% of an administered dose is excreted in urine; mostly as the unchanged drug and the rest as inactive or minimal activity metabolites. No quantifiable amounts of metabolites have been detected in plasma but five have been detected in urine.
Therapeutic Concentration
Eighteen male and female patients with coronary artery disease, mean age 55 years (range, 42 to 65 years) were administered doses of 1.5, 3.0 and 4.5 µg/kg dofetilide at a constant infusion rate over 10 min. The mean peak plasma concentrations were 1.74 (0.70 to 2.51) µg/L, 3.35 (2.7 to 3.86) µg/L and 5.11 (3.25 to 6.47) µg/L for the three doses. These concentrations were observed at the end of the infusion period [Sedgwick *et al.* 1991].

Ten healthy males (mean age, 23.4 years; range, 19 to 30 years) were administered 0.5 mg dofetilide orally and 0.5 mg IV as a continuous infusion over a 30-min period. A wash-out period of 1 week was allowed between treatments. The peak plasma concentrations were 1.9 (range, 1.3 to 2.4) µg/L for the oral dose, observed at 2.6 (1.5 to 4.0) h, and 6.0 (3.7 to 8.2) µg/L for the IV dose [Le Coz *et al.* 1995].

Healthy males aged 18 to 45 years (mean, 25 years) were divided into three groups and treated with dofetilide. Group 1: 1.0 mg daily (0.33 mg three times a day) and 0.5 mg twice daily; group 2: 1.5 mg daily (0.5 mg three times daily) and 0.75 mg twice daily; group 3: 2.5 mg daily (1.25 mg twice daily) and 0.83 mg three times daily. Each volunteer participated in a 5-day dosing period with a 6-day washout in between. For group 1, the peak plasma concentrations were 1.7 µg/L for the 0.33 mg dose on day 1 and 2.64 µg/L for the 0.5 mg dose. These concentrations were observed at 2.29 and 2.00 h, respectively. On day 5, the concentrations were 3.04 and 3.80 µg/L for the two doses, observed at 2 h. For group 2, peak plasma concentrations were 2.26 µg/L for the 0.5 mg dose on day 1 and 3.54 µg/L for the 0.75 mg dose, both observed at 2.13 h. On day 5, the concentrations were 4.78 and 5.23 µg/L for the 2 doses, observed at 2.0 and 1.88 h, respectively. For group 3, concentrations reached 3.55 µg/L for the 0.83 mg dose on day 1 and 5.47 µg/L for the 1.25 mg dose. These were observed at 2.29 and 1.57 h, respectively. On day 5, concentrations were 7.71 and 10.07 µg/L for the 2 doses, observed at 2.14 and 1.57 h, respectively. Steady-state concentrations were reached by day 3 [Allen *et al.* 2000].
Toxicity
In some patients being treated with dofetilide, it can cause an abnormal heartbeat which in rare instances can result in death. Symptoms are fast beating of the heart, dizziness and fainting which usually occur in the first few days of treatment [American Society of Health-System Pharmacists 2007].

Above the recommended therapeutic dose, 500 µg twice daily, the degree of QT prolongation and the subsequent risk of cardiac arrhythmia is considered too high [Allen *et al.* 2000].
Half-life Plasma elimination, 6.2 to 9.7 h; half-life increases with renal impairment.
Bioavailability 92 to 99%.
Volume of Distribution 226 to 249 L; 3.8 L/kg.
Clearance Systemic clearance, 0.35 L/h/kg; plasma, 4.7 mL/min/kg [Sedgwick *et al.* 1991]; 20.8 to 28.2 L/h; clearance decreases with renal impairment.
Protein Binding 60 to 70%.
Dose The recommended oral dose is 500 µg twice daily (normal renal function); 250 µg twice daily (creatinine clearance, 40 to 60 mL/min); 125 µg twice daily (creatinine clearance, 20 to 40 mL/min).

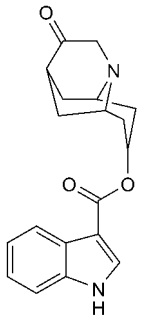
Dolasetron

5-HT_3 Receptor Antagonist, Antiemetic
$C_{19}H_{20}N_2O_3$ =324.4
CAS—115956-12-2

Synonyms 1*H*-Indole-3-carboxylic acid (2α,6α,8α,9^a,β)-octahydro-3-oxo-2,6-methano-2*H*-quinolizin-8-yl ester; MDL-73147.

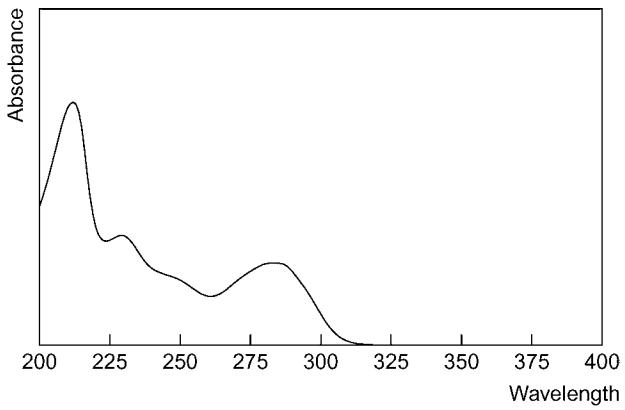


Chemical Properties Log *P* (octanol/water) 2.35 [Johnson *et al.* 2003].

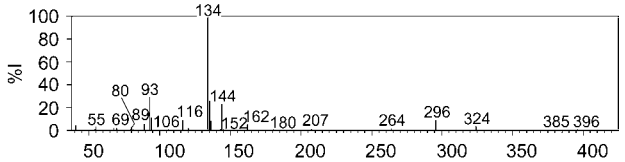
Dolasetron Methanesulfonate

$C_{19}H_{20}N_2O_3.CH_3SO_3H = 420.5$
CAS—115956-13-3
Synonyms Dolasetron mesylate; MDL-73147EF.
Proprietary Name *Anzemet*
Chemical Properties White to off-white powder. Mp 278°. Freely soluble in water and propylene glycol; slightly soluble in ethanol and normal saline. Stable for at least 90 days if stored at 3–5 or 23–25° in Ora-Plus and strawberry syrup (1 : 1) or Ora sweet SF [Johnson *et al.* 2003].

Ultraviolet Spectrum Aqueous acid (ethanol)—229, 282 nm.



Mass Spectrum Principal ions at *m/z* 134, 93, 135, 144, 116, 296, 162, 324.



Quantification

Plasma **GC-MS** Column: DB-5 (7.5 m × 0.32 mm i.d., 0.25 μm). Carrier gas: He, 10–11 psi. Temperature programme: 170° for 1 min to 270° at 20°/min for 2 min. PCI. Retention time: 6.45 min. Limit of quantification, 2 μg/L [Gillespie *et al.* 1993].

HPLC Column: C_{18}. Mobile phase: acetonitrile : 0.05 mol/L ammonium acetate (pH 7.5; 24 : 76), flow rate 0.8 mL/min. UV detection (λ = 280 nm). Retention time: 6.9 min. Limit of detection not reported [Johnson *et al.* 2003]. Column: OVM (150 × 4.6 mm i.d.). Mobile phase: acetonitrile : 25 mmol/L ammonium acetate (pH 7.2; 16 : 84), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 274 nm, λ_{em} = 345 nm). Limit of quantification, 1.7 μg/L. [McElvain *et al.* 1997]. Column: Ultrasphere IP C_{18} (150 × 4.6 mm i.d., 5 μm). Mobile phase: 0.05 mol/L sodium dihydrogenphosphate (pH 2.5) : *n*-butanol : acetonitrile (89 : 6 : 5) flow rate 0.7 mL/min. Fluorescence detection (λ_{ex} = 285 nm, λ_{em} = 345 nm). Retention time: 7.6 min for dolasetron mesylate (retention factor, 3.2); 8.7 min for hydrodolasetron (3.9). Limit of quantification, 10 nmol/L for dolasetron, 5 nmol/L for MDL 74156 [Huebert *et al.* 1996]. Column: CN Spherisorb (150 × 4.6 mm i.d., 3 μm). Mobile phase: acetonitrile : 0.05 mol/L ammonium acetate buffer (pH 7.5; 24 : 76), flow rate 0.8 mL/min. UV detection (λ = 280 nm). Retention time: 7.2 min. Limit of quantification, 10 μg/L [Gillespie *et al.* 1993].

Urine **HPLC** See Plasma. Limit of quantification, 5 nmol/L for dolasetron and MDL 74156 [Huebert *et al.* 1996]. Ultron ES-OVM (15 × 0.46 cm i.d.). Mobile phase: acetonitrile : 0.025 mol/L sodium hydrogen phosphate (pH 6.0; 10 : 90), flow rate 1.0 mL/min. UV detection (λ = 281 nm). Limit of detection not reported [Dow, Berg 1995]. Column: SCD-100 (250 × m i.d., 5 μm). Mobile phase: 0.05 mol/L dipotassium hydrogen phosphate : acetonitrile (70 : 30) with 0.8% triethylamine (pH 7.5), flow rate 1.0 mL/min. UV detection (λ = 280 nm). Limit of detection, 100 dpm [Reith *et al.* 1995]. Column: Nucleosil C_4 (250 × 4.6 mm, 5 μm). Mobile phase: acetonitrile- 0.05 mol/L ammonium acetate (pH 7.4; 10 : 90): acetonitrile-0.05 mol/L ammonium acetate (pH 7.4; 60 : 40, 100 : 0 to 0 : 100 over 30 min), flow rate 1.0 mL/min. UV detection (λ = 280 mn). Retention time (*k*): hydrodolasetron, 18.9 min (8.95). Limit of quantification, 200 μg/L [Sanwald *et al.* 1994].

LC-MS Column: Zorbax C_8 (25 cm × 0.32 mm i.d., 5 μm). Mobile phase: acetonitrile-1% acetic acid (5 : 95) : acetonitrile-1% acetic acid (95 : 5, 100 : 0 to 50 : 50 in 50 min), flow rate 2 μL/min. ESI. Limit of detection not reported [Ackermann *et al.* 1996].

Other **HPLC** Human Liver Microsomes. Column: Nucleosil C_4 (250 × 4.6 mm, 5 μm). Mobile phase: acetonitrile-20 mmol/L ammonium acetate (pH 6.0; 10 : 90) : acetonitrile-20 mmol/L ammonium acetate (pH 6.0; 60 : 40, 100 : 0 to 30 : 70 over 30 min), flow rate 1.0 mL/min. UV detection (λ = 280 mn). Limit of detection, 0.25 nmol/L [Sanwald *et al.* 1996].

Disposition in the Body Dolasetron is rapidly absorbed and subsequently metabolised to hydrodolasetron (with the most clinically relevant activity) by carbonyl reductase. The metabolite appears rapidly in plasma with peak concentrations appearing within the hour; the parent drug is rarely detected. Food does not affect the abosorption of the drug. Hydrodolasetron undergoes additional hydroxylation (CYP2D6) and *N*-oxidation (by flavin mono-oxygenase and CYP3A). It is excreted in urine as hydrodolasetron (53% of administered IV dose) and other metabolites including hydroxylated glucuronides and *N*-oxide. Approximately 66% of an administered dose is detected in urine and the remainder in the faeces.

Therapeutic Concentration

After a single IV dose of 2.4 mg/kg dolasetron mesylate to elderly healthy subjects, a mean maximum plasma concentration of 1465 ± 770 μg/L was observed [Dempsey *et al.* 1996].

Group 1: 6 healthy volunteers with a mean age 41.5 years (range, 34 to 53 years); group 2: 7 patients with mild hepatic impairment (Child–Pugh class A), mean age 40.7 (range, 34 to 46 years); group 3: 4 patients with moderate to severe impairment (class B or C1), mean age 48.5 (range, 42 to 52) years. All participants had creatinine clearance >70 mL/min and were fasted overnight before treatment. Each subject was administered a single 150 mg oral and intravenous dose of dolasetron mesylate over a 10-min infusion period. A 7-day washout period was allowed between the two doses. For the oral doses of the drug, mean peak plasma dolasetron concentrations were 6 (range, 0 to 12) μg/L, 37 (range, 0 to 138) μg/L and 214 (range, 137 to 289) μg/L for groups 1, 2 and 3, respectively. These concentrations were observed between 0.25 and 1.0 h. The mean peak hydrodolasetron concentrations were 347 (range, 170 to 526) μg/L, 387 (range, 258 to 542) μg/L and 410 (range, 374 to 466) μg/L for the 3 groups, observed between 0.5 and 2.0 h. After IV administration of dolasetron, peak plasma concentrations were 3055 (range, 2358 to 5584) μg/L for group 1, 2098 (range, 792 to 4025) μg/L for group 2 and 3299 (range, 2371 to 4871) μg/L for group 3. These concentrations were observed at 0.18 h (range, 0.1 to 0.28 h). Peak hydrodolasetron concentrations were 424 (range, 339 to 492) μg/L, 473 (range, 375 to 610) μg/L and 396 (range, 278 to 602) μg/L for the 3 groups, respectively, observed at 0.25 to 1.0 h [Stubbs *et al.* 1997].

Group 1: 12 male and female patients with mild-to-moderate renal impairment (creatinine clearance, 41 to 80 mL/min), mean age 62.8 years; group 2: 12 patients with moderate-to-severe renal impairment (creatinine clearance, 11 to 40 mL/min), mean age, 50.7 years; group 3: 12 patients, mean age 51.8 years, with end-stage renal impairment undergoing chronic haemodialysis (creatinine clearance ≤10 mL/min); group 4: 24 healthy male volunteers (creatinine clearance, >80 mL/min), mean age 23.8 years. All subjects were fasted overnight and administered 200 mg dolasetron mesylate orally and IV as a 10-min infusion, with a 7-day washout period between doses. Peak plasma hydrodolasetron concentrations were 775.7, 812.8, 866.5 and 646.9 μg/L for groups 1, 2, 3 and 4, respectively, after the IV dose. These concentrations were observed at 0.72, 0.77, 0.69 and 0.67 h, respectively. After the oral dose, concentrations were 742.7, 680.9, 700.8 and 601.2 μg/L at 0.81, 0.79, 0.72 and 0.74 h, respectively, for the 4 groups [Dimmitt *et al.* 1998].

Twenty-four healthy male volunteers were administered 200 mg dolasetron mesylate after an overnight fast or after a high-fat breakfast. The mean maximum plasma concentrations were 581.9 and 411.0 μg/L reached at 1.11 and 1.8 h in the fasted and fed states, respectively [Lippert *et al.* 1998].

Toxicity Symptoms of acute toxicity include tremors, depression and convulsions. Dolasetron has been associated with electrocardiogram interval changes; magnitude and frequency dependent on the concentration of the metabolite, hydrodolasetron, in the blood. This can lead to cardiovascular effects including heart block and cardiac arrhythmias.

Note For a case report of dolasetron leading to prolonged QTc interval and severe hypotension, see Rochford *et al.* [2007].

Half-life Hydrodolasetron, 8.1 h.

Bioavailability 75%.

Volume of Distribution 1.4 L/kg (patients with mild-to-moderate renal impairment); 1.5 L/kg (moderate to severe renal impairment); 3.65 L/kg (end-stage renal impairment); 1.03 L/kg (healthy individuals). Hydrodolasetron, 5.8 L/kg.

Clearance Systemic clearance, 55.7 mL/min/kg (patients with mild-to-moderate renal impairment); 117.5 mL/min/kg (moderate to severe renal impairment); 66.1 mL/min/kg (end-stage renal impairment); 114.9 mL/min/kg (healthy individuals). Apparent clearance, hydrodolasetron, 9.4 to 13.4 mL/min/kg.
Protein Binding 69 to 77%.
Dose
Oral Adults, 100 mg 1 h before chemotherapy or within 2 h before surgery. Children (2 to 16-years-old), 1.8 mg/kg body weight within 1 h of chemotherapy; a maximum of 100 mg; alternatively, 1.2 mg/kg body weight within 2 h before surgery.
By injection Adults, 100 mg 30 min before chemotherapy; alternatively, 12.5 mg 15 min before anaesthesia has finished before surgery. Children (2 to 16-years-old), 1.8 mg/kg 30 min before chemotherapy, maximum 100 mg; alternatively, 0.35 mg/kg 15 min before the end of anaesthesia, maximum 12.5 mg.

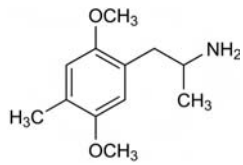
DOM

Hallucinogen
$C_{12}H_{19}NO_2$ = 209.3
CAS—15588-95-1

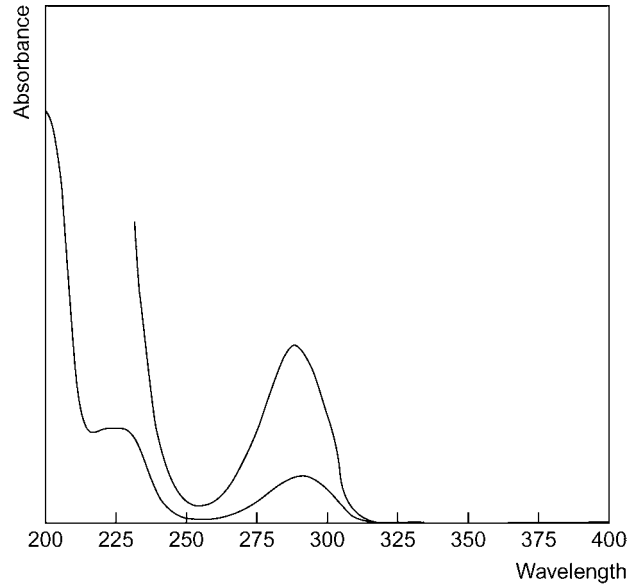
IUPAC Name 1-(2,5-Dimethoxy-4-methylphenyl)propan-2-amine
Synonyms 2,5-Dimethoxy-α,4-dimethylbenzene-ethanamine; 2,5-dimethoxy-4-methylamfetamine; 2,5-dimethoxy-4-metamfetamine; STP (STP has been used as a synonym for DOM and DOM is reported to be the active principle of the hallucinogenic preparation known as STP).



Chemical Properties Mp 60.5° to 61.0°. Practically insoluble in water; soluble in chloroform. Log *P* (octanol/water), 2.2.

DOM Hydrochloride
$C_{12}H_{19}NO_2$,HCl = 245.7
CAS—15589-00-1
Chemical Properties White crystals from propan-2-ol/ether. Mp 189° to 189.5°.

Colour Test Marquis test—yellow.
Thin-layer Chromatography System TA—R_f 0.51; system TB—R_f 0.15; system TC—R_f 0.17; system TE—R_f 0.41; system TAE—R_f 0.09; system TL—R_f 0.16; system TAF—R_f 0.76 (Dragendorff Spray—positive; FPN reagent—positive; acidified iodoplatinate solution—positive; Marquis test—yellow; Ninhydrin (spray)—positive; acidified potassium permanganate—positive).
Gas Chromatography System GA—DOM RI 1616, M (-PFP) RI 1730, M (-AC) RI 2020, M (-AC_2) RI 2090, M (art, formyl) RI 1565, M (*O*-desmethyl-)(-PFP_2) RI 1780, M (OH--AC_2) RI 2260, M (desamino-oxo-OH-)(-PFP_2) RI 2045, M (desamino-oxo-OH-)(-AC_2) RI 2560; system GB—RI 1652.
High Performance Liquid Chromatography System HC—*k* 1.13; system HX—RI 340.
Ultraviolet Spectrum Aqueous acid—289 nm (A^1_1=221b)



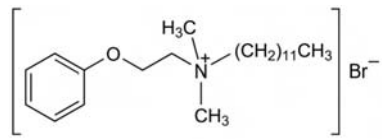
Infrared Spectrum Principal peaks at wavenumbers 1208, 1041, 1541, 1515, 1634, 1094 cm^{-1}.
Mass Spectrum Principal ions at *m/z* 44, 166, 151, 57, 43, 91, 135, 209.
Quantification **GC** Column: (1) 10% Apiezon L plus 2% potassium hydroxide, or (2) Carbowax 20M plus 2% potassium hydroxide, both on Chromosorb W/AW on 80/100 mesh. Carrier gas: N_2, 30 mL/min. Temperature: 165°. Retention time: 12.4 and 22.5 min for 4-methyl-2,5 dimethoxyamfetamine on columns 1 and 2, respectively. Limit of detection not reported [Canfield *et al.* 1977].
Other **GC-MS** Rat brain. Column: HP-5 MS methyl silicone (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 20 mL/min. Temperature programme: 80° for 2 min to 170° at 20°/min to 225° at 10°/min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 100 ng/g [Eckler *et al.* 2001].
Disposition in the Body Approximately 20% of an ingested dose is excreted in the urine unchanged in 24 h; peak urinary excretion occurs 3 to 6 h after ingestion.

Canfield DV *et al.* (1977). Gas chromatographic analysis of amphetamine derivatives and morpholine-related drugs. *J Forensic Sci* 22: 429–433.
Eckler JR *et al.* (2001). A sensitive method for determining levels of [−]-2,5,-dimethoxy-4-methylamphetamine in the brain tissue. *J Pharmacol Toxicol Meth* 46: 37–43.

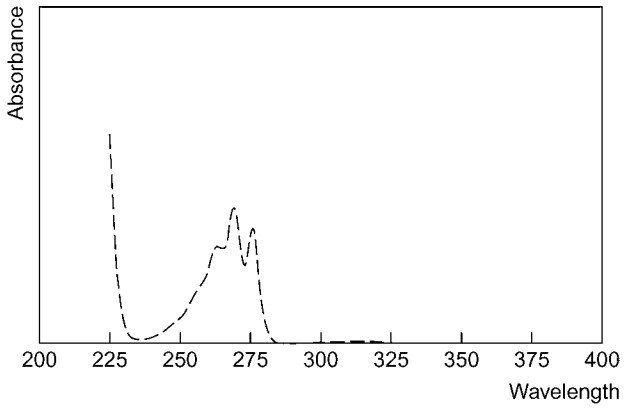
Domiphen Bromide

Cationic Disinfectant
$C_{22}H_{40}BrNO$ = 414.5
CAS—13900-14-6 (domiphen); 538-71-6 (bromide)

IUPAC Name Dodecyl-dimethyl-(2-phenoxyethyl)azanium bromide
Synonyms *N*,*N*-Dimethyl-*N*-(2-phenoxyethyl)-1-dodecanaminium bromide; phenododecinium bromide.
Proprietary Names *Antiseptique Pastilles*; *Bradoral*; *Bronchodex Pastilles*; *Neobradoral*; *Oraseptic*. It is an ingredient of *Bradosol*.



Chemical Properties Colourless or faintly yellow crystalline flakes. Mp 112° to 113°. Soluble 1 in less than 2 of water and of ethanol, and 1 in 30 of acetone; soluble in ethyl acetate and chloroform; very slightly soluble in benzene. Log *P* (octanol/water), 4.2.
Colour Test Dissolve 10 mg in 10 mL of water, add 0.1 mL of a 0.5% aqueous eosin solution and 100 mL of water—pink.
Thin-layer Chromatography System TA—R_f 0.05 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2310.
High Performance Liquid Chromatography System HY—RI 506 (domiphen).
Ultraviolet Spectrum Methanol—268 (A^1_1=30a), 277 nm.



Infrared Spectrum Principal peaks at wavenumbers 1228, 752, 1500, 1600, 689, 1080 cm^{-1} (KBr disk).

Dose Lozenges containing 500 µg of domiphen bromide are available.

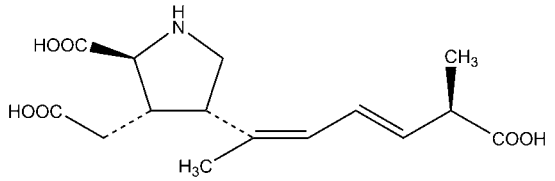
Domoic Acid

Glutamatergic Agonist, Kainoid, Neurotoxin

$C_{15}H_{21}NO_6 = 311.3$

CAS—14277-97-5

IUPAC Name (2*S*,3*S*,4*S*)-2-Carboxy-4-[(1*Z*,3*E*,5*R*)-5-carboxy-1-methyl-1,3-hexanedienyl]-3-pyrrolidine-acetic acid



Chemical Properties Excitory amino acid belonging to the kainoid class of compounds principally isolated from the red alga *Chondria armata* Okamura, Rhodomelaceae, known in Japanese as 'domoi'. It can also be produced by a number of marine organisms (plankton) such as diatoms of the genus *Pseudonitzschia*. Ten isomers of domoic acid (isodomoic acids A to H and domoic acid 5′-diastereomer) have been identified in marine samples [Wright *et al.* 1990; Zaman *et al.* 1997]. Isodomoic acids are minor consitutents relative to domoic acid and the isomers are not always present in contaminated shellfish. Domoic acid can be converted to isodomoic acids when exposed to UV light or heat. Domoic acid and its isomers do not degrade under ambient temperatures or when exposed to light in sterile saline solution [Johannessen 2000]. However, domoic acid has been shown to decompose under acidic conditions (50% loss in 1 week at pH 3) [Quilliam *et al.* 1989].

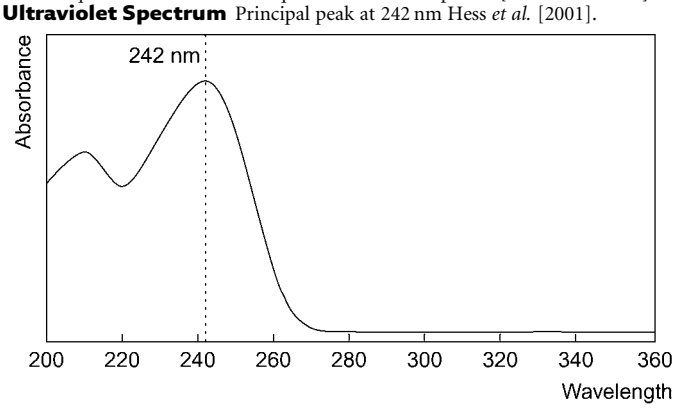
Domoic Acid Dihydrate

Chemical Properties Mp 217°. Soluble in water, acetic acid; insoluble in methanol, ethanol, chloroform, acetone, benzene [O'Neil *et al.* 2006]. pK_a 2.10, 3.72, 4.93, 9.82 [Pineiro *et al.* 1999].

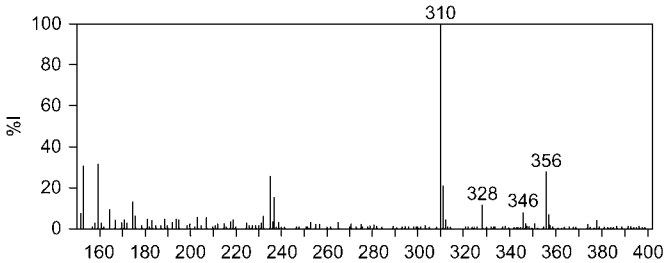
High Performance Liquid Chromatography Column: C_{18} (100 × 4.6 mm i.d., 3 µm). Mobile phase: 2.87 mmol/L aqueous phosphoric acid : acetonitrile (86 : 14), flow rate 1.0 mL/min. UV detection (λ = 242 nm). Limit of quantification not reported [Johannessen 2000].

Liquid Chromatography-Mass Spectrometry Column: C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : aqueous 0.01 mol/L trifluoroacetic acid containing 0.01% heptafluorobutyric acid (5 : 95 to 40 : 60 over 12 min to 70 : 30 over 5 min for 10 min), flow rate 0.7 mL/min. API, positive ion mode, MRM acquisition mode. Retention times: domoic acid 12 min, saxitoxin 7.5 min, okadaic acid 24 min. Limit of quantification not reported [Dahlmann *et al.* 2003]. Column: C_{18} (150 × 2.1 mm i.d., 5 µm). Mobile phase: 0.1% aqueous formic acid : 0.1% formic acid in acetonitrile (95 : 5 for 3 min to 5 : 95 over 10 min), flow rate 0.2 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification not reported [Burns *et al.* 2007].

Ultraviolet Spectrum Principal peak at 242 nm Hess *et al.* [2001].



Mass Spectrum Principal ions at *m/z* 73, 75, 692, 115, 95, 147(*N*-trifluoroacetyl-*O*-*tert*-butyldimethylsilyl derivative).



Quantification

Serum **HPLC** Column: Partisil ODS-3 (250 × 4.1 mm i.d., 10 µm). Mobile phase: acetonitrile : water (pH 3.0; 10.5 : 89.5), flow rate 1.5 mL/min for 19 min and 3.0 mL/min for 11 min. Retention time: 11.4 min. Limit of quantification, 0.2 mg/L [Blanchard, Tasker 1990].

Other **TLC** Shellfish Tissue. Plates: silica gel $60F_{254}$ (10 × 20 cm, 250 µm). Solvent system: butanol : acetic acid : water (3 : 1 : 1). UV detection (λ = 254 nm) and spray with ninhydrin reagent. R_f value: 0.45 (distinct yellow colour). Limit of detection, 0.3 µg/spot [Quilliam *et al.* 1998].

GC-MS Mussel Samples. Column: DB-1 fused silica capillary (20 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He. Temperature programme: 100° to 300° at 10°/min. EI ionisation at 70 eV, SIR. Retention time: 20.1 min (trifluoroacetyl-*O*-*tert*-butyldimethylsilyl derivative). Limit of quantification, 5 mg/kg [Pleasance *et al.* 1990].

HPLC Seawater. Column: C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water (38 : 62) with 0.05% trifluoroacetic acid, flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 470 nm, λ_{em} = 530 nm). Limit of detection, 120 ng/L (7-fluoro-4-nitro-2,1,3-benzoxadiazole derivative) [Chan *et al.* 2007]. Cuttlefish samples. Column: Nucleosil C_{18} (125 × 3.0 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.1% aqueous formic acid (10 : 90), flow rate 0.45 mL/min. UV detection (λ = 242 and 262 nm). Retention times: domoic acid 7.4 min, isodomoic acid 6.2 min, 5′-diastereomer 8.3 min. Limit of quantification, 0.2 µg/g [Costa *et al.* 2005]. Shellfish Tissue. Column: C_{18} (100 × 4.6 mm i.d.). Mobile phase: 5 mmol/L phosphate buffer (pH 2.7) : acetonitrile (9 : 1), flow rate 0.5 mL/min. Chemilumiscence detection and UV detection (λ = 242 nm). Limit of detection, 0.4 µg/L [Kodamatani *et al.* 2004]. Blue Mussel Extract. Column: C_{18} (250 × 4.0 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.05% aqueous trifluoroacetic acid (5 : 95 to 35 : 65 over 15 min for 5 min), flow rate 1 mL/min. UV detection (λ = 242 nm). Retention time: 12.6 min. Limit of detection, 0.5 mg/L [Yu *et al.* 2004]. Whale Faeces. Column: Vydac C_{18} (25 × 2.1 mm i.d.). Mobile phase: water : acetonitrile : trifluoroacetic acid (90 : 10 : 0.1). UV detection (λ = 242 nm). Limit of detection, 0.2 µg/g [Lefebvre *et al.* 2002]. Scallop Tissue Samples. Column: C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.1% trifluoroacetic acid in 10% aqueous acetonitrile, flow rate 1.5 mL/min. UV detection (λ = 242 nm). Limit of detection, 0.2 µg/g [Hess *et al.* 2001]. Phytoplankton (*Pseudonitzschia australis*). Column: C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: water : acetonitrile (40 : 60) with 0.1% trifluoroacetic acid, flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 470 nm, λ_{em} = 530 nm). Retention time: 10 min (7-fluoro-4-nitro-2,1,3-benzoxadiazole derivative). Limit of quantification, 1 µg/g [James *et al.* 2000]. Sea Lion Faeces and Anchovies. Column: Vydac C_{18} (25 × 2.1 mm i.d.). Mobile phase: water : methanol : trifluoroacetic acid (90 : 10 : 0.1), flow rate 0.3 mL/min. DAD (λ = 242 and 280 nm). Retention time: 9.5 min. Limit of detection, 0.1 mg/L [Lefebvre *et al.* 1999]. Red alga (*Chondria armata*). Column: C_{18} (250 × 4.0 mm i.d.). Mobile phase: 0.1% trifluoroacetic acid in 10% aqueous acetonitrile, flow rate 1.2 mL/min. UV detection (λ = 242 nm). Retention times: domoic acid 17.9 min, isodomoic acid 15.0 min, isodomoic acid A 16.0 min, isodomoic acid B 21.5 min, isodomoic acid G 23.0 min, isodomoic acid F 25.9 min, isodomoic acid H 31.7 min. Limit of quantification not reported [Zaman *et al.* 1997]. Crab and Razor Clam. Column: C_{18} Vydac (25 × 2.1 mm i.d.). Mobile phase: water : acetonitrile : trifluoroacetic acid (90 : 10 : 0.1), flow rate 0.3 mL/min. UV detection (λ = 242 nm). Retention time: 8.0 min. Limit of quantification, not reported [Hatfield *et al.* 1994]. Rat Urine, Serum and Faeces. Column: C_{18} (150 × 2.1 mm i.d., 5 µm). Mobile phase: 0.2% formic acid and 12% acetonitrile in water (pH 3.0), flow rate 0.5 mL/min. Retention time: ~7.0 min. Limit of detection, 0.1 µg/g [Lawrence *et al.* 1994]. Rat Serum and Urine. Column: µBondapak C_{18} (300 mm, 10 µm). Mobile phase: acetonitrile : 0.2% aqueous trifluoroacetic acid (10 : 90), flow rate 1.5 mL/min. UV detection (λ = 242 nm). Retention time: 13.5 min. Limit of quantification not reported [Suzuki, Hierlihy 1993]. Shellfish Tissue. Column: C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: aceonitrile : water (pH 2.5, 15 : 85 to 80 : 20 over 20 min), flow rate 1.0 mL/min. UV detection (λ = 242 nm). Retention time: 6.1 min. Limit of detection, 5 to 10 µg/g [Lawrence, Menard 1991].

LC-MS Seawater and Phytoplankton. Column: C_{18} (150 × 2.0 mm i.d., 5 µm). Mobile phase: water : acetonitrile with 0.1% formic acid (95 : 5 for 2 min to 60 : 40 over 13 min to 5 : 95 over 2 min for 5 min), flow rate 0.2 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention time: 12 min. Limit of quantification, 0.05 µg/L [Wang *et al.* 2007]. Shellfish Samples. Column: C_{18} (150 × 2.1 mm i.d., 5 µm). Mobile phase: acetonitrile : water (1 : 9) with 0.035% trifluroacetic acid (pH 2.5), flow rate 0.2 mL/min. ESI, APCI, APPI or APCI/APPI, positive ion mode, SRM acquisition mode. Retention time: 8.2 min. Limit of detection, ESI 0.2 µg/g, APCI 1.8 µg/g, APPI 1.2 µg/g, APCI/APPI 1.2 µg/g [Pardo *et al.* 2007]. Shellfish Tissue. Column: TSK-gel amide-80 (250 × 2.0 mm i.d., 5 µm). Mobile phase: water : 95% acetonitrile in water-2 mmol/L ammonium formate-3.6 mmol/L formic acid

(25 : 75), flow rate 0.2 mL/min. ESI, positive and negative ion modes, SIM and MRM acquisition modes. Retention time: 5.0 min. Limit of detection, 63 μg/kg (positive mode), 190 μg/kg (negative mode) [Ciminiello *et al.* 2005]. Greenshell Mussel, Pacific Oyster, New Zealand Cockle and Scallop Roe. Column: C_{18} (150 × 2.0 mm i.d., 5 μm). Mobile phase: acetonitrile-water (1 : 9) : acetonitrile–water (9 : 1) : 33 mmol/L aqueous ammonium hydroxide and 500 mmol/L aqueous formic acid. (85 : 5 : 10 for 2 min to 5 : 85 : 10 over 11 min for 12 min), flow rate 0.2 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 0.05 mg/kg [McNabb *et al.* 2005]. Bovine Serum and Urine. Column: SphereClone ODS2 (250 × 4.6 mm i.d., 5 μm). Mobile phase: 1% acetic acid in water : 1% acetic acid in methanol : acetonitrile (23 : 57 : 20), flow rate 0.5 mL/min. ESI, MRM acquisition mode. Retention time: 9.9 min. Limit of detection, 5 μg/kg [Tor *et al.* 2003]. Shellfish. Column: C_{18} (150 × 2.0 mm i.d., 5 μm). Mobile phase: methanol : water : 40 mmol/L ammonium hydroxide (90 : 33 : 10) with 0.5 mol/L formic acid, flow rate 0.2 mL/min. API, positive ion mode, MRM acquisition mode. Retention time: 5.8 min. Limit of quantification, 0.5 mg/kg; limit of detection, 0.15 mg/kg [Holland *et al.* 2003]. Shellfish Tissue. Column: C_{18} (150 × 2.0 mm i.d., 5 μm). Mobile phase: acetonitrile : water with 0.05% trifluoroacetic acid (5 : 95 to 40 : 60 over 25 min), flow rate 0.2 mL/min. DAD. Retention time: 18.1 min. Limit of detection, 25 μg/L (MS^1), 14 μg/L (MS^2), 8 μg/L (MS^3) [Furey *et al.* 2001]. Scallop Tissue Samples. Column: C_{18} (150 × 2.0 mm i.d., 5 μm). Mobile phase: water-50 mmol/L formic acid-2 mmol/L ammonium formate : acetonitrile-water (95 : 5)-50 mmol/L formic acid-2 mmol/L ammonium formate (85 : 15), flow rate 0.2 mL/min. ESI, MRM acquisition mode. Limit of detection, 0.4 μg/g [Hess *et al.* 2001].

CE Shellfish Samples. Column: bare fused silica (75 cm × 50 μm i.d.). UV detection (λ = 242 nm). Buffer: 20 mmol/L sodium tetraborate (pH 9.0) : acetonitrile (9 : 1). Migration times: domoic acid 9.0 min, isodomoic acid E 8.8 min. Limit of quantification, 150 μg/kg [Zhao *et al.* 1997].

Note For a review of HPLC-UV methods comparing different stationary phases for the analysis of domoic acid in mussels, see Lawrence *et al.* [1991] and Lawrence *et al.* [1989].

Disposition in the Body

Toxicity Domoic acid binding studies to the glutamate receptor have shown that domoic acid has a strong affinity for subclasses of the kainite receptor. These are widely distributed in the mammalian brain but are particularly concentrated in the CA3 region of the hippocampus in humans. It appears that the domoic acid-glutamate receptor interaction mediates the toxic response. Following the 1987 amnesic shellfish poisoning (ASP) outbreak, the Canadian authorities imposed an action limit for domoic acid in mussels of 20 μg/g mussel flesh, which when exceeded would result in closure of shellfish harvesting areas [Jeffery *et al.* 2004]. Ingestion of as little as 60 mg domoic acid is sufficient to induce gastro-intestinal illness. Similarly, ingestion of 270 mg domoic acid results in neurological effects [Perl *et al.* 1990].

Note For proceedings of a conference on domoic acid-induced ASP, see Liston [1990]. For a review of domoic acid, see Jeffery *et al.* [2004]. For a study of the renal clearance of domoic acid in the rat, see Suzuki, Hierlihy [1993].

Donepezil

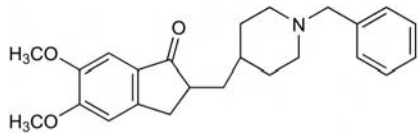
Nootropic

$C_{24}H_{29}NO_3$ = 379.5

CAS—120014-06-4

IUPAC Name 2-[(1-Benzylpiperidin-4-yl)methyl]-5,6-dimethoxy-2,3-dihydroinden-1-one

Synonyms 2,3-Dihydro-5,6-dimethoxy-2-[[1-(phenylmethyl)-4-piperidinyl] methyl]-1*H*-inden-1-one; ER-4111.



Donepezil Hydrochloride

$C_{24}H_{29}NO_3$,HCl = 416.0

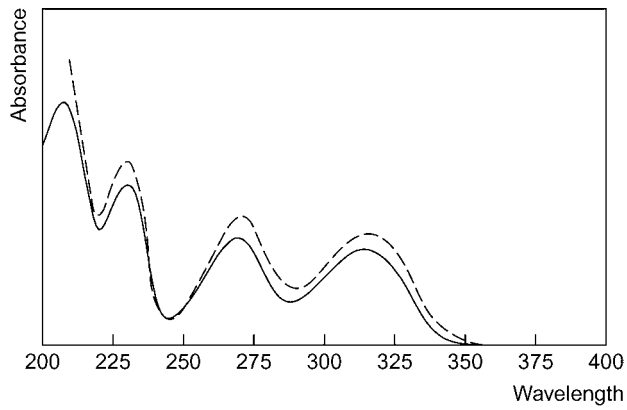
CAS—120011-70-3

Synonyms BNAG; E2020.

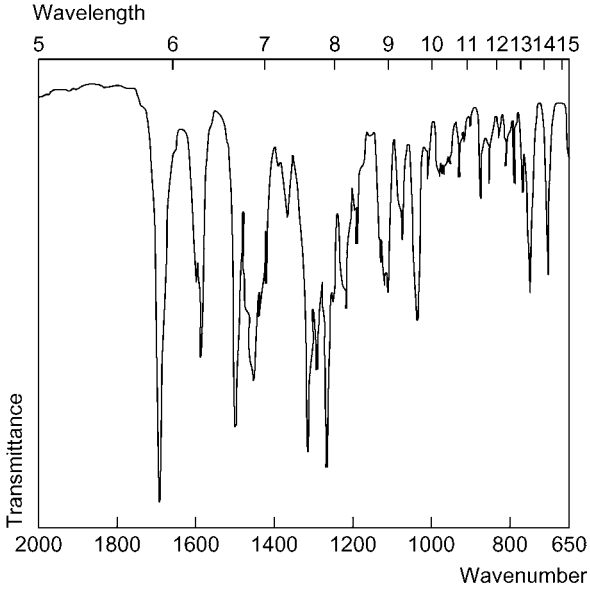
Proprietary Names *Aricept*; *Memac*.

Chemical Properties A white to off-white solid with Mp 224°. It is soluble in water (55 g/L at 25°); freely soluble in chloroform and glacial acetic acid. pK_a 8.90.

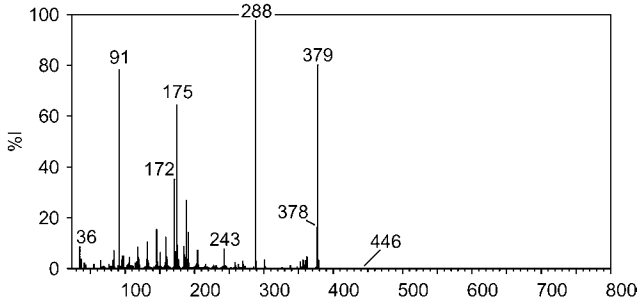
Ultraviolet Spectrum Aqueous acid—230, 271, 316 nm. No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1605, 1589, 1500, 749, 702 cm^{-1}.



Mass Spectrum Principal peaks at *m/z* 288, 379, 91, 175, 172, 178, 378, 243.



Quantification

Plasma **HPLC** Column: short C_{30}. Mobile phase: 25 mmol/L citric acid-50 mmol/L disodium hydrogen phosphate (pH 6.0) : acetonitrile (73 : 27) containing 3.5 mmol/L sodium 1-octanesulfonate. Fluorescence detection (λ_{ex}= 325 nm; λ_{em}= 390 nm). Limit of detection, 0.2 µg/L [Nakashima *et al.* 2006]. Column: C_{18} STR ODS-II (150 × 4.6 mm, 5 µm). Mobile phase: 0.02 mol/L phosphate buffer (pH 4.6) : 6 mol/L perchloric acid : acetonitrile (59.5: 0.5: 40), flow rate 1.0 mL/min. UV detection (λ= 315 nm). Limit of detection, 3 µg/L [Yasui-Furukori *et al.* 2002]. Column: Nucleosil 5 C_{18}(250 × 4.6 mm i.d.). Mobile phase: acetonitrile : 5 mmol/L SDS (pH 3.5, 60 : 40). UV detection. Retention time: donepezil hydrochloride, 7 min. Limit of detection, 0.5 µg/L [Ohnishi *et al.* 1993].

LC-MS Column: Betabasic-C(8) (100 × 4.6 mm, 5 µm). Mobile phase: methanol : water : formic acid (90 : 9.97 : 0.03). ESI, positive ion mode. Limit of quantification, 0.15 µg/L [Shah *et al.* 2009]. Column: reversed phase C_{18}. YMC Pack ODS-A (50 × 4.0 mm i.d., 5 µm). Mobile phase: acetonitrile : 10 mmol/L ammonium acetate (82 : 18), flow rate 700 µL/min. TIS. Limit of quantification, 2.5 µg/L [Apostolou *et al.* 2008]. Column: C_{18}.ODS-A (50 × 4.0 mm i.d., 5 µm). Mobile phase: acetonitrile : 10 mmol/L ammonium acetate (pH 5.0, 82 : 18), flow rate 0.7 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 0.1 µg/L [Apostolou *et al.* 2007]. Column: Waters Nova-Pak C_{18} (150 × 3.9 mm, 4 µm). Mobile phase: 0.2% formic acid in 20 mmol/L ammonium acetate : methanol : acetonitrile (pH 3.43, 63 : 20 : 17). TIS, positive ion mode, MRM acquisition mode. Limit of quantification, 0.1 µg/L [Patel *et al.* 2008]. Column: Aquasil C_{18} (150 × 2.1 mm i.d., 5 µm). Mobile phase: methanol : acetonitrile : 1% formic acid (70 : 10 : 20), flow rate 0.3 mL/min. ESI, SRM acquisition mode. Limit of quantification, 0.1 µg/L [Xie *et al.* 2006]. See also Lu *et al.* [2003], Lu *et al.* [2004], Matsui *et al.* [1999] and Matsui *et al.* [1995].

HILIC-MS Column: Atlantis HILIC silica. Mobile phase: acetonitrile : 50 mmol/L ammonium formate (pH 4.0, 85 : 15). SRM acquisition mode. Limit of quantification, 0.1 µg/L [Park *et al.* 2008].

Disposition in the Body Donepezil is well absorbed from the gastrointestinal tract after oral administration and is partially metabolised in the liver by cytochrome P450. Four major metabolites are produced by *O*-dealkylation followed by hydroxylation and partial subsequent glucuronidation or hydrolysis; the major metabolites are known to be active. There are also several minor metabolites. Over 10 days, 57% of a single dose is recovered as metabolites in urine and 15% in faeces; 17% of the drug remains unchanged and is excreted in urine; 28% is unrecovered, possibly owing to accumulation.

Therapeutic Concentration

Forty-eight healthy males (non-smokers) were administered a single dose of donepezil, 2, 4 or 6 mg. Maximum plasma concentrations reached 3.2 ± 0.6, 6.9 ± 0.7, 11.6 ± 2.8 µg/L, respectively. Plasma concentration rose in proportion to the dose (the same for multiple dose studies). These concentrations were reached within 1.7–6.6 h [Rogers, Friedhoff 1998].

For plasma levels with multiple dose donepezil, see Rogers *et al.* [1998].

Toxicity

A 79-year-old woman who took an overdose of 45 mg donepezil had a plasma level of 54.6 µg/L on admission to hospital. Plasma donepezil levels gradually decreased to normal limits in ~90 h [Yano *et al.* 2003].

Another report of an overdose occurred in a 79-year-old patient who was inadvertently given 50 mg donepezil instead of 5 mg. The main adverse effect was bradycardia, which responded to atropine [Shepherd *et al.* 1999].

For a further report of donepezil overdose, see Greene *et al.* [1999].

Half-life Elimination, ~50–60 h (single dose), 75 h (steady state) and 104 h (elderly).

Volume of Distribution 13.6–14.8 L/kg.

Clearance Body clearance, 0.12 L/h/kg.

Protein Binding ~95%.

Dose A 5 mg dose is administered once daily. After 4 to 6 weeks, the dose can be increased to 10 mg daily, if necessary.

Note For the metabolism and elimination of donepezil, see Tiseo *et al.* [1998]; for a further pharmacokinetic study, see Mihara *et al.* [1993].

Dopamine

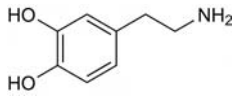
Sympathomimetic

$C_8H_{11}NO_2$ = 153.2

CAS—51-61-6

IUPAC Name 4-(2-Aminoethyl)-1,2-benzenediol

Synonym 3-Hydroxytyramine



Chemical Properties Crystals. pK_a 8.8, 10.6 (20°). Log *P* (octanol/water), −1.0.

Dopamine Hydrochloride

$C_8H_{11}NO_2$,HCl = 189.6
CAS—62-31-7

Proprietary Names *Abbodop*; *Cordodopa*; *Dopamex*; *Dopaminex*; *Docard*; *Dopmin*; *Drynalken*; *Drynalquin*; *Dynatra*; *Dynos*; *Giludop*; *Inopin*; *Inovan*; *Intropin*; *Inotropisa*; *Medopa*; *Revimine*; *Revivan*; *Zetarina*.

Chemical Properties A white crystalline powder. Mp about 241°, with decomposition. Freely soluble in water; soluble in methanol and ethanol; practically insoluble in ether, petroleum ether, chloroform, benzene and toluene.

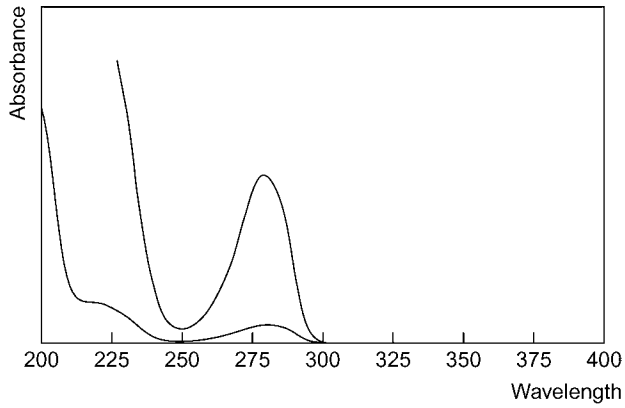
Colour Tests Ammoniacal silver nitrate—orange-brown/black; *p*-dimethylaminobenzaldehyde—orange/violet; ferric chloride—green; Folin–Ciocalteau reagent—blue; Marquis test—brown-violet; methanolic potassium hydroxide—blue→orange→brown; Nessler's reagent—black; potassium dichromate—green-→brown (30 s).

Thin-layer Chromatography System TA—R_f 0.18, streaking; system TB—R_f 0.00; system TC—R_f 0.00; system TE—R_f 0.43; system TL—R_f 0.00; system TAE—R_f 0.14; system TAF—R_f 0.59; system TAJ—R_f 0.00; system TAK—R_f 0.00; system TAL—R_f 0.07 (acidified potassium permanganate solution, positive).

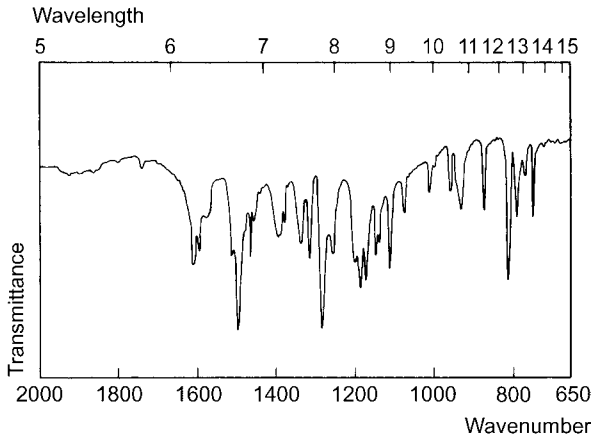
Gas Chromatography System GA—dopamine RI 2175, M (*O*-methyl-)-AC_2 RI 2070.

High Performance Liquid Chromatography System HA—*k* 2.7 (tailing peak); system HZ—retention time 1.7 min.

Ultraviolet Spectrum Aqueous acid—280 nm (A_1^1=178a).



Infrared Spectrum Principal peaks at wavenumbers 1503, 1287, 1190, 1174, 813, 1115 cm^{-1} (KBr disk).



Quantification See under Levodopa.

Disposition in the Body Dopamine is a naturally occurring catecholamine and is considered to be the metabolic precursor of noradrenaline. It is inactivated after oral administration. It is excreted mainly as 3,4-dihydroxyphenylacetic acid (DOPAC) and 3-methoxy-4-hydroxyphenylacetic acid (homovanillic acid); noradrenaline (norepinephrine) and 3-methoxytyramine are also metabolites.

Dopamine is a metabolite of levodopa.

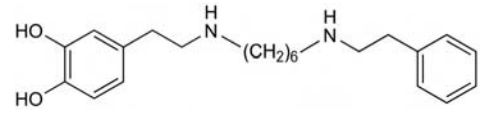
Dose Initially 2 to 5 μg/kg/min of dopamine hydrochloride, by IV infusion.

Dopexamine

β-*Adrenoceptor Agonist*
$C_{22}H_{32}N_2O_2$ = 356.5
CAS—86197-47-9

IUPAC Name 4-[2-[6-(Phenethylamino)hexylamino]ethyl]benzene-1,2-diol

Synonyms FPL-60278; 4-[2-[[6-(phenylethylamino)hexyl]amino]ethyl] pyrocatechol.



Chemical Properties Log *P* (octanol/water), 4.27.

Dopexamine Dihydrochloride

$C_{22}H_{32}N_2O_2$,2HCl = 429.4
CAS—86484-91-5

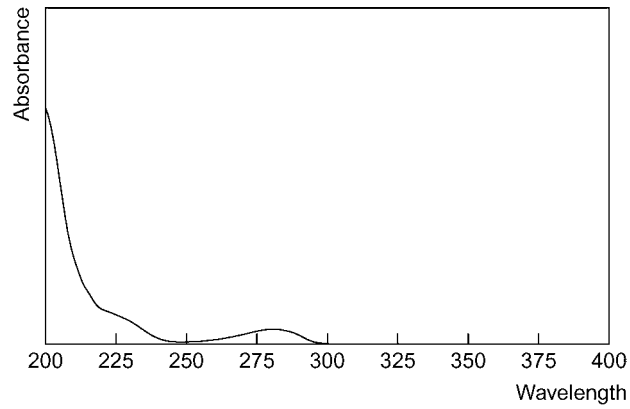
Synonym FPL-60278AR

Proprietary Name *Dopacard*

Thin-Layer Chromatography System TB—R_f 0.00; system TE—R_f 0.16; system TAE—R_f 0.00.

High Performance Liquid Chromatography System HX—RI 289.

Ultraviolet Spectrum



Quantification

Blood **HPLC** Columns: ODS silica Hypersil (250 × 4.9 mm i.d., 5 μm). Temperature: 37° to 43°. Mobile phase: methanol : 4.04 g/L sodium heptane-1--sulfonate, 1 mmol/L disodium EDTA, 10 ml/L orthophosphoric acid and 22.5 ml/L di-isopropylamine (49:51). flow rate 1.2 mL/min. ECD. Retention time: dopexamine hydrochloride, 7.0 to 7.3 min. Limit of quantification, 5 μg/L [Baker *et al.* 1995].

Disposition in the Body Dopexamine is extensively metabolised by *O*-methylation of the catechol-hydroxy moiety and subsequent sulfate conjugation. Elimination from blood occurs quickly. Two pharmacologically inactive metabolites are produced and both are excreted in urine and faeces, along with the unchanged drug. The major metabolite is the 2-methoxy, 1-sulfate metabolite and accounts for >90% of an administered dose. Over 12 days, 50% drug is excreted in urine and 20% in faeces.

Therapeutic Concentration

Ten healthy volunteers were administered dopexamine hydrochloride (total dose 180 μg/kg) over 60 min by IV infusion. There was a proportional increase in plasma concentration with a peak at 124 mg/L after 1 h. Plasma concentrations rapidly decreased when the infusion was stopped [Fitton, Benfield 1990].

Toxicity Overdose effects are short lived owing to short half-life with pharmacological actions including tachycardia, palpitations, tremors, nausea, vomiting and anginal pain.

Half-life 7 min; 11 min in patients with cardiac failure.

Clearance Plasma clearance, 36 mL/min/kg.

Dose An initial dose of 0.5 μg/kg body weight/min is administered, which can be increased up to 1 μg/kg body weight/min, if necessary. Further increases occur in 0.5 to 1.0 μg/kg/min increments at intervals of not less than 15 min with a maximum dose of 6 μg/kg body weight/min.

Baker PR *et al.* (1995). Determination of dopexamine hydrochloride in human blood by high-performance liquid chromatography with electrochemical detection. *J Chromatogr B Biomed Appl* 667(2): 283–290.

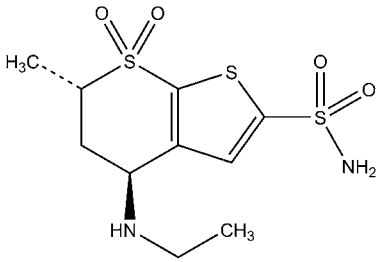
Dorzolamide

Antiglaucoma, Carbonic Anhydrase Inhibitor, Sulfonamide
$C_{10}H_{16}N_2O_4S_3 = 324.4$
CAS—120279-96-1

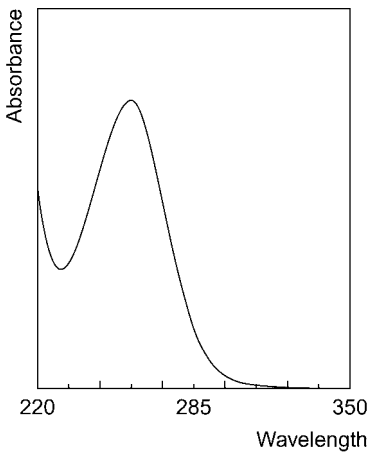
IUPAC Name (4*R*,6*R*)-4-Ethylamino-6-methyl-7,7-dioxo-5,6-dihydro-4*H*-thieno[5,4-b]thiopyran-2-sulfonamide
Synonyms (4*S*,6*S*)-4-(Ethylamino)-5,6-dihydro-6-methyl-4*H*-thieno[2,3-b] thiopyran-2-sulfonamide 7,7-dioxide; L-671152.



Dorzolamide Hydrochloride

$C_{10}H_{16}N_2O_4S_3,HCl = 360.9$
CAS—130693-82-2
Synonyms MK-0507; MK-507.
Proprietary Name *Trusopt*. It is also an ingredient of *Cosopt*.
Chemical Properties A white to off-white crystalline powder. Mp 283° to 285°. Soluble in water. pK_a 7.8 [Remko, der Lieth 2004], 8.4 [Supuran *et al.* 2003]. Log *P* (octanol/water), 0.71 [Remko, der Lieth 2004].

Thin-layer Chromatography Ophthalmic solution. Plates: Silica gel GF_{254} (20 × 20 cm, 0.25 mm). Solvent system: methanol : 25% ammonia (100 : 1.5). UV detection (λ = 254 nm). R_f 0.67 [Bebawy 2002].
High Performance Liquid Chromatography Ophthalmic solution. Column: C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : acetonitrile : phosphate buffer (pH 2.5; 8 : 10 : 85), flow rate 1.2 mL/min. UV detection (λ = 250 nm). Retention time: 4.1 min. Limit of quantification, 4 mg/L [Erk 2003].
Ultraviolet Spectrum Ophthalmic solution—Principal peak at 250.3 nm. Limit of detection, 34 µg/L [Erk 2002].



Quantification

Blood **HPLC** Column: C_8 (250 × 4.6 mm i.d., 5 µm) and C_{18} (50 × 4.6 mm i.d., 3 µm) in series. Mobile phase: acetonitrile : water-0.085% phosphoric acid-1.6 mg/mL sodium octanesulfonate (25 : 75), flow rate 1 mL/min. UV detection (λ = 252 nm). Limit of quantification, 5 µg/L [Matuszewski *et al.* 1994a].
Plasma **HPLC** Column: C_8 (250 × 4.6 mm i.d., 5 µm) and C_{18} (50 × 4.6 mm i.d., 3 µm) in series. Mobile phase: acetonitrile : water-0.085% phosphoric acid-1.6 mg/mL sodium octanesulfonate (25 : 75), flow rate 1 mL/min. UV detection (λ = 252 nm). Limit of quantification, 5 µg/L [Matuszewski *et al.* 1994a].
LC-MS Column: Hypersil base-deactivated cyano (100 × 3.0 mm i.d., 5 µm). Mobile phase: acetonitrile : 10 mmol/L ammonium acetate-0.1% trifluoracetic acid (35 : 65), flow rate 0.6 mL/min. APCI, positive ion mode, MRM acquisition mode. Limit of quantification, 0.5 µg/L [Constanzer *et al.* 1997].
Urine **HPLC** Column: C_8 (250 × 4.6 mm i.d., 5 µm) and C_{18} (50 × 4.6 mm i.d., 3 µm) in series. Mobile phase: acetonitrile : water-0.085% phosphoric acid-1.6 mg/mL sodium octanesulfonate (24 : 76), flow rate 1 mL/min. UV detection (λ = 252 nm). Limit of quantification, 5 µg/L [Matuszewski *et al.* 1994a].
Aqueous Humour **HPLC** Column: C_8 (125 × 4.0 mm i.d.). Mobile phase: acetonitrile : 0.085% phosphoric acid-2.1 mg/mL octanesulfonic acid (25 : 75). UV detection (λ = 252 nm). Retention time: 13.5 min. Limit of quantification, 100 µg/L, limit of detection, 50 µg/L [Schmitz *et al.* 1999].
Other **HPLC** Animal Tissues. Column: C_{18}. Mobile phase: acetonitrile : 1% TEA solution (pH 3.5; 7 : 93), flow rate 1 mL/min. UV detection (λ = 254 nm). Retention time: 16.5 min. Limit of quantification not reported [Inoue *et al.* 2004].

Note For methods describing the chiral separation of the stereoisomers of dorzolamide, see Matuszewski *et al.* [1994b]; Matuszewski and Constanzer [1992]. For a Raman spectroscopy method for the detection of dorzolamide in animal tissues, see Bauer *et al.* [1999].
Disposition in the Body The rate and extent of drug absorption after topical application is influenced by losses caused by tear turnover and blinking, and by protein binding in tears. Only a small part of the instilled drug becomes available for absorption. Studies have reported absorption rates of 50 to 73% of the applied drug. The drug then reaches the systemic circulation via drainage through the nasolacrimal duct and is subsequently absorbed from the nasopharyngeal mucosa or goes directly through the conjuctival blood vessels. Dorzolamide is metabolised to *N*-deethyldorzolamide in the systemic circulation via CYP2B1/2, CYP2E1 and CYP3A2. Steady-state concentrations are achieved after 6, 12 and 18 months of treatment. It binds strongly to human erythrocytes, more precisely to the enzymes carbonic anhydrase I and II, which are mainly located in red blood cells (>90%). Dorzolamide and its metabolite are excreted predominantly via the renal route.

Therapeutic Concentration

Thirty-two patients scheduled for routine cataract surgery were administered a drop of a 2% solution (equivalent to 0.76 mg) of dorzolamide. Maximum aqueous humour concentrations were reached 1 to 2 h after administration. The mean concentration was 1 mg/L after ~2 h, 0.7–1.0 mg/L after 4–6 h, and ~0.2 mg/L after 12 h [Schmitz *et al.* 1999].

Ten patients with open-angle glaucoma or ocular hypertension were administered a drop (30 µL) of a 2% solution of dorzolamide every 8 h (~4 mg/day) for 6 months. Red cell concentrations for dorzolamide and its metabolite were 23.0 and 4.9 µmol/L, respectively. Mean daily urine concentration for dorzolamide plus metabolite was 1.7 mg/day, although large variations were observed (range 0.1 to 2.9 mg/day) [Maren *et al.* 1997].

Toxicity For a case report of acidosis in a neonate, see Morris *et al.* [2003]; for a review on dorzolamide-induced thrombocytopenia, see Martin, Danese [2001].
Half-life Approximately 130 days.
Clearance Approximately 5.4 L/h.
Dose As eye drops containing 2% of the base. When used as monotherapy, the usual dose is one drop three times daily; a twice daily regimen is recommended when used in conjunction with a β-blocker.

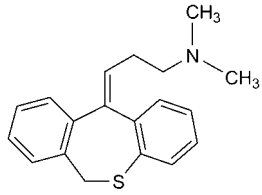
Dosulepin

Antidepressant
$C_{19}H_{21}NS = 295.4$
CAS—113-53-1

IUPAC Name (3*Z*)-3-(6*H*-Benzo[*c*][1]benzothiepin-11-ylidene)-*N*,*N*-dimethylpropan-1-amine
Synonyms 3-Dibenzo[*b*,*e*]thiepin-11(6*H*)-ylidene-*N*,*N*-dimethyl-1-propanamine; dothiepin.



Chemical Properties Mp 55° to 57°. Log *P* (octanol/pH 7.4), 2.8 [Ilett *et al.* 1992], (octanol/water) 4.49 [Hansch *et al.* 1995]. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005]. Unstable under conditions of putrefaction [Pounder *et al.* 1994].

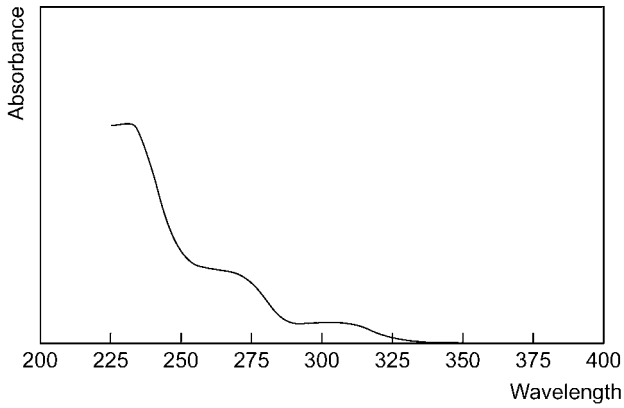
Dosulepin Hydrochloride

$C_{19}H_{21}NS,HCl = 331.9$
CAS—897-15-4
Synonym Dothiepin hydrochloride
Proprietary Names *Dopin*; *Dopress*; *Dothapax*; *Dothep*; *Jardin*; *Prepadine*; *Prothiaden*; *Protiaden(e)*; *Thaden*; *Xerenal.*
Chemical Properties White to faintly yellow crystalline powder. Mp 218° to 221°. Soluble 1 in 2 of water, 1 in 8 of ethanol and 1 in 2 of chloroform; practically insoluble in ether.

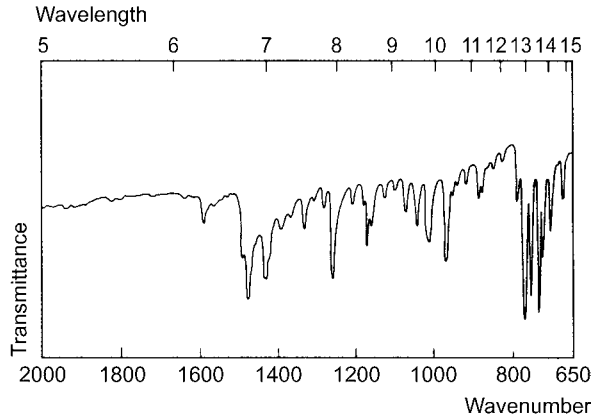
Colour Tests Liebermann's reagent—red-brown; Mandelin's test—green; Marquis test—brown; sulfuric acid—violet.
Thin-layer Chromatography System TA—R_f 0.51; system TB—R_f 0.49; system TC—R_f 0.42; system TE—R_f 0.65; system TF—dosulepin-*S*-oxide R_f 0.00; system TL—R_f 0.16; system TAE—R_f 0.27; system TAF—R_f 0.41 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—dosulepin RI 2380, M (OH-) RI 2500, M (nor-) RI 2421, M (*N*-oxide) RI 2100, M (OH-*N*-oxide) RI 2130, M (sulfoxide) RI 2392, M (norsulfoxide) RI 2421; system GB—dosulepin RI 2486, M (nor-) RI 2507, M (sulfoxide) RI 2533, M (norsulfoxide) RI 2839; system GF—dosulepin RI 2770, dosulepin sulfoxide RI 2820; system GM—dosulepin RRT 1.259, M (nor-) RRT 1.450 (both relative to iprindole).
High Performance Liquid Chromatography System HA—dosulepin *k* 3.2, dosulepin sulfoxide *k* 4.6 (tailing peak), monodesmethyldosulepin *k* 2.2; system HF—*k* 3.60; system HX—RI 428; system HY—RI 367; system HZ—RT 5.7 min.

Column: Hypersil (250 × 4.9 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.15 mol/L sodium hexane sulfonic acid (60 : 40), flow rate 2.0 mL/min. UV detection (λ = 260 nm). Limit of detection 1.9 mg/L [Pawlak, Clark 1989].

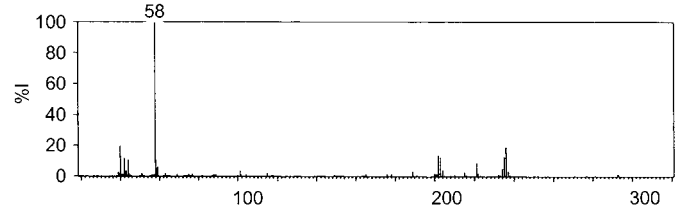
Column: Spherisorb (25 cm × 4.6 mm i.d., 5 µm). Mobile phase ethyl acetate : methanol : 3% ammonia (85 : 15 : 1), flow rate 1.0 mL/min. UV detection (λ = 260 nm). Retention time: 8.54 and 9.05 min for the *cis* and *trans*-isomers, respectively. Limit of detection, 1.0 mg/L [Li Wan Po, Irwin 1979].
Ultraviolet Spectrum Aqueous acid—230 (A^1_1 = 770a), 303 nm.



Infrared Spectrum Principal peaks at wavenumbers 763, 727, 747, 1252, 963, 717 cm^{-1} (dosulepin hydrochloride), (KBr disk).



Mass Spectrum Principal ions at *m/z* 58, 236, 40, 202, 235, 203, 42, 44; desmethyldosulepin 44, 204, 203, 202, 41, 221, 57, 55; dosulepin sulfoxide 58, 44, 31, 59, 57, 42, 45, 40.



Quantification

Blood **GC-MS** Column: DB-5 cross-linked 5% phenyl methyl siloxane (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 50° for 2 min to 180 at 30°/min to 280° at 5°/min for 19 min. Full scan mode. Retention time: 20.1 min. Limit of quantification, 0.05 mg/L [Paterson *et al.* 2004]. Column: HP-5 MS fused silica 95% dimethyl 5% diphenyl polysiloxane (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 180° to 200° at 5°/min for 2 min to 220° at 5°/min for 5 min to 240° at 5°/min and to 320° at 50°/min. Retention time: 16.5 min. MSD, SIM acquisition mode. Limit of detection, 0.5 mg/L [Keller *et al.* 2000]. Column: 3% OV-101 on GasChrom W HP 80/100 mesh (2 m × 2 mm i.d.). Carrier gas: He, 20 mL/min. Temperature programme: 210° to 230° at 4°/min. EI ionisation at 70 eV. Limit of detection, 1 µg/L [Maguire *et al.* 1981b].

HPLC Column: Novapak C_{18} (300 × 3.9 mm i.d., 4 µm). Mobile phase: methanol : tetrahydrofuran : 10 mmol/L potassium hydrogen phosphate buffer (pH 2.6; 65 : 5 : 30), flow rate 0.8 mL/min. DAD. Limit of detection not reported [Cirimele *et al.* 1995]. Column: Chromspher C_8 (10 × 0.3 cm i.d., 5 µm). Mobile phase: methanol : water (30 : 70 to 75 : 25 in 5 min), flow rate 0.7,L/min. DAD (λ = 230 nm). Retention time: ≈10.5 min, 10.7 min dosulepin-sulfoxide. Limit of detection not reported [Lambert *et al.* 1994]. Column: Apex II ODS silica (150 × 4.6 mm i.d., 5 µm). Mobile phase: 0.01 mol/L sodium dihydrogen phosphate buffer (pH 3.0) : acetonitrile (60 : 40), flow rate 1.5 mL/min. UV detection (λ = 255 nm). Limit of detection not reported [Pounder *et al.* 1994]. Column: Spheri-5 RP-18 (100 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.1 mol/L sodium dihydrogen phosphate : diethylamine (pH 8.0; 40 : 57.5 : 2.5), flow rate 2.0 mL/min. UV detection (λ = 220 or 254 nm). Retention time: 14.6 min. Limit of detection, 0.05 mg/L [McIntyre *et al.* 1993].

Plasma **GC** Column: 3% OV-17 on Chromosorb W 100/120 mesh (9′ × 0.25" o.d.). Carrier gas: 30 mL/min. Temperature: 275°. AFID. Limit of detection, 4.0 ng [Gifford *et al.* 1975].

GC-MS Column: 3% OV-17 on GasChrom Q 100/120 mesh (1 m × 2 mm i.d.). Carrier gas: CH_4, 8-10 mL/min. Temperature: 220°. EI/CI. Limit of detection, 0.5 µg/L [Crampton *et al.* 1980].

HPLC Column: Ultrasphere C_8 (250 × 4.6 mm i.d.). Mobile phase: acetonitrile : 4 mmol/L 1-octanesulfonic acid-0.5 mmol/L *N,N,N,N*-tetramethylethylene diame (pH 2.5; 35: 65, flow rate 2 mL/min. UV detection (λ = 230 nm). Retention time: 10.8 min. Limit of detection not reported [Hackett *et al.* 1998]. Column: µBondapak phenyl (30 cm × 4 mm i.d.). Mobile phase: acetonitrile : hydrogen phosphate : sodium chloride (35 : 0.01 : 0.01), flow rate 1.8 mL/min. UV detection (λ = 230 nm). Limit of quantification, 2 µg/L [Ilett *et al.* 1992]. Column: cyano (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.01 mol/L dipotassium hydrogen orthophosphate buffer (pH 7.0; methanol (50 : 30 : 20), flow rate 1.7 mL/min. UV detection (λ = 240 nm). Retention time: 4.6 min. Limit of detection, 50 µg/L [Taylor *et al.* 1992]. Column: Partisil 10 ODS (25 cm × 4.6 mm i.d., 10 µm). Mobile phase: acetonitrile : 0.5% aqueous potassium dihydrogen phosphate (pH 3.0; 35 : 65), flow rate 2.0 mL/min. UV detection (λ = 231 nm). Retention time: 9 min. Limit of detection, 10 µg/L [Brodie *et al.* 1977].

LC-MS Column: Inertsil C_8 (150 × 2.0 mm i.d., 5 µm). Mobile phase: methanol : 10 mmol/L ammonium acetate (pH 5.0) : acetonitrile (70 : 20 : 10), flow rate 0.1 mL/min. SSI, positive ion mode, full scan mode. Retention time: 6.5 min. Limit of quantification, 0.1 mg/L, limit of detection, 0.08 mg/L [Shinozuka *et al.* 2006]. Column: Symmetry C_{18} (150 × 3 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.1% formic acid (28 : 72 for 4 min to 70 : 30 in 1 min for 3 min to 28 : 72 in 0.7 min), flow rate 0.6 mL/min. APCI, positive ion mode. Limit of quantification, 10 µg/L, limit of detection, 5 µg/L [Kollroser, Schober 2002].

Serum **GC-MS** Column: HP-5 MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 60° for 1 min to 280° at 10°/min for 20 min. EI ionisation at 70 eV. Retention time: 22.5 min. Limit of detection, 0.025 mg/L, limit of detection, <0.025 mg/L [Maresova *et al.* 2008].

HPLC Column: Super-Octyl TSK gel (100 × 4.6 mm i.d., 2 µm) or Hypersil MOS-C_8 (100 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 20 mmol/L potassium dihydrogen phosphate (pH 7.0; 60 : 40), flow rate 0.6 mL/min. UV detection (λ = 254 nm). Retention time: 10.6 and 19.7 min for the TSK and Hypersil columns, respectively. Limit of quantification, 0.05 µg/L on the TSK column [Tanaka *et al.* 1997]. See Plasma [Brodie *et al.* 1977].

Urine **GC-MS** Column: HP-1 capillary (12 m × 0.2 mm i.d., 330 nm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 3 min to 310° at 30°/min for 8 min. EI ionisation at 70 eV, full scan mode. Limit of detection not reported [Bickeboeller-Friedrich, Maurer 2001]. See Blood [Keller *et al.* 2000].

HPLC See Blood [Cirimele *et al.* 1995]. See Serum [Tanaka *et al.* 1997]. See Blood [Lambert *et al.* 1994]. See Blood [Pounder *et al.* 1994]. Column: µBondapak C_{18} (15 cm × 0.4 cm i.d., 10 µm). Mobile phase: 0.015 mol/L phosphate buffer : acetonitrile : 1 mol/L dimethylamine (50 : 50 : 1), flow rate 2.0 mL/min. UV detection (λ = 210 nm). Retention time: 47.1 min. Limit of detection, 0.1 mg/L [Kawahara *et al.* 1987].

Bile **HPLC** See Blood [Keller *et al.* 2000]. See Blood [Cirimele *et al.* 1995]. See Blood [Pounder *et al.* 1994].

Gastric Contents **HPLC** See Blood [Keller *et al.* 2000]. See Blood [Cirimele *et al.* 1995]. See Blood [Lambert *et al.* 1994].

Milk **HPLC** See Plasma [Ilett *et al.* 1992].

Vitreous Humour **HPLC** See Blood [Keller *et al.* 2000]. See Blood [Pounder *et al.* 1994].

Brain **HPLC** See Serum [Tanaka *et al.* 1997]. See Blood [Cirimele *et al.* 1995].

Hair **GC** Column: BP-5 (12 m × 0.53 mm i.d., 1.0 µm). Carrier gas: He, 3.0 mL/min. Temperature programme: 100° for 2 min to 310° at 10°/min for 10 min. NPD. Limit of detection, 0.1 to 0.25 µg/g [Couper *et al.* 1995].

GC-MS Column: HPS-5MS 5% phenyl 95% methyl siloxane (30 m × 0.25 mm i.d.). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 3 min to 295° at 30°/min for 7 min. EI ionisation at 70 eV, SIM acquisition mode. Retention time: 11.08 min. Limit of detection not reported [Cirimele *et al.* 1995].

Heart **HPLC** See Blood [Cirimele *et al.* 1995]. See Blood [Pounder *et al.* 1994].

Kidney **HPLC** See Blood [Cirimele *et al.* 1995]. See Blood [Lambert *et al.* 1994].

Liver **HPLC** See Serum [Tanaka *et al.* 1997]. See Blood [Cirimele *et al.* 1995]. See Blood [Lambert *et al.* 1994]. See Blood [Pounder *et al.* 1994].

Lung **HPLC** See Blood [Pounder *et al.* 1994].

Muscle **HPLC** See Blood [Pounder *et al.* 1994].

Other **HPLC** Column. Rat Brain. Ultrasphere ODS (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.1 mol/L acetate buffer : acetonitrile : perchloric acid : trichloroacetic acid (50 : 50 : 2 : 1.5, pH 2.0), flow rate 1.5 mL/min. ECD. Limit of detection not reported [Shibanoki *et al.* 1987].

Disposition in the Body Well absorbed after oral administration. The main metabolic reactions are demethylation to desmethyldosulepin (northiaden) and oxidation to dosulepin sulfoxide. About 50 to 60% of a dose is excreted in the urine in 24 h, mainly as metabolites, and 15 to 40% of a dose is eliminated in the faeces in the same period. Enterohepatic circulation has been reported. Small amounts may be excreted in breast milk [Ilett *et al.* 1992].

Therapeutic Concentration Plasma concentrations vary considerably between individuals.

After a single oral dose of 75 mg dosulepin to 9 depressed patients a mean maximum plasma concentration of 49 ± 27 µg/L was reached at 3 ± 1.2 h [Maguire *et al.* 1983].

Eleven patients were administered a single oral dose of 75 mg dosulepin on the first day of the placebo period. On the following 4 days the patients received placebo but after that a single dose of 150 mg dosulepin was administered daily for the next 28 days. There was considerable inter-individual variation. Plasma concentrations at week 4 ranged from 16 to 179 µg/L dosulepin, 126 to 849 µg/L for dosulepin *S*-oxide and 1 to 53 µg/L desmethyldosulepin [Maguire *et al.* 1982].

After a single oral dose of 75 mg to 7 subjects, peak plasma concentrations of 47 (33 to 71) µg/L of dosulepin were reached in 2 to 5 h. Dosulepin *S*-oxide was the major metabolite reaching a peak level of 81 (34 to 150) ug/L at 5 (4 to 6) h. In comparison, desmethyldosulepin reached a peak concentration of only 10 (3 to 21) µg/L at 5 (4 to 9) h. The mean elimination half-life of dosulepin *S*-oxide was 19 (13 to 35) h while that for desmethyldosulepin was 33 (22 to 60) h. [Maguire *et al.* 1981a]

After a single oral dose of 75 mg dosulepin HCl to 6 healthy male volunteers a mean peak plasma concentration of 61.6 µg/L reached at 3 h [Crampton *et al.* 1980].

After oral administration of 25 mg given 3 times a day to 5 subjects for 12 days, minimum steady-state serum concentrations of 17 to 65 µg/L (mean 37) of dosulepin, and <0.01 to 47 µg/L (mean 15) of desmethyldosulepin, were reported [Nakra *et al.* 1977].

Toxicity Fatalities have been associated with blood concentrations of 1 to 5 to 19 mg/L.

A 36-year-old female was admitted to hospital 3 h after the ingestion of 2 to 3 g of dosulepin with alcohol. After 24 h, following treatment by haemoperfusion, she appeared to be recovering but toxic symptoms reappeared after 48 h followed by death 56 h after ingestion. The plasma concentrations shown below were reported (mg/L).

Hours after ingestion	*Dosulepin*	*Desmethyldosulepin*
4.5	2.51	0
6.0	1.88	0.13
17.5	1.07	0.32
57.5[a]	4.54	1.28

[a]postmortem
[b][Bloodworth *et al.* 1984]

In 8 cases of overdose with dosulepin, all had high initial levels of dosulepin (0.819 to 3.851 mg/L), dosulepin-*S*-oxide (0.655 to 2.162 mg/L), nordosulepin (0.088 to 0.422 mg/L), and nordosulepin-*S*-oxide (0.176 to 0.530 mg/L); all patients survived following treatment with repeated-dose activated charcoal [Ilett *et al.* 1991].

A 22-year-old female was found dead beside a canal. At postmortem her dosulepin concentrations in her blood, urine, stomach, liver, and kidney were 2.1, 9.7, 130, 2.19, 1.4 mg/L or µg/g, respectively [Lambert *et al.* 1994].

In 2 cases of suicide involving dosulepin ingestion (765 and 1875 mg, respectively), initial blood concentrations were 0.26 to 1.85 and 4.08 to 23.98 mg/L. Pulmonary artery concentrations rose over 18 h (0.32 rising to 0.9, and 6.54 rising to 19.53 mg/L) with peripheral blood concentrations remaining stable. Postmortem tissue concentrations in the respective cases were: liver 4.3 and 52 µg/g, heart 2.92 and 16.8 µg/g, lung 18.6 and 73.9, skeletal muscle 1.1 and 8.98 µg/g. Mean dosulepin levels in thoracic blood rose from 0.43 mg/L at 0 h postmortem to 1.73 at 8 h and then fell to 0.61 mg/L at 12 h, probably reflecting redistribution from the lungs [Pounder *et al.* 1994].

The following postmortem tissue concentrations were reported in a 22-year-old male suspected of ingesting up to 4.5 g of dosulepin (mg/L or µg/g): blood 5.75, urine 7.42, bile 110, gastric contents 373, liver 45.2, kidney 10.4, heart 16/0, brain 2.77, hair of head 1.89, axillary hair 1.17 [Cirimele *et al.* 1995].

In a 32-year-old male who committed suicide by ingesting an unknown quantity of dosulepin, the following postmortem tissue concentrations of dosulepin and desmethyldosulepin, respectively, were reported: peripheral blood 7.28 and 2.03 mg/L, heart blood 6.98 and 1.63 mg/L, urine 12.58 and 3.71 mg/L, vitreous humour 0.28 and 0.02 mg/L, stomach contents 65.41 and 1.01 mg/L, bile 12.24 and 1.06 mg/L; diazepam and desmethyldiazepam were also detected in tissues [Keller *et al.* 2000].

Note For reviews of CNS and cardiovascular effects of TCA poisoning, see Bateman [2005] and Thanacoody and Thomas [2005], respectively. For a case of serotonin syndrome after an overdose of dosulepin in a 13-year-old female, see Radomski [1998]. For a case of myocardial infarction after the ingestion of 1875 mg dosulepin, see Arya *et al.* [2004].

Bioavailability ≈30% after first pass metabolism [Pounder *et al.* 1994].

Half-life Plasma half-life, dosulepin 14 to 40 h (mean 22), desmethyldosulepin 22 to 60 h (mean 33), dosulepin sulfoxide 13 to 35 h (mean 19) [Maguire *et al.* 1981a].

Clearance 1.36 (0.88 to 1.8) L/kg/h [Maguire *et al.* 1981a].

Volume of Distribution 83.1 and 85.4 L/kg for females and males, respectively [Pounder *et al.* 1994], 45 (20 to 92) L/kg [Maguire *et al.* 1981a], 18.8 to 195.5 L/kg [Keller *et al.* 2000].

Distribution in Blood Plasma : whole blood ratio, ≈1.4 [Maguire *et al.* 1981a].

Note For a review of the pharmacokinetics of tricyclic antidepressants, see Molnar and Gupta [1980].

Dose 75 to 150 mg of dosulepin hydrochloride daily; up to 225 mg daily has been given.

Doxacurium Chloride

Muscle Relaxant

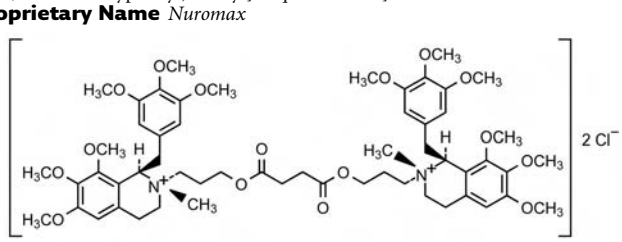
$C_{56}H_{78}Cl_2N_2O_{16}$ = 1106.1

CAS—106819-53-8 (meso isomer); 83348-52-1 (total racemate)

IUPAC Name 1-*O*-[3-[(1*R*,2*S*)-6,7,8-Trimethoxy-2-methyl-1-[(3,4,5-trimethoxyphenyl)methyl]-3,4-dihydro-1*H*-isoquinolin-2-ium-2-yl]propyl] 4-*O*-[3-[(1*S*,2*R*)-6,7,8-trimethoxy-2-methyl-1-[(3,4,5-trimethoxyphenyl)methyl]-3,4-dihydro-1*H*-isoquinolin-2-ium-2-yl]propyl] butanedioate dichloride

Synonyms BW-A938U; [1α,2β(1′*S**,2′*R**)]-2,2′-[(1,4-dioxo-1,4-butanediyl)bis(oxy-3,1-propanediyl)]bis[1,2,3,4-tetrahydro-6,7,8-trimethoxy-2-methyl-1-[(3,4,5-trimethoxyphenyl)methyl]isoquinolinium] dichloride.

Proprietary Name *Nuromax*



Chemical Properties An amorphous solid which is soluble in water.

Quantification

Plasma **HPLC** UV detection. Limit of quantification, 4 μg/L [Gariepy *et al.* 1993]. Column: S5C1 Spherisorb (150 × 4.6 mm i.d., 5 μm). Mobile phase: 0.05 mol/L monobasic potassium phosphate (pH 3) : acetonitrile containing 0.5% methanol (30:70), flow rate 1.0 mL/min. UV detection (λ=210 nm). Retention time: 6.7 min. Limit of quantification, 10 μg/L [DeAngelis *et al.* 1990].

Urine **HPLC** See Plasma [Gariepy *et al.* 1993]. See Plasma [DeAngelis *et al.* 1990].

Disposition in the Body Doxacurium is excreted in urine and bile, mostly as the unchanged parent drug. It is distributed primarily in extracellular fluids as it is a large polar compound. It is not metabolised by plasma cholinesterase or hepatic enzymes. The drug is rapidly cleared from the body and is eliminated mainly in urine (70%) and also via bile. In healthy individuals, 24 to 38% of a dose is recovered unchanged in urine within 6 to 12 h after administration.

Therapeutic Concentration

Nine healthy, young subjects (aged 19 to 39 years) and 9 healthy, elderly subjects (70 to 83 years) were administered 30 μg/kg doxacurium chloride (equivalent to 25 μg/kg doxacurium base) after induction of anaesthesia. In the younger subjects the mean plasma concentration reached 337 μg/L at 2 min and then declined to 5 μg/L over 360 min after injection. In the elderly subjects, however, their peak concentration of 336 μg/L declined to 8 μg/L after 480 min [Gariepy *et al.* 1993].

Half-life Approximately 1.7 to 2 h (healthy individuals); 3.7 h (patients with renal insufficiency).

Volume of Distribution Steady state, 0.23 (0.12 to 0.29) L/kg.

Clearance Plasma, 2.5 mL/kg/min.

Protein Binding Approximately 28 to 34%.

Dose The initial dose is 50 μg/kg body weight intravenously, followed by a maintenance dose of 5 to 10 μg/kg. A dose of 80 μg/kg may also be used.

DeAngelis R *et al.* (1990). High-performance liquid chromatographic analysis of doxacurium, a new long-acting neuromuscular blocker. *J Chromatogr* 525(2): 389–400.
Gariepy LP *et al.* (1993). Influence of aging on the pharmacokinetics and pharmacodynamics of doxacurium. *Clin Pharmacol Ther* 53(3): 340–347.

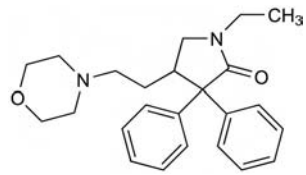
Doxapram

Respiratory Stimulant

$C_{24}H_{30}N_2O_2$ = 378.5

CAS—309-29-5

IUPAC Name 1-Ethyl-4-[2-(4-morpholinyl)ethyl]-3,3-diphenyl-2-pyrrolidinone



Chemical Properties Log *P* (octanol/water), 3.4.

Doxapram Hydrochloride

$C_{24}H_{30}N_2O_2$,HCl,H_2O = 433.0

CAS—113-07-5 (anhydrous); 7081-53-0 (monohydrate)

Proprietary Names *Dopram*; *Doxapril*; *Stimulexin*.

Chemical Properties A white crystalline powder. Mp about 220°. Soluble 1 in 50 of water; sparingly soluble in ethanol; slightly soluble in chloroform; practically insoluble in ether.

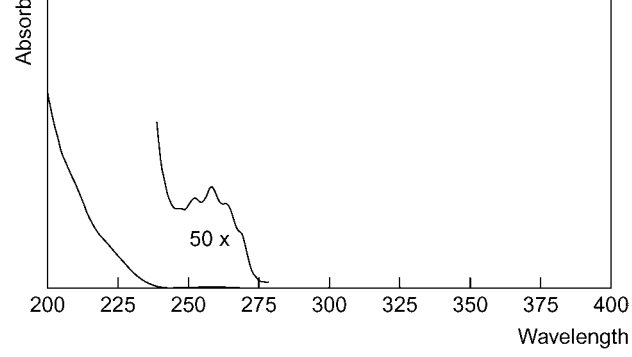
Colour Tests Liebermann's reagent—orange; Mandelin's test—blue.

Thin-layer Chromatography System TA—R_f 0.64; system TB—R_f 0.20; system TC—R_f 0.70; system TE—R_f 0.72; system TL—R_f 0.54; system TAE—R_f 0.69; system TAJ—R_f 0.60; system TAK—R_f 0.03; system TAL—R_f 0.73 (acidified iodoplatinate solution, positive).

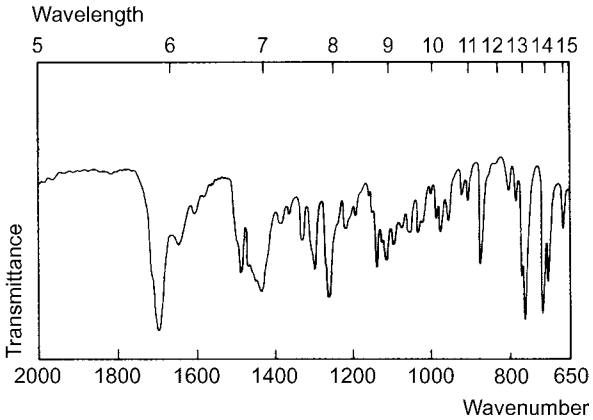
Gas Chromatography System GA—RI 2906; system GB—doxapram RI 3046, M (keto-) RI 3018; system GC—RI 2230.

High Performance Liquid Chromatography System HA—*k* 0.4; system HY—RI 312; system HZ—retention time 3.2 min; system HAX—retention time 8.7 min; system HAY—retention time 4.6 min.

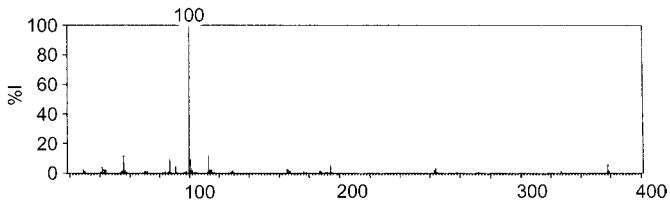
Ultraviolet Spectrum Aqueous acid—253, 259 (A^1_1=12c), 265 nm.



Infrared Spectrum Principal peaks at wavenumbers 1683, 753, 710, 1253, 696, 764 cm^{-1} (doxapram hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 100, 113, 56, 101, 87, 378, 194, 91.



Quantification

Blood **GC** MS detection. For method, see Nichol *et al.* [1980].

Plasma **GC** See Blood [Nichol *et al.* 1980]. AFID. Limit of detection, 10 µg/L [Robson, Prescott 1977].

Urine **GC** FID. For method, see Nichol *et al.* [1980].

Disposition in the Body Readily absorbed after oral administration. The major metabolite is the 2-ketomorpholino derivative.

Therapeutic Concentration

Following an IV injection of 1.5 mg/kg to 6 subjects, plasma concentrations of 1.6 to 4.3 mg/L (mean 2.6) were reported after 2 min declining to 0.6 to 1.5 mg/L (mean 0.9) at 2 h. Following IV infusion of 6.5 mg/kg to 6 subjects, peak plasma concentrations of 3.3 to 5.2 mg/L (mean 4.1) were reported at the end of the infusion; peak concentrations of the 2-ketomorpholino metabolite of 1.1 to 2.0 mg/L (mean 1.6) were attained 0.2 to 2 h after the end of the infusion [Clements *et al.* 1979].

In 18 premature infants, a steady-state plasma concentration of approx. 1.5 mg/L was achieved by IV administration of a loading dose of 5.5 mg/kg and a maintenance infusion of 1 mg/h [Jamali *et al.* 1988].

Bioavailability About 60%.

Half-life Plasma half-life, about 7 h.

Volume of Distribution About 3 L/kg.

Clearance Plasma clearance, about 5 mL/min/kg.

Dose 1 to 1.5 mg/kg of doxapram hydrochloride by IV injection.

Doxazosin

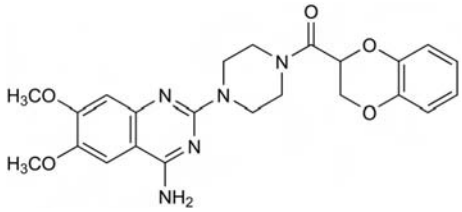
Antihypertensive

$C_{23}H_{25}N_5O_5$ = 451.5

CAS—74197-85-8

IUPAC Name [4-(4-Amino-6,7-dimethoxyquinazolin-2-yl)piperazin-1-yl]-(2,3-dihydro-1,4-benzodioxin-3-yl)methanone

Synonyms 1-(4-Amino-6,7-dimethoxy-2-quinazolinyl)-4-[(2,3-dihydro-1,4-benzodioxin-2-yl)carbonyl]piperazine; UK-33274.



Chemical Properties Log *P* (octanol/water), 2.09. Extraction yield (chlorobutane), 0.95 [Demme *et al.* 2005].

Doxazosin Hydrochloride

$C_{23}H_{25}N_5O_5$,HCl = 488.0

CAS—70918-01-3

Chemical Properties A crystalline powder. Mp 289° to 290°.

Doxazosin Mesilate

$C_{23}H_{25}N_5O_5$,CH_3SO_3H = 547.6

CAS—77883-43-3

Synonyms Doxazosin mesylate; UK-33274-27.

Proprietary Names *Aldafil*; *Benur*; *Cardenalin*; *Cardular*; *Cardura*; *Carduran*; *Dedralen*; *Diblocin*; *Normothen*; *Progandol*; *Prostadilate*; *Supressin*.

Chemical Properties It is freely soluble in dimethylsulfoxide; soluble in dimethylformamide; slightly soluble in methanol, ethanol, and water (0.8% solubility at 25°); very slightly soluble in acetone and methylene chloride.

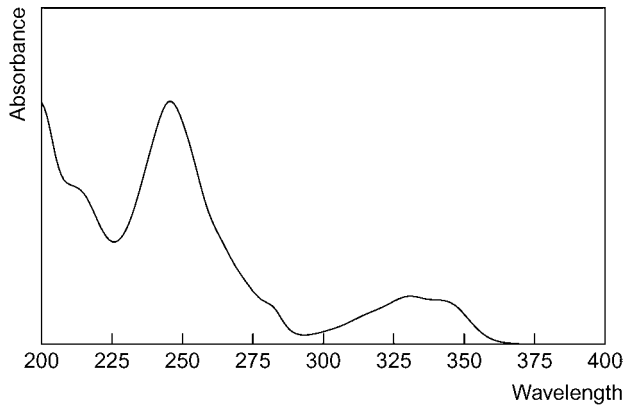
Thin-layer Chromatography System TB—R_f 0.00; system TE—R_f 0.73; system TAE—R_f 0.71.

Gas Chromatography System GB—RI 3054.

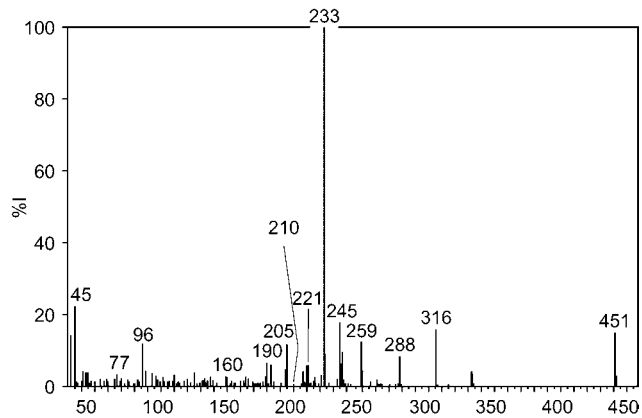
High Performance Liquid Chromatography System HX—RI 403.

Column: ODS Spherisorb (125 × 5 mm i.d., 5 µm). Mobile phase: methanol : 0.02 mol/L tetramethyl ammonium chloride / 0.01 mol/L sodium heptane sulfonate buffer (70:30), flow rate 1.0 mL/min. Retention time: 5.2 min [Kaye *et al.* 1986].

Ultraviolet Spectrum Aqueous acid—246, 331 nm (doxazosin); ethanol —250, 275, 282 nm (doxazosin mesilate).



Mass Spectrum Principal ions at *m/z* 233, 45, 245, 316, 451, 259, 42, 96.



Quantification

Plasma **HPLC** Limit of quantification, 0.2 µg/L [Vashi *et al.* 1996]. Limit of determination, 1 µg/L [Jackman *et al.* 1991].

Disposition in the Body Doxazosin is well absorbed and extensively metabolised in the liver by *O*-demethylation or hydroxylation. Enterohepatic recycling occurs as a large amount of the drug is excreted in faeces as its metabolites and a small amount of the unchanged drug. The remainder of the drug can be found in urine, ~9%. 16% of an oral dose is found as the 6-*O*-demethylation metabolite, 7% as the 7-*O*-demethylation metabolite, 5% as the 6′-hydroxy metabolite and 7% as the 7′-hydroxymetabolite. Other metabolites include 2-piperazinyl and 2-amino compounds.

Therapeutic Concentration

Five men and 5 women patients with essential hypertension were administered with a 1 mg dose of doxazosin. Peak plasma concentrations of 15.7 ± 2.7 µg/L were reached within 2.1 ± 0.4 h. After multiple dosing of the same dosage, over 2 weeks, peak concentrations reached 19.3 ± 2.3 µg/L still within 1.9 ± 0.2 h [Kaye *et al.* 1986].

Toxicity

A 32-year-old woman with chronic renal failure and depression took a 60 mg dose of doxazosin and died owing to a grand mal seizure resulting

from hypotension. Blood analysis showed a doxazosin level of 0.9 g/L [www.Rxlist.com]

Bioavailability 65%.

Half-life 16 to 22 h.

Volume of Distribution 1.01 L/kg (in young adults, aged ~29 years); 1.71 L/kg (elderly, aged 71 years).

Clearance 1.2 mL/min/kg.

Protein Binding Approximately 98%.

Dose Initially a dose of 1 mg daily is administered, which can be increased over time to a maximum of 16 mg daily.

Doxepin

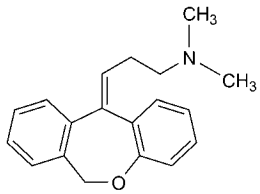
Tertiary Tricyclic Antidepressant, Histamine H_1- and H_2-Antagonist

$C_{19}H_{21}NO = 279.4$

CAS—1668-19-5

IUPAC Name (3*E*)-3-(6*H*-Benzo[*c*][1]benzoxepin-11-ylidene)-*N*,*N*-dimethylpropan-1-amine

Synonym Mixture of the *cis*-and *trans*-isomers of 3-dibenz[*b*,*e*]oxepin-11(6*H*)-ylidene-*N*,*N*-dimethyl-1-propanamine



Chemical Properties Oily liquid. pK_a 9.0 (25°). Log *P* (octanol/pH 7.4), 2.4 [Wozniakiewicz *et al.* 2008], (octanol/water), 4.29 [Sangster 1997], (hexane/water), 4.13 [Kemp *et al.* 1985]. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005]. Stock solutions were stable for 4 months at 4°. Spiked plasma samples were stable for at least 1 month at –18° and following 4 freeze-thaw cycles [Samanidou *et al.* 2007]. Plasma samples were stable for 6 weeks at –20°, after 3 freeze-thaw cycles, for 48 h at ≤20° for 24 h at 4° [Geister *et al.* 2001]. Urine and plasma samples were stable after 2 freeze-thaw cycles (–20°), after 2 days at 4° and when reconstituted in the mobile phase and stored at room temperature for up to 16.5 h [Yan *et al.* 1997]. Plasma samples were stable at –20° for at least 2 weeks [Dilger *et al.* 1988]. Standards kept at 4° deteriorated within 1 week while standards stored at –20° were stable for at least 4 months [Wilson *et al.* 1977]. Plasma samples were stable for at least 1 week if stored at –20° [Biggs *et al.* 1976].

Doxepin Hydrochloride

$C_{19}H_{21}NO,HCl = 315.8$

CAS—1229-29-4

Synonyms NSC-108160; P-3693A.

Proprietary Names *Anten*; *Aponal*; *Deptran*; *Desidoxepin*; *Doneurin*; *Doxal*; *Gilex*; *Mareen*; *Quitaxon*; *Sinequan*; *Sinquan(e)*; *Xepin*; *Zonalon*.

Chemical Properties White crystalline powder. Mp 184° to 186°, 188° to 189°. Soluble 1 in 1.5 of water, 1 in 1 of ethanol and 1 in 2 of chloroform; very slightly soluble in ether.

Colour Tests Liebermann's reagent—black; Mandelin's test—brown; Marquis test—brown; sulfuric acid—orange.

Thin-layer Chromatography System TA—R_f 0.51; system TB—R_f 0.48; system TC—R_f 0.37; system TE—R_f 0.63; system TL—R_f 0.13; system TAE—R_f 0.24; system TAF—R_f 0.45; system TAF—R_f 0.45; system TAJ—R_f 0.23; system TAK—R_f 0.14; system TAL—R_f 0.71 (acidified iodoplatinate solution, positive).

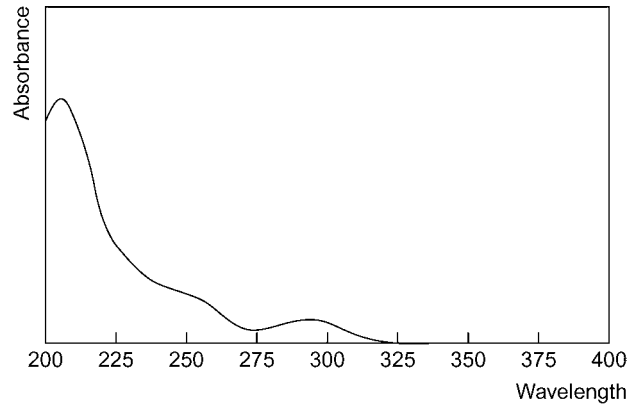
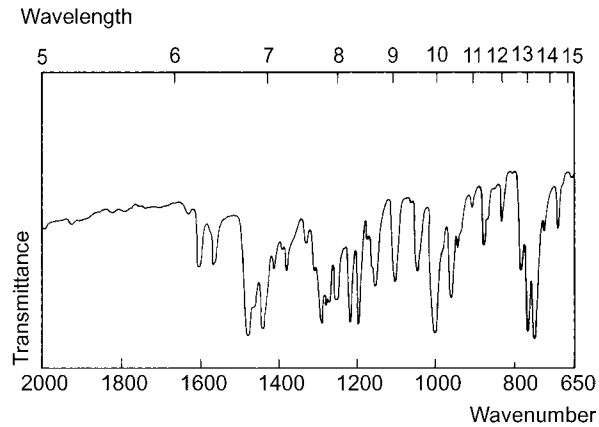
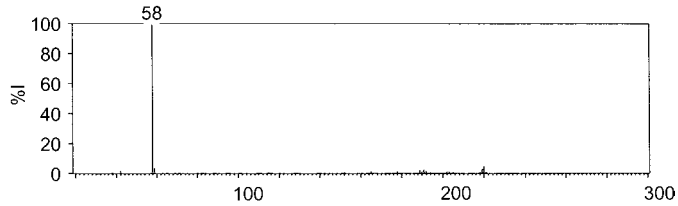
Ultraviolet Spectrum 0.1 N sulfuric acid—292 nm ($A_1^1 = 231a$) [Norheim 1973].



Infrared Spectrum Principal peaks at wavenumbers (doxepin hydrochloride) 1477, 750, 1439, 768, 1006, 1198, 1290, 1219 cm^{-1}, (KBr disk) [Norheim 1973].



Mass Spectrum Principal ions at *m/z* 58, 220, 219, 59, 191, 189, 42, 205.



Quantification

Blood **GC** Column: HP cross-linked methylsilicone (25 m × 0.2 mm i.d., 0.11 µm). Carrier gas: He, 195 kPa. Temperature programme: 180° for 1 min to 300° at 10°/min for 3 min. NPD. Limit of quantification, 23 µg/L, limit of detection, 7 µg/L [Martinez *et al.* 2004]. Column: 3.5% FFAP on 100/120 mesh Supelcoport or 3% OV-17 on 100/120 mesh chromosorb W-HP (1.2 m × 1.4 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature: 238° or 243°. FID. Retention time: 17.4 and 19.1 min for *cis*- and *trans*-doxepin, respectively on the first column, 10.6 min for the second column. Limit of detection, 25 µg/L [Cordonnier *et al.* 1983]. Column: 3% SE30 on Diatomite CLS 100/120 mesh (5′ × 1/8" i.d.) or 5% SE30 on 60/80 mesh AW Chromasorb W DMCS (6′ × 1/8" i.d.). Carrier gas: N_2, 60 mL/min. Temperature: 200°. FID. Relative retention time, 0.64. Limit of detection not reported [Oliver, Watson 1974]. Column: 3% SE-30 on Varaport 30 100/120 mesh (5′ × 1/8" i.d.) or 3% OV-17 on Chromosorb G80 to 80 mesh support (6′ × 2 mm i.d.). Carrier gas: N_2, 50 mL/min. Temperature: 220° or 270°, respectively. Retention time: 3.9 min on SE-30, 5.3 min on OV-17. Limit of detection, <10 ng [Norheim 1973].

GC-MS Column: 10% OV-17. Carrier gas: He, 30 mL/min. Temperature programme: 180° to 300° at 10°/min. EI ionisation at 70 eV. Limit of detection not reported [Norheim 1973].

LC-MS Column: XTerra RP18 (100 × 2.1 mm i.d.). Mobile phase: acetonitrile : 4 mmol/L ammonium formate buffer (pH 3.2; 5 : 95 for 2 min to 20 : 80 in 1 min to 30 : 70 over 12 min for 2 min to 5 : 95 in 30 s for 2.5 min), flow rate 0.15 mL/min. ESI, MRM acquisition mode, positive ion mode. Retention time: 9.4 min. Limit of quantification, 2 µg/L [Titier *et al.* 2007].

Plasma **GC** Column: 3% SP-2250 on 80/100 mesh Supelcoport (6′ × 2 mm i.d.). Carrier gas: He, 30 mL/min. Temperature: 230°. NPD. Retention time: 4.6 min. Limit of detection, 0.5 µg/L [Abernethy *et al.* 1981]. Column: OV-17 (20 m × 0.5 mm i.d.) or 3% OV-17 on 80/100 mesh Gas Chrom Q (1.8 m × 2 mm i.d.). Carrier

gas: H_2, 4 mL/min for the former, He, 30 mL/min for the latter. Temperature: 230°. NPD. Limit of detection, 2 µg/L [Rosseel *et al.* 1978]. Column: 1% OV-17 plus 2% OV 225 Chromosorb WHP on 80/100 mesh (1.8 m × 2 mm i.d.). Carrier gas: He, 20 mL/min. Temperature: 215°. FID. Relative retention time: 0.87. Limit of detection, 10 µg/L [Dorrity, Jr. *et al.* 1977]. Column: 3% OV-225 on 100/120 mesh Gas Chrom Q (1.83 m × 2 mm i.d.). Carrier gas: He, 40 mL/min. Temperature: 215°. FID. Limit of detection, 10 µg/L [O'Brien, Hinsvark 1976].

GC-MS Column: 3% OV-17 on 100/120 Gas-Chrom Q (1.1 m × 2 mm i.d.). Carrier gas: He, 20 mL/min. Temperature: 220°. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, 1 µg/L [Davis *et al.* 1983]. Column: 3% OV-225 on 80/100 mesh Chromosorb W (HP) (6′ × 1/8" i.d.). Carrier gas: He, 30 mL/min. Temperature: 205°. EI ionisation at 70 eV. Limit of detection, 0.4 mg/L [de Groot *et al.* 1978]. Column: 3% SP-2250DB on 100/120 mesh Supelcoport (15 m × 2 mm i.d.). Carrier gas: CH_4, 20 mL/min. Temperature: 205°. CI mode. Relative retention time: 1.7. Limit of detection, 10 µg/L [Jenkins, Friedel 1978]. Column: 3% OV-1 on 100/120 Gas Chrom Q (1 m × 2 mm i.d.). Carrier gas: CH_4: Ar (5 : 95), 30 mL/min. Temperature: 240°. EI ionisation at 70 eV. Limit of detection, 2.5 µg/L [Wallace *et al.* 1978]. Column: 3% OV-225 on 100/120 mesh Gas Chrom Q (1.5 m × 2.0 mm i.d.). Carrier gas: CH_4, 16 mL/min. Temperature: 220°. CI. Retention time: 3.6 and 3.91 min for *cis*- and *trans*-doxepin, respectively. Limit of detection, 5 µg/L [Wilson *et al.* 1977]. Column: 3% OV-17 on 100/120 mesh Gas Chrom Q (50 cm × 6 mm i.d.). Carrier gas: He, 30 mL/min. Temperature: 180° to 220°. EI ionisation at 70 eV. Retention time: 2–3.5 min. Relative retention time: 0.56. Limit of detection, 10 µg/L [Biggs *et al.* 1976].

HPLC Column: Kromasil C_8 (250 × 4mm i.d., 5 µm). Mobile phase: 0.05 mol/L ammonium acetate : acetonitrile (45 : 55), flow rate 1.5 mL/min. UV detection (λ = 238 nm). Retention time: 3.5 min. Limit of quantification, 0.2 ng, limit of detection, 0.07 ng [Samanidou *et al.* 2007]. Column: Ultrasphere C_8 (250 × 4.6 mm i.d.). Mobile phase: acetonitrile : 4 mmol/L 1-octanesulfonic acid-0.5 mmol/L *N,N,N,N*-tetramethylethylene diame (pH 2.5; 35: 650) flow rate 2 mL/min. UV detection (λ = 230 nm). Retention time: 7.7 min. Limit of detection not reported [Hackett *et al.* 1998]. Column: Spherisorb (150 × 4.5 mm i.d., 3 µm). Mobile phase: hexane : methanol : nonylamine (95 : 5 : 0.3), flow rate 1.0 mL/min. UV detection (λ = 254 nm). Limit of quantification, 1 µg/L for *cis* and *trans*-doxepin [Yan *et al.* 1997]. Column: Beckmann ultrasphere C_{18} (15 cm × 4.6 mm i.d., 5 µm). Mobile phase: methanol : water mixture (methanol : 0.25 mol/L potassium dihydrogen phosphate : triethylamine : orthophosphoric acid [58 : 10 : 0.4 : 0.24]), flow rate 1.0 mL/min. UV detection (λ = 254 nm). Limit of detection, 1.8 mg/L [Dunn *et al.* 1994]. Column: Hypersil Si 100 (250 cm × 4.6 mm i.d.). Mobile phase: water : acetonitrile : tetraethylammonium perchlorate (pH 8.4; 400 : 1200 : 1.2), flow rate 0.95 mL/min. UV detection (λ = 230 nm). Limit of quantification, 0.426 µg/L for *trans*-doxepin [Dilger *et al.* 1988].

LC-MS Column: Chromolith Speed ROD C18 (50 × 4.6 mm i.d., 5 µm). Mobile phase: methanol: 5 mmol/L acetic acid (pH 3.9) in ammonia (20 : 80 to 70 : 30 at 4 min for 1 min to 20 : 80), flow rate 1.0 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 4.43 µg/L Kirchherr, Kühn-Velten 2006. Column: Symmetry C_{18} (150 × 3 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.1% formic acid (28 : 72 for 4 min to 70 : 30 in 1 min for 3 min to 28 : 72 in 0.7 min), flow rate 0.6 mL/min. APCI, positive ion mode. Limit of quantification, 10 µg/L, limit of detection, 5 µg/L [Kollroser, Schober 2002]. Column: GROM SIL 120 Cyano-3cp (60 × 4.6 mm i.d., 5 µm). Mobile phase: ammonium carbaminate : acetonitrile, flow rate 0.6 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of detection, 59 ng/L [Geister *et al.* 2001]. Column: Phenomenex Luna C_{18} (150 × 2.1 mm i.d., 5 µm). Mobile phase: methanol : water : 0.05% formic acid (600 : 400 : 1), flow rate 0.25 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention time: 1.87 and 1.94 min for doxepin and desmethydoxepin, respectively. Limit of quantification, 0.32 and 0.18 µg/L for doxepin and desmethydoxepin, respectively [Badenhorst *et al.* 2000]. Column: SB-C_{18} Mac Mod (15 × 2.1 mm i.d., 3 µm). Mobile phase: 3 mmol/L ammonium acetate (pH 3.0) : acetonitrile (66 : 34), flow rate 1.4 mL/min. TIS, positive ion mode, SRM acquisition mode. Limit of quantification, 1 µg/L [Zhang *et al.* 2000].

CE Column: fused silica capillary (total/effective length 71.5/50 cm × 50 µm i.d.). Mobile phase: 25 mmol/L dodecyltrimethylammonium bromide with 2 mol/L urea in 37.5 mmol/L phosphate buffer (pH 8.0). UV detection (λ = 254 nm). Limit of detection, 5–10 µg/L [Lee *et al.* 1993].

Serum **GC** Column: SPB-1 100% polymethylsiloxane (60 m × 0.75 mm i.d., 1.0 µm). Carrier gas: He, 8 mL/min. Temperature: 260°. NSD. Limit of detection, 25 µg/L [Rifai *et al.* 1988]. Column: 3% OV-25 on Gas-Chrom Q 100/120 mesh (1.8 m × 2 mm i.d.). Carrier gas: N_2, 15 mL/min. Temperature: 245°. NPD. Relative retention time: 4.0. Limit of detection, 10 µg/L [Bredesen *et al.* 1981]. Column: 3% OV-225 on 100/120 mesh (1 m × 2 mm i.d.). Carrier gas: N_2, 50 mL/min. Temperature programme: 250° at 2°/min for 40 h. Retention time: 0.69 and 0.74 for *cis*- and *trans*-doxepin, respectively. Limit of detection, 5–10 µg/L [Kristinsson 1981]. Column: 3% OV-17 100/120 mesh Gas-Chrom Q (1.8 m × 2 mm i.d.). Carrier gas: He, 40 mL/min. Temperature programme: 235° for 6 min to 280° at 32°/min for 4 min. FID or NPD. Retention time: 4.1 min. Limit of detection, 3 µg/L [Vasiliades *et al.* 1979].

GC-MS Column: DB-1701 (15 m × 0.32 mm i.d., 1 µm). Carrier gas: He, 1 mL/min. Temperature programme: 170° for 1 min to 230° at 20°/min to 250° at 5°/min. CI, positive ion mode. Limit of detection, 0.5 µg/L [Ghabrial *et al.* 1991]. Column: 2% SP-2250 Chromosorb W-HP 100/120 mesh (1.2 m × 2.0 mm i.d.). Carrier gas: He, 30 mL/min. Temperature programme: 220° for 4 min to 250° at 30°/min for 10–15 min. EI ionisation at 70 eV. Limit of detection, 1 ng/L [Vasiliades 1980].

HPLC Column: Spheri-5 C_{18} (100 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : phosphoric buffer (pH 2.36; 1 : 1), flow rate 1 mL/min. DAD (λ = 254 nm). Limit of quantification, 0.04 mg/L, limit of detection, 0.01 mg/L [Wozniakiewicz *et al.* 2008]. Column: Nucleosil 100-5-Protect 1 (250 × 4.6 mm i.d., 5 µm). Mobile phase: 25 mmol/L potassium dihydrogenphosphate (pH 7.0) : acetonitrile (60 : 40), flow rate, 1.0 mL/min. UV detection (λ = 230 nm). Retention time: 18.3 min. Limit of detection not reported [Frahnert *et al.* 2003]. Column: Super-Octyl TSK gel (100 × 4.6 mm i.d., 2 µm) or Hypersil MOS-C_8 (100 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 20 mmol/L potassium dihydrogen phosphate (pH 7.0; 60 : 40), flow rate 0.6 mL/min. UV detection (λ = 254 nm). Retention time: 8.5 and 10.3 min for the TSK and Hypersil columns, respectively. Limit of quantification, 0.05 µg/L on the TSK column [Tanaka *et al.* 1997]. Column: silica 80Å (100 × 6 mm i.d., 3 µm). Mobile phase: 0.025 mol/L dibasic sodium phosphate (pH 3.0) : acetonitrile (80 : 20) with 0.021 mol/L *n*-nonylamine (pH 7.4 to 7.8), flow rate 1.6 mL/min. UV detection. Retention time: 8.35, 8.83, 14.7 and 16.4 min for *Z*-desmethyldoxepin, *E*-desmethyldoxepin, *Z*-doxepin, and *E*-doxepin, respectively. Limit of quantification, 10 µg/L for doxepin and 5 µg/L for desmethyldoxepin [Adamczyk *et al.* 1995]. Column: Nucleosil 100 CN (250 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : acetonitrile : 0.01 mol/L potassium phosphate buffer (pH 6.8; 188 : 5778 : 235). UV detection (λ = 214 nm). Limit of detection, 10 µg/L [Rao *et al.* 1994].

See also Emm *et al.* [1987], Lin, Frade [1987], Messiha [1986], Beierle, Hubbard [1983], Koteel *et al.* [1982], Sonsalla *et al.* [1982], Bannister *et al.* [1981], Kabra *et al.* [1981], Thoma *et al.* [1979], Proelss *et al.* [1978]

LC-MS Column: Uptisphere (12.5 cm × 2 mm i.d., 5 µm). Mobile phase: 50 mmol/L ammonium acetate (pH 4.0)-acetonitrile : acetonitrile (100 : 0), flow rate 200 µL/min. ESI, positive ion mode, SIM acquisition mode. Limit of quantification, 22 nmol/L [Gutteck, Rentsch 2003].

Urine **GC** See Blood [Cordonnier *et al.* 1983]. See Blood [Oliver, Watson 1974]. See Blood [Norheim 1973]. Column: 3% SE-30 on Chromosorb W HP 80/100 mesh (6′ × 4 mm i.d.). Carrier gas: N_2, 50 mL/min. Temperature: 220° FID. Retention time: 5.0 min. Limit of detection, 1 mg/L [Dusci, Hackett 1971].

GC-MS Column: CP-SIL 5CB (10 m × 0.15 mm i.d., 0.12 µm). Carrier gas: H_2, 1 mL/min. Temperature programme: 110° for 0.5 min to 250° at 40°/min to 280° at 60°/min. SIM acquisition mode. Retention time: 3.32 min. Limit of quantification, 100 µg/L, limit of detection, 50 µg/L [Rana *et al.* 2008]. See Plasma [de Groot *et al.* 1978]. See Blood [Norheim 1973].

HPLC See Plasma. Limit of quantification, 0.65 ng, limit of detection, 2.0 ng [Samanidou *et al.* 2007]. See Serum [Tanaka *et al.* 1997]. See Plasma [Yan *et al.* 1997]. See Plasma. Limit of detection, 0.19 mg/L [Dunn *et al.* 1994]. Column: Cyano (25 cm × 9.4 mm i.d.). Mobile phase: ethanol : water (1 : 1), 3 mL/min. UV detection (λ = 254 nm). Retention time: 5.5 min for doxepin N^+-glucuronide. Limit of detection, 5 mg/L [Luo *et al.* 1991]. Column: Zorbax CN (250 × 4.6 mm i.d.). Mobile phase: acetonitrile : methanol: 0.1 mol/L ammonium acetate (84 : 8 : 8), flow rate 1.6 mL/min. UV detection (λ = 254 nm). Limit of detection not reported [Shu *et al.* 1990a]. Column: Spherisorb nitrile (15 × 0.46 cm i.d., 3 µm). Mobile phase: water : acetonitrile-methanol (75 : 25, 95 : 5 for 1 min to 0 : 100 in 16 min for 4 min), flow rate 1.5 mL/min. UV detection (λ = 254 nm). Retention time: ≈5 min for glucuronide metabolites. Limit of detection not reported [Shu *et al.* 1990b].

Bile **GC-MS** See Plasma [de Groot *et al.* 1978].

HPLC See Plasma. Limit of detection, 15 mg/L [Dunn *et al.* 1994].

Gastric Contents **HPLC** See Plasma. Limit of detection, 1.5 g/L [Dunn *et al.* 1994].

Milk **HPLC** Column: MOS- Hypersil C_8 reversed phase (100 × 2 mm i.d., 3 µm). Mobile phase: 0.02 mol/L monobasic potassium phosphate : *N,N*-dimethyloctylamine (pH 6.5) : acetonitrile (66.0.085 : 34), flow rate 0.5 mL/min. UV detection (λ = 242 nm). Retention time: 6.74 min. Limit of quantification, 2.0 µg/L, limit of detection, 1.25 µg/L [Hostetter *et al.* 2004]. See Plasma [Kemp *et al.* 1985].

Vitreous Humour **HPLC** Column: Zorbax cyanopropyl (25 cm × 4.6 mm i.d., 5–6 µm). Mobile phase: 0.5 mol/L acetic acid : acetonitrile: *n*-butylamine (60 : 40 : 0.0022), flow rate 2.5 mL/min. UV detection (λ = 254 nm). Limit of detection, 16.7 µg/L [Evenson, Engstrand 1989].

Brain **GC** See Blood [Oliver, Watson 1974].

HPLC See Serum [Tanaka *et al.* 1997].

Hair **GC** Column: AC-5 capillary (15 m × 0.25 mm i.d.). Temperature programme: 180° to 270° at 10°/min for 10 min. NPD. Limit of detection, 0.1–0.5 µg/g [Shen *et al.* 2002].

GC-MS Column: DB-5 (30 m × 0.25 mm i.d.). Carrier gas: CH_4. Temperature programme: 100° for 2 min to 150° at 10°/min to 280° at 25°/min. CI, full scan mode. Retention time: 10.2 min [Shen *et al.* 2002]. Column: HP-5MS (30 m × 250 µm i.d., 0.25 µm). Carrier gas: He, 1.2 mL/min. Temperature programme: 130° for 1 min to 280° at 12°/min for 3 min. SIM acquisition mode. Retention time: 11.48 min. Limit of quantification, 0.25 µg/g [Negrusz *et al.* 1998].

Heart **GC** See Blood [Cordonnier *et al.* 1983].

Kidney **GC** See Blood [Cordonnier *et al.* 1983]. See Blood [Oliver, Watson 1974].

Liver **GC** See Blood [Cordonnier *et al.* 1983]. See Blood [Oliver, Watson 1974]. See Blood [Norheim 1973].

HPLC See Serum [Tanaka *et al.* 1997].

Other **GC-MS** Human Liver Microsomes. Column: DB-17 (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 35 cm/s. Temperature programme: 150° for 1 min to to 270° at 15°/min for 7 min. EI ionisation at 70 eV, SIM acquisition mode. Retention time: 10.6 and 10.75 min for *trans*-doxepin and *cis*-doxepin, respectively. Limit of detection, 50 mol/L [Haritos *et al.* 1999].

LC-MS Foodstuffs. Column: Luna C_8 100-Å (100 × 2.0 mm i.d., 3 µm). Mobile phase: 0.1% formic acid : 0.1% formic acid in acetonitrile (95 : 5 for 3 min to 5 : 95 at 18 min for 1 min to 95 : 5 over 0.5 min for 2.5 min. ESI, positive ion mode, SIM acquisition mode. Retention time: 10.4 min. Limit of detection not reported [Zuckschwerdt *et al.* 2008].

Note For a radioimmunoassay method in plasma and serum, see Virtanen *et al.* [1980].

Disposition in the Body Well absorbed after oral administration, but undergoes extensive first-pass demethylation; bioavailability 15 to 45%. Other metabolic reactions include *N*-oxidation, aromatic hydroxylation, and glucuronic acid conjugation [Luo *et al.* 1991; Shu *et al.* 1990b]. Monodesmethyldoxepin is an active metabolite. CYP2D6 is a major oxidative enzyme involved in the metabolism of doxepin [Haritos *et al.* 2000], whereas *N*-demethylation of doxepin is catalysed by CYP2C19 [Koski *et al.* 2007]. Doxepin is excreted in the urine, chiefly as metabolites and conjugated metabolites; <1% of a dose is excreted in the urine as unchanged drug in 24 h. It is also absorbed through the skin if applied topically. It crosses the blood–brain barrier and the placenta. Doxepin and its active metabolite desmethyldoxepin are excreted in breast milk, whereas only desmethyldoxepin is detectable in the plasma of the infant after 43 days [Kemp *et al.* 1985].

Therapeutic Concentration In plasma, usually in the range 0.05 to 0.15 mg/L.

After a single oral dose of 75 mg given to 7 subjects, peak plasma concentrations of 0.01 to 0.05 mg/L (mean 0.03) of doxepin were attained in 2 to 4 h and peak plasma concentrations of 0.005 to 0.014 mg/L (mean 0.01) of monodesmethyldoxepin were reported at 2 to 10 h [Ziegler *et al.* 1978].

Seven male patients, 4 with dysthymic disorders and 3 with non-psychomotor major depressive disorders were administered a single oral daily dose of 150 mg doxepin at bedtime for up to 3 weeks. Plasma clearance ranged from 0.7 to 1.15 L/h/kg and volume of distribution ranged between 12.7 to 30.2 L/kg. Approximately 70% of the oral dose was estimated to undergo first-pass metabolism [Faulkner *et al.* 1983].

After a single oral dose of 100 mg doxepin to 30 subjects the mean peak plasma concentration of *trans*-doxepin was ≈13 µg/L reached at 3 to 4 h. The desmethyldoxepin concentration reached ≈4 µg/L which slowly decreased to 0.5 µg/L at 72 h after dosing. The mean terminal elimination half-life was calculated to be ≈11 and 20 h for *trans*-doxepin and metabolite, respectively [Dilger *et al.* 1988].

After a single oral dose of 100 mg doxepin to 20 healthy volunteers the maximum doxepin concentration ranged from 6.79 to 18.57 µg/L at ≈2 h. The maximum desmethyldoxepin concentration was between 6.33 and 17.85 µg/L [Badenhorst *et al.* 2000].

Analysis of data from a serum-level databank from German and US sources showed the mean steady-state serum concentration of doxepin plus desmethyldoxepin to be 0.089 (±0.075) mg/L following a daily dose of 143 (±30) mg doxepin [Leucht *et al.* 2001].

A retrospective analysis of data from 114 psychiatric patients treated with doxepin 25 to 400 mg daily for 22 to 306 days (92% by the oral route; 8% by the IV route) revealed doxepin plasma concentration to be 40 to 1057 nmol/L (mean 276.23) and desmethyldoxepin to be 141 to 1627 nmol/L (mean 251) [Meyer-Barner *et al.* 2002].

Toxicity Doses >500 mg are likely to produce severe toxic effects and the estimated minimum lethal dose is 1 g. Blood concentrations >0.1 mg/L may be associated with toxic reactions and fatalities have been associated with blood concentrations of 1 to 8 to 18 mg/L.

A 35-year-old female was found dead. At postmortem the concentration of doxepin hydrochloride in blood, liver and urine was 1.9, 32, and 1.6 mg/g [Norheim 1973].

In 5 deaths due to over-dosage of doxepin, the postmortem blood concentrations ranged from 9 to 19 mg/L (mean 13 mg/L) and in 3 of these cases, liver concentrations of 71, 75, and 500 µg/g were reported [Oliver, Watson 1974].

In a report of 4 fatalities attributed to overdose of doxepin, the postmortem blood and tissue concentrations, mg/L or µg/g (mean), shown below were found.

	Doxepin	*Monodesmethyldoxepin*
Blood	0.7–29 (9.3)	0.1–6.2 (1.7)
Bile	38–195 (95)	1.0–19 (7.1)
Brain	9–21 (14)	1.5–22 (7.2)
Kidney	3.3–19 (12)	0.5–9.0 (3.0)
Liver	22–38 (32)	1.2–20 (7.5)
Urine	2.1–12 (7.5)	0.7–6.4 (2.8)

[de Groot *et al.* 1978]

A 24-year-old male ingested at least 2500 mg doxepin and 500 mg chlorazepate. The postmortem concentrations of *cis* and *trans*-doxepin (mg/L or mg/kg) are shown below.

	Cis and **trans***-doxepin*		*Desmethyldoxepin*	
Sample	Concentration	Ratio	Concentration	Ratio to doxepin
Standard	—	16 : 84	—	—
Blood	3.3	10 : 90	—	—
Urine	1.4	8 : 92	—	—
Kidney	4.3	11 : 89	0.52	12 : 88
Liver	63.8	13 : 87	4.47	7 : 93
Left ventricle	3.6	9 : 91	0.10	3 : 97
Ventricular septum	2.7	9 : 91	0.46	17 : 83

[a][Cordonnier *et al.* 1983]

A 5% doxepin hydrochloride cream was applied to a 2.5-year-old male with severe eczema. He suffered a grand mal seizure and was admitted to hospital. The serum doxepin concentration was 382 µg/L and nordoxepin was 141 µg/L. Eight days later his serum doxepin concentration was 119 µg/L [Vo *et al.* 1995].

A 43-year-old Finnish male was found dead. Postmortem revealed 2.4 and 2.9 mg/L of doxepin and nordoxepin in his femoral venous blood, respectively. CYP2D6 genotype analysis revealed *3 and *4, which translates to a total absence of the CYP2D6 enzyme. The CYP2C19 genotype was determined as *1/*1 (i.e. alleles *2 and *3 not found), corresponding to extensive metabolism of CYP2C19 substrates such as doxepin. The doxepin-to-nordoxepin ratio was 0.83. Cause of death was fatal doxepin poisoning [Koski *et al.* 2007].

In a young female fatality, femoral blood drug concentrations were: paroxetine 0.176 mg/L, doxepin 82.12 mg/L, and desmethyldoxepin 0.34 mg/L [Musshoff *et al.* 1999].

Note For a study of doxepin-induced contact dermatitis, see Shelley *et al.* [1996] and for doxepin poisoning in a child see Walter and Kauffman [1980].

Half-life Plasma half-life, doxepin 8.2 to 24.5 h (mean 16.8), desmethyldoxepin 33.2 to 80.7 h (mean 51.3) [Ziegler *et al.* 1978]. Urinary *cis*/*trans* ratio range 0.08 to 3.06 [Ghabrial *et al.* 1991].

Bioavailability 15 to 45%

Volume of Distribution 9.1 to 33.3 L/kg, mean 20.2 L/kg [Ziegler *et al.* 1978]; ≈20 to 24 L/kg.

Clearance Plasma clearance, 0.93 (0.69 to 1.02) L/h/kg [Faulkner *et al.* 1983].

Distribution in Blood Plasma: whole blood ratio, doxepin ≈0.8 but there is considerable intersubject variation; monodesmethyldoxepin ≈0.6.

Protein Binding ≈80%.

Note For a review of the pharmacokinetics of tricyclic antidepressants, see Molnar and Gupta [1980].

Dose The equivalent of 30 to 300 mg of doxepin daily by mouth.

Doxercalciferol

Antihyperparathyroid, Vitamin D Activity

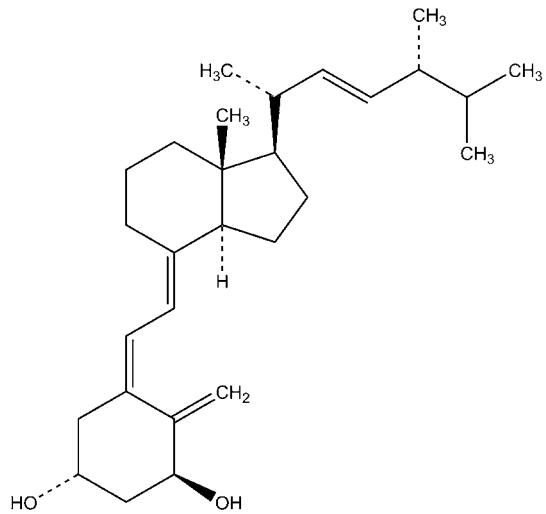
$C_{28}H_{44}O_2 = 412.6$

CAS—54573-75-0

IUPAC Name (1*R*,3*S*,5*Z*)-5-[(2*E*)-2-[(1*R*,3a*S*,7a*R*)-1-[(*E*,2*R*,5*R*)-5,6-Dimethylhept-3-en-2-yl]-7a-methyl-2,3,3a,5,6,7-hexahydro-1*H*-inden-4-ylidene]ethylidene]-4-methylidenecyclohexane-1,3-diol

Synonyms 1-Hydroxyergocalciferol; 1α-hydroxyvitamin D_2; 1α-OH-D_2; (1α,3β,5*Z*,7*E*,22*E*)-9,10-secoergosta-5,7,10(19),22-tetraene-1,3-diol.

Proprietary Name *Hectorol*



Chemical Properties Crystals. Mp 138° to 140°.

Quantification

Plasma **HPLC** Column: Zorbax-SIL (250 × 4.6 mm i.d.). Mobile phase: hexane : methylene chloride : propan-2-ol (47.9 : 47.9 : 4.2). Liquid scintillation detection. Limit of detection, 1 µg/L [Upton *et al.* 2003].

Serum **HPLC** See Plasma [Upton *et al.* 2003].

Disposition in the Body Doxercalciferol is not active when it is absorbed in the intestine or after injection. After intestinal absorption, it is metabolised within

liver microsomes to 1-25-dihydroxy vitamin D_2 (1-25-OH-D_2), the major active metabolite, and 1-24-OH-D_2, via CYP27. Hence, doxercalciferol is considered to be a prohormone.

Therapeutic Concentration

Twenty-two osteopenic women with normal kidney and liver function were administered 5 µg IV and 2 and 5 µg oral doses of doxercalciferol with a wash-out period of 1 week between each dosing regimen. Peak plasma concentrations of 1-25-OH-D_2 per µg of dose were 10.2, 5.0, and 3.5 ng/L for 5 µg IV and 2 µg and 5 µg oral doses, respectively, attained after 8, 11 and 11 h, respectively [Upton *et al.* 2003].

Twenty-four healthy volunteers were administered a 5 µg oral dose of doxercalciferol every 48 h for 5 doses. After a 14-day wash-out period, they were administered a 15 µg oral dose every 48 h for 5 doses. Peak plasma concentrations of 1-25-OH-D_2 per µg of dose were 6.0 and 4.5 ng/L for the 5 and 15 µg doses, respectively, reached after 11 h for both doses [Upton *et al.* 2003].

Orally administered doxercalciferol (10 µg every other day for 5 days, then 5 µg every other day for 5 days) was administered to 11 patients on chronic haemodialysis. The mean peak serum concentration of 1-25-OH-D_2 was 38 ng/L after 12 h [Bailie, Johnson 2002].

Bioavailability Approximately 42% for 1-25-OH-D_2.

Half-Life Approximately 34 h.

Protein Binding Highly bound to plasma proteins.

Dose Adult starting dose, 10 µg orally three times weekly for a total weekly dose of 30 µg.

Bailie GR, Johnson CA (2002). Comparative review of the pharmacokinetics of vitamin D analogues. *Semin Dial* 15: 352–357.

Upton RA *et al.* (2003). Pharmacokinetics of doxercalciferol, a new vitamin D analogue that lowers parathyroid hormone. *Nephrol Dial Transplant* 18: 750–758.

Doxofylline

Bronchodilator, Theophylline Derivative

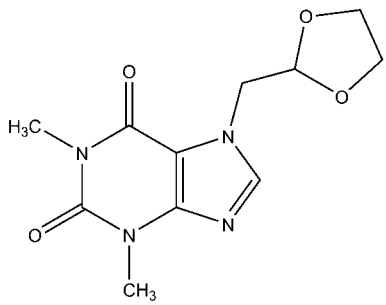
$C_{11}H_{14}N_4O_4 = 266.3$

CAS—69975-86-6

IUPAC Name 7-(1,3-Dioxolan-2-ylmethyl)-1,3-dimethylpurine-2,6-dione

Synonyms ABC-12/3; 7-(1,3-dioxolan-2-yl-methyl)-3,7-dihydro-1,3-dimethyl-1*H*-purine-2,6-dione doxophylline; dioxyfilline.

Proprietary Names *Ansimar*; *Maxivent*; *Ventax*.



Chemical Properties Crystals. Mp 144° to 145.5°. Soluble in water, acetone, ethyl acetate, benzene, chloroform, dioxane, hot methanol and hot ethanol. Practically insoluble in ethyl ether or petroleum ether.

Quantification

Plasma **HPLC** Column: RP silica particles derivatised with glycine–phenylalanine–phenylalanine (150 × 4.6 mm i.d., 5 µm). Mobile phase: 0.1 mol/L phosphate buffer (pH 6.8), flow rate 0.3 mL/min. UV detection (λ = 275 nm). Retention time: 13.9 min. Limit of detection, >1 mg/L [Tagliaro *et al.* 1990]. Column: C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol : 0.01 mol/L phosphate buffer (pH 3.0; 5 : 8 : 87), flow rate 1.2 mL/min. UV detection (λ = 273 nm). Retention time: ~7 min. Limit of detection, 10 µg/L [Lagana *et al.* 1990].

Serum **HPLC** See Plasma [Tagliaro *et al.* 1990]. Column: C_{18} (250 × 4.6 mm i.d., 5 µm) Mobile phase: acetonitrile : methanol : 0.01 mol/L phosphate buffer (pH 3.0; 5 : 8 : 87), flow rate 1.2 mL/min. UV detection (λ = 273 nm). Retention time and limit of quantification not reported [Bologna *et al.* 1990].

LC-MS Column: Amazon C_{18}. Mobile phase: formic acid (pH 2.5) : acetonitrile (10 : 90). API, MRM acquisition mode. Retention time: 1.46 min. Limit of quantification, 1 µg/L [Sreenivas *et al.* 2008].

Other **HPLC** Tablets and Syrup. Column: Lichrosorb C_{18} (250 mm, 10 µm). Mobile phase: acetonitrile : water (30 : 70), flow rate 1.5 mL/min. UV detection (λ = 273 nm). Retention time: 2.6 min. Limit of quantification, 5 mg/L [Badini *et al.* 1982].

Disposition in the Body Rapidly absorbed after oral administration, remaining in the blood for 6 h and completely excreted in the urine within 12 h. The drug circulates unchanged and the only metabolite detectable in serum is β-hydroethyltheophylline (also the main metabolite in urine).

Therapeutic Concentration The lower limit of the therapeutic concentration is approx. 12 µg/L in serum. The upper limit has not been determined, but in patients with serum concentrations higher than 30 µg/L no significant side effects were observed [Villani *et al.* 1997].

A group of 6 healthy volunteers were administered a 400 mg oral dose of doxophylline. A mean peak plasma concentration of 2.88 mg/L was reached at 1 h [Lagana *et al.* 1990].

Doxophylline was administered under fasting conditions to 6 patients with chronic bronchitis as a single IV dose of 100 mg over 10 min. A mean peak serum concentration of 2.5 mg/L was reached at 0.1 h but levels were very variable between patients (range 0.97 to 4.12 mg/L) [Bologna *et al.* 1990].

Eight patients with chronic bronchitis were administered a twice daily 400 mg oral dose of doxophylline for 5 days. A mean peak serum concentration of 15.2 mg/L was reached at 1 h [Bologna *et al.* 1990].

Bioavailability Approximately 63%.

Half-life Approximately 90 min, also reported as 8 h.

Volume of Distribution Approximately 267 L.

Clearance Approximately 0.5 L/min.

Dose Orally, up to 1200 mg daily. It may also be given by slow IV injection.

Doxorubicin

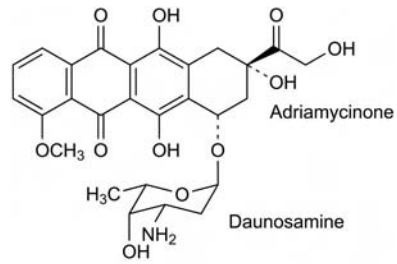
Antineoplastic

$C_{27}H_{29}NO_{11} = 543.5$

CAS—23214-92-8

IUPAC Name (7*S*,9*S*)-7-[(2*R*,4*S*,5*S*,6*S*)-4Amino-5-hydroxy-6-methyloxan-2-yl]oxy-6,9,11-trihydroxy-9-(2-hydroxyacetyl)-4-methoxy-8,10-dihydro-7*H*-tetracene-5, 12-dione

Synonyms Adriamycin; (8*S*-*cis*)-10-[(3-amino-2,3,6-trideoxy-α-L-lyxo-hexopyranosyl)oxy]-7,8,9,10-tetrahydro-6,8,11-trihydroxy-8-(hydroxyacetyl)-1-methoxy-5,12-naphthacenedione; 14-hydroxydaunorubicin.



Chemical Properties An antibiotic isolated from *Streptomyces peucetius* var. *caesius*. Mp 229° to 231°. pK_a 8.2, 10.2. Log *P* (octanol/water), 1.3.

Doxorubicin Hydrochloride

$C_{27}H_{29}NO_{11}$,HCl = 580.0

CAS—25316-40-9

Proprietary Names *Adriamycin*; *Adriblastin(a)*; *Adriblastine*; *Adrim*; *Adrimedac*; *Caelyx*; *Doxil*; *DOXO-cell*; *Doxolem*; *Doxorubin*; *Doxotec*; *Farmiblastina*; *Fauldoxo*; *Ribodoxo-L*; *Rubex*.

Chemical Properties An orange-red, hygroscopic, crystalline powder. Mp 204° to 205°, with decomposition. Soluble in water, methanol and aqueous alcohols; soluble 1 in 75 of ethanol; practically insoluble in acetone, benzene, chloroform, ethyl ether, petroleum ether, ether and other organic solvents.

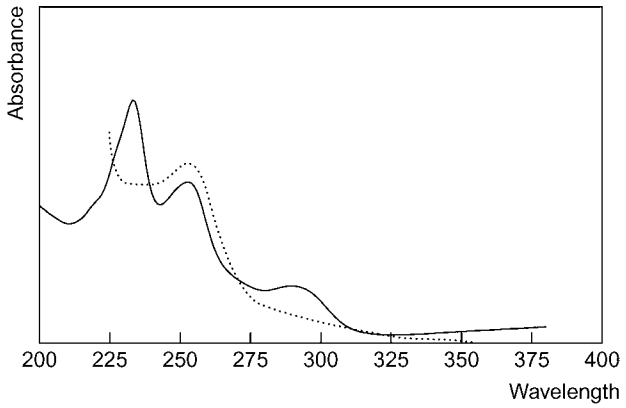
Caution Doxorubicin hydrochloride is irritant; avoid contact with skin and mucous membranes.

Colour Tests Mandelin's test—green; Marquis test—violet.

Thin-layer Chromatography System TA—R_f 0.12; system TE—R_f 0.00; system TF—R_f 0.00 (visible red streak).

High Performance Liquid Chromatography System HX—RI 370; system HAA—retention time 12.1 min.

Ultraviolet Spectrum Aqueous acid—233, 253, 290 nm; aqueous alkali—253 nm; methanol—233 (A^{1}_{1}=702b), 253, 290 nm.



Infrared Spectrum Principal peaks at wavenumbers 1282, 990, 1010, 1587, 1612, 1204 cm^{-1} (doxorubicin hydrochloride).

Quantification

Plasma **HPLC** Fluorescence detection. Limit of detection, <1 µg/L, doxorubicin and doxorubicinol [de Bruijn *et al.* 1999]. Electrochemical detection. Limit of detection, <1 µg/L, doxorubicin, epirubicin and principal metabolites [Ricciarello *et al.* 1998]. Fluorescence detection. Limit of detection, 1 to 2 nmol/L, doxorubicin and its metabolites [Andersen *et al.* 1993]. Fluorescence detection. Limit of detection, <25 µg/L [Cox *et al.* 1991]. Fluorescence detection. For method for quantification of doxorubicin and metabolites, see Beijnen *et al.* [1991]. UV detection. Limit of detection, 10 µg/L, doxorubicin and daunorubicin [Mikan *et al.* 1990].

Tissues **HPLC** See Plasma [Cox *et al.* 1991].

Dose 1.2 to 2.4 mg/kg, intravenously, as a single dose every 3 weeks.

Doxycycline

Antibiotic

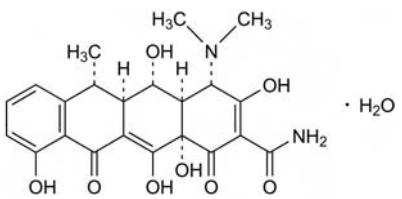
$C_{22}H_{24}N_2O_8,H_2O$ = 462.5

CAS—564-25-0 (anhydrous); 17086-28-1 (monohydrate)

IUPAC Name (2*Z*,4*S*,4*aR*,5*S*,5*aR*,6*R*,12*aS*)-2-[Amino(hydroxy)methylidene]-4-(dimethylamino)-5,10,11,12*a*-tetrahydroxy-6-methyl-4*a*,5,5*a*,6-tetrahydro-4*H*-tetracene-1,3, 12-trione

Synonyms [4*S*-(4α,4aα,5α,5aα,6α,12aα)]-4-(Dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,5,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-2-naphthacenecarboxamide monohydrate; doxycycline monohydrate.

Proprietary Names *Cyclodox*; *Doximed*; *Doxy*; *Doxybene*; *Doxycline*; *Doxyderma*; *Doxydoc*; *Doxy-HP*; *Doxymerck*; *Doxymono*; *Doxysol*; *Doxystad*; *Idocyklin*; *Vibradox*; *Vibramycin-D*; *Vibramycine N*; *Vibra-S*; *Vibravenös*.



Chemical Properties A yellow crystalline powder. Very slightly soluble in water; sparingly soluble in ethanol; practically insoluble in chloroform and ether; freely soluble in dilute acids and alkali hydroxides. pK_a 3.5, 7.7, 9.5 (20°). Log *P* (octanol/water), −0.02.

Doxycycline Hydrochloride

$C_{22}H_{24}N_2O_8,HCl,{}^{1}/_{2}C_2H_5OH,{}^{1}/_{2}H_2O$ = 512.9

CAS—10592-13-9 ($C_{22}H_{24}N_2O_8,HCl$); 24390-14-5 ($C_{22}H_{24}N_2O_8,HCl,{}^{1}/_{2}C_2H_5OH,{}^{1}/_{2}H_2O$)

Synonyms Doxycycline hyclate; doxycyclini chloridum.

Proprietary Names *Atridox*; *Demix*; *Doxi Crisol*; *Doxi Sergo*; *Doxibiotic*; *Doxiclat*; *Doxylar*; *Doximycin*; *Doxin(a)*; *Doxine*; *Doxitab*; *Doxiten*; *Doxitin*; *Doxy*; *Doxybene*; *Doxybiocin*; *Doxycap*; *Doxychel*; *Doxyclin(e)*; *Doxycyl*; *Doxylar*; *Dumoxin*; *Idocyklin*; *Periostat*; *Ramysis*; *Vibramycin(e)*; *Vibra-Tabs*; *Vibraveineuse*; *Vibravenos*.

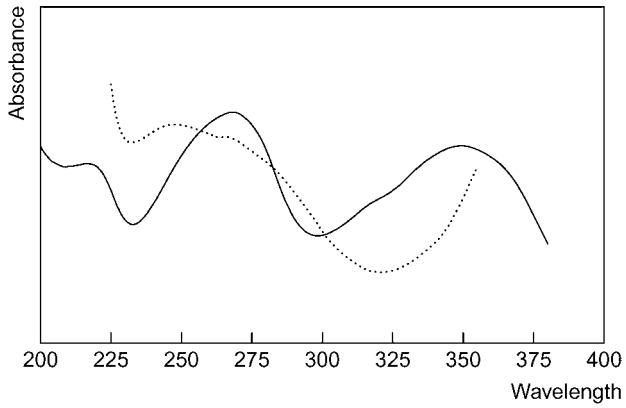
Chemical Properties A yellow crystalline powder. Mp about 200°, with decomposition. Soluble 1 in 3 of water, 1 in 60 of ethanol and 1 in 4 of methanol; practically insoluble in chloroform and ether.

Colour Tests Benedict's reagent—red; formaldehyde–sulfuric acid—yellow; Mandelin's test—green→yellow; Marquis test—yellow; sulfuric acid—yellow.

Thin-layer Chromatography System TA—R_f 0.12, streaking; system TAE—R_f 0.88 (acidified iodoplatinate solution, positive).

High Performance Liquid Chromatography System HY—RI 291.

Ultraviolet Spectrum Aqueous acid—269 (A^{1}_{1}=412b), 346 nm.



Infrared Spectrum Principal peaks at wavenumbers 1580, 1613, 1660, 1244, 1220, 1040 cm^{-1} (doxycycline hydrochloride, KBr disk).

Quantification

Plasma **HPLC** UV detection. Limit of detection, 3 µg/L [Zarghi *et al.* 2001]. Limit of detection, 0.125 mg/L [Axisa *et al.* 2000]. UV detection. Limit of detection, <25 µg/L [Prevosto *et al.* 1995].

Urine **HPLC** UV detection. Limit of detection, <25 µg/L [Prevosto *et al.* 1995]. See Serum [De Leenheer, Nelis 1979].

Tissue **HPLC** See Plasma [Axisa *et al.* 2000].

Disposition in the Body Readily and almost completely absorbed after oral administration; peak plasma concentrations are attained in about 2 h. It does not appear to be significantly metabolised. About 40% of a dose is excreted in the urine unchanged in 72 h (about 24% in the first 24 h).

Half-life Plasma half-life, about 22 h.

Protein Binding About 82 to 90%.

Note For a review of doxycycline, see Cunha *et al.* [1982].

Dose The equivalent of 100 to 200 mg of doxycycline daily; a 1-day course of 300 to 600 mg has also been given.

Doxylamine

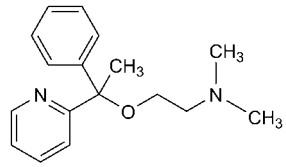
Antihistamine

$C_{17}H_{22}N_2O$ = 270.4

CAS—469-21-6

IUPAC Name *N,N*-Dimethyl-2-(1-phenyl-1-pyridin-2-ylethoxy)ethanamine

Synonyms *N,N*-Dimethyl-2-[1-phenyl-1-(2-pyridinyl)ethoxy]ethanamine; histadoxylamine.



Chemical Properties Liquid. Bp ≈140°. Soluble in acids. pK_a 4.4, 9.2. Log *P* (octanol/water), 2.37 [Meylan, Howard 1995]. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

D

Doxylamine Succinate

$C_{17}H_{22}N_2O,C_4H_6O_4 = 388.5$
CAS—562-10-7

Synonym Doxylamine hydrogen succinate

Proprietary Names *Decapryn*; *Donormyl*; *Dormidina*; *Dozile*; *Duebien*; *Gittalun*; *Hewedormir forte*; *Hoggar N*; *Lidene*; *Mereprine*; *Munleit*; *Noctyl*; *Restavit*; *Restwel*; *Sanalepsi N*; *Sedaplus*; *Somnil*; *Unisom*. It is an ingredient of many proprietary preparations—see Sweetman [2007].

Chemical Properties White or creamy-white powder. Mp 100° to 104°. Soluble 1 in 1 of water, 1 in 2 of ethanol, 1 in 2 of chloroform and 1 in 370 of ether; slightly soluble in benzene. Log *P* (octanol/water) −1.07 [Meylan, Howard 1995].

Colour Tests Cyanogen bromide—orange-pink; Liebermann's reagent—red-orange; Marquis test—violet; sulfuric acid—pink.

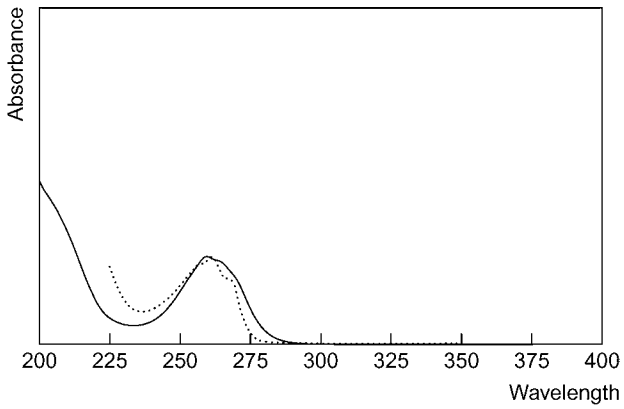
Thin-layer Chromatography System TA—R_f 0.48; system TB—R_f 0.41; system TC—R_f 0.10; system TE—R_f 0.60; system TL—R_f 0.09; system TAE—R_f 0.12 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—doxylamine RI 1910, M (carbinol)-H_2O RI 1560, M (OH-)-AC RI 2300, M (OH-carbinol-)-AC RI 2980, M (OH-methoxy-)-AC RI 2320; M (bis-nor-)-AC RI 2280, M (desamino-OH-)-AC RI 1960; M (nor-)-AC RI 2340; system GB—doxylamine RI 1970, M (nor-) RI 1974, M (carbinol)-H_2O RI 1670; system GF—RI 2170.

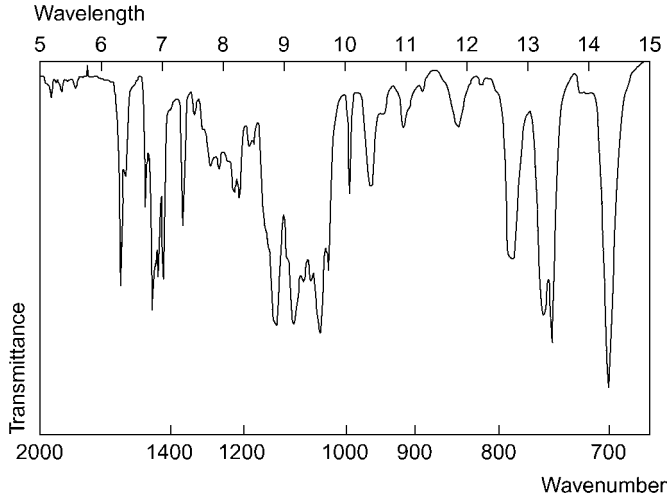
High Performance Liquid Chromatography System HA—*k* 4.4; system HY—RI 259; system HAA—RT 11.1 min.

Column: ODS-2 (120 × 4.6 mm i.d., 5 m). Mobile phase: methanol : water (60 : 40). UV detection (λ = 285 nm). Retention time: 2.1 min. Limit of detection, 35 µg/L [Gil-Agusti *et al.* 2001].

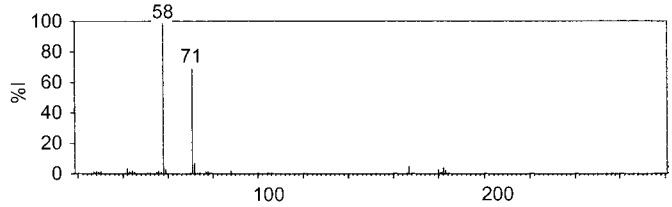
Ultraviolet Spectrum Aqueous acid—261 nm (A_1^1 = 335a). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 700, 1590, 1123, 1086, 1041, 751 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 58, 71, 72, 167, 182, 42, 180, 59.



Quantification

Blood **GC** Column: DB-1 fused silica capillary (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 22 cm/s. Temperature programme: 100° to 280° at 8°/min. NPD. Retention time: 14.3 min. Limit of detection, 100-250 ng/L [Hattori *et al.* 1992]. Column: SE-30 Chrom W HP 80/100 mesh (6′ × 0.08" i.d.). Carrier gas: He, 50 psi. Temperature programme: 115° for 3 min to 260° at 16°/min for 12 min. FID. Limit of detection, 1 mg/L [Bayley *et al.* 1975].

GC-MS Column: 2% SE-30 silicone oil on 100/120 mesh Chromosorb (2 m × 0.6 cm i.d.). Carrier gas: He, 30 mL/min. Temperature programme: 220° to 270° at 10°/min. EI ionisation at 70 eV or CI. Limit of quantification, 5–10 mg/L [Cailleux *et al.* 1981].

Plasma **GC** Column: 3% SP-2250 Supelcoport 80/100 mesh (3.05 m × 2 mm i.d.). Carrier gas: He, 30 mL/min. Temperature: 230°. NPD. Retention time: 4.2 min. Limit of detection, 1 µg/L [Friedman, Greenblatt 1985].

GC-MS Column: DB-5 (15 m × 0.25 mm i.d., 1.0 µm). Temperature programme: 150° for 1 min to 310° at 20°/min for 0.2 min. Limit of detection, 1.2 mg/L [Siek, Dunn 1993]. Limit of detection 100 ng/mL [Cailleux *et al.* 1981].

HPLC Column: Ultrasphere ODS C_{18} (150 × 4.6 mm i.d.). Mobile phase: acetonitrile : triethylamine : water (pH 5.3; 420 : 4 : 1000), flow rate 1.0 mL/min. UV detection. Limit of detection, 1.2 mg/L [Siek, Dunn 1993]. Column: µPorasil (30 cm × 3.9 mm i.d., 10 µm). Mobile phase: methanol-ammonium hydroxide-ammonium chloride (57 : 2 : 1) : chloroform : acetonitrile (1 : 8 : 1), flow rate 1.5 mL/min. UV detection (λ = 254 nm). Retention time: 14.6 min. Limit of detection, 5 µg/L [Kohlhof *et al.* 1983].

Urine **GC** See Blood [Hattori *et al.* 1992]. Column: 5% Dexsil 300 on Chromasorb W HP 80/100 mesh (183 cm × 2 mm i.d.). Carrier gas: He, 25 mL/min. Temperature: 260°. NPD. Retention time, 3.2 min. Limit of detection, 100 µg/L [Thompson, Jr. *et al.* 1982].

GC-MS Column: HP cross-linked methylsilicone (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 1.0 mL/min. Tempertature programme: 100° for 3 min to 310° at 30°/min for 5 min. EI ionisation at 70 eV, scan mode. Limit of detection not reported [Maurer, Pfleger 1988]. Column: 3% OV-1 on Gas Chrom Q 100/120 mesh (1.2 m × 2 mm i.d.). Carrier gas: He, 30 mL/min. Temperature programme: 150–300° at 0–16°/min. EI ionisation at 70 eV. Limit of detection not reported [Ganes, Midha 1987].

HPLC Column: Ultrasphere cyano (15 cm × 4.6 mm i.d., 5 µm). Mobile phase: diethylamine : 2 mol/L ammonium acetate : water : acetonitrile (0.1 : 4 : 196 : 800). UV detection (λ = 254 nm). Limit of detection not reported [Ganes, Midha 1987].

Peritoneal Fluid **GC** See Blood [Bayley *et al.* 1975].

Kidney **GC** See Blood [Bayley *et al.* 1975].

Liver **GC** See Blood [Bayley *et al.* 1975].

Lung **GC** See Blood [Bayley *et al.* 1975].

Spleen **GC** See Blood [Bayley *et al.* 1975].

Disposition in the Body Absorbed after oral administration with 60 to 80% of a dose recovered in urine within 24 h. *N*-Desmethyldoxylamine, *N,N*-didesmethyldoxylamine and their *N*-acetyl conjugates have been identified in human urine following a single oral dose [Ganes, Midha 1987].

Therapeutic Concentration

Twenty-five healthy female volunteers aged 20 to 35 years were administered a single oral dose of 25 mg doxylamine succinate. Thirteen of the subjects with a mean age of 27.6 years (range, 24–35) had been taking low-dose oestrogen-containing oral contraceptive steroids (50 µg of ethinyl oestradiol) for a minimum of 3 months. Mean maximum plasma concentrations were 102.9 and 100.2 µg/L at 2.4 and 1.9 h, respectively for the control group and the oral contraceptive users [Luna *et al.* 1989].

After a single oral dose of 25 mg in 16 subjects, a peak plasma level of 99 µg/L was obtained after 2.4 h [Friedman, Greenblatt 1985].

Toxicity

A 3-year-old male ingested ~100 Bendectin (10 mg dicyclomine hydrochloride, 10 mg doxylamine succinate and 10 mg pyridoxine hydrochloride). At postmortem the concentrations (mg/L) shown below were found.

	Doxylamine	*Dicyclomine*	*Pyridoxine*
Blood	12	N.D.	N.D.
Peritoneal fluid	18	3	2
Liver	14	1	4
Kidney	22	3	2
Lung	25	1	4
Spleen	20	1	2

N.D. Not determined
[a][Bayley *et al.* 1975].

A 20-year-old male was found dead in his home. Tissue distribution of doxylamine and pyrilamine (mg/L) were as shown below.

In 109 cases of doxylamine mono-intoxication, about 60% of the cases involved ingestion of 250 to 1000 mg (10- to 40-times the single therapeutic dose). For 23 of the cases, about 80% of doxylamine plasma levels were in the range 0.5 to 5.0 mg/L [Köppel *et al.* 1987].

	Doxylamine	*Pyrilaminne*
Blood	0.7	7.0
Urine	17.0	80.0
Bile	3.2	82.8
Gastric contents, total mg	5	147

[a][Wu Chen *et al.* 1983].

In a fatality involving doxylamine overdose, the blood concentration was 1.2 mg/L, with a nordoxylamine concentration of 0.52 mg/L; the concentration of doxylamine plus metabolites in urine was 25 mg/L [Siek, Dunn 1993].

A 24-year-old male took an overdose of 250 doxylamine succinate tablets. The plasma concentration of doxylamine was 13.3 mg/L, equivalent to ≈6250 mg. Despite evidence of massive rhabdomyelosis he was discharged after 16 days [Soto *et al.* 1993].

In 2 cases of suicide by means of doxylamine ingestion, the following tissue distribution was reported at postmortem: blood 140 and 100 mg/L (in case 1 and case 2, respectively), urine 180 mg/L and not reported, stomach contents 500 and 900 mg, liver 80 and 300 µg/g [Bockholdt *et al.* 2001].

Note Doxylamine overdose has been associated with severe rhabdomyelosis [Leybishkis *et al.* 2001].

Half-life Elimination half-life, ≈10 h [Köppel *et al.* 1987].

Clearance 217 mL/min [Köppel *et al.* 1987].

Dose Usually up to 150 mg of doxylamine succinate daily; usual hypnotic dose, 25 mg at night.

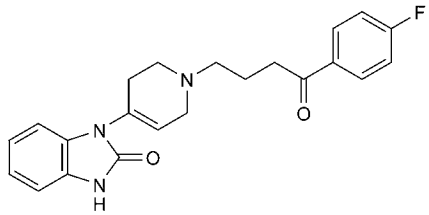
Droperidol

Neuroleptic, Tranquilliser

$C_{22}H_{22}FN_3O_2 = 379.4$

CAS—548-73-2



IUPAC Name 1-[1-[4-(4-Fluorophenyl)-4-oxobutyl]-1,2,3,6-tetrahydro-4-pyridinyl]-1,3-dihydro-2*H*-benzimidazol-2-one

Proprietary Names *Dehydrobenzperidol*; *Dridol*; *Droleptan*; *Inapsine*; *Paxical*; *Sintodian.* It is an ingredient of *Innovar* and *Thalamonal.*

Chemical Properties White to light tan-coloured, amorphous or microcrystalline powder that gradually darkens on exposure to light. Mp 145° to 146.5°. Practically insoluble in water; soluble 1 in 140 of ethanol, 1 in 4 of chloroform, and 1 in 500 of ether. pK_a 7.5. Log *P* (octanol/water) 3.5. Extraction yield (chlorobutane), 0.9 [Demme *et al.* 2005].

Colour Test Mandelin's test—blue→green.

Thin-layer Chromatography System TA—R_f 0.67; system TAE—R_f 0.71; system TAF—R_f 0.73; system TL—R_f 0.36; system TB—R_f 0.02; system TC—R_f 0.48; system TE—R_f 0.58 (acidified iodoplatinate solution, positive).

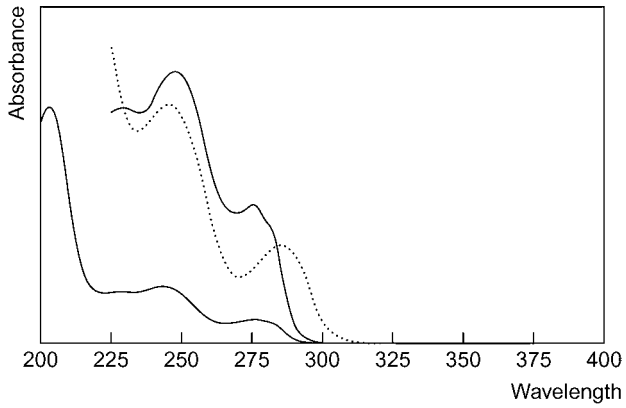
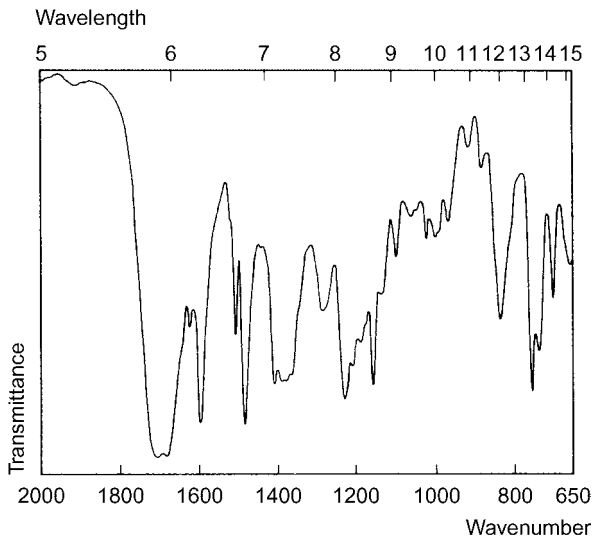
High Performance Liquid Chromatography System HA—*k* 0.6; system HAA—RT 21.2 min; system HX—RI 385; system HY—RI 323; system HZ—RT 3.5 min.

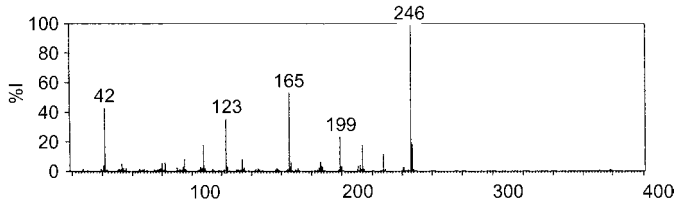
Ultraviolet Spectrum Aqueous acid—248 ($A^1_1 = 443$a), 276 nm; aqueous alkali—246, 288 nm.



Infrared Spectrum Principal peaks at wavenumbers 1685, 1705, 1595, 1230, 752, 1156 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 246, 165, 42, 123, 199, 247, 214, 108.



D

Quantification

Blood **HPLC** Column: Brownlee Spheri (220 × 4.6 mm i.d., 5 µm). Mobile phase: phosphate buffer : acetonitrile (pH 3.75; 40 : 60), flow rate 1.2 mL/min. UV detection (λ = 248 nm). Retention time: 4.4 min. Limit of quantification, 4.0 µg/L [Tan, Boniface 1990].

Plasma **GC** Column: 2% OV3 on HP Chrom W AW DMCS 80/100 mesh or 3% Dexil 300 on HP Chrom W AW DMCS 80/100 mesh. Carrier gas N_2, 35 mL/min. Temperature programme: 230° to 285° at 2°/min or 250° to 290° at 3°/min. Limit of detection, 30 µg/L [Quaglio *et al.* 1982].

HPLC Column: C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.1% phosphoric acid (240 : 760), flow rate 0.5 mL/min to 1.5 mL/min at 8 min to 1.65 min at 20 min. UV detection (λ = 250 nm). Limit of detection, 1 µg/L [Higashi *et al.* 2006]. Column: Spherisorb Nitrile S5CN (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.05 mol/L phosphate buffer (pH 2.4) : acetonitrile : ethanol (65 : 20 : 15), flow rate 1.4 mL/min. UV detection (λ = 200 nm). Retention time: 4.06 min. Limit of quantification, 2 µg/L, limit of detection, 0.5 µg/L [Kumar *et al.* 1996]. Column: Novapak C_{18} (150 × 3.9 mm i.d., 5 µm). Mobile phase: acetonitrile : 10 mmol/L ammonium acetate buffer (pH 6.7; 45 : 55), flow rate 1.0 mL/min. Retention time: 4.8 min. Limit of detection, 20 µg/L [Guichard *et al.* 1993]. Column: 100 RP 18 silica (120 × 4 mm i.d., 5 µm). Mobile phase: 0.05 mol/L phosphate buffer (pH 2.9)-ethanol-acetonitile (70 : 22 : 8) : 2-propanol (98.5 : 1.5 for 2.5 min to 94 : 6 at 10 min to 90 : 10 at 10.1 min until 15 min to 98.5 : 1.5 at 15.5 min), flow rate 0.8 mL/min. DAD (λ = 254 and 226 nm). Retention time: ≈3.5 min. Limit of quantification, 450 ng/L [Wilhelm, Kemper 1990].

Disposition in the Body Absorbed after oral administration. Approximately 75% of a dose is excreted in the urine with <10% as unchanged drug; about 22% of a dose is eliminated in the faeces [Cressman *et al.* 1973].

Toxicity

A 29-year-old male died following the administration of a therapeutic dose (5 mg IM) of droperidol. Concentrations of droperidol were 11 µg/L in his heart blood and 40 and 46 µg/L in other blood samples [Tan, Boniface 1990].

Half-life Plasma half-life, ≈2–3 h.

Protein Binding ≈85–90%.

Dose 5 to 20 mg every 4 to 8 h.

Dropropizine

Cough Suppressant

$C_{13}H_{20}N_2O_2$ = 236.3

CAS—17692-31-8

IUPAC Name 3-(4-Phenyl-1-piperazinyl)-1,2-propanediol

Proprietary Names *Atossion*; *Catabex*; *Domutussina*; *Eritos*; *Ribex*; *Tosofren*; *Tussiflex D*; *Vibral*.

Chemical Properties A white crystalline powder. Mp 108° to 109°. Soluble in chloroform and in dilute acetic acid. Log *P* (octanol/water), 0.1.

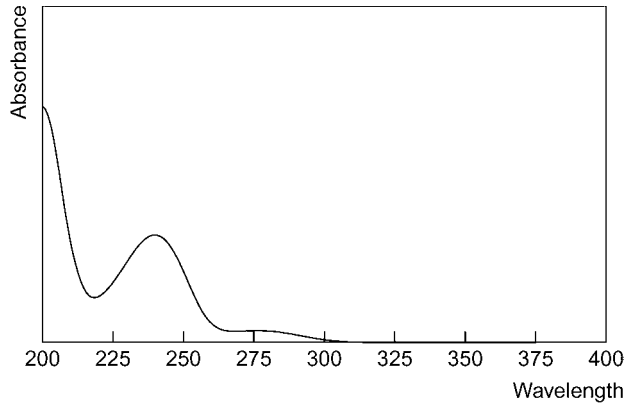
Colour Tests Liebermann's reagent—red-orange; Mandelin's test—orange (slow); nitric acid, cold gives a red colour.

Thin-layer Chromatography System TA—R_f 0.65; system TB—R_f 0.01; system TE—R_f 0.34; system TAE—R_f 0.59 (acidified iodoplatinate solution, strong reaction).

Gas Chromatography System GA—dropropizine RI 2205, dropropizine-AC_2 RI 2430, dropropizine-AC RI 2390.

High Performance Liquid Chromatography System HX—RI 240; system HAA—retention time 7.2 min.

Ultraviolet Spectrum Aqueous acid—238 nm (A^1_1=330a).



Infrared Spectrum Principal peaks at wavenumbers 1595, 1238, 1500, 760, 1060, 925 cm^{-1} (KBr disk).

Dose Dropropizine has been given in doses of 90 to 120 mg daily.

Drospirenone

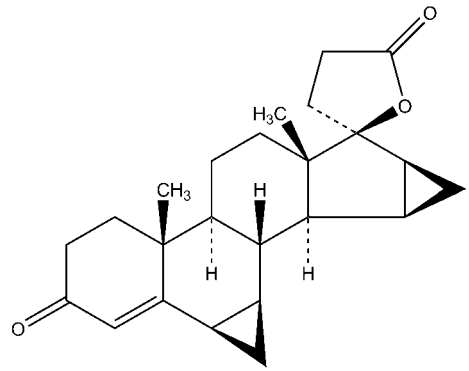
Aldosterone Antagonist, Contraceptive, Progestogen, Steroid Hormone

$C_{24}H_{30}O_3$ = 366.5

CAS—67392-87-4

Synonyms Dihydrospirorenone; 6β,7β,15β,16β-dimethylene-3-oxo-4-androstene-[17(β-1′)-spiro-5′]-perhydrofuran-2′-one; 6β,7β,15β,16β-dimethylen-3-oxo-17α-pregn-4-ene-21,17-carbolactone; (6*R*,7*R*,8*R*,9*S*,10*R*,13*S*,14*S*,15*S*,16*S*,17*S*)-1,3′,4′,6,6a,7,8,9,10,11,12,13,14,15,15a,16-hexadecahydro-10,13-dimethylspiro-[17*H*-dicyclopropa[6,7:15,16]cyclopenta[a]phenanthrene-17,2′(5′*H*)-furan]-3,5′(2*H*)-dione; ZK-30595.

Proprietary Names *Diva-Total*. It is also an ingredient of *Allurene*; *Angeliq*; *Belanette*; *Dahlia*; *Damsel*; *Diva*; *Divina*; *Equifem*; *Femelle*; *Gadofem*; *Isis Fe*; *Isis*; *Jasmine*; *Jasminelle*; *Kala*; *Kirumelle*; *Liofora*; *Maxima*; *Petibelle*; *Yadine*; *Yarine*; *Yasmin*; *Yasminelle*; *YAZ*; *Yira*; *Yirala*.



Chemical Properties Mp 201.3°.

Ultraviolet Spectrum Methanol—265 nm.

Quantification

Plasma **TLC** Plates: Silica gel 60F_{254} (20 x 20, 0.25 µm). Solvent system: chloroform : methanol (96 : 4, run twice) then cut the upper half of the plate and run in toluene : *n*-hexane (50 : 50). Detection: Zeiss scanner (KM 3) in remission mode. R_f values not reported. Limit of quantification not reported [Krause, Jakobs 1982].

HPLC Column: LiChrosorb C_{18} (250 x 4.6 mm i.d., 10 µm). Mobile phase: methanol : water-0.01 mol/L SDS-acetic acid (2 mL/L; 60 : 40), flow rate 2 mL/min. UV detection (λ = 254 nm). Retention time: 13.4 min. Limit of detection, <5 µg/L [Krause, Jakobs 1982].

Disposition in the Body Rapidly absorbed following oral administration with peak plasma concentrations occurring within 1 to 2 h and steady state achieved after ~7 daily administrations of a 3 mg dose. It is extensively metabolised, mostly independently of CYP enzymes although minor metabolism by CYP3A4 occurs. The 2 main plasma metabolites are the acid form of drospirenone and 4,5-dihydrodrospirenone-3-sulfate, neither of which is pharmacologically active. Excretion

of drospirenone is nearly complete after 10 days with trace amounts excreted as unchanged drospirenone in urine and faeces. At least 20 metabolites are observed in urine and faeces.

Therapeutic Concentration

In a study investigating the effects of renal function on the pharmacokinetics of drospirenone, 3 groups of patients were administered 1 tablet of 3 mg drospirenone daily for 14 days. The 3 groups were defined as normal renal function (creatine clearance (Cl_{CR}) >80 mL/min, Group A), mild renal impairment (CL_{CR} >50 to 80 mL/min, Group B), and moderate renal impairment (Cl_{CR} 30 to 50 mL/min, Group C). Peak serum concentrations were reported as follows:

Six healthy young women were administered a single tablet containing 3 mg drospirenone and 30 µg ethinylestradiol prior to a standard breakfast.

Parameter	*Group A*	*Group B*	*Group C*
C_{max} (µg/L)	35.8	39.6	42.4
Time (h)	4.0	2.0	2.0
$t_{1/2}$ (h)	33.6	32.4	42.8
Clearance (mL/min)	91.0	87.3	66.6

[Schurmann *et al.* 2006].

The mean peak drospirenone serum concentration was 30.8 µg/L after 2.5 h and corresponding values in breast milk were 13.5 µg/L after 2.8 h. The half-life of drospirenone in breast milk was reported as 11.7 h [Blode *et al.* 2001].

A total of 13 healthy women were administered a tablet containing 3 mg drospirenone and 30 µg ethinyl estradiol daily for 21 days followed by a 7-day tablet-free interval for 13 cycles. The mean peak serum drospirenone concentration following the first dose was 36.9 µg/L within 1 to 2 h. Mean peak serum concentrations measured after last tablet administration in treatment cycles 1, 6, 9, and 13 were reported as follows:

Parameter	*Cycle 1*	*Cycle 6*	*Cycle 9*	*Cycle 13*
C_{max} (µg/L)	87.5	84.2	81.3	78.7
Time (h)	1.7	1.8	1.6	1.6

[Blode *et al.* 2000].

Bioavailability Approximately 76%.
Half-life Approximately 30 to 40 h.
Volume of Distribution Approximately 4 L/kg.
Clearance Approximately 91 mL/min in healthy subjects.
Protein Binding Approximately 97% (not bound to sex-hormone-binding globulin or corticosteroid-binding globulin).
Note For a review of drospirenone, see Rapkin and Winer [2007].
Dose Used as the progestogenic component of a combined oral contraceptive in doses of 3 mg daily, and as the progestogenic component of menopausal HRT in a dose of 0.5 or 2 mg daily.

Blode H *et al.* (2001). Transfer of drospirenone to breast milk after a single oral administration of 3 mg drospirenone + 30 microg ethinylestradiol to healthy lactating women. *Eur J Contracept Reprod Health Care* 6: 167–171.

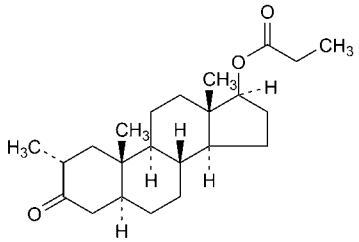
Drostanolone Propionate

Anabolic Steroid
$C_{23}H_{36}O_3$ = 360.5
CAS—58-19-5 (drostanolone); 521-12-0 (propionate)
IUPAC Name [(2*R*,5*S*,8*R*,9*S*,10*S*,13*S*,14*S*,17*S*)-2,10,13-Trimethyl-3-oxo-1,2,4,5,6,7,8,9,11,12,14,15,16,17-tetradecahydrocyclopenta[a]phenanthren-17-yl] propanoate
Synonyms Dromostanolone propionate; (2α,5α,17β)17-hydroxy-2-methyl-androstan-3-one propionate.
Proprietary Names *Drolban*; *Masterid*; *Masteril*; *Masteron*; *Permastril*.



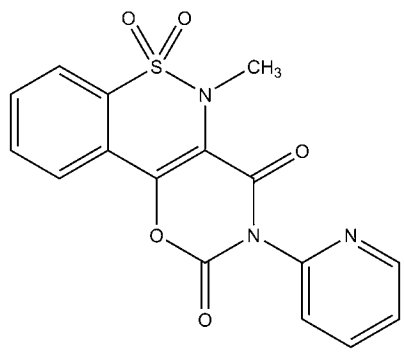
Chemical Properties White to creamy-white crystalline powder. Mp 127° to 133°. Practically insoluble in water; soluble 1 in 30 of ethanol, 1 in 2 of chloroform and 1 in 20 of ether. Log *P* (octanol/water) 4.98 [Meylan, Howard 1995].
Gas Chromatography System GA—drostanolone RI 2555, drostanolone-AC RI 2700, drostanolone-TMS RI 2575, drostanolone-enol-TMS_2 RI 2625, drostanolone propionate RI 2985; system GAI—RRT 0.974 (relative to 17α-methyl-5α-androstan-3β,17β-diol).
Infrared Spectrum Principal peaks at wavenumbers 1715, 1200, 1735, 1035, 1087, 1265 cm^{-1} (KBr disk).
Quantification **GC-MS** Column: DB1 (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 1.8 mL/min. Temperature programme: 120° for 0.5 min to 180° at 30°/min to 230° at 4°/min to 233° at 1°/min to 265° at 9°/min for 10 min. MSD. Limit of detection not reported [de Boer *et al.* 1992].
Dose Usually 100 mg thrice weekly, by IM injection.

deBoer D *et al.* (1992). The methyl-5 alpha-dihydrotestosterones mesterolone and drostanolone; gas chromatographic/mass spectrometric characterization of the urinary metabolites. *J Steroid Biochem Mol Biol* 42: 411–419.

Meylan WM, Howard PH (1995). Atom/fragment contribution method for estimating octanol-water partition coefficients. *J Pharm Sci* 84: 83–92.

Droxicam

Analgesic, Antiinflammatory, Antipyretic, NSAID, Prostaglandin Inhibitor
$C_{16}H_{11}N_3O_5S$ = 357.3
CAS—90101-16-9
IUPAC Name 5-Methyl-3-(2-pyridyl)-2*H*,5*H*-1,3-oxazino[5,6-c]-[1,2]benzothiazine-2,4(3*H*)-dione 6,6-dioxide
Proprietary Names *Dobenam*; *Drogelon*; *Droxar*; *Ferpan*; *Ombolan*; *Pensatron*.



Chemical Properties Droxicam is a prodrug of piroxicam.
Quantification
Plasma **HPLC** Column: LiChrospher 60 RP-Select B (250 × 4.0 mm i.d., 5 µm). Mobile phase: methanol : water : acetic acid (48 : 45 : 7), flow rate 1.1 mL/min. UV detection (λ = 340 nm). Limit of quantification, 20 µg/L for piroxicam [Maya *et al.* 1995a, 1995b]. Column: Lichrosorb DIOL (25 × 0.46 mm i.d., 5 µm). UV detection (λ = 314 nm) Limit of detection not reported [Martinez *et al.* 1988]. Column: µBondapak cyano (300 × 3.9 mm i.d., 10 µm). Mobile phase: acetonitrile : water : acetic acid (25 : 70 : 5), flow rate 1.2 mL/min. UV detection (λ = 365 nm). Retention time: 4.8 min for piroxicam. Limit of detection, 0.5 mg/L for piroxicam [Twomey *et al.* 1980].
Disposition in the Body Hydrolysis of droxicam to piroxicam appears to take place in the acid conditions of the stomach and gastrointestinal tract. The

bioavailability of droxicam is equivalent to that of piroxicam but mean peak plasma concentrations are reached more slowly with a t_{max} of ~7 h as opposed to 2 to 3 h [Olkkola *et al.* 1994]. Although the biotransformation of droxicam is a pH-dependent process, drugs that increase gastrointestinal pH, such as antacids and ranitidine, do not appear to alter the absorption or pharmacokinetic disposition of droxicam [Bartlett *et al.* 1992a].

Therapeutic Concentration Droxicam at a dose of 20 mg/day has been shown in clinical trials to be efficacious in relieving the symptoms of spinal osteoarthritis [Bohl *et al.* 1990], rheumatoid arthritis [Rodriguez-de-la-Serna *et al.* 1991; Sanchez Andrada, Rodriguez Valverde 1991], and degenerative joint disease [Schuetz *et al.* 1991].

Twenty healthy volunteers were administered droxicam at a dose of 20 mg a day for 20 days. After 20 days, the steady-state plasma concentration was achieved in all volunteers, ranging from 4.21 to 13.19 mg/L [Martinez *et al.* 1988].

Fouteen healthy male volunteers (aged 22 ± 4 years; weight 60.9 ± 8.8 kg) were administered a single dose of 10 mg droxicam. Mean peak plasma concentrations were 0.82 ± 0.15 mg/L at 6.1 ± 3.5 h. Another group of 14 healthy men (aged 28 ± 5 years; weight 68.2 ± 4.3 kg) was administered 10 mg/day for 20 consecutive days. The steady-state mean plasma concentration was 2.06 ± 0.42 mg/L reached at 8.2 ± 6.0 h [Martinez *et al.* 1989].

Eight healthy male volunteers were administered a single 20 mg dose of droxicam to investigate the effect of gastric emptying on droxicam pharmacokinetics. The absorption rate of droxicam was modified but the bioavailability was unchanged in conditions of altered gastric emptying [Sanchez *et al.* 1989].

When 10 elderly healthy volunteers were administered a single dose of 20 mg droxicam, the absorption, distribution and excretion did not differ significantly from young healthy volunteers [Hosie *et al.* 1991].

Twenty-five healthy volunteers were administered single (20 mg) or multiple (20 mg/day for 30 days) doses of droxicam. After a single dose, the mean peak concentration of piroxicam was 1.41 ± 0.25 mg/L at 15 ± 7 h. After multiple doses the mean peak plasma concentration at steady state was 6.23 ± 2.36 mg/L [Bartlett *et al.* 1992b].

Twelve healthy male volunteers were administered 20 mg droxicam alone or in combination with the antacid Mucal powder. Mean maximum plasma concentrations of 2.08 and 1.85 µg/L were reached at 7.08 and 8.17 h, respectively [Maya *et al.* 1995b].

Note For a review of the pharmacokinetic profile of droxicam, see Martinez and Sanchez [1991]; for a review of the adverse events seen with droxicam in the early clinical trials, see Sanchez *et al.* [1991].

Toxicity Droxicam was withdrawn from the market in December 1994 because of adverse effects on the liver [Lapeyre-Mestre *et al.* 2006]. The ulcerogenic dose of droxicam in 50% of the population is 57 mg/kg [Jane, Rodriguez de la Serna 1991].

Bioavailability As for piroxicam

Half-life Approximately 66 h following a single dose, 42 h after multiple doses.

Protein Binding Extensively (above 96%) plasma protein bound.

Droxidopa

Dopaminergic Agent

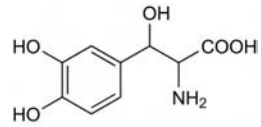
$C_9H_{11}NO_5$ = 213.2

CAS—23651-95-8

IUPAC Name 2-Amino-3-(3,4-dihydroxyphenyl)-3-hydroxypropanoic acid

Synonyms L-*threo*-3-(3,4-Dihydroxyphenyl)serine; *threo*-β,3-dihydroxy-L-tyrosine; L-DOPS; L-*threo*-DOPS; threo-dopaserine.

Proprietary Name *Dops*



Chemical Properties Crystals from ethanol and ether. Mp 232° to 235°, with decomposition.

High Performance Liquid Chromatography Column: C_{18} Cp MicroSpher (3 µm, 100 × 4.6 mm), at 35°. Mobile phase: 0.025 mol/L disodium hydrogen phosphate, 0.347 mmol/L sodium dodecyl sulfate, 0.269 mmol/L EDTA : methanol (90:10), (pH 2.1). ECD. Retention time: D,L-*threo*-DOPS, 4.1 min.

Quantification

Plasma **HPLC** Column: C_{18} Cp MicroSpher (3 µm, 100 × 4.6 mm). Mobile phase: (A) 0.05 mol/L sodium phosphate (pH 6.5); (B) 20 mL tetrahydrofuran : 10 mL methanol : 1 L sodium phosphate. Elution programme: 0 to 100% B in 0 to 1 min, followed by isocratic elution with B, flow rate 1 mL/min. Fluorescence detection (λ_{ex}=344 nm, λ_{em}=442 nm). Retention time: D-*threo*-DOPS derivative (*o*-phthaldialdehyde and *N*-acetyl-L-cysteine), 7.14 min; L-*threo*-DOPS derivative, 7.90 min. Limit of detection, 0.01 mg/L (liquid–liquid extraction method), 0.02 mg/L (deproteinisation method) [Boomsma *et al.* 1988]. Column: ODS-T Yanapak (250 × 4 mm i.d.), 7C_{18} Nucleosil or 7ODS-H Chemcosorb. Mobile phase: potassium phosphate (0.1 M, pH 3.10), flow rate 0.8 mL/min. ECD. Retention time: 3.5 min. Limit of detection, 0.15 mg/L [Suzuki *et al.* 1982].

Urine **HPLC** See Plasma [Suzuki *et al.* 1982].

Disposition in the Body Absorption of droxidopa is relatively slow after oral administration and it is converted to (–)-noradrenaline [(–)-norepinephrine] by aromatic L-amino acid decarboxylase, which is distributed in various tissues including the peripheral sympathetic nerves. Maximum plasma concentration is reached after 3 h. It is excreted in urine unchanged (20% of an oral dose is recovered within 12 h of administration) and as noradrenaline (norepinephrine), with ~1.5% of a dose being recovered over 24 h.

Therapeutic Concentration

Five healthy males and 2 women, aged between 25 and 41 years, were administered a single 300 mg dose of droxidopa after overnight fasting. Peak plasma concentrations of droxidopa were reached within 3 h after administration at 1.50 ± 0.31 mg/L. A considerable amount remained in the blood 12 h after administration [Suzuki *et al.* 1982].

Boomsma F *et al.* (1988). Determination of D,L-threo-3,4-dihydroxyphenylserine and of the D- and L-enantiomers in human plasma and urine. *J Chromatogr* 427: 219–227.

Suzuki T *et al.* (1982). Pharmacokinetic studies of oral L-threo-3,4-dihydroxyphenylserine in normal subjects and patients with familial amyloid polyneuropathy. *Eur J Clin Pharmacol* 23: 463–468.

Duloxetine

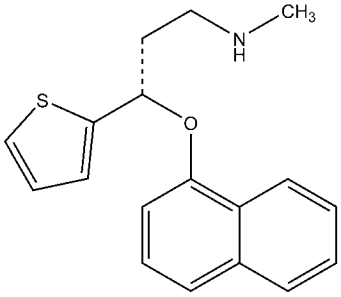
Amine, Antidepressant, SSNRI, Treatment of Urinary Incontinence

$C_{18}H_{19}NOS$ = 297.4

CAS—116539-59-4

IUPAC Name (3*S*)-*N*-Methyl-3-naphthalen-1-yloxy-3-thiophen-2-ylpropan-1-amine

Synonyms LY-248686; (+)-*N*-methyl-3-(1-naphthalenyloxy)-3-(2-thienyl)propanamine; (γ*S*)-*N*-methyl-γ-(1-naphthalenyloxy)-2-thiophenepropanamine; (+)-(*S*)-*N*-methyl-γ-(1-naphthyloxy)-2-thiophenepropylamine.

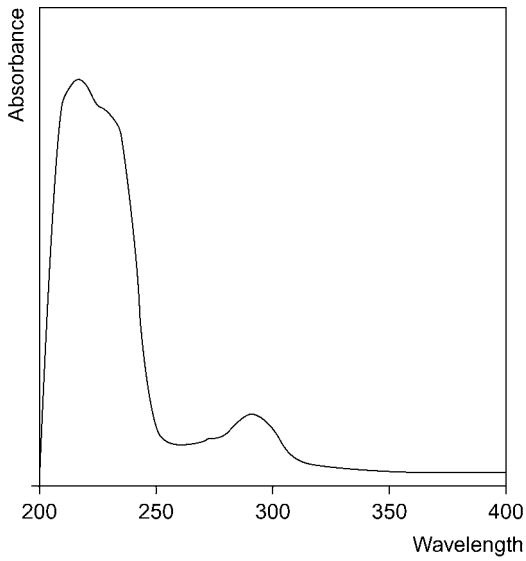


Chemical Properties pK_a 10.02. Log *P* (octanol/water), 4.23 [Berezhkovskiy 2006]. Stock solutions stable for up to 1 month and stable in plasma for up to 20 days at –20° [Ma *et al.* 2007].

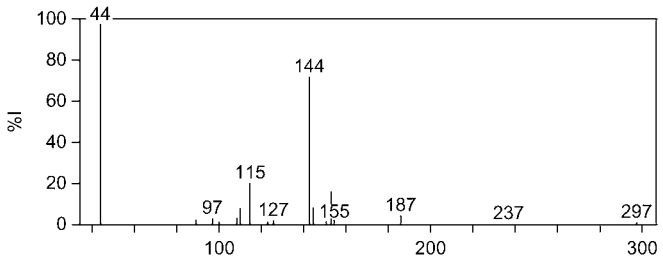
Duloxetine Hydrochloride

$C_{18}H_{19}NOS,HCl = 333.9$
CAS—136434-34-9
Proprietary Names *Ariclaim*; *Cymbalta*; *Duxetin*; *Xeristar*; *Yentreve*.
Chemical Properties White solid. pK_a in dimethylformide : water (66 : 34) 9.6 [O'Neil *et al.* 2006].

High Performance Liquid Chromatography Column: Zorbax SB-CN (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile-25 mmol/L potassium dihydrogen phosphate (pH 3.0, 20 : 80) : acetonitrile-25 mmol/L potassium dihydrogen phosphate (pH 3.0, 75 : 25; 100 : 0 to 70 : 30 over 15 min to 0 : 100 over 12 min), flow rate 1.0 mL/min. Retention time: ~21 min. Limit of quantification not reported [Jansen *et al.* 1998].
Ultraviolet Spectrum Principal peak at 210 nm.



Mass Spectrum Principal ions at *m/z* 44, 144, 115, 154 [Anderson *et al.* 2006].



Quantification

Blood **GC-MS** Column: HP-5 (15 m × 0.25 mm i.d., 0.25 µm). Temperature programme: 140° to 300° at 10°/min for 4 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 0.05 mg/L, limit of detection, 0.03 mg/L [Anderson *et al.* 2006].
Plasma **HPLC** Column: C_8 (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 20 mmol/L phosphate buffer–0.3% TEA (pH 3.0; 40 : 60), flow rate 1.0 mL/min. UV detection (λ = 230 nm). Retention time: ~5 min. Limit of quantification, 2.0 µg/L, limit of detection, 0.7 µg/L [Mercolini *et al.* 2007]. Column: LiChrospher 60 RP-select B (250 × 4.0 mm i.d., 5 µm). Mobile phase: acetonitrile-methanol (92 : 8) : 0.25 mol/L sodium acetate buffer (pH 4.5; 35 : 65), flow rate 1.0 mL/min. UV detection (λ = 230 nm). Retention time: 16.0 min. Limit of quantification, 5 µg/L [Malfara *et al.* 2007].
LC-MS Column: C_{18} (50 × 4.6 mm i.d., 3 µm). Mobile phase: acetonitrile : 5 mmol/L ammonium acetate (pH 3.5; 45 : 55), flow rate 0.3 mL/min. API, positive ion mode, MRM acquisition mode. Limit of quantification, 0.1 µg/L [Senthamil Selvan *et al.* 2007]. Column: Hypersil-Hypurity C_{18} (150 × 2.1 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol : 20 mmol/L ammonium acetate (pH 3.5; 42 : 20 : 38), flow rate 0.24 mL/min. ESI, positive ion mode, SIM acquisition mode. Retention time: ~2.0 min. Limit of quantification, 0.8 µg/L [Ma *et al.* 2007].
Urine **GC-MS** See Blood [Anderson *et al.* 2006].
Bile **GC-MS** See Blood [Anderson *et al.* 2006].
Gastric Contents **GC-MS** See Blood [Anderson *et al.* 2006].
Vitreous Humour **GC-MS** See Blood [Anderson *et al.* 2006].
Liver **GC-MS** See Blood [Anderson *et al.* 2006].
Disposition in the Body Rapidly absorbed following oral administration. There is an approximate 2 h lag until absorption begins, with peak plasma concentrations reached 6 h post-administration and steady-state levels reached after 3 days. When given with food, the absorption rate decreases by about 10%. There is a one-third reduction in duloxetine bioavailability in smokers compared with non-smokers owing to an effect on CYP1A4. Duloxetine is metabolised in the liver by CYP2D6 and CYP1A2 to form multiple oxidative and conjugated inactive metabolites. Metabolites found in plasma include 4-hydroxyduloxetine glucuronide and 5-hydroxy-6-methoxyduloxetine sulfate. These are largely excreted in the urine (72%) and to a lesser extent in faeces (18.5%). Unchanged duloxetine accounts for only ~3% of the circulating plasma concentration. Duloxetine and its metabolites cross the placental barrier and are distributed into breast milk. It is also worth noting that both CYP2D6 and CYP1A2 show racial differences such that 1% of Asians (Chinese, Japanese, Korean), 5–10% of Caucasians and 0–18% of Africans do not have the CYP2D6 enzyme. Chinese women and Africans have lower CYP1A2 activity than Caucasians. This may impact on duloxetine pharmacokinetics.
Therapeutic Concentration Reported as 20–80 µg/L [Muller *et al.* 2004] and also as 21–114 µg/L [Anderson *et al.* 2006].

Seven healthy subjects and 6 patients with moderate liver cirrhosis were administered a 20 mg dose of duloxetine hydrochloride as an enteric-coated capsule following an overnight fast. All participants were Caucasians and were genotyped as CYP2D6 extensive metabolisers. Mean peak plasma concentrations (C_{max}) and time to C_{max} for duloxetine, its 4-hydroxyduloxetine glucuonide conjugate (M1), and 5-hydroxy-6-methoxyduloxetine sulfate conjugate (M2) were reported as follows:

Significant differences in duloxetine values for plasma clearance, volume of distribution, and half-life were noted between the 2 groups, with values for cirrhotic patients at 24.1 L/h, 1704 L, and 48 h, compared with 160 L/h, 2909 L, and 13.5 h, respectively, in healthy subjects [Suri *et al.* 2005].

Twelve healthy non-smoking, non-drinking Chinese volunteers were administered 22.4 (low), 44.8 (middle), and 67.2 mg (high) oral dosages of duloxetine hydrochloride in 3 studies with a washout period of 14 days between studies. Mean peak plasma concentrations for the 3 groups were reported as follows:

Parameter	*Low dose*	*Middle dose*	*High dose*
C_{max} (µg/L)	22.7	42.3	69.6
Time (h)	6.1	6.4	6.3
Clearance (L/h)	58.3	67.8	55.7

[Ma *et al.* 2007].

The potential pharmacokinetic differences of duloxetine in Chinese, Caucasian and Japanese subjects were investigated in a multicentre study. All participants were administered a single oral dose of 60 mg duloxetine

Parameter	*Duloxetine*		*M1*		*M2*	
	Cirrhotic patients	*Healthy subjects*	*Cirrhotic patients*	*Healthy subjects*	*Cirrhotic patients*	*Healthy subjects*
C_{max} (µg/L)	14.6	13.8	35.0	118.0	19.6	96.7
Time (h)	6	3.5	7	5	6	4

Parameter	*Chinese subjects*	*Caucasian subjects*	*Japanese subjects*
C_{max} (μg/L)	36.3	39.8	46.0
Time (h)	6.0	6.0	6.0
Clearance (L/h)	102	104	80.7
Volume of distribution (L)	1728	1617	1495
Half-life (h)	10.3	9.78	11.1

hydrochloride and the following pharmacokinetic parameters were reported:

The difference in the C_{max} values obtained in Japanese subjects was attributed to a 15% lower mean bodyweight in these subjects [Tianmei *et al.* 2007].

Toxicity Duloxetine is both a substrate for, and a potent inhibitor of, CYP2D6. Caution needs to be exercised when duloxetine is co-administered with other potent inhibitors of this enzyme (paroxetine, fluoxetine) as significantly high concentrations of duloxetine may result.

In a review of deaths where duloxetine was detected alongside other medication, duloxetine postmortem concentrations in 4 such cases were reported as follows:

Further cases and full case histories are reported in Anderson *et al.* [2006]. The above represent the first postmortem cases to be reported but more data are required to establish clear postmortem therapeutic/toxic levels [Anderson *et al.* 2006].

Bioavailability Approximately 50% (range 30–80%).

Half-life Approximately 13.5 h in healthy subjects; up to 48 h in cirrhotic patients.

Volume of Distribution Approximately 1943 L (range 803–3065 L).

Clearance Approximately 114 L/h (range 44–214 L/h).

Protein Binding 96%, primarily to albumin and α_1-acid glycoprotein.

Dose Given by mouth as the hydrochloride although doses are expressed in terms of the base; duloxetine hydrochloride 22.5 mg is equivalent to ≈20 mg duloxetine. Used in the treatment of depression in usual doses of 20 or 30 mg twice daily, or 60 mg once daily. In the treatment of diabetic peripheral neuropathic pain, the usual dosage is 60 mg once daily. It is also used in the treatment of moderate to severe stress urinary incontinence in women. Usual initial dosage is 40 mg twice daily; however, some patients may benefit from an initial dosage of 20 mg twice daily for 2 weeks before increasing to 40 mg twice daily.

Dutasteride

5α-Reductase Inhibitor, Antiandrogen, Treatment of BPH

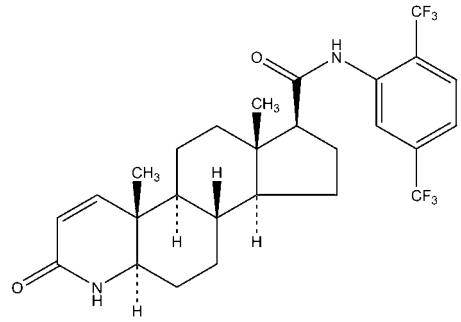
$C_{27}H_{30}F_6N_2O_2$ = 528.5

CAS—164656-23-9

IUPAC Name (1*S*,3a*S*,3b*S*,5a*R*,9a*R*,11a*S*)-*N*-[2,5-bis(Trifluoromethyl)phenyl]-9a,11a-dimethyl-7-oxo-1,2,3,3a,3b,4,5,5a,6,9b,10,11-dodecahydroindeno[5,4-f] quinoline-1-carboxamide

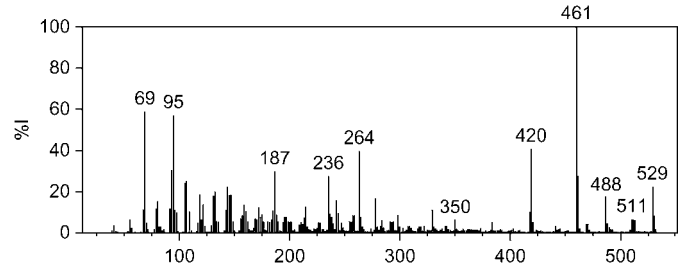
Synonyms GG-745; GI-198745; 17β-*N*-[2,5-bis(trifluoromethyl)phenyl]carbamoyl-4-aza-5α-androst-1-en-3-one; (4a*R*,4b*S*,6a*S*,7*S*,9a*S*,9b*S*,11a*R*)-*N*-[2,5-bis(trifluoromethyl)phenyl)]-2,4a,4b,5,6,6a,7,8,9,9a,9b,10,11,11a-tetradecahydro-4a,6a-dimethyl-2-oxo-1*H*-indeno[5,4f]quinoline-7-carboxamide.

Proprietary Names *Avodart*; *Avolve*; *Duagen*.



Chemical Properties A white to pale yellow powder. Mp 242° to 250°. Insoluble in water. Soluble in ethanol (44 g/L), methanol (64 g/L), and polyethylene glycol 400 (3 g/L). Log *P* (octanol/water), 7.17 [Wishart 2006].

Mass Spectrum Principal ions at *m/z* 461, 69, 95, 264, 420, 187, 236.



Quantification

Plasma **LC-MS** Column: Waters Xterra MS C_{18} (50 × 3 mm i.d.). Mobile phase: 10 mmol/L ammonium formate : acetonitrile (pH 3.0; 15 : 85), flow rate 0.6 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 100 ng/L [Ramakrishna *et al.* 2004].

Note For a study of the mass spectral fragmentation reactions of dutasteride and related compounds, see Burinsky *et al.* [2001].

Disposition in the Body Dutasteride is extensively metabolised to 4′-hydroxydutasteride and 6-hydroxydutasteride, primarily by CYP3A4. The 1,2-dihydroxy-, 6,4′-dihydroxy- and 15-hydroxy-metabolites have also been detected in serum. It is mainly excreted in faeces as the unchanged drug (5%) and as the metabolites (40%). Only trace amounts are found in urine. Therefore, approx. 55% of the drug is unaccounted for. Approximately 11.5% of the serum concentration can partition into semen. After oral administration of a 0.5 mg dose, the time to reach a peak serum concentration is 2 to 3 h. When the drug is administered with food, this concentration decreases by 10 to 15%. The drug can be detected in serum up to 4 to 6 months after completion of treatment.

[Anderson *et al.* 2006].

Therapeutic Concentration

Forty-eight healthy males aged between 20 and 57 years (median 37 years) and weighing between 56.3 and 102 kg received single doses (0.01 to 40 mg) of dutasteride or placebo. At high doses, there was a high volume of distribution (511 L) and a low linear clearance (0.58 L/h), which combined to result in a half-life of up to 5 weeks. The value of the peak plasma concentration increased proportionally with dose (levels not reported) and doses ranging from 0.1 to 10 mg/day were clinically effective [Gisleskog *et al.* 1999].

Toxicity Plasma concentrations may increase in the presence of CYP3A inhibitors such as verapamil, cimetidine, diltiazem, or ketoconozole. Dutasteride does not appear to interact with warfarin, digoxin, colestyramine, tamsulosin, or tarazosin.
Note For a review of dutasteride, see Brown and Nuttall [2003].
Bioavailibility Approximately 60%.
Half-life Steady state, 5 weeks.
Volume of Distribution 511 L.
Clearance 0.58 L/h.
Protein Binding 99%, plasma albumin and 96.6%, α_1-acid glycoprotein.
Dose 0.5 mg daily.

Duteplase

Thrombolytic
$C_{2736}H_{4174}N_{914}O_{824}S_{46}$ = 64529.1
CAS—120608-46-0

Synonyms Extrinsic plasminogen activator; fibrinokinase; 245-L-methionine plasminogen activator (human tissue type 2-chain form protein moiety); SM-9527; t-PA; TPA.
Proprietary Names *Actilyse*; *Actiplas*; *Prolysis*; *Solcot*; *Tiplagen*.
Chemical Properties Practically insoluble in solutions of low ionic strength at neutral pH.
Disposition in the Body
Therapeutic Concentration

Twenty-four patients with suspected acute myocardial infarction were divided into two dosing groups. Group 1: 9 patients, mean age 61 years, were administered a mean dose of 115.7 mg duteplase as an IV infusion at a rate of 33.3 mL/min for a mean of 81.3 min. Heparin was also administered intravenously as a bolus within 30 min of the start of the duteplase dose and continued for 48 h after the end of duteplase treatment. Group 2: 15 patients, mean age 53 years, were administered a lytic dose of 1.2 mg/kg (dose adjusted to nearest 5 kg body weight) duteplase over 60 min at an infusion rate of 30 mL/h, followed by a 0.12 mg/kg bolus over 1 min and a maintenance infusion of 0.69 mg/kg over 3 h at 5.6 mL/h. Heparin was also administered before duteplase treatment and for 3 h after. The mean total duteplase dose was 153.4 mg. The steady state plasma antigen concentration was 2335 µg/L for group 1 and 2319 µg/L after the lytic dose for group 2 and 434 µg/L after the maintenance dose. For the individuals in group 1, the mean time to reach 75% of the steady state concentration was 18 min and 27 min to reach 90%. For group 2, 75% of the steady state concentration was reached in 14 min and 90% in 22 min [Koster *et al.* 1991].

Toxicity High doses of duteplase are associated with an increased risk of serious bleeding.

A 47-year-old woman with acute myocardial infarction was treated with 162.5 mg oral aspirin, 0.4 million units/kg bolus duteplase, then 0.36 million units/kg over the first hour, followed by 0.7 million units/kg/h for 3 h and 12 500 units of subcutaneous heparin. This was the thrombolytic protocol. 9 h after duteplase was administered, the woman became hypotensive and tachycardic. She also developed a splenic haemorrhage and rupture resulting in removal of the spleen [Blankenship, Indeck 1991].

Half-life Mean, 8 min.
Volume of Distribution Mean, 8.5 L.
Clearance Mean, 685 mL/min.

Blankenship J, Indeck M (1991). Splenic hemorrhage after tissue plasminogen activator for acute myocardial infarction. *N Engl J Med* 325: 969.

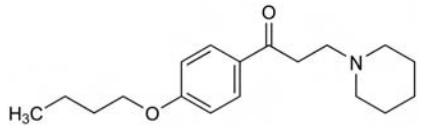
Dyclonine

Anaesthetic (Local)
$C_{18}H_{27}NO_2$ = 289.4
CAS—586-60-7

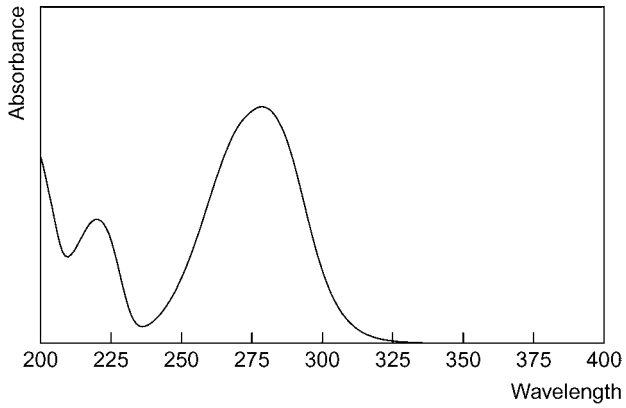
IUPAC Name 1-(4-Butoxyphenyl)-3-(1-piperidinyl)-1-propanone



Dyclonine Hydrochloride

$C_{18}H_{27}NO_2$,HCl = 325.9
CAS—536-43-6
Synonym Dyclonine chloride
Proprietary Names *Dyclone*; *Sucrets*.
Chemical Properties White crystals or white crystalline powder. Mp 175° to 176°. Soluble 1 in 60 of water, 1 in 24 of ethanol and 1 in 2.3 of chloroform; soluble in acetone; practically insoluble in ether.

Colour Tests Aromaticity (method 2)—yellow-orange; Liebermann's reagent (100°)—orange.
Thin-layer Chromatography System TA—R_f 0.60; system TB—R_f 0.49; system TC—R_f 0.40; system TL—R_f 0.25 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1678.
High Performance Liquid Chromatography System HR—*k* 2.78; system HY—RI 347.
Ultraviolet Spectrum Aqueous acid—282 nm (A^1_1=580b).

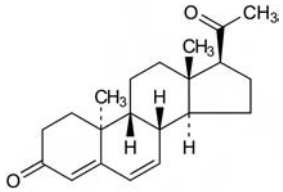


Infrared Spectrum Principal peaks at wavenumbers 1178, 1605, 1229, 1672, 1575, 965 cm^{-1} (dyclonine hydrochloride, KBr disk).
Use Dyclonine hydrochloride is applied as a 0.5 or 1% solution.

Dydrogesterone

Progestational Steroid
$C_{21}H_{28}O_2$ = 312.5
CAS—152-62-5

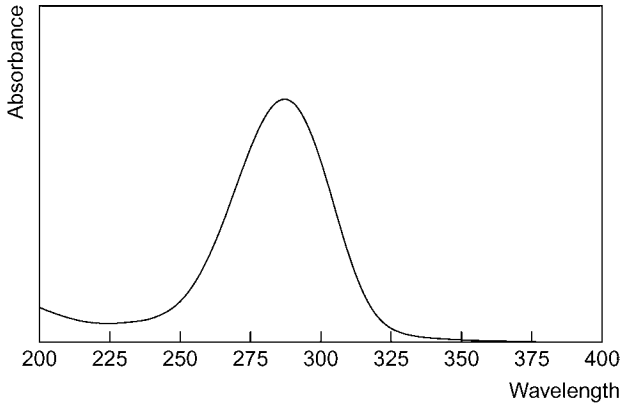
IUPAC Name (8*S*,9*R*,10*S*,13*S*,14*S*,17*S*)-17-Acetyl-10,13-dimethyl-1,2,8,9,11,12,14,15,16,17-decahydrocyclopenta[*a*]phenanthren-3-one
Synonyms Dehydroprogesterone; didrogesteron; isopregnenone; (9β,10α)-pregna-4,6-diene-3,20-dione.
Proprietary Names *Biphaston*; *Dufaston*; *Duphaston*; *Gynorest*. It is an ingredient of *Femapak* and *Femoston*.



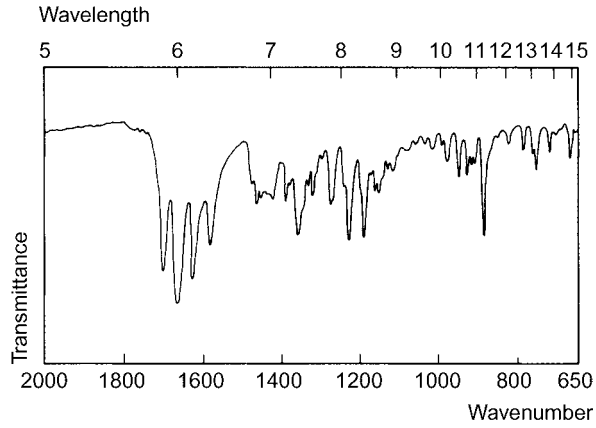
Chemical Properties A white to pale yellow crystalline powder. Mp 167° to 171°. Practically insoluble in water; soluble 1 in 40 to 1 in 52 of ethanol, 1 in 17 of acetone, 1 in 2 of chloroform and 1 in 140 of ether. Log *P* (octanol/water), 3.4.
Colour Tests Antimony pentachloride—orange; naphthol–sulfuric acid—orange-red; sulfuric acid—orange (green-yellow fluorescence under ultraviolet light).

Thin-layer Chromatography System TP—R_f 0.86; system TQ—R_f 0.53; system TR—R_f 0.96; system TS—R_f 0.98 (*p*-toluenesulfonic acid solution, positive).

Ultraviolet Spectrum Dehydrated alcohol—286 nm (A_1^1=838a).



Infrared Spectrum Principal peaks at wavenumbers 1660, 1622, 1697, 1581, 1232, 1197 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 43, 91, 227, 268, 312, 79, 55, 77.

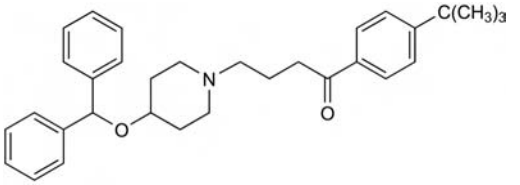
Disposition in the Body Rapidly absorbed after oral administration. The major metabolites are 20α-hydroxydydrogesterone and 21-hydroxydydrogesterone. About 50% of a dose is excreted in the urine in 24 h, as metabolites.

Dose Usually 20 to 30 mg daily.

Ebastine

Antihistamine
$C_{32}H_{39}NO_2 = 469.7$
CAS—90729-43-4

IUPAC Name 4-(4-Benzhydryloxypiperidin-1-yl)-1-(4-tert-butylphenyl)butan-1-one
Synonyms 1-[4-(1,1-Dimethylethyl)phenyl]-4-[4-(diphenylmethoxy)-1-piperidin-yl]-1-butanone; LAS-W-090.
Proprietary Names *Bastel*; *Bromselon*; *Ebastel*; *Evastel*; *Kestine*.



Chemical Properties pK_a 10.32.

Ebastine Fumarate

$C_{32}H_{39}NO_6,C_4H_4O_4 = 585.7$
Chemical Properties Crystals from ethanol. Mp 197° to 198°.

Quantification

Plasma **HPLC** Column: ODS (250 × 4.0 mm i.d., 10 µm). Mobile phase: methanol : 0.02 mol/L sodium acetate : glacial acetic acid : water (380:20:5.5:100), flow rate 2 mL/min. UV detection. Retention time: carebastine metabolite, 7.3 min. Limit of detection, 0.02 mg/L, carebastine [Vincent *et al.* 1988].
Disposition in the Body Ebastine is extensively metabolised in the liver into the active metabolite, carebastine, a carboxylic acid metabolite. As metabolism is extensive, there is little parent drug present in plasma. Ebastine is excreted mainly in urine with 40% of a dose being recovered over a 24-h period. Approximately 6% can be detected in faeces.
Therapeutic Concentration

Nine healthy normotensive male volunteers, aged between 19 and 33 years, were administered with a 10 mg and a 50 mg dose of ebastine. Peak plasma concentrations of 0.099 ± 0.029 mg/L and 0.417 ± 0.0546 mg/L were reached within 3.61 ± 1.06 and 3.70 ± 0.76 h, respectively [Vincent *et al.* 1988].

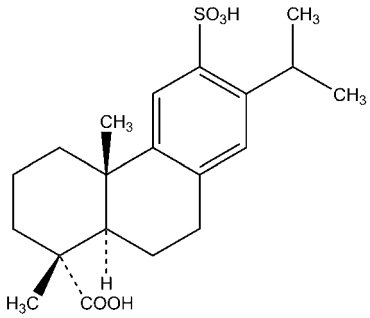
Bioavailability Increases with consumption of food.
Half-life 13 to 16 h.
Protein Binding Approximately 98%.
Dose A usual dose of 10 mg daily is administered to adults, with a maximum of 20 mg. For children over 6 years, 5 mg daily is given.

Vincent J *et al.* (1988). The pharmacokinetics, antihistamine and concentration-effect relationship of ebastine in healthy subjects. *Br J Clin Pharmacol* 26: 497–502.

Ecabet

Antiulcerative
$C_{20}H_{28}O_5S = 380.5$
CAS—33159-27-2

IUPAC Name (1*R*,4a*S*,10a*R*)-1,4a-Dimethyl-7-propan-2-yl-6-sulfo-2,3,4,9,10,10a-hexahydrophenanthrene-1-carboxylic acid
Synonyms Dehydro-6-sulfoabietic acid; 13-isopropyl-12-sulfopodocarpa-8,11,13-trien-15-oic acid; (1*R*,4a*S*,10a*R*)-1,2,3,4,4a,9,10,10a-octahydro-1,4a-dimethyl-7-(1-methylethyl)-6-sulfo-1-phenanthrenecarboxylic acid; 12-sulfodehydroabietic acid.



Ecabet Sodium

$C_{20}H_{27}NaO_5S,5H_2O = 492.6$
CAS—86408-72-2
Synonym TA-2711
Proprietary Name *Gastrom*
Chemical Properties Mp >300°.

Quantification

Other **TLC** Animal Tissues. Silica gel $60F_{254}$. Solvent system: chloroform: methanol (2 : 1). R_f values not reported [Ito *et al.* 1991].

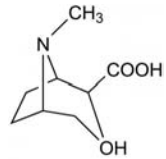
HPLC Animal Tissues. Column: ODS. Mobile phase: acetonitrile–tetrahydrofuran (7 : 3) : 0.1 mol/L phosphate buffer (pH 2.2; 20 : 80 for 1 min to 35 : 65 over 15 min for 4 min). UV detection (λ = 238 nm). Retention time, limit of quantification and limit of detection not reported [Ito *et al.* 1991].
Disposition in the Body Ecabet inhibits peptic activity and only a small amount of an oral dose transfers into circulating blood. Its cytoprotective effect is caused by direct action on the gastric mucosa. It is bound to proteins by hydrophobic interactions.
Bioavailability Approximately 97%, mainly to albumin.
Dose 1 g orally twice daily

Ito Y *et al.* (1991). Metabolic fate of a new anti-ulcer drug (+)-(1*R*,4a*S*,10a*R*)- 1,2,3,4,4a,9,10,10a-octahydro-1,4a-dimethyl-7-(1- methylethyl)-6-sulfo-1-phenanthrenecarboxylic acid 6-sodium salt pentahydrate (TA-2711). I. Disposition, metabolism and protein binding in rats and dogs. *J Pharmacobiodyn* 14: 533–546.

Ecgonine

Alkaloid
$C_9H_{15}NO_3 = 185.2$
CAS—481-37-8

IUPAC Name [1*R*-(*exo*,*exo*)]-3-Hydroxy-8-methyl-8-azabicyclo[3.2.1]octane-2-carboxylic acid
Synonym Laevo-ecgonine

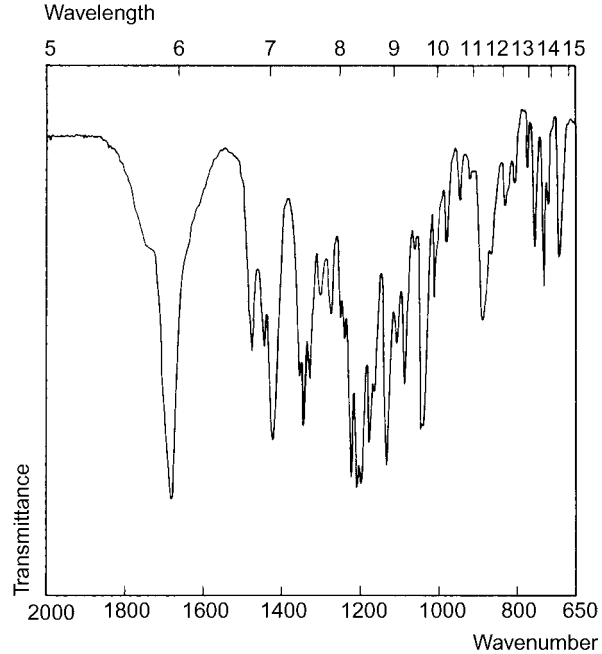


Chemical Properties Mp 198°, with decomposition; the dry substance melts at 205°. Soluble in water; slightly soluble in ethanol; sparingly soluble in acetone, ether, benzene, chloroform and petroleum ether. pK_a 2.8, 11.1. Log *P* (octanol/water), −3.8.

Ecgonine Hydrochloride

$C_9H_{15}NO_3,HCl = 221.7$
CAS—5796-31-6
Chemical Properties Triclinic plates from water. Mp 246°.

Thin-layer Chromatography System TA—R_f 0.17; system TAL—R_f 0.05 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—not eluted.
High Performance Liquid Chromatography System HA—*k* 1.1.
Ultraviolet Spectrum Ethanol—275 nm.
Infrared Spectrum Principal peaks at wavenumbers 1688, 1210, 1200, 1223, 1134, 1179 cm^{-1} (ecgonine hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 82, 97, 42, 83, 96, 57, 94, 55.
Quantification See also under Cocaine.
Plasma **HPLC–MS** For method for quantification of ecgonine and cocaine and some other metabolites, see Klingmann *et al.* [2001].
Urine **HPLC** Fluorescence detection. For method for quantification of ecgonine methyl ester and other cocaine metabolites, see Roy *et al.* [1992].

LC–MS Ecgonine methyl ester, benzoylecgonine and cocaine. Limit of detection, 0.5 µg/L, ecgonine methyl ester [Jeanville *et al.* 2001]. Ecgonine methyl ester and cocaine. Limit of detection, ecgonine methyl ester 2.8 pg [Needham *et al.* 2000]. For method for quantification of ecgonine, ecgonine methyl ester and other cocaine metabolites, see Nishikawa *et al.* [1994].
Note In blood, plasma, or serum: methods for monitoring drugs of abuse in cases of suspected driving under the influence of drugs [Moeller, Kraemer 2002].
Disposition in the Body Ecgonine and its methyl ester are metabolites of cocaine.

Roy IM *et al.* (1992). Analysis of cocaine, benzoylecgonine, ecgonine methyl ester, ethylcocaine and norcocaine in human urine using HPLC with post-column ion-pair extraction and fluorescence detection. *J Pharm Biomed Anal* 10: 943–948.

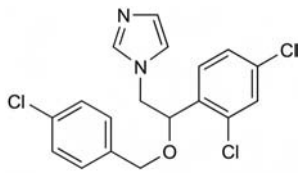
Econazole

Antifungal
$C_{18}H_{15}Cl_3N_2O$ = 381.7
CAS—27220-47-9

IUPAC Name 1-[2-[(4-Chlorophenyl)methoxy]-2-(2,4-dichlorophenyl)ethyl]-1*H*-imidazole

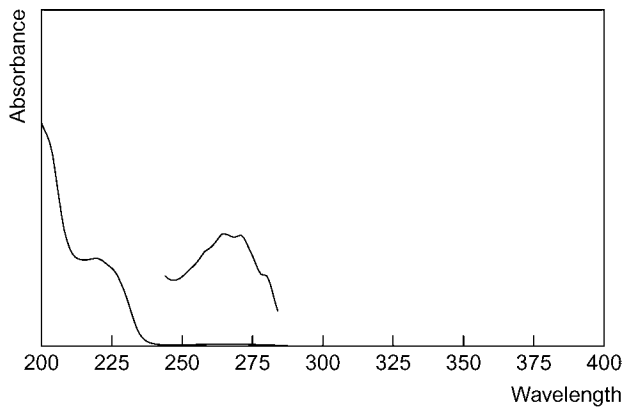


Chemical Properties Mp 86.8°.

Econazole Nitrate

$C_{18}H_{15}Cl_3N_2O,HNO_3$ = 444.7
CAS—24169-02-6; 68797-31-9
Proprietary Names *Dermazol(e)*; *Eccelium*; *Eco Mi*; *Ecodergin*; *Ecoderm*; *Ecorex*; *Ecostatin*; *Ecosteril*; *Ecotam*; *Ecreme*; *Epi-Pevaryl*; *Gyno-Pevaryl*; *Ifenac*; *Micoespec*; *Micoseptil*; *Micostyl*; *Pevalip*; *Pevaryl*; *Sebolith*; *Spectazole*. It is an ingredient of *Econacort*.
Chemical Properties A white crystalline powder. Mp about 164°, with decomposition. Very slightly soluble in water and ether; soluble 1 in 125 of ethanol, 1 in 60 of chloroform and 1 in 25 of methanol.

Thin-layer Chromatography System TA—R_f 0.80; system TB—R_f 0.09; system TC—R_f 0.61; system TE—R_f 0.75; system TAE—R_f 0.78; system TAF—R_f 0.80.
Gas Chromatography System GA—RI 3550.
High Performance Liquid Chromatography System HX—RI 526; system HY—RI 385; system HAA—retention time 20.1 min.
Ultraviolet Spectrum Methanolic acid—265 (A^1_1=12b), 271 (A^1_1=12.5a), 280 nm (A^1_1=7.6a).



Infrared Spectrum Principal peaks at wavenumbers 1090, 1310, 805, 825, 1010, 1040 cm^{-1} (econazole nitrate, KBr disk).
Quantification
Plasma **HPLC** UV detection. Limit of detection, 200 µg/L [Brodie *et al.* 1978].
Serum **HPLC** For method for quantification of econazole and other antifungal drugs, see Ng *et al.* [1996].
Disposition in the Body About 10% of a topical dose is absorbed and after vaginal application about 5% of the dose is absorbed. Following oral administration, about 40% of the dose is excreted in the urine and 30% is eliminated in the faeces, in 5 days.
Blood Concentration

A mean peak plasma concentration of 2.6 mg/L has been reported 2.5 h after oral administration of 250 mg of econazole to 8 subjects [Heel *et al.* 1978].

Uses Econazole nitrate is applied topically in a concentration of 1%, or as pessaries.

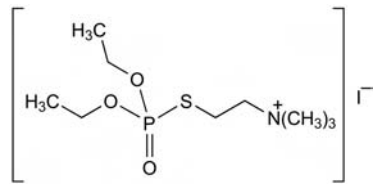
Ecothiopate Iodide

Anticholinesterase
$C_9H_{23}INO_3PS$ = 383.2
CAS—6736-03-4 (ecothiopate); 513-10-0 (iodide)

IUPAC Name 2-Diethoxyphosphorylsulfanylethyl(trimethyl)azanium iodide
Synonyms Diethoxyphosphinylthiocholine iodide; 2-[(diethoxyphosphinyl) thio]-*N*,*N*,*N*-trimethylethanaminium iodide; echothiopate iodide; echothiophate iodide; ecostigmine iodide.
Proprietary Name *Phospholine Iodide*

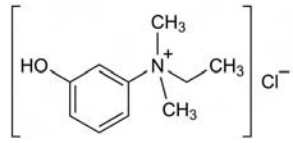


Chemical Properties A white, hygroscopic, crystalline powder. Mp 138° to 124.5°. Soluble in water, alcohol and chloroform. Log *P* (octanol/water), −2.2.
Colour Test Palladium chloride—orange.
Thin-layer Chromatography System TA—R_f 0.02. (Acidified iodoplatinate solution, positive.)
Use As a 0.03 to 0.25% ophthalmic solution.

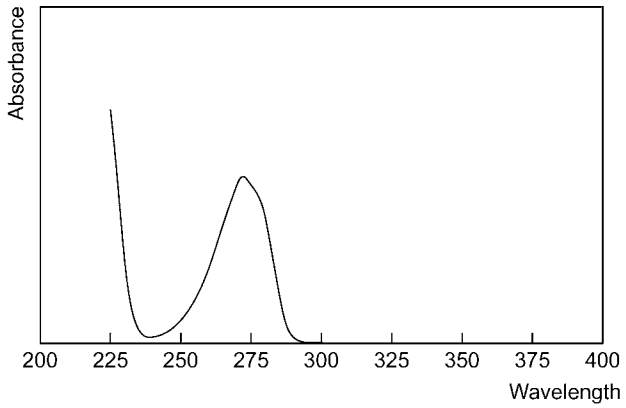
Edrophonium Chloride

Anticholinesterase
$C_{10}H_{16}ClNO$ = 201.7
CAS—312-48-1 (edrophonium); 116-38-1 (chloride)

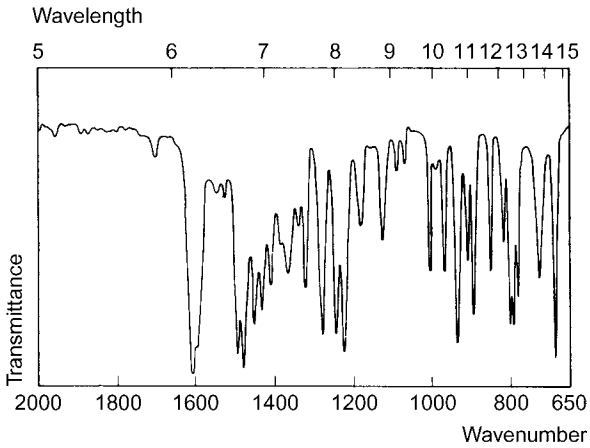
IUPAC Name Ethyl-(3-hydroxyphenyl)-dimethylazanium chloride
Synonym *N*-Ethyl-3-hydroxy-*N*,*N*-dimethylbenzenaminium chloride
Proprietary Names *Anticude*; *Camsilon*; *Enlon*; *Reversol*; *Tensilon*.



Chemical Properties A white crystalline powder. Mp 165° to 170°, with decomposition. Soluble 1 in 0.5 of water and 1 in 5 of ethanol; practically insoluble in chloroform and ether. Log *P* (octanol/water), −3.0.
Colour Test Mandelin's test—blue-green.
Thin-layer Chromatography System TA—R_f 0.07 (acidified iodoplatinate solution, positive).
Ultraviolet Spectrum Aqueous acid—273 nm (A^1_1=110a); aqueous alkali—240 (A^1_1=550b), 294 nm (A^1_1=170b).



Infrared Spectrum Principal peaks at wavenumbers 1609, 690, 1217, 1495, 934, 1280 cm^{-1} (KBr disk).



Disposition in the Body

Therapeutic Concentration

Following IV injections of 100 µg/kg to 5 subjects, plasma concentrations of 0.8 to 3.9 mg/L (mean 1.6) were reported at 2 min, declining to 0.038 to 0.056 mg/L (mean 0.048) at 1 h [Calvey *et al.* 1976].

Toxicity The estimated minimum lethal dose is 100 mg.

Half-life Plasma half-life, about 0.5 h.

Dose 2 to 10 mg intravenously, in the diagnosis of myasthenia gravis.

Calvey TN *et al.* (1976). Plasma concentration of edrophonium in man. *Clin Pharmacol Ther* 19: 813–820.

Efavirenz

Antiviral

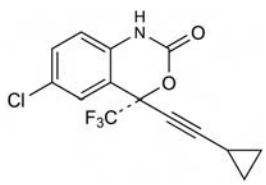
$C_{14}H_9ClF_3NO_2$ = 315.7

CAS—154598-52-4

IUPAC Name (*S*)-6-Chloro-4-(cyclopropylethynyl)-1,4-dihydro-4-(trifluoromethyl)-2*H*-3,1-benzoxazin-2-one

Synonyms DMP-266; L-743726.

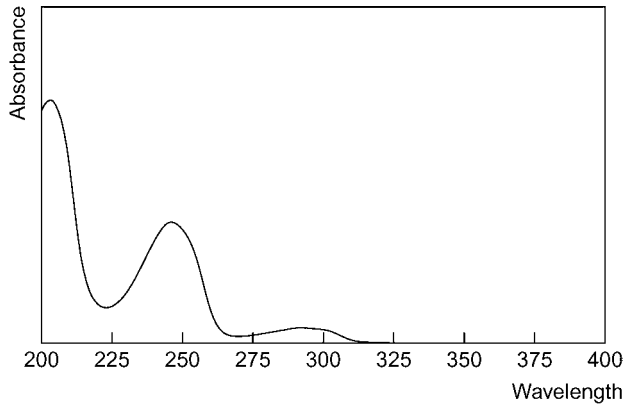
Proprietary Name *Sustiva*



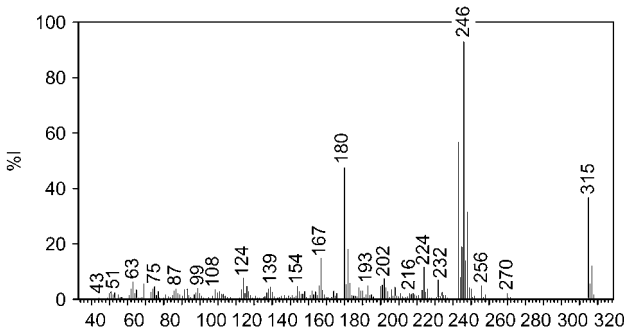
Chemical Properties A white to slightly pink crystalline powder, which is practically insoluble in water (<10 g/L). pK_a 10.2.

High Performance Liquid Chromatography System HAC—*k* 8.5; system HAE—retention time 28.6 min.

Ultraviolet Spectrum Principal peaks at 247, 293 nm.



Mass Spectrum Principal ions at *m/z* 246, 243, 180, 315, 248, 245, 182, 167.



Quantification

Plasma **HPLC** UV detection (λ=241 nm). Limit of quantification, 0.05 mg/L [Aymard *et al.* 2000]. Column: C_{18} Zorbak SB (3.5 µm, 150 × 4.6 mm i.d.). Mobile phase: 25 mmol/L phosphate buffer: acetonitrile (53:47), (pH 7.5), flow rate 1.5 mL/min. UV detection (λ=246 nm). Retention time: 10.2 min. Limit of detection, 0.01 mg/L [Veldkamp *et al.* 1999]. UV detection (λ=247 nm). Limit of detection, 0.1 mg/L [Villani *et al.* 1999].

Serum **HPLC** UV detection. Limit of detection, 0.062 mg/L [Simon *et al.* 2001].

Disposition in the Body

Efavirenz is metabolised by the cytochrome P450 system to hydroxylated metabolites, which can undergo subsequent glucuronidation to inactive metabolites. 14 to 34% of an administered dose can be recovered in urine as the metabolites and 16 to 61% in faeces as the parent drug. Efavirenz is known to cross the blood–brain barrier.

Therapeutic Concentration

A single oral dose between 100 and 1600 mg was administered to uninfected volunteers and peak plasma concentrations between 0.51 and 2.9 mg/L were observed. These levels were reached after 5 h. A 600 mg dose administered to HIV-infected patients, however, produced a peak plasma concentration of 4.1 mg/L, which was reached within 3 to 5 h [DuPont Pharmaceutical Company 1998].

Toxicity A mild to moderate rash with blistering and shedding is the main toxicological effect. Two incidents have been noted, where two patients accidentally took a total dose of 1200 mg and showed an increase in nervous system symptoms and involuntary muscle contractions.

Half-life The estimated half-life for a single dose is 52 to 76 h and 40 to 55 h for multiple doses.

Clearance Mean plasma clearance, 0.18 L/h/kg.

Protein Binding >99%, mainly albumin.

Dose Adult: 600 mg daily. Child: between 200 and 400 mg daily depending on body weight (13 to 39 kg), >40 kg: adult dose.

Aymard G *et al.* (2000). Determination of twelve antiretroviral agents in human plasma sample using reversed-phase high-performance liquid chromatography. *J Chromatogr B Biomed Sci Appl* 744: 227–240.

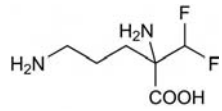
Eflornithine

Antineoplastic, Antiprotozoal

$C_6H_{12}F_2N_2O_2$ = 182.2

CAS—67037-37-0

IUPAC Name 2,5-Diamino-2-(difluoromethyl)pentanoic acid
Synonyms DFMO; 2-(difluoromethyl)-D,L-ornithine; MDL-71782; RMI-71782.



Eflornithine Hydrochloride

$C_6H_{13}ClF_2N_2O_2 = 218.7$
CAS—68278-23-9
Chemical Properties Crystalline powder. Mp 183°.

Eflornithine Hydrochloride Monohydrate

$C_6H_{15}ClF_2N_2O_3 = 236.6$
CAS—96020-91-6
Synonym MDL-71782A
Proprietary Name *Ornidyl*
Chemical Properties Crystalline powder. Mp 183°.

Quantification

Serum **HPLC** Column: RP C_8 (150 × 4.6 mm i.d., 5 µm). Mobile phases: (A) 10 mmol/L sodium acetate (pH 4.18) : tetrahydrofuran (95:5); (B) acetonitrile : tetrahydrofuran (90:10). Elution program: (A:B) (100:0) for 2 min, to (63.3:36.7) in 19 min, to (0:100) for 2 min at 1.5 mL/min, back to initial conditions in 2 min, held for 3 min. UV detection (λ=330 nm). Retention time: 14.7 min. Limit of detection, 10 mg/L [Cohen *et al.* 1989].
Note For an ELISA for the quantification of eflornithine, see Gunaretna *et al.* [1994].
Disposition in the Body Eflornithine is absorbed (~60%) after oral administration and undergoes decarboxylation. >80% of the dose is excreted in urine, 40 to 45% of which remains unchanged. The drug is distributed into central spinal fluid.
Therapeutic Concentration
Six healthy men, aged between 21 and 31 years, were administered an oral dose of 10 and 20 mg/kg body weight eflornithine, and a 10 mg/kg IV dose. Peak plasma concentrations of 31.4 to 51.0 nmol/L were reached, within 2 to 6 h, for the 10 mg/kg oral dose and 27.4 to 137.5 nmol/L for the 20 mg/kg dose (1.5 to 4 h) [Haegele *et al.* 1981].
Toxicity Ototoxicity can occur and loss of hearing has been observed with a cumulative dose. Low toxicity via ingestion and IP routes.
Bioavailability Oral bioavailability, 55%.
Half-life 3 to 4 h.
Volume of Distribution 0.33 to 0.37 L/kg.
Clearance Total body clearance, 1.17 mL/min/kg.
Dose A dose of 100 mg/kg body weight is administered every 6 h, IV, for at least 14 days, which may be followed by a 300 mg/kg body weight daily dose (orally) for 3 to 4 weeks. Dose is decreased for patients with impaired renal function.

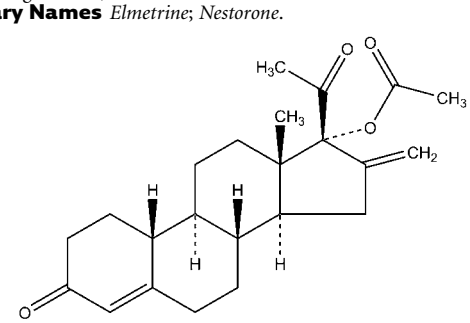
Gunaratna PC *et al.* (1994). Pharmacokinetic studies of alpha-difluoromethylornithine in rabbits using an enzyme-linked immunosorbent assay. *J Pharm Biomed Anal* 12(10): 1249–1257.
Haegele KD *et al.* (1981). Kinetics of alpha-difluoromethylornithine: an irreversible inhibitor of ornithine decarboxylase. *Clin Pharmacol Ther* 30: 210–215.

Elcometrine

Contraceptive, Progestogen, Progestational Steroid
$C_{23}H_{30}O_4 = 370.5$
CAS—7759-35-5
IUPAC Name [(8*R*,9*S*,10*R*,13S,14*S*,17*R*)-17-Acetyl-13-methyl-16-methylidene-3-oxo-2,6,7,8,9,10,11,12,14,15-decahydro-1*H*-cyclopenta[a]phenanthren-17-yl] acetate
Synonyms 17-(Acetyloxy)-16-methylene-19-norpregn-4-ene-3,20-dione; 16-methylene-17α-acetoxy-19-norpregn-4-ene-3,20-dione; 16-methylene-17α-acetoxy-19 norprogesterone; ST-1435.
Proprietary Names *Elmetrine*; *Nestorone*.



Chemical Properties Crystals. Mp 178° to 179°.

Quantification

Serum **HPLC** Column: Lichrosorb C_{18} (240 × 4.0 mm i.d.). Mobile phase: acetonitrile : water : methanol (35 : 35 : 30), flow rate 1 mL/min. UV detection (λ = 245 nm). Retention time: 9 min. Limit of quantification and limit of detection not reported [Heikinheimo *et al.* 1994].
Disposition in the Body Elcometrine is poorly absorbed by the oral route and rapidly metabolised during hepatic first-pass metabolism. It has a very short half-life because of its inability to bind to sex-hormone-binding globulin or to cortisol-binding globulin, transport proteins that prolong the biological half-life of many steroid hormones.
Therapeutic Concentration
A group of 25 postpartum nursing women were administered an implant containing 50 mg elcometrine. Mean serum concentrations were reported as 171.5 ng/L (463 pmol/L) on day 15 and 141.2 ng/L (381 pmol/L) on day 75. Elcometrine mean serum concentrations were also measured on day 75 in breast milk and in serum from babies and were reported as 373 pmol/L and 19.3 pmol/L, respectively [Coutinho *et al.* 1999].
After oral administration of 100 µg of elcometrine in fasting women, the mean peak plasma concentration reached 156.7 ng/L (423 pmol/L) after 10 min. This level was reduced by 50% at 60 min [Noe *et al.* 1993].
Six healthy postpartum women were administered 20 mg elcometrine parenterally. After 2 weeks, mean plasma and breast milk concentrations were measured by radioimmunoassay and reported as 62 and 38 µg/L, respectively [Lahteenmaki *et al.* 1990].
Bioavailability Approximately 12%.
Half-life Biphasic, 0.13 h and 14.6 h.
Volume of Distribution Approximately 263 L.
Clearance Approximately 126 L/h.

Coutinho EM *et al.* (1999). Use of a single implant of elcometrine (ST-1435), a nonorally active progestin, as a long acting contraceptive for postpartum nursing women. *Contraception* 59: 115–122.

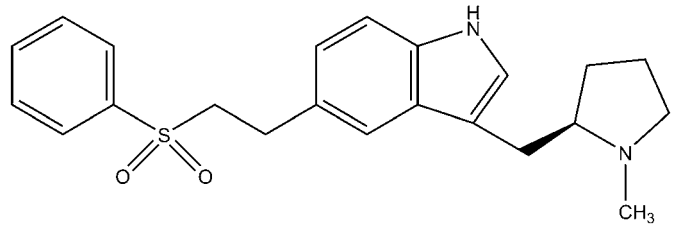
Lahteenmaki PL *et al.* (1990). Milk and plasma concentrations of the progestin ST-1435 in women treated parenterally with ST-1435. *Contraception* 42: 555–562.
Noe G *et al.* (1993). Pharmacokinetics and bioavailability of ST 1435 administered by different routes. *Contraception* 48: 548–556.

Eletriptan

5-HT$_1$ Receptor Agonist, Antimigraine
$C_{22}H_{26}N_2O_2S = 382.5$
CAS—143322-58-1
IUPAC Name 3-[[(2*R*)-1-Methylpyrrolidin-2-yl]methyl]-5-(2-phenylsulfonylethyl)-1*H*-indole
Synonyms 5-[2-(Benzenesulfonyl)ethyl]3-(1-methylpyrrolidin-2(*R*)-ylmethyl)-1H-indole; 3-[[(2*R*)-1-methyl-2-pyrrolidinyl]methyl]-5-[2-(phenylsulfonyl)ethyl]-1H-indole; 3-[(1-methylpyrrolidin-2-yl)methyl]-5-(2-phenylsulfonylethyl)-1H-indole; UK-116044.



Chemical Properties pK_a 9.2 [Cooper *et al.* 1999]. Log *P* (octanol/water), 3.58 [Wishart 2006].

Eletriptan Hydrobromide

$C_{22}H_{26}N_2O_2S,HBr = 463.4$
CAS—177834-92-3
Proprietary Name *Relpax*
Chemical Properties A white to light pale coloured powder. Readily soluble in water.

Quantification

Plasma **HPLC** Column (100 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 500 mmol/L potassium phosphate buffer (pH 3.5) : water (30 : 6 : 64), flow rate 1.0 mL/min. UV detection (λ = 225 nm). Limit of quantification, 0.5 µg/L [Cooper *et al.* 1999].
Oral Fluid **HPLC** Column (100 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 500 mmol/L potassium phosphate buffer (pH 3.5) : water (30 : 6 : 64), flow rate 1.0 mL/min. UV detection (λ = 225 nm). Limit of quantification, 0.5 µg/L [Cooper *et al.* 1999].
Disposition in the Body Readily absorbed after oral administration, with peak plasma concentrations reached 1.5 h after dosing (2 h in patients with migraine). It is primarily metabolised by CYP3A4, with a small contribution (<10%) from other CYP enzymes. The active *N*-demethylated metabolite makes up 10 to 20% of the plasma concentration of the drug. Only about 10% of a dose is cleared via the renal route. Eletriptan does not inhibit or induce any CYP enzymes

and, therefore, is unlikely to cause clinically important interactions or to alter the plasma levels of other drugs.

Therapeutic Concentration

In a low-dose range study, 8 healthy male volunteers were administered oral doses of 7.5 and 20 mg eletriptan with a washout period of 7 days between doses. Mean peak plasma concentrations were 23.9 μg/L for the 7.5 mg dose and 61.5 μg/L for the 20 mg dose, attained at 0.8 h and 1 h, respectively. In a high-dose range study, 12 healthy male volunteers were administered oral doses of 30 and 120 mg eletriptan with a washout period of 7 days. Mean peak plasma concentrations were 64.8 μg/L for the 30 mg dose and 369 μg/L for the 120 mg dose, attained at 0.8 h and 1.4 h, respectively [Milton *et al.* 2002].

Five groups of healthy adult males were randomised to receive eletriptan as a single oral dose of 10 mg ($n = 7$), 30 mg ($n = 10$), 60 mg ($n = 10$), 90 mg ($n = 11$), or 120 mg ($n = 10$). Mean peak plasma and saliva concentrations were measured and reported as follows:

	10 mg	*30 mg*	*60 mg*	*90 mg*	*120 mg*
Peak plasma concentration (μg/L)	13	57	151	181	285
Time (h)	1.0	1.25	1.0	1.25	1.25
Peak saliva concentration (μg/L)	NA	17	47	48	166
Time (h)	NA	2.0	2.0	2.0	1.0

NA, not available [Shah *et al.* 2002].

Note The different phases of the menstrual cycle have no clinically significant effect on the pharmacokinetics, safety or tolerability of eletriptan in healthy volunteers [Shah *et al.* 2001].

Bioavailability Absolute, 50%.

Half-life Approximately 4 h; 5.7 h in the elderly.

Volume of Distribution Approximately 138 L.

Protein Binding Approximately 85%.

Dose Eletriptan hydrobromide 40 mg once daily. If required, a second tablet can be taken if directed by a healthcare professional but no more than 2 tablets should be taken in any 24 h period.

Emamectin

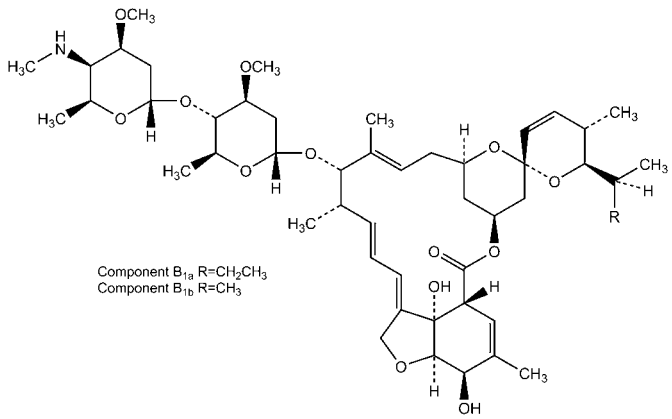
Insecticide, Macrocyclic Lactone

$C_{49}H_{75}NO_{13} : C_{48}H_{73}NO_{13}$ (9 : 1) = 886.13; 872.11

CAS—137335-79-6 (components); 121124-29-6 (major); 121424-52-0 (minor)

IUPAC Name 4′-Epi-(methylamino)-4′-deoxyavermectin B_{1a} and 4′-epi-(methylamino-4′-deoxyavermectin B_{1b} (mixture 9 : 1)

Synonyms (4′*R*)-5-*O*-Demethyl-4′-deoxy-4′-(methylamino)avermectin A1a and (4′*R*)-5-*O*-demethyl-25-de(1-methylpropyl)-4′deoxy-4′-(methylamino)-25-(1-methylethyl)avermectin A1a (mixture 9 : 1).



Emamectin Benzoate

CAS—137512-74-4

IUPAC Name 4′-Deoxy-4′-*epi*-*N*-methylaminoavermectin B_1 benzoate

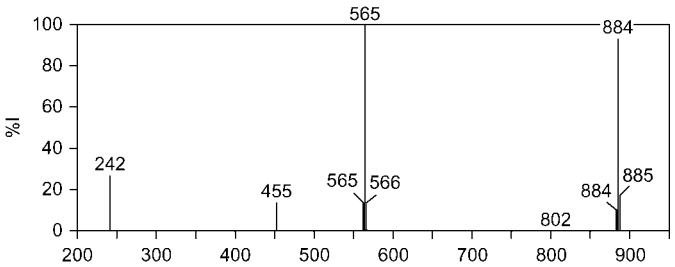
Synonym MK-244

Proprietary Names *Affirm*; *Proclaim*; *Slice*.

Chemical Properties 1.1% form is an off-white crystalline powder. Mp 141° to 146°. Freely soluble in chloroform and methanol. Solubility 0.32 mg/mL at pH 5 (aqueous), 0.024 mg/mL at pH 7 (aqueous); insoluble in hexane. pK_{a1} 4.2; pK_{a2} 7.6. Log *P* (octanol/aqueous phosphate), 3.0 (pH 5.1); 5.0 (pH 7.0) [O'Neil *et al.* 2006].

Ultraviolet Spectrum 10% Methanol—244 nm.

Mass Spectrum Principal ions at *m/z* 565, 884, 242, 885, 566, 455.



Quantification

Plasma **LC-MS** Column: Hypersil C_8 (50 × 2.0 mm i.d., 5 μm). Mobile phase: 20 mmol/L ammonium acetate (pH 4.8) : acetonitrile (60 : 40 for 0.5 min to 0 : 100 over 1.5 min for 1.5 min), flow rate 300 μL/min. API, positive ion mode, CID. Limit of quantification, 1.0 μg/L [Pereira, Chang 2004].

Other **LC-MS** Food. Column: C_8 (50 × 4.6 mm i.d., 1.8 μm). Mobile phase: acetonitrile : 0.2% ammonium formate (50 : 50 to 0 : 100 over 5 min), flow rate 200 μL/min. ESI, positive ion mode, MRM acquisition mode. Retention time: 3.8 min. Limit of quantification, 0.05 to 0.1 μg/kg [Hernando *et al.* 2007]. Milk. Column: C_{18} (100 × 3.0 mm i.d., 3.5 μm). Mobile phase: acetonitrile : 10 mmol/L TEA (75 : 25), flow rate 350 μL/min. ESI, negative ion mode, MRM acquisition mode. Limit of quantification, 0.85 μg/L; limit of detection, 0.35 μg/L [Durden 2007]. Lobster Tissue. Column: ODS/B (250 × 3.0 mm i.d., 5 μm). Mobile phase: acetonitrile : acetonitrile-water (90 : 10) : acetonitrile-methanol (90 : 10; 80 : 20 : 0 for 10 min to 0 : 0 : 100 over 1 min for 8 min), flow rate 1 mL/min. Fluorescence detection ($\lambda_{ex} = 365$ nm, $\lambda_{em} = 470$ nm). Retention time: emamectin, 8.0 min; desmethylaminoemamectin, 5.7 min (methylimidazole–trifluoroacetic acid derivatives). Limit of quantification, 3.32 ng/g; limit of detection, 1.1 ng/g [Tauber *et al.* 2006]. Fish. Column: C_{18} (250 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : water (94 : 6), flow rate 2.2 mL/min. Fluorescence detection ($\lambda_{ex} = 365$ nm, $\lambda_{em} = 470$ nm). Retention time: ~5 min (methylimidazole-trifluoroacetic acid derivative). Limit of quantification, 1.5 ng/g; limit of detection, 0.5 ng/g [van de Riet *et al.* 2001].

Note For a methodology review for the determination of macrocyclic lactone residues in biological matrices, see Danaher *et al.* [2006].

Disposition in the Body In salmon, unchanged emamectin is the major residue found in muscle and skin tissue, accounting for 98% of total residue at 12 h. The major metabolite found in tissue is *N*-desmethylemamectin.

Toxicity

A 67-year-old man (weight 75 kg), previously in good health attempted suicide by drinking ~500 mL of 2.15% w/w emamectin benzoate in 2,6-bis (1,1-dimethylethyl)-4-methylphenol and 1-hexanol. This corresponded to ~25.6 mg/kg emamectin benzoate. He developed a transient gastrointestinal upset with endoscopy-proven gastric erosion, mild CNS depression, and aspiration pneumonia. Emamectin blood levels were not measured and the patient was discharged after 1 week with no sequelae [Yen, Lin 2004].

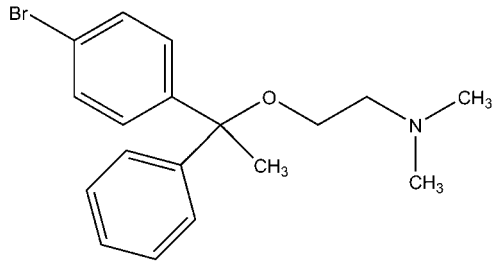
Embramine

Antiemetic, Antihistamine

$C_{18}H_{22}BrNO$ = 348.3

CAS—3565-72-8

IUPAC Name 2-[1-(4-Bromophenyl)-1-phenylethoxy]-*N*,*N*-dimethylethanamine
Synonym *p*-Bromo-α-methylbenzhydryl-2-dimethylaminoethyl ether

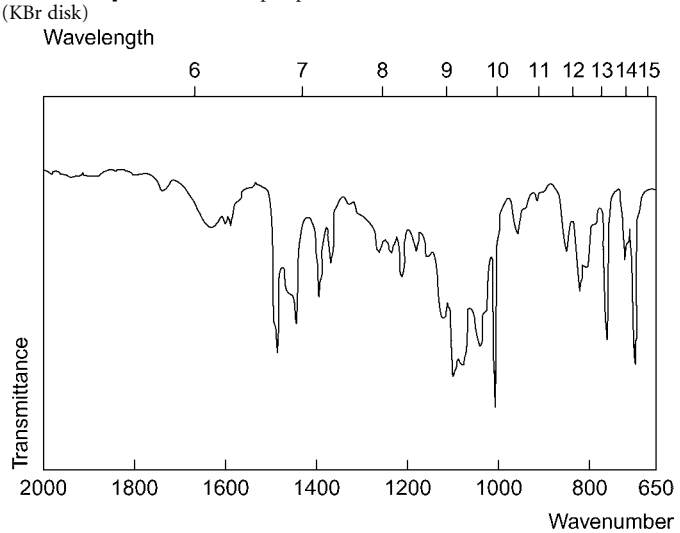


E

Embramine Hydrochloride

$C_{18}H_{22}BrNO,HCl = 384.7$
CAS—13977-28-1
Synonym Mebrophenhydramine
Proprietary Names *Mebryl*; *Medrin*.
Chemical Properties Crystals from acetone–ether. Mp 150° to 152°. Log *P* (octanol/water), 5.70 [Meylan, Howard 1995].

Colour Tests Ammonium molybdate test—yellow→green→blue (limit of detection, 0.1 µg); ammonium vanadate test—orange-brown (limit of detection, 0.25 µg); sulfuric acid-formaldehyde test—orange (limit of detection, 0.1 µg); Vitali's test—dull orange/dull orange/dull orange (limit of detection., 0.25 µg).
Thin-Layer Chromatography System TA—R_f 0.54; system TB—R_f 0.50; system TC—R_f 0.32; system TL—R_f 0.17.
Gas Chromatography System GA—RI 2185.
Ultraviolet Spectrum 0.05 mol/L sulfuric acid—226 ($A^1_1 = 400$), 258 nm ($A^1_1 = 18$).
Infrared Spectrum Principal peaks at wavenumbers 1009, 1095, 699 cm^{-1} (KBr disk)



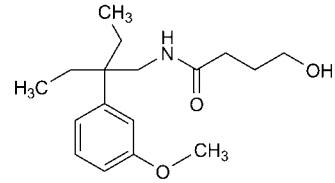
Disposition in the Body Embramine is rapidly absorbed form the gastrointestinal tract. Six hours after a large dose, high levels of the drug are found in the liver, lungs and spleen, with lower levels in the brain and heart.
Toxicity Long-term administration of large doses to dogs and cats has shown it to have negligible toxicity. The LD_{50} value in mice via oral dosing is 330 mg/kg
Dose Up to 150 mg daily. Adults: to prevent motion sickness one tablet (25 mg) is usually sufficient to be taken 15 to 30 min before departure; the full effect is achieved within 1 h. During long-lasting travel half to one tablet (12.5 to 25 mg) is taken at 2 to 3 h intervals as required. For treatment of motion sickness, the recommended dose is one to three tablets (25 to 75 mg). Repeated administration should be considered individually because of the long-lasting effect of the drug. The recommended maximum daily dose is six tablets. To prevent radiation sickness one tablet (25 mg) is given 1 h before exposure to radiation and one tablet (25 mg) at approx. 6 h after exposure. In other indications, the usual therapeutic dosage is 12.5 to 25 mg given two to three times daily. Children aged 2 to 6 years: the recommended dose is 6.25 mg (quarter of a tablet) one or two times daily. Children aged 6 to 15 years: the recommended dose is 6.25–12.5 mg (quarter to half a tablet) one to two times daily.

Meylan WM, Howard PH (1995). Atom/fragment contribution method for estimating octanol–water partition coefficients. *J Pharm Sci* 84: 83–92.

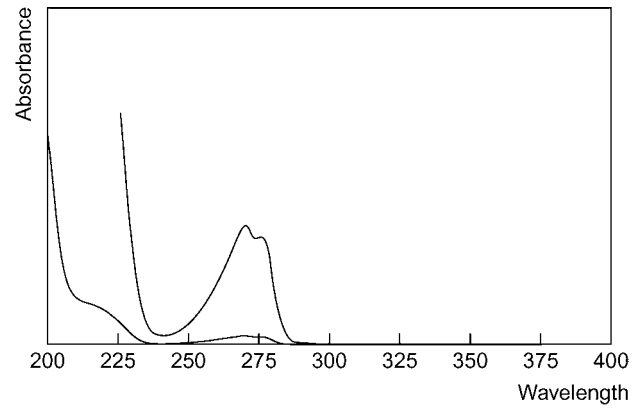
Embutramide

Narcotic Analgesic
$C_{17}H_{27}NO_3 = 293.4$
CAS—15687-14-6

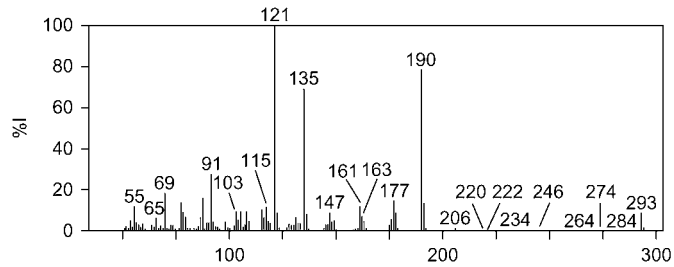
IUPAC Name *N*-[2-Ethyl-2-(3-methoxyphenyl)butyl]-4-hydroxybutanamide
Synonym *N*-(β,β-Diethyl-*m*-methoxyphenethyl)-4-hydroxybutyramide
Proprietary Names It is an ingredient of *Tanax* (veterinary) and *T 61* (veterinary).



Chemical Properties Crystals. Mp 70°. Stock solutions were stable at room temperature for 36 h, at 4° for 2 months and at –20° for 3 months. Spiked serum samples were stable for 1 month when stored at 4° [Fidani *et al.* 2008]. Samples stored at 4° for 6 months showed substantial degradation whereas samples stored at –20° for 6 months were stable [Huo *et al.* 1994].
Colour Tests Mandelin's test—brown; Marquis test—blue.
Thin-layer Chromatography System TA—R_f 0.72 (acidified potassium permanganate solution, positive).
High Performance Liquid Chromatography System HAA—RT 17.4 min.
Ultraviolet Spectrum Aqueous acid—271 ($A^1_1 = 50$b), 276 nm.



Infrared Spectrum Principal peaks at wavenumbers 1652, 1248, 1037, 1595, 1562, 1063 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 121, 135, 190, 91, 293, 161, 177 [Giorgi *et al* 2001; Abe *et al* 2004].



Quantification

Blood **GC-MS** Column: HP-5 MS capillary (30 m × 0.25 mm i.d.). Carrier gas: He, 1.0 mL/min. Temperature programme: 60° for 1 min to 295° at 30°/min for 5 min. MSD, SIM acquisition mode. Limit of detection, 1 mg/L [Kintz *et al.* 2002]. Column: Mega OV-1 fused silica capillary (15 m × 0.18 mm i.d., 0.1 mm). Carrier gas: He, 1 mL/min. Temperature programme: 100° to 295° at 15°/min for 10 min. EI ionisation at 70 eV, positive ion mode, SIM acquisition mode. Limit of quantification, 250 µg/L [Giorgi *et al.* 2001].

HPLC Column: Hypurity C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 25 mmol/L phosphate buffer (pH 3.8; 30 : 70 to 20 : 80 in 18 min), flow rate 1.0 mL/min. DAD (λ = 273 nm). Retention time: 10.4 min. Limit of quantification, 0.6 mg/L, limit of detection, 0.2 mg/L [Abe *et al.* 2004]. Column: Spherisorb ODS2 C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : water (pH 4.7; 65 : 35), flow rate 0.9 mL/min. UV detection (λ = 273 nm). Limit of quantification, 2.5 mg/L [Giorgi *et al.* 2001].

Kidney **GC-MS** See Blood [Giorgi *et al.* 2001].

HPLC See Blood [Giorgi *et al.* 2001].

Liver **GC-MS** See Blood [Giorgi *et al.* 2001].

HPLC See Blood [Giorgi *et al.* 2001].

Other **GC** Dog Blood. Column: Ultra 2 5% phenyl methyl silicone (25 m × 0.25 mm i.d., 0.17 µm). Carrier gas: He, 0.67 mL/min. Temperature programme: 150° for 2 min to 280° at 10°/min for 5 min. NPD. Limit of detection, 40 µg/L [Huo *et al.* 1994].

GC-MS Meat and Bone Meal. Column: CP-Sil 5 CB-MS capillary (15 m × 0.25 mm i.d., 0.1 μm). Carrier gas: He. Temperature programme: 90° for 2 min to 200° at 12.5°/min to 300° at 30°/min. EI ionisation at 70 eV or PICI. Limit of quantification, ≈200 μg/kg, limit of detection, 50 and 20 μg/kg for EI and CI, respectively [Hooijerink *et al.* 1998]. Porcine Tissues. Column: DB-5 (15 m × 0.25 mm, 0.2 μm). Carrier gas: 1 mL/min. Temperature programme: 215° to 275° at 25°/min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, 25 ng [Braselton *et al.* 1988].

LC-MS Equine Serum. Column: Ciano-phase Luna (150 × 2 mm i.d., 5 μm). Mobile phase: 0.1% trifluoroacetic acid : methanol (60 : 40), flow rate 0.25 mL/min. ESI, positive ion mode, full scan mode. Limit of quantification, 1 μg/L, limit of detection, 0.3 μg/L [Fidani *et al.* 2008].

Note For a UV spectrophotometry method for the measurement of ebutramide in blood and urine, see Bertol *et al.* [1983]

Disposition in the Body

Toxicity The lethal dose in mammals is between 50 and 180 mg/kg [Abe *et al.* 2004].

In 3 fatalities caused by the injection of a preparation containing embutramide and mebezonium iodide, the postmortem concentrations (mg/L) shown below were reported.

	Embutramide	*Mebezonium iodide*
Blood	3.0, 15.5, 12.1	4.5, 6.0, 7.5
Urine	2.0, 6.3, 4.5	0.8, 2.0, 1.8

[a][Bertol *et al.* 1983].

A 37-year-old Caucasian female was found dead. Two empty T-61 50 mL (dimethylformmaide containing 200 mg/mL embutramide, 50 mg/mL mebezonium iodide and 5 mg/mL tetracine) bottles were next to her. Blood and liver concentrations of embutramide were 31 and 12 ppm, respectively [Smith, Lewis 1989].

A 58-year-old veterinarian died after ingesting about 30 mL of T-61 solution (a mixture of embutramide, mebezonium and tetracaine; used for animal euthanasia). The embutramide concentration in postmortem femoral blood was 43.0 mg/L [Kintz *et al.* 2002].

A 40-year-old veterinarian was found dead with an IV 50 mL bottle of Tanax tied to his arm. It was empty, indicating that 10 g embutramide was administered. A blood concentration of 90 mg/L embutramide was measured [Abe *et al.* 2004].

Volume of Distribution 1.6 L/kg [Abe *et al.* 2004].

Emedastine

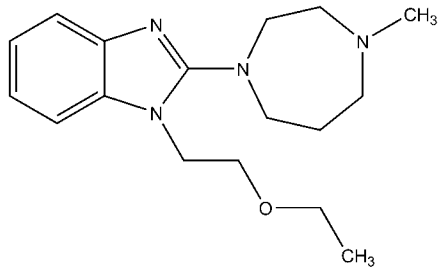
Antihistamine

$C_{17}H_{26}N_4O = 302.4$

CAS—87233-61-2

IUPAC Name 1-(2-Ethoxyethyl)-2-(4-methyl-1,4-diazepan-1-yl)benzimidazole

Synonym 1-(2-Ethoxyethyl)-2-(hexahydro-4-methyl-1H-1,4-diazepin-1-yl)-1H-benzimidazole



Emedastine Difumarate

$C_{17}H_{26}N_4O,2C_4H_4O_4 = 534.6$

CAS—87233-62-3

Synonyms KB-2413; LY-188695.

Proprietary Name *Emadine*

Chemical Properties Crystals from ethanol. Mp 148° to 151°. pK_{a1} 4.51, pK_{a2} 8.48 [Alcon Laboratories 2003]. Log *P* (octanol/water), 2.03 [Wishart 2006]. When stored at 4 to 30°, the ophthalmic solution is stable for 24 months. Discoloured solutions should be discarded. There were no stability related problems during the routine analysis of samples for pharmacokinetic, bioavailabilty, or bioequivalence studies [Tian *et al.* 2007].

Ultraviolet Spectrum Peaks at 206, 227, 280 and 286 nm.

Quantification

Plasma **LC-MS**Column: Phenomex Luna CN 100A (150 × 2.0 mm, 5 μm). Mobile phase: methanol : 20 mmol/L ammonium acetate (pH 4.0; 80 : 20), flow rate 0.2 mL/min. ESI, positive ion mode. Limit of quantification, 0.05 μg/L; limit of detection, 0.01 μg/L [Tian *et al.* 2007].

Other **HPLC** Rat Skin. Column: Intersil ODS-2 (150 × 5 mm i.d., 5 μm). Mobile phase: 0.025 mol/L phosphate buffer (pH 2.4) containing 0.25% sodium lauryl sulfate : acetonitrile (50 : 50), flow rate 1.2 mL/min. UV detection (λ = 280 nm). Limit of detection, 500 μg/L [Harada *et al.* 2005].

Disposition in the Body

Following oral administration, emedastine is metabolised by the liver to form 5- and 6-hydroxyemedastine. These metabolites are further oxidised to form 5′-oxo analogues. Emedastine *N*-oxide is a minor metabolite. Approximately 44% of an oral dose is recovered in the urine within 24 h. Approximately 3.6% of an oral dose is excreted in the urine as the parent compound, but the 5- and 6-hydroxyemedastine metabolites and their conjugates are recovered in urine.

Therapeutic Concentration

Six healthy males and 6 healthy females (mean ages 35 ± 4 and 30 ± 5 years, respectively) were included in a study to investigate the pharmacokinetics of emedastine. Volunteers were involved in either a single-dose study, where subjects received either 2, 4 or 8 mg of drug, a multiple-dose study, where subjects received drug for 5 consecutive days at 2 mg twice daily, or a food-effect study, where subjects were either given a light meal 4 h after administration or a meal directly afterwards (see table below).

Note For pharmacokinetic and pharmacodynamics parameters in healthy volunteers, see Brunner *et al.* [2002] or Jansen *et al.* [2000]. For pharmacokinetic parameters in renally impaired patients, see Joukhadar *et al.* [2001], in combination with alcohol, see Vermeeren *et al.* [2002], and in combination with ketoconazole, see Herranz *et al.* [2001].

Half-life Approximately 3 to 4 h [Alcon Laboratories 2003].

Dose Instilled twice daily as a 0.05% solution for the symptomatic relief of allergic conjunctivitis. Orally in doses of 2 to 4 mg daily in two divided doses for allergic rhinitis, urticaria and pruritic skin disorders.

E

Emepronium Bromide

Anticholinergic

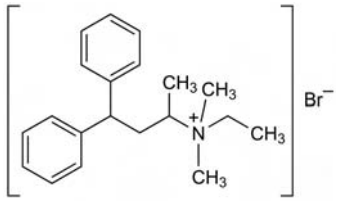
$C_{20}H_{28}BrN = 362.4$

CAS—27892-33-7 (emepronium); 3614-30-0 (bromide)

IUPAC Name 4,4-Diphenylbutan-2-yl-ethyl-dimethylazanium bromide

Synonym *N*-Ethyl-*N*,*N*-α-trimethyl-γ-phenylbenzenepropanaminium bromide

Proprietary Names *Cetiprin*; *Uro-Ripirin*.



Chemical Properties A white crystalline powder. Mp 204°. Soluble in water, ethanol and chloroform. Log *P* (octanol/water), 0.5.

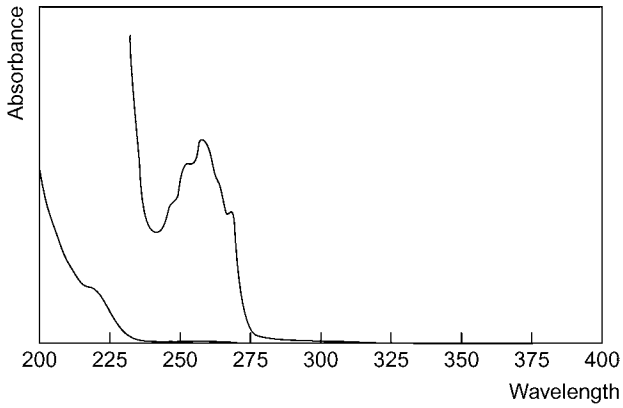
Colour Test Liebermann's reagent—brown.

Thin-layer Chromatography System TA—R_f 0.05; system TB—R_f 0.00; system TE—R_f 0.02; system TAE—R_f 0.03 (acidified iodoplatinate solution, strong reaction).

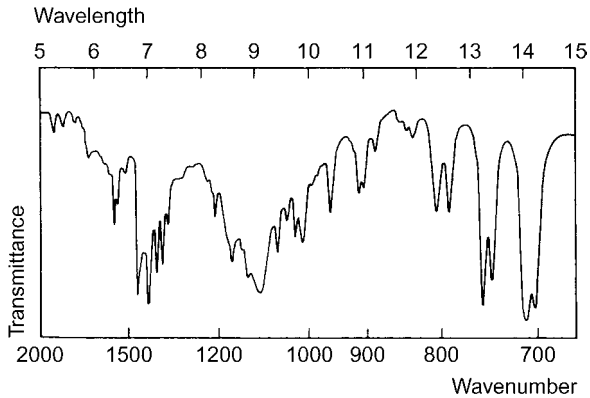
Gas Chromatography System GA—RI 1973.

High Performance Liquid Chromatography System HA—*k* 5.2; system HX—RI 420.

Ultraviolet Spectrum Aqueous acid—253, 258 (A^1_1=13a), 268 nm.



Infrared Spectrum Principal peaks at wavenumbers 708, 699, 752, 1102, 742, 1134 cm^{-1} (KBr disk).



Quantification

Serum **GC** ECD. Limit of detection, 200 ng/L [Hartvig *et al.* 1976].

Disposition in the Body Poorly absorbed after oral administration; <5% of a dose is excreted in the urine in 24 h, partly as metabolites. After IM administration, about 30% of a dose is excreted in the urine in 3 days and 45% is eliminated in the faeces in the same period.

Therapeutic Concentration

Following a single oral dose of 150 mg to 5 subjects, peak serum concentrations of 0.017 to 0.10 mg/L were attained in about 2 h [Vessman *et al.* 1970].

Half-life Plasma half-life, about 7 to 11 h.

Dose 200 to 600 mg daily.

Hartvig P *et al.* (1976). Electron-capture GC determination of subnanogram amounts of emepronium bromide in serum. *J Pharm Sci* 65: 1707–1709.
Vessman J *et al.* (1970). Gas chromatography and electron capture detection of benzophenone formed by chromic acid oxidation. 2. Determination of emepronium (Cetiprin), a quaternary ammonium compound in serum. *Acta Pharm Suec* 7: 363–372.

Emetine

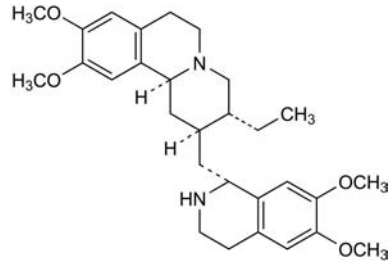
Antiamoebic

$C_{29}H_{40}N_2O_4 = 480.6$

CAS—483-18-1

IUPAC Name (2*S*,3*R*,11b*S*)-2-[[(1*R*)-6,7-Dimethoxy-1,2,3,4-tetrahydroisoquinolin-1-yl]methyl]-3-ethyl-9,10-dimethoxy-2,3,4,6,7,11*b*-hexahydro-1*H*-benzo[*a*]quinolizine

Synonyms Ipecine; methylcephaëline; 6′,7′,10,11-tetramethoxyemetan.



Chemical Properties An alkaloid present in ipecacuanha, the dried root, or rhizome and roots, of *Cephaëlis ipecacuanha* (= *Uragoga ipecacuanha*) (Rubiaceae) or *C. acuminata*. A white amorphous powder. Mp 74°. Slightly soluble in water; soluble in ethanol, chloroform and ether. pK_a 7.4, 8.3 (25°). Log *P* (octanol/water), 5.2.

Emetine Hydrochloride

$C_{29}H_{40}N_2O_4,2HCl,\ 7H_2O = 679.7$

CAS—316-42-7 (anhydrous); 7083-71-8 (hydrate)

Synonym Emetine dihydrochloride

Proprietary Names It is an ingredient of *Cophylac*, *Ipeca*, *Sano Tuss* and *Spirbon*.

Chemical Properties A white or very slightly yellow, crystalline powder. Mp 235° to 255° with decomposition, after drying. Soluble 1 in 8 of water, 1 in 12 of ethanol (90%) and 1 in 4 of chloroform; practically insoluble in ether.

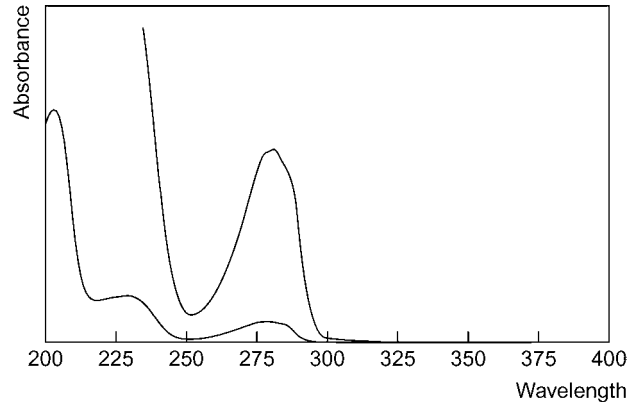
Colour Test Liebermann's reagent—black.

Thin-layer Chromatography System TA—R_f 0.54; system TB—R_f 0.13; system TC—R_f 0.34; system TE—R_f 0.53; system TL—R_f 0.12; system TAE—R_f 0.19; system TAJ—R_f 0.09; system TAK—R_f 0.02; system TAL—R_f 0.58 (acidified iodoplatinate solution, positive).

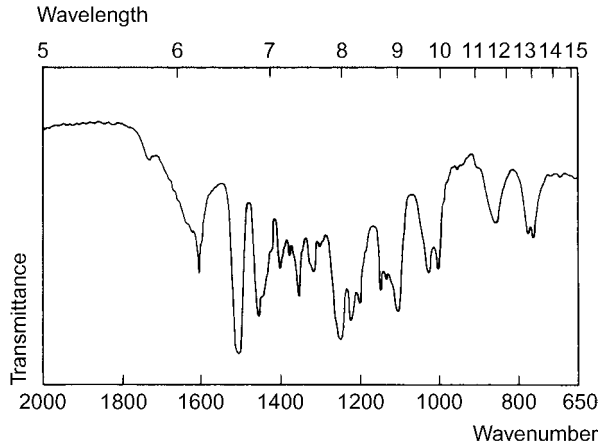
Gas Chromatography System GA—RI 2505.

High Performance Liquid Chromatography System HA—*k* 7.1 (tailing peak); system HX—RI 310; system HAA—retention time 9.4 min.

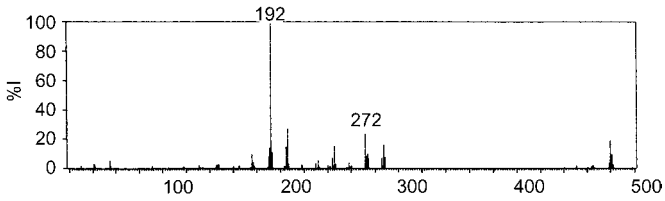
Ultraviolet Spectrum Aqueous acid—230 (A^1_1=341a), 282 nm (A^1_1=158a).



Infrared Spectrum Principal peaks at wavenumbers 1514, 1256, 1228, 1110, 1200, 1150 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 192, 206, 272, 480, 288, 246, 205, 191.



Quantification

Blood **HPLC** Fluorescence detection. Limit of detection, 5 µg/L [Crouch *et al.* 1984].

Plasma **HPLC** Fluorescence detection. Emetine and cephaëline. Limit of detection, <2.5 µg/L for emetine [Asano *et al.* 2001]. Fluorescence detection. Limit of detection, 10 µg/L [Bannister *et al.* 1979].

Urine **HPLC** See Plasma. Limit of detection, <5 µg/L for emetine [Asano *et al.* 2001]. See Blood [Crouch *et al.* 1984].

Disposition in the Body Rapidly absorbed after oral administration and after injection; concentrated in the liver, kidneys, lungs and spleen. It is excreted only very slowly in the urine and detectable concentrations are found up to 60 days after treatment.

Toxicity The minimum lethal dose is 150 mg.

In a fatality which occurred after chronic ingestion of about 70 mg of emetine daily for 3 months, the following postmortem tissue concentrations were reported: blood 2.4 µg/g, bile 1.9 µg/g, kidney 7.4 µg/g, liver 14 µg/g [Adler *et al.* 1980].

Dose Up to 60 mg of emetine hydrochloride daily, SC or IM, for no longer than 10 days.

Adler AG *et al.* (1980). Death resulting from ipecac syrup poisoning. *JAMA* 243(19): 1927–1928.

Asano T *et al.* (2001). High-performance liquid chromatographic assay with fluorescence detection for the determination of cephaeline and emetine in human plasma and urine. *J Chromatogr B Biomed Sci Appl* 757: 197–206.

Bannister SJ *et al.* (1979). High-performance liquid chromatographic analysis of emetine after oxidative activation to a fluorescent product. *J Chromatogr* 176: 381–390.

Crouch DJ *et al.* (1984). Quantitative analysis of emetine and cephaeline by reversed-phase high performance liquid chromatography with fluorescence detection. *J Anal Toxicol* 8: 63–65.

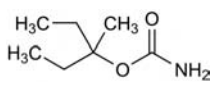
Emylcamate

Tranquilliser, Muscle Relaxant

$C_7H_{15}NO_2$ = 145.2

CAS—78-28-4

IUPAC Name 3-Methyl-3-pentanol carbamate



Chemical Properties A white crystalline powder. Mp 56°. Soluble 1 in 250 of water; freely soluble in benzene, ethanol, ether and glycol ethers. Log *P* (octanol/water), 1.8.

Gas Chromatography System GA—RI 1105.

Ultraviolet Spectrum No significant absorption, 230 to 360 nm.

Infrared Spectrum Principal peaks at wavenumbers 1690, 1610, 1041, 1170, 1150, 1010 cm^{-1} (KCl disk).

Mass Spectrum Principal ions at *m/z* 73, 43, 84, 55, 69, 41, 44, 85.

Dose Emylcamate was formerly given in doses of 600 to 800 mg daily.

Enalapril

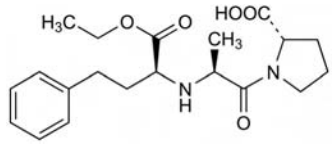
Antihypertensive

$C_{20}H_{28}N_2O_5$ = 376.5

CAS—75847-73-3

IUPAC Name (2*S*)-1-[(2*S*)-2-[[(2*S*)-1-Ethoxy-1-oxo-4-phenylbutan-2-yl]amino]propanoyl] pyrrolidine-2-carboxylic acid

Synonym (*S*)-1-[*N*-[1-(Ethoxycarbonyl)-3-phenylpropyl]-L-alanyl]-L-proline



Chemical Properties pK_a 2.97 and 5.35 (25°) (maleate). Log *P* (octanol/water), 2.45. Extraction yield (chlorobutane), 0 [Demme *et al.* 2005].

Enalapril Maleate

$C_{20}H_{28}N_2O_5,C_4H_4O_4$ = 492.5

CAS—76095-16-4

Synonyms L-154; MK-421; 739-001D.

Proprietary Names *Amprace*; *Bitensil*; *Cardiovet*; *Enacard*; *Enaloc*; *Enapren*; *Glioten*; *Hipoartel*; *Innovace*; *Lotrial*; *Olivin*; *Pres*; *Renitec*; *Reniten*; *Renivace*; *Vasotec*; *Xanef*.

Chemical Properties A white to off-white crystalline, odourless powder. Mp 143° to 144.5°. Solubility in water is 0.025 g/mL, alcohol 0.08 g/mL, methanol 0.2 g/mL and dimethyl formamide >400 g/L. It is, also, slightly soluble in semi-polar organic solvents; practically insoluble in non-polar organic solvents.

Enalaprilat

$C_{18}H_{24}N_2O_5,2H_2O$ = 384.4

CAS—76420-72-9 (anhydrous); 84680-54-6 (dihydrate)

Synonyms Enalaprilic acid; MK-422.

Chemical Properties A white to nearly white, hygroscopic crystalline powder, needles from water, Mp 148° to 151°. It is soluble in water (1 in 200), methyl alcohol (1 in 68), dimethyl formamide (1 in 40); slightly soluble in isopropyl alcohol; very slightly soluble in acetone, alcohol and hexane; practically insoluble in chloroform.

Colour Test Bromothymol blue (acidic aqueous, pH 2: $CHCl_3$)—yellow.

Thin-layer Chromatography System TB—R_f 0.00; system TD—R_f 0.00; system TE—R_f 0.00(enalapril), R_f 0.00(enalaprilat); system TF—R_f 0.00(enalapril), R_f 0.00(enalaprilat); system TAD—R_f 0.00; system TAE—R_f 0.85.

Plate: silica gel (Analtech GF, Whatman KLF or E Merck G60). Mobile phase: chloroform: methanol: acetic acid (90:10:1). Enalapril, Rf 0.6; enalaprilat, Rf 0.

Plate: silica gel (Analtech GF, Whatman KLF or E Merck G60). Mobile phase: n-butanol: water: acetic acid (3:1:1). Enalapril, Rf 0.7; enalaprilat, Rf 0.35.

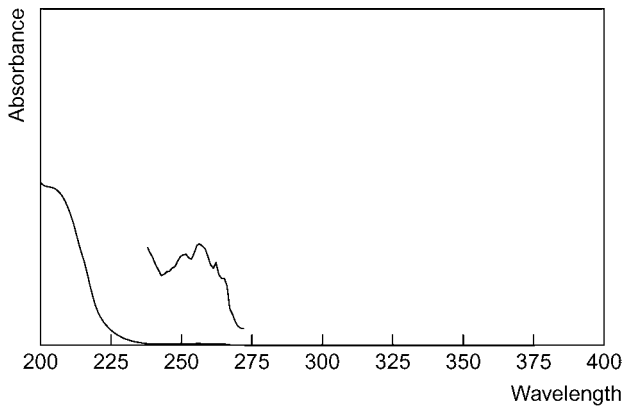
Plate: silica gel (Analtech GF, Whatman KLF or E Merck G60). Mobile phase: n-butanol: toluene: water: acetone: acetic acid (1:1:1:1). Enalapril, Rf 0.55; enalaprilat, Rf 0.45 [Ip, Brenner 1987].

Gas Chromatography System GA—RI 2620enalapril, RI 2650 enalapril-ME; system GP—RI 2675 enalapril-ME, RI 2680 M (enalaprilat)-ME3, RI 2735 M (enalaprilat-H_2O)-ME.

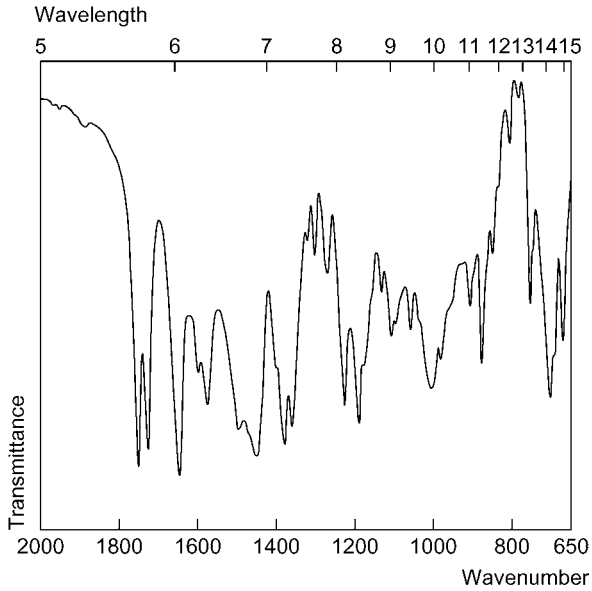
High Performance Liquid Chromatography System HX—RI 201; system HZ—retention time 1.5 min (enalaprilat); system HAA—retention time 3.4 min.

Column: Hypersil ODS (250 × 4.5 mm i.d., 5 µm). Mobile phase: 20 mmol/L sodium heptanesulfonate (pH 2.5) : acetonitrile (5% THF) (63:37), flow rate 1.0 mL/min. UV detection (λ=215 nm). Retention time: 10 min [Bonazzi *et al.* 1997].

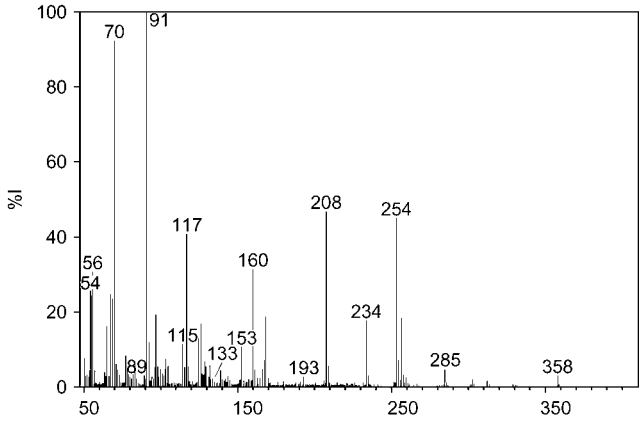
Ultraviolet Spectrum Aqueous acid (0.2 mol/L H_2SO_4)—257, 268 nm; (0.1 mol/L phosphate buffer, pH 4.5: methanol (80:20)—229 nm (enalapril maleate).



Infrared Spectrum Principal peaks at wavenumbers 1750, 1645, 1425, 1390, 1187 cm^{-1} (maleate).



Mass Spectrum Principal ions at *m/z* 91, 70, 208, 254, 117, 56, 160, 54 (maleate).



Quantification

Plasma **GC–MS** Column: silica (DB-1, 10 m × 0.25 mm i.d., 0.25 µm). Temperature programme: held at 150° for 1 min, and increased to 280° at 30°/min. Injector temperature: 280°. Carrier gas: He. MS detection (NICI, SIM at m/z 302, enalapril; 288 enalaprilat). Reference compound: RS-5139. Retention time: enalapril 4.58 min; enalaprilat 4.49 min. Limit of detection, 0.2 µg/L and 2 µg/L for enalapril and enalaprilat, respectively [Shioya *et al.* 1992].

Serum **Fluoroimmunoassay** Limit of detection, 0.5 µg/L [Yuan, Gilbert 1996].

Urine **GC–MS** See Plasma [Shioya *et al.* 1992].

Disposition in the Body After oral administration, 60% of a dose is absorbed, and rapidly and extensively hydrolysed in the liver to enalaprilat. Peak plasma concentrations of enalaprilat are achieved 3 to 4 h after oral dose. Enalapril is excreted in urine as the metabolite, enalaprilat and the rest in faeces as the unchanged drug. After a single oral dose of 20 mg enalapril, enalapril and enalaprilat can be detected in breast milk with a concentration of 1 to 2.3 µg/L for the latter. Enalaprilat is removed by haemodialysis and peritoneal dialysis.

Therapeutic Concentration The serum therapeutic concentration range is 0.01 to 0.05 mg/L for the metabolite, desethylenalapril.

Eighteen healthy, normotensive subjects: 9 males, aged between 21 and 39 years, 6 males and 3 females, aged between 66 to 76 years, were administered 10 mg enalapril maleate after an overnight fast. Peak plasma concentrations of 128 ± 63 nmol/L enalaprilat were reached, within 4 h, for the younger group and 199 ± 105 nmol/L, within 5 h, for the more elderly group [MacDonald *et al.* 1993].

Toxicity Treatment with enalapril can result in renal failure, with the possibility of death. Severe hypotension is the main toxic effect and loss of hearing has also been reported by some.

Bioavailability Oral bioavailability, 53 to 74% (enalapril) and 36 to 44% (enalaprilat).

Half-life Elimination half-life is ~2 h for enalapril and ≥38 h for enalaprilat (also reported as 11 h).

Volume of Distribution 1.7 L/kg.

Protein Binding 50 to 60% bound.

Dose An initial dose of 5 mg daily is administered, followed by a maintenance dose of 10 to 20 mg daily. The maximum dose is 40 mg daily. In patients with renal impairment, or those also taking a diuretic and the elderly, an initial dose of 2.5 mg daily is administered.

Enallylpropymal

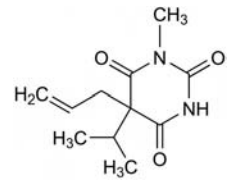
Barbiturate

$C_{11}H_{16}N_2O_3 = 224.3$

CAS—1861-21-8

IUPAC Name 1-Methyl-5-propan-2-yl-5-prop-2-enyl-1,3-diazinane-2,4,6-trione

Synonym 1-Methyl-5-(1-methylethyl)-5-(2-propenyl)-2,4,6(1*H*,3*H*,5*H*)-pyrimidinetrione



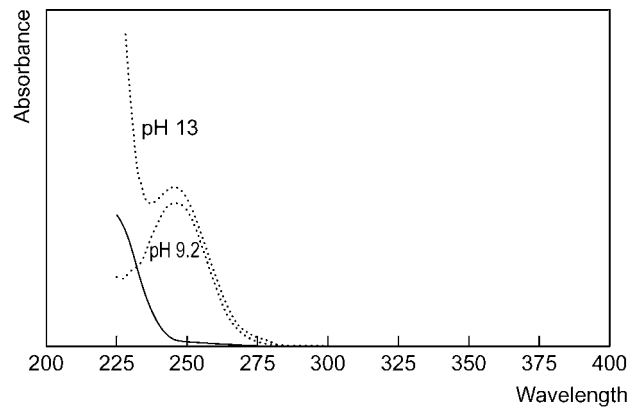
Chemical Properties Crystals. Mp 56° to 57°. Soluble in organic solvents. Log *P* (octanol/water), 1.6.

Thin-layer Chromatography System TD—R_f 0.71; system TE—R_f 0.58; system TF—R_f 0.71; system TH—R_f 0.87; system TAD—R_f 0.70.

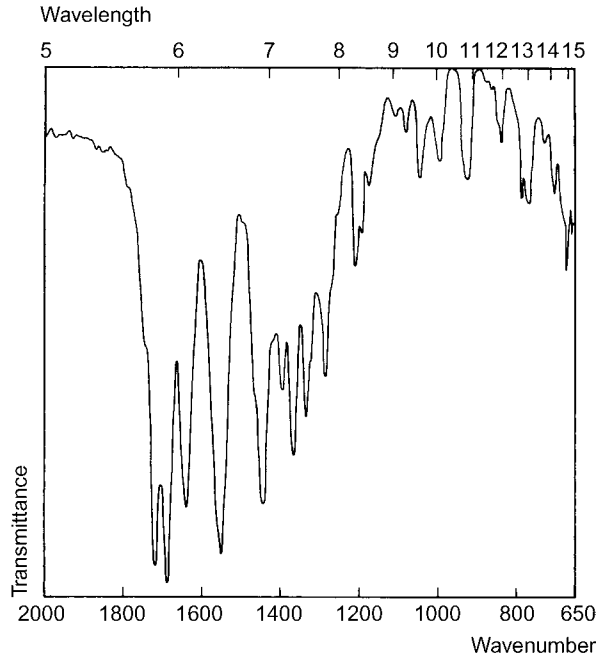
Gas Chromatography System GA—enallylpropymal RI 1560; enallylpropymal-Me_2 RI 1520.

High Performance Liquid Chromatography System HG—*k* 8.65; system HH—*k* 6.96; system HY—RI 394.

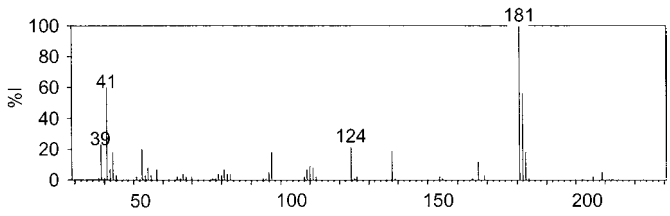
Ultraviolet Spectrum Borax buffer 0.05 mol/L (pH 9.2)—245 nm (A_1^1=329b); 1 mol/L sodium hydroxide (pH 13)—244 nm (A_1^1=362b).



Infrared Spectrum Principal peaks at wavenumbers 1689, 1718, 1550, 1640, 1285, 672 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 181, 41, 182, 39, 124, 53, 138, 97.



Encainide

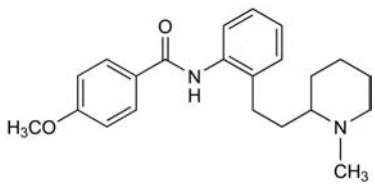
Antiarrhythmic

$C_{22}H_{28}N_2O_2$ = 352.5

CAS—66778-36-7; 37612-13-8

IUPAC Name 4-Methoxy-*N*-[2-[2-(1-methyl-2-piperidinyl)ethyl]phenyl] benzamide

Synonym MJ-9067-1



Chemical Properties pK_a 10.2. Log *P* (octanol/water), 4.24.

Encainide Hydrochloride

$C_{22}H_{28}N_2O_2$,HCl = 388.9

CAS—66794-74-9

Synonym MJ-9067

Proprietary Names *Enkade*; *Enkaid*.

Chemical Properties Crystalline powder. Mp 131.5° to 132.5°. It is freely soluble in water; slightly soluble in ethanol; insoluble in heptane.

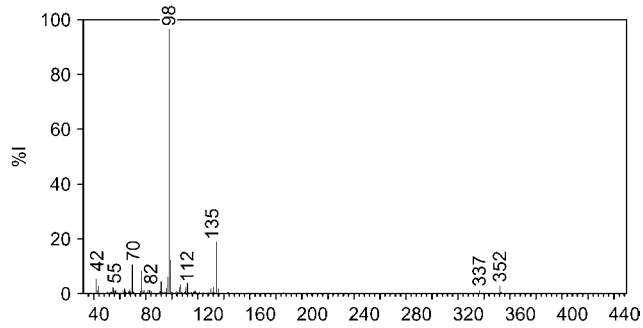
Thin-layer Chromatography System TB—R_f 0.28; system TE—R_f 0.54; system TAE—R_f 0.16.

Gas Chromatography System GA—RI 3016.

High Performance Liquid Chromatography System HX—RI 363; system HAX—retention time 9.4 min; system HAY—retention time 4.9 min.

Column: silica Resolve (150 mm × 4.6 mm i.d., 5 μm), (guard) 10 mm pre-column packed with same material. Mobile phase: methanol : water : methanesulfonic acid : triethylamine (400:4:0.02:0.02). Internal standard (IS): 4-methyl-propanolol. UV detection (λ=270 nm). Retention time: IS, 3.6 min; NDE, 4.5 min; ODE, 5.6 min; MODE, 6.3 min; encainide, 7.0 min [Poirier *et al.* 1990].

Mass Spectrum Principal ions at *m/z* 98, 135, 99, 70, 77, 97, 42, 112.



Quantification

***Plasma* HPLC** Column: phenyl μBondapak (300 × 3.9 mm i.d., 10 μm). Mobile phase: ethanol : water : methanesulfonic acid (500:30:0.1), flow rate 1.5 mL/min. UV detection (λ=254 nm). Retention time: encainide, 13.2 min; N-desmethyl encainide, 9.1 min; 3-methoxy-o-desmethyl encainide, 6.0 min; o-desmethyl encainide, 5.3 min. Limit of detection, 10 μg/L [Selinger, Crawhall 1989]. Column: silica Zorbax (250 × 4 mm i. d., 5 to 6 μm). Mobile phase: absolute ethanol : water : methanesulfonic acid (500:60:0.2), flow rate 1.0 mL/min. UV detection (λ=254 nm). Retention time: encainide, 9.29 min; 3-methoxy-o-desmethyl encainide (MODE), 8.15 min; o-desmethyl encainide (ODE), 7.11 min; N-desmethyl encainide (NDE), 6.00 min. Limit of detection, 5 μg/L [Bartek *et al.* 1988].

***Urine* HPLC** See Plasma. Limit of detection, 25 μg/L [Bartek *et al.* 1988].

Disposition in the Body Encainide is well absorbed and extensively metabolised in the liver to two active metabolites, (ODE) and (MODE). Inactive metabolites include (NDE) and sulfate and glucuronide conjugates. The extent of metabolism varies between individuals because there are extensive metabolisers and poor metabolisers. Approximately 7% of the Caucasian and Black population are poor metabolisers. Excretion varies between these individuals but is mainly via urine with approx. 30% of a dose present in faeces. 39% of an administered dose is found in the urine of poor metabolisers but only 4.9% for extensive metabolisers with 10.6% ODE and 3.6% MODE.

Therapeutic Concentration The serum therapeutic concentration range is 60 to 280 μg/L for the metabolite, MODE and 100 to 300 μg/L for ODE.

Eight healthy individuals, extensive and poor metabolisers, were administered a 50 mg dose encainide every 8 h. The extensive metabolisers reached plasma concentrations of 18 ± 6 μg/L encainide, 115 ± 11 μg/L ODE, 94 ± 10 μg/L MODE and <10 μg/L NDE. The poor metabolisers, however, had plasma concentrations of 450 μg/L encainide, 12 μg/L ODE and 80 μg/L NDE. No MODE was detected.

Six patients with hepatic disease were also studied with a dose of 50 mg encainide. Plasma concentrations of 63 ± 9 μg/L encainide, 87 ± 8 μg/L ODE and 113 ± 81 μg/L MODE were reached. No NDE was detected [Roden *et al.* 1988].

Toxicity Severe and potentially fatal ventricular tachycardia and cardiac arrest, congestive heart failure and seizures. Toxicity observed with ODE concentrations >300 μg/L.

Bioavailability 30% (extensive metabolisers) and 88% (poor metabolisers).

Half-life For encainide, 2.5 h (extensive metabolisers) and 8 to 11 h (poor metabolisers). For ODE, 4 to 8 h and MODE, 12 to 20 h.

Volume of Distribution Approximately 265 L.

Protein Binding Encainide is bound 70 to 78%, ODE 75 to 85% and MODE 92%.

Dose A usual dose of 100 to 200 mg daily is administered. In patients with renal clearance 10 to 50 mL/min: dose reduced by 50%, clearance <10 mL/min: initially 25 mg daily, which can be increased to a maximum of 150 mg daily.

Endosulfan

Insecticide

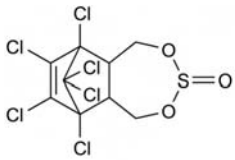
$C_9H_6Cl_6O_3S$ = 406.9

CAS—115-29-7; 959-98-8 (α-); 33213-65-9 (β-)

IUPAC Name 6,7,8,9,10,10-Hexachloro-1,5,5*a*,6,9,9*a*-hexahydro-6,9-methano-2,4,3-benzodioxathiepin-3-oxide

Synonyms Benzoepin; 1,4,5,6,7,7-hexachloro-8,9,10-trinorborn-5-en-2,3-yl-enebismethylene sulphite.

Proprietary Names *Malix*; *Thiodan*; *Thionex*.

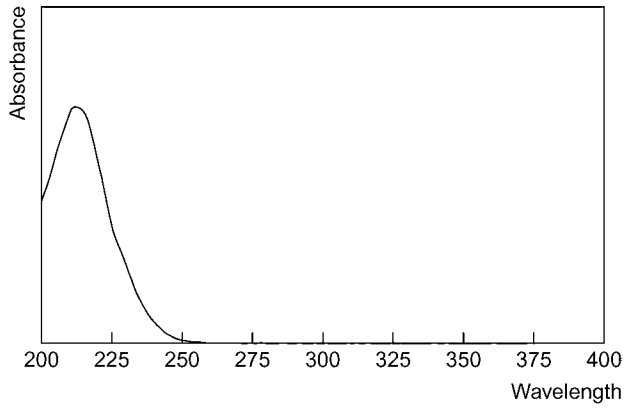


Chemical Properties Endosulfan is a mixture of 2 stereoisomers: the α-isomer, Mp 108° to 110°, accounts for ~70% of the technical grade and the β-isomer, Mp 208° to 210°, for ~30%. The technical grade is a brownish crystalline solid. Mp 70° to 100°. Practically insoluble in water; soluble in most organic solvents. Log *P* (octanol/water), 3.8.

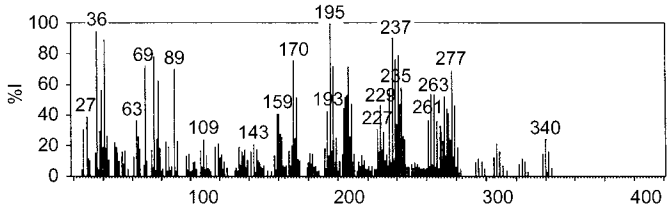
Thin-layer Chromatography System TX—R_f 0.40; system TY—R_f 0.77; system TZ—R_f 0.77; system TAA—R_f 0.95.

Gas Chromatography System GA—endosulfan RI 2090, M (sulfate) RI 2260, endosulfan II RI 2175; system GK—RRT 1.10 (relative to caffeine).

Ultraviolet Spectrum



Mass Spectrum Principal ions at *m/z* 195, 36, 237, 41, 241, 75, 239, 170.



Quantification

Blood **GC-MS** SIM acquisition mode. Limit of detection, 0.1 ng/L [Ramesh, Ravi 2003]. ECD. Limit of detection, 1.0 μg/L [Ramesh, Ravi 2002]. Column: Ultra-1 (25 m × 0.33 mm i.d., 200 μm). Carrier gas: He, 1.7 mL/min. Temperature programme: 60° for 3 min to 290° at 12°/min for 10 min. EI ionisation. Limit of quantification, 0.3 μg/L, limit of detection, 0.09 μg/L [Garcia-Repetto *et al.* 2001]. Column: OV-1 3% on Chromosorb G AW 80/100 mesh. Carrier gas: N_2, 50 mL/min. Temperature: 200° or 175°. ECD or FID. Limit of detection, 15 μg [Coutselinis *et al.* 1976].

Serum **GC-MS** Column: DB5-MS (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He. EI ionisation. Tissues **GC** See Blood [Coutselinis *et al.* 1976].

Disposition in the Body

Toxicity

In a death involving the ingestion of endosulfan dispersed in 55% xylene, the following concentrations of endosulfan were reported: blood 30 mg/L, liver 20 μg/g, kidney 2.0 μg/g and brain 0.3 μg/g; 0.5 g endosulfan and 0.4 g xylene were found in 50 mL stomach contents [Bernardelli, Gennari 1987].

In 6 reported cases of acute endosulfan intoxication, the 1 fatality had a blood endosulfan level of 2.85 mg/L compared with a mean of 0.48 mg/L in the survivors [Blanco-Coronado *et al.* 1992].

A 21-year-old woman who was 5 months pregnant ingested an unknown amount of endosulfan; the foetus died. Maternal blood levels were 0.47 μg/g. Highest levels of endosulfan were found in the liver and foetal kidneys [Sancewicz-Pach *et al.* 1997].

In a 43-year-old man who died 4 days after non-accidental ingestion of 100 mL of endosulfan (18 g, 260 mg/kg), the postmortem tissue concentrations of α-endosulfan, β-endosulfan and endosulfan sulfate, respectively, were adipose tissue 4.105 μg/g, –, –; liver <0.050, <0.055 and 3.034 μg/g; brain 0.080, 0.069 and 1.348 μg/g; kidney 0.059, <0.050 and 0.393 μg/g; and stomach contents 3.541, 1.391 and <0.080 μg/g. Blood concentrations 2.5 h after ingestion were 644, 101 and 874 μg/L, respectively, and declined to 106, 27 and 347 μg/L, respectively, at 7.5 h [Boereboom *et al.* 1998].

Cerebral oedema and cardiac failure developed following acute endosulfan poisoning in 2 subjects, 1 of whom died. Peak serum level of endosulfan in the survivor was 0.12 mg/L ~23 h after ingestion, whereas in the subject who died the peak blood level was 0.86 mg/L ~25 h after ingestion [Eyer *et al.* 2004].

In a retrospective study of 52 patients who presented with endosulfan toxicity, 16 patients died. Ingestion of endosulfan 35 g or more was associated with an increased risk of death [Moon, Chun 2009].

In a study on occupational exposure to pesticides on farms, mean baseline serum levels of endosulfan were 530 μg/L, which was considered high. After 1 day of spraying, serum levels of endosulfan increased by an average of 60 μg/L in workers applying the pesticide. Lower increases occurred in workers not directly involved in the spraying [Dalvie *et al.* 2009].

Note For other cases of endosulfan poisoning, see Brandt *et al.* [2001], Coutselinis *et al.* [1978], Demeter *et al.* [1977], Kucuker *et al.* [2009], Ramaswamy *et al.* [2008] and Satar *et al.* [2009].

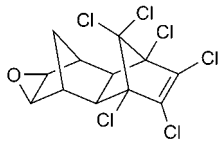
Endrin

Insecticide

$C_{12}H_8Cl_6O$ = 380.9

CAS—72-20-8

Synonym (1*a*α,2β,2*a*,β,3α,6α,6*a*β,7β,7*a*α)-3,4,5,6,9,9-Hexachloro-1*a*,2,2*a*,3,6,6*a*,7,7*a*-octahydro-2,7 : 3,6-dimethanonaphth[2,3-*b*]oxirene



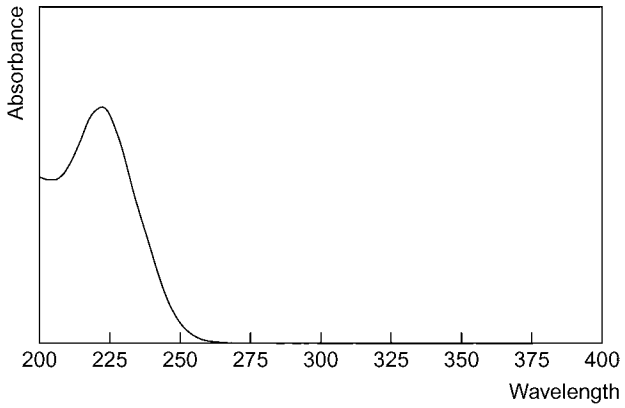
Chemical Properties White crystalline solid. Mp 245°, with decomposition. Practically insoluble in water; sparingly soluble in ethanol. Log *P* (octanol/water) 5.2.

Colour Tests Nitric–sulfuric acid—pink; sulfuric acid–fuming sulfuric Acid—pink-orange.

Thin-layer Chromatography System TAB—R_f 0.55; system TAC—R_f 0.35; system TX—R_f 0.71; system TY—R_f 0.90.

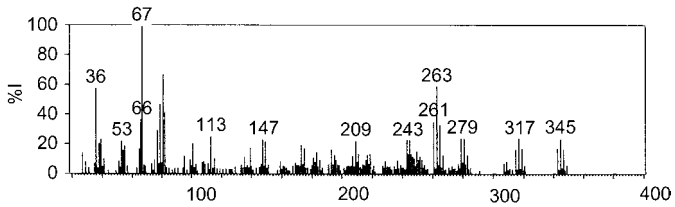
Gas Chromatography System GA—RI 2183; system GK—RT 1.19 relative to caffeine.

Ultraviolet Spectrum



Infrared Spectrum Principal peaks at wavenumbers 851, 750, 724, 1049, 889, 1010 cm^{-1} (Nujol mull).

Mass Spectrum Principal ions at *m/z* 67, 81, 263, 36, 79, 82, 261, 265.



Quantification

Blood **GC** Column: TC-1 dimethylsilicone (15 m × 0.53 mm i.d., 1.5 µm) or TC-17 50% phenylmethyl silicone (15 m × 0.53 mm i.d., 1 µm). Carrier gas: N_2, 15 kPa. Temperature programme: 100° or 150° for 0 or 2 min, respectively to 260° at 10°/min for 27 min. FTD or FID. Limit of detection, 25 µg/L [Moriya, Hashimoto 1999].

GC-MS Column: BP 5 fused silica capillary (12 m × 0.22 mm i.d.). Carrier gas: He, 2.6 mL/min. Temperature programme: 60° to 280° at 30°/min for 3 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection not reported [Kintz *et al.* 1992].

Serum **GC** Column: 5% phenyl methyl siloxane (30 m × 0.25 µm). Carrier gas: N_2, 30 mL/min. Temperature programme: 60° to 190° at 25°/min to 280° at 5°/min for 2 min. ECD. Limit of quantification, 1.4 µg/L [Delgado *et al.* 2002].

GC-MS Column: DB-5MS 5% phenylmethylpolysiloxane or DB-1MS 100% dimethylpolysiloxane (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He. Temperature programme: 80° to 290° at 10°/min for 9 min. CI, negative ion mode, or EI ionisation. Retention time: 17.2 min. Limit of quantification, 0.25 µg/L [Dmitrovic *et al.* 2002].

Urine **GC** See Blood [Moriya, Hashimoto 1999] Column: 3% OV-225 Gas-Chrom Q 100/120 mesh (1.5 m × 4 mm i.d.). Carrier gas: N_2, 145 mL/min. Temperature: 225°. Retention time: 1.3 and 3.25 min for 12-ketoendrin and anti-12-hydroxyendrin. Limit of detection 0.0048 mg/L [Baldwin, Hutson 1980].

GC-MS See Blood [Kintz *et al.* 1992].

Bile **GC** See Blood [Moriya, Hashimoto 1999].

GC-MS See Blood [Kintz *et al.* 1992].

CSF **GC** See Blood [Moriya, Hashimoto 1999].

Milk **GC** Column: SPB-608 capillary (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He. Temperature programme: 150° for 2 min to 200° at 15°/min to 290° at 5°/min for 10 min. ECD. Retention time: 24.9 min. [Al Saleh *et al.* 1998]. Column: 1.5% OV-17 or 1.9% OV-210 0n Gas-Chrom Q 80/100 mesh (6′ × 4 mm i.d.). Carrier gas: N_2, 80 mL/min. Temperature: 210°. Limit of detection not reported [Dogheim *et al.* 1996].

Pericardial Fluid **GC** See Blood [Moriya, Hashimoto 1999].

Stomach Contents **GC** See Blood [Moriya, Hashimoto 1999].

Vitreous Humour **GC** See Blood [Moriya, Hashimoto 1999].

Spleen **GC** See Cerebrum [Moriya, Hashimoto 1999].

Note For a colorimetric method for the detection of endrin in blood, urine or tissues, see Sane and Kamat [1981].

Disposition in the Body The major metabolite in the rat is *anti*-12-hydroxyendrrin, which is eliminated in the bile as the glucuronide but is excreted non-conjuated in the faeces. 12-Ketoendrin is a minor metabolite [Baldwin, Hutson 1980].

Toxicity

Endrin concentrations in blood 4 h, 6 days, and 11 days after ingestion of 12 g by a 49-year-old male were 450, 86 and 71 µg/L, respectively; corresponding dieldrin concentrations were 60, 19 and 19 µg/L. The man died on the 11th day following ingestion and at postmortem the tissue : blood ratios were as shown below.

Tissue	*Endrin concentration (mg/kg)*	*Ratio tissue/blood*
Adipose tissue	89.5	1260
Blood	0.071	1.0
Brain	0.89	12.5
Heart	0.87	12.3
Kidney	0.55	7.7
Liver	1.32	18.6

[Runhaar *et al.* 1985]

In a fatality attributed to the ingestion of endrin by an 86-year-old female, postmortem tissue concentrations, approximately 20 h after death, were (mg/L or µg/g): femoral vein blood 0.353, left cardiac chamber blood 0.615, thoracic aorta blood 0.542, bile 2.06, myocardium 0.467, cerebrum 1.93, cerebrospinal fluid 0.515, vitreous humour 1.67, left hilus of lung 6.20, right hilus of lung 1.19, liver 13.8, kidney none detected, right femoral muscle 2.08 and a stomach content total of 66 mg [Moriya, Hashimoto 1999].

A 21-year-old Caucasian female was found dead at home. The distribution of endrin (mg/L) was as shown below.

Tissue	*Endrin (mg/L)*
Blood	544.9
Bile	780.5
Stomach contents	47351.6
Urine	6.2

[Kintz *et al.* 1992]

Postmortem tissue concentrations from individuals from Pakistan, Qatar, and the Netherlands were as shown below.

Tissue	*Pakistan*	*Qatar*	*Netherlands*
Adipose	4010	N.D.	89500
Brain	1680	N.D.	890
Kidney	1760	116	100
Liver	1430	685	1320
Small intestine	13690	N.D.	N.D.
Stomach wall	N.D.	160	N.D.

N.D. Not determined [Rowley *et al.* 1987].

Note For reports of toxicity following shipments of endrin-contaminated flour, see Weeks [1967] or Coble *et al.* [1967]. For possible cases of endrin contamination of taquitos, see the Centre for Disease Control (CDC) [1989] or Waller *et al.* [1992].

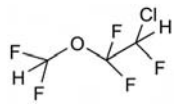
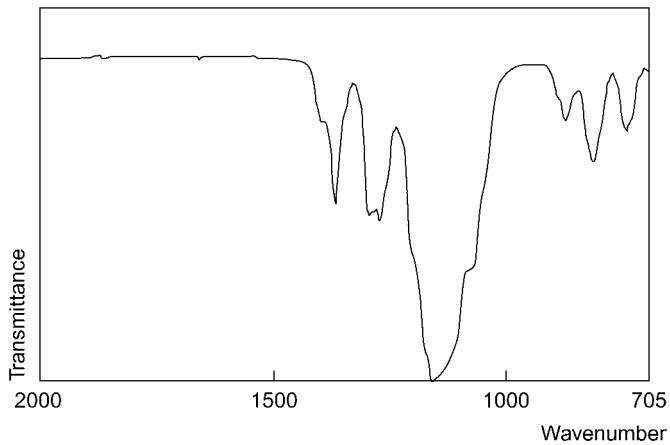
Enflurane

Anaesthetic (General)
$C_3H_2ClF_5O = 184.5$
CAS—13838-16-9

IUPAC Name 2-Chloro-1-(difluoromethoxy)-1,1,2-trifluoroethane
Synonyms Anaesthetic compound No. 347; 2-chloro-1,1,2-trifluoroethyl difluoromethyl ether; methylflurether; NSC-115944.
Proprietary Names *Alyrane*; *Efrane*; *Enfran*; *Enlirane*; *Ethrane*; *Etrane*.



Chemical Properties A colourless volatile liquid. Bp 56.5°. Relative density 1.516 to 1.519. Miscible with other organic liquids including fats and oils. Log *P* (octanol/water), 2.1.
Gas Chromatography System GA—RI 462; system GI—RT 8.3 min.
Infrared Spectrum



Quantification

Blood **GC** Column: Rtx-volatile fused silica capillary (30 m × 0.32 mm i.d., 1.5 µm). Carrier gas: He, 2 mL/min. Temperature programme: -40° for 1 min to 70° at 10°/min to 250° at 20°/min for 4 min. FID. Limit of detection, 10 µg/L [Kojima *et al.* 2001]. Column: DB-WAX (30 m × 0.53 mm i.d., 1.0 µm). Carrier gas: He, 20 mL/min. Temperature: 35°. FID. Limit of detection, 200 ng/0.25 g [Ise *et al.* 1997]. Column: SE-30 5% on Varaport 30 100/120 mesh (6 ft × 0.125 in o.d.). Temperature programme: 80° for 2 min to 200° at 50°/min for 1 min to 80°. TCD. Retention time: 0.8 min. Limit of detection, 1.5 µg/L [Miller, Gandolfi 1979].

GC-MS Column: DB-5 capillary (60 m × 0.25 mm i.d., 0.25 µm). Limit of quantification, ~20 mg/L [Yang *et al.* 2001]. Column: HP-WAX (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 35° for 5 min to 85° at 10°/min. Limit of detection, 200 ng/0.25 g [Ise *et al.* 1997].

Plasma **GC-MS** Column: DB-1 (30 m × 0.53 mm i.d., 5.0 µm). Carrier gas: He, 15 mL/min. Temperature: 60°. EI ionisation, positive ion mode, SIM acquisition mode. Limit of detection, 0.2 mg/L [Saito *et al.* 1995].

Reviews Toxicological and occupational/therapeutic monitoring of enflurane, desflurane, isoflurane and sevoflurane; a review of analytical methods, particularly GC methods with head space, purge and trap, or pulse heating extraction [Pihlainen, Ojanperä 1998].

In vaporisers, exhaled and inhaled gas mixtures, body fluids and tissues: enflurane, halothane, isoflurane and nitrous oxide, a review of GC methods [Uyanik 1997].

Disposition in the Body Enflurane is readily absorbed on inhalation. Approximately 50% of a dose is exhaled unchanged in 18 h and more than 80% is exhaled in 5 days. Less than 5% of a dose is excreted in the urine as non-volatile metabolites. Difluoromethoxydifluoroacetic acid has been identified as a urinary metabolite. Enflurane metabolism may be mainly catalysed by P450 isoform CYP2E1 [Kharasch *et al.* 1994].

Therapeutic Concentration

In 10 subjects receiving anaesthesia with 0.5–2.5% enflurane, a mean peak venous blood concentration of 95 mg/L was attained in 30 min, declining to 0.5 mg/L at 90 min after discontinuation of anaesthesia [Corall *et al.* 1977].

In 26 obese and 8 non-obese subjects given pharmacologically equivalent doses of enflurane (~2 h of monitored anaesthetic care), arterial enflurane reach maximal levels 3 times faster in obese than in non-obese subjects. The enflurane blood–gas partition coefficient was 30% lower in obese subjects and the rate at which inorganic fluoride appeared in serum of obese subjects (5.5 µmol/L/h) was twice that seen in non-obese subjects. Maximum serum fluoride occurred at 2 h post-anaesthesia and was 60% higher in obese subjects (27.8 vs 17 µmol/L), indicating increased biotransformation in obese subjects [Miller *et al.* 1980].

A mean peak serum fluoride concentration of 0.2 mg/L was attained 3 h after induction in 18 subjects receiving 0.6–2% of enflurane [Duvaldestin *et al.* 1981].

In 26 subjects undergoing cardiac surgery requiring hypothermic cardiopulmonary bypass, pre-bypass enflurane blood concentrations following delivered enflurane concentrations of 0.5%, 0.8% and 1% were 48, 52 and 115 mg/L, respectively. During hypothermia (28°), corresponding enflurane levels were 44, 56 and 145 mg/L, respectively, indicating that during cooling with enflurane at a concentration of 1% (but not with 0.5% and 0.8%) significant increases in blood levels occurred [Goucke *et al.* 2007].

Toxicity

A 21-year-old man found dead after apparent accidental intoxication with enflurane following its abuse had the following tissue concentrations $3^1/_2$ days later: blood 130 mg/L, brain 350 mg/L, SC fat 100 mg/L [Jacob *et al.* 1989].

An anaesthetist who was sniffing from an enflurane-moistened handkerchief before a road traffic accident was found to have an enflurane blood level of 2.92 mg/L, which was considered to have impaired his driving [Musshoff *et al.* 2002].

For a fatal enflurane poisoning by recreational inhalation, see Walker, Morano [1990].

Half-life ~36 h.
Dose For induction of anaesthesia, up to 4.5% of the vapour by inhalation; maintenance, 0.5 to 3% [Sweetman 2007].

Enoxacin

Antibiotic, Fluoroquinolone

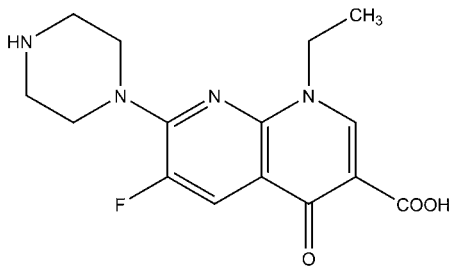
$C_{15}H_{17}FN_4O_3 = 320.3$

CAS—74011-58-8

IUPAC Name 1-Ethyl-6-fluoro-4-oxo-7-piperazin-1-yl-[1,8]naphthyridine-3-carboxylic acid

Synonyms AT-2266; CI-919; 1-ethyl-6-fluoro-1,4-dihydro-4-oxo-7-(1-piperazinyl)-1,8-naphthyridine-3-carboxylic acid; PD-107779.

Proprietary Names *Abenox*; *Comprecin*; *Flumark*; *Penetrex*.



Chemical Properties Crystals. Mp 220° to 224°. Soluble in water. pK_{a1} 6.3, pK_{a2} 8.7 [Jaehde *et al.* 1995; Neugebauer *et al.* 2005]. Log *P* (octanol/water), −0.20 [Sangster 1997], 0.387 [Wishart 2006]. Stock solutions stored refrigerated at 4° were stable for 2 months [Samanidou *et al.* 2005]. Stability was verified in serum refrigerated for 6 months [Samanidou *et al.* 2003]. Plasma and tissue extracts were stable for 4 days at 4° [Hamel *et al.* 1998].

Enoxacin Sesquihydrate

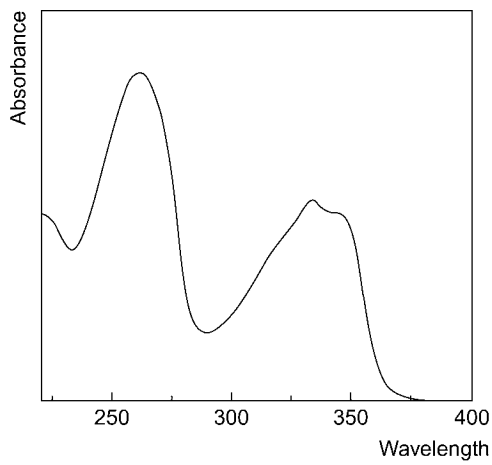
$C_{15}H_{17}FN_4O_3, {}^3/_2H_2O = 347.3$

CAS—84294-96-2

Proprietary Names *Bactidan*; *Enoxen*; *Enoxor*; *Gyramid*.

High Performance Liquid Chromatography Column: PerfectSil Target ODS-3 (250 × 4 mm i.d., 5 µm) Mobile phase: 0.1% trifluoroacetic acid : acetonitrile : methanol (80 : 10 : 10 for 10 min to 80 : 20 : 0 at 20 min to 45 : 55 : 0 at 30 min for 3 min to 80 : 10 : 10 at 33.1 min), flow rate 1.2 mL/min. DAD (λ = 275 nm). Limit of detection, 0.2 mg/L [Samanidou *et al.* 2005].

Ultraviolet Spectrum Aqueous acid—268, 219, 338 nm.



Infrared Spectrum Principal peaks at wavenumbers 2400 to 2000, 1615 cm^{-1} (KBr disk).

Quantification

***Plasma* HPLC** Column: C_{18} Nucleosil (250 × 4.0 mm i.d., 5 µm). Mobile phase: acetonitrile : 95 mmol/L citric acid–35 mmol/L ammonium perchloride (pH 2.1) : tetrabutylammonium hydroxide (209 : 788 : 3), flow rate 0.9 mL/min. UV detection (λ = 340 nm). Limit of quantification, 20 µg/L [Hamel *et al.* 1998]. Column: reversed phase (125 × 4.6 mm i.d.). Mobile phase: 0.1 mol/L citric acid buffer containing 22 mmol/L ammonium perchlorate : acetonitrile containing 5 mmol/L ion pairing reagent (88 : 12). UV detection (λ = 340 nm). Limit of quantification, 41.9 µg/L [Well *et al.* 1998]. Column: reversed phase Waters C_{18} (300 × 3.9 mm i.d., 10 µm). Mobile phase: 0.08 mol/L potassium dihydrogen phosphate and 6 mmol/L tetrabutylammonium hydroxide (pH 2.5 in 1 L of dH_2O, plus 350 mL methanol), flow rate 2.0 mL/min. UV detection (λ = 268 nm). Limit of detection, 50 µg/L [Zhai *et al.* 1995]. Column: Spherisorb ODS II C_{18} (5 µm). Mobile phase: acetonitrile : 0.1 mol/L citric acid–40 mmol/L ammonium perchlorate–5 mmol/L tetrabutylammonium hydroxide (12 : 88 to 14 : 86), flow rate 1.0 to 2.0 mL/min. UV detection (λ= 340 nm). Limit of quantification, 39 µg/L [Jaehde *et al.* 1995].

***Serum* HPLC** Column: Nova-Pak C_{18} (150 × 3.9 mm i.d.). Mobile phase: 30 mmol/L dipotassium hydrogen phosphate trihydrate (pH 3.0) : tetrahydrofuran (97 : 3). Fluorometric detection (λ_{ex} = 277 nm, λ_{em} = 409 nm). Limit of detection, 4.9 µg/L [Espinosa-Mansilla *et al.* 2005]. Column: Kromasil 100 C_8 (250 × 4 mm i. d., 5 µm). Mobile phase: acetonitrile : methanol : 0.4 mol/L citric acid (7 : 15 : 78), flow rate 1.2mL/min. UV detection (λ = 275 nm). Limit of detection, 1 µg/L [Samanidou *et al.* 2003].

***Oral Fluid* HPLC** Column: reversed phase Waters C_{18} (300 × 3.9 mm i.d., 10 µm). Mobile phase: 0.08 mol/L potassium dihydrogen phosphate and 6 mmol/L tetrabutylammonium hydroxide (pH 2.5 in 1 L of dH_2O, plus 350 mL methanol), flow rate 2.0 mL/min. UV detection (λ= 268 nm). Limit of detection, 50 µg/L [Zhai *et al.* 1995].

***Urine* LC-MS** Column: YMC/3-4-5 (50 × 4.0 mm i.d., 3 µm). Mobile phase: acetonitrile : water with 0.02 mol/L formic acid (pH 2.75; 2 : 98 to 57 : 43 in 10 min), flow rate 1 mL/min. ESI, MRM acquisition mode. Retention time: 3.68 min. Limit of detection not reported [Volmer *et al.* 1997].

HPLC Column: Nova-Pak C_{18} (150 × 3.9 mm i.d.). Mobile phase: 30 mmol/L dipotassium hydrogen phosphate trihydrate (pH 3.0) : tetrahydrofuran (96 : 4). Fluorometric detection (λ_{ex} = 277 nm, λ_{em} = 409 nm). Limit of detection, 4.9 µg/L [Espinosa-Mansilla *et al.* 2005]. Column: reversed phase (125 × 4.6 mm i.d.). Mobile phase: 0.1 mol/L citric acid buffer containing 22 mmol/L ammonium perchlorate : acetonitrile containing 5 mmol/L ion pairing reagent (88 : 12). UV detection (λ = 340 nm). Limit of quantification, 99.1 µg/L [Well *et al.* 1998]. See Plasma. Limit of quantification, 1.95 mg/L [Jaehde *et al.* 1995].

***Nasal Secretions* HPLC** See Plasma. Limit of quantification, 78 µg/L [Jaehde *et al.* 1995].

***Tissues* HPLC** Column: C_{18} Nucleosil column (250 × 4 mm i.d., 5 µm). Mobile phase: acetonitrile : 95 mmol/L citric acid–35 mmol/L ammonium perchloride (pH 2.1) tetrabutylammonium hydroxide (209 : 788 : 3), flow rate 0.9 mL/min. UV detection (λ = 340 nm). Limit of quantification, 50 µg/kg [Hamel *et al.* 1998].

***Other* LC-MS** Cow M ilk. See Urine. Limit of quantification, 2 mg/L, limit of detection, 2 mg/L [Volmer *et al.* 1997].

CE Pig Muscle. Capillary: uncoated fused silica (48.5 cm × 50 µm i.d., 40.0 cm to detector). Buffer: 25 mmol/L sodium dihydrogen phosphate with 25 mmol/L borax with 25 mmol/L boric acid (pH 9.0). DAD (λ = 280 nm). Limit of quantification, 0.075 mg/kg, limit of detection, 0.023 mg/kg [Sun *et al.* 2007].

Disposition in the Body Approximately 60% of enoxacin is excreted unchanged in the urine [Hamel *et al.* 1998] and another 10 to 15% is excreted as an active metabolite (3-oxoenoxacin).

Therapeutic Concentration

After an overnight fast, 11 healthy male volunteers were administered a single dose of 428 mg enoxacin IV over 60 min. Mean peak plasma concentrations of enoxacin and 3′-oxoenoxacin were 4.42 mg/L and 0.44 mg/L, respectively. Mean peak saliva concentrations for the same analytes were very similar at 4.14 mg/L and 0.11 mg/L, respectively. Mean peak enoxacin concentrations in tears and sweat were measured as 0.72 and 0.35 mg/L, respectively [Jaehde *et al.* 1995].

Bioavailability Approximately 90%.

Half-life Plasma, 5.1 h; oral fluid, 3.75 h; nasal secretions, 5.13 h; tears, 6.03 h and sweat, 8.27 h.

Volume of Distribution Steady state, 191 L.

Clearance 360 mL/min.

Protein Binding Approximately 51%.

Dose 200 to 400 mg twice daily.

Enoxaparin

Anticoagulant
CAS—74011-58-8

IUPAC Name 1-Ethyl-6-fluoro-4-oxo-7-piperazin-1-yl-1,8-naphthyridine-3-carboxylic acid
Synonyms Enoxaparine; low molecular weight Heparin; PK10169; RP-54563.
Proprietary Name *Lovenox*
Note Low molecular weight fragment of depolymerised heparin = ~4000–6000 Da.
Chemical Properties Obtained by peroxide fragmentation of heparin sodium.

Enoxaparin Sodium

CAS—9041-08-1
Synonyms Enoxaparinum natricum; heparin sodium.
Proprietary Names *Clexane*; *Decipar*; *Klexane*; *Lovenox*; *Plancina*; *Trombenox*; *Ultraparin*.

Quantification

Plasma **Bioassay** For method for bioassay of antifactor II_a activity, see Larsen *et al.* [1978].
Disposition in the Body Enoxaparin is rapidly and completely absorbed after SC injection with a peak plasma activity reached in 1–5 h. It is metabolised in the liver by desulfation and depolymerisation. It is excreted via the kidneys and is found unchanged and as its metabolites in urine. Enoxaparin is poorly absorbed after oral administration.
Therapeutic Concentration
Twelve healthy volunteers were administered with single doses of 20, 40, 60 and 80 mg enoxaparin. Peak plasma concentrations were between 1.6 and 7.5 mg/L and were reached between 2.3 and 4.0 h [Frydman *et al.* 1988].
Toxicity Large oral doses should not lead to any serious effects. Accidental overdosing, by parenteral administration, may lead to haemorrhagic problems with severe bleeding. Risk of bleeding increases with plasma concentrations of antifactor X_A >0.4 units/mL.
Bioavailability About 92%.
Half-life 4 to 5 h, 6 to 7 h in the elderly.
Volume of Distribution Between 5.2 and 9.3 L.
Clearance Total body clearance varies from 0.8 to 1.9 L/h.
Protein Binding Enoxaparin binds endogenous plasma proteins, for example, histidine-rich glycoprotein and fibronectin.
Note For a review of the pharmacokinetics of enoxaparin, see Noble *et al.* [1995]. For a review of low-molecular-weight heparins, see Cziraky and Spinler [1993].
Dose Dose ranges from 1 mg (100 International Units, IU)/kg body weight every 12 h with increases in 0.5 to 1 mg/kg body weight increments to a single dose of 40 mg (2000 IU) once daily.

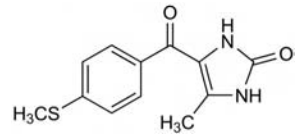
Larsen ML *et al.* (1978). Assay of plasma heparin using thrombin and the chromogenic substrate H-D-Phe-Pip-Arg-pNA (S-2238). *Thromb Res* 13(2): 285–288.
Noble S *et al.* (1995). Enoxaparin. A reappraisal of its pharmacology and clinical applications in the prevention and treatment of thromboembolic disease. *Drugs* 49: 388–410.

Enoximone

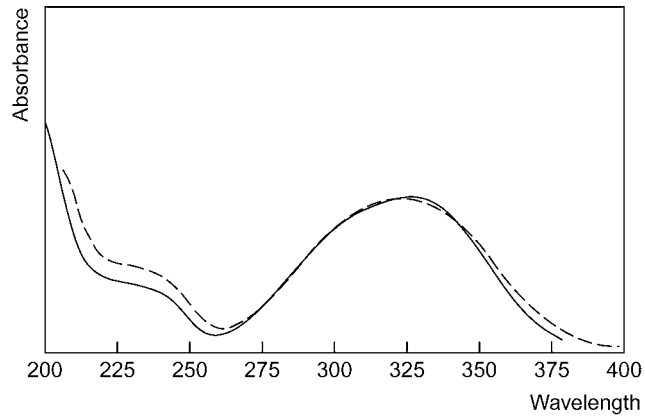
Vasodilator, Inotrope
$C_{12}H_{12}N_2O_2S$ = 248.3
CAS—77671-31-9

IUPAC Name 4-Methyl-5-(4-methylsulfanylbenzoyl)-1,3-dihydroimidazol-2-one
Synonyms 1,3-Dihydro-4-methyl-5-[4-(methylthio)benzoyl]-2*H*-imidazol-2-one; fenoximone; MDL-17043; MDL-19438; RMI-17043; YMDL-17043.

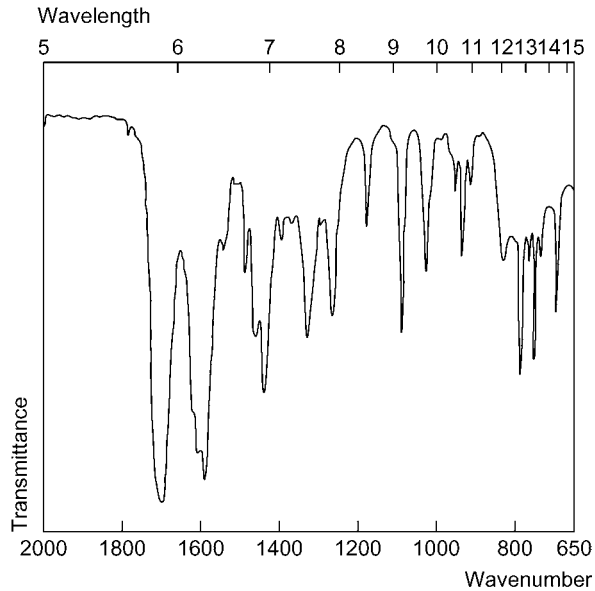
Proprietary Names *Perfan*; *Perfane*.



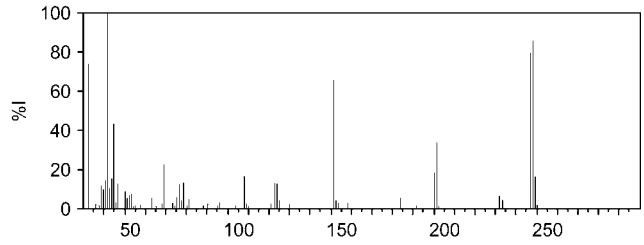
Chemical Properties Crystalline powder. Mp 255° to 258° with decomposition. Log *P* (octanol/water), 1.86.
High Performance Liquid Chromatography Column: C_{18} ODS Ultraspher (150 × 4.6 mm i.d., 5 µm). Mobile phase: water : acetonitrile (86:14) for 3 min, to (10:90) in 6 min, back to original conditions in 1 min, flow rate 1 mL/min. UV detection (λ=365 nm). Internal standard (IS): MDL 82249. Retention times: enoximone, 8.25 min; enoximone sulfoxide, 2.47 min; IS, 7.75 min [Tarral *et al.* 1990].
Ultraviolet Spectrum Aqueous acid—327 nm.



Infrared Spectrum Principal peaks at wavenumbers 1700, 1610, 1435, 1325, 830, 1090 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 42, 248, 247, 32, 151, 45, 201, 69.



Quantification
Plasma **HPLC** UV detection (λ=340 nm). Limit of quantification, 0.005 and 0.01 mg/L for enoximone and the metabolites, respectively [Morita *et al.* 1995].
Serum **HPLC** UV detection (λ=335 nm). Limit of detection, 0.01 mg/L for enoximone and metabolite [Cooper, Turnell 1986]. Limit of quantification, is 0.05 mg/L for enoximone and sulfoxide metabolite [Chan *et al.* 1984].
Urine **HPLC** UV detection (λ=340 nm). Limit of quantification, 0.5 and 1.0 mg/L for enoximone and the metabolites, respectively [Morita *et al.* 1995].
Disposition in the Body Following IV injection or infusion it undergoes metabolism in the liver to an active sulfoxide metabolite (piroximone). It is excreted primarily via the kidney, as metabolites in urine. After an IV dose, ~70% is excreted in urine as metabolites and 1% as the unchanged drug.
Therapeutic Concentration
Twenty infants, aged between 0.6 and 49.7 weeks (median 6.0 weeks), were administered a loading dose of 1 mg/kg enoximone over 2 min, followed by an infusion of 10 µg/kg/min for a median time of 97 h (24 to 572 h). The infants were already anaesthetised for weaning from cardiopulmonary bypass. The maximum plasma concentration ranged between 0.708 and 6.893 mg/L (median 1.536 mg/L) [Booker *et al.* 2000].
Twenty-three healthy male Japanese volunteers with a mean age of 22.0 years (range, 20 to 27 years) were administered either a 0.25, 0.5 or 1.0 mg/kg single IV bolus dose at 2-weekly intervals; or a single 2.0 mg/kg dose; or a single 1.0 mg/kg bolus dose on day 1 followed by 3-hourly interval doses on day 2; or a single 10 µg/kg/min continuous infusion over a 4-h period. In the first part of the study, the peak concentrations for the 0.25, 0.5, 1.0 and 2.0 mg/kg dose were 0.31, 1.82, 3.40 and 5.38 mg/L, respectively observed at 0.06, 0.01 and 0.0 h. The sulfoxide metabolite concentrations were 0.23, 0.53, 1.08 and 1.82 mg/L at 0.25, 0.25, 0.17 and 0.19 h for the four doses, respectively. The multiple dosing with a 1 mg/kg dose produced peak concentrations of 2.35 mg/L at 3.21 h. The single 10 µg/kg/min dose produced concentrations of 0.51 mg/L at 4.0 h [Morita *et al.* 1995].
Toxicity Severe supraventricular and ventricular arrhythmias can occur.
Half-life In healthy volunteers, 1 to 4 h, in patients with heart failure, 6 h (bolus injections), 8 h (continuous infusion); infants (0.6 to 49.7 weeks) 1.4 to 10.9 h (median 6.4); sulfoxide, 2.9 to 17.7 h (median 7.4).
Volume of Distribution 1.1 to 3.6 L/kg; 1.4 to 15.5 L/kg (median 3.8) (infants aged 0.6 to 49.7 weeks).
Clearance Plasma clearance, 3.7 to 13.0 mL/min/kg; 2.4 to 18.9 mL/min/kg (median 9.2) (infants aged 0.6 to 49.7 weeks).
Protein Binding 85%.
Dose Maximum of 24 mg/kg IV in 24 h.

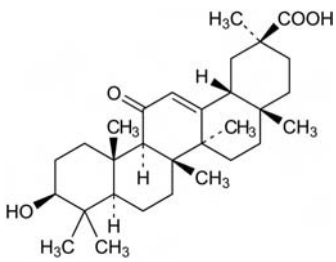
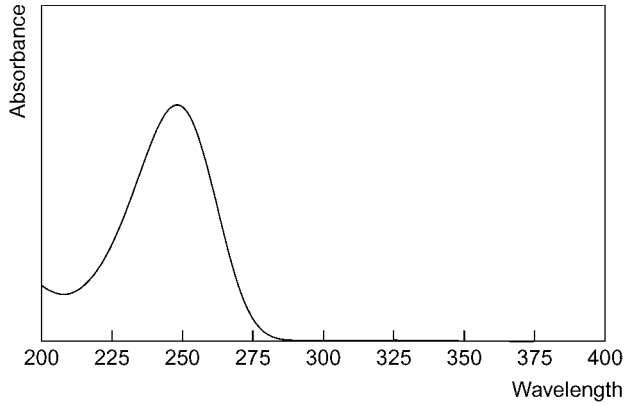
Enoxolone

Dermatological Agent
$C_{30}H_{46}O_4$ = 470.7
CAS—471-53-4

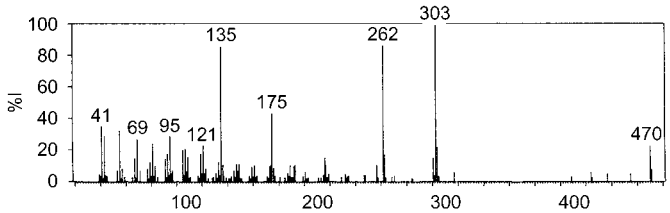
IUPAC Name (2*S*,4a*S*,6a*R*,6a*S*,6b*R*,8a*R*,10*S*,12a*S*,14b*R*)-10-Hydroxy-2,4a,6a,6b,9,9,12a-heptamethyl-13-oxo-3,4,5,6,6a,7,8,8a,10,11,12, 14b-dodecahydro-1*H*-picene-2-carboxylic acid
Synonyms Glycyrrhetic acid; glycyrrhetinic acid; (3β,20β)-3-hydroxy-11-oxo-olean-12-en-29-oic acid.
Proprietary Names *Arthrodont*; *PO 12*. It is an ingredient of *Gelclair*.



Chemical Properties A white or faintly cream-coloured powder. Mp 296°. Very sparingly soluble in water; soluble in ethanol, ether, pyridine and acetic acid; freely soluble in chloroform and dioxane; practically insoluble in petroleum ether. Log *P* (octanol/water), 6.9.
Colour Tests Antimony pentachloride—orange-brown→violet; naphthol–sulfuric acid—red-brown/orange; sulfuric acid—yellow
Thin-layer Chromatography System TD—R_f 0.21; system TE—R_f 0.07; system TF—R_f 0.46; system TAD—R_f 0.47.
Ultraviolet Spectrum Aqueous acid—254 nm; aqueous alkali—260 nm (A^1_1=338b).



Mass Spectrum Principal ions at *m/z* 303, 262, 135, 175, 41, 55, 43, 95.

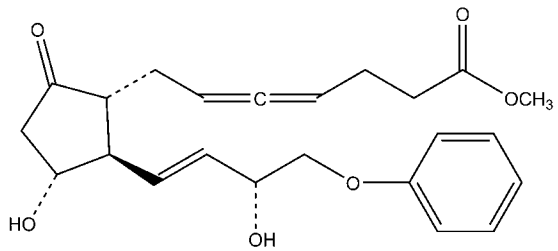


Disposition in the Body Enoxolone is a metabolite of carbenoxolone.
Use Has been used topically in a concentration of 2%.

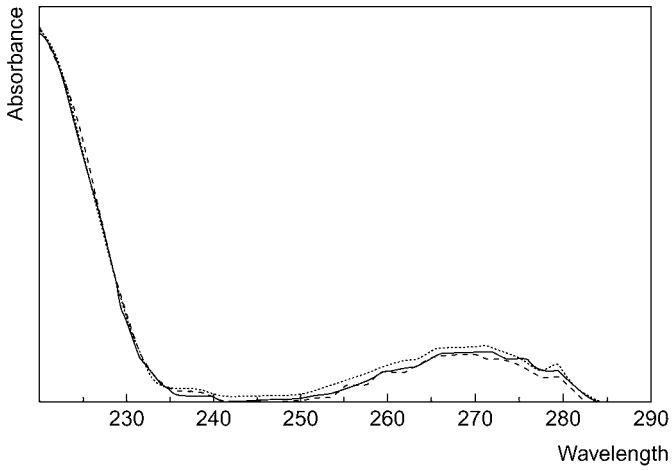
Enprostil

Antiulcerative, Prostaglandin
$C_{23}H_{28}O_6$ = 400.5
CAS—73121-56-9

IUPAC Name Methyl 7-[(1*R*,2*R*,3*R*)-3-hydroxy-2-[(*E*,3*R*)-3-hydroxy-4-(phenoxy)but-1-enyl]-5-oxocyclopentyl]hepta-4,5-dienoate
Synonyms rel-7-[(1*R*,2*R*,3*R*)-3-Hydroxy-2-[(1*E*,3*R*)-3-hydroxy-4-phenoxy-1-butenyl]-5-oxocyclopentanyl]-4,5-heptadienoic acid methyl ester; (*dl*)-9-keto-11α,15α-dihydroxy-16-phenoxy-17,18,19,20-tetranorprosta-4,5,13-*trans*-trienoic acid methyl ester; methyl (*E*)-(11*R*,15*R*)-11,15-dihydroxy-9-oxo-16-phenoxy-17,18,19,20-tetranorprosta-4,5,13-trienoate; methyl 7-{(*E*)-(3*R**)-3-hydroxy-2-[(1*R**,2*R**,3*R**)-3-hydroxy-4-phenoxybut-1-enyl]-5-oxocyclopentyl}hepta-4,5-dienoate; RS-84135.
Proprietary Names *Camleed*; *Fundyl*; *Gadrin(e)*; *Gardrin*.



Chemical Properties White to off-white waxy solid. Soluble in alcohol, propylene glycol and propylene carbonate. Slightly soluble in water. Log *P* (octanol/water), 1.45 [ACD 2007].
High Performance Liquid Chromatography Column: Partisil 5 ODS-3 (100 × 4.6 mm i.d., 5 µm). Mobile phase: tetrahydrofuran : methanol : 1 mmol/L phosphate buffer (pH 6.5; 15 : 30 : 55), flow rate 1.0 mL/min. UV detection (λ = 220 nm). Retention time: 8 min. Limit of quantification, 4 µmol/L [Kenley *et al.* 1986a].
Ultraviolet Spectrum Tetrahydrofuran : methanol : phosphate buffer—268 nm Kenley *et al.* [1986a].



Quantification

Plasma **HPLC** Column: Spheri-5 normal phase silica (100 × 4.6 mm i.d., 5 µm) followed by Column: NC2 Spheri-5 silica (220 × 4.6 mm i.d., 5 µm). Mobile phase: dichloromethane : acetonitrile (20 : 70); or Column: Chemcosorb 7CN reversed phase (250 × 4.6 mm i.d., 7 µm). Mobile phase: methanol : water : acetic acid (40 : 60 : 0.1), flow rate 1.0 mL/min. Fluorometric detection (λ_{ex} = 325 nm). Limit of quantification, 5 ng/L [Kiang *et al.* 1991].

Other **HPLC** Capsules. Column 1: Sphericel C_{18} (300 × 4.6 mm i.d., 10 µm). Mobile phase 1: water, flow rate 1.5 mL/min. Column 2: Partisil 10 cation exchange (250 × 4.6 mm i.d., 10 µm). Mobile phase 2: tetrahydrofuran : methanol : 1.0 mmol/L ammonium phosphate buffer (pH 2.4; 15 : 35 : 50), flow rate 1.0 mL/min. UV detection (λ = 220 nm). Retention time: 10.8 min. Limits of quantification and detection not reported [Kenley *et al.* 1986b].

Disposition in the Body Eliminated predominantly via the urine, with approx. 53% excreted after 48 h. After 144 h, a further 34% is eliminated via the faeces.

Therapeutic Concentration

Plasma concentrations in subjects administered an oral dose of 70 µg enprostil were measured at 15, 30, 60, 90 and 120 min post-dose and reported as 24, 113, 27, 21 and 7 µg/L, respectively. The plasma level at 3 h post-dose was below the limit of quantification of the HPLC–LIFD method used [Kiang *et al.* 1991].

Following a single oral dose of 1 µg/kg [^{3}H]enprostil administered to 4 healthy volunteers, plasma concentrations of 0.94 µg·equiv/L (enprostil plus unidentified metabolites) were reached within 30 to 60 min [Goa, Monk 1987].

Note For a study on the efficacy of enprostil combined with cimetidine compared with cimetidine alone in treating gastric ulcers, see Murata *et al.* [2005].

Half-life Approximately 34 h.

Dose In acute treatment of adults with duodenal or gastric ulcers, 35 µg orally, twice daily for at least 4 weeks.

Entacapone

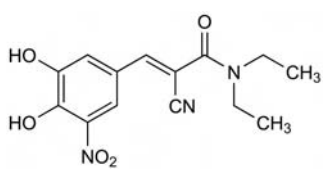
Dopaminergic Agent, Antiparkinsonian

$C_{14}H_{15}N_3O_5$ = 305.3

CAS—130929-57-6

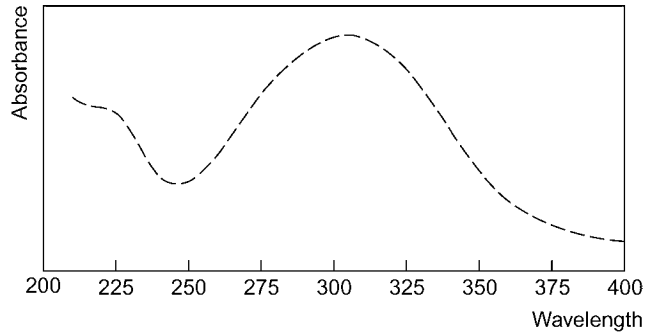
IUPAC Name (E)-2-Cyano-*N*,*N*-diethyl-3-(3,4-dihydroxy-5-nitrophenyl)acrylamide

Proprietary Names *Comtan*; *Comtess*.

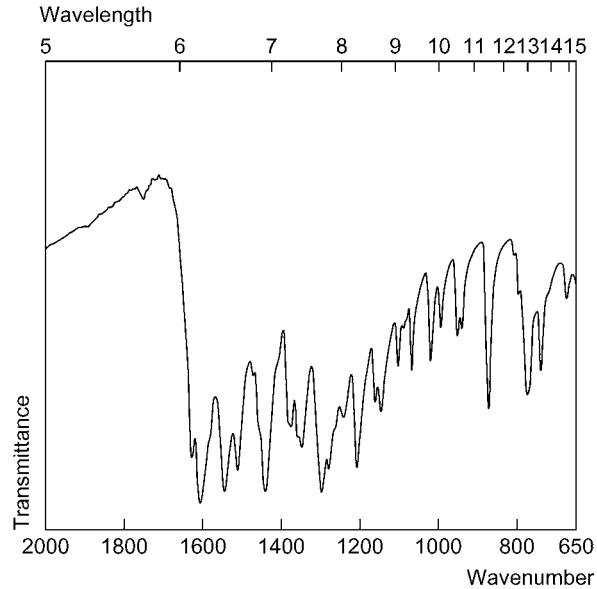


Chemical Properties Powder. Mp 153° to 156°. pK_a 4.5. Extraction yield (chlorobutane), 0 [Demme *et al.* 2005].

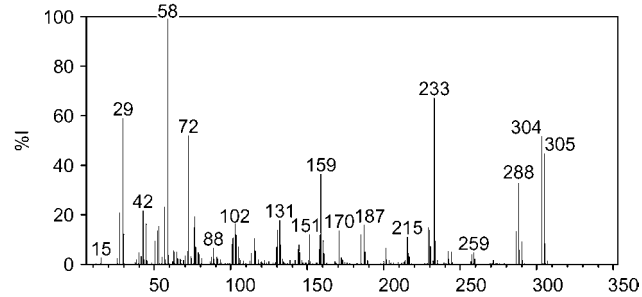
Ultraviolet Spectrum Neutral—306 nm.



Infrared Spectrum Principal peaks at wavenumbers 2209, 1630, 1610, 1537 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 58, 233, 29, 304, 72, 305, 159, 288.



Quantification

Plasma **HPLC** Amperometric detection. Limit of quantification, 0.01 mg/L [Karlson, Wikberg 1992].

Urine **HPLC** Column: ODS-2 silica Spherisorb (150 × 4.6 mm i.d., 5 µm). Mobile phase: 25 mmol/L sodium dihydrogen phosphate buffer and 10 mmol/L citric acid buffer (pH 2.2) : methanol (55:45), flow rate 1.0 mL/min. UV detection (λ=310 nm). Retention time: entacapone, 9.5 min; (*Z*)-entacapone, 5.8 min. Limit of detection, 0.5 mg/L [Wikberg *et al.* 1993].

Disposition in the Body Entacapone is rapidly absorbed from the gastrointestinal tract and undergoes extensive first-pass metabolism. Entacapone is converted to its (*cis*)-isomer, (*Z*)-entacapone, the main metabolite in plasma, followed by direct glucuronidation to inactive glucuronide conjugates. Four metabolites have been observed—M3, M6, M8 and M10. Elimination is mainly via faeces (80 to 90%) and the remainder in urine as glucuronide conjugates and (*Z*)-isomer.

Therapeutic Concentration

Twelve healthy males were administered single oral doses of entacapone: 5, 25, 50, 100, 200, 400 and 800 mg. Peak plasma concentrations ranged from 62 to 7280 µg/L, with increasing dose, and were reached between 0.46 and 0.88 h [Keranen *et al.* 1994].

Toxicity No special hazard to humans, anaemia observed in repeated dose toxicity studies.
Bioavailability Approximately 35% (oral).
Half-life Elimination half-life, $t_{1/2}$ (α-phase) 0.27 to 0.37 h and (β-phase) 1.59 to 3.10 h.
Volume of Distribution 181 L.
Clearance Total clearance, 800 mL/min.
Protein Binding Extensively binds to plasma proteins and serum albumin ~98%.
Dose A usual dose of 200 mg entacapone, up to ten times a day, with a maximum of 2000 mg.

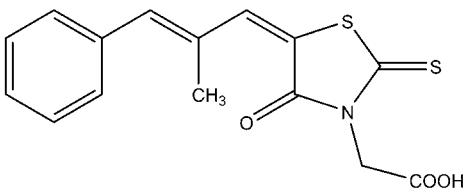
Epalrestat

Antidiabetic, Thiazolidine
$C_{15}H_{13}NO_3S_2 = 319.4$
CAS—82159-09-9

IUPAC Name 2-[(5*Z*)-5-[(*E*)-2-Methyl-3-phenylprop-2-enylidene]-4-oxo-2-sulfanylidene-1,3-thiazolidin-3-yl]acetic acid
Synonyms 3-Carboxymethyl-5-(2-methylcinnamylidene)rhodanine; 5-[(*E*,*E*)-β-methylcinnamylidene]-4-oxo-2-thioxo-3-thiazolidine-acetic acid; (5*Z*)-5-[(2*E*)-2-methyl-3-phenyl-2-propenylidene]-4-oxo-2-thioxo-3-thiazolidineacetic acid; ONO-2235.
Proprietary Names *Kinedak*; *Sorbistat*.



Chemical Properties Crystals from ethanol–water. Mp 210° to 217°.

Epalrestat *N*-Methyl-D-Glucamine
$C_{22}H_{30}N_2O_8S_2 = 514.6$
Chemical Properties Crystals from methanol. Mp 163° to 165°.

Disposition in the Body Metabolised to mono- and dihydroxyphenylepalrestat as sulfate conjugates and, together with unchanged drug, these are present in both serum and urine. There is some evidence that epalrestat binds to serum albumin.

Therapeutic Concentration

Single oral doses of 50, 100 and 200 mg epalrestat were administered to 7 healthy male volunteers. Mean peak plasma concentrations of the drug and its metabolites were as follows:

Dose (mg)	*Compound*	*C_{max} (mg/L)*	*Time (h)*
50	Epalrestast	3.9	1
	4-OH Metabolite	0.5	2
	3,4-$(OH)_2$ Metabolite	–	–
100	Epalrestast	7.4	2
	4-OH Metabolite	1.2	2
	3,4-$(OH)_2$ Metabolite	0.4	2
200	Epalrestast	13.6	2
	4-OH Metabolite	2.10	2
	3,4-$(OH)_2$ Metabolite	0.70	2

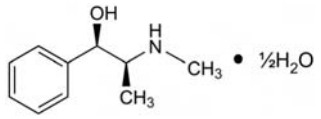
The half-life was in the range 0.8 to 1.1 h [Steele *et al.* 1993].
Half-life Approximately 1 h.
Dose Recommended, 50 mg three times daily before meals.

Steele JW *et al.* (1993). Epalrestat. A review of its pharmacology, and therapeutic potential in late-onset complications of diabetes mellitus. *Drugs Aging* 3: 532–555.

Ephedrine

Sympathomimetic
$C_{10}H_{15}NO,½H_2O = 174.2$
CAS—50906-05-3

IUPAC Name (1*R*,2*S*)-2-(Methylamino)-1-phenylpropan-1-ol hydrate
Synonyms Hydrated ephedrine; (α*R*)-α-[(1*S*)-1-(methylamino)ethyl]benzenemethanol hemihydrate.
Proprietary Names It is an ingredient of *Franolyn Expectorant* and *Letigen*.



Chemical Properties An alkaloid obtained from species of *Ephedra*, or prepared synthetically. Colourless crystals or white crystalline powder or granules that decompose on exposure to light. Mp 40° (hemihydrate); in warm weather it slowly volatilises. Soluble 1 in 20 of water and 1 in <1 of ethanol; soluble in chloroform with turbidity owing to separation of water; soluble in ether. Extraction yield (chlorobutane), 0.2 [Demme *et al.* 2005].

Anhydrous Ephedrine
$C_{10}H_{15}NO = 165.2$
CAS—299-42-3
Synonym Ephedrine
Proprietary Names *Ephed 20th*; *Kondon's Nasal*; *Tendrin*.
Chemical Properties Unctuous deliquescent colourless crystals, or white crystalline powder. It rapidly absorbs carbon dioxide and decomposes on exposure to light. Mp 38.1°. Soluble 1 in 20 of water; very soluble in ethanol; soluble in chloroform; freely soluble in ether.

Ephedrine Hydrochloride
$C_{10}H_{15}NO,HCl = 201.7$
CAS—50-98-6
Synonyms Ephedrine chloride; ephedrinium chloratum; l-ephedrinum hydrochloricum.
Proprietary Names *CAM*; it is an ingredient of many proprietary preparations [Sweetman 2007].
Chemical Properties Colourless crystals or white crystalline powder. Mp 217° to 220°. Soluble 1 in 3 to 1 in 4 of water and 1 in 14 to 1 in 17 of ethanol; very slightly soluble in chloroform; practically insoluble in ether.

Ephedrine Sulfate
$(C_{10}H_{15}NO)_2,H_2SO_4 = 428.5$
CAS—134-72-5
Proprietary Names It is an ingredient of *Franol Plus*.
Chemical Properties Fine white crystals or powder that darken on exposure to light. Mp 245° with decomposition [O'Neil *et al.* 2006]. Soluble 1 in 1.3 of water and 1 in 90 of ethanol. pK_a 9.6 (25°). Log *P* (octanol/water), 1.1.

Colour Test Liebermann's reagent—red-orange.
Thin-layer Chromatography System TA—R_f 0.30; system TB—R_f 0.05; system TC—R_f 0.05; system TE—R_f 0.25; system TL—R_f 0.01; system TAE—R_f 0.10; system TAF—R_f 0.64; system TAJ—R_f 0.00; system TAK—R_f 0.01; system TAL—R_f 0.29 (acidified iodoplatinate solution, positive; acidified potassium permanganate solution, positive; Dragendorff spray, positive; Marquis test, brown; ninhydrin spray, positive).
Gas Chromatography System GA—ephedrine RI 1365, M (-TFA_2) RI 1345, M (-PFP_2) RI 1370, M (-TMS_2) RI 1620, M (-AC_2) RI 1795, M (nor-) RI 1360, M (nor-)-TFA_2 RI 1355, M (nor-)-PFP_2 RI 1380, M (nor-)-TMS_2 RI 1555, M (nor-)-AC_2 RI 1805, M (OH-) RI 1875, M (OH-)-AC_3 RI 2145; system GB—ephedrine RI 1410, M (nor-) RI 1356; system GC—ephedrine RI 1467, M (nor-) RI 1383.

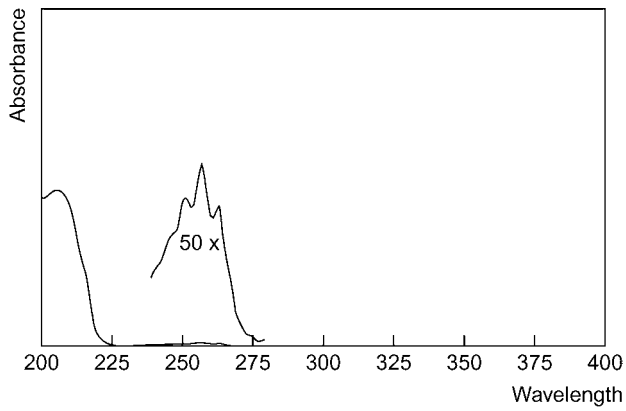
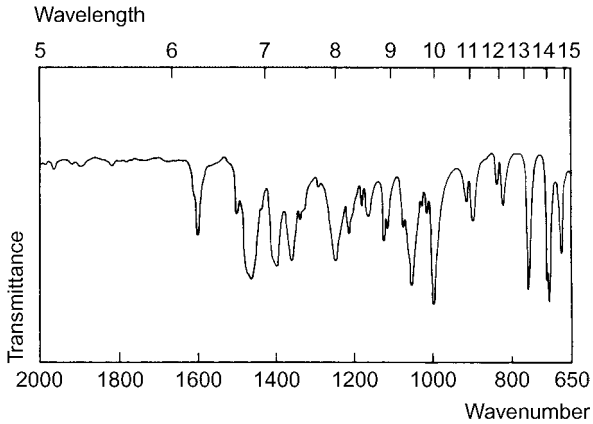
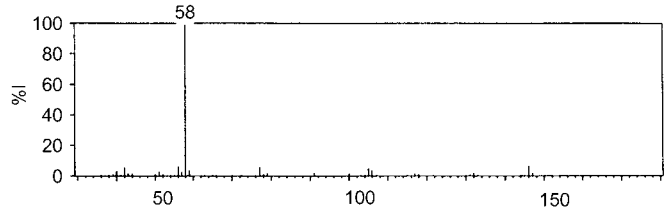
Ultraviolet Spectrum Aqueous acid—251, 257 ($A^1_1 = 12a$), 263 nm. No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 994, 699, 754, 1049, 1242, 670 cm^{-1} (ephedrine hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 58, 146, 56, 105, 77, 42, 106, 40; norephedrine 44, 77, 79, 51, 45, 42, 107, 105.



Quantification

Blood **GC-MS** Column: 5% phenyl silicone capillary (12.5 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 20 mL/min. Temperature programme: 70° to 175° at 25°/min to 280° at 50°/min. SIM acquisition mode [Backer *et al.* 1997].

LC-MS Column: XBridge Shield RP-18 (250 × 3.0 mm i.d., 5 µm). Mobile phase: acetonitrile : 10 mmol/L ammonium bicarbonate (pH 10.5, 100 : 0 to 40 : 60 at 3.5 min to 80 : 20 at 7.5 min), flow rate 0.5 mL/min. ESI, MRM acquisition mode. Limit of quantification, 0.2 µg/L [Qiu *et al.* 2008].

Plasma **GC** Column: 3% phenyl cyanopropyl methyl silicone on 100/120 mesh (0.9 m × 2.0 mm i.d.). Carrier gas: Ar : CH_4 (95 : 5), 93 mL/min. Temperature: 235°. ECD. Limit of detection, 2 µg/L [Midha *et al.* 1979].

GC-MS Column: HP-5MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 50° for 0.5 min to 200° at 30°/min to 300° at 10°/min for 5 min. EI ionisation, SIM acquisition mode. Limit of detection, 2–5 µg/L [Frison *et al.* 2005]. Limit of detection, 0.82 µg/L [Nakano *et al.* 2000].

HPLC Column: C_{18} (150 × 4.6 mm. Mobile phase: acetonitrile : water (52 : 48). Fluorescence detection (λ = 264 and 313 nm). Limit of detection, 2 µg/L for ephedrine and 5 µg/L for norephedrine [Aymard *et al.* 2000]. Column: reversed phase. Mobile phase: 0.6% phosphate buffer (pH 6.5) : methanol (3 : 8). Fluorescence detection. Limit of detection, 0.5 ng [Shao *et al.* 1995].

LC-MS Column: Zorbax SB-C_{18} (150 × 4.6 mm). Mobile phase: methanol : water : formic acid (80 : 20 : 0.5), flow rate 0.5 mL/min. ESI, positive ion mode, SRM acquisition mode. Limit of quantification, 0.5 µg/L [Ren *et al.* 2006]. Column: Hypersil Phenyl BDS (50 × 4.6 mm i.d.). Mobile phase: 10 mmol/L ammonium formate with 0.1% formic acid : 10 mmol/L ammonium formate with 0.1% formic acid (100 : 0 to 80 : 20 over 7 min to 0 : 100 over 0.5 min for 1 min to 100 : 0 for 3.5 min). APCI, positive ion mode, SRM acquisition mode. Limit of quantification, 1 µg/L [Jacob *et al.* 2004]. Column: YMC phenyl LC (250 × 2 mm, 5 µm). Mobile phase: 3.8 g ammonium acetate : 20 mL glacial acetic acid: 30 mL acetonitrile: to 1000 mL with water. Limit of quantification, 100 µg/L for ephedrine alkaloids [Trujillo, Sorenson 2003].

CE Buffer: 0.1 mol/L phosphate electrolyte (pH 2.5) : acetonitrile (90 : 10). Limit of detection, 5.3 µg/L [Wei *et al.* 2007].

Serum **CE** UV detection (λ = 192 nm). Limit of detection, 0.15–0.25 µg/L [Fang *et al.* 2006a].

Urine **GC** Column: Rtx–5 5% diphenyl 95% dimethylpolysiloxane (15 m × 0.25 mm i.d., 1.0 µm). Carrier gas: He. Temperature programme: 100° to 105° at 0.5°/min to 118° at 2°/min to 280° at 50°/min for 2 min. NPD. Retention time: 14.8 min. Limit of detection, 4 mg/L [Van Eenoo *et al.* 2001]. See Plasma [Midha *et al.* 1979].

GC-MS Column: 5% phenylmethyl silicone (17 m × 0.2 mm i.d., 0.33 µm). Temperature programme: 85° for 1.5 min to 270° at 15°/min to 290° at 50°/min for 2.5 min. EI ionisation at 70 eV, scan mode. Limit of quantification, 10 µg/L, limit of detection, 5 µg/L [Strano-Rossi *et al.* 2008]. Column: HP-5MS (30 m × 0.25 mm i.d., 0.25 µm). Temperature programme: 100° for 3 min to 300° at 20°/min for 3 min. MSD. Retention time: 7.67 min. Limit of quantification, 12.5 µg/L, limit of detection, 5 µg/L [Saito *et al.* 2007]. Column: HP Ultra 2 5% diphenyl 95% dimethylsiloxane (12.5 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 1.0 mL/min. Temperatue programme: 80° for 2 min to 150° at 10°/min to 310° at 10°/min for 1 min. EI ionisation at 70 eV, MSD, scan mode. Limit of detection, 5.0 mg/L [Spyridaki *et al.* 2001]. See Plasma [Frison *et al.* 2005].

HPLC Column: Nucleosil-100 C_{18} (125 × 4 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.03 mol/L sodium phosphate buffer (pH 3.0, 7 : 93 to 30 : 70 in 10 min), flow rate 1.0 mL/min. UV detection (λ = 210 nm). Limit of quantification, 10 µg/L, limit of detection, 5 µg/L [Bagheri *et al.* 2008]. Column: Hypersil C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: 10 mmol/L TEA and 20 mmol/L potassium dihydrogen phosphate (pH 3) : acetonitrile (88 : 12 for 6 min to 45 : 55 at 25 min), flow rate 1.0 mL/min. UV detection (λ = 210 nm). Limit of detection, 0.05 mg/L [Zhang *et al.* 2008]. Column: Spherisorb C_{18}. Mobile phase: tetraethylammonium phosphate : methanol. UV detection (λ = 206 nm). Limit of detection, 0.1–0.3 mg/L [Chan *et al.* 2005]. Column: Hypersil BDS C_{18} (150 × 3 mm i.d., 3 µm). Mobile phase: 3% acetonitrile in 0.1% sulfuric acid. Retention time: 11.9 min. Limit of quantification, 5.5 mg/L [Gmeiner *et al.* 2002]. Column: Symmetry Shield (compared with other columns). Mobile phase: 50 mmol/L phosphate buffer : 25 mmol/L TEA, flow rate 1.5 mL/min to 2.0 mL/min in 10 min. UV detection (λ = 215 nm). Limit of detection, 0.3 mg/L [Imaz *et al.* 2000]. Column: Sep Spherisorb ODS 1. Mobile phase: tetraethylammonium phosphate : methanol. UV detection (λ = 214 nm). Limit of detection, 0.5 mg/L [van der Merwe *et al.* 1994]. See also Imaz *et al.* [1993].

LC-MS Column: C_8. Mobile phase: water : acetonitrile (98 : 2) containing 0.1% HAc and 0.01% trifluroacetic acid. Limit of detection, 2.5–5 mg/L [Deventer *et al.* 2009]. Column: Hypersil GOLD (100 × 2.1 mm i.d., 5 µm). Mobile phase: 1% acetonitrile in 10 mmol/L formic acid : 60% acetonitrile in 10 mmol/L formic acid (100 : 0 to 0 : 100 at 10 min to 100 : 0 for 4 min), flow rate 200 µL/min. ESI, positive ion mode. Limit of quantification, 5 µg/L [Björnstad *et al.* 2009]. Limit of detection, 1 mg/L [Trujillo, Sorenson 2003]. See Blood [Qiu *et al.* 2008]. See Plasma [Jacob *et al.* 2004].

CE Buffer: 0.1 mol/L phosphate electrolyte (pH 2.5): acetonitrile (90 : 10). Limit of detection, 8 µg/L [Wei *et al.* 2007]. Limit of detection, 3 µg/L for ephedrine and 5 µg/L for pseudoephedrine [Fang *et al.* 2006b]. See Serum [Fang *et al.* 2006a].

Note For an ion mobility spectroscopy method for the analysis of ephedrine, see Lokhnauth, Snow [2005].

Oral Fluid **GC-MS** See Urine. SIM acquisition mode [Strano-Rossi *et al.* 2008].

Brain **GC-MS** See Blood [Backer *et al.* 1997].

Hair **GC-MS** See Plasma. Limit of detection, 0.1–0.2 µg/g [Frison *et al.* 2005]. Column: V-1 capillary (equivalent). Temperature programme: 60° to 280° at 20°/min. Limit of detection, <50 pg derivatised ephedrine [Nakahara, Kikura 1997].

Kidney **GC-MS** See Blood [Backer *et al.* 1997].

Liver **GC-MS** See Blood [Backer *et al.* 1997].

Disposition in the Body

Ephedrine is readily absorbed after oral or percutaneous administration. It is metabolised by *N*-demethylation to norephedrine (phenylpropanolamine) and by oxidative deamination followed by conjugation. It accumulates in the liver, lungs, kidneys, spleen and brain. Approximately 90% of a dose is excreted in the urine in 24 h, with ~55–75% of the dose as unchanged drug, 8–20% as norephedrine and 4–13% as deaminated metabolites such as benzoic acid, hippuric acid and 1-phenylpropane-1,2-diol. In acidic urine, excretion of unchanged drug is increased slightly, whereas in alkaline urine, ~20–35% of the dose is excreted unchanged and the proportion of norephedrine is increased.

Ephedrine is a metabolite of methylephedrine.

Therapeutic Concentration In plasma, usually in the range 0.035–0.08 mg/L.

After a single oral dose of 22 mg of ephedrine hydrochloride to 10 subjects, peak plasma concentrations of 0.04–0.14 mg/L (mean 0.08) were attained; after daily oral doses of 33 mg of ephedrine hydrochloride to 10 subjects, peak plasma concentrations of 0.07–0.12 mg/L (mean 0.08) were obtained [Costello *et al.* 1975].

Ephedrine toxicity has been linked to nutritional supplements containing *Ephedra sinica* (ma huang) and a number of deaths have occurred. The pharmcokinetics of 3 commercially available ma huang products (mean ephedrine content per dose: 27, 25.6 and 23.6 mg, respectively) were compared with those of ephedrine hydrochloride capsules (25 mg dose) in 10 subjects. The mean peak plasma concentrations of ephedrine (and the time at which the peak occurred) were ephedrine hydrochloride 86 µg/L (at 2.81 h) and the ma huang products 100.1 µg/L (at 2.68 h), 86.2 µg/L (at 2.61 h) and 73.4 µg/L (at 3.05 h), respectively [Gurley *et al.* 1998].

A single 25-mg dose of ephedrine may result in urine levels above 10 mg/L if tested within ~8 h after administration [Tseng *et al.* 2006].

For the pharmacodynamics and pharmacokinetics of single oral and nasal doses of ephedrine, see Berlin *et al.* [2001].

Toxicity The estimated minimum lethal dose in children up to 2 years of age is 200 mg and for adults 2 g, but fatalities are rare. Single doses of up to 400 mg have been given without causing serious toxic effects.

In a 28-year-old woman whose death was attributed to the ingestion of ephedrine with suicidal intent, the following postmortem tissue concentrations were reported: blood 11 mg/L, liver 24 µg/g, kidney 14 µg/g and brain 8.9 µg/g. Amitriptyline was also detected [Backer *et al.* 1997].

In a review of 127 autopsies where ephedrine was identified postmortem, blood ephedrine levels were found to be <0.49 mg/L in 50%, with a range of 0.07–11.73 mg/L in trauma victims and 0.02–12.35 mg/L in non-trauma cases. Norephedrine and pseudoephedrine were present in the blood of 22.8% and 6.3%, respectively. More than 88% of decedents tested positive for other drugs [Blechman *et al.* 2004].

For reports of sudden deaths related to ephedrine toxicity from a ma huang-containing drink, see Theoharides [1997] and Karch [1999]. For reports of 3 deaths after overdoses with Letigen (caffeine 200 mg/ephedrine 20 mg), see Hedetoft *et al.* [1999] and Kanstrup, Petersen [2003].

Half-life Plasma half-life, 3–6 h but may be increased when the urine is alkaline and decreased when it is acid.

Clearance Renal clearance 0.34 L/min.

Volume of Distribution 181 L.

Dose Ephedrine hydrochloride or sulfate 90 to 180 mg daily orally in divided doses; in concentrations of 0.5 to 1% in nasal drops.

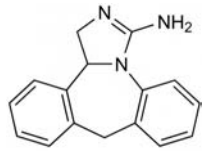
Epinastine

Antihistamine

$C_{16}H_{15}N_3 = 249.3$

CAS—80012-43-7

Synonyms 9,13b-Dihydro-1*H*-dibenz[*c*,*f*]imidazo[1,5-*a*]azepin-3-amine; WAL-801.



Chemical Properties A crystalline powder. Mp 205° to 208°. pK_a 11.2. Log *P* (octanol/water), 3.51; log *P* (octanol/aqueous buffer, pH 7.4 (20°)), −0.70.

Epinastine Hydrobromide

$C_{16}H_{15}N_3,HBr = 330.2$

Chemical Properties A crystalline powder. Mp 284° to 286°.

Epinastine Hydrochloride

$C_{16}H_{16}ClN_3 = 285.8$

CAS—108929-04-0

Synonym WAL-801-Cl

Proprietary Names *Alesion*, *Flurinol*.

Chemical Properties A crystalline powder. Mp 273° to 275°. It is freely soluble in water.

Quantification

Plasma **HPLC** Column: 5C18-MS Cosmosil (150 × 4.6 mm i.d.). Mobile phase: triethylamine (0.3%, pH 4.5) : methanol (64:36), flow rate 1.3 mL/min. UV detection (λ=220 nm). Internal standard (IS): diphenidol. Retention time: epinastine, 8.1 min; IS, 14.8 min. Limit of detection, 4 µg/L for epinastine hydrochloride [Ohtani *et al.* 1996].

Disposition in the Body Epinastine is excreted mainly via urine and faeces unchanged.

Dose A usual dose of 20 mg daily is administered.

Ohtani H *et al.* (1996). Quantitative determination of epinastine in plasma by high-performance liquid chromatography. *J Chromatogr B Biomed Appl* 683(2): 281–284.

Epirubicin

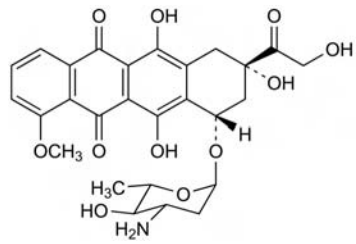
Antineoplastic

$C_{27}H_{29}NO_{11} = 543.5$

CAS—56420-45-2

IUPAC Name (7*S*,9*S*)-7-[(2*R*,4S,5*R*,6*S*)-4-Amino-5-hydroxy-6-methyloxan-2-yl]oxy-6,9, 11-trihydroxy-9-(2-hydroxyacetyl)-4-methoxy-8,10-dihydro-7*H*-tetracene-5,12-dione

Synonyms (8*S*,10*S*)-10-[(3-Amino-2,3,6-trideoxy-α-L-*arabino*-hexopyranosyl)oxy]-7,8,9,10-tetrahydro-6,8,11-trihydroxy-8-(hydroxyacetyl)-1-methoxy-5,12-naphthacenedione; 4′-epiadriamycin; 4′-epi-DX; 4′-Epidoxorubicin; IMI-28; pidorubicin.



Epirubicin Hydrochloride

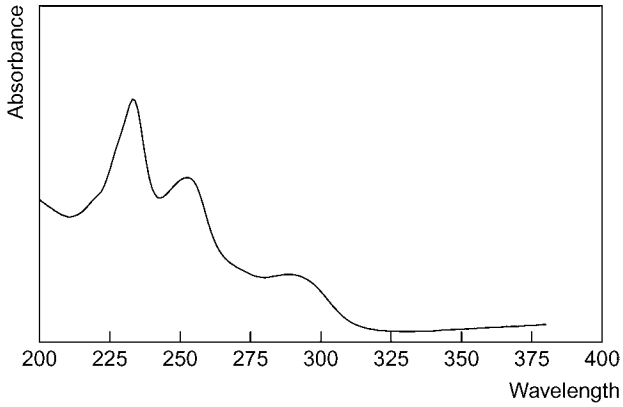
$C_{27}H_{29}NO_{11},HCl = 580.0$

CAS—56390-09-1

Proprietary Names *Farmorubicin*; *Farmorubicina*; *Farmorubicine*; *Pharmorubicin*.

Chemical Properties Red–orange crystals. Mp 185°, with decomposition.

Thin-layer Chromatography System TE—R_f 0.00; system TF—R_f 0.00.
High Performance Liquid Chromatography System HX—RI 379.
Ultraviolet Spectrum Principal peaks at 233, 253, 292 nm.



Quantification

Plasma **HPLC** Fluorescence detection. Epirubicin and metabolites. Limit of detection, 5 µg>L for epirubicin [Barker *et al.* 1996]. Fluorescence detection (λ_{ex}=480 nm, λ_{em}=580 nm). Limit of detection, 1 µg>L [Dobbs, Twelves 1991].

Disposition in the Body Pharmacokinetics vary widely between patients. Epirubicin is rapidly and extensively distributed into body tissues after IV administration. High concentrations occur in tumour tissues. It also concentrates in red blood cells and therefore concentrations in blood are substantially higher than those in plasma. It does not cross the blood–brain barrier. Epirubicin undergoes extensive metabolism, primarily in the liver (but also in other organs and cells including red blood cells), to form epirubicinol (13-hydroxyepirubicin) which has a very low degree of cytotoxic activity and appreciable amounts of glucuronide derivatives. 7-Deoxyaglycones have also been detected in plasma of patients treated with epirubicin. Epirubicinol is eliminated mainly in bile. About 10 to 20% of a dose is recovered in urine within 48 h as the unchanged drug, epirubicinol, or as the glucuronide metabolite. 40% is recovered in bile in 72 h.

Therapeutic Concentration The serum therapeutic concentration range is 10 to 50 µg/L.

Twenty-seven patients with nasopharyngeal carcinomas, were administered an IV dose of 75 mg/m^2 epirubicin rapidly. Peak plasma concentrations of >1860 µg/L were observed by the end of infusion [Hu *et al.* 1989].

Toxicity Myelosuppression is the major acute dose-limiting toxicity and cardiotoxicity is the most important cumulative dose-limiting toxicity.

Half-life Plasma, 30 to 40 h.

Volume of Distribution Between 13 and 52 L/kg. Steady state, 1000 L/m^2.

Clearance Plasma clearance, 50 L/h/m^2; 0.9 L/min.

Note For reviews of epirubicin, see Plosker and Faulds [1993] and Coukell and Faulds [1997].

For a review of the pharmacokinetics of epirubicin, see Robert [1994].

Dose Usually 60 to 90 mg/m^2 as a single dose IV every 3 weeks. A total cumulative dose of 0.9 to 1 g/m^2 should not generally be exceeded because of the risk of cardiotoxicity.

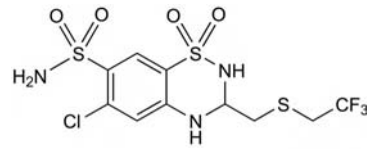
Epithiazide

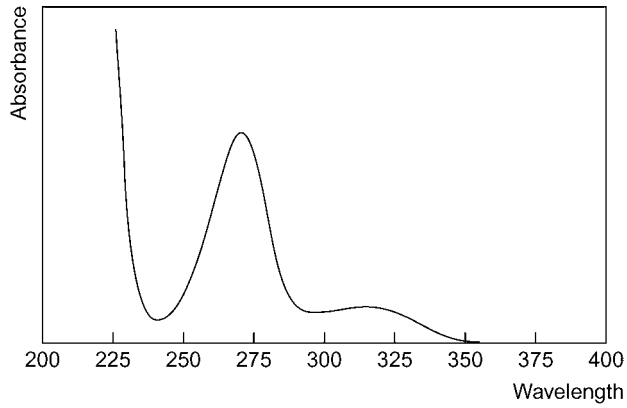
Diuretic

$C_{10}H_{11}ClF_3N_3O_4S_3$ = 425.8
CAS—1764-85-8

IUPAC Name 6-Chloro-3,4-dihydro-3-(2,2,2-trifluoroethylthiomethyl)-2*H*-1,2,4-benzothiadiazine-7-sulfonamide-1,1-dioxide
Synonym Epitizide
Proprietary Name It is an ingredient of *Dyta-Urese*.



Chemical Properties A white crystalline powder. Mp 206° to 207°. Practically insoluble in water; soluble in alkaline solutions. Log *P* (octanol/water), 0.8.
Thin-layer Chromatography System TB—R_f 0.00; system TD—R_f 0.13; system TE—R_f 0.44; system TF—R_f 0.62; system TAD—R_f 0.25; system TAE—R_f 0.88; system TAJ—R_f 0.22; system TAK—R_f 0.05; system TAL—R_f 0.63.
Gas Chromatography System GA—not eluted.
High Performance Liquid Chromatography System HX—RI 457.
Ultraviolet Spectrum Aqueous acid—272, 315 nm.



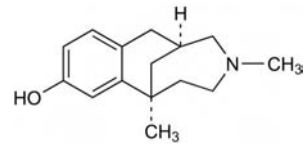
Infrared Spectrum Principal peaks at wavenumbers 1176, 1314, 1167, 1126, 1603, 1269 cm^{-1} (Nujol mull).
Dose 8 to 12 mg daily.

Eptazocine

Analgesic

$C_{15}H_{21}NO$ = 231.3
CAS—72522-13-5

Synonym (*1S*)-2,3,4,5,6,7-Hexahydro-1,4-dimethyl-1,6-methano-1*H*-4-benzazonin-10-ol



Eptazocine Hydrobromide

$C_{15}H_{22}BrNO$ = 312.2
CAS—72150-17-5
Synonym ST-2121
Proprietary Name *Sedapain*
Chemical Properties A crystalline powder. Mp 207° to 210°.

High Performance Liquid Chromatography Column: C_{18}-MS Cosmosil (150 × 4.6 mm i.d., 5 µm), at 25°. Mobile phase: 0.07 mol/L sodium phosphate buffer (pH 3) containing 5 mmol/L sodium heptylsulfonate : methanol (55:45), flow rate 0.8 mL/min. Fluorescence detection (λ_{ex}=278 nm, λ_{em}=324 nm). Internal standard (IS): methyleptazocine. Retention time: eptazocine, 4.9 min; IS, 7.2 min [Suzuki *et al.* 2000].

Suzuki T *et al.* (2000). Pharmacokinetic/pharmacodynamic relationship of eptazocine, a narcotic-antagonist analgesic, in rats. *Biol Pharm Bull* 23: 1504–1510.

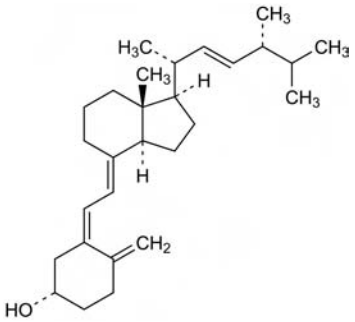
Ergocalciferol

Vitamin

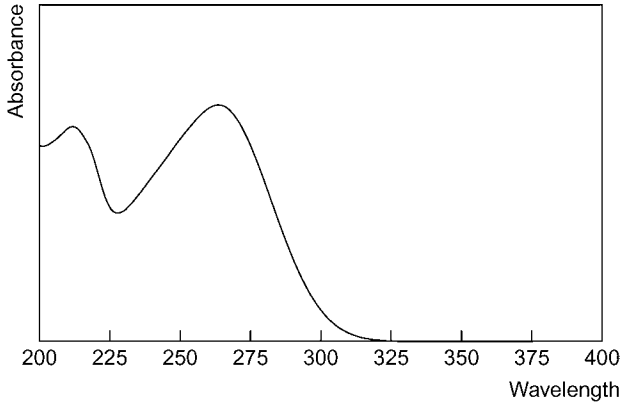
$C_{28}H_{44}O$ = 396.7
CAS—50-14-6

IUPAC Name 3-[2-[1-(5,6-Dimethylhept-3-en-2-yl)-7*a*-methyl-2,3,3*a*,5,6,7-hexahydro-1*H*-inden-4-ylidene]ethylidene]-4-methylidenecyclohexan-1-ol
Synonyms Calciferol; irradiated ergosterol; (3β,5*Z*,7*E*,22*E*)-9,10-secoergosta-5,7,10(19),22-tetraen-3-ol; viosterol; vitamin D_2.
Proprietary Names *Drisdol*; *Endo D*; *Ostelin*; *Radiostol*; *Sterogyl*; *Vita-D-Grin*.

Note Ergocalciferol is also used as a rodenticide. It is an ingredient of *Sorexa C.R.*



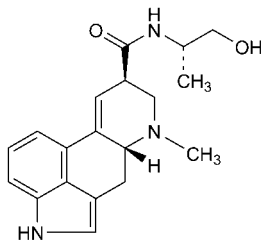
Chemical Properties Colourless or slightly yellow crystals, or white or slightly yellow crystalline powder. Mp 113° to 119°. Practically insoluble in water; soluble 1 in 2 of ethanol, 1 in 10 of acetone, 1 in 0.7 of chloroform and 1 in 2 of ether. Log *P* (octanol/water), 10.4.
High Performance Liquid Chromatography System HY—RI 276.
Ultraviolet Spectrum Ethanol—265 nm (A^1_1=475b).



Infrared Spectrum Principal peaks at wavenumbers 973, 1059, 1079, 1712, 893, 1000 cm^{-1} (KBr disk).
Quantification See under Colecalciferol.
Disposition in the Body Well absorbed after oral administration; absorption may be decreased with impaired liver and biliary function, and extensive enterohepatic circulation occurs. Metabolised by 25-hydroxylation in the liver followed by 1α- or 24-hydroxylation in the kidney; possibly conjugated with glucuronic acid or sulfate. Excreted mainly in the bile together with small amounts of metabolites in the urine; unchanged ergocalciferol does not appear to be excreted in the urine.
Blood Concentration Normal serum concentrations of 25-hydroxyergocalciferol are about 0.01 to 0.04 mg/L, but there are considerable inter-subject and seasonal variations.
Half-life About 40 days.
Protein Binding In blood, bound to α- and β-lipoproteins.
Dose 0.025 to 5 mg daily.

Ergometrine

Ergot Alkaloid
$C_{19}H_{23}N_3O_2$ = 325.4
CAS—60-79-7
Synonyms [8β(*S*)]-9,10-Didehydro-*N*-(2-hydroxy-1-methylethyl)-6-methylergoline-8-carboxamide; ergobasine; ergonovine.



Chemical Properties Colourless crystals. Solutions in water give a blue fluorescence. Mp 162°. Slightly soluble in water; more soluble in ethanol; freely soluble in ethyl acetate and acetone; sparingly soluble in chloroform. pK_a 6.8 (20°) [O'Neil MJ *et al.* 2006]. Log *P* (ether) 0.52 [Meylan, Howard 1995], −0.9. Methylergometrine was very unstable when kept in direct sunlight, with half-lives of 15 and 35 min at pH 2 and pH 7, respectively. There was no degradation under fluorescent light [Smith, Molinaro 1988]. Methylergometrine stock solutions were stable for 60 days at –50° [Edlund 1981].

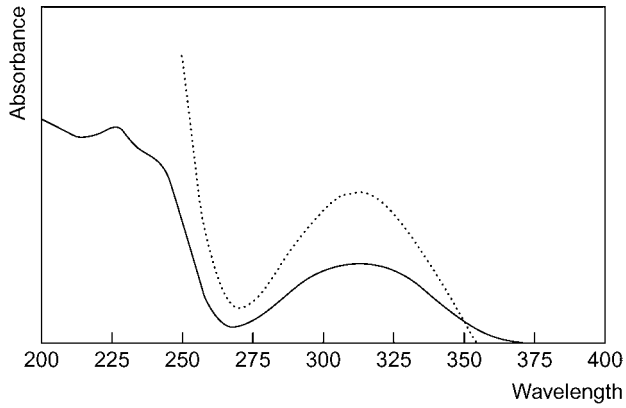
Ergometrine Maleate

$C_{19}H_{23}N_3O_2,C_4H_4O_4$ = 441.5
CAS—129-51-1
Synonyms Ergobasine maleate; ergometrinhydrogenmaleat; ergonovine bimaleate; ergonovine maleate; ergostetrine maleate; ergotocine maleate.
Proprietary Names *Ergotrate.* It is an ingredient of *Syntometrine.*
Chemical Properties A white or yellowish, slightly hygroscopic, microcrystalline powder. It darkens with age and on exposure to light. Solutions in water and ethanol give a blue fluorescence. Mp 167°, with decomposition. Soluble 1 in 36 of water and 1 in 100 of ethanol; practically insoluble in chloroform and ether.

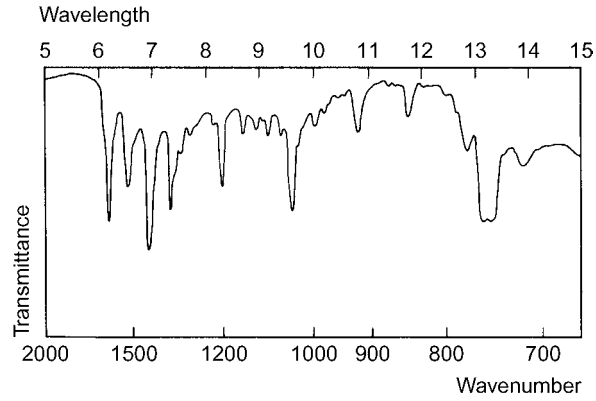
Ergometrine Tartrate

$(C_{19}H_{23}N_3O_2)_2,C_4H_6O_6$ = 800.9
CAS—129-50-0
Synonym Ergonovinum tartaricum
Chemical Properties White or slightly reddish-yellow, very light, matted masses of acicular crystals. Slightly soluble in water; soluble in ethanol; slightly soluble in chloroform and ether.

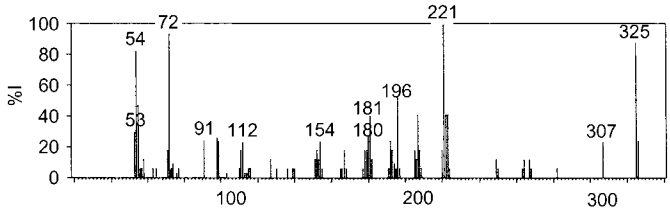
Colour Tests *p*-Dimethylaminobenzaldehyde—violet; Marquis test—brown.
Thin-layer Chromatography System TA—R_f 0.57; system TAE—R_f 0.62; system TAF—R_f 0.60; system TL—R_f 0.08; system TB—R_f 0.00; system TC—R_f 0.12; system TE—R_f 0.33; system TL—R_f 0.08; system TM—R_f 0.26 (Van Urk reagent, blue).
High Performance Liquid Chromatography System HA—*k* 0.4; system HP—*k* 0.50; system HX—RI 292.
Ultraviolet Spectrum Aqueous acid—313 nm (A^1_1 = 240a); aqueous alkali—310 nm.



Infrared Spectrum Principal peaks at wavenumbers 1634, 754, 748, 1044, 1212, 1541 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 221, 72, 325, 54, 196, 55, 207, 181.



Quantification

***Plasma* HPLC** Column: Spherisorb 5-ODS (25 cm × 4.6 mm i.d., 5 µm). Mobile phase: 0.067 mol/L potassium dihydrogen phosphate-diethylamine (1 : 1) : acetonitrile (60 : 40), flow rate, 1.2 mL/min. Fluorescence detection (λ_{ex} = 315 nm, λ_{em} = 430 nm). Retention time: 8.61 min for methylergometrine. Limit of quantification, 150 ng/L for methylergometrine [de Groot *et al.* 1995]. Column: Spherisorb 5-ODS (25 cm × 4.6 mm i.d., 5 µm). Mobile phase: 0.067 mol/L potassium dihydrogenphosphate-diethylamine (1 : 1) : acetonitrile (65 : 35), flow rate 1.2 mL/min. Fluorescence detection (λ_{ex} = 315 nm, λ_{em} = 430 nm). Retention time: 5.26 min. Limit of quantification, 75 ng/L [de Groot *et al.* 1993]. Column: Supelcosil LC-8 (octyl, 250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.01 mol/L potassium phosphate (pH 7.0; 3 : 7), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 315 nm, λ_{em} = 440 nm). Retention time: 4.5 min for methylergometrine. Limit of quantification, 20 ng/L, limit of detection, 5 ng/L, both for methylergometrine [Smith, Molinaro 1988]. Column: ODS Hypersil (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.01 mol/L ammonium carbonate (30 : 70 or 50 : 50). Fluorescence detection (λ_{ex} = 328 nm, λ_{em} = 320 nm). Limit of detection, 100 ng/L for methylergometrine [Edlund 1981].

Disposition in the Body More rapidly absorbed from the gastrointestinal tract than ergotamine. Metabolised by hydroxylation and glucuronic acid conjugation and possibly *N*-demethylation. Peak plasma concentrations are attained within 60–90 min and are more than tenfold those achieved with an equivalent dose of ergotamine. It is less toxic than ergotamine. Ergometrine has been reported to be detected unchanged in urine up to 8 h after injection, the maximum concentration usually occurring 2 to 3 h after an injection. It is mainly excreted in the bile as 12-hydroxyergometrine glucuronide.

Therapeutic Concentration

Six male volunteers were administered an oral dose of 0.2 mg ergometrine maleate. A mean peak plasma concentration of 0.16 ug/L was reached after 54 min [de Groot *et al.* 1994].

After a single oral dose of ergometrine maleate (0.2 mg = 0.147 mg base) to one healthy male volunteer, a peak plasma concentration of 1.32 µg/L was reached after 12 min [de Groot *et al.* 1993].

Toxicity A dose of 0.2 mg, if inadvertently given to a neonate, is ~20-times the dose applicable to an adult [Edwards 1971]. For cases of ergometrine being inadvertently given to neonates, see Baum *et al.* [1996], Yalaburgi and Mohapatra [1982], Kenna [1972], Brereteon-Stiles *et al.* [1972] and Edwards [1971].

Note For a fatality following ergometrine IM following birth, see Devitt *et al.* [1970]. See also Whitfield and Salfield [1980], Asgaonkar *et al.* [1987], Dargaville and Campbell [1998], De Costa [2002], Aeby *et al.* [2003] and Bangh *et al.* [2005].

Volume of Distribution 73.4 ± 22.01 [de Groot *et al.* 1994].

Bioavailability 1 [de Groot *et al.* 1993], 34–117% [de Groot *et al.* 1994].

Half-life 1.4 h [de Groot *et al.* 1993].

Dose 0.4 to 1.5 mg of ergometrine maleate daily, orally; doses of 200 to 500 µg are given IM.

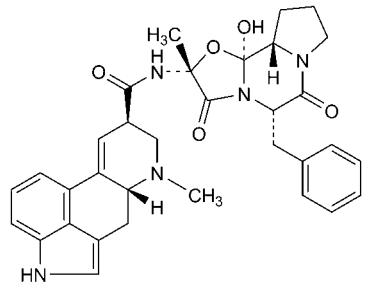
Ergotamine

α-Adrenoceptor Antagonist, Ergot Alkaloid

$C_{33}H_{35}N_5O_5$ = 581.7

CAS—113-15-5

Synonym (5′α)-12′-Hydroxy-2′-methyl-(phenylmethyl)ergotaman-3′,6′,18-trione



Chemical Properties Hygroscopic crystals which darken and decompose on exposure to air, heat and light. Mp 212° to 214°, with decomposition. Almost insoluble in water; slightly soluble in ethanol; freely soluble in chloroform, pyridine and glacial acetic acid; moderately soluble in ethyl acetate; slightly soluble in benzene. pK_a 6.4 (24°). Log *P* (octanol/water) 2.53 [Meylan, Howard 1995]. Ergotamine undergoes spontaneous epimerisation at C-8 to ergotaminine, epimerisation at C-2 in acidic solutions to form 'aci-compounds'. Addition of water to the 9 : 10 double bond can occur, catalysed by UV light. The indole is susceptible to oxidation by oxygen [Edlund 1981].

Ergotamine Tartrate

$(C_{33}H_{35}N_5O_5)_2,C_4H_6O_6$ = 1313.4

CAS—379-79-3

Proprietary Names *Enxak*; *Ergodryl Mono*; *Ergokapton*; *Ergomar*; *Ergostat*; *Ergotan*; *Gynergen(e)*; *Lingraine*; *Migrexa*. It is an ingredient of *Bellergal*; *Cafergot*; *Dolatrin*; *Migril*; *Wigraine*.

Chemical Properties Colourless crystals or white or yellowish-white crystalline powder. Mp about 180°, with decomposition. Soluble 1 in about 500 of water and 1 in 500 of ethanol; practically insoluble in chloroform and ether. Log *P* (octanol/water) 2.5 [Meylan, Howard 1995].

Colour Tests *p*-Dimethylaminobenzaldehyde—violet; Mandelin's test—violet-brown; Marquis test—brown.

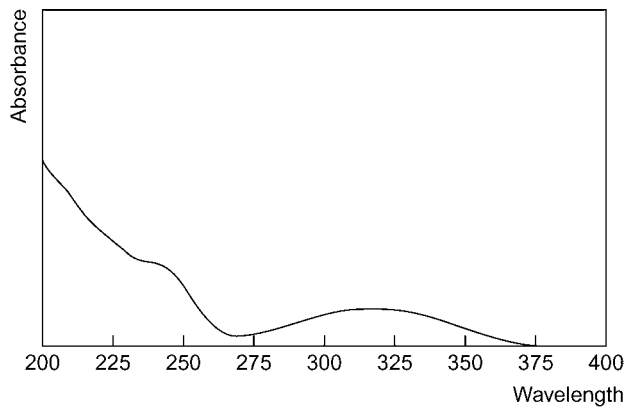
Thin-layer Chromatography System TA—R_f 0.63; system TAE—R_f 0.68; system TAF—R_f 0.64; system TL—R_f 0.22; system TB—R_f 0.01; system TC—R_f 0.34; system TE—R_f 0.44; system TL—R_f 0.23; system TM—R_f 0.48 (Van Urk reagent, blue).

Gas Chromatography System GA—RI 2366.

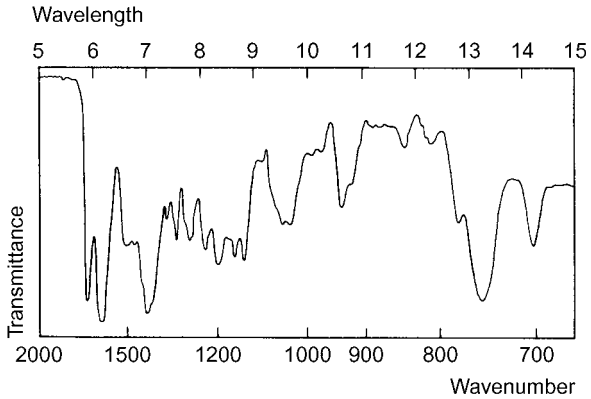
High Performance Liquid Chromatography System HA—*k* 0.4; system HP—*k* 9.58; system HX—RI 416; system HZ—RT 3.4 min.

Column: µBondapak C_{18} (300 × 3.9 mm i.d., 10 µm). Mobile phase: methanol : water : triethylamine (60 : 40 : 0.1), flow rate 1.5 mL/min. UV detection (λ = 254 nm). Retention time: 3.6 min. Limit of quantification, 0.5 mg/L, limit of detection, 0.35 mg/L [Elbarbry *et al.* 2007].

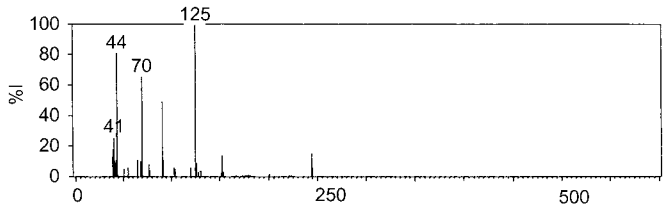
Ultraviolet Spectrum Aqueous acid—316 nm (A^1_1 = 133a); aqueous alkali—310 nm (A^1_1 = 148b).



Infrared Spectrum Principal peaks at wavenumbers 1631, 1712, 750, 1208, 1136, 1160 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 125, 44, 70, 91, 41, 40, 244, 153 (no peaks above 250).



Quantification

Blood **LC-MS** Column: Luna CN (150 × 2.1 mm i.d., 5 µm). Mobile phase: water-0.1% formic acid-2 mmol/L ammonium formate (pH 3.0) : acetonitrile-0.1% formic acid-2 mmol/L ammonium formate (80 : 20 to 20 : 80 in 8 min for 4 min), flow rate 0.2 mL/min. ESI, positive ion mode. Limit of quantification, 10 ng/L, limit of detection, 5 ng/L [Favretto *et al.* 2007].

Plasma **GC-MS** Column: 5% phenyl 95% methyl silicone fused silica capillary (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.034 bar. Temperature programme: 60° to 280° at 35°/min for 10 min. EI ionisation. Limit of detection, 50 ng/L [Feng *et al.* 1992].

HPLC Column: ODS Hypersil (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.01 mol/L ammonium carbonate (30 : 70 or 50 : 50). Fluorescence detection ($\lambda_{ex} = 328$ nm, $\lambda_{em} = 320$ nm). Limit of detection, 100 ng/L [Edlund 1981].

Note For a radioimmunoassay method for the detection of ergot alkaloids in plasma, see Schran *et al.* [1979] or Ala-Hurula *et al.* [1979].

Serum **GC-MS** See Plasma [Feng *et al.* 1992].

Urine **LC-MS** See Blood [Favretto *et al.* 2007].

Hair **LC-MS** See Blood. Limit of quantification, 15 pg/mg, limit of detection, 10 pg/mg [Favretto *et al.* 2007].

Disposition in the Body Poorly absorbed after oral administration; the extent and rate of absorption is increased if caffeine is administered concurrently. Ergotamine is rapidly metabolised in the liver and is excreted mainly in the bile as metabolites; only traces of unchanged drug are excreted in the urine or faeces. Metabolised by CYP3A4. Ergotamine increases peristalsis of the gastrointestinal tract [Zavaleta *et al.* 2001].

Therapeutic Concentration

After a single oral dose of 2 mg of ergotamine tartrate administered to 11 subjects, peak plasma concentrations of 0.13 to 0.91 µg/L (mean 0.59) were attained in 0.5 to 3 h; following an IM dose of 0.5 mg given to 10 subjects, peak plasma concentrations of 0.88 to 3.6 µg/L (mean 2.07) were attained in ~0.5 h [Ala-Hurula *et al.* 1979].

After an IM injection of ergotamine tartrate 0.5 mg (3.6 to 3.9 µg/kg) into 10 subjects with migraine, the steady-state plasma concentration resulting in 50% of maximal effect was calculated to be 0.24 µg/L [Tfelt-Hansen, Paalzow 1985].

Toxicity Ergotamine is highly toxic; in large repeated doses it can produce all the symptoms of ergot poisoning. Fatal poisoning has occurred after the oral administration of 26 mg of ergotamine over several days, and also after single injections of only 0.5 to 1.5 mg.

A 40-year-old female with ergotism after ergotamine tartrate ingestion had a blood concentration of 320 ng/L and a urine concentration of 100 ng/L. Ergotamine concentration was 24 and 15 pg/mg in proximal and distal hair, respectively [Favretto *et al.* 2007].

In 12 cases of non-fatal ergotamine overdose, plasma concentrations of 0 to 3.1 µg/L (mean 0.82) were reported 1.7 to 5 h after ingestion [Lamb *et al.* 1983].

A 17-year-old primigravida in her 35th week of pregnancy took 10 tablets of Migril (≈20 mg ergotamine tartrate). The foetus was in cephalic presentation and the heart rate was 170 bpm. Foetal death was diagnosed ≈8 h later. The girl was successfully treated with nifedipine for MI [Au *et al.* 1985].

A 14-month-old male swallowed a total of 12 mg ergotamine tartrate. Symptoms included severe dyspnoea, pyrexia, haemorrhagic gastritis, rapid onset of cerebral oedema followed by death [Jones, Williams 1966].

Note For cases of ergotism (arterial insuffiency in the extremities, also known as Holy Fire or St Anthony's fire) following therapeutic doses of ergotamine tartrate, see Enge and Sivertssen [1965], Voyvodic and Hayward [1996], Tay and Chee [1998], Sintenie *et al.* [1992], Doig *et al.* [1985], Weaver *et al.* [1989], Fitzgerald [1978], Matthews and Havill [1979] and MacGuire and Cassidy [1984]. For a case report of recurrent ergotism, see Curry, Jr. and Yalamanchili [1978]. For a case of facial ischaemia caused by ergotism, see Lazarides *et al.* [1992]. For a case of renal impairment following ergotamine, see Lund [1992]. There is a possible interaction between erythromycin and ergotamine Ghali *et al.* [1993] or Karam *et al.* [2000]. For interactions of ergotamine with ritonavir, see Baldwin and Ceraldi [2003]; Blanche *et al.* [1999]; Caballero-Granado *et al.* [1997]; Pardo *et al.* [2003]; Tribble *et al.* [2002]; or Vila *et al.* [2001]. For a case of pancreatitis and hepatitis after ergotamine ingestion, see Deviere *et al.* [1987]. For a review of ergotism, see Harrison [1978]. For a case of ergotamine poisoning in a paraplegic patient, see Lenger [1984]. See also Molkara *et al.* [2006], Aydogan *et al.* [2005], Garcia *et al.* [2000], Piquemal *et al.* [1998], Wilke *et al.* [1997], Flaherty and Bates [1996], Voyvodic and Hayward [1996], Fincham *et al.* [1985], Merhoff and Porter [1974], London *et al.* [1970], Yao *et al.* [1970] or Glazer *et al.* [1966] for case studies.

Half-life Biphasic, α phase, 2.7 h, β phase 21 h [Kanto 1983].

Bioavailability 1.2% (0.5 to 2.2) for inhalaton, 1.8% (0.6 to 3.5%) for suppositories and 1.5% (0.6 to 2.6%) for effervescent tablets [Ekbom *et al.* 1983], 47% for IM (28 to 61%) [Meyler 1996]

Volume of Distribution ≈2 L/kg, 141 L [Kanto 1983].

Clearance Plasma clearance, ≈5 to 18 mL/min/kg (mean 11).

Note For a review of ergometrine efficacy in migraine, see Perrin [1985].

Dose Not more than 8 mg of ergotamine tartrate in a day or 12 mg in any one week, as shown in the table below.

Recommended dosage for ergotamine

Route	Single dose	Maximum per attack	Maximum per week
Oral	1–2 mg	6 mg	12 mg
Sublingual	2 mg	6 mg	12 mg
Rectal	2 mg	4 mg	8 mg
Inhalaton	0.36 mg (1 inhalation)	2.16 mg (6 inhalations)	12 mg (33 inhalations)
Parenteral	0.25–0.5 mg	0.5 mg	1.0 mg

[Curry Jr, Yalamanchili 1978]

Note For a review of ergotamine and its use in migrane, see Saxena and de Deyn [1992].

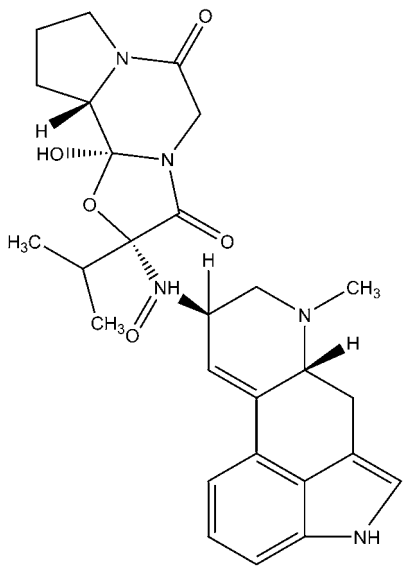
Ergotoxine

Ergot Derivative

$C_{28}H_{33}N_5O_5 = 519.6$

CAS—8006-25-5

Synonym Ecboline



Chemical Properties Ergotoxine is a 1 : 1 : 1 mixture of the 3 isomorphous alkaloids: ergocornine, ergocristine and ergocryptine. Crystals. Mp 190° with decomposition. Almost insoluble in water and petroleum ether; very soluble in alcohol, acetone, chloroform and ethyl acetate; slightly soluble in ether.

Ergotoxine Esilate

$C_{31}H_{39}N_5O_5,C_2H_5SO_{3H} = 671.8$

CAS—8047-28-7

Synonym Ergotoxine ethanesulfonate

Chemical Properties Colourless crystals that decompose at 209°. Almost insoluble in water; slightly soluble in ethanol; soluble in methanol. Solid and solutions are sensitive to light and air.

Ergotoxine Phosphate

Chemical Properties Clusters of needles, decomposing at 187°. Soluble in 320 parts of water, 15 parts boiling alcohol.

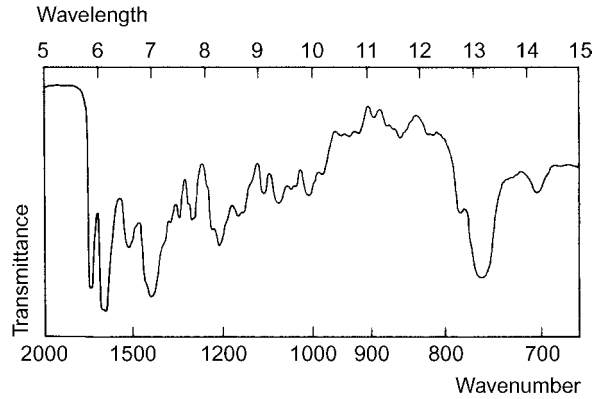
Colour Test *p*-Dimethylaminobenzaldehyde—violet.

Thin-layer Chromatography System TA—R_f 0.66; system TL—R_f 0.48; system TB—R_f 0.01; system TC—R_f 0.62; system TL—R_f 0.48; system TM—R_f 0.67 (acidified potassium permanganate solution, strong reaction; Van Urk reagent, blue).

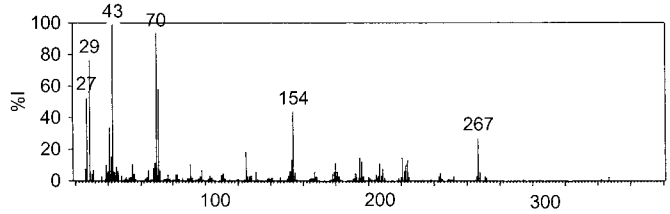
Gas Chromatography System GA—ergocristine RI 2495, ergocryptine RI 2184.

High Performance Liquid Chromatography System HA—ergocornine *k* 0.4, ergocristine *k* 0.3, ergocryptine *k* 0.4; system HP—ergocornine *k* 10.2, ergocristine *k* 17.3, ergocryptine *k* 15.2.

Infrared Spectrum Principal peaks at wavenumbers 1639, 1721, 758, 1534, 1212, 1294 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 43, 70, 29, 71, 27, 154, 41, 267; ergocornine 43, 70, 71, 54, 44, 154, 267, 55; ergocristine 70, 125, 71, 91, 153, 267, 154, 221; ergocryptine 43, 70, 71, 154, 41, 209, 69, 267.



Disposition in the Body

Therapeutic Concentration

Ten healthy volunteers (6 males, 4 females) aged between 30 and 68 years were administered 1 mL of 3H-dihydroergotoxine solution or 1 of 3H-DH-ergotoxine tablet (equivalent to 1 mg Hydergine) orally. The drug was also infused IV at a dose of 0.5 mg. Urinary excretion percentages were as shown in the table below.

Time (h)	*Tablet oral (1 mg)*	*Solution oral (1 mg)*	*Infusion IV (0.5 mg)*
0–4	0.55 ± 0.08	0.51 ± 0.06	3.4 ± 0.44
0–8	1.18 ± 0.11	1.13 ± 0.08	4.89 ± 0.55
0–16	1.44 ± 0.14	1.23 ± 0.07	5.91 ± 0.9
0–24	1.74 ± 0.2	1.59 ± 0.14	6.77 ± 1.26
0–48	2.01 ± 0.3	1.74 ± 0.15	8.12 ± 1.31
0–72	2.09 ± 0.33	1.77 ± 0.15	8.45 ± 1.11

[a][Loddo *et al.* 1976].

Half-life 5.2 to 8.7 h after a single oral or sublingual dose [Kanto 1983].
Dose Ergotoxine esilate was formerly given parenterally in doses of 0.5 to 1 mg.

Kanto J (1983). Clinical pharmacokinetics of ergotamine, dihydroergotamine, ergotoxine, bromocriptine, methysergide, and lergotrile. *Int J Clin Pharmacol Ther Toxicol* 21: 135–142.

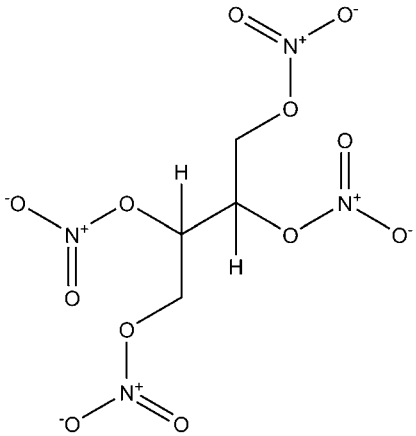
Erythrityl Tetranitrate

Vasodilator (Coronary)
$C_4H_6(NO_3)_4$ = 302.1
CAS—142435-64-1

IUPAC Name 1,3,4-Trinitrooxybutan-2-yl nitrate
Synonyms Erithritol tetranitrate; erythrol nitrate of tetranitrate; erythrotetranitral; nitro-erythrite; nitroerythrol; tetranitrol.
Proprietary Names *Cardilate*. It is an ingredient of *Dolorin* and *Erythin*.



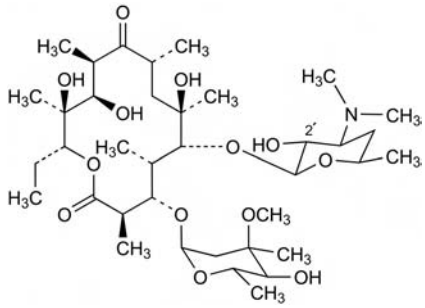
Chemical Properties Colourless crystals which are explosive unless mixed with an inert substance. Mp ≈61°. Almost insoluble in water; soluble in ethanol, ether and glycerin. Extracted by organic solvents from aqueous acid or alkaline solutions.
Quantification
Other **HPLC** Various Tablet Formulations. Column: C_{18} (300 × 3.9 mm i.d., 10 µm). Mobile phase: methanol : water (40 : 60), flow rate 1.0 mL/min. UV detection (λ = 220 nm). Retention times: erythrityl tetranitrate (ET) ≈32 min, isosorbide dinitrate (ID) ≈10 min, nitroglycerin (internal standard) ≈15 min, pentaerythritol tetranitrate (PT) ≈25 min. Limit of quantification, 0.6, 0.2 and 0.4 µg, for ET, ID and PT, respectively [Olsen, Scroggins 1984].
Disposition in the Body Acts more slowly than glyceryl trinitrate or amyl nitrite, but has a much longer duration of action. After oral administration, the maximum effect is attained in 20 to 30 min and lasts for 3 to 4 h. Erythrityl tetranitrate releases nitrite ions into the bloodstream, but the amount does not appear to be sufficient to account for the pharmacological effect of the drug.
Toxicity Prolonged use may result in methaemoglobinaemia.
Dose Up to 60 mg.

Olsen CS, Scroggins HS (1984). High-performance liquid chromatographic determination of the nitrate esters isosorbide dinitrate, pentaerythritol tetranitrate, and erythrityl tetranitrate in various tablet forms. *J Pharm Sci* 73: 1303–1304.

Erythromycin

Antibiotic
$C_{37}H_{67}NO_{13}$ = 733.9
CAS—114-07-8 (erythromycin A)

IUPAC Name (3*R*,4*S*,5*S*,6*R*,7*R*,9*R*,11*R*,12*R*,13*S*,14*R*)-6-[(2*S*,3*R*,4*S*,6*R*)-4-(Dimethylamino)-3-hydroxy-6-methyloxan-2-yl]oxy-14-ethyl-7,12,13-trihydroxy-4-[(2*R*,4*R*,5*S*,6*S*)-5-hydroxy-4-methoxy-4,6-dimethyloxan-2-yl]oxy-3,5,7,9,11,13-hexamethyl-oxacyclotetradecane-2,10-dione
Proprietary Names *Abboticine*; *Ak-Mycin*; *Akne-Mycin*; *ATS*; *Del-Mycin*; *E-Base*; *E/Gel*; *Emgel*; *Emu-V*; *E-Mycin*; *Eratrex*; *Eromycin*; *Eryacne*; *Eryc*; *Erycen*; *Erycette*; *Erycinum*; *Eryderm*; *Erygel*; *Erymax*; *Ery-Tab*; *Erythrocin*; *Erythromid*; *Ilosone*; *Ilotycin*; *Novo-Rythro*; *PCE*; *Retcin*; *Robimycin*; *Rommix*; *Ronmix*; *Staticin*; *Stiemycin*; *Theramycin Z*; *Toloryth*; *T-Stat*.



Chemical Properties Erythromycin and its salts are ingredients of many preparations—see Sweetman [2009]. An antimicrobial substance produced by the growth of certain strains of *Streptomyces erythreus*. It is a mixture consisting largely of erythromycin A with lesser amounts of erythromycins B and C. White or slightly yellow, slightly hygroscopic, crystals or powder. Mp 135° to 140°. Soluble 1 in 1000 of water, less soluble at higher temperatures; soluble 1 in 5 of ethanol; freely soluble in acetone, chloroform, acetonitrile and ethyl acetate; moderately soluble in ether, ethylene dichloride and amyl acetate. pK_a 8.9. Log *P* (octanol/water), 3.1.

Erythromycin Estolate
$C_{40}H_{71}NO_{14}$,$C_{12}H_{26}O_4S$ = 1056.4
CAS—3521-62-8
Synonyms Erythromycin propionate laurilsulfate; propionyl erythromycin laurilsulfate.
Proprietary Names *E-Mycin*; *Erymin*; *Eromycin*; *Ilosone*.
Chemical Properties A white crystalline powder. Mp 135° to 140°, with decomposition. Practically insoluble in water; soluble 1 in 2 of ethanol, 1 in 15 of acetone and 1 in 10 of chloroform.

Erythromycin Ethylsuccinate
$C_{43}H_{75}NO_{16}$ = 862.1
CAS—41342-53-4; 1264-62-6
Proprietary Names *Abboticin(e)*; *Arpimycin*; *EES*; *E-Mycin*; *Eromycin*; *Ery*; *Erymax*; *Erymin*; *Ery-Ped*; *Erythrocin(e) Erythroped*.
Chemical Properties A white or slightly yellow crystalline powder. Very slightly soluble in water; freely soluble in ethanol and chloroform.

Erythromycin Gluceptate
$C_{37}H_{67}NO_{13}$,$C_7H_{14}O_8$ = 960.1
CAS—23067-13-2
Synonym Erythromycin glucoheptonate
Proprietary Name *Ilotycin*
Chemical Properties A white, slightly hygroscopic powder. Mp 95° to 140°. Freely soluble in water, ethanol, methanol, acetone, propylene glycol and dioxane; slightly soluble in chloroform; practically insoluble in ether, carbon tetrachloride, toluene and benzene.

Erythromycin Lactobionate
$C_{37}H_{67}NO_{13}$,$C_{12}H_{22}O_{12}$ = 1092
CAS—3847-29-8
Proprietary Names *Abboticin*; *Eryc*; *Erycinum*; *Erymax*; *Erythrocin(e)*.
Chemical Properties White or slightly yellow crystals or powder. Mp 145° to 150°. Freely soluble in water, ethanol and methanol; slightly soluble in chloroform and ether.

Erythromycin Propionate
$C_{40}H_{71}NO_{14}$ = 790.0
CAS—134-36-1
Proprietary Names *Ery*; *Propiocine*.
Chemical Properties A white powder. Very slightly soluble in water; readily soluble in acetone, ethyl acetate, ethanol and chloroform.

Erythromycin Stearate
$C_{37}H_{67}NO_{13}$,$C_{18}H_{36}O_2$ = 1018.4
CAS—643-22-1
Proprietary Names *Abboticin(e)*; *Eramycin*; *Eromycin*; *Erotab*; *Erycin*; *Erycinum*; *Erythrocin(e)*.
Chemical Properties White or slightly yellow crystals or powder. Practically insoluble in water; slightly soluble in ethanol, chloroform and ether.

Colour Test Marquis test—brown.
Thin-layer Chromatography System TA—R_f 0.55; system TB—R_f 0.11; system TE—R_f 0.46; system TAE—R_f 0.24; system TAJ—R_f 0.04; system TAK—R_f 0.02; system TAL—R_f 0.42.
Infrared Spectrum Principal peaks at wavenumbers 1050, 1168, 1074, 1010, 1108, 1734 cm^{-1} (KBr disk).
Quantification
Plasma **HPLC** Electrochemical detection. For method of quantification, see Toreson and Eriksson [1995].
HPLC–MS Limit of detection, <0.5 µg/L [Li *et al.* 1998].
Serum **HPLC** Fluorescence detection. For method for quantification of erythromycin and other macrolide antibiotics, see Sastre Toraño and Guchelaar [1998].

Derivatisation and fluorescence detection. Limit of detection, <10 µg/L for erythromycin and erythromycin ethylsuccinate [Tsuji 1978].

Gastric Juice **HPLC** See Plasma [Toreson, Eriksson 1995].

Review Analysis of macrolide antibiotics [Kanfer *et al.* 1998].

Disposition in the Body Erythromycin base is destroyed by gastric acid; erythromycin stearate is hydrolysed in the intestine and absorbed as free erythromycin; the estolate is absorbed as the ester and then hydrolysed. About 5 to 10% of a dose is excreted in the urine unchanged and large amounts of unchanged drug are excreted in the bile.

Therapeutic Concentration

Following single oral doses of 250 mg, 500 mg and 1 g of a preparation containing enteric-coated pellets of erythromycin base to 23 subjects, mean peak serum concentrations of 1.9, 3.8 and 6.5 mg/L, respectively, were attained in about 2 h. After a single oral dose of 500 mg of erythromycin stearate to the same subjects, a mean peak serum concentration of 2.9 mg/L was attained in about 2 h [Josefsson *et al.* 1982].

Following oral administration of 250 mg of erythromycin four times a day to 16 subjects, maximum and minimum steady-state plasma concentrations of 1.7 and 0.45 mg/L were reported on the third day, compared with 1.34 and 0.58 mg/L respectively, following repeated oral administration of erythromycin estolate [DiSanto *et al.* 1980].

Half-life Plasma half-life, about 1 to 3 h (dose-dependent).

Volume of Distribution About 0.7 L/kg.

Clearance Plasma clearance, about 7 mL/min/kg.

Distribution in Blood Plasma : whole blood ratio, 0.43.

Protein Binding Erythromycin about 70 to 80%, erythromycin propionate about 90 to 99%, erythromycin stearate about 90%.

Dose 1 to 4 g daily.

Escitalopram

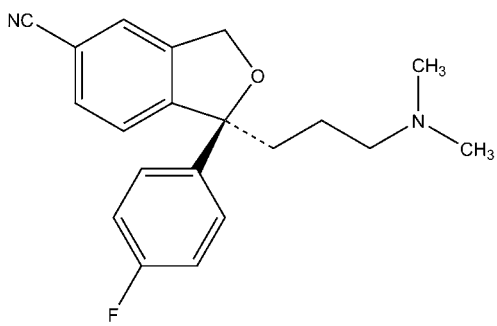
Antidepressant, Phthalane Derivative, Selective Serotonin Reuptake Inhibitor (SSRI)

$C_{20}H_{21}FN_2O = 324.4$

CAS—128196-01-0

IUPAC Name (1*S*)-1-(3-Dimethylaminopropyl)-1-(4-fluorophenyl)-3*H*-2-benzofuran-5-carbonitrile

Synonyms *S*-Citalopram; (+)-(*S*)-1-[3-(dimethylamino)propyl]-1-(*p*-fluorophenyl)-5-phthalancarbonitrile.



Chemical Properties Log *P* (octanol/water), 4.22 [Wishart 2006]. Stable in plasma for 36 days at –70° and for 8 h at room temperature. Working solutions of escitalopram stable for 30 days at 2 to 8° [Singh *et al.* 2004].

Escitalopram Oxalate

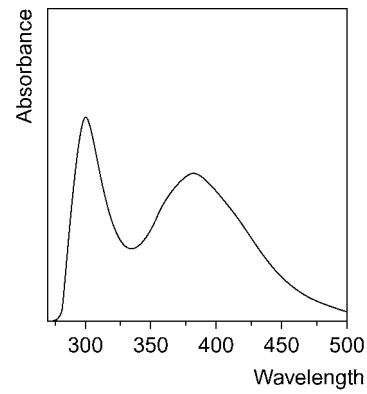
$C_{20}H_{21}FN_2O,C_2H_2O_4 = 414.4$

CAS—219861-08-2

Synonyms *S*-Citalopram oxalate; Lu-26-054/0.

Proprietary Names *Aramix*; *Cipralex*; *Citalax*; *Ectiban*; *Entact*; *Esertia*; *Ipran*; *Lexapro*; *Lextor*; *Meridian*; *Neozentius*; *Recita*; *S-Citadep*; *Seroplex*; *Sipralexa*.

Ultraviolet Spectrum Neutral—305, 384 nm.



Quantification

Blood **HPLC** Column: acetylated β-cyclodextrin (250 × 4.6 mm i.d.). Mobile phase: methanol : 100 mmol/L citric acid TEA (pH 6.3, 55 : 45), flow rate 0.8 mL/min. Fluorescence detection ($\lambda_{ex} = 240$ nm, $\lambda_{em} = 300$ nm). Retention times: escitalopram 15.6 min, desmethylescitalopram 12.5 min, didesmethylescitalopram 10.8 min; (*R*)-citalopram 17 min, (*R*)-desmethylcitalopram 13.2 min, (*R*)-didesmethylcitalopram 11.3 min. Limit of quantification, 2 µg/kg for all analytes [Holmgren *et al.* 2004].

Plasma **HPLC** Column: Merck RP Select B C_{18} (250 × 4.6 mm i.d.). Mobile phase: acetonitrile : water (40 : 60) containing 0.01% sodium chloride and 0.01% hydrogen phosphate, flow rate 1.6 mL/min. UV detection ($\lambda = 210$ nm). Limit of detection, 1 µg/L [Rampono *et al.* 2000]. Column: Chirobiotic vancomycin (150 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : acetic acid : TEA (99.9 : 0.055 : 0.060), flow rate 1.0 mL/min. Fluorescence detection ($\lambda_{ex} = 240$ nm, $\lambda_{em} = 296$ nm). Retention time: escitalopram 12.6 min, desmethylescitalopram 13.7 min, didesmethylescitalopram 9.7 min; (*R*)-citalopram 11.5 min, (*R*)-desmethylcitalopram 10.5 min, (*R*)-didesmethylcitalopram 8.0 min. Limit of quantification, 5 µg/L for escitalopram, (*R*)-citalopram and desmethyl metabolites; 7.5 µg/L for didesmethyl metabolites [Kosel *et al.* 1998]. Column: Chiral-AGP (100 × 4.0 mm i.d.). Mobile phase: 10 mmol/L hexanoic acid and 3.0 mmol/L SB-12 in phosphate buffer (pH 6.5), flow rate 0.90 mL/min. UV detection ($\lambda = 240$ nm). Retention time: escitalopram 10.7 min, (*R*)-citalopram 8.8 min. Limits of quantification, escitalopram 2.55 µg/L, (*R*)-citalopram 2.31 µg/L [Haupt 1996]. Column: Cyclobond (250 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 1% diethylamine buffer (pH 6.1; 65 : 35), flow rate 0.8 mL/min. Fluorescence detection ($\lambda_{ex} = 240$ nm, $\lambda_{em} = 296$ nm). Retention time: escitalopram 15.5 min, desmethylescitalopram 12.2 min, didesmethylescitalopram 10.6 min, (*R*)-citalopram 16.6 min, (*R*)-desmethylcitalopram 12.9 min, (*R*)-didesmethylcitalopram 11.1 min. Limit of quantification, 3 µg/L for all analytes [Rochat *et al.* 1995a]. Column: Chiralcel OD (250 × 4.6 mm i.d., 10 µm). Mobile phase: hexane : propan-2-ol (93.5 : 6.5) containing 0.2% diethylamine, flow rate 0.4 mL/min for 16 min, to 1.0 mL/min for 1 min. Fluorescence detection ($\lambda_{ex} = 240$ nm, $\lambda_{em} = 296$ nm). Retention times: escitalopram 21 min, desmethylescitalopram 25 min; didesmethylescitalopram 31 min; (*R*)-citalopram 20 min; (*R*)-desmethylcitalopram 28 min; (*R*)-didesmethylcitalopram 35.5 min. Limit of quantification, 25 µg/L for citalopram enantiomers, 5 µg/L for desmethylcitalopram and didesmethylcitalopram enantiomers. For analysis of citalopram propionic acid enantiomers: Mobile phase: hexane : propan-2-ol (50 : 50), flow rate 0.65 mL/min. Retention times: escitalopram propionic acid 12.5 min; (*R*)-citalopram propionic acid 10.5 min. Limit of quantification, 5 µg/L [Rochat *et al.* 1995b].

LC-MS Column: Chiralcel OD-R (250 × 4.6 mm i.d., 10 µm). Mobile phase: acetonitrile : methanol : water (30 : 30 : 40) containing 0.05% diethylamine, flow rate 0.5 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention time: escitalopram 10.5 min, desmethyl metabolite 11.5 min. Limit of quantification, 0.1 µg/L for all analytes [Rocha *et al.* 2007]. Column: ODS (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 2.0 mmol/L ammonium acetate (pH 5.0, 46 : 54), flow rate 1.0 mL/min. ESI, positive ion mode, SIM acquisition mode. Limit of quantification, 1.0 µg/L [Singh *et al.* 2004].

Serum **HPLC** Column: β-cyclodextrin (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.05 mol/L citric acid buffer (pH 6.0) with 30–40% methanol, flow rate 1.0-1.5 mL/min. Fluorescence detection ($\lambda_{ex} = 240$ nm, $\lambda_{em} = 296$ nm). Retention times: escitalopram ~38 min, desmethylescitalopram approx. 23 min, didesmethylescitalopram approx. 17 min; (*R*)-citalopram ~30 min, (*R*)-desmethylcitalopram approx. 20 min, (*R*)-didesmethylcitalopram ~15 min. Limits of quantification, 15.4, 8.1 and 3.4 nmol/L for both enantiomers of citalopram, desmethylcitalopram and didesmethylcitalopram, respectively [Sidhu *et al.* 1997].

Urine **HPLC** See Serum [Sidhu *et al.* 1997].

CE Column: fused silica capillary (50 cm, 75 µm i.d.). Buffer: 20 mmol/L sodium dihydrogen phosphate/disodium hydrogen phosphate buffer (pH 5) with 0.2%

carboxymethylated-γ-cyclodextrin and 0.05% hydroxypropylmethylcellulose. UV detection (λ = 205 nm). Limit of quantification, 230 µg/L for escitalopram, 270 µg/L for desmethyl/didesmethyl metabolites, 200 µg/L for *N*-oxide metabolite [Berzas-Nevado *et al.* 2006].

CE-MS Column: fused silica capillary (total/effective length: 55/42 cm, 75 µm i.d.) with 5 cm filled with solution of 575 µL of 3-(trimethoxysilyl)propyl methacrylate and 100 µL of 0.12 mol/L hydrochloric acid, irradiated at 365 nm for 4.5 min. Buffer: 5 mmol/L ammonium acetate (pH 6.8) : acetonitrile (30 : 70). TOF, ESI. Limit of quantification, 34 ng/L, limit of detection, 10 ng/L [Johannesson, Bergquist 2007].

***Milk* HPLC** See Plasma [Rampono *et al.* 2000].

Note For the fluorometric quantification of escitalopram in plasma, see Serebruany *et al.* [2007].

Disposition in the Body Rapidly absorbed after oral administration with peak plasma concentrations reached within 4 h of dosing. Escitalopram is predominantly metabolised in the liver to less lipophilic compounds that are readily excreted in urine. Biotransformation occurs via oxidative metabolism with *N*-demethylation to desmethylescitalopram ((*S*)-desmethylcitalopram) and didesmethylescitalopram ((*S*)-didesmethylcitalopram), deamination and dehydrogenation to a propionic acid derivative, and also *N*-oxidation and glucuronide conjugation. *N*-Demethylation of escitalopram is mediated by CYP3A4 (~37%), CYP2C19 (~35%) and, to a lesser extent, CYP2D6 (~28%). Studies have shown that genetic polymorphism of CYP2C19 affects plasma concentrations of escitalopram and its desmethyl metabolite. Poor metabolisers have higher plasma concentrations of escitalopram and lower concentrations of the desmethyl metabolite, although renal clearance and urinary recovery of the compounds do not differ significantly between the 2 phenotypes. Further demethylation of desmethylescitalopram to didesmethylescitalopram is mediated by CYP2D6 and an unknown non-CYP-mediated reaction. Monoamine oxidases A and B and aldehyde oxidase may mediate metabolism in the brain. Biotransformation of escitalopram to its propionic acid metabolite occurs via deamination mediated by MAOs A and B followed by aldehyde oxidase-mediated oxidation. Elimination of escitalopram and its metabolites is mainly via renal excretion with only a small fraction voided in the faeces. Only 8 to 10% of a dose is excreted unchanged. There is no conversion of escitalopram to the *R*-isomer after oral administration in either plasma or urine. It is distributed into breastmilk.

Therapeutic Concentration

A group of healthy volunteers were administered escitalopram as an IV infusion (10 mg over 60 min) or oral formulation (single 20 mg oral dose and 10 or 30 mg/day for 24 days). Mean peak plasma concentrations of escitalopram and its desmethyl metabolite (M1) for the different regimen were reported as:

Dose:	*10 mg IV*	*20 mg oral*	*10 mg/day oral for 24 days*	*30 mg/day oral for 24 days*
Escitalopram				
C_{max} (µg/L)	19.0	18.8	20.6	64.4
Time (h)	0.99	3.0	3.9	4.1
M1				
C_{max} (µg/L)	1.4	3.4	7.4	19.4
Time (h)	36.5	14.0	7.5	6.0

[Sogaard *et al.* 2005].

Twenty 20 healthy male subjects were administered either 10 mg/day escitalopram or 20 mg/day citalopram for 10 days. Mean peak plasma concentrations and concentrations at 5.5 h and 53.5 h post-dose were reported as:

	C_{max} (µg/L)	*Time (h)*	$C_{5.5\,h}$ (µg/L)	$C_{53.5\,h}$ (µg/L)
(*S*)-Citalopram				
Escitalopram 10 mg	16.7	5.5	16.7	4.6
Citalopram 20 mg	16.8	7.8	15.8	4.8
(*R*)-Citalopram				
Citalopram 20 mg	27.7	7.8	24.9	12.3

A higher serotonin transporter occupancy was found after escitalopram dosing compared to citalopram despite similar plasma concentrations of the *S*-enantiomer. This can be explained by the attenuating effect of (*R*)-citalopram on the occupancy of (*S*)-citalopram at the serotonin transporter [Klein *et al.* 2007].

The transfer of escitalopram into breastmilk was studied in a group of 8 breastfeeding women who were being treated for postnatal depression with a median dose of 10 mg/day escitalopram. Blood samples were taken just before the morning dose of escitalopram and at 2, 4 and 6 h after dosing. Mean peak concentrations of escitalopram and its desmethyl metabolite in breastmilk and plasma were reported as:

	Breastmilk		*Plasma*	
	C_{max} (µg/L)	*Time (h)*	C_{max} (µg/L)	*Time (h)*
Escitalopram	78	5.5	35	3.4
Metabolite	27	4.8	10	2.1

The absolute escitalopram infant dose was estimated as 7.6 µg/kg/day or 3.9% of the maternal dose [Rampono *et al.* 2006].

Toxicity Escitalopram is a weak or negligible inhibitor of CYP1A2, CYP2C9, CYP2C19, CYP2D6 and CYP3A4, suggesting that it has low potential to cause significant interactions with drugs that are substrates of these isoenzymes. However, the co-administration of desipramine (a CYP2D6 substrate) to a high-dose regimen of escitalopram resulted in a 40% increase in the peak plasma concentration and a 100% increase in the AUC of desipramine.

Bioavailability Approximately 80%.

Half-life Approximately 27 to 32 h.

Volume of Distribution 1100 L.

Clearance Approximately 36.0 L/h; renal 2.7 L/h.

Protein Binding Approximately 56%.

Note For a review of the clinical pharmacokinetics of escitalopram, see Rao [2007].

Dose Given orally as the oxalate although doses are expressed in terms of the base; escitalopram oxalate 12.8 mg is equivalent to approx. 10 mg of escitalopram.

In the treatment of depression, the usual dose is 10 mg once daily increased, after at least a week, to a maximum of 20 mg once daily if necessary.

It is also used in the treatment of panic disorder with or without agoraphobia. Initial doses are 5 mg once daily, increased after a week to 10 mg once daily; further increases up to a maximum of 20 mg daily may be necessary in some patients.

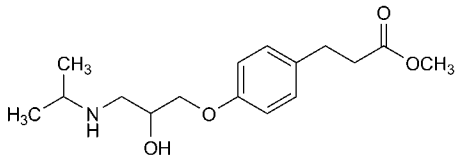
Esmolol

β-*Blocker*

$C_{16}H_{25}NO_4$ = 295.4

CAS—84057-94-3

IUPAC Name 4-[2-Hydroxy-3-[(1-methylethyl)amino]propoxy]benzenepropanoic acid methyl ester



Chemical Properties Esmolol is an oil which gradually becomes crystalline at room temperature. Mp 48° to 50°. pK_a 9.5 [Fan *et al.* 1991]. Log *P* (octanol/water, pH 7), 0.42. Extraction yield (chlorobutane), 0.8 [Demme *et al.* 2005]. Esmolol in methylene chloride extracts was stable for 1 year at –20° [Achari *et al.* 1988]. Esmolol is unstable in blood at room temperature with a half-life of ≈27 min, but the addition of NaF improves stability [Zuppa *et al.* 2003].

E

Esmolol Hydrochloride

$C_{16}H_{25}NO_4,HCl = 331.8$

CAS—81161-17-3

Synonym Asl-8052

Proprietary Name *Brevibloc*

Chemical Properties A white to off-white crystalline powder that is relatively hydrophilic. Mp 85° to 86°. It is very soluble in water; freely soluble in alcohol. For the stability of esmolol hydrochloride in IV solutions, see Baaske *et al.* [1994].

Gas Chromatography System GB—esmolol RI 2311, Art RI 2395.

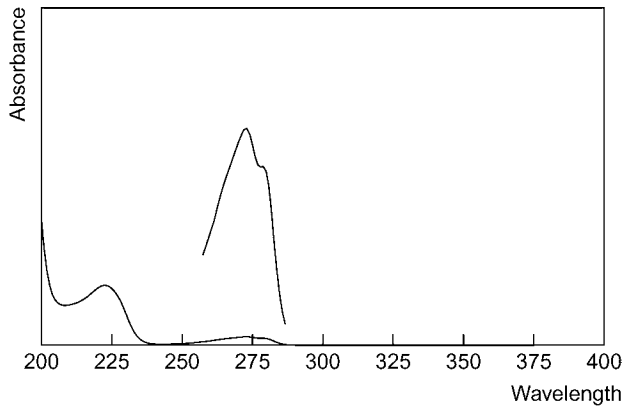
High Performance Liquid Chromatography Column: μBondapak C_{18} (30 cm × 3.9 mm). Mobile phase: 0.005 mol/L monobasic potassium phosphate : methanol : acetonitrile (65 : 20 : 15), flow rate 2.0 mL/min. UV detection (λ = 214 nm). Limit of detection not reported [Baaske *et al.* 1994].

Column: μBondapak C_{18} (300 × 3.9 mm i.d., 10 μm) Mobile phase: phosphate buffer (pH 6.2)-acetonitrile (pH 6.0; 65 : 35): 10 mmol/L sodium acetate-acetonitrile-glacial acetic acid (pH 3.4; 91 : 8 : 1), flow rate 2 mL/min. UV detection (λ = 229 nm). Retention time: 6.1 min for esmolol with the first mobile phase; 10.8 min for de-esterified metabolite with the second system. Limit of detection, 0.025 and 1 mg/L for esmolol and metabolite, respectively [Achari *et al.* 1986a].

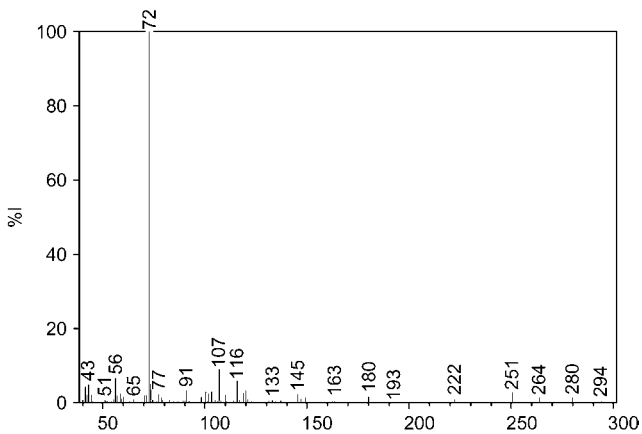
Column: cyano-bonded silica (30 cm × 3.9 mm i.d., 10 μm). Mobile phase: acetonitrile : glacial acetic acid : 0.068% sodium acetate trihydrate (150 : 10 : 840), flow rate 2 mL/min. UV detection (λ = 280 nm). Retention time: 7.71 min for esmolol hydrochloride, 5.14 min for esmolol. Limit of quantification, ≈10 mg/L [Lee *et al.* 1984].

Column: Radial-Pak CN (100 × 5 mm i.d., 10 μm). Mobile phase: methanol : 0.06 mol/L potassium dihydrogen phosphate buffer : triethylamine, (pH 3.15; 25 : 75 : 0.1), flow rate 1.8 mL/min. UV detection (λ = 221 nm). Retention time: 2.6 min. [Fan *et al.* 1991].

Ultraviolet Spectrum Aqueous acid (pH 2.38)—192, 220, 276 nm.



Mass Spectrum Principal ions at *m/z* 72, 107, 116, 251, 43, 56, 91, 102.



Quantification

Blood **GC-MS** Column: 3% SP-2250 on Supelcoport 100/200 mesh (2 m × 2 mm i.d.). Temperature: 230°. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, 2.5 μg/L [Sum, Yacobi 1984].

HPLC Column: Radial-Pak CN (10 cm × 5 mm, 10 μm). Mobile phase: methanol : 0.06 mol/L potassium dihydrogenphosphate buffer : triethylamine (pH 3.15; 25 : 75 : 0.1), flow rate 1.8 mL/min. UV detection (λ = 221 nm). Retention time: 2.6 min. Limit of quantification, 10 μg/L, limit of detection, 5 μg/L [Fan *et al.* 1991]. Column: μBondapak C_{18} (300 × 3.9 mm i.d., 10 μm). Mobile phases: 0.01 mol/L monobasic potassium phosphate (pH 2.45) : methanol (63 : 37) flow rate 1.5 mL/min. UV detection (λ = 229 nm). Retention time: 4.1 min. Limit of detection, 25 μg/L [Achari *et al.* 1988]. Column: μBondapak C_{18} (15 cm × 4 mm i.d.). UV detection (λ = 229 nm). Limit of detection, 50 μg/L [Sintetos *et al.* 1987]. Column: μBondapak phenyl (30 cm × 3.9 mm, 10 μm). Mobile phase: 0.01 mol/L sodium acetate : acetonitrile : glacial acetic acid (pH 3.7; 87 : 12 : 1), flow rate 2.0 mL/min. UV detection (λ = 280 nm). Retention time: 23.4 min, 7.3 min for metabolite. Limit of detection, 1.0 mg/L [Stampfli *et al.* 1984]. Column: μBondapak (25 cm × 4.6 mm i.d.). Mobile phase: 0.01 mol/L sodium acetate : acetic acid : acetonitrile (pH 3.5; 87 : 1 : 12), flow rate 2.0 mL/min. UV detection (λ = 280 nm). Limit of detection not reported [Sum *et al.* 1983].

Plasma **HPLC** Column: Zorbax C_{18} (250 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : 0.02 mol/L phosphate buffer (pH 4.5; 55 : 45), flow rate 0.75 mL/min. UV detection (λ = 224 nm). Retention time: 6.8, 7.7, 16.2 and 19.2 min for (—)-*S*-esmolol, (+)-*R*-esmolol, (—)-*S*-acid metabolite and (+)-*R*-acid metabolite, respectively. Limit of detection, 0.008 and 0.006 mg/L for each enantiomer and the acid metabolites, respectively [Tang *et al.* 2004a]. Limit of quantification, 0.035 mg/L, limit of detection, 0.003 mg/L [Tang *et al.* 2004b].

LC-MS Column: XTerra MSC18 (50 × 2.1 mm i.d., 3 μm). Mobile phase: water-0.05% formic acid-1% methanol : methanol-formic acid (95 : 5 to 20 : 80 at 5 min for 3 min to 95 : 5 at 9 min for 6 min), flow rate 250 μL/min. ESI. Retention time: 5.7 min. Limit of quantification, 2 μg/L [Zuppa *et al.* 2003].

Serum **LC-MS** Column: Zorbax SB-C_{18} (150 × 2.1 mm, 3.5 μm). Mobile phase: acetonitrile : 0.05 mol/L ammonium acetate (pH 6.4; 10 : 90 to 50 : 50 at 15 min), flow rate 0.7 mL/min. ESI, SIM acquisition mode. Retention time: 10.02 min. Limit of detection, 23 μg/L [Buszewski *et al.* 2009].

Urine **HPLC** Column: μBondapak C_{18} (300 × 3.9 mm i.d.). Mobile phase: phosphate buffer (pH 6.6) : acetonitrile : 13% phosphoric acid (65 : 35 : 0.05), flow rate 2.0 mL/min. UV detection (λ = 229 nm). Retention time: 6.1 min. Limit of detection, 0.025 and 1.0 mg/L for esmolol and metabolite, respectively [Achari *et al.* 1986a; Achari *et al.* 1986b].

Disposition in the Body Esmolol is rapidly hydrolysed in red blood cells by esterases. An acidic de-esterified metabolite (with very little β-blocking activity), methanol and several inactive metabolites are produced. Excretion is mainly via urine, primarily as the de-esterified metabolite (71 to 83%) and <2% of the drug appearing unchanged; the rest are inactive metabolites. The remainder of the dose can be recovered in the faeces. Only small amounts of the metabolite are removed by dialysis. The metabolite accumulates in patients with renal failure.

Therapeutic Concentration

Eight healthy male volunteers aged between 21 and 27 years were administered continuous IV doses of 50, 150 and 400 μg/kg/min for 2 h. Peak plasma concentrations of 77.9 mg/L ASL-8123 (mean) were reached within 26 min after infusion was stopped. Steady-state concentrations of the parent drug esmolol reached 1.59 mg/L (mean) [Yacobi *et al.* 1983].

Nine male volunteers with cirrhosis and 3 healthy males, aged between 23 and 65 years, were administered 200 μg/kg/min esmolol over 4 h. Mean steady-state esmolol concentrations were 1.68 mg/L for the healthy individuals and 1.41 mg/L for those with cirrhosis. These concentrations were observed during infusion and rapidly decreased once the infusion was complete. Mean concentrations of the metabolite were 39.2 and 56.0 mg/L for the healthy individuals and cirrhosis patients, respectively. These were seen after ~4 h [Buchi *et al.* 1987].

Twelve healthy male volunteers aged between 22 and 44 years were administered an initial dose of 30 mg followed by a subsequent larger IV bolus dose. Peak esmolol concentrations were measured in the blood samples drawn within 2 min of the bolus. In 4 subjects receiving the highest dose (150 mg), peak blood esmolol concentrations were 0.868, 1.16, 1.25, and 1.47 mg/L. Blood concentrations remained within the measurable range for <15 min. In the 4 subjects who received doses of 100 and 150 mg, peak metabolite concentrations were measured 90 min after the 150 mg dose in 3 subjects and at 120 min in the fourth subject. Peak concentrations were 2.89, 3.54, 3.59, and 3.86 mg/L [Sintetos *et al.* 1987].

Toxicity Massive accidental overdosing has occurred due to dilution errors, which has resulted in cardiac arrest, death and permanent disability. A concentration between 12.5 to 50 mg/kg is associated with fatalities.

Half-life ≈9 min for esmolol [Sum *et al.* 1983]; increases in patients with liver failure, up to 16 min; 3.7 h for the metabolite.

Volume of Distribution 1.0 to 2.4 L/kg; increases in patients with renal failure, up to 3.4 L/kg; 0.41 L/kg (metabolite) [Sum *et al.* 1983].

Clearance Plasma clearance, 20 L/kg/h; 0.08 L/h/kg or 1.28 mL/min/kg (metabolite); 285 mL/min/kg [Sum *et al.* 1983].

Protein Binding Esmolol is 55% bound and the metabolite 10%.

Note For a general review of esmolol, see Benfield and Sorkin [1987].

Dose An initial loading dose of 500 μg/kg body weight is administered. A maintenance dose of 50 μg/kg/min is used, which can be increased (if necessary) to a maximum of 200 μg/kg/min.

Esomeprazole

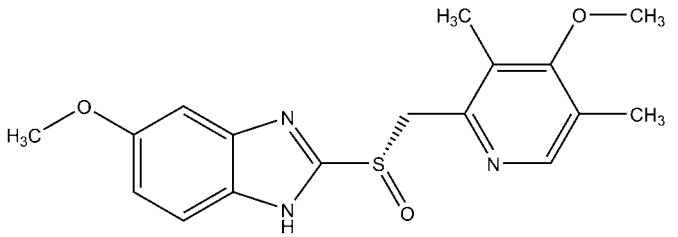
Antiulcerative, Benzimidazole, Proton Pump Inhibitor

$C_{34}H_{36}N_6O_6S_2 = 345.4$

CAS—119141-88-7

IUPAC Name 6-Methoxy-2-[(*R*)-(4-methoxy-3,5-dimethylpyridin-2-yl)methylsulfinyl]-1*H*-benzimidazole

Synonyms H199/18; 5-methoxy-2-{(*S*)-[(4-methoxy-3,5-dimethyl-2-pyridyl)methyl]sulfinyl}benzimidazole; perprazole.



Chemical Properties Mp 155°. Very slightly soluble in water. Log *P* (octanol/water), 1.078 [Wishart 2006].

Esomeprazole Magnesium

$C_{34}H_{36}MgN_6O_6S_2,3H_2O = 767.2$

CAS—217087-09-7

Proprietary Names *Axagon*; *Axiago*; *Esomac*; *Esomax*; *Esopral*; *Esoz*; *Inexium*; *Nexium*; *Nexiam*; *Sompraz.*

High Performance Liquid Chromatography Column: Zorbax C_{18} (150 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : phosphate buffer (pH 7.3; 35 : 65). Limit of quantification not reported [Bladh *et al.* 2007].

Quantification

Plasma **HPLC** Column: Hypersil BDS C_{18} (250 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : 0.01 mol/L phosphate buffer (pH 7.4; 30 : 70), flow rate 1.0 mL/min. UV detection (λ = 284 nm). Limit of quantification not reported [Agarwal *et al.* 2007]. Column: LiChrospher 100 Diol. Mobile phase: ammonium hydroxide : methanol : water : isohexane : ethyl acetate (0.05 : 8.0 : 0.8 : 55 : 37.15). UV detection (λ = 302 nm). Retention time: esomeprazole 3.5 min, esomeprazole sulfone 4.5 min, 5-hydroxyesomeprazole 8.0 min. Limit of quantification, 25 nmol/L for esomeprazole and esomeprazole sulfone; 50 nmol/L for 5-hydroxyesomeprazole [Hassan-Alin *et al.* 2006]. Column: Amylase tris(3,5-dimethylphenylcarbamate) coated (20% w/w) on to APS-Nucleosil (150 × 4.6 mm i.d., 7 μm). Mobile phase: acetonitrile : water (60 : 40), flow rate 0.5 mL/min. UV detection (λ = 302 nm). Retention time: esomeprazole 20 min, (*R*)-omeprazole 25 min. Limit of quantification, 0.05 mg/L; limit of detection, 6.3 μg/L for esomeprazole and (*R*)-omeprazole [Cass *et al.* 2003]. Column: α_1-acid glycoprotein (100 × 4.0 mm i.d., 5 μm). Mobile phase: acetonitrile : 10 mmol/L sodium phosphate (pH 5.5; 12 : 88), flow rate 0.9 mL/min. UV detection (λ = 302 nm). Limit of detection, 25 nmol/L for esomeprazole and 5-hydroxyesomeprazole [Tybring *et al.* 1997].

LC-MS Column: Hypersil BDS C_8 (50 × 4.6 mm i.d., 3 μm). Mobile phase: acetonitrile : formic acid : 0.1 mol/L ammonium acetate : water (250 : 1 : 100 : 645; pH 3.8), flow rate 0.75 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention time: esomeprazole 3.3 min, 5-hydroxyomeprazole 1.7 min, omeprazole sulfone 5.5 min. Limit of quantification, 20 nmol/L for all analytes [Hultman *et al.* 2007]. Column: Chiralpak AD (50 × 4.6 mm i.d., 10 μm). Mobile phase: concentrated acetic acid : ethanol : acetonitrile : isohexane (0.004 : 30.0 : 1.0 : 68.006), flow rate 1.0 mL/min. ESI, MRM acquisition mode. Retention time: esomeprazole 3 min, (*R*)-omeprazole 4.5 min. Limit of quantification, 10 nmol/L [Stenhoff *et al.* 1999].

Serum **LC-MS** Column: ReproSil Chiral-CA (250 × 2.0 mm i.d., 5 μm). Mobile phase: propan-2-ol-acetic acid-diethylamine (100 : 4 : 1) : hexane (10 : 90 to 15 : 85 over 10 min for 1 min), flow rate 0.35 mL/min. APPI, positive ion mode, MRM acquisition mode. Limit of quantification, 5 μg/L for esomeprazole and (*R*)-omeprazole, 2.5 μg/L for 5-hydroxyesomeprazole and (*R*)-5-hydroxyomeprazole, limit of detection, 0.2 μg/L for esomeprazole and (*R*)-omeprazole, 1 μg/L for 5-hydroxyesomeprazole and (*R*)-5-hydroxyomeprazole [Martens-Lobenhoffer *et al.* 2007].

Disposition in the Body Rapidly absorbed after oral doses, with peak plasma levels occurring after ≈1 to 2 h. It is acid labile and an enteric-coated formulation has been developed. Food delays and decreases the absorption of esomeprazole, but this does not significantly change its effect on intragastric acidity. It is extensively metabolised in the liver by CYP2C19 to hydroxy- and desmethyl-metabolites. These have no effect on gastric acid secretion. The remainder is metabolised by CYP3A4 to esomeprazole sulfone. Other minor metabolites include 5-*O*-desmethylesomeprazole, 3-hydroxyesomeprazole, and esomeprazole sulfide. With repeated dosing, there is a decrease in first-pass metabolism and systemic clearance, probably caused by an inhibition of the CYP2C19 isoenzyme. However, there is no accumulation during once daily use. Almost 80% of an oral dose is eliminated as metabolites in the urine, the remainder in the faeces. Less than 1% of the parent compound is found unchanged in urine.

Therapeutic Concentration

Two groups of healthy volunteers were administered esomeprazole as an IV infusion and/or oral formulation. In studies A and B, subjects received IV doses of 20 mg and 40 mg esomeprazole, respectively, on day 1. After a washout period of 5 to 14 days, the same doses (20 mg as a solution and 40 mg as a capsule) were given orally for 5 days and then again IV on day 6. Blood samples for determination of esomeprazole in plasma were taken up to 12 h (study A) or 24 h (study B) post-dose after the first and second IV doses and on day 1 and day 5 of oral dosing. Peak plasma concentrations for the 20 mg dose were reported as:

	C_{max} (μmol/L)
IV route	
1st dose	2.51
2nd dose	2.67
Oral route	
Day 1	1.86
Day 5	2.65

Peak plasma concentrations for the 40 mg dose were reported as:

	C_{max} (μmol/L)
IV route	
1st dose	5.53
2nd dose	6.91
Oral route	
Day 1	2.38
Day 5	4.64

Corresponding values for esomeprazole sulfone and 5-hydroxyesomeprazole following oral administration of the 40 mg dose were:

Metabolite	*C_{max} (μmol/L)*
Esomeprazole sulfone	
Day 1	0.76
Day 5	1.71
5-Hydroxyesomeprazole	
Day 1	0.29
Day 5	0.28

[Hassan-Alin *et al.* 2000].

Twelve healthy male volunteers were administered 5, 10 or 20 mg oral esomeprazole or 20 mg omeprazole once daily for 5 days. Peak plasma concentrations were reported as:

Dose	*Esomeprazole*			*Omeprazole*
	5 mg	*10 mg*	*20 mg*	*20 mg*
Day 1				
C_{max} (μmol/L)	0.35	0.79	1.68	0.62
Time (h)	0.31	0.30	0.38	1.94
Day 5				
C_{max} (μmol/L)	0.42	0.98	2.55	1.00
Time (h)	0.31	0.33	0.29	1.23

[Andersson *et al.* 2001].

In a bioequivalence study where 49 healthy male Caucasians were administered a single oral dose of 40 mg esomeprazole as a tablet or a tablet encapsulated in hard gelatine, peak plasma concentrations were reported as:

	Tablet	*Tablet in hard gelatine*
C_{max} (mg/L)	1.02	1.03
Time (h)	1.5	1.5
Half-life (h)	1.02	1.03

[Talpes *et al.* 2005].

Two group of young patients (group A: 1–5 years; group B: 6–11 years) with symptoms of gastro-oesophageal reflux disease were administered oral doses of 5, 10 or 20 mg esomeprazole. Peak plasma concentrations were reported as:

Dose	*Group A*		*Group B*	
	5 mg	*10 mg*	*10 mg*	*20 mg*
C_{max} (μmol/L)	0.62	2.98	1.77	3.73
Time (h)	1.33	1.44	1.79	1.75
Half-life (h)	0.42	0.74	0.88	0.73
Clearance (L/h)	19.4	6.0	7.8	9.2

[Zhao *et al.* 2006].

Toxicity Since intragastric pH will increase with esomeprazole treatment, the absorption of drugs with pH-sensitive absorption may be affected (e.g. digoxin and ketoconazole). Esomeprazole has the potential to inhibit CYP2C19, thus altering pharmacokinetics of drugs such as diazepam, phenytoin and warfarin. However, it does not seem to interact with drugs that are metabolised by CYP1A2, CYP2A6, CYP2C9, CYP2D6 or CYP2E1 [Andersson *et al.* 2001]. Studies on drug interactions between esomeprazole, amoxicillin and clarithromycin have shown that the combination treatment with these drugs results in higher plasma levels of esomeprazole compared with an esomeprazole-alone regimen. Plasma levels of amoxicillin and clarithromycin were similar irrespective of whether the drugs were administered alone or in combination with esomeprazole [Hassan-Alin *et al.* 2006]. In a case report, a 96% reduction in atazanavir trough plasma concentration was observed where a patient with HIV was taking a combination of 300 mg atazanavir and 100 mg ritonavir every morning plus 40 mg esomeprazole every evening [Kiser *et al.* 2006].
Bioavailability Increases with both dose and repeated administration to ≈68 and 89% for doses of 20 and 40 mg, respectively.
Half-life Approximately 1.3 h.
Volume of Distribution Steady state, 15.1 L.
Clearance Approximately 11.3 L/h.
Protein Binding Approximately 97%.
Dose Given as the magnesium or sodium salt but doses are calculated in terms of esomeprazole. Esomeprazole magnesium 22.2 mg and esomeprazole sodium 21.3 mg are each equivalent to ≈20 mg of esomeprazole. Usual dose is between 20 and 40 mg daily.

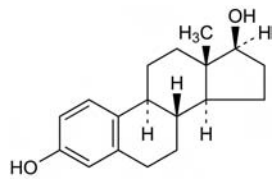
Estradiol

Oestrogen
$C_{18}H_{24}O_2$ = 272.4
CAS—50-28-2
IUPAC Name (8*R*,9*S*,13*S*,14*S*,17*S*)-13-Methyl-6,7,8,9,11,12,14,15,16,17-decahydrocyclopenta[*a*]phenanthrene-3,17-diol
Synonyms Beta-estradiol; dihydrofolliculine; dihydrotheelin; dihydroxyoestrin; (17β)-estra-1,3,5(10)-triene-3,17-diol; oestradiol.
Proprietary Names *Estrace*; *Farmacyrol*; *Gynoestryl*; *Oestrogel*; *Progynon*. It is an ingredient of *Hormonin* and *Trisequens*.



Chemical Properties White or creamy-white, hygroscopic crystals or crystalline powder. Mp 173° to 179°. Almost insoluble in water; soluble 1 in 28 of ethanol, 1 in 17 of acetone, 1 in 435 of chloroform and 1 in 150 of ether; soluble in dioxan and solutions of alkali hydroxides. Log *P* (octanol/water), 4.0.

Estradiol Benzoate

$C_{25}H_{28}O_3$ = 376.5
CAS—50-50-0
Synonyms Estradiol monobenzoate; oestradiol benzoate.
Proprietary Names *Benzo-Gynoestryl 5*; *Benztrone*; *Gynécormone*; *Oestramine*; *Ovocyclin M*; *Progynon B*. It is an ingredient of *Mixogen* (injection) and *Plex-Hormone* (injection).
Chemical Properties Colourless crystals or white or creamy-white crystalline powder. Mp 190° to 198°. Practically insoluble in water; slightly soluble in ethanol; soluble 1 in 5 of chloroform and 1 in 150 of ether; soluble in acetone and dioxan.

Estradiol Cipionate

$C_{26}H_{36}O_3$ = 396.6
CAS—313-06-4
Synonyms Estradiol cyclopentylpropionate; oestradiol cipionate.

Proprietary Names *Depo-Estradiol Cipionate*; *Neoginon Depositum*.
Chemical Properties A white crystalline powder. Mp 149° to 153°. Practically insoluble in water; soluble 1 in 40 of ethanol and 1 in 7 of chloroform; soluble in acetone, ether and dioxan.

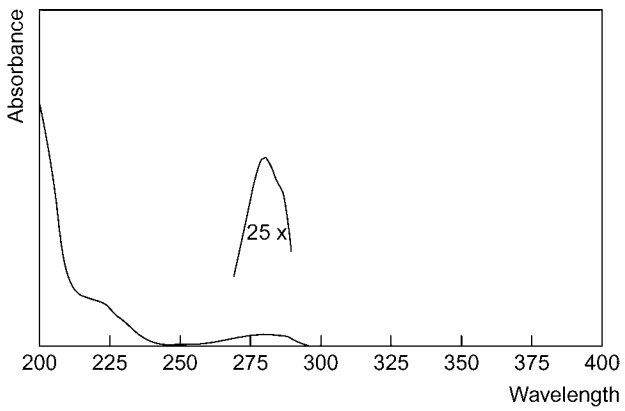
Estradiol Undecylate

$C_{29}H_{44}O_3$ = 440.7
CAS—3571-53-7
Synonyms Estradiol undecanoate; oestradiol undecylate.
Proprietary Names *Progynon Depot*; *Progynon-Retard*.

Estradiol Valerate

$C_{23}H_{32}O_3$ = 356.5
CAS—979-32-8
Synonym Oestradiol valerate
Proprietary Names *Delestrogen*; *Femogex*; *Östrogynol sine*; *Primogyn Depot*; *Progynon Depot*; *Progynova*. It is an ingredient of *Cyclacur* and *Cyclo-Progynova*.
Chemical Properties A white crystalline powder. Mp 144° to 145°. Practically insoluble in water; soluble in dioxan and methanol.

Colour Tests Antimony pentachloride—brown; Liebermann's reagent—black; naphthol–sulfuric acid—blue-green, yellow dichroism/orange; sulfuric acid—yellow (green fluorescence under ultraviolet light).
Thin-layer Chromatography Estradiol benzoate: system TP—R_f 0.79; system TQ—R_f 0.32; system TR—R_f 0.96; system TS—R_f 0.79. Estradiol: system TD—R_f 0.61; system TE—R_f 0.78; system TF—R_f 0.58; system TAD—R_f 0.64; system TAJ—R_f 0.55; system TAK—R_f 0.58; system TAL—R_f 0.91; system TAM—R_f 0.09.
Gas Chromatography System GA—RI 2659.
High Performance Liquid Chromatography System HX—RI 896; system HY—RI 456; system HAA—retention time 18.2 min.
Ultraviolet Spectrum Estradiol benzoate: ethanol—231 nm (A^1_1=490b).



Infrared Spectrum Principal peaks at wavenumbers 1245, 1054, 1227, 1493, 1276, 821 cm^{-1} (KBr disk).
Quantification
Serum **HPLC** Fluorescence detection. Limit of detection, 0.14 µg/L [DeSilva *et al.* 1996]. Fluorescence detection (comparison with radioimmunoassay). For method of quantification for estradiol and estriol, see Kondo *et al.* [1990].

HPLC–RIA Limit of detection, 0.64 µg/L and 1.04 µg/L for estradiol and estrone, respectively [Yasui *et al.* 1999].

MS For method of quantification for estradiol, estrone and other sex hormones (comparison with radioimmunoassay), see Dorgan *et al.* [2002].

Urine **GC–MS** For method of quantification for estradiol, estriol and estrone, see Xiao, McCalley [2000].
Disposition in the Body
Therapeutic Concentration

Mean serum estradiol concentrations in 25 subjects given 2 mg estradiol, 1 mg estriol and 1 mg norethisterone acetate for 4 months to 6 years were 138 (range, 53 to 279) ng/L; concentrations remained relatively even, reaching a broad maximum between 2 and 14 h after intake [Klehr-Bathmann, Kuhl 1995].

Following application of estradiol from a transdermal gel to 23 subjects at a dose of 0.5, 1.0 and 1.5 mg daily, mean peak serum levels of 39.0, 67.3 and 158.5 ng/L, respectively, were attained at 7, 6, and 3 h [Järvinen *et al.* 2000].

Dose Up to 2 mg daily, orally.

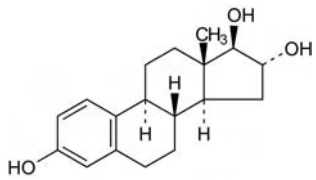
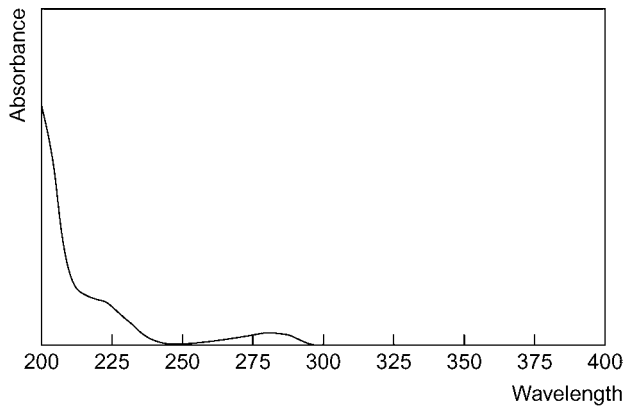
Estriol

Oestrogen
$C_{18}H_{24}O_3$ = 288.4
CAS—50-27-1
IUPAC Name (8*R*,9*S*,13*S*,14*S*,16*R*,17*R*)-13-Methyl-6,7,8,9,11,12,14,15,16,17-decahydrocyclopenta[*a*]phenanthrene-3,16,17-triol
Synonyms (16α,17β)-Estra-1,3,5(10)-triene-3,16,17-triol; oestriol; theelol.
Proprietary Names *Hormomed*; *Ovestin*. It is an ingredient of *Hormonin* and *Trisequens*.



Chemical Properties A white crystalline powder. Mp about 280°. Practically insoluble in water; soluble 1 in about 500 of ethanol; soluble in acetone, chloroform, dioxan and ether; freely soluble in pyridine and in solutions of fixed alkali hydroxides. pK_a 10.4. Log *P* (octanol/water), 2.4.
Colour Tests Antimony pentachloride—brown; Liebermann's reagent—black; naphthol–sulfuric acid—green, yellow dichroism/orange; sulfuric acid—no initial colour (yellow-green fluorescence under ultraviolet light).
Gas Chromatography System GA—RI 2955.
High Performance Liquid Chromatography System HAA—retention time 13.1 min.
Ultraviolet Spectrum Ethanol—280 nm.



Infrared Spectrum Principal peaks at wavenumbers 1228, 1067, 917, 1147, 1250, 1605 cm^{-1} (Nujol mull).
Quantification See also Estradiol.
Serum **HPLC** UV and electrochemical detection. Limit of detection, 2.5 µg/L and 295 µg/L for estriol and estriol 3-sulfate, respectively [Tagawa *et al.* 1999].
Urine **HPLC** UV detection. For method of quantification, see Ke and Yuan [1989].
Dose 0.25 to 1 mg daily.

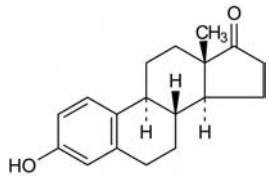
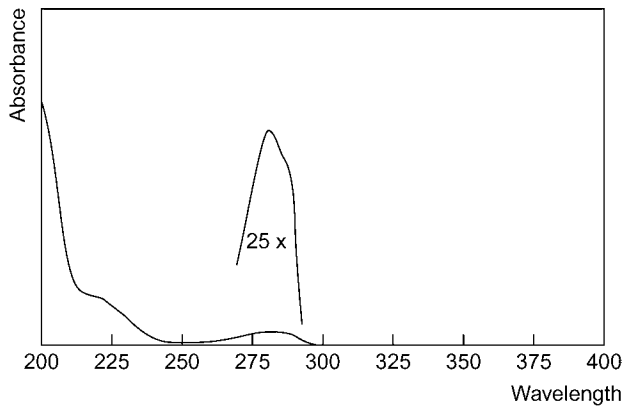
Estrone

Oestrogen
$C_{18}H_{22}O_2$ = 270.4
CAS—53-16-7

IUPAC Name (8*R*,9*S*,13*S*,14*S*)-3-Hydroxy-13-methyl-7,8,9,11,12,14,15,16-octahydro-6*H*-cyclopenta[*a*]phenanthren-17-one
Synonyms Folliculin; 3-hydroxyestra-1,3,5(10)-trien-17-one; ketohydroxyoestrin; oestrone.
Proprietary Names *Cristallovar*; *Femogen*; *Kolpon*; *Oestrilin* (vaginal preparations). It is an ingredient of *Hormonin*.



Chemical Properties Colourless crystals or white to creamy-white crystalline powder. Mp about 260°, with decomposition. Practically insoluble in water; soluble 1 in 250 of ethanol, 1 in 50 of acetone and 1 in 110 of chloroform; soluble in dioxan, pyridine, fixed alkali hydroxide solutions; slightly soluble in ether. Log *P* (octanol/water), 3.1.
Colour Tests Antimony pentachloride—brown; Liebermann's reagent—black; naphthol–sulfuric acid—green, yellow dichroism/orange; sulfuric acid—green-yellow (green fluorescence under ultraviolet light).
Thin-layer Chromatography System TB—R_f 0.09; system TE—R_f 0.76; system TF—R_f 0.68; system TAE—R_f 0.87; system TAJ—R_f 0.63; system TAK—R_f 0.66; system TAL—R_f 0.91; system TAM—R_f 0.95.
Gas Chromatography System GA—RI 2612.
High Performance Liquid Chromatography System HX—RI 544; system HY—RI 521.
Ultraviolet Spectrum Methanol—280 nm (A_1^1=78a).

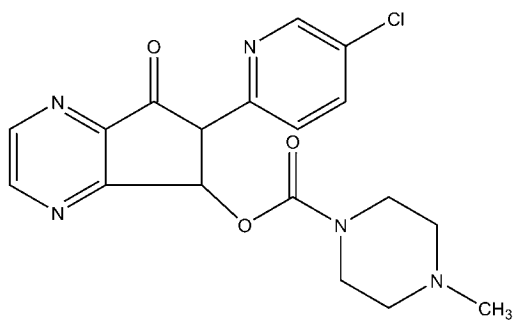


Infrared Spectrum Principal peaks at wavenumbers 1282, 820, 1709, 1244, 921, 1493 cm^{-1}.
Quantification See under Estradiol.
Dose Estrone has been given in doses of 0.1 to 5 mg daily by IM injection.

Eszopiclone

Cyclopyrrolone, GABA Receptor Agonist, Hypnotic, Sedative
$C_{17}H_{17}ClN_6O_3$ = 388.8
CAS—138729-47-2

IUPAC Name [(7*S*)-6-(5-chloropyridin-2-yl)-5-oxo-7*H*-pyrrolo[3,4-*b*]pyrazin-7-yl] 4-methylpiperazine-1-carboxylate
Synonyms (+)-(5*S*)-6-(5-Chloropyridin-2-yl)-7-oxo-6,7-dihydro-5*H*-pyrrolo[3,4-*b*]pyrazin-5-yl 4-methylpiperazine-1-carboxylate; (+)-zopiclone; (*S*)-zopiclone.
Proprietary Names *Inductal*; *Lunesta*.



Chemical Properties (+)-Isomer of zopiclone. Solid. Very slightly soluble in water. Log *P* (octanol/water), 0.8 [Wishart 2006].
Thin-layer Chromatography Plates: Polygram Sil G/UV_{254}. Solvent system: dichloromethane : methanol (92.5 : 7.5). UV detection (λ= 365 nm) with acidified iodoplatinate reagent spray. R_f 0.3 for eszopiclone, 0.08 for (*S*)-*N*-desmethyleszopiclone. Limit of quantification not reported [Mannaert, Daenens 1996].
High Performance Liquid Chromatography Column: Chiralpak AS (250 × 4.6 mm i.d.). Mobile phase: *n*-hexane : ethanol : diethylamine (60 : 40 : 0.1 for eszopiclone; 55 : 45 : 0.1 for *N*-desmethyleszopiclone), flow rate 0.5 mL/min. UV detection (λ= 305 nm). Retention time: eszopiclone 14.6 min, (*S*)-*N*-desmethylzopiclone 15.8 min. Limit of quantification not reported [Mannaert, Daenens 1996].
Quantification
Plasma **HPLC** Column: cellulose carbamate (250 × 4.6 mm i.d., 5 µm). Mobile phase: hexane : ethanol : methanol (55 : 30 : 15) with 1% diethylamine, flow rate 1.2 mL/min. Fluorescence detection (λ_{ex}= 305 nm, λ_{em}= 470 nm). Retention time: ≈22 min. Limit of quantification not reported [Fernandez *et al.* 1993a]. Column: cellulose carbamate (250 × 4.6 mm i.d., 5 µm). Mobile phase: hexane : ethanol (40 : 60), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex}= 300 nm, λ_{em}= 470 nm). Retention time: ≈11 min. Limit of quantification not reported [Fernandez *et al.* 1991].
Urine **CE** Column: uncoated fused silica capillary (total/effective length: 47/40 cm, 50 µm). Buffer: 100 mmol/L phosphate buffer (pH 2.75) with 16.3 mmol/L β-cyclodextrin. Fluorescence detection (λ_{ex}= 325 nm, λ_{em} = 450 nm). Retention time: eszopiclone 14.1 min, (*S*)-*N*-desmethylzopiclone 13.7 min, (*S*)-zopiclone-*N*-oxide 15.8 min. Limit of quantification not reported [Hempel, Blaschke 1996].
Oral Fluid **CE** See Urine [Hempel, Blaschke 1996].
Disposition in the Body Eszopiclone exhibits similar pharmacokinetics to zopiclone. It is rapidly absorbed after oral administration, with peak plasma concentrations reached within 1.6 h. It is extensively metabolised by CYP3A4 and CYP2E1 pathways via oxidation and demethylation. The primary plasma metabolites are (*S*)-zopiclone-*N*-oxide and (*S*)-*N*-desmethylzopiclone, the latter is pharmacologically active. It is widely distributed in body tissues, including the brain, and is eliminated in urine (75% as metabolites, <7% as parent compound), saliva,; and breast milk.
Therapeutic Concentration
Twelve healthy male Caucasian volunteers were administered a single oral dose of 15 mg of racemic zopiclone. Mean peak plasma concentrations of eszopiclone and (*R*)-zopiclone were 87.3 and 44.0 µg/L attained at 98.8 and 88.8 min, respectively [Fernandez *et al.* 1993b].
Toxicity The starting dose should be reduced in patients taking potent inhibitors of CYP3A4; a dose not exceeding 1 mg is recommended. This may then be increased to 2 mg. Eszopiclone and lorazepam decrease each other's peak plasma concentrations by 22%. Co-administration of 3 mg eszopiclone to subjects receiving 400 mg ketoconazole, a potent inhibitor of CYP3A4, resulted in a 2.2-fold increase in exposure to eszopiclone. It does not appear to inhibit CYP1A2, CYP2A6, CYP2C9, CYP2C19, CYP2D6, CYP2E1 or CYP3A4.
Bioavailability Approximately 80%.
Half-life Approximately 6.5 h.
Volume of Distribution 98.6 L.
Clearance 11.7 L/h.
Distribution in Blood Blood : plasma ratio, <1.
Protein Binding Approximately 52–59%.
Note For a review of eszopiclone, see Najib [2006].
Dose The usual dose is 2 mg orally immediately before sleep; if appropriate, the dose may be started at or increased to 3 mg. In elderly patients who have difficulty falling asleep, the initial dose is 1 mg; this may be increased to 2 mg. For elderly patients who have difficulty staying asleep, the starting dose is 2 mg. The starting dose of eszopiclone should be reduced to 1 mg before sleep in patients with severe hepatic impairment. No dose adjustment is necessary in patients with mild to moderate impairment.

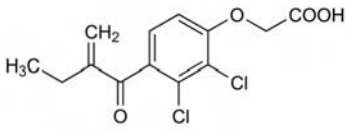
Etacrynic Acid

Diuretic
$C_{13}H_{12}Cl_2O_4$ = 303.1
CAS—58-54-8

IUPAC Name [2,3-Dichloro-4-(2-methylene-1-oxobutyl)phenoxy]acetic acid
Synonyms Etacrynsäure; ethacrynic acid.
Proprietary Names *Edecril*; *Edecrin(e)* (tablets); *Hydromedin* (tablets); *Reomax*; *Uregyt*.

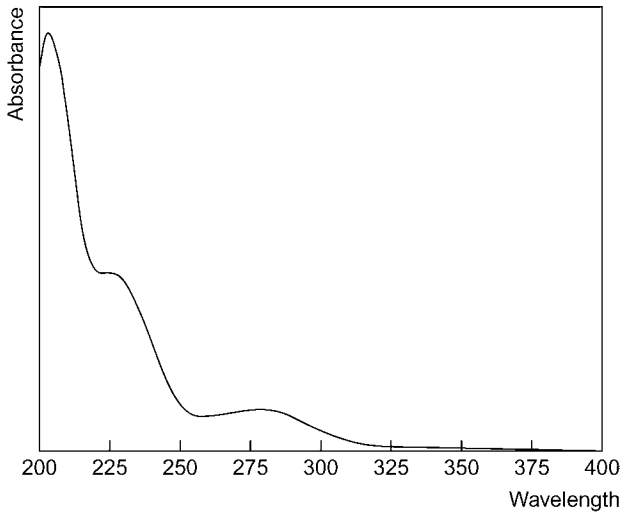


Chemical Properties A white crystalline powder. Mp about 121° to 122°. Sparingly soluble in water and aqueous acids; soluble 1 in 1.6 of ethanol, 1 in 6 of chloroform and 1 in 3.5 of ether. pK_a 3.5 (20°). Log *P* (octanol/water), 3.7.
Caution Etacrynic acid, especially in the form of dust, is irritating to the skin, eyes and mucous membranes.

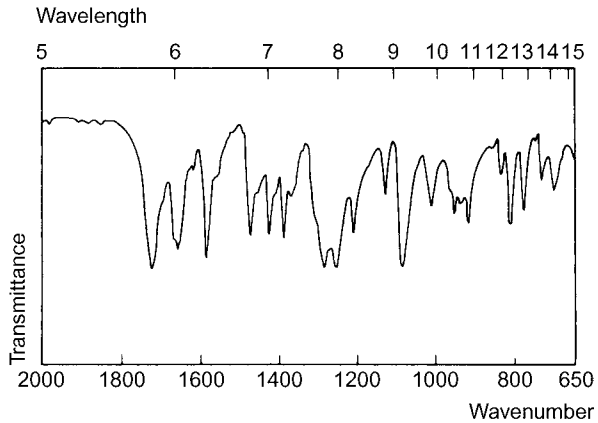
Etacrynate Sodium

$C_{13}H_{11}Cl_2NaO_4$ = 325.1
CAS—6500-81-8
Synonyms Etacrynate sodium; sodium etacrynate.
Proprietary Names *Edecrin(e)* (injection); *Hydromedin* (injection); *Reomax*.

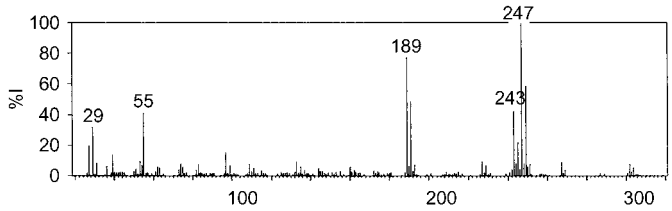
Thin-layer Chromatography System TA—R_f 0.96; system TD—R_f 0.03; system TE—R_f 0.05; system TF—R_f 0.02; system TAD—R_f 0.05; system TAE—R_f 0.71; system TAJ—R_f 0.05; system TAK—R_f 0.42; system TAL—R_f 0.57.
Gas Chromatography System GA—etacrynic acid, not eluted, etacrynic acid-Me, RI 2195; system GX—etacrynic acid-Me, retention time 4.0 min; system GY—etacrynic acid-Me, retention time 3.3 min.
High Performance Liquid Chromatography System HX—RI 521; system HY—RI 497.
Ultraviolet Spectrum Acid methanol—270 nm (A_1^1=115a).



Infrared Spectrum Principal peaks at wavenumbers 1726, 1249, 1279, 1077, 1586, 1661 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 247, 189, 249, 191, 243, 55, 29, 245; etacrynic acid-Me *m/z* 261, 263, 243, 245, 281, 316.



Quantification
Plasma **GC–MS** Limit of detection, 10 to 20 µg/L [Stuber *et al.* 1982].
HPLC UV detection. Etacrynic acid and its conjugated metabolite. Limit of detection, <20 µg/L for etacrynic acid [Voith *et al.* 1995]. UV detection. Limit of detection, 0.1 mg/L [LaCreta *et al.* 1991].
Urine **HPLC** See Plasma [Voith *et al.* 1995].
Disposition in the Body Readily absorbed after oral administration and distributed to the liver and kidneys. After IV administration, 60% is excreted in the urine and 30% in the bile in 24 h; urinary excretion is pH-dependent and the material excreted in the urine consists of unchanged drug, a cysteine conjugate and a third unstable metabolite, in approx. equal proportions.
Toxicity Thrombocytopenia and fatal agranulocytosis have been reported during chronic treatment.
Half-life Plasma half-life, 0.5 to 1 h.
Protein Binding Significantly bound.
Dose Usually 50 to 150 mg daily; maximum of 400 mg daily.

LaCreta FP *et al.* (1991). High-performance liquid chromatographic determination of ethacrynic acid in human plasma. *J Chromatogr* 571: 271–276.

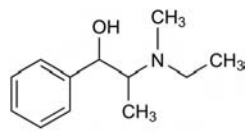
Etafedrine

Sympathomimetic
$C_{12}H_{19}NO$ = 193.3
CAS—7681-79-0; 48141-64-6
IUPAC Name 2-[Ethyl(methyl)amino]-1-phenylpropan-1-ol
Synonyms Ethylephedrine; α-[1-(ethylmethylamino)ethyl]benzenemethanol.

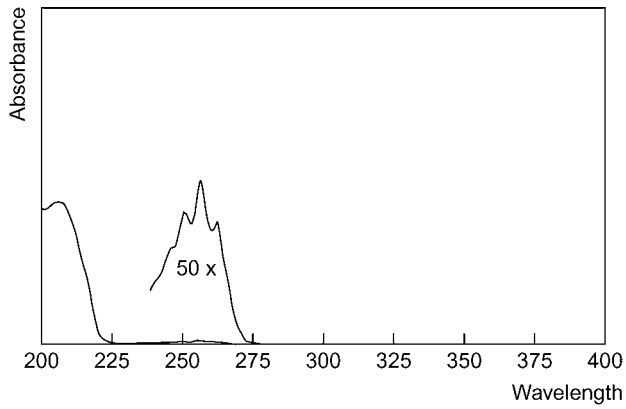


Chemical Properties Log *P* (octanol/water), 1.4.

Etafedrine Hydrochloride

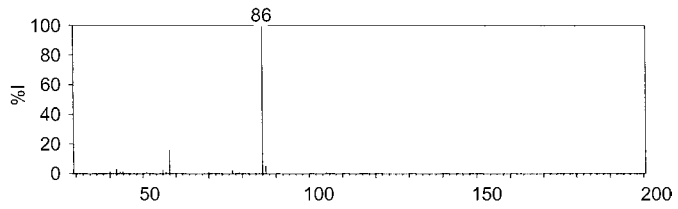
$C_{12}H_{19}NO,HCl$ = 229.8
CAS—5591-29-7
Proprietary Names It is an ingredient of *Calmydone*, *Dalmacol*, and some *Nethaprin* and *Revenil* preparations.
Chemical Properties Crystals. Mp 183° to 184°. Soluble 1 in 1.5 of water and 1 in 8 of ethanol.

Thin-layer Chromatography System TA—R_f 0.44; system TB—R_f 0.35; system TC—R_f 0.09; system TE—R_f 0.56; system TL—R_f 0.15; system TAE—R_f 0.14; system TAJ—R_f 0.04; system TAK—R_f 0.06; system TAL—R_f 0.49 (acidified potassium permanganate solution, positive).
Gas Chromatography System GA—RI 1519; system GB—RI 1510; system GC—RI 1737.
High Performance Liquid Chromatography System HA—*k* 1.9.
Ultraviolet Spectrum Aqueous acid—251, 257 (A_1^1=10a), 263 nm.



Infrared Spectrum Principal peaks at wavenumbers 697, 1051, 1020, 1000, 740, 1115 cm^{-1} (KBr disk).

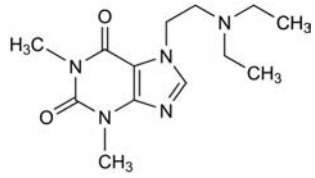
Mass Spectrum Principal ions at *m/z* 86, 58, 87, 42, 56, 77, 44, 43.



Dose 80 to 200 mg of etafedrine hydrochloride daily.

Etamiphylline

Xanthine Bronchodilator
$C_{13}H_{21}N_5O_2$ = 279.3
CAS—314-35-2
IUPAC Name 7-[2-(Diethylamino)ethyl]-3,7-dihydro-1,3-dimethyl-1*H*-purine-2,6-dione
Synonym Etamphyllin

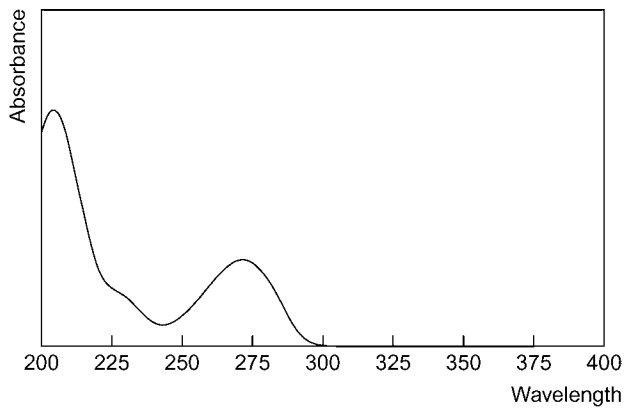


Chemical Properties A waxy solid. Mp 75°. Very soluble in water and acetone; slightly soluble in ethanol and ether. Log *P* (octanol/water), 0.8.

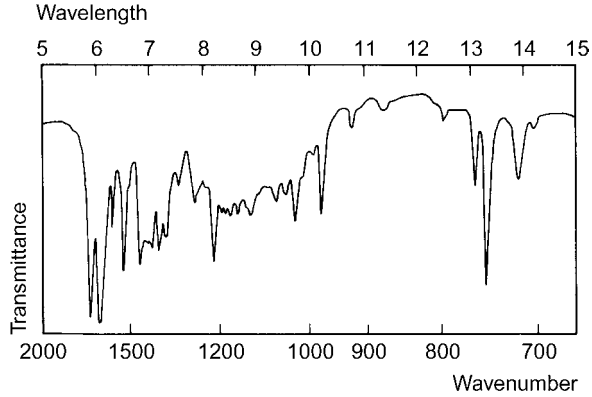
Etamiphylline Camsilate

$C_{23}H_{37}N_5O_6S$ = 511.6
CAS—19326-29-5
Synonym Diétamiphylline camphosulfonate
Proprietary Names *Camphophyline*. It is an ingredient of *Longtussin* and *Solufilina Sedante*.
Chemical Properties A white crystalline powder. Mp 174°. Very soluble in water; soluble in ethanol and chloroform; very slightly soluble in ether.

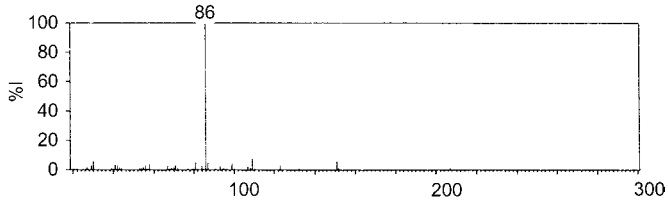
Colour Test Amalic acid test—yellow/pink.
Thin-layer Chromatography System TA—R_f 0.54; system TB—R_f 0.12; system TC—R_f 0.39; system TE—R_f 0.74; system TL—R_f 0.17; system TAJ—R_f 0.28; system TAK—R_f 0.02; system TAL—R_f 0.44 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—etamiphylline RI 2210, M (desethyl-)-AC RI 2560.
High Performance Liquid Chromatography System HA—*k* 1.2.
Ultraviolet Spectrum Water—274 nm (A_1^1=320b).



Infrared Spectrum Principal peaks at wavenumbers 1656, 1706, 748, 1543, 1220, 1600 cm^{-1}.



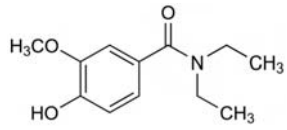
Mass Spectrum Principal ions at *m/z* 86, 109, 30, 151, 87, 81, 99, 58.



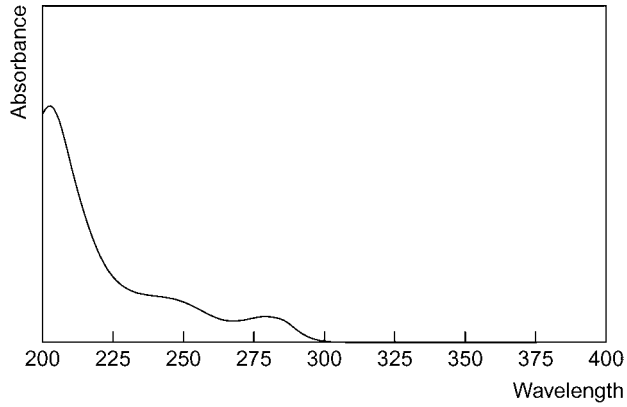
Dose 0.3 to 1.2 g of etamiphylline camsilate daily.

Etamivan

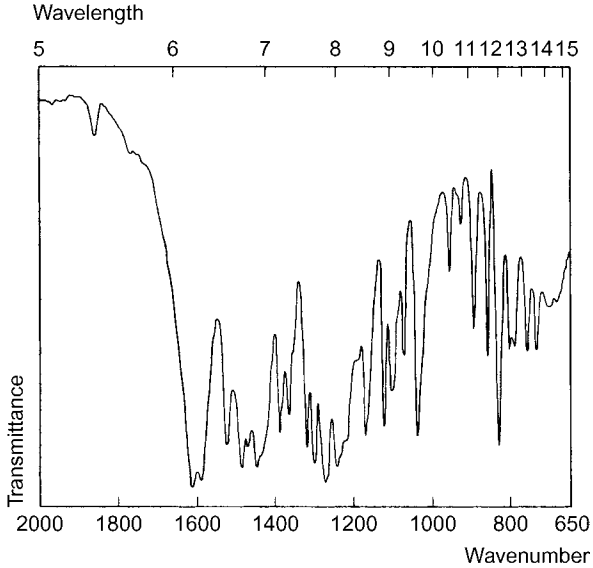
Respiratory Stimulant
$C_{12}H_{17}NO_3$ = 223.3
CAS—304-84-7
IUPAC Name *N*,*N*-Diethyl-4-hydroxy-3-methoxybenzamide
Synonyms Ethamivan; vanillic acid diethylamide; vanillic diethylamide.
Proprietary Names *Cardiovanil*; *Emivan*; *Vandid*.



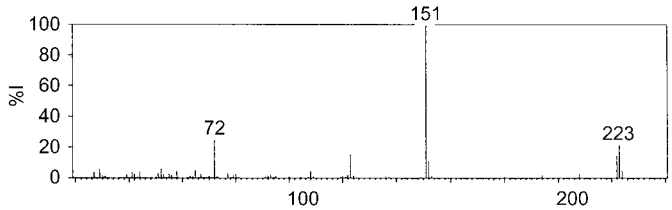
Chemical Properties A white crystalline powder. Mp 94° to 99°. Soluble 1 in 100 of water, 1 in 2 of ethanol, 1 in 1.5 of chloroform and 1 in 50 of ether. Log *P* (octanol/water), 1.1.
Colour Tests Ferric chloride—green; Folin–Ciocalteu reagent—blue; Liebermann's reagent—black
Thin-layer Chromatography System TA—R_f 0.94; system TD—R_f 0.38; system TE—R_f 0.41; system TF—R_f 0.35; system TAD—R_f 0.59; system TAE—R_f 0.85; system TAJ—R_f 0.60; system TAK—R_f 0.48; system TAL—R_f 0.96.
Gas Chromatography System GA—etamivan RI 1900, etamivan-AC RI 1970; system GC—RI 2409.
Ultraviolet Spectrum Aqueous acid—280 nm (A_1^1=153a).



Infrared Spectrum Principal peaks at wavenumbers 1608, 1270, 1585, 1240, 1300, 1543 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 151, 72, 223, 123, 222, 152, 52, 29.



Quantification
Urine **HPLC** For method of quantification for etamivan and other drugs of abuse, see Ma *et al.* [1998].
Dose Etamivan has been given IV in doses of up to 10 mL of a 5% solution; doses of 40 to 240 mg daily have been given orally.

Ma C *et al.* (1998). Studies on analytical method for 10 drugs of abuse in urine using HPLC. *Yao Xue Xue Bao* 33: 764–767.

Etanercept

Antiinflammatory, TNFα-Fusion Protein
CAS—185243-69-0

Synonyms Human tumour necrosis factor receptor p75 Fc fusion protein; Rhu-TNFR:Fc; 1-235-tumour necrosis factor receptor (human) fusion protein with 236-467-immunoglobulin G_1 (human γ_1-chain Fc fragment).
Proprietary Name *Enbrel*
Chemical Properties Dimer of 1–235 TNF receptor (human) fusion protein with 236-467-immunoglobin G_1. pK_a 7.89 [Wishart 2006]. Log P (octanol/water), −0.529 [Wishart 2006].
Disposition in the Body Eliminated by the reticuloendothelial system of the liver or spleen.
Therapeutic Concentration
In a single-dose study, 26 healthy volunteers were administered 25 mg etanercept by SC injection into the abdomen. Serum samples were collected for 21 days and analysed by ELISA. The mean peak serum concentration was 1.46 mg/L after 51 h [Korth-Bradley *et al.* 2000].
Eleven patients with heart failure were administered a dose of 12 mg/m^2(maximum dose 25 mg) etanercept by SC injection twice weekly for 12 weeks. The mean serum concentration was 2.34 mg/L, reached after 46 h [Soran *et al.* 2001].
Note For a study of the pharmacokinetics of etanercept in patients with psoriasis, see Nestorov *et al.* [2006].
Bioavailability Approximately 58%.
Half-life 68 ± 19 h.
Volume of Distribution 12 ± 6 L.
Clearance Apparent clearance, 132 ± 85 mL/h.
Dose Usually 25 mg SC, twice weekly.

Korth-Bradley JM *et al.* (2000). The pharmacokinetics of etanercept in healthy volunteers. *Ann Pharmacother* 34: 161–164.
Nestorov I *et al.* (2006). Pharmacokinetics of subcutaneously administered etanercept in subjects with psoriasis. *Br J Clin Pharmacol* 62: 435–445.

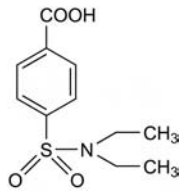
Etebenecid

Uricosuric
$C_{11}H_{15}NO_4S$ = 257.3
CAS—1213-06-5

IUPAC Name 4-Diethylsulfamoylbenzoic acid
Synonym Ethebenecid

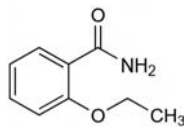


Chemical Properties Crystals. Mp 192° to 194°. pK_a 3.3 (25°). Log *P* (octanol/water), 1.9.
Ultraviolet Spectrum Methanol—246 nm (A^1_1=460b).
Infrared Spectrum Principal peaks at wavenumbers 1694, 729, 1162, 1282, 1298, 934 cm^{-1}.
Dose Etebenecid has been given in doses of 1 to 3 g daily.

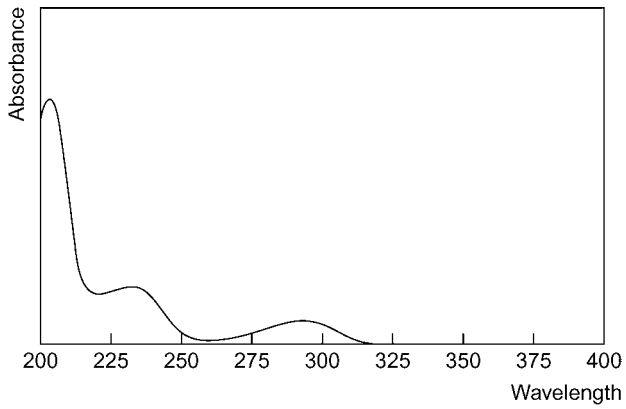
Etenzamide

Analgesic
$C_9H_{11}NO_2$ = 165.2
CAS—938-73-8

IUPAC Name 2-Ethoxybenzamide
Synonyms Aethoxybenzamidum; ethenzamide; ethoxybenzamide; ethylsalicylamide; HP-209; salicylamide *O*-ethyl ether.
Proprietary Names *Simil NF*; *Trancalgyl*. It is an ingredient of *Algopriv*; *Antifohnon-N*; *Cephyl*; *Coldadolin*; *Dolmix*; *Glutisal*; *Helopyrin*; *Katagrip*; *Kolton grippale N*; *Nicaphlogyl*; *Nisicur*; *Seltoc*; *Seranex sans codeine*.

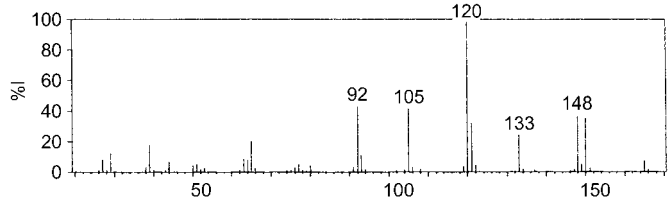


Chemical Properties A white crystalline powder. Mp 132° to 134°. Practically insoluble in cold water; slightly soluble in boiling water and in ether; soluble in ethanol and acetone; freely soluble in chloroform. Log *P* (octanol/water), 0.8.
Colour Tests Liebermann's reagent—brown; Mandelin's test—green-brown; Marquis test—red; Nessler's reagent—brown-orange (weak).
Thin-layer Chromatography System TA—R_f 0.64; system TB—R_f 0.03; system TC—R_f 0.59; system TE—R_f 0.76; system T—R_f 0.55; system TAE—R_f 0.87 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—etenzamide RI 1560, M (desethyl)/salicylamide RI 1414, M (desethyl-)-AC RI 1660.
High Performance Liquid Chromatography System HD—*k* 0.55; system HW—*k* 4.60; system HY—RI 303.
Ultraviolet Spectrum Aqueous acid—234 (A^1_1=540c), 293 nm.



Infrared Spectrum Principal peaks at wavenumbers 1634, 1233, 753, 1276, 1114, 1587 cm^{-1} (KBr disk).

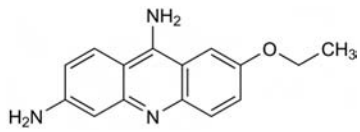
Mass Spectrum Principal ions at *m/z* 120, 92, 105, 148, 150, 121, 133, 65.



Dose Etenzamide has been given in doses of up to 4 g daily in divided doses.

Ethacridine

Disinfectant
$C_{15}H_{15}N_3O = 253.3$
CAS—442-16-0
IUPAC Name 7-Ethoxy-3,9-acridinediamine

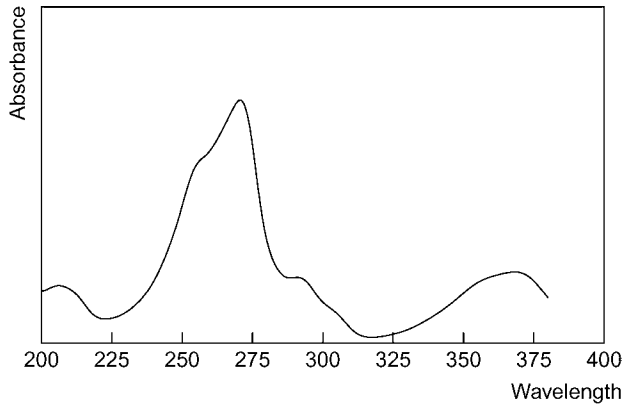


Chemical Properties Orange crystals. Mp 226°. Log *P* (octanol/water), 2.1.

Ethacridine Lactate

$C_{15}H_{15}N_3O,C_3H_6O_3 = 343.4$
CAS—1837-57-6
Synonyms Acrinol; acrinol lactate; aethacridinium lacticum; ethacrindini lactas; lactoacridine.
Proprietary Names *Metifex*; *Rivanol*; *Urocridin*; *Uroseptol*; *Vucine*.
Chemical Properties A yellow crystalline powder. It forms yellow fluorescent solutions. Mp about 245°, with decomposition. Slowly soluble 1 in 15 of water, 1 in 9 of boiling water and 1 in about 150 of ethanol.

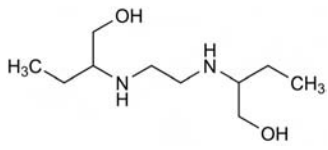
Colour Test Marquis test—orange→red.
Thin-layer Chromatography System TA—R_f 0.60; system TAE—R_f 0.07 (van Urk reagent, yellow).
Ultraviolet Spectrum Aqueous acid—268 nm (A_1^1=2062a).



Infrared Spectrum Principal peaks at wavenumbers 1113, 1630, 1495, 1226, 1591, 1034 cm^{-1} (KBr disk).
Dose Ethacridine lactate has been given, orally, in doses of 200 to 600 mg daily.

Ethambutol

Antituberculosis
$C_{10}H_{24}N_2O_2 = 204.3$
CAS—74-55-5
IUPAC Name (2*S*)-2-[2-[[(2*S*)-1-Hydroxybutan-2-yl]amino]ethylamino]butan-1-ol
Synonyms EMB; 2,2′-(1,2-ethanediyldiimino)bis-1-butanol.

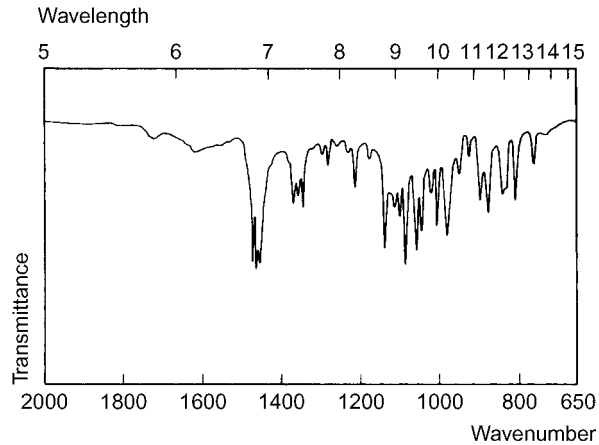


Chemical Properties Mp 87.5° to 88.8°. Sparingly soluble in water; soluble in chloroform and methylene chloride. pK_a 6.3, 9.5 (20°). Log *P* (octanol/water), −0.4.

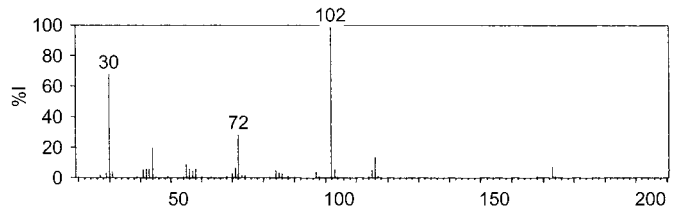
Ethambutol Hydrochloride

$C_{10}H_{24}N_2O_2,2HCl = 277.2$
CAS—1070-11-7
Proprietary Names *Dexambutol*; *EMB*; *Etapiam*; *Etibi*; *Lambutol*; *Miambutol*; *Myambutol*; *Mycrol*; *Myrin*; *Oributol*; *Servabutol*; *Tambutec*; *Tobutol*; *Tubetam*; *Turresis*. It is an ingredient of *Mynah*.
Chemical Properties A white, crystalline, hygroscopic powder. Mp 198.5° to 200.3° also reported as 201.8° to 202.6°. Soluble 1 in 1 of water, 1 in 4 of ethanol, 1 in 850 of chloroform and 1 in 9 of methanol; very slightly soluble in ether.

Thin-layer Chromatography System TA—R_f 0.30; system TB—R_f 0.03; system TC—R_f 0.02; system TE—R_f 0.76; system TL—R_f 0.02; system TAD—R_f 0.00; system TAE—R_f 0.12; system TAJ—R_f 0.00; system TAK—R_f 0.00; system TAL—R_f 0.20 (acidified potassium permanganate solution, positive).
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.
Infrared Spectrum Principal peaks at wavenumbers 1090, 1061, 1142, 987, 1050, 1009 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 102, 30, 72, 44, 116, 55, 173, 71.



Quantification

Plasma **GC** ECD. Limit of detection, 10 µg/L [Lee, Wang 1980].
GC–MS Limit of detection, 36 µg/L [Holdiness *et al.* 1981].
HPLC UV detection. Limit of detection, <0.2 mg/L [Chenevier *et al.* 1998]. Fluorescence detection. Limit of detection, <10 µg/L [Breda *et al.* 1996].
HPLC–MS Limit of detection, 0.05 mg/L [Conte *et al.* 2002].
Urine **HPLC** See Plasma [Breda *et al.* 1996].

Alveolar Cells **HPLC–MS** See Bronchoalveolar Lavage Fluid [Conte *et al.* 2002].
Disposition in the Body Readily absorbed after oral administration. About 50 to 70% of a dose is excreted in the urine as unchanged drug in 24 h, and up to 15% may be excreted as inactive aldehyde and carboxylic acid metabolites; up to 20% of an oral dose may be eliminated in the faeces.
Therapeutic Concentration In plasma, usually in the range 2.5 to 6.5 mg/L. After a single oral dose of 15 mg/kg to 6 subjects, peak plasma concentrations of 3.2 to 5.6 mg/L (mean 4) were attained in 2 to 4 h [Lee *et al.* 1977].
Toxicity Toxic effects are usually associated with plasma concentrations >6 mg/L. In a fatality caused by the ingestion of ethambutol and rifampicin, the following postmortem concentrations were reported for ethambutol and rifampicin, respectively: blood 84 and 182 mg/L, urine 6800 and 3300 mg/L; low concentrations of ethanol were also detected [Jack *et al.* 1978].
Half-life Plasma half-life, about 10 to 15 h.
Clearance Plasma clearance, about 9 mL/min/kg.
Distribution in Blood Plasma : whole blood ratio, 0.6 to 0.9.
Protein Binding About 10 to 40% (concentration-dependent).
Dose 15 to 25 mg/kg of ethambutol hydrochloride daily; 50 mg/kg has been given twice weekly.

Breda M *et al.* (1996). Determination of ethambutol in human plasma and urine by high-performance liquid chromatography with fluorescence detection. *J Chromatogr A* 729: 301–307.

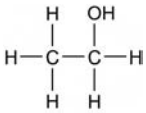
Ethanol

CNS Depressant
$CH_3CH_2OH = 46.07$
CAS—64-17-5

IUPAC Name Ethanol
Synonyms Alcohol; ethyl alcohol.



Chemical Properties Ethanol of the *British Pharmacopoeia* is Dehydrated Alcohol (Absolute Alcohol), which contains 99.4–100% of C_2H_6O, sp.gr. 0.7904–0.7935 (20°/20°). Rectified Spirit is ethanol (90%). In the *United States Pharmacopeia*, Alcohol contains 94.9–96.0% of C_2H_6O, sp.gr. 0.812–0.816 (15.56°). A clear, colourless, mobile, volatile, readily inflammable, hygroscopic liquid. Ethanol (96%) boils at ~78°. Miscible with water, chloroform and ether. pK_a, 15.9 (25°). Log *P* (octanol/water), −0.3.

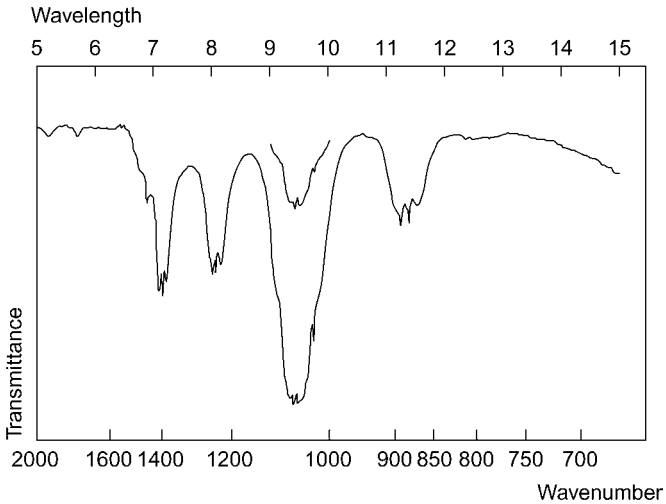
Industrial Denatured Alcohol

Synonym IDA
Chemical Properties A mixture of ethanol, of an appropriate strength, 95 parts by volume with wood naphtha 5 parts by volume.
Note Two other classes of methylated spirit are recognised in the United Kingdom: completely denatured alcohol (CDA) and denatured ethanol. Mineralised methylated spirits is ethanol of an appropriate strength, 90 parts by volume mixed with wood naphtha 9.5 parts by volume and crude pyridine 0.5 parts by volume, and to every 2000 L of this mixture is added 7.5 L of mineral naphtha (petroleum oil) and 3.0 g methyl violet. Denatured ethanol is ethanol, of a strength not less than 85%, 98 parts by volume mixed with propan-2-ol 2 parts by volume, and to the resulting mixture is added denatonium benzoate 10 µg/mL, or solid quassin 120 µg/mL, or sucrose octa-acetate 4000 µg/mL.

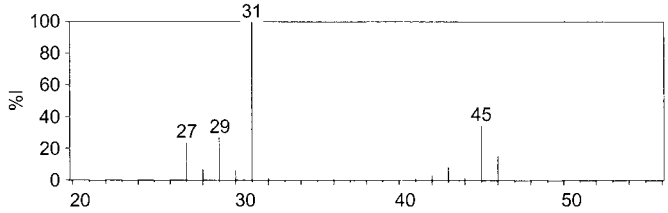
Surgical Spirit (BP) is a mixture of castor oil 2.5 mL, diethyl phthalate 2 mL and methyl salicylate 0.5 mL, diluted to 100 mL with industrial denatured alcohol.

Rubbing Alcohol (USP) is a mixture of acetone 8 volumes, methyl isobutyl ketone 1.5 volumes and alcohol 100 volumes; the mixture contains not less than 3550 µg/mL of sucrose octa-acetate or 14 µg/mL of denatonium benzoate.

Colour Test Potassium dichromate (method 2)—green.
Gas Chromatography System GA—RI 421; system GI—RT 1.9 min; system GAA—RI 427.
Infrared Spectrum



Mass Spectrum Principal ions at *m/z* 31, 45, 29, 27, 46, 43, 30, 42.



Quantification

Blood **GC** Column: Autosystem XL (60 m × 0.53 mm i.d., 1 µm). Carrier gas: N_2. Limit of detection not reported [Büyük *et al.* 2009]. FID. Limit of detection, <0.75 mg/L for ethanol and <0.85 mg/L for acetaldehyde [Pontes *et al.* 2009]. Comparison of alkyl nitrite GLC and direct vapour phase [Barinskaia *et al.* 2006]. Column: capillary. FID [Kristoffersen *et al.* 2006]. Column: capillary. Limit of detection, 5.6 mg/L [Maleki *et al.* 2006]. Postmortem alcohol. FID [De Martinis *et al.* 2006]. Postmortem alcohol. Limit of detection, 1 mg/L [De Martinis, Martin 2002]. See also Goto, Ikemoto [1991], [Macchia *et al.* [1995], McCarver-May, Durisin [1997], Tangerman [1997], Tsukamoto *et al.* [1998], Watanabe-Suzuki *et al.* [1999], Zuba *et al.* [2002a] and Zuba *et al.* [2002b].

GC-MS Postmortem ethanol [Maeda *et al.* 2006]. Scan mode. Limit of detection, 0.2 mg/L, limit of quantification, 2 mg/L [Wasfi *et al.* 2004].

HPLC ELSD to detect phosphatidylethanol [Aradottir, Olsson 2005]. Column: LiChrospher 100 RP-18 (250 × 4 mm i.d., 5 µm). Mobile phase: 14.7 mmol/L potassium dihydrogen phosphate : 8.76 mmol/L dipotassium hydrogen phosphate : acetonitrile (15 : 45 : 40), flow rate 1.5 mL/min. UV detection (λ= 276 nm). Limit of quantification, 17 mg/L, limit of detection, 76 mg/L [Pellegrino *et al.* 1999].

LC-MS Column: Luna C_8 (50 × 2 mm i.d., 3 µm). Mobile phase: 2 mmol/L ammonium acetate : methanol-acetone (95 : 5; 25 : 75 for 3 min to 0 : 100 at 9 min for 3 min to 25 : 75 at 13 min for 2 min), flow rate 0.4 mL/min. ESI. Limit of detection, 20 µg/L for phosphatidylethanol [Gnann *et al.* 2009]. Column: C_8 (2.1 mm). ESI. Limit of detection, 1 µg/L for phosphatidylethanol [Tolonen *et al.* 2005]. Alcohol dehydrogenase method. Limit of quantification, 24 mg/L, limit of detection, 7 mg/L [Kristoffersen, Smith-Kielland 2005; Kristoffersen *et al.* 2005]. Limit of detection, 500 mg/L [Poklis, Mackell 1982].

Plasma **GC** See Blood [Kristoffersen *et al.* 2006]. Column: HP-FFAP cross-linked capillary (50 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 200 kPa. Temperature: 70°. FID. Retention time: 7.1 min. Limit of detection, 10 mg/L [Macchia *et al.* 1995].

GC-MS Column: Porapak Q 80/100 mesh (6 ft × 0.125 in i.d.). Carrier gas: He, 50 mL/min. Temperature: 170° Limit of detection, 5 ng [Pereira *et al.* 1974].

Serum **GC** Comparison with enzymatic method [Winek *et al.* 2004]. Limits of detection, 0.1 mg/L for ethanol and acetaldehyde [Tangerman 1997]. See Plasma [Macchia *et al.* 1995].

HPLC See [Pellegrino *et al.* 1999].

LC-MS ESI. Limit of quantification, 0.2 µmol/L for ethylglucuronide) and 0.4 µmol/L for ethyl sulfate, limit of detection, 0.04 µmol/L for ethyl glucuronide and 0.08 µmol/L for ethylsulfate [Morini *et al.* 2007].

Urine **GC** Column: Stabilwax capillary (30 m × 0.53 mm, 1.0 µm). Carrier gas: He. FID Limit of quantification, 0.5 mg/L [Zilly *et al.* 2003]. Column: fused silica glass capillary bonded with PEG-20M or fused silica glass capillary of Pora PLOT Q. Ethanol and acetaldehyde [Tsukamoto *et al.* 1998]. Column: Poraplot Q (10 m × 0.32 mm i.d.). Carrier gas: He, 2.6 mL/min. Temperature: 250°. FID. Limit of quantification, 10 mg/L, limit of detection, 8 mg/L [Corrêa, Pedroso 1997].

See Blood [Barinskaia *et al.* 2006; De Martinis, Martin 2002; De Martinis *et al.* 2006; Maleki *et al.* 2006; Pontes *et al.* 2009]. See Serum [Tangerman 1997]. See Plasma [Macchia *et al.* 1995].

GC-MS See Plasma [Pereira *et al.* 1974]. Alcohol dehydrogenase method. Limit of detection, 12 mg/L, limit of quantification, 42 mg/L [Kristoffersen, Smith-Kielland 2005; Kristoffersen *et al.* 2005].

Faecal Supernatants **GC** See Serum [Tangerman 1997].

Oral Fluid **GC** See Blood [Barinskaia *et al.* 2006; Maleki *et al.* 2006]. See Plasma [Macchia *et al.* 1995].

Synovial Fluid **GC** See Blood [Büyük *et al.* 2009].

Vitreous Humour **GC** See Blood [De Martinis *et al.* 2006; De Martinis, Martin 2002; Pontes *et al.* 2009].

Bone Marrow **GC-MS** See Blood [Maeda *et al.* 2006].

Expired Air **GC** Limits of detection, 0.1 nmol/L to a few nmol/L [Qin *et al.* 1997]. Column: Poraplot Q (10 m × 0.32 mm i.d.). Carrier gas: He, 50 kPa. Temperature programme: 40° for 3 min to 175° at 50°/min. SIM acquisition mode. Ion-trap detection. Limit of detection, 5 pg [Ghoos *et al.* 1989].

Note Analysers. For recent reports of the analysis of breath alcohol with breath alcohol analysers, see Watterson, Ellefsen [2009] (Intoxilyzer 8000C), Lindberg *et al.* [2007]. For a comparison of blood and breath measurements (Intoxilyzer 5000), see Jones *et al.* [1992].

Other **GC** Mouse Liver Cells. Column: Porapak Q 100/120 mesh (1.8 m × 2 mm i.d.). Carrier gas: He, 37 mL/min. Temperature: 130°. FID. Retention time: 3.5 min [Mendenhall *et al.* 1980].

Reviews For a review of interpretation of results of ethanol analysis in postmortem specimens, see Kugelberg, Jones [2007]. For physical methods of quantification with sampling from different body fluids, see Swift [2003]; in blood, see Cravey, Jain [1974]; and in breath, see Mason, Dubowski [1976] and Jain, Cravey [1974]. For

early reviews of alcohol analysis by chemical and infrared methods, see Jain, Cravey [1972a] and by gas chromatography, see Jain, Cravey [1972b].

Disposition in the Body Ethanol is readily absorbed from the stomach and small intestine after oral administration but absorption may be delayed by the presence of food; it is rapidly distributed throughout the body fluids and is metabolised in the liver by alcohol dehydrogenase to acetaldehyde and then further oxidised to acetate and carbon dioxide. More than 90% is metabolised and is excreted by the lungs and in the urine, saliva, sweat and other secretions, together with unchanged alcohol. The body can metabolise ~10–15 mL/h. The rate of metabolism may be accelerated following repeated excessive use.

Blood Concentration

After administration of 15, 30, 45 and 60 mL of 95% ethanol to 8 fasting subjects, peak blood concentrations of 25–290 mg/L (mean 199), 180–620 mg/L (mean 440), 410–860 mg/L (mean 680) and 630–1120 mg/L (mean 860), respectively were attained in 0.3, 0.5, 0.8 and 1 h [Wilkinson *et al.* 1977a]. See also Wilkinson *et al.* [1977b].

After administration of 0.5 g/kg of ethanol to 4 subjects, blood acetaldehyde concentrations of 0.02–0.06 mg/mL were reported after 40–80 min [Christensen *et al.* 1981].

In a study in subjects with high blood alcohol levels, the mean blood concentration was 4.05 g/L and the rate of elimination was 0.33 g/L/h (range 0.02–0.62). It is possible that there is ultra-rapid elimination of blood alcohol in those with very high alcohol levels, possibly through induction of CYP2E1 ethanol metabolism [Jones 2008].

For a comparison of blood and breath alcohol levels with tissue levels and the contribution of alcohol pharmacokinetics to observed differences, see Ridder *et al.* [2009].

Toxicity The minimum lethal dose is ~500 mL of 50% spirit ingested in ~1 h. In the UK, it is illegal to be in charge of a motor vehicle with a concentration >800 mg/L in the blood, 1070 mg/L in the urine or 35 mg/L in the breath. Toxic effects are associated with blood concentrations of 840–4500 mg/L (mean 2400), and subjects with concentrations of 3000 mg/L or more are considered to be clinically drunk. Blood concentrations of 2250–6030 mg/L (mean 4000) have been associated with fatalities. The maximum permissible atmospheric concentration is 1000 ppm.

In 10 fatalities caused by the ingestion of ethanol, the following postmortem tissue concentrations were reported: blood 4230–17 660 mg/L (mean 7410), bile 1250–27 950 mg/L (mean 7860), brain 3100–9120 μg/g (mean 4430), kidney 2850–10 430 μg/g (mean 4830), liver 2450–11 610 μg/g (mean 4470) and urine 4850–9400 mg/L (mean 6190) [Christopoulos *et al.* 1973].

There was an unusual distribution of ethanol in a 48-year-old man with a history of alcoholism who was found dead: femoral blood (2 samples) 2.57 and 2.73 g/L, heart blood 6.43 g/L, vitreous humour 7.63 g/L, urine 840 μg/g, bile 6.16 g/L, liver 2.50 mg/g and gastric contents 2.47 g/53 g. It was proposed that agonal or postmortem aspiration of ethanol-rich vomitus and postmortem fermentation could account for the elevated concentrations in heart blood and bile; high vitreous ethanol could have resulted from diffusion in the agonal phase or postmortem from gastric aspirate in the carpet [Singer, Jones 1997].

Analysis of the blood of 169 acutely poisoned alcoholics on hospital admission showed the mean blood ethanol concentrations to be 3.14 g/L (range 0.76–6.6) [Zuba *et al.* 2002a; Zuba *et al.* 2002b].

In a study in 59 subjects, breath alcohol levels were determined at hourly intervals using an Alcotest 7110 MK IIIA analyser. Mean peak alcohol levels were 0.456 mg/L. The mean breath alcohol elimination rate was 0.082 mg/L. The mean elimination rate in females of 0.087 mg/L was significantly higher than that in males (0.078 mg/L) [Pavlic *et al.* 2007].

In a study to determine levels of drugs in postmortem femoral blood from 24 876 examinations representing all causes of death, alcohol was the most common psychoactive compound found, being present in 8108 (33%), at mean, median and highest concentrations of 1.43, 1.20 and 8.0 g/L, respectively [Jones, Holmgren 2009].

Mean blood alcohol levels of 1.86 g/L were found in 104 young patients (mean age 16.2 years) admitted to an emergency department with acute alcohol intoxication over a 12 month period; 21.2% were slightly intoxicated, 75.8% moderately and 3% severely [Sanz Marcos *et al.* 2009].

In a study of blood alcohol levels in suicides over a 10-year period in Sweden (11 441 cases), 34% (37% males, 31% females) had consumed alcohol before death. Mean blood alcohol levels were 1.34 g/L in men and 1.25 g/L in women. Many were heavily intoxicated, with 90th percentiles of blood alcohol levels in the range 2.3–2.8 g/L [Holmgren, Jones 2010].

Half-life Plasma half-life is dose dependent.

Volume of Distribution ~0.6 L/kg.

Distribution in Blood Plasma : whole blood ratio, 1.2.

Saliva Plasma : saliva ratio, ~0.93.

Protein Binding No significant binding.

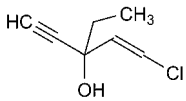
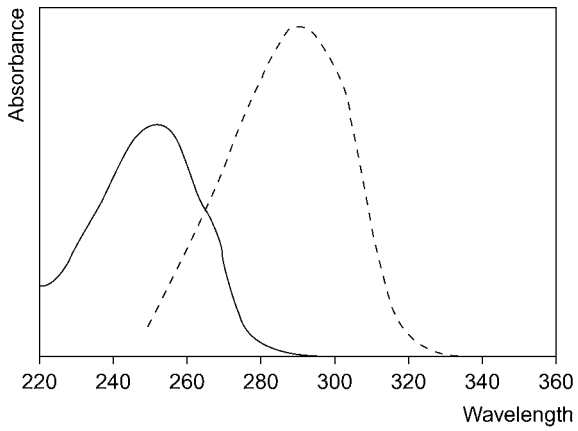
Ethchlorvynol

Hypnotic
C_7H_9ClO = 144.6
CAS—113-18-8

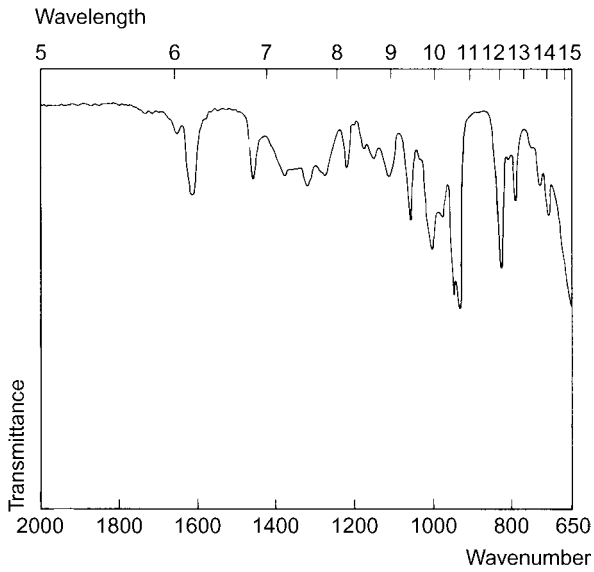
IUPAC Name 1-Chloro-3-ethyl-1-penten-4-yl-3-ol
Synonyms β-Chlorovinyl ethyl ethynyl carbinol; E-ethchlorvynol; ethyl B-chlorvynol.
Proprietary Name *Placidyl*



Chemical Properties A colourless to yellow liquid. This slightly viscous liquid darkens on exposure to air and light. Weight per mL ≈1.072 g. Refractive index at 20°, 1.4770 to 1.4805. Practically immiscible with water; miscible with ethanol, chloroform, ether and most other organic solvents. Log *P* (octanol/water), 1.6.
Colour Test Ammoniacal silver nitrate—white/yellow precipitate.
Thin-layer Chromatography System TB—R_f 0.00; system TD—R_f 0.81; system TF—R_f 0.74; system TAD—R_f 0.82; system TAE—R_f 0.87.
See Peel and Freimuth [1972].
Gas Chromatography System GA—RI 1015; system GB—RI 1060; system GI—RT 35.2 min.
Ultraviolet Spectrum



Infrared Spectrum Principal peaks at wavenumbers 935, 950, 830, 1010, 1063, 980 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 115, 117, 89, 53, 109, 51, 91, 39.
Quantification
Blood **GC** Column: 3% OV-17 on 100/200 Chromasorb WHB (PE, 6′). Carrier gas: He, 52 mL/min. Temperature: 80°. FID. Limit of detection not reported [Winek *et al.* 1989]. Column: 3% OV-1 GasChrom W on 80/100 mesh (6′ × 4 mm i.d.). Carrier gas: N_2, 35 mL/min. Temperature: 100°. Retention time: 1.9 min. Limit of detection, 1 mg/L [McCurdy 1977]. Column: SE-30. Carrier gas: He, 35 mL/min. Temperature: 80°. Limit of detection not reported [White, Graves 1974]. Column: 2.5% XE-60 on AW-DMCS Chromosorb G, 80/100 mesh (1.5 m × 4 mm i.d.). Carrier gas: Ar, 70 mL/min. Temperature: 100°. FID. Retention time: 13.5 min. Limit of detection, 20 mg/L [Gibson, Wright 1972]. Column: Chromosorb W 6% diethylene glycol (6′ × 1/8 "i.d.). Carrier gas: He, 60 mL/min. Temperature: 168°. FID. Limit of detection, 0.1 µg [Hedley-Whyte, Laasberg 1969]. Column: 1% Hi-Eff 3-BP on 80/100 mesh Gas Chrom Q (6′ × 1/4" i.d.). Carrier gas: He, 35 mL/min. Temperature: 110°. FID. Retention time: 3 min. Limit of detection, 4.5 µg/L [Maes *et al.* 1969].
Plasma **GC** Column: 2% Carbowax 20M 5% HOH on HP Chromosorb W 80/100 mesh. Carrier gas: N_2, 60 mL/min. Temperature: 140°. FID. Retention time: 0.69. Limit of detection, 2 mg/L [Flanagan *et al.* 1978]. Column: 2% Carbowax 20M and 5% KOH on HP Chromosorb W 80/100 mesh (1.5 m × 4 mm i.d.). Carrier gas: N_2, 60 mL/min. Temperature: 200°. FID. Relative retention time: 0.69. Limit of detection, 2 mg/L [Flanagan, Lee 1977].
HPLC Ultrasphere ODS C_{18} (15 cm × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : phosphate buffer (5 : 95 to 22 : 78 in 24 min to 45 : 55 in 10 min for 5 min to 5 : 95 for 5 min). Flow rate 3.0 mL/min. UV detection (λ = 210 nm). Retention time: 16.5 min. Limit of detection, 2 mg/L [Kabra *et al.* 1981].
Serum **GC** See Plasma [Flanagan *et al.* 1978]. Column: 5% NPGS on AW-DMCS 100/120 mesh (1.52 m × 0.32 m i.d.). Carrier gas: N_2, 50 to 60 mL/min. Temperature: 120°. ECD. Limit of detection, 0.25 mg/L [Cummins *et al.* 1971]. Column: Silicone L-40 20% on acid-washed Chromosorb V 80/100 mesh (5 ′ × 1/8″ i.d.). Carrier gas: N_2, 22 mL/min. Temperature: 125°. FID. Retention time: 3 to 4 min. Limit of detection, 5 mg/L [Robinson 1968].
HPLC See Plasma [Kabra *et al.* 1981].
Urine **GC** See Blood [Winek *et al.* 1989]. See Plasma [Flanagan *et al.* 1978]. See Plasma [Flanagan, Lee 1977]. See Blood [McCurdy 1977]. See Blood [Gibson, Wright 1972]. See Serum [Cummins *et al.* 1971]. See Blood [Hedley-Whyte, Laasberg 1969]. See Blood [Maes *et al.* 1969]. See Serum [Robinson 1968].
Bile **GC** See Blood [Winek *et al.* 1989]. Column: 0.2% Carbowax 1500 on 80/100 mesh (6′ × 1/8″ i.d.). Carrier gas: He, 30 mL/min. Temperature: 150°. FID. Limit of detection not reported [Winek *et al.* 1988]. See Blood [Maes *et al.* 1969].
Gastric Contents **GC** See Blood [Winek *et al.* 1989]. See Plasma [Flanagan *et al.* 1978]. See Blood [McCurdy 1977]. See Blood [Maes *et al.* 1969].

Kidney **GC** See Blood [Winek *et al.* 1989]. See Blood [Maes *et al.* 1969].
Liver **GC** See Blood [Winek *et al.* 1989]. See Blood [Maes *et al.* 1969].
Spleen **GC** See Blood [Maes *et al.* 1969].
Other **GC** Rabbit Blood and Bone Marrow. Column: 3% OV-17 on 100/120 mesh Chromosorb W HP (6′). Carrier gas: He, 52 mL/min. Temperature: 80°. FID. Limit of detection not reported [Winek *et al.* 1981].
Note For an evaluation of gas chromatographic and colorimetric methods, see Bridges and Jennison [1984]. For a colourimetric method, see Kaistha and Tadrus [1978]. For a UV spectrophotometric method for detection in blood, serum and urine, see Wallace *et al.* [1974].
Disposition in the Body Rapidly and completely absorbed after oral administration (60 to 90 min [Lynn *et al.* 1979;Yell 1990]). It is extensively metabolised; the major metabolite found in the blood and urine of poisoned patients is 1-chloro-3-ethynylpent-1-ene-3,4-diol [Kelner, Bailey 1983]; other metabolites include 1-chloro-3-ethynylpent-1-ene-3,5-diol and 1-chloro-3-ethylpent-1-ene-3,4-diol. Ethchlorvynol is highly localised in tissues (particularly adipose tissue) and released very slowly. Less than 0.1% of a dose is excreted in the urine in 24 h as unchanged drug or its glucuronide conjugate [Cummins *et al.* 1971]. Ethchlorvynol crosses the placenta. It is not known whether it is the parent compound or a metabolite that is responsible for the peculiar pungent breath odour frequently noticed in intoxicated patients [Bertino, Jr., Reed 1986].
Therapeutic Concentration The therapeutic concentraion in plasma is usually in the range 5 to 20 mg/L. After a single oral dose of 500 mg to 8 subjects, a mean peak plasma concentration of 6.5 mg/L was attained in 1 h [Cummins *et al.* 1971].
Toxicity The estimated minimum lethal dose is 15 g, although death has occurred after the acute ingestion of 2.5 g [Gary, Tresznewsky 1983]. Plasma concentrations greater than about 20 mg/L are associated with toxic effects [Kelner, Bailey 1983]. Prolonged use of ethchlorvynol may lead to dependence of the barbiturate–alcohol type. Ethchlorvynol overdose can result in pressure necrosis [Chamberlain *et al.* 1990].

In a review of 13 fatalities due to overdosage with ethchlorvynol, postmortem blood concentrations were in the range 14 to 400 mg/L (mean, 119 mg/L) [Rehling 1967].

A 36-year-old male attempted suicide. The initial plasma concentration of ethchlorvynol was 60 mg/L, and this decreased to 2.5 mg/L by the ninth day. The urinary concentration decreased from 6.5 to 1.1 mg/L. The initial whole-blood concentration was 90 mg/L and, in the peritoneal dialysate, the concentration was 7.2 mg/L [Hedley-Whyte, Laasberg 1969].

A 27-year-old male was admitted to hospital in grade-III coma. On admission, his blood contained 51 mg/L ethchlrovinol, 30 mg/L cyclobarbitone and 12 mg/L methaqualone. He made a complete recovery after haemodialysis [Gibson, Wright 1972].

In 3 fatalities due to ethchlorvynol, the following postmortem tissue concentrations were reported: blood, 85, 22 and 66 mg/L; brain, 57, not tested, 285 µg/g; kidney, 54, 63, and 860 µg/g; liver 70, 60, and 507 µg/g; adipose tissue 1040 and 142 µg/g (2 cases) [Cravey, Baselt 1968; Winek *et al.* 1989].

Toxicological analysis of body fluids and tissues of a 54-year-old female fatality who had been embalmed revealed an ethchlorvynol concentration of 112 mg/L in the bile; phenobarbital (32.8 mg/L) was also found in the bloody fluid from the heart [Winek *et al.* 1988].

The following 2 cases of fatal poisoning the following tissue concentrations (mg/100 mL or mg/100 g) were measured:

Tissue	*Case 1*	*Case 2*
Blood	15.4	15.4
Urine	1.0	N.D.
Bile	16.0	13.5
Gastric contents	11.3	4.5
Brain	8.3	14.8
Kidney	2.2	7.2
Liver	2.7	10.6
Spleen	4.6	9.7

N.D. Not determined. [Maes *et al.* 1969]

In 2 fatalities involving ethchlorvynol overdose, the following postmortem tissue concentrations were reported: blood, 198.2 and 29.0 mg/L; urine, 261.8 and 10.6 mg/L; bile, 361.8 and 22.7 mg/L; eye fluid, 10.0 and not reported; liver, 620.0 and 21.3 µg/g; kidney, not reported and 17.3 µg/g; and stomach contents (total), 130 000 and 533 mg. In case 1, ethanol, diazepam, and nordiazepam were also detected; in case 2, diazepam, nordiazepam, and hydrocodone were also present [Winek *et al.* 1989].

Note For ethchlorvynol concentrations in non-fatal (51) and fatal (38) ingestions, see Bailey and Shaw [1990].

Half-life Distribution half-life, ≈1 to 3 h and elimination half-life of 10 to 25 h [Gary, Tresznewsky 1983], increased to 21 to 105 h in overdose cases [Bertino, Jr., Reed 1986; Yell 1990] reduced by haemodialysis [Forycki *et al.* 1985].

Volume of Distribution ≈2 to 3 L/kg; 4 L/kg [Bertino, Jr., Reed 1986; Mack 1983; Yell 1990]; 270 to 300 L [Lynn *et al.* 1979]; 3.0 to 4.0 [Forycki *et al.* 1985].

Clearance 1 to 6 mL/min [Lynn *et al.* 1979].

Distribution in Blood Ratio of plasma : whole blood ≈1.1.

Protein Binding ≈55% [Forycki *et al.* 1985]; 62% [Yell 1990].

Dose 0.2 to 1 g, as a hypnotic.

Ether

Anaesthetic (General)

$(C_2H_5)_2O = 74.12$

CAS—60-29-7

IUPAC Name Ethoxyethane

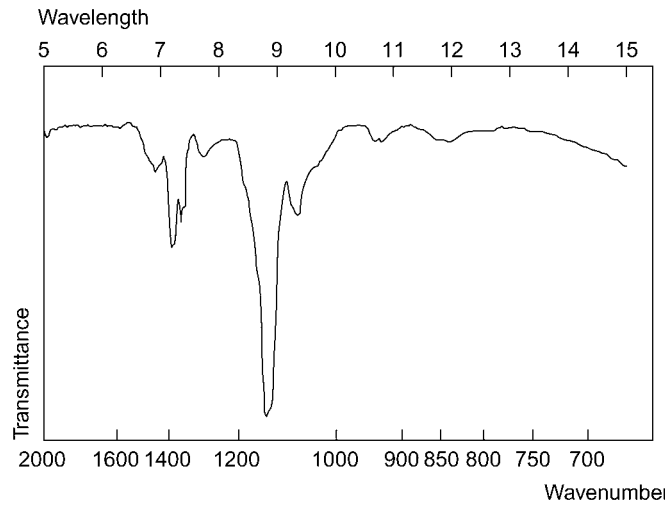
Synonyms Diethyl ether; diethyl oxide; ethyl ether; ethyl oxide; 1,1′-oxybisethane.

Chemical Properties A clear, colourless, volatile, inflammable, very mobile liquid. Bp 34° to 36°. Soluble 1 in 10 to 1 in 12 of water; miscible with ethanol, chloroform, benzene and petroleum ether. pK_a −3.6. Log *P* (octanol/water), 0.9. Anaesthetic Ether (BP) is highly purified ether containing not more than 0.002% of a stabiliser such as propyl gallate or hydroquinone. Solvent Ether (BP) is not so highly purified and is without a stabiliser.

Caution Ether is very volatile and inflammable, and mixtures of its vapour with oxygen, nitrous oxide or air at certain concentrations are explosive. It should not be used in the presence of an open flame or any electrical apparatus liable to produce a spark; precautions should be taken against the production of static electrical discharge. Explosive peroxides are generated by the atmospheric oxidation of solvent ether and it is dangerous to distil a sample which contains peroxides.

Gas Chromatography System GA—RI 515; system GI—RT 5.9 min; system GAA—RI 499.

Infrared Spectrum



Mass Spectrum Principal ions at *m/z* 31, 59, 29, 45, 74, 27, 41, 43.

Quantification

Blood **GC-MS** Column: Rtx-1 capillary (60 m × 0.32 mm i.d., 3.0 µm). Carrier gas: He, 1.5 mL/min. Temperature: 100°. SIM acquisition mode. Limit of quantification, 10 mg/L [Cox *et al.* 2006].

Urine **GC-MS** See Blood [Cox *et al.* 2006].

Bile **GC-MS** See Blood [Cox *et al.* 2006].

Kidney **GC-MS** See Blood [Cox *et al.* 2006].

Liver **GC-MS** See Blood [Cox *et al.* 2006].

Disposition in the Body Ether is absorbed into the circulation after inhalation; the blood: gas partition coefficient is high (~12). Approximately 90% of a dose is slowly exhaled unchanged and very little is metabolised; a small amount may be excreted unchanged in the urine. Acetaldehyde is believed to be a minor metabolite.

Therapeutic Concentration In plasma, during anaesthesia, usually in the range 500–1500 mg/L.

Toxicity The estimated minimum lethal oral dose is 30 mL; the maximum permissible atmospheric concentration is 400 ppm. Atmospheric concentrations of 2000 ppm may cause dizziness and 100 000 ppm may be rapidly fatal.

In 4 elderly persons who died after being given ether with other medication, ether concentrations (mg/L or µg/g) immediately after the operation were: blood 600, 3750, 2880, 190; brain 700, 610, 2720, 310; liver 400, 1280, 260, 230; and lung 200, 1580, 210, –. In the second patient, the urine contained 340 mg/L [Campbell 1960].

A 24-year-old man became severely comatose after attempting suicide by injecting 5 mL ether into his left cubital vein. Ether was identified by gas chromatography [Serrano *et al.* 1999].

A 49-year-old man who committed suicide using plastic bag suffocation and ether inhalation was found to have blood levels of ether of 1277 mg/L. As this was within the levels used in anaesthesia, it was concluded that death was caused by asphyxiation [Athanaselis *et al.* 2002].

For other reports of suicide involving ether, see Bauer, Denk [1985] and Winek *et al.* [1970]. For the report of the death of a small child from ether poisoning, see Rittner *et al.* [1984]; for other reports of poisoning with ether, see Lechat [1981a] and Lechat [1981b]. For another case report and review of the literature, see Kernbach-Wighton *et al.* [1998].

Dose For induction of anaesthesia, 10 to 20% of the vapour by inhalation; maintenance, 3 to 10%.

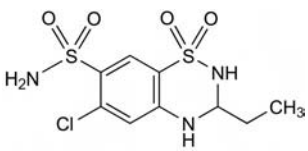
Ethiazide

Diuretic

$C_9H_{12}ClN_3O_4S_2$ = 325.8

CAS—1824-58-4

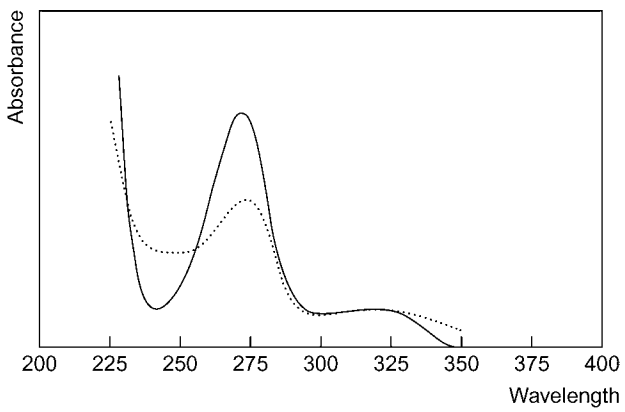
IUPAC Name 6-Chloro-3-ethyl-3,4-dihydro-2*H*-1,2,4-benzothiadiazine-7-sulfonamide-1,1-dioxide



Chemical Properties Crystals. Mp 269° to 270°. Log *P* (octanol/water), 0.3.

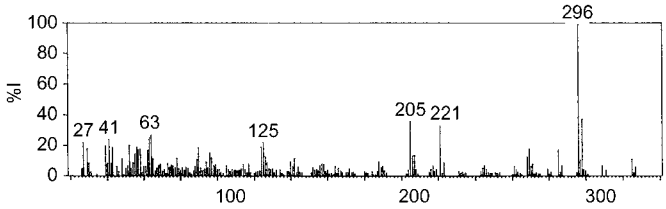
Thin-layer Chromatography System TD—R_f 0.11; system TE—R_f 0.50; system TF—R_f 0.50; system TL—R_f 0.22.

Ultraviolet Spectrum Aqueous acid—272 nm (A_1^1=345b).



Infrared Spectrum Principal peaks at wavenumbers 1163, 1172, 1603, 1312, 781, 1510 cm^{-1} (Nujol mull).

Mass Spectrum Principal ions at *m/z* 296, 298, 205, 221, 64, 63, 41, 125.



Dose Usually 5 to 10 mg daily.

E

Ethinamate

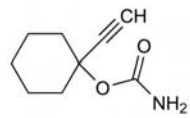
Hypnotic

$C_9H_{13}NO_2$ = 167.2

CAS—126-52-3

IUPAC Name 1-Ethynylcyclohexanol carbamate

Proprietary Names *Valamin*; *Valmid*; *Valmidate*.



Chemical Properties A white powder. Mp 96° to 98°. Soluble 1 in 400 of water and 1 in about 3 of ethanol; freely soluble in chloroform and ether. Log *P* (octanol/water), 1.9.

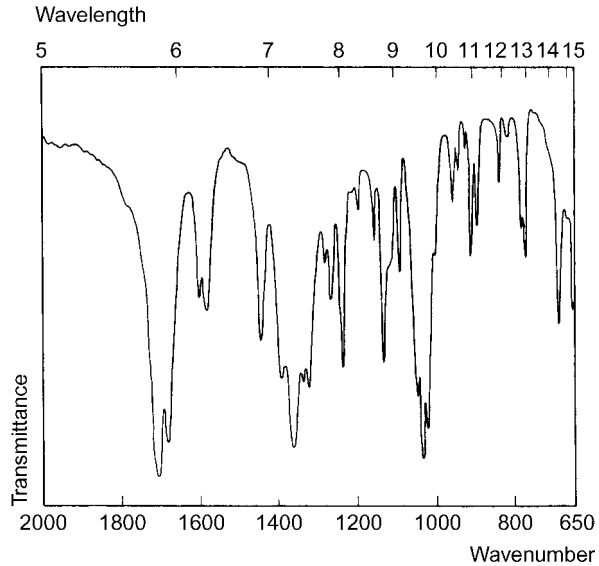
Colour Test Ammoniacal silver nitrate—yellow/brown.

Thin-layer Chromatography System TA—R_f 0.76; system TB—R_f 0.05; system TD—R_f 0.49; system TE—R_f 0.76; system TF—R_f 0.59; system TAD—R_f 0.58; system TAE—R_f 0.86; system TAF—R_f 0.87; system TAJ—R_f 0.58; system TAK—R_f 0.69; system TAL—R_f 0.91 (furfuraldehyde reagent, positive; acidified potassium permanganate solution, positive).

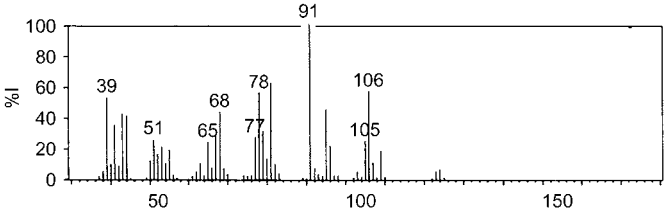
Gas Chromatography System GA—RI 1365.

Ultraviolet Spectrum No significant absorption, 230 to 360 nm.

Infrared Spectrum Principal peaks at wavenumbers 1713, 1041, 1694, 1030, 1052, 1250 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 91, 81, 106, 78, 39, 95, 68, 43.



Quantification
Plasma **GC** FID. Ethinamate and *trans*-4-hydroxyethinamate. Limit of detection, 500 µg/L for ethinamate [Kleber *et al.* 1977].
Urine **GC** See Plasma [Kleber *et al.* 1977].
Disposition in the Body Rapidly absorbed after oral administration. Metabolised by hydroxylation to 4-hydroxyethinamate, which exists as stereoisomers, and conjugated with glucuronic acid. About 40% of a dose is excreted in the urine in 24 h as *trans*-4-hydroxyethinamate or its glucuronide conjugate; only a small amount is excreted unchanged in the urine; 3- and 2-hydroxyethinamate have also been detected in urine.
Therapeutic Concentration In plasma, usually in the range 5 to 10 mg/L.
After a single oral dose of 1 g to 8 subjects, peak blood concentrations of 3.8 to 11.7 mg/L (mean 6.5) were attained in 1 to 2 h [Clifford *et al.* 1974].
Toxicity The estimated minimum lethal dose is 15 g but recovery has occurred after ingestion of as much as 28 g. Prolonged use of ethinamate may lead to dependence of the barbiturate–alcohol type. Blood concentrations >100 mg/L have been associated with fatalities.
Half-life Plasma half-life, about 2 h.
Dose 0.5 to 1 g, as a hypnotic.

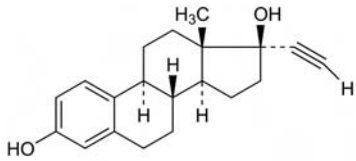
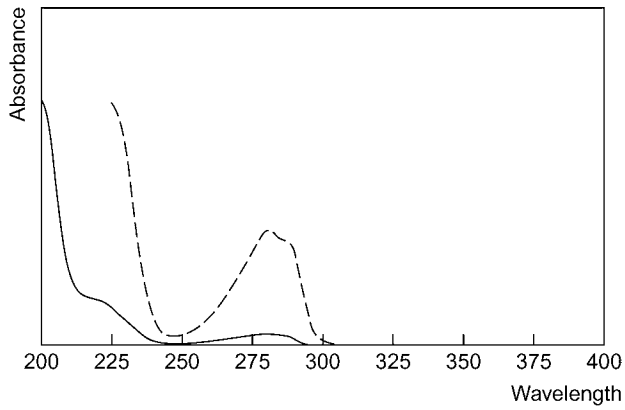
Ethinylestradiol

Oestrogen
$C_{20}H_{24}O_2$ = 296.4
CAS—57-63-6

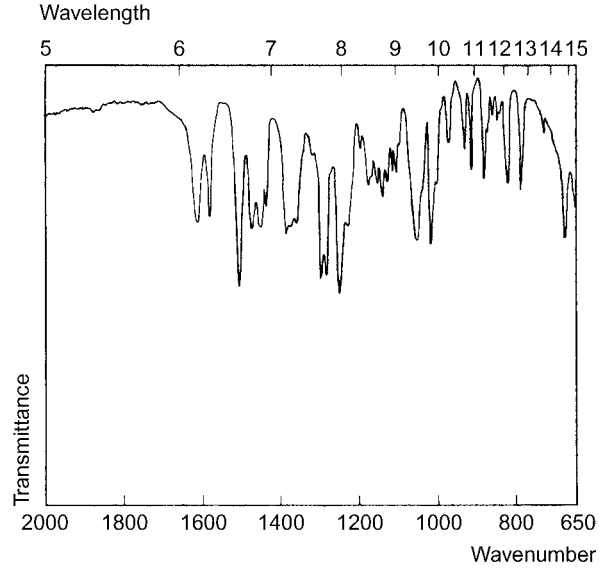
IUPAC Name (8*R*,9*S*,13*S*,14*S*,17*R*)-17-Ethynyl-13-methyl-7,8,9,11,12,14,15, 16-octahydro-6*H*-cyclopenta[*a*]phenanthrene-3,17-diol
Synonyms Ethinyl estradiol; ethinyloestradiol; etinilestradiol; (17α)-19-norpregna-1,3,5(10)-trien-20-yne-3,17-diol.
Proprietary Names *Estigyn*; *Estinyl*; *Etifollin*; *Farmacyrol*; *Feminone*; *Gynolett*; *Lynoral*; *Primogyn C*; *Progynon C*; *Turisteron*.



Chemical Properties Ethinylestradiol is an ingredient of many oral contraceptives, see Sweetman [2009]. A fine, white to slightly yellowish-white, crystalline powder. There are two forms, one melts at 141° to 146° and the other at 182° to 184°. Practically insoluble in water; soluble 1 in 5 of acetone, 1 in 4 of dioxane, 1 in 6 of ethanol, 1 in 20 of chloroform and 1 in 4 of ether. Log *P* (octanol/water), 3.7.
Caution Ethinylestradiol is a powerful estrogen. Contact with the skin or inhalation should be avoided.
Colour Tests Ammoniacal silver nitrate—white precipitate/yellow; antimony pentachloride—brown→black; Liebermann's reagent—black; naphthol–sulfuric acid—brown-red/pink; sulfuric acid—red-orange.
Thin-layer Chromatography System TA—R_f 0.90; system TB—R_f 0.04; system TE—R_f 0.71; system TP—R_f 0.72; system TQ—R_f 0.30; system TR—R_f 0.40; system TS—R_f 0.40, streaking may occur; system TAE—R_f 0.86; system TAJ—R_f 0.55; system TAK—R_f 0.58; system TAL—R_f 0.91; system TAM—R_f 0.94.
Gas Chromatography System GA—RI 2719.
High Performance Liquid Chromatography System HX—RI 539.
Ultraviolet Spectrum Ethanol—281 nm (A^1_1=70a).



Infrared Spectrum Principal peaks at wavenumbers 1252, 1505, 1298, 1285, 1020, 1060 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 213, 160, 159, 296, 133, 145, 212, 157.
Quantification
Plasma **HPLC** Limit of detection, <2 ng/L [Tacey *et al.* 1994].
Radioimmunoassay For method, see Agasan *et al.* [1994].
Serum **Radioimmunoassay** For comparison with GC–MS, see Kuhnz *et al.* [1993].
Disposition in the Body
Therapeutic Concentration Application of a 20 cm^2 contraceptive patch, releasing ethinylestradiol 20 µg and norelgestromin 150 µg daily, to the abdomen, arm, buttock or torso of 37 subjects produced respective mean peak plasma ethinylestradiol concentrations of 58.7, 69.5, 66.3 and 71.2 ng/L at 48 h; corresponding peak plasma concentrations of norelgestromin (at 72 h) were 0.88, 1.18, 1.17 and 1.07 µg/L) [Abrams *et al.* 2002].
Dose 10 to 150 µg daily; up to 2 mg daily may be given.

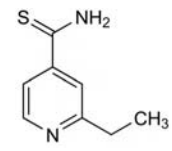
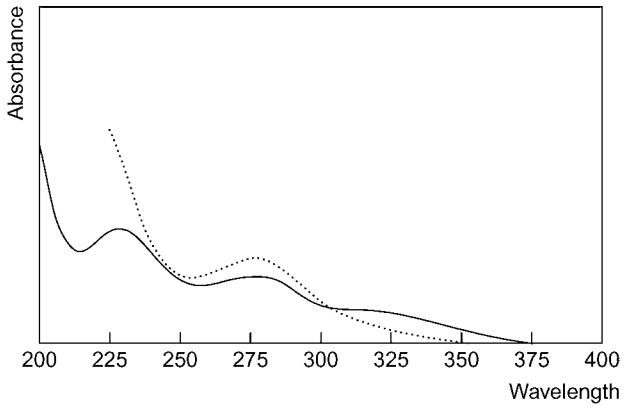
Ethionamide

Antituberculosis
$C_8H_{10}N_2S$ = 166.2
CAS—536-33-4

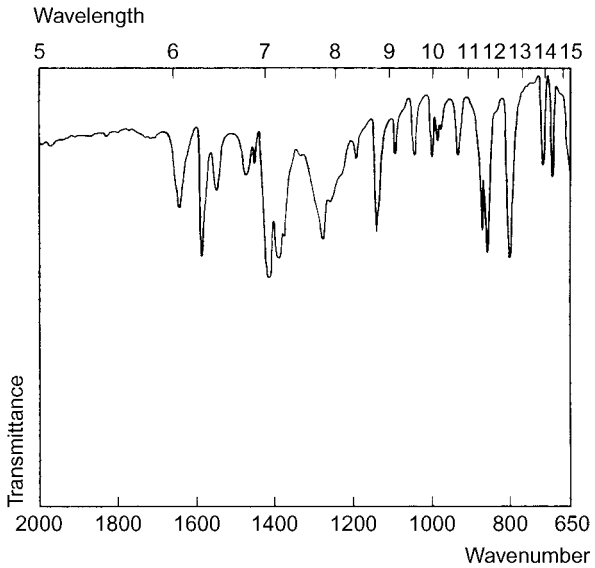
IUPAC Name 2-Ethyl-4-pyridinecarbothioamide
Synonym Etionamida
Proprietary Names *Ethatyl*; *Trescatyl*.



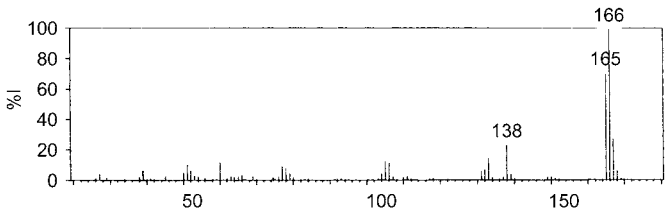
Chemical Properties A bright-yellow crystalline powder, darkening on exposure to light. Mp 158° to 165°. Very sparingly soluble in water; freely soluble in pyridine; soluble 1 in 30 of ethanol, 1 in 45 of acetone, 1 in 350 of chloroform and 1 in 600 of ether; sparingly soluble in methanol. Log *P* (octanol/water), 1.5.
Colour Tests Nessler's reagent—brown-orange; palladium chloride—brown
Thin-layer Chromatography System TA—R_f 0.65; system TB—R_f 0.00; system TC—R_f 0.36; system TL—R_f 0.55 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1756.
Ultraviolet Spectrum Aqueous acid—230 (A^1_1=635a), 275 nm; aqueous alkali—277 nm.



Infrared Spectrum Principal peaks at wavenumbers 1588, 808, 865, 1275, 1140, 880 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 166, 165, 167, 138, 133, 105, 60, 106.



Quantification

Plasma **HPLC** UV detection. Limit of detection 10 µg/L [Jenner, Ellard 1981].
HPLC–MS Limit of detection, 0.05 mg/L [Conte *et al.* 2001].

Serum **HPLC** Ethionamide and other antitubercular drugs. Limit of detection, <94 µg/L [Gennaro *et al.* 2001]. For method, see Peloquin *et al.* [1991]. See Plasma [Jenner, Ellard 1981].

Urine **HPLC** See Plasma [Jenner, Ellard 1981].

Bronchoalveolar Lavage **HPLC–MS** Limit of detection, 0.005 mg/L [Conte *et al.* 2001].

Alveolar Cells **HPLC–MS** See Bronchoalveolar Lavage [Conte *et al.* 2001].

Disposition in the Body Readily absorbed after oral administration and widely distributed throughout the body. Peak plasma concentrations are attained 2 to 3 h after a dose. It is extensively metabolised and is excreted in the urine mainly as metabolites with little unchanged drug. The metabolites include ethionamide sulfoxide, 2-ethylisonicotinic acid and 2-ethylisonicotinamide.

Therapeutic Concentration

Administration of a single oral 500 mg dose of ethionamide to 16 subjects resulted in a mean maximum plasma concentration of 2.3 mg/L (range, 0.99 to 6.10) at 1.7 h (0.75 to 3.00) in the fasting state; this was not statistically changed when ethionamide was given with food, orange juice or antacids [Auclair *et al.* 2001].

Dose 0.5 to 1 g daily.

Ethisterone

Progestational Steroid

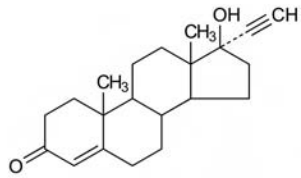
$C_{21}H_{28}O_2 = 312.4$

CAS—434-03-7

IUPAC Name 17-Ethynyl-17-hydroxy-10,13-dimethyl-2,6,7,8,9,11,12,14,15,16-decahydro-1*H*-cyclopenta[*a*]phenanthren-3-one

Synonyms Aethisteron; anhydrohydroxyprogesterone; ethinyltestosterone; 17α-hydroxypregn-4-en-20-yn-3-one; praegnin; pregneninolone; pregnin.

Proprietary Names *Etherone*; *Gestone-Oral*; *Lutocyclin*; *Lutocyclol*; *Ora-Lutin*; *Progesterol*; *Pranone*; *Syngestrotabs*; *Trosinone*.

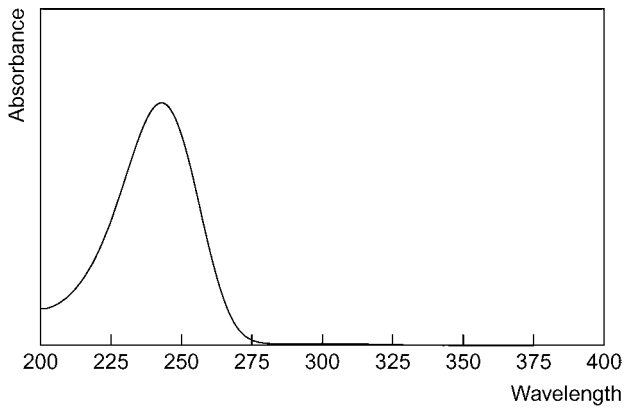


Chemical Properties A white, slightly hygroscopic, crystalline powder. Mp 272° to 276°. Practically insoluble in water; soluble 1 in 1000 of ethanol, 1 in 750 of acetone, 1 in 110 of chloroform, 1 in 3000 of ether and 1 in 35 of pyridine. Log *P* (octanol/water), 3.1.

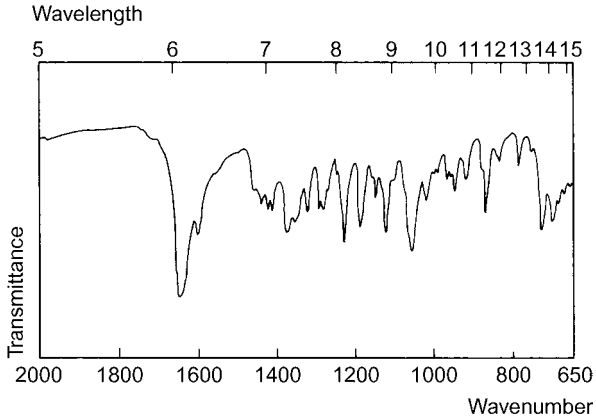
Thin-layer Chromatography System TP—R_f 0.78; system TQ—R_f 0.39; system TR—R_f 0.80; system TS—R_f 0.00.

High Performance Liquid Chromatography System HATb—RRT 0.84 (relative to testosterone).

Ultraviolet Spectrum Dehydrated alcohol—240 nm (A_1^1=520a).



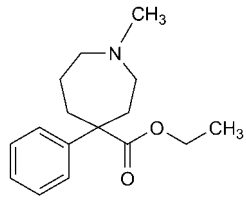
Infrared Spectrum Principal peaks at wavenumbers 1660, 1060, 1235, 1612, 1127, 723 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 122, 121, 91, 147, 161, 43, 107, 120.
Dose 25 to 100 mg daily.

Ethoheptazine

Narcotic Analgesic
$C_{16}H_{23}NO_2$ = 261.4
CAS—77-15-6
IUPAC Name Ethylhexahydro-1-methyl-4-phenyl-1*H*-azepine-4-carboxylate
Synonym Heptacyclazine

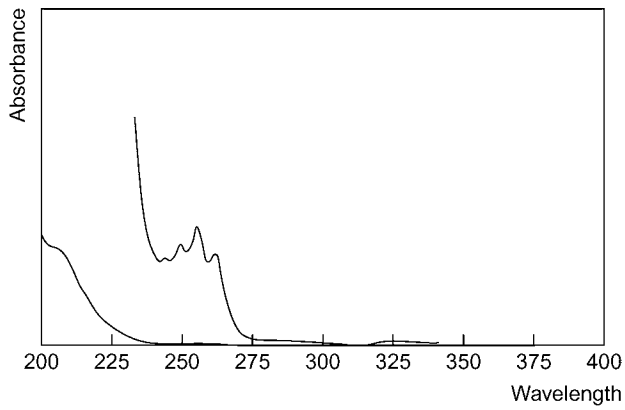


Chemical Properties Liquid. pK_a 8.5. Log *P* (octanol/water), 3.5.

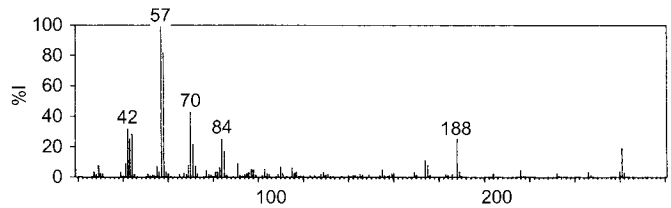
Ethoheptazine Citrate

$C_{16}H_{23}NO_2,C_6H_8O_7$ = 453.5
CAS—6700-56-7
Proprietary Names *Zactane*. It is an ingredient of *Equagesic*.
Chemical Properties White powder. Mp ≈140°. Soluble in water and ethanol; practically insoluble in ether.

Colour Test Marquis test—orange.
Thin-layer Chromatography System TA—R_f 0.40; system TAE—R_f 0.12; system TAF—R_f 0.41; system TL—R_f 0.04; system TB—R_f 0.45; system TC—R_f 0.19; system TE—R_f 0.55 (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, orange; acidified potassium permanganate solution, positive).
Gas Chromatography System GA—RI 1857; system GB—RI 1923; system GAS—RI 1882; system GC—RI 1630; system GF—RI 2110.
High Performance Liquid Chromatography System HA—*k* 3.3; system HC—*k* 1.55; system HX—RI 359.
Ultraviolet Spectrum Aqueous acid—251, 257 nm (A_1^1 = 8c), 263 nm. No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1727, 1193, 1094, 695, 1248, 1030 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 57, 58, 70, 42, 44, 188, 84, 43.



Quantification

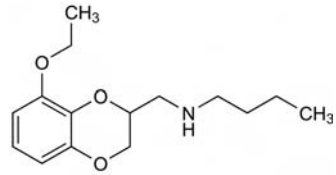
Blood **GC** Column: 3% OV-17 on Chromosorb W HP (2 m × 3.2 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature: 225°. FID. Limit of detection, 1.0 mg/L [Drost *et al.* 1983].
Brain **GC** See Blood [Drost *et al.* 1983].
Kidney **GC** See Blood [Drost *et al.* 1983].
Liver **GC** See Blood [Drost *et al.* 1983].
Spleen **GC** See Blood [Drost *et al.* 1983].

Disposition in the Body Readily absorbed after oral administration; peak blood concentrations are attained within 1 h of a dose. It is extensively metabolised and excreted in the urine.
Toxicity The estimated minimum lethal dose is 1 g.
In a fatality caused by the ingestion of an unknown amount of ethoheptazine, the following postmortem concentrations were reported: blood, 15 µg/g; brain, 4.5 µg/g; kidney, 2.4 µg/g; liver, 10.0 µg/g; spleen, 3.1 µg/g [Drost *et al.* 1983].
Dose 225 to 600 mg of ethoheptazine citrate daily.

Drost RH *et al.* (1983). Determination of ethoheptazine in human post mortem material. *J Chromatogr* 277: 352–355.

Ethomoxane

Tranquilliser
$C_{15}H_{23}NO_3$ = 265.4
CAS—3570-46-5
IUPAC Name *N*-Butyl-8-ethoxy-1,4-benzodioxan-2-ylmethylamine

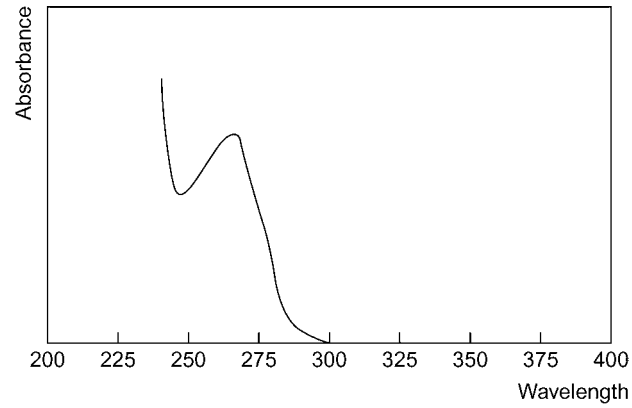


Chemical Properties A liquid.

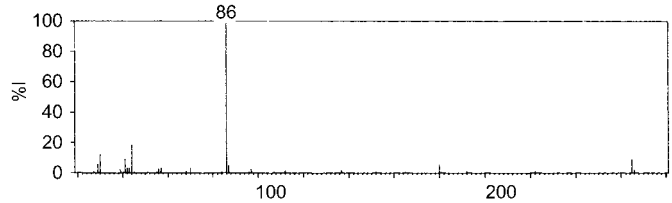
Ethomoxane Hydrochloride

$C_{15}H_{23}NO_3$,HCl = 301.8
CAS—6038-78-4
Chemical Properties Crystals. Mp 196° to 197°.

Colour Tests Mandelin's test—red-brown; Marquis test—red-violet.
Thin-layer Chromatography System TA—R_f 0.60; system TB—R_f 0.34; system TC—R_f 0.47; system TL—R_f 0.36 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1975.
Ultraviolet Spectrum Aqueous acid—267 nm (A_1^1=23.5a).



Infrared Spectrum Principal peaks at wavenumbers 1120, 1279, 1594, 1493, 1097, 1252 cm^{-1} (KBr disk).

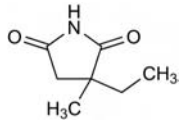


Mass Spectrum Principal ions at *m/z* 86, 44, 30, 265, 41, 180, 29, 87.

Ethosuximide

Anticonvulsant
$C_7H_{11}NO_2$ = 141.2
CAS—77-67-8
IUPAC Name 3-Ethyl-3-methyl-2,5-pyrrolidinedione
Synonym Ethosuccimide

Proprietary Names *Emeside*; *Ethymal*; *Petinimid*; *Petnidan*; *Pyknolepsinum*; *Simatin*; *Suxilep*; *Suxinutin*; *Zarondan*; *Zarontin*.



Chemical Properties A white powder or waxy solid. Mp 46° to 52°. Soluble 1 in 4.5 of water and 1 in less than 1 of ethanol, chloroform and ether. pK_a 9.5 (20°). Log *P* (octanol/water), 0.4. Extraction yield (chlorobutane), 0.2 [Demme *et al.* 2005].

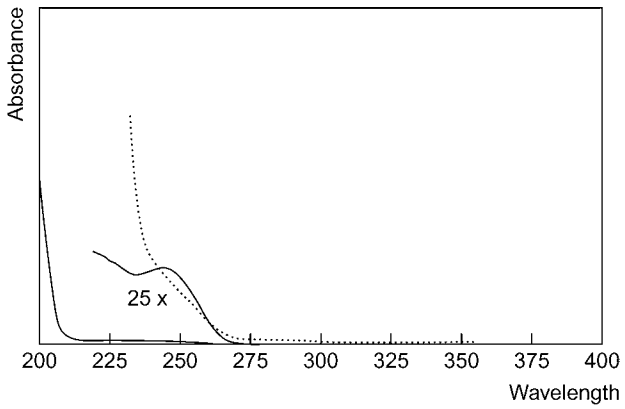
Colour Test Koppanyi–Zwikker test—violet.

Thin-layer Chromatography System TA—R_f 0.70; system TB—R_f 0.05; system TD—R_f 0.50; system TE—R_f 0.66; system TF—R_f 0.53; system TAD—R_f 0.59; system TAE—R_f 0.84.

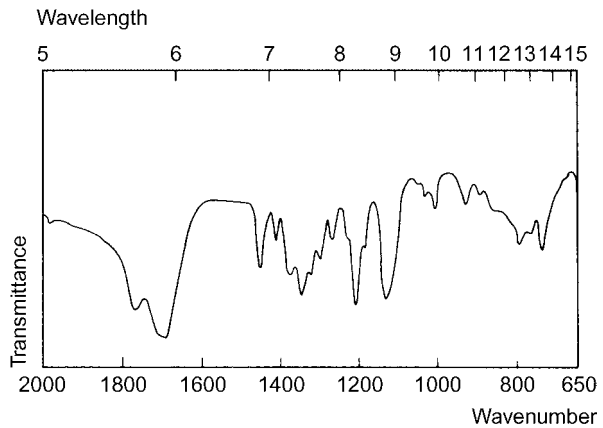
Gas Chromatography System GA—ethosuximide RI 1205, M (3-OH-) RI 1322, M (OH-ethyl-) RI 1370, M (oxo-) RI 1270; system GB—ethosuximide RI 1258, M (OH-ethyl-) RI 1436, M (3-OH-) RI 1395; system GE—ethosuximide RRT 0.18 (relative to phenytoin); system GAJ—ethosuximide RRT 0.453 (relative to methylphenobarbital).

High Performance Liquid Chromatography System HE—*k* 0.91; system HX—RI 301; system HY—RI 276; system HZ—retention time 2.3 min; System HAA—retention time 10.5 min.

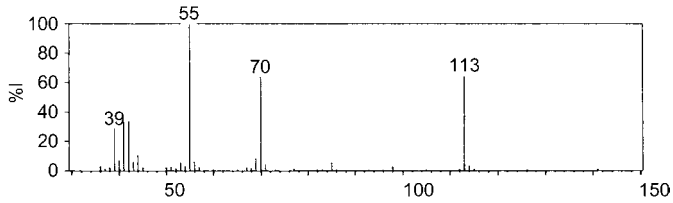
Ultraviolet Spectrum Aqueous acid—244 nm (A_1^1=9.9b).



Infrared Spectrum Principal peaks at wavenumbers 1700, 1777, 1208, 1130, 1303, 730 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 113, 70, 55, 42, 41, 39, 85, 69; M (OH-ethyl-) 113, 85, 98, 69, 71, 142; M (3-OH-) 71, 86, 129, 139, 142, 157; M (oxo-) 70, 155, 55, 113, 69, 98.



Quantification

Blood **GC–MS** For method for quantification of ethosuximide and other antiepileptic drugs, see Speed *et al.* [2000].

Plasma **GC** ECD. Limit of detection, 500 µg/L [Wallace *et al.* 1979]. FID. Limit of detection, 2.5 mg/L, ethosuximide and phensuximide [van der Kleijn *et al.* 1973].

GC–MS Limit of detection, <2.5 mg/L, ethosuximide enantiomers [Sghendo *et al.* 2002].

HPLC Limit of detection, about 0.9 µmol/L [Chen *et al.* 1999]. UV detection. For method for quantification of ethosuximide and other antiepileptic drugs, see Matar *et al.* [1999]. UV detection. Limit of detection, about 2 mg/L, ethosuximide and other anticonvulsants [Christofides, Fry 1980].

Serum **GC** See Plasma [Wallace *et al.* 1979].

HPLC See Plasma [Christofides, Fry 1980]. UV detection. Limit of detection, 1 mg/L, ethosuximide and other anticonvulsants [Kabra *et al.* 1978].

Urine **GC** See Plasma [van der Kleijn *et al.* 1973].

GC–MS See Plasma [Sghendo *et al.* 2002].

Liver **GC–MS** See Blood [Speed *et al.* 2000].

Disposition in the Body Readily absorbed after oral administration. Metabolised by hydroxylation to 3-hydroxyethosuximide and 1-hydroxyethylethosuximide; the latter is further oxidised to produce 2-acetyl-2-methylsuccinimide; an additional metabolite, 2-carboxymethyl-2-methylsuccinimide has also been reported. None of the metabolites is pharmacologically active. About 25% of a dose is excreted in the urine in 24 h as 1-hydroxyethylethosuximide glucuronide and about 14% as the unconjugated metabolite. Up to about 20% of a dose is excreted as unchanged drug in the urine over a 9 day period.

Therapeutic Concentration In plasma, usually in the range 40 to 100 mg/L.

After a single oral dose of 500 mg to 5 children, peak plasma concentrations of 28 to 51 mg/L (mean 39) were attained in 3 to 7 h [Buchanan *et al.* 1969].

Steady-state serum concentrations of 31 to 68 mg/L (mean 49) were reported in 5 young adults receiving daily oral doses of 1 g [Solow, Green 1971].

Toxicity The estimated minimum lethal dose is 5 g. Toxic effects may be observed at plasma concentrations greater than about 100 mg/L.

In a fatality involving ethosuximide, the following postmortem tissue concentrations were reported: blood 250 mg/L, liver 280 µg/g, urine 120 mg/L; phenobarbital was also detected [Rousseau *et al.* 1980].

Half-life Plasma half-life, 40 to 60 h in adults and about 30 h in children.

Volume of Distribution About 0.7 L/kg.

Saliva Plasma : saliva ratio, about 1.1.

Protein Binding Not significantly bound.

Dose 0.5 to 2 g daily.

Ethotoin

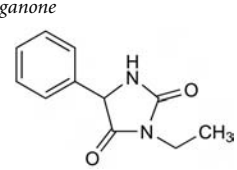
Anticonvulsant

$C_{11}H_{12}N_2O_2$ = 204.2

CAS—86-35-1

IUPAC Name 3-Ethyl-5-phenyl-2,4-imidazolidinedione

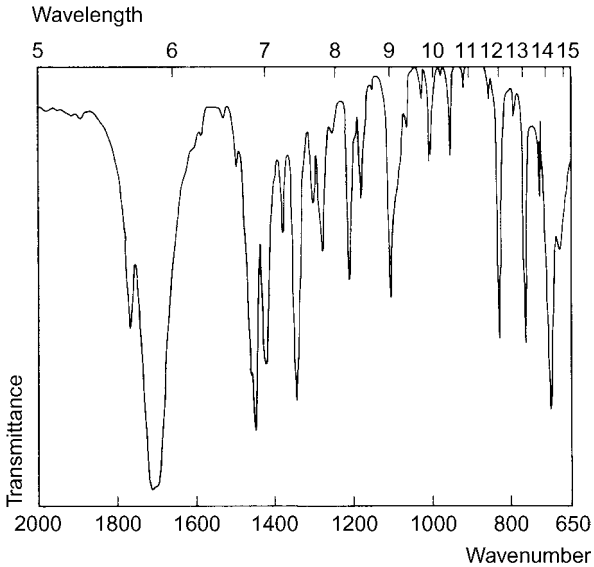
Proprietary Name *Peganone*



Chemical Properties A white crystalline powder. Mp about 90°. Sparingly soluble in cold water, more soluble in hot water; soluble 1 in 4 of dehydrated alcohol, 1 in 1.5 of chloroform and 1 in 25 of ether; freely soluble in benzene and dilute aqueous solutions of alkali hydroxides. pK_a 8.5. Log *P* (octanol/water), 1.0.

Thin-layer Chromatography System TA—R_f 0.88; system TD—R_f 0.53; system TE—R_f 0.71; system TF—R_f 0.54; system TAD—R_f 0.60; system TAJ—R_f 0.61; system TAK—R_f 0.66; system TAL—R_f 0.91.

Gas Chromatography System GA—RI 1800; system GB—RI 1751; system GE—RRT 0.57(relative to phenytoin); system GAJ—RRT 0.940(relative to methylphenobarbital).
High Performance Liquid Chromatography System HE—*k* 2.81.
Ultraviolet Spectrum Dehydrated alcohol—259 (A^{1}_{1}=11b), 265 nm (A^{1}_{1}=8b).
Infrared Spectrum Principal peaks at wavenumbers 1716, 700, 760, 820, 1780, 1100 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 104, 105, 204, 77, 78, 133, 51, 132.
Quantification
Serum **GC** FID. Limit of detection, 1 mg/L [Larsen, Naestoft 1974].
Urine **GC–MS** Limit of detection, 5 mg/L, ethotoin and some metabolites [Naestoft, Larsen 1977].
Disposition in the Body Readily absorbed after oral administration. Extensively metabolised by *N*-desethylation and ring cleavage, 5-hydroxylation and *p*-hydroxylation of the phenyl ring. During chronic therapy, <5% of the dose is excreted in the urine in 24 h as unchanged drug, together with 5 to 14% of the dose as desethylethotoin, 17 to 35% as 5-hydroxyethotoin, 14 to 32% as conjugated *p*-hydroxyethotoin and small amounts of other phenyl-substituted oxidation products. 2-Phenylhydantoic acid may account for about 10% of the dose.
Therapeutic Concentration In plasma, usually in the range 6 to 20 mg/L.
Following single oral doses of 500, 1500 and 2500 mg to 5 subjects, peak plasma concentrations of 9 to 15 mg/L (mean 12), 30 to 59 mg/L (mean 42) and 37 to 75 mg/L (mean 54), respectively, were attained in about 1.5, 3.5 and 3.5 h [Meyer *et al.* 1983].
During daily oral dosing with 30 mg/kg to 7 subjects, minimum steady-state plasma concentrations of 4.5 to 14 mg/L (mean 10) were reported; following daily oral treatment with 60 mg/kg to 6 subjects, minimum steady-state plasma concentrations of 14 to 50 mg/L (mean 30) were reported [Sjö *et al.* 1975].
Toxicity The estimated minimum lethal dose is 5 g.
Half-life Plasma half-life, 3 to 11 h (dose-dependent).
Dose Initially 1 g daily, increasing to 2 to 3 g daily.

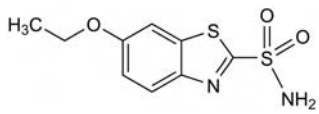
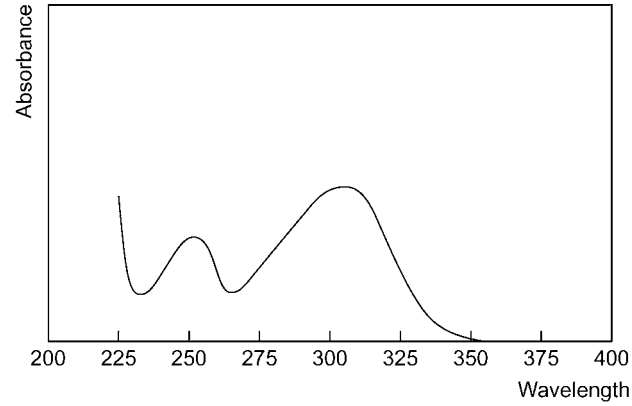
Ethoxzolamide

Carbonic Anhydrase Inhibitor, Diuretic
$C_9H_{10}N_2O_3S_2$ = 258.3
CAS—452-35-7
IUPAC Name 6-Ethoxy-2-benzothiazolesulfonamide
Synonym Ethoxyzolamide
Proprietary Names *Cardrase*; *Ethamide*; *Glaucotensil*; *Redupresin*.



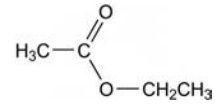
Chemical Properties A white or slightly yellow crystalline powder. Mp 189° to 195°. Practically insoluble in water; slightly soluble in ethanol, chloroform and ether. pK_a 8.1. Log *P* (octanol/pH 7.4), 2.2.
Colour Tests Koppanyi–Zwikker test—violet; Liebermann's reagent—yellow; Marquis test—yellow.
Thin-layer Chromatography System TA—R_f 0.76; system TD—R_f 0.43; system TE—R_f 0.43; system TF—R_f 0.65; system TAD—R_f 0.51; system TAJ—R_f 0.51; system TAK—R_f 0.48; system TAL—R_f 0.91 (Marquis reagent, positive).
Gas Chromatography System GA—RI 2578.
Ultraviolet Spectrum Aqueous acid—253, 304 nm (A^{1}_{1}=96a).



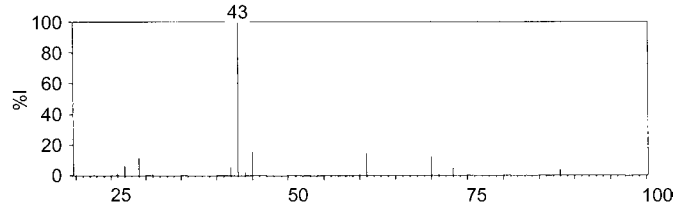
Infrared Spectrum Principal peaks at wavenumbers 1170, 1490, 1263, 824, 1224, 1036 cm^{-1} (KBr disk).
Dose In the treatment of glaucoma, 250 to 500 mg daily.

Ethyl Acetate

Flavouring Agent, Solvent
$C_4H_8O_2$ = 88.10
CAS—141-78-6
Synonym Acetic ether

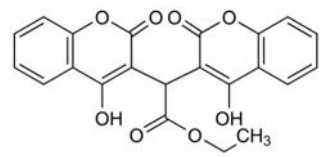


Chemical Properties A colourless flammable liquid. Sp. gr. 0.894 to 0.898. Bp 77°. Soluble 1 in 15 of water; miscible with acetone, ethanol, chloroform and ether. Log *P* (octanol/water), 0.7.
Gas Chromatography System GA—RI 596; system GI—retention time 9.4 min.
Mass Spectrum Principal ions at *m/z* 43, 61, 45, 70, 29, 27, 73, 42.



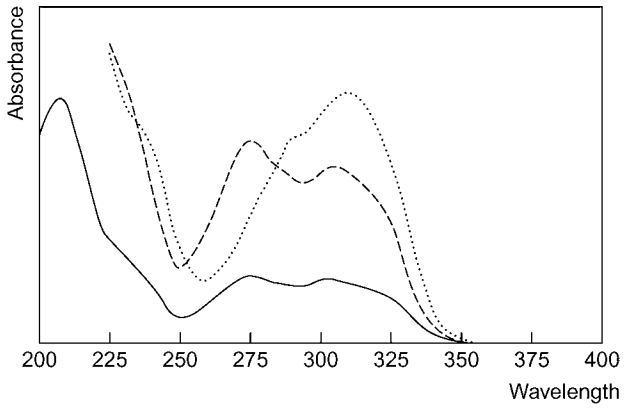
Ethyl Biscoumacetate

Anticoagulant
$C_{22}H_{16}O_8$ = 408.4
CAS—548-00-5
IUPAC Name Ethyl 2,2-bis(2-hydroxy-4-oxochromen-3-yl)acetate
Synonyms Aethylis biscoumacetas; BOEA; ethyldicoumarol; ethyl-4-hydroxy-α-(4-hydroxy-2-oxo-2*H*-1-benzopyran-3-yl)-2-oxo-2*H*-1-benzopyran-3-acetate; neodicumarinum.
Proprietary Names *Pelentan*; *Stabilène*; *Tromexan*.

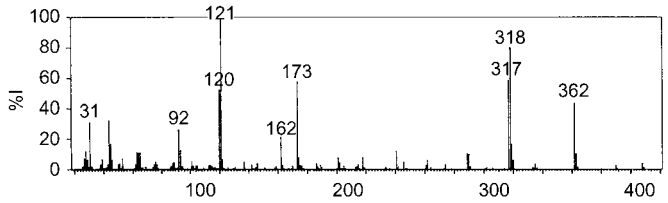


Chemical Properties A white to yellowish-white, fine crystalline powder. There are two forms, one melts at 154° to 157° and the other at 177° to 182°. Practically insoluble in water; soluble 1 in 20 of acetone; slightly soluble in alcohol and ether; soluble in chloroform. pK_a 3.1. Log *P* (octanol/water), 1.9.

Colour Test Sulfuric acid—orange-yellow.
Thin-layer Chromatography System TD—R_f 0.04; system TE—R_f 0.24; system TF—R_f 0.32; system TAD—R_f 0.21 (acidified potassium permanganate solution, positive).
Ultraviolet Spectrum Water—275 (A^1_1=449b), 303 nm; aqueous alkali—311 nm (A^1_1=622b).



Infrared Spectrum Principal peaks at wavenumbers 1653, 1600, 768, 1560, 754, 1730 cm^{-1}.
Mass Spectrum Principal ions at *m/z* 121, 318, 317, 173, 120, 362, 44, 31.



Quantification
Plasma **HPLC** UV detection. Limit of detection, 100 µg/L [Arman, Jamali 1983].
Serum **HPLC–MS** For method for quantification of ethyl biscoumacetate and its metabolite 7-hydroxyethyl bicoumacetate, see Pospisil *et al.* [1992].
Disposition in the Body Readily absorbed after oral administration and extensively metabolised. About 5 to 15% of a dose is excreted in the urine as hydroxyethyl biscoumacetate and only traces are excreted unchanged.
Therapeutic Concentration
Following a single oral dose of 300 mg to 4 subjects, peak plasma concentrations of 10.2 to 12.4 mg/L (mean 11.2) were attained in 1 to 1.5 h [Arman, Jamali 1983].
After a single 300 mg oral dose of ethyl biscoumacetate to 10 subjects, peak plasma concentrations of 4.46 mg/L were reached in 1.62 h; equivalent values for the main metabolite, 7-hydroxyethyl biscoumacetate, were 12.74 mg/L in 3.29 h [Perlik, Patzelova 1994].
Half-life Plasma half-life, about 1 to 2 h.
Protein Binding About 90%.
Dose Maintenance, 300 to 600 mg daily.

Arman M, Jamali F (1983). High-performance liquid chromatographic determination of ethyl biscoumacetate in human plasma. *J Chromatogr Biomed Appl* 272: 406–410.

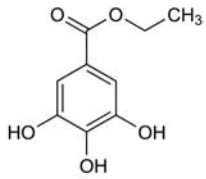
Ethyl Gallate

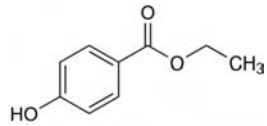
Antioxidant
$C_9H_{10}O_5$ = 198.2
CAS—831-61-8
IUPAC Name Ethyl-3,4,5-trihydroxybenzoate
Proprietary Name *Progallin A*



Chemical Properties A white to creamy-white crystalline powder. Mp 151° to 154°. Soluble 1 in 500 of water, 1 in 3 of ethanol, 1 in 3 of ether and 1 in 3 of propylene glycol. Log *P* (octanol/water), 1.3.
Colour Test Ferric chloride—violet-black→blue-black.
Ultraviolet Spectrum Methanol—275 nm (A^1_1=540b).

Ethyl Hydroxybenzoate

Preservative
$C_9H_{10}O_3$ = 166.2
CAS—120-47-8
IUPAC Name Ethyl-4-hydroxybenzoate
Synonyms Aethylum hydroxybenzoicum; ethylis paraoxybenzoas; ethylparaben.
Proprietary Names *Nipagin A*; *Solbrol A*.



Chemical Properties Colourless crystals or white crystalline powder. Mp 116°. Soluble 1 in 1500 of water, 1 in 2 of ethanol, 1 in 1.2 of acetone, 1 in 10 of chloroform and 1 in 3.5 of ether. pK_a 8.3 (25°). Log *P* (octanol/water), 2.5.

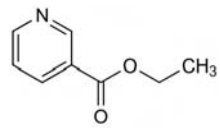
Sodium Ethyl Hydroxybenzoate

$C_9H_9NaO_3$ = 188.2
CAS—35285-68-8
Proprietary Name *Nipagin A Sodium*
Chemical Properties A white hygroscopic crystalline powder. Soluble 1 in 2 of water and 1 in 3 of ethanol (50%).

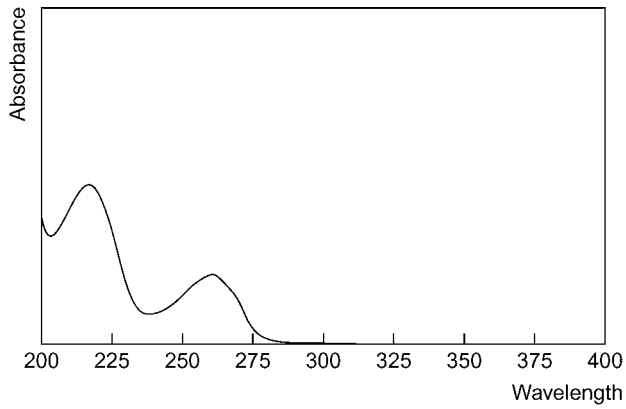
Colour Test Millon's reagent—red.
Thin-layer Chromatography System TD—R_f 0.64; system TE—R_f 0.46; system TF—R_f 0.66; system TAD—R_f 0.57; system TAE—R_f 0.88.
Gas Chromatography System GA—RI 1580.
Ultraviolet Spectrum Aqueous acid—254 nm (A^1_1=956b); aqueous alkali—295 nm (A^1_1=1390b).
Infrared Spectrum Principal peaks at wavenumbers 1290, 1673, 1170, 1240, 1610, 1590 cm^{-1} (KBr disk).

Ethyl Nicotinate

Vasodilator (Topical)
$C_8H_9NO_2$ = 151.2
CAS—614-18-6
IUPAC Name Ethyl pyridine-3-carboxylate
Proprietary Names It is an ingredient of *PR Heat Spray*, *Thermal*, *Thermocutan*, *Transvane* and *Transvasin*.



Chemical Properties A liquid. Mp 8° to 9°. Bp 225°. Very soluble in water, ethanol and ether. pK_a 3.4 (20°). Log *P* (octanol/water), 1.3.
Thin-layer Chromatography System TA—R_f 0.00 (acidified potassium permanganate solution, positive).
Ultraviolet Spectrum Aqueous acid—261 nm (A^1_1=341a).

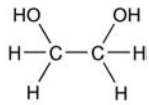


Infrared Spectrum Principal peaks at wavenumbers 1286, 1724, 1110, 740, 1591, 1025 cm^{-1} (KBr disk).
Use Topically in concentrations of 1 to 2%.

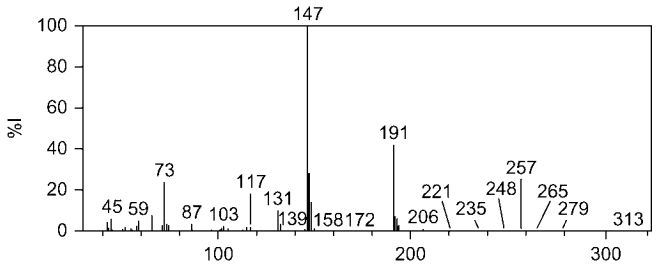
Ethylene Glycol

Antifreeze, Solvent
$C_2H_6O_2 = 62.07$
CAS—107-21-1

IUPAC Name Ethane-1,2-diol
Synonyms 1,2-Ethanediol; ethylene alcohol; glycol.



Chemical Properties A colourless, hygroscopic, syrupy liquid. Weight per volume ~1.114 g/mL. Fp ~-13°. Bp ~197°. Miscible with water, glycerol, acetic acid, ethanol and acetone; slightly soluble in ether; practically insoluble in benzene. pK_a 15.0. Log *P* (octanol/water), −1.4.
Gas Chromatography System GA—RI 798; system GI—RT 17.0 min (tailing peak).
Mass Spectrum Principal ions at *m/z* 147, 191, 73, 131, 45, 59, 87, 117.



Quantification

Blood **GC** Column: Chrompack CP Wax 57-CB (25 m × 0.32 mm i.d., 0.2 µm). Carrier gas: He, 3.0 mL/min. Temperature programme: 110° to 130° at 6°/min for 0.5 min to 250° at 30°/min for 2 min. FID. Limit of detection, 0.05 g/L [Jonsson *et al.* 1989].

GC-MS Column: 5% diphenylpolysiloxane, 95% dimethyl polysiloxane Rxi-5 ms (15 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 80° for 1 min to 125° at 25°/min to 160° at 5°/min to 220° at 25°/min. EI ionisation. Limit of detection, 25 mg/L for ethylene glycol and glycolic acid [Rosano *et al.* 2009]. Column: DB-5MS 5% phenylsiloxane, 95% methylsiloxane (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min Temperature programme: 80° for 1 min to 140° at 5°/min to 240° at 40°/min for 5 min. EI ionisation, scan mode. Limit of quantification, 1.3 mg/L, limit of detection, 0.7 mg/L [Gembus *et al.* 2002].

Plasma **GC** Column: Porapak Q 50/80 mesh (1.8 m × 4 mm i.d.). Carrier gas: N_2, 40 mL/min. Temperature programme: 100° to 210° at 2°/min. Limit of detection, 0.4 µmol/L [Cheung, Lin 1987]. Column: 3% OV-25 on 100/200 mesh Chromasorb W (1.8 m × 2 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature: 70°. FID. Retention time: 1.8 min. Limit of detection, 50 mg/L [Robinson, Reive 1981].

GC-MS Column: HP-5MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 36 cm/min. Temperature programme: 50° for 1 min to 100° at 10°/min to 230° at 40°/min. EI ionisation, SIM acquisition mode. Limit of quantification, 0.39 mg/L, limit of detection, 0.12 mg/L, for ethylene glycol [Van Hee *et al.* 2004]. Column: HP capillary (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 3 min to 200° at 10°/min. EI ionisation at 70 eV. Limit of quantification, 0.1 g/L, limit of detection, 0.01 g/L [Maurer, Kessler 1988; Maurer *et al.* 2001].

Serum **Spectrofluorimetry** Limit of detection, 50 mg/L [Meola *et al.* 1980].

GC Column: Rtx-200 capillary (30 m × 0.53 mm i.d., 3 µm). Carrier gas: he, 80.1 mL/min. Temperature programme: 40° for 1 min to 260° at 70°/min. FID. Retention time: 2.59 min. Limit of detection, 10 mg/L [Williams *et al.* 2000]. Column 1: Packed column (1.8 m × 2 mm) packed with 80/100 HayeSep R. Limit of detection, 2 mmol/L. Column 2: wide-bore capillary Rtx-200 (Restek) (30 m × 0.53 mm i.d., 3 µm). Carrier gas: N_2, 45 mL/min. Temperature programme: 90° to 205° at 10°/min for 2 min. Limit of detection, 0.1 mmol/L [Livesey *et al.* 1995].

GC-MS See Plasma [Van Hee *et al.* 2004]. See Blood [Gembus *et al.* 2002]. Column: Ultra-2 (25 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 0.9 mL/min. Temperature programme: 80° for 0.5 min to 225° at 25°/min. SIM acquisition mode. Limit of quantification, 10 mg/L for ethylene glycol and glycolic acid [Porter *et al.* 1999].

Urine **GC-MS** See Plasma [Van Hee *et al.* 2004].

Note For a review of assay methods see Doedens [1983].

Disposition in the Body Ethylene glycol is metabolised initially to glycoaldehyde and subsequently to lactic acid and oxalic acid. Calcium oxalate crystals are deposited in the kidneys and some oxalate may be excreted in the urine together with unchanged ethylene glycol.

Toxicity Ethylene glycol itself is probably non-toxic and the serious toxic effects are caused by the metabolites. In adults, the minimum lethal dose is ~100 mL, although survival has been reported after ingestion of 250 mL. Toxic effects are usually associated with plasma concentrations greater than 500 mg/L. The maximum permissible atmospheric concentration of ethylene glycol vapour is 100 ppm.

A 51-year-old man ingested 600 mL of antifreeze solution but recovered after treatment. A blood concentration of 6500 mg/L ethylene glycol was reported 2.5 h after ingestion; pharmacokinetic studies indicated that the volume of distribution of ethylene glycol was ~0.8 L/kg and the plasma half-life was ~3 h [Peterson *et al.* 1981].

A 36-year-old man was admitted to hospital 6 h after ingesting 500 mL of an antifreeze mixture containing ethylene glycol and methanol; initial serum concentrations were 1900 mg/L for ethylene glycol and 1130 mg/L for methanol; the subject recovered after treatment with ethanol and haemodialysis [Vites *et al.* 1984].

A 27-year-old man ingested 2.25 L of Prestone antifreeze in a suicide attempt. His serum ethylene glycol concentration was 995 mg/L [Eder *et al.* 1998].

A 58-year-old man ingested ~56 mL of half-strength antifreeze. His serum ethylene glycol concentration was 7.91 g/L on admission [Eder *et al.* 1998].

The plasma ethylene glycol concentration in a 36-year-old man who ingested ~3 L of ethylene glycol antifreeze in a suicide attempt was 18.89 g/L. Despite this very high level, the man survived after haemodialysis and ethanol infusion [Johnson *et al.* 1999].

Five hours after ingesting an unknown amount of ethylene glycol, the plasma concentration in a 23-year-old man was 1162 mg/L. The man died 27 h after ingestion. Just before death, the plasma ethylene glycol concentration was 359 mg/L and concentrations in postmortem tissue homogenates 70 h after death were: right and left kidney 227.6 and 258.5 mg/L, respectively; right and left lung 310 and 281.7 mg/L, respectively; heart 57.6 mg/L; liver 299.8 mg/L; spleen 310 mg/L; brain 134.5 mg/L; gastric contents 859.2 mg/L; bile 785.6 mg/L; pleural fluid 700.7 mg/L; and pancreas not detected [Hantson *et al.* 2002].

In a fatal case of ethylene glycol poisoning, in which it was estimated that the subject consumed 1034 g, the concentrations in blood, urine and vitreous humour were 23.4, 22.61 and 10.28 g/L, respectively [Garg *et al.* 2009].

In 12 fatalities involving ethylene glycol poisoning, levels in postmortem blood ranged from 58–7790 mg/L (mean, 1830). Glycolic acid levels were 810–1770 mg/L (mean, 1360) [Rosano *et al.* 2009].

For other cases of ethylene glycol poisoning, see Jorens [2009] and Lovric *et al.* [2007]. For a review of ethylene glycol poisoning, see Leth, Gregersen [2005]; for review of the management of ethylene glycol poisoning, see Brent [2001] and Scalley *et al.* [2002]. Ethylenediamine Hydrate

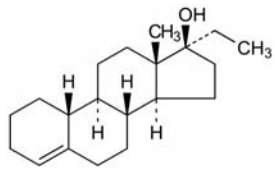
Pharmaceutical Adjuvant
$C_2H_8N_2,H_2O = 78.1$
CAS—107-15-3 (anhydrous); 6780-13-8 (monohydrate)

Chemical Properties A clear, colourless or slightly yellow, strongly alkaline liquid. It is hygroscopic and absorbs carbon dioxide from the air. It solidifies on cooling to a crystalline mass (Mp 10°). Mass per mL about 0.96 g. Bp about 120°. Miscible with water and ethanol; soluble 1 in 130 of chloroform; slightly soluble in ether. pK_a 7.2, 10.0 (20°). Log *P* (octanol/water), −2.0 (anhydrous).
Caution It is irritant to the skin and mucous membranes.
Colour Test Dissolve 1 mL in 5 mL of water and to 3 drops of this solution add 2 mL of a 1% solution of copper sulfate and shake—violet-blue.
Mass Spectrum Principal ions at *m/z* 30, 42, 43, 27, 44, 29, 31, 41.
Quantification
Plasma **HPLC** UV detection. Limit of detection, 50 µg/L [Cotgreave, Caldwell 1983].
Urine **HPLC** For method, see Cotgreave and Caldwell [1983].
Disposition in the Body Absorbed after oral administration and rapidly metabolised.
Toxicity The maximum permissible atmospheric concentration is 10 ppm.
Half-life Plasma half-life, about 0.5 to 1 h.
Use Ethylenediamine hydrate is used in the manufacture of aminophylline and in the preparation of aminophylline injections.

Cotgreave IA, Caldwell J (1983). Studies on aminophylline disposition I. A rapid and sensitive HPLC assay for ethylenediamine in plasma and urine. *Drug Dispos* 4(1): 53–62.

Ethylestrenol

Anabolic Steroid
$C_{20}H_{32}O = 288.5$
CAS—965-90-2
IUPAC Name (8*R*,9*S*,10*R*,13*S*,14*S*,17*S*)-17-Ethyl-13-methyl-2,3,6,7,8,9,10,11,12,14,15,16-dodecahydro-1*H*-cyclopenta[*a*]phenanthren-17-ol
Synonyms Ethyloestrenol; (17α)-19-norpregn-4-en-17-ol.
Proprietary Names *Durabolin-O*; *Maxibolin*; *Orabolin*; *Orgabolin*; *Orgaboral*.



Chemical Properties A white crystalline powder. Mp 76° to 78°. Practically insoluble in water; soluble 1 in 9 of ethanol, 1 in 2 of chloroform and 1 in 6 of ether. Log *P* (octanol/water), 5.5.
Thin-layer Chromatography System TP—R_f 0.79; system TQ—R_f 0.50; system TR—R_f 0.94; system TS—R_f 0.99.
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.
Infrared Spectrum Principal peaks at wavenumbers 975, 994, 964, 1299, 1142, 1165 cm^{-1} (Nujol mull).
Dose Usually 2 to 4 mg daily.

Ethylisobutrazine

Tranquilliser
$C_{20}H_{26}N_2S = 326.5$
IUPAC Name 3-(2-Ethylphenothiazin-10-yl)-*N*,*N*,2-trimethylpropan-1-amine
Synonyms Ethotrimeprazine; 2-ethyl-10-(3-dimethylamino-2-methylpropyl)-phenothiazine; ethymemazine; RP 6484.
Proprietary Name *Diquel*
Chemical Properties A white crystalline powder. Ethylisobutrazine is extracted by organic solvents from aqueous alkaline solutions.

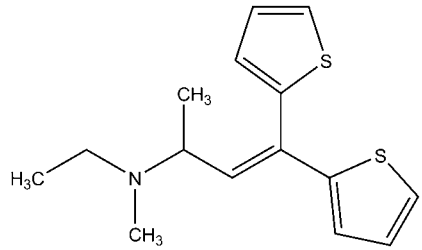
Ethylisobutrazine Hydrochloride

Proprietary Names *Nuital*; *Sergetyl*.
Chemical Properties Mp 160° to 163°. Soluble in water, ethanol, chloroform, methanol and acetone; practically insoluble in ether.

Colour Tests Ammonium molybate test—deep purple (limit of detection, 0.25 µg); ammonium vanadate test—green; sulfuric acid test—purple (limit of detection, 0.25 µg); sulfuric acid-formaldehyde test—purple (limit of detection, 0.25 µg).
Thin-layer Chromatography System T1—R_f 0.60 (location reagent acidified iodoplatinate spray, positive reaction).
Ultraviolet Spectrum 0.1 N sulfuric acid—maxima at 251 nm (E1%, 1 cm 760) and 300 nm (E1%, 1 cm 115); minima at 222 nm and 275 nm.
Dose Up to 40 mg daily.

Ethylmethylthiambutene

Narcotic
$C_{15}H_{19}NS_2 = 277.5$
CAS—441-61-2
IUPAC Name *N*-Ethyl-*N*-methyl-4,4-di(thiophen-2-yl)but-3-en-2-amine
Synonyms 1C50; emethibutin; ethylmethiambutene; *N*-ethyl-*N*,1-dimethyl-3,3-di-2-thienylallylamine; *N*-ethyl-*N*,1-dimethyl-3,3-di-2-thienyl-2-propenamine; 3-ethylmethylamino-1,1-di(2′-thienyl)but-1-ene; *N*-ethyl-*N*-methyl-4,4-di-2-thienyl-3-buten-2-amine; NIH-5145.



Chemical Properties Practically insoluble in water (61.7 mg/L). Log *P* (octanol/water) 4.02 [Meylan, Howard 1995]. Extracted by organic solvents aqueous alkaline solutions.

Ethylmethylthiambutene Hydrochloride

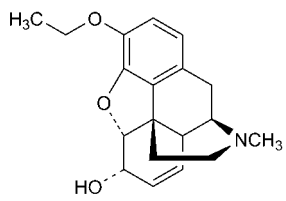
$C_{15}H_{19}NS_2,HCl = 314$
Chemical Properties Crystals. Mp 137° to 138°.

Colour Tests Ammonium molybdate test—orange-brown→pale green (limit of detection, 0.1 µg); ammonium vanadate test—green→greenish-blue (limit of detection, 0.1 µg); sulfuric acid–formaldehyde test—purple-brown (limit of detection, 0.1 µg); Vitali's test—red→green/brown/brown.
Thin-layer Chromatography System T1—R_f 0.58 (location reagent acidified iodoplatinate spray, positive reaction).
Gas Chromatography System G2/225—retention time 1.30 relative to diphenhydramine; system G4—retention time 0.80 relative to diphenhydramine.
Ultraviolet Spectrum Aqueous acid (0.1 N sulfuric acid)—268, 285, 226 nm.

Meylan WM, Howard PH (1995). Atom/fragment contribution method for estimating octanol-water partition coefficients. *J Pharm Sci* 84: 83–92.

Ethylmorphine

Narcotic Analgesic
$C_{19}H_{23}NO_3 = 313.4$
CAS—76-58-4
Synonym 7,8-Didehydro-4,5-epoxy-3-ethoxy-17-methylmorphinan-6-ol



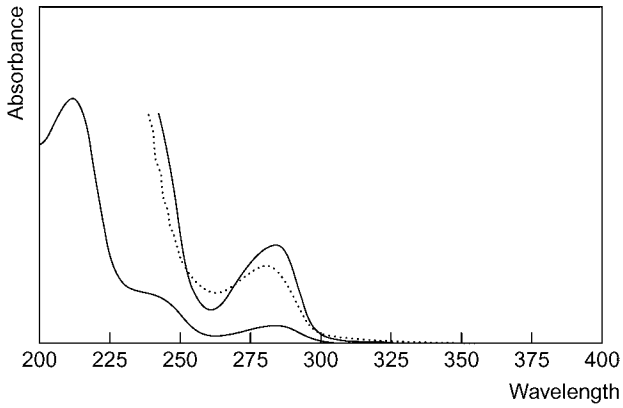
Chemical Properties Crystals. Mp 199° to 201°. pK_a 8.2 (20°) [Baselt 2008]. Log *P* (octanol/water), 1.77 [Meylan, Howard 1995].

Ethylmorphine Hydrochloride

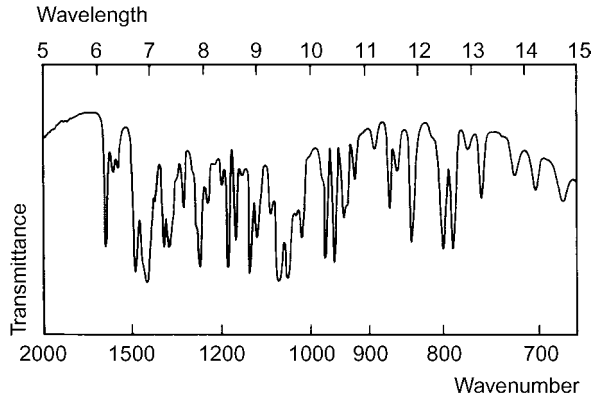
$C_{19}H_{23}NO_3,HCl,\ 2H_2O = 385.9$
CAS—125-30-4 (anhydrous); 6746-59-4 (dihydrate)
Synonym Chlorhydrate de Codéthyline
Proprietary Name It is an ingredient of *Natirose*.
Chemical Properties White crystalline powder. Mp ≈123°, with decomposition. Soluble 1 in 10 of water, 1 in 25 of ethanol, 1 in 1 of warm ethanol, and 1 in 250 of chloroform; slightly soluble in ether.

Colour Test Marquis test—yellow→violet→black.
Thin-layer Chromatography System TA—R_f 0.40; system TAE—R_f 0.21; system TAF—R_f 0.26; system TL—R_f 0.06; system TB—R_f 0.07; system TC—R_f 0.22; system TE—R_f 0.36 (Dragendorff spray, positive acidified iodoplatinate solution, positive; Marquis reagent, blue-violet).
Gas Chromatography System GA—ethylmorphine RI 2420, ethylmorphine-AC RI 2530, ethylmorphine-PFP RI 2430, ethylmorphine-TFA RI 2320, ethylmorphine-TMS RI 2540, M (nor-)-AC_2 RI 2930.
High Performance Liquid Chromatography System HA—*k* 3.7 (tailing peak); system HC—*k* 1.06; system H—*k* 1.45; system HX—RI 291; system HY—RI 244.

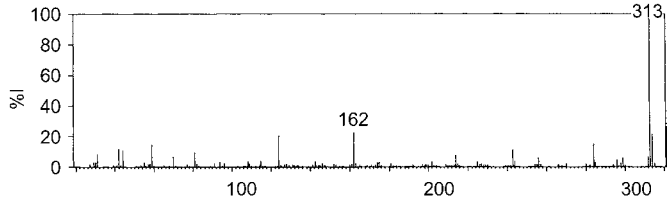
Ultraviolet Spectrum Aqueous acid—284 nm ($A_1^1 = 48a$); aqueous alkali—281 nm.



Infrared Spectrum Principal peaks at wavenumbers 1064, 1045, 1129, 1499, 1185, 1264 cm^{-1} (Ethylmorphine hydrochloride, Nujol mull).



Mass Spectrum Principal ions at *m/z* 313, 162, 314, 124, 284, 59, 42, 243; ethylmorphine-AC *m/z*355, 296, 327, 234, 268, 204; ethylmorphine-PFP *m/z* 296, 459, 280, 266, 402, 430; ehtylmorphine-TFA *m/z*296, 409, 380, 280, 352, 266; ethylmorphine-TMS *m/z*385, 192, 146, 196, 234, 357; M (nor-)-AC_2 *m/z*87, 209, 237, 383, 341, 181.



Quantification

Blood **GC** Column. CP-Sil 8 Chrompak (25 m × 0.32 mm i.d., 0.61 µm). Carrier gas: He, 0.8 bar. Temperature programme: 220° for 2 min to 260° at 5°/min for 2 min to 300° at 10°/min for 14 min. NPD. Retention time: 13.3 min. Limit of detection, 0.5 mg/L [Demedts *et al.* 1983].

GC-MS Column: HP-5 (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 0.7 mL/min. Temperature programme: 150° for 1 min to 220° at 30°/min to 320° at 10°/min for 1 min. EI ionisation, SIM acquisition mode. Retention time: 10.7 min. Limit of quantification, 0.01 mg/L [Mykkänen *et al.* 2000]. Column: Restek RTX-5MS (30 m × 0.25 mm i.d., 0.25 µm). Carier gas: He, 10 psi. Temperature programme: 85° for 1 min to 220° at 30°/min to 260° at 3°/min to 275° at 15°/min for 5 min. EI ionisation. Relative retention time: 0.877. Limit of detection not reported [Balíková, Maresová 1998]. Column: BP 5 SGE capillary (12 m × 0.22 mm i.d.). Carrier gas: He, 1.8 mL/min. Temperature programme: 60° to 310° at 30°/min for 2 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection not reported [Kintz *et al.* 1994]. Column: HP Ultra 1 cross-linked methylsilicone capillary (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 2 mL/min. Temperature programme: 120° for 30 s to 220° at 40°/min to 244° at 4°/min to 300° at 40°/min for 3.5 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, 0.05 µmol/L [Krogh *et al.* 1993]. Column: Bond Elut C_{18} methylsilicon (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 1.4 mL/min. Temperature programme: 120° for 0.5 min to 230° at 25°/min to 270 at 12°/min to 320° at 25°/min. EI ionisation at 70 eV, SIM acquisition mode. Retention time: 6.7 min. Limit of detection, 0.025 µmol/L [Gjerde *et al.* 1991].

Plasma **GC-MS** See Blood [Krogh *et al.* 1993].

GC Column: BP 10 SGE (25 m × 0.22 mm i.d.). Carrier gas: He, 3.2 mL/min. Temperature: 240°. NPD. Retention time: 10.67 min. Limit of detection, 9.0 µg/L [Kintz *et al.* 1989].

Urine **GC** See Plasma [Kintz *et al.* 1989]. Column: HP cross-linked methylsilicone (12.5 m × m i.d., 0.33 µm). Carrier gas: He, 30 mL/min. Temperature programme: 120° for 0.5 min to 200° at 30°/min to 240° at 5°/min to 300° at 40°/min. NPD, EI ionisation at 70 eV, SIM acquisition mode. Relative retention time: 0.84. Limit of detection, 0.25 µmol/L [Christophersen *et al.* 1987].

GC-MS See Blood [Kintz *et al.* 1994].

HPLC Column: Chromolith Flash RP-18e (25 × 4.6 mm i.d.). Mobile phase: 10 to 40% methanol in an aqueous solution adjusted to pH 2.0 with trifluoroacetic acid over 6 min, flow rate 1 mL/min. FIA. Limit of detection, 3 nmol/L [Adcock *et al.* 2007].

LC-MS Column: Luna C_{18} (100 × 2.0 mm i.d., 3 µm). Mobile phase: 25 mmol/L formic acin containing 1% acetonitrile : 25 mmol/L formic acid containing 90% acetonitrile (100 : 0 to 77 : 23 in 5 min to 0 : 100 at 6 min to 100 : 0 for 7 min), flow rate 0.3 mL/min. ESI, positive ion mode, SRM acquisition mode. Limit of quantification, 126 µg/L, limit of detection, 38 µg/L [Gustavsson *et al.* 2007].

CE Column: fused silica capillary (80 cm × 50 µm i.d.). Running buffer: methanol: water: acetic acid (60 : 39 : 1), flow rate 3 µL/min. ESI, positive ion mode. Limit of detection not reported [Wey *et al.* 2000].

Bile **GC-MS** See Blood [Kintz *et al.* 1994].

Gastric Contents **GC** See Blood [Demedts *et al.* 1983].

GC-MS See Blood [Kintz *et al.* 1994].

Vitreous Humour **GC-MS** See Blood [Kintz *et al.* 1994].

Brain **GC-MS** See Blood [Kintz *et al.* 1994].

Hair **GC-MS** Column: BP-5 SGE 5% phenyl 95% methyl siloxane (12 m × 0.22 mm i.d.). Carrier gas: He, 1.8 mL/min. Temperature programme: 60° to 310° at 30°/min for 3 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, ≈0.1 to 0.8 µg/g [Kintz, Mangin 1995].

HPLC Column: C_{18} NBS (150 × 4.6 mm i.d., 3 µm). Mobile phase: 20 mmol/L monobasic sodium phosphate-acetonitrile (pH 7.0; 90 : 10) : 20 mmol/L monobasic sodium phosphate-acetonitrile (pH 7.0; 50 : 50, 93 : 7 for 11.5 min to 50 : 50 at 19.5 min for 5 min to 10 : 90 at 34.5 min), flow rate 0.8 mL/min. Electrochemical detection. Limit of detection, 201 pg [Achilli *et al.* 1996].

LC-MS Column: Zorbax phenyl (50 × 2.1 mm i.d.). Mobile phase: acetonitrile-methanol-20 mmol/L formate buffer (pH 3.0; 10 : 1080) : acetonitrile-methanol-20 mmol/L formate buffer (pH 3.0; 35 : 35 : 30; 100 : 0 to 35 : 65 from 0.5 to 7 min to 100 : 0 for 2 min), flow rate 0.25 mL/min. ESI, MRM acquisition mode. Limit of quantification, 13 ng/g, limit of detection, 4 ng/g [Kronstrand *et al.* 2004].

Heart **GC-MS** See Blood [Kintz *et al.* 1994].

Kidney **GC-MS** See Blood [Kintz *et al.* 1994].

Liver **GC** See Blood [Demedts *et al.* 1983].

GC-MS See Blood [Kintz *et al.* 1994].

Lung **GC-MS** See Blood [Kintz *et al.* 1994].

Muscle **GC-MS** See Blood [Kintz *et al.* 1994].

Small Intestine **GC** See Blood [Demedts *et al.* 1983].

Disposition in the Body Absorbed after oral administration. It is metabolised by *N*-demethylation to norethylmorphine and by *O*-de-ethylation to morphine. The *O*-de-ethylation is catalysed by CYP2D6 and the *N*-demethylation by CYP3A4 [Liu *et al.* 1995]. 3-*O*-Ethylmorphin-6-yl-β-D-glucopyranosiduronic acid (ethylmorphine-6-glucuronide) is assumed to be the major metabolite of ethylmorphine in humans [Bugge *et al.* 1995].

Therapeutic Concentration Ten healthy male volunteers were given a single dose of Cosylan cough mixture. The median urinary recovery was 77% over 48 h. Two subjects phenotypically classified as poor metabolisers were genotypically CYP2D6A/wt and CYP2D6D/wt [Aasmundstad *et al.* 1995].

Toxicity The estimated minimum lethal dose is 500 mg.

A 27-year-old male was found vomiting in a park; he died before the emergency services arrived. His blood ethylmorphine concentration was 15.6 mg/L [Balíková, Maresová 1998].

In a death attributed to ingestion of ethylmorphine, the concentrations of the drug measured at postmortem were as described below.

Sample	*Concentration (µg/L or ng/g)*
Femoral blood	488
Cardiac blood	347
Urine	9488
Bile	681
Gastric contents	14454
Vitreous humour	469
Kidney	1809
Lung	329
Brain	158
Heart	253
Liver	1006
Psoas muscle	174

[Kintz *et al.* 1994].

Half-life 2 to 3 h [Baselt 2008], 2.5 to 6.2 [Popa *et al.* 1998].

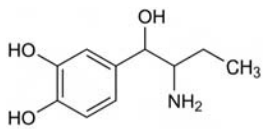
Ethylnoradrenaline

Sympathomimetic
$C_{10}H_{15}NO_3$ = 197.2
CAS—536-24-3

IUPAC Name 4-(2-Amino-1-hydroxybutyl)-1,2-benzenediol
Synonym Ethylnorepinephrine

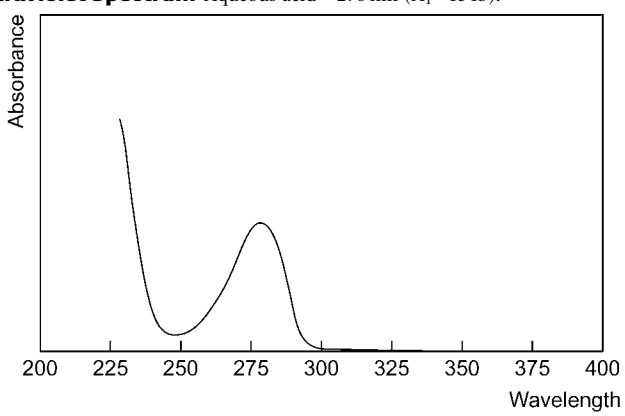


Chemical Properties pK_a 8.4 (25°).

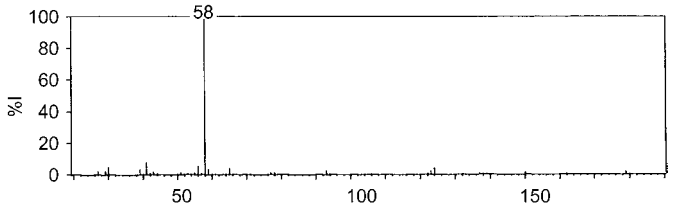
Ethylnoradrenaline Hydrochloride

$C_{10}H_{15}NO_3$,HCl = 233.7
CAS—3198-07-0
Proprietary Name *Bronkephrine*
Chemical Properties A crystalline solid. Mp 199° to 200°, with decomposition. Soluble in water.

Colour Tests Ferric chloride—green; Mandelin's test—orange; Marquis test—orange→brown; Nessler's reagent—black.
Thin-layer Chromatography System TA—R_f 0.42; system TB—R_f 0.01; system TC—R_f 0.02; system TE—R_f 0.15; system TL—R_f 0.24; system TAJ—R_f 0.00; system TAK—R_f 0.00; system TAL—R_f 0.15 (acidified potassium permanganate solution, positive).
Ultraviolet Spectrum Aqueous acid—278 nm (A^{1}_{1}=154b).



Infrared Spectrum Principal peaks at wavenumbers 1500, 1529, 1280, 1265, 1052, 1600 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 58, 41, 56, 30, 124, 65, 59, 93.

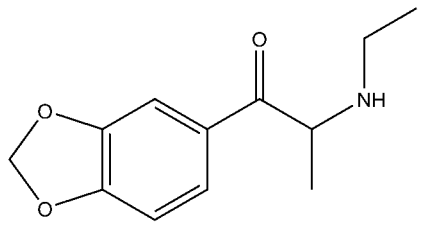


Dose 1 to 2 mg of ethylnoradrenaline hydrochloride, SC or IM.

E

Ethylone

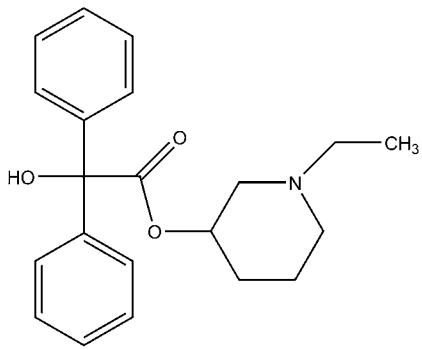
Cathinone Derivative, Phenethylamine, Stimulant
$C_{12}H_{15}NO_3$ = 221.2
IUPAC Name 2-Ethylamino-1-(3,4-methylenedioxyphenyl)propan-1-one
Synonym bk-MDEA



Chemical Properties Cathinone analogue of 3,4-methylenedioxy-*N*-ethylamphetamine (MDEA).
Dose Reported to be less potent than methylone.

Ethylpiperidyl Benzilate

Hallucinogen
$C_{21}H_{25}NO_3$ = 339.4
IUPAC Name (1-Ethylpiperidin-3-yl) 2-hydroxy-2,2-di(phenyl)acetate
Synonym 1-Ethylpiperid-3-yl benzilate



Chemical Properties Bp 194° to 198° at 0.12 to 0.18 mmHg. Ethylpiperidyl benzilate is extracted by organic solvents from aqueous alkaline solutions.

Ethylpiperidyl Benzilate Hydrochloride

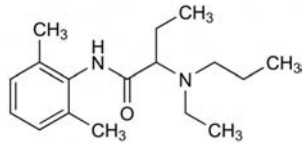
Synonym JB 318
Chemical Properties A white crystalline powder. Mp 186° to 192°. Ethylpiperidyl benzilate is extracted by organic solvents from aqueous alkaline solutions.

Thin-layer Chromatography System T1—R_f 0.73 (location reagent acidified iodoplatinate spray, strong reaction).
Ultraviolet Spectrum Methanol—maxima at 252 (E1%, 1 cm 10), 258 (E1%, 1 cm 11) and 264 nm (E1%, 1 cm 9); inflexion at 268 nm; minima at 249 nm, and 263 nm (hydrochloride).
Infrared Spectrum Principal peaks at wavenumbers 1210, 1716, 692 cm^{-1} (hydrochloride).
Toxicity LD_{50} (oral): in mice 34 mg/kg and in rats 25 mg/kg.

Etidocaine

Anaesthetic (Local)
$C_{17}H_{28}N_2O$ = 276.4
CAS—36637-18-0

IUPAC Name *N*-(2,6-Dimethylphenyl)-2-(ethylpropylamino)butanamide

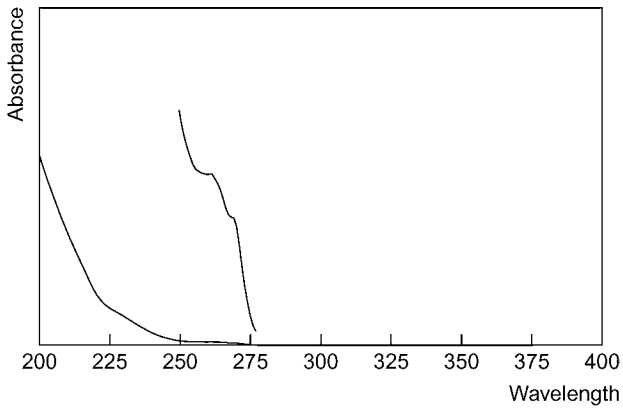


Chemical Properties A white crystalline powder. Mp 87° to 91°. Soluble 1 in about 7000 of water; freely soluble in organic solvents. pK_a 7.9. Log *P* (octanol/water), 3.7.

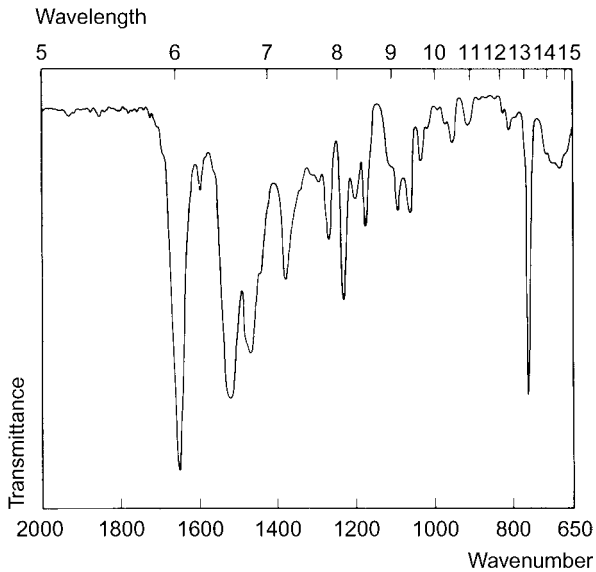
Etidocaine Hydrochloride

$C_{17}H_{28}N_2O,HCl = 312.9$
CAS—36637-19-1
Proprietary Name *Duranest*
Chemical Properties A white crystalline powder. Mp 202° to 205°, with decomposition. Soluble 1 in 10 of water and 1 in 5 of chloroform; practically insoluble in ether.

Thin-layer Chromatography System TA—R_f 0.91; system TE—R_f 0.75; system TAE—R_f 0.80; system TAJ—R_f 0.66; system TAK—R_f 0.19; system TAL—R_f 0.75.
Gas Chromatography System GA—RI 2040.
Ultraviolet Spectrum Aqueous acid—262 (A_1^1=17a), 271 nm (A_1^1=14a).



Infrared Spectrum Principal peaks at wavenumbers 1650, 1520, 765, 1235, 1272, 1180 cm^{-1} (KBr disk).



Quantification
Plasma **GC** FID. Limit of detection, 20 µg/L, etidocaine and *N*-desalkyl metabolites [Morgan *et al.* 1977].

HPLC UV detection. For method for quantification of etidocaine and other local anaesthetics, see Drewe *et al.* [1997]. UV detection. Limit of detection, about 30 µg/L, etidocaine and other amide local anaesthetics [Adams *et al.* 1989].
Serum **GC** Nitrogen–phosphorus detection. Etidocaine and other drugs including local anaesthetics. Limit of detection, 10 µg/L for etidocaine [Coyle, Denson 1986].
Urine **GC** See Plasma [Morgan *et al.* 1977].
Biological Samples **GC** Nitrogen-sensitive detection. For method for quantification of etidocaine and other local anaesthetics, see Lau *et al.* [1991].

Disposition in the Body Rapidly absorbed into the circulation after epidural administration. Extensively metabolised by *N*-dealkylation, hydrolysis and ring hydroxylation. Desethyletidocaine and despropyletidocaine are detectable in plasma. <1% of a dose is excreted in the urine unchanged in 48 h.
Toxicity Plasma concentrations >2 mg/L may be associated with toxic effects.
Half-life Plasma half-life, after IV administration, about 2.5 h, increased to about 6 h after epidural administration.
Volume of Distribution About 2 L/kg.
Clearance Plasma clearance, about 15 mL/min/kg.
Distribution in Blood Plasma : whole blood ratio, 1.7.
Protein Binding About 94%.
Note For a review of the pharmacokinetics of local anaesthetics, see Tucker and Mather [1979].
Dose Etidocaine hydrochloride is administered by injection as 0.5 to 1.5% solutions; maximum dose, 300 mg.

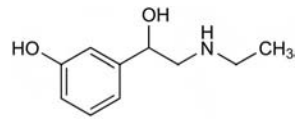
Etilefrine

Sympathomimetic
$C_{10}H_{15}NO_2 = 181.2$
CAS—709-55-7
IUPAC Name 3-[2-(Ethylamino)-1-hydroxyethyl]phenol
Synonyms Ethyladrianol; α-[(ethylamino)methyl]-3-hydroxybenzenemethanol; ethylnorphenylephrine.

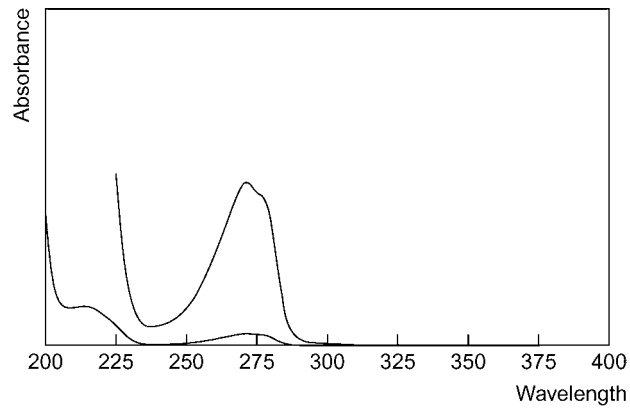


Chemical Properties A white crystalline powder. Mp 147° to 148°. Soluble 1 in 25 of water and 1 in 15 of ethanol. pK_a 9.0, 10.2 (25°). Log *P* (octanol/water), 0.3.

Etilefrine Hydrochloride

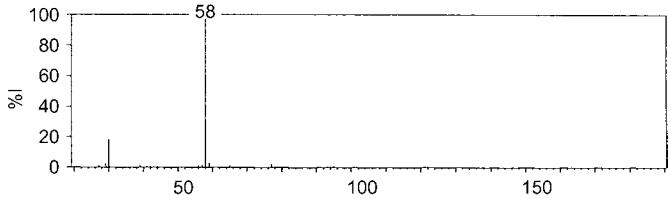
$C_{10}H_{15}NO_2,HCl = 217.7$
CAS—534-87-2
Proprietary Names *Adrenam*; *Bioflutin-N*; *Cardanat*; *Cardialgine*; *Circupon RR*; *Circuvit-E*; *Effortil*; *Efortil*; *Efxine*; *Hyprosia*; *Thomasin*; *Tonus-forte-Tablinen*; *Tri-Effortil*.
Chemical Properties A white crystalline powder. Mp 121°. Freely soluble in water; soluble in ethanol; practically insoluble in chloroform.

Colour Tests Folin–Ciocalteu reagent—blue; Liebermann's reagent—black; Mandelin's test—grey→green→brown; Marquis test—red.
Thin-layer Chromatography System TA—R_f 0.41; system TB—R_f 0.02; system TC—R_f 0.02; system TE—R_f 0.22; system TL—R_f 0.03; system TAE—R_f 0.15; system TAF—R_f 0.74 (acidified potassium permanganate solution, positive).
Gas Chromatography System GA—etilefrine RI 1685, etilefrine-AC_3 RI 2150, etilefrine-Me_2-AC RI 2000.
High Performance Liquid Chromatography System HX—RI 118; system HY—RI 142.
Ultraviolet Spectrum Aqueous acid—272 nm (A_1^1=102a); aqueous alkali—237 (A_1^1=491b), 290 nm (A_1^1=167a).



Infrared Spectrum Principal peaks at wavenumbers 1597, 1068, 797, 1305, 1279, 1222 cm^{-1} (etilefrine hydrochloride, KBr disk).

Mass Spectrum Principal ions at *m/z* 58, 30, 59, 77, 29, 95, 65, 57.

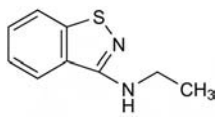


Dose Etilefrine hydrochloride has been given in doses of 15 to 50 mg daily.

Etisazole

Antifungal (Veterinary)
$C_9H_{10}N_2S$ = 178.3
CAS—7716-60-1

IUPAC Name *N*-Ethyl-1,2-benzisothiazol-3-ylamine



Chemical Properties A white to slightly brown crystalline powder. Mp 78°. Log *P* (octanol/water), 2.3.

Etisazole Hydrochloride

$C_9H_{10}N_2S$,HCl = 214.7
CAS—7716-59-8

Proprietary Name *Netrosylla*

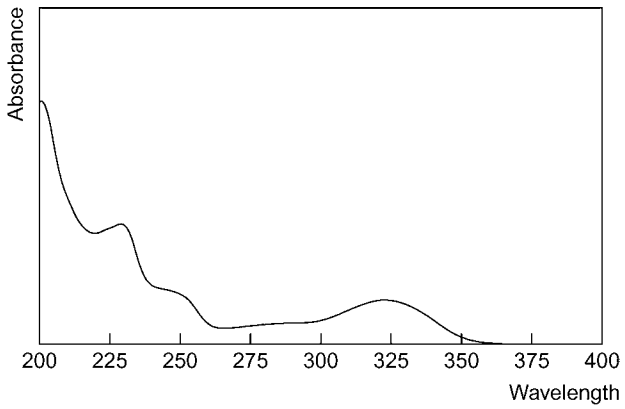
Chemical Properties A crystalline powder. Mp 182° to 186°. Sparingly soluble in water; freely soluble in ethanol and methanol; slightly soluble in chloroform and ether.

Colour Test Liebermann's reagent—red-brown.

Thin-layer Chromatography System TA—R_f 0.74 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 1668.

Ultraviolet Spectrum Aqueous acid—232 (A^{1}_{1}=1200b), 323 nm.



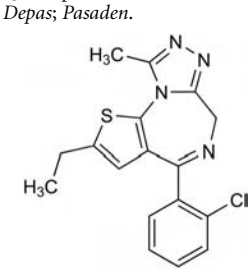
Infrared Spectrum Principal peaks at wavenumbers 1608, 1314, 1292, 772, 706, 1111 (KBr disk).

Etizolam

Anxiolytic
$C_{17}H_{15}ClN_4S$ = 342.9
CAS—40054-69-1

Synonyms AHR-3219; 4-(2-chlorophenyl)-2-ethyl-9-methyl-6*H*-thieno[3,2-*f*][1,2,4]triazolo-[4,3-*a*][1,4]diazepine; Y-7131.

Proprietary Names *Depas*; *Pasaden*.



Chemical Properties A white crystalline powder with Mp 147° to 148°. It is insoluble in water; soluble in ethanol and chloroform. Log *P* (octanol/water), 3.1.

Thin-layer Chromatography System TE—R_f 0.52; system TAE—R_f 0.72.

Plate: silica gel 60 F254 (10 × 10 cm). Mobile phase 1: cyclohexane : toluene : diethylamine (75:15:10); mobile phase 2: chloroform : methanol (90:10); mobile phase 3: chloroform : acetone (80:20). Dragendorff's reagent was used to visualise the spots. Rf 4 (mobile phase 1); Rf 45 (mobile phase 2); Rf 13 (mobile phase 3) [Otsubo *et al.* 1995].

Gas Chromatography System GA—RI 2980.

High Performance Liquid Chromatography System HAF—retention time 18.4 min.

Ultraviolet Spectrum Aqueous acid (ethanol)—243 nm; aqueous acid—250, 294, 362 nm; aqueous alkali—243 nm.

Infrared Spectrum Principal peaks at wavenumbers 764, 1410, 1615, 1380, 1040, 1524 cm^{-1} (KBr disc).

Mass Spectrum Principal ions at *m/z* 342, 18, 28, 266, 313, 224, 239, 45.

Quantification

Blood **HPLC** UV detection (λ=254 nm). Limit of quantification, 5 µg/L [Tanaka *et al.* 682].

Plasma **HPLC** Limit of detection, 2.5 µg/L [Fracasso *et al.* 1991].

Urine **HPLC** Limit of detection, 1 µg/L [Fracasso *et al.* 1991].

Disposition in the Body Etizolam is rapidly absorbed after oral administration and is almost entirely eliminated by non-renal pathways. Peak plasma concentrations are reached within 0.5 to 2 h. There is little accumulation of the drug in the body and elimination is by biotransformation of the drug; mainly microsomal oxidation to produce hydroxylated derivatives which are subsequently conjugated. The main metabolite is α-hydroxyetizolam (20% of which is in the unconjugated form) and is pharmacologically active as opposed to the other metabolites which are not.

Therapeutic Concentration

Six healthy males, aged between 20 and 32 years (mean 26 years), were administered a 0.5 mg etizolam after an overnight fast. A peak plasma concentration of 8.3 µg/L was observed 0.9 h after dosing. Multiple dosing of 0.5 mg every 12 h for 1 week was also carried out. Peak plasma concentrations for the parent drug and its metabolite, α-hydroxyetizolam, were 9.3 µg/L and 9.9 µg/L, respectively observed at 1.2 and 2.5 h [Fracasso *et al.* 1991].

Half-life Approximately 3.4 h.

Volume of Distribution 0.9 L (after a single 0.5 mg dose); usually referred to as 1.0 L/kg.

Clearance Oral, between 10.4 and 19.3 (mean 13.8) L/h (after a single 0.5 mg dose).

Protein Binding Approximately 93%.

Dose 1.5 to 3 mg daily.

Fracasso C *et al.* (1991). Single and multiple dose pharmacokinetics of etizolam in healthy subjects. *Eur J Clin Pharmacol* 40: 181–185.

Otsubo K *et al.* (1995). Rapid and sensitive detection of benzodiazepines and zopiclone in serum using high-performance thin-layer chromatography. *J Chromatogr B Biomed Appl* 669(2): 408–412.

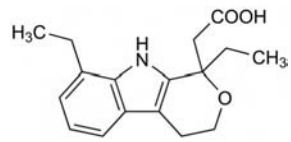
Etodolac

Antiinflammatory
$C_{17}H_{21}NO_3$ = 287.4
CAS—41340-25-4

IUPAC Name 2-(1,8-Diethyl-4,9-dihydro-3*H*-pyrano[3,4-b]indol-1-yl)acetic acid

Synonyms AY-24236;: CCRIS 3923; 1,8-diethyl-1,3,4,9-tetrahydropyrano-[3,4-*b*]indole-1-acetic acid; etodolic acid; NSC-282126.

Proprietary Names *Edolan*; *Lodine*; *Ramoder*; *Tedolan*; *Ultradol*; *Zedolac*.



Chemical Properties A white to almost-white crystalline powder. It is practically insoluble in water; freely soluble in alcohol, chloroform, dimethyl sulfoxide and aqueous polyethylene glycol. Mp 145° to 148°. pK_a 4.65. Log *P* (octanol/water), 3.93; (pH 7.4), 11.4.

Gas Chromatography System GL—RI 2225(etodolac-ME).

Column: methyl silicone HP1 (0.2 mm i.d., 0.33 µm). Temperature: 250°. Carrier gas: He, flow rate 0.9 mL/min. Detection: mass spectrometer. Retention index: 2333 [Mills, Roberson 1993].

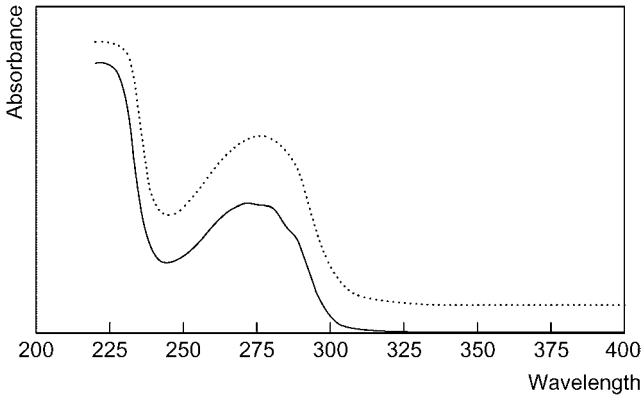
High Performance Liquid Chromatography System HAA—retention time 21.5 min.

Column: RP-18 LiChrosorb (250 × 4.0 mm i.d., 7 µm), (guard) (40 × 4.0 mm). Mobile phase: aqueous acetic acid (1%) : acetonitrile (50:50), flow rate 1.3 mL/min. UV detection (λ=227 nm). Retention time: 8.5 min [Koupai-Abyazani *et al.* 1999].

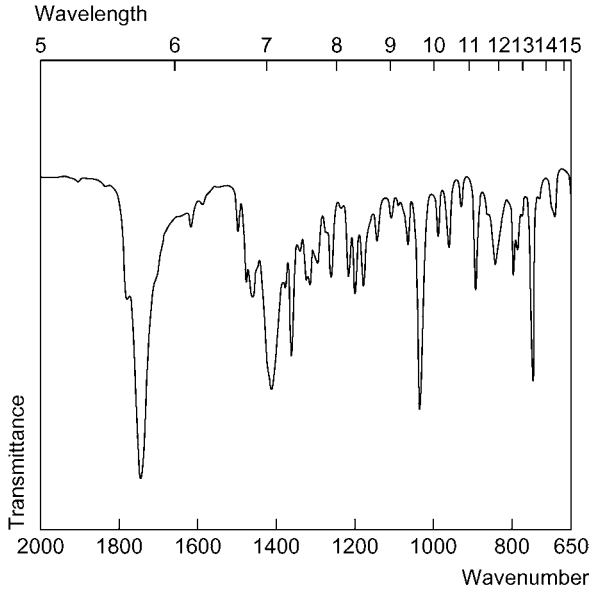
Column: silica (Partisil 5 Silica, 5 µm, 250 × 4.6 mm i.d.), (guard) (5 cm, packed with 30 to 38 µm silica-coated glass beads). Mobile phase: hexane : ethyl acetate : isopropanol (85:15:0.2), flow rate 2 mL/min. UV detection (λ=280 nm). Retention time: R-enantiomer of etodolac, 21.9 min; S-enatiomer, 29.5 min [Jamali *et al.* 1988].

Column: ODS Hypersil (100 × 4.6 mm i.d., 5 µm). Mobile phase: methanol, 1 mL/min flow rate. UV (λ=280 nm). Retention time: 2.8 min [Mills, Roberson 1993].

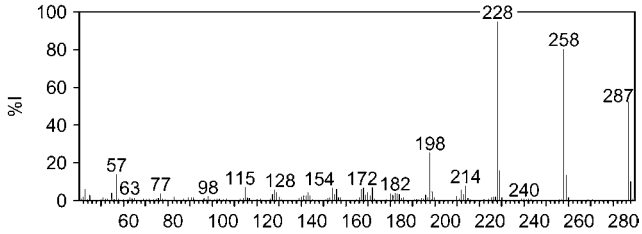
Ultraviolet Spectrum Aqueous acid (0.2 mol/L H_2SO_4)—272 nm; basic—274 nm.



Infrared Spectrum Principal peaks at wavenumbers 1746, 1412, 1034, 748 cm^{-1} (KBr pellet).



Mass Spectrum Principal ions at *m/z* 228, 258, 287, 198, 57, 229, 259, 214.



Quantification

***Serum* HPLC** UV detection (λ=227 nm). Limit of quantification, 0.04 mg/L, limit of detection, 0.03 mg/L [Koupai-Abyazani *et al.* 1999].

***Urine* HPLC** UV detection (λ=227 nm). Limit of quantification, 0.4 mg/L, limit of detection, 0.3 mg/L [Koupai-Abyazani *et al.* 1999].

Disposition in the Body Etodolac is well absorbed after oral administration and extensively metabolised in the liver, via hydroxylation followed by conjugation and acyl glucuronidation. The drug is easily distributed into synovial fluid. Etodolac is primarily excreted in urine but also in faeces. 1% of a dose is detected unchanged in urine with hydroxylated etodolac (46%), glucuronidated etodolac (13%), hydroxylated metabolites (5%), hydroxylated glucuronide metabolites (20%) and 4-ureidoetodolac metabolite.

Therapeutic Concentration The serum therapeutic concentration range is 20 to 50 mg/L.

Fourteen healthy male volunteers, with a mean age of 27 years, were administered a 400 mg dose of etodolac (in a solution and as the sustained release formulation). Peak plasma concentrations of 36.8 mg/L were reached within 0.55 h and 7.5 mg/L within 7.9 h, respectively [Dey *et al.* 1989].

Toxicity Gastrointestinal toxicity including bleeding and perforation has been reported with overdosing as well as a case of coma.

Bioavailability 80 to 100%.

Half-life 7 h.

Volume of Distribution 0.3 to 0.5 L/kg.

Clearance 40 to 47 mL/h/kg.

Protein Binding 99%.

Dose Patient with body weight >60 kg: a usual dose of 200 to 400 mg is administered every 6 to 8 h with a maximum of 1200 g daily. Patient <60 kg: maximum 20 mg/kg body weight daily.

Etofenamate

Analgesic

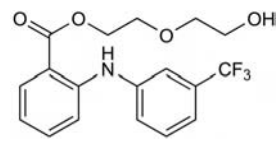
$C_{18}H_{18}F_3NO_4$ = 369.3

CAS—30544-47-9

IUPAC Name 2-(2-Hydroxyethoxy)ethyl 2-[3-(trifluoromethyl)anilino]benzoate

Synonym 2-[[3-(Trifluoromethyl)phenyl]amino]benzoic acid 2-(2-hydroxyethoxy)ethyl ester

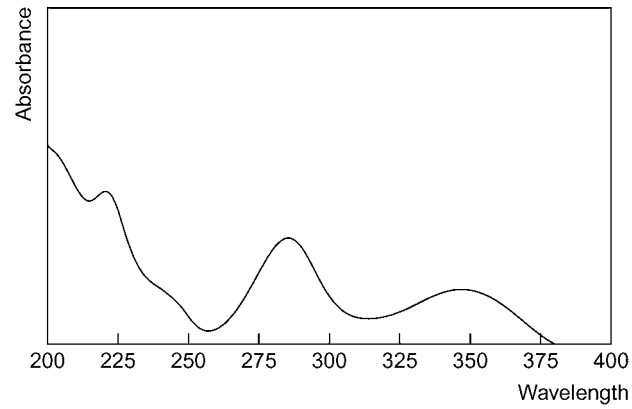
Proprietary Names *Activon*; *Afrolate*; *Algesalona*; *Bayro*; *Etofen*; *Fenogel*; *Flexium*; *Flogoprofen*; *Reumon*; *Rheuma-Gel*; *Rheumon*; *Traumalix*; *Traumon*; *Zenavan*.



Chemical Properties A pale-yellow viscous liquid. Practically insoluble in water; soluble in organic solvents. Log *P* (octanol/water), 4.2.

Thin-layer Chromatography System TE—R_f 0.78; system TAE—R_f 0.89.

Ultraviolet Spectrum Aqueous acid—284 (A^1_1=287b), 349 nm (A^1_1=165b).



Quantification

***Plasma* GC** FID. For method of quantification, see Dell *et al.* [1981].

***Urine* GC** See Plasma [Dell *et al.* 1981].

***Tissues* GC** See Plasma [Dell *et al.* 1981].

Disposition in the Body Well absorbed from the gastrointestinal tract and through the skin. The unchanged drug is found in small amounts in urine, together with hydroxylated derivatives of etofenamate and flufenamic acid.

Therapeutic Concentration

Following a single oral dose of 300 mg to 6 subjects, a mean peak plasma concentration of 10.0 mg/L was attained in 1 h; following topical administration of 6 g to 6 subjects, a mean peak plasma concentration of 0.15 mg/L was attained in 2 h [Dell *et al.* 1977].

Half-life Plasma half-life, about 1.6 h after ingestion and about 3.3 h after topical administration.
Use Topically in a concentration of 5%.

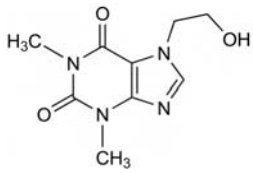
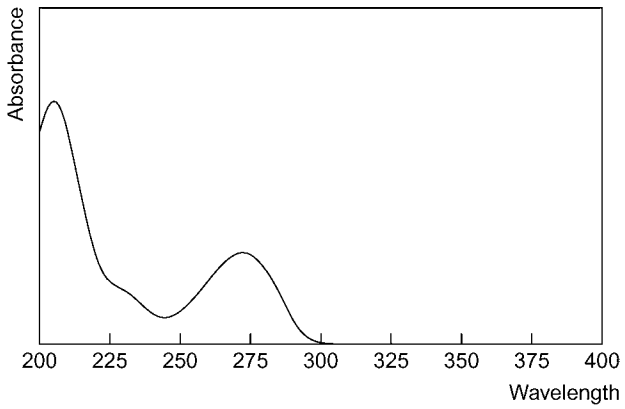
Etofylline

Xanthine Bronchodilator
$C_9H_{12}N_4O_3$ = 224.2
CAS—519-37-9

IUPAC Name 7-(2-Hydroxyethyl)-1,3-dimethylpurine-2,6-dione
Synonyms Aethophyllinum; 3,7-dihydro-7-(2-hydroxyethyl)-1,3-dimethyl-1*H*-purine-2,6-dione; hydroxyethyltheophyllinum; oxyetophylline.
Proprietary Names *Actophlem*; *Alcophyllex*; *Apoplectal*; *Bio-Phyllin*; *Coroverlan*; *Dilinct*; *Flebo Stop*; *Instenon*; *Oxyphylline*; *Perphyllon*; *Solphyllex*; *Solphyllin*; *Theophen*; *Theo-Talusin*.



Chemical Properties A white crystalline powder. Mp 161° to 166°. Freely soluble in water; moderately soluble in ethanol; sparingly soluble in chloroform; practically insoluble in ether. Log *P* (octanol/water), −0.8.
Thin-layer Chromatography System TB—R_f 0.00; system TE—R_f 0.38; system TF—R_f 0.06; system TAE—R_f 0.66.
Gas Chromatography System GA—etophylline RI 2125, etophylline-AC RI 2200, etophylline clofibrate RI 3125.
High Performance Liquid Chromatography System HX—RI 289.
Ultraviolet Spectrum Aqueous acid—270 nm (A^1_1=416b).

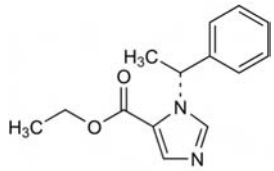


Dose Up to 1.5 g daily.

Etomidate

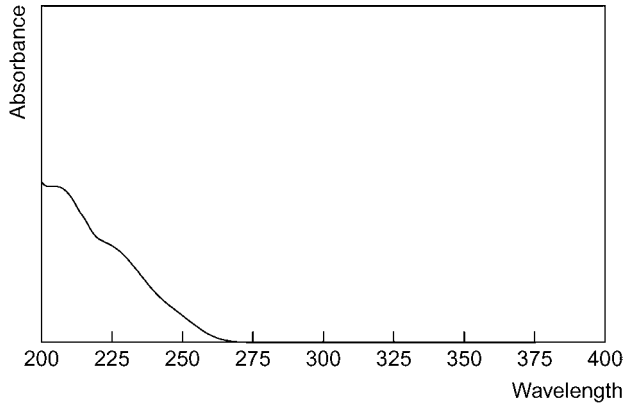
Anaesthetic (General)
$C_{14}H_{16}N_2O_2$ = 244.3
CAS—33125-97-2

IUPAC Name Ethyl 3-(1-phenylethyl)imidazole-4-carboxylate
Synonym 1-[(1*R*)-1-Phenylethyl]-1*H*-imidazole-5-carboxylic acid ethyl ester
Proprietary Names *Amidate*; *Hypnomidat(e)*; *Radenarcon*.

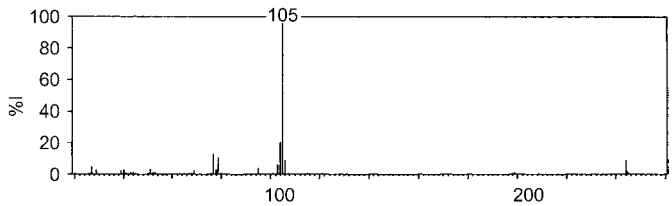


Chemical Properties A white or yellowish crystalline or amorphous powder. Mp about 67°. Solubility in water at 25°, 0.0045 mg in 100 mL; soluble in chloroform, methanol, ethanol, propylene glycol and acetone. pK_a 4.2. Log *P* (octanol/water), 3.0. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Thin-layer Chromatography System TA—R_f 0.67; system TB—R_f 0.26; system TC—R_f 0.71; system TE—R_f 0.73; system TL—R_f 0.52; system TAE—R_f 0.78; system TAF—R_f 0.85.
Gas Chromatography System GA—etomidate RI 1870, M (COOH-)-Me RI 1840.
High Performance Liquid Chromatography System HX—RI 475; system HY—RI 417.
Ultraviolet Spectrum Water—242 nm (A^1_1=450b).



Infrared Spectrum Principal peaks at wavenumbers 1212, 1708, 712, 1112, 1132, 664 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 105, 104, 77, 79, 244, 106, 108, 27.



Quantification
Plasma **GC** AFID. Limit of detection, 5 µg/L [de Boer *et al.* 1979].
GC–MS Limit of detection, 1 µg/L [Van Hamme *et al.* 1977].
HPLC For method of quantification, see McIntosh and Rajewski [2001]. UV detection. Limit of detection, 2 µg/L [Ellis, Beck 1982].
Disposition in the Body Rapidly distributed after IV injection. It is metabolised in the liver by hydrolysis and *N*-dealkylation to inactive metabolites. About 90% of a dose is excreted in the urine as the carboxylic acid derivative, together with mandelic acid and benzoic acid; <5% is excreted as unchanged drug.
Therapeutic Concentration
After IV injection of 0.3 mg/kg to 8 subjects, plasma concentrations of 0.22 to 0.41 mg/L (mean 0.32) were reported at 4 min [Van Hamme *et al.* 1978].
Half-life Plasma half-life, 2 to 11 h (mean 5).
Volume of Distribution About 4 to 5 L/kg.
Clearance Plasma clearance, 9 to 18 mL/min/kg.
Distribution in Blood Plasma : whole blood ratio, 0.62.
Protein Binding About 75%.
Dose 300 µg/kg IV, with supplementary doses of 100 to 200 µg/kg, as required.

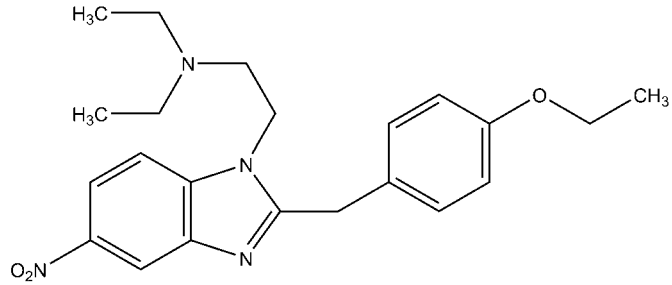
Etonitazene

Opiate, Narcotic Analgesic
$C_{22}H_{28}N_4O_3$ = 396.5
CAS—911-65-9

IUPAC Name 2-[2-[(4-Ethoxyphenyl)methyl]-5-nitrobenzimidazol-1-yl]-*N*,*N*-diethylethanamine
Synonyms 1-[(2-Diethylamino)ethyl]-2-(*p*-ethoxybenzyl)-5-nitrobenzimidazole; 2-*p*-ethoxybenzyl-1-(2-diethylaminoethyl)-5-nitrobenzimidazole; 2-[(4-ethoxyphenyl)methyl]-*N*,*N*-diethyl-5-nitro-1*H*-benzimidazole-1ethanamine; etonitazine.



Chemical Properties White crystalline powder. Slightly soluble in water (0.582 mg/L). Soluble in dilute hydrochloric acid. Log *P* (octanol/water) 5.11 [Meylan, Howard 1995]. Extracted by organic solvents from aqueous alkaline solutions.

Etonitazene Hydrochloride

$C_{22}H_{28}N_4O_3$,HCl = 432.9

Chemical Properties Mp 162° to 164° [O'Neil *et al.* 2006].

Thin-layer Chromatography System T1—R_f 0.70 (location reagent acidified iodoplatinate spray, positive reaction). Plates: fluorescent silica. Solvent system: methanol. Detection using fluorescence quenching (λ_{ex} = 254 nm). R_f value: 0.82. Limit of quantification not reported [Gabor, Leader 1980].

Ultraviolet Spectrum Aqueous acid (0.1 N sulfuric acid)—230, 282 nm.

Quantification

Note For the quantitative determination of etonitazene using chemical reduction and fluorescence detection, see Gabor and Leader [1980].

Dose Used as an analgesic having morphine-like activity. It is about 3 orders of magnitude more potent than morphine.

Etoposide

Antineoplastic

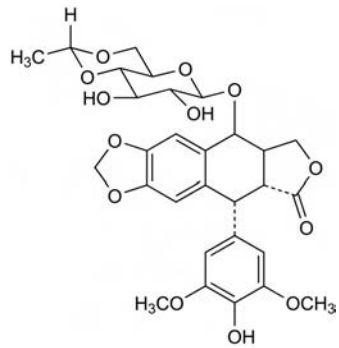
$C_{29}H_{32}O_{13}$ = 588.6

CAS—33419-42-0

IUPAC Name (5*S*,5*aR*,8*aR*,9*R*)-5-[[(2*R*,4*aR*,6*R*,7*R*,8*R*,8*aS*)-7,8-Dihydroxy-2-methyl-4,4*a*,6,7,8,8*a*-hexahydropyrano[3,2-*d*][1,3]dioxin-6-yl]oxy]-9-(4-hydroxy-3,5-dimethoxyphenyl)-5*a*,6,8*a*,9-tetrahydro-5*H*-[2]benzofuro[6,5-*f*][1,3]benzodioxol-8-one

Synonyms EPEG; 9-[(4,6-*O*-ethylidene-β-D-glucopyranosyl)oxy]-5,8,8a,9-tetrahydro-5-(4-hydroxy-3,5-dimethoxyphenyl)furo[3′,4′:6,7]naphtho[2,3-*d*]-1,3-dioxol-6(5a*H*)-one; NSC-141540; VP-16; VP-16-213.

Proprietary Names *Celltop*; *Eposin*; *Exitop*; *Lastet*; *Toposar*; *Vepesid*; *Vepeside*.



Chemical Properties A fine white, or almost white, crystalline powder. Mp 236° to 251°. It is practically insoluble or very slightly soluble in water; slightly soluble in ethanol, in chloroform, in dichloromethane, in ethyl acetate, and in methylene chloride; sparingly soluble in methanol. pK_a 9.8. Log *P* (octanol/water), 0.60.

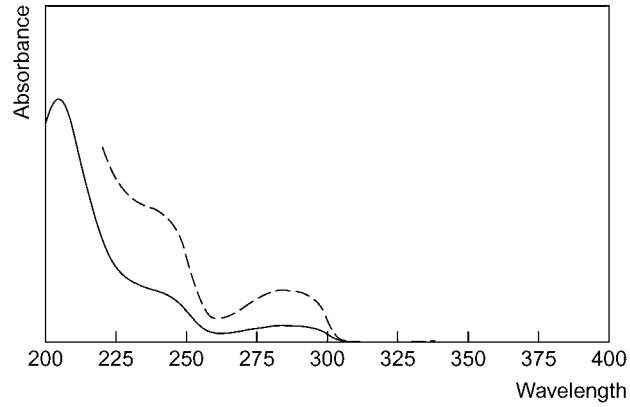
Etoposide Phosphate

$C_{29}H_{33}O_{16}P$ = 668.6

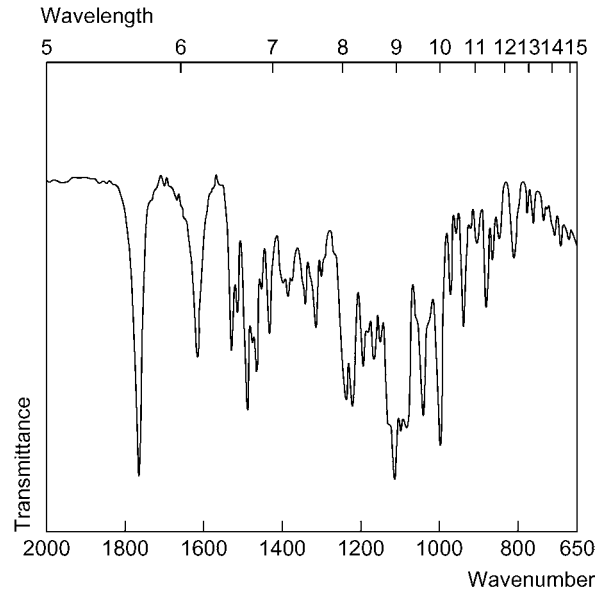
Proprietary Name *Etopophos*

High Performance Liquid Chromatography Column: ODS Hypersil Si-10 (300 × 4 mm i.d., 10 µm). Mobile phase: methanol with 1% NHOH : methylene chloride (2:98), flow rate 2 mL/min. UV detection (λ=254 nm). Retention time: 4.6 min [Mills, Roberson 1993].

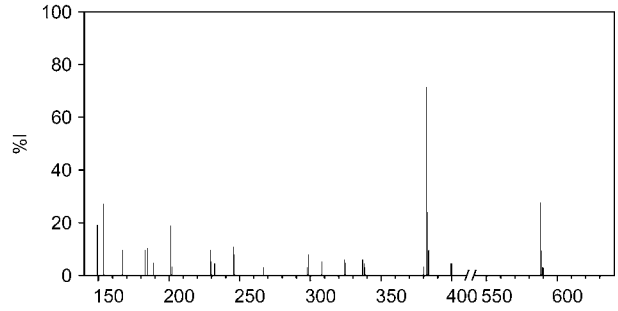
Ultraviolet Spectrum Methanol—283 nm (A^1_1=72.2); ethanol—284, 291 nm.



Infrared Spectrum Principal peaks at wavenumbers 1775, 1610, 1515, 1485, 1250 cm^{-1}.



Mass Spectrum



Quantification

Plasma **HPLC** Column: phenyl µBondapak (300 × 3.9 mm, 10 µm). Mobile phase: acetonitrile : water : glacial acetic acid (35:64:1), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex}=288 nm, λ_{em}=328 nm). Internal standard (IS): teniposide. Retention times: etoposide, 6.5 min; IS, 18 min. Limit of detection, 50 µg/L [Robieux *et al.* 1996]. Electrochemical detection. Limit of detection, 0.01 µg/L [el-Yazigi, Martin 1987]. Electrochemical detection. Limit of detection, 10 µg/L [Duncan *et al.* 1986]. UV detection. Limit of detection, 0.008 µg [Werkhoven-Goewie *et al.* 1983].

Serum **HPLC** See Plasma [Werkhoven-Goewie *et al.* 1983].

Urine **HPLC** See Plasma [Harvey *et al.* 1985]. See Plasma [Werkhoven-Goewie *et al.* 1983].

Disposition in the Body Pharmacokinetics show wide interindividual variation. Absorption is variable after oral administration, but on average about 50% of a dose is absorbed. Peak plasma concentrations occur 0.5 to 3 h after oral administration. Undergoes rapid distribution. It is metabolised to several metabolites,

including a hydroxy acid metabolite, glucuronide and sulfate conjugates, and an *O*-demethylated compound. Excreted in urine and via bile in the faeces (a small amount) as unchanged drug and metabolites; 30 to 50% of a dose is excreted in urine over 72 h as the unchanged drug and 20% as metabolites. Crosses the blood–brain barrier poorly; concentrations in CSF about 1 to 10% of those in plasma. It is distributed into breast milk.

Therapeutic Concentration The trough serum therapeutic concentration range is 2 to 6 mg/L and peak, 8 to 14 mg/L.

Twelve patients with biopsy-proven cancer, <65 years old, were split into four groups and administered either 400, 500, 600 or 800 mg/m^2 daily via a 2- to 3-h infusion. The maximum plasma-etoposide concentration following infusion of 400 mg/m^2 for 3 consecutive days ranged from 26 to 53 mg/L, 27 to 73 mg/L for the 500 mg/m^2 dose, 42 to 114 mg/L for 600 mg/m^2 and 72 mg/L for the single patient administered 800 mg/m^2. These concentrations were observed during the infusion period [Hande *et al.* 1984].

Fifteen adult patients with various malignancies, aged between 25 and 74 years, were administered 80 to 120 mg/m^2 etoposide over 30 to 60 min. All patients were receiving polychemotherapy as well. A mean peak concentration of 24.2 mg/L was observed [Pfluger *et al.* 1987].

Toxicity Etoposide doses of 2.4 to 3.5 mg/m^2 administered IV over 3 days caused severe mucositis and myelotoxicity. Metabolic acidosis and cases of severe hepatotoxicity have also been reported with doses above the recommended [Bristol Myers Squibb Pharmaceuticals Ltd].

The dose-limiting toxicity is dose-related myelosuppression.

Half-life Plasma half-life, 3 to 19 h.

Volume of Distribution Adults, 7 to 17 L/m^2; children, 5 to 10 L/m^2.

Clearance Plasma, adult, 15 to 35 mL/min/m^2 (0.9 to 2.1 L/h/m^2); children, 20 to 40 mL/min/m^2 (1.2 to 2.4 L/h/m^2).

Protein Binding About 94%.

Note For reviews of etoposide, see Henwood and Brogden [1990] and Clark and Slevin [1987].

Dose From 120 mg/m^2 up to 240 mg/m^2 of etoposide IV daily for 5 days. Oral dose is twice the IV dose.

Etoricoxib

Analgesic, COX-2 Inhibitor

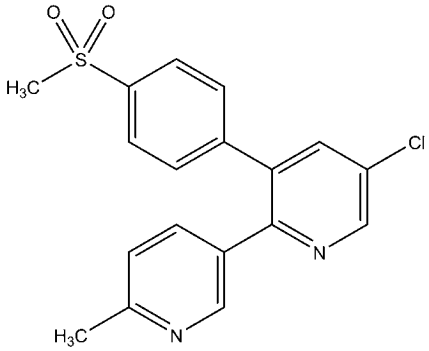
$C_{18}H_{15}ClN_2O_2S = 358.8$

CAS—202409-33-4

IUPAC Name 5-Chloro-6′-methyl-3-[4-(methylsulfonyl)-phenyl]-2,3′-bipyridine

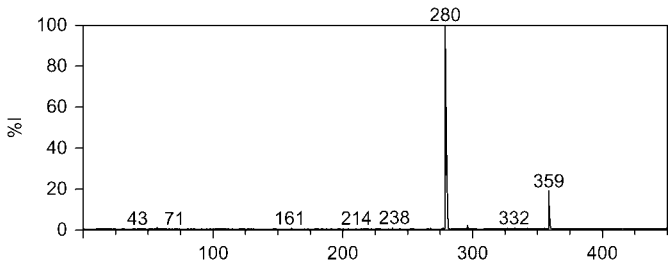
Synonyms L-791456; MK-0663.

Proprietary Name *Arcoxia*



Chemical Properties White solid. Mp 127° to 128°. pK_a 4.5. Stability was established for 21 days at –20°, in frozen plasma at –20° for at least 3 freeze–thaw cycles, over a period of 24 h at 5°, and on the benchtop for 8 h [Pavan Kumar *et al.* 2006]. Stability of etoricoxib stored at -80° including 2 freeze–thaw cycles was >90%. Standard solutions were found to be stable at –80° for at least 2 months and a minimum of 2 weeks when stored protected from light at room temperature [Werner *et al.* 2005]. Stock solutions were stable for at least 6 months when stored under light-protected conditions at 4°. Etoricoxib was stable in plasma for at least 30 days if stored at –70° as well as after 3 freeze–thaw cycles and 24 h room temperature storage [Ramakrishna *et al.* 2005].

Mass Spectrum Principal ions at *m/z* 280, 359, 238, 161.



Quantification

Plasma **HPLC** Column: Kromasil KR 100-5 C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.05 mol/L formic acid (pH 3.0) : water–acetonitrile (5 : 95) : methanol–water (90 : 10; 100 : 0 : 0 at 0 min, 90 : 0 : 10 at 2 min, 50 : 20 : 30 at 9 min, 30 : 50 : 20 at 25 min, 10 : 85 : 5 at 35 min, 100 : 0 : 0 at 36 min until 45 min), flow rate 1.0 mL/min. UV detection ($\lambda = 235$ nm). Limit of quantification, 0.1 mg/L [Pavan Kumar *et al.* 2006]. Column: Waters symmetry C_{18} (250 × 4.6 mm, 5 µm). Mobile phase: acetonitrile : water (42 : 58), flow rate 1.2 mL/min. UV detection ($\lambda = 284$ nm). Limit of quantification, 5 µg/L [Ramakrishna *et al.* 2005]. Column: Prism RP (150 × 4.6 mm). Mobile phase: acetonitrile : water (45 : 55) in 10 mmol/L acetate buffer (pH 4). Fluorescence detection ($\lambda_{ex} = 260$ nm, $\lambda_{em} = 375$ nm). Limit of quantification, 500 µg/L [Matthews *et al.* 2001].

LC-MS Column: Nucleosil C_8 guard column (120-5, 8 × 3 mm). Mobile phase: methanol : water (50 : 50), flow rate 300 µL/min. APCI source, SRM acquisition mode. Retention time: 1.05 min. Limit of quantification, 5 µg/L [Werner *et al.* 2005]. Limit of quantification, 0.2 µg/L [Brautigam *et al.* 2003]. Limit of quantification, 0.5 µg/L [Rose *et al.* 2002].

Urine **HPLC** Column: Prism RP (150 × 4.6 mm). Mobile phase: acetonitrile : water (45 : 55) in 10 mmol/L acetate buffer (pH 4). Fluorescence detection ($\lambda_{ex} = 260$ nm, $\lambda_{em} = 375$ nm). Limit of quantification, 500 µg/L [Matthews *et al.* 2001].

Disposition in the Body Eliminated primarily as metabolites in urine, with <1% of an administered dose recovered as the unchanged drug. Renal and hepatic impairments do not significantly affect the absorption and distribution of the drug. It is metabolised via 6′-methyl oxidation and 1′-*N*-oxidation, yielding 1 major compound, a 6′-carboxylic acid metabolite, and 4 minor compounds: etoricoxib 1′-*N*-oxide, 6′-hydroxymethyletoricoxib, its 1′-*N*-oxide and its glucuronide. These metabolites do not inhibit COX-1 and do not significantly contribute to the inhibition of COX-2. They are formed by the following P450 enzymes: CYP3A4 (major role), CYP2C9, CYP2D6, CYP1A2, and CYP2C19. In addition, oxidation of 6′-hydroxymethyletoricoxib to its corresponding carboxylic acid requires human liver cytosol and NAD^+. Excretion is preliminary via the renal route with 70% (IV) and 60% (oral) of the dose excreted in urine. Faecal elimination accounts for around 20% for either route of administration.

Therapeutic Concentration

Sixty healthy male and female subjects and ten patients with mild hepatic insufficiency were administered simultaneous single 5 mg IV doses of [$^{13}C_6$] etoricoxib (day 1) and 60 mg oral doses of etoricoxib once daily for 21 days. A further 10 patients with moderate hepatic insufficiency were administered the same regimen except the oral doses were administered every other day for 21 days. The mean peak plasma concentrations after the single dose were 1.69, 1.65, and 1.68 mg/L for the groups, respectively. These were observed at 1.06, 1.75, and 1.75 h, respectively. After dosing 60 mg to 152 healthy subjects and 6 patients with mild hepatic insufficiency, peak plasma concentrations were 1.11 and 1.10 mg/L, respectively, attained after 1.01 and 1.25 h, respectively [Agrawal *et al.* 2003a].

Twelve healthy male and female subjects were administered a single oral dose of 120 mg etoricoxib in a fasting state and after a meal with high fat content. The mean peak plasma concentrations were 2.43 ± 0.66 and 1.56 ± 0.36 mg/L, respectively, observed at 1.0 (0.5 to 2.0) and 3.0 (0.5 to 10.0) h, respectively. Another 12 healthy subjects were administered single oral doses of 30, 60, 120 and 240 mg etoricoxib. The mean peak plasma concentrations were 0.53 ± 0.14, 1.27 ± 0.36, 2.14 ± 0.6 and 4.37 ± 1.2 mg/L, attained at 1.8 (0.4 to 4.0), 1.0 (0.5 to 1.5), 1.5 (0.5 to 2.0) and 1.3 (0.5 to 2.0) h, respectively. Twenty-four healthy subjects were also administered 120 mg single dose and multiple oral doses (120 mg daily for 10 days). After the single dose, the mean peak plasma concentration was 2.05 ± 0.67 mg/L at

1.5 h (0.5 to 24.0) and was 3.59 ± 1.31 mg/L after the last dose during multiple dosing, attained at 1.3 h (0.5 to 4.0) [Agrawal *et al.* 2003b].

Toxicity On 27 April 2007, the FDA issued a 'non-approvable letter' that stated that Merck are required to provide more study data to prove that the benefits of etoricoxib outweigh the risks before it will receive FDA approval.

Bioavailability 100%.

Half-life 27 h.

Clearance 49 mL/min.

Protein Binding 91.9% (healthy); 86 to 88% (renal impairment).

Volume of Distribution 119 L at steady state

Dose 60 to 120 mg daily.

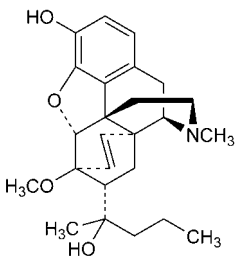
Etorphine

Narcotic Analgesic (Veterinary)

$C_{25}H_{33}NO_4$ = 411.5

CAS—14521-96-1

Synonyms (–)-[5α,7α(*R*)]-4,5-Epoxy-3-hydroxy-6-methoxy-α,17-dimethyl-α-propyl-6,14-ethenomorphinan-7-methanol; M-99; 19-propylorvinol; (6*R*,7*R*,14*R*)-7,8-dihydro-7-(1-hydroxy-1-methylbutyl)-6-*O*-methyl-6,14-ethenomorphine.



Chemical Properties Mp 214° to 217°. Soluble 1 in 30 000 of water; freely soluble in ethanol, chloroform and ether. Log *P* (octanol/pH 7.4), 1.9 (octanol/water) 2.79 [Sangster 1997].

Caution It is dangerous to smell or taste this material.

Etorphine Hydrochloride

$C_{25}H_{33}NO_4$,HCl = 448.0

CAS—13764-49-3

Proprietary Name It is an ingredient of *Immobilon*.

Chemical Properties White microcrystalline powder. Mp 266° to 267°. Soluble 1 in 40 of water, 1 in 30 of ethanol and 1 in 2200 of chloroform; practically insoluble in ether.

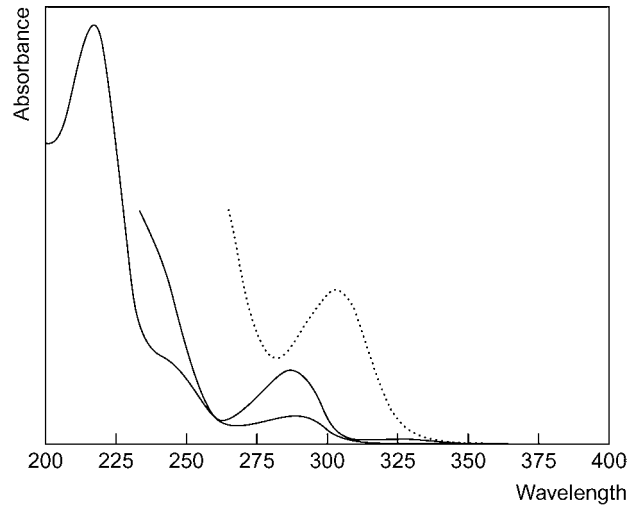
Colour Test Marquis test—blue-grey→yellow-brown.

Thin-layer Chromatography System TA—R_f 0.73; system TB—R_f 0.08; system TC—R_f 0.61; system TE—R_f 0.72; system TL—R_f 0.63; system TAE—R_f 0.84; system TAJ—R_f 0.52; system TAK—R_f 0.00; system TAL—R_f 0.60 (acidified iodoplatinate solution, positive; Marquis reagent, grey; acidified potassium permanganate solution, positive).

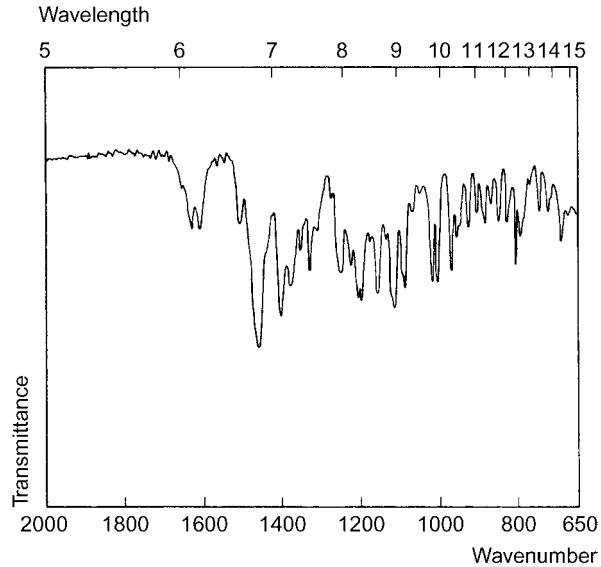
Gas Chromatography System GA—RI 3033; system GB—RI 3211; system GM—not eluted.

High Performance Liquid Chromatography System HA—*k* 0.6; system HC—*k* 1.11; system HX—RI 344; system HY—RI 292.

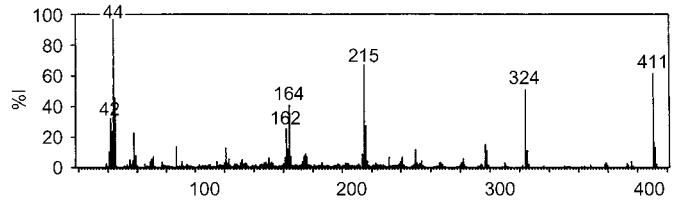
Ultraviolet Spectrum Aqueous acid—289 (A_1^1 = 37a); aqueous alkali—302 nm (A_1^1 = 65a).



Infrared Spectrum Principal peaks at wavenumbers 1113, 1195, 1205, 1155, 1088, 1005 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 44, 215, 411, 324, 45, 164, 42, 216.



Quantification

Blood **HPLC** Column; Spherisorb S5OD/CN (150 × 4.6 mm i.d.). Mobile phase: acetonitrile : water (0 : 100 to 70 : 30 in 15 min for 3 min, or 20 : 80), flow rate 2 mL/min. DAD (λ = 200–595 nm). Limit of quantification, 2 µg/L [Elliott, Hale 1999].

Urine **GC** Column: 3% OV-17 on 80/100 mesh Gas Chrom Q (3′ × 2 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature: 230°. FID. Retention time: 17 min. Limit of detection, 0.1 mg/L [Gorodetzky, Kullberg 1975].

Other **GC-MS** Equine Urine. Column: CP-Sil 5 Chrompak (25 m × 0.22 mm). Carrier gas: He, 2.0 mL/min. Temperature programme: 60° to 120° at 20°/min to 285° at 8°/min. EI ionisation, SIM acquisition mode. Limit of detection, 0.1 µg/L [Bonnaire *et al.* 1989].

Disposition in the Body

Toxicity It is up to 1000-times more potent than morphine; several cases of poisoning (including onefatality) have been reported after accidental pricking of the skin with an injection needle [Goodrich 1977; Volans, Whittle 1976].

A 54-year-old veterinary surgeon whose death was suspected to be due to parenteral administration of etorphine had the following postmortem tissue concentrations: femoral blood 14.5 µg/L, heart blood 23.5 µg/L, urine 0 µg/L [Elliott, Hale 1999].

Note For a case of etorphine poisoning, see Brink and Erasmus [2003] or for overdose, see Sterken *et al.* [2004].
Use With acepromazine as a sedative for the control of large animals, and with methotrimeprazine (levomepromazine) as a neuroleptanalgesic in small animals.

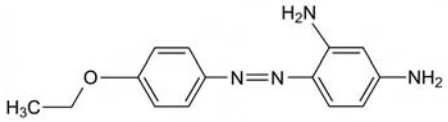
Etoxazene

Analgesic
$C_{14}H_{16}N_4O$ = 256.3
CAS—94-10-0

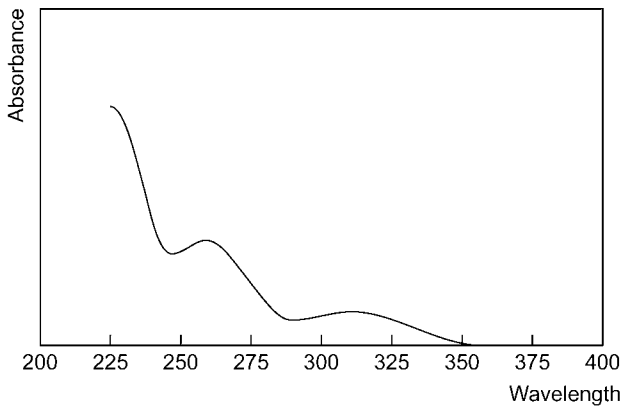
IUPAC Name 4-(4-Ethoxyphenylazo)benzene-1,3-diyldiamine
Synonyms *p*-Ethoxychrysoidine; ethoxazene.



Chemical Properties Mp 117° to 120°. Log *P* (octanol/water), 2.7.

Etoxazene Hydrochloride
$C_{14}H_{16}N_4O,HCl$ = 292.8
CAS—2313-87-3
Proprietary Name *Serenium*
Chemical Properties A reddish powder. Practically insoluble in water; soluble in boiling water and in ethanol.

Colour Test Marquis test—violet.
Thin-layer Chromatography System TA—R_f 0.65; system TB—R_f 0.00; system TC—R_f 0.56; system TL—R_f 0.67; system TAJ—R_f 0.57; system TAK—R_f 0.02; system TAL—R_f 0.70 (Dragendorff spray, positive).
Gas Chromatography System GA—not eluted.
Ultraviolet Spectrum Aqueous acid—261 (A^1_1=308b), 310 nm.

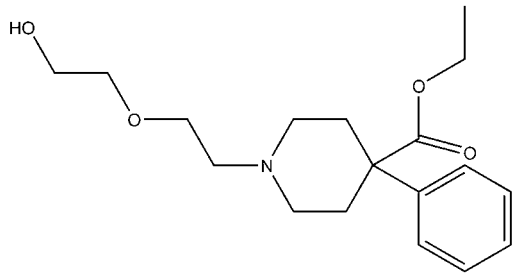


Infrared Spectrum Principal peaks at wavenumbers 1245, 1624, 1635, 1600, 1185, 1501 cm^{-1} (KBr disk).
Dose Etoxazene hydrochloride has been given in doses of 300 mg daily.

Etoxeridine

Phenylpiperidine, Narcotic
$C_{18}H_{27}NO_4$ = 321.4
CAS—469-82-9

IUPAC Name Ethyl 1-[2-(2-hydroxyethoxy)ethyl]-4-phenylpiperidine-4-carboxylate
Synonyms Aténorax; atenos; carbetidine; UC 2073; UCB 2073; Wy 2039.

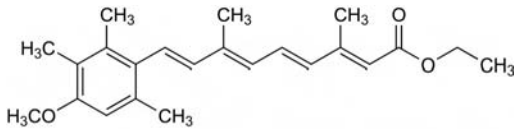


Chemical Properties White crystalline powder. Soluble in dilute hydrochloric acid. Extracted by organic solvents from aqueous alkaline solutions.
Thin-layer Chromatography System T1—R_f 0.64 (location reagent acidified iodoplatinate spray, positive reaction).
Gas Chromatography System G2/225—retention time 0.85 (relative to codeine); system G4—retention time 1.05 (relative to codeine).
Ultraviolet Spectrum Aqueous acid (0.1 N sulfuric acid)—258, 252, 264 nm.

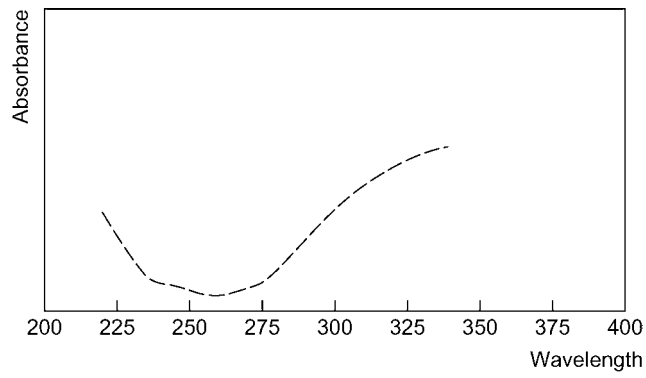
Etretinate

Dermatological Agent
$C_{23}H_{30}O_3$ = 354.5
CAS—54350-48-0

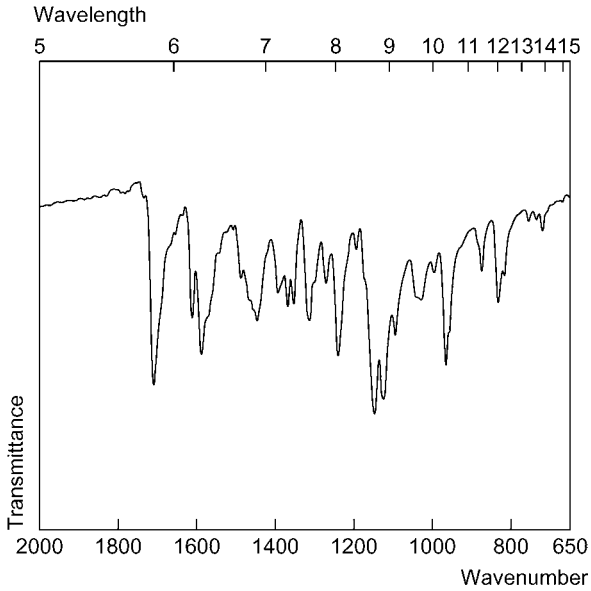
IUPAC Name Ethyl (2*E*,4*E*,6*E*,8*E*)-9-(4-methoxy-2,3,6-trimethylphenyl)-3,7-dimethylnona-2,4, 6,8-tetraenoate
Synonyms (*all-E*)-9-(4-Methoxy-2,3,6-trimethylphenyl)-3,7-dimethyl-2,4,6,8-nonatetraenoic acid ethyl ester; Ro-10-9359.
Proprietary Names *Tegison*; *Tigason*.



Chemical Properties Crystals. Mp 104° to 105°.
Gas Chromatography Column: methyl silicone (HP1, 0.2 mm i.d., 0.33 µm). Temperature: 280°. Carrier gas: He, flow rate 0.9 mL/min. Detection: mass spectrometer. Retention index: 2761 [Mills, Roberson 1993].
High Performance Liquid Chromatography Column: ODS Hypersil (100 × 4.6 mm i.d., 5 µm). Mobile phase: methanol, flow rate 1 mL/min. UV detection (λ=365 nm). Retention time: 3.4 min [Mills, Roberson 1993].
Ultraviolet Spectrum



Infrared Spectrum Principal peaks at wavenumbers 1703, 1140, 957 cm^{-1} (KBr disk).



Quantification

Plasma **HPLC** UV detection (λ=350 nm). Limit of detection, 3 μg/L [De Leenheer *et al.* 1990]. UV detection (λ=360 nm). Limit of quantification, 2 μg/L [Wyss, Bucheli 1988]. Column: Nucleosil 5 C_{18} (250 × 4.6 mm), steel. Mobile phase: acetonitrile : 0.1 mol/L ammonium acetate (80:20), flow rate 2.5 mL/min. UV diode array detection. Retention time: 6.8 min. Limit of detection, 1 μg/L [Jakobsen *et al.* 1987]. UV detection. Limit of detection, 4 μg/L [Paravicini, Busslinger 1983]. UV detection. Limit of detection, 25 μg/L [Besner *et al.* 1982].

Disposition in the Body Etretinate is rapidly absorbed after an initial lag time of ~1 h following oral administration. Peak plasma concentrations occur after about 2 to 6 h. Absorption is increased by administration with milk or fatty food. The drug undergoes significant first-pass metabolism (hydrolysis) and the active metabolite is acitretin (the carboxyl acid, Ro 10-1670) which may itself be metabolised to etretinate. Subsequent metabolism occurs to inactive 13-*cis*-acitretin (Ro 13-7652, the major metabolite in blood following multiple dosing) and other metabolites. Etretinate accumulates in adipose tissue (especially in liver and subcutaneous fat) after repeated dosing; detectable concentrations have been found in serum up to 3 years after discontinuation of therapy. Up to 75% of a dose is excreted via bile in faeces mainly as the unchanged drug, acitretin, β-glucuronides and other minor metabolites (18 metabolites have been identified in total). It is also excreted in urine as metabolites. No intact drug is present in urine. It crosses the placenta and is distributed into breast milk.

Therapeutic Concentration

Peak plasma concentrations of 180 to 353 μg/L (mean 238 μg/L) occurred after 3 to 3.5 h in patients with severe psoriasis (aged between 41 and 72 years) who had been taking 40 mg of etretinate daily for 3 months. The drug was administered after an overnight fast and also patients fasted for 3 h after dosing [Larsen *et al.* 1987].

Toxicity Etretinate is teratogenic at therapeutic doses.

Bioavailability 40%.

Half-life Plasma half-life, 120 days.

Volume of Distribution 40 L/kg (measured after oral administration).

Distribution in Blood Blood : plasma ratio, 0.60. Red blood cell : plasma, 0.11.

Protein Binding >99% (mainly to lipoproteins).

Dose Initially, 0.75 to 1 mg/kg per day with a maximum of 1.5 mg/kg, orally. 75 mg daily should not be exceeded.

Besner JG *et al.* (1982). High-performance liquid chromatography of Ro 10-9359 (tigason) and its metabolite Ro 10-1670 in human plasma. *J Chromatogr* 231: 467–472.

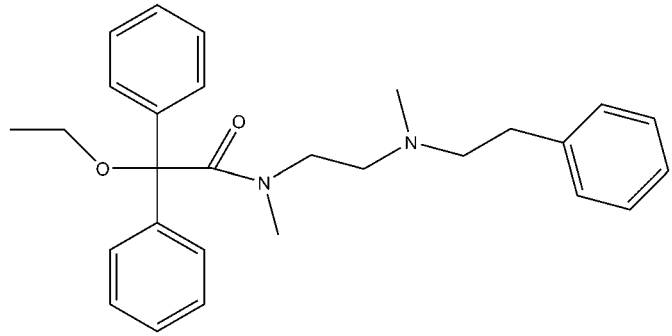
Etymide

Acetamide, Analgesic

$C_{28}H_{34}N_2O_2$ = 430.6

IUPAC Name 2-Ethoxy-*N*-methyl-*N*-[2-(methyl-(2-phenylethyl)amino)ethyl]-2,2-di(phenyl)acetamide

Synonyms Carbiphene; etomide; SQ 10269.



Chemical Properties Extracted by organic solvents from aqueous alkaline solutions.

Etymide Hydrochloride

Proprietary Names *Bandol*; *Jubalon*.

Colour Tests Ammonium molybdate test—orange→blue (limit of detection, 0.1 μg).

Thin-layer Chromatography System T1—R_f 0.72 (location reagent acidified iodoplatinate spray, positive reaction).

Ultraviolet Spectrum Aqueous acid (0.1 N sulfuric acid)—258, 263 nm, and an inflexion at ~270 nm.

Dose Up to 450 mg daily has been given.

Etynodiol Diacetate

Progestational Steroid

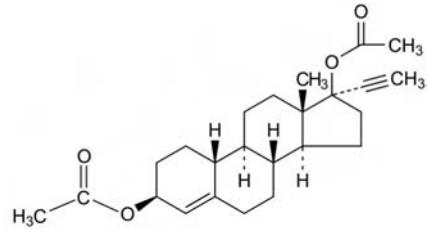
$C_{24}H_{32}O_4$ = 384.5

CAS—1231-93-2 (etynodiol); 297-76-7 (diacetate)

IUPAC Name [(3*S*,8*R*,9*S*,10*R*,13*S*,14*S*,17*R*)-17-Acetyloxy-17-ethynyl-13-methyl-2,3,6,7,8,9,10,11,12,14,15,16-dodecahydro-1*H*-cyclopenta[*a*]phenanthren-3-yl] acetate

Synonym (3β,17α)-19-Norpregn-4-en-20-yne-3,17-diol diacetate

Proprietary Names *Femulen*; *Lutométrodiol*. It is an ingredient of *Conova 30*, *Demulen*, *Normex*, *Ovulen* and *Zovia*.



Chemical Properties A white crystalline powder. Mp 126° to 131°. Very slightly soluble in water; soluble 1 in 15 of ethanol, 1 in 1 of chloroform and 1 in 3.5 of ether. Log *P* (octanol/water), 3.6 (etynodiol).

Thin-layer Chromatography System TB—R_f 0.11; system TE—R_f 0.71; system TF—R_f 0.57; system TP—R_f 0.83; system TQ—R_f 0.61; system TR—R_f 0.95; system TS—R_f 0.99; system TAE—R_f 0.89.

Gas Chromatography System GA— RI 2445 and RI 2779.

High Performance Liquid Chromatography System HX—RI 549.

Infrared Spectrum Principal peaks at wavenumbers 1252, 1226, 1746, 1737, 1012, 1028 cm^{-1} (KBr disk).

Dose 0.5 to 6 mg daily.

Eucatropine

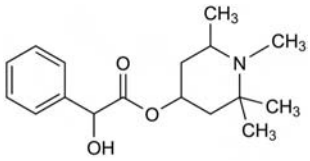
Anticholinergic

$C_{17}H_{25}NO_3$ = 291.4

CAS—100-91-4

IUPAC Name (1,2,2,6-Tetramethylpiperidin-4-yl) 2-hydroxy-2-phenylacetate

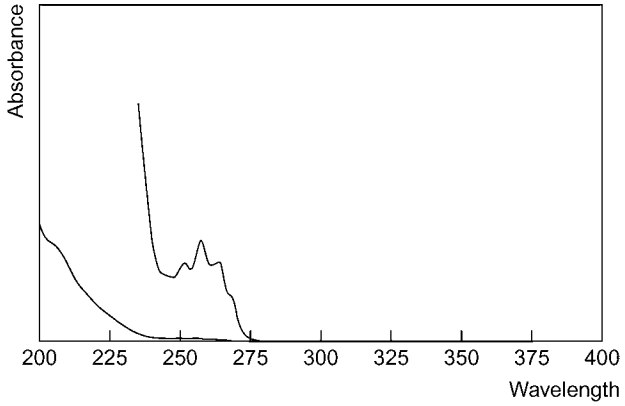
Synonym α-Hydroxybenzeneacetic acid 1,2,2,6-tetramethyl-4-piperidinyl ester



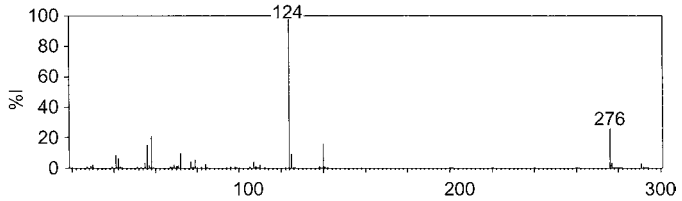
Chemical Properties Log *P* (octanol/water), 1.9.

Eucatropine Hydrochloride
$C_{17}H_{25}NO_3$,HCl = 327.9
CAS—536-93-6
Chemical Properties A white granular powder. Mp 183° to 186°. Very soluble in water; freely soluble in ethanol and chloroform; practically insoluble in ether.

Thin-layer Chromatography System TA—R_f 0.46; system TB—R_f 0.18; system TC—R_f 0.13; system TE—R_f 0.60; system TL—R_f 0.12; system TAJ—R_f 0.03; system TAK—R_f 0.02; system TAL—R_f 0.33 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2026.
Ultraviolet Spectrum Aqueous acid—252, 258 (A^1_1=6.8a), 264 nm.



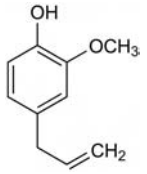
Infrared Spectrum Principal peaks at wavenumbers 1720, 1235, 1740, 1295, 1145, 1262 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 124, 276, 58, 140, 56, 72, 125, 41.



Use Eucatropine hydrochloride is used as a 2 to 10% ophthalmic solution.

Eugenol

Essential Oil
$C_{10}H_{12}O_2$ = 164.2
CAS—97-53-0
IUPAC Name 2-Methoxy-4-(2-propenyl)phenol
Synonyms 4-Allylguaiacol; caryophyllic acid; eugenic acid.



Chemical Properties Eugenol is the principal constituent of clove oil. A colourless or pale-yellow liquid with an odour of clove. It darkens in colour with age or on exposure to air. Mass per mL 1.064 to 1.068 g. Bp 255°. Refractive index, at 20°, 1.540 to 1.542. Practically insoluble in water; soluble 1 in 2 of ethanol (70%); miscible with ethanol, chloroform and ether; soluble in glacial acetic acid and in aqueous fixed alkali hydroxide solutions. pK_a 9.8 (20°). Log *P* (octanol/water), 2.3.
Thin-layer Chromatography System TA—R_f 0.95; system TE—R_f 0.87; system TAJ—R_f 0.85; system TAK—R_f 0.78; system TAL—R_f 0.96.
Gas Chromatography System GA—RI 1368; system GB—RI 1380.
High Performance Liquid Chromatography System HY—RI 430.
Ultraviolet Spectrum Aqueous alkali—246 (A^1_1=552b), 296 nm (A^1_1=262b); ethanol—232 (A^1_1=406b), 282 nm (A^1_1=193b).
Mass Spectrum Principal ions at *m/z* 164, 149, 131, 137, 103, 77, 133, 165.
Quantification
Serum **HPLC** For method of quantification, see Fischer and Dengler [1990].
Urine **GC–MS** For method for quantification of eugenol and other methoxyphenols, see Dills *et al.* [2001].
HPLC See Serum [Fischer, Dengler 1990].
Bile **HPLC** See Serum [Fischer, Dengler 1990].

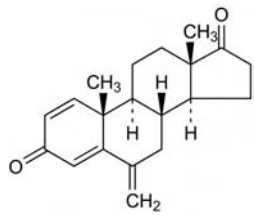
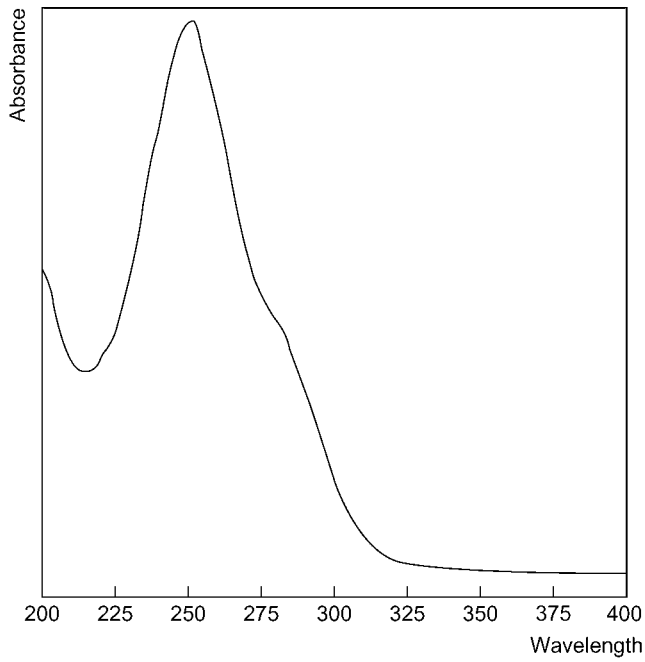
Exemestane

Aromatase Inhibitor, Antineoplastic
$C_{20}H_{24}O_2$ = 296.4
CAS—107868-30-4
IUPAC Name (8*R*,9*S*,10*R*,13*S*,14*S*)-10,13-Dimethyl-6-methylidene-7,8,9,11,12,14,15,16-octahydrocyclopenta[*a*]phenanthrene-3,17-dione
Synonyms FCE-24304; 6-methylenandrosta-1,4-diene-3,17-dione.
Proprietary Name *Aromasin*



Chemical Properties A white to slightly yellow crystalline powder. It is freely soluble in *N*,*N*-dimethylformamide; soluble in methanol; practically insoluble in water.
Ultraviolet Spectrum Aqueous acid (pH 4)—251 nm.



Quantification
Plasma **HPLC** Column: Zorbax SB C_8 (150 × 4.6 mm i.d., 5 µm). Mobile phase: 100% acetonitrile, flow rate 1 mL/min. MS–MS detection. Retention time: 2.3 min. Limit of quantification, 0.05 µg/L [Cenacchi *et al.* 2000]. Column: RP18 Lichrocart (125 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.05 mol/L potassium dihydrogen phosphate (pH 4.5) (35:65), flow rate 1.5 mL/min. UV detection (λ=247 nm). Retention time: exemestane, 14 min; 17-dihydroexemestane, 10 min. Limit of quantification, 10 µg/L [Breda *et al.* 1993].
Disposition in the Body Exemestane is rapidly absorbed after oral administration; more rapidly in women with breast cancer compared with those without. The presence of food can enhance absorption. It is extensively distributed into body tissues and is cleared from systemic circulation mainly by metabolism. The drug

undergoes extensive metabolism, in the liver, by oxidation and reduction to inactive or active metabolites which are less active than the parent drug including the 17-dihydro metabolite. Plasma levels can increase, by up to 40%, when the drug is administered with a high-fat meal. Plasma levels of the metabolite, 17-hydroxyexemestane are less than one tenth of the corresponding unchanged drug level. Exemestane is excreted, equally, in both urine and faeces with <1% of the dose being detected unchanged in urine.

Therapeutic Concentration

Thirty-two healthy post-menopausal women were administered multiple doses of 1.0, 2.5, 5.0 and 10.0 mg daily (8 volunteers each dose) for 7 days. Peak plasma concentrations were generally reached within 1 to 2 h and the concentrations measured on day 7 were 0.83, 2.18, 7.29 and 11.04 µg/L for the four doses, respectively [Persiani *et al.* 1995].

Fifteen healthy post-menopausal women, with a mean age of 60 years (range 48 to 75 years) and a mean time from menopause of 12.3 years (2 to 36 years), were administered single doses of 50, 200, 400 and 800 mg exemestane 15 to 30 min after a high lipid breakfast. Subjects were observed for 2 weeks at each dose level before it was increased. Peak plasma concentrations, observed between 1 and 2 h, were 27, 221, 343 and 414 µg/L for the doses, respectively [Evans *et al.* 1992].

Half-life Approximately 24 to 27 h.

Clearance Total, 517 L/h.

Distribution in Blood Distribution of the drug and its metabolites into blood cells is negligible.

Protein Binding 90%, especially albumin and α_1-acid glycoprotein.

Dose 25 mg once daily.

Exifone

Nootropic

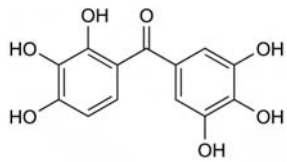
$C_{13}H_{10}O_7$ = 278.2

CAS—52479-85-3

IUPAC Name (2,3,4-Trihydroxyphenyl)(3,4,5-trihydroxyphenyl)methanone

Synonym 4-Galloylpyrogallol

Proprietary Name *Adlone*



Chemical Properties A pale-yellow crystalline powder. Mp 270°. Log *P* (octanol/water), 1.89.

High Performance Liquid Chromatography Column: C_{18} RCM NovaPak (4 µm, 100 × 5 mm i.d.). Mobile phase: acetonitrile : 300 mmol/L orthophosphoric acid (pH 2.2) (15:85), flow rate 0.9 mL/min. Electrochemical detection. Retention time: 8 min [Descombe *et al.* 1989].

Quantification

Plasma **HPLC** Limit of quantification, 1.0 ng/L [Descombe *et al.* 1989].

Urine **HPLC** See Plasma [Descombe *et al.* 1989].

Toxicity

In a reported fatality, a 74-year-old woman administered with 600 mg/day of exifone for memory loss developed hepatitis after 5 months of treatment [Pateron *et al.* 1990].

Dose 200 mg three times daily with a maximum of 1200 mg daily.

Descombe JJ *et al.* (1989). Determination of exifone in human plasma and urine by high-performance liquid chromatography with electrochemical detection. *J Chromatogr* 496: 345–353.

Ezetimibe

Antihyperlipidaemic, 2-Azetidinone, Cholesterol Absorption Inhibitor

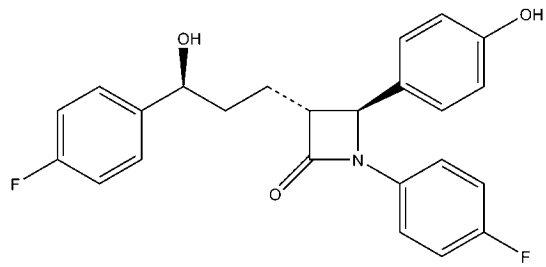
$C_{24}H_{21}F_2NO_3$ = 409.4

CAS—163222-33-1

IUPAC Name (3*R*,4*S*)-1-(4-fluorophenyl)-3-[(3*S*)-3-(4-fluorophenyl)-3-hydroxypropyl]-4-(4-hydroxyphenyl)azetidin-2-one

Synonyms (3*R*,4*S*)-1-(*p*-Fluorophenyl)-3-[(3*S*)-3-(*p*-fluorophenyl)-3-hydroxypropyl]-4-(*p*-hydroxyphenyl)-2-azetidinone; Sch-58235.

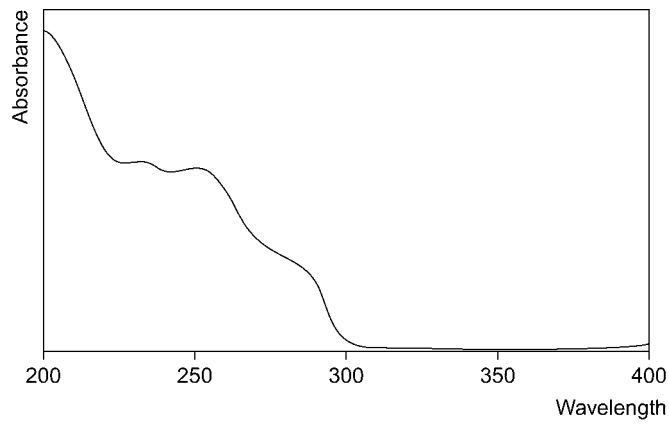
Proprietary Names *Acotral*; *Alin*; *Alipas*; *Cerclerol*; *Cetrakam*; *Coracil*; *Ezetrol*; *Ixacor*; *Lipimibe*; *Nalecol*; *Sinterol*; *Trilip*; *Vadel*; *Zetia*; *Zient.* It is also an ingredient of *Adacai*; *Alipas Duo*; *Ampliar Duo*; *Ateroclar Duo*; *Inegy*; *Vytorin*; *Zintrepid*.



Chemical Properties White solid. Mp 164° to 166°. pK_a 9.66. Log *P* (octanol/water), 4.39 [Oswald *et al.* 2006a]. For degradation studies of ezetimibe under various stress conditions, see Chaudhari *et al.* [2007] and Singh *et al.* [2006].

High Performance Liquid Chromatography Column: Lichrospher C_8 (250 × 4.0 mm i.d., 4 µm). Mobile phase: 0.02 mol/L ammonium acetate (pH 7.0) : acetonitrile (70 : 30 to 0 : 100 over 80 min), flow rate 1.0 mL/min. UV detection (λ = 250 nm). Retention time: ezetimibe 26.9 min; degradation products I, II, III, IV, V, VII and VII, 12.9, 16.5, 23.3, 29.2, 30.8, 43.0 and 50.5 min, respectively [Singh *et al.* 2006]. Column: Kromasil 100 C_{18} (250 × 4.0 mm i.d., 5 µm). Mobile phase: water-0.05% 1-heptane sulfonic acid (pH 6.8) : acetonitrile (30 : 70), flow rate 0.5 mL/min. UV detection (λ = 232 nm). Limit of quantification, 0.5 mg/L [Sistla *et al.* 2005].

Ultraviolet Spectrum Chaudhari et al [2007]



Quantification

Plasma **HPLC** Column: Capcell Pak C_{18} MG (50 × 2 mm i.d., 5 µm). Mobile phase: acetonitrile : 5 mmol/L ammonium acetate (70 : 30 to 100 : 0 over 0.1 min for 1.4 min to 30 : 70 over 0.1 min for 3.4 min), flow rate 0.25 mL/min. TSI, negative ion mode, MRM acquisition mode. Limit of quantification, unchanged ezetimibe 0.02 µg/L, total ezetimibe 0.25 µg/L [Li *et al.* 2006].

LC-MS Column: Spherisorb ODS-2 (100 × 4.6 mm i.d., 10 µm). Mobile phase: methanol : 0.025 mol/L ammonium acetate (90 : 10), flow rate 1.5 mL/min. API, positive ion mode, SRM acquisition mode. Limit of quantification, unchanged ezetimibe 1.0 µg/L, total ezetimibe 5.02 µg/L [Patrick *et al.* 2002].

Serum **LC-MS** Column: C_{18} (100 × 2.1 mm i.d., 3.5 µm). Mobile phase: acetonitrile : water (60 : 40), flow rate 0.2 mL/min. APCI, negative ion mode, MRM acquisition mode. Limit of quantification, unchanged ezetimibe 0.1 µg/L, total ezetimibe 1.0 µg/L [Oswald *et al.* 2006b].

Urine **LC-MS** See Serum. Limit of quantification, unchanged ezetimibe or total ezetimibe 25 µg/L [Oswald *et al.* 2006b]. See Plasma [Patrick *et al.* 2002].

Faeces **LC-MS** See Serum. Limit of quantification, unchanged ezetimibe or total ezetimibe 100 µg/L [Oswald *et al.* 2006b]. See Plasma [Patrick *et al.* 2002].

Other **HPLC** Tablets. Column: LiChrospher 100 C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water : methanol (pH 4.0; 60 : 25 : 15), flow rate 1.5 mL/min. UV detection (λ = 238 nm). Retention time: 2.04 min. Limit of quantification, 3.0 mg/L; limit of detection, 0.7 mg/L [Chaudhari *et al.* 2007]. Human Liver Microsomes and Rat Bile. Column: C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.05 mol/L formic acid (pH 3.0) : water-acetonitrile (10 : 90) : water-methanol (10 : 90; 100 : 0 : 0 to 90 : 0 : 10 over 2 min, to 50 : 20 : 30 over 7 min, to 50 : 25 : 25 over 3 min, to 30 : 50 : 20 over 13 min, to 10 : 85 : 5 over 3 min for 7 min), flow rate 1.0 mL/min. UV detection (λ = 250 nm). Retention time: ezetimibe 29.0 min, ezetimibe glucuronide 24.2 min, ezetimibe ketone glucuronide 27.8 min, ezetimibe ketone 30.6 min. Limit of quantification, 0.02 mg/L [Basha *et al.* 2007].

Disposition in the Body Rapidly absorbed when given orally and undergoes extensive conjugation in the small intestine and liver to an active glucuronide metabolite, which is the main circulating form. The major metabolic pathway consists of glucuronidation of the 4-hydroxyphenyl group by uridine 5′-diphosphate-glucuronosyltransferase isoenzymes. The parent drug and its conjugate are then transported through portal vessels to the liver, where ezetimibe undergoes further glucuronidation and subsequent biliary secretion into the intestine, forming further minor metabolites. After an oral dose, ~78% is excreted in the faeces, mainly as ezetimibe, and approx. 11% is excreted in the urine, mainly as the glucuronide. Ezetimibe undergoes enterohepatic recycling.

Therapeutic Concentration

Eight healthy volunteers were administered either ezetimibe alone (two 10 mg fast-release tablets) or concomitantly with a 600 mg tablet of rifampin. Mean peak plasma concentrations and time to peak concentration for ezetimibe and its glucuronide were reported as follows:

	Ezetimibe		*Glucuronide*	
	Without rifampin	*With rifampin*	*Without rifampin*	*With rifampin*
C_{max} (μg/L)	4.7	12.0	107	282
Time (h)	4.8	1.9	1.1	2.7

The differences observed in plasma concentrations are thought to be due to the inhibition of hepatic organic anion-transporting polypeptides by rifampin [Oswald *et al.* 2006b].

Eight healthy male volunteers were given a single dose of 20 mg [^{14}C] ezetimibe as a capsule. Peak plasma concentrations of free, conjugated and total ezetimibe were 5.21, 61.2 and 64.2 μg/L, respectively, reached after 9.9, 2.3 and 2.3 h, respectively. On average, ~89% of the administered dose was excreted in urine (11%) and faeces (78%) by 240 h post-administration. The major metabolite observed in plasma was ezetimibe glucuronide; ezetimibe was not observed in plasma samples taken 24 h post-dose. This was also the case in urine; however, additional minor metabolites were observed including the 4-hydroxyphenyl glucuronide conjugate of the ketone analogue of ezetimibe. In faeces, unconjugated ezetimibe accounted for approx. 96% of the chromatographic radioactivity together with another minor metabolite resulting from the oxidation of the benzylic hydroxyl group to a ketone [Patrick *et al.* 2002].

Half-life Approximately 22 h for both ezetimibe and its glucuronide conjugate.

Protein Binding >90% for both ezetimibe and its glucuronide conjugate.

Note For a review of ezetimibe, see Kosoglou *et al.* [2005].

Dose Given orally in a usual dose of 10 mg once daily.

Famciclovir

Antiviral

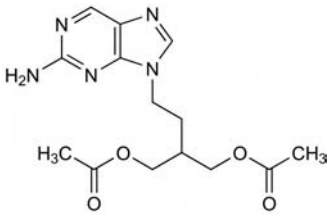
$C_{14}H_{19}H_5O_4 = 321.3$

CAS—104227-87-4

IUPAC Name [2-(Acetyloxymethyl)-4-(2-aminopurin-9-yl)butyl] acetate

Synonyms 9-[4-Acetoxy-3-(acetoxymethyl)but-1-yl]-2-aminopurine; BRL-42810; FCV.

Proprietary Names *Famvir*; *Vectavir*.

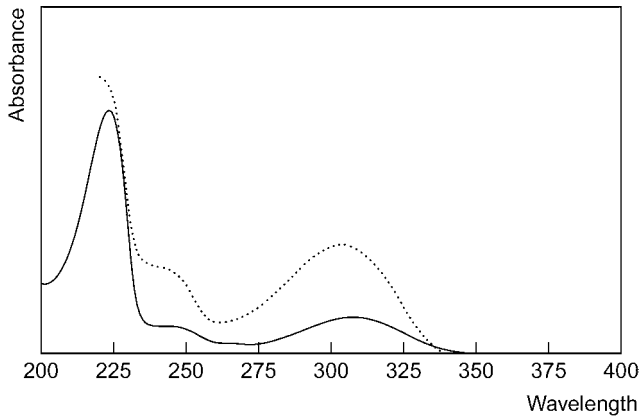


Chemical Properties A white to pale-yellow solid. Mp 102° to 104°. It is soluble in water (>25% at 25°), acetone and methanol; sparingly soluble in ethanol and isopropanol. Log *P* (octanol/water, pH 4.8), 1.09; log *P* (octanol/buffer pH 7.4), 2.08.

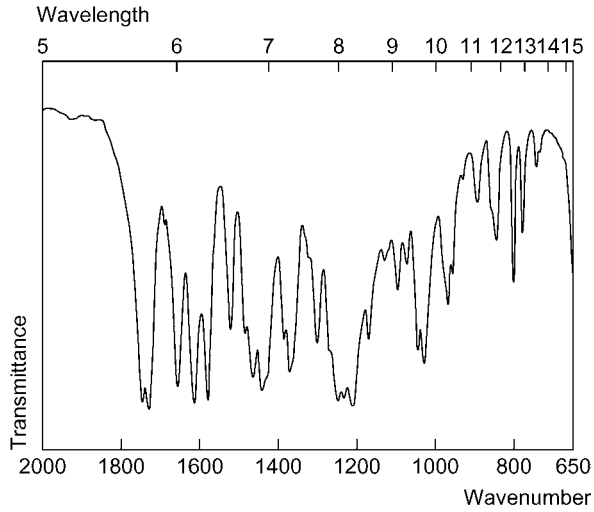
Gas Chromatography Column: methyl silicone (HP1, 0.2 mm i.d., 0.33 µm). Temperature: 280°. Carrier gas: He, flow rate 0.9 mL/min. MS detection. Retention index: 2552 [Mills, Roberson 1993].

High Performance Liquid Chromatography Column: ODS Apex 1 (100 × 4.6 mm i.d., 3 µm). Mobile phase: (A)-methanol : 0.01 mol/L disodium hydrogen orthophosphate (pH 7.0) (7:93); (B)-methanol : 0.01 mol/L disodium hydrogen orthophosphate (pH 7.0) (35:65). Elution programme: (A:B) (100:0) to (0:100) in 4 min, held for 1.5 min, back to initial conditions in 1 min, flow rate 2.0 mL/min. UV detection: dual wavelength (λ_1=254 nm, λ_2=305 nm). Retention time: penciclovir (metabolite), 1.6 min; 6-deoxyfamciclovir precursor, 2.6 min; famciclovir, 6.0 min [Winton *et al.* 1990].

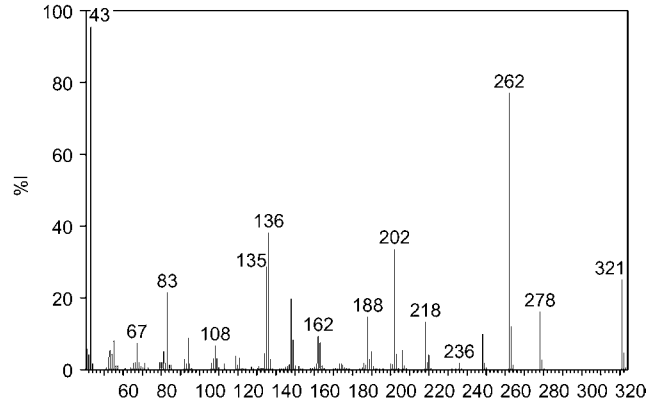
Ultraviolet Spectrum Aqueous acid—224, 246, 310 nm; basic—304 nm.



Infrared Spectrum Principal peaks at wavenumbers 1730, 1616, 1216 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 43, 262, 136, 202, 135, 321, 83, 148.



Quantification

***Plasma* HPLC** Column: ODS Apex 1 (100 × 4.6 mm i.d., 3 µm). Mobile phase: methanol : 0.01 mol/L sodium phosphate buffer (pH 7.0) (5:95), flow rate 1.0 mL/min. UV detection: dual wavelength (λ_1=254 nm, λ_2=305 nm). Retention time: penciclovir, 7.8 min; 6-deoxyfamciclovir precursor, 14.0 min. Limit of quantification, 0.2 mg/L [McMeekin *et al.* 1992].

***Urine* HPLC** See Plasma. Limit of quantification, 10 mg/L [McMeekin *et al.* 1992].

Disposition in the Body Famciclovir is rapidly absorbed after oral administration and converted, by deacetylation, in blood, and oxidation (aldehyde oxidase), in the liver, to penciclovir (BR-39123) and several inactive metabolites. Virtually no famciclovir is detected in plasma or urine. Penciclovir is converted by intracellular virus-induced thymine kinase to penciclovir triphosphate which is responsible for the antiviral activity. The drug is excreted, primarily, in urine as the metabolite, penciclovir, and the 6-deoxy precursor, BRL-42359. 73% of penciclovir can be detected in urine over 24 h and the remainder appears in faeces. Elimination is reduced in patients with renal impairment.

Therapeutic Concentration

Twenty healthy male volunteers, with a mean age of 36 years, were administered single oral doses of 125, 250, 500 and 750 mg famciclovir, after 10 h fasting. The peak plasma concentrations of penciclovir: 0.84, 1.59, 3.34 and 5.09 mg/L, respectively, were reached within 0.5 to 0.75 h. Concentrations reached below 0.2 mg/L within 6 h for the 125 and 250 mg doses, and within 10 h for the higher doses [Pue *et al.* 1994].

Bioavailability Approximately 77%.

Half-life 2 to 3 h.

Volume of Distribution Steady state, 0.98 to 1.08 L/kg; metabolite, penciclovir, 1.5 L/kg.

Clearance Approximately 0.48 L/h/kg.

Distribution in Blood The blood : plasma ratio for the metabolite, penciclovir is ~1.0.

Protein Binding The metabolite, penciclovir is <20% bound.

Dose The usual dose administered is between 250 and 500 mg every 8 h. Dosing interval is extended in patients with renal impairment.

Famotidine

Histamine H_2-Receptor Antagonist, Antiulcerative

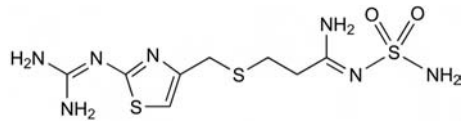
$C_8H_{15}N_7O_2S_3 = 337.5$

CAS—76824-35-6

IUPAC Name 3-[[[2-[(Aminoiminomethyl)amino]-4-thiazolyl]methyl]thio]-*N*-(aminosulfonyl)propanimidamide

Synonyms Famotidinum; L643341; MK-208; YM-11170.

Proprietary Names *Amfamox*; *Brolin*; *Dispromil*; *Famodil*; *Famodine*; *Famosan*; *Famoxal*; *Ganor*; *Gastor*; *Gastropen*; *Ifada*; *Lecedil*; *Motiax*; *Pepcid*; *Pepcidac*; *Pepcidin*; *Pepcidine*; *Pepdine*; *Pepdul*; *Ulcusan*; *Ulfinol*.



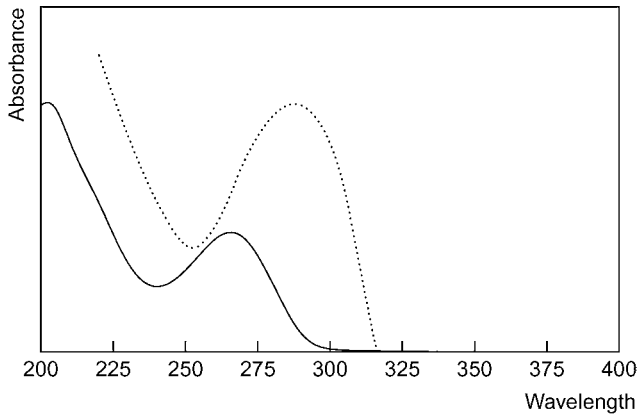
Chemical Properties A white to pale yellowish white crystalline powder with Mp 163° to 164°. Protect from light. It is very slightly soluble in water (0.1% at 20°) and dehydrated alcohol; practically insoluble in acetone, alcohol, chloroform (< 0.01%, 20°), ether and ethyl acetate (< 0.01%, 20°); slightly soluble in methyl alcohol; freely soluble in dimethylformamide (80%, 20°) and glacial acetic acid (50%, 20°). It dissolves in dilute mineral acids. pK_a 7.06. Log *P* (octanol/water), −0.64.

Thin-layer Chromatography System TB—R_f 0.00; system TE—R_f 0.25; system TAE—R_f 0.53.

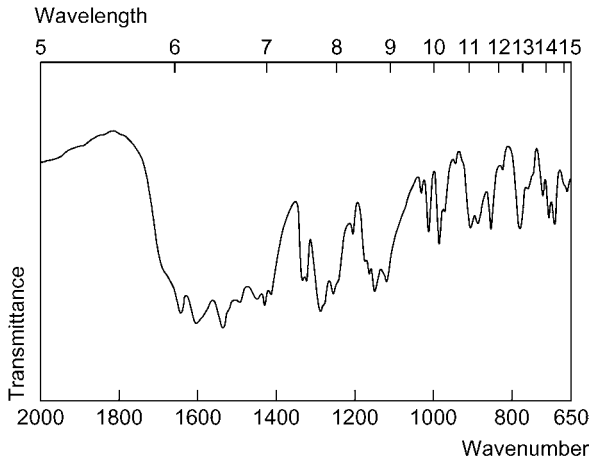
High Performance Liquid Chromatography System HX—RI 233;.system HY —RI 191; system HZ—retention time 1.8 min; system HAA—retention time 3.5 min.

Column: LC-8 Supelcosyl (250 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : acetonitrile : 0.016 mol/L phosphoric acid (10:10:80), flow rate 1.0 mL/min. UV detection (λ=254 nm). Retention time: 9.5 min [Carlucci *et al.* 1988].

Ultraviolet Spectrum Aqueous acid—265 nm; basic—286 nm.



Infrared Spectrum Principal peaks at wavenumbers 1638, 1535, 1290, 781 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 188, 155, 113, 43, 45, 85, 69, 146.

Quantification

***Plasma* HPLC** Column: ODS-3 Prodigy (250 × 3.9 mm i.d., 5 µm). Mobile phase: acetonitrile : 2.5 g/L heptanesulfonic acid in 20 mmol/L sodium acetate buffer (pH 4.7) (23:77), flow rate 1.0 mL/min. Internal standard (IS): cimetidine. UV detection (λ=267 nm). Retention time: 8.4 min; IS, 6.8 min. Limit of detection, 0.075 mg/L [Dowling, Frye 1999]. UV detection (λ=267 nm). Limit of quantification, 1 µg/L [Zhong, Yeh 1998]. UV detection (λ=267 nm). Limit of quantification, 5 µg/L [Wanwimolruk *et al.* 1991]. UV detection (λ=267 nm). Limit of quantification, 0.005 mg/L [Vincek *et al.* 1985].

***Urine* HPLC** See Plasma. Limit of detection, 1 mg/L [Dowling, Frye 1999]. See Plasma. Limit of quantification, 0.5 mg/L [Vincek *et al.* 1985].

Disposition in the Body After IV administration, the plasma famotidine concentration–time profile exhibits a biexponential decay. Famotidine is readily but incompletely absorbed after oral administration. There are three formulations available (tablet, capsule and suspension), which appear to be bioequivalent. Only a small amount of the drug is metabolised in the liver to famotidine *S*-oxide and the remainder is excreted unchanged in urine (~67%). The drug is widely distributed in body tissues and can be detected in breast milk. Famotidine interacts neither with the hepatic oxidative drug metabolism nor with tubular secretion of other commonly used therapeutic agents such as theophylline, warfarin and procainamide. Coadministration of potent antacids reduces the oral absorption of famotidine by 20 to 30%. A prolongation of elimination half-life and a decrease in total body clearance and renal clearance are observed in patients with renal failure, indicating that dosage adjustment may be necessary in patients who have renal insufficiency. No significant changes occur in famotidine disposition in patients with cirrhosis indicating that no reduction in drug dosage should be necessary in these patients. The pharmacokinetics and pharmacodynamics of IV famotidine appear to be similar in both children over the age of 1 year and adults.

Therapeutic Concentration The serum therapeutic concentration range is 0.02 to 0.06 mg/L.

Eight healthy males, aged between 22 and 27 years, were administered a single 40 mg dose of famotidine, after an overnight fast. Peak plasma levels of 0.156 ± 0.022 mg/L were reached within 3 h [Barzaghi *et al.* 1989].

Ten young patients, aged between 5 and 19 days, were administered a 0.5 mg/kg body weight infusion over 15 min. Peak concentrations of 0.641 mg/L were reached by the end of administration [James *et al.* 1998].

Plasma concentrations following IV continuous infusion of 40 (group A) or 20 (group B) mg/day over more than two days, were analysed in 10 adult patients. The mean age, dose and plasma concentration were 64.8 years, 0.81 mg/kg/day and 0.141 mg/L in group A, and 54.2 years, 0.34 mg/kg/day and 0.045 mg/L in group B, respectively [Espitia *et al.* 1992].

Toxicity Convulsions and mental deterioration have been reported in the elderly with renal failure owing to grossly elevated plasma and cerebrospinal fluid concentrations of the drug. Toxic epidermal necrolysis can also occur. Since 1992, there have been 60 reports of serious blood dyscrasias.

Bioavailability 20 to 66%.

Half-life Distribution half-life is ~0.18 to 0.5 h in adults. Elimination half-life is ~3 h in adults, which can increase to 24 h in patients with suppressed urine excretion. The elimination half-life for infants is ~10 h. Elimination half-life is 3.3 h in paediatric patients with normal kidney function, aged between 2 and 7 years.

Volume of Distribution In adults: 0.94 to 1.33 L/kg; in infants: 0.82 L/kg. In paediatric patients (aged between 2 and 7 years): 1.4 L/kg.

Clearance 0.19 to 0.43 L/min. In patients with end-stage renal failure: 0.034 L/min. In paediatric patients with normal kidney function: 0.3 L/h/kg.

Protein Binding 15 to 22%.

Dose A usual dose of 20 to 40 mg is administered once or twice daily. A paediatric dosage for IV famotidine is 0.3 to 0.5 mg/kg every 8 to 12 h similarly as adults. Patients with impaired renal function: dose is reduced or dose interval extended.

F

Famprofazone

Analgesic

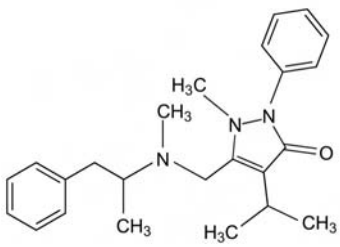
$C_{24}H_{31}N_3O = 377.5$

CAS—22881-35-2

IUPAC Name 1-Methyl-5-[[methyl(1-phenylpropan-2-yl)amino]methyl]-2-phenyl-4-propan-2-ylpyrazol-3-one

Synonym 4-Isopropyl-1-methyl-5-[*N*-methyl-*N*-(α-methylphenethyl)aminomethyl]-2-phenyl-4-pyrazolin-3-one

Proprietary Name It is an ingredient of *Gewodin*.



Chemical Properties A white crystalline powder. Mp 132° to 133°. Practically insoluble in water; slightly soluble in dilute acetic acid.

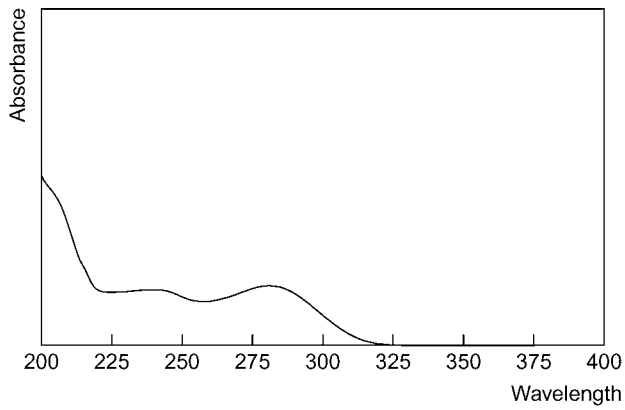
Colour Tests Liebermann's reagent—red-orange; Marquis test—orange.

Thin-layer Chromatography System TA—R_f 0.72; system TB—R_f 0.37; system TC—R_f 0.74; system TE—R_f 0.87; system TL—R_f 0.67; system TAE—R_f 0.90 (acidified iodoplatinate solution, positive).

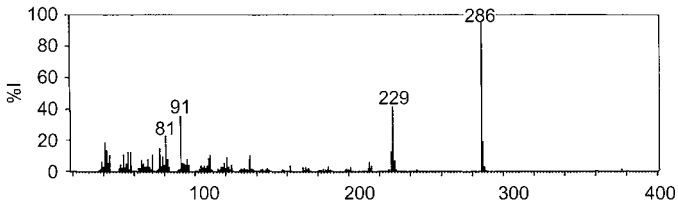
Gas Chromatography System GA—Famprofazone RI 2965, M (OH-propyphenazone) RI 2410, M (OH-propyphenazone)-AC RI 2240, M (metamfetamine) RI 1175.

High Performance Liquid Chromatography System HD—*k* 2.5.

Ultraviolet Spectrum Aqueous acid—243, 279 nm (A_1^1=248a).



Mass Spectrum Principal ions at *m/z* 286, 229, 91, 81, 287, 41, 77, 228.



Disposition in the Body

Therapeutic Concentration

After a single 100 mg dose of famprofazone to 2 subjects, the plasma concentration of metamfetamine was 24 to 44 µg/L over 2 to 12 h and declined to 10 µg/L in one subject and an undetectable level in the other after 24 h [Oh *et al.* 1992].

Dose Famprofazone has been given in doses of up to 150 mg daily.

Oh ES *et al.* (1992). Plasma and urinary concentrations of methamphetamine after oral administration of famprofazone to man. *Xenobiotica* 22(3): 377–384.

Fasudil

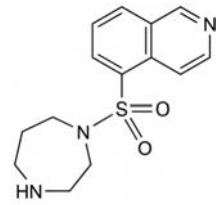
Vasodilator

$C_{14}H_{17}N_3O_2S = 291.4$

CAS—103745-39-7

IUPAC Name 5-(1,4-Diazepan-1-ylsulfonyl)isoquinoline

Synonym Hexahydro-1-(5-isoquinolinylsulfonyl)-1*H*-1,4-diazepine



Fasudil Hydrochloride

$C_{14}H_{17}N_3O_2S,HCl = 327.8$

CAS—105628-07-7

Synonyms AT-877; HA-1077.

Proprietary Names *Eril*; *Fadil*.

Chemical Properties A white crystalline powder with Mp 219.3°. It is soluble in water up to 2×10^{-2} mol/L at pH 5.0 to 7.0.

Fazadinium Bromide

Muscle Relaxant

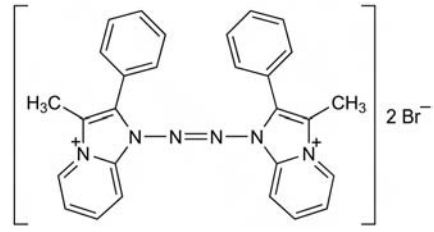
$C_{28}H_{24}Br_2N_6 = 604.3$

CAS—36653-54-0 (fazadinium); 49564-56-9 (bromide)

IUPAC Name (*E*)-bis(3-Methyl-2-phenylimidazo[1,2-*a*]pyridin-4-ium-1-yl) diazene dibromide

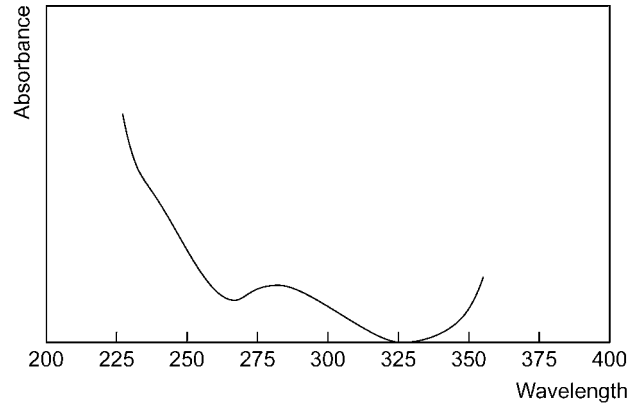
Synonym 1,1′-Azobis[3-methyl-2-phenylimidazo[1,2-*a*]pyridinium] dibromide

Proprietary Name *Fazadon*



Chemical Properties A yellow solid. Mp 215°. Soluble in water.

Ultraviolet Spectrum Aqueous acid—283 nm (A_1^1=188a).



Infrared Spectrum Principal peaks at wavenumbers 1280, 1220, 1160, 1250, 760, 780 cm^{-1} (Nujol mull).

Quantification

Plasma **Spectrofluorimetry** Limit of detection, 50 µg/L [Pastorino 1978].

Disposition in the Body About 50% of a dose is excreted in the urine in 24 h, mainly unchanged. Extensive biliary excretion has been reported.

Therapeutic Concentration

Following an IV dose of 70 mg to 5 subjects, the mean plasma concentration was >10 mg/L at 2 min and 2.2 mg/L at 1 h [D'Souza *et al.* 1979].

Half-life Plasma half-life, about 1 h.

Volume of Distribution About 0.3 L/kg.

Clearance Plasma clearance, about 3 mL/min/kg.

Protein Binding About 17%.

Dose Initially, the equivalent of 0.75 to 1 mg/kg of fazadinium, intravenously.

D'Souza J *et al.* (1979). 125I-labelled Rose Bengal in the quantitative estimation of fazadinium and other quaternary ammonium compounds in biological fluids. *J. Pharm. Pharmacol* 31(6): 416–418.

Pastorino AM (1978). Fluorimetric determination and pharmacokinetic studies of fazadinium bromide in dogs. *Arzneimittelforschung* 28: 1728–1730.

Felbamate

Anticonvulsant

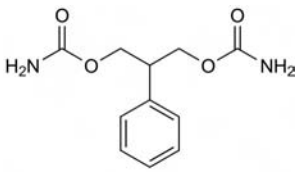
$C_{11}H_{14}N_2O_4 = 238.2$

CAS—25451-15-4

IUPAC Name (3-Carbamoyloxy-2-phenylpropyl) carbamate

Synonyms ADD-03055; 2-phenyl-1,3-propanediol dicarbamate; W-554.

Proprietary Names *Felbamyl*; *Felbatol*; *Taloxa*; *Taloxoral*.



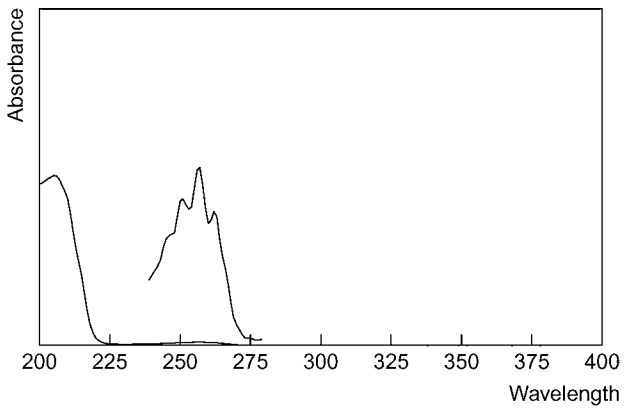
Chemical Properties A white, odourless powder with Mp 151° to 152°. It is sparingly soluble in water, methanol, ethanol, acetone, and chloroform; freely soluble in dimethylsulfoxide, 1-methyl-2-pyrrolidinone, and dimethylformamide. Log *P* (octanol/water), 0.76.

Gas Chromatography System GB—RI 1475.

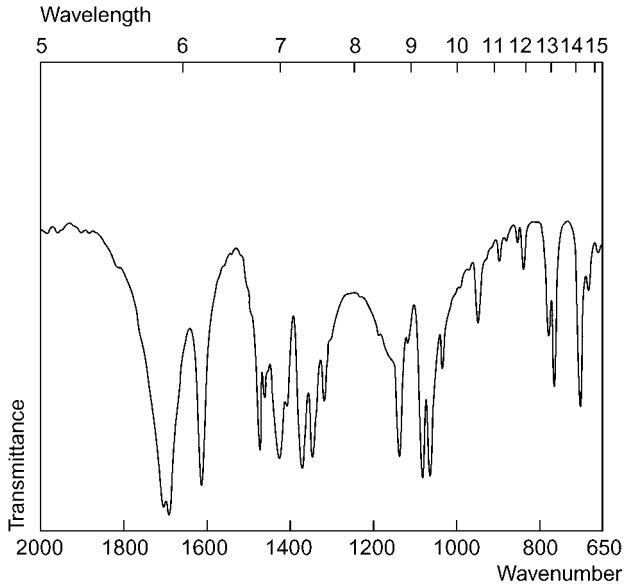
Column: DB-1 (30 m × 0.25 mm i.d., 0.25 µm). Temperature: 240°. Injector and detector temperatures: 280° and 320°, respectively. Carrier gas: H_2, 15 psi inlet pressure. Detection: FID. IS: 2-methyl-2-phenyl-1,3-propanedioldicarbamate. Retention time(s): felbamate, 2.29 min; IS, 2.50 min [Poquette 1995].

High Performance Liquid Chromatography Column: ODS-2 Spherisorb (150 × 4.6 mm i.d., 3 µm). Mobile phase: potassium dihydrogen phosphate (4.2 g in 850 mL water (pH 4.0)) and 150 mL acetonitrile, flow rate 1.0 mL/min. IS: 2-methyl-2-phenyl-1,3-propanedioldicarbamate. Retention time: felbamate, 11.0 min; 2-hydroxyfelbamate, 4.5 min; p-hydroxyfelbamate, 3.2 min; monocarbamate derivative, 7.1 min; IS, 18.8 min [Romanyshyn *et al.* 1994].

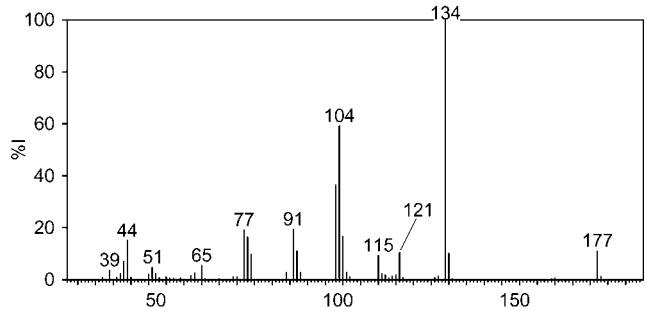
Ultraviolet Spectrum Aqueous acid—251, 256, 262 nm; basic—246, 251, 256, 262 nm.



Infrared Spectrum Principal peaks at wavenumbers 1693, 1614, 1082 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 134, 104, 103, 91, 77, 78, 105, 44.



Quantification

Serum **GC–MS** Column: methylsilicone HP (10 m × 0.53 mm i.d., 0.33 µm). Temperature programme: held at 170° for 0.1 min, increased to 280° at 10°/min, held for 2 min. Injector and detector temperatures: 235° and 300°, respectively. Carrier gas: He, flow rate 16.4 mL/min, hydrogen 4 mL/min, and air 75 mL/min. Detection: nitrogen selective. IS: methylfelbamate. Retention time: felbamate, 3.71 min; IS, 4.11 min. Limit of detection and quantification, 5 mg/L [Gur *et al.* 1995].

HPLC Column: C_{18} Zorbax (250 × 4.6 mm i.d.). Mobile phase: acetonitrile : methanol : tetrahydrofuran : phosphate buffer (210:410:500:2880), flow rate 1.5 mL/min. UV detection (λ=254 nm). IS: methylfelbamate. Retention time: felbamate, 5.0 min; IS, 7.0 min. Limit of detection and quantification, 5 mg/L [Gur *et al.* 1995].

Disposition in the Body Felbamate is well absorbed (~90%) after oral administration and is partly metabolised in the liver by hydroxylation and conjugation, to produce active and inactive metabolites. The drug is excreted in urine unchanged (40 to 50%), as unidentified metabolites and conjugates (40%) and known active metabolites (15%), including 2-hydroxyfelbamate, *p*-hydroxyfelbamate, a monocarbamate derivative, and 3-carbamoyloxy-2-phenyl propionic acid. <5% of the dose is excreted in faeces.

Therapeutic Concentration The therapeutic plasma concentration is between 30 and 80 µg/L.

A study was carried out with 24 healthy, elderly volunteers (male and female), aged between 66 and 78 years, and 11 younger volunteers, 18 to 45 years. Low dosage regimen: a single dose of 600 mg felbamate was administered on day 1, followed by 600 mg every 12 h (days 6 to 7) and 600 mg every 12 h (days 8 to 14) for a multiple dosing study. High dosage regimen: a single 1200 mg dose was administered on day 1 followed by 600 mg every 12 h and 1200 mg every 12 h, on the respective days. For the elderly group, peak plasma concentrations of 13.0 and 22.0 µg/L were reached for the low and high single doses, respectively. For the younger volunteers, 8.9 and 19.6 µg/L were reached, respectively. All peak concentrations were reached within 2 h of administration. After multiple dosing, peak plasma concentrations reached 32.7 and 78.5 µg/L for the low and high doses, respectively (young) and 41.1 and 75.5 µg/L, respectively for the elderly [Richens *et al.* 1997].

Toxicity

Acute liver failure has been reported with 4 fatalities out of 8 cases [Schering-Plough 1994] and aplastic anaemia with 2 out of 10 cases resulting in death [US report 1994].

Half-life Elimination half-life, 14 to 23 h.
Volume of Distribution 0.76 to 0.81 L/kg.
Clearance 25 mL/min/kg (single dose), 41 mL/min/kg (repeated dose).
Distribution in Blood Equilibrates freely between plasma and whole blood.
Protein Binding 22 to 36%.
Dose An initial dose of 1.2 g daily is administered to adults with a maximum 3.6 g daily. In children: an initial dose of 15 mg/kg body weight, maximum 45 mg/kg. Dose may be adjusted for patients with renal dysfunction.

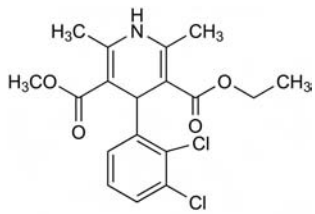
Felodipine

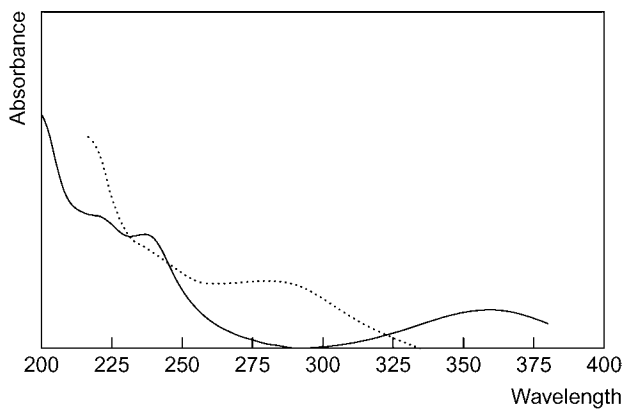
Antihypertensive
$C_{18}H_{19}Cl_2NO_4 = 384.3$
CAS—72509-76-3; 86189-69-7

IUPAC Name 5-*O*-Ethyl 3-*O*-methyl 4-(2,3-dichlorophenyl)-2,6-dimethyl-1,4-dihydropyridine-3,5-dicarboxylate
Synonyms 4-(2,3-Dichlorophenyl)-1,4-dihydro-2,6-dimethyl-3,5-pyridinedicarboxylic acid ethyl methyl ester; felodipinum; H-154/82.
Proprietary Names *Agon*; *Feloday*; *Felodur*; *Fensil*; *Flodil*; *Hydac*; *Modip*; *Munobal*; *Perfudal*; *Plendil*; *Preslow*; *Prevex*; *Renedil*; *Spendil*.

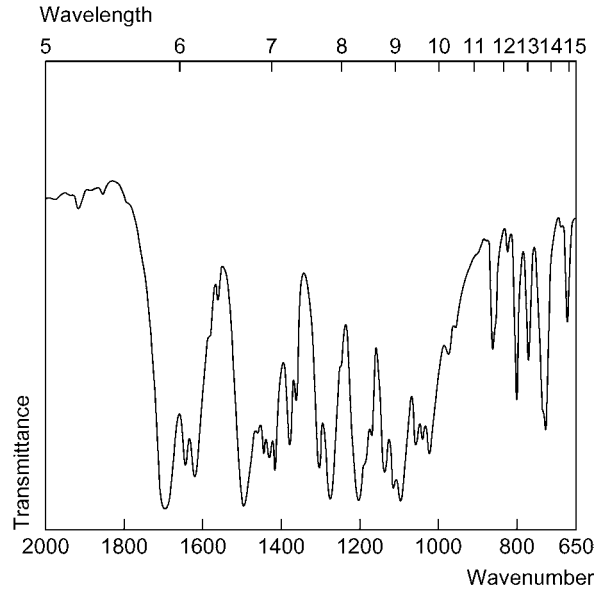


Chemical Properties A white to light-yellow crystalline powder. Mp 145°. Protect from light. It is practically insoluble in water (19.17 mg/L at 25°); freely soluble in acetone, absolute alcohol, methyl alcohol and dichloromethane. Log *P* (octanol/water), 3.86. Extraction yield (chlorobutane), 0.95 [Demme *et al.* 2005].
Thin-layer Chromatography System TB—R_f 0.02; system TE—R_f 0.77; system TF—R_f 0.60; system TAE—R_f 0.87.
Gas Chromatography System GB—RI 2793; system GP—RI 2235 M ((dehydro-desethyl)-ME); RI 2280 M (dehydro-).

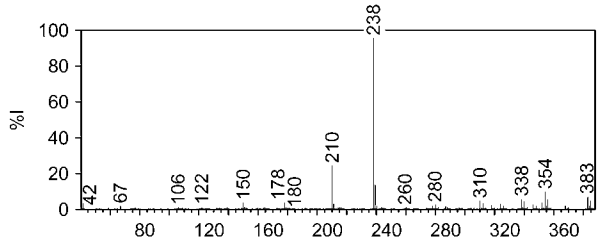
Column: methyl silicone HP1 (0.2 mm i.d., 0.33 μm). Temperature: 280°. Carrier gas: He, flow rate 0.9 mL/min. Detection: mass spectrometer. Retention index: 2647 [Mills, Roberson 1993].
High Performance Liquid Chromatography System HX—RI 690; system HZ—retention time 25.8 min; system HAA—retention time 24.4 min.
Ultraviolet Spectrum Aqueous acid—237, 359 nm; basic—281 nm.



Infrared Spectrum Principal peaks at wavenumbers 1698, 1496, 1206, 1099 cm^{-1} (KBr pellet).



Mass Spectrum Principal ions at *m/z* 238, 210, 239, 354, 383, 338, 178, 310.



Quantification
Plasma **GC** Limit of quantification, 0.1 μg/L for felodipine, 0.3 μg/L for its metabolite [Soons *et al.* 1990]. Column: silica (25 m × 0.32 mm i.d.), silanised with diphenyltetramethyldisilazane. Temperature: programmed: 8°/min to 270°. Injector and detector temperatures: 270° and 350°, respectively. Carrier gas: He at 1.2 bar pressure. Detection: electron capture, ^{63}Ni. Retention time: 14.8 min [Ahnoff 1984]. Limit of detection, 0.4 to 0.8 μg/L [Ahnoff 1984].

HPLC Column: RP-select B LiChrospher 60 (250 × 4.0 mm i.d., 5 μm). Mobile phase: A-methanol : 0.05 mol/L phosphate buffer (pH 3.5) (45:55); B-methanol: 0.05 mol/L phosphate buffer (pH 3.5) (80:20), flow rate 1.15 mL/min. Elution program: (A:B) (100:0) for 17 min, to (0:100) in 5 min, held for 5 min. UV detection (λ=220 nm). Internal standard (IS): 3,5-pyridine dicarboxylic acid. Retention time: felodipine metabolites, M3, 10.4 min; M4, 17.4 min; M6, 9.4 min; M7, 15.1 min; IS, 13.2 min. Limit of detection, 8 μg/L [Gabrielsson *et al.* 1992]. Limit of detection, 5 μg/L for each enantiomer [Soons *et al.* 1990].
Disposition in the Body Felodipine is almost completely absorbed after oral administration and undergoes extensive first-pass metabolism in the liver, by microsomal cytochrome P450 3A enzyme, to form a pyridine analogue (1,4-dihydropyridine goes to inactive dehydrofelodipine). Subsequent oxidation results in ~15 inactive metabolites. 70% of a dose is excreted in urine, with <0.5% unchanged, and the rest in faeces, as metabolites.
Therapeutic Concentration The serum therapeutic concentration range is 1 to 8 μg/L.

A total of 140 volunteers: men and women, healthy and hypertensive (all women), aged between 20 and 39 years (70 people), 40 and 59 (30 people) and 60 and 80 years (40 people) were administered doses of 5 mg twice daily and 10 mg twice daily. The duration of the treatment varied from 6 to 30 days. Peak plasma concentrations increased with age where levels of 0.019 ± 0.009, 0.023 ± 0.010, 0.030 ± 0.0129 nmol/L were reached for the 20 to 39 years, 40 to 59, 60 to 80 age groups, respectively. All peak levels were reached within 2 h [Blychert *et al.* 1991].

Twelve healthy males, mean age 25 years (range, 20 to 34 years) were administered with 20 mg (racemate) felodipine. Peak plasma concentrations for the racemate drug were 30.3 (13.6 to 47.6) μg/L; for (*S*)-felodipine, 20.4 (0.53 to 32.7) μg/L and (*R*)-felodipine, 9.77 (5.07 to 15.6) μg/L. All concentrations were observed at a mean of 58 min (range 19 to 180) [Soons *et al.* 1993].

Toxicity The serum toxic concentration range is 10 to 15 μg/L. Overdosing may cause excessive peripheral vasodilation with marked hypotension and possibly bradycardia.
Bioavailability 15%.
Half-life 11 to 16 h (oral administration in normal patients); 2 h (patients with renal failure).
Volume of Distribution Apparent volume of distribution, 10 L/kg (normal patients); 5.6 L/kg (patients with cirrhosis).
Clearance Systemic plasma clearance, about 0.8 L/min.
Protein Binding Approximately 99%, mainly albumin.

Dose An initial dose of 5 mg daily is given followed by a usual maintenance dose of 2.5 to 10 mg. Elderly and patients with impaired liver function: initial dose of 2.5 mg daily.

Fenamiphos

Nematocide

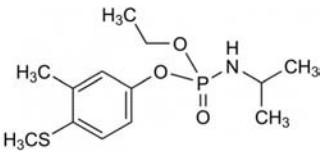
$C_{13}H_{22}NO_3PS = 303.4$

CAS—22224-92-6

IUPAC Name *N*-[Ethoxy-(3-methyl-4-methylsulfanylphenoxy)phosphoryl] propan-2-amine

Synonyms B-68138; Bay 68138; Bayer 68138; (1-methylethyl)phosphoramidic acid ethyl 3-methyl-4-(methylthio)phenyl ester; phenamiphos; SRA-3886.

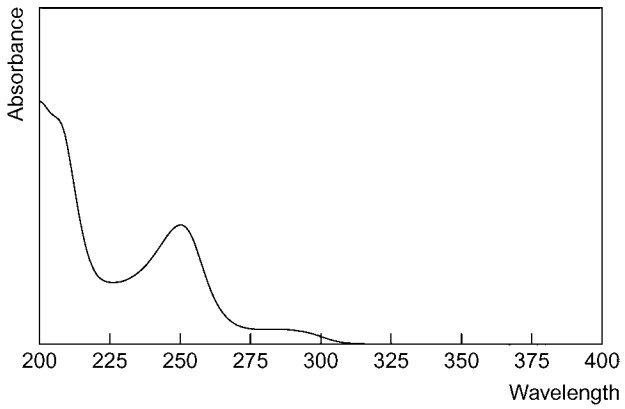
Proprietary Name *Nemacur*



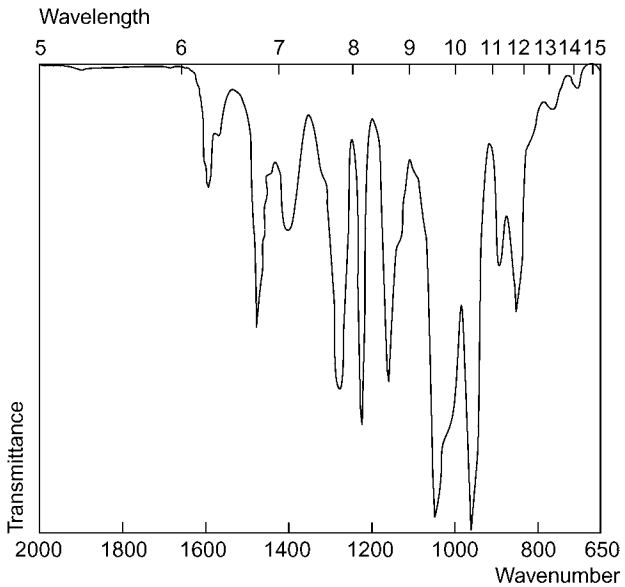
Chemical Properties A colourless, crystalline solid or a tan, waxy solid (technical state). Mp 49°. It is soluble in water (329 mg/L at 20°), 2-propanol, dichloromethane, toluene, and isopropanol. pK_a 10.5 (25°). Log *P* (octanol/water), 3.25.

Gas Chromatography System GA—RI 2020.

Ultraviolet Spectrum Principal peak at 250 nm.



Infrared Spectrum Principal peaks at wavenumber 967, 1049, 1226, 1278, 1158, 1473 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 303, 154, 217, 44, 288, 80, 260, 153.

Disposition in the Body Fenamiphos is readily absorbed after oral ingestion (~95%) and after inhalation, via the lungs. It is rapidly broken down within the body to produce the two major oxidative metabolites—fenamiphos sulfoxide and fenamiphos sulfone—which may be followed by subsequent hydrolysis and conjugation. These are excreted in urine. The majority of a dose is recovered in urine 15 h after exposure.

Toxicity Fenamiphos is highly toxic if ingested orally and by inhalation. It can also cause acute dermal toxicity if exposed and significant eye damage at acute exposure levels. The allowed daily intake is 0.5 µg/kg body weight.

Fenbendazole

Anthelmintic

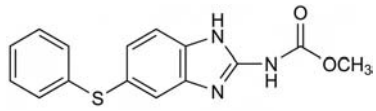
$C_{15}H_{13}N_3O_2S = 299.3$

CAS—43210-67-9

IUPAC Name Methyl *N*-(6-phenylsulfanyl-1*H*-benzimidazol-2-yl)carbamate

Synonym [5-(Phenylthio)-1*H*-benzimidazol-2-yl]carbamic acid methyl ester

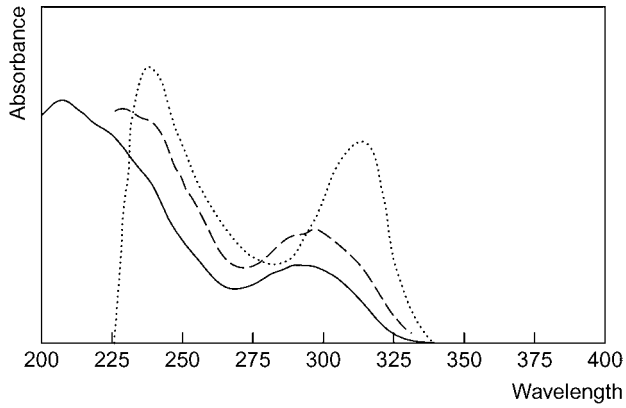
Proprietary Names *Axilur*; *Curazole*; *Fencare*; *Fenzol*; *Flexadin*; *Forazole*; *Granofen*; *Multiwurma-F*; *Orazole*; *Panacur*; *Parazole*; *Safe-Guard*; *Wormaway Feben*; *Zerofen* (all vet.).



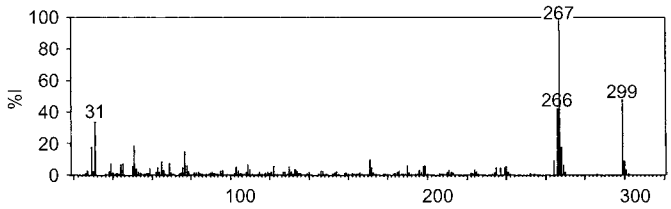
Chemical Properties A light brownish-grey crystalline powder. Mp 233°, with decomposition. Insoluble in water; freely soluble in dimethyl sulfoxide. Log *P* (octanol/water), 3.8.

High Performance Liquid Chromatography System HY—RI 370.

Ultraviolet Spectrum Aqueous acid—289, 302 nm; aqueous alkali—238, 312 nm; ethanol—296 nm (A^1_1=416b).



Mass Spectrum Principal ions at *m/z* 267, 299, 266, 31, 51, 268, 29, 77.



Dose Fenbendazole has been given in doses of 1 to 1.5 g.

Fenbufen

Analgesic

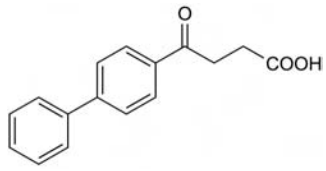
$C_{16}H_{14}O_3 = 254.3$

CAS—36330-85-5

IUPAC Name 4-Oxo-4-(4-phenylphenyl)butanoic acid

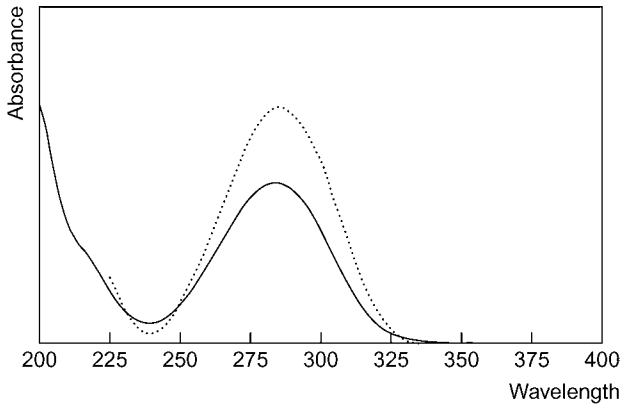
Synonym γ-Oxo-[1,1′-biphenyl]-4-butanoic acid

Proprietary Names *Cincopal*; *Cinopal*; *Lederfen*; *Reugast*.

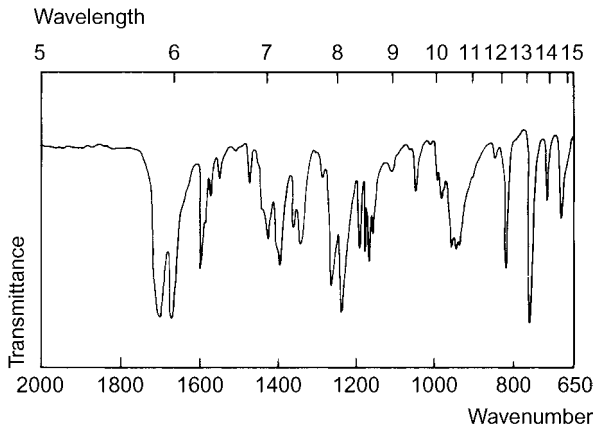


Chemical Properties Crystals. Mp about 180°. pK_a 4.5. Log *P* (octanol/water), 3.2.

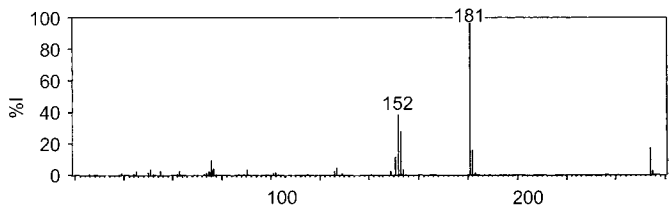
Colour Tests Liebermann's reagent—red-brown; Marquis test—orange→brown; sulfuric acid—yellow.
Thin-layer Chromatography System TA—R_f 0.92; system TD—R_f 0.18; system TE—R_f 0.04; system TF—R_f 0.30; system TG—R_f 0.09; system TAD—R_f 0.39; system TAJ—R_f 0.43; system TAK—R_f 0.68; system TAL—R_f 0.91.
Gas Chromatography System GA—fenbufen RI 3078, fenbufen-Me RI 2315; System GD—methyl derivative RRT 1.79 (relative to n-$C_{16}H_{34}$); system GL—fenbufen-Me RI 1975, M (acetic acid OH-)-Me_2 RI 2190.
High Performance Liquid Chromatography System HD—*k* 4.0; system HV—RRT 0.81 (relative to meclofenamic acid); system HX—RI 520; system HY—RI 461; system HAA—retention time 19.3 min.
Ultraviolet Spectrum Aqueous alkali—285 nm (A^1_1= 835a).



Infrared Spectrum Principal peaks at wavenumbers 764, 1674, 1708, 1242, 1268, 829 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 181, 152, 153, 254, 182, 151, 76, 127; fenbufen-Me *m/z* 181, 152, 153, 182, 268, 237; M (acetic acid OH-)-Me_2 *m/z* 197, 256, 154, 128, 152, 198.



Quantification
Plasma **GC** FID. Limit of detection, 50 µg/L for fenbufen, 100 µg/L for metabolites (i) and (ii) (see under Disposition in the Body) [Cuisinaud *et al.* 1978].

HPLC UV detection. Fenbufen, rufloxacin and felbinac. Limit of detection, 0.3 mg/L for fenbufen [Carlucci *et al.* 1996].
Serum **HPLC** Limit of detection, 300 to 800 µg/L for fenbufen and other NSAIDs [Haque, Stewart 1999]. Fluorescence detection. Limit of detection, 10 µg/L for fenbufen and its metabolites [Siluveru, Stewart 1996]. UV detection. Limit of detection, 500 µg/L for fenbufen and metabolites (i) and (ii) [Fleitman *et al.* 1982]. UV detection. Limit of detection, 500 µg/L for fenbufen and metabolites [Van Lear *et al.* 1978].
Urine **HPLC** UV detection. Fenbufen and other NSAIDs. Limit of detection, 0.05 mg/L for fenbufen [Hirai *et al.* 1997]. See Serum. Limit of detection, 1 µg/L for fenbufen and metabolites [Van Lear *et al.* 1978].
Disposition in the Body Readily absorbed after oral administration, and extensively metabolised to active metabolites. A number of metabolites have been identified including (i) 4-(biphenyl-4-yl)-4-hydroxybutyric acid, (ii) biphenyl-4-ylacetic acid, (iii) (4′-hydroxybiphenyl-4-yl)acetic acid, and (iv) 4-hydroxy-(4′-hydroxybiphenyl-4-yl)butyric acid. About 40% of a dose is excreted in the urine in 24 h. The major urinary metabolites are metabolite (iii), about 11% of the dose, and metabolite (iv), about 17% of the dose; metabolites (i) and (ii) are excreted in amounts less than about 3% of the dose. Very little unchanged drug is excreted in the urine. <2% of the dose is eliminated in the faeces in 24 h.

Therapeutic Concentration

After a single oral dose of 600 mg administered to 3 subjects, mean peak serum concentrations of 8.1 mg/L of fenbufen and 64.9 mg/L of metabolite (i) were attained in about 2 h. A mean peak serum concentration of 13.2 mg/L of metabolite (ii) was attained in about 8 h [Chiccarelli *et al.* 1980].

Half-life Plasma half-life, fenbufen and metabolites (i) and (ii), about 10 h.
Protein Binding Fenbufen and metabolite (ii), >99%; metabolite (i), about 98%.
Note For a review of the pharmacokinetics of fenbufen, see Brogden *et al.* [1981].
Dose 600 to 900 mg daily.

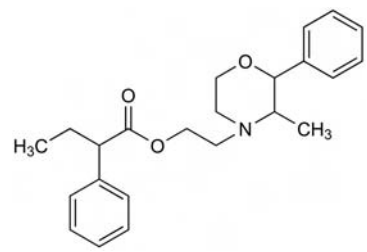
Fenbutrazate

Anorectic
$C_{23}H_{29}NO_3$ = 367.5
CAS—4378-36-3
IUPAC Name 2-(3-Methyl-2-phenylmorpholin-4-yl)ethyl 2-phenylbutanoate
Synonyms α-Ethylbenzeneacetic acid 2-(3-methyl-2-phenyl-4-morpholinyl) ethyl ester; phenbutrazate.



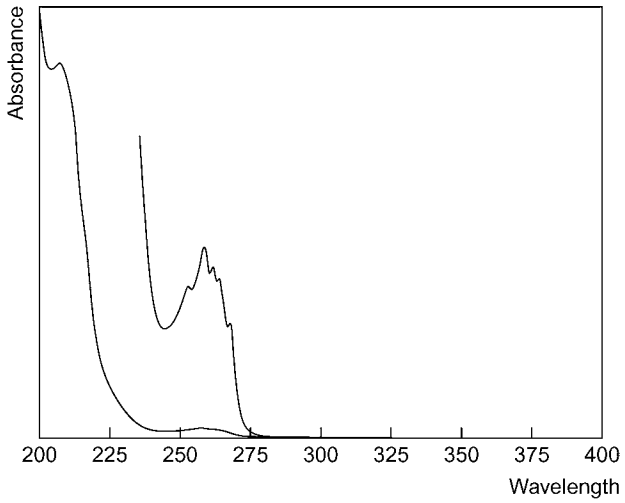
Chemical Properties A viscous oil. Soluble in methanol. Log *P* (octanol/water), 4.4.

Fenbutrazate Hydrochloride

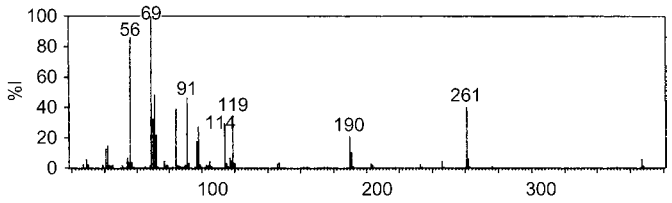
$C_{23}H_{29}NO_3$,HCl = 403.9
CAS—6474-85-7
Synonym Phenbutrazate hydrochloride
Chemical Properties A fine white crystalline powder. Mp 154°. Slightly soluble in water; soluble in ethanol and acetone; practically insoluble in ether and benzene.

Colour Tests Liebermann's reagent—red-orange; Marquis test—yellow (slow).

Thin-layer Chromatography System TA—R_f 0.72; system TB—R_f 0.47; system TC—R_f 0.78; system TE—R_f 0.86; system TL—R_f 0.67; system TAE—R_f 0.88 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2670.
High Performance Liquid Chromatography System HA—*k* 0.3.
Ultraviolet Spectrum Aqueous acid—252, 257 (A^1_1=10b), 261, 267 nm.



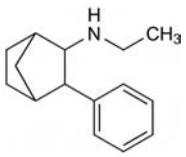
Infrared Spectrum Principal peaks at wavenumbers 1715, 1100, 1200, 690, 760, 1020 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 69, 56, 71, 91, 261, 84, 119, 70.



Dose Fenbutrazate hydrochloride has been given in doses of 40 to 60 mg daily.

Fencamfamin

CNS Stimulant
$C_{15}H_{21}N$ = 215.3
CAS—1209-98-9
IUPAC Name *N*-Ethyl-3-phenylbicyclo[2.2.1]heptan-2-amine



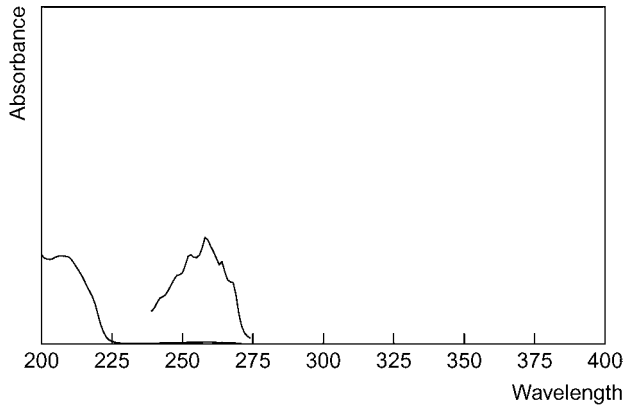
Chemical Properties Practically insoluble in water; soluble in chloroform. pK_a 8.7 (25°). Log *P* (octanol/water), 3.2.

Fencamfamin Hydrochloride

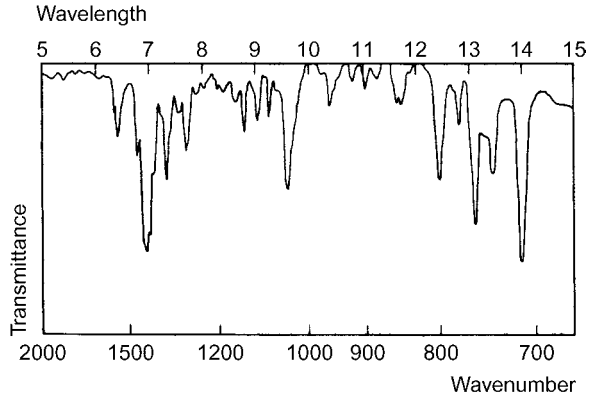
$C_{15}H_{21}N,HCl$ = 251.8
CAS—2240-14-4
Proprietary Name It is an ingredient of *Reactivan*.
Chemical Properties A white crystalline solid. Mp 192°. Freely soluble in water, ethanol, methanol and chloroform; slightly soluble in benzene; practically insoluble in ether.

Colour Tests Liebermann's reagent—red-orange; Marquis test—orange.
Thin-layer Chromatography System TA—R_f 0.54; system TB—R_f 0.62; system TC—R_f 0.34; system TE—R_f 0.77; system TL—R_f 0.30; system TAE—R_f 0.21 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—fencamfamin RI 1675, fencamfamin-AC RI 2085, fencamfamin-TFA RI 1970, fencamfamin-TMS RI 1780, fencamfamin-PFP RI 1755, M (desethyl-)-AC RI 2005, M (desethyl-OH-)-AC_2 RI 2305; system GB—RI 1737; system GC—RI 2180.
High Performance Liquid Chromatography System HA—*k* 1.3; system HC—*k* 0.72; system HX—RI 354; system HY—RI 309.

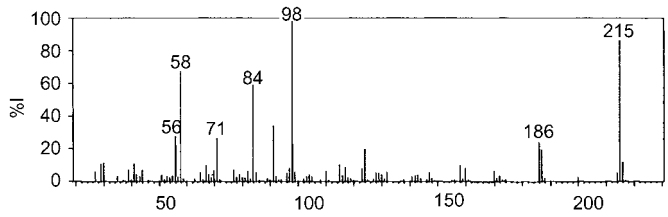
Ultraviolet Spectrum Aqueous acid—253, 259 (A^1_1=10a), 265, 269 nm.



Infrared Spectrum Principal peaks at wavenumbers 708, 756, 1042, 797, 738, 1492 cm^{-1} (fencamfamin hydrochloride (Nujol mull)).



Mass Spectrum Principal ions at *m/z* 98, 215, 58, 84, 91, 56, 71, 186; fencamfamin-AC *m/z* 170, 142, 58, 97, 91, 84; M (desethyl-)-AC *m/z* 170, 142, 91, 171, 115, 229; M (desethyl-OH-)-AC_2 *m/z* 142, 168, 228, 91, 119, 287.



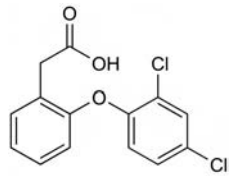
Quantification
Urine **GC** ECD. Limit of detection, 40 µg/L for fencamfamin, 50 µg/L for the desethyl metabolite [Delbeke, Debackere 1981].
Disposition in the Body Absorbed after oral administration. Metabolised by de-ethylation. About 10 to 30% of a dose is excreted in the urine as unchanged drug and desethylfencamfamin in 3 days. The extent and rate of excretion is dependent on the urinary pH.
Half-life Derived from urinary excretion data, about 16 h.
Dose Usually 30 mg of fencamfamin hydrochloride daily.

Delbeke FT, Debackere M (1981). Detection and metabolism of fencamfamine and the influence of acetazolamide on its urinary excretion. *Biopharm Drug Dispos* 2: 17–30.

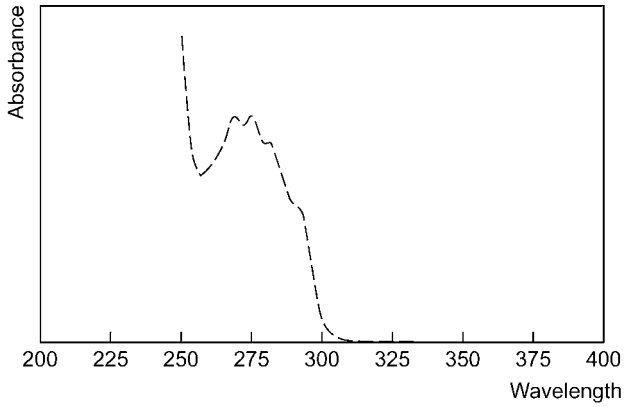
Fenclofenac

Analgesic
$C_{14}H_{10}Cl_2O_3$ = 297.1
CAS—34645-84-6

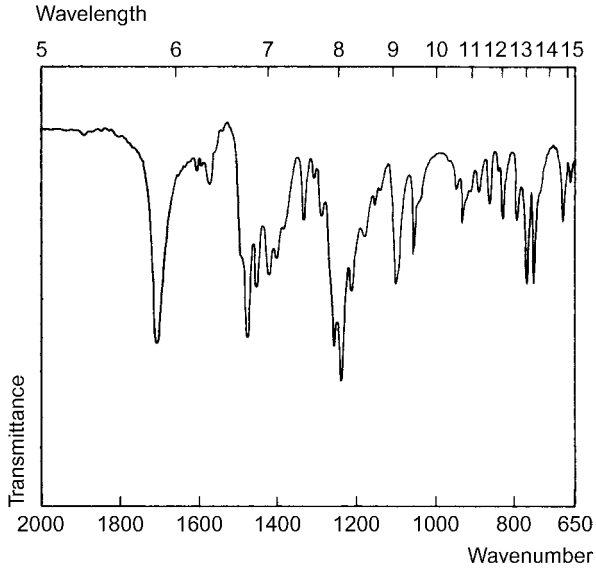
IUPAC Name [2-(2,4-Dichlorophenoxy)phenyl]acetic acid



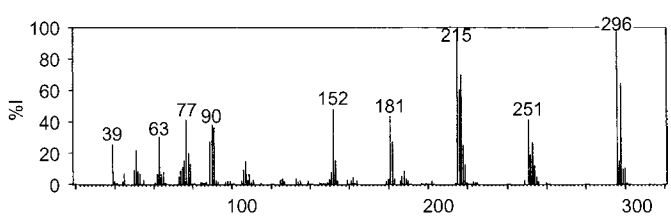
Chemical Properties A white powder. Mp about 136°. Slightly soluble in water, but less soluble in acid solutions; freely soluble in most organic solvents. pK_a 5.5. Log *P* (octanol/water), 4.8.
Colour Tests Liebermann's reagent—orange (slow), (→brown at 100°); Marquis test—red (slow).
Thin-layer Chromatography System TG—R_f 0.20.
Gas Chromatography System GD—methyl derivative RRT 1.55 and RRT 1.26 (relative to n-$C_{16}H_{34}$).
High Performance Liquid Chromatography System HV—RRT 0.91 (relative to meclofenamic acid).
Ultraviolet Spectrum Methanol—270 (A^1_1=72b), 276 nm.



Infrared Spectrum Principal peaks at wavenumbers 1242, 1258, 1707, 1215, 1100, 772 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 296, 215, 217, 298, 216, 152, 181, 251.



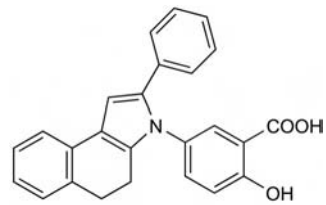
Quantification
Plasma **GC** ECD. Limit of detection, 300 µg/L [Henson *et al.* 1980].

Disposition in the Body Well absorbed after oral administration. >90% of a dose is excreted in the urine in the form of conjugates of the drug and hydroxylated metabolites.
Therapeutic Concentration
A single oral dose of 600 mg to 9 subjects produced a mean peak plasma concentration of 63 mg/L in 3 to 4 h. Daily oral doses of 1200 mg to 5 subjects produced a mean steady-state plasma concentration of 87 mg/L [Henson *et al.* 1980].
Following daily oral doses of 10 to 25 mg/kg to 18 children for 3 weeks, maximum steady-state plasma concentrations of 52 to 372 mg/L (mean 120) were reported 2 to 8 h after a dose [Mäkelä *et al.* 1983].
Toxicity Fenclofenac was used in rheumatic disorders but it had a high incidence of adverse effects, especially skin reactions, and was withdrawn from the market.
Half-life Plasma half-life, 15 to 40 h (mean 26).
Volume of Distribution About 0.2 L/kg.
Distribution in Blood Plasma : whole blood ratio, about 1.7.
Protein Binding About 99%.
Dose 0.6 to 1.2 g daily.

Henson R *et al.* (1980). Pharmacokinetics of fenclofenac following single and multiple doses. *Eur J Drug Metab Pharmacokinet* 5(4): 217–223.
Mäkelä AL *et al.* (1983). Pharmacokinetics of fenclofenac in children with juvenile rheumatoid arthritis. *Eur J Clin Pharmacol* 25(3): 381–388.

Fendosal

Analgesic
$C_{25}H_{19}NO_3$ = 381.4
CAS—53597-27-6
IUPAC Name 2-Hydroxy-5-(2-phenyl-4,5-dihydrobenzo[*e*]indol-3-yl)benzoic acid
Synonym 5-(4,5-Dihydro-2-phenyl-3*H*-benz[*e*]indol-3-yl)-2-hydroxybenzoic acid
Proprietary Name *Alnovin*

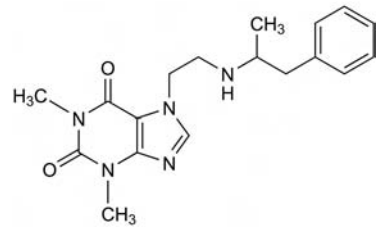


Chemical Properties A yellow powder. Mp 239° to 241°. Practically insoluble in water; soluble 1 in 50 of ethanol; slightly soluble in alkaline solutions and in propylene glycol. pK_a 3.1.
Thin-layer Chromatography System TA—R_f 0.95; system TE—R_f 0.22; system TAJ—R_f 0.05; system TAK—R_f 0.68; system TAL—R_f 0.83.
Ultraviolet Spectrum Aqueous alkali—292 nm (A^1_1=564b).
Infrared Spectrum Principal peaks at wavenumbers 1675, 1242, 1500, 1615, 1298, 765 cm^{-1} (KBr disk).
Quantification
Plasma **Fluorescence spectrophotometry** Limit of detection, 0.1 mg/L [Hill *et al.* 1980].
Dose Fendosal has been given in doses of 200 to 400 mg.

Hill HM *et al.* (1980). Rapid fluorimetric procedure for the analysis of fendosal in plasma and data following oral dosing. *Biopharm Drug Dispos* 1: 97–102.

Fenetylline

Xanthine Stimulant
$C_{18}H_{23}N_5O_2$ = 341.4
CAS—3736-08-1
IUPAC Name 1,3-Dimethyl-7-[2-(1-phenylpropan-2-ylamino)ethyl]purine-2,6-dione
Synonyms Amfetyline; 3,7-dihydro-1,3-dimethyl-7-[2-[(1-methyl-2-phenylethyl) amino]ethyl]-1*H*-purine-2,6-dione; 7-ethyltheophylline amfetamine; fenethylline.



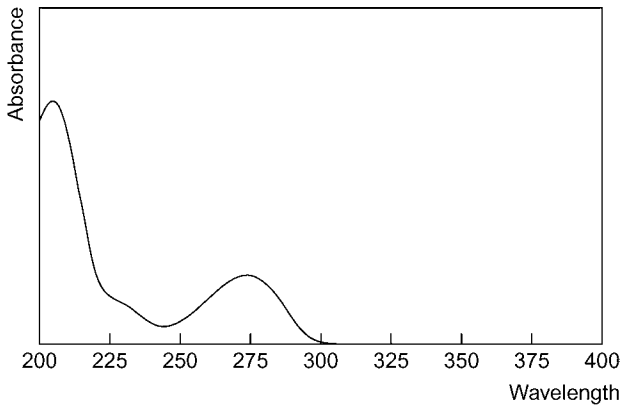
Chemical Properties Practically insoluble in water; soluble in chloroform. Extraction yield (chlorobutane), 0.9 [Demme *et al.* 2005].

Fenetylline Hydrochloride

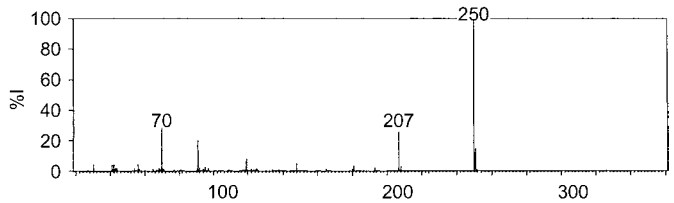
$C_{18}H_{23}N_5O_2$,HCl = 377.9
CAS—1892-80-4

Synonyms Fenethylline hydrochloride; H814; R-720-11.
Proprietary Names *Captagon*; *Fitton*.
Chemical Properties A white crystalline powder. Mp 227° to 229° and 237° to 239°. Soluble in water.

Colour Tests Amalic acid test—pink-orange/violet; Marquis test—orange.
Thin-layer Chromatography System TA—R_f 0.55; system TB—R_f 0.03; system TC—R_f 0.45; system TE—R_f 0.54; system TL—R_f 0.14; system TAE—R_f 0.44 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—fenetylline RI 2830, fenetylline-AC RI 3110, M (N-desalkyl)-AC RI 2480, M (amfetamine) RI 1125, M (etofylline) RI 2125; system GB—fenetylline RI 2900.
High Performance Liquid Chromatography System HC—*k* 0.27; system HX—RI 336; system HY—RI 277.
Ultraviolet Spectrum Aqueous acid—275 nm (A_1^1=242a). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1664, 1705, 1600, 1546, 746, 1219 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 250, 70, 207, 91, 251, 119, 148, 56.



Quantification
Hair **MS–GC** For method of quantification, see Kikura and Nakahara [1997].
Dose Fenetylline hydrochloride has been given in doses of 25 to 100 mg daily to treat narcolepsy.

Demme U *et al.* (2005). Systematic evaluation of 1-chlorobutane for liquid-liquid extraction of drugs. *Proceedings of the 12th TIAFT*, Seoul: 481–486.

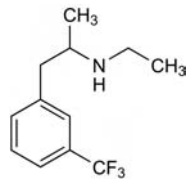
Fenfluramine

Anorectic
$C_{12}H_{16}F_3N$ = 231.3
CAS—458-24-2

IUPAC Name N-Ethyl-1-[3-(trifluoromethyl)phenyl]propan-2-amine
Synonym *N*-Ethyl-α-methyl-3-(trifluoromethyl)benzeneethanamine



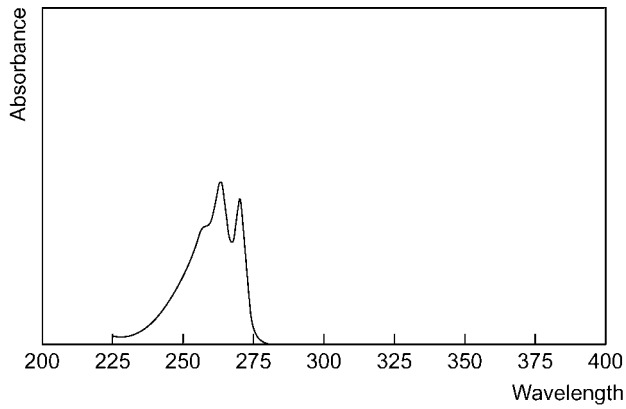
Chemical Properties Practically insoluble in water; soluble in chloroform. pK_a 9.1 (25°). Log *P* (octanol/water), 3.4.

Fenfluramine Hydrochloride

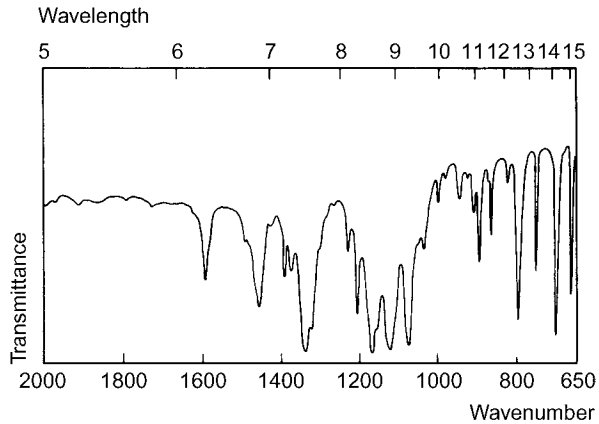
$C_{12}H_{16}F_3N$,HCl = 267.7
CAS—404-82-0

Proprietary Names *Dima-Fen*; *Pesos*; *Ponderal*; *Ponderax*; *Pondimin*.
Chemical Properties A white crystalline powder. Mp 168° to 172°. Soluble 1 in 20 of water, 1 in 10 of ethanol and 1 in 10 of chloroform; practically insoluble in ether.

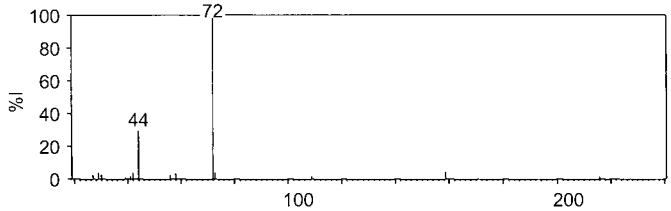
Colour Test Liebermann's reagent (100°)—yellow.
Thin-layer Chromatography System TA—R_f 0.48; system TB—R_f 0.42; system TC—R_f 0.16; system TE—R_f 0.61; system TL—R_f 0.11; system TAE—R_f 0.20; system TAJ—R_f 0.07; system TAK—R_f 0.25; system TAL—R_f 0.68 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—fenfluramine RI 1230, norfenfluramine RI 1133, fenfluramine-TFA RI 1455, fenfluramine-PFP RI 1455, fenfluramine-AC RI 1580, norfenfluramine-AC RI 1510; system GB—fenfluramine RI 1252, norfenfluramine RI 1157; system GC—fenfluramine RI 1621, norfenfluramine RI 1470.
High Performance Liquid Chromatography System HA—fenfluramine *k* 1.3, norfenfluramine *k* 1.0; system HC—*k* 0.88; system HX—RI 371; system HY—RI 315; system HZ—retention time 3.9 min; system HAA—retention time 13.1 min.
Ultraviolet Spectrum Aqueous acid—264 (A_1^1=22a), 271 nm.



Infrared Spectrum Principal peaks at wavenumbers 1165, 1116, 1070, 698, 793, 1202 cm^{-1} (fenfluramine hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 72, 44, 159, 73, 58, 42, 109, 56; norfenfluramine 44, 42, 159, 43, 45, 184, 41, 109.



Quantification
Blood **GC–MS** Fenfluramine, amfetamine and metamfetamine. Limit of detection, 5 µg/L for fenfluramine [Namera *et al.* 2000].
Plasma **GC** Nitrogen-specific detection. For method of quantification for D-fenfluramine and D-norfenfluramine, see Richards *et al.* [1989]. ECD. For method of quantification for enantiomers of fenfluramine and norfenfluramine see, Srinivas *et al.* [1988]. ECD. Limit of detection, 5 µg/L for fenfluramine, 100 ng/L for norfenfluramine [Midha *et al.* 1979].

HPLC Fluorescence detection. For method of quantification for DL-fenfluramine, DL-norfenfluramine and phentermine, see Kaddoumi *et al.* [2001].

Urine **GC** See Plasma [Richards *et al.* 1989]. ECD. For method of quantification for fenfluramine and norfenfluramine, see Midha *et al.* [1979].

GC–MS For method of quantification for fenfluramine and amfetamine-related drugs, see Namera *et al.* [2002].

Disposition in the Body Readily absorbed after oral administration and accumulates in the tissues. The major metabolite in the blood is the *N*-desethyl derivative, norfenfluramine, which is active. It is also metabolised by oxidation to *m*-trifluoromethylbenzoic acid which is conjugated with glycine to form *m*-trifluoromethylhippuric acid. The rate of elimination is influenced by urinary pH and urinary flow. In acidic urine about 23% of a dose is excreted unchanged and about 17% as norfenfluramine in 48 h; the remainder consists of *m*-trifluoromethylhippuric acid; in alkaline urine about 2% is excreted as unchanged drug and norfenfluramine; when the urinary pH is not controlled, 3 to 10% may be excreted as unchanged drug and 3 to 14% as norfenfluramine. Up to 5% of a dose is eliminated in the faeces as fenfluramine and norfenfluramine.

Therapeutic Concentration In plasma, usually in the range 0.05 to 0.15 mg/L. There is considerable inter-subject variation in plasma concentrations and it has been reported that the therapeutic effect (weight loss) is greater in those patients who can tolerate higher plasma concentrations (more than 0.2 mg/L) [Innes *et al.* 1977].

A single oral dose of 60 mg administered to 5 subjects, resulted in a mean plasma concentration of 0.06 mg/L of fenfluramine in 2 to 4 h and 0.016 mg/L of norfenfluramine in 4 to 6 h. Steady-state plasma concentrations of 0.04 to 0.12 mg/L of fenfluramine were attained in 3 to 4 days after daily administration of 60 mg, in divided doses, to 6 subjects; concentrations of norfenfluramine were similar [Campbell 1971].

Toxicity In adults the minimum lethal dose is probably in excess of 2 g but for young children as little as 200 mg may cause death. Toxic effects may be produced when the plasma concentration is greater than about 0.5 mg/L, and death has occurred at concentrations above 6 mg/L.

Three children aged 6 years, 3 years, and 1 year 9 months ingested between them about 4 g of fenfluramine hydrochloride. The youngest and the oldest child died; postmortem blood concentrations were 6.5 and 16 mg/L respectively and liver concentrations were 48 and 136 µg/g; a urine concentration of 60 mg/L was found in the younger child [Gold *et al.* 1969].

A 13-year-old boy died after ingesting 2 g of fenfluramine hydrochloride; postmortem concentrations, mg/L or µg/g, were:

[Fleisher, Campbell 1969].

	Fenfluramine	*Norfenfluramine*
Blood	6.5	0.75
Bile	64.5	10.2
Brain	42	5.3
Kidney	27.1	1.5
Liver	49	8.5
Urine	89	10

In a fatality involving the suicidal ingestion of fenfluramine, a blood concentration of 7.46 mg/L was reported. Chronic fenfluramine use was demonstrated by the presence of the drug in hair (14.1 µg/g) [Kintz, Mangin 1992].

Half-life Plasma half-life, 11 to 30 h (mean 20).

Distribution in Blood Plasma : whole blood ratio, about 0.74.

Protein Binding About 30%.

Note For reviews of fenfluramine, see Pinder *et al.* [1975] and Vivero *et al.* [1998]. For a review of fenfluramine poisoning, see Von Mühlendahl and Krienke [1979].

Dose Initially 40 mg of fenfluramine hydrochloride daily, increasing to 60 to 120 mg daily.

Fenimide

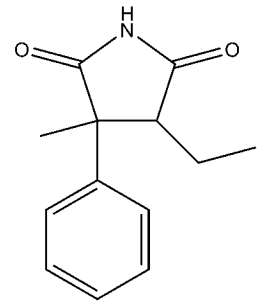
Succinimide, Antipsychotic

$C_{13}H_{15}NO_2 = 217.3$

CAS—60-45-7

IUPAC Name 4-Ethyl-3-methyl-3-phenylpyrrolidine-2,5-dione

Synonyms CI-419; α-ethyl-α′-methyl-α′-phenylsuccinimide; fenetimide; fenimid.



Chemical Properties White crystalline powder. Insoluble in water; soluble in ethanol and chloroform. Extracted by organic solvents from aqueous acid or alkaline solutions.

Thin-layer Chromatography System T1—R_f 0.75 (location reagents: strongly acid iodoplatinate spray, positive reaction; iodine-carbon tetrachloride spray, positive reaction).

Ultraviolet Spectrum Ethanol—253, 259, 248 and 265 nm.

Fenitrothion

Organophosphate, Cholinesterase Inhibitor, Insecticide

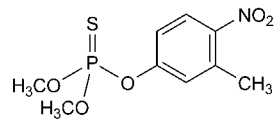
$C_9H_{12}NO_5PS = 277.2$

CAS—122-14-5

IUPAC Name Dimethoxy-(3-methyl-4-nitrophenoxy)-sulfanylidene-λ^5-phosphane

Synonyms AC-47300; Bayer 41831; Bayer S 5660; ENT-25715; MEP; OMS-45; OMS-223; phosphorothioic acid *O,O*-dimethyl *O*-(3-methyl-4-nitrophenyl) ester; S-5660; S-1102-A; metathion.

Proprietary Names *Accothion*; *Agrothion*; *Cyfen*; *Cytel*; *Cyten*; *Dicofen*; *Etalene*; *Fenitox*; *Folithion*; *Micromite*; *Novathion*; *Nuvanol*; *Pestroy*; *Sumithion*; *Verthion*.



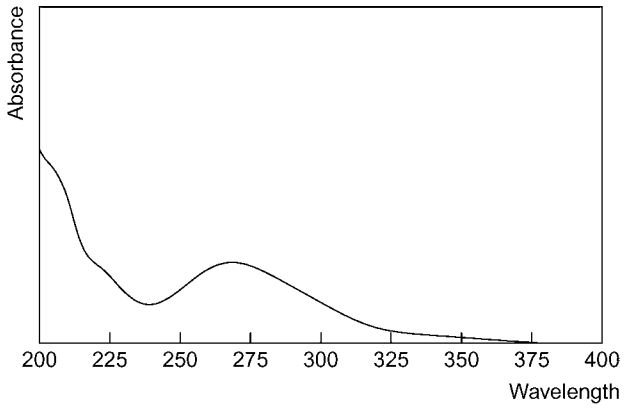
Chemical Properties A yellow to brown oil. Mp 3.4°. Bp 118° at 0.05 mmHg. It is practically insoluble in water (14 mg/L at 30°); has low solubility in aliphatic hydrocarbons; soluble in most organic solvents including alcohol esters, ketones, aromatic hydrocarbons and chlorinated hydrocarbons. It has a solubility in hexane of 42 g/kg at 20 to 25°; dichloromethane, methanol and xylene >1000 g/kg; propan-2-ol 193 g/kg. Log *P* (octanol/water), 3.43.

Thin-layer Chromatography System TX—R_f 0.32; system TY—R_f 0.76; system TZ—R_f 0.82; system TAA—R_f 0.65; system TAB—R_f 0.50; system TAC—R_f 0.17.

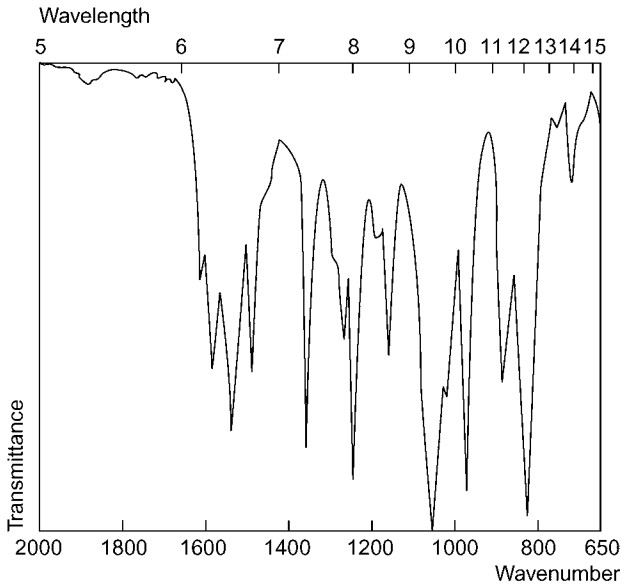
Gas Chromatography System GA—RI 1905; system GK—RRT 1.01 (relative to caffeine); system GKA—RI 1944; system GKB—RI 2112; system GKC—RI 2278.

High Performance Liquid Chromatography System HAP—*k* 2.86; system HAO—*k* 0.22.

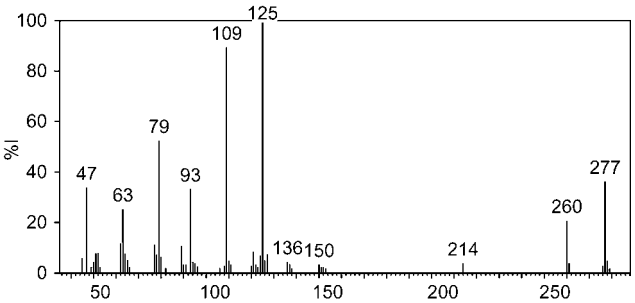
Ultraviolet Spectrum Aqueous acid (acetonitrile)—268 nm.



Infrared Spectrum Principal peaks at wavenumber 1055, 830, 971, 1243, 1359, 1539 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 125, 109, 79, 277, 47, 93, 63, 260.



Quantification

Blood **GC** Column: Shimadzu HiCap-CBP 1 (10 m × 0.53 mm i.d., 1.0 µm). Carrier gas: N_2, 20 mL/min. Temperature: 160°. FID or FPD. Limit of detection not reported [Kojima *et al.* 1989]. Column: 3% OV-17 on Chromosorb G 60/80 mesh (1 m × 2.6 cm i.d.). Carrier gas: N_2, 40 mL/min. Temperature: 240°. FPD. Limit of detection, 0.1 ng [Yashiki *et al.* 1986].

GC-MS Column: Shimadzu HiCap-CBP 1 (12 m × 0.53 mm i.d.). Carrier gas: He, 20 mL/min. Temperature programme: 100° to 280° at 8°/min. EI ionisation at 70 eV or CI at 150 eV. Limit of detection not reported [Kojima *et al.* 1989].

HPLC Column: Novapak C_{18} (150 × 3.9 mm i.d., 4 µm). Mobile phase: acetonitrile : water (4 : 6), flow rate 1.0 mL/min. UV detection (λ = 210 nm). Limit of detection, 0.1 mg/L [Ageda *et al.* 2006].

Serum

Note For a HPTLC method for the detection of fenirothion, see Futagami *et al.* [1997].

GC-MS Column: DB-5MS 5% phenyl methyl siloxane (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 90° for 1 min to 180° at 30°/min to 300° at 4°/min for 2 min. EI ionisation at 70 eV. Retention time: 10.6 min. Limit of quantification, 3.3 µg/L, limit of detection, 1.1 µg/L [Pitarch *et al.* 2003].

HPLC Column: Nucleosil 5C_{18} (15 cm × 4 mm i.d.). Mobile phase: acetonitrile : water (50 : 50), flow rate 1.0 mL/min. DAD (λ = 230 nm). Retention time: 9.54 min. Limit of quantification, 0.15 mg/L, limit of detection, 0.15 mg/L [Cho *et al.* 1997].

LC-MS Column: XTerra MS C_{18} (20 × 2.1 mm i.d., 3.5 µm). Mobile phase: 10 mmol/L ammonium formate : methanol (100 : 0 to 0 : 100 in 3 min for 6.5 min to 100 : 0 at 10 min), flow rate 0.3 mL/min. APCI, positive or negative ion mode. Retention time: 5.61 min. Limit of quantification, 0.25 mg/L, limit of detection, 0.125 mg/L [Inoue *et al.* 2007].

Urine **GC** See Blood [Kojima *et al.* 1989]. See Blood [Yashiki *et al.* 1986].

HPLC See Serum [Cho *et al.* 1997]. Column: Chemcosorb ODS (15 cm × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water (44 : 56) containing 0.1% acetic acid, flow rate 0.5 mL/min. UV detection (λ = 315 nm). Limit of detection, 3.4 g/L. [Chang, Lin 1995].

LC-MS Column: Discovery C_{18} (50 × 2.1 mm i.d., 5 µm) followed by Supelco ABZ+ (100 × 2.1 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.01% formic acid in water followed by acetonitrile: 0.0025% formic acid, flow rate 300 µL/min. ESI, MRM acquisition mode, negative ion mode. Retention time: 2.2 min for 3-methyl-4-nitrophenol. Limit of detection, <1 µg/L [Sancho *et al.* 2002].

Other **GC** Drinking Water. Column: Octadecyl C_{18}. Limit of detection, 0.01 µg/L [Badach *et al.* 2007].

LC-MS Mlik-based Infant Formulas. Column: HP-5MS 5% diphenyl 95% dimethylsiloxane (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 70° to 180° at 80°/min for 10 min. Retention time: 21.7 min. Limit of quantification, 0.2 µg/kg, limit of detection, 0.06 µg/kg [Mezcua *et al.* 2007].

Disposition in the Body

Fenitrothion is rapidly absorbed after ingestion. It is metabolised to 3-methyl-4-nitrophenol, aminofenitrothion, aminofenitroxon, acetyl-aminofenitroxon and *S*-methylfenitrothion. It is distributed among various tissues. All metabolites have been detected in urine and excretion mainly occurs within the first 12 h; 50–70% of a dose is excreted in urine within 24 h as the metabolites. There is no evidence to show that fenitrothion accumulates within the body, but it is stored in fat tissues and it is possibly released under stress conditions.

Toxicity

Allowed daily intake is 0.003 mg/kg body weight. A blood concentration of 260 ng/g causes low-to-mild poisoning. The low toxic dose reported for acute oral toxicity in a female is 800 mg/kg.

A 43-year-old male attempted suicide by ingesting ≈100 mL 5% fenitrothion and acetate emulsion. Serum concentrations on hospital admission were 7.2 and 4.5 mg/L for fenitrothion and acetate, respectively [Inoue *et al.* 2007].

A 23-year-old male was admitted to hospital after an attempted suicide. He had ingested 50 mL of fenitrothion emulsion (5%) but vomited soon after. A blood fenitrothion concentration of 169.5 ng/g was observed 3 h after ingestion. He made a full recovery and was discharged from hospital 3 days after admission. [Kojima *et al.* 1989].

A 56-year-old male attempted suicide by ingesting 60 mL of 50% fenitrothion emulsion. He was treated with haemodialysis and haemoperfusion 5 h later. After 60 min his symptoms gradually improved but 4 days after the initial ingestion, cholinergic symptoms recurred and he died 2 days later despite immediate treatment. Toxicological analysis showed that distribution within tissues and organs was high, with the highest concentration in fat (59 mg/kg wet weight, which is 10-times greater than in other organs, suggesting a slow release of the pesticide from fat). [Yoshida *et al.* 1987].

Half-life

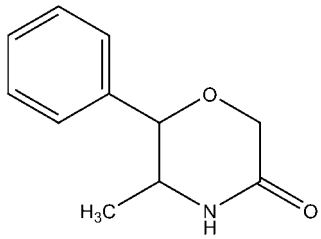
Fenmetramide

Antidepressant

$C_{11}H_{13}NO_2 = 191.2$

IUPAC Name 5-Methyl-6-phenylmorpholin-3-one

Synonyms Fenmetramid; McN 1075; 3-methyl-5-oxo-2-phenylmorpholine.



Chemical Properties A white crystalline powder. Slightly soluble in dilute acetic acid. Fenmetramide is extracted by organic solvents from aqueous alkaline solutions.

Colour Test Sulfuric acid-formaldehyde test—dull orange→brown (limit of detection, 0.1 µg).

Thin-layer Chromatography System T1—R_f 0.68 (location reagent Marquis reagent, strong reaction).

Fenofibrate

Antihyperlipidaemic, Fibric Acid Derivative

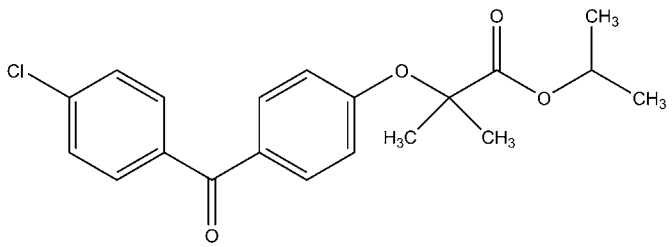
$C_{20}H_{21}ClO_4 = 360.8$

CAS—49562-28-9

IUPAC Name Propan-2-yl 2-[4-(4-chlorobenzoyl)phenoxy]-2-methylpropanoate

Synonyms 2-[4-(4-Chlorobenzoyl)-phenoxy]-2-methylpropanoic acid 1-methylethyl ester; isopropyl 2-[4-(4-chlorobenzoyl)phenoxy]-2-methylpropionate; LF-178; procetofen; procetofene.

Proprietary Names *Ankebin*; *Antara*; *Apo-Feno*; *Craveril*; *Docfenofi*; *Elasterin*; *Fegenor*; *Fenardin*; *Fenobrate*; *Fenofitop*; *Fenogal*; *Fenolip*; *Fenotard*; *Fenox*; *Fulcro*; *Grofibrat*; *Hypolip*; *Lipanthyl*; *Lipantil*; *Lipcor*; *Lipidil*; *Lipirex*; *Lipoclar*; *Lipofen*; *Lipofene*; *Liposit*; *Lipsin*; *Lofibra*; *Minuslip*; *Nolipax*; *Procetoken*; *Protolipan*; *Qualipantyl*; *Secalip*; *Sclerofin*; *Tricor*; *Triglide*; *Trolip*.



Chemical Properties Crystals from propan-2-ol. Mp 80° to 81°. Practically insoluble in water; slightly soluble in ethanol and methanol; soluble in acetone, ether, benzene and chloroform. A white or almost white crystalline powder. Mp 79° to 82°. Practically insoluble in water; slightly soluble in alcohol; very soluble in dichloromethane. Log *P* (octanol/water), 5.19 [Meylan, Howard 1995]. Protect from light.

Ultraviolet Spectrum Neutral—292, 215, 260 nm.

Quantification

Plasma **HPLC** Column: polar reversed phase (250 × 4.6 mm i.d., 4 µm). Mobile phase: 20 mmol/L ammonium acetate buffer : propan-2-ol : acetonitrile (56 : 24 : 20) with 0.1% formic acid, flow rate 0.75 mL/min. UV detection (λ = 285 nm). Limit of quantification, fenofibric acid 0.16 mg/L; limit of detection, fenofibric acid 0.05 mg/L [Straka *et al.* 2007]. Column: Uptisphere OBD (125 × 3.0 mm i.d., 3 µm). Mobile phase: 1% acetic acid : acetonitrile (50 : 50), flow rate 0.5 mL/min. UV detection (λ = 292 nm). Retention time: fenofibric acid 9.0 min. Limit of quantification, 0.03 mg/L [Sauron *et al.* 2006]. Column: C_{18} (250 × 4.0 mm i.d.). Mobile phase: acetonitrile : 0.02 mol/L phosphoric acid buffer (pH 3.4; 55 : 45). UV detection (λ = 287 nm). Limit of detection, 0.1 mg/L [Yun *et al.* 2006]. Column: Nucleosil C_8 (125 × 4.0 mm i.d., 5 µm). Mobile phase: methanol : 0.04 mol/L phosphoric acid buffer (60 : 40), flow rate 0.80 mL/min. UV detection (λ = 288 nm). Retention time: fenofibric acid 6.3 min. Limit of quantification, 120 µg/L; limit of detection, 36 µg/L [Streel *et al.* 2000]. Column: C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.02 mol/L phosphoric acid buffer (55 : 45), flow rate 2.0 mL/min for 6 min to 2.5 mL/min over 2 min for 9 min. UV detection (λ = 287 nm). Retention time: fenofibric acid 5.5 min. Limit of quantification, 0.25 mg/L [Masnatta *et al.* 1996]. See also Nobilis *et al.* [1998] and Doser *et al.* [1996].

LC-MS Column: C_{18} (50 × 4.6 mm i.d., 5 µm). Mobile phase: 0.05 mol/L formic acid : acetonitrile (45 : 55), flow rate 0.4 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention time: fenofibric acid 4.7 min. Limit of quantification, 0.5 µg/L [Trivedi *et al.* 2005].

Urine **TLC** Plates: silica gel F_{254} (0.2 mm). Solvent system: toluene : ethyl acetate : glacial acetic acid (20 : 10 : 1). UV detection (λ = 254 nm). R_f: fenofibrate 0.93, fenofibric acid 0.46, fenofibryl glucuronide 0.00. Solvent system: chloroform : methanol : glacial acetic acid (24 : 8 : 1). UV detection (λ = 254 nm). R_f: fenofibrate 0.98, fenofibric acid 0.97, fenofibryl glucuronide 0.50. Limit of quantification not reported [Weil *et al.* 1990].

HPLC Column: Partisil 10 ODS-3 (250 × 4.6 mm i.d., 10 µm). Mobile phase: methanol : 10 mmol/L sodium phosphate buffer containing 5 mmol/L tetraheptylammonium bromide (pH 6.0; 77 : 23), flow rate 1.0 mL/min. UV detection (λ = 300 nm). Retention times: fenofibric acid 18.5 min, fenofibryl glucuronide 14.5 min. Limit of quantification, fenofibric acid 0.3 mg/L [Liu *et al.* 1991]. Column: Nucleosil C_8 (250 × 4.6 mm i.d.). Mobile phase: acetonitrile : 10 mmol/L phosphate buffer (pH 7.5; 45 : 55) containing 5 mmol/L tetrabutylammonium bromide, flow rate 1.0 mL/min. UV detection (λ = 290 nm). Retention time: fenofibryl glucuronide 9.3 min. Limit of quantification not reported [Weil *et al.* 1990].

Faeces **TLC** See Urine [Weil *et al.* 1990].

HPLC See Urine [Weil *et al.* 1990].

Other **HPLC** Lipoprotein Fractions. Column: LichroCart C_{18} (125 × 4.0 mm i.d., 5 µm). Mobile phase: acetonitrile : water : concentrated acetic acid (60 : 40 : 1), flow rate 1 mL/min. UV detection (λ = 285 nm). Retention time: fenofibric acid 3.6 min. Limit of quantification not reported [Nobilis *et al.* 1998].

Disposition in the Body Fenofibrate is the oral prodrug of fenofibric acid. The micronised oral formulation of fenofibrate is readily absorbed from the gastrointestinal tract when taken with food; absorption is substantially reduced if given after an overnight fast. However, a new nanoparticle formulation offers equivalent absorption and pharmacokinetics even when administered independently of food. It is rapidly hydrolysed to its active metabolite fenofibric acid. Fenofibric acid is excreted mainly in the urine (~60%), mainly as the glucuronide conjugate but also as a reduced form of fenofibric acid and its glucuronide. Approximately 25% of a dose is excreted in the faeces. It is not removed by haemodialysis.

Therapeutic Concentration

A group of 24 healthy volunteers was administered a 250 mg sustained-release capsule of fenofibrate after a high fat meal (group A) or under fasted conditions (group B). Mean peak plasma concentrations of fenofibric acid for groups A and B were 9.15 mg/L and 2.39 mg/L, respectively, reached after 8.1 h and 6.4 h, respectively. A significant difference in the apparent volume of distribution was noted between the 2 groups, with a value of 30.2 L for group A and 134.7 L for group B [Yun *et al.* 2006].

A group of 45 healthy volunteers was administered a novel nanoparticle oral formulation tablet of 145 mg fenofibrate after a high fat meal, low fat meal, or under fasted conditions. Mean peak fenofibric acid plasma concentrations for the three regimens were 7.96, 7.96 and 7.94 mg/L, respectively, attained after 4.3, 3.6 and 2.3 h, respectively. This demonstrates pharmacokinetic equivalence when the drug is administered with or without food. In a previous study with a micronised fenofibrate 160 mg tablet, the effect of administration with food resulted in almost a 3-fold increase in the mean peak plasma concentration of fenofibric acid [Sauron *et al.* 2006].

In a bioequivalence study, a group of 24 healthy volunteers was administered either micronised or semi-solid formulations of fenofibrate at two doses: 67 mg and 200 mg. Peak plasma concentrations of fenofibric acid in the 67 mg study were 4.1 mg/L for both formulations, achieved at 5.1 h for the semi-solid dose and 6.3 h for the micronised dose. In the 200 mg study, peak plasma concentrations of fenofibric acid were 9.6 mg/L at 4.6 h for the semi-solid dose and 10.1 mg/L at 6.2 h for the micronised dose [Sonet *et al.* 2002].

Toxicity Fenofibrate has low potential for drug–drug interactions. Fenofibrate and fenofibric acid are weak inhibitors of CYP2C19 and CYP2A6 and mild to moderate inhibitors of CYP2C9.

Bioavailability Micronised fenofibrate, 100%.

Half-life In healthy volunteers, 19 to 27 h; in patients with renal failure, 143 h.

Volume of Distribution Approximately 0.89 L/kg

Clearance In the elderly, 1.2 L/h; in young adults, 1.1 L/h.

Protein Binding Fenofibric acid, ~99%, primarily to albumin.

Dose Given orally, usually in a micronised form that has improved bioavailability. The usual initial dosage is 43 to 200 mg daily, as a single dose or in three divided doses depending on the formulation. The dose should be adjusted according to response to a maximum dosage of 267 mg daily. Children may be given a dose of 67 mg per 20 kg bodyweight daily. A modified-release preparation is also available and is given in a dose of 54 to 160 mg daily (equivalent to 67 to 200 mg of micronised fenofibrate).

It may also be given in the non-micronised form; 67 mg of micronised fenofibrate is therapeutically equivalent to ≈100 mg of the non-micronised form. The usual initial dose is 300 mg daily in divided doses with food. Doses may be adjusted according to response to between 200 and 400 mg daily. Children may be given 5 mg/kg daily.

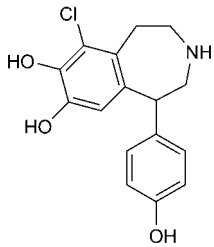
Fenoldopam

Dopamine D_1 Receptor Agonist, Antihypertensive
$C_{16}H_{16}ClNO_3 = 305.8$
CAS—67227-56-9

IUPAC Name 6-Chloro-1-(4-hydroxyphenyl)-2,3,4,5-tetrahydro-1*H*-3-benzazepine-7,8-diol
Synonyms 6-Chloro-2,3,4,5-tetrahydro-1-(4-hydroxyphenyl)-1*H*-3-benzazepine-7,8-diol; SK&F 82526.



Chemical Properties Log *P* (octanol/water), 2.39. Undergoes rapid decomposition in water. Stable for 3 months at 4° dissolved in 0.05 mol/L acetic acid. 0.5% Ascorbic acid also stabilises fenoldopam in samples of plasma and urine. Stable in plasma at –20° for at least 1 month with the addition of ascorbic acid [Boppana *et al.* 1984].

Fenoldopam Hydrobromide
$C_{16}H_{17}BrClNO_3 = 386.7$
Chemical Properties Mp 277°.

Fenoldopam Methanesulfonate
$C_{17}H_{20}ClNO_6S = 401.9$
CAS—67227-57-0
Synonyms Fenoldopam mesylate; SKF-82526-J.
Proprietary Name *Corlopam*
Chemical Properties Mp 274°. Water solubility is 4003 mg/L at 25°.

Quantification
***Plasma* HPLC** Column: Aquapore butylsilica (22 cm × 2.1 mm i.d., 7 µm). Mobile phase: Methanol : acetonitrile : citrate-acetate buffer (pH 5.6) : water (75 : 85 : 140 : 210), flow rate 0.3 mL/min. Electrochemical detection. Limit of detection, 0.5 µg/L [Boppana *et al.* 1992]. Column: Ultrasphere octadecyl silic (25 cm × 4.6 mm i.d., 5 µm). Mobile phase: methanol : citrate-acetate buffer (pH 3.2; 18 : 82), flow rate 1. mL/min. Retention time: 8.7 min. Limit of detection, 25 ng/L [Boppana *et al.* 1989]. Column: Ultrasphere octadecyl silica (250 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : citrate-acetate buffer (pH 4.0; 20 : 80), flow rate 1.0 mL/min. Electrochemical detection. Limit of detection, 4 µg/L [Boppana *et al.* 1986]. Column: Ultrasphere octadecyl silica (250 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : citrate-acetate buffer (pH 4.0; 20 : 80), flow rate 1.0 mL/min. Electrochemical detection. Retention time: 8.7 min. Limit of quantification, 50 ng/L [Boppana *et al.* 1984]. Column: Partisil ODS-3 5/25 (5 µm). Mobile phase: citrate-acetate buffer : acetonitrile (92 : 8), flow rate 1.0 mL/min. Electrochemical detection. Retention time: 12.7 min. Limit of detection, 50 ng/L [Osborne, Randolph 1983].
***Urine* HPLC** See Plasma [Boppana *et al.* 1986]. See Plasma [Boppana *et al.* 1984].

Disposition in the Body Fenoldopam is extensively metabolised by conjugation: glucuronidation, sulfation and methylation. Metabolites include fenoldopam 7-sulfate and 8-sulfate, and are excreted predominantly in urine (90%) and faeces (10%). Approximately 4% of a dose is excreted unchanged in urine. Fenolodpam has poor bioavailability, ~6%, by oral administration; <0.005% of the drug crosses the blood–brain barrier.

Therapeutic Concentration
Sixteen male and 2 female patients with New York Heart Association Class-III heart failure aged between 33 and 67 years were administered a 100-mg dose of fenoldopam. The dose was administered with food or after a 12 h fast. Peak plasma concentrations of 26.5 and 10.9 µg/L fenoldopam were reached for the fasted and fed patients within 1.3 to 2 h, respectively. Fenoldopam 7-sulfate and fenoldopam 8-sulfate were also detected at concentrations of 1357 and 689 µg/L, respectively, in the fasted patients and 1411 and 707 µg/L in the fed subjects. These concentrations were reached between 2.4 and 3.6 h after administration [Blanchett *et al.* 1991].

Toxicity Reported to be 6-times as potent as dopamine in causing vasodilation.
Bioavailability ≈6%.
Half-life ≈5 to 10 min.
Volume of Distribution 0.23 L/kg (0.025 µg/kg body weight/min dose) to 0.66 L/kg (0.25 and 0.5 µg/kg body weight/min).
Clearance 1.49 L/h/kg (0.025 µg/kg body weight/min dose) to 2.29 L/h/kg (0.5 µg/kg body weight/min dose).
Protein Binding ≈88%.
Dose IV: usual dose of 0.1 to 1.6 µg/kg body weight/min is administered and adjusted in increments of 0.05 to 1.0 µg/kg body weight. Oral: 100 mg two-to-four times daily.

Disposition in the Body Readily absorbed after oral administration. About 90% of a dose is excreted in the urine in 24 h, about 3% of the excreted material being unchanged drug, about 45% fenoprofen glucuronide, about 42% 4-hydroxyfenoprofen glucuronide and about 2% free 4-hydroxyfenoprofen. About 2% of a dose is eliminated in the faeces in 24 h.

Therapeutic Concentration

After a single oral dose of 250 mg administered to 4 subjects, peak plasma concentrations of 23 to 31 mg/L (mean 27) were attained in 0.5 to 2 h [Rubin *et al.* 1971].

Toxicity Recovery has been reported after the ingestion of about 60 g.

A 17-year-old girl presented with coma, metabolic acidosis, hypotension and respiratory depression within 4 h of ingesting 24 to 36 g of fenoprofen as a suicidal gesture; treatment led to recovery within 3 days [Kolodzik *et al.* 1990].

Half-life Plasma half-life, 2 to 3 h.

Volume of Distribution About 0.1 L/kg.

Protein Binding About 99%.

Note For a review of the pharmacological properties of fenoprofen, see Brogden *et al.* [1977].

Dose The equivalent of 0.9 to 2.4 g of fenoprofen daily.

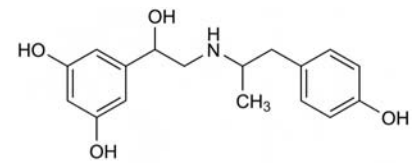
Fenoterol

Sympathomimetic

$C_{17}H_{21}NO_4 = 303.4$

CAS—13392-18-2

IUPAC Name 5-[1-Hydroxy-2-[[2-(4-hydroxyphenyl)-1-methylethyl]amino] ethyl]-1,3-benzenediol



Chemical Properties pK_a 8.5, 10.0. Log *P* (octanol/water), 1.2.

Fenoterol Hydrobromide

$C_{17}H_{21}NO_4,HBr = 384.3$

CAS—1944-12-3

Proprietary Names *Berotec*; *Dosberotec*; *Partusisten*. It is an ingredient of *Duovent*.

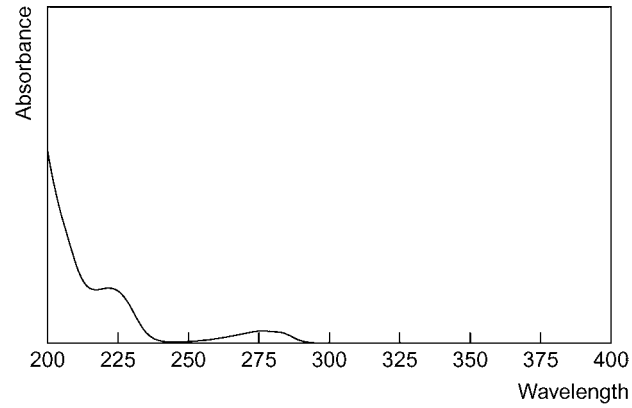
Chemical Properties A white crystalline powder. Mp about 230°, with decomposition. Soluble 1 in 10 of water and 1 in 11 of ethanol; practically insoluble in chloroform and ether.

Thin-layer Chromatography System TA—R_f 0.76; system TB—R_f 0.00; system TC—R_f 0.01; system TE—R_f 0.25; system TF—R_f 0.00; system TL—R_f 0.04; system TAE—R_f 0.38; system TAF—R_f 0.81.

Gas Chromatography System GA—fenoterol RI 1416, fenoterol-H_2O-AC_4 RI 3440.

High Performance Liquid Chromatography System HA—*k* 0.7; system HX—RI 287; system HY—RI 246; system HAX—retention time 5.7 min; system HAY—retention time 3.4 min.

Ultraviolet Spectrum Aqueous acid—275 nm (A_1^1=107a); aqueous alkali—295 nm (A_1^1=190b).



Infrared Spectrum Principal peaks at wavenumbers 1605, 1510, 700, 1160, 1575, 1200 cm^{-1} (fenoterol hydrobromide, KBr disk).

Quantification

Blood **GC–MS** Limit of detection, <1 µg/L, fenoterol, salbutamol and terbutaline [Couper, Drummer 1996].

***Plasma* HPLC** Fluorescence detection. For method for quantification, see Meineke *et al.* [2002]. Fluorescence detection. Limit of detection, <376 ng/L [Kramer, Blaschke 2001].

Disposition in the Body Rapidly but incompletely absorbed after inhalation or oral administration. It undergoes extensive first-pass metabolism by sulfate conjugation. About 35% of an oral dose is excreted in the urine in 24 h, mainly as the inactive sulfate conjugate, and <2% as unchanged drug; about 40% of an oral dose is eliminated in the faeces.

Therapeutic Concentration

After oral administration of 5 mg of tritiated fenoterol to 8 subjects, peak plasma radioactivity equivalent to about 0.04 mg/L of fenoterol was attained in 2 h; most of the radioactivity was due to metabolites. Following inhalation of a 200 µg or 500 µg metered-dose by 3 subjects, peak plasma radioactivity equivalent to about 0.0003 to 0.0004 mg/L of fenoterol was reported [Buchelt, Rominger 1972].

Fenoterol was given by IV infusion to 5 subjects at a dose of 0.5, 1.0 or 2.0 µg/min over 3 h. Steady-state plasma concentrations of 385, 636 and 980 ng/L, respectively, were reached within 90 to 120 min [Warnke *et al.* 1992].

In 20 healthy subjects receiving an IV infusion of fenoterol 1 µg/min for 4 h, steady-state plasma concentrations were reached by 2 h later (median 0.89 µg/L, range, 0.72 to 1.16 µg/L). The maximum plasma concentration of fenoterol glucuronide was 0.88 µg/L (range, 0.74 to 0.97) at the end of the infusion and that of fenoterol sulfate was 0.65 µg/L (0.49 to 0.70). A 10 mg oral dose every 20 min up to a total dose of 30 mg in the same subjects produced a median peak plasma-fenoterol level of 0.54 µg/L (range, 0.25 to 0.69), with the concentrations of fenoterol glucuronide and sulfate reaching a maximum of 14.3 µg/L (range 8.7 to 17.9) and 92 µg/L (87 to 105), respectively, at about 2 h [Hildebrandt *et al.* 1994].

Half-life Plasma half-life, about 6 to 7 h.

Note For a review of fenoterol see, Svedmyr [1985].

Dose Up to 360 µg of fenoterol hydrobromide every 4 h, by aerosol inhalation; 15 to 20 mg daily has been given orally.

Fenpipramide

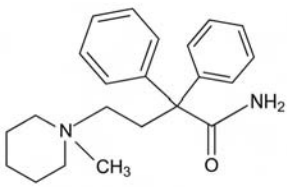
Antispasmodic (Veterinary)

$C_{21}H_{26}N_2O = 322.4$

CAS—77-01-0

IUPAC Name 2,2-Diphenyl-4-piperidinobutyramide

Synonym Fenpiverinium



Chemical Properties White crystals. Mp 188°. Practically insoluble in water; soluble in chloroform.

Fenpipramide Hydrochloride

$C_{21}H_{26}N_2O,HCl,\ H_2O = 376.9$

CAS—14007-53-5 (anhydrous)

Proprietary Name It is an ingredient of *Efosin*.

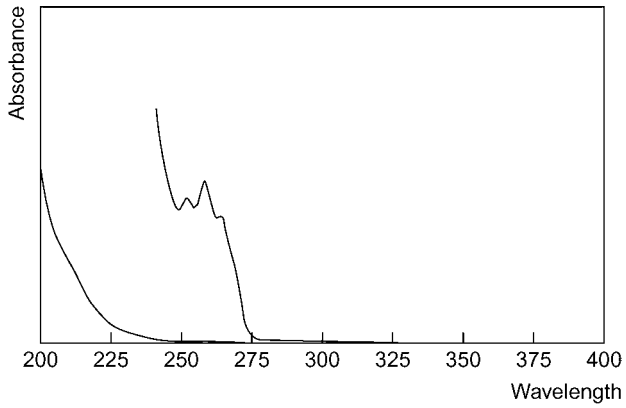
Chemical Properties A white crystalline powder. Soluble in water, ethanol and chloroform.

Colour Test Liebermann's reagent—orange.

Thin-layer Chromatography System TA—R_f 0.54; system TB—R_f 0.03; system TC—R_f 0.16; system TE—R_f 0.48; system TL—R_f 0.15; system TAE—R_f 0.25 (acidified iodoplatinate solution, positive).

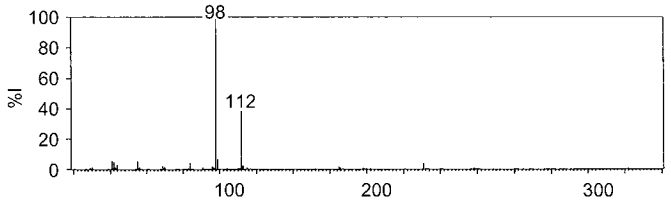
Gas Chromatography System GA—RI 2690.

Ultraviolet Spectrum Aqueous acid—253, 259 (A^1_1=12a), 265 nm.



Infrared Spectrum Principal peaks at wavenumbers 1618, 1684, 695, 712, 702, 764 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 98, 112, 99, 55, 42, 41, 211, 84.



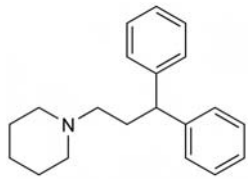
Fenpiprane

Antispasmodic (Veterinary)

$C_{20}H_{25}N = 279.4$

CAS—3540-95-2

IUPAC Name 1-(3,3-Diphenylpropyl)piperidine



Chemical Properties Crystals. Mp 41° to 42.5°. Practically insoluble in water; soluble in chloroform.

Fenpiprane Hydrochloride

$C_{20}H_{25}N,HCl = 315.9$

CAS—3329-14-4

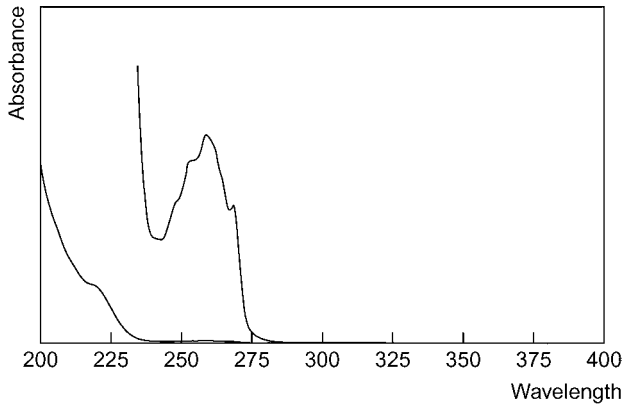
Proprietary Names *Aspasan*. It is an ingredient of *Efosin*.

Chemical Properties A white crystalline powder. Mp 216° to 217°. Soluble in water and chloroform.

Colour Tests Liebermann's reagent—brown; Mandelin's test—green; Marquis test—red.

Thin-layer Chromatography System TA—R_f 0.61 (acidified iodoplatinate solution, positive).

Ultraviolet Spectrum Aqueous acid—259 (A^1_1=16.7a), 268 nm.



Infrared Spectrum Principal peaks at wavenumbers 1492, 1631, 1092, 698, 1010, 1600 cm^{-1} (KBr disk).

Fenproporex

Anorectic

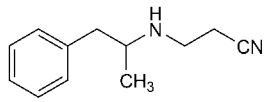
$C_{12}H_{16}N_2$ = 188.3

CAS—15686-61-0; 18305-29-8 (hydrochloride)

IUPAC Name 3-(1-Phenylpropan-2-ylamino)propanenitrile

Synonyms *N*-2-Cyanoethylamphetamine; 3-[(1-methyl-2-phenylethyl)amino] propanenitrile.

Proprietary Names *Antiobes*; *Delgafen*; *Desobesi-M*; *Dicel*; *Drenur*; *Fenisec*; *Gacilin*; *Igrasmin*; *Ifa Dex*; *Ifa Diety*; *Inobesin*; *Lipomax*; *Nobese*; *Obisin*; *Pesex-R*; *Solvolip*; *Tegisec* (includes proprietary names of the hydrochloride salt).



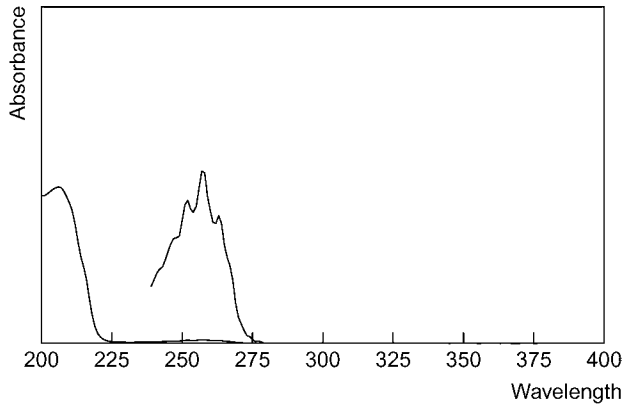
Chemical Properties Log *P* (octanol/water), 1.7.

Thin-layer Chromatography System TE—R_f 0.77.

Gas Chromatography System GA—fenproporex RI 1585, fenproporex-TFA RI 1705, fenproporex-PFP RI 1685, fenproporex-AC RI 1915; system GB—fenproporex RI 1648.

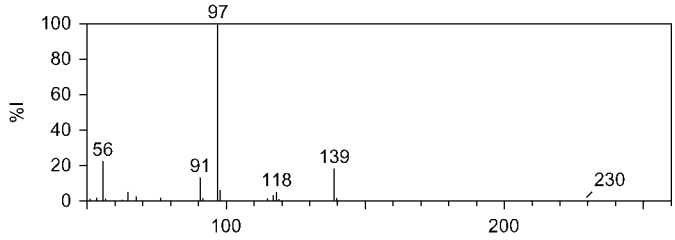
High Performance Liquid Chromatography System HY—RI 226; system HAA—RT 19.3 min.

Ultraviolet Spectrum Aqueous acid—252, 257, 263 nm.



Infrared Spectrum Principal peaks at wavenumbers 745, 1583, 697, 1019, 707, 1139 cm^{-1} (Fenproporex hydrochloride), (KBr disk).

Mass Spectrum Principal ions at *m/z* 97, 56, 91, 68, 132, 173; fenproporex-AC *m/z* 97, 56, 139, 91, 118, 65 [Kraemer *et al* 2000]; fenproporex-PFP *m/z* 243, 118, 190, 56, 91, 202; fenproporex-TFA *m/z* 193, 118, 140, 91, 56, 152.



Quantification

Blood **GC** Column: DB-17 (15 m × 0.32 mm i.d., 0.15 µm). Carrier gas: He, 17.5 psi. Temperature programme: 130° for 1 min to 300° at 15°/min for 1 min. NPD. Limit of detection, 1 µg/L [Bell *et al.* 2001].

GC-MS Column: HP cross-linked methylsilicone (12 m × 0.2 mm i.d., 330 nm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 3 min to 310° at 30°/min for 8 min. EI ionisation at 70 eV, full scan mode. Limit of detection, 50 µg/L [Kraemer *et al.* 2000].

Urine **GC** See Blood [Bell *et al.* 2001].

Gastric Contents **GC** See Blood [Bell *et al.* 2001].

Liver **GC** See Blood [Bell *et al.* 2001].

Disposition in the Body

Toxicity

In a fatality attributed to fenproporex in a young adult, the following tissue concentrations were found for fenproporex and amfetamine, respectively: inferior vena cava blood, 0.90 and 0.084 mg/L; urine, 1.2 and 0.94 mg/L; and total gastric content, 120 and 0.14 mg; other drugs detected in the blood included diazepam (0.54 mg/L), nordiazepam (0.46 mg/L), diphenhydramine (0.12 mg/L) and gamma hydroxybutyric acid (1100 mg/L) [Bell *et al.* 2001].

Dose Fenproporex has been given as the hydrochloride in usual doses equivalent to 20 mg of the base daily.

Bell RR *et al.* (2001). A contemporaneous finding of fenproporex in a polydrug suicide. *J Anal Toxicol* 25: 652–656.

Kraemer T *et al.* (2000). Studies on the metabolism and toxicological detection of the amphetamine-like anorectic fenproporex in human urine by gas chromatography-mass spectrometry and fluorescence polarization immunoassay. *J Chromatogr B Biomed Sci Appl* 738: 107–118.

Fentanyl

Narcotic Analgesic

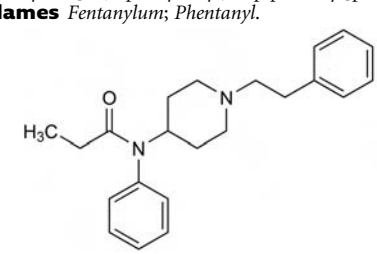
$C_{22}H_{28}N_2O$ = 336.5

CAS—437-38-7

IUPAC Name *N*-[1-Phenethylpiperidin-4-yl)-*N*-phenylpropanamide

Synonym *N*-Phenyl-*N*-[1-(2-phenylethyl)-4-piperidinyl]propanamide

Proprietary Names *Fentanylum*; *Phentanyl.*



Chemical Properties Crystals. Mp 83° to 84°. Sparingly soluble in water. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Fentanyl Citrate

$C_{22}H_{28}N_2O,C_6H_8O_7$ = 528.6

CAS—990-73-8

Synonyms Fentanyli citras; McN-JR-4263-49; R-4263

Proprietary Names *Actiq*; *Durogesic*; *Fentanest*; *Haldid*; *Leptanal*; *Sintenyl*; *Sublimaze*; *Tanyl*. It is an ingredient of *Fentazin (vet.)*; *Hypnorm (vet.)*; *Inoval*; *Innovar*; *Leptofen*; *Marcain with Fentanyl*; *Thalamonal*.

Chemical Properties White granules or a white glistening crystalline powder. Mp 149° to 151°. Soluble 1 in 40 of water, 1 in 140 ethanol, 1 in 350 of chloroform, and 1 in 10 of methanol; slightly soluble in ether. Log *P* (octanol/water pH 7.4), 2.3.

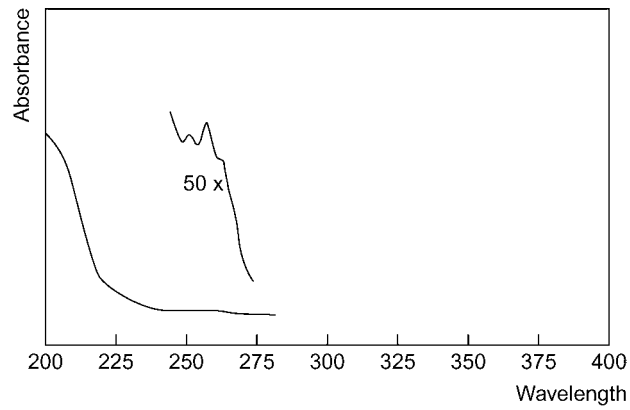
Colour Test Marquis test—orange.

Thin-layer Chromatography System TA—R_f 0.70; system TB—R_f 0.43; system TC—R_f 0.74; system TE—R_f 0.78; system TL—R_f 0.58; system TAE—R_f 0.70; system TAF—R_f 0.77 (acidified iodoplatinate solution, positive).

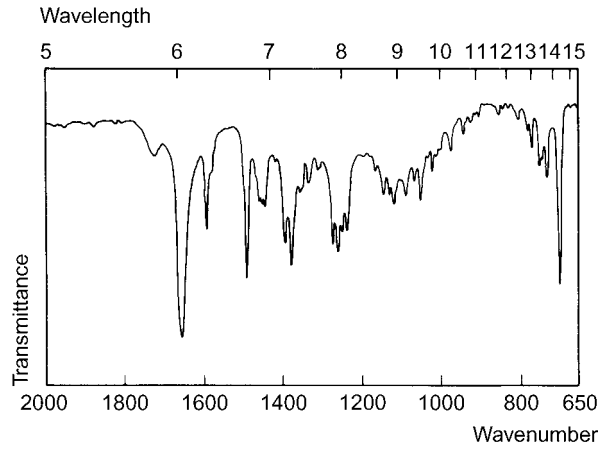
Gas Chromatography System GA—RI 2720; system GB—RI 2899.

High Performance Liquid Chromatography System HA—*k* 0.8; system HC—*k* 1.11; system HX—RI 373; system HY—RI 299; system HAA—RT 14.2 min; system HAX—RT 11.4 min; system HAY—RT 6.0 min.

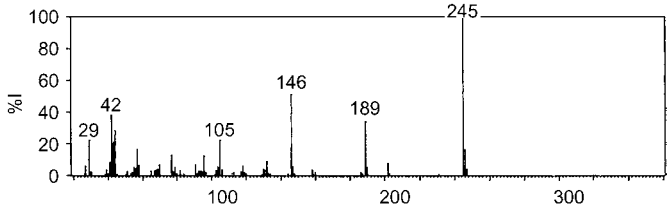
Ultraviolet Spectrum Aqueous acid—251, 257 (A^1_1 = 13a), 263 nm.



Infrared Spectrum Principal peaks at wavenumbers 1660, 701, 1493, 1263, 1273, 1236 cm^{-1} (KBr disk, see below).



Mass Spectrum Principal ions at *m/z* 245, 146, 42, 189, 44, 105, 29, 43.



Quantification

Blood **GC** NPD. Limit of detection not reported [Kowalski *et al.* 1987].

GC-MS Column: HP-5MS. SIM acquisition mode. Limit of detection, 2.5 μg/L [Wong *et al.* 2008]. Column: DB-5 (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 6 mL/min. Temperature: 270°. SIM acquisition mode. Limit of detection not reported [Martin *et al.* 2006]. Column: HP-5 (15 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 3.0 mL/min. SIM acquisition mode. Limit of detection, 1.67 μg/L [Anderson, Muto 2000].

LC-MS Column: Genesis C_{18} reversed phase (100 × 2.0 mm i.d., 3.0 μm). Mobile phase: acetronitrile : 0.1% formic acid (15 : 85 for 9 min to 30 : 70 over 13 min to 80 : 20 over 10 min to 95 : 5 for 1 min), flow rate 150 μL/min. Quadrapole MS detection, positive ion mode, MRM acquisition mode. Retention time: 13.3 min. Limit of detection, 0.08 μg/L [Gergov *et al.* 2009]. Column: XterraMS C_{18} (100 × 2.1 mm i.d., 3.5 μm). Mobile phase: 0.15% formic acid : 0.15% acetonitrile (90 : 10 for 2 min to 1 : 100 over 6 min for 5 min to 90 : 10 in 1 min), flow rate 0.2 mL/min. MS/MS detection, positive ion mode, MRM acquisition mode. Limit of detection not reported [Coopman *et al.* 2007]. Column: LiChriCART LiChrospher 60 reversed phase select B. Mobile phase: 0.1% formic acid in water : acetonitrile. Limit of quantification, 0.25 μg/L, limit of detection, 0.05 μg/L [Skulska *et al.* 2007].

Plasma **GC** Column: HP-1 (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1 mL/min. Temperature: 220°. Quadrapole MS detection, EI ionisation, SIM acquisition mode. Limit of detection, 0.03 μg/L [Bagheri *et al.* 2007]. Column: HP Ultra (12 m × 0.2 mm i.d., 0.33 μm). Carrier gas: He, 120 kPa. SIM acquisition mode. Limit of quantification, 0.01 μg/L [Moisés *et al.* 2005]. AFID detection. Column: HP-5MS (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.55 mL/min. MS detection, SIM acquisition mode. Limit of detection, 20 ng/L [Fryirs *et al.* 1997]. Limit of detection, 3.3 μg/L [Van Rooy *et al.* 1981].

HPLC Column: Shim-pack CLC-C_8 (250 × 4.6 mm i.d., 5 μm). Mobile phase: 0.02% perchloric acid : methanol (48 : 52), flow rate 1 mL/min. Limit of detection, 0.1 μg/L [Ebrahimzadeh *et al.* 2008]. MS-MS fluorescence detection [Nitsun *et al.* 2006]. Column: Spherisorb silica (250 × 4.5 mm i.d., 5 μm). Mobile phase: methanol : 0.02% perchloric acid (30 : 70). UV detection (λ = 200 nm). Limit of detection, 200 ng/L [Portier *et al.* 1999]. Column: Econosphere reverse-phase (250 × 4.6 mm i.d., 5 μm). Mobile phase: potassium dihydrogen phosphate adjusted with 85% orthophosphoric acid : acetonitrile (65 : 35), flow rate 1.4 mL/min. UV detection (λ = 195 nm). Limit of quantification, 2.0 μg/L, limit of detection, 0.25 μg/L [Kumar *et al.* 1996].

LC-MS Column: YMC Pro C_{18} (50 × 2 mm i.d.). Mobile phase: acetonitrile : 5 mmol/L formic acid (18 : 82). Triple quadrapole detection, positive ion mode. Limit of detection, 0.02 μg/L [Huynh *et al.* 2005]. Column: Betasil silica (50 × 3 mm i.d., 2 μm). Mobile phase: acetonitrile : water containing formic acid (90 : 10 to 50 : 50 over 2 min to 90 : 10 over 2.1 min), flow rate 0.5 mL/min. Limit of quantification, 40 ng/L [Naidong *et al.* 2002].

Serum **GC** Column: Chrompack fused silica (10 m × 0.32 mm i.d.). Carrier gas: He, 5 mL/min. TSD detection. Limit of detection, 0.25 μg/L [Woestenborghs *et al.* 1987].

Urine **GC-MS** See Blood [Wong *et al.* 2008]. Column: HP-5 (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 20 mL/min. SIM acquisition mode. Limit of detection, 3 μg/L [Poklis, Backer 2004]. Column: DB35-MS (30 m × 20.25 mm i.d., 0.15 μm). Carrier gas: He, 2.5 mL/min. EI ionisation. Limit of detection, 2.5 ng/L [Van Nimmen *et al.* 2004]. See Blood [Anderson, Muto 2000]. Limit of detection, 0.3 μg/L [Valaer *et al.* 1997].

HPLC See Plasma [Ebrahimzadeh *et al.* 2008]. DAD [Klinke, Linnet 2007].

LC-MS See Blood. Limit of detection, 0.10 μg/L [Gergov *et al.* 2009]. See Blood [Coopman *et al.* 2007]. See Blood. Limit of quantification, 2.1 μg/L, limit of detection, 1.9 μg/L [Skulska *et al.* 2007]. Column: YMC Pro C_{18} (50 × 2 mm i.d.). Mobile phase: acetonitrile : 5 mmol/L formic acid (2 : 98 to 30 : 70 over 4 min for 1 min). Triple quadrapole detection, positive ion mode. Limit of detection, 0.1 μg/L [Huynh *et al.* 2005].

Bile **GC-MS** See Blood [Anderson, Muto 2000].

Oral Fluid **GC-MS** Column: DB-35ms (30 m × 0.32 mm i.d., 0.25 μm). Carrier gas: He, 2.0 mL/min. Temperature: 90°. MS detection, EI ionisation, SIM acquisition mode. Retention time: 7.33 min. Limit of quantification, 5.42 μg/L [Gunnar *et al.* 2005].

Sweat **LC-MS** See Hair. Limit of quantification, 0.09 ng per half patch, limit of detection, 0.04 ng per half patch [Schneider *et al.* 2008].

Vitreous Humour **GC-MS** See Blood [Anderson, Muto 2000].

LC-MS See Blood [Coopman *et al.* 2007].

Hair **GC-MS** Column: 5% phenyl 95% methyl silicone DB-5 (15 m × 0.25 mm i.d., 0.25 μm). MSD, EI ionisation. Limit of quantification, 5 ng/g [[Moore *et al.* 2008]. Column: HP5-MS 5% phenyl 95% methylsiloxane (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas, He, 1.0 mL/min. Temperature programme: 100° for 1 min to 295° at 30°/min for 5 min. MS-MS detection, EI ionisation. Retention time: 11.9 min. Limit of quantification, 1 ng/g [Kintz *et al.* 2005].

LC-MS Column: Xterra MS C_{18} (150 × 3.9 mm i.d., 5 μm). Mobile phase: 20 mmol/L ammonium acetate (pH 3.8) : acetonitrile (62 : 38), flow rate 1.0 mL/min. Retention time: 5.59 min. MS-MS detection, EI ionisation. Limit of quantification, 0.06 μg/g, limit of detection, 0.03 μg/g [Schneider *et al.* 2008]. MS-MS detection [Musshoff *et al.* 2007].

Kidney **GC-MS** See Blood [Anderson, Muto 2000].

LC-MS See Blood [Coopman *et al.* 2007].

Liver **GC-MS** See Blood [Anderson, Muto 2000].

LC-MS See Blood [Coopman *et al.* 2007].

Disposition in the Body Fentanyl is rapidly metabolised in the liver. Two metabolites, norfentanyl and despropionylfentanyl, have been detected in plasma at concentrations similar to those of fentanyl. Approximately 70% of a dose is excreted in the urine in 72 h, mostly as metabolites, with ~10–20% of a dose being excreted as unchanged drug in 48 h. Approximately 9% of a dose is eliminated in the faeces. Fentanyl crosses the placenta and small amounts may be found in breast milk.

Therapeutic Concentration

Following IV injection of 200 μg to 6 subjects, plasma concentrations of ~2 μg/L were reported after 2 min [Michiels *et al.* 1977].

Following a single IV dose of 60 μg/kg to 5 subjects, plasma concentrations of 30–200 μg/L (mean 0.1) were reported at 1 min, decreasing to 10 μg/L at 1 h [Bovill, Sebel 1980].

After 10 subjects received 200 μg fentanyl by IV injection or 2000 μg of 50% free and 50% liposome-encapsulated fentanyl by aerosol inhalation, the mean peak plasma fentanyl level was significantly greater for the IV route (4.67 ± 1.87 at 3.6 min vs 1.15 ± 0.36 μg/L at 22.7 min); but at 8 and 24 h after administration the plasma levels were greater following inhalation (0.16 ± 0.10 vs 0.25 ± 0.14 μg/L at 8 h, and 0.05 ± 0.06 vs 0.12 ± 0.16 μg/L at 24 h, for IV and inhalation, respectively) [Hung *et al.* 1995].

In 10 children receiving treatment with fentanyl transdermal patches, the time to reach peak plasma concentration was 18 to >66 h for patches releasing 25 μg/h fentanyl. Peak plasma concentrations of 0.91 μg/L were obtained with 25 μg//h patches and 39.3 μg//L with 200 μg/h patches [Collins *et al.* 1999].

Administration of fentanyl (10 to 15 μg/kg) via an oral transmucosal delivery system to 17 children resulted in peak plasma concentrations of 1.03 ± 0.31 μg/L. The children were thought to have swallowed a large fraction of the dose, leading to a relatively late and variable peak concentration time of 53 ± 40 min [Wheeler *et al.* 2002].

Toxicity The estimated minimum lethal dose is 2 mg.

The following postmortem tissue concentrations were reported in a fatality resulting from the self-administration of fentanyl (in μg/L or μg/g): serum 17.7, blood 27.5, urine 92.7, bile 58.2, liver 0.0775, kidney 0.0415, brain 0.0302, lung 0.0834, stomach 31.6. A partly filled syringe containing 2800 μg/L fentanyl was found near the scene of death [Chaturvedi *et al.* 1990].

In a review of 25 fatalities involving fentanyl transdermal patches, the following post-mortem tissue concentrations were reported (in μg/L or μg/g): heart blood 1.89–139 (23 cases), femoral blood 3.1–43 (13 cases), vitreous humour 2–20 (4 cases), liver 0.0058–0.613 (22 cases), bile 3.5–262 (15 cases), urine 2.9–895 (19 cases), gastric 0–122 μg total (17 cases), spleen 0.0078–0.079 (3 cases), kidney 0.011 (1 case), lung 0.031 (1 case) [Anderson, Muto 2000].

An 83-year-old female who was found dead with three 100 μg/h fentanyl patches on her chest had the following tissue concentrations at postmortem: blood 25 μg/L, brain 0.054 μg/g, heart 0.094 μg/g, kidney 0.069 μg/g, liver 0.104 μg/g [Edinboro *et al.* 1997].

A postmortem serum fentanyl concentration of 2 μg/L was reported in a 35-year-old woman who had intravenously injected the contents of a trandermal fentanyl patch (5 mg, shared with another person who survived); 0.16 g/L ethanol was also found in the serum [Reeves, Ginifer 2002].

A 63-year-old man who was found dead with 20 fentanyl patches of different strengths with a total dose of 1350 μg/h had the following tissue concentrations at postmortem: femoral blood 0.0949 μg/g, heart blood (left) 0.0459 μg/g, heart blood (right) 0.0748 μg/g, urine 101 μg/L, bile 468 μg/L, gastric contents 745 μg/L, CSF 78.4 μg/L, vitreous humour 133 μg/L [Wiesbrock *et al.* 2008].

Half-life Plasma half-life, ~3.7 h (dose dependent: also increased in the elderly and premature infants and during cardiopulmonary by-pass surgery).

Volume of Distribution Approximately 4 L/kg.

Clearance Plasma clearance, ~13 mL/min/kg.

Protein Binding ~80%.

Dose For analgesia in surgery, initially, the equivalent of 50 to 200 μg fentanyl. IV; supplementary doses of 50 μg. With assisted ventilation, an initial dose of 300 to 3500 μg may be given.

Fenthion

Cholinesterase Inhibitor, Acaricide, Insecticide

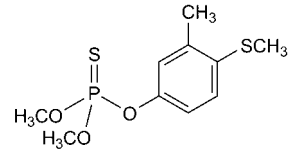
$C_{10}H_{15}O_3PS_2$ = 278.3

CAS—55-38-9

IUPAC Name Dimethoxy-(3-methyl-4-methylsulfanylphenoxy)-sulfanylidene-λ^5-phosphane

Synonyms Bay 29493; bayer 29493; *O,O*-dimethyl-*o*-(4-methylthio)-*m*-tolyl] phosphorothioate; DMTP; ENT25540; MPP; mercaptophos; OMS2; phosphorothioic acid *O,O*-dimethyl *O*-[3-methyl-4-(methylthio)phenyl] ester; S-1752.

Proprietary Names *Baycid*; *Baytex*; *Entex*; *Lebaycid*; *Lysoff*; *Queletox*; *Spotten*; *Talodex*; *Tiguvon*.



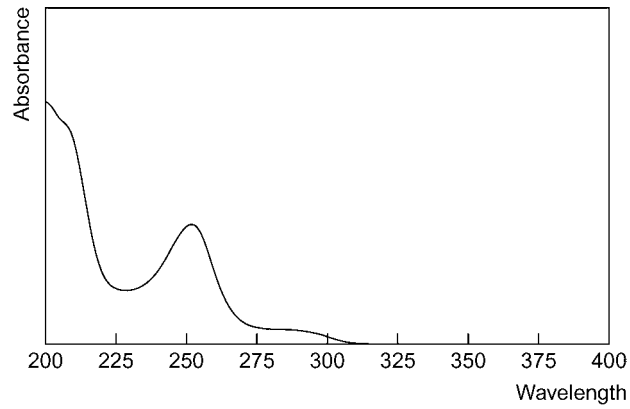
Chemical Properties Pure fenthion is a colourless liquid. The technical form is an oily yellowish-brown liquid. Mp 7.5°. Bp 87° at 0.01 mmHg. It is practically insoluble in water; readily soluble in methanol, ethanol, acetone, 2-propanol, dichloromethane, toluene and most organic solvents, including alcohol, ethers, esters and halogenated aromatics; slightly soluble in hexane. Log *P* (octanol/water), 4.09 [Hansch *et al.* 1995]. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005]. Stable through 3 freeze-thaw cycles and after 3 weeks at –30° [Inoue *et al.* 2007].

Thin-layer Chromatography System TX—R_f 0.41; system TY—R_f 0.81; system TZ—R_f 0.90; system TAA—R_f 0.68.

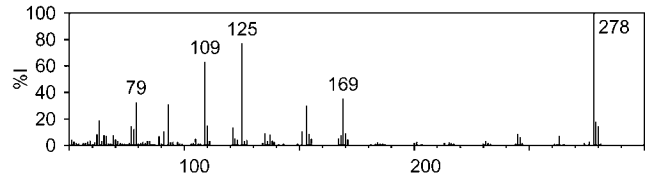
Plates: silica gel. Solvent system: benzene : methanol (9 : 1). Developed by spraying with 0.2% palladium chloride solution. R_f 0.9 [Meyer *et al.* 1998].

Gas Chromatography System GA—RI 1938.

Ultraviolet Spectrum Methanol—229 nm; aqueous acid—252 nm.



Mass Spectrum Principal ions at *m/z* 278, 125, 109, 169, 93.



Quantification

Blood **GC** Column: DB-5 (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 2.4 mL/min. Temperature programme: 180° for 3 min to 230° at 10°/min for 35 min to 270° at 5°/min for 5 min. Retention time: 33.6 min. Limit of detection, 1 ppb [Tsatsakis *et al.* 2002]. Column: HP-1 fused silica (10 m × 0.53 mm i.d., 2.65 µm). Carrier gas: He, 15 mL/min. Temperature programme: 60° for 2 min to 250° at 10°/min for 8 min. NPD. Retention time: 14.16 min. Limit of quantification, 0.5 µg/L, limit of detection, 0.15 µg/L [Garcia-Repetto *et al.* 2001]. Column: DB-5 (15 m × 0.32 mm i.d., 1.5 µm). Carrier gas: He, 6.1 mL/min. Temperature programme: 120° to 240° at 10°/min. FID. Limit of detection not reported [Tsatsakis *et al.* 1996]. Column: Chromosorb W/HP 8/100 mesh 3% OV-17 (1/2" o.d. × 2 mm i.d.) Carrier gas: N_2, 2.5 mL/min. Temperature: 200°. FPD. Limit of detection, 0.1 µg/L [Brunetto *et al.* 1992].

GC-MS Column: HP-5MS fused silica capillary (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 120° for 1 min to 290° at 10°/min for 1 min. EI ionisation, SIM acquisition mode. Limit of detection, 0.01 µg/g [Musshoff *et al.* 2002]. Column: SGE BPX5 (25 m × 0.22 mm i.d., 0.25 µm). Carrier gas: He, 0.8 mL/min. Column temperature: 60° to 120° at 30°/min to 220° at 10°/min to 290° at 5°/min to 300° for 3 min. EI ionisation, SIM acquisition mode. Retention time: 14.3 min. Limit of quantification, 0.1 mg/L [Meyer *et al.* 1998].

HPLC Column: Aluspher RP-select B (125 × 4.0 mm i.d., 5 µm). Mobile phase: 0.0125 mol/L sodium hydroxide in methanol : 0.0125 mol/L sodium hydroxide in water (10 : 90 for 5 min to 90 : 10 over 15 min for 5 min), flow rate 1.0 mL/min. UV detection (λ = 250 nm). Retention time: 18.3 min. Limit of quantification, 0.25 mg/L [Meyer *et al.* 1998].

LC-MS Column: Luna C_{18} reversed phase (30 × 2.0 mm i.d., 3 µm). Mobile phase: 2 mmol/L ammonium acetate buffer containing 1 mL/L formic acid in water (pH 2.8) : 2 mmol/L ammonium acetate buffer containing 1 mL/L formic acid in methanol (60 : 40 to 20 : 80 at 1.5 min to 60 : 40 at 6 min), flow rate 0.4 mL/min. ESI,

positive ion mode, SRM acquisition mode. Limit of quantification, 0.5 µg/L [Salm *et al.* 2009].

Plasma **GC** Column: 3% OV-17 on Chromosorb WAWDMCS 100/120 mesh (2 m × 1/8" i.d.). Carrier gas: N_2, 50 mL/min. Temperature: 230°. Limit of detection, 3 µg/L [Mahieu *et al.* 1982].

Serum

Note For a HPTLC method for the detection of fenthion, see Futagami *et al.* [1997].

HPLC Column: Nucleosil $5C_{18}$ (15 cm × 4 mm i.d.). Mobile phase: acetonitrile : water (50 : 50), flow rate 1.0 mL/min. DAD (λ = 230 nm). Retention time: 14.1 min. Limit of quantification, 0.25 mg/L, limit of detection, 0.13 mg/L [Cho *et al.* 1997].

LC-MS Column: XTerra MS C_{18} (20 × 2.1 mm i.d., 3.5 µm). Mobile phase: 10 mmol/L ammonium formate : methanol (100 : 0 to 0 : 100 in 3 min for 6.5 min to 100 : 0 at 10 min), flow rate 0.3 mL/min. APCI, positive or negative ion mode. Retention time: 5.61 min. Limit of quantification, 1.25 mg/L, limit of detection, 1 mg/L [Inoue *et al.* 2007].

Urine **GC** See Blood [Tsatsakis *et al.* 2002].

HPLC See Serum [Cho *et al.* 1997].

Vitreous Humour **GC** See Blood [Tsatsakis *et al.* 1996].

Orchis **GC** See Blood [Tsatsakis *et al.* 1996].

Thyroid **GC** See Blood [Tsatsakis *et al.* 1996].

Disposition in the Body Fenthion is readily absorbed into the bloodstream via the digestive tract, lungs and skin, and is systematically distributed. It is rapidly metabolised to weak active products by several pathways, the major pathway being by hepatic hydrolysis. It is eliminated through urine and faeces as the hydrolysis products. Fenthion is stored in fat and its release is delayed for metabolism.

Toxicity Fenthion is moderately toxic after ingestion and dermal exposure, and is slightly toxic if inhaled. The allowed daily intake is 1 µg/kg. A lethal dose of 50 mg/kg has been established, but the route of administration is not known. Acute respiratory failure defined as intermediate syndrome begins 24–96 h after the cholinergic crisis [Karademir *et al.* 1990; Sedgwick, Senanayake 1997; van den Neucker *et al.* 1991]. Delayed neuropathy can follow 2 to 3 weeks later with the inhibition of the neuropathy target esterase [Serrano, Fedriani 1997].

A 67-year-old male was admitted to hospital. His blood and urine fenthion concentrations were 2.7 and 0.5 mg/L, respectively, at the time of hospital admission. He was discharged 43 days later. A 13-year-old male was spraying crops with fenthion. On admission to hospital his blood concentration was 0.95 mg/L. After 5 days he was breathing by himself and he was discharged from hospital 4 days later [Tsatsakis *et al.* 2002].

A 66-year-old female was found dead in her bathroom, a suicide case that was not suspected to be fenthion poisoning. After toxicological analysis, a fenthion blood concentration of 3.8 mg/L was detected, and it was determined that fenthion ingestion was the cause of death. A total amount of 17 g of fenthion was found in the stomach and 203 g/g in the liver [Meyer *et al.* 1998].

A 69-year-old farmer ingested 200 mL Lebaycid. Postmortem concentrations of fenthion were 1.7, 4.8, 23.1, 16.8, 135.2 5.8, 7.1, or 13.8 mg/L or µg/g in the vitreous humour, blood, kidney, liver, fat, orchis, thyroid and brain, respectively [Tsatsakis *et al.* 1996].

A 41-year-old male was admitted to hospital having ingested an unknown quantity of fenthion. On admission, 20 h after the ingestion, he had a blood fenthion concentration of 0.27 mg/L. This increased on the first day to 0.78 mg/L. He died on day 7 from a refractory cardiovascular collapse [Brunetto *et al.* 1992].

A 43-year-old male ingested 30 mL of Lebaycid (–18 g fenthion). On admission to hospital his blood fenthion concentration was 71 µg/L, and 3 h later it was 102 µg/L [Mahieu *et al.* 1982].

Note Several cases in which extrapyramidal manifestations complicated the organophosphorus intoxication are reported in Senanayake and Sanmuganathan [1995]. For a case of prolonged toxicity after fenthion ingestion, see Merrill and Mihm [1982] or Borowitz [1988]. For a case of fenthion taken during pregnancy, see Karalliedde *et al.* [1988]. Cases of SC injection of fenthion are reported in Bala *et al.* [2008], Hadimioglu *et al.* [2002], Premaratna *et al.* [2001], Serrano and Fedriani [1997].

Fenticlor

Antifungal

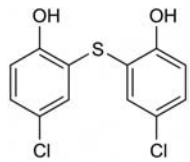
$C_{12}H_8Cl_2O_2S$ = 287.2

CAS—97-24-5

IUPAC Name 4-Chloro-2-(5-chloro-2-hydroxyphenyl)sulfanylphenol

Synonym 2,2′-Thiobis[4-chlorophenol]

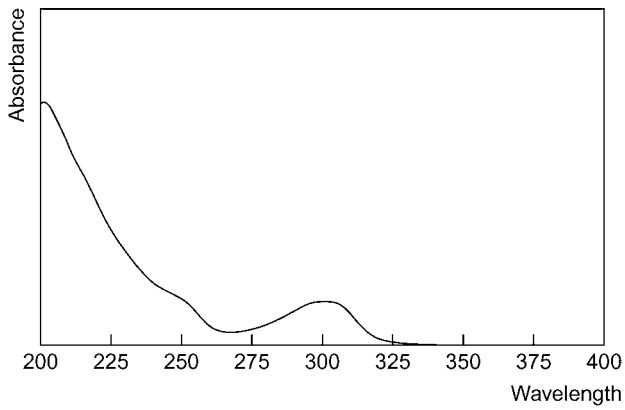
Proprietary Names *Novex*. It is an ingredient of *Dermisdin*.



Chemical Properties A white crystalline powder. Mp 176°. Practically insoluble in water; freely soluble in ethanol; soluble in aqueous solutions of sodium hydroxide. Log *P* (octanol/water), 4.6.

Thin-layer Chromatography System TAE—R_f 0.91.

Ultraviolet Spectrum Principal peak at 300 nm.



Infrared Spectrum Principal peaks at wavenumbers 1269, 825, 1209, 818, 889, 1104 cm^{-1}.

Use Fenticlor has been applied topically in concentrations of up to 2%.

Fenyramidol

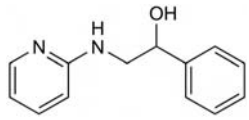
Analgesic, Muscle Relaxant

$C_{13}H_{14}N_2O$ = 214.3

CAS—553-69-5

IUPAC Name 1-Phenyl-2-(pyridin-2-ylamino)ethanol

Synonyms Phenyramidol; α-[(2-pyridinylamino)methyl]benzenemethanol.

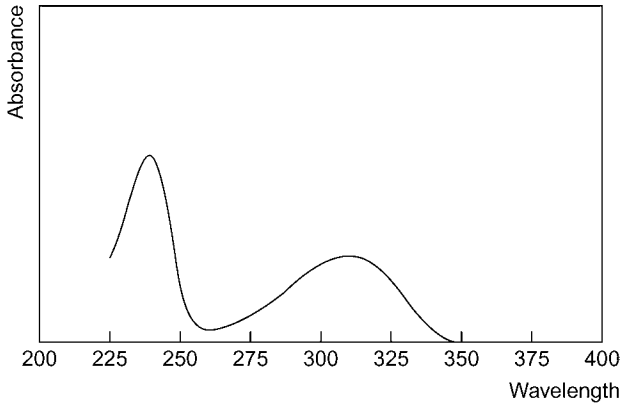


Chemical Properties Crystals. Mp 82° to 85°. pK_a 5.9. Log *P* (octanol/water), 1.7.

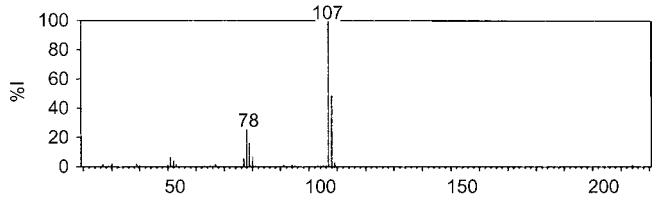
Fenyramidol Hydrochloride

$C_{13}H_{14}N_2O,HCl = 250.7$
CAS—326-43-2
Synonyms Phenyramidol hydrochloride; IN-511; MJ-505; NSC-17777.
Proprietary Name *Cabral*
Chemical Properties A white crystalline powder. Mp 140° to 142°. Freely soluble in water; soluble in ethanol.

Colour Tests Cyanogen bromide—orange-pink; Mandelin's test—blue; Marquis test—yellow.
Thin-layer Chromatography System TA—R_f 0.69; system TB—R_f 0.08; system TC—R_f 0.52; system TE—R_f 0.76; system TL—R_f 0.59; system TAE—R_f 0.80; system TAF—R_f 0.86 (Dragendorff spray, positive; acidified iodoplatinate solution, positive; acidified potassium permanganate solution, positive).
Gas Chromatography System GA—RI 1960.
High Performance Liquid Chromatography System HX—RI 282.
Ultraviolet Spectrum Aqueous acid—237 (A^1_1=666a), 309 nm.



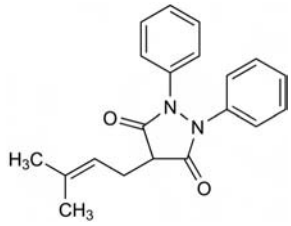
Infrared Spectrum Principal peaks at wavenumbers 1613, 1524, 700, 768, 1058, 752 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 107, 108, 78, 79, 80, 77, 51, 52.



Dose Up to 3.2 g of fenyramidol hydrochloride daily.

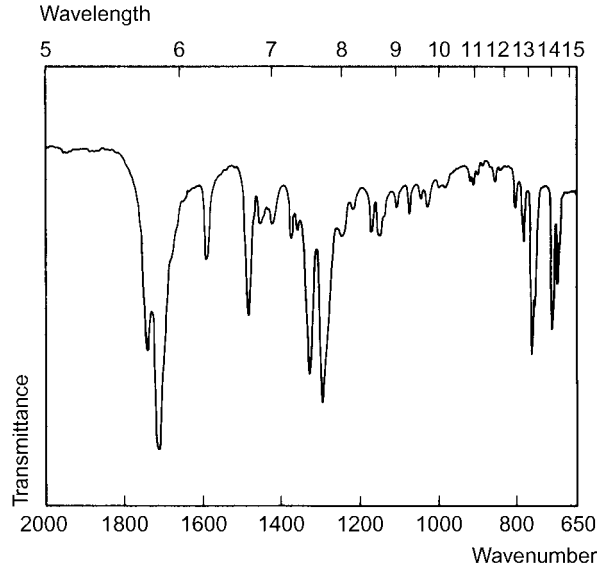
Feprazone

Analgesic
$C_{20}H_{20}N_2O_2 = 320.4$
CAS—30748-29-9
IUPAC Name 4-(3-Methyl-2-butenyl)-1,2-diphenyl-3,5-pyrazolidinedione
Synonyms Phenylprenazone; prenazone.
Proprietary Names *Brotazona*; *Methrazone*; *Reuflodol*; *Zepelan*; *Zepelin*.

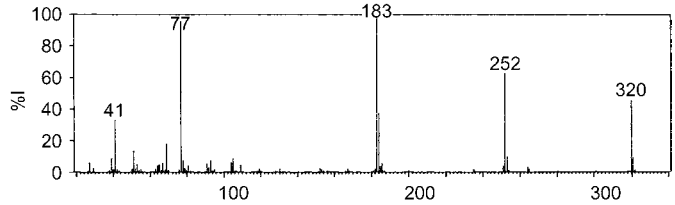


Chemical Properties A white crystalline powder. Mp about 157°. Practically insoluble in water; slightly soluble in cyclohexane, ethanol and ether; very soluble in acetone and chloroform; sparingly soluble in acetonitrile and benzene. Log *P* (octanol/water), 3.9.

Colour Tests *p*-Dimethylaminobenzaldehyde—red; Liebermann's reagent—brown-orange (→brown at 100°).
Thin-layer Chromatography System TE—R_f 0.19; system TG—R_f 0.45; system TAE—R_f 0.92 (chromic acid solution, yellow; Ludy Tenger reagent, orange; mercurous nitrate spray, positive).
Gas Chromatography System GA—RI 2380; system GD—methyl derivative RRT 1.81 (relative to n-$C_{16}H_{34}$); system GF—RI 2800.
High Performance Liquid Chromatography System HV—RRT 0.92 (relative to meclofenamic acid).
Ultraviolet Spectrum Methanolic alkali—266 nm (A^1_1=700b).
Infrared Spectrum Principal peaks at wavenumbers 1715, 1300, 767, 1745, 715, 703 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 183, 77, 252, 320, 184, 41, 69, 51.

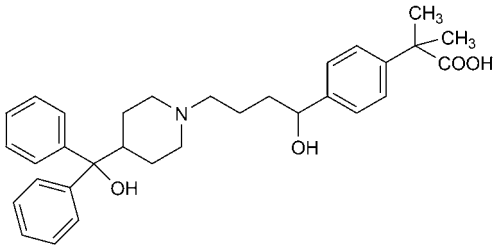


Quantification
Plasma **HPLC** UV detection. Limit of detection, 100 µg/L feprazone, 200 µg/L 4-(3-hydroxymethyl)feprazone [Spahn, Mutschler 1982].
Disposition in the Body Absorbed after oral administration. Metabolised by hydroxylation to 4-(3-hydroxymethyl)feprazone. <1% of a dose is excreted unchanged in the urine.
Therapeutic Concentration
Following a single oral dose of 400 mg to 8 subjects, peak plasma concentrations of 30.2 to 54.7 mg/L (mean 40.6) were attained in 4 to 8 h; peak plasma concentrations of 1.09 to 3.60 mg/L (mean 1.9) of the 4-(3-hydroxymethyl) metabolite were reported at about 27 h [Spahn, Mutschler 1985].
Half-life Plasma half-life, 6 to 30 h (mean 20).
Protein Binding 90 to 99%.
Dose 200 to 600 mg daily.

Spahn H, Mutschler E (1982). Determination of feprazone and one of its metabolites in human plasma after high-performance liquid chromatographic or thin-layer chromatographic separation. *J Chromatogr Biomed Appl* 232: 145–153.
Spahn H, Mutschler E (1985). The influence of aluminium hydroxide on the bioavailability of feprazone. Single dose study. *Arzneimittelforschung* 35: 167–169.

Fexofenadine

Antihistamine
$C_{32}H_{39}NO_4 = 501.7$
CAS—83799-24-0
IUPAC Name 2-[4-[1-Hydroxy-4-[4-[hydroxy(diphenyl)methyl]piperidin-1-yl]butyl]phenyl]-2-methylpropanoic acid
Synonyms Carboxyterfenadine; α,α-dimethyl-4-[1-hydroxy-4-[4-(hydroxydiphenylmethyl)-1-piperidinyl]butyl]benzene acetic acid; MDL-16455 M-I; terfenadine carboxylate.



Chemical Properties White to off-white crystalline powder. Mp 142° to 143°. Log *P* (octanol/water), 2.81 [Meylan, Howard 1995]. Plasma samples were stable at –80° for 6 months [Miura *et al.* 2007]. Stable in human plasma for 30 days at −20° ± 5° or –70° or below for 3 freeze-thaw cycles for 4 h at room temperature, and for 48 h in the autosampler at 5°. Fexofenadine stock solutions were stable for 6 h at room temperature and for 30 days at 5° [Yamane *et al.* 2007]. Fexofenadine in human plasma is stable toward 3 freeze-thaw cycles [Fu *et al.* 2004].

Fexofenadine Hydrochloride

$C_{32}H_{39}NO_4$,HCl = 538.1

CAS—138452-21-8

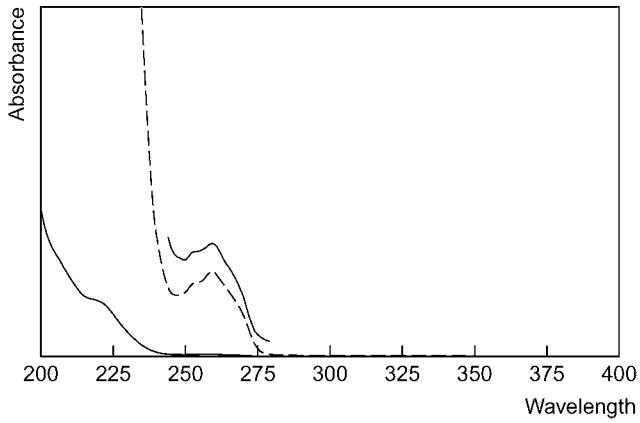
Synonym Terfenadine carboxylate hydrochloride

Proprietary Names *Allegra*; *Telfast*.

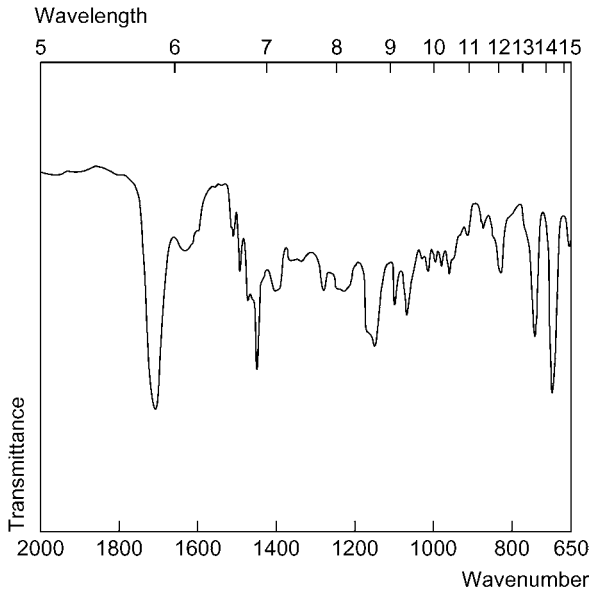
Chemical Properties White to off-white crystalline powder which is freely soluble in methanol and ethanol; slightly soluble in chloroform and water; insoluble in hexane.

High Performance Liquid Chromatography Column: Resolvosil BSA-7 (150 × 4 mm i.d., 5 µm). Mobile phase: 2-propanol : 0.08 mol/L sodium phosphate (pH 8.0; 1.5 : 98.5), flow rate 0.4 mL/min. UV detection (λ = 210 or 254 nm). Retention time: (*S*)-fexofenadine 10.2 min, (*R*)-fexofenadine 14.4 min [Chan *et al.* 1991].

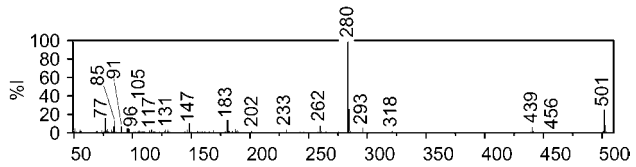
Ultraviolet Spectrum



Infrared Spectrum



Mass Spectrum Principal ions at *m/z* 280, 281, 501, 262, 105, 85.



Quantification

Plasma **HPLC** Column: Chiral CD-Ph (250 × 4.6 mm i.d.). Mobile phase: 0.5% potassium dihydrogen phosphate (pH 3.5) : acetonitrile (65 : 35), flow rate 0.5 mL/min. UV detection (λ = 220 nm). Limit of quantification, 25 µg/L, limit of detection, 12.5 µg/L [Miura *et al.* 2007].

LC-MS Column: C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: 0.03% formic acid : acetonitrile (40 : 60), flow rate 1.0 mL/min. TIS, MRM acquisition mode. Limit of quantification, 1 µg/L [Nirogi *et al.* 2007]. Column: XBridge C_{18} (100 × 2.1 mm i.d., 3.5 µm). Mobile phase: acetonitrile : 2 mmol/L ammonium acetate (91 : 9), flow rate 0.6 mL/min. ESI (TIS), MRM acquisition mode. Limit of quantification, 10 ng/L [Yamane *et al.* 2007] Column: Agilent Zorbax Eclipse XDB C_{18} (50 × 2.1 mm i.d., 5 µm). Mobile phase: acetonitrile : 10 mmol/L formic acid (25 : 75 for 3 min to 60 : 40 at 4 min for 1.25 min to 95 : 5 briefly before 25 : 75), flow rate 0.25 mL/min. MSD, SIM acquisition mode. Retention time: 5.7 min. Limit of detection, 1 µg/L [Kharasch *et al.* 2005]. Column: Ultra IBD (50 × 3.2 mm i.d., 3 µm). Mobile phase: acetonitrile : 10 mmol/L ammonium acetate : formic acid (90 : 10 : 0.1). APCI, MRM acquisition mode. Limit of detection, 1 µg/L [Fu *et al.* 2004]. Column: Inertsil ODS-80A (150 × 4.6 mm i.d., 5 µm). Mobile phase 0.05 mol/L potassium dihydrogen phosphate buffer-acetonitrile-methanol (60 : 35 : 10) : 0.05 mol/L potassium dihydrogen phosphate buffer-acetonitrile (40 : 60, 100 : 0 to 0 : 100 in 10 min to 100 : 0 at 17 min), flow rate 1 mL/min. Fluorescence detection (λ_{ex} = 220 nm, λ_{em} = 290 nm). Retention time: 4.5 min. Limit of quantification, 1.0 µg/L [Uno *et al.* 2004].

See also Hofmann *et al.* [2002].

Serum **HPLC** Column: Shimpack cyanopropyl (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 12 mmol/L ammonium acetate (pH 4.85; 50 : 50), flow rate 1.5 mL/min. UV detection (λ = 220 nm). Limit of quantification, 0.15 µg/L, limit of detection, 0.045 µg/L [Emara *et al.* 2007].

Urine **HPLC** Column: Cyclobond I (250 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 0.014 mol/L sodium perchlorate (75 : 25), flow rate 0.2 mL/min. UV detection (λ = 210 or 254 nm). Limit of detection not reported [Chan *et al.* 1991].

LC-MS See Plasma. Limit of quantification, 20 µg/L [Hofmann *et al.* 2002].

Disposition in the Body Fexofenadine is rapidly absorbed after oral administration, and only 5% of a dose is metabolised by the intestinal mucosa, 0.5 to 1.5 % undergoes hepatic biotransformation. The drug is mainly excreted in the faeces unchanged (80%) and 12% in urine [Mason *et al.* 1999]. Fexofenadine is a metabolite of terfenadine and therefore has been detected in breast milk after terfenadine administration. Fexofenadine does not cross the blood–brain barrier.

Therapeutic Concentration After the administration of 60 mg racemic fexofenadine to 3 healthy volunteers, the pharmacokinetic values shown below were measured.

Parameter	*(R)-Fexofenadine*	*(S)-Fexofenadine*
C_{max} (µg/L)	178 ± 220	121 ± 185
$t_{1/2}$ (h)	5.3 ± 2.0	4.0 ± 1.8
$AUC_{0-\infty}$ (ng h/mL)	979 ± 720	564 ± 555

[Miura *et al.* 2007]

Following a single oral dose of 60 mg fexofenadine a mean maximum plasma concentration of 275 µg/L was reached at 2 h [Yamane *et al.* 2007].

Seventy subjects (18 to 44 years) were administered 180 mg fexofenadine HCl/240 mg pseudoephedrine HCl extended-release or 180 mg fexofenadine HCl/240 mg pseudoephedrine HCl. Mean peak plasma concentrations of 569.4 and 561.6 µg/L and 631.3 and 584.6 µg/L fexofenadine were reached after the first dose and the seventh dose for each treatment group, respectively [Howard *et al.* 2005].

Four healthy adults were administered a single oral dose of 180 mg fexofenadine. Mean peak plasma concentration was 734.5 ± 261.3 µg/L at 1.5 ± 0.6 h [Hofmann *et al.* 2002].

Following a single oral dose of 80 mg fexofenadine, the mean maximum plasma concentration was 248.7 and 442.6 µg/L reached at 2.6 and 2.7 h in healthy subjects and renally impaired subjects [Mason *et al.* 1999].

Twenty-four healthy adult volunteers (19 to 45 year of age) were administered a single oral dose every 12 h for 7 days. A 60 mg dose produced peak plasma concentrations of 0.29 mg/L; a 120 mg dose produced 0.6 mg/L; and a 240 mg dose produced 1.53 mg/L. All levels were reached within 1.02 to 1.33 h [Robbins *et al.* 1998].

Toxicity Clinical data indicate that fexofenadine is non-sedating even at high doses [Philpot 2000].

A 67-year-old male was admitted to hospital after fainting. An abnormally long QTc time was seen on electrocardiography (ECG). He had started taking

180 mg fexofenadine every day approximately two months earlier. Fexofenadine treatment was stopped on hospital admission and the QTc time shortened. An everyday dose of 180 mg was restarted, and the QTc time increased again. After 11 days of treatment with fexofenadine, he suffered tachycardia and fibrillation. He was successfully defibrillated and treatment permanently stopped. The QTc time decreased [Pinto *et al.* 1999].

Note For a case of fexofenadine exacerbating psoriasis, see Saraswat and Saraswat [2006].

Half-life 14 to 18 h.

Volume of Distribution 5.4 to 5.8 L/kg.

Clearance 14 to 18 mL/min/kg.

Protein Binding 60 to 70%.

Dose A usual dose of 120 mg daily is administered but is reduced to 60 mg in patients with renal impairment. The maximum dose is 180 mg daily.

Finasteride

Azasteroid, 5α-Reductase Inhibitor, Treatment of BPH

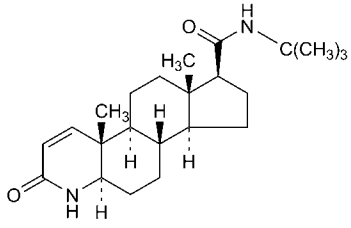
$C_{23}H_{36}N_2O_2 = 372.6$

CAS—98319-26-7

IUPAC Name (1*S*,3a*S*,3b*S*,5a*R*,9a*R*,9b*S*,11a*S*)-*N*-tert-Butyl-9a,11a-dimethyl-7-oxo-1,2,3,3a,3b,4,5,5a,6,9b,10,11-dodecahydroindeno[5,4-f]quinoline-1-carboxamide

Synonyms (5α,17β)-*N*-(1,1-Dimethylethyl)-3-oxo-4-aza-5-androst-1-ene-17-carboxamide; *N*-(2-methyl–2-propyl)-3-oxo-4-aza-5α-androst-1-ene-17β-carboxamide; MK-906; MK-0906.

Proprietary Names *Andozac*; *Chibro-Proscar*; *Finastid*; *Proscar*; *Prostide*; *Propecia*; *Urprosan*.



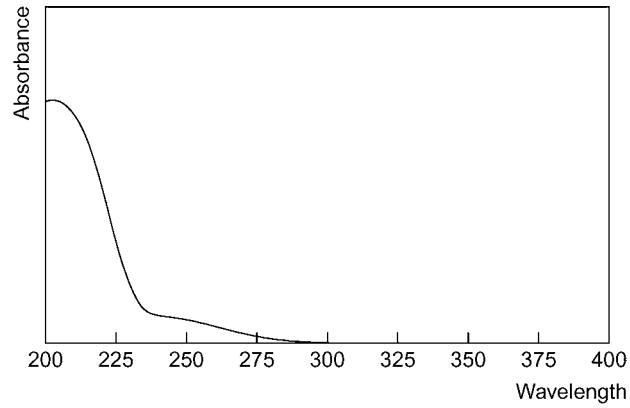
Chemical Properties White to off-white crystalline solid. Mp 252° to 254°, also reported to be 257°. It is freely soluble in chloroform, DMSO, ethanol, methanol and *n*-propanol; sparingly soluble in propylene glycol and polyethylene glycol 400; very slightly soluble in hydrochloric acid (0.1 mol/L) and sodium hydroxide (0.1 mol/L); practically insoluble in water (11.68 mg/L at 25°). Log *P* (octanol/water), 3.03 [Hansch *et al.* 1995]. Plasma samples were stable at −18° for at least 6 weeks [Ptácek *et al.* 2000]. Solutions stored at 4° were stable for at least 6 months [Takano, Hata 1996].

Thin-layer Chromatography Plate: silica. Solvent system: chloroform : methanol : water : ammonium hydroxide (55 : 35 : 6 : 4). Finasteride ω-oic acid R_f 0.58.

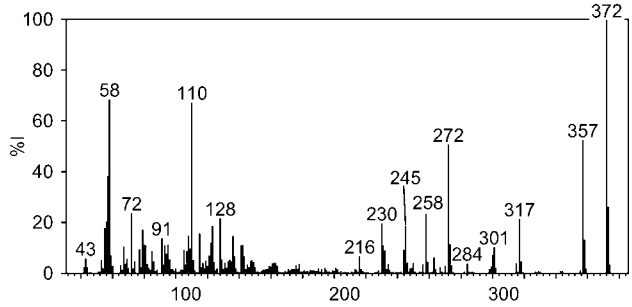
Plate: silica. Solvent system: ethyl acetate : 2-butanol : formic acid (90 : 8 : 2). Finasteride ω-oic acid R_f 0.43. [Carlin *et al.* 1992].

High Performance Liquid Chromatography Column: Zorbax C_8 (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol : water (26 : 39 : 35), flow rate 0.9 to 1.0 mL/min. UV detection (λ = 210 nm). Retention time: ω-hydroxyfinasteride 6.5 min, finasteride 13.4 min, 4-*n*-methylfinasteride 21.0 min. [Carlin *et al.* 1992].

Ultraviolet Spectrum



Mass Spectrum Principal ions at *m/z* 372, 58, 110, 357, 272, 57, 373, 72.



Quantification

Plasma **GC-MS** Column: 100% methylsilicone phase (12 m × 0.22 mm i.d., 0.33 µm). Carrier gas: He, 35 kPa. Temperature programme: 70° for 1 min, to 200° at 30°/min for 1 min to 280° at 10°/min for 10 min to 300° at 20°/min for 5 min. SIM acquisition mode. Retention time: 19.7 min. Limit of detection, 0.05 µg/L [Guarna *et al.* 1995].

HPLC Column: Nucleosil 100-3 C_{18} (150 × 3.2 mm i.d., 3 µm). Mobile phase: acetonitrile : 15 mmol/L potassium dihydrogen phosphate buffer (40 : 60), flow rate 0.6 mL/min. UV detection (λ = 210 nm). Retention time: 17 min. Limit of quantification 4.08 µg/L [Ptácek *et al.* 2000]. Column: RP symmetry (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.04 mol/L orthophosphoric acid (pH 4.0; 45 : 55), flow rate 1.2 mL/min. UV detection (λ = 215 nm). Retention time: 14.6 min. Limit of detection, 5 µg/L [Carlucci, Mazzeo 1997]. Column: Inertsil ODS-2 (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile water (10 : 90, 25 : 75, 70 : 30 or 45 : 55), flow rate 1.0 or 1.1 mL/min. UV detection (λ = 210 nm). Limit of quantification, 1 µg/L [Takano, Hata 1996]. Column: Zorbax C_8 (250 × 4.5 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol : water (26 : 39 : 35), flow rate 0.9 to 1.0 mL/min. UV detection (λ = 210 nm). Limit of quantification, 5–10 µg/L [Carlin *et al.* 1988;Carlin *et al.* 1992]. Column: Altex RP-8 (15 × 0.46 cm, 5 µm) with Analytichem RP-18 (5 × 0.46 cm, 3 µm). Mobile phase: methanol : acetonitrile : water (6 : 5 : 7), flow rate 1.0 mL/min. DAD (λ = 210 nm). Retention time: 13.1 min. Limit of quantification, 1 µg/L [Constanzer *et al.* 1991].

LC-MS Column: Luna C_{18} (50 × 2.0 mm i.d., 5 µm). Mobile phase: 0.1% formic acid : methanol (88 : 12 for 2 min to 10 : 90 over 1 min for 7 min), flow rate 0.2 mL/min. SRM acquisition mode, positive ion mode. Limit of quantification, 0.5 µg/L [Lundahl *et al.* 2009]. Column: SymmetryShield RP18 (50 × 2.1 mm i.d., 3.5 µm). Mobile phase: 10 mmol/L ammonium acetate-0.1% formic acid : acetonitrile (58 : 42 to 49.5 : 50.5 over 3.5 min to 70 : 30 for 2.5 min to 58 : 42 at 6.01 min for 6.99 min), flow rate 200 µL/min. SIM acquisition mode. Limit of quantification, 1 µg/L [Chen *et al.* 2008]. Column: Hypurity C_{18} (150 × 2.1 mm i.d., 5 µm). Mobile phase: acetonitrile : water (46 : 54) containing 0.1% acetic acid and 0.1% TFA, flow rate 0.2 mL/min. ESI, SIM acquisition mode. Limit of quantification, 0.2 µg/L [Guo *et al.* 2007]. Column: reversed phase. Mobile phase: acetonitrile : 1 mmol/L ammonium acetate (75 : 25), flow rate 200 µL/min. API. Limit of quantification, 0.5 µg/L [Almeida *et al.* 2005]. Column: reversed phase C_{18} (150 × 4.6 mm i.d.). Mobile phase: acetonitrile : water (80 : 20) with 10 mmol/L formic acid, flow rate 1.0 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention time: 2.6 min. Limit of quantification, 0.5 µg/L [de Menezes *et al.* 2001]. Column: Hypersil C_{18} (50 × 2 mm i.d., 3 µm). Mobile phase: acetonitrile : 10 mmol/L ammonium acetate and 0.1% formic acid (50 : 50 or 90 : 10), flow rate 0.2 mL/min. Retention time: 1.0 or 1.7 min. TIS. Limit of detection, 25 ng/L [Matuszewski *et al.* 1998] Column: C_{18} (33 × 4.6 mm i.d., 3 µm). Mobile phase: acetonitrile : water (70 : 30), flow rate

1.0 mL/min. APCI, positive ion mode. Limit of quantification, 200 ng/L [Constanzer *et al.* 1994].

Urine **LC-MS** See Plasma. Limit of quantification, 2.0 µg/L [Lundahl *et al.* 2009]. Column: Discovery Supelco C_{18} (150 × 2.1 mm i.d., 5 µm) or Zorbax C_{18} (50 × 2.1 mm i.d., 1.8 µm). Mobile phase: 0.1% acetic acid : acetonitrile with 0.1% acetic acid (85 : 15 to 40 : 60 in 7 min and 100 : 0 in 14 min), flow rate, 0.25 mL/min. CID, MRM acquisition mode. Limit of detection, 30 µg/L [Mazzarino, Botré 2006].

Bile **LC-MS** See Plasma. Limit of quantification, 2.5 µg/L [Lundahl *et al.* 2009].

Disposition in the Body Finasteride is well absorbed after oral administration and metabolised in the liver by oxidation to a (17)-monocarboxylic acid metabolite (18.5% of the dose) and ω-hydroxylated finasteride. There is virtually no unchanged drug. The metabolites are excreted in urine (approximately 40%) and faeces (50 to 65%). The drug is widely distributed throughout the body and crosses the blood–brain barrier.

Therapeutic Concentration

A 5 mg dose of finasteride was orally administered to 24 healthy volunteers. The mean maximum plasma concentration was 56.4 ± 8.7 µg/L reached at 1.8 ± 0.4 h [Guo *et al.* 2007].

Twenty-four healthy adult males were administered a single oral dose of 5 mg finasteride. A mean maximum plasma concentration of 35.9 µg/L was reached at 2 h [Almeida *et al.* 2005].

Twenty-six healthy male volunteers were administered 2 x 5 mg oral finasteride. The plasma concentration reached a maximum of ≈60 µg/L at 2 h [Ptácek *et al.* 2000].

Thirty-two healthy males aged between 28 and 53 years were administered with single doses of 5, 10, 20, 50 and 100 mg finasteride after an overnight fast. Peak plasma concentrations increased with dose: 38.1, 81.5, 147.1, 442.0 and 835.5 µg/L, respectively. The time to reach this peak increased from 1.8 to 2.8 h. The same volunteers were also administered with multiple doses of 10 mg daily for 7 days. On day 1 peak plasma concentrations of 82.5 µg/L were reached followed by 88.7 and 96.2 µg/L for days 4 and 7, respectively. Peak concentrations were reached between 3.7 and 4.5 h after administration [Ohtawa *et al.* 1991].

After a single oral dose of 50, 200 or 400 mg a peak plasma concentration of 0.29 ± 0.02, 0.92 ± 0.08 and 2.05 ± 0.19 mg/L were reached at 4, 2 to 4, and 4 to 6 h, respectively [Carlin *et al.* 1988].

Toxicity For a case of solitary fixed drug eruption after finasteride administration see Oyama, Kaneko [2009].

Bioavailability Mean bioavailability has been reported to be 63 and 80%.

Half-life ≈6 h (individuals aged <60 years); 8 h (>70 years). 17.3 ± 3.5 or 13.4 ± 0.73 [Carlin *et al.* 1988]; 5.71 h [Almeida *et al.* 2005].

Volume of Distribution 44 to 96 L.

Clearance 165 mL/min.

Protein Binding 90%.

Dose A usual dose of 1 mg daily is recommended. The maximum dose is 5 mg.

Flavoxate

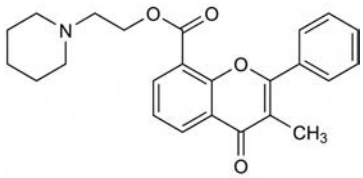
Antispasmodic

$C_{24}H_{25}NO_4$ = 391.5

CAS—15301-69-6

IUPAC Name 2-Piperidin-1-ylethyl 3-methyl-4-oxo-2-phenylchromene-8-carboxylate

Synonym 3-Methyl-4-oxo-2-phenyl-4*H*-1-benzopyran-8-carboxylic acid 2-(1-piperidinyl)ethyl ester



Chemical Properties Soluble in ethanol and chloroform. pK_a 7.3. Log *P* (octanol/water), 4.9.

Flavoxate Hydrochloride

$C_{24}H_{25}NO_4$,HCl = 427.9

CAS—3717-88-2

Proprietary Names *Bladderon*; *Bladuril*; *Cleanxate*; *Flavorin*; *Genurin*; *Spasuret*; *Spasuri*; *Urispadol*; *Urispas*; *Uronid*; *Uroxate*.

Chemical Properties A creamy-white crystalline powder. Mp 230° to 236°. Soluble 1 in 150 of water, 1 in 500 of ethanol, 1 in 40 of chloroform and 1 in 120 of methanol; practically insoluble in ether.

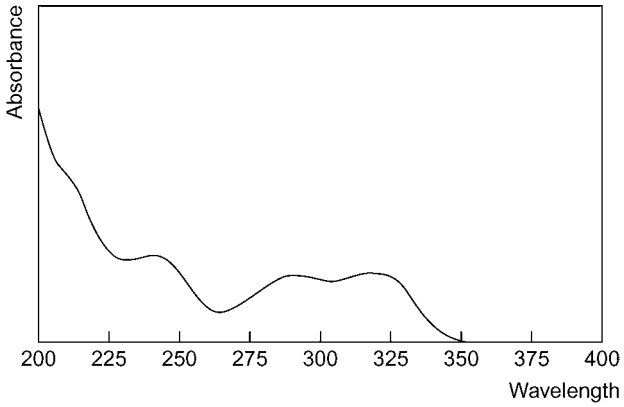
Colour Test Liebermann's reagent—yellow.

Thin-layer Chromatography System TA—R_f 0.62; system TB—R_f 0.36; system TC—R_f 0.67; system TE—R_f 0.77; system TL—R_f 0.45; system TAE—R_f 0.48; system TAJ—R_f 0.52; system TAK—R_f 0.71; system TAL—R_f 0.92 (acidified iodoplatinate solution, strong reaction).

Gas Chromatography System GA—not eluted.

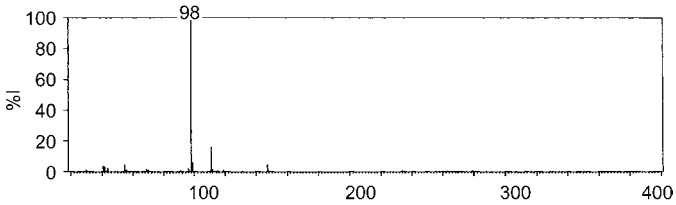
High Performance Liquid Chromatography System HA—*k* 2.2; system HAX—retention time 11.3 min; system HAY—retention time 6.0 min.

Ultraviolet Spectrum Aqueous acid—241 ($A^{\frac{1}{1}}$=360b), 293, 320 nm.



Infrared Spectrum Principal peaks at wavenumbers 1633, 1121, 1718, 1255, 759, 1272 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 98, 111, 99, 147, 55, 41, 42, 96.



Dose 300 to 800 mg of flavoxate hydrochloride daily.

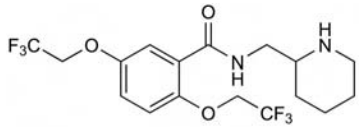
Flecainide

Antiarrhythmic

$C_{17}H_{20}F_6N_2O_3$ = 414.3

CAS—54143-55-4; 99495-87-1 (±)

IUPAC Name *N*-(2-Piperidinylmethyl)-2,5-bis(2,2,2-trifluoroethoxy)benzamide



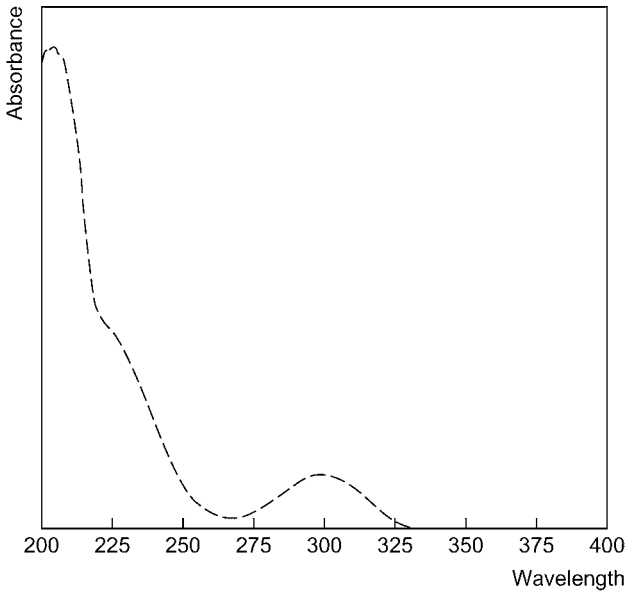
Chemical Properties A white, granular solid. Mp 105° to 107°. pK_a 9.3 (flecainide acetate). Log *P* (octanol/water), 3.8. Extraction yield (chlorobutane), 0.95 [Demme *et al.* 2005].

Flecainide Acetate
$C_{17}H_{20}F_6N_2O_3,C_2H_4O_2 = 474.4$
CAS—54143-56-5
Synonym R-818
Proprietary Names *Almarytm*; *Apocard*; *Aristocor*; *Corflene*; *Flecaine*; *Tambocor.*

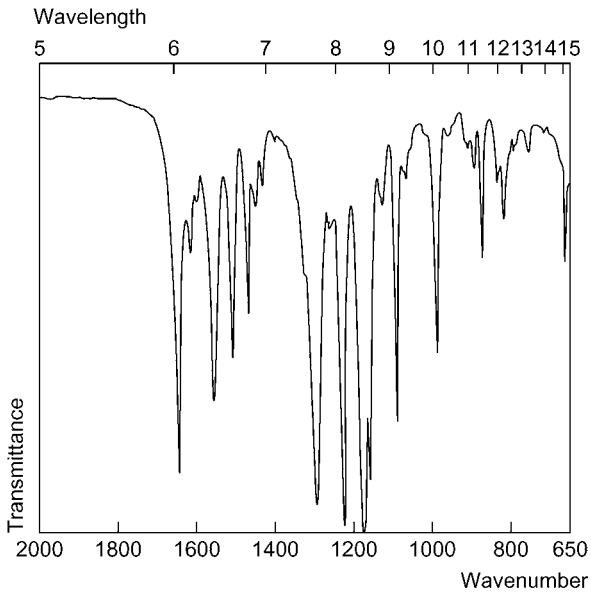
F

Chemical Properties A white to slightly off-white granular solid. Mp 145° to 147°. It is soluble in water (48.4 g/L at 37°) and ethanol (300 g/L at 37°); freely soluble in dilute acetic acid; practically insoluble in dilute hydrochloric acid.

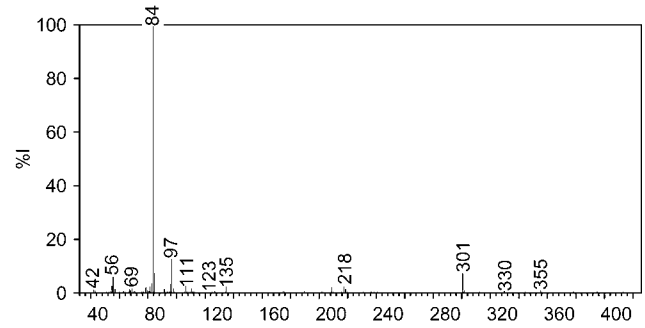
Thin-layer Chromatography System TB—R_f 0.06; system TE—R_f 0.49; system TAE—R_f 0.28.
Gas Chromatography System GA—RI 2250 (flecainide); RI 2500 (Art (formyl)); system GB—RI 2351 (flecainide); RI 2240 (Art (formyl)).
High Performance Liquid Chromatography System HX—RI 419; system HY—RI 355; system HZ—retention time 5.2 min.
Ultraviolet Spectrum Ethanol—205 (A^1_1=521), 230 (A^1_1=219), 300 (A^1_1=59) nm.



Infrared Spectrum Principal peaks at wavenumbers 1169, 1221, 1291, 1637, 1083, 1549 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 84, 97, 301, 56, 85, 96, 218, 82.



Quantification
Blood **HPLC** Fluorescence detection. Limit of detection, 20 µg/L [Bhamra *et al.* 1984].
Plasma **HPLC** Column: RP C_6 Spherisorb (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 15 mmol/L potassium dihydrogen phosphate (pH 3) (60:40), flow rate 1.5 mL/min. Internal standard (IS): S-15277. UV detection (λ=300 nm) or fluorescence detection (λ_{ex}=300 nm, λ_{em}=370 nm). Retention time: flecainide, 8.39 min; IS, 6.17 min. Limit of detection, 50 µg/L [Verbesselt *et al.* 1991]. Column: RP C_{18} Radial-Pak (100 × 8 mm, 5 µm). Mobile phase: methanol : 25% ammonia (99.9:0.1), flow rate 0.7 mL/min. IS: N-(2-piperidinylmethyl)-2,3-bis(2,2,2-trifluoroethoxy)benzamide hydrochloride. Fluorescence detection (λ_{ex}=293 nm, λ_{em}=340 nm). Retention time: flecainide, 7.2 min; IS, 8.3 min. Limit of detection, 10 µg/L [Plomp *et al.* 1986]. See Blood [Bhamra *et al.* 1984]. Fluorescence detection. Limit of detection, 3 µg/L. UV detection. Limit of detection, 50 µg/L [Chang *et al.* 1984].
Serum **HPLC** See Blood [Bhamra *et al.* 1984].
Disposition in the Body Flecainide is rapidly and almost completely absorbed after oral administration and peak plasma concentrations occur after 0.5 to 6 h. It is extensively metabolised (subject to genetic polymorphism) mainly to *m*-O-dealkylated flecainide and the *m*-O-dealkylated lactam of flecainide, which both have some activity. *m*-O-dealkylated flecainide makes up to 20% of the drug's anti-arrhythmic activity. CYP2D6 is involved in its metabolism. Flecainide is excreted mainly in urine (about 10 to 50% as the unchanged drug and the remainder as metabolites, depending on type of administration). About 5% is excreted in faeces. Excretion of flecainide is decreased in alkaline urine. Haemodialysis removes only about 1% of unchanged flecainide. It crosses the placenta and is distributed into breast milk.
Therapeutic Concentration The trough serum therapeutic concentration range is 0.45 to 0.9 mg/L and peak, 0.75 to 1.25 mg/L.

Trough plasma-flecainide concentrations at steady state in 13 individuals, aged between 28 and 72 years (average, 53.7 years), taking 100, 200 and 250 mg of flecainide orally twice a day were 0.295 and 0.314 mg/L (2 subjects), 0.390 to 0.814 mg/L (5 subjects), and 0.753 and 1.387 mg/L, respectively. All participants suffered from coronary artery disease, heart disease or primary rhythm disorder [Anderson *et al.* 1981].

Normal, healthy volunteers were administered 200 mg and peak concentrations of 0.341 mg/L were observed at 2.4 h [Hall 1984].

Twenty men and one woman, aged 33 to 74 years, with impaired renal function (10 of whom had end-stage renal disease requiring haemodialysis) were administered a single, oral dose of 200 mg flecainide acetate. 7 to 14 days after this single dose, each patient received 100 mg flecainide acetate every 12 or 24 h for 10 days. Mean peak flecainide acetate concentrations were 0.33 mg/L, after 3.3 h, following the single dose and 0.687 mg/L, after 2.7 h, for the multiple dosing regimen [Forland *et al.* 1988].

Toxicity Overdosing with flecainide is potentially life threatening and can cause or worsen supraventricular or ventricular arrhythmias and heart failure. Plasma levels above 0.7 to 1.0 mg/L are associated with increased likelihood of adverse experiences; the toxic concentration range is 1.5 to 3.0 mg/L.

Three subjects receiving flecainide developed dose-related blurring of vision at plasma concentrations of 0.713 to 0.906 mg/L (mean 0.802 mg/L). Three other subjects who required plasma concentrations >0.7 mg/L for efficacy reported no adverse effects [Duff *et al.* 1981].

A young woman attempted to commit suicide and was found with no effective blood pressure and in extreme cardiac suffering. A flecainide concentration of 5.4 mg/L was observed (therapeutic range 0.2 to 1.0 mg/L) and during 10 h of cardiopulmonary bypass support, this reduced to 1.4 mg/L. Blood pressure and effective cardiac rhythm eventually returned and treatment was continued until drug levels decreased further. Unfortunately, the woman died, however, owing to severe neurological damage which occurred at the time of overdose [Yasui *et al.* 1997].

Bioavailability 90 to 95%.
Half-life Plasma half-life, 7 to 23 h; 19 h (patients with arrhythmia); 26 to 49 h (patients with renal/hepatic dysfunction); 50 h (patients with congestive heart failure).
Volume of Distribution Steady state, 5 to 13.4 L/kg; average 5.5 to 8.7 L/kg for IV administration and 10 L/kg for oral.
Clearance Plasma, 4.6 to 12.1 mL/min/kg after an IV dose of 0.6 to 1.7 mg/kg; 4.1 to 17 mL/min/kg after an oral dose of 60 to 240 mg.
Protein Binding 32 to 58%.
Note For reviews of flecainide, see Holmes and Heel [1985] and Conard and Ober [1984].

Dose IV administration: initially 2 mg/kg body weight is administered for the first 30 min, followed by 1.5 mg/kg/h for the first hour and maintained at 0.1 to 0.25 mg/kg/h for subsequent hours. The infusion period should not exceed 24 h and the maximum dose is 600 mg. For patients with severe renal impairment (creatinine clearance <35 mL/min/1.73 m^2). Oral administration: initial dose is 50 to 100 mg twice daily, with a maximum of 300 to 400 mg daily. Flecainide is not recommended to children under 12 years old.

Floctafenine

Analgesic

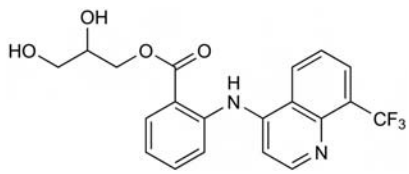
$C_{20}H_{17}F_3N_2O_4$ = 406.4

CAS—23779-99-9

IUPAC Name 2,3-Dihydroxypropyl 2-[[8-(trifluoromethyl)quinolin-4-yl]amino]benzoate

Synonym 2-[[8-(Trifluoromethyl)-4-quinolinyl]amino]benzoic acid 2,3-dihydroxypropyl ester

Proprietary Names *Idalon*; *Idarac*.



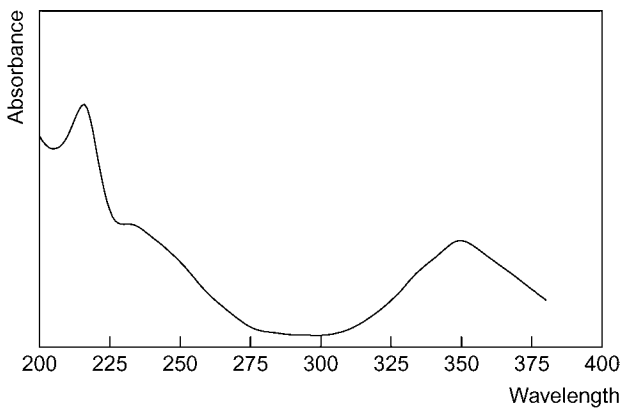
Chemical Properties A yellowish-white powder. Mp 175° to 179°. Insoluble in water; soluble in ethanol and acetone; very slightly soluble in chloroform, ether and methylene chloride; freely soluble in dimethylformamide and pyridine. Log *P* (octanol/water), 4.0.

Thin-layer Chromatography System TE—R_f 0.85; system TAE—R_f 0.85.

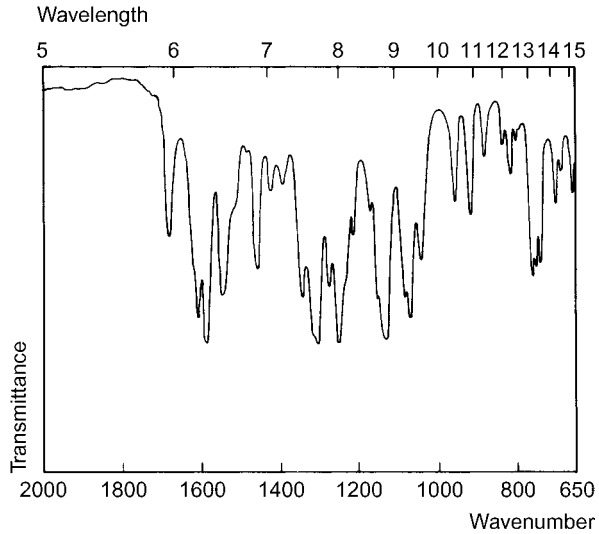
Gas Chromatography System GA—floctafenine RI 3132, floctafenine-Me RI 2433.

High Performance Liquid Chromatography System HZ—retention time 4.4 min; system HAA—retention time 17.2 min; system HAX—retention time 6.6 min; system HAY—retention time 5.8 min.

Ultraviolet Spectrum Aqueous acid—233 (A^1_1=547a), 348 nm (A^1_1=450a); aqueous alkali—249 (A^1_1=392b), 359 nm (A^1_1=390b).



Infrared Spectrum Principal peaks at wavenumbers 1585, 1305, 1252, 1131, 1605, 1070 cm^{-1} (KBr disk).



Quantification

Blood **TLC–spectrophotometry** For method of quantification for floctafenic acid and hydroxyfloctafenic acid, see Lynn *et al.* [1979].

Plasma **HPLC** UV detection. Limit of detection, 100 µg/L floctafenine, 50 µg/L floctafenic acid [Abdel-Hay, Gharaibeh 1992]. UV detection. Floctafenine and glafenine. Limit of detection, about 3.2 µmol/L for floctafenine [Tracqui *et al.* 1988].

Urine **TLC–spectrophotometry** See Blood [Lynn *et al.* 1979].

Disposition in the Body Absorbed after oral administration. It is rapidly metabolised to floctafenic acid, which is thought to be responsible for most of the analgesic activity. About 25% of a dose is excreted in the urine as floctafenic acid and hydroxyfloctafenic acid in 48 h.

Therapeutic Concentration

A single oral dose of 400 mg administered to 7 subjects produced peak blood concentrations of floctafenic acid of 0.9 to 3.8 mg/L (mean 2.0) in 0.5 to 2.5 h [Lynn *et al.* 1979].

Protein Binding Floctafenic acid, extensively bound.

Dose 0.8 to 1.6 g daily.

Abdel-Hay MH, Gharaibeh AM (1992). High-performance liquid chromatographic determination of floctafenine and its major metabolite, floctafenic acid in plasma. *J Clin Pharm Ther* 17: 31–35.

Lynn RK *et al.* (1979). The metabolism of floctafenin in man and rodents. *J Clin Pharmacol* 19: 20–30.

Tracqui A *et al.* (1988). Simultaneous determination of glafenine and floctafenine in human plasma using high-performance liquid chromatography. *Ann Biol Clin (Paris)* 46: 665–667.

Flosequinan

Antihypertensive

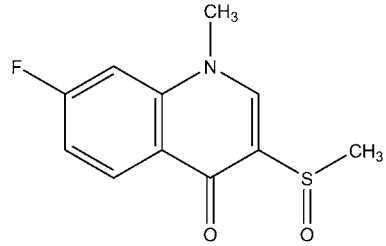
$C_{11}H_{10}FNO_2S$ = 239.3

CAS—76568-02-0

IUPAC Name 7-Fluoro-1-methyl-3-methylsulfinylquinolin-4-one

Synonyms BTS-49465; flosequinon; 7-fluoro-1-methyl-3-(methylsulfinyl)-4(1*H*)-quinolinone.

Proprietary Name *Manoplax*



Chemical Properties Crystals. Mp 226° to 228°. Log *P* (octanol/water), 2.72 [ACD 2007]. Standard solutions frozen at –20° were found to be stable for at least 6 months [Slegowski *et al.* 1988].

Quantification

Plasma **HPLC** Column: Cosmosil 5C_{18}. UV detection (λ = 254 nm). Limit of detection, 5 µg/L for flosequinan and its metabolite [Sakai *et al.* 1993]. Column: Cellulose tris-3,5-dimethylphenylcarbamate on silica gel. Mobile phase: ethanol : methanol (22 : 78). UV detection (λ= 320 nm). Limit of detection, 5 µg/L [Kashiyama *et al.* 1994]. Column: Waters C_{18} Nova-Pak (15 cm × 3.9 mm i.d., 5 µm). Mobile phase: water : methanol : acetonitrile (73 : 20 : 7), flow rate 1.2 mL/min. UV detection (λ= 254 nm). Limit of detection, 50 µg/L [Slegowski *et al.* 1988].

Column: Lichrosorb RP8 (25 cm × 4.6 mm i.d., 10 µm). Mobile phase: acetonitrile : water (3 : 1). UV detection (λ = 254 nm). Retention times: flosequinan, 6.0 min; sulfone metabolite, 6.8 min. Limit of detection not reported [Wynne *et al.* 1985].

Urine **HPLC** Column: Cosmosil $5C_{18}$. UV detection (λ = 254 nm). Limit of detection, 50 µg/L for flosequinan and 10 µg/L for its metabolite [Sakai *et al.* 1993]. See Plasma. Limit of detection, 2.5 mg/L [Slegowski *et al.* 1988]. See Plasma [Wynne *et al.* 1985].

Oral Fluid **HPLC** See Plasma [Wynne *et al.* 1985].

Disposition in the Body Rapidly absorbed following oral administration and rapidly cleared from the systemic circulation, primarily via metabolic oxidation to the corresponding sulfone. The major active metabolite is 7-fluoro-1-methyl-3 methylsulfinyl-4-quinolone (BTS 53554), which is cleared primarily by the renal route [Wynne *et al.* 1985]. Approximately 1% of the administered dose is excreted unchanged in the urine [Gallo *et al.* 1993].

Therapeutic Concentration Flosequinan is a direct-acting arteriovenous vasodilator that was used as an adjunct to the conventional treatment of heart failure, but it was withdrawn from the market after findings of excess mortality [Kamali, Edwards 1995].

Twenty patients with chronic cardiac failure had a mean maximum plasma concentration of 2.52 mg/L at 1.4 h after administration of 100 mg flosequinan. After 36 days, there was a small increase in the maximum plasma concentration to 3.21 mg/L. The elimination half-life decreased from 6.4 to 4.9 h. The $AUC_{0-\infty}$ and the elimination rate constant (k_{el}) remained unchanged [Nicholls *et al.* 1996].

Ten patients with compromised hepatic function were administered a single oral dose of 100 mg flosequinan. The mean peak plasma concentration was 0.98 ± 0.52 mg/L at 35.4 ± 27.4 h, compared with 1.84 ± 0.26 mg/L at 7.0 ± 3.1 h in healthy subjects. Adverse events were reported by 5 of the subjects, including headache and syncope [Hinson *et al.* 1994].

Twenty patients with severe renal dysfunction were administered a single oral dose of 100 mg flosequinan. Mean peak plasma concentration was 1.37 ± 0.67 mg/L at 1.6 ± 1.4 h. Renal clearance was decreased by approx. 20% compared with healthy volunteers. The active metabolite reached a mean peak plasma concentration of 2.22 ± 0.58 mg/L at 10.9 ± 5.9 h [Gallo *et al.* 1993].

A study in elderly patients with congestive heart failure investigated the effects of a single oral dose of 50 mg flosequinan (8 patients) compared with once-daily treatment with 25 mg for 2 weeks. After a single dose, the mean peak plasma concentration was 1.17 mg/L, attained at 2.5 h. The mean peak plasma concentration of the active metabolite was 1.44 mg/L at 20.3 h. Flosequinan did not accumulate but the active metabolite accumulated gradually reaching steady state after approx. 2 weeks [Sakai *et al.* 1993].

Six healthy male volunteers were administered a single oral dose of 200 mg flosequinan. Mean maximum plasma concentrations for flosequinan and its metabolite were 3.19 and 3.63 mg/L, respectively, attained at 0.5 and 6.0 h, respectively [Wynne *et al.* 1985].

Note For a study investigating the concomitant administration of flosequinan and digoxin, see Rau *et al.* [1994]; for a review of the pharmacology of flosequinan, see Yates [1991].

Half-life Flosequinan 1.6 h; sulfone metabolite 37.6 h.

Dose Patients taking 100 mg flosequinan a day were found to have a significantly increased risk of dying; the manufacturer recommended reducing the dose to 75 or 50 mg a day.

Fluanisone

Tranquilliser

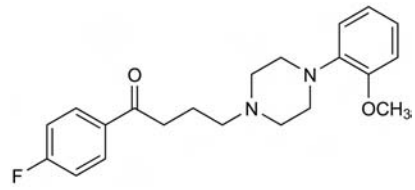
$C_{21}H_{25}FN_2O_2 = 356.4$

CAS—1480-19-9

IUPAC Name 1-(4-Fluorophenyl)-4-[4-(2-methoxyphenyl)-1-piperazinyl]-1-butanone

Synonym Haloanisone

Proprietary Names *Sedalande*. It is an ingredient of *Hypnorm* (vet.).



Chemical Properties An almost white to buff-coloured crystalline powder. Mp 67.5° to 68.5°. Practically insoluble in water; soluble 1 in 12 of ethanol, 1 in 1 of chloroform and 1 in 22 of ether. Log *P* (octanol/water), 3.6.

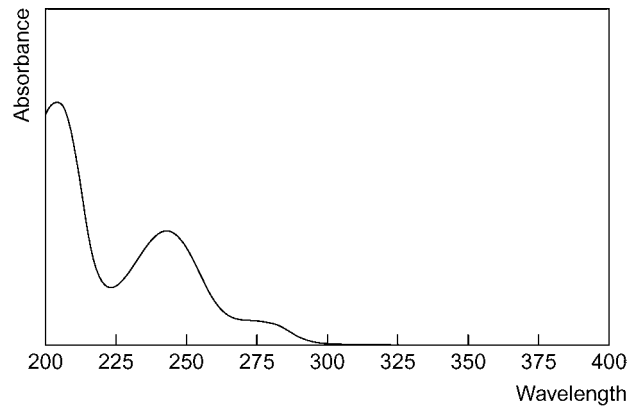
Colour Test Mandelin's test—brown.

Thin-layer Chromatography System TA—R_f 0.73; system TB—R_f 0.39; system TC—R_f 0.68; system TE—R_f 0.82; system TF—R_f 0.23; system TL—R_f 0.60; system TAE—R_f 0.67; system TAF—R_f 0.75 (acidified potassium permanganate solution, positive).

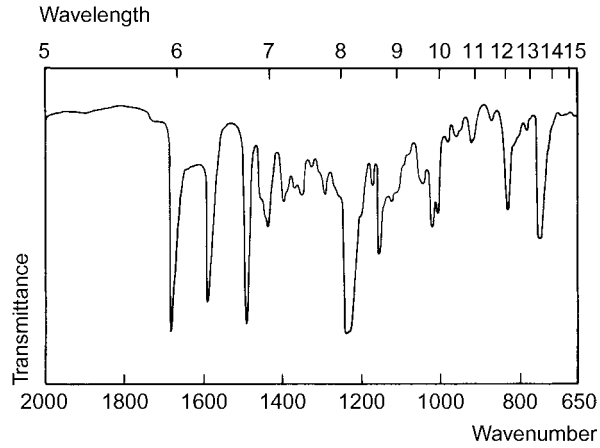
Gas Chromatography System GA—fluanisone RI 2785, M (*O*-desmethyl-) RI 2715.

High Performance Liquid Chromatography System HX—RI 423; system HY—RI 349.

Ultraviolet Spectrum Acid isopropyl alcohol—243 nm (A_1^1=550a).



Infrared Spectrum Principal peaks at wavenumbers 1690, 1235, 1497, 1598, 1155, 750 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 205, 218, 123, 356, 219, 162, 95, 190; M (*O*-desmethyl-) *m/z* 194, 165, 123, 342, 338, 134.

Dose Fluanisone has been given in doses of 5 to 7.5 mg daily.

Fluclorolone Acetonide

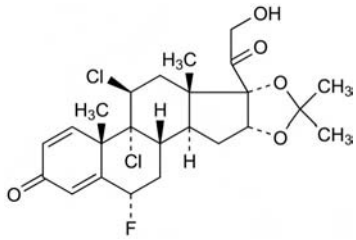
Corticosteroid

$C_{24}H_{29}Cl_2FO_5 = 487.4$

CAS—3693-39-8

Synonyms (6α,11β,16α)-9,11-Dichloro-6-fluoro-21-hydroxy-16,17-[(1-methylethylidine)bis(oxy)]-pregna-1,4-diene-3,20-dione; flucloronide.

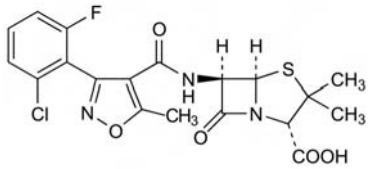
Proprietary Names *Cutanit*; *Topilar*.



Chemical Properties A white crystalline powder. Mp about 245°, with decomposition. Practically insoluble in water; soluble in ethanol, chloroform and methanol. Log *P* (octanol/water), 4.2.
Ultraviolet Spectrum Methanol—236 nm (A^{1}_{1}=242b).
Infrared Spectrum Principal peaks at wavenumbers 1666, 1086, 1052, 1063, 1724, 1639 cm^{-1}.
Use Topically as a 0.025% cream or ointment.

Flucloxacillin

Antibiotic
$C_{19}H_{17}ClFN_3O_5S$ = 453.9
CAS—5250-39-5
IUPAC Name (2*S*,5*R*,6*R*)-6-[[[3-(2-Chloro-6-fluorophenyl)-5-methyl-4-isoxazolyl]-carbonyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid
Synonym Floxacillin
Proprietary Names *Flucloxil*; *Staphlex*.

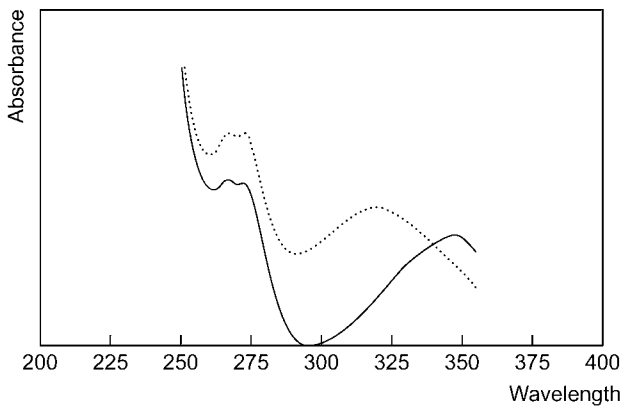


Chemical Properties pK_a 2.7. Log *P* (octanol/water), 2.6.

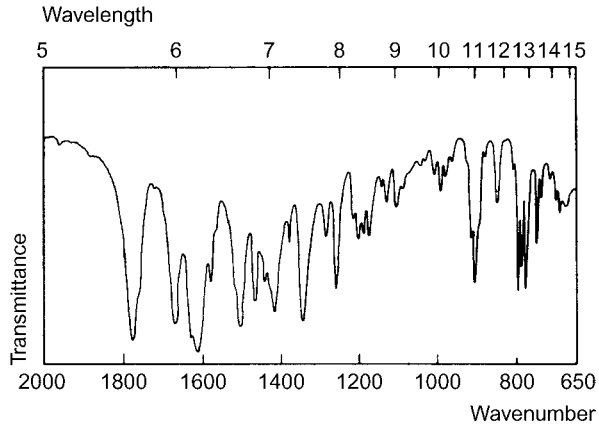
Flucloxacillin Sodium

$C_{19}H_{16}ClFN_3NaO_5S,H_2O$ = 493.9
CAS—1847-24-1 (anhydrous); 34214-51-2 (monohydrate)
Proprietary Names *Betabiotic*; *Cloxillin*; *Evercid*; *Flopen*; *Floxapen* (also as the magnesium salt); *Flucil*; *Flucillin*; *Flucinal*; *Fluclomix*; *Fluclon*; *Flucloxin*; *Fluoclox*; *Galfloxin*; *Geriflox*; *Heracillin*; *Ladropen*; *Stafoxil*; *Staphlex*; *Staphycid* (also as the magnesium salt); *Staphylex*; *Zoxin*. It is an ingredient of *Magnapen*.
Chemical Properties A white, hygroscopic, crystalline powder. Soluble 1 in 1 of water, 1 in 8 of ethanol, 1 in 8 of acetone and 1 in 2 of methanol.

High Performance Liquid Chromatography System HY—RI 469.
Ultraviolet Spectrum Aqueous acid—268, 274, 344 nm; aqueous alkali—268, 274, 318 nm.



Infrared Spectrum Principal peaks at wavenumbers 1603, 1767, 1622, 1495, 1660, 794 cm^{-1} (flucloxacillin sodium, KBr disk).



Quantification
***Plasma* HPLC** Limit of detection, 50 µg/L [Charles *et al.* 1994]. Flucloxacillin, cloxacillin and dicloxacillin. Limit of detection, 0.1 mg/L for flucloxacillin [Hung *et al.* 1988].
Disposition in the Body
Therapeutic Concentration
After a single oral dose of flucloxacillin sodium (500 mg) to 7 elderly subjects, the time to reach a mean peak plasma concentration of 15.3 mg/L (range ± 5.9) was 1.2 h; corresponding values for the 5-hydroxymethyl metabolite were 2.58 mg/L (±2.20) at 2.17 h. IV administration of the same dose to the same subjects produced mean maximum plasma concentrations of flucloxacillin and its 5-hydroxymethyl metabolite, of 69.0 mg/L (±21.2) at 0.14 h and 3.36 mg/L (±2.72) at 1.77 h, respectively [Gath *et al.* 1995].
Dose The equivalent of 1 to 2 g of flucloxacillin daily.

Charles BG *et al.* (1994). Rapid column liquid chromatographic analysis of flucloxacillin in plasma on a microparticulate pre-column. *J Chromatogr Biomed Appl* 660: 186–190.

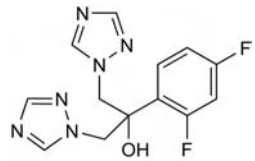
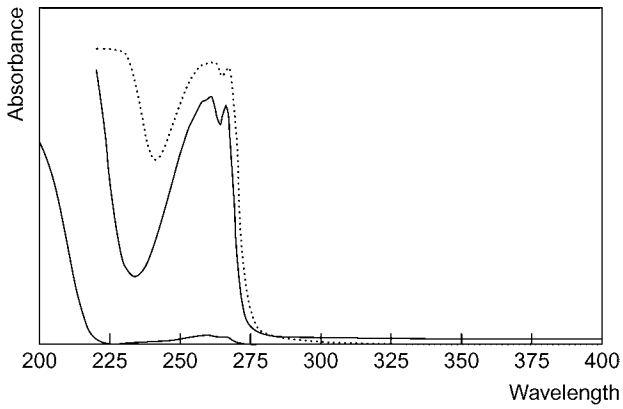
Fluconazole

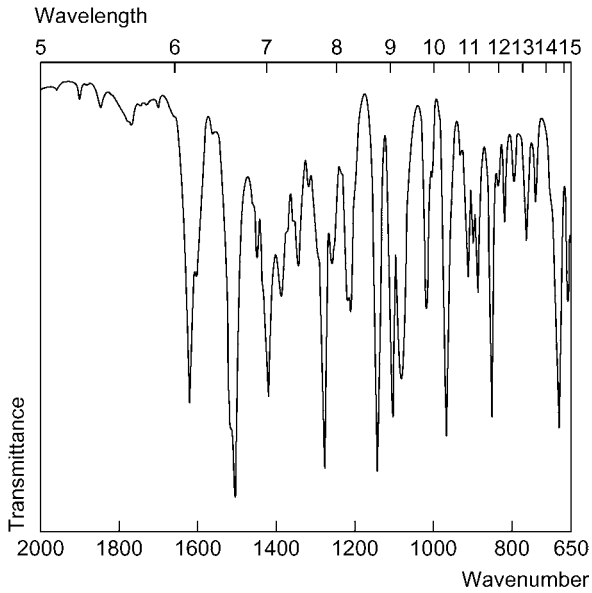
Antifungal
$C_{13}H_{12}F_2N_6O$ = 306.3
CAS—86386-73-4
IUPAC Name 2-(2,4-Difluorophenyl)-1,3-bis(1,2,4-triazol-1-yl)propan-2-ol
Synonyms α-(2,4-Difluorophenyl)-α-(1*H*-1,2,4-triazol-1-ylmethyl)-1*H*-1,2,4-triazole-1-ethanol; UK-49858.
Proprietary Names *Biozolene*; *Diflucan*; *Elazor*; *Fungata*; *Lavisa*; *Loitin*; *Solacap*; *Triflucan*.



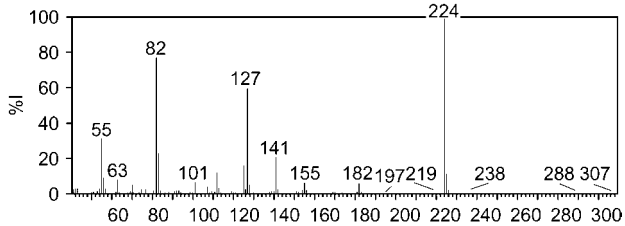
Chemical Properties A white crystalline solid. Mp 138° to 140°. It is slightly soluble in water and saline. pK_a 2.03 (37°). Log *P* (octanol/pH 7.4), 1.0. Extraction yield (chlorobutane), 0.1 [Demme *et al.* 2005].
Thin-layer Chromatography System TB—R_f 0.00; system TE—R_f 0.35; system TAE—R_f 0.67.
High Performance Liquid Chromatography System HAA—retention time 11.4 min; system HX—RI 340; system HY—RI 289.
Ultraviolet Spectrum Aqueous acid—261, 266 nm; basic—261, 267 nm.



Infrared Spectrum Principal peaks at wavenumbers 1507, 1279, 1144, 680, 1620, 966 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 224, 82, 127, 55, 83, 141, 125, 113.



Quantification

Plasma **GC** Column: 1-methylsilicone gum (10 m × 0.53 mm i.d.). Temperature: 220°. Injector and detector temperatures: 250° and 300°, respectively. Carrier gas: argon : methane (95:5), flow rate 5 mL/min. Detection: electron capture. IS: medazepam. Retention time: fluconazole, 4.35 min; IS, 6.40 min. Limit of detection, 0.003 mg/L [Beijnen *et al.* 1991].

HPLC Column: C_{18} (Genesis, 150 × 4.6 mm i.d., 4 µm). Temperature: 40°. Mobile phase: water : acetonitrile (60:40) with 5 mmol/L acetic acid, pH 3.7, flow rate 0.9 mL/min. IS: metronidazole. MS detection (APCI (atmospheric pressure chemical ionisation), MRM (multiple reaction monitoring) at m/z 306.9 to 219.8 for fluconazole and 171.8 to 127.7 for IS.). Retention time: fluconazole, 3.1 min; IS, 2.8 min. Limit of quantification, 0.005 mg/L [Moraes *et al.* 1999].

Bioassay Limit of detection, 2 mg/L [Rex *et al.* 1991]. Limit of detection, 0.2 mg/L [Van't Wout *et al.* 1988].

Serum **GC** Column: 5% methylphenyl : 95% dimethylpolysiloxane, silica DB5 (15 m × 0.32 mm i.d., 0.25 µm). Temperature: 230°. Injector and detector temperatures: 280° and 285°, respectively. Carrier gas: H_2, flow rate 25 mL/min. Detection: nitrogen-selective. Internal standard (IS): medazepam. Retention time: fluconazole, 1.5 min; IS, 3.2 min. Limit of detection, 0.05 mg/L [Debruyne *et al.* 1988].

HPLC Column: C_{18} Adsorbosphere (250 × 4.6 mm i.d., 5 µm). Mobile phase: 25 mmol/L tris(hydroxymethyl)aminomethane phosphate (pH 7) : acetonitrile (75:25), flow rate 1.0 mL/min. UV detection (λ=210 nm). IS: UK-48134. Retention time: fluconazole, 6.6 min; IS, 9.0 min. Limit of detection, 0.1 mg/L [Inagaki *et al.* 1992].

Bioassay See Plasma [Van't Wout *et al.* 1988].

Disposition in the Body Fluconazole is well absorbed after oral administration and is widely distributed throughout the body. It penetrates all body fluids and has been detected in breast milk, joint fluid, saliva, sputum, vaginal fluid and peritoneal fluid. 80% of the parent drug is excreted unchanged in urine and 11% as metabolites.

Therapeutic Concentration Multiple dosing increases peak plasma concentrations and steady state concentrations are reached between 6 and 10 days. The serum therapeutic concentration range is 5 to 15 mg/L.

Ten AIDS patients and 10 healthy volunteers were administered, IV, over 20 min with 100 mg fluconazole. Peak plasma concentrations reached 2.9 ± 0.9 and 2.8 ± 0.4 mg/L for the AIDS and healthy patients, respectively [Yeates *et al.* 1994].

Toxicity The toxic serum concentration is 20 mg/L.

Case: A 56-year-old woman was found dead at home. Toxicological investigation of her blood found a fluconazole concentration of 29.18 mg/L and an acenocoumarol concentration of 0.72 mg/L. Fluconazole inhibited the cytochrome P450 enzymes and thus decreased the clearance of acenocoumarol, resulting in death owing to the haemorrhaging effects of the drug [Kintz *et al.* 1995].

Half-life Approximately 30 h (range from 20 to 50 h); increased in patients with impaired renal function.

Bioavailability Approximately 90%.

Volume of Distribution Apparent volume of distribution, 0.7 to 1.0 L/kg.

Clearance In adults: approx. 0.23 mL/min/kg; 5 to 15 years old: 0.58 mL/min/kg; 9 months to 13 years old: 0.455 mL/min/kg.

Protein Binding Approximately 12%.

Dose Doses range from 50 to 400 mg daily, depending on symptoms and severity. Patients with renal impairment: reduced doses. Children: 3 mg/kg to 12 mg/kg daily (> 4 weeks old), every 72 h (< 2 weeks) and every 48 h (between 2 and 4 weeks).

Flucytosine

Antifungal

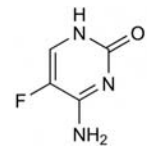
$C_4H_4FN_3O$ = 129.1

CAS—2022-85-7

IUPAC Name 4-Amino-5-fluoro-2(1*H*)-pyrimidinone

Synonym 5-Fluorocytosine

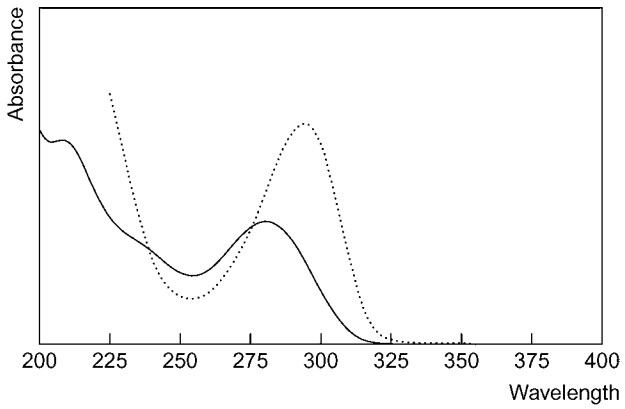
Proprietary Names *Alcobon*; *Ancobon*; *Ancotil*.



Chemical Properties A white crystalline powder. Mp 295° to 297°, with decomposition. Soluble 1 in 67 of water; slightly soluble in ethanol; practically insoluble in chloroform and ether. pK_a 2.9, 10.7. Log *P* (octanol/water), −1.4.

Thin-layer Chromatography System TB—R_f 0.00; system TE—R_f 0.09; system TAE—R_f 0.57.

High Performance Liquid Chromatography System HX—RI 72; system HZ—retention time 1.5 min; system HAA—retention time 3.1 min.
Ultraviolet Spectrum Aqueous acid—286 nm (A_1^1=709a); aqueous alkali—293 nm.



Infrared Spectrum Principal peaks at wavenumbers 1676, 1638, 1548, 1230, 1516, 1211 cm^{-1} (KBr disk).
Quantification
Plasma **HPLC** Diode-array detection. For method for quantification of flucytosine and fluorouracil, see Torano *et al.* [2001].
Serum **HPLC** See Plasma [Torano *et al.* 2001]. Limit of detection, 80 to 625 µg/L for flucytosine and other antifungal drugs [Ng *et al.* 1996]. For comparison with bioassays, see St-Germain *et al.* [1989]; Hulsewede [1994].
Dose 350 to 200 mg/kg daily.

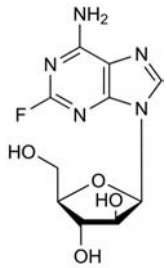
Fludarabine

Antineoplastic
$C_{10}H_{12}FN_5O_4$ = 285.2
CAS—21679-14-1

IUPAC Name (2*R*,3*S*,4*S*,5*R*)-2-(6-Amino-2-fluoropurin-9-yl)-5-(hydroxymethyl)oxolane-3, 4-diol
Synonyms 9-β-D-Arabino-furanosyl-2-fluoro-9*H*-purin-6-amine; 2-F-ara-A; 2-fluorovidarabine; NSC-118218; NSC-118218-H.

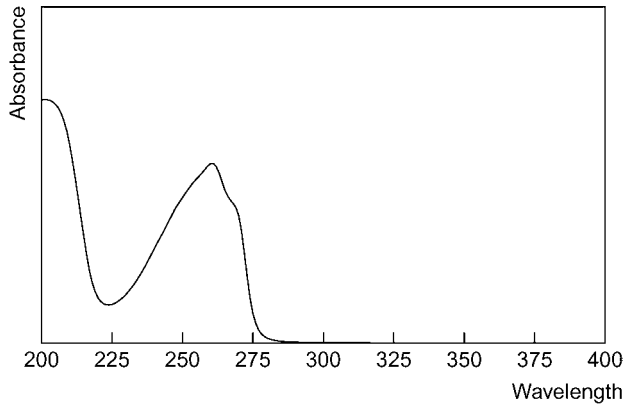


Chemical Properties Crystals from ethanol and water. Mp 260°. It is sparingly soluble in water and organic solvents. Log *P* (octanol/water), −1.18.

Fludarabine Phosphate

$C_{10}H_{13}FN_5O_7P$ = 365.2
CAS—75607-67-9
Synonyms Fludarabine-5′-monophosphate; 2-F-ara-AMP; 2-fluoro-AMP; NSC-312887; NSC-328002.
Proprietary Names *Beneflur*; *Fludara*.

Ultraviolet Spectrum Principal peak at 258 nm.



Quantification
Plasma **HPLC** Column: RP-18 LiChrosorb (200 × 4 mm i.d., 7 µm). Mobile phase: methanol : phosphate buffer (pH 4.15) (20:80), flow rate 1.0 mL/min. Internal standard (IS): mercaptopurine. UV detection (λ=254 nm). Retention time: fludarabine, 6.3 min; IS, 3.3 min. Limit of detection, 50 µg/L [Misztal *et al.* 1996]. Fluorescence detection. Limit of quantification, 0.6 µg/L [Kemena *et al.* 1991].
Urine **HPLC** Column: C-18 Ultrasphere (5 µm, 250 × 4.6 mm). Mobile phase: methanol : 10 mmol/L $(NH_4)H_2PO_4$ (pH 4.15) (6:94), flow rate 1.0 to 1.2 mL/min. UV detection (λ=254 nm). Retention time: 55 min. Limit of detection, 0.0125 ng/L [Hersh *et al.* 1986].
Disposition in the Body Fludarabine phosphate is rapidly dephosphorylated to fludarabine after IV administration and is taken up by lymphocytes where it is rephosphorylated, by kinase, to active fludarabine triphosphate (2-F-ara-ATP). Peak plasma concentrations of 2-F-ara-ATP are observed ~4 h after administration and then undergo triphasic clearance. Excretion is mainly via the kidneys with ~60% of a dose being excreted in urine within 24 h. Considerable variations in pharmacokinetics have been observed between individuals.
Therapeutic Concentration
A single dose of 25 mg 2-F-ara-AMP/m^2 was administered, by infusion, over 30 min, to a number of cancer patients. Maximum plasma concentrations of 2-F-ara-A reached 3.5 to 3.7 µg/L by the end of the infusion. Moderate accumulation was observed after the fifth dose to 4.4 to 4.8 µg/L [Schering Health Care Ltd]
Toxicity High doses of fludarabine phosphate are associated with irreversible central nervous system toxicity with symptoms such as blindness, coma and even death. Also, myelosuppression, pulmonary toxicity, ototoxicity, severe thrombocytopenia and neutropenia, owing to bone marrow suppression, have also been observed. The main intracellular metabolite, 2-F-ara-ATP, has cytotoxicity activity.
Overdose case: the usual dose of fludarabine phosphate, for chronic lymphocytic leukaemia, was administered and 6 months into treatment, progressive cerebral dysfunction due to leucoencephalopathy developed. The patient slipped into a coma and died 8 weeks later [Zabernigg *et al.* 1994].
Bioavailability Systemic bioavailability of 2-F-ara-ATP, 50 to 65%.
Half-life Initial half-life is 1 to 2 h and terminal half-life ranges from 10 to 30 h.
Volume of Distribution Steady state, 2.4 ± 1.6 L/kg (83 ± 55 L/m^2).
Clearance Plasma clearance, 2.2 ± 1.2 mL/min/kg (79 ± 40 mL/min/kg).
Protein Binding No tendency to bind proteins.
Dose A usual dose of 25 to 40 mg fludarabine phosphate/m^2 body surface is administered over 30 min, intravenously, daily for 5 days and courses repeated every 28 days. Dosage is reduced with severe or persistent myelosuppression and mild to moderate renal impairment (by up to 50%).

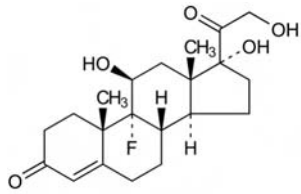
Fludrocortisone

Corticosteroid
$C_{21}H_{29}FO_5$ = 380.5
CAS—127-31-1

IUPAC Name (8*S*,9*R*,10*S*,11*S*,13*S*,14*S*,17*R*)-9-Fluoro-11, 17-dihydroxy-17-(2-hydroxyacetyl)-10,13-dimethyl-1,2,6,7,8,11,12,14,15, 16-decahydrocyclopenta[*a*]phenanthren-3-one
Synonyms 9α-Fluorohydrocortisone; (11β)-9-fluoro-11,17,21-trihydroxypregn-4-ene-3, 20-dione.
Proprietary Name *Astonin-H*

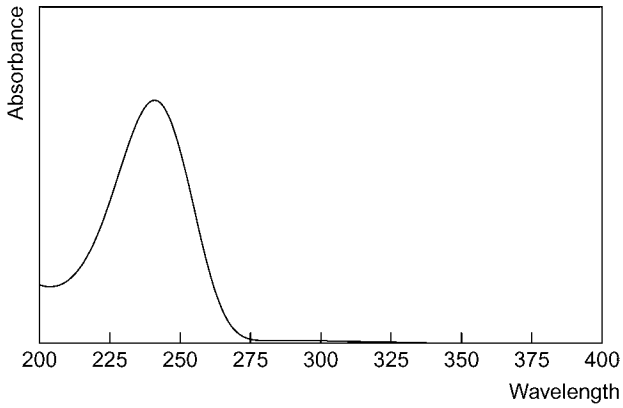


Chemical Properties Crystals which decompose between 260°. Very soluble in water. Log *P* (octanol/water), 1.7.

Fludrocortisone Acetate

$C_{23}H_{31}FO_6 = 422.5$
CAS—514-36-3
Synonym 9α-Fluorohydrocortisone 21-acetate
Proprietary Names *Florinef*. It is an ingredient of *Panotile*.
Chemical Properties A white to pale-yellow, hygroscopic, crystalline powder. Mp 233° to 234° (occasionally 205° to 208° with resolidification on further heating then Mp 226° to 228°). A solution in dioxan is dextrorotatory. Practically insoluble in water; soluble 1 in 50 of ethanol, 1 in 50 of chloroform and 1 in 250 of ether.

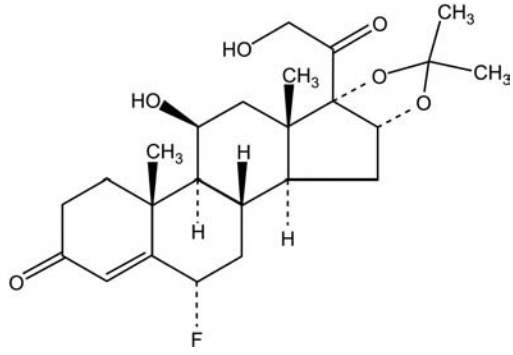
Colour Tests Antimony pentachloride—orange; naphthol–sulfuric acid—violet/brown; sulfuric acid—orange (green fluorescence under ultraviolet light).
Thin-layer Chromatography Fludrocortisone acetate: system TA—R_f 0.90; system TE—R_f 0.86; system TP—R_f 0.58; system TQ—R_f 0.12; system TR—R_f 0.30; system TS—R_f 0.00. Fludrocortisone: system TAJ—R_f 0.55; system TAK—R_f 0.35; system TAL—R_f 0.91; system TAM—R_f 0.90 (DPST solution).
Ultraviolet Spectrum Fludrocortisone acetate: dehydrated alcohol—240 nm (A^1_1=405a).



Infrared Spectrum Principal peaks at wavenumbers 1651, 1271, 1714, 1736, 1246, 1041 cm^{-1} (fludrocortisone acetate, KBr disk).
Dose Usually 100 to 300 μg of fludrocortisone acetate daily.

Fludroxycortide

Corticosteroid
$C_{24}H_{33}FO_6 = 436.5$
CAS—1524-88-5
Synonyms Fluorandrenolone; (6α,11β,16α)-6-fluoro-11,21-dihydroxy-16,17-[(1-methylethylidene)bis(oxy)]pregn-4-ene-3,20-dione; 6α-fluoro-16α-hydroxyhydrocortisone 16,17-acetonide; flurandrenolide; flurandrenolone.
Proprietary Names *Cordran*; *Drenison*; *Haelan*; *Sermaka*.

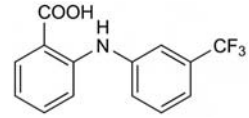


Chemical Properties A white, fluffy, crystalline powder. Mp 247° to 255°. Practically insoluble in water and ether; soluble 1 in 72 of ethanol, 1 in 10 of chloroform and 1 in 25 of methanol. Log *P* (octanol/water), 3.0.

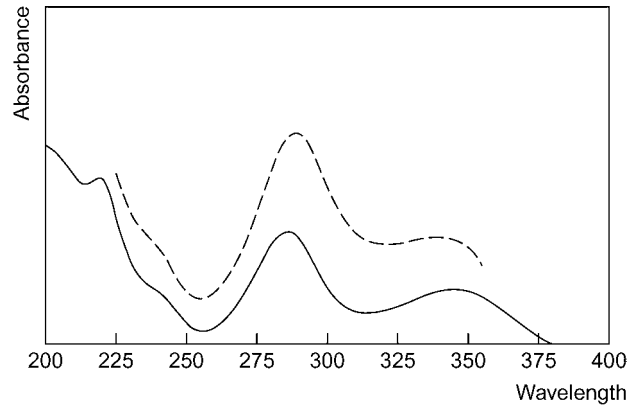
Colour Tests Naphthol–sulfuric acid—green, brown dichroism/yellow; sulfuric acid—yellow (green fluorescence under ultraviolet light).
Ultraviolet Spectrum Methanol–235 nm ($A^1_{1=}$ = 324a).
Infrared Spectrum Principal peaks at wavenumbers 1675, 1701, 1059, 1045, 1095, 1079 cm^{-1} (KBr disk).
Use Topically in concentrations of 0.0125 to 0.05%.

Flufenamic Acid

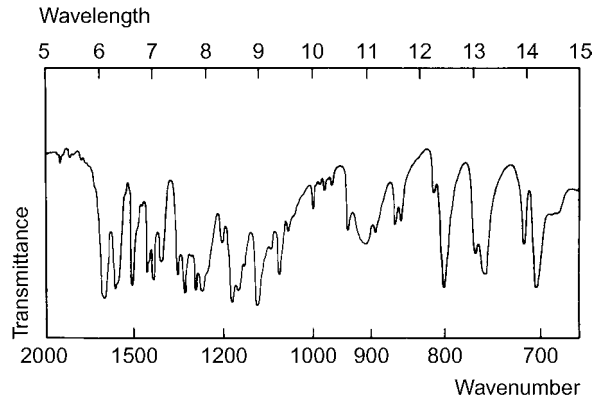
Analgesic
$C_{14}H_{10}F_3NO_2 = 281.2$
CAS—530-78-9
IUPAC Name 2-[[3-(Trifluoromethyl)phenyl]amino]benzoic acid
Proprietary Names *Achless*; *Ansatin*; *Arlef*; *Dignodolin*; *Fullsafe*; *Meralen*; *Paraflu*; *Parlef*; *Rheuma Lindofluid*; *Sastridex*; *Surika*; *Tecramine*.



Chemical Properties A pale-yellow crystalline powder. Mp 124° to 125°, with resolidification and 134° to 136°. Practically insoluble in water; soluble 1 in 4 of ethanol, 1 in 7 of chloroform and 1 in 3 of ether. pK_a 3.9. Log *P* (octanol/water), 5.2.
Thin-layer Chromatography System TA—R_f 0.96; system TE—R_f 0.18; system TG—R_f 0.37; system TAE—R_f 0.84; system TAJ—R_f 0.55; system TAK—R_f 0.78; system TAL—R_f 0.95 (chromic acid solution, blue).
Gas Chromatography System GA—RI 1950; system GD—methyl derivative RRT 1.26 (relative to n-$C_{16}H_{34}$); system GL—flufenamic acid-Me RI 1875, M (OH-)-Me_2 RI 2115.
High Performance Liquid Chromatography System HD—*k* 19.7; system HV—RRT 1.00 (relative to meclofenamic acid); system HX—RI 671; system HY—RI 667.
Ultraviolet Spectrum Methanol—288 (A^1_1=593a), 339 nm.



Infrared Spectrum Principal peaks at wavenumbers 1115, 1176, 1653, 1284, 1265, 1600 cm^{-1} (KBr disk). Five polymorphic forms occur.



Mass Spectrum Principal ions at *m/z* 263, 281, 166, 92, 145, 167, 235, 139; flufenamic acid-Me *m/z* 263, 295, 235, 166, 264, 92; M (OH-)-Me_2 *m/z* 325, 293, 278, 250, 223, 202.
Quantification
Plasma **HPLC** UV detection. Limit of detection, 1 mg/L for flufenamic acid and mefenamic acid [Lin *et al.*1980].

Urine **HPLC** UV detection. Flufenamic acid, mefenamic acid and tolfenamic acid. Limit of detection, about 3.5 ng for flufenamic acid [Mikami *et al.* 2000].

Disposition in the Body Readily absorbed after oral administration. Metabolised by hydroxylation and glucuronic acid conjugation. About 50% of a dose is excreted in the urine in 72 h and about 36% is eliminated in the faeces. The material excreted in the urine consists mainly of conjugated flufenamic acid and free and conjugated 4′-hydroxyflufenamic acid with smaller amounts of the 5′-hydroxy and dihydroxy derivatives.

Therapeutic Concentration

Following oral administration of 200 mg three times daily for 4 days to 10 subjects, plasma concentrations of 0.3 to 17 mg/L (mean 6.4) were reported 2 h after the morning dose [Buchanan *et al.* 1969].

Half-life Plasma half-life, about 3 h.

Protein Binding Extensively bound.

Dose 400 to 600 mg daily.

Buchanan RA *et al.* (1969). The breast milk excretion on flufenamic acid. *Curr Ther Res* 11: 533–538.

Lin CK *et al.* (1980). Determination of two fenamates in plasma by high-performance liquid chromatography. *J Pharm Sci* 69: 95–97.

Flugestone

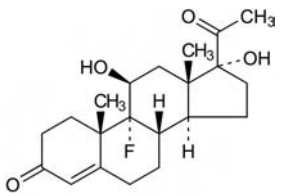
Progestational Steroid (Veterinary)

$C_{21}H_{29}FO_4 = 364.5$

CAS—337-03-1

IUPAC Name (8*S*,9*R*,10*S*,11*S*,13*S*,14*S*,17*R*)-17-Acetyl-9-fluoro-11,17-dihydroxy-10,13-dimethyl-1,2,6,7,8,11,12,14,15,16-decahydrocyclopenta[*a*]phenanthren-3-one

Synonyms 9α-Fluoro-11β,17α-dihydroxypregn-4-ene-3,20-dione; flurogestone.



Chemical Properties Log *P* (octanol/water), 2.0 (flugestone acetate).

Flugestone Acetate

$C_{23}H_{31}FO_5 = 406.5$

CAS—2529-45-5

Proprietary Names *Chronogest*; *Ovakron*.

Chemical Properties A white or creamy-white powder. Mp 266° to 269°. Very slightly soluble in water; soluble 1 in 23 of ethanol, 1 in 2.5 of chloroform and 1 in 100 of methanol.

Ultraviolet Spectrum Flugestone acetate: methanol—238 nm (A_1^1=425b).

Flumazenil

Benzodiazepine Antagonist

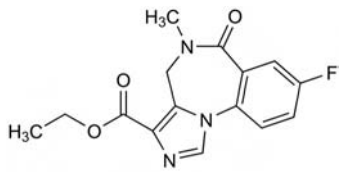
$C_{15}H_{14}FN_3O_3 = 303.3$

CAS—78755-81-4

IUPAC Name Ethyl 8-fluoro-5-methyl-6-oxo-4*H*-imidazo[1,5-*a*][1, 4]benzodiazepine-3-carboxylate

Synonyms Flumazepil; 8-fluoro-5,6-dihydro-5-methyl-6-oxo-4*H*-imidazo[1, 5-*a*][1,4]-benzodiazepine-3-carboxylic acid ethyl ester; Ro-15-1788.

Proprietary Names *Anexate*; *Lanexat*; *Mazicon*; *Romazicon*.

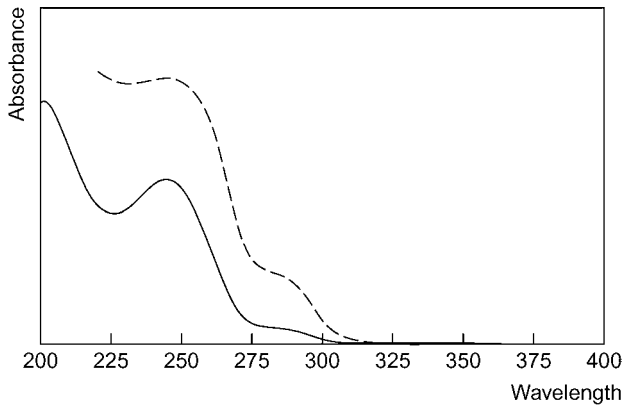


Chemical Properties A white to off-white crystalline compound. Mp 201° to 203°. Insoluble in water; slightly soluble in dilute acidic solutions. pK_a 1.8. Log *P* (octanol/water): 1.0. Extraction yield (chlorobutane), 0.8 [Demme *et al.* 2005].

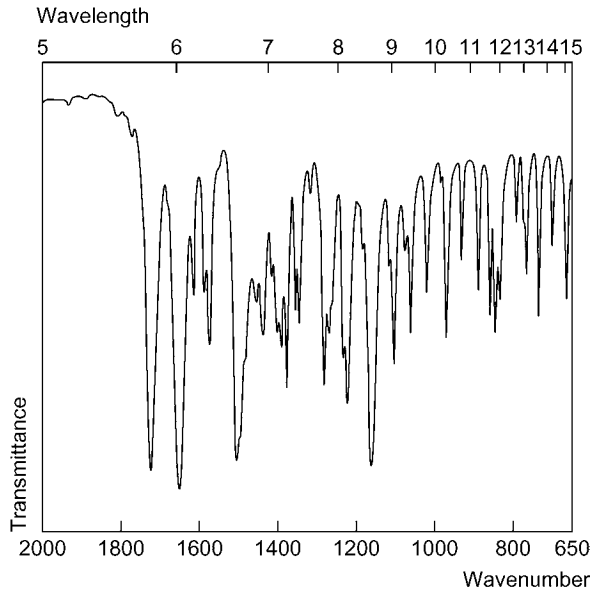
Thin-layer Chromatography System TA—R_f 0.71; system TB—R_f 0.03; system TC—R_f 0.63; system TD—R_f 0.30; system TE—R_f 0.61; system TF—R_f 0.14; system TL—R_f 0.44; system TAD—R_f 0.61; system TAE—R_f 0.76; system TAF—R_f 0.72.

High Performance Liquid Chromatography System HX—RI 387; system HY—RI 327; system HZ—retention time 2.6 min.

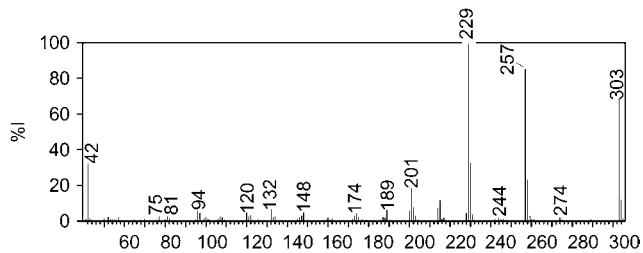
Ultraviolet Spectrum Aqueous base—244 nm.



Infrared Spectrum Principal peaks at wavenumbers 1724, 1652, 1161 cm^{-1} (KBr pellet).



Mass Spectrum Principal ions at *m/z* 229, 257, 303, 42, 230, 258, 201, 215.



Quantification

Plasma **GC** Column: RTX-5 capillary (30 m × 0.32 mm i.d., 0.25 μm). Temperature: 260°. Injector and detector temperature: 260° and 300°, respectively. Carrier gas: He, 103 kPa inlet pressure. Internal standard (IS): clinazolam. Detection: nitrogen–phosphorus. Retention time: flumazenil, 7 min; IS, 12 min. Limit of detection, 3 μg/L [Fisher *et al.* 1995]. NSD. Limit of detection, 0.05 μg/L [Zell, Timm, 1986].

GC-MS Limit of quantification, 1 μg/L [Song *et al.* 1995]. Limit of quantification, 0.5 μg/L [Fukuda *et al.* 1989].

HPLC Column: CP-microsphere C_{18} (100 × 4.6 mm i.d., 3 μm). Mobile phase: methanol : aqueous sodium dihydrogen phosphate monohydrate (0.3%, pH 3.9) (34.75:65.25), flow rate 1.5 mL/min. IS: Ro 15-3505. UV detection (λ=245 nm). Retention time: flumazenil, 4.86 min; IS, 6.17 min. Limit of quantification, 0.5 μg/L [Breimer *et al.* 1991]. UV detection (λ=220 nm). Limit of quantification, 2 μg/L, limit of detection, 0.3 μg/L [Vletter *et al.* 1990]. Column: C_{18} RP cartridge NovaPak (100 × 8 mm, 4 μm). Mobile phase: 32% acetonitrile : 0.04 mol/L sodium hydrogen phosphate buffer (with 1 mL/L TEA (triethylamine), pH 7.2) (32:68), flow rate 1.5 mL/min. UV detection (λ=220 nm). IS: flurazepam. Retention time: flumazenil, 3.8 min; IS, 18.5 min. Flumazenil and metabolites, limit of detection, 4 μg/L [Chan, Jones 1993].

Urine **HPLC** See Plasma [Chan, Jones 1993].

Disposition in the Body Flumazenil is rapidly and well absorbed after oral administration, but undergoes extensive first-pass hepatic metabolism. It is therefore given by IV administration. It is rapidly distributed into the brain. Flumazenil is extensively metabolised in the liver to an inactive carboxylic acid form and excreted predominantly in urine (<1% is excreted unchanged). Metabolites include *N*-desmethylflumazenil, *N*-desmethylflumazenil acid and flumazenil acid. Some (5 to 10%) is excreted via bile in faeces.

Therapeutic Concentration The trough serum therapeutic concentration range is 10 to 50 µg/L and peak, 200 to 300 µg/L.

Six healthy male volunteers, aged between 28 and 42 years, were administered intravenously a dose of 2.5 mg over 30 s. The effective plasma concentration was 60 µg/L during the infusion which stayed constant until 5 min after infusion had ended. It then rapidly declined to 3 µg/L over a 3 h period [Klotz *et al.* 1984].

Bioavailability Approximately 16%.

Half-life Plasma half-life, 0.7 to 1.3 h.

Volume of Distribution 0.9 to 1.1 L/kg.

Clearance Plasma clearance, 0.8 to 1.0 L/h/kg; 31 to 78 L/h. Blood, 43 L/h.

Distribution in Blood Blood : plasma ratio is 0.8 to 1.3.

Protein Binding 50% (of which about two-thirds is bound to albumin).

Note For a review of the pharmacokinetics of flumazenil, see Klotz and Kanto [1988].

Dose Usually, 300 to 600 µg as an IV injection; 100 to 400 µg/h may be given by IV infusion.

Flumetasone

Corticosteroid

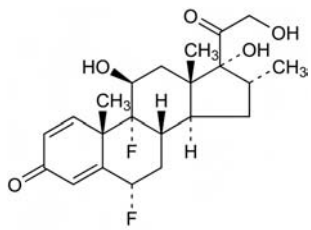
$C_{22}H_{28}F_2O_5 = 410.5$

CAS—2135-17-3

IUPAC Name (6*S*,8*S*,9*R*,10*S*,11*S*,13*S*,14*S*,16*R*,17*R*)-6,9-Difluoro-11,17-dihydroxy-17-(2-hydroxyacetyl)-10,13,16-trimethyl-6,7,8,11,12,14,15,16-octahydrocyclopenta[*a*]phenanthren-3-one

Synonyms 6α-Dexamethasone; (6α,11β,16α)-6,9-difluoro-11,17,21-trihydroxy-16-methylpregna-1,4-diene-3,20-dione; flumethasone.

Proprietary Name *Flucort* (vet.)



Chemical Properties Log *P* (octanol/water), 1.9.

Flumetasone Pivalate

$C_{27}H_{36}F_2O_6 = 494.6$

CAS—2002-29-1

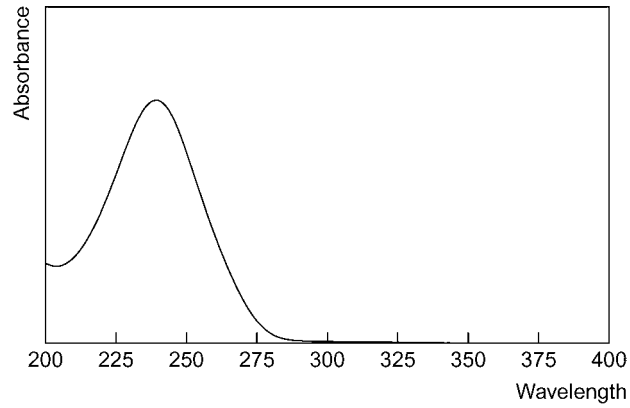
Synonym Flumetasone trimethylacetate

Proprietary Names *Cerson*; *Locacorten*; *Locorten(e)*.

Chemical Properties A white crystalline powder. Practically insoluble in water; soluble 1 in 89 of ethanol, 1 in 350 of chloroform and 1 in 2800 of ether.

Thin-layer Chromatography System TAM—R_f 0.64.

Ultraviolet Spectrum Methanol—238 nm (A^1_1=438a).



Infrared Spectrum Principal peaks at wavenumbers 1664, 1623, 901, 1733, 1139, 1160 cm^{-1} (flumetasone pivalate, KBr disk).

Use Flumetasone pivalate is used topically in a concentration of 0.02%.

Flunitrazepam

Benzodiazepine, Hypnotic

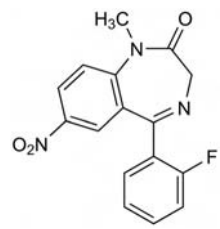
$C_{16}H_{12}FN_3O_3 = 313.3$

CAS—1622-62-4

IUPAC Name 5-(2-Fluorophenyl)-1-methyl-7-nitro-3*H*-1,4-benzodiazepin-2-one

Synonyms Flunitrazepamum; Ro-5-4200.

Proprietary Names *Absint*; *Darkene*; *Flunimerck*; *Fluninoc*; *Flunipam*; *Flupam*; *Fluscand*; *Fluserin*; *Flutraz*; *Hypnodorm*; *Hypnor*; *Insom*; *Narcozep*; *Rohipnol*; *Rohypnol*; *Roipnol*; *Ronal*; *Somnubene*; *Valsera*.



Chemical Properties An almost white to pale yellow crystalline solid. Mp ~170°. Sparingly soluble in water; soluble 1 in 172 ethanol, 1 in 3 of chloroform, 1 in 300 of ether and 1 in 100 of methanol. pK_a 1.8. Log *P* (octanol/water), 2.1. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

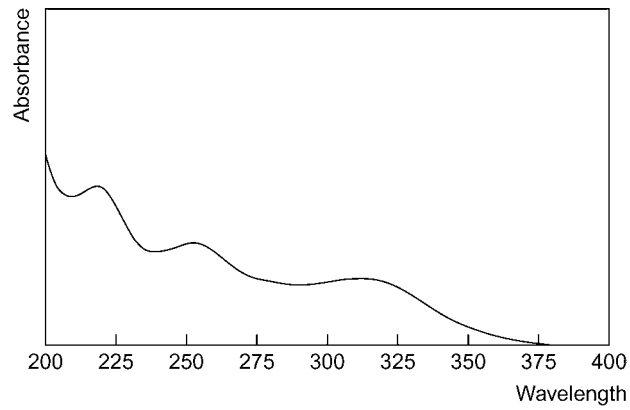
Colour Test Formaldehyde-sulfuric acid—orange.

Thin-layer Chromatography System TA—R_f 0.63; system TB—R_f 0.10; system TC—R_f 0.72; system TD—R_f 0.54; system TE—R_f 0.74; system TF—R_f 0.47; system TL—R_f 0.63; system TAD—R_f 0.72; system TAE—R_f 0.80; system TAF—R_f 0.82.

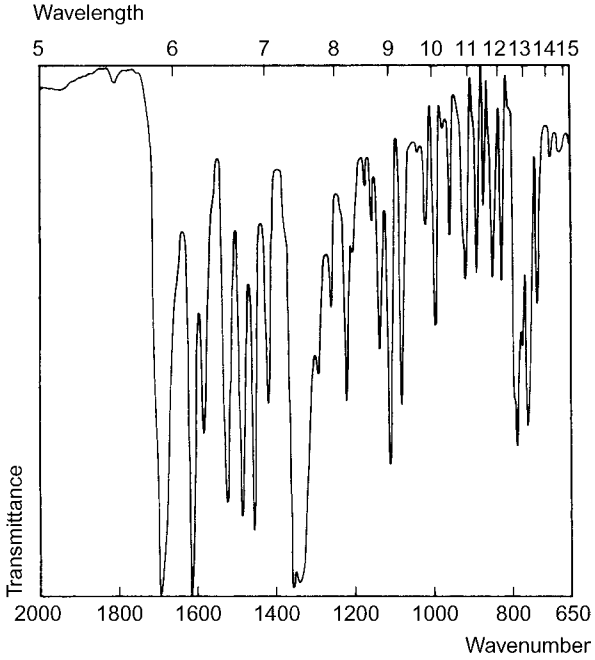
Gas Chromatography System GA—flunitrazepam RI 2600, M (nor-) RI 2720, M (7-amino-) RI 2723, M (nor-amino-) RI 2825; system GB—flunitrazepam RI 2744, M (nor-) RI 2816, M (nor-)-TMS RI 2622, M (7-amino-) RI 2804, M (7-amino-)-TMS RI 2836; system GG—RI 3190.

High Performance Liquid Chromatography System HI—*k* 3.15; system HK—*k* 0.47; system HX—RI 483; system HY—RI 305; system HZ—RT 5.6 min; system HAA—RT 18.6 min; system HAL—flunitrazepam RT 6.2 min, M (nor) RT 3.7 min; system HAZ—flunitrazepam *k* 0.86, M (nor-) *k* 0.65, M (7-amino) *k* 0.22; system HBH—*k* 3.34; system HBI—*k* 0.86.

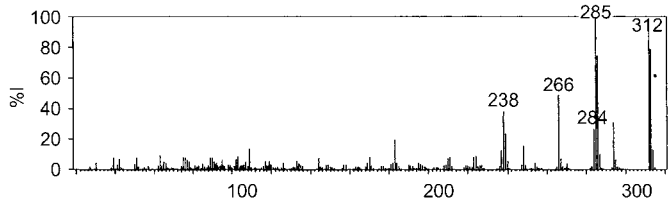
Ultraviolet Spectrum Methanol—252 (A^1_1= 516a), 308 nm (A^1_1 = 332a).



Infrared Spectrum Principal peaks at wavenumbers 1697, 1620, 1490, 1528, 1107, 783 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 285, 312, 313, 286, 266, 238, 294, 284 (flunitrazepam); 269, 240, 241, 268, 270, 107, 121, 213 (7-amino-1-desmethylflunitrazepam); 283, 44, 255, 282, 254, 284, 264, 256 (7-aminoflunitrazepam); 298, 271, 299, 224, 272, 270, 252, 280 (desmethylflunitrazepam).



Quantification

Blood **GC** Columns: DB-1 and DB-1701 (15 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 120° for 1 min to 28° at 30°/min to 230° at 2°/min to 300° at 30°/min for 1 min or 120° for 1 min to 230° at 40°/min to 280° at 8°/min for 9 min. ECD. Limit of detection, 0.015 µmol/L (DB-1701) [Gjerde *et al.* 1992]. Column: SE-54 5% phenyl methyl silicone (25 m × 0.31 mm i.d., 0.17 µm). Carrier gas: He, 2 to 3 mL/min. Temperature programme: 200° for 1 min to 290° at 10°/min. NPD or ECD. Retention time: 6.28 min. Limit of detection not reported [Lillsunde, Seppälä 1990].

GC-MS Column: HP-1 (12 m × 0.22 mm i.d., 0.33 µm). Carrier gas: He, 0.5 mL/min. EI, SIM acquisition mode. Limit of detection, 0.1 µg/L [Elian 1999]. Column: DB-5 MS (25 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 36.2 cm/s. SIM acquisition mode. Limit of detection, 5 µg/L [Elsohly *et al.* 1999]. Column: HP-5MS (12 m × 0.2 mm i.d., 0.33 µm). Temperature programme: 150° for 5 min to 300° at 30°/min. SIM acquisition mode. Limit of quantification, 1.0 µg/L [Hackett, Elian 2006]. Column: HP-5 MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 120° to 295° at 10°/min for 5 min. EI ionisation. Limit of quantification, 1.58 µg/L, limit of detection, 0.52 µg/L [Papoutsis *et al.* 2010].

HPLC UV detection (λ= 240 nm). Limit of detection, 1 to 8 µg/L [Robertson, Drummer 1995]. Column: LiChrospher RP-Select B C_8 (8 m × 4 mm i.d., 5 µm). Mobile phase: 20 mmol/L phosphate buffer (pH 2.1) : acetonitrile (65 : 35), flow rate 0.3 mL/min. UV detection (λ= 220 nm). Limit of quantification, 103.5 µg/L, limit of detection, 3.5 µg/L [El Mahjoub, Staub 2000]. Column: LiChrospher RP-Select B C_8 (125 × 3 mm i.d., 5 µm). Mobile phase: 20 mmol/L phosphate buffer (pH 2.1) : acetonitrile (94 : 6). DAD detection (λ= 254 nm). Limit of detection not reported [El Mahjoub, Staub 2001a]. Column: Retek Allure C_{18} (150 × 3.2 mm i.d., 5 µm). Mobile phase: 5 mmol/L ammonium acetate : acetonitrile : methanol (90 : 5 : 5), flow rate 0.45 mL/min. DAD. Limit of quantification, 3 µg/L [Dussy *et al.* 2006]. Column: RP-Synergi C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : trifluoroacetic acid, flow rate 1 mL/min. DAD (λ= 250 nm). Limit of quantification, 5 µg/L [Hackett, Elian 2006].

LC-MS Column: ODS. Mobile phase: acetonitrile : 50 mmol/L ammonium formate buffer (45 : 55, pH 3.0). APCI, SIM acquisition mode. Limit of detection, 0.2 µg/L [Bogusz *et al.* 1998]. Column: XTerra MS C_{18} (150 × 2.1 mm i.d., 3.5 µm). Mobile phase: formic acid : methanol (30 : 60), flow rate 0.2 mL/min. MS-MS detection. Limit of quantification, 0.7 µg/L, limit of detection, 0.2 µg/L [Smink *et al.* 2004]. Column: XTerra MS C_{18} (150 × 2.1 mm i.d., 3.5 µm). Mobile phase: methanol : formate buffer (10 : 90), flow rate 0.2 mL/min. ESI mode, MRM acquisition mode. Limit of quantification, 1.0 µg/L [Laloup *et al.* 2005]. Column: XBridge Shield (100 × 2.1 mm i.d., 3.5 µm). Mobile phase: acetate buffer (pH 5.0) : 20 mmol/L acetonitrile (67 : 33), flow rate 200 µL/min. APPI mode, SIM acquisition mode. Limit of quantification, 3 µg/L [Marchi *et al.* 2009].

Plasma **GC** ECD. Limit of detection, 0.5 µg/L [Sumirtapura *et al.* 1982]. See Blood [Lillsunde, Seppälä 1990]. Limit of detection, 0.01–0.48 mmol/L [Reubsaet *et al.* 1998].

GC-MS See Blood [Elsohly *et al.* 1999]. Column: DB-5 MS (25 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 43 cm/min. Temperature programme: 180° for 0.5 min to 260° at 20°/min for 1 min to 280° at 30°/min for 8 min. SIM acquisition mode. Limit of quantification, 1.0 µg/L, limit of detection, 10 µg/L [Snyder *et al.* 2001].

HPLC UV detection. Limit of detection, 1 µg/L [Vree *et al.* 1977]. Column: Nova-Pak C_{18}. Mobile phase: acetonitrile : 10 mmol/L ammonium acetate buffer (pH 6.7, 45 : 55). Limit of detection, 10 µg/L [Guichard *et al.* 1993]. Column: LiCrospher 60 RP-Select B (250 × 4 mm i.d.). Mobile phase: acetonitrile : 0.02 mmol/L phosphate buffer (pH 2.0, 36 : 64), flow rate 1.0 mL/min. UV detection (λ= 254 nm). Limit of detection, 1 µg/L [Deinl *et al.* 1998]. Column: Kromasil C_8 (250 × 5 mm i.d., 5 µm). Mobile phase: methanol : acetonitrile : 0.05 mmol/L ammonium acetate (14 : 32 : 54 for 0.01 min to 13 : 32 : 55 at 9 min to 11 : 28 : 61 at 11 min to 40 : 28 : 32 at 12 min), flow rate 1.1 mL/min. DAD detection (λ= 240 nm). Limit of quantification, 1.52 µg/L, limit of detection, 0.46 µg/L [Uddin *et al.* 2008]. Column: LC-18 DB (250 × 4.6 mm i.d., 5 µm). Mobile phase: 5 mmol/L potassium dihydrogen phosphate (pH 6.0) : methanol : diethyl ether (55 : 40 : 5), flow rate 0.8 mL/min. UV detection (λ= 245 nm). Limit of quantification, 30 µg/L [Borges *et al.* 2009].

LC-MS Column: Merck LiChroCART (125 × 2 mm i.d.) Mobile phase: 5 mmol/L ammonium formate : acetonitrile (60 : 40 for 5.5 min to 10 : 90 in 8 min to 60 : 40 in 9.5 min). ACPI mode, SIM acquisition mode. Limit of quantification, 5 µg/L, limit of detection, 5 µg/L [Kratzsch *et al.* 2004]. Column: XTerra RP 18 (150 × 2.1 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.1% formic acid, flow rate 0.25 mL/min. ESI. Limit of detection, 0.5 µg/L [Quintela *et al.* 2005].

Serum **GC-MS** See Plasma [Snyder *et al.* 2001]. Column DB-5 MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 100° to 290° at 20°/min. MS-MS detection. Limit of detection, 60 µg/L [Terada *et al.* 2003].

HPLC See Plasma [Deinl *et al.* 1998]. Column: LiChrospher 60 RP-Select B (25 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.05 mmol/L phosphate buffer (pH 2.0, 36 : 64), flow rate 1.0 mL/min. UV detection (λ= 254 nm). Limit of detection, 1 µg/L [Deinl *et al.* 1999]. See Blood [Dussy *et al.* 2006; El Mahjoub, Staub 2000].

LC-MS See Blood [Bogusz *et al.* 1998]. Column: Unison UK-C_{18} reversed phase (150 × 2 mm i.d., 3 µm). Mobile phase: 10 mmol/L aqueous ammonium formate : 0.1% formic acid (70 : 30 over 20 min to 20 : 80 over 5 min), flow rate 0.25 mL/min. MRM acquisition mode. Limit of quantification, 1.0 µg/L, limit of detection, 3.2 µg/L [Nakamura *et al.* 2009]. ESI mode. Limit of quantification, 2 µg/L [Kleinschnitz *et al.* 1996].

Urine **GC** See Plasma [Reubsaet *et al.* 1998].

GC-MS Column: DB-5 MS (25 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 43 cm/s. Temperature programme: 180° to 260° at 20°/min to 280° at 30°/min for 3 min. Limit of quantification, 25 µg/L, limit of detection, 10 µg/L [Elsohly *et al.* 1997]. Column: HP-5 MS (30 m × 0.25 mm i.d., 0.25 µm). Temperature programme: 100° for 1 min to 200° at 20°/min to 300° at 15°/min. Limit of detection, 5 µg/L [Augsburger *et al.* 1998]. See Plasma [Snyder *et al.* 2001]. See Blood [Hackett, Elian 2006].

HPLC See Serum [Kleinschnitz *et al.* 1996]. UV detection (λ= 254 nm). Column: LiChrospher 60 RP-Select B (25 × 4.6 mm i.d., 5 µm). Mobile phase: water : methanol–water (90 : 10) : acetonitrile–0.05 mol/L phosphate buffer (pH 2.0, 36 : 64), flow rate 0.5, 0.05 and 1.0 mL/min. Limit of detection, <2 µg/L [Deinl *et al.* 1997]. See Plasma [Deinl *et al.* 1998]. See Blood [Hackett, Elian 2006]. See Plasma. Limit of quantification, 0.38 µg/L, limit of detection, 0.11 µg/L [Uddin *et al.* 2008].

LC-MS See Blood [Bogusz *et al.* 1998]. See Blood. Limit of quantification, 10 µg/L [Laloup *et al.* 2005]. Column: ACQUITY UPLC C_{18} (50 × 2.1 mm i.d., 1.7 µm). Mobile phase: 0.05% formic acid in 10 mmol/L ammonium formate : 0.05% formic acid in acetonitrile (95 : 5 to 35 : 65 over 2 min to 5 : 95 for 5 min to 95 : 5). MRM acquisition mode. Limit of detection, 0.5 µg/L [Forsman *et al.* 2009].

Oral Fluid **GC-MS** Column: HP-1 (30 m × 250 µm i.d., 0.25 µm). Carrier gas: He, 2.1 mL/min. Temperature programme: 60° to 310° at 30°/min. SIM mode. Limit of quantification, 0.1 µg/L, limit of detection, 0.05 µg/L [Samyn *et al.* 2002]. Column: Ultra 1 (16.5 m × 0.2 mm i.d., 0.11 µm). Carrier gas: He, 0.8 mL/min. SIM mode. Limit of quantification, 10.9 µg/L, limit of detection, 3.6 µg/L [Pujadas *et al.* 2007].

HPLC See Plasma. Limit of quantification, 0.39 µg/L, limit of detection, 0.12 µg/L [Uddin *et al.* 2008].

LC-MS Column: XTerra RP C_{18} (150 × 2.1 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.1% formic acid, flow rate 0.25 mL/min. ESI mode. Limit of detection, 0.5 µg/L [Quintela *et al.* 2005]. Column: Zorbax Eclipse XDB C_{18} (50 × 4.6 mm i.d., 1.8 µm). Mobile phase: 20 mmol/L ammonium formate : acetonitrile (50 : 50), flow rate 0.2 mL/min. MRM mode. MS-MS detection. Limit of quantification, 0.5 µg/L [Moore *et al.* 2007]. Column: Zorbax Bonus RP C_{14} (100 × 2.1 mm i.d., 3.5 µm). Mobile phase: methanol : 0.1% formic acid, flow rate 200 µL/min. MRM acquisition

F

mode. MS-MS detection. Limit of quantification, 0.1 μg/L, limit of detection, 0.02 μg/L [Ngwa *et al.* 2007].

Hair **GC-MS** Column: HP5-MS 5% phenylsiloxane, 95% methylsiloxane (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.0 mL/min. NCI mode, SIM acquisition mode. Retention time: 10.5 min. Limit of detection, 15 pg/mg [Cirimele *et al.* 1997]. Column: HP-5 MS (30 m × 250 μm i.d., 0.25 μm). Carrier gas: He, 1.2 mL/min. Temperature programme: 60° to 310° at 30°/min. NCI mode. Limit of quantification, 2.5 ng/g, limit of detection, 1.5 ng/g [Negrusz *et al.* 1999].

HPLC Column: LiChrospher RP-Select B C_8 (125 × 3 mm i.d., 5 μm). Mobile phase: 30 mmol/L phosphate buffer : acetonitrile (pH 2.1, 95 : 5). DAD (λ = 254 nm). Limit of detection, 0.2 μg/g [El Mahjoub and Staub 2001b].

LC-MS Column: Zorbax Phenyl (50 × 2.1 mm i.d., 3 μm). Mobile phase: acetonitrile-methanol-20 mmol/L formate buffer (pH 3.0, 10 : 10 : 80) : acetonitrile-methanol-20 mmol/L formate buffer (35 : 35 : 30, 100 : 0 to 35 : 65 at 7 min to 100 : 0 for 2 min), flow rate 0.25 mL/min. MRM acquisition mode. Retention time: 5.85 min. Limit of quantification, 0.025 ng/mg [Kronstrand *et al.* 2002]. See Blood [Laloup *et al.* 2005].

Disposition in the Body Flunitrazepam is readily absorbed after oral administration. It is extensively metabolised in the liver to desmethylflunitrazepam, which has some activity, and 7-aminoflunitrazepam, which is inactive; other metabolites include 3-hydroxyflunitrazepam, 3-hydroxy-7-acetamidoflunitrazepam, and 7-amino-1-desmethylflunitrazepam. Flunitrazepam is excreted in the urine almost entirely as metabolites, both free and conjugated, with <1% as unchanged drug. Approximately 10% of a dose is eliminated in the faeces. Flunitrazepam crosses the placental barrier and it is excreted in breast milk.

Therapeutic Concentration

After single oral doses of 1 mg and 2 mg flunitrazepam given to 11 and 5 subjects, respectively, mean peak plasma concentrations of 0.0025 and 0.015 mg/L, respectively, were attained in ~1 h [Clarke *et al.* 1980].

Following oral doses of 2 mg daily for 28 days given to 7 subjects, a mean peak plasma concentration of ~0.02 mg/L was reported 3 h after the last dose [Wickstrøm *et al.* 1980].

Infusion of flunitrazepam over 20 min (0.2 mg/kg) to 25 neonates and 6 infants produced peak plasma concentrations of 0.077–1.028 mg/L (mean, 243) [Pariente-Khayat *et al.* 1999].

Toxicity

Of 8 deaths involving flunitrazepam, four had 7-aminoflunitrazepam levels of 0.45 mg/L (where the fatality involved flunitrazepam alone) and 4 had 7-aminoflunitrazepam levels of 0.16 mg/L (where the fatality involved flunitrazepam and ethanol); in the latter group, the mean ethanol concentration was 1.6 g/L. Levels of flunitrazepam were low, suggesting that 7-aminoflunitrazepam was produced postmortem [Drummer *et al.* 1993].

Half-life Plasma half-life, 3 h (distribution); 16–35 h (elimination).

Bioavailability 80–90%.

Volume of Distribution Approximately 3.5–5.5 L/kg.

Clearance Plasma clearance, ~2 mL/min/kg.

Protein Binding Approximately 77–80%.

Dose 0.5 to 2 mg, as a hypnotic.

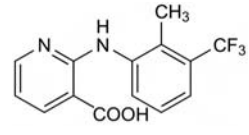
Flunixin

Analgesic

$C_{14}H_{11}F_3N_2O_2$ = 296.2

CAS—38677-85-9

IUPAC Name 2-[[2-Methyl-3-(trifluoromethyl)phenyl]amino]-3-pyridinecarboxylic acid



Chemical Properties Crystals. Mp 226° to 228°.

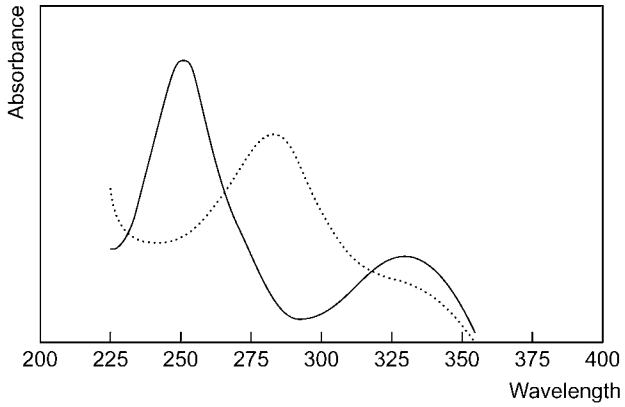
Flunixin Meglumine

$C_{14}H_{11}F_3N_2O_2.C_7H_{17}NO_5$ = 491.5

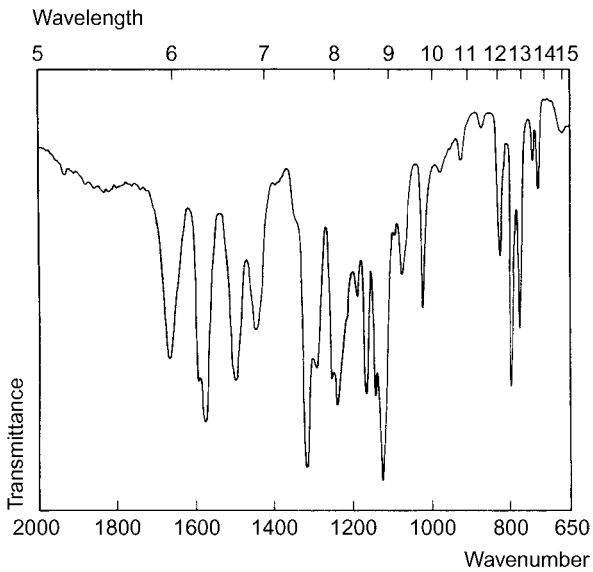
CAS—42461-84-7

Proprietary Names *Banamine*; *Binixin*; *Cronyxin*; *Equileve*; *Equi-Phar Equigesic*; *Finadyne*; *Flumeglumine*; *Flu-Nix*; *Flunixamine*; *Meflosyl*; *Resprixin*; *Suppressor* (all veterinary).
Chemical Properties Colourless crystals. Mp 135° to 139°. Soluble in water.

Thin-layer Chromatography System TA—R_f 0.96; system TE—R_f 0.12; system TG—R_f 0.33; system TAJ—R_f 0.37; system TAK—R_f 0.20; system TAL—R_f 0.83 (Ludy Tenger reagent, orange).
Gas Chromatography System GD—methyl derivative RRT 1.39 (relative to n-$C_{16}H_{34}$).
High Performance Liquid Chromatography System HV—RRT 0.99 (relative to meclofenamic acid); system HY—RI 414.
Ultraviolet Spectrum Aqueous acid—252, 327 nm; aqueous alkali—281 nm (A^1_1=490b).



Infrared Spectrum Principal peaks at wavenumbers 1122, 1315, 1572, 1237, 1142, 1165 cm^{-1}.



Quantification
Other **GC** Equine urine. NPD. Limit of detection, 74 µg/L [Johansson, Anler 1988].

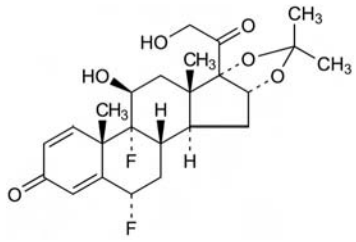
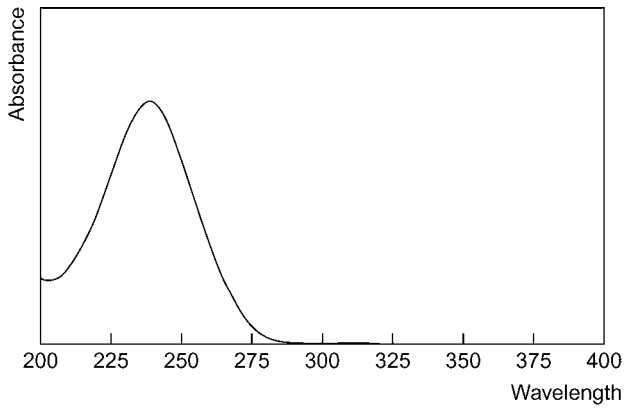
Fluocinolone Acetonide

Corticosteroid
$C_{24}H_{30}F_2O_6$ = 452.5
CAS—67-73-2

Synonyms (6α,11β,16α)-6,9-Difluoro-11,21-dihydroxy-16,17-[(1-methylethylidene)bis(oxy)]-pregna-1,4-diene-3,20-dione; 6α,9α-difluoro-16α-hydroxyprednisolone acetonide.
Proprietary Names *Alfa-Fluorone*; *Boniderma*; *Capex*; *Cortamide*; *Cortoderm*; *Dermalar*; *DermaSmoothe/FS*; *Dermobeta*; *Dermoline*; *Flucinar*; *Flunolone-V*; *Fluocortan*; *Fluoderm*; *Fluonid*; *Flurosyn*; *Gelidina*; *Jellin*; *Jellisoft*; *Synalar*; *Synamol*; *Synandone*; *Synemol*.



Chemical Properties A white crystalline powder. Mp about 270°, with decomposition. A solution in dioxan is dextrorotatory. Practically insoluble in water; soluble 1 in 26 of dehydrated alcohol, 1 in 10 of acetone, 1 in 15 to 1 in 25 of chloroform and 1 in 350 of ether; soluble in methanol. Log *P* (octanol/water), 2.5.
Colour Tests Naphthol–sulfuric acid—green/yellow; sulfuric acid—yellow (green fluorescence under ultraviolet light).
Thin-layer Chromatography System TP—R_f 0.42; system TQ—R_f 0.08; system TR—R_f 0.10; system TS—R_f 0.01; system TAM—R_f 0.68. (DPST solution.)
High Performance Liquid Chromatography System HY—RI 491 (fluocinolone).
Ultraviolet Spectrum Ethanol—240 nm (A^1_1=360a).

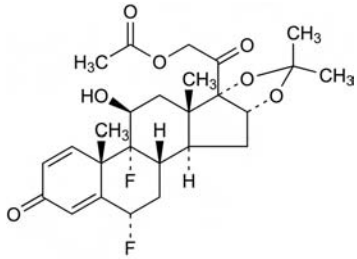


Infrared Spectrum Principal peaks at wavenumbers 1669, 1074, 1629, 910, 1056, 1615 cm^{-1} (KBr disk).
Use Topically in concentrations of 0.01 to 0.2%.

Fluocinonide

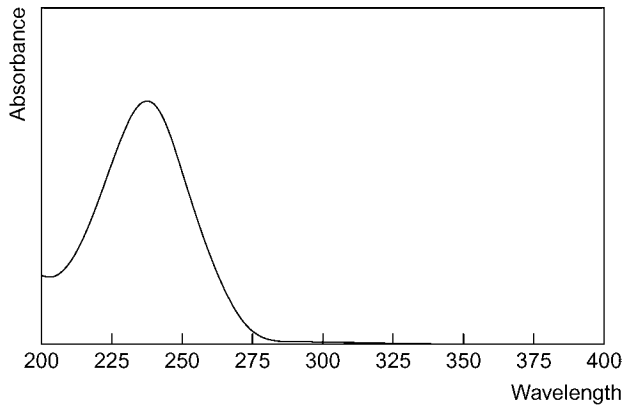
Corticosteroid
$C_{26}H_{32}F_2O_7$ = 494.5
CAS—356-12-7

Synonyms (6α,11β,16α)-21-(Acetyloxy)-6,9-difluoro-11-hydroxy-16,17-[(1-methylethylidene)bis(oxy)]pregna-1,4-diene-3,20-dione; fluocinolone acetonide 21-acetate.
Proprietary Names *Cusigel*; *Flu-21*; *Fluonex*; *Gelisyn*; *Klariderm*; *Korticoid*; *Lidemol*; *Lidex*; *Lyderm*; *Lydonide*; *Metosyn*; *Novoter*; *Tiamol*; *Topsym*; *Topsymin*; *Topsyn(e)*; *Vasoderm*.



Chemical Properties A white to cream-coloured crystalline powder. Mp about 300°, with decomposition. Practically insoluble in water; soluble 1 in 70 of ethanol, 1 in 10 of acetone and 1 in 10 of chloroform; very slightly soluble in ether. Log *P* (octanol/water), 3.2.

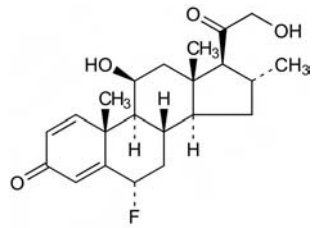
Ultraviolet Spectrum Methanol—240 nm (A^1_1=360a).



Infrared Spectrum Principal peaks at wavenumbers 1670, 1240, 1730, 1750, 1070, 1635 cm^{-1} (KBr disk).
Use Topically in a concentration of 0.05%.

Fluocortolone

Corticosteroid
$C_{22}H_{29}FO_4$ = 376.5
CAS—152-97-6
IUPAC Name (6*S*,8*S*,9*S*,10*R*,11*S*,13*S*,14*S*,16*R*,17*S*)-6-Fluoro-11-hydroxy-17-(2-hydroxyacetyl)-10,13,16-trimethyl-6,7,8,9,11,12,14,15,16,17-decahydrocyclopenta[*a*]phenanthren-3-one
Synonyms (6α,11β,16α)-6-Fluoro-11,21-dihydroxy-16-methylpregna-1,4-diene-3,20-dione; 6α-fluoro-16α-methyldehydrocorticosterone.
Proprietary Names *Ultralan* (tablets). It is an ingredient of *Ultralanum*.



Chemical Properties A white crystalline powder. Mp 188° to 190.5°. Practically insoluble in water; soluble 1 in 120 of ethanol; soluble in chloroform and ether. Log *P* (octanol/water), 2.1.

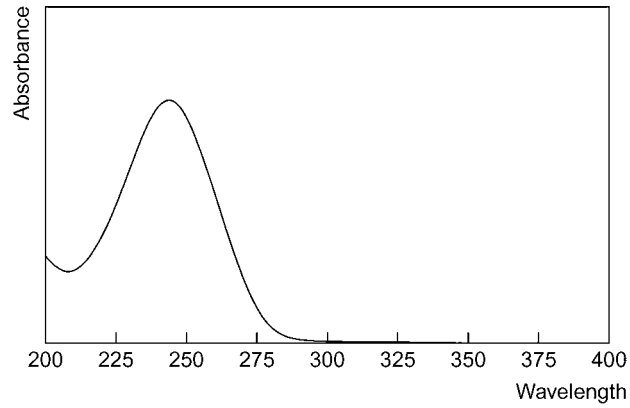
Fluocortolone Hexanoate

$C_{28}H_{39}FO_5$ = 474.6
CAS—303-40-2
Synonym Fluocortolone caproate
Proprietary Names It is an ingredient of *Ultradil Plain*, *Ultralan* (cream and lotion) and *Ultralanum*.
Chemical Properties A white to creamy-white crystalline powder. Mp 242° to 245°. Practically insoluble in water and ether; very slightly soluble in ethanol and methanol; soluble 1 in 18 of chloroform.

Fluocortolone Pivalate

$C_{27}H_{37}FO_5$ = 460.6
CAS—29205-06-9
Synonym Fluocortolone trimethylacetate
Proprietary Names It is an ingredient of *Ultradil Plain*, *Ultralan* (cream and lotion) and *Ultralanum Plain* (cream).
Chemical Properties A white to creamy-white crystalline powder. Mp 187°. Almost insoluble in water; soluble 1 in 36 of ethanol and 1 in 3 of chloroform; freely soluble in dioxan; slightly soluble in ether.

Colour Tests Antimony pentachloride—green-yellow; naphthol–sulfuric acid—red-brown/red-brown; sulfuric acid—orange-yellow.
Thin-layer Chromatography Fluocortolone: system TE—R_f 0.50; system TF—R_f 0.28. Fluocortolone hexanoate: system TP—R_f 0.79; system TQ—R_f 0.39; system TR—R_f 0.88; system TS—R_f 0.00. (*p*-Toluenesulfonic acid solution, positive.) Fluocortolone pivalate: system TP—R_f 0.78; system TQ—R_f 0.35; system TR—R_f 0.89; system TS—R_f 0.58.
Gas Chromatography System GA—fluocortolone RI 3225, fluocortolone-AC_2 RI 3400, fluocortolone-AC RI 3420.
Ultraviolet Spectrum Methanol—242 nm (A^1_1=429a).



Infrared Spectrum Principal peaks at wavenumbers 1658, 1163, 1622, 1722, 1176, 1747 cm^{-1} (fluocortolone hexanoate, KBr disk); 1662, 1159, 1725, 1619, 1605, 1285 cm^{-1} (fluocortolone pivalate, KBr disk).
Disposition in the Body
Therapeutic Concentration
Administration of 20, 50 and 100 mg oral doses of fluocortolone to 9 subjects at weekly intervals resulted in mean maximum plasma concentrations of 199, 419, and 812 mg/L, respectively, 1 to 2 h after dosing [Tauber *et al.* 1986].
Dose Fluocortolone has been given orally in doses of 5 to 60 mg daily.

Tauber U *et al.* (1986). Fluocortolone: pharmacokinetics and effect on plasma cortisol level. *Eur J Clin Pharmacol* 30: 433–438.

Fluorides

Anion

Fluoroacetic Acid

$C_2H_3FO_2$ = 78.0
CAS—144-49-0
Synonyms Fluoroethanoic acid; gifblaar poison.
Chemical Properties Crystals. Mp 33°. Bp 165°.

Hydrofluoric Acid

HF = 20.01
CAS—7664-39-3
Synonym Fluorohydric acid
Chemical Properties Solution of hydrogen fluoride gas in water. Colourless or almost colourless, fuming liquid. Miscible with water. Weak acid, pK_a 3.19 [O'Neil *et al.* 2006]. Attacks glass or stoneware, dissolving the silica. Keep in plastic, lead, wax, or paraffin paper bottles. Poisonous, handle with care.

Sodium Fluoride

FNa = 41.9
CAS—7681-49-4
Proprietary Names *Chemifluor*; *Duraphat*; *Florocid*; *Fluoros*; *Flura-Drops*; *Karidium*; *Lemoflur*; *Luride-SF*; *Ossalin*; *Ossin*; *Osteo-F*; *Osteofluor*; *Slow-Fluoride*; *Villiaumite*; *Zymafluor*.
Chemical Properties Cubic or tetragonal crystals. Mp 993°. Bp 1704°. Soluble in water; insoluble in alcohol. Used in the treatment of osteoporosis, as an insecticide, as a constituent of vitreous enamel and glass mixes, in electroplating, in the fluoridation of drinking water, as disinfectant for fermentation apparatus in breweries and distilleries, as an anticoagulant, as preservative for biological specimens.

Cryolite

AlF_6Na_3 = 209.9
CAS—15096-52-3
Synonyms Ice spar; kryolith; sodium aluminium fluoride.
Chemical Properties Snow-white, semi-opaque masses, vitreous fracture. Mp 1000°. Soluble in concentrated sulfuric acid. Used as a pesticide.

Stannous Fluoride

F_2Sn = 156.7
CAS—7783-47-3
Proprietary Names *Fluoristan*; *Tin Difluoride*.
Chemical Properties Monoclinic, lamellar plates. Mp 213°. Soluble in water. Used in dentistry.

Sodium Fluorosilicate

Na_2SiF_6 = 188.1
CAS—16893-85-9
Synonyms Disodium hexafluorosilicate; disodium silicofluoride; silicon sodium fluoride; sodium fluosililcate.
Proprietary Names *Prodan*; *Salufer*.
Chemical Properties White granular powder. Decomposes at red heat. Slightly soluble in water; insoluble in alcohol. Used in enamels, as insecticide, rodenticide,

fluoridating agent for drinking water, intermediate in production of synthetic cryolite.

Quantification

Note For the detection of fluoride ions in plasma, serum or urine using an ion-selective electrode, see Itai and Tsunoda [2001]; Fuchs *et al.* [1975]; Neefus *et al.* [1970]. For a comparison of methods for measuring fluorine in biological and environmental samples, see Venkateswarlu [1990].

Disposition in the Body Soluble fluoride compounds are rapidly and completely absorbed following oral exposure. Fluoride is believed to replace the hydroxyl ion and possibly the bicarbonate ion associated with hydroxyapatite – a mineral phase during formation of bone. Once absorbed, a portion of the fluoride is deposited in the skeleton, and most of the remainder is excreted in the urine, with smaller amounts in faeces, sweat and saliva, within 24 h. A fraction of the circulating inorganic fluoride acts as an enzyme inhibitor because it forms metal–fluoride–phosphate complexes that interfere with the activity of those enzymes requiring a metal ion cofactor. It is a general inhibitor of the energy production system of the cell.

Toxicity

A 65-year-old skilled worker sustained third-degree burns to his face after being splashed with hydrofluoric acid. His serum, urine, pericardium fluid and thoracic cavity fluid fluoride concentrations were 6.38, 6.60, 6.17 and 5.37 mg/L [Takase *et al.* 2004].

A 56-year-old man mistook the contents of a peanut butter jar, which contained a glass-etching compound including 20% ammonium bifluoride and 13% sodium bifluoride. The postmortem blood fluoride concentration was 19 mg/L (normal range, 0.2 to 0.6 mg/L) [Randall, Fraser 1994].

A 14-month-old boy spilled a bottle of rust remover and sustained 11% total body surface burns to both anterior thighs and knees and the right scapular region. The rust remover contained 4.4 mol/L hydrofluoric acid, equivalent to an 8% solution. On admission, his serum fluoride concentration was 21.3 mg/L (normal range, 0 to 0.5 mg/L) [Bordelon *et al.* 1993].

A 13-month-old boy ingested soldering flux containing potassium fluoride. He died ~12 h later. Postmortem fluoride concentrations in blood, liver, stomach and rib were 2, 3, 30 and 300 mg/L, respectively. There were multiple small (<1 cm) cardiac rhabdomyomas throughout both ventricular walls [Byard 1997; Byard *et al.* 1991].

A 33-year-old woman was found dead having ingested a cockroach powder based on sodium fluoride. The following concentrations were found at postmortem:

Tissue	*Concentration (mg/L or mg/kg)*
Bile	3.4
Stomach contents	2225
Kidney	16
Liver	8.6
Urine	295

[Poklis, Mackell 1989].

Note For a review of fluoride toxicity from ingestion of dental products, see Shulman and Wells [1997].

Half-life 49–72 days.

Bioavailability Nearly 100% when ingested orally in the fasting state [Ekstrand *et al.* 1990; Poklis, Mackell 1989].

Fluoroacetamide

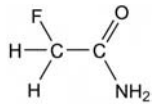
Rodenticide

$FCH_2CONH_2 = 77.1$

CAS—640-19-7

IUPAC Name 2-Fluoroacetamide

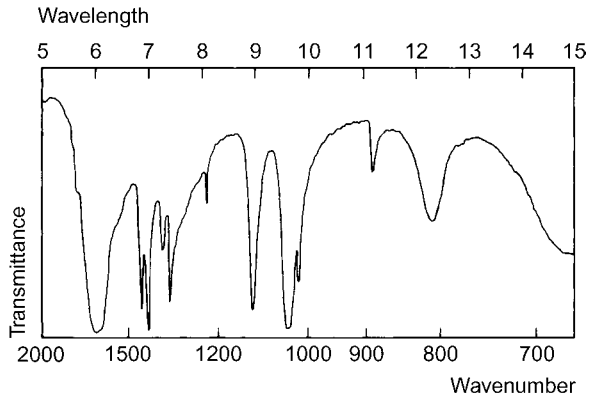
Synonyms Compound 1081; fluoroacetic acid amide.



Chemical Properties A fine fluffy white powder which decomposes if heated appreciably above 100°. Freely soluble in water; soluble in acetone; sparingly soluble in chloroform; relatively insoluble in organic solvents. Log *P* (octanol/water), −1.0.

Colour Test Nessler's reagent—brown-orange.

Infrared Spectrum Principal peaks at wavenumbers 1667, 1036, 1117, 1020, 810, 1239 cm^{-1} (Nujol mull).



Quantification See under Fluoroacetic Acid.

Disposition in the Body Rapidly absorbed after ingestion or through cuts and abrasions. It is converted to fluoroacetic acid and then to fluorocitric acid.

Toxicity Fluoroacetamide is extremely toxic to animals and humans but its lethal action is slower than sodium fluoroacetate.

Fluoroacetic Acid

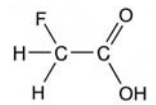
Rodenticide

$C_2H_3FO_2 = 78.0$

CAS—144-49-0

IUPAC Name 2-Fluoroacetic acid

Synonyms Fluoroethanoic acid; gifblaar poison; monofluoroacetic acid.



Chemical Properties Fluoroacetic acid is the toxic principle of the South African plant gifblaar, Dichapetalum cymosum (= Chailletia cymosa) (Dichapetalaceae). Crystals. Mp 33°. Bp 165°. Soluble in water and ethanol; practically insoluble in most common organic solvents. pK_a 2.6 (25°). Log *P* (octanol/water), 0.03.

Sodium Fluoroacetate

$C_2H_2FNaO_2 = 100.0$

CAS—62-74-8

Synonyms Compound 1080; sodium monofluoroacetate.

Chemical Properties A white hygroscopic powder which decomposes at 200° to 202°. Very soluble in water; relatively insoluble in organic solvents.

Quantification

Serum **GC-MS** Limit of detection, 0.02 mg/L [Sporkert *et al.* 2002].

Tissues **GC** ECD. Limit of detection, 100 ng/g [Okuno *et al.* 1982].

GC-MS Limits of detection, 700 ng/g for fluoroacetamide, 100 ng/g for fluoroacetic acid [Stevens *et al.* 1976].

Disposition in the Body Fluoroacetic acid and sodium fluoroacetate are absorbed rapidly through cuts and abrasions but less rapidly from intact skin. Sodium fluoroacetate is converted to fluorocitric acid which inhibits the citric acid cycle and leads to accumulation of citrate.

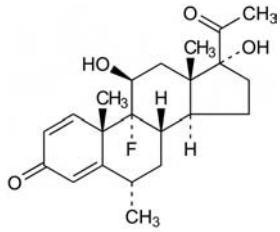
Toxicity Fluoroacetic acid and sodium fluoroacetate are extremely toxic to animals and humans; the minimum lethal dose is about 5 mg/kg. Toxic effects are delayed for several hours following ingestion or absorption through the skin. The maximum permissible atmospheric concentration is 50 $\mu g/m^3$.

Okuno I *et al.* (1982). Modified gas-liquid chromatographic method for determination of compound 1080 (sodium fluoroacetate). *J Assoc Off Anal Chem* 65: 1102–1105.
Sporkert F *et al.* (2002). Headspace solid-phase microextraction with 1-pyrenyldiazomethane on-fibre derivatisation for analysis of fluoroacetic acid in biological samples. *J Chromatogr B Anal Technol Biomed Life Sci* 772: 45–51.
Stevens HM *et al.* (1976). The recovery and identification of fluoroacetamide and fluoroacetic acid from tissues. *Forensic Sci* 8: 131–137.

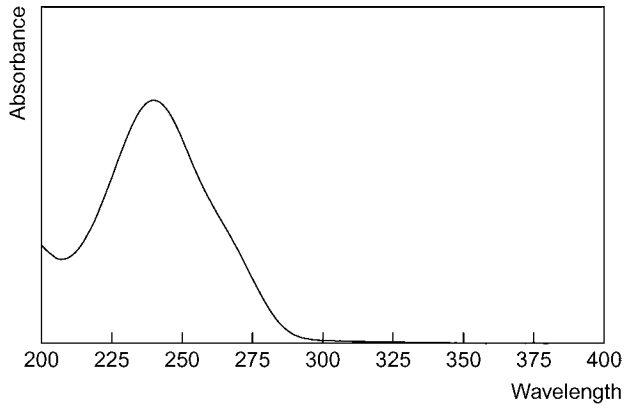
Fluorometholone

Corticosteroid
$C_{22}H_{29}FO_4 = 376.5$
CAS—426-13-1

IUPAC Name (6*S*,8*S*,9*R*,10*S*,11*S*,13*S*,14*S*,17*R*)-17-Acetyl-9-fluoro-11,17-dihydroxy-6,10,13-trimethyl-6,7,8,11,12,14,15,16-octahydrocyclopenta[*a*]phenanthren-3-one
Synonym (6α,11β)-9-Fluoro-11,17-dihydroxy-6-methylpregna-1,4-diene-3,20-dione
Proprietary Names *Delmeson*; *Efflumidex*; *Eflone*; *Flarex*; *Flu Oph*; *Fluaton*; *Flucon*; *Fluforte*; *Flumetol*; *Fluor-Op*; *Fluoropos*; *FML*; *Oxylone*; *Semplice*.



Chemical Properties A white to yellowish-white crystalline powder. Mp about 280°, with decomposition. Practically insoluble in water; soluble 1 in 200 of ethanol and 1 in 2200 of chloroform; very slightly soluble in ether. Log *P* (octanol/water), 2.0.
Thin-layer Chromatography System TB—R_f 0.00; system TE—R_f 0.68; system TF—R_f 0.52; system TAE—R_f 0.91; system TAJ—R_f 0.46; system TAK—R_f 0.26; system TAL—R_f 0.90; system TAM—R_f 0.86.
High Performance Liquid Chromatography System HX—RI 470.
Ultraviolet Spectrum Methanol—241 nm (A^1_1=375a).

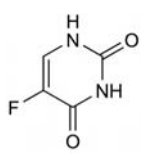


Use Usually applied as a 0.025% cream or ointment and is also available as a 0.1% ophthalmic suspension.

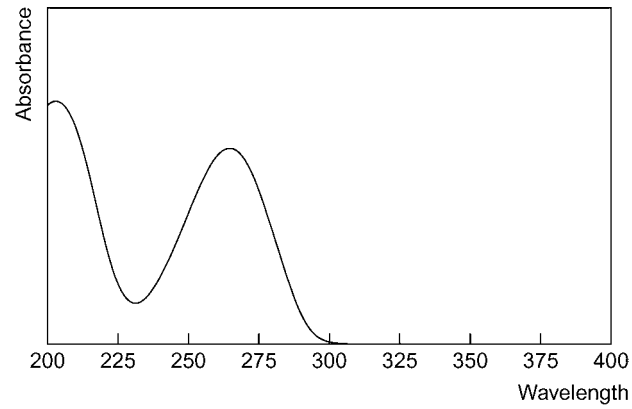
Fluorouracil

Antineoplastic
$C_4H_3FN_2O_2 = 130.1$
CAS—51-21-8

IUPAC Name 5-Fluoro-2,4(1*H*,3*H*)-pyrimidinedione
Synonyms 5-Fluorouracil; 5-FU.
Proprietary Names *AccuSite*; *Adrucil*; *Cinkef-U*; *Effluderm*; *Efudex*; *Efudix*; *Fiverocil*; *Fivoflu*; *Flurablastin*; *Fluracedyl*; *Fluroblastin(e)*; *Fluoroplex*; *Flurox*; *Ofluor*; *Rhonuracil*; *Ribofluor*.



Chemical Properties A white crystalline powder which decomposes at 282°. Sparingly soluble in water; slightly soluble in ethanol; practically insoluble in chloroform and ether. Solutions discolour on storage. pK_a 8.0, 13.0. Log *P* (octanol/pH 7.4), −1.0.
Caution Fluorouracil is an irritant; avoid contact with skin and mucous membranes.
Thin-layer Chromatography System TE—R_f 0.04; system TF—R_f 0.20.
Gas Chromatography System GA—RI 2090.
High Performance Liquid Chromatography System HX—RI 70; system HY—RI 96; system HAA—retention time 3.4 min.
Ultraviolet Spectrum Aqueous acid—266 nm (A^1_1=552a).



Infrared Spectrum Principal peaks at wavenumbers 1653, 1242, 1718, 816, 1220, 1495 cm^{-1} (KBr disk).
Quantification
Blood **HPLC** Limit of detection, 10 µg/L [Wattanatorn *et al.* 1997].
Plasma **GC-MS** Fluorouracil and α-fluoro-β-alanine, limit of detection, <1 µg/L for fluorouracil [Anderson *et al.* 1997]. Limit of detection, <0.5 µg/L [Anderson *et al.* 1992]. Selected-ion monitoring. Limit of detection, 0.4 µg/L [Bates *et al.* 1991].
HPLC UV detection. Limit of detection, 5 µg/L [Nassim *et al.* 2002]. Diode-array detection. Fluorouracil and flucytosine [Torano *et al.* 2001]. Limit of detection, <2 µg/L [Escoriaza *et al.* 1999]. UV detection. Limit of detection, <26 µg/L [Loos *et al.* 1999]. UV detection. Fluorouracil and uracil [House 1998]. UV detection. Fluorouracil and dihydrofluorouracil, limit of detection, 26 µg/L [Ackland *et al.* 1997]. UV detection. Fluorouracil and its major metabolites, limit of detection, 10 µg/L [Joulia *et al.* 1997]. See Blood [Wattanatorn *et al.* 1997]. UV detection. Limit of detection, 25 µg/L [Compagnon *et al.* 1996; Coe *et al.* 1996]. Fluorouracil and folinic acid [Vandenbosch 1993].
HPLC-MS Limit of detection, <1 µg/L [Wang *et al.* 1998].
Tissue **HPLC** Fluorescence detection. Limit of detection, 3 ng/g [Jochheim *et al.* 1994].
Disposition in the Body
Therapeutic Concentration
Seventeen subjects received fluorouracil, either 1 mg/m^2 orally (combined with eniluracil) twice daily or 300 mg/m^2 by continuous IV infusion, for 7 days. The mean steady-state plasma concentration during IV infusion was 104 µg/L compared with 38.1 µg/L for oral fluorouracil [Adjei *et al.* 2002].
Dose Initially 12 mg/kg daily IV, to a maximum of 1 g daily, for 3 or 4 days.

Ackland SP *et al.* (1997). Simultaneous determination of dihydrofluorouracil and 5-fluorouracil in plasma by high-performance liquid chromatography. *Anal Biochem* 246: 79–85.

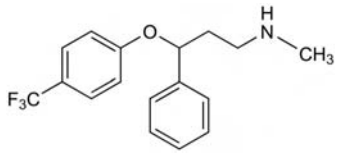
Fluoxetine

Antidepressant
$C_{17}H_{18}F_3NO$ = 309.3
CAS—54910-89-3

IUPAC Name *N*-Methyl-3-phenyl-3-[4-(trifluoromethyl)phenoxy]propan-1-amine
Synonym DB00472
Proprietary Name *Sarafem*



Chemical Properties Solubility in water 78.24 mg/L (25°). Log *P* (octanol/water), 4.05; (octanol/water pH 7.4), 1.82. Extraction yield (chlorobutane), 0.8 [Demme *et al.* 2005].

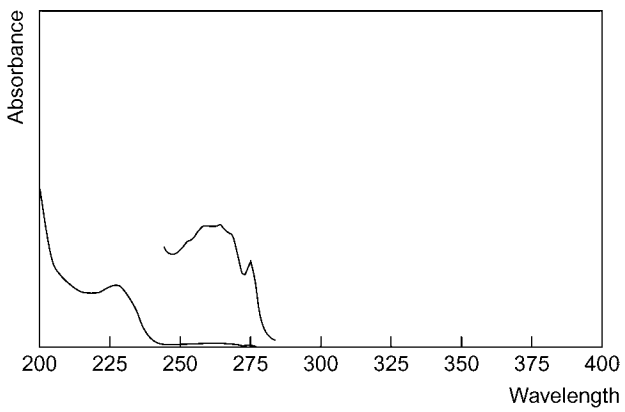
Fluoxetine Hydrochloride

$C_{17}H_{18}F_3NO,HCl$ = 345.8
CAS—59333-67-4
Synonym LY-110,140
Proprietary Names *Adofen*; *Docutrix*; *Erocap*; *Fluctin*; *Fluctine*; *Fluoxeren*; *Fontex*; *Foxetin*; *Lorien*; *Lovan*; *Mutan*; *Prozac*; *Prozyn*; *Reneuron*; *Sanzur*; *Zactin*.
Chemical Properties A white to off-white crystalline solid. Mp 138°. It is soluble in methanol, ethanol, acetonitrile, chloroform and acetone; slightly soluble in ethyl acetate, dichloromethane and water (maximum 14 g/L); insoluble in toluene, cyclohexane and hexane.

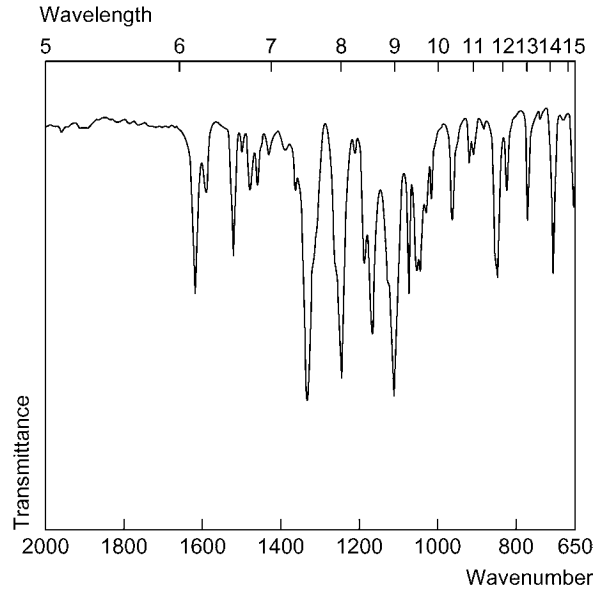
Fluoxetine Oxalate

$C_{17}H_{18}F_3NO,C_2H_4$ = 397.4
Chemical Properties Crystals from ethylacetate-methanol. Mp 179° to 182°.

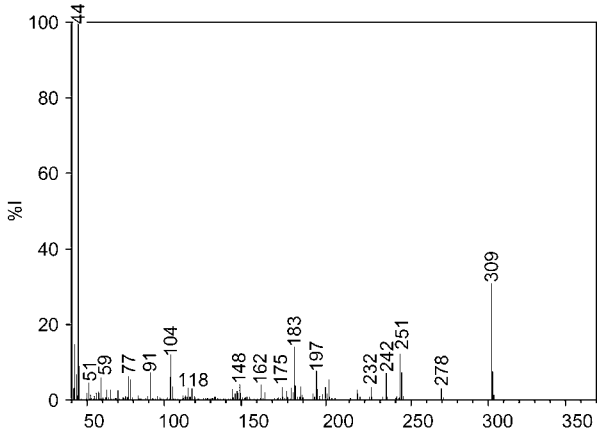
Thin-layer Chromatography System TB—R_f 0.13, M (nor) R_f 0.12; system TE—R_f 47, M (nor) R_f 0.47; System TAE—R_f 0.11; M (nor) R_f 0.11.
Gas Chromatography System GA—RI 1859, M (nor-) RI 1851, M (acetyl-) RI 2250, M (noracetyl-) RI 2190; system GB—RI 1903, M (nor-) RI 1888, M (acetyl-) RI 2319, M (noracetyl-) RI 2278; system GM—RRT 0.304, M (nor-) RI 0.284.
High Performance Liquid Chromatography System HY—RI 400; system HZ—RT 7.6 min, M (desmethyl-)RT 6.7 min; system HAA—RT 16.2 min; system HAX—RT 12.2 min; system HAY—RT 7.07 min
Ultraviolet Spectrum Aqueous acid (methanol)—227, 264, 268, 275 nm (fluoxetine); 0.025 mol/L sulfuric acid—226.5 nm (fluoxetine); (0.2 mol/L sulfuric acid)—226, 263, 275 nm (norfluoxetine); basic—264, 275 nm (norfluoxetine).



Infrared Spectrum Principal peaks at wave numbers 2986, 2772, 1614, 1329, 1257, 1122; 1335, 1240, 1110 cm^{-1} (norfluoxetine, KBr pellet).



Mass Spectrum Principal ions at *m/z* (fluoxetine) 44, 309, 183, 104, 251, 91, 77, 59, 148; (norfluoxetine) 134, 104, 191, 143, 162, 77.



Quantification

Blood **GC** Column: HP (25 m × 0.20 mm i.d., 0.11 µm). Carrier gas: He. Temperature programme: 180° for 1 min to 300° at 10°/min for 3 min. NPD. Limit of quantification, 220 µg/L, limit of detection, 66 µg/L [Martinez *et al.* 2003].

GC-MS Column: Varian FactorFour (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 70° to 290° at 30°/min for 2.67 min. SIM acquisition mode. Limit of detection not reported [Johnson *et al.* 2007]. Column: HP-5 MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 150° for 0.5 min at 10°/min, to 270° for 2.5 min. EI ionisation, SIM acquisition mode. Limit of detection not reported [Ferslew *et al.* 1998]. Column: DB-5 MS (25 m × 0.2 mm i.d., 0.33 mm). Carrier gas: He, 0.7 mL/min. Temperature programme: 100° for 2 min to 210°,at 15°/min to 280° at 20°/min for 5 min. EI ionisation, SIM acquisition mode. Limit of quantification, 25 µg/L, limit of detection, 12.5 µg/L [Crifasi *et al.* 1997].

LC-MS Column: C_{18}. Mobile phase: acetonitrile : 0.1% trifluoroacetic acid (50 : 50), flow rate 0.4 mL/min. ESI ionisation, SIM acquisition mode [Pufal, Sykutera 2008]. Column: XTerra RP18 (100 × 2.1 mm i.d.). Mobile phase: acetonitrile : 4 mol/L ammonium formate buffer (15 : 85 for 1 min to 35 : 65 over 12 min for 1 min), flow rate 0.3 mL/min. ESI, positive ion mode. Limit of detection, 5 µg/L [Castaing *et al.* 2007].

Plasma **GC** Column: Rtx-1 (15 m × 0.25 mm i.d., 1.0 µm). Carrier gas: H2. Temperature programme: 170° for 7 min. NPD. Limit of detection, 1.5 µg/L [Ulrich 2003]. Column: OV-1. NPD. Limit of detection, 0.3 µg/L [Fontanille *et al.* 1997]. Column: DB-17 (30 m × 0.25 mm i.d.). ECD. Limit of quantification, 5 µg/L [Lantz *et al.* 1993]

GC-MS Column: HP-5 MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 15 psi. Temperature programme: 80° to 280° at 30°/min for 5 min. EI ionisation, full scan and SIM acquisition mode. Limit of quantification, 1.37 ng/L [Fernandes *et al.* 2008]. Column: J&W-5 MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.3 mL/min. Temperature programme: 90° for 1 min, to 180° at 50°/min for 10 min, to 300° at 10°/min. EI ionisation, SIM acquisition mode. Limit of quantification, 12.5 µg/L [Wille *et al.* 2007]. Limit of quantification, 1 µg/L for (*R*)- and (*S*)-enantioners [Eap *et al.* 1996].

HPLC Column: LiChrospher 60 RP-Select B (125 × 4 mm i.d., 5 µm). Mobile phase: 0.005 mol/L sodium acetate buffer (pH 4.5) : acetonitrile (50 : 50), flow rate 0.6 mL/min. Fluorescence detection (λ_{ex} = 230 nm, λ_{em} = 290 nm). Limit of detection not reported [de Freitas *et al.* 2010]. Column: LiChrosphere 60 RP:Select B (250 × 4 mm i.d., 5 µm). Mobile phase: 0.05 mol/L phosphate buffer : acetonitrile (57 : 43). Flow rate 1.0 mL/min. UV detection (λ = 230 nm). Limit of quantification, 25 µg/L [Chaves *et al.* 2009]. Column: Chiralcel OD-R. Mobile phase: 7.5 mmol/L potassium hexafluorophosphate with 0.25 mol/L sodium phosphate : acetonitrile (75 : 25), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 230 nm, λ_{em} = 290 nm). Limit of quantification, 10 µg/L for (*R*)- and (*S*)-enantioners [Silva *et al.* 2009]. Fluorescence detection. Limit of quantification, 0.7 µg/L [Clausing *et al.* 1997]. Column: Symmetry C_{18} (250 × 4.6 mm i.d., 5 µm). DAD (λ = 226, 254, 400 nm). Limit of detection, 5 µg/L [Aymard *et al.* 1997]. See also Suckow *et al.* [1992], Thomare *et al.* [1992], Wong *et al.* [1990].

LC-MS Mobile phase: acetonitrile : 0.05 mol/L ammonium formate buffer, flow rate 200 µL/min. Limit of quantification, 5 µg/L, limit of detection, 3 µg/L [Saber 2009]. Column: Sunfire C_{18} IS (20 × 2.1 mm i.d., 3.5 µm). Mobile phase: acetonitrile : 2 mol/L ammonium formate (pH 3, 5 : 85 for 0.5 min to 50 : 50 over 4 min to 70 : 30 over 1 min), flow rate 0.4 mL/min. Limit of quantification, 2 µg/L [De Castro *et al.* 2008]. Column: C_{18}. ESI. Limit of quantification, 1 µg/L [Santos-Neto *et al.* 2008]. Column: Zorbax Eclipse SB-C_{18} (50 × 2.1 mm i.d., 5 µm). Mobile phase: acetonitrile : water (296 : 204), flow rate 0.2 mL/min. ESI, SRM acquisition mode. Limit of detection not reported [Guo *et al.* 2006].

Serum **GC** See Plasma [Ulrich 2003].

HPLC Column: Nova-Pak. Mobile phase: acetonitrile : TEA-acetic acid buffer (pH 5.5), flow rate 1.7 mL/min. UV detection (λ = 226 nm). Limit of detection, 15 µg/L [Orsulak *et al.* 1988].

LC-MS Column: Beckman C_{18} ODS (150 × 2.1 mm i.d., 5 µm). Mobile phase: acetonitrile : water : formic acid with 2 mol/L ammonium acetate (68 : 32 : 0.1), flow rate 0.2 mL/min. ESI, MRM acquisition mode. Limit of quantification, 0.17 µg/L, limit of detection 0.06 µg/L [Franceschi *et al.* 2009]. Column: Chromolith Speed ROD C_{18} (50 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 5 mol/L acetate buffer (pH 3.9, 20 : 80 to 70 : 30 over 4 min for 1 min, to 20 : 80), flow rate 1.0 mL/min. ESI, MRM acquisition mode. Limit of quantification, 2.17 µg/L [Kirchherr, Kühn-Velten 2006].

Urine **GC-MS** See Blood [Johnson *et al.* 2007]. Carrier gas: He, 0.91 mL/min. Temperature programme: 100° for 0.8 min to 220° at 50°/min for 1 min. SIM acquisition mode. Limit of detection, 5.7 µg/L [Berzas Nevado *et al.* 2006]. Column: CP-SIL_8 CB (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.2 mL/min. Temperature programme: 60° for 2 min, to 200° at 20°/min, to 280° over 5 min. Limit of detection, 0.25 µg/L [Salgado-Petinal *et al.* 2005]. See Blood [Crifasi *et al.* 1997; Ferslew *et al.* 1998].

HPLC Column: Extrasil ODS (250 × 4.0 mm i.d., 5 µm). Mobile phase: 0.4% tetramethylammonium chloride (pH 4.0) : acetonitrile (60 : 40), flow rate 1.0 mL/min. Fluorescence detection (λ = 228 nm). Limit of quantification, 1.0–10 µg/L [Unceta *et al.* 2010]. Column: Eclipse X-DB-C_8 (150 × 4.6 mm i.d.). Mobile phase: sodium dihydrogen phosphate buffer (pH 3.0) : acetonitrile : methanol (70 : 25 : 5). UV detection (λ = 254 nm). Limit of detection, 90.1 µg/L [Cruz-Vera *et al.* 2008]. Column: Spherisorb ODS2 (150 × 4.0 mm i.d., 5 µm). Mobile phase: 0.15% tetramethylammonium chloride (pH 4.0) : acetonitrile (50 : 50), flow rate 1.0 mL/min. DAD (λ = 230 nm). Limit of detection, 0.01 mg/L [Unceta *et al.* 2008].

Bile **GC** Column: DB-17 (15 m × 0.32 mm i.d., 0.15 µm). Carrier gas: He, 17.5 psi. Temperature programme: 130° to 300° at 15°/min for 1 min. NPD. Limit of detection not reported [Kincaid *et al.* 1990]

GC-MS See Blood [Johnson *et al.* 2007].

Milk **HPLC** UV detection [Hostetter *et al.* 2004].

Oral Fluid **LC-MS** Column: Zorbax Eclipse XDB-C_{18} (50 × 4.6 mm i.d., 1.8 µm). Mobile phase: 0.2% acetic acid : methanol (70 : 30 to 30 : 70 over 8 min), flow rate 1 mL/min. ESI. Limit of quantification, 5 µg/L [Coulter *et al.* 2010]. See Plasma [De Castro *et al.* 2008].

Stomach Contents **GC-MS** See Blood [Ferslew *et al.* 1998].

Vitreous Humour **GC** Column: DB-1 (15 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.2 mL/min. Temperature programme: 50° to 275° at 35°/min over 4.5 min. NPD. Limit of detection not reported [Cantrell *et al.* 2009].

GC-MS See Blood [Crifasi *et al.* 1997; Johnson *et al.* 2007].

Brain **GC-MS** Column: J&W-5 MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.3 mL/min. Temperature programme: 90° for 1 min, to 180° at 50°/min for 10 min, to 300° at 10°/min. EI ionisation, SIM acquisition mode. Limit of detection not reported [Wille *et al.* 2009]. See Blood [Johnson *et al.* 2007].

HPLC See Urine. Limit of quantification, 2–20 ng/g [Unceta *et al.* 2010]. See Plasma [Clausing *et al.* 1997].

Hair **GC-MS** See Brain [Wille *et al.* 2009].

Lung **GC-MS** See Blood [Johnson *et al.* 2007].

Muscle **GC-MS** See Blood [Johnson *et al.* 2007].

Disposition in the Body Fluoxetine is readily absorbed after oral administration and is extensively metabolised in the liver by demethylation. The primary active metabolite is norfluoxetine, which is excreted via the kidneys. Further metabolism can occur by *O*-dealkylation producing *p*-trifluoromethylphenol and hippuric acid. Of a drug dose, 80% is excreted in urine, with <10% as the unchanged parent drug, and 15% is excreted in faeces. Fluoxetine is widely distributed throughout the body and is secreted into breast milk.

Therapeutic Concentration Therapeutic serum concentrations are 0.15–0.5 mg/L (fluoxetine) and 0.1–0.5 mg/L (norfluoxetine).

Single doses of fluoxetine 40 mg given to 6 subjects produced maximum plasma concentrations of fluoxetine of 0.03–0.055 mg/L after 4–8 h; maximum plasma norfluoxetine concentrations were 0.006–0.036 mg/L after 48–96 h [Aronoff *et al.* 1984].

Daily doses of 20–80 mg of fluoxetine were given to 12 patients. Average plasma concentrations were 48.7, 142, 199.2 and 208.7 µg/L from daily doses of 20, 40, 60 and 80 mg, respectively [de Freitas *et al.* 2010].

Toxicity Blood concentrations of 1.3–6.8 mg/L fluoxetine and 0.9–5.0 mg/L norfluoxetine have been associated with deaths. Serum levels of 1.96 mg/L fluoxetine (0.42 mg/L norfluoxetine) have been associated with seizures.

A 44-year-old man was found dead, and medication at the scene included clozapine (Clorazil) and fluoxetine (Prozac). Toxicological analysis showed 0.7 mg/L fluoxetine and 0.6 mg/L norfluoxetine in the man's blood, as well as 4.9 mg/L clozapine and 350 mg/L ethanol. Death resulted from an overdose of fluoxetine and clozapine, which resulted in a fatal drug interaction [Ferslew *et al.* 1998].

A 58-year-old woman with suicidal tendencies was found dead at home surrounded by empty fluoxetine prescription vials. Postmortem blood and bile concentrations for fluoxetine plus norfluoxetine were 6.0 and 5.0 mg/L, and 13.0 mg/L [Kincaid *et al.* 1990].

A 31-year-old woman who died despite resuscitation attempts had the following postmortem fluoxetine and norfluoxetine concentrations, respectively: 33 and 12 mg/L in central blood, 400 and 460 mg/kg in liver and 5.2 and 2.2 mg/L in vitreous humour [Cantrell *et al.* 2009].

Bioavailability ≈60%.

Half-life Fluoxetine 4–6 days; norfluoxetine 4–16 days.

Volume of Distribution 27 L/kg (between 20 and 42 L/kg for both fluoxetine and norfluoxetine).

Clearance Renal clearance, 0.6 L/kg/h; also reported as 20.8 L/h for fluoxetine and 8.7 L/h for norfluoxetine.

Protein Binding Fluoxetine is bound to serum proteins 94.5%.

Dose A usual dose of 20 mg daily is administered for depression and 60 mg daily for bulimia nervosa. A maximum dose of 80 mg may be given daily. Dose is reduced for patients with renal and hepatic impairment. Not recommended for children.

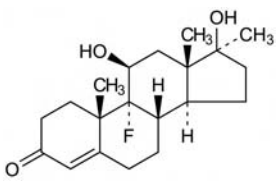
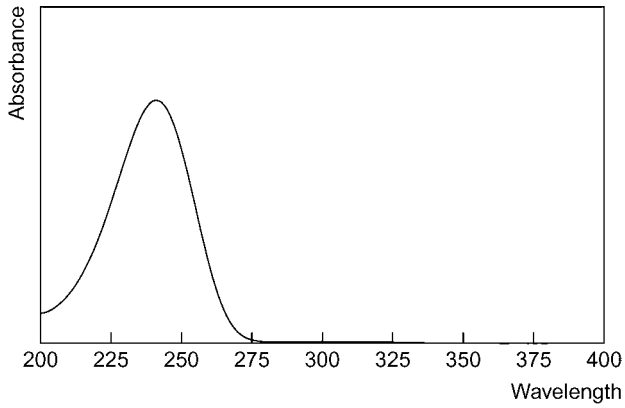
Fluoxymesterone

Androgen
$C_{20}H_{29}FO_3 = 336.4$
CAS—76-43-7

IUPAC Name (8*S*,9*R*,10*S*,11*S*,13*S*,14*S*,17*S*)-9-Fluoro-11,17-dihydroxy-10,13,17-trimethyl-1,2,6,7,8,11,12,14,15,16-decahydrocyclopenta[*a*]phenanthren-3-one
Synonyms (11β,17β)-9-Fluoro-11,17-dihydroxy-17-methylandrost-4-en-3-one; fluorohydroxymethyltestosterone.
Proprietary Names *Halotestin*; *Oratestin*; *Ora-Testryl*; *Stenox*; *Testoral*; *Ultandren*.
Note Testoral is also used as a proprietary name for testosterone.



Chemical Properties A white or creamy-white crystalline powder. Mp 270° with decomposition. Practically insoluble in water; soluble 1 in 70 of ethanol and 1 in 200 of chloroform; soluble in pyridine; slightly soluble in acetone; practically insoluble in ether, benzene, and hexanes. Log *P* (octanol/water), 2.4.
Colour Tests Antimony pentachloride—brown; naphthol–sulfuric acid—green-yellow/yellow; sulfuric acid—yellow (green fluorescence under UV light).
Thin-layer Chromatography System TP—R_f 0.51; system TQ—R_f 0.09; system TR—R_f 0.38; system TS—R_f 0.16, streaking may occur; system TAJ—R_f 0.41; system TAK—R_f 0.35; system TAL—R_f 0.91; system TAM—R_f 0.74.
Gas Chromatography System GA—RI 2835; system GAG—RRT 1.50(relative to testosterone); system GAI—RRT 1.155(relative to 17α-methyl-5α-androstan-3β,17β-diol); system GAR—retention time 14.6 min.
High Performance Liquid Chromatography System HY—RI 427; system HATb—RRT 0.70 (relative to testosterone); system HAR—RRT 0.78 (relative to testosterone).
Ultraviolet Spectrum Dehydrated alcohol—240 nm (A_1^1=495a).



Infrared Spectrum Principal peaks at wavenumbers 1654, 867, 1036, 1247, 926, 1282 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 43, 71, 55, 79, 91, 109, 123, 336.
Quantification
Serum **HPLC** UV detection [Capponi *et al.* 1985].
Hair **GC-MS** Fluoxymesterone and other anabolic steroids [Deng *et al.* 1999].
Dose 2 to 10 mg daily; up to 30 mg daily may be given.

Capponi VJ *et al.* (1985). Liquid chromatographic assay for fluoxymesterone in human serum with application to a preliminary bioavailability study. *J Pharm Sci* 74: 308–311.

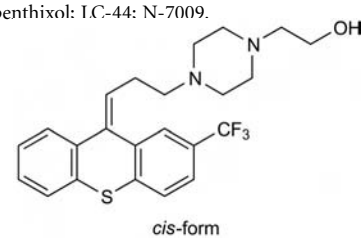
Flupentixol

Tranquilliser
$C_{23}H_{25}F_3N_2OS = 434.5$
CAS—2709-56-0

IUPAC Name 4-[3-[2-(Trifluoromethyl)-9*H*-thioxanthen-9-ylidene]propyl]-1-piperazine ethanol
Synonyms Flupenthixol; LC-44; N-7009.



cis-form

Chemical Properties Log *P* (octanol/buffer pH 7.0), 3.0. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Flupentixol Decanoate

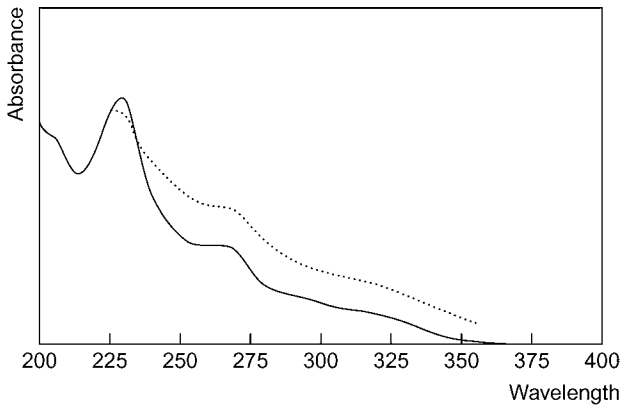
$C_{33}H_{43}F_3N_2O_2S = 588.8$
CAS—30909-51-4
Synonyms (*Z*)-Flupenthixol decanoate; *cis*-flupenthixol decanoate.
Proprietary Names *Depixol (injection)*; *Fluanxol Depot*.
Chemical Properties A yellow oil. Very slightly soluble in water; soluble in ethanol; freely soluble in chloroform and ether.

Flupentixol Hydrochloride

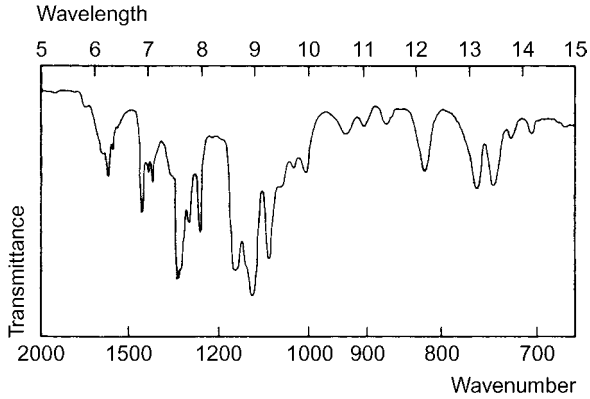
$C_{23}H_{25}F_3N_2OS,2HCl = 507.4$
CAS-2413-38-9
Synonyms Flupenthixol dihydrochloride; flupenthixol hydrochloride.
Proprietary Names *Depixol (tablets)*; *Fluanxol (tablets)*. It is an ingredient of *Deanxit*.
Chemical Properties A white or yellowish-white powder. Mp 230° to 240°. Soluble in water and ethanol; very slightly soluble in chloroform; practically insoluble in ether.

Colour Tests Formaldehyde–sulfuric acid—red (orange fluorescence under UV light); Liebermann's reagent—red; Mandelin's test—red; Marquis test—orange-red; sulfuric acid—orange (fluoresces under UV light).
Thin-layer Chromatography System TA—R_f 0.62; system TB—R_f 0.06; system TC—R_f 0.33; system TE—R_f 0.46; system TAE—R_f 0.50 (acidified iodoplatinate solution, strong reaction).
Gas Chromatography System GA—flupentixol – *cis*-isomer RI 3058, M (ring) RI 2190, M (*N*-oxide) RI 2120, flupentixol-AC RI 3045, M (desalkyl-dihydro-)-AC RI 3055, M (dihydro-)-AC RI 3005; system GB—flupentixol – *cis*-isomer RI 3199, flupentixol – *trans*-isomer RI 3217, M (desalkyl-)-*cis*- RI 2832, M (desalkyl-)-*trans*- RI 2855.
High Performance Liquid Chromatography System HA—flupentixol *k* 1.2, flupentixol sulfoxide *k* 1.3; system HX—RI 475; system HY—RI 435; system HZ—retention time 10.7 min; system HAA—retention time 17.4 min; system HAX—retention time 13.7 min; system HAY—retention time 7.5 min.

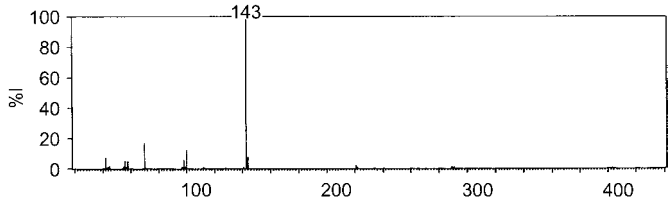
Ultraviolet Spectrum Aqueous acid—230 nm.



Infrared Spectrum Principal peaks at wavenumbers 1119, 1320, 1160, 1081, 1253, 1287 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 143, 70, 100, 144, 42, 98, 58, 56.



Quantification

Plasma **GC** NPD (comparison with radioimmunoassay). Limit of detection, <0.5 µg/L [Balant-Gorgia *et al.* 1985].

Serum **HPLC** UV detection. Flupentixol and haloperidol enantiomers, limit of detection for flupentixol, <0.5 µg/L [Walter *et al.* 1998].

Radioimmunoassay *cis*-flupentixol, limit of detection, 300 ng/L [Jørgensen 1978].

Disposition in the Body Readily absorbed after oral administration. Flupentixol decanoate is very slowly absorbed from the site of IM injection. Peak plasma concentrations are attained about 3 to 6 h after oral administration and 3 to 7 days after IM injection. The main metabolic reactions are sulfoxidation, side-chain *N*-dealkylation, and glucuronic acid conjugation. *N*-Desalkylflupentixol and flupentixol sulfoxide are the major metabolites found in plasma (both are inactive). Numerous metabolites are excreted in the urine and faeces and there is evidence of enterohepatic circulation. Flupentixol crosses the placenta and it is found in small amounts in breast milk.

Bioavailability About 55%.

Half-life Biological half-life of flupentixol hydrochloride, about 35 h.

Note For information on the pharmacokinetics of flupentixol, see Jørgensen [1980].

Dose For psychoses, the equivalent of 6 to 18 mg of flupentixol daily, orally.

Fluphenazine

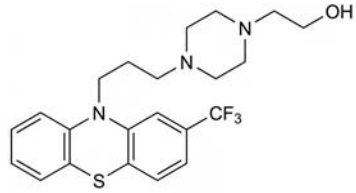
Tranquilliser

$C_{22}H_{26}F_3N_3OS$ = 437.5

CAS—69-23-8

IUPAC Name 4-[3-[2-(Trifluoromethyl)-10*H*-phenothiazin-10-yl]propyl]-1-piperazineethanol

Synonym Triflumethazine



Chemical Properties pK_a 3.9, 8.1. Log *P* (octanol/buffer pH 7.0), 3.5. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Fluphenazine Decanoate

$C_{32}H_{44}F_3N_3O_2S$ = 591.8

CAS—5002-47-1

Synonym Fluphenazini decanoas

Proprietary Names *Anatensol*; *Dapotum*; *Lyogen*; *Lyorodin*; *Modecate*; *Moditen Depot*; *Prolixin*; *Siqualone*.

Chemical Properties A pale yellow viscous liquid or a yellow crystalline oily solid. Mp 30° to 32°. Insoluble in water; very soluble in alcohol, chloroform, cyclohexane and ether.

Fluphenazine Enantate

$C_{29}H_{38}F_3N_3O_2S$ = 549.7

CAS—2746-81-8

Synonyms Fluphenazini enantas; fluphenazine enanthate; fluphenazine heptanoate.

Proprietary Names *Anatensol*; *Moditen (injection)*; *Prolixin*.

Chemical Properties A pale yellow to yellow-orange, clear to slightly turbid, viscous liquid or a yellow crystalline oily solid. Practically insoluble in water; soluble 1 in <1 of ethanol and of chloroform and 1 in 2 of ether.

Fluphenazine Hydrochloride

$C_{22}H_{26}F_3N_3OS,2HCl$ = 510.4

CAS—146-56-5

Synonym Fluphenazini hydrochloridum

Proprietary Names *Anatensol*; *Cenilene*; *Dapotum*; *Lyogen*; *Lyorodin*; *Moditen (tablets)*; *Omca*; *Pacinol*; *Permitil*; *Phenazin*; *Prolixin*; *Sevinol*; *Siqualone*. It is an ingredient of *Dominans*, *Motipress* and *Motival*.

Chemical Properties A white crystalline powder. Mp about 230°. Soluble 1 in 10 or less of water; slightly soluble in ethanol, acetone and chloroform; practically insoluble in ether.

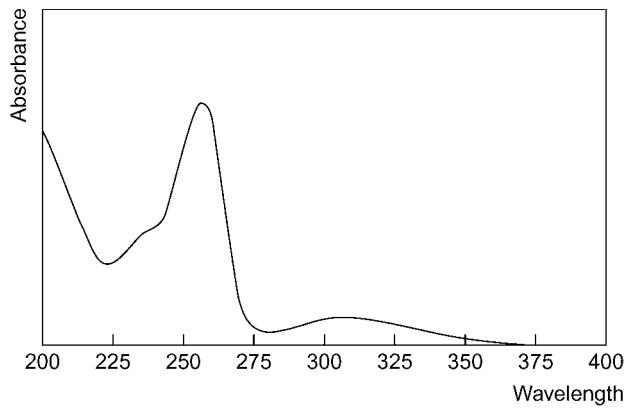
Colour Tests Formaldehyde–sulfuric acid—red; Forrest reagent—orange; FPN reagent—orange; Mandelin's test—brown; Marquis test—red.

Thin-layer Chromatography System TA—R_f 0.63; system TB—R_f 0.05; system TC—R_f 0.23; system TE—R_f 0.45; system TL—R_f 0.10; system TAE—R_f 0.45; system TAF—R_f 0.49; system TAJ—R_f 0.06; system TAK—R_f 0.00; system TAL—R_f 0.41 (Dragendorff spray, positive; FPN reagent, pink; acidified iodoplatinate solution, positive; Marquis reagent, brown; ninhydrin spray, positive).

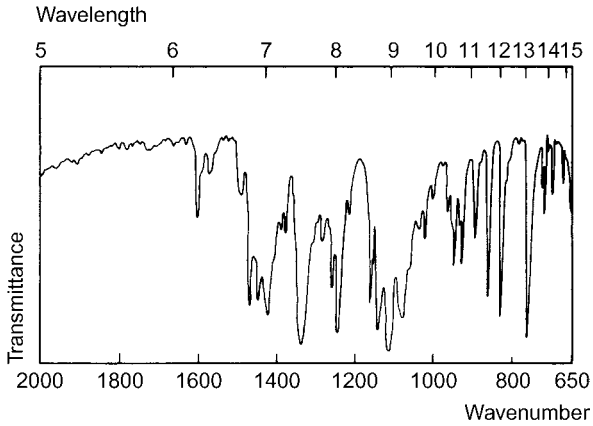
Gas Chromatography System GA—fluphenazine RI 3050, M (ring) RI 2190, fluphenazine-AC RI 3170, M (amino-)-AC RI 2765, M (desalkyl-)-AC RI 3145; system GB—fluphenazine RI 3194.

High Performance Liquid Chromatography System HA—*k* 1.2; system HX—RI 462; system HY—RI 471; system HZ—retention time 10.1 min; system HAA—retention time 17.4 min; system HAX—retention time 13.6 min; system HAY—retention time 7.2 min.

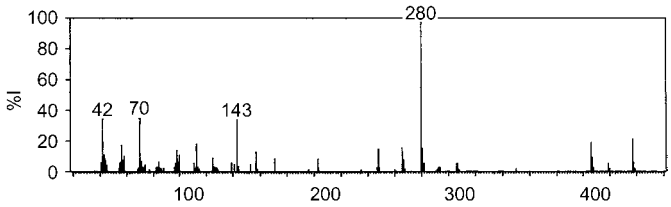
Ultraviolet Spectrum Aqueous acid—256 (A^1_1=690a), 306 nm.



Infrared Spectrum Principal peaks at wavenumbers 1116, 767, 1245, 1144, 1084, 836 cm^{-1} (fluphenazine hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 280, 143, 42, 70, 437, 406, 113, 56.



Quantification

Plasma **GC** AFID. Limit of detection, 500 ng/L [Javaid *et al.* 1981].

GC-MS Limit of detection, <50 ng/L [Jemal *et al.* 1987]. Limit of detection, 80 ng/L [McKay *et al.* 1983].

HPLC Coulometric detection. Fluphenazine and fluphenazine decanoate, limit of detection, 0.1 µg/L [Luo *et al.* 1997].

HPLC–radioimmunoassay Fluphenazine, related phenothiazines, and metabolites, limit of detection, 160 pg [Goldstein, Van Vunakis 1981].

Radioimmunoassay 7-Hydroxyfluphenazine, limit of detection, 0.1 µg/L [Aravagiri *et al.* 1994].

Serum **GC-MS** Fluphenazine decanoate [Glazer *et al.* 1992].

Urine **GC** AFID. Free and conjugated fluphenazine, limit of detection, 2 µg/L [Whelpton, Curry 1976].

Disposition in the Body The hydrochloride is well absorbed after oral administration; the decanoate and enantate are slowly absorbed from sites of injection. Fluphenazine is metabolised by sulfoxidation, hydroxylation and conjugation with glucuronic acid or sulfate. Fluphenazine sulfoxide and 7-hydroxyfluphenazine have been detected in urine and faeces. After an oral dose of the hydrochloride, 20% is excreted in the urine and 60% is eliminated in the faeces in 7 days; after an IM dose of the enantate, 26% is eliminated in the faeces and 14% excreted in the urine in 14 days; after an IM dose of the decanoate, 17% is eliminated in the faeces and 6% excreted in the urine in 30 days.

Therapeutic Concentration

Following a single oral dose of 5 mg of fluphenazine hydrochloride to 6 subjects, peak plasma concentrations of 0.3 to 1.0 µg/L (mean 0.6) were attained in 2.8 h [Midha *et al.* 1983].

Following daily oral doses of 20 mg of fluphenazine hydrochloride to 18 subjects, steady-state plasma concentrations of 0.2 to 4.0 µg/L were reported [Javaid *et al.* 1981].

In 24 subjects receiving continuous treatment with depot IM fluphenazine, steady-state plasma concentrations were less than 0.1 to 27.9 µg/L (median 0.5 µg/L) [Miller *et al.* 1995].

Of 12 subjects given a single oral dose of 12 mg fluphenazine hydrochloride, those given an immediate-release formulation had peak plasma concentrations of 2.3 µg/L at 2.8 h and those given a slow-release formulation had a peak plasma concentration of 1.2 µg/L at 4.6 h. The plasma level in the same subjects 10 min after being given an IV bolus dose of 2.5 mg was 0.261 mg/L [Koytchev *et al.* 1996].

Half-life Plasma half-life, fluphenazine hydrochloride about 15 h; fluphenazine decanoate about 5 to 12 days and fluphenazine enantate about 3 to 4 days, following IM injection.

Protein Binding About 99%.

Dose Usually 1 to 5 mg of fluphenazine hydrochloride daily; up to 20 mg daily has been given.

Flupirtine

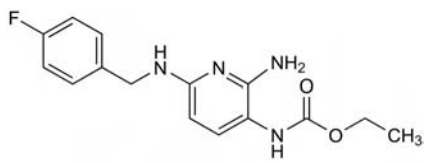
Analgesic

$C_{15}H_{17}FN_4O_2$ = 304.3

CAS—56995-20-1

IUPAC Name Ethyl *N*-[2-amino-6-[(4-fluorophenyl)methylamino]pyridin-3-yl]carbamate

Synonyms [2-Amino-6-[[(4-fluorophenyl)methyl]amino]-3-pyridinyl]carbamic acid ethyl ester; D-9998.



Chemical Properties A crystalline powder. Mp 115° to 116°. In 5% ethanol solution is colourless, turning green on exposure to air for 20 h. Log *P* (octanol/water), 2.66. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Flupirtine Hydrochloride

$C_{15}H_{17}FN_4O_2,HCl$ = 340.8

Chemical Properties A crystalline powder. Mp 214° to 215°.

Flupirtine Maleate

$C_{15}H_{17}FN_4O_2,C_4H_4O_4$ = 420.4

CAS—75507-68-5

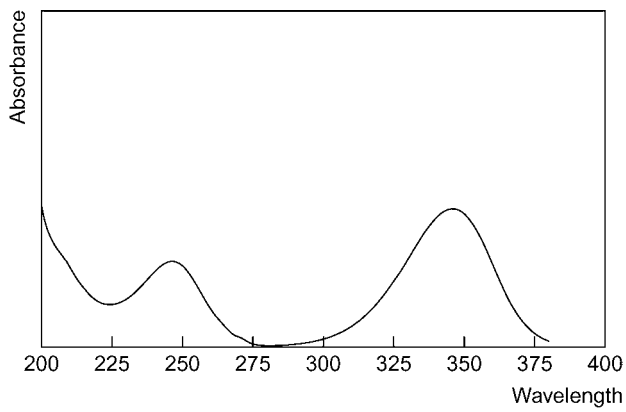
Synonym W-2964M

Proprietary Names *Katadolon*; *Trancopal Dolo*.

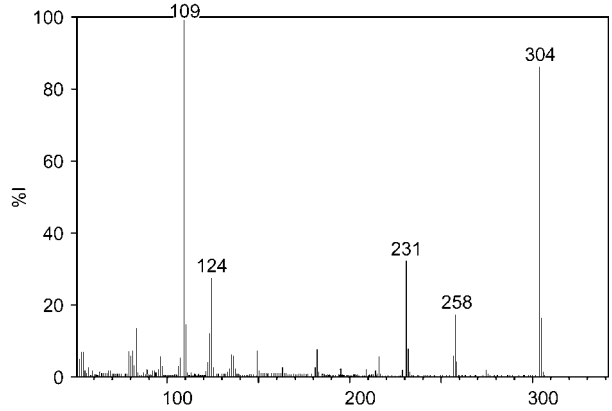
Chemical Properties A colourless, crystalline powder. Mp 175.5° to 176°. Freely soluble in water.

Gas Chromatography System GA—RI 2603.

Ultraviolet Spectrum Principal peaks at 247, 346 nm.



Mass Spectrum Principal ions at *m/z* 109, 304, 231, 124, 258, 110, 83, 123.



Quantification

Blood **HPLC** Column: ODS Hypersil (250 × 4.6 mm i.d., 5 µm). Mobile phases: (A) 10 mmol/L phosphate buffer (pH 3), (B) acetonitrile : methanol (50:50). Elution programme: (A:B) (40:60) to (30:70) over 8 min, held 3 min, flow rate 1.4 mL/min. Internal standard (IS): D-09925. Fluorescence detection (λ_{ex}=323 nm, λ_{em}=380 nm). Retention time: flupirtine, 6.0 min; flupirtine acetylated metabolite, 4.4 min; IS, 9.38 min. Limit of quantification, 0.025 mg/L [Niebch *et al.* 1992].

Plasma **HPLC** Column: ODS Ultrasphere (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol : 5 mmol/L phosphate buffer (pH 6.7, 32:32:36), flow rate 1.4 mL/min. IS: flupirtine dimethyl derivative. Fluorescence detection (λ_{ex}=323 nm, λ_{em}=370 nm). Retention time: flupirtine, 3.73 min; IS, 6.08 min. Limit of detection, flupirtine 0.03 mg/L and acetylated metabolite 0.5 mg/L [Narang *et al.* 1984].

Urine **HPLC** See Plasma [Narang *et al.* 1984].

Disposition in the Body Flupirtine is almost completely absorbed and undergoes oxidative degradation and acetylation of the hydrolysis product, in the liver, to two major metabolites; *p*-fluorohippuric acid and an acetylated metabolite, respectively. 72% of a dose is excreted in urine as the parent drug and as metabolites, and 18% in faeces. It is known to cross the blood–brain barrier and appears quickly in CSF. <0.005% of a dose is secreted in breast milk.

Therapeutic Concentration

Healthy subjects aged between 18 and 35 years, and 66 and 83 years and patients with renal impairment (creatine clearance 44 to 99 mL/min) were administered a single 100 mg dose of flupirtine. Peak plasma concentrations of 0.77, 1.12 and 0.72 mg/L were reached within 1.6 to 1.8 h [Abrams *et al.* 1988].

Toxicity Moderately toxic by ingestion and subcutaneous routes.

Half-life 8.5 to 10.7 h, depending on type of administration.

Bioavailability Approximately 90% (oral administration); 73% (suppositories).

Volume of Distribution 1.15 to 1.16 L/kg.

Clearance 16.5 L/h.

Protein Binding 80 to 90% bound to albumin proteins.

Dose Usual oral dose of 100 mg three or four times a day is administered in the maleate form with doses up to 600 or 900 mg daily.

Abrams SM *et al.* (1988). Pharmacokinetics of flupirtine in elderly volunteers and in patients with moderate renal impairment. *Postgrad Med J* 64: 361–363.

Demme U *et al.* (2005). Systematic evaluation of 1-chlorobutane for liquid-liquid extraction of drugs. *Proceedings of the 12th TIAFT*, Seoul: 481–486.

Narang PK *et al.* (1984). Quantitation of flupirtine and its active acetylated metabolite by reversed-phase high-performance liquid chromatography using fluorometric detection. *J Chromatogr* 305: 135–143.

Niebch G *et al.* (1992). Dose-proportional plasma levels of the analgesic flupirtine maleate in man. Application of a new HPLC assay. *Arzneimittelforshung* 42: 1343–1345.

Fluquinconazole

Insecticide

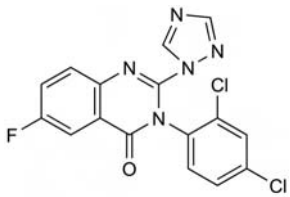
$C_{16}H_8Cl_2FN_5O$ = 376.2

CAS—136426-54-5

IUPAC Name 3-(2,4-Dichlorophenyl)-6-fluoro-2-(1*H*-1,2,4-triazol-1-yl)-4-(3*H*)-quinazolinone

Synonym SN-597265

Proprietary Names *Aventis*; *Castellan*; *Diablo*; *Flamenco*; *Jockey F*; *Jockey Flexi*; *Vista*.



Chemical Properties An off-white particulate solid. Mp 191.5° to 193°. Its solubility in water is 1 mg/L at 20°. Also soluble in dimethyl sulfoxide (150 g/L at 20°), acetone (44 g/L at 20°), xylene (10 g/L at 20°) and ethanol (3 g/L at 20°). Log *P* (octanol/water), 3.2.

Flurazepam

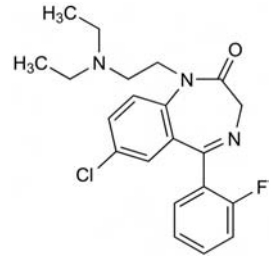
Benzodiazepine, Hypnotic

$C_{21}H_{23}ClFN_3O$ = 387.9

CAS—17617-23-1

IUPAC Name 7-Chloro-1-(2-diethylaminoethyl)-5-(2-fluorophenyl)-3*H*-1,4-benzodiazepin-2-one

Synonym 7-Chloro-1-[2-(diethylamino)ethyl]-5-(2-fluorophenyl)-1,3-dihydro-2*H*-1,4-benzodiazepin-2-one



Chemical Properties White crystals. Mp 77° to 82°. Soluble in chloroform. Extraction yield (chlorobutane), 0.95 [Demme *et al.* 2005].

Flurazepam Hydrochloride

$C_{21}H_{23}ClFN_3O,2HCl$ = 460.8

CAS—1172-18-5

Synonyms Flurazepam dihydrochloride; NSC-78559; Ro-5-6901.

Proprietary Names *Dalmadorm*; *Dalmane*; *Dormodor*; *Felison*; *Felmane*; *Flunox*; *Morfex*; *Remdue*; *Somnol*; *Staurodorm*; *Valdorm*. Includes proprietary names of flurazepam monohydrochloride.

Chemical Properties An off-white to yellow crystalline powder. Mp 190° to 220°. Soluble 1 in 2 of water, 1 in 4 of ethanol, 1 in 90 of chloroform and 1 in 3 of methanol; very slightly soluble in ether.

Flurazepam Monohydrochloride

$C_{21}H_{23}ClFN_3O,HCl$ = 424.3

CAS—36105-20-1

Synonym Aminazine

Proprietary Names See above under flurazepam hydrochloride.

Chemical Properties A white crystalline powder. Very soluble in water; freely soluble in ethanol; practically insoluble in ether. pK_{a1} 1.9, pK_{a2} 8.2. Log *P* (octanol/water pH 7.4), 2.3.

Colour Test Formaldehyde-sulfuric acid—pink.

Thin-layer Chromatography System TA—R_f 62; system TB—R_f 30; system TC—R_f 48; system TD—R_f 03; system TE—R_f 71; system TF—R_f 03; system TL—R_f 40; system TAD—R_f 41; system TAE—R_f 52; system TAF—R_f 45 (acidified iodoplatinate solution—positive).

Gas Chromatography System GA—flurazepam RI 2780, M (2-OH-ethyl-) RI 2675, M (desalkyl-) RI 2470, M (desalkyl-OH-) RI 2255, M (didesethyl-) RI 2694; system GB—flurazepam RI 2896, M (desalkyl-) RI 2559, M (desalkyl-)-TMS RI 2350, M (2-OH-ethyl-) RI 2805, M (2-OH-ethyl-)-TMS RI 2778, M (bis-desethyl-) RI 2739, M (desalkyl-OH-) RI 2373; system GF—RI 3210; system GG—RI 3220.

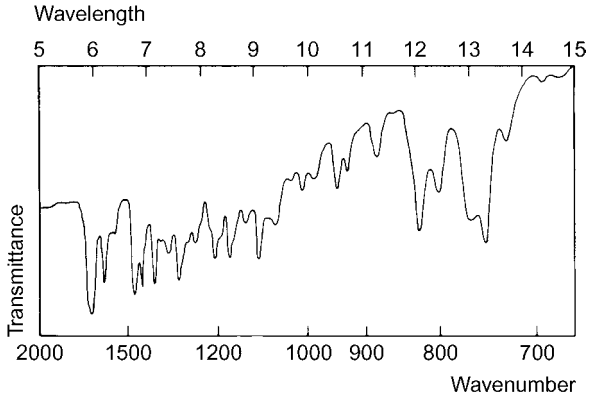
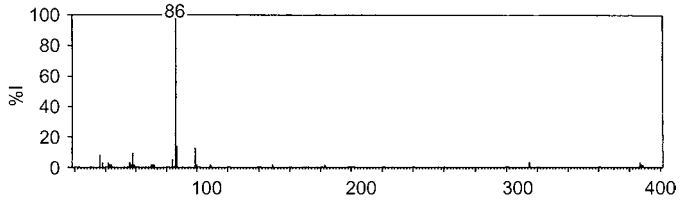
Infrared Spectrum Principal peaks at wavenumbers 1672, 1613, 1316, 1211, 1171, 1100 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 86, 87, 99, 58, 84, 387, 315, 56 (flurazepam); 260, 259, 288, 287, 261, 289, 262, 290 (N^1-desalkylflurazepam); 30, 313, 246, 211, 273, 274, 302, 183 (didesethylflurazepam); 288, 273, 331, 287, 304, 290, 289, 275 (N^1-[2-hydroxyethyl]flurazepam).



Quantification

Blood **GC** Columns: DB-1 and DB-1701 (15 m × 0.32 mm i.d., 0.25 μm). Carrier gas: He, 1 mL/min. Temperature programme: 120° for 1 min to 28° at 30°/min to 230° at 2°/min to 300° at 30°/min for 1 min or 120° for 1 min to 230° at 40°/min to 280° at 8°/min for 9 min. ECD. Limit of detection, 0.033 μmol/L (DB-1701) [Gjerde *et al.* 1992]. Column: SE-54 5% phenylmethylsiloxane (25 m × 0.31 mm i.d., 0.17 μm). Carrier gas: He, 2 to 3 mL/min. Temperature programme: 200° for 1 min to 290° at 10°/min. NPD or ECD. Retention time: 7.65 min. Limit of detection not reported [Lillsunde, Seppälä 1990]. ECD. Limit of detection, 0.5 μg/L [Hasegawa, Matsubara 1975].

GC-MS Column: HP-5 MS (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1 mL/min. Temperature programme: 120° to 295° at 10°/min for 5 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 1.96 μg/L, limit of detection, 0.65 μg/L [Papoutsis *et al.* 2010]. Column: 5% diphenyldimethylsiloxane DB-5MS (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 2 mL/min. Temperature programme: 150° for 0.6 min to 230° at 40°/min to 310° at 10°/min. EI ionisation, SIM acquisition mode. Limit of quantification, 10 μg/L, limit of detection, 10 μg/L for desalkylflurazepam [Tiscione *et al.* 2008]. Column: DB-35 (300 × 0.32 mm i.d., 0.25 μm). Carrier gas: He, 1.5 mL/min. Temperature programme: 120° for 1 min to 320° at 15°/min for 4 min. EI ionisation, SIM acquisition mode. Limit of quantification not reported [Gunnar *et al.* 2004]. Column: DB5-MS (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° to 230° at 8°/min to 313° at 4°/min. EI ionisation at 70 eV or CI in positive ion mode. Limit of detection, 100 μg/L [Pirnay *et al.* 2002].

LC-MS Column: Restek Allure C_{18} (150 × 3.2 mm i.d., 5 μm). Mobile phase: 5 mmol/L ammonium acetate : acetonitrile : methanol (90 : 5 : 5 to 50 : 25 : 25 at 7 min to 10 : 45 : 45 at 27 min for 3 min to 95 : 5 : 5 at 31 min), flow rate 0.45 mL/min. APCI. Limit of quantification, 2 μg/L [Dussy *et al.* 2006]. Column: XTerra MS C_{18} (150 × 2.1 mm i.d., 3.5 μm). Mobile phase: 0.006 mol/L formic acid (pH 3.0) : methanol (70 : 30 to 60 : 40 at 5 min to 50 : 50 in 25 min to 40 : 60 at 30 min for 5 min to 70 : 30 at 36 min for 9 min), flow rate 0.2 mL/min. Limit of quantification, 5.5 μg/L, limit of detection, 1.6 μg/L [Smink *et al.* 2004].

Plasma **GC** Column: 10% OV-101 on 80/100 Chromosorb WHP (1.22 m × 4 mm i.d.). Carrier gas: Ar : CH_4 (95 : 5), 50 mL/min. Temperature: 310°. Limit of detection, 1 μg/L [Burstein *et al.* 1988]. Column: DB-1701 (30 m × 0.32 mm i.d., 0.25 μm). Carrier gas: H_2, 1.0 or 1.2 bar. Temperature programme: 150° for 0.5 min to 260° at 80°/min for 8 min or 140° for 0.5 min to 220° at 10°/min to 260° at 5°/min for 2 min. ECD. Limit of quantification, 1 μg/L [Salama *et al.* 1988]. Column: 3% OV-17 on 100/120 Gas-Chrom Q (1.8 m × 2 mm i.d.). Carrier gas: Ar : CH_4 (95 : 5), 22 mL/min. Temperature programme: 255°. ECD. Retention time: 2.02 min. Limit of detection, 3 μg/L [Cooper, Drolet 1982].

GC-MS See Blood [Gunnar *et al.* 2004].

LC-MS Column: Merck LiChroCART (125 × 2 mm i.d.). Mobile phase: 5 mmol/L ammonium formate : acetonitrile (60 : 40 for 5.5 min to 10 : 90 in 8 min to 60 : 40 in 9.5 min for 10 min). APCI, SIM acquisition mode. Limit of quantification, 0.0025 mg/L, limit of detection, 0.0025 mg/L [Kratzsch *et al.* 2004].

Serum **GC-MS** See Blood [Gunnar *et al.* 2004].

HPLCSee Blood [Dussy *et al.* 2006]

LC-MS Unison UK-C18 RP ODS (150 × 2 mm i.d., 3 μm). Mobile phase: 10 mmol/L aqueous ammonium formate containing 0.1% formic acid : methanol containing 0.1% formic acid (70 : 30 over 20 min to 20 : 80 over 5 min), flow rate 0.25 mL/min. MRM acquisition mode. Limit of quantification, 1.3 μg/L, limit of detection, 0.4 μg/L [Nakamura *et al.* 2009].

Urine **GC** See Blood [Hasegawa, Matsubara 1975].

GC-MS Column: SGE BP1 capillary (300 × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.2 mL/min. Temperature programme: 65° to 250° at 15°/min for 8 min, to 300° at 10°/min for 2 min. Limit of detection, 1.1 μg/L [Borrey *et al.* 2001].

Oral Fluid **GC-MS** Column: methyl silicone capillary (165 × 0.2 mm i.d., 0.11 μm). Carrier gas: He, 0.8 mL/min. Temperature programme: 70°. EI ionisation mode, SIM acquisition mode. Limit of quantification, 10.9 μg/L, limit of detection, 3.6 μg/L [Pujadas *et al.* 2007].

LC-MS Zorbax Eclipse XDB C_{18} (50 × 4.6 mm i.d., 1.8 μm). Mobile phase: 20 mmol/L ammonium formate : acetonitrile (50 : 50), flow rate 0.2 mL/min. ESI, MRM acquisition mode. Limit of quantification, 0.5 μg/L [Moore *et al.* 2007].

Disposition in the Body Flurazepam is readily absorbed after oral administration; ~70% of a dose is metabolised during the first pass through the liver. The major metabolites in blood are N^1-desalkylflurazepam and N^1-(2-hydroxyethyl) flurazepam, which are both pharmacologically active and accumulate on daily administration; 7-chloro-5-(2-fluorophenyl)-1,3-dihydro-2-oxo-2*H*-1,4-benzodiazepin-1-acetaldehyde has also been detected in plasma. Other active metabolites found in urine include monodesethyl- and didesethylflurazepam and N^1-desalkyl-3-hydroxyflurazepam, but these are not detectable in blood. Up to 60% of a dose may be excreted in the urine in 48 h, with ~40% of the dose as a glucuronide/sulfate conjugate of N^1-(2-hydroxyethyl)flurazepam and ~4% as conjugated N^1-desalkyl-3-hydroxyflurazepam and conjugated flurazepam-N^1-ylacetic acid; only trace amounts of unchanged flurazepam and the unconjugated metabolites are present. N^1-(Hydroxyethyl)-3-hydroxyflurazepam has also been detected. Approximately 9% of a dose is eliminated in the faeces.

Therapeutic Concentration Flurazepam is rapidly metabolised and hence blood concentrations of the unchanged drug are low and quickly decrease; for normal doses, the peak concentration is usually in the range 0.0005–0.03 mg/L. The blood concentration of N^1-desalkylflurazepam is usually in the range 0.04–0.06 mg/L.

Following a single oral dose of 30 mg flurazepam hydrochloride to 2 subjects, peak blood concentrations were attained as follows: flurazepam 0.001 and 0.005 mg/L at 3 h, N^1-(2-hydroxyethyl)flurazepam 0.005 and 0.01 mg/L at 3 h and N^1-desalkylflurazepam 0.010 and 0.012 mg/L at 24 h [De Silva *et al.* 1974].

Following daily oral doses of 15 mg to 18 subjects, steady-state plasma concentrations of N^1-desalkylflurazepam of 0.03 0.15 mg/L (mean, 0.08) were reported [Greenblatt *et al.* 1981].

Toxicity Blood concentrations >0.2 mg/L flurazepam or 0.5 mg/L N^1-desalkylflurazepam may be toxic, and blood concentrations >0.5 mg/L flurazepam may be fatal.

In a fatality attributed to flurazepam overdose, the following postmortem concentrations were reported for flurazepam, N^1-desalkylflurazepam, and N^1-(2-hydroxyethyl)flurazepam, respectively: blood 0.51, 0.14, 9 mg/L; urine 7, 3.9, 98 mg/L. The amount ingested was estimated to be more than 2.4 g [Aderjan, Mattern 1979].

In a 5-year-old child who died following the ingestion of flurazepam and phenobarbital, the following postmortem tissue concentrations were reported for flurazepam, N^1-desalkylflurazepam and N^1-(2-hydroxyethyl)flurazepam, respectively: blood 3.2, 1.8 and 2.5 mg/L; brain 0.8, 0.7 and 0.7 μg/g; kidney 0.9, 0.6 and 1.1 μg/g; and liver 2.7, 3.1 and 3.5 μg/g. Phenobarbital concentrations were consistent with a therapeutic dose and low concentrations of phenytoin were also detected [Ferrara *et al.* 1979].

In a 52-year-old female whose death was attributed to suicidal ingestion of up to 2.2 g flurazepam, the following postmortem tissue concentrations were reported: femoral blood 5.5 mg/L, liver 130 μg/g, bile 33 mg/L, vitreous humour 1.3 mg/L, urine 3.3 mg/L, gastric contents 600 mg (total); desalkylflurazepam was also detected in blood, liver, bile and vitreous humour, but at concentrations much lower than the parent compound [McIntyre *et al.* 1994].

A 68-year-old woman was found dead at home with the following flurazepam concentrations: heart blood 2.8 mg/L, bile 323 mg/L and urine 172 mg/L [Martello *et al.* 2006].

Half-life Plasma : flurazepam 2–3 h, N^1-desalkylflurazepam 2–5 days, N^1-(2-hydroxyethyl)flurazepam 10–20 h.

Protein Binding Flurazepam ~97%, N^1-desalkylflurazepam ~98% and N^1-(2-hydroxyethyl)flurazepam ~90%.

Dose The equivalent of 15 to 30 mg of flurazepam, as a hypnotic.

Flurbiprofen

Analgesic

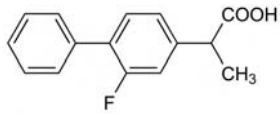
$C_{15}H_{13}FO_2 = 244.3$

CAS—5104-49-4

IUPAC Name 2-(3-Fluoro-4-phenylphenyl)propanoic acid

Synonym 2-Fluoro-α-methyl-[1,1′-biphenyl]-4-acetic acid

Proprietary Names *Ansaid*; *Antadys*; *Benactiv*; *Cebutid*; *Edolfene*; *Evril*; *Fenomel*; *Flurofen*; *Froben*; *Ocufen*; *Ocuflur*; *Reupax*; *Strefen*; *Strepfen*; *Transact*.



Chemical Properties A colourless crystalline solid. Mp about 110°. Slightly soluble in water; freely soluble in most organic solvents. Log *P* (octanol/water), 4.2.

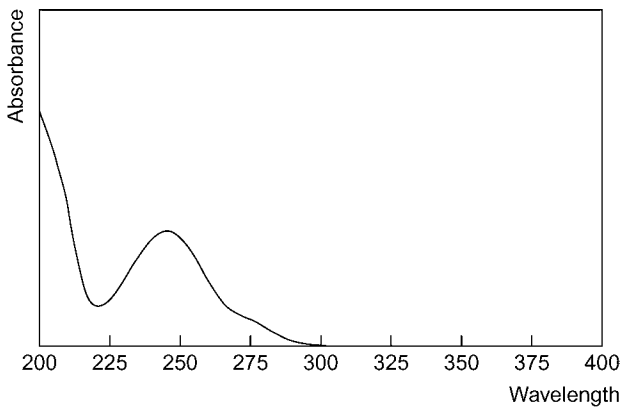
Colour Tests Liebermann's reagent—brown; Marquis test—red.

Thin-layer Chromatography System TD—R_f 0.30; system TE—R_f 0.06; system TF—R_f 0.30; system TG—R_f 0.16; system TAD—R_f 0.45; system TAJ—R_f 0.47; system TAK—R_f 0.69; system TAL—R_f 0.91 (Ludy Tenger reagent, orange).

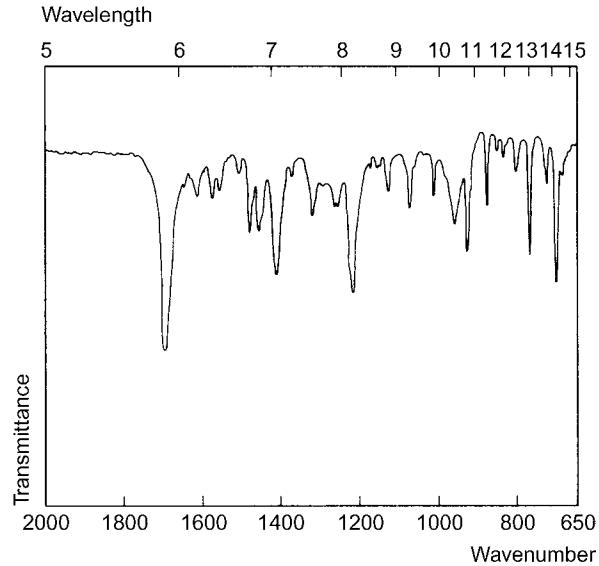
Gas Chromatography System GA—flurbiprofen RI 1900, flurbiprofen-Me RI 1885, M (OH-)-Me_2 RI 2180, M (OH-methoxy)-Me_2 RI 2310; system GD—methyl derivative RRT 1.30 (relative to n-$C_{16}H_{34}$); system GL—flurbiprofen-Me RI 1880, M (OH-)-Me_2 RI 2180.

High Performance Liquid Chromatography System HV—RRT 0.89 (relative to meclofenamic acid); system HX—RI 585; system HZ—retention time 11.8 min; system HAA—retention time 21.3 min; system HAX—retention time 8.0 min; system HAY—retention time 8.9 min.

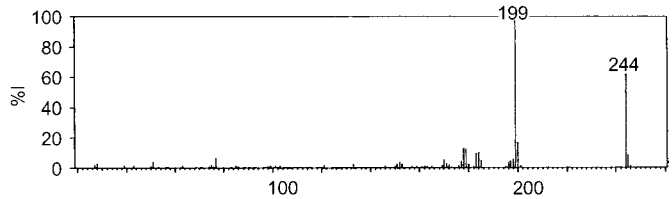
Ultraviolet Spectrum Aqueous acid—247 nm (A_1^1=787b). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1695, 1220, 707, 930, 773, 960 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 199, 244, 200, 178, 179, 184, 183, 245.



Quantification

Plasma **GC** ECD. Limit of detection, 50 µg/L [Kaiser *et al.* 1974].

GC-MS Limit of detection, <0.5 mg/L [Satomoto *et al.* 2002]. Limit of detection, 1 µg/L [Kawahara *et al.* 1981].

HPLC Fluorescence detection. Flurbiprofen and 4′-hydroxyflurbiprofen, limit of detection, <0.25 mg/L for flurbiprofen [Hutzler *et al.* 2000]. UV detection. Flurbiprofen enantiomers, limit of detection, <50 µg/L [Geisslinger *et al.* 1992]. Fluorescence detection. Flurbiprofen enantiomers and metabolites [Knadler, Hall 1989]. UV detection. Flurbiprofen and ibuprofen, limit of detection, 200 µg/L [Askholt, Nielsen-Kudsk 1986].

Serum **HPLC** UV detection. Limit of detection, 40 µg/L [Snider *et al.* 1981].

Urine **HPLC** See Plasma [Hutzler *et al.* 2000]. UV detection. Flurbiprofen and other NSAIDs, limit of detection, 0.05 mg/L [Hirai *et al.* 1997]. See Plasma [Knadler, Hall 1989].

Crevicular Fluid **HPLC** [Heasman *et al.* 1990].

Ocular Fluids **HPLC** UV detection. Flurbiprofen and diclofenac, limit of detection, 3 to 4 µg/L [Riegel, Ellis 1994].

Disposition in the Body Readily absorbed after oral administration. About 95% of a dose is excreted in the urine in 24 h, mainly as the 4′-hydroxy, 3′,4′-dihydroxy and 4′-methoxy metabolites, which are excreted partly as conjugates; about 25% of a dose is excreted as unchanged drug.

Therapeutic Concentration

After a single oral dose of 100 mg, administered to 6 subjects, peak serum concentrations of 9.1 to 16.6 mg/L (mean 12) were attained in about 1.5 h [Cardoe *et al.* 1977].

A single oral dose of 200 mg administered as a sustained-release capsule produced peak plasma concentrations of 4 to 10 mg/L and 4 to 8 mg/L, respectively, in 10 young and 9 elderly subjects at ≈6 and 9 h. On continuing the same dosage once daily, a mean steady-state level of ≈6 mg/L was achieved in all subjects [Hamdy *et al.* 1990].

Half-life Plasma half-life, 2 to 6 h (mean 3.5).

Volume of Distribution About 0.1 L/kg.

Clearance Plasma clearance, about 0.3 mL/min/kg.

Protein Binding About 99%.

Note For a review of the pharmacokinetics of flurbiprofen, see Brogden *et al.* [1979] and Davies [1995].

Dose 150 to 300 mg daily.

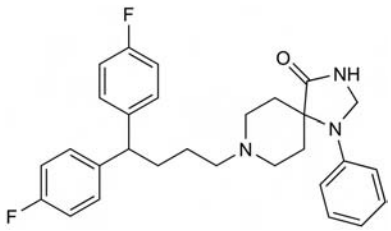
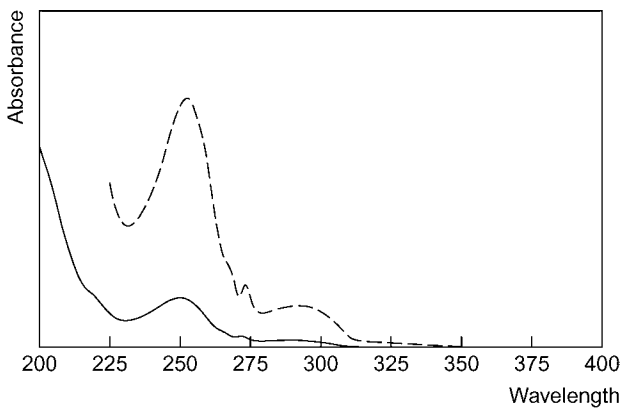
Fluspirilene

Tranquilliser
$C_{29}H_{31}F_2N_3O = 475.6$
CAS—1841-19-6

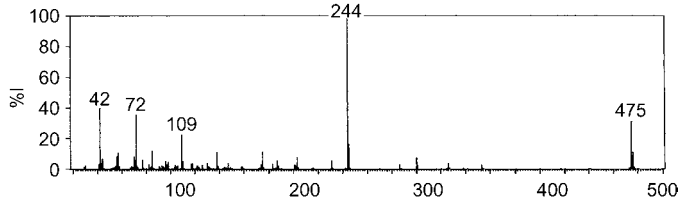
IUPAC Name 8-[4,4-bis(4-Fluorophenyl)butyl]-1-phenyl-1,3,8-triazaspiro[4.5]decan-4-one
Proprietary Names *Fluspi*; *Imap*; *Kivat*; *Redeptin*.



Chemical Properties A white to yellowish, amorphous or crystalline powder. Mp 187.5° to 190°. Practically insoluble in water; slightly soluble in ethanol and ether; sparingly soluble in acetone; freely soluble in chloroform. Log *P* (octanol/water), 5.9. Extraction yield (chlorobutane), 0.9 [Demme *et al.* 2005].
Thin-layer Chromatography System TA—R_f 0.69; system TB—R_f 0.04; system TC—R_f 0.59; system TE—R_f 0.71; system TL—R_f 0.49; system TAE—R_f 0.63; system TAF—R_f 0.78.
Gas Chromatography System GA—fluspirilene RI 1017, M (*N*-desalkyl-oxo-) RI 2405, M (desamino-OH-) RI 2120, M (desamino-carboxy-) RI 2230.
High Performance Liquid Chromatography System HX—RI 538; system HAX—retention time 18.3 min; system HAY—retention time 9.8 min.
Ultraviolet Spectrum Methanol—252 (A^1_1=295a), 273, 293 nm.



Infrared Spectrum Principal peaks at wavenumbers 1710, 1505, 1596, 1220, 743, 1230 cm^{-1} (KBr disk). Polymorphism may occur.
Mass Spectrum Principal ions at *m/z* 244, 42, 72, 475, 109, 245, 85, 476.



Quantification
Plasma **HPLC-MS** Limit of detection, <21 ng/L [Swart *et al.* 1998].
Dose Usually 2 to 8 mg weekly, by deep IM injection; maximum of 20 mg weekly.

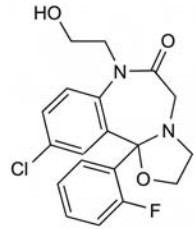
Demme U *et al.* (2005). Systematic evaluation of 1-chlorobutane for liquid-liquid extraction of drugs. *Poster presentation at TIAFT*, Seoul: 481–486.
Swart KJ *et al.* (1998). Determination of fluspirilene in human plasma by liquid chromatography-tandem mass spectrometry with electrospray ionisation. *J Chromatogr A* 828: 219–227.

F

Flutazolam

Anxiolytic
$C_{19}H_{18}ClFN_2O_3 = 376.8$
CAS—27060-91-9

IUPAC Name 10-Chloro-11b-(2-fluorophenyl)-2,3-7,11b-tetrahydro-7-(2-hydroxyethyl)oxazolo[3,2-*d*][1,4]benzodiazepin-6-(5*H*)-one
Synonyms MS-4101; Ro-7-6102.
Proprietary Name *Coreminal*



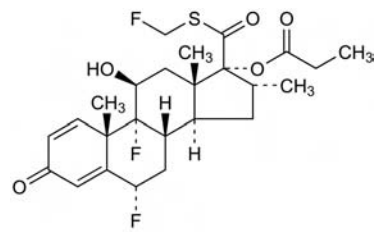
Chemical Properties White prisms from toluene. Mp 142° to 147°. Freely soluble in chloroform and ethanol; moderately soluble in acetone, benzene and methanol; practically insoluble in water. pK_a 5.4.
Thin-layer Chromatography System TE—R_f 0.68; system TAE—R_f 0.84.
Gas Chromatography System GA—RI 2460.
High Performance Liquid Chromatography System HAF—retention time 32.2 min.
Mass Spectrum Principal ions at *m/z* 289, 245, 246, 210, 259, 211, 183, 291.
Quantification
Serum **HPLC** Limit of quantification, 0.01 mg/L [Tanaka *et al.* 1996].

Tanaka E *et al.* (1996). Simultaneous determination of twelve benzodiazepines in human serum using a new reversed-phase chromatographic column on a 2-microns porous microspherical silica gel. *J Chromatogr B Biomed Appl* 682: 173–178.

Fluticasone Propionate

Antiinflammatory
$C_{25}H_{31}F_3O_5S = 500.6$
CAS—80474-14-2

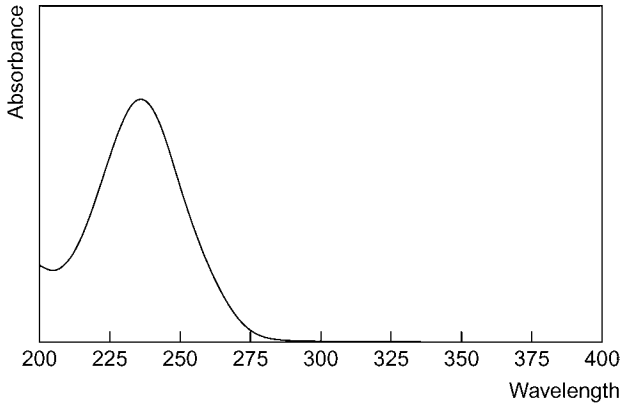
IUPAC Name (6α,11β,16α,17α)-6,9-Difluoro-11-hydroxy-16-methyl-3-oxo-17-(1-oxo-propoxy)androsta-1,4-diene-17-carbothioic acid *S*-(fluoromethyl) ester
Synonym CCI-18781
Proprietary Names *Atemur*; *Axotide*; *Cutivate*; *Flixonase*; *Flixotide*; *Flonase*; *Flovent*; *Flunase*; *Flutide*; *Flutivate*.



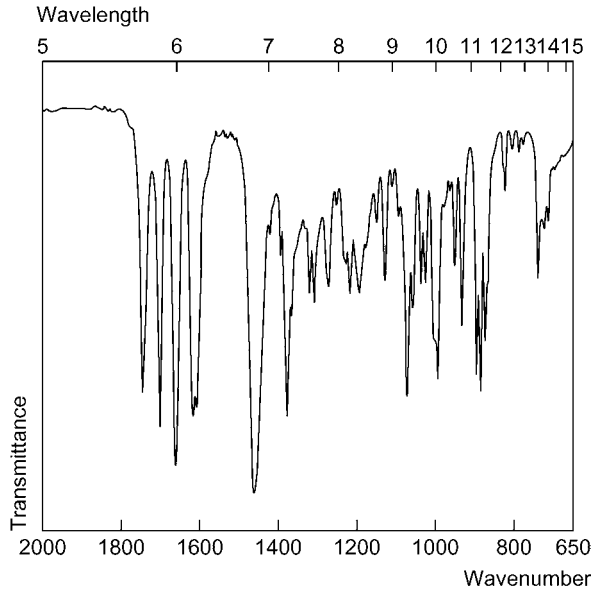
Chemical Properties A white to almost white crystalline powder. Mp 272° to 273°. Practically insoluble in water; slightly soluble in methanol and ethanol (95%); freely soluble in diemethylformamide and dimethylsulfoxide; sparingly soluble in acetone and dichloromethane.
High Performance Liquid Chromatography Column: ODS Hypersil (100 × 2.1 mm i.d., 5 µm). Mobile phase: ethanol : water (50:50), flow rate

0.45 mL/min. MS detection (APCI, SIM at *m/z* 501.2 for fluticasone propionate and 473.2 for internal standard (IS)). IS: 22*R* epimer of budesonide acetate. Retention time: fluticasone propionate, 3.09 min; IS, 3.35 min [Li *et al.* 1997].

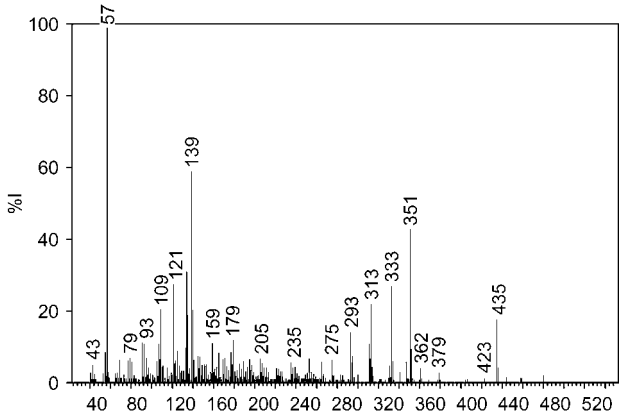
Ultraviolet Spectrum



Infrared Spectrum



Mass Spectrum Principal ions at *m/z* 57, 139, 351, 134, 121, 333, 313, 109.



Quantification

Plasma **HPLC** Limit of detection, 0.01 µg/L [Krishnaswami *et al.* 2000]. MS–MS detection. Limit of quantification, 0.025 µg/L [Laugher *et al.* 1999].

Disposition in the Body Fluticasone is poorly absorbed and undergoes extensive first-pass metabolism. The only known metabolite in humans is a 17β-carboxylic acid metabolite. Less than 5% of a dose is excreted in urine as the metabolite with the remainder being excreted in faeces as the parent drug (up to 75%) and the metabolite. Oral bioavailability is ≈1%. After IV administration, the drug is extensively administered in the body.

Therapeutic Concentration

Six healthy subjects were administered single doses of 0.25, 0.5, 1.0 and 3.0 mg fluticasone propionate. Maximum serum concentrations of 0.09 µg/L for the 0.25 mg dose and 0.40 µg/L for the 3.0 mg dose were reached within 0.5 to 1.0 h [Möllmann *et al.* 1998].

Twelve healthy males, aged between 21 and 38 years, were administered 250, 500 and 1000 µg fluticasone propionate intravenously over 3 min. Peak plasma concentrations were rapidly reached after administration was completed, 12.8, 32.8 and 63.7 µg/L, respectively [Mackie *et al.* 1996].

Toxicity Acute overdosing in excess of the recommended dose and chronic overdosing of >2 mg, over a prolonged period of time, leads to temporary adrenal suppression.

Half-life 7.8 h.

Volume of Distribution 4.2 L/kg (range 2.3 to 16.7 L/kg), also reported as 318 L.

Clearance Total blood clearance, 0.0182 L/h (range 0.0103 to 0.0284 L/h). Plasma clearance, 1.1 L/min.

Protein Binding 91%.

Dose Adults (by inhalation): usual dose of 100 to 250 µg twice a day up to 500 to 1000 µg twice a day. Children >4 years old: 50 to 100 µg twice a day. Oral dose: 5 mg four times a day.

Krishnaswami S *et al.* (2000). A sensitive LC-MS/MS method for the quantification of fluticasone propionate in human plasma. *J Pharm Biomed Anal* 22: 123–129.

Laugher L *et al.* (1999). An improved method for the determination of fluticasone propionate in human plasma. *J Pharm Biomed Anal* 21(4): 749–758.

Mackie AE *et al.* (1996). Pharmacokinetics of intravenous fluticasone propionate in healthy subjects. *Br J Clin Pharmacol* 41: 539–542.

Möllmann H *et al.* (1998). Pharmacokinetic and pharmacodynamic evaluation of fluticasone propionate after inhaled administration. *Eur J Clin Pharmacol* 53(6): 459–467.

Flutoprazepam

Anxiolytic

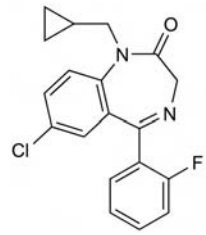
$C_{19}H_{16}ClFN_2O$ = 342.8

CAS—25967-29-7

IUPAC Name 7-Chloro-1-(cyclopropylmethyl)-5-(2-fluorophenyl)-1,3-dihydro-2*H*-1,4-benzodiazepin-2-one

Synonyms KB-509; ID-1937.

Proprietary Names *Restar*; *Restas*.



Chemical Properties Crystals. Mp 118° to 122°.

Quantification

Plasma **HPLC** Column: C_{18} µBondapak (10 µm, 300 × 3.9 mm i.d.). Mobile phase: 0.01 mol/L potassium dihydrogen phosphate : acetonitrile (pH 4.5, 50:50), flow rate 1.2 mL/min. UV detection (λ=235 nm). Retention time: flutoprazepam, 16 min; norflutoprazepam, 6 min; 3-hydroxynorflutoprazepam, 4 min; 3-hydroxyflutoprazepam, 12 min. Limit of detection of flutoprazepam 25 µg/L and 10 µg/L for norflutoprazepam [Conti *et al.* 1991].

Serum **GC-MS** Column: cross-linked methylsilicone (12 × 0.2 m i.d.). Temperature programme: 170° (1 min), increased to 270° at 8°/min, held for 10 min. Carrier gas: He, 14.4 psi (99.3 kPa). Detection: mass spectrometer (SIM, *m/z* 313 for flutoprazepam and 256 for internal standard (IS)). IS: diazepam. Retention time: flutoprazepam, 10.6 min; IS, 8.6 min. Limit of detection, 1 µg/L [Barzaghi *et al.* 1989].

HPLC UV detection (λ=235 nm). Limit of detection of norflutoprazepam, 3-hydroxyflutoprazepam and *N*-desalkyl-3-hydroxyflutoprazepam, 2 µg/L [Barzaghi *et al.* 1989].

Disposition in the Body Flutoprazepam is well absorbed after oral administration and undergoes extensive hepatic metabolism, by *N*-dealkylation, to an active metabolite, norflutoprazepam. Other possible metabolites include 3-hydroxyflutoprazepam and *N*-desalkyl-3-hydroxyflutoprazepam (both found in urine), and glucuronic acid conjugates of these. Extremely low bioavailability.

Therapeutic Concentration

Eight young, healthy males between 20 and 28 years were administered a single oral dose of flutoprazepam (2 mg), after overnight fasting. Peak plasma concentrations of norflutoprazepam ranged between 10.6 and 32.4 µg/L and were reached within 2 to 12 h [Barzaghi *et al.* 1989].

Toxicity Flutoprazepam is moderately toxic by ingestion and intraperitoneal routes.

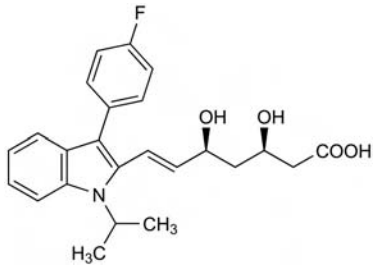
Half-life Norflutoprazepam, ≈87 ± 22 h.
Dose Usual dose of 2 to 4 mg flutoprazepam once daily.

Barzaghi N *et al.* (1989). Pharmacokinetics of flutoprazepam, a novel benzodiazepine drug, in normal subjects. *Eur J Drug Metab Pharmacokinet* 14: 293–298.
Conti I *et al.* (1991). Propranolol does not alter flutoprazepam kinetics and metabolism in the rat. *Eur J Drug Metab Pharmacokinet* 16: 53–58.

Fluvastatin

Antihyperlipoproteinaemic
$C_{24}H_{26}FNO_4$ = 411.5
CAS—93957-54-1

IUPAC Name (3*R*,5*S*,6*E*)-*rel*-7-[3-(4-Fluorophenyl)-1-(1-methylethyl)-1*H*-indol-2-yl]-3,5-dihydroxy-6-heptenoic acid

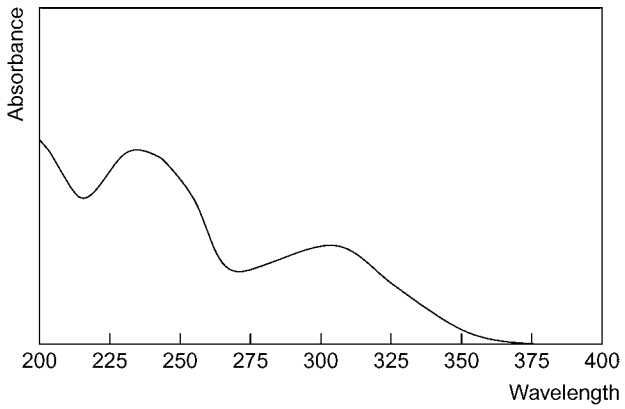


Chemical Properties pK_a 4.6. Log *P* (octanol/water), 4.85.

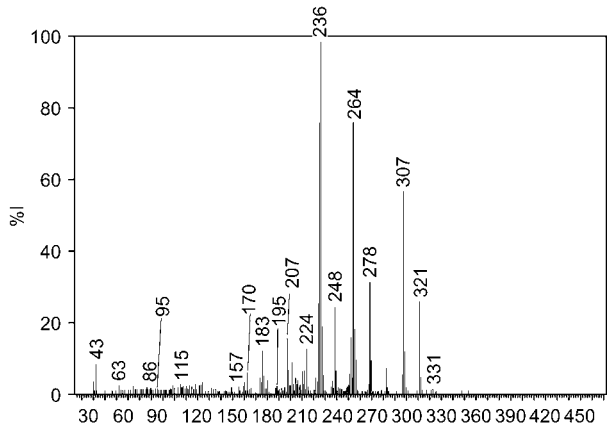
Fluvastatin Sodium

$C_{24}H_{25}FNNaO_4$ = 433.5
CAS—93957-55-2
Synonyms XU-62-320; Fluidostatin.
Proprietary Names *Canef*; *Cranoc*; *Fractal*; *Lescol*; *Lipaxan*; *LOCOL*; *Lymetel*; *Primesin*; *Vastin*.
Chemical Properties A white to pale yellow, hygroscopic powder. Mp 194° to 197°. Soluble in water, ethanol and methanol.

High Performance Liquid Chromatography Column: Rx-C8 Zorbax (150 × 4.6 mm i.d., 5 µm). Temperature: 40°. Mobile phase: aqueous TBAF (tetrabutylammonium fluoride) : 0.1 mol/L phosphate buffer (pH 6.0) : methanol (15:25:60), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex}=305 nm, λ_{em}=390 nm). Retention time: 15 min [Toreson, Eriksson 1996].
Ultraviolet Spectrum Aqueous acid—235, 305 nm.



Mass Spectrum Principal ions at *m/z* 236, 235, 264, 235, 307, 278, 321, 248, 207.



Quantification

Plasma **HPLC** Fluorescence detection (λ_{ex}=305 nm, λ_{em}=390 nm). Limit of detection, 1.0 µg/L [Kalafsky, Smith 1993].
Disposition in the Body Fluvastatin is rapidly and completely absorbed after oral administration and undergoes extensive first pass metabolism in the liver, the primary site of action. Hydroxylation of the indole rings at the 5- and 6- positions as well as *N*-dealkylation and β-oxidation of the side chains occurs. The main metabolite, *N*-desisopropylpropionic acid, is inactive. The active metabolite, fluvastatin lactone, is rapidly eliminated and not in significant amounts in plasma. Excretion is mainly via faeces, ≈90% (<2% unchanged drug) and 6% in urine. Fluvastatin is secreted in breast milk.

Therapeutic Concentration

Twelve healthy males, aged between 18 and 32 years, were administered a single 2 or 10 mg dose of fluvastatin sodium. Peak plasma concentrations of 5.6 ± 1.8 and 23 ± 4.5 µg/L, respectively were reached within 0.5 h. 6 healthy males, between 22 and 44 years, were administered a daily dose of 40 mg for 6 days in a multiple dose study. Peak concentrations of 438 ± 92 µg/L were observed [Tse *et al.* 1992].

Toxicity There are no clinically significant adverse reactions with a 60 mg dose of fluvastatin sodium (the maximum dose used in healthy volunteers). Potential hazards to the fetus.
Bioavailability Approximately 24%.
Half-life 0.5 to 1.0 h, also reported as 2.3 ± 0.9 h.
Volume of Distribution Steady state, 0.35 to 0.42 L/kg, also reported as 34.4 L.
Clearance Plasma clearance, 36.6 L/h; body clearance, 0.97 L/h/kg.
Distribution in Blood Plasma : blood ratio is 1.8.
Protein Binding >98% bound.
Dose A usual dose of 20 to 40 mg fluvastatin sodium is taken once daily and can be increased at intervals of up to 4 weeks, to a maximum of 40 mg twice daily.

Tse FL *et al.* (1992). Pharmacokinetics of fluvastatin after single and multiple doses in normal volunteers. *J Clin Pharmacol* 32: 630–638.

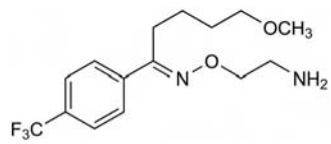
Fluvoxamine

Antidepressant, Selective Serotonin Reuptake Inhibitor (SSRI)
$C_{15}H_{21}F_3N_2O_2$ = 318.3
CAS—54739-18-3

IUPAC Name 2-[(*E*)-[5-Methoxy-1-[4-(trifluoromethyl)phenyl]pentylidene]amino]oxyethanamine
Synonym (*E*)-5-Methoxy-1-[4-(trifluoromethyl)phenyl]-1-pentanone *O*-(2-aminoethyl)oxime



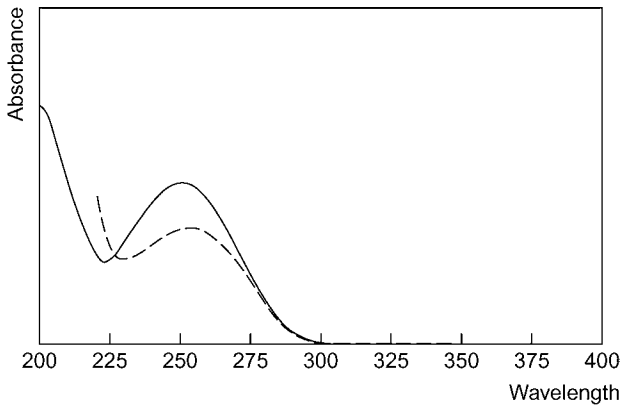
Chemical Properties pK_a 8.7. Log *P* (*n*-heptane/water), 0.04, (octanol/pH 7.2), 1.34 [Kristensen *et al.* 2002]. Extraction yield (chlorobutane), 0.8 [Demme *et al.* 2005]. Stable in plasma and oral fluid after 3 freeze-thaw cycles [De Castro *et al.* 2008]. Stock solutions were stable for 15 days when stored at 4°. Stable in plasma and urine stored at −20° after 3 freeze-thaw cycles or at room temperature for 24 h. Stable in plasma and urine for 3 and 2 months, respectively [Ulu 2007].

Fluvoxamine Maleate

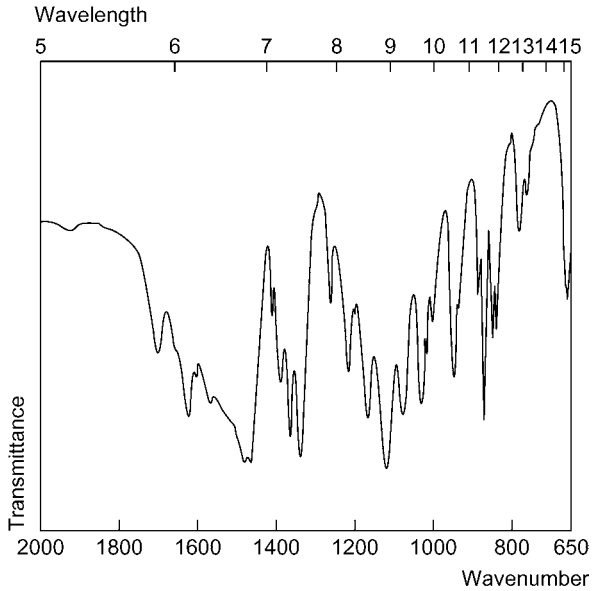
$C_{15}H_{21}F_3N_2O_2,C_4H_4O_4$ = 434.4
CAS—61718-82-9
Synonyms DU-23000; MK-264.
Proprietary Names *Avoxin*; *Depromel*; *Dumirox*; *Dumyrox*; *Faverin*; *Fevarin*; *Floxyfral*; *Luvoxe*; *Maveral*; *Servox*.
Chemical Properties White or off-white odourless crystalline powder. Mp 120° to 121.5°. Sparingly soluble in water; freely soluble in ethanol, methanol and in chloroform; practically insoluble in diethyl ether.

Thin-layer Chromatography System TAE—R_f 0.18; system TB—R_f 0.12; system TE—R_f 0.46.
Gas Chromatography System GA—RI 1885; system GB—RI 1911; system GM—RRT 0.295.
High Performance Liquid Chromatography System HAA—retention time 15.3 min; system HAX—retention time 10.0 min; system HAY—retention time 5.9 min; system HX—RI 430; system HY—RI 363; system HZ—retention time 5.6 min.
Liquid Chromatography-Mass Spectrometry Column: Phenomenex Synergi Fusion (20 × 2 mm i.d., 2.5 µm). Mobile phase: water-acetonitrile-formic acid (95 : 5 : 0.1) : acetonitrile with 0.1% formic acid (97 : 3 to 10 : 90 at 0.6 min), flow rate 1 mL/min. MRM acquisition mode [Youdim *et al.* 2008].

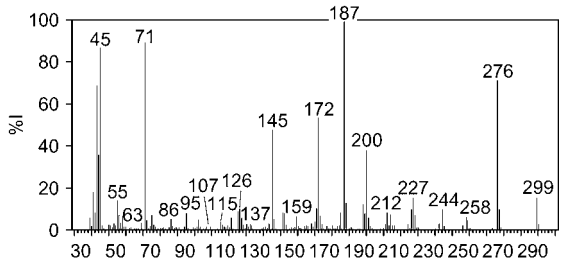
Ultraviolet Spectrum Aqueous acid—254 nm ($A_1^1 = 0.310$).



Infrared Spectrum



Mass Spectrum Principal ions at *m/z* 187, 71, 45, 276, 43, 172, 145, 200.



Quantification

Blood **GC** Column: HP cross-linked methylsilicone (25 m × 0.2 mm i.d., 0.11 µm). Carrier gas: He, 195 kPa. Temperature programme: 180° for 1 min to 300° at 10°/min for 3 min. NPD. Limit of quantification, 90 µg/L, limit of detection, 27 µg/L [Martinez *et al.* 2004].

GC-MS Column: HP-1 cross linked methylsilicone (12.5 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 1.2 mL/min. Temperature programme: 125° to 290° at 20°/min for 12.7 min. FID, MSD, EI ionisation, full scan mode. Limit of quantification, 0.125 mg/L [Kunsman *et al.* 1999].

LC-MS Column: XTerra RP18 (100 × 2.1 mm i.d.). Mobile phase: acetonitrile : 4 mmol/L ammonium formate buffer (pH 3.2; 15 : 85 for 1 min to 35 : 65 over 12 min for 1 min), flow rate 1mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 5 µg/L [Castaing *et al.* 2007].

Plasma For a TLC method see Schweitzer *et al.* [1986].

GC-MS Column: J & W-5 MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.3 mL/min. Temperature programme: 90° for 1 min to 180° at 50°/min for 10 min to 300° at 10°/min for 2.5 min. EI ionisation at 70 eV, MSD, SIM acquisition mode. Limit of quantification, 5 µg/L [Wille *et al.* 2007]. Column: Varian factor FOUR VF-5ms (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.3 mL/min. Temperature programme: 90° for 0.5 min to 180° at 50°/min for 10 min to 300° at 10°/min for 10 min. EI ionisation at 70 eV, MSD, SIM acquisition mode. Limit of detection not reported [Wille *et al.* 2005]. Column: Optima 5 fused silica capillary (15 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 50 mL/min. Temperature programme: 145° for 0.5 min to 207° at 30°/min for 7 min to 221° at 1°/min to 290° at 30°/min. Injector temperature: 250°. EI, SIM acquisition mode. Retention time: 20.0 min. Limit of quantification, 2 µg/L [Eap *et al.* 1996].

HPLC Column: Phenomenex C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water (80 : 20), flow rate 1 mL/min. UV detection (λ = 450 nm). Retention time: 4.8 min. Limit of quantification, 5 µg/L [Ulu 2007]. Column: Varian ResElut C_8 reversed phase (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 10.5 mmol/L phosphate buffer containing 0.12% triethylamine (pH 3.5; 30 : 70), flow rate 1.2 mL/min. UV detection (λ = 245 nm). Limit of quantification, 15 µg/L, limit of detection, 5.0 µg/L [Saracino *et al.* 2006]. Column: Hypurity C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : phosphate buffer (pH 3.8; 25 : 75 to 40 : 60 over 10 min to 44 : 56 in 8 min), flow rate 1.0 mL/min. DAD (λ = 240 nm). Retention time: 17.3 min. Limit of quantification 25 µg/L, limit of detection, 5 µg/L [Duverneuil *et al.* 2003]. Column: Grand Pack C_4-5 (150 × 4.6 mm i.d., 5 µm). Mobile phase: 0.5% potassium dihydrogen phosphate : acetonitrile (pH 2.5; 75 : 25), flow rate 1.0 mL/min. UV detection (λ = 254 nm). Retention time: 21.7 min. Limit of detection, 5 µg/L [Gerstenberg *et al.* 2003]. Column: Grand Pack C_4-5 (150 × 4.6 mm i.d., 5 µm). Mobile phase: 0.5% potassium dihydrogen phosphate (pH 2.5) : acetonitrile (75 : 25), flow rate 1.0 mL/min. UV detection (λ = 254 nm). Retention time: 21.7 min. Limit of detection, 10 µg/L [Ohkubo *et al.* 2003].

See also Titier *et al.* [2003], Spigset *et al.* [2001], Palego *et al.* [2000], Lucca *et al.* [2000], Härtter *et al.* [1992],Pullen & Fatmi [1992], van der Meersch-Mougeot and Diquet [1991], Foglia *et al.* [1989], and Schweitzer *et al.* [1986].

LC-MS Column: Sunfire C_{18} (20 × 2.1 mm i.d., 3.5 µm). Mobile phase: 2 mmol/L ammonium formate buffer (pH 3.0) : acetonitrile (85 : 15 for 0.5 min to 50 : 50 at 4 min to 30 : 70 at 5 min for 3 min), flow rate 0.4 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention time: 3.8 min. Limit of quantification, 10 µg/L [De Castro *et al.* 2008]. Column: Inertsil C_8 (150 × 2.0 mm i.d., 5 µm). Mobile phase: methanol : 10 mmol/L ammonium acetate (pH 5.0) : acetonitrile (70 : 20 : 10), flow rate 0.1 mL/min. SSI, positive ion mode, full scan mode. Retention time: 6.5 min. Limit of quantification, 0.2 mg/L, limit of detection, 0.13 mg/L [Shinozuka *et al.* 2006].

Serum **HPLC** Column: Shimpack CLC-ODS (150 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 0.05 mol/L sodium phosphate buffer (pH 2.8; 72 : 28) containing 1 mL/L triethylamine, flow rate 2.0 mL/min. Fluorescence detection (λ_{ex} = 470 nm, λ_{em} = 537 nm). Retention time: 4.1 min. Limit of quantification, 0.5 µg/L, limit of detection, 0.2 µg/L [Bahrami, Mohammadi 2007]. Column: Nucleosil 100-5-Protect 1 (250 × 4.6 mm i.d., 5 µm). Mobile phase: 25 mmol/L potassium dihydrogenphosphate (pH 7.0) : acetonitrile (60 : 40), flow rate, 1.0 mL/min. UV detection (λ = 230 nm). Retention time: 11.6 min. Limit of detection not reported [Frahnert *et al.* 2003]. Column: ODS C_{18} (25 cm × 4.6 mm i.d.). Mobile phase: acetonitrile : 0.05 mol/L sodium phosphate buffer (pH 3.8; 50 : 50), flow rate 1.0 mL/min. UV detection (λ = 22.4 nm). Retention time: 9.51 min. Limit of detection, 50 ng [Tournel *et al.* 2001].

LC-MS Column: Chromolith Speed ROD C_{18} (50 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 5 mmol/L acetic acid (pH 3.9) in ammonia (20 : 80 to 70 : 30 at 4 min for 1 min to 20 : 80), flow rate 1.0 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 1.17 µg/L [Kirchherr, Kühn-Velten 2006]. Column: Uptisphere (12.5 cm × 2 mm i.d., 5 µm). Mobile phase: 50 mmol/L ammonium acetate (pH 4.0)-acetonitrile: acetonitrile (100 : 0), flow rate 200 µL/min for 5 min to 300 µL/min in 1 min for 3 min to 200 µL/minin 0.5 min for 0.5 min. ESI, positive ion mode, SIM acquisition mode. Limit of quantification, 19 nmol/L [Gutteck, Rentsch 2003].

Urine **HPLC** See Plasma. Limit of quantification, 2 µg/L [Ulu 2007].

GC-MS Column: CP-SIL 8 CB (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.2 mL/min. Temperature programme: 60° for 2 min to 200° at 20°/min to 280° at 5°/min. EI ionisation at 70 eV. Limit of detection, 0.38 µg/lL [Salgado-Petinal *et al.* 2005]. Column: HP cross-linked methylsilicane (12 m × 0.2 mm i.d., 330 nm). Carrier gas: He, 1 mL/min. Temperature programme: 100° for 3 min to 310° at 30°/min for 8 min. EI ionisation at 70 eV, full scan mode. Limit of detection, 100 µg/L [Maurer, Bickeboeller-Friedrich 2000].

Milk **HPLC** Column: MOS- Hypersil C_8 reversed phase (100 × 2 mm i.d., 3 µm). Mobile phase: 0.02 mol/L monobasic potassium phosphate : *N, N*-dimethyloctylamine (pH 6.0) : acetonitrile (64 : 0.11 : 30), flow rate 0.5 mL/min. UV detection (λ = 225 nm). Retention time: 6.74 min. Limit of quantification, 2.0 µg/L, limit of detection, 1.25 µg/L [Hostetter *et al.* 2004]. Column: Select B C_{18} (250 × 4.6 mm i.d.). Mobile phase: 45 mmol/L phosphate buffer (pH 3) : acetonitrile (55 : 45), flow rate 1.5 mL/min. UV detection (λ = 210 nm) Limit of detection, 2 µg/L [Kristensen *et al.* 2002].

Oral Fluid **LC-MS** See Plasma. Limit of quantification, 2 µg/L [De Castro *et al.* 2008].

Disposition in the Body

Fluvoxamine is readily and completely absorbed after oral administration with peak plasma concentrations occurring after about 2 to 8 h (prolonged with enteric-coated tablets to 4 to 12 h). However, it undergoes significant first-pass metabolism and the bioavailability is about 53%. It is widely distributed. Fluvoxamine undergoes extensive metabolism in the liver, mainly by oxidative deamination, oxidative demethylation and *N*-acetylation to produce several inactive metabolites. The parent and all 11 metabolites have been recovered in urine; <4% as the parent drug [Benfield, Ward 1986; Perucca *et al.* 1994]. Fluvoxamine is metabolised primarily by CYP2D6 and, to a lesser, extent

CYP1A2 [Spigset *et al.* 2001]. Fluvoxamine appears to inhibit the following: CYP1A2, 2C9, and 3A4. It is distributed into breast milk [Arnold *et al.* 2000].

Therapeutic Concentration The therapeutic serum concentration is 50 to 250 μg/L.

Twenty-four healthy volunteers were administered a single oral dose of 100 mg fluvoxamine as 2 separate preparations. Mean maximum plasma concentrations were 46.2 and 48.5 μg/L, and were reached at 5.3 and 5.6 h for each formulation [Bahrami, Mohammadi 2007].

Seven healthy female volunteers were administered 50 mg fluvoxamine. The mean maximum plasma concentration was 58 μg/L at 5.2 h [Ulu 2007].

A 34-year-old female was treated with 100 mg fluvoxamine a day for severe anxiety and obsessive thinking. At 40-weeks' gestation she gave birth to a baby girl. The maternal serum concentration was 7 μg/L and the concentration in the cord blood was 5 μg/L [Hostetter *et al.* 2000]

Six healthy, young volunteers, 25 to 31 years' old, and 13 elderly individuals, aged 63 to 77 years, were administered single and multiple doses (twice daily) of 50 mg fluvoxamine, after an overnight fast. The mean plasma concentration after the single dose was 30 μg/L (range, 18 to 48 μg/L) for the younger individuals and a concentration of 93 (range 32 to 300) μg/L was observed for the multiple dosing regimen. These concentrations were observed at 6 (4 to 8) h and 5 (0 to 12) h, respectively. For the elderly individuals, after multiple dosing for 31 days, the mean concentration was 62 (range 32 to 225) μg/L at 5 h (range 4 to 12) [de Vries *et al.* 1992].

Note Enoxacin slightly inhibits the metabolism of fluvoxamine so the 2 should be combined with caution [Kunii *et al.* 2005].

Toxicity 12 g of fluvoxamine maleate has been ingested with no sequelae.

A 25-year-old female ingested 9.6 g fluvoxamine. Approximately 4 h after she presented at hospital she developed generalised tonic-clonic seizures that did not respond to lorazepam or midazolam. Her serum fluvoxamine concentration on arrival at hospital was 1970 μg/L, but she was discharged after 72 h after 24 h seizure-free [Wood *et al.* 2007].

A 32-year-old female attempted suicide with an unknown quantity of fluvoxamine and alimemazine. At 24 h after drug ingestion her serum fluvoxamine concentration was ≈500 μg/L, which decreased steadily with a half-life of 38 h to ≈150 μg/L at 96 h. After 150 μg/L the half life was ≈19 h with serum concentrations again declining to ≈5 μg/L at 168 h after drug intake [Spigset, Ohman 1996].

A 58-year-old female ingested 5.5 g of fluvoxamine in an attempted suicide. Several hours later she had severe sinus bradycardia that returned to normal over the next couple of days [Amital *et al.* 1994].

A 31-year-old female ingested 4.8 g of fluvoxamine together with 0.75 g of amitriptylline and 7 g of naproxen in an attempted suicide. She suffered no sequelae, although 1 month later she had a manic episode that was thought to have been triggered by the fluvoaxmine overdose [Lebegue 1990].

A 74-year-old female who had ingested 3 g fluvoxamine and 250 mg of temazepam was admitted to hospital unconscious. She remained unconscious for 5 days. On admission the serum fluvoxamine concentration was 160 μg/L. This increased to >1400 μg/L on day 3 [Banerjee 1988].

Note For a review of the pharmacology and toxicology of 168 cases of SSRI-related deaths, see Goeringer *et al.* [2000], and for 221 cases of overdose with fluvoxamine, see Garnier *et al.* [1993]. For a case of overdose in a 4-year-old child following the ingestion of 400 mg fluvoxamine, see Fraser and South [1999]. For cases of serotonin syndrome following fluvoxamine ingestion, see Gill *et al.* [1999], Mullins and Horowitz [1999], Ebert *et al.* [1997] or Bastani *et al.* [1996]. For a review of the safety of fluvoxamine in overdose, see Henry [1991]. There is a possible extrapyramidal interacton with clindamycin [Jakob and Wolf [2007]. Fluvoxamine is safe during pregnancy and while breastfeeding, see Gentile [2006], Kristensen *et al.* [2002] and Piontek *et al.* [2001]. Fluvoxamine may cause suicidal ideation [Chong, Cheong 1999]. For 2 cases of psychotic symptoms in schizophrenics during fluvoxamine therapy, see Silver *et al.* [1995]. For a case of neurotoxic malignant syndrome following fluvoxamine, see Reeves *et al.* [2002] or for a case of hand-foot syndrome, see Ke *et al.* [2006].

Half-life Plasma half-life, 17 to 22 h, after repeated dosing.

Volume of Distribution 25 L/kg [Goeringer *et al.* 2000].

Clearance Plasma clearance, 3 L/min (oral); 1.5 L/min (IV).

Protein Binding 77%, mostly to albumin [Perucca *et al.* 1994].

Note For a review of fluvoxamine, see Benfield and Ward [1986]. For a review of the pharmacokinetics of fluvoxamine, see Perucca *et al.* [1994] and van Harten [1995]. For reviews of the pharmacokinetics of selective serotonin reuptake inhibitors, see Catterson and Preskorn [1996], Preskorn [1997] and Baumann [1996].

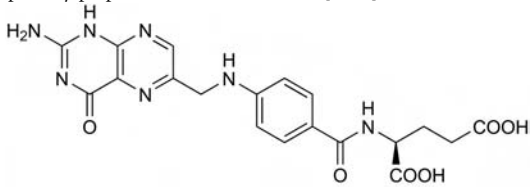
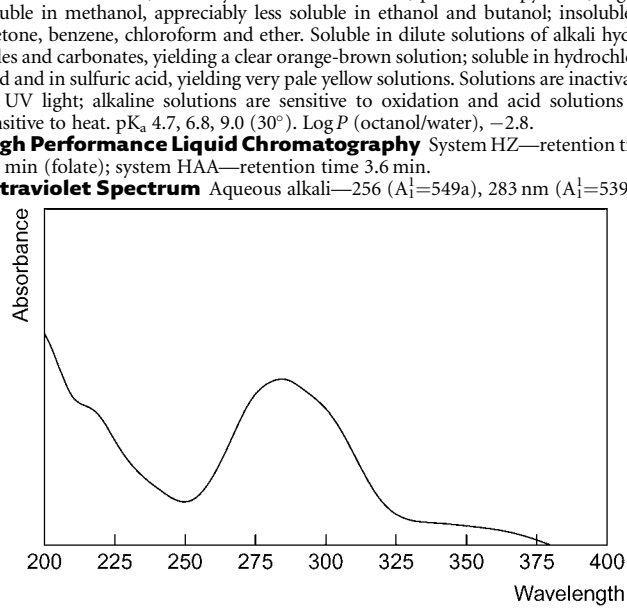
Folic Acid

Vitamin
$C_{19}H_{19}N_7O_6 = 441.4$
CAS—59-30-3

IUPAC Name (2*S*)-2-[[4-[(2-Amino-4-oxo-1*H*-pteridin-6-yl)methylamino] benzoyl]amino] pentanedioic acid
Synonyms *N*-[4-[[(2-Amino-1,4-dihydro-4-oxo-6-pteridinyl)methyl]amino] benzoyl]-L-glutamic acid; folacin; folinsyre; pteroylglutamic acid; pteroylmonoglutamic acid.
Proprietary Names *Acfol*; *Endofolin*; *Folacin*; *Folarell*; *Folasic*; *Fol-Asmedic*; *Folatine*; *Folavit*; *Folicare*; *Foldine*; *Folettes*; *Folsan*; *Folverlan*; *Folvite*; *Lafol*; *Lexpec*; *Megafol*; *Novo-Folacid*; *Preconceive*; *RubieFol*; *Specifoldine*. It is an ingredient of many proprietary preparations—see Sweetman [2009].



Chemical Properties A yellow to orange microcrystalline powder. Very slightly soluble in cold water; relatively soluble in acetic acid, phenol and pyridine; slightly soluble in methanol, appreciably less soluble in ethanol and butanol; insoluble in acetone, benzene, chloroform and ether. Soluble in dilute solutions of alkali hydroxides and carbonates, yielding a clear orange-brown solution; soluble in hydrochloric acid and in sulfuric acid, yielding very pale yellow solutions. Solutions are inactivated by UV light; alkaline solutions are sensitive to oxidation and acid solutions are sensitive to heat. pK_a 4.7, 6.8, 9.0 (30°). Log *P* (octanol/water), −2.8.
High Performance Liquid Chromatography System HZ—retention time 1.5 min (folate); system HAA—retention time 3.6 min.
Ultraviolet Spectrum Aqueous alkali—256 (A_1^1=549a), 283 nm (A_1^1=539a).

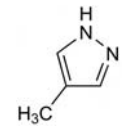


Infrared Spectrum Principal peaks at wavenumbers 1686, 1602, 1636, 1191, 1567, 1225 cm^{-1} (KBr disk).
Dose 2.5 to 20 mg daily.

Sweetman SC (2009). *Martindale: The complete drug reference*, 36 edn. London: Pharmaceutical Press.

Fomepizole

Alcohol Dehydrogenase Inhibitor
$C_4H_6N_2 = 82.1$
CAS—7554-65-6
IUPAC Name 4-Methyl-1*H*-pyrazole
Synonym 4-MP
Proprietary Name *Antizol*



Chemical Properties Mp 15.5° to 18.5°. Soluble in water and alcohol. pK_a 2.91. Log *P* (octanol/water), 0.61.
Ultraviolet Spectrum Ethanol—220 nm; acid (6 mol/L hydrochloric acid)—226 nm.
Mass Spectrum Principal ions at *m/z* 82, 81, 54, 28, 52, 55, 53, 51.
Quantification
Plasma **GC** Column: 5% carbowax (20 mol/L) and 2% potassium hydroxide on 80 to 100 mesh Chromosorb G (HP-5) (1.22 m × 2 mm i.d.). Column, injector and detector temperature: 135°, 250° and 300°, respectively. Carrier gas: He, flow rate 30 mL/min. Detection: nitrogen–phosphorus. Internal standard (IS): 3-methylpyrazole. Retention time: fomepizole, 10 min; IS, 8 min. Limit of quantification, 0.025 mg/L, limit of detection, 0.1 mg/L [Achari, Mayersohn 1984].
HPLC Column: 100 RP-18 Lichrospher (125 × 4 mm i.d., 5 µm). Temperature: 40°. Mobile phase: acetonitrile : 5 mmol/L potassium phosphate buffer (pH 6, 7.5:92.5), flow rate 1.5 mL/min. UV detection (λ=220 nm). IS: 3-methylpyrazole. Retention time: fomepizole, 4.9 min; IS, 4.1 min. Limit of quantification, 0.3 mg/L [Jobard *et al.* 1997].
Urine **GC** See Plasma [Achari, Mayersohn 1984].
Disposition in the Body Fomepizole is rapidly distributed to total body water. It is metabolised to the primary metabolite, 4-carboxypyrazole (80 to 85% of the dose), 4-hydroxymethylpyrazole and the *N*-glucuronide conjugates of these. Fomepizole is mainly eliminated via urine with 1 to 3.5% as the unchanged drug.
Therapeutic Concentration
Fifteen healthy male volunteers, aged between 20 and 40 years, were administered 10, 20, 50 and 100 mg/kg body weight doses. Mean peak plasma concentrations of 132, 326, 759 and 1425 µmol/L were reached for the doses, respectively. All peaks were observed between 0.5 and 2 h. Each mg/kg increase in dose resulted in an increase of 13 to 16 mg/L to the peak plasma concentration [Jacobsen *et al.* 1989].
Half-life Approximately 5.2 h.
Volume of Distribution 0.6 to 0.7 L/kg.
Protein Binding Negligible.
Dose The usual dose is 5 to 15 mg/kg body weight every 12 h.

Achari R, Mayersohn M (1984). Analysis of 4-methylpyrazole in plasma and urine by gas chromatography with nitrogen-selective detection. *J Pharm Sci* 73(5): 690–692.

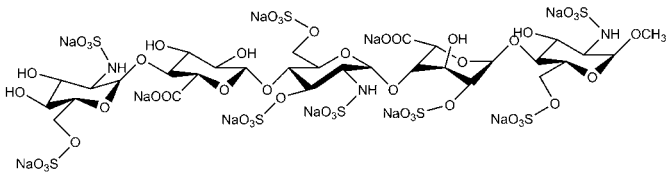
Jobard E *et al.* (1997). High-performance liquid chromatographic determination of 4-methylpyrazole in plasma and in dialysate. *J Chromatogr B Biomed Sci Appl* 695: 444–447.

Fondaparinux Sodium

Antithrombotic, Inhibitor of Activated Factor Xa, Pentasaccharide
$C_{31}H_{43}N_3Na_{10}O_{49}S_8 = 1728.1$
CAS—114870-03-0
IUPAC Name Decasodium (2*R*,3*S*,4*S*,5*R*,6*R*)-3-[(2*R*,3*R*,4*R*,5*R*,6*R*)-5-[(2*R*,3*R*,4*R*,5*S*,6*S*)-6-carboxylato-5-[(2*R*,3*R*,4*R*,5*S*,6*R*)-4,5-dihydroxy-3-(sulfonatoamino)-6-(sulfonatooxymethyl)oxan-2-yl]oxy-3,4-dihydroxyoxan-2-yl]oxy-3-(sulfonatoamino)-4-sulfonatooxy-6-(sulfonatooxymethyl)oxan-2-yl]oxy-4-hydroxy-6-[(2*R*,3*S*,4*R*,5*R*,6*S*)-4-hydroxy-6-methoxy-5-(sulfonatoamino)-2-(sulfonatooxymethyl) oxan-3-yl]oxy-5-sulfonatooxyoxane-2-carboxylate
Synonyms Fondaparin sodium; IC-851589; methyl *O*-2-deoxy-6-*O*-sulfo-2-(sulfoamino)-α-D-glucopyranosyl-(1→4)-*O*-β-D-glucopyranuronosyl-(1→4)-*O*-2-deoxy-3,6-di-*O*-sulfo-2-(sulfoamino)-α-D-glucopyranosyl-(1→4)-*O*-2-*O*-sulfo-

α-L-idopyranuronysl-(1→4)-2-deoxy-2-(sulfoamino)-α-D-glucopyranoside 6-(hydrogen sulfate) decasodium salt; Org-31540; *SR*-90107A.
Proprietary Name *Arixtra*



Chemical Properties White powder [O'Neil *et al.* 2006].
Quantification
Other **HPLC** Mammalian Liver Fractions. Column: HR 5/5 mono-Q. Mobile phase: 0.5 mol/L sodium chloride : 2 mol/L sodium chloride (100 : 0 to 0 : 100 over 25 min). Radioactivity detection (^{35}S). Retention time: 18 min. Limit of quantification not reported [Lieu *et al.* 2002].
Disposition in the Body Rapidly and completely absorbed after administration by SC injection, reaching peak plasma concentrations after 1.7 h. It distributes mainly in blood and to a minor extent in extravascular fluid. Fondaparinux is eliminated unchanged in urine (up to 77% in 72 h), and elimination is prolonged in patients with renal impairment, in the elderly, and in those weighing less than 50 kg. Although an *in vitro* study reported that fondaparinux does not cross the placenta, a small study in pregnant women who had received fondaparinux found that anti-factor Xa activity was elevated in umbilical cord blood, suggesting that a small amount of placental transfer had taken place.
Therapeutic Concentration
Sixty-six healthy male and female elderly subjects (aged 60 to 85 years) were administered single IV doses of 2, 4, 5.5, 12, 16, 18 or 20 mg fondaparinux sodium or 2, 4 and 8 mg SC. Mean peak plasma concentrations were as follows:

Dose (mg)	*C_{max} (mg/L)*	*Time (h)*	*Half-life (h)*
IV			
2	0.60	—	16.9
4	1.11	—	18.4
5.5	1.16	—	18.3
12	2.49	—	16.6
16	3.17	—	16.4
18	3.49	—	17.0
20	3.84	—	16.5
SC			
2	0.28	2.2	20.7
4	0.48	2.6	19.2
8	0.91	2.3	18.8

In another study, a group of healthy male subjects (aged 18 to 40 years) was administered single doses of 2.5 and 10 mg fondaparinux sodium SC as well as 4 and 10 mg in a repeat dose regimen. The mean C_{max} values were 0.34 and 1.26 mg/L for the single doses, respectively, observed at 1.7 and 1.9 h, respectively. In the repeated dosing regimen, mean C_{max} values for the 4 and 10 mg doses were 0.56 mg/L and 1.36 to 1.52 mg/L, respectively, attained at 2.0 h and 1.8 to 2.3 h, respectively [Donat *et al.* 2002].
Bioavailability 100%.
Half-life Elimination, 17 to 21 h.
Volume of Distribution 7 to 11 L.
Clearance Plasma, 0.31 ± 0.08 to 0.51 ± 0.07 L/h.
Protein Binding Extensively bound (>97%), predominantly to antithrombin III (>94%).
Note For a review of the use of fondaparinux sodium, see Reynolds *et al.* [2004].
Dose Once daily 2.5 mg as SC injection for deep vein thrombosis prophylaxis following hip fracture, hip or knee replacement surgery, and abdominal surgery. Once daily 5 mg (bodyweight <50 kg), 7.5 mg (bodyweight 50 to 100 kg) or 10 mg (bodyweight >100 kg) SC for the treatment of deep vein thrombosis and pulmonary embolism.

Formaldehyde

Disinfectant
CH_2O = 30.03
IUPAC Name Formaldehyde
Synonyms Formic aldehyde; methanal; methylene oxide; oxomethane.
Chemical Properties A colourless inflammable gas. Very soluble in water; soluble in ethanol and ether.

Formaldehyde Solution

CAS—50-00-0
Synonyms Formalin; formol.
Proprietary Names *Diformil*; *Emoform*; *Formadon*; *Formitrol*; *Lazerformaldehyde*; *Lysoform*; *Veracur.*
Chemical Properties An aqueous solution containing 34–38% w/w formaldehyde (CH_2O), with methanol as a stabilising agent. A colourless liquid. Approximate weight, 1.08 g/mL. Miscible with water, ethanol and acetone; immiscible with chloroform and ether. pK_a 13.3 (25°). Log *P* (octanol/water), 0.35 [Hansch *et al.* 1995].

Colour Test Chromotropic acid—red.
A little resorcinol is added to a solution containing formaldehyde; after shaking, sulfuric acid is then carefully added to form a layer under the solution; a red–violet ring forms at the junction of the 2 layers.
Mass Spectrum Principal ions at *m/z* 29, 30, 28, 31, 32.
Quantification
Plasma **HPLC** Column: HP Zorbax StableBond SB-C_{18} (250 × 4.6 mm, 5 µm). Mobile phase: acetonitrile : water (25 : 75), flow rate 1 mL/min. Fluorescence detection. Limit of quantification, 0.87 mg/L, limit of detection, 0.46 mg/L [Luo *et al.* 2001].
Urine **GC** Column: DB-5 (30 m × 0.53 mm, 1.5 µm). Carrier gas: He, 5.0 mL/min. Temperature: 80°. ECD. Limit of detection, 108 µg/L [Takeuchi *et al.* 2007].
Disposition in the Body Formaldehyde is rapidly metabolised in the body tissues to formic acid and methanol, especially in the liver and erythrocytes; the formic acid may then be excreted in the urine as formates or metabolised to labile methyl groups. Formaldehyde is a metabolite of methanol.
Toxicity Formaldehyde is very irritable to mucous membranes; inhalation of the vapour causes intense irritation of the respiratory tract, which may lead to bronchitis and pneumonia. Atmospheric concentrations of 2–3 ppm may cause mild irritation of the mucous membranes and exposure to concentrations of 10–20 ppm for only a few minutes may cause moderate to severe irritation. Adverse effects have been reported as a result of release of formaldehyde fumes from synthetic foam insulation. Few fatalities have been recorded but 30 mL formaldehyde solution may be fatal in an adult. The maximum permissible atmospheric concentration is 2 ppm or 3 mg/m^3.
In a fatality resulting from ingestion of 120 mL of formaldehyde solution, the following blood concentrations were reported 0.5 h after ingestion: formic acid 500 mg/L, formaldehyde 4.8 mg/L and methanol 420 mg/L; after 17 h, these had declined to 300, 2 and 70 mg/L, respectively. Death occurred ≈28 h after ingestion [Eells *et al.* 1981].
In 2 deaths occurring 3 and 8 weeks after the ingestion of an unknown amount of formaldehyde, formic acid plasma levels of 280 and 210 mg/L were reported on admission to hospital. In the second case, formic acid levels declined to 70 mg/L at 6 h after admission [Köppel *et al.* 1990].
A 58-year-old man died 12 h after ingesting approximately 4 ounces of a formaldehyde solution in a suicide attempt. The plasma levels of formaldehyde, formate and methanol 1.5 h after ingestion were 0.16, 16.0 and 5.8 mmol/L, respectively; at 5.5 h after ingestion, these levels were 0.32, 29.6 and 7.4 mmol/L, respectively. After this time, formaldehyde levels declined and methanol levels continued to increase, reaching 0.14 and 10.6 mmol/L at 12 h after ingestion [Burkhart *et al.* 1990].

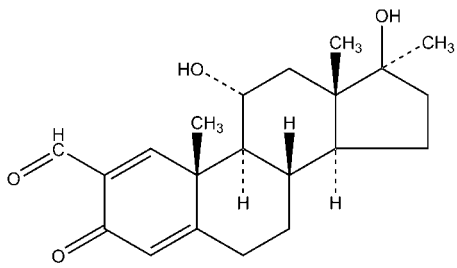
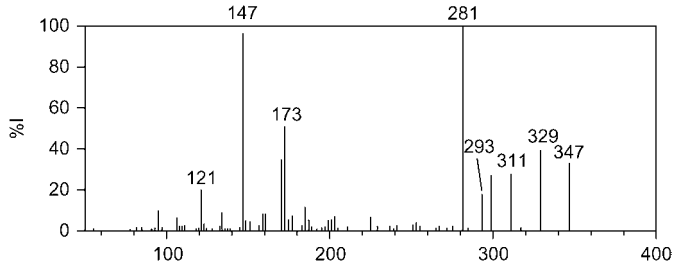
Formebolone

Anabolic Steroid
$C_{21}H_{28}O_4$ = 344.4
CAS—2454-11-7
IUPAC Name (8*S*,9*S*,10*R*,11*R*,13*S*,14*S*,17*S*)-11,17-Dihydroxy-10,13,17-trimethyl-3-oxo-7,8,9,11,12,14,15,16-octahydro-6*H*-cyclopenta[a]phenanthrene-2-carbaldehyde

Synonyms 11α,17β-Dihydroxy-17-methyl-3-oxoandrosta-1,4-diene-2-carboxaldehyde; formyldienolone.
Proprietary Name *Esiclene*



Chemical Properties Crystals. Mp 209° to 212°. Soluble in water. Log *P* (octanol/water), 1.43 [Meylan, Howard 1995].
Mass Spectrum



Quantification
Urine **LC-MS** Column: LiChroCART Purospher RP C_{18} (125 × 3 mm, 5 µm). Mobile phase: 5 mmol/L ammonium acetate–0.01% acetic acid : 90% methanol (50 : 50 to 0 : 100 at 15 min for 3 min), flow rate 0.5 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of detection, 0.4 µg/L for formebolone metabolite 2-hydroxymethyl-17α-methyl-androsta-1,4-diene-11α,17β-diol-3-one [Leinonen *et al.* 2004].
Therapeutic Concentration
In a double-blind between-patient controlled study in 50 patients (31 males, 19 females, aged 15 to 81 years), participants were given a standard diet for 21 days. For the first 6 days there was no treatment and then 25 patients were given 20 mg/day formebolone while the rest were given placebo for the successive 15 days. There was a significant decrease in urinary nitrogen excretion in all who received the drug. Plasma concentrations of formebolone were not reported [Gelli, Vignati 1976].

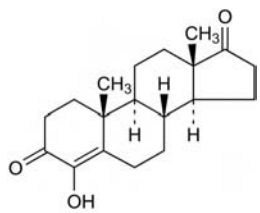
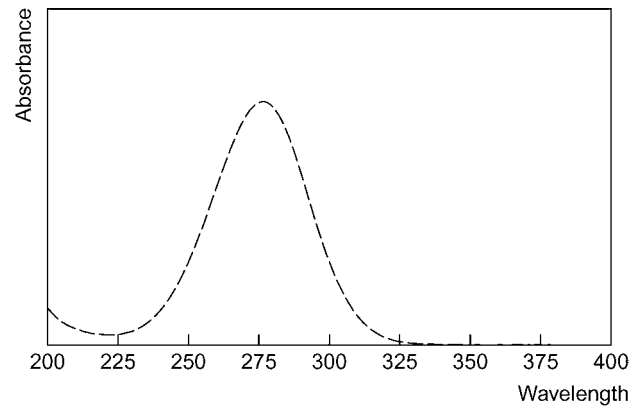
Formestane

Antineoplastic Aromatase Inhibitor
$C_{19}H_{26}O_3$ = 302.4
CAS—566-48-3

IUPAC Name (8*R*,9*S*,10*R*,13*S*,14*S*)-4-Hydroxy-10,13-dimethyl-2,6,7,8,9,11,12,14,15,16-decahydro-1*H*-cyclopenta[*a*]phenanthrene-3,17-dione
Synonyms BRN 1889793; CCRIS 7483; CGP-32349: 4-OHA; 4-hydroxyandrost-4-ene-3,17-dione; 4-OHAD.
Proprietary Names *Lentare*; *Lentaron*.



Chemical Properties A white to slightly yellow lyophilised solid. Poorly soluble in aqueous media. Needles from aqueous methanol, Mp 199° to 202°; also reported as crystals from ethyl acetate, Mp 203.5° to 206°.
Thin-layer Chromatography Plate: kiesel gel 60 F_{254} Merck 5714 (0.2 mm layer). Mobile phase (A): chloroform : methanol : water (6:4:1); (B): chloroform : methanol (19:1). R_f (formestane glucuronide metabolite) 0.5 (mobile phase A) and 0.71 (mobile phase B) [Goss *et al.* 1986].
High Performance Liquid Chromatography Column: C_{18} Supelco (3 µm, 250 × 2.1 mm i.d.). Mobile phase: acetonitrile (20%) in 10 mmol/L NH_4OAc, 5 min, up to 100% acetonitrile in 15 min, flow rate 0.2 mL/min. MS–MS detection. Retention time: formestane glucuronide, 10.6 min; sulfate, 12.0 min [Poon *et al.* 1992a].
Column: ODS APEX II (150 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : water (60:40) containing formic acid (0.1%), flow rate 1.2 mL/min. MS detection. Retention time: formestane, 8.1 min [Poon *et al.* 1992b].
Ultraviolet Spectrum Ethanol—278 nm.



Quantification
Plasma **GC** Column: 3% OV-225 on Supelcoport, 80 to 100 mesh (1.5 m × 2 mm), Pyrex glass. Temperature: 275°. Injector and detector temperatures: 250° and 350°, respectively. Carrier gas: N_2, flow rate 40 mL/min. IS: 17α-ethinylestradiol. Detection: electron capture, ^{63}Ni. Retention time: 4-OHA PFB-derivative, 3 min; IS, 2 min. Limit of detection, 0.02 nmol per sample (6 ng) [Degen, Schneider 1991].
GC-MS Limit of detection, 65 pg [Guarna *et al.* 1989].
Disposition in the Body After IM injection, there is a slow release of the active drug into systemic circulation, with systemic uptake of 20 to 25% of the dose, taking place over 14 days. Formestane is metabolised in the liver by conjugation into an inactive glucuronide metabolite and, also, by sulfation. Metabolites include 4-hydroxytestosterone (4-OHT), 3-β-hydroxy-5-α-androstan-4,17-dione (3-α-OHA)-sulfate, 4-hydroxyandrosta-4,6-diene-3,17-dione and 3-α-17-dihydroxy-5-β-androstan-4-one (3,17-OHA)-sulfate. <1% of the dose is detected in urine unchanged.
Therapeutic Concentration
Healthy volunteers were administered with single oral doses of formestane, 250 and 500 mg. Peak plasma concentrations were reached within 0.5 to 4 h and the drug was detected in serum 5 min after administration. Plasma levels peaked at 79.2 and 119.7 µg/L, respectively [Dowsett *et al.* 1992].
Toxicity Clinical trials with doses up to 1000 mg/week only showed an increase in the frequency of the adverse reactions, for example rash, hot flushes, nausea, sore throat and vomiting.
Half-life 5 to 6 days.
Protein Binding About 85%.
Dose Usual dose, 250 mg every two weeks.

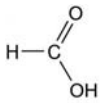
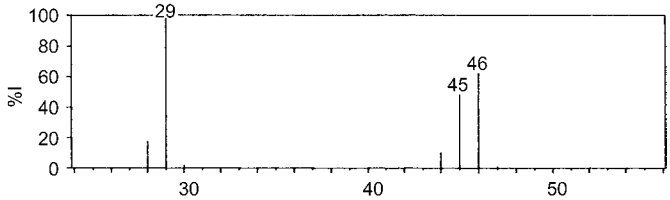
Formic Acid

Acid
HCOOH = 46.03
CAS—64-18-6

IUPAC Name Formic acid
Synonym Aminic acid
Proprietary Names It is an ingredient of *Aciforin*; *Berggeist*; *Discmigon*; *Euphon*; *Fortalis*; *Rubistenol*; *Rubjovit*; *Step 2*.



Chemical Properties A colourless liquid containing ~25% w/w of CH_2O_2. Bp 101°. Miscible with water, acetone, ethyl acetate, ethanol, and ether; partially soluble in benzene, toluene and xylenes. pK_a 3.8 (25°). Log *P* (octanol/water), −0.54 [Hansch *et al* 1995].
Colour Test Warm with sulfuric acid in a tube—carbon monoxide is evolved; the gas can be ignited at the mouth of the tube and burns with a blue flame.
Mass Spectrum Principal ions at *m/z* 29, 46, 45, 28, 44, 30, 47.



Quantification

Blood **GC** Column: Porapak Q (1.8 m × 3 mm i.d.). Carrier gas: N_2, 24 mL/min. Temperature: 124°. FID. Limit of detection, 5 mg/L [Abolin *et al.* 1980]. Column: fused silica (30 m × 0.32 mm i.d., 0.5 µm). Carrier gas: He, 2.8 mL/min. Limit of quantification not reported [Westphal *et al.* 2001].
Urine **GC** See Blood [Abolin *et al.* 1980]. Column: DB-WAX (60 m × 0.53 mm i. d., 1.0 µm). Carrier gas: He, 59 g/cm^2. Temperature: 60°. FID. Limit of detection, 1 mg/L [Yasugi *et al.* 1992].
Bile **GC** See Blood [Westphal *et al.* 2001].
Gastric Contents **GC** See Blood [Westphal *et al.* 2001].
Kidney **GC** See Blood [Westphal *et al.* 2001].
Liver **GC** See Blood [Westphal *et al.* 2001].
Disposition in the Body Formic acid is an intermediate in normal metabolism; when administered it probably takes part in the metabolism of 1-carbon compounds to produce methyl groups; it is excreted in the urine and also undergoes oxidation to carbon dioxide. Together with formaldehyde, it is a metabolite of methanol and the 2 are probably mainly responsible for the effect of methanol on vision.
Therapeutic Concentration Formic acid concentrations of 2–30 mg/L (mean, 13) were reported in the urine of normal subjects [Triebig, Schaller 1980].
Toxicity The minimum lethal dose is ~30 mL. Formic acid is dangerously caustic to the skin. The maximum permissible atmospheric concentration is 5 ppm or 9 mg/m^3; the estimated acceptable daily intake is up to 3 mg/kg.

In a fatality involving ingestion of formic acid, the blood concentration on admission was 348 mg/L [Verstraete *et al.* 1989].

Two men were fatally intoxicated with methanol and the formic acid levels in their blood, urine and organs were as follows: 320 and 230 mg/L in blood, 227 and 47 mg/L in urine, 0.11 and 1.17 mg/g in brain, 0.54 and 0.51 mg/g in liver, and 0.13 and 1.19 mg/g in kidneys. The total amounts of formic acid in the gastric contents were 108 and 23.2 mg [Tanaka *et al.* 1991].

In a death caused by the intentional ingestion of a decalcifying agent containing formic acid, the blood concentration on admission to hospital was 370.3 mg/L and declined to 13.9 mg/L after 6.5 h of haemodialysis. Postmortem concentrations were heart blood 855.4 mg/L, gastric contents 2712 mg/L, haemorrhagic fluid from abdominal cavity 1128 mg/L, bile 3051 mg/L, contents of small intestine 2664 mg/L, liver 442.7 µg/g and kidney 542.3 g/g [Westphal *et al.* 2001].

Note Formic acid is the principal ingredient (~60%) of several proprietary preparations used for descaling kettles.

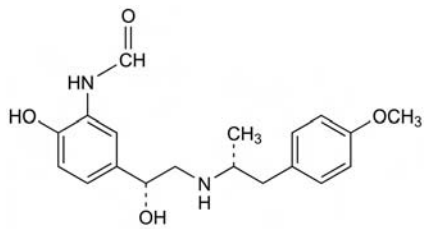
Formoterol

Antiasthmatic
$C_{19}H_{24}N_2O_4$ = 344.4
CAS—73573-87-2

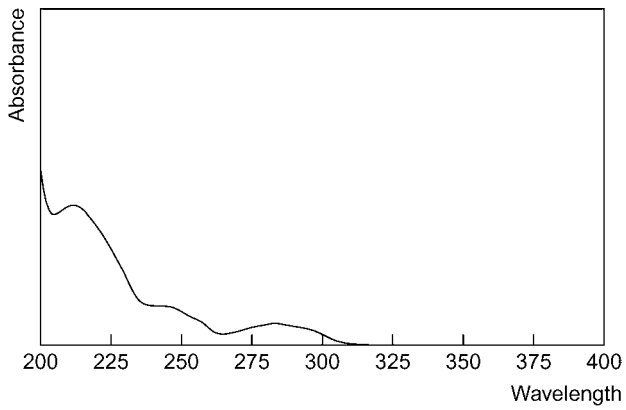
IUPAC Name *rel-N*-[2-Hydroxy-5-[(1*R*)-1-hydroxy-2-[[(1*R*)-2-(4-methoxyphenyl)-1-methylethyl]amino]ethyl]phenyl]formamide
Synonym Eformoterol



Chemical Properties pKa, 7.82; 8.53. Log *P* (octanol/pH 7), 0.10; (octanol/pH7.4), 0.4.

Formoterol Fumarate Dihydrate

$(C_{19}H_{24}N_2O_4)_2.C_4H_4O_4.2H_2O$ = 804.9
CAS—43229-80-7
Synonyms Eformoterol fumerate; BD-40A; CGP-25827A.
Proprietary Names *Atock*; *Eolus*; *Foradil*; *Foradile*; *Neblik*; *Oxis*; *Oxeze*.
Chemical Properties Crystals from 95% isopropyl alcohol. Mp 138° to 140°.
Ultraviolet Spectrum Aqueous acid—212, 283 nm.



Infrared Spectrum Principal peaks at wavenumbers 1690, 1515, 1370, 1250 cm^{-1}.
Mass Spectrum Principal ions at *m/z* (formoterol glucuronide) 122, 119, 77, 78, 91, 107, 65, 63.

Quantification

Plasma **HPLC** Electrochemical detection. Limit of detection, 0.004 µg/L [Campestrini *et al.* 1997]. Column: C_8 Alltech (100 × 4.6 mm i.d., 3 µm). Mobile phase: citrate buffer (0.031 mol/L sodium acetate, 0.012 mol/L citric acid, 0.033 mol/L sodium hydroxide, pH 6.0) : methanol (61.5:38.5), flow rate 1 mL/min. Internal standard (IS): bromoformoterol. Electrochemical detection. Retention time: formoterol, 5.6 min; IS, 10.0 min. Limit of detection, 0.02 µg/L [van der Berg *et al.* 1994].
Urine **GC-MS** Limit of detection, 5 µg/L [Kamimura *et al.* 1982].
Disposition in the Body After inhalation of formoterol, there is rapid absorption. Metabolism is mainly via direct glucuronidation and *O*-demethylation, and this is the main route of elimination. Formoterol is also sulfated to some extent to a sulfate conjugate. 8 to 13% of an oral dose is excreted unmetabolised in urine (20% for IV administration and 24% for an inhaled dose). 62% of a total dose is recovered in urine with 24% as faeces.
Therapeutic Concentration

Twelve healthy volunteers (8 male and 4 female) were administered a single 120 µg dose of formoterol fumarate (by inhalation). In 9 of the volunteers, peak plasma concentrations were reached within 5 min after inhalation, with a mean peak of 266 pmol/L [Lecaillon *et al.* 1999].

Toxicity Possible side effects include tremors, headaches, palpitations, tachycardia, hypotension and hyperglycaemia. It is a poison by intraperitoneal and IV routes and moderately toxic by ingestion and subcutaneous routes.
Half-life Elimination half-life ≈10 h.
Protein Binding Approximately 50%.
Dose A usual dose of formoterol fumarate is 12 or 24 µg twice daily (inhalation or aerosol), or 80 µg twice daily orally.

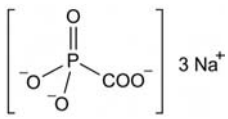
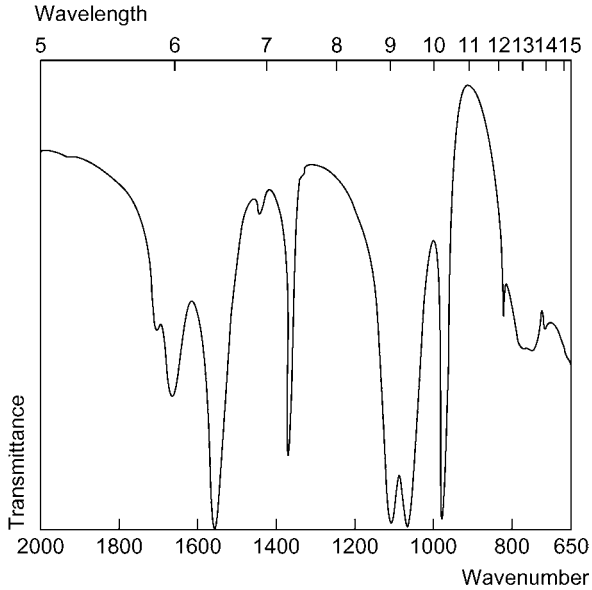
Foscarnet Sodium

Antiviral
$CNa_3O_5P = 192.0$
CAS—63585-09-1; 34156-56-4 (hexahydrate)

IUPAC Name Trisodium phosphonatoformate
Synonyms A-29622; dihydroxyphosphinecarboxylic acid oxide trisodium salt; EHB-776; phosphonatoformate trisodium; phosphonoformate trisodium; trisodium carboxyphosphate.
Proprietary Names *Foscavir*; *Triapten*; *Virudin*.



Chemical Properties A white crystalline powder. Mp 25°. Soluble in water; practically insoluble in alcohol. pK_a 0.5, 3.4, 7.3.
Ultraviolet Spectrum Aqueous acid—236 nm.
Infrared Spectrum



Quantification

Plasma **HPLC** Column: C_{18} Novapak (4 µm). Mobile phase: methanol containing 0.001 mol/L $THAHO_4$ (ion pairing agent) : 60 mmol/L phosphate buffer (pH 5.8) (30:70), also 0.0002 mol/L pyrophosphoric acid was added and final pH adjusted to 5.8, flow rate 0.7 mL/min. Electrochemical detection. Internal standard (IS): hydrochlorothiazide. Retention time: foscarnet sodium, 12.0 min; IS, 18.9 min. Limit of quantification, 0.033 mg/L [Hassanzadeh *et al.* 1990].
Serum **HPLC** Column: Kromasil 100 C_{18} (150 × 4.6 mm i.d., 5 µm), polyether ether ketone (PEEK) column. Mobile phase: methanol : 40 mmol/L disodium phosphate buffer (pH 7.6, containing 0.25 mmol/L tetrahexylammonium sulfate) ($THAHO_4$) (25:75), flow rate 1.0 mL/min. Amperometric detection (glassy carbon at +1.125 V). Retention time: 6.06 min. Electrochemical detection. Limit of quantification, 0.015 mg/L [Ba *et al.* 1999].
Urine **HPLC** See Plasma [Hassanzadeh *et al.* 1990].
Note For a review of chromatographic methods for the determination of antivirals in biological fluids, see Riley *et al.* [1990].
Disposition in the Body The pharmacokinetics of foscarnet are complicated by the high incidence of renal function impairment during therapy and by the deposition and subsequent gradual release of foscarnet from bone. The estimation of half-life thus depends on duration of foscarnet therapy. Foscarnet is poorly absorbed after oral administration and not metabolised to a great extent. It crosses the blood–brain barrier in variable amounts; CSF concentrations of between 0 and 300% of plasma concentrations have been reported. The drug is excreted mostly unchanged in the urine by glomerular filtration and tubular secretion, and is also cleared by uptake into bones (14 to 22%). It is removed by haemodialysis.

Therapeutic Concentration
Administration of 90 mg/kg (infused over 2 h) every 12 h to 10 patients with AIDS and disease of the GI tract (aged between 34 and 45 years) produced mean peak plasma concentrations of 0.621 mg/L on day 1 and 0.687 mg/L at steady state (after 17 to 21 days) at the end of the infusion [Dieterich *et al.* 1997].

Administration of 60 mg/kg (infused over 2 h) every 8 h to 8 AIDS patients (aged between 25 and 43 years, mean 34) for 14 days, produced mean peak and trough concentrations of 0.509 mg/L (range 0.306 to 0.876) and 0.098 mg/L (0.062 to 0.147 mg/L), respectively, on day 3 and 0.495 (range 0.272 to 0.699) mg/L and 0.126 (0.057 to 0.225) mg/L, respectively, on day 14 [Aweeka *et al.* 1989].
Toxicity Renal impairment is the major toxicity. Seizures related to alterations in plasma minerals and electrolytes have also been associated with foscarnet therapy.
Overdosing has been reported in 33 patients with the highest ≈10 times the prescribed dose. Of these, 28 experienced adverse effects, 5 had no ill effects connected with overdose and 4 died owing to respiratory and cardiac arrest with organ failure [Astra Pharmaceuticals Ltd].
Half-life Plasma half-life, 4.5 h.
Volume of Distribution 0.3 L to 0.74 L/kg.
Clearance Plasma clearance, 6 to 13 L/h/1.73 m^2; 1.7 to 1.9 mL/min/kg (101 to 106 mL/min/1.73 m^2).
Protein Binding 14 to 17%.
Note For reviews of foscarnet, see Chrisp and Clissold [1991] and Wagstaff and Bryson [1994].
Dose The usual dose is 60 mg/kg intravenously (over 1 to 2 h) every 8 h for 2 to 3 weeks, followed by 60 to 120 mg/kg daily.

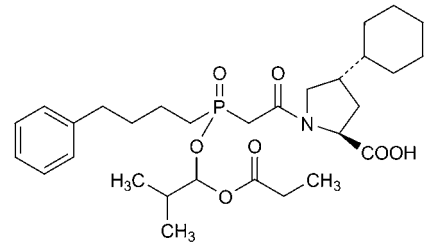
Fosinopril

ACE Inhibitor, Antihypertensive
$C_{30}H_{46}NO_7P = 563.7$
CAS—98048-97-6

IUPAC Name (2*S*,4*S*)-4-Cyclohexyl-1-[2-[[(1*S*)-2-methyl-1-propanoyloxypropoxy]-(4-phenylbutyl)phosphoryl]acetyl]pyrrolidine-2-carboxylic acid
Synonyms (4*S*)-4-Cyclohexyl-1-[[(*RS*)-2-methyl-1-(propionyloxy)propoxy](4-phenylbutyl)phosphinoylacetyl]-L-proline; fosenopril.



Chemical Properties Log *P* (octanol/water), 6.61 [Meylan, Howard 1995]. There were no stability-related problems: working solutions were stable at room temperature and stock solutions of fosinopril and fosinoprilat were stable for 2 weeks [Cui *et al.* 2007]. Following acidification with sodium acetate buffer (pH 4), fosinopril and fosinoprilat were stable at room temperature for at least 24 h. Fosinoprilat was stable in serum after 3 freeze-thaw cycles, in reconstituted samples at room temperature for at least 48 h, and at –20° for 181 days [Jemal, Mulvana 2000].

Fosinopril Sodium

$C_{30}H_{45}NNaO_7P = 585.6$
CAS—88889-14-9
Synonyms Fosenopril sodium; SQ-28555.

Proprietary names *Acecor*; *Dynacil*; *Eliten*; *Fosinorm*; *Fosipres*; *Fositens*; *Fozitec*; *Hiperlix*; *Monopril*; *New Ace*; *Secorvas*; *Staril*; *Tensogard*; *Tenso Stop*; *Tensozide*.
Chemical Properties White to off-white crystalline powder. It is soluble in water (100 g/L), methanol and ethanol; slightly soluble in hexane.

Fosinopril Diacid

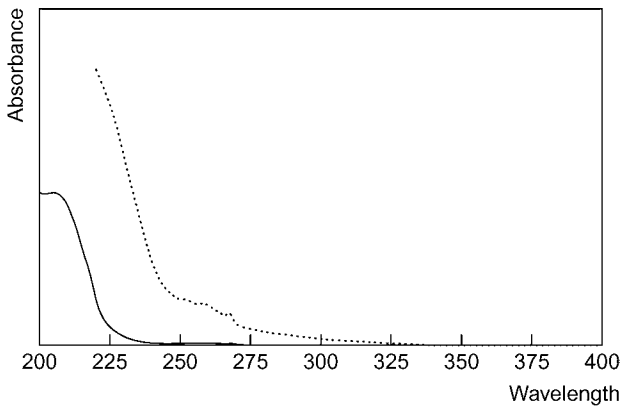
$C_{23}H_{34}NO_5P = 435.5$
Synonym SQ-27519
Chemical Properties Mp 149° to 153°.

High Performance Liquid Chromatography Column: alkylphenyl (300 × 4.0 mm i.d., 10 µm). Mobile phase: methanol : 0.2% phosphoric acid (72 : 28), flow rate 2 mL/min. UV detection (λ = 215 nm). Retention time: 10.5 min. Limit of quantification, 100 mg/L [Lozano *et al.* 1995].

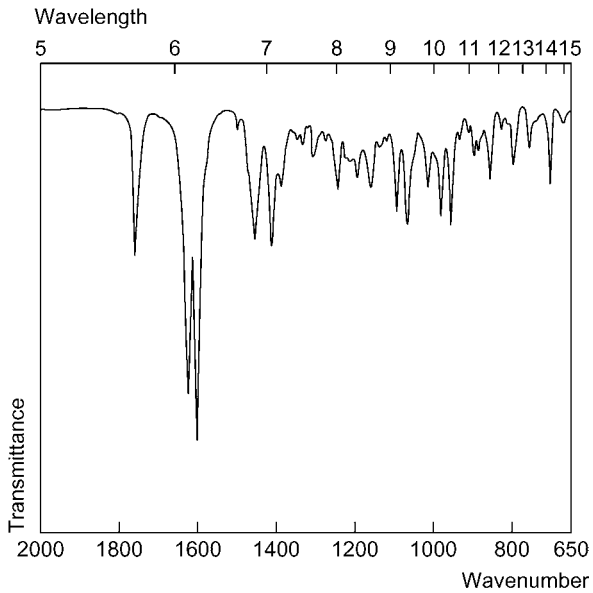
Column: Resolve (Waters, 150 × 3.9 mm, 5 µm). Temperature: 32°. Mobile phase: acetonitrile : water : orthophosphoric acid (4000 : 15 : 2), flow rate 1 mL/min. UV detection (λ = 205 nm). Retention time: 5.13 min. Limit of detecetion, 0.02 µg/L [Kirschbaum *et al.* 1990].

Capillary Electrophoresis Column: fused silica capillary (50/57 cm effective/total length × 75 µm i.d.). Buffer: 50 mmol/L sodium tetraborate (ph 8.3). UV detection (λ = 200 nm). Limit of quantification, 0.26 mg/L [Lozano *et al.* 1995].

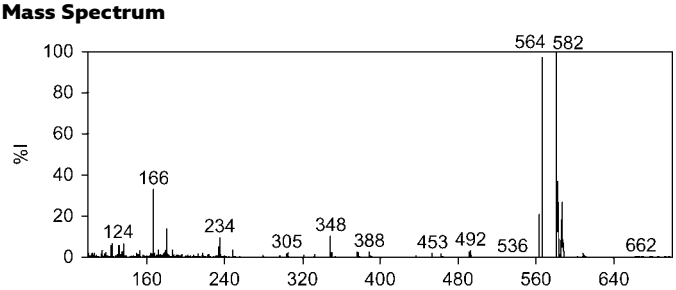
Ultraviolet Spectrum Basic—252, 258, 268 nm.



Infrared Spectrum Principal peaks at wavenumbers 1600, 1759, 1409, 1064 cm^{-1} (KBr pellet).



Mass Spectrum



Quantification

Serum **GC** Column: fused silica capillary (5 m × 0.32 mm i.d., 0.17 µm). Carrier gas: He, 34 kPa. Temperature programme: 210° for 2 min to 260° at 10°/min for 1 min. NPD. Limit of detection 10 µg/L. [Jemal *et al.* 1985].

LC-MS Column: LiChrospher-C_8 (250 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 10 mmol/L ammonium acetate (60 : 40 for 2 min to 85 : 15 at 10 min to 60 : 40 at 12 min), flow rate 1.0 mL/min. ESI, positive ion mode, SRM acquisition mode. Retention time: 8.7 min. Limit of quantification, 0.1 µg/L [Cui *et al.* 2007]. Column: ODP PVA C_{18} (50 × 2 mm i.d., 5 µm). Mobile phase: 10 mmol/L ammonium acetate in water : methanol (pH 4; 75 : 25) : 10 mmol/L ammonium acetate in methanol (70 : 30 to 5 : 95 in 3 minto 70 : 30 at 5 min), flow rate 200 µL/min. SRM acquisition mode. Retention time: 1.4 min. Limit of quantification,1.17 µg/L. [Jemal, Mulvana 2000].

Disposition in the Body Thirty-six percent of an orally administered dose of fosinopril is absorbed. It is rapidly and completely hydrolysed to fosinoprilat, a *p*-hydroxy metabolite and a glucuronide conjugate of fosinoprilat. Metabolism occurs by esterases in the gastrointestinal mucosa and in the liver. The metabolites are excreted in urine and faeces via bile. During 96-h post-IV administration, 90% of a dose is recovered, 44% in urine and 46% in faeces [Kelly, O'Malley 1990]. For oral administration, however, 13 to 16% is recovered in urine and 73 to 78% in faeces. The drug has also been detected in breast milk.

Therapeutic Concentration

Twenty healthy Chinese volunteers (18–25 years) were administered 20 mg fosinopril sodium. The mean maximum concentration of fosinopril sodium and fosinoprilat were 4.6 ± 2.34 and 409.43 ± 136 µg/L at 1.2 ± 0.42 and 3.74 ± 0.87 h, respectively. The mean plasma elimination half-life of fosinopril was 2.72 ± 1.75 h and for fosinoprilat was 7.25 ± 0.81 h [Cui *et al.* 2007].

Thirteen patients with renal impairment (mean creatine clearance, 55.7 mL/min) and 13 healthy volunteers (mean creatine clearance, 102.5 mL/min) were administered 20 mg fosinopril sodium once daily for 5 days. On day 1: the renally impaired patients reached peak plasma concentrations of 387 ± 0.2 µg/L within 3.5 h, and the healthy volunteers 324 ± 0.3 µg/L in 3 h. On day 5: the patients with renal impairment had peak plasma concentrations of 517 ± 0.4 µg/L and the healthy volunteers 357 ± 0.2 µg/L, both reached within 3 h. [O'Grady *et al.* 1999].

After an oral dose of 10 mg fosinipril to patients with mild, moderate and severe renal failure, mean maximum plasma concentrations of 165 ± 11, 136 ± 23, 127 ± 22 µg/L were reached at ≈4 h [Hui *et al.* 1991].

Toxicity Hypotension. For a case of hepatotoxicity induced by fosinopril, see Romero-Gómez *et al.* [2001].

Half-life ≈11.5 h in healthy volunteers; 14 h in patients with renal impairment.

Volume of Distribution Steady state, 1.525 L/kg (Caucasian); 0.074 L/kg (Chinese).

Clearance Fosinopril, body clearance, 1.55 to 2.35 L/h; fosinoprilat, 26 to 39 mL/min.

Protein Binding Fosinopril is bound >95% and fosinoprilat 89 to 99.8%.

Dose An initial dose of 10 mg daily is administered. Maintenance dose: 10–40 mg daily.

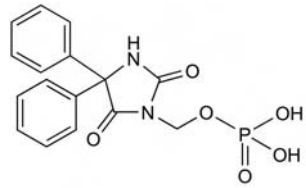
Fosphenytoin

Anticonvulsant
$C_{16}H_{15}N_2O_6P = 362.3$
CAS—93390-81-9

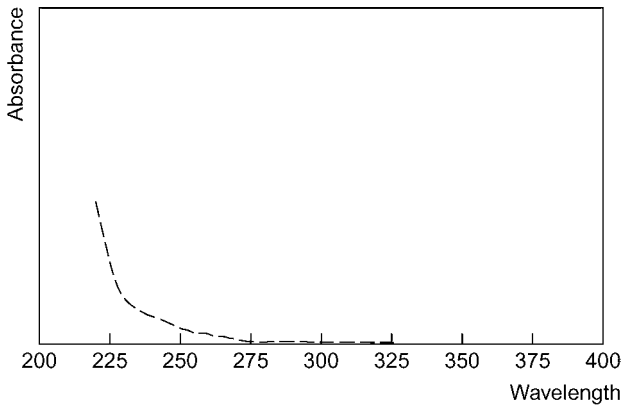
IUPAC Name (2,5-Dioxo-4,4-diphenylimidazolidin-1-yl)methyl dihydrogen phosphate
Synonym 5,5-Diphenyl-3-[(phosphonooxy)methyl]-2,4-imidazolidinedione



Fosphenytoin Sodium

$C_{16}H_{13}N_2Na_2O_6P = 406.2$
CAS—92134-98-0
Synonyms ACC-9653; Acc-9653-010; CI-982; PD-135711-15B.
Proprietary Names *Cerebyx*; *Pro-Epanutin*.
Chemical Properties Freely soluble in aqueous solutions.

High Performance Liquid Chromatography Column: C_{18} μBondapak (150 × 3.9 mm i.d., 10 μm). Mobile phase: 0.01 mol/L tetrabutylammonium dihydrogen phosphate : methanol (53:43%), flow rate 1.7 mL/min. Retention time: fosphenytoin sodium, 4.5 min [Gerber *et al.* 1988].
Ultraviolet Spectrum Ethanol—258 nm.



Quantification

Plasma **HPLC** Column: C_{18} (150 × 3.9 mm i.d., 5 μm). Mobile phase: acetonitrile (20%) in deionised water containing 0.005 mol/L tetrabutylammonium sulfate (TBA), (pH 2.5), flow rate 2.0 mL/min. Retention time: 8.8 min. Limit of quantification, 0.4 mg/L, limit of detection, 0.1 mg/L [Cwik *et al.* 1997].
Formulations **HPLC** Column: C_{18} Resolve (150 × 3.9 mm i.d., 5 μm). Mobile phase: acetonitrile : water : phosphoric acid (85%) (57:75:0.09) containing 5 mmol/L TBA, flow rate 2 mL/min. Retention time: fosphenytoin, 9.1 min. Limit of quantification, 15 mg/L [Fischer *et al.* 1997].
Disposition in the Body Fosphenytoin sodium is rapidly and completely metabolised to phenytoin and other metabolites including phosphate and formaldehyde which are subsequently converted to formate and further metabolites. Phenytoin is metabolised to 5-(*p*-hydroxyphenyl)-5-phenylhydantoin. The metabolites are excreted in urine. It is distributed in CSF, saliva, semen, gastrointestinal fluids, bile and breast milk.
Therapeutic Concentration

Twenty healthy, male volunteers (Caucasian, Black, Hispanic and Asian) were administered with a single IV dose of 150, 300, 600 and 1200 mg fosphenytoin sodium over 30 min. Peak plasma concentrations of fosphenytoin were observed half an hour after the beginning of the infusion and reached mean levels of 20, 36, 75 and 129 mg/L, respectively. Peak phenytoin plasma concentrations were reached at 2.2, 4.0, 7.4 and 17.2 mg/L, respectively, ≈51 to 109 min from the end of infusion [Gerber *et al.* 1988].

Toxicity The blood toxic range is 30 to 50 mg/L and a concentration of >100 mg/L has been associated with fatalities. Acute hepatotoxicity and hypersensitivity reactions have been observed and phenytoin and the other metabolites may result in toxicity after overdosing, including hypotension, coma and respiratory or circularity depression which may be fatal.
Bioavailability About 90%.
Half-life (IM administration) 33 min, (IV administration) 8 min.
Volume of Distribution Adults and children: 0.6 to 0.7 L/kg, infants: 0.7 to 0.7 L/kg, full term neonates: 0.8 to 0.9 L/kg and premature neonates: 1 to 1.2 L/kg.
Clearance 19.8 L/h.
Protein Binding About 90 to 99%.
Dose An initial dose of 10 to 15 mg phenytoin sodium equivalent (PSE)/kg body weight is administered at a rate of 50 to 150 mg/min. A daily maintenance dose of 4 to 5 mg/kg body weight is then administered. The dose is reduced in the elderly and patients with renal or hepatic impairment. Up to 450 mg has been administered intramuscularly in adults and IV doses of up to 3000 mg (38 mg/kg body weight).

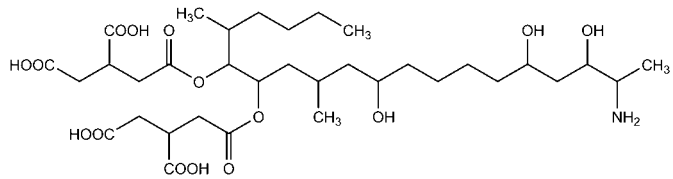
Fumonisins

Polyhydroxyl Alkylamine, Mycotoxin

Chemical Properties Toxic secondary metabolites produced by several species of the fungus *Fusarium*, first reported in South Africa in 1988. Among the most common and highest-yielding fumonisin species are *Fusarium verticillioides* (Sacc.) Nirenberg (formerly *Fusarium moniliforme* Sheldon) and *Fusarium proliferatum* (Matsushima) Nirenberg, both of which are ubiquitous on corn/maize and rice. There are at least 15 characterised fumonisins: FB_1, FB_2, FB_3, FB_4, FB_5 with a free amine function; FA_1, FA_2, FA_3, which are amides (i.e. the *N*-acetyl derivatives of FB_1, FB_2 and FB_3, respectively); FC_1, FC_2, FC_3, FC_4, which lack the C-1 terminal methyl group; and FP_1, FP_2 and FP_3. They are heat-stable compounds, structurally analogous to the sphingoid bases sphinganine and sphingosine. Minor losses occur after heating aqueous solutions of FB_1 and FB_2 at temperatures <150° (~20 to 30%). Temperatures >175° (for 1 h) are necessary to cause substantial fumonisin reduction (>80%) in maize-based foods [Jackson *et al.* 1996]. *o*-Phthaldialdehyde derivatives of fumonisins are unstable at 24° but the stability is much improved at 4° [Williams *et al.* 2004]. Decomposition of FB_1 and FB_2 occurs in methanolic solutions (percentage decreases after 6-week storage at 4°, 25° and 40° are 5%, 35% and 60%, respectively), whereas they are stable in acetonitrile : water (1 : 1) for up to 6 months at –18°, 4° and 25° [Visconti *et al.* 1994]. Gamma irradiation of maize flour at 15 kGy was shown to reduce FB_1 and FB_2 content by ~ 20% [Visconti *et al.* 1996]. The extraction efficiency of fumonisins from corn-based products is dependent on solvent composition and temperature and is most efficient with an ethanol: water (3 : 7) extraction solvent at 80° [Lawrence *et al.* 2000]. Studies have shown that some essential oils (eugenol, cinnamic aldehyde, thymol, carvacol and myristin) are effective in inhibiting the growth of *F. moniliforme* [Juglal *et al.* 2002] and that reaction with D-glucose may detoxify FB_1 [Lu *et al.* 2002].

Fumonisin B_1

$C_{34}H_{59}NO_{15} = 721.8$
CAS—116355-83-0
IUPAC Name 1,2,3-Propanetricarboxylic acid 1,1′-[1-(12-amino-4,9,11-trihydroxy-2-methyltridecyl)-2-(1-methylpentyl)-1,2-ethanediyl] ester
Synonyms FB1; macrofusine.



Chemical Properties Most prevalent toxin produced from *F. moniliforme*, a common mould associated with maize. The maximum yield of FB_1 produced by *F. moniliforme* in maize cultures is at temperatures of 20° to 25° and incubation periods of between 7 and 13 weeks [Alberts *et al.* 1990]. Powder, very hygroscopic.

Fumonisin B_2

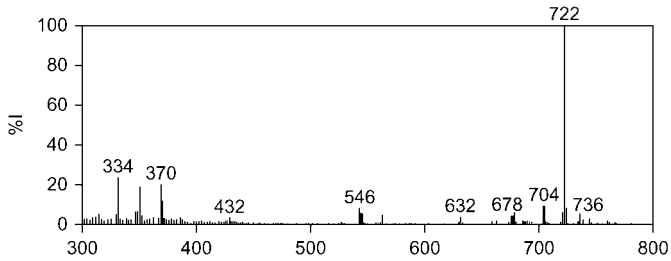
$C_{34}H_{59}NO_{14} = 691$
CAS—116355-84-1
IUPAC Name 1,2,3-Propanetricarboxylic acid 1,1′-[1-(12-amino-9,11-dihydroxy-2-methyltridecyl)-2-(1-methylpentyl)-1,2-ethanediyl] ester
Chemical Properties Powder, very hygroscopic.

Thin-layer Chromatography Plates: C_{18}. Solvent system: methanol : 1% aqueous potassium chloride (3 : 2). Locating reagent fluorescamine solution, buffered acetonitrile and UV detection. R_f values: FB_1 0.10, FB_2 0.50. Limit of quantification not reported [Dutton 1996] Plates: method 1, normal-phase silica; method 2, C_{18} silica (activated at 110° for 10 min). Solvent systems: method 1, chloroform : methanol : acetic acid (60 : 35 : 10); method 2, methanol : water (80 : 20). Locating reagent, acidic anisaldehyde. R_f values: method 1, FB_1 0.32, FB_2 0.52; method 2, FB_1 0.61, FB_2 0.47. Limit of quantification not reported [Ackermann 1991].
High Performance Liquid Chromatography Column: C_{18} (250 x 4.0 mm i.d., 5 μm). Mobile phase: methanol-0.05 mol/L sodium dihydrogen phosphate (pH 5.0; 50 : 50) : acetonitrile-water (80 : 20; 100 : 0 for 5 min to 50 : 50 for 15 min), flow rate 1.0 mL/min. Fluorescence detection (*o*-phthalaldehyde [OPA] derivatives $\lambda_{ex} = 335$ nm, $\lambda_{em} = 440$ nm; 4-fluoro-7-nitro-2,1,3-benzoxadiazole [NBD-F] derivatives $\lambda_{ex} = 440$ nm, $\lambda_{em} = 535$ nm). Limit of detection, 0.01 mg/kg for FB_1 and FB_2 (OPA derivatives), 0.08 mg/kg (NBD-F derivatives) [Hinojo *et al.* 2006]. Column: C_8 (250 x 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile-water-trifluoroacetic acid (pH 2.7; 5 : 95 : 0.025) : acetonitrile-water-trifluoroacetic acid (90 : 10 : 0.025; 80 : 20 to 40 : 60 over 30 min to 20 : 80 over 10 min to 0 : 100 over 2 min), flow rate 1.0 mL/min. ELS detection. Retention times: FB_1 16.3 min, FB_2

21.4 min, FB_3 19.1 min, FB_4 24.4 min (underivatised samples). Limit of quantification not reported [Wilkes *et al.* 1995]. Column: C_{18} (250 x 3.2 mm i.d., 5 µm). Mobile phase: methanol : 0.1 mol/L sodium dihydrogen phosphate (pH 3.35; 75 : 25), flow rate 1.0 mL/min. Fluorescence detection ($\lambda_{ex} = 335$ nm, $\lambda_{em} = 440$ nm). Retention times: FB_1 ~5 min, FB_2 ~ 12 min (OPA derivatives). Limit of quantification not reported [Visconti *et al.* 1994].

Liquid Chromatography-Mass Spectrometry Column: C_{18} (150 x 4.6 mm i.d., 4 µm). Mobile phase: 0.2% formic acid : acetonitrile containing 0.2% formic acid (75 : 25 for 5 min to 60 : 40 over 30 min for 2 min to 40 : 60 over 3 min for 5 min), flow rate 1.0 mL/min. ESI, positive ion mode. Limit of quantification not reported [Josephs 1996].

Mass Spectrum



Quantification

Urine **LC-MS** Column: C_{18} (50 x 4.6 mm i.d., 5 µm). Mobile phase: water-acetonitrile-formic acid (90 : 10 : 0.1) : water-acetonitrile-formic acid (10 : 90 : 0.1; 75 : 25 to 25 : 75 over 11 min), flow rate 1.0 mL/min. ESI, positive ion mode. Retention time: FB_1 8.0 min. Limit of quantification, 20 ng/L [Gong *et al.* 2008].

Hair **LC-MS** Column: C_{18} (150 x 4.6 mm i.d., 5 µm). Mobile phase: water-acetonitrile-formic acid (90 : 10 : 0.1) : water-acetonitrile-formic acid (10 : 90 : 0.1; 80 : 20 to 72 : 28 over 24 min for 1 min to 80 : 20 over 2 min for 8 min), flow rate 0.7 mL/min. ESI, positive ion mode. Retention times: FB_1 11.5 min, FB_2 26.5 min, FB_3 20.5 min. Limit of quantification, 60 pg on-column; limit of detection, 25 pg on-column [Sewram *et al.* 2003].

Other **TLC** Maize Samples. Plates: C_{18}. Solvent system: methanol : 4% aqueous potassium chloride (70 : 30). Locating reagent or derivatisation reagent, fluorescamine. UV detection. R_f value: FB_1 0.35. Limit of quantification, 0.5 mg/kg [Shephard, Sewram 2004]. Plates: C_{18}. Solvent system: 4% aqueous potassium chloride : methanol (2 : 3). Derivatisation spray agents (sequentially): 0.1 mol/L sodium tetraborate, 0.40 g/L fluorescamine in acetonitrile; dry for 1 to 5 min and then spray with 0.01 mol/L boric acid : acetonitrile (2 : 3); dry plate at 55° to 60° for 15 min. UV detection ($\lambda = 366$ nm). R_f values: FB_1 0.5, FB_2 0.25. Limit of detection, $FB_1$0.1 mg/kg [Preis, Vargas 2000].

HPLC Maize Samples and Laboratory Cultures. Column: C_{18} (250 x 4.6 mm, 5 µm). Mobile phase: acetonitrile-acetic acid (99 : 1) : water-acetic acid (99 : 1; 60 : 40 for 8 min to 80 : 20 over 16 min for 4 min), flow rate 1.0 mL/min. Fluorescence detection ($\lambda_{ex} = 420$ nm, $\lambda_{em} = 500$ nm). Limit of quantification, FB_1 and FB_2 (2,3-naphthalene dicarboxaldehyde derivatives) 25 µg/kg [Arino *et al.* 2007]. Maize Samples. C_{18} (250 x 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water : acetic acid (61 : 38 : 1), flow rate 1.0 mL/min. Fluorescence detection ($\lambda_{ex} = 420$ nm, $\lambda_{em} = 500$ nm). Retention times: FB_1 7.4 min, FB_2 13.3 min (naphthalene-2,3-dicarboxaldehyde derivatives). Limit of detection, FB_1 20 µg/kg, FB_2 15 µg/kg [Lino *et al.* 2006]. Swine Liver Samples. Column: phenylhexyl (250 x 4.6 mm i.d., 5 µm). Mobile phase: aqueous buffer (pH 3.4)-2% glacial acetic acid-0.1% TEA : acetonitrile (30 : 70 to 50 : 50 over 50 min), flow rate 1.0 mL/min. Pre-column derivatisation with OPA. Fluorescence detection ($\lambda_{ex} = 334$ nm, $\lambda_{em} = 440$ nm). Retention times: FB_1 ~ 45 min, aminopentol-1 ~ 41 min. Limit of quantification, FB_1 75 µg/kg, aminopentol-1 42 µg/kg; limit of detection, FB_1 20 µg/kg, aminopentol-1 10 µg/kg [Pagliuca *et al.* 2005]. Herbal Tea and Medicinal Plant Samples. Column: C_{18} (250 x 4.6 mm i.d., 5 µm). Mobile phase: methanol : 0.1 mol/L sodium dihydrogen phosphate (pH 3.3; 8 : 2), flow rate 0.7 mL/min. Fluorescence detection ($\lambda_{ex} = 338$ nm, $\lambda_{em} = 455$ nm). Retention times: FB_1 10.9 min, FB_2 25.6 min (OPA derivatives). Limit of quantification, FB_1 103 µg/kg, FB_2 1562 µg/kg; limit of detection, FB_1 31 µg/kg, FB_2 468 µg/kg [Martins *et al.* 2001; Omurtag, Yazicioglu 2004]. Maize Kernels, Tortillas, Masa samples. Column: C_{18} (250 x 4.6 mm i.d., 5 µm). Mobile phase: methanol : 0.1 mol/L phosphate buffer (pH 3.35; 77 : 23), flow rate 1.0 mL/min. Fluorescence detection ($\lambda_{ex} = 335$ nm, $\lambda_{em} = 440$ nm). Limit of detection, 25 µg/kg [De La Campa *et al.* 2004; Dilkin *et al.* 2001; Duncan *et al.* 1998; Sydenham *et al.* 1996; Visconti *et al.* 2001]. Maize Silage Samples. Column: C_{18} (250 x 4.0 mm i.d., 5 µm). Mobile phase: methanol-acetonitrile-water-propan-2-ol-acetic acid (100 : 52 : 73 : 20 : 4) : propan-2-ol (100 : 0 for 30 min to 70 : 30 over 30 min), flow rate 1.0 mL/min. Retention times: FB_1 20.9 min, FB_3 40.7 min, FB_2 43.3 min (naphthalene dicarboxaldehyde derivatives). Fluorescence detection ($\lambda_{ex} = 268$ nm, $\lambda_{em} = 470$ nm). Limit of detection, FB_1 50 µg/kg, FB_2 and FB_3 <50 µg/kg [Kim *et al.* 2004]. Maize-based Products. Column: C_{18} (250 x 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water : acetic acid (60 : 40 : 1), flow rate 0.5 mL/min. Fluorescence detection ($\lambda_{ex} = 335$ nm, $\lambda_{em} = 440$ nm). Limit of detection, FB_1, hydrolysed FB_1, and FB_2 8 to 10 µg/kg [Park *et al.* 2004; Stack 1998]. Column: C_{18} (250 x 4.6 mm i.d., 5 µm). Mobile phase: methanol : 0.1 mol/L sodium dihydrogen phosphate (pH 3.35; 80 : 20), flow rate 1.0 mL/min. Fluorescence detection ($\lambda_{ex} = 335$ nm, $\lambda_{em} = 440$ nm). Limit of detection, 2.5 ppb (OPA derivative). Limit of detection, FB_1 2.5 ppb [Ho, Durst 2003]. Column: Fluofix 120E (30 x 4.6 mm i.d., 5 µm). Mobile phase: methanol : 0.1% trifluoroacetic acid (1 : 1), flow rate 0.8 mL/min. Postcolumn derivatisation with OPA. Fluorescence detection ($\lambda_{ex} = 340$ nm, $\lambda_{em} = 450$ nm). Limit of detection, FB_1 and FB_2 0.01 mg/kg [Akiyama *et al.* 1997]. *Fusarium* cultures. Column: C_{18} (250 x 4.0 mm i.d., 5 µm). Mobile phase: methanol-0.05 mol/L sodium dihydrogen phosphate (pH 5.0; 50 : 50) : acetonitrile-water (80 : 20; 100 : 0 to 50 : 50 at 5 min for 15 min), flow rate 1.0 mL/min. Fluorescence detection. Limit of detection, FB_1, FB_2 5 µg/kg (OPA derivatives), 40 µg/kg (NBD-F derivatives) [Mateo *et al.* 2002]. Beer Samples. Column: C_{18} (33 x 4.6 mm i.d., 3 µm). Mobile phase: 0.05 mol/L potassium dihydrogen phosphate-acetonitrile (pH 3.3; 60 : 40) : acetonitrile : water (80 : 20; 100 : 0 for 6 min to 70 : 30 over 5 min for 2 min), flow rate 1.0 mL/min. Fluorescence detection ($\lambda_{ex} = 335$ nm, $\lambda_{em} = 440$ nm). Retention times: FB_1 ~8 min, FB_2 ~14 min (OPA derivatives). Limit of quantification, FB_1 and FB_2 0.3 µg/L [Hlywka, Bullerman 1999]. Bovine Urine and Faeces. Column: C_{18} (250 x 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile-water-acetic acid (40 : 59 : 1) : acetonitrile-water-acetic acid (60 : 39 : 1; 100 : 0 to 0 : 100 over 9 min), flow rate 1.0 mL/min. Fluorescence detection ($\lambda_{ex} = 229$ nm, $\lambda_{em} = 442$ nm). Retention times: FB_1 ~11 min, FB_2 ~16 min (OPA derivatives). Limit of quantification not reported [Smith, Thakur 1996]. Maize, Poultry Feed and *Fusarium* spp. Maize Culture Samples. Column: C_{18} (33 x 4.6 mm i.d., 3 µm). Mobile phase: acetonitrile : 50 mmol/L potassium dihydrogen phosphate (pH 3.3; 40 : 60), flow rate 1.0 mL/min. Fluorescence detection ($\lambda_{ex} = 335$ nm, $\lambda_{em} = 440$ nm). Retention times: FB_1 ~4.5 min, hydrolysed FB_1 ~5.1 min, FB_2 ~16 min, FB_3 ~17.5 min (OPA derivatives). Limit of quantification, FB_1 0.1 mg/kg, FB_2 and FB_3 0.2 mg/kg [Rice *et al.* 1995]. Frozen or Canned Maize Samples. Column: C_{18} (300 x 3.9 mm i.d.). Mobile phase: water : acetonitrile : acetic acid (50 : 50 : 1), flow rate 1.0 mL/min. Fluorescence detection ($\lambda_{ex} = 335$ nm, $\lambda_{em} = 440$ nm). Retention time: FB_1 10.5 min (OPA derivative). Limit of quantification, 0.1 µg/L [Trucksess *et al.* 1995]. Rat Plasma, Urine and Faecal Samples. Column: C_{18} (50 x 4.6 mm i.d., 3 µm). Mobile phase: methanol : 0.1 mol/L sodium dihydrogen phosphate (pH 3.4; 72 : 28), flow rate 1.0 mL/min. Fluorescence detection ($\lambda_{ex} = 335$ nm, $\lambda_{em} = 440$ nm). Retention time: FB_2 ~10 min (OPA derivative). Limit of quantification not reported [Shephard *et al.* 1995]. Milk Samples. Column: C_{18} (125 x 4.0 mm i.d., 4 µm). Mobile phase: 0.1 mol/L sodium dihydrogen phosphate : methanol (pH 6.0; 33 : 67), flow rate 1.0 mL/min. Fluorescence detection ($\lambda_{ex} = 335$ nm, $\lambda_{em} = 440$ nm). Limit of quantification, FB_1 50 µg/L; limit of detection, 10 µg/L (OPA derivative) [Spotti *et al.* 2001]. Column: C_{18} (220 x 4.6 mm i.d., 5 µm). Mobile phase: methanol-water-acetic acid (75 : 24 : 1) : acetonitrile-water-acetic acid (75 : 24 : 1; 70 : 30 to 55 : 45 at 2.6 min to 0 : 100 at 10.1 min), flow rate 1.0 mL/min. Fluorescence detection ($\lambda_{ex} = 250$ nm, $\lambda_{em} = 470$ nm). Retention times: FB_1 ~10 min, FB_2 ~ 17 min (naphthalene-2,3-dicarboxaldehyde derivatives). Limit of detection, FB_1 and FB_2 5 µg/L [Maragos, Richard 1994]. Monkey Faeces. Column: C_{18} (100 x 4.6 mm i.d., 3 µm). Mobile phase: methanol : 0.1 mol/L sodium dihydrogen phosphate (pH 6.0; 67 : 33), flow rate 1.0 mL/min. Fluorescence detection ($\lambda_{ex} = 335$ nm, $\lambda_{em} = 440$ nm). Retention times: FB_1 ~ 4.5 min, partially hydrolysed FB_1 metabolites 6.5 min and 7.5 min, aminopentol 14 min (OPA derivatives). Limit of detection, 0.4 mg/kg for FB_1 in dry faeces [Shephard *et al.* 1994]. Rat Urine and Plasma Samples. Column: C_8 (125 x 4.0 mm i.d., 5 µm). Mobile phase: methanol : 0.1 mol/L sodium dihydrogen phosphate (pH 3.4; 66 : 34), flow rate 1.0 mL/min. Fluorescence detection ($\lambda_{ex} = 335$ nm, $\lambda_{em} = 440$ nm). Retention time: FB_1 8 min (OPA derivative). Limit of detection, 50 µg/L in urine and in plasma [Shephard *et al.* 1992].

LC-MS Maize Silage Samples. Column: C_{18} (150 x 2.1 mm i.d., 5 µm). Mobile phase: acetonitrile : water-0.5% acetic acid (pH 3; 5 : 95 to 50 : 50 over 15 min to 80 : 20 over 10 min), flow rate 0.3 mL/min. ESI, positive and negative ion modes, SIM acquisition mode. Retention times: deoxynivalenol 6.9 min, aflatoxin B_1 15.4 min, citrinin 16.7 min, FB_1 15.1 min, gliotoxin 14.2 min, ochratoxin A 20.3 min, zearalenone 20.4 min. Limit of quantification, deoxynivalenol 5 ppb; gliotoxin 6.5 ppb; zearalenone 20 ppb; aflatoxin B_1, citrinin, FB_1, ochratoxin A 1.5 ppb [Richard *et al.* 2007]. Maize Samples. Column: C_{18} (150 ′ 2.0 mm i.d., 5 µm). Mobile phase: water : methanol-0.5% acetic acid-1 mmol/L ammonium acetate (80 : 20 for 3 min to 60 : 40 to 37 : 63 over 35 min for 11 min), flow rate 0.2 mL/min. ESI, negative and positive ion modes, MRM acquisition mode. Retention times: FB_1 30 min, FB_2 45 min, deoxynivalenol 7.5 min, aflatoxin G_2 15.5 min, aflatoxin G_1 17.0 min, aflatoxin B_2 18.5 min, aflatoxin B_1 20.5 min, HT-2 29 min, T-2 36 min, zearalenone 42 min, ochratroxin A 48.5 min. Limit of detection, FB_1 1.1 µg/kg, FB_2 0.4 µg/kg, other toxins 0.3 to 4.2 µg/kg [Lattanzio *et al.* 2007]. Rice Samples. Column: C_{18} (250 x 2.1 mm i.d., 5 µm). Mobile phase: water : acetonitrile-0.1% formic acid (75 : 25 to 60 : 40 over 22 min, to 0 : 100 over 5 min, for 3 min), flow rate 0.3 mL/min. ESI, positive ion mode. Retention times: FB_1 8.2 min, FB_2 15.6 min, FB_3 12.9 min, FB_4 20.8 min, FB_5 7.1 min, FA_1 12.4 min, FA_2 27.9 min, FA_3 19.6 min, FC_1 7.6 min, FC_2 15.0 min, FC_3 11.8 min, FC_4 19.5 min (method presents retention times for over 35 fumonisin-like compounds). Limit of quantification not reported [Bartok *et al.* 2006]. Maize-based Products. Column: C_{18} (250 x 2.1 mm i.d., 5 µm). Mobile phase: water : methanol both containing 25 mmol/L formic acid (40 : 60 for 3 min, to 10 : 90 over 5 min, to 0 : 100 for 10 min), flow rate 0.2 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention times: FB_1 8.2 min, FB_2 9.6 min, FB_3 8.9 min, FB_4 10.2 min. Limit of detection, FB_1 2 µg/kg, FB_2 1 µg/kg

F

[Faberi *et al.* 2005]. Column: Synergi Polar PR (150 x 2.0 mm i.d., 4 μm). Mobile phase: acetonitrile-methanol (50 : 50) : 0.02% aqueous formic acid (35 : 65 for 1 min to 60 : 40 over 9 min for 6 min), flow rate 0.2 mL/min. ESI, positive ion mode, SIM acquisition mode. Limit of detection, FB_1, hydrolysed FB_1 0.5 μg/kg [Park *et al.* 2004]. Column: C_{18} (150 x 2.1 mm i.d., 5 μm). Mobile phase: 0.05% trifluoroacetic acid-water : 0.05% trifluoroacetic acid-acetonitrile (70 : 30 to 55 : 45 over 15 min to 1 : 99 over 2 min), flow rate 0.2 mL/min. ESI, positive ion mode, SIM acquisition mode. Limit of detection, 10 μg/kg for FB_1, hydrolysed FB_1, and *N*-(carboxymethyl)-FB_1 [Hartl, Humpf 1999; Seefelder *et al.* 2001]. Maize Meal Samples. Column: C_{18} (250 ′ 2.1 mm i.d., 5 μm). Mobile phase: water : methanol-10 mmol/L formic acid (pH 3.8; 80 : 20 to 50 : 50 over 10 min to 20 : 80 over 15 min to 0 : 100 for 10 min), flow rate 0.2 mL/min. ESI, positive and negative ion modes, MRM acquisition mode. Retention times: FB_1 19.2 min, FB_2 23.3 min, FB_3 21.4 min, nivalenol 5.6 min, deoxynivalenol 7.6 min, fusarium X 9.6 min, neosolaniol 10.1 min, 3- and 15-acetyldeoxynivalenol 12.5 min, monoacetoxyscirpenol 14.2 min, diacetoxyscirpenol 16.7 min, HT-2 20.2 min, T-2 22.5 min, α-zearalenol 24.0 min, zearalanone 24.1 min, zearalenone 24.7 min. Limit of detection, FB_1 5 μg/kg, FB_2 3 μg/kg, other analytes 2–40 ng/g [Cavaliere *et al.* 2005]. Cornflakes Samples. Column: C_{18} (150 ′ 3.2 mm i.d., 5 μm). Mobile phase: acetonitrile : water-0.3% formic acid (60 : 40), flow rate 0.3 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention times: FB_1 3.5 min, FB_2 5.3 min, FB_3 7.1 min. Limit of quantification, 40, 15 and 25 μg/kg for FB_1, FB_2 and FB_3, respectively, limit of detection, 20, 7.5 and 12.5 μg/kg for FB_1, FB_2 and FB_3, respectively [Paepens *et al.* 2005]. Milk Samples. Column: C_{18} (150 x 4.6 mm i.d., 5 μm). Mobile phase: water-methanol (90 : 10) : water-methanol (10 : 90) both containing 0.02% acetic acid (30 : 70 for 2.2 min to 18 : 82 over 0.5 min for 11 min), flow rate 0.6 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention times: FB_1 6 min, FB_2 9.5 min. Limit of quantification, FB_1 50 ng/L, FB_2 40 ng/L; other toxins also detected [Sorensen, Elbaek 2005]. Soil Leachate Samples. Column: C_{18} (150 x 3.0 mm i.d., 5 μm). Mobile phase: methanol : water-0.3% acetic acid (60 : 40 to 90 : 10 over 20 min), flow rate 0.2 mL/min. ESI, positive ion mode, SIM acquisition mode. Retention times: FB_1 4.1 min, FB_2 9.8 min, FB_3 5.6 min (OPA derivatives). Limit of quantification not reported [Williams *et al.* 2003]. Porcine Tissue, Body Fluid Samples. Column: C_{18} (150 x 2.1 mm i.d., 3.5 μm). Mobile phase: acetonitrile : water : water–formic acid (95 : 5; 20 : 70 : 10 for 1 min to 80 : 10 : 10 over 18 min for 2 min), flow rate 0.2 mL/min. ESI, positive ion mode. Limit of quantification, 5 to 10 μg/kg for FB_1 depending on sample [Meyer *et al.* 2003]. Monkey and Rat Hair Samples. Column: C_{18} (150 x 4.6 mm i.d., 5 μm). Mobile phase: water-acetonitrile-formic acid (90 : 10 : 0.1): water-acetonitrile-formic acid (10 : 90 : 0.1; 80 : 20 to 72 : 28 over 24 min for 1 min), flow rate 0.7 mL/min. ESI, positive ion mode, SIM acquisition mode. Limit of quantification, FB_1, FB_2, FB_3 60 pg on-column, aminopentol-1 and aminopentol-2 80 pg. Limit of detection, FB_1, FB_2, FB_3 25 pg on-column; aminopentol-1 and aminopentol-2 35 pg [Sewram *et al.* 2001]. Maize Samples. Column: Fluofix 120E (30 x 4.6 mm i.d., 5 μm). Mobile phase: methanol : 0.1% trifluoroacetic acid (1 : 1), flow rate 0.8 mL/min. ESI, positive ion mode. Limit of quantification not reported [Akiyama *et al.* 1997].

CE Rodent Feed Samples. Column: uncoated capillary (total/effective length: 75/70 cm, 75 μm). Running buffer: 10% acetonitrile in 25 mmol/L sodium borate buffer (pH 9). Fluorescence detection ($\lambda_{ex} = 335$ nm, $\lambda_{em} = 440$ nm). Migration times: FB_1 ~16 min, FB_2 ~17 min (9-fluorenylmethylchloroformate derivatives). Limit of detection, 0.2 ppm [Holcomb, Thompson 1996]. Maize Samples. Column: capillary (50 cm, 75 μm i.d.). Running buffer: 60 mmol/L borate buffer (pH 9.5). Fluorescence detection. Migration time: 20 min (fluorescein isothiocyanate derivative). Limit of detection, 50 ppb [Maragos *et al.* 1996].

Note For a review of LC-MS methods for the detection of mycotoxins, see Zollner and Mayer-Helm [2006] and Sforza *et al.* [2006]. For a stable isotope dilution assay of fumonisins, see Rychlik and Asam [2008]. For a review of TLC systems and reagents and their applicability to FB_1 analysis, see Shephard and Sewram [2004]. For the analysis of sphinganine and sphingosine in blood and urine, see Ribar *et al.* [2001] and van der Westhuizen *et al.* [1999]; in serum, see Shephard and van der Westhuizen [1998]; in urine and tissues, see Castegnaro *et al.* [1996], Castegnaro *et al.* [1998]and Solfrizzo *et al.* [1997]. For an LC-ELISA method for the quantification of FB_1, FB_2, FB_3 and AAL toxins, see Yu and Chu [1998].

Disposition in the Body In animal studies, fumonisins are poorly absorbed from the gastrointestinal tract, have a low bioavailability (<3.5%), and are rapidly distributed and eliminated. Liver and kidney retain most of the absorbed material. Fumonisins do not appear to cross the placental barrier and are not metabolised *in vitro* or *in vivo*. Studies in rats administered FB_2 via IP injection have shown that it is rapidly absorbed from the peritoneum, reaching a peak plasma concentration within 20 min. It is rapidly eliminated from plasma, with a half-life of 26 min, and is not detected after 24 h. Elimination is mainly via faeces, and FB_2 appears to be excreted unmetabolised. Fumonisins, structurally similar to the sphingoid bases sphinganine and sphingosine, cause the inhibition of a key sphingolipid biosynthetic enzyme, ceramide synthase, which, in turn, can alter the activity of CYP enzymes. The inhibition of ceramide synthase leads to an elevation of sphinganine levels in cells, effectively killing the cells by the induction of apoptosis. The elevated sphinganine/sphingosine ratio resulting from the accumulation of sphinganine in blood and urine has been investigated as a possible biomarker for fumonisin exposure. The sphinganine/sphingosine ratio is a useful biomarker in animal studies (where exposures or doses are high), although exposures in human populations may be too low to produce definitive changes in these parameters to be conclusive.

Toxicity Fumonisins have been associated with several diseases in animals, including leukoencephalomalacia in horses, pulmonary oedema in pigs, and hepatocarcinoma in rats. Consumption of maize that is highly contaminated with fumonisins has been associated with increased risk of human oesophageal and liver cancer in South Africa, China, and northern Italy [Chu, Li 1994; Sun *et al.* 2007; Yoshizawa *et al.* 1994]. Furthermore, there is a possibility that fumonisins are connected with infant neural tube defects in southern Texas and Mexico [Hendricks 1999; Marasas *et al.* 2004; Missmer *et al.* 2006]. FB_1 is classified by the International Agency for Research on Cancer as possibly carcinogenic to humans (group 2B, [IARC 2002]). FDA recommended maximum levels for total fumonisins (FB_1, FB_2, FB_3) in human foods are 2 ppm for degermed dry-milled maize products, 4 ppm for whole or partially degermed dry-milled maizeproducts and dry-milled maize bran, and 3 ppm for cleaned maize intended for popcorn. FB_1 and FB_2 are also phytotoxic [Martins *et al.* 2001]. For a review on the biomarkers of fumonisin exposure, see Shephard *et al.* [2007].

In a study investigating tortilla consumption and human urinary FB_1 levels, 75 women were selected from a cohort of 996 volunteers according to their consumption of maize-based food in the previous year, as derived from a questionnaire. This group of volunteers were further split into three categories according to their level of maize-based food intake: high intake ($n = 26$), medium intake ($n = 25$) and low intake ($n = 24$). Urine samples were collected and analysed for FB_1 levels. Results were repoted as follows:

	Maize Consumption group		
	Low	***Medium***	***High***
Tortillas consumed each meal (median, range)	2 (1 to 5)	3 (3 to 3)	10 (6 to 16)
Urinary FB_1 levels (ng/L)	35.0	63.1	147.4

Although a correlation was demonstrated, a great inter-individual variation was observed in the urine levels, which reflects numerous factors (from variations in food preparation to the fact that other sources of fumonisin exposure were not considered in the study). An estimated daily exposure of 368 ng/kg bodyweight was calculated for the high-intake group (WHO and FDA daily recommendation 2 μg/kg). It is worth noting that the nixtamalisation process involved in the production of tortillas is known to reduce the fumonisin level up to 80% [Voss *et al.* 2001]. Therefore, FB_1 levels can be expected to be much higher when maize is consumed in forms other than tortillas [Gong *et al.* 2008].

In a study investigating the use of hair to assess exposure to fumonisins, monkeys receiving control, low-dose and high-dose fumonisin-contaminated diets had hair FB_1concentrations of 5.98, 33.77 and 65.93 μg/g, respectively. Similar results were observed in rats, thus indicating that hair may be an appropriate matrix for the assessment of chronic exposure to fumonisins [Sewram *et al.* 2001].

Half-life Estimated at 128 min.

Note For reviews and conference proceedings on fumonisins, see *Food Addit Contam* [Vol. 24, Issue 10, 2007; Vol. 18, Issue 3, 2001]. Furaltadone

Antibacterial (Veterinary)

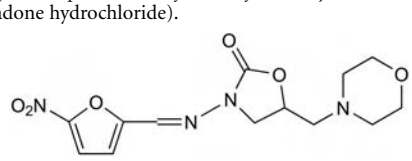
$C_{13}H_{16}N_4O_6$ = 324.3

CAS—139-91-3; 59302-14-6 (±)

IUPAC Name 5-(4-Morpholinylmethyl)-3-[[(5-nitro-2-furanyl)methylene] amino]-2-oxazolidinone

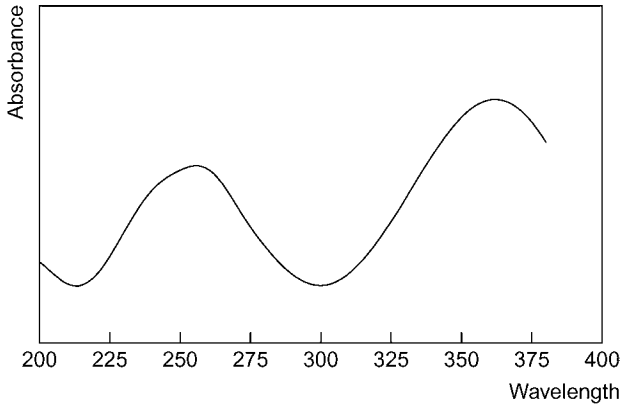
Synonyms Furmethonol; nitrofurmethonum.

Proprietary Names *Altafur*; *Altabactina*; *Furazolin*; *Ibifur*; *Medifuran*; *Nitraldone*; *Otifuril*; *Sepsinol*; *Ultrafur*; *Unifur*; *Valsyn*. It is an ingredient of *Panotile* (furaltadone hydrochloride).

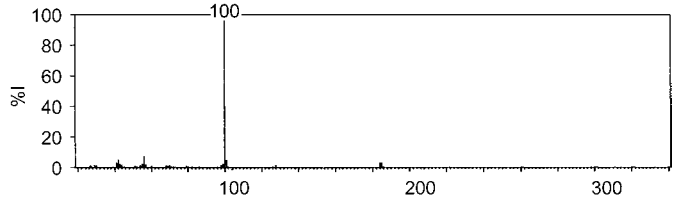


Chemical Properties A yellow crystalline powder. Mp about 205°. Soluble 1 in 2000 of water, 1 in 1000 of ethanol and 1 in 300 of chloroform; practically insoluble in ether. Log *P* (octanol/water), 0.2.

Colour Test Marquis test—yellow.
Thin-layer Chromatography System TA—R_f 0.43; system TB—R_f 0.00; system TC—R_f 0.40; system TL—R_f 0.40; system TAJ—R_f 0.35; system TAK—R_f 0.00; system TAL—R_f 0.62 (acidified iodoplatinate solution, positive).
High Performance Liquid Chromatography System HAA—retention time 8.9 min.
Ultraviolet Spectrum Aqueous acid—255, 362 nm.



Infrared Spectrum Principal peaks at wavenumbers 1755, 1226, 1250, 1110, 1020, 1315 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 100, 56, 101, 42, 185, 184, 41, 128.

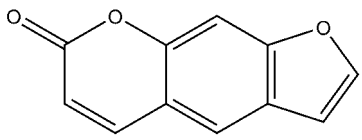


Disposition in the Body
Toxicity It was formerly administered orally, but preparations were withdrawn owing to its toxic effects. It is used in preparations for ear disorders.

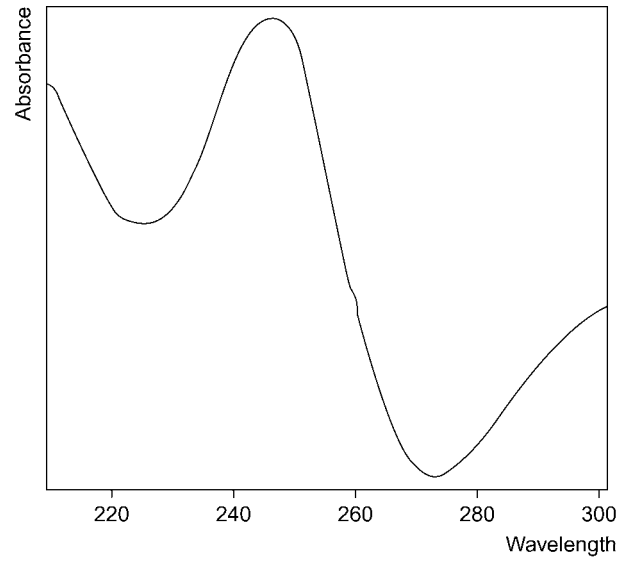
Furanocoumarins

Photosensitiser, Phytoalexin, Psoralens
$C_{11}H_6O_3$ = 186.2
CAS—66-97-7

IUPAC Name Furo[3,2-*g*]chromen-7-one
Synonyms Ficusin; furanocoumarin; 7*H*-Furo[3,2-*g*][1]benzopyran-7-one; furo[3,2-*g*]coumarin; furocoumarin; 6-hydroxy-5-benzofuranacrylic acid δ-lactone.



Chemical Properties Furanocoumarins (or psoralens) are potent photosensitising toxins that also act as phytoalexins, predominantly in plants of the Umbelliferae (parsley, celery, parsnips, carrots), Rutaceae (grapefruit, lime, bitter orange), and Moraceae (fig) families and several other plant sources. Furanocoumarins have been increasingly used for photochemotherapeutic treatment of dermatological diseases. Psoralen is one of the major linear furanocoumarins together with 8-methoxypsoralen (xanthotoxin), 5-methoxypsoralen (bergapten), and 5,8-dimethoxypsoralen (pimpinellin). White powder. Mp 158° to 161° [Valenciennes *et al.* 1999]; also reported as crystals from ether. Mp 163° to 164°, also as 169° to 179° [O'Neil *et al.* 2006]. Log *P* (octanol/water), 1.97 [Caffieri 2001]. Standard solutions of psoralen and bergapten were found to be stable for up to 24 h at 22°, 2 months at 4°, and 6 months at −20° [Cardoso *et al.* 2006].
Note For partition studies of psoralen and isopsoralen in different media, see Liu *et al.* [2004]. For the partition coefficient of psoralen derivatives and angelicin derivatives, see Caffieri [2001].
Ultraviolet Spectrum Principal peak at 250 nm



Infrared Spectrum Principal peaks at wavenumbers 1140, 1600–1650, 1725, 3100 cm^{-1}.
Mass Spectrum Principal ions at *m/z* 186, 158, 102, 51, 130, 50, 76, 75 [Valenciennes *et al.* 1999].
Quantification
Serum **HPLC** Column: C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : water (60 : 40), flow rate 1.0 mL/min. UV detection. *k* values: psoralen 2.2, bergapten 3.2. Limit of detection, 6 µg/L [Stolk *et al.* 1987].
Urine **HPLC** Column: C_8 (250 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : acetonitrile : water (0 : 30 : 70 for 10 min, to 25 : 25 : 50 over 12 min), flow rate 1.0 mL/min. UV detection (λ = 312 nm). Retention times: psoralen ~7.8 min, 7-hydroxycoumarin ~4.2 min, coumarin ~5.6 min, 7-methoxycoumarin ~6.6 min, 8-methoxypsoralen (xanthotoxin) ~8.4 min, 5,7-dimethoxycoumarin (citropten) ~9.6 min, 5,8-dimethoxypsoralen (isopimpinellin) ~10.6 min, 7-ethoxy-4-methylcoumarin ~13.2 min, 9-isopenteneoxypsoralen (imperatorin) ~20.8 min, 5-methoxypsoralen (bergapten) not reported. Limit of quantification, psoralen and isopimpinellin 2.5 mg/L; coumarin, 7-methoxycoumarin, citropten, bergapten and imperatorin 2.0 mg/L; 7-hydroxycoumarin and xanthotoxin 1.0 mg/L; 7-ethoxy-4-methylcoumarin 3.0 mg/L, limits of detection also reported [Wang, Jiang 2006].
Other **TLC** Plant Extracts (*Aglae marmelos*, *Trachyspermum ammi*, *Foeniculum vulgare*). Plates: precoated silica gel $60F_{254}$ (20 × 10 cm, 0.2 mm). UV detection (λ = 304 nm for psoralen, 331 nm for umbelliferone and 280 nm for eugenol). Solvent system: toluene : methanol (9.5 : 0.5). R_f values: psoralen 0.58, umbelliferone 0.3, eugenol 0.7. Limit of quantification, psoralen 16 ng/spot, umbelliferone 1.2 ng/spot, eugenol 150 ng/spot; limit of detection, psoralen 8.0 ng/spot, umbelliferone 0.8 ng/spot, eugenol 60 ng/spot [Dhalwal *et al.* 2007].
GC Cream and Pomade Phytochemical Formulations. Column: LM-5 fused silica capillary (15 m × 0.2 mm i.d., 0.2 µm). Carrier gas: H_2, 0.8 mL/min. Temperature programme: 150° to 240° at 10°/min to 280° at 5°/min for 15 min. FID. Limit of quantification, psoralen 4.3 mg/L, bergapten 2.0 mg/L, pimpinellin 9.7 mg/L, isopimpinellin 3.0 mg/L; limit of detection, psoralen 1.3 mg/L, bergapten 0.6 mg/L, pimpinellin 2.9 mg/L, isopimpinellin 1.0 mg/L [Cardoso *et al.* 2000].
GC-MS Capsules and Tablets of Phytochemical Preparations (*Dorstenia multiformes, Plumeria lancifolia*, *Cereus jamacaru*, *Erythrina mulungu*). Column: LM-5 fused silica capillary (15 m × 0.2 mm i.d., 0.2 µm). Temperature programme: 150° to 240° at 10°/min for 20 min. EI ionisation at 70 eV. Retention times: psoralen 4.3 min, bergapten 6.3 min, 5-[3-(4,5-dihydro-5,5-dimethyl-4-oxo-2-furanyl)-butoxy]-7*H*-furo[3,2-*g*][1]benzopyran-7-one (DT) 16.5 min. Limit of quantification, psoralen 0.33 mg/L, bergapten 0.30 mg/L, DT 0.8 mg/L, limit of detection, psoralen 0.1 mg/L, bergapten 0.09 mg/L, DT 0.24 mg/L [Cardoso *et al.* 2006].
HPLC Traditional Chinese Medicine Samples (*Psoralea corylifolia*). Column: C_8 (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water-0.1% acetic acid (10 : 90 to 82 : 18 over 40 min), flow rate 1.0 mL/min. UV detection (λ = 310 nm). Retention times: psoralen 17.4 min, isopsoralen 17.9 min, psoralenoside 7.5 min, isopsoralenoside 7.9 min, bavachromene 23.5 min, corylifolin 24.7 min, corylin 25.8 min, psoralidin 26.3 min, isobavachalcone 29.1 min, bavachinin 30.1 min, corylifol A 30.7 min, bakuchiol 37.7 min. Limit of quantification, (on-column) psoralen 2.42 ng, isopsoralen 2.35 ng, limit of detection, (on-column) psoralen 0.85 ng, isopsoralen 0.77 ng [Qiao *et al.* 2007]. Traditional Chinese Medicine Samples (*Umbelliferae* spp.). Column: C_8 (250 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : acetonitrile : water (0 : 30 : 70 for 10 min to 25 : 25 : 50 over 12 min), flow rate 1.0 mL/min. UV detection (λ = 312 nm). Retention times: psoralen ~7.8 min, 7-hydroxycoumarin ~4.2 min, coumarin ~5.6 min, 7-methoxycoumarin ~6.6 min, xanthotoxin ~8.4 min, citropten ~9.6 min, isopimpinellin ~10.6 min, 7-ethoxy-4-methylcoumarin ~13.2 min, imperatorin ~20.8 min, bergapten not reported. Limit

of quantification not reported [Wang, Jiang 2006]. Capsules, Tablets and Topical Preparations of Phytochemicals (*D. multiformes, P. lancifolia*, *C. jamacaru*, *E. mulungu*). Column: C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water (55 : 45), flow rate 1.0 mL/min. UV detection (λ = 223 nm). Retention times: psoralen 6.2 min, bergapten 7.5 min, DT 11.4 min. Limit of quantification, psoralen 0.1 mg/L, bergapten 0.23 mg/L, DT 0.5 mg/L, limit of detection, psoralen 0.03 mg/L, bergapten 0.07 mg/L, DT 0.15 mg/L [Cardoso *et al.* 2002a, 2002b, 2006; Pires *et al.* 2004]. Plant Extracts (*Zanthoxylum americanum*). Column: C_{18} (125 × 4.0 mm i.d., 5 µm). Mobile phase: water : sodium dihydrogen phosphate buffer : acetonitrile (80 : 10 : 20 to 50 : 10 : 50 over 20 min to 45 : 10 : 55 over 10 min), flow rate 1.0 mL/min. UV detection (λ = 225 nm). Limit of quantification not reported [Bafi-Yeboa *et al.* 2005]. Traditional Chinese Medicine Samples (*P. corylifolia*). Column: C_{18} (200 × 4.6 mm i.d., 10 µm). Mobile phase: methanol : water (40 : 60), flow rate 1.0 mL/min. UV detection (λ = 254 nm). Retention time: psoralen ~26 min, isopsoralen ~30 min. Limit of quantification not reported [Liu *et al.* 2004]. Celery and Parsnip Samples. Column: C_{18} (200 × 2.1 mm i.d., 4 µm). Mobile phase: water : methanol (45 : 55), flow rate 0.2 mL/min. UV detection (λ = 304, 270, 246 nm). Limit of detection, 0.5 mg/L [Ostertag *et al.* 2002]. Column: diphenyl (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile-methanol-water (20 : 180 : 800) : acetonitrile-methanol (20 : 180; 100 : 0 for 10 min to 70 : 30 over 20 min to 25 : 75 over 15 min), flow rate 1.5 mL/min. DAD. Retention times: psoralen 18 min, angelicin 20 min, xanthotoxin 23 min, bergapten 26 min, trioxsalen 36 min. Limit of quantification, 0.03 mg/kg (DAD), 0.1 mg/kg (UV λ = 254 nm) [Lombaert *et al.* 2001].

LC-MS Traditional Chinese Medicine Samples (*P. corylifolia*). Column: C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: water-acetic acid (100 : 0.1) : acetonitrile (60 : 40 to 50 : 50 over 15 min to 40 : 60 over 20 min to 30 : 70 over 10 min to 20 : 80 over 10 min), flow rate 1.0 mL/min. ESI, positive ion mode and UV detection (λ = 245 nm). Retention times: psoralen ~12 min, isopsoralen ~13 min, neobavaisoflavone ~20 min, bavachin ~24 min, corylin ~26 min, bavachromene ~28 min, psoralidin ~31 min, isobavachalcone ~37 min, bavachinin ~39 min, bavachalcone ~52 min. Limit of quantification not reported [Zhao *et al.* 2005].

CE Plant Samples (*P. corylifolia* L.) and Traditional Chinese Medicine Samples. Column: fused silica capillary (total/effective length: 50/42.2 cm, 75 µm i.d.). Running buffer: 30% microemulsion (ethyl acetate : SDS : butan-1-ol : water [3.2 : 3.5 : 0.8 : 92.5]) with 25 mmol/L borate (pH 8.5). UV detection (λ = 254 nm). Limit of detection, psoralen 0.42 mg/L, isopsoralen 0.32 mg/L [Zhang *et al.* 2007]. Column: fused silica capillary (total/effective length: 59/51 cm, 75 µm i.d.). Running buffer: 18 mmol/L borate buffer, 12 mmol/L phosphate buffer, 25 mmol/L SDS (pH 9.2). UV detection (λ = 254 nm). Limit of quantification, psoralen and isopsoralen 0.05 mg/L [Wang *et al.* 1999].

Disposition in the Body Furanocoumarins can intercalate into DNA in the presence of UV light. These molecules absorb energy and can react with epidermal DNA producing a covalent bond between the furancoumarin and nucleic acid. Depending on the dose administered, this bond can lead to either cell death or DNA repair, synthesis and replication.

Toxicity Furanocoumarins are capable of inducing photodermatitis and high-dose exposure may result in swelling, redness and lesion formation on the epidermis, or even cutaneous carcinoma in extreme cases. The storage of furanocoumarin-containing foodstuff can dramatically affect levels of furanocoumarins present and should be monitored [Ostertag *et al.* 2002].

Note For a case study of a severe bullous reaction in a 6-year-old boy resulting from soaking both hands in a lime-based drink, see Wagner *et al.* [2002] (no furanocoumarin levels measured in human samples).

Protein Binding Approximately 89% to serum albumin.

Note For an overview of psoralens in the treatment of psoriasis, see McEvoy and Stern [1987].

Dose Used as a photochemotherapy in conjunction with high-intensity UV for the treatment of skin diseases.

Furazolidone

F

Antimicrobial

$C_8H_7N_3O_5$ = 225.2

CAS—67-45-8

IUPAC Name 3-[[(5-Nitro-2-furanyl)methylene]amino]-2-oxazolidinone

Synonym Nifurazolidonum

Proprietary Names *Coryzium* (vet.); *Exofur*; *Furasian*; *Furion*; *Furovag*; *Furoxane*; *Furoxona*; *Furoxone*; *Fuxol*; *Giardil*; *Giarlam*; *Medaron*; *Neftin* (vet.); *Nicolen*; *Nifulidone*; *Nifuran*; *Novafur*; *Ortazol*; *Quimefuran*; *Roptazol*; *Salmocide*; *Seforman*; *Tikofuran*; *Topazone*; *Tricofuron*.

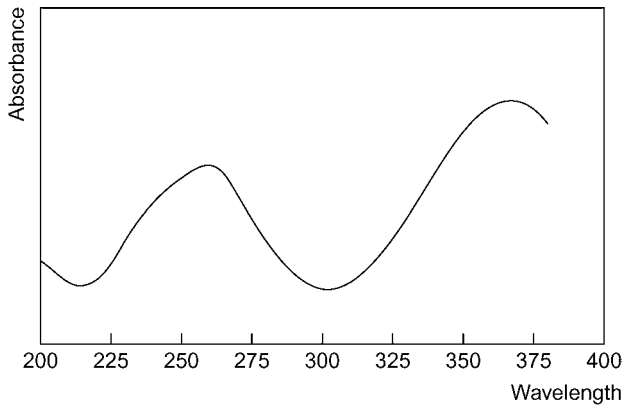
Chemical Properties A yellow crystalline powder. Mp about 259°, with decomposition. Very slightly soluble in water and ethanol; slightly soluble in chloroform; practically insoluble in ether. Log *P* (octanol/water), −0.04.

Colour Test Dissolve 1 mg in 1 mL of dimethylformamide with 0.05 mL of 1 mol/L ethanolic potassium hydroxide—deep blue.

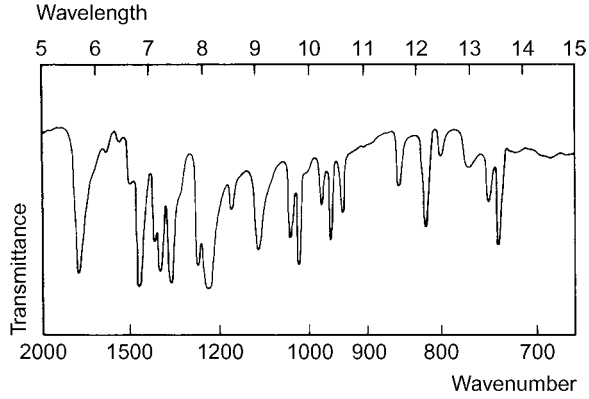
Thin-layer Chromatography System TA—R_f 0.44; system TB—R_f 0.00; system TC—R_f 0.47; system TE—R_f 0.46; system TF—R_f 0.18; system TL—R_f 0.59; system TAE—R_f 0.56.

High Performance Liquid Chromatography System HAA—retention time 12.2 min; system HX—RI 336.

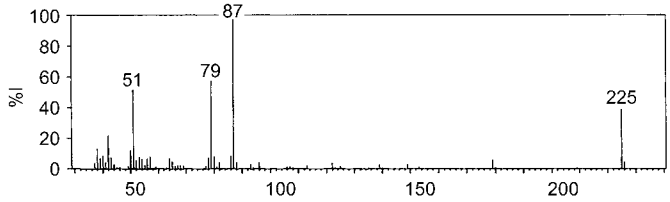
Ultraviolet Spectrum After solution in dimethylformamide and dilution with water—259, 367 nm (A^1_1=754a).



Infrared Spectrum Principal peaks at wavenumbers 1227, 1739, 1015, 1250, 1101, 738 cm^{-1} (Nujol mull).



Mass Spectrum Principal ions at *m/z* 87, 79, 51, 225, 42, 50, 86, 80.



Quantification
Biological Fluids **HPLC** Limit of detection, 50 µg/L [Valadez-Salazar *et al.* 1989].
Dose 400 mg daily.

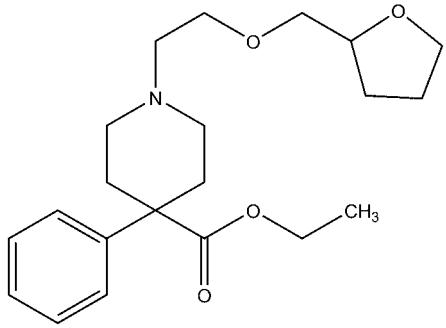
Valadez-Salazar A *et al.* (1989). Detection of furazolidone in human biological fluids by high performance liquid chromatography. *J Antimicrob Chemother* 23: 589–595.

F

Furethidine

Narcotic
$C_{21}H_{31}NO_4$ = 361.5
CAS—2385-81-1

IUPAC Name Ethyl 1-[2-(oxolan-2-ylmethoxy)ethyl]-4-phenylpiperidine-4-carboxylate
Synonyms Ethyl 4-phenyl-1-(2-tetrahydrofurfuryloxyethyl)piperidine-4-carboxylate; ethyl 1-(tetrahydrofurfuryloxyethyl)-4-phenylpiperidine-4-carboxylate; 4-phenyl-1-[2-(tetrahydro-2-furanyl)methoxy]ethyl]-4-piperidinecarboxylic acid ethyl ester; 4-phenyl-1-[2-(tetrahydrofurfuryloxy)ethyl]isonipecotic acid ethyl ester; TA 48; 1-(2′-tetrahydrofurfuryloxyethyl)norpethidine.



Chemical Properties A yellow oil. Mp ≈28°. Soluble in dilute hydrochloric acid. pKa 7.48 [O'Neil *et al.* 2006]. Furethidine is extracted by organic solvents from aqueous alkaline solutions.

Furethidine Methiodide
$C_{22}H_{34}INO_4$ = 503.4

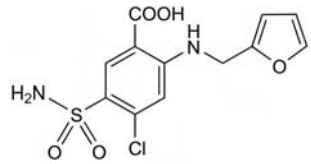
Chemical Properties Crystals from ethyl acetate. Mp 174°.
Colour Test Sulfuric acid-formaldehyde test—orange (limit of detection, 0.5 µg).
Thin-layer Chromatography System T1—R_f 0.66 (location reagent acidified iodoplatinate spray, positive reaction).

O'Neil MJ *et al.* (2006). *The Merck Index: An Encyclopedia of Chemicals, Drugs and Biologicals*, 14 edn. Whitehouse Station, NJ: Merck & Co., Inc.

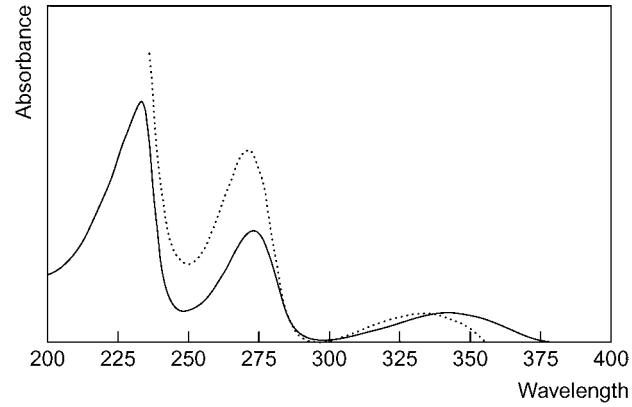
Furosemide

Diuretic
$C_{12}H_{11}ClN_2O_5S$ = 330.7
CAS—54-31-9

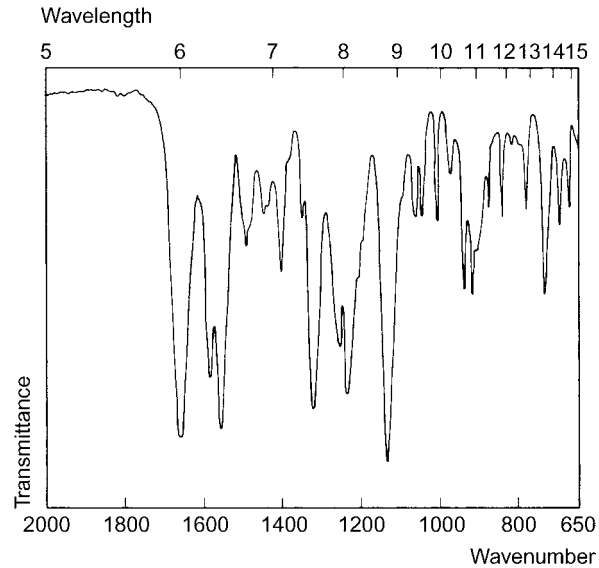
IUPAC Name 4-Chloro-2-(furan-2-ylmethylamino)-5-sulfamoylbenzoic acid
Synonyms 5-(Aminosulfonyl)-4-chloro-2-[(2-furanylmethyl)amino]benzoic acid; furosemidum; fursemide; frusemide; LB-502.
Proprietary Names *Dryptal*; *Froop*; *Frumax*; *Frusid*; *Frusol*; *Lasix*; *Rusyde*; *Tenkafruse*. See Sweetman [2009] for further proprietary names. It is an ingredient of *Aridil*, *Diumide-K*, *Frumil*, *Frusemek*, *Frusene*, *Lasikal*, *Lasilactone* and *Lasoride*.



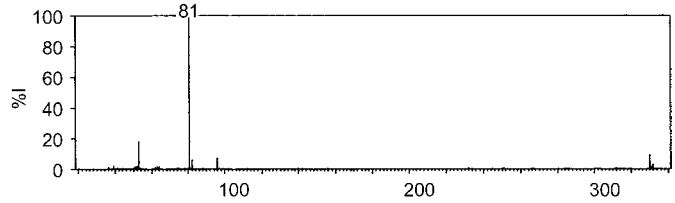
Chemical Properties A white or slightly yellow crystalline powder. Mp about 206°, with decomposition. Slightly soluble in water and chloroform; soluble 1 in 75 of ethanol, 1 in 15 of acetone and 1 in 850 of ether; soluble in dimethylformamide. pK_a 3.9 (20°). Log *P* (octanol/water), 2.0. Extraction yield (chlorobutane), 0 [Demme *et al.* 2005].
Colour Tests Koppanyi-Zwikker test—violet; Liebermann's reagent—black; sulfuric acid—yellow.
Thin-layer Chromatography System TB—R_f 0.00; system TD—R_f 0.01; system TE—R_f 0.06; system TF—R_f 0.07; system TG—R_f 0.19; system TAD—R_f 0.07; system TAE—R_f 0.86; system TAJ—R_f 0.10; system TAK—R_f 0.25; system TAL—R_f 0.70 (mercurous nitrate spray, positive; acidified potassium permanganate solution, positive; Van Urk reagent, pink-brown).
Gas Chromatography System GA—furosemide not eluted, furosemide-Me RI 2890, furosemide-Me_2 RI 2850, furosemide-Me_3 RI 2800, art (-SO_2NH) RI 2040, art (-SO_2NH)-Me RI 2020, art (-SO_2NH)-Me_2 RI 2050, M (*N*-desalkyl-)-Me RI 2750, M (*N*-desalkyl-)-Me_2 RI 2450; system GD—methyl derivative RRT 2.64 (relative to n-$C_{16}H_{34}$); system GX—furosemide-Me_3 retention time 7.0 min; system GY—furosemide-Me_3 retention time 4.7 min.
High Performance Liquid Chromatography System HV—RRT 0.45 (relative to meclofenamic acid); system HX—RI 435; system HY—RI 380; system HZ—retention time 3.5 min; system HAA—retention time 15.2 min; system HAX—retention time 5.8 min; system HAY—retention time 5.0 min.
Ultraviolet Spectrum Aqueous acid—235 (A^1_1=1333a), 274 (A^1_1=600a), 342 nm; aqueous alkali—271 (A^1_1=580a), 333 nm.



Infrared Spectrum Principal peaks at wavenumbers 1143, 1668, 1565, 1240, 1590, 1260 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 81, 53, 330, 96, 82, 332, 64, 63.



Quantification
Plasma **GC** ECD. Limit of detection, 20 µg/L [Keller *et al.* 1981].
GC-MS Selected ion monitoring [Ptacek *et al.* 1996].
HPLC Limit of detection, 5 µg/L [Abou-Auda *et al.* 1998]. Fluorescence detection. Furosemide and its acyl glucuronide [Vree *et al.* 1994]. Fluorescence detection.

Limit of detection, 1.8 µg/L [Farthing *et al.* 1992]. Fluorescence detection. Furosemide and amiloride. Limit of detection 0.3 µg/L for furosemide [Reeuwijk *et al.* 1992]. Fluorescence detection. Limit of detection, 5 µg/L [Saugy *et al.* 1991]. Fluorescence detection. Limit of detection, 100 µg/L [Kerremans *et al.* 1982]. Fluorescence detection. Furosemide and its glucuronide metabolite. Limit of detection, 8 µg/L [Smith *et al.* 1980].

HPLC-MS Limit of detection, 10 µg/L [Abdel-Hamid 2000].

Serum **HPLC** [Okuda *et al.* 1996].

Urine **GC** See Plasma [Keller *et al.* 1981].

GC-MS See Plasma [Ptacek *et al.* 1996].

HPLC UV detection [Nava-Ocampo *et al.* 1999]. See Plasma [Abou-Auda *et al.* 1998]. Amperometric detection. Furosemide and piretanide, [Barroso *et al.* 1996]. See Plasma [Vree *et al.* 1994]; [Saugy *et al.* 1991]; limit of detection, 500 µg/L [Kerremans *et al.* 1982]; [Smith *et al.* 1980].

Other **HPLC** Neonatal plasma. Fluorescence detection [Sidhu, Charles 1993].

Disposition in the Body Rapidly but incompletely absorbed after oral administration. Up to 90% of an IV dose is excreted in the urine, mainly as unchanged drug with up to 14% of the dose as a glucuronide conjugate. 2-Amino-4-chloro-5-sulfamoylanthranilic acid has been reported as a metabolite in several studies, but in other cases it has not been detected and it has been suggested that it is an analytical artefact produced during acid extraction procedures. In normal subjects, about 6 to 18% of a dose is eliminated in the faeces after IV administration; this may be increased to about 60% in renal failure. It crosses the placenta and is found in breast milk.

Therapeutic Concentration

Following a single oral dose of 80 mg to 8 fasting subjects, peak serum concentrations of 1.8 to 4.9 mg/L (mean 2.3) were attained in 60 to 70 min [Kelly *et al.* 1974].

Plasma concentrations averaging 7.5 mg/L were reported 10 min after an IV dose of 40 mg to 9 subjects [Smith *et al.* 1980].

Bioavailability About 60 to 70%.

Half-life Plasma half-life, about 1 to 3 h, increased in subjects with renal failure, congestive heart failure, liver disease and in neonates (up to about 46 h).

Volume of Distribution About 0.1 to 0.2 L/kg, increased in subjects with liver disease, nephrotic syndrome and in neonates.

Clearance Plasma clearance, about 1 to 3 mL/min/kg, decreased in uraemia, heart failure, the elderly and neonates.

Protein Binding About 99%, decreased in patients with cirrhosis, the nephrotic syndrome and uraemia.

Note For reviews of furosemide pharmacokinetics, see Benet [1979] and Cutler and Blair [1979].

Dose Usually 20 to 80 mg daily; in oliguria, up to maximum single dose of 2 g.

F

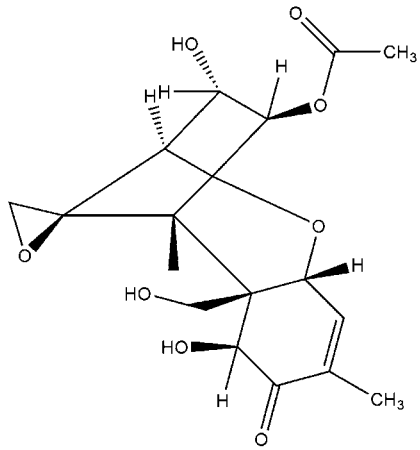
Fusarenone-X

12,13-Epoxytrichothecene, Mycotoxin

$C_{17}H_{22}O_8 = 354.4$

IUPAC Name 4β-Acetoxy-3α,7α,15-trihydroxy-12,13-epoxytrichothec-9-en-8-one

Synonyms Fusarenon-X, fusarenon, nivalenol monoacetate, monoacetylnivalenol.



Ultraviolet Spectrum Principal peak at 220 nm [Sydenham *et al.* 1996].

Mass Spectrum Principal peaks at *m/z* 179, 159, 191, 247, 217, 229 [Sydenham *et al.* 1996].

Thin-layer Chromatography Plates: RP-18 and KC-18. Solvent systems: (A) methanol : water; (B) acetonitrile : water; (C) tetrahydrofuran : water. Location reagents: 4-(*p*-nitrobenzyl)pyridine for trichothecenes; UV (λ= 365 nm) for aflatoxins, ochratoxin A, citrinin; aluminium trichloride for sterigmatocystin; Azoene Fast Violet B for zearalenone; 3-methyl-2-benzthiazolinone hydrazone hydrochloride for patulin and penicillic acid. Solvent composition and R_f values reported on the table as followe:

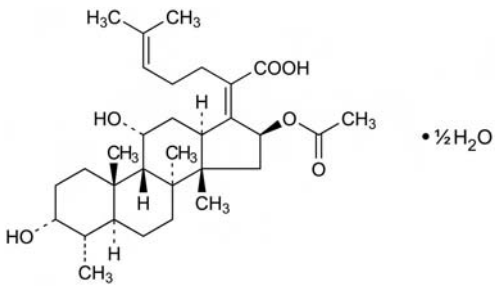
Fusidic Acid

F

Antibiotic
$C_{31}H_{48}O_6, {}^1/_2H_2O$ = 525.7
CAS—6990-06-3 (anhydrous)

IUPAC Name (2*Z*)-2-[(3*R*,4*S*,5*S*,8*S*,9*S*,10*S*,11*R*,13*R*,14*S*,16*S*)-16-Acetyloxy-3,11-dihydroxy-4,8,10,14-tetramethyl-2,3,4,5,6,7,9,11,12,13,15,16-dodecahydro-1*H*-cyclopenta[*a*]phenanthren-17-ylidene]-6-methylhept-5-enoic acid
Synonym (3α,4α,8α,9β,11α,13α,14β,16β,17*Z*)-16-(Acetyloxy)-3,11-dihydroxy-29-nordammara-17(20),24-dien-21-oic acid hemihydrate
Proprietary Names *Fucidin (suspension)*; *Fucithalmic*; *Futasole*.

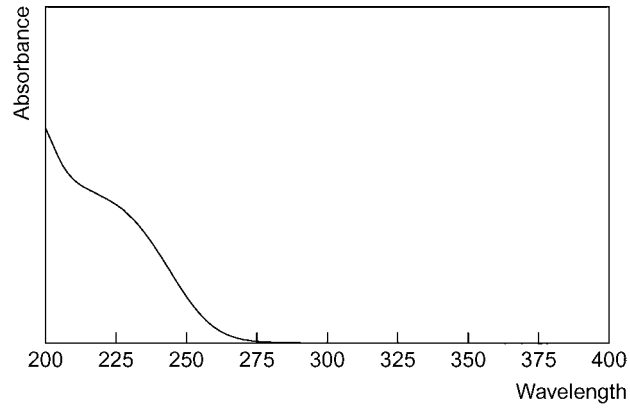


Chemical Properties A white crystalline powder. Mp about 193°. Sparingly soluble in water and hexane; soluble 1 in 5 of ethanol, 1 in 4 of chloroform and 1 in 60 of ether; soluble in acetone, pyridine, and dioxane. pK_a 5.4. Log *P* (octanol/water), 6.8.

Sodium Fusidate

$C_{31}H_{47}NaO_6$ = 538.7
CAS—751-94-0
Synonym Fusidate sodium
Proprietary Names *Dermomycin*; *Fucidin(e) (tablets)*.
Chemical Properties A white, slightly hygroscopic, crystalline powder. Soluble 1 in 1 of water, 1 in 1 of ethanol and 1 in 350 of chloroform; practically insoluble in ether.

High Performance Liquid Chromatography System HAA—retention time 24.9 min.
Ultraviolet Spectrum

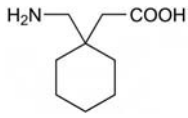


Infrared Spectrum Principal peaks at wavenumbers 1267, 1547, 1706, 1238, 1020, 966 cm^{-1} (sodium fusidate, KBr disk).
Quantification
Plasma **HPLC** UV detection. Limit of detection, 200 µg/L [Rahman, Hoffman 1988]. UV detection. Limit of detection, 500 µg/L [Hikal 1983].
Dose 1.5 to 3 g of sodium fusidate daily.

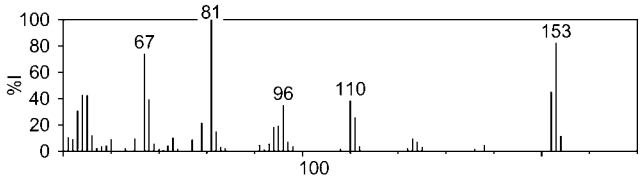
Hikal AH (1983). *Int J Pharm* 13: 297–301.
Rahman A, Hoffman NE (1988). High-performance liquid chromatographic determination of fusidic acid in plasma. *J Chromatogr* 433: 159–166.

Gabapentin

Anticonvulsant
$C_9H_{17}NO_2$ = 171.2
CAS—60142-96-3
IUPAC Name 1-(Aminomethyl)cyclohexaneacetic acid
Synonyms CI-945; GOE-3450.
Proprietary Names *Aclonium*; *Neurontin*.



Chemical Properties A white to off-white crystalline solid. Mp 162° to 166°, also reported as 165° to 167°. Feely soluble in water (4491 mg/L at 25°), basic and acidic aqueous solutions. pK_a 3.68, 10.7. Log *P* (octanol/water), −1.10. Extraction yield (chlorobutane), 0 [Demme *et al.* 2005].
Gas Chromatography System GA—gabapentin-H_2O RI 1750, gabapentin-H_2O-Me RI 1560; system GB—gabapentin-H_2O RI 1633.
Mass Spectrum Principal ions at *m/z* 81, 153, 67, 152, 55, 54, 68, 96 (gabapentin-H_2O).



Quantification

Plasma **GC** Column: capillary Megabore DB-1 (30 m × 0.53 mm, i.d., 1.5 µm). Temperature programme: held at 160° for 4 min, to 260° at 15°/min. Injector and detector temperature: 285°. Carrier gas: He, flow rate 8 mL/min. IS: Go-3609A. Detection: FID. Retention time: gabapentin, 7.24 min; IS, 9.0 min. Limit of quantification, 0.2 mg/L [Hooper *et al.* 1990].
Serum **HPLC** Column: C_{18} Hypersil BDS (125 × 3 mm i.d., 3 µm). Temperature: 35°. Mobile phase: 250 mmol/L phosphate buffer-acetonitrile-water (32:9.5:58.5) : acetonitrile-methanol-water (28 : 24 : 48; 42:58 for 7 min, to 35:65 for 6 min to 25:74 for 3 min, then to 0:100 for 7 min, flow rate 0.45 mL/min. Fluorescence detection (λ_{ex}=340 nm, λ_{em}=440 nm). Retention time: 16.7 min. Limit of quantification, 0.9 mg/L, limit of detection, 0.2 mg/L [Ratnaraj, Patsalos 1998]. Column: C_{18} Ultrasphere (250 × 4.6 mm i.d.). Mobile phase: water : acetonitrile : acetic acid : *n*-butylamine, (pH <4.5, 480:520:1.0:0.1), flow rate 1.2 mL/min. IS: 1-(aminomethyl)cycloheptaneacetic acid. UV detection (λ= 340 nm). Retention time: gabapentin, 9.8 min; IS, 13.3 min. Limit of detection, 0.03–0.05 mg/L [Lensmeyer *et al.* 1995].
Urine **GC** Limit of quantification, 5 mg/L, see Plasma [Hooper *et al.* 1990].
Disposition in the Body Gabapentin is well absorbed after oral administration but is not metabolised within the body. 80% of a single dose is excreted unchanged in urine and the rest in faeces. It is widely distributed throughout the body and easily crosses the blood–brain barrier.
Therapeutic Concentration

Healthy male volunteers were orally administered with single doses of 300, 600, 900, 1200, 1800, 2400, 3600 and 4800 mg gabapentin. Peak plasma concentrations increased with dose with 1.91, 3.29, 4.02, 5.50, 8.46, 7.65, 11.9 and 12.4 mg/L, respectively and were all reached between 1.8 and 2.8 h [*Eur J Clin Pharmacol* 1989.]

Toxicity Up to 49 g of gabapentin has been reported in a single overdose with drowsiness, mild diarrhoea, dizziness, double vision, slurred speech and lethargy as symptoms. Full recovery was made.
Bioavailability Absolute bioavailability is ≈60% over the dose range 300–600 mg, but outside this, as dose increases, bioavailability decreases.
Half-life 5–7 h.
Volume of Distribution 0.6–0.8 L/kg.
Distribution in Blood Drug penetrates red blood cells. Extravascular distribution.
Protein Binding <3%.
Dose Initial adult dose is 300 mg/day, 300 mg twice a day (2nd day of treatment), 300 mg three times a day (third day), with a maximum of 2.4 g a day. Usual range is between 0.9 and 1.8 g a day. Reduced for elderly patients and those with reduced renal function.

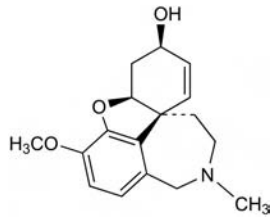
Galantamine

Treatment of Alzheimer's Disease, Anticholinesterase
$C_{17}H_{21}NO_3$ = 287.4
CAS—357-70-0
Synonyms Galanthamine; (4a*S*,6*R*,8a*S*)-4a,5,9,10,11,12-hexahydro-3-methoxy-11-methyl-6*H*-benzofuro[3a,3,2-e,f][2]benzazepin-6-ol; jilkon; lycoremin; lycoremine; NSC-100058.



Chemical Properties Crystals from benzene. Mp 126° to 127°. Fairly soluble in hot water; freely soluble in alcohol, acetone and chloroform; less soluble in benzene and ether. Solubility in water is 31 g/L (pH 6). pK_a 8.2. Log *P* (octanol/pH 12), 1.09.

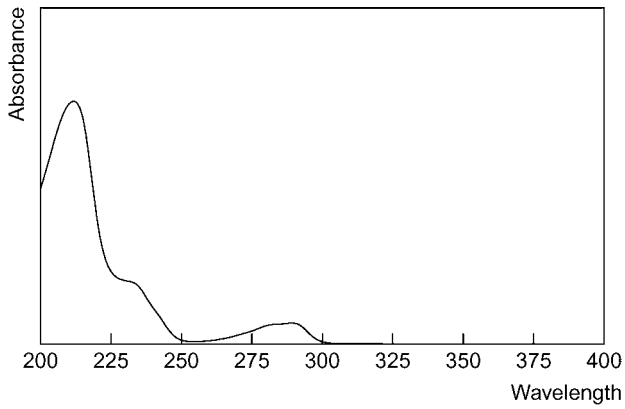
Galantamine Hydrochloride

$C_{17}H_{21}NO_3$,HCl = 323.8
Chemical Properties Crystals from water. Mp 256° to 257° (dec.). Sparingly soluble in cold water; more soluble in hot water; very sparingly soluble in alcohol and acetone.

Galantamine Hydrobromide

$C_{17}H_{21}NO_3$,HBr = 368.3
CAS—1953-04-4
Proprietary Names *Nivalin*; *Reminyl*.
Chemical Properties Crystals from water. Mp 246° to 247° (dec.).

Gas Chromatography System GA—RI 2285.
Ultraviolet Spectrum Principal peaks at 213, 233, 289 nm.



Quantification

Plasma **HPLC** Fluorescence detection (λ_{ex}=290, λ_{em}=320 nm). Limit of detection, 1 µg/L for galantamine and epigalantamine and 15 µg/L for galantaminone [Bickel *et al.* 1991a].
Disposition in the Body The presence of food delays the rate of absorption of galantamine but does not affect the extent. Patients with Alzheimer's disease tend to produce plasma drug concentrations 30 to 40% higher than healthy, young subjects. Galantamine is metabolised in the liver by the cytochrome P450 isoenzymes CYP2D6 and CYP3A4, and ≈75% of the dose is metabolised. Metabolites include norgalantamine (active), *N*-oxide-galantamine, *O*-desmethylgalantamine (active), *O*-desmethylnorgalantamine (active), epigalantamine and galantaminone. No active metabolites have been detected in the unconjugated forms in plasma. The majority of the dose is excreted in urine; 18 to 22% as the unchanged drug during the 24 h period after dosing. A minor amount is excreted in faeces. The drug does not appear to accumulate after multiple dosing.

Therapeutic Concentration

Eight healthy male volunteers, aged 21 to 35 years (mean age, 29.5 years), were fasted overnight and administered with 5 mg and 10 mg galantamine intravenously as a constant-rate infusion over 30 min. The same subjects were also administered with a 10 mg solution and tablet form orally. The peak plasma concentrations for the IV doses were 24.2 to 42.9 µg/L for the 5 mg dose and 50.7 to 97.4 µg/L for the 10 mg dose. For the oral doses, the peak concentrations were 28.7 to 57.9 µg/L for the tablet, observed at 0.5 to 2.0 h, and 28.9 to 56.5 µg/L for the oral solution at 0.5 to 1.25 h [Bickel *et al.* 1991b].

Eight female patients, aged 38 to 79 years, undergoing minor gynaecological operations were treated with 0.3 mg/kg galantamine hydrobromide (equivalent to 0.234 mg free base) intravenously by rapid infusion. The patients were already anaesthetically induced with althesin, fentanyl and nitrous oxide, and the galantamine dose was administered at the end of surgery. The peak serum concentrations obtained were 543 µg/L at 2 min and 128 µg/L after 30 min [Westra *et al.* 1986].

Toxicity

Significant overdosing of galantamine can lead to signs and symptoms similar to those observed with overdosing of other cholinomimetics; generally involving the central nervous system, the parasympathetic nervous system and the neuromuscular junction. Symptoms include muscle weakness or fasciculations, severe nausea, vomiting, gastro-intestinal cramping, salivation, lacrimation, urination, defecation, sweating, bradycardia, hypotension, collapse and convulsions. Increasing muscle weakness along with tracheal hypersecretions and bronchospasm, may result in vital airway compromise [Janssen-Cilag Ltd.].

Bioavailability Absolute, 88.5%.

Half-life 7 to 8 h.

Volume of Distribution 175 L; steady state, 2.64 L/kg (194.8 L).

Clearance Plasma, 0.34 L/h/kg; serum, 5.37 mL/min. Clearance is approximately 20% lower in females than males and 25% lower in poor metabolisers of galantamine than extensive metabolisers.

Protein Binding 18%.

Dose Initially 4 mg is administered twice daily for 4 weeks and can be increased to 8 mg twice daily for 4 weeks. The maintenance dose is 8 to 12 mg twice daily. For patients with moderate hepatic impairment, the dose is 4 mg once daily and should not exceed 8 mg.

Gallamine Triethiodide

Muscle Relaxant

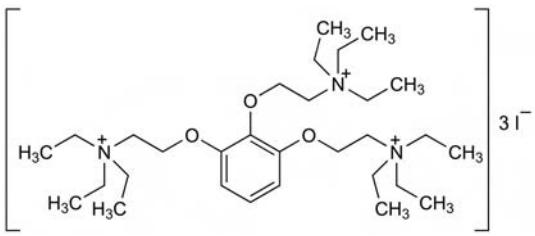
$C_{30}H_{60}I_3N_3O_3 = 891.5$

CAS—153-76-4 (gallamine); 65-29-2 (triethiodide)

IUPAC Name 2,2′,2″[1,2,3-Benzenetriyltris(oxy)]tris[*N*,*N*,*N*-triethylethanaminium] triiodide

Synonym Bencurine iodide

Proprietary Names *Flaxedil*; *Miowas G*; *Relaxan*.



Chemical Properties A white, or faintly cream-coloured, hygroscopic powder. Mp about 235°, with decomposition. Soluble 1 in 0.6 of water, 1 in 115 of ethanol and 1 in 1500 of chloroform; freely soluble in dilute acetone; sparingly soluble in anhydrous acetone, ether and benzene. Log *P* (octanol/water), −6.4.

Thin-layer Chromatography System TA—R_f 0.00; system TN—R_f 0.34; system TO—R_f 0.05 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 2625.

Ultraviolet Spectrum Aqueous acid—225 (A^1_1=525a), 266 nm (A^1_1=9a).

Infrared Spectrum Principal peaks at wavenumbers 1100, 1120, 1260, 1000, 780, 1600 cm^{-1} (KBr disk).

Quantification

Plasma **Spectrofluorimetry** Limit of detection, 50 ng [Ramzan *et al.* 1980].

Disposition in the Body Slowly and incompletely absorbed after oral administration; absorbed after IM administration but is generally given by the IV route. Small amounts enter the CSF. Almost 100% of a dose is excreted unchanged in the urine in 24 to 30 h. Negligible amounts are excreted in the bile.

Half-life Plasma half-life, 2 to 3 h; greatly increased in renal failure.

Volume of Distribution About 0.3 L/kg.

Clearance Plasma clearance, about 1.4 mL/min/kg.

Dose 40 to 120 mg IV.

Ramzan MI *et al.* (1980). Pharmacokinetic studies in man with gallamine triethiodide. I. Single and multiple clinical doses. *Eur J Clin Pharmacol* 17: 135–143.

Gallium Nitrate

Antihypercalcaemic

$GaN_3O_9 = 255.7$

CAS—135886-70-3 (nonahydrate); 13494-90-1 (anhydrous)

IUPAC Name Gallium nitrate

Synonyms Gallium trinitrate; gallium (III) nitrate; gallium salt : nitric acid; NSC-15200; WR-135675.

Proprietary Name *Ganite*

Chemical Properties A white crystalline powder. Mp 110°. Very soluble in water; soluble in warm and cold aqueous solutions and absolute alcohol; insoluble in ether.

Disposition in the Body Up to 70% of a dose is excreted by the kidneys with ≈50% of a dose excreted in urine within the first 48 h, mostly in the first 6 h.

Therapeutic Concentration

Twenty-five patients (male and female) with non-small cell lung cancer, aged between 39 and 88 years, were administered 700 mg/m^2 IV doses of gallium nitrate over 30 min. The mean peak plasma concentration was 15.2 mg/L, with a range from 9.5–21.2 mg/L. Most of the gallium remained ultrafilterable for the first 10 h but by 48 h, only 11% of the dose was present as ultrafilterable gallium. Total gallium present reached a peak at 1.9 mg/L within 8–12 h. Maximum urine concentration of gallium was 40–196 mg/L [Webster *et al.* 2000].

Toxicity Gallium nitrate is a poison by intraperitoneal, IV and SC routes, and moderately toxic by ingestion. An IV dose of 7 mg/kg can result in gastrointestinal tract toxicity and 144 mg/kg in blood toxicity. It can also cause severe skin and eye irritations, at doses >500 mg. Serious nephrotoxicity can also occur.

Half-life 25–111 h.

Dose The usual dose is 100 to 200 mg/m^2 body surface administered once daily.

Webster LK *et al.* (2000). A pharmacokinetic and phase II study of gallium nitrate in patients with non-small cell lung cancer. *Cancer Chemother Pharmacol* 45(1): 55–58.

γ-Butyrolactone

Depressant

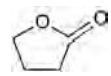
$C_4H_6O_2 = 86.1$

CAS—96-48-0

IUPAC Name Oxolan-2-one

Synonyms γBL; 1,2-Butanolide; butyrylactone; dihydro-2(3H)-furanone; gamma hydroxybutyric acid lactone; gamma lactone; 2-Oxanolone; tetrahydro-2-furanone.

Proprietary Names *Blue Nitro*; *Blue Nitro Vitality*; *Firewater*; *Gamma G*; *GH Revitalizer*; *Insom-X*; *Invigorate*; *Longevity*; *Remforce*; *Renewtrient*; *Revivarant*; *Revivarant G*.



Chemical Properties Colourless liquid. Mp −43°; Bp 204°. It is miscible with water, alcohol, ketones, esters and aromatic hydrocarbons; limited solubility in aliphatic and cycloaliphatic hydrocarbons. Log *P* (octanol/water), −0.64 [Hansch *et al.* 1995]. No significant instability [Wood *et al.* 2004]. Stock standard solutions, internal standard solutions and prepared solutions were stable for 3 months at 4°. Stable in plasma for 3 months [Fukui *et al.* 2003].

(S)-3-Hydroxy-γ Butyrolactone

$C_4H_6O_3 = 102.0$

CAS—7331-52-4

Synonym HGB

Chemical Properties Pale-yellow liquid. Bp 98° to 100°.

Colour Test Specific tests for GBL using mixtures of several common reagents are given in the Colour Tests chapter.

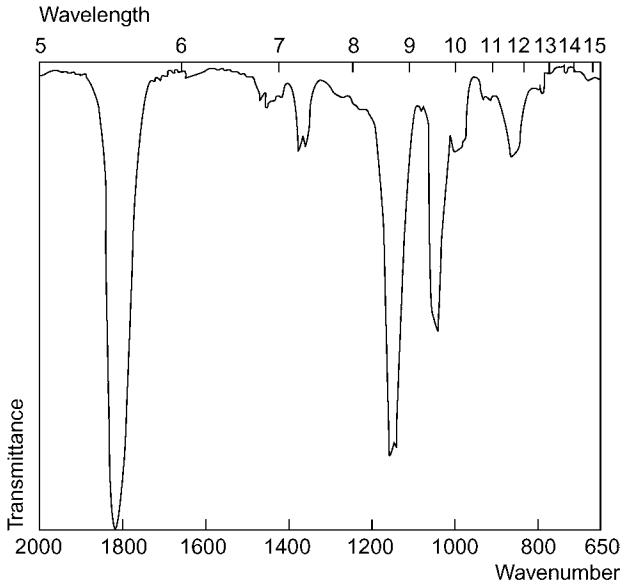
Gas Chromatography System GAO—GBL RT 4.0 min;GHB-TMS_2 RT 5.6 min.

Gas Chromatography-Mass Spectrometry Column: HP Ultra 1 bonded phase capillary (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 0.2 kg/cm^2. Temperature programme: 50° for 0.6 min to 275° at 15°/min. SIM acquisition mode (*m/z*: 41, 42, 56, 86, 100). Retention time: 2.6 min [Ferrara *et al.* 1993].

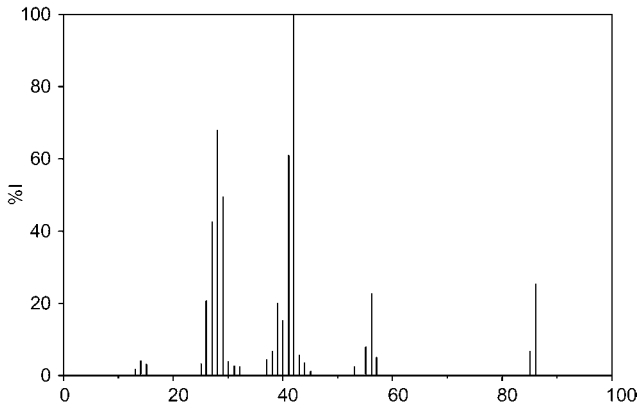
High Performance Liquid Chromatography System HBG—GBL RT 4.0 min; GHB RT 3.5 min.

Column: C_{18} µBondapak (300 × 3.9 mm i.d., 10 µm). Mobile phase: 10 mmol/L potassium dihydrogen phosphate buffer (pH 3.0): methanol (70 : 30), flow rate 1.0 mL/min. DAD (λ = 215 nm). Retention time: 3.96 min for GBL; 3.45 min for GHB [Mesmer, Satzger 1998].

Infrared Spectrum Principal peaks at wavenumbers 1820, 1163, 1047, 2993, 2909, 874 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 42, 28, 41, 29, 27, 86, 56, 39.



Quantification

Blood **GC** Column: DB-624 capillary (30 m × 0.25 mm i.d., 1.4 μm). Temperature programme: 50° for 3 min to 150° at 20°/min for 7 min. Carrier gas: N_2, 34 cm/s. IS: γ butyrolactone-d_6. FID, SIM acquisition mode (*m/z*: 86 for GBL and 92 for IS). Retention time: 11.2 min for GBL; 12.7 min for IS. Limit of detection, 0.5 mg/L for GHB [LeBeau *et al.* 2000].

GC-MS Column: ZB-FFAP (30 m). Carrier gas: He. EI ionisation. Limit of detection not reported [Strickland *et al.* 2005]. Column: DB5-MS (30 m × 0.25 mm i.d., 5 μm).Carrier gas: He, 15 psi. Temperature programme: 60° for 1 min to 85° for 1 min to 300° for 15 min all at 30°/min. MID. Limit of detection, 10 mg/L [Duer *et al.* 2001]. Column: 5% phenylmethylsilicone (30 m × 0.25 mm i.d., 0.33 μm). Carrier gas: He. Temperature programme: 60° for 2 min to 180° at 20°/min to 250° at 35°/min for 4 min. SIM acquisition mode. Limit of quantification, 1 mg/L, limit of detection, 0.5 mg/L [Couper, Logan 2000]. EI ionisation, full scan mode. Retention time: 10.9 min. Limit of detection, 0.5 mg/L for GHB [LeBeau *et al.* 2000].

Plasma **GC-MS** Column: DB-5 (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He. Temperature programme: 60° to 115 at 10°/min up to 300° at 30°/min. Retention time: 4.54 min. Limit of quantification, 8 mg/L [Jones *et al.* 2008]. Column: Varian Factor IV (15 m × 0.25 mm i.d., 0.25 μm). Temperature programme: 60° for 2 min to 180° at 20°/min to 250° at 50°/min for 9.4 min. EI ionisation, MRM acquisition mode. Limit of quantification, 100 mg/L [Paul *et al.* 2006]. Column: DB-5 MS (25 m × 0.2 mm i.d., 0.33 μm). Carrier gas: He, 38 cm/s. Temperature programme: 60° for 1 min to 90° at 10°/min to 270° at 35/°min for 1 min. SIM acquisition mode. Retention time: 4.35 min. Limit of quantification, 0.5 mg/L, limit of detection, 0.2 mg/L [Brenneisen *et al.* 2004]. Column: DB-WAX capillary (30 m × 0.32 mm i.d., 0.25 μm). Temperature programme: 50° for 1 min to 190° at 20°/min to 250° at 40°/min for 2 min. NICI at 70 eV, SIM acquisition mode. Retention time: 5.89 min. Limit of detection, 10 μg/L [Fukui *et al.* 2003]. Column: FFAP (acid-modified polyethylene glycol) capillary (25 m × 0.2 mm i.d., 0.3 μm). Carrier gas: He, 0.8 mL/min. Temperature programme: 50° for 1.5 min to 240° at 30°/min for 2 min. IS: γ-butyrolactone-d_6. PICI, SIM acquisition mode (*m/z*: 86, 87, 88 for GBL and 92,93,94 for IS). Retention time: 6.54 min for GBL; 6.53 min, IS. Limit of detection, 0.05 mg/L [Frison *et al.* 2000].

Serum **GC-MS** Macherey-Nagel Optima 5MS 5% phenyl 95% methylsiloxane (30 m × 0.25 mm i.d., 1 μm). Carrier gas: He, 1.0 mL/min. Temperature programme: 35° for 1 min to 100° at 10°/min to 200° at 50°/min for 1 min. EI ionisation at 70 eV or PICI. Limit of quantification, 0.2 mg/L, limit of detection, 0.16 mg/L [Lenz *et al.* 2009]. Column: Macherey-Nagel Optima 5MS GC capillary (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1 mL/min. Temperature programme: 35° for 1 min to 100° at 10°/min to 200° at 50°/min for 1 min. PICI, full scan mode. Limit of quantification, 2 mg/L, limit of detection, 0.5 mg/L [Lenz *et al.* 2008].

Urine **GC** See Blood [Duer *et al.* 2001]. See Blood [LeBeau *et al.* 2000].

GC-MS See Serum. Limit of detection, 0.17 mg/L [Lenz *et al.* 2009]. See Serum. Limit of quantification, 4 mg/L [Lenz *et al.* 2008]. See Blood. Limit of quantification, 0.2 mg/L, limit of detection, 0.1 mg/L [Brenneisen *et al.* 2004]. Column: DB5-MS. Carrier gas: He, 12 psi. Temperature programme: 60° to 270° at 9°/min for 23.3 min in total. EI ionisation, SIM acquisition mode. Limit of detection, 2 mg/L [Blair *et al.* 2001]. See Blood [LeBeau *et al.* 2000]. See Plasma. Limit of detection, 0.1 mg/L [Frison *et al.* 2000]. Column: HP-1MS cross-linked methylsiloxane capillary (12 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.6 mL/min. Temperature programme: 65° for 0.5 min to 105° at 15°/min to 300° at 25°/min. SIM acquisition mode. Limit of detection, 5 mg/L [McCusker *et al.* 1999].

LC-MS Column: Atlantis dC_{18} (100 × 3 mm i.d., 5 μm). Mobile phase: 0.1% aqueous formic acid: methanol (90 : 10), flow rate 0.2 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention time: 5.1 min for β-hydroxybutyric acid. Limit of quantification, 1.0 mg/L [Wood *et al.* 2004].

Ocular Fluid **GC** See Blood [Duer *et al.* 2001].

Brain **GC** See Blood [Duer *et al.* 2001].

Other **GC-MS** Commercial Beverages. Column: HP-5 MS (30 m × 0.25 mm i.d., 0.25 μm). Temperature programme: 45° for 2 min to 110° at 5 K/min to 300° at 30 K/min. Full scan mode. Limit of quantification, 150 ppb, limit of detection, 50 ppb [Sabucedo, Furton 2004]. Wine. Column: DB-5 (20 m × 0.18 mm). Carrier gas: He, 10.2 psi. Temperature programme: 60° for 1 min to 300° at 15°/min. Retention time: 3.6 min. Limit of detection, 5 mg/L [Vose *et al.* 2001].

CE Beverages. Column: Polymicro capillary (total/effective length 80/72 cm, 50 μm). Mobile phase: 20 mmol/L SDS (pH 9.2) with 7.0% acetonitrile. DAD. Limit of detection, 152 mg/L [Bishop *et al.* 2004].

Note For the positive detection of GBL in vermouth, sherry, port, and red and white wine see Elliott, Burgess [2005].

Disposition in the Body γ-butyrolactone (GBL) is well absorbed after administration and is biotransformed in the body to γ- hydroxybutyrate (GHB), which is a potent CNS depressant. This conversion can occur within minutes. GBL has a greater bioavailability than GHB.

Toxicity Signs and symptoms of toxicity can include prolonged unconsciousness and coma, respiratory depression (including respiratory arrest and very dangerously slow breathing), nausea/vomiting, confusion, anxiety/nervousness, cardiac arrest and seizures.

A 44-year-old male tourist collapsed after consuming 'Furamax Revitaliser' – 2.5 g of 2(3H) furanone dihydro (GBL) per fluid ounce (8 g/100 mL). He subsequently made a full recovery [Dupont, Thornton 2001].

A 19-year-old female was offered a drink from a plastic container at a party. After consuming some of the drink, she had no recollection of the rest of the evening. Her friends described her as being 'drunker than she should have been'. A sexual assault examination indicated that intercourse had occurred. A urine sample had a concentration of GBL of 4.4 mg/L, 9 h after the drink was consumed. GHB was detected at concentrations consistent with endogenous levels. A 25-year-old male was found sleeping behind the wheel of his car in the middle of a busy street. In the car there was a container of RenewTrient, a GBL-containing product. Blood analysis showed a concentration of GHB of 157 mg/L but GBL was not detected. [LeBeau *et al.* 2000].

Note See Lenz *et al.* [2008] for more case studies.

γ-Hydroxybutyrate

Anaesthetic

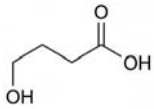
$C_4H_8O_3$ = 104.1

CAS—591-81-1

IUPAC Name 4-Hydroxybutanoic

Synonyms BRN-1720582; gamma hydroxybutyric acid; GHB; 4-hydroxybutyric acid.

Street Names Georgia home boy; grievous bodily harm; liquid ecstasy; scoop; fantasy.



Chemical Properties Crystals. It is water soluble and produces solutions that are mildly saline. Extraction yield (chlorobutane), 0 [Demme *et al.* 2005].

Sodium Gamma Hydroxybutyrate

Synonyms NSC-84223; sodium gamma hydroxybutyric acid; sodium oxybate; sodium oxybutyrate; Wy3478.

Proprietary Names *Alcover*; *Gamma-OH*; *Somatomax PM*; *Somsanit*; *Xyrem*.

Sodium-4-hydroxybutyrate

$C_4H_8NaO_3$ = 127.1

CAS—502-85-2

Chemical Properties A colourless, odourless powder, capsules or liquid.

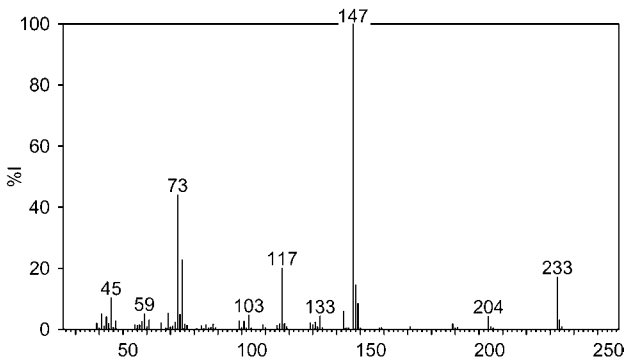
Colour Test Specific tests using mixtures of several common reagents are given in the Colour Tests chapter.

Gas Chromatography System GAO—γ-hydroxybutyrate (GHB)-TMS_2 RT 5.6 min, γ-butyrolactone (GBL) RT 4.0 min.

High Performance Liquid Chromatography System HBG—GHB-TMS_2 RT 3.5 min, GBL RT 4.0 min.

Column: μBondapak C_{18} (300 × 3.9 mm i.d., 10 μm). Mobile phase: 10 mmol/L potassium dihydrogen phosphate buffer (pH 3.0) : methanol (70 : 30), flow rate 1.0 mL/min. Retention time: GHB 3.45 min, GBL 3.96 min [Mesmer, Satzger 1998].

Mass Spectrum Principal ions at *m/z* 147, 73, 75, 233, 117, 148, 77, 59 (GHB-TMS_2).



Quantification

Blood **GC** Column: DB-624 (30 m × 0.25 mm i.d., 1.4 μm). Carrier gas: N_2, 34 cm/s. Temperature programme: 50° for 3 min to 150° at 20°/min for 7 min. FID. Limit of detection, 0.5 mg/L [LeBeau *et al.* 2000].

GC-MS See GC. EI ionisation, full scan mode. Retention time: 10.9 min. Limit of detection, 0.5 mg/L [LeBeau *et al.* 2000].

Plasma **GC-MS** Column: ULTRA-1 (12 m × 0.2 mm i.d., 0.33 μm). Carrier gas: He, 0.2 kg/cm^2. Temperature programme: 50° for 0.6 min to 275° at 15°/min. EI ionisation, SIM acquisition mode. Limit of detection, 0.2 mg/L [Ferrara *et al.* 1993]. Column: HP ULTRA 1 bonded phase (12 m × 0.2 mm i.d., 0.3 μm). EI ionisation, SIM acquisition mode. Limit of detection, 1 mg/L [Ferrara *et al.* 1992].

Urine **GC** See Blood [LeBeau *et al.* 2000].

GC-MS Column: HP-1 (25 m × 0.32 mm i.d., 0.5 μm). Carrier gas: He, 1.0 mL/min. Temperature programme: 50° for 1 min to 300° at 10°/min. Limit of detection, 2 mg/L [Kavanagh *et al.* 2001]. Column: HP-1 100% polydimethylsiloxane (12 m × 0.2 mm i.d., 0.33 μm). Temperature programme: 60° for 2 min to 260° at 30°/min for 1 min. Carrier gas: He, 0.5 mL/min. I.S.: GHB-d_6. SIM acquisition mode, *m/z* 233, 234, 235 for GHB and 239, 240, 241 for IS. Retention time: GHB 4.43 min, IS 4.41 min. Limit of detection, 2 mg/L [Elian 2000]. See Blood [LeBeau *et al.* 2000]. Column: HP-1MS cross-linked methylsiloxane (12 m × 0.25 mm i.d., 0.25 μm). Temperature programme: 65° for 0.5 min to 105° at 15°/min to 300° at 25°/min. Carrier gas: He, 1.6 mL/min. SIM acquisition mode, *m/z* as above. I.S.: GHB-d_6. Retention time: GHB 3.7 min. Limit of detection, 5 mg/L [McCusker *et al.* 1999]. See Plasma. Limit of detection, 0.1 mg/L [Ferrara *et al.* 1993]. See Plasma. Limit of detection, 0.2 mg/L [Ferrara *et al.* 1992]

Hair **LC-MS** Limit of quantitation 0.4 ng/mL, limit of detection, 0.2 ng/mL [Stout *et al.* 2010].

Disposition in the Body GHB is readily absorbed after oral administration and rapidly metabolised in the liver by oxidative enzymes. Conversion to GBL can occur and elimination is rapid, via the kidneys, with urine recovery virtually complete within 8 h of administration. Only negligible amounts of the parent drug are recovered unchanged in urine (<5%); the drug is not detectable after 12 h. GHB crosses the blood–brain barrier and the placental barrier. Endogenous concentrations of GHB are thought to be up to 10 mg/L in urine and 4 mg/L in antemortem plasma of individuals not suffering from the genetic disorder gamma hydroxybutyric aciduria. Endogenous concentrations appear to be increased postmortem, particularly in blood.

Therapeutic Concentration

Eight healthy non-smoker males, aged between 22 and 26 years, were administered with 12.5, 25 and 50 mg/kg single doses of GHB after an overnight fast. Peak plasma concentrations reached 23 ± 9, 23 ± 11 and 20 ± 7 mg/L, respectively, achieved within 25 ± 20, 30 ± 20, 45 ± 30 min, respectively [Palatini *et al.* 1993].

Toxicity Doses greater than 50 mg/kg can lead to a decrease in cardiac output, respiratory depression/arrest, seizure-like activity and, possibly, death. An intoxicating dose is 15 mg/kg and a dose of 4 g has been associated with death. It has also been reported that doses between 5 and 10 g can be toxic or fatal. Effects usually occur within 20 min of taking a dose and are also associated with a steep dose–response curve that may result in accidental overdosage.

An 18-year-old male was admitted to hospital unresponsive and in respiratory failure, he died 30 min later. Toxicological postmortem analysis showed a 309.4 mg/L blood concentration of GHB along with alcohol, cocaine, cocaethylene and benzoylecgonine [Mozayani *et al.* 1998].

A 47-year-old Caucasian male was found dead on his living room floor. At postmortem GHB concentrations in his blood, vitreous and urine were 538, 652, and 2927 mg/L, respectively [Win, Baselt 2000].

A 22-year-old female who had taken a suspected single dose of liquid GHB revealed a postmortem femoral blood concentration of 330 mg/L and a frontal cortex brain tissue concentration of 221 ng/mg. GHB was also detected in her hair. No other drugs were detected [Kalasinsky *et al.* 2001].

A 24-year-old woman ingested 4 mL fantasy – the South Australian street name for GHB. Her blood concentration was 1200 mg/L [Strickland *et al.* 2005].

Half-life Terminal half-life, 0.3–1.0 h.

Volume of Distribution 0.5 L/kg.

Clearance Oral, 9.0 mL/min/kg (range, 4.7–15.3).

Protein Binding None.

Dose Usual dose required for general anaesthesia is 50 mg/kg, for treatment of amnesia; as an analgesic dose is 10 to 20 mg.

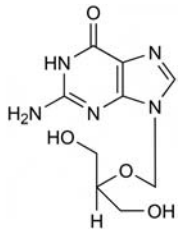
Ganciclovir

Antiviral
$C_9H_{13}N_5O_4 = 255.2$
CAS—82410-32-0

IUPAC Name 2-Amino-1,9-[[2-hydroxy-1-(hydroxymethyl)ethoxy]methyl]-6*H*-purin-6-one

Synonyms BIOLF-62; BW-759; BW-B759U; BW-759U; DHPG; dihydroxypropoxymethylguanine; 2′-NDG; 2′-nor-2′-deoxyguanosine; RS-21592.



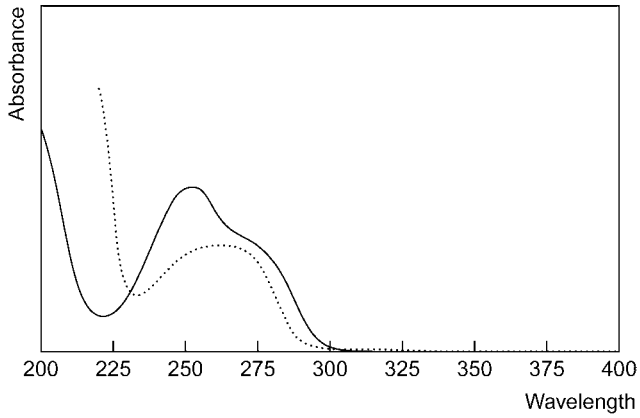
Chemical Properties A white to off-white crystalline powder. Mp 250° (decomposes). Soluble 2.6 g/L in water at 25°; 4.3 g/L in solution at pH 7. pK_a 2.2, 9.4. Log *P* (octanol/water), −1.66.

Ganciclovir Sodium

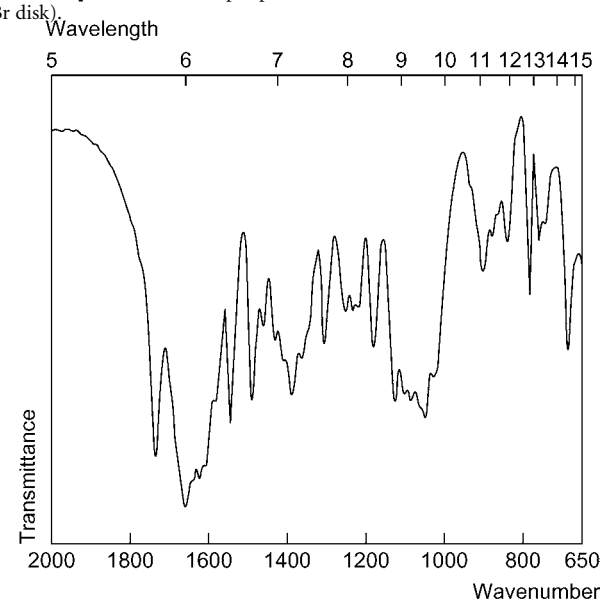
$C_9H_{12}N_5NaO_4 = 277.2$
CAS—107910-75-8

Proprietary Names *Citovirax*; *Cymevan*; *Cymeven*; *Cymevene*; *Cytovene*; *Denosine*; *Virgan*; *Vitrasert*.

Ultraviolet Spectrum Aqueous acid—255 nm; methanol—254 nm; aqueous base—264 nm.



Infrared Spectrum Principal peaks at wavenumbers 1647, 1379, 1041 cm^{-1} (KBr disk).



Quantification

***Plasma* HPLC** Column: RP Hypersil ODS (100 × 4.6 mm, 3 µm). Temperature: 40°. Mobile phase: 0.1 mol/L sodium hydrogen phosphate monohydrate : 0.04 mol/L triethylamine, pH 6.6, flow rate 1.0 mL/min. IS: acyclovir. UV detection (λ=254 nm). Retention time: ganciclovir, 4.0 min; IS, 5.1 min. Limit of quantification, 0.05 mg/L, limit of detection, 0.01 mg/L [Campanero *et al.* 1998]. UV detection (λ=254 nm). Limit of quantification, 0.01 mg/L, limit of detection, 0.003 mg/L [Cociglio *et al.* 1998]. UV detection (λ=254 nm). Limit of detection, 0.5 µg/L [Boulieu *et al.* 1991]. UV detection. Limit of detection, 0.25 mg/L [Fletcher *et al.* 1986].

***Serum* HPLC** Column: Lichrospher RP8e (125 × 4 mm i.d., 5 µm). Mobile phase: methanol : 50 mmol/L 1-octanesulfonic acid in 0.1 mol/L phosphate buffer (pH 3), flow rate 1.0 mL/min. Internal standard (IS): guanosine. Fluorescence detection (λ_{ex}=285 nm, λ_{em}=380 nm). Retention time: ganciclovir, 4.71 min; IS, 7.35 min. UV detection. Limit of detection, 50 µg/L. Fluorescence detection. Limit of detection, 0.01 mg/L [Koel, Nebinger 1994]. UV detection (λ=254 nm). Limit of quantification, 0.05 mg/L [Page *et al.* 1996].

***Urine* HPLC** See Serum [Page *et al.* 1996].

***CSF* HPLC** See Plasma [Fletcher *et al.* 1986].

Review For a review of chromatographic methods for the determination of antiviral drugs in biological fluids, see Riley *et al.* [1990].

Disposition in the Body Ganciclovir is poorly absorbed after oral administration; peak plasma concentrations are reached after about 2 to 4 h. Following IV administration, it is widely distributed to body tissues and fluids including intraocular fluid and CSF. It crosses the placenta. The drug is excreted unchanged in the urine by glomerular filtration and active tubular secretion; ≈90% of an oral dose is excreted in urine within 24 h of administration. With an IV dose, on the other hand, the majority is excreted in faeces. Haemodialysis reduces plasma concentrations by about 50%. Ganciclovir does not accumulate in plasma after repeated dosing.

Therapeutic Concentration The trough serum therapeutic concentration is 0.2 to 1.0 mg/L and peak, 5.0 to 12.5 mg/L.

Ninety-seven patients with AIDS and life-threatening or sight-threatening cytomegalovirus infections, mean age 36.2 years, were administered intravenously with doses of 1, 2.5 and 5 mg/kg (infused over 1 h) every 8 h. Mean peak steady-state plasma concentrations of 0.0094, 0.0203 and 0.0445 mg/L, respectively, were measured after the last dose [Laskin *et al.* 1987].

Six subjects (bone marrow recipients aged between 13 and 53 years) were administered intravenously with 2.5 mg/kg (infused over 1 h) every 8 h, for 10 days. Plasma concentrations between 3.93 and 4.45 mg/L 15 min after the end of the infusion were observed. The mean CSF concentration measured 2.75 h after IV administration was 0.51 mg/L [Fletcher *et al.* 1986].

20 mg/kg was orally administered, every 6 h, to 4 subjects with AIDS and CMV retinitis, after an overnight fast which was continued for 1 h after administration. 4 to 6 months prior to this treatment, the patients were also administered 2.5 mg/kg intravenously every 8 h, for 10 days, and 5 to 7.5 mg/kg daily 5 days a week. The 20 mg/kg dose produced mean peak and trough steady-state plasma concentrations of 2.96 µg/L and 1.05 µg/L, respectively, on day 3. The 2.5 mg/kg intravenous dose produced a peak concentration of 18.0 µg/L; the 5 mg/kg dose, 40.0 µg/L and a 10 mg/kg oral dose every 6 h produced a peak concentration of 2.01 µg/L. These were observed after ≈1 h [Jacobson *et al.* 1987].

Toxicity The trough serum toxic concentration is 3 to 5 mg/L and peak, 20 mg/L.

Bioavailability 5 to 8%; increases when administered with food.

Half-life Plasma half-life, 2.5 to 4 h.

Volume of Distribution 0.5 to 2.0 L/kg; quoted as 0.74 L/kg. Also reported as 33 to 45 L.

Clearance Plasma clearance, 200 mL/min/1.73 m^2; 0.1 L/h/kg.

Protein Binding 1 to 2%.

Note For reviews of ganciclovir, see Faulds and Heel [1990], Markham and Faulds [1994], Crumpacker [1996] and Noble and Faulds [1998]. For a review of the pharmacokinetics of antiviral nucleosides, see Morse *et al.* [1993].

Dose Initially, 5 mg/kg (of ganciclovir) intravenously over 1 h every 12 h for 14 to 21 days. Orally, 1 g (of ganciclovir) three times daily.

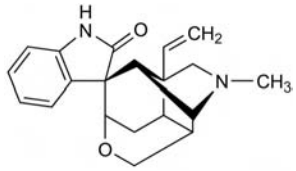
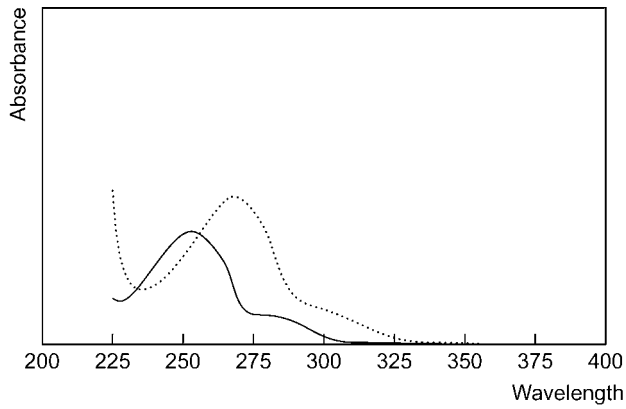
Gelsemine

CNS Depressant
$C_{20}H_{22}N_2O_2$ = 322.4
CAS—509-15-9



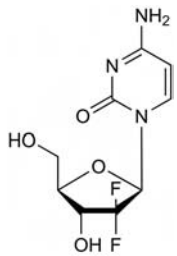
Chemical Properties An alkaloid present in gelsemium, the dried rhizome and roots of *Gelsemium sempervirens* (Loganiaceae). Crystals. Mp 178°. Slightly soluble in water; soluble in ethanol, chloroform, benzene, acetone, dilute acids and ether. Log *P* (octanol/water), 1.4.
Colour Test Mandelin's test—red→green.
Thin-layer Chromatography System TA—R_f 0.49; system TB—R_f 0.09; system TE—R_f 0.52; system TAE—R_f 0.25 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2850.
High Performance Liquid Chromatography System HX—RI 290.
Ultraviolet Spectrum Aqueous acid—252 nm (A^{1}_{1}=220b); aqueous alkali—268 nm.



Infrared Spectrum Principal peaks at wavenumbers 1715, 1620, 1100, 747, 759, 1237 cm^{-1}.
Disposition in the Body
Toxicity Death has been caused by the ingestion of 4 mL of a 1:1 fluid extract.

Gemcitabine

Antineoplastic
$C_9H_{11}F_2N_3O_4$ = 263.2
CAS—95058-81-4
IUPAC Name 4-Amino-1-[(2*R*,4*R*,5R)-3,3-difluoro-4-hydroxy-5-(hydroxymethyl)-oxolan-2-yl]pyrimidin-2-one
Synonyms dFdC; dFdCyd; 2′-deoxy-2′,2′-difluorocytidine; LY-188011.

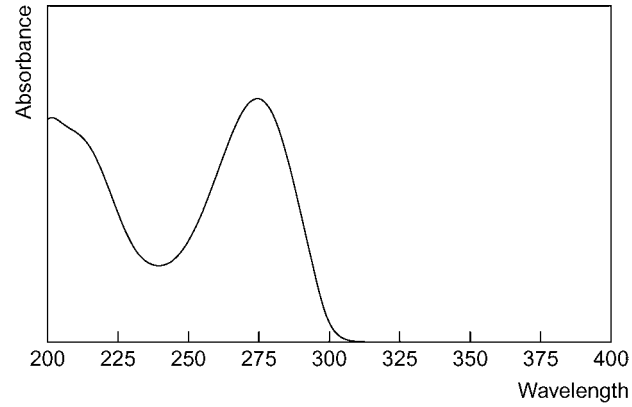


Chemical Properties pK_a 3.6.

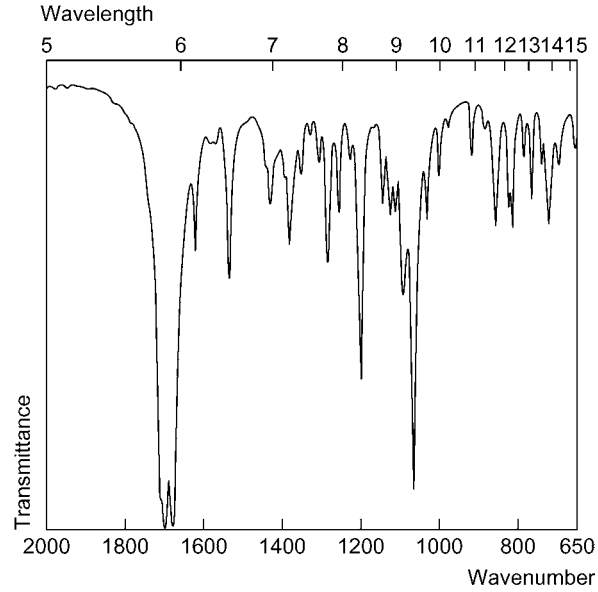
Gemcitabine Hydrochloride

$C_9H_{11}F_2N_3O_4$,HCl = 299.7
CAS—122111-03-9

Proprietary Name *Gemzar*
Chemical Properties A white to off-white solid. Mp 287° to 292°. Soluble in water; slightly soluble in methanol; practically insoluble in ethanol and in polar organic solvents.
Ultraviolet Spectrum Aqueous acid—204, 274 nm.



Infrared Spectrum



Quantification
Plasma **HPLC** UV detection (λ=272 nm). Limit of quantification, 0.05 mg/L [Freeman *et al.* 1995].
Urine **HPLC** Limit of quantification, 20 mg/L, see Plasma [Freeman *et al.* 1995].
Disposition in the Body Following IV administration, gemcitabine is rapidly cleared from blood and is metabolised by cytidine deaminase in the liver, kidney, blood and other tissues. The pharmacokinetics of gemcitabine are significantly affected by gender and age of patient and length of time over which the drug is infused. Clearance is ≈30% lower in women compared to men. It is not distributed extensively into tissues. Less than 10% of the drug is excreted in urine as the unchanged drug and the rest as metabolites. Approximately 1% of a dose is excreted in faeces. The primary, inactive metabolite is dFdU (2′-deoxy-2′,2′-difluorouridine) which has been observed in both plasma and urine. Other metabolites detected in plasma and urine include the gemcitabine mono, di and triphosphates, the latter are considered active.
Therapeutic Concentration
In a total of seven studies, 121 women and 232 men, aged between 29 and 79 years, diagnosed with non-small cell lung cancer or pancreatic cancer, were administered doses of 500 to 1592 mg/m^2 over an infusion period of 0.4 to 1.2 h. Peak plasma concentrations of 3.2 to 45.5 mg/L were observed within 5 min of the end of the infusion. The peak plasma concentration for the metabolite, dFdU, is 28 to 52 mg/L observed 3 to 15 min after the end of a 30-min infusion of 1 g/m^2 [Eli Lilly & Ltd.].
Toxicity The most severe toxicity is possible life-threatening oesophagitis and pneumonitis observed in patients receiving radical radiotherapy to thorax in association with gemcitabine.
Half-life Plasma half-life, 0.7 to 1.6 h, depending on age and gender; 0.18 to 0.43 (mean 0.28) h for gemcitabine triphosphate.
Volume of Distribution Steady state, 17 (range 9 to 30) L/m^2 (gemcitabine); 150 L/m^2 (range 96 to 228 L/m^2) (metabolite, dFdU).

Clearance Systemic, ranges between 29.2 and 92.2 L/h/m^2 depending on age and gender. Total body, 90 (range 40 to 130) L/h/m^2.
Protein Binding Negligible.
Note For reviews of gemcitabine, see Plunkett *et al.* [1995] and Noble and Goa [1997].
Dose Usually 1 g/m^2 body surface is administered intravenously, over an hour, once a week; adjusted up to 1250 or 1500 mg/m^2 according to response and toxicity.

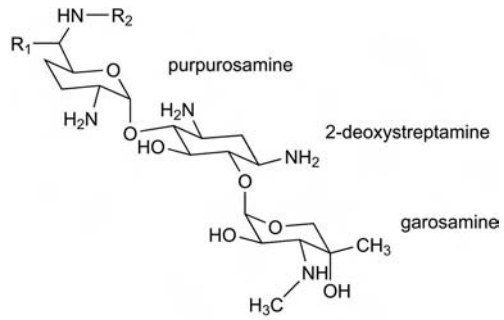
Gentamicin

Antibiotic
CAS—1403-66-3



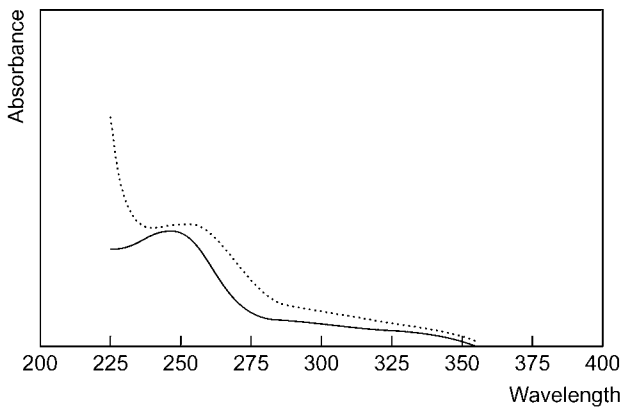
Gentamicin C_1 $R_1 = R_2 = CH_3$
Gentamicin C_2 $R_1 = CH_3$, $R_2 = H$
Gentamicin C_{1a} $R_1 = R_2 = H$

Chemical Properties A mixture of isomeric aminoglycoside antibiotics (gentamicin C_1, gentamicin $C_{1A}$and gentamicin C_2) produced by *Micromonospora purpurea* or *M. echinospora*. A white amorphous powder. Mp 102° to 108°. Freely soluble in water; soluble in pyridine; moderately soluble in methanol, ethanol and acetone; sparingly soluble in chloroform; practically insoluble in benzene and halogenated hydrocarbons. Log *P* (octanol/water), −1.9.

Gentamicin Sulfate

CAS—1405-41-0
Proprietary Names *Alcomicin*; *Cidomycin*; *Garamycin*; *Genoptic*; *Gentacidin*; *Gentak*; *Gentalline*; *Gentasol*; *Genticin*; *Gentigan*; *G-Myticin*; *Jenamicin*; *Lugacin*; *Ocu-Mycin*; *Refobacin*; *Sulmycin*. It is an ingredient of many proprietary preparations—see Sweetman [2009].
Chemical Properties A white to buff-coloured powder. Mp 218° to 237°. Soluble in water, ethylene glycol and formamide; practically insoluble in ethanol, chloroform and ether.

Colour Tests Nessler's reagent (100°)—black; ninhydrin (heat for 4 min)—violet.
High Performance Liquid Chromatography System HAA—retention time 14.0 min.
Ultraviolet Spectrum Aqueous acid—247 nm; aqueous alkali—251 nm.



Infrared Spectrum Principal peaks at wavenumbers 1120, 1060, 1625, 1525, 1290, 880 cm^{-1} (KBr disk).
Quantification See also under Amikacin.
Plasma **HPLC** UV detection. Gentamicin isomers (C_1, $C_{1A}$and C_2) [Isoherranen, Soback 2000]. Fluorescence detection (comparison with fluorescence polarisation immunoassay) [Yusuf *et al.* 1999]. Fluorescence detection. Gentamicin components C_1, C_{1A} and C_2, limit of detection, 500 µg/L [D'Souza, Ogilvie 1982].
Serum **Immunoassay** Fluoroimmunoassay [Munro *et al.* 1982]. Enzyme immunoassay, limit of detection, 100 µg/L [Wills, Wise 1979].
Urine **HPLC** Fluorescence detection. Limit of detection, 75 µg/L [Al-Amoud *et al.* 2002]. See Plasma [Isoherranen, Soback 2000]; [D'Souza, Ogilvie 1982].
Reviews For a review of methods for the determination of gentamicin in serum, see Hospes *et al.* [1982]. For a review of HPLC methods for the determination of gentamicin and other aminoglycosides in biological fluids, see Soltes [1999].
Disposition in the Body Poorly absorbed after oral administration but rapidly absorbed after IM injection; it is also absorbed systemically following topical application to wounds. In normal subjects it is rapidly excreted in the urine as unchanged drug, up to 80% of a dose being excreted in 24 h. It accumulates in the tissues and there may be considerable intersubject variation in the pharmacokinetics. Gentamicin may be detected in serum and urine for several days after cessation of treatment.
Therapeutic Concentration During treatment the serum concentration should be in the range 4 to 12 mg/L and should be monitored regularly, especially in patients who have renal insufficiency. During multiple dosing, the trough concentration immediately preceding a dose should not exceed 2 mg/L.

A single IM dose of 1 mg/kg given to 10 subjects produced a mean peak serum concentration of 5.8 mg/L in 0.5 to 1 h [Chung *et al.* 1980].

In 11 subjects, a 30-min IV infusion of 6 or 2 mg/kg produced respective mean plasma concentrations of 35.0 and 10.1 mg/L at the end of the infusion, 17.0 and 5.4 mg/L 30 min after the end of the infusion, and 0.45 and 0.69 mg/L at the end of the dosing interval [Sangha *et al.* 1995].

Toxicity Toxic effects may be produced at serum concentrations of 12 mg/L or more, or during chronic treatment, if the trough serum concentration exceeds 2 mg/L.
Half-life Plasma half-life, about 2 to 4 h, increased in renal failure; a very long terminal elimination phase of several days has also been reported.
Volume of Distribution About 0.2 L/kg.
Clearance Plasma clearance, about 1 mL/min/kg.
Protein Binding Less than 30%.
Dose The equivalent of 3 to 5 mg/kg of gentamicin daily, given parenterally.

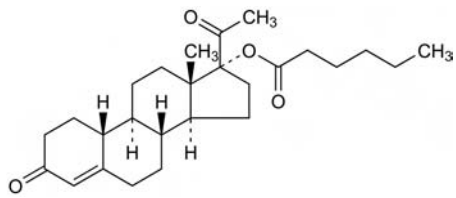
Gestonorone Caproate

Progestational Steroid
$C_{26}H_{38}O_4$ = 414.6
CAS—1253-28-7

IUPAC Name 17-[(1-Oxohexyl)oxy]-19-norpregn-4-ene-3,20-dione
Synonym Gestronol hexanoate
Proprietary Names *Depostat*; *Primostat*.

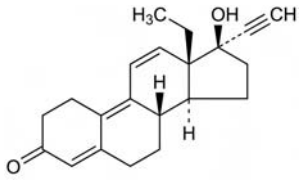


Chemical Properties A white to creamy-white crystalline powder. Mp 123° to 124°; a polymorph melting at 119° to 123° may also occur. Soluble in ethanol and methanol; freely soluble in acetone and chloroform; sparingly soluble in ether. Log *P* (octanol/water), 5.2.
Thin-layer Chromatography System TB—R_f 0.31; system TE—R_f 0.83; system TF—R_f 0.59.
Gas Chromatography System GA—RI 3440.
Ultraviolet Spectrum Methanol—240 nm (A^1_1=415b).
Infrared Spectrum Principal peaks at wavenumbers 1733, 1667, 1715, 1266, 1250, 1618 cm^{-1} (KBr disk).
Dose 200 to 400 mg IM every 5 to 7 days.

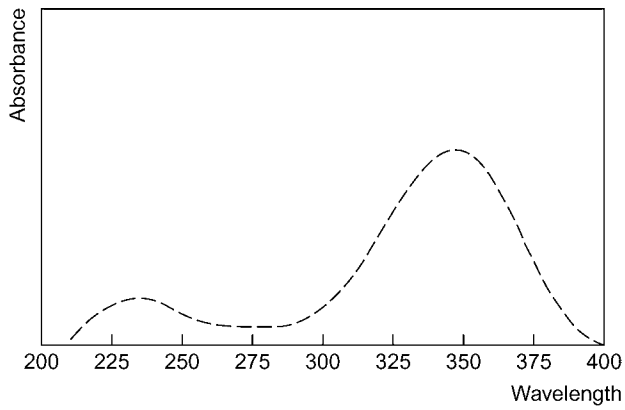
Gestrinone

Anabolic Steroid, β_2-Adrenoceptor Agonist
$C_{21}H_{24}O_2$ = 308.4
CAS—16320-04-0; 40542-65-2

IUPAC Name (8*S*,13*S*,14*S*,17*R*)-13-Ethyl-17-ethynyl-17-hydroxy-1,2,6,7,8,14,15,16-octahydrocyclopenta[*a*]phenanthren-3-one
Synonyms A46745; (17α)-13-ethyl-17-hydroxy-18,19-dinorpregna-4,9,11-trien-20-yn-3-one; ethylnorgestrienone; R2323; RU2323.
Proprietary Names *Dimetriose*; *Dimetrose*; *Nemestran*; *Trodomose*.



Chemical Properties A white to slightly yellow powder. Mp 154°.
High Performance Liquid Chromatography Column: C_{18} UG120, Capcell pack (150 × 2.0 mm i.d., 5 µm). Temperature: 40°. Mobile phase: acetonitrile : water (A:B). Elution programme: (5:95) to (30:70) in 3 min, to (52.5:47.5) in 14 min, to (100:0) in 3 min, held for 5 min. UV detection (λ=345 nm). Retention time: gestrinone, 16.3 min; metabolite 1, 11.3 min; metabolite 2, 12.2 min [Kim *et al.* 2000].
Ultraviolet Spectrum Neutral—235, 347 nm.



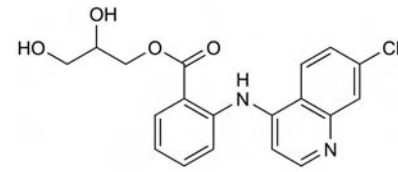
Disposition in the Body Gestrinone is well absorbed after oral administration with negligible first-pass metabolism. It is metabolised in the liver by hydroxylation to two unknown metabolites and the conjugate forms. It is excreted as the latter.
Therapeutic Concentration Peak plasma concentrations are observed about 3 h after administration.
Half-life Approximately 24 h.
Dose A usual dose of 2.5 mg is administered twice weekly.

Kim Y *et al.* (2000). Determination of the metabolites of gestrinone in human urine by high performance liquid chromatography, liquid chromatography/mass spectrometry and gas chromatography/mass spectrometry. *Rapid Commun Mass Spectrom* 14: 1717–1726.

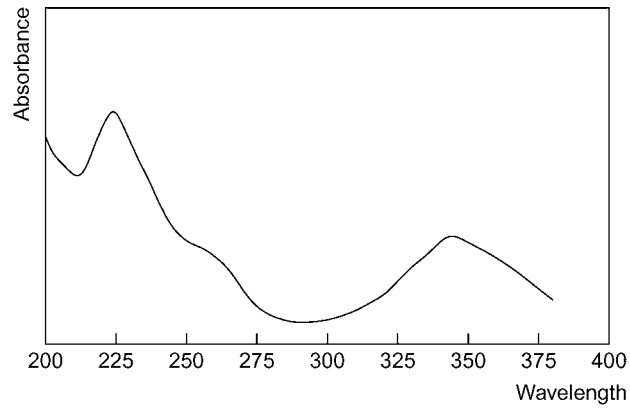
Glafenine

Analgesic
$C_{19}H_{17}ClN_2O_4$ = 372.8
CAS—3820-67-5

IUPAC Name 2,3-Dihydroxypropyl 2-[(7-chloro-4-quinolinyl)amino]benzoate
Synonym Glaphenine
Proprietary Names *Glifan*; *Glifanan*; *Privadol*.



Chemical Properties A white or slightly yellow crystalline powder. Mp 169° to 170°. Practically insoluble in water; slightly soluble in absolute alcohol, acetone, ether, benzene and chloroform; soluble in dilute aqueous alkalis and acids. Log *P* (octanol/water), 3.7.
Thin-layer Chromatography System TA—R_f 0.67; system TB—R_f 0.01; system TC—R_f 0.38; system TE—R_f 0.46; system TF—R_f 0.03; system TL—R_f 0.40; system TAE—R_f 0.81; system TAF—R_f 0.78.
Gas Chromatography System GA—glafenine, not eluted; glafenine-Me RI 2770.
High Performance Liquid Chromatography System HX—RI 372; system HY—RI 276; system HZ—retention time 2.3 min.
Ultraviolet Spectrum Aqueous acid—345 nm (A^1_1=467b).



Quantification
Plasma **HPLC** UV detection. Limits of detection, 50 µg/L for glafenine , 250 µg/L for glafenic acid [Ennachachibi *et al.* 1988]. Glafenine and floctafenine. Limit of detection, about 2 µmol/L for glafenine [Tracqui *et al.* 1988]. UV detection. Glafenine and metabolites. Limits of detection, 500 µg/L for glafenine and hydroxyglafenic acid, 200 µg/L for glafenic acid [Tournet *et al.* 1981].
Disposition in the Body Absorbed after oral administration with peak plasma concentrations occurring about 1 to 2 h after ingestion. It is hydrolysed to glafenic acid which is excreted in the urine as an acylglucuronide conjugate; glafenic acid is found in plasma at concentrations greater than those of unchanged drug. Small amounts of unconjugated *N*-oxide of glafenic acid, and hydroxyglafenic acid which is mainly conjugated, have also been found in urine.
Therapeutic Concentration
After a single 400-mg oral dose of glafenine, a mean peak plasma concentration of 0.7 mg/L was achieved in 1.5 h in 12 healthy subjects and 2.2 mg/L in 2.8 h in 12 cirrhotic subjects; the large hepatic first-pass effect observed in healthy subjects was markedly reduced in cirrhotic subjects (ratio of C_{max} glafenic acid to C_{max} glafenine=18.9 in healthy subjects and 3.6 in cirrhosis) [Vermerie *et al.* 1992].
Toxicity Plasma concentrations >75 mg/L may be associated with toxic effects. It has a high incidence of anaphylactic reactions and has been withdrawn from the market in most countries.
Half-life About 1 to 2 h.
Dose Up to 1.2 g daily.

Ennachachibi A *et al.* (1988). Effective high-performance liquid chromatographic determination of glafenine in plasma: pharmacokinetic application. *J Chromatogr* 427: 307–314.

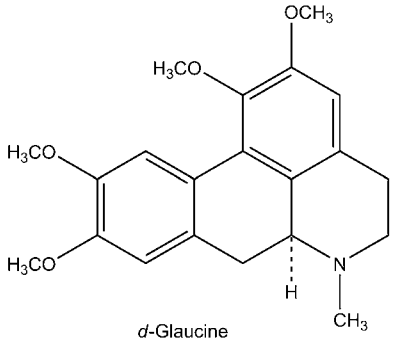
Glaucine

Cough Suppressant, Drug of Abuse, Quinoline
$C_{21}H_{25}NO_4$ = 355.4
CAS—475-81-0 (*d*-glaucine); 5630-11-5 (*dl*-glaucine).

Synonyms Boldine dimethyl ether; (6a*S*)-5,6,6a-7-tetrahydro-1,2,9,10-tetramethoxy-6-methyl-4*H*-dibenzo[*de*,*g*]quinoline; 1,2,9,10-tetramethoxyaporphine.
Proprietary Name *Glauvent*. It is also an ingredient in *Bronchitussin*; *Bronchocin*; *Broncholytin*.



d-Glaucine

Chemical Properties Found in *Glaucium flavum* Crantz (*G. luteum* Scop.), Papaveraceae, in *Dicentra* and *Corydalis* species, Fumariaceae and several more species. The *d*-form is prevalent in nature. Orthorhombic plates, prisms from ethyl acetate or ether. Mp 120°. Soluble in acetone, alcohol, chloroform, ethyl acetate; moderately soluble in ether, petroleum ether; practically insoluble in water and benzene. Dimethoxy analogue of boldine.

Glaucine Hydrochloride Trihydrate

$C_{21}H_{25}NO_4$,HCl, $3H_2O$ = 445.9
Chemical Properties Mp 232° (anhydrous). Soluble in water, alcohol and chloroform.

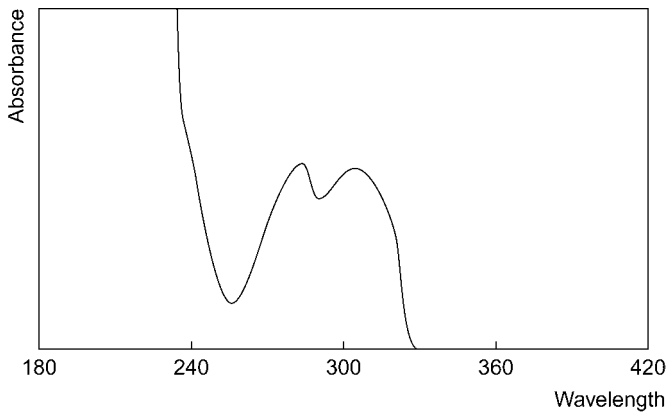
Glaucine Hydrobromide

$C_{21}H_{25}NO_4$,HBr = 436.1
CAS—5996-06-5 (*d*-form)
Chemical Properties Mp 235°. Less soluble than the hydrochloride.

Glaucine Phosphate

$(C_{21}H_{25}NO_4)_2$,$3H_3PO_4$ = 1004.8
CAS—73239-87-9 (*dl*-form)
Synonym DL-832
Chemical Properties Crystalline powder.

Ultraviolet Spectrum Principal peaks at 290, 310 nm.



Mass Spectrum Principal ions at *m/z* 354, 355, 80.

Quantification

Plasma **HPLC** Column: LiChrosorb Si 60 (125 × 4.0 mm i.d., 5 µm). Mobile phase: *n*-hexane : methanol : tetrahydrofuran : diethylamine (88.5 : 7.5 : 4 : 0.15), flow rate 1.5 mL/min. Fluorescence detection (λ_{ex} = 310 nm, λ_{em} = 340 nm). Retention time: 3.4 min. Limit of quantification, 5 µg/L [Fels *et al.* 1984].

Serum **GC-MS** Column: (5%-phenyl)-methylpolysiloxane capillary (30 m × 0.25 mm, 0.5 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 80° for 4 min to 290° at 25°/min for 9.6 min. EI ionisation at 70 eV, positive ion mode, SIM acquisition mode. Retention time: 19.1 min (methyl *tert*-butyl ether derivative). Limit of quantification not reported [Dargan *et al.* 2008].

Urine **HPLC** Column: LiChrosorb Si 60 (125 × 4.0 mm i.d., 5 µm). Mobile phase: *n*-hexane : methanol : tetrahydrofuran : diethylamine (88.5 : 7.5 : 4 : 0.15), flow rate 1.5 mL/min. Fluorescence detection (λ_{ex} = 310 nm, λ_{em} = 340 nm). Retention time: 3.4 min. Limit of quantification, 2 µg/L [Fels *et al.* 1984].

GC-MS Column: (5%-phenyl)-methylpolysiloxane capillary (30 m × 0.25 mm, 0.5 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 80° for 4 min to 290° at 25°/min for 9.6 min. EI ionisation at 70 eV, positive ion mode, SIM acquisition mode. Retention time: 19.1 min (methyl *tert*-butyl ether derivative). Limit of quantification not reported [Dargan *et al.* 2008].

Other **TLC** Plant Samples (*Thalictrum flavum*). Plates: silica gel GF_{254}. Solvent system: petroleum ether : chloroform : acetone : methanol (4 : 4 : 1 : 1). Location reagent Dragendorff's reagent. R_f values: glaucine 0.71, thalidazine 0.38, thaliglucine 0.35. Limit of quantification not reported [Velcheva *et al.* 1992].

GC-MS Plant Samples (members of the genus *Sarcocapnos*). Column: HP-1 fused silica capillary (12 m × 0.2 mm i.d., 0.33 mm). Carrier gas: He, 1.0 mL/min. Temperature programme: 200° for 4 min to 250° at 10°/min for 15 min. EI ionisation at 70 eV, positive ion mode, SIM acquisition mode. Retention times: glaucine 8.0 min, sarcophylline 6.2 min, sarcocapnine 6.5 min, cularicine 6.6 min, *O*-methylcularicine 6.8 min, cularidine 7.2 min, celtisine 7.3 min, cularine 7.5 min, sarcocapnidine 7.5 min, celtine 7.6 min, protopine 8.8 min, ribasine 9.5 min, dihydrosanguinarine 10.9 min, chelidonine 11.7 min. Limit of quantification, not reported [Suau *et al.* 2005].

HPLC Plant MaterialSamples (*Critesion lechleri*). Column: C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: (leaf samples) acetonitrile : 0.1 mol/L phosphate (pH 2.5)-10 mmol/L SDS-0.08% TEA (43 : 57); (latex samples) acetonitrile : 0.1 mol/L phosphate (pH 2.5)-10 mmol/L SDS-0.1% TEA (45 : 55), flow rate 2 mL/min. UV detection (λ = 254 nm). Retention times: (leaf samples) glaucine 9.8 min, norisoboldine 4.2 min, isoboldine 4.6 min, magnoflorine 5.2 min, thaliporphine 6.5 min, taspine 9.0 min. Limit of quantification not reported [Milanowski *et al.* 2002].

Therapeutic Concentration

Three healthy volunteers were administered a single 60 mg oral dose of *d*-glaucine. Peak plasma concentrations were reported as follows:

	Subject 1	*Subject 2*	*Subject 3*
C_{max} (µg/L)	200	285	255
Time (h)	1.5	2	0.75
Urinary excretion 0–72 h (% of dose)	0.10	0.27	0.13

[Fels *et al.* 1984].

Toxicity LD_{50} in mice 98 mg/kg (IV), 401 mg/kg (oral).

A 23-year-old woman presented to an emergency department following the ingestion of 2 tablets of 'head candy', marketed as a 1-benzylpiperazine (BZP)-free 'herbal high'. She developed nausea and vomiting within 30 min of ingestion. Serum and urine samples were collected at admission and both contained glaucine. The serum glaucine concentration was ~0.7 mg/L. She was discharged the following day her symptoms had resolved [Dargan *et al.* 2008].

Note For a study of the mechanism of action of glaucine in the rat, see Orallo *et al.* [1993]; for a study of the abuse potential of glaucine in monkeys, see Schuster *et al.* [1982].

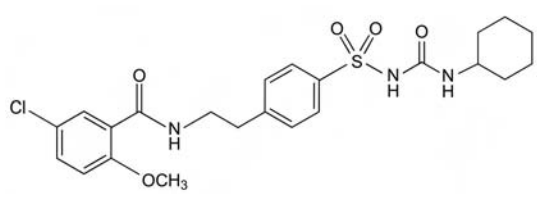
Glibenclamide

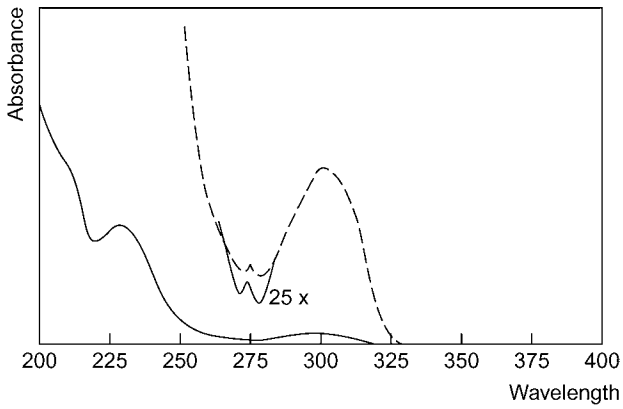
Antidiabetic
$C_{23}H_{28}ClN_3O_5S$ = 494.0
CAS—10238-21-8

IUPAC Name 5-Chloro-*N*-[2-[4-[[[(cyclohexylamino)carbonyl]amino]sulfonyl]-phenyl]ethyl]-2-methoxybenzamide
Synonyms Glybenclamide; glyburide; glycbenzcyclamide.
Proprietary Names *Azuglucon*; *Basstiverit*; *Calabren*; *Daonil*; *DiaBeta*; *Diabetamide*; *Diacon*; *Euglucan*; *Euglucon*; *Glib*; *Gliben*; *Glibenbeta*; *Gluconorm*; *Glucoremed*; *Glynase*; *Hemi-Doanil*; *Libanil*; *Malix*; *Maninil*; *Micronase*; *Miglucan*; *Semi-Daonil*; *Semi-Euglucon*.

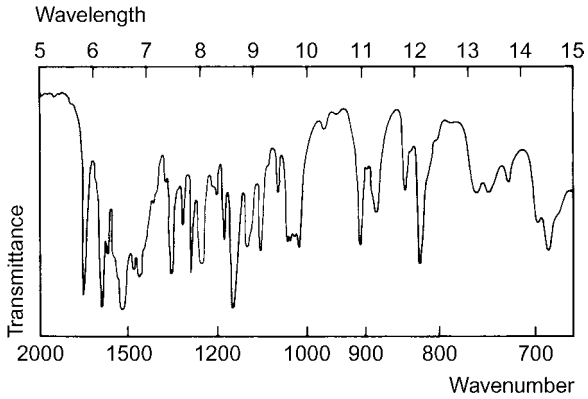


Chemical Properties A white crystalline powder. Mp 172° to 174°. Sparingly soluble in water; practically insoluble in ether; soluble 1 in 330 of ethanol, 1 in 36 of chloroform and 1 in 250 of methanol. pK_a 5.3. Log *P* (octanol/water), 4.8. Extraction yield (chlorobutane), 0.2 [Demme *et al.* 2005].
Colour Tests Aromaticity (method 2)—yellow/orange; Liebermann's reagent (100°)—orange (15 s).

Thin-layer Chromatography System TA—R_f 0.80; system TB—R_f 0.00; system TD—R_f 0.30; system TE—R_f 0.11; system TF—R_f 0.30; system TAD—R_f 0.57; system TAE—R_f 0.90 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—glibenclamide-Me RI 3800, glibenclamide-Me_2 RI 3840.
High Performance Liquid Chromatography System HX—RI 637; system HY—RI 571; system HZ—retention time 14.4 min; system HAA—retention time 22.0 min; system HAX—retention time 8.5 min; system HAY—retention time 9.8 min.
Ultraviolet Spectrum Methanol—275, 300 nm (A_1^1=63a).



Infrared Spectrum Principal peaks at wavenumbers 1524, 1160, 1623, 1718, 1276, 823 cm^{-1} (KBr disk).



Quantification
Plasma **GC** ECD. Limit of detection, 5 µg/L [Castoldi, Tofanetti 1979].
HPLC Limit of detection, <10 µg/L [Niopas, Daftsios 2002]. Fluorescence detection. Limit of detection, 5 µg/L [Khatri *et al.* 2001]. UV detection. Urine **GC** See Serum [Rydberg *et al.* 1991].
HPLC See Plasma [Emilsson *et al.* 1986].
Disposition in the Body Readily absorbed after oral administration; widely distributed throughout the body and metabolised mainly by 4-*trans*- and 3-*cis*-hydroxylation of the cyclohexyl ring. About 20 to 50% of a dose is excreted in the urine in 24 h, mainly as metabolites; about 45 to 75% of a dose is eliminated in the faeces over a period of 5 days.
Therapeutic Concentration
After a single oral dose of 5 mg to 2 subjects, peak plasma concentrations of 0.17 to 0.36 mg/L were attained in 3 h [Balant *et al.* 1975].
Toxicity
In a suicide attempt, a concentration of 0.6 mg/L was found in the serum initially. After 84 h the concentration had declined to less than 0.1 mg/L [Berger *et al.* 1977].
Half-life Plasma half-life, 5 to 16 h.
Volume of Distribution About 0.3 L/kg.
Distribution in Blood Plasma : whole blood ratio, 2.
Protein Binding About 99%.
Note For reviews of the pharmacokinetics of hypoglycaemic drugs, see Balant [1981] and Jackson and Bressler [1981].

Dose 5 to 15 mg daily.

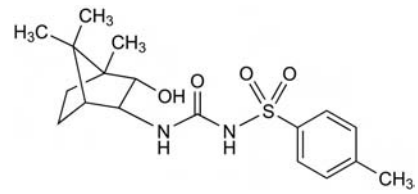
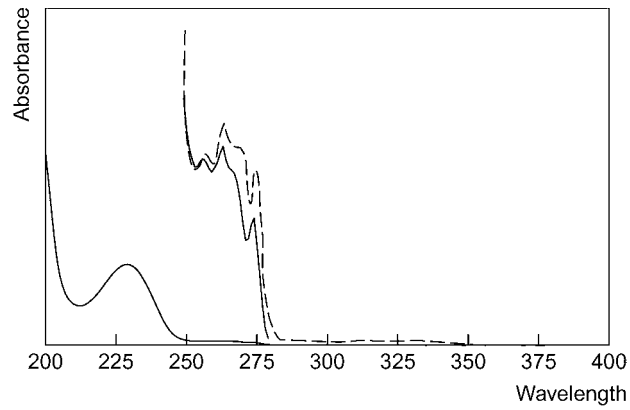
Glibornuride

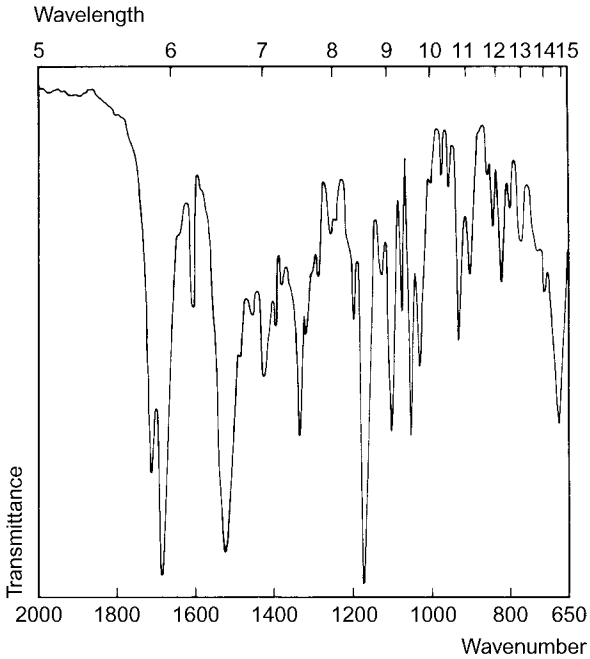
Antidiabetic
$C_{18}H_{26}N_2O_4S$ = 366.5
CAS—26944-48-9
IUPAC Name 1-(3-Hydroxy-4,7, 7-trimethyl-2-bicyclo[2.2.1]heptanyl)-3-(4-methylphenyl)sulfonylurea
Synonym [1*S*-(*endo*,*endo*)]-*N*-[[(3-Hydroxy-4,7,7-trimethylbicyclo[2.2.1]hept-2-yl)amino]carbonyl]-4-methylbenzenesulfonamide
Proprietary Names *Gluborid*; *Glutril*.



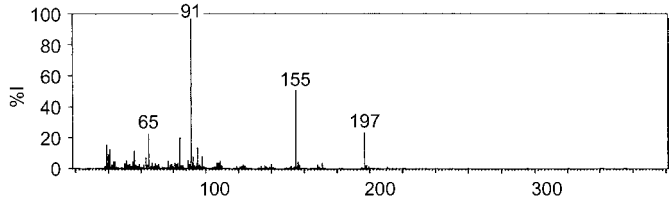
Chemical Properties Crystals. Mp 192° to 195°.
Colour Tests Koppanyi–Zwikker test—violet; mercurous nitrate—black.
Thin-layer Chromatography System TD—R_f 0.40; system TE—R_f 0.05; system TF—R_f 0.60; system TAD—R_f 0.54; system TAE—R_f 0.92.
Gas Chromatography System GA—art (methylsulfonamide) RI 1730, art (methylsulfonamide)-Me RI 1740, art (amide) RI 1620, M (OH-)-art (sulfonamide)-Me RI 2265, M (OH-)-art (sulfonamide)-Me_2 RI 2030, M (COOH-)-art (sulfonamide)-Me_3 RI 1955; system GB—glibornuride, not eluted, art (methylsulfonamide) RI 1660, art (amide) RI 1695.
Ultraviolet Spectrum Ethanol—257, 264 (A_1^1=17a), 275 nm.



Infrared Spectrum Principal peaks at wavenumbers 1170, 1682, 1520, 1710, 1050, 1100 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 91, 155, 197, 65, 84, 39, 95, 41.



Quantification

Plasma **Spectrofluorimetry** Limit of detection, 40 µg/L [Becker 1977].

Serum **Spectrofluorimetry** See Plasma [Becker 1977].

HPLC UV detection. Limit of detection, 500 µg/L [Harzer 1980].

Disposition in the Body Readily absorbed after oral administration. Extensively metabolised by hydroxylation to a series of inactive or almost inactive compounds and by oxidation to a *p*-carboxy derivative. About 60 to 70% of a dose is excreted in the urine as metabolites; four hydroxylated derivatives account for about 75% of the urinary material, *p*-hydroxyglibornuride accounts for about 6% and *p*-carboxyglibornuride for about 7%; the remainder of a dose is eliminated in the faeces.

Therapeutic Concentration

After an oral dose of 50 mg to 7 subjects, peak plasma concentrations of 1.6 to 3.4 mg/L were attained in about 3 to 4 h [Rentsch *et al.* 1972].

Half-life Plasma half-life, 5 to 11 h (mean 8).

Volume of Distribution 0.15 to 0.35 L/kg.

Protein Binding About 95%.

Note For reviews of the pharmacokinetics of sulfonylurea hypoglycaemic drugs, see Balant [1981] and Jackson and Bressler [1981].

Dose 12.5 to 75 mg daily.

Gliclazide

Antidiabetic

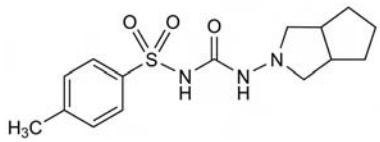
$C_{15}H_{21}N_3O_3S = 323.4$

CAS—21187-98-4

IUPAC Name 1-(3,3*a*,4,5,6,6*a*-Hexahydro-1*H*-cyclopenta[*c*]pyrrol-2-yl)-3-(4-methylphenyl)sulfonylurea

Synonym *N*-[[(Hexahydrocyclopenta[*c*]pyrrol-2(1*H*)-yl)amino]carbonyl]-4-methylbenzenesulfonamide

Proprietary Names *Cadicon*; *Diabeside*; *Diabrezide*; *Diaclaron*; *Diaglyk*; *Dialoc*; *Diamexon*; *Diamicron*; *Dramion*; *Glicron*; *Glimicron*; *Glucozide*; *Glyade*; *Glycemirex*; *Glycon*; *Glycron*; *Medoclazide*; *Serviclazide*; *Sun-Glizide*; *Ziclin*.



Chemical Properties A crystalline solid. Mp about 181°. pK_a 5.8. Log *P* (octanol/water), 2.1.

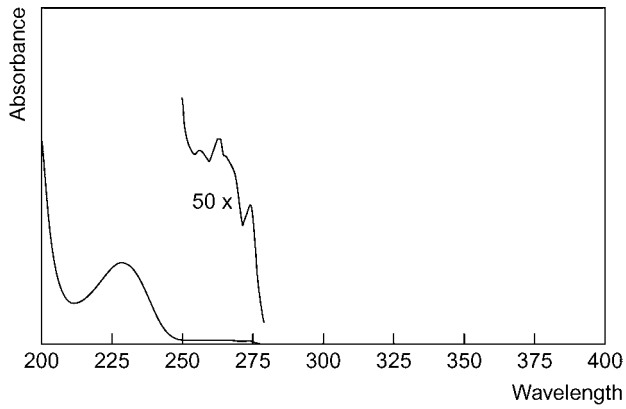
Colour Tests Liebermann's reagent—yellow; mercurous nitrate—black.

Thin-layer Chromatography System TB—R_f 0.00; system TE—R_f 0.09; system TAE—R_f 0.84.

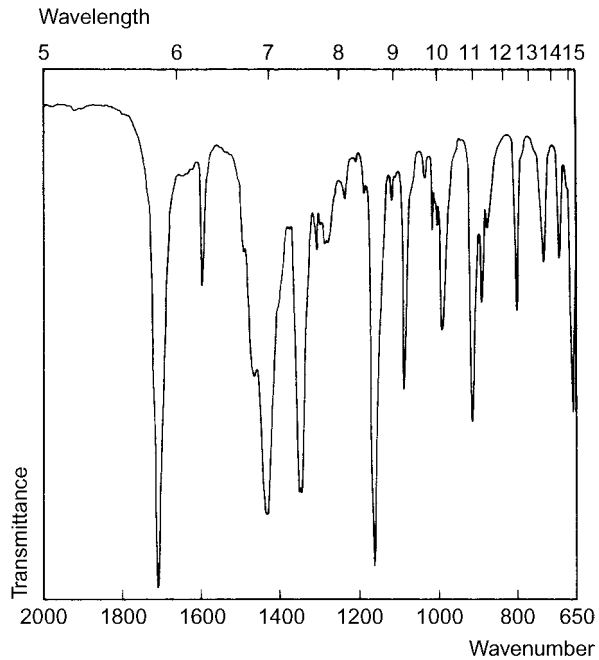
Gas Chromatography System GA—art 1-Me RI 1545; art (amide) RI 1620; art 3 RI 1670; art (methylsulfonamide) RI 1730; art (methylsulfonamide)-Me RI 1740; M art (OH-)(sulfonamide)-Me RI 2265; M art (OH-)(sulfonamide)-Me_2 RI 2030; M art (HOOC-)(sulfonamide)-Me_3 RI 1955; system GB—art (methylsulfonamide) RI 1660.

High Performance Liquid Chromatography System HX—RI 536; system HY—RI 483; system HZ—retention time 8.8 min; system HAA—retention time 20.5 min.

Ultraviolet Spectrum Aqueous acid—230 nm (A^1_1=440b); aqueous alkali—263 nm (A^1_1=20b).



Infrared Spectrum Principal peaks at wavenumbers 1707, 1162, 920, 667, 1089, 997 cm^{-1} (KBr disk).



Quantification

Plasma **HPLC** Gliclazide and other sulfonylureas. Limit of detection, 10–40 µg/L [Sener *et al.* 1995]. UV detection. Limit of detection, 300 µg/L [Kimura *et al.* 1980a].

Serum **HPLC** UV detection. Limit of detection, 20 µg/L [Noguchi *et al.* 1992]. UV detection. Limit of detection, 200 µg/L [Kimura *et al.* 1980b].

Disposition in the Body Absorbed after oral administration. It is extensively metabolised by hydroxylation, *N*-oxidation and oxidation to several inactive metabolites; the *p*-carboxy metabolite, which accounts for about 1% of the plasma concentration, has no hypoglycaemic activity but has some antithrombotic activity.

About 60–70% of a dose is excreted in the urine with less than 5% as unchanged drug. The *p*-carboxy and *N*-oxide metabolites account for about 40% of the dose. About 10–20% of the dose is eliminated in the faeces as metabolites.

Therapeutic Concentration

After a single oral dose of 80 mg to 23 subjects, peak plasma concentrations of 0.7–4.9 mg/L were attained in about 4 h. Following daily oral administration of 80 mg to 144 subjects, steady-state plasma concentrations of 0.3 to 8.2 mg/L (mean 2.5) were reported [Campbell *et al.* 1980].

Half-life Plasma half-life, 6 to 14 h (mean 10).

Protein Binding 85–95%.

Dose 40 to 320 mg daily.

Glimepiride

Antidiabetic

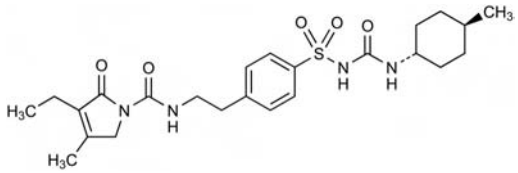
$C_{24}H_{34}N_4O_5S = 490.6$

CAS—93479-97-1

IUPAC Name 3-Ethyl-2,5-dihydro-4-methyl-*N*-[2-[4-[[[[(*trans*-4-methylcyclohexyl)-amino]carbonyl]amino]sulfonyl]phenyl]ethyl]2-oxo-1*H*-pyrrole-1-carboxamide

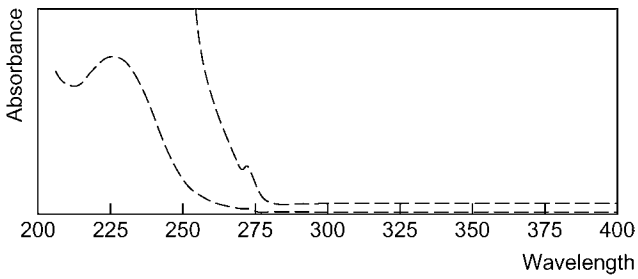
Synonym HOE-490

Proprietary Name *Amaryl*

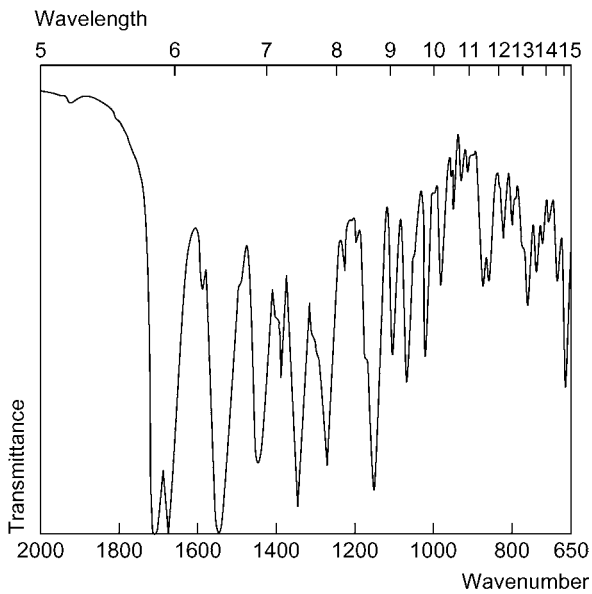


Chemical Properties A white to yellowish-white crystalline, almost odourless powder. Mp 207°. Practically insoluble in water.

Ultraviolet Spectrum Methanol—226, 273 nm.



Infrared Spectrum



Quantification

Serum **HPLC** In serum—column: ODS Spherisorb (125 × 4.6 mm i.d., 5 µm). Mobile phase: (A) 0.05 mol/L perchloric acid : acetonitrile (60:40); after 6 min, switched to (B) 0.05 mol/L perchloric acid : acetonitrile (42:58); after 8 min, (A), flow rate 2 mL/min. Retention time: (derivatives) glimepiride, 11.3 min; metabolites, 4.3 and 5.2 min. In urine—column: ODS Spherisorb (125 × 4.6 mm i.d., 5 µm). Mobile phase: 0.05 mol/L perchloric acid : acetonitrile (60:40), flow rate 2 mL/min. UV detection (λ=350 nm). Retention time: (derivatives) metabolites, 4.8 and 5.6 min. Limit of detection, 5 µg/L [Lehr, Damm 1990].

Urine **HPLC** See Serum [Lehr, Damm 1990].

Disposition in the Body Glimepiride is completely absorbed after oral administration. Peak plasma concentrations are attained within about 2 to 3 h. It is completely metabolised principally in the liver, mainly to the cyclohexyl hydroxy methyl derivative that has about a third the pharmacological activity of glimepiride, and the carboxyl derivative. These metabolites appear rapidly after administration of the parent drug. Cytochrome P450 isoenzyme 2C9 is involved in the formation of the cyclohexyl hydroxy methyl derivative. Glimepiride is distributed into breast milk and crosses the placenta. About 40% of a dose is eliminated in faeces as metabolites and about 60% of a dose is eliminated in urine as metabolites.

Therapeutic Concentration

Forty-two healthy volunteers, with a mean age of 27 years, were administered a single dose of 0.25 to 1.5 mg after an overnight, 10 to 12 h fast. The serum concentration measured 30 min after administration was 54 to 247 µg/L and after 180 min, 17 to 72 µg/L [Ratheiser *et al.* 1993].

Twelve healthy volunteers were administered single doses of 1, 2, 4 or 8 mg glimepiride. Mean drug concentrations were 103.2, 176.8, 307.8 and 550.8 µg/L for the doses at 2.3, 2.4, 2.1 and 2.8 h, respectively [Malerczyk *et al.* 1994].

Half-life Plasma half-life, 5 h after single dose; 9 h after multiple doses.

Volume of Distribution Approximately 113 mL/kg; 8.8 L.

Clearance Total body, 2.7 to 3.4 L/h.

Protein Binding >99.5%.

Note For a review of glimepiride, see Langtry and Balfour [1998].

Dose Usually up to 4 mg daily.

Langtry HD, Balfour JA (1998). Glimepiride. A review of its use in the management of type 2 diabetes mellitus. *Drugs* 55: 563–584.

Glipizide

Antidiabetic

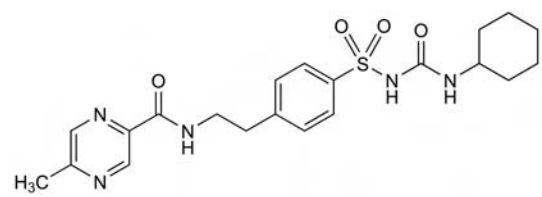
$C_{21}H_{27}N_5O_4S = 445.5$

CAS—29094-61-9

IUPAC Name *N*-[2-[4-[[[(Cyclohexylamino)carbonyl]amino]sulfonyl]phenyl] ethyl]-5-methylpyrazinecarboxamide

Synonyms Glipizidum; glydiazinamide; K-4024; CP-28720.

Proprietary Names *Apamid*; *Diasef*; *Dipazide*; *Glibenese*; *Glidiab*; *Glipid*; *Glipiscand*; *Gluco-Rite*; *Glucotrol*; *Glupital*; *Glygen*; *Melizid(e)*; *Mindiab*; *Minidiab*; *Minodiab*; *Ozidia*.



Chemical Properties A white powder. Mp about 205°. Practically insoluble in water and ethanol; soluble in chloroform, dimethylformamide and dilute solutions of alkali hydroxides; sparingly soluble in acetone. pK_a 5.9. Log *P* (octanol/water), 1.9.

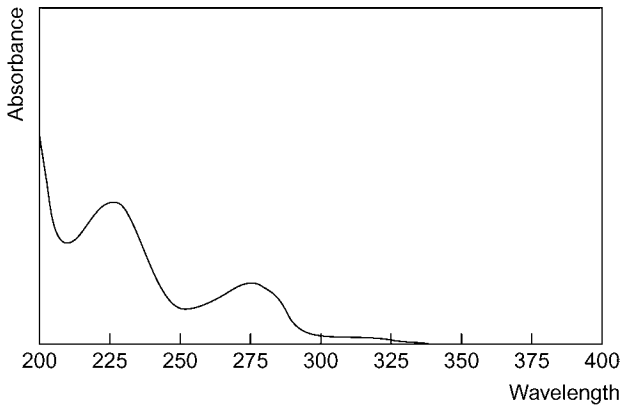
Colour Test Mercurous nitrate—black.

Thin-layer Chromatography System TA—R_f 0.87; system TB—R_f 0.00; system TC—R_f 0.41; system TE—R_f 0.07; system TL—R_f 0.05; system TAE—R_f 0.86.

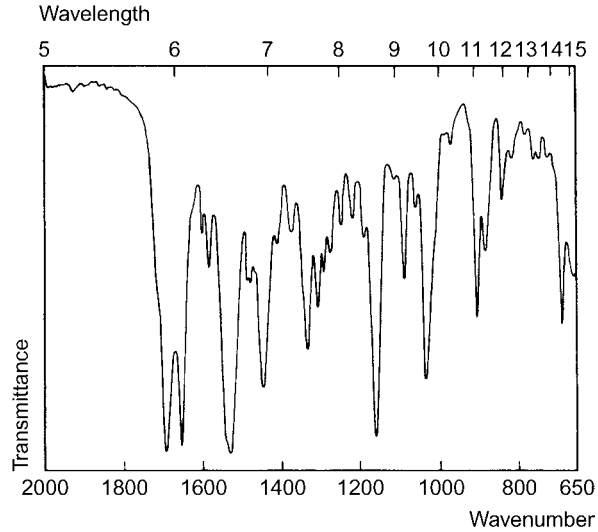
Gas Chromatography System GA—glipizide-Me RI 3420, glipizide-Me_2 RI 3455.

High Performance Liquid Chromatography System HX—RI 478; system HY—RI 423; system HZ—retention time 4.5 min; system HAA—retention time 17.6 min.

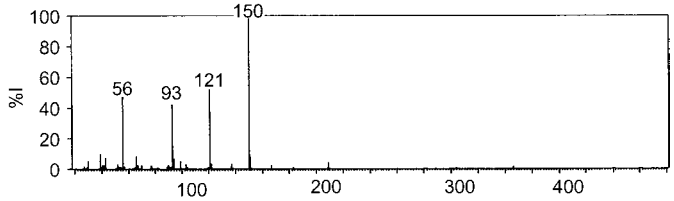
Ultraviolet Spectrum Aqueous acid—276 nm (A^1_1=231a). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1528, 1690, 1650, 1159, 1032, 900 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 150, 121, 56, 93, 39, 151, 66, 94.



Quantification

Plasma **HPLC** Glipizide and other sulfonylureas. Limit of detection, 10 to 40 µg/L [Sener *et al.* 1995]. UV detection. Limit of detection, 5 to 10 µg/L [Emilsson 1987].

Radioimmunoassay Limit of detection, 1 µg/L [Maggi *et al.* 1981].

Serum **HPLC** UV detection. Limit of detection, 20 µg/L [Wåhlin-Boll, Melander 1979].

Urine **HPLC** See Plasma [Emilsson 1987].

Disposition in the Body Readily absorbed after oral administration. Metabolised by hydroxylation to form a number of inactive metabolites, principally the 4-*trans*-hydroxycyclohexyl and 3-*cis*-hydroxycyclohexyl derivatives. About 65 to 85% of a dose is excreted in the urine in 24 h, with about 3 to 10% as unchanged drug, up to 80% as hydroxylated metabolites, mainly the 4-*trans*-hydroxycyclohexyl derivative, and about 1 to 2% as an *N*-acetamido metabolite; about 11% of a dose is eliminated in the faeces.

Therapeutic Concentration

After a single oral dose of 5 mg given to 6 subjects, peak serum concentrations of 0.11 to 0.49 mg/L (mean 0.33) were attained in about 1.6 h [Wåhlin-Boll *et al.* 1982].

Bioavailability Almost 100%.

Half-life Plasma half-life, 2 to 4 h.

Volume of Distribution About 0.2 L/kg.

Clearance Plasma clearance, about 0.6 mL/min/kg.

Protein Binding About 98%.

Note For a review of the pharmacokinetics of glipizide, see Brogden *et al.* [1979].

Dose Usually 2.5 to 20 mg daily; up to 40 mg have been used.

Gliquidone

Antidiabetic

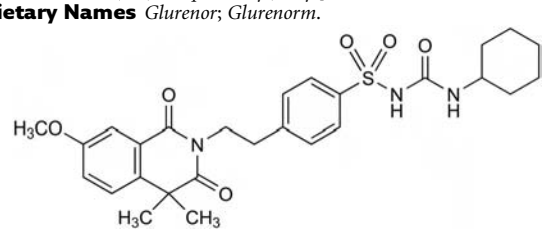
$C_{27}H_{33}N_3O_6S$ = 527.6

CAS—33342-05-1

IUPAC Name 1-Cyclohexyl-3-[4-[2-(7-methoxy-4,4-dimethyl-1,3-dioxoisoquinolin-2-yl)ethyl]phenyl]sulfonylurea

Synonym *N*-[(Cyclohexylamino)carbonyl]-4-[2-(3,4-dihydro-7-methoxy-4,4-dimethyl-1,3-dioxo-2(1*H*)-isoquinolinyl)ethyl]benzenesulfonamide

Proprietary Names *Glurenor*; *Glurenorm*.



Chemical Properties A white or slightly yellow crystalline substance. Mp about 178°. Practically insoluble in water; slightly soluble in ethanol and methanol; soluble in acetone and chloroform. Log *P* (octanol/water), 4.6.

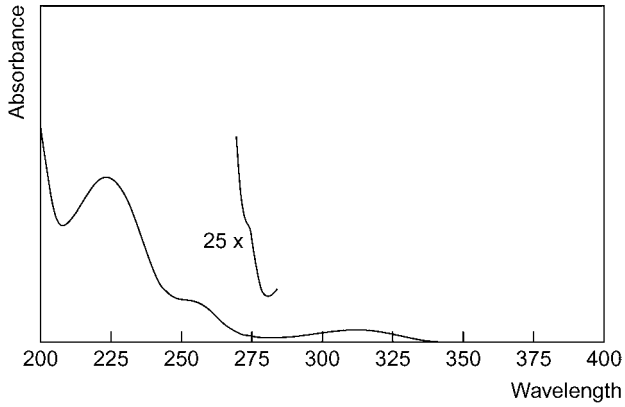
Colour Test Koppanyi–Zwikker test—violet.

Thin-layer Chromatography System TAE—R_f 0.93.

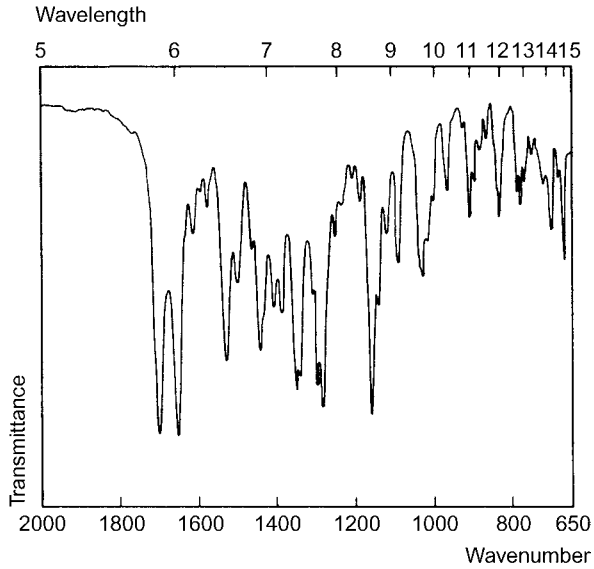
Gas Chromatography System GA—gliquidone RI 2024, gliquidone-Me RI 3850.

High Performance Liquid Chromatography System HY—RI 667.

Ultraviolet Spectrum Methanol—311 nm (A^1_1=50a); aqueous alkali—276 nm.



Infrared Spectrum Principal peaks at wavenumbers 1700, 1652, 1160, 1285, 1295, 1530 cm^{-1} (KBr disk).



Quantification
Plasma **HPLC** Gliquidone and other sulfonylureas. Limit of detection, 10 to 40 µg/L [Sener *et al.* 1995]. UV detection. Limit of detection, 30 µg/L [Guo *et al.* 1992].

Radioimmunoassay Limit of detection, 1 µg/L [Kopitar, Kompa 1975].

Disposition in the Body Readily absorbed after oral administration. Extensively metabolised by hydroxylation and demethylation to inactive metabolites. Less than 5% of a dose is excreted in the urine and about 95% is eliminated in the faeces, via the bile.

Therapeutic Concentration
After a single oral dose of 15 mg to 10 subjects, peak plasma concentrations of about 0.7 mg/L, and peak blood concentrations of about 0.37 mg/L were reported [Kopitar 1975].

In 20 subjects, a single 30-mg oral dose produced peak plasma concentrations of 0.12 to 2.14 mg/L (mean 0.65) at 1.25 to 4.75 h (2.25) [von Nicolai *et al.* 1997].

Half-life Plasma half-life, about 1.5 h.

Distribution in Blood Plasma:whole blood ratio, about 1.9.

Protein Binding About 99%.

Dose 15 to 180 mg daily.

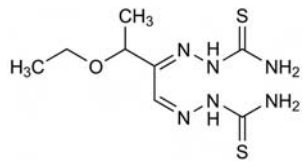
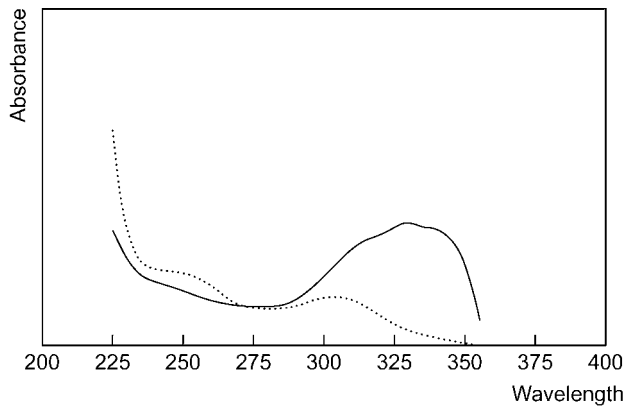
Gloxazone

Anaplasmodastat (Veterinary)
$C_8H_{16}N_6OS_2$ = 276.4
CAS—2507-91-7

IUPAC Name [(*E*)-[(1*E*)-1-(Carbamothioylhydrazinylidene)-3-ethoxybutan-2-ylidene] amino]thiourea
Synonym 2,2′-[1-(1-Ethoxyethyl)-1,2-ethanediylidene] bishydrazinecarbothioamide



Chemical Properties A yellow powder. Practically insoluble in water and ether; slightly soluble in chloroform.
Colour Test Palladium chloride—red.
Thin-layer Chromatography System TA—R_f 0.77 (acidified iodoplatinate solution, positive).
Ultraviolet Spectrum Aqueous acid—329 nm; aqueous alkali—303 nm.

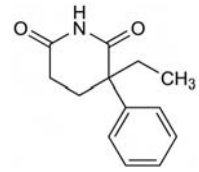


Infrared Spectrum Principal peaks at wavenumbers 1587, 1079, 1228, 1259, 1575, 1022 cm^{-1} (KBr disk).

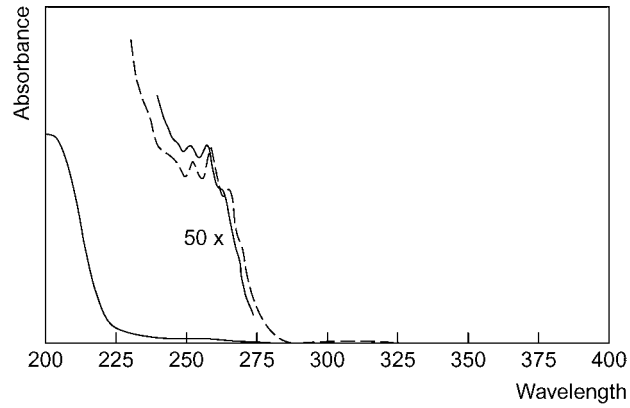
Glutethimide

Hypnotic
$C_{13}H_{15}NO_2$ = 217.3
CAS—77-21-4

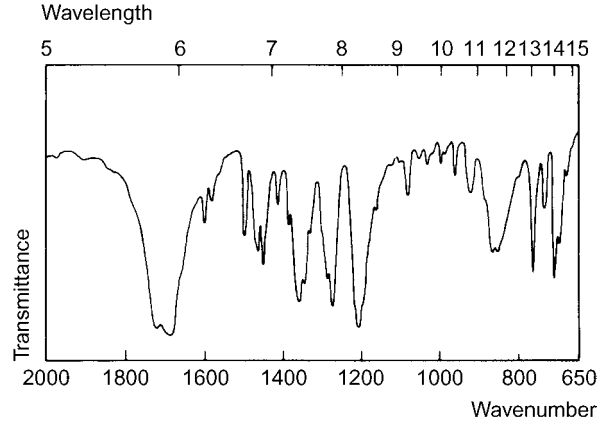
IUPAC Name 3-Ethyl-3-phenyl-2,6-piperidinedione
Synonyms Glutethimidum; glutetimide.
Proprietary Name *Doriden(e)*



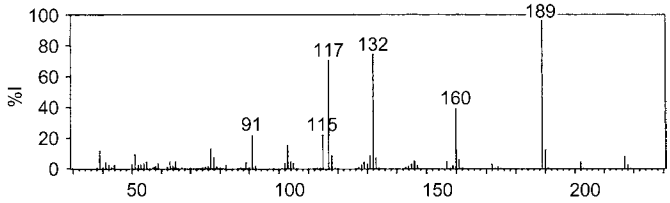
Chemical Properties Colourless crystals or white crystalline powder. Mp 85° to 89°. Practically insoluble in water; soluble 1 in 5 of ethanol, 1 in less than 1 of chloroform and 1 in 12 of ether; freely soluble in acetone. pK_a 9.2. Log *P* (octanol/water), 1.9. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].
Colour Tests Koppanyi–Zwikker test—violet; Liebermann's reagent—red-orange; mercurous nitrate—black.
Thin-layer Chromatography System TA—R_f 0.75; system TB—R_f 0.31; system TD—R_f 0.63; system TE—R_f 0.80; system TF—R_f 0.62; system TAD—R_f 0.70; system TAE—R_f 0.86; system TAF—R_f 0.89 (Dragendorff spray, weak reaction; acidified iodoplatinate solution, positive; mercuric chloride–diphenylcarbazone reagent, positive; mercurous nitrate spray, black).
Gas Chromatography System GA—glutethimide RI 1830, M (OH-ethyl-) RI 1865, M (OH-phenyl-) RI 1875, M (OH-ethyl-)-AC RI 2060, M (OH-phenyl-)-AC RI 2250; system GB—glutethimide RI 1910, M (OH-ethyl-) RI 1958, M (OH-phenyl-) RI 2040; system GF—RI 2315.
High Performance Liquid Chromatography System HE—*k* 7.97; system HX—RI 436; system HY—RI 401; system HZ—retention time 4.8 min; system HAX—retention time 6.6 min; system HAY—retention time 6.2 min.
Ultraviolet Spectrum Ethanol—252, 258 ($A^{1\%}_{1cm}$=18a), 264 nm.



Infrared Spectrum Principal peaks at wavenumbers 1686, 1710, 1200, 1270, 1281, 704 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 189, 132, 117, 160, 91, 115, 103, 77; 4-hydroxyglutethimide 146, 233, 103, 133, 91, 117, 115, 77; 2-phenylglutarimide 104, 189, 103, 117, 78, 91, 51, 146.



Quantification

Plasma **GC** FID. Glutethimide and 4-hydroxyglutethimide. Limit of detection, 200 µg/L for glutethimide and 500 µg/L for 4-hydroxyglutethimide [Hansen, Fischer 1974].

GC-MS Glutethimide and six metabolites. Limit of detection, 50 µg/L [Kennedy *et al.* 1978].

Serum **GC** FID. Limit of detection, 250 µg/L [Kadar, Kalow 1972].

Urine **GC** See Plasma [Hansen, Fischer 1974].

GC-MS See Plasma [Kennedy *et al.* 1978].

Tissues **GC** See Plasma [Hansen, Fischer 1974].

Disposition in the Body Irregularly absorbed from the gastrointestinal tract; absorption is enhanced if alcohol is taken concomitantly. Widely distributed in body tissues and fat. Glutethimide is a racemate; the (+)-isomer is metabolised in the liver to 4-hydroxyglutethimide and the (−)-isomer to 2-(1-hydroxyethyl)-2-phenylglutarimide. 4-Hydroxyglutethimide is twice as active as glutethimide in animals but does not appear to contribute to the effects of single therapeutic doses in humans; however it tends to accumulate in the plasma during intoxication and may contribute to the central nervous depression in overdose cases. Both hydroxylated metabolites are converted to glucuronides and undergo enterohepatic circulation; they are still being excreted in the urine after >48 h. 2-Ethyl-2-(4-hydroxyphenyl)glutarimide is a major metabolite during chronic administration. Other metabolites include 2-phenylglutarimide, α-phenyl-γ-butyrolactone and 2-ethyl-2-phenylglutaconimide, which are pharmacologically active; numerous other mono- and dihydroxyphenyl metabolites have been isolated from human urine. <2% of a dose is excreted unchanged in the urine in 24 h. 2-Phenylglutarimide and 2-ethyl-2-phenylglutaconimide each account for about 2 to 4% of the dose as urinary excretion products and the remainder consists largely of glucuronide conjugates of the hydroxylated metabolites. It crosses the placenta and traces are found in breast milk.

Therapeutic Concentration

Following single oral doses of 500 mg to 6 subjects, peak plasma concentrations of 2.8 to 7.1 mg/L (mean 4.3) were attained in 1 to 6 h (mean 2) [Curry *et al.* 1971].

Toxicity The estimated minimum lethal dose is 5 g, although recoveries have occurred after the ingestion of up to 10 g. Blood concentrations of 3.4 to 27 to 48 mg/L of glutethimide have been associated with toxic effects and concentrations of 25 to 48 to 90 mg/L have been associated with fatalities. Postmortem blood concentrations of about 10 mg/L may be indicative of poisoning if the survival time has been prolonged.

In a review of 11 fatalities, blood concentrations of glutethimide were reported to range from 10 to 97 mg/L (mean 45) and liver concentrations from 63 to 141 µg/g (mean 89) [Baselt, Cravey 1977].

In a suicide attempt involving the ingestion of a glutethimide preparation that had been stored for 20 years, a blood concentration of 5 mg/L and a urinary concentration of 11 mg/L were reported. [Mankowski *et al.* 2002].

Half-life Plasma half-life, biphasic with a half-life of up to 22 h for the terminal phase; in acute intoxication the plasma half-life has an average value of about 40 h but may exceed 100 h.

Volume of Distribution About 3 L/kg.

Protein Binding About 50%.

Dose Usually 250 to 500 mg has been given as a hypnotic.

Glyceryl Trinitrate

Antianginal Vasodilator

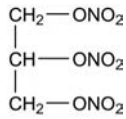
$C_3H_5N_3O_9$ = 227.1

CAS—55-63-0

IUPAC Name 1,2,3-Propanetriol trinitrate

Synonyms Glonoin; nitroglycerin; nitroglycerol; trinitrin; trinitroglycerin.

Proprietary Names *Coro-Nitro*; *Deponit*; *Glytrin*; *Minitran*; *Nitrek*; *Nitro-Bid*; *Nitrocine*; *Nitro-Derm*; *Nitrodisc*; *Nitro-Dur*; *Nitrogard*; *Nitroglyn*; *Nitrol*; *Nitrolingual*; *Nitromin*; *Nitrotime*; *Nitronal*; *Nitrong*; *NitroQuick*; *Nitrostat*; *NitroTab*; *NTS*; *Percutol*; *Suscard*; *Sustac*; *Transdermal-NTG*; *Transderm-Nitro*; *Transiderm-Nitro*; *Tridil*.



Chemical Properties A colourless, slightly volatile, oily liquid. It explodes on rapid heating or on percussion. Mass per mL about 1.6 g. Soluble 1 in 800 of water and 1 in 4 of ethanol; miscible with acetone, glacial acetic acid, ethyl acetate, benzene, pyridine, chloroform and ether; sparingly soluble in petroleum ether, liquid petrolatum and glycerol. Log *P* (octanol/water), 1.6.

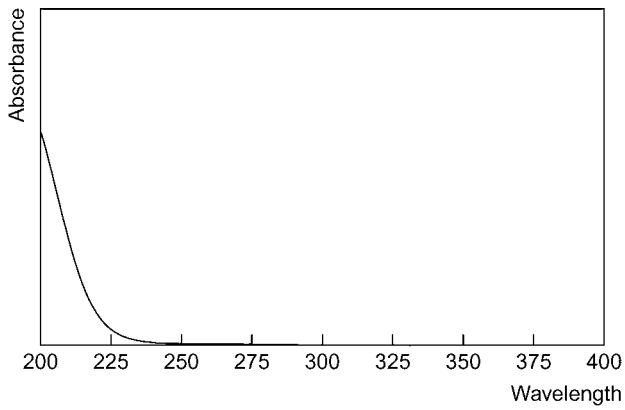
Caution In fatty or oily solution it is safe and stable but in alcoholic solution the substance must be handled with the utmost caution.

Colour Test Ferrous sulfate—red.

Thin-layer Chromatography System TD—R_f 0.71; system TE—R_f 0.86; system TF—R_f 0.72.

High Performance Liquid Chromatography System HY—RI 499.

Ultraviolet Spectrum



Infrared Spectrum Principal peaks at wavenumbers 1647, 1279, 843, 1013, 903, 754 cm^{-1}.

Quantification

Plasma **GC** ECD. Glyceryl trinitrate and its dinitrate metabolites. Limit of detection, about 0.2 nmol [Jorgensen *et al.* 1992]. Glyceryl trinitrate, isosorbide dinitrate and their metabolites. Limit of detection, for glyceryl trinitrate 0.75 nmol [Booth *et al.* 1990]. ECD. Glyceryl trinitrate and its dinitrate metabolites. Limits of detection, 0.025 µg/L for glyceryl trinitrate and 0.1 µg/L for dinitrate metabolites [Lee *et al.* 1988]. ECD. Limit of detection, 0.1 µg/L [Hennig, Benecke 1987]. ECD. 1,2- and 1,3-glyceryl dinitrates, limit of detection 250 ng/L [Sioufi *et al.* 1987]. ECD. Limit of detection, 25 ng/L [Noonan *et al.* 1984]. ECD. Glyceryl trinitrate and its mono- and di-nitrate metabolites. Limit of detection, <0.4 µg/L [Han *et al.* 1992].

HPLC Thermal energy analyser detection. Glyceryl trinitrate and its dinitrate metabolites. Limit of detection, 0.05 µg/L [Woodward *et al.* 1984]. Limit of detection, 500 ng/L [Spanggord, Keck 1980].

Serum **GC** ECD. Glyceryl trinitrate and dinitrate metabolites. Limit of detection, 50 ng/L for glyceryl trinitrate [Janssens *et al.* 1989].

Biological Samples **GC** ECD. Glycerol 1-nitrate and glycerol 2-nitrate [Scharpf *et al.* 1987].

Disposition in the Body Readily absorbed from the skin and mucous membranes; less readily absorbed after oral administration. It is rapidly metabolised in the body to dinitrates, which are active, and to inactive mononitrates. About 20% of a sublingual dose is excreted in the urine in 24 h, mainly as the mononitrate.

Therapeutic Concentration

After sublingual administration of 0.3 mg to 1 subject, a blood concentration of about 0.001 mg/L was attained in 3 min; following an oral dose of 6.5 mg or application of an ointment containing 16 mg of glyceryl trinitrate to the same subject, peak blood concentrations of about 0.0002 to 0.0003 mg/L were reported, 20 to 60 min after the dose [Blumenthal *et al.* 1977].

Following sublingual administration of 0.5 mg to 6 subjects, a mean peak plasma concentration of 0.0014 mg/L was attained in 3 min; after oral administration of 6.4 mg, a peak plasma concentration of 0.0026 mg/L was reported at 2 to 4 h, and after topical administration of 35 mg, a mean peak plasma concentration of 0.0025 mg/L was attained in 1 h. Plasma nitrate and nitrite concentrations were undetectable after sublingual administration; after oral administration peak plasma concentrations of about 0.5 mg/L of nitrate and nitrite were attained in 5 and 2 h respectively, and following topical administration, peak concentrations of about 0.7 mg/L were reported at 5 h and 1 h respectively [Bashir *et al.* 1982].

Toxicity The estimated minimum oral lethal dose is 2 g and the maximum permissible atmospheric concentration is 0.2 ppm.
Half-life Plasma half-life, after IV administration about 2 to 5 min; after sublingual administration about 5 min.
Volume of Distribution About 3 L/kg.
Note For a review of the pharmacokinetics of organic nitrates, see Bogaert [1983]. For a review of IV glyceryl trinitrate, see Sorkin *et al.* [1984].
Dose Usually the equivalent of 0.5 to 1 mg of glyceryl trinitrate sublingually, repeated as required; doses of 5.2 to 38.4 mg daily are given orally as sustained-release tablets.

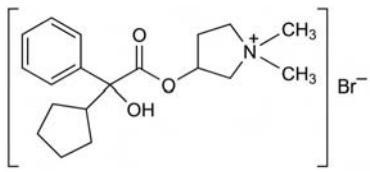
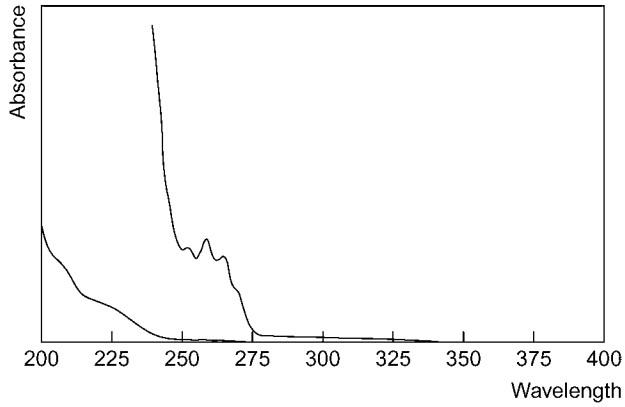
Glycopyrronium Bromide

Anticholinergic
$C_{19}H_{28}BrNO_3$ = 398.3
CAS—596-51-0

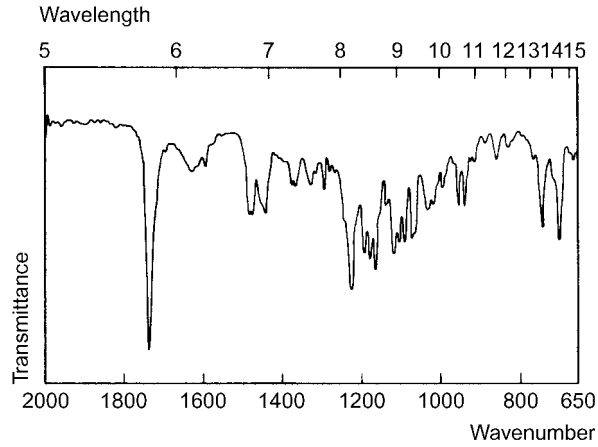
IUPAC Name 3-[(Cyclopentylhydroxyphenylacetyl)oxy]-1,1-dimethylpyrrolidinium bromide
Synonym Glycopyrrolate
Proprietary Names *Gastrodyn*; *Nodapton*; *Ronanul*; *Robinul*; *Tarodyl*; *Tarodyn*.



Chemical Properties A white crystalline powder. Mp 193° to 198°. Soluble 1 in about 5 of water and 1 in 10 of ethanol; practically insoluble in chloroform and ether. Log *P* (octanol/water), −1.0.
Colour Test The following test is performed on glycopyrronium nitrate: Liebermann's reagent—black.
Thin-layer Chromatography System TA—R_f 0.03; system TE—R_f 0.01; system TAE—R_f 0.03 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2120.
High Performance Liquid Chromatography System HA—*k* 3.2 (tailing peak).
Ultraviolet Spectrum Aqueous acid—252, 258 (A^1_1=7.1a), 264 nm.



Infrared Spectrum Principal peaks at wavenumbers 1738, 1225, 1164, 1178, 1115, 1192 cm^{-1}.



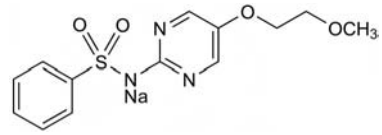
Quantification
Plasma **GC** Nitrogen-sensitive detection [Murray *et al.* 1984].
Disposition in the Body
Therapeutic Concentration
Following a single IM injection of glycopyrronium at a dose of 8 μg/kg to 9 subjects, peak plasma concentrations of 5.03 to 26.55 μg/L (mean 15.79) were achieved in 16.11 min [Ali-Melkkila *et al.* 1990].
Dose 2 to 12 mg daily.

Ali-Melkkila TM *et al.* (1990). Pharmacokinetics of i.m. glycopyrronium. *Br J Anaesth* 64: 667–669.
Murray GR *et al.* (1984). Quantitative capillary column gas chromatographic method for the determination of glycopyrronium in human plasma. *J Chromatogr* 308: 143–151.

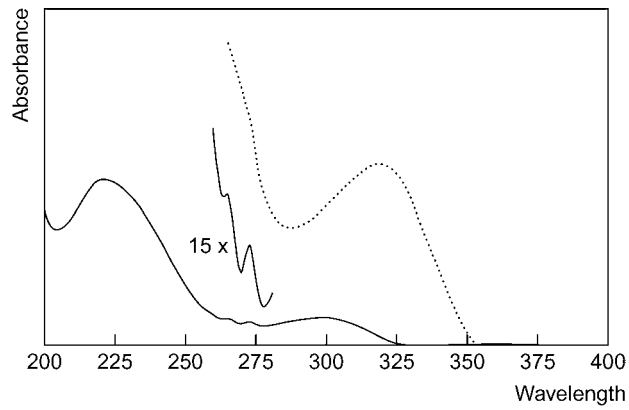
Glymidine Sodium

Antidiabetic
$C_{13}H_{14}N_3NaO_4S$ = 331.3
CAS—3459-20-9

IUPAC Name Sodium benzenesulfonyl-[5-(2-methoxyethoxy)pyrimidin-2-yl] azanide
Synonyms Glidiazine sodique; glycodiazine sodium; sodium glymidine.
Proprietary Names *Glyconormal*; *Gondafon*; *Lycanol*; *Redul*.
Note The sodium salt of *N*-[5-(2-methoxyethoxy)-2-pyrimidinyl]-benzenesulfonamide.

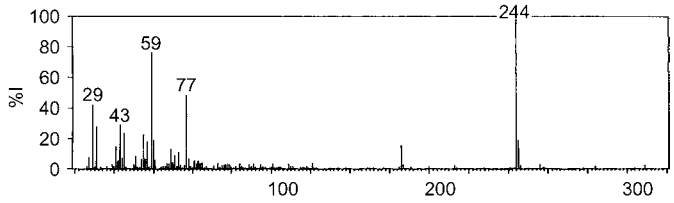


Chemical Properties A white crystalline powder. Mp 221° to 226°. Soluble in water; sparingly soluble in ethanol.
Colour Tests Koppanyi–Zwikker test—pink-violet; mercurous nitrate—black.
Thin-layer Chromatography System TA—R_f 0.76; system TB—R_f 0.00; system TC—R_f 0.65; system TE—R_f 0.05.
Gas Chromatography System GA—RI 1632; system GB—RI 2750; system GJ—methyl derivative RRT 0.53 (relative to griseofulvin).
Ultraviolet Spectrum Aqueous acid—273, 299 nm; aqueous alkali—243, 317 nm.



Infrared Spectrum Principal peaks at wavenumbers 1130, 1092, 1267, 1247, 691, 1220 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 244, 59, 77, 29, 43, 31, 45, 55.



Quantification
Blood **GC** ECD. Limit of detection, 1.5 mg/L [Schlicht *et al.* 1978].
Plasma **Spectrofluorimetry** Limit of detection, 1 mg/L [Held *et al.* 1970].
TLC Glymidine sodium and metabolites. Limit of detection, 2.5 mg/L [Soyfer *et al.* 1969].
Urine **Spectrofluorimetry** Desmethyl and carboxy metabolites, see Plasma [Held *et al.* 1970].
Disposition in the Body Almost completely absorbed after oral administration. Metabolised by demethylation to an active metabolite and oxidation to an inactive carboxy derivative. About 85 to 95% of a dose is excreted in the urine in 48 h, with <1% of the urinary material as unchanged drug, 20 to 40% as the desmethyl metabolite and 60 to 80% as the carboxy metabolite; about 6% of a dose is eliminated in the faeces.
Half-life Plasma half-life, about 2 to 6 h, increased in subjects with hepatic disease.
Protein Binding About 80%.
Dose 0.5 to 2 g daily.

Held H *et al.* (1970). [Spectrofluorometric method for determination of glycodiazine in plasma and of the both glycodiazine metabolites in urine]. *Arzneimittelforschung* 20: 1927–1929.

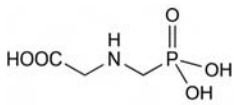
Glyphosate

Herbicide
$C_3H_8NO_5P$ = 169.1
CAS—1071-83-6

IUPAC Name 2-(Phosphonomethylamino)acetic acid
Synonym *N*-(Phosphoromethyl)glycine
Proprietary Names *Acrion*; *Agriguard*; *Bronco*; *Gallup*; *Gliakla*; *Landmaster*; *MON 0573*; *MON 2139*; *MON 6000*; *Pondmaster*; *Ranger*; *Rattler 4AS*; *Sonic*; *Spasor*; *Sting*; *Tumbleweed*.



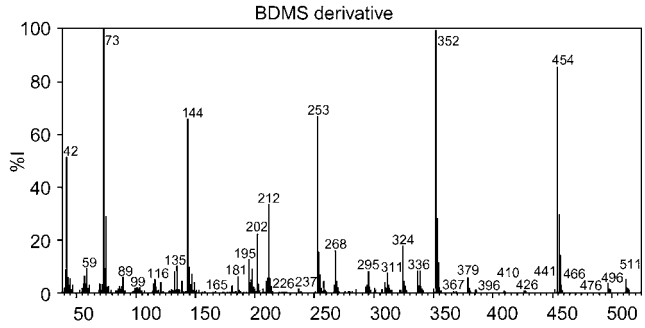
Chemical Properties A white solid/ colourless crystals (pure state) or light amber to brown liquid (technical state). Mp 230°. Soluble in water (12 g/L at 25°); insoluble in most common organic solvents. pK_a 0.8 (also reported as 5.6). Log *P* (octanol/water), −4.00.

Glyphosate Isopropylammonium
$C_6H_{17}N_2O_5P$ = 228.2
CAS—38641-94-0
Synonym MON-2139
Proprietary Names *Drat*; *Glifonox*; *Glycel*; *Liphadione*; *Quick*; *Revoke*; *Rodeo*; *Rondo*; *Roundup*.
Chemical Properties Very soluble in water.

Glyphosate Sesquisodium Salt
$C_6H_{13}N_2Na_3O_{10}P_2$ = 404.1
CAS—70393-85-0
Synonym Sodium glyphosate
Proprietary Names *MON-8000*; *Polado*.

Glyphosate Trimesium
$C_{12}H_{32}NO_5PS_3$ = 245.2
CAS—81591-81-3
Synonyms SC-0224; sulfosate.
Proprietary Name *Touchdown*

Thin-layer Chromatography System TAB—R_f 0.00(glyphosate acid); system TAC—R_f 0.00(glyphosate acid).
Gas Chromatography System GA—glyphosate-(Me_3) RI 1410, glyphosate-(Me_4) RI 1390.
Ultraviolet Spectrum Acetonitrile—257 nm.
Mass Spectrum Principal ions at *m/z* (*tert*-butyldimethylsilyl (BDMS) derivative) 73, 352, 454, 253, 144, 42, 212, 455.



Quantification
Serum **HPLC** Limit of detection, 0.3 mg/L for glyphosate, 0.2 mg/L for the metabolite AMPA. [Tomita *et al.* 1991].
Biological Specimens **GC** Limit of detection, 100 mg/L [Tsunoda 1993].
GC-MS Limit of detection, 10 mg/L [Tsunoda 1993].
Disposition in the Body Glyphosate is poorly absorbed through the skin and from the digestive tract after ingestion. It is mostly excreted unchanged but one metabolite identified is (aminomethyl)phosphonic acid (AMPA). There is no significant evidence that glyphosate accumulates in tissue.
Toxicity Glyphosate is practically non-toxic by ingestion. The allowed daily intake is 0.3 mg/kg body weight. Minimum lethal dose is 60 mL (84-year-old man). Individuals over 40 years old who ingest over 150 mL of glyphosate are at a higher risk of death than those who are younger.

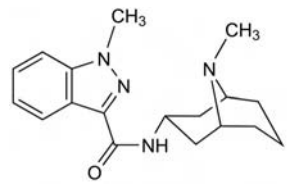
A 58-year-old man was found collapsed by his wife at home but was pronounced dead by the emergency services on arrival. Postmortem analysis discovered a dark greenish-brown fluid material in his stomach. Toxicological analysis determined that there were glyphosate concentrations of 0.30 g/L, 1.03 g/L, and 92.6 g/L in his blood, urine, and stomach contents, respectively. It was concluded that the man had consumed the Touchdown found by the side of his body [Sato *et al.* 1997].

Sato Y *et al.* (1997). An autopsy case of glyphosate herbicide: Touchdown poisoning and detection of glyphosate using HPLC. Poster abstract at *XXXV TIAFT Annual Meeting*, abstract 145.
Tomita M *et al.* (1991). High-performance liquid chromatographic determination of glyphosate and (aminomethyl)phosphonic acid in human serum after conversion into p-toluenesulphonyl derivatives. *J Chromatogr* 566(1): 239–243.
Tsunoda N (1993). Simultaneous determination of the herbicides glyphosate, glufosinate and bialaphos and their metabolites by capillary gas chromatography-ion-trap mass spectrometry. *J Chromatogr* 637(2): 167–173.

Granisetron

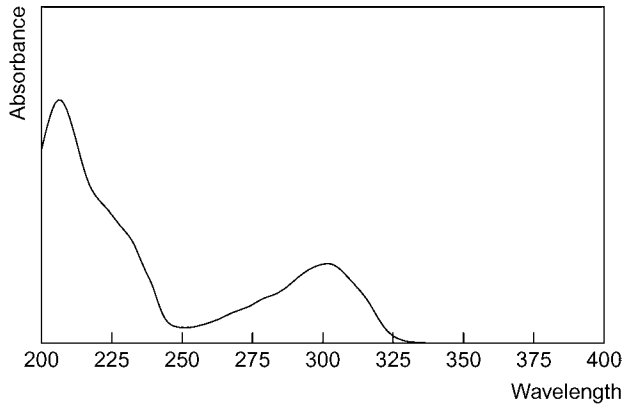
Antiemetic
$C_{18}H_{24}N_4O$ = 312.4
CAS—109889-09-0

IUPAC Name 1-Methyl-*N*-[(3-*endo*)-9-methyl-9-azabicyclo[3.3.1]non-3-yl]-1*H*-indazole-3-carboxamide
Synonym BRL-43694

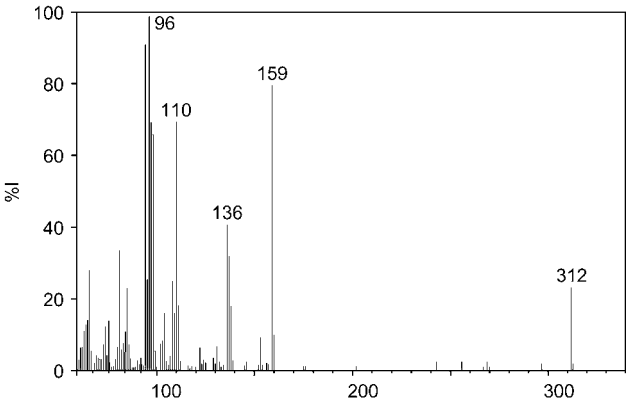


Granisetron Hydrochloride
$C_{18}H_{24}N_4O.HCl$ = 348.9
CAS—107007-99-8
Synonym BRL-43694A
Proprietary Name *Kytril*
Chemical Properties A white to off-white solid. Mp 290° to 292°. Readily soluble in water and normal saline at 20°.

Thin-layer Chromatography System TB—R_f 0.18; system TE—R_f 0.51; system TAE—R_f 0.14.
High Performance Liquid Chromatography System HX—RI 359.
Column: Apex CN (250 × 4.5 mm i.d., 10 µm). Mobile phase: 0.05 mol/L sodium acetate buffer (3%) (pH 6.0). Internal standard (IS): BRL-43704. Fluorescence detection (λ_{ex}=305 nm, λ_{em}=360 nm). Retention time: granisetron, 13.5 min; IS, 19.2 min [Clarkson *et al.* 1987].
Ultraviolet Spectrum Principal peaks at 207, 303 nm.



Mass Spectrum Principal ions at *m/z* 96, 94, 159, 110, 97, 98, 136, 137.



Quantification

Plasma **HPLC** Fluorescence detection. Limit of quantification 0.1 µg/L for granisetron and 0.25 µg/L for 7-hydroxygranisteron [Boppana 1995]. UV detection (λ=305 nm). Limit of detection, 0.019 µg/L [Capacio *et al.* 1993].

Disposition in the Body Granisetron is rapidly and completely absorbed after oral administration and is metabolised in the liver by 7-hydroxylation, *N*-demethylation, aromatic ring oxidation and conjugation. Its active metabolite is 7-hydroxygranisetron. <20% of a dose is recovered in urine unchanged and the rest is excreted in urine and faeces as its metabolites.

Therapeutic Concentration

In clinical trials, 27 cancer patients and 39 healthy volunteers were administered a single dose of 1.0 mg. Mean peak plasma concentrations of 3.63 µg/L (range of 0.27 to 9.14 µg/L) were reached. Receiving 1.0 mg doses daily for 7 days, peak concentrations were 5.99 µg/L (range 0.63 to 30.9 µg/L). Peak plasma concentrations can increase up to 30% in fasted states [SmithKline Beecham].

Toxicity During clinical trials, one patient received over 10 times the recommended dose (total of 38.5 mg) and complained of a headache only. Acute overdose: somnolence and myalgia.

Bioavailability Oral, 60%.

Half-life In healthy volunteers: 3 to 4 h; in patients with cancer: 9 to 12 h.

Volume of Distribution 2 to 3 L/kg, also reported as 200 L.

Clearance 0.2 to 0.5 L/h/kg.

Distribution in Blood Distributed freely between plasma and red blood cells.

Protein Binding 65% bound.

Dose Adults: intravenously: a single 3 mg dose of granisetron is administered, repeated if necessary with a maximum daily dose of 9 mg. Oral dose of 2 mg daily can be administered. Children: the usual dose is 10 to 40 µg/kg body weight intravenously with a maximum of 3 mg daily.

Boppana VK (1995). Simultaneous determination of granisetron and its 7-hydroxy metabolite in human plasma by reversed-phase high-performance liquid chromatography utilizing fluorescence and electrochemical detection. *J Chromatogr A* 692(1-2): 195–202.

Capacio BR *et al.* (1993). An HPLC method for the determination of granisetron in guinea pig plasma. *J Anal Toxicol* 17(3): 151–155.

SmithKline Beecham, data on file

Griseofulvin

Antifungal

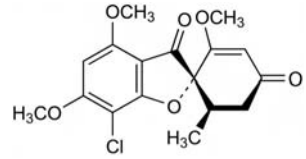
$C_{17}H_{17}ClO_6 = 352.8$

CAS—126-07-8

IUPAC Name (1′*S*,6′*R*)-7-Chloro-2′,4,6-trimethoxy-6′-methylspiro[benzofuran-2(3*H*),1′-[2]-cyclohexene]-3,4′-dione

Synonym Curling factor

Proprietary Names *Erlivin*; *Fulcin*; *Fulvicin*; *Fulvina*; *Grifulvin V*; *Grisactin*; *Grisaltin*; *Grisefuline*; *Griseo*; *Griseomed*; *Griseostatin*; *Grisovin*; *Gris-PEG*; *Grivin*; *Krisovin*; *Lamoryl*; *Likuden M*; *Medofulvin*; *Microcidal*; *Neo-Fulcin*; *neofulvin*; *Polygris*; *Polcyl-FP*; *Spirofulvin*; *Sporostatin*; *Trivanex*.



Chemical Properties A white to pale cream-coloured powder. Mp 217° to 224°. Practically insoluble in water and petroleum ether; soluble 1 in 300 of dehydrated alcohol, 1 in 20 of acetone and 1 in 25 of chloroform; soluble in dimethylformamide; slightly soluble in benzene, ethyl acetate and acetic acid. Log *P* (octanol/water), 2.2.

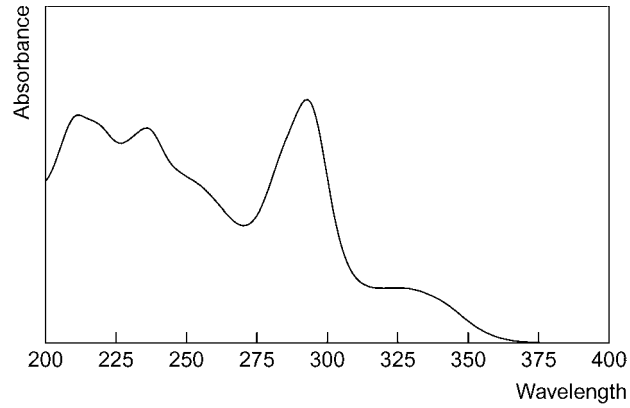
Colour Test Dissolve 5 mg in 1 mL of sulfuric acid and add 5 mg of powdered potassium dichromate—red.

Thin-layer Chromatography System TD—R_f 0.52; system TE—R_f 0.69; system TF—R_f 0.37; system TAD—R_f 0.68; system TAE—R_f 0.78; system TAJ—R_f 0.68; system TAK—R_f 0.48; system TAL—R_f 0.96.

Gas Chromatography System GA—RI 2700.

High Performance Liquid Chromatography System HY—RI 488; system HAA—retention time 18.4 min.

Ultraviolet Spectrum Dehydrated alcohol—236, 291 nm (A_1^1=686a).



Infrared Spectrum Principal peaks at wavenumbers 1220, 1611, 1210, 1583, 1135, 800 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 138, 352, 215, 310, 214, 69, 321, 354.

Dose 0.5 to 1 g daily.

Guaifenesin

Expectorant

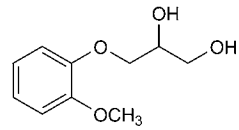
$C_{10}H_{14}O_4 = 198.2$

CAS—93-14-1

IUPAC Name 3-(2-Methoxyphenoxy)-propane-1.2-diol

Synonyms Glyceryl guaiacolate; glycerylguayacolum; guaiacol glycerol ether; guaiacyl glyceryl ether; guaiphenesin; guajacolum glycerolatum; 3-(2-methoxyphenoxy)-1,2-propanediol.

Proprietary Names *Anti-Tuss*; *Benylin Children's Chesty Coughs*; *Breonesin*; *Duratuss G*; *Expulin Chesty Cough*; *Famel Expectorant*; *Fenesin*; *Genatuss*; *Glyate*; *Glycotuss*; *Glytuss*; *Hill's Balsam Chesty Cough*; *Hytuss*; *Jackson's All Fours*; *Jacksons Bronchial Balsam*; *Owbridges for Chesty Coughs*; *Robitussin for Chesty Coughs*; *Tixylix Chesty Cough*; *Vicks Vaposyrup for Chesty Coughs*. It is an ingredient of many proprietary preparations [Sweetman 2007].



Chemical Properties White or slightly-grey crystals or crystalline aggregates. Mp 78° to 82°. Soluble 1 in 33 of water, 1 in 11 of ethanol, 1 in 11 of chloroform, and 1 in 100 of ether; soluble in glycerol and propylene glycol; moderately soluble in benzene; practically insoluble in petroleum ether. Log *P* octanol/water), 1.4.Samples in plasma stored at −70° were stable for up to a year. Stable for 3 freeze-thaw cycles and for 6 h on the benchtop [Eichhold *et al.* 2007]. Samples were stable following

freeze-thaw cycles, after bench top for 2 h, after reinjection and after −20° for 30 days [Chen *et al.* 2005]. Plasma samples are stable at −20° [Jancic *et al.* 2005].

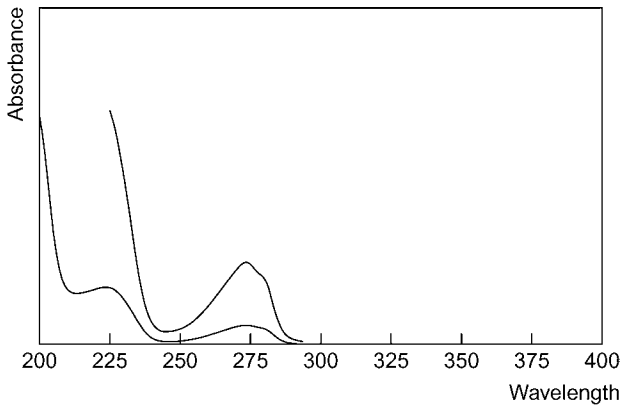
Colour Tests Liebermann's reagent—black; Mandelin's test—grey-green; Marquis test—violet.

Thin-layer Chromatography System TAD—R_f 0.40; system TAE—R_f 0.81; system TB—R_f 0.02; system TD—R_f 0.11; system TE—R_f 0.39; system TF—R_f 0.17.

Gas Chromatography System GA—guaifenesin RI 1650, (M *O*-desmethyl-) RI 1700, guaifenesin-AC_2 RI 1865, M (OH-methoxy-)-AC_2 RI 2290.

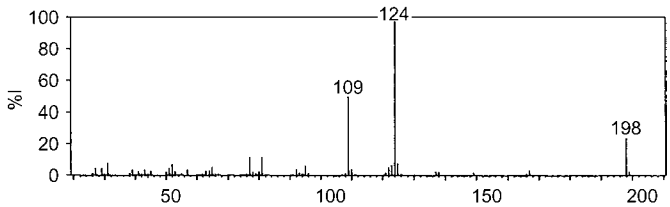
High Performance Liquid Chromatography System HAA—RT 11.4 min; system HX—RI 328; system HY—RI 262.

Ultraviolet Spectrum Aqueous acid—273 nm ($A^1_1 = 125a$). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1255, 1510, 740, 1230, 1125, 1020 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 124, 109, 198, 81, 77, 125, 52, 31.



Quantification

Blood **GC** Column: 3% XE-60 on dichromatous earth (1.21 m). Carrier gas: N_2, 40 mL/min. Temperature: 144°. ECD. Retention time: 6 min 10 s. Limit of detection not reported [Maynard, Bruce 1970].

Plasma **GC** Column: 3% OV-17 on Gas-Chron Q 100/120 mesh (1.5 m × 0.2 cm i.d.). Carrier gas: N_2, 30 mL/min. Temperature: 240°. ECD. Limit of detection, 15 µg/L [Singhawangcha *et al.* 1980].

HPLC Column: µBondapak C_{18} (300 × 3.9 mm i.d.). Mobile phase: methanol : acetonitrile: 0.95 Mol/L potassium hydrogen phosphate buffer (11 : 11 : 78), containing 4 mmol/L heptane sulfonic acid and 1% glacial acetic acid, flow rate 1.0 mL/min. UV detection (λ = 272 nm). Retention time: 7.9 min. Limit of detection, 25 µg/L [Aluri, Stavchansky 1993].

LC-MS Column: Xterra MSC_{18} (30 × 2.1 mm i.d.). Mobile phase: 0.1% formic acid : 0.1% formic acid in methanol (80 : 20 for 2.25 min to 30 : 70 in 0.75 mn for 0.25 min), flow rate 0.35 mL/min. TIS, positive ion mode. Limit of quantification, 1.0 µg/L [Eichhold *et al.* 2007]. Column: Zorbax SB C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : water : formic acid (80 : 20 : 0.5), flow rate 0.6 mL/min. APCI, positive ion mode, SRM acquisition mode. Limit of quantification, 10 µg/L [Chen *et al.* 2005]. Column: Bakerbond ENV (150 × 4.6 mm i.d., 5 µm). Mobile phase: 10 g diisopropyl ether, 20 g of SDS, 60 g of *n*-propanol in 910 mL of 25 mmol/L disodium hydrogen phosphate (pH 2.8), flow rate 1.0 mL/min. Retention time: 21.0 min. Limit of detection, 0.4 mg/L [Jancic *et al.* 2005]. Column: XTerrra MS C_{18} (30 × 2.1 mm i.d., 3.5 µm). Mobile phase: 0.1% formic acid : 0.1% formic acid in methanol (80 : 20 to 30 : 70 for 0.25 min at 1.26 min 80 : 20), flow rate 0.35 mL/min. TIS. SRM acquisition mode. Retention time: 2.0 min. Limit of quantification, 5.0 µg/L [Kuhlenbeck *et al.* 2005]. Column: XTerra MS C_{18} (50 × 3.0 mm i.d., 3.5 µm). Mobile phase: acetonitrile : water (50 : 50), flow rate 0.25 mL/min. CID, ESI. Limit of detection, 0.05 µg/L [Sheen, Her 2004].

Serum **GC-MS** Column: HP-5 MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 60° for 1 min to 280° at 10°/min for 20 min. EI ionisation at 70 eV. Retention time: 16.3 min. Limit of detection, 0.025 mg/L, limit of detection, <0.025 mg/L [Maresova *et al.* 2008].

Urine **GC-MS** Column: HP cross-linked methylsilicone (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 1 mL/min. Temperature programme: 100° for 3 min to 310° at 30°/min for 5 min. EI ionisation at 70 eV, scan mode. RI: 1865. Limit of detection, 10–20 µg/L [Maurer 1990].

CE Column: fused silica capillary (50.2 cm × 50 µm i.d. effective length, 10 cm). Electrolyte: 35 mmol/L phosphate buffer: acetonitrile (75 : 25) containing 120 mmol/L sodium dodecyl sulfate. UV detection (λ = 200 nm). Limit of detection, 3.0 µmol/L [Lin *et al.* 2008].

Disposition in the Body Readily absorbed after oral administration. It is rapidly metabolised by oxidation to β-(2-methoxyphenoxy)lactic acid; about 40% of a dose is excreted as this metabolite in the urine in 3 h.

Therapeutic Concentration

Twenty extensive metabolisers and 8 poor metabolisers were administered 20 mg dextromethorphan hydrobromide and 200 mg guaifenesin. Mean peak plasma concentration was 1200 µg/L in the extensive metaboliser compared with 1000 µg/L in the poor metabolisers, at 1 h in both groups [Eichhold *et al.* 2007].

After a single oral dose of 600 mg given to 3 subjects, a mean peak blood concentration of ≈1.4 mg/L was attained in 15 min [Maynard, Jr., Bruce 1970].

Toxicity

In a fatality due to ingestion of cough syrup containing guaifenesin and hydrocodone, postmortem blood concentrations of 14 and 3 mg/L, were reported respectively [Baselt 2008].

In a suicide involving the ingestion of guaifenesin, diphenhydramine, and chlorphenamine by a 48-year-old female, the following postmortem tissue concentrations (mg/L) were reported, respectively:

Heart blood 27.4, 8.8, and 0.2
Urine 21, 29, and 3.6
Bile 222, 89, and 3
Gastric contents 7700, 635, and 56
Vitreous humour 7, 1, and 0.1
CSF 13, 2.7, and 0.32
[Wogoman *et al.* 1999].

Half-life Blood half-life, ≈1 h.

Volume of Distribution ≈1 L/kg.

Dose 100 to 200 mg every 2 to 4 h.

Guanethidine

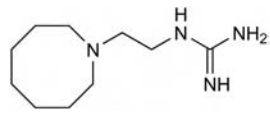
Antihypertensive

$C_{10}H_{22}N_4 = 198.3$

CAS—55-65-2

IUPAC Name 2-[2-(Azocan-1-yl)ethyl]guanidine

Synonym [2-(Hexahydro-1(2*H*)-azocinyl)ethyl]guanidine

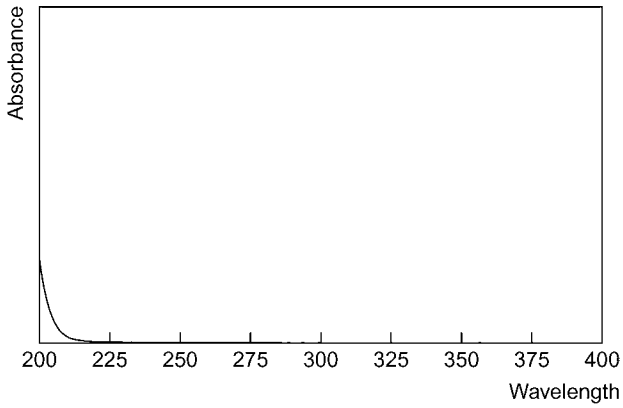


Chemical Properties pK_a 8.3, 11.4 (20°). Log *P* (octanol/water), 0.9.

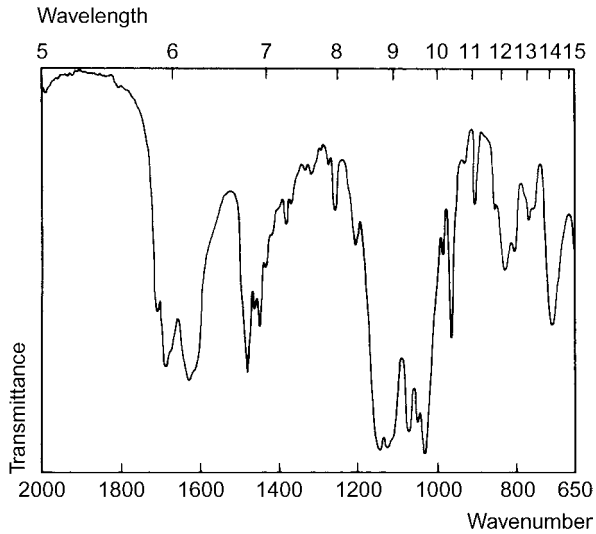
Guanethidine Monosulfate

$C_{10}H_{22}N_4,H_2SO_4 = 296.4$
CAS—645-43-2
Synonym Guanethidine sulfate
Proprietary Names *Ismelin(e)*; *Sanotensin*; *Vitutensil*. It is an ingredient of *Esimil*, *Ganda* and *Suprexon*.
Chemical Properties A colourless crystalline powder. Mp about 250°, with decomposition. Soluble 1 in 1.5 of water; very slightly soluble in alcohol; practically insoluble in chloroform and ether.

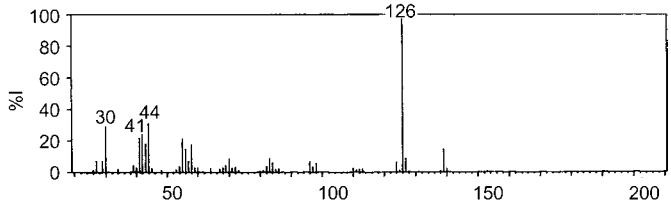
Thin-layer Chromatography System TA—R_f 0.01; system TB—R_f 0.00; system TC—R_f 0.02; system TE—R_f 0.01; system TL—R_f 0.00; system TN—R_f 0.56; system TO—R_f 0.50; system TAE—R_f 0.03; system TAF—R_f 0.30; system TAJ—R_f 0.00; system TAK—R_f 0.00; system TAL—R_f 0.16 (Dragendorff spray, positive; acidified iodoplatinate solution, positive).
Gas Chromatography System GA—not eluted.
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.



Infrared Spectrum Principal peaks at wavenumbers 1030, 1143, 1127, 1070, 1050, 1630 cm^{-1} (guanethidine sulfate, KBr disk).



Mass Spectrum Principal ions at *m/z* 126, 44, 30, 42, 41, 55, 43, 58.



Quantification
Plasma **GC-MS** Guanethidine and other guanido-containing drugs. Limit of detection, 100 µg/L using FID and 1 µg/L using MID [Hengstmann *et al.* 1974].
Radioimmunoassay Limit of detection, 4 µg/L [Loeffler, Pittman 1979].
Urine **GC-MS** See Plasma [Hengstmann *et al.* 1974].
Disposition in the Body Incompletely absorbed after oral administration. Up to about 25% of an oral dose is excreted in the urine in 24 h as unchanged drug and two metabolites, guanethidine *N*-oxide and 2-(6-carboxyhexylamino)ethylguanidine; the proportion of metabolites to unchanged drug is variable. A total of about 40% of an oral dose is excreted in the urine in 9 days and about 40 to 47% is eliminated in the faeces as unchanged drug in 6 days.
Therapeutic Concentration In plasma, usually in the range 0.008 to 0.017 mg/L. After a single oral ^{3}H-labelled dose of 50 mg to 1 subject, a peak plasma-guanethidine concentration of 0.009 mg/L was attained in 3 h and was almost constant over the period 1 to 12 h, declining slowly to about 0.003 mg/L at 24 h; a peak total metabolite concentration of about 0.04 mg/L was reported at 2 to 4 h [McMartin *et al.* 1970].

Following daily oral doses of 25 mg to 8 subjects, steady-state plasma-guanethidine concentrations of 0.003 to 0.016 mg/L (mean 0.009) were reported; after oral doses of 37.5 mg daily to 8 subjects, the steady-state plasma-guanethidine concentrations ranged from 0.008 to 0.015 mg/L (mean 0.011) [Walter *et al.* 1975].
Bioavailability About 20%.
Half-life Plasma half-life, about 4 to 8 days.
Protein Binding Not significantly bound.
Note For a review of guanethidine disposition, see Lukas [1973].
Dose Usually 10 to 100 mg of guanethidine monosulfate daily; up to 300 mg daily may be given.

Hengstmann JH *et al.* (1974). Quantitative determination of guanethidine and other guanido-containing drugs in biological fluids by gas chromatography with flame ionization detection and multiple ion detection. *Anal Chem* 46: 34–39.

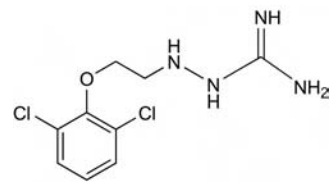
Guanoclor

Antihypertensive
$C_9H_{12}Cl_2N_4O = 263.1$
CAS—5001-32-1
IUPAC Name 1-[2-(2,6-Dichlorophenoxy)ethylamino]guanidine

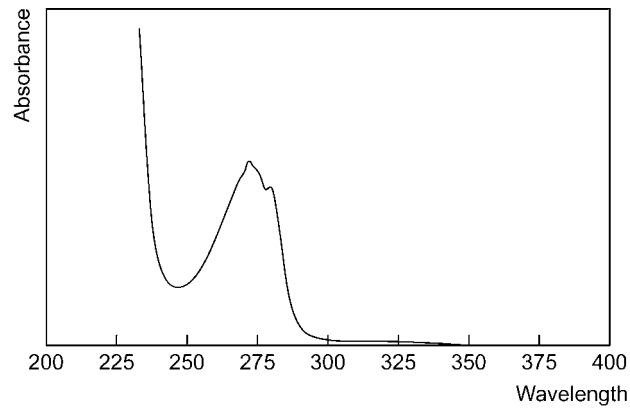


Chemical Properties Log *P* (octanol/water), 1.5.

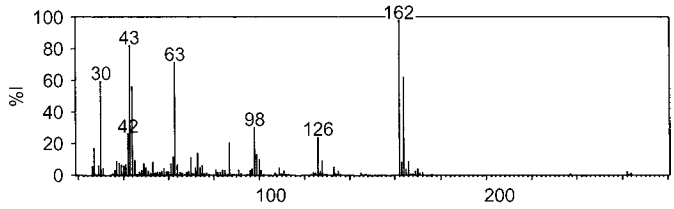
Guanoclor Sulfate

$(C_9H_{12}Cl_2N_4O)_2,H_2SO_4 = 624.3$
CAS—551-48-4
Proprietary Name *Vatensol*
Chemical Properties A white crystalline powder. Mp about 208°. Soluble 1 in about 400 of water.

Colour Test Mandelin's test—violet→orange→brown-yellow.
Thin-layer Chromatography System TA—R_f 0.03; system TB—R_f 0.00; system TC—R_f 0.00; system TL—R_f 0.00 (acidified iodoplatinate solution, positive).
Ultraviolet Spectrum Aqueous acid—272 (A^1_1=14b), 278 nm.



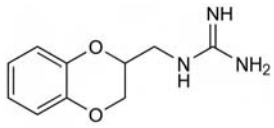
Infrared Spectrum Principal peaks at wavenumbers 1672, 1134, 1652, 1050, 765, 1243 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 162, 43, 63, 164, 30, 44, 98, 42.



Dose 10 to 120 mg of guanoclor sulfate daily; doses of 200 mg or more daily have been given.

Guanoxan

Antihypertensive
$C_{10}H_{13}N_3O_2$ = 207.2
CAS—2165-19-7
IUPAC Name [(2,3-Dihydro-1,4-benzodioxin-2-yl)methyl]guanidine



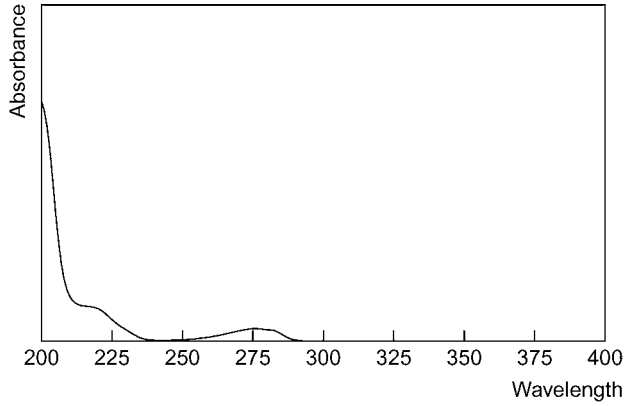
Chemical Properties Crystals. Mp 164° to 165°. pK_a 12.3.

Guanoxan Sulfate

$(C_{10}H_{13}N_3O_2)_2,H_2SO_4$ = 512.5
CAS—5714-04-5
Proprietary Name *Envacar*

Chemical Properties A white crystalline powder. Mp about 206°. Soluble 1 in 50 of water.

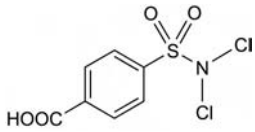
Colour Tests Mandelin's test—green, sometimes violet, depending on relative proportions of test material and reagent; Marquis test—violet.
Thin-layer Chromatography System TA—R_f 0.01; system TB—R_f 0.00; system TC—R_f 0.00; system TE—R_f 0.00; system TL—R_f 0.00; system TAE—R_f 0.03; system TAF—R_f 0.76 (acidified potassium permanganate solution, positive).
High Performance Liquid Chromatography System HX—RI 295.
Ultraviolet Spectrum Aqueous acid—275 nm (A^1_1=104b).



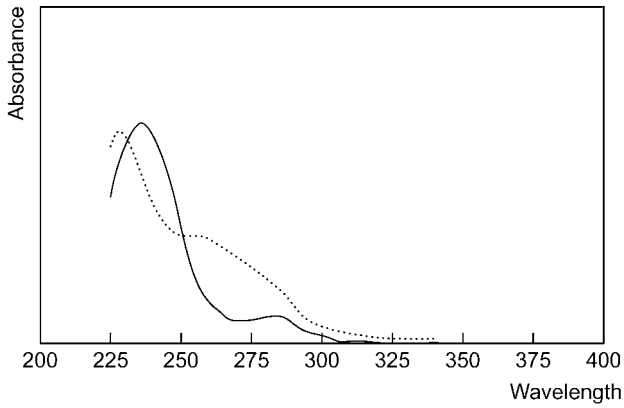
Infrared Spectrum Principal peaks at wavenumbers 1115, 1495, 1264, 1665, 1592, 748 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 30, 72, 43, 135, 121, 148, 52, 56.
Dose 10 to 50 mg of guanoxan sulfate daily; doses of 120 mg or more daily have been given.

Halazone

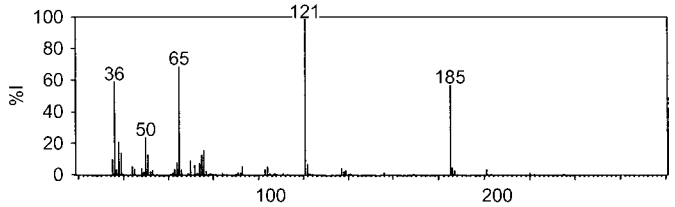
Disinfectant
$C_7H_5Cl_2NO_4S$ = 270.1
CAS—80-13-7
IUPAC Name 4-[(Dichloroamino)sulfonyl]benzoic acid
Synonym Pantocide
Proprietary Names *Clordispenser*; *Speton*; *Steridrolo a rapida idrolisi*.



Chemical Properties A white crystalline powder containing about 52% of 'available chlorine'. Mp about 195°, with decomposition. Slightly soluble in water, chloroform and ether; soluble 1 in 140 of ethanol; soluble in glacial acetic acid, and in aqueous solutions of alkali hydroxides and carbonates. Log *P* (octanol/water), −0.2.
Ultraviolet Spectrum Aqueous acid—237 nm; aqueous alkali—229 nm (A^1_1=382b).

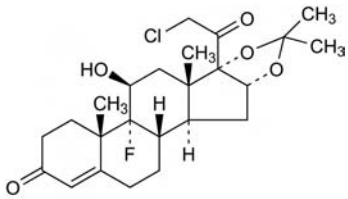


Mass Spectrum Principal ions at *m/z* 121, 65, 36, 185, 50, 38, 76, 39.

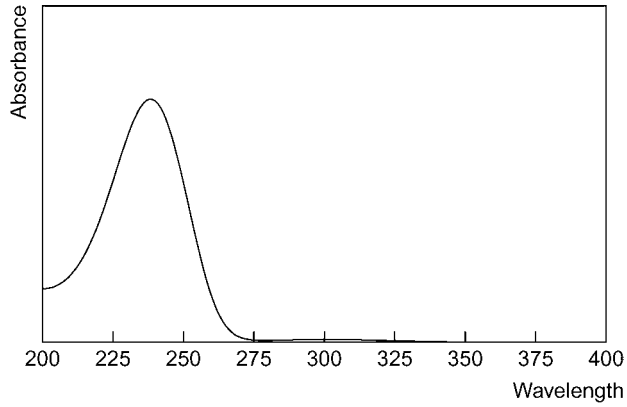


Halcinonide

Corticosteroid
$C_{24}H_{32}ClFO_5$ = 455.0
CAS—3093-35-4
Synonym (11β,16α)-21-Chloro-9-fluoro-11-hydroxy-16,17-[(1-methylethylidene)-bis(oxy)]pregn-4-ene-3,20-dione
Proprietary Names *Betacortone*; *Dermalog*; *Halciderm*; *Halcimat*; *Halog*.



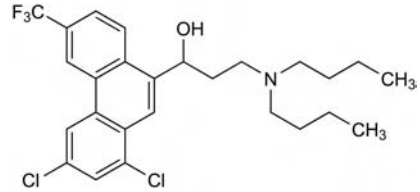
Chemical Properties Crystals. Mp 264° to 265°, with decomposition. Insoluble in water and hexanes; soluble in acetone and chloroform; slightly soluble in benzene, ethanol, ethyl ether and methanol. Log *P* (octanol/water), 2.9.
Thin-layer Chromatography System TAJ—R_f 0.62; system TAK—R_f 0.58; system TAL—R_f 0.91
Ultraviolet Spectrum Methanolic acid—238 nm (A^1_1=370b). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1660, 1060, 1730, 1080, 1250, 1175 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 377, 43, 55, 246, 278, 59, 378, 41.
Use Topically in concentrations of 0.025 to 0.1%.

Halofantrine

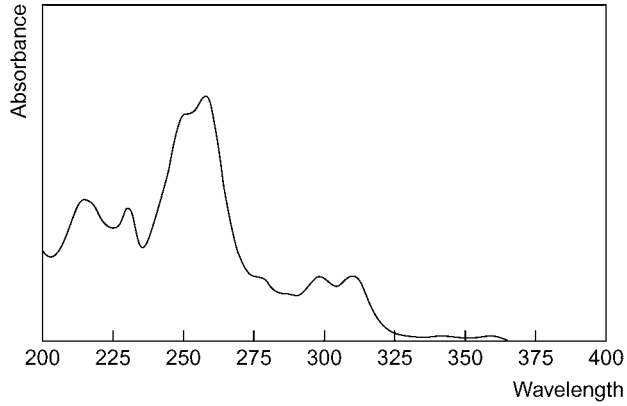
Antimalarial
$C_{26}H_{30}Cl_2F_3NO$ = 500.4
CAS—69756-53-2 (halofantrine); 66051-63-6 (racemic halofantrine)
IUPAC Name (1*S*)-3-(Dibutylamino)-1-[1,3-dichloro-6-(trifluoromethyl)phenanthren-9-yl]propan-1-ol
Synonym 1,3-Dichloro-α-[2-(dibutylamino)ethyl]-6-(trifluoromethyl)-9-phenanthrenemethanol



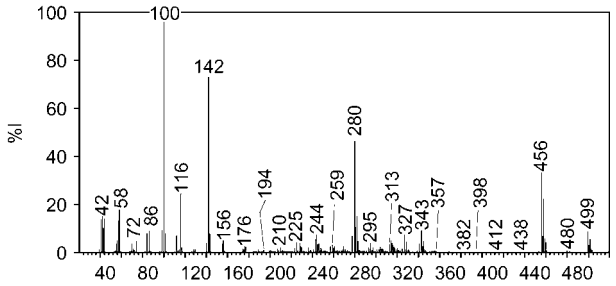
Halofantrine Hydrochloride
$C_{26}H_{30}Cl_2F_3NO$, HCl = 536.9
CAS—36167-63-2
Synonyms SKF-102886; WR-171669.
Proprietary Name *Halfan*
Chemical Properties Two crystalline forms of the hydrochloride with Mp 93° to 96° and 203° to 204°.

Halofantrine β-Glycerophosphate
$C_{29}H_{39}Cl_2F_3NO_7P$ = 672.5
Chemical Properties White crystals. Mp 60° to 65°.

Thin-layer Chromatography System TB—R_f 0.50(halofantrine); R_f 0.12 (desbutylhalofantrine); system TE—R_f 0.88(halofantrine); R_f 0.61(desbutylhalofantrine); system TAE—R_f 0.56(halofantrine); R_f 0.19(desbutylhalofantrine).
High Performance Liquid Chromatography System HX—RI 800(halofantrine); RI 618(desbutylhalofantrine); system HAA—retention time 23.0 min (halofantrine); retention time 20.5 (desbutylhalofantrine) min.
Ultraviolet Spectrum Aqueous acid—258, 215, 230, 298 nm.



Mass Spectrum Principal ions at *m/z* 100, 142, 280, 456, 116, 58, 458, 42.



Quantification

Blood **HPLC** Fluorescence detection. Halofantrine and metabolite. Limit of detection, 0.9 µg/L [Gawienowski *et al.* 1988]. Column: Hypersil 5 ODS (250 × 4.6 mm i.d.), stainless steel. Mobile phase: water : acetonitrile (35:65) containing triethylamine (1%),(pH 4), flow rate 2.0 mL/min. Internal standard (IS): BL-22312. UV detection (λ=254 nm). Retention time: halofantrine, 8.5 min; *N*-desbutylhalofantrine, 4.5 min; IS, 11.0 min. Halofantrine and metabolite. Limit of quantification, 10 µg/L [Mberu *et al.* 1992]. UV detection (λ=254 nm). Halofantrine and metabolite. Limit of detection, 2 µg/L in red blood cells [Milton *et al.* 1988].

Plasma **HPLC** Column: Lichrosorb RP-18 (200 × 4.6 mm i.d., 10 µm). Mobile phase: methanol:0.05 mol/L potassium dihydrogen phosphate (70:30) with 55 mmol/L perchloric acid, pH 3.1, flow rate 1.3 mL/min. UV detection (λ=254 nm). Retention time: halofantrine, 7.5 min; desbutylhalofantrine, 5.3 min. Halofantrine and metabolite. Limit of detection, 2.5 µg/L [Onyeji, Aideloje 1997]. Fluorescence detection (λ_{ex}=300 nm, λ_{em}=380 nm). Halofantrine and metabolite. Limit of quantification, 6 µg/L [Terefe, Blaschke 1994]. See Blood [Gawienowski *et al.* 1988; Mberu *et al.* 1992]. See Blood. Limit of detection 1 µg/L [Milton *et al.* 1988].

Serum **HPLC** Column: Ultrasphere C_8 bonded-phase (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water (75:25) with 0.2% SDS (sodium dodecyl sulfate) and 0.2% glacial acetic acid, flow rate 1.5 mL/min. IS: BL-22312. UV detection (λ=257 nm). Retention time: halofantrine, 8.3 min; desbutylhalofantrine, 5.5 min; IS, 11.5 min. Limit of detection, 5 µg/L, for halofantrine, and 3 µg/L, for metabolite [Keeratithakul *et al.* 1991].

Urine **HPLC** See Blood [Milton *et al.* 1988].

Disposition in the Body After oral administration, halofantrine is slowly and erratically absorbed and the drug enters systemic circulation within 1 h. The rate and extent of absorption are increased in the presence of food. Peak concentrations are observed 3–6 h after administration. There is wide and unpredictable interindividual variability of peak plasma concentrations. The major metabolite is *N*-desbutylhalofantrine which is active and has a longer half-life than halofantrine. Peak concentrations of the metabolite are observed after 12–20 h and are 2–4 times lower than the drug levels. The main route of elimination is in faeces as the unchanged drug.

Therapeutic Concentration

Six adult volunteers, aged between 23 and 54 years, were administered 250 mg at 6-h intervals and after the last of 3 doses, the drug concentrations were measured. Mean maximum plasma concentrations were halofantrine 621.4 µg/L at 16.2 h and *N*-desbutylhalofantrine 114.9 µg/L at 43.2 h [Gimenez *et al.* 1994].

Six male adult patients of Melanesian origin with uncomplicated falciparum malaria (most severe form), mean age 22.7 years, were treated with 500 mg of halofantrine hydrochloride every 6 h for a total of 1.5 g. The mean concentration for halofantrine was 896 µg/L after 15 h and 491 µg/L after 56 h for the metabolite, *N*-desbutylhalofantrine [Veenendaal *et al.* 1991].

Half-life Plasma half-life, 38 h in healthy volunteers and 91–113 h in patients with malaria (halofantrine); 103 h in healthy individuals and 79–118 h in those with malaria (*N*-desbutylhalofantrine).

Volume of Distribution 73 L/kg (patients with malaria); 8572 L (healthy individuals).

Clearance Plasma clearance, 0.58 L/h/kg.

Note For a review of halofantrine, see Bryson and Goa [1992]. For a review of the pharmacokinetics of halofantrine, see Karbwang and Na Bangchang [1994].

Dose Three doses of 500 mg at 6-h intervals.

Haloperidol

Antipsychotic, Butyrophenone

$C_{21}H_{23}ClFNO_2$ = 375.9

CAS—52-86-8

IUPAC Name 4-[4-(4-Chlorophenyl)-4-hydroxypiperidin-1-yl]-1-(4-fluorophenyl)butan-1-one

Synonyms 4-[4-(4-Chlorophenyl)-4-hydroxy-1-piperidinyl]-1-(4-fluorophenyl)-1-butanone; 4-[4-(*p*-chlorophenyl)-4-hydroxypiperidino]-4′-fluorobutyrophenone; 4′-fluoro-4-(4-hydroxy-4-*p*-chlorophenylpiperidino)butyrophenone; 1-(3-*p*-fluorobenzoylpropyl)-4-*p*-chlorophenyl-4-hydroxypiperidine; *R*-1625.

Proprietary Names *Dozic*; *Haldol*; *Serenace*.

Chemical Properties Crystals. Mp 148.0° to 149.4°. Solubility in water (1.4 mg/100 mL); freely soluble in chloroform, methanol, acetone, benzene and dilute acids. pK_a 8.3. Log *P* (octanol/water) 3.23. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Haloperidol Decanoate

$C_{31}H_{41}ClFNO_3$ = 530.1

CAS—74090-97-8

IUPAC Name 4-[4-(4-Chlorophenyl)-4-hydroxypiperidin-1-yl]-1-(4-fluorophenyl)butan-1-one decanoate

Synonym KD-136

Proprietary Name *Haldol*

Colour Tests Aromaticity (method 2)—yellow/orange-red; Liebermann's reagent—brown.

Thin-layer Chromatography System TA—R_f 0.67; system TB—R_f 0.11; system TC—R_f 0.27; system TE—R_f 0.76; system TL—R_f 0.33; system TAE—R_f 0.51; system TAF—R_f 0.75 (acidified iodoplatinate solution—positive).

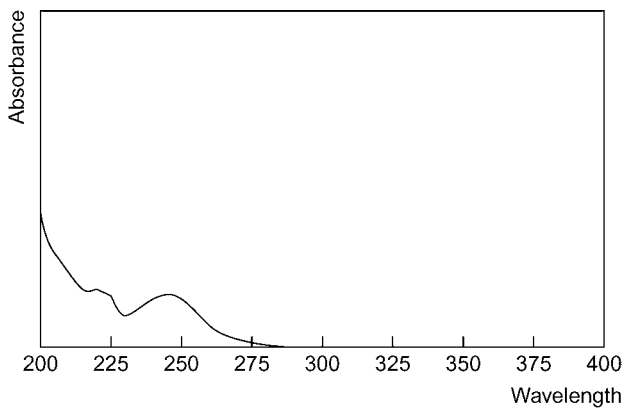
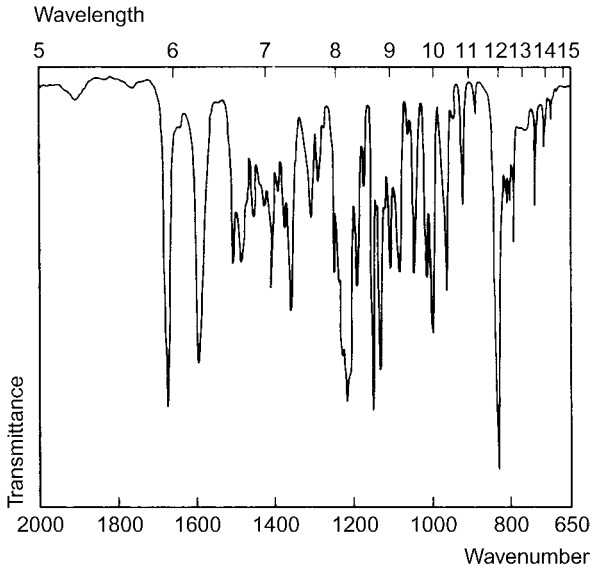
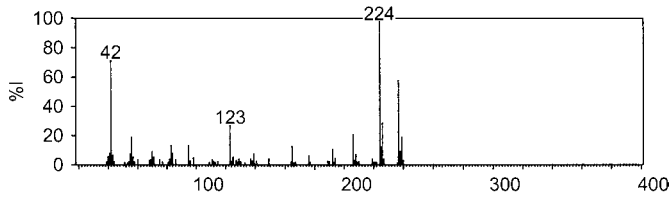
Ultraviolet Spectrum Aqueous acid (methanol)—245 nm (A_1^1 = 340a). No alkaline shift



Infrared Spectrum Principal peaks at wavenumbers 832, 1151, 1673, 1217, 1136, 1598 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 224, 42, 237, 226, 123, 206, 239, 56 (none above 240).



Quantification

Blood **GC** NPD. Limit of quantification, 515 µg/L, limit of detection, 156 µg/L [Sanchez de la Torre *et al.* 2005]. SID. Limit of detection, 0.1 pmol [Seno *et al.* 1993].

HPLC Column: Waters Nova-Pak C_{18} (150 × 3.9 mm i.d., 3 µm). Mobile phase: phosphate buffer (pH 7.25) : acetonitrile (65 : 25), flow rate 1.3 mL/min. Limit of detection, 0.1 µg/L [Eyles *et al.* 1992].

LC-MS Limit of detection, 0.1 µg/L [Seno *et al.* 2000].

Plasma **GC** NPD. Limit of detection, 0.4 ng/mL [Ulrich *et al.* 1995]. Column: 3% OV-17 on Gas Chrom Q 100/120 mesh (1.5 m × 2 mm i.d.). Carrier gas: N_2, 55 mL/min. Temperature: 300°. NPD. Retention time: 2.9 min. Limit of detection, 0.5 µg/L [Franklin 1980].

GC-MS Column: fused silica bonded phase. NICI, SIM acquisition mode. Limit of detection, 0.1 µg/L [Häring *et al.* 1987].

HPLC Column: Chromsep C_8 reversed phase (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 30 mmol/L phosphate buffer (pH 3.0) containing 0.5% TEA (30 : 70), flow rate 1.0 mL/min. UV detection (λ = 238 nm). Limit of quantification, 1.0 µg/L, limit of detection, 0.3 µg/L [Mercolini *et al.* 2007]. Column: RP-18e (100 × 4.6 mm i.d.). Mobile phase: 100 mmol/L phosphate buffer (pH 3.5) : acetonitrile (80 : 20), flow rate 2 mL/min. UV detection (λ = 230 nm). Limit of detection, 3 ng [Aboul-Enein *et al.* 2006]. Column: C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.1% phosphoric acid (240 : 760), flow rate 0.5 mL/min to 1.5 mL/min until 8 min to 1.65 mL/min until 20 min. UV detection (λ = 250 nm). Limit of detection, 7.5 µg/L [Higashi *et al.* 2006]. Haloperidol and its reduced metabolite. Limit of quantification, 2 µg/L with UV detection, 0.5 µg/L with electrochemical detection [Pan *et al.* 1998]. See Blood [Eyles *et al.* 1992]. Column: Waters µBondapak CN (30 × 3.9 cm i.d., 10 µm). Mobile phase: acetonitrile : phosphate buffer (pH 6.8, 45 : 55). Electrochemical detection. Limit of detection, 0.5 ng [Korpi *et al.* 1983].

LC-MS Column: Bondapak C_{18} (150 × 3.9 mm i.d.). Mobile phase: 0.4 mol/L ammonium acetate : methanol (40 : 60 at 0 min to 20 : 80 at 15 min to 0 : 100 at 25 min until 32 min). ESI. Limit of detection, 0.1 µg/L [Yun *et al.* 2005]. Limit of detection, 5 µg/L [Arinobu *et al.* 2002].

CE Buffer: Tris phosphate with dimethyl-β-cyclodextrin and PEG 6000. Limit of detection, 15 µg/L for haloperidol and 30 µg/L for both enantimers of its chiral metabolites [Wu *et al.* 1999].

Serum **GC** SID. Limit of detection, 1.1 µg/L [Fujii *et al.* 1996]. See Plasma [Ulrich *et al.* 1995]. NPD or AFID. Limit of detection, 0.5 µg/L [Abernethy *et al.* 1984].

GC-MS CI. SIM acquisition mode [Szczepanik-van Leeuwen 1985].

HPLC Column: Lichrosorb Si60 (250 × 4 mm i.d., 5 µm). Mobile phase: acetonitrile : water (90 : 10) containing 0.01% TEA and 0.02% acetic acid. Fluorescence detection (λ_{ex} = 330 nm, λ_{em} = 420 nm). Limit of detection, 0.22 µg/L [Kishikawa *et al.* 2006]. UV detection. Limit of quantification, 4 µg/L [Angelo, Petersen 2001]. UV detection. Limit of quantification, 0.3 µg/L [Walter *et al.* 1998]. Limit of detection, 0.5 µg/L [Hoffman, Edkins 1994].

Urine **GC** See Blood [Seno *et al.* 1993].

GC-MS SIM acquisition mode (*m/z* 206, 237, 224). Limit of detection, 10 µg/L [Olmos-Carmona, Hernandez-Carrasquilla 1999].

HPLC Pyridinium metabolites of haloperidol, Fluorescence detection [Eyles *et al.* 1994].

LC-MS See Plasma [Arinobu *et al.* 2002].

Breast Milk **HPLC** UV detection. Limit of detection, 5 µg/L T[Ohkubo *et al.* 1992].

CSF **GC** See Serum [Abernethy *et al.* 1984].

Oral Fluid **GC-MS** Column: methyl silicone. SIM acquisition mode. Limit of quantification, 0.9–44.2 µg/L [Pujadas *et al.* 2007].

Hair **HPLC** Column: TSK-Gel 80-TM ODS (150 × 4.6 mm i.d.). Mobile phase: 50 mmol/L potassium phosphate buffer (pH 6.8) : acetonitrile : methanol (3 : 2 : 1), flow rate 0.8 mL/min. Electrochemical detection. Limit of detection, 0.5 µg/L [Matsuno *et al.* 1990].

Note For an ELISA in serum, limit of quantification, 0.3 µg/L see Terauchi *et al.* [1990]. See also Poland, Rubin [1981], Rubin *et al.* [1982] and Smith *et al.* [1984], Smith *et al.* [1985].

Other **GC-MS** Microsomes [Tyndale, Inaba 1990].

CE-MS Mouse and guinea-pig Liposomes. ESI [Tomlinson *et al.* 1993a, 1993b].

Disposition in the Body Haloperidol is readily absorbed after oral administration. It is localised in the tissues and rapidly taken up by the brain. It is slowly excreted in the urine, ≈40% of a dose being eliminated in 5 days with only ≈1% of the dose as unchanged drug; ≈15% of a dose is excreted in the bile. It is metabolised by oxidative *N*-dealkylation. Metabolites that have been identified in urine are 4-fluorobenzoylpropionic acid and 4-fluorophenylaceturic acid (the glycine conjugate of 4-fluorophenylacetic acid), both of which are inactive. Haloperidol is also metabolised by reduction of the ketone group to a secondary alcohol (reduced haloperidol). Haloperidol is excreted in breast milk.

Therapeutic Concentration There is considerable inter-subject variation in steady-state blood concentrations. However, for normal doses (up to 15 mg per day), the serum concentration is usually below 0.05 mg/L.

There has been much discussion regarding the relationship between serum concentrations and the therapeutic effect of haloperidol in schizophrenia and related disorders. A review of ≈50 clinical studies concluded that the therapeutic window for haloperidol was in the range 0.0056–0.0169 mg/L [Ulrich *et al.* 1998].

Steady-state serum concentrations of 0.0008–0.033 mg/L (mean, 0.0065) were attained after daily oral administration of 1–14 mg (mean, 6) to 34 patients [Forsman, Ohman 1977].

In a study of the effect of CYP2D6 polymorphism on haloperidol pharmacokinetics in 172 patients, the mean haloperidol and reduced haloperidol serum trough concentrations were 0.007 and 0.0072 mg/L, respectively, in patients with ultrafast CYP2D activity (daily dose 14 mg), 0.0073 and 0.0020 mg/L in those with extensive CYP2D6 activity (daily dose 12 mg), 0.0086 and 0.0042 mg/L in those with intermediate CYP2D6 activity (daily dose 12 mg), and 0.0069 and 0.0095 mg/L in those with poor CYP2D6 activity (daily dose 13 mg) [Brockmöller *et al.* 2002].

Toxicity The minimum lethal dose is probably in excess of 3 g. Toxic effects may appear with blood concentrations greater than approx. 0.05 mg/L but there is considerable inter-subject variation.

A psychiatric patient who committed suicide by running into traffic had haloperidol concentrations of 1.2 mg/L in heart blood, 2.7 mg/L in brain and 10.8 mg/L in liver [Johnson 1988].

In a death attributed to a suicidal overdose of haloperidol, the following postmortem tissue concentrations were reported for haloperidol and reduced haloperidol, respectively: blood 1.9 and 1.4 mg/L, bile 3.4 and 1.6 mg/L, liver 44 and 43 µg/g, and urine 6.6 and 5.7 mg/L [Levine *et al.* 1991].

In a case believed to be a natural cardiac death, the postmortem tissue concentrations of haloperidol and reduced haloperidol were blood 0.6 mg/L and not reported, bile 0.4 and 0.5 mg/L, kidney 0.7 and 2.3 µg/g, liver 5.0 and 13 µg/g, and urine 0.4 and 2.3 mg/L [Levine *et al.* 1991].

In 24 children who received an accidental overdosage of haloperidol at the same hospital, the maximum blood level measured within 4 days of the final administration was 0.0289 mg/L (dosage unknown); symptoms of acute toxicity were evident (disturbances in consciousness, tremor, oculogyric crisis, dysarthria, drooling, akathisia, hyperreflexia, opisthotonos, elevated liver enzyme values, abnormal electrocardiograph) [Yoshida *et al.* 1993].

Bioavailability 38–86% (mean, 58%).

Half-life Plasma half-life, 10–40 h (mean, 20).

Volume of Distribution 10–30 L/kg (mean, 18).

Clearance Plasma clearance, 8–17 mL/min/kg (mean, 12).

Distribution in Blood Plasma : whole blood ratio, ≈0.93.

Protein Binding ≈92%.

Dose Haloperidol 1 to 30 mg daily by mouth. Up to 100 mg daily may be required; rarely, higher doses have been used.

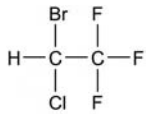
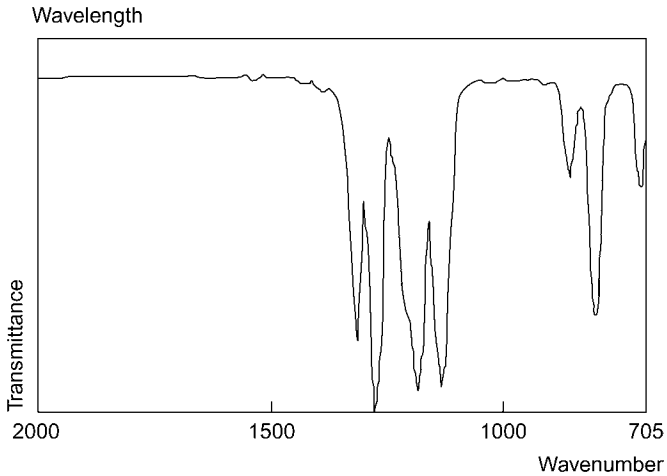
Halothane

Anaesthetic (General)
$CF_3CHBrCl = 197.4$
CAS—151-67-7

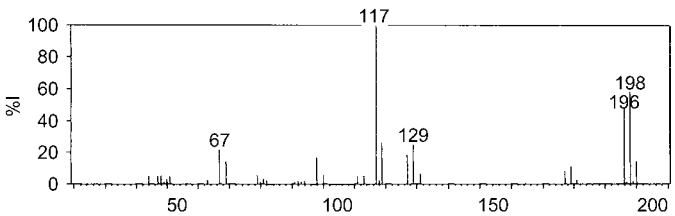
IUPAC Name 2-Bromo-2-chloro-1,1,1-trifluoroethane
Synonyms Alotano; phthorothanum.
Proprietary Names *Fluothane*; *Rhodialothan*.



Chemical Properties A colourless, mobile, heavy, non-inflammable liquid. Bp 49° to 51°. Refractive index at 20°, 1.3695 to 1.3705. Halothane contains thymol 0.01% w/w as a preservative. Soluble 1 in 400 of water; miscible with dehydrated alcohol, chloroform, and ether. Log *P* (octanol/water), 2.32 [Cole *et al.* 1975].
Gas Chromatography System GA—RI 533; system GI—RT 8.5 min; system GR—RT 4.2 min; system GAA—RI 543.
Infrared Spectrum



Mass Spectrum Principal ions at *m/z* 117, 198, 196, 119, 129, 67, 127, 98.



Quantification
Blood **GC** Column: Rtx-Volatiles (30 m × 0.32 mm i.d.,m 1.5 µm). Carrier gas: He, 2 mL/min. Temperature programme: 40° for 1 min to 70° at 10°/min to 250° at 20°/min for 4 min. FID. Limit of detection, 20 µg/L [Kojima *et al.* 2001]. Halothane and other fluorinated inhalation anaesthetics [Yang *et al.* 2001]. 15% Apiezon L on 80/100 mesh Chromosorb W (2 m × 4 mm i.d.). Carrier gas: N_2, 35 mL/min. Temperature: 130°. FID. Limit of detection not reported [Flynn *et al.* 1989a, 1989b].Column: Porapak Q 100/120 mesh (1.8 m × 2 mm i.d.). Carier gas: N_2, 300 mL/min. FID. Limit of detection, 2.0 nmol/L for 2-chloro-1,1-difluoroethylene and and 2.5 nmol/L for 2-chloro-1,1,1-trifluoroethane [Maiorino *et al.* 1979]. Column: 15% FFAP (275 × 0.4 cm i.d.). Carrier gas: N_2, 50 mL/min. Temperature: 100°. FID. Limit of detection, 50 mg/L [Cole *et al.* 1975]. See also Fink, Mikawa [1970], Tham *et al.* [1972], Wagner *et al.* [1974] and Yokota *et al.* [1967].

GC-MS Column: HP-5MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 40° for 2 min to 280° at 30°/min. EI ionisation. SIM acquisition mode. Limit of detection, 0.004 mg/kg [Musshoff *et al.* 2000]. Column: J&W (30 m × 0.53 mm i.d.). Carrier gas: He: 15 mL/min. Temperature: 60°. EI ionisation, positive ion mode, SIM acquisition mode. Retention time: 4.2 min. Limit of detection, 0.2 mg/L [Saito *et al.* 1995].
Note For a continuous *in vivo* blood gas device see Richman *et al.* [1980].
Plasma **GC** Column: Porapak Q 100/120 mesh (1.8 m × 2 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature: 110°. FID. Limit of detection, 300 µg/L for trifluoroacetic acid [Maiorino *et al.* 1980].

HPLC Column: Dionex IonPac AS11 (250 × 4 mm i.d.). Mobile phase: sodium hydroxide (0.5 mmol/L for 5 min to 3.0 mmol/L over 10.5 min to 80 mmol/L at 25 mmol/min for 5 min to 0.5 mol/L at 14.4 mmol/min for 7 min), flow rate 2.0 mL/

min. Limit of quantification, 10 µmol/L for trifluroacetic acid, 2 µmol/L for bromide [Hankins, Kharasch 1997].

Serum **GC** See Plasma [Maiorino *et al.* 1980].

Urine **GC** See Plasma. Limit of detection, 1 mg/L [Maiorino *et al.* 1980].

GC-MS See Blood [Musshoff *et al.* 2000]. Column: RT-QPLOT (30 m × 0.32 mm i.d.). Carrier gas: He. Temperature programme: 40° for 3 min to 130° at 15°/min for 1 min to 180° at 10°/min for 2 min. SIM acquisition mode. Limit of detection, <30 ng/L [Poli *et al.* 1999].

HPLC See Plasma [Hankins, Kharasch 1997].

Bile **GC-MS** See Blood [Musshoff *et al.* 2000].

Stomach Contents **GC-MS** See Blood [Musshoff *et al.* 2000].

Brain **GC-MS** See Blood [Musshoff *et al.* 2000].

Kidney **GC-MS** See Blood [Musshoff *et al.* 2000].

Liver **GC-MS** See Blood [Musshoff *et al.* 2000].

Tissues **GC** See Blood [Maiorino *et al.* 1979].

Disposition in the Body Halothane is rapidly absorbed upon inhalation; blood : gas partition coefficient is ≈2.4. It accumulates in adipose tissue. Approximately 60–80% of an absorbed dose is exhaled unchanged from the lungs in 24 h and smaller amounts continue to be exhaled for several days or weeks. A variable amount is metabolised in the liver by debromination and dechlorination; replacement of a fluorine atom by a methoxy group followed by glucuronic acid conjugation occurs to a limited extent. Other metabolites detected in expired air and in blood are 2-chloro-1,1,1-trifluoroethane and 2-chloro-1,1-difluoroethylene. Up to ≈20% of a dose may be excreted in the urine as trifluoroacetic acid and its salts. Bromide ion is slowly excreted in the urine.

Therapeutic Concentration During surgical anaesthesia, concentrations in blood are usually in the range 22–84 mg/L. Venous blood concentrations lag behind arterial concentrations during induction and decline less rapidly during recovery.

Blood concentrations ranging from 50.5–106.5 mg/L were reported in 8 patients following anaesthesia with 1.5% halothane for 20 min. At recovery 10 min later, the range was 22–30 mg/L; traces were still detectable after 44 h; bromide concentrations increased during the post-anaesthetic period [Atallah, Geddes 1973].

Peak plasma-bromide concentrations occurred in surgical patients 2–3 days after anaesthesia and ranged from 52–180 mg/L [Tinker *et al.* 1976].

Toxicity The minimum lethal dose by ingestion or inhalation is ≈10 mL although 1 case of recovery after the ingestion of 250 mL has been reported. Blood concentrations of 7–310 mg/L (mean, 40 mg/L) have been associated with fatalities.

In 1 fatality involving the ingestion of 35 mL halothane, the following postmortem tissue concentrations were reported: blood 650 mg/L, brain 1560 µg/g, lung 500 µg/g, liver 880 µg/g, spleen 230 µg/g and urine 20 mg/L; salicylate and an unidentified barbiturate were also present [Spencer, Green 1968].

Dose For induction of anaesthesia, 2–3% of the vapour by inhalation; maintenance, 0.5 to 1.5%.

Haloxon

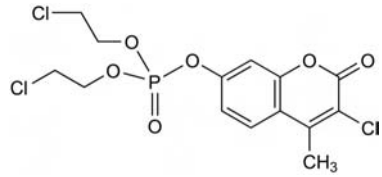
Anthelmintic (Veterinary)

$C_{14}H_{14}Cl_3O_6P$ = 415.6

CAS—321-55-1

IUPAC Name Bis(2-chloroethyl) 3-chloro-4-methyl-2-oxo-2*H*-1-benzopyran-7-yl phosphate

Proprietary Names *Galloxon*; *Loxon*; *Luxon*; *Ruby Horse Wormer.*



Chemical Properties A white powder. Mp 88° to 93°. Practically insoluble in water; soluble 1 in 9 of ethanol, 1 in 4 of acetone and 1 in 2 of chloroform. Log *P* (octanol/water), 3.2.

Ultraviolet Spectrum After solution in dioxan and dilution with acid methanol—290, 312 nm.

Infrared Spectrum Principal peaks at wavenumbers 1738, 1010, 1070, 1036, 1277, 1605 cm^{-1} (KBr disk).

Halquinol

Antimicrobial

CAS—8067-69-4

IUPAC Name 5-Chloroquinolin-8-ol; 7-chloroquinolin-8-ol; 5,7-dichloroquinolin-8-ol

Synonyms Chlorhydroxyquinoline; chlorquinol.

Proprietary Names *Capitrol (chloroxine)*; *Valpeda*.

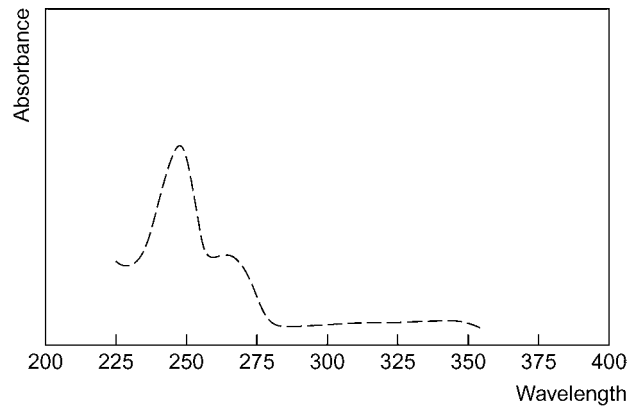
Chemical Properties A mixture of the chlorinated products of quinolin-8-ol containing 57 to 74% of 5,7-dichloroquinolin-8-ol (chloroxine), 23 to 40% of 5-chloroquinolin-8-ol and not more than 4% of 7-chloroquinolin-8-ol. A yellowish-white to yellowish-grey, voluminous powder. Practically insoluble in water; soluble 1 in 250 of ethanol, 1 in 50 of chloroform and 1 in 130 of ether; soluble in acids.

Colour Tests Mandelin's test—yellow; Marquis test—yellow; sulfuric acid—yellow.

Thin-layer Chromatography System TA—R_f 0.19, streaking (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 1743.

Ultraviolet Spectrum Aqueous acid—258 nm (A^1_1=2187a); aqueous alkali—259, 343 nm; methanol—248, 263, 334 nm.



Infrared Spectrum Principal peaks at wavenumbers 1512, 1282, 812, 1200, 950, 785 cm^{-1} (KBr disk).

Dose 3 to 4 g daily for 5 days.

Harmaline

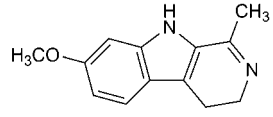
Hallucinogen

$C_{13}H_{14}N_2O$ = 214.3

CAS—304-21-2

IUPAC Name 7-Methoxy-1-methyl-3,4-dihydro-2*H*-pyrido[3,4-*b*]indole

Synonym 4,9-Dihydro-7-methoxy-1-methyl-3*H*-pyrido[3,4-*b*]indole



Chemical Properties Alkaloid obtained from peganum, the dried seeds of *Peganum harmala* (Zygophyllaceae). It is also found (together with harmine) in the South American hallucinogenic drink *caapi*, also known as *Yagé* and *ayahuasca*. Mp 249° to 250°, with decomposition. Slightly soluble in water, ethanol, and ether. Log *P* octanol/water), 4.64 [Meylan, Howard 1995]. Harmaline solutions were unstable with a 30% loss of activity [Yritia *et al.* 2002]. Standard solutions in drug-free urine were stable for at least 9 months at −2° [Björnstad *et al.* 2009].
Colour Tests Mandelin's test—green-brown; Marquis test—brown-green.
Thin-layer Chromatography System TA—R_f 0.38 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—harmaline RI 2430, harmaline-2H (harmine) RI 2291, M (*O*-desmethyl-)-2H- RI 2550, art (dihydro-) RI 2375.
Ultraviolet Spectrum Aqueous acid—256 nm; aqueous alkali—330 nm; methanol—260 ($A^1_1 = 288$b), 344 nm ($A^1_1 = 468$b).
Mass Spectrum Principal ions at *m/z* 213, 214, 170, 198, 169, 115, 63, 143.
Disposition in the Body The P450 isoenzymes that *O*-demethylate exogenous harmaline are CYP1A2 and polymorphic CYP2D6 [Yu *et al.* 2003].
Quantification
Blood **LC-MS** Column: XTerra MS-C_{18} (100 × 3.0 mm, 3.5 µm). Mobile phase: 0.02 mol/L ammonium formate : acetonitrile (75 : 25), flow rate 0.4 mL/min. ESI, positive ion mode, SIM acquisition mode. Limit of quantification, 10 µg/L, limit of detection, 5 µg/L [Sklerov *et al.* 2005].
Plasma **HPLC** Column: Kromasil 100 C_{18} (150 × 4 mm i.d., 5 µm). Mobile phase: 50 mmol/L ammonium acetate buffer (pH 8.0)-acetonitrile : methanol (20 : 30) (63 : 37) : acetonitrile-methanol (20 : 30; 100 : 0 for 6.5 min to 68.3 : 31.7 at 8.5 min), flow rate 0.8 mL/min for 6.5 min to 1.2 mL/min. Fluorescence detection ($\lambda_{ex} = 340$ nm, $\lambda_{em} = 495$ nm). Limit of quantification, 0.3 µg/L, limit of detection, 0.1 µg/L [Yritia *et al.* 2002]. Column: Supelcosil LC-DB-8 (15.0 × 4.6 mm i.d., 5 mm). Mobile phase: methanol : acetonitrile : 0.1 mmol/L ammonium acetate (pH 6.9; 20 : 20 : 60), flow rate 2.0 mL/min. Fluorescence detection ($\lambda_{ex} = 340$ nm, $\lambda_{em} = 495$ nm). Limit of quantification, 1 µg/L [Callaway *et al.* 1996].
Urine **GC-MS** Column: HP-5MS capillary (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: 1 mL/min. Temperature programme: 50° for 2 min to 220° at 15°/min to 300° at 30°/min. TIC, full scan mode. Retention time: 15.7 min. Limit of detection, 1 mg/L [Frison *et al.* 2008].
LC-MS Column: Hypersil GOLD (100 × 2.1 mm i.d., 5 µm). Mobile phase: 1% acetonitrile in 10 mmol/L formic acid : 60% acetonitrile in 10 mmol/L formic acid (100 : 0 to 0 : 100 over 10 min to 100 : 0 for 4 min), flow rate 200 µL/min. SRM acquisition mode. Limit of detection, 3 µg/L [Björnstad *et al.* 2009].
Bile **LC-MS** See Blood [Sklerov *et al.* 2005].
Stomach Contents **LC-MS** See Blood [Sklerov *et al.* 2005].
Brain **LC-MS** See Blood [Sklerov *et al.* 2005].
Kidney **LC-MS** See Blood [Sklerov *et al.* 2005].
Liver **LC-MS** See Blood [Sklerov *et al.* 2005].
Other **HPLC** Column: Regis REXCHROM phenyl (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.1% trifluoroacetic acid : 40% acetonitrile (40 : 60), flow rate 1.0 mL/min. Fluorescence detection ($\lambda_{ex} = 250$ nm, $\lambda_{em} = 480$ nm). Limit of detection not reported [Yu *et al.* 2003].
LC-MS Column: Luna C_{18} (50 × 4.6 mm i.d., 3 µm). Mobile phase: methanol : 0.1% formic acid (50 : 50) or methanol : 0.1% formic acid (70 : 30), flow rate 0.2 mL/min. TIS, positive ion mode. Limit of detection, 0.2 µmol/L [Yu *et al.* 2003].
Note For a review of the analysis of toxic alkaloids in plants, see Beyer *et al.* [2009].
Toxicity

Following the ingestion of *P. harmala*, an 18-year-old was admitted to hospital suffering psychomotor agitation, visual hallucinations, diffuse tremours, ataxia and vomiting. His urine concentration of harmaline was 0.45 mg/mL. He recovered with no further sequelae [Frison *et al.* 2008].

A 25-year-old white male ingested a preparation from a South American tree bark, 'ooasca' and 4 h later he ingested tryptamines. He went to sleep and was found dead the following morning. The table below shows the toxicological findings. The medical examiner ruled cause of death was 'hallucinogenic amine intoxication' and manner of death was 'undetermined'.

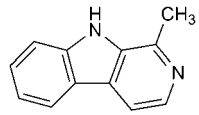
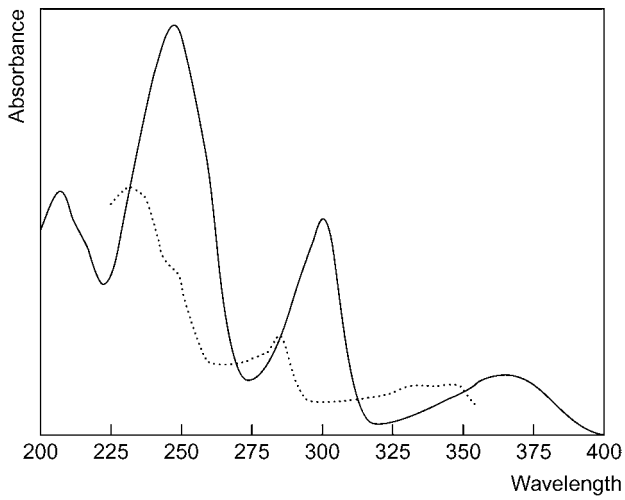
Harman

β-*Carboline, Alkaloid*
$C_{12}H_{10}N_2 = 182.2$
CAS—486-84-0
IUPAC Name 1-Methyl-9*H*-pyrido[3,4-*b*]indole
Synonyms Aribine; harmane; loturine.



Chemical Properties Alkaloid present in passion flower, the dried flowering and fruiting tops of *Passiflora incarnata* (Passifloraceae). Crystals. Mp about 238°. Sparingly soluble in hot water; soluble in ethanol, chloroform, dilute acids, and ether. Log *P* (octanol/water), 3.1.
Note Harman may be found in tobacco smoke and in homemade wine. It may also be found as a putrefactive base, particularly in cases where embalming has taken place. It is a condensation product of tryptophan and acetaldehyde.
Colour Tests Mandelin's test—green; Marquis test—green.
Thin-layer Chromatography System TA—R_f 0.70; system TAE—R_f 0.72; system TAF—R_f 0.76; system TL—R_f 0.33; system TB—R_f 0.02; system TC—R_f 0.40; system TE—R_f 0.57 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—harman RI 1952; M (1-OH-) RI 1920; M (1-OH-) RI 2015; M (1-OH-) RI 2290.
High Performance Liquid Chromatography System HX—RI 319.
Ultraviolet Spectrum Aqueous acid—245 ($A^1_1 = 1987$a), 300 nm; aqueous alkali—232, 284 nm.



Infrared Spectrum Principal peaks at wavenumbers 751, 1317, 1235, 1504, 1245, 1567 cm^{-1}.
Mass Spectrum Principal ions at *m/z* 182, 57, 43, 55, 40, 69, 41, 181.
Quantification

ND: None detected [Sklerov *et al.* 2005]

(30 : 70), flow rate 1.0 mL/min. Fluorescence detection ($\lambda_{ex} = 300$ nm, $\lambda_{em} = 435$ nm). Retention time: 7–8 min. Limit of detection, 206 ng/L [Zheng *et al.* 2000]. Column: Nucleosil C8 (150 × 4.6 mm i.d., 5 µm). Mobile phase: 50 mmol/L potassium hydrogen phosphate (pH 3) : methanol (65 : 35), flow rate 0.9 mL/min. Fluorescence detection ($\lambda_{ex} = 300$ nm, $\lambda_{em} = 433$ nm). Limit of quantification, 4 pg [Breyer-Pfaff *et al.* 1996]. Column: Zorbax BP C_8 Chrompak (250 × 4.6 mm i.d., 7 to 8 µm). Mobile phase: 25 mmol/L diammonium phosphate with 35% 2-propanol (pH 6.0). Fluorometric detection ($\lambda_{ex} = 375$ nm, $\lambda_{em} = 434$ nm). Limit of detection not reported [Schouten, Bruinvels 1985].

Other **LC-MS** Meat-Based Infant Foods. Column: TSK-gel ODS-80TS (250 × 2.0 mm i.d., 5 µm). Mobile phase: ammonium formate-formic acid buffer (pH 2.8): acetonitrile (95 : 5 to 45.5 : 54.5 in 20 min for 3 min to 95 : 5 in 3 min for 10 min), flow rate 0.2 mL/min. ESI, positive ion mode, SRM acquisition mode. Limit of quantification, 1.0 ng/g, limit of detection, 0.5 ng/g [Calbiani *et al.* 2007]. Coffee. Column: Zorbax SB-C_{18} (150 × 2.1 mm i.d., 5 µm). Mobile phase: 0.5% formic acid: 0.5% formic acid in acetonitrile (100 : 0 to 20 : 80 in 30 min), flow rate 0.25 mL/min. Fluorescence detection ($\lambda_{ex} = 300$ nm, $\lambda_{em} = 433$ nm). ESI, positive ion mode. Limit of detection, 0.4 ± 0.1 µg/g [Herraiz, Chaparro 2006].

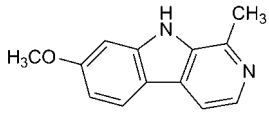
Harmine

Hallucinogen

$C_{13}H_{12}N_2O$ = 212.3

CAS—442-51-3

IUPAC Name 7-Methoxy-1-methyl-9*H*-pyrido[3,4-*b*]indole



Chemical Properties An alkaloid obtained from peganum, the dried seeds of *Peganum harmala* (Zygophyllaceae). Harmine is identical to an alkaloid known as banisterine or telepathine obtained from *Banisteria caapi* (Malpighiaceae) and with the alkaloid, yageine, from *Haemadictyon amazonicum* (Apocynaceae). It is also found (together with harmaline) in the South American hallucinogenic drink *caapi*, also known as *Yagé* and *ayahuasca*. Crystals. Mp 261°, with decomposition or sublimation. Slightly soluble in water, ethanol, chloroform and ether. pK_a 7.6 (20°). Log *P* (octanol/water), 3.56 [Sangster 1997]. Standard solutions in drug-free urine were stable for at least 9 months at –2° [Björnstad *et al.* 2009].

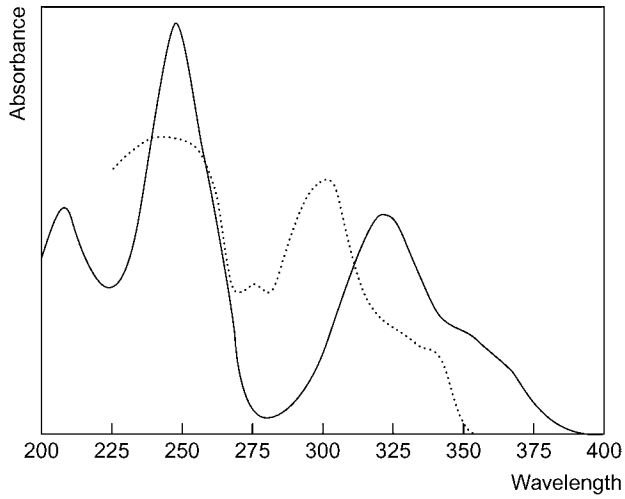
Colour Tests *p*-Dimethylaminobenzaldehyde—red; Mandelin's test—blue→green; Marquis test—orange.

Thin-layer Chromatography System TA—R_f 0.63; system TAE—R_f 0.65; system TAF—R_f 0.68; system TL—R_f 0.28; system TB—R_f 0.00; system TC—R_f 0.22; system TE—R_f 0.52 (acidified iodoplatinate solution, positive).

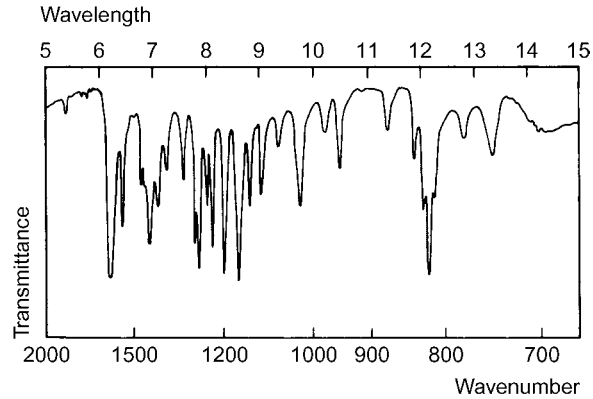
Gas Chromatography System GA—harmine RI 2291, harmine-AC RI 2545, M (*O*-desmethyl-) RI 2550, M (*O*-desmethyl-)-AC RI 2600; system GB—harmine RI 2322.

High Performance Liquid Chromatography System HA—*k* 0.8; system HX—RI 339; system HY—RI 271.

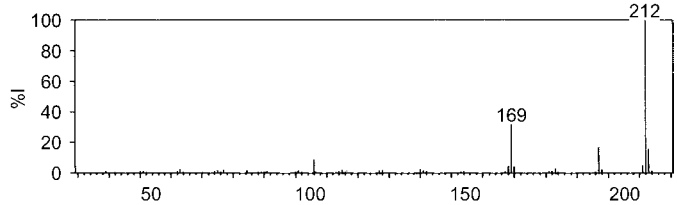
Ultraviolet Spectrum Aqueous acid—247 ($A_1^1 = 1927$a), 319 nm; aqueous alkali—243, 275, 300 nm.



Infrared Spectrum Principal peaks at wavenumbers 1165, 817, 1629, 1200, 1282, 1239 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 212, 169, 197, 213, 106, 211, 170, 168.



Disposition in the Body The P450 isoenzymes that *O*-demethylate exogenous harmine are CYP1A2 and polymorphic CYP2D6 [Yu *et al.* 2003].

Quantification

Blood **HPLC** Column: Econosphere C_{18} ODS2 (250 × 4.6 mm i.d., 5 µm). Mobile phase: 17.5 mmol/L potassium phosphate buffer (pH 6.5) : methanol (30 : 70), flow rate 1.0 mL/min. Fluorescence detection ($\lambda_{ex} = 300$ nm, $\lambda_{em} = 435$ nm). Retention time: 10 to 11 min. Limit of detection, 81 ng/L [Zheng *et al.* 2000].

LC-MS Column: XTerra MS-C_{18} (100 × 3.0 mm, 3.5 µm). Mobile phase: 0.02 mol/L ammonium formate : acetonitrile (75 : 25), flow rate 0.4 mL/min. ESI, positive ion mode, SIM acquisition mode. Limit of quantification, 10 µg/L, limit of detection, 5 µg/L [Sklerov *et al.* 2005].

Plasma **HPLC** Column: Kromasil 100 C_{18} (150 × 4 mm i.d., 5 µm). Mobile phase: 50 mmol/L ammonium acetate buffer (pH 8.0)-acetonitrile : methanol (20 : 30) (63 : 37) : acetonitrile-methanol (20 : 30; 100 : 0 for 6.5 min to 68.3 : 31.7 at 8.5 min), flow rate 0.8 mL/min for 6.5 min to 1.2 mL/min. Fluorescence detection ($\lambda_{ex} = 260$ nm, $\lambda_{em} = 370$ nm). Limit of quantification, 0.5 µg/L, limit of detection, 0.1 µg/L [Yritia *et al.* 2002]. Column: Supelcosil LC-DB-8 (15.0 × 4.6 mm i.d., 5 mm). Mobile phase: methanol : acetonitrile : 0.1 mmol/L ammonium acetate (pH 6.9; 20 : 20 : 60), flow rate 2.0 mL/min. Fluorescence detection ($\lambda_{ex} = 340$ nm, $\lambda_{em} = 495$ nm). Limit of quantification, 2 µg/L [Callaway *et al.* 1996].

Urine **GC-MS** Column: HP-5MS capillary (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: 1 mL/min. Temperature programme: 50° for 2 min to 220° at 15°/min to 300° at 30°/min. TIC, full scan mode. Retention time: 15.9 min. Limit of detection, 1 mg/L [Frison *et al.* 2008].

LC-MS Column: Hypersil GOLD (100 × 2.1 mm i.d., 5 µm). Mobile phase: 1% acetonitrile in 10 mmol/L formic acid: 60% acetonitrile in 10 mmol/L formic acid (100 : 0 to 0 : 100 over 10 min to 100 : 0 for 4 min), flow rate 200 µL/min. SRM acquisition mode. Limit of detection, 3 µg/L [Björnstad *et al.* 2009].

Bile **LC-MS** See Blood [Sklerov *et al.* 2005].

Stomach Contents **LC-MS** See Blood [Sklerov *et al.* 2005].

Brain **LC-MS** See Blood [Sklerov *et al.* 2005].

Kidney **LC-MS** See Blood [Sklerov *et al.* 2005].

Liver **LC-MS** See Blood [Sklerov *et al.* 2005].

Other **HPLC** Column: Regis REXCHROM phenyl (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.1% trifluoroacetic acid : 40% acetonitrile (35 : 65), flow rate 1.0 mL/min. Fluorescence detection ($\lambda_{ex} = 350$ nm, $\lambda_{em} = 490$ nm). Limit of detection not reported.

LC-MS Column: Luna C_{18} (50 × 4.6 mm i.d., 3 µm). Mobile phase: methanol : 0.1% formic acid (50 : 50) or methanol : 0.1% formic acid (70 : 30), flow rate 0.2 mL/min. TIS, positive ion mode. Limit of detection, 0.2 µmol/L [Yu *et al.* 2003].

Note For a review of the analysis of toxic alkaloids in plants, see Beyer *et al.* [2009].

Toxicity

Following the ingestion of *P. harmala*, an 18-year-old was admitted to hospital suffering psychomotor agitation, visual hallucinations, diffuse tremours, ataxia and vomiting. His urine concentration of harmine was 0.06 mg/mL. He recovered with no further sequelae [Frison *et al.* 2008].

A 25-year-old white male ingested a preparation from a South American tree bark, 'ooasca' and 4 h later he ingested tryptamines. He went to sleep and was found dead the following morning. The table overleaf shows the toxicological findings. The medical examiner ruled cause of death to be 'hallucinogenic amine intoxication' and the manner of death to be 'undetermined'.

Substance	Heart blood (mg/L)	Peripheral blood (mg/L)	Gastric (mg/L)	Bile (mg/L)	Brain (mg/kg)	Kidney (mg/kg)	Liver (mg/kg)	Urine (mg/L)

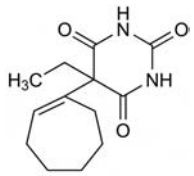
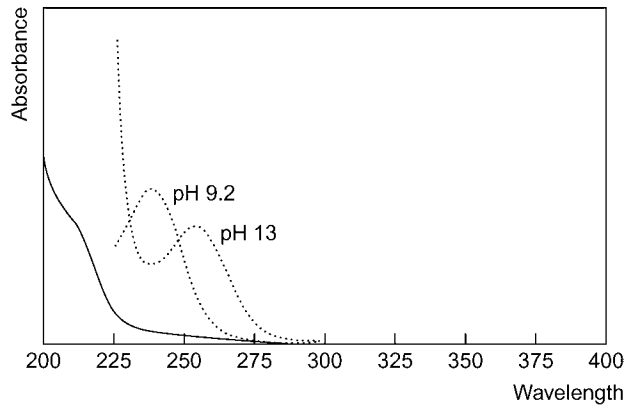
Heptabarb

Sedative, Barbiturate
$C_{13}H_{18}N_2O_3 = 250.3$
CAS—509-86-4

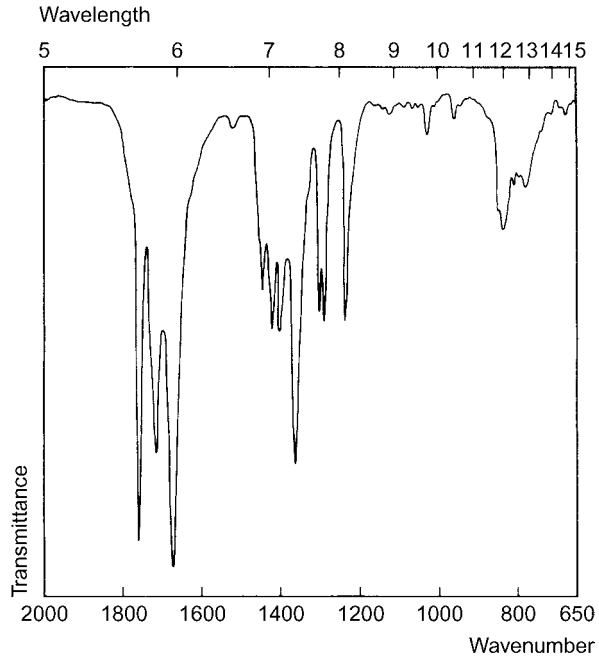
IUPAC Name 5-(1-Cyclohepten-1-yl)-5-ethyl-2,4,6(1*H*,3*H*,5*H*)-pyrimidinetrione
Synonyms Heptabarbital (distinguish from heptobarbitalum); heptabarbitone.
Proprietary Names *Heptadorm*; *Medomin(e)*.



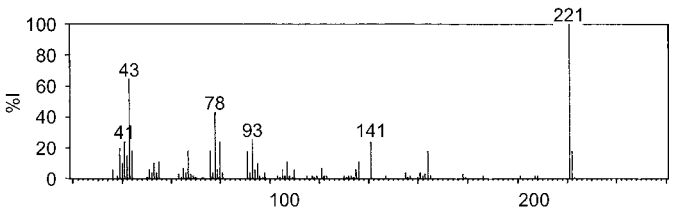
Chemical Properties A white crystalline powder. Mp 174°. Very sparingly soluble in water; soluble 1 in 30 of ethanol, 1 in 20 of acetone and 1 in 75 of chloroform; soluble in solutions of alkali hydroxides. pK_a 7.5 (20°). Log *P* (octanol/pH 7.4), 2.2.
Colour Tests Koppanyi–Zwikker test—violet; mercurous nitrate—black; vanillin reagent—violet-red/colourless.
Thin-layer Chromatography System TD—R_f 0.50; system TE—R_f 0.38; system TF—R_f 0.64; system TH—R_f 0.62; system TAD—R_f 0.59; system TAE—R_f 0.88 (mercuric chloride–diphenylcarbazone reagent, positive; mercurous nitrate spray, black; acidified potassium permanganate solution, yellow-brown; Zwikker's reagent, pink).
Gas Chromatography System GA—heptabarb RI 2055, 3′-hydroxyheptabarbital RI 2275, 3′-oxoheptabarbitone RI 2320; system GB—heptabarb RI 2110; system GF—RI 2940; system GAJ—heptabarb RRT 1.282 (relative to methylphenobarbital).
High Performance Liquid Chromatography System HG—*k* 9.90; system HH—*k* 4.93; system HX—RI 416; system HY—RI 377; system HZ—retention time 3.9 min.
Ultraviolet Spectrum Borax buffer 0.05 mol/L (pH 9.2)—239 nm (A^1_1=413a); 1 mol/L sodium hydroxide (pH 13)—255 nm (A^1_1=326b).



Infrared Spectrum Principal peaks at wavenumbers 1673, 1761, 1718, 1237, 1292, 1303 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 221, 43, 78, 93, 80, 41, 141, 39.



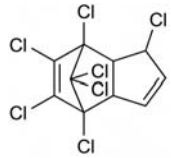
Quantification See under Amobarbital.
Disposition in the Body Readily absorbed after oral administration. Less than 1% of a dose is excreted unchanged in the urine. Major metabolites which have been identified in the urine are 3′-oxoheptabarbitone and 3′-hydroxyheptabarbitone.
Therapeutic Concentration In plasma, usually in the range 1 to 4 mg/L. After a single oral dose of 200 mg administered to 7 subjects, peak plasma concentrations of 1.3 to 2.4 mg/L (mean 1.9) were attained in 1.5 to 4 h [Breimer *et al.* 1975].
Toxicity The estimated minimum lethal dose is 2 g. Plasma concentrations greater than about 8 mg/L may produce toxic effects.
Half-life Plasma half-life, 6 to 11 h.
Volume of Distribution About 1 L/kg.
Note For a review of the clinical pharmacokinetics of barbiturates, see Breimer [1977].
Dose 150 to 400 mg daily.

Breimer DD (1977). Clinical pharmacokinetics of hypnotics. *Clin Pharmacokinet* 2: 93–109.
Breimer DD *et al.* (1975). Pharmacokinetics and relative bioavailability of heptabarbital and heptabarbital sodium after oral administration to man. *Eur J Clin Pharmacol* 9: 169–178.

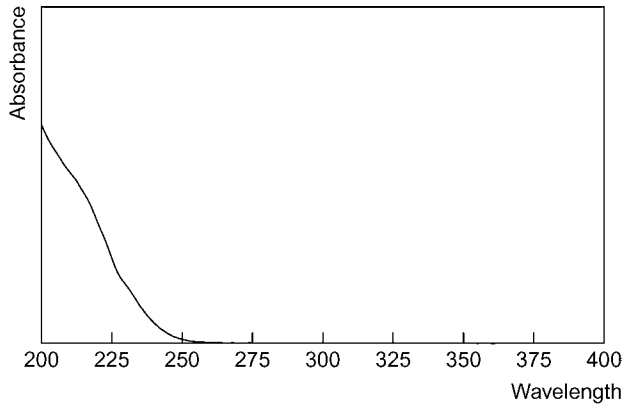
Heptachlor

Insecticide
$C_{10}H_5Cl_7 = 373.3$
CAS—76-44-8

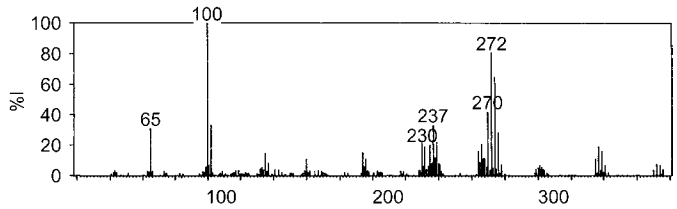
Synonym 1*H*-1,4,5,6,7,8,8-Heptachloro-3a,4,7,7a-tetrahydro-4,7-methanoindene
Proprietary Names *Drinox*; *Heptamul*; *Velsicol 104*.



Chemical Properties The pure substance is a white crystalline solid and the technical grade is a soft, waxy solid which contains about 72% of heptachlor and 28% of related compounds. Heptachlor may be found as an impurity in chlordane. Mp 95° to 96° (pure substance), 46° to 74° (technical grade). Practically insoluble in water; soluble 1 in 22 of ethanol. Log *P* (octanol/water), 6.1.
Thin-layer Chromatography System TB—R_f 0.74; system TE—R_f 0.89; system TF—R_f 0.75; system TX—R_f 0.84; system TY—R_f 0.97; system TAB—R_f 0.69; system TAC—R_f 0.51.
Gas Chromatography System GA—RI 1880; system GK—RRT 0.85(relative to caffeine).
High Performance Liquid Chromatography System HX—RI 1072; system HAO—*k* 0.00; system HAP—*k* 20.8.
Ultraviolet Spectrum



Mass Spectrum Principal ions at *m/z* 100, 272, 274, 270, 237, 102, 65, 276.



Quantification
Serum **GC** ECD. Heptachlor and other chlorinated hydrocarbon pesticides [Saady, Poklis 1990].
GC-MS Selected ion monitoring. Heptachlor and other polychlorinated biphenyl congeners [Dmitrovic *et al.* 2002].

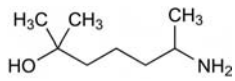
Heptaminol

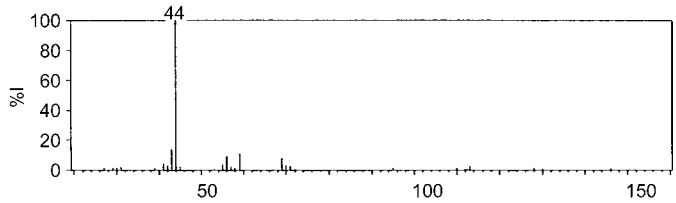
Cardiac Stimulant, Vasodilator
$C_8H_{19}NO$ = 145.2
CAS—372-66-7
IUPAC Name 6-Amino-2-methyl-2-heptanol



Chemical Properties Log *P* (octanol/water), 1.2.

Heptaminol Hydrochloride
$C_8H_{19}NO$, HCl = 181.7
CAS—543-15-7
Proprietary Names *Ampecyclal*; *Coreptil*; *Cortensor*; *Eoden*; *Hept-a-myl*; *Heptylon*.
Chemical Properties A white crystalline powder. Mp 150°. Freely soluble in water; soluble in ethanol; practically insoluble in acetone, benzene and ether.

Thin-layer Chromatography System TA—R_f 0.23; system TB—R_f 0.01; system TC—R_f 0.02; system TE—R_f 0.22; system TL—R_f 0.05; system TAE—R_f 0.14 (acidified potassium permanganate solution, positive).
Gas Chromatography System GA—heptaminol RI 1120, heptaminol-AC_2 RI 1530.
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.
Infrared Spectrum Principal peaks at wavenumbers 1529, 1537, 896, 1622, 1153, 1614 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 44, 43, 59, 56, 69, 55, 41, 113.

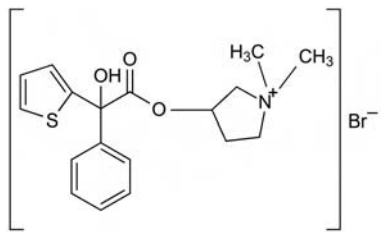


Quantification
Plasma **HPLC** Fluorescence detection. Limit of detection, 100 µg/L [Brodie *et al.* 1983].
Urine **HPLC** See Plasma [Brodie *et al.* 1983].
Dose Heptaminol hydrochloride has been given in doses of 0.3 to 1.6 g daily.

Brodie RR *et al.* (1983). Determination of heptaminol in human plasma and urine by high-performance liquid chromatography. *J Chromatogr* 274: 179–186.

Heteronium Bromide

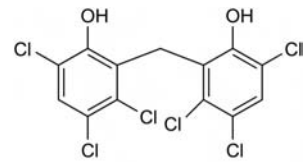
Anticholinergic
$C_{18}H_{22}BrNO_3S$ = 412.3
CAS—7247-57-6
IUPAC Name 1,1-Dimethyl-3-(α-2-thienylmandeloyloxy)pyrrolidinium bromide



Chemical Properties A white crystalline powder. Mp 182° to 184°. Very soluble in water and ethanol. Log *P* (octanol/water), −1.5.
Thin-layer Chromatography System TA—R_f 0.03 (acidified iodoplatinate solution, positive).
Ultraviolet Spectrum Aqueous acid—234 nm ($A^{1\%}_1$=235b).
Infrared Spectrum Principal peaks at wavenumbers 1735, 1219, 1085, 1234, 1063, 700 cm^{-1}.

Hexachlorophene

Disinfectant
$C_{13}H_6Cl_6O_2$ = 406.9
CAS—70-30-4
IUPAC Name 3,4,6-Trichloro-2-[(2,3,5-trichloro-6-hydroxyphenyl)methyl] phenol
Synonyms Hexachlorophane; 2,2′-methylenebis[3,4,6-trichlorophenol].
Proprietary Names *Aknefug simplex*; *Dermalex*; *Hexaphenyl*; *Lotocreme*; *Phaisohex*; *pHisoHex*; *Sapoderm*; *Ster-Zac*. It is an ingredient of *Anacal*.



Chemical Properties A white or pale buff, crystalline powder. Mp 161° to 167°. Practically insoluble in water; soluble 1 in 3.5 of ethanol, 1 in less than 1 of

acetone and 1 in less than 1 of ether; soluble in chloroform (possibly with turbidity) and propylene glycol. pK_a 5.7. Log *P* (octanol/water), 7.5.

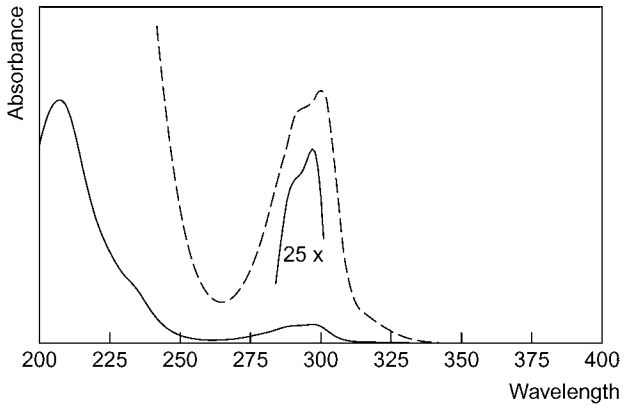
Colour Tests Ferric chloride—violet (transient); nitric acid, fuming—orange-red/orange/orange-brown.

Thin-layer Chromatography System TB—R_f 0.00; system TD—R_f 0.32; system TE—R_f 0.30; system TF—R_f 0.34; system TAD—R_f 0.44; system TAE—R_f 0.94; system TAF—R_f 0.98; system TAJ—R_f 0.56; system TAK—R_f 0.71; system TAL—R_f 0.91.

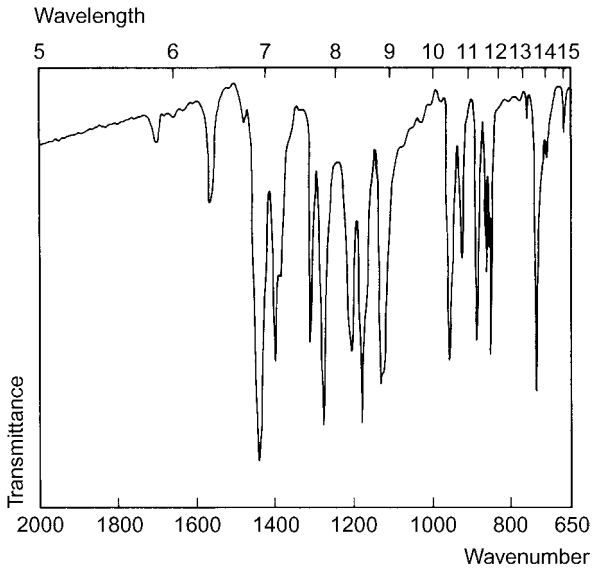
Gas Chromatography System GA—RI 2795.

High Performance Liquid Chromatography System HX—RI 936.

Ultraviolet Spectrum Ethanol—299 nm (A_1^1=155a); aqueous alkali—249 (A_1^1=400b), 320 nm (A_1^1=312a).



Infrared Spectrum Principal peaks at wavenumbers 1276, 1182, 737, 1139, 960, 1213 cm^{-1} (KBr disk).



Quantification

Blood **GC** ECD [Dodson *et al.* 1977]; [Browning *et al.* 1968].

Urine **HPLC** See Blood [Browning *et al.* 1968].

Disposition in the Body Absorbed after oral administration and through the skin. Percutaneous absorption may be significant in premature infants and through damaged skin. After topical application, up to about 10% may be excreted in the urine over a period of 4 to 5 days.

Blood Concentration

Cord-blood concentrations of 0.003 to 0.18 mg/L (mean 0.02) were reported in 50 neonates at birth. After washing once daily for 1 to 11 days with a 3% solution of hexachlorophene diluted with 50 to 100 mL of water, whole blood concentrations of 0.009 to 0.65 mg/L (mean 0.11) were attained [Curley *et al.* 1971].

After whole-body washing with 30 mL of a 3% skin-cleansing product once daily, blood concentrations in 36 adults reached a plateau of about 0.6 mg/L after 3 to 5 weeks and decreased to about 0.3 to 0.4 mg/L after 7 to 8 weeks [Calesnick *et al.* 1975].

Toxicity The estimated minimum lethal dose is 5 g. A number of deaths have occurred after accidental ingestion and also after chronic application for the treatment of burns. Repeated exposure of neonates and infants to high concentrations of hexachlorophene has been associated with spongy lesions of the brain. Fatalities have been associated with blood concentrations >2 mg/L, although recovery has occurred after development of plasma concentrations up to 90 mg/L.

In an epidemic of percutaneous poisoning which occurred in 1972 in infants and children due to exposure to a talcum powder accidentally contaminated with 6% of hexachlorophene, 36 children died. An antemortem serum concentration of 1.15 mg/L was reported in 1 child and the following postmortem tissue concentrations were reported: brain 1 to 149 µg/g (mean 21, 23 cases), kidney 17 to 43 µg/g (mean 26, 4 cases), liver 12.5 to 1080 µg/g (mean 133, 25 cases), lung 10 to 67 µg/g (mean 30, 17 cases), and skin 1 to 392 µg/g (mean 52, 30 cases) [Martin-Bouyer *et al.* 1982].

Use In soaps and creams at a concentration of 0.25 to 3%.

Hexaconazole

Fungicide

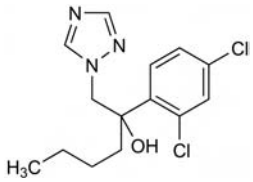
$C_{14}H_{17}Cl_2N_3O$ = 314.2

CAS—79983-71-4

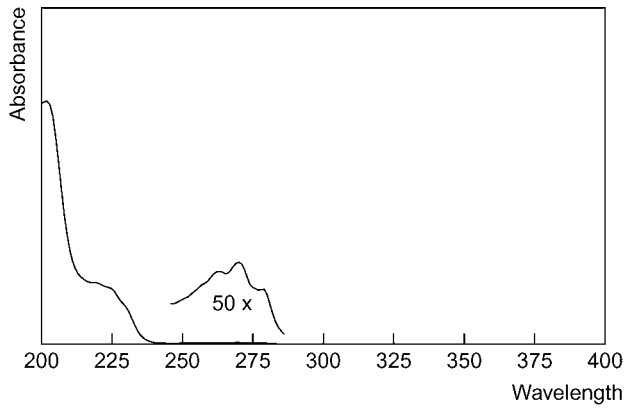
IUPAC Name 2-(2,4-Dichlorophenyl)-1-(1,2,4-triazol-1-yl)hexan-2-ol

Synonyms α-Butyl-α-(2,4-dichlorophenyl)-1*H*-1,2,4-triazole-1-ethanol; R154523; PP 523; ICIA-0523.

Proprietary Names *Anvil*; *Planete*.



Chemical Properties White crystalline solid. Mp 111°. Soluble in water at 17 mg/L (20°), methanol (246 g/L at 20°), acetone (164 g/L at 20°), toluene (59 g/L at 20°) and hexane (0.8 g/L at 20°). Log *P* (octanol/water), 3.90.



Disposition in the Body Hexaconazole is rapidly excreted from the body with no significant retention of the substance in the body.

Toxicity Hexaconazole is moderately toxic by ingestion and via skin exposure.

Hexamethonium Bromide

Antihypertensive

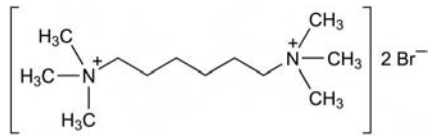
$C_{12}H_{30}Br_2N_2$ = 362.2

CAS—60-26-4 (hexamethonium); 55-97-0 (dibromide)

IUPAC Name *N*,*N*,*N*,*N*′,*N*′,*N*′-Hexamethyl-1,6-hexanediaminium dibromide

Synonyms Hexamethone bromide; hexonium bromide.

Proprietary Names *Esametina*; *Gangliostat*; *Simpatoblock*; *Vegolysen*; *Vegolysin*.



Chemical Properties A white or creamy-white hygroscopic powder. Mp 274° to 276°. Soluble 1 in less than 1 of water and 1 in 60 of ethanol; insoluble in acetone, chloroform and ether.

Hexamethonium Iodide

$C_{12}H_{30}I_2N_2$ = 456.2
CAS—870-62-2
Synonym Hexonium iodide
Proprietary Name *Hexathide*
Chemical Properties A white, slightly hygroscopic, crystalline powder. Soluble 1 in 2 of water; practically insoluble in ethanol.

Thin-layer Chromatography System TA—R_f 0.00; system TN—R_f 0.36; system TO—R_f 0.10 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—not eluted.
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.
Infrared Spectrum Principal peaks at wavenumbers 913, 970, 1630, 945, 1063, 1000 cm^{-1} (KBr disk).
Disposition in the Body
Toxicity

A healthy subject taking part in a pharmacological trial died after receiving about 1 g of hexamethonium by inhalation (a non-standard route of administration) [Ramsay 2001].

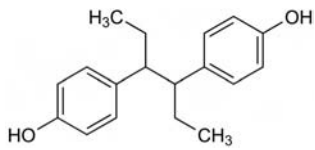
Dose Hexamethonium bromide has been given parenterally in doses of up to 500 mg daily.

Ramsay S (2001). Johns Hopkins takes responsibility for volunteer's death. *Lancet* 358: 213.

H

Hexestrol

Oestrogen
$C_{18}H_{22}O_2$ = 270.4
CAS—5635-50-7; 84-16-2 (meso)
IUPAC Name 4-[4-(4-Hydroxyphenyl)hexan-3-yl]phenol
Synonyms Dihydrostilboestrol; 4,4′-(1,2-diethyl-1,2-ethanediyl)bisphenol; hexanoestrol; hexoestrol; synestrol; synoestrol.
Proprietary Names *Cycloestrol*; *Hormoestrol* (tablets); *Synthovo*; *Syntrogene*.

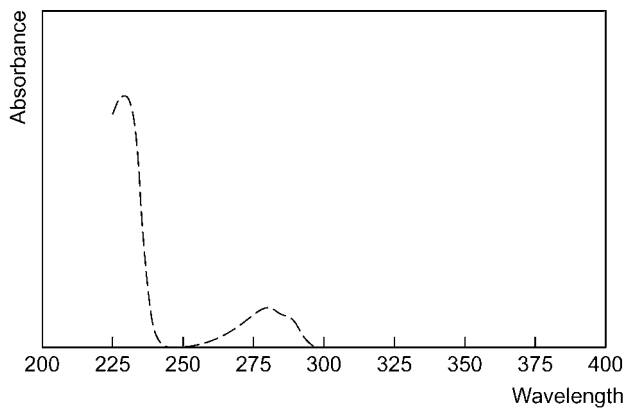


Chemical Properties Colourless crystals or white crystalline powder. Mp 185° to 188°. Practically insoluble in water and dilute mineral acids; freely soluble in ether; soluble in ethanol and acetone; slightly soluble in benzene and chloroform. Log *P* (octanol/water), 5.6.

Hexestrol Dipropionate

$C_{24}H_{30}O_4$ = 382.5
CAS—4825-53-0
Proprietary Names *Hormoestrol* (injection); *Retalon Oleosum*.
Chemical Properties A white crystalline powder. Mp 127° to 128°. Sparingly soluble in water; soluble in warm ethanol and ether.

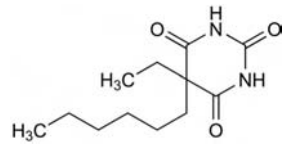
Thin-layer Chromatography System TB—R_f 0.02; system TE—R_f 0.73; system TF—R_f 0.70; system TAE—R_f 0.88.
Gas Chromatography System GA—RI 2402.
High Performance Liquid Chromatography System HX—RI 618.
Ultraviolet Spectrum Ethanol—230 (A^1_1=775b), 280 nm (A^1_1=135a); aqueous alkali—242 (A^1_1=965b), 297 nm (A^1_1=175b).



Infrared Spectrum Principal peaks at wavenumbers 1175, 1523, 1220, 840, 857, 1615 cm^{-1} (KBr disk).
Dose Hexestrol has been given in doses of 1 to 5 mg daily.

Hexethal

Barbiturate
$C_{12}H_{20}N_2O_3$ = 240.3
CAS—77-30-5
IUPAC Name 5-Ethyl-5-hexyl-2,4,6(1*H*,3*H*,5*H*)-pyrimidinetrione

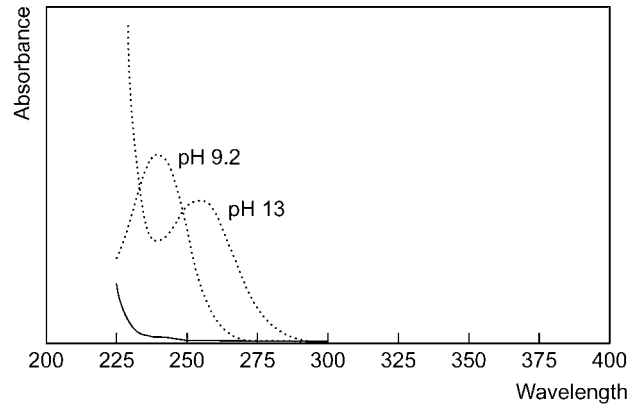


Chemical Properties pK_a 8.0. Log *P* (octanol/water), 2.5.

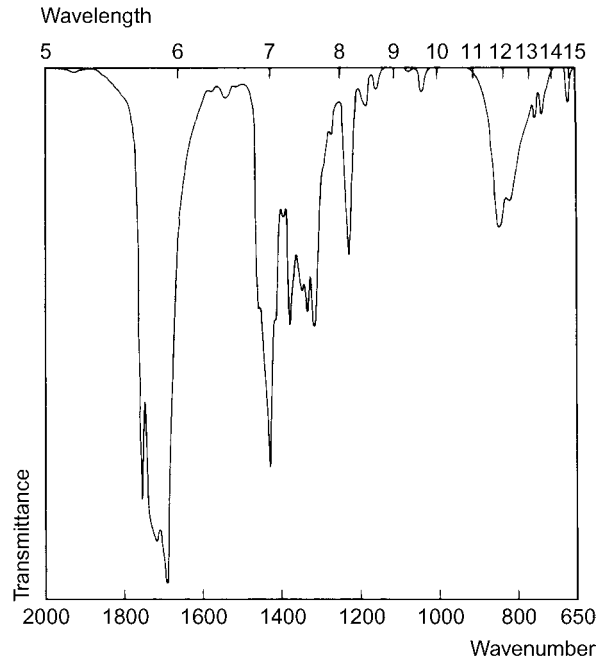
Hexethal Sodium

$C_{12}H_{19}N_2NaO_3$ = 262.3
CAS—144-00-3
Proprietary Names *Hebarel*; *Ortal Sodium*.
Chemical Properties A white or slightly yellowish powder. Mp 126°. Very soluble in water; soluble in ethanol; insoluble in ether and benzene. Aqueous solutions are unstable and decompose on standing.

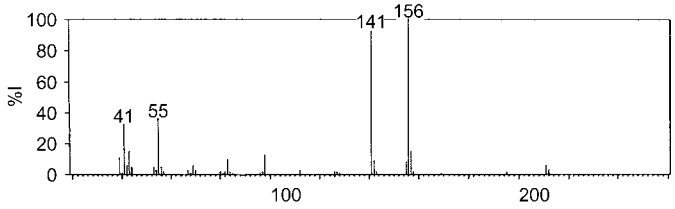
Thin-layer Chromatography System TD—R_f 0.53; system TE—R_f 0.44; system TF—R_f 0.67; system TH—R_f 0.74; system TAD—R_f 0.60.
Gas Chromatography System GA—hexethal RI 1850, hexethal-Me_2 RI 1745.
High Performance Liquid Chromatography System HG—*k* 34.28; system HH—*k* 20.39; system HY—RI 451.
Ultraviolet Spectrum Borax buffer 0.05 mol/L (pH 9.2)—238 (A^1_1=423b); 1 mol/L sodium hydroxide (pH 13)—253 nm (A^1_1=323b).



Infrared Spectrum Principal peaks at wavenumbers 1698, 1720, 1757, 1316, 1230, 850 cm^{-1} (hexethal sodium).



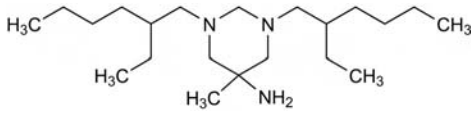
Mass Spectrum Principal ions at *m/z* 156, 141, 55, 41, 157, 43, 98, 39.



Hexetidine

Antimicrobial
$C_{21}H_{45}N_3$ = 339.6
CAS—141-94-6

IUPAC Name 1,3-Bis(2-ethylhexyl)hexahydro-5-methyl-5-pyrimidinamine
Proprietary Names *Bactidol*; *Collu-Hextril*; *Doreperol N*; *Drossadin*; *Gurfix*; *Hexatin*; *Hexifluor*; *Hexigel*; *Hexoral*; *Hextril*; *Isozid-H*; *Kleenosept*; *Oraldene*; *Oraldine*; *Oraseptic*; *Oralspray*; *Steri/Sol*; *Vagi-Hex*.



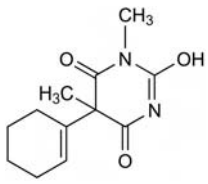
Chemical Properties A viscous oil. Mass per mL about 0.87 g. Refractive index 1.466. Practically insoluble in water; soluble in ethanol, acetone, chloroform, petroleum ether and benzene. pK_a 8.3. Log *P* (octanol/water), 5.3.
Thin-layer Chromatography System TA—R_f 0.70; system TB—R_f 0.48; system TC—R_f 0.40; system TE—R_f 0.79; system TL—R_f 0.20; system TAE—R_f 0.30; system TAF—R_f 0.91 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2093.
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.
Infrared Spectrum Principal peaks at wavenumbers 1093, 854, 1300, 910, 1176, 1234 cm^{-1} (thin film).
Mass Spectrum Principal ions at *m/z* 142, 57, 42, 197, 185, 339, 240, 226.
Quantification
Saliva **HPLC** [McCoy *et al.* 2000].
Use As a 0.1% solution.

McCoy CP *et al.* (2000). Determination of the salivary retention of hexetidine in-vivo by high-performance liquid chromatography. *J Pharm Pharmacol* 52: 1355–1359.

Hexobarbital

Sedative, Barbiturate
$C_{12}H_{16}N_2O_3$ = 236.3
CAS—56-29-1

IUPAC Name 5-(Cyclohexen-1-yl)-1,5-dimethyl-1,3-diazinane-2,4,6-trione
Synonyms Ciclobarbital; 5-(1-cyclohexen-1-yl)-1,5-dimethyl-2,4,6(1*H*,3*H*,5*H*)-pyrimidinetrione; enhexymalum; enimal; hexobarbitalum; hexobarbitone; methexenyl; methyl-cyclohexenylmethyl-barbitursäure; methylhexabarbital.
Proprietary Names *Noctivane*; *Sombulex*.

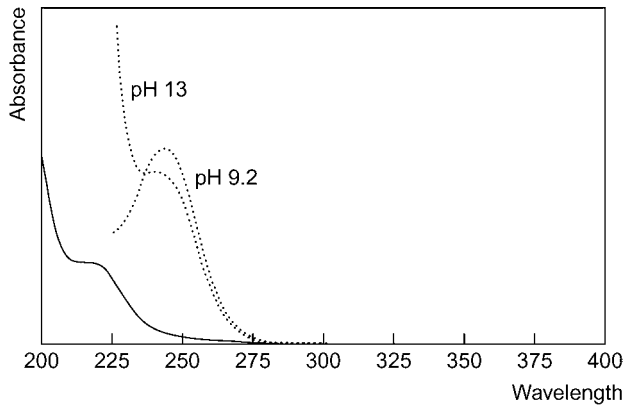


Chemical Properties Colourless crystals or a white crystalline powder. Mp 145° to 147°. Practically insoluble in water; soluble 1 in 45 of ethanol, 1 in 4 of chloroform and 1 in 80 of ether; soluble in acetone, benzene and methanol. pK_a 8.2 (20°). Log *P* (octanol/water), 2.0.

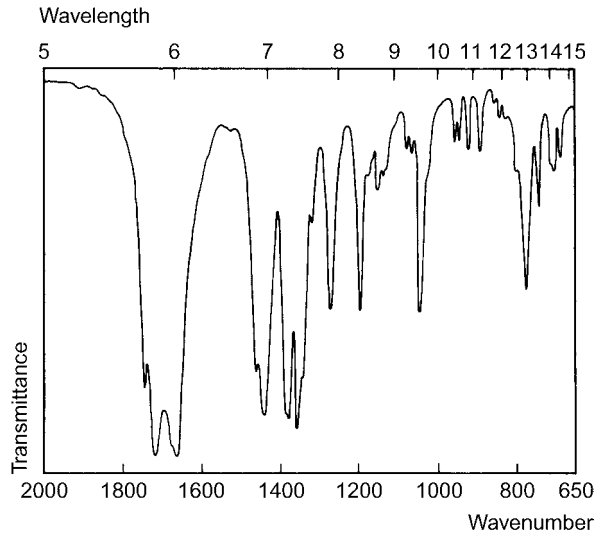
Hexobarbital Sodium

$C_{12}H_{15}N_2NaO_3$ = 258.3
CAS—50-09-9
Synonyms Enhexymalnatrium; hexenalum; sodium hexobarbitone; soluble hexobarbital.
Proprietary Names *Evipan-Natrium*; *Noctivane Sodium*.
Chemical Properties A white, very hygroscopic powder. Discolours on exposure to air. Very soluble in water; freely soluble in ethanol, acetone and methanol; practically insoluble in chloroform, ether and benzene. A solution in water slowly decomposes.

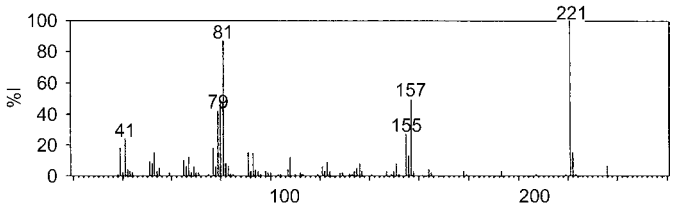
Colour Tests Koppanyi–Zwikker test—violet; mercurous nitrate—black; vanillin reagent—brown/violet.
Thin-layer Chromatography System TD—R_f 0.65; system TE—R_f 0.53; system TF—R_f 0.65; system TH—R_f 0.85; system TAD—R_f 0.69; system TAE—R_f 0.85 (mercuric chloride–diphenylcarbazone reagent, positive; mercurous nitrate spray, black; acidified potassium permanganate solution, yellow-brown on violet).
Gas Chromatography System GA—hexobarbital RI 1855, M (1,5-dimethyl-5-(3-oxo-1-cyclohexen-1-yl)barbituric acid) RI 2050, M (nor-) RI 1980, M (3′-oxo-) RI 2055, M (OH-)-H_2O RI 1970, hexobarbital-Me RI 1800, M (oxo-)-Me RI 2020; system GF—RI 2380; system GAJ—hexobarbital RRT 0.940 (relative to methylphenobarbital).
High Performance Liquid Chromatography System HG—*k* 7.37; system HH—*k* 5.67; system HX—RI 419; system HY—RI 242; system HZ—retention time 4.3 min; system HAL—retention time 2.4 min.
Ultraviolet Spectrum Borax buffer 0.05 mol/L (pH 9.2)—243 nm (A_1^1=331a); 1 mol/L sodium hydroxide (pH 13) —243 nm (A_1^1=301b).



Infrared Spectrum Principal peaks at wavenumbers 1720, 1665, 1748, 1200, 1275, 1045 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 221, 81, 157, 80, 79, 155, 41, 77; 3′-oxohexobarbital 250, 95, 39, 235, 66, 207, 41, 193.



Quantification See also under Amobarbital.
Plasma **GC-MS** Hexobarbital enantiomers and metabolites [Prakash *et al.* 1991].
Urine **GC-MS** See Plasma [Prakash *et al.* 1991].
Disposition in the Body Readily absorbed after oral administration. The sodium salt has a very short duration of action and is usually administered intravenously. Hexobarbital is inactivated in the liver by *N*-demethylation and oxidation. About 32% of a dose is excreted in the urine in 24 h as 3′-oxohexobarbital, 5% as 3′-hydroxyhexobarbital and 18% as 1,5-dimethylbarbituric acid; <1% of a dose is excreted unchanged in the urine in 24 h.
Therapeutic Concentration In plasma, usually in the range 1 to 5 mg/L.
Following a single oral dose of 500 mg to 6 subjects, peak plasma concentrations of 4.9 to 10.9 mg/L (mean 7) were attained in about 1 h [Vermeulen *et al.* 1983].

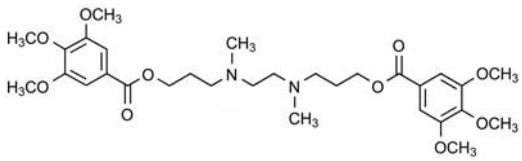
Toxicity The estimated minimum lethal dose is 2 g. Plasma concentrations greater than about 8 mg/L may produce toxic effects.
Half-life Plasma half-life, 3 to 7 h.
Volume of Distribution About 1 L/kg.
Clearance Plasma clearance, about 3.5 mL/min/kg.
Protein Binding 42 to 52%.
Note For a review of the pharmacokinetics of barbiturates, see Breimer [1977].
Dose 250 to 500 mg, as a hypnotic; up to 750 mg daily in divided doses, as a sedative.

Breimer DD (1977). Clinical pharmacokinetics of hypnotics. *Clin Pharmacokinet* 2: 93–109.
Prakash C *et al.* (1991). Enantiospecific quantification of hexobarbital and its metabolites in biological fluids by gas chromatography/electron capture negative ion chemical ionization mass spectrometry. *Biol Mass Spectrom* 20: 559–564.
Vermeulen NP *et al.* (1983). Disposition of hexobarbitone in healthy man: kinetics of parent drug and metabolites following oral administration. *Br J Clin Pharmacol* 15: 459–464.

Hexobendine

Antianginal Vasodilator
$C_{30}H_{44}N_2O_{10}$ = 592.7
CAS—54-03-5

IUPAC Name 3-[Methyl-[2-[methyl-[3-(3,4,5-trimethoxybenzoyl)oxypropyl]amino]ethyl]amino]propyl 3,4,5-trimethoxybenzoate
Synonym 1,2-Ethanediylbis[(methylimino)-3,1-propanediyl]-3,4,5-trimethoxybenzoate

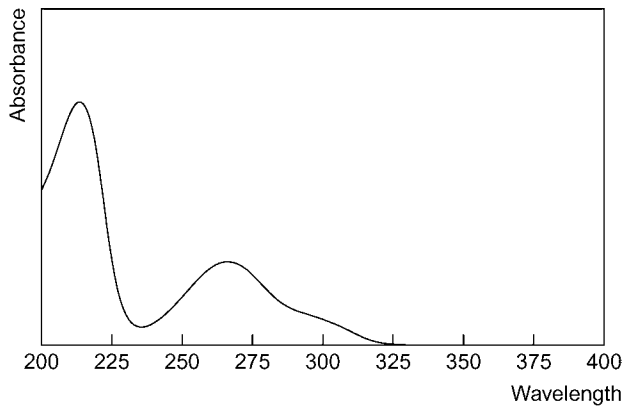


Chemical Properties Mp 75° to 77°. Log *P* (octanol/water), 2.7.

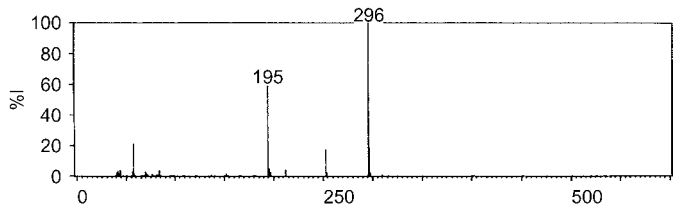
Hexobendine Hydrochloride

$C_{30}H_{44}N_2O_{10}$, 2HCl = 665.6
CAS—50-62-4
Proprietary Names *Reoxyl*; *Ustimon*.
Chemical Properties A white crystalline powder. Mp 170° to 174°. Freely soluble in water; soluble in chloroform; slightly soluble in ethanol; practically insoluble in ether.

Colour Tests Liebermann's reagent—black; Mandelin's test—violet.
Thin-layer Chromatography System TA—R_f 0.47; system TB—R_f 0.10; system TC—R_f 0.44; system TE—R_f 0.16; system TL—R_f 0.06; system TAE—R_f 0.12 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—not eluted.
Ultraviolet Spectrum Aqueous acid—265 nm (A^1_1=311a).



Infrared Spectrum Principal peaks at wavenumbers 1123, 1219, 1703, 1585, 1497, 1171 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 296, 195, 58, 297, 253, 196, 212, 84.

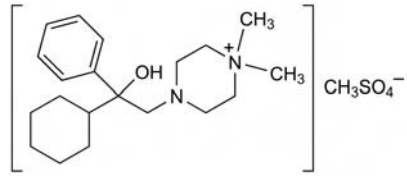


Dose Hexobendine hydrochloride has been given in doses of 60 to 180 mg daily.

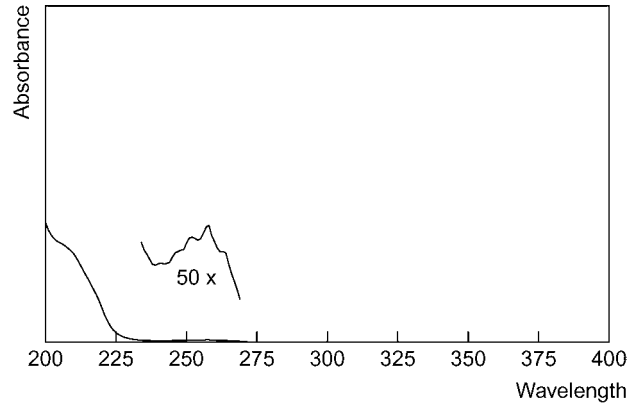
Hexocyclium Metilsulfate

Anticholinergic, Antispasmodic
$C_{20}H_{33}N_2O$, CH_3SO_4 = 428.6
CAS—6004-98-4 (hexocyclium); 115-63-9 (metilsulfate)

IUPAC Name 4-(2-Cyclohexyl-2-hydroxy-2-phenylethyl)-1,1-dimethylpiperazinium methylsulfate
Proprietary Names *Tral*; *Tralin*.



Chemical Properties A white powder. Mp 200° to 210°. Soluble 1 in 2 of water; slightly soluble in chloroform; practically insoluble in ether. Log *P* (octanol/water), 1.0.
Colour Tests Mandelin's test—blue-violet; Marquis test—violet.
Thin-layer Chromatography System TA—R_f 0.02; system TE—R_f 0.01; system TAE—R_f 0.03 (acidified iodoplatinate solution, positive).
Ultraviolet Spectrum Aqueous acid—252, 257 (A^1_1=5.3b), 264 nm.

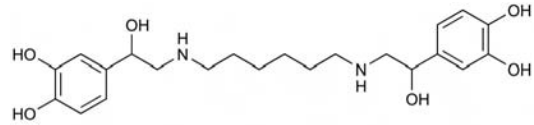


Infrared Spectrum Principal peaks at wavenumbers 1224, 1005, 748, 1052, 700, 770 cm^{-1} (KBr disk).
Dose Initially, 100 mg daily.

Hexoprenaline

Sympathomimetic
$C_{22}H_{32}N_2O_6$ = 420.5
CAS—3215-70-1

IUPAC Name 4,4′-[1,6-Hexanediylbis[imino(1-hydroxy-2,1-ethanediyl)]]bis-1,2-benzenediol
Proprietary Name *Ipradol*



Chemical Properties Crystals. Mp 162° to 165° (hemihydrate).

Hexoprenaline Hydrochloride

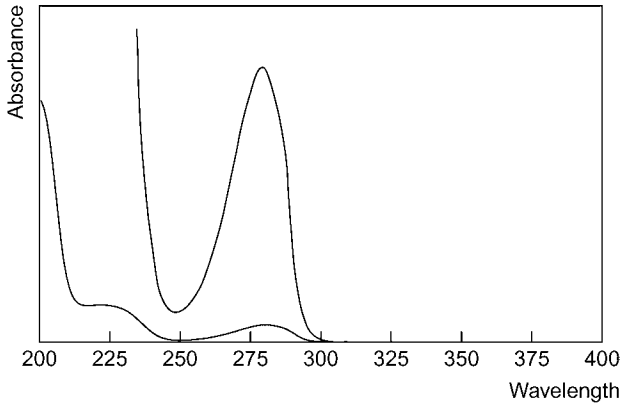
$C_{22}H_{32}N_2O_6$, 2HCl = 493.4
CAS—4323-43-7
Proprietary Name *Ipradol*
Chemical Properties Crystals. Mp 197° to 198°.

Hexoprenaline Sulfate

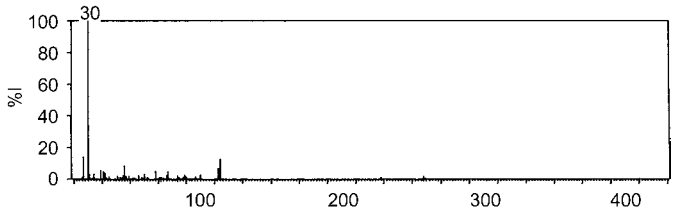
$C_{22}H_{32}N_2O_6$, H_2SO_4 = 518.6
CAS—32266-10-7
Proprietary Names *Bronalin*; *Delaprem*; *Etoscol*; *Gynipral*; *Ipradol*; *Leanol*.
Chemical Properties A white crystalline powder. Mp 214°, with decomposition. Soluble in water and dilute hydrochloric acid; practically insoluble in ethanol.

Colour Tests Ammoniacal silver nitrate—red→brown→black; ferric chloride—orange; Folin-Ciocalteu reagent—blue; Mandelin's test—orange-yellow; Marquis test—red; methanolic potassium hydroxide—orange→brown; Nessler's reagent—black; potassium dichromate (method 1)—green→brown (30 s); sulfuric acid—orange-yellow.
Thin-layer Chromatography System TA—R_f 0.03; system TB—R_f 0.01; system TC—R_f 0.00; system TE—R_f 0.71; system TL—R_f 0.01; system TAE—R_f 0.12 (acidified iodoplatinate solution, positive).

Ultraviolet Spectrum Aqueous acid—280 nm (A_1^1=129a).



Infrared Spectrum Principal peaks at wavenumbers 1102, 1242, 1190, 1605, 1517, 1280 cm^{-1} (hexoprenaline sulfate, KBr disk).
Mass Spectrum Principal ions at *m/z* 30, 27, 124, 56, 123, 87, 78, 41.

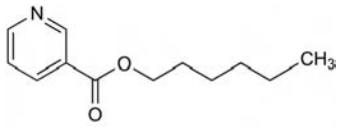


Dose Hexoprenaline sulfate has been given in doses of 0.75 to 1.5 mg daily.

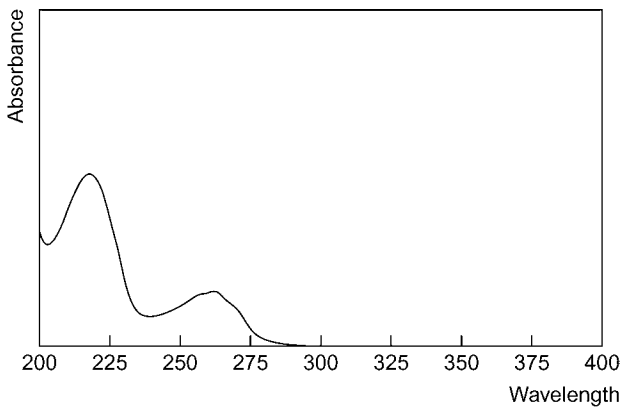
Hexyl Nicotinate

Vasodilator (Topical)
$C_{12}H_{17}NO_2$ = 207.3
CAS—23597-82-2

IUPAC Name Hexyl pyridine-3-carboxylate
Synonym *n*-Hexyl nicotinate
Proprietary Names It is an ingredient of *Hipodor*, *Transvane* and *Transvasin*.



Chemical Properties A pale yellow liquid. Practically insoluble in water; soluble in ethanol, chloroform, and methanol. Log *P* (octanol/water), 3.5.
Thin-layer Chromatography System TA—R_f 0.70 (acidified iodoplatinate solution, positive).
Ultraviolet Spectrum Aqueous acid—260 nm (A_1^1=268b).

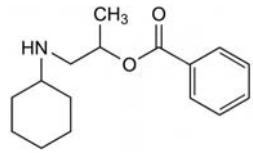


Infrared Spectrum Principal peaks at wavenumbers 1724, 1276, 1111, 741, 1022, 1590 cm^{-1} (KBr disk).
Use Topically in a concentration of 2%.

Hexylcaine

Anaesthetic (Local)
$C_{16}H_{23}NO_2$ = 261.4
CAS—532-77-4

IUPAC Name 1-(Cyclohexylamino)-2-propanol benzoate



Chemical Properties pK_a 9.1. Log *P* (octanol/water), 0.9 (hydrochloride).

Hexylcaine Hydrochloride

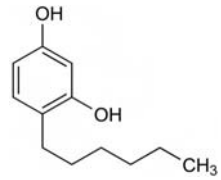
$C_{16}H_{23}NO_2$, HCl = 297.8
CAS—532-76-3
Proprietary Name *Cyclaine*
Chemical Properties A white powder. Mp 182° to 184°. Soluble 1 in 17 of water; freely soluble in ethanol and chloroform; practically insoluble in ether.

Thin-layer Chromatography System TA—R_f 0.01; system TE—R_f 0.80; system TAJ—R_f 0.29; system TAK—R_f 0.15; system TAL—R_f 0.70 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1965.
Ultraviolet Spectrum Aqueous acid—232 (A_1^1=485a), 275 nm (A_1^1=43a).
Infrared Spectrum Principal peaks at wavenumbers 1270, 1718, 1105, 710, 1068, 1022 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 112, 77, 105, 139, 55, 41, 96, 56.
Use Hexylcaine hydrochloride has been used in concentrations of up to 5%.

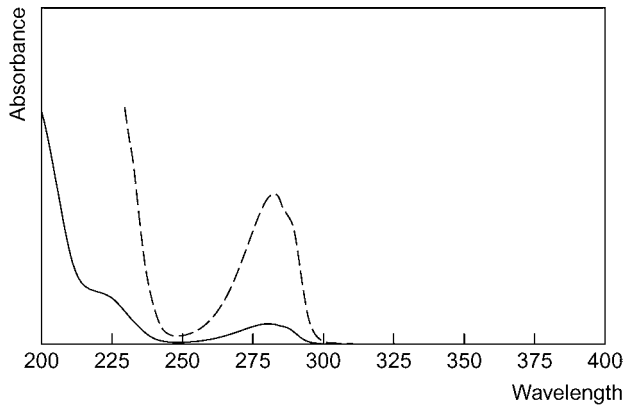
Hexylresorcinol

Anthelmintic
$C_{12}H_{18}O_2$ = 194.3
CAS—136-77-6

IUPAC Name 4-Hexyl-1,3-benzenediol
Proprietary Names *Ascaryl*; *Benylin Sore Throat Lozenge*; *Caprokol*; *Crystoids*; *Gelovermin*; *Lemsip Sore Throat*; *Mac Dual Action*; *Strepsils Extra*; *Sucrets*; *Worm-Agen*.



Chemical Properties White or yellowish-white acicular crystals, crystalline plates or crystalline powder. Acquires a brownish-pink tint on exposure to light and air. Mp 62° to 68°. Soluble 1 in 2000 of water; soluble in acetone, ethanol, chloroform and ether; slightly soluble in petroleum ether. Log *P* (octanol/water), 3.4.
Caution Hexylresorcinol is irritating to the oral mucosa, to the respiratory tract and to the skin; ethanolic solutions have vesicant properties.
Colour Test Ferric chloride—green.
Thin-layer Chromatography System TB—R_f 0.00; system TE—R_f 0.60; system TF—R_f 0.65; system TAE—R_f 0.88.
Gas Chromatography System GA—RI 1830.
High Performance Liquid Chromatography System HX—RI 579; system HY—RI 528.
Ultraviolet Spectrum Methanol—282 nm (A_1^1=160c).



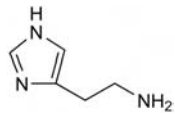
H

Infrared Spectrum Principal peaks at wavenumbers 970, 980, 1185, 1616, 1150, 1205 cm^{-1} (KBr disk).
Disposition in the Body Partly absorbed after oral administration. About 20 to 30% of a dose is rapidly excreted unchanged in the urine and the remainder is eliminated in the faeces.
Dose 1 g as a single dose.

Histamine

Diagnostic Agent (Gastric Secretion)
$C_5H_9N_3$ = 111.1
CAS—51-45-6

IUPAC Name 1*H*-Imidazole-4-ethanamine
Synonym Ergotidine
Proprietary Name *Destamin*



Chemical Properties Deliquescent acicular crystals. Mp 83° to 84°. Freely soluble in water, ethanol and hot chloroform; practically insoluble in ether. pK_a 5.9, 9.7 (25°). Log *P* (octanol/water), −0.7.

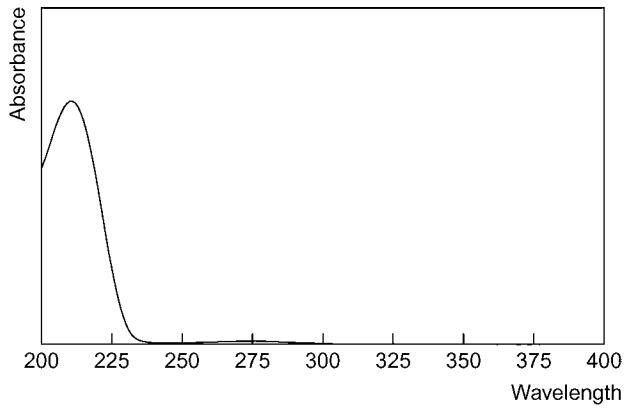
Histamine Acid Phosphate

$C_5H_9N_3$, $2H_3PO_4$ = 307.1
CAS—51-74-1
Synonyms Histamine diphosphate; histamine phosphate.
Chemical Properties Colourless crystals. Mp 130° to 133°. Soluble 1 in 4 of water; slightly soluble in ethanol; practically insoluble in ether.

Histamine Hydrochloride

$C_5H_9N_3$, 2HCl = 184.1
CAS—56-92-8
Synonym Histamine dihydrochloride
Proprietary Name *Maxamine*. It is an ingredient of *Histadestil*, *Histaglobin*, *Midalgan* and *Radalgin*.
Chemical Properties Hygroscopic colourless crystals or white crystalline powder. Mp about 245°, with decomposition. Freely soluble in water and methanol; soluble in ethanol and acetone; practically insoluble in chloroform and ether.

Thin-layer Chromatography System TA—R_f 0.13; system TB—R_f 0.00; system TC—R_f 0.00; system TE—R_f 0.07; system TL—R_f 0.00; system TAE—R_f 0.00; system TAF—R_f 0.03 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1497.
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.



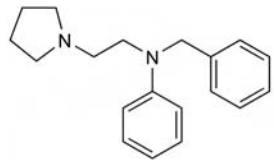
Infrared Spectrum Principal peaks at wavenumbers 840, 1622, 1522, 1084, 802, 1577 cm^{-1} (histamine hydrochloride, KBr disk).
Mass Spectrum Principal ions at *m/z* 82, 30, 81, 54, 28, 55, 83, 41.
Quantification
Biological Fluids **HPLC** Fluorescence detection [Tsikas *et al.* 1993]. Electrochemical detection. Histamine and *N*-methylhistamine [Houdi *et al.* 1987].
Tissues **HPLC** See Biological Fluids [Tsikas *et al.* 1993].
Disposition in the Body
Toxicity
Harbour workers experienced allergy-like symptoms of toxicity after handling bags containing fish flour contaminated with histamine (510 mg/100 g) [Macan *et al.* 2000].
Dose Histamine acid phosphate is given subcutaneously, in a dose of 40 µg/kg, following administration of a large dose of an antihistamine.

Houdi AA *et al.* (1987). A simple and sensitive determination of histamine and N tau-methylhistamine in biological fluids by high-performance liquid chromatography with electrochemical detection. *J Pharm Sci* 76: 398–401.
Macan J *et al.* (2000). Occupational histamine poisoning by fish flour: a case report. *Occup Med (Lond.)* 50: 22–24.
Tsikas D *et al.* (1993). Ion-pair extraction of histamine from biological fluids and tissues for its determination by high-performance liquid chromatography with fluorescence detection. *J Chromatogr* 614: 37–41.

Histapyrrodine

Antihistamine
$C_{19}H_{24}N_2$ = 280.4
CAS—493-80-1

IUPAC Name *N*-Benzyl-*N*-(2-pyrrolidin-1-ylethyl)aniline
Synonym *N*-Phenyl-*N*-(phenylmethyl)-1-pyrrolidineethanamine

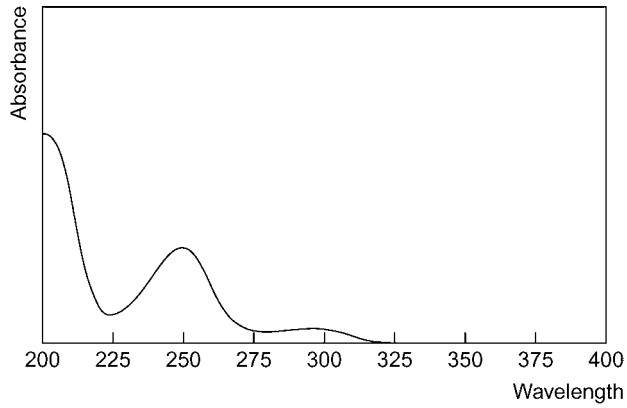


Chemical Properties An oil. Log *P* (octanol/water), 4.2.

Histapyrrodine Hydrochloride

$C_{19}H_{24}N_2$, HCl = 316.9
CAS—6113-17-3
Proprietary Names *Calcistin*; *Domistan*; *Luvistin*.
Chemical Properties A white powder. Mp 196°. Solubility in water (at 18°), 2 g in 100 mL.

Colour Test Mandelin's test—red-violet.
Thin-layer Chromatography System TA—R_f 0.60; system TE—R_f 0.75; system TAE—R_f 0.32 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—histapyrrodine RI 2240, M (OH-) RI 2500, M (oxo-) RI 2570, M (*N*-desbenzyl-) RI 1800, M (*N*-desbenzyl-oxo-) RI 2120, M (*N*-desphenyl-oxo-)-H_2O RI 2100.
High Performance Liquid Chromatography System HA—*k* 3.0.
Ultraviolet Spectrum Aqueous acid—250 (A^1_1=141a), 295 nm.

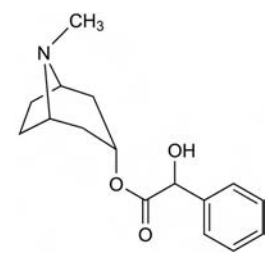


Infrared Spectrum Principal peaks at wavenumbers 1513, 1604, 750, 698, 1500, 732 cm^{-1}.
Mass Spectrum Principal ions at *m/z* M (OH-) 84, 91, 212, 296, 213, 297; M (oxo-) 91, 196, 209, 197, 275, 294; M (*N*-desbenzyl-)84, 190, 106, 111, 122, 77; M (*N*-desbenzyl-oxo-) 106, 119, 118, 98, 77, 204; M (*N*-desphenyl-oxo--H_2O 91, 159, 216, 160, 215), 84.
Dose Histapyrrodine hydrochloride has been given in doses of 50 to 150 mg daily.

Homatropine

Anticholinergic
$C_{16}H_{21}NO_3$ = 275.3
CAS—87-00-3

IUPAC Name 8-Methyl-8-azabicyclo[3.2.1]oct-3-yl-*endo*-α-hydroxybenzeneacetate
Proprietary Names *Homasedin*; *Homatropil*; *Homo*; *Pasmolit*.

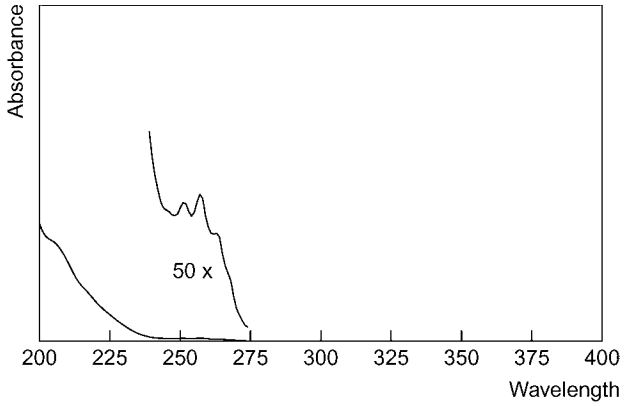


Chemical Properties Small white prismatic crystals or coarse crystalline powder. Mp 99° to 100°. Slightly soluble in water; soluble in ethanol, benzene, acetone, dilute acids, chloroform and ether. pK_a 9.9 (20°). Log *P* (octanol/water), 1.4.

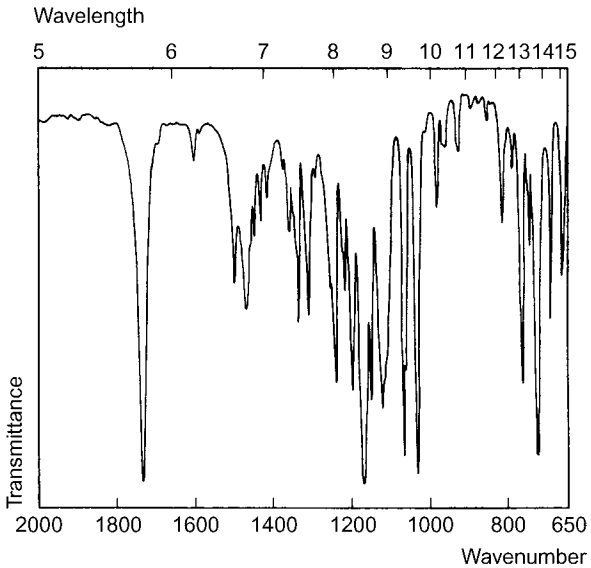
Homatropine Hydrobromide

$C_{16}H_{21}NO_3$, HBr = 356.3
CAS—51-56-9
Synonym Tropyl mandelate hydrobromide
Proprietary Names *Bufopto Homatrocel*; *Homat*; *Homatrisol*; *Homatrocil*; *Homatrop*.
Chemical Properties Colourless crystals or a white crystalline powder. Mp 214° to 217°, with decomposition. Soluble 1 in 6 of water, 1 in 60 of ethanol and 1 in 420 of chloroform; practically insoluble in ether.

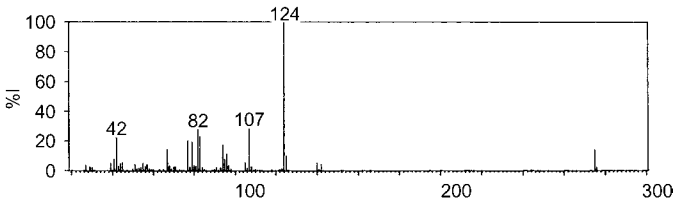
Thin-layer Chromatography System TA—R_f 0.01; system TB—R_f 0.05; system TC—R_f 0.01; system TE—R_f 0.23; system TL—R_f 0.01; system TAE—R_f 0.07; system TAF—R_f 0.27; system TAJ—R_f 0.00; system TAK—R_f 0.02; system TAL—R_f 0.34 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2072; system GB—RI 2165.
High Performance Liquid Chromatography System HA—*k* 4.2 (tailing peak); system HX—RI 272; system HY—RI 223; system HAX—retention time 6.8 min; system HAY—retention time 3.6 min.
Ultraviolet Spectrum Aqueous acid—252, 258 (A_1^1=7.3a), 264 nm. No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1730, 1172, 1030, 735, 1063, 1125 cm^{-1} (KBr disk).



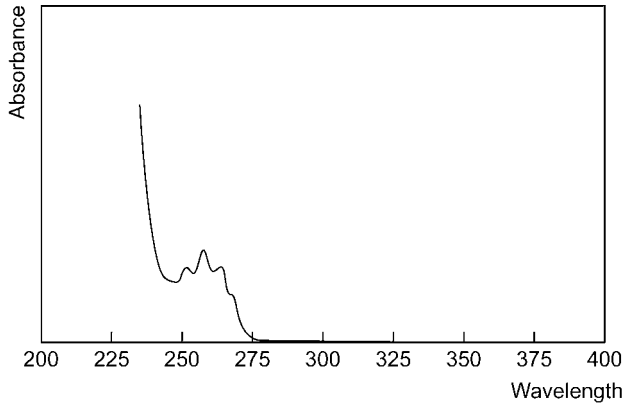
Mass Spectrum Principal ions at *m/z* 124, 107, 82, 83, 42, 77, 79, 94.



Use Homatropine hydrobromide is used as a 2% ophthalmic solution.

Homatropine Methylbromide

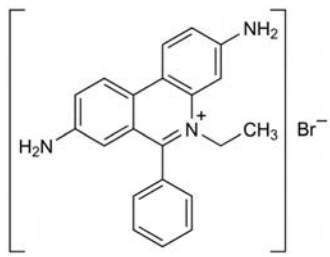
Anticholinergic
$C_{16}H_{21}NO_3$, CH_3Br = 370.3
CAS—80-49-9
IUPAC Name (8,8-Dimethyl-8-azoniabicyclo[3.2.1]octan-3-yl) 2-hydroxy-2-phenylacetate bromide
Synonyms Homatropine methobromide; 8-methyl-8-azabicyclo[3.2.1]oct-3-yl-*endo*-α-hydroxybenzeneacetate methylbromide; methylhomatropinium bromide.
Proprietary Names *Arkitropin*; *Homapin*; *Malcotran*; *Mesopin*; *Novatrin*; *Novatropina*; *Sethyl*.
Chemical Properties A white powder. Mp about 190°. Freely soluble in water and ethanol; practically insoluble in acetone and ether.
Thin-layer Chromatography System TA—R_f 0.00; system TB—R_f 0.00; system TC—R_f 0.00; system TE—R_f 0.00; system TL—R_f 0.00; system TAE—R_f 0.00; system TAF—R_f 0.12 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—not eluted.
High Performance Liquid Chromatography System HX—RI 262.
Ultraviolet Spectrum Aqueous acid—252, 258 (A_1^1=5.8b), 264 nm.



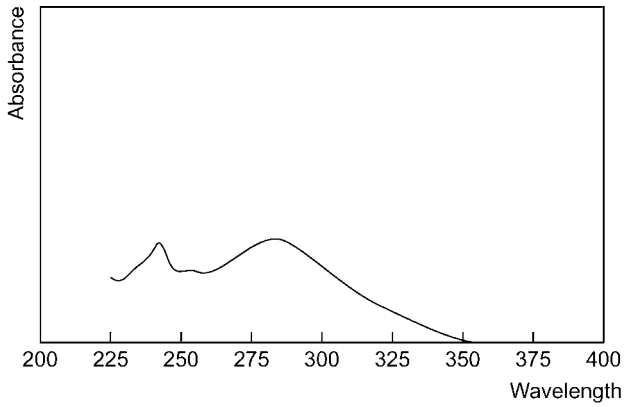
Infrared Spectrum Principal peaks at wavenumbers 1724, 1179, 1160, 1195, 1044, 935 cm^{-1} (KBr disk).
Dose Usually 12 to 40 mg daily.

Homidium Bromide

Trypanocide (Veterinary)
$C_{21}H_{20}BrN_3$ = 394.3
CAS—1239-45-8
IUPAC Name 3,8-Diamino-5-ethyl-6-phenylphenanthridinium bromide
Synonym Ethidium bromide
Proprietary Name *Dromilac*



Chemical Properties A dark purple crystalline or amorphous powder. Mp 245°, with decomposition. Soluble 1 in 20 of water and 1 in 750 of chloroform.
Colour Test The test is performed on homidium nitrate: Mandelin's test—yellow.
Thin-layer Chromatography System TA—R_f 0.55 (acidified potassium permanganate solution, positive).
Ultraviolet Spectrum Aqueous acid—242, 283 nm (A_1^1=785a).

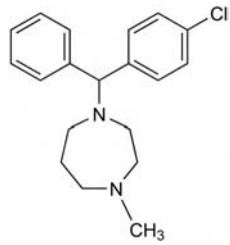


Infrared Spectrum Principal peaks at wavenumbers 1628, 1492, 1260, 1312, 836, 1077 cm^{-1} (KBr disk).

Homochlorcyclizine

Antihistamine
$C_{19}H_{23}ClN_2 = 314.9$
CAS—848-53-3

IUPAC Name 1-[(4-Chlorophenyl)phenylmethyl]hexahydro-4-methyl-1*H*-1,4-diazepine
Proprietary Name *Homoclomin (hydrochloride)*



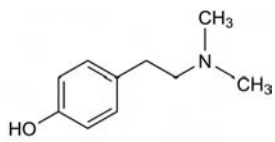
Chemical Properties A white crystalline powder. Soluble in dilute acetic acid. Log *P* (octanol/water), 4.1.
Thin-layer Chromatography System TA—R_f 0.28 (acidified iodoplatinate solution, positive).
Ultraviolet Spectrum Aqueous acid—233 (A_1^1=457b), 258, 263, 270 nm.
Infrared Spectrum Principal peaks at wavenumbers 1135, 1010, 1600, 1618, 1630, 720 cm^{-1} (KBr disk).
Quantification
Urine **HPLC** UV detection. Homochlorcyclizine enantiomers. Limit of detection, less than 50 µg/L [Nishikata *et al.* 1993].
Dose Homochlorcyclizine has been given in doses of 30 to 60 mg daily.

Nishikata M *et al.* (1993). Enantioselective pharmacokinetics of homochlorcyclizine. III. Simultaneous determination of (+)- and (–)- homochlorcyclizine in human urine by high-performance liquid chromatography. *J Chromatogr* 612: 239–244.

Hordenine

Sympathomimetic
$C_{10}H_{15}NO = 165.2$
CAS—539-15-1

IUPAC Name 4-[2-(Dimethylamino)ethyl]phenol



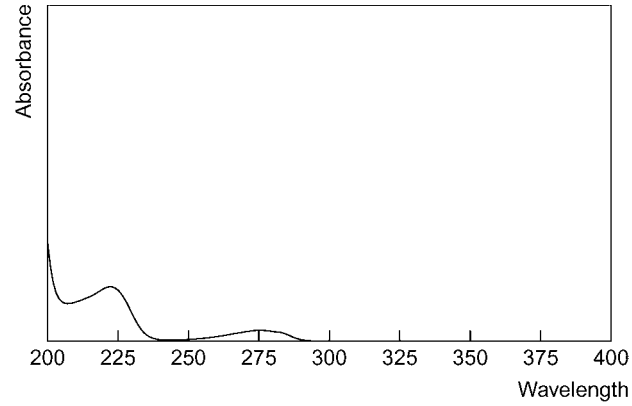
Chemical Properties Occurs naturally in germinating barley and other Gramineae. Crystals. Mp 117° to 118°. Slightly soluble in water; very soluble in ethanol, chloroform and ether; sparingly soluble in benzene, toluene and xylene; practically insoluble in petroleum ether. Log *P* (octanol/water), 1.5.

Hordenine Sulfate

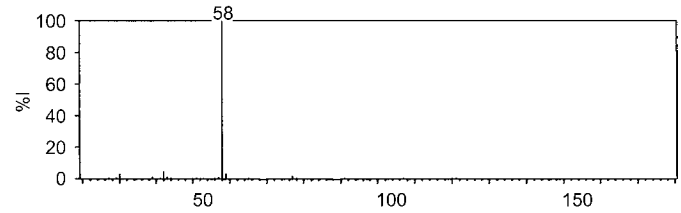
$(C_{10}H_{15}NO)_2, H_2SO_4, 2H_2O = 464.6$
CAS—622-64-0 (anhydrous); 6202-17-1 (dihydrate)

Chemical Properties Crystals. Mp 197°. Soluble in water; slightly soluble in ethanol; practically insoluble in ether.

Colour Tests Mandelin's test—grey-green; Marquis test—brown→green.
Thin-layer Chromatography System TA—R_f 0.40; system TB—R_f 0.05; system TC—R_f 0.06; system TE—R_f 0.52; system TL—R_f 0.05; system TAJ—R_f 0.03; system TAK—R_f 0.00; system TAL—R_f 0.20 (Acidified potassium permanganate solution, positive).
Gas Chromatography System GA—RI 1432.
High Performance Liquid Chromatography System HB—*k* 2.00.
Ultraviolet Spectrum Aqueous acid—274 nm.



Infrared Spectrum Principal peaks at wavenumbers 1252, 1512, 820, 1612, 1270, 869 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 58, 42, 59, 30, 77, 107, 57, 51.



HT-2 Toxin

Trichothecene Mycotoxin
$C_{22}H_{32}O_8 = 424.5$
CAS—26934-87-2

IUPAC Name 15-Acetoxy-3α,4β-dihydroxy-8α-(3-methylbutyryloxy)-12,13-epoxytrichothec-9-ene
Synonyms 12,13-Epoxytrichothec-9-ene-3,4,8,15-tetraol 4,15-diacetate 8-isovalerate; mycotoxin HT 2; NSC 278571; Toxin HT 2.

[Abramson *et al.* 1989].

H

Chemical Properties HT-2 toxin is a trichothecene mycotoxin produced by a saprophyte *Fusarium sporotrichoides* and other *Fusarium* spp. It is not normally found in grains at harvest but results from water damage to grain, which provides favourable conditions for the growth of *Fusarium* spp. [WHO/JECFA 2002]. White solid. Mp 151° to 152°. Soluble in dichloromethane, ethanol, ethyl acetate and DMSO; slightly soluble in petroleum ether; very slightly soluble in water. For a study of the stability of tricothecenes in calibrant samples, see [Widestrand, Pettersson 2001].

Thin-layer Chromatography Plates: RP-18 and KC-18. Solvent systems: (A) methanol : water; (B) acetonitrile : water; (C) tetrahydrofuran : water. Location reagents: 4-(*p*-nitrobenzyl)pyridine for trichothecenes; UV (λ = 365 nm) for aflatoxins, ochratoxin A, citrinin; aluminium trichloride for sterigmatocystin; Azoene Fast Violet B for zearalenone; 3-methyl-2-benzthiazolinone hydrazone hydrochloride for patulin and penicillic acid. Solvent composition and R_f values reported as in the table above.

High Performance Liquid Chromatography Column: C_{18} (250 × 4.6 mm i.d., 10 µm). Mobile phase: acetonitrile : water (70 : 30), flow rate 3 mL/min. UV detection (λ = 278 nm). Retention time: 9.6 min. Limit of detection, 30–50 ng for HT-2 toxin and other trichothecene mycotoxins [Yagen *et al.* 1986].

Ultraviolet Spectrum No UV absorption [Rejakylä *et al.* 1987; Sydenham *et al.* 1996].

Quantification

Blood **GC-MS** MRM acquisition mode. Limit of detection, 0.5 ppb for HT-2 and T-2 toxins [Pawlosky *et al.* 1989]. Column: BP-5 (12 m × 0.22 mm i.d., 0.25 µm). Carrier gas: He, 8 psi. Temperature programme: 90° for 2 min to 180° at 20°/min to 240° at 5°/min for 2 min. CI, negative ion mode, SIM acquisition mode. Limit of detection, 2–7 ppb for HT-2, deoxynivalenol, nivalenol, T-2, T-2 tetraol, diacetoxyscirpenol, scirpentriol, 15-acetylscirpenol (heptafluorobutyrylimidazole derivatives) [Black *et al.* 1986]. Column: Varian 3700 J&W DB-5 (15 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 35 cm/s. Temperature programme: 50° for 2 min to 300° at 10°/min for 8 min. CI, SIM acquisition mode. Limit of detection, 0.7 ng/g [D'Agostino *et al.* 1986].

Plasma **GC** Column: OV-17. ECD. Limit of detection, 5 µg/L for HT-2 and 30 µg/L for T-2 [Yagen *et al.* 1986].

Urine **GC-MS** See [Pawlosky *et al.* 1989]. Column: BP-1 methyl silicone (25 m × 0.2 mm i.d., 0.25 µm). Carrier gas: He, 15 psi. Temperature programme: 160° for 1 min to 275° at 10°/min, for 5 min. EI ionisation at 70 eV, positive ion mode, SIM acquisition mode. Limit of detection, 2 to 7 ppb for HT-2, deoxynivalenol, nivalenol, T-2 toxin, T-2-tetraol, diacetoxyscirpenol, scirpentriol and 15-acetylscirpenol (heptafluorobutyrylimidazole derivatives) [Black *et al.* 1986].

Other **TLC** Liquid Culture. Fluorometric detection [Kotsonis, Ellison 1975].

GC Cereals. ECD. Limits of quantification, 40 to 200 µg/kg for HT-2 and other trichothecenes [Kotal *et al.* 1999]. Bananas. Fluorescence detection. HT-2 toxin and other mycotoxins [Jimenez, Mateo 1997]. *In vitro* Bovine Ruminal Fluid. Column: DB-1701 capillary (30 m × 0.25 mm i.d., 0.25 µm). Temperature programme: 250° to 275° at 5°/min for 5 min for TMS or 225° to 275° at 5°/min for 5 min for trifluroacetic acid. Retention time: 8.26 min [Swanson *et al.* 1987]. Cereal Samples. Column: SE-52 (12 m × 0.25 mm i.d.). Carrier gas: H_2, 40 kPa. Temperature programme: 180° to 260° at 4°/min. FID. Limit of detection, for HT-2 and other fusariotoxins, 100 ppb [Bata *et al.* 1983].

GC-MS Wheat Samples. Column: HP-5 capillary (30 m × 0.25 mm i.d., 0.25 mm). Carrier gas: N_2, 1 mL/min. Temperature programme: 80° for 1 min to 160° at 30°/min to 183° at 1°/min to 280° at 12°/min for 5 min. ECD. Limit of quantification, 20 µg/kg for HT-2 toxin and other trichothecenes, limit of detection, 10 µg/kg [González *et al.* 2008]. Soy Sauce Samples. Column: DB-5MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He. Temperature programme: 140° for 2 min to 275° at 7°/min for 2 min to 290° at 30°/min for 5 min. Limit of detection, 1–19 µg/kg for HT-2 toxin and other *Fusarium* toxins [Schollenberger *et al.* 2007]. Food Samples. Column: Rtx-200 (60 m × 0.25 mm i.d., 0.1 µm). Carrier gas: He, 1.3 mL/min. Temperature programme: 115° for 5 min to 125° at 50°/min to 300° at 5°/min for 10 min. EI ionisation at 70 eV, positive ion mode. Retention time: 24.6 min for deoxynivalenol, 28.8 min for 3-acetyldeoxynivalenol, 28.3 min for 15-acetyldeoxynivalenol, 26.9 min for nivalenol, 26.4 min for fusarenone-X, 29.4 min for diacetoxyscirpenol, 30.1 min for neosolaniol, 33.7 min for HT-2 and 34.5 min for T-2. Limit of quantification, 0.30 µg/kg for deoxynivalenol, 0.26 µg/kg for 3-acetyldeoxynivalenol, 0.19 µg/kg for 15-acetyldeoxynivalenol, 0.28 µg/kg for nivalenol, 0.16 µg/kg for fusarenone-X, 0.36 µg/kg for diacetoxyscirpenol, 0.37 µg/kg for neosolaniol, 0.26 µg/kg for HT-2 and 0.18 µg/kg for T-2, limit of detection, 0.16 µg/kg [Schothorst *et al.* 2005]. Grain Samples. Column: DB-5MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He. Temperature programme: 80° to 245° at 60°/min for 3 min to 260° at 3°/min to 270° at 10°/min for 7 min. EI ionisation at 70 eV, positive ion mode, SIM acquisition mode. Limit of quantification, 30 µg/kg for deoxynivalenol, 3-acetyldeoxynivalenol, fusarenone-X and diacetoxyscirpenol; 20 µg/kg for HT-2 and T-2; 30 µg/kg for nivalenol (*N*,*O*-bis (trimethylsilyl)acetamide: trimethylchlorosilane: *N*-trimethylsilylimidazole derivatives) [Jestoi *et al.* 2004]. Food and Food Products. Column: fused silica capillary. EI and NCI or PCI mode. Limit of quantification, 50–5000 pg, limit of detection, 10–50 pg for HT-2 and T-2 toxins [Melchert, Pabel 2004]. *In vitro* Bacterial Suspensions. Column: DB-5 (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 0.6 mL/min. Temperature programme: 80° to 245° at 60°/min for 3 min to 260° at 4°/min to 270° at 10°/min for 7 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection not reported for HT-2 toxin and other *Fusarium* toxins [el Nezami *et al.* 2002]. Fungal Extracts. Column: HP-5 (30 m × 0.25 mm i.d., 0.1 µm). Carrier gas: He, 40 cm/s. Temperature programme: 80° for 1 min to 160° at 40°/min to 205° at 4°/min to 240° at 8°/min to 300° at 40°/min for 3 min. EI ionisation, positive ion mode, CID or NICI mode. Limit of detection, 30–70 pg or 50–120 pg (NICI) for HT-2 toxin and other trichothecenes [Nielsen, Thrane 2001]. Spiked Barley. Column: HP-5 5% phenylmethylsiloxane capillary (25 m × 0.2 mm i.d., 0.3 µm). Carrier gas: He, 1.5 mL/min. Temperature programme: 333K for 1 min to 473K at 20K/min to 553K at 10K/min for 10 min. EI ionisation at 70 eV. Limit of detection, 0.005–0.05 mg/kg for HT-2 toxin and other trichothecenes [Kostiainen, Nokelainen 1990]. 'Yellow Rain' Powder Sample. Column: glass packed with 3% OV-17 on 100/120 mesh Chromosorb (1.0 m × 2.0 mm i.d.). Carrier gas: He, 25 mL/min. Temperature programme: 180° to 260° at 12°/min for 5 min. EI ionisation at 70 eV, positive ion mode, SIM acquisition mode. Retention time: 2.3 min for deoxynivalenol, 6.2 min for T-2, 5.5 min for HT-2, 6.5 min for zearalenone and 4.0 min for diacetoxyscirpenol (trimethylsilyl derivatives). Limit of quantification not reported [Rosen, Rosen 1982].

HPLC Oat-based Media. DAD. Limit of detection, 0.459 mg/kg for HT-2 toxin and 0.508 mg/kg for T-2 toxin [Medina *et al.* 2010]. Cereal Grains. Fluorescence detection. Limit of detection, 2.3–6.3 ng for HT-2 toxin and 2–10 ng for T-2 toxin [Lippolis *et al.* 2008]. Cereals. Fluorescence detection. Limit of quantification, 8 µg/kg for HT-2 and T-2 toxins [Trebstein *et al.* 2008]. Eggs (whole with shells removed). Fluorescence detection. Limit of detection, 5 µg/L for HT-2 and T-2 toxins [Maragos 2006]. Cereal Grains. Column: reversed phase. Fluorimetric detection (λ_{ex} = 381 nm, λ_{em} = 470 nm). Limit of detection, 3 µg/kg for HT-2 toxin and 5 µg/kg for T-2 toxin [Visconti *et al.* 2005]. Grain Samples. Column: C_{18} (250 × 4.0 mm i.d., 5 µm). Mobile phase: acetonitrile : water (65 : 35) containing 0.75% acetic acid, flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 292 nm, λ_{em} = 425 nm). Limit of detection, 0.4 µg/kg for deoxynivalenol and HT-2, 0.2 µg/kg for nivalenol and diacetoxyscirpenol, 1.0 µg/kg for 15-acetyldeoxynivalenol and 3-acetyldeoxynivalenol, and 0.6 µg/kg for fusarenone-X and T-2 (coumarin-3-carbonyl derivatives) [Dall'Asta *et al.* 2004; Mateo *et al.* 2001]. Column: LiChrospher 100 C_{18} (250 × 4.0 mm i.d., 5 µm). Mobile phase: acetonitrile : water (65 : 35) containing 0.75% acetic acid, flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 292 nm,

λ_{em}= 425 nm). Retention time: ≈8.5 min. Limit of detection, 10 ng/g for T-2 toxin) and 15 ng/g for HT-2 toxin and other trichothecenes [Jimenez *et al.* 2000]. Cereal Grains. Limit of detection, 0.02–0.15 mg/kg for HT-2 toxin and other mycotoxins [Stratton *et al.* 1993].

LC-MS Wheat Flour. Modified QuEChers method. H-2 toxin and other trichothecenes [Sospedra *et al.* 2010]. Cereals. QuEChers-like method and accelerated solvent extraction. ESI. Limit of quantification, 5–100 μg/kg for HT-2 toxin and T-2 toxin [Desmarchelier *et al.* 2010]. Food Grains. Limit of detection, 0.005 mg/kg for HT-2 toxin and 0.002 mg/kg for T-2 toxin [Sedova *et al.* 2009]. Food Supplements (soy isoflavones, St John's Wort, garlic, *Ginkgo biloba*, Black radish). Acquity UPLC system coupled to a Micromass Quattro triple quadropole MS. Limit of quantification, 1–100 μg/kg, limit of detection, 0.3–30 μg/kg, for HT-2 toxin and other mycotoxins [Diana Di Mavungu *et al.* 2009]. Cereals (maize, wheat, oats). Total sum of HT-2 and T-2 toxins for food (peanuts, pistachios, wheat, maize, cornflakes, raisins, figs). Column: Alltima C_{18} (150 × 3.2 mm i.d., 5 μm). Mobile phase: 0.1% formic acid : 0.1% formic acid in acetonitrile (90 : 10 to 30 : 70 at 12 min for 4 min to 10 : 90 at 17.5 min for 2.5 min to 90 : 10 at 21 min for 4 min), flow rate 0.3 mL/min. ESI, MRM acquisition mode, positive ion mode. Limit of detection, 50 μg/kg [Lattanzio *et al.* 2009; Spanjer *et al.* 2008]. Cereals and Cereal-based Products (infant foods, snacks, biscuits, wafers). APCI. Limit of detection, 0.4–1.7 μg/kg for HT-2 toxin and 0.4–1.0 μg/kg for T-2 toxin [Lattanzio *et al.* 2008]. Maize. Column: reversed phase. Mobile phase: methanol : water containing 0.5% acetic acid and 1 mmol/L ammonium acetate. ESI. Limit of detection, 0.3–4.2 μg/kg for H-2 toxin and other mycotoxins [Lattanzio *et al.* 2007]. Corn, Wheat, Cornflakes and Biscuits. Column: Zorbax Eclipse XDB-C_{18} (150 × 2.1 mm i.d., 3.5 μm). Mobile phase: 10 mmol/L ammonium acetate : methanol (90 : 10 to 0 : 100 in 40 min), flow rate 200 μL/min. APCI. Limit of detection 0.1–6.1 ng/g for HT-2 toxin and other mycotoxins [Tanaka *et al.* 2006]. Cereals and Cereal-based Foods. ESI. Limit of detection, 0.3–5 ng/g for HT-2 toxin and other trchothecenes [Klötzel *et al.* 2006]. Maize. APCI. Limit of detection, 0.3–3.8 μg/kg [Berthiller *et al.* 2005]. Wheat Flour. Column: LC-18 Supelcosil (250 × 4.6 mm i.d., 5 μm). Mobile phase: water : methanol (80 : 20 to 35 : 65 in 9 min for 8 min to 10 : 90 for 5 min to 80 : 20 for 7 min), flow rate 1.0 mL/min. ESI, positive ion mode. Limits of quantification, 10–20 ng/g for HT-2 toxin and other trichothecenes [Biancardi *et al.* 2005]. Column: SB-RP18-Zorbax (150 × 3.0 mm i.d., 3.5 μm). Mobile phase: methanol : water (30 : 70 to 100 : 0 in 8 min), flow rate 250 μL/min. ESI, negative and positive ion mode, MRM acquisition mode. Retention time: 13.6 min. Limit of quantification, 0.02–10 ppb for HT-2 toxin and other mycotoxins [Biselli, Hummert 2005]. Wheat and Oat Samples. ESI. Limit of detection, 0.18–5.0 ng/g [Klötzel *et al.* 2005]. Bovine Milk. Column: Hypersil ENV or Luna C_{18}. Positive ion mode. Limit of detection, 0.020–0.15 μg/L for HT-2 toxin and 17 other mycotoxins [Sorensen, Elbaek 2005]. Barley Tea and Beer. Column: ODS. Mobile phase: water: methanol : acetonitrile, flow rate 0.2 mL/min. HT-2 toxin and other trichothecenes [Suga *et al.* 2004]. Spiked Oats and Naturally Contaminated Oats, Maize, Wheat and Barley. Column: ODS-2 C_{18} (200 × 2.1 mm i.d., 5 μm). Mobile phase: 1 mmol/L ammonium acetate : acetonitrile (80 : 20 to 0 : 100 in 5 min for 3 min to 80 : 20 for 10 min), flow rate 0.3 mL/min. APCI, positive ion mode, SIM acquisition mode. Limit of detection, 50–80 ng/g for HT-2 toxin and other type A trichothecenes [Razzazi-Fazeli *et al.* 2002]. Wheat Samples. Column: C_{18} (125 × 2.0 mm i.d., 3 μm). Mobile phase: methanol : water (25 : 75 to 2 : 98 over 12 min), flow rate 0.25 mL/min. APCI, positive ion mode, full-scan mode. Limit of quantification, 50 ppb for deoxynivalenol and neosolaniol, 100 ppb for nivalenol and 15-acetyldeoxynivalenol, 40 ppb for fusarenone-X, 25 ppb for3-acetyldeoxynivalenol, 20 ppb for diacetoxyscirpenol, 10 ppb for HT-2, 60 ppb for T-2, limit of detection, 3 ppb [Berger *et al.* 1999].

Note For a screening immunoassay for HT-2 and T-2 toxins in cereal and baby foods, see Meneely *et al.* [2010]; for ELISA assays for screening cereals and other food or fodder for mycotoxins, see Nikulin *et al.* [1996], Stratton *et al.* [1993] and Yoshizawa *et al.* [2004]. For an assessment of immunochemical methods for the analysis of trichothecene mycotoxins, see Park, Chu [1996]. For an assessment of methods for the analysis of trichothecene, see Koch [2004]. For an HPLC screening method for mycotoxins, see Kuronen [1989]. For the determination of 39 mycotoxins in wheat and maize by LC-MS, see Sulyok *et al.* [2006]. For a review of LC-MS methods of mycotoxin analysis in biological and food matrices, see Zollner, Mayer-Helm [2006]. For a purity assessment study of mycotoxin standards comparing UV, HPLC-UV, GC-ECD, GC-FID, GC-MS, LC-MS, DSC, NMR and FT-IR methods, see Krska *et al.* [2005]. For the stability of HT-2, T-2 and T-2 tetraol in blood and urine, see Pace, Matson [1988].

Disposition in the Body In humans, T-2 toxin undergoes rapid metabolism to its main metabolite HT-2 toxin. In animals, the major metabolic pathways of T-2 toxin are hydrolysis, hydroxylation, de-epoxidation and conjugation. HT-2 toxin formed from T-2 toxin then undergoes further hydroxylation to yield 3′-hydroxy-HT-2 toxin which is considered an activation pathway. T-2 toxin also undergoes metabolism to T-2 tetraol, which is an inactivation pathway [Ueno 1986; Wu *et al.* 2010]. See also T-2 toxin.

Toxicity LD_{50} in chickens (oral) 7.22 mg/kg; in guinea pigs (oral) 0.5 mg/kg; in mice (oral) 3.8 mg/kg, (IP) 6.5 mg/kg, (SC) 6.7 mg/kg; in rats: (SC) 1 mg/kg, (intracerebral) 0.052 mg/kg.

Note For toxicity data on HT-2 toxin and other mycotoxins, see Schlatter [2004], and Wu *et al.* [2010]; for reviews of trichothecene toxicology and potential effects on humans, see Pestka, Smolinski [2005], Rotter *et al.* [1996], Sudakin [2003] and Wu *et al.* [2010].

Half-life 19.6 min (after IV administration in dogs) [Sintov *et al.* 1986].

Volume of Distribution 4.47 L/kg (after IV administration in dogs) [Sintov *et al.* 1986].

Clearance 0.167 L/min/kg (after IV administration in dogs) [Sintov *et al.* 1986].

Dose For a report of the mycotoxin content of UK organic and conventional oats, see Edwards [2009]. The tolerable daily intake for the sum of HT-2 and T-2 toxins has been established as 0.06 μg/kg [Schlatter 2004]. The average daily intake of HT-2 toxin has been estimated to be 9 ng/kg [WHO/JECFA 2002]. It has been reported that the trichothecenes have been used as an agent of biological/chemical warfare ('yellow rain') [Mirocha *et al.* 1983; Rosen, Rosen 1982; Stark 2005].

Hydralazine

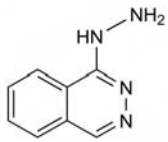
Antihypertensive

$C_8H_8N_4$ = 160.2

CAS—86-54-4

IUPAC Name 1(2*H*)-Phthalazinone hydrazone

Synonym Hydrallazine



Chemical Properties Yellow crystals. Mp 172° to 173°. Soluble 1 in 12 of warm methanol. pK_a 0.5, 7.1. Log *P* (octanol/water), 1.0.

Hydralazine Hydrochloride

$C_8H_8N_4$, HCl = 196.6

CAS—304-20-1

Synonym Apressinum

Proprietary Names *Alphapress*; *Apresolina*; *Apresolin(e)*; *Cesoline*; *Hydrapres*; *Hyperphen*; *Novo-Hylazin*; *Nu-Hydral*; *Rolazine*.

Chemical Properties A white crystalline powder. Mp 273°, with decomposition. Soluble 1 in 25 of water and 1 in 500 of ethanol; very slightly soluble in ether; practically insoluble in chloroform.

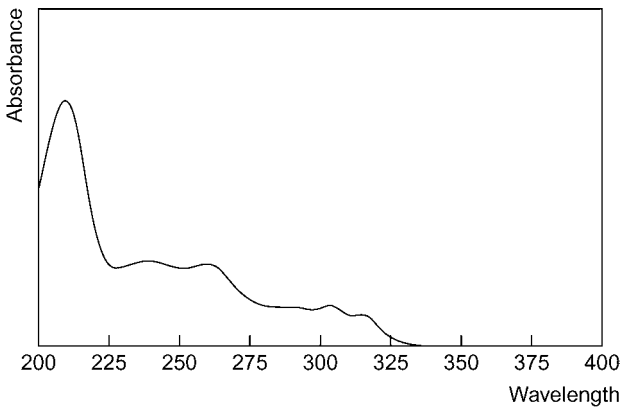
Colour Test Nessler's reagent—black.

Thin-layer Chromatography System TA—R_f 0.51; system TB—R_f 0.41; system TC—R_f 0.11; system TE—R_f 0.80; system TL—R_f 0.64; system TAE—R_f 0.73; system TAJ—R_f 0.01; system TAK—R_f 0.01; system TAL—R_f 0.25 (acidified iodoplatinate solution, positive).

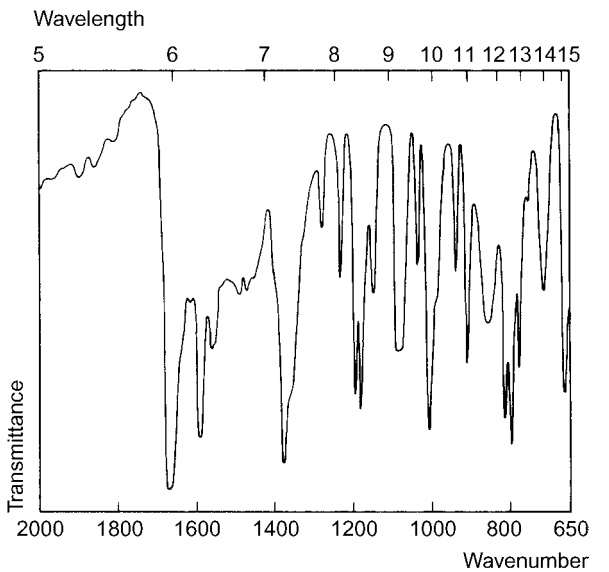
Gas Chromatography System GA—RI 1528; system GB—RI 1914.

High Performance Liquid Chromatography System HX—RI 193; system HY—RI 132; system HZ—retention time 1.9 min; system HAX—retention time 6.5 min; system HAY—retention time 3.5 min.

Ultraviolet Spectrum Water—240 (A^1_1=675a), 260 (A^1_1=675a), 304, 315 nm.

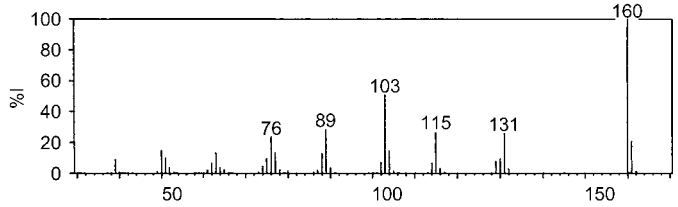


Infrared Spectrum Principal peaks at wavenumbers 1665, 790, 1582, 1000, 810, 1175 cm^{-1} (hydralazine hydrochloride, KBr disk).



H

Mass Spectrum Principal ions at *m/z* 160, 103, 89, 131, 115, 76, 161, 104.



Quantification

Blood **HPLC** Limit of detection, 300 ng/L [Semple *et al.* 1988]. UV detection. Limit of detection, 1 µg/L [Ludden *et al.* 1983].

Plasma **HPLC** Electrochemical detection [Wong *et al.* 1987]. Fluorescence detection. Limit of detection, 1 µg/L for hydralazine and 200 ng/L for hydralazine pyruvic acid hydrazone [Reece *et al.* 1980].

Note Spectrophotometric and gas chromatographic assays have been shown to be non-selective owing to interference from acid-labile hydrazones—see Reece *et al.* [1978] and Ludden *et al.* [1982].

Disposition in the Body Readily absorbed after oral administration. It undergoes first-pass acetylation, the extent of which is genetically determined. The major metabolites are: 3-methyl-1,2,4-triazolo[3,4-*a*]phthalazine (MTP—the acetylation product); hydralazine pyruvic acid hydrazone (HPH) which is the major plasma metabolite; 4-(2-acetylhydrazino)phthalazin-1-one (*N*-AcHPZ) which is the major urinary metabolite; 3-hydroxymethyl-1,2,4-triazolo[3,4-*a*]phthalazine (3-OHMTP). About 65% of a dose is excreted in the urine in 24 h. In rapid acetylators, about 30% is excreted as *N*-AcHPZ and 10 to 30% as conjugated 3-OHMTP; in slow acetylators, about 15 to 20% is excreted as *N*-AcHPZ and up to 10% as conjugated 3-OHMTP. Other metabolites include phthalazin-1-one (PZ), 1,2,4-triazolo[3,4-*a*] phthalazine (TP), 9-hydroxy-MTP, phthalazine, tetrazolo[5,1-*a*]phthalazine and hydrazones of hydralazine formed with acetone and α-ketoglutaric acid. About 10% of a dose is eliminated in the faeces.

Therapeutic Concentration

Following a single oral dose of 1 mg/kg to 4 rapid acetylators, a mean peak plasma hydralazine concentration of 0.05 mg/L was attained in 0.4 h and a mean peak plasma HPH concentration of 0.26 mg/L was attained in 0.6 h; after the same dose was given to 4 slow acetylators the corresponding peak plasma concentrations were 0.17 mg/L of hydralazine and 0.54 mg/L of HPH in 0.3 h and 1 h, respectively. [Shepherd *et al.* 1980].

Bioavailability About 30 to 35% in slow acetylators, 10 to 16% in rapid acetylators.

Half-life Plasma half-life, hydralazine 0.4 to 2 h, HPH about 4 h, MTP about 1.5 to 2 h.

Volume of Distribution About 3 to 8 L/kg.

Note For a review of the pharmacokinetics of hydralazine, see Ludden *et al.* [1982].

Dose 50 to 200 mg of hydralazine hydrochloride daily.

Ludden TM *et al.* (1982). Clinical pharmacokinetics of hydralazine. *Clin Pharmacokinet* 7: 185–205.

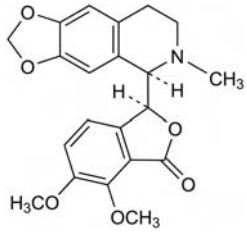
Hydrastine

Alkaloid

$C_{21}H_{21}NO_6$ = 383.4

CAS—118-08-1

IUPAC Name (3*S*)-6,7-Dimethoxy-3-[(5*R*)-5,6,7,8-tetrahydro-6-methyl-1,3-dioxolo[4,5-*g*]isoquinolin-5-yl]-1(3*H*)-isobenzofuranone



Chemical Properties An alkaloid obtained from hydrastis, the dried rhizome and roots of golden seal, *Hydrastis canadensis* (Ranunculaceae). Crystals. Mp 132°. Insoluble in water; soluble 1 in 210 of ethanol, 1 in 1 of chloroform and 1 in 245 of ether; freely soluble in acetone and benzene. pK_a 6.2 (25°). Log *P* (octanol/water), 1.9.

Hydrastine Hydrochloride

$C_{21}H_{21}NO_6$, HCl = 419.9

CAS—5936-28-7

Chemical Properties A white or creamy-white hygroscopic powder. Mp 116°. Very soluble in water and ethanol; slightly soluble in chloroform; very slightly soluble in ether.

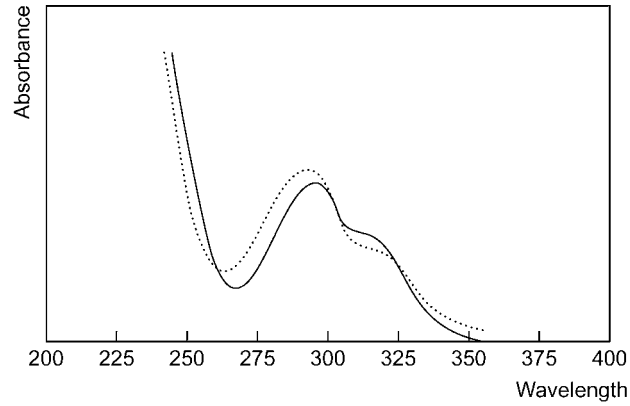
Colour Tests Liebermann's reagent—green; Mandelin's test—red-brown→red.

Thin-layer Chromatography System TA—R_f 0.61; system TB—R_f 0.15; system TC—R_f 0.64; system TE—R_f 0.71; system TL—R_f 0.52; system TAE—R_f 0.59; system TAF—R_f 0.57 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 2988.

High Performance Liquid Chromatography System HY—RI 280.

Ultraviolet Spectrum Aqueous acid—294 nm (A^{1}_{1}=195b); aqueous alkali—292 nm.



Infrared Spectrum Principal peaks at wavenumbers 1760, 1501, 1037, 1260, 1020, 1111 cm^{-1} (KBr disk).

Dose Hydrastine hydrochloride was formerly given in doses of 15 to 60 mg.

Hydrastinine

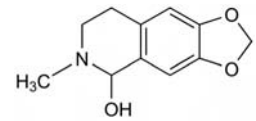
Alkaloid

$C_{11}H_{13}NO_3$ = 207.2

CAS—6592-85-4

IUPAC Name 6-Methyl-7,8-dihydro-5*H*-[1,3]dioxolo[4,5-g]isoquinolin-5-ol

Synonym 5,6,7,8-Tetrahydro-6-methyl-1,3-dioxolo[4,5-*g*]isoquinolin-5-ol



Chemical Properties An alkaloid produced by oxidation of hydrastine. A white crystalline substance. Mp 117°. Moderately soluble in hot water; freely soluble in ethanol, chloroform, dilute acids and ether. Log *P* (octanol/water), 1.9.

Hydrastinine Hydrochloride

$C_{11}H_{11}NO_2$, HCl = 225.7

CAS—4884-68-8

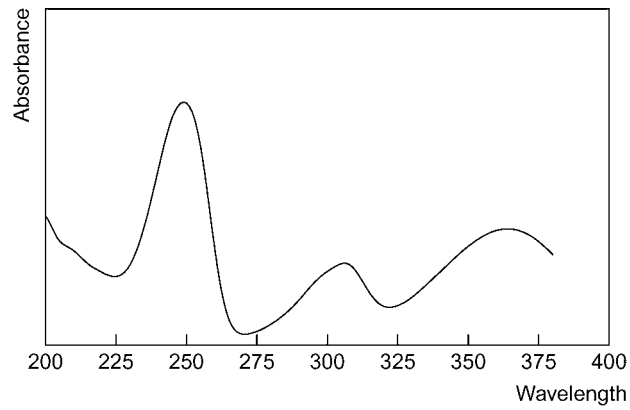
Chemical Properties Pale yellow crystals or crystalline powder. Mp 212°, with decomposition. Very soluble in water and ethanol; sparingly soluble in chloroform and ether. Solutions in water show a blue fluorescence.

Colour Test Mandelin's test—orange→green.

Thin-layer Chromatography System TA—R_f 0.00; system TB—R_f 0.46; system TC—R_f 0.00; system TE—R_f 0.37; system TL—R_f 0.00; system TAE—R_f 0.01; system TAF—R_f 0.15 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 1590.

Ultraviolet Spectrum Aqueous acid—249, 306, 363 nm.

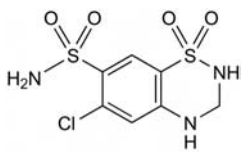


Infrared Spectrum Principal peaks at wavenumbers 1235, 1032, 1499, 925, 1075, 934 cm^{-1} (KBr disk).
Dose Hydrastinine hydrochloride was formerly given in doses of 15 to 60 mg as a cardiotonic.

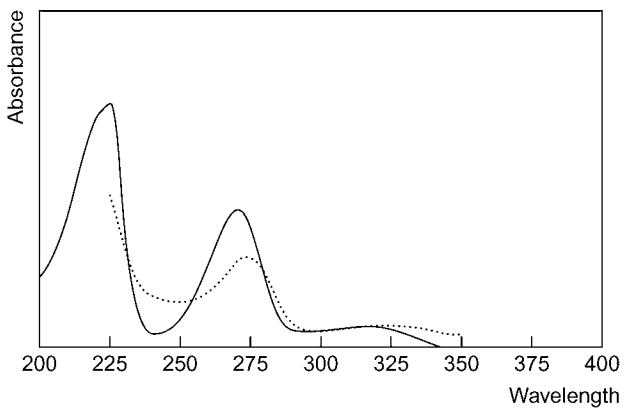
Hydrochlorothiazide

Diuretic
$C_7H_8ClN_3O_4S_2 = 297.7$
CAS—58-93-5

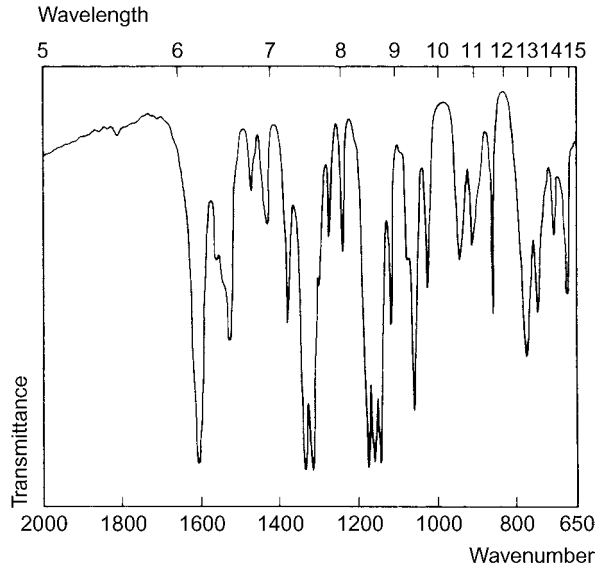
IUPAC Name 6-Chloro-3,4-dihydro-2*H*-1,2,4-benzothiadiazine-7-sulfonamide 1,1-dioxide
Synonyms Chlorosulthiadil; hidroclorotiazida; hydrochlorothiazidum.
Proprietary Names *Acuretic*; *Apo-Hydro*; *Clorana*; *Dichlotride*; *Diclotride*; *Didralin*; *Di-Ertride*; *Direma*; *Disalunil*; *Disothiazide*; *Dithiazid*; *Diuret-P*; *Diurezin*; *Drenol*; *Esidrex*; *Esidrix*; *Hidrosaluretil*; *Hydrex*; *Hydro-Aquil*; *HydroDiuril*; *HydroSaluric*; *Hydro-Z*; *Hydrozide*; *Novo-Hydrazide*; *Microzide*; *Mictrin*; *Oretic*; *Servithiazid*; *Thiuretic*.



Chemical Properties Hydrochlorothiazide is an ingredient of many proprietary preparations—see Sweetman [2009]. A white crystalline powder. Mp 273° to 275°. Practically insoluble in water, chloroform and ether; soluble 1 in 200 of ethanol and 1 in 20 of acetone; freely soluble in dimethylformamide and solutions of alkali hydroxides. pK_a 7.0, 9.2. Log *P* (octanol/water), −0.1. Extraction yield (chlorobutane), 0 [Demme *et al.* 2005].
Colour Tests Chromotropic acid—violet, after dilution; Koppanyi–Zwikker test—violet; Liebermann's reagent—blue-green.
Thin-layer Chromatography System TD—R_f 0.04; system TE—R_f 0.34; system TF—R_f 0.34; system TAD—R_f 0.11; system TAE—R_f 0.78; system TAJ—R_f 0.09; system TAK—R_f 0.00; system TAL—R_f 0.40 (mercuric chloride–diphenylcarbazone reagent, positive).
Gas Chromatography System GA—hydrochlorothiazide, not eluted; hydrochlorothiazide-Me_4 RI 2966; system GX—hydrochlorothiazide-Me_4 retention time 9.0 min; system GY—hydrochlorothiazide-Me_4 retention time 5.0 min.
High Performance Liquid Chromatography System HN—*k* 0.70; system HX—RI 294; system HY—RI 255; system HZ—retention time 2.2 min; system HAX—retention time 5.1 min; system HAY—retention time 4.0 min.
Ultraviolet Spectrum Aqueous acid—272 (A_1^1=644a), 318 nm; aqueous alkali—274 (A_1^1=520a), 324 nm.



Infrared Spectrum Principal peaks at wavenumbers 1318, 1180, 1150, 1168, 1602, 1060 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 269, 205, 221, 297, 271, 62, 285, 124.
