Disposition in the Body Betaxolol is completely absorbed after oral administration. Administration with food does not affect the rate or extent of absorption. The primary route of elimination is hepatic metabolism and urinary excretion. About 15% of a dose is excreted in urine as the unchanged drug but the majority is oxidatively metabolised to inactive and weakly active metabolites, including α-hydroxybetaxolol. There are no active metabolites of clinical importance. It has high lipid solubility and crosses the placenta. It is distributed into breast milk where higher concentrations have been achieved than in maternal blood. It is not removed by dialysis.

Therapeutic Concentration The serum therapeutic concentration range is 5 to 50 µg/L.

Six healthy male and female volunteers, aged between 20 and 25 years, were administered with a 20-mg oral dose of betaxolol after a light breakfast and moderate exercise. The peak plasma concentrations were between 48 and 75 µg/L 2 to 4 h after administration. The drug could be measured up to 25 h after administration in all the subjects [Giudicelli *et al.* 1980].

Bioavailability Oral, 80 to 90%.

Half-life Plasma, 14 to 22 h.

Volume of Distribution 8 L/kg; reported as 4.9, 6.0 and 9.8 L/kg for single doses and 7.7 to 8.8 L/kg for repeated doses.

Clearance Plasma, 0.28 L/h/kg.

Protein Binding 55%.

Note For a review of betaxolol, see Beresford and Heel [1986].

Dose Usually 10 to 20 mg daily.

Bethanechol Chloride

Parasympathomimetic

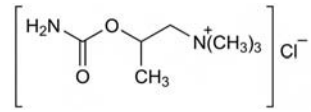
$C_7H_{17}ClN_2O_2$ = 196.7

CAS—674-38-4 (bethanechol); 590-63-6 (chloride)

IUPAC Name 2-[(Aminocarbonyl)oxy]-*N*,*N*,*N*-trimethyl-1-propanaminium chloride

Synonym Carbamylmethylcholine chloride

Proprietary Names *Duvoid*; *Mechothane*; *Myotonachol*; *Myotonine Chloride*; *Urecholine*; *Urocarb*; *Vesicholine*.

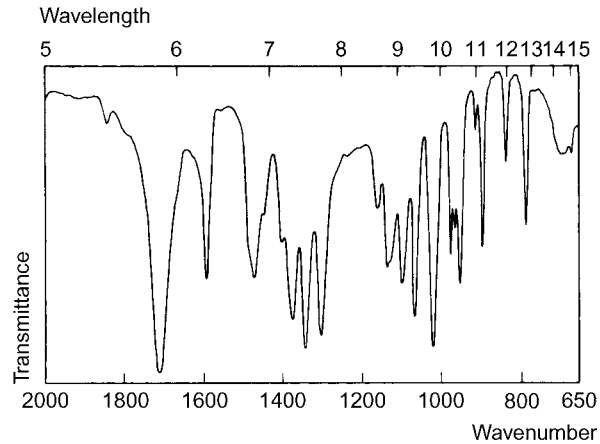


Chemical Properties Colourless or white hygroscopic crystals, or white crystalline powder. Mp 211°. Soluble 1 in 0.6 of water and 1 in 10 of ethanol, less soluble in dehydrated alcohol; practically insoluble in chloroform and ether. Log *P* (octanol/water), −3.4.

Thin-layer Chromatography System TA—R_f 0.02 (acidified iodoplatinate solution, positive).

Ultraviolet Spectrum No significant absorption, 230 to 360 nm.

Infrared Spectrum Principal peaks at wavenumbers 1712, 1014, 1300, 1062, 1094, 946 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 43, 58, 42, 143, 85, 171, 157, 102.

Dose 15 to 200 mg daily.

Bethanidine

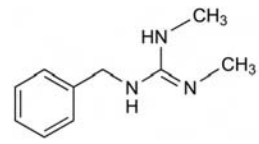
Antihypertensive

$C_{10}H_{15}N_3$ = 177.2

CAS—55-73-2

IUPAC Name *N*,*N*′-Dimethyl-*N*″-(phenylmethyl)guanidine

Synonym Betanidine



Chemical Properties Crystals. Mp 195° to 197°. pK_a 12 (20°). Log *P* (octanol/water), 1.6.

Bethanidine Sulfate

$(C_{10}H_{15}N_3)_2,H_2SO_4$ = 452.6

CAS—114-85-2

Proprietary Names *Esbaloid*; *Esbatal*; *Regulin*.

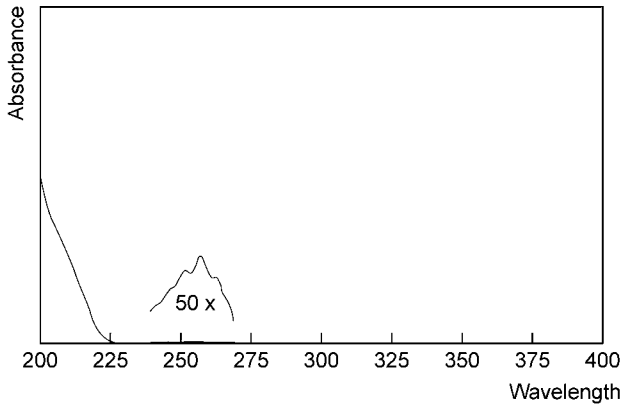
Chemical Properties A white crystalline powder. Mp about 280°. Soluble 1 in 1 of water and 1 in 30 of ethanol; practically insoluble in ether.

Colour Tests Liebermann's reagent—orange→brown; Marquis test—orange-red.

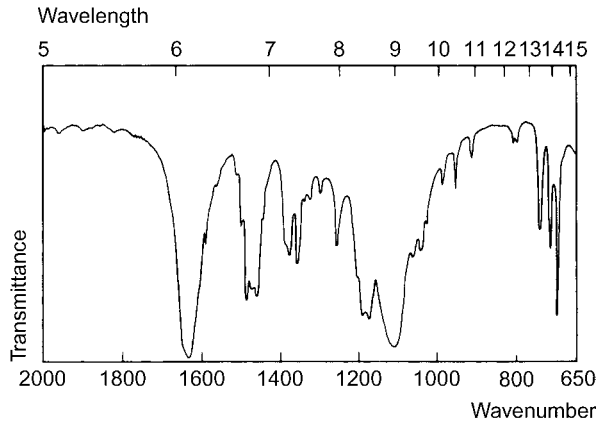
Thin-layer Chromatography System TA—R_f 0.01; system TB—R_f 0.00; system TC—R_f 0.00 (Dragendorff spray, positive).

Gas Chromatography System GA—RI 1925.

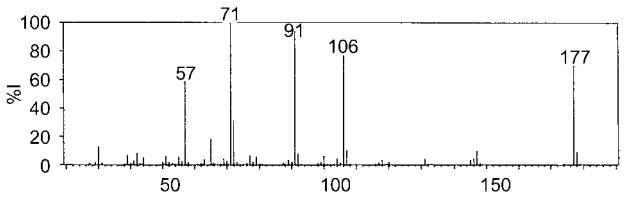
Ultraviolet Spectrum Aqueous acid—252, 258 (A^1_1=11a), 264 nm. No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1630, 1111, 1174, 701, 1192, 1066 cm^{-1} (bethanidine sulfate, KBr disk).



Mass Spectrum Principal ions at *m/z* 71, 91, 106, 177, 57, 72, 65, 30.



Quantification

Plasma **GC–MS** Limit of detection, 1 µg/L for guanethidine and other guanido-containing drugs [Hengstmann *et al.* 1974].

HPLC UV detection. Limit of detection, 20 µg/L [Shipe *et al.* 1983].

Spectrofluorimetry Limit of detection, 4 µg/L [Corder *et al.* 1975].

Urine **GC–MS** Limit of detection, 1 µg/L for guanethidine and other guanido-containing drugs [Hengstmann *et al.* 1974].

Disposition in the Body Bethanidine is readily but incompletely absorbed after oral administration. It does not appear to be metabolised. After an IV dose, about 90% is excreted unchanged in the urine in 3 to 4 days; after an oral dose, 50 to 85% is excreted in the urine and up to about 50% is eliminated in the faeces.

Therapeutic Concentration In plasma, usually in the range 0.02 to 0.5 mg/L. After a single oral dose of 10 mg to 3 subjects, peak plasma concentrations of about 0.02 to 0.15 mg/L were attained in 2 h [Corder *et al.* 1975].

After daily oral administration of 30 to 150 mg in divided doses to 12 subjects, steady-state plasma concentrations of 0.02 to 0.5 (mean 0.12) mg/L were reported [Corder *et al.* 1978].

Half-life The plasma half-life is multiphasic and there is considerable intersubject variation; after IV administration, plasma half-lives of about 2 to 6 h and terminal half-lives of several days have been reported.

Protein Binding Not significantly bound.

Dose 20 to 200 mg of bethanidine sulfate daily.

Corder CN *et al.* (1975). Fluorometric assay of bethanidine in plasma. *J Pharm Sci* 64: 785–788.

Corder CN *et al.* (1978). Bethanidine dose, plasma levels, and antihypertensive effects. *J Clin Pharmacol* 18: 249–258.

Hengstmann JH *et al.* (1974). Quantitative determination of guanethidine and other guanido-containing drugs in biological fluids by gas chromatography with flame ionization detection and multiple ion detection. *Anal Chem* 46: 34–39.

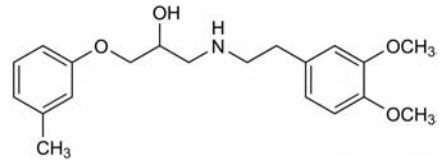
Bevantolol

β-Blocker

$C_{20}H_{27}NO_4$ = 345.4

CAS—59170-23-9

IUPAC Name 1-[[2-(3,4-Dimethoxyphenyl)ethyl]-amino]-3-(3-methylphenoxy)-2-propanol



Chemical Properties pK_a 8.1. Log *P* (octanol/water), 3.0; (pH 7), 13.0.

Bevantolol Hydrochloride

$C_{20}H_{28}ClNO_4$ = 381.9

CAS—42864-78-8

Synonyms CI-775; NC-1400.

Proprietary Names *Ranestol*; *Sentiloc*; *Vantol*.

Chemical Properties Mp 137° to 138°. Water solubility is 184.3 mg/L (25°).

High Performance Liquid Chromatography System HZ—retention time 4.2 min.

Column: Partisil RAC II (100 × 4.6 mm, 5 µm). Mobile phase: 75 mmol/L dibasic ammonium phosphate buffer (pH 3.5) : acetonitrile (50:50), flow rate 2.0 mL/min. UV detection (λ=220 nm). Retention time: (+)-bevantolol, 7.4 min; (−)-bevantolol, 6.4 min [Rose, Randinitis 1991].

Quantification

Plasma **HPLC** Column: ODS-2 Spherisorb (5 µm). Mobile phase: 0.5 mol/L phosphate buffer (pH 3.5) : acetonitrile : methanol (50:30:20). Fluorescence detection. Retention time: 3.0 min [Nattel *et al.* 1987]. Column: LC-CN Supelcosil (250 × 4.6 mm i.d. 5 µm). Mobile phase: 0.01 mol/L ammonium acetate buffer (pH 3.5) : acetonitrile : methanol (70:20:10), flow rate 1.0 mL/min. UV detection (λ=205 nm). Retention time: 9.6 min. Limit of detection, 0.05 mg/L. Limit of detection, 0.026 mg/L [Selen *et al.* 1986].

Disposition in the Body Bevantolol is virtually completely absorbed (>85%) and undergoes moderate first pass metabolism. It is extensively metabolised to 4 metabolites; the principal metabolite makes up 16% of the dose and 3 minor metabolites in trace amounts. It is excreted in urine (72%) mostly as metabolites and small amounts of the unchanged drug (<10%). It is also excreted in faeces (~12%).

Therapeutic Concentration

Twelve healthy volunteers (11 women and 1 man) with a mean age of 37 years, were administered with a single 100-mg dose of bevantolol in a fasting state, 15 min before a meal or after a meal. The mean peak plasma concentrations observed were 1.05, 1.06 and 0.92 mg/L, respectively, and these levels were reached at ~1.0, 0.9 and 1.8 h [Toothaker *et al.* 1987].

Bioavailability 60%.

Half-life 1.5 to 2 h.

Volume of Distribution Approximately, 1.5 L/kg.

Protein Binding 95 to 98% bound especially to plasma glycoproteins.

Dose The usual dose of 150 to 400 mg is administered daily.

Bezafibrate

Lipid-Regulating Agent

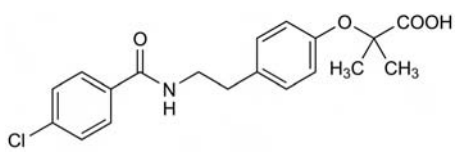
$C_{19}H_{20}ClNO_4$ = 361.8

CAS—41859-67-0

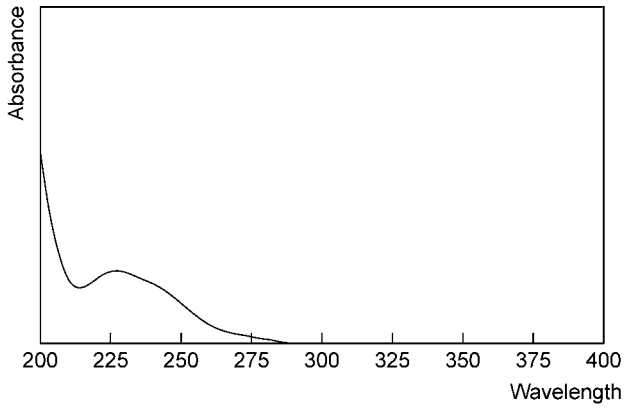
IUPAC Name 2-[4-[2-[(4-Chlorobenzoyl)amino]ethyl]phenoxy]-2-methylpropanoic acid

Synonym BM-15075

Proprietary Names *Bezalip*; *Cedur*.



Chemical Properties An off-white crystalline powder. Mp 183° to 186°. Practically insoluble in water; slightly soluble in ethanol, acetone and methanol; soluble in dimethylformamide. Log *P* (octanol/water), 4.2.
Thin-layer Chromatography System TF—R_f 0.00; system TAE—R_f 0.89.
Gas Chromatography System GA—RI 3100.
High Performance Liquid Chromatography System HX—RI 513; system HAA—retention time 18.3 min.
Ultraviolet Spectrum Methanol—230 nm (A^1_1=644b).



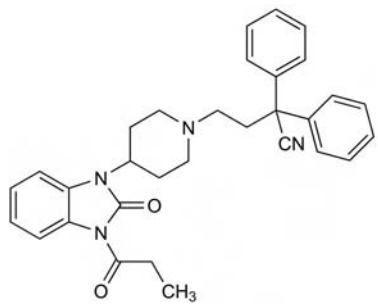
Infrared Spectrum Principal peaks at wavenumbers 1715, 1540, 1610, 1140, 1500, 1220 cm^{-1} (KBr disk).
Quantification
Plasma **HPLC** UV detection (λ=232 nm). Limit of quantification, 0.25 mg/L [Masnatta *et al.* 1996].
Dose 400 to 600 mg daily.

Masnatta LD *et al.* (1996). Determination of bezafibrate, ciprofibrate and fenofibric acid in human plasma by high-performance liquid chromatography. *J Chromatogr B Biomed Sci Appl* 687(2): 437–442.

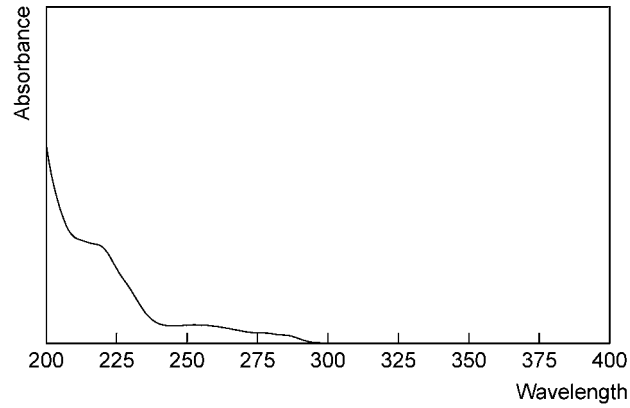
Bezitramide

Narcotic Analgesic
$C_{31}H_{32}N_4O_2$ = 492.6
CAS—15301-48-1

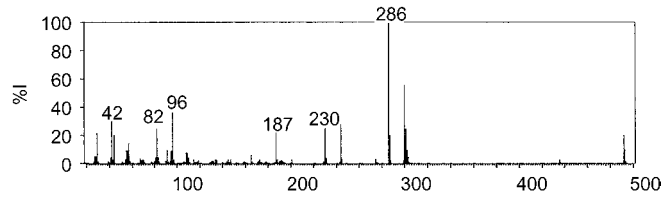
IUPAC Name 1-[1-(3-Cyano-3,3-diphenylpropyl)-4-piperidinyl]-1,3-dihydro-3-(1-oxopropyl)-2*H*-benzimidazol-2-one
Synonyms Benzitramide; R-4845.
Proprietary Name *Burgodin*



Chemical Properties A white, amorphous or crystalline powder. Mp 145° to 149°. Practically insoluble in water and ethanol; soluble 1 in 45 of acetone, 1 in 2 of chloroform, and 1 in 400 of ether. Log *P* (octanol/water), 4.8.
Colour Test Mandelin's test—violet→orange.
Thin-layer Chromatography System TA—R_f 0.71; system TB—R_f 0.41; system TC—R_f 0.79; system TL—R_f 0.70; system TAE—R_f 0.92; system TAF—R_f 0.96 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—not eluted.
High Performance Liquid Chromatography System HA—*k* 0.2; system HX—RI 564; system HZ—retention time 22.5 min.
Ultraviolet Spectrum After solution in chloroform and dilution with acid isopropyl alcohol—251 nm (A^1_1=118b), inflexion at 274 nm.



Infrared Spectrum Principal peaks at wavenumbers 1733, 755, 1708, 700, 1286, 1054 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 286, 300, 96, 42, 244, 230, 301, 82.



Quantification
Blood **LC-MS**. Column: Hypersil ODS (5 microm). Mobile phase: 1.0 mmol/L ammonium acetate: methanol- acetonitrile (50:50): 1.0 mmol/L ammonium acetate (80:20). ESI, SRM acquisition mode. Limit of detection, 1 microg/L [De Baere *et al.* 1999].
HPLC Fluorescence detection. Limit of detection, 1 µg/L [De Baere *et al.* 1997].
Urine **GC** NPD. Limit of quantification, 10 µg/L [De Baere *et al.* 1998]. NPD. Limit of quantification, 10 µg/L for acidic metabolite [De Baere *et al.* 1996]. AFID. Limit of detection, 600 µg/L for 3-cyano-3,3-diphenylpropionic acid [van Rooy *et al.* 1978].

HPLC Fluorescence detection. Limit of detection, 1 µg/L [De Baere *et al.* 1997]. UV detection. Limit of detection, 150 µg/L for 1,3-dihydro-1-(piperidin-4-yl)benzimidazol-2-one [van Rooy, Soe-Agnie 1978].
Bile **LC-MS** See Blood [De Baere *et al.* 1999].
Kidneys **LC-MS** See Blood [De Baere *et al.* 1999].
Liver **LC-MS** See Blood [De Baere *et al.* 1999].
Stomach contents **LC-MS** See Blood [De Baere *et al.* 1999].
Disposition in the Body Absorbed after oral administration. It is metabolised by hydrolysis to 3-cyano-3,3-diphenylpropionic acid and 1,3-dihydro-1-(piperidin-4-yl)benzimidazol-2-one which are excreted in the urine.
Therapeutic Concentration
Following a single oral dose of 5 mg to 7 subjects, peak plasma concentrations (bezitramide plus major metabolite) of about 5 µg/L were attained in about 3 h; in 3 of the subjects, plasma concentrations remained fairly constant over a period of 7 h; in a further 2 subjects, distinct secondary peak plasma concentrations were observed [Meijer *et al.* 1984].
Dose Bezitramide has been given in doses of 5 mg; maximum of 30 mg in 24 h.

De Baere SM *et al.* (1996). Quantitative gas chromatographic analysis of 3-cyano-3,3-diphenylpropionic acid, the acidic metabolite of bezitramide (Burgodin), in urine. *J Anal Toxicol* 20(3): 159–164.

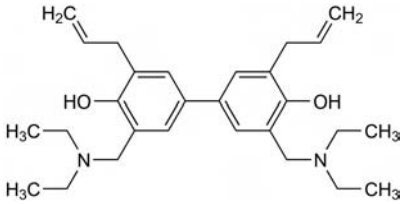
Bialamicol

Antiamoebic
$C_{28}H_{40}N_2O_2$ = 436.6
CAS—493-75-4

IUPAC Name 3,3′-Bis[(diethylamino)methyl]-5,5′-di-2-propenyl-[1,1′-biphenyl]-4,4′-diol
Synonyms Biallylamicol; biethylamicol.

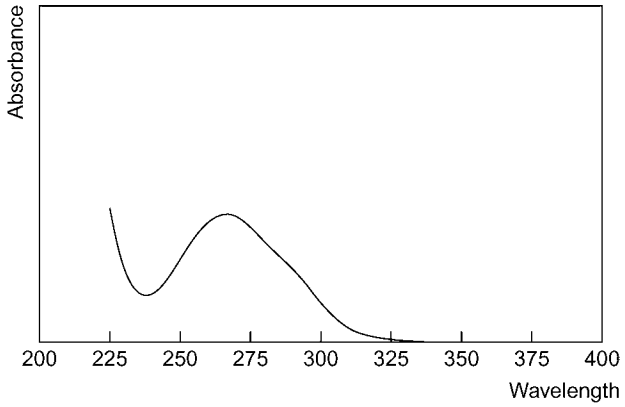


Chemical Properties Log *P* (octanol/water), 7.0.

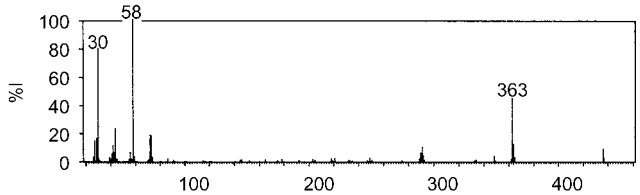
Bialamicol Hydrochloride

$C_{28}H_{40}N_2O_2$,2HCl = 509.6
CAS—3624-96-2
Proprietary Name *Camoform*
Chemical Properties A white crystalline powder. Mp 209° to 210°. Soluble 1 in 5 of water, 1 in 40 of ethanol and 1 in 150 of chloroform; slightly soluble in ether.

Colour Tests Folin-Ciocalteu reagent—blue; Liebermann's reagent—green. Dissolve 100 mg in 2 mL of water and add 2 mL of nitric acid—intense orange-red.
Thin-layer Chromatography System TA—R_f 0.74; system TB—R_f 0.62; system TC—R_f 0.80; system TL—R_f 0.73.
Ultraviolet Spectrum Aqueous acid—266 nm (A^1_1=440a).



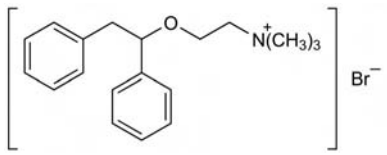
Mass Spectrum Principal ions at *m/z* 58, 30, 363, 44, 72, 29, 27, 364.



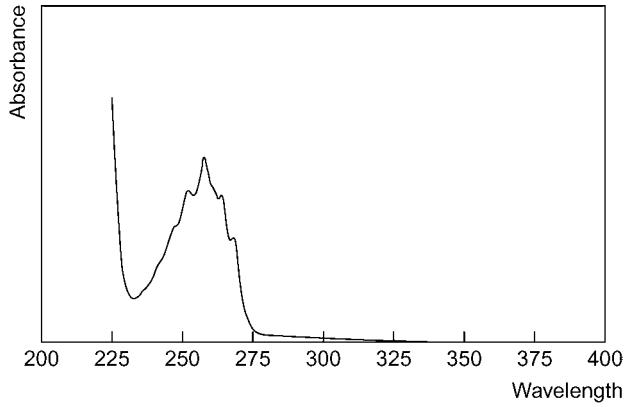
Disposition in the Body Bialamicol is rapidly absorbed from the gastrointestinal tract and stored in high concentrations in the liver, lungs and tissues. Slowly excreted in the bile and eliminated in the faeces.
Dose Bialamicol hydrochloride has been given in doses of 0.75 to 1.5 g daily.

Bibenzonium Bromide

Cough Suppressant
$C_{19}H_{26}BrNO$ = 364.3
CAS—59866-76-1 (bibenzonium); 15585-70-3 (bromide)
IUPAC Name 2-(1,2-Diphenylethoxy)-*N*,*N*,*N*-trimethylethanaminium bromide
Synonym Diphenetholine bromide
Proprietary Name *Lysobex*, *Medipectol*, *Thoragol*.



Chemical Properties Crystals. Mp 142° to 144°. Very soluble in water and ethanol; practically insoluble in benzene and in ether. Log *P* (octanol/water), 0.6.
Colour Tests The following tests are performed on bibenzonium nitrate: Mandelin's test—green; Marquis test—brown.
Thin-layer Chromatography System TA—R_f 0.02 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1923.
Ultraviolet Spectrum Aqueous acid—253, 258 (A^1_1=11.4b), 264, 268 nm.

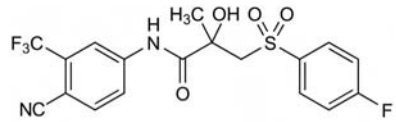


Infrared Spectrum Principal peaks at wavenumbers 705, 1095, 749, 759, 1020, 952 cm^{-1} (KBr disk).
Dose 40 to 120 mg daily.

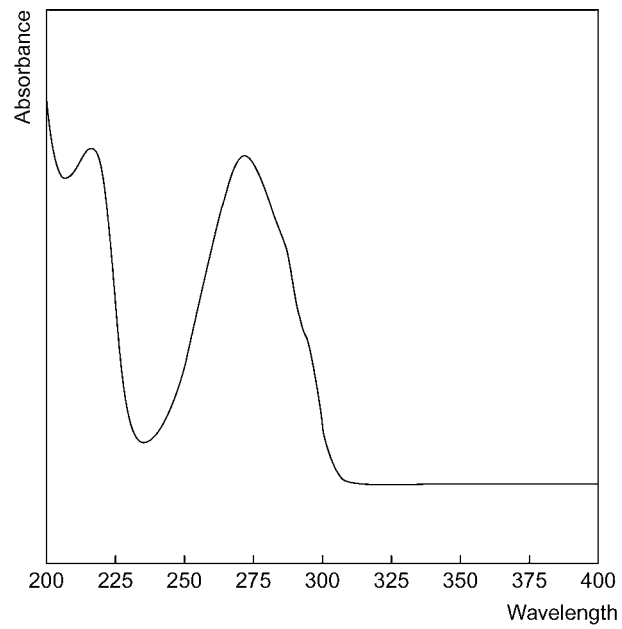
Bicalutamide

Antiandrogen, Antineoplastic
$C_{18}H_{14}F_4N_2O_4S$ = 430.4
CAS—90357-06-5

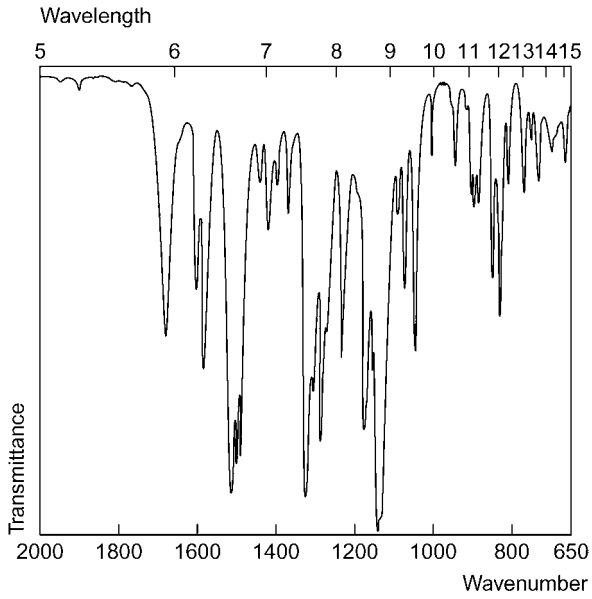
IUPAC Name (*RS*)-*N*-[4-Cyano-3-(trifluoromethyl)phenyl]-3-[(4-fluorophenyl)sulfonyl]-2-hydroxy-2-methylpropanamide
Synonym ICI-176334
Proprietary Names *Casodex*; *Cosudex*.



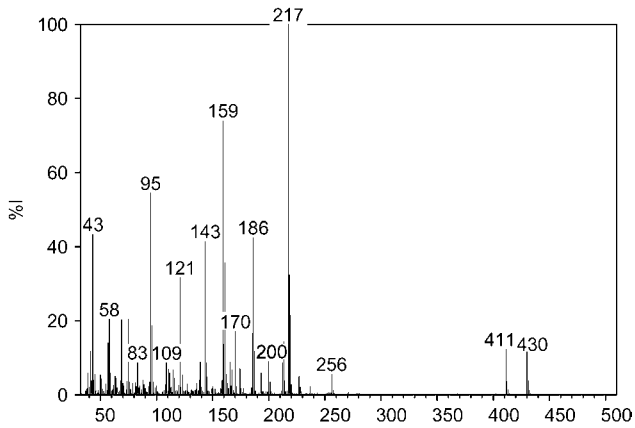
Chemical Properties A fine white to off-white powder. Mp 191° to 193°. It is practically insoluble in water (solubility in aqueous solution is 5 mg/L); slightly soluble in chloroform and anhydrous ethanol; sparingly soluble in methanol; soluble in acetone and in tetrahydrofuran. pK_a 12.
Ultraviolet Spectrum Aqueous acid (pH 4.0)—217, 272 nm.



Infrared Spectrum



Mass Spectrum Principal ions at *m/z* 217, 159, 95, 43, 186, 143, 160, 218.



Quantification

Plasma **HPLC** Limit of detection, 5 µg/L for (*R*)-bicalutamide, 3.8 µg/L for (*S*)-bicalutamide [Cockshott *et al.* 1997]. UV detection (λ=270 nm). Limit of quantification, 7.9 µg/L for (*R*)-bicalutamide, 7.6 µg/L for (*S*)-bicalutamide [McKillop *et al.* 1993].

Disposition in the Body Bicalutamide is extensively absorbed after oral administration and undergoes extensive metabolism in the liver; the active *R*-enantiomer is metabolised predominantly by oxidation, the inactive *S*-enantiomer primarily by glucuronidation. The drug is rapidly cleared and the metabolites are excreted in approximately equal amounts in urine and faeces. Approximately half of an administered dose is excreted in urine as the glucuronide conjugates of the drug and its metabolite, hydroxy-bicalutamide. The remainder is detected in faeces as the drug and metabolite. Bicalutamide is not removed in significant amounts by dialysis.

Therapeutic Concentration

Fifteen healthy males, aged 36 to 54 years (mean, 44 years), were administered with a 50 mg single dose after an overnight fast and a standard high-fat cooked breakfast. The mean peak plasma (*R*)-enantiomer concentrations were 836 µg/L for those administered the drug with food and 734 µg/L for those in the fasting state. These concentrations were observed at 15.8 and 23.4 h, respectively. For the (*S*)-enantiomer, the peak concentrations were 100.2 µg/L at 20.8 h for the fed individuals and 84 µg/L for those who were being fasted, observed at 20.7 h [Cockshott *et al.* 1997].

Toxicity Hepatic failure has occurred rarely and consideration should be given to periodic liver function monitoring.

Half-life Plasma, *R*-enantiomer, 5.8 days to 1 week; the *S*-enantiomer is cleared more rapidly.

Clearance Plasma, 0.32 L/h (*R*-enantiomer).

Protein Binding Racemate, 96%; *R*-enantiomer, >99%.

Note For a review of the pharmacokinetics of bicalutamide, see Mahler *et al.* [1998].

Dose Up to 150 mg daily.

Cockshott ID *et al.* (1997). The effect of food on the pharmacokinetics of the bicalutamide ('Casodex') enantiomers. *Biopharm Drug Dispos* 18(6): 499–507.

Biperiden

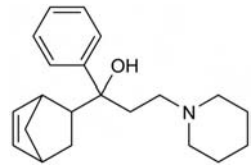
Anticholinergic

$C_{21}H_{29}NO$ = 311.5

CAS—514-65-8

IUPAC Name α-Bicyclo[2.2.1]hept-5-en-2-yl-α-phenyl-1-piperidinepropanol

Proprietary Name *Roloken*



Chemical Properties A white crystalline powder. Mp 101°. Practically insoluble in water; slightly soluble in ethanol; readily soluble in methanol. Log *P* (octanol/water), 4.25. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Biperiden Hydrochloride

$C_{21}H_{29}NO,HCl$ = 347.9

CAS—1235-82-1

Proprietary Names *Akineton (tablets)*; *Akinophyl*; *Dekinet*; *Ipsatol*; *Norakin N*.

Chemical Properties A white crystalline powder. Mp 238°. Slightly soluble in water, ethanol, chloroform, and ether; sparingly soluble in methanol.

Biperiden Lactate

$C_{21}H_{29}NO,C_3H_6O_3$ = 401.5

CAS—7085-45-2

Proprietary Names *Akineton (injection)*; *Dekinet*; *Ipsatol*.

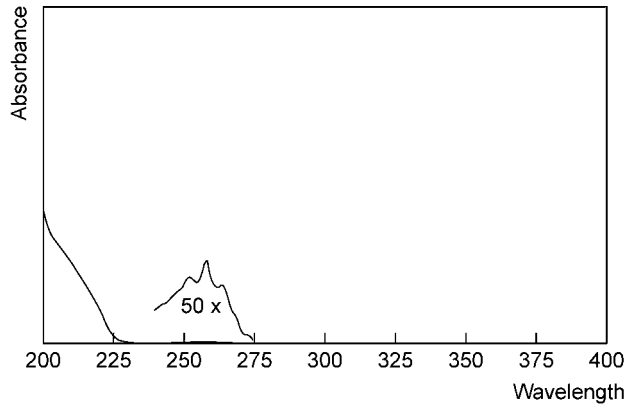
Colour Tests Liebermann's reagent—brown; Marquis test—red-brown; sulfuric acid—orange-brown.

Thin-layer Chromatography System TA—R_f 0.64; system TB—R_f 0.68; system TC—R_f 0.64; system TE—R_f 0.83; system TL—R_f 0.64; system TAE—R_f 0.45; system TAJ—R_f 0.37; system TAK—R_f 0.12; system TAL—R_f 0.73 (acidified iodoplatinate solution, positive).

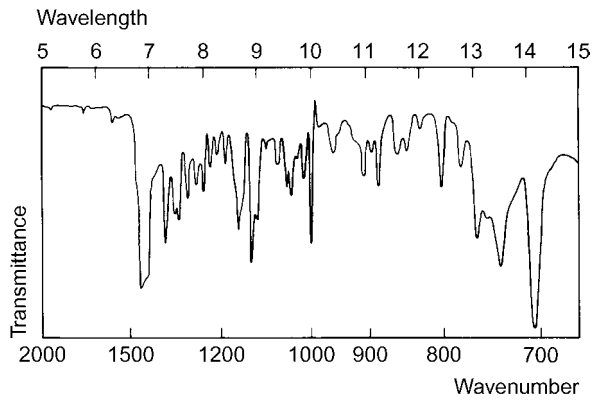
Gas Chromatography System GA—biperiden RI 2276, M (OH-) RI 2645.

High Performance Liquid Chromatography System HZ—retention time 6.4 min; system HAA—retention time 14.8 min.

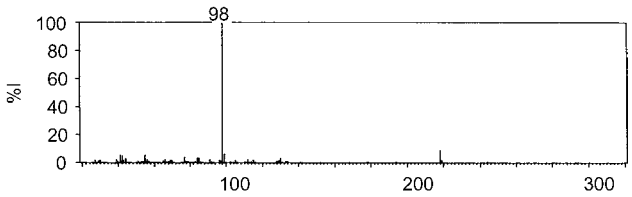
Ultraviolet Spectrum Aqueous acid—252, 259 (A^1_1=5.6b), 264 nm.



Infrared Spectrum Principal peaks at wavenumbers 702, 735, 1121, 997, 760, 1153 cm^{-1} (Nujol mull).



Mass Spectrum Principal ions at *m/z* 98, 218, 99, 55, 41, 42, 77, 84.



Quantification
Plasma **GC** AFID. Limit of quantification, 250 ng/L [Le Bris, Brode 1985].
Disposition in the Body Rapidly absorbed after oral administration.
Therapeutic Concentration
Following a single oral dose of 4 mg to 6 subjects, peak plasma concentrations of 4 to 6 µg/L were attained in 1.5 h [Hollman *et al.* 1984].
Toxicity For a summary of fatalities caused by anticholinergics in Norway, see Gjerden *et al.* [1998].
Bioavailability About 30%.
Half-life Plasma half-life, about 18 h.
Clearance 146 L/h (oral).
Dose 2 to 12 mg of biperiden hydrochloride daily, by mouth. Biperiden lactate is given parenterally in doses of 5 to 20 mg daily.

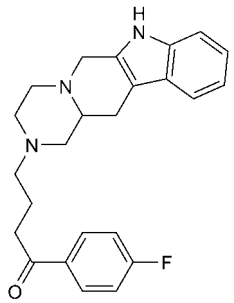
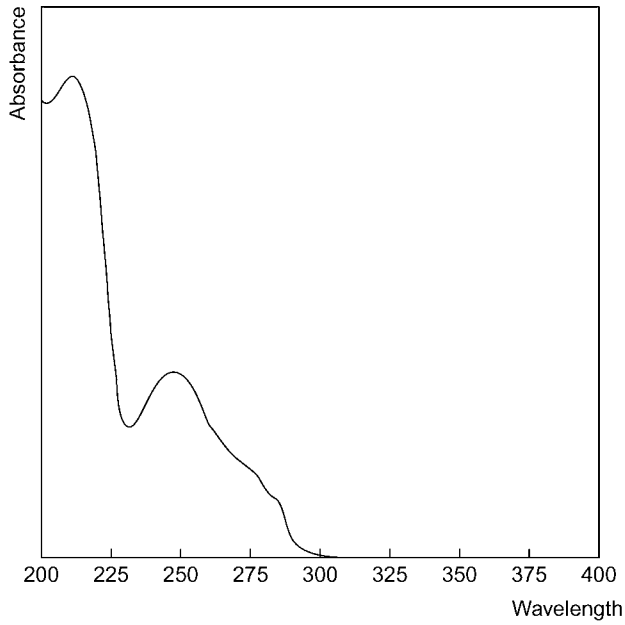
Biriperone

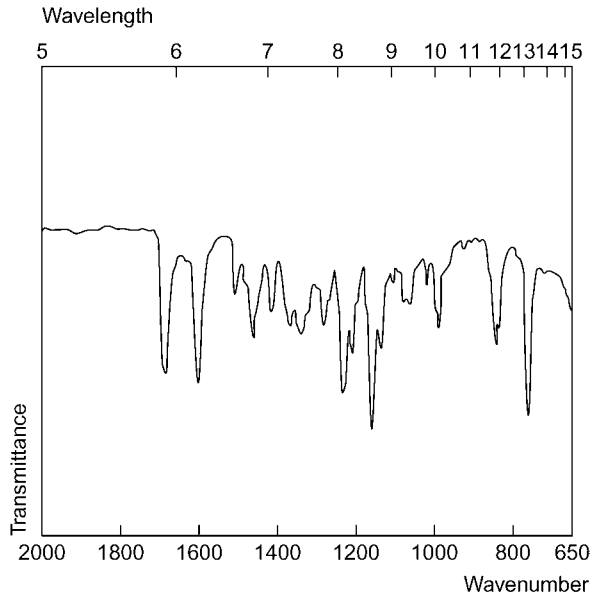
Antipsychotic
$C_{24}H_{26}FN_3O = 391.5$
CAS—41510-23-0
Synonyms Centbutindole; 2-γ-[(*p*-fluorobenzoyl)propyl]-1,2,3,4,6,7,12,12a-octahydropyrazino[2′,1′:6,1]pyrido[3,4-b]indole.
Proprietary Names *Biriperona*; *Biriperonum*.



Chemical Properties Faint-yellow, odourless powder. Mp 184° to 186°. Soluble in methanol, ethanol, isopropanol, *n*-butanol, acetone and dilute acids; practically insoluble in *n*-hexane, cyclohexane, propylene glycol and glycerol.
Thin-layer Chromatography Plate: neutral alumina (20% Gypsum) (6 g) (5 × 20 cm). Mobile phase: chloroform : methanol (99 : 1). Detection by exposure to iodine vapour or by spraying with Dragendorff reagent. R_f 0.48.
Plates: silica gel GF_{254} (4G) (10 × 20 cm). Mobile phase: chloroform : methanol (19 : 1). Detection as above. R_f 0.25 [Seth, Sarin 1989].
High Performance Liquid Chromatography Column: Nucleosil Cyano (200 × 4 mm i.d., 5 µm). Mobile phase: acetonitrile : 20 mmol/L potassium dihydrogen phosphate : 0.3 mmol/L orthophosphoric acid (pH 2.3; 20 : 70 : 10), flow rate 1.0 mL/min. UV detection (λ = 220 nm). Retention time: 6.6 min. Limit of detection, 0.4 mg/L [Paliwal *et al.* 1990].
Ultraviolet Spectrum Aqueous acid (0.1 N HCl)—215, 250, 286 nm.



Infrared Spectrum Principal peaks at wavenumber 1170, 770, 1290, 1620, 1700, 2850 cm^{-1}.



Quantification
Serum **HPLC** Column: Cyano (100 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.01 mol/L potassium dihydrogen phosphate (60 : 40). Fluorescence detection (λ_{ex} = 280 nm, λ_{em} = 350 nm). Retention time: ≈10 min. Limit of detection, 0.25 µg/L [Paliwal *et al.* 1992]. Column: Cyano (10 cm × 4.6 mm i.d.). Mobile phase: acetonitrile : 0.01 mol/L potassium dihydrogenphosphate (pH 3.0; 60 : 40) flow rate 1.0 ml/min. Fluorescence detection (λ_{ex} = 280 nm, λ_{em} = 350 nm). Retention time: biriperone, 10 min and hydroxy-metabolite, 8.6 min. Limit of quantification, 0.25 and 0.05 µg/L for biriperone and its hydroxy-metabolite, respectively, limit of detection, 0.1 and 0.02 µg/L for biriperone and its hydroxy-metabolite, respectively [Paliwal *et al.* 1991].
Other **HPLC** Rat Serum. Column: Spheri-5 C_{18} reversed phase (220 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol : 50 mmol/L potassium dihydrogen orthosphosphate (pH 3.5; 35 : 25 : 40), flow rate 1 mL/min. Limit of quantification, 2.5 and 1.25 µg/L for biriperone and its hydroxy-metabolite, respectively [Issar *et al.* 2002].
Disposition in the Body Large inter-subject variation for absorption and bioavailability of centbutindole has been observed and extensive tissue distribution has been shown. Biriperone is metabolised to its hydroxy-metabolite, 2-γ-hydroxy-δ-(4-fluorophenyl)butyl]-1,2,3,4,6,7,12,12a-octahydropyrazino[2′,1′:6,1]pyrid-o [3,4-b]indole.

Therapeutic Concentration
A single 3 mg oral dose of biriperone was administered to 5 healthy males aged between 24 and 36 years old. The mean peak serum level was 3.48 mg/L (range, 2.24 to 6.13 mg/L), which was achieved within 4.0 h (range, 1.41 to 5.87 h) [Paliwal *et al.* 1992].

Half-life The absorption half-life for centbutindole varies between 0.23 and 2 h and the terminal phase elimination half-life is approximately 12.45 h.

Volume of Distribution 765 L.

Clearance Systemic clearance is approximately 44.2 h (range, 23.4 to 64.1 h).

Bisacodyl

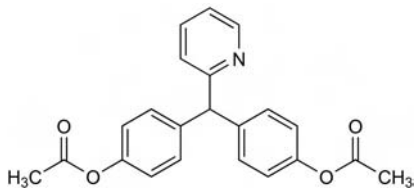
Purgative

$C_{22}H_{19}NO_4$ = 361.4

CAS—603-50-9

IUPAC Name 4,4′-(2-Pyridylmethylene)bisphenol diacetate

Proprietary Names *Bisacolax*; *Biscolax*; *Contlax*; *Deficol*; *Delco-Lax*; *Dulcolax*; *Laco*; *Laxbene*; *Perilax*; *Theralax*; *Toilax*. It is an ingredient of *Dulcodos*.



Chemical Properties A white crystalline powder. Mp 138°. Practically insoluble in water and in alkaline solutions; soluble 1 in 100 of ethanol, 1 in 35 of chloroform and 1 in 170 of ether; sparingly soluble in methanol; soluble in dilute acids, in acetone, and in propylene glycol. Log *P* (octanol/water), 3.4. Extraction yield (chlorobutane), 0.7 [Demme *et al.* 2005].

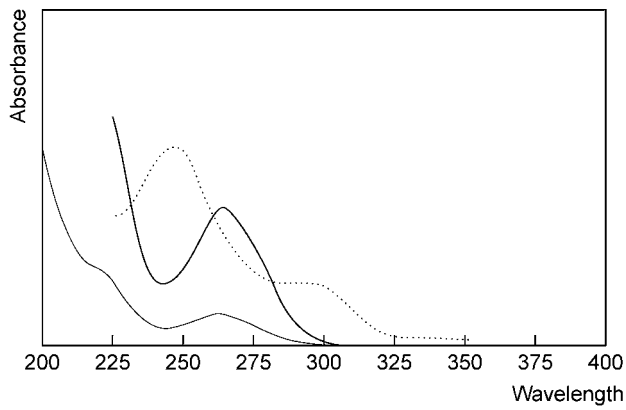
Colour Tests Liebermann's reagent—red-brown; Mandelin's test—violet; Marquis test—violet.

Thin-layer Chromatography System TA—R_f 0.74; system TB—R_f 0.15; system TC—R_f 0.76; system TL—R_f 0.66; system TAE—R_f 0.82; system TAF—R_f 0.87 (acidified iodoplatinate solution, positive).

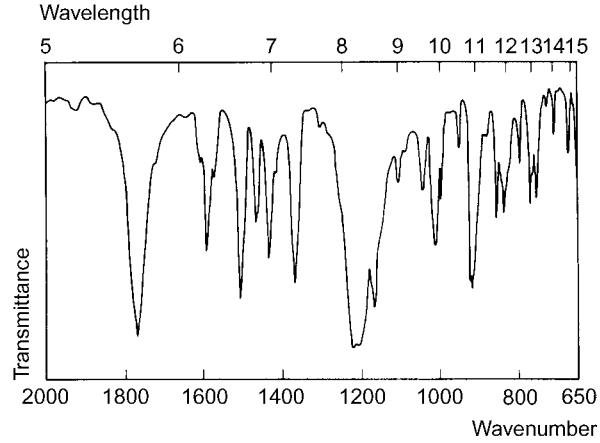
Gas Chromatography System GA—bisacodyl RI 2818, M (bismethoxybisdesacetyl) RI 2820, M (bismethoxydesacetyl) RI 2890, M (desacetyl) RI 2750, M (bisdesacetyl) RI 2655, M (methoxybisdesacetyl) RI 2680, M (methoxydesacetyl) RI 2810; system GB—bisacodyl RI 2956, M (desacetyl) RI 2876, M (bisdesacetyl) RI 2793.

High Performance Liquid Chromatography System HX—RI 531; system HY—RI 431; system HZ—retention time 9.6 min.

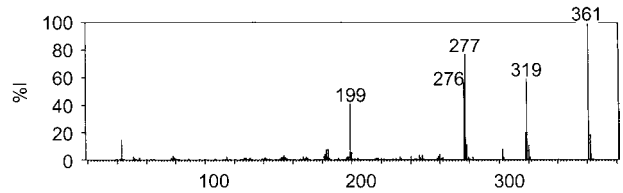
Ultraviolet Spectrum Aqueous acid—264 nm (A^1_1=270a); methanolic potassium hydroxide—248 nm (A^1_1=650a).



Infrared Spectrum Principal peaks at wavenumbers 1212, 1198, 1754, 1162, 1500, 909 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 361, 277, 319, 276, 199, 318, 362, 43.



Quantification

Serum **GC–MS** SIM *m/z* 305. Limit of detection, 10 µg/L [Kudo *et al.* 1998].

Urine **TLC–colorimetry** For bisacodyl diphenol, see Jauch *et al.* [1975].

GC–MS SIM *m/z* 305. Limit of detection, 5 µg/L [Kudo *et al.* 1998].

HPLC See Perkins and Livesey [1993]. UV detection. Limit of detection, 1 mg/L for bisacodyl diphenol [Loof *et al.* 1980].

Disposition in the Body Variably absorbed after oral administration and metabolised by deacetylation to the active metabolite, bis(4-hydroxyphenyl)-2-pyridylmethane (bisacodyl diphenol). Up to about 30% of a dose is excreted in the urine in 48 h as bisacodyl diphenol glucuronide; about 50% of a dose is eliminated in the faeces as unconjugated bisacodyl diphenol.

Dose 5 to 10 mg daily.

Bismuth

Metal

Bi = 208.9

Chemical Properties Used in alloys, pigments; in various compounds (alluminate, carbonate, gallate, nitrate, subsalicylate, subcitrate) as antacids, astringents, and for treatment of peptic ulcers, diarrhoea, warts.

Colour Tests Reinsch test. Applicable to urine, gastric contents, scene residues. Clean a 5 × 10 mm square of copper foil (2–3 cm copper wire) with aqueous nitric acid (500 mL/L) until shiny. Rinse the copper with purified water and add 10 mL of concentrated hydrochloric acid and 20 mL of test sample in a 100 mL conical flask. Heat on a boiling water bath in a fume cupboard for 1 h. Cool and gently wash the copper with purified water.—Bismuth imparts a shiny black stain to the copper (antimony, arsenic, selenium, and tellurium also give black deposits).

Confirmation test. Place the stained copper in 100 g/L potassium cyanide solution and leave for 10 min. Wash any undissolved stain with purified water and add 1 mL of freshly prepared sodium sulfite solution (50 g/L). Shake frequently for 5 min and add 1 mL of purified water followed by 1 mL of a quinine/potassium iodide reagent (prepared by dissolving 1 g of quinine sulfate in 100 mL of purified water containing 0.5 mL of concentrated nitric acid. Add 2 g of potassium iodide when the quinine has dissolved completely).—Stains from arsenic dissolve in the potassium cyanide solution, whereas stains from antimony and bismuth do not. An orange/brown suspension is slowly formed with the quinine/iodide reagent if bismuth is present. Limit of detection, 2 mg/L.

Quantification

Specimen collection Blood—10 mL, K-EDTA; urine—20 mL universal plastic container.

Plasma **FAAS** Carrier gas: N_2. Hollow cathode lamp ($\lambda = 223.1$ nm). Flame: air–acetylene. Limit of detection, 0.1 μg/L [Froomes *et al.* 1988].

ICP-MS Outer gas: Ar, 12 L/min. Nebuliser gas: Ar, 0.75 L/min. Limit of quantification, 1.2 nmol/L, limit of detection, 0.07 nmol/L [Mauras *et al.* 1993].

Serum **ETAAS** Dry cycle: 100° at 10 s for 20 s. Char cycle: 330° in 10 s for 20 s. Atomisation cycle: 2000° for 5 s, gas stop. Perkin Elmer 5000 ($\lambda = 223.1$ nm). Limit of detection, 1 μg/L [Hundal *et al.* 1999]. Dry cycle: 95° in 5 s to 100° in 40 s to 200° in 15 s for 10 s. Char cycle: 1030° in 10 s for 30 s. Atomisation cycle: 2300° for 3 s. Varian hollow cathode lamp ($\lambda = 223.1$ nm). Limit of detection, approx. 0.9 nmol/L [Dean *et al.* 1992].

ICP-MS Plasma gas: 13 L/min. Auxiliary gas: 1 L/min. Nebuliser gas: 0.7 L/min. Limit of detection, 0.007 to 0.027 μg/L [Vanhoe *et al.* 1993].

CSF **ETAAS** Palladium–triton modifier ($\lambda = 223.1$ nm). Limit of detection, 2 ppb [Gane *et al.* 1996].

Urine **AAS** Purge gas: N_2, 120 mL/min. Bismuth hollow cathode lamp ($\lambda = 223.1$ nm). Limit of detection, 320 ng/L [Cadore *et al.* 1998].

FAAS See Plasma [Froomes *et al.* 1988].

TAAS See Serum [Dean *et al.* 1992].

ICP-MS Plasma gas: 15 L/min. Nebuliser gas: 0.825 L/min. Auxillary gas: 0.8 L/min. Limit of detection, 5 ng/L [Schramel *et al.* 1997]. See Plasma [Mauras *et al.* 1993].

Bone **ETAAS** Dry cycle: 90° at 20 s for 10 s, gas flow 100 mL/min, to 110° in 30 s for 10 s, gas flow 30 mL/min. Char cycle: 800° in 30 s for 15 s, gas flow 30 mL/min for the first 15 s to 10 mL/min for 5 s to 20° in 1 s for 15 s. Atomisation cycle: 2100° for 5 s, gas stop, to 2300° in 1 s for 1 s, gas flow 300 mL/min. Limit of detection, 1 μg/L [Slikkerveer *et al.* 1993].

Brain **ETAAS** See Bone [Slikkerveer *et al.* 1993].

Kidney **ETAAS** See Bone [Slikkerveer *et al.* 1993].

Liver **ETAAS** Palladium–triton modifier ($\lambda = 223.1$ nm). Limit of detection, 2 ppb [Gane *et al.* 1996]. See Bone [Slikkerveer *et al.* 1993].

Spleen **ETAAS** See Bone [Slikkerveer *et al.* 1993].

Synovial Fluid **ICP-MS** Coolant gas: Ar, 15.0 L/min. Auxiliary gas: 0.99 L/min. Nebuliser gas: 1.0 L/min. Limit of detection, low ng/L [Krachler *et al.* 2000].

Other **ETAAS** Rat Bone, Brain, Kidney, Liver and Spleen. See Bone [Slikkerveer *et al.* 1993].

Note For an autometallographic technique for tracing bismuth in postmortem brain samples, see Stoltenberg *et al.* [2001]. For a study of bismuth in soils, plants, water and sediments in Korea, see Jung *et al.* [2002].

Disposition in the Body Bismuth salts with low solubility are eliminated almost entirely unabsorbed in the faeces. Water-soluble salts (e.g. the subsalicylate) given parenterally are excreted mainly in the urine over several weeks.

Normal Concentrations Blood—<1 μg/L (<5 nmol/L); urine—<1 μg/L (<5 nmol/L).

Therapeutic Concentration Blood—up to 50 μg/L (239 nmol/L). The presence of an active ulcer does not significantly influence the absorption of colloidal bismuth citrate or bismuth subnitrate [Hundal *et al.* 1999].

Eighteen healthy male volunteers were assigned to receive a capsule containing 140 mg bismuth biskalcitrate, 125 mg metronidazole, and 125 mg tetracycline four times daily for 6 days, alone or in combination with 20 mg omeprazole twice daily. Mean peak plasma concentrations of bismuth were 8.06 ± 6.79 μg/L at 0.67 ± 0.2 h in the former group compared with 25.5 ± 17.7 μg/L at 0.84 ± 0.35 h in the group that also received omeprazole [Spénard *et al.* 2004].

Toxicity Bismuth toxicity resembles that of lead and mercury. The insoluble salts are relatively non-toxic, whereas the soluble compounds, particularly the organic lipid-soluble forms, can accumulate in the body after excessive dosage and lead to neurotoxicity. Water-soluble compounds usually cause renal damage, including acute renal failure. Many cases of severe poisoning, including deaths, have been recorded after chronic and acute overdose with therapeutic bismuth agents. Generally toxicity is associated with blood bismuth concentrations in excess of 100 μg/L (480 nmol/L) [Serfontein, Mekel 1979; Serfontein *et al.* 1979].

A 16-year-old girl ingested 60 tablets (18 g) of colloidal bismuth citrate. Twelve days later her serum bismuth concentration was 495 μg/L [Cengiz *et al.* 2005].

A 66-year-old man worked for 20 years as a repairer in a glassworks. The hard tissue bismuth content of one of his teeth was 50.1 ppm [Bachanek *et al.* 2000].

Patients undergoing elective myelography after the administration of therapeutic doses of tripotassium dicitrato bismuthate for 1 month had significantly higher bismuth concentrations in their liver and CSF than patients receiving sucralfate or aluminium hydroxide [Gane *et al.* 1996].

A 60-year-old man developed an encephalopathy and had a blood bismuth level of 72 μg/L after chronic usage of bismuth subsalicylate [Hasking, Duggan 1982].

Half-life In blood, ≈5 days

Protein Binding Preferably to transferrin instead of albumin in aqueous solutions and plasma [Sun *et al.* 2001].

Bisoprolol

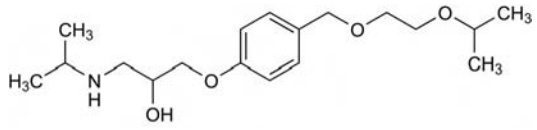
β-*Blocker*

$C_{18}H_{31}NO_4 = 325.5$

CAS—66722-44-9

IUPAC Name 1-[4-[[2-(1-Methylethoxy)ethoxy]methyl]phenoxy]-3-[(1-methylethyl)amino]-2-propanol

Synonym EMD-33512



Chemical Properties pK_a 9.57. Log *P* (octanol/water), 2.15; (dodecane/water), −0.24. Extraction yield (chlorobutane), 0.9 [Demme *et al.* 2005].

Bisoprolol Fumarate (hemifumarate)

$(C_{18}H_{31}NO_4)_2,C_4H_4O_4 = 767.0$

CAS—104344-23-2; 66722-45-0

Proprietary Names *Bisobloc*; *Bisomerck*; *Concor*; *Cordalin*; *Detensiel*; *Emconcor*; *Emcor*; *Euradal*; *Fondril*; *Godal*; *Isoten*; *Monocor*; *Soprol*; *Zebeta*.

Chemical Properties A white crystalline powder. Mp 100°. It is readily soluble in water, chloroform, ethanol and methanol.

Thin-layer Chromatography System TB—R_f 0.08; system TE—R_f 0.48; system TF—R_f 0.00; system TAE—R_f 0.22.

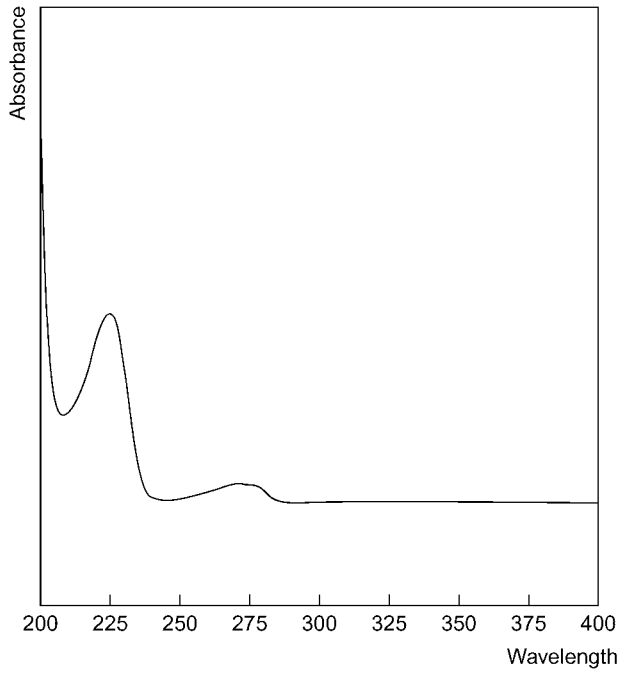
Gas Chromatography System GA—RI 2378 (bisoprolol), RI 2595 (Art), RI 2400 (Art(-H_2O)), RI 1690 (M (phenol)); system GB—RI 2427 (bisoprolol), RI 2680 (Art), RI 2480 (Art(-H_2O)).

Gas Chromatography-Mass Spectrometry

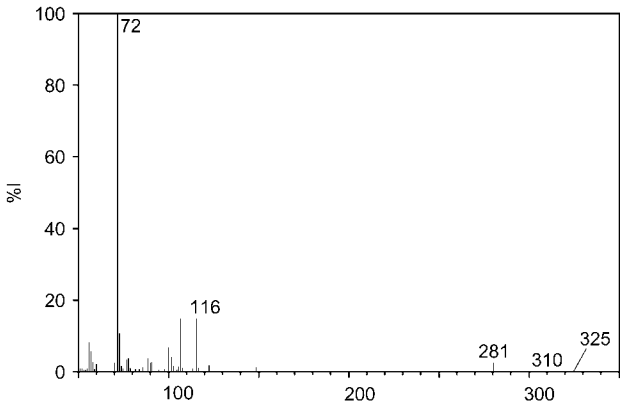
Column: 5% phenylmethyl silicone RTx-5 fused-silica capillary (30 m × 0.25 mm i.d.). Injector port: 250°, splitless conditions. Temperature programme: 110° for 1 min, to 170° at 20°/min to 225° at 7°/min to 290° at 24°/min, for 10 min. Carrier gas: He. Retention time (relative to isoproteronol, internal standard): 1.31 [Branum *et al.* 1998].

High Performance Liquid Chromatography System HX—RI 358; system HZ—retention time 3.1 min; system HAA—retention time 12.3 min.

Ultraviolet Spectrum Aqueous acid (pH 4)—225, 273 nm.



Mass Spectrum Principal ions at *m/z* 72, 116, 107, 100, 281, 73, 43, 325.



Quantification

Plasma **HPLC** Column: Chiralcel OD (250 × 4.6 mm i.d., 10 µm). Mobile phase: hexane : 2-propanol (10:0.9) containing 0.01% diethylamine, flow rate 0.5 mL/min. Fluorescence detection (λ_{ex}=228 nm, λ_{em}=298 nm). Retention time: *R*(+)-bisoprolol, 20 min; *S*(−)-bisoprolol, 30 min. Limit of detection, 2 µg/L for each enantiomer [Suzuki *et al.* 1993]. Fluorescence detection. Limit of detection, 1 µg/L [Poirier *et al.* 1988]. Fluorescence detection. Limit of detection; 1 to 2 µg/L[Bühring, Garbe 1986].

Urine **HPLC** See Plasma Suzuki *et al.* [1993]. See Plasma. Limit of detection, 10 µg/L [Poirier *et al.* 1988]. See Plamsa. Limit of detection, 10 µg/L [Bühring, Garbe 1986].

Disposition in the Body Bisoprolol is almost completely absorbed after oral administration and undergoes only minimal first-pass metabolism. Peak plasma concentrations are reached 2 to 4 h after oral administration. It is moderately lipid-soluble and rapidly and widely distributed in the body. Approximately 50% of a dose is metabolised in the liver to pharmacologically inactive polar metabolites that are then excreted by the kidneys; the remaining 50% is excreted unchanged by the kidneys. <2% of a dose is excreted in faeces.

Therapeutic Concentration The serum therapeutic concentration range is 0.01 to 0.06 mg/L.

Group 1: 8 healthy subjects (with a mean age of 23 years), group 2: 11 patients with impaired renal function (mean age, 59 years), group 3: 5 patients with acute hepatitis (mean age, 38 years) and group 4: 13 patients with liver cirrhosis (mean age, 52 years). Each group was administered with 10 mg bisoprolol daily for 7 days. The mean peak plasma concentrations were 52, 74, 54 and 62 µg/L for the groups, respectively, and the mean trough concentrations 11, 32, 19 and 22 µg/L. All peak concentrations were observed 1.7 to 3 h after administration [Kirch *et al.* 1987].

Bioavailability 90%.

Half-life Plasma, 10 to 12 h; increased in patients with renal or liver impairment.

Volume of Distribution 2.9 L/kg for healthy individuals; 3.1 L/kg for patients with impaired renal function; 3.9 L/kg for patients with acute hepatitis; 2.9 L/kg for those with liver cirrhosis.

Clearance Total, 14.2 L/h for healthy individuals; 7.8 L/h for patients with impaired renal function; 11.9 L/h for patients with acute hepatitis; 10.8 L/h for those with liver cirrhosis.

Protein Binding 30 to 35%.

Note For reviews of bisoprolol, see Lancaster, Sorkin [1988] and Johns, Lopez [1995].

Dose Up to 20 mg of bisoprolol fumarate daily.

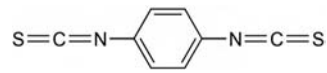
Bitoscanate

Anthelmintic

$C_8H_4N_2S_2$ = 192.3

CAS—4044-65-9

IUPAC Name 1,4-Di-isothiocyanatobenzene

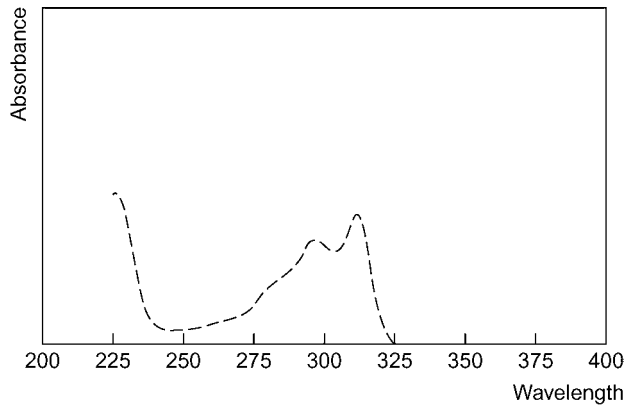


Chemical Properties A yellowish-white crystalline powder. Mp 130° to 132°. Practically insoluble in water; soluble in ethanol, chloroform and ether. Log *P* (octanol/water), 4.7.

Colour Tests Mandelin's test—brown-violet; palladium chloride—orange.

Thin-layer Chromatography System TA—R_f 0.65 (acidified potassium permanganate solution, positive).

Ultraviolet Spectrum Ethanol—296, 311 nm (A^1_1=1795a).



Disposition in the Body Partly absorbed after oral administration. About 28% of a dose is excreted in the urine in 30 days and 55% is eliminated in the faeces, mainly in the first week.

Therapeutic Concentration

Following a single oral dose of 100 mg of ^{14}C-labelled bitoscanate to 6 subjects, peak blood concentrations of total radioactivity equivalent to 0.58 to 2.1 mg/L (mean 1.4) of bitoscanate were reported at about 24 h [Christ *et al.* 1970].

Half-life Plasma half-life (total radioactivity), about 26 h.

Dose 100 mg at 12-hourly intervals for 3 doses.

Christ OE *et al.* (1970). *Arzneimittelforschung* 20: 756–762.

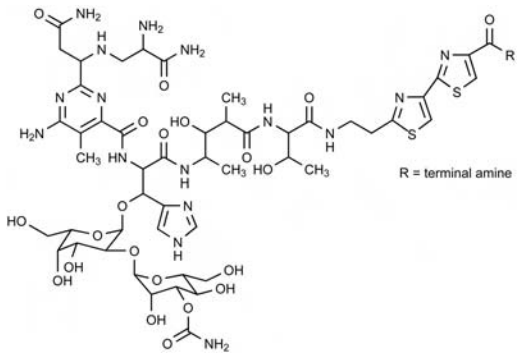
Bleomycin

Antineoplastic

$C_{55}H_{84}N_{17}O_{21}S_3$ = 1415.6

CAS—11056-06-7

Note Bleomycins are a group of related glycopeptide antineoplastic antibiotics isolated from *Streptomyces verticillus*. The main component of bleomycin used clinically is bleomycin A_2(N^1-[3-(dimethylsulfonio)propyl]bleomycinamide).
Synonyms NSC-125066; bleo.

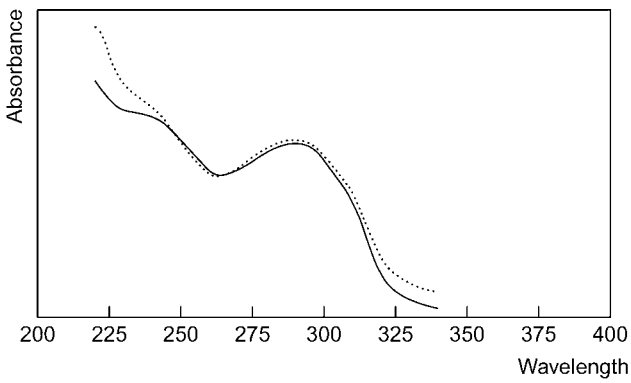


Chemical Properties A colourless or yellowish powder which becomes blueish depending on copper content. It is very soluble in water and in methanol; slightly soluble in ethanol; practically insoluble in acetone, in ethyl acetate, in butyl acetate and in ether.

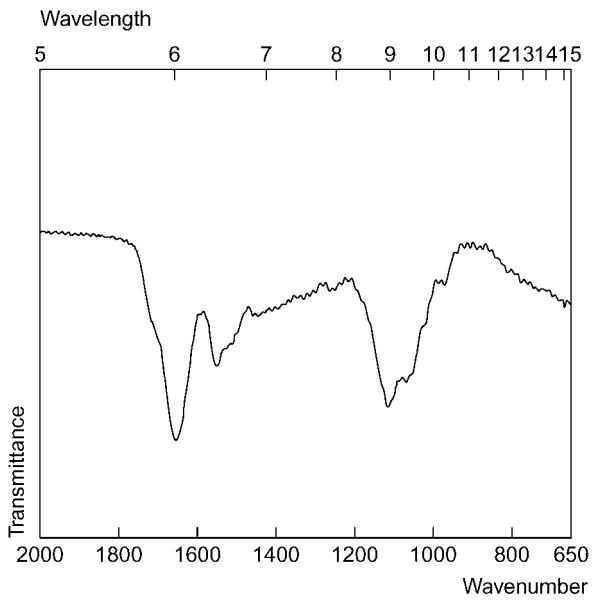
Bleomycin Sulfate

CAS—9041-93-4
Proprietary Names *Blenoxane*; *Bleo-S*; *Oil Bleo*.
Chemical Properties A white or yellowish white or cream-coloured amorphous very hygroscopic powder. It is very soluble in water; slightly soluble in ethanol; practically insoluble in acetone and in ether.

Ultraviolet Spectrum Aqueous acid (0.2 mol/L H_2SO_4)—290 nm: basic—290 nm.



Infrared Spectrum Principal peaks at wavenumbers 1653, 1548, 1118, 618 cm^{-1} (sulfate salt).



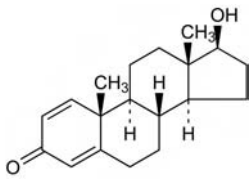
Quantification

Plasma **HPLC** UV detection. Limit of detection, 0.5 mg/L [Shiu *et al.* 1979].
Disposition in the Body It is poorly absorbed after oral administration. After parenteral administration 60 to 70% is excreted in urine as the active drug. Most tissues, except skin and lung, can degrade bleomycin enzymically. About 45% of a dose is absorbed into the systemic circulation following intrapleural or intraperitoneal administration. It does not cross the blood–brain barrier.
Therapeutic Concentration
Following intraperitoneal administration of 150 units of bleomycin in 2 L of peritoneal dialysis fluid to 3 subjects, mean peak peritoneal concentration at 15 min was 38 milli-units/L. The corresponding mean plasma concentration was 0.075 milli-units/L [Bitran 1985].
Toxicity Pulmonary toxicity is the most serious adverse effect and is more likely in those given total cumulative doses >400 units.
Half-life Plasma, 2 to 4 h.
Volume of Distribution 0.35 to 0.45 L/kg.
Clearance Plasma, 119 to 128 mL/min/m^2.
Protein Binding 1%.
Note For review of bleomycin, see Dorr [1992].
Dose Usually 15 to 60 units weekly intravenously. The maximum total cumulative dose is 400 or 500 units.

Bitran JD (1985). Intraperitoneal bleomycin. Pharmacokinetics and results of a phase II trial. *Cancer* 56: 2420–2423.
Dorr RT (1992). Bleomycin pharmacology: mechanism of action and resistance, and clinical pharmacokinetics. *Semin Oncol* 19: 3–8.
Shiu GK *et al.* (1979). Rapid high-performance liquid chromatographic determination of bleomycin A2 in plasma. *J Pharm Sci* 68: 232–234.

Boldenone

Anabolic Steroid
$C_{19}H_{26}O_2$ = 286.4
CAS—846-48-0
IUPAC Name (17β)-17-Hydroxyandrosta-1,4-dien-3-one
Synonym Dehydrotestosterone



Chemical Properties Crystals. Mp 164° to 166°. Log *P* (octanol/water), 3.05.

Boldenone Acetate

$C_{21}H_{28}O_3$ = 328.5
Chemical Properties Crystals. Mp 151° to 153°.

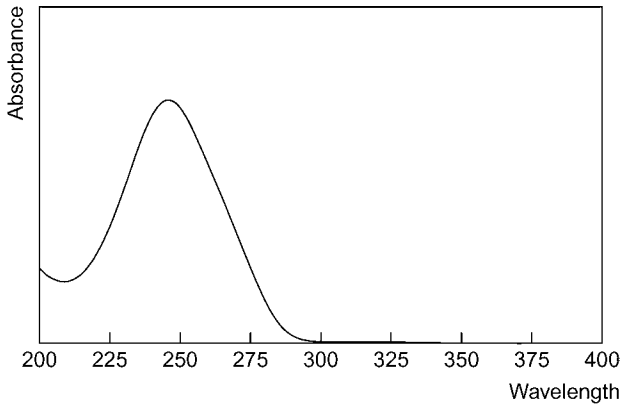
Boldenone Benzoate

$C_{26}H_{30}O_5$ = 422.5

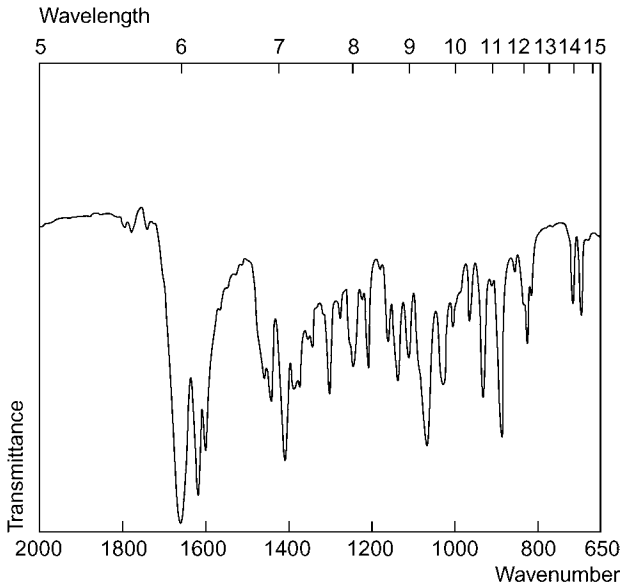
Boldenone Undecylenate

$C_{30}H_{44}O_3$ = 452.7
CAS—13103-34-9
Synonyms Ba-29038; 10-undecenoate.
Proprietary Names *Parenabol*; *Vebonol*.

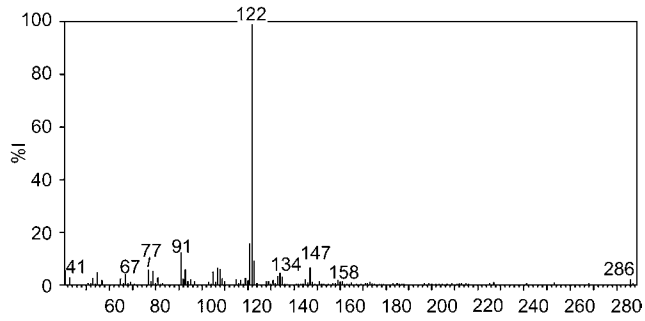
Thin-layer Chromatography System TA—R_f 0.98; system TE—R_f 0.98; system TAJ—R_f 0.90; system TAK—R_f 0.88; system TAL—R_f 0.98; system TAM—R_f 0.99.
Gas Chromatography System GAG—boldenone RRT 1.05, boldenone undecylenate RRT 2.62 (both relative to testosterone); system GAI—boldenone RRT 0.961, 5β-androst-1-en-17β-ol-3-one metabolite RRT 0.96 (both relative to 17α-methyl-5α-androstan-3β, 17β-diol); system GAR—boldenone retention time 12.8 min, boldenone acetate retention time 13.6 min, boldenone benzoate retention time 18.7 min, boldenone undecylenate retention time 22.4 min.
Column: silica SE54, cross-linked 5% phenyl, 1% vinyl methyl silicone (17 m × 0.2 mm i.d., 0.33 μm). Carrier gas: He, flow rate 1 mL/min. Split 1:10. MS detection (EI), SIM. Internal standard: 5α-androstane-3,17-dione,bis-TMS. RI: boldenone (TMS derivative) 2685.
Column: silica OV1, cross-linked methyl silicone (20 m × 0.25 mm i.d., 0.33 μm). Carrier gas: He, flow rate 1 mL/min. MS detection (EI), SIM. Internal standard: 5α-androstane-3,17-dione,bis-TMS. RI: boldenone (TMS derivative) 2672 [Schanzer, Donike 1992].
High Performance Liquid Chromatography System HAR—RRT 0.74 (relative to testosterone); system HATa—boldenone undecylenate RRT 1.94(relative to testosterone); system HATb—boldenone RRT 0.76(relative to testosterone).
Column: C_{18} Nucleosil (250 × 10 mm i.d., 7 μm). Mobile phase: (A) water, (B) acetonitrile : water (90:10). Elution programme: (A:B) (70:30) to (20:80) over 25 min, flow rate 6 mL/min. Retention time: 13.1 min [Schanzer, Donike 1992].
Ultraviolet Spectrum Aqueous acid—248 nm; aqueous base—250 nm; ethanol—243 nm.



Infrared Spectrum Principal peaks at wavenumbers 1654, 1400, 1055 cm^{-1}; (acetate)1725, 1231, 1034 cm^{-1}; (benzoate)1658, 1276, 716 cm^{-1}; (undecylenate) 1725, 1654, 1175 cm^{-1} (KBr disks).



Mass Spectrum Principal ions at *m/z* 122, 121, 91, 123, 147, 77, 107, 93.



Quantification

Urine **GC–MS** Column: 5% phenylmethylpolysiloxane Ultra-2 (30 m × 0.2 mm i.d., 0.33 µm), cross-linked capillary. Temperature programme: 150° held for 2 min, step rate of 20°/min to 300°, held for 2 min. MS detection negative chemical ionisation (NCI): Internal standard: 1,2-d2-testosterone. Retention time: boldenone metabolite, 9.17 min. Limit of detection, 2 ppb [Choi *et al.* 1998].

Disposition in the Body Boldenone is metabolised to 5β-androst-1-en-17β-ol-3-one, 5β-androst-1-ene-3α,17β-diol, 5β-androst-1-en-3α-ol-17-one, 5β-androst-1-ene-3,17-dione, androsta-1,4-diene-6β,17β-diol-3-one, androsta-1,4-dien-6β-ol-3,17β-dione and 5β-androstan-3α-ol-17-one, by 5β-reduction. Excreted, via the kidneys, to a large extent as a conjugate.

Choi MH *et al.* (1998). Determination of four anabolic steroid metabolites by gas chromatography/mass spectrometry with negative ion chemical ionization and tandem mass spectrometry. *Rapid Commun Mass Spectrom* 12: 1749–1755.

Boldione

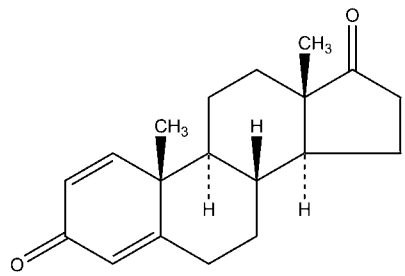
Anabolic Steroid

$C_{19}H_{24}O_2$ = 284.4

CAS—897-06-3

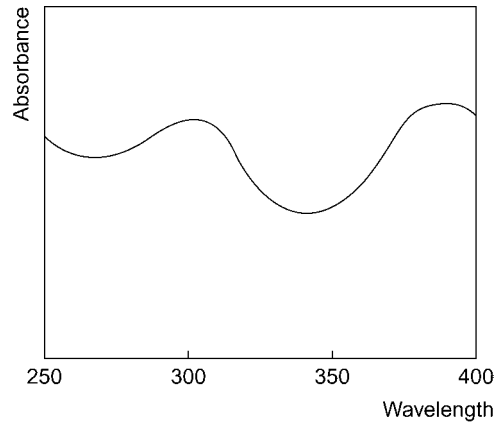
IUPAC Name (8*R*,9*S*,10*R*,13*S*,14*S*)-10,13-Dimethyl-7,8,9,11,12,14,15,16-octahydro-6*H*-cyclopenta[a]phenanthrene-3,17-dione

Synonyms Androstadienedione; 1,4-androstadiene-3,17-dione; 1-dehydroandrostenedione.



Chemical Properties Prohormone of the anabolic steroid boldenone. Log *P* (octanol/water), 2.92 [Meylan, Howard 1995]. Stability of boldione in bovine urine was verified for 4 weeks in the dark at –20° [Draisci *et al.* 2003].

Ultraviolet Spectrum



Quantification

Urine **GC-MS** Column: Ultra-2 cross linked phenylmethylsiloxane (17 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 180° for 2 min to 260° at 5°/min to 310° at 6°/min for 2 min. EI ionisation, scan mode. Limit of detection, 4.6 and 4.2 µg/L for boldione and boldenone, respectively [Kim *et al.* 2006].

LC-MS Column: Agilent Hypersil ODS C_{18} (150 × 2.0 mm i.d., 5.0 µm). Mobile phase: acetonitrile : water (20 : 80 to 45 : 55 at 5 min). ESI, positive ion mode. Limit of detection not reported [Kim *et al.* 2006].

Other **GC-MS** Bovine Urine. Column: 30 m × 0.25 mm i.d., 0.25 µm. Carrier gas: He, 1.0 mL/min. Temperature programme: 120° for 2 min to 250° at 15°/min to 300° at 5°/min for 10 min. EI ionisation, negative ion mode. Limit of detection, 0.05 µg/L [Le Bizec *et al.* 2006].

HPLC Bovine Liver and Kidney. Column: SYNERGY fusion RP 80 (150 × 4.6 mm i.d., 4.0 µm). Mobile phase: acetonitrile : water (20 : 80 for 9 min to 40 : 60 at 42 min to 20 : 80 at 47 min). Retention time: approx. 41.9 min. Limit of detection, 7.11 mg/L [Merlanti *et al.* 2007].

LC-MS Bovine Urine. Column: Uptisphere C_{18} TF (50 × 2.1 mm i.d., 3.0 µm). Mobile phase: methanol : 0.5% acetic acid (10 : 90 to 0 : 100 at 9 min for 6 min). ESI, positive ion mode, SRM acquisition mode. Limit of detection not reported [Le Bizec *et al.* 2006]. Equine Urine. Column: Supelcosil LC-8-DB reversed phase (100 × 2.1 mm i.d., 3.0 µm). Mobile phase: 0.1% acetic acid : methanol (60 : 40 to 0 : 100 at 5 min for 5 min), flow rate 0.2 mL/min. API, ESI, positive ion mode, MRM acquisition mode. Retention time: 4.88 min. Limit of detection, 5 µg/L [Yu *et al.* 2005]. Bovine Urine. Column: Allure C_{18} reversed phase. Mobile phase: acetonitrile : 5 mol/L ammonium acetate (60 : 40), flow rate 130 µL/min. APCI, positive ion mode. Limit of quantification, 0.2 µg/L [Draisci *et al.* 2003].

Note Neoformation of 17α-boldenone in bovine faeces requires that only uncontaminated urine be analysed, see Pompa *et al.* [2006]. There is a natural occurrence of various boldenone metabolites in the urine of non-treated animals; for more information, see Le Bizec *et al.* [2006].

Disposition in the Body Rapidly metabolised to boldenone and 2 minor metabolites, M2 and M3. M2 appears to be a hydroxylated version of boldione and M3 the reduced form of M2.

A healthy male volunteer (age 26 years, weight 71 kg) was administered one 100 mg boldione tablet orally. Urine samples were collected over 48 h and analysed by GC-MS. The maximum amount of boldione excreted occurred after 1.8 h and was 16.1 mg (in 750 mL urine), whereas figures for boldenone (the main metabolite) were 6.8 mg (in

700 mL urine) after 3.6 h. The total amount excreted after the 48 h period was 34.5 mg for boldione and 16.0 mg for boldenone (in 4.16 L urine) [Kim *et al.* 2006].

Draisci R *et al.* (2003). Confirmatory analysis of 17beta-boldenone, 17alpha-boldenone and androsta-1,4-diene-3,17-dione in bovine urine by liquid chromatography-tandem mass spectrometry. *J Chromatogr B Analyt Technol Biomed Life Sci* 789: 219–226.

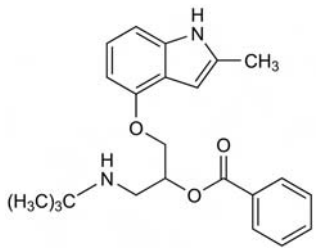
Bopindolol

Antihypertensive

$C_{23}H_{28}N_2O_3 = 380.5$

CAS—62658-63-3

IUPAC Name 1-[(1,1-Dimethylethyl)amino]-3-[(2-methyl-1*H*-indol-4-yl)oxy]-2-propanol benzoate ester



Chemical Properties It is soluble in ether and methylene chloride.

Bopindolol Maleate

$C_{27}H_{32}N_2O_7 = 496.6$

Proprietary Name *Sandonorm*

Bopindolol Malonate

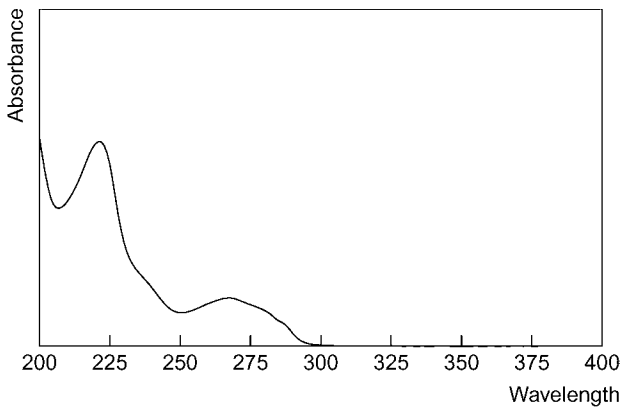
$C_{26}H_{32}N_2O_7 = 484.5$

CAS—82857-38-3

Synonyms Bopindolol hydrogen malonate; LT-31-200.

Proprietary Name *Wandonorm*

Ultraviolet Spectrum Principal peaks at 221, 267 nm.



Quantification

Plasma **HPLC** Electrochemical detection. Limit of detection, 0.025 µg/L [Humbert *et al.* 1987].

Disposition in the Body Bopindolol is rapidly hydrolysed in plasma and no measurable amounts of the parent drug can be detected after oral administration. The two main metabolites identified are benzoic acid and an active hydrolysed metabolite.

Therapeutic Concentration

Twenty young male volunteers, aged between 18 and 42 years, and 20 elderly males, 62 to 83 years old, were administered with a single 1-mg dose of bopindolol once daily for 7 days. Mean peak plasma concentrations of 4.5 and 5.2 µg/L were reached for the young and elderly volunteers, respectively. All peak concentrations were observed approximately 1.5 h after administration. No significant differences were observed between the young and elderly [Holmes *et al.* 1991].

Fourteen patients with cirrhosis (male and female, aged between 40 and 66 years) and 15 healthy volunteers (21 to 28 years) were administered with a 1.2-g dose antipyrine on day 1 and 2-mg bopindolol on day 3. The patients with cirrhosis reached a mean peak plasma concentration of 5.8 µg/L at 1.6 h and the healthy volunteers 6.9 µg/L within 1.5 h. No significant difference was observed [Wensing *et al.* 1990].

Half-life Mean, 4.4 h (range 3.1 to 6.0 h).

Volume of Distribution Mean, 202 L (range, 102 to 504 L) after oral administration; 148 L intravenously.

Clearance After single dose administration, plasma clearance is 30.9 L/h and for multiple dosing, 38.0 L/h.

Dose Between 0.5 and 4 mg.

Holmes D *et al.* (1991). Steady state pharmacokinetics of hydrolysed bopindolol in young and elderly men. *Eur J Clin Pharmacol* 41: 175–178.
Humbert H *et al.* (1987). Column liquid chromatographic determination of hydrolysed bopindolol, in the picogram per millilitre range in plasma, using cartridge extraction and dual electrochemical detection. *J Chromatogr* 422: 205–215.
Wensing G *et al.* (1990). Pharmacokinetics after a single oral dose of bopindolol in patients with cirrhosis. *Eur J Clin Pharmacol* 39: 569–572.

Borates

Anion

Boric Acid

$H_3BO_3 = 61.8$

CAS—10043-35-3

Synonyms Boracic acid; orthoboric acid; occurs in nature as the mineral sassolite.

Proprietary Name *Borofax*

Chemical Properties Colourless, odourless, transparent crystals, or white granules or powder. Mp 171°. Very soluble in water, alcohol, glycerol. Used for weatherproofing wood and fireproofing fabrics; as a preservative; in manufacture of cements, crockery, porcelain, enamels, leather, soaps, artificial gems; in cosmetics; photography; hardening steel; as an insecticide.

Sodium Borate Decahydrate

$Na_2B_4O_7{,}10H_2O = 381.2$

CAS—1330-43-4

Synonyms Sodium biborate; sodium pyroborate; sodium tetraborate; fused sodium borate, borax glass, or fused borax (anhydrous form).

Proprietary Names *Borax*; *Jaikin* (decahydrate).

Chemical Properties Hard odourless crystals, granules or crystal powder. Mp 75°; loses $5H_2O$ at 100° and $9H_2O$ at 150°; becomes anhydrous at 320°. Soluble in water; very soluble in glycerol; insoluble in alcohol. Used for soldering metals; in manufacture of glazes and enamels; in tanning; in cleaning compounds; artificially ageing wood; as a preservative; fireproofing fabrics and wood; in cockroach control; pharmaceutical aid.

Colour Test Test applicable to gastric contents and scene residues. A portion of the sample is acidified with 1 mol/L hydrochloric acid and applied to turmeric paper (prepared by soaking strips of filter paper in turmeric spice dissolved in methanol (10 g/L) and allowing them to dry at room temperature)—A brown-red colour, which intensifies when the paper dries, indicates the presence of borate; moisten the filter paper with 4 mol/L ammonium hydroxide solution—A colour change to green-black suggests the presence of borates (oxidising agents such as bromates, chlorates, iodates and nitrates interfere by bleaching the turmeric). Limit of detection, 20 mg/L.

Confirmation Test Stomach contents, 5 mL, is filtered into a 10 mL glass tube and 0.5 mL of the filtrate is added to a clean glass tube before slowly adding 0.5 mL of carminic acid solution (0.5 g/L in concentrated sulfuric acid) down the side of the tube so that it forms a layer underneath the sample—A blue-violet ring at the interface of the two layers suggests the presence of borate. Strong oxidising agents (e.g. bromates, chlorates, iodates and nitrates) also give a positive result with this test.

Quantification Specimen collection: Blood—10 mL EDTA tube; urine—20 mL plastic universal container; gastric contents are useful in postmortem examinations.

Blood **ICP-AES** Nebuliser gas: 0.70 L/min ($\lambda = 249.7$ nm). Limit of detection not reported [Svantesson *et al.* 2002].

ICP-MS Plasma gas: Ar, 15 L/min. Auxiliary gas: Ar, 0.8 L/min. Nebuliser gas: Ar, 0.9 L/min. Limit of detection, 5 µg/L [Moreton, Delves 1999]. Jobin-Yvon JY 48 spectrometer. Plasma-Therm source. Limit of detection, 0.06 µmol/L [Mauras *et al.* 1986].

Note For a DEAE cellulose method for the analysis of boron-10, see Schremmer and Noonan [1987]. For a colorimetric method for the detection of boron in blood, see Dill *et al.* [1977]. For a spectrophotometric method for the detection of boron in blood, see Edwall *et al.* [1979].

Plasma **ICP-MS** Plasma gas: Ar, 15 L/min. Auxiliary gas: Ar, 0.8 L/min. Nebuliser gas: Ar, 0.9 L/min. Limit of detection, 5 µg/L [Moreton, Delves 1999].

Serum **FAAS** Gas: nitrous oxide–acetylene. Perkin-Elmer ($\lambda = 249.7$ nm). Limit of detection, 15 mg/L [Bader, Brandenberger 1968]. Gas: air–acetylene. Limit of quantification, 0.2 µg [Siemer 1982].

Urine **FAAS** See Serum [Bader, Brandenberger 1968; Siemer 1982].

ICP-AES See Blood [Svantesson *et al.* 2002].

CSF **FAAS** See Serum [Bader, Brandenberger 1968].

Dialysis Fluid **ICP-MS** See Blood [Mauras *et al.* 1986].

Brain **ICP-MS** See Plasma [Moreton, Delves 1999].

Note For a review of the considerations for measuring boron at low concentrations, see Downing *et al.* [1998]. For a spectrometric method for the determination of boron, see Aznárez and Mir [1984].

Disposition in the Body Boric acid is well absorbed through mucous membranes and damaged skin, but not when the skin is intact. Intestinal absorption of

boron is rapid and almost complete following ingestion of boric acid or borates, with peak blood concentrations being reached within 2 h [Locatelli *et al.* 1987]. The main route of elimination of borates is via the kidneys and they are excreted substantially unchanged, regardless of the route of administration. Urinary excretion accounts for 85 to 100% of a dose within 5 to 7 days. Smaller amounts are excreted in the faeces and in sweat. Boric acid is not metabolised in humans or animals [Murray 1998].

Note For a possible role of dietary boron, see Hunt [1998].

Normal Concentrations Blood—<2 mg/L (as borate). Normal boron concentrations from 50 humans have been reported as follows:

Sample	*Median (ppm)*	*Range (ppm)*
Whole blood	0.057	0.008–0.17
Blood serum	0.022	0.008–0.048
Urine	0.75	0.16–2.9
Scalp hair	4.3	0.83–10.2
Fingernails	15.2	7.4–82.7
Toenails	17.9	7.6–57.4

[Moseman 1994].

Therapeutic Concentration Infusion of sodium borocaptate (mercaptoundecahydrododecaborate [BSH]) is used in boron neutron capture therapy of brain tumours (glioblastomas and astrocytomas). It is a system that tries to combine chemotherapy with radiotherapy with a greater selectivity, efficacy and safety than chemotherapy or radiotherapy alone. An IV infusion of 25 mg/kg is given over the course of 1 h [Gibson *et al.* 2003; Horn *et al.* 1998; Shibata *et al.* 2003].

Toxicity The minimal lethal dose of boric acid for humans is estimated as ~2–3 g in infants, 5–6 g in children and 15–20 g in adults. The serum toxic concentration is cited as 4 mg/L and the lethal concentration is reported to be 50–100 mg/L [Ishii *et al.* 1993].

A 77-year-old man mistakenly ingested approximately 30 g boric acid to stop hiccups. At 55 h after ingestion, his serum boric acid was 25.3 mg/L and his plasma boric acid concentration was 25.5 mg/L. The patient died 63 h post-ingestion; a postmortem was not performed [Ishii *et al.* 1993].

A 45-year-old ingested 2 cups of boric acid crystals in a suicide attempt. He died 63 h later. Whole-blood and urine concentrations of boric acid at 52 h post-ingestion were 42 and 160 mg/L, equivalent to 7 and 28 mg boron/L, respectively. At postmortem, his urinary boron concentration was 29.4 mg/L [Restuccio *et al.* 1992].

In a fatal case of a man who ingested a large quantity of boric acid, a serum borate concentration of 440 mg/L was reported [Litovitz *et al.* 1991].

A review of 784 exposures to boric acid between 1981 and 1985 showed that the median age was 2 years and that children under 6 years made up 80.2% of cases. All but 2 cases were acute ingestions:

A 14-month-old boy ingested 20 g of 50% boric acid. His serum boric acid concentration was 8 mg/L. A 2-year-old ingested 10 g of boric acid. His serum boric acid concentrations were 53 and 58 mg/L, attained at 1 and 7 h, respectively [Litovitz *et al.* 1988].

After an attempted suicide by ingesting 80 g of boric acid, a 35-year-old woman had serum borate concentrations at 1 and 13 h of 2320 mg/L and 1360 mg/L, respectively. Similarly, a 28-year-old woman ingested an estimated 297 g of a 99% boric acid solution. Her serum boric acid concentrations was 4.9 mg/L 2 h later [Linden *et al.* 1986].

The mean blood plasma boron concentrations was 2.6 ± 0.9 µmol/L in control subjects and 16.1 ± 5.6 µmol/L in haemodialysed patients before dialysis. After dialysis, the plasma concentration of boron was 9.5 ± 3.2 [Mauras *et al.* 1986].

Chronic ingestion has more severe consequences than acute ingestion: acute ingestion of up to 20 g of boric acid by infants induced only diarrhoea and sickness, with serum borate concentrations of 80–580 mg/L [Linden *et al.* 1986]. In contrast, seizures were observed in infants who ingested between 4 and 30 g over a period of 4–10 weeks and had blood borate levels of 2.6–8.5 mg/L. Control values in 15 children who had received no boron in their diet were 0.0–0.63 mg/L [O'Sullivan, Taylor 1983].

Application of boric acid for nappy rash has caused neurological disorders, severe erythema of the skin, and gastrointestinal problems, as well as deaths in infants.

In a child who survived application of boric acid, a serum borate concentration of over 300 mg/L was recorded, which reduced to 32 mg/L after 54 h of peritoneal dialysis [Baliah *et al.* 1969].

Eleven infants who were accidentally administered boric acid in their food developed the same symptoms. The 6 who survived (doses 2–4.5 g) had serum borate levels of 20–150 mg/L; the remaining 5 (doses 4.5–14 g) died 3 days later, with serum borate levels of 200–1600 mg/L [Wong *et al.* 1964].

Note For a case of poisoning with boron trifluoride, see Stewart and Waisberg [1998]. For a study of the relationship between blood and urine concentrations of boron and boron exposure in borax workers, see Culver *et al.* [1994].

Volume of Distribution 0.17–0.50 L/kg.

Clearance 0.107–0.294 mL/min/kg. For a study on the effect of boron supplementation on its urinary excretion, see Naghii and Samman [1997].

Distribution in Blood Plasma : blood, 1.3 ± 0.2.

Half-life 12–27 h.

Botulinum Toxin

Neurotoxin, Skeletal Muscle Relaxant

Botulinum toxins are potent neurotoxins produced by *Clostridium botulinum*. There are 7 serologically distinct types designated A to G. The proteins targeted by each serotype are:

Toxin	*SNARE target*
A, E	SNAP-25
B, D, F, G	Synaptobrevin (VAMP)
C	Syntaxin

Only types A and B are approved by the FDA for use in humans. The active components of types A and B consist of an amino acid complex composed of a heavy and a light chain linked by disulfide bonds. The heavy chain is thought to be responsible for binding to target cells and the translocation of the toxin across the synaptic membrane, while the light chain is responsible for the toxicity. For a review, see Thakker and Rubin [2004].

Synonym BoNT

Botulinum Toxin A

Treatment of Blepharospasm/Treatment of Cervical Dystonia/Treatment of Severe Primary Axillary Hyperhidrosis/Treatment of Strabisimus

149.3 kDa

CAS—93384-43-1

Synonyms AGN-191622; BoNT-A; botulin A; oculinum.

Proprietary Names *BoTox*; *Dysport*.

Chemical Properties The fluorescence emission of the CBQCA-labelled products is stable at 4° for up to 14 days [Laing *et al.* 2006]. Most stable in the pH range 5–7 [Callaway 2004]. The toxin must be kept frozen at –5° or colder until reconstituted, when it should be refrigerated and administered within 4 h [Thakker, Rubin 2004].

Botulinum Toxin B

Treatment of Spasmodic Torticollis

150.6 kDa

CAS—93384-44-2

Synonyms BoNT-B; botulin B.
Proprietary Names *Myobloc*; *NeuroBloc*.
Chemical Properties Colourless to light yellow solution. Most stable in the pH range 5–7. Purified toxin stable for 9 months when stored at room temperature and for >36 months when refrigerated (2° to 8°) [Callaway 2004].

Note The mouse bioassay is the currently accepted method for detecting BoNT. Drawbacks of this method include the need to euthanise a number of animals and that the results are not available for several hours. ELISAs, which recognise protein antigenic sites, are less sensitive than the mouse bioassay [Karner, Allerberger 2006]. For an overview of immunoassays and polymerase chain reaction techniques, see Shone *et al.* [2006].
High Performance Liquid Chromatography Column: BioRad HiPore C_{18} reversed phase 304 (250 × 4.6 mm). Mobile phase: 0.1% trifluroacetic acid in water : 0.1% trifluroacetic acid in 70% acetonitrile (100 : 0 for 2.5 min to 55 : 45 for 28.5 min to 0 : 100 for 6 min), flow rate 1.0 mL/min. UV detection ($\lambda = 210$ nm). Total time for separation, ~60 min. Limit of detection not reported [Laing *et al.* 2006].
Liquid Chromatography-Mass Spectrometry Column: Phenomenex Luna C_{18} (150 × 1 mm i.d., 5 µm). Mobile phase: 1% formic acid in water : acetonitrile-1% formic acid in water (80 : 20; 100 : 0 to 20 : 80 at 25 min), flow rate 50 µL/min. ESI, MRM acquisition mode. Limit of detection, 0.62 LD_{50}/mL in mouse for serotypes A, B and F, and <0.31 LD_{50}/mL in mouse for serotype E [Barr *et al.* 2005]. Column: C_{18} (1 mm). MALDI-TOF or ESI, positive ion mode. Limits of detection for serotypes A, B, E and F were as follows:

Detection method	*Reaction time (h)*	*Limit of detection (U/mL)*			
		BoNT-A	*BoNT-B*	*BoNT-E*	*BoNT-F*
MALDI-TOF-MS	4	1.250	1.250	1.250	6.250
MALDI-TOF-MS	10 to 17	0.625	0.625	0.313	6.250
ESI-MS-(MS)	4	1.250	0.156	0.078	0.781
ESI-MS-(MS)	10 to 17	1.000	0.039	0.039	0.781

[Boyer *et al.* 2005].

Capillary Electrophoresis Capillary: Bare fused silica (37 cm × 50 µm i.d., 30 cm effective length). Buffer: 50 mmol/L HEPES (pH 8.4), 20 mol/L sodium chloride, 0.005% Tween-20 and 1 mmol/L EDTA. Fluorescence detection ($\lambda_{ex} = 488$ nm, $\lambda_{em} = 520$ nm). Total time for separation, 8 min. Limit of detection not reported [Laing *et al.* 2006].
Note For the AOAC official ELISA method for the detection of serotypes A, B, E and F, see Ferreira *et al.* [2003]; for a characterisation of serotypes C, D, E and F by MALDI and ESI mass spectrometry, see van Baar *et al.* [2004]. For a review of the laboratory diagnostics of botulism, see Lindstrom and Korkeala [2006]. The avian eyelid assay may represent a new diagnostic method for the detection of serotypes A, B and E, see Wang *et al.* [2007].
Disposition in the Body Once internalised in the presynaptic terminal, botulinum toxin causes an irreversible block of acetyl choline release. Functional recovery occurs after sprouting of new motor nerve terminals, which reaches its peak after 5–10 weeks.
Therapeutic Concentration Botulinum toxin A is currently in clinical trials for benign prostatic hyperplasia.
Toxicity BoNT-A is defined in terms of its biological activity; 1 unit is equal to the LD_{50} for IP injections in mice. The LD_{50} in monkeys is 39 U/kg, which implies LD_{50} in humans of 3000 units. The Centers for Disease Control and Prevention (CDC) report that there are 110 cases of botulism each year, 72% of which are infantile. For a case report of botulism caused by BoNT-B in a 4-week-old white boy, see Lavoie *et al.* [2006].

Most foodborne botulism results from the consumption of improperly prepared home-canned foods, although fermented foods, such as fish, seal and whale, have also been associated. Foodborne botulism has been reported from home-prepared fermented tofu [Centers for Disease Control and Prevention 2007], barbequed pork [Meusburger *et al.* 2006] and commercial carrot juice [Centers for Disease Control and Prevention 2006].

No human deaths have been associated with cosmetic or therapeutic botulinum toxin injections.

In late 2004, four cases of botulism following injections of a highly concentrated, unlicensed preparation of BoNT-A were reported. Serum toxin levels showed that three of the four patients had 23 to 41 times the estimated human lethal dose. A 100 µg vial of toxin from the same batch was found to contain sufficient toxin to cause 14 286 deaths by injection if disseminated evenly [Chertow *et al.* 2006].

A 34-year-old woman developed shortness of breath, difficulty swallowing, double vision, and generalised weakness 2 days after receiving what she had thought to be cosmetic BoNT. It was, in fact, research-grade toxin purchased from the Internet. She had plasma toxin concentrations that were 20 times the mouse LD_{50}. The patient showed signs of improvement 4 weeks after admission and had achieved a remarkable recovery after 14 weeks [Souayah *et al.* 2006].

A 3-year-old patient with cerebral palsy received a total dose of 40 U/kg BoNT-A as injections into both legs and her right arm. She presented with dysphagia, excessive drooling, and she had begun to aspirate on liquids. Her mother reported that the child suffered from sleep apnoea and within a month of the injections she had developed generalised weakness and a decline in her functional abilities. The severe weakness lasted 6 weeks but she was unable to hold her head up for 3 months. Since the initial evaluation, the child had received additional doses of BoNT-A in doses ranging from 17.7 to 20.0 U/kg with no adverse events [Crowner *et al.* 2007].
Note For a case of botulinophilia, see Kreyden *et al.* [2002].
Dose For cervical dystonia, 236 U IM divided between the affected muscles. For bletharospasm 1.25 to 2.5 U IM at each site. For strabismus 1.25 to 2.5 IM in vertical muscles and horizontal strabismus of less than 20 prism dioptres, 2.5 to 5.0 U in horizontal strabismus of 20 to 50 prism dioptres, and 1.25 to 2.5 U IM for persistant cranial nerve VI palsy ≥1 month in duration. For severe primary axillary hyperhydrosis, 50 U per axilla divided in multiple intradermal injections [Anderson 2004].

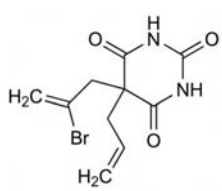
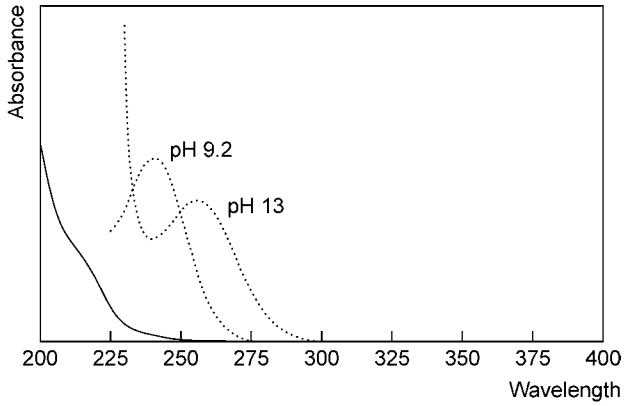
Brallobarbital

Sedative, Barbiturate
$C_{10}H_{11}BrN_2O_3 = 287.1$
CAS—561-86-4
IUPAC Name 5-(2-Bromoprop-2-enyl)-5-prop-2-enyl-1,3-diazinane-2,4,6-trione
Synonyms Brallobarbitone; 5-(2-bromo-2-propenyl)-5-(2-propenyl)-2,4,6 (1*H*,3*H*,5*H*)-pyrimidinetrione.
Proprietary Name It is an ingredient of *Vesparax*.

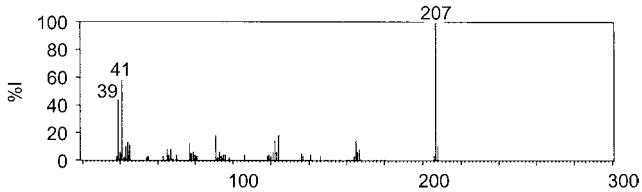


Chemical Properties Mp 168° to 169°. Log *P* (octanol/water), 1.4.
Colour Test Vanillin reagent—brown-orange.
Thin-layer Chromatography System TD—R_f 0.52; system TE—R_f 0.30; system TF—R_f 0.68; system TH—R_f 0.47; system TAD—R_f 0.57; system TAE—R_f 0.87.
Gas Chromatography System GA—brallobarbital RI 1853, brallobarbital-Me_2 RI 1725, M (2-OH-) RI 2040, M (desbromo-OH-) RI 1795; system GF—brallobarbital RI 2765; system GM—brallobarbital RRT 1.000 (relative to methylphenobarbital).
High Performance Liquid Chromatography System HG—*k* 3.09; system HH—*k* 1.72; system HX—RI 371; system HY—RI 336; system HZ—retention time 3.0 min.

Ultraviolet Spectrum Borax buffer 0.05 mol/L (pH 9.2)—240 (A^{1}_{1}=304b); 1 mol/L sodium hydroxide (pH 13) —256 nm (A^{1}_{1}=236b).



Mass Spectrum Principal ions at *m/z* 207, 41, 39, 124, 91, 165, 122, 44.



Quantification See under Amobarbital.

Plasma **GC** NPD. Limit of detection, 0.5 mg/L [Coudore *et al.* 1993].

Disposition in the Body Brallobarbital is absorbed after oral administration. About 5% of a dose is excreted in the urine as unchanged drug, 9% as 5-acetonyl-5-allylbarbituric acid and <1% each as 5-acetonyl-5-(2-bromoallyl)barbituric acid and 5-allyl-5-(2-hydroxypropyl)barbituric acid.

Toxicity

In 10 fatalities involving the ingestion of a preparation containing brallobarbital, quinalbarbital and hydroxyzine, the following postmortem concentrations, µg/g (mean, *N*) were reported:

	Brallobarbital	*Quinalbarbital*
Blood	9.8–25 (16.3, 9)	10–33.4 (17.7, 9)
Brain	1.9–24.1 (12.7, 10)	8.6–50 (29.3, 10)
Kidney	8.9–28.1 (20.4, 10)	14.5–83.4 (30.6, 10)
Liver	14.9–241 (50.2, 10)	23.1–231 (95.7, 10)
Urine	1.8–201 (40.8, 6)	1.0–7.1 (4.0, 6)

[Sticht, Kaferstein 1980].

In an overdose involving the ingestion of >3 g of brallobarbital (in combination with quinalbarbital), plasma concentrations of 106 mg/L of brallobarbital and 57 mg/L of quinalbarbital were reported 6 h and 4 h, respectively, after ingestion; the subject slowly recovered after treatment by haemoperfusion [de Groot *et al.* 1979].

Coudore F *et al.* (1993). Rapid toxicological screening of barbiturates in plasma by wide-bore capillary gas chromatography and nitrogen-phosphorus detection. *J Anal Toxicol* 17: 109–113.

Bretylium Tosilate

Antiarrhythmic, Antihypertensive

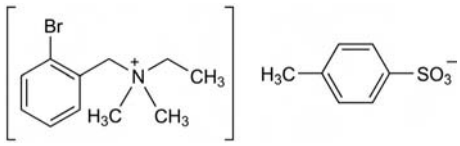
$C_{11}H_{17}BrN,C_7H_7O_3S = 414.4$

CAS—59-41-6 (bretylium); 61-75-6 (tosilate)

IUPAC Name (2-Bromophenyl)methyl-ethyl-dimethylazanium; 4-methylbenzenesulfonate

Synonyms Bretylium tosylate; 2-bromo-*N*-ethyl-*N*,*N*-dimethylbenzenemethanaminium 4-methylbenzenesulfonate.

Proprietary Names *Bretylate*; *Bretylol*.

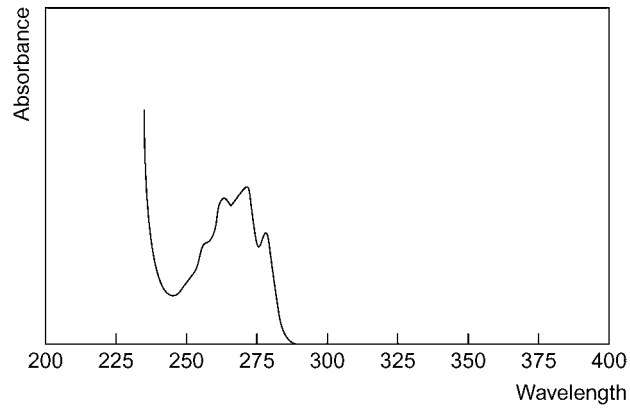


Chemical Properties A white crystalline powder. Mp 97° to 99°. Soluble 1 in 1 of water and 1 in 0.4 of ethanol; practically insoluble in ether, ethyl acetate and hexane.

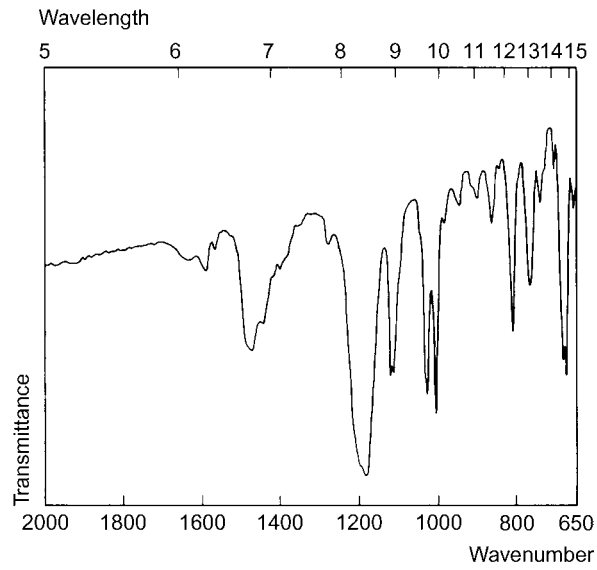
Thin-layer Chromatography System TA—R_f 0.01; system TN—R_f 0.94; system TO—R_f 0.40 (acidified iodoplatinate solution, positive).

High Performance Liquid Chromatography System HA—*k* 4.3 (tailing peak); system HY—RI 275.

Ultraviolet Spectrum Aqueous acid—263, 272 (A^{1}_{1}=22a), 278 nm. No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1188, 1012, 1032, 1120, 680, 815 cm^{-1} (KBr disk).



Quantification

Plasma **GC** ECD. Limit of detection, 5 µg/L [Lai *et al.* 1980]. ECD. Limit of detection, 1 µg/L [Patterson *et al.* 1980].

Urine **GC** See Plasma [Lai *et al.* 1980]. See Plasma [Patterson *et al.* 1980].

Myocardial Tissue **GC** See Plasma [Patterson *et al.* 1980].

Disposition in the Body Bretylium tosilate is poorly absorbed after oral administration. Excreted mainly in the urine as unchanged drug but a high proportion of bretylium is also excreted into the bile. After IV infusion about 70% of the dose is excreted in the urine in 24 h and 90% in 48 h. After chronic oral dosing about 20% of a dose is excreted in the 24-hour urine.

Therapeutic Concentration

After a single oral dose of 5 mg/kg to 10 subjects, peak serum concentrations of 0.04 to 0.14 (mean 0.08) mg/L were attained in 1 to 8 h; following IV infusion of 5 mg/kg over 30 min to the same subjects, serum concentrations at the end of the infusion were reported to be in the range 1.1 to 2.4 (mean 1.9) mg/L [Anderson *et al.* 1980].

Bioavailability About 25%.

Half-life Plasma half-life, about 7 to 10 h, increased in renal impairment.

Volume of Distribution About 8 L/kg.

Clearance Plasma clearance, about 11 mL/min/kg.

Protein Binding Not significantly bound.

Note For further information on bretylium tosilate, see Garrett *et al.* [1982].

Dose 5 to 10 mg/kg by IM injection. Bretylium tosilate has been given orally in doses of 0.3 to 1.2 g daily.

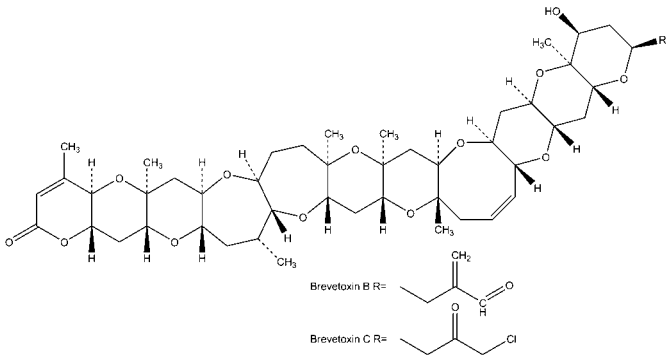
Brevetoxin

Sodium Channel Activator, Neurotoxin

Synonym BTX



Chemical Properties Brevetoxin is produced by the 'red-tide' dinoflagellate *Ptychodiscus brevis* Davis (*Karenia brevis,* formerly known as *Gymnodinium breve* Davis) , prevalent in the Gulf of Mexico and along the Florida coast [O'Neil *et al.* 2006]. One generic chemical structure of brevetoxins consists of an 11-member heterocyclic oxygen-containing fused ring system (or backbone) culminating in an unsaturated lactone at one end and at the other an unsaturated aldehyde (brevetoxin B), a halogen-containing alkyl group (brevetoxin C), an unsaturated alcohol (brevetoxin D), or an ether-ketone group (brevetoxin E). Another ring system includes the compound brevetoxin A and consists of a 10-member heterocyclic oxygen-containing ring backbone with an unsaturated lactone at one end and a saturated aldehyde at the other [Viviani 1992]. Several more compounds exist for both ring systems although they are not as commonly encountered. Decomposition of brevetoxins is accelerated in aqueous solution below pH 2 and above pH 10. Aqueous 0.1 mol/L sodium hydroxide degrades brevetoxins in minutes by saponification of the lactone in ring A. Ozonolysis and aqueous chlorine degrade brevetoxins by addition and cleavage at double bonds and by oxidation, respectively [Poli *et al.* 1990a].

Brevetoxin A

$C_{49}H_{70}O_{13}$ = 867.1

Synonym GB-1

Chemical Properties Fine prisms from acetonitrile. Mp 197° to 199°, 228° to 220° (double melting point) [O'Neil *et al.* 2006].

Brevetoxin B

$C_{50}H_{70}O_{14}$ = 895.1

Synonyms BTX-B; GB-2; T-34; T-47.

Chemical Properties Needles from acetonitrile. Mp 270° with decomposition [O'Neil *et al.* 2006].

Brevetoxin C

$C_{49}H_{69}ClO_{14}$ = 917.5

Synonym BTX-C

Ultraviolet Spectrum Methanol—208 nm (brevetoxins B and C).

Quantification

Urine **LC-MS** Column: C_{18} (250 × 2.0 mm i.d.). Mobile phase: acetonitrile : water with 0.1% formic acid (20 : 80 to 65 : 35 in 45 min), flow rate 0.2 mL/min. ESI or APCI, positive ion mode. Limit of quantification, 25 ng on-column [Poli *et al.* 2000].

Other **TLC** Rat Faeces. Plates: silica (10 × 20 cm, 0.2 mm thickness). Solvent system: chloroform : ethyl acetate : ethanol (50 : 25 : 25), drying stage and redeveloped in chloroform : ethyl acetate : ethanol (80 : 10 : 10). Radioactivity detection. R_f 0.74 (brevetoxin C). Limit of quantification not reported [Poli *et al.* 1990b].

HPLC Rat Skeletal Muscle. Column: C_{18} (250 × 4.0 mm i.d., 5 µm). Mobile phase: methanol : water (40 : 60 for 5 min to 85 : 15 over 10 min for 15 min), flow rate 0.8 mL/min. Radioactivity detection. Retention time: 22.5 min. Limit of quantification not reported [Poli *et al.* 1990b]. Monkey Buccal Mucosa and Skin. Column: C_{18} (360 × 2.0 mm i.d., 10 µm). Mobile phase: methanol : water (85 : 15), flow rate 0.5 mL/min. UV detection (λ = 215 nm). Retention time: 4.1 min (brevetoxin C). Limit of quantification not reported [Mehta *et al.* 1991]. Air, Seawater and Seafoam. Column: C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : water (85 : 15), flow rate 1 mL/min. UV detection (λ = 215 nm). Limit of quantification not reported [Pierce *et al.* 2003].

LC-MS *K. brevis* Cultures, Oysters. Column: C_8 (150 × 2.0 mm i.d., 5 µm). Mobile phase: water : acetonitrile with 0.1% acetic acid (50 : 50 for 2 min to 20 : 80 over 20 min, to 5 : 95 over 1 min for 6 min. ESI, positive ion mode, SIM acquisition mode. Limit of quantification not reported [Twiner *et al.* 2007]. Air and Seawater. Column: C_{18} (75 × 2.0 mm i.d., 3 µm). Mobile phase: water : 1 mmol/L ammonium acetate in methanol (80 : 20 for 1 min to 10 : 90 over 2 min for 7 min), flow rate 0.15 to 0.20 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification not reported [Cheng *et al.* 2005]. *K. brevis* Cultures, Oysters. Column: C_{18} (150 × 2.0 mm i.d.). Mobile phase: water : acetonitrile with 0.1% acetic acid (65 : 35 for 2 min to 20 : 80 over 28 min to 5 : 95 over 5 min for 15 min), flow rate 0.2 mL/min. Limit of quantification, 0.15 ng on-column (brevetoxin C) [Abraham *et al.* 2006; Plakas *et al.* 2004; Wang *et al.* 2004]. Rat Liver Microsomes. Column: C_{18} (100 × 2.1 mm i.d., 3.5 µm). Mobile phase: methanol : water (80 : 20 for 2.5 min, to 90 : 10 over 1 min), flow rate 0.2 mL/min. ESI, positive ion mode, CID. Retention time: brevetoxin B, 8.5 min; brevetoxin D, 7.8 min. Limit of quantification not reported [Wang *et al.* 2005]. Rat Blood and Urine. Column: C_{18} (150 × 2.0 mm i.d.). Mobile phase: water : acetonitrile with 0.1% acetic acid (65 : 35 for 2 min to 20 : 80 over 28 min to 5 : 95 over 5 min for 15 min), flow rate 0.2 mL/min. Limit of quantification, 0.15 ng on-column [Radwan *et al.* 2005].

CE Fish Samples. Column: Bare silica capillary (50 cm × 75 µm i.d.). Buffer: 10 mmol/L disodium borate : 30 mmol/L SDS : 10% methanol (pH 9.3). Fluorescence or UV detection (λ = 214 nm). Limit of quantification not reported [Shea 1997].

Note For the detection of brevetoxins using immunoassay methodology, see Poli *et al.* [2007] and Woofter *et al.* [2003].

Toxicity Brevetoxins, which are lipid soluble, act as depolarising substances in the membrane of the excitable cells, opening membrane channels permeable to sodium, leading to a sodium influx and causing neurotoxic poisoning.

One man, aged 49, and his 2 young children (3 and 4 years old) ate boiled whelks contaminated with brevetoxin. Urine samples were collected from the children ~3 h post-ingestion and the presence of brevetoxin was confirmed, with concentrations reported as 42 µg/L and 117 µg/L. No brevetoxin was detected 4 days later at follow-up examination. Total brevetoxin content in the whelks was measured and reported as 24.5 mg/kg [Poli *et al.* 2000].

Protein Binding Brevetoxin has a 50 to 100% preference to bind to high density lipoprotein over other lipoprotein classes, which is consistent with the difference in surface lipid to core lipid ratio of high density lipoprotein and high density lipoprotein particles. The binding of brevetoxin to the plasma remnants, of which albumin and α-glycoprotein represent the predominant components, is a third less than any of the lipoproteins. Brevetoxin in plasma can, therefore, be distributed by lipoproteins either to tissues for storage and/or biological action or to the liver for metabolism [Woofter, Ramsdell 2007].

Note For a study of the distribution of brevetoxin to lipoproteins in human plasma, see Woofter and Ramsdell [2007]. For a distribution and elimination study of brevetoxins in rats, see Poli *et al.* [1990b]. For a study on the metabolism of brevetoxin in rats, see Wang *et al.* [2005] and Radwan and Ramsdell [2006].

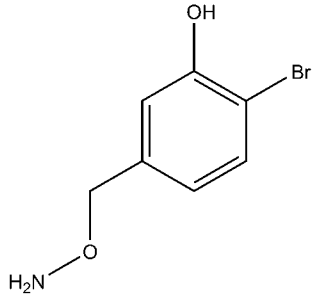
Brocresine

Histidine Decarboxylase Inhibitor

$C_7H_8BrNO_2$ = 218.0

CAS—555-65-7

IUPAC Name 5-(Aminooxymethyl)-2-bromophenol
Synonyms 5-Amino-oxymethyl-2-bromophenol; CL 54998; NSD 1055.
Proprietary Name *Contramine* is a phosphate.

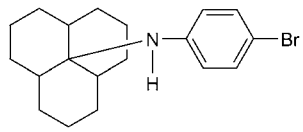


Chemical Properties White crystalline powder. Soluble in dilute acetic acid and chloroform. Brocresine is extracted by chloroform from aqueous alkaline solutions.
Colour Tests Ammonium vanadate test—green (limit of detection, 1.0 µg); Vitali's test—pale yellow/pale yellow/bright yellow (limit of detection, 0.5 µg).
Thin-layer Chromatography System T1—R_f 0.75 (location reagent potassium permanganate spray, positive reaction).
Gas Chromatography System G2/225—no peaks within 30 min; system G4/225—no peaks within 30 min.
Ultraviolet Spectrum Brocresine in 0.1 N sulfuric acid, maximum at 280 nm (E1%, 1 cm 86); inflexion at 225 nm (E1%, 1 cm 248); minimum at 250 nm.
Infrared Spectrum Principal peaks at wavenumbers A 1412, B 1121, C 1028 or 1285 cm^{-1} (KBr disk).
Disposition in the Body Brocresine is rapidly cleared from the plasma and/or metabolised. The inhibitory activity of the blood plasma disappears 2 h after administration [Ellenbogen *et al.* 1971].

Ellenbogen L *et al.* (1971). Assay and rapid disappearance of brocresine activity in blood. *Biochem Pharmacol* 20: 1501–1506.

Bromantane

Psychostimulant
$C_{16}H_{20}BrN$ = 306.2
CAS—87913-26-6
Synonyms Bromantan; *N*-(4-bromophenyl)tricyclo[3.3.1.13,7]decan-2-amine



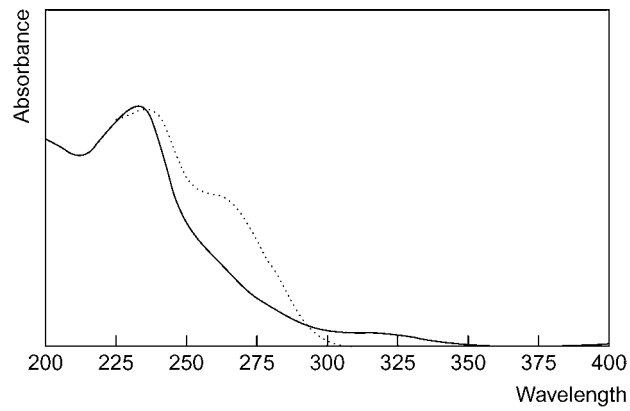
Disposition in the Body
Toxicity LD_{50} (oral) in rats >10000 mg/kg [Iezhitsa *et al.* 2002].
Use Bromantane is used as a performance-enhancing agent for muscles in athletes and as an immunostimulant [Burnat *et al.* 1997].

Burnat P *et al.* (1997). Bromontan, a new doping agent. *Lancet* 350: 963–964.
Iezhitsa IN *et al.* (2002). Toxic effect of single treatment with bromantane on neurological status of experimental animals. *Bull Exp Biol Med* 133: 380–383.

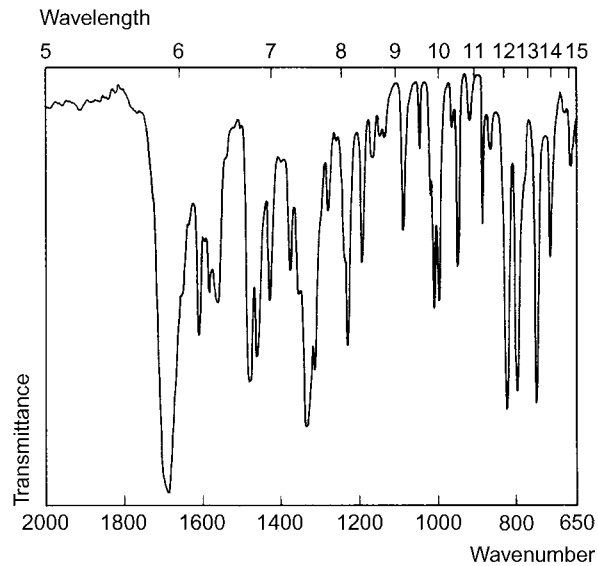
Bromazepam

Anxiolytic, Benzodiazepine, Tranquilliser
$C_{14}H_{10}BrN_3O$ = 316.2
CAS—1812-30-2
IUPAC Name 7-Bromo-5-pyridin-2-yl-1,3-dihydro-1,4-benzodiazepin-2-one
Synonyms Bromazepamas; bromazepamum; 7-bromo-1,3-dihydro-5-(2-pyridinyl)-2*H*-1,4-benzodiazepin-2-one; Ro-5-3350.
Proprietary Names *Compendium*; *Creosedin*; *Durazanil*; *Lectopam*; *Lexomil*; *Lexotan*; *Lexotanil*; *Normoc.*

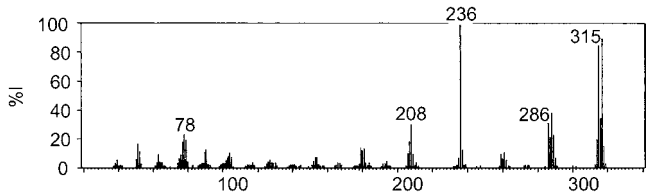
Chemical Properties A white or yellowish crystalline powder. Mp 237° to 238.5° with decomposition. Practically insoluble in water, sparingly soluble in alcohol and in dichloromethane. pK_a 2.9, 11.0. Log *P* (octanol/water), 2.05. Extraction yield (chlorobutane), 0.9 [Demme *et al.* 2005].
Colour Test Formaldehyde–sulfuric acid—yellow.
Thin-layer Chromatography System TA—R_f 0.61; system TB—R_f 0.06; system TC—R_f 0.41; system TD—R_f 0.13; system TE—R_f 0.63; system TF—R_f 0.18; system TL—R_f 0.53; system TAD—R_f 0.47; system TAE—R_f 0.73; system TAF—R_f 0.69; system TAJ—R_f 0.34; system TAK—R_f 0.04; system TAL—R_f 0.63.
Gas Chromatography System GA—bromazepam RI 2665; M (3-OH-) RI2470; system GB—bromazepam RI 2760; bromazepam-TMS RI 2702; M (3-OH-)-TMS_2 RI 2650; system GG—RI 3280.
Column: DB-17 (30 m × 0.32 mm, 0.25 µm). Temperature programme: 150° for 1 min to 230° for 5 min to 300° at 10°/min for 9 min. Injector and detector temperatures 270° and 300°, respectively. Carrier gas: He (pre-column pressure, 80 kPa). ECD. Retention time: 18 min [Guan *et al.* 1999].
Gas Chromatography-Mass Spectrometry Column: HP5-MS 5% phenyl 95% siloxane (30 m × 0.25 mm, 0.25 µm). Temperature programme: 60° for 1 min to 295° at 30°/min for 6 min. Injector temperature: 250°. Carrier gas: He, 1 mL/min. NCI. Retention time: 9.65 min [Cirimele *et al.* 1997].
High Performance Liquid Chromatography System HI—*k* 2.32; system HK—*k* 2.99; system HX—RI 397; system HY—RI 331; system HZ—RT 3.0 min; system HAA—RT 14.7 min; system HAF—RT 6.6 (tailing peak) min; system HAG—RT 25.5 (tailing peak) min; system HAX—RT 5.8 min; system HAY—RT 5.1 min; system HBH—*k* 1.63; system HBI—*k* 0.80; system HAL—RT 8.1 min; system HAM—not detected.
Column: RP C_{18} (150 × 3.9 mm i.d., 5 µm). Mobile phase: water : acetonitrile : TEA (700 : 300 : 4, pH 7.4), flow rate 2 mL/min . UV detection (λ = 240 nm). Retention time: bromazepam, 2.05 min, α-hydroxytriazolam (I.S.), 3.16 min [Le Solleu *et al.* 1993].
Ultraviolet Spectrum Aqueous acid—239, 345 nm; aqueous alkali—237 nm (A_1^1 = 920b), 348 nm; methanol—233 nm (A_1^1 = 1050b), 320 nm (A_1^1 = 61b)



Infrared Spectrum Principal peaks at wavenumbers 1685, 825, 750, 802, 1315, 1230 cm^{-1}.



Mass Spectrum Principal ions at m/z 236, 317, 315, 288, 316, 286, 208, 78 (bromazepam); 79, 78, 52, 105, 304, 314, 316, 51 (3-hydroxybromazepam).



Quantification

Blood **GC** Column: SE-54 fused silica 5% phenyl methyl silicone (25 m × 0.31 mm i.d., 0.17 μm). Carrier gas: He, 2–3 mL/min. Temperature programme: 200° for 1 min to 290° at 10°/min. NPD. Retention time: 6.99 min. [Lillsunde, Seppälä 1990].

GC-MS Column: DB5-MS (20 m × 0.18 mm i.d., 0.18 μm). Temperature programme: 70° for 0.5 min to 320° at 40°/min for 1 min. TOF-MS. Limit of detection, 0.63 ng [Aebi *et al.* 2002]. Column: HP-1 (13 m × 0.2 mm i.d., 0.33 μm). Carrier gas: He, 60 kPa. Temperature programme: 100° to 250° at 30°/min to 300° at 20°/min for 5 min. SIM acquisition mode (*m/z* 317). Limit of detection, 2–5 ng/g [Zhang *et al.* 1996].

LC-MS Column: Restek Allure C_{18} (150 × 3.2 mm i.d., 5 μm). Mobile phase: 5 mmol/L ammonium acetate (pH 4.75) : acetonitrile : methanol (90 : 5 : 5 to 50 : 25 : 25 at 7 min to 10 : 45 : 45 at 27 min for 3 min to 90 : 5 : 5 at 31 min), flow rate 0.45 mL/min. DAD-ESI detection. Limit of detection, 6 μg/L [Dussy *et al.* 2006]. Column: Uptisphere ODB 18. Mobile phase: 2 mmol/L formate buffer and acetonitrile. Limit of detection, <2 pg/mg [Chèze *et al.* 2005]. Column: XTerra MS C_{18} (150 × 2.1 mm i.d., 3.5 μm). Mobile phase: methanol : 0.006 mol/L formic acid (pH 3.0, 30 : 70 to 40 : 60 at 5 min to 50 : 50 at 25 min to 40 : 60 at 30 min to 60 : 40 at 35 min to 30 : 70 at 36 min for 9 min), flow rate 0.2 mL/min. Limit of quantification, 4.3 μg/L, limit of detection, 1.3 μg/L [Smink *et al.* 2004].

Plasma **GC** See Blood [Lillsunde, Seppälä 1990]. ECD. Limit of detection, 5 ng/mL [Klotz 1981].

HPLC Column: Kromasil C(8) (250 × 5 mm, 5 μm). Mobile phase: methanol, acetonitrile and 0.05 mol/L ammonium acetate. Limit of quantification, 0.3–20 mg/L [Uddin *et al.* 2008]. Column: Inertsil C_8 (250 × 4 mm, 5 μm). Mobile phase: 0.05 mol/L ammonium acetate, acetonitrile and methanol. UV detection (λ = 240 nm). Limit of detection, 3.3–10.2 ng/20 μL injection volume [Samanidou *et al.* 2007]. MRM acquisition mode. Limit of detection, 1 ng/mL [Goncalves *et al.* 2005]. SIM acquisition mode. Run time, 2.5 min. Limit of detection, 1 ng/mL [Andraus *et al.* 2004]. Column: Genesis C_{18} (100 × 2.1 mm, 4 μm). ESI. Run time 5 min. Limit of quantification, 5 ng/mL [Laurito *et al.* 2004]. See also Le Solleu *et al.* [1993], Boukhabza *et al.* [1989] and Hirayama *et al.* [1983].

LC-MS Column: LiChroCart (125 × 2 mm i.d.). Mobile phase: 5 mmol/L aqueous ammonium formate (pH 3.0) : acetonitrile (60 : 40 for 5.5 min to 10 : 90 until 8 min to 60 : 40 until 10 min), flow rate 0.4 mL/min for 5.5 min to 0.7 mL/min until 8 min to 0.65 mL/min until 9.5 min to 0.4 mL/min for 0.5 min. APCI, SIM or scan acquisition mode, positive ion mode. Limit of quantification, 0.04 mg/L (SIM), limit of detection, 0.01 mg/L (scan) [Kratzsch *et al.* 2004].

Serum **HPLC** Column: C_{18} reversed phase (100 × 4.6 mm, particle size 2 μm) or TSK gel Super-ODS (100 × 4.6 mm, particle size 5 μm). Mobile phase: methanol : 5 mmol/L monobasic sodium phosphate pH 6 (45 : 55), flow rate 0.65 mL/min. UV detection (λ = 254 nm) [Tanaka *et al.* 1996]. See Blood [Dussy *et al.* 2006].

LC-MS Column: Unison UK-C_{18} (150 × 2 mm i.d., 3 μm) or Cadenza CD-C_{18} (150 × 2 mm i.d., 3 μm). Mobile phase: 10 mmol/L aqueous ammonium formate containing 0.1% formic acid : methanol containing 0.1% formic acid (70 : 30 to 20 : 80 at 20 min for 5 min), flow rate 0.25 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention time: 12.6 min. Limit of quantification, 5.2 μg/L, limit of detection, 17.5 μg/L [Nakamura *et al.* 2009].

Urine **GC** Column: DB-17 (30 m × 0.32 mm i.d., 0.25 μm). Carrier gas: He, 80 kPa. Temperature programme: 150° for 1 min to 230° at 10°/min for 5 min to 300° at 10°/min for 9 min. ECD. Limit of detection, 160 ng/mL [Guan *et al.* 1999]

HPLC See Plasma [Uddin *et al.* 2008]. Limit of detection, 2.6–12.6/20 μL injection sample [Samanidou *et al.* 2007].

LC-MS See Blood [Chèze *et al.* 2005]. Column: Uptisphere ODB (100 × 2 mm i.d., 5 μm). Mobile phase: acetonitrile : 2 mmol/L formate buffer pH 3 (15 : 85 for 0.5 min to 10 : 90 for 10 min to 85 : 15 for 5 min), flow rate 200 μL/min. ESI, positive ion mode, SRM acquisition mode. Limit of quantification, 1 μg/L, limit of detection, 0.1 μg/L [Chèze *et al.* 2004].

Note For a fluorometric method for the detection of bromazepam, see Salem *et al.* [2004].

Adipose Tissue **GC-MS** See Blood [Zhang *et al.* 1996].

Brain **GC-MS** See Blood [Zhang *et al.* 1996].

Hair **LC-MS** See Blood [Chèze *et al.* 2005]. See Urine. Limit of quantification, 5 pg/mg, limit of detection, 1–2 pg/mg [Chèze *et al.* 2004].

Kidney **GC-MS** See Blood [Zhang *et al.* 1996].

Liver **GC-MS** See Blood [Zhang *et al.* 1996].

Lung **GC-MS** See Blood [Zhang *et al.* 1996].

Saliva **HPLC** See Plasma [Uddin *et al.* 2008].

Skeletal Muscle **GC-MS** See Blood [Zhang *et al.* 1996].

Spleen **GC-MS** See Blood [Zhang *et al.* 1996].

Disposition in the Body Bromazepam is well absorbed after oral administration, and peak plasma concentrations are usually achieved within 2 h. Approximately 70% of a dose is excreted in the urine in 72 h, including ~2% of the dose as unchanged bromazepam, ~27% as the glucuronide of 3-hydroxybromazepam, ~40% as the glucuronide of 2-amino-5-bromo-3-hydroxybenzoylpyridine and <1% as 2-(2-amino-5-bromobenz-oyl)pyridine.

Therapeutic Concentration

After a single oral dose of 12 mg, administered to 10 subjects, peak plasma concentrations of 0.11–0.17 mg/L (mean 0.13) were attained in 1–4 h. Steady-state concentrations of 0.08–0.15 mg/L (mean 0.12) were measured during dosing of 6 subjects with 9 mg daily [Kaplan *et al.* 1976].

Administration of bromazepam as a slow-release formulation to 24 healthy subjects resulted in maximum plasma concentrations of 11.05 μg/L at 8 h (dose 3 mg); the corresponding values for a conventional-release preparation were 10.21 μg/L, also at 8 h (2 doses of 1.5 mg) [Lerner *et al.* 2001].

After administration of a single oral dose of 6 mg to 32 healthy subjects, peak serum levels of 132 ng/mL were attained in subjects aged 60–81 years and lower levels (82 ng/mL) in those aged 21–29 years. Compared with the younger age group, the older age group had a smaller volume of distribution (1.44 and 0.88 L/kg, respectively), lower oral clearance (0.76 and 0.41 mL/min/kg, respectively) and increased serum free fraction (28.8% and 34.8%, respectively, unbound) [Ochs *et al.* 1987].

Toxicity

In a 68-year-old woman who was found unconscious and barely breathing, bromazepam intoxication was discovered to be the cause (a serum level of 6 mg/L was detected); normal functions were restored 12 days after the ingestion [Rudolf *et al.* 1998].

A 42-year-old woman ingested 420 mg bromazepam in a suicide attempt and survived despite being found unconscious outdoors in a state of semi-undress and suffering from hypothermia. Approximately 12 h after the ingestion, the blood concentration of bromazepam was 7.7 mg/L [Michaud *et al.* 2001].

In 57 patients who were admitted to hospital ~7.3 h after ingesting ~88 mg bromazepam, mostly with other drugs, average serum levels of bromazepam were 1.87 mg/L and the elimination half-life was ~29 h. Signs of toxicity were not seen at serum levels below 2.3 mg/L [Koyama *et al.* 2003]

Half-life Plasma half-life, 8–19 h (mean 12).

Volume of Distribution Approximately 0.9 L/kg.

Protein Binding 70%.

Dose Usually 3 to 18 mg daily in divided doses; up to a maximum of 60 mg daily in divided doses has been given to hospitalised patients.

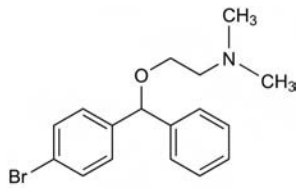
Bromazine

Antihistamine
$C_{17}H_{20}BrNO$ = 334.3
CAS—118-23-0

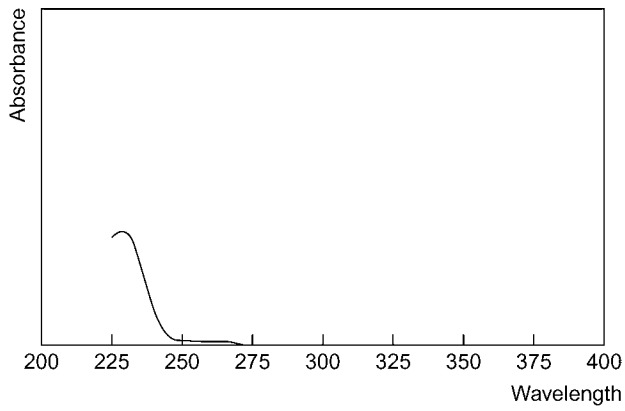
IUPAC Name 2-[(4-Bromophenyl)phenylmethoxy]-*N*,*N*-dimethylethanamine
Synonyms Bromodiphenhydramine; bromdiphenhydramine; histabromamine.



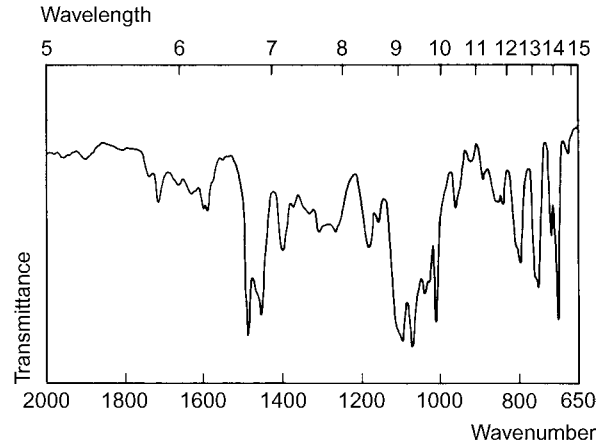
Chemical Properties pK_a 8.6 (25°).

Bromazine Hydrochloride
$C_{17}H_{20}BrNO,HCl$ = 370.7
CAS—1808-12-4
Proprietary Name *Ambodryl*
Chemical Properties A white to pale buff-coloured crystalline powder. Mp 148° to 152°. Soluble 1 in less than 1 of water, 1 in 2 of ethanol, 1 in 2 of chloroform and 1 in 31 of isopropyl alcohol; practically insoluble in ether.

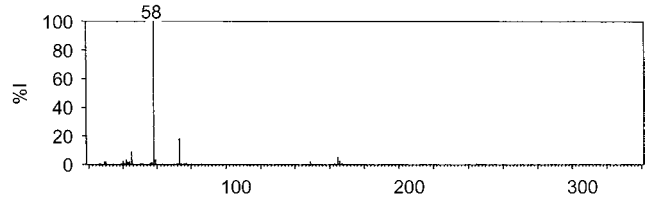
Colour Test Marquis test—yellow.
Thin-layer Chromatography System TA—R_f 0.54; system TB—R_f 0.44; system TC—R_f 0.43; system TL—R_f 0.13; system TAE—R_f 0.27; system TAF—R_f 0.48 (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, yellow).
Gas Chromatography System GA—RI 2155; system GF—RI 2480.
High Performance Liquid Chromatography System HA—*k* 2.7; system HX—RI 444.
Ultraviolet Spectrum Aqueous acid—230 nm (A_1^1=465a).



Infrared Spectrum Principal peaks at wavenumbers 1067, 1094, 1007, 696, 1041, 746 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 58, 73, 45, 165, 59, 42, 166, 149.

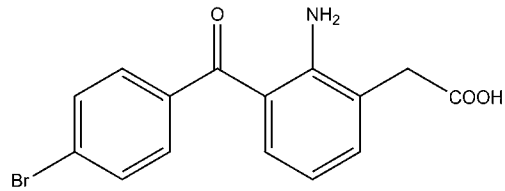


Disposition in the Body Absorbed after oral administration. A number of metabolites have been identified in the urine including the *N*-oxide, monodesmethyl and didesmethyl derivatives, 4-bromobenzhydrol, 4-bromobenzophenone and 4-hydroxybenzophenone; glucuronide conjugates of some of these metabolites have also been reported. Unchanged drug is also excreted in the urine.
Dose 75 to 100 mg of bromazine hydrochloride daily.

Bromfenac

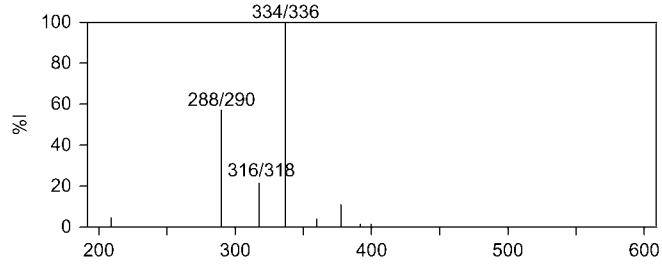
NSAID, Phenylacetic Acid Derivative
$C_{15}H_{12}BrNO_3$ = 334.2
CAS—91714-94-2

IUPAC Name 2-[2-Amino-3-(4-bromobenzoyl)phenyl]acetic acid
Synonyms AHR-10282; 2-amino-3-(4-bromobenzoyl)benzeneacetic acid.



Bromfenac Sodium
$C_{15}H_{11}BrNNaO_3,1^1/_2H_2O$ = 383.2
CAS—120638-55-3 (sesquihydrate); 91714-93-1
Synonym AHR-10282B
Proprietary Names *Bronuck*; *Duract*; *Xibrom*.
Chemical Properties Bright orange-yellow crystalline powder. Mp 284° to 286°, with decomposition. Soluble in water, methanol and in dilute base; insoluble in chloroform and in dilute acid. pK_a 4.29 [O'Neil *et al.* 2006].

Thin-layer Chromatography Solvent system: chloroform : acetone (80 : 20). Detection: Bratton-Marshall reagent. R_f 70 (acid hydrolysis product) [Holland, Schutz 1989].
Mass Spectrum



Quantification

Plasma **HPLC** Column: Hichrom (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.1 mol/L ammonium acetate (pH 4.9; 10 : 90 to 45 : 55 over 50 min for 10 min), flow rate 1.0 mL/min. UV detection (λ = 270 nm). Retention time: ~42 min. Limit of quantification not reported [Osman *et al.* 1998]. Column: µBondapak C_{18} (300 × 3.9 mm i.d., 10 µm). Mobile phase: 0.05 mol/L sodium acetate buffer (pH 6.5) : acetonitrile : tetrahydrofuran (55 : 39 : 6), flow rate 1.5 mL/min. UV detection (λ = 270 nm). Retention time: ~9.5 min. Limit of quantification, 30 µg/L [Osman *et al.* 1989].

LC-MS Column: C_{18} DB (250 × 2.0 mm i.d.). Mobile phase: acetonitrile : 0.1 mol/L ammonium acetate (pH 4.9; 10 : 90 to 45 : 55 over 50 min for 10 min), flow rate 0.2 mL/min. ESI, negative ion mode. Limit of quantification not reported [Osman *et al.* 1998].

Urine **HPLC** Column: Hichrom (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.1 mol/L ammonium acetate (pH 4.9; 10 : 90 to 45 : 55 over 50 min for 10 min)), flow rate 1.0 mL/min. UV detection (λ = 270 nm). Retention time: ~42 min. Limit of quantification not reported [Osman *et al.* 1998].

LC-MS Column: C_{18} DB (250 × 2.0 mm i.d.). Mobile phase: acetonitrile : 0.1 mol/L ammonium acetate (pH 4.9; 10 : 90 to 45 : 55 over 50 min for 10 min), flow rate 0.2 mL/min. ESI, negative ion mode. Limit of quantification not reported [Osman *et al.* 1998].

Disposition in the Body Rapidly absorbed after oral administration in the fasted state. When administered with food, less drug is absorbed and the peak plasma concentration decreases by ≈25%. The major metabolic pathway involves hepatic biotransformation via oxidative and conjugative mechanisms. One third of an orally administered dose is subject to first-pass metabolism in the liver and gut wall. Approximately 80% of a dose is excreted in the urine within 24 h, with the majority eliminated in the first 8 h. Urinary metabolites include a cyclic amide and 2 pairs of diastereomeric glucuronides of the hydroxylated cyclic amide. No metabolites have been observed in plasma.

Therapeutic Concentration

Sixteen healthy volunteers were administered 50 mg of bromfenac orally every 8 h for 3 days. Doses were given 30 min before or 2 h after food. The mean peak plasma concentration was 4.8 mg/L after 0.7 h. The concomitant administration of 300 mg phenytoin for 7 days resulted in a 40% fall in the bromfenac peak plasma concentration [Gumbhir-Shah *et al.* 1997].

A single drop of bromfenac ophthalmic solution (0.09%) was administered to 54 patients before cataract surgery. The mean peak aqueous humour concentration was 78.7 µg/L at between 2.5 and 3 h after dosing [Donnenfeld, Donnenfeld 2006].

A single oral dose of 50 mg bromfenac A was administered to 40 patients in the fasted state who had varying degrees of impaired kidney function. Pharmacokinetic parameters were reported as follows:

Treatment group	*Plasma bromfenac (mg/L)*	*Time (h)*	*Half-life (h)*	*Clearance (L/h/kg)*	*Volume of distribution (L/kg)*
Normal	3.4	0.8	0.9	0.13	0.15
Renal impairment	3.9	0.7	1.8	0.12	0.22
Dialysis	3.3	0.6	1.7	0.17	0.24

Total urinary excretion of unchanged bromfenac was less than 2% of the administered dose [Ermer *et al.* 1997].

Toxicity The oral formulation has been withdrawn from the market following reports of severe and sometimes fatal hepatic failure. For a case study of severe hepatotoxicity associated with bromfenac use, see Moses *et al.* [1999].

Bioavailability Approximately 67%.

Half-life 30 min to 4 h (with most studies reporting <1 h).

Volume of Distribution Apparent, 0.15 to 0.36 L/kg.

Clearance 0.12 to 9.6 L/h.

Distribution in Blood Blood : plasma ratio 0.2 to 0.3.

Protein Binding Extensively (>99%) bound to albumin.

Dose Used as 0.1% eye drops for ocular pain and inflammation, including postoperative inflammation in patients who have undergone cataract extraction.

Bromhexine

Mucolytic Expectorant

$C_{14}H_{20}Br_2N_2$ = 376.1

CAS—3572-43-8

IUPAC Name 2,4-Dibromo-6-[[cyclohexyl(methyl)amino]methyl]aniline

Synonym 2-Amino-3,5-dibromo-*N*-cyclohexyl-*N*-methylbenzenemethanamine

Chemical Properties Log *P* (octanol/water), 4.9.

Bromhexine Hydrochloride

$C_{14}H_{20}Br_2N_2$,HCl = 412.6

CAS—611-75-6

Synonym NA-274

Proprietary Names *Auxit*; *Bisolvon*; *Broncokin*; *Dakryo Biciron*; *Ophtosol*; *Quentan*. It is an ingredient of *Alupent Expectorant* and *Bisolvomycin*.

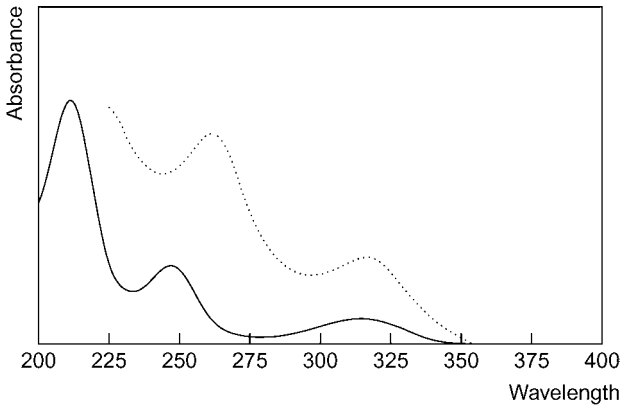
Chemical Properties A white crystalline powder. Mp about 235°. Soluble 1 in 250 of water, 1 in 100 of ethanol, 1 in 300 of chloroform and 1 in 50 of methanol; practically insoluble in acetone; soluble in glacial acetic acid.

Thin-layer Chromatography System TA—R_f 0.75; system TB—R_f 0.67; system TC—R_f 0.79; system TL—R_f 0.71; system TAE—R_f 0.84; system TAJ—R_f 0.98; system TAK—R_f 0.28; system TAL—R_f 0.78 (acidified iodoplatinate solution, positive).

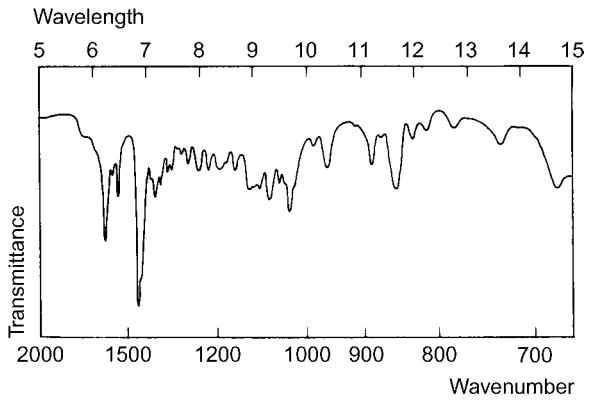
Gas Chromatography System GA—RI 2337.

High Performance Liquid Chromatography System HA—*k* 0.4; system HX—RI 417; system HY—RI 334; system HZ—retention time 7.5 min.

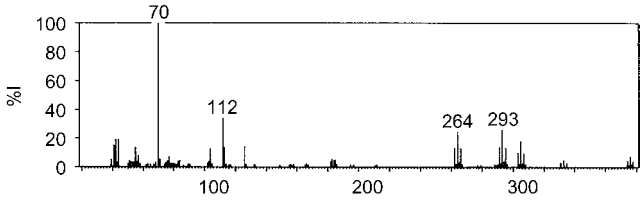
Ultraviolet Spectrum Aqueous acid—245 (A^{1}_{1}=259a), 310; aqueous alkali—262, 317 nm.



Infrared Spectrum Principal peaks at wavenumbers 1602, 1031, 1074, 1548, 1122, 857 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 70, 112, 293, 264, 44, 42, 305, 41.



Quantification
Plasma **GC** ECD. Limit of detection, 1 µg/L [DeLeenheer, Vandecasteele-Thienpont 1980].

HPLC UV detection. Limit of detection, 4 µg/L [Bechgaard, Nielsen 1982].
Urine **HPLC** UV detection. Limit of detection, 2 µg/L [Bechgaard, Nielsen 1982].
Disposition in the Body Bromhexine is well absorbed after oral administration but undergoes considerable first-pass metabolism including conjugation with glucuronic acid or sulfate; ambroxol, *trans*-4-(2-amino-3,5-dibromobenzylamino) cyclohexanol, is an active metabolite of bromhexine. About 70% of an oral dose is excreted in the urine in 24 h as metabolites with <1% as unchanged drug.
Therapeutic Concentration
Following single oral doses of 32 mg to 10 subjects, peak plasma concentrations of 0.01 to 0.14 (mean 0.04) mg/L were attained in 0.5 to 2.5 h [Bechgaard, Nielsen 1982].
Half-life Derived from plasma and urinary data, about 6 h.
Dose 24 to 64 mg of bromhexine hydrochloride daily.

Bechgaard E, Nielsen A (1982). Determination of bromhexine in human plasma and urine by high-performance liquid chromatography. *J Chromatogr* 228: 392–397.

Bromides

Anion

Organic bromide compounds such as the fumigant methyl bromide and the sedative agent carbromal, which give rise to inorganic bromide following ingestion, are dealt with in separate monographs.

Ammonium Bromide

BrH_4N = 97.9
CAS—12124-97-9
Chemical Properties White, odourless, slightly hygroscopic crystals or granules, slowly becomes yellowish in air. Sublimes at high temperature without melting. Freely soluble in water, methanol, ethanol and acetone; slightly soluble in ether; practically insoluble in ethyl acetate. Used in the manufacture of photographic film, plates and papers; in process engraving and lithography; for fireproofing of wood; in corrosion inhibitors; as a sedative.

Calcium Bromide

Br_2Ca = 199.9
CAS—7789-41-5
Chemical Properties Odourless, deliquescent granules or rhombic crystals; becomes yellow on long exposure to air. Mp 730° (anhydrous). Very soluble in water, methanol and ethanol; soluble in acetone; practically insoluble in dioxane, chloroform and ether. Used in photography, manufacture of mineral waters, fire extinguishing compositions, as a sedative, anticonvulsant.

Potassium Bromide

BrK = 119.0
CAS—7758-02-3
Chemical Properties Colourless crystals or white granules or powder. Mp 730°. Very soluble in water and glycerol. Used in the manufacture of photographic papers and plates, in process engraving, as a sedative, anticonvulsant.

Sodium Bromide

BrNa = 102.9
CAS—7647-15-6
Proprietary Name *Sedoneural*
Chemical Properties White crystals, granules or powder. Mp 755°. Very soluble in water and methanol; soluble in alcohol. Used in photography; as a sedative, hypnotic, anticonvulsant.

Colour Tests Applicable to urine, gastric contents and scene residues. To 1 mL of a clear test solution, add 0.1 mL of 2 mol/L nitric acid. Mix for 5 s and add 0.1 mL of 10 g/L aqueous silver nitrate solution. Centrifuge and add 0.1 mL of concentrated ammonium hydroxide—A white precipitate that dissolves in ammonium hydroxide indicates chloride; an off-white precipitate sparingly soluble in ammonium hydroxide indicates bromide, and a creamy-yellow insoluble precipitate indicates iodide. Limit of detection, 50 mg/L.

Confirmatory test. To a 1 mL portion of the clear test sample add 5 mL of chlorine solution and 3 mL of chloroform.—A yellow colour, which is extracted into the chloroform layer, indicates the presence of bromide; iodides give a violet colour and chlorides do not react. Limit of detection, 50 mg/L

Quantification
Specimen Collection Blood—10 mL, heparinised or EDTA tube; urine—20 mL plastic universal container; gastric contents (useful for postmortem examinations).
Note For a method for the detection of bromide in biological fluids using ion-sensitive electrodes, see Poser *et al.* [1974].
Blood **GC** Column: 60/80 Carbopak B/1% SP-1000. Carrier gas: He, 38 mL/min. Temperature programme: 45° for 3 min to 200° at 8°/min for 5 min. Retention time: 2.6 min. Limit of detection not reported [Michalodimitrakis *et al.* 1997].
Plasma **HPLC** Column: Hypersil APS (150 × 4.6 mm i.d., 5 µm). Mobile phase: 0.03 mol/L phosphate buffer (pH 2.8). UV detection (λ = 214 nm). Limit of detection, 1 ng [Goewie, Hogendoorn 1985].
Serum **GC** Column: Chromosorb G HP (2 m × 3 mm i.d.). Carrier gas: N_2, 40 mL/min. Temperature programme: 140°. Limit of detection, 1.2 nmol/L [Maros *et al.* 1989]. Column: 3% OV-17 Diatomite CQ (2.1 m × 2 mm i.d.). Carrier gas: N_2, 15 mL/min. Temperature programme: 145°. FID. Retention time: 2.1 min for bromo-2,4-dimethylphenol, 5.0 min for 2,3-dibromocyclohexanol. Limit of detection, 10 mg/L [Corina *et al.* 1979].

HPLC Column: Partisil-10 SAX (250 × 4.6 mm i.d.). Mobile phase: 30 mmol/L potassium dihydrogen phosphate, flow rate 0.7 mL/min. UV detection (λ = 195 nm). Limit of detection, 60 µg/L [Miller, Cappon 1984].

CE Capillary: Fused silica (total/effective length 100/87.7 cm × 75 µm i.d.). Mobile phase: 250 mmol/L sodium chloride and 7.5 mmol/L cetyltrimethylammonium chloride (pH 2.2). UV detection (λ = 226 nm). Limit of detection, 0.54 mg/L [Hirokawa *et al.* 2004].
Urine **GC** See Serum. Limit of detection, 10 mg/L [Corina *et al.* 1979].

CE Capillary: Fused silica (100/87.7 cm (total/effective length) × 75 µm i.d.). Mobile phase: 250 mmol/L sodium chloride and 7.5 mmol/L cetyltrimethylammonium chloride (pH 2.2). UV detection (λ= 226 nm). Limit of detection, 0.44 mg/L [Hirokawa *et al.* 2004].
Bile **GC** See Blood [Michalodimitrakis *et al.* 1997].
Brain **GC** See Blood [Michalodimitrakis *et al.* 1997].

Spleen **GC** See Blood [Michalodimitrakis *et al.* 1997].
Testis **GC** See Blood [Michalodimitrakis *et al.* 1997].
Adrenal Gland **GC** See Blood [Michalodimitrakis *et al.* 1997].
Milk **HPLC** See Plasma [Goewie, Hogendoorn 1985].
Disposition in the Body Bromide ion is poorly absorbed after oral ingestion. Approximately 4.3% of a dose is excreted daily in the urine. Smaller amounts are excreted in sweat and hair. Bromide ion is not bound to plasma proteins and is not sequestered in cells.
Normal Concentration Blood—<5 mg/L.
Toxicity Acute poisoning with inorganic bromide medicines is rare and has fewer severe consequences than those of chronic poisoning (bromism), which include fatigue, abdominal pain, hallucinations, delirium and coma. Therapeutic concentrations are 750 to 1000 mg/L. Following poisoning with these agents and organic forms that metabolise to inorganic bromide, signs of intoxication develop when serum bromide concentrations exceed 1000 mg/L and in severe cases these may exceed 3000 mg/L [Maes *et al.* 1985; Vaiseman *et al.* 1986].

A 30-year-old woman was admitted to hospital after ingesting 20 calcium bromogalactogluconate effervescent tablets daily for the prior 1.5 months. Her serum bromide concentration was 1717 mg/L (21.5 Eq/L) [Frances *et al.* 2003].

A 30-year-old woman presented with lethargy and fever. Her serum bromide concentration was 19.7 Eq/L following ingestion of 20 mg tablets of dextromethorphan hydrobromide [Hung 2003].

A 12-year-old girl was admitted to hospital with dizziness, nausea, vomiting and uncoordinated movements. Her blood bromide concentration was 202 mg/L. In a barn near her house were approximately forty 50-year-old fire extinguishers containing methyl bromide [Hoizey *et al.* 2002].

A 39-year-old man, a 34-year-old woman, and a 5-year-old girl were found in a state of akinetic mutism. Twenty seven cans of methyl bromide had been damaged in their building a few days before the onset of symptoms. On day 1, the man had a plasma bromide concentration of 72.9 mg/L, which decreased to 6.6 mg/L after dialysis on day 9. The woman had a plasma bromide concentration of 67.8 mg/L on day 1 and also had dialysis on day 9, which decreased her plasma bromide concentration to 7.3 mg/L. The 5-year-old girl had a plasma bromide concentration of 91.5 mg/L on day 1 that decreased to 7.5 mg/L following peritoneal lavage [Yamano *et al.* 2001].

A 36-year-old woman ingested 15 calcium bromogalactogluconate tablets daily prior to being admitted to hospital (recommended daily dose is one to two tablets). Her plasma bromide concentration was 37.5 mEq/L [Danel *et al.* 2001].

A 36-year-old woman was exposed to methyl bromide gas with 0.5% chloropicrin. At postmortem, methyl bromide was detected in the blood (2.9 mg/L), bile (1.7 mg/L), liver (24 mg/kg), and adipose tissue (28 mg/kg) [Horowitz *et al.* 1998].

A 40-year-old man complained of headache, fatigue and loss of concentration. His serum bromide concentration was 3180 mg/L (39.8 mmol/L). Following haemodialysis, his bromide concentration fell to 377 mg/L (4.7 mmol/L). The

patient had drunk a case or 2 of a cola beverage containing brominated vegetable oil daily [Horowitz 1997].

A 43-year-old man inhaled an unknown quantity of methylbromide solution. Postmortem concentrations (mg/kg or mg/L) of methyl bromide and inorganic bromide were as follows:

Specimen	*Methyl bromide*	*Inorganic bromide*
Adrenal gland	3.4	130
Bile	1.2	ND
Brain	3.5	30
Epididymis	1.2	ND
Kidney	2.6	310
Liver	1.9	290
Lung	2.9	410
Peripheral blood	3.3	480
Spleen	ND	460
Subclavian blood	3.8	530
Testis	2.8	120

ND, not determined. [Michalodimitrakis *et al.* 1997].

Note For a non-fatal ingestion of ethylene dibromide, see Prakash *et al.* [1999]; for an accidental exposure to methyl bromide, see Lifshitz and Gavrilov [2000].
Half-life 9–15 days.
Volume of Distribution 0.35–0.48 L/kg.

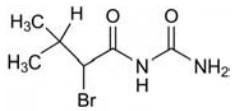
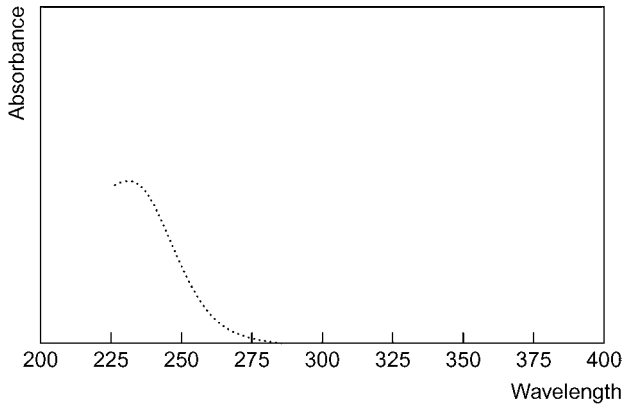
Bromisoval

Hypnotic, Sedative
$C_6H_{11}BrN_2O_2 = 223.1$
CAS—496-67-3

IUPAC Name 2-Bromo-*N*-carbamoyl-3-methylbutanamide
Synonyms *N*-(Aminocarbonyl)-2-bromo-3-methylbutanamide; bromvaletone; bromisovalerylurea; bromisovalum; bromvalerylurea; bromylum.
Proprietary Names *Bromural*. Bromisoval is an ingredient of *Seduan*, *Sekundal* and *Steno-Valocordin*.



Chemical Properties Small, white, acicular or scale-like crystals, which sublime on heating. Mp 147° to 149°. Soluble 1 in 500 of water, 1 in 15 of ethanol, 1 in 6 of chloroform, and 1 in 25 of ether; soluble in solutions of alkali hydroxides. pK_a 10.8. Log *P* (octanol/water), 1.14.
Colour Test Nessler's reagent—brown-orange.
Thin-layer Liquid Chromatography System TB—R_f 0.06; system TD—R_f 0.35; system TE—R_f 0.68; system TF—R_f 0.51; system TAD—R_f 0.52; system TAE—bromisoval R_f 0.84, α-(N-acetylcysteine-S-yl)-isovalerylurea R_f 0.87, dl-isovalthine R_f 0.77.
Gas Chromatography System GA—bromisoval RI 1540, M (Br-isovalerianic acid) RI 1190, M (OH-isovalerianic acid) RI 1140, M (isovalerianic acid carbamide) RI 1850.
High Performance Liquid Chromatography System HX—bromisoval RI 365, α-(N-acetylcysteine-S-yl)-isovalerylurea RI 312, dl-isovalthine RI 211, α-(cystein-S-yl)isovalerylurea RI 237; system HY—RI 307; system HZ—retention time 2.9 min.
Ultraviolet Spectrum Aqueous alkali—233 nm (A^1_1=160b).



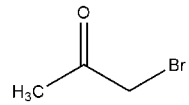
Infrared Spectrum Principal peaks at wavenumbers 1720, 1700, 1581, 1210, 1170, 1300 cm^{-1} (KBr disk). Polymorphism may occur.
Mass Spectrum Principal ions at *m/z* 44, 83, 180, 182, 137, 143, 139, 41.
Quantification
Biological Fluids **GC** FID. Limit of detection, 200 mg/L [Goldbaum, Domanski 1966].
Tissues **GC** See Biological fluids [Goldbaum, Domanski 1966].
Dose Bromisoval has been given in doses of 300 to 900 mg.

Goldbaum LR, Domanski TJ (1966). Detection and identification of micrograms of neutral drugs in biological samples. *J Forensic Sci* 11: 233–242.

Bromoacetone

Lachrymator
$C_3H_5BrO = 136.9$
CAS—598-31-2

IUPAC Name 1-Bromopropan-2-one
Synonyms Acetonyl bromide; 1-bromo-2-propanone; α-bromoacetone; martonite.



Chemical Properties Liquid, Mp −36.5°. Bp 137°. Turns violet rapidly even in the absence of air. Sparingly soluble in water, soluble in alcohol and acetone. Log *P* (octanol/water), 0.11 [Meylan, Howard 1995].
Quantification
Plasma **GC** Column: Heliflex AT 225 (30 m × 0.25 mm i.d., 0.25 μm). Temperature programme: 105° for 9 min to 185° at 40°/min for 5 min. ECD. Retention time 5.99 min [van Kreel 1994].
Urine See Plasma [van Kreel 1994].
Faeces See Plasma [van Kreel 1994].
Use Chemical war gas.

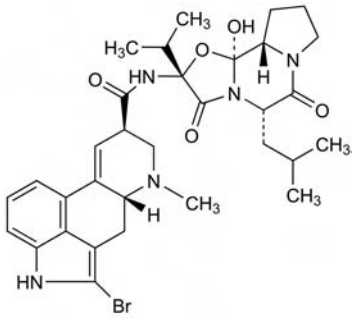
Bromocriptine

Dopaminergic Agent
$C_{32}H_{40}BrN_5O_5 = 654.6$
CAS—25614-03-3

Synonyms 2-Bromo-α-ergocryptine; bromocryptine; 2-bromoergocryptine; (5′α)-2-bromo-12′-hydroxy-2′-(1-methylethyl)-5′-(2-methylpropyl)-ergotaman-3′,6′,18-trione.

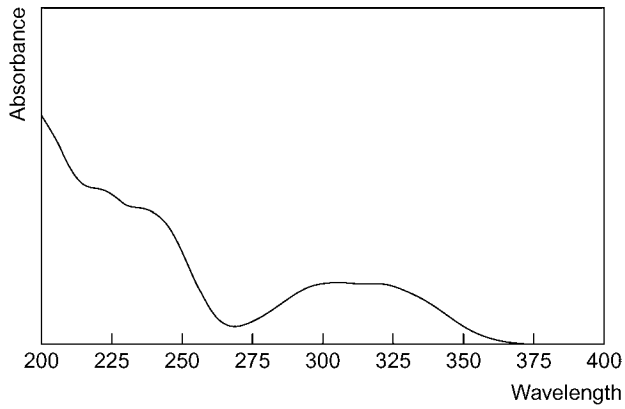


Chemical Properties Crystals. Mp 215° to 218°, with decomposition. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

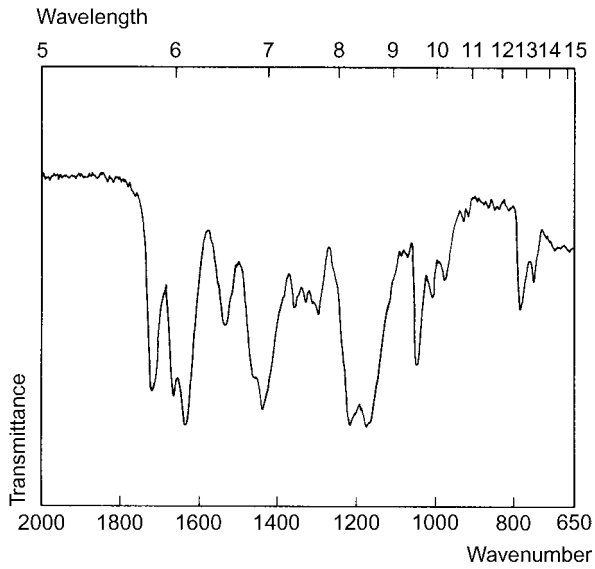
Bromocriptine Mesilate

$C_{32}H_{40}BrN_5O_5,CH_4O_3S = 750.7$
CAS—22260-51-1
Synonym Bromocriptine methanesulfonate
Proprietary Names *Parlodel*; *Pravidel*.
Chemical Properties A yellowish-white crystalline powder. Mp 192° to 196°, with decomposition.

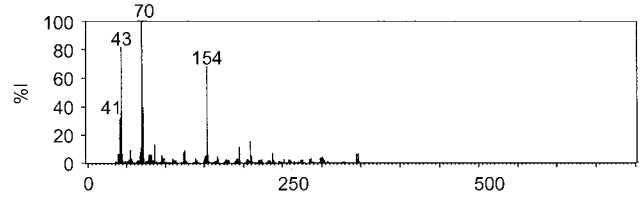
Thin-layer Chromatography System TA—R_f 0.72; system TB—R_f 0.00; system TC—R_f 0.69; system TL—R_f 0.61; system TAE—R_f 0.84; system TAF—R_f 0.88.
Gas Chromatography System GA—RI 2156.
High Performance Liquid Chromatography System HP—*k* 44.3; system HX—RI 456; system HZ—retention time 5.7 min; system HAA—retention time 16.7 min.
Ultraviolet Spectrum Aqueous acid—306 nm (A^1_1=138b); aqueous alkali—239 (A^1_1=373b), 300 nm (A^1_1=144b).



Infrared Spectrum Principal peaks at wavenumbers 1170, 1633, 1217, 1660, 1715, 1045 cm^{-1} (bromocriptine mesilate).



Mass Spectrum Principal ions at *m/z* 70, 43, 154, 71, 41, 209, 86, 195.



Quantification
Plasma **GC** Limit of detection, 0.5 µg/L [Larsen *et al.* 1979].
GC-MS Limit of detection, 1 µg/L [Larsen *et al.* 1979].
HPLC Limit of detection, 1 µg/L [Larsen *et al.* 1979].
Disposition in the Body Rapidly absorbed after oral administration. It undergoes extensive first-pass metabolism by hydrolysis and isomerisation to 2-bromolysergic acid and 2-bromoisolysergic acid, and, by hydroxylation, further oxidation and conjugation to produce a large number of metabolites. About 7% of a dose is excreted in the urine as metabolites together with a small fraction as unchanged drug. About 70% of a dose is eliminated in the faeces via the bile within 5 days of a single oral dose.
Therapeutic Concentration
Following a single oral dose of 25 mg to 9 subjects, peak plasma concentrations of 1 to 4 µg/L were attained in about 90 min; after single doses of 50 and 100 mg to 7 and 5 subjects, respectively, peak plasma concentrations of 3 to 20 µg/L (mean 10) and 6 to 25 µg/L (mean 10) were attained in about 90 to 120 min [Price *et al.* 1978.]

Following daily oral administration of 60 to 150 mg in divided doses to 4 subjects, minimum steady-state plasma concentrations of 9 to 54 µg/L (mean 30) and saliva concentrations of 0.1 to 0.4 µg/L were reported [Friis *et al.* 1980.]

Half-life Plasma half-life, about 3 h.
Volume of Distribution About 3 L/kg.
Protein Binding 90 to 96%.
Dose The equivalent of 1.25 to 30 mg of bromocriptine daily. In Parkinsonism, the usual maintenance dose is the equivalent of 40 to 100 mg daily, but up to 300 mg daily has been given.

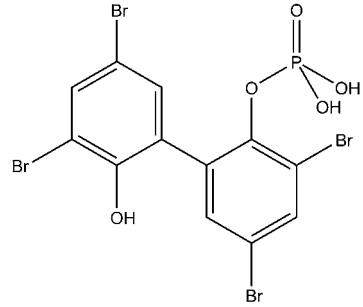
Bromofenofos

Anthelmintic, Organophosphate
$C_{12}H_7Br_4O_5P = 581.8$
CAS—21466-07-9
IUPAC Name [2,4-Dibromo-6-(3,5-dibromo-2-hydroxyphenyl)phenyl] dihydrogen phosphate
Synonyms BFF; bromophenophos; bromphenphos; PH-1882; 3,3′,5,5′-tetrabromo-(1,1′-biphenyl)-2,2′-diol mono(dihydrogen phosphate); 3,3′,5,5′-tetrabromo-2,2′-biphenyldiol mono(dihydrogen phosphate); 4,4′,6,6′-tetrabromobiphenyl-2,2′-diol mono(dihydrogen phosphate).
Proprietary Name *Acedist*



Chemical Properties Crystals with no mp; decompostion >350°. Very slightly soluble in water (0.0074 mg/L). Log *P* (octanol/water), 4.28 [Meylan, Howard 1995].
Quantification
Other **HPLC** Cow Milk. Column: Kaseisorb ODS-300-5 (250 × 4.6 mm i.d., 5.0 µm). Mobile phase: acetonitrile : 0.05 mol/L potassium dihydrogen phosphate

(pH 3; 55 : 45), flow rate 1 mL/min. Electrochemical detection. Limit of detection, 0.2 µg/L for dephosphate bromofenofos [Takeba *et al.* 1994]. Rat Plasma. Column: Nucleosil C_{18} (250 × 4.6 mm i.d., 5.0 µm). Mobile phase: acetonitrile : methanol : water : phosphoric acid (35 : 35 : 30 : 0.1), flow rate 1.0 mL/min. UV detection (λ = 210 nm). Retention times: 8.8 min for bromofenofos; 21.1 min for dephosphate metabolite. Limit of detection, 1.0 mg/L for both compounds [Endoh *et al.* 1988].

Disposition in the Body In animal toxicity studies, bromofenofos is hydrolysed mostly in the gastrointestinal tract to the dephosphate bromofenofos metabolite, which is the only compound detected in animal tissues.

Toxicity In animal studies, placental transfer occurs, resulting in teratogenic and embryolethal effects.

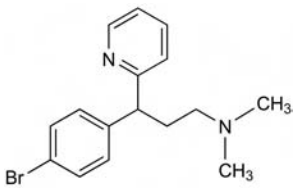
Brompheniramine

Antihistamine
$C_{16}H_{19}BrN_2$ = 319.2
CAS—86-22-6

IUPAC Name 3-(4-Bromophenyl)-*N*,*N*-dimethyl-3-pyridin-2-ylpropan-1-amine

Synonym γ-(4-Bromophenyl)-*N*,*N*-dimethyl-2-pyridinepropanamine; parabromdylamine.



Chemical Properties A slightly yellow, oily liquid. Miscible with dilute acids. pK_a 3.9, 9.2. Log *P* (octanol/water), 4.1.

Brompheniramine Maleate

$C_{16}H_{19}BrN_2,C_4H_4O_4$ = 435.3
CAS—980-71-2; 32865-01-3 (±)

Proprietary Names *Antial*; *Dimegan*; *Dimetane*; *Dimotane*; *Drauxin*; *Ebalin*; *Gammistin*; *Ilvin*; *Veltane*. It is an ingredient of *Dimotapp* and *Exyphen*.

Chemical Properties A white crystalline powder. Mp 132° to 134°. Soluble 1 in 5 of water, 1 in 15 of ethanol, and 1 in 15 of chloroform; slightly soluble in ether.

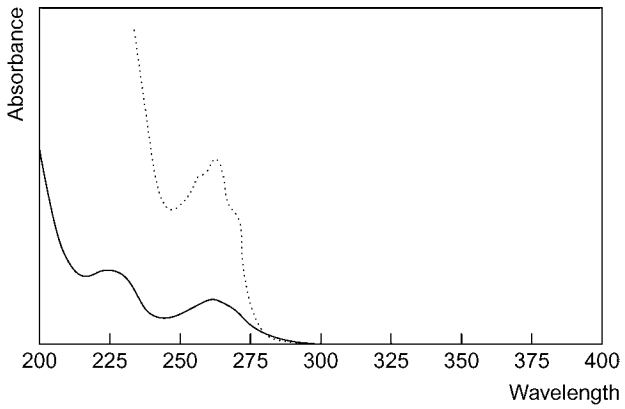
Colour Test Cyanogen bromide—orange.

Thin-layer Chromatography System TA—R_f 0.45; system TB—R_f 0.33; system TC—R_f 0.16; system TL—R_f 0.06; system TAE—R_f 0.12; system TAJ—R_f 0.01; system TAK—R_f 0.00; system TAL—R_f 0.28 (acidified iodoplatinate solution, positive).

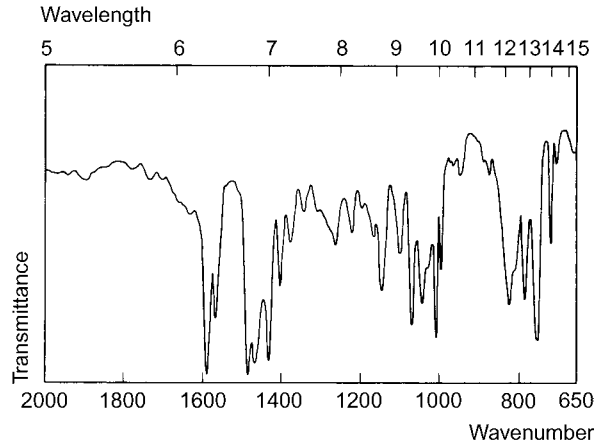
Gas Chromatography System GA—RI 2092; system GB—brompheniramine RI 2184, M (nor-) RI 2219, M (bis-nor-) RI 2203; system GC—RI 2457; system GF—RI 2470.

High Performance Liquid Chromatography System HA—*k* 4.1; system HY—RI 267; system HAA—retention time 13.9 min.

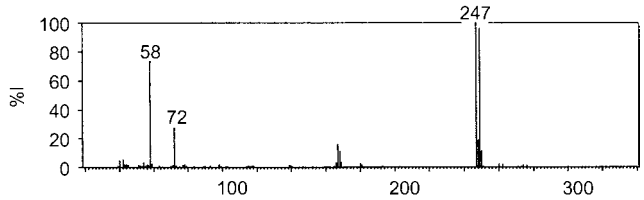
Ultraviolet Spectrum Aqueous acid—265 nm (A_1^1=272a); aqueous alkali—262 (A_1^1=177a), 269 nm.



Infrared Spectrum Principal peaks at wavenumbers 1585, 750, 1003, 1067, 1565, 1040 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 247, 249, 58, 72, 248, 167, 250, 168.



Quantification

Blood **GC** ECD. Limit of detection, 10 µg/L [Bruce *et al.* 1968].

Urine **GC** ECD. See Blood Bruce *et al.* [1968].

Disposition in the Body Absorbed after oral administration; accumulates in the body during chronic daily dosing. The main metabolic reactions are *N*-demethylation and deamination. About 50% of a ^{14}C-labelled dose is excreted in the urine in 5 days, with 10% of the dose as unchanged brompheniramine, 11% as monodesmethylbrompheniramine, 10% as didesmethylbrompheniramine, 4% as 3-(4-bromophenyl)-3-(2-pyridyl)-propionic acid, and 2% as its glycine conjugate; other unidentified polar metabolites are also present. <3% of the dose is eliminated in the faeces. Under steady-state conditions the daily excretion rate appears to be dependent on urinary pH and volume.

Therapeutic Concentration

After a single oral dose of 8 mg administered to 2 subjects, peak blood concentrations of 12 and 17 µg/L were attained in 3 h [Bruce *et al.* 1968.]

Fourteen children with a mean age of 9.5 years were administered 4 mg brompheniramine. Mean peak drug concentrations of 7.7 µg/L at 3.2 h [Simons *et al.* 1999.]

Half-life Plasma half-life, about 15 h.

Dose 12 to 32 mg of brompheniramine maleate daily.

Bruce RB *et al.* (1968). Determination of brompheniramine in blood and urine by gas-liquid chromatography. *Anal Chem* 40: 1246–1250.

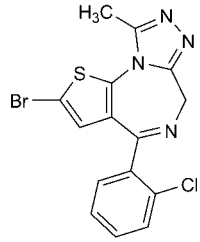
Brotizolam

Thienotriazolodiazepine, Sedative, Hypnotic
$C_{15}H_{10}BrClN_4S$ = 393.7
CAS—57801-81-7

Synonyms 2-Bromo-4-(2-chlorophenyl)-9-methyl-6*H*-thieno[3,2-f][1,2,4]triazolo[4,3-a][1,4]diazepine; WE-941-BS.

Proprietary Names *Dormex*; *Landormin*; *Lendorm*; *Lendormin*; *Lindormin*; *Mederantil*; *Nimbisan*; *Noctilen*; *Sintonal*.



Chemical Properties Colourless crystalline powder. Mp 212° to 214°. Water solubility of 1.078 mg/L at 25°. Log *P* (octanol/water) 2.79. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005]. Stable in serum after freeze–thaw cycles, in the

autosampler for at least 6 h and for 62 days at –30° [Nakamura *et al.* 2009]. Brotizolam was found to be stable in extracts for > 24 h at room temperature [Kratzsch *et al.* 2004].

Thin-layer Chromatography System TA—R_f 0.72 (brotizolam), R_f 0.68 (M-6-hydroxy), R_f 0.72 (M-α-hydroxy); system TAD—R_f 0.53 (brotizolam), R_f 0.37 (M-6-hydroxy), R_f 0.41 (M-α-hydroxy); system TAE—R_f 0.72 (brotizolam), R_f 0.76 (M-6-hydroxy), R_f 0.78 (M-α-hydroxy); system TAF—R_f 0.71 (brotizolam), R_f 0.76 (M-6-hydroxy), R_f 0.78 (M-α-hydroxy); system TAG—R_f 0.27 (brotizolam), R_f 0.13 (M-6-hydroxy), R_f 0.31 (M-α-hydroxy); system TB—R_f 0.05 (brotizolam), R_f 0.01 (M-6-hydroxy), R_f 0.02 (M-α-hydroxy); system TC—R_f 0.52 (brotizolam), R_f 0.35 (M-6-hydroxy), R_f 0.46 (M-α-hydroxy); system TD—R_f 0.15 (brotizolam), R_f 0.05 (M-6-hydroxy), R_f 0.07 (M-α-hydroxy); system TE—R_f 0.52 (brotizolam), R_f 0.28 (M-6-hydroxy), R_f 0.45 (M-α-hydroxy); system TF—R_f 0.05 (brotizolam), R_f 0.04 (M-6-hydroxy), R_f 0.06 (M-α-hydroxy).

Plates: silica gel 60 F_{254}. Mobile phase: methylene chloride : methanol (9 : 1) followed by toluene : isopropanol: 25% ammonia (5 : 4 : 1). UV detection (λ= 254 nm). We 964 R_f 0.59–0.62; We 1061 R_f 0.37–0.40 [Bechtel *et al.* 1986a].

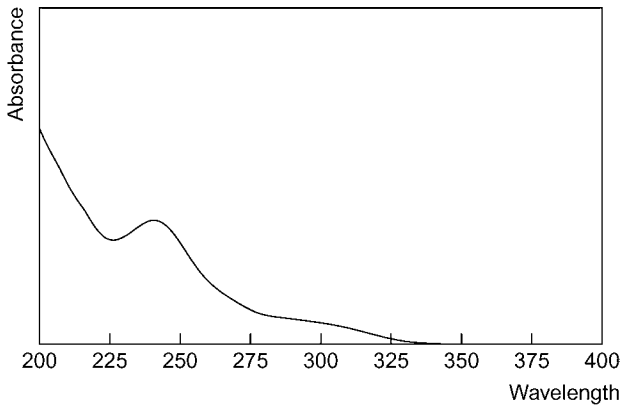
Plate: silica gel 60 F_{254} (10 × 10 cm). Mobile phase 1: cyclohexane : toluene : diethylamine (75 : 15 : 10); mobile phase 2: chloroform : methanol (90 : 10); mobile phase 3: chloroform : acetone (80 : 20). Dragendorff reagent for visualision. R_f 0.06 (mobile phase 1); R_f 0.52 (mobile phase 2); R_f 0.13 (mobile phase 3) [Otsubo *et al.* 1995].

Gas Chromatography System GA—RI 3070 (brotizolam), RI 3050 (M (OH-) Art (-CH_2O)).

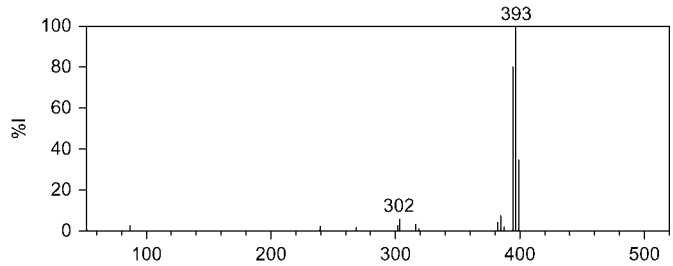
High Performance Liquid Chromatography System HAX—RT 7.4 min; system HAY—RT 7.9 min; system HX—RI 484; system HZ—RT 4.6 min.

Column: Nucleosil C_{18} (200 × 4.5 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.01 mol/L NH_4CO_3 : diethylamine (35 : 65 : 0.1), flow rate 1 mL/min. UV detection (λ=254 nm). Retention time: (metabolites) We 964, 10 to 11 min; We 1061, 12 to 13 min [Bechtel *et al.* 1986a].

Ultraviolet Spectrum Principal peak at 240 nm



Mass Spectrum Principal peaks at *m/z* 394, 245, 316, 210, 291, 176, 365, 313; (Hydroxybrotizolam) 55, 69, 83, 149, 95, 410, 245, 111.



Quantification

Blood **LC-MS** Column: XTerra MS C_{18} (150 × 2.1 mm i.d., 3.5 µm). Mobile phase: methanol : 0.006 mol/L formic acid (pH 3.0; 30 : 70 to 40 : 60 at 5 min to 50 : 50 at 25 min to 60 : 40 at 30 min for 5 min to 30 : 70 at 36 min for 9 min. APCI. Retention time: 29.8 min. Limit of quantification, 0.9 µg/L, limit of detection, 0.3 µg/L [Smink *et al.* 2004].

Plasma **GC** Column: 0.5% PPE and 3% OV-17 SCOT. Carrier gas: He, 10 mL/min. Temperature: 230°. Limit of detection, 2.0 µg/L [Jochemsen *et al.* 1983c]. Column: 1% OV-17 80-100 Chromosorb WHP (1.83 m × 2 mm i.d.). Carrier gas: He, 50 mL/min. Temperature: 290°. ECD. Limit of detection, 0.25 µg/L [Greenblatt *et al.* 1983].

HPLC C_{18} ultrabase (35 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : water (60 : 40), flow rate 0.9 mL/min. UV detection (λ= 240 nm). Limit of detection, 76 µg/L [Casas *et al.* 1993].

LC-MS Column: LiChroCart (125 × 2 mm i.d.). Mobile phase: 5 mmol/L aqueous ammonium formate (pH 3.0) : acetonitrile (60 : 40 for 5.5 min to 10 : 90 until 8 min to 60 : 40 until 10 min), flow rate 0.4 mL/min for 5.5 min to 0.7 mL/min until 8 min to 0.65 mL/min until 9.5 min to 0.4 mL/min for 0.5 min. APCI, SIM or scan acquisition mode, positive ion mode. Limit of quantification, 0.5 µg/L (SIM); limit of detection, 0.5 µg/L (scan) [Kratzsch *et al.* 2004].

Serum **HPLC** Column: LichroCART RP-18 (150 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : water: 0.1 mol/L phosphate buffer (pH 5.7; 60 : 20 : 20 or 65 : 15 : 20), flow rate 0.75 mL/min. Limit of detection, 0.1 mg/L [Otsubo *et al.* 1995]. Limit of detection, 2 µg/L [Musshoff, Daldrup 1992].

LC-MS Column: Unison UK-C_{18} ODS (150 × 2 mm i.d., 3 µm) or Cadanza CD-C_{18} ODS (150 × 2 mm i.d., 3 µm). Mobile phase: 10 mmol/L aqueous ammonium formate containing 0.1% formic acid : methanol containing 0.1% formic acid (70 : 30 to 20 : 80 at 20 min for 5 min), flow rate 0.25 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 3.5 µg/L; limit of detection, 1.0 µg/L [Nakamura *et al.* 2009].

Urine **HPLC** See Plasma [Casas *et al.* 1993].

Disposition in the Body Brotizolam is rapidly absorbed after oral administration and is completely metabolised to 2 major hydroxylated metabolites, including 6-hydroxylated brotizolam. Evidence from human liver microsomes and trials in healthy volunteers suggests that CYP3A4 is the isoenzyme predominantly responsible for the α- and 6-hydroxylation of brotizolam [Osanai *et al.* 2004; Senda *et al.* 1997; Tokairin *et al.* 2005]. The drug is more slowly absorbed in the elderly and if metabolic clearance is impaired. Metabolites are excreted in urine as glucuronide and sulfate conjugates (65%) and in the faeces (22%) with only 2 to 3% of the dose excreted unchanged [Bechtel *et al.* 1986b]. Brotizolam is rapidly distributed throughout the body.

Therapeutic Concentration The serum therapeutic concentration range is 1–20 µg/L.

Six healthy male volunteers were administered single 0.25 and 0.5 mg doses of brotizolam on 2 occasions in random sequence separated by at least 1 week. They fasted 8 h before and 3 h after each dose. Mean peak plasma brotizolam concentrations were 9.2 and 5.5 µg/L after the 0.5 and 0.25 mg dose, respectively. Peak concentrations were attained within 1.5 h of dosing [Greenblatt *et al.* 1983].

Twenty elderly patients; 10 males and 10 females aged between 71 and 93 years, and 8 young, healthy volunteers; 5 males and 3 females, 21 to 26 years old, were administered a 0.25 mg dose of brotizolam in the fasting state. Peak plasma concentrations ranged between 3.8 and 13.6 µg/L for the elderly patients and 5.0–6.6 µg/L for the young. These were reached within 1.1–1.7 h, respectively [Jochemsen *et al.* 1983d; Jochemsen *et al.* 1983b].

Eight healthy volunteers; 5 males and 3 females, 21–26 years old, were administered an oral dose of 0.5 mg brotizolam. Mean peak plasma concentrations were 7.3 ± 3.1 µg/L at 1.1 ± 1.0 h [Jochemsen *et al.* 1983e].

Eighteen patients with mild (CL_{CR} 45 to 80 mL/min), moderate (CL_{CR} 15–45 mL/min) or severe (CL_{CR} <15 mL/min) renal insufficiency were administered 0.25 mg brotizolam twice daily for 6 days and once on the seventh day. There was no delay in elimination in severe renal failure and there was no drug accumulation [Evers *et al.* 1983].

Eight male patients with liver cirrhosis aged between 34 and 64 years were administered 0.5 mg brotizolam orally. Peak plasma concentrations were 7.1 (3.2–10.7) µg/L in patients compared with 9.4 (2.9–19.0) µg/L in controls. Elimination half-lives were 12.8 (9.4–25) h in patients compared with 6.9 (4.4–8.4) h in controls [Jochemsen *et al.* 1983a].

Toxicity

A 42-year-old male was found dead; toxicological screening was carried out on his blood, urine and stomach contents. In his blood, 10.4 µg/L brotizolam, 3000 µg/L ibuprofen and 130 µg/L dihydrocodeine were found. In his urine, the brotizolam metabolite We 964, α-OH-triazolam, ibuprofen, dihydrocodeine and phenylpropanolamine were found at varying concentrations. Brotizolam and ibuprofen were detected in the stomach contents. It was determined that death occurred due to a combination of these drugs and alcohol poisoning [Saito *et al.* 1997].

Note For a review of the toxicology of brotizolam in animals, see Hewett *et al.* [1983].

Half-life The mean elimination half-life is 4.4 h for the unchanged drug and 9.5 h for the metabolites. In the elderly, the half-life increases to ~9.8 h for the parent drug.

Bioavailability 70%.

Volume of Distribution 0.45–0.72 L/kg in the elderly and 0.40–0.77 L/kg in the young.

Clearance For the elderly, 109 mL/min and the young, 40 mL/min.

Protein Binding ≈86–91% with serum albumin and 89–95% other plasma proteins [Bechtel 1983].

Dose The usual dose of 250 µg daily is reduced to 125 µg in the elderly and debilitated patients [Nicholson 1983].

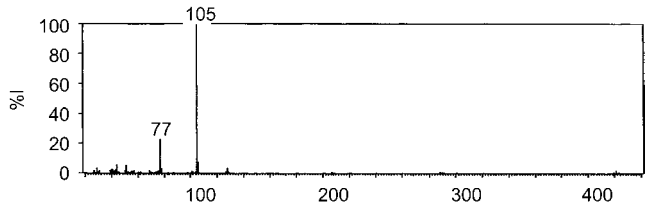
Broxaldine

Antiprotozoal
$C_{17}H_{11}Br_2NO_2$ = 421.1
CAS—3684-46-6
IUPAC Name 5,7-Dibromo-2-methyl-8-quinolyl benzoate
Synonym Brobenzoxaldine
Proprietary Name It is an ingredient of *Intestopan*.

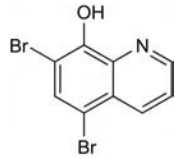
Chemical Properties An off-white powder. Practically insoluble in water; soluble in ether.
Colour Tests Mandelin's test—yellow; Marquis test—yellow; sulfuric acid—yellow.
Thin-layer Chromatography System TA—R_f 0.74; system TB—R_f 0.52; system TC—R_f 0.79; system TL—R_f 0.71; system TAE—R_f 0.78 (acidified iodoplatinate solution, strong reaction).
Gas Chromatography System GA—RI 2686.
Mass Spectrum Principal ions at *m/z* 105, 77, 106, 44, 51, 128, 78, 40.



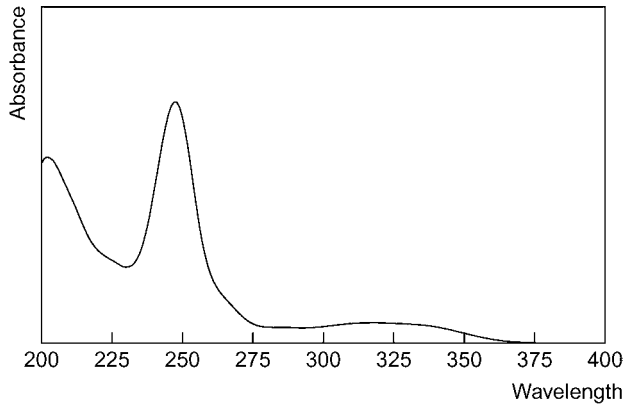
Dose 120 to 300 mg daily, usually in combination with broxyquinoline.

Broxyquinoline

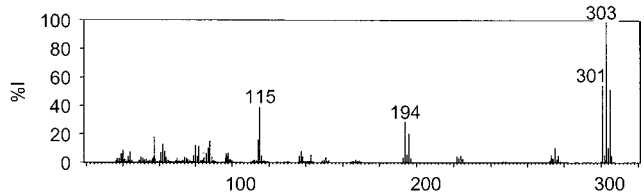
Antiprotozoal
$C_9H_5Br_2NO$ = 303.0
CAS—521-74-4
IUPAC Name 5,7-Dibromo-8-quinolinol
Synonym Broxichinolinum
Proprietary Name It is an ingredient of *Intestopan*.



Chemical Properties A cream-coloured powder. Mp 196°. Practically insoluble in water; freely soluble in acetic acid, benzene, chloroform and ethanol; slightly soluble in ether. Log *P* (octanol/water) 3.4.
Colour Tests Liebermann's reagent—orange; Marquis test—yellow; Millon's reagent—red; sulfuric acid—yellow.
Thin-layer Chromatography System TA—R_f 0.51; system TL—R_f 0.03; system TB—R_f 0.00; system TC—R_f 0.06 (acidified potassium permanganate solution, positive).
Ultraviolet Spectrum Aqueous acid—263 nm (A^1_1=800b); ethanol—249 (A^1_1=1525b), 325 nm (A^1_1=125b).



Infrared Spectrum Principal peaks at wavenumbers 1316, 1190, 930, 806, 1258, 782 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 303, 301, 305, 115, 194, 196, 114, 87.

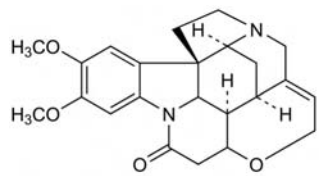


Quantification
Urine **Colorimetry** See Berggren, Hansson [1968] and Rodriguez, Close [1968].
Disposition in the Body Absorbed after oral administration. About 36% of a dose is excreted in the urine in 24 h, mainly as the glucuronide conjugate; very little unchanged drug is excreted and 8-hydroxyquinoline accounts for <2% of the dose.
Dose 0.6 to 1.5 g daily, usually in combination with broxaldine.

Berggren L, Hansson O (1968). Absorption of intestinal antiseptics derived from 8-hydroxyquinolines. *Clin Pharmacol Ther* 9: 67–70.
Rodriguez LA, Close JA (1968). The metabolism of the 5-7-dibromo-8-hydroxyquinoline (broxyquinoline) in man. *Biochem Pharmacol* 17: 1647–1653.

Brucine

CNS Stimulant
$C_{23}H_{26}N_2O_4$ = 394.5
CAS—357-57-3 (anhydrous)
Synonyms 2,3-Dimethoxystrychnidin-10-one; dimethoxystrychnine.

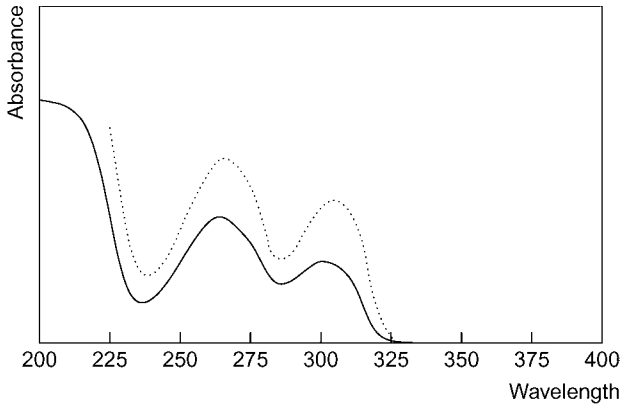


Chemical Properties An alkaloid present in the seeds of *Strychnos nux-vomica* and other species of *Strychnos (Loganiaceae)*. Small white crystals. Mp 178°. pK_a 2.3, 8.3 (25°). Log *P* (octanol/water), 1.0.

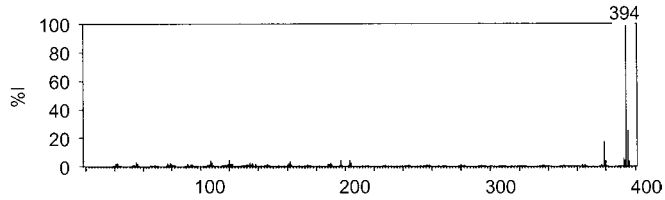
Brucine Sulfate
$(C_{23}H_{26}N_2O_4)_2,H_2SO_4,\ 7H_2O = 1013$
CAS—4845-99-2 (anhydrous); 60583-39-3 (heptahydrate)
Chemical Properties Small white crystals or powder. Soluble 1 in 75 of cold water, 1 in about 10 of boiling water, 1 in 105 of ethanol and 1 in 170 of chloroform.

Brucine tetrahydrate
$C_{23}H_{26}N_2O_4,4H_2O = 466.5$
Chemical Properties Becomes anhydrous at 100°. Soluble 1 in 1320 of water, 1 in 100 of benzene, 1 in 1.3 of ethanol, 1 in 5 of chloroform, 1 in 187 of ether, 1 in 25 of ethyl acetate and 1 in 36 of glycerol.

Colour Test Liebermann's reagent—red.
Thin-layer Chromatography System TA—R_f 0.16; system TB—R_f 0.00; system TC—R_f 0.17; system TL—R_f 0.01; system TAE—R_f 0.05; system TAF—R_f 0.07; system TAJ—R_f 0.04; system TAK—R_f 0.00; system TAL—R_f 0.64 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 3280.
High Performance Liquid Chromatography System HA—*k* 11.1 (tailing peak); system HX—RI 312; system HY—RI 267.
Ultraviolet Spectrum Aqueous acid—265 (A_1^1=330a), 300 nm; aqueous alkali—266 (A_1^1=320a), 304 nm.



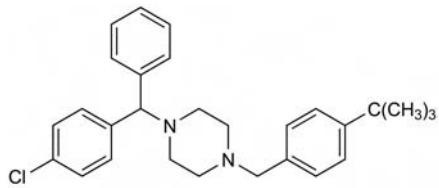
Infrared Spectrum Principal peaks at wavenumbers 1500, 1660, 1280, 1195, 1120, 1212 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 394, 395, 379, 392, 120, 197, 203, 393.



Buclizine

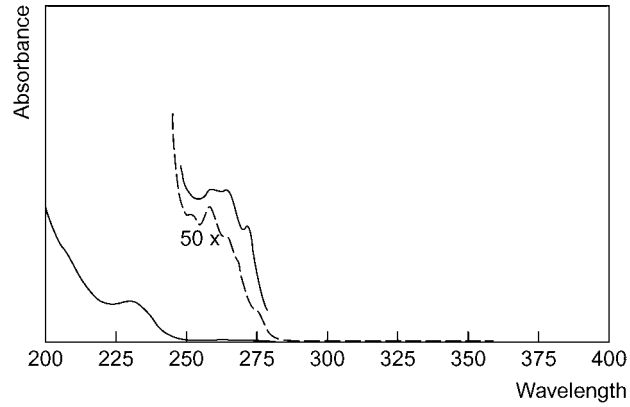
Antihistamine
$C_{28}H_{33}ClN_2 = 433.0$
CAS—82-95-1

IUPAC Name 1-[(4-Tert-butylphenyl)methyl]-4-[(4-chlorophenyl)-phenylmethyl] piperazine
Synonym 1-[(4-Chlorophenyl)phenylmethyl]-4-[[4-(1,1-dimethylethyl)phenyl]-methyl]piperazine

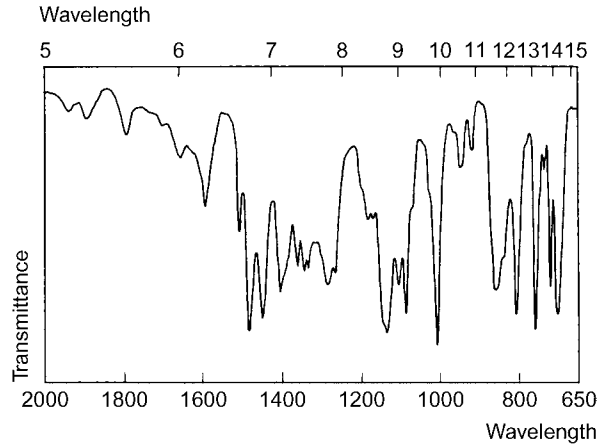


Buclizine Hydrochloride
$C_{28}H_{33}ClN_2,2HCl = 506.0$
CAS—129-74-8
Proprietary Names *Aphilan R*; *Bucladin-S*; *Longifene*. It is an ingredient of *Equivert* and *Migraleve* (pink tablets).
Chemical Properties A white crystalline powder. Mp 230° to 240°. Slightly soluble in water.

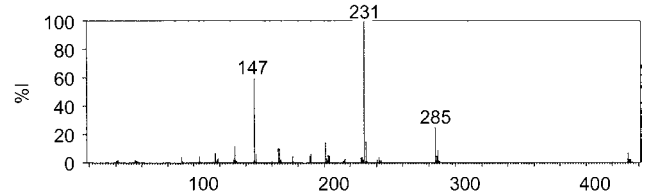
Thin-layer Chromatography System TA—R_f 0.75; system TB—R_f 0.61; system TC—R_f 0.83; system TL—R_f 0.72 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—buclizine RI 3360; M (desalkyl-) (norchlorcyclizine)-RI 2520; M (chlorobenzophenone (ClBP)-) RI 1850; M (OH-ClBP-) RI 2300; M (carbinol) RI 1750; system GB—buclizine RI 3461; M (4-chloromethylbiphenyl) RI 1688; M (4-chlorobiphenylmethanone) RI 1862.
High Performance Liquid Chromatography System HA—*k* 0.7; system HY—RI 454.
Ultraviolet Spectrum Methanol—255, 260 nm (A_1^1=19b).



Infrared Spectrum Principal peaks at wavenumbers 1002, 1131, 754, 800, 1075, 694 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 231, 147, 285, 232, 201, 132, 165, 166.

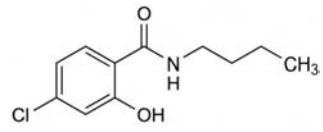


Dose 25 to 150 mg of buclizine hydrochloride daily.

Buclosamide

Antifungal
$C_{11}H_{14}ClNO_2 = 227.7$
CAS—575-74-6

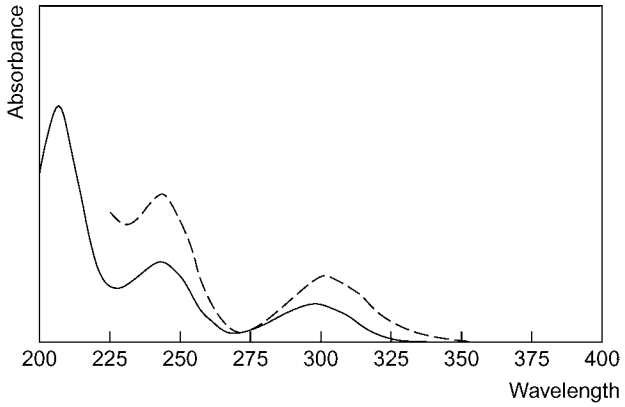
IUPAC Name *N*-Butyl-4-chloro-2-hydroxybenzamide



Chemical Properties A white crystalline powder. Mp about 91°. Practically insoluble in water; soluble 1 in 3 of ethanol, and 1 in 3 of ether. Log *P* (octanol/water) 3.6.

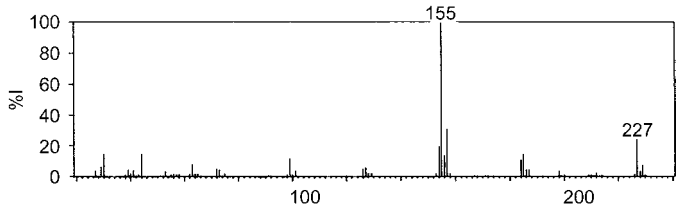
Colour Tests Folin-Ciocalteu reagent—blue; Mandelin's test—green→blue rim; Millon's reagent—red.
Thin-layer Chromatography System TA—R_f 0.90; system TB—R_f 0.02; system TC—R_f 0.67; system TL—R_f 0.70; system TAE—R_f 0.90 (location under ultraviolet light, blue fluorescence; acidified potassium permanganate solution, positive).

Ultraviolet Spectrum Aqueous acid—245 (A_1^1=532b), 297 nm (A_1^1=204b); aqueous alkali—247 (A_1^1=391b), 325 nm (A_1^1=323a); ethanol—243 (A_1^1=497a), 301 nm.



Infrared Spectrum Principal peaks at wavenumbers 1543, 898, 1190, 1590, 1201, 1506 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 155, 157, 227, 154, 185, 44, 30, 156.



Use Buclosamide has been applied topically at a concentration of 10%.

Budipine

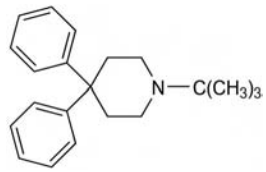
Dopaminergic Agent

$C_{21}H_{27}N$ = 293.4

CAS—57982-78-2

IUPAC Name 1-Tert-butyl-4,4-diphenylpiperidine

Synonyms Budipina; BY 701; 1-(1,1-dimethylethyl)-4,4-diphenylpiperidine.



Chemical Properties Crystals. Mp 73° to 75°. Bp 160° to 165°. pK_a 10.55. Log *P* (octanol/water), 5.10; −0.55 (pH 4.5); 1.49 (pH 7.4). Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Budipine Hydrochloride

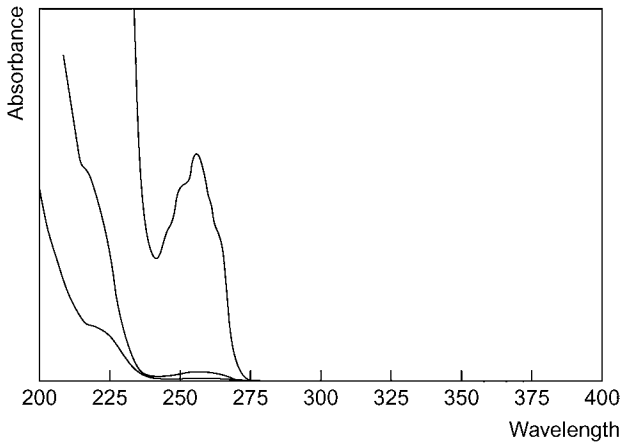
$C_{21}H_{28}ClN$ = 329.9

CAS—63661-61-0

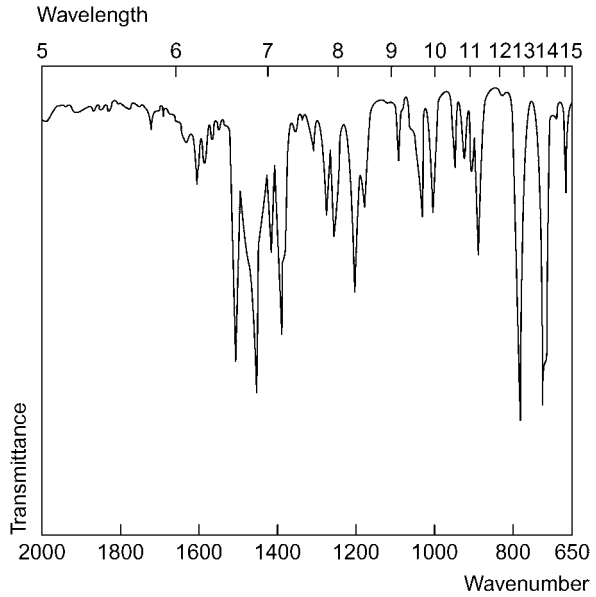
Proprietary Name *Parkinsan*

Chemical Properties Crystals.

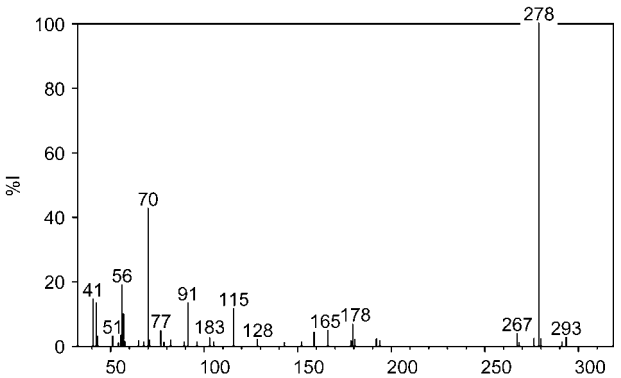
Ultraviolet Spectrum



Infrared Spectrum Principal peaks at wavenumbers 767, 698, 1446, 1496, 1383, 1242 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 278, 70, 56, 41, 42, 91, 115, 178.



Disposition in the Body It is well absorbed after oral administration (about 80%). It mainly metabolises to mono-*p*-hydroxybudipine, which is significantly less active than budipine. About 80% of a dose is excreted via the kidneys, partly as unchanged budipine and, to a greater extent, as the hydroxymetabolite.

Toxicity Can be poisonous intravenously.

Bioavailability Approximately 47%.

Half-life About 30 h.

Volume of Distribution 2.7 L/kg.

Protein Binding About 96%.

Dose Initially, 10 mg three times daily. Maximum dose of 60 mg. In patients with severe impairment of renal function or liver damage, the dose should not exceed 30 mg.

Demme U *et al.* (2005). Systematic evaluation of 1-chlorobutane for liquid-liquid extraction of drugs. *Proceedings of the 12th TIAFT*, Seoul: 481–486.

Bufexamac

Analgesic

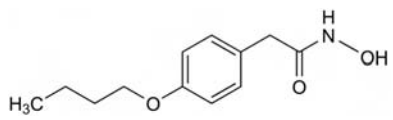
$C_{12}H_{17}NO_3$ = 223.3

CAS—2438-72-4

IUPAC Name 4-Butoxy-*N*-hydroxybenzeneacetamide

Synonym CP-1044-J3

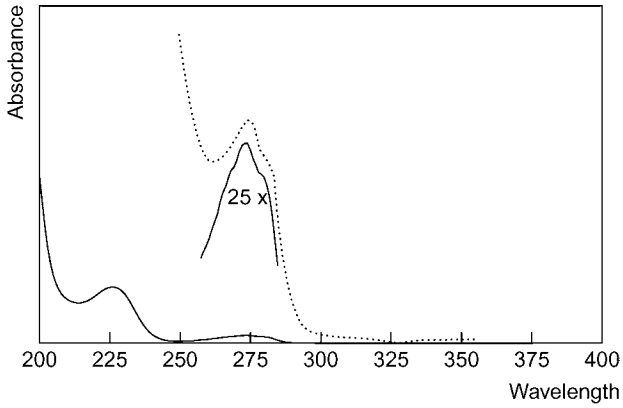
Proprietary Names *Droxaryl*; *Feximac*; *Malipuran*; *Mofenar*; *Norfemac*; *Paraderm*; *Parfenac*; *Parfenal*.



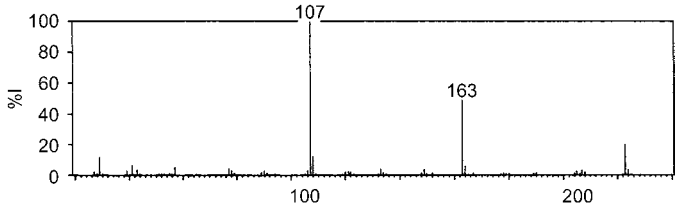
Chemical Properties Almost colourless pearly flakes. Mp 153° to 155°, with decomposition. Practically insoluble in water. Log *P* (octanol/water), 2.1.

Thin-layer Chromatography System TD—R_f 0.11; system TE—R_f 0.18; system TF—R_f 0.19; system TG—R_f 0.36; system TAD—R_f 0.31.

Gas Chromatography System GD—RRT 1.12 of methyl derivative, relative to n-$C_{16}H_{34}$.
High Performance Liquid Chromatography System HD—*k* 1.95.
Ultraviolet Spectrum Aqueous alkali—275 nm (A^1_1=72b).



Infrared Spectrum Principal peaks at wavenumbers 1612, 1234, 1515, 980, 1052, 1176 cm^{-1}.
Mass Spectrum Principal ions at *m/z* 107, 163, 223, 108, 29, 164, 41, 57.

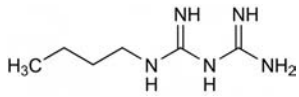


Dose 0.75 to 1.5 g daily.

Buformin

Antidiabetic
$C_6H_{15}N_5$ = 157.2
CAS—692-13-7

IUPAC Name 2-Butyl-1-(diaminomethylidene)guanidine
Synonym *N*-Butylimidodicarbonimidic diamide

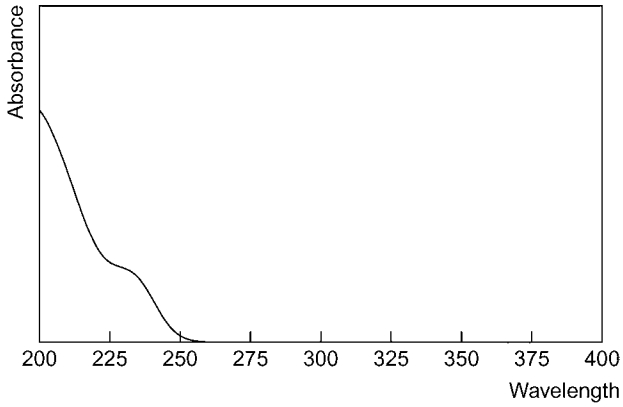


Chemical Properties Log *P* (octanol), −1.2.

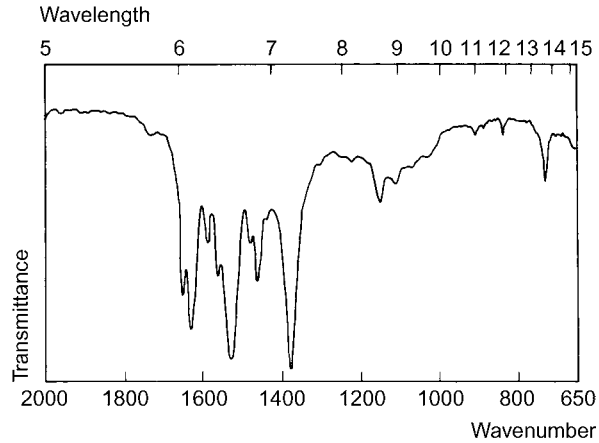
Buformin Hydrochloride

$C_6H_{15}N_5$,HCl = 193.7
CAS—1190-53-0
Proprietary Names *Silubin*; *Sindiatil*.
Chemical Properties A fine white crystalline powder. Mp 174° to 177°. Freely soluble in water and ethanol.

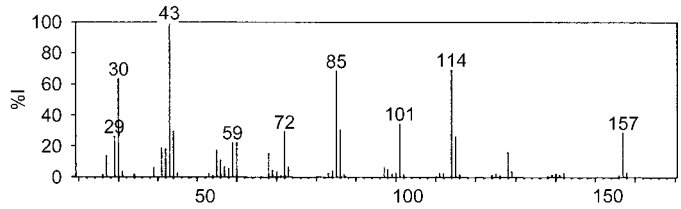
Thin-layer Chromatography System TA—R_f 0.02; system TB—R_f 0.00; system TC—R_f 0.00; system TL—R_f 0.00.
Gas Chromatography System GB—not eluted.
Ultraviolet Spectrum Aqueous alkali—230 nm (A^1_1=919b).



Infrared Spectrum Principal peaks at wavenumbers 1530, 1634, 1666, 1562, 1587, 1149 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 43, 114, 85, 30, 101, 86, 44, 72.



Quantification
Blood **UV Spectrophotometry** See Garrett *et al.* [1972].
Plasma **GC** ECD. Limit of detection, 1 µg/L [Matin *et al.* 1975].
UV Spectrophotometry See Garrett *et al.* [1972].
Urine **GC** See Plasma [Matin *et al.* 1975].
UV Spectrophotometry See Garrett, Tsau [1972].
Biological Fluids **GC** AFID. See de Groot *et al.* [1980].
Tissues **GC** AFID. See de Groot *et al.* [1980].
Disposition in the Body Absorbed after oral administration. About 35% of an oral dose is excreted in the urine as unchanged drug in 24 h and up to 30% is eliminated in the faeces; after IV administration about 90% is excreted unchanged in the urine in 12 h.
Therapeutic Concentration In plasma, usually in the range 0.2 to 0.6 mg/L. Following a single oral dose of 100 mg to 6 subjects, a mean peak plasma concentration of 0.4 mg/L was reported after 2.5 h; plasma concentrations >0.2 mg/L were maintained up to 8 h after the dose [Gutsche *et al.* 1976].
Toxicity Lactic acidosis is associated with plasma concentrations greater than 1 mg/L.
An 84-year-old diabetic died 6 h after admission to hospital with severe lactic acidosis caused by buformin. The plasma concentration on admission was 5.5 mg/L. Postmortem tissue concentrations were: plasma 3.2 mg/L, bile 6.3 mg/L, heart 3.0 µg/g, kidney 98 µg/g, liver 5.2 µg/g, lung 2.8 µg/g [de Groot *et al.* 1980].
Half-life Plasma half-life, about 2 to 6 h.
Volume of Distribution About 2 L/kg.
Protein Binding About 10%.
Dose 100 to 300 mg of buformin hydrochloride daily.

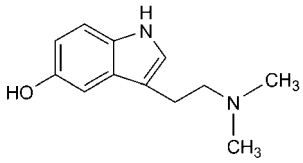
Bufotenine

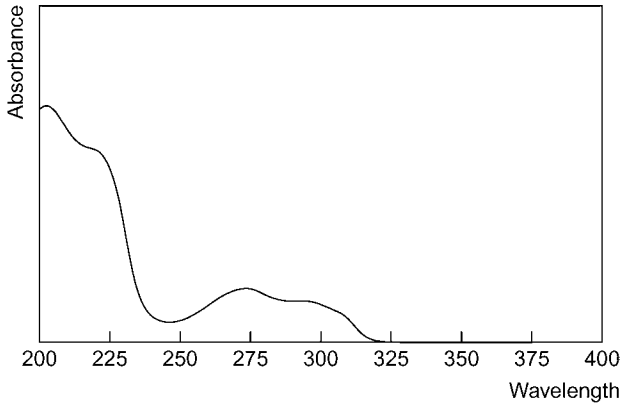
Hallucinogen
$C_{12}H_{16}N_2O$ = 204.3
CAS—487-93-4

IUPAC Name 3-[2-(Dimethylamino)ethyl]-1*H*-indol-5-ol
Synonyms *N,N*-Dimethylserotonin; 5-hydroxy-*N,N*-dimethyltryptamine; mappine.

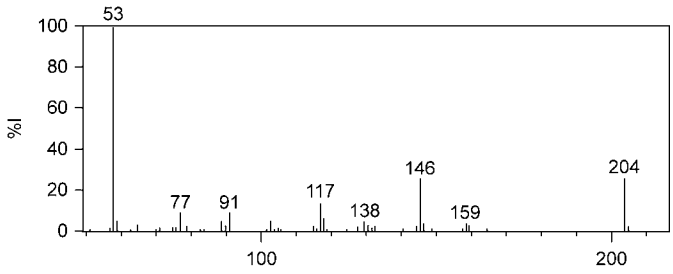


Chemical Properties An indole alkaloid obtained from the seeds and leaves of *Piptadenia peregrina* and *P. macrocarpa* (Mimosaceae). It has also been isolated from species of *Amanita* (Agaricaceae) and from the skin glands of toads (Bufo spp.). A white crystalline powder. Mp 138° to 140°. Almost insoluble in water; freely soluble in ethanol; slightly soluble in ether; soluble in dilute acids and alkalis. Log *P* (octanol) 0.06 [McBride 2000], 1.5.
Colour Test Marquis test—green-brown.
Thin-layer Chromatography System TA—R_f 0.35; system TB—R_f 0.00; system TC—R_f 0.01; system TE—R_f 0.33; system TL—R_f 0.01; system TAE—R_f 0.10; system TAF—R_f 0.34 (Van Urk reagent, violet).
Gas Chromatography System GA—RI 2057.

Column: 2% SE-30 on 80/100 mesh Gas-Chrom Q or 1% OV-225 on 100/200 mesh Gas-Chrom Q. Temperature: 190°. EI ionisation at 70 eV. SIM acquisition mode. Retention time: 0.55 and 0.62 min on the SE-30 and OV-225 columns, respectively (di-TMS derivative). Limit of detection, <5 pmol [Räisänen, Kärkkäinen 1978].
High Performance Liquid Chromatography System HA—*k* 3.1; system HY—RI 181.
Ultraviolet Spectrum Aqueous acid—278 (A_1^1 = 269b), 297 nm.



Infrared Spectrum Principal peaks at wavenumbers 1232, 824, 1493, 1615, 792, 1052 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 53, 204, 146, 117, 91, 77, 138, 159.



Quantification
Blood **HPLC** Column: Bondapak μC_{18} (1 ft × 0.25 in o.d.). Mobile phase: 0.01 mol/L sodium phosphate buffer (pH 7.6) : acetonitrile (40 : 60), flow rate 1.0 mL/min. UV detection (λ = 254 nm). Limit of detection, 5 pmol/L [Riceberg, Vunakis 1978].
Plasma **LC-MS** Column: Xterra MS C_{18} (100 × 2.1 mm i.d., 3.5 µm). Mobile phase: water : methanol (70 : 30) containing 1% acetic acid, flow rate 60 µL/min to 120 µL/min at 3 min for 2 min to 60 µL/min at 8 min for 2 min. ESI, SIR acquisition mode. Limit of detection, 300 ng/L [Kärkkäinen *et al.* 2005].
Serum **LC-MS** See Plasma [Kärkkäinen *et al.* 2005].
Urine **GC** Column: 1%-OV-101 on 80/100 mesh Gas-Chrom Q. Temperature: 210°. EI ionisation at 70 eV, MID. Limit of detection, 300 ng/L [Räisänen, Kärkkäinen 1979].

GC-MS Column: 1% OV-101 on 80/100 mesh Gas-Chrom Q. Temperature: 210°. EI ionisation. Limit of detection not reported [Räisänen 1984].

HPLC See Blood [Riceberg, Vunakis 1978].

LC-MS Column: C_8 Sunfire (100 × 2.1 mm i.d., 3.5 µm). Mobile phase: 10 mmol/L ammonium formate buffer (pH 3.5) : acetonitrile-methanol (2 : 1, 98 : 2 at 3.5 min to 80 : 20 at 4 min for 4 min to 2 : 98 at 11 min for 4 min to 98 : 2 at 11.5 min for 6.5 min), flow rate 0.3 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 10 µg/L, limit of detection, 0.0125 µg/L [del Mar Ramirez Fernandez *et al.* 2007]. See Plasma [Kärkkäinen *et al.* 2005]. Column: Spheri-5 RP-18 (100 × 1.0 mm i.d., 5 µm). Mobile phase: methanol : water with 0.2% formic acid (50 : 50), flow rate 40 µL/min. ESI, MRM acquisition mode. Limit of detection, 0.35 µg/L [Forsström *et al.* 2001].
Kidney **LC-MS** See Plasma [Kärkkäinen *et al.* 2005].
Lung **LC-MS** See Plasma [Kärkkäinen *et al.* 2005].
Other **GC-MS** Aphrodisiac Preparations. Column: DB-17 (30 m × 0.32 mm, 0.25 µm). Carrier gas: He, 12 psi. Temperature programme: 50° for 3 min to 320° at 20°/min. EI ionisation at 70 eV. Limit of detection not reported [Barry *et al.* 1996].
Disposition in the Body After the IV infusion of 0.2 and 1 mg bufotenine-s′-^{14}C to 2 healthy volunteers, >90% was excreted within 12 h, mainly as 5-hydroxyindoleacetic acid (68 and 74%). Only small amounts were excreted as the unchanged drug (1 and 6%) [Sanders-Bush *et al.* 1976].
Note For reviews of bufotenine, see Lyttle *et al.* [1996] and McBride [2000]. Bufotenine and other bufadienolides derived from toad venom or secretions have been used for their aphrodisiac properties, see Barry *et al.* [1996].

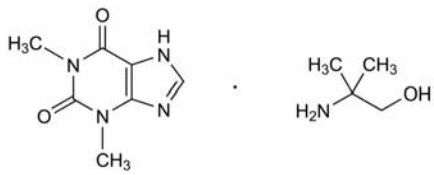
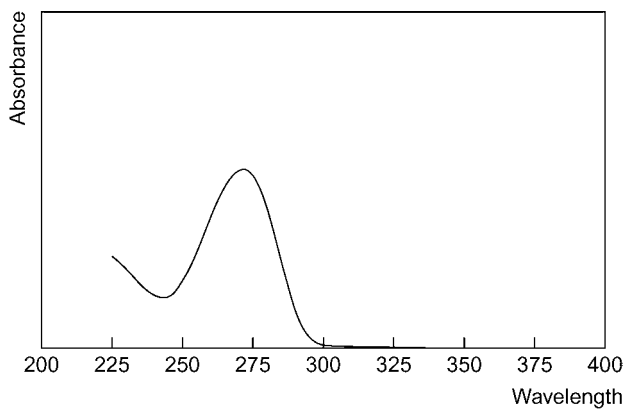
Bufylline

Xanthine Bronchodilator
$C_{11}H_{19}N_5O_3$ = 269.3
CAS—5634-34-4

IUPAC Name 2-Amino-2-methylpropan-1-ol; 1,3-dimethyl-7*H*-purine-2,6-dione
Synonyms Ambuphylline; 3,7-dihydro-1,3-dimethyl-1*H*-purine-2,6-dione compound with 2-amino-2-methyl-1-propanol (1:1); theophylline-aminoisobutanol.
Proprietary Names *Butaphyllamine*; *Buthoid*. It is an ingredient of *Nethaprin* and *Nethaprin Dospan*.

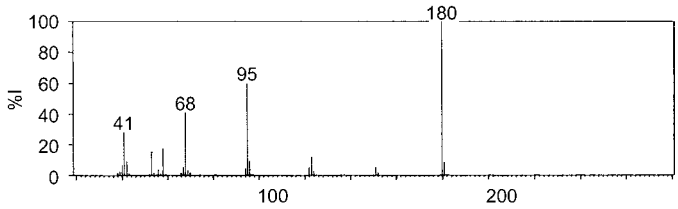


Chemical Properties A white crystalline powder. Mp 254° to 256°. Slightly soluble in water.
Colour Test Amalic acid test—red/violet.
Gas Chromatography System GA—RI 2301.
Ultraviolet Spectrum Aqueous acid—271 nm (A_1^1=350b).



Infrared Spectrum Principal peaks at wavenumbers 1665, 1712, 1636, 1562, 740, 1180 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 180, 95, 68, 41, 58, 53, 123, 96.



Dose 60 to 120 mg every 3 to 4 h.

Bumetanide

Diuretic

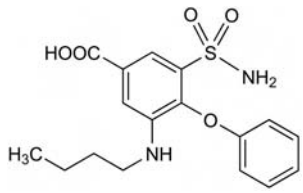
$C_{17}H_{20}N_2O_5S = 364.4$

CAS—28395-03-1

IUPAC Name 3-(Butylamino)-4-phenoxy-5-sulfamoylbenzoic acid

Synonyms 3-(Aminosulfonyl)-5-(butylamino)-4-phenoxybenzoic acid; PF-1593; Ro-10-6338.

Proprietary Names *Burinex*; *Fordiuran*.



Chemical Properties A white crystalline powder. Mp about 230°. Soluble 0.1 mg/mL water; 30.6 mg/mL ethanol; 18.7 mg/mL propylene glycol; >500 mg/mL dimethylacetamide; 76.5 mg/mL methanol; 0.4 mg/mL benzene; 21.6 mg/mL benzyl alcohol; 50.2 mg/mL acetone. Soluble in alkaline solutions. Log *P* (octanol/water), 2.6.

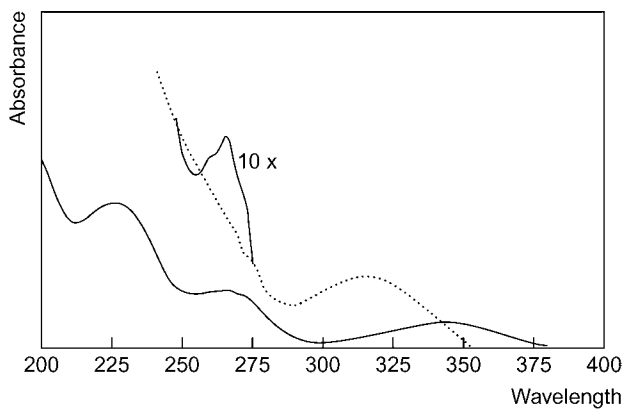
Colour Tests Koppanyi-Zwikker test—violet; Liebermann's reagent—brown-orange; mercurous nitrate—black.

Thin-layer Chromatography System TD—R_f 0.01; system TE—R_f 0.04; system TF—R_f 0.10; system TAD—R_f 0.06; system TAE—R_f 0.87; system TAJ—R_f 0.18; system TAK—R_f 0.42; system TAL—R_f 0.80.

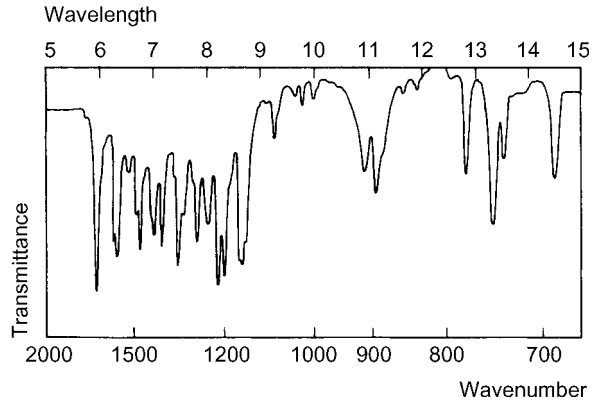
Gas Chromatography System GA—bumetanide-Me_3 RI 2970; system GX—bumetanide-Me_3 retention time 7.7 min; system GY—bumetanide-Me_3 retention time 4.9 min.

High Performance Liquid Chromatography System HAA—retention time 19.1 min.

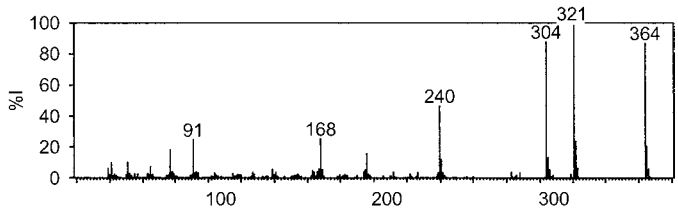
Ultraviolet Spectrum Aqueous acid—340 nm (A_1^1=80b); aqueous alkali—317 nm (A_1^1=87b).



Infrared Spectrum Principal peaks at wavenumbers 1695, 1215, 1199, 1153, 1587, 1280 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 321, 364, 304, 240, 168, 91, 322, 365.



Quantification

Plasma **HPLC** Fluorescence detection (λ_{em}=418 nm; λ_{ex}=228 nm). Limit of detection, 5 µg/L [Wells *et al.* 1991]. Fluorescence detection. Limit of detection, 5 µg/L [Smith 1982].

Serum **GC** FID. Limit of detection, 1 µg/L [Davies *et al.* 1974].

Urine **GC** See Serum [Davies *et al.* 1974].

GC–MS Limit of detection, 10 to 50 µg/L [Lisi *et al.* 1992].

HPLC Amperometric detection. Limit of detection, 0.25 µg/L [Legoburu *et al.* 2001]. See Plasma [Wells *et al.* 1991]. Fluorescence detection. Limit of detection, <10 µg/L [Graaden *et al.* 1990].

Disposition in the Body Rapidly and completely absorbed after oral administration. Metabolised to some extent by hydroxylation of the butyl side-chain to give the 2′-, 3′-, and 4′-alcohols; the 3′-carboxylic acid and desbutyl metabolites have also been reported. About 50% of a dose is excreted in the urine as unchanged drug in 24 h together with 4 to 6% as the 3′-alcohol. About 80% of a dose is excreted in the urine and 10% to 15% is eliminated in the faeces in 48 h.

Therapeutic Concentration

After a single dose of 1 mg given to 12 subjects, a mean peak plasma concentration of 0.03 mg/L was attained in 1 to 8 h [Holazo *et al.* 1984].

Half-life Plasma half-life, about 1 h.

Volume of Distribution About 0.2 L/kg.

Clearance Plasma clearance about 3 mL/min/kg.

Protein Binding About 96%.

Note For a review of bumetanide, see Ward, Heel [1984].

Dose Usually 1 to 2 mg daily; doses of 20 mg or more daily have been given.

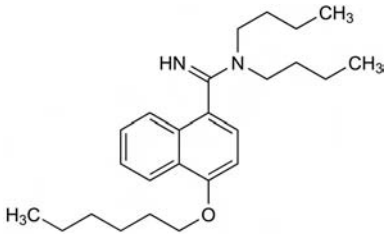
Bunamidine

Anthelmintic (Veterinary)

$C_{25}H_{38}N_2O = 382.6$

CAS—3748-77-4

IUPAC Name *N*,*N*-Dibutyl-4-(hexyloxy)-1-naphthalenecarboximidamide

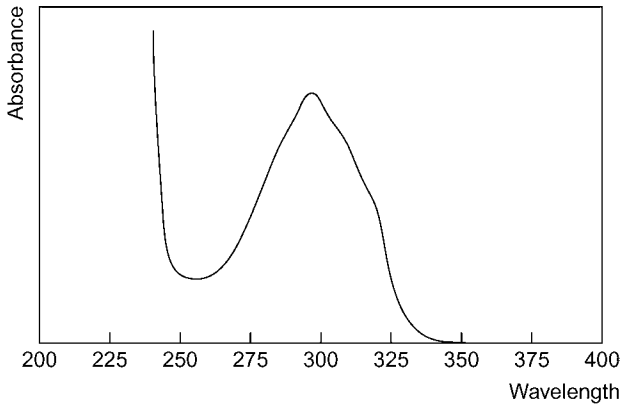


Bunamidine Hydrochloride
$C_{25}H_{38}N_2O,HCl = 419.0$
CAS—1055-55-6
Proprietary Name *Scolaban*
Chemical Properties A white crystalline powder. Mp about 210°. Soluble 1 in 200 of water, 1 in 2 of ethanol and 1 in 2 of chloroform; practically insoluble in ether.

Caution Bunamidine hydrochloride is irritant, especially to the eyes, and should be handled with care.

Bunamidine Hydroxynaphthoate
$C_{36}H_{46}N_2O_4 = 570.8$
CAS—13501-04-7
Proprietary Name *Buban*
Chemical Properties A pale yellow crystalline powder. Mp 169° to 170°. Practically insoluble in water; soluble 1 in 35 of ethanol, 1 in 3 of chloroform and 1 in 300 of ether.

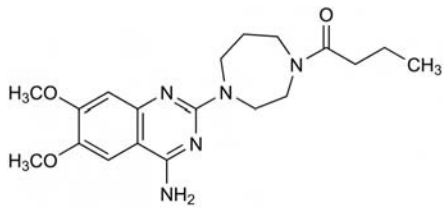
Colour Tests Mandelin's test—green; Marquis test—orange→red.
Thin-layer Chromatography System TA—R_f 0.64 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—not eluted.
Ultraviolet Spectrum Aqueous acid—298 nm (A^1_1=240a).



Infrared Spectrum Principal peaks at wavenumbers 1572, 1079, 1263, 1234, 763, 1511 cm^{-1} (KBr disk).

Bunazosin

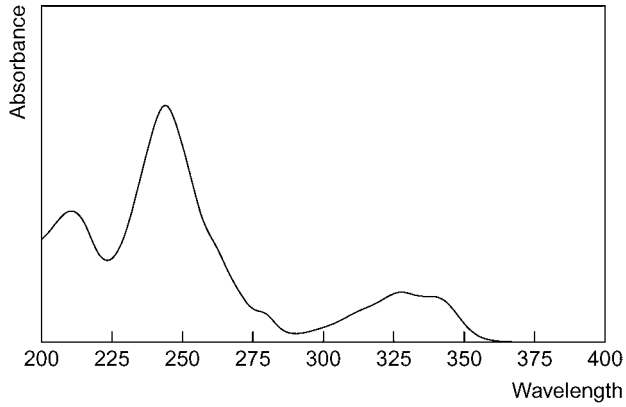
Antihypertensive
$C_{19}H_{27}N_5O_3 = 373.5$
CAS—80755-51-7
IUPAC Name 1-[4-(4-Amino-6,7-dimethoxyquinazolin-2-yl)-1, 4-diazepan-1-yl]butan-1-one
Synonyms 1-(4-Amino-6,7-dimethoxy-2-quinazolinyl)-hexahydro-4-(1-oxobutyl)-1*H*-1,4-diazepine; bunazocine; bunazosine; DDQ.



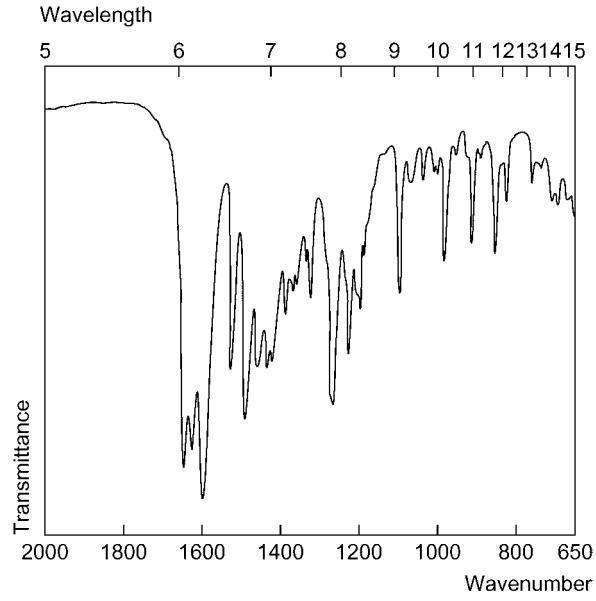
Chemical Properties Log *P* (octanol/water), 0.215.

Bunazosin Hydrochloride
$C_{19}H_{28}ClN_5O_3 = 409.9$
CAS—52712-76-2
Synonym E643
Proprietary Names *Andante*; *Bunazosin Retard*; *Detantol*.
Chemical Properties A white crystalline powder. Mp 273°. It is very soluble in formic acid; slightly soluble in water and methanol; very slightly soluble in dehydrated ethanol; practically insoluble in ether.

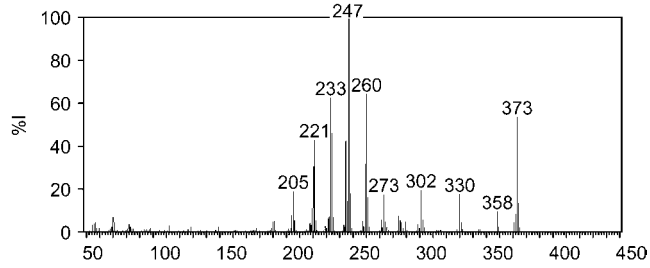
Ultraviolet Spectrum Principal peaks at 211, 244 nm.



Infrared Spectrum Principal peaks at wavenumbers 1598, 1648, 1628, 2953, 3144, 864 cm^{-1} (hydrochloride salt).



Mass Spectrum Principal ions at *m/z* 247, 260, 233, 373, 234, 221, 245, 259.



Quantification
Plasma **HPLC** Fluorescence detection (λ_{ex}=254 nm; λ_{em}=370 nm). Limit of detection, 0.1 µg/L [Nobumichi *et al.* 1993].
Urine **HPLC** Fluorescence detection (λ_{ex}=254 nm; λ_{em}=370 nm). Limit of detection, 0.5 µg/L [Nobumichi *et al.* 1993].
Disposition in the Body Bunazosin is rapidly absorbed after oral administration and undergoes metabolism in the liver. It is eliminated mainly in faeces (60%) and the rest in urine as the unchanged drug (0.7%) and its metabolites. Bunazosin can pass through the placenta to the fetus and is secreted in milk.
Therapeutic Concentration
Twelve healthy, adult males were administered with a 2 mg dose of bunazosin hydrochloride after a meal. The peak plasma concentration of the unchanged drug was 22.5 µg/L which was observed 1 h after administration [Eisai Product Information Sheets].

Twelve healthy volunteers, aged between 65 and 75 years (2 males and 10 females), were administered with a single dose of 6 mg bunazosin (sustained release formulation). Peak plasma concentrations of 9.0 ± 4.0 µg/L were reached within 5 to 7 h. 12 healthy young volunteers, 22 to 39 years old

(6 males and 6 females), were administered with the same dose. Peak plasma concentrations were lower, reaching 6.1 ± 2.6 µg/L for the males and 5.4 ± 1.5 µg/L for females within 3.5 to 6 h [Nobumichi *et al.* 1993].

Toxicity Acute overdose, over 12 mg/day, can result in tachycardia, hypotension, miosis and oliguria. Poison by SC, IM, IV and IP routes. Moderate toxicity by ingestion.

Bioavailability Approximately 45%.

Half-life Elimination half-life is approximately 2 h.

Volume of Distribution Apparent volume of distribution is ~3 to 6 L/kg.

Clearance Body clearance, ~0.25 to 0.35 L/h/kg.

Protein Binding Up to 97%.

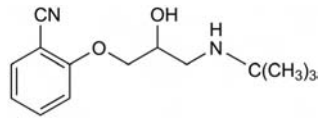
Dose An initial dose of 1.5 mg bunazosin (as the hydrochloride) is administered, which may be increased to 3 to 6 mg daily (sustained-release formulation). The maximum dose is 12 mg/day. The usual adult daily dose for the sustained release preparation is 3 to 9 mg.

Nobumichi NM *et al.* (1993). *Drug Invest* 6: 5–9.
Nobumichi NM *et al.* (1993). *Drug Invest* 6: 62–69.

Bunitrolol

β-*Blocker*
$C_{14}H_{20}N_2O_2 = 248.3$
CAS—34915-68-9

IUPAC Name 2-[3-(Tert-butylamino)-2-hydroxypropoxy]benzonitrile
Synonyms 2-[3-[(1,1-Dimethylethyl)amino]-2-hydroxypropoxy]benzonitrile; Ko-1366.

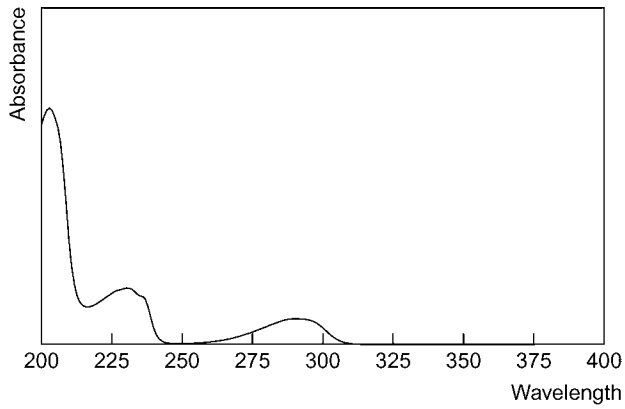


Chemical Properties Log *P* (octanol/water), 1.6.

Bunitrolol Hydrochloride

$C_{14}H_{20}N_2O_2,HCl = 284.8$
CAS—23093-74-5
Proprietary Name *Stresson*
Chemical Properties A crystalline solid. Mp about 164°.

Thin-layer Chromatography System TE—R_f 0.40; system TAE—R_f 0.16.
Gas Chromatography System GA—bunitrolol RI 1948, bunitrolol-Art RI 1980.
Ultraviolet Spectrum Aqueous acid—232 (A^1_1=332b), 292 nm (A^1_1=142b).



Quantification

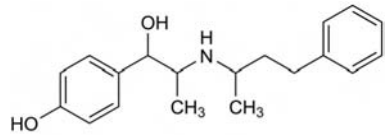
Plasma **HPLC** Fluorescence detection. Limit of detection, 2.5 µg/L for bunitrolol and 4-hydroxybunitrolol [Nagakura, Kohei 1982].
Urine **HPLC** See Plasma [Nagakura, Kohei 1982].
Disposition in the Body Bunitrolol is absorbed after oral administration and metabolised by *p*-hydroxylation followed by conjugation with glucuronic acid. About 1% of a dose is excreted in the urine as unchanged drug and 5% as the *p*-hydroxy metabolite, in 6 h.
Dose Bunitrolol hydrochloride has been given in doses of 20 to 40 mg daily.

Nagakura A, Kohei H (1982). Simultaneous determination of bunitrolol and its metabolite in biological fluids, plasma and urine. *J Chromatogr* 232: 137–143.

Buphenine

Vasodilator
$C_{19}H_{25}NO_2 = 299.4$
CAS—447-41-6

IUPAC Name 4-[1-Hydroxy-2-(4-phenylbutan-2-ylamino)propyl]phenol
Synonyms 4-Hydroxy-α-[1-[(1-methyl-3-phenylpropyl)amino]ethyl]benzenemethanol; nylidrin.

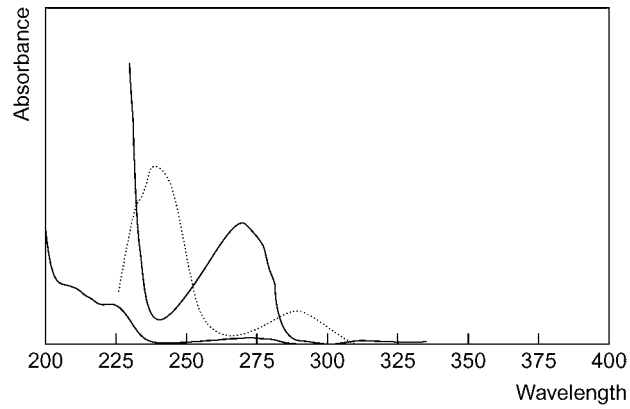


Chemical Properties Mp 111° to 112°. Log *P* (octanol/water), 3.3.

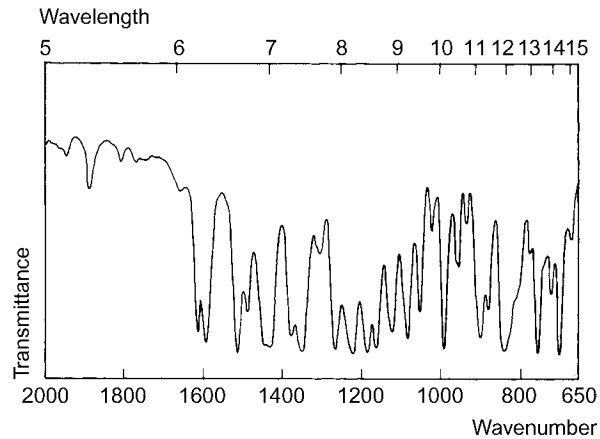
Buphenine Hydrochloride

$C_{19}H_{25}NO_2,HCl = 335.9$
CAS—849-55-8
Proprietary Names *Arlidin*; *Dilatol*; *Opino*; *Penitardon*; *Pervadil*.
Chemical Properties A white crystalline powder. Mp 223° to 226°. Soluble 1 in 65 of water and 1 in 40 of ethanol; practically insoluble in benzene, chloroform and ether.

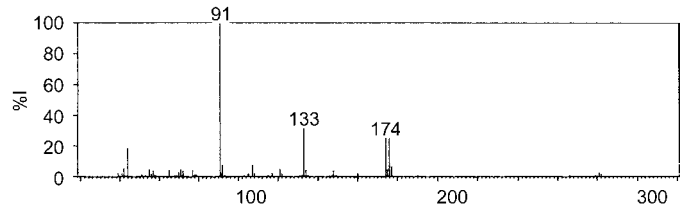
Colour Test Marquis test—red.
Thin-layer Chromatography System TA—R_f 0.74; system TB—R_f 0.03; system TC—R_f 0.14; system TE—R_f 0.62; system TL—R_f 0.50; system TAE—R_f 0.33; system TAF—R_f 0.83 (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, brown; acidified potassium permanganate solution, positive).
Gas Chromatography System GA—RI 2314.
High Performance Liquid Chromatography System HA—*k* 0.9; system HX—RI 370.
Ultraviolet Spectrum Aqueous acid—273 nm (A^1_1=40a); aqueous alkali—242 (A^1_1=390b), 291 nm.



Infrared Spectrum Principal peaks at wavenumbers 1512, 1220, 750, 695, 1182, 837 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 91, 133, 176, 174, 44, 107, 92, 177.



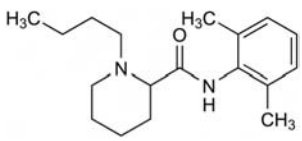
Quantification
Urine **GC** FID. See Li, Cervoni [1976].
Disposition in the Body Buphenine is readily absorbed after oral administration. About 5% of a single dose is excreted in the urine as unchanged drug in 24 h.
Toxicity The estimated minimum lethal dose in adults is 2 g and in children 200 mg.
Dose 18 to 48 mg of buphenine hydrochloride daily.

Li H, Cervoni P (1976). GLC determination of nylidrin in human urine samples. *J Pharm Sci* 65: 1352–1356.

Bupivacaine

Anaesthetic (Local)
$C_{18}H_{28}N_2O$ = 288.4
CAS—2180-92-9

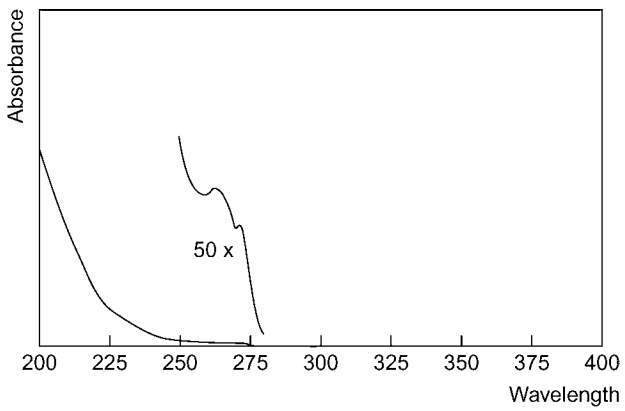
IUPAC Name 1-Butyl-*N*-(2,6-dimethylphenyl)piperidine-2-carboxamide
Synonym 1-Butyl-*N*-(2,6-dimethylphenyl)-2-piperidinecarboxamide



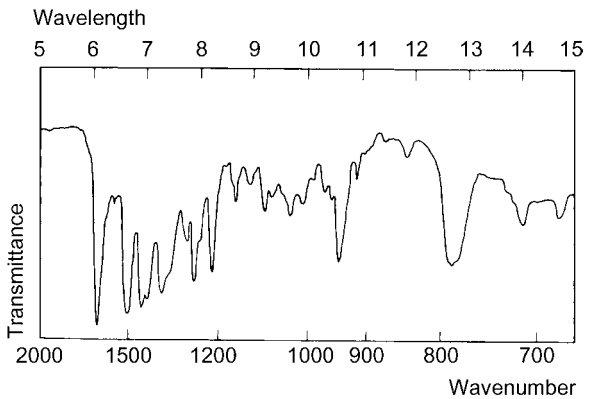
Chemical Properties Mp 107.5° to 108°. pK_a 8.1. Log *P* (octanol), 3.4. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Bupivacaine Hydrochloride
$C_{18}H_{28}N_2O,HCl,H_2O$ = 342.9
CAS—18010-40-7 (anhydrous); CAS—14252-80-3 (monohydrate).
Proprietary Names *Carbostesin*; *Marcain(e)*; *Sensorcaine*.
Chemical Properties A white crystalline powder. Mp 258.5°. Soluble 1 in 25 of water and 1 in 8 of ethanol; slightly soluble in acetone, chloroform, and ether.

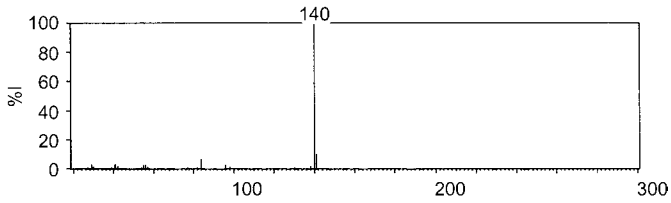
Thin-layer Chromatography System TA—R_f 0.69; system TB—R_f 0.42; system TC—R_f 0.73; system TE—R_f 0.80; system TL—R_f 0.65; system TAE—R_f 0.69; system TAF—R_f 0.79; system TAG—R_f 0.65 (acidified iodoplatinate solution—positive).
Gas Chromatography System GA—RI 2269.
High Performance Liquid Chromatography System HA—*k* 0.9; system HQ—*k* 7.19; system HR—*k* 0.86; system HX—RI 366; system HY—RI 310; system HZ—RT 4.1 min.
Ultraviolet Spectrum Aqueous acid—263 (A_1^1 = 16a), 271 nm.



Infrared Spectrum Principal peaks at wavenumbers 1667, 1522, 1279, 1222, 787, 944 cm^{-1} (bupivacaine hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 140, 141, 84, 41, 29, 96, 56, 55.



Quantification
Blood **GC** FID. Limit of detection, 15 µg/L [Berlin *et al.* 1973].
Plasma **HPLC** Column: C_8 Phenomenex (150 × 4.6 mm i.d., 5 µm). Mobile phase: 70 mmol/L sodium sulfate (pH 3.1) : acetonitrile (70 : 30), flow rate 1.5 mL/min. UV detection (λ = 205 nm). Limit of quantification, 8 µg/L [Gaudreault *et al.* 2009]. Column: LC_8 DB (50 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol : 50 mmol/L phosphate buffer (pH 6.0, 20 : 20 : 60), flow rate 1.2 mL/min. UV detection (λ = 210 nm) Retention time: 3.0 min. Limit of detection, 5 µg/L for bupivacaine and ropivacaine [Rifai *et al.* 2001]. Column: Symmetry C_{18} (150 × 3.9 mm i.d., 5 µm). Mobile phase: 10 mmol/L octanesulfonic acid in acetonitrile-0.05 mol/L phosphate buffer (3 : 97) : 10 mmol/L octanesulfonic acid in acetonitrile-0.05 mol/L phosphate buffer (pH 2, 50 : 50, 70 : 30 for 10 min to 10 : 90 at 45 min to 70 : 30 at 48 min), flow rate 1.0 mL/min. UV detection (λ = 210 nm). Limit of quantification, 0.1 µmol/L for bupivacaine, ropivacaine and their major metabolites [Arvidsson *et al.* 1999]. Column: Cyano (CN) (250 × 4.6 mm). Mobile phase: methanol : acetonitrile : orthophosphoric acid : 0.01 mol/L sodium dihydrogen phosphate (200 : 80 : 2 : 718). UV detection (λ = 215 nm). Limit of quantification, 125 µg/L [Gross *et al.* 1999]. Column: µBondapak C_{18} (300 × 3.9 mm i.d., 10 µm). Mobile phase: methanol : acetonitrile : 0.02 mol/L sodium phosphate buffer (pH 6.0, 15 : 40 : 45), flow rate 1.2 mL/min. UV detection (λ = 210 nm). Limit of detection, 10 µg/L for bupivacaine and metabolites [Kastrissios *et al.* 1992]. See also Abraham *et al.* [1997].

LC-MS Column: Mercury MS Luna C_{18} (10 × 4.0 mm i.d., 5 µm). Mobile phase: 10 mmol/L ammonium acetate : acetonitrile (95 : 5 for 0.5 min to 10 : 90 at 3 min for 1 min to 95 : 5 at 4.01 min until 5 min), flow rate 3.0 mL/min. ESI, SIM acquisition mode. Limit of quantification, 2.5 µg/L [Kawano *et al.* 2003]. Column: Phenomenex Luna C_{18} (75 × 4.6 mm i.d., 3 µm). Mobile phase: acetonitrile : 50 mmol/L ammonium acetate buffer (pH 7.0, 60 : 40), flow rate 0.8 mL/min. ESI, SIM acquisition mode. Limit of quantification, 2.5 µg/L, limit of detection, 0.5 µg/L [Stumpe *et al.* 2000].
Serum **GC** Column: HP-Innowax (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: N_2, 35 mL/min. Temperature programme: 50° for 1 min to 150° at 25°/min to 240° at 5°/min. FID. Limit of quantification, ~50 µg/L [Baniceru *et al.* 2004]. Column: 3% OV-17 on Chromosorb W HP 100/120 mesh (1.8 m × 2 mm i.d.). Carrier gas: N_2, 16 mL/min. Temperature programme: 180° to 240° at 20°/min for 8 min. AFID. Limit of detection, 50 µg/L for bupivacaine and 2′,6′-pipecoloxylidide [Lesko *et al.* 1980].

HPLC Column: reversed phase C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol : sodium dihydrogen phosphate (pH 5.6, 100 : 100 : 300), flow rate 1 mL/min. UV detection (λ = 210 nm). Limit of quantification, 5 µg/L for bupivacaine and ropivacaine and 2 µg/L for mepivacaine [Tanaka *et al.* 2006].

LC-MS Column: Synergy Polar-RP 80A (150 × 2 mm i.d., 4 µm). Mobile phase: acetonitrile-2 mmol/L ammonium acetate–formic acid (5 : 95 : 0.2) : acetonitrile-2 mmol/L ammonium acetate-formic acid (95 : 5 : 0.2, 100 : 0 for 0.1 min to 20 : 80 at 2.5 min for 0.5 min to 100 : 0 at 3.2 min until 7 min), flow rate 0.5 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 1 µg/L for bupivacaine and other local anaesthetics [Koehler *et al.* 2005].
Urine **GC-MS** Column: HP5MS cross-linked 5% phenyl methyl silicone (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 70° for 2 min to 270° at 20°/min for 6 min. EI ionisation at 70 eV, SIM acquisition mode. Retention time: 14.07 min. Limit of detection, 5 µg/L for phenolic bupivacaine metabolites [Zhang *et al.* 1998].

HPLC Column: Johnssen Spherigel C_{18} (250 × 4.6 mm i.d.). Mobile phase: acetonitrile-11 mmol/L triethylamine solution with 0.1% phosphoric acid (10 : 90) : acetonitrile-20 mmol/L triethylamine with 0.1% phosphoric acid (50 : 50; 100 : 0 to 30 : 70 over 15 min to 0 : 100 at 30 min), flow rate 1.0 mL/min. UV detection (λ = 210 nm). Limit of detection, 0.03 mg/L [Ma *et al.* 2006]. See Plasma. Limit of quantification, 1 µmol/L for bupivacaine, ropivacaine and their major metabolites [Arvidsson *et al.* 1999]. See Plasma [Kastrissios *et al.* 1992].
Disposition in the Body Bupivacaine is metabolised in the liver by oxidative dealkylation to 2′,6′-pipecoloxylidide; 3′- and 4′-hydroxylation also occur. <10% of a dose is excreted in the urine as unchanged drug in 24 h.
Therapeutic Concentration
After epidural administration of 150 mg with adrenaline (epinephrine) to 12 subjects, mean peak plasma concentrations of 1.1 mg/L were reported at 0.3 h and peak CSF concentrations averaged 30 mg/L at 0.5 h [Wilkinson, Lund 1970].

After slow IV infusion of 1.35 mg/kg to three subjects, peak venous plasma concentrations of 2.6–4.5 mg/L were reported 3–17 min after completion of the infusion [Mather *et al.* 1971].

A healthy female patient undergoing tubal ligation was induced with anaesthesia and maintained with propofol, droperidol and fentanyl. Lidocaine (4 mL at 1%) was also administered prior to incision followed by 2 mL (*R,S*)-bupivacaine (0.5%). Peak plasma concentrations of 144 µg/L (*R*)-bupivacaine and 212 µg/L (*S*)-bupivacaine were reached 5.4 min after infiltration with the drug. [Abraham *et al.* 1997].

Fifteen infants, aged <5 months, undergoing minor lower abdominal procedures under a standard general anaesthesia, were administered 0.25%

bupivacaine at a dose of 2.5 mg/kg or 0.25% bupivacaine with adrenaline. The total plasma drug concentration was 114–446 μg/L (median, 400.5) for those receiving the drug only compared with 372–1423 μg/L (median, 742) for those receiving the drug with adrenaline [Hansen *et al.* 2001].

Toxicity Bupivacaine is several times more toxic than lidocaine.

Muscular rigidity has been reported in 2 subjects having blood concentrations of 9 and 12 mg/L following the administration of approximately 210 mg, and convulsions have been reported at plasma concentrations greater than 4 mg/L.

A case report describes the accidental high thoracic epidural infusion of 337.5 mg of 0.75% bupivacaine and 180 μg sufentanil over 30 min. The patient experienced severe hypotension, mild respiratory depression and an extensive sensory and motor block developed, but recovered after treatment [Wolff *et al.* 1992].

A 54-year-old man died after self-injecting bupivacaine into external genitalia. Bupivacaine concentrations of 3.8 mg/L (femoral blood), 2.8 mg/L (heart blood), 1.3 mg/L (vitreous humour) and 11.4 mg/L (urine) were found at postmortem [Yazzie *et al.* 2004].

Half-life Plasma half-life, ~1–3 h, increased in neonates.

Volume of Distribution ~1 L/kg.

Clearance Plasma clearance, ~8 mL/min/kg.

Distribution in Blood Plasma : whole blood ratio, ~1.4.

Protein Binding ~90%.

Note For a review of the clinical pharmacokinetics of local anaesthetics, see Tucker, Mather [1979].

Dose Bupivacaine hydrochloride is given by injection as a 0.25 or 0.5% solution (calculated as the anhydrous hydrochloride); maximum recommended dose is 2 mg/kg in any 4 h period.

Buprenorphine

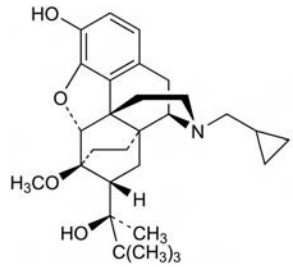
Narcotic Analgesic

$C_{29}H_{41}NO_4$ = 467.6

CAS—52485-79-7

Synonyms Buprenorphinum; [5α,7α(*S*)]-17-(cyclopropylmethyl)-α-(1,1-dimethylethyl)-4,5-epoxy-18,19-dihydro-3-hydroxy-6-methoxy-α-methyl-6,14-ethenomorphinan-7-methanol; (2*S*)-2-[(-)-(5*R*,6*R*,7*R*,14*S*)-9α-cyclopropylmethyl-4,5-epoxy-6,14-ethano-3-hydroxy-6-methoxymorphinan-7-yl]-3,3-dimethylbutan-2-ol; RX-6029-M.

Proprietary Names *BuTrans*; *Nopan*; *Transtec*.



Chemical Properties A white or almost white crystalline powder. Very slightly soluble in water; freely soluble in acetone; soluble in methanol; slightly soluble in cyclohexane. Also dissolves in dilute solutions of acids. Mp 209°. pK_{a1}, 8.5, pK_{a2}, 10.0. Log *P* (octanol/water), 4.98. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Buprenorphine Hydrochloride

$C_{29}H_{41}NO_4$,HCl = 504.1

CAS—53152-21-9

Synonyms CL-112302, NIH-8805, UM-952.

Proprietary Names *Anorfin*; *Buprenex*; *Buprex*; *Buprine*; *Finibron*; *Lepetan*; *Nopan*; *Prefin*; *Suboxone*; *Subutex*; *Temgesic*.

Chemical Properties A white or almost white crystalline powder. Sparingly soluble in water; soluble in alcohol; freely soluble in methanol; practically insoluble in cyclohexane.

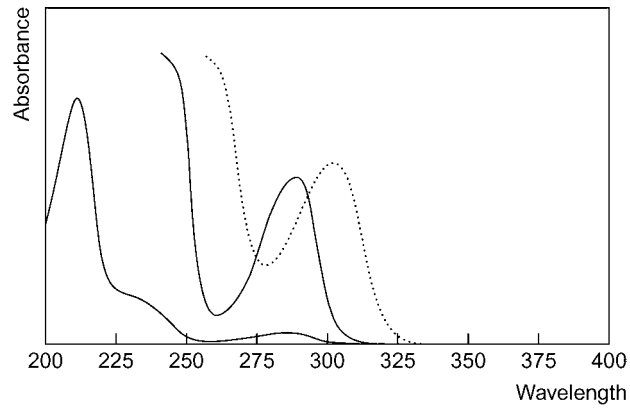
Colour Tests Liebermann's reagent—black; Marquis test—violet.

Thin-layer Chromatography System TA—R_f 0.76; system TB—R_f 0.09; system TC—R_f 0.68; system TE—R_f 0.80; system TL—R_f 0.69; system TAE—R_f 0.80; system TAJ—R_f 0.62; system TAK—R_f 0.04; system TAL—R_f 0.77.

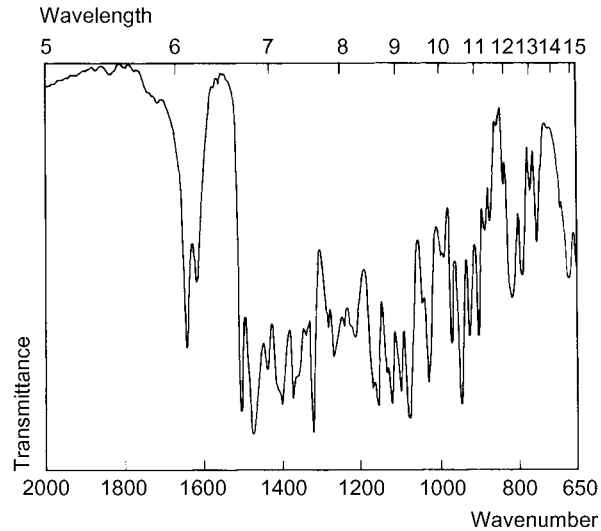
Gas Chromatography System GA—RI 3360, M (-AC) 3410, art (-H_2O) RI 3240, art (-H_2O)-AC RI 3320; system GB—RI 3610; system GM—not eluted.

High Performance Liquid Chromatography System HA—*k* 0.4; system HC—*k* 0.05; system HX—RI 397; system HY—RI 339; system HZ—RT 5.0 min; system HAA—RT 14.0 min.

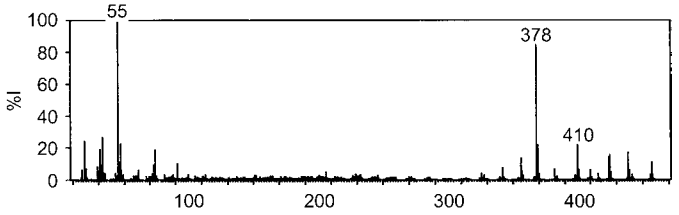
Ultraviolet Spectrum Aqueous acid—286 nm (A_1^1 = 33b); aqueous alkali—300 nm.



Infrared Spectrum Principal peaks at wave numbers 1320, 1077, 1503, 1155, 1120, 947 cm^{-1} (buprenorphine hydrochloride, KCl disk).



Mass Spectrum Principal ions at *m/z* 55, 378, 43, 29, 57, 410, 379, 84.



Quantification

Blood **LC-MS** Column: Varian Pursuit 3 C_{18} (100 × 3 mm i.d., 3 μm). Mobile phase: methanol : ammonium formate. MRM acquisition mode, positive ion mode. Limit of quantification, 0.0005–0.01 mg/kg for buprenorphine and other drugs of abuse [Bjork *et al.* 2010]. Column: Genesis C_{18} reversed phase. Mobile phase: acetonitrile ammonium acetate (pH 3.2). MRM acquisition mode, positive ion mode [Gergov *et al.* 2009] Column: Phenomenex Synergi reverse phase. Mobile phase: 10 mmol/L ammonium formate (pH 3) : acetonitrile. Limit of quantification, 0.5–4.09 μg/L, limit of detection, 0.16–1.2 μg/L for buprenorphine and other opioids [Al Asmari, Anderson 2007]. Column: cyanopropyl (150 × 2.1 mm). ESI, positive ion mode. Limit of detection, 0.05 μg/L for buprenorphine and norbuprenorphine [Favretto *et al.* 2006]. APCI, SIM acquisition mode [Bogusz *et al.* 1998]. Column: Nova-Pak C_{18} (150 × 2 mm i.d., 4 μm). Mobile phase: acetonitrile : 2 mmol/L ammonium acetate buffer (pH 3.0, 80 : 20), flow rate 200 μL/min. Limit of detection, 0.1 μg/L for buprenorphine and 0.05 μg/L for norbuprenorphine [Tracqui *et al.* 1997]. See also [Hoja *et al.* 1997].

Plasma **GC** ECD. Limit of quantification, 0.1 μg/L [Everhart *et al.* 1997].

GC-MS Column: HP-1 fused silica. Carrier gas: He. EI ionisation, SIM acquisition mode. Limit of quantification, 0.05 μg/L for buprenorphine and 0.1 μg/L for norbuprenorphine [Gopal *et al.* 2001]. PICI. Limit of quantification, 0.5 μg/L [Moody *et al.* 1997].

HPLC Column: reversed-phase C_8 (250 × 4.6 mm i.d., 5 μm). Mobile phase: phosphate buffer containing TEA : methanol : acetonitrile (pH 6.0, 40 : 50 : 10). Limit of quantification, 1.0 μg/L, limit of detection, 0.4 μg for buprenorphine and norbuprenorphine [Mercolini *et al.* 2007]. Column: reversed phase Spherisorb C_8. Mobile phase: 0.06 mol/L potassium dihydrogen phosphate-disodium hydrogen phosphate (pH 6.4) : acetonitrile : TEA : Pic B5 (520 : 480 : 0.5 : 15). UV detection (λ = 214 nm) [Lagrange *et al.* 1998]. ECD. Limit of detection, 40 ng/L for buprenorphine and norbuprenorphine [Schleyer *et al.* 1993].

LC-MS Buprenorphine, norbuprenorphine and glucuronide metabolites [Concheiro *et al.* 2010]. Limit of quantification, 0.25 μg/L for buprenorphine and norbuprenorphine [DiFrancesco *et al.* 2007]. Column: chiral α_1-acid glycoprotein. Mobile phase: acetonitrile : 10 mmol/L ammonium acetate (pH 7.0, 18 : 82), flow rate 0.9 mL/min. Buprenorphine, norbuprenorphine and methadone enantiomers and metabolite [Rodriguez-Rosas *et al.* 2007]. Limit of quantification, 0.1 μg/L for buprenorphine, norbuprenorphine and glucuronides [Huang *et al.* 2006]. Column: Phenomenex C_{12} MX-RP (150 × 2 mm i.d., 4 μm). Mobile phase: ammonium formate buffer (pH 3.5) : acetonitrile. Buprenorphine and other opioids [Musshoff *et al.* 2006]. See also Ceccato *et al.* [2003], Moody *et al.* [1997], Moody *et al.* [2002], Murphy, Huestis [2005] and Polettini, Huestis [2001].

Serum **LC-MS** ESI. Limit of detection, 0.2 μg/L for buprenorphine and its major metabolites [Oechsler, Skopp 2010]. Column: LiChroCART with a Purospher RP-18e cartridge. SIM acquisition mode. Limit of quantification, 0.2 μg/L for buprenorphine and norbuprenorphine [Scislowski *et al.* 2005]. See Blood [Bogusz *et al.* 1998].

Urine **TLC** Fluorescence densiometric detection (λ = 340 nm) [Alemany *et al.* 1996].

GC-MS EI ionisation. Limit of quantification, 1 μg/L for buprenorphine and norbuprenorphine [Fuller 2008]. Limit of detection, 1.0 μg/L for buprenorphine and norbuprenorphine [George *et al.* 2004]. EI ionisation, SIM acquisition mode. Limit of quantification, 0.25 μg/L for buprenorphine and 0.20 μg/L for norbuprenorphine [Vincent *et al.* 1999]. Limit of quantification, 1 μg/L, limit of detection, 0.2 μg/L for buprenorphine and norbuprenorphine [Lisi *et al.* 1997].

HPLC Electrochemical detection. Limit of detection, 0.2 μg/L for buprenorphine and 0.15 μg/L for norbuprenorphine [Debrabandere *et al.* 1992]. Electrochemical detection. Limit of detection, 250 ng/L for buprenorphine and 100 ng/L for norbuprenorphine [Debrabandere *et al.* 1991]. See Plasma [Mercolini *et al.* 2007; Schleyer *et al.* 1993].

LC-MS Column: Synergy Polar RP. Mobile phase: 10 mmol/L ammonium formate (pH 3) : acetonitrile. Limit of quantification, 0.7–1.2 μg/L, limit of detection, 0.2–0.4 μg/L for buprenorphine and its metabolites [Al Asmari, Anderson 2008]. Buprenorphine and its metabolites [Kacinko *et al.* 2008]. Column: C_{18}. ESI [Liu *et al.* 2008]. MRM acquisition mode. Limit of quantification, 4.6 μg/L for buprenorphine glucuronide and 11.8 μg/L for norbuprenorphine glucuronide [Hegstad *et al.* 2007]. Limit of quantification, 0.5 μg/L for buprenorphine, buprenorphine and norbuprenorphine glucuronides and 2.5 μg/L for norbuprenorphine [Huang *et al.* 2006]. See Blood [Bogusz *et al.* 1998; Favretto *et al.* 2006; Gergov *et al.* 2009]. See also Fox *et al.* [2006] and Kronstrand *et al.* [2003].

Immunoassay Immunoassay versus LC-MS [Twigger *et al.* 2008]. Buprenorphine and norbuprenorphine, validation with GC-MS [Wang *et al.* 2007]. Limit of detection, 20 μg/L [Debrabandere *et al.* 1995].

Milk **LC-MS** Limit of quantification, 0.18 μg/L for buprenorphine and 0.20 μg/L for norbuprenorphine, limit of detection, 0.05 μg/L for buprenorphine and norbuprenorphine [Grimm *et al.* 2005].

Hair **GC-MS** Limit of quantification, 0.005 μg/g for buprenorphine and norbuprenorphine [Vincent *et al.* 1999].

HPLC Column: Lichrosorb CN Mobile phase: phosphate buffer (pH 4.0) : acetonitrile : 1-heptanosulfonic acid : butylamine (85 : 17 : 2 : 0.01). Electrochemical detection. Limit of detection, 0.02 μg/g for buprenorphine and 0.01 μg/g for norbuprenorphine [Kintz *et al.* 1994].

LC-MS Column: cyanopropyl (150 × 2.1 mm i.d.). ESI, positive ion mode. Limit of detection, 4 ng/g for buprenorphine and norbuprenorphine [Favretto *et al.* 2006]. Column: Nova-Pak C_{18} (150 × 2 mm i.d., 4 μm). Mobile phase: acetonitrile : 2 mmol/L ammonium acetate buffer (pH 3.0, 80 : 20), flow rate 200 μL/min. Limit of detection, 4 ng/g for buprenorphine and 2 ng/g for norbuprenorphine [Tracqui *et al.* 1997].

Disposition in the Body Following IM administration, buprenorphine rapidly reaches peak plasma concentration. Absorption also takes place through the buccal mucosa following sublingual administration. It is metabolised mainly by *N*-dealkylation via cytochrome P450 CYP3A4 to *N*-dealkylbuprenorphine (norbuprenorphine) and by conjugation. It is eliminated mainly in the faeces, with a small proportion excreted in the urine, as metabolites. Buprenorphine is subject to considerable first-pass metabolism following oral administration. Small amounts of buprenorphine are distributed into breast milk.

Therapeutic Concentration

In 11 patients receiving maintenance doses of 8 mg buprenorphine sublingually, those receiving the dose daily had a mean steady-state plasma concentration (at 24 h) of 0.00080 mg/L; those receiving the dose on alternate days had a level of 0.00077 mg/L at 24 h. Daily and alternate-day steady-state norbuprenorphine plasma concentrations were 0.0010 and 0.0009 ng/L, respectively [Kuhlman, Jr *et al.* 1998].

After sublingual administration of buprenorphine solution at a dose of 16 mg/70 kg body weight daily to 10 subjects, mean plasma concentrations of 0.00067 mg/L were attained 24 h after each dose. Different thrice-weekly dosing schedules with doses of 16–44 mg/70 kg resulted in plasma concentrations varying from 0.0009–0.00169 mg/L at 24 h and 0.00041–0.00096 mg/L at 48 h [Chawarski *et al.* 1999].

In 6 subjects each receiving a 7.7 mg dose of buprenorphine in liquid form (sublingually) and 8 mg in tablet form, 1 week apart, peak plasma levels were 0.0071 mg/L attained at 0.9 h and 0.0029 mg/L attained at 1.2 h for the liquid and tablet dosages, respectively [Nath *et al.* 1999].

Toxicity

A 25-year-old man who apparently had committed suicide (drug packages including high-dose sublingual tablets of buprenorphine were found next to his body) had the following postmortem tissue concentrations of buprenorphine and norbuprenorphine, respectively: blood 3.3 and 0.4 mg/L, urine 3.4 and 0.6 mg/L, bile 2035 and 536 mg/L and brain 6.4 and 3.9 μg/g. High concentrations of amino-7-flunitrazepam, the main metabolite of flunitrazepam, were also detected in blood, urine and gastric fluid [Gaulier *et al.* 2000].

A 14-year-old boy died of asphyxia caused by a combination of buprenorphine and benzodiazepines in drug-facilitated sexual abuse. Postmortem buprenorphine concentrations were 1.1 μg/L in blood and 23 ng/g in hair [Kintz *et al.* 2003].

In a survey of 21 cases in which buprenorphine was detected in postmortem blood and/or urine, 18 were sudden deaths. Of these, 6 deaths were attributed to natural causes and blood buprenorphine levels ranged from undetected (detected in urine) to 3.2 μg/L. The other 12 cases were attributed directly or indirectly to mixed drug poisoning, and blood buprenorphine levels ranged from undetected (detected in urine) to 17 μg/L [Lai *et al.* 2006].

In an analysis of 86 cases of buprenorphine overdoses in children under 6 years of age, 54 children developed signs of toxicity. The mean time to onset of effects was 64.2 min (range, 20–180). No child ingesting <4 mg experienced a severe effect [Hayes *et al.* 2008].

In 2 series of 39 and 78 fatalities involving buprenorphine, postmortem blood levels were 0.0005–0.0510 mg/L (mean, 0.0102) and 0.0001–0.0760 mg/L (mean, 0.0126); norbuprenorphine levels were 0.0002–0.0471 mg/L (mean, 0.0082) and <0.0001–0.0650 mg/L (mean, 0.0106), respectively. Two of the deaths were suicides, with blood buprenorphine concentrations of 0.1440 and 3.276 mg/L [Kintz 2001].

For an earlier report of 20 fatalities involving buprenorphine, see Tracqui *et al.* [1998] and for a later report of 13 buprenorphine-related deaths, see Kintz [2002].

Half-life Plasma half-life, 1.2–7.2 h.

Volume of Distribution ~1.4 L/kg.

Clearance Plasma, ~13 mL/min/kg.

Protein Binding ~96%.

Dose In the treatment of pain, equivalent of 300 to 600 μg buprenorphine given parenterally, or 200 to 400 μg sublingually, every 6 to 8 h. In the treatment of opioid dependence, initially 0.8 to 4 mg sublingually once daily; maintenance, up to maximum of 32 mg daily.

Bupropion

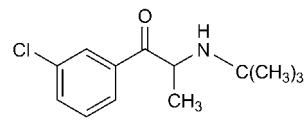
Aminoketone, Antidepressant

$C_{13}H_{18}ClNO = 239.7$

CAS—34911-55-2

IUPAC Name 2-(*tert*-Butylamino)-1-(3-chlorophenyl)propan-1-one

Synonyms Amfebutamone; 1-(3-chlorophenyl)-2-[(1,1-dimethylethyl)-amino]-1-propanone.



Chemical Properties A pale-yellow oil. Bp 52°. Soluble in methanol, ethanol, acetone, ether and benzene. Bupropion is unstable in plasma at 22° and 37°, but samples frozen at –20° were stable for at least 6 months [Laizure, DeVane 1985]. When stored at −20°, plasma and urine samples were within 15% of the original concentration for both bupropion and hydroxybupropion enantiomers. After 3 freeze–thaw cycles, analyte concentrations in plasma and urine were within 15% of the initial value. When extracted samples were stored in an autosampler at 10°, bupropion and hydroxybupropion began to racemise within 24 h. When the autosampler temperature was lowered to 4°, the enantiomeric ratio remained stable for 24 h but began to racemise by 4 days. When extracted samples were stored at −20° before analysis, the enantiomeric ratio remained constant for at least 7 days [Coles, Kharasch 2007].

Bupropion Hydrochloride

$C_{13}H_{19}Cl_2NO = 276.2$

CAS—31677-93-7

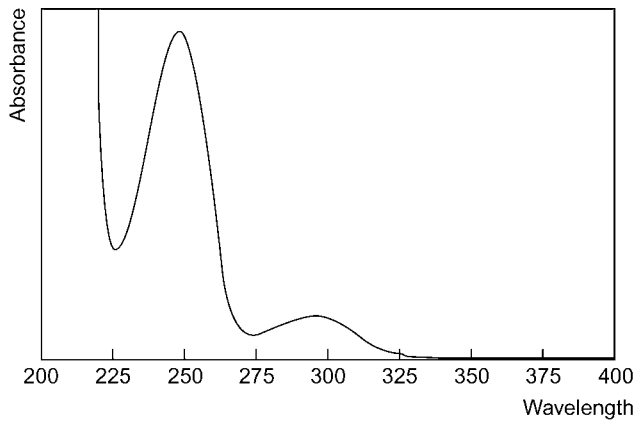
Synonyms Amfebutamone hydrochloride; BW-323.

Proprietary Names *Wellbutrin*; *Zyban*.

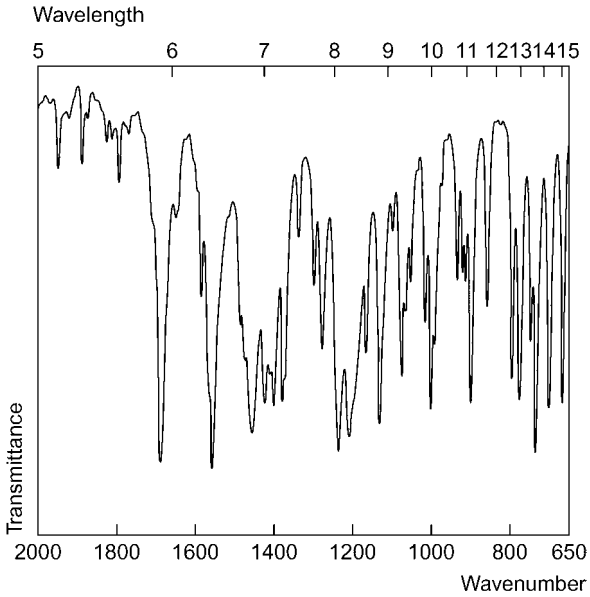
Chemical Properties White crystalline powder. Mp 233° to 234°. Soluble in water, alcohol and hydrochloric acid.

Gas Chromatography System GB—RI 1645 (bupropion), RI 1898 (M (OH-)).

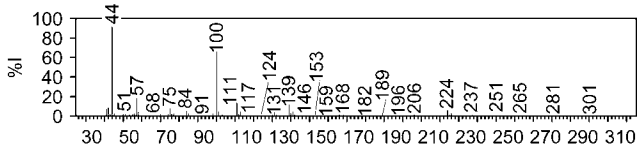
Ultraviolet Spectrum Aqueous acid (methanol)—249, 296 nm.



Infrared Spectrum Principal peaks at wavenumbers 1560, 1691, 2676, 2982, 1458, 739 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 44, 100, 57, 111, 139, 75, 84, 224.



Quantification

Blood **GC** Column: DB-1 (15 m × 0.54 mm i.d., 1.5 µm) or DB-17 (15 m × 0.55 mm i.d., 1.0 µm). Temperature programme: 120° for 1 min to 220° at 20°/min for 5 min. NPD. Limit of detection not reported [Meeker *et al.* 1992]. Column: DB-5 (12 m) and HP-1 (10 m). Temperature programme: 100° to 300° at 10°/min for 10 min. NPD. Reference compound: *n*-propylamphetamine. Retention time: 8.62 min. Limit of detection not reported [Rohrig, Ray 1992].

GC-MS Column: BP-1 capillary (15 m). Temperature programme: 80° for 1 min to 295° at 15°/min for 5 min. R_f 0.75. Limit of detection not reported [Friel *et al.* 1993]. Column: HP-5 cross-linked 5% phenyl methyl silicone fused silica capillary (25 m × 0.32 mm i.d., 0.17 µm). Carrier gas: He, 1 mL/min. Temperature programme: 100° for 1 min to 200° at 30°/min to 260° at 10°/min to 300° at 20°/min for 8 min. Limit of detection not reported [Ramcharitar *et al.* 1992]. Column: DB-5 capillary (30 m × 0.25 mm i.d.). Temperature programme: 150° for 5 min to 280° at 10°/min for 5 min. Ion trap detection. Retention time: 8.14 min. Limit of detection, 0.1 mg/L [Wohlenberg *et al.* 1992].

LC-MS Column: SymmetryShield RP 18 (150 × 1.0 mm i.d., 3.5 µm). Mobile phase: 2 mmol/L ammonium formate (pH 4.0) : acetonitrile 2 mmol/L ammonium formate buffer (pH 4.0; 90 : 10; 95 : 5 for 1 min to 65 : 35 at 1.5 min to 60 : 40 at 5.5 min to 5 : 95 at 7.5 min to 95 : 5 at 8.5 min for 3.5 min), flow rate 50 µL/min. ESI, positive ion mode. Limit of quantification, 10 µg/L; limit of detection, 5 µg/L [Mercerolle *et al.* 2008].

Plasma **HPLC** Column: Phenomenex Aqua C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 0.05 mol/L phosphate buffer (pH 5.5; 45 : 55), flow rate 1.0 mL/min. UV detection (λ = 254 nm for bupropion, 214 nm for hydroxybupropion). Limit of quantification, 2.5, 10, 5 and 10 µg/L for bupropion, hydroxybupropion, threohydrobupropion and erythrohydrobupropion, respectively, limit of detection, 2.0, 7.5, 2.5 and 7.5 µg/L for bupropion, hydroxybupropion, threohydrobupropion and erythrohydrobupropion, respectively [Loboz *et al.* 2005]. Column: TMS (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.05 mol/L monobasic potassium phosphate buffer : acetonitrile (80 : 20) with 0.007 mol/L sodium heptane sulfonate and 0.01 mol/L triethylamine (pH 3.0), flow rate 2.3 mL/min. UV detection (λ = 254 nm). Retention time: 11.5 min. Limit of detection, 5.0 µg/L for bupropion and 0.1 mg/L for its metabolites [Cooper *et al.* 1984]. Column: silica (100 × 4.6 mm i.d., 3 µm). Mobile phase: methanol : 0.05 mol/L ammonium acid phosphate (pH 3.2), flow rate 0.9 mL/min. UV detection (λ = 248 nm). Retention time: 4.29 min. Limit of detection, 5.0 µg/L [Jennison *et al.* 1995].

LC-MS Column: Chiral α_1-acid glycoprotein (AGP; 100 × 2 mm i.d., 5 µm). Mobile phase: 20 mmol/L ammonium formate (pH 5.7) : methanol (90 : 10 for 0.5 min to 70 : 30 at 1.0 min for 4.0 min to 50 : 50 at 8 min for 7 min), flow rate 0.22 mL/min. Retention time: 8.4 and 10.1 min for (*R*)- and (*S*)-bupropion and 9.3 and 13.5 min for (*S,S*)- and (*R,R*)-hydroxybupropion, respectively. Limit of detection, 0.5 and 2.5 µg/L for the bupropion and hydroxybupropion enantiomers, respectively [Coles, Kharasch 2007]. Column: Chromolith SpeedROD RP-18 (50 × 4.6 mm i.d.). Mobile phase: 8 mmol/L ammonium acetate : acetonitrile (55 : 45), flow rate 5.0 mL/min. TIS, positive ion mode, SRM acquisition mode. Retention time: 0.38, 0.25 and 0.23 min for bupropion, threohydrobupropion and hydroxybupropion, respectively. Limit of quantification, 0.25 µg/L for bupropion and threohydrobupropion, 1.25 µg/L for hydroxybupropion [Borges *et al.* 2004].

Serum **HPLC** Column: Silica (100 × 4.6 mm i.d., 3 µm). Mobile phase: methanol : 0.05 mol/L ammonium acid phosphate (pH 3.2), flow rate 0.9 mL/min. UV detection (λ = 248 nm). Retention time: 4.29 min. Limit of detection, 5.0 µg/L [Jennison *et al.* 1995].

Urine **GC-MS** See Blood [Ramcharitar *et al.* 1992].

LC-MS See Blood [Mercerolle *et al.* 2008]. See Plasma. Limit of detection, 5 and 25 µg/L for the bupropion and hydroxybupropion enantiomers, respectively [Coles, Kharasch 2007]. Column: Gemini C_{18} (150 × 2.0 mm i.d., 5.0 µm). Mobile phase: 0.1% acetic acid : methanol (98 : 2 to 10 : 90 in 20 min), flow rate 0.3 mL/min. ESI, positive ion mode. Retention time: 10.4 min. Limit of detection not reported [Petsalo *et al.* 2007].

Bile **GC-MS** See Blood [Ramcharitar *et al.* 1992].

Stomach **GC-MS** See Blood [Ramcharitar *et al.* 1992].

Vitreous Humour **GC** See Blood [Meeker *et al.* 1992].

Kidney **GC-MS** See Blood [Ramcharitar *et al.* 1992].

Liver **GC** See Blood [Meeker *et al.* 1992]. See Blood [Rohrig, Ray 1992].

GC-MS See Blood [Ramcharitar *et al.* 1992].

Note For an enantiomeric separation of the phenylmorphinol metabolite of bupropion, see Suckow *et al.* [1997].

Disposition in the Body Bupropion is well absorbed and undergoes hepatic metabolism via oxidation, hydroxylation and reduction. Peak plasma concentrations reached within 3 h for sustained-release preparations and 2 h for immediate release. Several metabolites are produced, which are pharmacologically active. The 3 active metabolites are hydroxybupropion (the major metabolite), threohydrobupropion and erythrohydrobupropion. The enzyme CYP2B6 is involved in the hydroxylation of bupropion [Turpeinen *et al.* 2004]. Greater than 60% of a dose is excreted in urine within 24 h, 87% over 96 h and 10% in the faeces, with <1% being the parent drug [Lai, Schroeder 1983; Schroeder 1983]. Bupropion crosses the placenta and is secreted in milk.

Therapeutic Concentration The serum therapeutic concentration range is 0.025 to 0.1 mg/L.

Six healthy male volunteers were administered a single oral dose of 200 mg bupropion hydrochloride. Mean peak plasma concentrations ranged from 126 to 388 µg/L and were reached within 100 min [Laizure *et al.* 1985].

Eight healthy male volunteers were administered bupropion in the following doses: a single oral dose of 100 mg, 100 mg 8-hourly oral dose for 14 days, and a single 100 mg oral dose 14 days later. Mean peak plasma concentrations were 0.31 ± 0.08, 0.31 ± 0.07 and 0.26 ± 0.07 µmol/L at 1.72 ± 0.6, 1.73 ± 0.38, and 1.25 ± 0.30 h, respectively [Posner *et al.* 1985].

Toxicity Blood levels >0.17 mg/L are associated with seizures, and those >0.45 mg/L can be fatal. Other toxic effects include tachycardia, hallucinations and loss of consciousness.

A 35-year-old male was found dead next to an empty box of thirty 150 mg slow-release bupropion tablets. Blood and urine concentrations (mg/L) of bupropion and its metabolites were as shown below:

Sample	*Bupropion*	*Hydroxybupropion*	*Threohydrobupropion*
Femoral blood	N.D.	5.8	30.4
Urine	42.9	100	617

N.D. Not detected [Mercerolle *et al.* 2008].

In 3 fatal overdose cases involving bupropion, the victims had blood concentrations of 4.0, 0.16 and 4.2 mg/L bupropion. In the 2 cases where bupropion was highest, the lethal dose was estimated to be <10 g [Friel *et al.* 1993].

A 45-year-old female with a history of psychological problems took 2 bottles of bupropion (100 to 150 tablets, up to 22.5 g). She was admitted to hospital semi-conscious and died after failing to respond to resuscitation. At postmortem her bupropion concentrations in subclavian blood, vitreous humour and liver were 13.0, 11.0 and 8.7 mg/L, respectively [Meeker *et al.* 1992].

A 62-year-old female was found to be unresponsive. Her heart and femoral blood bupropion concentrations were 4.62 and 0.12 mg/L, respectively. A 34-year-old female attempted suicide by stabbing herself in the abdomen. She was treated with bupropion in hospital but died 6 days later. Her heart and femoral blood bupropion concentrations were 1.02 and 1.05 mg/L, respectively [Wohlenberg *et al.* 1992].

A 40-year-old female was found dead in bed. Her heart and femoral blood bupropion concentrations were 20.8 and 11.0 mg/L, respectively with 13.8 mg/kg bupropion in her liver. There was 1.58 g bupropion in her stomach [Rohrig, Ray 1992].

A 38-year-old female with a history of depression was found unresponsive in the street. The bupropion and metabolite concentrations described below were found at postmortem.

Specimen	*Bupropion*	*Hydroxybupropion*	*Erythroamino Alcohol*	*Threoamino Alcohol*
Heart blood (mg/L)	4.2	5.0	0.6	4.6
Subclavian blood (mg/L)	6.2	5.8	1.0	5.1
Bile (mg/L)	1.4	5.0	1.0	5.1
Kidney (mg/kg)	2.4	14	3.5	21
Liver (mg/kg)	1.0	13	6.3	35
Stomach contents (mg)	16	9	0.7	3.4
Urine (mg/L)	37	27	14	54

[Ramcharitar *et al.* 1992]

Half-life Terminal half-life is approximately 14 h (regular release formulation) and 21 h (sustained release).
Volume of Distribution Apparent, 27 to 63 L/kg [Lai, Schroeder 1983].
Clearance ≈2 L/h/kg [Lai, Schroeder 1983].
Protein Binding ≈84% [Findlay *et al.* 1981].
Dose Initial dose of 100 mg twice daily, after 3 days increased to 100 mg three times a day. Maximum dose 450 mg/day. With modified-release preparations, initial dose is 150 mg daily, increasing to 150 mg twice daily. Maximum dose is 200 mg twice daily. The dose is reduced for patients with renal or hepatic failure.

CAS—57982-77-1
IUPAC Name (2*S*)-*N*-[(2*S*)-1-[[(2*S*)-1-[[(2*S*)-1-[[(2*S*)-1-[[(2*R*)-1-[[(2*S*)-1-[[(2*S*)-5-(Diaminomethylideneamino)-1-[(2*S*)-2-(ethylcarbamoyl)pyrrolidin-1-yl]-1-oxopentan-2-yl]amino]-4-methyl-1-oxopentan-2-yl]amino]-3-[(2-methylpropan-2-yl)oxy]-1-oxopropan-2-yl]amino]-3-(4-hydroxyphenyl)-1-oxopropan-2-yl]amino]-3-hydroxy-1-oxopropan-2-yl]amino]-3-(1*H*-indol-3-yl)-1-oxopropan-2-yl]amino]-3-(1*H*-imidazol-5-yl)-1-oxopropan-2-yl]-5-oxopyrrolidine-2-carboxamide
Synonym 6-[*O*-(1,1-Dimethylethyl)-D-serine]-9-(*N*-ethyl-L-prolinamide)-10-deglycinamide-luteinising hormone-releasing factor (pig)

5-oxoPro—His—Trp—Ser—Tyr—D-Ser(t-Bu)—Leu—Arg—ProNHCH$_2$CH$_3$

Chemical Properties A white or slightly yellowish hygroscopic powder. It is sparingly soluble in water and in dilute mineral acids.

Buserelin Acetate

$C_{60}H_{86}N_{16}O_{13},C_2H_4O_2$ = 1299.5
CAS—68630-75-1
Synonym HOE-766
Proprietary Names *Bigonist*; *Profact*; *Receptal*; *Suprecur*; *Supreface*.

Disposition in the Body Buserelin is completely absorbed after SC injection, with peak plasma concentrations occurring after about 1 h. It accumulates in the liver and kidneys as well as in the anterior pituitary gland. A high degree of inactivation of the drug occurs by gastrointestinal enzymes (peptidases), and the proportion of active compound reaching systemic circulation is very low. The main serum metabolite is inactive buserelin (5–9) pentapeptide. Buserelin is excreted in urine and bile as the unchanged drug (66% dose) and its metabolites (28% in 24 h). 17 to 32% of a dose is detected in urine after IV or SC administration. Very small amounts are distributed into breast milk.

Therapeutic Concentration

A mean peak plasma concentration of 54.2 µg/L was reached 30 min after administration of 30 µg/kg SC to 11 children being treated for central precocious puberty. Following administration of 200 µg intranasally to 10 children, a mean peak plasma concentration of 0.65 µg/L was obtained after 30 min [Holland *et al.* 1986].

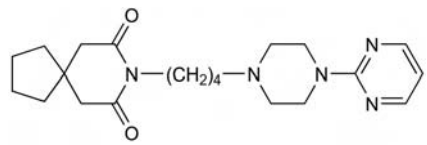
Following administration of 1000 µg SC every 12 h for 7 days to 3 women (aged between 18 and 30 years, with laparoscopically diagnosed endometriosis), the mean plasma concentration was 41.7 µg/L at 15 min. Concentrations were also 23.7, 7.3 and 0.97 µg/L after 2, 4 and 8 h, respectively. Mean plasma concentrations of 1.39 µg/L were measured 15 min after the third dose of 300 µg intranasally every 8 h to 5 women [Kiesel *et al.* 1989].

Half-life Plasma, 80 min.
Protein Binding 15%.
Note For a review of buserelin, see Brogden *et al.* [1990].
Dose In prostatic carcinoma, 500 µg (of the base) SC every 8 h for 7 days, then 200 µg into each nostril every 8 h.

Brogden RN *et al.* (1990). Buserelin. A review of its pharmacodynamic and pharmacokinetic properties, and clinical profile. *Drugs* 39: 399–437.
Holland FJ *et al.* (1986). Pharmacokinetic characteristics of the gonadotropin-releasing hormone analog D-Ser(TBU)-6EA-10luteinizing hormone-releasing hormone (buserelin) after subcutaneous and intranasal administration in children with central precocious puberty. *J Clin Endocrinol Metab* 63: 1065–1070.
Kiesel L *et al.* (1989). Serum concentration and urinary excretion of the luteinizing hormone-releasing hormone agonist buserelin in patients with endometriosis. *J Clin Endocrinol Metab* 68: 1167–1173.

Buspirone

Anxiolytic
$C_{21}H_{31}N_5O_2$ = 385.5
CAS—36505-84-7
IUPAC Name 8-[4-[4-(2-Pyrimidinyl)-1-piperazinyl]butyl]-8-azaspiro[4.5]decane-7,9-dione



Chemical Properties Extraction yield (chlorobutane), 0.95 [Demme *et al.* 2005].

Buspirone Hydrochloride

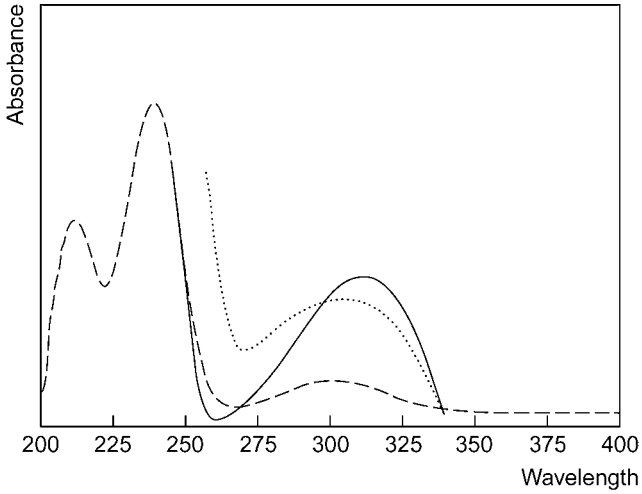
$C_{21}H_{31}N_5O_2$,HCl = 422.0
CAS—33386-08-2
Proprietary Names *Ansial*; *Ansiced*; *Axoren*; *Bespar*; *Buspar*; *Buspimen*; *Buspinol*; *Buspisal*; *Censpar*; *Lucelan*; *Narol*; *Travin*.
Chemical Properties A white crystalline powder. Mp 201.5° to 202.5°. It is very soluble in water; sparingly soluble in ethanol and in acetonitrile; very slightly soluble in ethyl acetate; freely soluble in methanol and in methylene chloride; practically insoluble in hexanes.

Thin-Layer Chromatography System TB—R_f 0.30; system TE—R_f 0.71; system TF—R_f 0.05; system TAE—R_f 0.64.
Gas Chromatography Column: methyl silicone (HP1, 0.2 mm i.d., 0.33 µm). Temperature: 280°. Carrier gas: He, flow rate 0.9 mL/min. MS detection. Retention index: 3299 [Mills, Roberson 1993].
High Performance Liquid Chromatography System HX—RI 369; system HY—RI 310; system HZ—retention time 3.5 min; system HAA—retention time 12.5 min; system HAX—retention time 9.1 min; system HAY—retention time 5.0 min.

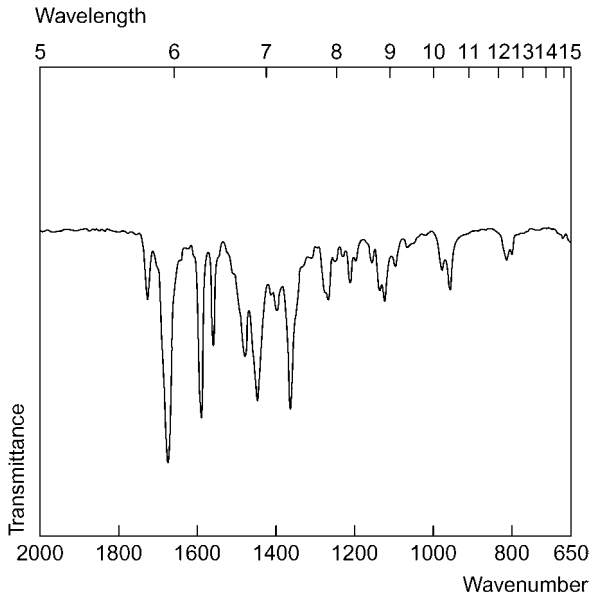
Column: ODS Hypersil (100 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : aqueous 0.01 mol/L dihydrogen potassium phosphate buffer, (pH 3.5) (70:30), flow

rate 1 mL/min. UV diode array detection. Retention time: 2.1 min [Mills, Roberson 1993].

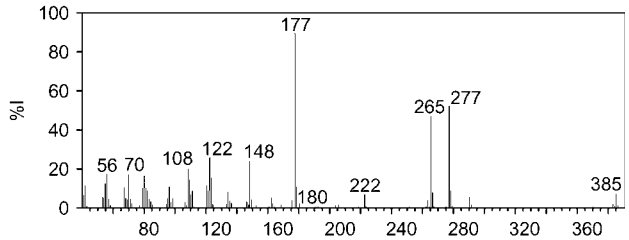
Ultraviolet Spectrum Aqueous acid (0.2 mol/L H_2SO_4)—312 nm; basic—307 nm.



Infrared Spectrum Principal peaks at wavenumbers 1668, 1436, 1351 cm^{-1} (KBr pellets).



Mass Spectrum Principal peaks at *m/z* 177, 277, 265, 122, 148, 108, 56, 70.



Quantification

Plasma **GC** Column: fused-silica capillary coated with Ultra 2.5% phenyl methyl silicone (25 m × 0.32 mm i.d., 0.52 µm). Temperature programme: 210° to 285° at 2.5°/min. Carrier gas: He, flow rate 2.1 mL/min. Detection: electron-capture/nitrogen–phosphorous. Relative retention time (to prazepam, internal standard): 2.03. ECD and NPD. Limit of detection, 5 µg/L [Gaillard *et al.* 1993].

GC–MS Limit of detection, 0.1 µg/L [Sciacca *et al.* 1988]. Limit of detection, 0.05 µg/L [Gammans 1985].

HPLC Electrochemical detection. Limit of detection, 0.1 µg/L [Ary *et al.* 1998].

Serum **HPLC** UV detection. Limit of detection, 0.2 µg/L [Kristjánsson 1991].

Urine **GC–MS** Limit of detection, 0.2 µg/L [Sciacca *et al.* 1988].

Disposition in the Body It is rapidly absorbed after oral administration; peak plasma concentrations occur after about 40 to 90 min. It undergoes extensive first-pass metabolism primarily by oxidation and bioavailability is therefore low. Metabolism is probably mediated by CYP3A4. Most metabolites are inactive, although oxidative dealkylation produces 1-(2-pyrimidinyl)-piperazine which is about 20 to 25% as potent as the parent drug. The major metabolite is 5-hydroxybuspirone which may be oxidised further to many more metabolites and its glucuronide conjugate. The metabolites are excreted mainly in urine (65%); some are also excreted in faeces (35%). <1% of a dose is excreted as the unchanged drug. It is not removed by haemodialysis.

Therapeutic Concentration The serum therapeutic concentration range is 0.9 to 5 mg/L.

Plasma concentrations of buspirone are usually very low and variable between subjects. Studies suggest that buspirone has nonlinear pharmacokinetics.

Bioavailability 4%.

Half-life Plasma, 2 to 11 h; mean, 2.4 h.

Volume of Distribution 5.3 L/kg after a 20 mg IV dose.

Clearance Plasma, 2.0 to 3.5 L/h/kg, also reported as 1.70 L/h/kg.

Protein Binding 95%.

Note For a review of buspirone, see Gammans *et al.* [1986].

Dose Usually 15 to 30 mg of buspirone hydrochloride daily.

Busulfan

Antineoplastic

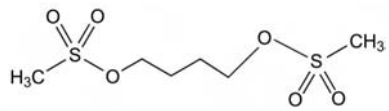
$C_6H_{14}O_6S_2$ = 246.3

CAS—55-98-1

IUPAC Name 4-Methylsulfonyloxybutyl methanesulfonate

Synonyms Busulphan; 1,4-butanediol dimethanesulfonate esters; CB-2041; GT-41.

Proprietary Names *Misulban*; *Myleran*.



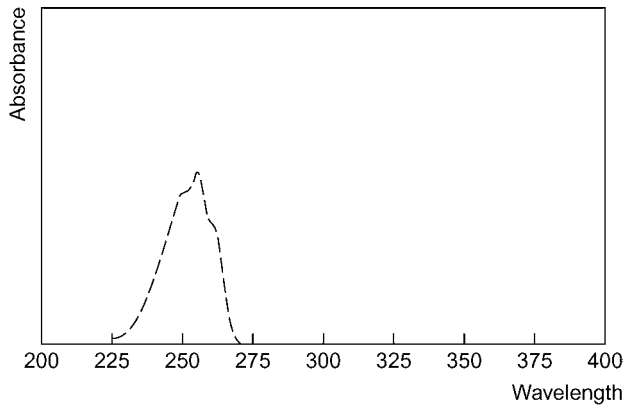
Chemical Properties A white crystalline powder. Mp 114° to 118°. Soluble 1 in 750 of water and 1 in 25 of acetone; slightly soluble in ethanol. Log *P* (octanol/water), −0.5.

Caution Busulfan is irritant; avoid contact with skin and mucous membranes.

Thin-layer Chromatography System TAE—R_f 0.00.

High Performance Liquid Chromatography System HX—RI 368.

Ultraviolet Spectrum Methanol—256 nm (A^1_1=20b).



Infrared Spectrum Principal peaks at wavenumbers 1178, 934, 861, 980, 962, 773 cm^{-1} (KBr disk).

Quantification

***Plasma* GC** ECD. Limit of quantification, 0.01 mg/L [Burns *et al.* 1995]. ECD. Limit of quantification, 0.1 mg/L, limit of detection, 0.06 mg/L [Embree *et al.* 1993].

GC–MS SIM (*m/z* 183 and 197). Limit of quantification, 0.04 mg/L [Lai *et al.* 1998]. Limit of detection, 10 mg/L [Ehrsson, Hassan 1983].

HPLC Fluorescence detection (λ_{ex}=360 nm; λ_{em}=425 nm). Limit of quantification, 20 µg/L, limit of detection, 9 µg/L [Peris *et al.* 1999]. UV detection (λ=251 nm). Limit of quantification, 0.06 mg/L, limit of detection, 0.02 mg/L [Heggie *et al.* 1997].

***Serum* HPLC** UV detection (λ=278 nm). Limit of quantification, 10 mg/L [Funakoshi *et al.* 1994].

Disposition in the Body Readily absorbed after oral administration. It is mainly excreted in the urine as metabolites; about 1% of a dose is excreted in the urine unchanged in 24 h.

Therapeutic Concentration

Following single oral doses of 6 mg to 5 subjects, peak plasma concentrations of 0.05 to 0.13 mg/L (mean 0.08) were reported [Ehrsson *et al.* 1983].

A patient was administered a 1 mg/kg dose of busulfan on two consecutive days. The maximum plasma concentrations reached were 1.2 mg/L 20 min after dosing on the first day and 1.6 mg/L after approx. 60 min on the following day [Peris *et al.* 1999].

Six adult patients, aged 31.8 to 56.9 years, were administered a single low dose of busulfan of 4.87 to 8.2 mg, and six children, aged 0.9 to 15.8 years were administered 2.29 to 7.72 mg. A mean maximum concentration of 0.504 mg/L was reached by the children and 0.352 mg/L by the adults less than 2 h after dosing [Hassan *et al.* 2001].

Half-life Plasma half-life, about 2 to 3 h.

Dose Usually 2 to 4 mg daily; maintenance, 0.5 to 2 mg daily.

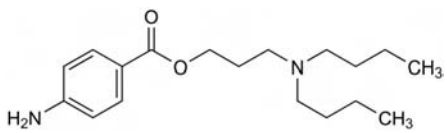
Butacaine

Anaesthetic (Local)

$C_{18}H_{30}N_2O_2$ = 306.4

CAS—149-16-6

IUPAC Name 3-(Dibutylamino)-1-propanol 4-aminobenzoate



Chemical Properties A liquid. pK_a 9.0. Log *P* (octanol/water), 4.4.

Butacaine Sulfate

$(C_{18}H_{30}N_2O_2)_2,H_2SO_4$ = 711.0

CAS—149-15-5

Proprietary Name It is an ingredient of *Rhinamid*.

Chemical Properties A white, very hygroscopic, crystalline powder. Unstable to light and moisture. Mp 100° to 103°. Soluble 1 in 1.5 of water, 1 in 2 of ethanol, 1 in 2.5 of chloroform and 1 in 2000 of ether; quite soluble in acetone.

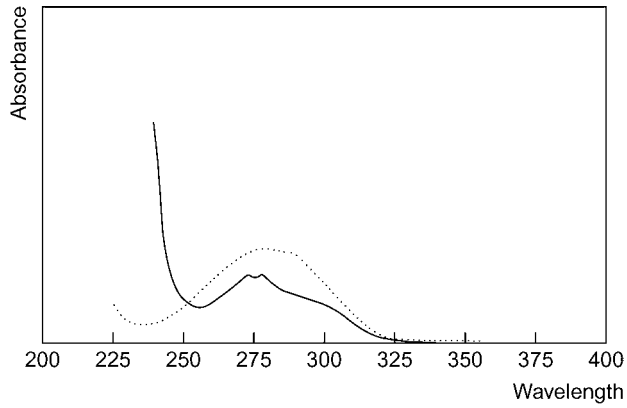
Colour Test Diazotisation—red.

Thin-layer Chromatography System TA—R_f 0.71; system TB—R_f 0.07; system TC—R_f 0.30; system TE—R_f 0.83; system TL—R_f 0.64; system TAE—R_f 0.44; system TAF—R_f 0.76; system TAJ—R_f 0.27; system TAK—R_f 0.05; system TAL—R_f 0.20 (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Ninhydrin spray, positive; Van Urk reagent, bright yellow).

Gas Chromatography System GA—RI 2457.

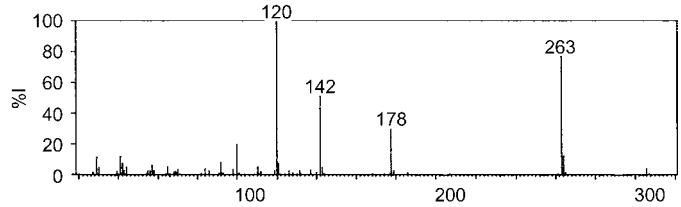
High Performance Liquid Chromatography System HA—*k* 1.2; system HQ—*k* 8.97; system HX—RI 392; system HY—RI 331.

Ultraviolet Spectrum Aqueous acid—272, 278 nm (A_1^1=72b); aqueous alkali—282 nm.



Infrared Spectrum Principal peaks at wavenumbers 1275, 1165, 1598, 1694, 1639, 1111 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 120, 263, 142, 178, 100, 264, 41, 29.



Use A 2% solution of butacaine sulfate has been used for surface anaesthesia.

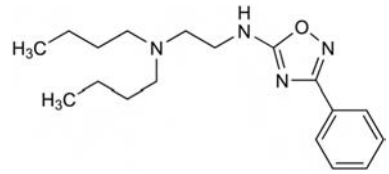
Butalamine

Vasodilator

$C_{18}H_{28}N_4O$ = 316.4

CAS—22131-35-7

IUPAC Name *N*,*N*-Dibutyl-*N′*-(3-phenyl-1,2,4-oxadiazol-5-yl)-1,2-ethanediamine



Chemical Properties Log *P* (octanol/water), 4.4.

Butalamine Hydrochloride

$C_{18}H_{28}N_4O,HCl$ = 352.9

CAS—56974-46-0

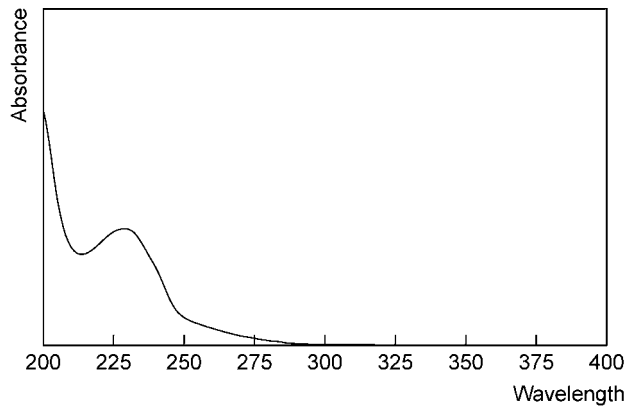
Proprietary Names *Adrevil*; *Surheme*.

Chemical Properties A white crystalline powder. Mp 145°. Soluble 1 in 7 of water, 1 in 10 of ethanol and 1 in 2.5 of chloroform.

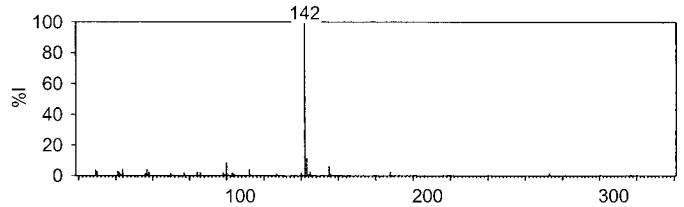
Thin-layer Chromatography System TA—R_f 0.68; system TD—R_f 0.11; system TE—R_f 0.86; system TF—R_f 0.29; system TAD—R_f 0.46 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 2490.

Ultraviolet Spectrum Aqueous acid—228 nm (A_1^1=812a).



Infrared Spectrum Principal peaks at wavenumbers 1639, 751, 1603, 694, 1492, 1170 cm^{-1}.
Mass Spectrum Principal ions at *m/z* 142, 143, 100, 155, 44, 112, 57, 29.

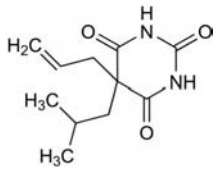


Dose Butalamine hydrochloride has been given in doses of 160 to 320 mg daily.

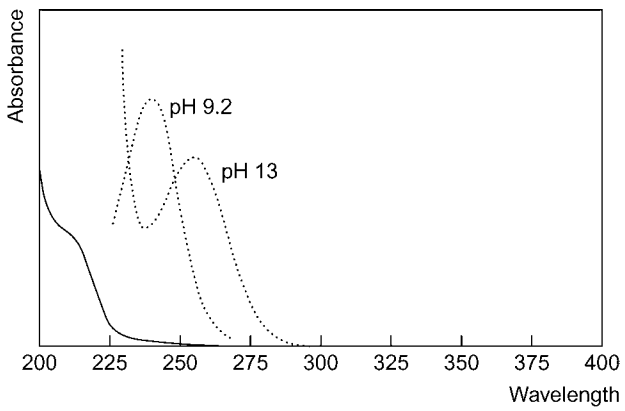
Butalbital

Sedative, Barbiturate
$C_{11}H_{16}N_2O_3 = 224.3$
CAS—77-26-9

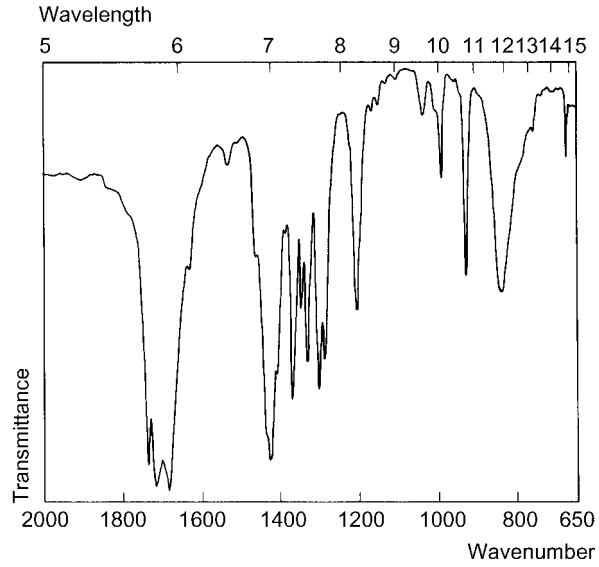
IUPAC Name 5-(2-Methylpropyl)-5-prop-2-enyl-1,3-diazinane-2,4,6-trione
Synonyms Alisobumalum; allylbarbituric acid; itobarbital; 5-(2-methylpropyl)-5-(2-propenyl)-2,4,6(1*H*,3*H*,5*H*)-pyrimidinetrione; tetrallobarbital.
Proprietary Names *Sandoptal*. It is an ingredient of *Fiorinal*.
Note The name Butalbital has also been applied to talbutal, the *sec*-butyl analogue.



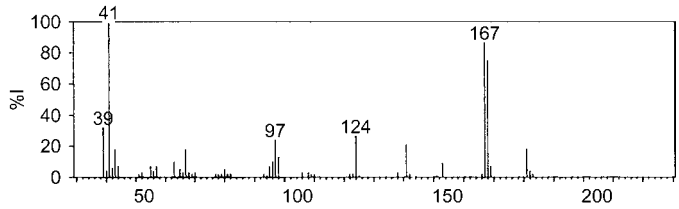
Chemical Properties pK_a 7.6 (20°). Log *P* (octanol/water), 1.9. A white crystalline powder. Mp 138° to 139°. Slightly soluble in cold water; soluble in boiling water; soluble in acetone, ethanol, chloroform, ether, and glacial acetic acid; soluble in aqueous solutions of alkali hydroxides and carbonates.
Colour Tests Koppanyi-Zwikker test—violet; vanillin reagent—orange/colourless.
Thin-layer Chromatography System TB—R_f 0.01; system TD—R_f 0.54; system TE—R_f 0.44; system TF—R_f 0.67; system TH—R_f 0.67; system TAD—R_f 0.57; system TAE—R_f 0.87 (mercurous nitrate spray, black; acidified potassium permanganate solution, yellow-brown).
Gas Chromatography System GA—butalbital RI 1665, butalbital-Me_2 RI 1655, M (OH-) RI 1940; system GB—butalbital RI 1698, M (OH-) RI 2016; system GF—RI 2395; system GAJ—butalbital RRT 0.778 (relative to methylphenobarbital).
High Performance Liquid Chromatography System HG—*k* 6.17; system HH—*k* 3.48; system HX—RI 394; system HY—RI 342; system HZ—retention time 3.4 min.
Ultraviolet Spectrum Borax buffer 0.05 mol/L (pH 9.2)—240 nm (A^1_1=439a); 1 mol/L sodium hydroxide (pH 13)—255 nm (A^1_1=329b).



Infrared Spectrum Principal peaks at wavenumbers 1690, 1720, 1740, 1310, 1290, 1200 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 41, 167, 168, 39, 124, 97, 141, 181.



Quantification See under Amobarbital.
Blood **GC–MS** Limit of quantification, 50 mg/L, limit of detection, 5 mg/L [Meatherall 1997].
Urine **GC–MS** Limit of quantification, 20 mg/L, limit of detection, 5 mg/L [Meatherall 1997].
Disposition in the Body Absorbed after oral administration. About 5% of a dose is excreted in the urine as unchanged drug in 96 h and 20 to 60% as 5-(2,3-dihydroxypropyl)-5-isobutylbarbituric acid.
Therapeutic Concentration Usually in the range 1 to 10 mg/L.
A small group of healthy volunteers was administered 100 mg butalbital orally. Peak blood concentrations reached 2.1 mg/L and fell to 1.5 mg/L after 24 h [Drost, Walter 1988].
Toxicity Plasma concentrations of 10 to 25 mg/L are usually associated with toxic effects.
The following concentrations were reported in one fatality attributed to butalbital overdose: blood 26 mg/L, liver 50 µg/g [Baselt, Cravey 1977].
Half-life Derived from urinary excretion data, about 30 to 40 h.
Dose 200 mg as a hypnotic; 150 to 400 mg daily as a sedative.

Baselt RC, Cravey RH (1977). A compendium of therapeutic and toxic concentrations of toxicologically significant drugs in human biofluids. *J Anal Toxicol* 1: 81–103.
Drost ML, Walter L (1988). Blood and plasma concentrations of butalbital following single oral doses in man. *J Anal Toxicol* 12(6): 322–324.

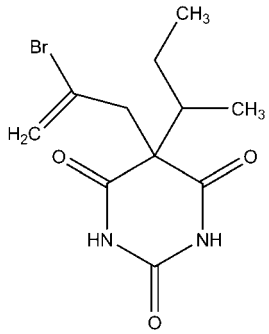
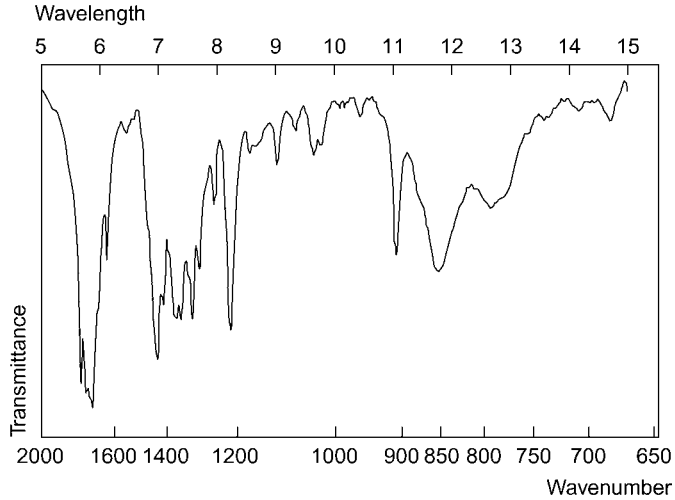
Butallylonal

Barbiturate
$C_{11}H_{15}BrN_2O_3 = 303.2$
CAS—1142-70-7

IUPAC Name 5-(2-Bromoallyl)-5-*s*-butylbarbituric acid
Synonym Butylbromallylbarbituric acid
Proprietary Name *Pernocton*



Chemical Properties Fine white crystalline powder. Mp 130° to 133°. Very slightly soluble in water; soluble in ethanol, ether, and aqueous solutions of alkalis. May be isolated in the A2 fraction. Log *P* (octanol/water) 2.20 [Meylan, Howard 1995].
Colour Test Zwikker's reagent—violet-blue
Thin-layer Chromatography System T10—R_f 0.28 (location reagents: fluorescein spray, pink; mercurous nitrate spray, black; potassium permanganate spray, yellow-brown).
Infrared Spectrum

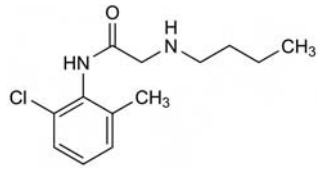


Disposition in the Body Intermediate-acting barbiturate. Metabolised by side-chain oxidation to 5-(2-acetonyl)-5-(1-methylpropyl)barbituric acid with 5 to 17% of the dose appearing in the urine in this form with only traces of unchanged drug.
Toxicity The minimum oral lethal dose in rabbits is 400 mg/kg.
Dose Usually 200 mg.

Meylan WM, Howard PH (1995). Atom/fragment contribution method for estimating octanol-water partition coefficients. *J Pharm Sci* 84: 83–92.

Butanilicaine

Anaesthetic (Local)
$C_{13}H_{19}ClN_2O$ = 254.8
CAS—3785-21-5
IUPAC Name 2-(Butylamino)-*N*-(2-chloro-6-methylphenyl)acetamide

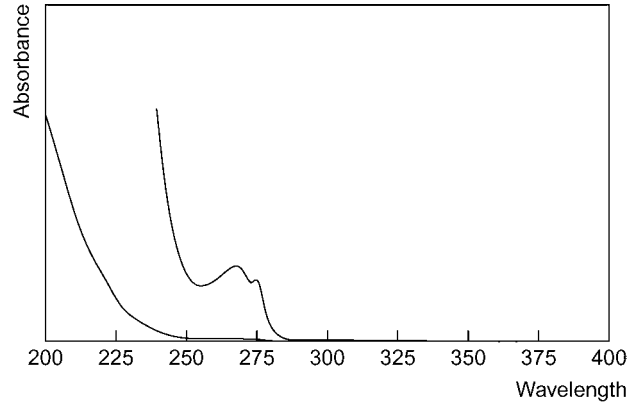


Chemical Properties Crystals. Mp 45° to 46°. Log *P* (octanol/water), 2.0.

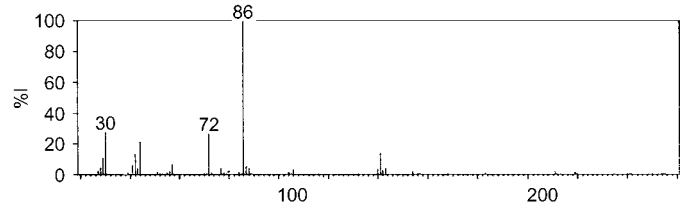
Butanilicaine Phosphate
$C_{13}H_{19}ClN_2O,H_3PO_4$ = 352.8
CAS—2081-65-4
Proprietary Name *Hostacain* (also as hydrochloride).
Chemical Properties Crystals. Mp 126° to 127°.

Colour Tests Aromaticity (method 2)—colourless/orange; Koppanyi–Zwikker test—violet; Liebermann's reagent—orange.
Thin-layer Chromatography System TA—R_f 0.76; system TB—R_f 0.14; system TC—R_f 0.54; system TE—R_f 0.75; system TL—R_f 0.61; system TAE—R_f 0.65 (Acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 2025.
High Performance Liquid Chromatography System HQ—*k* 4.42; system HY—RI 280.
Ultraviolet Spectrum Aqueous acid—267 (A_1^1=15b), 275 nm.



Infrared Spectrum Principal peaks at wavenumbers 1495, 1694, 770, 1136, 1562, 1587 cm^{-1}.
Mass Spectrum Principal ions at *m/z* 86, 30, 72, 44, 141, 42, 29, 57.

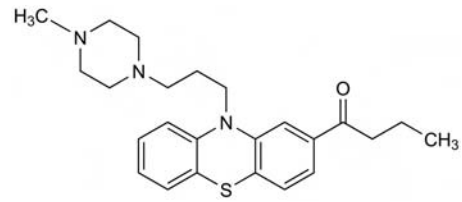


Quantification
Plasma (horse) **GC** AFID. Limit of detection, 5 µg/L [Delbeke, Debackere 1982].
Urine (horse) **GC** See Plasma [Delbeke, Debackere 1982].
Dose Butanilicaine phosphate has been administered by injection, as a 0.5 to 3% solution.

Delbeke FT, Debackere M (1982). Determination of butanilicaine in horse plasma and urine by extractive benzoylation and gas chromatography with a nitrogen-phosphorus detector. *J Chromatogr* 237: 344–349.

Butaperazine

Tranquilliser
$C_{24}H_{31}N_3OS$ = 409.6
CAS—653-03-2
IUPAC Name 1-[10-[3-(4-Methyl-1-piperazinyl)propyl]-10*H*-phenothiazin-2-yl]-1-butanone
Synonym Butyrylperazine



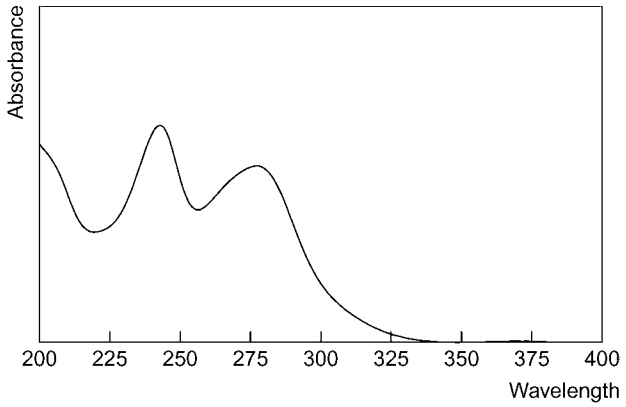
Chemical Properties A yellow oil. Bp 195° to 210°. Log *P* (octanol/water), 4.8.

Butaperazine Maleate
$C_{24}H_{31}N_3OS,2C_4H_4O_4$ = 641.7
CAS—1063-55-4
Synonym Butaperazine dimaleate
Proprietary Name *Repoise*
Chemical Properties A yellow crystalline powder. Mp about 195°. Soluble in water; practically insoluble in chloroform and ether.

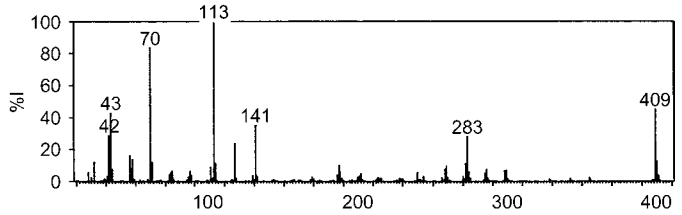
Butaperazine Phosphate
$C_{24}H_{31}N_3OS,2H_3PO_4$ = 605.6
CAS—7389-45-9
Synonym Butaperazine diphosphate
Chemical Properties A yellow crystalline powder. Mp 161° to 162°. Soluble in water; practically insoluble in chloroform and ether.

Colour Tests Mandelin's test—brown-violet; Marquis test—brown-violet.
Thin-layer Chromatography System TA—R_f 0.53; system TB—R_f 0.28; system TC—R_f 0.37; system TE—R_f 0.52; system TL—R_f 0.05; system TAE—R_f 0.26;

system TAJ—R_f 0.10; system TAK—R_f 0.00; system TAL—R_f 0.42 (acidified potassium permanganate solution, positive).
Gas Chromatography System GA—RI 3190.
High Performance Liquid Chromatography System HA—*k* 3.4; system HX—RI 464; system HY—RI 406.
Ultraviolet Spectrum Aqueous acid—242 (A^{1}_{1}=609a), 277 nm.



Infrared Spectrum Principal peaks at wavenumbers 1675, 749, 1279, 1193, 1163, 1143 cm^{-1}.
Mass Spectrum Principal ions at *m/z* 113, 70, 409, 43, 141, 283, 42, 127.



Quantification
Plasma **Spectrofluorimetry** For method, see Manier *et al.* [1974].
Biological Fluids **GC** AFID. Limit of detection, 5 µg/L [Javaid *et al.* 1979].
Disposition in the Body Butaperazine is readily absorbed after oral administration. It is metabolised to the sulfoxide and sulfone; other unidentified metabolites have been detected in plasma.
Therapeutic Concentration
Following oral administration of 40 mg as a single dose to 13 subjects, peak plasma concentrations of 0.07 to 0.69 (mean 0.28) mg/L were attained in 2 to 4 h; peak erythrocyte concentrations of 0.01 to 0.52 (mean 0.11) mg/L were also reported [Garver *et al.* 1976].

Following oral administration of 20 mg twice a day to 9 subjects, minimum steady-state plasma concentrations of 0.02 to 0.20 (mean 0.09) mg/L, and erythrocyte concentrations of 0.01 to 0.06 (mean 0.03) mg/L were reported; therapeutic effect appeared to correlate with erythrocyte concentrations in the range 0.03 to 0.06 mg/L [Casper *et al.* 1980].

Half-life Plasma half-life, 5 to 30 (mean 12) h.
Dose Usually the equivalent of 15 to 30 mg of butaperazine daily; maximum of 100 mg daily.

Casper R *et al.* (1980). Phenothiazine levels in plasma and red blood cells. Their relationship to clinical improvement in schizophrenia. *Arch Gen Psychiatry* 37(3): 301–305.
Garver DL *et al.* (1976). Pharmacokinetics of red blood cell phenothiazine and clinical effects. Acute dystonic reactions. *Arch Gen Psychiatry* 33(7): 862–866.

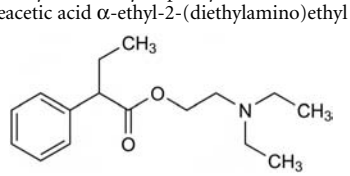
Manier DH *et al.* (1974). A fluorometric method for the measurement of butaperazine in human plasma. *Clin Chim Acta* 57: 225–230.

Butetamate

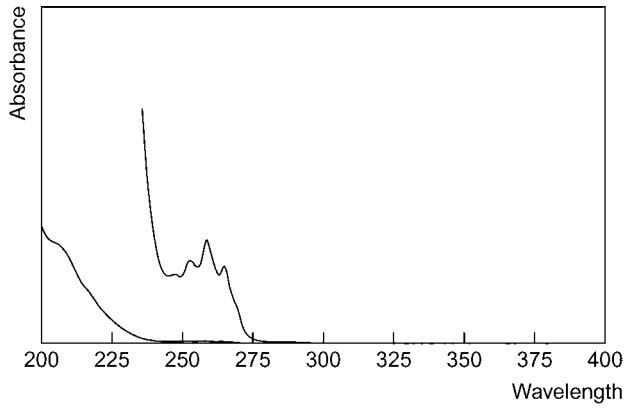
Antispasmodic, Bronchodilator
$C_{16}H_{25}NO_2$ = 263.4
CAS—14007-64-8
IUPAC Name 2-Diethylaminoethyl 2-phenylbutanoate
Synonym Benzeneacetic acid α-ethyl-2-(diethylamino)ethyl ester; butethamate.



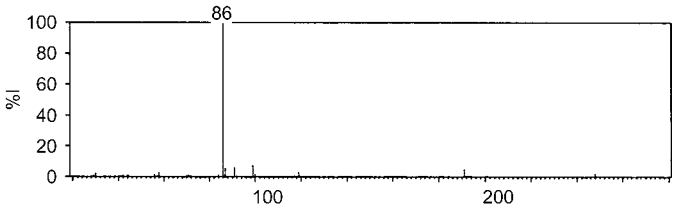
Chemical Properties Log *P* (octanol/water), 3.7.

Butetamate Citrate
$C_{16}H_{25}NO_2$,$C_6H_8O_7$ = 455.5
CAS—3639-12-1
Proprietary Name It is an ingredient of *CAM*.
Chemical Properties Colourless crystals. Mp 107° to 110°. Soluble 1 in 10 of water and 1 in 40 of ethanol.

Thin-layer Chromatography System TA—R_f 0.69; system TB—R_f 0.59; system TC—R_f 0.57; system TE—R_f 0.81; system TL—R_f 0.47; system TAE—R_f 0.48; system TAF—R_f 0.56 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1754.
High Performance Liquid Chromatography System HA—*k* 1.7; system HX—RI 390.
Ultraviolet Spectrum Aqueous acid—253, 258 (A^{1}_{1}=7.6b), 264 nm.



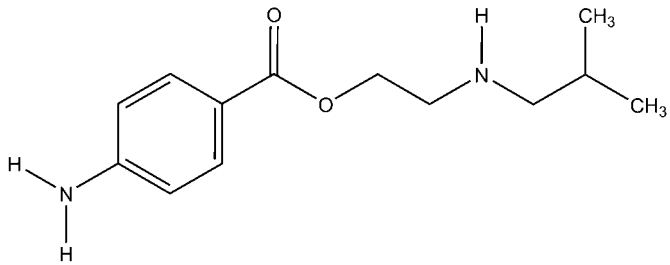
Infrared Spectrum Principal peaks at wavenumbers 1730, 1158, 1194, 694, 1265, 1219 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 86, 99, 91, 191, 87, 119, 58, 248.



Dose Butetamate citrate has been given in doses of 18 to 90 mg daily.

Butethamine

Anaesthetic (Local)
$C_{13}H_{20}N_2O_2$ = 236.3
CAS—2090-89-3
IUPAC Name 2-Isobutylaminotheyl *p*-aminobenzoate



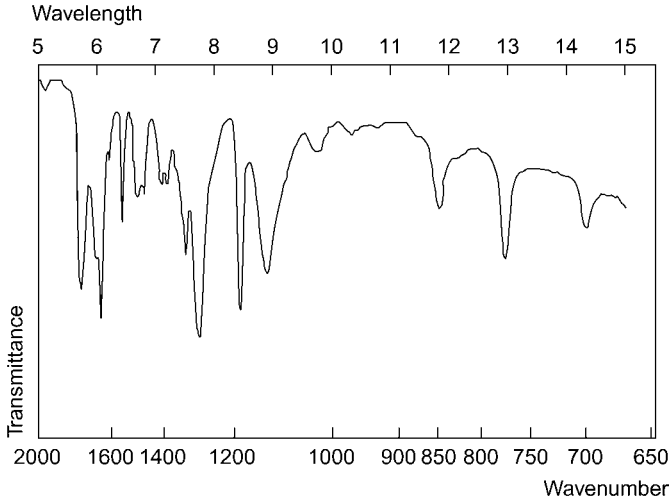
Chemical Properties Butethamine and metabutethamine are isomers. Extracted by organic solvents from aqueous alkaline solutions. Log *P* (octanol/water) 2.19 [Meylan, Howard 1995].

Butethamine Formate
Proprietary Name *Monocaine Formate*
Chemical Properties White crystals or crystalline powder. Mp 136° to 139°. Readily soluble in water and ethanol; slightly soluble in ether and chloroform.

Butethamine Hydrochloride
Proprietary Name *Monocaine Hydrochloride*
Chemical Properties White crystalline powder. Mp 192° to 196°. Sparingly soluble in water; slightly soluble in ethanol and chloroform; practically insoluble in ether.

Colour Tests Diazotisation test—red; Vitali's test—yellow/yellow (limit of detection, 1.0 µg).

Thin-layer Chromatography System T1—R_f 0.60 (location reagents: acidified iodoplatinate spray, positive reaction; *p*-dimethylaminobenzaldehyde spray, yellow).
Gas Chromatography System G2/225—retention time 1.80 relative to diphenhydramine.
Ultraviolet Spectrum Water—290 nm; aqueous acid (0.1 N sulfuric acid)—228, 280 nm and inflexions at 275, 290 nm.
Infrared Spectrum Principal peaks at wavenumbers 1272, 1600, 1702 cm^{-1} (KBr disk).



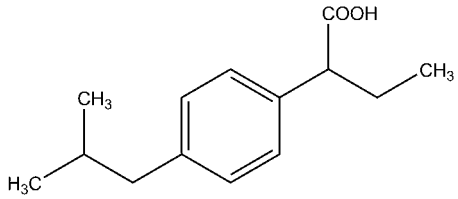
Disposition in the Body Metabolised by hydrolysis to *p*-aminobenzoic acid.
Toxicity It is one-third more potent and one-third more toxic than procaine hydrochloride; it is not recommended as a surface anaesthetic for mucous membranes. The maximum safe amount by injection or topical application is 750 mg, or 75 mL of a 1% solution. LD_{50} (IP) in rats: 183 mg/kg.
Dose Used by injection as a 1 to 1.5% solution with adrenaline.

Meylan WM, Howard PH (1995). Atom/fragment contribution method for estimating octanol-water partition coefficients. *J Pharm Sci* 84: 83–92.

Butibufen

Butyric Acid, NSAID
$C_{14}H_{20}O_2$ = 220.3
CAS—55837-18-8

IUPAC Name 2-[4-(2-Methylpropyl)phenyl]butanoic acid
Synonyms α-Ethyl-4-(2-methylpropyl)benzeneacetic acid; FF-106; 2-(4-isobutylphenyl)butyric acid.



Chemical Properties Solid. Mp 51° to 53°. Soluble in water (43 mg/L). pK_a 6.04 [Barrigon *et al.* 1985]. Log *P* (octanol/water), 4.28 [Meylan, Howard 1995].

Butibufen Sodium

$C_{14}H_{19}NaO_2$ = 242.3
CAS—60682-24-8
Proprietary Names *Butilopan*; *Mijal.*

Quantification

Plasma **GC** Column: 3% D-C 550 on 80-100 Chromosorb (1.82 m × 3 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature programme: 170° isothermal. FID. Retention time: 5.5 min. Limit of quantification, 0.5 mg/L [Barrigon *et al.* 1985].
Other **HPLC** Pharmaceutical Dosage Forms. Column: C_{18} Novapak (150 × 3.9 mm i.d., 4 µm). Mobile phase: water : acetonitrile : orthophosphoric acid (528 : 472 : 0.4), flow rate 1 mL/min. UV detection (λ = 264 nm). Retention time: 10.1 min. Limit of quantification not reported [Gonzalez Tavares *et al.* 1992].
Note For a chiroptical characterisation method, see Hoult *et al.* [1999].

Disposition in the Body

Therapeutic Concentration

Four healthy young volunteers (aged 18 to 21 years) were administered a single dose of 0.5 g butibufen as either enteric-coated microcapsules (ECM) or non-enteric-coated (gastric release) microcapsules (GRM), with a washout period of a week between doses. The mean peak plasma concentration in the ECM study was 22.2 mg/L after 1.73 h and in the GRM study, 23.7 mg/L after 1.26 h. There was a significant difference in half-life absorption values, with 39.3 min for the ECM study and 23.0 min in the GRM study [Barrigon *et al.* 1985].
Dose Given orally in inflammatory and rheumatic disorders.

Barrigon S *et al.* (1985). Butibufen enteric-coated vs non-enteric-coated microcapsules: pharmacokinetics and gastrointestinal blood loss effect relationships in healthy volunteers. *Arch Farmacol Toxicol* 11: 189–197.

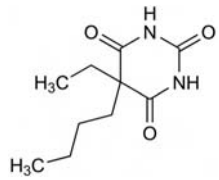
Meylan WM, Howard PH (1995). Atom/fragment contribution method for estimating octanol–water partition coefficients. *J Pharm Sci* 84: 83–92.

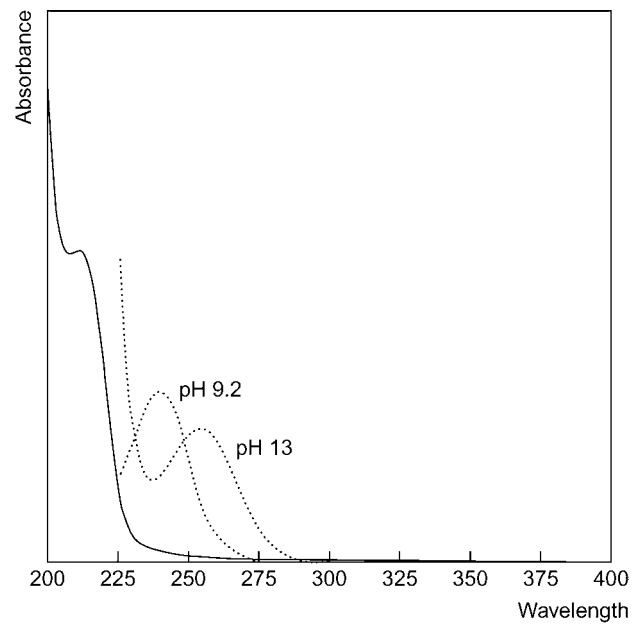
Butobarbital

Hypnotic, Barbiturate
$C_{10}H_{16}N_2O_3$ = 212.3
CAS—77-28-1

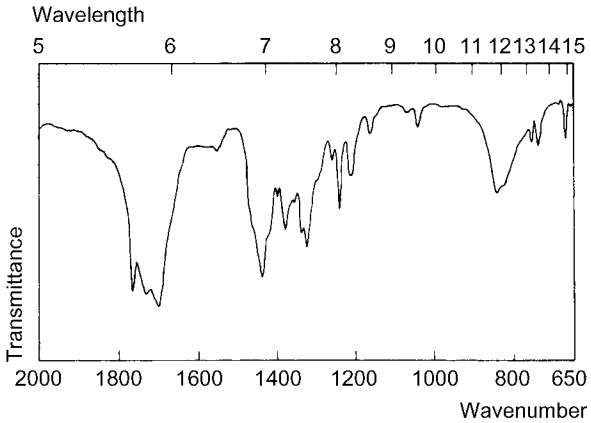
IUPAC Name 5-Butyl-5-ethyl-1,3-diazinane-2,4,6-trione
Synonyms Butethal; butobarbitalum; butobarbitone; 5-butyl-5-ethyl-2,4,6 (1*H*,3*H*,5*H*)-pyrimidinetrione.
Proprietary Names *Sonabarb*; *Soneryl.* It is an ingredient of *Belloid* and *Hypnasmine.*



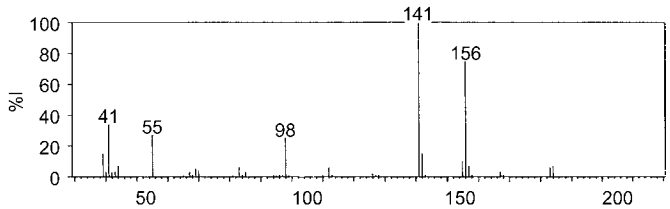
Chemical Properties Colourless crystals or white crystalline powder. Mp 124° to 127°. Soluble 1 in 5 alcohol and 1 in 10 ether; practically insoluble in water, insoluble in petroleum ether and aliphatic hydrocarbons. pK_a 8.0 (25°). Log *P* (octanol/water), 1.73.
Colour Tests Koppanyi–Zwikker test—violet; mercurous nitrate—black.
Thin-layer Chromatography System TD—R_f 0.50; system TE—R_f 0.41; system TF—R_f 0.65; system TH—R_f 0.68; system TAD—R_f 0.58; system TAE—R_f 0.86 (mercuric chloride–diphenylcarbazone reagent, positive; mercurous nitrate spray, black; Zwikker's reagent, pink).
Gas Chromatography System GA—butobarbital RI 1660, butobarbital-Me_2 RI 1565, M (3′-OH-) RI 1920, M (3′-OH-)-AC RI 1940, M (3′-oxo-) RI 1880; system GF—RI 2390; system GAJ—butobarbital RRT 0.732, M (3′-OH-) RRT 1.053 (both relative to methylphenobarbital).
High Performance Liquid Chromatography System HG—*k* 5.43; system HH—*k* 3.42; system HX—RI 384; system HY—RI 355; system HZ—retention time 3.2 min; system HAA—retention time 14.9 min.
Ultraviolet Spectrum Borax buffer 0.05 mol/L (pH 9.2)—239 nm (A^1_1=477a); M sodium hydroxide (pH 13)—254 nm (A^1_1=388b).



Infrared Spectrum Principal peaks at wavenumbers 1696, 1727, 1760, 1242, 850, 1215 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 141, 156, 41, 55, 98, 39, 142, 155; 3′-hydroxybutobarbitone 156, 141, 45, 157, 41, 29, 55, 27.



Quantification See also under Amobarbital.
Urine **GC–MS** For butobarbital and metabolites see Gilbert and Powell [1976].
Disposition in the Body Readily absorbed after oral administration. Metabolic reactions include side-chain oxidation to form the 3′-hydroxy, 3′-oxo, and 3′-carboxypropyl metabolites. About 5 to 9% of an oral dose is excreted in the urine unchanged, 22 to 28% as 3′-hydroxybutobarbital, 14 to 18% as 3′-oxobutobarbital, and 4 to 8% as 5-(3′-carboxypropyl)-5-ethylbarbituric acid.
Therapeutic Concentration In plasma, usually in the range 2 to 15 mg/L.
A single oral dose of 200 mg, given to 5 subjects, produced peak plasma concentrations of 2.9 to 4.1 mg/L (mean 3.6) in 0.6 to 2 h; following oral doses of 200 mg daily for 3 days to 2 subjects, plasma concentrations of 6.5 and 6.4 mg/L were observed 9 h after the last dose [Breimer 1976].
Toxicity The estimated minimum lethal dose is 2 g. Toxic effects are associated with plasma concentrations of 14 to 32 to 98 mg/L and fatalities with blood concentrations of 11 to 30 to 75 mg/L.
In 3 fatalities attributed to butobarbital overdose, the following postmortem tissue concentrations, mg/L or μg/g, were reported:

	Butobarbital	*3′-Hydroxybutobarbital*
Blood	18, 22, 49	—, 3, —
Bile	49, 27, 131	204, 4, 312
Kidney	31, 23, 72	—, 8, 12
Liver	47, 58, 83	2, 10, 17
Lung	26, 19, 52	—, 8, 19
Urine	4, 26, 38	259, —, 5

[Robinson, McDowall 1979].

Half-life Plasma half-life, about 40 h following single doses, but may be reduced to about 30 h after multiple dosing.
Volume of Distribution About 0.8 L/kg.
Protein Binding About 26%.
Dose 100 to 200 mg, as a hypnotic.

Breimer DD (1976). Pharmacokinetics of butobarbital after single and multiple oral doses in man. *Eur J Clin Pharmacol* 10: 263–271.

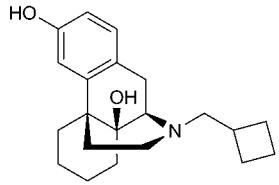
Butorphanol

Narcotic Analgesic
$C_{21}H_{29}NO_2 = 327.5$
CAS—42408-82-2

Synonyms 17-(Cyclobutylmethyl)morphinan-3,14-diol; Levo-BC-2627.

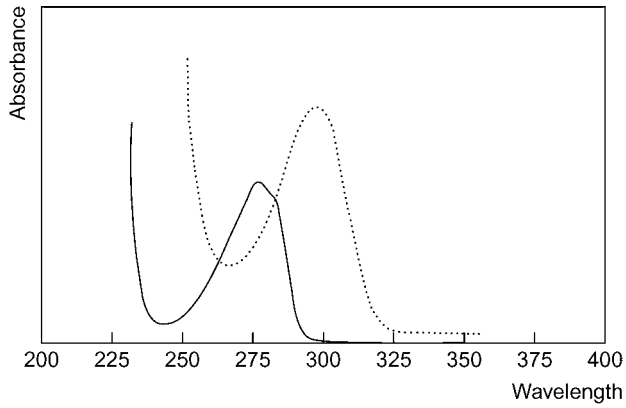


Chemical Properties Solid. Mp 215° to 217°. Butorphanol and its metabolites were stable in plasma for 123 and 87 days, respectively, when stored at −20°. Reconstituted PFB-derivatives of butorphanol were stable for at least 42 h, and the TFA-derivatives were stable for at least 24 h [Mulvana *et al.* 1996]. Butorphanol and its metabolites were stable in frozen human urine for 1 month. This was independent of concentration. Reconstituted samples were stable in the autosampler for at least 68 h [Willey *et al.* 1994].

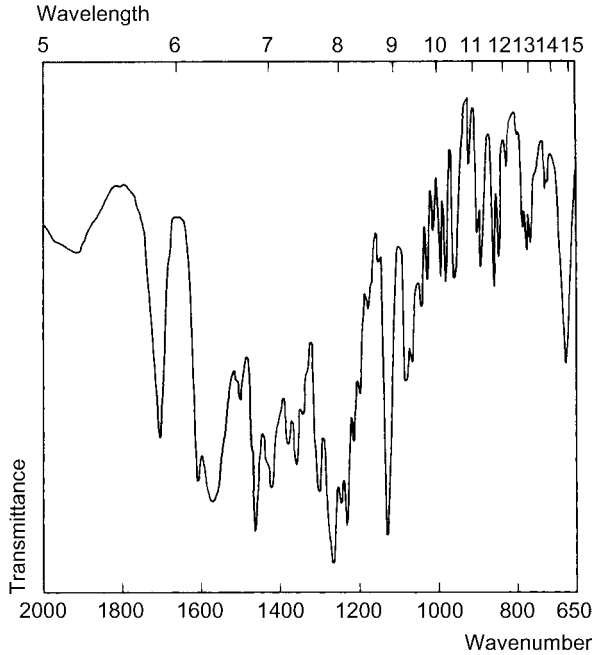
Butorphanol Tartrate

$C_{21}H_{29}NO_2,C_4H_6O_6 = 477.6$
CAS—58786-99-5
Proprietary Name *Stadol*
Chemical Properties White crystalline powder. Mp 217° to 219°, with decomposition. Sparingly soluble in water; slightly soluble in methanol; practically insoluble in ethanol, chloroform, and ether; soluble in dilute acids. Log *P* (octanol) 3.7.

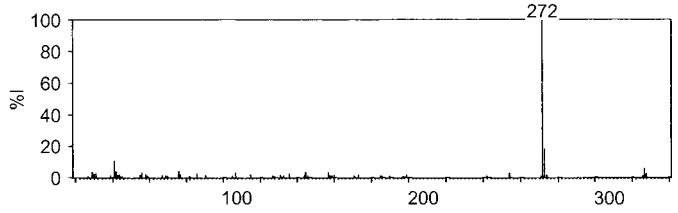
Colour Tests Liebermann's reagent—black; Marquis test—grey.
Gas Chromatography System GA—RI 2761; system GB—RI 2902.
High Performance Liquid Chromatography System HY—RI 300.
Ultraviolet Spectrum Aqueous acid—278 nm. ($A^{1}_{1} = 62$b); aqueous alkali—299 nm.



Infrared Spectrum Principal peaks at wavenumbers 1269, 1130, 1233, 1575, 1249, 1303 cm^{-1} (butorphanol tartrate), (KBr disk).



Mass Spectrum Principal ions at *m/z* 272, 273, 41, 327, 145, 76, 42, 29.



Quantification

Plasma **GC-MS** Column: DB-1 (15 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 50 cm/s. Temperature programme: 200° for 1 min to 310° at 25°/min for 2.1 min. NCI, SIM acquisition mode. Limit of detection, 20 ng/L [Mulvana *et al.* 1996].

HPLC Column: Bondapak-NH_2 (30 cm × 4 mm i.d.). Mobile phase: ethanol : benzene (10 : 90 for 12 min to 100 : 0), flow rate 1 mL/min for 12 min to 6 mL/min. UV detection (λ = 280 nm). Retention time: butorphanol 3–6 min, hydroxybutorphanol 6–12 min, norbutorphanol 19–24 min. Limit of detection, 0.1 ng butorphanol [Gaver *et al.* 1980].

LC-MS Column: Partisil C_8 (100 × 4.6 mm i.d., 5 μm). Mobile phase: methanol : water : formic acid (90 : 10 : 0.1), flow rate 0.3 mL/min. ESI, positive ion mode. Limit of quantification, 13.7 ng/L, [Boulton *et al.* 2002]. Column: Capcell Pak-ODS.UG120 (150 × 4.6 mm i.d.). Mobile phase: acetonitrile : 0.1 mol/L potassium phosphate buffer (3 : 7), flow rate 1.0 mL/min. UV detection (λ = 220 nm) followed by APCI, SIM acquisition mode. Retention time: 14.0 min. Limit of quantification, 10.7 ng [Kanazawa *et al.* 1998].

Serum **GC** Column: 3% SE-30 on 100/200 mesh GasChrom Q (30.5 cm × 4 mm i.d.). ECD. Limit of quantification, 0.9 μg/L; limit of detection, 2 μg/L [Pfeffer *et al.* 1980].

Urine **HPLC** Column: Octyl (250 × 4.6 mm i.d., 5 μm). Mobile phase: 1.0 mol/L tetramethyl ammonium hydroxide 1.0 mol/L ammonium acetate (pH 6.0) : water : methanol : acetonitrile (20 : 1380 : 200 : 400), flow rate, 1.0 mL/min. Fluorescence detection (λ_{ex} = 200 nm, λ_{em} = 325 nm). Limit of quantification, 1 mg/L for butorphanol and hydroxybutorphanol, 2 mg/L for norbutorphanol [Willey *et al.* 1994].

Disposition in the Body Well absorbed after oral or IM administration. Undergoes extensive first-pass metabolism, mainly by hydroxylation, dealkylation and conjugation. The major metabolite is 3′-hydroxybutorphanol. Approximately 70% of a dose is excreted in the urine and 13% is eliminated in the faeces in 5 days. In 24 h, 5 to 10% of a dose is excreted in the urine as unchanged drug, 5 to 10% as free and conjugated norbutorphanol, and approximately 50% as 3′-hydroxybutorphanol.

Therapeutic Concentration

Two healthy male volunteers were administered 1 mg butorphanol tartrate as an intranasal dose for 24 h. The maximum plasma concentrations were 1.47 μg/L 0.25 h after the dose and 1.33 μg/L 0.5 h after [Boulton *et al.* 2002].

Nine healthy male volunteers received a 1 mg nasal dose of butorphanol on days 1 and 6 and a 1 mg transnasal dose every 6 h on days 2–5. After the first dose, the mean peak plasma butorphanol concentration was 1.54 μg/L and was reached at 0.25 h. The steady-state plasma butorphanol concentration was 1.38 μg/L at 0.5 h. After the first dose, the mean peak plasma hydroxybutorphanol concentration was 0.376 μg/L and was reached at 6.0 h. The steady-state plasma hydroxybutorphanol concentration was 1.81 μg/L at 4.0 h [Vachharajani *et al.* 1997].

A single IM dose of 2 mg butorphanol administered to 6 subjects produced a mean peak plasma concentration of 2 μg/L butorphanol in 0.5 to 1 h, and a mean peak plasma concentration of 1 μg/L of 3′-hydroxybutorphanol after 4 to 6 h [Gaver *et al.* 1980].

After oral administration of 16 mg of butorphanol tartrate to 4 subjects, peak serum concentrations of 0.3 to 3.0 μg/L (mean 1.0) were attained in 2 to 4 h [Pittman *et al.* 1980].

Bioavailability ≈17%.

Half-life Plasma half-life, 2 to 4 h.

Volume of Distribution ≈5 L/kg.

Protein Binding ≈80%.

Note For a review of butorphanol, see Gillis *et al.* [1995].

Dose 1 to 4 mg of butorphanol tartrate every 4 h by IM injection; doses of 4 to 16 mg have been given by mouth.

Butoxamine

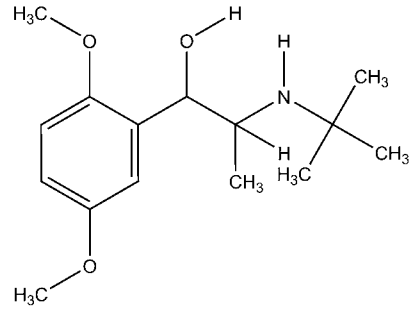
β_2-Adrenoceptor Antagonist, Antidiabetic

$C_{15}H_{25}NO_3$ = 267.4

CAS—2922-20-5

IUPAC Name (±)–Erythro-1-(2,5-dimethoxyphenyl)-2-*t*-butylaminopropan-1-ol

Synonym BW64-9



Chemical Properties Extracted by organic solvents from aqueous alkaline solutions.

Colour Tests Ammonium molybdate test—green (limit of detection 0.1 μg); sulfuric acid-formaldehyde test—green (limit of detection 0.1 μg); Vitali's test—yellow/yellow/yellow (limit of detection 0.5 μg).

Thin-layer Chromatography System T1—R_f 0.60 (location reagent potassium permanganate spray, positive reaction).

Infrared Spectrum Principal peaks at wavenumbers 1485, 1206, 1263 cm^{-1} (KCl disk).

Butoxyethyl Nicotinate

Vasodilator (Topical)

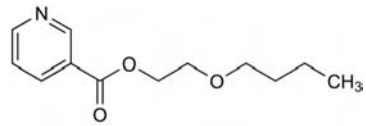
$C_{12}H_{17}NO_3$ = 223.3

CAS—13912-80-6

IUPAC Name 2-Butoxyethyl pyridine-3-carboxylate

Synonym 2-Butoxyethyl nicotinate

Proprietary Names It is an ingredient of *Actinac* and *Finalgon*.

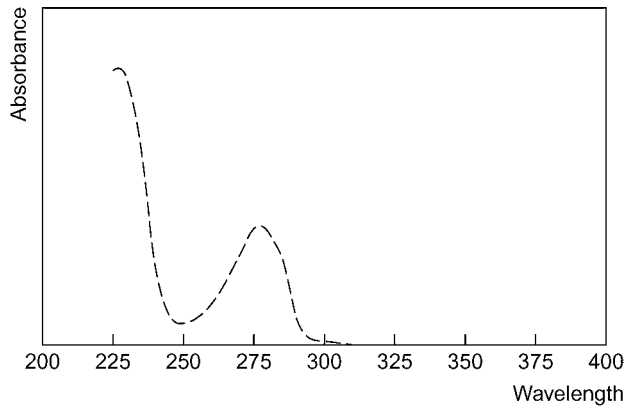


Chemical Properties Soluble in ether; slightly soluble in dilute acetic acid.

Thin-layer Chromatography System TA—R_f 0.63; system TB—R_f 0.45; system TC—R_f 0.69; system TL—R_f 0.62 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 1640.

Ultraviolet Spectrum Methanol—279 nm (A^1_1=152b).



Infrared Spectrum Principal peaks at wavenumbers 1282, 1724, 1111, 740, 1020, 1587 cm^{-1}.

Use Topically in a concentration of 2.5%.

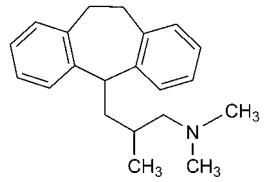
Butriptyline

Tricyclic Antidepressant

$C_{21}H_{27}N$ = 293.5

CAS—35941-65-2

Synonym 10,11-Dihydro-*N*,*N*,β-trimethyl-5*H*-dibenzo[*a*,*d*]cycloheptene-5-propanamine



Chemical Properties Oil. Butriptyline is stable in human serum at room temperature for 8 days [Bruderlein *et al.* 1977].

Butriptyline Hydrochloride

$C_{21}H_{27}N,HCl = 329.9$
CAS—5585-73-9

Proprietary Name *Evadyne*

Chemical Properties White crystalline powder. Mp ≈186°. Freely soluble in water; moderately soluble in aliphatic alcohols and chloroform; insoluble in ether.

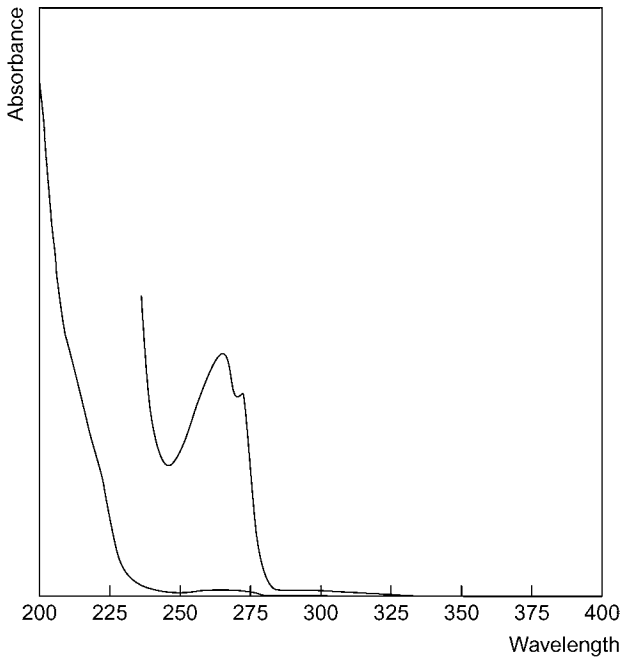
Colour Test Marquis test—violet.

Thin-layer Chromatography System TA—R_f 0.59; system TAG—R_f 0.38; system TB—R_f 0.61; system TC—R_f 0.48 (acidified iodoplatinate solution, positive).

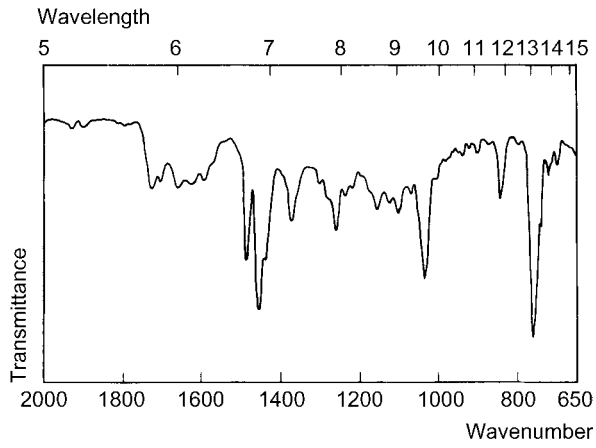
Gas Chromatography System GA—RI 2181; system GB—butriptyline RI 2288, M (nor-) RI 2330; system GF—RI 2465; system GM—butriptyline RRT 0.683,M (nor-) RRT 0.761.

High Performance Liquid Chromatography System HA—butriptyline *k* 2.7, norbutriptyline *k* 1.7; system HF—*k* 7.33; system HY—RI 369.

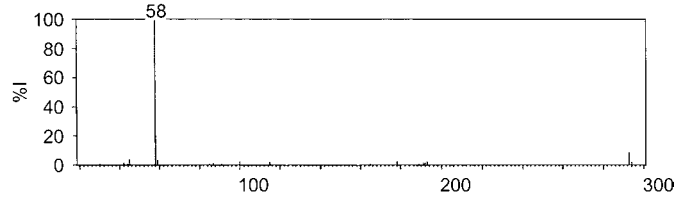
Ultraviolet Spectrum Aqueous acid—265 nm.



Infrared Spectrum Principal peaks at wavenumbers 757, 1033, 1265, 740, 1098, 1149 cm^{-1} (KCl disk).



Mass Spectrum Principal ions at *m/z* 58, 293, 45, 59, 193, 100, 178, 294.



Quantification

Blood **GC-MS** DB-5MS (15 m × 0.25 mm i.d., 0.25 µm). Temperature programme: 80° for 2 min to 195° at 25°/min to 300° at 5°/min for 2 min. NPD. Limit of detection, 250 µg/L [Hutchison *et al.* 1994].

Plasma **GC** Column: 3% OV-17 on Gas-Chom Q (80/100 mesh; 6′ × 2 mm i.d.). Carrier gas: He, 60 mL/min. Temperature: 208°. Limit of detection not reported [Bourgouin *et al.* 1981]. Column: Coiled glass (1.8 m × 4 mm i.d.). Carrier gas: N_2, 21 mL/min. Temperature: 215°. FID. Retention time: 9.3 min. Limit of detection, 10 µg/L [Norman *et al.* 1977].

Serum **GC** Column: U-shaped glass (6′ × 2 mm i.d.). Carrier gas: He, 15 mL/min. FID. Limit of detection, 10 µg/L [Bruderlein *et al.* 1977].

Disposition in the Body Readily absorbed after oral administration. It is rapidly metabolised, and the metabolites are thought to undergo enterohepatic circulation; the major metabolite is norbutriptyline. Butriptyline is slowly excreted in the urine mainly as metabolites; up to 25% of a dose is excreted in the urine in 24 h with <2% of the dose as unchanged drug, and about 4% as glucuronide conjugates; approximately 1 to 2% of a dose is eliminated in the faeces in 24 h [Cameron *et al.* 1974].

Therapeutic Concentration

After a single oral dose of 75 mg to 14 subjects, peak plasma concentrations of 0.024 to 0.11 mg/L (mean 0.05) were attained in ~ 3 h [Bourgouin *et al.* 1981].

After oral administration of 50 mg three times a day to 9 subjects, steady-state plasma butriptyline concentrations of 0.06 to 0.28 mg/L (mean 0.15) were reported 6 h after the final dose; plasma concentrations of norbutriptyline were of a similar order [Burrows *et al.* 1977].

Toxicity

A 16-year-old female was found dead with several medication bottles nearby. It was estimated that she had taken approximately 137 butriptyline tablets (25 mg each). The drug was detected in her blood at a concentration of 14.9 mg/L and in her urine at 2.96 mg/L. Salicylate and acetaminophen were also detected in her blood [Hutchison *et al.* 1994].

Half-life Plasma half-life, ≈20 h.

Protein Binding >90%.

Dose The equivalent of 75 to 150 mg of butriptyline daily.

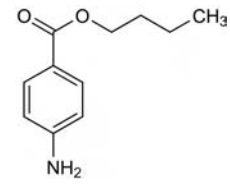
Butyl Aminobenzoate

Anaesthetic (Local)
$C_{11}H_{15}NO_2 = 193.2$
CAS—94-25-7

IUPAC Name Butyl 4-aminobenzoate

Synonyms Butamben; butoforme; scuroforme.



Chemical Properties A white crystalline powder. It slowly hydrolyses when boiled with water. Mp 57° to 59°. Very slightly soluble in water; soluble 1 in 3 of ethanol, and 1 in 2 of ether; soluble in chloroform and in dilute mineral acids. pK_a 2.5 (25°). Log *P* (octanol/water), 2.9.

Butyl Aminobenzoate Picrate

$(C_{11}H_{15}NO_2)_2,C_6H_3N_3O_7 = 615.6$
CAS—577-48-0

Proprietary Name *Butesin Picrate*
Chemical Properties A yellow powder. Mp 109° to 110°. Very slightly soluble in water; soluble in ethanol, chloroform, and ether.

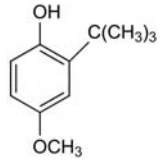
Colour Test Diazotisation—red.
Thin-layer Chromatography System TA—R_f 0.75; system TB—R_f 0.06; system TC—R_f 0.63; system TL—R_f 0.70; system TAE—R_f 0.83; system TAF—R_f 0.90.
Gas Chromatography System GA—RI 1742.
High Performance Liquid Chromatography System HY—RI 483.
Ultraviolet Spectrum Aqueous acid—279 nm; aqueous alkali—285 nm; ethanol—294 nm (A^1_1=1065a).
Infrared Spectrum Principal peaks at wavenumbers 1273, 1595, 1681, 1630, 1111, 1163 cm^{-1}.
Mass Spectrum Principal ions at *m/z* 120, 137, 193, 92, 65, 121, 138, 41.
Quantification
Plasma **GC** Nitrogen selective detection. Limit of quantification, 6 mg/L, limit of detection, 3 mg/L [Grouls *et al.* 1995].
Note For a review of the toxicology of topical local anaesthetics, see Bangha *et al.* [1996].
Dose The maximum safe dose for topical use is estimated to be 5 g.

Bangha E *et al.* (1996). Toxicology of topical local anesthetics. *Skin Pharmacol* 9: 376–380.
Grouls RJ *et al.* (1995). Capillary gas chromatographic method for the determination of n-butyl-p-aminobenzoate and lidocaine in plasma samples. *J Chromatogr B Biomed Sci Appl* 673(1): 51–57.

Butylated Hydroxyanisole

Antioxidant
$C_{11}H_{16}O_2$ = 180.2
CAS—25013-16-5

IUPAC Name 2-Tert-butyl-4-methoxyphenol
Synonym BHA; (1,1-dimethylethyl)-4-methoxyphenol.
Proprietary Names *Embanox BHA*; *Nipantiox 1-F*; *Tenox BHA*.



Chemical Properties A white crystalline powder or a yellowish-white waxy solid. Mp 48° to 55°. It contains a variable proportion of 3-*tert*-butyl-4-methoxyphenol. Practically insoluble in water; soluble 1 in 4 of ethanol, 1 in 2 of chloroform, 1 in 1.2 of ether and 1 in 2 of propylene glycol; soluble in solutions of alkali hydroxides. Log *P* (octanol/water), 3.5.
Colour Tests Dissolve 0.1 g in 10 mL of ethanol, add 2 mL of a 2% solution of borax and a few crystals of 2,6-dichloroquinone-chloroimide—blue (compare blue colour produced by butylated hydroxytoluene).

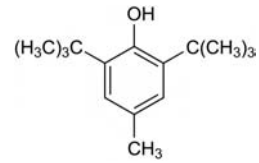
Dissolve a few crystals in 10 mL of ethanol and add 0.5 mL of a 0.2% solution of ferric ammonium sulfate in 0.5 mol/L sulfuric acid—green-blue.
Gas Chromatography System GA—RI 1462.
Ultraviolet Spectrum Acid ethanol—228 (A^1_1=340a), 292 nm (A^1_1=205a).
Infrared Spectrum Principal peaks at wavenumbers 1202, 1220, 1050, 805, 1185, 1294 cm^{-1} (KBr disk).
Quantification
Plasma **GC** FID. Limit of detection, <100 µg/L [El-Rashidy, Niazi 1979].
HPLC For method, see Verhagen *et al.* [1987].
Urine **GC** See Plasma [El-Rashidy, Niazi 1979].
Disposition in the Body Butylated hydroxyanisole is absorbed after oral administration and may be stored in body fat after large doses. It is metabolised by *O*-demethylation and conjugation with glucuronic acid and sulfate. Less than 1% of a dose is excreted in the urine unchanged in 24 h together with 44% as the glucuronide, 26% as the sulfate and about 22% each as the glucuronide and sulfate conjugates of the desmethyl metabolite.
Protein Binding Highly bound.

El-Rashidy R, Niazi S (1979). GLC determination of butylated hydroxyanisole in human plasma and urine. *J Pharm Sci* 68: 103–104.
Verhagen H *et al.* (1987). Sensitive high-performance liquid chromatographic method for the routine determination of butylated hydroxyanisole in plasma. *J Chromatogr* 413: 282–286.

Butylated Hydroxytoluene

Antioxidant
$C_{15}H_{24}O$ = 220.4
CAS—128-37-0

IUPAC Name 2,6-Ditert-butyl-4-methylphenol
Synonyms BHT; 2,6-bis-(1,1-dimethylethyl)-4-methylphenol; DBPC.
Proprietary Names *Anullex BHT*; *Embanox BHT.*



Chemical Properties Colourless crystals or white crystalline powder. Mp 70°. Insoluble in water; freely soluble in toluene; soluble in acetone; soluble 1 in 4 of ethanol, 1 in 1.1 of chloroform, and 1 in 0.5 of ether; practically insoluble in propylene glycol and in solutions of alkali hydroxides. pK_a 12.2. Log *P* (octanol/water), 5.1.

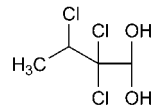
Colour Test Dissolve 0.1 g in 10 mL of ethanol, add 2 mL of a 2% solution of borax and a few crystals of 2,6-dichloroquinonechloroimide—faint blue (compare blue colour produced by butylated hydroxyanisole).
Gas Chromatography System GA—RI 1490.
Ultraviolet Spectrum Dehydrated alcohol—278 nm (A^1_1=85a).
Quantification
Plasma **HPLC** Electrochemical detection. Limit of detection, 0.4 mg/L [Bianchi *et al.* 1997].
Tissue **HPLC** See Plasma [Bianchi *et al.* 1997].
Disposition in the Body Readily absorbed after oral administration. About 50% of a dose is excreted in the urine in 24 h, mainly as glucuronide conjugates of oxidation products.

Bianchi L *et al.* (1997). Measurement of synthetic phenolic antioxidants in human tissues by high-performance liquid chromatography with coulometric electrochemical detection. *J Chromatogr B Biomed Sci Appl* 694(2): 359–365.

Butylchloral Hydrate

Hypnotic
$C_4H_7Cl_3O_2$ = 193.5
CAS—76-40-4

IUPAC Name 2,2,3-Trichlorobutane-1,1-diol
Synonyms Croton-cloral hydrate; trichlorobutylidene glycol.

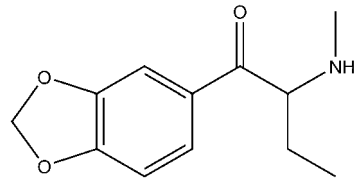


Chemical Properties Pearly-white crystalline scales. Mp ≈78°. Soluble 1 in 40 of water, 1 in 0.6 of ethanol (forming an ethanolate), 1 in 20 of chloroform and 1 in 2 of ether. Log *P* (octanol) 1.9.
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.
Infrared Spectrum Principal peaks at wavenumbers 830, 1090, 1051, 1020, 690, 1300 cm^{-1} (KBr disk).
Dose Butylchloral hydrate has been given at a dose of 0.3 to 1.2 g.

Butylone

Cathinone Derivative, Phenethylamine, Stimulant
$C_{12}H_{15}NO_3$ = 221.2
CAS—17762-90-2

IUPAC Name 2-Methylamino-1-(3,4-methylenedioxyphenyl)butan-1-one
Synonym bk-MBDB

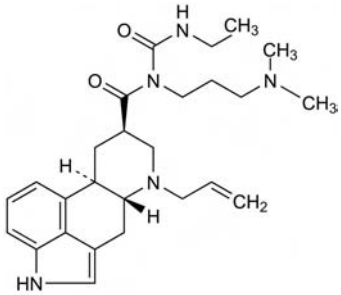


Chemical Properties Cathinone analogue of MDBD.
Note The name Butylone is also a trademarked brand name for pentobarbital.
Dose Reported as 160 mg orally.

Cabergoline

Dopamine D_2 Agonist
$C_{26}H_{37}N_5O_2 = 451.6$
CAS—81409-90-7

IUPAC Name 2,6-Ditert-butyl-4-methylphenol
Synonym (8β)-*N*-[3-(Dimethylamino)propyl]-*N*-[(ethylamino)carbonyl]-6-(2-propenyl)ergoline-8-carboxamide; FCE-21336.
Proprietary Names *Cabaser*; *Dostinex*.

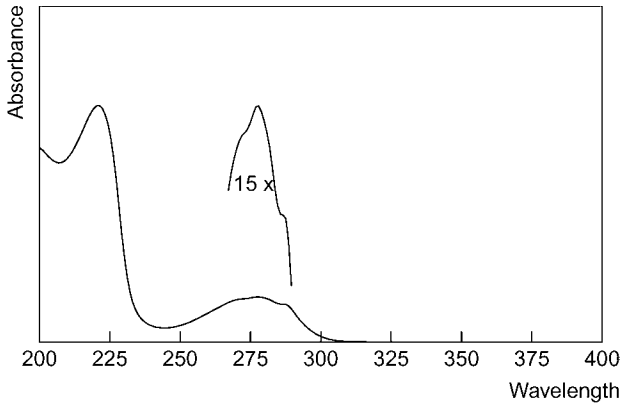


Chemical Properties A white powder. It is insoluble in water; soluble in chloroform, ethanol, and dimethylformamide; slightly soluble in 0.1 mol/L hydrochloric acid; very slightly soluble in hexane.

Cabergoline Diphosphate

$C_{26}H_{37}N_5O_2, 2H_3PO_4 = 647.6$
CAS—85329-89-1
Chemical Properties Mp 153° to 155°.

Ultraviolet Spectrum



Quantification

Plasma **HPLC** Column: C_{18} (Nucleosil, 250 × 4 mm i.d., 5 µm). Mobile phase: acetonitrile : 75 mM phosphate buffer pH 3 (20:80), 0.6 mL/min. Electrochemical detection. Retention time: 14 min. Limit of detection 0.25 µg/L [Pianezzola *et al.* 1992].
Urine **HPLC** Electrochemical detection. Limit of detection 0.30 µg/L [Pianezzola *et al.* 1992].
Disposition in the Body Cabergoline is absorbed after oral administration and undergoes significant first-pass metabolism. It is widely distributed and extensively metabolised, mainly by hydrolysis, to several inactive metabolites. The drug is mainly eliminated via faeces with a small proportion excreted in urine. <4% is excreted unchanged; 1% as the parent drug.
Therapeutic Concentration
Twelve healthy males, aged 21 to 31 years (mean 26 years), were administered with single doses of 0.5, 1.0 and 1.5 mg cabergoline. Mean maximum plasma concentrations were 33.3, 40.3 and 67.0 ng/L, respectively, for the three doses and all were observed at ~2 h [Andreotti *et al.* 1995].
Half-life Plasma half-life, 63 to 68 h (in healthy subjects); 79 to 115 h (in hyperprolactinaemic subjects).
Protein Binding 40%.
Note For reviews of cabergoline, see Rains *et al.* [1995] and Fariello [1998].
Dose Usually 1 mg weekly for hyperprolactinaemia, up to 6 mg daily for Parkinson's disease.

Andreotti AC *et al.* (1995). Pharmacokinetics, pharmacodynamics, and tolerability of cabergoline, a prolactin-lowering drug, after administration of increasing oral doses (0.5, 1.0, and 1.5 milligrams) in healthy male volunteers. *J Clin Endocrinol Metab* 80(3): 841–845.
Fariello RG (1998). Pharmacodynamic and pharmacokinetic features of cabergoline. Rationale for use in Parkinson's disease. *Drugs,* 55: 10–16.
Pianezzola E *et al.* (1992). Determination of cabergoline in plasma and urine by high-performance liquid chromatography with electrochemical detection. *J Chromatogr* 574: 170–174.
Rains CP *et al.* (1995). Cabergoline. A review of its pharmacological properties and therapeutic potential in the treatment of hyperprolactinaemia and inhibition of lactation. *Drugs* 49: 255–279.

Cadaverine

Putrefactive Base
$C_5H_{14}N_2 = 102.2$
CAS—462-94-2

IUPAC Name 1,5-Pentanediamine
Synonym Pentamethylenediamine

Chemical Properties A colourless syrupy basic liquid, which fumes and absorbs carbon dioxide on exposure to air. Fp 9°. Bp 178° to 180°. Soluble in water and ethanol; slightly soluble in ether. Log *P* (octanol/water), −0.2.
Thin-layer Chromatography System TA—R_f 0.02 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1035.
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.
Infrared Spectrum Principal peaks at wavenumbers 1565, 1508, 1600, 1120, 1173, 923 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 56, 55, 41, 43, 45, 85, 42, 84.
Quantification
Serum **GC** FID. Limit of detection, 0.5 mg/L [Khuhawar *et al.* 1999].
Hair **GC–MS** For method, see Choi *et al.* [2000].
Disposition in the Body Cadaverine is formed during putrefaction by bacterial decarboxylation of lysine in the gastrointestinal tract. It may be deaminated to yield ammonia and an aldehyde, and it may undergo cyclisation to piperidine. The piperidine normally excreted in the urine is from cadaverine.

Choi MH *et al.* (2000). Determination of hair polyamines as N-ethoxycarbonyl-N-pentafluoropropionyl derivatives by gas chromatography-mass spectrometry. *J Chromatogr A* 897(1–2): 295–305.
Khuhawar MY *et al.* (1999). Capillary gas chromatographic determination of putrescine and cadaverine in serum of cancer patients using trifluoroacetylacetone as derivatizing reagent. *J Chromatogr B Biomed Sci Appl* 723(1–2): 17–24.

Cadmium

Dermatological Agent, Nematocide
Cd = 112.4
CAS—7440-43-9

Synonym Colloidal cadmium
Chemical Properties Odourless silver-white lustrous solid. Mp 321°. Bp 765°. Insoluble in water, soluble in acids, ammonium nitrate, hot sulfuric acid. Valency Cd(+2). Widely but sparsely distributed element found in the earth's crust at concentrations ranging from 0.1 to 1 ppm, primarily in association with zinc ores. Used in alloys, nickel–cadmium batteries.

Cadmium Carbonate

$CdCO_3 = 172.4$
CAS—513-78-0
Synonyms Cadmium monocarbonate; carbonic acid, cadmium salt; otavite.
Chemical Properties White powder or rhombohedral leaflets. Mp <500° with decomposition. Insoluble in water; soluble in dilute acid and concentrated ammonia solution. Formerly used as a fungicide.

Cadmium Chloride

$CdCl_2 = 183.3$
CAS—10108-64-2
Synonyms Cadmium dichloride; dichlorocadmium.
Proprietary Names *Caddy*; *Vi-Cad*.
Chemical Properties Odourless, colourless rhombohedral crystals. Mp 568°. Bp 960°. Soluble in water and acetone; slightly soluble in methanol and ethanol. Used in the preparation of cadmium sulfide; in the manufacture of special mirrors; in dyeing and calico printing. Formerly used as a fungicide.

Cadmium Oxide

CdO = 128.4
CAS—1306-19-0
Synonyms Cadmium fume; Cadmium monoxide.

Chemical Properties Dark brown infusible powder or cubic crystals. Sublimes at 1559°. Insoluble in water; soluble in dilute acids; slowly soluble in ammonium salts. Used in semiconductors; manufacture of silver alloys; in battery electrodes; as nematocide; in ceramic glazes.

Cadmium Sulfate

$CdSO_4 = 208.5$

CAS—10124-36-4

Synonyms Sulfuric acid, cadmium (2+) salt

Chemical Properties Odourless, colourless monoclinic crystals. Mp 1000°. Soluble in water; insoluble in alcohol, acetone and ammonia. Used in electrodeposition of cadmium, copper and nickel; as nematocide, fungicide, bactericide, lubricant.

Cadmium Sulfide

CdS = 144.5

CAS—1306-23-6

Synonyms Cadmium monosulfide; cadmium orange; cadmium yellow; cadmopur yellow; capsebon; greenockite.

Chemical Properties Light yellow or orange cubic or hexagonal crystals. Mp 1750°. Slightly soluble in water; soluble in concentrated or warm dilute mineral acids. Used as a dermatologic agent; as a pigment; colour for soaps; colouring glass yellow; colouring textiles, paper, rubber; in printing inks; ceramic glazes; fireworks; in phosphors and fluorescent screens; in scintillation counters; semiconductors; photoconductors.

Colour Test There are no simple colour tests applicable to biological samples.

Note For reference values for cadmium in the German population, see Wilhelm *et al.* [2004].

Quantification

Specimen collection Blood—10 mL K-EDTA; urine—20 mL plastic universal container.

Blood **DPASV** Limit of detection, 0.1 µg/L [Moreno *et al.* 1999].

FAAS Lead and hydrogen hollow cathode lamps ($\lambda = 228.8$ nm). Limit of quantification, 30 µg/L [Delves 1977].

ETAAS Perkin-Elmer 5100 PC/HGA with Zeeman background collection. Limit of detection, 0.06 µg/L [Palminger Hallén *et al.* 1995].

Dry cycle: 120° in 1 s for 20 s. Char cycle: 1200° in 10 s for 20 s to 90° in 1 s for 10 s to 120° in 1 s for 20 s to 550° in 20 s for 20 s to 700° in 10 s for 20 s to 20° in 1 s for 10 s; Ar, 300 mL/min. Atomisation cycle: 1700° for 4 s (gas stop). Cadmium discharge lamp. Limit of detection, 0.22 µg/L [Moreira *et al.* 1995]. Dry cycle: 110° to 120°. Char cycle: 350°. Atomisation cycle: 2000° ($\lambda = 228.8$ nm). Limit of detection not reported [Baranowska 1995].

ICP-MS Plasma gas: Ar, 14.8 L/min. Auxiliary gas: Ar, 0.9 L/min. Carrier gas: 1.1 L/min. Babington nebuliser (*m/z* 27). Limit of detection, not reported [Botta *et al.* 2006]. Plasma gas: 16 L/min. Auxiliary gas: 1 L/min. Nebuliser gas: 1.15 or 1.33 mL/min. Limit of detection, 0.3 µg/L [De Boer *et al.* 2004]. Plasma gas: 14.8 L/min. Auxiliary gas: 0.85 L/min. Nebulizer gas: 0.93 L/min. Limit of detection, 5 ng/kg [Diemer *et al.* 2001]. Perkin-Elmer Sciex Elan 5000. Nebuliser gas: 1.0 mL/min. Limit of detection, 20 ng/L [White 1999].

Note For an immunoassay to determine concentrations of cadmium in serum, see Darwish and Blake [2002].

Urine **ETAAS** Perkin-Elmer 5100. Limit of detection, 0.05 µg/L [White 1999]. See Blood [Moreira *et al.* 1995].

ETV-ID-ICP-MS Outer gas: 15.0 L/min. Intermediate gas: 0.74 L/min. Carrier gas: 1.08 L/min. Dry cycle: 90° at 30 s for 10 s to 130° in 10 s for 10 s. Char cycle: 300° in 10 s for 20 s. Atomisation cycle: 1000° in 1 s for 20 s. Limit of detection, 0.02 µg/L [Lee *et al.* 1998].

ICP-MS Plasma gas: Ar, 14.8 L/min. Auxiliary gas: Ar, 0.9 L/min. Carrier gas: 1.1 L/min. Babington nebuliser (*m/z* 27). Limit of detection not reported [Botta *et al.* 2006]. See Blood. Limit of detection, 0.15 µg/L [De Boer *et al.* 2004]. See Blood. Limit of detection, 0.1 µg/L [White 1999]. Plasma gas: 15 L/min. Nebuliser gas: 0.825 L/min. Auxiliary gas: 0.8 L/min. Limit of detection, 0.02 µg/L [Schramel *et al.* 1997].

Oral Fluid ICP-MS Plasma gas: 13 L/min. Auxiliary gas: 0.55 L/min. Nebulizer gas: 0.1 L/min. Limit of detection, 0.03 µg/L [Menegario *et al.* 2001].

Ocular Fluid **ICP-MS** Perkin-Elmer Sciex Elan 6100. Limit of detection, 0.2 µg/L [Erie *et al.* 2005].

Bone **ETAAS** Dry cycle: 110° to 120° in 30 s. Char cycle: 300° to 350° in 30 s. Atomisation cycle: 1200° for 20 s. Carrier gas: Ar, 200 mL/min ($\lambda = 228.8$ nm). Limit of detection, 1 µg/L [Baranowska *et al.* 1995].

Hair **ETAAS** Dry cycle: 80° to 120° in 10 s. Char cycle: 300° to 400° at 10 s. Atomisation cycle: 2700° to 2800° in 5 s. Carrier gas: 200 mL/min. Hitachi model 180-50, S.N.5721-2 ($\lambda = 193.8$ nm). Limit of detection not reported [Kazi *et al.* 2006]. Dry cycle: 100° for 15 s to 140° for 20 s. Char cycle: 850° for 20 s. Atomisation cycle: 1650° for 5 s. Perkin-Elmer 700 spectrometer ($\lambda = 228.8$ nm). Limit of detection, 4.6 µg/L [Sweileh 2003].

ICP-MS Limit of detection, 0.03 mg/kg [Nadal *et al.* 2005]. Plasma gas: 15 L/min. Auxiliary gas: 0.8 L/min. Nebuliser gas: 0.8 L/min. Limit of detection, not reported [Samanta *et al.* 2004].

Note For a study following the trace element hair analysis of 1 man over 2 decades, see [Klevay *et al.* 2004].

Synovial Fluid **ICP-MS** Coolant gas: Ar, 15.0 L/min. Auxiliary gas: 0.99 L/min. Nebuliser gas: 1.0 L/min. Limit of detection, low ng/L [Krachler *et al.* 2000].

Liver **ICP-MS** Perkin-Elmer Elan 6000. Nebuliser gas: Ar, 1.04 L/min. Limit of detection, 26 ng/L [Patriarca *et al.* 1999].

Note For a portable system for detecting cadmium in human liver, see Al Hiti *et al.* [1979].

Nail **ICP-MS** See Hair [Samanta *et al.* 2004].

Colostrum **ETAAS** Dry cycle: 50° to 120° at 20 s for 20 s. Char cycle: 120° to 900° in 30 s for 30 s. Atomisation cycle: 1600° for 7 s. Limit of detection, 0.62 µg/L [Turan *et al.* 2001].

Milk **ETAAS** Perkin-Elmer 5100 PC/HGA 600 with Zeeman background correction. Limit of detection, 0.06 µg/L [Palminger Hallén *et al.* 1995].

Placenta **ETAAS** Dry cycle: 110° to 120°. Char cycle: 350°. Atomisation cycle: 2000° ($\lambda = 228.8$ nm). Limit of detection not reported [Baranowska 1995]. Atomisation cycle: 1400° ($\lambda = 228.8$ nm). Limit of detection, <4 µg/kg [Fiala *et al.* 1998].

Teeth **DPV** Limit of quantification, 0.394 µg/L, limit of detection, 0.078 µg/L [Bayo *et al.* 2001].

Other **DPASV** Yemeni Khat. Limit of detection, 0.15 µg/kg [Matloob 2003].

ETAAS Eggs and Chicken Feed. Dry cycle: 120° at 1 s for 50 s. Char cycle: 1400° in 1 s for 30 s to 20° in 1 s for 5 s; Ar, 300 mL/min. Atomisation cycle: 2300° for 5 s (gas stop). Limit of detection, 0.07 mg/kg [Fakayode, Olu-Owolabi 2003]. Cocaine Samples. Char cycle: 800°. Atomisation cycle: 1400° ($\lambda = 228.8$ nm). Limit of detection not reported [Bermejo-Barrera *et al.* 1999].

ICP-AES Argentine Wine. Outer gas: 8.5 L/min. Auxiliary gas: 1.0 L/min. Nebuliser gas: 1.0 L/min. Limit of detection, 8 ng/L [Lara *et al.* 2005].

ICP-MS Seafood. Perkin-Elmer Elan 6000. Limit of detection, 0.02 mg/kg [Falcó *et al.* 2006]. Food. Varian-Vista with an ultrasonic nebuliser. Limit of detection, 0.02 mg/kg [Llobet *et al.* 2003]. Meals from Catering Establishments. Plasma gas: 15 L/min. Auxiliary gas: 0.9 L/min. Nebuliser gas: 0.73 L/min. Limit of quantification, 0.6 µg/kg [Noel *et al.* 2003]. Beverages. Limit of detection, 0.2 µg/kg [MacIntosh *et al.* 2000].

Disposition in the Body Cadmium can be absorbed by the inhalation, oral and dermal routes of exposure in any of its chemical forms. Dermal absorption is relatively insignificant, although small amounts are absorbed percutaneoulsy over time. Gastrointestinal absorption of cadmium in any chemical form is relatively low when compared with the inhalation route and is in the range of 3 to 8%. Several blood and dietary factors can influence gastrointestinal absorption, such as deficiencies in calcium or iron, or blood ferritin content in women. Zinc decreases the dietary absorption of cadmium. A higher fraction of cadmium is absorbed by inhalation and depends very much on the particle size of the cadmium salt and its solubility.

Cadmium accumulates in the lungs, liver and kidney after chronic exposure and is excreted very slowly in the urine. Cadmium may bind to plasma proteins, plasma metallothionein, or directly to the erythrocytes, and it tends to accumulate in the liver and kidney. Spleen, pancreas and testes also have relatively high concentrations of cadmium. It is not known to undergo any direct metabolic processes, but binds as the bivalent cation ion to anionic groups in proteins and other molecules. The majority of an oral dose is excreted in faeces; following inhalation and cadmium distribution throughout the body, the amounts of faecal and urinary excretion are approximately equal. Excessive occupational exposure results in a high body burden, which leads to elevated blood and urine cadmium concentrations that persist into old age.

Normal Concentrations Blood (non-smokers)—<2 µg/L (18 nmol/L); blood (smokers)—<6 µg/L (54 nmol/L); urine (smokers and non-smokers)—<1 µg/L (9 nmol/L); kidney—2.1 to 22.0 mg/kg; liver—1.2 to 3.7 mg/kg. Occupational Guidance Values: blood and urine—5 µg/L (45 nmol/L).

Toxicity Chronic cadmium poisoning causes proximal renal tubular damage, with disturbances in calcium and phosphate metabolism, and it is associated with urine concentrations >15 µg/L. Prolonged excessive exposure by the oral route leads to skeletal deformities, gastrointestinal disorders, and kidney, lung and heart defects. Inhalation of approx. 4 mg of cadmium can be fatal; the lethal dose by the oral route is of the order of several hundred milligrams of a soluble salt. Cadmium exposure from industrial contamination of water supplies led to an epidemic of cadmium poisoning in the Jinzu river basin of Japan during the 1940s and the name 'itai-itai' (meaning 'ouch-ouch') disease was coined to describe the painful symptoms associated with the condition. This multiple-system disorder primarily affects postmenopausal women and is characterised by renal osteomalacia, proteinuria and enteropathy [Nogawa *et al.* 2004]. Blood cadmium concentrations are higher in exposed workers than in non-exposed workers: 9.3 versus 3.8 µg/L [Baker *et al.* 1979].

In 5 men who survived exposure to cadmium fumes over a long period and developed fatigue, chest pains and coughing, urine cadmium levels ranged from 10 to 50 µg/L [Hardy, Skinner 1947].

In a further 5 cases of non-fatal acute exposure to cadmium, blood and urine concentrations of 1.2 to 3.0 mg/L and 0.10 to 0.36 mg/L, respectively, were reported [Cotter, Cotter 1951].

A man who ingested 5 g of cadmium iodide had a urine cadmium concentration of 5.6 mg/L after 7 days. The postmortem blood concentration was 1.1 mg/L; the liver contained 80 mg/kg and the renal cortex 80 mg/kg [Wisniewska-Knypl *et al.* 1971].

A 43-year-old man who worked in copper alloy manufacture was admitted to hospital with breathlessness having been exposed to smolten copper scrap. On his 11th day in hospital, 12 days after exposure, he died. The cadmium concentration in the right upper lobe of the lung was 1.06 mg/kg wet weight [Yamamoto *et al.* 1983].

An analysis of 41 cadmium workers predicted that there is a 50% probability of having kidney dysfunction when there are concentrations of 38.4 and 42.3 mg/kg cadmium in the kidney and liver, respectively [Ellis *et al.* 1984].

A study of 29 patients whose clinical findings motivated a kidney biopsy and/or had a history of possible exposure to cadmium found a mean cadmium concentration of 12.9 µg/g kidney tissue. The highest concentrations (30 to 45 µg/g) were found in 3 patients with tubulo-interstitial damage. In a control group of 22 postmortem samples, the mean cadmium concentration was 8.7 µg/g [Lindqvist *et al.* 1989].

A 68-year-old man developed diffuse abdominal pain within days of beginning to fashion boxes from sheet metal. On the third day he developed a fever, cough, increased abdominal pain, and ileus. He was hospitalised and treatment for occult sepsis was begun. He developed peritoneal signs but an exploratory laparotomy was inconclusive. His hypoxia worsened and there were progressive alveolar infiltrates. On his fifth day in hospital he died. Postmortem examination revealed congestive cardiomegaly with pulmonary congestion and oedema and small bilateral pulmonary effusions. A heavy metal screen revealed dramatically elevated cadmium in the cardiac blood of 280 µg/L and slightly elevated kidney concentrations of 24 mg/kg [Fuortes *et al.* 1991].

A 43-year-old man sought medical attention for acute respiratory insufficiency. He had been suffering from cough, chest tightness, abdominal pain and diarrhoea. He worked in a crematorium and smoked 20 cigarettes a day. Screening for heavy metals showed an initial urinary cadmium concentration of 438 mmol/L. Analysis of dialysate fluid showed a cadmium concentration of 130 mmol/L. A renal biopsy 3 weeks later showed a cadmium concentration of 0.015 mg/kg. The patient was discharged after 10 weeks [Nicholson *et al.* 1997].

A 66-year-old man worked for 20 years as a repairer in a glassworks. The hard tissue cadmium content of one of his teeth was 1.4 mg/kg [Bachanek *et al.* 2000].

A 35-year-old woman was found dead in bed. She had last eaten beetroot. Because of the purple discoloration it was deemed that an investigation for manganese and other elements was appropriate. Manganese and cadmium concentrations were as follows:

Medium	*Mn (µg/L or µg/g)*	*Cd (µg/L or µg/g)*
Serum (heart blood)	127	ND
Heart blood	899	238
Stomach contents	0.1	0.4
Brain	0.2	3.6
Kidney	3.6	34.3
Liver	0.8	20.2
Small bowel	1266	<0.1

[Dressler *et al.* 2002].

A 42-year-old man presented with marked lethargy and fever. He had ingested approx. 50 mL of an industrial chemical solution approx. 1 h prior to admission. His serum cadmium concentration was 24.9 µg/L (normal range 0.2 to 6.0 µg/L) [Hung, Chung 2004].

Note For a review of cadmium in the environment and human health, see Yost [1986] and for an investigation of toxic trace elements in the hair of children with autism, see Fido and Al Saad [2005]. For an evaluation of metal levels in welders, see Iarmarcovai *et al.* [2005]. For a comparison of trace metal profiles in hair samples from children in urban or rural areas, see Hasan *et al.* [2004]. For a study of cadmium in the blood, serum and red blood cells of patients with motor neuron disease, see Pamphlett *et al.* [2001]. Rahil-Khazen *et al.* [2002] have studied trace element levels in the postmortem tissue of 30 Norwegians. For biological monitoring of cadmium in workers in hazardous-waste incineration, see Schuhmacher *et al.* [2002]; for concentrations in the urine of glass-manufacturing workers, see Apostoli *et al.* [1998] and Arai *et al.* [1994]. For a study of cadmium concentrations in the Greenlandic population, see Hansen *et al.* [1985].

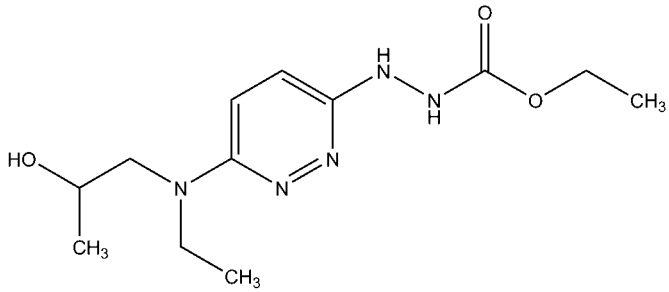
Cadralazine

Antihypertensive
$C_{12}H_{21}N_5O_3$ = 283.3
CAS—64241-34-5

IUPAC Name Ethyl *N*-[[6-(ethyl-(2-hydroxypropyl)amino)pyridazin-3-yl]amino]carbamate
Synonyms 3-(2-Carbethoxyhydrazino)-6-[*N*-(2-hydroxypropyl)ethylamino]-pyridazine; DC-826; 2-[6-[ethyl(2-hydroxy-propyl)amino]-3-pyridazinyl]hydrazinecarboxylic acid ethyl ester; ISF-2469.
Proprietary Names *Cadral*; *Cadraten*; *Cadrilan*; *Presmode*.

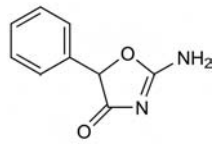


Chemical Properties Crystals. Mp 160° to 162°. pK_a 6.0.
Dose 10 mg orally once a day.

Caffeine

Xanthine Stimulant
$C_8H_{10}N_4O_2$ = 194.2
CAS—58-08-2

IUPAC Name 1,3,7-Trimethylpurine-2,6-dione
Synonyms 1,3,7-Trimethyl-2,6-dioxopurine; 1,3,7-trimethylxanthine; 3,7-dihydro-1,3,7-trimethyl-1*H*-purine-2,6-dione; anhydrous caffeine; coffeine; guaranine; methyltheobromine; methylxanthine theophylline.
Proprietary Names *Caffedrine*; *Enerjets*; *Keep Alert*; *NoDoz*; *Pro-Plus*; *Quick Pep*; *Spray-n-Wake*; *Stay Alert*; *Tirend*; *Vivarin*; *Wake-Up Tablets*. Caffeine is an ingredient of many proprietary preparations [Sweetman 2007].



Chemical Properties Silky white crystals, usually matted together, or a white crystalline powder. It sublimes at 178°. Mp 238°. When crystallised from water, caffeine contains 1 molecule of water of crystallisation, but it is anhydrous when crystallised from ethanol, chloroform or ether. It is decomposed by strong solutions of caustic alkalis. Freely soluble in pyrrole, in tetrahydrofuran containing approx. 4% water; soluble in ethyl acetate; soluble 1 in 46 of water, 1 in 5.5 of water at 80°, 1 in 1.5 of boiling water, 1 in 66 of alcohol, 1 in 22 of alcohol at 60°, 1 in 50 of acetone, 1 in 5.5 of chloroform; 1 in 530 of ether, 1 in 100 of benzene, 1 in 22 of boiling benzene; slightly soluble in petroleum ether. Solubility in water is increased by alkali benzoates, cinnamates, citrates or salicylates. pK_a 10.4 (40°) [Dean *et al.* 1985], 14.0 (25°). Log *P* (octanol/water), −0.07 [Hansch *et al.* 1995]. Extraction yield (chlorobutane), 0.3 [Demme *et al.* 2005].

Caffeine Citrate

$C_8H_{10}N_4O_2,C_6H_8O_7$ = 386.3
CAS—69-22-7
Synonyms Caffeina citrate; citrated caffeine; coffeinum citricum; cofeincitrat.
Proprietary Names *Cafcit*. An ingredient of *Askit*.

Chemical Properties A mixture of caffeine and citric acid containing 47–50% of anhydrous caffeine. A white, crystalline powder that is decomposed by water. Soluble 1 in 4 of hot water, dissociating on further dilution with the separation of caffeine on cooling, which redissolves in ~1 in 32 of water; soluble 1 in 25 of ethanol. Log *P* (octanol/water), 0.16.

Caffeine Hydrate

$C_8H_{10}N_4O_2,H_2O$ = 212.2
CAS—5743-12-4
Synonyms Caféine monohydratée; caffeine monohydrate; coffein monohyrat; coffeinum monohydricum.
Proprietary Names An ingredient of *Migril* and *Pardale*.
Chemical Properties Silky white crystals, usually matted together, or a white crystalline powder containing 8.5% water. It effloresces in dry air and loses its water of crystallisation when heated, becoming anhydrous at 80°. It sublimes at ~180°. Mp 234° to 239°. Soluble 1 in 60 of water and 1 in 110 of ethanol; soluble in chloroform with the separation of water; slightly soluble in ether.

Colour Test Amalic acid test—orange/violet.
Thin-layer Chromatography System TA—R_f 0.52; system TB—R_f 0.03; system TC—R_f 0.58; system TD—R_f 0.15; system TE—R_f 0.52; system TF—R_f 0.10; system TL—R_f 0.25; system TAD—R_f 0.55; system TAE—R_f 0.59; system TAF—R_f 0.55; system TAJ—R_f 0.54; system TAK—R_f 0.18; system TAL—R_f 0.81 (acidified iodoplatinate solution—positive; Dragendorff spray—positive).

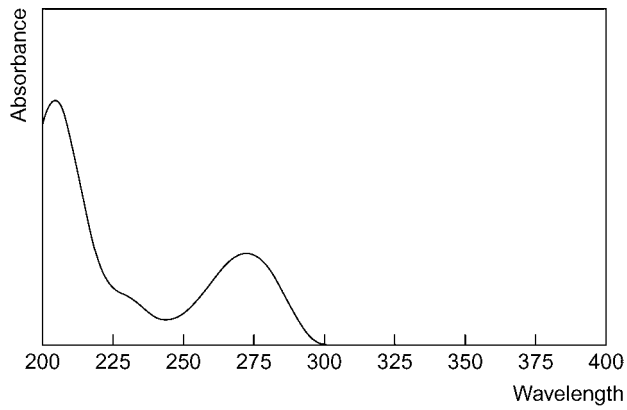
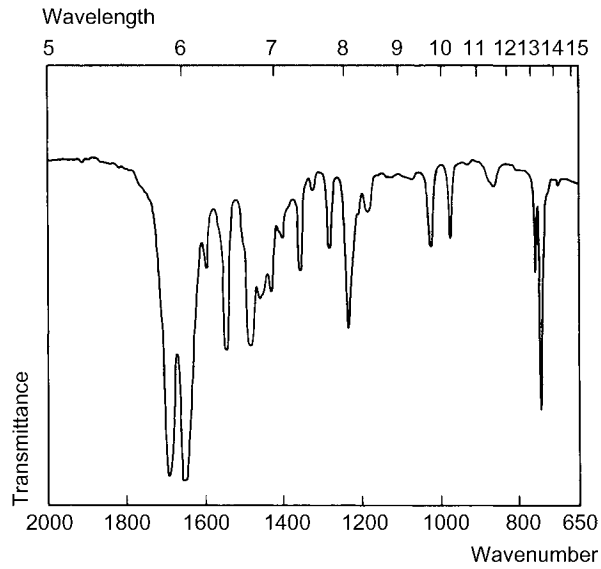
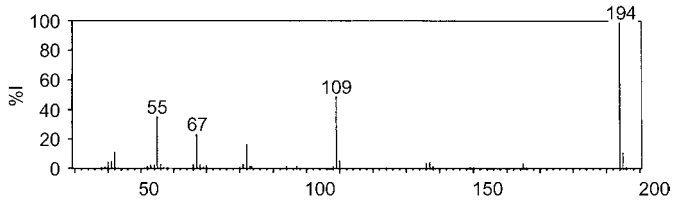
Ultraviolet Spectrum Aqueous acid—273 nm (A_1^1 = 504a). No alkaline shift.



Infrared Spectrum Principal peaks at wave numbers 1658, 1698, 747, 1548, 1242, 760 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 194, 109, 55, 67, 82, 195, 42, 110.



Quantification

Plasma **GC** Column: DB-17 (15 m × 530 µm i.d., 1 µm). Carrier gas: He, 21 mL/min. Temperature programme: 70° to 280°. NPD. Limit of detection, 50 µg/L [Carregaro *et al.* 2001]. Column: OV-17. NSD. Limit of detection, 1 µg/L [Teeuwen *et al.* 1991]. AFID. Limit of detection, 50 µg/L [Bradbrook *et al.* 1979].

HPLC Column: Partisil-10 SCX. Mobile phase: 0.1 mol/L sodium phosphate buffer (pH 4.9) : methanol (92 : 8), flow rate.1.5 mL/min. UV detection (λ = 254 nm). Retention time: 5.1 min. Limit of detection, 10 µg/L [Ghosheh *et al.* 2000]. Column: reversed phase. UV detection. Limit of detection, 0.1 mg/L for caffeine and theophylline [Schreiber-Deturmeny, Bruguerolle 1996]. Caffeine and its metabolites [Dobrocky *et al.* 1994]. Column: TSK gel ODS-80TM (150 × 4.6 mm i.d.). Mobile phase: methanol : 0.1 mol/L sodium dihydrogen phosphate (30 : 70), flow rate 0.8 mL/min. UV detection (λ = 274 nm). Limit of detection, 5 µg/L for caffeine [Tanaka 1992]. UV detection. Limit of detection, 100 µg/L [Haughey *et al.* 1982]. UV detection (λ = 273 nm). Limit of detection, 100 µg/L [O'Connell, Zurzola 1984].

LC-MS FAB. Limit of detection, ~5 µg/L [Hieda *et al.* 1995].

Serum **HPLC** Caffeine and its metabolites. Column: MZ Kromasil C4 (250 × 4 mm i.d., 5 µm). Mobile phase: acetate buffer (pH 3.5) : methanol (97: 3 to 80 : 20 in 20 min). UV detection (λ = 275 nm). Limit of detection, 20 mg/L for caffeine [Georgia *et al.* 2001]. Caffeine and paraxanthine. Column: reversed phase. UV detection. Limit of detection, 0.3 mg/L for caffeine [Koch *et al.* 1999]. Caffeine and paraxanthine. UV detection. Limit of quantification, 50 µg/L [Holland *et al.* 1998]. Caffeine and theophylline. Column: ODS reversed phase. Mobile phase: 0.2 mmol/L sodium hydrogen phosphate solution (pH 7.4). UV detection (λ = 273 nm). Limit of detection, 0.5 mg/L for caffeine [Umemura *et al.* 1998]. See Plasma [Haughey *et al.* 1982].

Urine **HPLC** Caffeine, theobromine and theophylline. UV detection. Limit of detection, <1 ng/L [Bispo *et al.* 2002]. Caffeine metabolites. Column: Eclipse XDB-C_{18}. DAD [Caubet *et al.* 2002]. See Serum [Georgia *et al.* 2001]. Column: YMC-Pack Polyamine-II (250 × 4.6 mm i.d.). Mobile phase: acetonitrile : 0.75% formic acid (91 : 9), flow rate 1.0 mL/min. UV detection (λ = 260 and 280 nm) [Nyeki *et al.* 2001]. Caffeine and its metabolites. Column: ODS. Mobile phase: 0.05% acetic acid: methanol (92.5 : 7.5). UV detection (λ = 280 nm) [Bendriss *et al.* 2000]. Caffeine metabolites. UV detection. Limit of detection, 1–2 µmol [Rasmussen, Brosen 1996]. See Plasma [Dobrocky *et al.* 1994].

LC-MS See Plasma [Hieda *et al.* 1995].

CE Caffeine and its metabolites. Limit of detection, 2–5 µmol/L [Rodopoulos, Norman 1994].

Oral Fluid **GC** See Blood [Teeuwen *et al.* 1991]. See Plasma [Haughey *et al.* 1982].

Sweat **GC-MS** [Tsuda *et al.* 2000].

Disposition in the Body Caffeine is rapidly absorbed after oral administration; bioavailability is almost 100%. It is widely distributed, crossing the placenta, entering the CNS and saliva; small amounts are excreted in breast milk. Metabolic reactions include *N*-demethylation, acetylation and oxidation to uric acid derivatives. Approximately 85% of a dose is excreted in the urine in 48 h with up to 40% of the dose as 1-methyluric acid, 10–15% as 1-methylxanthine and up to 35% as 5-acetylamino-6-formylamino-3-methyluracil and 5-acetylamino-6-amino-3-methyluracil; other metabolites excreted in the urine include theophylline, 1,7-dimethylxanthine (paraxanthine), 7-methylxanthine, and 1,3-dimethyluric acid. Approximately 1% is excreted in the urine as unchanged drug. The extent of *N*-acetylation is genetically determined. In neonates, caffeine is largely excreted unchanged in the urine, because the capacity to metabolise the drug is reduced until approx. 6 months of age. Caffeine, theophylline, theobromine and paraxanthine are found in plasma from dietary sources, especially coffee, tea and cocoa. An average cup of coffee or tea contains approximately 100 mg caffeine.

Therapeutic Concentration

Following a single dose of 130 mg caffeine to 36 subjects, peak plasma concentrations of 2.5–6.8 mg/L (mean, 4.0) were attained in 20–40 min [O'Connell, Zurzola 1984].

Following a single oral dose of 5 mg/kg to 10 subjects, peak plasma concentrations of 6.9–16.1 mg/L (mean, 10) were attained in ~0.5 h [Blanchard, Sawers 1983].

Toxicity Fatalities have occurred after the ingestion of 5–50 g caffeine, but recovery following the ingestion of 30 g has been reported. Toxic effects are associated with blood concentrations greater than 15 mg/L and fatalities with blood concentrations greater than 80 mg/L.

In a fatality resulting from ingestion of mail order diet pills containing caffeine as their only active ingredient, a 1560 mg/L postmortem serum concentration was reported in a 22-year-old woman [Mrvos *et al.* 1989].

The following postmortem tissue concentrations were reported in a fatality resulting from ingestion of 5.3 g caffeine by a 5-year-old child: blood 159 mg/L, kidney 230 µg/g, liver 198 µg/g and urine 114 mg/L [DiMaio, Garriott 1974].

In a death caused by the ingestion of 50 g caffeine, the following postmortem tissue concentrations were reported: blood 79 mg/L, brain 105 µg/g, kidney 145 µg/g, liver 214 µg/g and urine 280 mg/L [Grusz-Harday 1973].

A 1-year-old girl survived after ingesting 2–3 g caffeine (200–300 mg/kg) despite having a maximum serum concentration of 385 mg/L 4 h after ingestion. Symptoms of toxicity included arrhythmias, seizures, metabolic disturbances and severe pulmonary oedema [Dietrich, Mortensen 1990].

Note For a review of caffeine toxicology, see Abbott [1986]. For a review of deaths involving caffeine, see Shum *et al.* [1997].

Half-life Plasma half-life, 2–10 h (mean, 4).

Volume of Distribution ~0.5 L/kg.

Clearance Plasma clearance, 1–2 mL/min/kg.

Distribution in Blood Plasma : whole blood ratio, 0.93;

Saliva Plasma : saliva ratio, ~1.3.

Protein Binding ~35%.

Dose As a mild stimulant 50 to 200 mg; maximum 1 g daily.

Calfactant

Pulmonary Surfactant
CAS—183325-78-2

Synonyms CLSE; CLL.
Proprietary Name *Infasurf*
Disposition in the Body Chloroform/methanol extract of calf lung lavage fluid consisting of 35 mg/mL phospholipid (of which 55 to 70% is dipalmitoylphosphatidylcholine), 0.9 mg/mL fatty acids, 1.8 mg/mL neutral lipids, and low-molecular-weight surfactant proteins (SP-B and SP-C).
Protein binding Approximately 50%.
Note For the separation of subfractions of the hydrophobic components of calfactant, see Hall *et al.* [1994]; for a review of calfactant, see Willson [2001].
Dose In prophylaxis of respiratory distress syndrome at birth, 3 mL/kg of birth weight in two doses. In treatment of respiratory distress syndrome within 72 h of birth, 3 mL/kg of birth weight, in two doses. Repeat doses of 3 mL/kg of birth weight to a maximum of 3 doses 12 h apart.

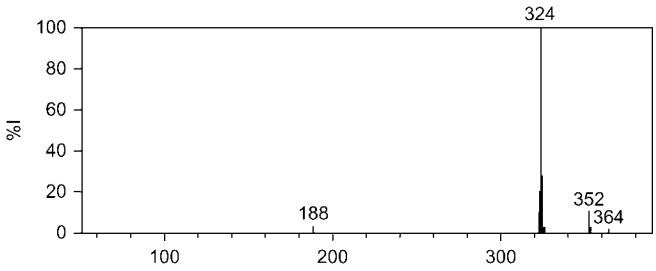
Californine

Anxiolytic, Pavine Alkaloid
$C_{19}H_{18}NO_4 = 324.4$

IUPAC Name (5*S*,12*S*)-5,6,12,13-Tetrahydro-15-methyl-cycloocta[1,2-*f*:5,6-*f*′]bis[1,3]benzodioxol-5,12-imine
Synonym Eschscholtzine
Proprietary Name It is an ingredient of the phytopharmaceutical *Sympathyl* as a component of *Eschscholtzia californica*.
Chemical Properties Alkaloid isolated from *Eschscholtzia californica* (Papaveraceae, 'California poppy' or 'Yellow poppy').
Mass Spectrum



Quantification

Other **GC-MS** Rat Urine. Column: cross-linked methylsilicone capillary (12 m × 0.2 mm i.d., 0.33 μm). Carrier gas: He, flow rate 1.0 mL/min. Temperature programme: 100° for 3 min to 310° at 30°/min for 8 min. EI ionisation at 70 eV and PICI. RI 2615 (acetyl derivative). Limit of quantification not reported [Paul, Maurer 2003].

HPLC Rat Liver Microsome Samples. Column: Supersher 60 RP-select B (125 × 2.0 mm i.d.). Mobile phase: 20 mmol/L ammonium formate buffer (pH 3.0) : acetonitrile (83 : 17), flow rate 0.4 mL/min. Fluorescence detection ($\lambda_{ex} = 230$ nm, $\lambda_{em} = 334$ nm). Retention time: approx. 16.5 min. Limit of quantification not reported [Paul *et al.* 2004].

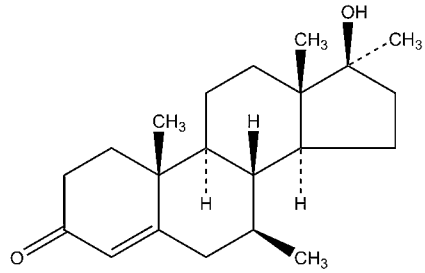
Disposition in the Body *In vitro* studies have shown that californine is extensively metabolised by *N*-demethylation and/or single or double demethylation, with consecutive catechol *O*-methylation of 1 of the hydroxyl groups. This is mainly mediated by CYP3A2 and to a minor extent by CYP1A2 and CYP2D1.
Toxicity *Eschscholtzia* has been described as a substitute drug for marijuana, with similar mild euphoria after ingestion or smoking, lasting for 20–30 min. Gradual increase of the dose is recommended until the desired effect occurs. Regular and prolonged use is not thought to be habit forming.
Note For a study on the metabolism of californine in rats, see Paul and Maurer [2003].
Dose Plant sources of californine are used in phytotherapy preparations for the treatment of anxiety disorders. They are also misused as herbal drugs of abuse (marijuana substitutes).

Paul LD, Maurer HH (2003). Studies on the metabolism and toxicological detection of the *Eschscholtzia californica* alkaloids californine and protopine in urine using gas chromatography–mass spectrometry. *J Chromatogr B Analyt Technol Biomed Life Sci* 789: 43–57.
Paul LD *et al.* (2004). Cytochrome P450 isoenzymes involved in rat liver microsomal metabolism of californine and protopine. *Eur J Pharmacol* 485: 69–79.

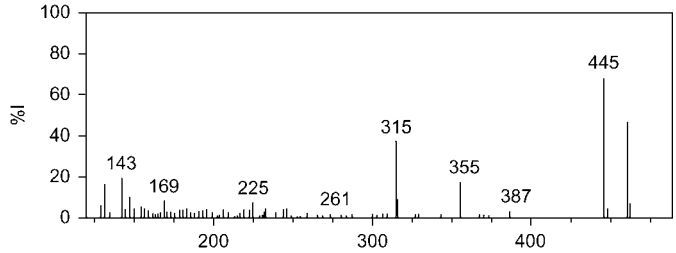
Calusterone

Antineoplastic, Anabolic Steroid
$C_{21}H_{32}O_2 = 316.5$
CAS—17021-26-0

IUPAC Name (7*S*,8*R*,9*S*,10*R*,13*S*,14*S*,17*S*)-17-Hydroxy-7,10,13,17-tetramethyl-2,6,7,8,9,11,12,14,15,16-decahydro-1*H*-cyclopenta[a]phenanthren-3-one
Synonyms 7β,17α-Dimethyltestosterone; (7β,17β)-17-hydroxy-7,17-dimethyl-androst-4-en-3-one; U-22550.
Proprietary Name *Methosarb*



Chemical Properties Crystals. Mp 127° to 129°. Log *P* (octanol/water), 4.14 [Meylan, Howard 1995].
Mass Spectrum Principal ions at *m/z* 445, 460, 315, 143, 355, 169, 225 (MSTFA/TMSI derivative) Zhang *et al.* [1993].



Disposition in the Body Metabolised to dihydrocalusterone by 5-reductase and undergoes further hydrogenation through 3-hydroxysteroid-dehydrogenase to tetrahydrocalusterone. Both dihydrocalusterone and tetrahydrocalusterone form hydroxy analogs via hydroxidase.
Therapeutic Concentration

Forty-five postmenopausal women with advanced metastatic breast cancer were given 200 mg calusterone daily. Of the 40 evaluable patients, 11 were unable to tolerate its toxicity. Disease regresson was seen in 4 patients for an average of 15.2 weeks. Lesions continued to grow in 12 patients. Thirty three patients experienced side effects, including nausea, vomiting, fluid retention, and androgenic side effects, and 11 discontinued the drug. Plasma concentrations of calusterone or its metabolites were not reported [Aslam, Maxwell 1977].

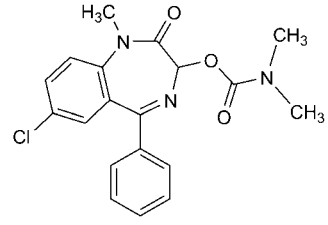
Camazepam

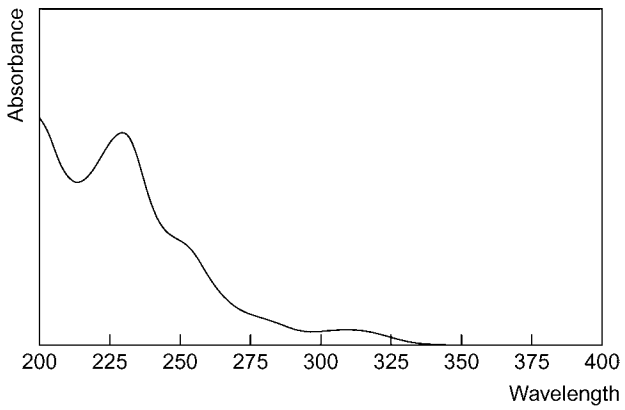
Benzodiazepine, Tranquilliser
$C_{19}H_{18}ClN_3O_3 = 371.8$
CAS—36104-80-0

IUPAC Name (7-Chloro-1-methyl-2-oxo-5-phenyl-3*H*-1,4-benzodiazepin-3-yl) *N*,*N*-dimethylcarbamate
Synonyms 7-Chloro-2,3-dihydro-1-methyl-2-oxo-5-phenyl-1*H*-1,4-benzodiazepin-3-yl dimethylcarbamate; 3-*N*,*N*-dimethylcarbamoyloxy-7-chloro-5-phenyl-1-methyl-1,3-dihydro-2*H*-1,4-benzodiazepin-2-one; SB 5833.
Proprietary Names *Albego*; *Limpidon*.

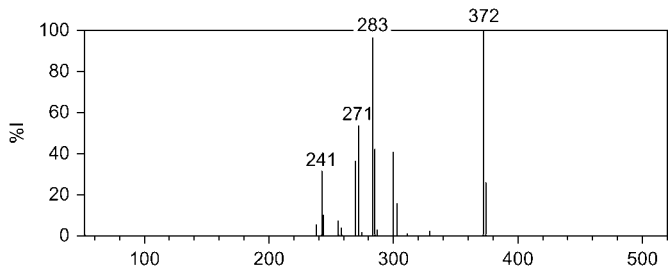


Chemical Properties White crystalline powder. Mp 173° to 174°. Moderately soluble in water; soluble in ethanol. Log *P* (octanol) 2.7. Stock solutions prepared in acetone were stable for 6 months at 4° [Cuisinaud *et al.* 1985]. In extracts, camazepam was found to be stable for >24 h at room temperature [Kratzsch *et al.* 2004].

Thin-layer Chromatography System TA—R_f 0.76; system TAD—R_f 0.69; system TAE—R_f 0.82; system TAF—R_f 0.83; system TAG—R_f 0.65; system TB—R_f 0.12; system TC—R_f 0.73; system TD—R_f 0.55; system TE—R_f 0.75; system TF—R_f 0.32.
Gas Chromatography System GA—RI 2945; system GB—RI 3162.
High Performance Liquid Chromatography System HY—RI 506; system HZ—RT 9.6 min.
Ultraviolet Spectrum Methanol—231 ($A^1_1 = 937b$), 315 nm ($A^1_1 = 67b$).



Infrared Spectrum Principal peaks at wavenumbers 1680, 1718, 1193, 1318, 1110, 703 cm^{-1}.
Mass Spectrum Principal ions at *m/z* 58, 72, 43, 78, 271, 57, 44, 77.



Quantification

Plasma **GC-MS** Column: 3% OV 17 dimethylchlorosilane GasChrom Q (100/120 mesh; 1 m × 3 mm i.d.). Carrier gas: N_2, 50 mL/min. ECD. Limit of detection, 1 µg/L [Riva *et al.* 1982]. Column: 3% OV-17 on Chromosorb W HP 80/100 mesh (1 m × 3 mm i.d.). Carrier gas: Ar: CH_4 (9 : 1), 80 mL/min. Temperature: 260°. ECD at 70 eV. Limit of detection, 10 µg/L [Cuisinaud *et al.* 1979].

LC-MS Column: LiChroCart (125 × 2 mm i.d.). Mobile phase: 5 mmol/L aqueous ammonium formate (pH 3.0) : acetonitrile (60 : 40 for 5.5 min to 10 : 90 until 8 min to 60 : 40 until 10 min), flow rate 0.4 mL/min for 5.5 min to 0.7 mL/min until 8 min to 0.65 mL/min until 9.5 min to 0.4 mL/min for 0.5 min. APCI, SIM or scan acquisition mode, positive ion mode. Limit of quantification, 0.05 mg/L (SIM), limit of detection, 0.01 mg/L (scan) [Kratzsch *et al.* 2004].

Urine **LC-MS** Column: 5% OV-101 Chromosorb G HP 100/120 mesh (60 cm × 2 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature: 100° to 310° at 30°/min. EI ionisation at 70 eV. Limit of detection not reported [Maurer, Pfleger 1987].

Other **GC** Rat and Mouse Blood and Brain. Column: 3% OV-17 on 100/120 mesh GasChrom Q (1 m × 3 mm i.d.). Carrier gas: N_2, 60 mL/min. Temperature: 275°. ECD. Limit of detection, 15 µg/L of blood or 15 µg/kg brain [Marcucci *et al.* 1978].

HPLC Rat Plasma and Brain. Column: Nucleosil 7C 18 (250 × 4.6 mm i.d.). Mobile phase: methanol : acetonitrile : water (10 : 1 : 7), flow rate 1.0 mL/min. UV detection (λ = 254 nm). Limit of detection not reported [Morino, Sugiyama 1985].

Note For a comparison of achiral and chiral analysis of camazepam by supercritical fluid chromatography, see Wang *et al.* [1995].

Disposition in the Body Metabolises to oxazepam and temazepam.
Toxicity LD_{50} (mice) is 970 and 800 mg/kg oral and IP, respectively [Deberdt 1975].
Protein Binding ≈91% [Morino *et al.* 1985].
Dose 20 to 60 mg daily.

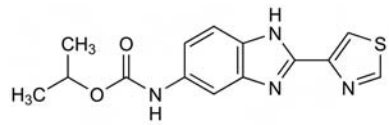
Cambendazole

Anthelmintic
$C_{14}H_{14}N_4O_2S = 302.4$
CAS—26097-80-3

IUPAC Name Propan-2-yl N-[2-(1,3-thiazol-4-yl)-3H-benzimidazol-5-yl] carbamate
Synonym MK-905; [2-(4-thiazolyl)-1*H*-benzimidazol-5-yl]carbamic acid 1-methylethyl ester.
Proprietary Names *Bovicam (vet.)*. It is an ingredient of *Porcam (vet.)*.

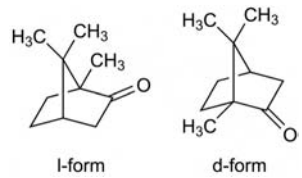


Chemical Properties A white crystalline powder. Mp 238° to 240°, with decomposition. Practically insoluble in water; soluble in ethanol and dimethylformamide; sparingly soluble in acetone; slightly soluble in benzene; very slightly soluble in 0.1 M HCl. Log *P* (octanol/water), 2.7.
Ultraviolet Spectrum Aqueous acid—235 (A^1_1=620b), 319 nm (A^1_1=689b); aqueous alkali—237 (A^1_1=936b), 314 nm (A^1_1=649b).
Mass Spectrum Principal ions at *m/z* 260, 302, 216, 215, 243, 189, 242, 188.

Camphor

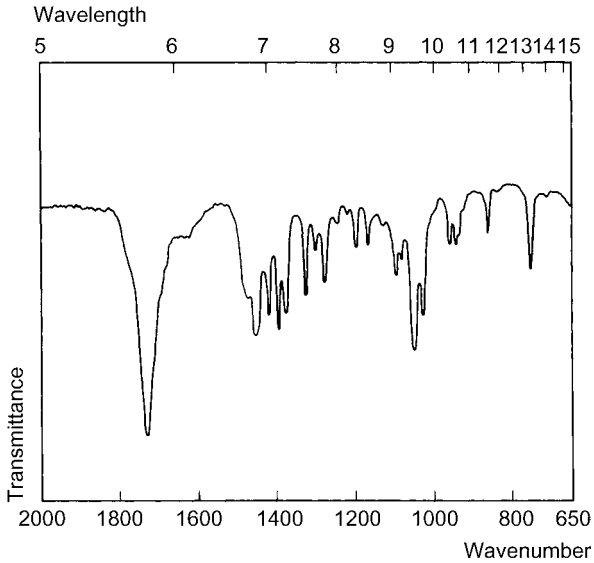
Rubefacient
$C_{10}H_{16}O = 152.2$
CAS—76-22-2; 464-49-3 (+)

IUPAC Name 1,7,7-Trimethylbicyclo[2.2.1]heptan-2-one
Synonyms Alcanfor; 2-camphanone; camphre droit (natural); camphre du Japon (natural); cânfora.
Proprietary Name It is an ingredient of *Pernomol*.



l-form d-form

Chemical Properties Camphor is obtained by distillation from the wood of *Cinnamomum camphora* (Lauraceae) and purified by sublimation, or it may be prepared synthetically. Natural camphor is dextrorotatory; the synthetic product is optically inactive. Colourless transparent or white crystals, crystalline masses, blocks, or powdery masses known as 'flowers of camphor'. Mp 179°. Soluble 1 in 700 to 1 in 800 of water, 1 in 1 of ethanol, 1 in 0.5 of chloroform, and 1 in 1 of ether. Log *P* (octanol/water), 2.4.
Thin-layer Chromatography System TAF—R_f 0.93; system TAJ—R_f 0.98; system TAK—R_f 0.95; system TAL—R_f 0.98.
Gas Chromatography System GA—RI 1143; system GI—retention time 38.2 min.
Ultraviolet Spectrum Methanol—289 nm (A^1_1=about 2b).
Infrared Spectrum Principal peaks at wavenumbers 1730, 1047, 1025, 1277, 1095, 755 cm^{-1} (KCl disk).



Mass Spectrum Principal ions at *m/z* 95, 81, 41, 69, 55, 83, 67, 137.

Quantification

Plasma **GC** FID. Limit of quantification, 5 mg/L, limit of detection, 1 mg/L [Valdez *et al.* 1999].

Disposition in the Body Absorbed after ingestion through the mucous membranes and through the skin. Metabolised by hydroxylation and excreted in the urine mainly as the glucuronides of 2-hydroxy- and 3-hydroxycamphor. Oxidation also occurs at the 7-position yielding a small amount of a carboxylic acid.

Toxicity Poisoning by camphor has usually been due to ingestion of camphorated oil. The fatal dose in a one-year-old child is stated to be about 1 g of camphor, although some children have survived the ingestion of 5 g. In adults, doses in the region of 2 g are likely to produce toxic symptoms and a dose of 4 g or more may be lethal, although one man survived after ingestion of as much as 30 g in the form of 150 mL of camphorated oil. The maximum permissible atmospheric concentration is 2 ppm.

A plasma concentration of 1.7 mg/L was reported in a severely intoxicated subject, 12 h after the ingestion of about 18 g of camphor; the patient recovered after treatment by resin haemoperfusion [Kopelman *et al.* 1979].

A serum concentration of 19.5 mg/L was observed 7 h after the ingestion of 0.7 g of camphor in a moderately intoxicated 3-year-old child [Phelan 1976].

Dose Camphor was formerly given orally in doses of 120 to 300 mg.

Kelly RC *et al.* (1979). *J Anal Toxicol* 3: 76–77.

Candesartan

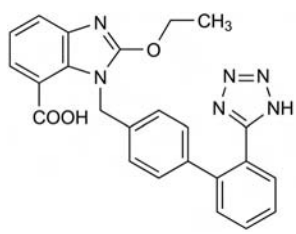
Angiotensin II Receptor Antagonist

$C_{24}H_{20}N_6O_3 = 440.5$

CAS—139481-59-7

IUPAC Name 2-Ethoxy-3-[[4-[2-(2*H*-tetrazol-5-yl)phenyl]phenyl]methyl] benzimidazole- 4-carboxylic acid

Synonym CV-11974; 2-ethoxy-1-[[2′-(1*H*-tetrazol-5-yl)[1,1′-biphenyl]-4-yl] methyl]-1*H*-benzimidazole-7-carboxylic acid.



Chemical Properties Colourless crystals. Mp 183° to 185°.

Candesartan Cilexetil

$C_{33}H_{34}N_6O_6 = 610.7$

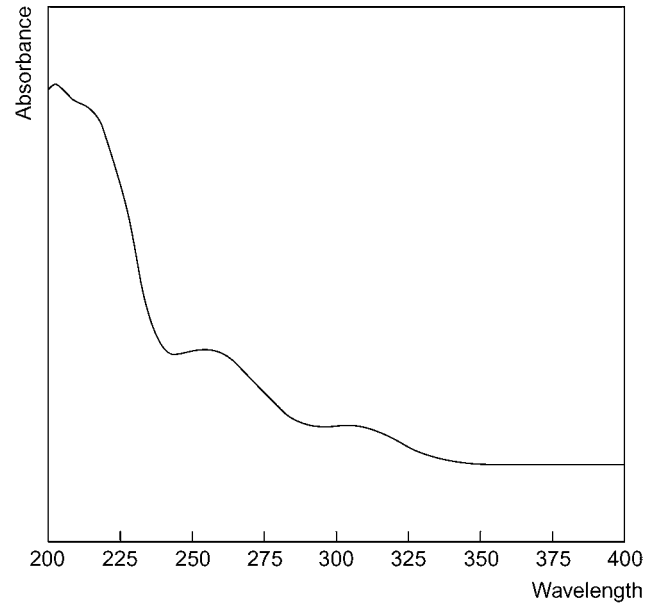
CAS—145040-37-5

Synonym TCV-116

Proprietary Names *Amias*; *Atacand*.

Chemical Properties A white to off-white powder. Mp 163°. It is practically insoluble in water; sparingly soluble in methanol.

Ultraviolet Spectrum Aqueous acid (0.2 mol/L H_2SO_4)—246, 281 nm; (ethanol)—253 nm; aqueous base (0.5 mol/L NaOH)—251 nm.



Quantification

Serum **HPLC** Limit of detection, 0.8 µg/L [Delacrétaz *et al.* 1995]. UV detection. Limit of detection, 2 µg/L for candesartan and candesartan cilexetil [Lee *et al.* 1995].

Urine **HPLC** UV detection. Limit of detection, 10 µg/L for candesartan cilexetil [Lee *et al.* 1995].

Disposition in the Body Candesartan cilexetil is absorbed after oral administration with an absolute bioavailability for candesartan of about 40% following administration of a solution or 14% following administration of tablets. Candesartan is the active metabolite. Peak plasma concentrations occur after about 3 to 4 h. It is excreted in urine and bile mainly as unchanged drug and a small amount of inactive metabolites. Hydrolysed during absorption to form candesartan. Not removed by haemodialysis.

Therapeutic Concentration

Twenty-seven male, healthy volunteers, aged 20 to 36 years (mean age, 26 years), were administered with doses of 1, 2, 4 or 8 g candesartan cilexetil on 8 consecutive days, after an overnight fast. Plasma concentrations of the parent drug were not detected but the active metabolite was detected at peak concentrations between 3.5 and 6.0 h. The mean concentrations on day 1 were 5.5, 12.7, 34.3 and 47.7 µg/L for the 1, 2, 4 and 8 mg doses, respectively. On day 8, the concentrations were 8.8, 17.6, 42.8 and 48.2 µg/L, respectively [Delacrétaz *et al.* 1995].

Half-life Plasma half-life, 9 h.

Protein Binding >99%.

Dose Usually 8 mg of candesartan cilexetil daily, with a maximum dose of 16 mg.

Delacrétaz E *et al.* (1995). Characterization of the angiotensin II receptor antagonist TCV-116 in healthy volunteers. *Hypertension* 25: 14–21.

Lee JW *et al.* (1995). Development and validation of column-switching high-performance liquid chromatographic methods for the determination of a potent AII receptor antagonist, TCV-116, and its metabolites in human serum and urine. *J Chromatogr* 670: 287–298.

Cannabis

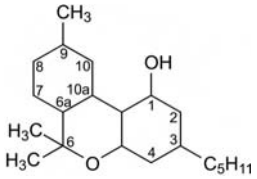
Psychomimetic

CAS—8063-14-7

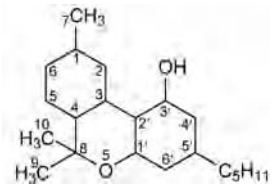
Synonyms Bhang; cannabis indica; chanvre; charas; dagga; ganja; guaza; hashish; hanfkraut; Indian Hemp; kif; maconha; marijuana; marihuana.

Note Many other synonyms, approximate synonyms and street names for cannabis and cannabis resin have been used [Sweetman 2007]. Marijuana usually refers to a mixture of the leaves and flowering tops. Bhang, dagga, ganja, kif and maconha are commonly used in various countries to describe similar preparations. Hashish and charas are names often applied to the resin, although in some countries hashish is applied to any cannabis preparation.

Dibenzofuran numbering



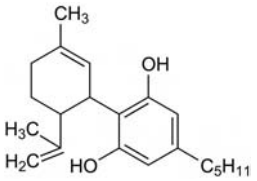
Monoterpenoid numbering



The most important cannabinoids are cannabidiol (CBD), cannabinol (CBN), (−)-*trans*-Δ^9-tetrahydrocannabinol (Δ^9-THC [Δ^1-THC]), (−)-*trans*-Δ^8-tetrahydrocannabinol (Δ^8-THC [Δ^{1-6}-THC]) and Δ^9-tetrahydrocannabinolic acid.

Cannabidiol

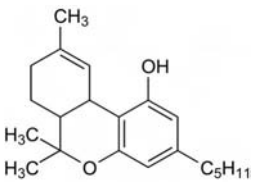
$C_{21}H_{30}O_2 = 314.5$
CAS—13956-29-1
IUPAC Name 2-[3-Methyl-6-(-methylethenyl)-2-cyclohexen-1-yl]-5-pentyl-1,3-benzenediol
Synonym CBN



Chemical Properties Pale yellow resin or crystal. Mp 66° to 67°. Practically insoluble in water or 10% sodium hydroxide; readily soluble in ethanol, methanol, ether, benzene, chloroform and light petroleum.

Δ^9-Tetrahydrocannabinol

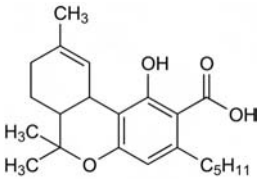
$C_{21}H_{30}O_2 = 314.5$
CAS—1972-08-3
Synonyms (−)-*trans*-Δ^9-Tetrahydrocannabinol; Δ^1-THC; Δ^9-THC.



Chemical Properties A viscous oil. Practically insoluble in water; soluble 1 in 1 of ethanol and 1 in 1 of acetone; readily soluble in chloroform and light petroleum.

Δ^9-Tetrahydrocannabinolic Acid

$C_{22}H_{30}O_4 = 358.5$
CAS—23978-85-0



The amount of the major constituents in various samples of *Cannabis* spp. varies between ~5% and zero, depending on climatic and genetic factors. Almost all the psychomimetic activity of the plant is associated with the Δ^9-THC content, which is usually 20 times as great as that of Δ^8-THC. The Δ^9-THC content may average 1, 3 and 5% in marihuana, ganja and hashish, respectively. However, newer plant strains ('skunk weed' and derivatives) can contain much larger Δ^9-THC percentages. The potency of confiscated marijuana samples rose from <1.5% Δ^9-THC in 1980 to 4.2% Δ^9-THC in 1997. Δ^9-Tetrahydrocannabinolic acid, which is present in abundance in some cannabis samples, is itself inactive but it is converted by smoking into active Δ^9-THC. Cannabinol and CBD may be present in large amounts but have little activity.
Note Δ^9-THC binds readily to glass and plastic, reducing recoveries during analytical procedures. Δ^9-THC adsorption can be minimised with storage of solutions in amber silylated glassware and by maintenance of the compound in a basic solution or organic solvent.

Colour Tests Marquis test—slow/weak 'salmon orange' (pink, orange red); Mecke's reagent—dark orange→dark purple-ish orange; sodium nitroprusside—cherry red colour [Zimmerman 2001].

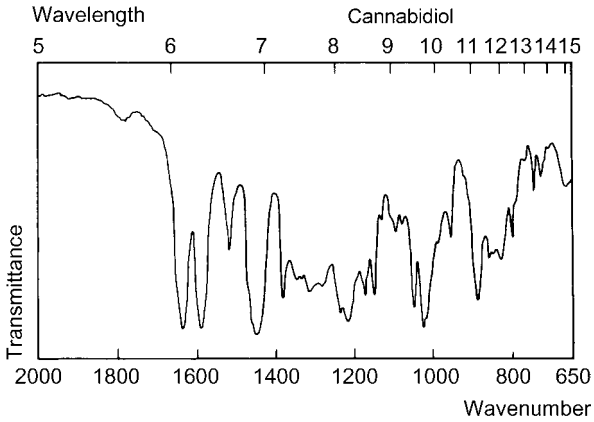
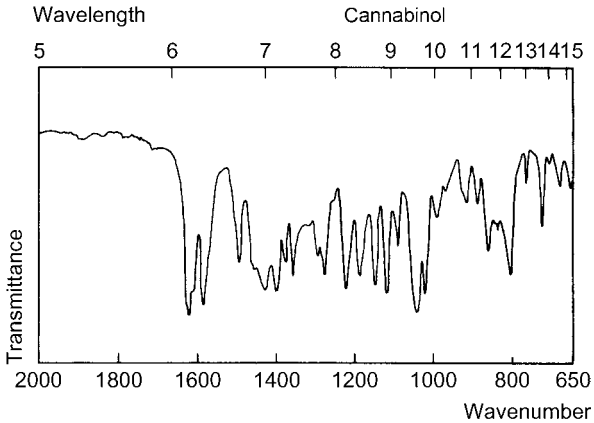
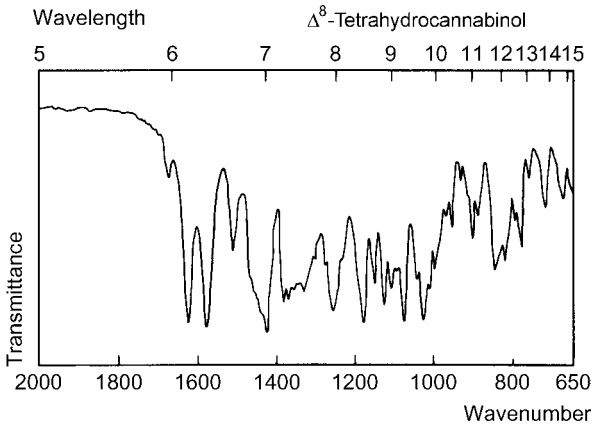
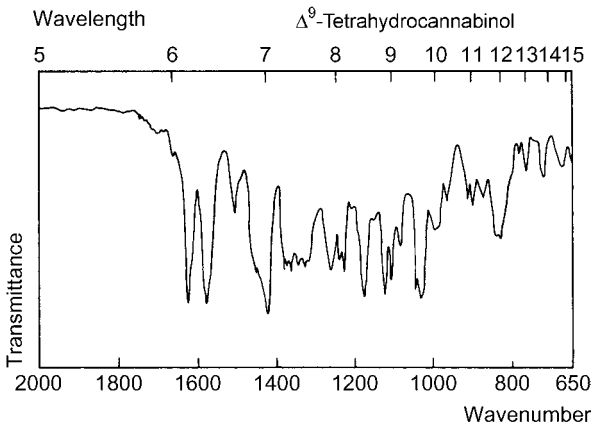
Infrared Spectrum Main components have principal peaks at the following wavenumbers (all thin films): 1585, 1630, 1020, 1210, 1240, 1050 cm^{-1} (CBD); 1620, 1050, 1580, 1030, 1120, 1228 cm^{-1} (CBN); 1580, 1030, 1620, 1180, 1080, 1260 cm^{-1} (Δ^8-THC); 1580, 1040, 1620, 1180, 1130, 1050 cm^{-1} (Δ^9-THC).

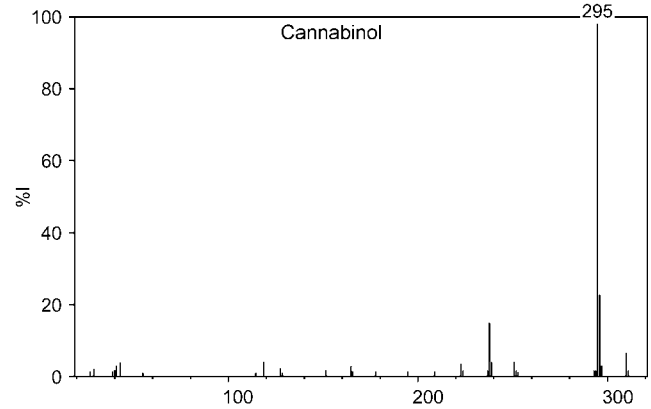








Mass Spectrum Main components and metabolites have principal peaks at the following *m/z*: 231, 246, 314, 232, 121, 193, 74, 174 (CBD); 295, 296, 238, 310, 119, 43, 251, 239 (CBN); 221, 314, 248, 261, 193, 236, 222, 315 (Δ^8-THC); 299, 231, 314, 43, 41, 295, 55, 271 (Δ^9-THC); 271, 43, 41, 311, 295, 312, 297, 91 (8α-hydroxy-Δ^9-THC); 271, 43, 295, 41, 297, 29, 330, 272 (8β-hydroxy-Δ^9-THC); 299, 43, 41, 67, 300, 69, 231, 29 (11-hydroxy-Δ^9-THC); 41, 229, 43, 329, 69, 344, 29, 283 (Δ^9-THC-11-oic acid).



Quantification

Blood **GC** Column: 6% OV-1 or Hi-Eff 9BP. TID. Limit of detection, 0.2 μg/L [McCallum, Shaw 1981].

GC-MS Limit of detection, 1 μg/L [Kintz, Cirimele 1997]. Column: 2% OV-17 Chromosorb W (HP). Temperature programme: 190° to 275° at 10°/min. Limit of detection, 1 μg/L [Bergman *et al.* 1981].

Plasma **GC-MS** Column: ZB-50 (30 m × 0.25 mm i.d., 0.25 μm) and DB-1MS (15 m × 0.25 mm i.d., 0.25 μm). Temperature programme: 185° for 0.5 min to 225° at 45°/min for 3 min to 275° at 15°/min for 1.58 min to 195° at 80°/min for 2.3 min to 230° at 10°/min to 275° at 25°/min. FID, SIM acquisition mode. Limit of quantification, 0.25 μg/L for CBD, THC, and THC-COOH, 0.125 μg/L for H-OH-THC, limit of detection, 0.25 μg/L for CBD and THC, 0.125 μg/L for H-OH-THC and THC-COOH [Karschner *et al.* 2010]. See Brenneisen *et al.* [2010]. Column: HP 5 MS 95% dimethylsiloxane 5% diphenylsiloxane (30 m × 0.25 mm i.d., 0.25 μm). Temperature programme: 130° at 2 min to 300° at 20° for 5 min. Limit of quantification, 0.80, 0.51, 0.88, 0.95 and 3.9 μg/L for THC, 11-THC-OH, THC-COOH, CBD and CBN, respectively, limit of detection, 0.24, 0.15, 0.26, 0.29 and 1.1 μg/L for THC, 11-THC-OH, THC-COOH, CBD and CBN, respectively [Nadulski *et al.* 2005]. Limit of quantification, 0.5 μg/L [Huang *et al.* 2001].

HPLC Column: C_8 (150 × 4.6 mm i.d., 5 μm). Mobile phase: 50 mmol/L phosphate buffer (pH 2.7) : acetonitrile (35 : 65), flow rate 0.3 mL/min to 2.5 mL/min at 8 min for 4 min to 0.3 mL/min between 12 and 14 min. UV detection (λ = 220 nm). Limit of quantification, 2 μg/L, limit of detection, 0.8 μg/L [Mercolini *et al.* 2008]. Column: Synergi MAX-RP 80A C_{12} (75 × 2 mm i.d., 4 μm). Mobile phase: 10 mmol/L ammonium formate (pH 3.0) : acetonitrile–10 mmol/L ammonium formate (pH 3.0, 90 : 10; 50 : 50 to 21 : 79 at 12 min to 5 : 95 at 12.5 min for 2.5 min to 50 : 50 at 15.01 min until 25 min), flow rate 400 μL/min. APCI, SIM acquisition mode. Limit of quantification, 0.2 μg/L, limit of detection, 0.1 μg/L [Grauwiler *et al.* 2007]. Electrochemical detection. Limit of detection, 0.5 μg/L [Nakahara *et al.* 1989]. Limit of detection, 6.5 μg/L [Law *et al.* 1984a].

LC-MS Column: XTerra MS C_{18} (150 × 2.1 mm i.d., 3.5 μm). Mobile phase: 1 mmol/L ammonium formate : methanol (10 : 90), flow rate 0.2 mL/min. ESI, positive ion mode. Limit of quantification, 0.5 μg/L [Laloup *et al.* 2006].

Serum **HPLC** Limit of detection, 3.3 μg/L [Law *et al.* 1984a].

Urine **GC-MS** See Kintz *et al.* [1995].

HPLC See Plasma [Grauwiler *et al.* 2007; Mercolini *et al.* 2008]. Column: reversed phase C_8-selent B (150 × 2 mm i.d., 5 μm). Mobile phase: 0.1% formic acid-1 mmol/L ammonium formate : acetonitrile-0.1% formic acid (90 : 10 to 70 : 30 to 30 : 30 to 10 : 90 for 4 min). TIS. Retention time, 26.8 min. Limit of detection, <3–10 μg/L [Weinmann *et al.* 2000]. Column: C_8 RP. Mobile phase: acetonitrile : acid phosphate buffer (55 : 45). UV detection. Limit of quantification, 10 μg/L [Bianchi, Donzelli 1996].

Oral Fluid **HPLC** Column: Lichrospher RP-Select B C_8 (125 × 4 mm i.d., 5 μm). Mobile phase: methanol-0.15 mol/L aqueous NaCl solution (20 : 80) : methanol-0.15 mol/L aqueous NaCl solution (82 : 18, 100 : 0 for 5 min to 0 : 100 at 5.01 min until 25 min to 100 : 0 at 25.1 min until 35 min), flow rate 0.8 mL/min. UV detection (λ = 220 nm). Limit of detection, 2, 1, and 8 mg/L for Δ^9-THC, CBD and CBN, respectively [Kircher, Parlar 1996].

GC-MS Column: ZB-50 (30 m × 0.25 mm i.d., 0.25 μm) followed by DB-1MS (15 m × 0.25 mm i.d., 0.25 μm). EI ionisation, SIM acquisition mode. Limit of quantification, 0.5 μg/L for THC, 11-OH-THC and CBD; 1 μg/L for CBN; 7.5 ng/L for THC-COOH (NCI) [Milman *et al.* 2010]. Column: HP-5MS (30 m × 0.25 mm i.d., 0.25 μm). Temperature programme: 290° at 10°/min for 10 min. SIM acquisition mode. Limit of quantification, 2 μg/L for THC-COOH and THC, limit of detection, 1 μg/L for THC-COOH and THC [Choi *et al.* 2009].

LC-MS See Plasma. Limit of quantification, 1.2 μg/L [Laloup *et al.* 2006]. Column: XTerra MS C_{18} (50 × 2.1 mm i.d., 3.5 μm). Mobile phase: acetonitrile : 0.05% ammonia (70 : 30), flow rate 0.3 mL/min. SIR acquisition mode, positive ion mode. Limit of quantification, 2 μg/L, limit of detection, 1 μg/L [Teixeira *et al.* 2004].

Brain **GC** See Blood [McCallum, Shaw 1981].

Hair **GC-MS** Column: cross-linked 5% phenylmethysiloxane (12 m × 0.2 mm i.d., 0.33 μm). Carrier gas: 1.0 mL/min. Temperature programme: 150° for 1 min to 270 at 20° at 5 min. EI ionisation. HP Ultra 2 cross-linked 5% phenylmethylsiloxane (12 m × 0.2 mm i.d., 0.33 μm). Carrier gas: He, 1.0 mL/min. Temperature programme: 150° for 2 min to 230° at 20 min to 270° at 10°/min for 1 min. SIM acquisition mode. Limit of quantification, 10 ng/g for Δ^9-THC-COOH (GC-MS-NCI); 0.1 μg/mg for Δ^9-THC, CBD and CBN; and 1.00 μg/g for Δ^9-THC-COOH (GC-MS-EI) [Baptista *et al.* 2002]. Column: HP-5 cross-linked 5% phenyl methyl silicone (12 m × 0.32 mm i.d., 0.33 μm). Temperature programme: 100° for 2 min to 200° at 50°/min to 270° at 15°/min. SIM acquisition mode. Limit of detection, 0.1 μg/L for CBN and HBC, 0.2 ng/kg for CBD [Strano-Rossi, Chiarotti 1999].

HPLC Limit of quantification, 1.1 ng/g. Limit of detection, 0.3 ng/g [Sachs, Dressler 2000].

Nail Clippings **GC-MS** Column: HP-1 cross-linked dimethyl dimethyl silicone (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He. Column: 150° to 300° at 10°/min for 10 min. EI ionisation, SIM acquisition mode. Limit of detection, <0.1 ng/mg [Lemos *et al.* 1999].

Note For a study of the detection of cannabis in oral fluid and forehead wipes from impaired drivers, see Kintz *et al.* [2000]. For a review of radioimmunoassay for the quantification of cannabinoid metabolites, see Law *et al.* [1984a].

Disposition in the Body Δ^9-THC is absorbed from the gastrointestinal tract but absorption is slow and irregular. However, Δ^9-THC can be measured in plasma within seconds after inhalation of the first puff of marijuana smoke. Δ^9-THC is lipophilic and is widely distributed in the body. It is oxidised to the active metabolites 11-hydroxy-Δ^9-THC and 8β-hydroxy-Δ^9-THC by an hepatic cytochrome P450 enzyme. The inactive substances 8α-hydroxy-Δ^9-THC and 8α,11-dihydroxy-Δ^9-THC are also formed. 11-Hydroxy-Δ^9-THC is further oxidised to 11-nor-Δ^9-THC-9-carboxylic acid (Δ^9-THC-11-oic acid), and many other polar mono- and dicarboxylic acids are formed; these are conjugated with glucuronic acid to a variable extent. Enterohepatic circulation of metabolites may occur. Up to ~25% of a dose is excreted in the urine in 3 days, mainly as 11-nor-Δ^9-THC-9-carboxylic acid glucuronide, together with the other carboxylic acids in free and conjugated form. Δ^9-THC-*O*-glucuronide has also been detected in urine. The major excretion route is via the faeces, up to around 65% of a dose being excreted in 5 days, mainly as 11-hydroxy-Δ^9-THC and the carboxylic acids in conjugated form. Δ^9-THC metabolites have been detected in urine for up to 12 days following a single oral dose. It crosses the placenta and is distributed into breast milk.

Therapeutic Concentration

Six healthy males with histories of marijuana use smoked a single marijuana cigarette (placebo or 1.75% or 3.55% Δ^9-THC). The smoking protocol consisted of a 2-s inhalation, a 10-s hold period and a 72-s exhalation and rest period. A total of eight puffs were inhaled in 11.2 min. Mean plasma levels of 7.0 and 18.1 μg/L Δ^9-THC, respectively, were observed after the first inhalation of the 1.75% and 3.55% Δ^9-THC cigarettes. Levels continued to increase rapidly to mean peak plasma concentrations of 79.0 and 152.0 μg/L for the 1.75% and 3.55% Δ^9-THC cigarettes, respectively, and were reached after 9 min (before initiation of the last puff sequence at 9.8 min) [Huestis *et al.* 1992a].

After 11 subjects had smoked 11.6 to 15.6 mg (mean, 13.0) of Δ^9-THC from a cigarette over a period of 5 to 7 min, peak plasma concentrations of 0.03 to 0.12 mg/L (mean, 0.08) of Δ^9-THC were observed within 3 min after termination of smoking; the concentration fell rapidly to 0.003–0.01 mg/L (mean, 0.007) at 1 h and to 0.0006–0.003 mg/L (mean, 0.0016) at 4 h, after smoking. When 20 mg Δ^9-THC was given orally to the same subjects, peak plasma concentrations of 0.004–0.01 mg/L Δ^9-THC were produced between 60 and 300 min after ingestion [Ohlsson *et al.* 1980].

Toxicity Cannabis or Δ^9-THC intoxication may result in loss of consciousness or even death, but reports of fatalities are rare.

In 6 deaths from cardiovascular effects folllowing cannabis use, the following Δ^9-THC levels were found in the blood: 22 μg/L, 4 μg/L, 2 μg/L, 5 μg/L, 3 μg/L and 7 μg/L; no other drugs were detected except for 400 mg/L ethanol in the 4th case [Bachs, Morland 2001].

In a fatal poisoning by Δ^9-THC, the following postmortem concentrations of Δ^9-THC in tissues were reported: liver 37.5 μg/g, kidney 42 μg/g and spleen 12 μg/g [Tewari, Sharma 1980].

Bioavailability After ingestion, ~6–20%. During smoking, ~18–50%.

Half-life Plasma half-life, Δ^9-THC ~20–36 h.

Volume of Distribution Δ^9-THC ~10 L/kg.

Distribution in Blood Plasma : whole blood ratio, Δ^9-THC 1.8.

Protein Binding Δ^9-THC and 11-hydroxy-Δ^9-THC: 94–99%.

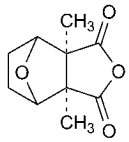
C

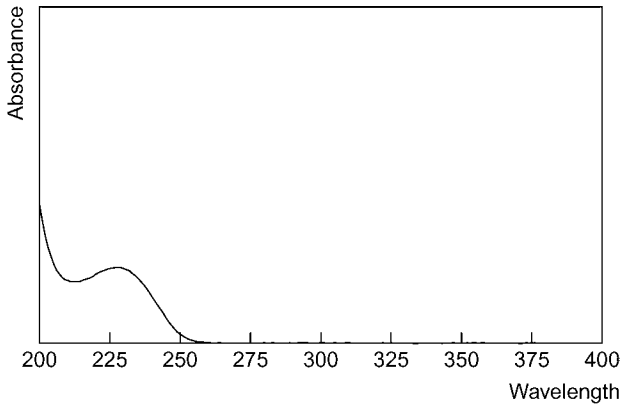
Cantharidin

Protein Phosphatase 1 and 2A Inhibitor, Vesicant
$C_{10}H_{12}O_4 = 196.2$
CAS—56-25-7

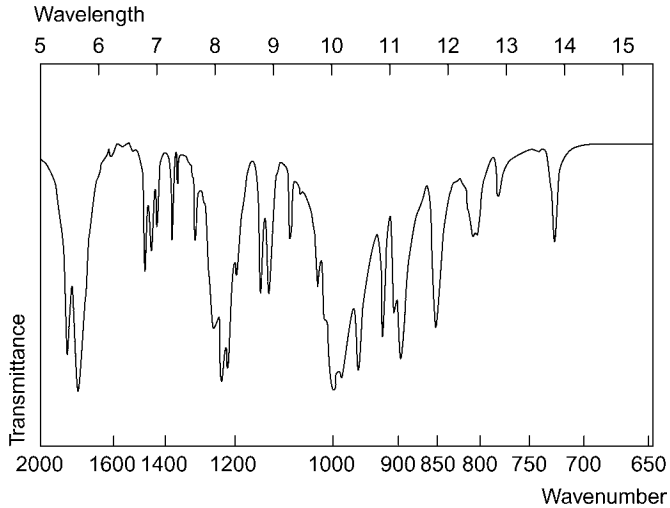
Synonyms Hexahydro-3a,7a-dimethyl-4,7-epoxyisobenzofuran-1,3-dione; Spanish fly.
Proprietary Name *Cantharone*



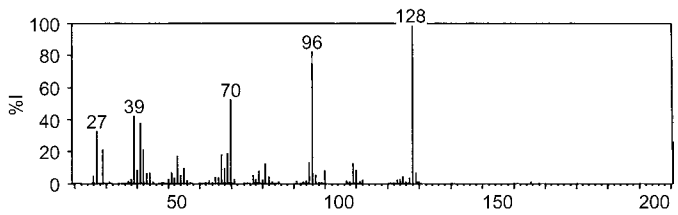
Chemical Properties Cantharidin is obtained from cantharides, the dried beetle *Cantharis vesicatoria* (*Lytta vesicatoria*) (Meloidae) or other spp., containing not less than 0.6%, or from mylabris, the dried beetles *Mylabris sidae* (*M. phalerata*), *M. cichorii* and *M. pustulata* (Meloidae), containing not less than 1%. Colourless, glistening crystals which sublime at ≈120°. Mp 218°. Insoluble in cold water, somewhat soluble in hot water; soluble 1 in about 1100 of ethanol, 1 in 40 of acetone, 1 in 65 of chloroform, 1 in 560 of ether and 1 in 150 of ethyl acetate. Soluble in oils. Log *P* (octanol/water) 1.2.
Gas Chromatography System GA—RI 1492.
Ultraviolet Spectrum Principal peak at 230 nm



Infrared Spectrum Principal peaks at wavenumbers 1242, 962, 900, 1786, 1852, 1002 cm^{-1} (Nujol mull).



Mass Spectrum Principal ions at *m/z* 128, 96, 70, 39, 41, 27, 42, 29.



Quantification

Blood **GC** Column: OV-1 fused silica (15 m × 0.53 mm i.d.). Carrier gas: He, 5.0 mL/min. Temperature: 150°. FID. Limit of detection, 0.24 mg/L [Cheng *et al.* 1990].

GC-MS HP Ultra fused silica capillary (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 0.8 mL/min. Temperature programme: 70° for 1.5 min to 290° at 20°/min for 3.5 min. EI ionisation. Limit of detection not reported [Polettini *et al.* 1992].

Serum **GC-MS** Column: CPSIL-8-CB 5% phenyl 95% methyl silicone (25 m × 0.22 mm i.d., 0.11 µm). Carrier gas: He, 40 cm/s. Temperature programme: 80° for 3 min to 280° at 12 /min for 10 min. EI ionisation at 70 eV. SIM acquisition mode. Retention time: 11 min. Limit of detection, 5 µg/L [Hundt *et al.* 1990; Steyn, Hundt 1988].

Urine **GC** See Blood. Limit of detection, 0.9 mg/L [Cheng *et al.* 1990].

GC-MS HP Ultra fused silica capillary (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 0.8 mL/min. Temperature programme: 70° for 1.5 min to 290° at 20°/min for 3.5 min. EI ionisation. Limit of detection not reported [Polettini *et al.* 1992].

Liver **GC** See Blood [Cheng *et al.* 1990].

Other **GC** Insect Tissue. Column: DB-5 fused silica capillary (27 m × 0.329 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 100° to 270° at 20°/min. FID. Limit of detection, 30 pg [Carrel *et al.* 1985]. Rat Liver. Column: 3% SE-30 silicon (8′). Temperature: 200°. Limit of detection, 0.12 µg [Bagatell *et al.* 1966].

GC-MS Horse Urine and Stomach. Column: 3% OV-101 on Chromosorb W-HP 100/120 mesh (2′ or 6′ × 2 mm i.d.). Carrier gas: He, 30 mL/min. Temperature programme: 140° to 220° at 4°/min. Retention time: 1.9 and 5.8 min for the 2 and 6′ columns, respectively. Limit of detection, 10 ng [Ray *et al.* 1980].

HPLC Animal Liver, Kidney, and Blood. Column: µPorasil (30 cm × 4 mm i.d., 10 µm). Mobile phase: 0.5% acetonitrile in chloroform, flow rate 2 mL/min. UV detection (λ = 254 nm). Retention time: 6.6 min. Limit of detection, 0.2 µg [Ray *et al.* 1979].

Disposition in the Body Readily absorbed from the skin and mucous membranes. It does not appear to be metabolised.

Toxicity When taken orally it causes great pain as well as blistering and gross inflammation of the gastrointestinal tract, the kidneys and the bladder. The lethal dose is between 10 and 60 mg although a crystal weighing not more than 0.5 mg lodged in the mucosa may produce a blister that could be fatal [Till, Majmudar 1981].

A 27-year-old female died approximately 17 h after she had eaten coconut ice into which a small quantity of cantharidin had been introduced by a fellow employee. Postmortem findings revealed that between 65 and 130 mg of cantharidin was circulating in the organs. At the same time as the above incident, a 19-year-old girl also ate a piece of the cantharidin-impregnated coconut ice. She died 26 h later. The postmortem level of cantharidin in the organs was somewhat less than in the former case [Nickolls, Teare 1954].

A 43-year-old male ingested between 32 and 65 mg cantharidin when he spilt some on his thumb while fishing. He died 2 days later. Pathological symptoms were those of cantharidin, but none was detected at postmortem [Nickolls, Teare 1954].

Cantharidin was detected at a concentration of 0.11 mg/L in postmortem blood after ingestion of a crude extract of cantharides (over 200 dried beetles). The liver concentration was 1.24 mg/kg [Cheng *et al.* 1990].

In another case, cantharidin was detected at a concentration of 72.3 mg/L in postmortem serum after ingestion of cantharide powder containing 0.87% cantharidin [Hundt *et al.* 1990].

A 30-year-old male ingested ~26 to 45 mg cantharidin. He died 30 h post-ingestion. Blood and urine concentrations (mg/L) were as shown below.

Time (h)	*Blood*	*Urine*
6	–	2.35
10	0.29	1.12
20	0.18	0.59
30	0.15	0.38

[Polettini *et al.* 1992].

Note For an account of the findings from 4 cases of poisoning from cantharidin, see Karras *et al.* [1996] and for cases of poisoning after the ingestion of a beetle, see Mallari *et al.* [1996], Wertelecki *et al.* [1967] and Tagwireyi *et al.* [2000]. For a case of poisoning after the ingestion of liquor epispasticus (≈20 mg cantharidin), see Rosin [1967] and after the ingestion of wart remover (0.7% cantharidin), see Ewart *et al.* [1978]. For a review of cantharidin, see Moed *et al.* [2001].

Capecitabine

Antineoplastic

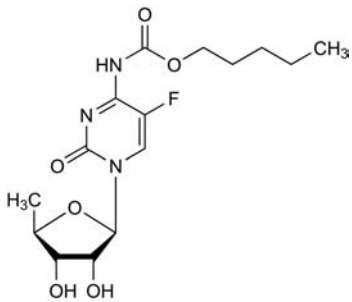
$C_{15}H_{22}FN_3O_6 = 359.4$

CAS—154361-50-9

IUPAC Name Pentyl *N*-[1-[(2*R*,3*R*,4*S*,5*R*)-3, 4-dihydroxy-5-methyloxolan-2-yl]-5-fluoro-2-oxopyrimidin-4-yl]carbamate

Synonym [1-(5-Deoxy-β-D-ribofuranosyl)-5-fluoro-1,2-dihydro-2-oxo-4-pyrimidinyl]carbamic acid pentyl ester; Ro-09-1978/000

Proprietary Name *Xeloda*



Chemical Properties A white to off-white crystalline powder. Aqueous solubility approx. 26 g/L at 20°.

Disposition in the Body Capecitabine is extensively absorbed after oral administration and hydrolysed first to 5′-deoxy-5-fluorocytidine (5′-DFCR) by a carboxylesterase. 5′-DFCR is then converted to 5′-deoxy-5-fluorouridine (5′-DFUR) by cytadine deaminase to 5′-fluorouracil by thymidine phosphorylase to 5-fluoro-5,6-dihydrofluorouracil (FUH_2) to 5-fluoro-ureidopropionic acid (FUPA) and to α-fluoro-β-alanine (FBAL) by β-ureidopropionase. >95% of an administered dose is excreted in urine, with ~3% unchanged and 5% as FBAL, the major metabolite. 2.5% of the dose is recovered in faeces.

Therapeutic Concentration

A single oral dose of 892 to 2510 mg/m^2 was administered and taken within 30 min of the end of a meal. Mean peak plasma concentrations of the drug ranged from 2.4 to 3.9 mg/L and were reached within ~1.5 h [Roche Laboratories Inc. 1998].

Toxicity In patients treated with doses of up to 3514 mg/m^2 daily (i.e. cases of acute overdose), nausea, vomiting, diarrhoea and bleeding were observed.

Half-life 0.5 to 1 h.

Protein Binding <60% for the drug and metabolites.

Dose A usual dose of 2.5 g/m^2 body surface is administered daily.

Roche Laboratories Inc., (1998) Xeloda (Capecitabine) prescribing information, USA

Capreomycin

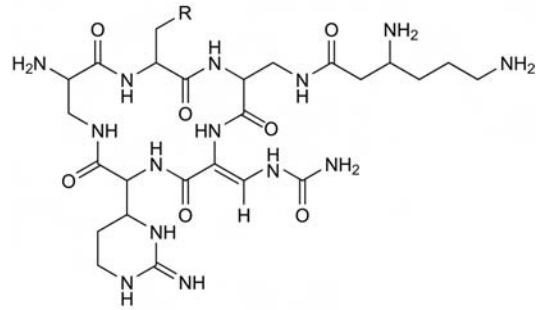
Antibacterial

$C_{25}H_{44}N_{14}O_8 = 668.7$

CAS—11003-38-6

IUPAC Name (3*S*)-3,6-Diamino-N-[[(2*S*,5*S*,8*Z*,11*S*,15*S*)-15-amino-11-[(6*S*)-2-amino-1,4,5,6-tetrahydropyrimidin-6-yl]-8-[(carbamoylamino)methylidene]-2-(hydroxymethyl)-3,6,9,12,16-pentaoxo-1,4,7,10,13-pentazacyclohexadec-5-yl]methyl]hexanamide

Synonyms Capromycin; caprolin; capostatin.



Capreomycin IA R = OH
Capreomycin IB R = H

Chemical Properties A mixture of the polypeptide antimicrobial substances produced by certain strains of *Streptomyces capreolus*. Capreomycin I consists of capreomycin IA ($C_{25}H_{44}N_{14}O_8 = 668.7$), Mp 246° to 248°; and capreomycin IB ($C_{25}H_{44}N_{14}O_7 = 652.7$), Mp 253° to 255°, which predominates. Capreomycin II that makes up about 10% of the mixture consists of capreomycin IIA and capreomycin IIB.

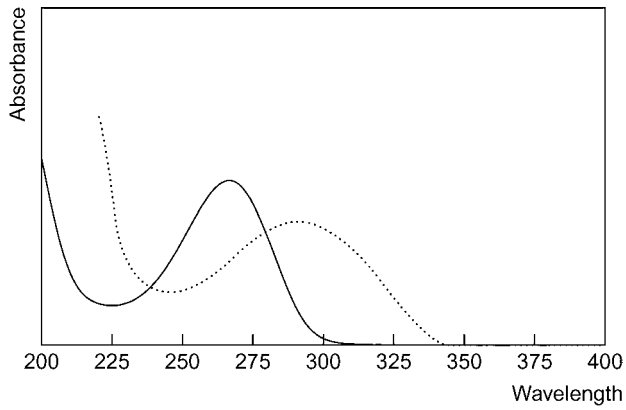
Capreomycin Sulfate

CAS—1405-37-4

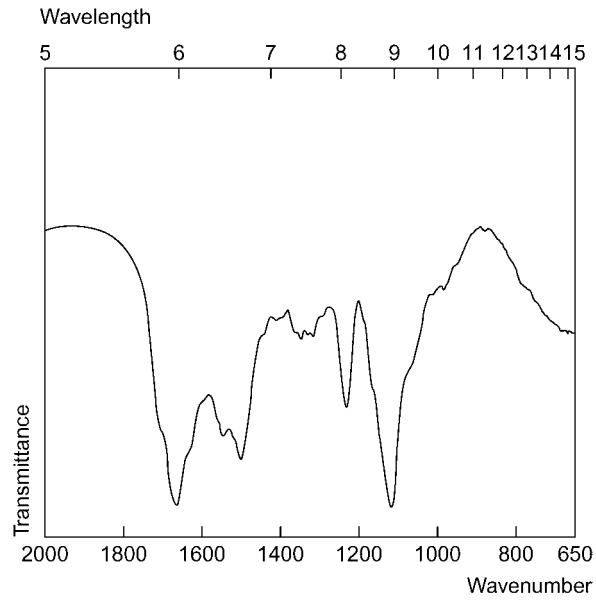
Proprietary Names *Capastat*; *Caprocin*; *Ogostal*.

Chemical Properties A white or almost white solid or amorphous powder. It is very soluble in water: practically insoluble in chloroform, ethanol, ether, and most other organic solvents.

Ultraviolet Spectrum (Capreomycin sulfate) Aqueous acid (0.2 mol/L H_2SO_4)—268 nm; basic—289 nm.



Infrared Spectrum Principal peaks at wavenumbers 1668, 1498, 1231, 1118 cm^{-1} (sulfate salt).



Quantification

Urine **Electrophoresis** UV detection. Limit of detection, 0.15 mg/L [Zhang *et al.* 1998].

Disposition in the Body Capreomycin is poorly absorbed after oral administration (<1%). It is not distributed into cerebrospinal fluid (CSF), but it does cross the

placenta. About 50% of a dose is excreted unchanged in urine by glomerular filtration within 12 h. Small amounts are excreted in bile. It is removed by haemodialysis.

Therapeutic Concentration A 1 g IM dose produces peak serum concentrations of about 30 mg/L (range 20 to 47 mg/L) after 1 to 2 h.

Toxicity

Nephrotoxicity, including acute tubular necrosis, and ototoxicity, including dizziness and vertigo, have been reported. Neuromuscular blockage or respiratory paralysis may also occur after rapid IV administration [Eli Lilly & Co.].

Half-life Plasma half-life, 4 to 6 h.

Clearance Plasma clearance, 57 mL/h/kg.

Dose The equivalent of 1 g of capreomycin daily is administered IM for 60 to 120 days, followed by 1 g two or three times a week. 20 mg/kg daily should not be exceeded. The dose should be reduced in patients with reduced renal function.

Data as supplied by Eli Lilly & Company Ltd.

Zhang SS *et al.* (1998). A reproducible, simple, and sensitive high-performance capillary electrophoresis method for simultaneous determination of capreomycin, ofloxacin and pasiniazide in urine. *J Pharm Biomed Anal* 17: 617–622.

Captodiame

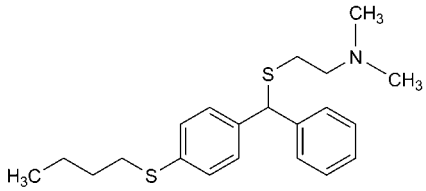
Tranquilliser

$C_{21}H_{29}NS_2$ = 359.6

CAS—486-17-9

IUPAC Name 2-[(4-Butylsulfanylphenyl)-phenylmethyl]sulfanyl-*N*,*N*-dimethylethanamine

Synonyms 2-[[[4-(Butylthio)phenyl]phenylmethyl]thio]-*N*,*N*-dimethylethanamine; captodiamine.



Captodiame Hydrochloride

$C_{21}H_{29}NS_2$, HCl = 396.1

CAS—904-04-1

Proprietary Name *Covatine*

Chemical Properties Crystals. Mp 131° to 132°.

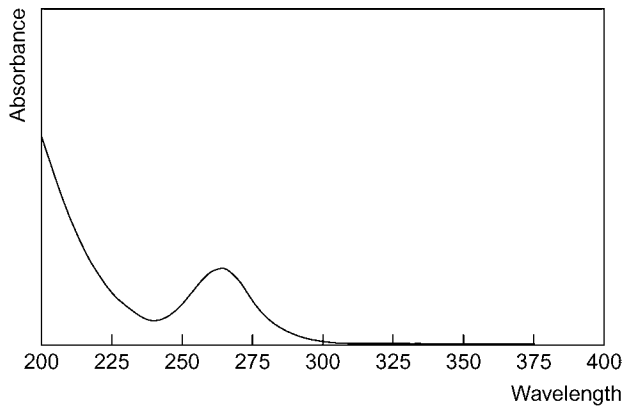
Colour Tests Mandelin's test—violet; Marquis test—violet.

Thin-layer Chromatography System TA—R_f 0.66; system TAE—R_f 0.47; system TB—R_f 0.49; system TE—R_f 0.77 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 2774.

High Performance Liquid Chromatography System HAA—RT 20.2 min; system HX—RI 561.

Ultraviolet Spectrum Aqueous acid—266 nm (A^1_1 = 370b); aqueous alkali—273 nm.



Infrared Spectrum Principal peaks at wavenumbers 694, 751, 1086, 1041, 1010, 714 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 58, 165, 255, 359, 166, 73, 199, 45.

Dose Captodiame hydrochloride has been given in doses of 150 mg daily.

Captopril

Antihypertensive

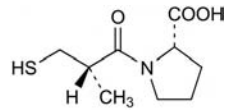
$C_9H_{15}NO_3S$ = 217.3

CAS—62571-86-2

IUPAC Name 1-[(2*S*)3-Mercapto-2-methyl-1-oxopropyl]-l-proline

Synonyms SQ-14225; captoprilum.

Proprietary Names *Acediur*; *Aceomel*; *Acepril*; *Aceplus*; *Alopresin*; *Acepress*; *Capoten*; *Captolane*; *Captoril*; *Cesplon*; *Dilabar*; *Ecopace*; *Garranil*; *Hipertil*; *Kaplon*; *Lopirin*; *Lopril*; *Tensiomin-Cor*; *Tensobon*; *Tensoprel*; *Tensopril*.



Chemical Properties Polymorphic white to off-white crystals. Mp ~106°. Freely soluble in water, ethanol, chloroform, methylene chloride and methanol. It dissolves in dilute solution of alkali hydroxides. pK_{a1} 3.7, pK_{a2} 9.8. Log *P* (octanol/water), 0.34.

Colour Tests Palladium chloride—orange; sodium nitroprusside (method 2)—violet.

Thin-layer Chromatography System TD—R_f 0.01; system TE—R_f 0.00; system TF—R_f 0.01; system TAD—R_f 0.06 (acidified potassium permanganate solution—yellow; ferric chloride—yellow; mercuric chloride–diphenylcarbazone reagent—violet (turns pink on heating); Van Urk reagent–yellow (fades on heating).

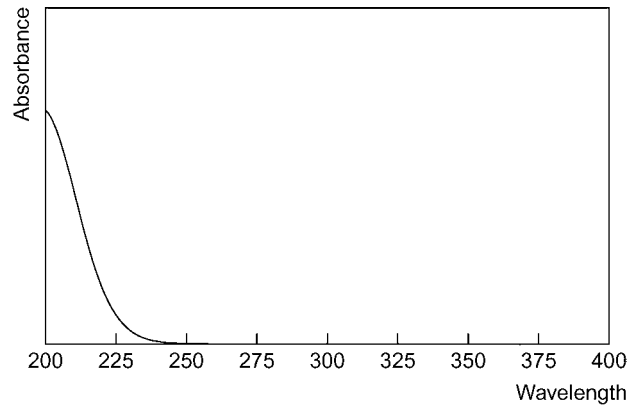
Gas Chromatography System GA—captopril, not eluted; methylcaptopril RI 1730; system GB—captopril, not eluted.

High Performance Liquid Chromatography System HZ—RT 2.1 min; system HY—RI 283; system HX—RI 316; system HAA—RT 9.7 min.

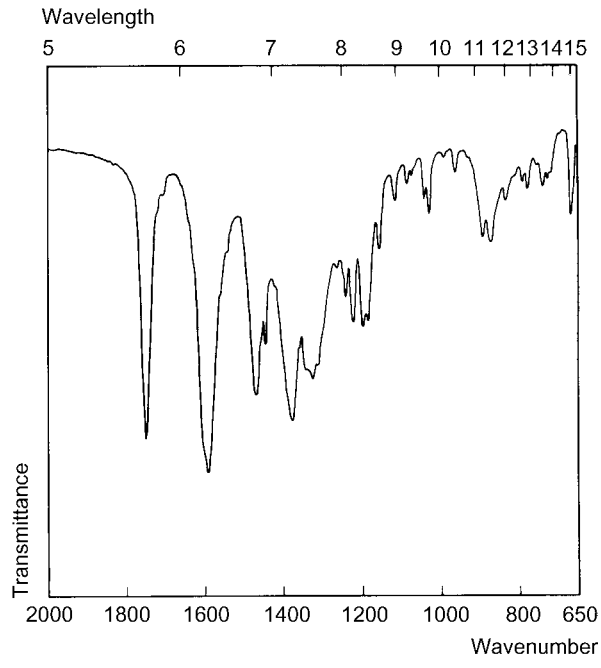
Column: Nova Pak RP C_{18} (150 × 3.9 mm i.d., 4 µm). Mobile phase: acetonitrile : 1% acetic acid pH 2.8 (42 : 58), flow rate 1.5 mL/min. I.S.: *N*-acetyl-L-cysteine. Fluorescence detection (λ_{ex} = 340 nm, λ_{em} = 389 nm). Retention time: captopril, 3.7 min; I.S. 2.2 min [Arroyo *et al.* 1997].

Column: RP C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 1% acetic acid (60 : 40), flow rate 1.3 mL/min. I.S.: nitrazepam. UV detection (λ = 260 nm). Retention time: captopril, 4.1 min; I.S., 4.6 min [Jankowski *et al.* 1995].

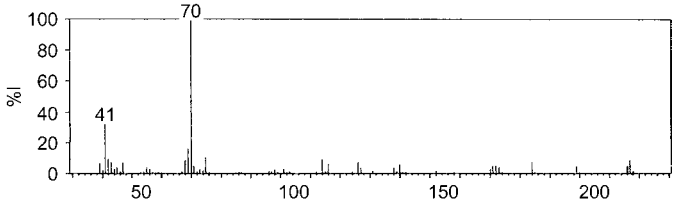
Ultraviolet Spectrum Aqueous acid—no significant absorption, 230–360 nm; aqueous alkali—238 nm (A^1_1 = 235c) (See below).



Infrared Spectrum Principal peaks at wavenumbers 1589, 1742, 1202, 1192, 1229, 1245 cm^{-1} (KBr disk). Polymorphism may occur.



Mass Spectrum Principal ions at *m/z* 70, 41, 69, 75, 114, 42, 217, 68.



Quantification

Blood **GC** Column: 3% OV-101 on Chromosorb W-HP. ECD. Limit of detection, 20 µg/L [Bathala *et al.* 1984].

HPLC Column: Separon SGX C_{18} (150 × 3.3 mm i.d., 5 µm). Mobile phase: 20 mmol/L sodium octanesulfonate (pH 2.5) with 0.1 mol/L citric buffer : acetonitrile (3 : 1), flow rate 0.5 mL/min. UV detection (λ = 314 nm). Retention time: 23 min. Limit of detection, 0.3 µg/L [Sypniewski, Bald 1996].

Plasma **GC** See Blood. Limit of detection, 50 µg/L [Bathala *et al.* 1984].

GC-MS Column: HP-5 capillary column (25 m × 0.2 mm i.d., 33 µm). Carrier gas: He, 0.8 mL/min. Temperature: 310°. Limit of quantification, 10 ng/mL [Franklin *et al.* 1998]. Column: 3% OV-101 on 100/120 Chromosorb WAW DMCS (2 m × 2 mm i.d.). Carrier gas: He, 30 mL/min. Temperature programme: 150° for 1 min to 290° at 10°/min. EI ionisation at 70 eV, positive ion mode. Limit of detection, 1 µg/L for captopril, 25 µg/L for captopril disulfide [Drummer *et al.* 1984]. Limit of detection, 20 µg/L [Ivashkiv *et al.* 1984].

HPLC Column: DIAMONSIL (150 × 4 mm i.d., 5 µm). Mobile phase: acetonitrile : trifluoroacetic acid : water, flow rate 1.2 mL/min. UV detection (λ = 263 nm). Limit of quantification, 7 µg/L [Huang *et al.* 2006]. Column: Inertsil 5 ODS-2 (150 × 4.6 mm i.d., 5 µm). Mobile phase: 0.1% aqueous trifluoacetic acid : acetonitrile (85 : 15), flow rate 1.5 mL/min. Fluoresence detection. Limit of detection, 4 ppb [Tache *et al.* 2002]. Column: µbondapak NH_2 (150 × 3.9 mm i.d., 10 µm). Mobile phase: *n*-hexane : propan-2-ol : methanol : acetic acid (68 : 15 : 15 : 2), flow rate 2 mL/min. UV detection (λ = 246 nm). Limit of quantification, 10 mg/L [Amini *et al.* 1999]. Column: C_{18} reversed phase. Mobile phase: methanol: acetonitrile: phosphate buffer (pH 6.4, 30 : 30 : 135), flow rate 1 mL/min. Fluorescence detection. Limit of quantification, 5 µg/L [Zhong *et al.* 1998]. Column: Nova-Pak C_{18} (150 × 3.9 mm i.d., 4 µm). Mobile phase: acetonitrile : 100% acetic acid (pH 2.30, 42 : 58). Fluoresence detection (λ_{ex} = 340 nm and λ_{em} = 389 nm). Limit of quantification, 25 µg/L [Arroyo *et al.* 1997]. Mobile phase *o*-phthalaldehyde : acetonitrile : water : trifluoroacetic acid (15 : 85 : 0.1) with glycine 100 mg/L, flow rate 0.8 mL/min. Fluorescence detection (λ_{ex} = 345 nm and λ_{em} = 455 nm). Limit of quantification, 12.5–25 µg/L [Kok *et al.* 1997]. Column: Spherisorb C_{18}. Mobile phase: water : acetonitrile : acetic acid (44 : 55 : 0.2). UV detection (λ = 258 nm). Limit of detection, 2 ng/L [Li *et al.* 1996]. Column: Kontron Analytical S5 ODS-2 (250 × 4.6 mm i.d.). Mobile phase: acetonitrile : 1% acetic acid (60 : 40), flow rate 1.3 mL/min. UV detection (λ = 260 nm). Limit of detection, 15 µg/L [Jankowski *et al.* 1995]. Column: µBondapak C_{18} (37–50 µm) and YWG-C_{18} (10 µm). Mobile phase: acetonitrile : water : acetic acid (35 : 65 : 0.4). UV detection (λ = 260 nm). Limit of quantification, 20 and 10 µg/L, for columns respectively [Gao *et al.* 1992]. Column: Nova-Pak C_{18} (150 × 3.9 mm i.d., 4 µm). Mobile phase: 2-methyl-1,5-benzoylbenzimidazole : acetonitrile : water : trifluoroacetic acid (20 : 80 : 0.1), flow rate 1.0 mL/min. Fluoresence detection (λ_{ex} = 400 nm and λ_{em} = 280 nm) [Perrot *et al.* 1988].

LC-MS Column: Chromolith C_{18} (50 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : water (65 : 35, pH 3.1). ESI, positive ion mode, MRM acquisition mode. Retention time: 1.45 min. Limit of quantification, 10 µg/L [Rezende *et al.* 2007].

Note For a radioimmunoassay for the detection of captopril see Duncan *et al.* [1983].

Serum **HPLC** Column: ODS reversed phase column. Mobile phase: acetonitrile : water : acetic acid (225 : 270 : 5), flow rate 1 mL/min. UV detection (λ = 263 nm). Limit of quantification, 50 ng/mL [Bahmaei *et al.* 1997].

Urine **GC-MS** See Plasma [Drummer *et al.* 1984].

HPLC See Plasma. Limit of detection, 250 µg/L [Kok *et al.* 1997]. See Plasma [Gao *et al.* 1992]. See Blood [Sypniewski, Bald 1996]. See Plasma [Perrot *et al.* 1988].

Disposition in the Body Captopril is readily absorbed after oral administration; ~60–75% of the dose is absorbed and peak plasma concentrations are achieved within ~1 h. It crosses the placenta and is found in breast milk at ~1% of maternal blood concentrations. Urinary excretion of an oral dose is 40–50% as unchanged drug, ~3% as captopril disulfide and ~30% as polar metabolites. Excretion in the urine is rapid, about half the dose being excreted within the first 4 h. An *S*-methyl metabolite has been identified in plasma and urine. Captopril is removed by haemodialysis.

Therapeutic Concentration

Analysis of captopril concentrations in plasma samples from 20 volunteers following oral administration of 100 mg captopril resulted in a mean peak concentration of 1.47 mg/L after 0.75 h [Franklin *et al.* 1998].

After a single oral dose of 100 mg of ^{35}S-labelled captopril to 10 subjects, peak blood concentrations of 0.51–1.31 mg/L (mean 0.8 mg/L) captopril and 0.11–0.49 mg/L (mean 0.23 mg/L) captopril disulfide were attained in 0.5–1.5 h [Kripalani *et al.* 1980].

Following oral administration of 25 mg three times a day to 12 subjects, a mean maximum steady-state blood concentration of 0.14 mg/L captopril was reported 0.9 h after a dose [Cody *et al.* 1982].

Toxicity

A 75-year-old man committed suicide by taking an overdose of captopril. He took ~90 tablets each containing 12.5 mg. The postmortem plasma concentration of captopril was 60.4 mg/L. This was the first case report of fatal captopril overdose with the measurement of plasma concentration of the drug [Park *et al.* 1990].

Serum levels of captopril reached 20 mg/L in a 43-year-old individual who had attempted suicide by ingesting 5–7.5 g captopril 7 h earlier. The patient survived and displayed minimal symptoms [Lechleitner *et al.* 1990].

Half-life ≈1–2 h in blood.

Volume of Distribution ≈0.7 L/kg in blood.

Clearance ≈13 mL/min/kg from blood.

Protein Binding ≈30% in plasma.

Note For a review of captopril, see Romankiewicz *et al.* [1983].

Dose Daily dose 75 to 150 mg; maximum of 450 mg daily in divided doses.

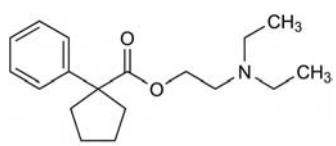
Caramiphen

Anticholinergic

$C_{18}H_{27}NO_2$ = 289.4

CAS—77-22-5

IUPAC Name 2-(Diethylamino)ethyl 1-phenylcyclopentanecarboxylate



Chemical Properties A liquid. Log *P* (octanol/water), 4.5.

Caramiphen Edisilate

$C_{18}H_{27}NO_2$, $^1/_2C_2H_6O_6S_2$ = 384.5

CAS—125-86-0

Synonym Caramiphen ethanedisulfonate
Chemical Properties Crystals. Mp 115° to 116°. Soluble in water and ethanol.

Caramiphen Hydrochloride

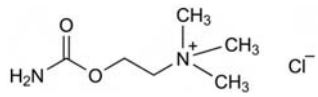
$C_{18}H_{27}NO_2$, HCl = 325.9
CAS—125-85-9
Chemical Properties White crystals or crystalline powder. Mp 145° to 146°. Soluble 1 in 4 of water and 1 in 8 of ethanol; practically insoluble in ether.

Colour Tests Liebermann's reagent—red-orange; Marquis test—yellow; sulfuric acid (when warmed)—red.
Thin-layer Chromatography System TA—R_f 0.66 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1971.
Ultraviolet Spectrum Aqueous acid—252 (A^1_1=7.9b), 259 (A^1_1=7.9b), 265 nm.
Infrared Spectrum Principal peaks at wavenumbers 1718, 1154, 694, 1173, 1220, 1060 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 86, 99, 91, 144, 58, 56, 41, 87.
Quantification
Blood **GC** AFID. Limit of detection, <2.5 µg/L [Levandoski, Flanagan 1980].
Disposition in the Body
Therapeutic Concentration
Following daily oral administration of 20 mg of caramiphen edisilate at 0, 4, and 8 h to 11 subjects for 4 days, peak blood concentrations of 0.018 to 0.078 (mean 0.046) mg/L were reported 1 to 2 h after a dose [Levandoski, Flanagan 1980].
Dose Caramiphen hydrochloride has been given in doses of 50 to 600 mg daily.

Levandoski P, Flanagan T (1980). Use of nitrogen-specific detector for GLC determination of caramiphen in whole blood. *J Pharm Sci* 69: 1353–1354.

Carbachol

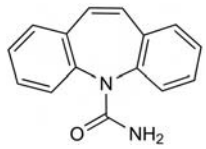
Parasympathomimetic
$C_6H_{15}ClN_2O_2$ = 182.6
CAS—51-83-2
IUPAC Name 2-Carbamoyloxyethyl(trimethyl)azanium chloride
Synonyms 2-[(Aminocarbonyl)oxy]-*N*,*N*,*N*-trimethylethanaminium chloride; carbacholine; carbamoylcholine chloride; carbamylcholine chloride; choline chloride carbamate.
Proprietary Names *Carbyl*; *Doryl*; *Miostat*.



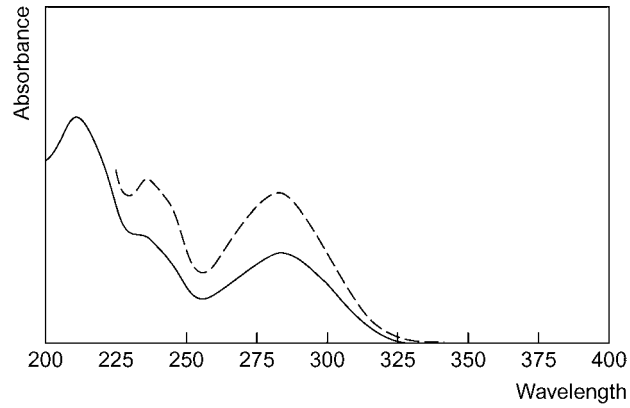
Chemical Properties White or faintly yellow, hygroscopic, crystals or crystalline powder. Mp 200° to 204°, with decomposition. Soluble 1 in 1 of water and 1 in 50 of ethanol; very slightly soluble in dehydrated alcohol, more readily soluble on boiling; practically insoluble in acetone, chloroform and ether. pK_a 4.8. Log *P* (octanol/water), −3.8.
Thin-layer Chromatography System TA—R_f 0.00; system TB—R_f 0.00; system TC—R_f 0.00; system TE—R_f 0.00; system TL—R_f 0.00; system TAE—R_f 0.04; system TAF—R_f 0.23 (acidified iodoplatinate solution, positive).
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.
Infrared Spectrum Principal peaks at wavenumbers 1730, 1083, 1056, 930, 1102, 1200 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 43, 58, 42, 44, 30, 129, 36, 143.
Dose 6 mg daily orally. For acute symptoms, 250 µg by SC injection, repeated if necessary.

Carbamazepine

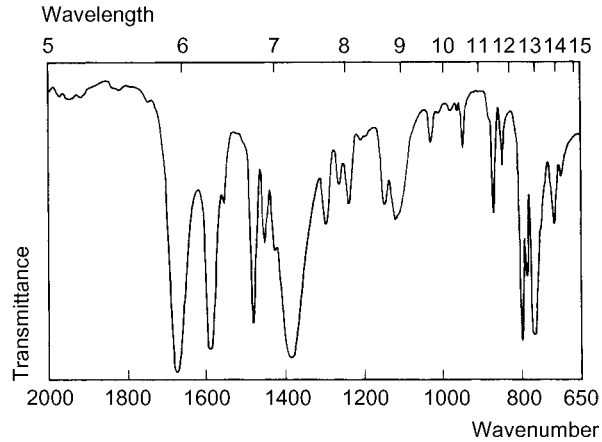
Anticonvulsant
$C_{15}H_{12}N_2O$ = 236.3
CAS—298-46-4
IUPAC Name Benzo[*b*][1]benzazepine-11-carboxamide
Synonyms Carbamazepinum; *5H*-Dibenz[*b*,*f*]azepine-5-carboxamide; G-32883.
Proprietary Names *Atretol*; *Biston*; *Calepsin*; *Carbagen*; *Carbatrol*; *Carbium*; *Carpaz*; *Convuline*; *Epimaz*; *Epitol*; *Finlepsin*; *Fokalepsin*; *Gericarb*; *Hermolepsin*; *Neurotop*; *Prozine*; *Sirtal*; *Stazepin*; *Tegretol*; *Telesmin*; *Teril*; *Timonil*.



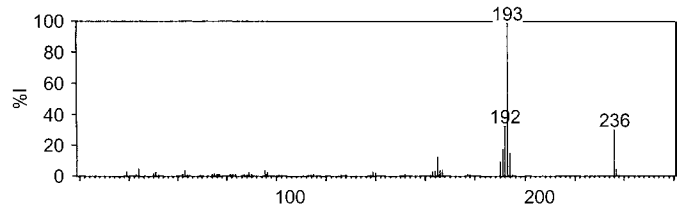
Chemical Properties A white or yellowish-white crystalline powder. Mp 189° to 193°. Practically insoluble in water and ether; soluble in alcohol, acetone, chloroform and propylene glycol, pK_a 7.0 [Martinavarro-Dominguez *et al.* 2002]. Log *P* (octanol/water), 2.45 [Martinavarro-Dominguez *et al.* 2002]. Extraction yield (chlorobutane), 0.95 [Demme *et al.* 2005].
Colour Test Dissolve the sample in 1 mL of chloroform, add 0.2 mL of sodium hypobromite solution and mix for 1 min—blue-violet (limit of detection, 250 mg/L).
Thin-layer Chromatography System TA—R_f 0.6; system TB—R_f 0.02; system TC—R_f 0.56; system TE—carbamazepine R_f 0.56, M (OH-) R_f 0.36; system TL—R_f 0.47; system TAE—carbamazepine R_f 0.79, M (OH-) R_f 0.79; system TAF—R_f 0.75; system TAJ—R_f 0.44; system TAK—R_f 0.64; system TAL—R_f 0.94 (acidified potassium permanganate solution, positive).
Gas Chromatography System GA—carbamazepine RI 2285, M (-Me) RI 1905, M (OH-)(methoxy-ring) RI 2340, M (OH-ring) RI 2240, M (epoxide) RI 2220, M (iminostilbene) RI 1998, M (acridine) RI 1800, M (formylacridine) RI 2025; system GB—carbamazepine RI 2435, M (iminostilbene) RI 2064, M (acridine) RI 1880, M (formylacridine) RI 2158, M (methylacridine) RI 2054, M (10,11-di-OH-) RI 2738; system GE—carbamazepine RRT 0.83 (relative to phenytoin); system GF—carbamazepine RI 2610, M (epoxide) RI 2560, M (iminostilbene) RI 2620; system GAJ—carbamazepine RRT 1.716, M (epoxide) RRT 1.188, M (iminostilbene) RRT 1.065 (all relative to methylphenobarbital).
High Performance Liquid Chromatography System HE—*k* 8.30; system HX—carbamazepine RI 418, M (10,11-di-OH-) RI 355; system HY—carbamazepine RI 368, M (epoxide) RI 336; system HZ—carbamazepine RT 3.5 min, M (epoxide) RT 1.9 min, M (10,11-di-OH-) RT 2.6 min; system HAA—carbamazepine RT 15.8 min; system HAX—carbamazepine RT 6.2 min; system HAY—carbamazepine RT 5.5 min; system HAZ—carbamazepine *k* 0.82, M (epoxide) *k* 0.38; system HAK—carbamazepine RT 4.7 min.
Ultraviolet Spectrum Methanol—237, 285 nm (A^1_1 = 490a).



Infrared Spectrum Principal peaks at wavenumbers 1678, 1594, 800, 769, 787, 1298 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 193, 192, 236, 191, 194, 165, 190, 237; carbamazepine-10,11-epoxide 180, 179, 178, 152, 44, 181, 223, 51; *trans*-10,11-dihydro-10,11-dihydroxycarbamazepine 180, 77, 181, 44, 179, 51, 209, 167.



Quantification
Blood **GC-MS** Column: Bond Elut Certify [Speed *et al.* 2000].

Plasma **GC** Thermionic detection. Limit of quantification, 50–200 μg/L [Queiroz *et al.* 2002]. Column: GP-2% SP-2510-DA on 100/120 mesh Supelcoport. Limit of detection, 1 mg/L [Riva *et al.* 1980].

HPLC Column: reversed phase monolithic. Mobile phase: 0.1 mol/L phosphate buffer (pH 6.5) : methanol : acetonitrile (77 : 20 : 3). UV detection (λ = 210 nm) [Heideloff *et al.* 2010]. Column: reversed phase C_{18}. Mobile phase: water : acetonitrile (78 : 22). UV detection (λ = 210 nm). Limit of quantification, 80 μg/L [Queiroz *et al.* 2008]. Column: Hisep (150 × 0.46 mm i.d., 5 μm). Mobile phase: acetonitrile : 0.1 mol/L ammonium acetate (12 : 88), flow rate 1.5 mL/min. UV detection (λ = 280 nm). Limit of detection, 0.5 mg/L [Ma *et al.* 2002], Column: C_8 reversed phase (150 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : methanol : phosphate buffer (pH 1.9). UV detection [Mandrioli *et al.* 2001]. Column: reversed phase C_8. Mobile phase: potassium dihydrogen phosphate (pH 2.5) : acetonitrile (67 : 33). UV detection (λ = 254 nm). Limit of quantification, 20 μg/L [Shimoyama *et al.* 2000].

Liver **GC-MS** See Blood [Speed *et al.* 2000].

Disposition in the Body Carbamazepine is slowly but almost completely absorbed after oral administration; bioavailability >70%. Metabolic reactions, catalysed by P450 isoforms CYP3A4 and CYP2C8, include epoxidation to form the 10,11-epoxide, which is active, followed by hydroxylation to *trans*-10,11-dihydro-10,11-dihydroxycarbamazepine; glucuronic acid conjugation also occurs. The rate of metabolism is higher in children than in adults and levels of the epoxide may be higher in children than in adults. Approximately 25% of a dose is excreted in the urine as the dihydroxy metabolite, together with 2% as the 10,11-epoxide and <10% as unchanged drug; other metabolites identified in the urine include carbamazepine-*N*-glucuronide, iminostilbene and several monohydroxy- and trihydroxycarbamazepine isomers. Approximately 30% of a dose is eliminated in the faeces. Carbamazepine crosses the placental barrier and is distributed into breast milk.

Therapeutic Concentration In plasma, usually in the range 4–12 mg/L.

Following single oral doses of 200 mg given to 9 subjects, peak plasma concentrations of 7.8–14 mg/L (mean 10) were attained in ~9 h [Anttila *et al.* 1979].

Steady-state plasma concentrations of 3–13 mg/L (mean 8) for carbamazepine and 0.6–5.7 mg/L (mean 3) for the epoxide metabolite were reported in 24 subjects receiving daily oral doses of 8–30 mg/kg [MacKichan *et al.* 1981].

Twenty-two children receiving long-term therapy with slow-release carbamazepine tablets (300 to 800 mg daily in 2 divided doses) had their treatment replaced with carbamazepine suppositories for 7 days (at an equivalent dosage; 375 to 1000 mg daily in 2 to 4 divided doses). Minimum to maximum plasma concentrations over 24 h were reported as follows: carbamazepine 20.4–33.1 μmol/L after slow-release tablets and 18.9–31.2 μmol/L after suppositories; 10,11-epoxy-carbamazepine 3.33–5.49 μmol/L after slow-release tablets and 3.11–4.90 μmol/L after suppositories [Arvidsson *et al.* 1995].

In a study involving 435 blood samples taken from 248 patients receiving carbamazepine therapy (dosage 2.86 to 37.50 mg/kg daily), steady-state plasma concentrations of 2.5–82.9 μmol/L (mean 22.3) carbamazepine, 0.85–16.9 μmol/L (mean 5.17) carbamzepine epoxide, and 0.77–36.4 μmol/L (mean 11.3) carbamazepine-diol were found [Svinarov, Pippenger 1996].

Toxicity The estimated minimum lethal dose is 5 g. Plasma concentrations of 2.4–10.5 mg/L (mean 6.0) have been associated with slight toxic effects and concentrations of 3.2–21 mg/L (mean 10) with severe toxicity.

A 15-year-old girl was admitted having taken at least 23 tablets of Tegretol (4.6 g) 6 h earlier. Her serum carbamazepine level was 190 μmol/L. Orogastric lavage was followed by activated charcoal. Within 20 h of admission, there was no improvement in her neurological status, so it was decided to perform plasmapheresis. The carbamazepine level immediately after the procedure was 101 μmol/L, and at the hours 36, 60 and 84 was 72, 33 and 20 μmol/L, respectively. The patient was discharged on the fourth day [Duzova *et al.* 2001].

In a massive overdose with controlled-release carbamazepine by a 31-year-old female, serum levels were 75 μmol/L on admission, fell to 66 μmol/L 22 h later (39 h post-ingestion), and rose to 196 μmol/L on day 4 despite treatment with activated charcoal and whole bowel irrigation. Benzodiazepines were also detected. At this time, coma and intermittent general seizures developed, so charcoal haemoperfusion was started and serum carbamazepine levels fell from 176 to 106 μmol/L after 1 h. Upon recovery the patient admitted ingesting 300 controlled-release carbamazepine (200 mg) tablets as well as diazepam, nitrazepam and alcohol [Graudins *et al.* 2002].

In a fatality involving overdose with carbamazepine, blood concentrations were reported as 47.7 mg/L 2 h before death and 53 mg/L 9 h after death [Spiller, Carlisle 2001].

In 28 cases of massive carbamazepine overdose, peak concentrations ranged from 78–285 μmol/L (18.4–67.4 mg/L). Serum levels of at least 170 μmol/L (40 mg/L) were associated with serious complications such as coma, seizures, respiratory failure and cardiac conduction defects. Two of the cases were fatalities [Hojer *et al.* 1993].

In a fatality attributed to carbamazepine and alcohol, postmortem kidney and liver concentrations of 306 μg/g and 173 μg/g, respectively, of carbamazepine were reported: the blood alcohol concentration was 1600 mg/L [Borkowski, Janowska 1983].

Half-life Plasma half-life, 18–65 h (mean 35) after single doses; reduced during chronic treatment to ~10–30 h for adults and 8–19 h for children.

Volume of Distribution ~1.4 L/kg.

Clearance Plasma clearance, ~1.3 mL/min/kg.

Distribution in Blood Plasma : whole blood ratio, ~1.6.

Saliva Plasma : saliva ratio, ~3–5.

Protein Binding Carbamazepine, ~75% and 10,11-epoxycarbamazepine, ~50%.

Note For reviews of the pharmacokinetics of carbamazepine see Bertilsson [1978] and Bertilsson, Tomson [1986].

Dose Initially 100 to 400 mg daily, increasing to 0.4 to 1.2 g daily; occasionally up to 2 g daily in epilepsy; in trigeminal neuralgia and bipolar disorder, up to 1.6 g daily.

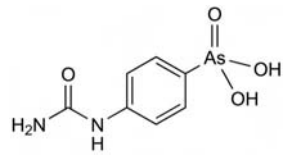
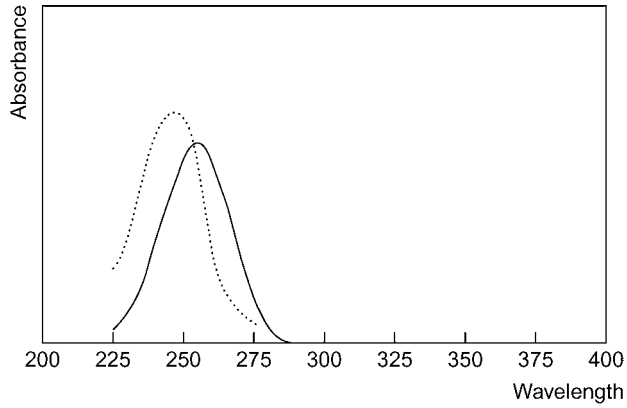
Carbarsone

Antiamoebic
$C_7H_9AsN_2O_4 = 260.1$
CAS—121-59-5

IUPAC Name [4-[(Aminocarbonyl)amino]phenyl]arsonic acid
Synonym Aminarsonum
Proprietary Names *Amabevan*; *Ameban*; *Carb-O-Sep*; *Fenarsone*; *Histocarb*; *Leucarsone*.



Chemical Properties A white powder. Mp 174°. Soluble 1 in 330 of water and 1 in 400 of ethanol; nearly insoluble in chloroform and ether; soluble in solutions of alkali hydroxides and carbonates. Log *P* (octanol/water), −1.2.
Ultraviolet Spectrum Aqueous acid—257 nm; aqueous alkali—248 nm.

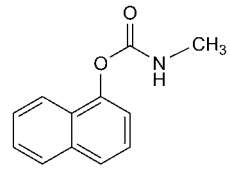


Infrared Spectrum Principal peaks at wavenumbers 1508, 1580, 1101, 903, 1681, 1248 cm^{-1}.
Dose 500 to 750 mg daily, for 10 days.

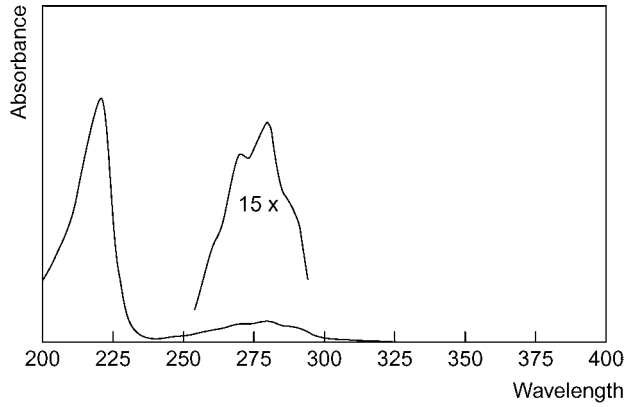
Carbaryl

Carbamate, Anticholinesterase, Insecticide, Parasiticide
$C_{12}H_{11}NO_2 = 201.2$
CAS—63-25-2

IUPAC Name Naphthalen-1-yl *N*-methylcarbamate
Synonyms Carbaril; 1-naphthalenol methylcarbamate.
Proprietary Names *Carylderm*; *Derbac* (shampoo); *Murvin*; *Sevin*; *Suleo-C*.



Chemical Properties A white crystalline solid. Mp 142°. Practically insoluble in water; soluble in most polar organic solvents. Log *P* (octanol/water) 2.4. Stock solutions in tetrohydrofuran were stable for >6 months when stored at –30° and for >3 months when stored at 4° in dark-coloured vials [Petropoulou *et al.* 2006].
Colour Tests Liebermann's reagent—black→green; Marquis test—green.
Thin-layer Chromatography System TAA—R_f 0.17; system TAB—R_f 0.12; system TAC—R_f 0.04; system TX—R_f 0.18; system TY—R_f 0.25; system TZ—R_f 0.68.
Gas Chromatography System GA—carbaryl RI 1865, carbaryl-TFA RI 1785, M (1-naphthol) RI 1490, M (1-naphthol)-AC RI 1555; system GK—M (1-naphthol) RT 0.47 relative to caffeine.
High Performance Liquid Chromatography System HAA—RT 18.0 min; system HY—RI 402.
Ultraviolet Spectrum Ethanol—279 nm ($A_1^1 = 310$b).



Infrared Spectrum Principal peaks at wavenumbers 1724, 1219, 1250, 1111, 781, 1265 cm^{-1}.

Mass Spectrum Principal ions at *m/z* 144, 115, 116, 57, 58, 63, 145, 89.

Quantification

Blood **GC-MS** Column: 5% diphenyl-dimethyl polysiloxane capillary (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 75° for 1.5 min to 135° at 15°/min to 138° at 2°/min to 175° at 10°/min for 1 min to 191° at 20°/min to 300° at 25°/min for 4.0 min. EI ionisation at 70 eV, positive ion mode, full scan mode. Retention time: 16.1 min. Limit of quantification, 0.5 µg/L; limit of detection, 0.1 µg/L [Petropoulou *et al.* 2006].

HPLC Column: Zorbax Cyano (250 × 4.6 mm i.d., 5 µm). Mobile phase: ethyl acetate : *iso*-octane (20 : 80), flow rate 1.0 mL/min. Refractive index detection. Relative retention time: 1.72 min. Limit of detection, 100 ng [Sharma *et al.* 1990]. Column: C_{18} reversed phase (5 mm i.d., 10 µm). Mobile phase: acetonitrile : water (37.5 : 62.5) containing 0.1% diethylamine (pH 7.0), flow rate 1.8 mL/min. UV detection (λ = 214 nm). Retention time: 2.85 min. Limit of detection, 1mg/L [Duck, Woolias 1985]. Column: Alltech C_8 (25 cm × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.13 mol/L phosphate buffer (pH 6.2; 2 : 3), flow rate 1.42 mL/min. Fluorescence detection (λ_{ex} = 285 nm, λ_{em} = 340 nm). Retention time: carbaryl 10.6 min, 1-naphthol 12.5 min, napropamide 30.0 min. Limit of detection, 40 µg/L [DeBerardinis, Wargin 1982].

Serum **GC** Column: DB-1701 intermediately fused silica capillary (15 m × 0.53 mm i.d., 1.5 µm). Temperature programme: 100° for 3 min to 200° at 8°/min. FID. Limit of detection not reported [Yamazaki *et al.* 2001].

GC-MS Column: DB-5 slightly polar fused silica capillary (15 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 70° to 250° at 20°/min for 20 min. EI ionisation. Limit of detection not reported [Yamazaki *et al.* 2001].

Urine **GC-MS** Column: AT-MS 5 5% diphenyl 95% dimethyl polysiloxane capillary (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 75° for 1.5 min to 135° at 15°/min for 2.0 min to 138° at 2°/min to 175° at 10°/min for 1.0 min to 191° at 20°/min to 300° at 25°/min for 4 min. EI ionisation. Limit of quantification, 1 µg/L, limit of detection, 0.2 µg/L [Petropoulou *et al.* 2006].

HPLC See Blood [Duck, Woolias 1985]. Column: C_{18} µBondapak reversed phase. Mobile phase: acetonitrile : water (30 : 40), flow rate 1 mL/min. UV detection (λ = 254 nm). *k*′: 10.5 min for 1-naphthol. Limit of detection not reported [Keiser *et al.* 1983].

Stomach **HPLC** See Blood [Duck, Woolias 1985].

Liver **HPLC** See Blood [Sharma *et al.* 1990]. See Blood [Duck, Woolias 1985].

Lung **HPLC** See Blood [Sharma *et al.* 1990].

Other **GC** Animal Blood, Brain and Liver. Column: 3% OV-17 on 80/100 mesh Chromosorb W-HP (180 cm × 2 mm i.d.). Carrier gas: N_2, 35 mL/min. Temperature: 180°. ECD. Limit of detection, 0.02 mg/L for blood, 0.1 mg/L for tissues [Mount, Oehme 1980].

HPLC Fruit. Column: C_{18} (150 × 4.6 mm i.d.). Mobile phase: water : tetrahydrofuran (100 : 0 to 30 : 70 in 20 min), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 330 nm, λ_{em} = 450 nm). Limit of detection not reported [Stuart *et al.* 1999]. Drinking Water. Column: Supelcosil LC_8 (25 cm × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water (30 : 70 for 5 min to 60 : 40 at 15 min for 10 min to 30 : 70 at 30 min for 5 min), flow rate, 1.5 mL/min. UV detection, 220 nm. Retention time: 17.35 min. Limit of detection, 10 ng/L [Marvin *et al.* 1990].

Disposition in the Body It is rapidly metabolised after acute exposure (although metabolism in humans is yet to be investigated). Hydrolysis would yield 1-naphthol whereas the low pH of gastric juice may lead to the production of *N*-nitrosocarbaryl [Kubacki, Kupryszewski 1980]. Metabolism is slower in women and older adults [Wiener, Young 1995].

Toxicity Repeated exposure may have effects similar to those of 'irreversible' organophosphate cholinesterase inhibitors. Neuropsychiatric sequelae may include aggression, memory loss, progressive muscle weakness and peripheral neuropathy. One case of depression after carbaryl exposure has been reported [Wiener, Young 1995].

A 47-year-old male died due to possible pesticide poisoning. Carbaryl was found in gastric contents at a concentration of 1.27 g/L and in serum at 8.1 mg/L. Propanil, ethylbenzene and xylene were also detected [Yamazaki *et al.* 2001].

A 17-year-old female accidentally drank a glass of carbaryl liquid. She presented with abdominal pain, constipation, pain, and weakness in her limbs. Two hours later she had nausea, vomiting and cramp-like abdominal pain. By the fourth day her limbs had become weak. She was diagnosed with porphyria and, despite supportive therapy, died of respiratory and circulatory failure [Sargin *et al.* 1992].

A 48-year-old female ingested an unknown quantity of carbaryl garden spray. Post-mortem concentrations of carbaryl were 6 mg/L and 12 and 2400 mg/kg in the blood, liver, and stomach, respectively. There were trace amounts in her urine [Duck, Woolias 1985].

Note For a review of the toxicology of carbaryl, see Cranmer [1986] and for a case of pontine myelinosis in a 4-year-old boy with carbamate poisoning, see Santinelli *et al.* [2006].

Carbazochrome

Haemostatic

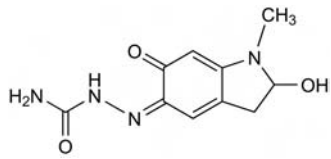
$C_{10}H_{12}N_4O_3$ = 236.2

CAS—69-81-8

IUPAC Name [(*Z*)-(3-Hydroxy-1-methyl-6-oxo-2,3-dihydroindol-5-ylidene) amino]urea

Synonym Adrenochrome monosemicarbazone; 5,6-dihydro-3-hydroxy-1-methylindoline-5,6-dione 5-semicarbazone.

Proprietary Names *Adrenoxyl*; *Cromosil*.



Chemical Properties An oxidation product of adrenaline. Yellowish-red or red crystals or crystalline powder. Mp about 222°, with decomposition. Very slightly soluble in water and ethanol; practically insoluble in ether.

Carbazochrome Salicylate

CAS—13051-01-9

IUPAC Name A complex of carbazochrome with sodium salicylate.

Proprietary Name *Adrenosem Salicylate*

Chemical Properties A fine, orange-red, crystalline powder. Mp 196° to 197.5°, with decomposition. Soluble in water and ethanol; practically insoluble in ether and chloroform.

Carbazochrome Sodium Sulfonate

$C_{10}H_{11}N_4NaO_5S$ = 322.3

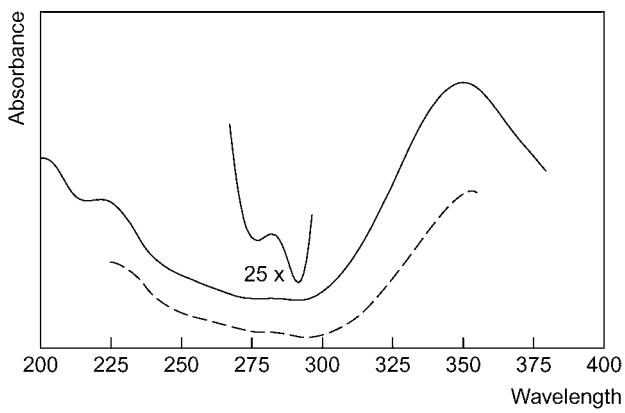
CAS—51460-26-5

Proprietary Names *Adona*; *Emex*.

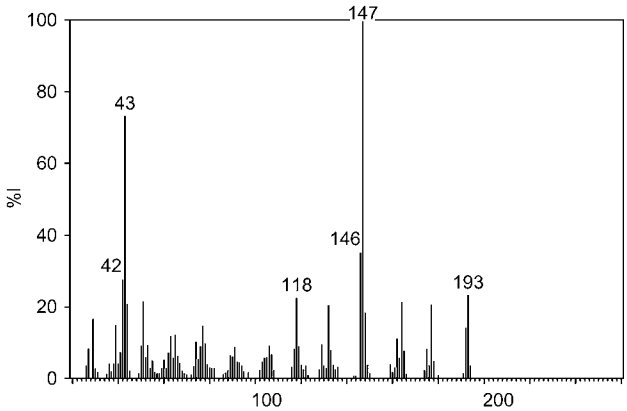
Chemical Properties Orange to yellow, fine, needle-like crystals. Mp 227° to 228°, with decomposition. Soluble 1 in 67 of cold water; slightly soluble in ethanol; practically insoluble in chloroform and ether.

Thin-layer Chromatography System TD—R_f 0.00; system TE—R_f 0.16; system TF—R_f 0.00; system TAD—R_f 0.10.

Ultraviolet Spectrum Methanol—356 nm (A_1^1=960b).



Mass Spectrum Principal ions at *m/z* 147, 43, 146, 42, 193, 118, 164, 44.

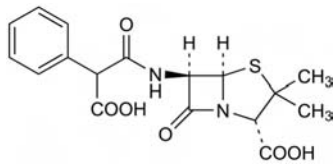


Dose The equivalent of 5 to 10 mg of carbazochrome has been given IM or orally.

Carbenicillin

Antibiotic
$C_{17}H_{18}N_2O_6S = 378.4$
CAS—4697-36-3

IUPAC Name (2*S*,5*R*,6*R*)-6-[(Carboxyphenylacetyl)amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid
Synonym α-Carboxybenzylpenicillin

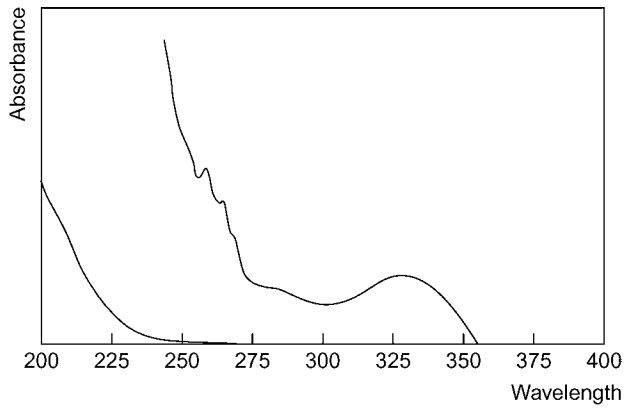


Chemical Properties pK_a 2.6, 2.7. Log *P* (octanol/water), 1.1.

Carbenicillin Sodium

$C_{17}H_{16}N_2Na_2O_6S = 422.4$
CAS—4800-94-6
Proprietary Names *Anabactyl*; *Carbapen*; *Fugacillin*; *Geopen*; *Microcillin*; *Pyopen*.
Chemical Properties A white, hygroscopic, crystalline powder. Soluble 1 in 1.2 of water and 1 in 25 of ethanol; practically insoluble in chloroform and ether.

Ultraviolet Spectrum Aqueous acid—259, 265, 327 nm.



Infrared Spectrum Principal peaks at wavenumbers 1612, 1754, 1315, 1123, 1030, 1000 cm^{-1}.

Quantification
Plasma **HPLC** Limit of detection, 10 mg/L [Ishida *et al.* 1994].
Serum **HPLC** UV detection (λ=208 nm). Limit of quantification, 0.25 mg/L [Naidong *et al.* 1994].
Urine **HPLC** See Plasma [Ishida *et al.* 1994].

Disposition in the Body
Therapeutic Concentration
Four healthy male volunteers aged 20 to 23 years were fasted overnight and administered 2 g of carbenicillin IV. The peak plasma concentrations of the drug were 88 mg/L for *R*-carbenicillin and 83 mg/L for *S*-carbenicillin ~30 min after dosing [Ishida *et al.* 1994].

Dose The equivalent of 20 to 30 g of carbenicillin daily, IV.

Ishida M *et al.* (1994). Determination of carbenicillin epimers in plasma and urine with high-performance liquid chromatography. *J Chromatogr B Biomed Sci Appl* 652(1): 43–49.

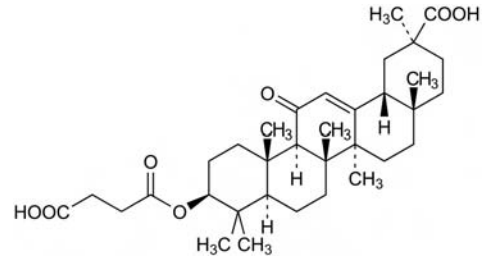
Carbenoxolone

Treatment of Peptic Ulcer
$C_{34}H_{50}O_7 = 570.8$
CAS—5697-56-3

IUPAC Name (2*S*,4*aS*,6*aR*,6*aS*,6*bR*,8*aR*,10*S*,12*aS*, 14*bR*)-10-(4-Hydroxy-4-oxobutanoyl)oxy-2,4*a*,6*a*,6*b*,9,9, 12*a*-heptamethyl-13-oxo-3,4,5,6,6*a*,7,8,8*a*,10,11,12, 14*b*-dodecahydro-1*H*-picene-2-carboxylic acid
Synonyms (3β,20β)-3-(3-Carboxy-1-oxopropoxy)-11-oxoolean-12-en-29-oic acid; glycerrhetic acid hydrogen succinate; glycyrrhetinic acid hydrogen succinate.

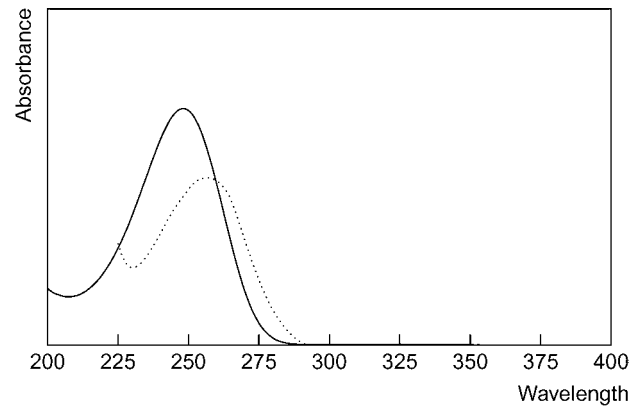


Chemical Properties Cream-coloured crystals. Mp 291° to 294°. pK_a 6.7, 7.1. Log *P* (octanol/water), 7.1.

Carbenoxolone Sodium

$C_{34}H_{48}Na_2O_7 = 614.7$
CAS—7421-40-1
Synonym Disodium enoxolone succinate
Proprietary Names *Biogastrone*; *Duogastrone*; *Gastrausil*; *Neogel*; *Ulcus-Tablinen*. It is an ingredient of *Pyrogastrone*.
Chemical Properties A white or pale cream-coloured hygroscopic powder. Soluble 1 in 6 of water and 1 in 30 of ethanol; insoluble in chloroform and ether.

Caution Carbenoxolone sodium powder is irritating to nasal membranes.
Colour Tests Antimony pentachloride—brown; naphthol–sulfuric acid—yellow-brown/orange; sulfuric acid—yellow; mix 5 mg with 50 mg of resorcinol and 2 mL of 80% v/v sulfuric acid, heat at 200° for 10 min, cool, and add to 200 mL of water; make just alkaline with sodium hydroxide solution—an intense green fluorescence is produced.
Thin-layer Chromatography System TD—R_f 0.07; system TE—R_f 0.00; system TF—R_f 0.17; system TAD—R_f 0.28 (acidified potassium permanganate solution, positive, faint).
High Performance Liquid Chromatography System HY—RI 824.
Ultraviolet Spectrum Carbenoxolone sodium: aqueous acid—248 nm; aqueous alkali—257 nm (A^1_1=172b).



Infrared Spectrum Principal peaks at wavenumbers 1562, 1642, 1715, 1289, 1261, 1210 cm^{-1} (carbenoxolone sodium, KBr disk).

Quantification
Serum **GC** FID. Limit of detection, 5 mg/L [Rhodes, Wright 1974].
Radioimmunoassay Limit of detection, 1 µg/L [Peskar *et al.* 1976].

Disposition in the Body Carbenoxolone is rapidly and almost completely absorbed after oral administration; absorption is reduced at gastric pH levels above 2 and delayed after food. It is almost entirely eliminated in the faeces via the bile, <5% being excreted in the urine. Carbenoxolone is excreted mainly as the glucuronide conjugate together with small amounts as the sulfate conjugate of β-glycyrrhetic acid (enoxolone).

Therapeutic Concentration

After a single oral dose of 200 mg to 10 subjects, peak blood concentrations of 13 to 35 (mean 24) mg/L were attained in 1 to 2 h, followed by a second peak of 3 to 32 (mean 20) mg/L at 3 to 6 h; in some subjects, the second peak was higher than the first [Downer *et al.* 1970].

Following oral administration of 100 mg to 3 fasting subjects, peak serum concentrations of 15 to 20 mg/L were attained in 1 to 2 h; following administration of 100 mg to 2 subjects after meals, peak serum concentrations of 8 to 9 mg/L were reported at 5 to 6 h.

After oral doses of 100 mg three times a day to 9 subjects, serum concentrations of 20 to 98 (mean 49) mg/L were reported on the eighth day [Baron *et al.* 1975].

Half-life Plasma half-life 8 to 20 (mean 13) h, increased in elderly subjects.
Volume of Distribution About 0.1 L/kg.
Protein Binding >99%.
Note For a review of carbenoxolone, see Pinder *et al.* [1976].
Dose 150 to 300 mg of carbenoxolone sodium daily.

Baron JH *et al.* (1975). Factors affecting the Absorption of Carbenoxolone in Patients with Peptic Ulcer. In: Jones FA, Parke DV, eds. *4th Symposium on Carbenoxolone.* London: Butterworths, 115–124

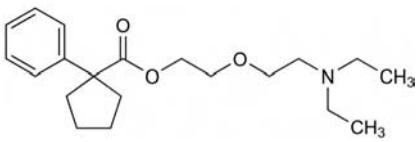
Carbetapentane

Cough Suppressant
$C_{20}H_{31}NO_3$ = 333.5
CAS—77-23-6

IUPAC Name 2-(Diethylaminoethoxy)ethyl 1-phenylcyclopentanecarboxylate
Synonym Pentoxyverine

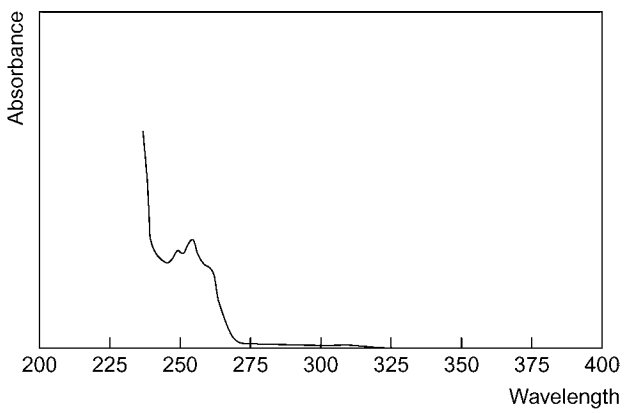


Chemical Properties Log *P* (octanol/water), 4.2.

Carbetapentane Citrate

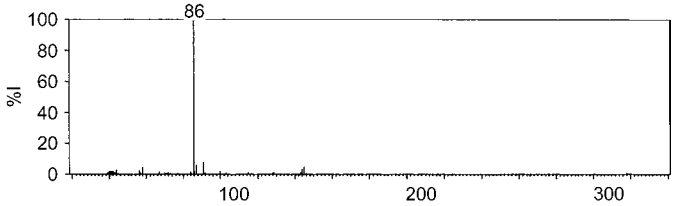
$C_{20}H_{31}NO_3$, $C_6H_8O_7$ = 525.6
CAS—23142-01-0
Proprietary Names *Atussil*; *Germapect*; *Sedotussin*; *Toclase*; *Tuclase*; *Tussa-Tablinen*.
Chemical Properties A white crystalline powder. Mp 93°. Freely soluble in water and chloroform; soluble in ethanol, acetone and ethyl acetate; practically insoluble in ether and in benzene.

Colour Tests Liebermann's reagent—red-orange; Mandelin's test—brown (slow); Marquis test—orange (slow).
Thin-layer Chromatography System TA—R_f 0.48; system TB—R_f 0.48; system T—R_f 0.22 (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, brown).
Gas Chromatography System GA—RI 2232; system GF—RI 2455.
Ultraviolet Spectrum Aqueous acid—252, 258 (A^1_1=6.1a), 264 nm. No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1725, 1120, 1158, 1176, 694, 1234 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 86, 91, 87, 145, 58, 144, 30, 44.

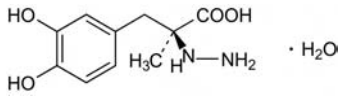


Dose 25 to 150 mg of carbetapentane citrate daily.

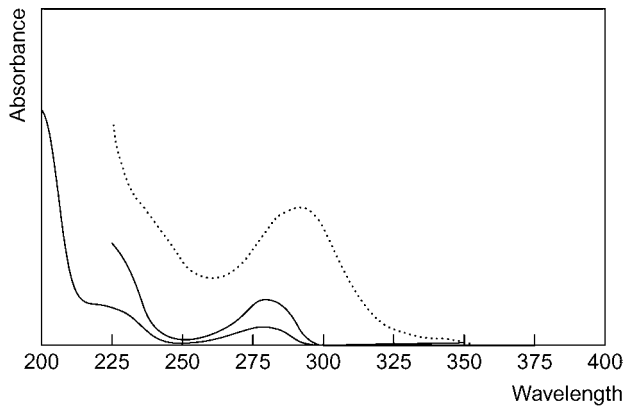
Carbidopa

Dopa-Decarboxylase Inhibitor
$C_{10}H_{14}N_2O_4$, H_2O = 244.2
CAS—28860-95-9 (anhydrous); 38821-49-7 (monohydrate)

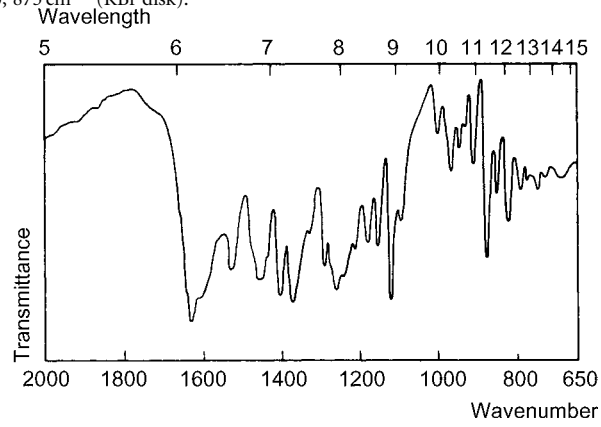
IUPAC Name (2*S*)-3-(3,4-Dihydroxyphenyl)-2-hydrazinyl-2-methylpropanoic acid hydrate
Synonyms HMD; (α*S*)-α-hydrazino-3,4-dihydroxy-α-methylbenzenepropanoic acid monohydrate; (−)-L-α-Methyldopa hydrazine; Mk-486.
Proprietary Name It is an ingredient of *Sinemet*.



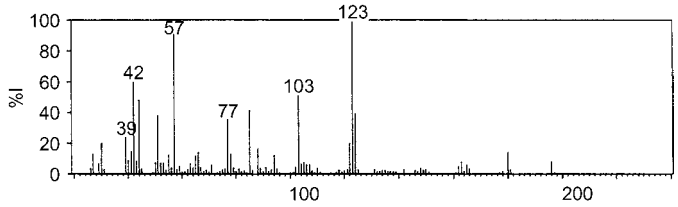
Chemical Properties A white or creamy-white powder. Mp 203° to 205°, with decomposition. Soluble 1 in 500 of water; practically insoluble in ethanol, chloroform, and ether; freely soluble in 3 mol/L hydrochloric acid. Log *P* (octanol/water), −0.1. Extraction yield (chlorobutane), 0 [Demme *et al.* 2005].
Colour Tests Ammoniacal silver nitrate (on warming) —silver mirror; ferric chloride—brown; Folin-Ciocalteu reagent—blue; Liebermann's reagent—black; Marquis test—brown; methanolic potassium hydroxide—orange; Millon's reagent (cold)—orange; Nessler's reagent—orange→black; palladium chloride—orange→brown; potassium dichromate (method 1)—red.
Thin-layer Chromatography System TD—R_f 0.00; system TE—R_f 0.00; system TF—R_f 0.02; system TAD—R_f 0.04.
Gas Chromatography System GA—carbidopa, not eluted; carbidopa-Me_2 RI 1660.
High Performance Liquid Chromatography System HY—RI 190.
Ultraviolet Spectrum Methanolic acid—282 nm (A^1_1=130a); aqueous alkali—291 nm.



Infrared Spectrum Principal peaks at wavenumbers 1625, 1121, 1260, 1525, 1290, 875 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 123, 57, 42, 103, 44, 85, 124, 51.



Quantification

Plasma **HPLC** Electrochemical detection. Limit of detection, 8 µg/L [Sagar, Smyth 2000]. Electrochemical detection. See Lucarelli *et al.* [1990]. Electrochemical detection. See Titus *et al.* [1990]. Electrochemical detection. Limit of detection, 15 µg/L [Nissinen, Taskinen 1982].

Urine **HPLC** See Plasma Titus *et al.* [1990].

Disposition in the Body Readily but incompletely absorbed after oral administration. About 50% of an oral dose is excreted in the urine in 48 h and 47% is eliminated in the faeces. Of the urinary material, about 30% is unchanged drug, 10 to 14% is 2-(4-hydroxy-3-methoxybenzyl)propionic acid, 10% is 2-(3,4-dihydroxybenzyl)propionic acid, 5% is 3,4-dihydroxyphenylacetone and 10% is 2-(3-hydroxybenzyl)propionic acid. The metabolites are excreted mainly as glucuronide conjugates.

Therapeutic Concentration

Following an oral dose of 50 mg to 10 subjects, a mean peak plasma concentration of 0.2 mg/L was attained in 2 to 4 h [Vickers *et al.* 1974].

Half-life Plasma half-life, about 2 h.

Protein Binding About 36%.

Note For a review of the pharmacokinetics of carbidopa, see Pinder *et al.* [1976].

Dose Usually the equivalent of 75 to 150 mg of anhydrous carbidopa daily, given in combination with levodopa.

Carbimazole

Antithyroid Agent

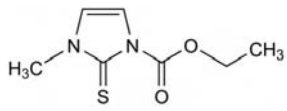
$C_7H_{10}N_2O_2S$ = 186.2

CAS—22232-54-8

IUPAC Name Ethyl 3-methyl-2-sulfanylideneimidazole-1-carboxylate

Synonym 2,3-Dihydro-3-methyl-2-thioxo-1*H*-imidazole-1-carboxylic acid ethyl ester

Proprietary Names *Carbazole*; *Carbotiroid*; *Neo-Mercazole*; *Neo-Morphazole*; *Neo-Thyreostat*; *Neo-Tireol.*



Chemical Properties A white or creamy-white crystalline powder. Mp 122° to 125°. Soluble 1 in 500 of water, 1 in 50 of ethanol, 1 in 17 of acetone, 1 in 3 of chloroform and 1 in 330 of ether. Log *P* (octanol/water), 0.5.

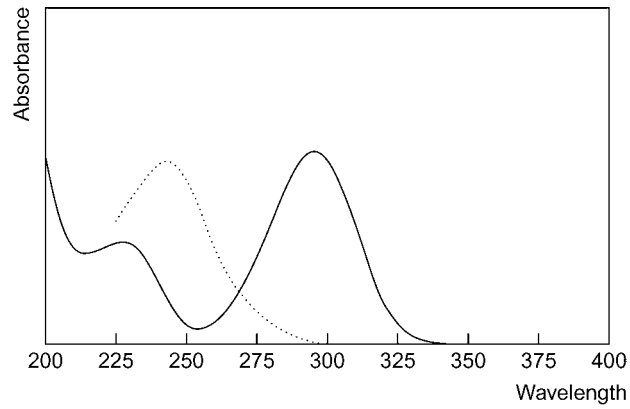
Colour Tests Palladium chloride—orange; to a small quantity add 1 drop of iodobismuthous acid solution—red.

Thin-layer Chromatography System TA—R_f 0.72; system TB—R_f 0.01; system TD—R_f 0.63; system TE—R_f 0.42; system TF—R_f 0.47; system TAD—R_f 0.68; system TAE—R_f 0.75; system TAF—R_f 0.75 (acidified iodoplatinate solution, positive; acidified potassium permanganate solution, positive).

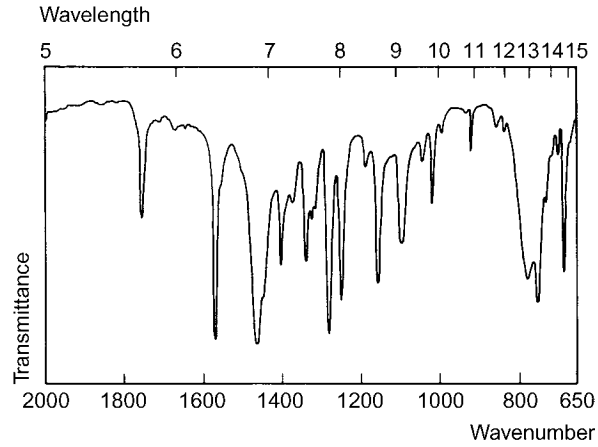
Gas Chromatography System GA—carbimazole RI 1678, thiamazole RI 1550.

High Performance Liquid Chromatography System HX—RI 318; system HAA—retention time 11.1 min.

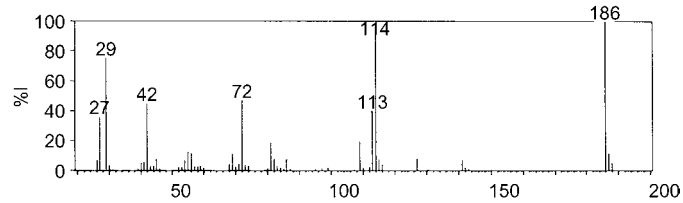
Ultraviolet Spectrum Aqueous acid—291 nm (A_1^1=557a); aqueous alkali—244 nm.



Infrared Spectrum Principal peaks at wavenumbers 1574, 1275, 740, 1246, 1150, 767 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 186, 114, 29, 72, 42, 113, 27, 109; thiamazole 114, 42, 72, 113, 69, 81, 54, 115.



Quantification

Plasma **GC** AFID. Limit of detection, 30 µg/L for thiamazole [Bending, Stevenson 1978].

GC–MS Limit of detection, 2 µg/L for thiamazole [Floberg *et al.* 1980].

HPLC Absorbance detection at 405 nm. Limit of detection, 5 µg/L for thiamazole [Meulemans *et al.* 1980].

Disposition in the Body Carbimazole is rapidly and almost completely absorbed after oral administration and converted to the active metabolite thiamazole. It is almost completely excreted in the urine in 24 h as metabolites; 3-methyl-2-thiohydantoin has been identified as a minor metabolite in urine and plasma. About 3% of a dose is eliminated in the faeces.

Therapeutic Concentration

After an oral dose of 60 mg, given to 11 subjects, peak serum concentrations of thiamazole of 0.5 to 3.4 (mean 0.9) mg/L were attained in about 0.7 to 3 h [Melander *et al.* 1980].

Half-life Plasma half-life, thiamazole about 3 to 5 h.

Volume of Distribution Thiamazole, about 0.5 L/kg.

Protein Binding Thiamazole, not significantly bound.

Note For a review of the pharmacokinetics of antithyroid drugs, see Kampmann and Hansen [1981].

Dose Initially 30 to 60 mg daily; maintenance, 5 to 20 mg daily.

Bending MR, Stevenson D (1978). Measurement of methimazole in human plasma using gas-liquid chromatography. *J Chromatogr* 154: 267–271.

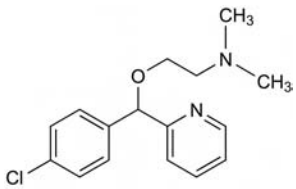
Carbinoxamine

Antihistamine
$C_{16}H_{19}ClN_2O = 290.8$
CAS—486-16-8

IUPAC Name 2-[(4-Chlorophenyl)-2-pyridinylmethoxy]-*N*,*N*-dimethylethanamine
Synonym Paracarbinoxamine

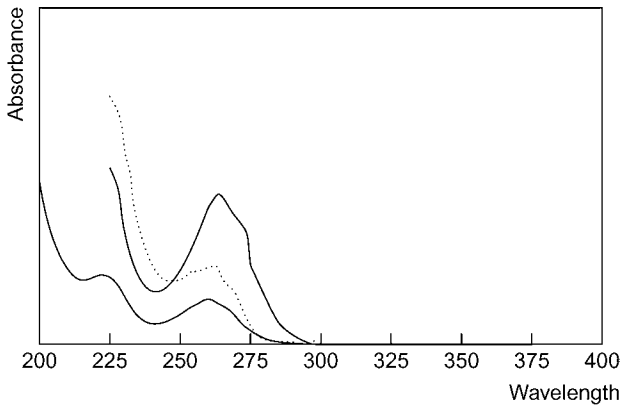


Chemical Properties A liquid. pK_a 8.1 (25°). Log *P* (octanol/water), 2.6.

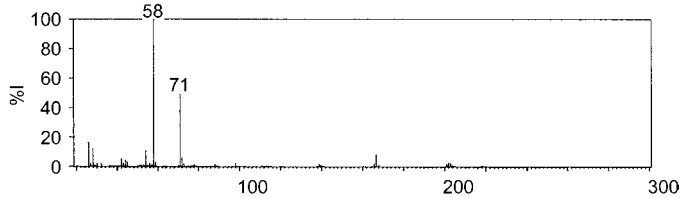
Carbinoxamine Maleate

$C_{16}H_{19}ClN_2O$, $C_4H_4O_4 = 406.9$
CAS—3505-38-2
Proprietary Names *Allergefon*; *Clistin*; *Histex*; *Ziriton*. It is an ingredient of *Davenol*, *Extil*, and *Rondec*.
Chemical Properties A white crystalline powder. Mp 117° to 119°. Soluble 1 in less than 1 of water, 1 in 1.5 of ethanol, and 1 in 1.5 of chloroform; very slightly soluble in ether.

Colour Test Cyanogen bromide—orange-pink.
Thin-layer Chromatography System TA—R_f 0.48; system TB—R_f 0.26; system TC—R_f 0.19; system TE—R_f 0.50; system TL—R_f 0.04; system TAE—R_f 0.13; system TAF—R_f 0.16; system TAJ—R_f 0.04; system TAK—R_f 0.00; system TAL—R_f 0.27 (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, pink).
Gas Chromatography System GA—carbinoxamine RI 2080, M (chlorobenzoylpyridine) RI 1645, M (carbinol) RI 1670, M (nor-) RI 2150; system GB—RI 2147; system GC—RI 2430.
High Performance Liquid Chromatography System HA—*k* 4.7 (tailing peak); system HX—RI 359; system HAA—retention time 12.8 min.
Ultraviolet Spectrum Aqueous acid—263 nm (A^1_1=323a); aqueous alkali—261 nm (A^1_1=181a).



Infrared Spectrum Principal peaks at wavenumbers 1084, 1110, 1584, 1041, 763, 1010 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 58, 71, 26, 54, 167, 72, 42, 44.



Quantification
Plasma **GC** AFID. Limit of detection, 200 ng/L [Hoffman *et al.* 1983].

HPLC Coulometric detection. Limit of quantification, 2 µg/L, limit of detection, 0.5 µg/L [Stockis *et al.* 1995]. Coulometric detection. For method see Stockis *et al.* [1992].

Disposition in the Body
Therapeutic Concentration Twenty healthy males and females (20 to 42 years) were administered a single medication containing 20 mg phenylephrine and 4 mg carbinoxamine maleate. The peak plasma carbinoxamine concentration was 6.5 µg/L, 2 to 6 h after dosing for a single dose and a steady state concentration of 13.5 µg/L, approximately 4.8 h after dosing was observed over a 4-day dosing period [Stockis *et al.* 1995].
Dose 12 to 32 mg of carbinoxamine maleate daily.

Hoffman DJ *et al.* (1983). Capillary GLC assay for carbinoxamine and hydrocodone in human serum using nitrogen-sensitive detection. *J Pharm Sci* 72: 1342–1344.

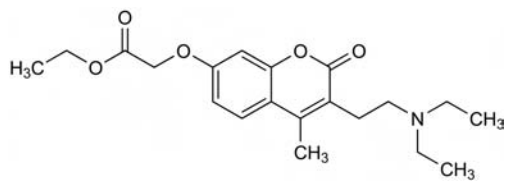
Carbocromen

Antianginal Vasodilator
$C_{20}H_{27}NO_5 = 361.4$
CAS—804-10-4

IUPAC Name Ethyl 2-[3-(2-diethylaminoethyl)-4-methyl-2-oxochromen-7-yl] oxyacetate
Synonyms Chromonar; [[3-[2-(diethylamino)ethyl]-4-methyl-2-oxo-2*H*-1-benzopyran-7-yl]oxy]-acetic acid ethyl ester.

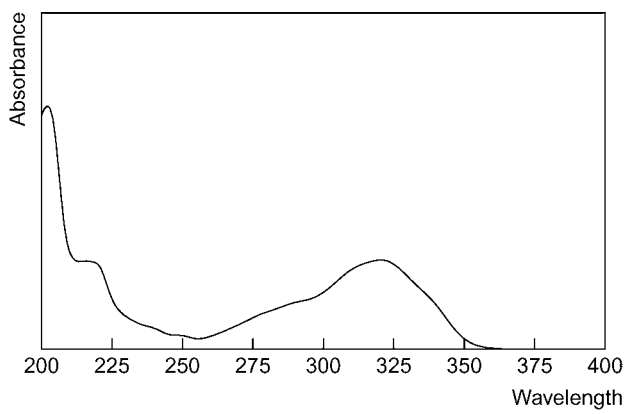


Chemical Properties Practically insoluble in water; soluble in chloroform and ether. Log *P* (octanol/water), 3.4.

Carbocromen Hydrochloride

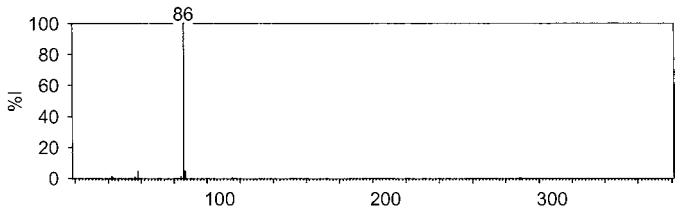
$C_{20}H_{27}NO_5$, HCl = 397.9
CAS—655-35-6
Synonym Cassella 4489
Proprietary Name *Intensain*
Chemical Properties A white crystalline powder. Mp 159° to 160°. Freely soluble in water, ethanol, methylene chloride, and chloroform; sparingly soluble in acetone, benzene, and ether.

Colour Tests Aromaticity (method 2)—yellow/orange; Liebermann's reagent (100°)—blue (3 min); sulfuric acid—violet (blue fluorescence at 350 nm).
Thin-layer Chromatography System TA—R_f 0.48; system TB—R_f 0.17; system TC—R_f 0.24; system TE—R_f 0.62; system TL—R_f 0.12; system TAE—R_f 0.18 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2835.
Ultraviolet Spectrum Aqueous acid—202, 216, 321 nm (A^1_1=527a).



Infrared Spectrum Principal peaks at wavenumbers 1708, 1608, 1210, 1755, 1178, 1085 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 86, 87, 58, 30, 29, 84, 56, 42.

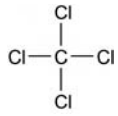


Quantification
Plasma **Spectrofluorimetry** Limit of detection, 40 µg/L [Martin, Wiegand 1970].
Urine **Spectrofluorimetry** See Plasma [Martin, Wiegand 1970].
Disposition in the Body Incompletely absorbed after oral administration (about 35%); rapidly hydrolysed to the corresponding carboxylic acid. About 70% of an IV dose and 20% of an oral dose are excreted in the 24-h urine as the carboxylic acid metabolite.
Therapeutic Concentration
Following oral administration of 150 mg three times a day to 6 subjects, a peak plasma concentration of 0.9 mg/L of the carboxylic acid metabolite was reported, declining to 0.06 mg/L, 10 h after the last dose [Martin, Wiegand 1970].
Half-life Plasma half-life, carboxylic acid metabolite about 0.8 h.
Volume of Distribution Carboxylic acid metabolite, about 0.4 L/kg.
Dose Carbocromen hydrochloride has been given in doses of 225 to 675 mg daily.

Martin YC, Wiegand RG (1970). Metabolism and excretion of chromonar and its metabolite in dog and man. *J Pharm Sci* 59: 1313–1318.

Carbon Tetrachloride

Anthelmintic (Veterinary), Solvent
CCl_4 = 153.8
CAS—56-23-5
IUPAC Name Tetrachloromethane
Synonyms Carboneum tetrachloratum medicinale; methane tetrachloride; perchloromethane; tetrachlorocarbon; tetracloruro de carbono.



Chemical Properties A heavy, clear, colourless, volatile liquid, with a chloroform-like odour. It is non-inflammable, but in contact with a flame it decomposes and gives rise to toxic products (phosgene, carbon dioxide and hydrochloric acid), which have an acrid odour. Weight per millilitre, 1.592–1.595 g. Bp 76° to 78°. Refractive index 1.4607. Soluble 1 in 2000 water; miscible with dehydrated alcohol, benzene, chloroform and ether. Log *P* (octanol), 2.8.
Colour Test Fujiwara test—red.
Gas Chromatography System GA—RI 1000; system GI—RT 8.6 min; system GAA—RI 661.
Mass Spectrum Principal ions at *m/z* 117, 119, 47, 35, 121, 82, 84, 49.
Quantification
Blood **GC** Column: Carbowax 20 M on Carbopak P 60/80 mesh (2 m × 2 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature: 90°. FID. Limit of detection, 50 mg/L [Tombolini, Cingolani 1996]. Column: 2.5% OV 17 silicone on Chromosorb G 80/100 mesh (6 ft × 1/8 in i.d.). Carrier gas: N_2, 30 mL/min. Temperature: 150°. FID. Limit of detectin, 2 µg/L [Goldermann *et al.* 1983]. Column: 20% Supelco SP-2100 plus 0.1% Carbowax 1500 on Supelcoport 80/100 mesh (3.0 m × 2.0 mm i.d.). Carrier gas: N_2, 20 mL/min. Temperature: 95°. FID. Spleen **GC** See Blood [Tombolini, Cingolani 1996].
Disposition in the Body Carbon tetrachloride is readily absorbed after inhalation and also absorbed after ingestion or through the skin; the rate of absorption is increased by the concomitant ingestion of alcohol. It is excreted mainly from the lungs as carbon tetrachloride and carbon dioxide; it is excreted in urine as urea and an unidentified metabolite, and is eliminated in faeces.
Toxicity The minimum lethal dose is 3–5 mL, but recoveries have occurred following ingestion of 30–40 mL. Carbon tetrachloride injures almost all cells of the body including those of the blood, CNS, liver and kidney; the kidneys and liver of those who have died often show marked fatty degeneration. The maximum permissible atmospheric concentration is 10 ppm. Inhalation of concentrations of 1000 ppm, even for short periods, may cause acute toxic reactions. Continued exposure to concentrations of approx. 100 ppm may give rise to chronic poisoning. When carbon tetrachloride is ingested together or immediately after alcohol, its toxicity, particularly nephrotoxicity, is greatly increased. Toxic effects are associated with blood concentrations of 20–50 mg/L and a postmortem blood concentration of 260 mg/L has been reported in one fatality.
A 75-year-old man died in hospital after ingesting an unknown amount of carbon tetrachloride. Concentrations were 328.5 mg/L in urine, 169.8 mg/L in bile, 143.4 mg/L in systemic venous blood, 57.5 mg/L in arterial blood and 170.5 mg/L in vitreous humour. In tissues, the concentrations were 657.9 mg/kg in pancreas, 243 mg/kg in brain, 237.3 mg/kg in testis, 127.3 mg/kg in lungs, 150.5 mg/kg in kidneys, 71.1 mg/kg in muscle, 78.5 mg/kg in myocardium, 68.3 mg/kg in spleen and 58.6 mg/kg in liver [Tombolini, Cingolani 1996].
The following postmortem tissue concentrations were reported in a fatality caused by inhalation of carbon tetrachloride: blood 18 mg/L, brain 175 µg/g, lung 12.5 µg/g [Franc 1983].
A 36-year-old man drank 50 mL of carbon tetrachloride. At the beginning of hyperventilation therapy blood concentrations were 120 µg/L. These levels fell to 30 µg/L within 6 days but the patient died from pneumonia 39 days after admission [Goldermann *et al.* 1983].
A 61-year-old man ingested a large amount of carbon tetrachloride, well in excess of the adult lethal dose. He was treated and survived with relatively mild clinical and biochemical evidence of toxicity [Mathieson *et al.* 1985].
A middle-aged alcoholic ingested ~30 mL carbon tetrachloride under the impression that it was alcohol. He was seriously ill but recovered. On his admission to hospital, his serum concentration of carbon tetrachloride was 20 mg/L. The first 24-h urine collection contained 8 mg/L and the first peritoneal dialysate contained 1 mg/L of carbon tetrachloride [SL Tompsett, personal communication 1967].
The following postmortem tissue concentrations were reported in a fatality caused by inhalation of carbon tetrachloride: kidney 32 µg/g, liver 142 µg/g, lung 39 µg/g, muscle 46 µg/g [Korenke, Pribilla 1969].

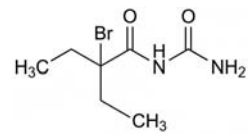
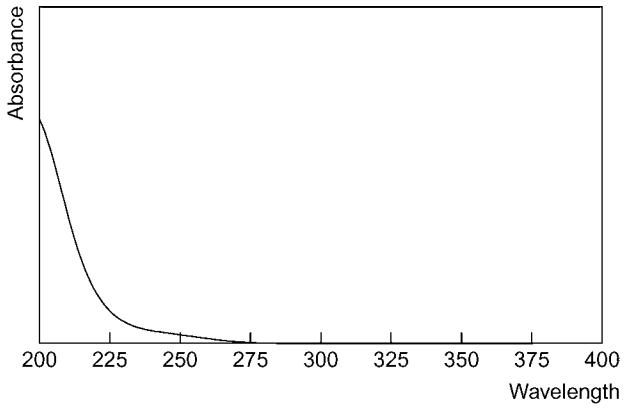
Carbromal

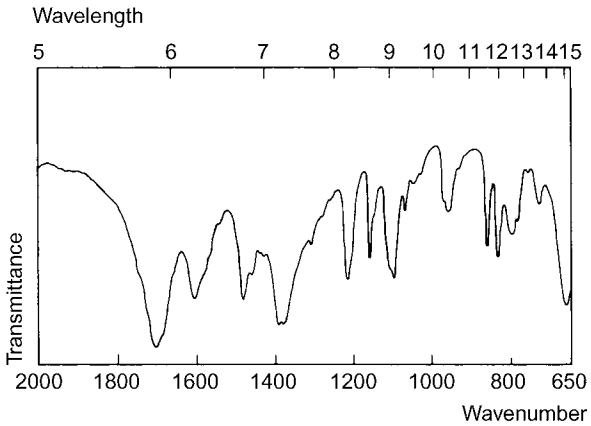
Hypnotic
$C_7H_{13}BrN_2O_2$ = 237.1
CAS—77-65-6
IUPAC Name 2-Bromo-N-carbamoyl-2-ethylbutanamide
Synonyms *N*-(Aminocarbonyl)-2-bromo-2-ethylbutanamide; bromadal; bromodiethylacetylurea; karbromal; uradal.
Proprietary Names *Adalin*; *Mirfudorm*.



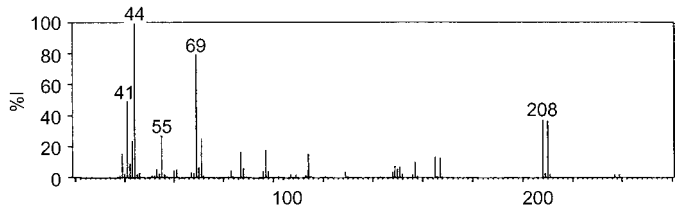
Chemical Properties A white crystalline powder. Mp 116° to 119°. Soluble 1 in 3000 of water, 1 in 18 of ethanol, 1 in 3 of chloroform and 1 in 14 of ether. Log *P* (octanol/water), 1.5.
Colour Test Nessler's reagent—brown-orange.
Thin-layer Chromatography System TB—R_f 0.12; system TD—R_f 0.53; system TE—R_f 0.75; system TF—R_f 0.55; system TAD—R_f 0.64; system TAE—R_f 0.85; system TAF—R_f 0.87 (fluorescein solution, pink).
Gas Chromatography System GA—carbromal RI 1513, M (carbromide) RI 1215, M (OH-carbromide) RI 1340, M (desbromo-) RI 1380, carbromal-Art RI 1450.
High Performance Liquid Chromatography System HX—RI 410; system HY—RI 377; system HZ—retention time 3.9 min.
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.



Infrared Spectrum Principal peaks at wavenumbers 1694, 660, 1600, 1094, 1212, 834 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 44, 69, 41, 208, 210, 55, 71, 43; 2-bromo-2-ethylbutyramide 69, 43, 41, 44, 71, 167, 165, 55; 2-bromo-2-ethyl-3-hydroxybutyramide 150, 152, 165, 41, 167, 43, 44, 130; 2-ethylbutyrylurea 45, 130, 44, 71, 42, 61, 115, 55.



Quantification

Blood **GC** FID. For determination of inorganic bromide, see Wells, Cimbura [1973].

Plasma **HPLC** UV detection. Carbromal, 2-bromo-2-ethylbutyramide and 2-ethylbutyrylurea. Limit of detection, 200 µg/L for carbromal [Eichelbaum *et al.* 1978].

Disposition in the Body Carbromal is readily absorbed after oral administration. The major metabolite is free bromide ion; hydrolysis to an active metabolite, 2-bromo-2-ethylbutyramide, also occurs followed by oxidation to 2-bromo-2-ethyl-3-hydroxybutyramide; other metabolites include 2-ethylbutyrylurea and 2-ethyl-2-hydroxybutyric acid. Carbromal is excreted in the urine mainly as bromide ion and partly as 2-ethyl-2-hydroxybutyric acid, with very little as unchanged drug. Peak bromide excretion is attained after about 48 h.

Therapeutic Concentration

Following a single oral dose of 1 g given to 4 subjects, mean peak serum concentrations of about 6 mg/L of carbromal and 3 mg/L of 2-bromo-2-ethylbutyramide were attained in 0.5 and 4 h respectively; the total bromide concentration reached about 12 mg/L in 9 h and was still increasing [Vohland *et al.* 1976].

Toxicity Fatalities have occurred in adults following the ingestion of 10 to 25 g but they are rare. Long-term use of carbromal may give rise to symptoms of chronic toxicity resembling bromism. Toxic effects are associated with serum-bromide concentrations of 300 to **1200** to 3200 mg/L.

In 11 fatalities attributed to carbromal overdose, the following post-mortem tissue concentrations, mg/L or µg/g (mean, *N*), were reported

	Carbromal	*Bromoethylbutyramide*
Blood	19.9–26.1 (23, 3)	0.2–27.2 (15, 10)
Brain	0.6–120.9 (45, 8)	23.3–118.4 (66, 11)
Kidney	0.4–13 (6, 4)	16.1–79.6 (45, 9)
Liver	1.1–2.8 (2.3, 4)	1.75–50.5 (14, 9)
Urine	0.85–47.4 (24, 5)	2.5–36.9 (23, 8)

Total bromide concentrations in the blood ranged from 145 to 1898 (mean 536) mg/L [Kaferstein, Sticht 1978].

Post-mortem serum-carbromal concentrations of 158 and 71 mg/L were found in 2 fatalities resulting from acute intoxication [Gruska *et al.* 1970 and [Gruska *et al.* 1971].

Half-life Plasma half-life, carbromal 7 to 15 h, bromide about 15 days.

Dose 0.3 to 1 g, as a hypnotic.

Carbutamide

Antidiabetic

$C_{11}H_{17}N_3O_3S = 271.3$

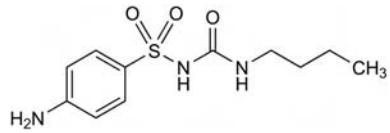
CAS—339-43-5

IUPAC Name 1-(4-Aminophenyl)sulfonyl-3-butylurea

Synonyms 4-Amino-*N*-[(butylamino)carbonyl]benzenesulfonamide; BZ-55; glybutamide; U-6987.

Proprietary Names *Diabetoplex*; *Dia-Tablinen*; *Glucidoral*; *Insoral*; *Invenol*; *Nadisan*.

Note *Insoral* is also used as a proprietary name for phenformin hydrochloride.

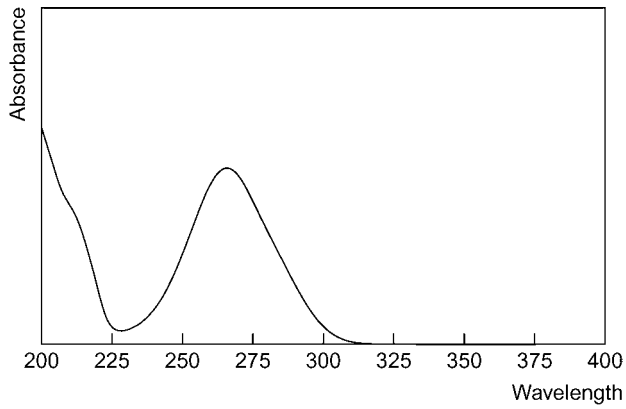


Chemical Properties A white finely crystalline powder. M.p. 144° to 145°. Soluble in water at pH 5–8. Practically insoluble in chloroform, and ether; soluble in ethanol and acetone. pK_a 6.0 (20°). Log *P* (octanol/water), 1.0.

Thin-layer Chromatography System TA—R_f 0.78; system TT—R_f 0.90; system TU—R_f 0.27; system TV—R_f 0.07; system TAE—R_f 0.87.

High Performance Liquid Chromatography System HY—RI 321; system HAA—retention time 14.5 min.

Ultraviolet Spectrum Aqueous acid—266 nm (A^1_1=149a); aqueous alkali—255 nm (A^1_1=616a).



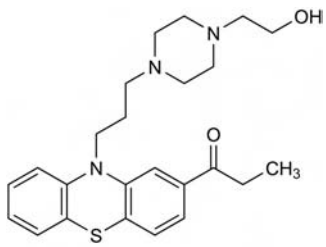
Infrared Spectrum Principal peaks at wavenumbers 1661, 1147, 1599, 1089, 1635, 1310 cm^{-1} (KBr disk).

Quantification
Serum **HPLC** UV detection. See Saffar *et al.* [1982].
Disposition in the Body Absorbed after oral administration. It is excreted in the urine mainly as the acetyl derivative.
Therapeutic Concentration
Following an oral dose of 250 mg to 5 subjects, a mean peak serum concentration of 48.8 mg/L was reported at 2.6 h [Saffar *et al.* 1982].
Half-life Plasma half-life, about 24 h.
Dose Carbutamide has been given in doses of 0.5 to 1 g daily.

Saffar F *et al.* (1982). Biopharmaceutical studies on the clinical inequivalence of two carbutamide tablets. *Chem Pharm Bull* 30: 679–683.

Carfenazine

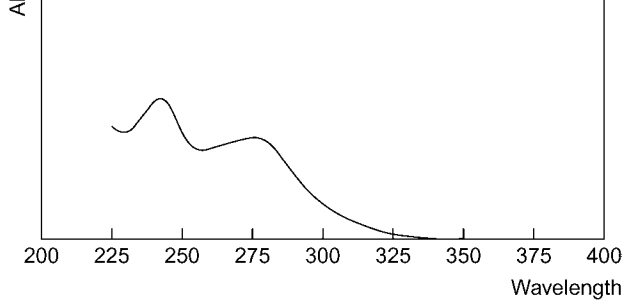
Antipsychotic, Tranquilliser
$C_{24}H_{31}N_3O_2S = 425.6$
CAS—2622-30-2
IUPAC Name 1-(10-[3-[4-(2-Hydroxyethyl)-1-piperazinyl]propyl]-10*H*-phenothiazin-2-yl)-1-propanone
Synonym Carphenazine



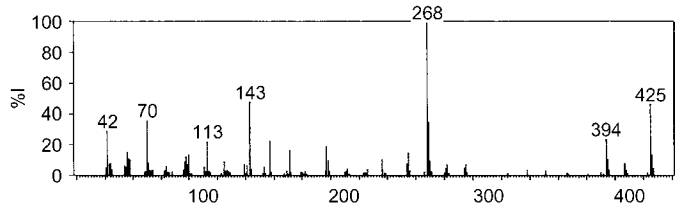
Chemical Properties Log *P* (octanol/water), 3.3.

Carfenazine Maleate
$C_{24}H_{31}N_3O_2S, 2C_4H_4O_4 = 657.7$
CAS—2975-34-0
Proprietary Name *Proketazine*
Chemical Properties A fine yellow powder. Mp 176° to 185°, with decomposition. Soluble 1 in 600 of water and 1 in 400 of ethanol; practically insoluble in chloroform and ether.

Colour Tests Formaldehyde–sulfuric acid—blue; Forrest reagent—red; FPN reagent—red-orange; Liebermann's reagent—red-brown; Mandelin's test—red-violet; Marquis test—orange→red-violet.
Thin-layer Chromatography System TA—R_f 0.54; system TB—R_f 0.05; system TC—R_f 0.27; system TE—R_f 0.39; system TL—R_f 0.07; system TAE—R_f 0.39; system TAJ—R_f 0.08; system TAK—R_f 0.00; system TAL—R_f 0.51 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 3590.
High Performance Liquid Chromatography System HA—*k* 1.7; system HX—RI 419.
Ultraviolet Spectrum Aqueous acid—243 (A^{1}_{1}=606a), 277 nm. No alkaline shift.



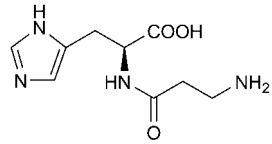
Infrared Spectrum Principal peaks at wavenumbers 1585, 1557, 1666, 1204, 751, 1298 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 268, 143, 425, 70, 269, 42, 394, 157.



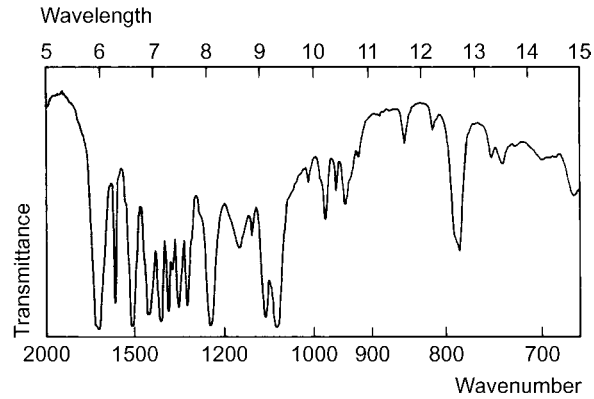
Dose 75 to 400 mg of carfenazine maleate daily.

Carisoprodol

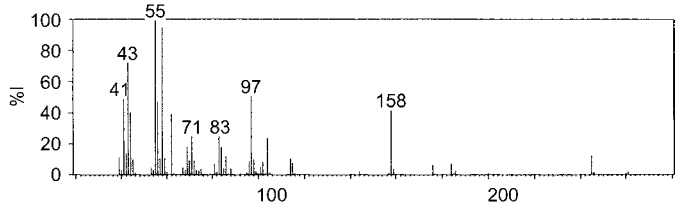
Skeletal Muscle Relaxant
$C_{12}H_{24}N_2O_4 = 260.3$
CAS—78-44-4
IUPAC Name [2-(Carbamoyloxymethyl)-2-methylpentyl] *N*-propan-2-ylcarbamate
Synonyms 2-[[(Aminocarbonyl)oxy]methyl]-2-methylpentyl (1-methylethyl) carbamate; carisoprodate; carisoprodolum; isobamate; *N*-isopropylmeprobamate.
Proprietary Names *Artifar*; *Caridolin*; *Carisoma*; *Chinchen*; *Dolaren*; *Flexartal*; *Mio Relax*; *Mioxom*; *Muslax*; *Myolax*; *Neotica*; *Rela*; *Rotalin*; *Sanoma*; *Scutamil-C*; *Soma*; *Somadril*; *Somalgit*. It is also an ingredient of *Flectomas*; *Flexidone*; *Lagaflex*; *Relaxibys*; *Sodol Compound*; *Soma Compound*; *Teknadone*.
Note The name Soma has also been applied to a hallucinogenic fungus.



Chemical Properties White crystalline powder. Mp 92° to 93°. Soluble in water: 30 mg/100 mL at 25°, 140 mg/100 mL at 50°; soluble in most common organic solvents; practically insoluble in vegetable oils. Log *P* (octanol/water) 2.36. Stable in dilute acids and alkalis. Carisoprodol in plasma was stable at −20° for up to 37 days [Kucharczyk *et al.* 1986].
Thin-layer Chromatography System TB—R_f 0.04; system TD—R_f 0.36; system TE—R_f 0.75; system TF—R_f 0.53; system TAD—R_f 0.59; system TAE—R_f 0.85; system TAF—R_f 0.79 (furfuraldehyde reagent, positive).
Gas Chromatography System GA—RI 1830; RI 1785 meprobamate.
Column: 2% GE-SE 30 on Aeropak 30* 80/100 mesh (1.8 m × 2 mm i.d.). Carrier gas: N_2, 50 mL/min. Temperature programme: 100° to 210° at 4.2°/min. FID. Retention time: ≈16 min [Cardini *et al.* 1968].
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.
Infrared Spectrum Principal peaks at wavenumbers 1695, 1527, 1075, 1246, 1101, 1319 cm^{-1} (Nujol mull).



Mass Spectrum Principal ions at *m/z* 55, 57, 43, 97, 41, 56, 158, 44; meprobamate 83, 84, 55, 56, 43, 71, 41, 62 (no peaks above 160).



Quantification
Blood **GC** Column: 5% phenyl methyl silicone (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He. Temperature programme: 175° for 30 s to 220° at 10 /min to 260° at

20°/min for 6 min. FID. Limit of detection, 0.5 mg/L [Logan *et al.* 2000]. Column: 3% SE-30 on 80/100 mesh Chromosorb W AW-DMDS (4′ × 0.25" o.d.). Carrier gas: He, 60 mL/min. Temperature: 190°. FID. Retention time: 2.25 min. Limit of detection not reported [Maes *et al.* 1969].

GC-MS Column: DB-35 ms cross-linked silica capillary (30 m × 0.32 mm i.d., 0.25 μm). Carrier gas: He, 1.5 mL/min. Temperature programme: 120° for 1 min to 320° at 15/min for 4 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 1 mg/L; limit of detection, 0.1 mg/L [Gunnar *et al.* 2004]. Column: DB-5 capillary (30 m × 0.25 mm i.d.). Temperature programme: 100° to 280° at 10/min for 11 min. Retention time: 7.53 and 8.44 for carisoprodol and meprobamate, respectively. Limit of detection not reported [Backer *et al.* 1990].

Plasma **GC** Column: 3% OV-17 on 100/120 mesh Chromosorb WHP (6′ × 2 mm i.d.). Carrier gas: N_2, 14 psi. Temperature: 180°. FID. Retention time: 5.25 and 4.81 min for carisoprodol and meprobamate, respectively. Limit of detection, 0.5 and 1 mg/L for carisoprodol and meprobamate, respectively [Kintz *et al.* 1988]. Column: 3% GP SP2100 DB on 100/120 mesh Supelcoport (2 m × 2 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature: 180°. Retention time: ≈5.1 min. Limit of detection, 230 μg/L [Kucharczyk *et al.* 1986].

GC-MS Column: HP-5 MS (30 m × 0.25 mm i.d., 0.25 μm). Temperature programme: 190° for 5 min to 245° at 30°/min to 255° at 2°/min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 1.93 mg/L, limit of detection, 0.58 mg/L, both for meprobamate [Daval *et al.* 2006].

LC-MS Column: Symmetry C_{18} reversed phase ODS (150 × 2.1 mm i.d., 3.5 μm). Mobile phase: 10 mmol/L ammonium acetate : acetonitrile (90 : 10 for 5 min to 20 : 80 at 15 min for 10 min), flow rate 150 μL/min. ESI, full scan and SIM acquisition modes. Limit of quantification, 0.5 μg/L [Matsumoto *et al.* 2003].

Serum **GC** Column: GP 2% SP-2110/1% SP-2510 DA on 100/120 Supelcoport (1.2 m × 2 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature programme: 180° for 2 min to 240° at 8°/min for 2 min. FID. Limit of detection not reported [Olsen *et al.* 1994]. Column: 3% OV-1 or 3% OV-17 (6′ × 0.25" o.d.). Carrier gas: N_2. Temperature programme: 140° for 1 min to 275° at 24°/min for 12 min. FID. Limit of detection not reported [Adams *et al.* 1975].

GC-MS See Blood [Gunnar *et al.* 2004].

Oral Fluid **LC-MS** Column: Atlantis dC_{18}(50 × 2.1 mm i.d., 3.5 μm). Mobile phase: acetonitrile : 5 mmol/L aqueous ammonium acetate (pH 5.0; 10 : 90 to 40 : 60 at 4.0 min to 90 : 10 at 4.1 min until 8.0 min to 10 : 90 at 8.1 min), flow rate 0.3 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, <0.02 μmol/L, limit of detection, <5.7 μg/L [øiestad *et al.* 2007].

Urine **GC** Column: 3% OV-17 on 100/120 mesh Chromosorb WHP (6′ × 2 mm i.d.). Carrier gas: N_2, 14 psi. Temperature: 180°. FID. Retention time: 5.25 and 4.81 min for carisoprodol and meprobamate, respectively. Limit of detection not reported [Kintz *et al.* 1988]. Column: 3% OV-1 or 3% OV-17 (6′ × 0.25" o.d.). Carrier gas: N_2. Temperature programme: 140° for 1 min to 275° at 24°/min for 12 min. FID. Limit of detection not reported [Adams *et al.* 1975]. See Blood [Maes *et al.* 1969].

GC-MS See Blood [Backer *et al.* 1990].

LC-MS Column: Symmetry C_{18} reversed phase ODS (150 × 2.1 mm i.d., 3.5 μm). Mobile phase: 10 mmol/L ammonium acetate : acetonitrile (90 : 10 for 5 min to 20 : 80 at 15 min for 10 min), flow rate 150 μL/min. ESI, full scan and SIM acquisition modes. Limit of quantification, 0.5 μg/L [Matsumoto *et al.* 2003].

Bile **GC** See Blood [Maes *et al.* 1969].

Stomach **GC** See Blood [Maes *et al.* 1969].

Vitreous Humour **GC-MS** See Blood [Backer *et al.* 1990].

Hair **GC-MS** Column: DB-5MS (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.0 mL/min. Temperature programme: 120° to 240° at 25°/min 300° at 10/min for 0.5 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 0.43 μg/g, limit of detection, 0.13 μg/g [Kim *et al.* 2005].

LC-MS Column: Zorbax SB-Phenyl (100 × 2.1 mm i.d., 3.5 μm). Mobile phase: 25 mmol/L formic acid : acetonitrile (98 : 2 to 80 : 20 for 3 min to 10 : 90 in 4 min for 2 min), flow rate 0.25 mL/min. ESI, MRM acquisition mode. Limit of quantification, 12.5 ng/g [Hegstad *et al.* 2008].

Kidney **GC** See Blood [Maes *et al.* 1969].

Liver **GC** See Blood [Maes *et al.* 1969].

Spleen **GC** See Blood [Maes *et al.* 1969].

Disposition in the Body Rapidly absorbed after oral administration. It is metabolised principally to meprobamate by *N*-dealkylation, which is active, and to hydroxymeprobamate and their glucuronide conjugates. The enzyme responsible for the formation of meprobamate is CYP2C19 [Dalén *et al.* 1996], with heterozygous individuals with the CYP2C19*1/*2 genotype having a reduced capacity to metabolise carisoprodol. Such individuals are termed 'intermediate metabolisers' [Bramness *et al.* 2003]. The use of oral contraceptives has been shown to inhibit the metabolism of carisoprodol in intermediate and extensive metabolisers [Bramness *et al.* 2005]. Less than 1% of a dose is excreted in the urine as unchanged drug in 24 h, and approximately 5% is excreted as meprobamate in the same period. It is distributed in substantial amounts into breast milk [Nordeng *et al.* 2001].

Therapeutic Concentration

After administration of a 700 mg oral dose of carisoprodol to 9 healthy adults, the mean peak plasma carisoprodol concentration was 3.5 mg/L at 0.8 h and the mean peak meprobamate concentration was 4.0 mg/L at 3.7 h [Olsen *et al.* 1994].

Toxicity CNS toxicity of short duration is the chief manifestation of acute carisoprodol poisoning. Symptoms start at serum concentrations >33 mg/L and last <16 h, although very small amounts of drug may still be detectable 10 days post-ingestion [Goldberg 1969].

A 37-year-old female attempted suicide by ingesting carisoprodol/acetaminophen tablets. On admission to hospital her carisoprodol plasma concentration was 29.5 mg/L. This was reduced 40 h later to 0.07 mg/L [Matsumoto *et al.* 2003].

In 21 cases of driving impairment where carisoprodol was the sole drug involved, most overt symptoms of intoxication were noted when the combined blood concentration of carisoprodol and meprobamate was >10 mg/L [Logan *et al.* 2000].

A 39-year-old male ingested 35 g carisoprodol. He became agitated, developed tachycardia and myoclonus, and slipped into a coma. The blood carisoprodol concentration was 71 mg/L with a meprobamate concentration of 26 mg/L. Carisoprodol overdose is thought to induce simple CNS depression [Roth *et al.* 1998].

In 3 cases involving overdose with carisoprodol, the following tissue concentrations were reported in the respective cases: heart blood 39.4, 14.0 and 8.1 mg/L, femoral blood 39.3, 6.5 and 7.9 mg/L, urine 12.6, – and –, vitreous humour 18.9, 8.7 and 8.1 mg/L. The concentration of meprobamate in the respective cases was: 40.1, 18.9 and 20.9 mg/L, femoral blood 51.9, 20.5 and 34.3 mg/L, urine 61.0, – and –, vitreous humour 45.9, 50.2 and 102.0 mg/L. Verapamil was also detected in case 2 and propoxyphene was detected in case 3 in addition to carisoprodol [Backer *et al.* 1990].

The following concentrations were reported 4.5 h after the ingestion of 3.5 g by a young child: blood, carisoprodol 36.4 mg/L, meprobamate 15 mg/L; urine, carisoprodol 24.4 mg/L, meprobamate 166.4 mg/L; the child's condition deteriorated and death occurred within 36 h [Adams *et al.* 1975].

After the ingestion of some pills, a female had postmortem concentrations of carisoprodol of 110, 165, 64 and 350 mg/L in her blood, urine, bile and stomach, respectively, and 127, 50 and 110 mg/kg in her liver, spleen, and kidney, respectively [Maes *et al.* 1969].

An 18-year-old white male took approximately 27 tablets of 350 mg carisoprodol. He was admitted to hospital and he had the serum and urine concentrations (mg/L) shown below.

Serum		*Urine*	
Time (h)	*Carisoprodol*	*Time*	*Carisoprodol*
4.5	38	3–8	2775
8.5	36	8–16	2400
16	22	16–25	2640
25	11	—	—

The patient was given supportive treatment and suffered no sequelae [Goldberg 1969].

Note For a review of acute intoxications with carisoprodol, see Høiseth *et al.* [2007] or Høiseth *et al.* [2008]. For a review of deaths involving carisoprodol, see Davis and Alexander [1998].

Half-life 0.9 to 2.4 h.

Protein Binding Approximately 58%.

Dose Usual dose is 350 mg given three to four times daily by mouth. Half the usual dose or less is recommended in elderly patients.

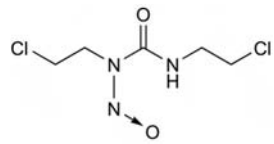
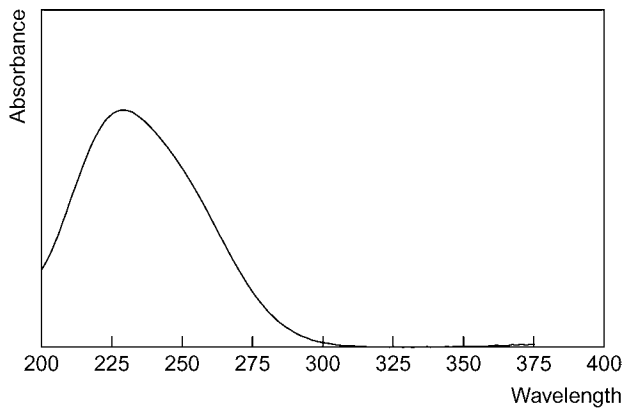
Carmustine

Antineoplastic
$C_5H_9Cl_2N_3O_2$ = 214.0
CAS—154-93-8

IUPAC Name 1,3-Bis(2-chloroethyl)-1-nitrosourea
Synonyms *N*,*N*′-Bis(2-chloroethyl)-*N*-nitrosourea; BCNU.
Proprietary Names *Becenun*; *BiCNU*; *Carmubris*; *Gliadel*; *Nitrourean*; *Nitrumon*.



Chemical Properties A yellowish granular powder that melts to an oily liquid. Mp 31°, with decomposition. It is slightly soluble in water; freely soluble in ethanol; very soluble in dichloromethane and ether. Log *P* (octanol/water), 1.53.
Ultraviolet Spectrum Principal peak at 229 nm.



Mass Spectrum Principal ions at *m/z* 56, 62, 42, 77, 69, 49, 105, 64.
Quantification
Plasma **HPLC** Column: ODS RP (Ultrasphere, 250 × 4.6 mm i.d., 5 µm). Mobile phase: 35% acetonitrile : 0.1% glacial acetic acid in water, flow rate 1.2 mL/min. Retention time: 13.8 min. UV detection (λ=230 nm). Limit of detection, 50 µg/L [Yeager *et al.* 1984].
Brain Tissue **GC** Column: SPB1 fused-silica capillary (60 m × 0.25 mm i.d., 0.25 µm coating). Temperature programme: held at 50° for 5 min; increased to 100° at 10°/min; increased to 105.5° at 0.1°/min. Detection: ^{63}Ni electron capture. Retention time: 30 min. Limit of detection, 0.02 µg [Hassenbusch *et al.* 1995].
Disposition in the Body Rapidly metabolised after IV administration. Readily crosses the blood–brain barrier. Alkylates DNA/RNA and has also been shown to inhibit several enzymes by carbamoylation of amino acids in proteins. Metabolites have a longer half-life and are presumed to be responsible for its activity. Some enterohepatic circulation is believed to occur. Excreted primarily in the urine; about 10% is excreted as carbon dioxide via the lungs. Very small amounts (1%) are detected in the faeces.
Therapeutic Concentration
Ten patients with advanced neoplasms were being treated with a high-dose combination of chemotherapy, cyclophosphamide, cisplatin and carmustine. Each patient received 300 to 750 mg/m^2 carmustine over a 2 h infusion period, but this was increased to 1 g/m^2 for maximum results. Peak plasma concentrations reached 7.8 µg/L at the end of the infusion for the corrected dose [Henner *et al.* 1986].
Toxicity Hypotension was the most prominent feature with high-dose carmustine administration.
Half-life Plasma half-life, 22 min.
Volume of Distribution 3.25 L/kg; 5.1 L/kg (patients with advanced neoplasms).
Clearance Plasma clearance, 56 mL/min/kg; 77.6 mL/min/kg (patients with advanced neoplasms).
Protein Binding 77%.
Dose 150 to 200 mg/m^2 IV as a single dose or divided into two doses given on successive days. Implants are also available (containing 7.7 mg/implant).

Hassenbusch SJ *et al.* (1995). Determination of nitrosourea compounds in brain tissue by gas chromatography and electron capture detection. *J Pharm Sci* 84(7): 840–842.

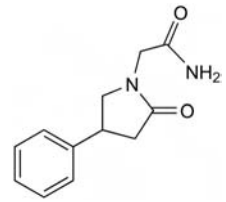
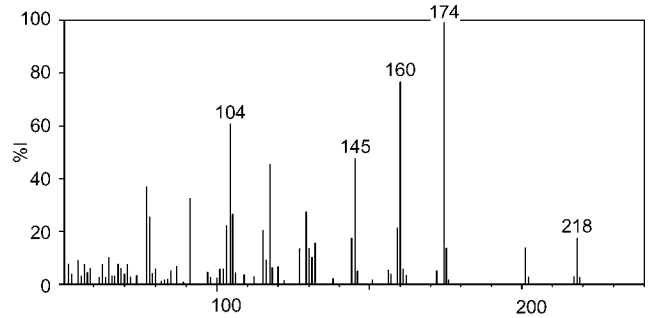
Carphedon

Psychostimulant, Treatment of Amnesia
$C_{12}H_{14}N_2O_2$ = 218.3
CAS—77472-70-9

IUPAC Name (2-Oxo-4-phenylpyrrolidine)acetamide
Synonyms BRN-5030440; 4-phenylpiracetam.



Mass Spectrum Principal ions at *m/z* 174, 160, 104, 145, 117, 77, 91, 129.



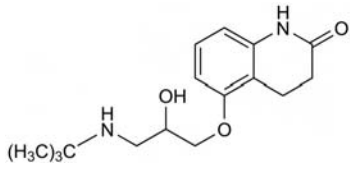
Quantification
Urine **GC** Column: DB-17 (30 m × 0.25 mm i.d., 0.25 µm). Temperature programme: 100° to 280° at 25°/min, held at 280° for 8 min. Carrier gas: He, flow rate 0.9 mL/min. Detection: nitrogen–phosphorous. Retention time: 11.5 min. Limit of detection, 0.01 mg/L [Kim *et al.* 1999].
Disposition in the Body
Therapeutic Concentration
A healthy man was administered with a 0.38 mg/kg dose of carphedon. A concentration of 6.34 mg/L was detected in urine after 18 h [Kim *et al.* 1999].

Kim S *et al.* (1999). Determination of carphedon in human urine by solid-phase microextraction using capillary gas chromatography with nitrogen-phosphorus detection. *Analyst* 124: 1559–1562.

Carteolol

β-*Blocker*
$C_{16}H_{24}N_2O_3$ = 292.4
CAS—51781-06-7

IUPAC Name 5-[3-(Tert-butylamino)-2-hydroxypropoxy]-3,4-dihydro-1H-quinolin-2-one
Synonym 5-[3-[(1,1-Dimethylethyl)amino]-2-hydroxypropoxy]-3,4-dihydro-2(1*H*)-quinolinone



Chemical Properties pK_a 9.74. Log *P* (octanol/water), 1.42. Extraction yield (chlorobutane), 0.06 [Demme *et al.* 2005].

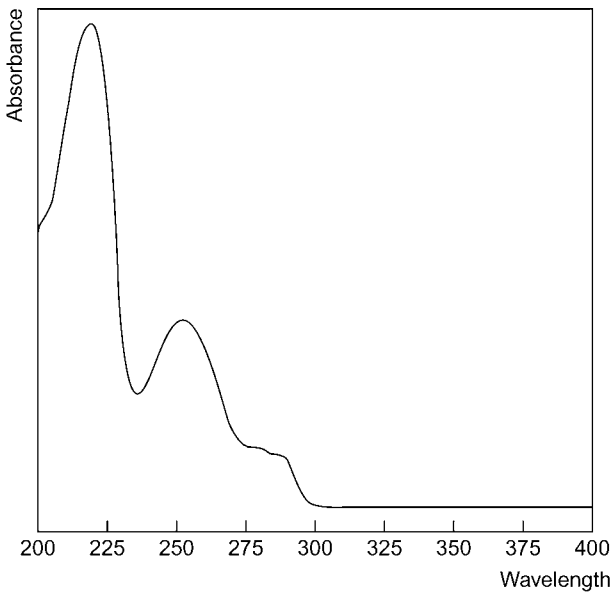
Carteolol Hydrochloride

$C_{16}H_{24}N_2O_3$, HCl = 328.8
CAS—51781-21-6
Synonyms Abbott-43326;OPC-1085.
Proprietary Names *Arteolol*; *Arteoptic*; *Carteol*; *Cartrol*; *Dispersa*; *Elebloc*; *Endak*; *Mikelan*; *Ocupress*; *Teoptic*.
Chemical Properties White crystals or a white crystalline powder., Mp 278°. It is soluble in water; very slightly soluble in ethanol and glacial acetic acid; sparingly soluble in methanol; practically insoluble in ether.

Thin-layer Chromatography System TE—R_f 0.33; system TAE—R_f 0.14.
Gas Chromatography System GA—RI 2588 carteolol); RI 2690 Art).

Column: 5% phenyl methyl silicone RTx−5 fused-silica capillary (30 m × 0.25 mm). Temperature programme: held at 110° for 1 min; increased to 170° at 20°/min; increased to 225° at 7°/min; 290° at 24°/min, held for 10 min. Carrier gas: He. MS detection. Retention time (relative to isoproteronol, internal standard): 1.20 [Branum *et al.* 1998].

High Performance Liquid Chromatography System HAA—retention time 5.9 min.
Ultraviolet Spectrum Aqueous acid (pH 4)—219, 252, 288 nm.



Mass Spectrum Principal ions at *m/z* 86, 57, 277, 70, 292, 87, 114, 60 (carteolol); *m/z* 301, 138, 41, 70, 96, 84, 316, 153 (carteolol methaneboronate).
Quantification
Plasma **GC** Column: fused-silica capillary coated with dimethylpolysiloxane (15 m × 0.25 mm i.d., 0.25 µm). Temperature programme: held at 50°, 0.7 min after injection, 55°/min to 320°, held for 3 min. Carrier gas: He. MS detection, SIM. Retention time: PFB amide−DMES ether derivative, 6.7 min. Limit of quantification, <0.03 µg/L [Nagasawa *et al.* 1995].

HPLC UV detection. Limit of detection, 5 µg/L [Ishizaki *et al.* 1983]. Electrochemical detection. Limit of detection, 5 µg/L for 8-hydroxycarteolol [Chu 1978].
Urine **HPLC** UV detection. Limit of detection, 100 µg/L [Ishizaki *et al.* 1983]. Electrochemical detection. Limit of detection, 25 µg/L for 8-hydroxycarteolol [Chu 1978].
Disposition in the Body Carteolol is well absorbed after oral administration with peak plasma concentrations being reached within 1 to 3 h. It has low lipid solubility. It is distributed into breast milk. Carteolol undergoes minimal hepatic metabolism to form the active metabolite, 8-hydroxycarteolol and glucuronic acid conjugates of carteolol and 8-hydroxycarteolol. The major route of elimination is renal with 50 to 70% being excreted unchanged in urine.
Bioavailability Absolute bioavailability, 85%.
Half-life Plasma, carteolol, 5 to 6 h; 8-hydroxycarteolol, 8 to 12 h.
Volume of Distribution 4 L/kg.
Clearance Plasma clearance, 10 mL/min/kg.
Protein Binding 20 to 30%.
Dose Usually 2.5 or 5 mg of carteolol hydrochloride daily.

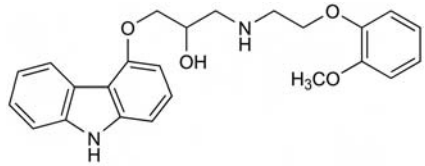
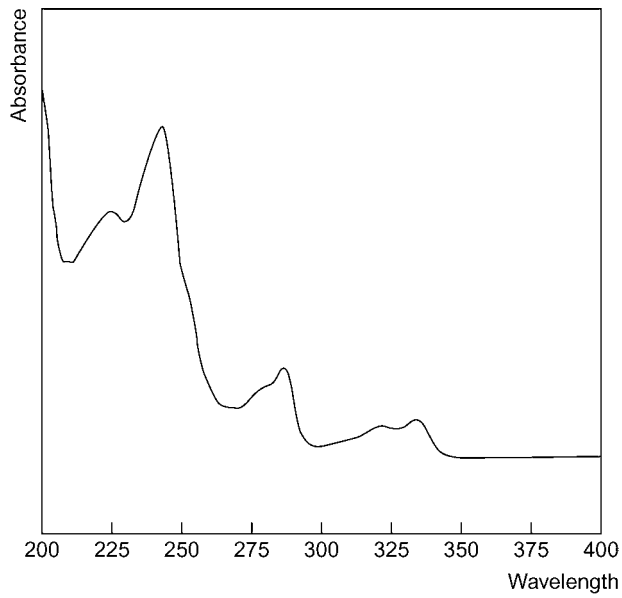
Carvedilol

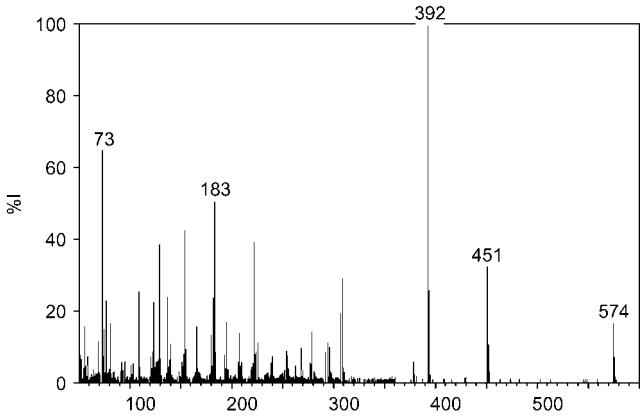
β-*Blocker*
$C_{24}H_{26}N_2O_4$ = 406.5
CAS—72956-09-3
IUPAC Name 1-(9*H*-Carbazol-4-yloxy)-3-[[2-(2-methoxyphenoxy)ethyl]amino]-2-propanol
Synonyms BM-14190; DQ-2466.
Proprietary Names *Carvipress*; *Dilatrend*; *Dimitone*; *Eucardic*; *Kredex*; *Querto*.



Chemical Properties A white to off-white powder. Mp 114° to 115°. It is practically insoluble in water; freely soluble in dimethyl sulfoxide; soluble in methylene chloride and in methanol; sparingly soluble in ethanol and in isopropyl alcohol; slightly soluble in ethyl ether. Log *P* (octanol/water), 4.19. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].
High Performance Liquid Chromatography System HZ—carvedilol retention time 5.2 min, desmethylcarvedilol retention time 4.4 min.
Ultraviolet Spectrum Aqueous acid (2.0 mol/L HCl)—241, 285, 320, 332 nm; (methanol)—224, 243, 286, 319, 332 nm.



Mass Spectrum Principal ions at *m/z* 392, 73, 183, 154, 129, 222, 451, 309 (TMSTFA derivative).



Quantification

Plasma **HPLC** Fluorescence detection. Limit of detection, 1.55 µg/L [Fujimaki *et al.* 1990]. Limit of quantification, 1 µg/L *S*(−)-enantiomer, 2 µg/L *R*(+)-enantiomer [Neugebauer *et al.* 1990]. Fluorescence detection (λ_{ex}=285 nm, λ_{em}=360 nm). Limit of detection, 1.1 µg/L (*S*(−)-enantiomer), 0.6 µg/L (*R*(+)-enantiomer), [Eisenberg *et al.* 1989]. Fluorescence detection (λ_{ex}=285 nm, λ_{em}=340 nm). Limit of detection, 0.38 µg/L [Reiff 1987].

Serum **HPLC** Column: Spherisorb octyl (125 × 5 mm i.d., 5 µm). Mobile phase: acetonitrile : water (45:55) containing 5 mM dibutylamine, flow rate 2 mL/min. Retention time: 3.8 min Fluorescence detection (λ_{ex}=240 nm, λ_{em}=340 nm). Limit of detection, 0.1 µg/L [Varin *et al.* 1986].

Urine **HPLC** Fluorescence detection (λ_{ex}=285 nm, λ_{em}=340 nm). Limit of detection, 0.82 µg/L [Reiff 1987].

Disposition in the Body Carvedilol is rapidly and well absorbed after oral administration, but is subject to considerable first-pass metabolism in the liver. The rate of absorption is impaired by the co-administration with food but the bioavailability is not affected. The drug is widely distributed and extensively metabolised, primarily by aromatic ring oxidation and glucuronidation. The oxidative metabolites undergo further metabolism by glucuronidation and sulfation. The metabolites are excreted mainly via bile into faeces. Approximately 16% of a dose is detected in urine with <2% as the unchanged drug. Some of the metabolites have beta-blocking and vasodilating activity; one metabolite has greater beta-blocking activity than carvedilol but all have weaker vasodilating effects than carvedilol. The *o*-demethyl-*p*-hydroxyl and *m*-hydroxyl metabolites possess beta-blocking activity. Its metabolism is stereoselective and plasma concentrations of *R*(+)-carvedilol are about 2–3-times higher than *S*(−)-carvedilol. The principal enzymes involved are CYP2D6 and CYP2C9. The metabolism of carvedilol is subject to genetic polymorphism with poor metabolisers of debrisoquine having plasma-*R*(+)-carvedilol concentrations 2–3-fold higher than extensive metabolisers. It is not significantly cleared by haemodialysis. No accumulation of the drug has been observed.

Therapeutic Concentration In plasma, concentrations are linearly related to the administered dose.

The mean maximum plasma concentration after a 20 mg dose, administered orally after an overnight fast, to 5 healthy Japanese males was 0.025 (range, 0.0065 to 0.044) mg/L for the (*R*)-enantiomer and 0.0098 (0.0023 to 0.0187) mg/L, (*S*)-enantiomer. These concentrations were observed 0.5 to 1.0 h after administration [Fujimaki *et al.* 1990].

Following oral administration of a 50 mg tablet to 20 healthy males, aged between 19 and 45 years, maximum plasma concentrations ranged from 34 to 130 mg/L (mean 66 mg/L) after 0.65 to 2.25 h (mean 1.20 h). Peak concentrations of 128 mg/L (range, 55 to 237 mg/L), 0.66 (range, 0.24 to 1.29 h after administration were observed, however, for a 50 mg suspension. Following administration of a 25 mg tablet, maximum plasma concentrations were 5 to 99 mg/L (mean 21 mg/L) seen after 1.46 h (range, 0.68 to 3.10 h). After IV administration of 12.5 mg over a 1-h period, the peak concentration was 173 mg/L (range, 109 to 234) by the end of infusion [von Möllendorff *et al.* 1987].

Bioavailability Absolute bioavailability, 25 to 35%; *S*(−)-enantiomer, 15%; *R*(+)-enatiomer, 31%.

Half-life Plasma, 4 to 7 h (values outside this range have also been noted).

Volume of Distribution 1.5 to 2.0 L/kg.

Clearance Plasma clearance, 0.52 L/h/kg.

Protein Binding >98% with *R*(+)-enantiomer being more tightly bound.

Note For reviews of carvedilol, see McTavish *et al.* [1993] and Morgan [1994].

Dose It is recommended that all receive 12.5 mg for the first 2 days and then increase if necessary up to 50 mg daily.

Cathine

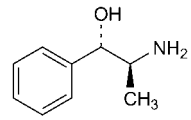
Amine, Anorectic, Sympathomimetic

$C_9H_{13}NO$ = 151.2

CAS—492-39-7; 36393-56-3

IUPAC Name (1*S*,2*S*)-2-Amino-1-phenylpropan-1-ol

Synonyms (α*S*)-α-[(1*S*)-1-Aminoethyl] benzenemethanol; katine; (+)-norpseudoephedrine; pseudonorephedrine.



Chemical Properties An alkaloid obtained from catha, the fresh or dried leaves of *Catha edulis* (Celastraceae). Catha (also known as Abyssinian, African, or Arabian Tea; Kat; Kath; Khat; Miraa) is used in northern and eastern Africa as a stimulant, the leaves being chewed or used as an infusion. Crystals. Mp 77° to 78°. Soluble in ethanol, chloroform, ether, and dilute acids. Extraction yield (chlorobutane), 0.07 [Demme *et al.* 2005]. Cathine is stable in urine if stored at –20°, 4°, and 22° for up to 9 months [Van Eenoo *et al.* 2007].

Cathine Hydrochloride

$C_9H_{13}NO$, HCl = 187.7

CAS—2153-98-2

Proprietary Names *Adiposetten N*; *Amorphan Depot*.

Chemical Properties Crystals. Mp 180° to 181°. Soluble in water. pK_a 9.4 (20°), 8.92 for *D*-cathine [Frosch 1977]. Log *P* (octanol/water) 0.8.

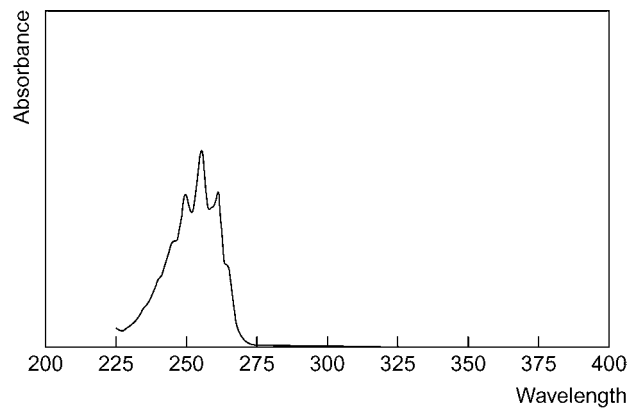
Thin-layer Chromatography System TA—R_f 0.42; system TB—R_f 0.25; system TC—R_f 0.05 (acidified potassium permanganate solution, positive).

The 'Toxilab' TLC system cannot distinguish phenylpropanolamine (*d,l*-norephedrine) from *d*-norpseudoephedrine [Gal, Lichtenstein 1987].

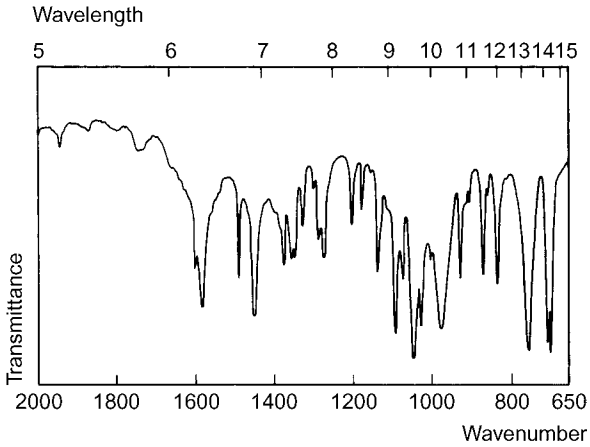
Gas Chromatography System GA—RI 1360; system GB—RI 1352; system GC—RI 1383; system GAL—RI 1362.

High Performance Liquid Chromatography System HA—*k* 1.0; system HB—*k* 4.39; system HC—*k* 0.83.

Ultraviolet Spectrum Aqueous acid—252, 258 (A_1^1 = 10a), 263 nm No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1045, 695, 754, 704, 1091, 976 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 44, 57, 43, 40, 55, 41, 79, 77.

Quantification

Plasma **GC** Column: GP 2% SP-2510-DA on 100/120 mesh Suppelcoport (1.8 m × 4 mm i.d.). Carrier gas: CH_3 : Ar (5 : 95), 90 mL/min. Temperature: 280°. ECD. Limit of detection, 50 µg/L [Lo *et al.* 1981]. Column: 3% OV-17 on 100/120 mesh Gas-Chrom Q (6′ × 0.125" o.d.). Carrier gas: N_2, 6 mL/min. Temperature: 150°. ECD. Limit of detection, 0.5 mg/L [Lin *et al.* 1977].

GC-MS Column: HP-1 MS capillary (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 120° for 0.5 min to 170° at 10°/min to 310° at 30°/min for 5 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, 1 µg/L [Toennes *et al.* 2003].

HPLC Column: LiChrosorb SI 60 (5 µm). Mobile phase: diisopropylether : isopropanol : 25% ammonium hydroxide (480 : 25 : 3), flow rate, 0.9 mL/min. Fluorescence detection (λ_{ex} = 354 nm, λ_{em} = 450–520 nm). Limit of detection, 25 µg/L [Meyer, Portmann 1982].

LC-MS Column: Agilent Zrbax (150 × 2.1 mm i.d., 5 µm). Mobile phase: 5 mmol/L aqueous ammonium formate (pH 3.0) : acetonitrile (95 : 5 to 70 : 30 at 10.0 min for 1 min to 95 : 5), flow rate 1.5 mL/min. ESI, MRM acquisition mode. Limit of quantification, 10 µg/L [Beyer *et al.* 2007]. Column: Hypersil Phenyl BDS (50 × 4.6 mm i.d.). APCI. Limit of quantification, 1 µg//L [Jacob, III *et al.* 2004]. Column: Hypersil Phenyl BDS (50 × 4.6 mm i.d.). Mobile phase: 10 mmol/L ammonium formate : 0.1% formic acid : methanol (100 : 0 to 20 : 80 in 7 min to 100 : 0 over 0.5 min), flow rate 0.7 mL/min. APCI, positive ion mode, SRM acquisition mode. Limit of detection, 0.5 µg/L [Haller *et al.* 2002].

Urine **TLC** Plates: Silica. Solvent system: ethyl acetate : methanol : ammonia (A, 17 : 2 : 1) or cyclohexane : chloroform : diethylamine (B, 5 : 4 : 1). UV and 0.3% ninhydrin at 105° for 10 min. R_f value: 0.42 and 0.47 for solvent systems A and B, respectively [Guantai, Maitai 1983]. Plates: Silica. Solvent system: butanol : acetic acid : water (A, 60 : 15 : 25); butanol saturated with water (upper phase, B); methanol : ammonia (C, 100 : 1.5); or isopropanol : water : ammonia (80 : 15 : 5). R_f value: 0.61, 0.31, 0.47 and 0.80 for solvent systems A, B, C and D, respectively [Maitai, Mugera 1975].

GC Column: HP-5MS cross-linked 5% diphenyl 95% dimethylpolysiloxane capillary (25 m × 0.25 mm i.d., 0.33 µm). Carrier gas: He, 1.1 mL/min. Temperature programme: 100° for 1 min to 200° at 10°/min to 300° at 20°/min for 4 min. EI ionisation at 70 eV. NPD. Limit of detection, 0.25 mg/L [Tseng *et al.* 2006]. Column: Rtx-5 Amine cross-linked 5% diphenyl 95% dimethylpolysiloxane (15 m × 0.25 mm i.d., 1.0 µm). Carrier gas: He. Temperature programme: 100° to 105° at 0.5°/min to 118° at 2°/min to 280° at 50°/min for 2 min. NPD. Retention time: 12.1 min. Limit of detection, 2 mg/L [Van Eenoo *et al.* 2001]. Column: Chromosorb W 100/200 mesh (1.5 m × 4 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature programme: 80° to 200° at 5°/min for 10 min. FID. Retention time: 7.5 min. Limit of detection not reported [Guantai, Maitai 1983]. Column: GP 2% SP-2510-DA on 100/120 mesh Suppelcoport (1.8 m × 4 mm i.d.). Carrier gas: CH_3: Ar (5 : 95), 90 mL/min. Temperature: 280°. ECD. Limit of detection, 50 µg/L [Lo *et al.* 1981]. Column: 3% OV-17 on 100/120 mesh Gas-Chrom Q (6 ft × 0.125 in o.d.). Carrier gas: N_2, 6 mL/min. Temperature: 150°. ECD. Limit of detection, 0.5 mg/L [Lin *et al.* 1977]. Column: Celite CQ 100/120 mesh with 3% methyl silicone (1.5 m × 0.3 cm o.d.). Carrier gas: N_2, 50 mL/min. Temperature: 150°. FID. Limit of detection not reported [Maitai, Mugera 1975].

GC-MS Column: Ultra-2 fused silica capillary (12 m × 0.20 mm i.d., 0.33 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 95° to 270° at 10°/min for 2.5 min. EI ionisaton at 70 eV, full scan mode. Retention time: 6.42 min. Limit of detection not reported [de Oca Porto *et al.* 2007]. Column: HP fused silica capillary (17 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° to 320° at 20°/min for 2 min. Limit of detection, 0.1 µg/L [Shin *et al.* 1998]. Column: OV-1701 fused silica capillary (25 m). Carrier gas: He, 3 mL/min. Temperature programme: 84° for 1.5 min to 170° at 3°/min. EI ionisation at 70 eV. Retention time: 25.1 min [Brenneisen *et al.* 1986].

HPLC Column: Spherisorb ODS 1 C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: tetraethylammonium phosphate : methanol (985 : 15), flow rate 1.0 mL/min. DAD (λ = 206 nm). Limit of quantification, 0.3 mg/L, limit of detection, 0.1 mg/L [Chan *et al.* 2005]. Column: HP-1 MS capillary (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 120° for 0.5 min to 170° at 10°/min to 310° at 30°/min for 5 min. EI ionisation at 70 eV. SIM acquisition mode. Limit of detection, <0.01 mg/L [Toennes, Kauert 2002]. Column: Phase Sep Spherisorb ODS 1 (150 × 4.6 mm i.d., 5 µm). Mobile phase: tetraethylammoniumphosphate : methanol (98 : 2), flow rate 1.0 mL/min. Limit of detection, 0.5 mg/L [van der Merwe *et al.* 1994]. Column: LiChrospher 60 RP Select B (125 × 4 mm i.d., 5 µm). Mobile phase: 200 mmol/L phosphate buffer : 150 mmol/L tetraethylammonium (pH 5.5), flow rate 1.3 mL/min. DAD (λ = 215 nm). Limit of detection, 0.2 mg/L [Imaz *et al.* 1993]. Column: Spherisorb ODS-1 (150 × 4.6 mm i.d., 3 µm). Mobile phase: acetonitrile : water (8.5 : 91.5) containing 8.5 g/L ortho-phosphoric acid and 200 µL/L hexylamine, flow rate 1.0 mL/min. DAD (λ = 192 nm). Limit of detection, 25 µg/L [Mathys, Brenneisen 1992].

LC-MS Column: Hypersil Phenyl BDS (50 × 4.6 mm i.d.). APCI. Limit of quantification, 1 µg//L [Jacob, III *et al.* 2004]. Column: Hypersil Phenyl BDS (50 × 4.6 mm i.d.). Mobile phase: 10 mmol/L ammonium formate : 0.1% formic acid : methanol (100 : 0 to 20 : 80 in 7 min to 100 : 0 over 0.5 min), flow rate 0.7 mL/min. APCI, positive ion mode, SRM acquisition mode. Limit of detection, 0.5 µg/L [Haller *et al.* 2002].

Milk **GC** Column: Fused silica cross-linked methylsilicone capillary (12 m × 0.2 mm i.d.). NPD. Retention time: 1.19 min. Limit of detection, 10 µg/L [Kristiansson *et al.* 1987].

Hair **GC-MS** Column: HP5-MS capillary (25 m × 0.2 mm i.d., 0.33 µm). Temperature programme: 80° for 3 min to 150° at 10°/min to 300° at 20°/min. EI ionisation, SIM acquisition mode. Limit of quantification, 0.1 µg/g, limit of detection, 0.03 µg/g [Sporkert *et al.* 2003].

Disposition in the Body Approximately 40% of an ingested dose is excreted unchanged in the urine in 6 h. Cathine is excreted in the breast-milk of lactating mothers 2–4 h after starting to chew khat. [Kristiansson *et al.* 1987]. Cathine is a metabolite of pseudoephedrine, famprofazone [Shin *et al.* 1998] and cathinone [Brenneisen *et al.* 1986; Guantai, Maitai 1983].

Therapeutic Concentration

Following a single oral dose of 60 mg to 6 subjects, a mean peak plasma concentration of 0.2 mg/L was attained in 1.3 h; cathine could not be detected in the plasma after 24 h [Frosch 1977].

Six khat-naïve subjects were administered 0.8 mg/kg cathinone (~54–71 g fresh khat leaves). The mean peak plasma concentration was 89 ± 49 µg/L at 183 ± 73 min [Widler *et al.* 1994].

Toxicity Two previously healthy female patients (43 and 55-years-old) took norpseudoephedrine to lose weight. Both patients developed dyskinesias which resolved only after botulinum toxin therapy [Thiel, Dressler 1994]. Addiction to catha has been reported.

Note For a review of the pharmacology of khat consumption, see Nencini and Ahmed [1989], Kalix [1984] or Kalix and Braenden [1985]. For a review of psychoactive alkaloids from *Ephedra* and *Catha*, see Kalix [1991].

Half-life Plasma half-life, ≈3 h.

Bioavailability ≈94% [Meyer, Portmann 1982].

Dose Cathine hydrochloride has been given in doses of 20 to 60 mg daily.

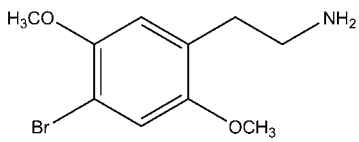
2C-B

5-HT$_{2A}$ Receptor Antagonist, Entactogen, Hallucinogen, Phenethylamine
$C_{10}H_{14}BrNO_2$=260.1
CAS—66142-81-2

IUPAC Name 2-(4-Bromo-2,5-dimethoxy-phenyl)ethanamine
Synonyms BDMPEA; 4-bromo-2,5-dimethoxybenzeneethanamine; 4-bromo-2,5-dimethoxy-β-phenethylamine; 2-(4-bromo-2,5-dimethoxyphenyl)-1-aminoethane; α-desmethyl DOB; 2,5-dimethoxy-4-bromophenethylamine; MFT.
Street Names Bees; Bromo; Erox; Nexus; Performax; Venus; XTC.



Chemical Properties Log *P* (octanol/water), 2.03 [ACD 2007]. No indication of instability of processed samples over a time period of 32 h. When the samples were freeze-thawed, the ratio of the means was within 90 and 110% for all analytes at high concentrations [Habrdova *et al.* 2005].

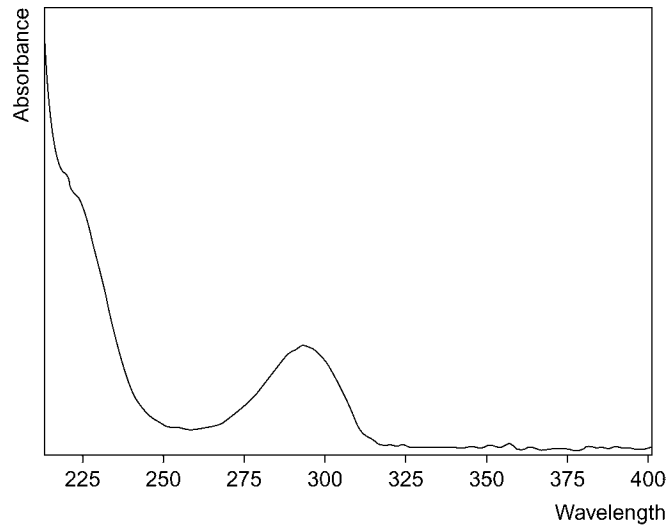
2C-B Hydrochloride

$C_{10}H_{14}BrNO_2$, HCl = 296.6
CAS—56281-37-9

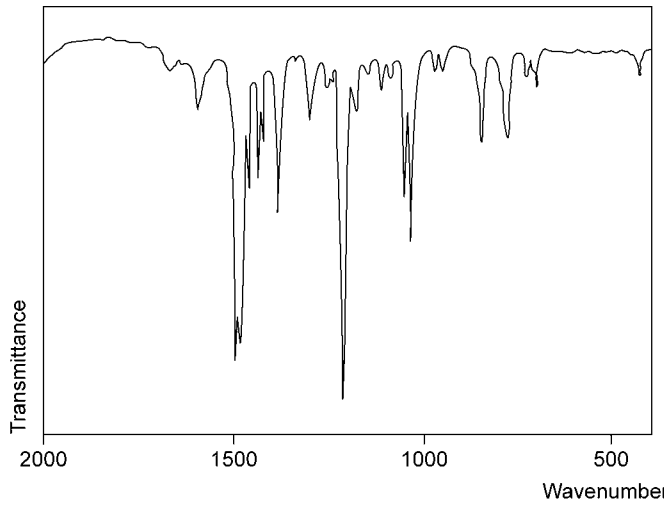
Synonyms BDMPEA hydrochloride; 4-bromo-2,5-dimethoxybenzeneethanamine hydrochloride; 4-bromo-2,5-dimethoxy-β-phenethylamine hydrochloride; 2-(4-bromo-2,5-dimethoxyphenyl)-1-aminoethane hydrochloride; α-desmethyl DOB hydrochloride; 2,5-dimethoxy-4-bromophenethylamine hydrochloride; MFT hydrochloride.
Chemical Properties Pale pink crystals, fine white crystals when dry. Mp 237° to 239°. Soluble in water.

Colour Test Marquis test—yellow→green [Cole *et al.* 2002].
Gas Chromatography-Mass Spectrometry Column: HP-5MS cross-linked phenylmethylysiloxane (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 70° for 1 min to 200° at 20°/min for 8.84 min. EI ionisation at 70 eV. Limit of detection, 4.94 mg/L [Tsai *et al.* 2006]. Column: HP Ultra-2 fused silica capillary (25 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He. Temperature programme: 55° for 1 min, to 190° at 20°/min to 305° at 10°/min for 11 min. EI ionisation at 70 eV. Retention time: 7.4 min [Giroud *et al.* 1998].
High Performance Liquid Chromatography Column: Spherisorb C_{18} ODS2 (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.05 mol/L ammonium acetate (pH 3.9) buffer (0.1% triethylamine) : methanol (77 : 23 for 19 min to 65 : 35 for 16 min), flow rate 0.7 mL/min for 9 min, 1.2 mL/min for 12 min, and 1.4 mL/min for 14 min. DAD (λ= 210 nm). Retention time: 27.6 min. Limit of detection, 105 mg/L [Soares *et al.* 2004]. Column: Lichrospher RP-8 Select B (250 × 4 mm i. d., 5 µm). Mobile phase: acetonitrile : 10 mmol/L potassium phosphate buffer (pH 3.2; 5 : 95 to 60 : 40 after 20 min), flow rate 0.5 mL/min. DAD (λ= 210 nm). Limit of detection, 1 mg/L [Giroud *et al.*, 1998].

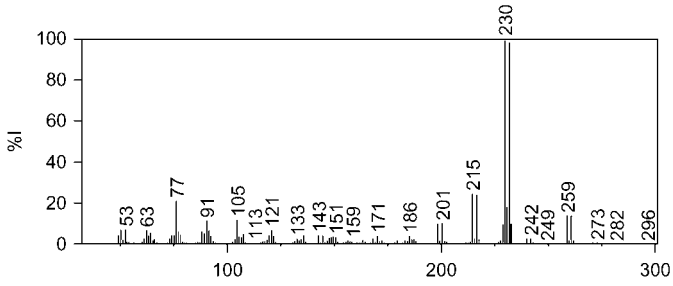
Capillary Electrophoresis Capillary: fused silica (total/effective length: 96/90 cm for sweeping MEKC and 100/94 cm for stacking MEKC, 50 µm i.d.). Lamp: Xe. Fluorescence detection (λ_{ex}= 300 nm, λ_{em}= 340 nm). Limit of detection, 36.4 and 4.94 µg/L for sweeping and stacking MEKC, respectively [Tsai *et al.* 2006].
Ultraviolet Spectrum Methanol—203 nm, 296 nm.



Infrared Spectrum Principal peaks at wavenumbers 1250, 1500, 825, 740, 750 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 230, 232, 215, 217, 77, 259, 261, 91; 242, 244, 229, 148, 301, 303, 77, 201 (AC); 244, 242, 229, 231, 148, 455, 457, 199 (HFB derivative) [Giroud *et al.* 1998].



Quantification

Blood **GC-MS** Column: Phenomex ZBI (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 100° for 1 min to 200° at 10°/min to 300° at 60°/min for 14 min. EI ionisation, SIM acquisition mode. Limit of detection, 5 to 10 µg/L [Vorce, Sklerov 2004].
Plasma **HPLC** Column: Daisopak SP-120-5-ODS-BP (250 × 4.6 mm i.d., 5 µm). Mobile phase: methanol-water-ethyl acetate (69 : 30 : 1) : acetonitrile-water (70 : 30; 60 : 40 for 20 min, 5 : 95 at 26 min until 49 min to 60 : 40). Fluorescence detection (λ_{ex}=325 nm, λ_{em}= 430 nm). Limit of detection, 312 ng/L [Kaddoumi *et al.* 2001].

GC-MS Column: HP-5MS capillary 5% phenylmethylsiloxane (30 m × 0.25 mm i.d., 250 nm). Carrier gas: He, 1.1 mL/min. Temperature programme: 80° for 0.5 min to 310° at 30°/min for 2 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 10 µg/L [Habrdova *et al.* 2005].

Urine **GC-MS** See Blood [Vorce, Sklerov 2004]. Column: Supelco fused silica capillary (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 0.8 mL/min. Temperature programme: 80° for 3 min to 220° at 40°/min to 280°at 8°/min for 3 min. SIM acquisition mode. Limit of detection, 10 µg/L [Namera *et al.* 2002].

HPLC Column: Waters Spherisorb C_{18} ODS2 (250 × 4.6 mm, 5 µm). Mobile phase: methanol: 0.05 mol/L ammonium acetate buffer containing 0.1% triethylamine (pH 3.9, 23 : 77 for 19 min to 35 : 65 for 16 min), flow rate 0.7 mL/min to 8 min to 1.2 mL/min to 19 min to 1.4 mL/min to 35 min. UV detection (λ= 210 nm). Limit of detection, 105 µg/mL [Soares *et al.* 2004].

LC-MS Direct injection, positive ion mode, MRM acquisition mode. Limit of detection, 50 µg/L [Nordgren *et al.* 2005]. Column: HyPURITY Advance (30 × 2.1 mm, 3 µm). Mobile phase: 10 mmol/L ammonium acetate : methanol (95 : 5 at 0.1 min to 20 : 80 at 1 min to 95 : 5 for 5 min), flow rate 400 µL/min. APCI, positive ion mode. Retention time: 1.44 min. Limit of detection, 0.5 µg/L [Nordgren, Beck 2004].

Hair **GC-MS** Column: DB-5MS capillary (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.1 mL/min. Temperature programme: 90° for 3 min to 170° at 15°/min for 3 min to 210° at 25°/min for 1.5 min to 230° at 20°/min for 0.5 min to 300° at 35°/min for 0.5 min. EI ionisation mode at 70 eV, SIM acquisition mode. Limit of quantification, 20 pg/mg, limit of detection, 4 pg/mg [Kim *et al.* 2007].

Other **HPLC** Tablets. Column: Lichrospher RP-8 Select B (250 × 4 mm i.d., 5 µm). Mobile phase: acetonitrile : 10 mmol/L potassium phosphate buffer (pH 3.2; 5 : 95 to 60 : 40 at 20 min), flow rate 1.0 mL/min. UV detection (λ = 210 nm). Quantification, down to 1 ng/L [Giroud *et al.* 1998].

GC-MS Rat Urine. Column: HP-1 capillary cross-linked methylsilicone (12 m × 0.2 mm i.d., 330 nm). Carrier gas: He, 1 mL/min. Temperature programme: 100° to 310° at 30°/min. EI ionisation at 70 eV. Limit of detection not reported [Theobald *et al.* 2007]. Tablets. Column: HP Ultra-2 silica phenylmethylsilicone (25 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He. Temperature programme: 55° to 190° at 20°/min to 305° at 10°/min for 11 min. Limit of detection, 1 mg/L [Giroud *et al.* 1998].

Disposition in the Body Metabolised by oxidative deamination and demethylation to form 2-(4-bromo-2,5-dimethoxyphenyl)-ethanol, 4-bromo-2,5-dimethoxyphenylacetic acid, 4-bromo-2,5-dimethoxybenzoic acid, and 2-(4-bromo-2-hydroxy-5-methoxyphenyl)ethanol [Carmo *et al.* 2005].

Toxicity There have been no published cases of fatal 2C-B toxicity. It is a partial agonist of serotonergic receptors producing euphoric and hallucinogenic effects (auditory and visual), which increase with dosage.

Note For further information, see Giroud *et al.* [1998] and Shulgin, Shulgin [1991].

Dose Light dose 5 to 15 mg; strong dose 20 to 50 mg [Cole *et al.* 2002].

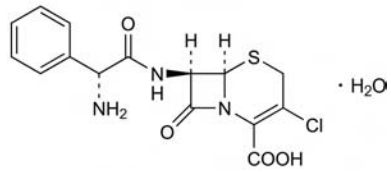
CAS—53994-73-3 (anhydrous); 70356-03-5 (monohydrate)

IUPAC Name (6*R*,7*R*)-7-[[(2*R*)-Aminophenylacetyl]amino]-3-chloro-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid monohydrate

Proprietary Names *Alfatil*; *Cec*; *Ceclor*; *Ceclorbeta*; *Cefabiocin*; *Cefallone*; *Cefa-Wolff*; *Cef-diolan*; *Distaclor*; *Infectocef*; *Keflor*; *Kefolor*; *Keftid*; *Kloclor*; *Panacef*; *Panoral*; *Sigacefal*; *Vercef*.

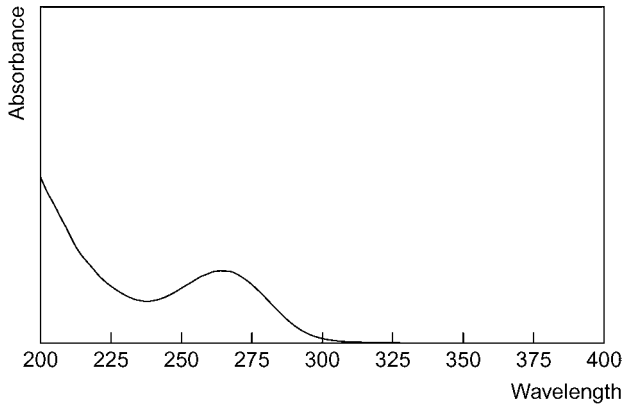


Chemical Properties A white to off-white, or slightly yellow, crystalline powder. It is soluble to slightly soluble in water (10 g/L); practically insoluble in benzene, chloroform, dichloromethane, and methanol (all <0.5 g/L). pK_a 1.5, 7.2 (water); 4.33, 7.34 (66% DMF). Log *P* (octanol/water), 0.35.

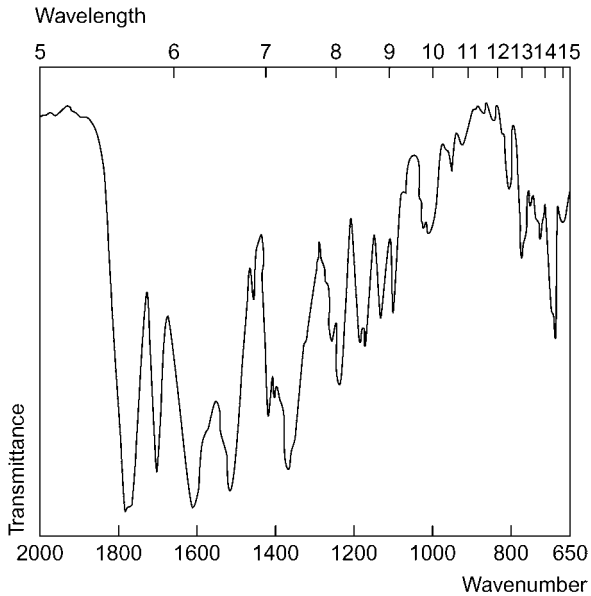
Thin-layer Chromatography System TE—R_f 0.00; system TF—R_f 0.00.

High Performance Liquid Chromatography System HX—RI 268.

Ultraviolet Spectrum Aqueous acid (0.1 mol/L hydrochloric acid)—265 nm.



Infrared Spectrum Principal peaks at wavenumbers 1775, 1693, 1600, 1365, 1500, 1560 cm^{-1}.



Quantification

Plasma **HPLC** UV detection (λ=265 nm). Limit of detection, 0.5 mg/L [Kovach, Lantz 1991]. UV detection. UV detection (λ=254 nm). Limit of detection, 0.5 mg/L [Signs *et al.* 1984].

Serum **HPLC** See Plasma [Kovach, Lantz 1991]. UV detection. Limit of detection, about 1 mg/L [Lindgren 1987]. UV detection (λ=240 nm). Limit of detection, 1 mg/L [McAteer *et al.* 1987].

Urine **HPLC** See Plasma [Kovach, Lantz 1991].

Disposition in the Body Cefaclor is well absorbed after oral administration; food may delay absorption but the total amount absorbed is unchanged. The peak concentration, however, with food is 50 to 75% of that observed for the drug when administered in the fasting state. It is widely distributed in the body and crosses the placenta and low concentrations appear in breast milk. Cefaclor is rapidly excreted by the kidneys; up to 85%

of a dose appears unchanged in urine within 8 h, with the greater proportion appearing in the first 2 h. Probenecid delays excretion. Some cefaclor is removed by haemodialysis.

Therapeutic Concentration The serum therapeutic concentration range is 13 to 35 mg/L for an oral dose and up to 900 mg/L for an IV dose.

Oral doses of 250, 500 and 1000 mg administered to fasting individuals, produce peak plasma concentrations of about 7, 13 and 23 mg/L, respectively at 0.5 to 1 h [Eli Lilly & Co. Ltd].

Half-life Plasma half-life, 0.5 to 1 h; 2.3 to 2.8 h in patients with the complete absence of renal function. Serum, 0.6 to 0.9 h; slightly prolonged in patients with renal impairment.

Protein Binding 25%.

Dose Adults: usually 250 to 500 mg of anhydrous cefaclor every 8 h. Total daily dose should not exceed 4 g. Children: usual recommended daily dose is 20 mg/kg every 8 h.

Data as supplied by Eli Lilly & Company Ltd.

Urine **HPLC** See Serum [Kovach *et al.* 1991].

Biological Fluids **HPLC** For a review of methods for the analysis of antibiotics, see Nilsson-Ehle [1983].

Disposition in the Body

Therapeutic Concentration

Non-fasting and fasting patients were administered a single oral dose of 250 mg or 500 mg cephalexin. The highest concentration of the drug in radicular granuloma was observed 2 h after dosing at a concentration of 1.65 mg/g after the 250 mg dose in the non-fasting patients. The highest concentration for the 500 mg dose was observed to be 3.35 mg/g after 2 h for the non-fasting and 3.42 mg/g after 1.5 h for the fasting patients [Akimoto *et al.* 1994].

Dose 1 to 6 g daily.

Kovach PM *et al.* (1991). High-performance liquid chromatographic determination of loracarbef, a potential metabolite, cefaclor and cephalexin in human plasma, serum and urine. *J Chromatogr* 567(1): 129–139.

Akimoto Y *et al.* (1994). Cephalexin concentrations in radicular granuloma following a single oral administration of 250- or 500-mg cephalexin. *Gen Pharmacol* 25(8): 1563–1566.

Cefaloridine

Antibiotic

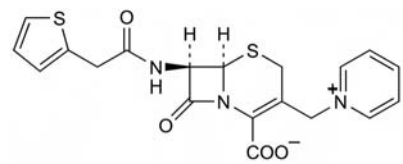
$C_{19}H_{17}N_3O_4S_2 = 415.5$

CAS—50-59-9

IUPAC Name (6*R*, 7*R*)-8-Oxo-3-(pyridin-1-ium-1-ylmethyl)-7-[(2-thiophen-2-ylacetyl)amino]- 5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate

Synonym 1-[[(6*R*,7*R*)-2-Carboxy-8-oxo-7-[(2-thienylacetyl)amino]-5-thia-1-azabicyclo[4.2.0]oct-2-en-3-yl]methyl]pyridinium inner salt; cephaloridine.

Proprietary Names *Cepaloridin*; *Cepalorin*; *Ceporan*; *Ceporin(e)*; *Keflodin*; *Loridine*.



Chemical Properties A white crystalline powder, which discolours on exposure to light. Soluble 1 in 5 of water and 1 in 1000 of ethanol; practically insoluble in chloroform and ether. pK_a 3.2. Log *P* (octanol/water), −1.6.

Colour Tests Mandelin's test—violet; Marquis test—red-violet.

Thin-layer Chromatography System TA—R_f 0.73 (acidified potassium permanganate solution, positive).

Ultraviolet Spectrum Aqueous acid—241 (A^1_1=350a), 254 nm (A^1_1=341a); aqueous alkali—261 nm (A^1_1=88b); methanol—234 nm (A^1_1=372a).

Infrared Spectrum Principal peaks at wavenumbers 1600, 1764, 1656, 1538, 715, 1143 cm^{-1} (KBr disk).

Dose 1 to 3 g daily, IM; maximum of 6 g daily.

Cefalothin

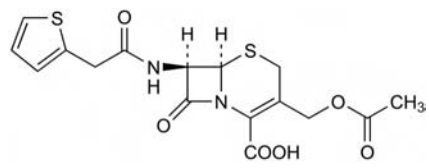
Antibiotic

$C_{16}H_{16}N_2O_6S_2 = 396.4$

CAS—153-61-7

IUPAC Name (6*R*,7*R*)-3-[(Acetyloxy)methyl]-8-oxo-7-[(2-thienylacetyl) amino]-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid

Synonyms Cefalotin; cephalothin.



Chemical Properties Mp 160°. pK_a 2.2 (35°). Log *P* (octanol/water), 0.0.

Cefalothin Sodium

$C_{16}H_{15}N_2NaO_6S_2 = 418.4$

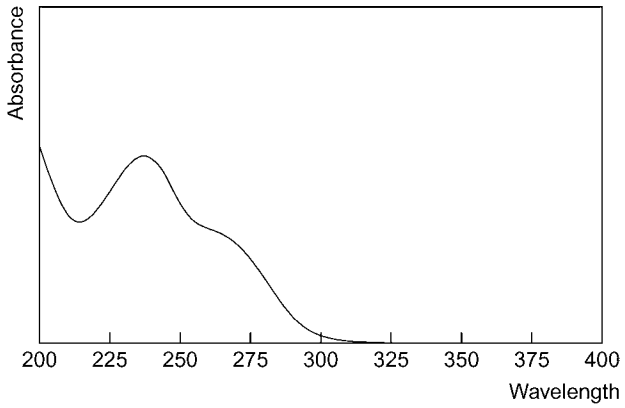
CAS—58-71-9

Proprietary Names *Ceporacin*; *Cepovenin*; *Keflin*.

Chemical Properties A white crystalline powder. Mp 204° to 205°. Soluble 1 in 3.5 of water and 1 in 700 of ethanol; practically insoluble in chloroform and ether.

Thin-layer Chromatography System TAJ—R_f 0.00; system TAK—R_f 0.06; system TAL—R_f 0.41.

Ultraviolet Spectrum Cefalothin sodium: water—237 (A^1_1=335a), 265 nm (A^1_1=204b).

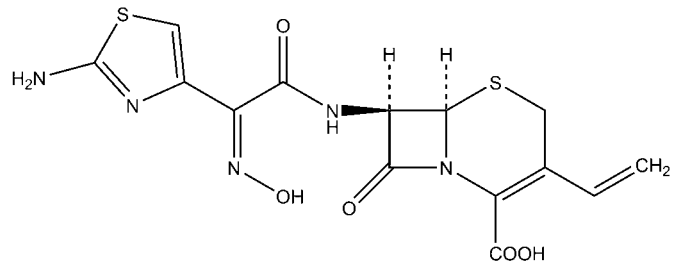


Infrared Spectrum Principal peaks at wavenumbers 1704, 1724, 1637, 1600, 1227, 1510 cm^{-1} (cefalothin sodium, KBr disk).
Dose The equivalent of 4 to 12 g of cefalothin daily, IV.

Cefdinir

Antibacterial, Cephalosporin
$C_{14}H_{13}N_5O_5S_2 = 395.4$
CAS—91832-40-5

IUPAC Name (−)-(6*R*,7*R*)-7-[2-(2-Amino-4-thiazolyl)glyoxylamido]-8-oxo-3-vinyl-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 72-(*Z*)-oxime
Synonyms 7-{(2-Amino-1,3-thiazol-4-yl)-2-[(*Z*)-hydroxyimino]acetamido}-3-vinylcephem-4-carboxylic acid; BMY-28488; FK-482.
Proprietary Names *Cefzon*; *Kefdir*; *Omnicef*; *Sefdin*.



Chemical Properties White to slightly brownish-yellow solid. Mp 170° (with decomposition). Slightly soluble in dilute hydrochloric acid; sparingly soluble in 0.1 mol/L phosphate buffer (pH 7.0). pK_a 9.70 [O'Neil *et al.* 2006]. Cefdinir degrades via 2 major routes in aqueous solution, β-lactam ring opening and pH-dependent isomerisation: lactonisation and epimerisation at C-6 under acidic to neutral conditions, isomerisation of the *N*-oxime function under neutral to basic conditions, and epimerisation at C-7 under basic conditions [Okamoto *et al.* 1996a].
High Performance Liquid Chromatography Column: C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.05 mol/L potassium dihydrogen phosphate : methanol : TEA (75 : 25 : 0.2; pH 2.2 with perchloric acid), flow rate 1.0 mL/min. UV detection (λ = 287 nm). Retention time: ~10 min. Limit of quantification not reported [Mehta *et al.* 2005]. Column: TSK-gel ODS-80T × M (75 × 4.6 mm i.d., 5 µm). Mobile phase: dioxane : methanol : 33 mmol/L citric acid buffer (pH 2.0; 1 : 4 : 36), flow rate 1.5 mL/min. UV detection (λ = 254 nm). Retention time: ~4.0 min. Limit of quantification, 0.5 mg/L [Okamoto *et al.* 1996a, b].
Quantification
***Plasma* HPLC** Column: TSK-gel ODS-80TM (75 × 4.6 mm i.d., 5 µm). Mobile phase: dioxane : methanol : 33 mmol/L citric acid buffer (pH 2.0; 1 : 4 : 36), flow rate 1.0 mL/min. UV detection (λ = 280 nm). Retention time: 12.0 min. Limit of quantification not reported [Fujita *et al.* 2007]. Column: TSK-gel ODS-80TM (250 × 4.6 mm i.d.). Mobile phase: citrate buffer (pH 2.5) : acetonitrile, flow rate 1.2 mL/min. UV detection (λ = 280 nm). Limit of detection, 0.05 mg/L [Hishida *et al.* 1998]. Column: NovaPak C_{18} (4 µm). Mobile phase: acetonitrile: 0.015 mol/L dibasic potassium phosphate (pH 3.1; 12 : 88), flow rate 1.0 mL/min. UV detection (λ = 287 nm). Retention time: 7.6 min. Limit of detection, 0.015 mg/L [Richer *et al.* 1995].
LC-MS Column: C_{18} (50 × 2.1 mm i.d., 5 µm). Mobile phase: methanol : water : formic acid (25 : 75 : 0.075), flow rate 0.2 mL/min. ESI, positive ion mode, SRM acquisition mode. Retention time: 2.4 min. Limit of quantification, 5 µg/L [Chen *et al.* 2006].
***Urine* HPLC** Column: TSK-gel ODS-80TM (75 × 4.6 mm i.d., 5 µm). Mobile phase: dioxane : methanol : 33 mmol/L citric acid buffer (pH 2.0; 1 : 4 : 36), flow rate 1.0 mL/min. UV detection (λ = 280 nm). Retention time: 12.0 min. Limit of quantification not reported [Fujita *et al.* 2007].
***Other* HPLC** Blister Fluid. Column: NovaPak C_{18} (4 µm). Mobile phase: acetonitrile : 0.015 mol/L dibasic potassium phosphate (pH 3.3, 11 : 89), flow rate 1.0 mL/min. UV detection (λ = 287 nm). Retention time: 8.2 min. Limit of detection, 0.05 mg/L [Richer *et al.* 1995]. Pharmaceutical Suspension. Column: C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.05 mol/L potassium dihydrogen phosphate : methanol : TEA (pH 2.2; 75 : 25 : 0.2), flow rate 1.0 mL/min. UV detection (λ = 287 nm). Retention time: approx. 10 min. Limit of quantification, 0.03 mg/L, limit of detection, 0.01 mg/L [Mehta *et al.* 2005].
Disposition in the Body Readily absorbed from the gastrointestinal tract after oral doses, with peak plasma concentrations occurring 2 to 4 h after a dose. It is widely distributed and shows good penetration into bronchial mucosa and epithelial lining fluid, tonsillar tissue, sinus tissue, skin blister fluid, and middle ear fluid. Cefdinir does not penetrate into alveolar macrophages. Distribution into skin blisters is reported to average 48% of plasma concentrations. It is not appreciably metabolised in adults and is predominantly eliminated via the kidneys as unchanged drug (12 to 18% of the total dose). Cefdinir is removed by dialysis.
Therapeutic Concentration

Twenty-nine young patients (aged 6 months to 10 years) were administered a single 14 mg/kg dose of cefdinir on day 1 followed by another 25 mg/kg dose on day 2, under fasted or non-fasted conditions. Mean peak plasma cefdinir concentrations were reported as follows:

	14 mg/kg		*25 mg/kg*	
	Non-fasting	*Fasting*	*Non-fasting*	*Fasting*
C_{max} (mg/L)	2.07	1.80	3.70	4.42
Time (h)	3.40	2.90	2.90	2.70

[Bowlware *et al.* 2006].

Sixteen healthy male volunteers (age 19 to 30 years) were administered a single dose of 200, 300, 400 or 600 mg cefdinir on each of study days 1, 8, 15 and 22. Mean peak plasma and blister fluid cefdinir concentrations were reported as follows:

Dose (mg)	*Plasma*		*Blister fluid*	
	C_{max} (mg/L)	*Time (h)*	*C_{max} (mg/L)*	*Time (h)*
200	1.00	3.3	0.54	4.9
300	1.55	3.2	0.67	4.9
400	2.15	3.0	0.89	4.8
600	2.35	3.2	1.09	4.8

[Richer *et al.* 1995].

Sixteen elderly patients (mean age 62 years) requiring bronchoscopy were administered a single oral dose of either 300 or 600 mg cefdinir. Concentrations of cefdinir in serum, bronchial mucosa and epithelial lining fluid were 2.00, 0.78 and 0.29 mg/L, respectively, for the 300 mg dose and 4.20, 1.14 and 0.49 mg/L, respectively, following the 600 mg dose. The extent of penetration of cefdinir into bronchial mucosa after both doses was 31 to 41% [Cook *et al.* 1996].
Note For a study of cefdinir pharmacokinetics in haemodialysis patients, see Hishida *et al.* [1998].
Toxicity Absorption of cefdinir is decreased by antacids or iron supplements, and doses should be separated by an interval of at least 2 h. Probenecid reduces the renal excretion of cefdinir. The pharmacokinetics of cefdinir are altered in patients with renal impairment.
Bioavailability Between 16 and 25%.
Half-life 1.7 h.
Volume of Distribution Approximately 1.6 to 2.1 L/kg.
Protein Binding Approximately 60 to 70%.
Dose The usual adult dose is 600 mg daily as a single dose or in two divided doses given orally. Children may be given 14 mg/kg daily up to a maximum of 600 mg daily. Doses may need to be reduced in patients with renal impairment.

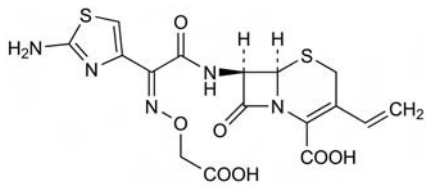
Cefixime

Antibacterial
$C_{16}H_{15}N_5O_7S_2 = 453.5$
CAS—79350-37-1

IUPAC Name (6*R*,7*R*)-7-[[(2*Z*)-(2-Amino-4-thiazolyl)[(carboxymethoxy)imino]acetyl]amino]-3-ethenyl-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid
Synonyms Cefiximum; CL-284635; FK-027; FR-17027.
Proprietary Names *Aerocef*; *Cefixoral*; *Cefspan*; *Cephoral*; *Denvar*; *Fixim(e)*; *Oroken*; *Necopen*; *Suprax*; *Tricef*; *Unixine*.



Chemical Properties A white/almost white to light-yellow crystalline powder. It is slightly soluble in water and alcohol; sparingly soluble in dehydrated alcohol and acetone; freely soluble in methyl alcohol, glycerol and propylene glycol; very slightly soluble in 70% sorbitol and octanol; practically insoluble in ether, ethyl acetate and hexane. pK_a, 3.73.

Cefixime Trihydrate

$C_{16}H_{21}N_5O_{10}S_2 = 507.5$
Chemical Properties Pale-yellow solid. Mp 218° to 225°.

Cefixime Disodium Salt

$C_{16}H_{13}N_5Na_2O_7S = 465.4$
Chemical Properties Mp >250°.

Thin-layer Chromatography Plate: silica gel with (2.5 × 10 cm). Mobile phase: ethylacetate: acetone: methanol: water (5:2.5:2.5:1.5). R_f 0.67 [Eric-Jovanovic *et al.* 1998].
High Performance Liquid Chromatography System HAA—retention time 4.8 min.
Quantification
Serum **HPLC**. Column: reversed phase Altex Ultrasphere Octyl C_8 (15 cm x 4.6 mm i.d., 5 µm). Mobile phase: methanol: 12.5 mmol/L monobasic sodium potassium buffer (pH 2.6, 20 : 80), flow rate 2 mL/min. UV detection (λ=240 nm). Limit of detection, 0.1 mg/L [McAteer *et al.* 1987].
Bioassay Limit of detection 0.1 mg/L [Brittain *et al.* 1985].
Urine **Bioassay** Limit of detection, 2.0 mg/L [Brittain *et al.* 1985].
Disposition in the Body 40 to 50% of an orally administered dose of cefixime (tablet form or as a suspension) is slowly absorbed. 20% of a dose (or 50% of the absorbed dose) is excreted unchanged in the urine within 24 h. Possibly up to 60% is eliminated by non-renal pathways, with some excretion in faeces as bile. There is no evidence of metabolism. Cefixime crosses the placenta.
Therapeutic Concentration An oral suspension dose provides on average a peak concentration 25 to 50% higher than that for the tablet form.
Twelve healthy subjects, aged between 24 and 31 years, were administered with a 50, 100, 200 and 400 mg dose of cefixime, after fasting. Peak serum concentrations of 1.02 ± 0.12, 1.46 ± 0.09, 2.63 ± 0.2 and 3.85 ± 0.23 mg/L were reached, respectively, within 2.5 to 4.5 h [Brittain *et al.* 1985].
Toxicity Diarrhoea and pseudomembranous colitis can be mild to life-threatening. Doses up to 2 g have been administered and no other serious toxic effects observed.
Bioavailability 22 to 54% (oral).
Half-life Elimination half-life is between 3 and 4 h.
Volume of Distribution 0.1 L/kg.
Clearance Serum, 0.4 mL/min/kg.
Protein Binding Approximately 65%.
Dose Adults: 200 to 400 mg daily. Children with a body weight <50 kg: 8 mg/kg body weight daily. Patients with a creatinine clearance <20 mL/min: maximum 200 mg daily.

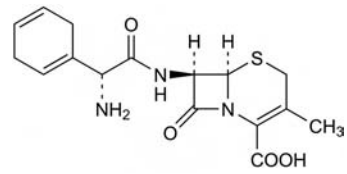
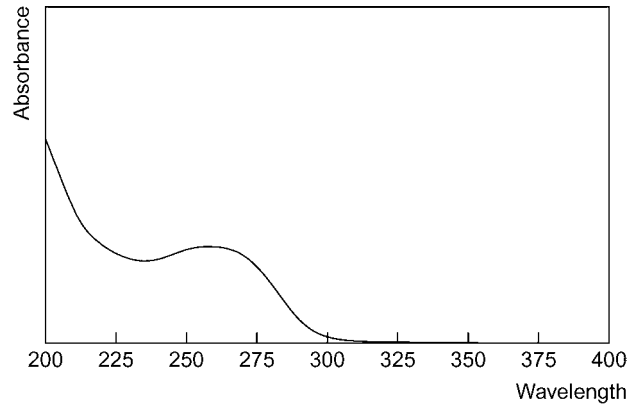
Cefradine

Antibiotic
$C_{16}H_{19}N_3O_4S = 349.4$
CAS—38821-53-3 (anhydrous); 75975-70-1 (monohydrate); 31828-50-9 (dihydrate)

IUPAC Name (6*R*,7*R*)-7-[[(2*R*)-Amino-1,4-cyclohexadien-1-ylacetyl]amino]-3-methyl-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid
Synonyms Cephradine; SQ-11436.
Proprietary Names *Anspor*; *Eskacef*; *Maxisporin*; *Megacef*; *Sefril*; *Velosef*.



Chemical Properties A white to cream-coloured crystalline powder. Soluble 1 in 100 of water and 1 in 70 of methanol; practically insoluble in ethanol, chloroform, and ether. pK_a 2.5, 7.3 (35°). Log *P* (octanol/water), 0.4.
Ultraviolet Spectrum Aqueous acid—257 nm.



Infrared Spectrum Principal peaks at wavenumbers 1754, 1582, 1678, 1271, 1235, 1190 cm^{-1} (KBr disk).
Quantification
Plasma **HPLC** UV detection (λ=260 nm). Limit of quantification, 0.2 mg/L [Johnson *et al.* 2000].
Disposition in the Body
Therapeutic Concentration
Ten healthy, young male and female volunteers (aged 19 to 25 years) and nine elderly volunteers (aged 65 to 81 years) were administered 1 g cephradine as a 5-min IV infusion followed by 1 g oral dose the next day. The mean serum drug concentration was 1.52 mg/L 6 h after dosing and 0.73 mg/L after 8 h for the elderly volunteers compared with 0.43 mg/L at 6 h for the younger volunteers [Schwinghammer *et al.* 1990].
Dose 1 to 4 g daily.

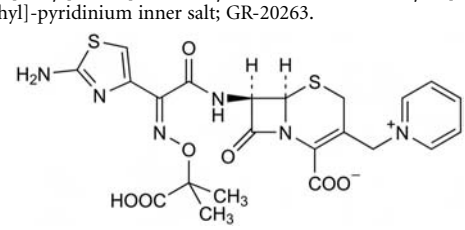
Ceftazidime

Antibacterial
$C_{22}H_{22}N_6O_7S_2 = 546.6$
CAS—72558-82-8

IUPAC Name 6*R*,7*R*)-7-[[(2*Z*)-2-(2-Amino-1, 3-thiazol-4-yl)-2-(1-hydroxy-2-methyl-1-oxopropan-2-yl)oxyiminoacetyl] amino]-8-oxo-3-(pyridin-1-ium-1-ylmethyl)-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate
Synonym 1-[[(6*R*,7*R*)-7-[[(2*Z*)-(2-Amino-4-thiazolyl)[(1-carboxy-1-methylethoxy)imino]acetyl]amino]-2-carboxy-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-en-3-yl]methyl]-pyridinium inner salt; GR-20263.



Chemical Properties pK_a 1.9, 2.7, 4.1.

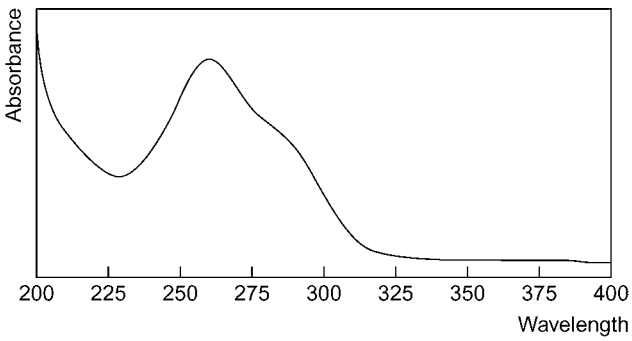
Ceftazidime Pentahydrate

$C_{22}H_{22}N_6O_7S_2$, $5H_2O$ = 636.7
CAS—78439-06-2

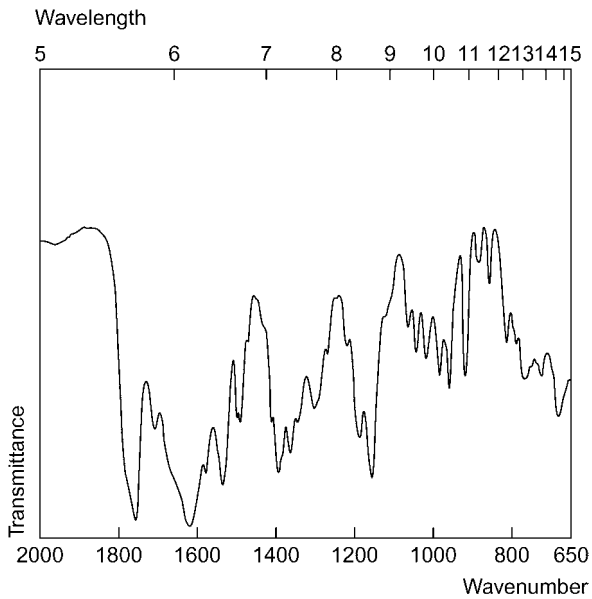
Proprietary Names *Ceftim*; *Ceptaz*; *Fortam*; *Fortaz*; *Fortum*; *Glazidim*; *Kefadim*; *Kefamin*; *Kefazim*; *Kefzim*; *Panzid*; *Potendal*; *Spectrum*; *Starcef*; *Tazicef*; *Tazidime*.

Chemical Properties A white to cream-coloured crystalline powder. Mp 135° to 137°, with decomposition (dark brown). It is slightly soluble in water (5 g/L); soluble in dimethylsulfoxide and in alkali; slightly soluble in dimethyl formamide and in methanol; practically insoluble in acetone, in chloroform, in dioxan, in ethanol (<1 g/L), in ether, in ethyl acetate, and in toluene; soluble in alkali.

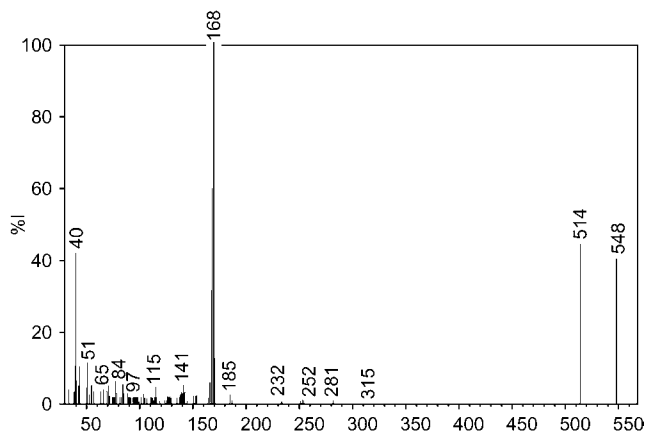
Ultraviolet Spectrum Aqueous acid (0.2 mol/L NH_2SO_4)—259 nm; (methanol)—257 nm; (0.1 mol/L sulfuric acid)—260 nm (A=2.514); basic—257 nm.



Infrared Spectrum Principal peaks at wavenumbers 1621, 1757, 1537, 1157, 3000–3600 cm^{-1} (pentahydrate salt) (KBr pellet).



Mass Spectrum Principal ions at *m/z* 168, 167, 514, 548, 40, 166, 51.



Quantification

Serum **HPLC** Column: C_{18} LiChrosorb (250 × 4.6 mm, 10 µm). Mobile phase: methanol (6%) : 100 mM sodium phosphate buffer (pH 6.0), flow rate 2.5 mL/min. Retention time: 9.6 min. UV detection (λ=254 nm). Limit of detection, 1 mg/L [Holt *et al.* 1990]. UV detection. Limit of detection, 0.2 mg/L (conventional HPLC), 0.05 mg/L (high-speed HPLC) [Jehl *et al.* 1987]. Column: C_{18} µBondapak (300 × 3.9 mm i.d.). Mobile phase for serum analysis: 150 mmol/L potassium dihydrogen phosphate buffer (pH 6.5) : methanol (82:18), flow rate 1.2 mL/min. For urine analysis: 50 mM potassium dihydrogen phosphate buffer (pH 6.5) : methanol (88:12). Retention time in serum and urine: 5.0 min. UV detection (λ=255 nm). Limit of detection, 1 mg/L [Leeder *et al.* 1983]. Column: RP MCH 10 Micropak (300 × 4.0 mm). Temperature: 50°. Mobile phase: (method A) 20% methanol : 50 mmol/L 80% aqueous ammonium dihydrogen phosphate and 117 µM perchloric acid, flow rate 1.0 mL/min. (Method B) 9% acetonitrile : 91% phosphate–perchloric acid solution (as method A), flow rate 0.5 mL/min, increased to 1.5 mL/min over first 4 min. *k* value: 0.3. UV detection (λ=257 nm). Limit of detection, 0.3 mg/L [Myers, Blumer 1983].

Urine **HPLC** See Serum [Holt *et al.* 1990]. See Serum [Jehl *et al.* 1987]. See Serum [Leeder *et al.* 1983]. See Serum [Myers, Blumer 1983].

Bile **HPLC** See Serum [Jehl *et al.* 1987].

Cerebrospinal Fluid **HPLC** See Serum [Holt *et al.* 1990].

Disposition in the Body Ceftazidime is not absorbed by oral administration but is given by injection as its sodium salt or in solution with arginine. It is widely distributed in body tissues and fluids including bone, synovial fluid, heart and bile; therapeutic concentrations are achieved in the CSF when the meninges are inflamed. The drug crosses the placenta and is distributed into breast milk. It is passively excreted in bile, although only a small proportion is eliminated by this route. The drug is mainly excreted by the kidneys, almost exclusively by glomerular filtration. About 80 to 90% of a dose is recovered unchanged in urine in 24 h as it does not undergo metabolism. It is removed by haemodialysis and peritoneal dialysis. There is no evidence of accumulation of the drug in serum after multiple dosing.

Therapeutic Concentration The trough serum therapeutic concentration range is 20 to 40 mg/L and peak, 50 to 200 mg/L.

In healthy adults, mean peak serum concentrations of 45 and 90 mg/L have been reported after IV administration of 500 mg and 1 g, respectively, over 5 min. Mean peak serum concentrations of 42, 69 and 170 mg/L have been reported after IV infusion of 500 mg, 1 g and 2 g, respectively, over 20 to 30 min. These concentrations were observed up to 30 min after the end of infusion. After IM injection of 500 mg and 1 g ceftazidine, mean peak serum concentrations were 17 and 39 mg/L, respectively, at approximately, 1 h. Serum concentrations stayed above 4 mg/L for 6 to 8 h after these doses [Eli Lilly & Co.].

Toxicity

Ceftazidime overdosage may lead to neurological effects, including encephalopathy, neuromuscular excitability, convulsions and coma. Seizures may occur in patients with renal impairment [Eli Lilly & Co.].

Half-life Plasma half-life, ~2 h.

Volume of Distribution Steady state, 0.2 to 0.3 L/kg.

Clearance Plasma clearance, 115 mL/min; serum, 98 to 122 mL/min (healthy individuals); 142 to 376 mL/min/1.73m^2 for patients suffering with cystic fibrosis; 79 mL/min for geriatric patients aged between 63 and 83 years.

Protein Binding <10%.

Note For a review of ceftazidime, see Rains *et al.* [1995].

Dose Adults: usual dose is 500 mg to 2 g every 8 to 12 h. In patients >80 years, daily dose should not exceed 2 g. Infants and children over 2 months: between 50 and 150 mg/kg daily IV. Maximum is 6 g daily. Neonates and children up to 2 months: 25 to 60 mg/kg daily. Dose should be reduced in patients with impaired renal function.

Ceftriaxone

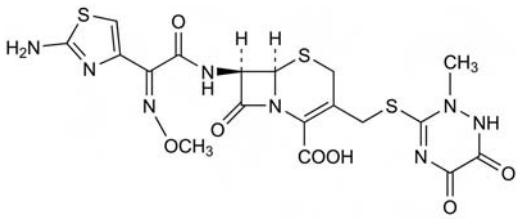
Antibacterial

$C_{18}H_{18}N_8O_7S_3$ = 554.6
CAS—73384-59-5

IUPAC Name (6*R*,7*R*)-7-[[(2*Z*)-2-(2-Amino-1,3-thiazol-4-yl)-2-methoxyiminoacetyl]amino]-3-[(2-methyl-5,6-dioxo-1H-1,2,4-triazin-3-yl)sulfanylmethyl]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid

Synonyms (6*R*,7*R*)-7-[[(2*Z*)-(2-Amino-4-thiazolyl)(methoxyimino)acetyl]amino]-8-oxo-3-[[(1,2,5,6-tetrahydro-2-methyl-5,6-dioxo-1,2,4-triazin-3-yl)

thio]-methyl]-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid; cefatriaxone, Ro-13-9904/000.

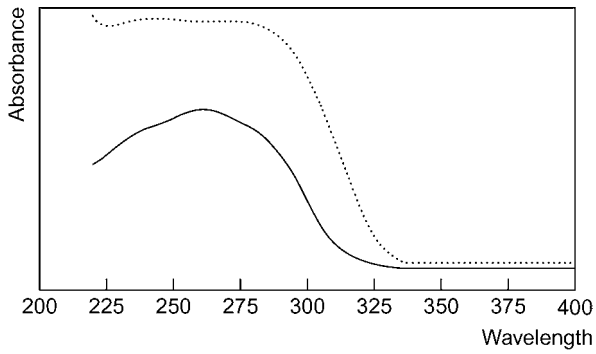


Chemical Properties pK_a 3, 3.2, 4.1. (disodium salt, hemiheptahydrate).

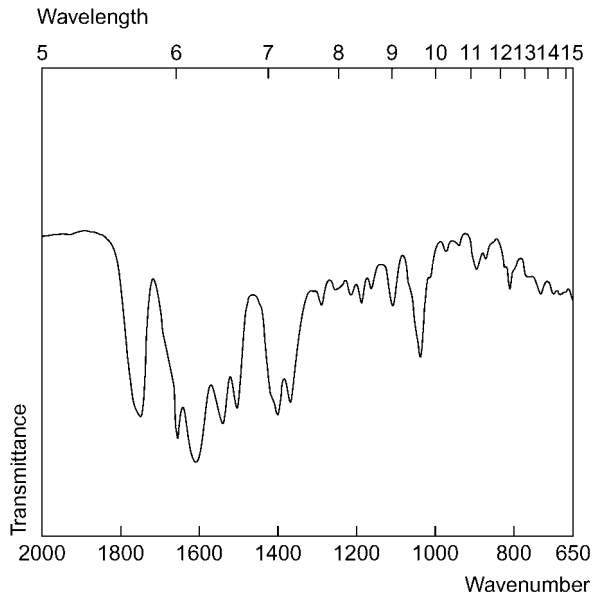
Ceftriaxone Sodium

$C_{18}H_{16}N_8Na_2O_7S_3$, $3^1/_2H_2O$ = 661.6
CAS—74578-69-1 (anhydrous); 104376-79-6 (hemiheptahydrate)
Synonym Cefatriaxone sodium
Proprietary Names *Hosbocin*; *Rocefalin*; *Rocefin*; *Rocephalin*; *Rocephin*; *Rocephine*.
Chemical Properties An almost white to yellowish-orange, slightly hygroscopic, crystalline powder. Mp >155°, with decomposition. It is freely or very soluble in water (40 g/100 mL at 25°); very slightly soluble in ethanol; sparingly soluble in methanol.

Thin-layer Chromatography System TB—R_f 0.00; system TE—R_f 0.00; system TF—R_f 0.00; system TAE—R_f 0.88.
High Performance Liquid Chromatography System HX—RI 239; system HAA—retention time 5.3 min.
Ultraviolet Spectrum Aqueous acid (0.2 mol/L NH_2SO_4)—261 nm; basic—242, 269 nm.



Infrared Spectrum Principal peaks at wavenumber 1739, 1598, 1527, 1393 cm^{-1} (KBr pellets).



Quantification
Plasma **HPLC** UV detection. Limit of detection, 0.4 mg/L [Ascalone, Dal Bò 1983].
Serum **HPLC** Column: C_{18} RP μBondapak (300 × 4.0 mm i.d.). Mobile phase: acetonitrile : 10 mmol/L potassium phosphate buffer (pH 9) containing 10 mmol/L hexadecyltrimethylammonium bromide (46:54), flow rate 1.5 mL/min. UV detection (λ=274 nm). Retention time: 4.6 min. Limit of detection, 1 mg/L [Granich, Krogstad 1987]. UV detection. Limits of detection, 0.2 mg/L (conventional HPLC), 0.05 mg/L (high-speed HPLC) [Jehl *et al.* 1987].
Urine **HPLC** See Serum [Granich, Krogstad 1987]. See Serum [Jehl *et al.* 1987]. UV detection. Limit of detection, 3.0 mg/L [Ascalone, Dal Bò 1983].
Bile **HPLC** See Serum [Jehl *et al.* 1987].
Cerebrospinal Fluid **HPLC** See Serum [Granich, Krogstad 1987].
Saliva **HPLC** UV detection. Limit of detection, 0.03 mg/L [Ascalone, Dal Bò 1983].
Disposition in the Body Following IM administration of ceftriaxone, peak plasma concentrations occur after about 2 to 3 h. It is widely distributed in body tissues and fluids; therapeutic concentrations may occur in the CSF when the meninges are inflamed. It crosses the placenta and is distributed into breast milk. High concentrations are found in bile. About 40 to 65% of a dose is excreted unchanged in urine, mainly by glomerular filtration; the remainder is excreted in bile and is found in faeces as the unchanged drug and inactive metabolites.
Therapeutic Concentration The serum therapeutic concentration range is 15 to 75 mg/L.

Peak plasma concentrations of 46.2 to 66.5 mg/L (mean, 54.9 mg/L) occurred 1 to 2 h after an IM injection of 500 mg administered to 6 subjects. Those participating in the study were males, mean age 25.7 years (range 19 to 43 years) with maturity-induced diabetes controlled by diet alone. Doses were repeated every 12h for a total of 5 doses. At steady state, the plasma concentrations ranged from 64.8 to 86.5 mg/L (mean 74.1 mg/L) [Pickup *et al.* 1981].

Half-life Plasma, 6 to 9 h.
Volume of Distribution 5.8 to 13.5 L.
Clearance Plasma, 0.58 to 1.45 L/h.
Protein Binding 85 to 95% depending on plasma concentration of ceftriaxone.
Note For reviews of the pharmacokinetics of ceftriaxone, see Yuk *et al.* [1989], Patel, Kaplan [1984] and Brogden, Ward [1988].
Dose 1 g daily or for severe infections, the equivalent of up to 4 g of ceftriaxone intravenously or intramuscularly daily.

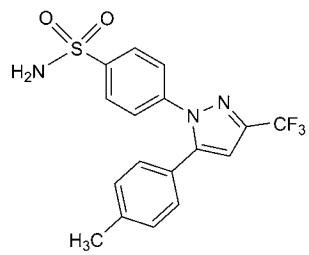
Celecoxib

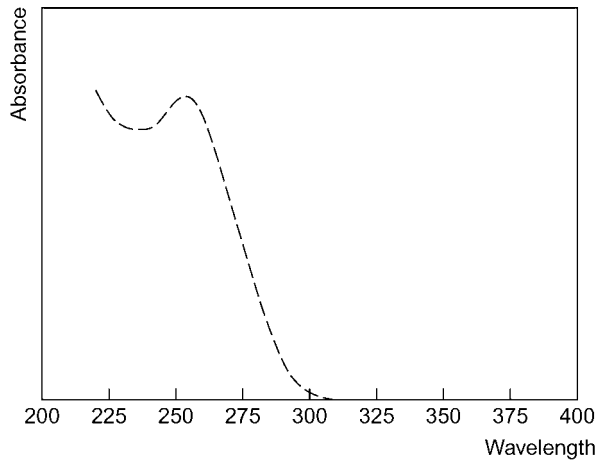
COX-2 Inhibitor, NSAID
$C_{17}H_{14}F_3N_3O_2S$ = 381.4
CAS—169590-42-5
IUPAC Name 4-[5-(4-Methylphenyl)-3-(trifluoromethyl)pyrazol-1-yl]benzenesulfonamide
Synonyms C-58635; *p*-[5-*p*-methylphenyl-3-(trifluoromethyl)-1*H*-pyrazol-1-yl]benzenesulfonamide; YM-177.
Proprietary Name *Celebrex*



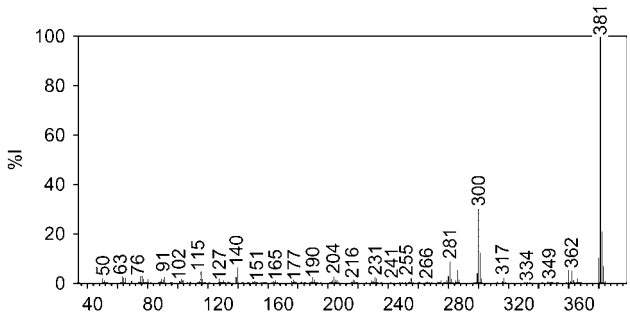
Chemical Properties Pale-yellow solid. Mp 157° to 159°. pK_a 11.1. Spiked plasma samples were stable at –20° for up to 2 months, 4° for at least 1 month, and at room temperature for 12 h [Zarghi *et al.* 2006]. Stable in plasma and breast milk for at least 4 freeze-thaw cycles if stored at –30°. The standard stock solution was stable for at least 4 months at 4° [Zhang *et al.* 2006]. The stability of analytes was established for 21 days at −20°, in frozen plasma at –20° for at least 3 freeze-thaw cycles, over 24 h at 5° and on the benchtop for 8 h [Pavan Kumar *et al.* 2006]. Standards and plasma samples were stable at −20° for 2 months and at room temperature for 24 h [Jalalizadeh *et al.* 2004]. Stable in plasma after 3 freeze-thaw cycles and at −70° for up to 9 months [Chow *et al.* 2004]. Serum samples were stable for at least 1 year when stored at −20°, after 3 freeze-thaw cycles, at room temperature for at least 3 days, and at 4° for at least 2 weeks [Schönberger *et al.* 2002]. Standard solutions were found to be stable at −80° for at least 2 months and for a

minimum of 2 weeks when stored protected from light at room temperature [Werner *et al.* 2002].

Ultraviolet Spectrum Aqueous acid (ethanol)—254 nm.



Mass Spectrum Principal ions at *m/z* 381, 300, 281, 140, 115, 362, 360, 204.



Quantification

Plasma **HPLC** Column: Chromolith Performance RP-18e (100 × 4.6 mm i.d.). Mobile phase: acetonitrile : methanol : distilled water (45 : 10 : 45) containing 0.2% acetic acid (pH 3.5), flow rate 2 mL/min. UV detection (λ = 254 nm). Retention time: 3.6 min. Limit of quantification, 10 µg/L [Zarghi *et al.* 2006]. Column: Aqua C_{18} (75 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.01 mol/L phosphate buffer (pH 3.5; 50 : 50) containing 0.1% triethylamine, flow rate 1.0 mL/min. UV detection (λ = 254 nm). Retention time: 8.2 min. Limit of quantification, 10 µg/L [Zhang *et al.* 2006]. Column: Kromasil KR 100-5 C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.05 mol/L formic acid (pH 3.0) : water-acetonitrile (5 : 95) : methanol-water (90 : 10; 100 : 0 : 0 at 0 min, 90 : 0 : 10 at 2 min, 50 : 20 : 30 at 9 min, 30 : 50 : 20 at 25 min, 10 : 85 : 5 at 35 min, 100 : 0 : 0 at 36 min until 45 min), flow rate 1.0 mL/min. UV detection (λ = 235 nm). Retention time: 32.2 min. Limit of quantification, 0.1 mg/L [Pavan Kumar *et al.* 2006]. Column: Zorbax SB-CN (5 µm). Mobile phase: acetonitrile : 0.1 mol/L potassium dihydrogen orthophosphate buffer (pH 2.4; 42 : 58), flow rate 1.0 mL/min. UV detection (λ = 254 nm). Retention time: 14.6 min. Limit of quantification, 10 µg/L [Hamama *et al.* 2005]. Column: Inertsil C_{18} ODS (25 cm × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 0.05% glacial acetic acid (68 : 32), flow rate 1.0 mL/min. DAD (λ = 230 nm). Retention time: 19 min. Limit of quantification, 3.2 mg/L; limit of detection, 1.0 mg/L [Rao *et al.* 2005]. Column: Nucleosil 100-5 CN (250 × 4.6 mm i.d.). Mobile phase: water : acetonitrile (60 : 40), flow rate 0.9 mL/min. UV detection (λ = 260 nm). Retention time: 7.02 min. Limit of quantification, 10 µg/L, limit of detection, 4 µg/L [Jalalizadeh *et al.* 2004]. Column: Nova Pak C_8 (150 × 3.9 mm i.d., 5 µm). Mobile phase: acetonitrile : tetrahydrofuran: 0.02 mol/L sodium acetate buffer (30 : 8 : 62), flow rate 1.5 mL/min. UV detection (λ = 215 nm). Retention time: 18 min. Limit of quantification, 40 µg/L [Chow *et al.* 2004]. Column: Phenomenex Luna C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile-0.01 mol/L sodium hydrogen phosphate buffer (pH 5.4; 10 : 90): acetonitrile-0.01 mol/L sodium hydrogen phosphate buffer (pH 5.4; 80 : 20, 90 : 10 for 10 min to 62 : 38 at 47 min to 27 : 73 at 63 min for 5 min to 90 : 10 at 68.1 min), flow rate 1.5 mL/min. UV detection (λ = 254 nm). Limit of quantification, 10 µg/L, limit of detection, 0.5 ng [Störmer *et al.* 2003]. Column: Nucleosil-NO_2 (150 × 4.6 mm i.d., 5 µm). Mobile phase: hexane : methylene chloride : isopropyl alcohol (70 : 25 : 5), flow rate 1.4 mL/min. UV detection (λ = 260 nm). Limit of quantification, 25 µg/L [Rose *et al.* 2000].

LC-MS Column: Nucleosil C_8 120-5 (11 × 2.0 mm i.d.). Mobile phase: methanol : water (50 : 50) with 1% acetic acid, flow rate 200 µL/min. APCI, SRM acquisition mode. Limit of quantification, 5 mg/L [Werner *et al.* 2002]. Column: Nucleosil C_{18} (30 × 2.0 mm i.d., 5 µm). Mobile phase: acetonitrile : water : 25% ammonium hydroxide solution (85 : 15 : 0.1), flow rate 0.2 mL/min. ESI, negative ion mode, MRM acquisition mode. Retention time: 0.8 min. Limit of quantification, 0.25 µg/L [Brautigam *et al.* 2001].

Serum **HPLC** Column: SGE C_{18} (15 cm × 4.6 mm i.d., 5 µm). Mobile phase: 10 mmol/L potassium dihydrogen orthophosphate (pH 3.2) : acetonitrile (50 : 50), flow rate 1.0 mL/min. UV detection (λ = 250 nm). Retention time, 9.6 min. Limit of quantification, 10 µg/L [Jayasagar *et al.* 2002]. Column: Prontosil C_{18} AQ (150 × 3.0 mm i.d., 3 µm). Mobile phase: water : acetonitrile (40 : 60), flow rate 0.35 mL/min. Fluorescence detection (λ_{ex} = 240 nm, λ_{em} = 380 nm). Retention time: 11.7 min. Limit of quantification, 12.5 µg/L [Schönberger *et al.* 2002].

Milk **HPLC** See plasma [Zhang *et al.* 2006].

Liver Microsomes **HPLC** Column: Betasil reversed phase C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: 0.05% phosphoric acid : acetonitrile-water (90 : 10) in 0.05% phosphoric acid (70 : 30 to 20 : 80 over 13 min. UV detection (λ = 254 nm). Retention time: 14.8 min. Limit of quantification, 25 nmol/L [Tang *et al.* 2000].

Skin **HPLC** Hypersil ODS (125 × 4 mm i.d., 5 µm). Mobile phase: acetonitrile : water (55 : 45), flow rate, 1.0 mL/min. UV detection (λ = 252 nm). Limit of detection not reported [Ventura *et al.* 2006].

Disposition in the Body Celecoxib is well and rapidly absorbed and metabolised in the liver to primary alcohol, the corresponding carboxylic acid (the primary metabolite) and its glucuronide conjugate. The drug is widely distributed throughout the body. It is eliminated predominantly by hepatic metabolism (>97%), with approximately 57% of the dose excreted in the faeces and 27% in urine [Paulson *et al.* 2000]. CYP2C9 is the major isoform responsible for the metabolism of celecoxib [Davies *et al.* 2000], although CYP3A4 also plays a part [Tang *et al.* 2000].

Note For studies on the influence of CYP2C9 genetic polymorphisms, see Kirchheiner *et al.* [2003] or Brenner *et al.* [2003].

Therapeutic Concentration

Twelve healthy volunteers were administered a single 200 mg oral dose of celecoxib. The mean peak plasma concentration was 700 µg/L at 18 h [Zarghi *et al.* 2006].

After an overnight fast, 12 healthy male volunteers received 200 mg celecoxib. After 2 days, a once-daily dose of 600 mg rifampicin was given for 5 consecutive days, and on day 9 another 200 mg dose of celecoxib was administered. Before rifampicin, the mean peak plasma celecoxib concentration was 545 ± 274 µg/L reached at 4 ± 0.9 h, and after rifampicin the mean peak plasma celecoxib concentration was 239 ± 146 µg/L at 4 ± 0.8 h. Rifampicin pretreatment decreased the AUC of celecoxib by 64% and increased clearance by 185% [Jayasagar *et al.* 2003].

Twelve healthy volunteers were administered a single oral dose of 200 mg celecoxib. The mean maximum plasma concentration was 840 ± 280 µg/L reached at 2.9 ± 1.2 h [Werner *et al.* 2002].

Four healthy young volunteers were administered a single 200 mg dose of celecoxib. Peak plasma concentrations of 0.797 mg/L were reached within 1.8 h for those who had celecoxib administered without food, and 0.877 mg/L within 6.3 h for the volunteers who had the drug administered with a high-fat breakfast [Davies *et al.* 2000].

Toxicity Acute overdose can result in coma, hypertension, acute renal failure and respiratory depression. Several cases of cholestatic hepatitis have been reported after celecoxib therapy [Alegria *et al.* 2002; Galan *et al.* 2001; Nachimuthu *et al.* 2001; O'Beirne, Cairns 2001], one case also involved pancreatitis [Carrillo-Jimenez, Nurnberger 2000]. Celecoxib has been associated with toxic epidermal necrolysis [Friedman *et al.* 2002; Giglio 2003] and allergic vasculitis [Drago *et al.* 2004; Jordan *et al.* 2002], in one case fatally [Schneider *et al.* 2002]. Celecoxib has also been associated with acute febrile neutrophilic dermatoses [Fye *et al.* 2001], acute generalised exanthematous pustulosis [Yang *et al.* 2004] as well as 'drug rash with eosinophilia and systemic symptoms (DRESS)' syndrome [Lee *et al.* 2008].

Half-life 11.2 to 15.6 h.

Volume of Distribution 5.7 to 7.1 L/kg (455 ± 166 L) [Davies *et al.* 2000].

Clearance 27.7 L/h.

Distribution in Blood Red blood cells : plasma ratio is 0.89.

Protein binding 97% to albumin.

Dose 200 mg daily and increased (if necessary) to 400 mg.

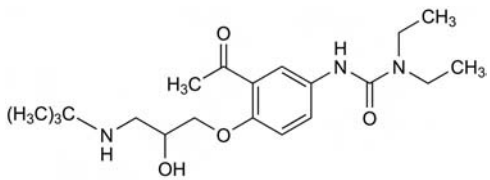
Celiprolol

β-*Blocker*
$C_{20}H_{33}N_3O_4$ = 379.5
CAS—56980-93-9

IUPAC Name 3-[3-Acetyl-4-[3-(tert-butylamino)-2-hydroxypropoxy]phenyl]-1,1-diethylurea
Synonyms *N′*-[3-Acetyl-4-[3-[(1,1-dimethylethyl)-amino]-2-hydroxypropoxy]phenyl]-*N*,*N*-diethylurea; ST-1396.

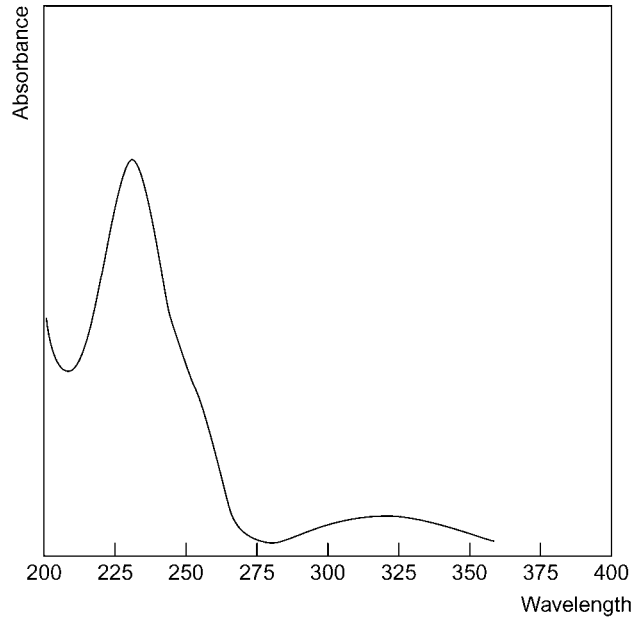


Chemical Properties Crystals. Mp 110° to 112°. pK_a 9.68 (25°). Log *P* (octanol/aqueous phosphate buffer, pH 7.4), 0.8 (37°); log *P* (chloroform/water), 0.14; log *P* (chloroform/pH 7.1 aqueous phosphate buffer), 2.42; log *P* (octanol/water), 1.92. Extraction yield (chlorobutane), 0.1 [Demme *et al.* 2005].

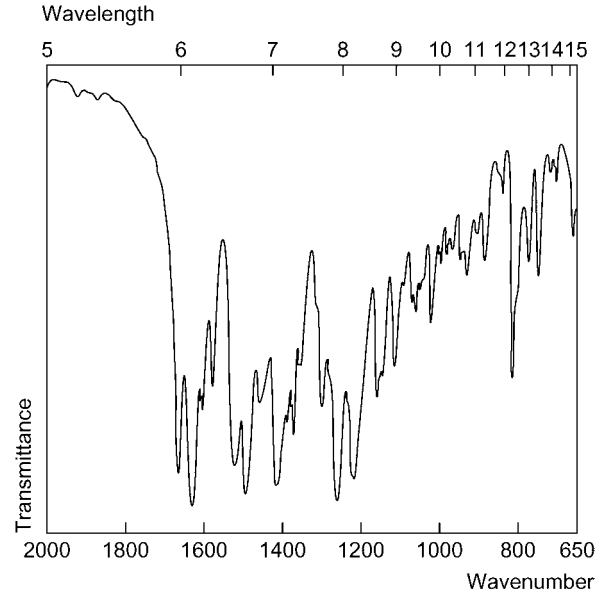
Celiprolol Hydrochloride

$C_{20}H_{33}N_3O_4$, HCl = 416.0
CAS—57470-78-7
Synonyms REV-5320A; RG-5320A; RHC-5320A; ST-1236.
Proprietary Names *Cardem*; *Celectol*; *Celipro*; *Corliprol*; *Dilanorm*; *Jofurol*; *Moderator*; *Selectol*.
Chemical Properties White odourless crystals. Mp 197° to 200°, with decomposition. Solubility at 25° in water, 15.1 g/100 mL; methanol, 18.2 g/100 mL; ethanol, 1.61 g/100 mL; chloroform, 0.42 g/100 mL.

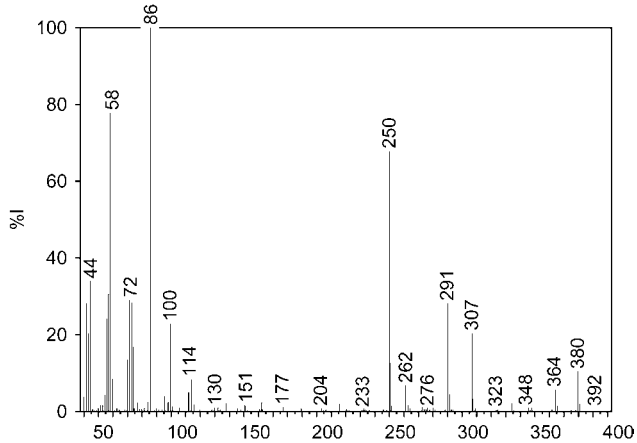
Thin-layer Chromatography System TAE—R_f 0.15; system TE—R_f 0.33.
Gas Chromatography System GA— RI 2610.
High Performance Liquid Chromatography System HAV—*k* 2.2; system HAA—retention time 11.5 min; system HZ—RI 2.5 min.
Ultraviolet Spectrum Aqueous acid (0.01 mol/L hydrochloric acid)—231 (A_1^1=660) and 324 (A_1^1=60) nm; aqueous alkali (0.01 mol/L sodium hydroxide)—231 (A_1^1=640) and 324 (A_1^1=60) nm; methanol—232 (A_1^1=775) and 329 (A_1^1=58) nm.



Infrared Spectrum Principal peaks at wavenumbers 1674, 1636, 823, 591 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 86, 58, 250, 44, 57, 72, 291, 71.



Quantification
Blood **HPLC** For fluorescence detection and UV detection methods, see Buskin *et al.* [1982].

Plasma **HPLC** UV detection. Limit of detection, about 16 µg/L [Braza *et al.* 1998]. Fluorescence detection. Limit of detection, 5 µg/L [Chiu, Raymond 1996]. UV and fluorescence detection. Limit of detection, 5 µg/L (total celiprolol), 2.5 µg/L (each enantiomer) [Verbesselt *et al.* 1996]. UV detection. Limit of detection, 4 µg/L [Rutledge *et al.* 1994a]. UV detection. Limit of detection, 25.7 µg/L [Rutledge *et al.* 1994b]. Fluorescence detection. Limit of detection, 1.5 µg/L (each enantiomer) [Hartmann *et al.* 1989]. Fluorescence detection. Limit of detection, 10 µg/L [Hippmann, Takacs 1983]. UV detection. Limit of detection, 10 µg/L. Fluorescence detection. Limit of detection, 5 µg/L [Buskin *et al.* 1982].
Urine **HPLC** Fluorescence detection. Limit of detection, 2.5 µg/L (each enantiomer) [Hartmann *et al.* 1989]. See Plasma [Hippmann, Takacs 1983]. See Blood Buskin *et al.* [1982].
Disposition in the Body Absorbed after oral administration in a non-linear fashion; the percentage of dose absorbed increases with increasing dose. The extent of absorption is reduced in the presence of food. Peak plasma concentrations are reached after 2 to 3 h. Crosses the placenta. Low lipid solubility. Undergoes only minimal metabolism and is excreted unchanged in the urine (~11%) and faeces (84% in 24 h after an oral dose). After an IV dose, ~50% is excreted in urine and 31% in faeces. A very low percentage of the drug is excreted as three metabolites.
Bioavailability 30 to 70%, which is reduced in the presence of food.
Therapeutic Concentration Considerable inter-individual variation in peak plasma concentrations.

Mean peak plasma concentration measured after administration of a 200 mg single oral dose to 12 subjects was 687 µg/L after 3.71 h. Following administration of 200 mg and 400 mg daily for 7 days to 12 subjects, the mean peak plasma concentration was 597 µg/L and 1676 µg/L, respectively [Norris *et al.* 1986].

Half-life Plasma, 5 to 6 h.
Protein Binding 25%.
Note For reviews of celiprolol, see Riddell *et al.* [1987] and Milne, Buckley [1991].
Dose 200 mg of the hydrochloride daily, increased to 400 mg daily if necessary.

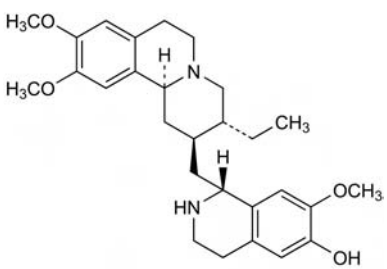
Cephaëline

Emetic, Expectorant
$C_{28}H_{38}N_2O_4$ = 466.6
CAS—483-17-0

IUPAC Name (1*R*)-1-[[(3*R*,11*bS*)-3-ethyl-9,10-dimethoxy-2,3,4,6,7,11*b*-hexahydro-1*H*-pyrido[2,1-*a*]isoquinolin-2-yl]methyl]-7-methoxy-1,2,3,4-tetrahydroisoquinolin-6-ol
Synonyms Desmethylemetine; dihydropsychotrine; 7′,10,11-trimethoxyemetan-6′-ol.

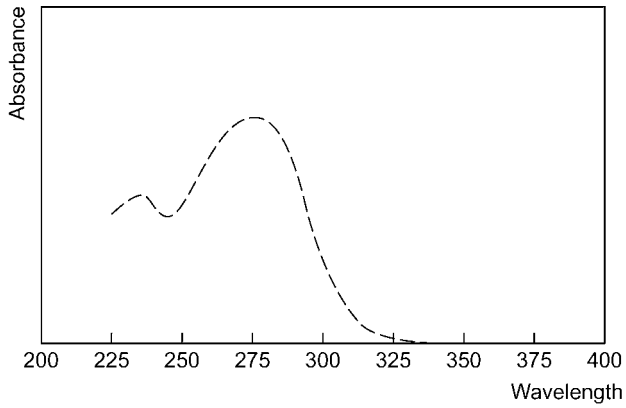


Chemical Properties An alkaloid present in ipecacuanha, the dried root, or rhizome and root, of *Cephaëlis ipecacuanha* (=*Uragoga ipecacuanha*) (Rubiaceae) or *C. acuminata*. Needles. Mp 115° to 116°. Practically insoluble in water; freely soluble in acetic acid, acetone, ethanol, and chloroform; slightly soluble in ether. Log *P* (octanol/water), 4.9.

Cephaëline Hydrochloride

$C_{28}H_{38}N_2O_4$,2HCl = 539.5
CAS—5853-29-2
Chemical Properties White crystals or crystalline powder. Solutions turn yellow. Soluble in water; less soluble in alcohol, acetone and chloroform. Practically insoluble in benzene.

Colour Test Liebermann's reagent—black.
Thin-layer Chromatography System TA—Rf 53; system TB—Rf 01; system TC—Rf 19; system TL—Rf 08 (acidified iodoplatinate solution, positive).
High Performance Liquid Chromatography System HA—*k* 7.7 (tailing peak).
Ultraviolet Spectrum Aqueous acid—283 nm (A_1^1=127b); ethanol—235, 276 nm (A_1^1=144b).



Infrared Spectrum Principal peaks at wavenumbers 1264, 1515, 1116, 1229, 1213, 1616 cm^{-1} (cephaëline hydrochloride, KBr disk).
Mass Spectrum Principal ions at *m/z* 178, 192, 272, 466, 244, 288, 191, 273.
Quantification See under Emetine.
Plasma **HPLC** Fluorescence detection. Limit of quantification, 1.0 mg/L [Asano *et al.* 2001].
Urine **HPLC** See Plasma. Limit of quantification, 5 mg/L [Asano *et al.* 2001].
Disposition in the Body
Therapeutic Concentration

Six healthy male volunteers were administered Ipecac syrup containing 0.843 g/L cephaëline and 0.503 g/L emetine at doses of 5, 10, 15, 20, 25, and 30 mL. Cephaëline was found in plasma at a concentration of 1.7, 3.0, 3.1, 3.6, 5.6, and 3.1 mg/L, respective, to the dosings at times of 2.1, 1.7, 0.8, 1.1, 2.4, and 1.5 h, respectively [Asano *et al.* 2001].

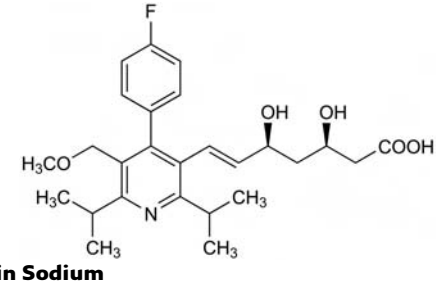
Dose Cephaëline hydrochloride has been given in doses of 5 to 10 mg.

Asano T *et al.* (2001). High-performance liquid chromatographic assay with fluorescence detection for the determination of cephaeline and emetine in human plasma and urine. *J Chromatogr B Biomed Sci Appl* 757: 197–206.

Cerivastatin

Lipid-Regulating Agent
$C_{26}H_{34}FNO_5$ = 459.6
CAS—145599-86-6

IUPAC Name (*E*,3*R*,5*S*)-7-[4-(4-Fluorophenyl)-5-(methoxymethyl)-2,6-di(propan-2-yl)pyridin-3-yl]-3,5-dihydroxyhept-6-enoic acid
Synonym (3*R*,5*S*,6*E*)-7-[4-(4-Fluorophenyl)-5-(methoxymethyl)-2,6-bis(1-methylethyl)-3-pyridinyl]-3,5-dihydroxy-6-heptenoic acid

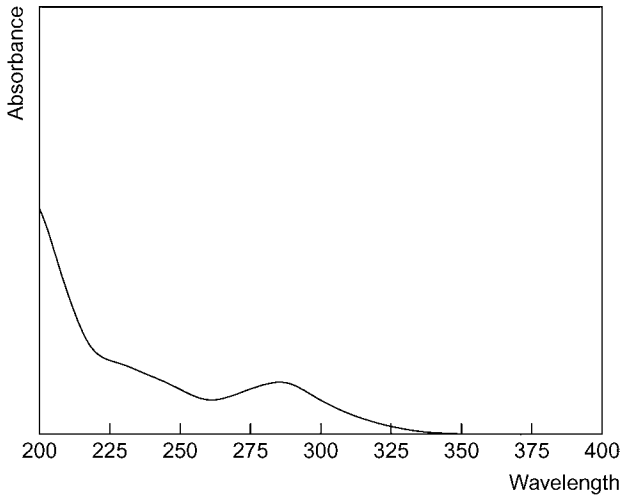


Cerivastatin Sodium

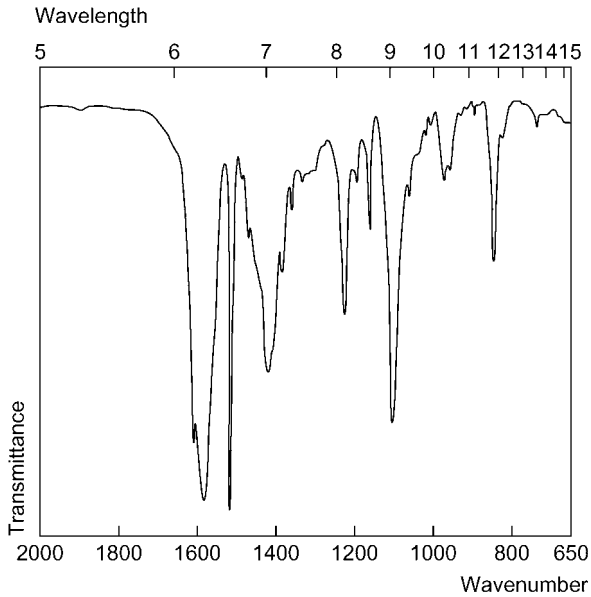
$C_{26}H_{33}FNNaO_5$ = 481.5
CAS—143201-11-0

Synonym Bay-W-6228
Proprietary Names *Baycol*; *Lipobay*.
Chemical Properties A white to off-white hygroscopic amorphous powder. It is soluble in water, ethanol, and methanol; very slightly soluble in acetone.

Ultraviolet Spectrum Methanol—228, 263 nm.



Infrared Spectrum Principal peaks at wavenumbers 1603, 1098, 1381, 1222 cm^{-1} (KBr disc).



Quantification
Plasma **HPLC** Fluorescence detection. Limit of quantification, 0.025 µg/L [Krol *et al.* 1993].
Serum **HPLC** MS detection. Limit of quantification, 0.01 µg/L for cerivastatin and the lactone form, 0.05 to 0.5 µg/L for its biotransformation products [Jemal *et al.* 1999].
Disposition in the Body Cerivastatin is readily and almost completely absorbed after oral administration. It undergoes metabolism in the liver and is catalysed by at least two cytochrome P450 isoenzymes, CYP2C8 and CYP3A4. Three active metabolites are formed. The demethylated metabolite (about 50% as potent as the parent drug) and the hydroxylated metabolite (about 80% as potent) are the major metabolites formed; the product of both demethylation and hydroxylation also has activity, but it is only a minor metabolite. The metabolites are excreted in urine (about 30%) and in faeces (about 70%). There is no unchanged drug found in urine. There is no significant clearance by haemodialysis.
Therapeutic Concentration
Twenty-four healthy, Caucasian males, aged between 21 and 44 years, were administered with a single dose of 0.8 mg after an overnight fast (group 1), with breakfast (group 2), in the evening with dinner (group 3) or 4 h after dinner (group 4). The peak plasma concentrations were 7.7, 8.7, 7.1 and 7.1 µg/L for the four groups, respectively. These concentrations were reached within 1.5, 2.3 and 2.5 h, respectively. The mean concentration detected for the demethylated metabolite, M1, was 0.6 µg/L for the four groups and this was observed approx. 4 h after administration. The hydroxylated metabolite, M23, showed a concentration of 1.6 µg/L at approx. 4 to 6 h [Muck *et al.* 2000].
Bioavailability Absolute bioavailability, 60%.
Half-life Plasma, 2 to 3 h.
Volume of Distribution 0.3 L/kg.
Clearance Plasma, 0.2 L/h/kg.
Protein Binding 99%; 80% to albumin.
Dose Initially 0.1 mg of cerivastatin sodium daily, increasing to 0.3 mg daily.

Jemal M *et al.* (1999). Quantitation of cerivastatin and its seven acid and lactone biotransformation products in human serum by liquid chromatography-electrospray tandem mass spectrometry. *J Chromatogr B, Biomed Sci Appl* 736(1–2): 19–41.

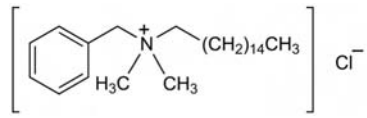
Muck W *et al.* (2000). Pharmacokinetics of cerivastatin when administered under fasted and fed conditions in the morning or evening. *Int J Clin Pharmacol Ther* 38(6): 298–303.

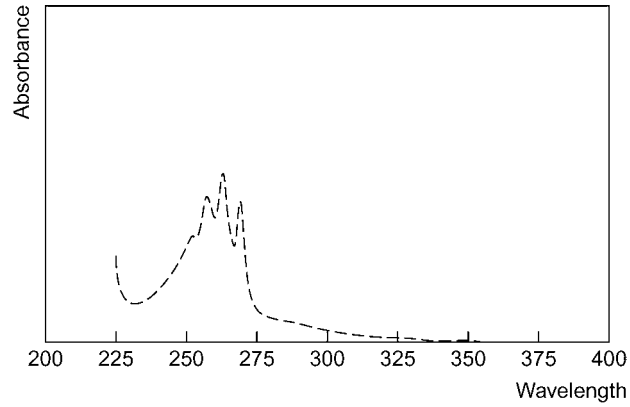
Cetalkonium Chloride

Cationic Disinfectant
$C_{25}H_{46}ClN$ = 396.1
CAS—122-18-9

IUPAC Name Benzyl-hexadecyl-dimethylazanium chloride
Synonym *N*-Hexadecyl-*N*,*N*-dimethylbenzenemethanaminium chloride
Proprietary Names *Baktonium*. It is an ingredient of *AAA*, *Bonjela*, and *Teejel*.



Chemical Properties A white crystalline powder. Mp 58° to 60°. Sparingly soluble in cold water, soluble in hot water; soluble in acetone, ethanol, chloroform, ether, ethyl acetate, propylene glycol, and glycerol. Log *P* (octanol/water), 4.9.
Thin-layer Chromatography System TA—R_f 0.12, streaking (acidified iodoplatinate solution, positive).
Ultraviolet Spectrum Aqueous acid—258 (A^1_1=8b), 264 (A^1_1=10b), 270 (A^1_1=8b) nm; methanol—253, 258, 263 (A^1_1=11b), 270 nm.

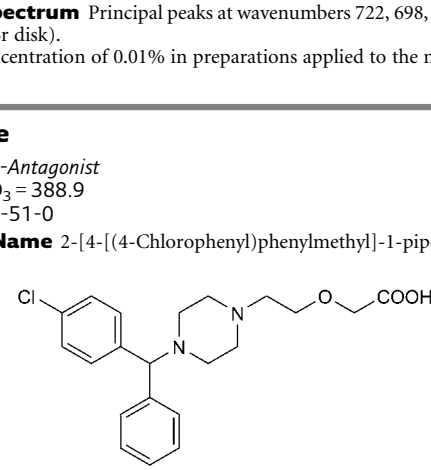


Infrared Spectrum Principal peaks at wavenumbers 722, 698, 1612, 1204, 875, 790 cm^{-1} (KBr disk).
Use In a concentration of 0.01% in preparations applied to the mouth or throat.

Cetirizine

Histamine H_1-Antagonist
$C_{21}H_{25}ClN_2O_3$ = 388.9
CAS—83881-51-0

IUPAC Name 2-[4-[(4-Chlorophenyl)phenylmethyl]-1-piperazinyl]ethoxy] acetic acid

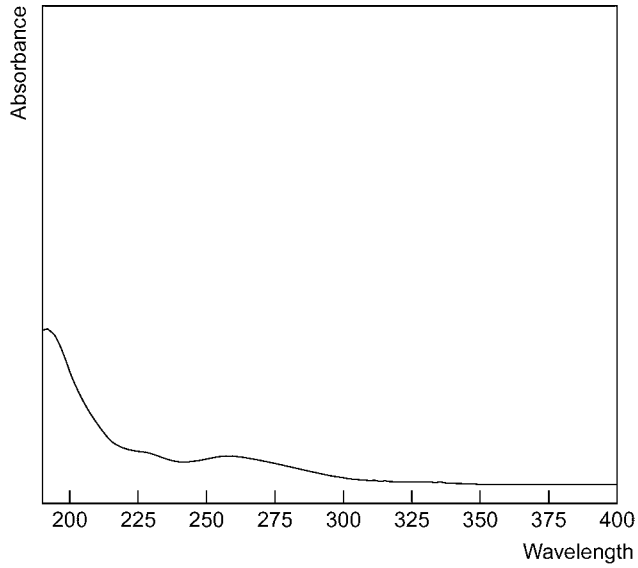


Chemical Properties Crystals from ethanol. Mp 110° to 115°.

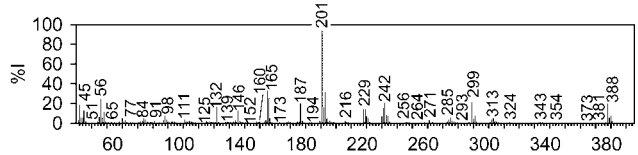
Cetirizine Dihydrochloride
$C_{21}H_{27}Cl_3N_2O_3$ = 461.8
CAS—83881-52-1

Synonyms P-071; UCB-P071.
Proprietary Names *Alerlisin*; *Formistin*; *Reactine*; *Virlix*; *Voltric*; *Zirtek*; *Zyrlex*; *Zyrtec*.
Chemical Properties White-to-almost-white crystalline powder. Mp 225°. Freely soluble in water; practically insoluble in acetone and dichloromethane. Log *P* octanol/water) −0.61.

Thin-layer Chromatography Plate: silica 60 F_{254}. Solvent system: chloroform followed by chloroform : methanol (85 : 15). R_f 0.31 [Pandya *et al.* 1996].
High Performance Liquid Chromatography. System HAA—RT 15.7 min; system HAX—RT 8.89 min; system HAY—RT 5.29 min; system HZ—RT 3.6 min.
Ultraviolet Spectrum Aqueous acid (pH 2.38)—192, 258 nm.



Mass Spectrum Principal ions at *m/z* 201, 165, 203, 56, 187, 242, 299, 388.



Quantification
Plasma **GC** Column: fused silica methylsilicone (25 m × 0.31 mm i.d., 0.17 µm). Temperature: 260°. Carrier gas: He, 35 cm/s. NPD or FID. Retention time: 8.5 min. Limit of detection, 0.02 mg/L [Baltes *et al.* 1988].

HPLC Column: C_{18} Nucleosil 100-3 (150 × 3.2 mm, 3 µm). Mobile phase: 30 mmol/L potassium dihydrogen phosphate (pH 6.8). UV detection (λ= 232 nm). Retention time: 8.25 min. Limit of quantification, 0.01 mg/L. [Macek *et al.* 1999]. Column: Beckman 5 gm octyl reversed phase (25 cm × 2 mm). Mobile phase: acetonitrile : 0.01 mol/L potassium dihydrogen phosphate-0.02 mol/L sodium octane sulfonic acid (pH 3.0; 40 : 60), flow rate 0.25 mL/min. UV detection (λ = 230 nm). Limit of detection, 10 µg/L [Pariente-Khayat *et al.* 1995]. Column: reversed phase C_{18} RP-18 (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.01 mol/L potassium dihydrogen phosphate-0.02 mol/L sodium dodecyl sulfate (pH 2.9) : acetonitrile (55 : 45), flow rate 2.5 mL/min. UV detection (λ= 230 nm). Retention time: 15 min. Limit of detection, 5 µg/L [Muscará, De Nucci 1995].
Serum **HPLC** Column: C_{18} (150 × 3.9 mm i.d., 4 µm). Mobile phase: acetonitrile : water (39 : 61) containing 13 mmol/L phosphate buffer (pH 2.8). UV detection (λ= 230 nm). Retention time: 1.69 min. Limit of detection, 0.005 mg/L [Zaater *et al.* 2000]. Column: Spherisorb S5 ODS2 reversed phase (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol: 0.05 mol/L ammonium phosphate (pH 2.5; 33 : 9 : 58), flow rate 2 mL/min. UV detection (λ= 211 nm). Retention time: 6.4 min. Limit of detection, 0.02 mg/L [Moncrieff 1992]. Column: Spherisorb C_8 (5 µm). Mobile phase: methanol : acetonitrile : 0.2 mol/L sodium hydrogen phosphate (30 : 20 : 50). UV detection. Limit of detection, 5 µg/L [Awni *et al.* 1990].
Urine **HPLC** See Plasma [Pariente-Khayat *et al.* 1995]. Column: Spherisorb 5ODS-2 (25 cm × 4.6 mm i.d.). Mobile phase: Pic A: methanol : tetrahydrofuran (33 : 65 : 2), flow rate 1.0 mL/min. DAD (λ = 230 nm). Retention time: 6.17 min. Limit of detection, 20 µg/L [Rosseel, Lefebvre 1991].
Renal Dialysate **HPLC** See Serum. Limit of detection, 2.1 µg/L [Awni *et al.* 1990].
Disposition in the Body Cetirizine is rapidly absorbed after oral administration and undergoes metabolism in the liver, to a very limited extent by *O*-dealkylation. The metabolite produced has negligible antihistaminic activity. Cetirizine is primarily excreted in urine (70%) and 10% in the faeces, as the unchanged drug [Wood *et al.* 1987]. It is secreted in breast milk.
Therapeutic Concentration
Fifteen infants and toddlers, with a mean age of 12.3 months, were admitted to hospital for reoccurring respiratory infections or other hypersensitivity-related diseases and treated with a single dose of 0.25 mg/kg cetirizine solution. A mean peak plasma concentration of 0.39 mg/L was observed at 2.0 h [Spicák *et al.* 1997].
Eight children (2–6-years-old) were administered a single 5-mg oral dose of 10 mg/mL cetirizine 1.5 h before anaesthesia. The mean maximum plasma concentration of 607 ± 231 µg/L was reached at 1.93 ± 1.39 h [Pariente-Khayat *et al.* 1995].
Fourteen healthy male volunteers (age: 21 to 46 years) received a single oral dose of 10 mg cetirizine hydrochloride as Zyrtek or Zetir. Mean peak plasma concentrations were 307 and 302 µg/L for Zetir and Zyrtek, respectively, both reached at 0.5 h.
Ten elderly volunteers (aged between 60 and 90 years) and 10 healthy, young volunteers (21–29-years-old) were administered with a single oral dose of 10 mg. Mean plasma concentrations were 0.362 mg/L for the elderly individuals and 0.337 mg/L for the young. These concentrations were observed at 1.30 and 1.12 h, respectively [Lefebvre *et al.* 1988].
Five patients with end-stage renal disease ingested 10-mg cetirizine dihydrochloride. The mean maximum plasma concentration was 285 µg/L reached at 2 h [Awni *et al.* 1990].
Toxicity Two cases of overdose have been reported: an adult took a 150-mg dose of cetirizine and was admitted to hospital with somnolence, but no other clinical signs or blood chemistry/haematology. An 18-month-old child overdosed on 180 mg of cetirizine and became restless, irritable and drowsy. Multiple-dose toxicity targets the liver and a single dose the central nervous system.
Note For a review of the comparative safety of histamine H_1 antagonists, see Simons [1994].
Half-life Elimination half-life is 7–11 h in adults; 6–7 h in children; 3.1 h in infants.
Volume of Distribution In adults, volume of distribution is 0.6–0.8 l/kg; children, 0.44 L/kg.
Clearance Body clearance, 0.76 mL/min; 2.13 mL/min/kg (infants). 1.27 ± 0.80 mL/min/kg in children [Pariente-Khayat *et al.* 1995].
Protein Binding ≈93% bound.
Dose Adults and children >6 years: a usual dose of 10 mg is administered daily. Children (2 to 6 years) and patients with renal impairment: usual dose 5 mg daily.

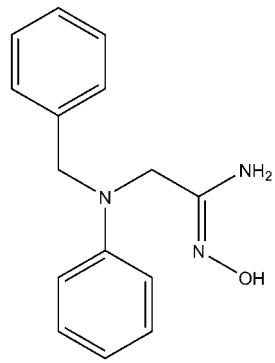
Cetoxime

Antihistamine
$C_{15}H_{17}N_3O$ = 255.3
IUPAC Name *N*-Benzylanilinoacetamidoxime



Cetoxime Hydrochloride
CAS—22204-29-1
Proprietary Name *Febramine*
Chemical Properties Mp 160°. Soluble in water.

Colour Tests Ammonium vanadate test—red (limit of detection, 0.1 μg); Vitali's test—red/yellow/red-brown (limit of detection, 0.1 μg).
Thin-layer Chromatography System T1—R_f 0.75 (location reagent potassium permanganate spray, positive reaction).
Ultraviolet Spectrum Aqueous acid (0.1 N sulfuric acid)—242, 290 nm; aqueous alkali (0.1 N sodium hydroxide)—249, 300 nm.
Disposition in the Body
Toxicity LD_{50} (oral): in mice 300 mg/kg.
Dose Up to 800 mg daily has been given.

Cetrimide

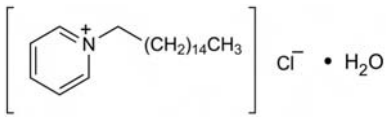
Cationic Disinfectant
$C_{17}H_{38}BrN = 336.4$
CAS—8044-71-1

IUPAC Name Trimethyl(tetradecyl)azanium bromide
Note Consists chiefly of tetradecyltrimethylammonium bromide together with smaller amounts of dodecyl- and hexadecyltrimethylammonium bromides.
Proprietary Names *Cetavlon*; *Morpan CHSA*; *Silquat C100*. It is an ingredient of *Ceanel*, *Cetal (liquid)*, *Savloclens*, *Savlodil*, *Savlon (liquid)*, and *Travasept*.
Chemical Properties A white to creamy-white, voluminous, free-flowing, hygroscopic powder. A solution in water foams on shaking. Mp 232° to 247°. Soluble 1 in 2 of water; freely soluble in ethanol; soluble in ether.
Thin-layer Chromatography System TA—R_f 0.00; system TB—R_f 0.00; system TC—R_f 0.01; system TE—R_f 0.00; system TL—R_f 0.00; system TN—R_f 0.100; system TO—R_f 0.50; system TAE—R_f 0.00; system TAF—R_f 0.29 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1699.
High Performance Liquid Chromatography System HX—RI 56.
Infrared Spectrum Principal peaks at wavenumbers 961, 909, 952, 719, 970, 724 cm^{-1} (KC1 disk).

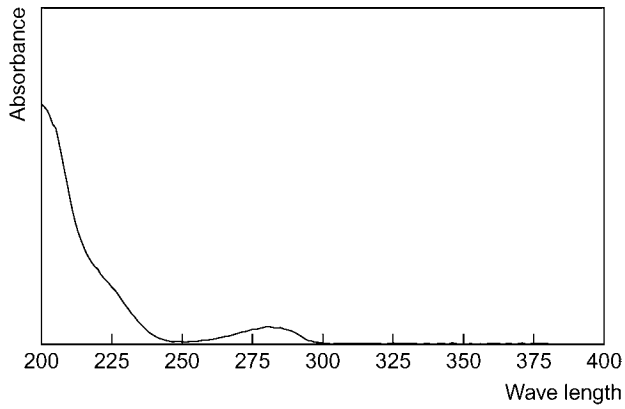
Cetylpyridinium Chloride

Cationic Disinfectant
$C_{21}H_{38}ClN, H_2O = 358.0$
CAS—7773-52-6 (cetylpyridinium); 123-03-5 (cetylpyridinium chloride, anhydrous); 6004-24-6 (cetylpyridinium chloride, monohydrate)

IUPAC Name 1-Hexadecylpyridin-1-ium chloride hydrate
Synonym 1-Hexadecylpyridinium chloride monohydrate
Proprietary Names *Ceepryn*; *Cepacol*; *Dobendan*; *Merocet(s)*. It is an ingredient of *Merocaine* and *Tyrosolven*.



Chemical Properties A white powder. A solution in water foams strongly when shaken. Mp 77° to 83°. Soluble 1 in 20 of water; freely soluble in ethanol and chloroform; very slightly soluble in ether and in benzene. Log *P* (octanol), 1.7.
Thin-layer Chromatography System TA—R_f 0.20; system TL—R_f 0.00; system TAE—R_f 0.00; system TAF—R_f 0.29 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—not eluted.
Ultraviolet Spectrum Aqueous acid—280 nm. No alkaline shift.

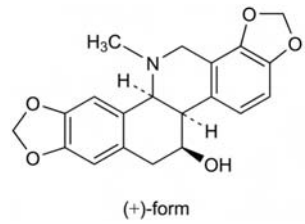


Infrared Spectrum Principal peaks at wavenumbers 685, 1629, 776, 1174, 715, 1205 cm^{-1}.
Use In concentrations of 0.01 to 1%.

Chelidonine

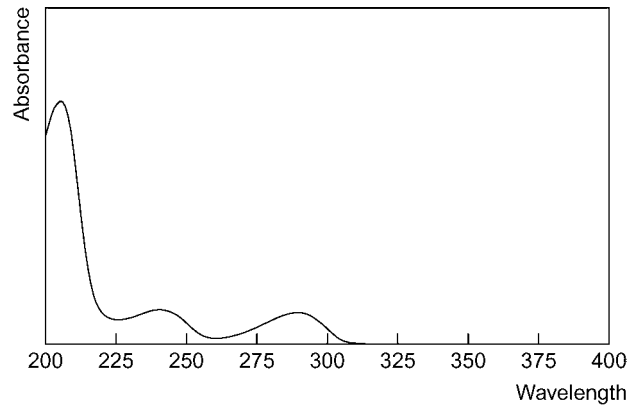
Alkaloid
$C_{20}H_{19}NO_5 = 353.4$
CAS—476-32-4

Synonyms [5b*R*-(5bα,6β,12bα)]-5b,6,7,12b,13,14-Hexahydro-13-methyl[1,3]-benzodioxolo[5,6-*c*]-1,3-dioxolo[4,5-*i*]phenanthridin-6-ol; stylophorin.



(+)-form

Chemical Properties An alkaloid obtained from the greater celandine, *Chelidonium majus* (Papaveraceae). A white crystalline powder. Mp 135° to 136°. Practically insoluble in water; soluble in ethanol, chloroform, and ether. Log *P* (octanol/water), 2.9.
Colour Tests Mandelin's test—yellow→green; Marquis test—green; sulfuric acid—brown.
Thin-layer Chromatography System TA—R_f 0.72 (acidified iodoplatinate solution, positive).



Infrared Spectrum Principal peaks at wavenumbers 1035, 1257, 1222, 1497, 748, 1070 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 332, 333, 304, 335, 176, 303, 334, 162.

Chloral Betaine

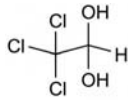
Hypnotic, Sedative
$C_7H_{12}Cl_3NO_3, H_2O = 282.6$
CAS—2218-68-0

IUPAC Name 2,2,2-Trichloroethane-1,1-diol; 2-(trimethylazaniumyl)acetate
Chemical Properties 1-Carboxy-*N*,*N*,*N*-trimethanaminium inner salt compound with 2,2,2-trichloro-1,1-ethanediol (1 : 1). The adduct formed by chloral hydrate, $CCl_3{\cdot}CH(OH)_2$, and betaine, $C_5H_{11}NO_2$, containing about 58% of chloral hydrate. A white crystalline powder. Mp about 124°, with decomposition. Soluble 1 in 1 of water and 1 in 4 of ethanol; practically insoluble in chloroform and ether.
Ultraviolet Spectrum No significant absorption, 230–360 nm.
Infrared Spectrum Principal peaks at wavenumbers 840, 1630, 1085, 1130, 730, 1500 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 81, 83, 46, 110, 82, 112, 84, 117.
Dose Usually 0.87 to 2.61 g daily, but doses of up to 3.5 g may be necessary.

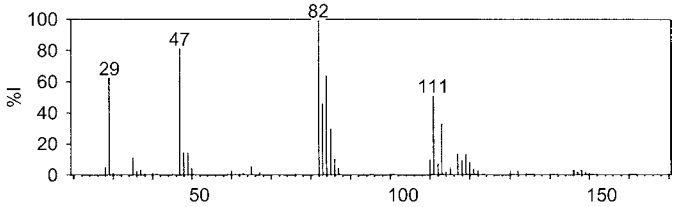
Chloral Hydrate

Hypnotic, Sedative
$C_2H_3Cl_3O_2 = 165.4$
CAS—302-17-0

IUPAC Name 2,2,2-Trichloro-1,1-ethanediol
Synonyms Cloral; cloral hydrate.
Proprietary Names *Aquachloral*; *Chloradorm*; *Chloraldurat*; *Chloralex*; *Chloralvan*; *Dormel*; *Elix-Nocte*; *Escre*; *Medianox*; *Noctec*; *Novo-chlorhydrate*; *Nycton*; *Rectules*; *Somnos*; *Welldorm*. Also an ingredient of *Babygencal*; *Dermophil Indien*; *Synthol*.



Chemical Properties Colourless or white crystals which volatilise slowly on exposure to air and are decomposed by caustic alkalis, liberating chloroform. Mp 50°. Bp 98°. 1 mL of water dissolves the following amounts of cloral hydrate: 2.4 g at 0°, 8.3 g at 25°, 14.3 g at 140°. Soluble: 1 in 0.2 of ethanol, 1 in 1.3 of alcohol, 1 in 2 of chloroform, 1 in 1.4 olive oil, 1 in 0.5 glycerol, 1 in 68 g carbon disulfide and 1 in 1.5 of ether. Freely soluble in acetone and methylethyl ketone. Moderately or sparingly soluble in turpentine, petroleum ether, carbon tetrachloride, benzene, and toluene. Ethanolic solutions may deposit crystals of cloral ethanolate. pK_a 10.0. Log *P* (octanol/water), 0.99.
Colour Tests Fujiwara test—red; palladium chloride—black.
Gas Chromatography System GA—RI 695 (tailing peak); system GI—retention time 12.5 min (tailing peak).
Ultraviolet Spectrum No significant absorption, 230–360 nm.
Infrared Spectrum Principal peaks at wavenumbers 835, 1083, 1300, 970, 1620 cm^{-1}.
Mass Spectrum Principal peaks at *m/z* 82, 47, 84, 29, 111, 83, 113, 85; trichloroacetic acid 44, 83, 85, 36, 28; trichloroethanol 31, 49, 77, 113, 115, 82, 51, 117.



Quantification
Blood **UV-Vis** Trichloroethanol (modified Fujiwara reaction) [McBay *et al.* 1980].
GC ECD [Meyer *et al.* 1995] ECD. Chloral hydrate, trichloroethanol, and trichloroacetic acid, head-space analysis. Limit of detection, 500 µg/L for chloral hydrate and trichloroethanol [Breimer *et al.* 1974].
Plasma **GC** ECD. Trichloroethanol [Berry 1975].
GC-MS Chloral hydrate and metabolites, see [Yan *et al.* 1999].
Urine **UV-Vis** See Blood [McBay *et al.* 1980].
GC See Blood [Breimer *et al.* 1974]. See Plasma [Berry 1975].
Disposition in the Body Readily absorbed following oral administration. It is rapidly metabolised by reduction to trichloroethanol, the major active metabolite, which is further metabolised by conjugation with glucuronic acid to give urochloralic acid and by oxidation to trichloroacetic acid, the major urinary metabolite. Trichloroethanol passes into the CSF, into breast milk, and across the placenta. About 10–30% of a dose is excreted in the urine as urochloralic acid and up to 5% as trichloroethanol in 24 h. Trichloroacetic acid is slowly excreted in urine over several days; a small amount of urochloralic acid may be excreted in the bile.
Therapeutic Concentration Chloral hydrate is difficult to detect in body fluids after normal doses. The plasma concentration of trichloroethanol is usually in the range 1.5 to 15 mg/L. Trichloroacetic acid and urochloralic acid are present in plasma at concentrations similar to, or greater than, those of trichloroethanol. When alcohol has been taken, peak plasma concentrations of trichloroethanol are increased and remain elevated for about 6 h after ingestion, and those of trichloroacetic acid are decreased. Trichloroacetic acid accumulates in the plasma during chronic administration of cloral hydrate.

Following a single oral dose of 825 mg to 5 subjects, peak plasma trichloroethanol concentrations of 7.6 to 12.2 mg/L (mean 9.7) were attained in 0.5 to 1 h [Berry 1975].

Toxicity Fatalities have occurred following the ingestion of 1.25 and 3 g but recovery has occurred after ingestion of 30 g. Plasma concentrations greater than 40 mg/L of trichloroethanol are likely to produce toxic effects; fatalities have been reported at blood concentrations of 20–495 mg/L (mean 155) of trichloroethanol.

In a fatality caused by the admistration of chloral hydrate, lidocaine, and nitrous oxide, postmortem trichloroethanol concentrations were: plasma, 79.0 mg/L; urine, 31.0 mg/L; gastric contents, 454.0 mg/L; bile, 111.0 mg/L; vitreous humour, 40.2 mg/L; CSF, 68.3 mg/L; and liver, 164 mg/kg. Lidocaine concentrations ranged from 3.7 mg/L in urine to 19.0 mg /L in bile. Nitrous oxide was measured at 4.4 mL/L in blood [Engelhart *et al.* 1998].

In 4 fatalities known to involve the acute ingestion of 15 to 30 g of chloral hydrate, postmortem blood trichloroethanol concentrations ranged from 100 to 640 mg/L (mean 265) [Baselt, Cravey 1977].

In a fatality due to the ingestion of chloral hydrate, the following postmortem tissue concentrations of trichloroethanol were reported: blood 55 mg/L, brain 91 mg/kg, liver 200 mg/kg, urine 30 mg/L [Poklis *et al.* 1973].
Half-life Plasma half-life, chloral hydrate about 4 min, trichloroethanol about 7 to 11 h, urochloralic acid about 7 h, trichloroacetic acid about 4 days.
Volume of Distribution Trichloroethanol, about 0.6 L/kg.
Distribution in Blood Plasma : whole blood ratio, trichloroethanol, about 0.9.
Protein Binding Trichloroethanol 35% and trichloroacetic acid 94%.
Note For a review of the pharmacokinetics of sedatives in neonates, see Jacqz-Aigrain, Burtin [1996]; for a review of the pharmacokinetics of hypnotic drugs, see Breimer [1977].
Dose 0.5 to 2 g daily. Children may be given 30 to 50 mg/kg body-weight with a maximum single dose of 1 g.

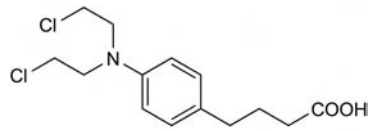
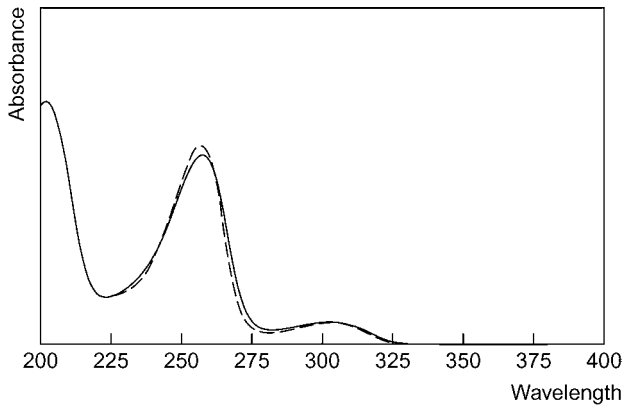
Chlorambucil

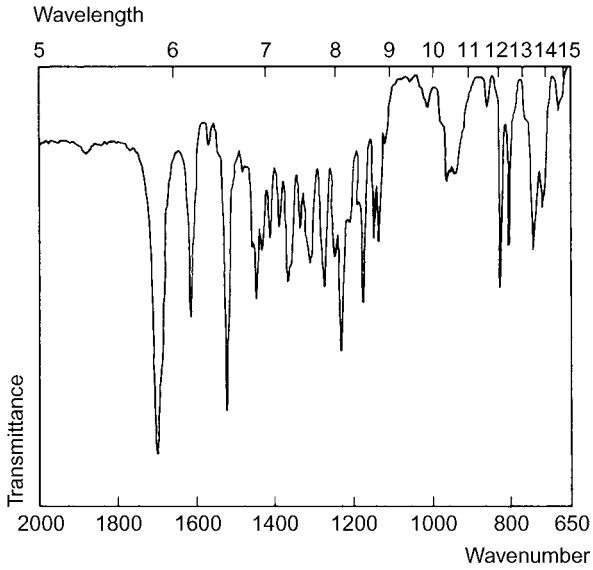
Antineoplastic
$C_{14}H_{19}Cl_2NO_2$ = 304.2
CAS—305-03-3
IUPAC Name 4-[4-[Bis(2-chloroethyl)amino]phenyl]butanoic acid
Synonyms 4-[Bis(2-chloroethyl)amino]benzenebutanoic acid; CB-1348; chlorbutinum.
Proprietary Names *Chloraminophène*; *Leukeran*.



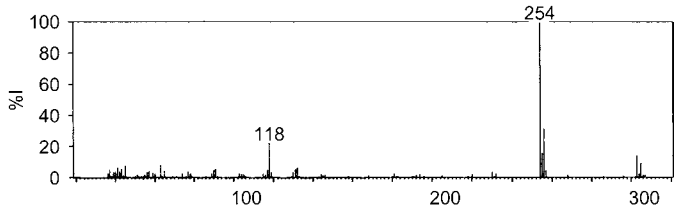
Chemical Properties A white crystalline or granular powder. Mp 66°. Practically insoluble in water; soluble 1 in 1.5 of ethanol, 1 in 2 of acetone, and 1 in 2.5 of chloroform; soluble in ether. pK_a 5.8. Log *P* (octanol/pH 7.4), 1.7.
Caution Chlorambucil is irritant; avoid contact with skin and mucous membranes.
Thin-layer Chromatography system TD—R_f 0.33; system TE—R_f 0.06; system TF—R_f 0.40; System TAD—R_f 0.50; system TAE—R_f 0.84.
Gas Chromatography System GA—chlorambucil RI 2420, chlorambucil-Me RI 2340.
High Performance Liquid Chromatography System HAA—Retention time 22.4 min.
Ultraviolet Spectrum Methanol—258 (A_1^1=642a), 303 nm. No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1695, 1520, 1229, 1610, 1175, 1270 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 254, 256, 118, 255, 303, 305, 63, 45.



Quantification

Plasma **GC–MS** Limit of detection, <10 mg/L [Ehrsson *et al.* 1980].

HPLC MS/MS. Limit of detection, 4 to 800 mg/L for drug and metabolites [Davies *et al.* 1999]. UV detection. Limit of detection, 100 mg/L [Ahmed *et al.* 1982].

Serum **HPLC** See Plasma [Davies *et al.* 1999].

Disposition in the Body Rapidly absorbed after oral administration with peak plasma concentrations being attained in 0.5 to 2 h. It is extensively metabolised; <1% of a dose is excreted in the urine unchanged. Phenylacetic acid mustard is a major metabolite.

Therapeutic Concentration

A single oral dose of 0.2 mg/kg (three different formulations tested: UK, US, and worldwide) was administered to healthy volunteers. Mean peak plasma drug concentrations of 475, 575, and 534 mg/L were observed for the three different formulations, respectively, and 340, 381, and 338 mg/L for the major metabolite, respectively [Davies *et al.* 1999].

Half-life Plasma half-life, about 1 to 2 h.

Dose Initially 200 µg/kg daily, orally; maintenance, 30 to 100 µg/kg daily.

Ahmed AE *et al.* (1982). Studies on the quantitation of chlorambucil in plasma by reversed-phase high-performance liquid chromatography. *J Chromatogr* 233(22): 392–397.

Rapid determination of the anti-cancer drug chlorambucil (Leukeran) and its phenyl acetic acid mustard metabolite in human serum and plasma by automated solid-phase extraction and liquid chromatography-tandem mass spectrometry. *J Chromatogr B Biomed Sci Appl* 732(1): 173–184.

Ehrsson H *et al.* (1980). Determination of chlorambucil in plasma by GLC with selected-ion monitoring. *J Pharm Sci* 69: 710–712.

Chloramphenicol

Antibiotic

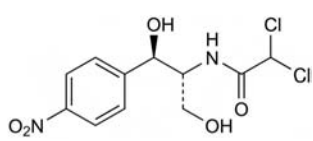
$C_{11}H_{12}Cl_2N_2O_5 = 323.1$

CAS—56-75-7

IUPAC Name 2,2-Dichloro-*N*-[(1*R*,2*R*)-1,3-dihydroxy-1-(4-nitrophenyl)propan-2-yl]acetamide

Synonyms Chloranfenicol; cloranfenicol; 2,2-dichloro-*N*-[(1*R*,2*R*)-2-hydroxy-1-(hydroxymethyl)-2-(4-nitrophenyl)ethyl]acetamide; laevomycetinum.

Proprietary Names *Amphicol*; *Chloromycetin*; *Chloroptic*; *Econochlor*; *Fenicol*; *Kemicetine*; *Novochlorocap*; *Sno Phenicol*.



Chemical Properties Fine, white to greyish-white or yellowish-white crystals. Mp 149° to 153°. A solution in dehydrated alcohol is dextrorotatory and a solution in ethyl acetate is laevorotatory. Soluble 1 in 400 of water and 1 in 2.5 of ethanol; very soluble in acetone and ethyl acetate; slightly soluble in chloroform and ether. pK_a 5.5. Log *P* (octanol/water), 1.1.

Chloramphenicol Cinnamate

$C_{20}H_{18}Cl_2N_2O_6 = 453.3$

CAS—14399-14-5

Chemical Properties A white or yellowish-white crystalline powder. Mp about 119°. Very slightly soluble in water; soluble 1 in 25 of ethanol, 1 in 50 of chloroform, and 1 in 500 of ether.

Chloramphenicol Palmitate

$C_{27}H_{42}Cl_2N_2O_6 = 561.5$

CAS—530-43-8

Synonyms Chloramphenicol α-palmitate; palmitylchloramphenicol.

Proprietary Names *Chloromycetin Palmitate Suspension*; *Globenicol*.

Chemical Properties A fine, white, unctuous, crystalline powder. Mp 87° to 95°. Very slightly soluble in water; soluble 1 in 45 of ethanol, 1 in 6 of chloroform, and 1 in 14 of ether; freely soluble in acetone; soluble in ethyl acetate.

Chloramphenicol Sodium Succinate

$C_{15}H_{15}Cl_2N_2NaO_8 = 445.2$

CAS—982-57-0

Synonym Chloramphenicol α-sodium succinate

Proprietary Names *Chloromycetin Succinate*; *Globenicol*; *Kemicetine Succinate*; *Mychel-S*.

Chemical Properties A white or yellowish-white hygroscopic powder.

Soluble 1 in less than 1 of water and 1 in 1 of ethanol; practically insoluble in chloroform and ether.

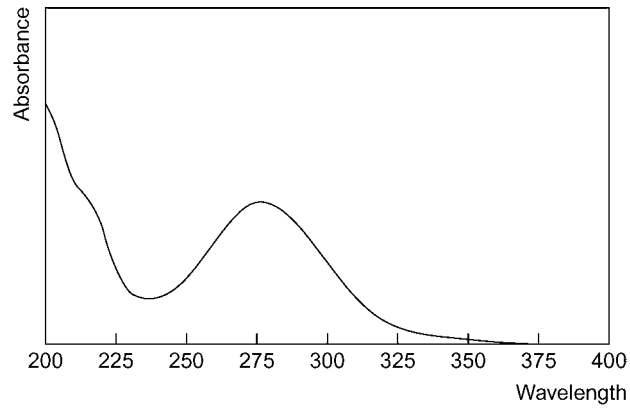
Colour Tests Fujiwara test—red; Nessler's reagent—brown-orange.

Thin-layer Chromatography System TA—R_f 0.69; system TB—R_f 0.00; system TC—R_f 0.31; system TD—R_f 0.11; system TE—R_f 0.36; system TF—R_f 0.31; system TL—R_f 0.48; system TAD—R_f 0.34; system TAE—R_f 0.86; system TAF—R_f 0.90; system TAJ—R_f 0.32; system TAK—R_f 0.08; system TAL—R_f 0.71.

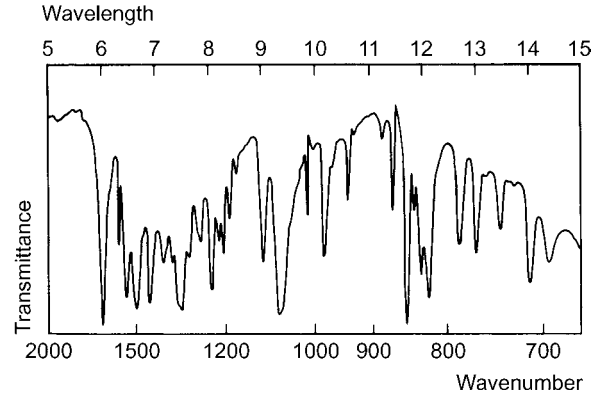
Gas Chromatography System GA—RI 2310.

High Performance Liquid Chromatography System HX—RI 390; system HY—RI 336; system HAA—retention time 14.1 min.

Ultraviolet Spectrum Water—278 nm (A^1_1=298a). Chloramphenicol palmitate: dehydrated alcohol—271 nm (A^1_1=178a).



Infrared Spectrum Principal peaks at wavenumbers 1681, 847, 1072, 1515, 816, 1562 cm^{-1} (Nujol mull).



Mass Spectrum Principal ions at *m/z* 70, 150, 151, 153, 77, 51, 118, 60.

Quantification

Plasma **GC** ECD. See Pickering *et al.* [1979].

HPLC UV detection. Limit of detection, 500 µg/L for chloramphenicol and 1 mg/L for chloramphenicol succinate [Velagapudi *et al.* 1982]. UV detection. Limit of detection, 100–200 µg/L [Sample *et al.* 1979].

Serum **HPLC** See Plasma [Sample *et al.* 1979].

Urine **GC** See Plasma Pickering *et al.* [1979]. FID. For quantification of chloramphenicol or thiamphenicol and their metabolites see Nakagawa *et al.* [1975].

Cerebrospinal Fluid **GC** See Plasma Pickering *et al.* [1979].

HPLC See Plasma [Sample *et al.* 1979].

Disposition in the Body Readily absorbed after oral administration. The inactive palmitate ester is hydrolysed to free drug in the gastro-intestinal tract before absorption and the inactive sodium succinate ester, given parenterally, is similarly hydrolysed *in vivo*. It is widely distributed in the body, giving a concentration in the CSF about 50% of that in the blood. The main metabolic pathway is conjugation with glucuronic acid; chloramphenicol is also hydrolysed to 1-(4-nitrophenyl)-2-aminopropane-1,3-diol. Both metabolites are inactive. Up to about 90% of a dose is excreted in the urine in 24 h, mainly as the glucuronide, with about 5 to 10% of the dose in unchanged form. About 3% of the dose is excreted in the bile but this is mainly reabsorbed to give about 1% eliminated in the faeces.

Therapeutic Concentration In plasma, usually in the range 10 to 20 mg/L.

Following oral administration of chloramphenicol palmitate, equivalent to 15 to 27 mg/kg of chloramphenicol, four times a day to 18 children, plasma concentrations of 15.2 to 38.9 mg/L (mean 27.5) were reported 1.5 h after a dose [Kauffman *et al.* 1981].

Twenty-nine adults with uncomplicated enteric fever were administered 30 mg/kg chloramphenicol succinate ester IV or IM. The mean peak plasma concentrations of chloramphenicol were 16.2 and 7.8 mg/L, respectively [Acharya *et al.* 1997].

Toxicity There is an increased incidence of reversible bone-marrow depression when plasma concentrations exceed 25 mg/L. The 'grey' syndrome (cardiovascular collapse, respiratory depression, and coma) has been reported in patients with plasma concentrations in the range 40 to 200 mg/L.

A 26-year-old woman received an initial 1-g dose followed in 7 and 12 h by two 10-g doses. A plasma concentration of 201 mg/L was measured $5^1/_2$ h after the last dose while she was in severe shock, but she recovered [Thompson *et al.* 1975].

In a fatality involving ingestion of an unknown quantity of chloramphenicol (probably 2.5 to 4 g) by a 5-year-old boy, post-mortem liver and urine concentrations of 10.7 µg/g and 2.09 g/L, respectively, were reported; death occurred about 18 h after ingestion [Grusz-Harday 1973].

Half-life Plasma half-life, about 2 to 5 h.

Volume of Distribution About 0.5 to 1 L/kg.

Clearance Plasma clearance, about 4 mL/min/kg.

Protein Binding About 40 to 60%.

Note For a review of the pharmacokinetics of chloramphenicol, see Ambrose [1984].

Dose Usually 2 g daily.

Chlorcyclizine

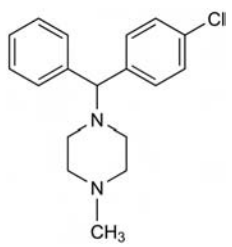
Antihistamine

$C_{18}H_{21}ClN_2 = 300.8$

CAS—82-93-9

IUPAC Name 1-[(4-Chlorophenyl)phenylmethyl]-4-methylpiperazine

Synonym Histachlorazine



Chemical Properties A liquid. pK_a 2.4, 7.8 (25°).

Chlorcyclizine Hydrochloride

$C_{18}H_{21}ClN_2$, HCl = 337.3

CAS—1620-21-9;14362-31-3

Synonym Chlorcyclizinium chloride

Proprietary Names *Di-Paralene*; *Trihistan*. It is an ingredient of *Fedrazil*.

Chemical Properties A white crystalline powder. Mp 226° to 227°. Soluble 1 in 2 of water, 1 in 11 of ethanol, and 1 in 4 of chloroform; practically insoluble in ether and benzene.

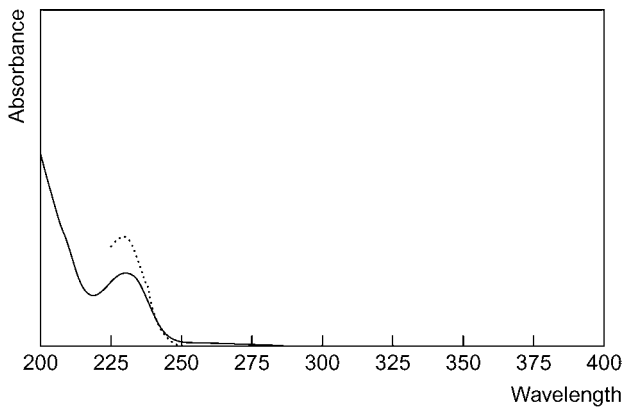
Colour Test Liebermann's reagent—red-orange.

Thin-layer Chromatography System TA—R_f 0.57; system TB—R_f 0.42; system TC—R_f 0.46; system TE—R_f 0.67; system TL—R_f 0.14; system TAE—R_f 0.35; system TAF—R_f 0.52; system TAJ—R_f 0.21; system TAK—R_f 0.10; system TAL—R_f 0.70 (Dragendorff spray, positive; acidified iodoplatinate solution, positive).

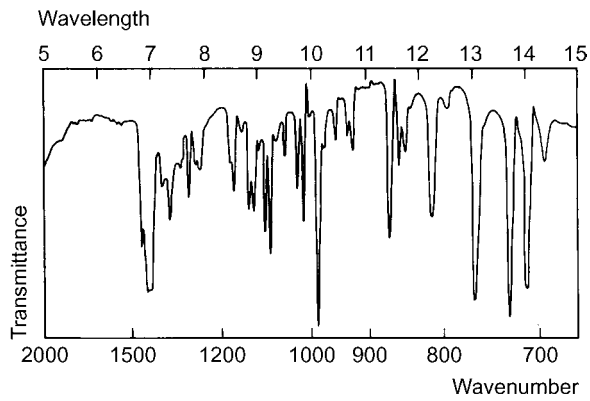
Gas Chromatography System GA—chlorcyclizine RI 2220, M (nor-) RI 2520; system GB—chlorcyclizine RI 2316, M (nor-) RI 2355; system GF—RI 2560.

High Performance Liquid Chromatography System HA—*k* 2.3; system HY—RI 340.

Ultraviolet Spectrum Aqueous acid—232 nm (A^1_1=581a).



Infrared Spectrum Principal peaks at wavenumbers 988, 725, 760, 706, 1087, 870 cm^{-1} chlorcyclizine hydrochloride (Nujol mull).



Mass Spectrum Principal ions at *m/z* 99, 56, 72, 165, 300, 228, 229, 242.

Quantification

Plasma (animal) **Colorimetry** For method for quantification of chlorcyclizine, cyclizine and their metabolites, see Kuntzman *et al.* [1965].

Tissues (animal) **Colorimetry** See Plasma Kuntzman *et al.* [1965].

Disposition in the Body Readily absorbed after oral administration and widely distributed throughout the body. Metabolised by *N*-demethylation to form norchlorcyclizine and by *N*-oxidation. High concentrations of the *N*-desmethyl metabolite are found in the liver, lungs, kidney, and spleen. Slowly excreted in the urine; measurable amounts of norchlorcyclizine have been detected in the urine for up to 3 weeks after the cessation of chronic oral administration. About 0.5% of a dose is excreted in the urine as the *N*-oxide.

Therapeutic Concentration

After a single oral dose of 2 mg/kg to 4 subjects, average peak plasma concentrations of about 0.05 mg/L and 0.03 mg/L were attained in 5 h for unchanged drug and norchlorcyclizine, respectively. After oral administration of 50 mg 3 times a day for 6 days, plasma concentrations of norchlorcyclizine of 0.05 to 0.11 mg/L were reported on the first day after the cessation of treatment and plasma concentrations of 0.02 to 0.04 mg/L were found on the 10th day after cessation of treatment [Kuntzman *et al.* 1973].

Half-life Plasma half-life, chlorcyclizine about 12 h, norchlorcyclizine 6 to 9 days.
Protein Binding Norchlorcyclizine, about 85 to 90%.
Dose 50 to 200 mg of chlorcyclizine hydrochloride daily.

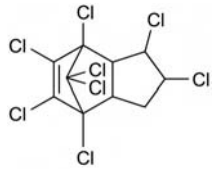
Chlordane

Insecticide
$C_{10}H_6Cl_8$ = 409.8
CAS—57-74-9; 12789-03-6 (technical grade); 22212-52-8 (*cis*-); 5103-74-2 (*trans*-)
IUPAC Name 1,2,4,5,6,7,8,8-Octachloro-2,3,3a,4,7,7a-hexahydro-4,7-methano-1*H*-indene
Synonym Chlordan
Proprietary Names *Corodane*; *Murphy Ant Killer*; *Nippon Ant Powder*; *Nizran*; *Sydane*; *Toxichlor*. It is an ingredient of *Cooper Ant Killer*.



Chemical Properties Technical chlordane is a mixture of chlorinated methano-indenes, the major components being the two stereoisomers *cis*-chlordane and *trans*-chlordane. The technical grade is an amber viscous liquid which is decomposed by alkalis. Insoluble in water; miscible with ethanol, chloroform, and ether. Log *P* (octanol/water), 6.3.
Thin-layer Chromatography System TB—R_f 0.72; system TE—R_f 0.87; system TF—R_f 0.72; system TAB—R_f 0.64; system TAC—R_f 0.44; system TAE—R_f 0.91.
Gas Chromatography System GA—RI 2020; system GK—*cis*-chlordane RRT 1.08, *trans*-chlordane RRT 1.06 (relative to caffeine).
High Performance Liquid Chromatography system HX—RI 1017; system HAO—*k* 0.00; system HAP—*k* 99.9.
Infrared Spectrum Principal peaks at wavenumbers 704, 1265, 1020, 1075, 1612, 826 cm^{-1}.
Mass Spectrum Principal ions at *m/z* 373, 375, 377, 371, 44, 109, 75, 272 (*cis*-chlordane); 373, 375, 377, 371, 272, 237, 75, 65 (*trans*-chlordane).
Quantification
Blood **GC** For method, see Dale *et al.* [1966].
Disposition in the Body Readily absorbed from the gastrointestinal tract, lungs, and the skin. It is stored in adipose tissue. Oxychlordane has been detected in adipose tissue and breast milk.
Toxicity Severe toxicity may result after ingestion or skin contamination with >1 g, and fatalities have occurred after the ingestion of >2 g and after excessive skin contamination. The maximum permissible atmospheric concentration is 0.5 mg/m^3.

In a non-fatal poisoning case, a 4-year-old child who ingested an unknown amount of chlordane and developed intermittent convulsions had an initial serum concentration of 3.4 mg/L which decreased to 0.14 mg/L after 72 h; the rate of decline of the serum concentration was non-linear with a terminal half-life of 88 days. Urine samples obtained during the first 3 days after ingestion showed a decrease from 1.9 mg/L to 0.05 mg/L, but increased to 0.13 mg/L on the 35th day [Aldrich, Holmes 1969].

The following postmortem concentrations were reported in a fatality due to the ingestion of chlordane: blood 4.4 mg/L, urine 0.24 mg/L [Bost 1978].

A 66-year-old man who ingested about 400 mL of a 70% commercial solution and died after 40 h had the following postmortem tissue concentrations: blood 1.7 mg/L, fat 378 µg/g, kidney 14 µg/g, liver 43 µg/g, urine 0.6 mg/L [Baselt 2000].

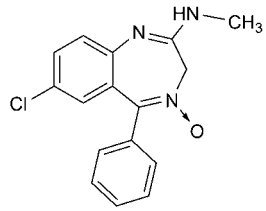
Chlordiazepoxide

Anticonvulsant, 1,4-Benzodiazepine, Tranquilliser
$C_{16}H_{14}ClN_3O$ = 299.8
CAS—58-25-3
IUPAC Name 7-Chloro-4-hydroxy-*N*-methyl-5-phenyl-3*H*-1,4-benzodiazepin-2-imine
Synonyms Chlordiazepoxidum; 7-chloro-*N*-methyl-5-phenyl-3*H*-1,4-benzodiazepin-2-amine 4-oxide; clopoxide; methaminodiazepoxide.
Proprietary Names *Helogaphen*; *Libritabs*; *Librium* (tablets); *Multum*; *Omnalio*; *Reposans*; *Risolid*; *Silibrin*; *Tropium*. It is an ingredient of *Libraxin*; *Limbatril*; *Limbitrol*; *Menrium*.

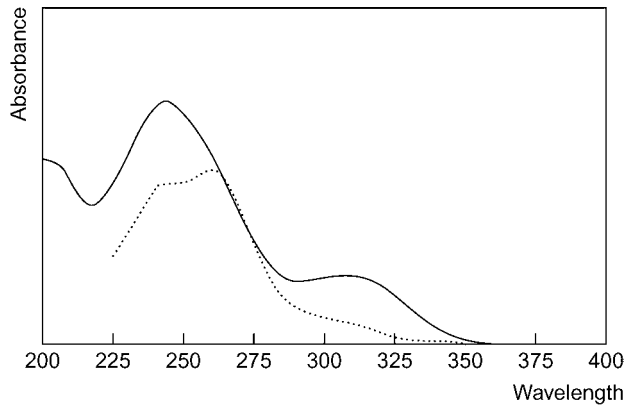


Chemical Properties Yellow crystalline powder, sensitive to sunlight. Mp 236° to 236.5°. Practically insoluble in water; soluble 1 in 50 of ethanol and 1 in 130 of ether; slightly soluble in chloroform. Extraction yield (chlorobutane), 0.95 [Demme *et al.* 2005]. Chlordiazepoxide is unstable in blood at room temperature. Even in refrigerated samples originally of 5 mg/L the drug was not detectable within 1–2 weeks [Levine *et al.* 1983].

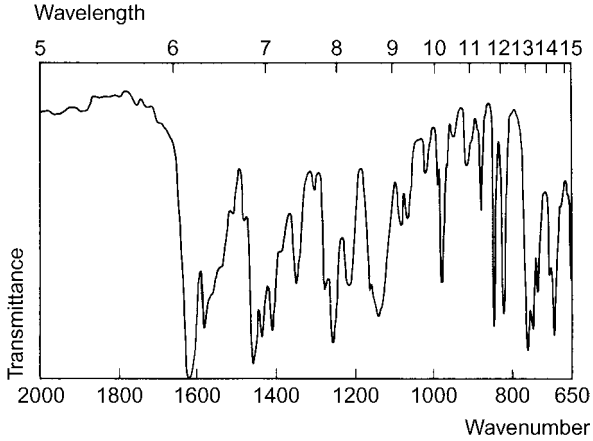
Chlordiazepoxide Hydrochloride

$C_{16}H_{14}ClN_3O$, HCl = 336.2
CAS—438-41-5
Proprietary Names *Ansiacal*; *A-Poxide*; *Balance*; *Benzodiapin*; *Cebrum*; *Corax*; *C-Tran*; *Disarim*; *Elenium*; *Equibral*; *Labican*; *Librium*; *Medilium*; *Mitran*; *Nack*; *Novopoxide*; *O.C.M.*; *Psichial*; *Psicoterina*; *Relaxil*; *Reliberan*; *Reposans*; *Seren Vita*; *SK-Lygen*; *Solium*; *Trilium*; *Tropium*; *Viansin*. It is an ingredient of *Clindex*; *Librax*; *Limbitrol*; *Menrium*.
Chemical Properties White or slightly yellowish crystalline powder. Mp 213°, with decomposition. Soluble 1 in 10 of water and 1 in 40 of ethanol; practically insoluble in chloroform and ether. pK_a 4.8 [Greenblatt *et al.* 1978]. Log *P* (octanol/water) 2.44.

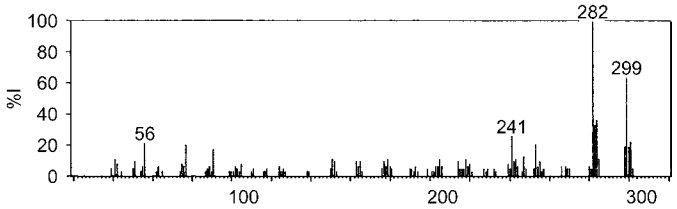
Colour Test Marquis test—yellow.
Thin-layer Chromatography System TA—R_f 0.62; system TB—R_f 0.02; system TC—R_f 0.50; system TD—R_f 0.10; system TE—R_f 0.52; system TF—R_f 0.10; system TL—R_f 0.22; system TAD—R_f 0.53; system TAE—R_f 0.76; system TAF—R_f 0.77; system TAJ—R_f 0.48; system TAK—R_f 0.02; system TAL—R_f 0.79 (Dragendorff spray, positive; FPN reagent, yellow; acidified iodoplatinate solution, positive; Marquis reagent, yellow).
Gas Chromatography System GA—chlordiazepoxide RI 2795, M (nor-) RI 2452, M (demoxepam) RI 2529, nordiazepam RI 2490, oxazepam RI 2325; system GB—chlordiazepoxide RI 2981, M (nor-) RI 2679, M (demoxepam) RI 2806; system GG—chlordiazepoxide RI 3065, nordiazepam RI 3041, oxazepam RI 2803.
High Performance Liquid Chromatography System HI—chlordiazepoxide *k* 6.41, demoxepam *k* 2.42, M (nor-) *k* 4.47, nordiazepam *k* 8.00, oxazepam *k* 4.62; system HK—chlordiazepoxide *k* 2.87, demoxepam *k* 0.03, M (nor-) *k* 2.39, nordiazepam *k* 1.99, oxazepam *k* 0.73; system HX—RI 363; system HY—RI 285; system HZ—RT 3.2 min; system HAA—RT 15.2 min; system HAF—chlordiazepoxide RT 21.0 min; system HAL—chlordiazepoxide RT 7.7 min; system HAM—chlordiazepoxide RT 3.1 min; system HAX—chlordiazepoxide RT 6.9 min; system HAY—chlordiazepoxide RT 5.3 min; system HAZ—chlordiazepoxide *k* 1.68; system HBH—chlordiazepoxide *k* 6.68; system HBI—chlordiazepoxide *k* 1.65.
Ultraviolet Spectrum Aqueous acid—246 (A^1_1= 1112a), 308 nm; aqueous alkali—262 nm.



Infrared Spectrum Principal peaks at wavenumbers 1625, 760, 1260, 690, 1590, 850 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 282, 299, 284, 283, 241, 56, 301, 253; 285, 286, 269, 287, 241, 242, 77, 270 demoxepam; 285, 268, 284, 77, 286, 42, 287, 233 desmethylchlordiazepoxide; 242, 269, 270, 241, 243, 271, 244, 272 desmethyldiazepam; 257, 77, 268, 239, 205, 267, 233, 259 oxazepam.



Quantification

Blood **GC** Column: SE-54 5% phenyl methyl silicone (25 m × 0.31 mm i.d., 0.17 µm). Carrier gas: He, 2–3 mL/min. Temperature programme: 200° for 1 min to 290° at 10°/min. NPD and ECD. Retention time: 6.16 min. Limit of detection, 10 µg/L ECD [Lillsunde, Seppala 1990]. Column: 3% OV-17 on Gas Chrom Q 100/120 mesh (1.2 m × 3.2 mm i.d.). Carrier gas: N_2, 50 mL/min. Temperature: 240°. ECD. Retention time: 9.95 min. Limit of detection, 0.2 mg/L [Peat, Kopjak 1979].

GC-MS Column: SE-30 WCOT vitreous silica capillary (25 m × 0.2 mm i.d.). Carrier gas: He, 22 psi. Temperature programme: 50° to 260° at 30°/min. EI ionisation at 70 eV. Limit of detection, 20–50 ng [Joyce *et al.* 1984].

HPLC Column: Bondapak C_{18} (30 cm × 4 mm i.d.). Mobile phase: methanol : 0.025 mol/L disodium hydrogen phosphate (pH 7.5; 58 : 42) or methanol : 0.025 mol/L disodium hydrogen phosphate (pH 7.5; 73 : 37), flow rate 2.4 mL/min. UV detection. Retention time: 12 and <5 min for the first and second mobile phases, respectively. Limit of detection, 0.2 mg/L [Peat, Kopjak 1979].

Note For 10 TLC methods for the detection of 21 anticonvulsants, see Gardner-Thorpe *et al.* [1971].

Plasma **TLC** Plates: silica gel F_{254} (20 × 20 cm). Solvent system: methanol : 12 N ammonium hydroxide (A, 100 : 1); *n*-heptane : chloroform : absolute methanol (B, 70 : 30 : 10), ethyl acetate : *n*-heptane : absolute ethanol (C, 70 : 30 : 10). R_f: 0.76, 0.45 and 0.38 for solvent system A, B and C, respectively. Limit of detection, 2.5 µg [Zingales 1971].

GC Column: SE-54 5% phenyl methyl silicone (25 m × 0.31 mm i.d., 0.17 µm). Carrier gas: He, 2 to 3 mL/min. Temperature programme: 200° for 1 min to 290° at 10 /min. NPD and ECD. Retention time: 6.16 min. Limit of detection, 10 µg/L [Lillsunde, Seppala 1990]. Column: Ultra 2 5% phenyl methyl silicone (25 m × 0.32 mm i.d.). Carrier gas: He, 2.1 mL/min. Temperature programme: 210° to 285° at 2.5°/min. NPD and ECD. Limit of quantification, 5 µg/L [Gaillard *et al.* 1993]. See Blood [Peat, Kopjak 1979]. Column: 2% OV-17 on Chromosorb W HP 80/100 mesh (4′ × 2 mm i.d.). Carrier gas: He, 80 mL/min. Temperature: 275°. ECD. Retention time: ≈6 min. Limit of detection, 0.5 ng [Zingales 1971].

HPLC Column: Bondapak C_{18} (5 µm). Mobile phase: water : methanol : acetonitrile : acetic acid (pH 3.7; 51 : 28 : 16 : 0.2), flow rate 1.0 mL/min. UV detection (λ= 241 nm). Retention time: 10.1 min. Limit of detection, 75 µg/L [Garretty *et al.* 1998]. Column: LiChrosorb 10RP8 (25 cm × 4.6 mm i.d.). Mobile phase: water : methanol : tetraethylammonium (pH 6.0; 43 : 57 : 0.25), flow rate 2.0 mL/min. UV detection (λ= 254 nm). Retention time: 1.42 min relative to *N*-methylnitrazepam. Limit of detection, 0.02 mg/L [Willems *et al.* 1985]. Column: µBondapak (30 cm × 3.9 mm i.d.). Mobile phase: 450 mL methanol : acetonitrile (50 : 50), 550 mL water and 1 mL of 1 mol/L sodium acetate, flow rate 2.0 mL/min. UV detection (λ= 254 nm). Retention time: 11 min. Limit of detection, 50 µg/L [Divoll *et al.* 1982]. Column: LiChrosorb RP-8 (10 cm × 4.6 mm i.d., 5 µm). Mobile phase: 0.01 mol/L sodium acetate : methanol : acetonitrile (600 : 200 : 200), flow rate 2.0 mL/min. UV detection (λ= 240 nm). k': 11.2. Limit of detection, 20 µg/L [Vree *et al.* 1981]. Column: µBondapak C_{18} (30 cm × 3.9 mm i.d., 10 µm). Mobile phase: methanol : isopropanol : 7.5 mmol/L acetate buffer (53 : 5 : 42), flow rate 0.9 mL/min. Electrochemical detection. Retention time: 12.3 min (k': 2.5) for chlordiazepoxide, 9.8 min (k': 1.8) for *N*-desmethylchlordiazepoxide. Limit of detection, 50 µg/L [Hackman, Brooks 1981]. Column: LiChrosorb RP-18 (250 × 4 mm i.d., 10 µm). Mobile phase: acetonitrile : 0.1% ammonium carbonate (31 : 69), flow rate 2.0 mL/min. Retention time: 7.75 min. Limit of detection, 30 µg/L [Ascalone 1980]. See Blood [Peat, Kopjak 1979]. Column: Bondapak C_{18} Corasil (600 × 2.3 mm i.d., 35–52 µm). Mobile phase: acetonitrile : 0.1% aqueous ammonium carbonate (30 : 70), flow rate 1.0 mL/min. UV detection (λ= 254 nm). Limit of detection, ≈0.1 mg/L [Skellern *et al.* 1978].

LC-MS Column: LiChroCart (125 × 2 mm i.d.). Mobile phase: 5 mmol/L aqueous ammonium formate (pH 3.0) : acetonitrile (60 : 40 for 5.5 min to 10 : 90 until 8 min to 60 : 40 until 10 min), flow rate 0.4 mL/min for 5.5 min to 0.7 mL/min until 8 min to 0.65 mL/min until 9.5 min to 0.4 mL/min for 0.5 min. APCI, SIM or scan acquisition mode, positive ion mode. Limit of quantification, 0.2 mg/L (SIM), limit of detection, 0.01 mg/L (scan) [Kratzsch *et al.* 2004].

Serum **TLC** Plates: Quanta-Gram LQD (20 × 20 cm). Solvent system: acetone : dioxane : isopropanol : *n*-heptane : toluene : hexane (15 : 15 : 30 : 30 : 30 : 25). R_f: 0.48. Limit of quantification, 0.1 µg [Straughan *et al.* 1978]. Plates: silica gel GF (20 × 20 cm, 250 µm). Solvent system: chloroform : methanol : ammonium hydroxide (85 : 15 : 0.5). Development with 7 mol/L sulphuric acid followed by UV detection. Densitometry by fluorescence detection (λ_{ex}= 390 nm). R_f: 0.63, pale-blue spot. Limit of detection, 0.05 mg/L [Sun 1978a].

GC Column: 3% OV-17 Chromosorb W (HP) 80/100 mesh (3′ × 0.25" i.d.). Carrier gas: Ar: CH_4 (95 : 5), 66 mL/min. Temperature: 265°. ECD. Retention time: 5.1 min. Limit of detection, 0.05 mg/L [Kelly *et al.* 1979]. Column: 10% OV-1 on Chromosorb G HP 80/100 mesh (1.21 m × 4 mm i.d.). Carrier gas: Ar : CH_4 (95 : 5), 50 mL/min. Temperature: 270°. ECD. Retention time: 6.99 min. Limit of detection, 0.1 mg/L [Sun 1978b].

HPLC Column: TSK gel Super-ODS C_{18} reversed phase (100 × 4.6 mm i.d., 2 µm). Mobile phase: acetonitrile : 5 mmol/L sodium hydrogen phosphate (pH 6.0; 45 : 55), flow rate 0.65 mL/min. UV detection (λ= 254 nm). Retention time, 21.0 min. Limit of quantification, 1 µg/L [Tanaka *et al.* 1996; Tanaka *et al.* 1998] Column: C_{18} reversed phase (250 × 4.6 mm i.d., 5 µm). Mobile phase: 10 mmol/L potassium phosphate buffer (pH 6.0) containing 2.6 g/L pentane sulfonic acid : methanol : acetonitrile (45 : 35 : 20), flow rate 1.0 mL/min. UV detection (λ= 254 nm). Limit of detection, 50 µg/L [Haver *et al.* 1986]. Column: C_{18} (250 × 4.6 mm i.d., 10 µm). Electrochemical detection. Limit of detection, 2 mg/L [Selavka *et al.* 1985]. Column: µBondapak C_{18} (15 cm × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : phosphate buffer, flow rate 3.0 mL/min. UV detection (λ= 210 nm). Retention time: 19.6 min. Limit of detection, 0.2 mg/L [Kabra *et al.* 1981]. Column: Ultrasphere ODS (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 7 mmol/L dipotassium hydrogen phosphate (pH 3.7; 35 : 65), flow rate 2.0 mL/min. UV detection (λ= 242 nm). Retention time: 4.81 min. Limit of detection, 25 µg/L [Good, Andrews 1981]. Column: µBondapak C_{18} reversed phase (30 cm × 3.9 mm i.d.). Mobile phase: acetonitrile : methanol : acetate buffer (pH 5.0; 200 : 225 : 500), flow rate 2.0 mL/min. UV detection (λ= 240 nm). Retention time: 1.19 min relative to *N*-desmethylchlordiazepoxide. Limit of detection, 0.08 mg/L [Foreman *et al.* 1980].

Urine **TLC** Plates: Quanta-Gram LQD (20 × 20 cm). Solvent system: acetone : dioxane : isopropanol : *n*-heptane : toluene : hexane (15 : 15 : 30 : 30 : 30 : 25). R_f: 0.48. Limit of quantification, 0.1 µg [Straughan *et al.* 1978]. Plates: silica gel F_{254} (20 × 20 cm). Solvent system: chloroform twice followed by chloroform : acetone (1 : 1). UV detection (λ= 260 nm). R_f: 0.3. Limit of detection, 0.1–0.2 mg/L [Stronjny *et al.* 1977]. Plates: chromatoplates (250 µm). Solvent system: chloroform : acetone (A, 9 : 1), benzene (B), methanol (C), ethyl acetate : *n*-propanol : diethylamine (D, 70 : 30 : 1), ethylene chloride : methanol : concentrated aqueous ammonia (E, 90 : 10 : 1), toluene : acetone : concentrated aqueous ammonia (F, 50 : 50 : 1). UV detection, Dragendorff's reagent, Bratton-Marshall reagent or KI-*o*-tolidine. R_f: 0.15, 0.00, 0.56, 0.63, 0.48 and 0.55 for solvent system A to F, respectively. Light brown with UV light. Limit of detection, 5 (orange), 0.5 (purple-red) and 5 (brown) µg for each reagent, respectively [Sawada, Shinohara 1970].

GC-MS Column: DB-5 fused silica capillary cross-linked methyl silicone (12 m × 0.25 mm i.d., 0.25 µm). Temperature programme: 250° for 3 min to 280° at 10°/min. Retention time: 4.90 min. Limit of detection not reported [Needleman, Porvaznik 1995]. Column: 5% OV-101 Chromosorb G HP 100/120 mesh (60 cm × 2 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature: 100° to 310° at 30 /min. EI ionisation at 70 eV. Limit of detection not reported [Maurer, Pfleger 1987].

HPLC Column: Zorbax ODS (25 cm × 4.6 mm i.d., 5–6 µm). Mobile phase: 60 mmol/L ammonium hydroxide (pH 7.69) : 60 mmol/L acetic acid: acetonitrile 42 : 20 : 38 for 1 min to 0 : 25 : 75 at 5 min for 3 min to 42 : 20 : 38 at 8.1 min until 15 min), flow rate 2.0 mL/min. UV detection (λ = 254 nm). Retention time: ≈7 min. Limit of detection, 0.05 mg/L [Lensmeyer *et al.* 1982]. Column: LiChrosorb RP-8 (10 cm × 4.6 mm i.d., 5 µm). Mobile phase: 0.01 mol/L sodium acetate : methanol : acetonitrile (600 : 200 : 200), flow rate 2.0 mL/min. UV detection (λ= 240 nm). k': 11.2. Limit of detection, 20 µg/L [Vree *et al.* 1981].

Oral Fluid **GC-MS** Column: Agilent capillary (15 m × 0.25 mm i.d.). CI, SIM acquisition mode. Limit of quantification, 0.5 µg/L [Cone *et al.* 2007].

LC-MS Column: Zorbax Eclipse XDB C_{18} (50 × 4.6 mm i.d., 1.8 µm). Mobile phase: 20 mmol/L ammonium formate (pH 8.6) : acetonitrile (50 : 50), flow rate 0.2 mL/min for 6.5 min to 1 mL/min for 1.5 min to 0.2 mL/min for 2 min. ESI, MRM acquisition mode. Limit of quantification, 1 µg/L [Moore *et al.* 2007]. Column: Zorbax Bonus-RP (100 × 2.1 mm i.d., 3.5 µm). Mobile phase: methanol :

0.1% formic acid (50 : 50 for 0.5 min to 95 : 5 over 3 min for 1.3 min to 50 : 50 in 1 min for 2.2 min), flow rate 200 µL/min. APCI, positive ion mode. Limit of quantification, 1 µg/L, limit of detection, 0.5 µg/L [Ngwa *et al.* 2007].

Stomach Contents **TLC**. See Urine [Sawada, Shinohara 1970].

Liver **HPLC** Column: Ultrasphere ODS (150 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 0.025 mol/L disodium hydrogen phosphate (pH 7.8, 60 : 40). UV detection (λ= 254 nm). Limit of detection not reported [Entwistle *et al.* 1986].

Note For a review of analytical methods for the measurement of 1,4-benzodiazepines, see Hailey [1974].

Disposition in the Body Readily absorbed after oral administration. Peak plasma concentrations are found after 1–2 h. Metabolised by demethylation and subsequent deamination to the active metabolites desmethylchlordiazepoxide and demoxepam. Demoxepam is further metabolised by hydrolysis with cleavage of the lactam ring and by reduction to desmethyldiazepam (nordazepam) followed by hydroxylation to oxazepam (desmethyldiazepam and oxazepam are also pharmacologically active). After a single oral or IV dose of 30-mg chlordiazepoxide, measurable plasma concentrations of *N*-desmethyldiazepam are reached 24–72 h after administration. When 10 mg chlordiazepoxide is administered 3 times daily, steady-state *N*-desmethydiazepam concentrations in plasma are reached after ~1 week of administration (range: 220–260 µg/L) [Dixon *et al.* 1976]. Approximately 60% of a dose is excreted in the urine and 10 to 20% is eliminated in the faeces; <1% of a dose is excreted in the urine unchanged, ~ 6% is excreted as demoxepam, and the remainder as ring-opened derivatives and glucuronide conjugates of oxazepam and other hydroxylated metabolites. Chlordiazepoxide passes into the cerebrospinal fluid and breast milk. It also crosses the placenta.

Therapeutic Concentration

In plasma, usually in the range 0.4 to 4 mg/L. Demoxepam and desmethyldiazepam may accumulate in the plasma of patients on chronic therapy; demoxepam is not normally detectable in plasma after a single dose of chlordiazepoxide.

After a single 50 mg IV dose of chlordiazepoxide to a healthy 72-year-old volunteer, the initial distribution half-life was 4.4 min, the elimination half-life was 18.3 h, the total volume of distribution was 0.32 L/kg, and the total clearance was 0.2 mL/min/kg [Divoll *et al.* 1982].

After the administration of a single 50 mg dose of chlordiazepoxide to a 50 kg female, a peak plasma concentration of ~2.25 mg/L was reached after 2 h [Straughan *et al.* 1978].

After daily oral administration of 10 mg three times a day to 8 subjects, mean steady-state plasma concentrations were: chlordiazepoxide 0.5–1.0 mg/L (mean 0.8), desmethylchlordiazepoxide 0.3–0.8 mg/L (mean 0.5), demoxepam 0.24–0.44 mg/L (mean 0.36) [Boxenbaum *et al.* 1977].

After a single oral dose of 20 mg to 6 subjects, peak plasma concentrations of 0.78–1.24 mg/L (mean 1.0) of chlordiazepoxide were attained in 2–6 h; desmethylchlordiazepoxide was detectable 5 h after the dose and peak plasma concentrations of 0.14–0.46 mg/L (mean 0.3) were attained in 8–24 h [Schwartz *et al.* 1971].

Toxicity Toxic reactions may be produced by plasma concentrations >3 mg/L; plasma concentrations in the region of 20 mg/L may produce coma or death, but fatalities caused by chlordiazepoxide alone are rare. Recoveries have occurred after the ingestion of single doses of about 2 g.

A 45-year-old female alcoholic was administered 5.2 g chlordiazepoxide over 4 days. Chlordiazepoxide therapy was stopped when she fell into a coma. Toxicity corresponded to the blood concentration of the metabolite demoxepam [Minder 1989].

The following postmortem chlordiazepoxide tissue concentrations were reported in a fatality in which death occurred 18–20 h after the ingestion of an unknown quantity of chlordiazepoxide: blood 26.4 mg/L, bile 39 mg/L, kidney 11 µg/g, liver 10 µg/g, spleen 9 µg/g, urine 7.8 mg/L [Moheni 1975].

The following peak plasma concentrations were observed in a comatose adult subject who had ingested 1 g: chlordiazepoxide 20 mg/L after 6 h, desmethylchlordiazepoxide 12 mg/L after 21 h, demoxepam 9 mg/L after 51 h [de Silva, D'Arconte 1969].

Bioavailability Almost 100%.

Half-life Plasma half-life, chlordiazepoxide 5–30 h (mean 15), demoxepam 14–95 h (mean 40); desmethyldiazepam about 40–100 h, but there is considerable inter-subject variation—see under Nordazepam.

Volume of Distribution 0.3–0.6 L/kg.

Clearance Plasma clearance, ≈0.5 mL/min/kg.

Saliva Plasma : saliva ratio, ≈33.

Protein Binding ≈96%.

Note For a review of the pharmacokinetics of chlordiazepoxide, see Greenblatt *et al.* [1978]. For a general review of benzodiazepines, see Miller and Gold [1990].

Dose In the treatment of anxiety 30 to 100 mg daily. For symptoms of alcohol withdrawal up to a maximum of 300 mg daily.

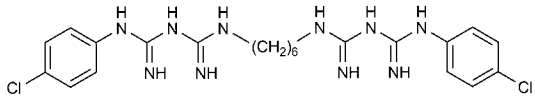
Chlorhexidine

Cationic Disinfectant
$C_{22}H_{30}Cl_2N_{10}$ = 505.5
CAS—55-56-1

IUPAC Name (1*E*)-2-[6-[[Amino-[[amino-[(4-chlorophenyl)amino]methylidene]amino]methylidene]amino]hexyl]-1-[amino-[(4-chlorophenyl)amino]methylidene]guanidine
Synonyms 1,6-Bis[*N*′-(*p*-chlorophenyl)-N^5-biguanido]hexane; 1,6-bis(N^5-*p*-chlorophenyl-*N*′-diguanido)hexane; *N*,*N*″ bis(4-chlorophenyl)-3,12-di-imino-2,4,11,13-tetra-azatetradecanedi-imidamide; 1,6-di(4′-chlorophenyldiguanido)hexane; 1,1′-hexamethylenebis[5-(*p*-chlorophenyl)biguanidine.
Proprietary Names *Hexol*. It is an ingredient of *Cetal* (liquid).



Chemical Properties Crystals. Mp 134°. pK_{a1} 10.8 (25°), pK_{a2} 10.3, pK_{a3} 2.2 [Lam *et al.* 1993]. Log *P* (octanol/water) 0.1. Stable in saliva at –20° for at least 2 months [Lam *et al.* 1993].

Chlorhexidine Diacetate

$C_{22}H_{30}Cl_2N_{10}$, $2C_2H_4O_2$ = 625.6
CAS—56-95-1
Proprietary Names *Chlorasept 2000*; *Nolvasan*.
Chemical Properties White to pale-cream microcrystalline powder. Mp 154° to 155°. When heated it decomposes with the production of trace amounts of 4-chloroaniline. Aqueous solutions slowly decompose. Soluble 1 in 55 of water and 1 in 15 of ethanol; soluble in glycerol and propylene glycol.

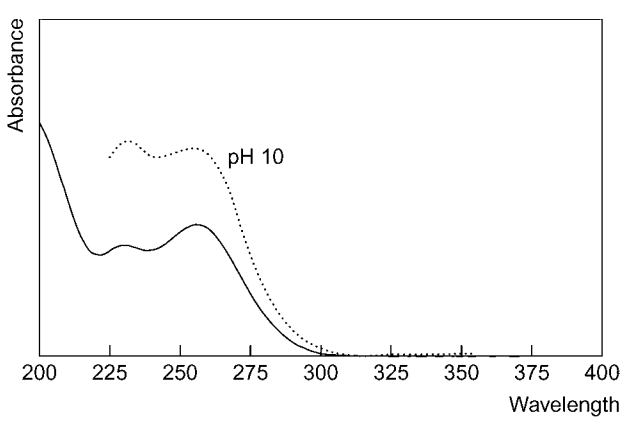
Chlorhexidine Digluconate

An aqueous solution containing 19 to 21% of $C_{22}H_{30}Cl_2N_{10}$, $2C_6H_{12}O_7$ = 897.8.
CAS—18472-51-0 (chlorhexidine gluconate)
Proprietary Names *Corsodyl*; *Dispray*; *Hibicare*; *Hibiclens*; *Hibidil*; *Hibiscrub*; *Hibisol*; *Hibitane (solution)*; *pHiso-MED*; *Rotersept*. It is an ingredient of *Cyteal*; *Eludril*; *Savloclens*; *Savlodil*; *Savlon (liquid)*; *Stomosol*.
Chemical Properties Colourless-to-pale-straw-coloured liquid that is affected by light. Weight per mL 1.06 to 1.07 g. Miscible with water, with up to 5 parts of ethanol, and with up to 3 parts of acetone.

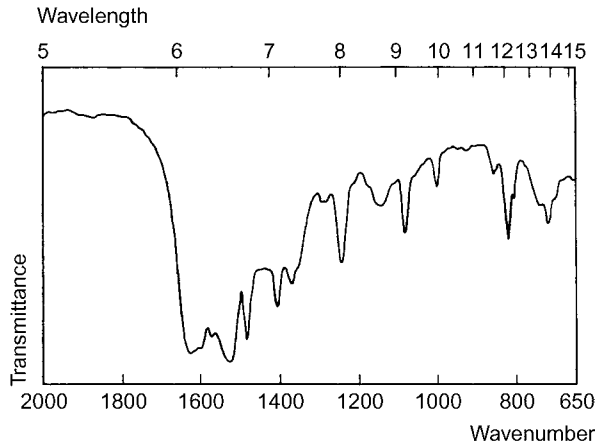
Chlorhexidine Hydrochloride

$C_{22}H_{30}Cl_2N_{10}$, 2HCl = 578.4
CAS—3697-42-5
Proprietary Names *Hibitane* (powder); *Lisium*; *Sterilon* (powder).
Chemical Properties Light-sensitive white crystalline powder. Mp 260° to 262°, with decomposition. Soluble 1 in 1700 of water, 1 in 450 of ethanol and 1 in 50 of propylene glycol; slightly soluble in methanol.

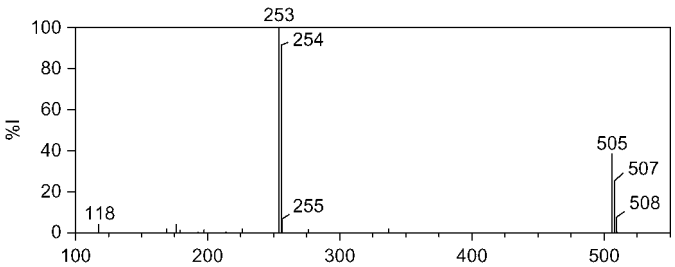
Colour Test Stir a small quantity on a white tile with a drop of bromine solution followed by a drop of sodium hydroxide solution—red.
Thin-layer Chromatography System TA—R_f 0.33; system TAE—R_f 0.01; system TB—R_f 0.00; system TE—R_f 0.13 (acidified iodoplatinate solution, positive).
High Performance Liquid Chromatography System HAA—RT 13.5 min; system HX—RI 398; system HY—RI 305.
Ultraviolet Spectrum Aqueous acid—245 nm; aqueous alkali (pH 10)—232, 253 nm.



Infrared Spectrum Principal peaks at wavenumbers 1527, 1628, 1575, 1235, 820, 1080 cm^{-1} (KBr disk).



Mass Spectrum



Quantification

Blood **HPLC** Column: ODS reversed phase (10 µm). Mobile phase: 1 g/L toluene-4-sulfonic acid in methanol : water (65 : 35), flow rate 1.5 mL/min. UV detection (λ = 254 nm). Limit of detection, 1 mg/L [Huston *et al.* 1982].

LC-MS Column: TSKgel ODS-100V (50 × 2.0 mm, 5 µm). Mobile phase: acetonitrile : water : trifluoroacetic acid (65 : 35 : 0.1), flow rate 200 µL/min. ESI, positive or negative ion mode, SIM acquisition mode. Limit of quantification, 100 µg/L, limit of detection, 18.3 µg/L [Usui *et al.* 2006].

Serum **HPLC** Column: Capcell Pak C_{18} MG (250 × 3.0 mm i.d., 4.0 µm). Mobile phase: acetonitrile : water with 0.05% trifluoroacetic acid, 0.05% heptafluorobutyric acid and 0.1% triethylamine (40 : 60), flow rate 0.8 mL/min. UV detection (260 nm). Limit of detection, 0.05 mg/L [Kudo *et al.* 2002]. Column: LiChrospher 100 RP-18 (125 × 4 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.1 mol/L disodium hydrogen phosphate with 5 mmol/L 1-heptanesulfonic acid and 0.05 mol/L triethylamine (pH 2.5; 35 : 65). UV detection (λ = 260 nm). Limit of quantification, 0.5 mg/L [Pesonen *et al.* 1995]. See Blood [Huston *et al.* 1982].

Urine **HPLC** See Blood [Huston *et al.* 1982].

Oral Fluid **HPLC** Column: Shimpack CLC-C8 (250 × 4.6 mm i.d., 5 µm). Mobile phase: 10 mmol/L sodium pentanesulfonate in acetonitrile : 50 mmol/L sodium phosphate buffer (pH 3.0; 47 : 53), flow rate 1.0 mL/min. DAD. Limit of quantification, 50 µg/L [Tsuchiya *et al.* 1999]. Column: Ultrasphere ODS C_{18} (15 cm × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.05 mol/L sodium acetate buffer and 5 mmol/L heptanesulfonic acid (pH 5.0; 40 : 60), flow rate 1.0 mL/min. UV detection (λ = 260 nm). Retention time: 5.8–6.1 min. Limit of detection, 50 µg/L [Lam *et al.* 1993].

Skin **HPLC** LiChrospher 60 RP-select (250 × 4 mm i.d.). Mobile phase: acetonitrile : 30 mmol/L sodium acetate buffer (pH 3.3; 50 : 50), flow rate 1.0 mL/min. UV detection (λ = 260 nm). Retention time: 3.4 min for chlorhexidine digluconate. Limit of detection, 50 µg/L [Carret *et al.* 1997].

Toxicity

A 28-year-old female was found dead with her left arm connected to an IV drip. The chlorhexidine concentration in her blood was 352 mg/L [Usui *et al.* 2006].

A 58-year-old Japanese female suffering from articular rheumatism underwent synovectomy on her finger. While in hospital she received an injection of antibiotics. Twenty minutes later she went into cardiac arrest, and after 100 min she died. A concentration of chlorhexidine was detected in the serum taken from the right side of her heart at a level of 39.5 mg/L only 27 h after death [Kudo *et al.* 2002].

Use Chlorhexidine gluconate is used in solutions of 0.01 to 0.5%.

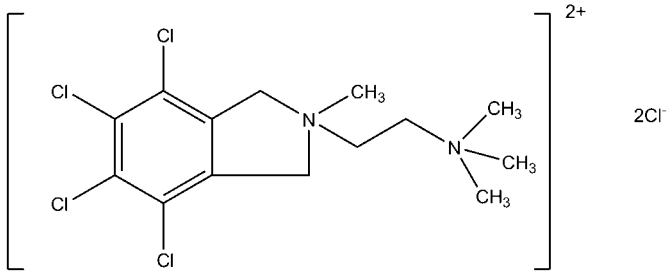
Chlorisondamine Chloride

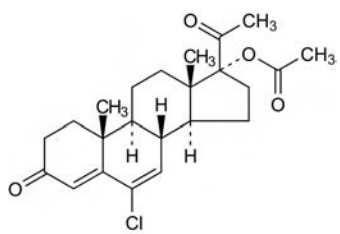
Quaternary Ammonium, Selective Nicotinic Receptor Antagonist, Antihypertensive
$C_{14}H_{20}Cl_6N_2 = 429.0$
IUPAC Name Ethylene-1-(4,5,6,7-tetrachloro-2-methylisoindolinium)-2-trimethylammonium dichloride
Synonym SU 3088
Proprietary Name *Ecolid*



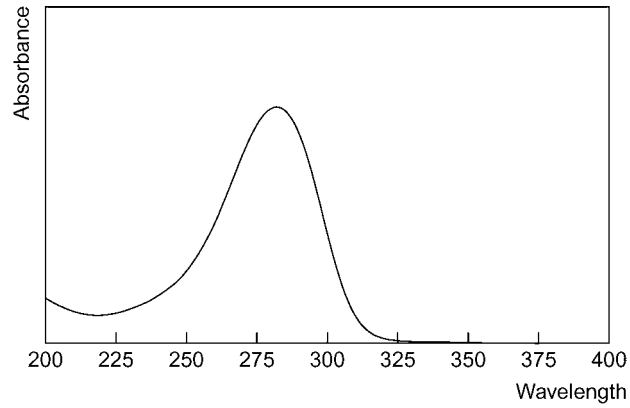
Chemical Properties Crystals. Mp 258° to 265° with decomposition. Soluble in water and ethanol.
Thin-layer Chromatography System T1—R_f 0.01 (location reagent acidified iodoplatinate spray, positive reaction).
Ultraviolet Spectrum Aqueous acid (0.1 N sulfuric acid)—274, 282, 290 nm.
Infrared Spectrum Principal peaks at wavenumbers 1392, 964, 1480, 1177 cm^{-1} (KBr disk).
Dose Up to 200 mg daily.

Chlormadinone Acetate

Progestational Steroid
$C_{23}H_{29}ClO_4 = 404.9$
CAS—1961-77-9 (chlormadinone); 302-22-7 (acetate)
IUPAC Name [(8*R*,9*S*,10*R*,13*S*,14*S*,17*R*)-17-Acetyl-6-chloro-10,13-dimethyl-3-oxo-2,8,9, 11,12,14,15,16-octahydro-1H-cyclopenta[a]phenanthren-17-yl] acetate
Synonym 17-(Acetyloxy)-6-chloropregna-4,6-diene-3,20-dione
Proprietary Names *Chronosym*; *Cormin*; *Cyclonorm*; *Fertiletren*; *Gestafortin*; *Lutéran*; *Matrol*; *Traslan*.



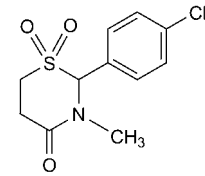
Chemical Properties A white to creamy-white, fluffy, crystalline powder. Mp 208° to 212°. Practically insoluble in water; soluble 1 in 160 of ethanol, 1 in 1.5 of chloroform, and 1 in 210 of ether. Log *P* (octanol/water), 4.0.
Gas Chromatography System GA—chlormadinone-H_2O RI 3340, chlormadinone acetate RI 3360.
High Performance Liquid Chromatography System HAA—Retention time 24.1 min (chlormadinone).
Ultraviolet Spectrum Methanol—285 nm (A_1^1=575b).



Infrared Spectrum Principal peaks at wavenumbers 1238, 1724, 1646, 1219, 881, 1597 cm^{-1} (KBr disk).
Dose Chlormadinone acetate has been given in doses of 2 to 10 mg daily.

Chlormezanone

Tranquilliser
$C_{11}H_{12}ClNO_3S = 273.7$
CAS—80-77-3
IUPAC Name 2-(4-Chlorophenyl)tetrahydro-3-methyl-4*H*-1,3-thiazin-4-one 1,1-dioxide
Synonyms Chlormethazanone; chlormezanonum; dichloromethazanone.
Proprietary Names *Trancopal*. It is an ingredient of *Arcanaflex*; *Besaprin*; *Beserol*; *Clormetadone*; *Lobak*; *Trancogesic*; *Trancoprin*.



Chemical Properties White crystalline powder. Mp 116.2° to 118.2°. Very slightly soluble in water; sparingly soluble in ethanol; freely soluble in acetone and chloroform. Log *P* (octanol/water) −0.26. Extraction yield (chlorobutane), 0.9 [Demme *et al.* 2005]. Stable in plasma for at least 9 weeks when stored at −20° and after 3 freeze-thaw cycles. Extracts were stable at room temperature for 3 days [Schütz *et al.* 1997].
Thin-layer Chromatography System TA—R_f 0.66; system TB—R_f 0.01; system TC—R_f 0.63; system TE—R_f 0.68; system TL—R_f 0.57; system TAE—R_f 0.84; system TAF—R_f 0.80; system TAJ—R_f 0.55; system TAK—R_f 0.45; system TAL—R_f 0.94.
Gas Chromatography System GA—chlormezanone RI 2199, M (4-chlorobenzoic acid) RI 1400, M (*N*-methyl-4-chlorobenzamide) RI 1555, art RI 1235; system GB—chlormezanone RI 2346, M (*N*-methyl-4-chlorobenzamide) RI 1596, art RI 1245.
High Performance Liquid Chromatography System HY—RI 334; system HAA—RT 15.5 min; system HAX—RT 6.0 min; system HAY—RT 5.3 min.
Column: Nucleosil RP C_{18} (120 × 4.0 mm i.d., 5 µm). Mobile phase: acetonitrile : water : 85% orthophosphoric acid (35 : 65 : 0.1), flow rate 1.5 mL/min [Köppel *et al.* 1991].
Ultraviolet Spectrum Aqueous acid—258, 265 (A_1^1 = 23b), 272 nm; aqueous alkali—259 nm.
Infrared Spectrum Principal peaks at wavenumbers 1650, 1150, 1130, 1315, 880, 1090 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 98, 152, 154, 42, 69, 174, 208, 153.
Quantification
Blood **GC** Column: HP-5 (25 m × 0.25 mm i.d., 0.33 µm). Temperature programme: 100° for 1 min to 300° at 10°/min. FID. Relative retention time: 1.12 min [Lo *et al.* 1997].
HPLC Column: ODS-Hypersil (200 × 2.1 mm i.d., 5 µm). Mobile phase: 2 mmol/L phosphate buffer (pH 3.2) : acetonitrile (95 : 5 to 50 : 50 at 20 min for 10 min to 95 : 5 at 31 min), flow rate 0.4 mL/min. DAD (λ = 210 nm). Relative retention time: 0.96 min [Lo *et al.* 1997]. Column: Nucleosil C_{18} (12 × 0.4 cm i.d., 5 µm). Mobile phase: acetonitrile : water: *o*-phosphoric acid (35 : 65 : 0.1) flow rate 1.5 mL/min. UV detection (λ = 225 nm). Limit of detection, 0.05 mg/L [Köppel *et al.* 1991].
Plasma **GC** Column: 3% OV-17 (2 m). Temperature programme: 100° to 300° at 10°/min. EI or CI. Limit of detection, 0.15 mg/L [Köppel *et al.* 1986]. Column: 5% EGS polyester on 80/100 Gas-Chrom Q (1 m × 3 mm i.d.). Carrier gas: N_2, 40 mL/min. Temperature: 100°. ^{63}N-ECD. Limit of detection, 0.1 mg/L [Ohya *et al.* 1980].

HPLC Column: reversed phase. Mobile phase: isocratic. UV detection ($\lambda = 230$ nm). Limit of quantification, 0.1 mg/L, limit of detection, 0.02 mg/L [Schütz *et al.* 1997]. Column: Nucleosil C_{18} (12 cm × 4 mm i.d., 7.5 µm). Mobile phase: methanol : water: 85% *o*-phosphoric acid (50 : 50 : 1), flow rate 1.0 mL/min. UV detection ($\lambda = 228$ nm). Retention time: 3.37 min. Limit of detection, 0.1 mg/L [Ali, Blume 1987].

Disposition in the Body Rapidly absorbed after oral administration, with peak plasma concentrations reached after 1 to 2 h. It appears to be metabolised by hydrolysis then oxidation to chlorobenzaldehyde and conjugation. Less than 5% of a dose is excreted in the urine as unchanged drug in 48 h; about 40% of a dose is excreted in the urine in 72 h as acidic metabolites (mainly 4-chlorohippuric acid).

Therapeutic Concentration

After a single 200-mg oral dose peak plasma concentrations ranged from 2.6 and 3.1 mg/L reached within 1–1.5 h [Schütz *et al.* 1997].

After a single oral dose of 200 mg to 5 subjects a mean peak plasma concentration of 1.86 mg/L was attained in 1 h. Repeated oral doses of 3 × 200 mg (12 subjects) or 4 × 400 mg (10 subjects) produced pre-dose chlormezanone plasma levels of 12.0 and 22.7 mg/L, respectively, after 5 days; levels were comparable after 10 days in 3 patients from each group. After a loading dose of 800 mg and repeated doses of 3 × 200 mg chlormezanone to 5 patients, plasma levels of 6.5, 8.9, 12.7, and 10.4 mg/L were determined after 2, 8, 16, and 36 h, respectively [Köppel *et al.* 1991].

After a single oral dose of 200 mg to 5 subjects, peak plasma concentrations of 2.5 to 3.4 mg/L (mean 2.8) were attained in ~4 h [Ohya *et al.* 1980].

After a single oral dose of 400 mg to 4 subjects, peak plasma concentrations of 4.9 to 9.9 mg/L (mean 7) were attained in 1 to 2 h; following oral doses of 150 mg three times a day for 3 days to 4 subjects, plasma concentrations of 5.8 to 8.4 mg/L (mean 6.8) were reported 2 h after the final dose [McChesney *et al.* 1967].

Toxicity Chlormezanone has been withdrawn from the market in many countries because of reports of serious skin reactions [Guillaume *et al.* 1987; Mahboob, Haroon 1998; Saiag *et al.* 1992].

A 39-year-old female was found in a comatose state 6 h after ingesting chlormezanone (possibly up to 12 g). A liver biopsy revealed diffuse hydropic degeneration and necrosis of hepatocytes. Chlormezanone levels 7 to 8 h post-ingestion and then every other day were as follows: 78.0, 45.9, 21.6 and 7.8 mg/L in serum and 3.8, 1.1, 0.5 mg/L then untraceable, in urine [Sheu *et al.* 1995].

A 29-year-old female experienced muscle spasm in the 27th week of pregnancy. She was given 600 mg of chlormezanone per day for 3 weeks. In the third week she complained of nausea and vomiting and jaundice appeared 3 days later. Four days later, the patient went into a coma. A healthy baby boy was delivered by Caesarean section and the following day an orthotopic liver transplant was carried out. The removed liver weighed 335 g. Mother and baby were in good health 26 months after the transplant [Bourliere *et al.* 1992].

In a fatality due to the combined ingestion of chlormezanone (possibly up to 11 g), diazepam (up to 200 mg) and nitrazepam (up to 80 mg), the following postmortem concentrations of chlormezanone were reported: femoral blood, 53 mg/L; brain 109 µg/g; liver, 88 µg/g and urine, 31 mg/L [Köppel *et al.* 1991].

A 14-year-old female ingested an unknown amount of ofloxacin, diphenhydramine and chlormezanone. Plasma concentrations of chlormezanone were 6 and 1.3 mg/L at 12 and 24 h post-ingestion, respectively [Koppel *et al.* 1990].

A 70-year-old female had received drug therapy for cervical vertebral syndrome and hypertension for 5 years. She had taken 3 g/day Pro G (15 mg propantheline bromide [Koppel *et al.* 1990], 778 mg magnesium silicate, 30 mg sodium copper chlorphylin, and 20 mg glycyrrhizin in 1 g granule), 5 mg/day diazepam, 600 mg/day Salyitamine (150 mg isopropylantipyrine, 40 mg allylisopropylacetylurea, 250 mg phenacetin, and 50 mg anhydrous caffeine per 600 mg granule), and 150 mg/day vitamin E. Approximately 4 months later, 200 mg/day chlormezanone was added, this was increased to 600 mg/day 2 months later. Approximately 2 weeks later she was admitted to hospital with abdominal pain and weight loss. She was diagnosed with hepatitis and chlormezanone therapy was stopped. She was discharged ~2 months later due to improvement of her symptoms [Ohsawa, Konishi 1986].

A 36-year-old female was admitted to hospital comatose after the ingestion of 7 g of chlormezanone; an initial plasma concentration of 60 mg/L was reported, which declined with a half-life of 29 h; the patient regained consciousness after 15 h [Armstrong *et al.* 1983].

Half-life Plasma half-life, ≈20 to 30 h.

Protein Binding ≈50%.

Note For a review of the pharmacokinetics of chlormezanone, see Gautier *et al.* [1990].

Dose 300 to 800 mg daily in divided doses.

Chloroaniline

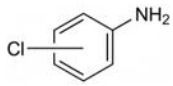
Insecticide

C_6H_6ClN = 127.6

CAS—27134-26-5

IUPAC Name 2-Chloroaniline

Synonyms Chlorobenzenamine; NSC-174207.



2-Chloroaniline

C_6H_6ClN = 127.6

CAS—95-51-2

Synonyms *o*-Chloroaniline; OCA.

Chemical Properties A pale amber liquid. Mp −1.9°. Bp 208.8°. It is practically insoluble in water (<0.1 g/100 mL at 20°) but soluble in acid and most organic solvents.

3-Chloroaniline

C_6H_6ClN = 127.6

CAS—108-42-9

Synonyms *m*-Chloroaniline; MCA.

Chemical Properties A colourless to light amber liquid. Mp −10.3°. Bp 230.5°. It is practically insoluble in water (<0.1 g/100 mL at 18°) but soluble in most common organic solvents (completely miscible in methanol and diethyl ether).

4-Chloroaniline

C_6H_6ClN = 127.6

CAS—106-47-8

Synonyms *p*-Chloroaniline; *p*-chlorophenylamine

Chemical Properties A white to pale yellow solid. Mp 72.5°. Bp 232.0°. It is practically insoluble in cold water (39 mg/100 mL) but soluble in hot water and freely soluble in alcohol, ether, acetone, and carbon disulphide.

Gas Chromatography System GA—4-chloroaniline RI 1210.

Quantification

Plasma **HPLC** Limit of detection, <6 µg/L for 3-chloroaniline, <14 µg/L for 4-chloroaniline [Marengo *et al.* 1999].

Disposition in the Body Chloroaniline is metabolised primarily to conjugated *p*-chloroaniline (*p*-CA) and 2-amino-5-chlorophenol (2-A-5-CP). Small amounts of 2,4-dichloroaniline (2,4-DCA) and *p*-chloroformanilide (*p*-CFA) have also been detected. All metabolites and the parent chemical are excreted mainly in urine with <1% present in faeces. Accumulation can occur in the liver.

Toxicity Hepatotoxicity, splenotoxicity, hematotoxicity, and nephrotoxicity.

Half-life Elimination half-lives of the metabolites: *p*-CA 2.4 h, 2-A-5-CP 1.7 h and 2,4-DCA 1.7 h.

Marengo E *et al.* (1999). Optimization of the separation of mono- and dichloroanilines in ion interaction high-performance liquid chromatography. *J Chromatogr A* 863(1): 1–11.

Chlorobutanol

Preservative

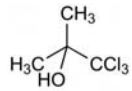
$C_4H_7Cl_3O$ = 177.5

CAS—57-15-8 (anhydrous); 6001-64-5 (hemihydrate)

IUPAC Name 1,1,1-Trichloro-2-methyl-2-propanol

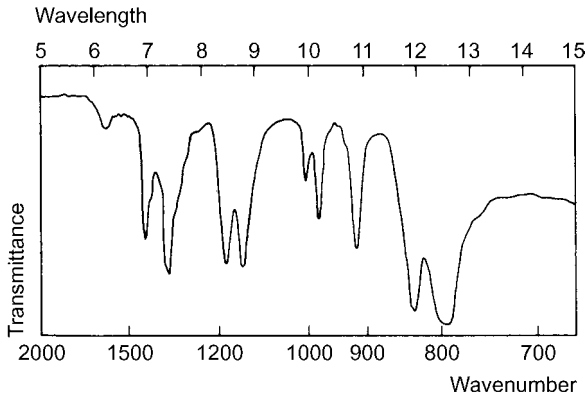
Synonyms Acetone-chloroforme; alcohol trichlorisobutylicus; chlorbutanol; chlorbutanolum hydratum; chlorbutol; chloretone; trichlorbutanolum.

Proprietary Names *Chloretone*; *Coliquifilm*; *Methaform*; *Sedaform*.



Chemical Properties Colourless or white crystals which are volatile at ordinary temperatures. Mp 78°; 97°. Bp about 167°. Soluble 1 in 130 of water, 1 in 1 of ethanol and 1 in 3 of chloroform; soluble in ether, acetone, and glacial acetic acid. Log *P* (octanol/water), 2.0.

Colour Test Fujiwara test—red.
Gas Chromatography System GA—RI 949; system GI—retention time 29.8 min.
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.
Infrared Spectrum Principal peaks at wavenumbers 790, 833, 1145, 1186, 917, 980 cm^{-1} (Nujol mull).



Quantification
Blood **GC** ECD. Limit of detection, about 100 µg/L [Valentour, Sunshine 1975].
Urine **GC** See Blood [Valentour, Sunshine 1975].
Tissues **GC** See Blood [Valentour, Sunshine 1975].
Disposition in the Body Rapidly absorbed after oral administration, peak plasma concentrations being attained within 0.25 to 1 h. About 10% of a dose is excreted in the urine in 17 days mostly as the glucuronide and sulfate conjugates.
Toxicity

In a non-fatal case of chlorobutanol toxicity, a man who had been taking 1 to 1.5 g daily was admitted to hospital. An initial plasma concentration of about 100 mg/L was reported and the plasma half-life was found to be about 13 days [Borody *et al.* 1979].

In a fatality caused by chlorobutanol overdose, the following postmortem tissue concentrations were found: blood 64 mg/L, bile 123 mg/L, brain 161 µg/g, kidney 87 µg/g, liver 141 µg/g, spleen 120 µg/g, urine 31 mg/L [Valentour, Sunshine 1975].

Half-life Plasma half-life, about 10 days.
Volume of Distribution About 3 L/kg.
Protein Binding About 50 to 60%.
Note For a report on the pharmacokinetics of chlorobutanol, see Tung *et al.* [1982].
Uses Chlorobutanol is used in a concentration of 0.5%. It was formerly given as a sedative in doses of 0.3 to 1.2 g.

Borody T *et al.* (1979). Chlorbutol toxicity and dependence. *Med J Aust* 1: 288.

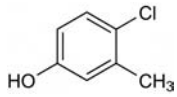
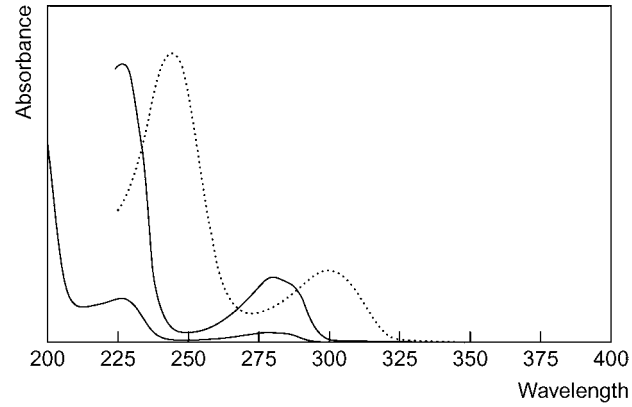
Chlorocresol

Disinfectant
C_7H_7ClO = 142.6
CAS—59-50-7

IUPAC Name 4-Chloro-3-methylphenol
Synonyms Chlorkresolum; parachlorometacresol; PCMC.
Proprietary Name *Wright's Vaporizing Fluid*



Chemical Properties Colourless crystals or crystalline powder. It is volatile in steam. Mp 55.5°. Soluble 1 in 260 of water, 1 in 50 of boiling water, and 1 in 0.4 of ethanol; freely soluble in acetone, benzene, chloroform, aqueous alkaline solutions, and ether. Solutions in water acquire a yellowish colour on exposure to light and air. pK_a 9.6 (25°). Log *P* (octanol/water), 3.1.
Gas Chromatography System GA—RI 1400.
High Performance Liquid Chromatography System HY—RI 455.
Ultraviolet Spectrum Aqueous acid—227, 279 nm (A^{1}_{1}=105a); aqueous alkali—244, 299 nm.

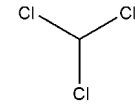


Use In concentrations of 0.1 to 0.2%.

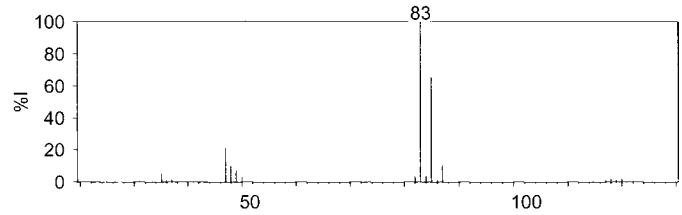
Chloroform

Anaesthetic (General)
$CHCl_3$ = 119.4
CAS—67-66-3

Synonyms Chloroformium anaesthesicum; chloroformum pro narcosi; trichloromethane.



Chemical Properties A colourless mobile volatile liquid. Bp 61° to 62°. Refractive index 1.4464. Chloroform (BP) contains 1–2% v/v of ethanol. Soluble 1 in 200 of water; miscible with dehydrated alcohol, benzene, and ether. Log *P* (octanol/water), 2.0.
Colour Tests Fujiwara test—red; palladium chloride—black; heat with a small amount of resorcinol in 2 mol/L sodium hydroxide—red; heat with a small amount of either α- or β-naphthol—blue.
Gas Chromatography System GA—RI 605; system GI—RT 6.2 min; system GAA—RI 603.
Infrared Spectrum Principal peaks at wavenumbers 714, 787, 1205, 1220, 928, 1515 cm^{-1} (thin film).
Mass Spectrum Principal ions at *m/z* 83, 85, 47, 87, 48, 49, 35, 82.



Quantification
Blood **GC** Column: 15% silicone fluid MS 550 (1.8 m × 6.5 mm i.d.). Carrier gas: N_2, 50 mL/min. Temperature: 52.5°. FID. Limit of detection, 10 mg/L [Poobalasingam 1976]. Column: 2.5% OV-225 on 80/100 mesh (1.8 m (6 ft)). Carrier gas: N_2, 50 mL/min. Temperature: 50°. ECD. Limit of detection, 0.05 mg/L [Fry *et al.* 1972].

GC-MS See [Gottzein *et al.* 2010].

Urine **GC** See Blood [Fry *et al.* 1972].
Disposition in the Body Chloroform is almost completely absorbed after oral administration, rapidly absorbed after inhalation and subject to first-pass metabolism in the liver and lungs. It is rapidly distributed throughout the body and is taken up by adipose tissue. Between 20 and 70% of a dose is exhaled unchanged in 8 h and up to ~50% is exhaled as carbon dioxide in the same period; <0.01% of a dose is excreted in the urine.
Blood Concentration

After a single oral dose of 500 mg to 2 subjects, peak blood concentrations of ~1 and 5 mg/L were attained in 1 h [Fry *et al.* 1972].

A mean chloroform concentration in arterial blood of 173 mg/L was reported in spontaneously breathing subjects during surgical anaesthesia [Poobalasingham, Payne 1978].

Toxicity The minimum lethal dose is 10 mL by ingestion and the maximum permissible atmospheric concentration is 10 ppm. Exposure to air concentrations of 100–1000 ppm for short periods may cause discomfort and dizziness; concentrations of 7000 ppm or more will produce rapid loss of consciousness.

The following postmortem tissue concentrations were reported in 7 fatalities: blood (7 cases) 10–48 mg/L (mean, 32), brain (4 cases) 50.4–156 µg/g (mean, 101), kidney (3 cases) 16–27 µg/g (mean, 20), liver (6 cases) 6–86.2 µg/g (mean, 43.4) and urine (5 cases) 0–60 mg/L (mean, 15) [Bonnichsen, Maehly 1966; Giusti, Chiarotti 1981].

A case of chloroform poisoning in a 30-year-old male was reported with a blood concentration of 60 mg/kg and lung concentration of 14 mg/kg. [Kim *et al.* 1996].

Half-life Blood, ~1.5 h.

Volume of Distribution Blood, ~2–3 L/kg.

Clearance Blood, ~20 mL/min/kg.

Dose Concentrations of 2 to 4% of the vapour have been used for induction and 1 to 2% for maintenance of anaesthesia.

Chloromethylaniline

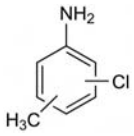
Insecticide

C_7H_8ClN = 141.6

CAS—95-81-8

IUPAC Name 2-Chloro-5-methylaniline

Synonyms Chlorotoluidine; 2-chloro-5-methylbenzeneamine; 6-chloro-*m*-toluidine.



Chemical Properties Mp 29.5°. Bp 228° to 229°. It is soluble in water. Log *P* (octanol/water), 2.27.

Mass Spectrum Principal ions at *m/z* 106, 141, 77, 143, 140, 142, 52, 79.

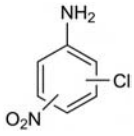
Chloronitroaniline

Insecticide

$C_6H_5ClN_2O_2$ = 172.6

CAS—41587-36-4

IUPAC Name *N*-Chloro-*N*-phenylnitramide



Chloronitrotoluene

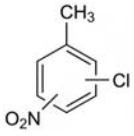
Pesticide

$C_7H_6ClNO_2$ = 171.6

CAS—25567-68-4

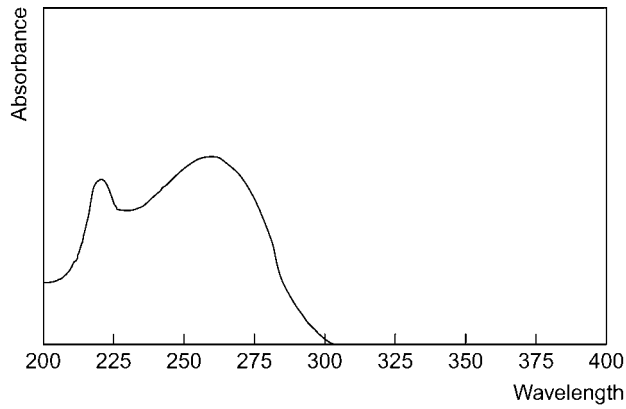
IUPAC Name [Chloro(nitro)methyl]benzene

Synonyms 1-(Chloromethyl)-4-nitrobenzene; α-chloro-*p*-nitrotoluene; *p*-nitrobenzylchloride.

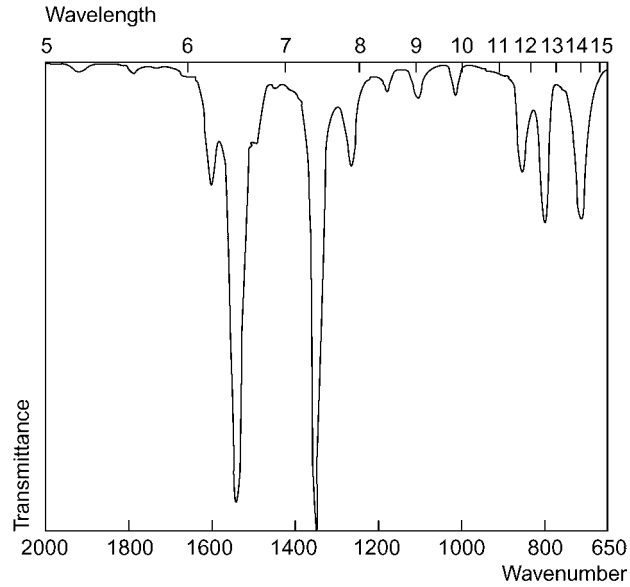


Chemical Properties A solid. Mp 71°. It is insoluble in water.

Ultraviolet Spectrum Aqueous solution—260 nm.



Infrared Spectrum Principal peaks at wavenumber 1353, 1541, 809, 719, 1263, 1609 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 136, 89, 171, 125, 63, 90, 78, 77.

m-Chlorophenylpiperazine

5-HT_{2C} Receptor Agonist, Arylpiperazine, Drug of Abuse

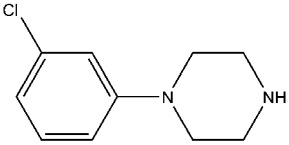
$C_{10}H_{13}ClN_2$ = 196.7

CAS—6640-24-0

IUPAC Name 1-(3-Chlorophenyl)piperazine

Synonyms Metachlorophenypiperazine; mCPP.

Street Names Arc-en-ciel; Arlequin; Duhovka; Rainbow; Regenboogies; X4.



Chemical Properties White powder. Soluble in water (7.31 g/L) [Meylan, Howard 1995]. pK_a 8.64 [Caccia 2007]. Log *P* (octanol/water), 2.11 [Caccia *et al.* 1981; Caccia 2007]. Metabolite of the antidepressants nefazodone, trazodone, etoperidone and mepiprazole.

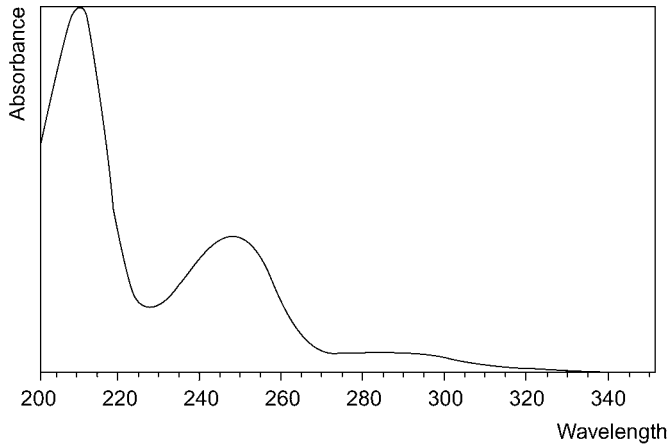
mCPP Hydrochloride

$C_{10}H_{13}ClN_2$, HCl = 233.2

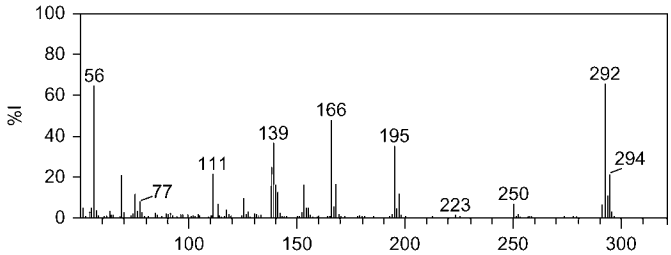
CAS—65369-76-8

Chemical Properties White powder.

Ultraviolet Spectrum Alkali—215, 250 nm [Suckow *et al* 1990].



Mass Spectrum Principal ions at *m/z* 292, 56, 166, 139, 195, 138, 111, 294 ((*N*)-trifluoroacetyl derivative) [Andriollo *et al* 1990].



Quantification

Plasma **GC-MS** Column: HP-5MS 5% phenylmethylsiloxane capillary (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 0.6 mL/min. Temperature programme: 100° to 250° at 10°/min to 310° at 30°/min for 1 min. EI ionisation at 70 eV, SIM acquisition mode. Retention times: mCPP 12.3, amfetamine 5.2 min, metamfetamine 6.5 min, ethylamfetamine 6.9 min, hydroxyamfetamine 7.8 min, *para*-methoxyamphetamine (PMA) 7.9 min, pholedrine 8.8 min, methylenedioxyamphetamine (MDA) 9.0 min, *N*-methyl-PMA (PMMA) 9.1 min, benzodioxolylbutanamine (BDB) 9.8 min, 4-methylthio-PMA (MTA) 9.9 min, benzylpiperazine 10.0 min, 1(3-trifluoromethylphenyl)piperazine 10.1 min, 3,4-methylenedioxymethamphetamine (MDMA) 10.2 min, methylenedioxyethylamphetamine (MDEA) 10.5 min, methyl-BDB (MBDB) 10.7 min, *p*-tolylpiperazine 10.9 min, 1-(4-methoxyphenyl)piperazine 12.3 min, 1-(3,4-methylenedioxybenzyl)-piperazine 13.6 min (all heptafluorobutyrate derivatives). Limit of quantification, 10 µ/L [Peters *et al.* 2003].

HPLC Column: LiChrospher 60 RP Select B (250 × 5.0 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.02 mol/L phosphate buffer (pH 2, 36 : 64), flow rate 0.9 mL/min. DAD. Limit of quantification not reported [Staack *et al.* 2007]. Column: C_8 (150 × 4.6 mm i.d., 5 µm). Mobile phase: 0.5% potassium dihydrogen phosphate (pH 2.5) : acetonitrile (77 : 23). Electrochemical detection. Limit of quantification, 5 µg/L; limit of detection, 2.5 µg/L [Ohkubo *et al.* 1995]. Column: TMS-bonded silica (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.05 mol/L potassium phosphate monobasic (pH 3.2) : acetonitrile (82 : 18) containing 1.2 mL/L TEA and 20% heptanesulfonic acid solution, flow rate 1.8 to 2.0 mL/min. UV detection (λ = 214 nm). Retention times: mCPP ~7.0 min, *o*-tolylpiperazine ~6.0 min. Limit of detection, <3 µg/L [Suckow *et al.* 1990]. Column: TMS-bonded silica (250 × 4.6 mm i.d., 5 µm). Mobile phase: phosphate buffer (pH 3.0) : acetonitrile (73 : 27) containing 0.04 mol/L TEA and 0.02 mol/L heptanesulfonic acid, flow rate 1.5 mL/min. UV detection (λ = 214 nm). Retention times: mCPP 7.1 min, trazodone 12.8 min. Limit of detection, 5 µg/L [Miller, DeVane 1986].

Urine **GC-MS** Column: VF-5MS cross-linked methylsilicone capillary (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, flow rate 1.0 mL/min. Temperature programme: 100° for 2 min, to 310° at 30°/min, for 12 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification not reported [Staack *et al.* 2007].

Other **GC** Rat Brain and Plasma. Column: 3% OV-17 on 80-100 mesh Supelcoport (2 m × 3.0 mm i.d.). Carrier gas: Ni, 35 mL/min. Temperature programme: 205°. Electrochemical detection (^{63}Ni). Retention time: 4.2 min (heptafluorobutyrate derivative). Limit of detection, 0.05 mg/L in plasma and 0.05 µg/g in brain [Caccia *et al.* 1981].

GC-MS Rat Urine. Column: HP-1 cross-linked methyl silicone capillary (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 3 min to 310° at 30°/min for 8 min. EI ionisation at 70 eV and PICI, full scan mode. Limit of detection, 50 µg/L [Staack, Maurer 2003]. Rat Brain and Plasma. Column: CP-SIL-19 CB fused silica capillary (15 m × 0.25 mm i.d.). Carrier gas: He, 0.4 bar. Temperature programme: 80° for 0.5 min to 220° at 35°/min to 240° at 8.5°/min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 1 µg/L in plasma and 12 ng/g in brain (*N*-trifluoroacetyl derivative) [Andriollo *et al.* 1990].

HPLC Human Liver Microsomes. Column: C_{18} (300 × 3.9 mm i.d.). Mobile phase: acetonitrile : 50 mmol/L phosphate buffer (35 : 65), flow rate 1.5 mL/min. UV detection (λ = 206 nm). Retention time: 3.7 min. Limit of quantification not reported [von Moltke *et al.* 1999]. Breast Milk Samples. Column: C_{18} (150 × 3.9 mm i.d., 10 µm). Mobile phase: acetonitrile : 50 mmol/L potassium dihydrogen phosphate (40 : 60), flow rate 1.0 mL/min. UV detection (λ = 205 nm). Retention time: 3.1 min. Limit of quantification not reported [Dodd *et al.* 1999].

Note See Trazodone and Nefazodone for further quantification methods.

Disposition in the Body In humans, metabolised to *p*-hydroxy-mCPP via CYP2D6 and subsequently conjugated. Urinary metabolites detected in rats include two hydroxy-mCPP isomers, *N*-(3-chlorophenyl)ethylenediamine, 3-chloroaniline, *N*-acetyl-3-chloroaniline, two hydroxyl-3-chloroaniline isomers, and two hydroxyl-3-chloroaniline isomers; however, hydroxylation of mCPP is the main metabolic step.

Therapeutic Concentration

Twelve healthy men (mean age 27 years) were administered either an infusion of 0.08 mg/kg mCPP (1 mL/min) or oral capsules containing 0.4 mg/kg mCPP after an overnight fast. The mean peak plasma concentration at the end of the infusion was reported as 31.4 µg/L, and for the oral administration 53.0 µg/L after 2.2 h; however, high inter-individual variations were observed [Feuchtl *et al.* 2004].

Single oral doses of mCPP (40 mg) or trazodone (100 mg) were given to 11 healthy volunteers (mean age 62.6 years). The mean plateau phase plasma concentrations of mCPP were 40.9 µg/L following mCPP administration and 14.6 µg/L following the trazodone dose [Lawlor *et al.* 1997].

Nine healthy male volunteers were administered mCPP, IV infused over 90 seconds in 0.06 and 0.08 mg/kg doses. Blood samples were collected for mCPP concentrations at 30, 45, 60, 90, 120, 150, 180 and 210 min following infusion. Mean blood levels reported for the 0.06 and 0.08 mg/kg doses were 12.6 µg/L and 16.5 µg/L, respectively [Kalus *et al.* 1992].

In a study investigating the pharmacokinetic profile of mCPP in a group of healthy volunteers, bioavailability after oral administration as well as clearance after IV administration varied ≈8-fold. This resulted in an oral AUC variation of >40-fold [Gijsman *et al.* 1998].

Toxicity Variability in CYP2D6 phenotype may lead to drug–drug interactions since it is involved in the metabolism of many other drugs, and may also explain the wide variation in the pharmacokinetics of mCPP. An intake of mCPP is differentiated from an intake of its precursor drugs by screening for unique urinary metabolites of the parent compound.

A 29-year-old woman (CYP2D6 intermediate metaboliser) admitted consuming cocaine intranasally, alcohol and paracetamol (acetaminophen). Blood and urine specimens were collected ~5.5 h after the last consumption of alcohol and cocaine. The blood alcohol concentration was found to be 0.87 g/L and plasma concentrations of benzoylecgonine (476 µg/L), ecgoninemethylester (56 µg/L) and ecgoninethylester (45 µg/L) confirmed the consumption of cocaine. However, mCPP was also detected in plasma at a relatively high concentration of ~16 µg/L, together with diltiazem (a known adulterant for cocaine). It is believed the cocaine consumed was adulterated with both diltiazem and mCPP. The high mCPP plasma concentration measured may have been the result of the subject's CYP2D6 phenotype and also the fact that cocaine is a CYP2D6 inhibitor [Staack *et al.* 2007].

A 29-year-old woman admitted consuming 3 multicoloured Arlequin tablets over a 5 h period. Thirty minutes after consuming the last tablet, she suffered from impaired vision, anxiety, and felt like she was overheating. Plasma and urine mCPP concentrations were reported as 3.2 mg/L and 2.3 mg/L, respectively. The patient was discharged 8 h later without apparent sequelae. In a clinical setting, a 28-year-old man treated for 13 years for obsessive–compulsive disorder, developed an adverse reaction 45 min after receiving an oral dose of 0.5 mg/kg mCPP. His blood mCPP concentration 90 min post-ingestion was only 124 µg/L. These 2 cases further highlight the inter-individual variability in the pharmacokinetics of mCPP [Lecompte *et al.* 2006].

Bioavailability Ranging from 10 to more than 100%.

Half-life Approximately 4.5 h (range 2.4 h to 6.8 h).

Volume of Distribution Approximately 2.65 L/kg (range 0.86 to 4.07).

Clearance Approximately 49.6 mL/h (range 11 mL/h to 92 mL/h).

Protein Binding Ranging from 66 to 74%.

Note For a review of the disposition and metabolism of mCPP and other 1-aryl-piperazines, see Caccia [2007]. For a study of the metabolism of mCPP in rats, see Staack and Maurer [2003] and Mayol *et al.* [1994].

Dose Used as a model reference compound in neurochemical studies of serotonin 5HT receptors (usual oral dose up to 0.75 mg/kg); however, because of the high variability in pharmacokinetics observed in humans, its applicability to such studies is now in question. Illicit mCPP is normally consumed orally with tablets containing anything from 8 to 80 mg. mCPP is also sometimes consumed in powder form and has been found in cocaine powder samples and is suspected to be a cutting agent and/or psychotropic enhancement agent.

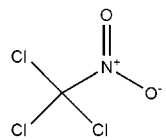
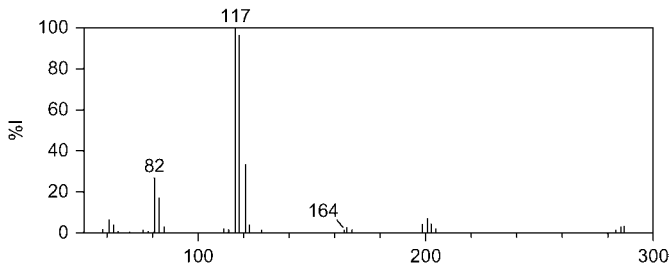
Chloropicrin

Fumigant, Nematocide, War Gas
CCl_3NO_2 = 164.4
CAS—76-06-2

IUPAC Name Trichloro(nitro)methane
Synonyms Acquinite; nitrochloroform; PS.
Proprietary Names *Larvacide 100*; *Picfume*.



Chemical Properties A colourless oily liquid, intense odour. Mp −69°. Bp 112°. Practically insoluble in water; miscible with benzene, absolute alcohol, and carbon disulfide; soluble in ether.
Mass Spectrum Principal peaks at *m*/*z* 117, 119, 121, 82, 164 [Gonmori *et al.* 1987].



Quantification

Lung **GC-MS** Column: 2% Silicone OV-17 on Uniport HP 80/100 mesh. Temperature: 66°. EI ionisation at 70 eV. Limit of detection, ~1.5 ng/g [Gonmori *et al.* 1987].
Other **GC-MS** Mouse Samples. Column: DB-5 (30 m × 0.25 mm i.d.). Temperature programme: 40° to 250° over 21 min. Limit of detection not reported [Sparks *et al.* 1997].

Disposition in the Body

Toxicity Potential symptoms of overexposure are irritation of eyes, skin, respiratory system; lacrimation; cough and pulmonary oedema; nausea and vomiting. See Centers for Disease Control and Prevention [2010].

A 37-year-old woman was exposed to chloropicrin inside a fumigation tent. Postmortem showed acute tracheitis with pulmonary congestion and oedema [Schneir *et al.* 2008].
An 18-year-old girl and a 21-year-old boy were sprayed with chloropicrin. The girl died of pulmonary oedema after 3 h and the boy recovered after 30 days in hospital [Gonmori *et al.* 1987].

Note For reports of acute exposure, see Goldman *et al.* [1987], Centers for Disease Control and Prevention [2004a, 2004b].
Use Disinfecting cereals and grains; in synthesis, especially in the manufacture of methyl violet; as a fumigant, soil insecticide and war gas.

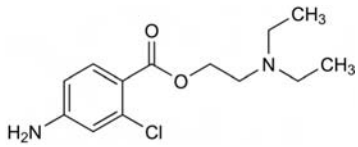
Chloroprocaine

Anaesthetic (Local)
$C_{13}H_{19}ClN_2O_2$ = 270.8
CAS—133-16-4

IUPAC Name 2-Diethylaminoethyl 4-amino-2-chlorobenzoate
Synonym 4-Amino-2-chlorobenzoic acid 2-(diethylamino)ethyl ester

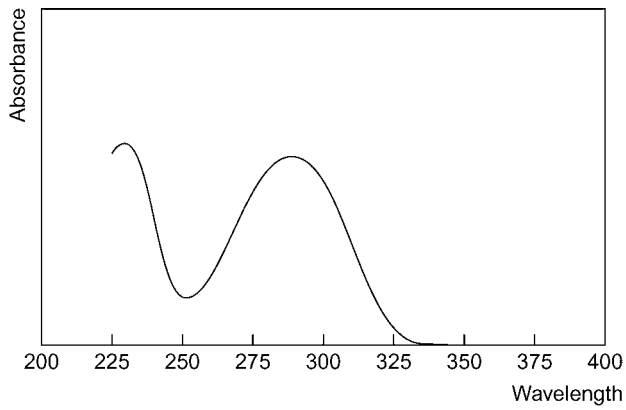


Chemical Properties pK_a 8.7. Log *P* (octanol/water), 2.9.

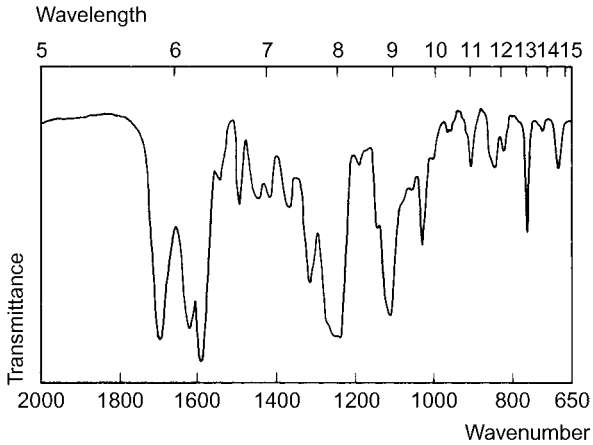
Chloroprocaine Hydrochloride

$C_{13}H_{19}ClN_2O_2$, HCl = 307.2
CAS—3858-89-7
Proprietary Name *Nesacaine*
Chemical Properties A white crystalline powder. Mp 176° to 178°. Soluble 1 in 20 of water and 1 in 100 of ethanol; very slightly soluble in chloroform; practically insoluble in ether.

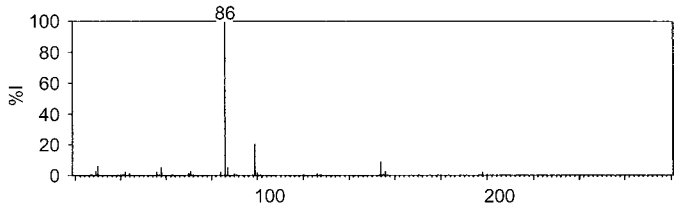
Colour Test Diazotisation—red.
Thin-layer Chromatography System TA—R_f 0.59; system TB—R_f 0.05; system TC—R_f 0.23; system TL—R_f 0.37; system TAJ—R_f 0.09; system TAK—R_f 0.00; system TAL—R_f 0.32 (acidified iodoplatinate solution, positive; Van Urk reagent, yellow).
Gas Chromatography System GA—RI 2241.
High Performance Liquid Chromatography System HQ—*k* 0.24; system HY—RI 250.
Ultraviolet Spectrum Aqueous acid—230 (A^{1}_{1}=330b), 288 nm (A^{1}_{1}=311b).



Infrared Spectrum Principal peaks at wavenumbers 1595, 1698, 1240, 1625, 1111, 1315 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 86, 99, 154, 30, 87, 58, 29, 156.



Quantification

Blood **TLC** For quantification of 4-amino-2-chlorobenzoic acid, see O'Brien *et al.* [1979].

HPLC Limit of detection, 5 µg/L for diethylaminoethanol [Meng *et al.* 1999].

Plasma **TLC** See Blood O'Brien *et al.* [1979].

GC FID. Limit of detection, 10 µg/L [O'Brien *et al.* 1979].

GC–MS Limit of detection, <2 µg/L [Kuhnert *et al.* 1981].

Serum **HPLC** See Blood [Meng *et al.* 1999].

Urine **TLC** See Blood O'Brien *et al.* [1979].

Disposition in the Body Rapidly hydrolysed in the plasma to 4-amino-2-chlorobenzoic acid and 2-diethylaminoethanol. About 50% of an IV dose is excreted in the urine in 90 min, mainly as an unidentified conjugate (possibly the glycine conjugate) of 4-amino-2-chlorobenzoic acid.

Therapeutic Concentration

After IV infusion of 250 mg over a period of 30 min to 3 subjects, peak plasma concentrations of 3.5 to 4.3 mg/L of 4-amino-2-chlorobenzoic acid were attained at the end of the infusion; chloroprocaine was not detectable in the plasma [O'Brien *et al.* 1979].

Toxicity The maximum safe IV or topical dose is 750 mg.

Dose Chloroprocaine hydrochloride is injected as a 0.5 to 3% solution.

Kuhnert BR *et al.* (1981). Measurement of 2-chloroprocaine in plasma by selected ion monitoring. *J Chromatogr* 224: 488–491.

Meng QC *et al.* (1999). High-performance liquid chromatographic analysis of the 2-chloroprocaine metabolite, diethylaminoethanol, in blood and serum. *Reg Anesth Pain Med* 24(3): 242–245.

Chloropyramine

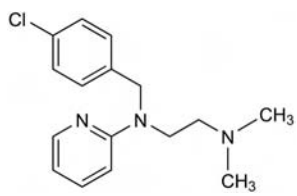
Antihistamine

$C_{16}H_{20}ClN_3$ = 289.8

CAS—59-32-5

IUPAC Name *N*-[(4-Chlorophenyl)methyl]-*N*′,*N*′-dimethyl-*N*-2-pyridinyl-1,2-ethanediamine

Synonyms Chlortripelennamine; halopyramine.



Chemical Properties A yellow oil. Log *P* (octanol/water), 3.4.

Chloropyramine Hydrochloride

$C_{16}H_{20}ClN_3$, HCl = 326.3

CAS—6170-42-9

Proprietary Names *Alegan S*; *Avapena*; *Suprastin*; *Synopen*; *Synpen*.

Chemical Properties A white powder. Mp 172°. Freely soluble in water, ethanol, and chloroform; practically insoluble in ether.

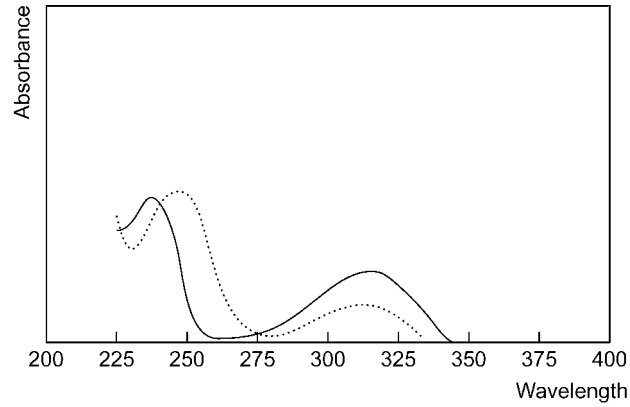
Colour Test Cyanogen bromide—yellow.

Thin-layer Chromatography System TA—R_f 0.52; system TB—R_f 0.41; system TC—R_f 0.28; system TE—R_f 0.63; system TL—R_f 0.17; system TAD—R_f 0.00; system TAE—R_f 0.22 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—chloropyramine RI 2190, M (N-desalkyl-) RI 1900, M (nor-) RI 2210, M (OH-)-AC RI 2440, M (N-desalkyl-)-AC RI 2160, M (nor-)-AC RI 2470, M (bis-nor-)-AC RI 2420.

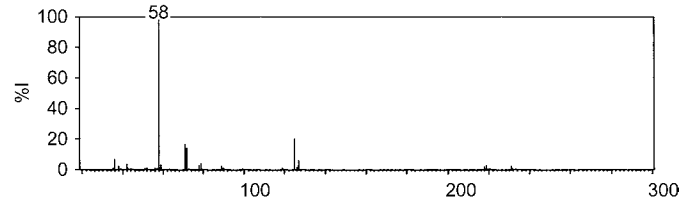
High Performance Liquid Chromatography System HA—*k* 4.2.

Ultraviolet Spectrum Aqueous acid—239 (A_1^1=515a), 315 nm; aqueous alkali—248, 313 nm.



Infrared Spectrum Principal peaks at wavenumbers 1494, 1598, 769, 1562, 1010, 1098 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 58, 125, 71, 72, 36, 127, 79, 219.



Dose Chloropyramine hydrochloride has been given in doses of up to 150 mg daily.

Chloropyrilene

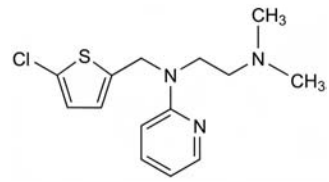
Antihistamine

$C_{14}H_{18}ClN_3S$ = 295.8

CAS—148-65-2

IUPAC Name N′-[(5-Chlorothiophen-2-yl)methyl]-N,N-dimethyl-N′-pyridin-2-ylethane-1, 2-diamine

Synonyms Chloromethapyrilene; chlorothen; *N*-[(5-chloro-2-thienyl)-methyl]-*N*′,*N*′-dimethyl-*N*-2-pyridinyl-1,2-ethanediamine; chlorpyrilen; hista-chlorylene.



Chemical Properties A liquid. pK_a 8.4 (25°). Log *P* (octanol/water), 3.2.

Chloropyrilene Citrate

$C_{14}H_{18}ClN_3S$, $C_6H_8O_7$ = 488.0

CAS—148-64-1

Proprietary Names *Panta*; *Tagathen*.

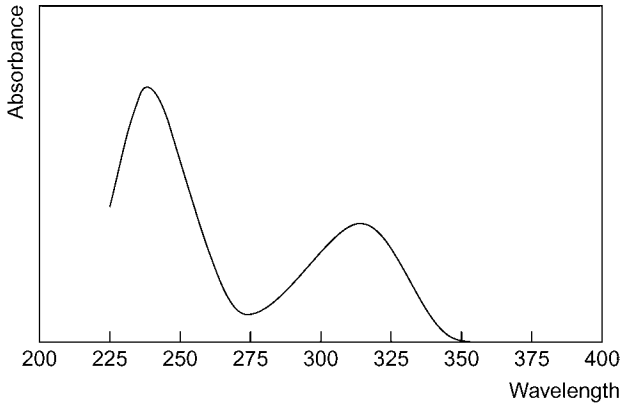
Chemical Properties A white crystalline powder. Mp 112° to 116°; on further heating it gradually solidifies and 125° to 140°, with decomposition. Soluble 1 in 35 of water and 1 in about 65 of alcohol; practically insoluble in benzene, chloroform, and ether.

Colour Tests Mandelin's test—violet→orange; Marquis test—violet.

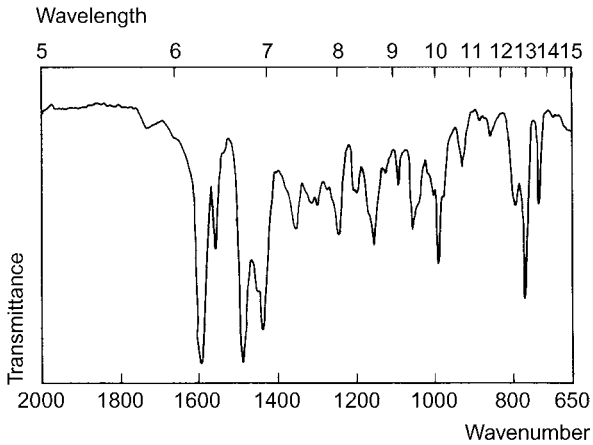
Thin-layer Chromatography System TA—R_f 0.53 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 2133.

High Performance Liquid Chromatography System HA—*k* 4.0.
Ultraviolet Spectrum Aqueous acid—237 (A^1_1=520c), 312 nm; aqueous alkali—243 (A^1_1=676b), 308 nm (A^1_1=148b).



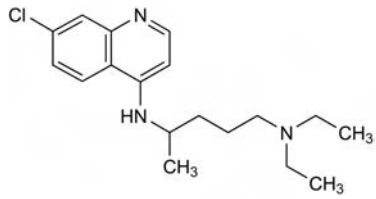
Infrared Spectrum Principal peaks at wavenumbers 1595, 767, 990, 1562, 1149, 1234 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 58, 131, 72, 71, 79, 42, 30, 78.
Dose Up to 150 mg of chloropyrilene citrate daily.

Chloroquine

Antimalarial
$C_{18}H_{26}ClN_3$ = 319.9
CAS—54-05-7
IUPAC Name N^4-(7-Chloro-4-quinolinyl)-N^1,N^1-diethyl-1,4-pentanediamine
Synonyms Cloroquina; RP-3377.
Proprietary Names *Aralen*; *Artrichin*; *Bemaphate*; *Capquin*; *Nivaquine B*; *Paluken*; *Resoquine*; *Reumachlor*; *Sanoquin*.



Chemical Properties A white or slightly yellow crystalline powder. Mp 87° to 92°. Very slightly soluble in water; soluble in chloroform and ether. pK_a 8.4, 10.8 (20°). Log *P* (octanol/water), 4.63. Extraction yield (chlorobutane), 0.95 [Demme *et al.* 2005].

Chloroquine Phosphate
$C_{18}H_{26}ClN_3,2H_3PO_4$ = 515.9
CAS—50-63-5
Synonyms Chingaminum; chlorochinum diphosphoricum; quingamine; SN-7618.
Proprietary Names *Anoclor*; *Aralen* (tablets); *Arechin*; *Avloclor*; *Chlorquin*; *Diroquine*; *Genocin*; *Heliopar*; *Imagon*; *Klorokin*; *Malaquin*; *Malarex*; *Malarivon*; *P-Roquine*; *Palux*; *Resochin(e)*; *Tresochin*; *Weimerquin*. It is an ingredient of *Aralis*; *Clopirim*; *Savarine*.
Chemical Properties A white powder, discolouring on exposure to light. There are 2 polymorphic forms, with Mp of 193° to 195° and at 215° to 218°. Freely soluble in water; very slightly soluble or practically insoluble in alcohol, in chloroform and in ether; very slightly soluble in methanol.

Chloroquine Hydrochloride
$C_{18}H_{26}ClN_3$, 2HCl = 392.8
CAS—3545-67-3

Chloroquine Sulfate
$C_{18}H_{26}ClN_3,H_2SO_4,H_2O$ = 436.0
CAS—132-73-0 (anhydrous)
Synonyms Chloroquini sulfas; chloroquine sulphate; RP-3377; Sulfato de cloroquina.
Proprietary Names *Daramal*; *Nivaquine*; *Plasmoquine*. It is an ingredient of *Daramal-Paludrine*.
Chemical Properties A white or almost white crystalline powder. Mp 205° to 210°. Requires protection from light. Freely soluble in water and methanol; very slightly soluble in alcohol; practically insoluble in ether.

Colour Test Liebermann's reagent (100°)—orange.
Thin-layer Chromatography System TA—R_f 0.38; system TB—R_f 0.14; system TC—R_f 0.04; system TE—R_f 0.46; system TL—R_f 0.02; system TAD—R_f 0.00; system TAE—R_f 0.04; system TAF—R_f 0.14; system TAJ—R_f 0.00; system TAK—R_f 0.00; system TAL—R_f 0.04 (acidified iodoplatinate solution—positive).
Gas Chromatography System GA—RI 2605, M (desethyl-) RI 2555, M (desethyl-)-AC RI 3010; system GF—RI 3245.

Quantification

Blood **GC** NSD. Limit of detection, 3 μg/L [Bergqvist, Eckerbom 1984].

HPLC Column: reversed phase. UV detection [Bell *et al.* 2007]. Column: XTerra. UV detection (λ= 254 nm). Limit of quantification, ~50 μg/L [Lejeune *et al.* 2007]. Column: XTerra RP18. Mobile phase: 20 μmol/L borate buffer (pH 9.0) : acetonitrile (60 : 40), flow rate 1 mL/min [Deng *et al.* 2006]. Column: C_{18}. Mobile phase: methanol : 0.1 mol/L phosphate buffer (pH 3) : perchloric acid (250: 747.5 : 2.5). Limit of quantification, 10 nmol/L [Minzi *et al.* 2003]. Fluorescence detection (λ_{ex}= 215 nm, no emission filter). Limit of quantification, 0.005 mg/L [Croes *et al.* 1994]. See also Houze *et al.* [1992].

Plasma **GC** See Blood [Bergqvist, Eckerbom 1984].

HPLC UV detection. Limit of detection, 20 μg/L [Yakasai 2006]. See Blood [Minzi *et al.* 2003]. See Dua *et al.* [1999] and Walker, Ademowo [1996]. Column: C_8 Lichrospher 60 RP select B. Mobile phase: water: acetonitrile : methanol (78 : 28 : 4) : 0.5 mol/L ammonium formate : 0.075 mol/L perchloric acid. UV detection (λ= 254 nm). Limit of quantification, 6 μg/L [Chaulet *et al.* 1994]. See Blood [Houze *et al.* 1992]. See also Alvan *et al.* [1982], Brown *et al.* [1982], Chaulet *et al.* [1993] and Zhong *et al.* [1993].

LC-MS Column: reversed phase. Mobile phase: 20 μmol/L ammonium formate : acetonitrile (both containing 0.5% formic acid). Limit of quantification, 0.15–3 μg/L [Hodel *et al.* 2009]. Column: Chirobiotic V. Mobile phase: methanol : acetonitrile : glacial acetic acid : diethylamine (90 : 10 : 0.5 : 0.5). ESI, MRM acquisition mode, positive ion mode [dos Santos Magalhaes, Sueli 2008].

Serum **HPLC** LIFD. Limit of detection, 1.9 fmol [Ibrahim *et al.* 2007]. Column: MZ Kromasil C_{18} (250 × 4 mm i.d., 5 μm). Mobile phase: methanol : acetonitrile : 0.1 mol/L ammonium acetate, (45 : 15 : 40), flow rate 1 mL/min. Fluorescence detection (λ_{ex}= 325 nm, λ_{em}= 375 nm). Limit of detection, 500 μ/L [Samanidou *et al.* 2005]. DAD [Volin 1995]. See Blood [Croes *et al.* 1994].

Urine **GC** See Blood [Bergqvist, Eckerbom 1984].

HPLC See Serum [Samanidou *et al.* 2005]. See Blood [Houze *et al.* 1992; Minzi *et al.* 2003]. See Plasma [Alvan *et al.* 1982; Walker, Ademowo 1996].

Liver **HPLC** Column: C_1. Mobile phase: methanol : water (70 : 30, v/v) : TEA (0.1% v/v). detection (λ_{ex}= 250 nm, λ_{em}= 380 nm). Limit of quantification, 78 nmol/L [Ducharme, Farinotti 1997].

Note For spectrofluometry for the quantification of chloroquine, see Adelusi, Salako [1980].

Disposition in the Body Chloroquine is rapidly absorbed after oral administration and widely distributed into body tissues. It accumulates in high concentrations in the kidneys, liver, lungs and spleen, and is strongly bound in melanin-containing cells (eyes and skin). It also crosses the placenta. Metabolic reactions include *N*-dealkylation and deamination followed by conjugation, possibly with glucuronic acid, of the carboxylic acid metabolites; the metabolites include monodesethyl- and didesethylchloroquine, 4-(7-chloroquinol-4-ylamino)pentan-1-ol, and 4-(7-chloroquinol-4-ylamino)pentanoic acid and its conjugate. Chloroquine is excreted slowly and may persist in tissues for prolonged periods; ~55% is excreted in the urine and approx. 10% is eliminated in the faeces in 90 days following therapy with 310 mg chloroquine phosphate daily for 14 days. The urinary excretion of unchanged drug is dependent upon urinary pH and larger amounts are excreted in acid urine than in alkaline urine; of the material excreted in the urine, ~70% is unchanged, 23% is monodesethylchloroquine, 1–2% is didesethylchloroquine and an unidentified metabolite, and 1–2% is conjugated carboxylic acid metabolites. Chloroquine and its monodesethyl metabolite are both distributed into breast milk.

Therapeutic Concentration In plasma, usually in the range 0.02–0.2 mg/L.

Following a single oral dose of 300 mg chloroquine to 11 subjects, peak plasma concentrations of chloroquine of 0.056–0.10 mg/L (mean, 0.08) and of monodesethylchloroquine of 0.01–0.02 mg/L were attained in 1–6 h [Gustafsson *et al.* 1983].

Healthy subjects received 3 different chloroquine regimens for 3 weeks: once weekly 300 mg (5 subjects), twice weekly 200 mg (4 subjects) and once daily 50 mg (5 subjects). All regimens produced peak and trough chloroquine concentrations above 16 μg/L after the first week, sufficient to suppress chloroquine-sensitive *Plasmodium falciparum* strains [Wetsteyn *et al.* 1995].

In 29 patients undergoing long-term chloroquine treatment for rheumatoid arthritis, steady-state blood concentrations varied considerably (0.0366–3.895 mg/L); concentrations of the 2 main metabolites also varied (bisdesethylchloroquine 0–0.267 mg/L, desethylchloroquine 0.0247–1.506 mg/L) [Augustijns *et al.* 1992].

Toxicity Doses as low as 1 g have caused deaths in children, and fatalities have occurred in adults after the ingestion of 3 to 44 g. Plasma concentrations greater than 0.6 mg/L may produce toxic effects and concentrations greater than 3 mg/L may be fatal.

Plasma concentrations in a 52-year-old woman who ingested 10 g chloroquine in a suicide attempt were 13.1 mg/L 3 h after ingestion and fell to 0.5 mg/L after 335 h. The chloroquine concentration in whole blood was 18.4 mg/L at 3 h and rose to a peak of 28.4 mg/L at 6–6.5 h after ingestion and then fell to 3.1 mg/L at 335 h. Maximum plasma and whole blood concentrations of desethylchloroquine were 1.48 mg/L and 3.7 mg/L, at 3 and 6 h, respectively [Boereboom *et al.* 2000].

A 32-year-old man died 3 days after ingesting an unknown quantitiy of chloroquine in a suicide attempt, despite receiving treatment. The chloroquine concentration on admittance to hospital was 6.5 mg/L in serum and 683.0 mg/L in urine. Postmortem concentrations were as follows: peripheral blood 9.2 mg/L, heart blood 26.4 mg/L, vitreous humour 5.3 mg/L, stomach content 2.7 mg/L and bile 18.2 mg/L [Keller *et al.* 1998].

In a 27-year-old man whose death was attributed to heart failure caused by chloroquine overdosage, the following tissue concentrations were reported: femoral blood 16.71 mg/L, urine 516.0 mg/L, bile 8410 mg/L, stomach contents 82 020 mg/L, duodenal contents 7550 mg/L, tracheal foam 50 370 mg/L, left lung 1170 μg/g, right lung 1270 μg/g, left kidney 1690 μg/g, right kidney 1690 μg/g, heart 520 μg/g, liver 1110 μg/g, pancreas 5510 μg/g, spleen 1000 μg/g, cerebral hemispheres 100 μg/g and cerebellum 80 μg/g; chloroquine was not detected in hair. The blood ethanol concentration was 350 mg/L, which could not have enhanced the effect of chloroquine [Kintz *et al.* 1988].

In 2 deaths from chloroquine overdosage in which ~3 g and 10 g had been ingested, the postmortem concentrations were blood 16 and 12.4 mg/L, kidney 70 and 300 μg/g, liver 175 and 344 μg/g, liver blood 90 and 44 mg/L, lung 38 and 98 μg/g, urine 20 and 68.4 mg/L; in the second of these cases the antemortem blood concentration was reported to be 8.6 mg/L [Robinson *et al.* 1970].

A 26-year-old woman died after ingesting an unknown quantity of chloroquine, possibly to induce abortion; postmortem concentrations were blood 4.2 mg/L, brain 3.8 μg/g, kidney 32.9 μg/g and liver 71 μg/g; alcohol was also present [Noirfalise 1978].

Bioavailability ~80–90%.

Half-life Plasma half-life, ~25–60 days.

Volume of Distribution Reported as 116–285 L/kg.

Clearance Plasma, ~3.7 mL/min/kg (after IV administration).

Distribution in Blood Plasma : whole blood ratio, ~0.3.

Protein Binding ~50–70%.

Note For reviews of the pharmacokinetics of chloroquine, see Ducharme, Farinotti [1996] and Krishna, White [1996].

Dose For an acute attack, the equivalent of 1.5 g chloroquine base over 3 days (900 mg on the first day); for prophylaxis, 300 mg once every 7 days.

Chloroquine base 300 mg is approx. equivalent to chloroquine phosphate 500 mg or chloroquine sulfate 400 mg; chloroquine base 40 mg is approx. equivalent to chloroquine hydrochloride 50 mg.

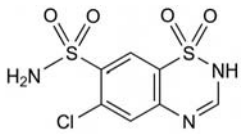
Chlorothiazide

Diuretic
$C_7H_6ClN_3O_4S_2$ = 295.7
CAS—58-94-6

IUPAC Name 6-Chloro-1,1-dioxo-4*H*-1λ^6,2,4-benzothiadiazine-7-sulfonamide
Synonym 6-Chloro-2*H*-1,2,4-benzothiadiazine-7-sulfonamide 1,1-dioxide; clorotiazida.
Proprietary Names *Azide*; *Chlotride*; *Diubram*; *Diuret*; *Diuril*; *Diurilix*; *Diurone*; *Saluric*. It is an ingredient of *Aldoclor* and *Diupres*.

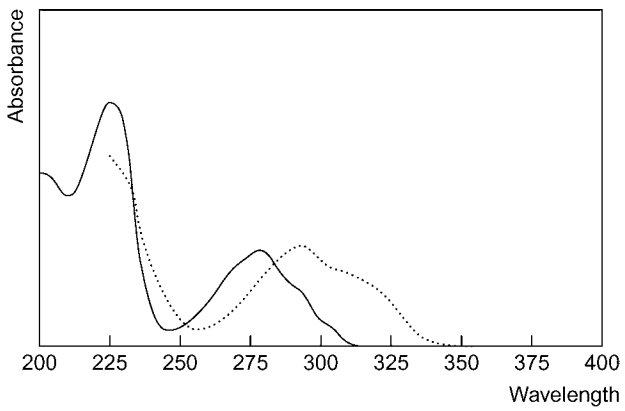


Chemical Properties A white crystalline powder. Mp about 340°, with decomposition. Very slightly soluble in water; practically insoluble in benzene, chloroform, and ether; soluble 1 in 650 of ethanol and 1 in 100 of acetone; freely soluble in dimethylformamide and dimethyl sulfoxide. pK_a 6.7, 9.5 (20°). Log *P* (ether/pH 7.4), −1.9.

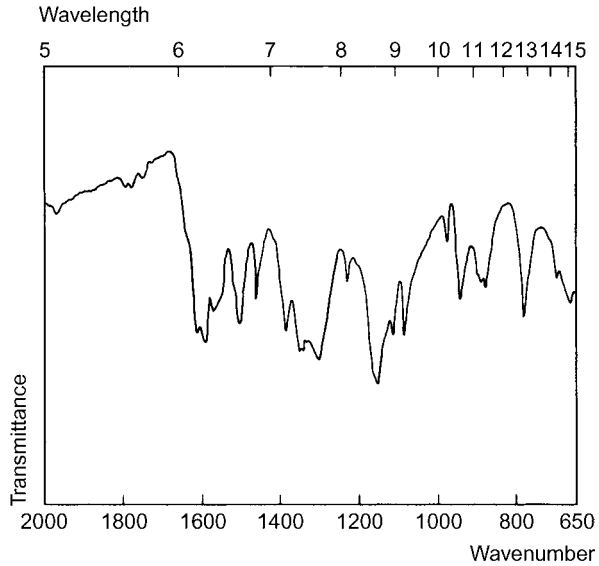
Chlorothiazide Sodium

$C_7H_5ClN_3NaO_4S_2$ = 317.7
CAS—7085-44-1
Synonym Sodium chlorothiazide
Proprietary Name *Diuril* (injection)
Chemical Properties A crystalline solid. Soluble in water.

Colour Tests Koppanyi–Zwikker test—blue; mercurous nitrate—black.
Thin-layer Chromatography System TD—R_f 0.02; system TE—R_f 0.02; system TF—R_f 0.16; system TAD—R_f 0.11; system TAJ—R_f 0.11; system TAK—R_f 0.00; system TAL—R_f 0.41; system TAM—R_f 0.13 (mercuric chloride–diphenylcarbazone reagent, positive).
Gas Chromatography System GA—RI 1720; system GX—chlorothiazide-Me_3 retention time 6.6 min; system GY—chlorothiazide-Me_3 retention time 4.3 min.
High Performance Liquid Chromatography System HN—*k* 0.54; system HY—RI 239; system HZ—retention time 2.1 min.
Ultraviolet Spectrum Aqueous acid—278 nm (A^1_1=400a); aqueous alkali—292 nm (A^1_1=430a).



Infrared Spectrum Principal peaks at wavenumbers 1157, 1305, 1595, 1090, 1123, 1620 cm^{-1} (KBr disk).



Quantification
Plasma **HPLC** UV detection. Limit of detection, 0.01 mg/L [de Vries, Voss 1993]. UV detection. Limit of detection, 10 µg/L, chlorothiazide or hydrochlorothiazide [Barbhaiya *et al.* 1981].
Serum **HPLC** Electrochemical detection. Limit of quantification, 5 µg/L [Richter *et al.* 1996].
Urine **HPLC** UV detection. Limit of detection, 1 mg/L [Farthing *et al.* 1998]. UV detection. Limit of detection, 0.2 mg/L [de Vries, Voss 1993]. UV detection. Limit of detection, 2 µg/L, chlorothiazide or hydrochlorothiazide [Barbhaiya *et al.* 1981].
Disposition in the Body Poorly and erratically absorbed after oral administration; bioavailability, about 20 to 30% after doses of 250 mg, decreasing with increasing dose. Chlorothiazide is not significantly metabolised and is excreted in the urine to a variable extent depending on the extent of absorption.
Therapeutic Concentration
Following single oral doses of 125, 250, and 500 mg to 12 subjects, mean peak plasma concentrations of 0.64, 0.92, and 1.3 mg/L were attained in about 1 h [Welling *et al.* 1982].
Twenty healthy males were administered 25 mg of hydrochlorothiazide daily for 11 days. The mean steady-state plasma concentration was 288 µg/L observed at 2 h [Weir *et al.* 1998].
Half-life Plasma half-life, about 1.5 h.
Protein Binding About 95%.
Dose 0.5 to 2 g daily.

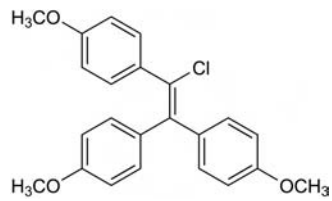
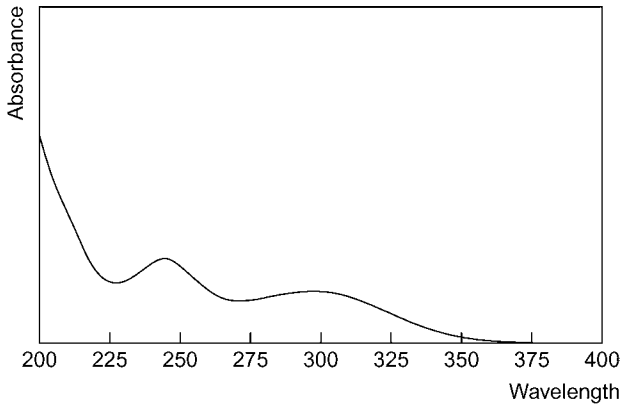
Chlorotrianisene

Oestrogen
$C_{23}H_{21}ClO_3$ = 380.9
CAS—569-57-3

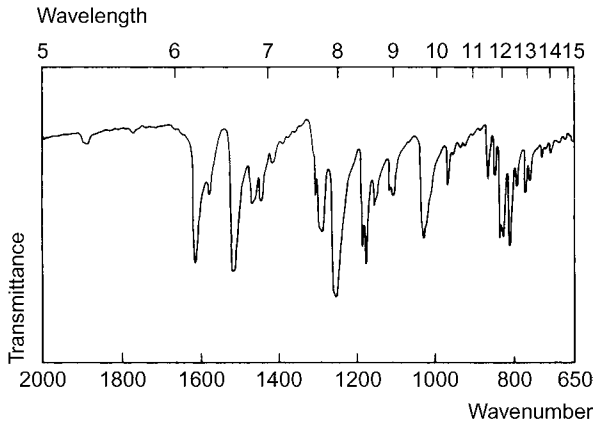
IUPAC Name 1-[1-Chloro-2,2-bis(4-methoxyphenyl)ethenyl]-4-methoxybenzene
Synonyms 1,1′,1″-(1-Chloro-1-ethenyl-2-ylidene)tris[4-methoxybenzene]; tri-*p*-anisylchloroethylene.
Proprietary Names *Anisene*; *Chlorotrisin*; *Merbentul*; *Tace*; *Triagen*.



Chemical Properties Small white crystals or crystalline powder. Mp about 118°. Soluble 1 in 4200 of water, 1 in 360 of ethanol, 1 in 7 of acetone, 1 in 1.5 of chloroform, and 1 in 28 of ether. Log *P* (octanol/water), 6.2.
Caution Chlorotrianisene is a powerful oestrogen. Contact with the skin or inhalation should be avoided.
Colour Tests Liebermann's reagent—green; sulfuric acid—violet.
Thin-layer Chromatography System TP—R_f 0.88; system TQ—R_f 0.77; system TR—R_f 0.98; system TS—R_f 0.92.
Gas Chromatography System GA—RI 2917.
Ultraviolet Spectrum Ethanol—247 (A^1_1=635a), 307 nm (A^1_1=410a).



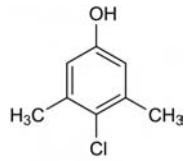
Infrared Spectrum Principal peaks at wavenumbers 1250, 1510, 1606, 1174, 813, 1184 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 380, 223, 382, 238, 152, 345, 215, 113.
Dose 12 to 24 mg daily.

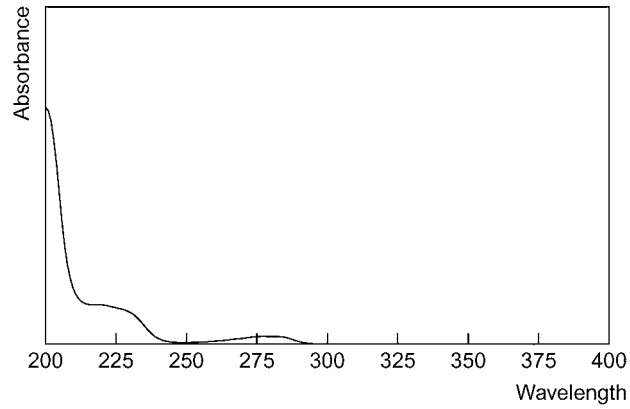
Chloroxylenol

Disinfectant
C_8H_9ClO = 156.6
CAS—88-04-0
IUPAC Name 4-Chloro-3,5-dimethylphenol
Synonyms Parachlorometaxylenol; PCMX.
Proprietary Names *Dettol*; *Metasep*.

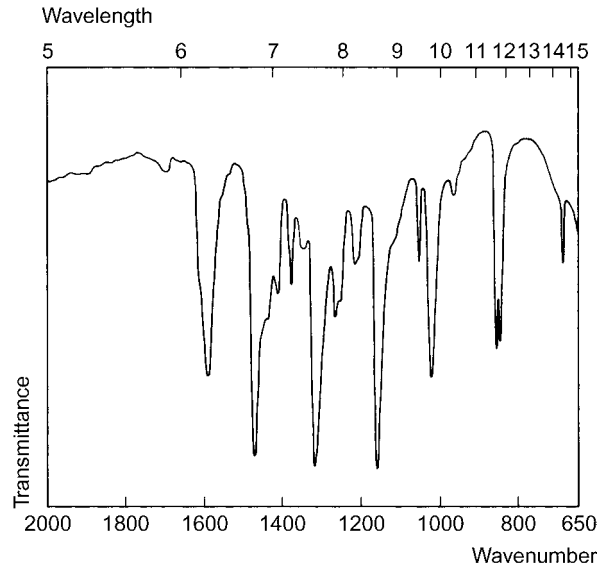


Chemical Properties White or cream-coloured crystals or crystalline powder. Volatile in steam. Mp 114° to 116°. Soluble 1 in 3000 of water, 1 in 200 of boiling water, and 1 in 1 of ethanol; soluble in benzene and in ether. pK_a 9.7 (25°). Log *P* (octanol/water), 3.3.
Colour Test Liebermann's reagent—black.

Gas Chromatography System GA—RI 1420.
High Performance Liquid Chromatography System HY—RI 511.
Ultraviolet Spectrum Aqueous acid—279 nm (A^1_1=83a); aqueous alkali—242 (A^1_1=650a), 296 nm.



Infrared Spectrum Principal peaks at wavenumbers 1158, 1317, 1590, 1020, 858, 848 cm^{-1} (KCl disk).

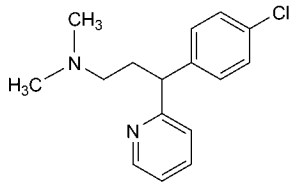


Disposition in the Body About 14% of ingested chloroxylenol is excreted in the urine as a glucuronide conjugate and 17% as the sulfate, together with traces of unchanged chloroxylenol; the amount of unchanged chloroxylenol excreted is increased if the urine is alkaline.
Toxicity
In a fatality caused by the ingestion of at least 100 mL of a solution containing 4.8% of chloroxylenol, postmortem chloroxylenol concentrations were as follows: blood 23 mg/L, liver 8 µg/g [Coutselinis, Boukis 1976].
A subject who had ingested about 17 g of chloroxylenol in solution was admitted to hospital 30 min afterwards and recovered after intensive treatment [Joubert *et al.* 1978].
Use Chloroxylenol is available in concentrations of about 5%; it is further diluted before use.

Coutselinis A, Boukis D (1976). Suicidal intoxication with Dettol (chloroxylenol) (a case report). *Med Sci Law* 16(3): 180.
Joubert P *et al.* (1978). Severe Dettol (chloroxylenol and terpineol) poisoning. *Brit Med J* 1: 890.

Chlorphenamine

Alkylamine, Antihistamine
$C_{16}H_{19}ClN_2$ = 274.8
CAS—132-22-9; 42882-96-2 (±)
IUPAC Name γ-(4-Chlorophenyl)-*N*,*N*-dimethyl-2-pyridinepropanamine
Synonyms Chlorpheniramine; chlorprophenpyridamine.
Proprietary Names *Alerdil*; *Bioflusin*; *Blendox*; *Cronal*; *Pollenase Antihistamine*; *Rimarin*.



Chemical Properties Oily liquid. Bp 142°. pK_{a1} 9.2, pK_{a2} 4.0 [Barnhart, Johnson 1977]. Log *P* (octanol/water) 3.38. Plasma samples at room temperature for 24 h were stable [Chen *et al.* 2004]. Plasma samples were stable for 24 h at room temperature and for 3 freeze-thaw cycles at −20° for 3 months. Plasma extracts at 4° showed contradictory results after 24 and 48 h [Celma *et al.* 2000]. Stock standard solutions prepared in methanol were stable for at least 3 months if kept at 4° [Hasegawa *et al.* 2006]. Stable in the mobile phase for 24 h at 10°, after 2 freeze–thaw cycles and at –20° for 75 days [Takagaki *et al.* 2002].

Chlorphenamine Maleate

$C_{16}H_{19}ClN_2$, $C_4H_4O_4$ = 390.9
CAS—113-92-8

Synonyms Chlorphenamini maleas; chlorpheniramine maleate.

Proprietary Names *Aller-Chlor*; *Allergex*; *Allergin*; *Allerphen*; *Allergy*; *Allergy Relief*; *Calimal*; *Chlo-Amine*; *Chlorhist*; *Chlor-Pro*; *Chlorpyrimine*; *Chlorspan*; *Chlor-Trimeton*; *Chlor-Tripolon*; *Histafen*; *Histalon*; *Piriject*; *Piriton*; *Teldrin*; *Trimeton*. It is an ingredient of many proprietary preparations—see Sweetman [2007].

Note The name Chloramin has been applied to tosylchloramide sodium.

Chemical Properties White crystalline powder. Mp 30° to 135°. Solubility in mg/mL at 25°: ethanol 330; chloroform 240; water 160; methanol 130. Slightly soluble in benzene and ether.

Dexchlorphenamine Maleate

CAS—25523-97-1 (dexchlorpheniramine); 2438-32-6 (dexchlorpheniramine maleate)

Synonyms Dexchlorpheniramine maleate; dexchlorphenamini maleas.

Proprietary Names *Phenamin*; *Polamin*; *Polaronil*; *Polaramin(e)*; *Rhiniramine*; *Trenelone*.

Chemical Properties White odourless crystalline powder. Protect from light. Soluble 1 in 1.1 water; 1 in 2 of alcohol; 1 in 1.7 chloroform and 1 in 2500 of ether; freely soluble in methyl alcohol and dichloromethane.

Colour Test Cyanogen bromide—orange.

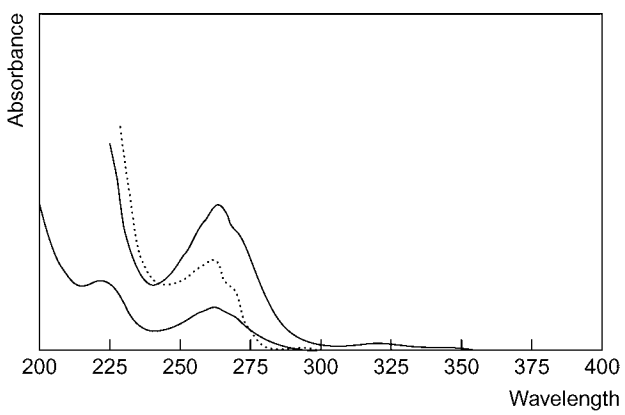
Thin-layer Chromatography System TA—R_f 0.45; system TB—R_f 0.35; system TC—R_f 0.18; system TE—R_f 0.46; system TL—R_f 0.02; system TAE—R_f 0.12; system TAF—R_f 0.21; system TAJ—R_f 0.00; system TAK—R_f 0.00; system TAL—R_f 0.25 (Dragendorff spray, positive; FPN reagent, blue; acidified iodoplatinate solution, positive; Marquis reagent, violet; ninhydrin spray, positive).

Gas Chromatography System GA—chlorphenamine RI 1996, M (nor-) RI 2014, M (OH-)-AC RI 2405, M (bis-nor-)-AC RI 2535, M (desamino-OH-)-AC RI 2130, M (nor-)-AC RI 2530; system GB—chlorphenamine RI 2079, M (nor-) RI 2115, M (bis-nor-) RI 2065, M (nor-)-AC RI 2563; system GC—RI 2586; system GF—RI 2335.

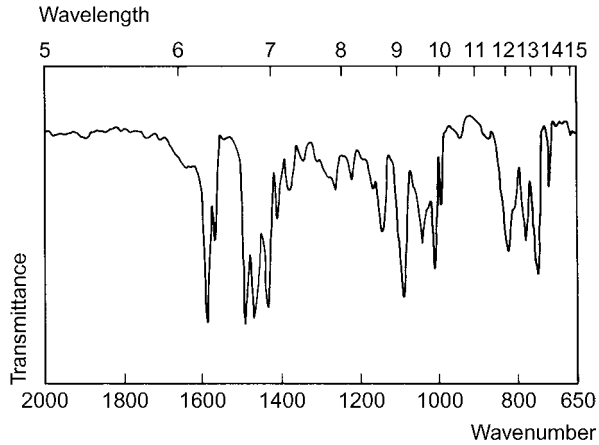
High Performance Liquid Chromatography System HA—*k* 3.9; system HX—RI 356; system HY—RI 264; system HZ—RT 3.5 min; system HAA—RT 12.9 min; system HAX—RT 10.8 min; system HAY—RT 5.3 min.

Column: Discovery cyanopropyl (250 × 4.6 mm i.d., 5 µm). Mobile phase: phosphate buffer (pH 7.5) : phosphate buffer (pH 2.0; 95 : 0 to 0 : 95) with 5% acetonitrile, flow rate 1.0 mL/min. UV detection (λ = 215 nm). Retention time: 14.5 min. Limit of quantification, 6 µg/L, limit of detection, 1.8 µg/L [Olmo *et al.* 2005].

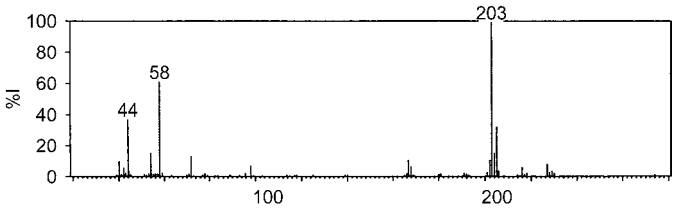
Ultraviolet Spectrum Aqueous acid—265 nm (A^1_1 = 302a); aqueous alkali—262 nm (A^1_1 = 205a).



Infrared Spectrum Principal peaks at wavenumbers 1585, 1086, 746, 1010, 830, 1562 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 203, 58, 44, 205, 54, 204, 72, 202.



Quantification

Blood **GC** Column: 10% SE-30 on 100/120 mesh Supelcoport (4′). Carrier gas: N_2, 40 mL/min. Temperature: 240°. FID. Retention time: 2.6 min [Reed 1981].

Plasma **GC** Column; cross-linked 50% phenylmethyl silicone (5 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He. Temperature programme: 150° for 1 min to 240° at 10°/min for 1 min. NPD. Limit of detection, 0.3 µg/L [Masumoto *et al.* 1986].

GC-MS Column: DB-1MS fused silica capillary (30 m × 0.32 mm i.d., 0.25 um). Carrier gas: He, 2.0 mL/min. Temperature programme: 120° for 1 min to 300° at 20°/min. EI ionisation at 70 eV, positive ion mode. Limit of detection, 2 µg/L [Hasegawa *et al.* 2006].

HPLC Column: µBondapak C_{18} (30 cm × 3.9 mm i.d., 10 µm). Mobile phase: acetonitrile : 0.05 mol/L ammonium phosphate (pH 2.5; 20 : 80). UV detection (λ = 254 nm). *k* 2.80. Retention time: 6.6 min. Limit of detection, 2 µg/L [Athanikar *et al.* 1979].

LC-MS Column: Diamonsil C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : water : formic acid (70 : 30 : 1), flow rate 0.65 mL/min. APCI, SRM acquisition mode. Limit of quantification, 0.2 µg/L [Chen *et al.* 2004]. Column: CYCLOBOND I β-cyclodextrin (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.25% diethylamine (pH 4.4) : acetonitrile : methanol (85 : 7.5 : 7.5), flow rate 0.5 mL/min. APEI, SIM acquisition mode. Limit of quantification, 0.25 µg/L; limit of detection, 0.13 µg/L [Fried *et al.* 2002]. Column: Develosil PhA (250 × 2.0 mm i.d., 5 µm). Mobile phase: 20 mmol/L ammonium acetate : acetonitrile-water (1 : 1, 45 : 55 for 5 min to 20 : 80 at 6.3 min to 10 min to 45 : 55), flow rate 0.3 mL/min for 5 min to 0.35 mL/min at 6.3 min to 0.3 mL/min at 10 min. ESI, positive ion mode, SIM acquisition mode. Retention time: 7.4 min. Limit of quantification, 0.52 µg/L [Takagaki *et al.* 2002]. Column: CYCLOBOND I β-cyclodextrin (250 × 4.6 mm, 5 µm). Mobile phase: 0.25% diethylamine (pH 4.4) : acetonitrile-methanol (50 : 50, 85 : 15), flow rate 0.5 mL/min. SIM acquisition mode. Retention time: 17.5 and 18.9 min for the (*R*)-(−) and (*S*)-(+)-enantiomers, respectively. Limit of detection, 0.05 µg/L [Yasuda *et al.* 2002]. Column: Kromasil C_{18} (50 × 4.6 mm i.d., 5 µm). Mobile phase: water : acetonitrile (80 : 20) with 0.5% formic acid and 1 mmol/L pentafluoropropionic anhydride, flow rate 1.0 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of detection, 0.2 µg/L [Celma *et al.* 2000].

Serum **GC** Column: 3% SP-2250 on 100/120 mesh Supelcoport (6′ × 3 mm i.d.). Carrier gas: N_2, 70 mL/min. Temperature: 195°. Limit of detection, 0.5 µg/L [Barnhart, Johnson 1977].

HPLC Column: Inertsil ODS-2 (150 × 4.6 mm i.d., 5 µm). Mobile phase: 20 mmol/L potassium dihydrogen phosphate : acetonitrile (7 : 3) with or without 5 mmol/L SOS. UV detection (λ = 210 nm). Limit of quantification, 0.5 µg/L [Yamaguchi *et al.* 1994].

Urine **GC** Column: Chromosorb Q on 100/120 mesh (2 m × 0.64 cm o.d.). Carrier gas: N_2, 1.68 kg/cm^2. Temperature: 210°. Retention time: 6.0 min. Limit of detection, 0.5 mg/L [Ali, Beckett 1981].

HPLC Column: Nucleosil cyanopropyl (250 × 4.6 mm i.d., 5 µm). Mobile phase: hexane : ethanol : diethylamine (96 : 4 : 0.05), flow rate 0.5 mL/min. UV detection (λ = 262 nm). Limit of quantification, 35 µg/L [Hiep *et al.* 1998]. See Plasma [Athanikar *et al.* 1979].

LC-MS Column: Sunfire C_8 (100 × 2.1 m i.d., 3.5 µm). Mobile phase: 10 mmol/L ammonium formate buffer (pH 3.5) : acetonitrile-methanol (2 : 1, 98 : 2 for 3.5 min to 80 : 20 at 4 min for 4 min), flow rate 0.3 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention time: 12.2 min. Limit of quantification, 12.5 ng/L, limit of detection, 10 µg/L [del Mar Ramirez Fernandez *et al.* 2007].

Bile **GC** See Blood [Reed 1981].

Oral Fluid **HPLC** See Plasma [Athanikar *et al.* 1979].
Stomach Contents **GC** See Blood [Reed 1981].
Brain **GC** See Blood [Reed 1981].
Kidney **GC** See Blood [Reed 1981].
Liver **GC** See Blood [Reed 1981].
Lung **GC** See Blood [Reed 1981].

Disposition in the Body Chlorphenamine maleate is readily and almost completely absorbed after oral administration; peak plasma concentrations are reached after 2.5 to 6 h. It is widely distributed in the body, including passage into the CNS. The major metabolites are monodesmethyl- and didesmethylchlorpheniramine. Approximately 35% of a single dose is excreted in the urine in 48 h; the 24-h excretion of unchanged drug accounts for ~3 to 10% of the dose, but this is increased by acidification of the urine and increased urinary flow, and decreased when the urine is alkaline; more non-polar metabolites appear to be excreted after IV rather than after oral administration. After daily oral administration, ~20% of a dose is excreted in the 24-h urine as unchanged drug, 20% as monodesmethylchlorpheniramine, and 5% as didesmethylchlorpheniramine. Less than 1% of a dose is eliminated in the faeces. Chlorphenamine inhibits CYP2D6-mediated reactions [He *et al.* 2002; Yasuda *et al.* 2002]

Therapeutic Concentration

Eighteen healthy volunteers who were administered a single oral dose of 4 mg chlorpheniramine maleate and 60 mg pseudoephedrine hydrochloride had a mean maximum plasma concentration of 7.25 ± 2.34 µg/L at 3.50 ± 1.79 h [Chen *et al.* 2004].

In 13 subjects who received a single oral dose of 8 mg (as test formulation tablets or as reference tablets), the maximum plasma concentrations were 0.022 and 0.0205 mg/L at 2.5 and 2.08 h for the test and reference preparations, respectively [Najjar *et al.* 1995].

After a single oral dose of 8 mg to 5 subjects, peak plasma concentrations of 0.01 to 0.04 mg/L (mean 0.02) were attained in 2 to 3 h; after repeated oral administration of 6 mg twice a day to 2 subjects, mean plasma steady-state concentrations of 0.02 and 0.03 mg/L were reported; the plasma concentration of monodesmethylchlorpheniramine averaged 0.008 mg/L and plasma concentrations of didesmethylchlorpheniramine were <0.003 mg/L [Huang *et al.* 1982].

After a single oral dose of 4, 8, or 12 mg chlorpheniramine peak serum concentrations were 5.5, 10.4, and 17.6 µg/L reached at 4 h [Barnhart, Johnson 1977].

Toxicity Toxic effects may be produced by plasma concentrations >20 mg/L.

Postmortem results from 47 pilot fatalities involving chlorphenamine revealed that where chlorphenamine was the sole agent present, tissue concentrations were as follows: blood 0.109 mg/L, liver 1.412 mg/L, lung 1.16 to 3.26 µg/g. In the remaining 31 cases, in which other drugs were also involved, the chlorphenamine concentration was reported as follows: blood 0.093 mg/L, liver 0.747 mg/L, lung 0.731 to 6.483 µg/g [Soper *et al.* 2000].

The following postmortem heart blood concentrations were reported in a fatality due to the ingestion of chlorphenamine, diphenhydramine, and guaifenesin: 0.2 mg/L, 8.8 mg/L and 27.4 mg/L. The cause of death was determined to be acute intoxication by the combined effects of the 3 drugs [Wogoman *et al.* 1999].

The following postmortem tissue concentrations were reported in a fatality due to the ingestion of chlorphenamine and alcohol in µg/mL: blood 1.1, bile 1.5, brain 2.5, kidney 1.4, liver 6.6, lung 5.2; a blood-alcohol concentration of 1200 µg/mL was also reported. The blood chlorphenamine concentration was ~65-times the therapeutic dose [Reed 1981].

Note For a case of atrioventricular block after an overdose of Decontabs (40 mg phenylpropanolamine, 10 mg phenylephrine, 5 mg chlorphenamine and 15 mg phenyltoloxamine per tablet), see Burton *et al.* [1985]. For a case of contact dermatitis from chlorphanamine in eye drops, see Tosti *et al.* [1990]. For a case of homicidal psychosis after cocaine abuse and chlorphenamine, see Strauss [1989].

Bioavailability Between 25 and 50%.

Half-life Values from 2 to 43 h have been reported; shorter half-life in children.

Volume of Distribution ≈3 to 5.9 L/kg.

Clearance Plasma clearance, ≈1.7 mL/min/kg.

Distribution in Blood Plasma : whole blood ratio, ≈0.83.

Protein Binding ≈70%.

Note For a review of the pharmacokinetics of chlorphenamine, see Rumore [1984]. For a review of the pharmacokinetics of general H1-receptor antagonists, see Paton and Webster [1985].

Dose 12 to 24 mg of chlorphenamine maleate daily in divided doses; single doses of 8 to 12 mg have been given in sustained-release preparations. Up to 12 mg daily of dexpheniramine maleate is given in divided doses.

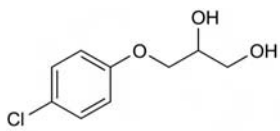
Chlorphenesin

Antifungal

$C_9H_{11}ClO_3 = 202.6$

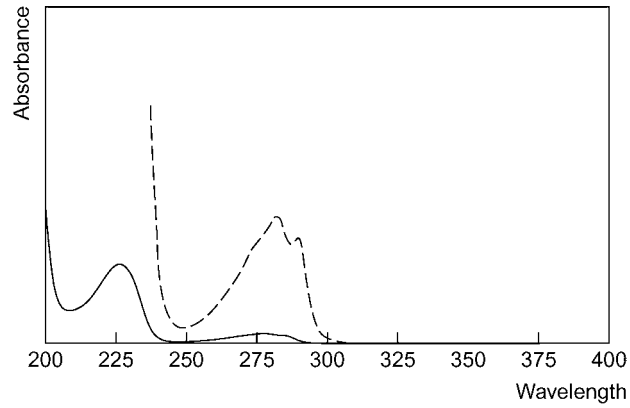
CAS—104-29-0

IUPAC Name 3-(4-Chlorophenoxy)-1,2-propanediol
Synonym *p*-Chlorophenyl α-glyceryl ether
Proprietary Names *Adermykon*; *Mycil*; *Soorphenesin*.

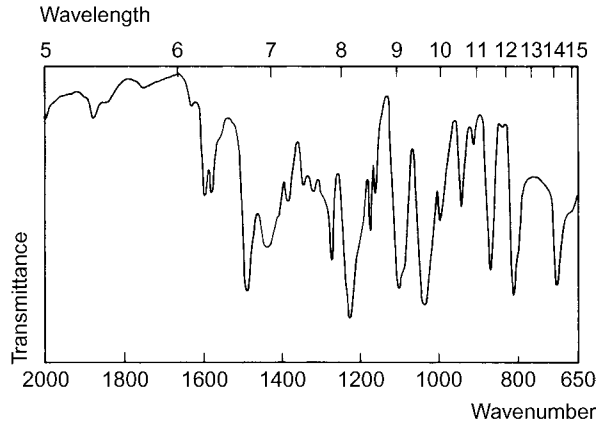


Chemical Properties White or pale cream-coloured crystals or crystalline aggregates. Mp 77° to 79°. Soluble 1 in 200 of water and 1 in 5 of ethanol; soluble in ether. Log *P* (octanol/water), 1.5.

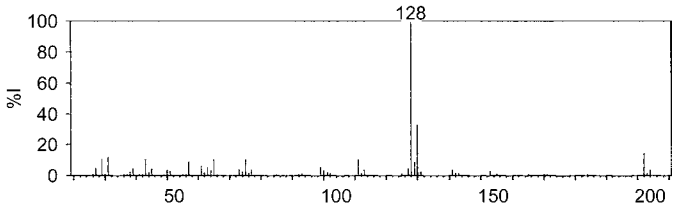
Colour Tests Liebermann's reagent—black; Mandelin's test—brown-green.
Thin-layer Chromatography System TA—R_f 0.82; system TE—R_f 0.62; system TAJ—R_f 0.38; system TAK—R_f 0.32; system TAL—R_f 0.86 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—chlorphenesin RI 1680, chlorphenesin-AC_2 RI 2070, chlorphenesin-AC RI 2030.
Ultraviolet Spectrum Methanol—281 (A_1^1=79b), 289 nm.



Infrared Spectrum Principal peaks at wavenumbers 1232, 1043, 818, 1109, 1490, 710 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 128, 130, 202, 31, 29, 65, 43, 111.

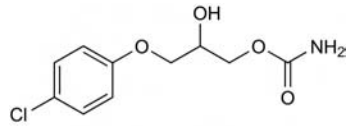


Use Topically in concentrations of 0.5 to 1%.

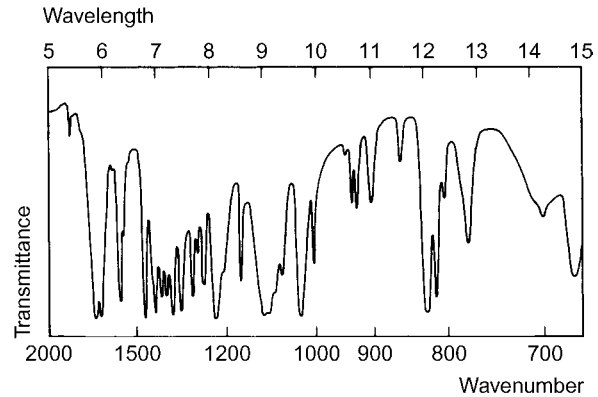
Chlorphenesin Carbamate

Muscle Relaxant
$C_{10}H_{12}ClNO_4$ = 245.7
CAS—886-74-8

IUPAC Name [3-(4-Chlorophenoxy)-2-hydroxypropyl] carbamate
Synonym 3-(4-Chlorophenoxy)-1,2-propanediol-1-carbamate
Proprietary Names *Maolate*; *Rinlaxer*.



Chemical Properties A white crystalline powder. Mp about 90°. Practically insoluble in water, benzene, and cyclohexane; readily soluble in ethanol, acetone, and ethyl acetate; soluble in chloroform. Log *P* (octanol/water), 0.8.
Thin-layer Chromatography System TA—R_f 0.82; system TB—R_f 0.00; system TD—R_f 0.11; system TE—R_f 0.52; system TF—R_f 0.34; system TAD—R_f 0.32; system TAE—R_f 0.87; system TAJ—R_f 0.31; system TAK—R_f 0.18; system TAL—R_f 0.80 (furfuraldehyde reagent, positive).
Gas Chromatography System GA—chlorphenesin RI 1680.
High Performance Liquid Chromatography System HX—RI 387; system HY—RI 348.
Ultraviolet Spectrum Ethanol—280 (A_1^1=75b), 288 nm (A_1^1=62b).
Infrared Spectrum Principal peaks at wavenumbers 1724, 1234, 1028, 1692, 1111, 824 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 128, 130, 202, 43, 129, 111, 75, 204.

Quantification
Serum **GC** FID. Limit of detection, 500 µg/L [Kaiser, Shaw 1974].
Colorimetry See Forist, Judy [1971].
Disposition in the Body Readily absorbed after oral administration. About 85% of a dose is excreted in the urine as a glucuronide conjugate in 24 h together with small amounts of unchanged drug, and the oxidised metabolites, 4-chlorophenoxylactic acid, 4-chlorophenoxyacetic acid, and 4-chlorophenol.
Therapeutic Concentration
Following a single oral dose of 800 mg to 10 subjects, peak serum concentrations of 3.9 to 17.0 mg/L (mean 10) were attained in about 2 h; after daily oral dosing with 800 mg three times a day for 11 weeks to the same subjects, a mean peak serum concentration of 14.4 mg/L was reported about 2 h after the last dose [Stoll *et al.* 1974].
Half-life Plasma half-life, about 2 to 5 h.
Volume of Distribution About 1 L/kg.
Dose Initially 2.4 g daily, reduced to 1.6 g daily or less.

Forist AA, Judy RW (1971). Comparative pharmacokinetics of chlorphenesin carbamate and methocarbamol in man. *J Pharm Sci* 60: 1686–1688.

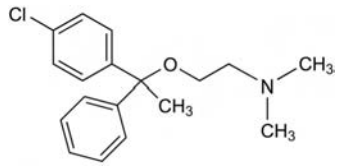
Chlorphenoxamine

Anticholinergic
$C_{18}H_{22}ClNO$ = 303.8
CAS—77-38-3

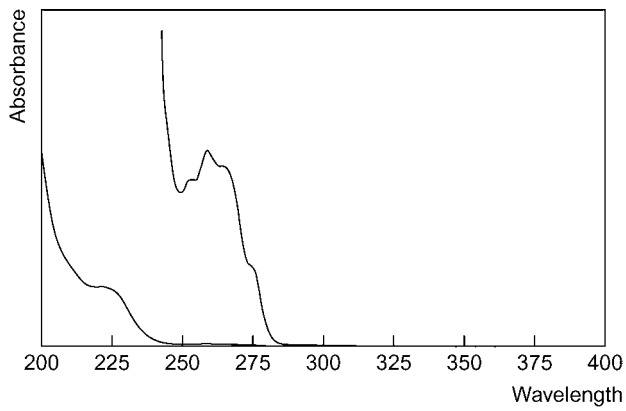
IUPAC Name 2-[1-(4-Chlorophenyl)-1-phenylethoxy]-*N*,*N*-dimethylethanamine



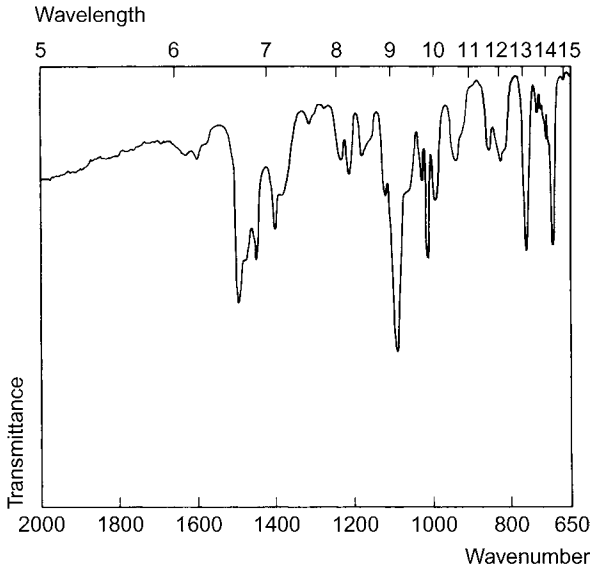
Chemical Properties An oil.

Chlorphenoxamine Hydrochloride
$C_{18}H_{22}ClNO$, HCl = 340.3
CAS—562-09-4
Proprietary Names *Clorevan*; *Phenoxene*; *Systral*.
Chemical Properties A white crystalline powder. Mp 128°. Soluble 1 in 2 of water, 1 in 1.8 of ethanol, and 1 in 1.5 of chloroform; practically insoluble in ether.

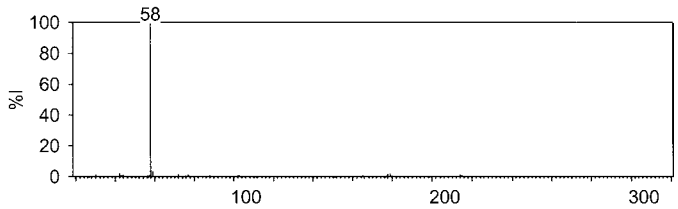
Colour Test Marquis test—yellow→green.
Thin-layer Chromatography System TA—R_f 0.53; system TB—R_f 0.47; system TC—R_f 0.36; system TE—R_f 0.70; system TL—R_f 0.17; system TAE—R_f 0.29; system TAJ—R_f 0.11; system TAK—R_f 0.05; system TAL—R_f 0.54 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—chlorphenoxamine RI 2080, M (OH-) RI 2470, M (OH-methoxy-carbinol-)-H_2O RI 2220; system GB—chlorphenoxamine RI 2190, M (nor-) RI 2205; system GF—RI 2365.
High Performance Liquid Chromatography System HA—*k* 2.9; system HY—RI 346.
Ultraviolet Spectrum Aqueous acid—259 nm (A_1^1=16b).



Infrared Spectrum Principal peaks at wavenumbers 1088, 1490, 1010, 760, 700, 990 cm^{-1} (chlorphenoxamine hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 58, 59, 179, 42, 178, 72, 77, 30.



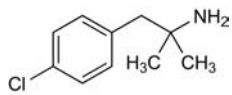
Dose 150 to 400 mg of chlorphenoxamine hydrochloride daily.

Chlorphentermine

Anorectic

$C_{10}H_{14}ClN$ = 183.7
CAS—461-78-9

IUPAC Name 1-(4-Chlorophenyl)-2-methylpropan-2-amine
Synonym 4-Chloro-α,α-dimethylbenzeneethanamine
Proprietary Names *Lucofen*; *Teramine*.

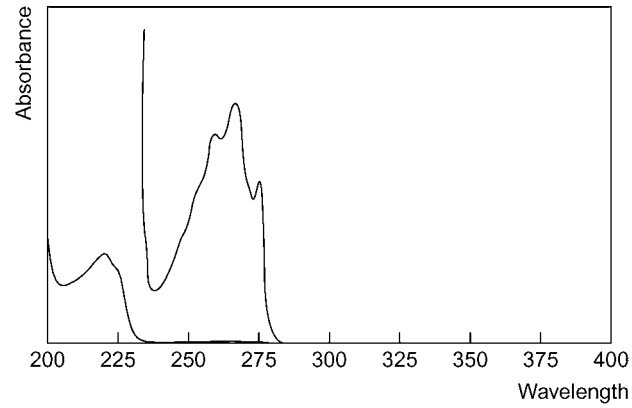


Chemical Properties A liquid. pK_a 9.6. Log *P* (octanol/water), 2.6.

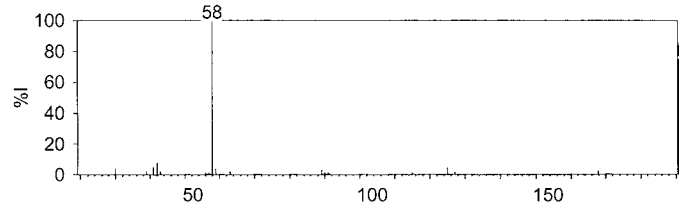
Chlorphentermine Hydrochloride

$C_{10}H_{14}ClN$, HCl = 220.1
CAS—151-06-4
Proprietary Name *Pre-Sate*
Chemical Properties A white or off-white crystalline powder. Mp about 234°. Soluble in water and ethanol; sparingly soluble in chloroform; practically insoluble in ether.

Thin-layer Chromatography System TA—R_f 0.44; system TB—R_f 0.18; system TC—R_f 0.17; system TE—R_f 0.48; system TL—R_f 0.08; system TAE—R_f 0.14; system TAF—R_f 0.77 (Dragendorff spray, positive; acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1344; system GB—RI 1393; system GC—RI 1725.
High Performance Liquid Chromatography System HA—*k* 0.9; system HC—*k* 0.82.
Ultraviolet Spectrum Aqueous acid—220, 259, 267 (A_1^1=11.6c), 274 nm. No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 818, 1493, 1092, 1020, 848, 754 cm^{-1} (chlorphentermine hydrochloride, KBr disk).
Mass Spectrum Principal ions at *m/z* 58, 42, 41, 125, 59, 30, 89, 168.



Quantification
Blood **GC** FID. Limit of detection, 25 µg/L [Jun, Triggs 1970].
Urine **GC** FID. For quantification of chlorphentermine and metabolites, see Beckett, Bélanger [1977].
Disposition in the Body Absorbed after oral administration and metabolised mainly by *N*-oxidation and *N*-hydroxylation to nitro, nitroso and hydroxylamine derivatives. Excretion in the urine is dependent upon urinary pH, a much greater proportion of unchanged drug being excreted when the urine is acidic than when it is alkaline. In normal urine, about 17% of a dose is excreted unchanged and about 50% as *N*-oxidised metabolites in 48 h. If the urine is maintained at an acid pH, these proportions are approximately reversed, about 70% of a dose being excreted in 24 h. In alkaline urine <12% of a dose is excreted unchanged in 48 h.
Therapeutic Concentration
A single oral dose of 100 mg given to 4 subjects produced a mean peak blood concentration of about 0.32 mg/L in 4 h [Jun, Triggs 1970].
Half-life Plasma half-life, about 40 h.
Volume of Distribution About 2 to 3 L/kg.
Dose Usually the equivalent of 65 mg of chlorphentermine daily.

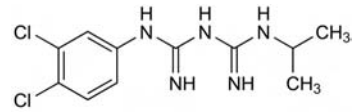
Chlorproguanil

Antimalarial

$C_{11}H_{15}Cl_2N_5$ = 288.2
CAS—537-21-3

IUPAC Name (1*E*)-1-[Amino-(3,4-dichloroanilino)methylidene]-2-propan-2-ylguanidine
Synonym *N*-(3,4-Dichlorophenyl)-*N′*-(1-methylethyl)imidodicarbonimidic diamide; M-5943.



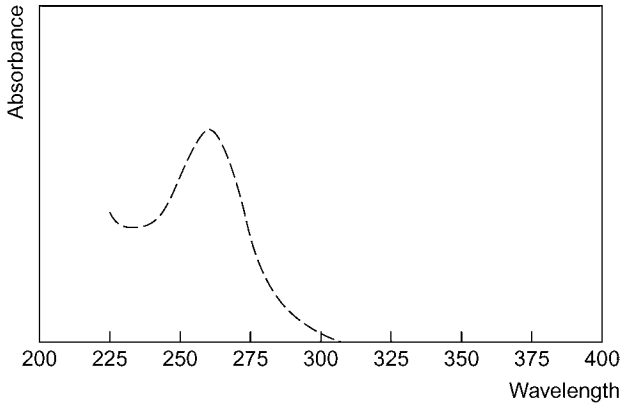
Chemical Properties Log *P* (octanol/water), 3.2.

Chlorproguanil Hydrochloride

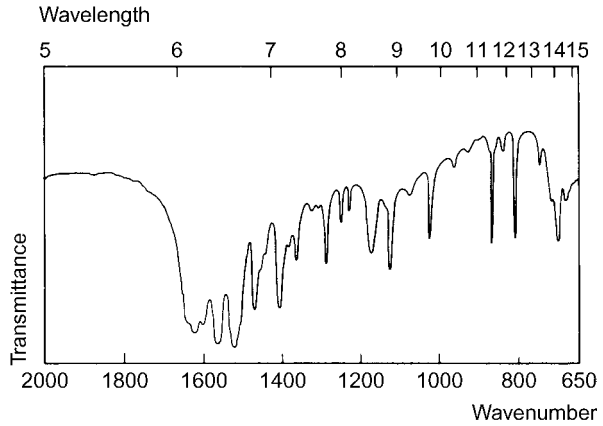
$C_{11}H_{15}Cl_2N_5$, HCl = 324.6
CAS—15537-76-5
Proprietary Name *Lapudrine*
Chemical Properties A white crystalline powder. Mp 246° to 247°. Soluble 1 in 100 of water and 1 in 50 of ethanol; practically insoluble in chloroform and ether.

Colour Tests To 10 mL of a saturated aqueous solution add 1 drop of 10% copper sulfate solution and 2.5 mL of dilute ammonia solution and shake well; add 5 mL of toluene and shake again—toluene layer is violet-red; dissolve 5 mg in 5 mL of a warm 1% solution of cetrimide in water, add 1 mL of sodium hydroxide solution and 1 mL of bromine solution—red.

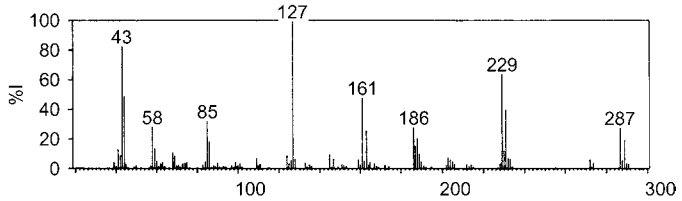
Thin-layer Chromatography System TA—R_f 0.03; system TB—R_f 0.00; system TC—R_f 0.01; system TL—R_f 0.01 (acidified potassium permanganate solution, positive).
Gas Chromatography System GA—RI 1621.
Ultraviolet Spectrum Aqueous acid—250 nm (A^1_1=293c); methanol—260 nm (A^1_1=755b).



Infrared Spectrum Principal peaks at wavenumbers 1520, 1562, 1620, 1600, 1128, 1290 cm^{-1} (chlorproguanil hydrochloride, KBr disk).



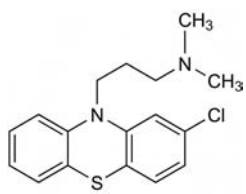
Mass Spectrum Principal ions at *m/z* 127, 43, 229, 44, 161, 231, 85, 186.



Dose 20 mg of chlorproguanil hydrochloride every 7 days.

Chlorpromazine

Tranquilliser
$C_{17}H_{19}ClN_2S$ = 319.9
CAS—50-53-3
IUPAC Name 3-(2-Chlorophenothiazin-10-yl)-*N,N*-dimethylpropan-1-amine
Synonyms 2601-A; 2-chloro-*N,N*-dimethyl-10*H*-phenothiazine-10-propanamine; HL-5746; RP-4560; SKF-2601-A.
Proprietary Names *Aminazine*; *Amplictil*; *Chlorderazin*; *Chlorpromados*; *Contomin*; *Esmind*; *Fenactil*; *Largactil* (suppositories); *Novomazina*; *Plegomazil*; *Promactil*; *Prozil*; *Thorazine* (suppositories); *Wintermin*.



Chemical Properties A white to creamy-white powder or waxy solid. It darkens on prolonged exposure to light. Mp 56° to 60°. Practically insoluble in water; soluble in 1 in 2 of ethanol, 1 in <1 of chloroform, and 1 in 1 of ether. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

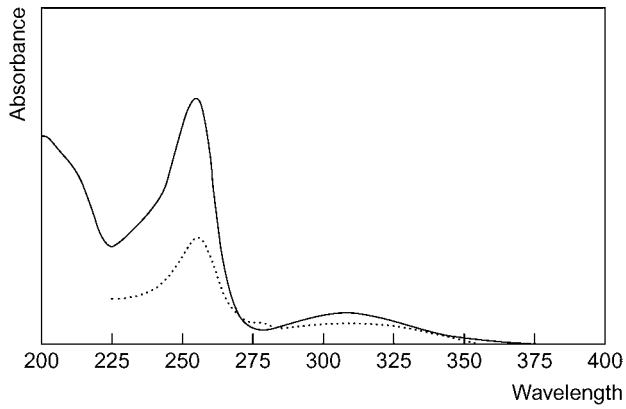
Chlorpromazine Embonate

$(C_{17}H_{19}ClN_2S)_2$, $C_{23}H_{16}O_6$ = 1026
Synonym Chlorpromazine pamoate
Proprietary Names *Chloractil*; *Chlorazin*; *Chlor-Promanyl*; *Chlorpromed*; *Clonazine*; *Hebanil*; *Hibanil*; *Hibernal*; *Klorproman*; *Klorpromex*; *Largactil*; *Lagatrex*; *Megaphen*; *Marazine*; *Matcine*; *Propaphenin*; *Prozin(e)*; *Taroctyl*; *Thorazine*; *Torazina*.
Chemical Properties A pale yellow powder. Very slightly soluble in water; soluble in acetone.

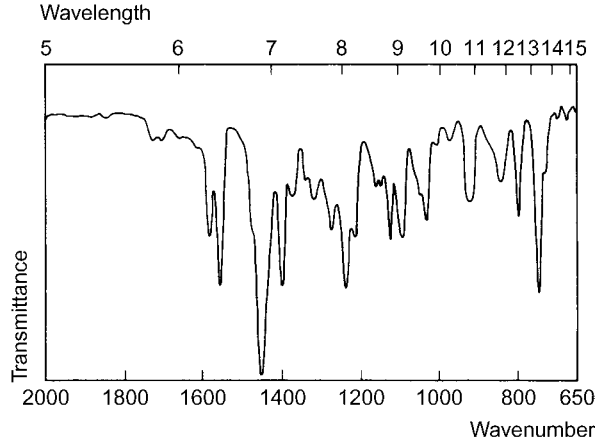
Chlorpromazine Hydrochloride

$C_{17}H_{19}ClN_2S$, HCl = 355.3
CAS—69-09-0
Synonym Aminazine
Proprietary Name *Largactil* (suspension)
Chemical Properties A white or creamy-white crystalline powder. It decomposes on exposure to air and light, becoming yellow, pink and finally violet. Mp with decomposition 179° to 180° (capillary), 194° to 196° (microblock). Soluble 1 in 2.5 of water; soluble in methanol, ethanol and chloroform; practically insoluble in ether and benzene. pK_a 9.3 (20°). Log *P* (octanol pH 7.4), 3.4.

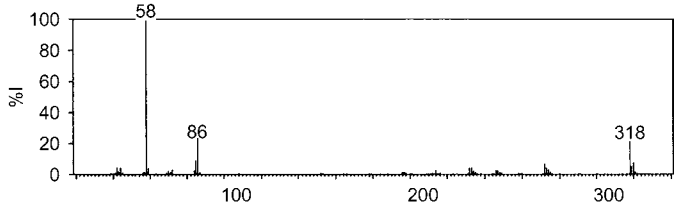
Colour Tests Formaldehyde-sulfuric acid—red-violet; Forrest reagent—red; FPN reagent—red; Liebermann's reagent—red-brown; Mandelin's test—green-→violet; Marquis test—violet.
Thin-layer Chromatography System TA—R_f 0.49; system TB—R_f 0.45; system TC—R_f 0.35; system TE—R_f 0.70; system TL—R_f 0.17; system TAE—R_f 0.25; system TAF—R_f 0.45; system TAJ—R_f 0.11; system TAK—R_f 0.02; system TAL—R_f 0.47 (Dragendorff spray—positive; FPM reagent—pink; acidified iodoplatinate solution—positive; Marquis reagent—pink).
Gas Chromatography System GA—chlorpromazine RI 2413, M (nor-) RI 2480, M (didesmethyl-) RI 2480, M (sulfoxide) RI 2809, M (norsulfoxide) RI 2900, M (*N*-oxide) RI 2100, M (ring) RI 2100, M (OH-)-Me RI 2590, M (bisnor-)-AC RI 2990, M (nor-)-AC RI 3070; system GB—chlorpromazine RI 2618, M (nor-) RI 2656, M (didesmethyl-) RI 2646, M (sulfoxide) RI 3003, M (norsulfoxide) RI 3046, M (7-OH-) RI 2939, M (*N*-oxide) RI 2355; system GF—RI 2940; system GV—RT 16.6 min; system GW—RT 23.0 min.
High Performance Liquid Chromatography System HA—*k* 4.1, M (nor-) 2.2; system HX—RI 456; system HY—RI 350; system HZ—RT 9.1 min; system HAA—RT 16.0 min; system HAX—RT 17.0 min, M (sulfoxide) RT 8.4 min; system HAY—RT 7.8 min, M (sulfoxide) RT 4.3 min; system HAZ—*k* 2.64, M (sulfoxide) *k* 0.62.
Ultraviolet Spectrum Aqueous acid—269 nm (A^1_1 = 1025a). Chlorpromazine sulfoxide: aqueous acid—239 nm (A^1_1 = 1107b), 274 nm (A^1_1 = 343b), 300 nm (A^1_1 = 232b), 341 nm (A^1_1 = 168b).



Infrared Spectrum Principal peaks at wavenumbers 747, 1240, 1561, 1125, 1095, 1220 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 58, 86, 318, 85, 320, 272, 319, 273.



C

Quantification

Blood **GC-MS** SID. Limit of detection, 250–500 ng/L [Hattori *et al.* 1992]. SIM acquisition mode. Limit of detection, μg/L range [Gruenke *et al.* 1985].

HPLC Column: Zorbax ODS. Mobile phase: methanol : water : tritely amine (pH 7.5, 75 : 24 : 0.7 : 0.3). DAD [Zhuo *et al.* 1997]. Column: Silica (300 × 4 mm i. d., 10 μm). Mobile phase: methanol : water (60 : 40) containing 0.2% ethanolamine, flow rate 1.5 mL/min. UV detection. Retention time: 6.24 min. Limit of quantification not reported [Allender *et al.* 1983].

LC-MS ESI, positive ion mode, SIM acquisition mode [Pufal, Sykutera 2008].

Plasma **GC-MS** Column: CBP1-bonded methyl silicone (12 m × 0.53 mm i.d., 1 μm). Carrier gas: He, 20 mL/min. Temperature programme: 200° for 2 min to 300° at 10°/min. Limit of detection, 5 μg/L [Tokunaga *et al.* 1996]. See Blood [Gruenke *et al.* 1985].

HPLC Column: Chromsep C_8 reverse phase (150 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : 30 mmol/L phosphate buffer TEA (pH 3.0, 30 : 69.5 : 0.5), flow rate 1.0 mL/min. UV detection (λ = 238 nm). Retention time: 18 min. Limit of quantification, 2.5 μg/L, limit of detection, 0.8 μg/L [Mercolini *et al.* 2007]. Column: Cyano. Mobile phase: 0.1 mol/L ammonium acetate : acetonitrile (10 : 90). Limit of quantification, 0.25 μg/L [Cooper *et al.* 1983]. Electrochemical detection. Limit of detection, 0.25 μg/L [McKay *et al.* 1982]. UV detection. Limit of detection, 1 μg/L [Midha *et al.* 1981].

LC-MS Column: Discovery pentafluorophenylpropyl (150 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : 3 mmol/L phosphate buffer (pH 1.9, 32 : 68), flow rate 0.5 mL/min. Electrochemical detection. Limit of quantification, 0.5 μg/L, limit of detection, 0.17 μg/L [Saracino *et al.* 2008].

Serum **GC-MS** Column: non-polar fused silica wide-bore capillary (15 m × 0.53 mm i.d., 1.5 μm). Carrier gas: He. Temperature: 280°. FID. Limit of detection not reported [Ohashi *et al.* 2004]. NPD. Limit of quantification, 2.5 mg/L [Bailey, Guba 1979].

HPLC Column: Shim-Pack CLC-C_8 (250 × 4.6 mm i.d.). Mobile phase: methanol : sodium acetate (pH 4.1, 80 : 20), flow rate 1.0 mL/min. UV detection (λ = 254 nm). Limit of detection, 0.5 μg/L [Sobhi *et al.* 2007]. Column: reversed phase C_{18} (250 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : methanol : 30 mmol/L sodium dihydrogen phosphate (pH 5.6, 300 : 200 : 500), flow rate 0.9 mL/min. Retention time: 22.3 min. UV detection (λ = 250 nm). Retention time: 22.3 min. Limit of quantification, 3.6 μg/L [Tanaka *et al.* 2007]. Column: reversed phase. UV detection (λ = 254 nm). Limit of quantification, 10 μg/L [Ohkubo *et al.* 1993].

LC-MS Column: Chromolith Speed ROD C_{18} (50 × 4.6 mm i.d., 5 μm). Mobile phase: methanol : 5 mmol/L acetic acid (pH 3.9) in ammonia (20 : 80 to 70 : 30 at 4 min for 1 min to 20 : 80), flow rate 1.0 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention time: 4.09 min. Limit of quantification, 0.27 μg/L [Kirchherr, Kühn-Velten 2006]. Column: Symmetry C_{18} (150 × 2.1 mm i.d., 3.5 μm). Mobile phase: methanol : 10 mmol/L ammonium acetate (10 : 90 for 5 min to 90 : 10 over 40 min for 10 min to 10 : 90 over 5 min for 20 min), flow rate 0.2 mL/min. ZQ single-quadrapole mass detector. Limit of detection, 1 μg/L [Miyaguchi *et al.* 2006].

Urine **GC-MS** Column: DB 5MS (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.5 mL/min. Quadrupole MSD, SIM acquisition mode. Limit of detection, 5 μg/L [Olmos-Carmona, Hernandez-Carrasquilla 1999]. See Blood [Hattori *et al.* 1992].

HPLC See Serum [Sobhi *et al.* 2007].

LC-MS Column: Tandem LiChrosorb C_8 (150 × 4.6 mm i.d.)-LiChrosorb C_{18} (150 × 4.6 mm i.d.). Mobile phase: acetonitrile : water : acetic acid : TEA (40 : 40 : 20 : 2), flow rate 0.5 mL/min. UV detection (λ = 250 nm). Limit of quantification, 102 μg/L, limit of detection, 30.6 μg/L [Cruz-Vera *et al.* 2009]. Column: KK-CARNU (100 × 4.6 mm i.d., 5 μm). Mobile phase: hexane-1 : 2-dichlormethane : absolute ethanol : trifluoracetic acid (400 : 150 : 100 : 1), flow rate 1 mL/min. Fluorescence detection (λ_{ex} = 250 nm, λ_{em} = 280 nm). Limit of quantification, 0.25 mg/L [Ponder, Stewart 1995].

Gastric Contents **HPLC** See Blood [Allender *et al.* 1983].

Milk **HPLC** See Serum [Ohkubo *et al.* 1993].

Oral Fluid **GC-MS** Column: methyl silicone capillary (16.5 m × 0.2 mm i.d., 0.11 μm). Carrier gas: He, 0.8 mL/min. Temperature: 70°. EI ionisation, SIM acquisition mode (*m/z* 40 to 550). Limit of quantification, 1.0 μg/L, limit of detection, 0.4 μg/L. [Pujadas *et al.* 2007]. Column: HP-1 (300 × 0.25 mm i.d., 0.25 μm). Carrier gas: He. Temperature: 80°. Limit of quantification, 4.8 μg/L, limit of detection, 1.4 μg/L [Wylie *et al.* 2005].

Hair **GC-MS** Column: Saturn 2000 DB-5 capillary (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: CH_4. Temperature: 100°. EI ionisation, SIM acquisition mode (*m/z* 50 to 500). Limit of detection, not reported [Shen *et al.* 2002].

Liver **HPLC** See Blood [Allender *et al.* 1983].

Disposition in the Body Chlorpromazine is readily absorbed after oral administration, with peak plasma levels occurring after 2–4 h; it undergoes first-pass metabolism in the gut wall, is extensively metabolised in the liver and excreted in the bile and urine. Metabolism is catalysed by the P450 isoenzyme CYP2D6 and includes sulfoxidation, *N*-demethylation, hydroxylation and *N*-oxidation; glucuronic acid conjugation and possibly ring fission also occur. There is some evidence that chlorpromazine may stimulate its own metabolism. A large number of metabolites have been isolated and some of the metabolites are active, particularly 7-hydroxychlorpromazine, although less so than the parent drug; several metabolites may be detected in plasma at concentrations similar to those of chlorpromazine during chronic treatment. Approximately 20 to 70% of an oral dose is excreted in the urine as metabolites, mostly conjugated, with 5% of the dose as the sulfoxide, and less than 1% as unchanged drug; approx. 5% of a dose is eliminated in the faeces as metabolites. Chlorpromazine metabolites have been detected in urine up to 18 months after discontinuation of long-term treatment. The monodesmethyl, 7-hydroxy and sulfoxide metabolites are taken up by erythrocytes together with traces of the parent drug and its *N*-oxide.

Chlorpromazine is widely distributed in the body. It crosses the blood–brain barrier, with levels in the brain higher than those in plasma. Chlorpromazine and its metabolites cross the placenta and are found in breast milk.

Therapeutic Concentration

A single oral dose of 150 mg given to 6 subjects produced peak plasma concentrations of 0.010–0.026 mg/L (mean 0.018) 3 h after administration [Hollister *et al.* 1970].

Following daily oral doses of 200–600 mg in 10 subjects, minimum steady-state plasma concentrations of 0.002–0.122 mg/L (mean 0.03) were reported; monodesmethyl and 7-hydroxychlorpromazine plasma concentrations averaged 16% and 30%, respectively, of the chlorpromazine plasma concentration, but there were considerable intersubject variations [Alfredsson *et al.* 1976].

Toxicity Severe toxic symptoms have occurred with doses of <0.1 g. Overdose of chlorpromazine is a fairly common occurrence, but fatalities are relatively rare. Blood concentrations in the region of 0.5–2 mg/L are associated with toxic effects, and concentrations of 2 mg/L or greater may be lethal.

In a review of eight fatal cases, blood concentrations of 3–35 mg/L (mean 17) and liver concentrations of 54–2110 μg/g (mean 366) were reported [Bonnichsen *et al.* 1970].

The following tissue distribution was reported in 2 fatalities: blood 4.2 and 6.7 mg/L, brain 126 and 148 μg/g, kidney 134 and 162 μg/g, liver 240 and 280 μg/g, urine 62 and 78 mg/L [Coutselinis *et al.* 1974].

A patient with renal failure died suddenly following the administration of chlorpromazine 780 mg daily for 5 days. Blood concentrations of 1.534 mg/L were reported [Dorson, Crismon 1988].

Bioavailability ≈20–30%, reduced during chronic therapy.

Half-life Plasma half-life, 7–120 h; mean values are usually in the range 15–30 h.

Volume of Distribution ≈21 L/kg.

Clearance ≈8.6 mL/min/kg from plasma.

Protein Binding ≈95–98%.

Dose Daily dosage of 75 to 300 mg of chlorpromazine hydrochloride; up to 1 g or more daily has been given to psychotic patients.

Chlorpropamide

Antidiabetic

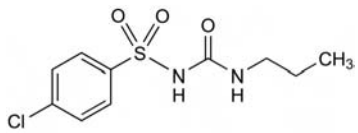
$C_{10}H_{13}ClN_2O_3S = 276.7$

CAS—94-20-2

IUPAC Name 1-(4-Chlorophenyl)sulfonyl-3-propylurea

Synonyms Chlorglypropamide; 4-Chloro-*N*-[(propylamino)carbonyl]benzenesulfonamide; P-607.

Proprietary Names *Chloromide*; *Chloronase*; *Diabetoral*; *Diabinese*; *Glymese*; *Insulase*; *Melitase*; *Mellinese*; *Novopropamide*; *Promide*; *Stabinol*.



Chemical Properties A white crystalline powder. Mp 126° to 130°. Practically insoluble in water; soluble 1 in 12 of ethanol, 1 in 5 of acetone, 1 in 9 of chloroform, and 1 in 200 of ether. pK_a 5.0 (20°). Log *P* (octanol/water), 2.3.

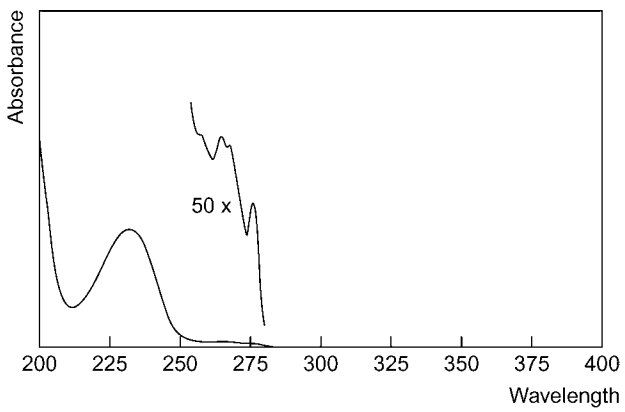
Colour Tests Koppanyi–Zwikker test—violet; mercurous nitrate—black.

Thin-layer Chromatography System TA—R_f 0.72; system TB—R_f 0.00; system TD—R_f 0.38; system TE—R_f 0.10; system TF—R_f 0.43; system TT—R_f 0.84; system TU—R_f 0.43; system TV—R_f 0.03; system TAD—R_f 0.49; system TAE—R_f 0.87; system TAF—R_f 0.88; system TAJ—R_f 0.65; system TAK—R_f 0.78; system TAL—R_f 0.06.

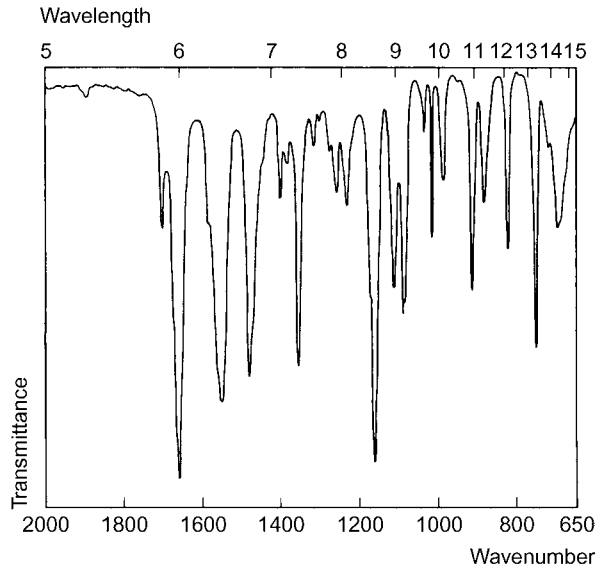
Gas Chromatography System GA—chlorpropamide RI 1791, chlorpropamide-Me RI 2165, chlorpropamide-Me_2 RI 2250.

High Performance Liquid Chromatography System HX—RI 450; system HY—RI 411 andRI 413; system HZ—retention time 5.0 min; system HAA—Retention time 17.7 min.

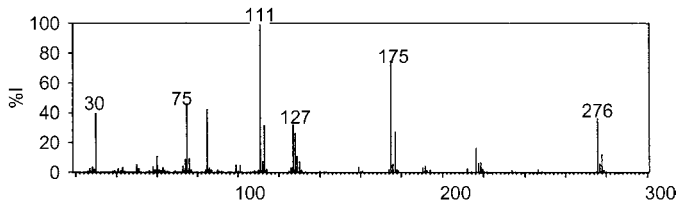
Ultraviolet Spectrum Methanolic acid—232 nm (A^1_1=598a).



Infrared Spectrum Principal peaks at wavenumbers 1661, 1159, 1553, 757, 1086, 909 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 111, 175, 75, 85, 30, 276, 127, 113.



Quantification

Blood **GC** ECD. Limit of detection, 1 mg/L for chlorpropamide or tolbutamide [Matin, Rowland 1973].

Plasma **GC** FID. Limit of detection, 50 µg/L for chlorpropamide or tolbutamide [Midha *et al.* 1976]. See Blood [Matin, Rowland 1973].

Serum **HPLC** UV detection. Chlorpropamide and tolbutamide. Limit of detection, 7 mg/L for chlorpropamide [Hill, Crechiolo 1978].

Urine **HPLC** UV detection. For method for chlorpropamide and metabolites using initial separation by thin-layer chromatography, see Taylor [1972].

Disposition in the Body Rapidly and completely absorbed after oral administration. The main metabolic reactions are hydroxylation at the 2- and 3-positions of the propyl substituent in the side-chain, *N*-dealkylation and hydrolysis to form the sulfonamide metabolite. About 80% of a single oral dose is excreted in the urine in 7 days. During chronic therapy, up to 100% of a dose is excreted in the urine in 24 h, with about 18% of the dose as unchanged drug, 2% as 4-chlorobenzenesulfonamide, 20% as 4-chlorobenzenesulfonylurea, 55% as 2-hydroxychlorpropamide, and 2% as 3-hydroxychlorpropamide.

Therapeutic Concentration In plasma, usually in the range 30 to 250 mg/L. Following single oral doses of 250 mg to 6 subjects, peak plasma concentrations of 23.9 to 39.4 mg/L (mean 28) were attained in 1 to 7 h. After daily oral doses of 250 to 500 mg to 4 subjects, steady-state plasma concentrations of 75.5 to 245.5 mg/L (mean 142) were reported; plasma concentrations of 4-chlorobenzenesulfonylurea and 2-hydroxychlorpropamide ranged from 3 to 6 mg/L and <1 to 9 mg/L, respectively [Taylor 1972].

Toxicity Prolonged hypoglycaemic coma has been reported after overdosage but fatalities are comparatively rare, although some instances of fatal blood dyscrasias have been reported. Peak plasma concentrations of 200 to 750 mg/L have been observed in comatose subjects.

Half-life Plasma half-life, 20 to 45 h (mean 35); increased in renal impairment.

Volume of Distribution About 0.1 to 0.3 L/kg.

Protein Binding 60 to 95%.

Dose 100 to 500 mg daily.

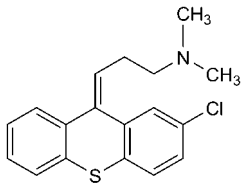
C

Chlorprothixene

Antipsychotic, Tranquilliser
$C_{18}H_{18}ClNS$ = 315.9
CAS—113-59-7

IUPAC Name (3*E*)-3-(2-Chlorothioxanthen-9-ylidene)-*N*,*N*-dimethylpropan-1-amine
Synonyms α-2-Chloro-10-(3-dimethylaminopropylidene)thiaxanthene; (*Z*)-2-chloro-*N*,*N*-dimethylthioxanthene-Δ9,γ-propylamine; *cis*-2-chloro-*N*,*N*-dimethyl-3-thioxanthen-9-ylidenepropylamine; (*Z*)-3-(2-chloro-9*H*-thioxanthen-9-ylidene)-*N*,*N*-dimethyl-1-propanamine; N-714; Ro-4-0403.
Proprietary Names *Taractan*; *Tarasan*; *Truxal*; *Truxaletten*. It is also an ingredient of *Silgastrin-T*.



Chemical Properties Pale-yellow crystalline powder. Mp 97° to 98°. Protect from light. Soluble 1 in 1700 of water, 1 in 29 of ethanol, 1 in 18 of acetone, 1 in 2 of chloroform and 1 in 14 of ether. Incompatible with acids and alkalis. pK_a 8.8 [Baselt 2008]. Log *P* (octanol/water) 5.18. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005]. Stable in acetonitrile and serum samples for at least 6 months when stored at –20° [Bagli *et al.* 1994].

Chlorprothixene Hydrochloride

$C_{18}H_{18}ClNS$, HCl = 352.4
CAS—6469-93-8
Proprietary Names *Cloxan*; *Truquil*.
Chemical Properties White or almost-white crystalline powder. Mp 221°. Protect from light. Freely soluble in water at pH 6 to pH 6.5, slightly soluble in dichloromethane.

Chlorprothixene Mesilate

$C_{18}H_{18}ClNS$, CH_3SO_3H, H_2O = 430.0
Synonym Chlorprothixene mesylate

Colour Tests Formaldehyde–sulfuric acid—red (orange fluorescence under ultraviolet light); Liebermann's reagent—red; Mandelin's test—red; Marquis test—red-orange; sulfuric acid—orange (fluoresces under ultraviolet light).
Thin-layer Chromatography System TA—R_f 0.56; system TB—R_f 0.51; system TC—R_f 0.51; system TE—R_f 0.74; system TL—R_f 0.25; system TAE—R_f 0.34; system TAF—R_f 0.51; system TAJ—R_f 0.20; system TAK—R_f 0.08; system TAL—R_f 0.65 (acidified iodoplatinate solution, positive).

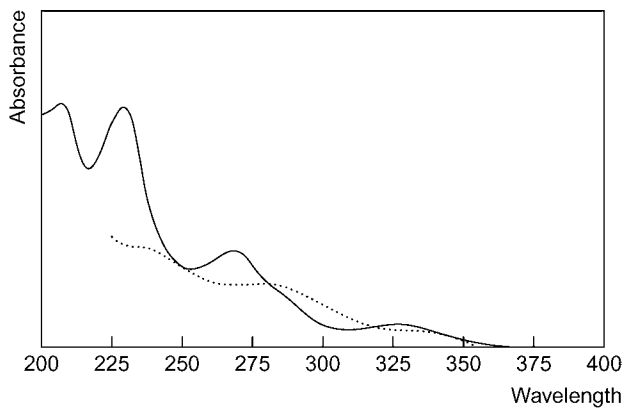
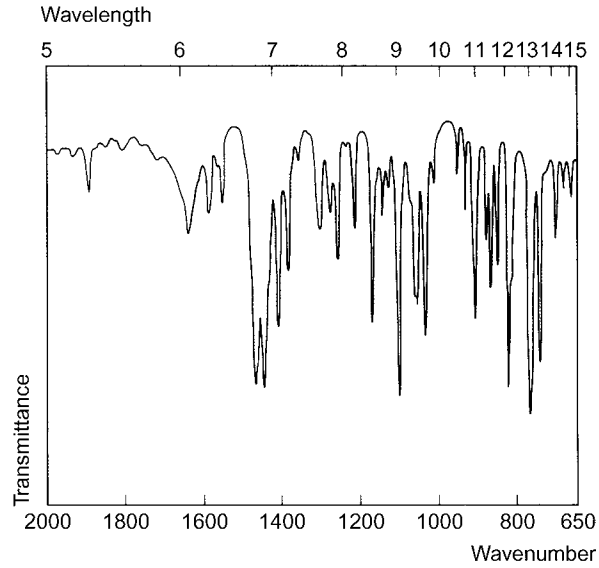
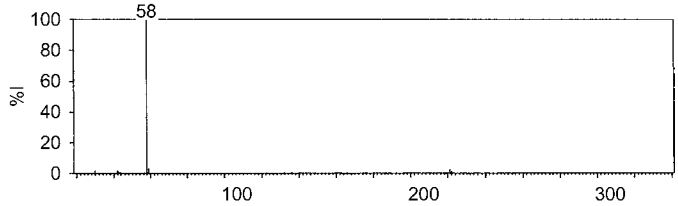
Column: Nucleosil RP-100 CN (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : pyridine : 0.14 mol/L sodium acetate (pH 3.1, 698 : 2 : 300), flow rate 0.9 mL/min. Electrochemical detection. Retention time: 10.2 min [Bagli *et al.* 1994].
Ultraviolet Spectrum Aqueous acid—230 (A_1^1 = 1096b), 268, 325 nm [Allgen *et al* 1960].



Infrared Spectrum Principal peaks at wavenumbers 776, 1104, 832, 746, 1030, 1170 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 58, 59, 221, 30, 42, 222, 255, 43.



Quantification

Blood **TLC** Plates: silica. Solvent system: benzene : acetone: 25% ammonia (1, 100 : 20 : 10), benzene : dioxane : 25% ammonia (2, 65 : 35 : 5), *n*-propanol: 25% ammonia (3, 100 : 1), *n*-butanol : acetic acid : water (4, 80 : 20 : 20). R_f: 0.78, 0.92, 0.61 and 0.49 for solvent systems 1, 2, 3 and 4, respectively. Limit of quantification, 0.5 mg/L [Christensen 1974].
Plasma **HPLC** Column: Supelco LC-PCN cyano (25 cm × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.02 mol/L potassium dihydrogen phosphate (pH 4.5; 60 : 40), flow rate 2.0 mL/min. Retention time: 7.6 min. *k'*: 9.55. UV detection (λ = 229 nm). Limit of quantification, 5 µg/L [Brooks *et al.* 1985].
Serum **HPLC** Column: Nucleosil 100 CN (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : pyridine: 0.14 mol/L sodium acetate (pH 3.1; 698 : 2 : 300), flow rate 0.9 mL/min. Electrochemical detection. Retention time: 10.2 min. Limit of detection 0.5 µg/L [Bagli *et al.* 1994].
LC-MS Column: C_{18} (50 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 5 mmol/L acetic acid (pH 3.9; 20 : 80 to 70 : 30 over 4 min for 1 min), flow rate 1.0 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention time: 4.1 min. Limit of quantification, 0.93 µg/L [Kirchherr, Kühn-Velten 2006].
Urine **TLC** See Blood [Christensen 1974].
Gastric Aspirate **GC-MS** Column: 3% QF-1 on Supelcoport 80/100 mesh (2.5 m × 2 mm i.d.). Carrier gas: He, 30 mL/min. Temperature: 210°. EI ionisation at 70 eV. Limit of detection not reported [Pettersen *et al.* 1981].
Hair **GC** Column: AC-5 capillary (15 m × 0.25 mm i.d.). Temperature programme: 180° to 270° at 10°/min for 10 min. NPD. Limit of detection, 0.1–0.5 µg/g [Shen *et al.* 2002].
Liver **TLC** See Blood [Christensen 1974].
Disposition in the Body Readily absorbed after oral administration, but undergoes extensive first-pass metabolism. The major metabolite is the sulfoxide, but *N*-demethylation, *N*-oxidation and ring hydroxylation also occur [Breyer-Pfaff *et al.* 1985]. Chlorprothixene and its sulfoxide metabolites are distributed into breast milk. After daily oral doses, up to about 30% is excreted in the urine in 24 h as chlorprothixene sulfoxide, and up to ~40% is eliminated in the faeces, also as the sulfoxide [Allgen *et al.* 1960].

Therapeutic Concentration

Therapeutic doses range from 60 mg/day in ambulatory patients to 600 mg/day in institutionalised patients. A single oral dose of 50 mg produces blood concentrations of 0.04 mg/L 8 h after administration while 400 mg every 3 h resulted in concentrations ranging from 0.06 to 0.3 mg/L [de Silva, D'Arconte 1969].
Following a single oral dose of 30 mg to one subject, a peak blood concentration of ~0.01 mg/L was attained in 4 h [Raaflaub 1975].
After an overnight fast, 2 healthy male volunteers were administered a single oral dose of chlorprothixene. Maximum plasma concentrations of 5.3 and 8.8 µg/L were reached at 5 and 4 h, respectively [Brooks *et al.* 1985].

Oral administration of a single 100 mg dose of chlorprothixene, in the form of a solution (base), suspension (base) or tablets (hydrochloride), to 8 subjects, produced respective peak plasma chlorprothixene concentrations of 22.4 to 65.7 µg/L (mean 31.6) at 3.0 h, 13.3 to 70.6 µg/L (mean 24.2) at 2.88 h and 13.4 to 52.6 µg/L (mean 25.8) at 2.5 h [Bagli *et al.* 1996].

Toxicity The estimated minimum lethal dose is 2.5 g, although recovery has occurred after the ingestion of 12 g.

Two to 12 h after a suicidal ingestion of ~10 g of chlorprothixene, a 31-year-old female had the following plasma concentrations: chlorprothixene 10 mg/L, desmethylchlorprothixene 8 mg/L and chlorprothixene sulfoxide 1 mg/L. After 4-h haemoperfusion, the levels were: chlorprothixene 0.1 mg/L, desmethylchlorprothixene 0.1 mg/L and chlorprothixene sulfoxide was not detected [Köppel *et al.* 1987].

In 6 fatalities attributed to the ingestion of about 2.5 to 4 g of chlorprothixene, the following postmortem concentrations were reported: blood, chlorprothixene <0.1 to 0.4 mg/L, total metabolites <0.1 to 0.3 mg/L; liver, chlorprothixene 5 to 42 mg/L (mean 18), total metabolites <0.1 to 44 mg/L; in 1 case a urine concentration of total thioxanthenes of 15 mg/L was also reported; desmethylchlorprothixene was the major metabolite in the liver. Alcohol was also detected in 3 cases [Christensen 1974].

In a fatality involving the ingestion of up to 4 g of chlorprothixene, the postmortem tissue concentrations shown below were reported (mg/L):

	Chlorprothixene	*Chlorprothixene sulfoxide*
Blood	0.1	0.6
Bile	3.9	7.0
Urine	0.4	3.4

The stomach contents contained 340 mg chlorprothixene and 25 mg of the sulfoxide [Poklis *et al.* 1983].

Bioavailability ≈40%.

Half-life Plasma half-life, 8 to 12 h [Köppel *et al.* 1987] or 17 to 24 h [de Silva, D'Arconte 1969].

Volume of Distribution 11 to 23 L/kg [Köppel *et al.* 1987].

Clearance Plasma clearance, ≈14 to 20 mL/min/kg.

Protein Binding >99% [Köppel *et al.* 1987].

Dose Available as 10 to 100 mg tablets as the free base or a 100 mg/5 mL concentrate as the lactate or hydrochloride salts for oral administration; vials of 25 mg/2 mL as the hydrochloride salt are available for parenteral injection. The usual dose is 45 to 200 mg daily, oral or IM, in divided doses; up to 600 mg daily has been given.

Chlorpyrifos

Organophosphate, Acaricide, Insecticide

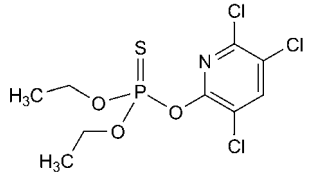
$C_9H_{11}Cl_3NO_3PS$ = 350.6

CAS—2921-88-2

IUPAC Name Phosphorothioic acid *O,O*-diethyl *O*-(3,5,6-trichloro-2-pyridinyl) ester

Synonyms Chlorpyrifos-ethyl; Dowco 179; ENT-27311.

Proprietary Names *Affront*; *Brodan*; *Bullet*; *Detmol UA*; *Dursban*; *Empire*; *Eradex*; *Ethion*; *Lorsban*; *Paqeant*; *Piridane*; *Pyrinex*; *Scout*; *Stipend*.



Chemical Properties Off-white to pale-yellow granular crystals. Mp 41° to 42°. It is practically insoluble in water (2 mg/L at 24°); readily soluble in organic solvents, acetone (6500 g/kg at 25°), benzene (7900 g/kg at 25°), chloroform (6300 g/kg at 25°), carbon disulphide (5900 g/kg at 25°), diethyl ether (5100 g/kg at 25°), xylene (5000 g/kg at 25°), methanol (450 g/kg at 25°), methylene chloride and ethylene dichloride. Log *P* (octanol/water) 4.96.

Chlorpyrifos-(Me)

$C_7H_7Cl_3NO_3PS$ = 322.5

CAS—5598-13-0

Synonyms Dowco 214; ENT-27520; NSC-60380; OMS-1155.

Proprietary Names *Douco 214*; *Dusban-methyl*; *Graincote*; *Noltron*; *Reldan*; *Smite*; *Turmar*; *Zertell*.

Chemical Properties Colourless, crystalline solid. Mp 45.5° to 46.5°. It is soluble in water (5 mg/L at 25°); very soluble in organic solvents; acetone (6400 g/kg at 24°), benzene (5200 g/kg at 24°), diethyl ether (4800 g/kg at 24°), chloroform (3500 g/kg at 24°), methanol (390 g/kg at 24°) and hexane (230 g/kg at 24°).

Thin-layer Chromatography System TE—chlorpyrifos R_f 0.99; system TX—chlorpyrifos R_f 0.64, chlorpyrifos-methyl R_f 0.56; system TY—chlorpyrifos R_f 0.95, chlorpyrifos-methyl R_f 0.89; system TAB—chlorpyrifos-methyl R_f 0.60; system TAC—chlorpyrifos-methyl R_f 0.35; system TAE—chlorpyrifos R_f 0.85.

Other **GC** Food and Water Samples. See Milk [Dogheim *et al.* 1996].

GC-MS Handwipes. Column: DB-5 capillary (30 m × 0.25 mm). SIM acquisition mode. Limit of detection, 10 µg/L [Geno *et al.* 1996].

Disposition in the Body Chlorpyrifos is readily absorbed into the bloodstream from the gastrointestinal tract through the lungs and through the skin. After the formation of oxon by oxidative desulfuration, the major metabolites observed are 3,5,6-trichloro-2-pyridinol (TCP), diethylphosphate and diethylthio-phosphate. Chlorpyrifos and its metabolites are eliminated rapidly from the body via urine and faeces. Most of an ingested dose is recovered in urine as the metabolites whereas only 1% of the compound absorbed through dermal exposure is detected as metabolites in urine. No significant bioaccumulation has been observed.

Blood Concentration

Six healthy male Caucasian volunteers were administered a single oral dose of 0.5 mg/kg bodyweight chlorpyrifos followed by topical exposure of 0.5 mg/kg 4 weeks later. After both doses, blood chlorpyrifos concentrations of <30 µg/L were observed. The maximum TCP blood concentration was on average 930 µg/L (range, 510 to 1350 µg/L) 6 h after oral administration, and 63 µg/L (range: 29 to 122 µg/L) 24 h after topical administration [Nolan *et al.* 1984].

Toxicity Chlorpyrifos is very toxic and affects the central nervous, cardiovascular and respiratory systems. It is irritating to the skin and eyes. Doses up to 28 g may be fatal. No toxic effects have been observed with doses of 0.1 mg/kg body weight daily taken over 4 weeks. This dose is deemed the acceptable daily intake. A toxic dose of 300 mg/kg body weight has effects on the peripheral nervous system.

A pregnant 23-year-old attempted suicide wth chlorpyrifos-ethyl. The foetus had no cardiac activity. At postmortem the foetal blood had a concentration of 264 µg/L chlorpyrifos [Sebe *et al.* 2005].

A 26-year-old male ingested ~360 mL Dexol (6.7% chloropyrifos in 76.8% distillates), 360 mL of Ortho Weed-B-Gone M (10.8% diethylamine salts of 2,4-D, 11.6% MCPP and 77.6% aqueous inert ingredients) and a few granules of D-Con concentrate (0.025% warfarin). On hospital admission the gastric aspirate contained 17.2 µg/g chlorpyrifos. At postmortem chlorpyrifos tissue concentrations (ng/g) were as shown below.

Tissue	*Chlorpyrifos*
Brain grey matter (frontal lobe)	91.0
Brain white matter (frontal lobe)	574.6
Kidney	415.6
Liver	4187.0
Pancreas	2373.2

[Osterloh *et al.* 1983].

Note For an unusual case of chlorpyrifos ingestion by a 16-month-old female, see Mattingly *et al.* [2003]. For a review of 439 chlorpyrifos poisonings in Sri Lanka, see Eddleston *et al.* [2005] and >30,000 US suspected exposures including 8 fatalities, see Kingston *et al.* [1999]. For a case study of chlorpyrifos poisoning in pregnancy, see Solomon, Moodley [2007].

Half-life Chlorpyrifos, 1 day; TCP, 26.9 h (oral dose) and 30 h (dermal exposure).

Volume of Distribution TCP, 181 mL/kg.

Chlorquinaldol

Antibacterial, Antifungal

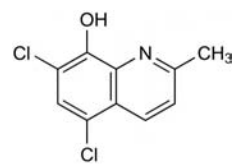
$C_{10}H_7Cl_2NO$ = 228.1

CAS—72-80-0

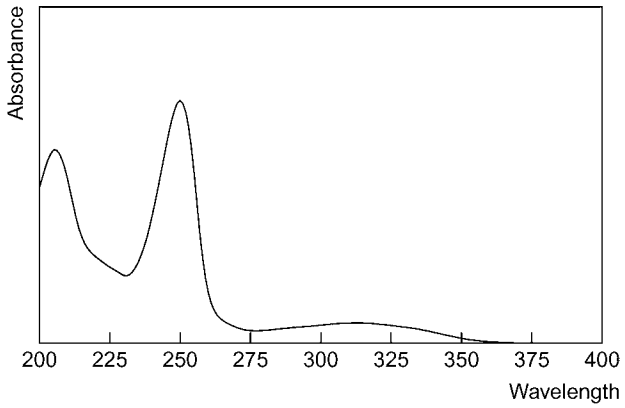
IUPAC Name 5,7-Dichloro-2-methyl-8-quinolinol

Synonyms Chlorchinaldol; hydroxydichloroquinaldine.

Proprietary Names *Afungil*; *Gyno-Sterosan*; *Gynothérax*; *Quesil*; *Siogen(o)*; *Siosteran*; *Soprosan*; *Sterosan*; *Steroxin*.



Chemical Properties A green or yellowish-brown crystalline powder. Mp about 113°. Practically insoluble in water; soluble 1 in 100 of ethanol, 1 in 20 of chloroform, and 1 in 33 of ether; soluble in acetone, benzene, and glacial acetic acid. Log *P* (octanol/water), 3.5.
Colour Test Ferric chloride—blue-green.
Thin-layer Chromatography System TA—R_f 0.71 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1802.
Ultraviolet Spectrum Aqueous acid—263 (A^1_1=2100b), 330 nm (A^1_1=132b); aqueous alkali—263 (A^1_1=1410b), 345 nm (A^1_1=186b); methanol—251 (A^1_1=1900b), 315 nm (A^1_1=146b).

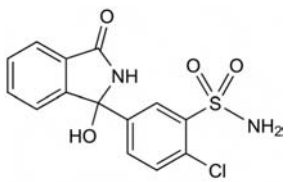


Infrared Spectrum Principal peaks at wavenumbers 1656, 1739, 1605, 758, 1111, 1153 cm^{-1} (KBr disk).
Uses Chlorquinaldol is used topically in a concentration of 3%; it has been used as 200 mg vaginal tablets.

Chlortalidone

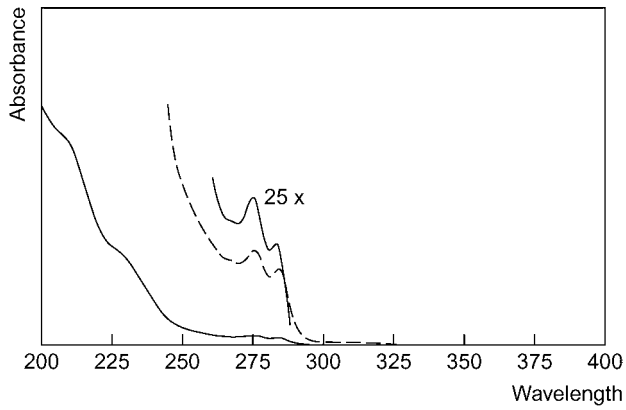
Diuretic
$C_{14}H_{11}ClN_2O_4S$ = 338.8
CAS—77-36-1

IUPAC Name 2-Chloro-5-(1-hydroxy-3-oxo-2H-isoindol-1-yl)benzenesulfonamide
Synonyms 2-Chloro-5-(2,3-dihydro-1-hydroxy-3-oxo-1*H*-isoindol-1-yl)-benzenesulfonamide; chlorthalidone; G-33182; phthalamudine.
Proprietary Names *Hydro-long*; *Hygroton*; *Igrolina*; *Novothalidone*; *Renon*; *Uridon*; *Urolin*; *Zambesil*. It is an ingredient of *Kalspare*, *Lopresoretic*, *Regroton*, and *Tenoret(ic)*.

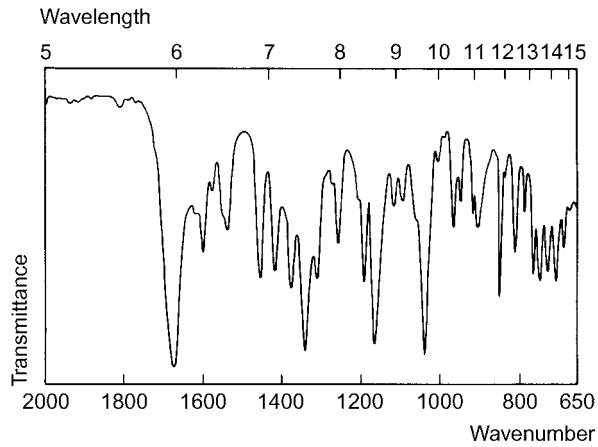


Chemical Properties A white or yellowish-white crystalline powder. Mp about 220°, with decomposition. Practically insoluble in water; soluble 1 in 150 of ethanol, 1 in 650 of chloroform, and 1 in 25 of methanol; slightly soluble in ether; soluble in solutions of alkali hydroxides. pK_a 9.4. Log *P* (octanol/water), 0.8.

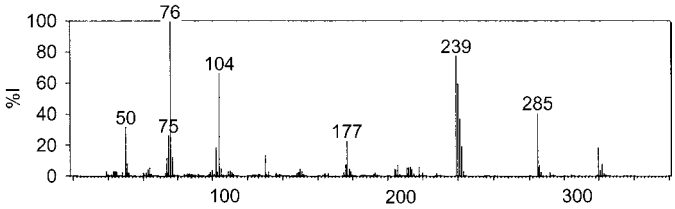
Colour Tests Koppanyi-Zwikker test—violet; Marquis test—yellow.
Thin-layer Chromatography System TD—R_f 0.04; system TE—R_f 0.42; system TF—R_f 0.40; system TAD—R_f 0.23; system TAE—R_f 0.88; system TAF—R_f 0.83; system TAJ—R_f 0.17; system TAK—R_f 0.10; system TAL—R_f 0.63.
Gas Chromatography System GA—chlortalidone RI 2145, chlortalidone-Me_4 RI 2630; system GX—chlortalidone-Me_4 retention time 7.7 min; system GY—chlortalidone-Me_4 retention time 4.8 min.
High Performance Liquid Chromatography System HN—*k* 1.28; system HX—RI 367; system HY—RI 308; system HZ—retention time 2.3 min.
Ultraviolet Spectrum Ethanol—275 (A^1_1=57a), 284 nm (A^1_1=45a).



Infrared Spectrum Principal peaks at wavenumbers 1685, 1033, 1160, 845, 1190, 1310 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 76, 239, 104, 240, 285, 241, 50, 75.



Quantification
Blood **HPLC** UV detection. Limit of detection, 100 µg/L [MacGregor *et al.* 1984]. UV detection. Limit of detection, 30 µg/L [Guelen *et al.* 1980].
Plasma **GC** AFID. Limit of detection, 10 µg/L [Fleuren, van Rossum 1978].
HPLC UV detection. Limit of quantification, 10 µg/L [Giachetti *et al.* 1997]. UV detection. Limit of detection, 30 µg/L [Guelen *et al.* 1980].
Urine **GC** AFID. See Plasma [Fleuren, van Rossum 1978].
HPLC UV detection (λ=214 nm). Limit of quantification, 0.1 mg/L, limit of detection, 0.02 mg/L [Salado *et al.* 1997]. See Blood [MacGregor *et al.* 1984]. See Blood [Guelen *et al.* 1980].
Erythrocytes **GC** AFID. See Plasma [Fleuren, van Rossum 1978].
Disposition in the Body Readily but incompletely absorbed after oral administration. It does not appear to be significantly metabolised. After a single dose, about 25 to 40% is excreted in the urine as unchanged drug and about 1% is eliminated in the bile; the quantity excreted in the urine appears to be dose-dependent. During daily therapy, about 50% of the daily dose is excreted unchanged in the urine in 24 h and about 25% is eliminated in the faeces.
Therapeutic Concentration
After single oral doses of 50 to 75 mg given to 7 subjects, peak plasma concentrations of 0.14 to 0.26 mg/L were attained in 1 to 3 h [Fleuren *et al.* 1979]. Following daily oral doses of 50 mg to 10 subjects, steady-state plasma concentrations of 0.2 to 1.4 mg/L (mean 0.5) were reported [Collste *et al.* 1976].
Bioavailability About 65%.
Half-life Plasma half-life, 35 to 70 h (mean, 48), increased in elderly subjects.
Volume of Distribution About 4 L/kg.
Clearance Plasma clearance, about 1 to 2 mL/min/kg.
Distribution in Blood Plasma : whole blood ratio, about 0.04 at therapeutic concentrations.
Protein Binding About 75%.
Note For a review of the pharmacokinetics of diuretics, see Beerman, Groschinsky-Grind [1980].

Dose Usually 50 mg daily or 100 to 200 mg on alternate days.

Beermann B, Groschinsky-Grind M (1980). Clinical pharmacokinetics of diuretics. *Clin Pharmacokinet* 5(3): 221–245.

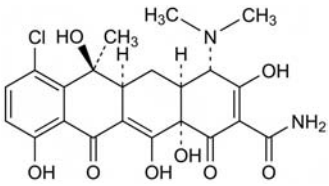
Chlortetracycline

Antibacterial
$C_{22}H_{23}ClN_2O_8$ = 478.9
CAS—57-62-5

IUPAC Name (2*Z*,4*S*,4a*S*,5a*S*,6*S*,12a*S*)-2-[Amino(hydroxy)methylidene]-7-chloro-4-(dimethylamino)-6,10,11,12a-tetrahydroxy-6-methyl-4,4a,5,5a-tetrahydrotetracene-1,3,12-trione
Synonym [4*S*-(4α,4aα,5aα,6β,12aα)]-7-Chloro-4-dimethylamino-1,4,4a,5,5a,6,11,-12a-octahydro-3,6,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-2-naphthacenecarboxamide
Proprietary Names *Acronize*; *Biomitsin*; *Orospray*.



Chemical Properties A yellow crystalline powder. Mp 168° to 169°. Very slightly soluble in water; very soluble in aqueous solutions above pH 8.5; slightly soluble in ethanol, acetone, ethyl acetate, and benzene; practically insoluble in ether. pK_a 3.3, 7.4, 9.3 (25°). Log *P* (octanol/pH 7.5), −0.9.

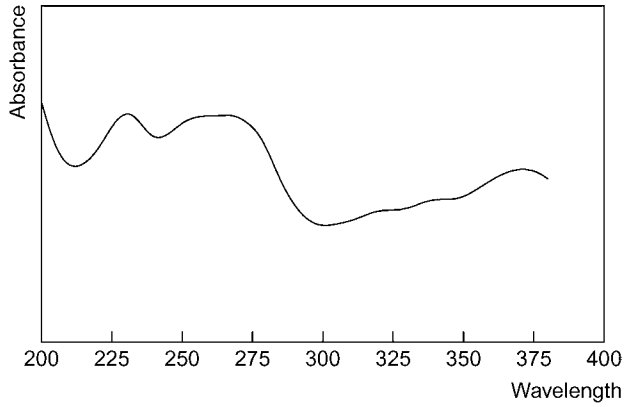
Chlortetracycline Calcium

CAS—5892-31-9
Chemical Properties A white powder. Practically insoluble in water.

Chlortetracycline Hydrochloride

$C_{22}H_{23}ClN_2O_8$, HCl = 515.3
CAS—64-72-2
Synonym Biomycin
Proprietary Names *Aureomycin(e)*; *Chlortet*. It is an ingredient of *Aureocort* and *Deteclo*.
Chemical Properties Yellow crystals. Mp about 210°, with decomposition. Soluble 1 in 75 to 1 in 110 of water and 1 in 250 to 1 in 560 of ethanol; practically insoluble in acetone, chloroform, and ether; soluble in solutions of alkali hydroxides and carbonates.

Colour Tests Benedict's reagent—red;formaldehyde–sulfuric acid—orange-brown; Mandelin's test—violet-brown→yellow; Marquis test—yellow→green; sulfuric acid—brown-blue.
Thin-layer Chromatography System TA—R_f 0.05, streaking (location under ultraviolet light, orange fluorescence; acidified potassium permanganate solution, positive).
High Performance Liquid Chromatography System HY—RI 280, RI 282.
Ultraviolet Spectrum Aqueous acid—266 (A^1_1=386a), 359 nm; aqueous alkali—253, 284, 346 nm.

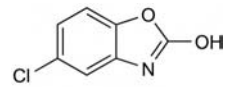


Infrared Spectrum Principal peaks at wavenumbers 1622, 1580, 1666, 1311, 1041, 1227 cm^{-1} (chlortetracycline hydrochloride, KBr disk). Polymorphism may occur.
Disposition in the Body Readily absorbed after oral administration but rapidly inactivated in the body. It is eliminated mainly by biliary excretion with only about 15% of a dose being excreted in the urine as unchanged drug.
Half-life Plasma half-life, about 6 h.
Protein Binding About 47%.
Dose 1 to 2 g of chlortetracycline hydrochloride daily.

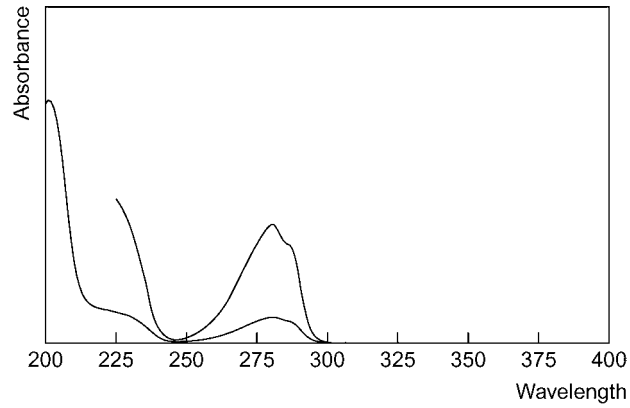
Chlorzoxazone

Muscle Relaxant
$C_7H_4ClNO_2$ = 169.6
CAS—95-25-0

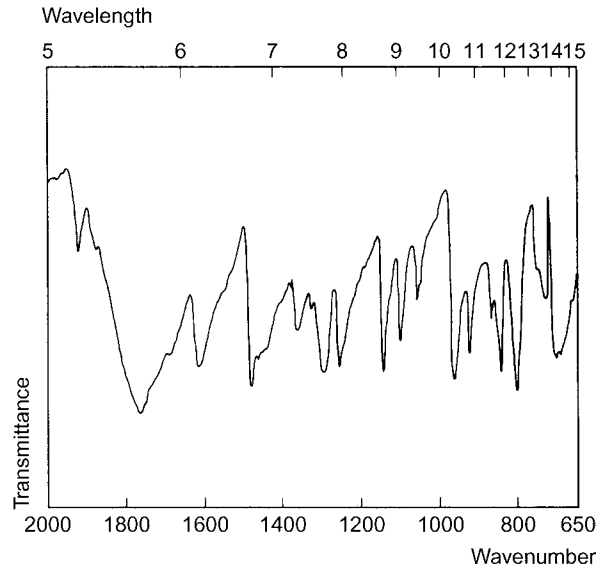
IUPAC Name 5-Chloro-3*H*-1,3-benzoxazol-2-one
Synonym Chlorobenzoxazolinone; 5-chloro-2(3*H*)-benzoxazolone.
Proprietary Names *Biomioran*; *Paraflex*. It is an ingredient of *Parafon*.



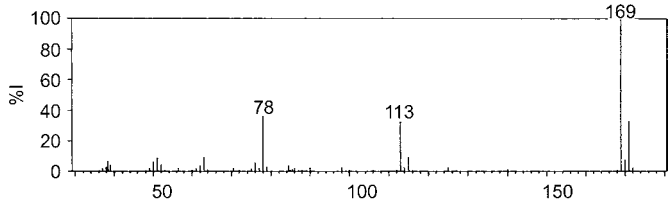
Chemical Properties Colourless crystals or white crystalline powder. Mp 190° to 194°. Sparingly soluble in water; soluble 1 in 20 of ethanol, 1 in 250 of chloroform, and 1 in 60 of ether; soluble in acetone, methanol, and isopropanol; freely soluble in aqueous solutions of alkali hydroxides and ammonia. pK_a 8.0 (20°). Log *P* (octanol/water), 1.6.
Colour Test Koppanyi–Zwikker test—violet.
Thin-layer Chromatography System TA—R_f 0.85; system TB—R_f 0.00; system TC—R_f 0.51; system TD—R_f 0.54; system TE—R_f 0.33; system TF—R_f 0.61; system TL—R_f 0.47; system TAD—R_f 0.56; system TAE—R_f 0.88; system TAF—R_f 0.90; system TAJ—R_f 0.51; system TAK—R_f 0.61; system TAL—R_f 0.92.
Gas Chromatography System GA—chlorzoxazone RI 1728, chlorzoxazone-Me RI 1750.
High Performance Liquid Chromatography System HX—RI 397.
Ultraviolet Spectrum Aqueous acid—280 nm (A^1_1=306a); aqueous alkali—243 (A^1_1=580a), 287 nm (A^1_1=409a).



Infrared Spectrum Principal peaks at wavenumbers 1762, 801, 962, 1149, 840, 1300 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 169, 78, 171, 113, 115, 63, 51, 170.



Quantification

Plasma **GC-MS** Limit of quantification, 5 µg/L [Eap *et al.* 1998].

HPLC UV detection (λ=283 nm). Limit of quantification, 100 µg/L [Frye, Stiff 1996]. Chlorzoxazone and 6-hydroxychlorzoxazone. UV detection. Limit of detection, 80 ng [Honigberg *et al.* 1979].

Spectrofluorimetry Limit of detection, 60 µg/L [Stewart, Chan 1979].

Serum **HPLC** UV detection (λ=287 nm). Limit of quantification, 0.01 mg/L [Tanaka 1998]. UV detection (λ=230 nm). Limit of quantification, 0.5 mg/L, limit of detection, 0.1 mg/L [Haque, Stewart 1997].

Urine **HPLC** See Plasma [Frye, Stiff 1996].

Spectrofluorimetry Limit of detection, 130 µg/L, see Plasma [Stewart, Chan 1979].

Disposition in the Body Absorbed after oral administration and rapidly metabolised to 6-hydroxychlorzoxazone. Up to 90% of a dose is excreted in the urine in 48 h as conjugates of the 6-hydroxy metabolite; <1% is excreted as unchanged drug; 5-chloroacetanilide and 6-hydroxybenzoxazol-2(3*H*)-one have also been detected in urine.

Therapeutic Concentration

Following a single oral dose of 750 mg of chlorzoxazone and 900 mg of paracetamol, a mean peak plasma concentration of 36.3 mg/L of chlorzoxazone was attained in 0.7 h [Desiraju *et al.* 1983].

Half-life Plasma half-life, about 1 h.

Dose 0.75 to 3 g daily.

Desiraju RK *et al.* (1983). Pharmacokinetics of chlorzoxazone in humans. *J Pharm Sci* 72(9): 991–994.

Eap CB *et al.* (1998). Determination of chlorzoxazone and 6-hydroxychlorzoxazone in plasma by gas chromatography–mass spectrometry. *J Chromatogr B Biomed Sci Appl* 705(1): 139–144.

Cholesterol

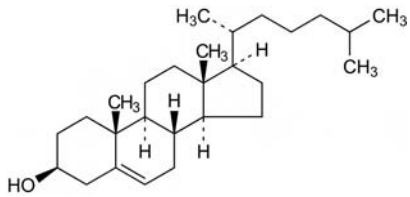
Sterol

$C_{27}H_{46}O$ = 386.7

CAS-57-88-5

IUPAC Name (3*S*,8*S*,9*S*,10*R*,13*R*,14*S*,17*R*)-10,13-Dimethyl-17-[(2*R*)-6-methylheptan-2-yl]-2,3,4,7,8,9,11,12,14,15,16,17-dodecahydro-1*H*-cyclopenta[*a*]phenanthren-3-ol

Synonyms (3β)-Cholest-5-en-3-ol; cholesterin.



Chemical Properties White or faintly yellow, pearly leaflets, needles, powder, or granules. It acquires a yellow to pale tan colour on prolonged exposure to light. Mp 147° to 150°. Practically insoluble in water; slowly soluble 1 in 100 of ethanol and 1 in 50 of dehydrated alcohol; soluble 1 in 2.8 of ether and 1 in 4.5 of chloroform; soluble in acetone, benzene and dioxan. Log *P* (octanol/water), 8.7.

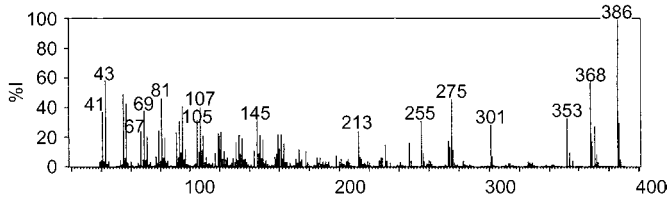
Colour Tests Antimony pentachloride—orange→brown; naphthol–sulfuric acid—yellow-brown/violet; sulfuric acid—orange; to a solution of 10 mg in 1 mL of chloroform add 1 mL of sulfuric acid; chloroform layer—red; sulfuric acid—green fluorescence; dissolve about 5 mg in 2 mL of chloroform, add 1 mL of acetic anhydride and 1 drop of sulfuric acid—pink→red→blue→green.

Thin-layer Chromatography System TB—R_f 0.22; system TC—R_f 0.64; system TD—R_f 0.61; system TE—R_f 0.76; system TF—R_f 0.60; system TL—R_f 0.69; system TAD—R_f 0.64; system TAE—R_f 0.84; system TAF—R_f 0.96; system TAJ—R_f 0.65; system TAK—R_f 0.78; system TAL—R_f 0.96; system TAM—R_f 0.96.

Gas Chromatography System GA—cholesterol RI 3088, cholesterol-H_2O RI 3030; system GE—RRT 1.35(relative to phenytoin).

Infrared Spectrum Principal peaks at wavenumbers 1059, 1022, 800, 959, 952, 839 cm^{-1} (Nujol mull).

Mass Spectrum Principal ions at *m/z* 386, 368, 43, 55, 275, 81, 57, 95.



Quantification

Semen **HPLC** Light-scattering detection [Grizard *et al.* 2000].

Grizard G *et al.* (2000). Separation and quantification of cholesterol and major phospholipid classes in human semen by high-performance liquid chromatography and light-scattering detection. *J Chromatogr Biomed B Sci Appl* 740(1): 101–107.

Choline

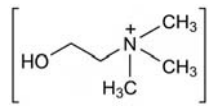
B Vitamin

$[C_5H_{14}NO]^+$ = 104.2

CAS—62-49-7 (cation)

IUPAC Name 2-Hydroxy-*N*,*N*,*N*-trimethylethanaminium

Proprietary Names Choline and its salts are ingredients of many preparations, see Sweetman [2009].



Chemical Properties A colourless, viscid, hygroscopic, strongly alkaline liquid. Very soluble in water and ethanol; practically insoluble in ether. pK_a 8.9.

Choline Bitartrate

$C_9H_{19}NO_7$ = 253.3

CAS—87-67-2

Synonym Choline acid tartrate

Chemical Properties A white, hygroscopic, crystalline powder. Very soluble in water; slightly soluble in ethanol; practically insoluble in chloroform and ether.

Choline Chloride

$C_5H_{14}ClNO$ = 139.6

CAS—67-48-1

Proprietary Name *Becholine*

Chemical Properties White, very hygroscopic crystals. Very soluble in water and ethanol; practically insoluble in chloroform and ether.

Choline Dihydrogen Citrate

$C_{11}H_{21}NO_8$ = 295.3

CAS—77-91-8

Synonym Choline citrate

Proprietary Name *Neurotropan*

Chemical Properties Colourless, translucent, hygroscopic crystals or white crystalline powder. Mp 105.0° to 107.5°. Soluble 1 in 1 of water and 1 in 45 of ethanol; practically insoluble in benzene, chloroform, and ether.

Choline Hydroxide

$C_5H_{15}NO_2$ = 121.2

Synonyms Bursine; fagine; gossypine; sincaline; vidine.

Chemical Properties Strongly alkaline liquid. Very soluble in water, alcohol. Insoluble in ether.

Thin-layer Chromatography System TA—R_f 0.02; system TN—R_f 0.60; system TO—R_f 0.60 (acidified iodoplatinate solution, positive; acidified potassium permanganate solution, positive).

Ultraviolet Spectrum No significant absorption, 230–360 nm.

Infrared Spectrum Principal peaks at wavenumbers 1636, 1620, 953, 1075, 1040, 860 cm^{-1} (choline chloride, thin film).

Quantification

Plasma **HPLC** Electrochemical detection [Fossati *et al.* 1994; Webb *et al.* 1993]. Choline and metabolites [Pomfret *et al.* 1989].

Urine **Colorimetry** [Eksborg, Persson 1971].

Peritoneal Dialysis Effluent **HPLC** See Plasma [Webb *et al.* 1993].

Tissues **HPLC** Choline and metabolites [Koc *et al.* 2002].

Disposition in the Body Choline is a metabolite of suxamethonium chloride and suxethonium bromide.
Dose Choline has been given in doses of 2 to 4 g daily.

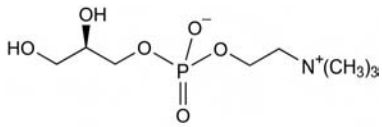
Choline Alfoscerate

Nootropic
$C_8H_{20}NO_6P = 257.2$
CAS—28319-77-9
IUPAC Name (*R*)-2-[[(2,3-Dihydroxypropoxy)hydroxyphosphinyl]oxy]-*N*,*N*,*N*-trimethylethanaminium hydroxide inner salt
Synonym L-α-Glycerylphosphorylcholine
Proprietary Names *Brezal*; *Delecit*; *Gliatilin*.



Chemical Properties White crystals. Mp 142.5°. Log *P* (octanol/water), −5.15.
High Performance Liquid Chromatography Column: RP cyano (Spheri-10, 10 µm, 30 × 4.6 mm), (bioreactor) anion-exchange cartridge (Aquapore AX-300, 7 µm, 30 × 2.1 mm i.d.). Mobile phase: 15 mmol/L sodium hydrogen phosphate and 0.5 mmol/L tetramethylammonium chloride solution, (pH 7). Electrochemical detection: platinum electrode against Ag/AgCl electrode at +0.5 V. Retention time: choline, 3.1 min [Abbiati *et al.* 566].
Quantification
Blood **GC-MS** Limit of quantification, 0.3 pg/L [Hasegawa *et al.*].
Plasma **HPLC** Column: RP cyano (Spheri-5, 5 µm, 100 × 4.6 mm i.d.), (bioreactor) anion-exchange cartridge (Aquapore AX-300, 7 µm, 30 × 2.1 mm i.d.). Mobile phase: 20 mmol/L sodium hydrogen phosphate and 10 mmol/L tetramethylammonium chloride solution, (pH 7.1). Flow rate, 0.7 mL/min. Electrochemical detection: platinum electrode at +300 mV. Retention time: choline, 5 min. Limit of quantification, 3.58 µg/L [Fossati *et al.* 1994].
Disposition in the Body Choline alfoscerate is completely absorbed after oral administration and is widely metabolised after IM or oral administration. It is rapidly cleaved by glycerylphosphorylcholine diesterase to glycerophosphate and choline, the main plasma metabolite, which is detectable until 6 to 8 h after administration.
Therapeutic Concentration
Twelve healthy males aged between 20 and 29 years were administered, IM, with a 1 g dose of L-α-glycerylphosphorylcholine. Choline levels in plasma reached 35.5 ± 3.5 µmol/L at 0.25 h and 35.8 ± 3.5 µmol/L at 0.5 h and mean endogenous plasma levels ranged from 10.6 to 12.0 µg/L [Gatti *et al.* 1992].
Half-life Terminal half-life of free choline derived from L-α-glycerylphosphorylcholine is 1.37 h.
Clearance 42.7 ± 2.7 µmol/l/h.

Abbiati G *et al.* (1991). High-performance liquid chromatographic assay of L-alpha-glycerophosphorylcholine using a two-step enzymic conversion. *J Chromatogr*,445–451.

Hasegawa Y *et al.* (1982). Determination of picomole amounts of choline and acetylcholine in blood by gas chromatography-mass spectrometry equipped with a newly improved pyrolyzer. *J Chromatogr* 30(239): 335–342.

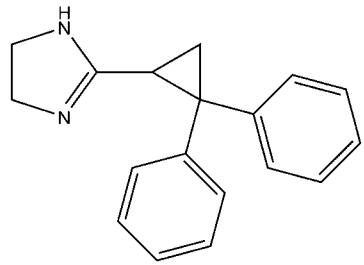
Chorionic Gonadotropin

Gonad Stimulating Hormone
Sialoglycoprotein = approx. 37000
CAS—9002-61-3
Synonyms CG; choriogonadotropin; gonadotrophinum chorionicum.
Proprietary Names *APL*; *Choragon*; *Chorex*; *Choron*; *Gonadotraphon LH*; *Gonasi HP*; *Gonic*; *Physex*; *Predalon*; *Pregnesin*; *Pregnyl*; *Primogonyl*; *Profasi*.
Chemical Properties Molecular structure. α-Subunit consists of 96 amino acids and 2 carbohydrate moieties, and the β-subunit consists of 149 amino acid residues at the C-terminal region. It is a white or almost white amorphous powder, which needs to be protected from light. It is soluble in water, aqueous glycerol and glycols; insoluble in anhydrous organic solvents.
Quantification
Serum **Fluoroimmunoassay** Limit of detection, 2.7 International Units (IU)/L [Cowan *et al.* 1991].
Urine **Fluoroimmunoassay** Limit of detection, 4.9 IU/L [Cowan *et al.* 1991].
Disposition in the Body Distributed primarily to the gonads. 20 to 30% of IM dose is excreted in urine within 5 to 6 days. The β-subunit of chorionic gonadotrophin is metabolised in the liver to a smaller component of molecular weight 12 000 to 17 500. Normally present in males and non-pregnant females <10 IU/L.
Therapeutic Concentration
Eighteen pituitary-suppressed healthy females, aged between 18 and 26 years, were administered with single-dose human chorionic gonadotrophin injections of 5000 and 10 000 IU (IM) and 10 000 IU (SC). Mean serum peak concentrations reached 156 IU/L, 307 IU/L and 339 IU/L, respectively, 20 h after injection [Mannaerts *et al.* 1998].
Toxicity Dose of 36 mg/kg (female) can cause reproductive side effects and changes in female fertility.
Half-life Blood concentrations decline in a biphasic manner. Half-lives between 6 and 11, and 23 and 38 h, respectively.
Clearance Metabolic clearance is 3.4 mL/min for men and 3.9 mL/min for women.
Dose Infertility treatment (female): single dose between 5000 and 10 000 IU, IM injection, followed by up to 3 repeat injections of 5000 IU each, within 9 days. Infertility treatment (male): single dose between 500 and 4000 units twice/three times a week. Prepubertal cryptorchidism treatment: single dose between 500 and 4000 IU three times a week, for 6 to 10 weeks. Delayed puberty treatment (male): initial dose of 500 to 1500 IU administered twice weekly, 4 to 6 weeks.

Cowan DA *et al.* (1991). Effect of administration of human chorionic gonadotrophin on criteria used to assess testosterone administration in athletes. *J Endocrinol* 131: 147–154.
Mannaerts BM *et al.* (1998). A randomized three-way cross-over study in healthy pituitary-suppressed women to compare the bioavailability of human chorionic gonadotrophin (Pregnyl) after intramuscular and subcutaneous administration. *Hum Reprod* 13(6): 1461–1464.

Cibenzoline

Antiarrhythmic, Sodium Channel Blocker
$C_{18}H_{18}N_2 = 262.4$
CAS—53267-01-9
IUPAC Name 2-[2,2-Di(phenyl)cyclopropyl]-4,5-dihydro-1*H*-imidazole
Synonyms Cifenline; 2-(2,2-diphenylcyclopropyl)-4,5-dihydro-1*H*-imidazole; (±)-2-(2,2-diphenylcyclopropyl)-2-imidazoline; 1-(2-Δ^2-imidazolinyl)-2,2-diphenylcyclopropane; Ro-22-7796; UP-33-901.



Chemical Properties Crystals. Mp 103° to 104°. Log *P* (octanol/water), 4.22 [Meylan, Howard 1995]. Stock solutions stable for at least 2 months at 4° [Kuhlkamp *et al.* 1990].

Cibenzoline Succinate

$C_{18}H_{18}N_2$, $C_4H_6O_4 = 380.4$
CAS—100678-32-8
Proprietary Names *Cibenol*; *Cipralam*; *Exacor*.

Quantification
Plasma **GC-MS** Column: Glass packed with 3% SP-2250 on 80 to 100 mesh Supelcoport (120 cm × 2 mm i.d.). Carrier gas: CH_4, 1.2 kg/m^2. SIM acquisition mode. Limit of detection, 1.0 µg/L [Min, Garland 1984].

HPLC Column: Zorbax SCX (250 × 4.6 mm i.d., 7–8 µm). Mobile phase: acetonitrile : 0.015 mol/L phosphate buffer (pH 6.0; 80 : 20), flow rate 1.5 mL/min. UV detection (λ = 214 nm). Limit of detection, 10.0 µg/L [Hackman *et al.* 1983].

Serum **HPLC** Column: Nucleosil CN reversed phase (125 × 4.6 mm i.d., 5 µm). Mobile phase: 971.5 mL water/25 mL PIC B-8 low UV reagent/1 mL butylamine/2.5 mL PIC D-4 reagent : acetonitrile (65 : 35), flow rate 1.1 mL/min. UV detection (λ = 214 nm). Limit of quantification, 10 ng/mL [Kuhlkamp *et al.* 1990].

Urine **HPLC** See Plasma. Limit of detection, 50.0 µg/L [Hackman *et al.* 1983]

Disposition in the Body Four main metabolites, M1 (*p*-hydroxycibenzoline), M2 (4,5-dehydrocibenzoline), and unknown metabolites M3 and M4 are formed by the action of CYP3A and CYP2D [Niwa *et al.* 2000].

Therapeutic Concentration

A study in 18 healthy volunteers investigated the effect of food on the bioavailability of 160 mg cibenzoline. Mean maximum plasma concentrations were 468 ± 121, 394 ± 123, 397 ± 110, 484 ± 159 ng/mL at 1.5 ± 0.4, 2.2 ± 1.0, 2.4 ± 1.1, 1.5 ± 0.7 h when the dose was administered in the fasting state, after a standard breakfast, midway through a standard breakfast, and before a standard breakfast, respectively. The rate of absorption was decreased slightly in the presence of food but this was not expected to be of clinical significance [Massarella *et al.* 1986a].

Twenty-five healthy male volunteers received a single dose of 160 mg cibenzoline followed 2 or 3 days later by 160 mg cibenzoline once every 12 h for 7 days. Mean maximum plasma concentrations were 454 ± 103 and 716 ± 187 ng/mL, respectively, at 1.6 ± 0.5 and 1.5 ± 0.5 h after the initial and final doses, respectively. The half-life following administration of the last dose was longer than that observed after the first dose, 9.7 and 8.4 h, respectively, because of a decrease in non-renal clearance [Massarella *et al.* 1986b].

Six patients with congestive heart failure and 5 healthy subjects were administered a 1 h infusion of 80 mg $^{15}N_2$-cibenzoline with a simultaneous 80 mg oral dose. Mean peak plasma concentrations were 313 ± 67 at 1.5 h and 327 ± 49 ng/mL at 1.4 h in healthy subjects and patients with heart failure, respectively [Massarella *et al.* 1987].

Thirty-four patients undergoing cardiac catheterisation received a single IV dose of 0.25, 0.5, 0.75, 1.0, or 1.2 mg/kg cibenzoline. The elimination half-life ranged from 45 min to 12 h, with a mean of 5 h 9 min ± 41 min. Cibenzoline had a dose-related negative inotropic effect and a similar haemodynamic effect to disopyramide [Humen *et al.* 1987].

Twelve healthy volunteers aged between 41 and 55 years (mean 47 years) were administered 160 mg cibenzoline concomitantly with 0.25 or 0.375 mg digoxin. The addition of cibenzoline did not significantly alter the pharmacokinetic profile of the digoxin regimen (levels not reported) [Khoo *et al.* 1988].

Sixteen male and female volunteers (27 to 67 years) were administered a single 130 mg oral dose of cibenzoline. Ten of the patients had renal impairment with a creatinine clearance <60 mL/min/70 kg and six were healthy with a creatinine clearnace of >60 mL/min/70 kg. The mean maximum plasma concentration was in the same range in all subjects (levels not reported). The elimination half-life increased with decreased renal function [Massarella *et al.* 1988].

Note For a study of cibenzoline in patients with frequent premature ventricular contractions see Holazo *et al.* [1986].

Toxicity

Three patients (aged 36, 68, and 80 years) were treated with 300 mg of cibenzoline and developed signs of toxicity (prolonged QTc, wide QRS, arrhythmias, hypotension, and hypoglycaemia). Plasma concentrations were 1944 to 2580 µg/L, 5 to 10 times the expected therapeutic concentration. All patients had severe renal dysfunction and after withdrawal of the drug, the elimination half-lives were 3 to 10 times longer than in patients with end-stage renal failure [Takahashi *et al.* 2002].

A 69-year-old man presented with severe general fatigue and progressive systemic muscle weakness. He had taken 300 mg cibenzoline a day for several years and at the end of June 2001 he began to feel generally fatigued with walking disturbance. By the beginning of July, he was unable to stand by himself and he felt short of breath. Once admitted to hospital he developed severe respiratory depression with increased serum BUN and creatinine. He was put on a respirator and the cibenzoline was replaced with mexiletine. His renal function improved and his spontaneous respiration and muscle movement were restored. He was released a month after admission [Inada *et al.* 2002].

An 80-year-old woman with permanent right ventricular pacing was admitted to hospital with general fatigue and clouding of consciousness. She had been taking cibenzoline succinate for 1 month. ECG revealed a prolonged QRS and QTc interval and pacing failure. Together with haemodynamic failure and liver and renal dysfunction, her symptoms were consistent with cibenzoline succinate poisoning. On day 4, charcoal haemoperfusion was performed because of the development of hypoglycaemia. After the haemoperfusion her symptoms resolved and she was discharged. Digoxin was prescribed [Aoyama *et al.* 1999].

Bioavailability Approximately 90% [Khoo *et al.* 1988].

Half-life Approximately 6 to 15 h [Khoo *et al.* 1988].

Volume of Distribution In healthy volunteers: 7.3 ± 3.4 and 6.5 ± 3.0 L/kg for an oral and IV dose, respectively. In patients with congestive heart failure, 5.4 ± 1.0 and 4.7 ± 1.1 L/kg for an oral and IV dose, respectively [Massarella *et al.* 1987].

Clearance

Disease state	*Treatment*	*Creatinine clearance (mL/min)*		
		Total	*Renal*	*Non-renal*
Chronic heart failure	80 mg oral	488 ± 207	289 ± 147	199 ± 120
	80 mg IV	414 ± 170	273 ± 140	141 ± 61
Healthy	80 mg oral	636 ± 240	385 ± 115	251 ± 167
	80 mg IV	536 ± 193	347 ± 113	189 ± 116
	160 mg oral	854 ± 179	420 ± 119	434 ± 165
	160 mg every 12 h for 7 days	653 ± 174	455 ± 121	198 ± 128

Cicletanine

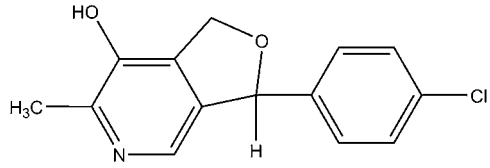
Antihypertensive, Diuretic, Furopyridine

$C_{14}H_{12}ClNO_2$ = 261.7

CAS—89943-82-8

IUPAC Name 3-(4-Chlorophenyl)-6-methyl-1,3-dihydro-furo[3,4-d]pyridin-7-ol

Synonyms Cicletanide; 3-(4-chlorophenyl)-1,3-dihydro-6-methylfuro[3,4-c]pyridine-7-ol; 3-(4-chlorophenyl)-6-methyl-1,3-dihydro-furo[3,4-c]pyridin-7-ol cicletanide; 1,3-dihydro-3-(4-chlorophenyl)-7-hydroxy-6-methylfuro[3,4-c]pyridine.



Cicletanine Hydrochloride

$C_{14}H_{12}ClNO_2$, HCl = 298.2

CAS—82747-56-6

Synonym BN-1270

Proprietary Names *Coverine*; *Justar*; *Secletan*; *Tenstaten*.

Chemical Properties White crystals. Mp 219° to 228°. Insoluble in water. There was no apparent effect of freezing at –20° over a 3 month period [Antoniewicz *et al.* 1992].

Quantification

Blood **HPLC** Column: Nucleosil C_{18} (250 × 4.6 mm i.d., 10 µm) Mobile phase: methanol : 0.1 mol/L acetic acid (50 : 50), flow rate 1.0 mL/min. UV detection (λ = 280 nm). Limit of detection, 20 µg/L [Cuisinaud *et al.* 1985].

Plasma **HPLC** Column: Nova-Pak reversed phase C_{18} (100 × 8 mm i.d., 4 µm). Mobile phase: 0.1 mol/L monobasic potassium phosphate (pH 2.5) : acetonitrile (75 : 25); flow rate 2.0 mL/min. Fluorescence detection ($\lambda_{ex} = 290$ nm, $\lambda_{em} > 370$ nm). Limit of quantification, 50 µg/L [Antoniewicz *et al.* 1992]. Column: Nova-Pak C_{18} (100 × 8.0 mm i.d., 4 µm). Mobile phase: acetonitrile : water (22 : 78) containing 0.02% isopropylamine (pH 2.4) with 0.085% phosphoric acid, flow rate 2.5 mL/min. UV detection ($\lambda = 220$ nm). Limit of detection, 10 µg/L [Prunonosa *et al.* 1992a]. See Blood [Cuisinaud *et al.* 1985].

CE Capillary: fused silica (57 cm total length, 75 µm i.d.). Buffer: 100 mmol/L sodium borate buffer (pH 8.6) : 25 mmol/L SDS containing 10% acetonitrile. UV detection ($\lambda = 214$ nm). Limit of detection, 20 µg/L [Prunonosa *et al.* 1992b]. Capillary: fused silica (57 cm total length, 75 µm i.d.). Buffer: 100 mmol/L sodium borate buffer (pH 8.6) : 100 mmol/L SDS : 25 mmol/L γ-cyclodextrins containing 10% acetonitrile. UV detection ($\lambda = 214$ nm). Limit of detection, 10 µg/L [Prunonosa *et al.* 1992a].

Urine **HPLC** See Blood. Limit of detection, 30 µg/L [Cuisinaud *et al.* 1985].

Oral Fluid **HPLC** See Blood [Cuisinaud *et al.* 1985].

Disposition in the Body Cicletanine undergoes glucuronidation and sulfation. Elimination is both renal and hepatic while urinary excretion of the unchanged drug is negligible.

Therapeutic Concentration

Ten healthy volunteers were administered a single 50 mg cicletanine dose of cicletanine. The mean peak plasma concentration was 1.78 ± 0.586 mg/L at 0.83 ± 0.8 h. The mean elimination half-life was 9.89 ± 4.32 h [Prunonosa *et al.* 1992c].

Eight healthy volunteers were administered 50 mg orally a day for 7 days. There was no significant difference between the parameters after the first dose and after repeated doses. The mean peak plasma concentration was 1.73 ng/L after the final dose [Peraire *et al.* 1991].

Forty-three patients with varying degrees of chronic renal failure were administered a single oral dose of 300 or 200 mg cicletanine. Six patients with moderate renal dysfunction were administered 200 mg a day orally for 30 days. In patients with severe renal dysfunction, the pharmacokinetics of cicletanine were significantly altered, with increased elimination half-life and tissue accumulation. Only minor pharmacokinetic changes were seen in patients with mild or moderate renal impairment, even after repeated administration of the drug. Mean maximum plasma concentrations were 20 ± 2, 14 ± 2 and 13 ± 2 µg/mL at 1.3 ± 0.1, 1.3 ± 0.2 and 0.9 ± 0.2 h, respectively, in control subjects, patients with mild renal failure, and patients with severe renal failure, respectively [Jungers 1988].

Note For a summary of the pharmacokinetics of cicletanine under various conditions, see Fredj [1988]. For a study of the interaction of cicletanine with tolbutamide in healthy volunteers, see Bayes *et al.* [1996].

Half-life Approximately 5 to 18 h.

Volume of Distribution In 8 subjects (weighing 75.3 ± 6.4 kg): 35.5 to 152.4 L [Peraire *et al.* 1991].

Clearance Oral and renal clearance 7.3 ± 2.5 and 0.026 ± 0.012 L/h, respectively.

Protein Binding 97.3% bound to serum proteins, 93.5% of which is to albumin [Zini *et al.* 1988].

Dose 50 to 100 mg orally daily.

Ciclosporin

Immunosuppressant

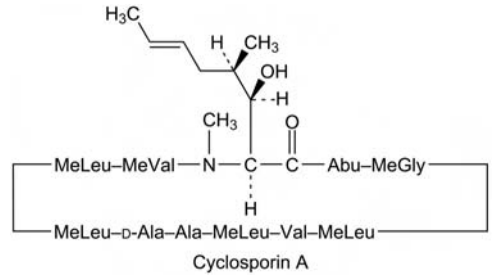
$C_{62}H_{111}N_{11}O_{12} = 1202.6$

CAS—59865-13-3

IUPAC Name 30-Ethyl-33-[(*Z*,1*S*,2*R*)-1-hydroxy-2-methylhex-4-enyl]-1,4,7,10,12,15,19,25,28-nonamethyl-6,9,18,24-tetrakis(2-methylpropyl)-3,21-di(propan-2-yl)-1,4,7,10,13,16,19,22,25,28,31-undecazacyclotritriacontane-2,5,8,11,14,17,20,23,26,29,32-undecone

Synonyms [*R*-[*RR**(E)]]-Cyclic(L-alanyl-D-alanyl-*N*-methyl-L-leucyl-*N*-methyl-L-leucyl-*N*-methyl-L-valyl-3-hydroxy-*N*,4-dimethyl-L-2-amino-6-octenoyl-L-α-aminobutyryl-*N*-methylglycyl-*N*-methyl-L-leucyl-L-valyl-*N*-methyl-L-leucyl); cyclosporin; cyclosporin A; cyclosporine.

Proprietary Names *Neoral*; *Sandimmun*; *Sandimmune*, *SangCya*.



Cyclosporin A

Chemical Properties A white or almost white powder. Soluble in methanol, ethanol, ether, chloroform and methylene chloride. It is practically insoluble in water and saturated hydrocarbons.

Quantification

Blood **HPLC** Column: C_8 (Alltima, 100 × 2.1 mm i.d., 5 µm) at 70°. Mobile phase: 72% methanol : 28% 50 mmol/L ammonium acetate buffer (pH 5.1), flow rate 0.3 mL/min. Electron spray tandem mass spectrometry detection. Retention time: 11.8 min. Limit of detection, 5 µg/L [Taylor *et al.* 1998]. Column: Spherisorb S5 CN (250-4 phasesep, 250 × 4.6 mm, 5 µm) at 50°. Mobile phase: hexane : isopropanol (90:10), flow rate 1.45 mL/min. UV detection (λ=212 nm). Retention times: ciclosporin, 8.9 min; metabolites, 11.0, 12.9 and 16.3 min. Limit of detection, 0.01 mg/L [Khoschsorur *et al.* 1997]. Column: Si 60 silica (250 × 4 mm, 5 µm) at 60°. Mobile phase: hexane : ethanol (85:15), flow rate 1.5 mL/min. UV detection (λ=210 nm). Retention time: 3.4 min . Limit of quantification, 25 µg/L [Poirier *et al.* 1994]. Column: RP-18 (RP Velosep, (400 × 3.2 mm, 3 µm). Mobile phase: 50% acetonitrile : 11% methanol : 39% 0.01 mol/L dipotassium hydrogen orthophosphate buffer (pH 6.5), flow rate 1.5 mL/min. UV detection (dual wavelength, 220 and 230 nm). Retention time: 2.5 min. Limit of detection, 45 µg/L [Salm *et al.* 1993].

Disposition in the Body After oral administration of conventional formulations absorption is very variable; absolute bioavailability can vary from <10% in liver transplant patients to up to 89% in some renal transplant patients. Peak blood and plasma concentrations are achieved about 3.5 h after an oral dose. Following administration of a microemulsion formulation, peak concentrations are achieved after about 1.5 to 2 h and bioavailability is greater than with conventional formulations although is still very variable. Ciclosporin is widely distributed throughout the body. In blood, the distribution is concentration dependent. It is extensively metabolised by CYP4503A mainly in the liver (some also in the gastro-intestinal tract and kidney) and excreted primarily in faeces via the bile; only about 6% is excreted in the urine. The low oral bioavailability of ciclosporin is due to first-pass metabolism in the gastro-intestinal wall rather than the liver. It crosses the placenta and is distributed into breast milk. Dialysis does not affect clearance significantly.

Therapeutic Concentration

Nine paediatric patients undergoing liver transplants, aged between 0.5 and 11 years, were administered with a 10.1 mg/kg IV dose over 24 h. The peak concentration was 0.834 mg/L after 4.4 h. The same children administered with an oral dose of 30 mg/kg reached peak plasma concentrations of 1.356 mg/L 2.6 h after ingestion [Dunn *et al.* 1995].

Fifty-four paediatric patients, with a mean age of 13.2 years, were administered with an oral 7.8 mg/kg dose under steady state conditions. Peak concentrations of 0.588 mg/L were reached 2.4 h after ingestion [Humbert *et al.* 1994].

Toxicity Nephrotoxicity is the major toxic effect; doses must be adjusted individually and kidney function must be monitored during therapy.

A 31-year-old woman accidentally received 5000 mg (92.6 mg/kg) of ciclosporin orally as a single dose on day 80 post-kidney transplant. She developed a severe headache, intractable vomiting and felt drunk. By 72 h post-ingestion all symptoms had subsided. At 18 h post dose serum-ciclosporin concentration was 2.6 mg/L. At 30 h post-dose, whole blood-ciclosporin concentration was 1.775 mg/L. There was little evidence of nephrotoxicity and no evidence of hepatotoxicity. There were no long-term sequelae [Schroeder *et al.* 1986].

A 43-year-old man with multiple sclerosis took 25 g of ciclosporin over an 8-day period when he misunderstood instructions. Symptoms included burning sensations in mouth and feet, altered taste, hyperaesthesia of the hands, sore gums, facial flushing, sensation of abdominal swelling, foot swelling, and mild stomach upset. Whole blood-ciclosporin concentration measured the day after discontinuation of ciclosporin was 1.778 mg/L. There was no evidence of hepatotoxicity or nephrotoxicity [Baumhefner *et al.* 1987].

A 31-year-old man was given an overdose of 1.1 mg/kg/h for 33 h on day–19 post-kidney transplant. He developed severe abdominal pain that was considered to be due to the toxic levels of ciclosporin. There was also hepatotoxicity. Blood-ciclosporin concentration measured 10 h after stopping ciclosporin was 2 mg/L. It was estimated that concentrations were higher than 4 mg/L for the duration of the infusion. There was little evidence of nephrotoxicity [Kokado *et al.* 1989].

Half-life Terminal, ranged from 6.3 h (healthy adults); 20.4 h (patients with severe liver disease).
Volume of Distribution 2 to 5 L/kg; apparent, 13 L/kg.
Clearance Blood clearance, 0.71 L/h/kg (paediatrics); 0.34 L/h/kg (adults).
Distribution in Blood This is concentration and temperature dependent. Approximately 40% is taken up in erythrocytes and the remainder extensively binds plasma proteins. At high concentrations the binding to blood cells becomes saturated.
Protein Binding 90% (mostly to lipoprotein).
Note For reviews, see Cooney *et al.* [1997] and Holt, Johnston [1995].
Dose Organ transplantation: initially 10 to 15 mg/kg orally daily in two divided doses; the IV dose is one-third of the oral dose; maintenance dose, 2 to 6 mg/kg daily. Bone-marrow transplant: maintenance dose, 12.5 mg/kg orally daily (3 to 6 months). Psoriasis and atopic dermatitis: 2.5 to 5.0 mg/kg orally daily. Rheumatoid arthritis: 2.5 to 4.0 mg/kg orally daily. Nephrotic syndrome: 5 mg/kg orally daily (adults); 6 mg/kg (children).

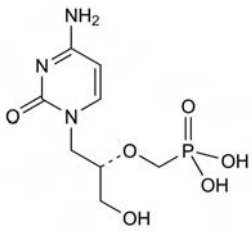
Cidofovir

Antiviral
$C_8H_{14}N_3O_6P = 279.2$
CAS—113852-37-2
IUPAC Name [(2*S*)-1-(4-Amino-2-oxopyrimidin-1-yl)-3-hydroxypropan-2-yl] oxymethylphosphonic acid
Synonyms (*S*)-[[2-(4-Amino-2-oxo-1(2*H*)-pyrimidinyl)-1-(hydroxymethyl) ethoxy]methyl]-phosphonic acid; (*S*)-HPMPC; GS-504.
Proprietary Name *Vistide*



Chemical Properties A fluffy white powder. Mp 260° with decomposition. It is soluble in water at 170 g/l.
High Performance Liquid Chromatography Column: C_8 (Zorbax, 250 × 4.6 mm i.d., 5 µm). Mobile phase: (A) acetonitrile : 100 mmol/L phosphate buffer (pH 7.2) with 5 mM tetrabutylammonium dihydrogen phosphate (TBAHP) (5:95); (B) acetonitrile : 100 mmol/L phosphate buffer (pH 7.2) with 5 mM TBAHP (15:85). Linear gradient—100% (A) to 100% (B) over 9 min, flow rate 1.4 mL/min. UV detection (λ=274 nm). Retention time: 6.0 min.
Quantification
Plasma **HPLC** Column: ODS-2 (Prodigy, 100 × 4.6 mm, 5 µm). Mobile phase: 6 mmol/L Q12 and 12 mmol/L phosphoric acid in acetonitrile : water (30:70), final pH 3.0 to 3.1, flow rate 3 mL/min. Fluorescence detection ($\lambda_{ex} = 305$ nm, $\lambda_{em} = 370$ nm). Retention time: 3.1 min. Limit of detection, 5 µg/L [Eisenberg, Cundy 1996].
Serum **HPLC** Column: ODS-IP (Beckman Ultrasphere, 150 × 4.6 mm). Mobile phase: acetonitrile : methanol : water containing 5 mmol/L octyltriethylammonium phosphate (5:5:90), flow rate 2.0 mL/min. UV detection (λ= 274 nm). Retention time: 6.6 min. Limit of quantification, 0.22 mg/L [Cundy *et al.* 1995].
Urine **HPLC** Limit of quantification, 1.0 mg/L, see Serum [Cundy *et al.* 1995].
Disposition in the Body Cidofovir is administered IV. It is excreted largely unchanged in urine by glomerular filtration and tubular secretion. About 80 to 100% of a dose is recovered unchanged in urine over 24 h. No active metabolites are detected in serum. It is given concurrently with prehydration and oral probenecid to block the tubular secretion and thus reduce high concentrations in the kidney, since cidofovir is nephrotoxic.
Therapeutic Concentration
Thirty-nine HIV-infected males and 3 females, aged between 28 and 55 years, mean 39 years, were intravenously administered with 1 (no of subjects, n=5), 3 (n=10), 5 (n=2) or 10 (n=8) mg/kg cidofovir. Peak serum concentrations of the drug were 3.12, 7.34, 11.5 and 23.56 mg/L, respectively, for the 4 doses observed at the end of infusion. In the same study, cidofovir was also administered to the patients along with a high dose of probenecid. A 3 mg/kg dose of cidofovir produced a peak concentration of 8.08 mg/L; 5 mg/kg, 26.07 mg/L and 7.5 mg/kg dose, 42.95 mg/L, respectively [Cundy *et al.* 1995].
Toxicity Dose-dependent nephrotoxicity is the major adverse effect. A 5 mg/kg dose twice weekly is not well tolerated with resulting renal toxicity. (5 mg/kg weekly or 7.5 mg/kg every 3 weeks is feasible).
Half-life Plasma half-life of cidofovir, 2.2 h; active metabolite, cidofovir diphosphate, 17 to 65 h.
Volume of Distribution Steady state, mean, 490 mL/kg; 356 mL/kg (with probenecid).
Clearance Serum, mean, 148 mL/h/kg; 125 mL/h/kg (with probenecid).
Protein Binding <10% (*in vitro*) bound to plasma or serum proteins.
Note For a review of cidofovir, see Poklis *et al.* [1995].
Dose 5 mg/kg IV once every 2 weeks (maintenance dose) together with probenecid and prehydration.

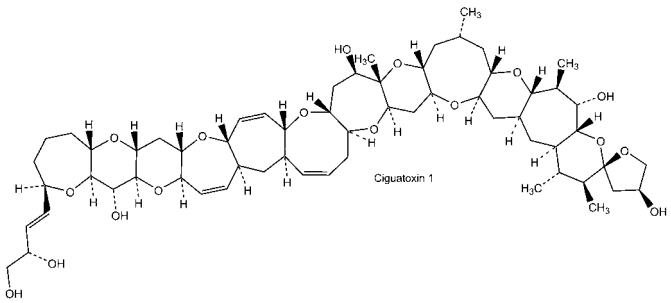
Ciguatoxins

Neurotoxin, Sodium Channel Activator
Synonym CTX



Chemical Properties Ciguatoxins are potent sodium channel activators found in a wide variety of fish; the toxins were ultimately traced to a dinoflagellate *Gambierdiscus* spp. Family of lipid-soluble polyether toxins responsible for ciguatera food poisoning; structural variations are associated with the oceanic region from which the dinoflagellate originates.

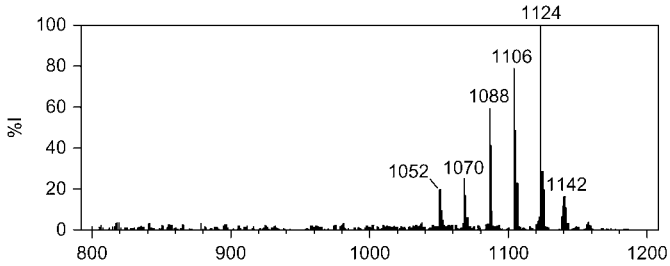
Ciguatoxin-1
$C_{60}H_{86}O_{19} = 1111.3$
CAS—11050-21-8
Synonym CTX-1
Chemical Properties White solid.

Ciguatoxin-2
$C_{60}H_{86}O_{18} = 1095.3$
CAS—142185-85-1
Synonym CTX-2
Chemical Properties White amorphous solid.

Ciguatoxin-3
$C_{60}H_{86}O_{18} = 1095.3$
CAS—139341-09-6
Synonym CTX-3
Chemical Properties White amorphous solid.

High Performance Liquid Chromatography Column: Ultrasphere ODS (250 × 2.1 mm i.d.). Mobile phase: 80 or 90% acetonitrile, flow rate 0.5 mL/min. Fluorescence detection ($\lambda_{ex} = 238$ nm, $\lambda_{em} = 244$ nm). Limit of detection, 0.5 to 1.0 ng [Dickey *et al.* 1992].

Mass Spectrum Principal ions at *m/z* 1124, 1106, 1088, 1070, 1052, 1142.



Quantification

Other **TLC** Australian and French Polynesian *Gambierdiscus toxicus.* Plates: silica gel 60. Solvent system: pentanol : pyridine : water (4 : 4 : 1) [Holmes *et al.* 1990]. Barracuda (*Sphyraena jello*) Flesh and Viscera. Plates: Silica gel 60 (0.25 mm). Solvent system: chloroform : methanol : 6 mol/L ammonium hydroxide (90 : 9.5 : 0.5). Mobile phase: 0.1% formic acid : 90% acetonitrile with 0.1% formic acid (100 : 0 to 40 : 60 over 60 min to 0 : 100 for 2 min), flow rate 0.2 mL/min. API, positive ion mode. Limit of detection, 10 ng [Pottier *et al.* 2003]. Indian Ocean Reef Fish. Column: Zorbax 300SB-C3 (150 × 2.1 mm i.d.) or 300SB-C_{18} (150 × 2.1 mm i.d.). Mobile phase: 0.1% formic acid : 90% acetonitrile with 0.1% formic acid (100 : 0 to 30 : 70 over 70 min), flow rate 0.2 mL/min. ESI. Limit of detection not reported [Hamilton *et al.* 2002a]. Extracts of Red Bass (*Lutjanus bohar*) and Red Emperor (*Lutjanus sebae*). Column: Zorbax 300SB-C_{18} (150 × 2.1 mm i.d.). Mobile phase: acetonitrile : water : propan-2-ol (80 : 19 : 1 buffered with 0.1% formic acid), flow rate 0.2 mL/min. ESI. Limit of detection not reported [Hamilton *et al.* 2002b]. Crude Extracts of Fish. Column: Zorbax reversed phase C_3 (150 × 2.1 mm i.d.). Mobile phase: 0.1% formic acid : 90% acetonitrile with 0.1% formic acid (100 : 0 to 40 : 60 over 60 min to 0 : 100 for 2 min), flow rate 0.2 mL/min. API, positive ion mode. Limit of detection, 10 ng [Pottier *et al.* 2002a, b]. Column: Vydac TP52 (250 × 2.1 mm i.d., 5 μm). Mobile phase: 0.05% trifluoroacetic acid : 90% acetonitrile-0.05% trifluoroacetic acid (50 : 50 for 2 min to 0 : 100 over 25 min for 10 min), flow rate 150 μL/min. API, positive ion mode. Limit of detection, 0.04 ppb [Lewis *et al.* 1999]. Moray Eel (*Lycodontis javanicus*). Column: PRP-1 reversed phase (150 × 0.41 mm i.d., 5 μm). Mobile phase: 0.1% trifluoroacetic acid or 1 mmol/L ammonium acetate (pH 5.8) : 95% acetonitrile with 0.1% trifluoroacetic acid or 1 mmol/L ammonium acetate (50 : 50 for 10 min to 0 : 100 over 20 min for 20 min), flow rate 0.5 mL/min. API, positive ion mode. Limit of detection, ≈0.3 ppb [Lewis, Jones 1997]. Greater Amberjack (*Seriola dumerili*). Column: ODS-L80 J-sphere (250 × 2.0 mm i.d.). Mobile phase: 36% acetonitrile and 0.1% formic acid to 90% acetonitrile and 0.1% formic acid over 20 min, flow rate 200 μL/min. APCI. Retention time: 18.25 min. Limit of detection not reported [Poli *et al.* 1997]. Horse-eye Jack (*Caranx latus*). Column: Vydac 201 HS C_{18} (250 × 0.21 mm i.d.). Mobile phase: acetonitrile : 0.1% trifluoroacetic acid (1 : 1), flow rate 10 μL/min. API, positive ion mode. Limit of detection not reported [Vernoux, Lewis 1997]. Coral Cod (*Cephalopolis miniatus*). Column: PRP-1 reversed phase (150 × 41 mm i.d., 5 μm). Mobile phase: 0.1% trifluroacetic acid : 95% acetonitrile with 0.1% trifluoroacetic acid (50 : 50 for 10 min to 0 : 100 over 20 min for 20 min), flow rate 0.5 mL/min. API, positive ion mode. Limit of detection not reported [Lucas *et al.* 1997]. Moray Eel Viscera and Crude Fish Extracts. Column: C_{18} (5 μm). Mobile phase: acetonitrile : water (1 : 1), flow rate 1 mL/min. ESI, positive ion mode. Limit of detection, 1 ng [Lewis *et al.* 1994].

Note Ciguatoxin is often measured by mouse bioassay. The mouse bioassay defines the mouse unit (MU) as the minimum amount of toxin needed to kill a 20 g mouse within 24 h: 1 MU is equivalent to 72 μg ciguatoxin.

Disposition in the Body Ciguatera toxin appears to open and activate voltage-dependent sodium channels. This affects a global array of bodily functions. It has been reported that the Schwann cells surrounding peripheral nerve axons become oedematous, possibly modifying or impeding neural transmission [Levine 1995].

Toxicity Ciguatera fish poisoning (CFP) is a considerable cause of morbidity in tropical regions, affecting an estimated 50 000 people worldwide each year. Symptoms typically manifest 3–18 h after the ingestion of toxic fish, with gastrointestinal malaise usually occurring 6 h after ingestion and neurological manifestations occurring after 6–12 h. The most distinctive features of ciguatera are severe pruritus, hot/cold reversal (the 'dry ice sensation'), and tingling and numbness of the extremities. The gastrointestinal complaints usually abate within 1 to 3 days but neurological perturbations can last for 3 days to several years [Hahn, Capra 1992]. Ciguatera symptoms are highly variable between individuals and between regions, largely owing to the type of fish consumed [Anderson, Lobel 1987]. In very rare cases, delirium, coma, cardiac and respiratory failure, and death may occur [Levine 1995]. The LD_{50} values in mice via IP injection are 0.25, 2.3 and 0.9 μg/kg for CTX-1, CTX-2 and CTX-3, respectively, reached at a minimum time of 37, 53 and 60 min, respectively [Lewis *et al.* 1991].

A 47-year-old previously healthy woman was admitted to hospital after ingesting ~10 barracuda eggs. She presented with nausea, vomiting, watery diarrhoea and myalgias. Approximately 2 h after ingestion, she suffered from numbness and tingling of the lips and all 4 limbs, as well as severe headache and dizziness. She was treated with IV fluids as well as 5 mg atropine and a dopamine infusion because of her bradycardia and hypertension. Her symptoms improved but she remained bradycardic so required a continuous IV infusion of atropine totalling 40 mg over 2 days. She made a full recovery 26 months later [Hung *et al.* 2005].

A 71-year-old man was admitted to hospital with dyspnoea, severe nausea, vomiting, watery diarrhoea and myalgias. He had consumed 8 barracuda eggs 1 h previously. He developed headache, dizziness, weakness, dysuria, perioral paraesthesia and paraesthesia of the extremities. Sinus bradycardia and hypotension followed. He was treated with IV fluids, 5 mg atropine, and a dopamine infusion. Bradycardia persisted and he required a total of 30 mg atropine as a continuous infusion over 2 days. His paraesthesia resolved 2 months later [Hung *et al.* 2005].

A 45-year-old previously healthy woman presented with dizziness, nausea, vomiting, watery diarrhoea, perioral paraesthesia and myalgias. She had consumed 3 barracuda eggs ≈1 h previously. After treatment with IV fluids she was discharged 4 h later [Hung *et al.* 2005].

A 26-year-old white man was admitted to hospital after ingesting coral cod. He presented with weakness and listlessness and complained of nausea, vomiting and myalgia, with perioral and extremity paraesthesia. The patient was managed with IV fluids, metoclopramide, hyoscine, and paracetamol with codeine. He was discharged the following day, although still complaining of paraesthesia and dysaesthesia of the extremities [Lucas *et al.* 1997].

A 24-year-old Aboriginal woman was admitted to hospital with a 24 h history of vomiting and diarrhoea, abdominal cramps, listlessness and malaise. She had ingested coral cod 24 h previously. The patient was administered IV mannitol (1 g/kg) and additional IV fluid. The following day the patient was ambulant without cerebellar ataxia, fully alert, and afebrile The patient discharged herself before further examination was possible [Lucas *et al.* 1997].

Ciquatera poisoning occurs throughout the Caribbean and tropical Pacific regions but cases have also been reported in the more temperate climates of South Carolina and Texas, USA [Centers for Disease Control and Prevention 1998, 2006], the Canary Islands [Pérez-Arellano *et al.* 2005] and Avonmouth, UK [Kipping *et al.* 2006].

Cilazapril

ACE Inhibitor

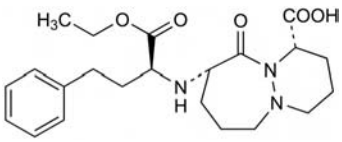
$C_{22}H_{31}N_3O_5.H_2O = 435.5$

CAS—92077-78-6

IUPAC Name (4*S*,7*S*)-7-[[(2*S*)-1-Ethoxy-1-oxo-4-phenylbutan-2-yl]amino]-6-oxo-1,2,3,4,7,8,9,10-octahydropyridazino[1,2-*a*]diazepine-4-carboxylic acid hydrate

Synonyms Cilazapril monohydrate; [1*S*-[1α,9α(*R**)]]-9-[[1-(ethoxycarbonyl)-3-phenylpropyl]amino]octahydro-10-oxo-6*H*-pyridazino[1,2-a][1,2]diazepine-1-carboxylic acid monohydrate; Ro-31-2848/006.

Proprietary Names *Dynorm*; *Inhibace*; *Initiss*; *Justor*; *Vascace*



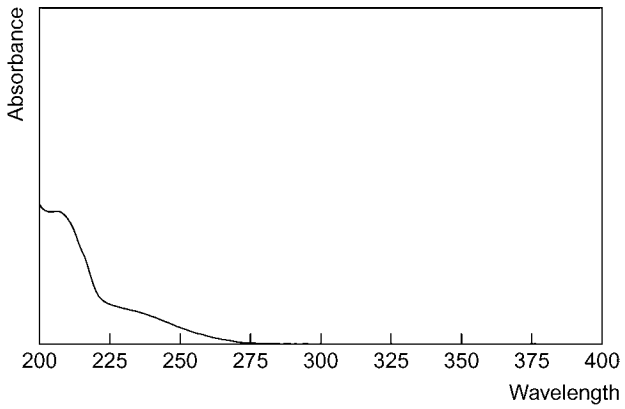
Chemical Properties Crystals (from aqueous ethanol). Mp 95° to 97°.

Thin-Layer Chromatography System TE—R_f 0.03; system TF—R_f 0.00.

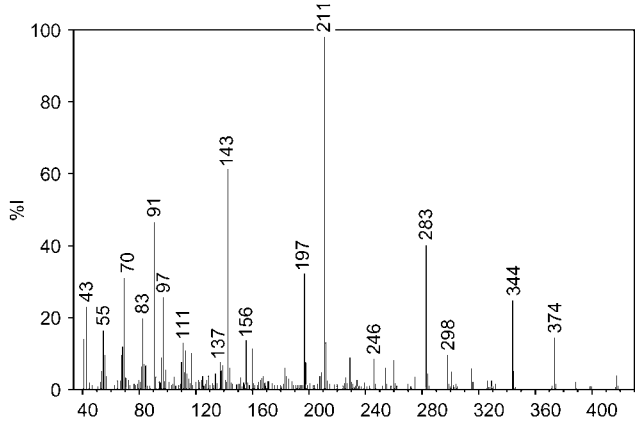
Gas Chromatography System GP—RI 3010 (cilazapril-Me); RI 2960 (M (cilazapril-Me_3)).

High Performance Liquid Chromatography System HX—RI 420; system HZ—cilazapril, retention time 4.5min; cilazaprilate,retention time 1.7 min; system HAA—retention time 14.4 min.

Ultraviolet Spectrum Principal peak at 208 nm.



Mass Spectrum Principal ions at *m/z* 211, 143, 91, 283, 197, 70, 344, 97.



Quantification

Plasma **Enzymic immunoassay** Limit of detection, 30 ng/L for cilazapril and 30 µg/L for cilazaprilate [Tanaka *et al.* 1987].

Serum **Enzymic immunoassay** See Plasma [Tanaka *et al.* 1987].

Urine **HPLC** Column: C_{18} (µBondapak, 300 × 3.9 mm i.d., 10 µm). Mobile phase: methanol : 5 mmol/L phosphoric acid (50:50), flow rate 1.0 mL/min. Electrochemical detection. Retention time: cilazapril, 5.1 min; cilazaprilate, 8.4 min. Limit of quantification, 0.17 mg/L for cilazapril and 0.14 mg/L for cilazaprilate. Limit of detection 50 µg/L and 40 µg/L, respectively [Prieto *et al.* 1998].

Pharmaceutical Products **HPLC** See Urine [Prieto *et al.* 1998].

Disposition in the Body After oral administration and rapid absorption, cilazapril is hydrolysed in the liver to its diacid, cilazaprilate (active ACE inhibitor), and no further metabolism occurs. Excretion is biphasic and occurs almost exclusively in the kidneys with ~53% cilazaprilate being recovered in urine after oral administration of cilazapril. Rapid elimination of cilazaprilate occurs with unbound drug eliminated within 8 h. Both cilazapril and cilazaprilate are removed to a limited extent by haemodialysis.

Therapeutic Concentration

Twelve healthy males, between 19 and 38 years old, were administered a single 2.5 mg oral dose of cilazapril at weekly intervals. A mean maximum plasma concentration of 0.082 mg/L at 0.83 h was observed for cilazapril and 0.036 mg/L at 1.7 h for cilazaprilate [Williams *et al.* 1989a]; [Williams *et al.* 1989b].

Toxicity Skin rashes and allergies have been noted in women administered the low toxic dose of 15 mg/kg at 22 week intervals. It is a poison by IV routes and moderately toxic by SC and IP routes.

Bioavailability About 60%.

Half-life Initial half-life of 1.3 to 1.8 h and a terminal phase elimination half-life of 40 to 50 h for cilazaprilate. Effective half-life (steady-state reached) is ~9 h.

Volume of Distribution Apparent mean volume of distribution for cilazaprilate is 29 to 46 L.

Clearance Plasma clearance, of cilazaprilate is 14 to 24 L/h, after a single oral dose of 2.5 to 10 mg cilazapril, and in patients with moderate essential hypertension clearance is 14 to 16 L/h, after a single oral dose of 5 to 20 mg.

Protein Binding 24%.

Dose An initial daily dose of 1.25 mg for 2 days; gradually increasing to 5 mg/day depending on blood pressure response. A single dose is usually between 2.5 and 5 mg/day.

Patients with creatinine clearance >40 mL/min, receive an initial daily dose of 1 mg; patients with clearance between 10 and 40 mL/min have an initial daily dose of 0.5 mg and following doses with a maximum of 2.5 mg. Patients with clearance <10 mL/min receive a 0.25 to 0.5 mg/day dose once or twice a week.

Cilostazol

Antithrombotic

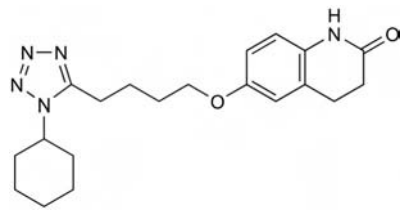
$C_{20}H_{27}N_5O_5 = 369.5$

CAS—73963-72-1

IUPAC Name 6-[4-(1-Cyclohexyl-1*H*-tetrazol-5-yl)butoxyl]-3,4-dihydro-2(1*H*)-quinolinone

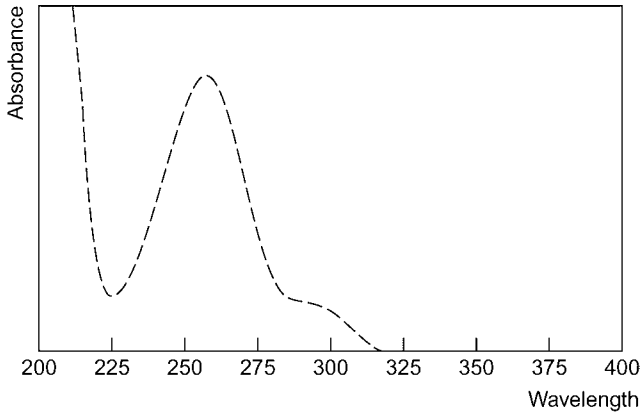
Synonyms OPC-21; OPC-13013.

Proprietary Names *Pletaal*; *Pletal*.

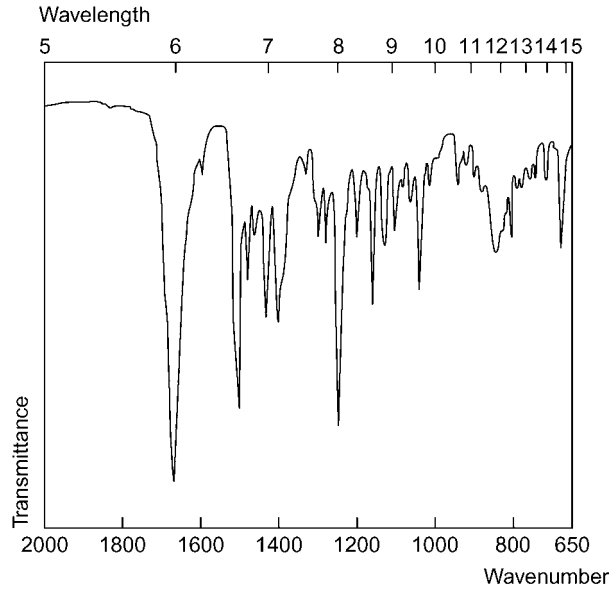


Chemical Properties White to off-white crystals or crystalline powder. Mp 160°. It is freely soluble in acetic acid, chloroform, *N*-methyl-2-pyrrolidone and DMSO; slightly soluble in methanol and ethanol; practically insoluble in ether, water, 0.1 mol/L hydrochloric acid and 0.1 mol/L sodium hydroxide. Log *P* (octanol/water), 4.04.

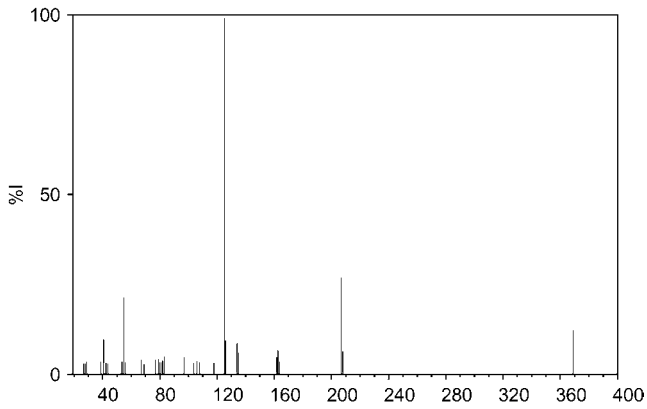
Ultraviolet Spectrum Methanol—257 nm.



Infrared Spectrum Principal peaks at wavenumbers 1667, 1505, 1246, 1039, 2932, 2867 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 125, 207, 55, 369, 41, 126, 134, 163.



Disposition in the Body Cilostazol is absorbed at a moderate rate after oral administration. Absorption is increased if the drug is administered with a high-fat meal. Mean peak plasma concentrations are observed 2.4 h after administration and the drug is extensively metabolised by hepatic cytochrome P450 enzymes (mainly 3A4). A number of metabolites are produced, two of which are active; 3,4-dehydrocilostazol (the most active metabolite accounting for at least 50% of the pharmacological activity) and 4′-*trans*-hydroxycilostazol. In plasma, 56% of the dose is detected as the unchanged drug, 15% 3,4-dehydrocilostazol and 4% 4′-*trans*-hydroxycilostazol. The primary elimination route is urine with 74% of the dose excreted in this way; <2% as the 3,4-dehydrocilostazol metabolite and 30% 4′-*trans*-hydroxycilostazol. No unchanged drug is detected in urine. It is extensively distributed in tissues.

Therapeutic Concentration

Twenty healthy non-smoking males, with a mean age of 24 years, were administered with single doses of 50, 100 and 200 mg. Twenty-six patients (male and female) with intermittent claudication (a complex of symptoms) resulting from peripheral arterial disease (PAD), with a mean age of 68 years, were administered with a dose of 100 mg. The mean peak plasma concentration of cilostazol was 1.223 mg/L for the healthy individuals and 1.332 mg/L for the patients which were observed 2.5 h (range 1 to 5) and 2 h (range 1 to 6) after administration, respectively. Mean peak concentrations for the metabolite OPC-13015 were 0.406 mg/L and 0.426 mg/L, respectively, for the healthy individuals and the patients. These levels were reached at about 3 h (range 1 to 6). Mean peak concentrations for the metabolite OPC-13213 were 0.125 mg/L and 0.224 mg/L, respectively, for the healthy individuals and the patients. These levels were reached at about 3 h (range 1 to 8 and 1 to 5, respectively) [Bramer *et al.* 1999].

Half-life 11 to 13 h.

Volume of Distribution 2.76 L/kg.

Clearance Oral, 0.18 L/h/kg. Relatively low plasma clearance.

Protein Binding Approximately 95 to 98%.

Dose The recommended dose is 100 mg daily but reduced to 50 mg if co-administered.

Bramer SL *et al.* (1999). Cilostazol pharmacokinetics after single and multiple oral doses in healthy males and patients with intermittent claudication resulting from peripheral arterial disease. *Clin Pharmacokinet* 37: 21–11.

Cimetidine

Histamine H_2-Receptor Antagonist

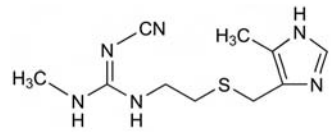
$C_{10}H_{16}N_6S = 252.4$

CAS—51481-61-9

IUPAC Name 1-Cyano-2-methyl-3-[2-[(5-methyl-1*H*-imidazol-4-yl)methylsulfanyl]ethyl] guanidine

Synonyms *N*-Cyano-*N*′-methyl-*N*″-[2-[[(5-methyl-1*H*-imidazol-4yl)methyl] thio]-ethyl]guanidine; SKF-92334.

Proprietary Names *Acibilin*; *Dyspanet*; *Edalene*; *Gimal*; *Gimetum*; *Peptol*; *Tagamet*; *Tratul*; *Ulcomet*; *Ulhys*.



Chemical Properties A crystalline powder. Mp 141° to 143°. Soluble 1 in about 88 of water. pK_a 6.8. Log *P* (octanol/water), 0.4.

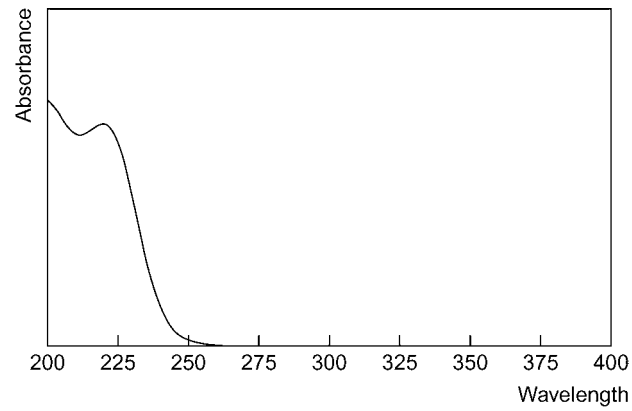
Colour Tests Nessler's reagent (100°)—black; sodium picrate (Steyn test)—red.

Thin-layer Chromatography System TA—R_f 0.54; system TB—R_f 0.00; system TC—R_f 0.09; system TE—R_f 0.27; system TL—R_f 0.12; system TAE—R_f 0.53; system TAF—R_f 0.55; system TAJ—R_f 0.00; system TAK—R_f 0.00; system TAL—R_f 0.08.

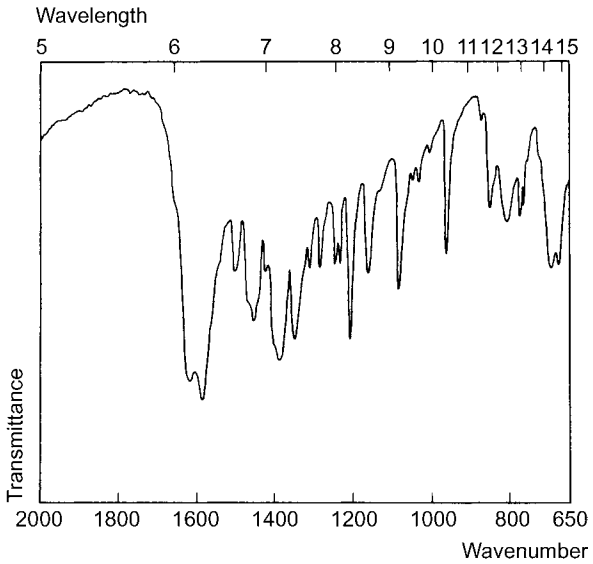
Gas Chromatography System GA—not eluted.

High Performance Liquid Chromatography System HA—*k* 0.4; system HX—RI 251; system HY—RI 226; system HZ—retention time 1.8 min; system HAA—retention time 3.6 min.

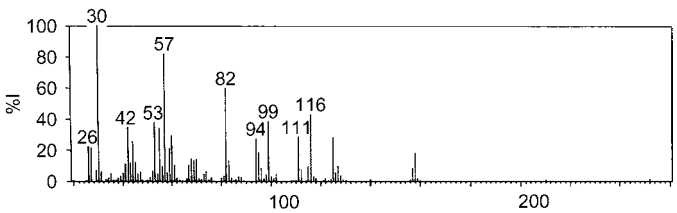
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.



Infrared Spectrum Principal peaks at wavenumbers 1588, 1620, 1208, 1082, 1160, 1503 cm^{-1} (KBr disk). Polymorphism may occur.



Mass Spectrum Principal ions at *m/z* 30, 57, 82, 116, 99, 53, 55, 42.



Quantification

Plasma **HPLC** MS detection. Limit of quantification, 5 µg/L [Xu *et al.* 1999]. UV detection (λ=234 nm). Lower limit of quantification, 0.1 mg/L [Hempenius *et al.* 1998]. UV detection (λ=228 nm). Limit of quantification, 50 µg/L Limit of detection, 15 µg/L [Kelly *et al.* 1995]. UV detection. Limit of detection, 25 µg/L [Ching *et al.* 1984].

Serum **HPLC** UV detection. Cimetidine and metabolites, limit of detection, 50 µg/L for cimetidine [Ziemniak *et al.* 1981].

Urine **HPLC** See Plasma [Ching *et al.* 1984], and Serum [Ziemniak *et al.* 1981].

Disposition in the Body Rapidly absorbed after oral administration. About 50 to 80% of an IV dose is excreted in the urine as unchanged drug in 24 h, together with about 10% as the sulfoxide metabolite and about 5% as the 5-hydroxymethyl derivative. Up to about 10% of the dose is eliminated in the faeces.

Therapeutic Concentration In plasma, usually in the range 0.5 to 1.5 mg/L.

A single oral dose of 200 mg administered to 20 subjects resulted in peak blood concentrations of 0.6 to 1.9 mg/L (mean 1.1) in 1 to 2 h [Redolfi *et al.* 1979]. Following oral administration of 200 mg five times a day to 10 subjects, minimum steady-state plasma concentrations of 0.26 to 0.80 mg/L (mean 0.4) were reported; steady-state plasma concentrations of the sulfoxide metabolite ranged from 0.07 to 0.21 mg/L (mean 0.12) [Larsson 1982].

Toxicity Cimetidine appears to be relatively non-toxic; recovery has occurred after ingestion of 24 g in one dose, and ingestion of 60 g during 5 days caused no untoward effects. During chronic therapy, toxic effects are reportedly associated with trough plasma concentrations >1.3 mg/L.

In 3 cases of overdose caused by the ingestion of 5.2, 16, and 19.6 g of cimetidine, plasma concentrations of 37, 57, and 36 mg/L, respectively, were reported 2 to 3 h after ingestion; the subjects all recovered [Illingworth, Jarvie 1979].

In a fatality caused by the ingestion of cimetidine and diazepam, post-mortem blood concentrations of 110 mg/L of cimetidine and 5.8 mg/L of diazepam were reported [Hiss *et al.* 1982].

Bioavailability About 70% but there is considerable inter-subject variation.

Half-life Plasma half-life, 1 to 3 h.

Volume of Distribution About 1 to 2 L/kg.

Clearance Plasma clearance, about 9 mL/min/kg; considerably reduced in elderly patients.

Distribution in Blood Plasma : whole blood ratio, about 1.0.

Protein Binding 13 to 26%.

Note For a review of the pharmacokinetics of cimetidine, see Somogyi, Gugler [1983].

Dose 0.8 to 1.6 g daily; maximum of 2.4 g daily.

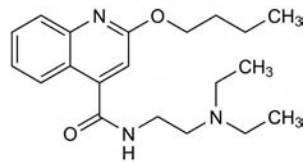
C

Cinchocaine

Anaesthetic (Local)
$C_{20}H_{29}N_3O_2$ = 343.5
CAS—85-79-0

IUPAC Name 2-Butoxy-*N*-[2-(diethylamino)ethyl]-4-quinolinecarboxamide
Synonyms Cincainum; dibucaine.
Proprietary Name *Nupercainal*. It is an ingredient of many proprietary preparations—see Sweetman [2009].

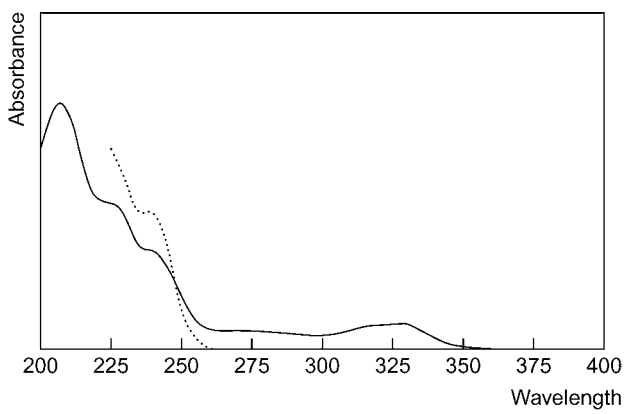


Chemical Properties A white, somewhat hygroscopic powder. Mp 64°. Soluble 1 in 4600 of water, 1 in less than 1 of ethanol and of chloroform, and 1 in 1.5 of ether. pK_a 7.5 (20°). Log *P* (octanol/water), 4.4.

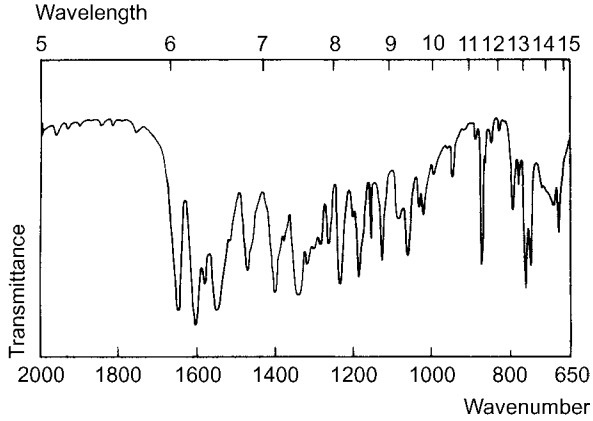
Cinchocaine Hydrochloride

$C_{20}H_{29}N_3O_2$, HCl = 379.9
CAS—61-12-1
Synonyms Cincaini chloridum; percainum; sovcainum.
Proprietary Names *Cincain*; *Doloposterine N*; *Nupercainal*; *Nupercaine*.
Chemical Properties Fine, white, crystals or white crystalline powder. Mp 90° to 98°, with decomposition. Soluble 1 in 0.5 of water; freely soluble in ethanol, acetone and chloroform; insoluble in ether and oils.

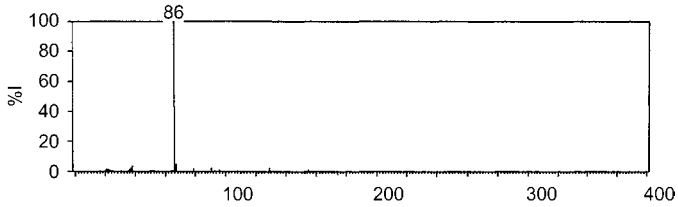
Colour Test Mercurous nitrate—black
Thin-layer Chromatography System TA—R_f 0.63; system TB—R_f 0.25; system TC—R_f 0.34; system TE—R_f 0.67; system TL—R_f 0.35; system TAE—R_f 0.42 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2890; system GQ—retention time 10.4 min.
High Performance Liquid Chromatography System HA—*k* 1.9; system HR—*k* 5.51; system HY—RI 371.
Ultraviolet Spectrum Aqueous acid—247 (A^1_1=720a), 319 nm (A^1_1=260a); aqueous alkali—238, 325 nm.



Infrared Spectrum Principal peaks at wavenumbers 1598, 1643, 1540, 766, 1236, 1574 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 86, 87, 58, 149, 111, 99, 57, 41 (no peaks above 210).



Quantification
Plasma **GC-MS** SIM. Limit of quantification, 100 µg/L. Limit of detection, 80 µg/L [Ohhima, Takayasu 1999].
Serum **GC-MS** Limit of detection, 1 µg/L [Alkalay *et al.* 1981].
Urine **GCMS** See Plasma [Ohhima, Takayasu 1999].

Disposition in the Body
Toxicity Cinchocaine is more toxic than procaine by injection, and more toxic than cocaine by local application.

An 18-month-old girl died 7 h after ingesting an estimated 150 mg (15 mg/kg) cinchocaine contained in a tube of ointment; cinchocaine levels were not obtained at autopsy. In a second fatality, involving a 2-year-old boy who ingested an unknown quantity of cinchocaine cream, the postmortem blood cinchocaine level was 1.3 mg/L. A third fatality was reported—a 21-month-old girl who ingested three-quarters of a 1 oz tube of cinchocaine ointment (~225 mg; 19 mg/kg)—in which death occurred 3 h after the ingestion; no autopsy was performed [Dayan *et al.* 1996].

In a fatality involving the ingestion of cinchocaine, the following postmortem tissue concentrations were reported: blood 0.6 mg/L, kidney 5.7 µg/g, liver 25 µg/g; ethanol was also detected in blood at a concentration of 1500 mg/L [Borkowski, Gubala 1976].

Half-life Plasma half-life, about 11 h.
Use Cinchocaine is used in concentrations of 0.1 to 1%, for surface anaesthesia.

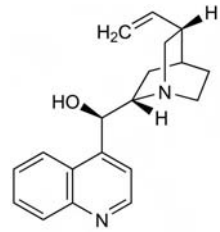
Cinchonidine

Antimalarial
$C_{19}H_{22}N_2O = 294.4$
CAS—485-71-2

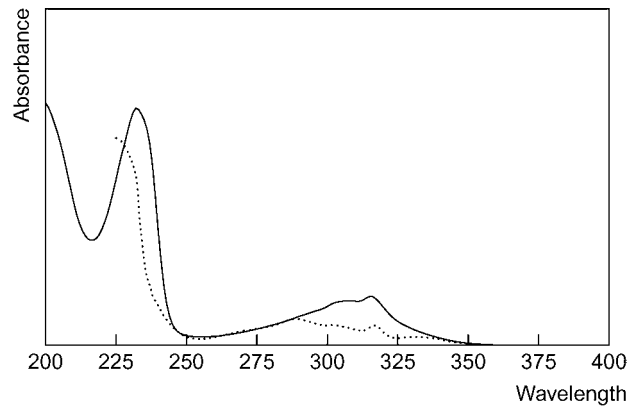
IUPAC Name (*R*)-[(2*S*,4*S*, 5*R*)-5-Ethenyl-1-azabicyclo[2.2.2]octan-2-yl]-quinolin-4-ylmethanol
Synonyms (8α,9*R*)-Cinchonan-9-ol; cinchonatine; α-quinidine.



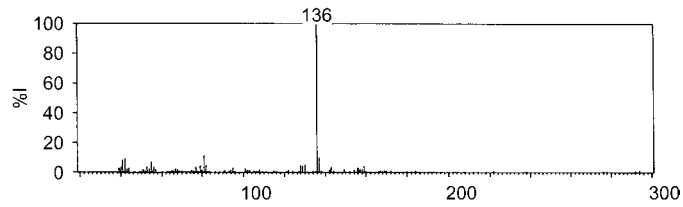
Chemical Properties An alkaloid present in the bark of various species of *Cinchona* (Rubiaceae). Cinchonidine is the (−)-stereoisomer of cinchonine; quinine is its (−)-6′-methoxy derivative. White crystals or powder. Mp about 210°, with decomposition. Practically insoluble in water; soluble 1 in 10 of ethanol; soluble in chloroform; moderately soluble in ether. pK_a 4.0, 8.2 (25°). Log *P* (octanol/water), 2.8.

Cinchonidine Sulfate
$(C_{19}H_{22}N_2O)_2, H_2SO_4, 7H_2O = 813.0$
CAS—524-61-8 (anhydrous)
Chemical Properties Colourless, shining, silky crystals. Mp about 207°. Soluble 1 in 100 of water and 1 in 60 of ethanol; practically insoluble in chloroform and ether.

Thin-layer Chromatography System TA—R_f 0.49; system TB—R_f 0.06; system TC—R_f 0.08; system TE—R_f 0.44; system TL—R_f 0.06; system TAE—R_f 0.24; system TAF—R_f 0.55; system TAJ—R_f 0.00; system TAK—R_f 0.00; system TAL—R_f 0.70 (Dragendorff spray, positive; acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2590.
High Performance Liquid Chromatography System HA—*k* 3.1; system HX—RI 306; system HY—RI 214.
Ultraviolet Spectrum Aqueous acid—236 (A^1_1=1208a), 316 nm.



Infrared Spectrum Principal peaks at wavenumbers 754, 899, 1090, 800, 877, 1587 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 136, 81, 137, 42, 41, 55, 130, 128.

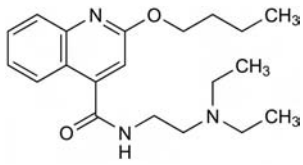


Disposition in the Body Metabolised by 2′-hydroxylation of the quinoline nucleus followed by 2-hydroxylation of the quinuclidine ring; both 2′-hydroxycinchonidine and 2,2′-dihydroxycinchonidine have been detected in urine.
Dose Cinchonidine sulfate was formerly given in doses of 60 to 600 mg.

Cinchonine

Antimalarial
$C_{19}H_{22}N_2O = 294.4$
CAS—118-10-5

IUPAC Name (*S*)-[(2*R*, 5*R*)-5-Ethenyl-1-azabicyclo[2.2.2]octan-2-yl]-quinolin-4-ylmethanol
Synonym (9*S*)-Cinchonan-9-ol



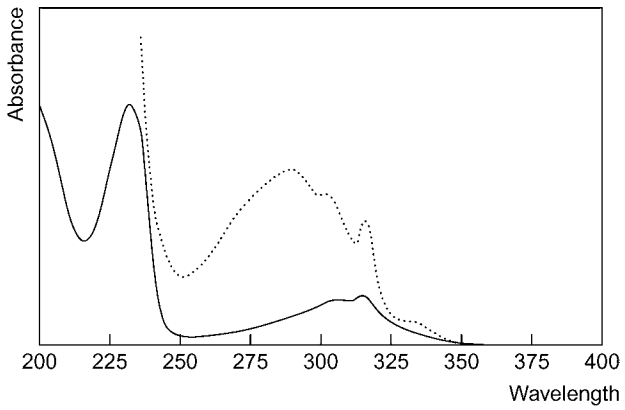
Chemical Properties An alkaloid present in the bark of various species of *Cinchona* (Rubiaceae). Cinchonine is the (+)-stereoisomer of cinchonidine; quinidine is its (+)-6′-methoxy derivative. White shining prisms or needles. Mp 264°. Practically insoluble in water; soluble 1 in 60 in ethanol, 1 in 110 of chloroform, and 1 in 500 of ether. pK_a 4.1, 8.2 (25°). Log *P* (octanol/water), 2.7.

Cinchonine Hydrochloride

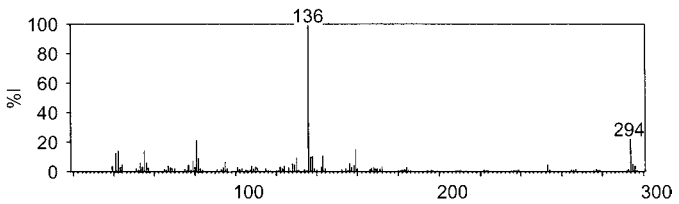
$C_{19}H_{22}N_2O$, HCl, $2H_2O$ = 366.9
CAS—5949-11-1 (anhydrous)

Chemical Properties White microcrystalline flakes or needles. Mp about 215°, with decomposition (anhydrous salt). Soluble 1 in 20 of water, 1 in 1.5 of ethanol, 1 in 20 of chloroform, and 1 in 300 of ether.

Thin-layer Chromatography System TA—R_f 0.49; system TB—R_f 0.06; system TC—R_f 0.12; system TE—R_f 0.44; system TL—R_f 0.05; system TAE—R_f 0.19; system TAF—R_f 0.61 (Dragendorff spray, positive; acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2590.
High Performance Liquid Chromatography System HX—RI 304; system HY—RI 209; system HAA—retention time 10.2 min.
Ultraviolet Spectrum Aqueous acid—235 (A^1_1=1208a), 315 nm; aqueous alkali—288, 302, 315 nm.



Infrared Spectrum Principal peaks at wavenumbers 760, 1110, 1505, 1590, 990, 909 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 136, 294, 81, 159, 55, 42, 41, 143.

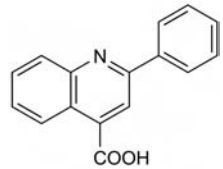


Disposition in the Body Rapidly and almost completely absorbed from the gastrointestinal tract, peak plasma concentrations being attained in 1 to 2 h. Metabolised by 2′-hydroxylation of the quinoline nucleus followed by 2-hydroxylation of the quinuclidine ring. About 55% of a dose is excreted as 2′-hydroxycinchonine, 22% as 2,2′-dihydroxycinchonine, and 5% as unchanged cinchonine.
Dose Cinchonine hydrochloride was formerly given in doses of 60 to 600 mg.

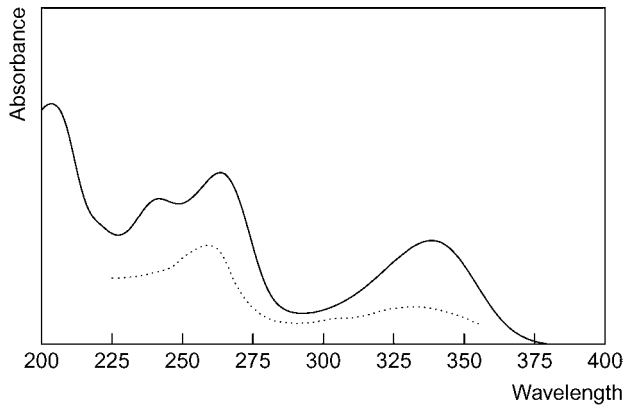
Cinchophen

Analgesic
$C_{16}H_{11}NO_2$ = 249.3
CAS—132-60-5

IUPAC Name 2-Phenyl-4-quinolinecarboxylic acid
Synonyms Acifenokinolin; phenylcinchoninic acid; quinophan.
Proprietary Names *Agotan*; *Atophan*; *Phenoquin*; *Quinophan*; *Rhematan*; *Tophol*; *Tophosan*.



Chemical Properties White or yellowish crystals or powder. Mp 213° to 216°. Practically insoluble in water; soluble 1 in 120 of ethanol, 1 in 40 of acetone, 1 in 400 of chloroform, and 1 in 100 of ether. Log *P* (octanol/water), 3.8.
Colour Tests Liebermann's reagent—red-orange; Marquis test—yellow; sulfuric acid—yellow.
Thin-layer Chromatography System TA—R_f 0.75; system TB—R_f 0.00; system TC—R_f 0.02; system TD—R_f 0.00; system TE—R_f 0.08; system TF—R_f 0.00; system TL—R_f 0.00; system TAD—R_f 0.07; system TAE—R_f 0.82; system TAF—R_f 0.72 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—not eluted.
Ultraviolet Spectrum Aqueous acid—243 (A^1_1=610b), 268, 344 nm; aqueous alkali—259, 330 nm.

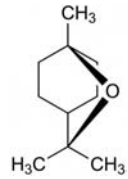


Infrared Spectrum Principal peaks at wavenumbers 759, 1250, 1698, 699, 731, 1199 cm^{-1} (KBr disk).
Disposition in the Body Readily absorbed after oral administration and extensively metabolised; <5% of a dose is excreted in the urine unchanged.
Half-life Plasma half-life, about 4 h.
Dose Cinchophen was formerly given in doses of 300 to 600 mg.

Cineole

Essential Oil
$C_{10}H_{18}O$ = 154.3
CAS—470-82-6

IUPAC Name 1,3,3-Trimethyl-2-oxabicyclo[2.2.2]octane
Synonyms Cajuputol; eucalyptol.

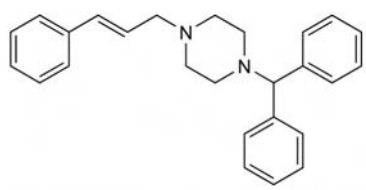


Chemical Properties Cineole is obtained from eucalyptus oil, cajuput oil, and other oils. A colourless liquid with an aromatic camphoraceous odour. Mass per mL 0.922 to 0.924 g. Fp 0°. Bp 176° to 177°. Refractive index (at 20°) 1.456 to 1.460. Practically insoluble in water; miscible with ethanol, chloroform, ether, and glacial acetic acid. Log *P* (octanol), 2.7.
Gas Chromatography System GB—RI 1063; system GO—retention time 11.2 min.
Infrared Spectrum Principal peaks at wavenumbers 980, 1075, 1219, 847, 1162, 1052 cm^{-1}.

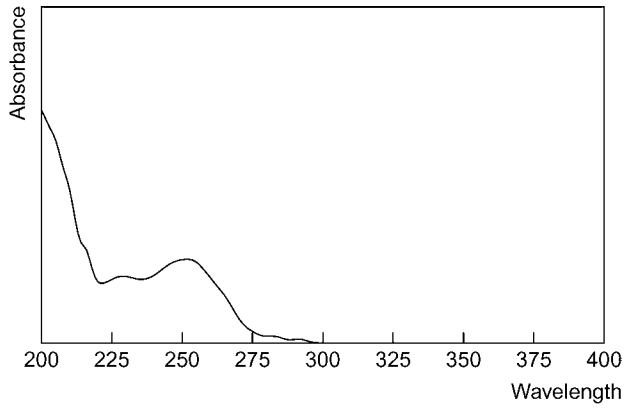
Cinnarizine

Antihistamine
$C_{26}H_{28}N_2$ = 368.5
CAS—298-57-7

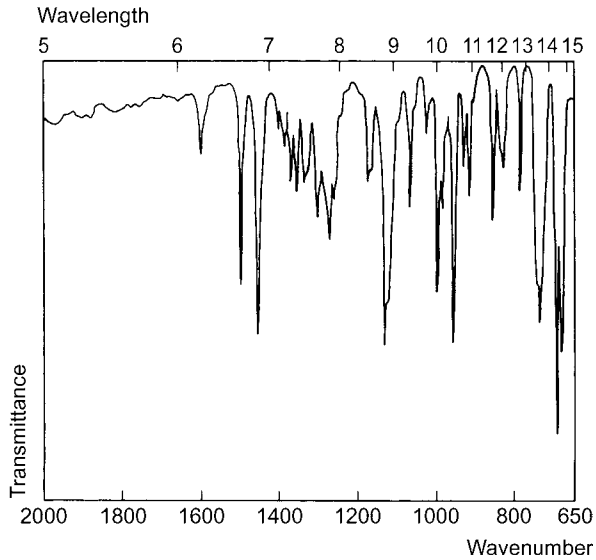
IUPAC Name 1-Benzhydryl-4-[(*E*)-3-phenylprop-2-enyl]piperazine
Synonyms 1-(Diphenylmethyl)-4-(3-phenyl-2-propenyl)piperazine; ginnipirine; S16-MD.
Proprietary Names *Aplactan*; *Aplexal*; *Carecin*; *Cerepar*; *Cinnacet*; *Gigantēn*; *Hilactan*; *Ixertol*; *Katoseran*; *Midronal*; *Olamin*; *Sepan*; *Stugeron*.



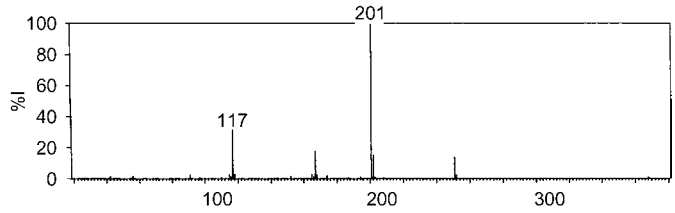
Chemical Properties Practically insoluble in water; soluble in dilute hydrochloric acid. Log *P* (octanol/water), 5.8.
Thin-layer Chromatography System TA—R_f 0.76; system TB—R_f 0.54; system TC—R_f 0.78; system TE—R_f 0.86; system TL—R_f 0.65; system TAE—R_f 0.79; system TAF—R_f 0.87 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—cinnarizine RI 3050, M (desalkyl-norcyclizine) RI 2120, M (benzophenone) (BPH) RI 1610, M (OH-benzophenone) isomer 1 RI 2065, M (OH-benzophenone) isomer 2 RI 2080, M (OH-methoxy-benzophenone) isomer 1 RI 2050, M (OH-methoxy-benzophenone) isomer 2 RI 2070, M (carbinol) RI 1750; system GB—cinnarizine RI 3233, M (desalkyl-) RI 2128, M (benzophenone) RI 1673.
High Performance Liquid Chromatography System HA—*k* 0.8; system HX—RI 560; system HZ—retention time 22.0 min; system HAA—retention time 19.3 min.
Ultraviolet Spectrum Aqueous acid—254 nm (A_1^1=584a).



Infrared Spectrum Principal peaks at wavenumbers 702, 691, 1138, 964, 740, 1000 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 201, 117, 167, 202, 251, 165, 118, 115.



Quantification
Plasma **GC** AFID. Limit of detection, 0.5 µg/L [Woestenborgh et al. 1982].
HPLC UV detection. Limit of detection, 20 µg/L [Nitsche, Mascher 1982].
Serum **TLC** Limit of detection, 10 µg/L [Hassan *et al.* 2002].
HPLC UV detection (λ=250 nm). Limit of detection, 16 µg/L [Hassan *et al.* 2002].
Urine **GC** See Plasma [Woestenborgh et al. 1982].
Disposition in the Body
Therapeutic Concentration
Following a single oral dose of 50 mg to 6 subjects, a mean peak plasma concentration of 0.08 mg/L was attained in 2.3 h [Hundt *et al.* 1980].
Six young, healthy males were administered 75 mg cinnarizine as a tablet. Peak plasma drug concentrations reached a mean of 275 µg/L 3 h after dosing [Castaneda-Hernandez *et al.* 1993].
Half-life Plasma half-life, about 5 h.
Dose Usually 45 to 90 mg daily; doses of 150 to 225 mg daily are given in peripheral arterial disease.

Castaneda-Hernandez G *et al.* (1993). Pharmacokinetics of cinnarizine after single and multiple dosing in healthy volunteers. *Arzneimittelforschung* 43(5): 539–542.

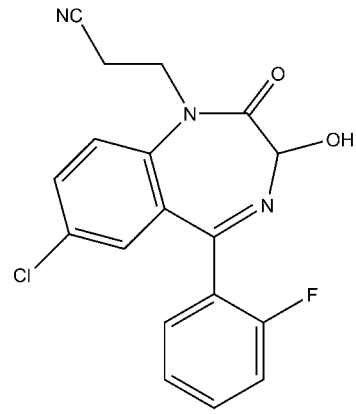
Cinolazepam

Anticonvulsant, Hypnotic, Sedative, Skeletal Muscle Relaxant
$C_{18}H_{13}ClFN_3O_2$ = 357.8
CAS—75696-02-5
IUPAC Name 3-[7-Chloro-5-(2-fluorophenyl)-3-hydroxy-2-oxo-3*H*-1,4-benzodiazepin-1-yl]propanenitrile
Synonyms 7-Chloro-5-(2-fluorophenyl)-2,3-dihydro-3-hydroxy-2-oxo-1*H*-1,4-benzodiazepine-1-propanenitrile; OX-373.
Proprietary Name *Gerodorm*



Chemical Properties Crystals. Mp 190° to 193°. Soluble in ethanol.
Quantification
Plasma **HPLC** Column: Lichrosorb RP-18 (125 × 4 mm i.d., 7 µm) or Polygosil 60–7 C_{18} (7.5 µm). Mobile phase: acetonitrile : 0.01 mol/L orthophosphoric acid (20 : 80; 30 : 70 for separation of optical isomeric glucuronides as well as free oxazepam and cinolazepam). UV detection (λ = 230 nm). Limit of detection not reported [Mascher *et al.* 1984].
Urine **HPLC** See Plasma [Mascher *et al.* 1984].
Note For a fluorometric method for the determination of cinolazepam in serum and urine, see Walash *et al.* [1994].

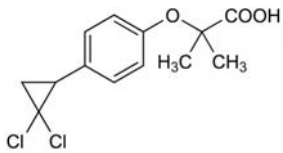
***Other* HPLC** Rabbit Plasma, Urine and Bile. See Plasma [Mascher *et al.* 1984].

Mascher H *et al.* (1984). Separation, isolation and identification of optical isomers of 1,4-benzodiazepine glucuronides from biological fluids by reversed-phase high-performance liquid chromatography. *J Chromatogr* 306: 231–239.
Walash MI *et al.* (1994). A selective fluorimetric method for the determination of some 1,4-benzodiazepine drugs containing a hydroxyl group at C-3. *J Pharm Biomed Anal* 12: 1417–1423.

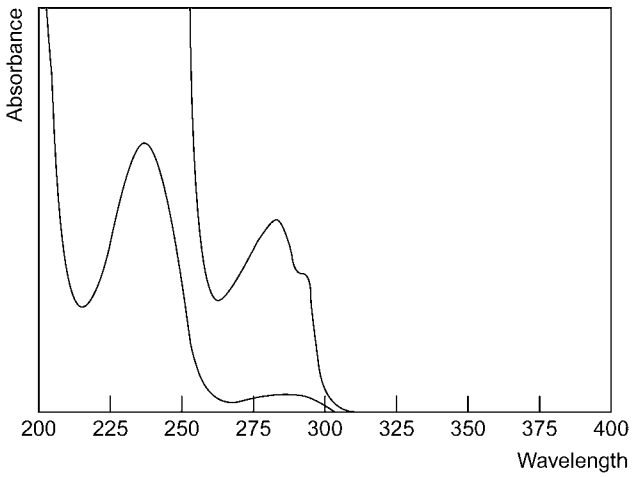
Ciprofibrate

Lipid-Regulating Agent
$C_{13}H_{14}Cl_2O_3 = 289.2$
CAS—52214-84-3

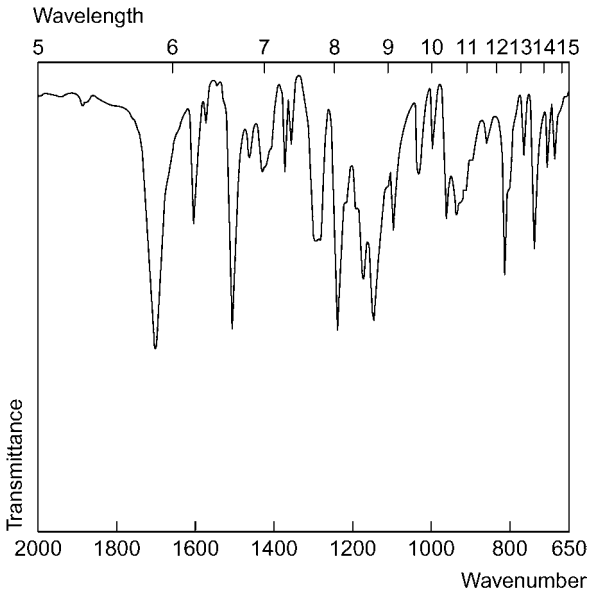
IUPAC Name 2-[4-(2,2-Dichlorocyclopropyl)phenoxy]-2-methylpropanoic acid
Synonym Win-35833
Proprietary Names *Bi-Lipanor*; *Ciprol*; *Hyperlipen*; *Lipanor*; *Modalim*.



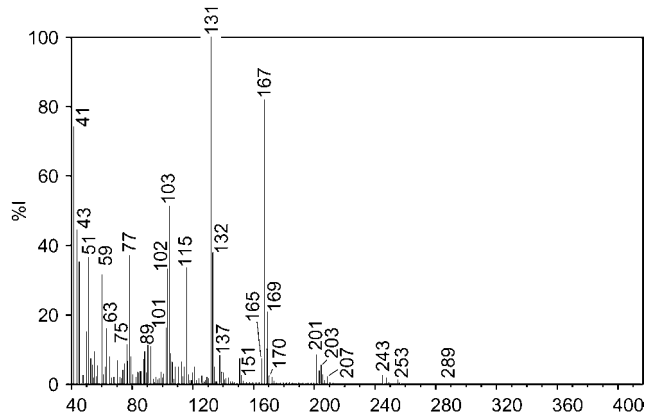
Chemical Properties A pale cream solid. Mp 114° to 116°. Log *P* (octanol/water), 3.94.
High Performance Liquid Chromatography System HAA—retention time 21.2 min.
Ultraviolet Spectrum Ethanol—232 nm.



Infrared Spectrum



Mass Spectrum Principal ions at *m/z* 131, 167, 41, 103, 43, 132, 77, 289.



Quantification
***Plasma* HPLC** Column: RP Shimpack CLC-ODS RP-C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.02 mol/L H_3PO_4 (55:45), flow rate 2.0 mL/min for the first 8 min then 2.5 mL/min until the end. UV detection (λ=232 nm). Retention time: 4.9 min. Limit of detection, 0.25 mg/L [Masnatta *et al.* 1996]. UV detection. Limit of detection, 0.69 mg/L [Park *et al.* 1982].
Disposition in the Body Ciprofibrate is readily absorbed after oral administration; peak plasma concentrations occur within 1 to 4 h. About 30 to 75% of a single dose is excreted in urine as the unchanged drug (20 to 25% of total excreted) and as glucuronide conjugates, in 72 h. It is not removed by dialysis.
Therapeutic Concentration
Group 1: Six patients with normal renal function, creatinine clearance 89 to 133 mL/min/1.73 m^2, aged 24 to 37 years; group 2: mild renal insufficiency, creatinine clearance 39 to 60 mL/min 1.73 m^2, aged 25 to 66 years; group 3: severe insufficiency, creatinine clearance 11 to 30 mL/min/1.73 m^2, aged 37 to 60 years; group 4: haemodialysis patients, 44 to 70 years old. Each group was administered with 100 mg ciprofibrate in a fasting state. The peak concentrations were 24, 22 and 17 mg/L for the first three groups observed at 1.3, 2.3 and 2.8 h [Ferry *et al.* 1989].
Half-life Plasma, 81 h in healthy individuals; 117 h (patients with mild renal failure; 154 h (patients undergoing haemodialysis); 172 h (severe renal failure).
Protein Binding 95% bound to albumin.
Note For reviews of ciprofibrate, see Betteridge [1993], and Turpin, Bruckert [1996].
Dose 100 mg daily.

Betteridge DJ (1993). Ciprofibrate–a profile. *Postgrad Med J* 69: 1S42–S49.

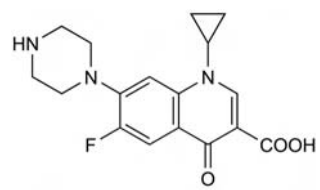
Ciprofloxacin

Antibacterial
$C_{17}H_{18}FN_3O_3 = 331.4$
CAS—85721-33-1

IUPAC Name 1-Cyclopropyl-6-fluoro-4-oxo-7-piperazin-1-ylquinoline-3-carboxylic acid
Synonyms Bay-q-3939; 1-cyclopropyl-6-fluoro-1,4-dihydro-4-oxo-7-(1-piperazinyl)-3-quinolinecarboxylic acid.
Proprietary Names *Ciflox*; *Cipro*; *Ciprobay*; *Ciproxin*; *Ciproxine*; *Plenolyt*; *Septocipro*.



Chemical Properties Mp 255° to 257°, with decomposition. It is practically insoluble in water; very slightly soluble in ethanol and in methylene chloride; soluble in dilute acetic acid. Log *P* (octanol/water), 0.28.

C

Ciprofloxacin Hydrochloride

$C_{17}H_{18}FN_3O_3.HCl, H_2O = 385.8$
CAS—86483-48-9 (anhydrous); 86393-32-0 (monohydrate)
Synonym Bay-o-9867
Proprietary Names *Baycip*; *Belmacina*; *Catex*; *Ceprimax*; *Cetraxal*; *Ciflox*; *Ciloxan*; *Cipro*; *Ciprobay*; *Ciproxin*; *Ciproxine*; *Cunesin*; *Estecina*; *Flociprin*; *Globuce*; *Huberdoxina*; *Inkamil*; *Quipro*; *Rigoran*; *Sepcen*; *Septocipro*; *Tam*; *Velmonit*.
Chemical Properties Faintly yellowish to light yellow crystals. Mp 318° to 320°. It is sparingly soluble to soluble in water; slightly soluble in acetic acid and in methanol; very slightly soluble in ethanol; practically insoluble in acetone, in acetonitrile, in ethyl acetate, in hexane and in methylene chloride.

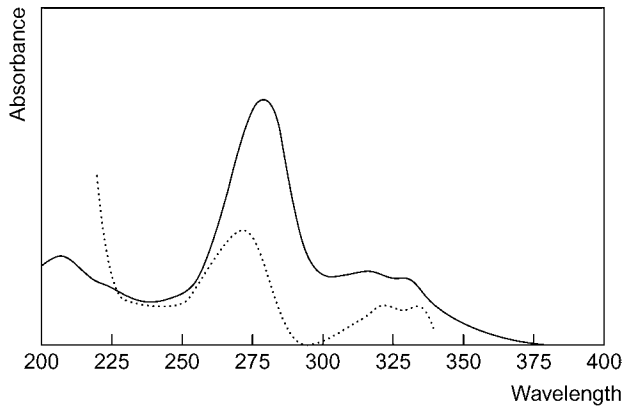
Ciprofloxacin Lactate

$C_{17}H_{18}FN_3O_3, C_3H_6O_3 = 421.4$
CAS—97867-33-9
Proprietary Names *Baycip*; *Ciprobay*; *Ciproxin*; *Ciproxine*; *Flociprin*; *Rigoran*; *Septocipro*; *Velmonit*.

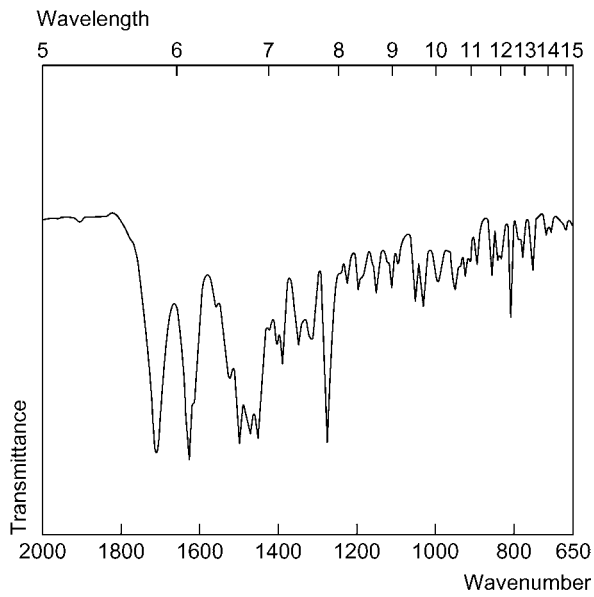
Thin-Layer Chromatography System TE—R_f 0.00; system TF—R_f 0.00.
High Performance Liquid Chromatography System HX—RI 318; system HY—RI 260; system HZ—retention time 1.8 min; system HAA—retention time 9.1 min.

Column: ODS Hypersil (100 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : aqueous 0.01 mol/L dihydrogen potassium phosphate buffer, (pH 3.5), flow rate 1 mL/min. UV diode array detection. Retention time: 1.1 min [Mills, Roberson 1993].

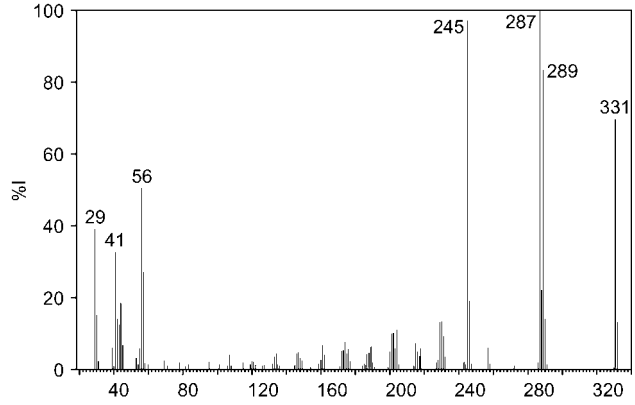
Ultraviolet Spectrum Aqueous acid (0.2 mol/L NH_2SO_4)—277, 315 nm; basic—272, 322, 334 nm.



Infrared Spectrum Principal peaks at wavenumbers 1703, 1619, 1267 cm^{-1} (KBr pellets).



Mass Spectrum Principal ions at *m/z* 287, 245, 289, 331, 56, 29, 41, 57.



Quantification

Blood **HPLC** Fluorescence detection. Limit of detection, 0.025 mg/L [Teja-Isavadharm *et al.* 1991].
Plasma **HPLC** Limit of quantification, 0.05 mg/L for ciprofloxacin and 0.01, 0.05 and 0.5 mg/L for its metabolites, M1, M2 and M3, respectively [Krol *et al.* 1995]. See Blood [Teja-Isavadharm *et al.* 1991].

CE Fluorescence detection. Limit of detection, 0.02 mg/L [Bannefeld *et al.* 1997].
Serum **HPLC** See Plasma [Krol *et al.* 1995]. UV detection. Limit of detection, 0.05 mg/L [Mack 1992]. UV detection. Limit of detection, 0.1 mg/L [Pou-Clave *et al.* 1991]. Fluorescence detection. Limit of detection, 0.02 mg/L [Myers, Blumer 1987]. Fluorescence detection. Limit of detection, 0.01 mg/L [Nilsson-Ehle 1987]. UV detection. Limit of detection, 0.06 mg/L [Vallée *et al.* 1986]. UV detection. Limit of detection, 0.01 mg/L [Jehl *et al.* 1985]. Fluorescence detection. Limit of detection, 0.08 mg/L [Nix *et al.* 1985].

Sputum **HPLC** See Serum [Mack 1992]; [Myers, Blumer 1987]; [Vallée *et al.* 1986].

Disposition in the Body Ciprofloxacin is rapidly and well absorbed after oral administration. It is widely distributed and it diffuses into CSF (cerebrospinal fluid); concentrations are usually <10% of peak plasma concentrations, although higher concentrations are found if the meninges are inflamed. It crosses the placenta and is distributed into breast milk. The drug is eliminated principally by urinary excretion (active tubular secretion as well as glomerular filtration). Non-renal clearance may account for about a third of elimination (hepatic metabolism, biliary excretion, and possibly transluminal secretion across intestinal mucosa). Active metabolites have been identified. About 40 to 50% of an oral dose is excreted unchanged in urine with about 15% excreted as metabolites. Up to 70% of a parenteral dose may be excreted unchanged within 24 h and 10% as metabolites. Faecal excretion over 5 days has accounted for 20 to 35% of an oral dose and 15% of an IV dose. Only small amounts are removed by haemodialysis or peritoneal dialysis.

Therapeutic Concentration The trough serum therapeutic concentration range is 0.05 to 0.5 mg/L and peak, 1 to 5 mg/L.

Single oral doses of 500 mg administered to 7 people undergoing orthopaedic surgery produced mean concentrations of 1.4 mg/L (serum), 0.4 µg/g (bone) and 1.1 µg/g (muscle) [Fong *et al.* 1986].

Toxicity

A 29-year-old woman was presented to hospital the day after ingesting 21 g of ciprofloxacin. She had vomited about 3 h after swallowing the tablets. The serum-ciprofloxacin concentration at presentation was 12 mg/L. 12 h later she developed oliguric acute renal failure. She made a full recovery following treatment with steroids, and hydration and acidification of urine [George *et al.* 1991].

Bioavailability 70%.
Half-life Plasma, 3.5 to 4.5 h.
Volume of Distribution 1.8 to 5.0 L/kg.
Clearance Plasma, 35 L/h.
Protein Binding 20 to 40%.
Note For reviews of ciprofloxacin, see Campoli-Richards *et al.* [1988] and Vance-Bryan *et al.* [1990].
Dose The equivalent of up to 1500 mg of ciprofloxacin daily by mouth; up to 800 mg daily may be given IV.

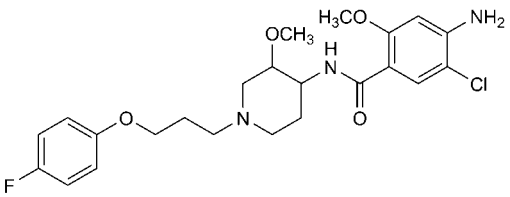
Cisapride

Peristaltic Stimulant
$C_{23}H_{29}ClFN_3O_4 = 466.0$
CAS—81098-60-4

IUPAC Name 4-Amino-5-chloro-*N*-[1-[3-(4-fluorophenoxy)propyl]-3-methoxypiperidin-4-yl]-2-methoxybenzamide
Proprietary Names *Alimix*; *Arcasin*; *Cyprid*; *Fisiogastrol*; *Kelosal*; *Kinet*; *Prepulsid*; *Propulsid*; *Propulsin*; *Pulsitil*; *Trautil.*



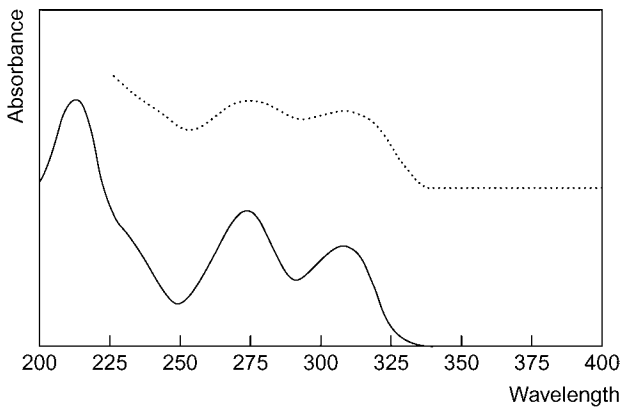
Chemical Properties White or almost-white powder; it exhibits polymorphism. It is practically insoluble in water; freely soluble in dimethylformamide; soluble in dichloromethane; sparingly soluble in methanol. pK_a 7.83. Log *P* (octanol/water) 3.96 [Woestenborghs *et al.* 1988]. Stable when extracted samples were reconstituted in mobile phase and stored at 20 ± 3° for 24 h. Stable in plasma stored at room temperature or 4° for at least 6 h, and at –20° for at least 48 h. Satisfactory stability was observed after 8 weeks at –70° [Preechagoon, Charles 1995]. Stable in suspension for 91 days at 4° and 28 days at 25° in darkened vials [Nahata *et al.* 1995]. Stable in plasma for at least 9 months at −20° [Woestenborghs *et al.* 1988].

Cisapride Monohydrate

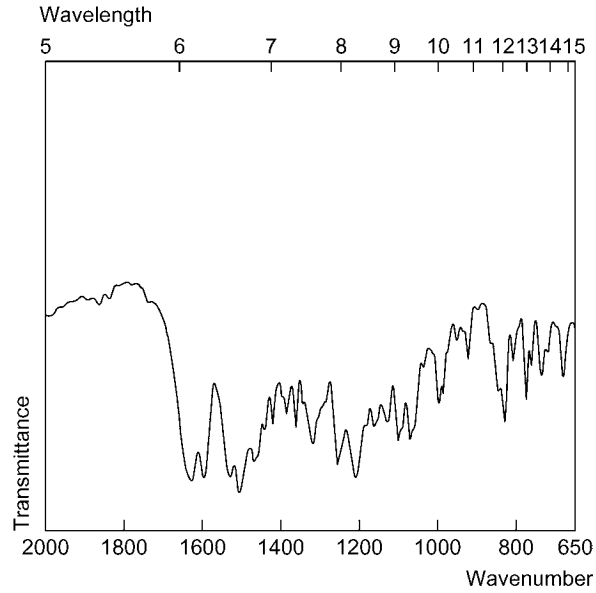
$C_{23}H_{29}ClFN_3O_4, H_2O = 484.0$
Synonym R-51619
Proprietary Names *Acenalin*; *Alimix*; *Cipril*; *Prepulsid*; *Propulsin*; *Risamal.*
Chemical Properties Crystals from 2-propanol. Mp 109.8°. Stable in plasma for at least 9 months if stored at –20° [Barone *et al.* 1987].

Thin-Layer Chromatography System TAE—R_f 0.66; system TB—R_f 0.00; system TE—R_f 0.62.
High Performance Liquid Chromatography System HAA—retention time 14.6 min; system HAX—retention time 10.9 min; system HAY—retention time 5.8 min; system HX—RI 431; system HY—RI 317; system HZ—retention time 5.2 min.

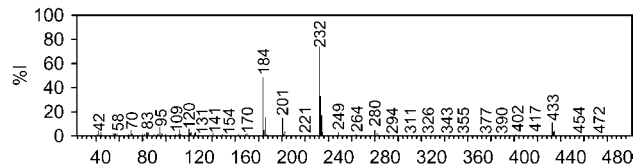
Column: Zorbax Rx-C8 (160 × 4.0 mm i.d., 5 µm). Mobile phase: water : triethylamine : acetonitrile (35 : 0.02 : 65), flow rate 1.0 mL/min. UV detection (λ = 276 nm). Retention time: 2.7 min [Nahata *et al.* 1995].
Ultraviolet Spectrum Aqueous acid (0.2 mol/L H_2SO_4)—273, 307 nm; basic—275, 308 nm.



Infrared Spectrum Principal peaks at wavenumbers 1499, 1203, 823 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 232, 184, 233, 201, 186, 433, 95, 120.



Quantification

Plasma **HPLC** Column: Chiral (250 × 4.6 mm i.d.). Mobile phase: ethanol : hexane (35 : 65), flow rate 1.2 mL/min. UV detection (λ = 275 nm). Limit of quantification, 5 µg/L, limit of detection, 1 µg/L [Desta et al 2000]. Column: C_{18} RP NovaPak (150 × 3.9 mm i.d., 4 µm). Mobile phase: acetonitrile : methanol : 0.015 mol/L sodium phosphate buffer (pH 2.2; 68 : 19.4 : 12.6), flow rate 0.8 mL/min. UV detection (λ = 276 nm). *k* values: cisapride, 2.7 (retention time, 4.3 min); norcisapride, 3.7 (5.3 min). Limit of quantification, 10 µg/L for cisapride and norcisapride [Cisternino *et al.* 1998]. Column: C_8 Symmetry (150 × 3.9 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.02 mol/L phosphate buffer (pH 5.2; 37 : 63), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 295 nm, λ_{em} = 350 nm). Limit of quantification, 8 µg/L; limit of detection, 5 µg/L [Preechagoon, Charles 1995]. Column: ODS-Hypersil (150 × 2.1 mm i.d., 5 µm). Mobile phase: water : acetonitrile (56 : 44), flow rate 0.8 mL/min. UV detection (λ = 276 nm). Retention time: 3.04 min. Limit of detection, 1 µg/L [Woestenborghs *et al.* 1988].

LC-MS Column: Hypersil C_{18} (500 × 4.6 mm i.d.). Mobile phase: methanol : 0.1 mol/L phosphate buffer (25 : 75 to 90 : 10). TIS, positive ion mode. Limit of detection, 1 µg/L [Lowry *et al.* 2003].

Serum **HPLC** Column: ODS Hypersil (150 × 4.6 mm i.d.). Mobile phase: 0.05 mol/L disodium hydrogen phosphate : acetonitrile (pH 8.4; 60 : 40), flow rate 1.0 mL/min. Electrochemical detection. Limit of detection, 0.5 µg/L [de Condado *et al.* 2001].

Urine **HPLC** Column: Platinum EPS C_8 (150 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 0.02 mol/L sodium dihydrogen phosphate (45 : 55) containing 1 g/L triethylamine (pH 7.0), flow rate 1.3 mL/min. Fluorescence detection (λ_{ex} = 295 nm), λ_{em} = 300 nm). Limit of quantification, 50 µg/L [Addison *et al.* 1999].

Disposition in the Body Cisapride is readily absorbed after oral administration and the presence of food enhances absorption. It undergoes extensive metabolism in the liver and gut wall mainly via CYP3A4. This could affect neonates [Kearns *et al.*]. The main metabolic pathways are oxidative *N*-dealkylation, producing the major metabolite norcisapride, and aromatic hydroxylation to 3-fluoro-4-hydroxycisapride and 4-fluoro-2-hydroxycisapride. More than 90% of a dose is excreted as metabolites in urine and the faeces in ~equal amounts; 4 to 6% of a dose is recovered as the unchanged drug in the faeces and 0.2% in urine [Meuldermans *et al.* 1988]. A small amount is distributed into breast milk with ~0.1% of a dose being detected (milk : serum ratio, 0.045). It is not removed by haemodialysis.

Therapeutic Concentration

Mean peak plasma concentrations of 45 to 65 µg/L were reached about 1 to 2 h after administration of 10 mg given orally to healthy volunteers 15 min before food intake. Peak plasma concentrations of 49 µg/L were observed in the fasting state and 60 µg/L after the meal [Janssen Pharmaceutica data files].

Seventeen healthy females (age: 18 to 50 years) were administered 0.07 mg/kg cisapride. Mean peak plasma concentrations were 21.7 ± 8.3 μg/L at 1.29 ± 0.83 h [Lowry *et al.* 2003].

Ten male healthy volunteers were given 200 mL double-strength grapefruit juice 3 times a day. On day 3, subjects were given 10 mg cisapride with 200 mL double-strength grapefruit juice or water. Mean peak plasma concentrations of cisapride were 78.3 ± 23.6 μg/L at 2.5 h in the grapefruit juice phase compared with 43.2 ± 16.8 μg/L at 1.5 h in the control phase [Kivisto *et al.* 1999].

Eight elderly Japanese patients (age: 85 ± 6 years) were administered a single oral dose of 2.5 mg cisapride. They were also given 7.5 mg/day for the next 26 days. On day 1, the mean maximum plasma concentration was 10.7 ± 8.4 μg/L at 2.2 ± 1.2 h and on day 28 the mean maximum plasma concentration was 26.7 ± 7.6 μg/L at 2.8 ± 1.4 h [Yamamoto *et al.* 1998].

Twenty-two patients undergoing haemodialysis were administered a single oral dose of 20 mg cisapride. The mean maximum plasma concentration was 78.2 ± 20.9 μg/L reached at 2.0 ± 1.3 h. The terminal half-life was 9.6 ± 3.3 h, the volume of distribution was 4.8 ± 3.3 L/kg, and the total oral plasma clearance was 380 ± 161 mL/min [Gladziwa *et al.* 1991].

Toxicity Rare cases of cardiac arrhythmia, including ventricular tachycardia, ventricular fibrillation, torsade de pointes, and QT interval prolongation, have been reported [Bedu *et al.* 1997; Hanson *et al.* 1997].

A prolonged QT interval developed in 6 infants aged 11 to 70 days (weighing 1.2 to 4.0 kg) who were given cisapride 1.0 to 1.6 mg/kg daily. Correction of the QT interval occurred after cessation of cisapride in 5 of the infants and dose reduction to 0.8 mg/kg in another (plasma-cisapride concentrations were not reported) [Bedu *et al.* 1997].

Note For a case of movement disorders in a 3-year-old female while cisapride was being administered, see Elzinga-Huttenga *et al.* [2006]. For a case of an 8-month-old female with cisapride poisoning, see Gibly *et al.* [1997].

Bioavailability 35 to 40%.

Half-life Plasma, 7 to 10 h.

Volume of Distribution ≈24 L/kg [Gibly *et al.* 1997].

Clearance Plasma clearance, ≈100 mL/min.

Protein Binding 98% mainly to albumin [Gibly *et al.* 1997].

Note For a review of cisapride, see McCallum *et al.* [1988].

Dose Usually 5 to 10 mg three or four times daily.

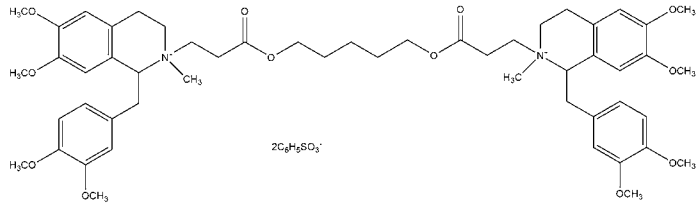
Cisatracurium

Skeletal Muscle Relaxant

$C_{53}H_{72}N_2O_{12} = 929.2$

IUPAC Name 5-[3-[(1*R*,2*S*)-1-[(3,4-Dimethoxyphenyl)methyl]-6,7-dimethoxy-2-methyl-3,4-dihydro-1*H*-isoquinolin-2-ium-2-yl]propanoyloxy]pentyl 3-[(1*R*,2*R*)-1-[(3,4-dimethoxyphenyl)methyl]-6,7-dimethoxy-2-methyl-3,4-dihydro-1*H*-isoquinolin-2-ium-2-yl]propanoate

Synonym (1*R*,1′*R*,2*R*,2′*R*)-2,2′-[1,5-Pentanediylbis[oxy(3-oxo-3,1-propanediyl)]]bis[1-[(3,4-dimethoxyphenyl)methyl]-1,2,3,4-tetrahydro-6,7-dimethoxy-2-methylisoquinolinium]



Chemical Properties Log *P* (octanol/water), −2.12.

Cisatracurium Besilate

$C_{65}H_{82}N_2O_{18}S_2 = 1243.5$

CAS—96946-42-8

Synonyms Cisatracurium besylate; 51W89.

Proprietary Name *Nimbex dibenzenesulfonate*, .

Quantification

Plasma **HPLC** Fluorescence detection. Limit of quantification, 0.01 mg/L [Boyd *et al.* 1996].

Disposition in the Body After IV administration it is inactivated in plasma by Hofmann elimination, a non-enzymatic breakdown process (pH and temperature dependent) to form a monoquaternary acrylate metabolite and laudanosine, neither of which has neuromuscular blocking activity. This elimination process contributes to 77% of the clearance of the drug. The acrylate metabolite may also undergo further metabolism to its corresponding alcohol and then more laudanosine. Laudanosine (which may have some stimulatory action on the CNS (central nervous system) is further metabolised to desmethyl metabolites that are conjugated with glucuronic acid. Cisatracurium is excreted mainly as metabolites in urine and faeces; <10% is excreted as the unchanged drug. About 40% of a dose is eliminated in faeces.

Therapeutic Concentration

The mean peak plasma laudanosine concentration was 0.71 mg/L (range 0.21 to 1.26) following an infusion of cisatracurium at 0.19 (0.16 to 0.21) mg/kg/h in 6 intensive-care patients, critically ill, sedated and requiring neuromuscular blocking drug to assist mechanical ventilation (>18 years old). Following a mean atracurium infusion of 0.47 (range 0.3–0.74) mg/kg/h, the mean concentration was 2.31 mg/L (range 0.78 to 4.40) [Boyd *et al.* 1996].

The mean peak plasma concentration of laudanosine was 23.1 μg/L 4 min after a 0.1 mg/kg cisatracurium dose administered IV to 15 healthy subjects, with a mean age of 42.9 years (range 21.8 to 64.0) undergoing elective surgery. Seventeen patients with end-stage chronic renal failure, most of them scheduled for dialysis-access procedures with a mean age of 43.9 years (range 25.7 to 62.4), were administered with the same dose and mean concentrations were 0.031 mg/L at 150 min [Eastwood *et al.* 1995].

Peak plasma concentrations of laudanosine following administration of 0.1 mg/kg IV bolus of cisatracurium to 10 subjects ranged from 0.013–0.086 mg/L (mean 0.038 mg/L). Following administration of 0.2 mg/kg IV bolus to 10 subjects peak plasma-laudanosine concentrations ranged from 0.066–0.174 mg/L (mean 0.103 mg/L) [Lien *et al.* 1996].

Half-life Plasma, 22–35 min.

Volume of Distribution Steady state, 0.11–0.16 L/kg; increased in the elderly 17–37% and in patients with end-stage liver failure (21%).

Clearance Plasma, 4.6–5.7 mL/min/kg; decreases in those with renal failure and increases in patients with end-stage liver disease.

Note For a review of cisatracurium, see Bryson, Faulds [1997].

Dose The equivalent of 0.15 or 0.2 mg/kg of cisatracurium IV for intubation followed by 0.03 mg/kg every 20 min for maintenance.

Boyd AH *et al.* (1996). Comparison of the pharmacodynamics and pharmacokinetics of an infusion of cis-atracurium (51W89) or atracurium in critically ill patients undergoing mechanical ventilation in an intensive therapy unit. *Br J Anaesth* 76: 382–388.

Cisplatin

Antineoplastic

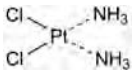
$(NH_3)_2.PtCl_2 = 300.1$

CAS—15663-27-1

IUPAC Name Azanide; dichloroplatinum(2+)

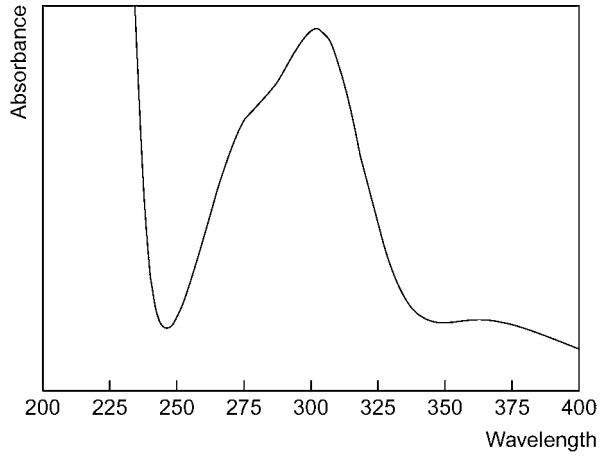
Synonyms CACP; CDDP; *cis*-DPP; cisplatinum; CPDC; DDP; *cis*-diamminedichloroplatinum; NSC-119875; Peyrone's salt; platinum diamminodichloride.

Proprietary Names *Abiplatin*; *Cisplatyl*; *Citoplatino*; *Lederplatin*; *Neoplatin*; *Norplatin*; *Placis*; *Platamine*; *Platiblastin*; *Platiblastine*; *Platinex*; *Platinol*; *Platistil*; *Platistin*; *Platosin*; *Randa*.

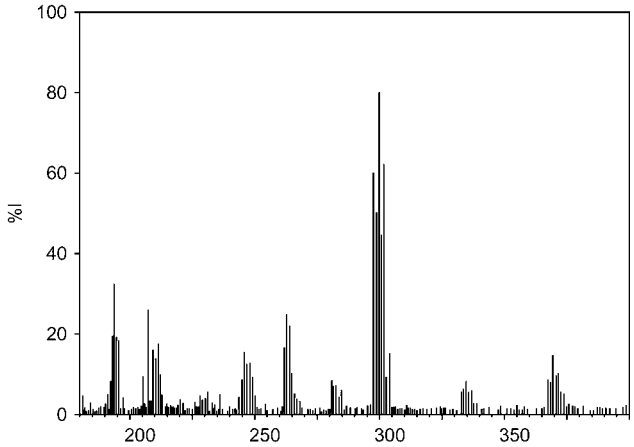


Chemical Properties A yellow powder or yellow or orange-yellow crystals. Mp 270°, with decomposition. It is slightly soluble in water (0.253 g/100 g at 25°); sparingly soluble in dimethylformamide; practically insoluble in ethanol and most common organic solvents, except *N,N*-dimethylformamide, *N,N*-dimethylacetamide and dimethylsulfoxide. Log *P* (octanol/water), −2.19.

Ultraviolet Spectrum Aqueous acid (0.1 mol/L hydrochloric acid)—203 ($A^1_1 = 173$), 285 ($A^1_1 = 3.63$), 301 ($A^1_1 = 4.33$), 362 nm ($A^1_1 = 0.806$).



Mass Spectrum Principal ions at *m/z* 300, 302, 193, 207, 264, 246, 211, 370.



Quantification

Blood **HPLC** Column: Varian Micro-Pak SP C_{18} (150 × 4.0 mm i.d., 5 µm). Mobile phase: methanol : acetonitrile : water (40 : 30 : 30), flow rate 1.0 mL/min. UV detection (λ = 254 nm). Limit of detection, 4 ng per injection [Lanjwani *et al.* 2006].

Plasma **HPLC** Column: Nucleosil 5 SB (150 × 4.6 mm i.d.). Mobile phase: methanol : 0.1 mol/L phosphate buffer (pH 5.0, 11 : 9), flow rate 1.0 mL/min. UV detection (λ = 210 nm). Limit of quantification, 60 nmol/L [Verschraagen *et al.* 2002]. Column: anionic exchange resin (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 10 mmol/L sodium chloride (85 : 15), flow rate 0.7 mL/min. UV detection (λ = 290 nm). Retention time: 11 min. Limit of detection, 0.08 mg/L [Kinoshita *et al.* 1990]. Column: Hypersil ODS (150 × 4.6 mm i.d., 5 µm). AES. Limit of detection, 0.035 mg/L [de Waal *et al.* 1987] Column: µBondapak C_{18} (150 × 3.9 mm i.d., 10 µm). Electrochemical detection. Limit of detection, 0.062 mg/L [Parsons, LeRoy 1986]. See also Andrews *et al.* [1984] and Reece *et al.* [1984].

LC-MS Column: µBondapak C_{18}. Mobile phase: 0.075 µmol/L SDS : methanol (pH 2.5, 93 : 7), flow rate 0.5 mL/min. Limit of quantification, 0.1 µmol/L [Bell *et al.* 2006].

Urine **HPLC** See Blood [Lanjwani *et al.* 2006]. See Plasma [Kinoshita *et al.* 1990].

Disposition in the Body Following IV administration, cisplatin concentrates in the liver, kidneys, and the large and small intestines. Penetration into CNS is poor. It is distributed into breast milk. The chlorine atoms in cisplatin undergo chemical displacement reactions with water and sulfhydryl groups (e.g. on proteins) rather than undergoing enzyme-catalysed metabolism. Excretion is mainly in urine but is incomplete and prolonged; up to 50% of a dose has been reported to be excreted in urine over 5 days and platinum may be detected in tissue for several months afterwards. There is some excretion in faeces via bile. Cisplatin is well absorbed following intraperitoneal administration.

Therapeutic Concentration The peak plasma therapeutic concentration is 1–5 mg/L (free fraction).

Toxicity The trough toxic concentration is 0.1 mg/L (free fraction).

A 59-year-old man received an accidental overdose of 300 mg/m^2 over 3 days. He developed severe emesis, myelosuppression, renal failure, mental deterioration, dim vision and hepatic toxicity. Three days later the plasma platinum concentration was 2.679 mg/L. Plasmapheresis was employed to reduce plasma platinum concentrations, and all symptoms resolved [Jung *et al.* 1995].

A 68-year-old woman received 280 mg/m^2 cisplatin without hydration when it was accidentally substituted for carboplatin. She developed severe emesis, myelosuppression, nephrotoxicity, ototoxicity, central neurotoxicity, visual loss and hepatic toxicity. On day 13 after the overdose, the plasma platinum concentration was 2.6 mg/L. Plasmapheresis was performed to reduce plasma platinum concentrations, but the patient required a kidney and bone-marrow transplant and remained deaf [Chu *et al.* 1993].

Half-life Plasma: unbound cisplatin 25–48 min, protein-bound platinum 58–73 h.

Volume of Distribution 11–12 L/m^2, also reported as 20–80 L.s.

Clearance Plasma, 15–16 L/h/m^2.

Protein Binding The majority is bound.

Dose Up to 120 mg/m^2 body-surface area by IV infusion as a single dose, or 15 to 20 mg/m^2 by infusion daily for 5 consecutive days, every 3 to 4 weeks.

Citalopram

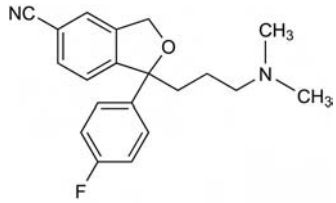
Antidepressant, Selective Serotonin Reuptake Inhibitor (SSRI)

$C_{20}H_{21}FN_2O$ = 324.4

CAS—59729-33-8

IUPAC Name 1-[3-(Dimethylamino)propyl]-1-(4-fluorophenyl)-1,3-dihydro-5-isobenzofurancarbonitrile

Synonyms Lu 10-171; nitalapram.



Chemical Properties Log *P* (octanol/water), 3.74. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Citalopram Hydrobromide

$C_{20}H_{21}FN_2O$, HBr = 405.3

CAS—59729-32-7

Synonym Lu 10-171-B

Proprietary Names *Cipramil*; *Seropram*.

Chemical Properties A white to off-white, crystalline solid with Mp 186°. It is sparingly soluble in water; soluble in ethanol (96%); freely soluble in chloroform; practically insoluble in diethylether pK_a 9.5. Log *P* (octanol/phosphate buffer pH 7.4), 1.57.

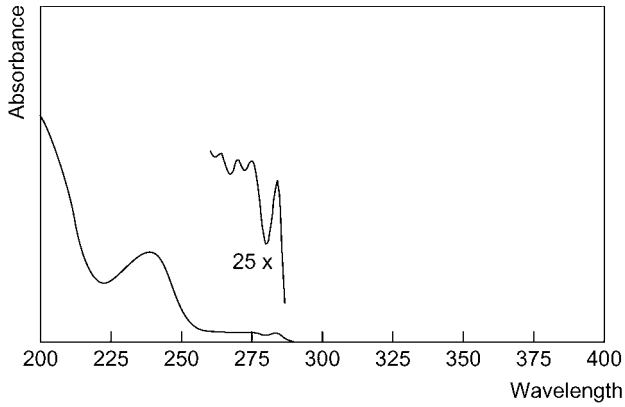
Thin-layer Chromatography System TB—R_f 0.22; system TE—R_f 0.60; system TAE—R_f 0.19.

Gas Chromatography System GB—citalopram RI 2499, M (nor) RI 2526; system GM—citalopram RRT 1.12 min, M (nor) RRT 1.23 min (relative to iprindole).

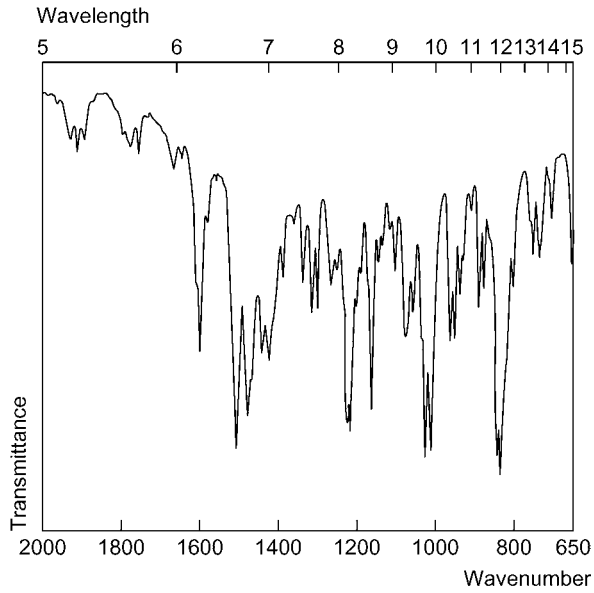
High Performance Liquid Chromatography System HX—RI 403; system HZ—citalopramRT 4.5 min, M (desmethyl) RT 3.7 min.

Column: C_{18} (Supelco, 250 × 4.6 mm i.d.). Mobile phase: 44 mmol/L potassium dihydrogen phosphate buffer containing 1.5 mL TEA in 1 L (pH 2.5) : acetonitrile (55 : 45), flow rate 1.5 mL/min. UV detection (λ = 240 nm). Retention time: 5.56 min for citalopram, 5.06 min for desmethylcitalopram, and 4.51 min for didesmethylcitalopram [Olesen, Linnet 1996].

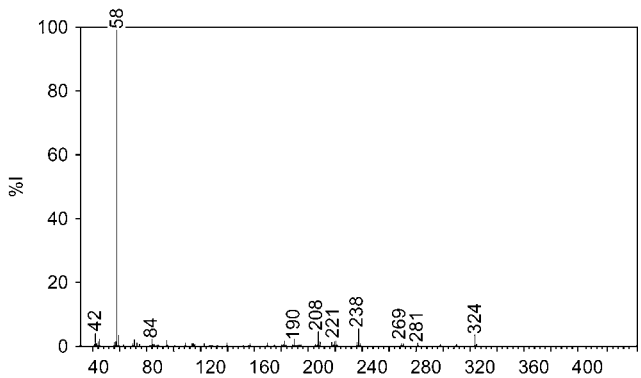
Ultraviolet Spectrum Aqueous acid (0.1 mol/L hydrochloric acid)—205, 238 nm (hydrobromide); Methanol—209, 237, 270 nm.



Infrared Spectrum Principal peaks at wavenumbers 834, 1507, 1034, 1226, 1160, 1601 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 58, 238, 208, 42, 324, 190 (citalopram); *m/z* 44, 238, 310, 138, 208, 57 (desmethylcitalopram).



Quantification

Blood **GC** NPD. Limit of quantification, 60–786 μg/L, limit of detection, 18–236 μg/L [Martinez *et al.* 2004].

GC-MS [Wille *et al.* 2009].

Plasma **GC-MS** EI ionisation or CI, SIM acquisition mode. Limit of quantification, 5–12.5 μg/L (EI) 1–6.25 μg/L (CI) [Wille *et al.* 2007]. Column: Permabond SE-54-DF-0.25 fused silica capillary (25 m × 0.25 mm, 0.27 μm). Temperature programme: 160° to 260° at 30°/min. Carrier gas: He, 60 mL/min. Retention time (relative to amitriptyline): 1.27 for citalopram, 1.27 for didesmethylcitalopram, and 1.32 for desmethylcitalopram. Limit of quantification, 1 μg/L [Reymond *et al.* 1993].

HPLC Column: ODS (250 × 4.0 mm, 5 μm). Mobile phase: 0.4% tetramethylammonium chloride (pH 4.0) : acetonitrile (40 : 60), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 240 nm, λ_{em} = 308 nm). Limit of quantification, 0.5 μg/L [Unceta *et al.* 2010]. Column: Nucleosil 100 C_{18} (125 × 4 mm i.d., 5 μm). Mobile phase: acetonitrile : 45 mmol/L ammonium formate (pH 4.0, 50 : 50), flow rate 1.2 mL/min. Fluorescence detection (λ_{ex} = 245 nm, λ_{em} = 295 nm). Limit of quantification, 0.8 μg/L, limit of detection, 0.3 μg/L [Bagheri *et al.* 2008]. Column: Chiral-AGP. Mobile phase: 3 μmol/L *N*-dodecyl-*N*,*N*-dimethylammonio-3-propanesulfonate : 10 μmol/L hexanoic acid in phosphate buffer (pH 6.5). UV detection (λ = 240 nm). Limit of detection, 1 μg/L [Haupt 1996]. Column: acetylated β-Cyclobond (250 × 4.6 mm, 5 μm). Mobile phase: 20% acetonitrile or 65% methanol with 1% diethanolamine buffer (pH 6.1), flow rate 0.8 mL/min. Fluorometric detection λ_{ex} = 240 nm, λ_{em} = 296 nm). Retention time: (*S*)-(+)-citalopram 15.5 min, (*R*)-(−)-citalopram 16.6 min, (*S*)-(+)-desmethylcitalopram 12.2 min, (*R*)-(−)-desmethylcitalopram 12.9 min; (*S*)-(+)-didesmethylcitalopram 10.6 min; (*R*)-(−)-didesmethylcitalopram, 11.1 min. Limit of quantification, 3 μg/L [Rochat *et al.* 1995]. UV detection (λ = 239 nm). Limit of detection, 0.8 μg/L [Rop *et al.* 1990]. Column: μBondapak C_{18} (300 × 3.9 mm i.d., 10 μm). Mobile phase: acetonitrile : 0.025 mol/L potassium dihydrogen phosphate : water (45 : 50 : 5), flow rate 0.5 mL/min. UV detection (λ = 254 nm). Retention time: 11.3 min. Limit of detection, 4–5 μg/L [Rop *et al.* 1985].

Serum **HPLC** Column: LiChrospher CN (5 μm). Mobile phase: 8 mmol/L phosphate buffer (pH 6.4) : acetonitrile (50 : 50), flow rate 1.5 mL/min. UV detection (λ = 210 nm). Limit of detection, 6 μg/L [Greiner *et al.* 2007]. Monolithic C_{18} (50 × 4.6 mm). Mobile phase: methanol : 5 μmol/L acetate buffer at pH 3.9 [Kirchherr, Kühn-Velten 2006]. Column: reversed phase C_{18}. Mobile phase: acetonitrile : ammonium acetate buffer (pH 4). Limit of quantification, 1.2–54 nmol/L [Gutteck, Rentsch 2003]. Column: Nucleosil 100-Protect 1. Mobile phase: acetonitrile : potassium dihydrogenphosphate buffer. UV detection [Frahnert *et al.* 2003]. Column: C_{18}. Mobile phase: acetonitrile : buffer (30 : 70), flow rate 1.5 mL/min. Fluorescence detection (λ_{ex} = 227 nm, λ_{em} = 300 nm) [Waschgler *et al.* 2002]. See also Olesen, Linnet [1996].

Urine **HPLC** See Plasma. Limit of quantification, 2.5 μg/L [Unceta *et al.* 2010].

Brain **GC-MS** See Blood [Wille *et al.* 2009].

HPLC See Plasma. Limit of quantification, 5.0 ng/g [Unceta *et al.* 2010].

Hair **GC-MS** See Blood [Wille *et al.* 2009].

Disposition in the Body Citalopram is readily absorbed after oral administration, with a bioavailability of ~80%; peak plasma concentrations occur after ~2–4 h. It is metabolised by *N*-demethylation, deamination and oxidation to desmethylcitalopram, didesmethylcitalopram, citalopram-*N*-oxide and a propionic acid derivative. The metabolites have some pharmacological activity although they do not contribute to the overall antidepressant effect of citalopram. Unlike some other selective serotonin reuptake inhibitors, it has only a mild inhibitory effect on CYP2D6. Approximately 12% of the daily dose is excreted unchanged in urine and an equal amount as the main active metabolite, desmethylcitalopram. Also present are an amino metabolite and a conjugated propionic acid derivative. Approximately 65% of a dose is unaccounted for and could possibly be present in faeces or undergo a number of different metabolic pathways. It is distributed into breast milk in very small amounts. Extensive tissue binding has been observed and accumulation can occur with repeated dosing.

Therapeutic Concentration The therapeutic concentration range is 20–200 μg/L.

Twelve healthy male volunteers, aged between 18 and 40 years, were administered citalopram 20 or 40 mg daily for 9 days. The mean plasma concentration was 91 μg/L (range, 45–126). The mean dimethylcitalopram concentration was 19–50 μg/L [Lader *et al.* 1986].

Patients suffering from severe depression were administered 20 mg citalopram daily for 12 weeks and the steady-state concentrations were 40 μg/L for citalopram, 12 μg/L for desmethylcitalopram and 2 μg/L for didesmethylcitalopram. For those given 40 mg daily, steady-state concentrations were 67, 22 and 4 μg/L for citalopram, desmethylcitalopram and didesmethylcitalopram, respectively [Montgomery *et al.* 1993].

Toxicity The lethal concentration is 500 μg/L.

Citalopram plasma concentrations were 6 times greater than the therapeutic concentrations in a patient who attempted suicide. There were no significant changes in level of consciousness, ECG or blood pressure [Pedersen *et al.* 1982].

A 41-year old Caucasian man was found dead at his home; he had a history of depression and suicide attempts. Surrounding the man was a number of medication bottles and a bottle of whiskey. Toxicological analysis showed that the man had ethanol, lormetazepam, cotinine, caffeine, moclobemide and citalopram in his urine and blood. Citalopram was detected in blood at a concentration of 4.47 mg/L and in urine at 19.7 mg/L. The metabolite desmethylcitalopam was found at concentrations of 0.42 mg/L and 1.22 mg/L in the 2 fluids, respectively. The cause of death was determined as the synergistic toxicity of moclobemide and citalopram; and death was ruled as multiple drug intoxication [Dams *et al.* 2001].

Bioavailability ≈80%.

Half-life Plasma: citalopram 33 h, desmethylcitalopram 48 h and didesmethylcitalopram, 96 h; half-life is longer in the elderly, 3.75 days.

Volume of Distribution 12–16 L/kg.

Clearance Plasma: 0.33 L/min in the young and 0.08 L/min in the elderly.

Protein Binding 50%.

Note For reviews of citalopram, see Baumann [1996], Milne, Goa [1991], and Preskorn [1997].

Dose The usual starting dose is 20 mg or, more frequently, 40 mg, which may be increased up to 60 mg citalopram daily, given as the hydrobromide.

Citrinin

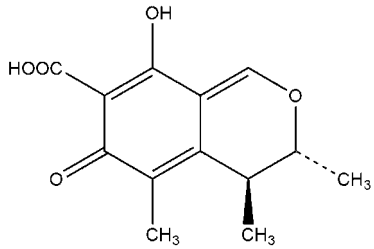
Mycotoxin

$C_{13}H_{14}O_5$=250.3

CAS—518-75-2

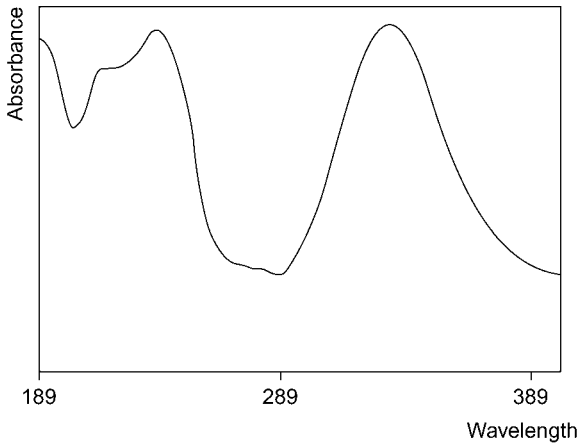
IUPAC Name (3*R*,4*S*)-7-(Dihydroxymethylidene)-3,4,5-trimethyl-3,4-dihydroisochromene-6,8-dione

Synonyms Antimycin; (3*R*,4*S*)-8-hydroxy-3,4,5-trimethyl-6-oxo-4,6-dihydro-3*H*-isochromene-7-carboxylic acid.



Chemical Properties Mycotoxin first isolated from *Penicillium citrinum*. Lemon-yellow needles from alcohol. Mp 175° with decomposition. Strong acid. Practically insoluble in water. Soluble in alcohol, dioxane, and dilute alkali. Solutions change colour with changes in pH, from lemon-yellow at pH 4.6 to cherry-red at pH 9.9. Log *P* (octanol/ water), 0.45 [Meylan, Howard 1995].

Ultraviolet Spectrum 250, 331 nm [O'Neil *et al.* 2006].



Thin-layer Chromatography Plates: RP-18 and KC-18. Solvent systems: A) methanol : water; B) acetonitrile : water; C) tetrahydrofuran : water. Location reagent: 4-(*p*-nitrobenzyl)pyridine for trichothecenes; UV (λ= 365 nm) for aflatoxins, ochratoxin A, citrinin; aluminium trichloride for sterigmatocystin; Azoene Fast Violet B for zearalenone; 3-methyl-2-benzthiazolinone hydrazone hydrochloride for patulin and penicillic acid. Solvent composition and R_f values reported as shown in the table overleaf.

Quantification

Plasma **HPLC** Column: reversed phase (10 µm). Mobile phase: 0.25 N phosphoric acid : acetonitrile : 2-propanol (55 : 35 : 10). UV detection (λ= 340 nm). Limit of detection, 2–5 ng [Phillips *et al.* 1980].

Urine **HPLC** Column: C_8 reversed phase. Mobile phase: 0.25 N phosphoric acid : acetonitrile : 2-propanol (55 : 40 : 5). Fluorescence detection (λ_{ex}= 319 nm, λ_{em}= 460 nm). Limit of detection, 10 ppb [Orti *et al.* 1986].

Other **LC-MS** Peanut, Pistachio, Wheat, Maize, Cornflakes, Raisins, and Figs. ESI, positive ion mode, MRM acquisition mode. Retention time, 16.2 min. Limit of quantification, 10–200 µg/kg [Spanjer *et al.* 2008].

Toxicity LD_{50} (IP) in mice, rats: 35, 67 (mg/kg), respectively.

Citronella Oil

Monoterpene, Essential Oil, Insect Repellent, Antifungal
CAS—89998-15-2

Proprietary Names *Aulo Gelio Repelente*; *Buzz Away*; *Druide Insect Repellent*; *Kneipp Beruhigungs-Bad spezial*; *Mozzie Patch*; *Natrapel*; *Repelente Rep*; *Schupps Melissen Olbad*; *Valmarin Bad N*. It is also an ingredient in *Air Citronella*; *Amol*; *Apex Repel Natural*; *Aulo Repelente De Piojos*; *Apex Repel Natural*; *Baume du Chalet*; *Biokosma Embrocation*; *Biokosma Medizinalbad*; *Biokosma Red Point-Massagecreme*; *Carmolis*; *Citrosystem*; *Dr Fischers Melissengeist*; *esto-gast*; *Goanna Bite-Eze*; *Herzfluid*; *Kneipp Krauter Taschenkur Nerven und Schlaf N*; *Kneipp Sedativ-Bad*; *Melissengeist*; *Mistick Verde*; *Natural Zanzy*; *No-Bite*; *Novital*; *Pungino*; *Saltrates*; *Sansilla*; *Schupps Baldrian Sedativbad*; *Silvapin Aktiv-Tonic MMP*; *Snowfire*; *Treo*; *Valin Baldrian*; *Ysol 206*.

Chemical Properties The oil is obtained by steam distillation from the fresh or partially dried aerial parts of *Cymbopogon winterianus*. It contains 30.0 to 45.0% citronellal ($C_{10}H_{18}O$=154.3), 9.0 to 15.0% citronellol, 2.0 to 4.0% citronellyl acetate, <2.0% geranial, 20.0 to 25.0% geraniol ($C_{10}H_{18}O$=154.3), 3.0 to 8.0% geranyl acetate, 1.0 to 5.0% limonene, and <2.0% neral. A pale-yellow to brownish-yellow liquid with a very strong odour of citronellal. Soluble 1 in 4 of ethanol (80%), forming a clear or slightly opalescent solution. Citronella oil is volatile and may be isolated by distillation. Store in well-closed containers. Protect from light.

Quantification

Other **GC-MS** Plant Samples. Column: HP-5 (25 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 60° to 240° at 3°/min, for 7 min. EI ionisation at 70 eV. Retention indices: β-myrcene 990, *cis*-β-ocimene 1034, *trans*-β-ocimene 1044, *trans*-geraniol 1254, geranyl acetate 1382, *trans*-caryophyllene 1414, (*E*,*E*)-farnesol 1720. Limit of quantification not reported [Duarte *et al.* 2007]. Leaf Samples. Column: BP21 fused silica capillary (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He. Temperature programme: 40° for 7 min to 190° at 5°/min for 20 min. EI ionisation at 70 eV. Retention times: limonene 10.1 min, citronellal 19.7 min, isolimonene 23.1 min, citronellol 26.8 min, geraniol 28.2 min, citronellyl acetate 32.1 min; 17 further constituents detected. Limit of quantification not reported [Batish *et al.* 2006]. Leaf Samples (*Cymbopogon citratus*). Column: DB5-MS 5% phenylmethylpolysiloxane (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 60° to 280° at 3°/min for 30 min. EI ionisation at 70 eV. Retention indices: citronellol 1202, neral 1216, geraniol 1231, geranial 1253, hydroxyl-citronellal 1257, neryl acetate 1357; 21 further compounds detected. Limit of quantification not reported [Marongiu *et al.* 2006].

Note For a stable-isotope GC-MS method for the detection of citronellal and citral in essential oils, see Nhu-Trang *et al.* [2006]. For a colorimetric method for the identification of plant essential oil components, see Niu and Gilbert [2004].

Disposition in the Body Citronellal has been shown to undergo a cyclisation reaction in rabbits under the influence of hydrochloric acid in the stomach. The product, *p*-menthane-3,8-diol, is excreted as a glucuronide conjugate. Geraniol has been found to undergo a double ω-oxidation and also reduction of the 2,3-double bond, with 2 acids being produced.

Toxicity Hypersensitivity has been reported [Davids *et al.* 1978]. For a report of 5 non-fatal cases of poisoning with citronella oil in children, see Temple *et al.* [1991], no blood levels are presented. Report of a fatal poisoning in a 21-month-old child attributed to citronella oil [Mant 1961] is now in question. The child was administered a salt-water emetic, and postmortem findings included the presence of cerebral haemorrhages. These are consistent with salt intoxication [Temple *et al.* 1991].

Dose Used as a perfume and insect repellent. It is also used in aromatherapy.

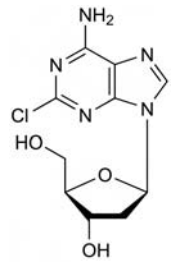
Cladribine

Antineoplastic
$C_{10}H_{12}ClN_5O_3$ = 285.7
CAS—4291-63-8

IUPAC Name (2*R*,3*S*,5*R*)-5-(6-Amino-2-chloropurin-9-yl)-2-(hydroxymethyl) oxolan-3-ol

Synonyms 2-CdA; 2-chloro-2′-deoxyadenosine; CldAdo; NSC-105014-F.

Proprietary Names *Leustat*; *Leustatin*; *Leustatine*.



Chemical Properties Crystals from water which soften at 210° to 215° and when solidified, turn brown. Also reported as crystals from ethanol with mp 220° (soften), that re-solidify, turn brown and do not melt <300°.

Ultraviolet Spectrum Aqueous acid (0.1 mol/L hydrochloric acid)—265 nm; aqueous alkali (0.1 mol/L sodium hydroxide)—265 nm.

Quantification

Plasma **HPLC** Column: C_{18} (80 × 4.6 mm, 3 µm). Mobile phase: 10 mmol/L phosphate buffer, pH 3 with 11% methanol and 7% acetonitrile, flow rate 1 mL/min. UV detection (λ 265 nm). *k* value: cladribine, 4.8; 2-chloro-2′-deoxyadenosine (metabolite), 2.2. Limit of detection, 1 nmol/L [Albertioni *et al.* 1994]. Limit of detection, 1 µg/L [Liliemark *et al.* 1991].

LC-MS Column: Supelcosil LC-8-DB (330 × 4.6 mm i.d., 3 µm). Mobile phase: methanol : 5 mmol/L ammonium acetate (25:75), flow rate 1.0 mL/min. Tandem MS detection (positive ion mode). Retention time: 1.5 min. Limit of detection, 0.1 µg/L [Moyer *et al.* 1998].

Urine **HPLC** Limit of detection, 100 nmol/L, see Plasma [Albertioni *et al.* 1994].

Disposition in the Body Cladribine is extensively distributed after IV administration and undergoes metabolism in cells containing deoxycytidine kinase activity to form 2-chloro-2′-deoxyadenosine-5′-triphosphate. Other metabolites include, 5′-monophosphate and 2-chloroadenine (CAde), the major metabolite identified in plasma. It penetrates into CSF (cerebrospinal fluid); concentrations are about 25% of those in plasma. About 21 to 32% of an IV dose is excreted unchanged in urine within 24 h with 1.5% as CAde. After oral administration, 25% of the dose is excreted in urine with 3.8% the metabolite, CAde.

Therapeutic Concentration

A mean steady-state plasma concentration of 22.5 ng/L was reported during IV infusion of 0.14 mg/kg/day over 24 h for 5 days in 12 subjects. The mean peak concentration was 198 ng/L (range 70 to 381 ng/L) observed during the 2 h infusion, which decreased to the steady state levels with a mean of 6.3 h after the end of infusion. The volunteers were either diagnosed with chronic lymphocytic leukaemia, non-Hodgkins lymphoma or hairy-cell leukaemia [Liliemark, Juliusson 1991].

IV infusion of 8.9 mg/m^2/24 h for 5 days in 25 patients, aged between 8 months and 23 years, produced steady-state plasma concentrations ranging from 23.2 to 84.5 ng/L (mean 37.7 ng/L) at 12 h. Mean CSF concentration was 6.1 ng/L. These patients suffered from relapsed haematological malignancies, acute myeloid leukaemia or acute lymphoid leukaemia [Kearns *et al.* 1994].

Toxicity Cladribine has considerable bone-marrow toxicity (haemopoietic stem cell toxicity). In a phase I study, patients were administered with doses >0.26 mg/kg daily for 10 to 14 days. Both renal and central nervous system toxicity was observed, with some patients requiring haemodialysis due to severity of toxicity. Toxicity was not observed with doses of 0.9 mg/kg daily for 7 days [Beutler 1992].

Half-life Plasma, from 3 to 22 h

Volume of Distribution Approximately 9.2 to 12.7 L/kg; 356.6 L/m^2.

Clearance Plasma clearance, ~26 to 45 L/h/m^2; mean, 1.44 L/h/kg.

Protein Binding 20%.

Note For reviews of cladribine, see Beutler [1992], Bryson, Sorkin [1993], and Saven, Piro [1994].

For a review of the pharmacokinetics of cladribine, see Liliemark [1997].

Dose In chronic lymphocytic leukaemia 120 μg/kg daily for 5 consecutive days of a 28-day cycle, in hairy-cell leukaemia 90 μg/kg daily for 7 days.

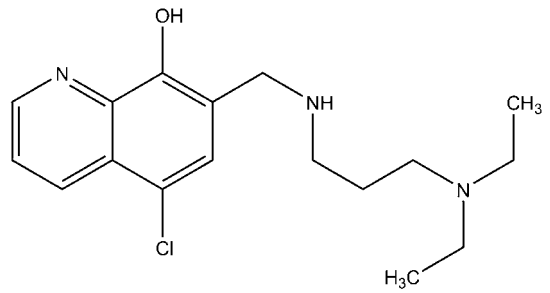
Clamoxyquin

Quinolinol, Antiamoebic

$C_{17}H_{24}ClN_3O$ = 321.9

CAS—2545-39-3

IUPAC Name 5-Chloro-7-[(3-diethylaminopropyl)aminomethyl]-8-hydroxyquinoline



Chemical Properties Extracted by organic solvents from aqueous alkaline solutions.

Clamoxyquin Hydrochloride

$C_{17}H_{24}ClN_3O$, HCl = 358.4

CAS—4724-59-8

Synonyms ci 433; PAA 3854.

Chemical Properties Mp 160°. Soluble in water.

Clamoxyquin Pamoate

Chemical Properties The solubility of clamoxyquin pamoate in pH 7 0.1 mol/L phosphate buffer is 0.012%. Solutions of this drug (0.01%) in methanol or pH 7 phosphate buffer are stable for >2 weeks.

Thin-layer Chromatography System T1—R_f 0.02 (location reagent acidified iodoplatinate spray, positive reaction).

Ultraviolet Spectrum Clamoxyquin pamoate: Methanol—238, 289, 278, 300, 362 nm; aqueous alkali (0.1 N NaOH)—236, 288, 364, 300 nm.

Infrared Spectrum Principal peaks at wavenumbers 1387, 1347, 1444 cm^{-1} (KBr disk).

Disposition in the Body

Toxicity Clamoxyquin hydrochloride, LD_{50} (oral): in mice 891 mg/kg; clamoxyquin pamoate, LD_{50} (oral): in mice >2500 mg/kg.

Clarithromycin

Antibacterial

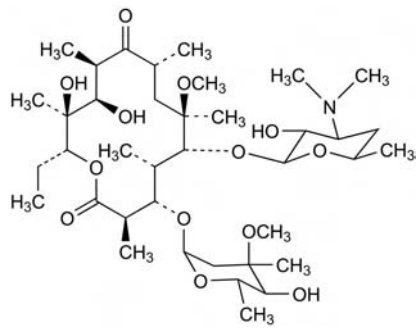
$C_{38}H_{69}NO_{13}$ = 748.0

CAS—81103-11-9

IUPAC Name (3*R*,4*S*,5*S*,6*R*,7*R*,9*R*,11*R*,12*R*,13*S*,14*R*)-6-[(2*S*,3*R*,4*S*,6*R*)-4-(Dimethylamino)-3-hydroxy-6-methyloxan-2-yl]oxy-14-ethyl-12,13-dihydroxy-4-[(2*R*,4*R*,5*S*,6*S*)-5-hydroxy-4-methoxy-4,6-dimethyloxan-2-yl]oxy-7-methoxy-3,5,7,9,11,13-hexamethyl-oxacyclotetradecane-2,10-dione

Synonyms (2*R*,3*S*,4*S*,5*R*,6*R*,8*R*,10*R*,11*R*,12*S*,13*R*)-3-(2,6-Dideoxy-3-*C*,3-*O*-dimethyl-α-L-*ribo*hexopyranosyloxy)-11,12-dihydroxy-6-methoxy-2,4,6,8,10,12-hexamethyl-9-oxo-5-(3,4,6-trideoxy-3-dimethylamino-β-D-*xylo*hexopyranosyloxy)pentadecan-13-olide; 6-*O*-methylerythromycin, A-56268.

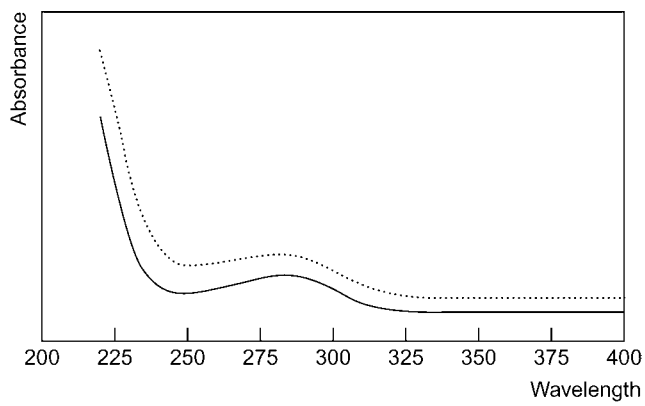
Proprietary Names *Biaxin*; *Biaxin HP*; *Biclar*; *Bremon*; *Cyllind*; *Klacid*; *Klaciped*; *Klaricid*; *Kofron*; *Macladin*; *Maclar*; *Mavid*; *Naxy*; *Veclam*; *Zeclar*.



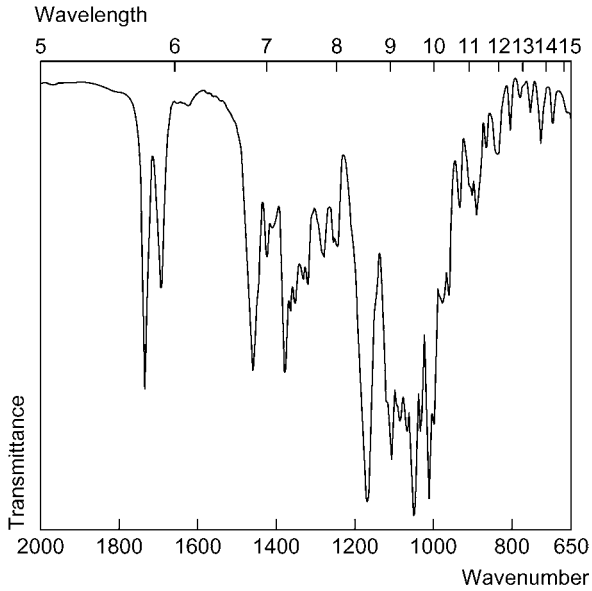
Chemical Properties A white to off-white crystalline powder. Crystals, mp 217° to 220° from chloroform and diisopropyl ether; mp 222° to 225° from ethanol. It is practically insoluble in water; soluble in acetone; slightly soluble in acetonitrile, ethanol and methanol.

High Performance Liquid Chromatography System HBA—retention time 15.7 min; system HBB—retention time 6.8 min.

Ultraviolet Spectrum Aqueous acid (0.2 mol/L H_2SO_4)—283 nm; basic—282 nm.



Infrared Spectrum Principal peaks at wavenumbers 1052, 1170, 1108, 1734 cm^{-1} (KBr pellet).



Quantification

Plasma **HPLC** Electrochemical detection. Limit of quantification, 0.1 mg/L [Taninaka *et a l.* 2000]. Column: C_{18} (Nucleosil 100-3, 150 × 4.6 mm i.d., 3 µm). Mobile phase: methanol : 15 mmol/L potassium dihydrogen phosphate buffer, (pH 6.0) (70:30), flow rate 1.2 mL/min. UV detection (λ=220 nm). Retention time: 10.2 min. Limit of quantification, 0.5 mg/L [Macek *et al.* 1999]. Electrochemical detection. Limit of detection, 0.03 mg/L [Kees *et al.* 1998]. Electrochemical detection. Clarithromycin and 14-hydroxyclarithromycin, limit of detection, 0.03 mg/L [Chu *et al.* 1991].

Serum **HPLC** Fluorescence detection (λ_{ex}=255 nm, λ_{em} = 315 nm). Limit of detection, 0.2 mg/L [Sastre Toraño, Guchelaar 1998].

Urine **HPLC** See Plasma [Chu *et al.* 1991].

Note For a review of methods for the determination of macrolides in biological fluids, see Kanfer *et al.* [1998].

Disposition in the Body Clarithromycin is rapidly absorbed from the gastrointestinal tract after oral administration with a bioavailability of about 55%. It undergoes first-pass metabolism. Pharmacokinetics are non-linear and dose-dependent with high doses producing disproportionate increases in plasma concentrations owing to saturation of metabolic pathways. Widely distributed and tissue concentrations exceed plasma concentrations. Readily enters leukocytes and macrophages. It is distributed into breast milk. Undergoes extensive metabolism in the liver by demethylation, hydroxylation and hydrolysis. The principal metabolite is 14-hydroxyclarithromycin and this also has antibacterial activity. At steady state, about 20% and 30%, respectively of a 250 mg or 500 mg dose is excreted in the urine as unchanged drug. Excretion in urine and faeces occurs in a dose-dependent manner: at low doses the two fractions are similar; at high doses urinary excretion is predominant. Not significantly removed by haemodialysis or peritoneal dialysis.

Therapeutic Concentration

Sixteen patients, aged between 31 and 67 years (mean 50.1 years) were administered with a single nasogastric dose of 500 mg clarithromycin suspension on days 1 and 4 with at least 72 h 'wash-out' between doses. The mean peak plasma concentration of clarithromycin was 2.1 mg/L on day 1 and 2.3 mg/L on day 4, observed at 3.5 and 3.3 h, respectively. The mean concentrations for the metabolite, 14-hydroxyclarithromycin, were 0.9 mg/L at 4.4 h and 1.0 mg/L at 4.3 h, on days 1 and 4, respectively [Fish, Abraham 1999].

Seventeen healthy males aged 18 to 40 years (mean 29 years) and 17 healthy males aged 20 to 39 years (mean 31 years) were administered with 250 and 500 mg doses, respectively, every 12 h for 7 doses after an overnight fast. The peak plasma concentrations for the 250 mg dose were 0.78 (0.4 to 1.22), 1.01 (0.67 to 1.67) and 1.14 (0.51 to 1.72) mg/L for a single dose and multiple dosing (dose 5 and 7), respectively. These were observed at 1.8, 2.1 and 2.0 (range of 0.5 to 4) h. For the 500 mg single dose, a concentration of 2.12 (0.78 to 3.54) mg/L was observed at 2 (1 to 3) h and for the multiple dosing 2.67 (095 to 4.71) mg/L at 2.6 (1 to 6) h for dose 5; and 2.85 (0.98 to 4.85) mg/L at 2.6 h (range, 1 to 4 h) for dose 7 [Chu *et al.* 1993].

Twelve healthy, young volunteers with mean age 23.2 (21 to 29) years and 12 healthy, elderly individuals (mean 73.6 years; range, 65 to 81 years) were administered with 500 mg clarithromycin every 12 h for 5 doses. The subjects were in fasting state and fasted for an additional 2 h after dosing. The mean drug peak plasma concentrations were 2.41 (range 1.58 to 4.09) mg/L and 3.28 (1.75 to 4.55) mg/L for the young and elderly, respectively, observed at ~2 h (slightly later in the elderly). Peak concentrations for the metabolite, 14-hydroxyclarithromycin, were 0.66 (0.29 to 1.06) mg/L for the young and 1.33 (0.72 to 2.05) mg/L for the elderly [Chu *et al.* 1992].

Bioavailability About 55%.

Half-life Plasma half-life is dose-dependent: clarithromycin about 3 to 4 h in subjects taking 250 mg twice daily and about 5 to 7 h in subjects taking 500 mg twice daily; 14-hydroxyclarithromycin 5 to 6 h in subjects taking 250 mg twice daily and about 7 h in subjects taking 500 mg twice daily. Plasma half-life is increased in subjects with impaired renal function: clarithromycin half-life is about 22 h and 14-hydroxyclarithromycin half-life is about 47 h when creatinine clearance is less than 30 mL/min.

Volume of Distribution Apparent, 175 L.

Clearance Total body, 29.2 to 58.1 L/h.

Protein Binding About 80% at therapeutic concentrations (free clarithromycin fraction increases at serum concentrations >1 mg/L suggesting saturation of binding process).

Note For a review of the pharmacokinetics of clarithromycin, see Fraschini *et al.* [1993]. For reviews of clarithromycin, see Peters, Clissold [1992] and Barradell *et al.* [1993].

Dose Usually 250 or 500 mg twice daily.

Clefamide

Antiamoebic

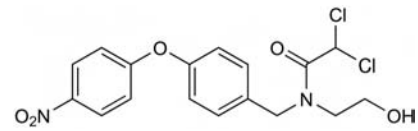
$C_{17}H_{16}Cl_2N_2O_5$ = 399.2

CAS—3576-64-5

IUPAC Name 2,2-Dichloro-*N*-(2-hydroxyethyl)-*N*-[[4-(4-nitrophenoxy)phenyl]methyl]-acetamide

Synonym Chlorophenoxamide

Proprietary Name *Mebinol*

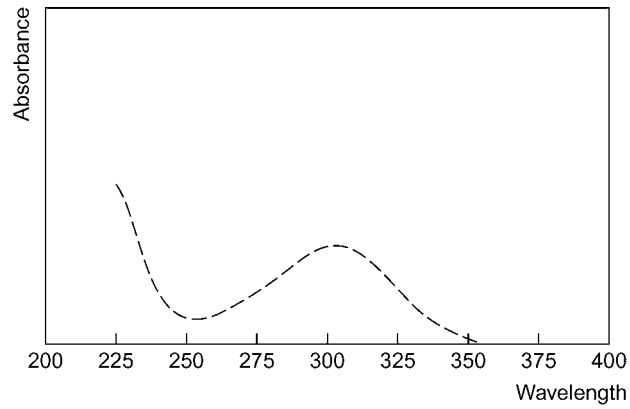


Chemical Properties A lemon-yellow crystalline powder. Mp 134° to 137°. Practically insoluble in water; soluble 1 in 100 of ethanol, 1 in 40 of acetone, and 1 in 80 of chloroform. Log *P* (octanol/water), 3.2.

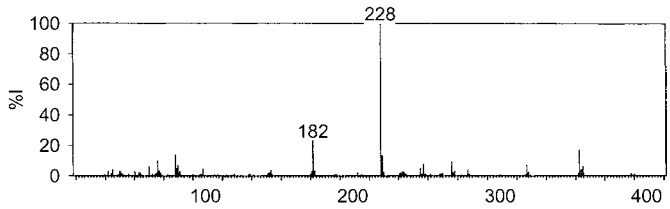
Colour Tests Mandelin's test—green→brown; Marquis test—yellow; sulfuric acid—yellow.

Thin-layer Chromatography System TA—R_f 0.69; system TB—R_f 0.00; system TC—R_f 0.56; system TL—R_f 0.68 (acidified iodoplatinate solution, positive).

Ultraviolet Spectrum Ethanol—303 nm (A^1_1=310b).



Infrared Spectrum Principal peaks at wavenumbers 1244, 1666, 1510, 1595, 1078, 880 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 228, 182, 363, 88, 229, 76, 276, 257.

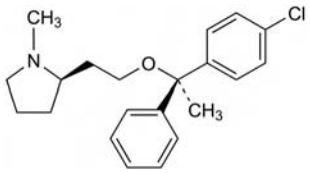


Disposition in the Body Poorly absorbed after oral administration.
Dose Clefamide has been given in doses of 1.5 to 2.25 g daily.

Clemastine

Antihistamine
$C_{21}H_{26}ClNO$ = 343.9
CAS—15686-51-8

IUPAC Name (2*R*)-2-[2-[(1*R*)-1-(4-Chlorophenyl)-1-phenylethoxy]ethyl]-1-methylpyrrolidine
Synonyms Meclastine; mecloprodin.

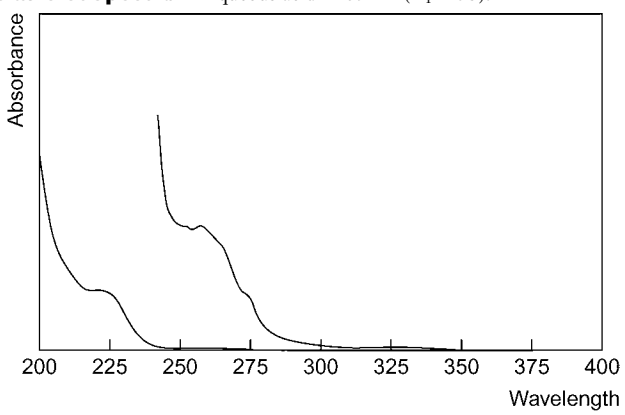


Chemical Properties Soluble in chloroform.

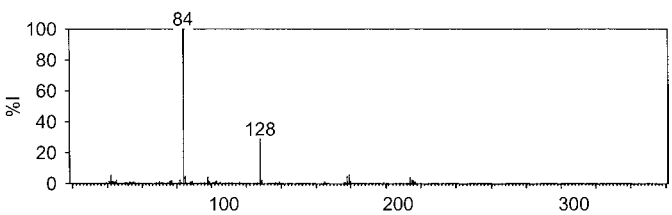
Clemastine Fumarate

$C_{21}H_{26}ClNO$, $C_4H_4O_4$ = 460.0
CAS—14976-57-9
Proprietary Names *Aller-eze*; *Alginan*; *Tavegil*; *Tavegyl*; *Tavist*; *Xolamin*.
Chemical Properties A white crystalline powder. Mp 177° to 178°. Slightly soluble in dilute acetic acid; soluble in methanol.

Colour Tests Liebermann's reagent—brown; Mandelin's test—yellow-brown; Marquis test—yellow (green rim); sulfuric acid—yellow (green rim).
Thin-layer Chromatography System TA—R_f 0.46; system TB—R_f 0.49; system TC—R_f 0.25; system TE—R_f 0.58; system TL—R_f 0.09; system TAE—R_f 0.88; system TAF—R_f 0.49 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—clemastine RI 2425, M (OH-methoxy-carbinol-)-H_2O RI 2220; system GF—RI 2710.
High Performance Liquid Chromatography System HA—*k* 3.7; system HX—RI 501; system HZ—retention time 14.0 min.
Ultraviolet Spectrum Aqueous acid—257 nm (A_1^1=27b).



Infrared Spectrum Principal peaks at wavenumbers 1090, 1011, 700, 763, 1121, 1210 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 84, 128, 179, 42, 85, 178, 214, 98.



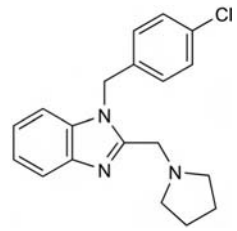
Quantification
Plasma **GC** NPD. Limit of detection, 0.06 µg/L [Davydova *et al.* 2000]. ECD. Limit of detection, 1 µg/L [Tham *et al.* 1978].
Disposition in the Body
Therapeutic Concentration
Following a single oral dose equivalent to 2 mg of clemastine to 12 subjects, peak plasma concentrations of about 0.002 mg/L were attained in 3 to 5 h [Tham *et al.* 1978].
Nineteen healthy men and women, aged 19 to 56 years, were orally administered a single 2.68 mg clemastine fumarate dose and in addition received the same dose three times daily for 3 days in a multidose study. The mean peak plasma concentrations reached were 0.75 µg/L for the single dose and 1.75 µg/L for the multiple dose. Each observed approximately 3.4 h after dosing [Davydova *et al.* 2000].
Dose The equivalent of 2 to 6 mg of clemastine daily.

Davydova NN *et al.* (2000). Determination of clemastine in human plasma by gas chromatography with nitrogen-phosphorus detection. *J Chromatogr B Biomed Sci Appl* 744(1): 177–181.
Tham R *et al.* (1978). Gaschromatography of clemastine. A study of plasma kinetics and biological effect. *Arzneimittelforschung* 28: 1017–1020.

Clemizole

Antihistamine
$C_{19}H_{20}ClN_3$ = 325.8
CAS—442-52-4

IUPAC Name 1-[(4-Chlorophenyl)methyl]-2-(1-pyrrolidinylmethyl)-1*H*-benzimidazole

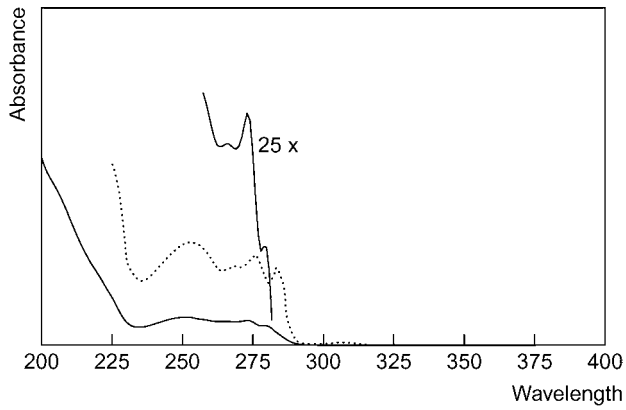


Chemical Properties Crystals. Mp 167°. Log *P* (octanol/water), 4.4.

Clemizole Hydrochloride

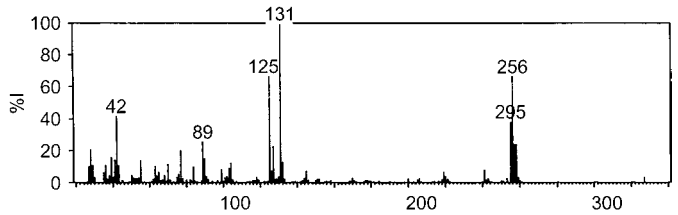
$C_{19}H_{20}ClN_3$, HCl = 362.3
CAS—1163-36-6
Proprietary Name *Allercur*
Chemical Properties A white crystalline powder. Mp about 246°. Sparingly soluble in water; soluble in ethanol and chloroform; practically insoluble in ether.

Thin-layer Chromatography System TA—R_f 0.78; system TB—R_f 0.33; system TC—R_f 0.69; system TE—R_f 0.78; system TL—R_f 0.52; system TAE—R_f 0.76; system TAF—R_f 0.73 (Dragendorff spray, positive; acidified iodoplatinate solution, positive).
Gas Chromatography System GA—clemizole RI 2620, M (oxo-) RI 2965.
High Performance Liquid Chromatography System HA—*k* 4.8 (tailing peak); system HX—RI 420.
Ultraviolet Spectrum Aqueous acid—275 nm (A_1^1=330a); aqueous alkali—254 (A_1^1=253b), 269, 275, 283 nm.



Infrared Spectrum Principal peaks at wavenumbers 748, 765, 740, 833, 1111, 1010 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 131, 256, 125, 42, 255, 89, 258, 257.

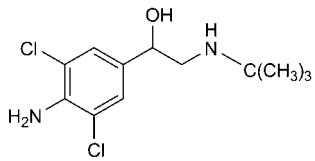


Dose 40 to 160 mg of clemizole hydrochloride daily.

Clenbuterol

β_2-*Adrenoceptor Agonist, Bronchodilator*
$C_{12}H_{18}Cl_2N_2O = 277.2$
CAS—37148-27-9

IUPAC Name 1-(4-Amino-3,5-dichlorophenyl)-2-(*tert*-butylamino)ethanol
Synonyms 4-Amino-3,5-dichloro-α-[[(1,1-dimethylethyl)amino]methyl]benzenemethanol; 4-amino-α-[(*tert*-butylamino)methyl]-3,5-dichlorobenzyl alcohol; NAB-365.



Chemical Properties Log *P* (octanol/water) 2.47 [Prezelj *et al.* 2003].

Clenbuterol Hydrochloride

CAS—21898-19-1
IUPAC Name 1-(4-Amino-3, 5-dichlorophenyl)-2-(tert-butylamino)ethanol hydrochloride
Synonym NAB-365C
Proprietary Names *Broncodil*; *Clenasma*; *Contrasmina*; *Contraspasmin*; *Monores*; *Prontovent*; *Spiropent*; *Ventolase*; *Ventipulmin*.
Chemical Properties Colourless, microcrystalline powder. Mp 174° to 175.5°. Very soluble in water, methanol and ethanol; slightly soluble in chloroform; insoluble in benzene.

Thin-layer Chromatography System TAE—R_f 0.22 (clenbuterol), R_f 0.30 (M-hydroxy), R_f 0.87 (M2), R_f 0.87 (M3); system TB—R_f 0.13 (clenbuterol), R_f 0.01 (M-hydroxy), R_f 0.00 (M2), R_f 0.00 (M3); system TE—R_f 0.58 (clenbuterol), R_f 0.43 (M-hydroxy), R_f 0.02 (M2), R_f 0.06 (M3); system TF—R_f 0.00 (M2), R_f 0.19 (M3).

Plates: silica gel 60 (10 × 10 cm). Mobile phase: ethyl acetate : methanol : propionic acid (A, 8 : 1 : 1) and ethyl acetate : methanol : ammonia (B, 8.5 : 1 : 0.5). Developed with Ehrlich's reagent. R_f 0.40 (A) and 0.51 (B) [Courtheyn *et al.* 1991].

Gas Chromatography System GAI—RT 0.57 relative to 17α-methyl-5α-androstan-3β; system GA—RI 2100 (clenbuterol); RI 1895 (Art (-H_2O)) , RI 2160 (Art (-H_2O)).

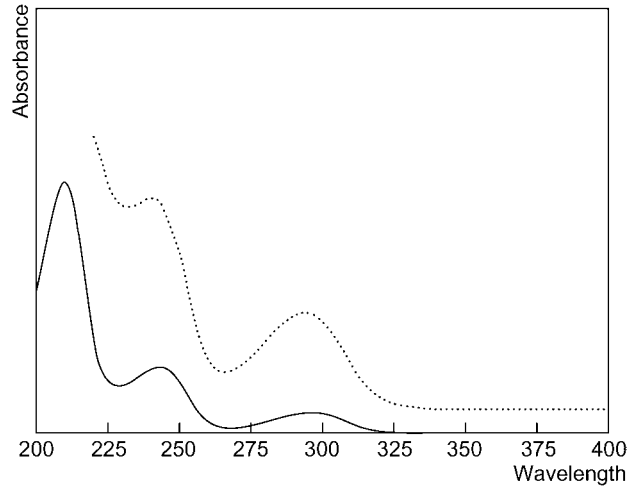
Column: HP Ultra 1 (25 m × 0.2 mm i. d., 0.11 μm). Temperature programme: 80° for 2 min, 20°/min up to 160°, then 2°/min to 190° and 30°/min to 300° for 10 min. Carrier gas: He, flow rate 1.0 ml/min. EI ionisation, SIM acquisition mode. Retention time: 15.4 min for the clenbuterol–mono-TMS (tetramethylsilane) derivative [Courtheyn *et al.* 1991].

Column: Equity 1701 (10 m × 0.1 mm i.d., 0.1 μm). Carrier gas: He, 0.6 mL/min. Temperature programme: 100° for 1 min to 300° at 55°/min for 2.1 min. EI ionisation at 70 eV, SIM acquisition mode. Retention time: 0.06 min. Limit of detection, 1.5 μg/L [Brunelli *et al.* 2006].

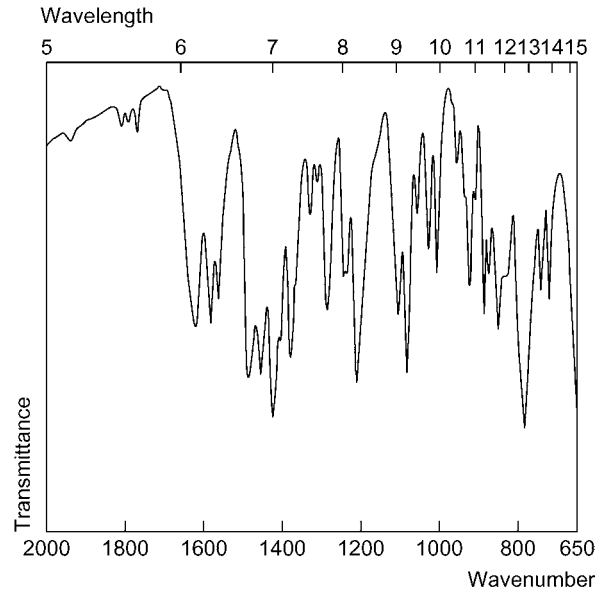
Column: 1% phenylmethylsilicone HP 1-MS (15 m × 0.25 mm i. d., 0.25 μm). Carrier gas: He, 1.1 ml/min. Temperature programme: 150° for 1 min to 215° at 15°/min to 300° at 35°/min for 2 min. FS mode. Retention time: 5.09 min [Abukhalaf *et al.* 2000].

High Performance Liquid Chromatography System HAW—*k* 6.1 (column (a)), *k* 5.0 (column (b)); system HAA—retention time 10.8 min; system HX—RI 326 clenbuterol-hydroxy-, RI 297 (M-hydroxy-), RI 346 ((M2)-hydroxy-), RI 419 ((M3)-hydroxy-); system HY—RI 282.

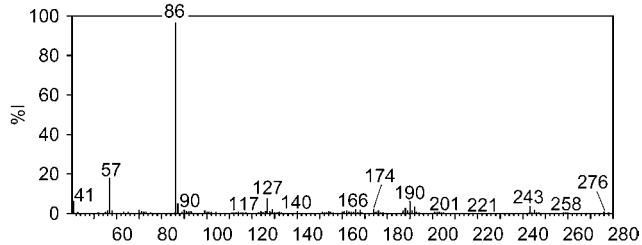
Ultraviolet Spectrum Aqueous acid (0.2 mol/L NH_2SO_4)—242, 295 nm; basic—240, 295 nm.



Infrared Spectrum Principal peaks at wavenumbers 1414, 774, 640 cm^{-1} (KBr pellets).



Mass Spectrum Principal ions at *m/z* 86, 57, 41, 127, 190, 243, 90, 174.



Quantification

Blood **GC-MS** Column: ZB5MS capillary (15 m × 0.25 mm i.d., 0.25 μm). Temperature programme: 50° for 1.5 min to 300° at 20°/min for 4 min. Full scan mode. Retention time: 10.3 min. Limit of quantification, 5 μg/L, limit of detection, 2.5 μg/L [Wingert *et al.* 2008]. Column: DB-1 capillary (25 m × 0.2 mm i.d., 0.25 μm). Carrier gas: He, 1 mL/min. Temperature programme: 120° for 1 min to 300° at 25°/min for 2 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, 100 μg/L [Black, Hansson 1999].

LC-MS Column: BDS Hypersil (15 cm × 2 mm i.d., 3 μm). Mobile phase: 2 mmol/L formic acid : acetonitrile (97 : 3 to 5 : 95 over 5 min), flow rate 250 μL/min. ESI, full MS. Retention time: 5.81 min. Limit of detection, 0.01 μmol/L [Yuen *et al.* 2005].

Plasma **GC-MS** Column: HP 1MS cross-linked 1% phenyl methylsilicone (15 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.1 mL/min. Temperature programme: 150° for 1 min to 215° at 15°/min to 300° at 35°/min for 2 min. SIM acquisition mode. Limit of quantification, 1.5 μg/L, limit of detection, 0.5 μg/L [Abukhalaf *et al.* 2000]. Column: OV 1701 fused silica capillary (25 m × 0.22 mm i.d., 0.11 μm). Carrier gas: He, 14 psi. Temperature programme: 180° to 230° at 8°/min to 290° at 20°/min. NICI at 100 eV. Limit of detection, 5 ng/L [Girault *et al.* 1990].

HPLC Column: Chirobiotic T (25 cm × 4.6 mm i.d., 5 µm). Mobile phase: methanol : acetonitrile (70 : 30) containing 0.3% glacial acetic acid and 0.2% triethylamine, flow rate 1.0 mL/min. UV detection (λ = 246 nm). Retention time: 8.38 and 9.56 min for (–)-*R*- and (+)-*S*-clenbuterol, respectively. Limit of detection, <0.25 µmol/L [Aboul-Enein, Serignese 1999]. Column: Chirex 3022 (250 × 4.0 mm i.d.). Mobile phase: hexane : 1,2-dichloroethane : ethanol-5% trifluoroacetic acid (80 : 10 : 10), flow rate, 0.8 mL/min. UV detection (λ = 254 nm). Retention time: 9.73 and 11.63 min for *S*- and *R*-clenbuterol, respectively. Limit of quantification, 0.1 nmol [Abou-Basha, Aboul-Enein 1996].

LC-MS Column: NovaPak C_{18}. Mobile phase: acetonitrile : 1 mmol/L ammonium acetate buffer (pH 4.1; 90 : 10), flow rate 1.0 mL/min. APCI, positive ion mode, full scan or SIM acquisition mode. Limit of detection, 10 µg/L [Doerge *et al.* 1993].

Serum **HPLC** Column: Luna C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol : 20 mmol/L phosphate buffer (pH 10; 10 : 50 : 40), flow rate 1.0 mL/min. UV detection (λ = 244 nm). Limit of quantification, 24 µg/L, limit of detection, 5 µg/L [Aresta *et al.* 2008]. Column: Chirex 3005 (250 × 4.6 mm i. d.). Mobile phase: *n*-hexane: 1,2-dichloroethane : methanol (54 : 38 : 8), flow rate 1.0 mL/min. UV detection (λ = 247 nm). Limit of detection, 0.47 and 1.04 µmol/L for *R*- and *S*-clenbuterol, respectively [Song *et al.* 2003].

LC-MS Column: Betasil C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: 50 mmol/L ammonium acetate- 8 mmol/L trifluoroacetic acid (pH 5.4) : acetonitrile (60 : 40), flow rate 0.8 mL/min. APCI, positive ion mode. Retention time: 4.7 min. Limit of detection, 1.0 µg/L [Hoffman *et al.* 2001]. Column: Pinkerton reversed phase (50 × 4.6 mm i.d., 5 µm). Mobile phase: 0.1 mol/L ammonium acetate : 0.01 mol/L triethylamine (pH 7.0), flow rate 1.0 mL/min. TSI. Limit of quantification, 0.5 µg/L [Hogendoorn *et al.* 1998].

Urine **GC-MS** See Serum. Limit of quantification, 32 µg/L, limit of detection, 9 µg/L [Aresta *et al.* 2008]. See Blood [Wingert *et al.* 2008]. Column: HP5 cross-linked phenyl methyl silicone (30 m). Carrier gas: He, 0.6 mL/min. Temperature programme: 125° for 2 min to 225° at 20°/min for 1 min to 320° at 10°/min for 10 min. EI ionisation. Limit of detection, 0.1 µg/L [Amendola *et al.* 2002]. Column: HP methylsiloxane fused silica capillary (17.5 m × 0.2 mm i.d., 0.11 µm). Carrier gas: He, 0.7 mL/min. Temperature programme: 100° for 2 min to 190° at 30°/min to 300° at 20°/min for 4 min. EI ionisation at 70 eV, scan or SIM acquisition mode. Retention time: 6.84 min. Limit of detection, 0.5 µg/L [Damasceno *et al.* 2002]. See plasma. Limit of quantification, 0.7 µg/L, limit of detection, 0.2 µg/L [Abukhalaf *et al.* 2000]. See Blood. Limit of detection, 500 µg/L [Black, Hansson 1999]. Column: Ultra-2% 5 phenyl methyl siloxane capillary (17 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 0.7 mL/min. Temperature programme: 150° to 280° at 15°/min. EI ionisation at 70 eV, scan and SIM acquisition mode. Limit of detection, 0.02 µg/L [Keskin *et al.* 1998]. See Plasma [Abou-Basha, Aboul-Enein 1996]. Column: J & W DB-1 methylsilicone capillary (15 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He. Temperature programme: 100° for 1 min to 220° at 16°/min to 301° at 3.8°/min for 5.5 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection not reported [Ayotte *et al.* 1996]. Column: DB-1 (15 m × 0.25 mm i.d.). Temperature programme: 150° for 1 min to 300° at 15°/min for 10 min. EI ionisation at 35 eV, positive ion mode, full scan or SIR mode. Retention time: 6.08 min. Limit of detection, <1 mg/L [Kingston *et al.* 1995]. See also [van Rhijn *et al.* 1995], [Polettini *et al.* 1993], [van Rhijn *et al.* 1993], [Polettini *et al.* 1991], [Förster *et al.* 1988], or [Schmid *et al.* 1988].

LC-MS Column: Purospher Star 18e (55 × 4.6 mm i.d., 3 µm). Mobile phase: 5 mmol/L ammonium acetate containing 0.1 acetic acid (pH 3.5) : acetonitrile (95 : 5 to 20 : 80 in 7 min), flow rate 1 mL/min. ESI, MRM acquisition mode. Limit of detection, 2 µg/L [Thevis *et al.* 2003].

Milk **LC-MS** Column: cyano (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.1% diethylamine and 0.1% trifluoroacetic acid : methanol (20 : 80), flow rate 2.0 mL/min. UV detection (λ = 230 nm) followed by APCI, positive ion mode, SIM acquisition mode. Limit of detection, 500 µg/L [Jones *et al.* 1999].

Hair **GC-MS** Column: HP5-MS 5% phenyl 95% methylsiloxane (30 m × 0.25 mm i.d., 0.25 mm). Carrier gas: He, 1.2 mL/min. Temperature programme: 110° for 1 min to 170° at 20°/min to 225° at 7°/min to 295° at 24°/min for 10 min. EI ionisation. Retention time: 12.6 min. Limit of detection, 2 ng/g [Kintz *et al.* 2000]. Column: CP-Sil 5 CB WCOT fused silica (15 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 1.0 min to 300° at 20°/min for 5 min. EI ionisation at 70 eV, SIM acquisition mode. Retention time: 6.87 min. Limit of quantification, 0.1 µg/g, limit of detection, 0.02 µg/g [Deng *et al.* 1999]. Column: HP Ultra 1 cross-linked methylsilicone capillary (17 m × 0.2 mm i.d., 0.11 µm). Carrier gas: He, 0.7 mL/min. Temperature programme: 150° to 250° at 10°/min to 310° at 40°/min for 3 min. EI ionisation at 65 eV, SIM acquisition mode. Limit of detection, 4 ng/g, 0.8 ng/g with immunoaffinity chromatography [Machnik *et al.* 1999].

Other HPLC Animal Samples. Column: Nova-Pak C_{18} (15 cm × 4.6 mm i.d., 4 µm). Mobile phase: 0.025 mol/L sodium *n*-dodecyl sulfate 0.02 mol/L glacial acetic acid (pH 3.5) : acetonitrile (53 : 47), flow rate 1.3 mL/min. UV detection (λ = 493 nm). Limit of detection, 0.1 and 0.2 ng/g for liquid and solid samples, respectively [Courtheyn *et al.* 1991].

LC-MS Equine Urine. See Urine. Limit of detection, 10 µg/L [Thevis *et al.* 2003]. Bovine Liver. Column: Symmetry C_{18} (150 × 2.1 mm, 5 um). Mobile phase: methanol : 0.032% trifluoroacetic acid (22 : 78), flow rate 0.3 mL/min. ESI, full scan mode, positive ion mode. Relative retention time: 1.02 min. Limit of quantification, 0.21 ng/g, limit of detection, 0.11 ng/g [de Wasch *et al.* 1998].

Disposition in the Body Clenbuterol is rapidly and almost completely absorbed after oral administration, and extensively metabolised by first-pass sulfation. Excretion is mainly via the kidneys for IV administration and biotransformation for oral administration. No accumulation has been observed.

Therapeutic Concentration

Hair was collected from 4 pregnant females who had been treated with clenbuterol hydrochloride (3 × 20 µg/day). Concentrations ranged from 2 to 236 ng/g [Machnik *et al.* 1999].

Ten healthy volunteers were orally administered 20 µg clenbuterol. The mean maximum plasma concentration was 86.5 ± 18.1 ng/L reached at 2.35 ± 1.2 h [Girault *et al.* 1990].

Healthy males were orally administered 20, 40 and 80 µg doses of clenbuterol. Plasma levels reached maximum values of 0.1, 0.2 and 0.35 µg/L, respectively, within 2.5 h and lasted over 6 h. After repeated oral administration (twice a day), plasma levels reached 0.2 to 0.3 µg/L and 0.5 to 0.6 µg/L for doses of 20 and 40 µg, respectively [Yamamoto *et al.* 1985].

Toxicity Acute exposure has been associated with pulmonary oedema and respiratory failure [Schechter *et al.* 2007] as well as supraventricular tachycardia [Daubert *et al.* 2007].

In 12 heroin-related deaths the victims' urine tested positive for clenbuterol. Blood concentrations ranged from none detectable to 76 µg/L [Wingert *et al.* 2008].

A 28-year-old female accidentally ingested an unknown quantity of clenbuterol. Three hours after admission to hospital her serum clenbuterol concentration was 2.93 µg/L [Hoffman *et al.* 2001].

A 21-year-old body builder drank orange juice 'spiked' with 48 tablets (4.8 g) of clenbuterol and admitted with tachycardia, headache, dizziness, tremour, sweats, muscle weakness and agitation [Chodorowski, Sein 1997].

Note For other cases of clenbuterol toxicity after diamorphine use, see CDC [2005]. For cases of clenbuterol poisoning due to its unauthorised use in animal husbandry, see Salleras *et al.* [1995], Brambilla *et al.* [1997], Mitchell and Dunnavan [1998] or Barbosa *et al.* [2005].

Bioavailability 70 to 80% [Hoffman *et al.* 2001].

Volume of Distribution 5 L/kg [Schmid *et al.* 1988].

Half-life 25 to 39 h [Hoffman *et al.* 2001].

Protein Binding ≈89 to 98%, after a single dose of 80 µg [Yamamoto *et al.* 1985].

Dose A dose of 20 µg is administered by mouth twice daily and up to 40 µg has been reported. Clenbuterol hydrochloride can be used as an inhaler with a dosage of 20 µg three times a day.

Clidinium Bromide

Anticholinergic

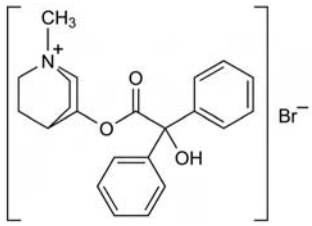
$C_{22}H_{26}BrNO_3$ = 432.4

CAS—7020-55-5 (clidinium); 3485-62-9 (bromide)

IUPAC Name (1-Methyl-1-azoniabicyclo[2.2.2]octan-3-yl) 2-hydroxy-2,2-diphenylacetate bromide

Synonyms 3-[(Hydroxydiphenylacetyl)oxy]-1-methyl-1-azoniabicyclo[2.2.2] octane bromide; Ro-2-3773.

Proprietary Names *Quarzan*. It is an ingredient of *Librax(in)*.



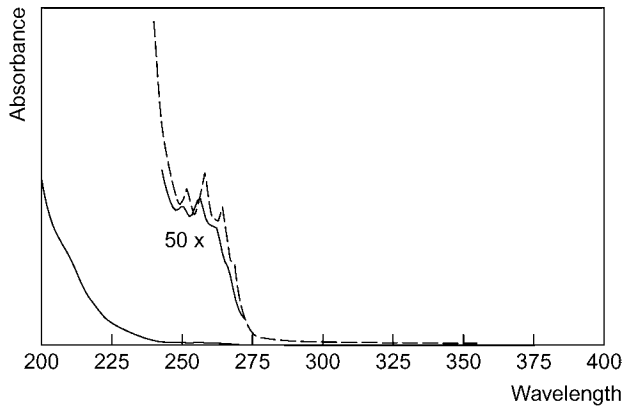
Chemical Properties A white crystalline powder. Mp about 242°. Soluble in water and ethanol; slightly soluble in ether. Log *P* (octanol/water), −0.5.

Colour Tests The following tests are performed on the nitrate: Liebermann's reagent—orange→brown; Mandelin's test—brown; Marquis test—orange→blue; sulfuric acid—orange.

Thin-layer Chromatography System TA—R_f 0.02; system TB—R_f 0.00; system TE—R_f 0.01; system TF—R_f 0.70; system TAE—R_f 0.03 (acidified iodoplatinate solution, positive).

High Performance Liquid Chromatography System HX—RI 379; system HAA—retention time 13.3 min (clidinium).

Ultraviolet Spectrum Aqueous acid—253 (A^1_1=10b), 259 nm (A^1_1=11b); methanol—252, 258 (A^1_1=10.4a), 264 nm.



Infrared Spectrum Principal peaks at wavenumbers 1730, 1240, 769, 1190, 712, 1011 cm^{-1}.

Mass Spectrum Principal ions at *m/z* 105, 77, 96, 183, 51, 42, 182, 94.

Disposition in the Body The major metabolite is 3-hydroxy-1-methylquinuclidinium bromide.

Dose 7.5 to 20 mg daily.

Clindamycin

Antibiotic

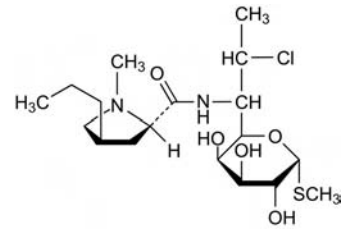
$C_{18}H_{33}ClN_2O_5S$ = 425.0

CAS—18323-44-9

IUPAC Name (2*S*,4*R*)-*N*-[(1*S*,2*S*)-2-Chloro-1-[(2*R*,3*R*,4*S*,5*R*,6*R*)-3,4, 5-trihydroxy-6-methylsulfanyloxan-2-yl]propyl]-1-methyl-4-propylpyrrolidine-2-carboxamide

Synonyms Chlorodeoxylincomycin; (7*S*)-chloro-7-deoxylincomycin; (2*S*-*trans*)-methyl-7-chloro-6,7,8-trideoxy-6-[[(1-methyl-4-propyl-2-pyrrolidinyl)carbonyl]amino]-1-thio-L-*threo*-α-D-*galacto*-octopyranoside; U-21251.

Note The name Clinimycin was formerly used for clindamycin and has also been used for a preparation of oxytetracycline.



Chemical Properties A yellow, amorphous solid. pK_a 7.7 (25°). Log *P* (octanol/water), 2.2.

Clindamycin Hydrochloride

$C_{18}H_{33}ClN_2O_5S$, HCl, H_2O = 479.5

CAS—21462-39-5 (anhydrous); 58207-19-5 (monohydrate)

Proprietary Names *Cleocin*; *Dalacin C*; *Dalacin(e)*; *Sobelin* (all as capsules).

Chemical Properties A white crystalline powder. Mp 141° to 143°. Soluble 1 in 2 of water and 1 in 200 of ethanol; freely soluble in methanol; very slightly soluble in chloroform.

Clindamycin Palmitate Hydrochloride

$C_{34}H_{63}ClN_2O_6S$, HCl = 699.9

CAS—36688-78-5 (palmitate); 25507-04-4 (palmitate hydrochloride)

Proprietary Names *Cleocin*; *Dalacin*; *Dalacin C*; *Sobelin* (all as granules for oral suspension).

Chemical Properties A white amorphous powder. It hydrolyses in solutions above pH 6.0. Freely soluble in water, ethanol, chloroform, and ether.

Clindamycin Phosphate

$C_{18}H_{34}ClN_2O_8PS$ = 505.0

CAS—24729-96-2

Proprietary Names *Cleocin*; *Dalacin*; *Dalacin C*; *Sobelin* (all as injection).

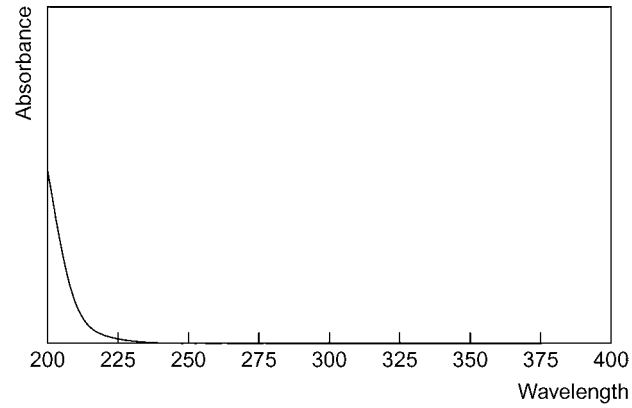
Chemical Properties A white, hygroscopic, crystalline powder. Soluble 1 in 2.5 of water; slightly soluble in dehydrated alcohol; practically insoluble in chloroform and ether.

Colour Tests Palladium chloride—yellow; sodium nitroprusside (method 2)—violet.

Thin-layer Chromatography System TA—R_f 0.72; system TB—R_f 0.00; system TE—R_f 0.28; system TAE—R_f 0.81 (acidified iodoplatinate solution, positive).

High Performance Liquid Chromatography System HX—RI 354; system HY—RI 291; system HAA—retention time 12.0 min.

Ultraviolet Spectrum No significant absorption, 230 to 360 nm.



Infrared Spectrum Principal peaks at wavenumbers 1513, 1664, 1080, 1050, 1302, 1250 cm^{-1} (KBr disk).

Quantification

Plasma **HPLC** MS–MS detection [Rechberger *et al.* 2003]. MS–MS detection. Limit of quantification, 0.05 mg/L [Yu *et al.* 1999].

Serum **HPLC** MS detection (*m/z* 405 to 425). Limit of quantification, 0.1 mg/L [Martens-Lobenhoffer, Banditt 2001].

Bone **HPLC** Limit of quantification, 0.1 µg/g, see Serum [Martens-Lobenhoffer, Banditt 2001].

Dose The equivalent of 0.6 to 1.8 g of clindamycin daily.

Martens-Lobenhoffer J, Banditt P (2001). Sensitive and specific determination of clindamycin in human serum and bone tissue applying liquid chromatography-atmospheric pressure chemical ionization-mass spectrometry. *J Chromatogr B Biomed Sci Appl* 755(1–2): 143–149.

Rechberger GN *et al.* (2003). Quantitative analysis of clindamycin in human plasma by liquid chromatography/electrospray ionisation tandem mass spectrometry using d1-N-ethylclindamycin as internal standard. *Rapid Commun Mass Spectrom* 17(2): 135–139.

Yu LL *et al.* (1999). Determination of clindamycin in human plasma by liquid chromatography-electrospray tandem mass spectrometry: application to the bioequivalence study of clindamycin. *J Chromatogr B Biomed Sci Appl* 724(2): 287–294.

Clioquinol

Antiamoebic

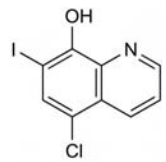
C_9H_5ClINO = 305.5

CAS—130-26-7

IUPAC Name 5-Chloro-7-iodo-8-quinolinol

Synonyms Chinoform; chloroiodoquine; cliochinolum; iodochlorhydroxyquin; iodochlorhydroxyquinoline; quiniodochlor; vioformo.

Proprietary Names *Amebil*; *Budoform*; *Eczecidin*; *Enteroquinol*; *Entero-Valodon*; *Entero-Vioform*; *Nioform*; *Rometin*; *Vioform*. It is an ingredient of *Oralcer* and *Unidiarea*.

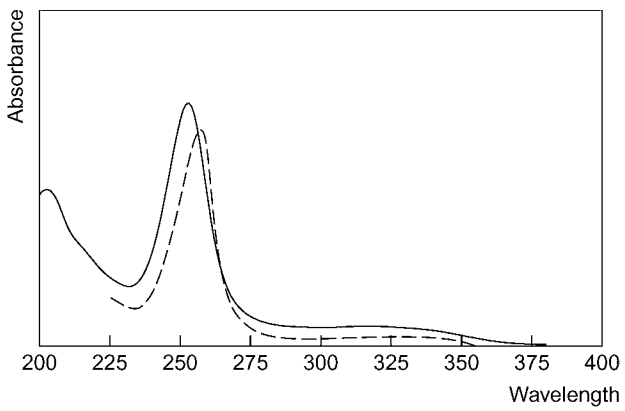


Chemical Properties A yellowish-white to brownish-yellow, voluminous powder. It darkens on exposure to light. Mp 178° to 179°, with decomposition. Almost insoluble in water, ethanol, and ether; soluble 1 in 43 of boiling ethanol, 1 in 128 of chloroform, 1 in 17 of boiling ethyl acetate, 1 in 170 of cold acetic acid, and 1 in 13 of boiling acetic acid; soluble in dimethylformamide. Log *P* (octanol/water), 3.5.

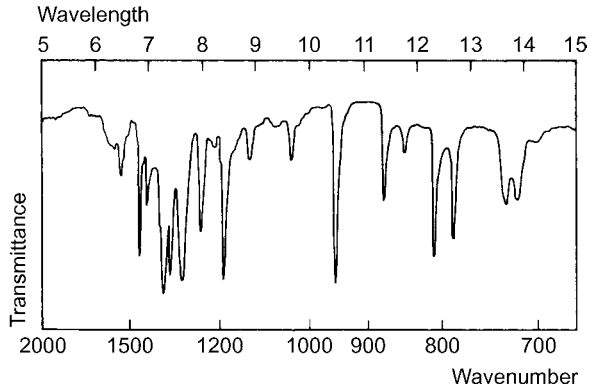
Thin-layer Chromatography System TA—R_f 0.56; system TB—R_f 0.00; system TC—R_f 0.05; system TE—R_f 0.30; system TL—R_f 0.09; system TAD—R_f 0.70; system TAE—R_f 0.40; system TAF—R_f 0.88.

Gas Chromatography System GA—RI 1975.

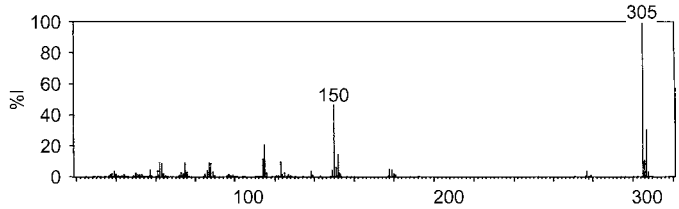
Ultraviolet Spectrum Methanol—255 (A_1^1=1196a), 325 nm.



Infrared Spectrum Principal peaks at wavenumbers 953, 1198, 808, 784, 1266, 728 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 305, 150, 307, 115, 152, 114, 306, 123.



Quantification

Plasma **GC** ECD. Limit of detection, 50 µg/L [Sioufi, Pommier 1981].

HPLC UV detection. Limit of detection, 600 µg/L [Hayakawa *et al.* 1982].

Urine **HPLC** See Plasma [Hayakawa *et al.* 1982].

Disposition in the Body Poorly absorbed after oral administration. About 25% of a dose is excreted in the urine in 24 h as glucuronide and sulfate conjugates.

Therapeutic Concentration

Following single oral doses of 250 and 1500 mg to 6 subjects, peak plasma concentrations of 1.7 to 8.3 mg/L (mean 5.2) and 14.6 to 34.8 mg/L (mean 23), respectively, were attained in 2 to 4 h [Jack, Riess 1973].

Half-life Plasma half-life, 11 to 14 h.

Dose Usually 0.75 to 1.5 g daily.

Hayakawa K *et al.* (1982). High-performance liquid chromatographic determination of clioquinol and its conjugates in biological materials. *J Chromatogr* 229(1): 159–165.

Jack DB, Riess W (1973). Pharmacokinetics of iodochlorhydroxyquin in man. *J Pharm Sci* 62: 1929–1932.

Sioufi A, Pommier F (1981). Gas chromatographic determination of clioquinol (Vioform) in human plasma. *J Chromatogr* 226(1): 219–223.

Clioxanide

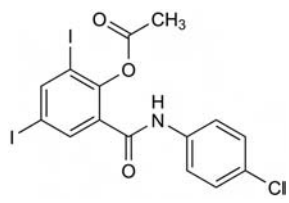
Anthelmintic (Veterinary)

$C_{15}H_{10}Cl_2NO_3$ = 541.5

CAS—14437-41-3

IUPAC Name [2-[(4-Chlorophenyl)carbamoyl]-4,6-diiodophenyl] acetate

Synonyms 2-(Acetyloxy)-*N*-(4-chlorophenyl)-3,5-diiodobenzamide; CI-633; SYD-230.



Chemical Properties A white crystalline powder. Mp 215° to 216°. Sparingly soluble in water; moderately soluble in ethanol and acetone; soluble in chloroform. Log *P* (octanol/water), 5.3.

Colour Tests Iodine test—positive; Mandelin's test—red-brown.

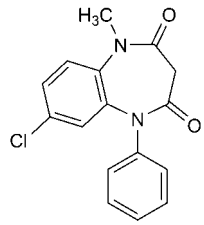
Thin-layer Chromatography System TA—R_f 0.79 (acidified potassium permanganate solution, positive).

Gas Chromatography System GA—not eluted.
Ultraviolet Spectrum Ethanol—233 nm (A_1^1=625b); aqueous alkali—240 (A_1^1=561b), 282 (A_1^1=270b), 362 nm(A_1^1=172b).
Infrared Spectrum Principal peaks at wavenumbers 1190, 1647, 1520, 1309, 1764, 816 cm^{-1} (Nujol mull).

Clobazam

Anxiolytic, Anticonvulsant, Benzodiazepine, Tranquilliser
$C_{16}H_{13}ClN_2O_2$ = 300.7
CAS—22316-47-8

IUPAC Name 8-Chloro-5-methyl-1-phenyl-1,5-benzodiazepine-2,4-dione
Synonyms 7-Chloro-1-methyl-5-phenyl-1*H*-1,5-benzodiazepine-2,4(3*H*,5*H*)-dione; H-4723; HR-376; LM-2717; 1-phenyl-5-methyl-8-chloro-1,2,4,5-tetrahydro-2,4-dioxo-3*H*-1,5-benzodiazepine.
Proprietary Names *Castilium*; *Clarmyl*; *Clopax*; *Frisium*; *Noiafren*; *Urbadan*; *Urbanil*; *Urbanol*; *Urbanyl*.



Chemical Properties White crystalline powder. M.p. 166° to 168°. Practically insoluble in water; sparingly soluble in ethanol; freely soluble in acetone and chloroform. Log *P* (octanol/water), 2.12. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].
Colour Test Aromaticity (method 2)—colourless (heat for 3 min)/red.
Thin-layer Chromatography System TA—R_f 0.62; system TB—R_f 0.08; system TC—R_f 0.70; system TD—R_f 0.53; system TE—R_f 0.75; system TF—R_f 0.47; system TL—R_f 0.62; system TAD—R_f 0.70; system TAE—R_f 0.84; system TAF—R_f 0.85.

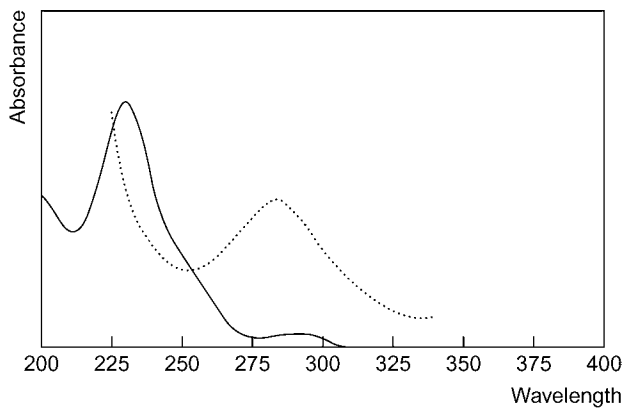
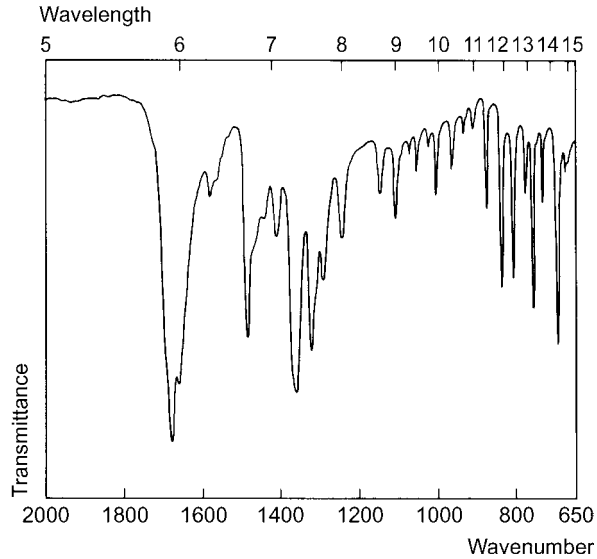
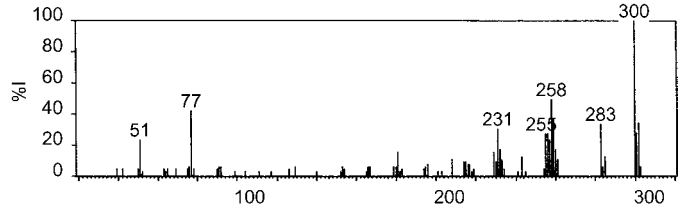
High Performance Liquid Chromatography System HI—clobazam *k* 3.91, M (nor)*k* 3.06; system HK—clobazam *k* 0.03, M (nor-)*k* 0.01; system HX—clobazam RI 488; system HY—clobazam RI 455; system HZ—clobazam RT 6.2 min; system HAA—RT 19.2 min; system HAK—clobazam RT 9.3 min; system HAL—clobazam RT 7.8 min; system HAM—not detected; system HAX—clobazam RT 7.2 min; system HAY—clobazam RT 7.1 min; system HBH—clobazam *k* 4.14; system HBI—clobazam *k* 1.09.
Ultraviolet Spectrum Ethanol—228 (A_1^1 = 1450), 285 and 295 nm (A_1^1 = 75) [Hajdú *et al.* 1980]; aqueous acid—230 (A_1^1 = 1373b), 289 nm (A_1^1 = 76b); aqueous alkali—286 nm (A_1^1 = 193b).



Infrared Spectrum Principal peaks at wavenumbers 1684, 1664, 704, 1490, 764, 845 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 300, 258, 77, 259, 283, 302, 231, 256; desmethylclobazam 286, 244, 77, 218, 51, 217, 288, 215.



Quantification

Blood **GC** Column: SE-54 5% phenyl methyl silicone (25 m × 0.31 mm i.d., 0.17 µm). Carrier gas: He, 2–3 mL/min. Temperature programme: 200° for 1 min to 290° at 10°/min. NPD or ECD. Retention time: 6.28 min. Limit of detection not reported [Lillsunde, Seppala 1990].

HPLC Column: Restek Allure C_{18} (150 × 3.2 mm i.d., 5 µm). Mobile phase: 50 mmol/L potassium dihydrogen phosphate : acetonitrile (75 : 25 to 70 : 30 at 15 min to 65 : 35 at 25 min for 5 min), flow rate 0.8 mL/min. DAD. Limit of quantification, 10 µg/L [Dussy *et al.* 2006].

LC-MS Column: Symmetry C_{18} reversed phase (150 × 2.1 mm i.d., 3.5 µm). Mobile phase: methanol : water (55 : 45 for 5 min to 65 : 35 over 12 min for 5 min), flow rate 0.25 mL/min. DAD (λ = 254 nm) followed by ESI, positive ion mode, SIR acquisition mode. Retention time: 6.7 min. Limit of quantification, 10.0 µg/L, limit of detection, 1.0 µg/L [Proença *et al.* 2004].

Plasma **GC** Column: Ultra 2 5% phenyl methyl silicone (25 m × 0.32 mm i.d.). Carrier gas: He, 2.1 mL/min. Temperature programme: 210° to 285° at 2.5°/min. NPD and ECD. Relative retention time: 0.87. Limit of quantification, 2 µg/L [Gaillard *et al.* 1993]. Column: 3% CP-Sil on Chromosorb G HP, 100/120 mesh (0.9 m × 2.0 mm i.d.). Carrier gas: N_2, 60 mL/min. Temperature: 255°. ECD. Retention time: 4.2 min. Limit of detection, 7 nmol/L [Badcock, Zoanetti 1987]. Column: 10% OV-101 on 80/100 mesh Chromosorb (122 cm × 4 mm i.d.). Carrier gas: Ar:CH_4 (95 : 5), 25 mL/min. Temperature: 265°. ECD. Limit of detection, 3–5 µg/L [Greenblatt 1980].

GC-MS Column: CP-Sil 5 glass-coated capillary (25 m × 0.5 mm i.d.). Carrier gas: He, 0.6 bar. Temperature: 260°. ECD. Retention time: 4.3 min. Limit of quantification, 1 µg/L [Monjanel-Mouterde *et al.* 1994]. Column: cross-linked dimethylsilicone fused silica capillary (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 1.0 bar. Temperature programme: 70° to 300° at 20°/min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, 1–5 µg/L [Drouet-Coassolo *et al.* 1989]. Column: GP-2% SP-2510-DA on 100/120 mesh (0.5 m × 3.0 mm i.d.). Carrier gas: N_2, 80 mL/min. Temperature: 245°. ECD. Limit of detection, 5 µg/L [Riva *et al.* 1981].

HPLC Column: Chromolith Performance RP-18e (100 × 4.6 mm i.d.). Mobile phase: 10 mmol/L phosphate buffer (pH 3.5) : acetonitrile (70 : 30), flow rate 2.0 mL/min. UV detection (λ = 228 nm). Retention time: 2.4 min. Limit of quantification, 5 µg/L [Rouini *et al.* 2005]. Column: Hisep (25 cm × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.18 mol/L ammonium acetate buffer (pH 2.5; 15 : 85), flow rate 2.0 mL/min. UV detection (λ = 254 nm). Retention time: 8.65 min. Limit of quantification, 0.5 mg/L, limit of detection, 0.16 mg/L [Pistos, Stewart 2003]. Column: RP C_8 Ultrasphere (250 × 4.6 mm, 5 µm). Mobile phase: 20 mmol/L acetate buffer (pH 5.5) : acetonitrile : triethylamine (70 : 30 : 0.01), flow rate 1.8 mL/min. Retention time: 13.5 min. Limit of detection, 6 µg/L [Bolner *et al.* 2001]. Column: Lichrosorb C_{18} (250 × 4.0 mm i.d., 10 µm). Mobile phase: methanol : acetonitrile : 0.1 mol/L potassium dihydrogen phosphate (pH 3.6; 23 : 20 : 57), flow rate

2 mL/min. Retention time: 12 min [Knapp *et al.* 1999]. Column: Novapak C_{18} (150 mm, 4.0 μm). Mobile phase: acetonitrile : methanol : 10 mmol/L dipotassium hydrogen phosphate (pH 3.7; 30 : 2 : 100), flow rate 1.5 mL/min. DAD (λ = 240 nm). Limit of detection, 15 nmol/L [Akerman 1996].

See also Lacroix *et al.* [1993], Streete *et al.* [1991], Dusci and Hackett [1987], Tomasini *et al.* [1985] and Brachet-Liermain *et al.* [1982].

Serum **GC** Column: HP-5 cross-linked phenyl methylsilicone capillary (5.0 m × 0.53 mm i.d., 2.65 μm). Carrier gas: He, 10 mL/min. Temperature: 250°. ECD. Retention time: 1.86 min. Limit of detection, 0.3 μmol/L [LeGatt, McIntosh 1993]. Column: SE-54 5% phenyl methyl silicone capillary (25 m × 0.31 mm i.d., 0.17 mm). Temperature programme: 200° to 270° at 10°/min. NPD. Limit of detection not reported [Bardy *et al.* 1991]. Column: SPB-1 wide bore capillary (30 m × 0.75 mm i.d.). Temperature: 120°. NPD. Limit of detection not reported [Fraser *et al.* 1988]. See Plasma [Badcock, Zoanetti 1987]. Column: 3% SP 2250 on 100/120 mesh Supelcoport (2 m × 2 mm i.d.). Temperature: 280°. NPD. Relative retention time: 0.88 min. Limit of detection, 2–5 μg/L [Arranz Peña, Sanenz Lope 1986]. Column: 2% OV 101 glass (1.2 m × 4 mm i.d., 120–150 μm). Carrier gas: He, 40 mL/min. Temperature: 240°. FID. Limit of detection, 5 μg/L [Hajdú *et al.* 1980].

HPLC See Blood [Dussy *et al.* 2006]. Column: Supelcosil LC-8-DB (250 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : water : potassium dihydrogen phosphate : hydrogen phosphate (440 : 540 : 20 : 0.4), flow rate 1.5 mL/min. UV detection (λ = 228 nm). Retention time: 6.6 min. Limit of quantification, 2 μg/L, limit of detection, 1.0 μg/L [Kunicki 2001]. See Plasma [Akerman 1996]. Column: Partisil II CCS/C_8 (100 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : water : 0.5 mmol/L potassium dihydrogen phosphate (40 : 59 : 1), flow rate 70 mL/h. UV detection (λ = 228 nm). Retention time: 8.6 min. Limit of detection, 10 μg/L [Gazdzik *et al.* 1989]. Column: RP-8 (250 × 4.6 mm i.d., 5 μm). Mobile phase: 0.1 mol/L sodium phosphate : acetonitrile (pH 3.0; 1 : 1), flow rate 1.6 mL/min. UV detection (λ = 228–232 nm). Limit of detection, 0.1 mg/L [Fraser *et al.* 1988]. Column: Supelco C_8 reversed phase (150 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : 1.75 mmol/L hydrochloric acid : 50 mmol/L sodium acetate (36 : 10 : 54), flow rate 1.5 mL/min. UV detection (λ = 220 nm). Limit of detection, 0.5 μg/L [Zilli, Nisi 1986]. Column: Spherisorb ODS (250 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : water (53 : 47), flow rate 1.8 mL/min. UV detection (λ = 228 nm). Retention time: 2 min. Limit of detection, 50 μg/L [Ratnaraj *et al.* 1984].

CE Capillary: fused silica (total/effective length 47/40 cm, 50 μm i.d.). Buffer: 50 mmol/L sodium borate (pH 9.5) containing 18 mmol/L SDS : acetonitrile (86 : 14). UV detection (λ = 214 nm). Limit of quantification, 15 μg/L [Imazawa, Hatanaka 1997].

Urine **GC** See Plasma [Tomasini *et al.* 1985]. See Serum [Hajdú *et al.* 1980].

GC-MS Column: 5% OV-101 Chromosorb G HP 100/120 mesh (60 cm × 2 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature: 100° to 310° at 30°/min. EI ionisation at 70 eV. Limit of detection not reported [Maurer, Pfleger 1987].

HPLC See Serum. Mobile phase: acetonitrile : water : potassium dihydrogen phosphate : hydrogen phosphate (360 : 580 : 60 : 0.4). Limit of quantification, 1 μg/L, limit of detection, 0.5 μg/L [Kunicki 2001].

Oral Fluid **GC** See Serum [Bardy *et al.* 1991]

LC-MS Column: XTerra MS C_{18} (100 × 2.1 mm i.d., 3.5 μm). Mobile phase: acetonitrile : 0.1% formic acid (5 : 95 to 80 : 20 at 10 min), flow rate 200 μL/min. API, positive ion mode, MRM acquisition mode. Retention time: 11.7 min. Limit of quantification, 0.2 μg/L [Kintz *et al.* 2005].

Hair **LC-MS** Column: Phenomenex Luna phenyl hexyl (50 × 2 mm i.d., 3 μm). Mobile phase: acetonitrile : 2 mmol/L ammonium formate (20 : 80 for 1 min to 90 : 10 at 4 min for 2 min to 20 : 80 at 7 min for 1 min). ESI. Limit of detection, 0.06 ng/g [Irving, Dickson 2007]. Column: XTerra MS C_{18} (100 × 2.1 mm i.d., 3.5 μm). Mobile phase: acetonitrile : 0.1% formic acid (5 : 95 to 80 : 20 at 10 min), flow rate 200 μL/min. API, positive ion mode, MRM acquisition mode. Retention time: 11.7 min. Limit of quantification, 2 ng/g [Villain *et al.* 2005].

Liver **GC** See Serum [Fraser *et al.* 1988].

HPLC See Serum [Fraser *et al.* 1988].

Nails **LC-MS** See Hair [Irving, Dickson 2007].

Disposition in the Body Readily absorbed after oral administration; peak plasma concentrations reached after 1 to 4 h. Clobazam is highly lipophilic and rapidly crosses the blood–brain barrier. It is metabolised in the liver by demethylation and hydroxylation. Metabolites found in the serum include *N*-desmethylclobazam, which is thought to be active, 4′-hydroxyclobazam and 4′-hydroxydesmethylclobazam. Approximately 90% of a dose is excreted in the urine in 17 days and approximately 2% is eliminated in the faeces.

Therapeutic Concentration

After the oral administration of 10 mg clobazam to 14 healthy volunteers a mean peak plasma concentration of 173 ± 33.3 μg/L was reached at 1.4 ± 0.6 h [Rouini *et al.* 2005].

Fifteen patients with liver disease and 6 healthy volunteers were administered a single oral dose of 20 mg clobazam. Mean peak plasma concentrations were 350 ± 63, 230 ± 70, and 240 ± 113 μg/L in healthy volunteers, patients with viral hepatitis, and patients with cirrhosis, respectively. Peak concentrations were reached at 1.7 ± 0.8, 3 ± 1.9, and 2.5 ± 1.5 h in each group, respectively [Monjanel-Mouterde *et al.* 1994].

After a single oral dose of 20 mg, administered to 16 subjects, peak serum concentrations of 0.30 to 0.95 mg/L (mean 0.57) were attained in ~1.3 h [Ochs *et al.* 1984].

After daily oral doses of 10 mg to 7 young male and 6 elderly male subjects, the mean steady-state plasma concentrations for the 2 groups were: clobazam 0.12 to 0.25 mg/L (mean 0.17) and 0.17 to 0.41 mg/L (mean 0.3); desmethylclobazam 0.12 to 0.25 mg/L (mean 0.16) and 0.21 to 12.8 mg/L (mean 3.9), respectively. The corresponding steady-state plasma concentrations in 5 young female and 6 elderly female subjects, receiving the same dosage schedule, were: clobazam 0.19 to 0.27 mg/L (mean 0.23) and 0.16 to 0.32 mg/L (mean 0.23); desmethylclobazam 0.22 to 1.37 mg/L (mean 0.7) and 0.17 to 4.13 mg/L (mean 1.0), respectively [Greenblatt *et al.* 1983b].

After the administration of 0.3 to 1.6 mg/kg/day clozabam to 16 patients (age: 4 to 47 years) plasma concentrations ranged from 20 to 197 μg/L [Riva *et al.* 1981].

A healthy 30-year-old male was administered a single oral dose of 20 mg clobazam. A peak plasma concentration of 510 μg/L was reached after 1.5 h. Desmethylclozabam reached a peak concentration of 91 μg/L 48 h after dosing [Greenblatt 1980].

Seven healthy volunteers were administered clobazam for 10 days, 10 mg in the morning and 20 mg in the evening. On day 1, the mean maximum serum concentration of 0.31 mg/L was reached after 2 h. The elimination half-life was 8 h. *N*-Desmethylclobazam was only detected after 8 h at a concentration of 0.05 mg/L. A steady-state concentration of 0.90 ± 0.23 mg/L was reached on the 4th day. *N*-Desmethylclobazam reached a steady state serum concentration of 3.6 ± 1.3 mg/L on the 9th day [Hajdú *et al.* 1980].

Toxicity Up to 300 mg has been ingested without serious toxic effects.

A 49-year-old female was found dead. The blood concentration of clobazam was 3.9 mg/L [Proença *et al.* 2004].

Postmortem concentrations for clobazam in serum and liver in a 6-year-old male were 0.1 mg/L and 0.4 μg/g. Desmethylclobazam concentrations were also reported as 1.5 mg/L in serum, 8.6 μg/g in liver and 3.6 μg/g in the brain [Fraser *et al.* 1988].

Note For a case of clobazam causing toxic epidermal necrosis, see Redondo *et al.* [1996].

Half-life Plasma half-life, clobazam 10 to 58 h (mean 25), desmethylclobazam, ~40 h. The half-life may be prolonged considerably in elderly subjects.

Volume of Distribution ≈1 L/kg [Ochs *et al.* 1984].

Clearance Plasma, ≈0.5 mL/min/kg [Ochs *et al.* 1984].

Protein Binding ≈85 to 90% at therapeutic levels (0.1 to 1.6 mg/L) [Hajdú *et al.* 1980].

Note For a review of the pharmacokinetics of clobazam, see Brogden *et al.* [1980]. For a review of the pharmacokinetics of benzodiazepines, see Greenblatt *et al.* [1983a].

Dose Adults, usually 20 to 30 mg; in severe conditions up to 60 mg daily; children (3 years and over), no more than 30 mg daily.

Clobenzorex

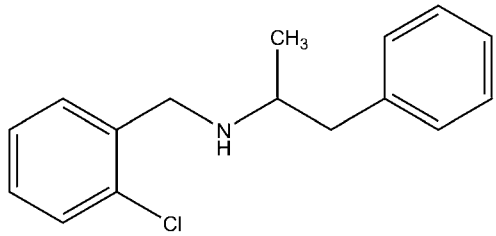
Anorectic

$C_{16}H_{18}ClN$ = 259.8

CAS—13364-32-4

IUPAC Name *N*-[(2-Chlorophenyl)methyl]-1-phenylpropan-2-amine

Synonyms (+)-*N*-(*o*-Chlorobenzyl)-α-methylphenethylamine; (+)-*N*-[(2-chlorophenyl)methyl]-α-methylbenzeneethanamine; (+)-*N*-[(2-chlorophenyl)methyl]-α-methylphenethylamine; *d*-*N*-(1-phenyl-2-propyl)-2-chlorobenzylamine.



Chemical Properties Colourless to light yellow solution. Bp 132° to 134°. Log *P* (octanol/water), 4.57 [Meylan, Howard 1995].

Clobenzorex Hydrochloride

$C_{16}H_{18}ClN$, HCl = 296.2

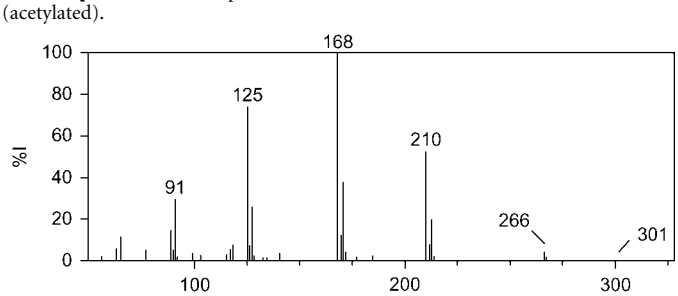
CAS—5843-53-8

Synonyms Ba-7205; SD-271-12.

Proprietary Names *Asenlix*; *Dinintel*; *Finedal*; *Itravil*; *Rexigen*.

Chemical Properties Crystals. Mp 182° to 183°. Soluble in water and ethanol; slightly soluble in methanol and chloroform.

Mass Spectrum Principal ions at *m/z* 168, 125, 210, 170, 91, 127, 212, 89 (acetylated).



Quantification

Urine **GC-MS** Column: HP-1 capillary (12 m × 0.2 mm i.d., 0.33 µm) or ZB-50 Phenomenex (15 m × 0.25 mm i.d., 0.25 µm). Temperature programme: 80° for 1 min to 180° at 20°/min to 250° at 28°/min with a 1 min final time. Limits of quantification and detection, 1 µg/L [Cody, Valtier 2001]. Column: HP-1 (12 m × 0.2 mm i.d., 0.33 µm). Temperature programme: 80° for 1 min to 180° at 20°/min to 250° at 28°/min. Limit of detection, 10 µg/L for *p*-hydroxyclobenzorex; limits of quantification and detection for clobenzorex, 1 µg/L [Valtier, Cody 2000]. Column: HP-1 (12 m × 0.2 mm i.d., 0.33 µm) or DB-17 (30 m × 0.18 mm, 0.30 µm). Temperature programme: 80° for 1 min to 180° at 20°/min to 250° at 28°/min with 1 min final time. For DB-17, the same temperature programme only with a 2 min final time. Limit of detection, 1 µg/L [Cody, Valtier 1999]. Column: HP cross-linked methylsilicone capillary (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 1.9 mL/min. Temperature programme: 100° to 310° at 30°/min, initial time 3 min, final time 8 min. Limit of detection, 10 µg/L [Maurer *et al.* 1997].

Other **GC-MS** Traditional Chinese Medicines. Column: HP-5MS fused silica 5% phenylmethylsilicone capillary (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He. Temperature programme: 65° for 1 min to 280° at 10°/min for 5 min. EI ionisation at 70 eV, full scan mode. Limit of detection not reported [Ku *et al.* 1999].

CE Traditional Chinese medicines. Capillary (57 cm × 75 µm i.d.) Electrolyte buffer: 120 mmol/L sodium phosphate buffer (pH 2.1, NaH_2PO_4/H_3PO_4) : acetonitrile (85 : 15). UV detection (λ = 200 nm). Limit of detection, 200 µg/L [Ku *et al.* 1999].

Disposition in the Body Readily absorbed from the gastrointestinal tract. Eliminated as *p*-hydroxyclobenzorex (1.5 to 6% of administered dose) and amfetamine (15% of dose). *p*-Hydroxyclobenzorex is excreted much more rapidly than amfetamine. Other metabolites include *p*-hydroxyamfetamine, hippuric acid and conjugated clobenzorex, *p*-hydroxyclobenzorex, and *p*-hydroxyamfetamine.

Therapeutic Concentration

Five subjects were administered 30 mg clobenzorex for 7 days and individual urine samples were collected *ad hoc* for 14 days from the first day the drug was administered. Peak amfetamine urine concentrations were found at 82 to 168 h after the first dose and ranged from 2.9 to 4.7 mg/L. Peak concentrations of clobenzorex were found at 50 to 120 h after the first dose and ranged between 8 and 47 µg/L [Baden *et al.* 1999].

Note For a review of precursor compounds to amfetamine and metamfetamine, see Musshoff [2000]. For a study on the incorporation of amfetamine analogues into hair, see Nakahara and Kikura [1996].

EU regulatory authorities called for withdrawal of all anorectics from the market; still available in Mexico at the time of writing (2007).

Clobetasol Propionate

Corticosteroid

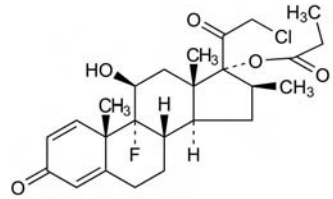
$C_{25}H_{32}ClFO_5$ = 467.0

CAS—25122-41-2 (clobetasol); 25122-46-7 (propionate)

IUPAC Name [(8*S*,9*R*,10*S*,11*S*,13*R*,14*S*,16*S*,17*R*)-13-(2-Chloroacetyl)-9-fluoro-11-hydroxy-10,16,17-trimethyl-3-oxo-6,7,8,11,12,14,15,16-octahydrocyclopenta[*a*]phenanthren-17-yl] propanoate

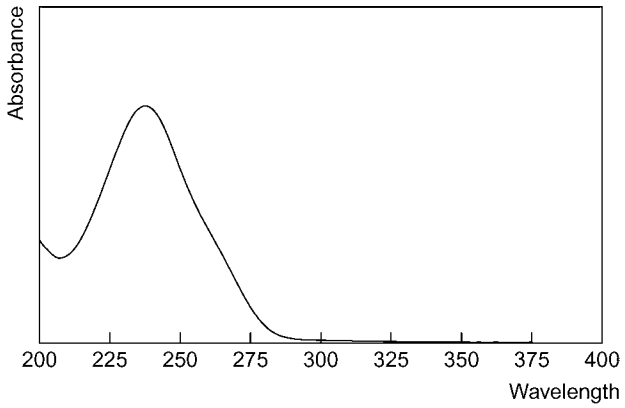
Synonym (11β,16β)-21-Chloro-9-fluoro-11,17-dihydroxy-16-methylpregna-1,4-diene-3,20-dione-17-propionate

Proprietary Names *Dermoval*; *Dermovat(e)*; *Dermoxin*.



Chemical Properties A white to creamy-white, crystalline powder. Mp 195.5° to 197°. Practically insoluble in water; soluble 1 in 100 of ethanol and 1 in 1000 of ether; soluble in acetone and chloroform. Log *P* (octanol/water), 3.5.

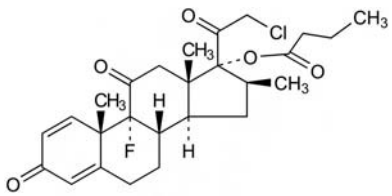
High Performance Liquid Chromatography System HY—RI 636.
Ultraviolet Spectrum Methanol—239 nm (A^1_1=390b).



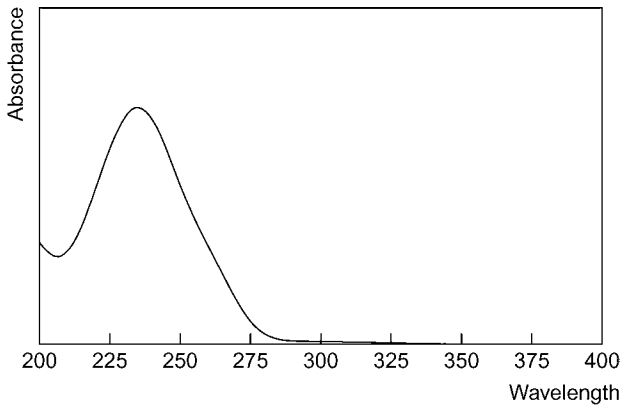
Infrared Spectrum Principal peaks at wavenumbers 1666, 1612, 1724, 884, 1063, 1010 cm^{-1}.
Use Topically in a concentration of 0.05%.

Clobetasone Butyrate

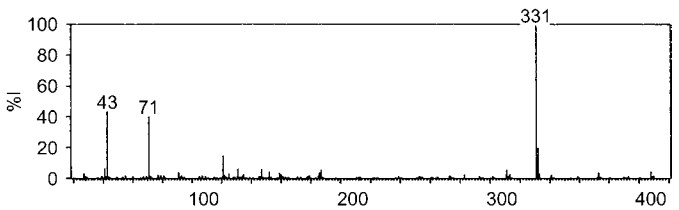
Corticosteroid
$C_{26}H_{32}ClFO_5$ = 479.0
CAS—54063-32-0 (clobetasone); 25122-57-0 (butyrate)
IUPAC Name [(8*S*,9*R*,10*S*,13*S*,14*S*,16*S*,17*R*)-17-(2-Chloroacetyl)-9-fluoro-10,13, 16-trimethyl-3,11-dioxo-7,8,12,14,15, 16-hexahydro-6*H*-cyclopenta[*a*]phenanthren-17-yl] butanoate
Synonym (16β)-21-Chloro-9-fluoro-17-hydroxy-16-methylpregna-1,4-diene-3,11,20-trione-17-butyrate
Proprietary Names *Emovat(e)*; *Eumovate*. It is an ingredient of *Trimovate*.



Chemical Properties A white crystalline powder. Mp 90° to 100°. Practically insoluble in water; soluble in many organic solvents. Log *P* (octanol/water), 3.8.
Ultraviolet Spectrum Methanol—236 nm (A^1_1=330b).



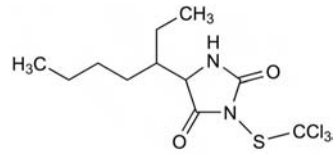
Mass Spectrum Principal ions at *m/z* 331, 43, 71, 332, 121, 147, 131, 41 (clobetasone).



Use Topically in a concentration of 0.05%.

Clodantoin

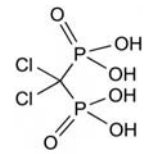
Antifungal
$C_{11}H_{17}Cl_3N_2O_2S$ = 347.7
CAS—5588-20-5
IUPAC Name 5-Heptan-3-yl-3-(trichloromethylsulfanyl)imidazolidine-2,4-dione
Synonyms Chlordantoin; 5-(1-ethylpentyl)-3-[(trichloromethyl)thio]-2,4-imidazolidinedione.
Proprietary Name *Sporostacin*



Chemical Properties Log *P* (octanol/water), 3.7.
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.
Infrared Spectrum Principal peaks at wavenumbers 1730, 1786, 730, 1059, 766, 1309 cm^{-1}.
Use Topically in a concentration of 1%.

Clodronic Acid

Calcium Regulator
$CH_4Cl_2O_6P_2$ = 244.9
CAS—10596-23-3
IUPAC Name [Dichloro(phosphono)methyl]phosphonic acid
Synonyms Clondronate; (dichloromethylene)bisphosphonic acid; DMDP.



Chemical Properties Mp 249° to 251°. Log *P* (octanol/water), 0.67.

Disodium Clodronate

$CH_2Cl_2Na_2O_6P_2$ = 288.9
CAS—22560-50-5
Synonyms Clodronate disodium; clodronate sodium; sodium clodronate; BM-06.011; Cl_2MDP.
Proprietary Names *Ascredar*; *Bonefos*; *Clasteon*; *Clastoban*; *Difosfonal*; *Lodronat*; *Loron*; *Lytos*; *Mebonat*; *Ostac*; *Ossiten*.

Quantification

Urine **GC-MS** Column: OV-1 (25 m × 0.31 mm i.d., 0.1 µm). Temperature: 120° to 230° at 10°/min. Injector temperature: 250°. Carrier gas: methane. MS detection (EI). Retention time: clodronate (TMS (trimethylsilyl) derivative), 7.2 min. Limit of detection, 0.025 mg/L [Auriola *et al.* 1989].

HPLC Column: anion exchange HPIC AS7 (250 × 4.0 mm i.d., 10 µm). Mobile phase: 30 mmol/L nitric acid solution, flow rate 1.0 mL/min. UV detection (λ=550 nm). k values: 7.16 (pH 2.7); 7.36 (pH 2.4); 5.82 (pH 2.1); 5.18 (pH 1.8). Limit of detection, 0.3 mg/L [Virtanen, Lajunen 1993].

Disposition in the Body Clodronate is poorly absorbed after oral administration and absorption is reduced by food, especially products containing calcium or other polyvalent cations; bioavailability is only 1 to 4% and varies between different formulations. It is not metabolised. Over 70% of an IV dose is excreted unchanged in the urine within 24 h, 5% in faeces, and the remainder is sequestered in bone tissue from where it is eliminated very slowly.

Therapeutic Concentration

Twenty patients with tumour-related bone disease of varying stages, 15 of which were women and 5 men with a mean age of 61 years (range 36 to 78), were administered with 300 mg clodronate over 2 to 3 h. The peak serum concentration was 11.8 mg/L after 2 h which decreased to 0.4 mg/L over 24 h [O'Rourke *et al.* 1994].

Six patients, 3 females and 2 males with Paget's disease and 1 male with prostatic cancer, were administered with 300 mg as a 3 h infusion daily for 5 consecutive days. A peak serum disodium clodronate concentration of 5.7 mg/L was observed in the males and 10.1 mg/L for the females [Hanhijarvi *et al.* 1989].

Bioavailability About 1 to 2%.
Half-life Plasma, 2 h; also reported as 5.6 h.
Volume of Distribution 0.2 to 0.7 L/kg.
Clearance Plasma, 5 to 15 L/h.
Protein Binding 36%.
Note For a review of clodronic acid, see Plosker, Goa [1994].
Dose Up to 3.20 g of disodium clodronate (in capsule form) daily orally or up to 2.08 g of disodium clodronate (in tablet form) daily. By IV infusion, 300 mg of disodium clodronate daily for not more than 10 days, or a single dose of 1.5 g infused over 4 h.

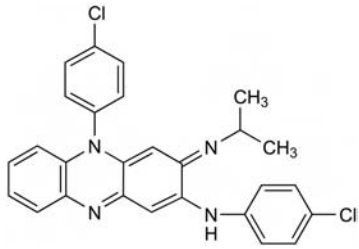
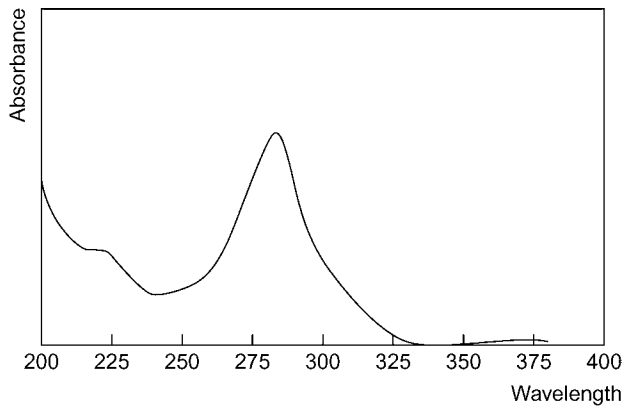
Clofazimine

Antileprotic
$C_{27}H_{22}Cl_2N_4$ = 473.4
CAS—2030-63-9

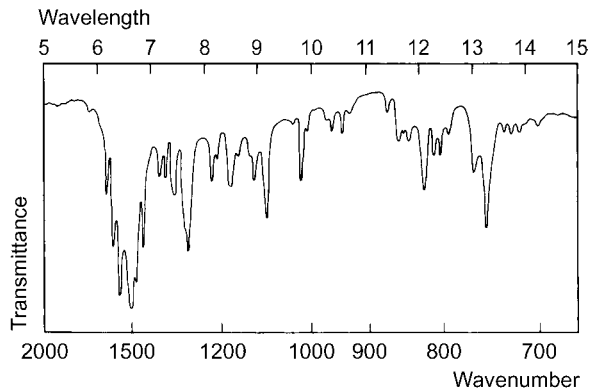
IUPAC Name *N*,5-Bis(4-chlorophenyl)-3-propan-2-yliminophenazin-2-amine
Synonyms B-663; *N*,5-bis(4-chlorophenyl)-3,5-dihydro-3-[(1-methylethyl) imino]-2-phenazinamine; G-30320; riminophenazine.
Proprietary Name *Lampren(e)*



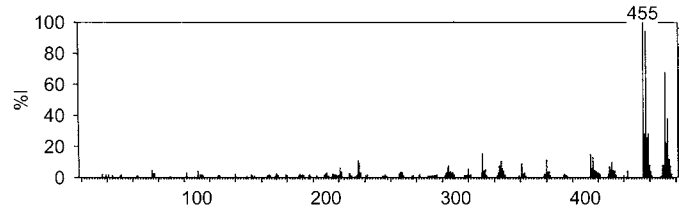
Chemical Properties Dark red crystals or orange-red microcrystalline powder. Mp 210°–212°. Practically insoluble in water; soluble 1 in 700 of ethanol, 1 in 15 of chloroform, and 1 in 1000 of ether; soluble in dilute acetic acid and dimethylformamide. pK_a 8.5. Log *P* (octanol/water), 7.7.
Colour Tests Mandelin's test—yellow-brown; Marquis test—violet; sulfuric acid—violet.
Thin-layer Chromatography System TA—R_f 0.70; system TB—R_f 0.57; system TC—R_f 0.59; system TE—R_f 0.86; system TL—R_f 0.68; system TAE—R_f 0.33; system TAF—R_f 0.86 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—not eluted.
Ultraviolet Spectrum Methanolic acid—283 nm (A^1_1=1300b).



Infrared Spectrum Principal peaks at wavenumbers 1508, 1560, 1295, 1587, 747, 1083 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 455, 457, 472, 474, 459, 456, 458, 473.



Quantification
Plasma **TLC** Limit of detection, 5 µg/L [Lanyi, Dubois 1982].
HPLC UV detection. Limit of detection, 10 µg/L [Peters *et al.* 1982].
Serum **HPLC** [Borner *et al.* 1999].
Urine **TLC** [Krishna *et al.* 1997].
LC-MS [Krishna *et al.* 1997].
Tissue **HPLC** See Serum [Borner *et al.* 1999].
Disposition in the Body Incompletely absorbed after oral administration. It is stored in body tissues and only very slowly excreted in the urine. 3-(*p*-Hydroxy) clofazimine and a 3-glucuronide conjugate have been detected in the urine, each accounting for <0.5% of a daily dose.
Therapeutic Concentration
Following single oral doses of 200 mg and 400 mg to 1 subject, peak plasma concentrations of 0.07 mg/L and 0.16 mg/L were attained in 8 and 4 h, respectively; plasma concentrations of clofazimine were still detectable at 264 h [Lanyi, Dubois 1982].
Dose 50 to 100 mg daily; 300 mg daily for lepra reactions.

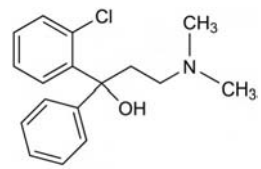
Clofedanol

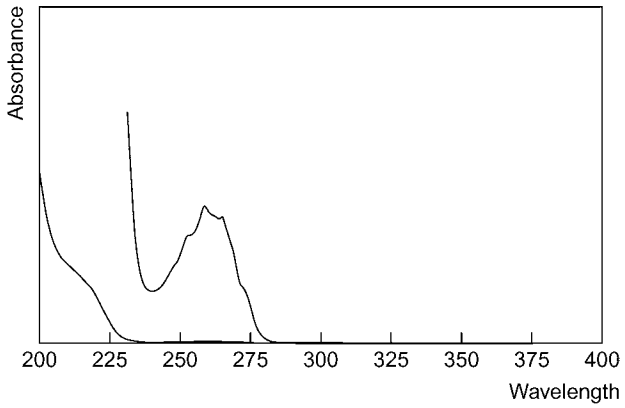
Cough Suppressant
$C_{17}H_{20}ClNO$ = 289.8
CAS—791-35-5

IUPAC Name 1-(2-Chlorophenyl)-3-(dimethylamino)-1-phenylpropan-1-ol
Synonym Clophedianol; 2-chloro-α-[2-(dimethylamino)ethyl]-α-phenylbenzenemethanol.

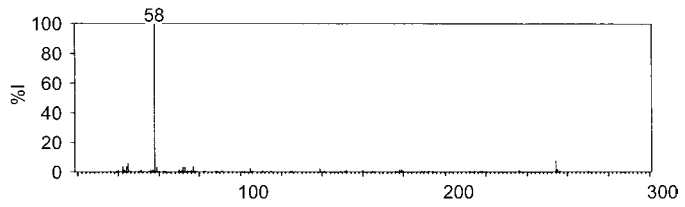


Chemical Properties Mp 120°. Log *P* (octanol/water), 3.5.

Clofedanol Hydrochloride
$C_{17}H_{20}ClNO$, HCl = 326.3
CAS—511-13-7
Proprietary Names *Detigon*; *Pectolitan*.
Chemical Properties Crystals. Mp 190° to 191°. Freely soluble in water and ethanol; sparingly soluble in ether, benzene, and ethyl acetate.
Colour Tests Mandelin's test—green-blue; Marquis test—red-violet→ brown.
Thin-layer Chromatography System TA—R_f 0.52; system TB—R_f 0.41; system TC—R_f 0.37; system TL—R_f 0.29; system TAE—R_f 0.32 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—clofedanol RI 2090, clofedanol-H_2O RI 2085, M (2-Cl-benzophenone) RI 1720, M (OH-)-H_2O RI 2130, M (aldehyde) RI 1900, M (nor-)-H_2O RI 2090.
Ultraviolet Spectrum Aqueous acid—259 (A^1_1=14.6a), 265 nm. No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 756, 700, 1035, 770, 1190, 735 cm^{-1}(KBr disk).
Mass Spectrum Principal ions at *m/z* 58, 254, 45, 44, 77, 42, 59, 72.

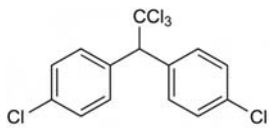


Dose 75 to 100 mg of clofedanol hydrochloride daily.

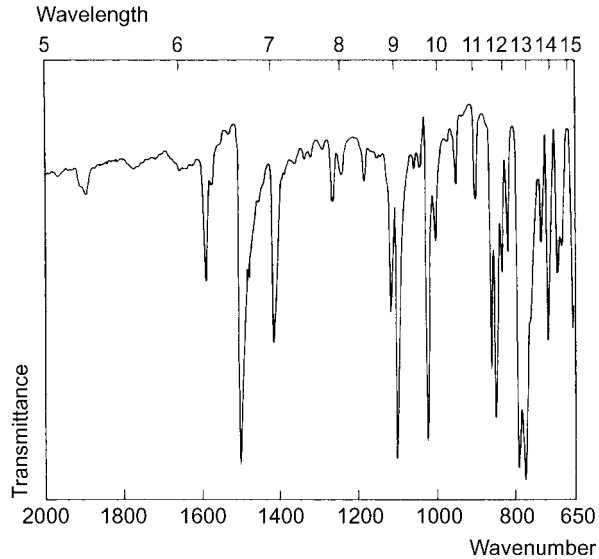
Clofenotane

Insecticide
$C_{14}H_9Cl_5$ = 354.5
CAS—50-29-3

Note Clofenotane contains about 70% of 1,1,1-trichloro-2,2-bis(4-chlorophenyl) ethane (*pp′*-DDT) together with varying quantities of an isomer, 1,1,1-trichloro-2-(2-chlorophenyl)-2-(4-chlorophenyl)ethane (*op′*-DDT) and other related compounds.
Synonyms Chlorophenothane; chlorphenothanum; dicophane; DDT; dichlorodiphenyltrichloroethane; dichophanum; parachlorocidum; penticidum.



Chemical Properties White or nearly white crystals, small granules, flakes, or powder. Mp about 109°. The technical product is a waxy solid of indefinite melting point. Practically insoluble in water; soluble 1 in 50 of ethanol, 1 in 6 of boiling ethanol, 1 in 2.5 of acetone, 1 in 3.5 of chloroform, and 1 in 4 of ether. Log *P* (octanol/water), 6.9.
Colour Tests Liebermann's reagent—brown; nitric–sulfuric acid (Erdman's reagent—red→orange→green; heat a small quantity with a 0.5% solution of hydroquinone in sulfuric acid—red. Clofenotane does not react to the Fujiwara test.
Thin-layer Chromatography System TD—R_f 0.82; system TE—R_f 0.87; system TF—R_f 0.74; system TAD—R_f 0.80; system TAJ—R_f 0.95; system TAK—R_f 0.93; system TAL—R_f 0.97.
Gas Chromatography System GA— RI 2314 *pp′*-DDT, RI 2218 *op′*-DDT, RI 2140 *pp′*-DDE, RI 2090 *op′*-DDE; system GK— RRT 1.32 *pp′*-DDT, RRT 1.24 *op′*-DDT (both relative to caffeine).
Ultraviolet Spectrum Methanol—236 (A^1_1=510b), 267 nm (A^1_1=19b).
Infrared Spectrum Principal peaks at wavenumbers 775, 790, 1500, 1100, 1022, 850 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 235, 237, 165, 236, 75, 239, 82, 199 (*pp′*-DDT).
Quantification
Blood **GC** ECD. Clofenotane and metabolites, limit of detection, <1 mg/L [Radomski, Rey 1970].
Serum **GC** ECD. Clofenotane and metabolites [Dale *et al.* 1970].
Urine **GC** ECD. Dichlorodiphenylacetic acid (DDA), limit of detection, 50 pg [Della Fiorentina *et al.* 1978].
Tissues **GC** Limit of detection, <5 ng/g, see Blood [Radomski, Rey 1970].
Disposition in the Body Clofenotane dry powder is poorly absorbed from the gastrointestinal tract and is not absorbed through the skin. Solutions of clofenotane in oils are rapidly absorbed through intact skin and are also readily absorbed from the gastrointestinal tract. Clofenotane is metabolised to a small extent by dehydrochlorination to dichlorodiphenyldichloroethylene (DDE), which is less toxic; DDE does not appear to be metabolised further and is stored indefinitely in adipose tissues. Most of the DDE present in human fat is thought to result from preformed DDE taken in the diet rather than being due to ingestion of clofenotane. The major metabolic route for clofenotane is dechlorination to dichlorodiphenyldichloroethane (DDD) followed by degradation to dichlorodiphenylacetic acid (DDA) which is the major urinary excretion product. Urinary concentrations of DDA are indicative of storage of DDT in adipose tissue.
Blood Concentration

The following tissue concentrations of total DDT plus metabolites were reported in 35 industrially exposed subjects: blood 0.11 to 2.2 µg/mL (mean 0.6), fat 38 to 647 µg/g (mean 204), urine 0.05 to 3.4 µg/mL (mean 1.3); DDE accounted for about 40% of the material stored in fat and 6% of the urinary material compared to about 80% and 60%, respectively, reported for members of the general population [Laws *et al.* 1967].

Fat residues ranging from 0.04 to 17 µg/g (mean 2.6) of total DDT were reported in 236 subjects, without occupational exposure, in the United Kingdom in 1976–77 [Abbott *et al.* 1981].

Toxicity The estimated minimum lethal dose is 30 g but a single oral dose of 10 mg/kg may produce toxic symptoms; the maximum permissible atmospheric concentration is 1 mg/m^3 and the maximum acceptable daily intake is 5 µg/kg. The toxicity of some of the organic solvents, such as kerosene, used in the application of clofenotane has probably contributed to clofenotane fatalities.

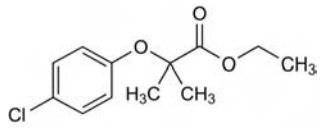
Clofibrate

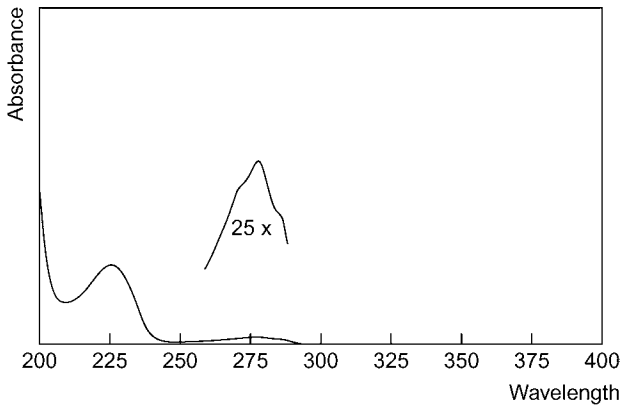
Lipid-Regulating Agent
$C_{12}H_{15}ClO_3$ = 242.7
CAS—637-07-0

IUPAC Name Ethyl 2-(4-chlorophenoxy)-2-methylpropanoate
Synonyms 2-(4-Chlorophenoxy)-2-methylpropionoic acid ethyl ester; ethyl chlorophenoxyisobutyrate; ethyl clofibrate.

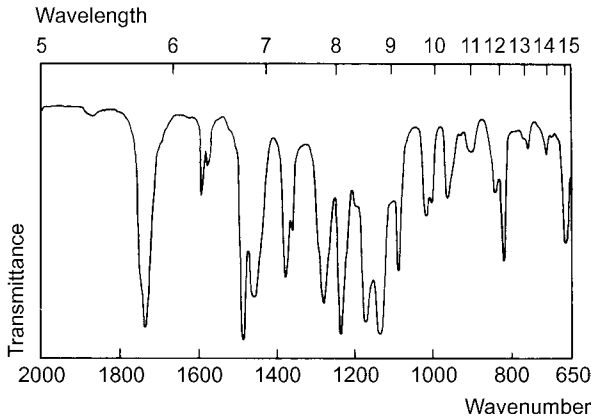
Proprietary Names *Amotril*; *Atheropront*; *Atromidin*; *Atromid-S*; *Azionyl*; *Claripex*; *Clofibral*; *Clofirem*; *Lipavlon*; *Liprin(al)*; *Normolipol*; *Novofibrate*; *Regelan*; *Skleromexe*.



Chemical Properties A clear, colourless to pale yellow liquid. Mass per mL 1.138 to 1.144 g. Practically insoluble in water; miscible with ethanol, acetone, chloroform, and ether. pK_a 3.0 (clofibric acid). Log *P* (octanol/water), 3.6.
Colour Tests Liebermann's reagent—violet-brown; Marquis test—blue (deepening).
Thin-layer Chromatography System TD—R_f 0.75; system TE—R_f 0.84; system TF—R_f 0.66; system TAD—R_f 0.71; system TAE—R_f 0.81; system TAJ—R_f 0.90; system TAK—R_f 0.80; system TAL—R_f 0.97.
Gas Chromatography System GA—clofibate RI 1542, M (clofibric acid) RI 1640.
High Performance Liquid Chromatography System HAA—retention time 18.3 min.
Ultraviolet Spectrum Dehydrated alcohol—280 (A^1_1=43b), 288 nm (A^1_1=31b).



Infrared Spectrum Principal peaks at wavenumbers 1140, 1238, 1735, 1175, 1282, 1090 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 128, 130, 169, 87, 41, 129, 242, 171.
Quantification
Plasma **GC** FID. Limit of detection, 1 mg/L for clofibrate and clofibric acid [Wolf, Zimmerman 1980].

HPLC UV detection (λ=223 nm). Limit of quantification, clofibrate 3.6 and clofibric acid 4.9 mg/L, limit of detection, 1.1 mg/L and 1.5 mg/L, respectively [Barra *et al.* 1994]. UV detection. Limit of detection, 10 mg/L for clofibric acid and 1.5 mg/L for the glucuronide [Veenendaal, Meffin 1981]. UV detection. Limit of detection, 500 µg/L for clofibric acid [Bjornsson *et al.* 1977].
Urine **HPLC** See Plasma [Veenendaal, Meffin 1981; Bjornsson *et al.* 1977].
Saliva **HPLC** See Plasma [Bjornsson *et al.* 1977].
Disposition in the Body Readily and almost completely absorbed after oral administration. Rapidly hydrolysed by serum enzymes to clofibric acid, 2-(4-chlorophenoxy)-2-methylpropionic acid (active), which is conjugated with glucuronic acid. About 50 to 85% of a dose is excreted in the urine in 48 h, mostly as conjugated clofibric acid.
Therapeutic Concentration
After a single oral dose of 1 g, given to 8 subjects, peak plasma concentrations of 43 to 79 mg/L (mean 55) of clofibric acid were attained in 2 to 8 h [Chasseaud *et al.* 1974].
After a single oral dose of 2 g, given to 5 subjects, a mean plasma concentration of 151 mg/L of clofibric acid was attained in 4 to 6 h; a mean steady-state plasma concentration of 122 mg/L of clofibric acid was achieved after administering 1 g twice daily to 5 subjects [Gugler 1978].
Toxicity
A 15-year-old boy who took 24.5 g of clofibrate in a suicide attempt complained of headache, pain in the arms, and inability to walk, but no evidence of toxicity was found in the following 5 days [Greenhouse 1968].
Half-life Plasma half-life, clofibric acid 12 to 25 h but may be decreased when free fatty acid concentrations are high; longer half-lives have been reported after repeated doses, and in subjects with renal impairment.
Volume of Distribution Clofibric acid, about 0.1 to 0.2 L/kg.
Protein Binding Clofibric acid, about 95 to 98%. This may be reduced in the presence of high free fatty acid concentrations and is progressively reduced at plasma concentrations >50 mg/L.
Note For a summary of the clinical pharmacokinetics of clofibrate, see Sheiner *et al.* [1981].
Dose 20 to 30 mg/kg daily, orally.

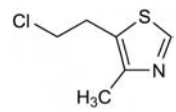
Clomethiazole

Hypnotic, Sedative
C_6H_8ClNS = 161.7
CAS—533-45-9
IUPAC Name 5-(2-Chloroethyl)-4-methylthiazole
Synonym Chlormethiazole
Proprietary Names *Distraneurin(e)*; *Hemineurin(e)*; *Heminevrin* (includes proprietary names of clomethiazole edisilate).

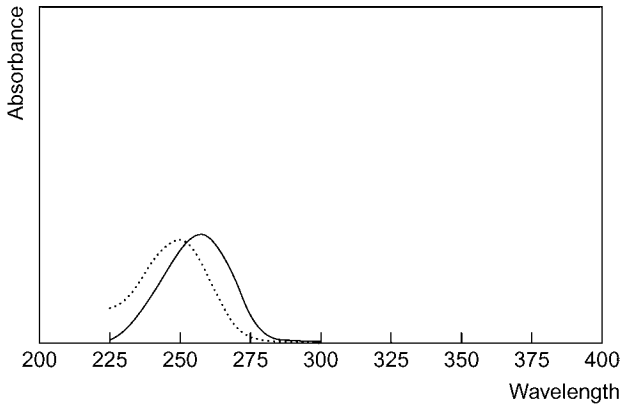


Chemical Properties A colourless to slightly yellow-brown, oily, viscous liquid. Soluble 1 in 100 of water; miscible with ethanol, chloroform, and ether. pK_a 3.2. Log *P* (octanol/water), 2.1. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

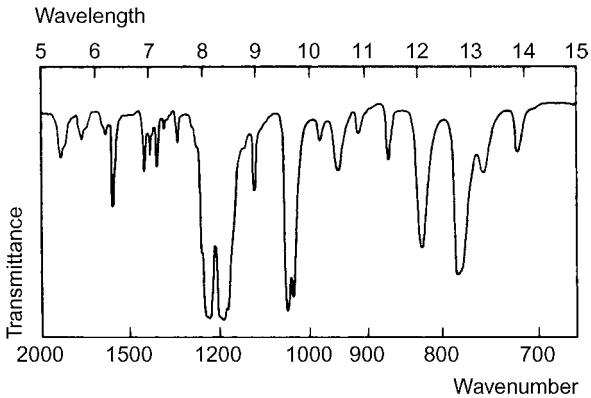
Clomethiazole Edisilate

$C_{14}H_{22}Cl_2N_2O_6S_4$ = 513.5
CAS—1867-58-9
Synonyms Chlormethiazole edisylate; chlormethiazole ethanedisulphonate.
Chemical Properties A white crystalline powder. Mp 126° to 129°. Freely soluble in water and warm ethanol; practically insoluble in ether.

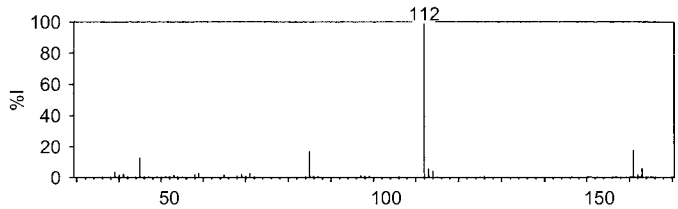
Colour Test Sodium nitroprusside (method 3)—violet.
Thin-layer Chromatography System TA—R_f 0.64; system TB—R_f 0.44; system TC—R_f 0.69; system TE—R_f 0.76; system TL—R_f 0.58; system TAE—R_f 0.80; system TAF—R_f 0.85 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—clomethiazole RI 1227, M (1-OH-ethyl-) RI 1560, M (2-OH-) RI 1365, M (deschloro-) RI 1185, M (deschloro-2-OH-) RI 1160, M (deschloro-2-OH-ethyl-) RI 1380, M (deschloro-COOH-) RI 1235, M (deschloro-di-OH-) RI 1685; system GB—clomethiazole RI 1269.
High Performance Liquid Chromatography System HA—*k* 0.1; system HX—RI 395; system HY—RI 292; system HAA—retention time 16.0 min.
Ultraviolet Spectrum Aqueous acid—258 (A^1_1=288a); aqueous alkali—250 nm (A^1_1=270b).



Infrared Spectrum Principal peaks at wavenumbers 1190, 1227, 1041, 1031, 779, 823 cm^{-1} (clomethiazole edisilate, KBr disk).



Mass Spectrum Principal ions at *m/z* 112, 161, 85, 45, 163, 113, 114, 59.



Quantification

Blood **GC** AFID. Clomethiazole and two metabolites [Tsuei *et al.* 1980].

GC-MS Limit of detection, 1 µg/L [Jostell *et al.* 1978].

Plasma **GC** Limit of detection, 32 ng [Tsuei *et al.* 1980]. FID. Limit of detection, 50 µg/L for clomethiazole edisilate [Moore *et al.* 1975].

GC-MS See Blood [Jostell *et al.* 1978]. Clomethiazole and two metabolites, limit of detection, 1 µg/L for clomethiazole [Nation *et al.* 1977].

HPLC UV detection. Limit of detection, 50 µg/L [Hartley *et al.* 1987]. UV detection. Limit of detection, 200 µg/L [Hartley *et al.* 1983].

Urine **GC** See Plasma [Moore *et al.* 1975].

Disposition in the Body Rapidly absorbed after oral administration but extensively metabolised. A considerable number of metabolites have been identified in small quantities in urine. <5% of a dose is excreted unchanged in the urine, and up to about 14% is excreted as 4-methylthiazole-5-acetic acid. Other metabolites identified in the urine include 5-(1-hydroxy-2-chloroethyl)-4-methylthiazole and 5-(2-hydroxyethyl)thiazole-4-carbolactone (which appear to be more abundant than 4-methylthiazole-5-acetic acid), together with 5-acetyl-4-methylthiazole, 5-(1-hydroxyethyl)-4-methylthiazole, and 5-(2-hydroxyethyl)-4-methylthiazole in both free and conjugated forms. 5-Ethyl-2-hydroxy-4-methylthiazole has been found in the tissues following overdoses of clomethiazole. 5-(1-Hydroxyethyl)-4-methylthiazole and 5-acetyl-4-methylthiazole may be present in the plasma at concentrations similar to, or greater than, those of unchanged drug. Clomethiazole crosses the placenta and is found in breast milk.

Therapeutic Concentration In plasma, usually in the range 0.1 to 2.8 mg/L.

Following single oral doses of 192 mg to 6 subjects, peak plasma concentrations of 0.10 to 0.55 mg/L (mean 0.27) were attained in about 0.6 h [Pentikainen *et al.* 1980].

Toxicity Toxic effects are associated with plasma concentrations of 1.6 to 13 to 26 mg/L, and fatalities with concentrations of 8 to 50 to 170 mg/L.

In a report of 9 cases of fatal overdose, in which doses of about 10 to 50 g had been ingested, postmortem blood concentrations of 25 to 80 mg/L (mean 56) were found; in a further 6 fatalities due to clomethiazole and alcohol ingestion, postmortem blood concentrations ranged from 5 to 47 mg/L (mean 21) [Jakobsson, Möller 1972].

In a report of 2 cases of fatal overdose, postmortem concentrations were: blood 21 and 214 mg/L, liver blood 21 and 100 mg/L, bile 38 and 143 mg/L, urine 5 and 114 mg/L; in 3 further cases blood concentrations were reported to be 3.4, 50, and 75 mg/L [Robinson, McDowall 1979].

Note For a review of clomethiazole fatalities, see Klug, Schneider [1984].

Half-life Plasma half-life, about 3 to 7 h, increased in elderly subjects and in patients with liver disease.

Volume of Distribution About 3 to 12 L/kg (mean 8).

Clearance Plasma clearance, 10 to 25 mL/min/kg.

Distribution in Blood Plasma : whole blood ratio, about 1.2.

Protein Binding About 60 to 70%.

Note For a review of clomethiazole toxicity, see Houston *et al.* [1983].

Dose Clomethiazole as *Heminevrin (Astra)* is given in doses of 2 to 3 capsules daily. In alcohol withdrawal, an initial dose of 9 to12 capsules is given on the first day in a hospital or specialist centre, with dosage gradually reduced over the following 5 days.

Note Due to variations in bioavailability: for an equivalent therapeutic effect, one capsule (192 mg clomethiazole base ≡ 5 mL syrup (250 mg/5 mL clomethiazole edisilate) ≡ one tablet (500 mg edisilate).

Clomifene

Induction of Ovulation

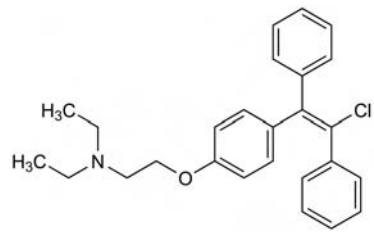
$C_{26}H_{28}ClNO$ = 406.0

CAS—911-45-5; 15690-57-0 (*E*-); 15690-55-8 (*Z*-)

IUPAC Name 2-[4-[(*Z*)-2-Chloro-1,2-diphenylethenyl]phenoxy]-*N*,*N*-diethylethanamine

Synonyms Chloramiphene; clomiphene.

Note A mixture of the *E* and *Z* isomers of 2-[4-(2-Chloro-1,2-diphenylethenyl) phenoxy]-*N*,*N*-diethylethanamine.



Chemical Properties Clomifene may be separated into its *E* and *Z* isomers, enclomifene and zuclomiphene. A white to pale yellow solid. Mp 111° to 115°. Sparingly soluble in water and ethanol; slightly soluble in chloroform. Log *P* (octanol/water), 6.7.

Clomifene Citrate

$C_{26}H_{28}ClNO$, $C_6H_8O_7$ = 598.1

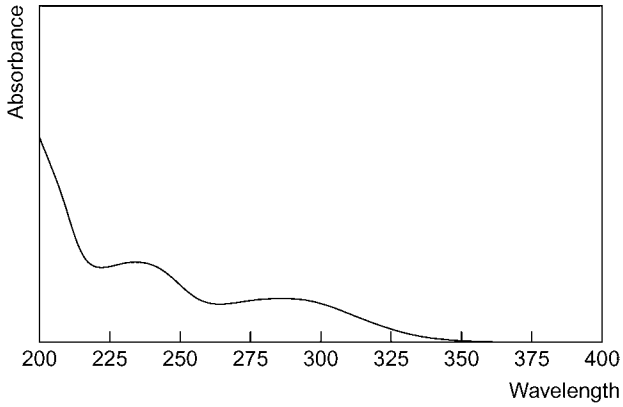
CAS—50-41-9; 7599-79-3 (*E*-); 7619-53-6 (*Z*-)

Proprietary Names *Clomid*; *Clomivid*; *Dyneric*; *Serophene*.

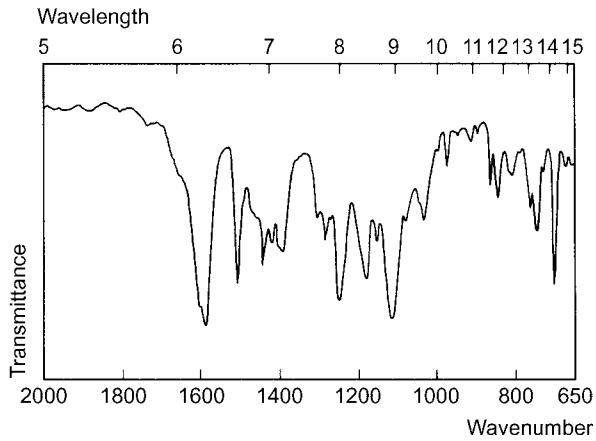
Chemical Properties A white to pale yellow powder. Mp 116.5° to 118°. Soluble 1 in 900 of water, 1 in 40 of ethanol, and 1 in 800 of chloroform; freely soluble in glacial acetic acid and methanol; insoluble in ether.

Colour Tests Liebermann's reagent—brown; Mandelin's test—violet →orange-brown; Marquis test—violet-brown.

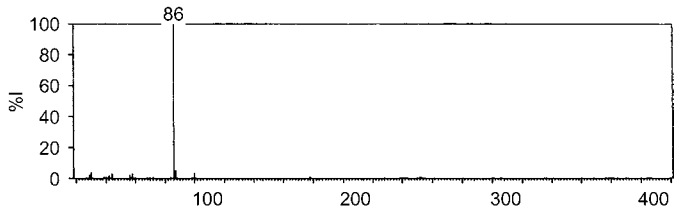
Thin-layer Chromatography System TA—R_f 0.60; system TB—R_f 0.56; system TC—R_f 0.52; system TE—R_f 0.82; system TL—R_f 0.35; system TAE—R_f 0.30 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2930.
Ultraviolet Spectrum Aqueous acid—235 (A_1^1=464b), 292 nm (A_1^1=259b).



Infrared Spectrum Principal peaks at wavenumbers 1590, 1111, 1245, 1505, 700, 1170 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 86, 87, 100, 30, 58, 44, 42, 29.



Quantification
Plasma **HPLC** Fluorescence detection (λ_{ex}=247 nm; λ_{em}=378 nm). Limit of quantification, 0.75 µg/L for *cis*-clomiphene and 1.25 µg/L for *trans*-clomiphene [Urmos *et al.* 1993]. Photolysis and fluorescence detection. Limit of detection, 350 ng/L [Harman *et al.* 1981].
Disposition in the Body Absorbed after oral administration and slowly excreted in the bile; enterohepatic circulation occurs.
Half-life Biological half-life, about 5 days.
Dose 50 mg of clomifene citrate daily, for 5 days; up to 250 mg daily has been given.

Harman PJ *et al.* (1981). High-performance liquid chromatographic determination of clomiphene using post-column on-line photolysis and fluorescence detection. *J Chromatogr* 225(1): 131–138.

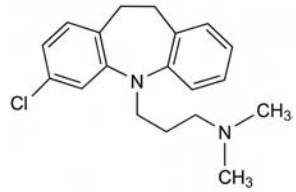
Clomipramine

Antidepressant
$C_{19}H_{23}ClN_2$ = 314.9
CAS—303-49-1

IUPAC Name 3-(9-Chloro-5,6-dihydrobenzo[*b*][1]benzazepin-11-yl)-*N*,*N*-dimethylpropan-1-amine
Synonyms Chlorimipramine; 3-chloro-10,11-dihydro-*N*,*N*-dimethyl-5*H*-dibenz[*b*,*f*]azepine-5-propanamine; monochlorimipramine.

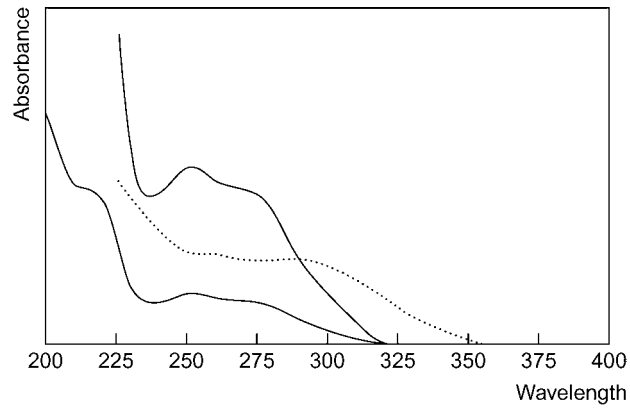


Chemical Properties Log *P* (octanol/water), 5.19 [Hansch *et al.* 1995]. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

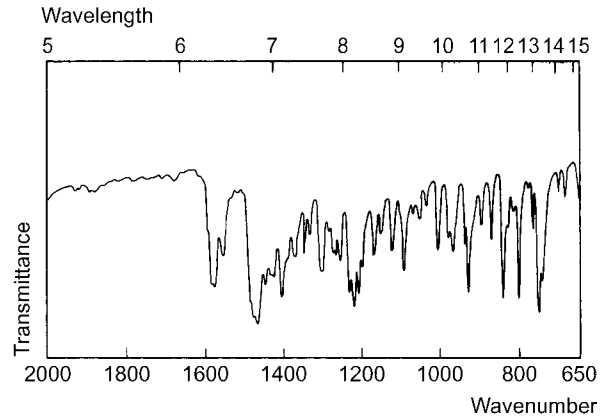
Clomipramine Hydrochloride

$C_{19}H_{23}ClN_2$, HCl = 351.3
CAS—17321-77-6
Proprietary Name *Anafranil*
Chemical Properties A white or slightly yellow crystalline powder. Mp approximately 192°. Soluble 1 in 8 of water, 1 in 5 of ethanol, 1 in 3 of chloroform and 1 in 100 of ether. Log *P* (octanol/water), 5.65 [Meylan, Howard 1995].

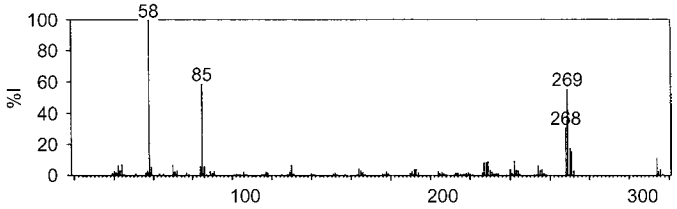
Colour Tests Forrest reagent—blue; FPN reagent—blue; Liebermann's reagent—blue; Mandelin's test—blue.
Thin-layer Chromatography System TA—R_f 0.51; system TB—R_f 0.53; system TC—R_f 0.34; system TE—R_f 0.72; system TAE—R_f 0.26; system TAF—R_f 0.54; system TAG—R_f 0.18 (acidified iodoplatinate solution, strong reaction).
Gas Chromatography System GA—clomipramine RI 2415, M (nor-) RI 2432, M (*N*-oxide) RI 2146, M (ring) RI 2230, M (8-OH-) RI 2727, M (8-OH-nor) RI 2762, M (2-OH-) RI 2569, M (10-OH-) RI 2574; system GB—clomipramine RI 2511, M (nor-) RI 2540, M (*N*-oxide) RI 2150, M (ring) RI 2335, M (8-OH-) RI 2843, M (8-OH-nor-) RI 2880, M (2-OH-) RI 2735, M (10-OH-) RI 2698; system GF—RI 2795; system GM—clomipramine RRT 1.172, M (nor-) RRT 1.374 (relative to iprindole).
High Performance Liquid Chromatography System HA—clomipramine *k* 3.4, M (monodesmethyl-) *k* 2.0; system HF—*k* 9.92; system HX—RI 462; system HY—RI 405; system HZ—RT 10.2 min; system HAA—RT 16.4 min.
Ultraviolet Spectrum Aqueous acid—251 nm (A_1^1 = 253a).



Infrared Spectrum Principal peaks at wavenumbers 752, 1225, 805, 842, 1212, 1237 cm^{-1} (clomipramine hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 58, 85, 269, 268, 270, 271, 314, 242; monodesmethylclomipramine 44, 71, 268, 227, 193, 42, 269, 229; 8-hydroxyclomipramine 58, 85, 86, 57, 84, 70, 43, 268.



Quantification

Blood **GC** Column: Chem Elut. NPD. Limit of quantification, 44–485 µg/L, limit of detection, 13–146 µg/L; Column: Bond Elut Certify. Limit of quantification, 25–223 µg/L, limit of detection, 8–67 µg/L [Martinez *et al.* 2003].

HPLC Column: silica gel. Mobile phase: ethanol : hexane : dichloromethane : diethylamine (30 : 62 : 8 : 5), flow rate 1.5 mL/min. UV detection. Limit of detection, 5 µg/L for clomipramine, 10 µg/L for monodesmethylclomipramine [Godbillon, Gauron 1981].

LC-MS Column: C_{18}. Mobile phase: acetonitrile : 0.1% trifluoroacetic acid (50 : 50), flow rate 0.4 mL/min [Pufal, Sykutera 2008]. Column: XTerra RP-18. Mobile phase: 4 mmol/L acetonitrile : ammonium formate buffer (pH 3.2). Limit of quantification, 2 µg/L [Titier *et al.* 2007]. Column: LiChroCART (125 × 3 mm i. d., 5 µm). Mobile phase: 0.1% formic acid : acetonitrile-0.1% formic acid (95 : 5, 95 : 5 for 2 min to 30 : 70 in 30 min for 2 min to 95 : 5 for 8 min), flow rate 0.4 mL/min. APCI, positive ion mode. Limit of quantification, 0.25 ng/mg, limit of detection, 0.12 ng/mg [Klys *et al.* 2005]

Plasma **GC** Column: 3% OV-17 on Chromosorb W, 100/120 (9 ft × 0.25 in o.d. (270 × 6.2 mm)). Carrier gas: 30 mL/min. Temperature: 275°. AFID. Limit of detection, 5 µg/L [Gifford *et al.* 1975].

HPLC Column: Kromasil C_8 (250 × 4 mm, 5 µm). Mobile phase: 0.05 mol/L ammonium acetate : acetonitrile (45 : 55), flow rate 1.5 m/min. UV detection (λ = 238 nm). Limit of detection, 0.1–0.6 ng [Samanidou *et al.* 2007]. Column: Lichrospher CN (250 × 4 mm, 5 µm) Mobile phase: 10 mmol/L dibasic potassium phosphate : acetonitrile : methanol (35 : 25 : 40), flow rate 1.5 mL/min. UV detector (λ = 214 nm). Limit of quantification, 5 µg/L [Pirola *et al.* 2002]. Mobile phase: water : acetonitrile (63 : 37) containing tetramethylethylenediamine and TEA. UV detection (λ = 254 nm). Limit of detection, 10 µg/L [Palego *et al.* 2001]. Column: Symmetry C_{18} (250 × 4.6 mm, 5 µg). DAD (λ = 200 to 450 nm) [Aymard *et al.* 1997]. Mobile phase: acetonitrile : aqueous sodium perchlorate (pH 2.5, 30 : 70). UV detection (λ = 220 nm) [Nielsen, Brosen 1993]. See also Diquet *et al.* [1993], Godbillon, Gauron [1981] and Spreux-Varoquaux *et al.* [1987].

LC-MS Column: Sunfire C_{18} IS (20 × 2.1 mm, 3.5 µm). Mobile phase: 2 mmol/L acetonitrile and ammonium formate (pH 3) [de Castro *et al.* 2008]. Limit of detection, 10 µg/L [de Castro *et al.* 2007]. Column: Inertsil C_8. Mobile phase: methanol : 10 mmol/L ammonium acetate (pH 5.0) : acetonitrile (70 : 20 : 10), flow rate 0.1 mL/min. Limit of detection, 0.03–0.63 µg/mL [Shinozuka *et al.* 2006].

CE Capillary: Coated: alkylphosphonate-modified zirconia capillary electrochromatography. Buffer: 0.3 mol/L ammonium acetate (pH 4.5) : acetonitrile (65 : 35). Limit of detection, 11.4–51.5 µg/L [Wei *et al.* 2010].

Serum **GC** NPD. Limit of detection, 5 µg/L [Rao *et al.* 1994].

HPLC Column: Nucleosil 100-Protect 1. Mobile phase: acetonitrile : monobasic potassium phosphate buffer [Frahnert *et al.* 2003]. Column: LiChrospher CN (250 × 4.6 mm). Mobile phase: acetonitrile : 0.02 mol/L aqueous sodium perchlorate (pH 2.5, 38 : 62). UV detection (λ = 260 nm). Limit of quantification, 15 µg/L [Weigmann *et al.* 1998]. Column: silica gel. Mobile phase: methanol : water with butylamine. UV detection (λ = 254 nm). Limit of detection, 5–10 µg/L for clomipramine and metabolites [Coudoré *et al.* 1996].

LC-MS Column: Monolithic C_{18} (50 × 4.6 mm). Mobile phase: methanol : 5 mmol/L acetate buffer (pH 3.9). MRM acquisition mode [Kirchherr, Kühn-Velten 2006]. Turbulent flow chromatography [Sauvage *et al.* 2006]. Column: C_{18}. Mobile phase: acetonitrile : ammonium acetate buffer (pH 4). Limit of quantification, 1.2–54 nmol/L [Gutteck, Rentsch 2003].

Note For a fluorescence polarisation immunoassay, see Rao *et al.* [1994].

Urine **HPLC** Column: Kromasil C_8 (250 × 4 mm, 5 µm). Mobile phase: 0.05 mol/L ammonium acetate : acetonitrile (45 : 55), flow rate 1.5 mL/min. UV detection (λ = 238 nm). Limit of detection, 0.2–0.7 ng [Samanidou *et al.* 2007]. See Plasma [Nielsen, Brosen 1993].

LC-MS Column: reversed phase (5 µm). Mobile phase: phosphate buffer with tetraethylammonium chloride : acetonitrile (57 : 43). ECD. Limit of quantification, 0.2 µg/L [Spreux-Varoquaux *et al.* 1987].

CE See Plasma. Limit of detection, 3.7–17 µg/L [Wei *et al.* 2010].

Oral Fluid **LC-MS** See Plasma [de Castro *et al.* 2008].

Hair **LC-MS** See Blood. Limit of quantification 0.5 ng/mg, limit of detection, 0.5 ng/mg [Klys *et al.* 2005].

Note For a review of analytical methods see Scoggins *et al.* [1980].

Disposition in the Body Clomipramine is rapidly and completely absorbed after oral administration but undergoes extensive first-pass *N*-demethylation to the major active metabolite, monodesmethylclomipramine. Clomipramine and monodesmethylclomipramine are further metabolised by 8-hydroxylation, *N*-oxidation and conjugation. Approximately 10–15% of a dose is excreted in the urine in 24 h, of which <0.2% is unchanged clomipramine or monodesmethylclomipramine. A total of 45–60% of a dose is excreted in the urine over a period of 14 days and ~20–30% is slowly eliminated in the faeces.

Therapeutic Concentration Plasma concentrations of clomipramine and monodesmethylclomipramine vary considerably between individual patients. Steady-state concentrations of clomipramine are usually achieved in ~1–2 weeks, but monodesmethylclomipramine may continue to accumulate for 6 weeks or longer. 8-Hydroxyclomipramine and 8-hydroxydesmethylclomipramine have been detected in plasma at significant concentrations during high-dose chronic treatment.

Blood clomipramine concentration lower than 150 µg/L is usually associated with non-response; increasing levels to above 450 µg/L seldom improves therapeutic efficacy [Balant-Gorgia *et al.* 1991].

After a single oral dose of 50 mg, given to 5 subjects, peak plasma concentrations of clomipramine of 0.02–0.07 mg/L (mean 0.05) were attained in 2–4 h; peak plasma concentrations of monodesmethylclomipramine of 0.0005–0.012 mg/L (mean 0.005) were attained in 4–24 h [Jones, Luscombe 1976].

Steady-state plasma concentrations of 0.10–0.48 mg/L (mean 0.23) were reported after daily oral doses of 150 mg given to 17 subjects; the steady-state concentration of monodesmethylclomipramine was 0.24–0.96 mg/L (mean 0.45) [Montgomery *et al.* 1980].

After a single oral dose of 0.7 mg/kg given to 18 healthy subjects, peak plasma levels of clomipramine 43.8 ng/mL were attained in 2 h [Della Corte *et al.* 1993].

Clearance Clearance of clomipramine in Japanese patients was found to be 12.7 L/h and in Swedish patients 62.7 L/h. The difference was not accounted for by differences in body weight but was attributed to ethnic difference [Shimoda *et al.* 1999].

Toxicity Toxic effects have been associated with blood concentrations >0.4 mg/L for clomipramine plus monodesmethylclomipramine.

In 2 deaths caused by clomipramine, postmortem concentrations of clomipramine and monodesmethylclomipramine, respectively, were 1 mg/L and trace in blood, – and 4.5 µg/g in brain, 30 and 22 µg/g in liver, and 25 mg/L and – in urine [Haqqani, Gutteridge 1974].

In a fatality caused by clomipramine overdose, the following postmortem concentrations were reported for clomipramine and monodesmethylclomipramine, respectively: 0.54 and 0.58 mg/L in blood and 0.35 and 0.70 mg/L in urine [Meatherall *et al.* 1983].

In a fatality caused by clomipramine, alprazolam and ethanol, blood levels of clomipramine and desmethylclomipramine were 0.84 and 1.4 mg/L, respectively. Urine levels of clomipramine and desmethylclomipramine were 0.56 and 0.62 mg/L, respectively [Fraser *et al.* 1986]. Postmortem clomipramine concentrations ranged from 0.48–1.61 mg/L in the brain and 0.26–1.32 mg/L in the heart in this case.

A 31-year-old man suffering from mental illness died in hospital after a suicide attempt. Blood clomipramine concentration was 1.61 mg/L in heart and 0.48 mg/L in brain. Liver concentration was 3.95 mg/kg and 2.36 mg/kg in kidney. [Romano, Di Bono 1994].

In 10 cases, postmortem blood concentrations of 0.21–4.9 mg/L were observed and liver concentrations were 7.0–320.0 mg/kg [McIntyre *et al.* 1994].

A 41-year-old female suffering from depression was found dead and clomipramine concentrations were detected in blood at 3.3 mg/L and in liver at 280 mg/kg [McIntyre *et al.* 1994].

A 29-year-old man also suffering from depression showed concentrations of 1.8 mg/L and 320 mg/kg, in blood and liver, respectively [McIntyre *et al.* 1994].

In a case of fatal clomipramine toxicity, postmortem blood levels of clomipramine and norclomipramine were 9.49 and 1.10 µg/g, respectively. Levels of clomipramine and monodesmethylclomipramine in hair ranged from 1.86–7.6 ng/mg and from 4.13–9.71 ng/mg, respectively [Klys *et al.* 2005].

In a case of fatal poisoning involving clomipramine, chlorpromazine and flunitrazepam, the level of clomipramine in femoral blood was found to be 3.24 mg/L [Kinoshita *et al.* 2008].

For details of a fatality involving the ingestion of clomipramine and trimipramine, see Trimipramine.

For 5 further cases of clomipramine toxicity, including 3 fatalities, see Avella *et al.* [2004], Dale, Hole [1994], Ferrer-Dufol *et al.* [1998] and Stolk, van der Geest [1998].

Half-life Plasma half-life, 12–36 h (mean 21), considerably extended in overdose; desmethyl metabolite about 36 h; decreased in children.

Distribution in Blood Plasma : whole blood ratio, 1.2.

Volume of Distibution 12–17 L/kg.

Clearance Mean plasma clearance 73 L/h.

Protein Binding Clomipramine 90–95%; monodesmethylclomipramine 97–99%.

Note For a review of the pharmacokinetics of tricyclic antidepressants, see Molnar, Gupta [1980].

Dose Clomipramine hydrochloride, 10 to 150 mg daily. In severe depression may be increased to up to 250 mg daily or higher.

Clomocycline

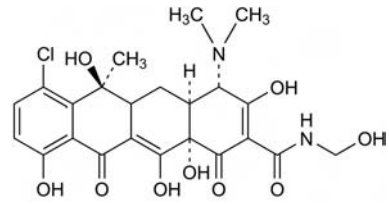
Antibacterial

$C_{23}H_{25}ClN_2O_9 = 508.9$

CAS—1181-54-0

IUPAC Name (2*Z*,4*S*,4*aS*,5*aS*,6*S*,12*aS*)-7-Chloro-4-(dimethylamino)-6,10,11,12*a*-tetrahydroxy-2-[hydroxy-(hydroxymethylamino)methylidene]-6-methyl-4,4*a*,5,5*a*-tetrahydrotetracene-1,3,12-trione

Synonyms 7-Chloro-4-(dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,6,10,12,12a-pentahydroxy-*N*-(hydroxymethyl)-6-methyl-1,11-dioxo-2-naphthacenecarboxamide; chlormethylencycline; N^2-(hydroxymethyl)chlortetracycline; methylolchlortetracycline.



Chemical Properties A yellow powder. It is sensitive to light and air, and undergoes decomposition between 145° and 170° without a definite melting point. Log *P* (octanol/water), −1.5.

Clomocycline Sodium

$C_{23}H_{24}ClN_2NaO_9 = 530.9$

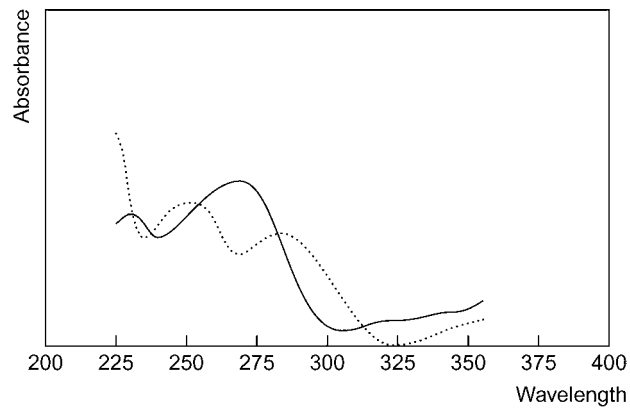
Proprietary Name *Megaclor*

Chemical Properties A yellow powder. It is sensitive to light and air, and undergoes decomposition without melting. Very soluble in water; soluble 1 in 250 of ethanol; practically insoluble in chloroform and ether.

Colour Tests Benedict's reagent—red; formaldehyde–sulfuric acid—orange-brown; Liebermann's reagent—black; Mandelin's test—violet→brown; Marquis test—orange-brown; sulfuric acid—blue-black.

Thin-layer Chromatography System TA—R_f 0.05, streaking (acidified potassium permanganate solution, strong reaction).

Ultraviolet Spectrum Aqueous acid—229, 268 nm (A_1^1=350b); aqueous alkali—251, 283 nm.



Infrared Spectrum Principal peaks at wavenumbers 1600, 1634, 1501, 1307, 1205, 1235 cm^{-1} (clomocycline sodium, KBr disk).

Dose 0.68 to 1.36 g of clomocycline sodium daily.

Clonazepam

Anticonvulsant, Benzodiazepine

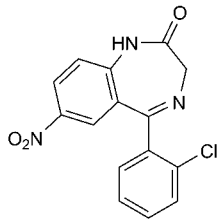
$C_{15}H_{10}ClN_3O_3 = 315.7$

CAS—1622-61-3

IUPAC Name 5-(2-Chlorophenyl)-7-nitro-1,3-dihydro-1,4-benzodiazepin-2-one

Synonyms 5-(2-Chlorophenyl)-1,3-dihydro-7-nitro-2*H*-1,4-benzodiazepin-2-one; clonazepamum; Ro-5-4023.

Proprietary Names *Antelepsin*; *Clonapam*; *Clonex*; *Clonopin*; *Iktorivil*; *Kenoket*; *Klonopin*; *Paxam*; *Rivotril*.



Chemical Properties White to light-yellow crystalline powder. Mp 236.5° to 238.5°. Protect from light. Solubility in mg/mL at 25°: acetone 31, chloroform 15, methanol 8.6, ether 0.7, benzene 0.5, water <0.1. pK_{a1}, 1.5; pK_{a2},10.5. Log *P* (octanol/water) 2.41. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

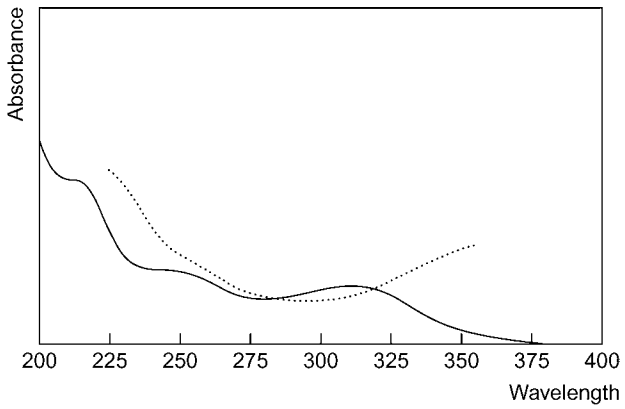
Colour Test Formaldehyde-sulfuric acid—orange.

Thin-layer Chromatography System TA—R_f 0.72; system TB—R_f 0.00; system TC—R_f 0.53; system TD—R_f 0.35; system TE—R_f 0.67; system TF—R_f 0.45; system TL—R_f 0.61; system TAD—R_f 0.56; system TAE—R_f 0.85; system TAF—R_f 0.87; system TAJ—R_f 0.50; system TAK—R_f 0.53; system TAL—R_f 0.91 (acidified iodoplatinate solution, positive; acidified potassium permanganate solution, positive).

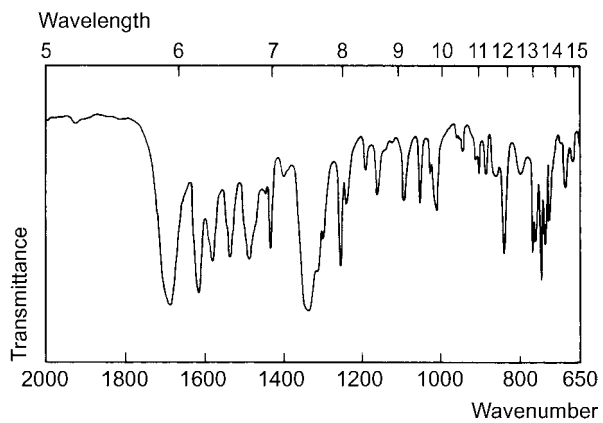
Gas Chromatography System GA—clonazepam RI 2823, M (7-amino-) RI 2890, M (amino-OH-) RI 2935; system GB—clonazepam RI 3000, clonazepam-TMS RI 2781, M (7-amino) RI 2996, M (7-amino-)-TMS_2 RI 2742; system GG—RI 3600.

High Performance Liquid Chromatography System HPLC 27—clonazepam RT 3.43 min, 7-acetamidoclonazepam RT 2.37 min; system HI—*k* 2.85; system HK—*k* 0.35; system HX—RI 465; system HY—RI 403; system HZ—RT 4.6 min; system HAA—RT 17.4 min; system HAF—clonazepam RT 5.30 min; system HAK—clonazepam RT 6.2 min; system HAL—clonazepam RT 4.3 min, 7-acetamidoclonazepam RT 1.45 min, 7-aminoclonazepam RT 1.55 min; system HAM—clonazepam RT 4.3 min; system HAX—clonazepam RT 6.5 min; system HAY—clonazepam RT 6.0 min; system HAZ—clonazepam *k* 0.79; system HBH—clonazepam *k* 2.92; system HBI—clonazepam *k* 0.79.

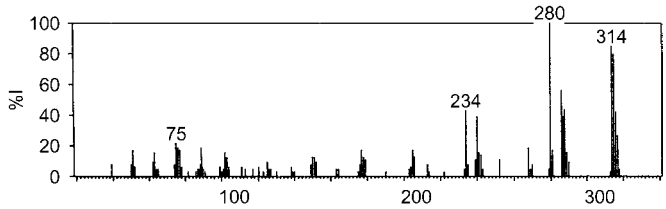
Ultraviolet Spectrum Aqueous acid—273 nm (A_1^1= 645b); methanol—245 (A_1^1= 460b), 309 nm (A_1^1= 360b).



Infrared Spectrum Principal peaks at wavenumbers 1685, 1610, 748, 1255, 1578, 1532 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 280, 314, 315, 286, 234, 288, 316, 240; 7-acetamidoclonazepam 43, 327, 299, 298, 292, 329, 328, 256; 7-aminoclonazepam 285, 256, 257, 258, 44, 287, 110, 220.



C

Quantification

Blood **HPLC** Column: LiChrospher Select B C_8 reversed phase (125 × 3.0 mm i.d., 5 µm). Mobile phase: 20 mmol/L potassium dihydrogen phosphate buffer (pH 2.1) : acetonitrile (30 : 70 to 35 : 65 at 30 min), flow rate 0.5 mL/min to 0.3 mL/min at 30 min. UV detection (λ = 254 nm). Limit of quantification, 50 µg/L, limit of detection, 15 µg/L [El Mahjoub, Staub 2001]. Column: Nova-Pak phenyl bonded (150 × 3.9 mm i.d., 4 µm). Mobile phase: acetonitrile : 40 mmol/L potassium dihydrogen phosphate (pH 3.75; 28 : 72), flow rate 0.8 mL/min. UV–Vis detection (λ = 240 nm). Relative retention time: 1.99. Limit of quantification, 0.01 mg/L, limit of detection, 0.006 mg/L [Robertson, Drummer 1995].

Plasma **GC** Column: 3% OV-17 on Gas Chrom Q (1.2 m × 3 mm i.d.). Carrier gas: N_2, 35 mL/min. Temperature: 270°. ECD. Limit of detection, 2.5 µg/L [de Carvalho, Lanchote 1991]. Column: 3% SE-30 on 80/200 mesh Gas-Chrom Q (1.8 m × 2 mm i.d.). Carrier gas: He, 30 mL/min. Temperature: 215°. FID and NPD. Retention time: 8 min. Limit of detection, 1 µg/L [Dhar, Kutt 1981]. Column: 3% OV-17 (10 m × 0.4 mm i.d.). Carrier gas: Ar : CH_3 (95 : 5), 10 mL/min. Temperature: 230°. ECD. Limit of detection, 1 µg/L [de Boer *et al.* 1978]. Column: OV-17 Gas Chrom Q on 80/100 mesh. ECD. Retention time: 6.9 min. Limit of detection, 0.5 µg/L [Berlin, Dahlström 1975].

GC-MS Column: HP-5 (12 m × 0.25 mm i.d., 0.33 µm). Carrier gas: He, 1 mL/min. Temperature programme: 180° to 300° at 30°/min. NCI, SIM acquisition mode. Limit of quantification, 0.25 µg/L, limit of detection, 0.1 µg/L [Song *et al.* 1996]. Column: O V-17 on Celite JJ CQ 100/120 mesh (0.9 m × 4.0 mm i.d.). Carrier gas: Ar : CH_3 (90 : 10), 80 mL/min. Temperature: 240°. EI ionisation at 70 eV. Limit of detection, 3.0 µg/L [Naestoft, Larsen 1974].

HPLC Column: Symmetry C_{18} (250 × 4.6 mm i.d.). Mobile phase: acetonitrile : phosphate buffer (1.09 g of potassium dihydrogen phosphate, pH 7.0; 50 : 50 to 70 : 30 at 15 min), flow rate 1.0 mL/min. UV detection (λ = 313 nm). Retention time: 6.20. Limit of detection, 2.0 µg/L [Le Guellac *et al.* 1998]. Column: C_{18} Velosep (100 × 3.2 mm i.d., 3 µm). Mobile phase: acetonitrile : glacial acetic acid : water (32 : 0.5 : 67.5), flow rate 0.5 mL/min. UV detection (λ = 0.5 mL/min). Retention time: 7.0 min. Limit of quantification, 5 µg/L, limit of detection, 2 µg/L [Sallustio *et al* 1994]. Column: ODS C_{18} (150 × 4.0 mm i.d., 3 µm). Mobile phase: water : acetonitrile (1 : 1), flow rate 0.7 mL/min. UV detection (λ = 313 nm). Limit of detection, 4.0 µg/L [de Carvalho, Lanchote 1991]. Column: µBondapak Phenyl (30 cm × 4 mm i.d.). Mobile phase: acetonitrile : 45 mmol/L potassium dihydrogen phosphate buffer (pH 3.0; 40 : 60), flow rate 1.5 mL/min. UV detection (λ = 313 nm). Retention time: 6.0 min. Limit of detection, 5 µg/L [Dusci, Hackett 1987]. Column: Supelcosil LC-18 (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.1 mol/L sodium acetate (pH 7.7; 35 : 65), flow rate 3.0 mL/min. UV detection (λ = 254 nm). Limit of detection, 5 µg/L [Petters *et al.* 1984].

Serum **HPLC** Column: C_{18} reversed phase TSK gel Super-ODS (1, 100 × 4.6 mm i.d., 2 µm) or Hypersail ODS (2, 100 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 5 mmol/L sodium dihydrogen phosphate (pH 6.0; 45 : 55), flow rate 0.65 mL/min. UV detection (λ = 254 nm). Retention time: 5.3 and 18.2 min for columns 1 and 2, respectively. Limit of quantification, 5 µg/L [Tanaka *et al.* 1996; Tanaka *et al.* 1998]. Column: µ-Bondapak C_{18} (300 × 3.9 mm i.d., 10 µm). Mobile phase: acetonitrile : water (40 : 60), flow rate 1.5 mL/min. UV detection (λ = 254 nm). Retention time: 7.0 min. Limit of detection, 2.0 µg/L [Furuno *et al.* 1991]. Column: Supelco C_8 reversed phase (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 1.75 mmol/L hydrochloric acid : 50 mmol/L sodium acetate (36 : 10 : 54), flow rate 1.5 mL/min. UV detection (λ = 220 nm). Limit of detection, 1.0 µg/L [Zilli, Nisi 1986].

Urine **GC-MS** Column; DB-17 capillary (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 80 kPa. Temperature programme: 150° for 1 min to 230° at 10°/min for 5 min to 300° at 10°/min for 9 min. ECD. Limit of detection, 80 µg/L [Guan *et al.*]. Column: 5% phenyl methyl silicone (25 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 0.5 mL/min. Temperature programme: 240° to 260° at 25°/min to 300° at 30°/min. EI ionisation at 70 eV, SIM acquisition mode. Retention time: 10.1 min. Limit of detection, 0.1 mg/L [Black *et al.* 1994].

HPLC Column: Supelcosil C_{18} (5.0 cm × 4.6 mm i.d., 5 µm). Mobile phase: water : methanol (52 : 48), flow rate 1.0 mL/min. UV detection (λ = 230 nm). Limit of detection, 600 µg/L [Mullet, Pawliszyn 2002].

Hair **GC-MS** Column: HP-5MS capillary (30 m × 250 µm i.d., 0.25 µm). Carrier gas: He, 1.2 mL/min. Temperature programme: 60° for 1 min to 310° at 30°/min for 3 min. NCI, SIM acquisition mode. Retention time: 10.8 min. Limit of quantification, 10 ng/g, limit of detection, 5 ng/g [Negrusz *et al.* 2000].

Disposition in the Body Rapidly absorbed after oral administration with peak plasma levels found after about 4 h. The major metabolic reaction is catalysed by CYP3A4, is reduction of the nitro group to 7-aminoclonazepam, followed by acetylation to 7-acetamidoclonazepam; 7-aminoclonazepam is slightly active and is found in plasma at concentrations similar to those of clonazepam. 3-Hydroxylation of clonazepam and its 2 metabolites may also occur, followed by conjugation with glucuronic acid or sulfate. Clonazepam crosses the placental barrier and is excreted in breast milk. Less than 1% of a dose is excreted unchanged in the urine in 24 h. Urinary excretion accounts for up to 70% of a dose, as both free and conjugated metabolites, over 7 days, of which about 50% consists of 7-amino-clonazepam and 7-acetamidoclonazepam.

Therapeutic Concentration In plasma, usually in the range 0.02–0.07 mg/L.

A single oral dose of 2 mg given to 8 subjects produced peak plasma concentrations of 0.007–0.024 mg/L (mean 0.017) in 1–4 h [Berlin, Dahlström 1975].

After daily oral dosing of 25 subjects with 6 mg per day, steady-state plasma concentrations of 0.029–0.075 mg/L of clonazepam, 0.023–0.137 mg/L of 7-aminoclonazepam, and <0.003–0.013 mg/L of 7-acetamidoclonazepam were reported [Naestoft, Larsen 1974].

In 4 children whose epilepsy was unsatisfactorily controlled with valproate therapy, a single oral dose of clonazepam 0.05 mg/kg produced peak plasma concentrations of 0.02485–0.1138 mg/L at 1–1.5 h; valproate concentrations remained within the therapeutic range and were unaffected by clonazepam [Wang, Wang 2002].

Toxicity Toxicity is associated with plasma concentrations >0.1 mg/L.

Bioavailability ≈98%.

Half-life Plasma half-life, 20–40 h.

Volume of Distribution ≈3 L/kg.

Distribution in Blood Plasma : whole blood ratio, 1.54

Clearance Plasma clearance, ≈1.5 mL/min/kg.

Protein Binding ≈86%.

Note For reviews of the pharmacokinetics of clonazepam, see Berlin and Dahlström [1976] and Pinder [1976].

Clonidine

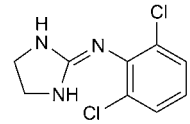
α_2 *Adrenoceptor Agonist, Antihypertensive*

$C_9H_9Cl_2N_3$ = 230.1

CAS—4205-90-7

IUPAC Name *N*-(2,6-Dichlorophenyl)-4,5-dihydro-1*H*-imidazol-2-amine

Synonyms Chlophazoline; ST-155-BS.



Chemical Properties White powder. Mp 130°. Soluble 1 in 8 of chloroform and 1 in 50 of ether. pK_a 8.3 [Baselt 2008], 8.2 [Nirogi *et al.* 2008]. Log *P* (octanol/water) 1.59. Stock solutions were stable at room temperature for 6 h and at 2 to 8° for 7 days. Clonidine was stable in plasma at room temperature for at least 4 h and for a minimum of 5 freeze-thaw cycles. Spiked plasma samples were stable for a minimum of 133 days when stored at –20°. Dry extract samples were stable for 19 h at 2 to 8° [Parekh *et al.* 2008]. No degradation was detected when plasma samples were stored at –20° for 12 days [Häring *et al.* 1988]. Stable in human plasma for 3 freeze-thaw cycles when stored below –50° and thawed at room temperature. Stable in plasma for 30 days at below –50°. Stock solutions are stable at room temperature for 6 and 22 h and at –4° for 30 days [Nirogi *et al.* 2008].

Clonidine Hydrochloride

$C_9H_9Cl_2N_3$, HCl = 266.6

CAS—4205-91-8

Synonym ST-155

Proprietary Names *Aruclonin*; *Atensina*; *Barclyd*; *Caprysin*; *Catanidin*; *Catapres (an)*; *Clonistada*; *Clonnirit*; *Dispaclonidin*; *Dixarit*; *Duraclon*; *Edolglau*; *Haemiton*; *Isoglaucon*; *Mirfat*; *Normopresan*; *Paracefan*; *Tenso-Timelets*. It is an ingredient of *Clorpres*; *Combipres*; *Combipresan* and *Dilapres*.

Chemical Properties White crystalline powder. Mp 305°. Soluble 1 in 13 of water, 1 in 25 of ethanol, 1 in 38 of dehydrated alcohol and 1 in 5000 of chloroform; practically insoluble in ether.

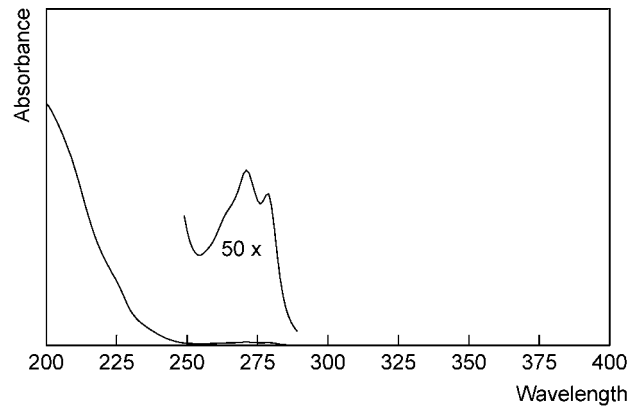
Colour Test Liebermann's reagent—yellow (→orange at 100°).

Thin-layer Chromatography System TA—R_f 0.62; system TB—R_f 0.08; system TC—R_f 0.31; system TE—R_f 0.70; system TL—R_f 0.53; system TAE—R_f 0.44; system TAF—R_f 0.76; system TAJ—R_f 0.09; system TAK—R_f 0.02; system TAL—R_f 0.51 (acidified iodoplatinate solution, positive).

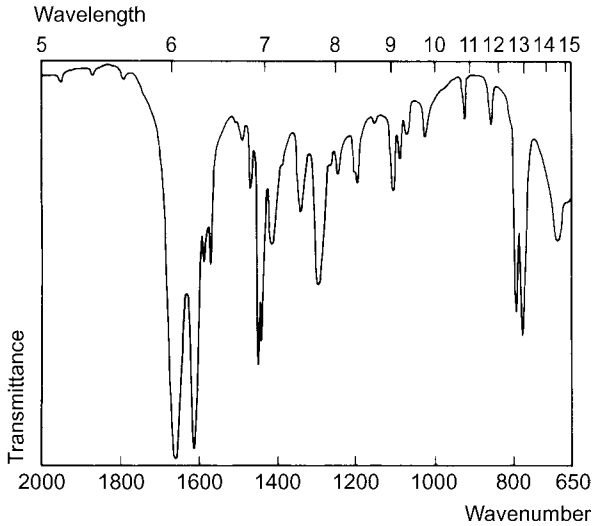
Gas Chromatography System GA—clonidine RI 2090, art (dichlorophenylisocyanate) RI 1350, art (dichlorophenylmethylcarbamate) RI 1500; system GB—clonidine RI 2165.

High Performance Liquid Chromatography System HA—*k* 1.2; system HX—RI 258; system HY—RI 194; system HZ—RT 2.5 min; system HAA—RT 6.1 min; system HAX—RT 7.8 min; system HAY—RT 4.3 min.

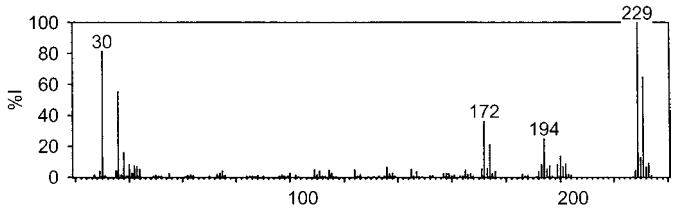
Ultraviolet Spectrum Aqueous acid—271 (A_1^1 = 21a), 278 nm.



Infrared Spectrum Principal peaks at wavenumbers 1653, 1610, 778, 795, 1295, 1568 cm^{-1} (clonidine hydrochloride) (KBr disk).



Mass Spectrum Principal ions at *m/z* 229, 30, 231, 172, 194, 174, 200, 230.



Quantification

Plasma **GC-MS** Column: Ultra-1 bonded phase fused silica (25 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 103 kPa. Temperature programme: 50° for 1 min to 300° at 40°/min. EI ionisation at 70 eV, SIM acquisition mode. Retention time: ≈9.75 min. Limit of detection 0.025 µg/L [Yamahata *et al.* 1994]. Column: SE-54 capillary (30 m × 0.3 mm i.d., 0.05 µm). Carrier gas: He, 40 cm/s. Temperature programme: 100° for 1 min to 300° at 6°/min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, 1 µg/L [Arrendale *et al.* 1988]. Column: CP Sil-5 fused silica capillary (25 m × 0.23 mm i.d., 0.13 µm). Carrier gas: He, 12 psi. Temperature programme: 180° to 250° at 10°/min to 300° at 20°/min. NICI. Limit of detection, 5 ng/L [Girault, Fourtillan 1988]. Column: OV-1 Oribond fused silica (25 m × 0.25 mm i.d.). Temperature programme: 60° for 1 min to 150° to 275° at 25°/min. NICI, SIM acquisition mode. Limit of detection, 10 ng/L [Häring *et al.* 1988]. Column: 3% OV-17 on Gas Chrom Q 100/120 mesh (1.8 m × 2.0 mm i.d.). Carrier gas, He, 15 mL/min. Temperature: 270°. ECD, CI, positive/negative ion mode. Limit of quantification, 10 ng/L [Murray, Davies 1984]. Column: 3% OV-17 on Gas-Chrom Q (1.8 m × 2 mm i.d.). Carrier gas: He, 15 mL/min. CI, SIM acquisition mode. Retention time: 2.3 min. Limit of quantification, 100 ng/L [Murray *et al.* 1981]. Column: 3% OV-17 on Gas-Chrom Q 80/100 (2 mm × 3 mm i.d.). Carrier gas: Ar : CH3 (95 : 5). ECD. Limit of detection, 100 ng/L [Edlund 1980]. Column: 3% OV-17 Chromosorb 100/120 (1.8 m × 2.0 mm i.d.). Carrier gas: N_2, 25 mL/min. Temperature: 175°. ECD. Retention time: 5.0 min. Limit of detection, 25 ng/L [Chu *et al.* 1979].

LC-MS Column: Inertsil ODS-3 (50 × 3.0 mm i.d., 3 µm). Mobile phase: 5 mmol/L ammonium formate buffer (pH 2.8) : methanol (10 : 90), flow rate 0.25 mL/min. TIS, MRM acquisition mode, positive ion mode. Limit of quantification, 10 ng/L [Nirogi *et al.* 2008]. Column: Hypersil Hypurity C_{18} (50 × 4.6 mm i.d., 5 µm). Mobile phase: 2 mmol/L ammonium acetate : acetonitrile (20 : 80), flow rate 0.4 mL/min. TIS, positive ion mode, MRM acquisition mode. Retention time: 2.1 min. Limit of quantification, 50 ng/L [Parekh *et al.* 2008]. Column: Inertsil ODS3 or Betasil silica (30 × 3.0 mm i.d., 5 µm). Mobile phase: acetonitrile : water : formic acid (10 : 90 : 1 to 70 : 30 : 1 at 2 min to 10 : 90 : 1 at 2.1 min (Inertsil column) or 90 : 10 : 1 to 50 : 50 : 1 at 1.0 min for 1.1 min to 90 : 10 : 1 at 2.1 min (Betasil column), flow rate 0.5 mL/min. ESI, MRM acquisition mode. Limit of quantification, 500 ng/L [Naidong *et al.* 2002].

Serum **GC-MS** Column: DB-5 capillary (30 m × 0.25 mm i.d., 0.25 µm). Temperature programme: 70° for 1.0 min to 200° at 25°/min to 300° at 10°/min for 1 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 87.5 ng/L, limit of detection, 26.3 ng/L [Wenzl *et al.* 2002].

LC-MS Column: BetaBasic C4 (100 × 3.0 mm i.d., 5 µm). Mobile phase: acetonitrile : water (80 : 20), flow rate 350 µL/min. ESI, CID, SRM acquisition mode. Retention time: 3.44 min. Limit of quantification, 0.1 µg/L, limit of detection, 0.01 µg/L [Müller *et al.* 2007].

Urine **GC** See Plasma [Chu *et al.* 1979].

GC-MS See Plasma [Murray *et al.* 1981].

Other **HPLC** Reservoirs for IV Drips. Column: Hibar RT LiChrospher RP-18 (12.5 × 4.0 mm i.d., 5 µm). Mobile phase: 2.2 mmol/L potassium dihydrogen phosphate and 16 mmol/L disodium hydrogen phosphate (pH 7.9) : methanol (35 : 65) with 3.5 mmol/L sodium dodecylsulfate, flow rate 1.0 mL/min. UV detection (λ = 254 nm). Retention time: 3.9 min. Limit of detection not reported [Wulf *et al.* 1994].

Disposition in the Body Well absorbed after oral administration; peak plasma concentrations reached within 3 to 5 h. Approximately 40 to 60% of a single dose is excreted in the urine as unchanged drug in 24 h, and ~20% of a dose is eliminated in the faeces in 4 days, probably via the enterohepatic circulation. Several inactive metabolites have been detected in urine in small quantities. Clonidine is absorbed through the skin, the therapeutic concentration being achieved 2 or 3 days after application of a transdermal delivery system, and it is maintained for ≈8 h after removal. Clonidine crosses the placental barrier.

Therapeutic Concentration

In 31 cancer patients given 0.030 mg/h clonidine by continuous epidural infusion for 14 days, steady-state plasma concentrations of 0.00022 to 0.00623 mg/L (mean 0.00219) on day 8 and 0.00061 to 0.00651 mg/L (mean 0.0025) on day 15 were reported; no accumulation in the plasma appeared to occur [Boswell *et al.* 1997].

After oral administration of clonidine 0.075 mg every 12 h for 3 days to 8 subjects, a peak plasma concentration of 0.00039 mg/L was attained at 75 h after the seventh dose. In the same subjects, when clonidine was applied transdermally to the chest wall for 3 days (as a patch containing 6 mg), the peak plasma concentration was not significantly different (0.00030 at 68 h) [Fujimura *et al.* 1994].

After rectal administration of 0.0025 mg/kg clonidine to 10 infants (aged 14 to 48 month), peak plasma concentrations of 0.00062 to 0.00088 mg/L (mean 0.00077) were obtained at 29 to 70 min (mean 52) [Lonnqvist *et al.* 1994].

After the administration of a single oral dose of 300 µg clonidine peak plasma concentrations of ≈700 ng/L were reached after 3 h [Häring *et al.* 1988].

Toxicity Serious toxic effects have been reported after ingestion of doses of 0.4 to 4 mg by children and 4 to 11 mg by adults, but recovery is usually rapid. Clonidine patches have a programmed delivery of 0.1, 0.2, or 0.3 mg per day for 7 days. The patches contain 2.5, 5.0, and 7.5 mg clonidine, respectively. They can be extremely toxic or even fatal to the paediatric population [Behrman, Goertemoeller 2007].

A 5-year-old child weighing 17.5 kg ingested an overdose of 50 mg clonidine hydrochloride, the serum concentration was 0.064 mg/L 17 h later, the highest reported in a paediatric patient. After supportive treatment and administration of atropine and naloxone, the child recovered and was discharged without sequelae 42 h after admission. The overdose resulted from a pharmacy compounding error so that the child ingested 5 mL of a medication containing ~50 mg of clonidine instead of 0.05 mg/5 mL [Romano, Dinh 2001].

A 9-month-old child was admitted to hospital with a reduced level of consciousness and within a few hours developed apnoea and pinpoint pupils. The child was discharged 36 h after admission after treatment with naloxone. Further investigation led to the theory that the evening before admission, the elderly babysitter's clonidine patch had accidentally fallen into the baby's playpen where the baby subsequently sucked on it (despite the babysitter's denial of involvement); the baby's clonidine level was determined to be 0.011 mg/L but the results were not available until nearly 2 weeks after discharge [Kraft 1998].

Two females were accidentally given doses of 25 mg instead of 0.025 mg; plasma concentrations of 0.025 and 0.027 mg/L were reported on admission and at 24 h, respectively, and decreased with a half-life of 22 h; the subjects recovered with treatment [Oliver Rotellar *et al.* 1981].

A 28-year-old female ingested 30 to 70 clonidine tablets (150 µg each). She was admitted to hospital and 16 h later her plasma clonidine concentration was 4.7 µg/L. Forty hours after the overdose her plasma concentration was 2.1 µg/L [Lilja *et al.* 1984].

In a fatality due to clonidine overdose, the following postmortem concentrations were reported: blood 0.023 mg/L, brain 0.024 µg/g, kidney 0.086 µg/g [Lukkari *et al.* 1983].

Note There are several reported cases of overdose with clonidine in children and adults. For a case study of overdose after the ingestion of just 3 × 0.2 mg tablets, see Anagnos and Mazyck [1984]. For cases of iatrogenic overdose in children, see Meyer and Cambray [2008] or Suchard and Graeme [2002]. For 2 cases of overdose in children after clonidine administration by transdermal patch, see Broderick-Cantwell [1999]. For a review of the pharmacology of clonidine overdose, see Conner and Watanabe [1979] or [Seger 2002].

Bioavailability 75 to 95 %.

Half-life Plasma half-life, 10 to 25 h.

Volume of Distribution 2.1 to 5.6 L/kg

Clearance 200 to 250 mL/min [Marruecos *et al.* 1983].

Protein Binding ≈20 to 40%.

Note For a review of the pharmacokinetics of clonidine, see Lowenthal *et al.* [1988].

Dose Usually 0.2 to 1.2 mg of clonidine hydrochloride daily; doses of 1.8 mg or more daily may be given.

Clonitazene

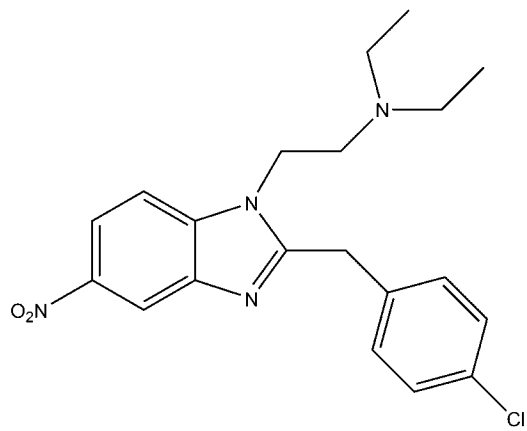
Narcotic

$C_{20}H_{23}ClN_4O_2$ = 386.9

CAS—3861-76-5

IUPAC Name 2-(*p*-Chlorobenzyl)-1-(2-diethylaminoethyl)-5-nitrobenzimidazole

Synonym Clonitazine



Chemical Properties Mp 75.5°. Log *P* (octanol/water) 5.18 [Meylan, Howard 1995].

Colour Tests Ammonium molybdate test—faint grey-blue (limit of detection, 1.0 µg); Vitali's test—faint brown/faint brown/faint brown (limit of detection, 1.0 µg).

Thin-layer Chromatography System T1—R_f 0.70 (location reagent acidified iodoplatinate spray, positive reaction).

Ultraviolet Spectrum Aqueous acid (0.1 N sulfuric acid)—232, 285 nm.

Meylan WM, Howard PH (1995). Atom/fragment contribution method for estimating octanol-water partition coefficients. *J Pharm Sci* 84: 83–92.

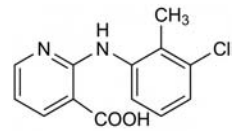
Clonixin

Analgesic

$C_{13}H_{11}ClN_2O_2$ = 262.7

CAS—17737-65-4

IUPAC Name 2-[(3-Chloro-2-methylphenyl)amino]-3-pyridinecarboxylic acid



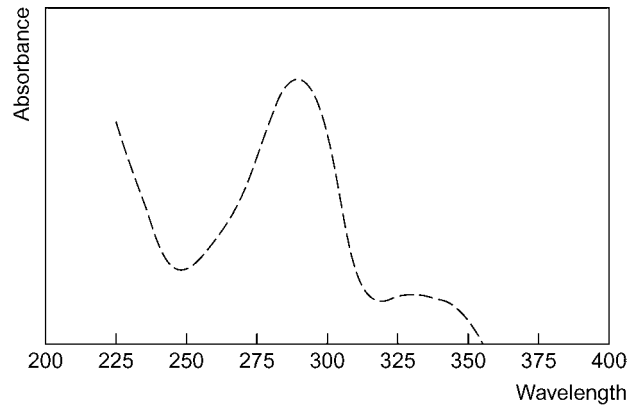
Chemical Properties A colourless or cream-coloured solid. Mp about 234°. Log *P* (octanol/water), 4.6.

Thin-layer Chromatography System TG—R_f 0.30; system TAJ—R_f 0.40; system TAK—R_f 0.14; system TAL—R_f 0.80 (Ludy Tenger reagent, orange).

Gas Chromatography System GD—Methyl derivativeRRT 1.61 (relative to n-$C_{16}H_{34}$).

High Performance Liquid Chromatography System HV—RRT 0.87 (relative to meclofenamic acid); system HY—RI 345.

Ultraviolet Spectrum Methanol—289 (A^{1}_{1}=950b), 335 nm.



Quantification

Plasma **HPLC** Limit of quantification, 10 µg/L [Bica *et al.* 2000].

Urine **HPLC** Limit of quantification, 20 µg/L [Bica *et al.* 2000].

Disposition in the Body Rapidly absorbed after oral administration. Metabolised by hydroxylation to 4′-hydroxy-, 5′-hydroxy-, and 2′-hydroxymethyl derivatives. About 60% of a dose is excreted in the urine in 24 h.

Therapeutic Concentration

Following a single oral dose of 750 mg to 12 subjects, peak serum concentrations of 29 to 66 mg/L (mean 46) were attained in about 1.7 h [Furst, Paulus 1975].

Half-life Plasma half-life, about 1.5 h.

Dose Clonixin has been given in doses of 600 mg.

Bica A *et al.* (2000). Determination of clonixin in plasma and urine by reversed-phase high-performance liquid chromatography. *J Chromatogr A* 889: 135–141.

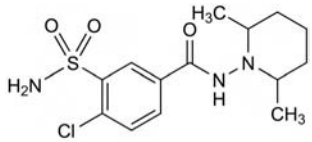
Clopamide

Antihypertensive, Diuretic

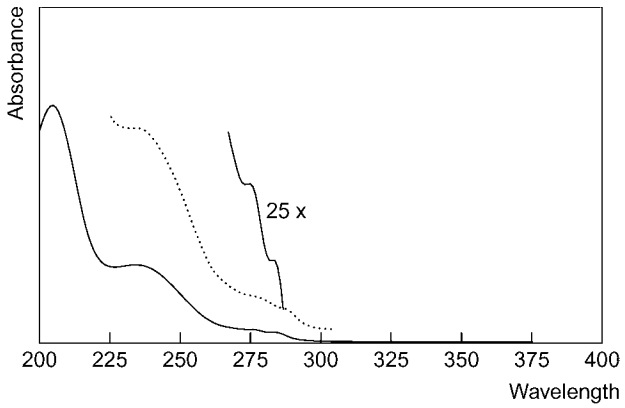
$C_{14}H_{20}ClN_3O_3S$ = 345.9

CAS—636-54-4

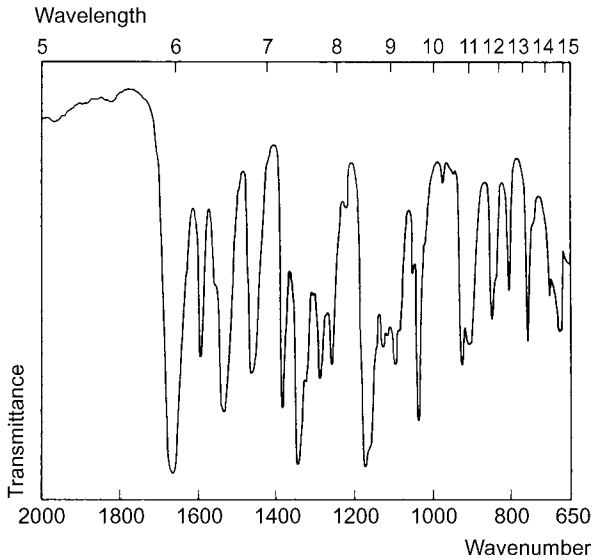
IUPAC Name 4-Chloro-*N*-[(2*R*,6*S*)-2,6-dimethylpiperidin-1-yl]-3-sulfamoylbenzamide
Synonyms *rel*-3-(Aminosulfonyl)-4-chloro-*N*-[(2*R*,6*S*)-2,6-dimethyl-1-piperidinyl]benzamide; chlosudimeprimyl; DT-327.
Proprietary Names *Brinaldix*. It is an ingredient of *Viskaldix*.



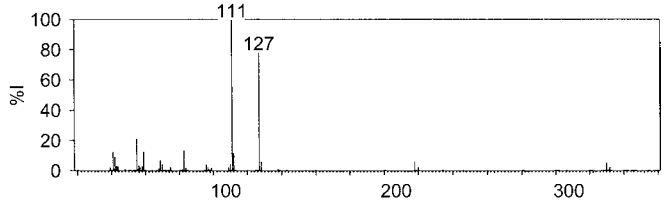
Chemical Properties A white crystalline powder. Mp about 246°. Soluble 1 in about 250 of water, 1 in about 100 of dehydrated alcohol, 1 in about 250 of chloroform, and 1 in 35 of methanol. Log *P* (octanol/water), 1.9. Extraction yield (chlorobutane), 0.06 [Demme *et al.* 2005].
Colour Tests Koppanyi-Zwikker test—violet; mercurous nitrate—black.
Thin-layer Chromatography System TA—R_f 0.79; system TD—R_f 0.19; system TE—R_f 0.55; system TF—R_f 0.38; system TAD—R_f 0.39 (acidified iodoplatinate solution, strong reaction).
Gas Chromatography System GA—clopamide not eluted, clopamide-Me_2 RI 2805, clopamide-ME_3 RI 2600, clopamide-Art (-SO_2NH) RI 2195; system GX—clopamide-Me_2 retention time 7.0 min.
High Performance Liquid Chromatography System HN—*k* 4.01; system HX—RI 377; system HY—RI 310.
Ultraviolet Spectrum Aqueous acid—242 nm (A^1_1=346b); methanol—232, 277 (A^1_1=48b), 286 nm (A^1_1=36b).



Infrared Spectrum Principal peaks at wavenumbers 1663, 1172, 1038, 1532, 1285, 928 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 111, 127, 55, 83, 59, 41, 112, 42; clopamide-Me_2 *m/z* 111, 112, 127, 55, 139, 358; clopamide-Me_3 *m/z* 372, 374, 387, 373, 264, 245; clopamide-Art (-SO_2NH) *m/z* 111, 127, 139, 83, 96, 251.



Quantification
Plasma **GLC-MS** Limit of detection, 10 mg/L [Stuber *et al.* 1989].
Disposition in the Body
Therapeutic Concentration
Eight healthy volunteers were administered 5 mg clopamide and a mean peak plasma concentration of 197 mg/L was reached after 1.1 h [Stuber *et al.* 1989].
Dose 20 to 60 mg daily.

Demme U *et al.* (2005). Systematic evaluation of 1-chlorobutane for liquid-liquid extraction of drugs. *Proceedings of the 12th TIAFT*, Seoul: 481–486.

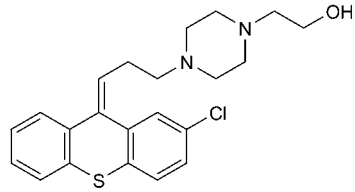
Clopenthixol

Thioxanthene, Dopamine Antagonist, Tranquilliser
$C_{22}H_{25}ClN_2OS$ = 401.0
CAS—982-24-1

IUPAC Name 2-[4-[3-(2-Chlorothioxanthen-9-ylidene)propyl]piperazin-1-yl] ethanol
Synonyms 4-[3-(2-Chloro-9*H*-thioxanthen-9-ylidene)propyl]-1-piperazineethanol; cloperphenthixan; zuclopenthixol.



Chemical Properties Colourless syrup. Sparingly soluble in ether. Readily soluble in methanol. Log *P* (octanol/water) 4.2. Extraction yield (chlorobutane), 1 [Demme *et al* 2005].

Clopenthixol Decanoate

$C_{32}H_{43}ClN_2O_2S$ = 555.2
Proprietary Name *Clopixol* (injection)
Chemical Properties Yellowish oily liquid. Practically insoluble in water; soluble in ethanol, chloroform, and ether.

Clopenthixol Hydrochloride

$C_{22}H_{25}ClN_2OS$, 2HCl = 473.9
CAS—633-59-0
Proprietary Names *Ciatyl*; *Clopixol* (tablets); *Sordinol*.
Chemical Properties Crystals. Mp ≈257°, with decomposition. Freely soluble in water, sparingly soluble in ethanol.

Colour Tests Formaldehyde-sulfuric acid—red (orange fluorescence under UV light); Liebermann's reagent—red; sulfuric acid—orange (fluoresces under UV light).
Thin-layer Chromatography System TA—R_f 0.56; system TAE—R_f 0.45; system TL—R_f 0.11; system TB—R_f 0.07; system TC—R_f 0.32; system TE—R_f 0.44 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—Clopenthixol *cis*-isomer (zuclopenthixol) RI 3400, clopenthixol-AC RI 3460, M (*N*-oxide)-$C_6H_{14}N_2O_2$- RI 2410, M (desalkyl-)-AC RI 3490, M (desalkyl-dihydro-)-AC RI 3450, Art-(Cl-thioxanthenone) RI 2260.
High Performance Liquid Chromatography System HX—RI 448; system HY—RI 411.

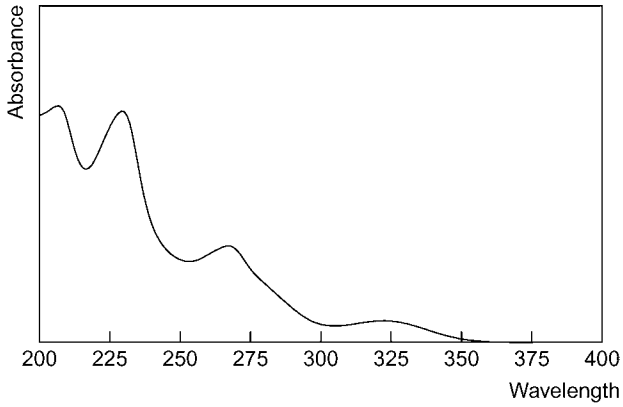
Column: Kromasil Si 100 (250 × 4 mm i.d., 5 µm). Mobile phase: acetonitrile : sodium dihydrogen phosphate buffer (pH 3.5; 30 : 70 for calixarene phases, 35 : 65 for resorcinarene phase), flow rate 1.0 mL/min. UV detection (λ = 225 nm). *k'*: 3.6-14.46 for calixarene phases, 5.41 for resorcinarene phase [Sokoließ *et al.* 2002].

Column: LiChrosorb RP-18 ODS silica (120 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : water : 0.2 mol/L potassium phosphate buffer (pH 4.0; 60 : 35 : 5) with 2.5 mmol/L DTMA bromide and 5 mmol/L sodium decanesulfonate, flow rate 1.0 mL/min. UV detection (λ = 254 nm). Retention time: ≈24 and 17 min for *cis*- and *trans*-clopenthixol, respectively [Helboe 1990].

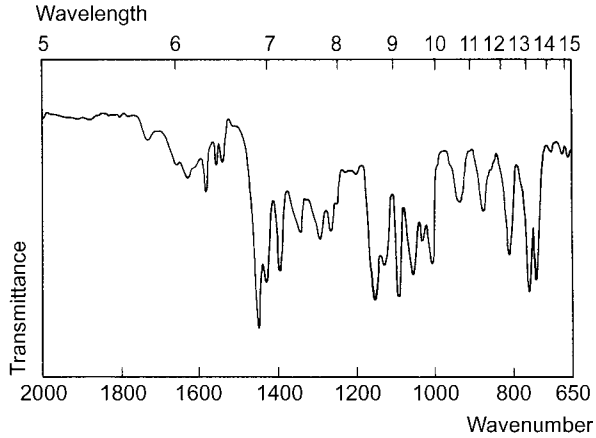
Column: Spherisorb (25 cm × 4.6 mm i.d., 5 µm). Mobile phase: ethyl acetate : methanol : 3% ammonia (85 : 15 : 1), flow rate 1 mL/min. UV detection (λ = 260 nm). Retention time: 8.02 and 8.89 min for *cis*- and *trans*-clopenthixol, respectively. Limit of detection, 1 mg/L [Li Wan Po *et al.* 1979].

C

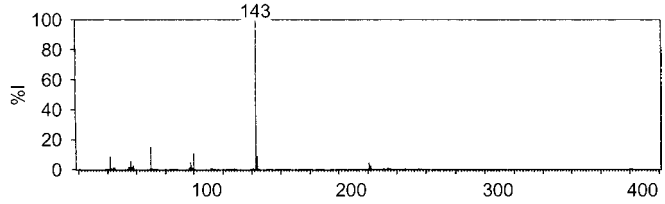
Ultraviolet Spectrum Aqueous acid—231 ($A_1^1 = 891$a), 269, 325 nm.



Infrared Spectrum Principal peaks at wavenumbers 1150, 1090, 757, 740, 1052, 1123 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 143, 70, 100, 144, 42, 56, 98, 221.



Quantification

Blood **GC-MS** Column: BPX5 capillary (15 m × 0.22 mm i.d., 0.25 µm). Carrier gas: He, 30 mL/min. Temperature programme: 70° for 1 min to 220° at 15°/min to 260° at 5°/min to 330° at 25°/min. EI ionisation at 70 eV, MSD. Retention time: 22.26 and 22.43 min for the *trans*(*E*)- and *cis*(*Z*)-isomers, respectively [Rop 2001].

HPLC Column: Symmetry (25 cm × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol : 0.1 mol/L ammonium acetate (30 : 30 : 40), flow rate 1.0 mL/min. DAD (λ = 230 nm). Limit of quantification, 40 and 45 µg/L for the *trans*(*E*)- and *cis*(*Z*)-isomers, respectively [Rop 2001]. Column: NovaPak C_{18} (300 × 3.9 mm i.d., 4 µm). Mobile phase: methanol : tetrahydrofuran : 10 mmol/L potassium dihydrogen phosphate (65 : 5 : 30), flow rate 0.80 mL/min. DAD (λ = 228 nm). Retention time: 8.98 min for *cis*(*Z*)-clopenthixol, 10.21 min for *trans*(*E*)-clopenthixol. Limit of detection, 7 µg/L for both isomers [Tracqui *et al.* 1997].

Column: Symmetry C_{18} (150 × 3.0 mm i.d., 5 µm). Mobile phase: acetonitrile: 0.1% formic acid (10 : 90 to 90 : 10 in 10 min to 10 : 90 in 1 min), flow rate 0.5 mL/min. ESI, full scan mode. Limit of detection, 1 µg/L [Kollroser *et al.* 2001].

Plasma **HPLC** Column: Microsorb MV C reversed phase (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 25 mmol/L phosphate buffer (pH 2.2; 35 : 65), flow rate 1.0 mL/min. UV detection (λ = 230 nm). Limit of quantification, 1 µg/L, limit of detection, 0.3 µg/L [Pucci *et al.* 2003]. Column: Phenomenex Luna C_{18} (100 × 2.0 mm i.d., 3 µm). Mobile phase: 40 mmol/L phosphate buffer (pH 7.5) : acetonitrile (52 : 48). UV detection (λ = 258 nm). Retention time: 7.12 min. Limit of detection, 1.0 nmol/L [Jaanson *et al.* 2002]. Column: Spherisorb S5 CN (120 × m i.d.). Mobile phase: acetonitrile : 0.2 mol/L potassium phosphate (pH 6.5) : water (36 : 5 : 59) containing dodecyl-*N,N,N*-trimethylammonium bromide, flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 260 nm; λ_{em} = 435 nm). Limit of detection, 0.05 µg/L, 0.2 µg/L for metabolite [Hansen, Hansen 1994].

Serum **HPLC** Column: Spherisorb S5CN (150 × 4.6 mm i.d.). Mobile phase: 10 mmol/L ammonium acetate buffer : methanol (1 : 9), flow rate 0.6 mL/min. UV detection (λ = 256 nm). Limit of quantification, 2 µg/L [Angelo, Petersen 2001]. Column: Spherisorb S 5 W (25 cm × 4.6 mm i.d., 5 µm). Mobile phase: *n*-heptane : 2-propanol : concentrated ammonia : water (85 : 15 : 0.4 : 0.2), flow rate 1.0 mL/min. UV detection (λ = 254 nm). Limit of detection, 0.5 µg/L for clopenthixol and 2.5 µg/L for des-(2-hydroxyethyl)clopenthixol [Aaes-Jørgensen 1980].

LC-MS Column: Nucleosil C_{18} (300 × 4.0 mm i.d.). Mobile phase: methanol : 0.2% ammonia (75 : 25), flow rate 0.6 mL/min. EI/CI. Retention time: 8.38 min. Limit of detection, 1.0 µg/L [Tas *et al.* 1986]

Disposition in the Body Clopenthixol decanoate is slowly absorbed after injection to give peak serum concentrations of clopenthixol and the des-(2-hydroxyethyl) metabolite after approximately 3 to 7 days. Clopenthixol, the des-(2-hydroxyethyl) metabolite, and their sulfoxide metabolites have been detected in urine together with small amounts of clopenthixol glucuronide [Khan 1969]. A significant part is played by CYP2D6 in the systemic elimination of clopenthixol [Jaanson *et al.* 2002].

Therapeutic Concentration

After the administration of a single IM dose of 50 mg clopenthixol to 19 acutely disturbed psychotic Asian patients, serum concentrations were 19.9 ± 2.8, 31.5 ± 4.5 and 17.8 ± 2.9 µg/L at 24, 48, and 72 h, respectively [Tan *et al.* 1993].

Nine healthy male volunteers were administered a 30 mg dose of clopenthixol (*cis*(*Z*)/*trans*(*E*)-clopenthixol 1/2) followed by a 10 mg dose of *cis*(*Z*)-clopenthixol after at least a week. The serum concentration curves of *cis*(*Z*)-clopenthixol were equal after both doses [Aaes-Jørgensen 1981].

A mean minimum steady-state serum concentration of 0.004 mg/L of clopenthixol was reported in 24 subjects, who had been receiving average doses of 200 mg IM every 4 weeks, for 5 to 6 months [Dencker *et al.* 1980].

After an oral dose of 30 mg of clopenthixol to 1 subject, a peak serum concentration of about 0.005 mg/L of *cis*-clopenthixol was attained in about 3 h; the peak concentration of the inactive *trans*-isomer was slightly higher and was attained after 4 h; the serum concentrations declined slowly and could be measured after 48 h; only traces of the des-(2-hydroxyethyl) metabolite were detected [Aaes-Jørgensen 1980].

Toxicity

A 39-year-old female with bipolar affective disorder was found dead in her room. Clopenthixol concentrations in her peripheral and heart blood were 0.60 and 0.68 mg/L, respectively [Kollroser *et al.* 2001].

A 26-year-old male with mental illness and drug addiction was found dead. The total clopenthixol in peripheral blood was 0.455 mg/L, 0.7 mg/L in cardiac blood, 31.56 mg/L in gastric contents and 0.735 mg/L in urine. The *cis*(Z)-isomer of the drug was found at a concentration of 0.455, 29.88 and 0.505 mg/L in cardiac blood, gastric contents and urine, respectively. *Trans*(E)-isomer were found at concentrations of 0.245, 1.68 and 0.23 mg/L, respectively [Rop 2001].

A 16-year-old female was found dead. The *cis*(Z)-clopenthixol concentrations were 0.391, 0.957 and 105.4 mg/L, 0.75, 1.413, 5.21 and 0.12 ng/g in blood, urine, gastric contents, liver, kidney, lung and brain, respectively. The *trans*(E)-clopenthixol concentrations were 0.275, 0.832 and 7.430 mg/L, and 0.837, 2.380, 9.758 and 0.058 ng/g, respectively [Tracqui *et al.* 1997].

A patient took 200 to 300 mg bromazepam, 2.5 g of clopenthixol and an unspecified amount of reserpine in an attempted suicide. Serum samples taken on the following 7 consecutive days showed that the clopenthixol concentrations decreased from 0.9 to 0.04 mg/L [Tas *et al.* 1986].

Note For a case of a 14-year-old female with neuroleptic malignant syndrome following clopethixol intake, see Erermis *et al.* [2007].

Volume of Distribution 15 to 20 L/kg [Tracqui *et al.* 1997].

Dose The equivalent of 20 to 150 mg of clopenthixol daily; up to 250 mg daily has been given.

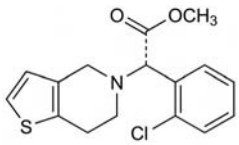
Clopidogrel

Antiplatelet
$C_{16}H_{16}ClNO_2S$ = 321.8
CAS—113665-84-2; 94188-84-8

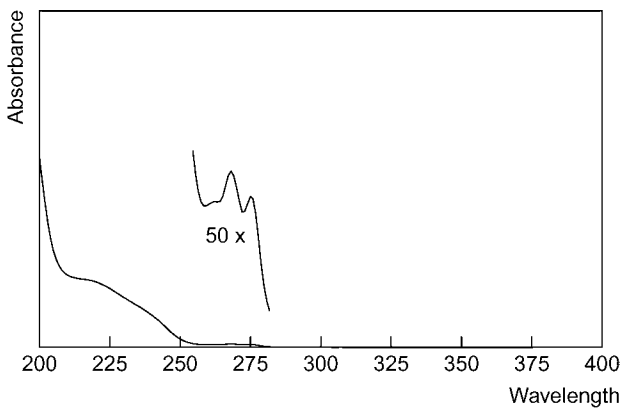
IUPAC Name Methyl (2*S*)-2-(2-chlorophenyl)-2-(6,7-dihydro-4*H*-thieno[3, 2-*c*]pyridin-5-yl)acetate
Synonyms (α*S*)-α-(2-Chlorophenyl)-6,7-dihydrothieno[3,2-*c*]pyridine-5-(4*H*)-acetic acid methyl ester; SR-25990.



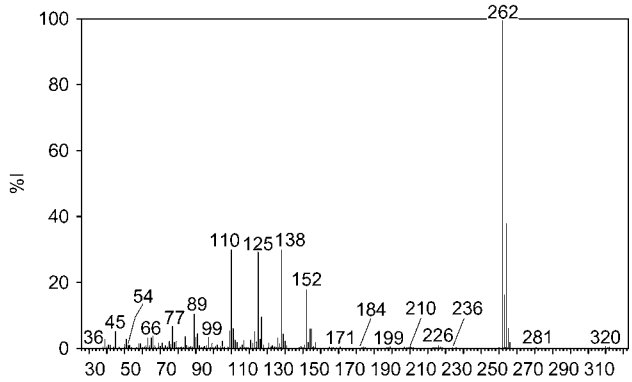
Clopidogrel Bisulfate

$C_{16}H_{16}ClNO_2S$, H_2SO_4 = 419.9
CAS—120202-66-6
Synonyms Clopidogrel bisulphate; clopidogrel hydrogen sulphate; SR-25990C
Proprietary Name *Plavix*
Chemical Properties A white to off-white powder. Mp 184°. It is practically insoluble in water at neutral pH; freely soluble in water at pH 1, and in methanol; sparingly soluble in methylene chloride; practically insoluble in ethyl ether.

Ultraviolet Spectrum Aqueous acid—270, 278, 308 nm.



Mass Spectrum Principal ions at *m/z* 262, 264, 110, 138, 125, 152, 89, 77 (clopidogrel bisulfate).



Quantification

Plasma **GC-MS** Column: DB1 (30 m × 0.25 mm i.d., 0.1 µm). Temperature programme: 120° then up to 290° at 30°/min, held for 3 min. Injector temperature: 290°. Carrier gas: He, flow rate 40 cm/s. MS detection (CI (chemical ionisation), FS (full scan) mode). Retention time: clopidogrel (carboxylic acid derivative), 6.5 min. Limit of quantification, 5 µg/L [Lagorce *et al.* 1998].
Serum **GC-MS** See Plasma [Lagorce *et al.* 1998].
Disposition in the Body After oral administration, clopidogrel is rapidly, but incompletely (~50%), absorbed. It is extensively metabolised in the liver to produce two metabolites, the main circulating metabolite (85%) being the inactive carboxylic acid derivative. Clopidogrel is oxidised to 2-oxo-clopidogrel with further hydrolysis to produce the active thiol derivative, which has not yet been identified in plasma. Clopidogrel and its metabolites are equally excreted in urine and faeces.
Therapeutic Concentration
Twelve healthy males were administered with single oral doses of 50, 75, 100 and 150 mg. Plasma concentrations of the parent drug were very low, less than the quantification limit (0.00025 mg/L) and peak concentrations of the inactive metabolite reached ~1.6, 2.9, 3.1 mg/L, respectively, within 0.8 to 1 h. Steady state values (between 0.8 and 0.11 mg/L) were reached by the eighth day (75 mg/day) [Caplain *et al.* 1999].
Toxicity A single case of deliberate overdose, during clinical trials, has been reported. A 34-year-old woman swallowed a single dose of 1050 mg (equivalent to 14 standard 75 mg tablets) clopidogrel with no associated undesirable effects. No special therapy was needed.
Half-life The elimination half-life of the inactive metabolite is ~8 h.
Clearance 10 mg/L/h.
Protein Binding Clopidogrel and its inactive metabolite bind plasma proteins 98% and 94%, respectively.
Dose A single oral daily dose of 75 mg.

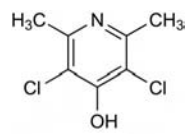
Lagorce P *et al.* (1998). Assay method for the carboxylic acid metabolite of clopidogrel in human plasma by gas chromatography-mass spectrometry. *J Chromatogr B, Biomed Sci Appl* 720: 107–117.

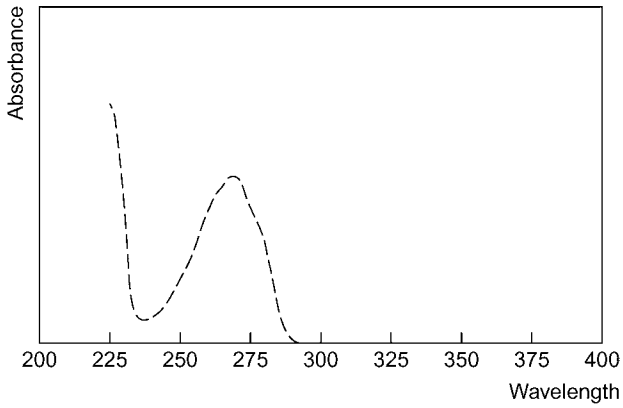
Clopidol

Coccidiostat (Veterinary)
$C_7H_7Cl_2NO$ = 192.0
CAS—2971-90-6

IUPAC Name 3,5-Dichloro-2,6-dimethyl-4-pyridinol
Synonyms Clopindol; meticlorpindol.
Proprietary Name *Coyden*



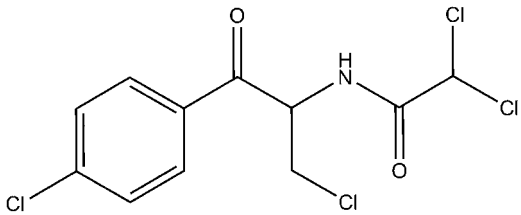
Chemical Properties A white crystalline powder. Mp 320°. Practically insoluble in water; slightly soluble in ethanol; soluble in methanol. Log *P* (octanol/water), 2.7.
Ultraviolet Spectrum Ethanol—269 nm (A_1^1=460b).



Infrared Spectrum Principal peaks at wavenumbers 1538, 1504, 753, 1618, 762, 1095 cm^{-1} (KBr disk).

Cloponone

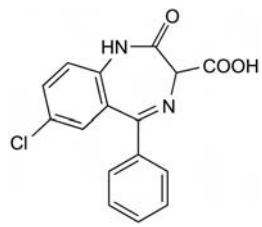
Antibacterial, Antimycotic
$C_{11}H_9C_{l4}NO_2 = 329.0$
CAS—15301-50-5
IUPAC Name 2,2-Dichloro-*N*-[3-chloro-1-(4-chlorophenyl)-1-oxopropan-2-yl]acetamide
Synonyms β-*p*-Dichloro-α-dichloroacetamidopropiophenone; K 374.
Proprietary Names It is an ingredient of *Ginetris* and *Golaval*.



Chemical Properties A white crystalline powder. Slightly soluble in ethanol; soluble in methanol and chloroform. Cloponone is extracted by chloroform from aqueous acid solutions.
Thin-layer Chromatography System T1—R_f 0.76 (location reagent acidified iodoplatinate spray, positive reaction).
Gas Chromatography System G2/225—retention time 1.55 relative to diphenhydramine; retention time 0.35 relative to codeine.
Ultraviolet Spectrum 0.1 N sulfuric acid—261 nm (E1%, 1cm 466); minimum at 232 nm.
Infrared Spectrum Principal peaks at wavenumbers 1667, 1689, 1536 cm^{-1}.

Clorazepic Acid

Tranquilliser
$C_{16}H_{11}ClN_2O_3 = 314.7$
CAS—23887-31-2
IUPAC Name 7-Chloro-2,3-dihydro-2-oxo-5-phenyl-1*H*-1,4-benzodiazepine-3-carboxylic acid



Chemical Properties pK_a 3.5, 12.5. Log *P* (octanol/water), 2.05.

Clorazepate Dipotassium

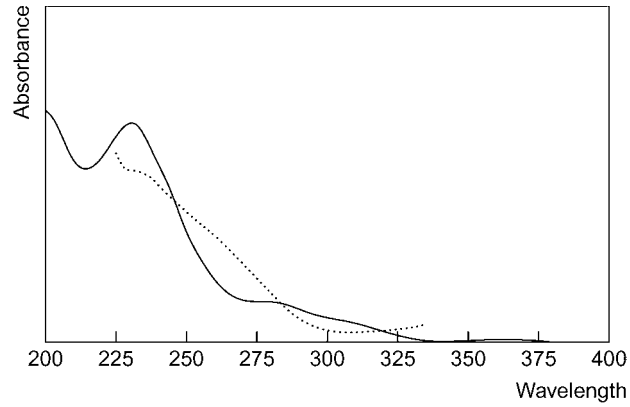
$C_{16}H_{10}ClKN_2O_3$, KOH = 408.9
CAS—57109-90-7
Synonyms Abbott 35616; AH-3232; CB-4306; clorazepate dipotassium; potassium clorazepate.
Proprietary Names *Belseren*; *Clorazecaps*; *Clorazetabs*; *Dorken*; *Gen-Xene*; *Medipax*; *Mendon*; *Nansius*; *Novo-Clopate*; *Transene*; *Tranxen(e)*; *Tranxilen(e)*; *Tranxilium*. It is an ingredient of *Dorken* and *Noctran*.

Chemical Properties A fine off-white powder. Freely soluble in water, very poorly soluble in ethanol. Practically insoluble in ether and chloroform. In aqueous solution, it converts to the monopotassium salt.

Clorazepate Monopotassium

$C_{16}H_{10}ClKN_2O_3 = 352.8$
CAS—5991-71-9
Synonym CB-4311
Proprietary Name *Azene*
Chemical Properties A fine, off-white powder. Very soluble in water; practically insoluble in organic solvents.

Colour Test Formaldehyde–sulfuric acid—orange.
Thin-layer Chromatography System TA—R_f 0.84; system TB—R_f 0.03; system TC—R_f 0.56; system TD—R_f 0.34; system TE—R_f 0.68; system TF—R_f 0.46; system TL—R_f 0.60; system TAD—R_f 0.57; system TAE—R_f 0.83; system TAF—R_f 0.87.
Gas Chromatography System GA—clorazepic acid RI 2457, nordazepam RI 2490, oxazepam RI 2325; system GB—clorazepic acid RI 2618, nordazepam RI 2625, oxazepam RI 2438; system GG—clorazepic acid RI 3125, nordazepam RI 3041, oxazepam RI 2803.
High Performance Liquid Chromatography System HI—*k* 1.17; system HK—*k* 2.00; system HX—RI 475; system HY—RI 388; system HZ—retention time 5.6 min; system HAA—clorazepate retention time 18.4 min; system HBH—*k* 8.22; system HBI—*k* 1.84.
Ultraviolet Spectrum Dipotassium clorazepate: aqueous acid—237 (A^1_1=747b), 287 nm.



Infrared Spectrum Principal peaks at wavenumbers 1597, 1548, 1300, 702, 1230, 830 cm^{-1} (dipotassium clorazepate) (KBr disk).
Mass Spectrum Principal ions at *m/z* 242, 43, 270, 269, 241, 103, 243, 76.
Quantification
Blood **GC** ECD. Clorazepic acid and desmethyldiazepam. Limit of detection, 4 µg/L [Brooks *et al.* 1977].
Plasma **HPLC** UV detection. Clorazepate dipotassium and desmethyldiazepam [Colin *et al.* 1983].
Urine **GC** ECD. Clorazepic acid and desmethyldiazepam. Limit of detection, 5 µg/L for clorazepic acid and desmethyldiazepam, 25 µg/L for oxazepam [Brooks *et al.* 1977].
Disposition in the Body Rapidly decarboxylated below pH 4 to the active metabolite desmethyldiazepam (nordazepam), and thus is absorbed mainly as desmethyldiazepam after oral administration; this is then hydroxylated to form oxazepam which is conjugated with glucuronic acid. Up to about 10% of a dose is excreted in urine in 24 h, mainly as oxazepam glucuronide, together with small amounts of unchanged clorazepate and conjugated desmethyldiazepam. Oxazepam glucuronide is still detectable in urine 12 days after a single dose. Small amounts of clorazepic acid and its metabolites are excreted in breast milk.
Therapeutic Concentration
Following a single oral dose of 15 mg to 4 subjects, peak blood concentrations of desmethyldiazepam of 0.14 to 0.18 mg/L (mean 0.16) were attained in 0.5 to 1 h; peak blood-clorazepate concentrations of 0.03 to 0.11 mg/L (mean 0.06) were reported at about 1 h [Abruzzo *et al.* 1977].
Average steady-state serum concentrations of 0.40 to 0.61 mg/L (mean 0.48) of desmethyldiazepam were reported in 7 patients receiving daily oral doses of 0.6 mg/kg [Wilensky *et al.* 1978].
Toxicity Fatalities from overdosage are rare and recovery from an overdose of 600 mg has been reported.
Half-life Plasma half-life, clorazepate about 2 h, desmethyldiazepam about 40 to 100 h but there is considerable intersubject variation—see under Nordazepam.
Volume of Distribution Desmethyldiazepam 0.5 to 2.5 L/ kg, increased in elderly subjects.
Clearance Plasma clearance, desmethyldiazepam about 0.1 to 0.3 mL/min/kg.
Distribution in Blood Plasma : whole blood ratio, desmethyldiazepam 1.7.
Protein Binding Desmethyldiazepam about 91%.
Dose 7.5 to 22.5 mg of dipotassium clorazepate daily; up to 60 mg daily has been given.

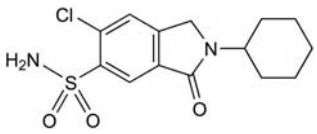
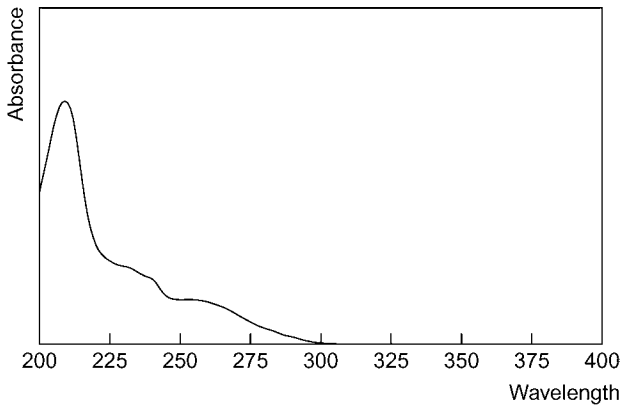
Clorexolone

Diuretic
$C_{14}H_{17}ClN_2O_3S$ = 328.8
CAS—2127-01-7

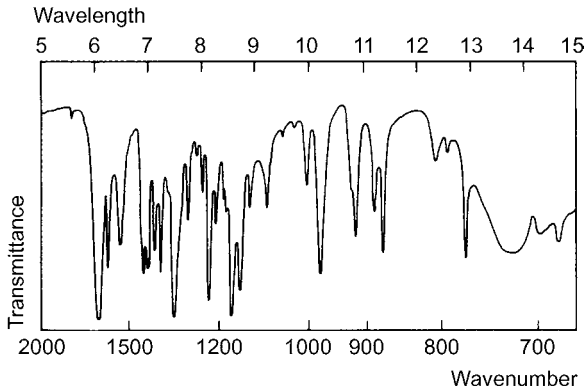
IUPAC Name 6-Chloro-2-cyclohexyl-2,3-dihydro-3-oxo-1*H*-isoindole-5-sulfonamide
Proprietary Names *Flonatril*; *Nefrolan*.



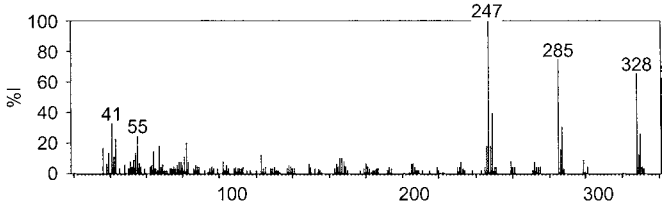
Chemical Properties A white crystalline powder. Mp 266° to 268°. Very slightly soluble in water; soluble in dimethylformamide, methanol, and solutions of alkali hydroxides. Log *P* (octanol/water), 2.0.
Colour Test Koppanyi–Zwikker test—violet.
Thin-layer Chromatography System TA—R_f 0.76; system TD—R_f 0.31; system TE—R_f 0.60; system TF—R_f 0.51; system TAD—R_f 0.47; system TAE—R_f 0.79 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 3194.
High Performance Liquid Chromatography System HN—*k* 7.26; system HY—RI 391.
Ultraviolet Spectrum Ethanol—252 nm (A_1^1=246a).



Infrared Spectrum Principal peaks at wavenumbers 1661, 1172, 1234, 1149, 978, 1613 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 247, 285, 328, 249, 41, 287, 330, 55.

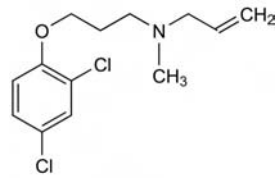


Disposition in the Body Absorbed after oral administration. It is almost completely excreted in the urine in 48 h as three cyclohexane ring-hydroxylated metabolites.
Dose 10 to 100 mg daily.

Clorgiline

Antidepressant
$C_{13}H_{15}Cl_2NO$ = 272.2
CAS—17780-72-2

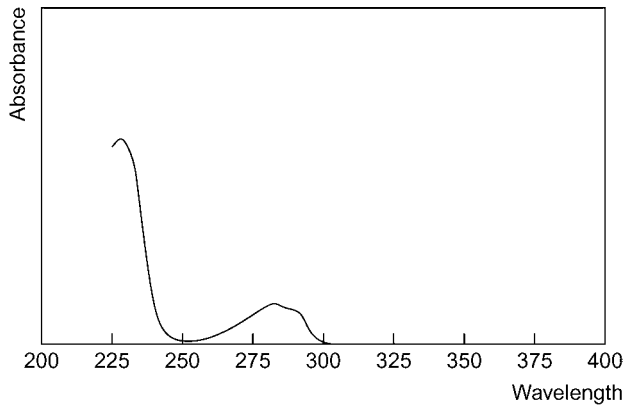
IUPAC Name *N*-[3-(2,4-Dichlorophenoxy)propyl]-*N*-methylprop-2-ynylamine
Synonym Clorgyline



Clorgiline Hydrochloride

$C_{13}H_{15}Cl_2NO$, HCl = 308.6
CAS—17780-75-5
Chemical Properties A white crystalline powder. Mp 102° to 103°. Very soluble in water; soluble in chloroform.

Colour Test Liebermann's reagent—black.
Thin-layer Chromatography System TA—R_f 0.67; system TB—R_f 0.42; system TC—R_f 0.70; system TL—R_f 0.59 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1883.
Ultraviolet Spectrum Aqueous acid—228 (A_1^1=310b), 282 nm.

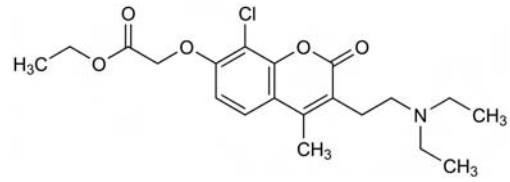


Infrared Spectrum Principal peaks at wavenumbers 1280, 1250, 1055, 1099, 801, 1124 cm^{-1}.
Dose Clorgiline hydrochloride has been tried in doses of 10 to 30 mg daily.

Cloricromen

Antithrombotic, Vasodilator (Coronary)
$C_{20}H_{26}ClNO_5$ = 395.9
CAS—68206-94-0

IUPAC Name Ethyl 2-[8-chloro-3-(2-diethylaminoethyl)-4-methyl-2-oxochromen-7-yl] oxyacetate
Synonyms AD_6; 8-chlorocarbocromen; [[8-chloro-3-[2-(diethylamino)ethyl]-4-methyl-2-oxo-2*H*-1-benzopyran-7-yl]oxy]acetic acid ethyl ester.



Chemical Properties Crystals. Mp 147° to 148° (from ethyl acetate).

Cloricromen Hydrochloride

$C_{20}H_{25}ClNO_5$, HCl = 432.3
CAS—74697-28-2
Proprietary Names *Cromocap*; *Proendotel*.

Chemical Properties Mp 219° to 220°.

Quantification

Biological Samples **HPLC** Fluorescence detection (λ_{ex}=310 nm; λ_{em}=390 nm) [Mariot *et al.* 1992].

Note For studies on the molecular aspects of cloricromen distribution in human platelets and its pharmacological effects, see Travagli *et al.* [1989].

Dose Orally, 100 mg two or three time daily or IV in a dose of 30 mg daily.

Mariot R *et al.* (1992). Determination of the coumarin derivative cloricromene acid in rabbit plasma and platelets. *J Chromatogr* 576: 143–148.

Travagli RA *et al.* (1989). Molecular aspects of cloricromene (AD6) distribution in human platelets and its pharmacological effects. *Thromb Res* 54: 327–338.

Clorprenaline

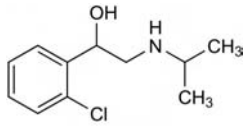
Sympathomimetic

$C_{11}H_{16}ClNO$ = 213.7

CAS—3811-25-4

IUPAC Name 2-Chloro-α-[[(1-methylethyl)amino]methyl]benzenemethanol

Synonyms Chlorprenaline; isoprofenamine; isoprophenamine.



Chemical Properties Soluble in chloroform. Log *P* (octanol/water), 1.82.

Clorprenaline Hydrochloride

$C_{11}H_{16}ClNO$, HCl, H_2O = 268.2

CAS—6933-90-0 (anhydrous); 5588-22-7 (monohydrate)

Proprietary Names *Broncon*; *Clopinerin*; *Conselt*; *Fusca*; *Katulein*; *Pentadoll*; *Restanolon*.

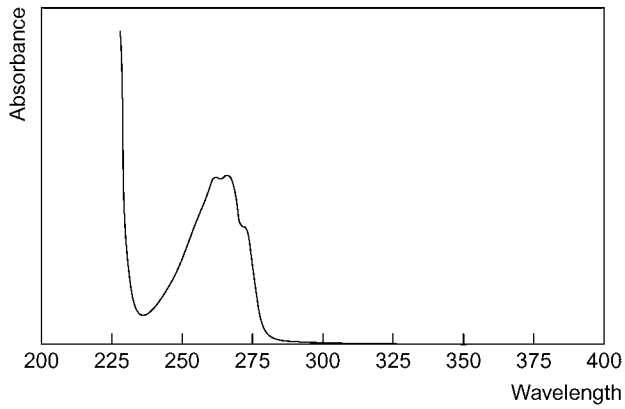
Chemical Properties White crystals. Mp 163° to 164° (monohydrate). Soluble in water.

Thin-layer Chromatography System TA—R_f 0.57; system TB—R_f 0.18; system TC—R_f 0.15; system TL—R_f 0.20 (acidified potassium permanganate solution, positive).

Gas Chromatography System GA—RI 1604; system GB—RI 1614; system GC—RI 1880.

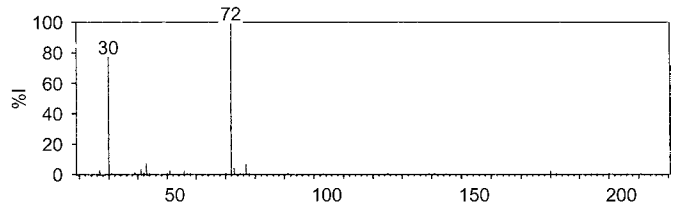
High Performance Liquid Chromatography System HA—*k* 1.1.

Ultraviolet Spectrum Aqueous acid—262, 266 nm (A^1_1=10.1b).



Infrared Spectrum Principal peaks at wavenumbers 1075, 775, 1587, 1041, 1030, 1123 cm^{-1}.

Mass Spectrum Principal ions at *m/z* 72, 30, 43, 77, 73, 51, 41, 27.



Quantification

Plasma **HPLC** Clorprenaline enantiomers, limit of quantification, 1 ng [Miwa *et al.* 1991].

Dose Clorprenaline hydrochloride has been given in doses of 30 to 80 mg daily.

Miwa T *et al.* (1991). Application of an ovomucoid-conjugated polymer column for the enantiospecific determination of chlorprenaline concentrations in plasma. *J Chromatogr* 566: 163–171.

Clospipramine

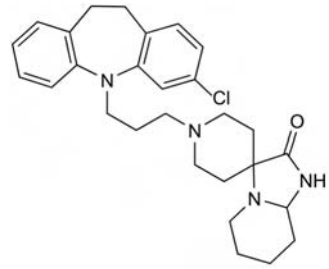
Antipsychotic

$C_{28}H_{35}ClN_4O$ = 479.1

CAS—89419-40-9

IUPAC Name 1′-[3-(3-Chloro-10,11-dihydro-5*H*-dibenz[*b*,*f*]azepin-5-yl)propyl]-hexahydrospiro[imidazo[1,2-*a*]pyridine-3(2*H*),4′-piperidin]-2-one

Synonym Mosapramine.



Clospipramine Dihydrochloride

$C_{28}H_{35}ClN_4O.2HCl$ = 552.0

CAS—98043-60-8

Synonym Mosapramine dihydrochloride.

Proprietary Names *Cremin*; *Y-516*.

Chemical Properties A white to slightly creamy white, odourless crystalline powder. Mp 271°. It is freely soluble in formic acid; slightly soluble in water, methanol, ethanol and dimethylformamide; practically insoluble in acetonitrile, acetic anhydride and ether.

Quantification

Plasma **HPLC** UV detection (λ=257 nm). Limit of detection, 1 μg/L [Ishigooka *et al.* 1989].

Urine **HPLC** Limit of detection, 20 μg/L, see Plasma [Ishigooka *et al.* 1989].

Disposition in the Body Clospipramine dihydrochloride is metabolised, mainly in the liver, by hydrogenation at the spiroamine site and hydroxylation at the iminodibenzyl ring to produce two metabolites. Excretion is mainly via bile but the drug has also been recovered in faeces and urine (rate urinary excretion <0.5%).

Therapeutic Concentration

Five healthy males, aged between 22 and 44 years, were administered orally with single doses of 6.25, 12.5 and 25 mg. Plasma concentrations reached a maximum of 7.9 ± 1.7 μg/L within 6.0 ± 1.4 h. Plasma concentrations are dose-dependent and decrease in a monophasic manner [Ishigooka *et al.* 1989].

Half-life 15 h.

Clearance 130 to 170 L/h.

Dose Usual dose of 30 to150 mg/day is administered as three separate doses. Dose may be increased to 300 mg/day.

Ishigooka J *et al.* (1989). Pharmacokinetic study of iminodibenzyl antipsychotic drugs, clocapramine and Y-516 in dog and man. *Psychopharmacology* 97: 303–308.

Clostebol

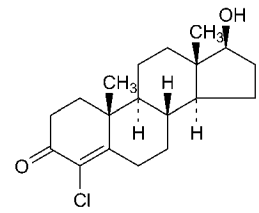
Anabolic Steroid

$C_{19}H_{27}ClO_2$ = 322.87

CAS—1093-58-9

IUPAC Name (8*R*,9*S*,10*R*,13*S*,14*S*,17*S*)-4-Chloro-17-hydroxy-10,13-dimethyl-1,2,6,7,8,9,11,12,14,15,16,17-dodecahydrocyclopenta[a]phenanthren-3-one

Synonyms (17β-4-Chloro-17-hydroxyandrost-4-en-3-one; 4-chlorotestosterone.



Chemical Properties Crystals from acetone and hexane. Mp 188° to 190. Log *P* (octanol/water) 3.76.

Clostebol Acetate

$C_{21}H_{29}ClO_3$ = 364.9

CAS—855-19-6

Synonyms Chlortestosterone acetate; 4-chlorotestosterone acetate.

Proprietary Names *Alfa-Trofodermine*; *Macrobin*; *Megagrisent Mono*; *Steranabol*; *Trofodermin*; *Trofoseptine*.

Chemical Properties Crystals from methanol. Mp 228° to 230°. Soluble in ethanol.

Colour Test Zimmerman test—blue.

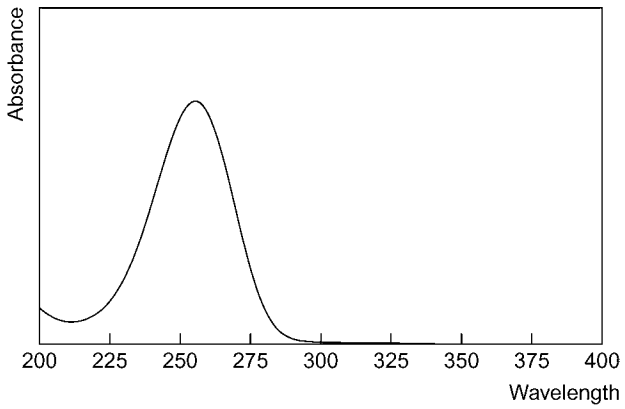
Gas Chromatography System GA—clostebol acetate RI 2965, clostebol acetate-TMS RI 2870, clostebol enol-TMS_2 RI 2830, clostebol-HCl-Ac RI 2700, clostebol-HCl-TMS RI 2675, clostebol-HCl enol-TMS_2 RI 2640.

Column: HP1 methyl silicone (0.2 mm i.d., 0.33 µm). Column temperature: 280°. Carrier gas: He, 0.9 mL/min. Detection: mass spectrometer. RI: 3023 [Mills, Roberson 1993].

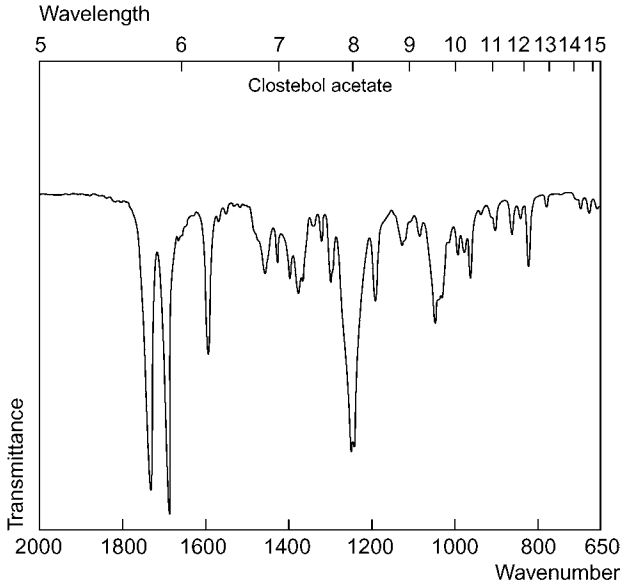
High Performance Liquid Chromatography System HAR—clostebol acetate RRT 1.90 (relative to testosterone).

Column: ODS Hypersil (100 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : aqueous 0.01 mol/L dihydrogen potassium phosphate buffer (pH 3.5; 90 : 10), flow rate 1 mL/min. DAD. Retention time: 4.6 min [Mills, Roberson 1993].

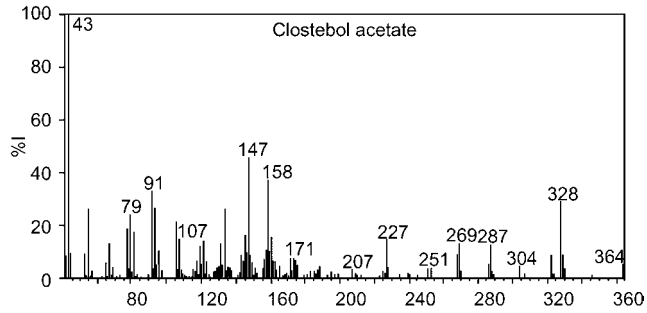
Ultraviolet Spectrum Clostebol acetate: Aqueous acid (ethanol)—254 nm.



Infrared Spectrum Clostebol acetate: Principal peaks at wavenumbers 1727, 1683, 1251 cm^{-1} (KBr pellets).



Mass Spectrum Clostebol acetate: Principal ions at *m/z* 43, 147, 158, 91, 328, 55, 93, 79.



Quantification

Urine **GC-MS** EI ionisation, SIM acquisition mode. Retention time: 21.3 min. Limit of quantification, 0.8 µg/L [Walshe *et al.* 1998]. Column: HP Ultra 2 fused silica cross-linked with 5% phenylmethylsilicone (25 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 26 cm/s. Temperature programme: 100° for 1 min to 230° at 40°/min to 280° at 5/min for 15 min. EI ionisation at 70 eV, SIM acquisition mode. Retention time: 15.6 min [Debruyckere *et al.* 1992; Debruyckere *et al.* 1994].

Note For an ELISA for clostebol, see Crabbe *et al.* [2003].

Disposition in the Body A high percentage of clostebol acetate is absorbed after oral administration and possibly inactivated. Clostebol is metabolised to 4-chloro-Δ^4-androstene-3α-ol-17-one, which can be detected in urine along with additional 17-ketisteroid metabolites and 4-chlorotestosterone alcohol. Free 4-chlorotestosterone acetate can be detected in faeces but never in urine [Castegnaro, Sala 1973]. It is distributed in breast milk.

Dose 30 mg dose administered weekly (IM injection) or 15 mg two or three times daily (orally).

Clotiapine

Tranquilliser

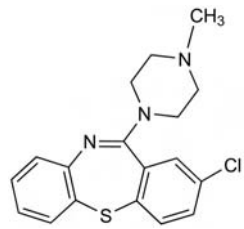
$C_{18}H_{18}ClN_3S$ = 343.9

CAS—2058-52-8

IUPAC Name 8-Chloro-6-(4-methylpiperazin-1-yl)benzo[*b*][1,4]benzothiazepine

Synonyms 2-Chloro-11-(4-methyl-1-piperazinyl)dibenzo[*b,f*][1,4]thiazepine; clothiapine.

Proprietary Names *Entumin(e)*



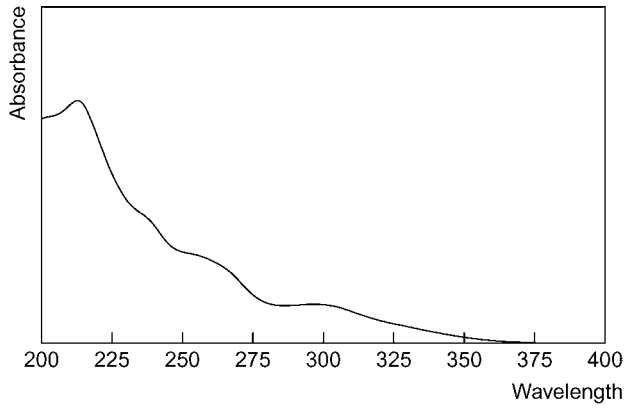
Chemical Properties Crystals. Mp 116° to 122°. Soluble 1 in 10 of hydrochloric acid. Log *P* (octanol/water), 3.8.

Thin-layer Chromatography System TA—R_f 0.59; system TB—R_f 0.41; system TC—R_f 0.59; system TL—R_f 0.23 (acidified iodoplatinate solution, positive).

Gas chromatography System GA—clotiapine RI 2712, M (OH-)-AC RI 3000, M (nor-)-AC RI 3030, M (nor-OH-)-AC_2 RI 3400, M (oxo-) RI 3030; system GB—clotiapine RI 2833, M (nor-) RI 2882.

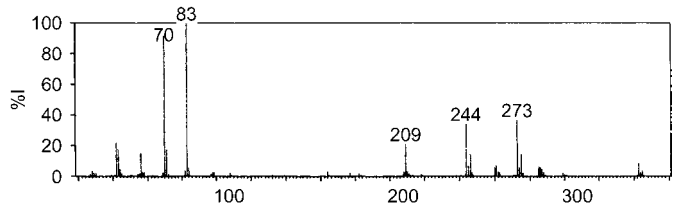
High Performance Liquid Chromatography System HY—RI 348.

Ultraviolet Spectrum Aqueous acid—213, 297 nm.



Infrared Spectrum Principal peaks at wavenumbers 1596, 1570, 1548, 1295, 757, 1234 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 83, 70, 273, 244, 209, 42, 71, 43.

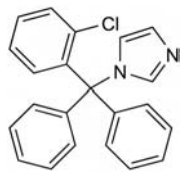


Dose Clotiapine has been given in doses of 40 to 120 mg daily.

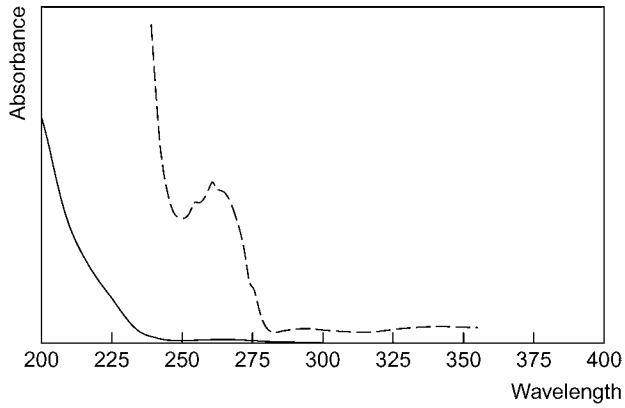
Clotrimazole

Antifungal
$C_{22}H_{17}ClN_2$ = 344.8
CAS—23593-75-1

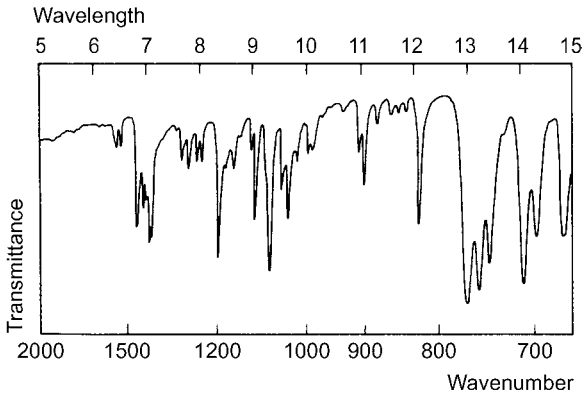
IUPAC Name 1-[(2-Chlorophenyl)diphenylmethyl]-1*H*-imidazole
Synonym Chlortritylimidazol
Proprietary Names *Canesten*; *Eparol*; *Gyne-Lotrimin*; *Lotrimin*; *Mycelex*; *Trimysten*.



Chemical Properties A white to pale yellow crystalline powder. Mp 147° to 149°. Slightly soluble in water, benzene, and toluene; freely soluble in ethanol; soluble in acetone, chloroform, and ethyl acetate; slightly soluble in ether. Log *P* (octanol/water), 6.3.
Thin-layer Chromatography System TE—R_f 0.76; system TAD—R_f 0.68; system TAE—R_f 0.80.
Gas Chromatography System GA—RI 2800.
Ultraviolet Spectrum Methanol—254, 260 nm (A_1^1=20b).



Infrared Spectrum Principal peaks at wavenumbers 765, 752, 708, 1075, 741, 1205 cm^{-1} (KBr disk).

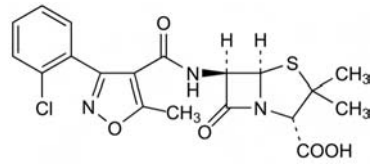


Mass Spectrum Principal ions at *m/z* 277, 279, 165, 278, 241, 239, 242, 240.
Uses Topically in a concentration of 1 or 2% or as vaginal tablets.

Cloxacillin

Antibiotic
$C_{19}H_{18}ClN_3O_5S$ = 435.9
CAS—61-72-3

IUPAC Name (2*S*,5*R*,6*R*)-6-[[[3-(2-Chlorophenyl)-5-methyl-4-isoxazolyl]carbonyl]-amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid

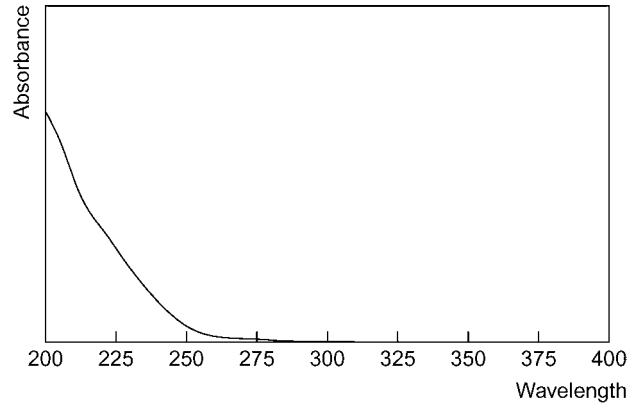


Chemical Properties pK_a 2.7 (25°). Log *P* (octanol/water), 2.5.

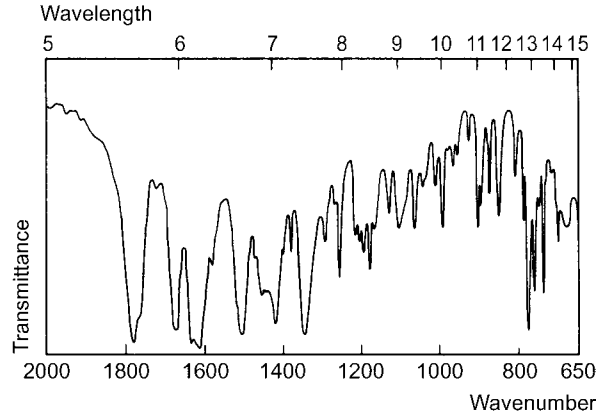
Cloxacillin Sodium

$C_{19}H_{17}ClN_3NaO_5S$, H_2O = 475.9
CAS—642-78-4 (anhydrous); 7081-44-9 (monohydrate)
Proprietary Names *Austrastaph*; *Bactopen*; *Cloxapen*; *Cloxilean*; *Cloxypen*; *Ekvacillin*; *Novocloxin*; *Orbenin(e)*; *Staphybiotic*; *Tegopen*. It is an ingredient of *Ampiclox*.
Chemical Properties A white, hygroscopic, crystalline powder. Mp 170° with decomposition. Soluble 1 in 2.5 of water, 1 in 30 of ethanol, and 1 in 500 of chloroform. Soluble in pyridine and ethylene glycol.

Ultraviolet Spectrum No significant absorption between 200 and 400 nm.



Infrared Spectrum Principal peaks at wavenumbers 1598, 1620, 1765, 1495, 1659, 771 cm^{-1} (cloxacillin sodium, KBr disk).



Quantification
Serum **HPLC** UV detection. Limit of detection, 50 mg/L [Teare *et al.* 1982]. UV detection. Limit of detection, 500 mg/L [Soldin *et al.* 1980].
Urine **HPLC** See Serum [Teare *et al.* 1982].
Disposition in the Body Incompletely absorbed after oral administration. About 35% of an oral dose is excreted in the urine unchanged in 12 h, together with about 11% as penicilloic acid; about 10% of a dose is excreted in the bile.
Half-life Plasma half-life, about 0.5 to 1.5 h.
Volume of Distribution About 0.1 L/kg.
Protein Binding About 94%.
Dose Usually the equivalent of 2 g of cloxacillin daily.

Soldin SJ *et al.* (1980). A rapid high performance liquid chromatographic procedure for the analysis of cloxacillin and/or nafcillin in serum. *Ther Drug Monit* 2: 417–422.

Teare FW *et al.* (1982). High-pressure liquid chromatographic assay of cloxacillin in serum and urine. *J Pharm Sci* 71: 938–941.

Clozapine

Antipsychotic, Benzodiazepine

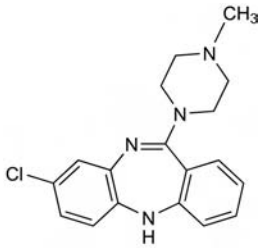
$C_{18}H_{19}ClN_4 = 326.8$

CAS—5786-21-0

IUPAC Name 3-Chloro-6-(4-methylpiperazin-1-yl)-5*H*-benzo[*c*][1,5]benzodiazepine

Synonyms 8-Chloro-11-(4-methyl-1-piperazinyl)-5*H*-dibenzo[*b,e*][1,4]diazepine; clozapina; clozapinum; HF-1854; klotsapiini; klozapin; klozapina; klozapinas.

Proprietary Names *Clopine*; *Clopsine*; *Clozaril*; *Denzapine*; *Elcrit*; *FazaClo*; *Froidir*; *Leponex*; *Zaponex*.



Chemical Properties Yellow crystals. Mp 183° to 184°. Soluble in chloroform; slightly soluble in acetone, acetonitrile, ethyl acetate and ethanol; practically insoluble in water. pK_{a1} 3.70, pK_{a2} 7.60. Log *P* (octanol/water), 3.23. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005]. Stable in processed samples for 24 h in the autosampler, after 3 freeze-thaw cycles and at −20° for 1 month. Serum samples were stable at room temperature for 6 h [Ming, Heathcote 2009].

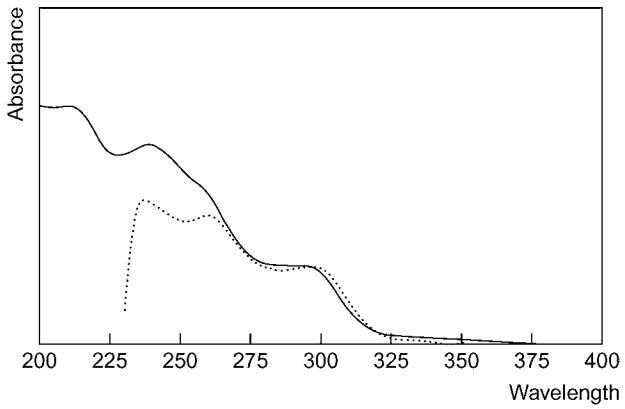
Colour Tests Formaldehyde–sulfuric acid—yellow; nitric acid, cold—red.

Thin-layer Chromatography System TA—R_f 0.57; system TB—R_f 0.04; system TC—R_f 0.38; system TD—R_f 0.04; system TE—R_f 0.55; system TF—R_f 0.05; system TL—R_f 0.17; system TAD—R_f 0.29; system TAE—R_f 0.42.

Gas Chromatography System GA—clozapine RI 2895; M (nor-) RI 3105; M (nor-acetyl-) RI 3490; system GB—clozapine RI 3024; M (nor-) RI 3092; M (nor-acetyl-) RI 3609; system GG—RI 3455.

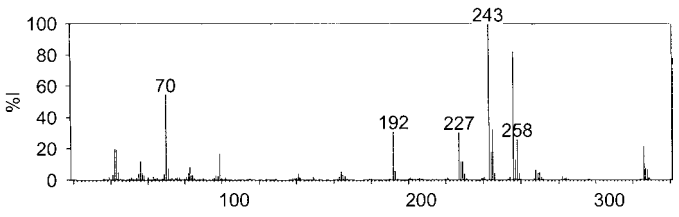
High Performance Liquid Chromatography System HX—RI 368; system HY—RI 284; system HZ—RT 3.9 min; system HAX—RT 10.9 min; system HAY—RT 5.2 min.

Ultraviolet Spectrum Aqueous acid—245, 297 nm; aqueous alkali—238, 261, 297 nm.



Infrared Spectrum Principal peaks at wavenumbers 1600, 1560, 758, 1136, 1101, 1117 cm^{-1}.

Mass Spectrum Principal ions at *m/z* 243, 256, 70, 245, 192, 227, 258, 326.



Quantification

Blood **GC** Column: cross-linked fused silica (25 m × 0.2 mm i.d., 0.11 µm). Carrier gas: He, 195 kPa. Temperature programme: 180° for 1 min to 300° at 10°/min for 3 min. NPD. Retention time: 12.8 min. Limit of quantification, 122–218 µg/L, limit of detection, 37–66 µg/L [Sanchez de la Torre *et al.* 2005].

GC-MS Limit of detection, 25 ng/mL [Melent'ev, Kurochkina 1999].

HPLC Column: Kromasil Ultrabase C_{18} (250 × 4.6 mm, 5 µm). Mobile phase: acetonitrile : phosphate buffer (pH 7.0, 48 : 52), UV detection (λ = 254 nm). Limit of quantification, 20 µg/L for clozapine and norclozapine and 30 µg/L for clozapine *N*-oxide [Guitton *et al.* 1997].

Plasma **GC** Column: HP-5890 (30 m × 0.53 mm i.d., 1 µm). Temperature: 260°. NPD. Limit of detection, 30 µg/L [Ulrich *et al.* 1999]. Column: Heliflex Drug Three (15 m). Carrier gas; N_2, 14 mL/min. Temperature programme; 230° for 1 min to 295° at 12°/min for 1 min. NPD. Retention time: 6.04 min. Limit of quantification, 35 µg/L [Jennison *et al.* 1995; Patrick, Markowitz 1997]. See Blood [Guitton *et al.* 1997].

GC-MS Column: OV-1701 (8 m × 0.32 mm i.d.). Carrier gas: He, 1.0 mL/min. Temperature: 260°. EI ionisation at 40 eV Limit of quantification, 1 µg/L for clozapine and 5 µg/L for norclozapine [Bondesson, Lindström 1988].

HPLC Column: C_8 reversed phase. Mobile phase: acetonitrile : 34 mmol/L phosphate buffer containing 0.3% TEA (pH 2.0, 29 : 71). UV detection (λ = 254 nm). Retention time: 5.9 min. Limit of quantification, 20 µg/L, limit of detection, 7 µg/L [Mercolini *et al.* 2007a]. Column: C_8 reversed phase. Mobile phase: aqueous phosphate buffer containing TEA (pH 3.0) : acetonitrile (70 : 30). UV detection (λ = 238 nm). Limit of quantification, <2.6 µg/L for clozapine and metabolites, limit of detection, <0.9 µg/L [Mercolini *et al.* 2007b]. Column: C_6 phenyl (150 × 2 mm, 3 µm). Mobile phase: 10 mmol/L ammonium acetate (pH 5) : acetonitrile : methanol (5 : 3 : 2). UV detection (λ = 254 nm). Limit of quantification, 100 µg/L for clozapine and 50 µg/L for norclozapine [Rosland *et al.* 2007]. Column: XTerra MS C_{18}. UV detection. Limit of quantification, 15 µg/L [Garay Garcia *et al.* 2003]. Column: C(8). Mobile phase: acetonitrile : 50 mmol/L phosphate buffer (pH 3.8). DAD (λ = 260, 280 and 240 nm). Limit of quantification, 5 µg/L [Titier *et al.* 2003]. See also Akerman [1997], Avenoso *et al.* [1998], Chung *et al.* [1993] Coudoré *et al.* [1999], Edno *et al.* [1997], Freeman *et al.* [1996], Johansen *et al.* [1997], Liu *et al.* [2001], Llerena *et al.* [2001], Lovdahl *et al.* [1991] and McCarthy *et al.* [1995].

LC-MS Column: reversed phase. Mobile phase: gradient (pH 8.1). SIM acquisition mode. Linit of detection, 2 µg/L [Choong *et al.* 2009]. Column: Macherey-Nagel C_{18} (125 × 2 mm, 3 µm). Mobile phase: 2.7 mmol/L formic acid-10 mmol/L ammonium acetate : acetonitrile (53 : 47), flow rate 0.16 mL/min. ESI, SIR acquisition mode. Limit of quantification, 20–1000 µg/L [Zhou *et al.* 2004]. Column: LiChroCART Superspher 60 RP Select B (125 × 2 mm i.d.). Mobile phase: 5 mmol/L aqueous ammonium formate (pH 3) : acetonitrile (60 : 40 for 5.5 min to 10 : 90 at 8 min to 60 : 40 at 9.5 min for 0.5 min), flow rate 0.4 mL/min for 5.5 min to 0.7 mL/min until 8 min to 0.65 mL/min at 9.5 min to 0.4 mL/min. APCI, SIM acquisition mode or scan mode. Limit of quantification, 0.05 mg/L (SIM mode), limit of detection, <0.02 mg/L (scan mode) [Kratzsch *et al.* 2003]. Column: Symmetry C_{18} (150 × 30 mm, 5 µm). Mobile phase: acetonitrile : 0.1% formic acid (20 : 80), flow rate 0.5 mL/min [Kollroser, Schober 2002].

CE Capillary: coated alkylphosphonate-modified zirconia CEC. Buffer: 0.3 mol/L ammonium acetate (pH 4.5) : acetonitrile (65 : 35). Limit of detection, 11.4–51.5 µg/L [Wei *et al.* 2010]. Capillary: untreated fused silica (31.2/20 cm, total/effective length, 50 µm). Buffer: 400 mmol/L phosphate buffer (pH 3.0) containing 50% ethylene glycol. UV detection (λ = 214 nm). Limit of detection, 5 µg/L for clozapine and norclozapine, 10 µg/L for clozapine *N*-oxide [Ho *et al.* 2004].

Serum **TLC** Plates: HPTLC silica gel F 254. Solvent: chloroform : methanol (9 : 1). Densiometry (290 nm). Limit of quantification, 50 µg/L, limit of detection, 30 µg/L [Mennickent *et al.* 2007].

GC See Plasma [Jennison *et al.* 1995]. Column: DB5 (15 m × 0.53 mm i.d., 1.5 µm). Carrier gas: He, 6 mL/min. Temperature: 250°. NSD. Limit of quantification, 1–2 µg/L [Richter 1988].

HPLC Column: ODS Hypersil C_{18} (250 × 4.6 mm, 5 µm). UV detection (λ = 254 nm). Limit of quantification, 10–50 µg/L [Sachse *et al.* 2006]. Column: Nucleosil 100-Protect 1. Mobile phase: acetonitrile : potassium dihydrogen phosphate buffer [Frahnert *et al.* 2003]. Column: C_{18}. Mobile phase: acetonitrile : buffer (30 : 70), flow rate 1.5 mL/min. UV detection (λ = 260 nm) and fluorescence detection (λ_{ex} = 227, λ_{em} = 300 nm) [Waschgler *et al.* 2002]. Column: C_{18} ODS Hypersil (250 × 4.6 mm, 5 µm). Mobile phase: acetonitrile : water : tetramethylethylenediamine (pH 6.5, 37 : 62.6 : 0.4). UV detection (λ = 254 nm). Limit of quantification, 10–30 µg/L [Weigmann *et al.* 1997; Weigmann *et al.* 2001]. Column: C_{18} ODS Hypersil (250 × 4.6 mm, 5 µm). Mobile phase: acetonitrile : water (40 : 60) buffered with 0.4% tetramethylethylenediamine (pH 6.5). Column: C_8. Mobile phase: acetonitrile : methanol : 10 mmol/L dipotassium hydrogen phosphate (pH 3.7, 30 : 2 : 100), flow rate 1.5 mL/min. DAD (λ = 220 nm). Limit of detection, 15 nmol/L [Akerman 1997]. See also Gupta [1995], McCarthy *et al.* [1995], Schulz *et al.* [1995] and Weigmann, Hiemke [1992].

LC-MS Column: ACQUITY BEH C_{18} (50 × 2.1 mm, 1.7 µm). Mobile phase: methanol : 0.2% ammonium hydroxide (50 : 50 for 0.4 min to 20 : 80 at 0.5 min until 1.4 min to 0 : 100 at 1.5 min for 1.3 min to 50 : 50 at 2.9 min for 0.6 min), flow rate 0.40 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 10 µg/L [Ming, Heathcote 2009]. Column: monolithic C_{18} (50 × 4.6 mm). Mobile phase: methanol-5 mmol/L acetate buffer (pH 3.9). MRM acquisition mode [Kirchherr, Kühn-Velten 2006].

Urine **GC-MS** Limit of detection, 30 ng/mL [Melent'ev, Kurochkina 1999].

HPLC See Serum [Weigmann *et al.* 1997].

CE See Plasma. Limit of detection, 3.7–17 µg/L [Wei *et al.* 2010].

Hair **LC-MS** Column: RP-C8-select B (125 × 2 mm i.d., 5 µm). Mobile phase: 1 mmol/L ammonium formate with 0.1% formic acid (pH 3) : acetonitrile with

0.1% formic acid (90 : 10 to 70 : 30 at 6.6 min to 30 : 70 at 26.6 min to 10 : 90 at 33.3 min). MRM acquisition mode. Limit of quantification, 0.051 ng/mg, limit of detection, 0.017 ng/mg [Weinmann *et al.* 2002].

Disposition in the Body Clozapine undergoes a moderate first-pass metabolism and is almost completely metabolised before excretion via *N*-demethylation, *N*-oxidation, oxidation of the chlorine-containing ring and thiomethyl conjugation. Metabolism is catalysed by P450 isoenzyme CYP1A2. Only the desmethyl metabolite shows any pharmacological activity but it is considerably weaker and of shorter duration than that of the parent drug. Only trace amounts of unchanged drug are detected in the urine and faeces. Approximately 50% of the administered dose is excreted as metabolites in the urine and 30% in the faeces.

Therapeutic Concentration

After administration of an oral dose of 200 mg clozapine to 10 schizophrenic patients, average peak plasma concentrations of 0.249–0.386 mg/L were attained in 1.0–6.3 h (mean 3 h) [Cheng *et al.* 1988].

In 14 patients, the oral clearance and half-life of clozapine after administration of a single dose of 100 mg was 55.4 L/h and 13.7 h, respectively. The mean AUCs for clozapine and norcloazapine were 2389.9 and 751.1 μg.h/L, respectively [Lin *et al.* 1994].

In 12 patients where dose was titrated over 10–14 days to a target dose of 6 mg/kg daily, the mean clozapine plasma concentration achieved after 5 days at the target dose was 0.584 mg/L; a wide variation was apparent (±0.417 mg/L) [Bennett, Keck 1996].

After administration of clozapine at a dosage of up to 500 mg daily for 12 weeks to 45 schizophrenic patients, mean steady-state plasma concentrations of clozapine and norclozapine were reported to be 0.472 and 0.201 mg/L, respectively, in those who responded to treatment and 0.328 and 0.156 mg/L in those unresponsive to treatment. A cut-off value of 0.350–0.400 mg/L distinguished responders from non-responders, although the incidence of adverse effects was twice as high at concentrations above 0.350 mg/L compared with those below [Spina *et al.* 2000].

Twenty-six subjects treated with clozapine 200–700 mg daily for psychosis had concentrations of 0.030–1.016 mg/L in plasma (22 subjects), 0.17–34.24 μg/g in hair (23 subjects) and 0.049–5.609 μg/patch in sweat (20 subjects); a better dose–concentration relationship was observed between daily dose and hair or sweat concentrations than plasma concentration [Cirimele *et al.* 2000].

In children aged 9–16 years, serum levels of clozapine and its metabolites norclozapine and clozapine *N*-oxide were 289, 410 and 63 μg/L, respectively. In contrast to these findings, norclozapine levels in adults are usually 10 to 25% less than clozapine levels. Dose-normalised clozapine serum levels in children were found to be similar to those reported in adults [Frazier *et al.* 2003].

Plasma clozapine levels in Asian and Caucasian patients were found to be similar; however, the mean clozapine daily dose was 176 mg in the Asian patients but 433 mg in Caucasian patients. Therefore, Asian patients had more than twice the effective clozapine concentration–dose ratio [Ng *et al.* 2005]. See also Lee *et al.* [2009].

Patients with plasma clozapine levels >0.25 mg/L were found to be more likely to have moderate to severe side effects than patients with plasma levels <0.25 mg [Yusufi *et al.* 2007].

Toxicity

A 25-year-old man who died several hours after the ingestion of an estimated 2 g clozapine had the following postmortem tissue concentrations: blood 0.00581 mg/L, liver 42.9 μg/g, urine 0.0113 mg/L, gastric contents 6.5 mg (total); the antemortem blood concentration was 0.00194 mg/L at approximately 4 h after the ingestion [Meeker *et al.* 1992].

In 3 fatalities involving clozapine, tissue concentrations were reported as follows: 3.6, 2.6 and 13 μg/g in blood and 28, 19 and 85 μg/g in the liver. The concentrations of desmethylclozapine were: –, 1.1 and 3.1 μg/g in the blood and –, 18 and 50 μg/g in the liver [Worm *et al.* 1993].

The following body-fluid concentrations were reported in a 15-year-old girl who died following ingestion of an unknown quantity of 100 mg clozapine tablets in a suicide attempt:

	Clozapine (mg/L)	*N-Desmethylclozapine (mg/L)*
Antemortem peripheral blood	9.4	0.6
Postmortem peripheral blood	8.8	0.5
Heart blood	12.0	1.5
Cerebrospinal fluid	0.2	ND
Vitreous humour	1.3	ND
Stomach content	2410	172
Bile	1844	75

[Keller *et al.* 1997]

A 19-year-old woman who survived despite ingesting 5 g clozapine had a plasma concentration of 3.8 mg/L 2.5 h after the ingestion. The only symptoms were somnolence with intermittent periods of agitation and a mild anticholinergic syndrome [Broich *et al.* 1998].

For a further report of a fatal overdose with clozapine and orphenadrine, see Fucci *et al.* [2001].

A 10-year-old-girl who accidently ingested clozapine presented with dramatic changes in mental status and progressive alteration of consciousness. Urine analysis 24 h after ingestion found clozapine 500 μg/L. Full recovery occurred after ~55 h [Borzutzky *et al.* 2003].

For reports of a neonatal death and a case of delayed peristalsis in a neonate following clozapine self-poisoning in late pregnancy, see Klys *et al.* [2007] and Novikova *et al.* [2009], respectively.

For a report of clozapine poisoning in a child as a result of Munchausen syndrome by proxy, see Bartsch *et al.* [2003].

In a case of sudden unexpected death in a patient who had been taking clozapine 300 mg daily for ~6 weeks, no clozapine was found in the patient's stomach at postmortem 8 h after death. This was consistent with reports of non-compliance with medication on the previous day. However, clozapine levels in cardiac blood were found to be 4500 μg/L (>1300 μg/L is considered toxic). The high blood level was attributed to postmortem drug redistribution rather than overdose [Kerswill, Vicente 2003]. For comment, see de Leon, Simpson [2004].

For reports of toxic clozapine levels during acute urinary-tract infection and during inflammatory reactions, see Jecel *et al.* [2005] and Pfuhlmann *et al.* [2009], respectively.

In an analysis of clozapine poisoning in the UK/Eire between 1992 and 2003, there were 7 fatal and 5 non-fatal overdoses in patients who were poorly or non-adherent to clozapine or who had taken clozapine prescribed for someone else. Postmortem blood concentrations were 8.2 mg/L (clozapine) and 1.9 mg/L (norclozapine), and the clozapine : norclozapine ratio was 4.4. Postmortem plasma levels were 3.9 mg/L (clozapine) and 0.4 mg/L (norclozapine), and clozapine : norclozapine ratio was 7.6. In 54 other patients who died while taking clozapine, postmortem blood levels were 1.9 mg/L (clozapine) and 1.4 mg/L (norclozapine), and the clozapine : norclozapine ratio was 1.5. Median postmortem increase in clozapine and norclozapine levels compared with the most recent values before death were 489% and 371%, respectively. It was concluded that clozapine poisoning cannot be diagnosed from postmortem blood levels alone, but that a comparison with antemortem levels provides further diagnostic information [Flanagan *et al.* 2005].

For other analyses of clozapine self-poisoning and poisoning, see Reith *et al.* [1998] and Sliundin *et al.* [2007], respectively.

Bioavailability ≈50–60%.

Half-life 6 to 17 h.

Volume of Distribution 2–7 L/kg. Also reported as 1.6 L/kg.

Clearance 6.1 mL/min/kg.

Protein Binding ≈95%.

Note For a review of the pharmacokinetics and pharmacodynamics of clozapine, see Jann *et al.* [1993] and Mauri *et al.* [2007]. For discussions on therapeutic drug monitoring in clozapine therapy, see Freeman, Oyewumi [1997], Olesen [1998] and Ulrich *et al.* [2003],

Dose In schizophrenia, initially 12.5 mg once or twice daily, increased gradually to 300–450 mg daily; maximum daily dose 900 mg; usual maintenance dose 250–450 mg daily.

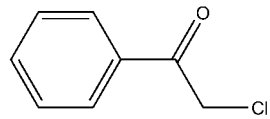
CN Gas

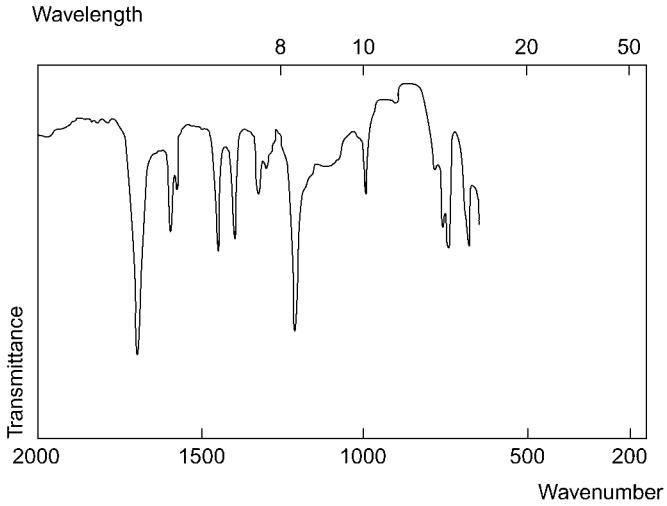
Phenylketone, Riot Control Agent
$C_8H_7ClO = 154.6$
CAS—532-27-4

IUPAC Name 2-Chloro-1-phenylethanone
Synonyms α-Chloroacetophenone; ω-chloroacetophenone; 1-chloroacetophenone; 2-chloroacetophenone; phenacyl chloride; phenylchloromethylketone; tear gas.
Proprietary Names *Chemical Mace*; *CN*; *Mace*; *Mace CN* (defense spray formulations); *CN Smoke Mix 206 Long Range Projectile*; *CN Smoke Mix 219/70 Yard Projectile*; *Pyrotechnic CN Agent* (pyrotechnic formulations).



Chemical Properties Colourless-to-grey crystalline solid with a floral odour. Mp 58° to 59°; also reported as 54° and 56.5°. Bp 244° to 245°; also reported as 247°. Practically insoluble in water; freely soluble in alcohol, ether, benzene [O'Neil *et al.* 2006]. Log *P* (octanol/water), 1.93 [Meylan, Howard 1995]. Stable in storage for 2 weeks in the dark at 25°; a 4% decrease is observed after storage at 60° [National Toxicology Program 1990]. Hydrolysis of CN is very slow in water or when alkali is added; therefore, CN is difficult to decompose under practical conditions [Blain 2003]. CN is an SN_2 alkylating agent that reacts directly with nucleophilic sites [Ballantyne, Swanston 1978].
Thin-layer Chromatography Plates: precoated silica gel (0.25 mm). Solvent systems: (1) toluene or (2) hexane : dioxane (88 : 12). Locating reagent 2,4-dinitrophenylhydrazine in hydrochloric acid-ethanol and UV detection ($\lambda = 254$ nm). R_f value: not reported. Limit of quantification not reported [National Toxicology Program 1990].

Infrared Spectrum



Mass Spectrum Principal ions at *m/z* 105, 77, 51.

Disposition in the Body Little is known on the uptake and distribution of CN following exposure. It is postulated that CN is converted to an electrophilic metabolite that reacts with sulfhydryl-containing enzymes, such as lactic dehydrogenase and nucleophilic sites of macromolecules.

Toxicity CN is the most toxic lachrymator (when compared with others in its class) used in tear gas formulations, causing burning in the eyes, nose and throat as well as a stinging or burning sensation on exposed skin. These symptoms occur almost instantaneously on exposure and generally resolve within ≈20 min. However, severe and permanent cornea injury has been demonstrated in laboratory animals. Odour threshold by humans is 0.035 ppm, the nose irritation threshold is 0.034 ppm, and the eye irritation threshold is 0.022 ppm [Amoore, Hautala 1983]. Human ocular irritancy thresholds and toxicity estimates are reported as follows: irritancy threshold 1 mg/m^3, intolerable concentration 5 mg/m^3, lethal concentration (10 min exposure) 850 mg/m^3 [Olajos, Salem 2001]. The inhalation toxicity of chemical warfare agents, military chemicals and riot control agents is, by convention, expressed by the notation Ct. It is defined as the product of the concentration in mg/m^3 multiplied by the exposure time (t) in minutes (mg·min/m^3). The terms LCt_{50} and ICt_{50} describe the airborne dosages that are lethal (L) or incapacitating (I) to 50% of the exposed population. The minimal irritant concentration estimate in humans is 0.3 to 1 mg·min/m^3 with LCt_{50} and ICt_{50} estimates reported as from 8500 to 25 000 mg·min/m^3 (also as 7000 mg·min/m^3) and 20 to 50 mg·min/m^3, respectively. Animal LCt_{50} (mg·min/m^3) values: rat 8750 (also reported as 3700), mouse 18 200 (also reported as 73 500), rabbit 11 480, guinea pig 13 140 (also reported as 3500). Animal LD_{50} (mg/kg) values: rat 127 (oral), 36 (IP), 41 (IV); mouse 81 (IV); rabbit 118 (oral), 31 (IV); guinea pig 158 (oral), 17 (IP). [Ballantyne, Swanston 1978; National Toxicology Program 1990; Olajos, Salem 2001; Punte *et al.* 1962]. Volunteers exposed to airborne concentrations of CN responded to its short-term irritant properties after 1 min of exposure at 210 mg/m^3; 2 min of exposure at 120 mg/m^3, or 3 min of exposure at 90 mg/m^3. The maximum safe inhaled dose of CN for humans is estimated at 500 mg·min/m^3 [Punte *et al.* 1962]. CN has accounted for at least 5 deaths resulting from pulmonary injury and/or asphyxia [Chapman, White 1978; Stein, Kirwan 1964]. OSHA air monitoring/exposure levels for CN are 0.05 ppm for the permissible exposure limit (PEL) and 15 mg/m^3 for the immediately dangerous to life and health (IDLH) limit. Owing to its poor water solubility, CN formulations usually contain solvents as carriers as well as some kind of propellant gas. It is worth noting that some solvents may contribute to unwanted effects of CN use, such as corneal erosion, skin blistering, or even neurotoxicity [Olajos, Stopford 2004].

Note For a review and assessment of the toxicology and carcinogenesis of CN in rats and mice, see National Toxicology Program [1990]. For reviews of riot control agents, see Blain [2003]; Hu *et al.* [1989]; Olajos and Salem [2001]; Olajos and Stopford [2004].

Dose Used as riot control agent, having replaced adamsite (DM).

Cocaine

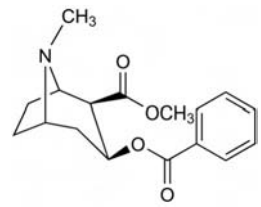
Anaesthetic (Local)

$C_{17}H_{21}NO_4$ = 303.4

CAS—50-36-2

IUPAC Name Methyl-(1*S*,3*S*,4*R*,5*R*)-3-benzoyloxy-8-methyl-8-azabicyclo-[3.2.1]octane-4-carboxylate

Synonyms Cocaina; ethyl-[1*R*-(exo,exo)]-3-(benzoyloxy)-8-methyl-8-azabicyclo[3.2.1]octane-2-carboxylate; methyl benzoylecgonine. For names used to describe various forms of cocaine, see Sweetman [2007].



Chemical Properties An alkaloid obtained from coca, the dried leaves of *Erythroxylum coca* and other species of *Erythroxylum* (Erythroxylaceae) or by synthesis from ecgonine. A white crystalline, slightly volatile, powder. Mp 98°. Soluble 1 in 600 of water (1 in 270 of water at 80°), 1 in 6.5 of ethanol, 1 in 0.7 of chloroform and 1 in 3.5 of ether; also soluble in acetone, ethyl acetate and carbon disulfide. pK_a 8.7 [Needham *et al.* 2000], 8.6 (20°). Log P (octanol/water), 2.3. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005]. Hydrolysed when stored at −16° [Javaid *et al.* 1978]. Brain tissue samples show degradation of 48% when stored at 4° for 1 month and 90% when stored for 2 months. Traces of cocaine were still detectable after 144 days storage at 4° [Hernandez *et al.* 1994].

Cocaine Hydrochloride

$C_{17}H_{21}NO_4$, HCl = 339.8

CAS—53-21-4

Synonyms Cocainium chloratum; cocaini hydrochloridum.

Chemical Properties Hygroscopic colourless crystals or white crystalline powder. Mp ~195°, with decomposition. Soluble 1 in 0.4 of water, 1 in 3.2 of cold alcohol, 1 in 2 of hot alcohol and 1 in 12.5 of chloroform; also soluble in glycerol and acetone; practically insoluble in ether.

Colour Tests Cobalt thiocyanate—blue; *p*-dimethylaminobenzaldehyde (100° for 3 min)—red.

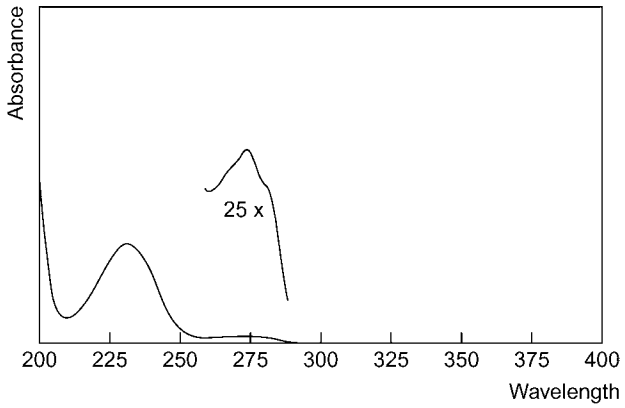
Thin-layer Chromatography System TA—R_f 0.65; system TB—R_f 0.45; system TC—R_f 0.47; system TE—R_f 0.77; system TL—R_f 0.54; system TAE—R_f 0.35; system TAF—R_f 0.30; system TAJ—R_f 0.13; system TAK—R_f 0.00; system TAL—R_f 0.02 (acidified iodoplatinate solution—positive; Dragendorff spray—positive).

Plate: silica 60 F_{254} (10 × 10 cm). Mobile phase: hexane : toluene : diethylamine (65 : 20 : 5). UV detection. R_f 0.36 [Antonilli *et al.* 2001].

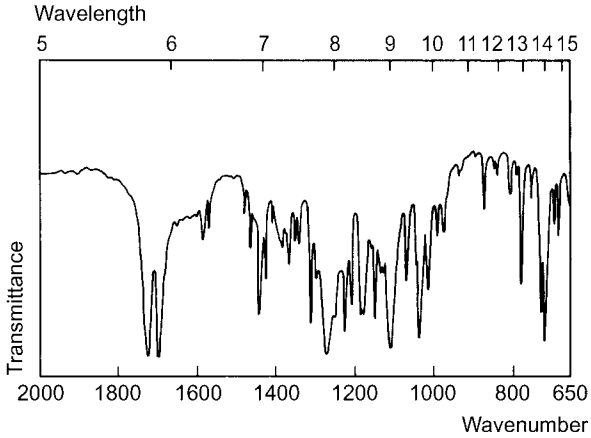
Gas Chromatography System GA—cocaine RI 2187, M (benzoylecgonine) RI 2570, M (ecgonine) not eluted, M (anhydroecgonine methylester) RI 1280, M (methylecgonine) RI 1472, M (nor-) RI 2162, M (*m*-OH-) RI 2460, M (OH-methoxy-) RI 2670, M (cocaethylene) RI 2250, M (nor-cocaethylene) RI 2115; system GB—cocaine RI 2289, M (ecgonine) not eluted, M (anhydroecgonine methylester) RI 1430, M (norecgonine) RI 1472, M (methylecgonine) RI 1530, M (ethylecgonine) RI 1602, M (nor-) RI 2259, M (benzoylecgonine) RI 2663, M (*m*-OH-) RI 2608, M (*p*-OH-) RI 2650, M (OH-methoxy-) RI 2729, M (cocaethylene) RI 2345, M (norcocaethylene) RI 2317, M (OH-cocaethylene) RI 2709, M (OH-methoxycocaethylene) RI 2779, M (methoxycocaethylene) RI 2663; system GF—RI 2550; system GQ—RT 7.85 min; system GAK—RT 12.7 min.

High Performance Liquid Chromatography System HA—cocaine k 2.8, M (benzoylecgonine) k 0.9 (tailing peak), M (ecgonine) k 1.1; system HQ—cocaine k 2.68, M (benzoylecgonine) k 5.68; system HX—RI 348; system HY—RI 289; system HZ—RT 3.3 min; system HAA—RT 11.9 min; system HAX—RT 10.0 min; system HAY—RT 5.0 min; system HBC—RT 5.2 min.

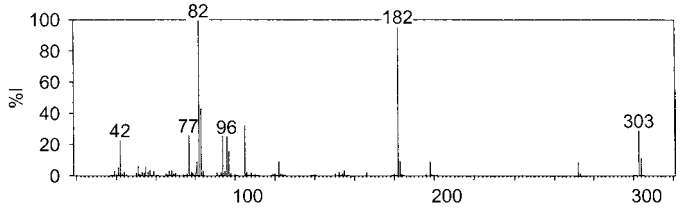
Ultraviolet Spectrum Aqueous acid—233 (A^1_1 = 430a), 275 nm.



Infrared Spectrum Principal peaks at wavenumbers 1710, 1738, 1275, 1110, 712, 1037 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 82, 182, 83, 105, 303, 77, 94, 96 (cocaine); 124, 82, 168, 77, 105, 42, 94, 83 (benzoylecgonine).



Quantification

Blood **GC** Column: 5% OV-225 on Gas-Chrom Q 100/120 mesh (3.0 m [10′]). Temperature: 110°. ECD. Limit of detection not reported [Javaid *et al.* 1978]. AFID. Limit of detection, 0.02 mg/L [Dvorchik *et al.* 1977]

GC-MS SIM acquisition mode [Fleming *et al.* 2010]. SIM acquisition mode. Limit of detection, 25 µg/L [Cardona *et al.* 2006]. Limit of detection, 0.5–4.0 µg/L [Paul *et al.* 2005]. FID. Limit of detection, 71 µg/L [Fernandez *et al.* 2004]. Column: DB-35 ms (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 1.5 mL/min. Temperature programme: 120° for 1 min to 320° at 15°/min for 4 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 10 µg/L, limit of detection, 2 µg/L [Gunnar *et al.* 2004]. See also Abusada *et al.* [1993]; Aderjan *et al.* [1993]; Chasin, Midio [2000]; Corburt, Koves [1994]; and Smirnow, Logan [1996].

HPLC Column: Varian Pursuit C_{18} (100 × 3 mm i.d., 3 µm). Mobile phase: methanol : ammonium formate. Limit of quantification, 0.0005–0.01 mg/kg [Bjork *et al.* 2010]. Column: Zorbax C_{18}. Mobile phase: formic acid : water : acetonitrile. MRM acquisition mode. Limit of quantification, 0.008 mg/kg [Johansen, Bhatia 2007]. Column: Spherisorb 5 RP 8S (100 × 2.1 mm i.d., 5 µm). Mobile phase: water : acetonitrile containing 0.1% formic acid and 2 mmol/L ammonium formate (50 : 50), flow rate 400 µL/min. ESI, MRM acquisition mode. Limit of quantification, 5 µg/L [Cailleux *et al.* 1999].

LC-MS Column: Gemini C6-Phenyl (50 × 3.0 mm i.d., 5 µm). Mobile phase: 0.1% formic acid in water : 0.1% formic acid in acetonitrile (100 : 0 for 3.01 min to 98 : 2 at 3.05 min to 10 : 90 at 7.35 min until 8 min to 100 : 0 at 9.15 min until 10 min), flow rate 0.9 mL/min to 1.0 mL/min at 3.05 min until 10 min. TIS, positive ion mode, MRM acquisition mode. Limit of quantification, 8 µg/L, limit of detection, 3 µg/L [Jagerdeo *et al.* 2008].

Plasma **GC** Column: HP Ultra-2 (12 m × 0.2 mm i.d., 0.33 µm). Temperature programme: 200° for 2 min to 280° at 30°/min until 11 min. NPD. Limit of quantification, 4 µg/L [Virag *et al.* 1994]. See Blood [Dvorchik *et al.* 1977; Javaid *et al.* 1978].

GC-MS Column: 5% phenylmethylsiloxane (12 m × 200 µm i.d., 0.33 µm). Temperature programme: 90° for 2 min to 215° at 30°/min for 5 min to 260° at 30°/min. SIM acquisition mode. Limit of quantification, 25 µg/L, limit of detection, 19 µg/L [Alvarez *et al.* 2007]. See Blood [Gunnar *et al.* 2004]. Column: DB-1 (15 m × 0.53 mm i.d., 1.5 µm). Carrier gas: He, 15 mL/min. Temperature programme: 140° to 300° at 16°/min for 10 min. EI ionisation, positive ion mode, SIM acquisition mode (*m/z* 82). Limit of quantification, 100 µg/L. Limit of detection, 80 µg/L [Ohshima, Takayasu 1999]. Column: HP-1 (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 70° for 1 min to 220° at 35°/min for 0.25 min to 250° at 10°/min for 3 min. SIM acquisition mode. Limit of detection, 1 µg/L [Wang *et al.* 1994]. Column: HP-1 (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 0.8 mL/min. Temperature programme: 70° to 220° at 35°/min for 15 s to 250° at 10°/min for 15 s to 260° at 3.5°/min for 15 s. Limit of detection, 1 µg/L [Cone *et al.* 1994]. See also Abusada *et al.* [1993].

HPLC DAD. Limit of detection, 0.05 mg/L [Fernandez *et al.* 2007]. See Blood [Cailleux *et al.* 1999]. Column: Lichrospher RP18 (125 × 4 mm i.d.). Mobile phase: methanol (pH 7) : phosphate buffer (70 : 30), flow rate 0.4 mL/min to 0.7 mL/min at 6 min to 1.0 mL/min at 8.0 min to 0.7 mL/min at 10 min to 0.7 mL/min at 11.0 min to 0.6 mL/min at 12 min to 0.4 mL/min. UV detection (λ = 235 nm). Retention time: 8.8 min. Limit of detection, 12.5 µg/L [Fernandez *et al.* 1996]. See also Evans, Morarity [1980] and Tagliaro *et al.* [1994].

LC-MS TIS, positive ion mode [Sergi *et al.* 2009]. Column: Zorbax Eclipse XDB-C_8 (150 × 2.1 mm i.d., 5 µm). Mobile phase: 20 mmol/L ammonium acetate buffer : acetonitrile-methanol (1 : 1, 99 : 1 for 3 min to 20 : 80 at 4 min for 11 min), flow rate 0.3 mL/min. TIS, MRM acquisition mode. Limit of quantification, 14.4 µg/L, limit of detection, 4.1 µg/L [Klingmann *et al.* 2001]. Column: fused silica (500 × 0.1 mm i.d.) followed by C_{18} (30 × 4.6 mm i.d., 3 µm). Mobile phase: 25 mmol/L ammonium acetate in methanol water (50 : 50), flow rate 1.0 mL/min. APCI, MRM acquisition mode. Limit of detection, 2 µg/L [Sosnoff *et al.* 1996].

Serum **GC-MS** Limit of quantification, 25 µg/L [Maresova *et al.* 2008]. See Blood [Gunnar *et al.* 2004]. See Weinmann *et al.* [2000].

Urine **GC** Limit of quantification, 5 µg/L, limit of detection, 20 µg/L [Farina *et al.* 2002]. See Blood [Javaid *et al.* 1978].

GC-MS Column: Oasis hydrophilic-lipophilic balance (20 × 3.9 mm i.d.) [Brunetto *et al.* 2010]. See Blood [Fleming *et al.* 2010]. Column: HP-5 (30 m × 250 µm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 90° for 1 min to 190° for 1 min at 30°/min to 260° at 4°/min for 4 min to 290° for 10 min. EI ionisation at 70 eV, SIM acquisition mode. Retention time: 13.8 min. Limit of quantification, 20 ng/g, limit of detection, 5 ng/g [Lopez *et al.* 2009]. Column: HP-5MS (30 m × 0.25 mm i.d., 0.25 µm). Temperature programme: 100° for 3 min to 300° at 20°/min for 3 min. Limit of quantification, 100 µg/L, limit of detection, 50 µg/L [Saito *et al.* 2007]. See Blood [Fernandez *et al.* 2004; Paul *et al.* 2005; Wang *et al.* 1994]. See also Aderjan *et al.* [1993], Cardenas *et al.* [1996], Cone *et al.* [1994], De Giovanni, Strano Rossi [1994], de la Torre *et al.* [1995], Elsohly *et al.* [1998], Gaillard, Pepin [1997], Garside *et al.* [1997], Gerlits [1993], Hall *et al.* [1999], Karacic, Skender [2000], Lombardero *et al.* [1993], Ohshima, Takayasu [1999], and Yonamine, Saviano[2006].

HPLC Limit of detection, 0.5 µg/L [Jeanville *et al.* 2001]. Column: LiChroCART-LiCrospher 100 RP-18 (250 × 4 mm i.d., 5 µm). Mobile phase: 0.045 mol/L ammonium acetate solution in water-methanol-acetonitrile (80 : 10 : 10) : 0.045 mol/L ammonium acetate solution in water-methanol-acetonitrile (20 : 40 : 40, 100 : 0 to 47.2 : 52.8 in 20 min), flow rate 1 mL/min. UV detection, (λ = 235 nm). Retention time: 14.8 min. Limit of quantification, 200 µg/L [Antonilli *et al.* 2001]. See Blood [Cailleux *et al.* 1999]. See also Clauwaert *et al.* [1996], Nakashima *et al.* [1992], Nishikawa *et al.* [1994], and Roy *et al.* [1992].

LC-MS Limit of quantification, 25 µg/L [Shakleya *et al.* 2010]. Column: XDB-C_8 (50 × 2.1 mm i.d., 1.8 µm). Mobile phase: 20 mmol/L ammonium formate (pH 2.7) : methanol-acetonitrile (50 : 50). Flow rate 270 µL/min. Limit of detection, 1.0 µg/L [Langman *et al.* 2009]. Column: Restek (30 × 2.1 mm i.d., 5 µm). Mobile phase: acetonitrile : 5 mmol/L ammonium formate (pH 3.0). ESI, CID, MRM acquisition mode. Limit of quantification, 5.3 µg/L, limit of detection, 1.6 pg [Needham *et al.* 2000]. See Plasma. Limit of detection, 5 µg/L [Fernandez *et al.* 1996].

Amniotic Fluid **HPLC** See Moore *et al.* [1992].

Breast Milk **GC-MS** Column: HP-5MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 90° for 1 min to 220° at 30°/min for 0.5 mL/min to 330° at 20°/min. SIM acquisition mode. Limit of quantification, 10 µg/L, limit of detection, 2.5 ng/mL [Winecker *et al.* 2001].

Sweat **GC-MS** Column: HP-1 (12 m × 0.2 mm i.d., 0.33 µm). Limit of quantification, 2.5 ng/patch, limit of detection, 1.25 ng/patch [Huestis *et al.* 1999].

Meconium **GC-MS** See Urine [Lopez *et al.* 2009]. Column: DB-1 (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 6 psi. Temperature programme: 50° for 1 min to 280° at 33°/min. Limit of detection, 11 µg/L [Lombardero *et al.* 1993]. See Blood [Abusada *et al.* 1993]. Limit of quantification, <0.25 µg/g [Clark *et al.* 1992].

HPLC Column: C_{18} (100 × 4.6 mm i.d., 3 µm). Mobile phase: 0.01 mol/L sodium dihydrogen phosphate buffer (pH 2.0)-58 µmol/L tetrabutylammonium hydroxide : acetonitrile (87 : 13), flow rate 1.0 mL/min. Limit of quantification, 50 ng/g [Murphey *et al.* 1993].

Brain **GC-MS** Column: DB 5 MS (15 m × 0.25 mm i.d., 0.25 μm). Temperature programme: 115° for 1.3 min to 290° at 15°/min for 2 min. EI ionisation, full scan mode. Limit of quantification, 50 ng/g, limit of detection, 25 ng/g [Hernandez *et al.* 1994].

HPLC See Browne *et al.* [1991].

Hair **GC-MS** See Gambelunghe *et al.* [2005]. Column: DB-5MS (15 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.0 mL/min. Temperature programme: 130° to 270° at 25°/min to 280° at 6°/min to 300° at 35°/min. PICI. Limit of quantification, 0.05 ng/mg, limit of detection, 0.01 ng/mg [Bourland *et al.* 2000]. Column: RTX 5 5% diphenylpolysiloxane: 95% dimethylpolysiloxane (30 m × 0.25 mm i.d.). Carrier gas: He, 1.0 mL/min. Temperature programme: 50° for 1 min to 300° at 50°/min for 6 min. SIM acquisition mode. Limit of detection, 0.2 ng/mg [Skender *et al.* 2002]. See Brewer *et al.* [2001], Girod, Staub [2000], Hold *et al.* [1998a], Hold *et al.* [1998b], Kintz, Mangin [1995], Pichini *et al.* [1999]. See Plasma [Moeller *et al.* 1993; Wang *et al.* 1994].

HPLC Column: Hypersil BDS-C_{18} (150 × 2.1 mm i.d., 3 μm). Mobile phase: 45 mmol/L ammonium acetate-methanol : acetonitrile (84 : 8 : 8) : methanol-acetonitrile-water (42 : 42 : 16, 100 : 0 for 7 min to 65 : 35 in 27 min for 3 min), flow rate 0.2 mL/min. Fluorescence detection (λ_{ex}= 242 nm, λ_{em}= 315 nm). Limit of detection, 0.2 ng/mg [Clauwaert *et al.* 2000]. Column: Hypersil BDS-C_{18} (125 × 2.1 mm i.d., 3 μm). Mobile phase: ammonium acetate buffer : methanol : acetonitrile. Fluorescence detection (λ_{ex}= 242 nm, λ_{em}= 315 nm) [Clauwaert *et al.* 1998]. Column: Polystyrene divinylbenzene (5 μm). Mobile phase: 0.1 mol/L potassium phosphate (pH 3.0) : methanol : tetrahydrofuran (70 : 25 : 5), flow rate 0.5 mL/min. Fluorescence detection (λ_{ex}= 230 nm, λ_{em}= 315 nm). Limit of detection, 1.5 μg/L [Tagliaro *et al.* 1993].

LC-MS Column: Zorbax SB-Phenyl (100 × 2.1 mm i.d., 3.5 μm). 25 mmol/L formic acid : 100% acetonitrile (98 : 2 to 80 : 20 for 3 min to 10 : 90 in 4 min for 2 min), flow rate 0.25 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 0.0125 ng/mg [Hegstad *et al.* 2008].

Disposition in the Body Cocaine is normally only used as a surface anaesthetic in the eye, ear, nose and throat because of the possibility of systemic toxic effects when given by other routes. Addicts may inject it or use it as a snuff; it is, however, increasingly misused in its smokeable form ('crack cocaine') owing to the rapid absorption of the substance from the lungs. It is less toxic when taken orally owing to hydrolysis in the gastrointestinal tract. The main metabolites are benzoylecgonine, ecgonine and ecgonine methyl ester, all of which are inactive; some norcocaine, an active metabolite, may also be produced; other metabolites which have been reported are ethylecgonine, hydroxycocaine and methylecgonidine. Approximately 1–9% of a daily IV dose of 120 mg cocaine is excreted unchanged in the urine, together with 35–55% as benzoylecgonine. The excretion of unchanged drug is increased when the urine is acid; some ecgonine may also be present. After an intranasal dose of 1.5 mg/kg, up to 4% of the dose is excreted in the urine unchanged in 24 h, and 16–36% of the dose is excreted as benzoylecgonine. Approximately 30–60% of an oral, intranasal or intravenous dose is excreted in the urine as ecgonine methyl ester. No unchanged drug is eliminated in the faeces. Cocaine crosses the placenta and is found in breast milk.

Therapeutic Concentration

Six males with a history of cocaine abuse were administered with a single cocaine dose by the following routes: 25 mg cocaine hydrochloride IV, 32 mg cocaine hydrochloride intranasal and 42 mg cocaine base (smoked). Peak plasma concentrations of benzoylecgonine (BZE), ecgonine methyl ester (EME), norcocaine (NCOC), benzoylnorecgonine (BNE), *meta*- and *para*-hydroxycocaine (*m*-HOCOC, *p*-HOCOC), *meta*- and *para*-hydroxybenzoylecgonine (*m*-HOBZE, *p*-HOBZE) and anhydroecgonine methyl ester (AEME) were determined by GC–MS and were as follows:

	IV (n = 6)		*Intranasal (n = 6)*		*Smoked (n = 5)*	
	Peak conc. (ng/mL)	*Time (h)*	*Peak conc. (ng/mL)*	*Time (h)*	*Peak conc. (ng/mL)*	*Time (h)*
Cocaine	775	3.9	412	5.1	707	2.6
BZE	15611	5.6	13681	7.8	9395	4.1
EME	4968	5	5831	5	3193	4.1
NCOC	19	5.1	11	4.3	4	3.3
BNE	255	0.6	409	8.5	160	5.1
m-HOCOC	43	0.08	47	5.3	48	3.7
p-HOCOC	6	0.01	7	4.6	1	4.8
m-HOBZE	131	0.45	208	10.2	131	6.9
p-HOBZE	247	0.43	353	7.5	258	4.1
AEME	0	n/a	0	n/a	23	2.3

Total percentage dose excreted in urine for the IV, intranasal and smoked routes were 57.1, 45.4 and 24.9,%, respectively [Cone *et al.* 1998].

Ten volunteers were administered with single and multiple doses of cocaine; IV and by inhalation. On 4 separate study days, the volunteers smoked 2 doses of 25 mg cocaine with a 14–min interval (day 1), smoked 2 doses of 50 mg cocaine (day 2), were administered 2 doses of IV 16 mg cocaine with a 14–min period between (day 3), and were again given 2 doses of IV 32 mg cocaine (day 4). Peak plasma concentrations of cocaine and benzoylecgonine were determined and were as follows:

		Cocaine	*Benzoylecgonine*
IV			
2 × 16 mg	peak (mg/L)	0.23	0.24
	time (min)	18	90
2 × 32 mg	peak (mg/L)	0.47	0.4
	time (min)	18	90
Smoked			
2 × 25 mg	peak (mg/L)	0.21	0.2
	time (min)	18	60
2 × 50 mg	peak (mg/L)	0.38	0.35
	time (min)	18	90

After multiple dosing in 3 volunteers (316–mg dose administered over 90 min), the peak plasma cocaine concentration was 1.2 mg/L [Isenschmid *et al.* 1992].

Toxicity The estimated minimum lethal dose is 1.2 g but susceptible persons have died from doses as small as 30 mg when applied to mucous membranes; addicts may be able to tolerate up to 5 g a day. Toxic effects have been noted with blood concentrations in the range 0.25–5 mg/L and fatalities have occurred with concentrations of 1 mg/L or more.

Postmortem concentrations of cocaine and benzoylecgonine in a 27-year-old man who died following the rupture in his gastrointestinal tract, of 4 cocaine-containing packages were reported as: blood 4.0 and 17.0 mg/L, urine 152.0 and 512 mg/L, bile 99.8 and 54.0 mg/L, vitreous humour 7.1 and 5.8 mg/L, brain 7.5 and 3.5 mg/g, and hair 55.5 and 27.7 μg/g [Furnari *et al.* 2002].

A 17-year-old male drug dealer died ~90 min after swallowing a package containing cocaine; the following postmortem tissue concentrations were reported for cocaine, benzoylecgonine and ecgonine methyl ester, respectively: blood 98.1, 86.1 and 51.4 mg/L, liver 128.1, 134.3 and 20.3 μg/g, kidney 92.5, 8.6 and 6.2 μg/g, brain 99.1, 32.1 and 17.6 μg/g, spleen 72.6, 4.7 and 6.9 μg/g, lung 121.3, 89.4 and 36.4 μg/g, and urine 10, 3.3 and 4.2 mg/L [Fineschi *et al.* 2002].

A teenage drug courier who died after a 12–h flight was found to have 24 packages of cocaine in her intestinal tract, several of which had burst or become damaged. Her postmortem blood concentration of cocaine was 104 mg/L [Patel 1996].

A blood cocaine concentration of 330 mg/L was found in a 26-year-old female who died as a result of cocaine intoxication; the concentrations of benzoylecgonine and ecgonine methyl ester were 50 and 18 mg/L, respectively. Such high concentrations suggested a massive administration but the manner of death was undetermined [Peretti *et al.* 1990].

Half-life Plasma half-life, 0.7–1.5 h (dose dependent).

Volume of Distribution ~1–3 L/kg.

Clearance Plasma clearance, 10–32 mL/min/kg (dose dependent).

Dose Cocaine hydrochloride is used in concentrations of 1 to 25%, for local anaesthesia.

Codeine

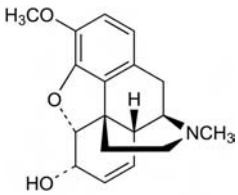
Narcotic Analgesic

$C_{18}H_{21}NO_3,H_2O = 317.4$

CAS—76-57-3 (anhydrous); 6059-47-8 (monohydrate)

IUPAC Name (5α,6α)-7,8-Didehydro-4,5-epoxy-3-methoxy-17-methylmorphinan-6-ol monohydrate

Synonyms Codeinum; methylmorphine; metilmorfina; morphine methyl ether.
Proprietary Names *Codicaps*; *Eulyptan*; *Pneumogenol*.



Chemical Properties An alkaloid obtained from opium or prepared by methylation of morphine. Colourless crystals or white crystalline powder that effloresces slowly in dry air and is affected by light. Mp 154° to 156°. Soluble 1 in 120 of water, 1 in 15 of boiling water, 1 in 2 of ethanol, 1 in 0.5 of chloroform, 1 in 13 of benzene and 1 in 18 of ether; freely soluble in amyl alcohol, methanol and dilute acids; almost insoluble in petroleum ether or in solutions of alkali hydroxides. pK_a 8.2 (20°). Log *P* (octanol/water pH 7.4), 0.6. Extraction yield (chlorobutane), 0.8 [Demme *et al.* 2005].

Codeine Hydrochloride

$C_{18}H_{21}NO_3$, HCl,$2H_2O$ = 371.9
CAS—1422-07-7 (anhydrous)
Chemical Properties A white crystalline powder. Mp ~280°, with some decomposition. Soluble 1 in 20 of water, 1 in 180 of ethanol and 1 in 800 of chloroform.

Codeine Phosphate

$C_{18}H_{21}NO_3$,H_3PO_4,$^1/_2H_2O$ = 406.4
CAS—52-28-8 (anhydrous); 41444-62-6 (hemihydrate); 5913-76-8 (sesquihydrate)
Synonyms Codeine phosphate hemihydrate; codeini phosphas; methylmorphine phosphate.
Proprietary Names *Actacode*; *Bromophar*; *Bronchodine*; *Bronchosedal*; *Codant*; *Codedrill*; *Codenfan*; *Codicompren*; *Evacode*; *Galcodine*; *Glottyl*; *Paderyl*; *Toularynx*; *Tricodein*; *Tryasol*; *Tussoret*. Codeine phosphate is an ingredient of many proprietary preparations [Sweetman 2007].
Chemical Properties Small colourless crystals or white crystalline powder. Soluble 1 in 4 of water, 1 in 450 of ethanol and 1 in 125 of boiling ethanol; practically insoluble in chloroform and ether.

Codeine Sulfate

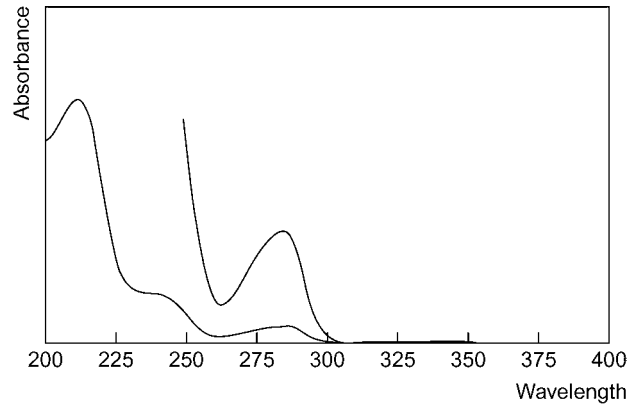
$(C_{18}H_{21}NO_3)_2$,H_2SO_4,$3H_2O$ = 750.9
CAS—1420-53-7 (anhydrous); 6854-40-6 (trihydrate)
Synonym Codeine sulphate
Chemical Properties White crystals or crystalline powder. Soluble 1 in 30 of water and 1 in 1300 of ethanol; practically insoluble in chloroform and ether.

Colour Test Liebermann's reagent—black; Mandelin's test—green; Marquis test—violet.
Thin-layer Chromatography System TA—R_f 0.33; system TB—R_f 0.06; system TC—R_f 0.18; system TE—R_f 0.35; system TL—R_f 0.03; system TAE—R_f 0.21; system TAF—R_f 0.22; system TAJ—R_f 0.10; system TAK—R_f 0.00; system TAL—R_f 0.26 (acidified iodoplatinate solution—positive; Dragendorff Spray—positive; Marquis test—violet).
Gas Chromatography System GA—RI 2375, codeine-AC RI 2503, codeine-PFP RI 2430, codeine-trifluroacetic acid RI 2280, codeine-TMS RI 2520, M (nor-)RI 2388, M (nor-)-AC_2RI 2945, M (morphine) RI 2445; system GB—RI 1511, codeine-AC RI 2645, codeine-TMS RI 2592, M (nor-) RI 2535, M (nor-)-TMS_2 RI 2631; system GC—RI 2681, M (morphine) RI 2542; system GF—RI 2860; system GM—RRT 1.519, codeine-ACRI 1.449 (both relative to iprindole).
Gas Chromatography-Mass Spectrometry Column: HP-5 capillary 95% dimethylsiloxane, 5% diphenylsiloxane (25 m × 0.25 mm i.d., 0.25 µm). Temperature programme: 120° for 2 min to 280° at 20°/min for 10 min. Carrier gas: 1 mL/min. SIM acquisition mode (*m/z* 282, 395). Retention time: 13.18 min [Pragst *et al.* 1999].
High Performance Liquid Chromatography system HA—*k* 4.8 (tailing peak), M (morphine) RI 3.8 (tailing peak), M (nor-) RI 3.1 (tailing peak); system HC—*k* 1.21, M (morphine) RI 1.30, M (nor-) 3.51; System HS—*k* 1.90, M (morphine) RI 5.16;system HX—RI 266; system HY—RI 237; system HZ—RT 1.9 min; system HAA—RT 5.0 min; system HAM—not detected; system HAX—RT 6.1 min; system HAY—RT 3.4 min.

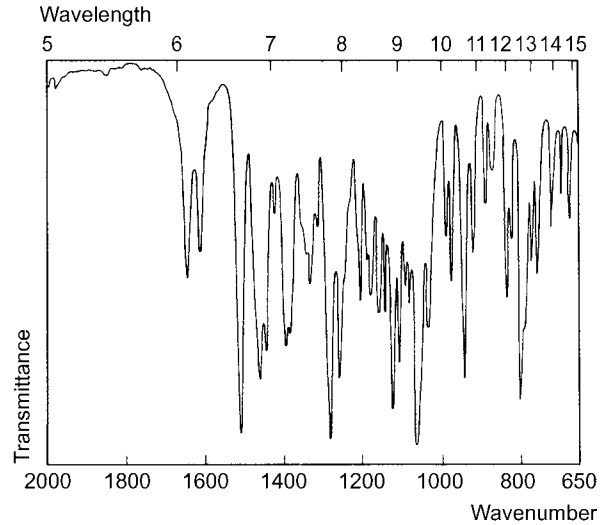
Column: Basic C_8 (150 × 4.6 mm i.d., 3 µm). Mobile phase: acetonitrile : 5 mmol/L ammonium phosphate dibasic (pH 5.8, 8 : 92), flow rate 1.0 mL/min. Fluorescence detection, (λ_{ex} = 214 nm, λ_{em} = 345 nm). Retention time: 15 min [Weingarten *et al.* 1995].

Column: µPorasil (300 × 3.9 mm i.d., 10 µm). Mobile phase: 5 mmol/L sodium acetate buffer (pH 3.75) : acetonitrile (25 : 75), flow rate 1.2 mL/min. ECD. Retention time: 8.24 min (*k*, 3.76) [Liaw *et al.* 1998].

Column: Hypersil BDS-C_{18} (100 × 46 mm i.d., 3 µm). Mobile phase: 10 mmol/L potassium dihydrogen phosphate (pH 3) : acetonitrile (93 : 7), flow rate 1.0 mL/min. UV detection (λ = 212 nm). Retention time: 6.4 min for codeine, 5.5 min for norcodeine [Pascual, Sanagustin 1999].
Ultraviolet Spectrum Aqueous acid—285 nm (A^1_1 = 55a). No alkaline shift.



Infrared Spectrum Principal peaks at wave numbers 1052, 1268, 1500, 1111, 793, 934 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* (codeine) 299, 42, 162, 124, 229, 59, 300, 69; (morphine) 285, 162, 42, 215, 286, 124, 44, 284; (norcodeine) 285, 81, 215, 148, 286, 164, 110, 115.

Quantification

Blood **GC** NPD. Limit of detection, 100 µg/L [Lee, Lee 1991]. Column: Borosilicate OV-1 (25 m × 0.36 mm i.d.). Carrier gas: He, 35 cm/s. Temperature: 220°. ECD. Limit of detection, 5 µg/L [Edlund 1981].

GC-MS Temperature programme: 150° for 0.5 min to 320° at 25°/min for 3 min. SIM acquisition mode. Retention time: 4.65 min. Limit of detection, 12.5 µg/L [Goldberger *et al.* 2010]. Column: DB-1 (15 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 60 cm/s. Temperature programme: 140° for 1 min to 220° at 50°/min to 305° at 10°/min for 0.5 min. EI ionisation. Limit of quantification, 10 µg/L, limit of detection, 2 µg/L [Meatherall 2005]. Column: Chromabond DB-1 C_{18} (30 m × 25 mm i.d., 0.25 µm). Carrier gas: He, 30 mL/min. Temperature programme: 100° to 300° at 20°/min. TIC, SIM acquisition mode. Limit of detection, <5 µg/L [Geier *et al.* 1996]. Column: OV1 (12 m × 0.2 mm i.d). Temperature programme: 150° for 2 min to 220° at 40°/min for 6 min. MSD. Retention time: 8.2 min. Limit of detection, <1 µg/L [Musshoff, Daldrup 1993]. Column: HP Ultra1 cross-linked methyl silicone (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 2 mL/min. Temperature programme: 120° for 30 s to 220° at 40°/min to 244° at 4°/min to 300° at 40°/min. EI ionisation at 70 eV. Limit of detection, 0.05 µmol/L [Krogh *et al.* 1993]. See also Gjerde *et al.* [1991].

HPLC Column: Varian Pursuit 3 C_{18} (100 × 3 mm i.d., 3 µm). Mobile phase: methanol : ammonium formate. Limit of quantification, 0.0005–0.01 mg/kg [Bjork *et al.* 2010]. Column: ODS-3 (150 × 3 mm i.d., 5 µm). Mobile phase: 1 mmol/L ammonium formate (pH 3.0) : acetonitrile (95 : 5 for 5 min to 80 : 20 in 5 min for 5 min), flow rate 0.4 mL/min. ESI, SIM acquisition mode. Limit of quantification, 1 µg/L [Dienes-Nagy *et al.* 1999]. Column: Superspher RP-18 ODS (125 × 3 mm i.d., 4 µm). Mobile phase: acetonitrile : 50 mmol/L ammonium formate buffer (pH 3.0, 5 : 95), flow rate 0.6 mL/min for 4 min to 1.1 mL/min in 3 min for 10 min. APCI, SIM acquisition mode. Limit of detection, 2.5 µg/L [Bogusz *et al.* 1997]. Column: Nova-Pak phenyl (150 × 3.9 mm i.d., 5 µm). Mobile phase: acetonitrile : 10 mmol/L sodium dihydrogen orthophosphate (pH 6.6, 10 : 90), flow rate 1.2 mL/min. UV detection (λ = 210 nm). Retention time: 19.2 min. Limit of detection, 0.06 mg/L [Crump *et al.* 1994].

LC-MS Column: Nova-Pak CN (100 × 3.9 mm i.d., 4 μm). Mobile phase: acetonitrile : 2 mmol/L ammonium formate buffer (pH 3.0, 15 : 85). ESI, MRM acquisition mode. Limit of quantification, 2 μg/L, limit of detection, 1 μg/L [Coles *et al.* 2007].

Plasma **GC** Column: DB-17 fused silica capillary (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He. Temperature programme: 130° for 2 min to 300° at 8°/min. NPD. Retention time: 23.9 min. Limit of detection, 2.5 μg/L [Seno *et al.* 1995]. See Blood [Edlund 1981].

GC-MS See Blood [Geier *et al.* 1996]. Column: HP-1 (12 m × 0.25 mm i.d., 0.33 μm). Carrier gas: He, 5 psi. Temperature programme: 100° for 1 min to 250° at 20°/min to 257° at 2°/min. NICI. Limit of detection, <1 pg [Watson *et al.* 1995]. Limit of detection, 5 μg/L [Wang *et al.* 1994]. See Blood [Krogh *et al.* 1993].

HPLC Column: C_{18}.(150 × 2.1 mm i.d., 5 μm). Mobile phase: methanol : acetonitrile : 1% formic acid (70 : 10 : 20), flow rate 0.4 mL/min. SIM acquisition mode, *m/z* 300/165, positive ion mode. Limit of quantification, 0.2 μg/L [Liao *et al.* 2009]. Column: XTerra RP8 (250 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : 20 mmol/L phosphate buffer (pH 6.5, 10 : 90 to 2 : 98 at 5 min to 20 : 80 at 7 min to 35 : 65 at 10 min to 50 : 50 at 15 min for 5 min to 10 : 90 at 22 min), flow rate 0.7 mL/min to 0.8 mL/min at 7 min until 20 min to 0.7 mL/min. DAD (λ= 285 nm). Limit of detection, 0.05 mg/L [Fernandez *et al.* 2007]. Column: XTerra RP8 (250 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : phosphate buffer (pH 6.53, 10 : 90 to 15 : 85 at 5 min to 20 : 80 at 7 min to 35 : 65 at 10 min to 50 : 50 at 15 min for 5 min to 10 : 90 at 22 min), flow rate 0.7 mL/min to 0.8 mL/min at 7 min until 20 min to 0.7 mL/min at 22 min. DAD (λ= 285 nm). Limit of detection, 0.032 mg/L [Fernandez *et al.* 2006]. Column: Hypersil BDS-C_{18} (100 × 4.6 mm i. d., 3 μm). Mobile phase: 10 mmol/L potassium dihydrogen phosphate (pH 3.0) : acetonitrile (93 : 7), flow rate 1 mL/min. UV detection (λ= 212 nm). Retention time: 6.4 min. Limit of quantification, 1.56 μg/L, limit of detection, 0.47 μg/L [Pascual, Sanagustin 1999]. Column: MicroPorasil. Mobile phase: 5 mmol/L sodium acetate buffer (pH 3.75) : acetonitrile (25 : 75), flow rate 1.2 mL/min. Electrochemical detection. Retention time: 8.24 min. Limit of detection, 0.14 μg/L [Liaw *et al.* 1998].

Meconium **LC-MS** See Blood [Coles *et al.* 2007].

Oral Fluid **GC-MS** Column: DB-5 (25 m × 0.2 mm i.d., 0.33 mm). Carrier gas: 1.5 mL/min. Temperature programme: 150° for 1.0 min to 245° at 20°/min for 8 min to 290° at 50°/min. EI ionisation. Limit of quantification, 2 μg/L, limit of detection, 2 μg/L [Jones *et al.* 2002]. See Plasma [Wang *et al.* 1994].

Vitreous Humour **GC-MS** See CSF [Pragst *et al.* 1999].

HPLC See Blood [Bogusz *et al.* 1997].

Hair **GC-MS** See Oral Fluid. Limit of quantification, 0.32 ng/mg, limit of detection, 0.03 ng/mg [Jones *et al.* 2002]. Column: 100% poly(dimethylsiloxane) (30 m × 0.245 mm i.d., 0.25 μm). Carrier gas: He, 35 cm/s. Temperature programme: 80° for 1 min to 120° at 50°/min to 300° at 20°/min for 11 min. SIM acquisition mode. Limit of detection not reported [Brewer *et al.* 2001]. Column: Restek Rtx-5 MS (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 1 min to 260° at 15°/min to 290° at 7°/min for 6 min. Limit of detection, 0.01 ng/mg [Pichini *et al.* 1999]. Column: DB-1 capillary (30 m × 0.32 mm i.d., 1.0 μm). Carrier gas: He, 8 psi. Temperature programme: 120° for 0.1 min to 270° at 20°/min to 310° at 10°/min for 1.4 min. PICI, SIM acquisition mode (*m/z* 372). Limit of quantification, 0.5 mg/g [Hold *et al.* 1998]. Column: DB-5 MS capillary (30 m × 0.25 mm i.d.). Carrier gas: He, 7 psi. Temperature programme: 175° for 1 min to 300° at 15°/min for 0.5 min. Limit of detection, 10 pg [Wilkins *et al.* 1995]. See also Kintz, Mangin [1995] and Wang *et al.* [1994].

HPLC Column: silica-based C_{18} (150 × 4.6 mm i.d., 3 μm). Mobile phase: 20 μmol/L monobasic sodium phosphate : acetonitrile (90 : 10 to 50 : 50). Electrochemical detection. Retention time: 15.53 min. Limit of detection, 18 pg [Achilli *et al.* 1996].

LC-MS Column: Zorbax SB-Phenyl (2.1 × 100 mm i.d., 3.5 μm). Mobile phase: acetonitrile : 25 μmol/L formic acid (5 : 95). ESI, positive ion mode [Hegstad *et al.* 2008].

Note For a review of the analysis of opioids by GC-MS, see Wasels, Belleville [1994].

Disposition in the Body

Codeine is well absorbed after oral administration, with peak plasma levels occurring after ~1 h; it is metabolised in the liver by *O*-demethylation involving P450 isozyme CYP2D6 to form morphine, *N*-demethylation to form norcodeine and conjugation to form glucuronides and sulfates of both unchanged drug and its metabolites. After an oral dose, ~86% is excreted in the urine in 24 h; of the excreted material, 40–70% is free or conjugated codeine, 5–15% is free or conjugated morphine, 10–20% is free or conjugated norcodeine and trace amounts may be free or conjugated normorphine; some of the dose is excreted in the bile and trace amounts are found in the faeces; unchanged drug accounts for 6–8% of the dose in urine in 24 h but this may increase to ~10% when the urinary pH is decreased. After an IM dose, 15–20% is excreted unchanged in acid urine in 24 h. Small amounts of hydrocodone, norhydrocodone, 6α-hydrocodol and 6β-hydrocodol have also been detected in urine.

Therapeutic Concentration

Thirteen healthy adult volunteers with a mean age of 36.5 years (range, 33–44) were administered 150 mg of the sustained-release formulation of codeine (Contin) every 12 h for 5 doses and an immediate-release codeine phosphate dose of 60 mg every 4 h for the first 3 doses followed by 30 mg every 4 h for 12 doses. After a single dose, the peak plasma concentration was 217.8 μg/L (range, 112.1–375.7) for the sustained-release formulation and 138.8 μg/L (range, 49.7–221.3) for the immediate release. These concentrations were observed at 2.3 h (range, 1.0–4.5) and 1.1 h (range, 0.5–2.0), respectively. The mean steady-state concentrations were 263.8 μg/L (range, 172.9–453.0) and 222.9 μg/L (range, 129.8–274.6), respectively, for the sustained-release and immediate-release formulations of codeine, and were attained at 3.2 h (range, 1.5–5.0) and 1.1 h (range, 0.5–1.5), respectively [Band *et al.* 1994].

Eight healthy male and female volunteers, aged 20–50 years, were administered an oral dose of 30 mg codeine phosphate (equivalent to 22 mg codeine). The mean peak plasma concentrations for codeine, codeine-6-phosphate and morphine 3-glucuronide, respectively, were 66.9 μg/L (range, 34.0–118.8), 968.0 μg/L (range, 693.0–1518.0) and 53.5 μg/L (range, 32.2–71.3). These concentrations were observed after 2 h [Vree, Verwey-van Wissen 1992].

In 11 women undergoing hysterectomy and using patient-controlled analgesia as a means of administering codeine, there was a nine-fold variation in the minimum plasma concentrations consistent with pain relief (40–350 μg/L). Two patients did not experience pain relief, one of whom had been classified as a poor metaboliser of dextromethorphan. In the 9 responding patients, the effective dose varied from 4.8–25.3 mg/h [Persson *et al.* 1995].

Toxicity The estimated minimum lethal dose is 800 mg, but codeine is much less toxic than morphine and death directly attributable to codeine is rare; in most fatalities involving codeine, other drugs and/or alcohol are also present. Drug addicts may use doses up to 10 times normal before showing toxic effects, while children may show toxicity with only 1/20th of the dose.

Of 107 drug-related deaths involving codeine, it was considered to be the major poison in six. The mean total concentration of codeine in femoral blood was 4.0 mg/L (range, 2.1–8.0), with the mean concentration of free codeine being 1.3 mg/L (range, 0.4–2.8). In the remaining 101 cases involving a combination of codeine and other drugs (most often paracetamol, diazepam, salicylates or ethanol), the mean total and free codeine blood concentrations were 1.8 mg/L (range, 0.04–26.00) and 0.82 mg/L (range, 0.02–9.00), respectively. In the absence of other contributing factors, total and free codeine concentrations of >2.0 and >0.4 mg/L, respectively, may be sufficient to cause death [Gerostamoulos *et al.* 1996].

In 39 deaths in which codeine was implicated, the postmortem blood concentrations for codeine ranged from <0.1–8.8 mg/L (mean, 1.2) and for morphine from <0.1–0.7 mg/L (mean, 0.16); in 22 of these deaths, the following concentrations ranges (mean) in other tissues and fluids were reported:

	Codeine	*Morphine*
Bile (mg/L)	0.5–43 (11)	<0.1–119 (33)
Kidney (μg/g)	<0.1–36.3 (7)	<0.1–12.4 (2)
Liver (μg/g)	<0.1–45 (5)	<0.1–6.4 (2)
Urine (mg/L)	3.2–229 (60)	<0.1–69.8 (20)

In all cases, other drugs were also present [Nakamura *et al.* 1976].

In 2 deaths involving the ingestion of large numbers of codeine tablets, postmortem blood concentrations of codeine of 15 and 48 mg/L were reported; urine concentrations were 155 and 370 mg/L; in both cases alcohol had also been ingested and in one case a low concentration of salicylate was also found in the blood [Peat, Sengupta 1977].

Bioavailability ~50%.

Half-life Plasma half-life, 2–4 h.

Volume of Distribution ~2.5–3.5 L/kg.

Clearance Plasma clearance, 10–15 mL/min/kg.

Protein Binding ~7–25%

Dose For pain relief, 30 to 60 mg every 4 h to a usual maximum of 240 mg daily.

Codeine *N*-oxide

Narcotic

$C_{18}H_{21}NO_4 = 315.4$

IUPAC Name Codeine *N*-oxide

Synonym Genocodeine

Colour Tests Ammonium molybdate test—green→blue (limit of detection, 0.1 μg); sulfuric acid–formaldehyde test—deep purple (limit of detection, 0.1 μg); Vitali's test—yellow/faint orange/purple→chocolate-brown (limit of detection, 0.1 μg).

Thin-layer Chromatography System T1—R_f 0.23 (location reagent acidified iodoplatinate spray, positive reaction).

Quantification

Other **HPLC** Elixirs. Column: μBondapak C_{18} (300 × 3.9 mm i.d.). Mobile phase: buffer (0.015 mol/L 1-butane sulfonic acid sodium salt, 0.015 mol/L potassium

phosphate monobasic, 2 mL triethylamine/L water, pH 4.8) : methanol (80 : 20), flow rate 2.0 mL/min. UV detection ($\lambda = 214$ nm). Retention times: codeine *N*-oxide 6.4 min, codeine phosphate 4.9 min, codeinone 8.8 min. Limit of detection, 0.25 wt.% with respect to parent compound [Sisco *et al.* 1986]. Tablets and Capsules. Column: μBondapak C_{18} (300 × 3.9 mm i.d.). Mobile phase: buffer (0.015 mol/L potassium phosphate monobasic, 2 mL triethylamine/L water, pH 2.35) : methanol (93 : 7), flow rate 3.0 mL/min. UV detection ($\lambda = 214$ nm). Retention times: codeine *N*-oxide 4.2 min, codeine 5.3 min, codeinone 8.8 min. Limit of quantification not reported, sensitivity factors reported [Sisco *et al.* 1985].

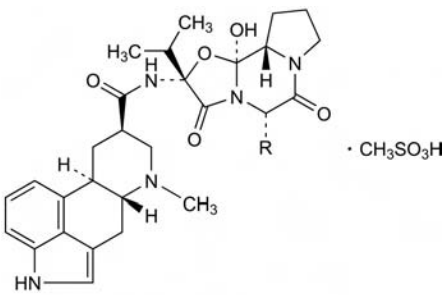
Codergocrine Mesilate

Vasodilator

CAS—11032-41-0 (codergocrine); 8067-24-1 (mesilate)

Synonyms Co-dergocrine methanesulfonate; DEA; DHAE; dihydroergotoxine mesilate; dihydrogenated ergot alkaloids; hydrogenated ergot alkaloids.

Proprietary Names *Circanol*; *Deapril-ST*; *Hydergin(e)*; *Progeril*.



Dihydroergocornine	$R = CH(CH_3)_2$
Dihydroergocristine	$R = CH_2C_6H_5$
Dihydro-α-ergocryptine	$R = CH_2CH(CH_3)_2$
Dihydro-β-ergocryptine	$R = CH(CH_3)CH_2CH_3$

Chemical Properties A mixture in equal proportions of dihydroergocornine mesilate ($C_{31}H_{41}N_5O_5$, $CH_4O_3S = 659.8$), dihydroergocristine mesilate ($C_{35}H_{41}N_5O_5$, $CH_4O_3S = 707.8$), and α- and β-dihydroergocryptine mesilates ($C_{32}H_{43}N_5O_5$, $CH_4O_3S = 673.8$) in the ratio 2:1. A white to yellowish-white powder. Mp 196° to 206°, with decomposition. Soluble 1 in 50 of water, 1 in 30 of ethanol, 1 in 10 of acetone, and 1 in 100 of chloroform; practically insoluble in ether. pK_a 6.9 (24°).

Thin-layer Chromatography Codergocrine: system TA—R_f 0.66; system TB—R_f 0.01; system TC—R_f 0.48; system TL—R_f 0.29; system TM—R_f 0.64.

High Performance Liquid Chromatography System HP—dihydro-ergocristine *k* 18.3, dihydroergocryptine *k* 15.9.

Infrared Spectrum Principal peaks at the following wavenumbers (all KBr disk):

Dihydroergocornine 1633, 1662, 1720, 1705, 1558, 768 cm^{-1}.
Dihydroergocristine 1635, 1728, 1510, 1215, 760, 1540 cm^{-1}.
Dihydroergocryptine mesilate 1633, 1210, 1172, 1048, 1675, 1732 cm^{-1}.

Mass Spectrum Principal ions at the following *m/z*:

Codergocrine 70, 154, 125, 41, 43, 155, 42, 225.
Dihydroergocornine 70, 71, 269, 154, 195, 55, 59, 57.
Dihydroergocristine 125, 70, 91, 153, 41, 244, 43, 71.
Dihydroergocryptine 154, 70, 155, 167, 223, 225, 349, 153.

Quantification

Plasma **HPLC** Fluorescence detection. Limit of detection, 700 ng/L [Zecca *et al.* 1983].

Radioimmunoassay Limit of detection, 10 ng/L [Loh, Woodcock 1983].

Disposition in the Body Poorly absorbed after oral administration.

Therapeutic Concentration

Following a single oral dose of 4.5 mg to 8 subjects, peak plasma concentrations of 0.3 to 1.1 μg/L (mean 0.0006) were attained in 0.2 to 1.2 h [Woodcock *et al.* 1982].

Bioavailability 5 to 12%.

Half-life Plasma half-life, 8 to 25 h (mean 13).

Volume of Distribution 10 to 20 L/kg.

Clearance Plasma clearance, 20 to 30 mL/min/kg.

Dose Up to 4.5 mg daily, orally; 0.75 to 3 mg daily, sublingually.

Loh W, Woodcock BG (1983). Specificity and precision of a radioimmunoassay of dihydroergotoxine in plasma. *Arzneimittelforschung* 33: 568–570.

Colchicine

Gout Suppressant

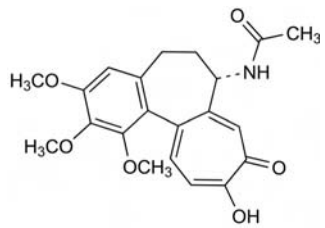
$C_{22}H_{25}NO_6 = 399.4$

CAS—64-86-8

IUPAC Name *N*-[(7*S*)-5,6,7,9-Tetrahydro-1,2,3,10-tetramethoxy-9-oxobenzo[*a*]-heptalen-7-yl]acetamide

Synonym Colchicinum

Proprietary Names *Colchineos*; *Colchiquim*; *Colcin*; *Colgout*; *Coluric*; *Ticolcin*. It is also an ingredient of *ColBenemid*, *Colchimax*, *Gripponyl*, and *Proben-C*.



Chemical Properties An alkaloid obtained from the corm and seeds of the meadow saffron *Colchicum autumnale* (Liliaceae) and other *Colchicum* species. Pale yellow to greenish-yellow crystals or amorphous scales or powder, darkening on exposure to light. Mp 142° to 150°. Soluble 1 in about 20 of water, but moderately concentrated aqueous solutions may deposit crystals of a sesquihydrate, which is less soluble in cold water than the anhydrous alkaloid. Freely soluble in ethanol and chloroform; soluble 1 in 220 of ether and 1 in 100 benzene; practically insoluble in petroleum ether. pK_a 12.35 (20°). Log *P* (octanol/water), 1.3. Extraction yield (chlorobutane), 0.13 [Demme *et al.* 2005].

Colour Tests Liebermann's reagent—green; Mandelin's test—green; Marquis test—yellow

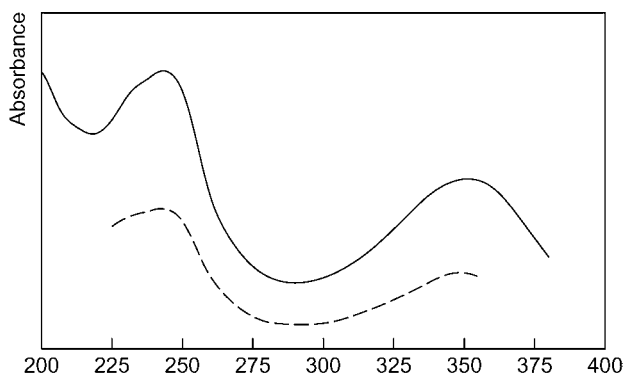
Thin-layer Chromatography System TA—R_f 0.55; system TB—R_f 0.00; system TC—R_f 0.37; system TE—R_f 0.33; system TL—R_f 0.12; system TAE—R_f 0.69; system TAF—R_f 0.63; system TAJ—R_f 0.39; system TAK—R_f 0.08; system TAL—R_f 0.73 (van Urk reagent, yellow).

Gas Chromatography System GA—RI 3200.

High Performance Liquid Chromatography System HA—*k* 0.2; system HX—RI 382; system HY—RI 327; system HZ—retention time 2.1 min; system HAX—retention time 5.1 min; system HAY—retention time 4.1 min.

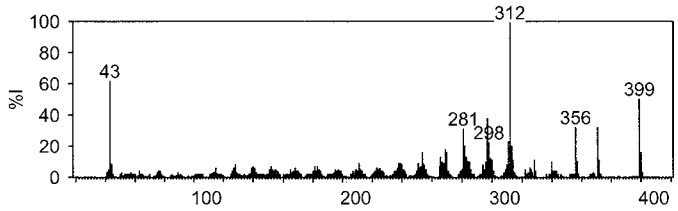
Column: RP C_{18} (Novapak, 150 × 4.6 mm i.d., 5 μm). Mobile phase: 0.1 mol/L potassium dihydrogen phosphate (with 5 μmol/L pentane sulfonic acid, pH 6.0) : methanol : acetonitrile (60:26.6:13.4), flow rate 0.8 mL/min. UV detection (λ=245 nm). Retention time: 6.6 min [McIntyre *et al.* 1994].

Ultraviolet Spectrum Ethanol—243 (A^1_1=730a), 350 nm (A^1_1=425a).



Infrared Spectrum Principal peaks at wavenumbers 1250, 1550, 1588, 1610, 1090, 1655 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 312, 43, 399, 297, 356, 281, 371, 311.



Quantification

Blood **HPLC** UV detection (λ=350 nm). Limit of detection, 1.0 µg/L [Kintz *et al.* 1997]. UV detection. Limit of detection, 10 µg/L [Caplan *et al.* 1980].

HPLC-MS Limit of detection, 0.6 µg/L [Tracqui *et al.* 1996].

Plasma **Spectrofluorimetry** [Bourdon, Galliot 1976].

HPLC UV detection. Limit of detection, 5 µg/L [Jarvie *et al.* 1979].

HPLC-MS See Blood [Tracqui *et al.* 1996].

Radioimmunoassay Comparison of three RIAs. Limit of detection, 0.2 µg/L [Sabouraud *et al.* 1994].

Serum **HPLC** (λ=254 nm). Limit of detection, 0.4 µg/L for desacetylcolchicine and 4.0 µg/L for colchicine [Ko *et al.* 1990].

Radioimmunoassay Limit of detection, 350 ng/L [Scherrmann *et al.* 1980].

Urine **Spectrofluorimetry** See Plasma [Bourdon, Galliot 1976].

HPLC See Serum [Ko *et al.* 1990].

HPLC-MS See Blood [Tracqui *et al.* 1996].

Tissue **HPLC** Column: C_{18} ODS (Hypersil, 125 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.03 mol/L ammonium sulfate (with 1% TEA, pH 3.0); (25:75) for 5 min, gradient to (40:60) in 5 min, held for 10 min; flow rate 1 mL/min. IS: methylclonazepam. UV detection (λ=340 nm). Retention time(s): colchicine, 8.1 min; IS, 18.0 min. Limit of detection, 5 ng/g [Dehon *et al.* 1999].

Disposition in the Body Readily absorbed after oral administration with peak plasma concentrations reached within 2 h. It is partially deacetylated in the liver to desmethylcolchicine. Most of the drug is excreted in the faeces but 10 to 20% is excreted in the urine. Colchicine is excreted in the bile and undergoes enterohepatic circulation. Colchicine is distributed in the kidney, liver, and spleen, but little is found in the heart, skeletal muscle, and brain.

Therapeutic Concentration

In 30 patients treated for familial Mediterranean fever with colchicine 0.5 to 2 mg daily, there was a large inter-subject variability in plasma colchicine concentration (0.13 to 1.75 µg/L 24 h after a dose of 1 mg daily) [Chappey *et al.* 1994].

After administration of a single oral dose of 1 mg colchicine to 8 patients with chronic liver disease, a mean peak plasma concentration of 3.6 µg/L (range 0.4 to 10.0) was attained at 2.16 h. Repeated administration resulted in comparable values. Concentrations in bile were higher (2.025 mg/L) [Rudi *et al.* 1994].

Steady-state serum concentrations of 0.3 to 2.4 µg/L were reported after daily oral doses of 1 mg given to 8 subjects [Halkin *et al.* 1980].

Toxicity The minimum lethal dose in man is about 6 mg (although recovery has occurred after much larger doses).

A 73-year-old man was hospitalised 8 h after receiving a 1 mg IV dose of colchicine for gouty arthritis and died 10 h later; he had consumed 8 × 0.6 mg colchicine tablets over the previous 8 days. The following postmortem colchicine tissue concentrations were reported: cardiac blood 50 µg/L, vitreous humour 10 µg/L, liver 0.575 µg/g, bile 12 000 µg/L, gastric contents 4.4 µg in 60 g [Jones *et al.* 2002].

After ingestion of about 40 flowers of *Colchicum autumnale* L., a 44-year-old man was admitted 2 h later with nausea, vomiting, and abdominal pains followed by diarrhoea after 14 h. Maximal colchicine levels were 4.34 µg/L at 13 h in plasma and 5.43 µg/L at 16 h in erythrocytes [Danel *et al.* 2001].

In a reported fatality following the ingestion of colchicine tablets, a 42-year-old man had the following levels in blood and postmortem tissues: plasma, 4.5 µg/L (after 24 h); kidney, 396 µg/g; liver, 347 µg/g; heart, 334 µg/g; lung, 58 µg/g; muscle, 10 µg/g; and brain, 5 µg/g [Dehon *et al.* 1999].

In a suicidal overdose resulting from the ingestion of colchicine tablets, the femoral blood level was 62 µg/L and the maximum concentration found in bile was 2921 µg/L [Kintz *et al.* 1997].

Half-life Plasma half-life, about 1 h.

Volume of Distribution About 0.7 to 2 L/kg.

Protein Binding About 30 to 50%.

Dose For an acute attack of gout, 1 mg initially, followed by 500 µg every 2 or 3 h; maximum total dose of 6 mg; a second course may be taken after an interval of at least 3 days.

Colecalciferol

Vitamin

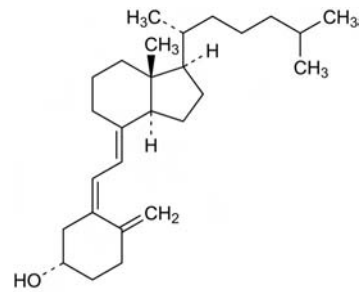
$C_{27}H_{44}O$ = 384.6

CAS—67-97-0

IUPAC Name (1*S*,3*Z*)-3-[(2*E*)-2-[(1*R*,3*aS*,7*aR*)-7*a*-Methyl-1-[(2R)-6-methylheptan-2-yl]-2,3,3*a*,5,6,7-hexahydro-1*H*-inden-4-ylidene]ethylidene]-4-methylidenecyclohexan-1-ol

Synonyms Activated 7-dehydrocholesterol; cholecalciferol; (3β,5*Z*,7*E*)-9,10-secocholesta-5,7,10(19)-trien-3-ol; vitamin D_3.

Proprietary Names *D-Mulsin*; *D_3-Vicotrat forte*; *Neo-Dohyfral D_3*.



Chemical Properties White crystals. It is affected by air and light, and should be stored in a cool place in hermetically sealed containers in which the air has been replaced by an inert gas. Solutions in volatile solvents are unstable. Mp about 84°. Practically insoluble in water; freely soluble in ethanol, chloroform, and ether. Log *P* (octanol/water), 10.2.

Colour Test To a 10% solution in chloroform, add 0.3 mL of acetic anhydride and 0.1 mL of sulfuric acid—red→violet→blue-green.

Gas Chromatography System GA—colecalciferol RI 3150, colecalciferol-H_2O RI 3130.

Ultraviolet Spectrum Ethanol—265 nm (A_1^1=480a).

Infrared Spectrum Principal peaks at wavenumbers 1052, 894, 901, 967, 862, 1075 cm^{-1} (KBr disk).

Quantification

Plasma **HPLC** UV detection. Colecalciferol, ergocalciferol and the 25-hydroxy metabolites, limit of detection, 500 ng/L [Jones 1978].

Disposition in the Body Well absorbed after oral administration and subject to enterohepatic circulation; decreased absorption may occur in subjects with impaired liver and biliary function. Metabolised by hydroxylation to active metabolites. The major metabolite is 25-hydroxycolecalciferol which is formed in the liver. This is further metabolised by 1α- or 24-hydroxylation in the kidneys. Most of a dose is excreted in the bile and eliminated in the faeces; about 25% of a dose is excreted as conjugates. Unchanged colecalciferol does not appear to be excreted in the urine.

Blood Concentration Normal serum concentrations of 25-hydroxycolecalciferol are about 15 to 40 µg/L, but there are considerable inter-subject and seasonal variations.

Half-life Plasma half-life, about 1 to 2 days; after IV administration a terminal elimination half-life of about 18 days has been reported.

Protein Binding Bound to some extent to globulins and to lipoproteins.

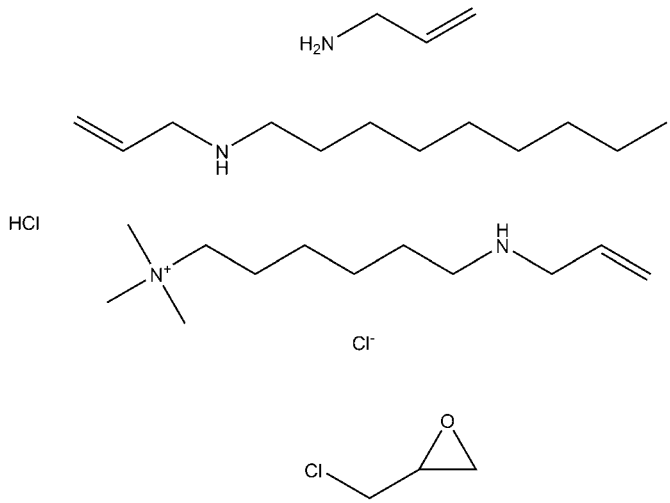
Dose 0.025 to 5 mg daily.

Jones G (1978). Assay of vitamins D2 and D3, and 25-hydroxyvitamins D2 and D3 in human plasma by high-performance liquid chromatography. *Clin Chem* 24: 287–298.

Colesevelam Hydrochloride

Antihyperlipidaemic, Bile Acid Sequestrant
$C_{31}H_{66}Cl_2N_4O$, HCl = 618.3
CAS—182815-44-7

IUPAC Names 2-(Chloromethyl)oxirane; prop-2-en-1-amine; *N*-prop-2-enyldecan-1-amine; trimethyl-[6-(prop-2-enylamino)hexyl]azanium; chloride; hydrochloride.
Synonyms GT-31-104; *N,N,N*-trimethyl-6-(2-propenylamino)-1-hexanaminium chloride polymer with (chloromethyl)oxirane, 2-propen-1-amine, and *N*-2-propenyl-1-decanamine, hydrochloride.
Proprietary Names *CholestaGel*; *WelChol*.



Disposition in the Body Colesevelam forms non-absorbable complexes with bile acids and is excreted entirely through the gastrointestinal tract.
Therapeutic Concentration Sixteen healthy volunteers were administered non-radiolabelled colesevelam hydrochloride 1.9 g twice daily for 4 weeks, followed by a single dose of 2.4 g [^{14}C]colesevelam (480 pCi). Total recovery of [^{14}C]colesevelam was 0.05 ± 0.01 and $74 \pm 27\%$ in urine and faeces, respectively. The mean faecal recovery was $82 \pm 16\%$. The mean maximum concentration of 0.165 ± 0.1 µg equiv/g was reached at 72 h after the administered dose [Heller *et al.* 2002]. Colesevelam has been shown to have no effect on the pharmacokinetics of lovastatin when co-administered at dinner [Donovan *et al.* 2002].

Colesevelam hydrochloride was co-administered with fenofibrate to investigate its effect on fenofibrate metabolism. Co-administration of 3750 mg colesevelam with 160 mg fenofibrate resulted in an approximate 20% reduction in the mean peak plasma concentration of fenofibric acid. There were no significant differences in the time to reach maximum plasma concentration, elimination rate constant or elimination half-life [Jones *et al.* 2004].

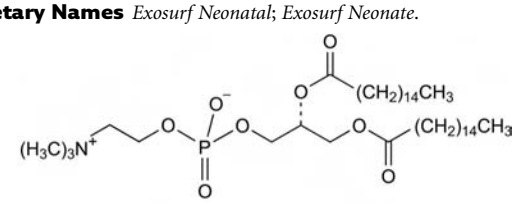
Dose 3.75 g daily orally alone or divided into 2, may be increased to 4.375 g. When combined with statins the dose is usually 2.5 to 3.75 g daily.

Donovan JM *et al.* (2002). Effect of colesevelam on lovastatin pharmacokinetics. *Ann Pharmacother* 36: 392–397.
Heller DP *et al.* (2002). Absorption of colesevelam hydrochloride in healthy volunteers. *Ann Pharmacother* 36: 398–403.
Jones MR *et al.* (2004). Effect of colesevelam HCl on single-dose fenofibrate pharmacokinetics. *Clin Pharmacokinet* 43: 943–950.

Colfosceril Palmitate

Lung Surfactant
$C_{40}H_{80}NO_8P$ = 734.0
CAS—63-89-8

IUPAC Name [(2*R*)-2,3-Di(hexadecanoyloxy)propyl] 2-(trimethylazaniumyl) ethyl phosphate
Synonyms Dipalmitoyl phosphatidylcholine; DPCC; (7*R*)-4-hydroxy-*N,N,N*-trimethyl-10-oxo-7-[(1-oxohexadecyl)oxy]-3,5,9-trioxa-4-phosphapentacosan-1-aminium inner salt 4-oxide.
Proprietary Names *Exosurf Neonatal*; *Exosurf Neonate*.



Chemical Properties A sterilised lyophilised powder. Mp 234° to 235°. Readily soluble in chloroform, hot di-isobutyl ketone, hot dioxane. Solubility at 22° to 23° (g/100 mL): ethanol 1.5, ether 0.02, acetone 0.02, pyridine 1.1, acetic acid 4.0, methanol 1.4. Log *P* (octanol/water), 9.81.
Thin-layer Chromatography Plate: silica gel (LK5, 20 × 20 cm). Mobile phase: chloroform : methanol : 1-propanol : potassium chloride (0.25%) : ethyl acetate (25:13:25:9:25 mL). Reference compounds: phosphatidylcholine, sphingomyelin, phosphatidylinositol, phosphatidylethanolamine, phosphatidylserine and phosphatidyl-glycerol. Detection by spraying with cupric acetate (3%):phosphoric acid (8%). Rf 0.35.

Plate: silica gel (LK5, 20 × 20 cm). Mobile phase: chloroform : methanol : 2-propanol : potassium chloride (0.25%) : triethylamine (30:9:25:6:18 mL). Rf 0.26.

Plate: LHPK (HPTLC) (10 × 10 cm). Mobile phase: chloroform : methanol : 2-propanol : water : triethylamine (30:9:27:8:25 mL). Rf 0.23.

Plate: LHPK (HPTLC) (10 × 10 cm). Mobile phase: chloroform : ethanol : water : triethylamine (30:34:7:35 mL). Rf 0.21 [Touchstone *et al.* 1980].

Quantification
Endotracheal Tube Aspirate **HPLC** Column: ODS silica (Apex II, 25 cm). Mobile phase: 40 mmol/L choline chloride in methanol : water (92.5:7.5), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex}=340 nm, λ_{em}=460 nm). Retention time: colfosceril palmitate, 39.7 min. Limit of detection, 0.2 ng/L [Ashton *et al.* 1992].
Disposition in the Body Colfoscerol palmitate is absorbed from the alveolus into the lung tissue where it is reused for further phospholipid synthesis and secreted into the alveolus as new surfactant. Metabolism occurs and the products are incorporated into the body pools. Elimination is mainly through expired air with a small amount in faeces and urine.
Therapeutic Concentration

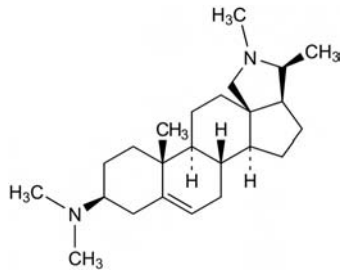
Twenty-two infants of less than 34 weeks' gestation and ventilated from day 1 for respiratory distress syndrome, were administered two doses of 67.5 mg colfosceril palmitate (DPPC) in the first 24 h. Percentage DPPC (of total phosphatidylcholine) reached 100% within 2 days [Ashton *et al.* 1992].

Toxicity Associated with cytotoxicity.
Half-life Mean half-life of the phosphatidylcholine component, 30 h.
Dose A single dose of 67.5 mg/kg birth weight of colfoscerol palmitate is administered. Doses may be repeated 12 and 24 h later.

Ashton MR *et al.* (1992). Turnover of exogenous artificial surfactant. *Arch Dis Child* 67: 383–387.
Touchstone JC *et al.* (1980). *Lipids* 15(1): 61–62.

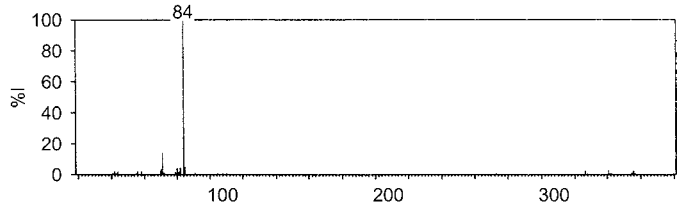
Conessine

Antiamoebic
$C_{24}H_{40}N_2$ = 356.6
CAS—546-06-5
Synonym (3β)-*N,N*-Dimethylcon-5-enin-3-amine



Chemical Properties An alkaloid obtained from the seeds of *Holarrhena antidysenterica* (Apocynaceae). A white crystalline powder. Mp 127° to 129°. Sparingly soluble in water. Log *P* (octanol/water), 5.1.

Conessine Hydrobromide
$C_{24}H_{40}N_2$, 2HBr = 518.4
CAS—5913-82-6
Synonym Conessine bromide
Chemical Properties White acicular crystals or microcrystalline powder. Mp 340°, with decomposition. Soluble 1 in 5 of water and 1 in 11 of ethanol (90%); very slightly soluble in ether; practically insoluble in petroleum ether.
Colour Tests Mandelin's test—yellow; Marquis test—yellow→orange.
Thin-layer Chromatography System TA—R_f 0.28; system TB—R_f 0.49; system TC—R_f 0.03; system TL—R_f 0.03 (acidified iodoplatinate solution, positive).
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.
Mass Spectrum Principal ions at *m/z* 84, 71, 85, 82, 80, 341, 70, 356.

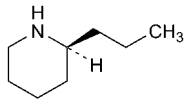


Dose Conessine hydrobromide was formerly given in doses of 300 to 500 mg daily.

Coniine

Alkaloid
$C_8H_{17}N = 127.2$
CAS—458-88-8

IUPAC Name (2*S*)-2-Propylpiperidine
Synonyms Cicutine; conicine; conine.



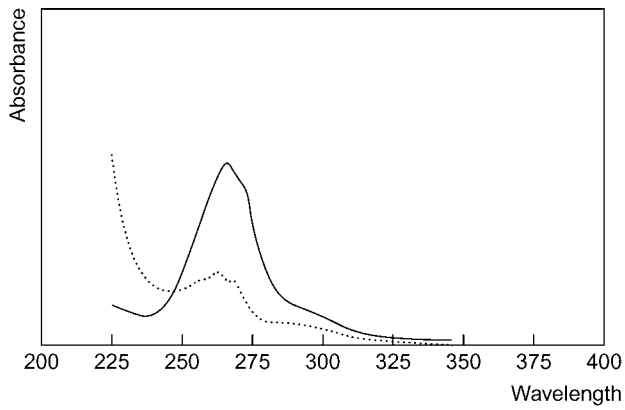
Chemical Properties An alkaloid obtained mainly from the fruits and leaves of hemlock, *Conium maculatum* (Umbelliferae). An almost colourless volatile liquid. Fp –2°. Bp 166°. Soluble 1 in 100 of water; miscible with ethanol and ether; slightly soluble in chloroform. pK_a 11.0 (25°). Log *P* (octanol/water) 2.6. In extracts, coniine was stable at high and low concentrations for >24 h, before and after 3 freeze-thaw cycles and after storage at −20° for 1 month [Beyer *et al.* 2007].

Coniine Hydrobromide

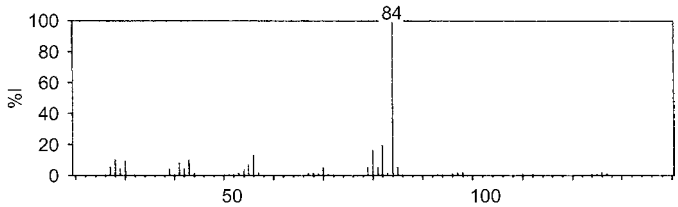
$C_8H_{17}N$, HBr = 208.1
CAS—637-49-0

Chemical Properties Colourless crystals. Mp ≈211°. Soluble 1 in 2 of water and 1 in 3 of ethanol; soluble in chloroform and ether.

Thin-layer Chromatography System TA—R_f 0.26; system TAE—R_f 0.05; system TAF—R_f 0.70; system TL—R_f 0.05; system TB—R_f 0.39; system TC—R_f 0.13; system TE—R_f 0.37 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—not eluted.
High Performance Liquid Chromatography System HX—RI 214.
Ultraviolet Spectrum Aqueous acid—266 nm (A_1^1 = 6b); aqueous alkali—262, 268 nm.



Infrared Spectrum Principal peaks at wavenumbers 1033, 1007, 1575, 1300, 1078, 1139 cm^{-1} (coniine hydrobromide (Nujol mull)).
Mass Spectrum Principal ions at *m/z* 84, 82, 80, 56, 43, 28, 30, 41.



Quantification

Plasma **LC-MS** Column: LiChroCART (125 × 2 mm i.d.). Mobile phase: 50 mmol/L aqueous ammonium formate (pH 3.5) : acetonitrile (90 : 10 for 2 min to 20 : 80 at 5 min for 2 min to 90 : 10 at 10 min), flow rate 0.4 mL/min for 2 min to 0.6 mL/min for 5 min to 0.4 mL/min for 3 min. APCI, positive ion mode, SIM acquisition mode or tandem MS, ESI, MRM acquisition mode. Limit of quantification, 50 and 0.1 µg/L for single stage MS and tandem MS, respectively [Beyer *et al.* 2007].
Other **GC-MS** Plants, Hay and Cattle Urine. Column: HP-1 capillary (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 2 psi. Temperature programme: 40° for 2 min to 80° at 20°/min to 90° at 5°/min to 200° at 45°/min. Limit of detection not reported [Galey *et al.* 1992]. Chicken, Quail and Turkey Tissue. Column: DB-17 capillary (30 m × 0.25 mm i.d.). Temperature programme: 50° for 10 min to 240° at 10°/min. EI ionisation at 70 eV and CI. Limit of detection, 0.58 mg/L [Frank, Reed 1990].

HPLC Plant Extracts. Column: Betasil C_{18} (100 × 2.1 mm i.d.). Mobile phase: 20 mmol/L ammonium acetate : methanol (50 : 50), flow rate 0.5 mL/min. UV detection. Limit of detection not reported [Lee *et al.* 2008].

Disposition in the Body

Toxicity Coniine is well absorbed from the gastrointestinal tract and is very poisonous; the estimated minimum lethal dose is 150 mg and toxic symptoms may occur after ingestion of 60 mg. Death may occur within 30 min or be delayed 3 to 12 h. Coniine resembles nicotine in its peripheral action but produces more pronounced paralysis of the CNS and of the skeletal muscle nerve-endings.
Note For a review of the clinical manifestations of accidental poisoning by hemlock, see Rizzi *et al.* [1991]. For a non-fatal case of a 4-year-old male who ingested poison hemlock, see Frank *et al.* [1995]. For a review of 11 cases of hemlock poisoning, see Rizzi *et al.* [1989] and for cases of acute renal failure after hemlock poisoning, see Scatizzi *et al.* [1993].

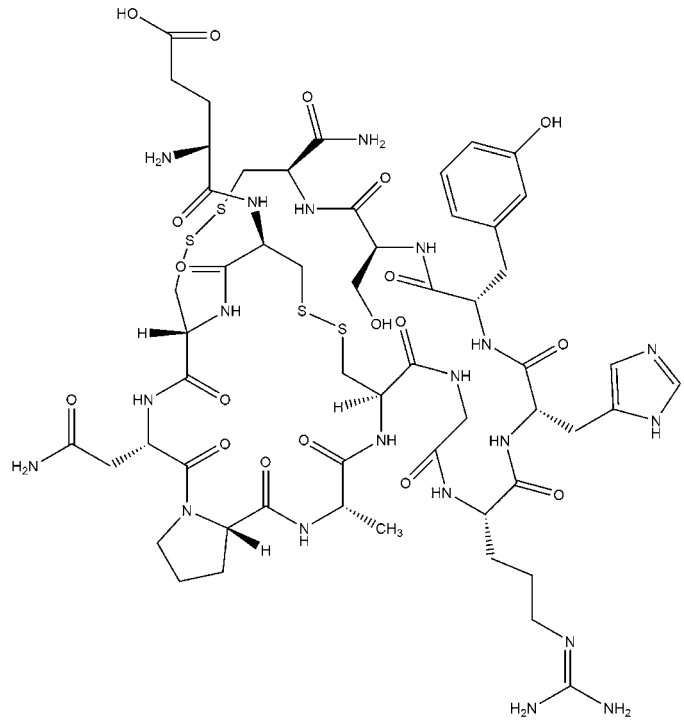
Conotoxins

Neurotoxin



Chemical Properties Conotoxins are potent neurotoxins produced by the venom of the marine cone snail, genus *Conus*. They are peptides of 10 to 30 amino acid residues, typically with one or more disulfide bond. There have been five conotoxins identified so far:

Toxin	*Target*
α	Acetylcholine receptors
δ	Inhibits the inactivation of voltage-activated calcium channels (VACC)
	Inhibits potassium channels
µ	Inhibits VACC in muscles
ω	Inhibits *N*-type VACC

Ziconitide

Analgesic/Calcium Channel Blocker/Neuroprotective
$C_{102}H_{172}N_{36}O_{32}S_7 = 2639.13$
CAS—107452-89-1

Synonyms ω-Conotoxin MVIIA; ω-conopeptide MVIAA; SNX-111; CI-1009.
Proprietary Name *Prialt* (Elan).
Chemical Properties An ω-toxin derived from *Conus magus*. Acts as a selective N-type VACC blocker.
Use As a pharmacological tool to target VACC; licensed by FDA for the relief of intrathecal pain.

Copper

Metal
Cu = 63.55
CAS—7758-98-7

Chemical Properties Reddish solid. Mp 1083°. Bp 2595°. Insoluble in water. Valencies: Cu(O), Cu(+1), Cu(+2), Cu(+3). Found in nature in the elemental form and also in many minerals: cuprite, malachite, azurite, chalcopyrite, chalcocite and bornite. Extensively used in all industries and many applications because of its durability, ductility, malleability, and electrical and thermal conductivity.

Copper Sulfate

$CuSO_4$ = 159.6
Synonyms Blue copperas; blue stone; blue vitriol; copper (II) sulphate; cupric sulphate; Roman vitriol; Salzburg vitriol.
Chemical Properties Blue crystals. Decomposes at 560°. Very soluble in water; soluble in methanol; slightly soluble in ethanol. Used in metal finishing, mineral froth flotation, wood preservatives, water treatment, fungicides, algicides, petroleum refining.

Colour Tests Applicable to gastric contents and scene residues. Place a small volume (0.1 mL) of sample on to a filter paper to give a spot of an approximate diameter of 1 cm. Expose the spot to concentrated ammonia fumes and add 0.1 mL of a methanolic solution of dithiooximide (10 g/L)—Copper salts give an olive-green stain. Chromium salts also give a green stain, but usually before the dithiooximide is added. Several other metals give yellow-brown or red-brown colours. Limit of detection, 1 mg/L.

Confirmatory test Place 0.1 mL of the sample in a spotting-tile well and add 0.05 mL of 0.01 mol/L hydrochloric acid. Mix 0.1 mL of ammonium mercurithiocyanate reagent (prepared by mixing 8 g of mercuric chloride and 9 g of ammonium thiocyanate in 100 mL of water) with 0.1 mL of zinc acetate solution (10 g/L) and add to the sample in the well.—Copper salts form a violet precipitate of zinc mercurithiocyanate. Limit of detection, 50 mg/L

Quantification

Specimen Collection Blood—5 mL, K-EDTA tube; urine—sample of 24 h urine collection (for investigation of copper-related disease).
Blood **DPASV** Limit of detection, 2 µg/L [Moreno *et al.* 1999].

AAS Gas flow: 4.5 L/min. Acetylene: 1.1 L/min (λ = 324.8 nm). Limit of detection not reported [Piekoszewski *et al.* 2000]. Gas flow: 2.3 mL/min. Hollow cathode lamp (λ = 324.7 nm). Limit of detection not reported [Chatterjee *et al.* 1994].

ETAAS Dry cycle: 78° for 40 s to 82° for 10 s to 86° for 5 s. Char cycle: 600° for 20 s. Atomisation cycle: 2600° for 7 s. Carrier gas: Ar, 60 mL/min. Zeeman AA mode (λ = 324.8 nm). Limit of detection, 1.3 µg/L [Liska *et al.* 1985].

FAAS Oxidant: air, 1.60 kg/cm^2. Fuel: acetylene, 0.30 kg/cm^2. Zeeman AA mode (λ = 324.8 nm). Flame continuous aspiration, microsampler/peak area, or microsampler/peak height mode. Limit of detection, 4.1, 10.3 and 25.3 µg/L for each mode, respectively [Liska *et al.* 1985].

ICP-AES Limit of detection, 10 µg/kg [Dinya *et al.* 2005]. Meinhard or Babington nebuliser (λ = 324.8 nm). Limit of detection, 1.7 and 2.2 µg/L for each nebuliser, respectively [Prohaska *et al.* 2000].

ICP-MS Plasma gas: 15 L/min. Auxiliary gas: 1.13 L/min. Nebuliser gas: 1.0 mL/min. Limit of detection not reported [Rainska *et al.* 2007]. Plasma gas: 16 L/min. Auxiliary gas: 1 L/min. Nebuliser gas: 1.15 or 1.33 mL/min. Limit of detection, 5 µg/L [De Boer *et al.* 2004].
Plasma **ETAAS** See Blood [Liska *et al.* 1985].

FAAS See Blood [Liska *et al.* 1985].

ICP-MS Plasma gas: 15 L/min. Auxiliary gas: 0.6 L/min. Nebuliser gas: 0.93 L/min. Limit of detection not reported [Venelinov *et al.* 2004].
Serum **ETAAS** See Blood [Liska *et al.* 1985].

FAAS See Blood [Liska *et al.* 1985]. Perkin-Elmer hollow cathode lamp (λ = 324.8 nm). Limit of detection, not reported [Weinstock, Uhlemann 1981].

ICP-AES Plasma gas: Ar, 12 L/min. Nebuliser gas: Ar, 0.5 L/min. Nebuliser pressure: 2.3 bar. (λ = 324.8nm). Limit of detection, 0.02 µmol/L [Chappuis *et al.* 1992].

ICP-MS Plasma gas: Ar, 11.0 L/min. Auxiliary gas: Ar, 1.4 L/min. Nebuliser gas: Ar, 0.9 to 1.0 L/min. Limit of detection, 0.03 µg/L [Gercken, Barnes 1991]. Plasma gas: 13 L/min. Auxiliary gas: 1 L/min. Nebuliser gas: 0.72 L/min. Limit of detection not reported [Vanhoe *et al.* 1989].
Oral Fluid **ICP-MS** Plasma gas: 13 L/min. Auxillary gas: 0.55 L/min. Nebuliser gas: 0.1 L/min. Limit of detection, 0.04 µg/L [Menegario *et al.* 2001].
Urine **ETAAS** Dry cycle: 110° at 1 s for 20 s to 130° in 15 s for 20 s. Char cycle: 1250° in 30 s for 15 s; change gas from Ar to 5% H_2 in Ar for 5 s. Atomisation cycle: 2300° for 5 s; normal gas, Ar 250 mL/min; purge gas, 5% H_2 in Ar 250 mL/min. Hollow cathode lamp (λ = 324.8 nm). Limit of detection, 0.08 µg/L [Lin, Huang 2001]. Dry cycle: 110° at 7 s for 13 s. Char cycle: 900° in 7 s for 23 s. Atomisation cycle: 2700° in 2 s for 10 s, gas flow: 10 mL/min (λ = 324.8 nm). Limit of detection not reported [Halls *et al.* 1981].

ICP-MS Plasma gas: 15 L/min. Auxiliary gas: 1.13 L/min. Nebuliser gas: 1.0 mL/min. Limit of detection, not reported [Rainska *et al.* 2007]. See Blood. Limit of detection, 2.5 µg/L [De Boer *et al.* 2004].
Note For a direct spectrophotometric method for determining copper in urine, see Jerònimo *et al.* [2004].
Bone **FAAS** Carrier gas: air-acetylene (λ = 324.8 nm). Limit of detection not reported [Baranowska *et al.* 1995].
Hair **AAS** Gas flow: 2.3 mL/min. Hollow cathode lamp (λ = 324.7 nm). Limit of detection not reported [Chatterjee *et al.* 1994].

ETAAS Dry cycle: 80° to 120° in 10 s. Char cycle: 300° to 400° at 10 s. Atomisation cycle: 2700° to 2800° in 5 s. Carrier gas: 200 mL/min. Hitachi model 180-50, S.N.5721-2 (λ = 193.8 nm). Limit of detection, not reported [Kazi *et al.* 2006].

ICP-MS Plasma gas: 15 L/min. Auxiliary gas: 0.8 L/min. Nebuliser gas: 0.8 L/min. Limit of detection not reported [Samanta *et al.* 2004].
Note For a study following the trace element hair analysis of one man over 20 years, see Klevay *et al.* [2004].
Liver **ETAAS** Dry cycle: 120° at 30 s for 10 s, Ar, 3.0 L/min. Char cycle: 700° in 30 s for 10 s, Ar, 3.0 L/min. Atomisation cycle: 2600° in 1 s for 7 s, gas stop. Zinc hollow cathode lamp (λ= 324.8 nm). Limit of detection not reported [Treble *et al.* 1998]
Nail **ICP-MS** See Hair [Samanta *et al.* 2004].
Teeth **ICP-AES** Perkin-Elmer Plasma 40 Spectrometer (λ = 324.8 nm). Limit of detection not reported [Chew *et al.* 2000].
Synovial Fluid **ICP-MS** Coolant gas: Ar, 15.0 L/min. Auxiliary gas: 0.99 L/min. Nebuliser gas: 1.0 L/min. Limit of detection, low ng/L [Krachler *et al.* 2000a].
Colostrum **ETAAS** Dry cycle: 50° to 120° at 20 s for 20 s. Char cycle: 120° to 900° in 30 s for 30 s. Atomisation cycle: 1600° for 7 s. Limit of detection, 0.71 µg/L [Turan *et al.* 2001].
Milk **ICP-AES** Cooling gas: 13 L/min. Auxiliary gas: 0.5 L/min. Meinhard nebuliser (λ = 324.8 nm). Limit of detection, 0.012 mg/kg [Silva *et al.* 1997].

ICP-MS Plasma gas: 12 to 13 L/min. Auxiliary gas: 0.9 to 1.0 L/min. Sample gas: 1.0 to 1.2 L/min. Limit of detection, 180 µg/L [Krachler *et al.* 2000b].
Ascitic Fluid **ETAAS** Dry cycle: 60° to 90° in 15 s for 5 s to 100° in 10 s for 5 s to 110° in 15 s for 5 s to 140° for 5 s, 200 mL/min. Char cycle: 140° to 800° in 10 s for 20 s, 100 mL/min. Atomisation cycle: 2400° for 4 s. Lamp current: 10.0 mA (λ = 324.8 nm). Limit of detection, 0.4 µg/L [Milacic, Benedik 1999; Scancar *et al.* 1999].
Iliac Crest **ETAAS** Dry cycle: 60° to 90° in 10 s for 5 s to 100° in 10 s for 5 s to 150° in 10 s, 200 mL/min. Char cycle: 150° to 1000° in 10 s for 20 s, 100 mL/min. Atomisation cycle: 2700° for 4 s. Lamp current: 10.0 mA (λ = 324.8 nm). Limit of detection, 0.4 µg/L [Scancar *et al.* 2000].
Thyroid Tissue **FAAS** ATI UNICAM hollow cathode lamp. Limit of quantification, 70 ppb [Yaman, Akdeniz 2004].
Other **DPASV** Yemeni Khat. Limit of detection, 2.8 µg/kg [Matloob 2003].

ETAAS Eggs and Chicken Feed. Dry cycle: 120° at 1 s for 50 s. Char cycle: 1400° in 1 s for 30 s to 20° in 1 s for 5 s; Ar, 300 mL/min. Atomisation cycle: 2300° for 5 s (gas stop). Limit of detection, 0.74 mg/kg [Fakayode, Olu-Owolabi 2003]. Cocaine samples. Char cycle: 1300°. Atomisation cycle: 2400° (λ = 324.8 nm). Limit of detection not reported [Bermejo-Barrera *et al.* 1999].

ICP-AES Argentine wine. Outer gas: 8.5 L/min. Auxiliary gas: 1.0 L/min. Nebuliser gas: 1.0 L/min. (λ = 324.7 nm). Limit of detection, 40 ng/L [Lara *et al.* 2005].

ICP-MS Meals from Catering Establishments. Plasma gas: 15 L/min. Auxiliary gas: 0.9 L/min. Nebuliser gas: 0.73 L/min. Limit of quantification, 46 µg/kg [Noel *et al.* 2003].
Note For a study characterising copper in the uterine fluid of patients using the copper T-380A intrauterine device, see Arancibia *et al.* [2003].

Disposition in the Body Copper is absorbed from the gastrointestinal tract bound to amino acids or as ionic copper. Average absorption efficiencies in healthy adults range from 25 to 60%, although numerous factors affect this process, including the amount of copper in the diet, competition with other metals (zinc, iron and cadmium), and age. Roughly 80% of absorbed copper is excreted into the bile. Intestinal excretion into the bowel accounts for a further 18% and 2 to 4% appears in the urine. A small proportion of the copper taken into the liver is tightly bound to ceruloplasmin and this form accounts for over 90% of the copper present in serum. Copper is an essential element required for the normal functioning of at least 30 enzymes. The ability of copper to cycle between an oxidised state and a reduced state is used by cuproenzymes involved in redox reactions. However, it is this very property which poses a potential toxicity risk, as the transitions between oxidation states can generate superoxide radicals and hydroxyl radicals.
Normal Concentrations Serum—0.7 to 1.6 mg/L (11 to 25 µmol/L); urine—< 50 µg/day (0.8 µmol/day); brain—5.1 to 8.3 mg/kg; kidney—1.2 to 3.1 mg/kg; liver—3.0 to 9.5 mg/kg; muscle—0.6 to 1.0 mg/kg; spleen—0.2 to 2.1 mg/kg.
Concentrations in Copper-Related Liver Disease (Wilson's Disease) Serum—<0.4 mg/L; urine—>100 µg/day.
Toxicity Acute occupational inhalation of copper fumes or copper dust causes respiratory problems and aching muscles. In a group of workers occupationally

exposed to copper, serum levels averaged 1.26 mg/L [Cohen 1974]. Chronic occupational copper poisoning leads to nausea, vomiting, nervous disorders and hepatomegaly, and serum copper levels of 0.8 to over 2.0 mg/L have been reported [Suciu *et al.* 1977]. In cases of severe copper poisoning following ingestion of soluble salts (10 to 20 g), blood copper concentrations average ~8 mg/L [Chuttani *et al.* 1965].

An 18-month-old boy was admitted to hospital 1 h after dinking a solution containing ~3 g cupric sulfate. His serum copper concentration was 16.5 mg/L, which decreased to 2.3 mg/L 24 h later [Walsh *et al.* 1977].

In 27 patients with acute copper sulfate poisoning, 11 developed renal failure. In these 11 patients serum copper concentrations ranged from 1.15 to 3.9 mg/L [Chugh *et al.* 1977].

A person ingested an unknown quantity of wood-preserving solution containing large amounts of copper sulfate and sodium dichromate, with a smaller but substantial amount of an arsenic compound. Concentrations of copper in various tissues were reported as follows:

Tissue	*Concentration (μg/kg)*
Blood	5.5
Brain	63
Heart	3.7
Kidney	17.5
Liver	56
Lung	11.2
Spleen	3.8
Stomach	33
Urine	1.5 (mg/L)

[Cross *et al.* 1979].

A 58-year-old white woman died 18 h after admission to hospital. Postmortem examination revealed in the stomach 275 US coins, amounting to $14.84. Kidney and liver copper concentrations were 963 and 1160 mg/kg, respectively. Concentrations of nickel, chromium,and lead were within normal ranges [Yelin *et al.* 1987].

A 58-year-old man was found dead. Copper concentrations in tissues at postmortem were as follows:

Tissue	*Concentration (mg/kg or mg/L)*
Bile	2.8
Blood	13.8
Kidney	41.4
Liver	35.1
Lung	33.7
Stomach contents	2988

Concentrations of zinc and cadmium were within the normal range [Kurisaki *et al.* 1988].

A 48-year-old woman went to a witch-doctor (*iNyanga*) where she was administered a concoction of salt, vinegar, sugar, methylated ethanol and copper sulfate. She lapsed into a coma and died ~48 h later. During this time she was given additional medication that may have contained more copper sulfate. At postmortem, her blood copper concentration was 42 mg/L [Lamont, Duflou 1988].

An 11-year-old girl accidentally drank a solution containing 29 mg/L copper sulfate. Copper concentrations in her stomach contents were 240 mg/L, antemortem serum 25 mg/L, antemortem blood 16 mg/L, and postmortem blood 66 mg/L [Gulliver 1991; Mucklow 1997].

A 47-year-old man attempted suicide by injecting copper sulfate, both IV and SC. He was given haemodialysis for acute renal failure. His serum and dialysate copper levels were as follows:

Time	*Serum copper*		*Dialysate copper*	
	Pre-dialysis (μg/L)	*Post-dialysis (μg/L)*	*Pre-dialysis (μg/L)*	*Post-dialysis (μg/L)*
Day 1	180	165	20	25
Day 3	165	168	28	23

[Oldenquist, Salem 1999].

A 25-year-old woman ingested ≈25 diazepam 2.5 mg tablets. She was given 2.5 g cupric sulfate in 1.75 L water as an emetic. She died 3 days later. Postmortem copper concentrations were as follows:

Tissue	*Concentration (mg/kg or mg/L)*
Whole blood	5.31
Brain	1.1
Colon wall	0.3
Gastric contents	4.6
Gastric wall	1.1
Intestinal contents	12.6
Jejunal wall	1.5
Kidney	8.9
Liver	19.0

[Liu *et al.* 2001].

Note For a study of copper levels in the CSF of patients with multiple sclerosis, see Melo *et al.* [2003]; in the blood, serum and red blood cells of patients with motor neuron disease, see Pamphlett *et al.* [2001].·Rahil-Khazen *et al.* [2002] have studied trace element levels in the postmortem tissue of 30 Norwegians. For a case of suicide by ingesting a chromated copper arsenate wood preservative, see Hay *et al.* [2000]. For a report warning against preparing acidic drinks in copper urns, see Gill, Bhagat [1999]. For concentrations in the urine of glass-manufacturing workers, see Apostoli *et al.* [1998] and Arai *et al.* [1994]. For a review of the detection and monitoring of disorders of copper and other trace elements, see Taylor [1996]; for a study on the environmental influences on the trace element content of teeth, see Brown *et al.* [2004]. For a residential exposure to copper naphthenate, see Bluhm *et al.* [1992]. For 4 fatal poisonings following the ingestion of 'spiritual water', see Akintonwa *et al.* [1989]. For a case study on the fatal accidental ingestion of Clinitest (20 mg copper sulfate, 300 mg citric acid, 232.5 mg sodium hydroxide and 80 mg sodium carbonate), see O'Connor *et al.* [1984].

Half-life 26 days.

Volume of Distribution 2.0 L/kg.

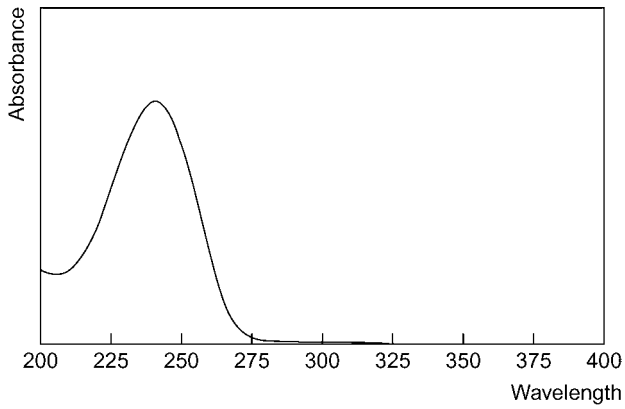
Chemical Properties Crystals. Mp 217° to 224°, with some decomposition. Very slightly soluble in water; fairly soluble in ethanol and acetone; sparingly soluble in chloroform and ether. Log *P* (octanol/water), 1.5.

Cortisone Acetate

$C_{23}H_{30}O_6 = 402.5$
CAS—50-04-4
Synonym Cortisone 21-Acetate
Note The name Cortisol is also applied to hydrocortisone.
Proprietary Names *Adreson*; *Cortate*; *Cortelan*; *Cortisol*; *Cortison*; *Cortistab*; *Cortisyl*; *Cortone*; *Cortone Acetate*; *Sterop*.
Chemical Properties A white crystalline powder. Mp 235° to 238°, with decomposition. Soluble 1 in 5000 of water, 1 in 300 to 1 in 350 of ethanol, and 1 in 4 of chloroform; slightly soluble in ether.

Colour Tests Naphthol–sulfuric acid—orange-brown/orange; sulfuric acid—yellow (green fluorescence under UV light).
Thin-layer Chromatography Cortisone acetate: system TA—R_f 0.90; system TB—R_f 0.03; system TE—R_f 0.68; system TP—R_f 0.72; system TQ—R_f 0.28; system TR—R_f 0.55; system TS—R_f 0.00; system TAE—R_f 0.87; system TAJ—R_f 0.51; system TAK—R_f 0.09; system TAL—R_f 0.83; system TAM—R_f 0.91 (DPST solution).
High Performance Liquid Chromatography System HT—*k* 2.4; system HY—RI 372.
Ultraviolet Spectrum Cortisone acetate: ethanol—240 nm (A_1^1=390a).



Infrared Spectrum Principal peaks at wavenumbers 1700, 1660, 1235, 1720, 1275, 1750 cm^{-1} (cortisone acetate, KBr disk).
Quantification
Plasma **HPLC** Fluorescence detection. Limit of detection, 0.1 mg/L [Shibata *et al.* 1998].
Urine **HPLC** MS/MS. Limit of detection, 2 mg/L [Taylor *et al.* 2002] and see Plasma.
Hair **HPLC** MS. Limit of detection, 0.03 to 0.17 mg/g [Cirimele *et al.* 2000].
Dose 25 to 50 mg of cortisone acetate daily.

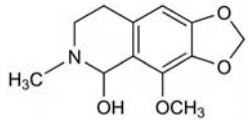
Cortisone

Corticosteroid
$C_{21}H_{28}O_5 = 360.4$
CAS—53-06-5
IUPAC Name (8*S*,9*S*,10*R*,13*S*,14*S*,17*R*)-17-Hydroxy-17-(2-hydroxyacetyl)-10,13-dimethyl-1,2,6,7,8,9,12,14,15,16-decahydrocyclopenta[*a*]phenanthrene-3,11-dione
Synonyms Compound E; 11-dehydro-17-hydroxycorticosterone; 17,21-dihydroxypregn-4-ene-3,11,20-trione.

Cotarnine

Haemostatic
$C_{12}H_{15}NO_4 = 237.3$
CAS—82-54-2
IUPAC Name 4-Methoxy-6-methyl-7,8-dihydro-5*H*-[1,3]dioxolo[4,5-*g*]isoquinolin-5-ol
Synonym 5,6,7,8-Tetrahydro-4-methoxy-6-methyl-1,3-dioxolo[4,5-*g*]isoquinolin-5-ol

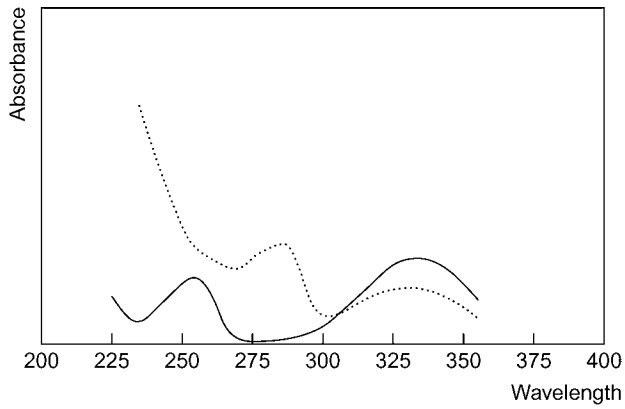


Chemical Properties An alkaloid obtained by oxidising noscapine with nitric acid. Crystals. Mp 132° to 137°, with decomposition. Slightly soluble in water; soluble in dilute acids, ethanol, chloroform, benzene, and ether. Log *P* (octanol/water), 0.6.

Cotarnine Chloride

$C_{12}H_{14}ClNO_3$, $2H_2O$ = 291.7
CAS—10018-19-6 (anhydrous); 16210-52-9 (dihydrate)
Synonyms Cotarnine hydrochloride; stypticine.
Chemical Properties A pale yellow deliquescent powder. Mp 197°. When heated to decomposition, highly toxic fumes are evolved. Soluble in water, ethanol, and chloroform; practically insoluble in ether.

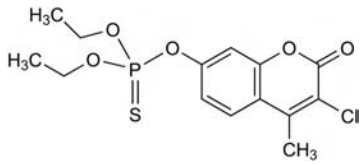
Colour Tests Liebermann's reagent—black; Mandelin's test—red-orange→brown.
Thin-layer Chromatography System TA—R_f 0.02; system TB—R_f 0.38; system TC—R_f 0.01; system TE—R_f 0.26; system TL—R_f 0.00; system TAE—R_f 0.01; system TAF—R_f 0.22 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1808.
High Performance Liquid Chromatography System HA—*k* 8.2 (tailing peak).
Ultraviolet Spectrum Aqueous acid—253 (A_1^1=582b), 332 nm (A_1^1=666b); aqueous alkali—286, 330 nm.



Infrared Spectrum Principal peaks at wavenumbers 1605, 1086, 1490, 1655, 1505, 1300 cm^{-1} (cotarnine chloride, KCl disk).
Dose Cotarnine chloride was formerly given in doses of 20 to 100 mg.

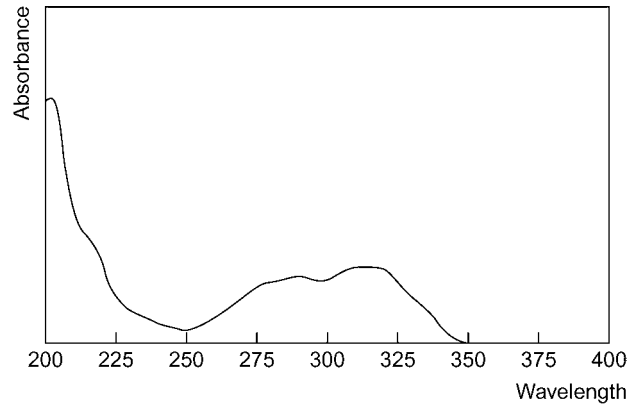
Coumaphos

Ectoparasiticide, Insecticide, Nematocide
$C_{14}H_{16}ClO_5PS$ = 362.8
CAS—56-72-4
IUPAC Name 3-Chloro-7-diethoxyphosphinothioyloxy-4-methylchromen-2-one
Synonyms Bayer 21/199; coumafos; ENT 17957; OMS 485; phosphorothioic acid *O*-(3-chloro-4-methyl-2-oxo-2*H*-1-benzopyran-7-yl) *O*,*O*-diethyl ester.
Proprietary Names *Agridip*; *Asunthol*; *Baymix*; *Checkmite*; *Co-Ral*; *Diolice*; *Meldane*; *Muscatox*; *Negasunt*; *Perizin*; *Resitox*; *Suntol*; *Umbethion*.

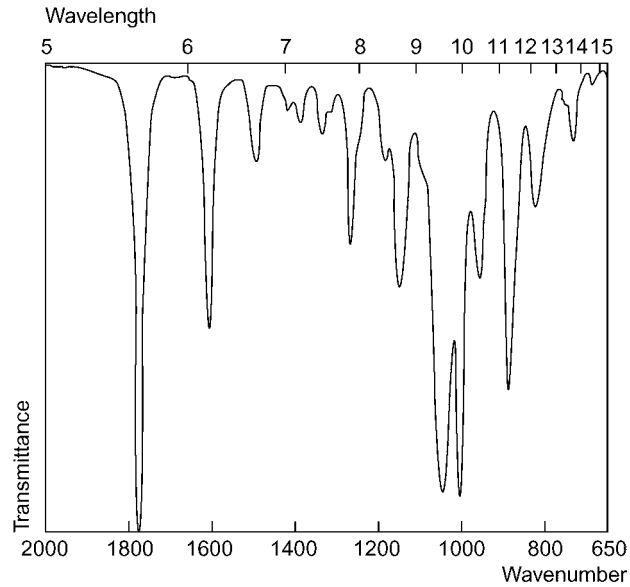


Chemical Properties A white to tan to grey-coloured crystalline solid. Mp 95° to 92° in the technical state). It is practically insoluble in water; limited solubility in most organic solvents; soluble in chloroform. Log *P* (octanol/water), 4.13.
Thin-layer Chromatography System TX—R_f 0.27; system TY—R_f 0.61.
Gas Chromatography System GA—RI 2573.

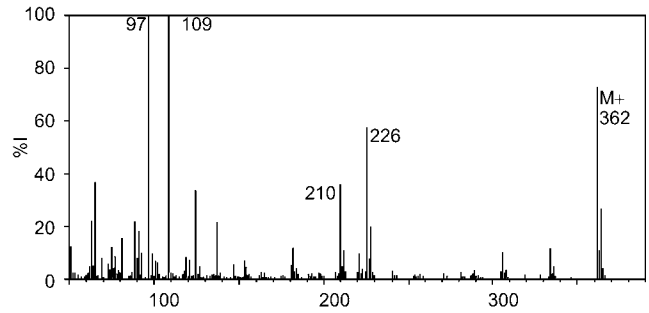
Ultraviolet Spectrum



Infrared Spectrum Principal peaks at wavenumber 1774, 1046, 1004, 888, 1609, 1151 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 97, 109, 362, 226, 65, 210, 125, 137.

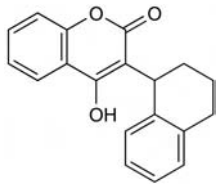


Disposition in the Body Coumaphos is readily absorbed through the skin. It is rapidly broken down in the body into non-toxic products which are eliminated via urine (the majority) and faeces. There is no evidence of bioaccumulation.
Toxicity Coumaphos is highly toxic if ingested or inhaled, and is moderately toxic via skin contact and if administered via IP routes.

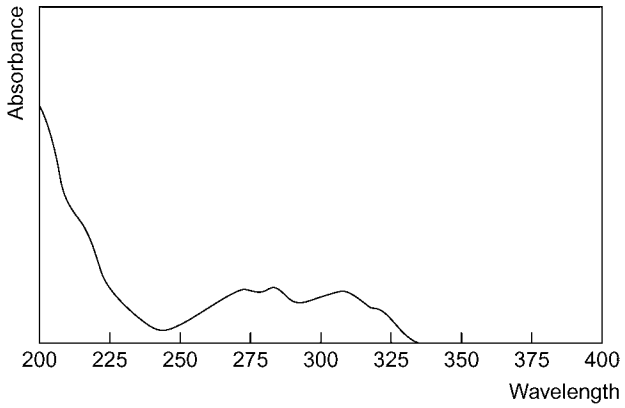
Coumatetralyl

Rodenticide
$C_{19}H_{16}O_3$ = 292.3
CAS—5836-29-3

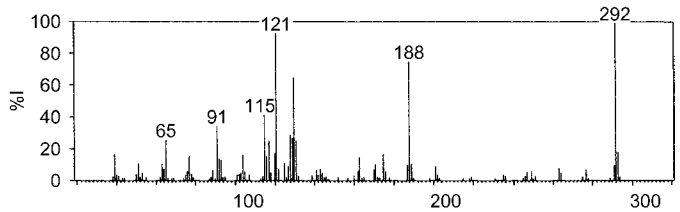
IUPAC Name 2-Hydroxy-3-(1,2,3,4-tetrahydronaphthalen-1-yl)chromen-4-one
Synonym 4-Hydroxy-3-(1,2,3,4-tetrahydro-1-naphthyl)coumarin
Proprietary Name *Racumin*



Chemical Properties A yellowish-white crystalline powder. Mp 172° to 176°. Practically insoluble in water; soluble in ethanol and acetone; slightly soluble in ether. pK_a 4.8. Log *P* (octanol/water), 3.5.
Thin-layer Chromatography System TD—R_f 0.73; system TE—R_f 0.13; system TF—R_f 0.74; system TX—R_f 0.14; system TY—R_f 0.30 (location under UV light, pink fluorescence; acidified potassium permanganate solution, positive).
Gas Chromatography System GA—coumatetralyl RI 2635, coumatetralyl-HY RI 2250, coumatetralyl-Me-HY RI 2300, coumatetralyl isomer-1-Me RI 2655, coumatetralyl isomer-2-Me RI 2690, M (OH-) isomer-1-Me RI 2910, M (OH-) isomer-2-Me_2 RI 2925, M (OH-) isomer-3-Me_2 RI 2935, M (OH-) isomer-4-Me_2 RI 2990, M (di-OH-) isomer-1-Me_2 RI 3005, M (OH-methoxy-)-Me_2 RI 3070, M (di-OH-) isomer-2-Me_2 RI 3085, M (di-OH-) isomer-3-Me_3 RI 3105, M (tri-OH-)-H_2O-Me_2 RI 3175.
High Performance Liquid Chromatography System HY—RI 598; system HAA—retention time 5.0 min.
Ultraviolet Spectrum Aqueous acid—273, 283, 309 nm; aqueous alkali—311 nm.



Infrared Spectrum Principal peaks at wavenumbers 1615, 762, 740, 1685, 1250, 1570 cm^{-1}.
Mass Spectrum Principal ions at *m/z* 292, 121, 188, 130, 115, 91, 128, 129.



Quantification
Blood **TLC** Limit of quantification, 0.5 mg/L. Limit of detection, 0.2 mg/L [Berny *et al.* 1995].
Serum **HPLC** Fluorescence detection (λ_{ex}=318 nm; λ_{em}=390 nm). 1 mg/L [Chalermchaikit *et al.* 1993].
Liver **TLC** Limit of detection, 0.2 mg/g, see Blood [Berny *et al.* 1995].
HPLC 1 ng/g, see Serum [Chalermchaikit *et al.* 1993].

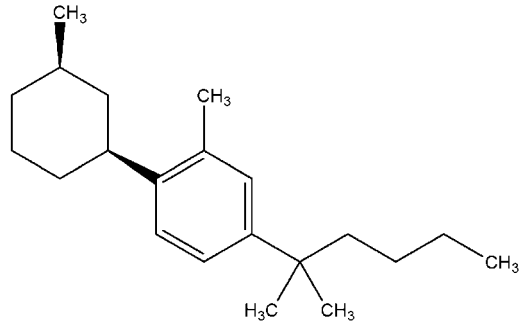
CP 47,497

Analgesic, Cannabinoid Agonist
$C_{21}H_{34}O_2$ = 318.5
CAS—70434-82-1

IUPAC Name 1-[(1*R*,3*S*)-3-Hydroxycyclohexyl]-5-(2-methyloctan-2-yl)phenol



Chemical Properties Scientific research tool developed by Pfizer as a potent agonist of the cannabinoid CB1 receptor. It is the main active ingredient of the herbal incense known as Spice, specifically the 1,1-dimethyloctyl homologue. It is illegal in France and Germany.
Mass Spectrum Principal peak at *m/z* 301.
Quantification
Blood **LC-MS** MRM acquisition mode. Limit of quantification, 0.6 µg/L, limit of detection, 0.2 µg/L [Neukamm *et al.* 2009].
Urine **LC-MS** Enhanced product ion scan. Limit of detection not reported [Kraemer *et al.* 2009].
GC-MS EI ionisation. Limit of detection, not reported [Kraemer *et al.* 2009].
Hair **LC-MS** See Blood [Neukamm *et al.* 2009].
Other **LC-MS** Herbal Products. Column: UPLC HSS T3 (100 × 2.1 mm i.d., 1.8 µm). Mobile phase: 0.1% formic acid in acetonitrile : water, flow rate 0.3 mL/min. Limit of detection not reported [Uchiyama *et al.* 2009].

Kraemer T *et al.* (2009). Studies on the metabolism of JWH-018 and of a homologue of CP 47,497, pharmacologically active ingredients of different misused incense ('Spice') using GC-MS and LC-MS techniques. *Ann Toxicol Anal* 21(Suppl 1): S21–S22.
Neukamm MA *et al.* (2009). Quantitative determination of the active 'Spice' ingredient JWH-018 in blood and hair by liquid chromatography–tandem mass spectrometry. *Ann Toxicol Anal* 21: S1–21.

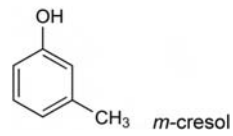
Cresol

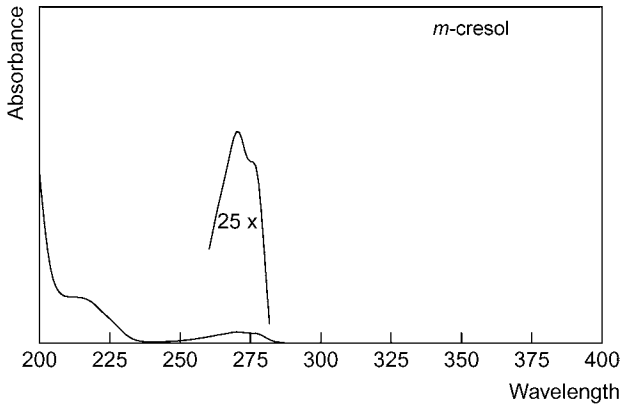
Disinfectant
$C_{21}H_{24}O_3$ = 324.4
CAS—1319-77-3; 95-48-7 (*o*-cresol); 108-39-4 (*m*-cresol); 106-44-5 (*p*-cresol)

Synonyms Cresylic acid; tricresol.
Proprietary Name It is an ingredient of *Lyseptol*.
Note The use of the name *Lysol* is limited. In some countries it is a trademark applied to a product of different composition.



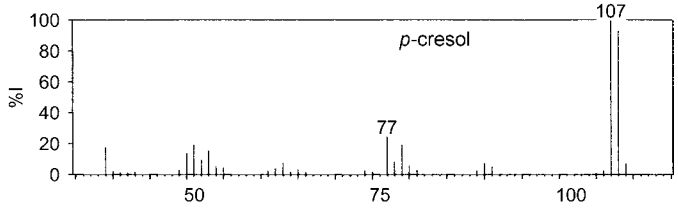
Chemical Properties Cresol is a mixture of *o*-, *m*-, and *p*-cresols ($CH_3C_6H_4OH$ = 108.1), in which the *m*-isomer predominates, and of other phenols obtained from coal tar. An almost colourless to pale brownish-yellow liquid, becoming darker with age or on exposure to light. Mass per mL 1.029 to1.044 g. Bp 195° to 205°. Almost completely soluble 1 in 50 of water; miscible with ethanol, benzene, chloroform, glycerol, petroleum ether, and ether. Soluble in solutions of fixed alkali hydroxides. pK_a *m*-cresol 10.1, *o*-cresol 10.3, *p*-cresol 10.3 (25°). Log *P* (octanol/water), 2.0.
Colour Tests Folin–Ciocalteu reagent—blue; Liebermann's reagent—black; potassium dichromate—brown (*o*-cresol 30 s, *m*-cresol 2 min); heat with about an equal quantity of phthalic anhydride and a few drops of sulfuric acid until the mixture is orange-brown; cool the mixture with a few drops of water and make alkaline with sodium hydroxide solution—red with *o*-cresol and blue-violet with *m*-cresol
Thin-layer Chromatography System TAJ—*m*-cresol RF 69, *o*-cresol RF 73, *p*-cresol RF 66; system TAK—*m*-cresol RF 78, *o*-cresol RF 82, *p*-cresol RF 78; system TAL—RF 96 *m*-, *o*-, *p*-cresol.
Gas Chromatography System GA—*m*-cresol RI 1065, *o*-cresol RI 1040, *p*-cresol RI 1060, *p*-cresol-AC RI 1110.

Ultraviolet Spectrum Aqueous alkali—239 (A^{1}_{1}=949b), 290 nm (A^{1}_{1}=251b); ethanol—275 (A^{1}_{1}=163b), 279 nm (A^{1}_{1}=145b).



Infrared Spectrum Principal peaks at wavenumbers 1209, 816, 1515, 741, 1176, 1105 cm^{-1} (*p*-cresol (Nujol mull)).

Mass Spectrum Principal ions at *m/z* 107, 108, 77, 79, 51, 39, 53, 50 (*p*-cresol).



Quantification

Blood **GC** FID. Limit of detection 20 mg/L [Bruce *et al.* 1976].

Serum **HPLC** Fluorescence detection (λ_{ex}=284 nm; λ_{em}=310 nm). Limit of detection *p*-cresol 0.14 mg/L [De Smet *et al.* 1998].

Urine **GC** FID [Amorim *et al.* 1997]. ECD [Dills *et al.* 1997] and see Blood.

HPLC UV detection (λ=270 nm). Limit of detection, 0.8 mg [Birkett *et al.* 1995]. UV detection (λ=271 nm). Limit of detection, 0.2 mg/L [Schlatter, Astier 1995].

Biological Fluids **GC** [Yashiki *et al.* 1990].

Faeces **HPLC** See Urine [Birkett *et al.* 1995].

Tissues **GC** See Blood [Bruce *et al.* 1976].

Disposition in the Body Absorbed after ingestion, and through the skin and mucous membranes. It is metabolised by conjugation and oxidation; *p*-cresol is endogenously produced in normal subjects, and may be present in urine at concentrations of 20 to 200 mg/L (mainly in conjugated form).

Toxicity The estimated minimum lethal dose is 2 g, and the maximum permissible atmospheric concentration is 5 ppm.

In 2 fatalities due to the ingestion of cresol, the following postmortem tissue concentrations were reported: blood 71, 190 mg/L; brain 2.8, – μg/g; kidney 396, – μg/g; liver 900, 480 μg/g; urine –, 304 mg/L [Bruce *et al.* 1976].

A 65-year-old man with schizophrenia died 15 min after he ingested a large volume of saponated cresol solution. Free *p*-cresol was detected in heart blood at a concentration of 458.8 mg/L and *m*-cresol at 957.3 mg/L; and the glucuronic acid conjugated forms at 38.2 and 85.6 mg/L, respectively. 250 mL of a cresol-odour-emitting fluid was also present in the stomach [Monma-Ohtaki *et al.* 2002].

A 46-year-old man ingested 100 mL of saponated cresol solution and was admitted to hospital. The serum concentrations of *p*-cresol and *m*-cresol were 43.3 mg/g and 73.8 mg/g, respectively, and the total concentration of cresol was 117 mg/g. Although levels were in the fatal ranges the individual recovered after hospital treatment [Yashiki *et al.* 1990].

CR Gas

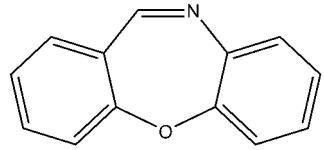
Benzodiazepine, Riot Control Agent

$C_{13}H_9ON$ = 195.2

CAS—257-07-8

IUPAC Name Dibenz[b][1,4]oxazepine

Synonyms Dibenz[b,f][1,4]oxazepine; dibenzoxazepine; tear gas.



Chemical Properties Odourless pale yellow solid; also reported as white solid. Mp 72°. Bp 335°. Sparingly soluble in water (3.73 mg/L). Soluble in organic solvents including chlorinated organics. Chemically stable in organic solvents. Log *P* (octanol/water), 3.49. CR hydrolyses slowly in water. CR riot control agent formulations generally consist of 0.1% CR dissolved in a solution of 80 parts of propylene glycol and 20 parts water. It may persist for prolonged periods in the environment because of the aqueous stability of benzodiazepines in aqueous media [Meylan, Howard 1995; Olajos, Salem 2001]. CR is the parent compound of the antipsychotic drug loxapine [Blain 2003].

Disposition in the Body CR metabolism has not been elucidated in humans owing to the very high sensitivity of humans to the irritant properties of CR. Animal studies have shown that aerosols of CR are rapidly absorbed from the respiratory tract, with a plasma half-life after inhalation exposure of ~5 min. It is readily absorbed by the cornea and corneal homogenates and metabolised to a lactam derivative. Studies in rats have shown that CR is rapidly absorbed from the gastrointestinal tract, undergoes hepatic metabolism, biliary secretion, enterohepatic circulation, and renal excretion. The major metabolic pathway of CR in the rat is oxidation to its more toxic lactam form, subsequent ring hydroxylation, sulfate conjugation and urinary excretion.

Toxicity CR is a potent sensory irritant of low toxicity. It is less toxic than CS or CN by all routes of exposure. Human ocular irritancy thresholds and toxicity estimates are reported as follows: irritancy threshold 0.002 mg/m^3, intolerable concentration 1 mg/m^3, lethal concentration (10 min exposure) 10 000 mg/m^3 [Olajos, Salem 2001]. The inhalation toxicity of chemical warfare agents, military chemicals, and riot control agents is, by convention, expressed by the notation Ct. It is defined as the product of the concentration in mg/m^3 multiplied by the exposure time (*t*) in minutes (mg·min/m^3). The terms LCt_{50} and ICt_{50} describe the airborne dosages that are lethal (L) or incapacitating (I) to 50% of the exposed population. The minimal irritant concentration estimate in humans is 0.002 mg·min/m^3, with LCt_{50} and ICt_{50} estimates reported as >100 000 mg·min/m^3 and ≈1 mg·min/m^3, respectively. Animal LCt_{50} (mg·min/m^3) values: mouse 169 500 to 203 600; rat 139 000 to 428 400; rabbit 160 000 to 169 000; guinea pig 169 500 [Olajos, Salem 2001]. Animal LD_{50} (mg/kg) values: rat 5900 (oral), 766 (IP), 68 (IV); mouse 112 (IV), 4000 (oral); rabbit 1760 (oral), 47 (IV); guinea pig 629 (oral), 463 (IP) [Ballantyne, Swanston 1978].

Note For reviews of riot control agents, see Blain [2003]; Hu *et al.* [1989]; Olajos and Salem [2001]; and Olajos and Stopford [2004].

Ballantyne B, Swanston DW (1978). The comparative acute mammalian toxicity of 1-chloroacetophenone (CN) and 2-chlorobenzylidene malononitrile (CS). *Arch Toxicol* 40: 75–95.

Cropropamide

Respiratory Stimulant

$C_{13}H_{24}N_2O_2$ = 240.3

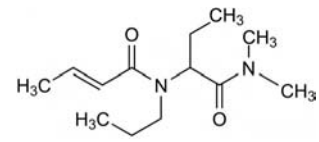
CAS—633-47-6 (cropropamide); 8015-51-8 (prethcamide)

IUPAC Name 2-[[(*E*)-But-2-enoyl]-propylamino]-*N*,*N*-dimethylbutanamide

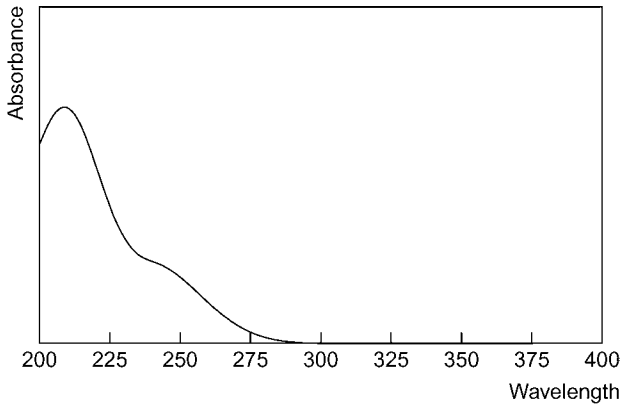
Synonym *N*-[1-[(Dimethylamino)carbonyl]propyl]-*N*-propyl-2-butenamide

Note It is an ingredient of Prethcamide, which is a mixture of equal parts (by weight of) cropropamide and crotetamide.

Proprietary Names It is an ingredient of *Micoren* and of *Respirot*.



Chemical Properties A liquid. Easily soluble in water and ether; miscible with ethanol. Log *P* (octanol/water), 1.6.
Thin-layer Chromatography System TA—R_f 0.70; system TB—R_f 0.29; system TC—R_f 0.69; system TE—R_f 0.74; system TL—R_f 0.57; system TAE—R_f 0.25; system TAF—R_f 0.83 (acidified potassium permanganate solution, positive).
Gas Chromatography System GA—RI 1738.
High Performance Liquid Chromatography System HZ—retention time 3.3 min.
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.

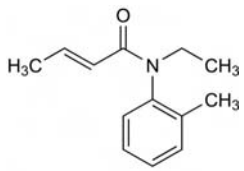


Infrared Spectrum Principal peaks at wavenumbers 1654, 1617, 1219, 1282, 1098, 1123 cm^{-1} (KBr disk).
Dose Prethcamide (cropropamide and crotetamide) is usually given in doses of 1.2 to 1.6 g daily.

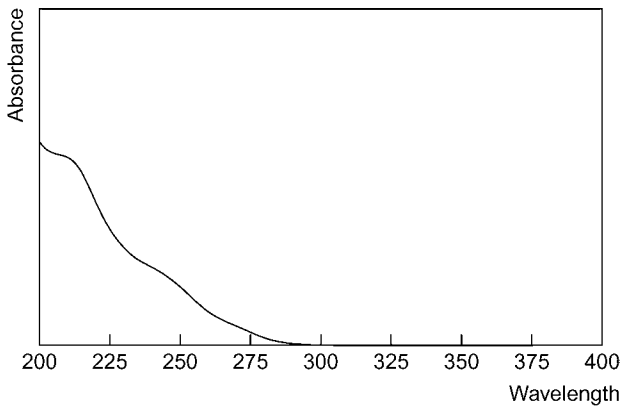
Crotamiton

Acaricide, Antipruritic
$C_{13}H_{17}NO = 203.3$
CAS—483-63-6

IUPAC Name *N*-Ethyl-*N*-(2-methylphenyl)-2-butenamide
Proprietary Names *Crotamitex*; *Eurax*; *Euraxil*.



Chemical Properties A colourless or pale yellow, oily liquid. Soluble 1 in 400 of water; miscible with ethanol, ether, and methanol. Log *P* (octanol/water), 2.7.
Thin-layer Chromatography System TA—R_f 0.83; system TE—R_f 0.83; system TAE—R_f 0.84 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1600.
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.

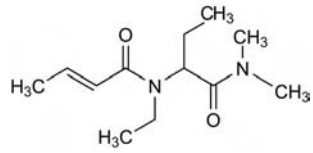


Infrared Spectrum Principal peaks at wavenumbers 1656, 1623, 1235, 1280, 1316, 1590 cm^{-1} (thin film).
Use Topically in a concentration of 10%.

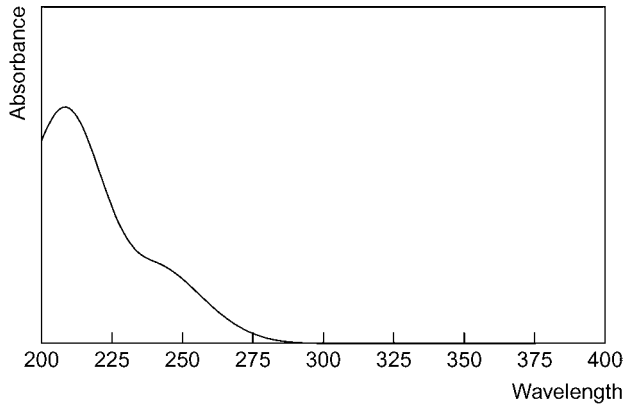
Crotetamide

Respiratory Stimulant
$C_{12}H_{22}N_2O_2 = 226.3$
CAS—6168-76-9 (crotetamide); 8015-51-8 (prethcamide)

IUPAC Name 2-[[(*E*)-But-2-enoyl]-ethylamino]-*N*,*N*-dimethylbutanamide
Synonyms Crotethamide; *N*-[1-[(dimethylamino)carbonyl]propyl]-*N*-ethyl-2-butenamide.
Proprietary Names It is an ingredient of *Micoren* and of *Respirot*.



Chemical Properties A liquid. Easily soluble in water and ether; miscible with ethanol. Log *P* (octanol/water), 1.1.
Thin-layer Chromatography System TA—R_f 0.68; system TB—R_f 0.28; system TC—Rf 67; system TE—R_f 0.69; system TL—R_f 0.55; system TAE—R_f 0.83; system TAF—R_f 0.79 (acidified potassium permanganate solution, positive).
Gas Chromatography System GA—RI 1688.
High Performance Liquid Chromatography System HX—RI 366; system HZ—retention time 2.6 min.
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.

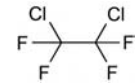


Infrared Spectrum Principal peaks at wavenumbers 1655, 1617, 1234, 1098, 1282, 1123 cm^{-1} (KBr disk).
Dose See under Cropropamide.

Cryofluorane

Aerosol Propellent, Refrigerant
$CClF_2{\cdot}CClF_2 = 170.9$
CAS—76-14-2

IUPAC Name 1,2-Dichloro-1,1,2,2-tetrafluoroethane
Synonyms Dichlorotetrafluoroethane; propellent 114; refrigerant 114; tetrafluorodichloroethane.
Proprietary Names *Arcton 33*; *Arcton 114*.

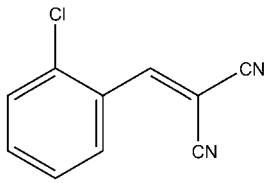


Chemical Properties A colourless non-flammable gas which, when liquefied by compression, forms a clear colourless liquid. Bp about 3.5°. In the liquid state it is practically immiscible with water, but miscible with dehydrated alcohol. Log *P* (octanol/water), 2.8.
Gas Chromatography System GA—RI 361; system GI—Retention time 2.0 min.
Mass Spectrum Principal ions at *m/z* 85, 135, 87, 137, 31, 101, 100, 50.

CS Gas

Organonitrile, Riot Control Agent
$C_{10}H_5ClN_2 = 188.6$
CAS—2698-41-1

IUPAC Name [(2-Chlorophenyl)methylene]propanedinitrile
Synonyms *o*-Chlorobenzalmalononitrile; *o*-chlorobenzylidenemalononitrile; β,β-dicyano-*o*-chlorostyrene.
Proprietary Names *Paralyzer*. It is also an ingredient of *Sabre*.



Chemical Properties White crystalline solid with pungent pepper-like odour. Mp 95° to 96°. Bp 310° to 315°. Sparingly soluble in water; soluble in acetone, dioxane, methylene chloride, ethyl acetate, benzene [O'Neil *et al.* 2006]. Log *P* (octanol/water), 2.75 [Meylan, Howard 1995]. CS can be disseminated as a dry powder (by thermal or explosive methods), via spraying of the molten material, or in solution with inorganic solvents. CS exists in three forms: CS (pure form), CS1 and CS2 (mixtures of the crystalline agent and an aerogel). CS2 contains 95% micronised CS, 5% Cab-o-Sil and 1% hexamethyldisilazane. CS hydrolyses slowly to *o*-chlorobenzaldehyde and malononitrile. Chemically, CS is the most persistent of the lachrymatory agents and will adsorb on to most porous surfaces [Olajos, Salem 2001]. CS is an SN_2 alkylating agent that reacts directly with nucleophilic sites [Ballantyne, Swanston 1978].
Note For a study of the thermal degradation products of CS at elevated temperatures, see Kluchinsky *et al.* [2002].
Mass Spectrum Principal ions at *m/z* 153, 183, 126, 75, 50, 161, 99, 137.

Quantification

Other **TLC** Rat Urine. Plates: aluminium coated with silica gel H-60 (20 × 20 cm). Solvent system: dichloromethane : methanol : acetic acid (20 : 4 : 1). UV detection (with radioactive ink). R_f values: 2-chlorobenzaldehyde, 0.91; 2-chlorohippuric acid, 0.55; 2-chlorobenzylmercapturic acid, 0.63; 2-chlorobenzoic acid, 0.76; 2-chlorobenzyl alcohol, 0.85. Limit of quantification not reported [Rietveld *et al.* 1988].

GC-MS CS Canisters. Column: HP5-MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 37 cm/s. Temperature programme: 80° for 2 min to 275° at 15°/min. EI ionisation at 70 eV. Retention times: CS, 15.5 min; 2-chlorobenzaldehyde, 7.7 min; CS epoxide, 13.6 min; 3-quinolinecarbonitrile, 15.1 min; CS isomer, 16.4 min. Limit of quantification not reported [Smith *et al.* 2002].

Disposition in the Body Animal and human studies have shown that CS is readily absorbed from the respiratory tract and rapidly distributed by the blood throughout the body. CS and its main metabolites in blood (dihydro-CS and 2-chlorobenzaldehyde) have extremely short half-lives (CS blood half-life <30 s). Elimination of CS follows first-order kinetics, almost spontaneously hydrolysing to malononitrile, 2-chlorobenzyl malononitrile, 2-chlorobenzaldehyde, 2-chlorohippuric acid, thiocyanate and cyanide. CS and its metabolites can be detected in blood following inhalation exposure, but only after high doses. Intravenous and intragastric studies have shown that the majority of the administered dose is eliminated in the urine. Major urinary metabolites include 2-chlorohippuric acid, 1-*O*-(2-chlorobenzyl)glucuronic acid, 2-chlorobenzyl cysteine and 2-chlorobenzoic acid. Theories have been postulated that some of the toxic effects attributed to CS may arise from the conversion of CS to cyanide but this does not seem likely since a 1-min CS exposure to an intolerable level (10 mg/m^3) produces less cyanide than 2 inhalations of a cigarette. Furthermore, significant amounts of free cyanide do not appear in the plasma.

Toxicity CS produces harassing effects principally on the eyes (excessive tearing and discomfort), which usually resolve within 20 min. Human ocular irritancy thresholds and toxicity estimates are reported as follows: irritancy threshold 0.004 mg/m^3, intolerable concentration 3 mg/m^3, lethal concentration (10 min exposure) 2500 mg/m^3 [Olajos, Salem 2001]. The inhalation toxicity of chemical warfare agents, military chemicals, and riot control agents is, by convention, expressed by the notation Ct. It is defined as the product of the concentration in mg/m^3 multiplied by the exposure time (*t*) in minutes (mg·min/m^3). The terms LCt_{50} and ICt_{50} describe the airborne dosages that are lethal (L) or incapacitating (I) to 50% of the exposed population. The minimal irritant concentration estimate in humans is 0.004 mg·min/m^3, with LCt_{50} and ICt_{50} estimates reported as from 25 000 to 150 000 mg·min/m^3 and 5 mg·min/m^3, respectively. The maximum tolerable concentration in humans is estimated at <10 mg/m^3 (also as 3 mg/m^3) and the lethal concentration 2500 mg/m^3. Animal LCt_{50} values (mg·min/m^3) from acute exposures to CS dispersed from 10% CS in methylene dichloride: rats 1 004 000; mice 627 000; guinea pigs 46 000; doses of up to 30 000 were not lethal to monkeys. Animal LCt_{50} values (mg·min/m^3) from exposures to CS dispersed from thermal grenades: rats 164 000; guinea pigs 36 000. LCt_{50} values (mg·min/m^3) for acute exposure to CS2: rats 68 000; guinea pigs 49 000; dogs 70 000; monkeys 74 000. [Olajos, Salem 2001]. LD_{50} in rats (mg/kg): 28 (IV), 48 (IP), 1366 (oral) [Ballantyne, Swanston 1978]. CS is 10 times more potent as a lachrymator than CN (1-chloroacetophenone) but is less toxic [Blain 2003]. OSHA air monitoring/exposure levels for CS are 0.05 ppm for the permissible exposure limit (PEL) and 2 mg/m^3 for the immediately dangerous to life (IDLH) limit. Owing to its poor water solubility, CS-containing formulations usually comprise solvents as carriers as well as some kind of propellant gas. It is worth noting that some solvents may contribute to unwanted effects of CS use, such as corneal erosion, skin blistering, or even neurotoxicity. At the time of writing, in spite of its extensive use, there have been no verified causes of death in humans following CS application [Olajos, Stopford 2004].

Six male volunteers were exposed to CS at concentrations of 0.5 to 1.5 mg/m^3 for 90 min. Neither CS nor 2-chlorobenzaldehyde was detected in the blood, and only in 1 volunteer was a trace of 2-chlorobenzyl malononitrile detected [Leadbeater 1973].

Note For a study of absorption, metabolism, and toxicokinetics of 2-chlorobenzaldehyde in rats, see Rietveld *et al.* [1983] and Rietveld *et al.* [1988]. For reviews of riot control agents, see Blain [2003]; Hu *et al.* [1989]; Olajos, Salem [2001]; and Olajos and Stopford [2004]. For a review and assessment of the toxicology and carcinogenesis of CS2 in rats and mice, see National Toxicology Program [1990]. For a study of the metabolism of CS in rats, see Brewster *et al.* [1987].
Dose Used as riot control agent having replaced CN gas (chloroacetophenone), which, in turn, replaced adamsite (DM).

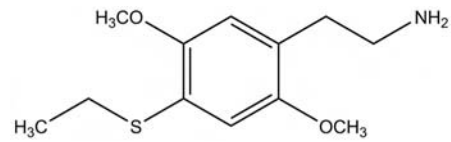
2C-T-2

5-HT$_{2A}$ Receptor Agonist, Hallucinogen, Phenethylamine
$C_{12}H_{19}NO_2S$ = 241.4
CAS—207740-24-7

Synonyms 2,5-Dimethoxy-4-ethylthiophenethylamine; 4-ethylsulfanyl-2,5-dimethoxyphenethylazan; 4-ethylthio-2,5-dimethoxyphenethylamine.

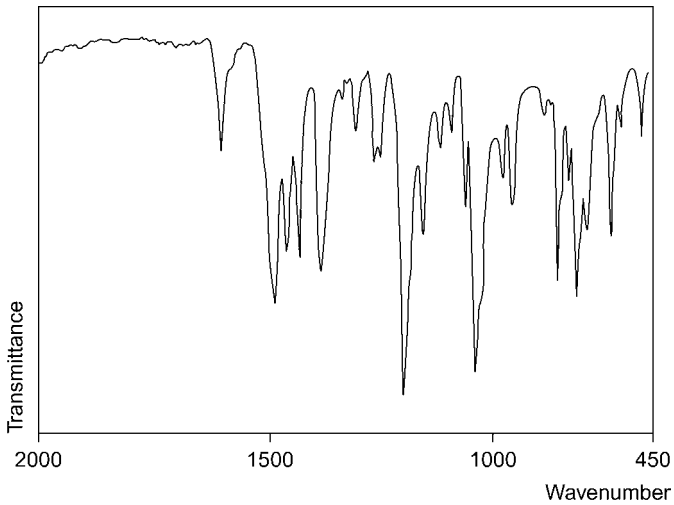


Chemical Properties Bp 120° to 130°.

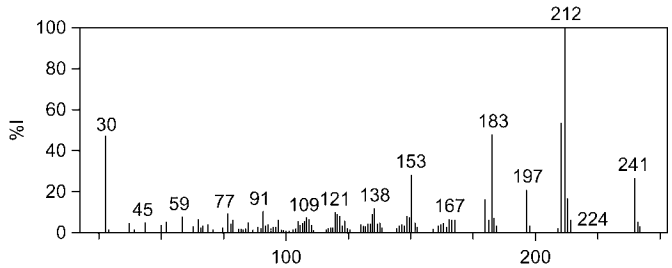
2C-T-2 Hydrochloride

$C_{12}H_{19}NO_2S$, HCl = 277.9
Synonym 2,5-Dimethoxy-4-ethylthiophenethylamine hydrochloride; 4-ethylsulfanyl-2,5-dimethoxyphenethylazan hydrochloride; 4-ethylthio-2,5-dimethoxyphenethylamine hydrochloride
Chemical Properties White crystalline solid. Mp 180°. No indication of instability of processed samples over a time period of 32 h. When the samples were freeze-thawed, the ratio of the means was within 90 and 110% for all analytes at high concentrations [Habrdova *et al.* 2005].

Colour Test Marquis test—light pink-orange.
Gas Chromatography-Mass Spectrometry Column: HP-5MS cross-linked phenylmethylsiloxane (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 70° for 1 min to 200° at 20°/min for 8.84 min. EI ionisation at 70 eV. Limit of detection, 5.1 mg/L [Tsai *et al.* 2006].
Capillary Electrophoresis Column: fused silica capillary (total/effective length: 96/90 cm for sweeping MEKC and 100/94 cm for stacking MEKC, 50 µm i.d.). Lamp: Xe. Fluorescence detection (λ_{ex} = 300 nm, λ_{em} = 340 nm). Limit of detection, 28.9 and 9.66 µg/L for sweeping and stacking MEKC, respectively [Tsai *et al.* 2006].
Infrared Spectrum Principal peaks at wavenumber 736, 809, 1036, 1384, 1489, 1204 cm^{-1} (hydrochloride).



Mass Spectrum Principal ions at *m/z* 72, 43, 30, 56, 151, 221, 41, 98 (HFB derivative).



Quantification

Plasma **GC-MS** Column: HP-5MS capillary 5% phenylmethylsiloxane (30 m × 0.25 mm i.d., 250 nm). Carrier gas: He, 1.1 mL/min. Temperature programme: 80° for 0.5 min to 310° at 30°/min for 2 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 5 µg/L [Habrdova *et al.* 2005].

Other **GC-MS** Microsomes. Column: HP-5MS capillary 5% phenylmethylsiloxane (30 m × 0.25 mm i.d., 250 nm). Carrier gas: He, 0.6 mL/min. Temperature programme: 50° for 3 min to 310° at 40°/min for 1 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection not reported [Theobald, Maurer 2007]. Rat Urine. Column: HP-1 capillary cross-linked methylsilicone (12 m × 0.2 mm i.d., 330 nm) Carrier gas: He, 1 mL/min. Temperature programme: 100° to 310° at 30°/min. EI ionisation at 70 eV, full scan mode. Limit of detection, 20 µg/L [Theobald *et al.* 2005]. Synthesised Sample. Column: Ultra-1 (12 m × 0.22 mm i.d, 0.25 µm). Temperature programme: 100° to 280° at 10°/min. EI ionisation. Limit of detection not reported [Poortman-van der Meer 1999].

CE Mouse Urine, Spleen and Thymus. Column: Fused silica capillary (50 or 75 µm i.d.). UV detection (λ= 290 nm). Limit of detection, 4500, 5000, 19.2 and 9.1 µg/L for CZE, MEKC, stacking MEKC and sweeping MEKC, respectively [Chiu *et al.* 2004].

Disposition in the Body Rat studies have indicated the presence of 4 metabolites in the urine; 2-(4-ethylthio-2,5-dimethoxyphenyl)-ethanol (M_r 242), 4-ethylthio-2,5-dimethoxyphenyl acetic acid (M_r 256), 1-acetamino-2-(2-hydroxy-4-ethylthio-5-methoxyphenyl)-ethane (M_r 269), and 1-acetamino-2-(2-methoxy-4-ethylthio-5-hydroxyphenyl)-ethane [Lin *et al.* 2003]. There are no published human data.

Toxicity At the time of writing (2007), there are no published data regarding non-fatal or fatal 2C-T-2 intoxication. In addition, there is no published pharmacological and toxicological information in humans. Subjective reports indicate it is a stimulant with hallucinogenic properties [Shulgin, Shulgin 1991].

Dose Threshold, 5 mg; light dose 10 to 15 mg; common dose 16 to 32 mg; strong dose 32 to 48 mg [Shulgin, Shulgin 1991].

2C-T-7

5-HT_2 Receptor Agonist, Hallucinogen, Phenethylamine

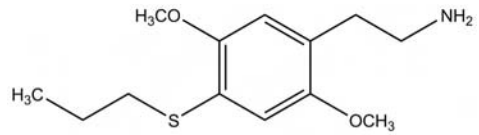
$C_{13}H_{21}NO_2S$=255.4

CAS—207740-26-9

IUPAC Name 2-(2,5-Dimethoxy-4-propylsulfanylphenyl)ethanamine

Synonyms 2,5-Dimethoxy-4-propylthiophenethylamine; 2-[2,5-dimethoxy-4-(propylthio)phenyl]ethanamine.

Street Names 7th Heaven; 7-Up; Beautiful; Lucky 7; Red Raspberry; T-7; Tripstasy; Tweety bird mescaline. Blue tablets with a 'Ying-Yang' logo containing 2C-T-7 have been sold as Blue Mystic in Dutch Smartshops.



Chemical Properties Mp 140° to 150°.

2C-T-7 Hydrochloride

$C_{13}H_{21}NO_2S$, HCl = 291.9

Synonyms 2-(2,5-Dimethoxy-4-propylsulfanylphenyl)ethanamine hydrochloride; 2,5-dimethoxy-4-propylthiophenethylamine hydrochloride; 2-[2,5-dimethoxy-4-(propylthio)phenyl]ethanamine hydrochloride.

Chemical Properties White crystalline solid. 2C-T-7 is stable for approximately 70 days in sodium fluoride-preserved blood when stored at 4° [Curtis *et al.* 2003].

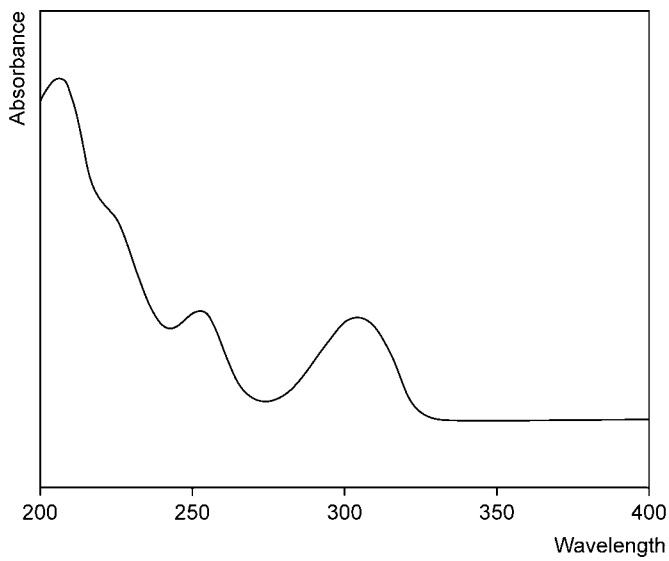
Colour Tests Marquis test—slow/weak 'salmon orange' (pink, orange red); Mecke's reagent—dark orange→dark purple-ish orange; sodium nitroprusside reagent—cherry red colour [Zimmerman 2001].

Gas Chromatography-Mass Spectrometry Column: HP-5MS cross-linked phenylmethylysiloxane (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 70° for 1 min to 200° at 20°/min for 8.84 min. EI ionisation at 70 eV. Limit of detection, 5.11 mg/L [Tsai *et al.* 2006]. Column: HP-1 (12 m × 0.20 mm i.d., 0.33 µm). Temperature programme: 150° to 260° at 20°/min, for 2 min. MSD. Retention time: 3.75 min [Zimmerman 2001].

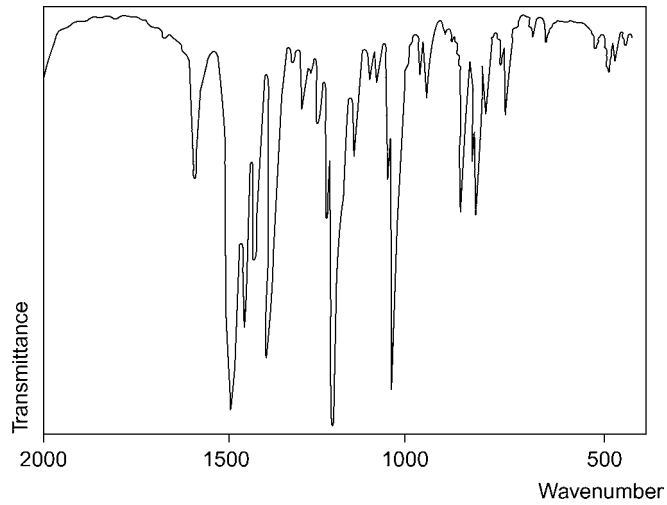
Gas Chromatography Column: HP-1 capillary (15 m × 0.25 mm i.d., 0.25 µm). Temperature programme: 120° to 300° at 20°/min. NPD [Curtis *et al.* 2003].

Capillary Electrophoresis Column: fused silica capillary (total/effective length: 96/90 cm for sweeping MEKC and 100/94 cm for stacking MEKC, 50 µm i.d.). Lamp: Xe. Fluorescence detection (λ_{ex}= 300 nm, λ_{em}= 340 nm). Limit of detection, 562 and 10.7 µg/L for sweeping and stacking MEKC, respectively [Tsai *et al.* 2006].

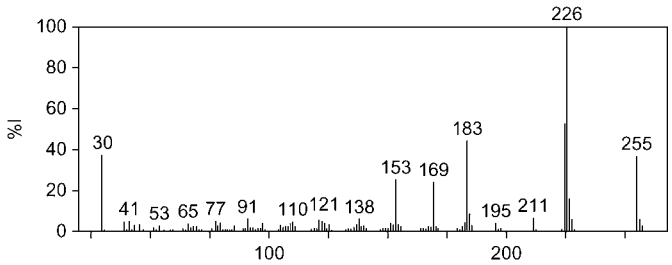
Ultraviolet Spectrum Methanol—206, 253 and 304 nm.



Infrared Spectrum Principal peaks at wavenumber 1208, 1499, 1392, 1040, 850, 811 cm^{-1} [Zimmerman 2001].



Mass Spectrum Principal ions at *m/z* 226, 225, 183, 30, 255, 153, 169, 227.



Quantification

Blood **GC-MS** Column: Phenomex ZBI (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 100° for 1 min to 200° at 10°/min to 300° at 60°/min for 14 min. EI ionisation, SIM acquisition mode. Retention time: 12.9 min. Limit of detection, 5–10 µg/L [Vorce, Sklerov 2004]. Column: HP-1MS capillary (15 m × 0.25 mm i.d). Temperature programme: 120° to 300° at 20°/min. EI ionisation, SIM acquisition mode. Retention time: 11.3 min. Limit of quantification, 15.6 µg/L, limit of detection, 6.25 µg/L [Curtis *et al.* 2003].

Urine **GC-MS** See Blood [Vorce, Sklerov 2004]. See Blood [Curtis *et al.* 2003].

Other **GC-MS** Rat Urine. Column: HP-1 cross-linked methylsilicone capillary (12 m × 0.2 mm i.d., 330 nm). Carrier gas: He, 1 mL/min. Temperature programme: 100° to 310° at 30°/min. Full scan mode, EI ionisation at 70 eV. Limit of detection, 10 µg/L [Theobald *et al.* 2005].

Toxicity 2C-T-7 is believed to have been involved in 4 deaths worldwide but only 1 case has been published. 2C-T-7 can produce both CNS stimulation and hallucinogenic effects. Acute toxicity may present as nausea, vomiting and headache. Because of its potential inhibition of the action of monoamine oxidase, 2C-T-7 may adversely interact with monoamine oxidase inhibitor medication.

In a fatality where 2C-T-7 was identified 1 year after death, 2C-T-7 was found to be 57 µg/L in postmortem heart blood, 100 µg/L in femoral blood, 1.12 mg/L in urine and 0.854 mg/kg in liver. No other drugs were detected. Toxic symptoms included hallucinations, vomiting, convulsions, respiratory depression, and finally cardiac arrest. Studies indicated 2C-T-7 concentrations began to decline after 70 days at 4°; therefore it was suggested that the concentrations measured were likely to have been higher at the time of death [Curtis *et al.* 2003].

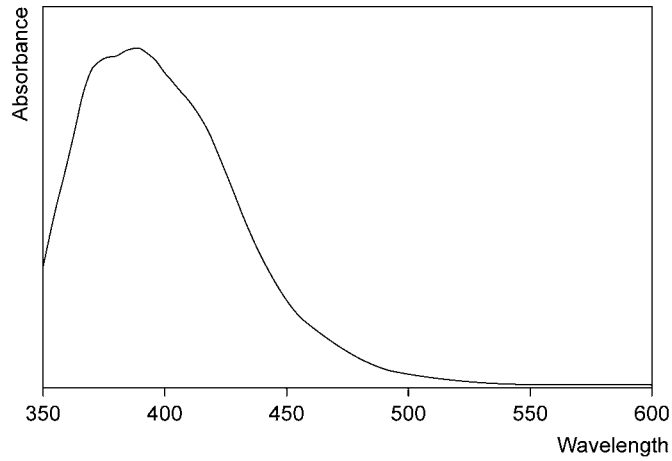
Cyanide

Electron Transport Chain Inhibitor
CN = 26.02
CAS—57-12-5

IUPAC Name Cyanide
Synonyms Cyanide (1−); cyanide anion; cyanide ion; cyanides; isocyanide.

Chemical Properties A white solid with a faint almond odour. Water solubility 9.54 mg/L (25°). Log P (octanol/water), −0.69.
Colour Test Sodium Picrate (Steyn test)—orange-red/red; limit of detection, 25–135 µg/L.
Ultraviolet Spectrum



Mass Spectrum Principal ions at *m/z* 27, 26, 12, 28, 13, 14 (HCN).
Quantification

Blood **GC** Column: GasPRO (60 m × 0.32 mm i.d.). Carrier gas: He, 1.4 mL/min. Temperature programme: 130° for 1 min to 150° at 2°/min to 260° at 8°/min for 15 min. NPD. Limit of quantification, <4 µg/L, limit of detection, <3 µg/L [Boadas-Vaello *et al.* 2008]. Column: PoraBOND U fused silica (30 m × 0.32 mm i.d., 7 µm). Carrier gas: He, 2.0 mL/min. Temperature programme: 90° for 5 min to 140° at 10°/min. Retention time: 1.9 min. NPD. Limit of detection, 50 µg/L [Gambaro *et al.* 2007]. Column: HP-PLOT Q capillary (15 m × 0.32 mm i.d., 20 µm). Carrier gas: He, 3 mL/min. Temperature programme: 30° for 1.5 min to 190° at 35°/min for 1 min. NPD. Limit of detection, 30 µg/L [Calafat, Stanfill 2002]. Column: Supel-Q PLOT fused silica (30 m × 0.32 mm i.d.). Column temperature: −30° for 1 min to 160° at 10°/min. Carrier gas: He, 3.0 mL/min. NPD or EI ionisation, SIM acquisition mode. Retention time: 9.0 min. [Ishii *et al.* 1998].

GC-MS Column: CPSIL-19 CB (50 m × 0.32 mm i.d., 1.2 µm). Carrier gas: N_2, 20 psi. µECD. Limit of quantification, 0.01 mg/L [Felby 2009]. Column: HP-PLOT Q-bonded polystyrene–divinylbenzene (15 m × 0.32 mm i.d., 20 µm). Carrier gas: He, 2.1 mL/min. Temperature programme: −15° for 1.5 min to 240° at 40°/min for 1 min. SIM acquisition mode. Retention time: ~4.7 min. Limit of detection, 0.007 µg/g [Murphy *et al.* 2006]. Column: capillary with polar stationary phase. SIM acquisition mode. Limit of quantification, 10 µg/L, limit of detection, 6 µg/L (both in aqueous solutions) [Frison *et al.* 2006]. Carrier gas: He. Temperature programme: 40° for 1 min to 240° at 25°/min for 5 min. Limit of quantification, 1 µmol/L, limit of detection, 0.3 µmol/L [Dumas *et al.* 2005]. Column: CP Sil 8B methyl silicone (50 m × 0.23 mm, 1.2 µm). Temperature: 60°. Carrier gas: He, flow rate 2 mL/min. ECD. Retention time: cyanogen chloride, 2.7 min [Odoul *et al.* 1994]. See also Maseda *et al.* [1990].

HPLC Column: RP-18 (Hypersil ODS, 5 µm, 100 × 2.1 mm i.d.). Mobile phase: deionised water : acetonitrile (92 : 8), 0.4 mL/min flow rate. Fluorescence detection (λ_{ex} = 418 nm, λ_{em} = 460 nm). Retention time: 1.7 min for the 1-cyano-2-substituted benzoisoindole derivative. Limit of detection, 2 µg/L [Felscher, Wulfmeyer 1998]

LC-MS Column: NovaPak C_{18}. Mobile phase: 2 mmol/L ammonium acetate (pH 3.0). Negative ion mode. Limit of quantification, 15 µg/L, limit of detection, 5 µg/L [Tracqui *et al.* 2002].

CE Capillary: fused silica (64.5/56.0 cm total/effective length, 75 µm). Mobile phase: 0.1 mol/L β-alanine (pH 3.5). DAD (λ = 232 nm). Limit of quantification, 9 µmol/L, limit of detection, 3 µmol/L [Papežová, Glatz 2006]. Capillary: fused silica (117/55/108.5 cm total/length to fluorescence detector/length to UV detector, 75 µm i.d.). Mobile phase: 20 mmol/L borax buffer (pH 6.0) : methanol (8 : 2). Fluorescence detection (λ_{ex} = 418 nm, λ_{em} = 460 nm) or UV detection (λ = 250 nm). Limit of detection, 0.1 µg/L [Chinaka *et al.* 2001].

Plasma **GC-MS** Column: Rtx-5 fused silica (10 m × 0.18 mm i.d., 0.2 µm). Carrier gas: He, 1.01 mL/min. Temperature programme: 60° for 1 min to 180° at 15°/min for 1 min. EI ionisation at 70 eV, scan or SIM acquisition mode. Limit of detection, 40 µg/L [Liu *et al.* 2009]. Column: DB-5 MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 0.8 mL/min. Temperature programme: 100° for 1 min to 230° at 15°/min to 300° at 30°/min for 1 min. MSD, SIM acquisition mode. Limit of quantification, 50 µg/L [Logue *et al.* 2005].

Note For a bioassay for the detection of cyanide in serum see Fonong [1987].

Urine **GC-MS** See Plasma. Limit of detection, 10 µg/L [Liu *et al.* 2009]. See Plasma [Logue *et al.* 2005].

HPLC Column: Kromasil KR 100-5 C_{18} (250 × 4.6 mm, 5 µm). Mobile phase: methanol : 50 mmol/L *o*-phosphoric acid (pH 2.3, 1 : 1.3), flow rate 0.5 mL/min. Fluorometric detection (λ_{ex} = 385 nm, λ_{em} = 476 nm). Retention time: 12 min for the *N*-carbamylcysteine–DACM derivative, 22 and 24 min for the cysteine-DACM derivative. Limit of detection, 0.3 µmol/L [Lundquist *et al.* 1995].

CE Capillary: fused silica (44/36 cm total/effective length, 50 µm) coated with cetyltrimethylammonium bromide. UV detection (λ = 254 nm). Limit of detection, 0.01 µmol/L [Meng *et al.* 2009]. Capillary: fused silica (25/18 cm total/effective length, 75 µm i.d.). Running buffer: 20 mmol/L sulfuric acid (pH 3) with 1 mmol/L hexamethonium bromide. UV detection (λ = 254 nm). Limit of detection, 0.08 µmol/L [Jermak *et al.* 2006].

Oral Fluid **CE** See Urine [Jermak *et al.* 2006; Meng *et al.* 2009].

Disposition in the Body Cyanide is metabolised to thiocyanate after reacting with a sulfur donor, for example thiosulfate. Up to 80% of a cyanide dose is converted this way. An alternative metabolic pathway is the formation of 2-aminothiazoline-4-carboxylic acid when cyanide reacts with cystine (when exposure rate exceeds cyanide-to-thiocyanate conversion rate). Cyanide is excreted through the lungs and kidneys.

Therapeutic Concentration In healthy subjects, endogenous cyanide concentration is approximately 8.41 ± 3.09 µg/L [Ishii *et al.* 1998].

A smoker can have cyanide levels of ≥500 µg/L in whole blood. For normal red blood cell cyanide, levels can be <26 µg/L. The blood therapeutic concentration is 1–12 µg/L.

Toxicity Cyanide can be fatal at plasma concentrations of 260 µg/L and above. The toxic concentration is 500 µg/L; lethal concentration, 4–5 mg/L but also reported to be as low as 1 mg/L.

A woman who attempted suicide by subcutaneous injection of cyanide had serum cyanide levels of 4.6 mg/L [Prieto *et al.* 2005].

Half-life Cyanide has a half-life of 0.7–2.1 h.

Volume of Distribution 0.4 L/kg.

Distribution in Blood Cyanide is concentrated in the erythrocytes. 98% of cyanide is found in red blood cells and 2% in plasma.

Protein Binding Binds to methemoglobin, present in haemoglobin.

Cyanocobalamin

Haemopoietic Vitamin

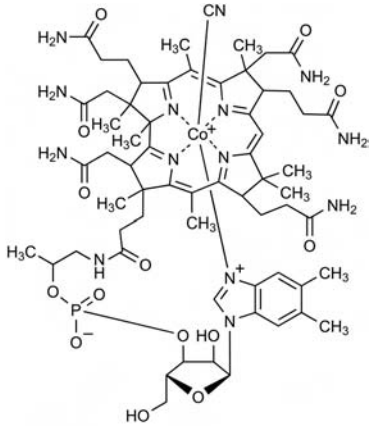
$C_{63}H_{88}CoN_{14}O_{14}P$ = 1355.4

CAS—68-19-9

IUPAC Name 5,6-Dimethylbenzimidazolyl cyanocobamide

Synonyms Cobamin; cycobemin; vitamin B_{12}.

Proprietary Names *Anacobin*; *Bedoz*; *Berubigen*; *Betalin 12*; *Bio-12*; *Cyanabin*; *Cytacon*; *Cytamen*; *Hepacon-B12*; *Neo-Rubex*; *Redisol*; *Rubesol*; *Rubion*; *Rubramin*; *Ruvite*; *Sytobex*. It is an ingredient of *Ce-Cobalin*, *Hepanorm* and *Reactivan*.



Chemical Properties Dark red hygroscopic crystals or powder. Soluble 1 in 80 of water and 1 in 180 of ethanol (90%); practically insoluble in chloroform and ether. Log *P* (octanol/water), 3.6.

High Performance Liquid Chromatography System HAA—retention time 3.8 min.

Ultraviolet Spectrum Water—278 (A^1_1=119a), 361 (A^1_1=207a), 550 nm (A^1_1=63a).

Infrared Spectrum Principal peaks at wavenumbers 1660, 1497, 1575, 1070, 1150, 1220 cm^{-1} (KBr disk).

Dose Initially 0.25 to 1 mg IM, on alternate days.

Cyanogen Bromide

Reagent for Synthesis of Cyanamides

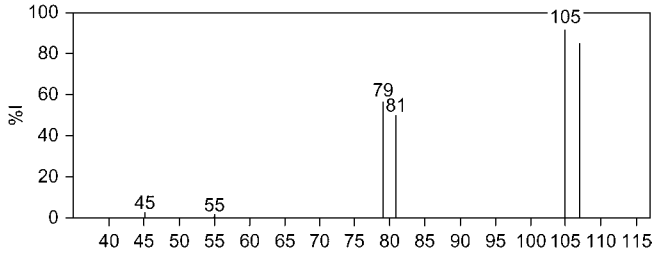
CNBr = 105.9

CAS—506-68-3

Synonyms Bromine cyanide; CBrN.

Chemical Properties Crystalline solid, decomposition in the presence of moisture. Vapours are highly irritant and very poisonous. Mp 52°. Bp 61° to 62°. Freely soluble in water, alcohol and ether. Aqueous solutions of alkalis decompose it to alkali cyanide and alkali bromide. Log *P* (octanol/water), −0.29 [Meylan, Howard 1995].

Mass Spectrum Principal ions at *m/z* 105, 79, 81, 45, 55 [Yang, Shang 2005].



Quantification

Other **GC** Water. Column: DB-1701 fused silica (30 m × 320 µm i.d., 1.0 µm). Carrier gas: He. Temperature programme: 30° to 35° at 5°/min to 220° at 10°/min. ECD. Limit of detection, 41 ng/L [Cancho *et al.* 2000].

GC-MS Environmental Samples. EI ionisation at 70 eV, MSD. Limit of detection, 1.7 µg/L [Yang, Shang 2005].

Cancho B *et al.* (2000). Simultaneous determination of cyanogen chloride and cyanogen bromide in treated water at sub-microg/L levels by a new solid-phase microextraction–gas chromatography–electron-capture detection method. *J Chromatogr A* 897: 307–315.

Meylan W, Howard M, PH (1995). Atom/fragment contribution method for estimating octanol–water partition coefficients. *J Pharm Sci* 84: 83–92.

Yang X, Shang C (2005). Quantification of aqueous cyanogen chloride and cyanogen bromide in environmental samples by MIMS. *Water Res* 39: 1709–1718.

Cyanogen Chloride

Reagent for Synthesis of Cyanamides, Military Poison Gas

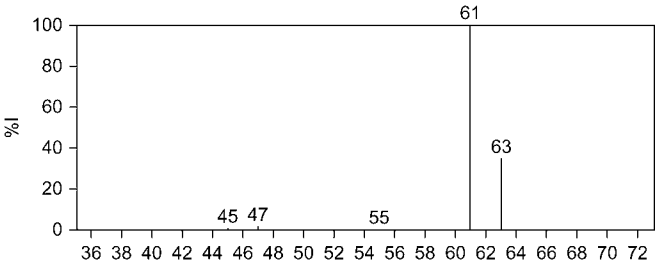
CNCl = 61.5

CAS—506-77-4

Synonym CClN

Chemical Properties Liquid. Vapours are highly irritant and very poisonous. Mp −6°. Bp 13.8°. Soluble in water, alcohol and ether. Log *P* (octanol/water), −0.29 [Meylan, Howard 1995].

Mass Spectrum Principal ions at *m/z* 61, 63, 47, 45, 55 [Yang, Shang 2005].



Quantification

Other **GC** Water. Column: DB-1701 fused silica (30 m × 320 µm i.d., 1.0 µm). Carrier gas: He. Temperature programme: 30° to 35° at 5°/min to 220° at 10°/min. ECD. Limit of detection, 77 ng/L [Cancho *et al.* 2000].

GC-MS Environmental Samples. EI ionisation at 70 eV, MSD. Limit of detection, 1.7 µg/L [Yang, Shang 2005].

Cancho B *et al.* (2000). Simultaneous determination of cyanogen chloride and cyanogen bromide in treated water at sub-microg/L levels by a new solid-phase microextraction–gas chromatography–electron-capture detection method. *J Chromatogr A* 897: 307–315.

Meylan WM, Howard PH (1995). Atom/fragment contribution method for estimating octanol–water partition coefficients. *J Pharm Sci* 84: 83–92.

Yang X, Shang C (2005). Quantification of aqueous cyanogen chloride and cyanogen bromide in environmental samples by MIMS. *Water Res* 39: 1709–1718.

Cyclamic Acid

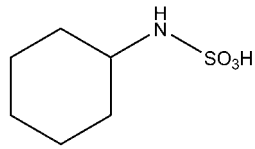
Cyclic Sulfamic Acid, Sweetener

$C_6H_{13}NO_3S$ = 179.2

CAS—100-88-9

IUPAC Name *N*-Cyclohexylsulfamic acid

Synonyms Cyclam. acid; E952; hexamic acid.



Chemical Properties White crystalline powder. Mp 175°. Soluble 1 in 7.5 of water, 1 in 3 of ethanol, 1 in 250 of chloroform, and 1 in 4 of propylene glycol. Cyclamic acid and its salts are intense sweetening agents. In dilute solutions (≤0.17%), sodium cyclamate is approximately 30-times as sweet as sucrose (but this factor decreases at higher concentrations). When the concentration approaches 0.5%, a bitter taste becomes noticeable. It is stable to heat. pKa 1.9.

Calcium Cyclamate

$C_{12}H_{24}CaN_2O_6S_2$, $2H_2O$ = 432.6

CAS—139-06-0 (anhydrous calcium cyclamate); 5897-16-5 (calcium cyclamate dihydrate)

IUPAC Name Calcium *N*-cyclohexylsulfamate dihydrate

Synonyms Calcium calc. cyclam.; calcium cyclohexanesulfamate; ciclamato de calcio; cyclamate calcium; E952.

Proprietary Name *Sucaryl Calcium*

Chemical Properties White crystals or crystalline powder. Soluble 1 in 4 of water and 1 in 50 of ethanol; almost insoluble in ether and chloroform.

Potassium Cyclamate

$C_6H_{12}NO_3SK$ = 217.3

CAS—7758-04-5

IUPAC Name Potassium *N*-cyclohexysulfamate

Synonyms Cyclamate potassium; HSDB 1239; monopotassium cyclohexanesulfamate; potassium cyclohexanesulfamate.

Sodium Cyclamate

$C_6H_{12}NNaO_3S$ = 201.2

CAS—139-05-9

IUPAC Name Sodium *N*-cyclohexylsulfamate

Synonyms

Ciclamato de sodio; cyclamate sodium; E952; natrii cyclamas; natrio ciklamatas; nátrium-ciklamát; natrium-cyklamát; natriumcyklamat; natriumsyklamaatti; siklamat sodyum; sod. cyclam.; sodium cyclohexanesulphamate; sodium, cyclamate de.

Proprietary Names *Dulceryl*; *Finn Cristal*; *Kaldil-Diet*; *Rondo*; *Sucaryl Sodium*; *Sucrin*; *Sukar-Sin*; *Tadalin*.

Chemical Properties White crystals or crystalline powder. Soluble 1 in 5 of water and 1 in 250 of ethanol; almost insoluble in ether and chloroform. A 10% solution in water has a pH of 5.5 to 7.5.

Thin-layer Chromatography Plates: glass plates (10 × 10 cm or 10 × 20 cm) were coated with 0.25 mm of Avicel SF (other experiments included coating the plates with polyamide, silica gel, alumina or DEAE-cellulose). Solvent systems: A) ethyl acetate : concentrated ammonia : acetone (1 : 1 : 8); B) dimethylformamide : ethanol : water (5 : 4 : 1); C) dioxane : pyridine : water (7 : 2 : 1); D) pyridine : ethanol : water (6 : 3 : 1); E) tetrahydrofuran : pyridine : water (6 : 3 : 1). Location reagents: 1) spray with 0.1 % Pinacryptol Yellow solution in 95% ethanol, dry in the dark for 10 min and examine under UV light; cyclamate appears as an orange fluorescent spot on a light-greenish-blue background, saccharin is a non-fluorescent orange spot, dulcin a dark violet spot; 2) after exposure to bromine vapour, spray with 0.1% ethanolic solution of fluorescein, air-dry, spray with 2% ethanolic solution of naphthylethylenediamine; cyclamate appears as a yellow spot, saccharin is yellowish pink, dulcin is yellowish orange on a dull orange background; 3) spray with 1 part of 0.1% ethanolic solution of Methyl Red and 2 parts of phosphate buffer solution (pH 7.0); cyclamate and saccharin give reddish orange spots on a yellow background; 4) spray with solution of silver nitrate (0.17 g) in 1 mL water and mixed with 5 mL of 10% ammonia, diluted to 200 mL with ethanol, then spray with 0.01% ethanolic pyrogallol; cyclamate appears as a transient white spot on a brown background. R_f values were reported as follows:

	Solvent system				
	A	***B***	***C***	***D***	***E***
Cyclamate	0.15	0.74	0.29	0.47	0.31
Saccharin	0.31	0.83	0.39	0.64	0.41
Dulcin	0.82	0.91	0.80	0.79	0.89

Limits of detection (µg) were reported as follows:

	Method of detection			
	1	***2***	***3***	***4***
Cyclamate	1.0	2.0	4.0	8.0
Saccharin	0.2	1.0	1.0	1.0
Dulcin	0.2	1.0	–	–

[Nagasawa *et al.* 1970]

Plates: glass plates (10 × 20 cm) coated with silica Gel G in water (1 : 2), 0.25-µm thickness, activated at 110° for 1 h. Solvent system: ethyl acetate : isopropyl alcohol : acetone : methanol : water (50 : 15 : 15 : 4 : 16). Location reagent bromine vapour and 0.05 g sodium fluorescein in 10 mL absolute alcohol. R_f 0.56. Quantification with fluorescence detection (λ = 540 nm). Limit of quantification not reported [Das *et al.* 1970].

Quantification

Urine **HPLC** Column: C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.01 mol/L monoammonium phosphate (pH 3.5; 60 : 40), flow rate 1.0 mL/min. UV detection (λ = 335 nm). Retention time: cyclohexylamine 10 min (trinitrophenyl derivative). Limit of detection, 0.11 ppm for cyclamate, 0.06 ppm for cyclohexylamine [Casals *et al.* 1996].

Other **HPLC** Food Samples. Column: C_{18} (250 × 3.0 mm i.d., 5 µm). Mobile phase: buffer preparation, 4 mL formic acid in 5 L water, adjusted to pH 4.5 with 12.5 mL triethylamine; methanol-buffer-acetone (69 : 24 : 7) : methanol-buffer-acetone (11 : 82 : 7; 0 : 100 for 4 min to 53 : 47 over 7 min to 100 : 0 over 12 min for 1 min), flow rate 0.5 mL/min. ELS detection. Retention times: cyclamic acid ≈5.5 min, acesulfame potassium ≈3.8 min, saccharin ≈4.2 min, aspartame ≈11 min, sucralose ≈12.5 min, dulcin ≈13.5 min, alitame ≈15.0 min, neohesperidine dihydrochalcone ≈17.5 min, neotame ≈22.0 min. Limit of quantification, 26 mg/kg for cyclamic acid, aspartame, neotame, saccharin, sucralose, 25 mg/kg for neohesperidine dihydrochalcone, 27 mg/kg for alitame, 29 mg/kg for acesulfame chicken, 43 mg/kg for dulcin; limit of detection, 13 mg/kg for cyclamic acid, acesulfame potassium, alitame, aspartame, neodulcin, saccharin and sucralose, 11 mg/kg for neohesperidine dihydrochalcone; 30 mg/kg for dulcin [Wasik *et al.* 2007]. Column: C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : water (4 : 1), flow rate 1.0 mL/min. UV detection (λ = 314 nm). Limit of quantification not reported [Horie *et al.* 2007]. Column: C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.02 mol/L phosphate buffer (pH 7.0) : methanol (3 : 2), flow rate 1.0 mL/min with Methyl Red (pH 7.0), flow rate 30 µmol/L. UV-Vis detection (λ = 433 nm). Retention times: sodium cyclamate 6 min, saccharin 4 min, aspartame 10 min. Limit of quantification not reported [Choi *et al.* 2000]. Column: C_{18} (300 × 4.6 mm i.d.). Mobile phase: acetonitrile : 0.02 mol/L potassium dihydrogen phosphate (3 : 97), flow rate 1.3 mL/min. Post-column ion-pair extraction and absorbance detection (λ = 546 nm). Retention time: 10 min. Limit of detection, 1 to 2 mg/L [Lawrence 1987].

LC-MS Food Samples. Column: C_{18} (150 × 2.0 mm i.d., 5 µm). Mobile phase: methanol: 0.1% aqueous formic acid (4 : 1), flow rate 0.2 mL/min. ESI, negative ion mode. Limit of quantification not reported [Horie *et al.* 2007].

CE Food Samples. Column: uncoated fused silica capillary (total/effective length: 64.5/56 cm, 75 µm i.d.). Running buffer: 1.0 mmol/L hexadecyltrimethylammonium bromide and 10 mmol/L potassium sorbate. UV detection (λ = 300 nm). Migration time: 4 min. Limit of detection, 5 mg/kg for syrups, jams, and drinks and 10 mg/kg for pickles and confectionery [Horie *et al.* 2007].

Note For the detection of cyclamic acid using GC with packed columns, see Weston and Wheals [1970] and Nagasawa *et al.* [1975].

Disposition in the Body When administered as the sodium or calcium salt in humans, cyclamic acid has been found to be largely excreted unchanged, mainly in the urine and, to a lesser extent, in the faeces. However, there is some evidence that a very small proportion may be converted to cyclohexylamine, which is reported to be toxic. Inter-individual differences have been observed with regard to the ability to metabolise cyclamate: >70% of the human population cannot metabolise cyclamate, whereas only 3–5% of the population metabolise >20% of their daily intake.

Toxicity Single 1-g doses of sodium and calcium cyclamate have been administered IV without ill effect and up to 12 g of calcium cyclamate has been administered orally, the only side-effect being the production of soft stools. The use of cyclamates as artificial sweeteners in food, soft drinks, and artificial sweetening tablets was at one time prohibited in Great Britain and some other countries because of concern about the metabolite cyclohexylamine. However, after reappraisal their use is now allowed.

The WHO has set an estimated acceptable daily intake for sodium and calcium cyclamate, expressed as cyclamic acid, at up to 11 mg/kg body-weight. In Europe, a temporary acceptable daily intake for sodium and calcium cyclamate, expressed as cyclamic acid, has been set at up to 1.5 mg/kg body-weight. LD_{50} (mouse, IP): 1.15 g/kg; LD_{50} (mouse, IV): 4.8 g/kg; LD_{50} (mouse, oral): 17 g/kg; LD_{50} (rat, IP): 1.35 g/kg; LD_{50} (rat, IV): 3.5 g/kg; LD_{50} (rat, oral): 15.25 g/kg.

Half-life Cyclamic acid 8 h, cyclohexylamine 4 h.

Volume of Distribution Cyclohexylamine 2.05 to 2.90 L/kg.

Clearance Cyclohexylamine 511 to 757 mL/min (renal).

Protein Binding Cyclohexylamine 33%.

Note For absorption/excretion studies of cyclamic acid and cyclohexylamine in humans and other species, see Renwick and Williams [1972] and Eichelbaum *et al.* [1974].

Cyclandelate

Vasodilator

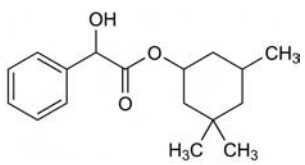
$C_{17}H_{24}O_3$ = 276.4

CAS—456-59-7

IUPAC Name (3,3,5-Trimethylcyclohexyl) 2-hydroxy-2-phenylacetate

Synonym α-Hydroxybenzeneacetic acid 3,3,5-trimethylcyclohexyl ester

Proprietary Names *Cyclobral*; *Cyclospasmol*; *Spasmocyclon*.



Chemical Properties A white amorphous powder, which may sublime on storage into a crystalline form, resembling cotton wool. Mp 55.0° to 56.5°. Practically insoluble in water; soluble 1 in about 1 of ethanol; very soluble in chloroform and ether; freely soluble in acetonitrile, ethyl acetate, dimethylformamide and toluene. Log *P* (octanol/water), 4.1.

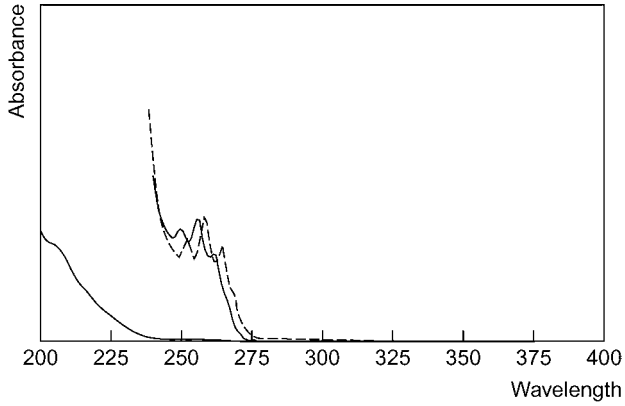
Colour Tests Liebermann's reagent—orange; Marquis test—orange (slow).

Thin-layer Chromatography System TB—R_f 0.37; system TD—R_f 0.74; system TE—R_f 0.80; system TF—R_f 0.77; system TAD—R_f 0.73; system TAE—R_f 0.87; system TAF—R_f 0.95; system TAJ—R_f 0.81; system TAK—R_f 0.71; system TAL—R_f 0.95.

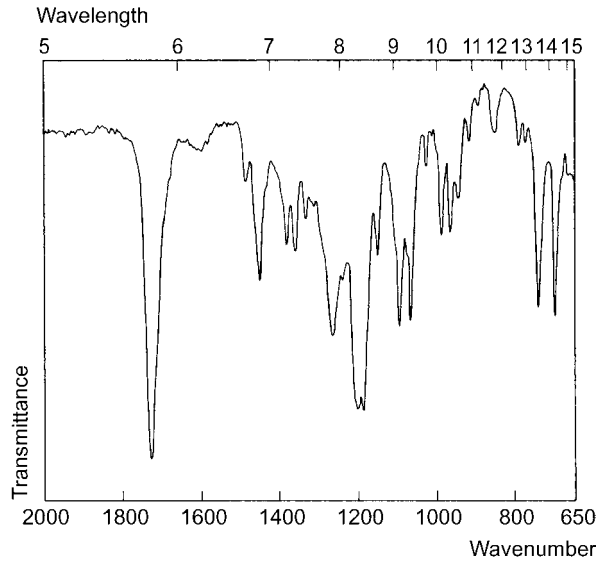
Gas Chromatography System GA—RI 1903.

High Performance Liquid Chromatography System HAA—retention time 26.4 min.

Ultraviolet Spectrum Methanol—252, 258 (A_1^1=7.6b), 264 nm.



Infrared Spectrum Principal peaks at wavenumbers 1734, 1192, 1212, 1274, 1104, 1074 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 107, 69, 125, 83, 79, 55, 41, 77.

Dose 1.6 g daily.

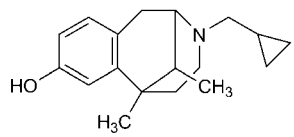
Cyclazocine

Narcotic Antagonist

$C_{18}H_{25}NO$ = 271.4

CAS—3572-80-3

IUPAC Name 3-(Cyclopropylmethyl)-1,2,3,4,5,6-hexahydro-6,11-dimethyl-2,6-methano-3-benzazocin-8-ol



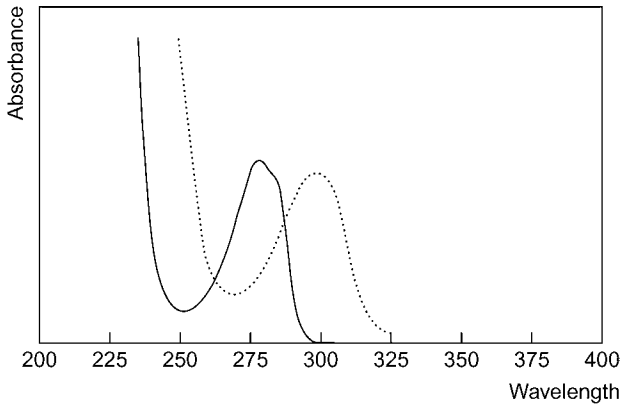
Chemical Properties Crystals. Mp 201° to 204°. Soluble in chloroform and dilute acetic acid. Log *P* (octanol/pH 7.4) 1.3.

Colour Tests Liebermann's reagent—black; Mandelin's test—green; Marquis test—brown→green.

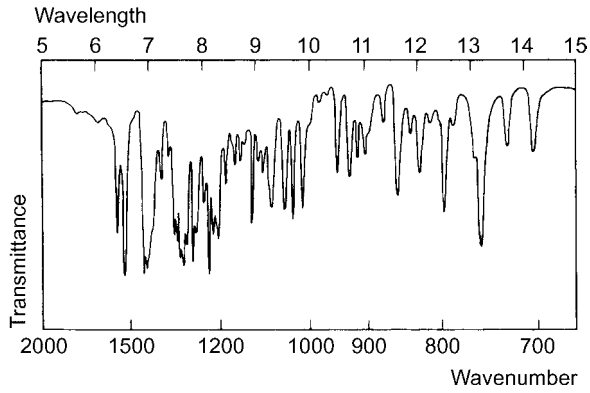
Thin-layer Chromatography System TA—R_f 0.53; system TAE—R_f 0.24; system TAF—R_f 0.74; system TAG—R_f 0.25; system TB—R_f 0.15; system TC—R_f 0.13; system TE—R_f 0.65 (acidified iodoplatinate solution, strong reaction).

High Performance Liquid Chromatography System HA—*k* 2.1; system HY—RI 289.

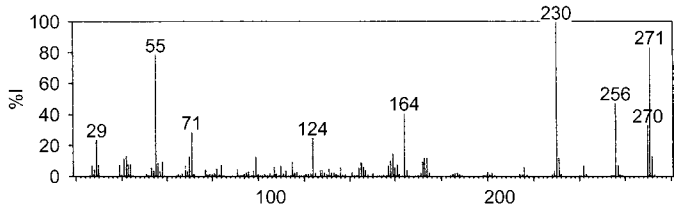
Ultraviolet Spectrum Aqueous acid—277 nm; aqueous alkali—237, 298 nm.



Infrared Spectrum Principal peaks at wavenumbers 1570, 1255, 1304, 754, 1227, 1241 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 230, 271, 55, 256, 164, 270, 71, 124.



Quantification

Plasma **GC** Column: 3% OV-1 on Gas Chrom Q (180 cm × 4 mm i.d.). Temperature: 210°. FID. Retention time: 5.7 min. Limit of detection, 0.05–0.12 mg/L [Medzihradsky, Dahlstrom 1975].

GC-MS Column: glass (91.44 cm). Carrier gas: CH_4, 10 mL/min. Temperature: 260°. CI, SIM acquisition mode. Retention time: ≈0.9 min. Limit of quantification, 110 ng/L, limit of detection, 20 ng/L [Peterson *et al.* 1979].

Urine **GC** Column: 3% OV-17 on Chromosorb W-HP 80/100 mesh. Carrier gas: N_2, 40 mL/min. Temperature: 270°. FID. Limit of detection, 1 mg/L [Digregorio, O'Brien, 1974]. Column: 3% SE-30 on Gas-Chrom Q 80/100 mesh (6′ × 2 mm i.d.). Carrier gas: He, 30–35 mL/min. Temperature 210°–220°. FID. Limit of detection, 10 ng/mL [Kaiko, Inturrisi 1974].

Disposition in the Body Absorbed after oral administration. Approximately 20% of a dose is excreted in the urine unchanged together with 24% as conjugated cyclazocine, 4% as norcyclazocine, and 11% as conjugated norcyclazocine.

Dose Cyclazocine has been given in maintenance doses of about 4 mg daily; doses of 10 mg have been given to extend the effect to 48 h.

Cyclizine

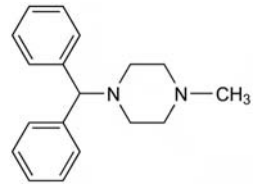
Antihistamine, Antiemetic

$C_{18}H_{22}N_2$ = 266.4

CAS—82-92-8

IUPAC Name 1-Benzhydryl-4-methylpiperazine

Synonyms Compound 47-83; 1-diphenylmethyl-4-methylpiperazine; Wellcome preparation 47-83.



Chemical Properties A white or creamy-white light-sensitive crystalline powder. Mp 105.5° to 107.5° (from petroleum ether). Practically insoluble in water; soluble 1 in 6 of ethanol, 1 in 1 of chloroform, and 1 in 6 of ether. Dissolves in most organic solvents and in dilute acids. pK_a 2.4, 7.8. Log *P* (octanol/water), 2.97.

Cyclizine Hydrochloride

$C_{18}H_{22}N_2$, HCl = 302.8

CAS—303-25-3

Synonym Cyclizinium chloride

Proprietary Names *Covamet*; *Echnatol*; *Emitex*; *Fortravel*; *Marezine (tablets)*; *Marzine*; *Medazine*; *Nauzine*; *Norizine*; *Ryccard*; *Triazine*; *Valoid (tablets)*. It is an ingredient of *Cyclimorph*, *Diconal*, *Igril*, *Megral*, *Migral*, *Migril*, *Vertipam*, and *Wellconal*.

Chemical Properties A white crystalline powder, or small colourless crystals. Mp about 285°, with decomposition. Soluble 1 in about 125 of water, 1 in about 120 of ethanol, and 1 in 75 of chloroform; practically insoluble in ether.

Cyclizine Lactate

$C_{18}H_{22}N_2$, $C_3H_6O_3$ = 356.5

CAS—5897-19-8

Proprietary Names *Marezine* (injection); *Valoid* (injection).

Chemical Properties Freely soluble in water.

Cyclizine Tartrate

$C_{18}H_{22}N_2$, $C_4H_6O_6$ = 416.5

Colour Tests Liebermann's reagent—orange; Marquis test—yellow

Thin-layer Chromatography System TA—R_f 0.57; system TB—R_f 0.48; system TC—R_f 0.41; system TE—R_f 0.68; system TL—R_f 0.16; system TAE—R_f 0.39; system TAF—R_f 0.52; system TAJ—R_f 0.23; system TAK—R_f 0.11; system TAL—R_f 0.72 (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, yellow).

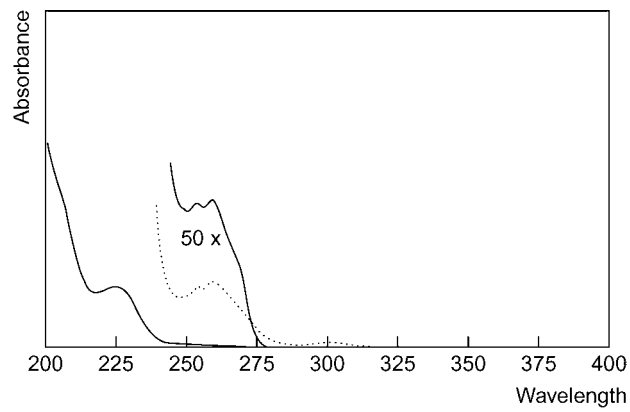
Gas Chromatography-Mass Spectrometry

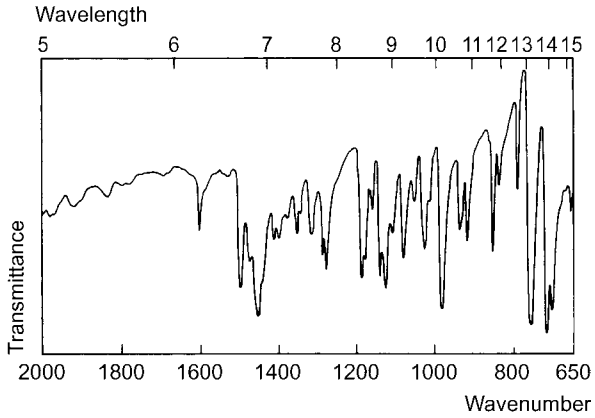
Column: OV-17 fused silica (15 m × 0.25 mm i.d., 0.2 μm). Temperature programme: 100° to 260° at 10°/min for 11 min. Injector temperature: 230°. IS: diphenhydramine. TIC, *m/z*56 and 58 for cyclizine and diphenhydramine, respectively. Retention time: cyclizine, 12.2 min; diphenhydramine, 10.5 min [Backer *et al.* 1989].

High Performance Liquid Chromatography System HA—cyclizine *k* 2.9, norcyclizine *k* 2.2; system HX—RI 405; system HZ—retention time 4.8 min; system HAX—retention time 12.4 min; system HAY—retention time 5.8 min.

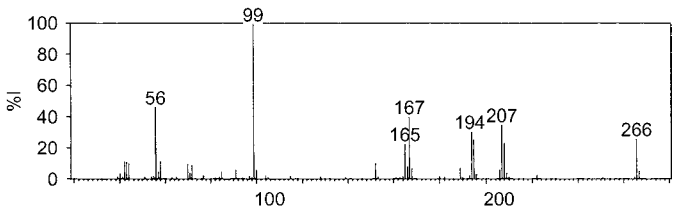
Ultraviolet Spectrum Aqueous acid—257, 262 (A_1^1=28a), 268 nm; aqueous alkali—260 nm (A_1^1=16b).



Infrared Spectrum Principal peaks at wavenumbers 716, 756, 701, 984, 1125, 1496 cm^{-1} (cyclizine hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 99, 56, 167, 207, 194, 266, 195, 165.



Quantification

Blood **GC** AFID. Limit of detection, 10 µg/L [Griffin, Baselt 1984].

Plasma **GC** AFID. Cyclizine and norcyclizine. Limit of detection, 10 µg/L for cyclizine [Land *et al.* 1981].

Serum **HPLC** Column: ODS C_{18} (Techil, 150 × 4.1 mm i.d., 5 µm), at 30°. Mobile phase: 0.05 mol/L phosphate buffer (pH 3.0) : acetonitrile (70:30), flow rate 1 mL/min. IS: chlorcyclizine hydrochloride. Electrochemical detection. Retention time: norcyclizine, 5 min; cyclizine, 6 min; IS, 12 min. Limit of detection, 1 µg/L [Walker, Kanfer 1995].

Urine **GC** See Plasma [Land *et al.* 1981]. See Blood. Limit of detection, 5 µg/L [Griffin, Baselt 1984].

HPLC See Serum [Walker, Kanfer 1995].

Disposition in the Body Cyclizine is absorbed from the gastrointestinal tract with an onset of action within 2 h. It is extensively metabolised by *N*-demethylation to form the relatively inactive norcyclizine, a metabolite that is widely distributed throughout the tissues and especially in lungs, kidneys, liver, and spleen. <1% of the total oral dose is eliminated in the urine.

Therapeutic Concentration

Following a single oral dose of 50 mg of cyclizine hydrochloride to 1 subject, a peak blood concentration of 0.069 mg/L was attained in 2 h [Griffin, Baselt 1984].

On the first day after termination of therapy with oral doses of 50 mg thrice daily to 4 subjects, plasma concentrations of norcyclizine were in the range of 0.004–0.022 mg/L (mean 0.014) [Kuntzman *et al.* 1967].

Toxicity

In a fatality resulting from a cyclizine overdose, 80 mg/L cyclizine in blood was detected in a 17-year-old female. Norcyclizine was not detected [Backer *et al.* 1989].

In a fatality attributed principally to cyclizine, postmortem concentrations were: blood 15 mg/L, liver 108 µg/g; doxepin was also detected at concentrations of 0.7 mg/L and 6 µg/g in the blood and liver, respectively [Lewin *et al.* 1981].

For case histories involving the injection of cyclizine with dipipanone, see under Dipipanone.

Half-life Plasma half-life, cyclizine about 24 h.

Protein Binding Norcyclizine about 60%.

Dose Adults, up to 150 mg of cyclizine hydrochloride daily; children (6 to 12 years), up to 75 mg daily, in divided doses.

Cyclobarbital

Hypnotic, Barbiturate

$C_{12}H_{16}N_2O_3 = 236.3$

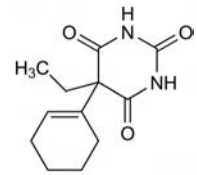
CAS—52-31-3

IUPAC Name 5-(Cyclohexen-1-yl)-5-ethyl-1,3-diazinane-2,4,6-trione

Synonyms Ciclobarbital; cyclobarbitalum; cyclobarbitone; 5-(1-cyclohexen-1-yl)-5-ethyl-2,4,6(1*H*,3*H*,5*H*)-pyrimidinetrione; ethylhexabital; hexemalum; tetrahydrophenobarbital.

Note The name ciclobarbital has been applied to hexobarbital.

Proprietary Names *Cavonyl*; *Cyclodorm*; *Cyklodorm*; *Fanodormo*; *Irifan*; *Namuron*; *Palinum*; *Phanodorm*; *Phanodorn*; *Philodorm*; *Prälumin*; *Pro-Sonil*; *Sonaform*.



Chemical Properties A white crystalline powder, which gradually decomposes on storage. Mp 171° to 174°. Soluble 1 in 800 of water, 1 in 5 of ethanol, 1 in 20 of chloroform, and 1 in 20 of ether. pK_a 7.6 (20°). Log *P* (octanol/water), 1.77.

Cyclobarbital Calcium

$(C_{12}H_{15}N_2O_3)_2Ca = 510.6$

CAS-143-76-0

Synonyms Ciclobarbital calcium; cyclobarbitone Calcium; hexemalcalcium.

Proprietary Name It is an ingredient of *Domidorm*.

Chemical Properties A white or slightly yellowish, crystalline powder. Soluble 1 in 70 of water, 1 in 500 of 95% alcohol. Practically insoluble in ether and chloroform.

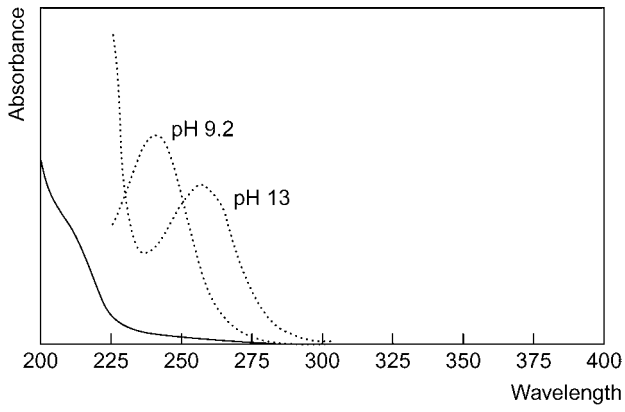
Colour Tests Koppanyi–Zwikker test—violet; mercurous nitrate—black; vanillin reagent—brown-red/green.

Thin-layer Chromatography System TD—R_f 0.50; system TE—R_f 0.40; system TF—R_f 0.64; system TH—R_f 0.59; system TAD—R_f 0.58; system TAE—R_f 0.88 (mercuric chloride–diphenylcarbazone reagent, positive; mercurous nitrate spray, black; acidified potassium permanganate solution, yellow-brown; Zwikker's reagent, pink).

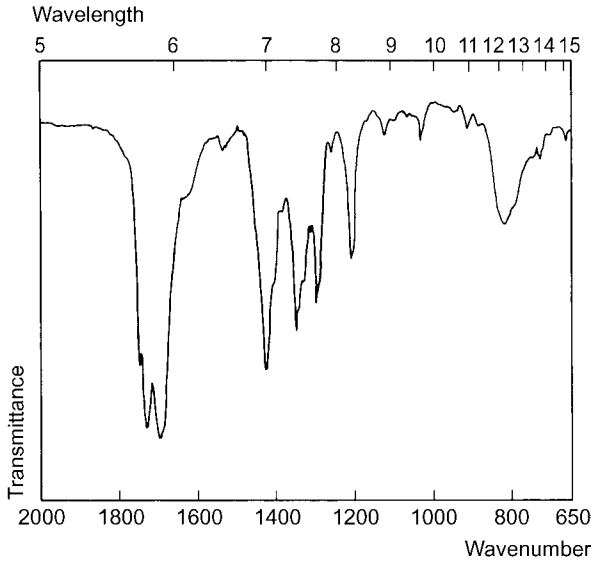
Gas Chromatography System GA—cyclobarbital RI 1955, cyclobarbital-Me_2 RI 1845, M (oxo-) RI 2190, M (oxo-)-Me_2 RI 2050; system GF—RI 2825; system GAJ—cyclobarbital RRT 1.142 (relative to methylphenobarbital).

High Performance Liquid Chromatography System HG—*k* 5.25; system HH—*k* 2.61; system HX—RI 384; system HY—RI 352; system HZ—retention time 3.2 min.

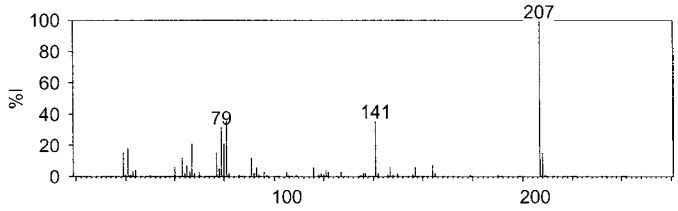
Ultraviolet Spectrum Borax buffer 0.05 mol/L (pH 9.2)—239 nm (A_1^1=410a); 1 mol/L sodium hydroxide (pH 13)—256 nm (A_1^1=320b).



Infrared Spectrum Principal peaks at wavenumbers 1693, 1725, 1745, 1300, 1210, 830 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 207, 141, 81, 79, 67, 80, 41, 77.

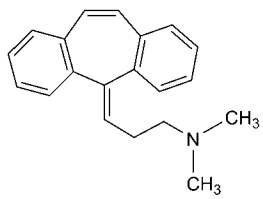


Quantification See under Amobarbital.
Disposition in the Body Rapidly absorbed after oral administration. The main metabolic reaction appears to be oxidation to ketocyclobarbital [5-(3-oxocyclohex-1-enyl)-5-ethylbarbituric acid]. <10% of a dose is excreted in the urine unchanged.
Therapeutic Concentration In plasma, usually in the range 2 to 10 mg/L. After a single oral dose of 300 mg of the calcium salt, given to 6 subjects, peak plasma concentrations of 7.4 to 10.3 mg/L (mean 8.7) were attained in 0.7 to 2.5 h [Breimer, Winten 1976].
Toxicity The estimated minimum lethal dose is 2 g. Severe toxic effects are associated with blood concentrations greater than 10 mg/L.
Half-life Plasma half-life, 8 to 17 h (mean 12), increased in subjects with liver disease.
Volume of Distribution About 0.5 L/kg.
Clearance Plasma clearance, about 0.5 mL/min/kg.
Protein Binding About 70%.
Dose 100 to 400 mg of cyclobarbital calcium, as a hypnotic.

Breimer DD, Winten MA (1976). Pharmacokinetics and relative bioavailability of cyclobarbital calcium in man after oral administration. *Eur J Clin Pharmacol* 9: 443–450.

Cyclobenzaprine

Tricyclic Amine, Skeletal Muscle Relaxant
$C_{20}H_{21}N$ = 275.4
CAS—303-53-7
IUPAC Name 3-(5*H*-Dibenzo[*a*,*d*]cyclohepten-5-ylidene)-*N*,*N*-dimethyl-1-propanamine
Synonyms CBZ; MK-130; proheptatriene.

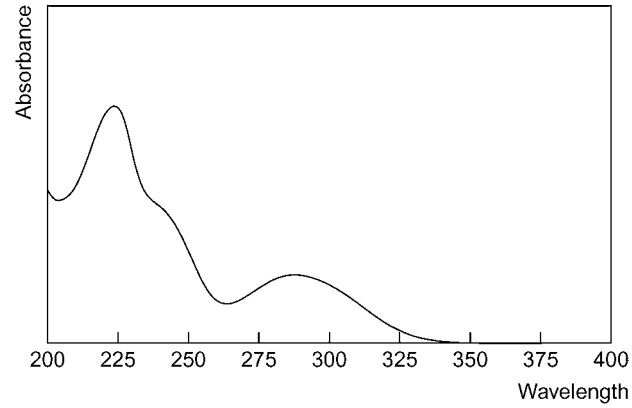


Chemical Properties pK_a 8.5 [Baselt 2008]. Log *P* (octanol/water) 4.8 [Meylan, Howard 1995]. Stable in urine and plasma when stored at –20° for 1 and 3 months, respectively [Constanzer *et al.* 1995].

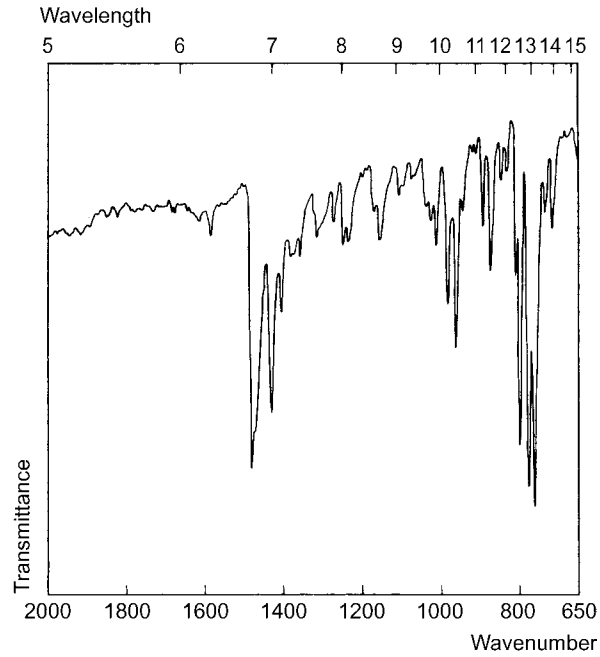
Cyclobenzaprine Hydrochloride

$C_{20}H_{21}N$, HCl = 311.9
CAS—6202-23-9
Proprietary Names *Flexeril*; *Lisseril*.
Chemical Properties White crystalline powder. Mp 215° to 219°. Freely soluble in water and ethanol; sparingly soluble in isopropanol; slightly soluble in chloroform and methylene chloride; practically insoluble in hydrocarbons.

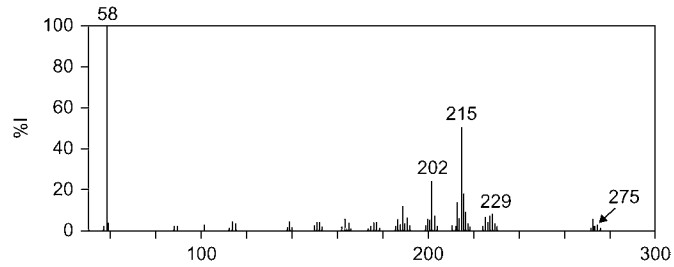
Thin-layer Chromatography System TE—R_f 0.69.
Gas Chromatography System GA—RI 2195.
High Performance Liquid Chromatography System HY—RI 378.
Column: octyl-bonded phase on silica (25 × 0.46 mm i.d.). Mobile phase: acetonitrile : 0.6% potassium dihydrogen phosphate (pH 3.0; 75 : 25), flow rate 1.5 mL/min. UV detection (λ = 254 nm). Retention time: ≈7 min. Limit of detection, 5.0 mg/L [Heinitz 1982].
Ultraviolet Spectrum Aqueous acid—290 nm (A_1^1 = 407b) No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 764, 778, 800, 968, 988, 880 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 58, 59, 42, 215, 202, 57, 189, 43.



Quantification
Blood **HPLC** Column: PE HS-5 silica. Mobile phase: methanol : 1 mol/L ammonium nitrate : 1 mol/L ammonium hydroxide (3925 : 25 : 37.5), flow rate 1.0 mL/min. DAD. Retention time: 4.09 min. Limit of detection, 1.5 mg/L [Winek, Jr. *et al.* 1999].

Plasma **GC** Column: DB-5 J&W 1% OV-17 on Gas-Chrom Q 80/100 mesh (40 m, 0.25 μm). Carrier gas: He, 2.068 bars. Temperature programme: 140° to 230° at 50°/min to 245° at 4°/min to 300° at 50°/min for 3 min. NPD. Limit of quantification, 1.0 μg/L [Constanzer *et al.* 1985]. Column: 3% OV-17 on Gas-Chrom Q 100/120 mesh (6′ × 0.08" i.d.). Carrier gas: He, 50 mL/min. Temperature: 240°. NPD. Limit of detection, 2 μg/L [Hucker, Stauffer 1976a]. Column: 1.5% OV-17 on Gas Chrom Q 80/100 mesh (1.8 m × 4.0 mm i.d.). Carrier gas: He, 100 mL/min. Temperature: 218°. FID. Retention time: 2.8 min. Limit of detection, 10 μg/L [Hucker, Stauffer 1976b].

GC-MS Column: Ultra-1 fused silica capillary (15 m × 0.2 μm i.d., 0.33 μm). Carrier gas: He, 0.8 mL/min. Temperature programme: 180° to 220° at 25°/min. EI ionisation, full scan mode. Retention time: ≈8.5 min. Limit of detection not reported [Wong *et al.* 1995].

HPLC Column: Supelcosil LC-PCN (15 cm × 4.7 mm i.d., 5 μm). Mobile phase: acetonitrile : methanol : 0.01 mol/L phosphate buffer (600 : 150 : 250), flow rate 2.0 mL/min. UV detection (λ = 254 nm). Relative retention time: 0.46. Limit of detection, 3 μg/L [Wong *et al.* 1995]. Column: BDS C_{18} (250 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : 0.085% phosphoric acid (pH 6.5; 50 : 50), flow rate 1.0 mL/min. UV detection (λ = 226 nm). Retention time, 7.8 min. Limit of quantification, 0.5 μg/L [Constanzer *et al.* 1995].

LC-MS Column: BDS C_{18} (50 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : water (90 : 10) containing 0.1% formic acid and 10 mmol/L ammonium acetate, flow rate 1.0 mL/min. APCI. Retention time: 1.9 min. Limit of quantification, 0.1 μg/L [Constanzer *et al.* 1995].

Serum **HPLC** Column: LC-PCN (150 × 4.6 mm i.d.). Mobile phase: acetonitrile : methanol : 10 mmol/L phosphate buffer (pH 7.1; 60 : 15 : 25), flow rate 2 mL/min. UV detection (λ = 214 to 254 nm). Limit of detection, 10 μg/L [Puopolo, Flood 1987].

Urine **GC** See Plasma. Column: DB-5 J&W 1% OV-17 on Gas-Chrom Q 80/100 mesh (20 m, 0.25 μm). Temperature programme: 140° to 230° at 50°/min to 245° at 4°/min for 2 min. Limit of quantification, 0.2 mg/L [Constanzer *et al.* 1985]. See Plasma [Hucker, Stauffer 1976b].

HPLC See Plasma. Mobile phase: acetonitrile : 0.085% phosphoric acid (pH 6.5; 43 : 57). Retention time, 9.6 min. Limit of quantification, 10 μg/L [Constanzer *et al.* 1995].

LC-MS See Plasma [Constanzer *et al.* 1995].

Other **GC** Rat Urine. Column: 3% OV-17 on 100/120 mesh Gas Chrom Q (2 m × 4 mm i.d.). Carrier gas: N_2, 50 mL/min. Temperature: 270°. FID. Limit of detection not reported [Belvedere *et al.* 1976].

GC-MS Rat Urine. Column:. Column: 3% OV-17 on 100/120 mesh Gas Chrom Q (2 m × 4 mm i.d.). Carrier gas: He, 30 mL/min. Temperature: 270°. EI ionisation at 70 eV. Limit of detection not reported [Belvedere *et al.* 1976].

Disposition in the Body Irregularly absorbed after oral administration, and extensively metabolised. The major metabolites are a glucuronide conjugate and 10,11-dihydroxynortriptyline; monodesmethylcyclobenzaprine is a minor metabolite. Approximately 50% of an oral dose is excreted in the urine in 5 days, with less than 1% as unchanged drug. Approximately 14% of a dose is eliminated in the faeces.

Therapeutic Concentration

After a single oral dose of 40 mg to 4 subjects, peak plasma concentrations of about 0.027 mg/L were attained in 4 h; after oral doses of 20 mg three times a day to 9 subjects, a mean peak plasma concentration of 0.034 mg/L was reported 6 h after the first dose on the fourth day [Hucker *et al.* 1977].

Toxicity Cyclobenzaprine should be used with caution in patients receiving other serotonin-enhancing drugs due to the possibility of serotonin syndrome [Day, Jeanmonod 2008; Keegan *et al.* 2006].

Case 1: A 56-year-old female was found dead at home. Postmortem femoral blood concentrations of cyclobenzaprine and diazepam were 0.96 and 0.3 mg/L, respectively.

Case 2: a 37-year-old male took a handful of cyclobenzaprine tablets. He was found dead 5 h later. His femoral blood cyclobenzaprine concentration was 0.8 mg/L and ethanol concentration was 0.174 g/dL [Spiller, Cutino 2003].

Steady-state plasma concentrations were twice as high in elderly subjects after consumption of oral doses of 5 mg cyclobenzaprine twice daily when compared with healthy young subjects. Subjects with mild hepatic insufficiency also had a twofold increase in steady-state concentrations compared with healthy controls [Winchell *et al.* 2002].

A 35-year-old female was found dead in the bath. Cyclobenzaprine was found at a concentration of 1.79 mg/L in the blood along with ethanol at 21.5 mg/L [Winek, Jr. *et al.* 1999].

A 19-year-old male died 7 h after admission to hospital after being found with several medicine bottles. Cyclobenzaprine was found in his blood at a concentration of 0.3 mg/L as well as phenylpropanolamine (2.5 mg/L), chlorpheniramine (0.2 mg/L), lidocaine (6.6 mg/L), phenytoin (19 mg/L) and ibuprofen (130 mg/L). Cause of death was intoxication by cyclobenzaprine and ibuprofen [Levine *et al.* 1993].

In a fatality in which cyclobenzaprine was the suspected cause of death, the following postmortem tissue concentrations were reported: blood 0.46 mg/L, bile 12.0 mg/L, liver 12.4 μg/g, urine 3.2 mg/L; low concentrations of morphine and diazepam were also detected [Beck, Lamoreaux 1979].

Note For a case of paranoid psychosis after self-administration of cyclobenzaprine, see O'Neil *et al.* [2000].

Bioavailability ≈55% [Winchell *et al.* 2002].

Half-life Plasma half-life, ≈1 to 3 days [Linden *et al.* 1983].

Clearance 689 mL/min [Winchell *et al.* 2002].

Protein Binding ≈93% [Linden *et al.* 1983].

Dose Usually 30 mg (as 10 mg tablets) of cyclobenzaprine hydrochloride daily; maximum of 60 mg daily.

Cyclofenil

Induction of Ovulation

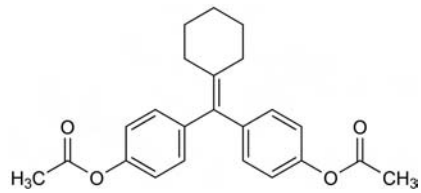
$C_{23}H_{24}O_4$ = 364.4

CAS—2624-43-3

IUPAC Name 4-[[4-(Acetyloxy)phenyl]cyclohexylidenemethyl]phenol acetate

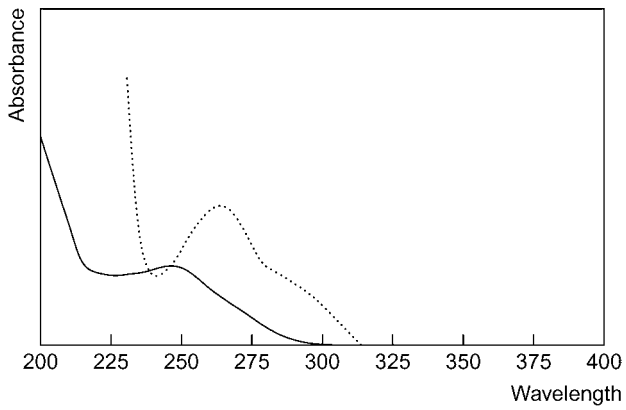
Synonyms F-6066; H-3452; ICI-48213.

Proprietary Names *Fertodur*; *Ondogyne*; *Ondonid*; *Rehibin*; *Sexovid*.



Chemical Properties A white crystalline powder. Mp 137° to 140°. Practically insoluble in water; soluble 1 in 250 of ethanol, 1 in 2 of chloroform and 1 in 30 of ether. Log *P* (octanol/water), 5.4.

Ultraviolet Spectrum Acid ethanol—247 nm; alkaline ethanol—262 nm.



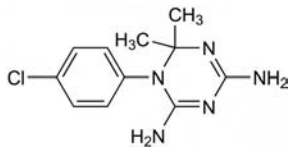
Infrared Spectrum Principal peaks at wavenumbers 1204, 1219, 1754, 917, 1162, 1492 cm^{-1}.

Dose 200 to 400 mg daily; doses of 800 mg daily have been given in 5-day courses.

Cycloguanil

Antimalarial
$C_{11}H_{14}ClN_5 = 251.7$
CAS—516-21-2

IUPAC Name 1-(4-Chlorophenyl)-1,6-dihydro-6,6-dimethyl-1,3,5-triazine-2,4-diamine
Synonyms Chlorguanide triazine; D-20; M-10580; TCl.

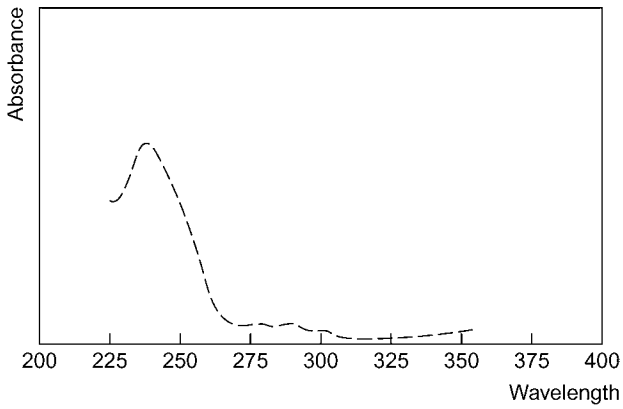


Chemical Properties Crystals. Mp 146°. Log *P* (octanol/water), 1.0.

Cycloguanil Embonate

$(C_{11}H_{14}ClN_5)_2, (C_{23}H_{16}O_6) = 891.8$
CAS—609-78-9
Synonym Cycloguanil pamoate
Chemical Properties A pale greenish-yellow, crystalline powder. Mp 231° to 234°. Practically insoluble in water; sparingly soluble in dimethylformamide.

High Performance Liquid Chromatography System HAA—retention time 10.8 min.
Ultraviolet Spectrum Methanol—237 (A_1^1=2250b), 278, 289 (A_1^1=180b), 301 nm.



Infrared Spectrum Principal peaks at wavenumbers 1673, 1515, 1628, 1570, 760, 1224 cm^{-1} (KBr disk).
Quantification See also under Proguanil.
Blood **HPLC** UV detection. Limit of quantification, 15 mg/L [Kolawole *et al.* 1995].
Plasma **HPLC** Limit of detection, 1 mg/L [Kusaka *et al.* 1996].
Urine **HPLC** Limit of detection, 5 mg/L [Kusaka *et al.* 1996].
Disposition in the Body Slowly absorbed after IM administration and excreted mainly in the urine.

Cycloguanil is the active metabolite of proguanil.

Dose The equivalent of 5 to 6 mg/kg of cycloguanil, IM, every 4 months.

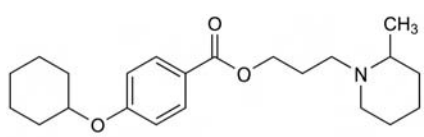
Kolawole JA *et al.* (1995). Determination of proguanil and metabolites in small sample volumes of whole blood stored on filter paper by high-performance liquid chromatography. *J Chromatogr B Biomed Sci Appl* 674(1): 149–154.

Kusaka M *et al.* (1996). Simultaneous measurement of proguanil and its metabolites in human plasma and urine by reversed-phase high-performance liquid chromatography, and its preliminary application in relation to genetically determined S-mephenytoin 4′-hydroxylation status. *Am J Trop Med Hyg* 54(2): 189–196.

Cyclomethycaine

Anaesthetic (Local)
$C_{22}H_{33}NO_3 = 359.5$
CAS—139-62-8 (cyclomethycaine); 537-61-1 (hydrochloride)

IUPAC Name 3-(2-Methylpiperidin-1-yl)propyl 4-cyclohexyloxybenzoate
Synonym 4-(Cyclohexyloxy)benzoic acid 3-(2-methyl-1-piperidinyl)propyl ester

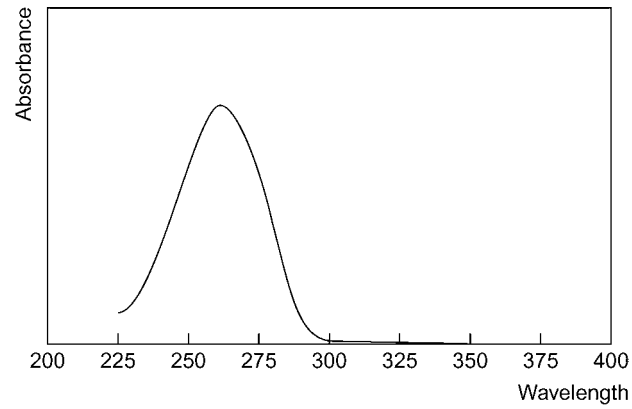


Chemical Properties A white crystalline powder. Sparingly soluble in water, ethanol and ether; very slightly soluble in chloroform. Log *P* (octanol/water), 6.2.

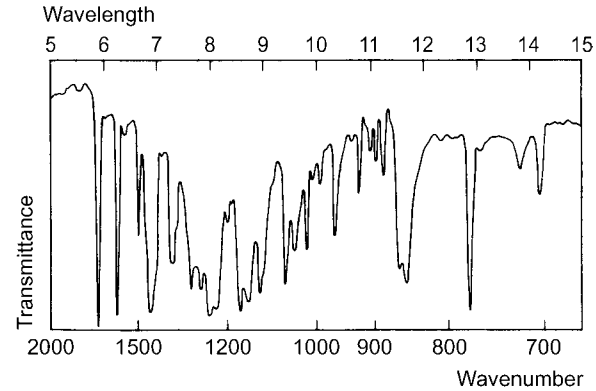
Cyclomethycaine Sulfate

$C_{22}H_{33}NO_3, H_2SO_4 = 457.6$
CAS—50978-10-4
Proprietary Name *Surfacaine*
Chemical Properties A white crystalline powder. Mp 162° to 166°. Soluble 1 in 50 of water, 1 in 50 of ethanol and 1 in about 227 of chloroform.

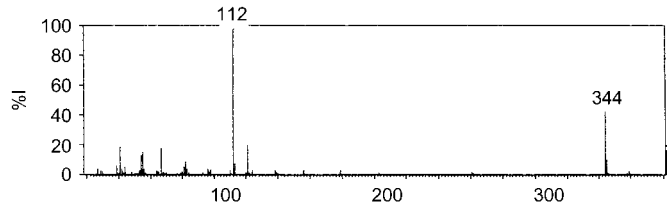
Colour Test Mandelin's test—green→brown.
Thin-layer Chromatography System TA—R_f 0.58; system TB—R_f 0.55; system TC—R_f 0.36; system TL—R_f 0.25 (acidified iodoplatinate solution, positive).
High Performance Liquid Chromatography System HR—*k* 10.31; system HY—RI 413.
Ultraviolet Spectrum Aqueous acid—261 nm (A_1^1=508a).



Infrared Spectrum Principal peaks at wavenumbers 1704, 1605, 1253, 775, 1170, 1235 cm^{-1} (cyclomethycaine sulfate, Nujol mull).



Mass Spectrum Principal ions at *m/z* 112, 344, 121, 41, 67, 55, 54, 345.

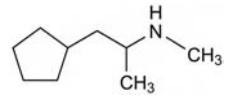


Use Cyclomethycaine sulfate has been used in concentrations of 0.5 to 1%.

Cyclopentamine

Sympathomimetic
$C_9H_{19}N = 141.3$
CAS—102-45-4

IUPAC Name 1-Cyclopentyl-*N*-methylpropan-2-amine
Synonyms Cyclopentadrin; *N*,α-dimethylcyclopentaneethanamine.



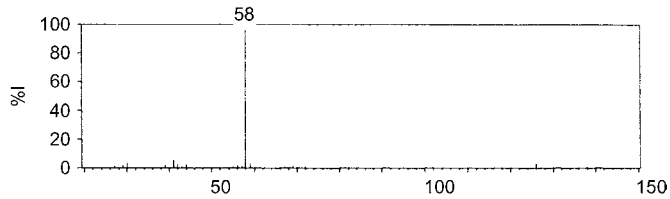
Chemical Properties Log *P* (octanol/water), 3.0.

Cyclopentamine Hydrochloride

$C_9H_{19}N, HCl = 177.7$
CAS—3459-06-1

Synonym Cyclopentaminium chloride
Proprietary Name It is an ingredient of *Co-Pyronil*.
Chemical Properties A white crystalline powder. Mp 113° to 115°. Soluble 1 in 1 of water, 1 in 2 of ethanol, and 1 in 1 of chloroform; slightly soluble in ether.

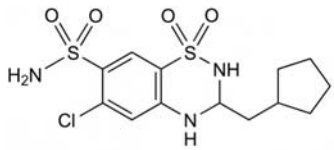
Thin-layer Chromatography System TA—R_f 0.20; system TB—R_f 0.32; system TC—R_f 0.10; system TE—R_f 0.66; system TL—R_f 0.02; system TAE—R_f 0.06; system TAF—R_f 0.68 (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Ninhydrin spray, positive; acidified potassium permanganate solution, positive).
Gas Chromatography System GA—cyclopentamine RI 1230, cyclopentamine-AC RI 1680.
High Performance Liquid Chromatography System HA—*k* 1.7.
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.
Infrared Spectrum Principal peaks at wavenumbers 1585, 1020, 1050, 1100, 1082, 115 cm^{-1}.
Mass Spectrum Principal ions at *m/z* 58, 41, 30, 126, 59, 69, 56, 44.



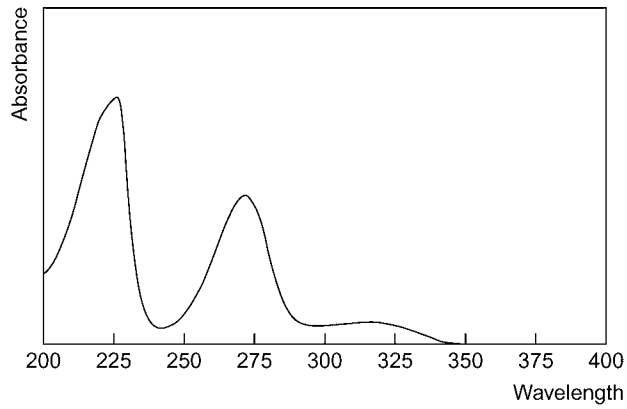
Disposition in the Body
Toxicity The estimated minimum lethal dose for children up to 2 years is 200 mg when applied to the mucous membranes; the minimum lethal dose for adults may be at least 10–times greater.
Dose Cyclopentamine hydrochloride has been used as a 0.5 or 1% nasal solution. It has been given in doses of 25 mg IM, or 5 to 10 mg IV.

Cyclopenthiazide

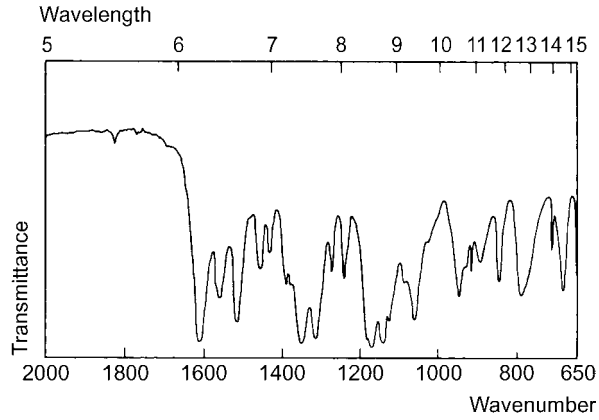
Diuretic
$C_{13}H_{18}ClN_3O_4S_2$ = 379.9
CAS—742-20-1
IUPAC Name 6-Chloro-3-(cyclopentylmethyl)-3,4-dihydro-2*H*-1,2,4-benzothiadiazine-7-sulfonamide 1,1-dioxide
Proprietary Names *Navidrex*. It is an ingredient of *Trasidrex*.



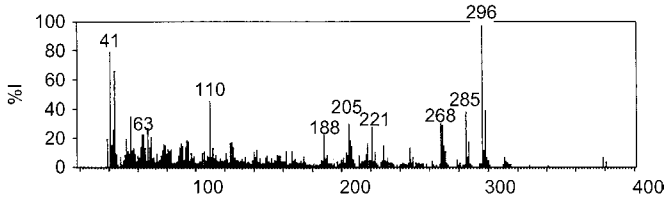
Chemical Properties A white powder. Mp 235°, with decomposition. Practically insoluble in water; soluble 1 in 12 of ethanol and 1 in 600 of chloroform; soluble in ether. Log *P* (octanol/water), 1.3.
Colour Tests Koppanyi–Zwikker test—violet; Liebermann's reagent—brown-green; sulfuric acid—yellow.
Thin-layer Chromatography System TD—R_f 0.21; system TE—R_f 0.66; system TF—R_f 0.62; system TAD—R_f 0.27.
Gas Chromatography System GY—cyclopenthiazide-Me_4 retention time 6.3 min.
High Performance Liquid Chromatography System HN—*k* 16.45; system HY—RI 453.
Ultraviolet Spectrum Aqueous acid—274 (A^1_1=556a), 319 nm. No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1168, 1138, 1605, 1309, 1511, 1060 cm^{-1} (KBr disk).



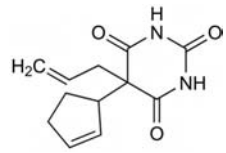
Mass Spectrum Principal ions at *m/z* 296, 41, 44, 110, 298, 285, 55, 268.



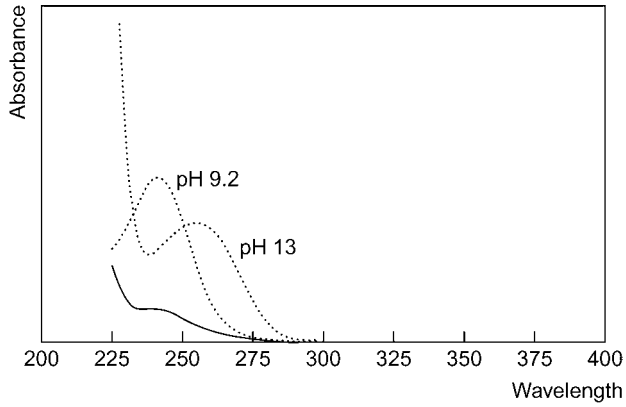
Dose 250 to 500 µg daily; maximum of 1.5 mg daily.

Cyclopentobarbital

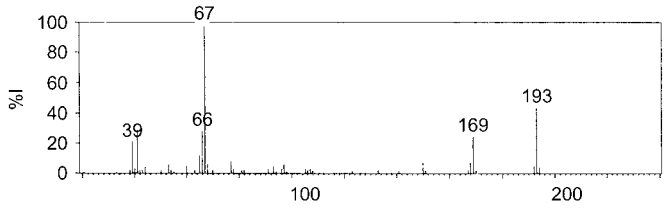
Sedative, Barbiturate
$C_{12}H_{14}N_2O_3$ = 234.3
CAS—76-68-6
IUPAC Name 5-Cyclopent-2-en-1-yl-5-prop-2-enyl-1,3-diazinane-2,4,6-trione
Synonyms Cyclopentenylallyl barbituric acid; 5-(2-cyclopenten-1-yl)-5-(2-propenyl)-2,4,6(1*H*,3*H*,5*H*)-pyrimidinetrione; cyclopentobarbitone.
Proprietary Name *Cyclopal*



Chemical Properties Crystals. Mp 139° to 140°. Slightly soluble in cold water; moderately soluble in hot water; freely soluble in ethanol and organic solvents. pK_a 7.8. Log *P* (octanol/water), 1.5.
Colour Test Vanillin reagent—brown-red/green.
Thin-layer Chromatography System TD—R_f 0.50; system TE—R_f 0.39; system TF—R_f 0.65; system TH—R_f 0.62; system TAD—R_f 0.59; system TAE—R_f 0.90; system TAJ—R_f 0.66; system TAK—R_f 0.63; system TAL—R_f 0.90.
Gas Chromatography System GA—cyclopentobarbital RI 1865; cyclopentobarbital-Me_2 RI 1775.
High Performance Liquid Chromatography System HG—*k* 6.00; system HH—*k* 3.84; system HX—RI 391; system HY—RI 352.
Ultraviolet Spectrum Borax buffer 0.05 mol/L (pH 9.2)—241 nm (A^1_1=411a); 1 mol/L sodium hydroxide (pH 13)—254 nm (A^1_1=306b).



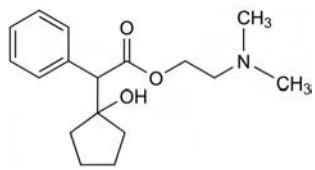
Infrared Spectrum Principal peaks at wavenumbers 1700, 1755, 1212, 815, 1319, 848 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 67, 193, 66, 41, 169, 39, 65, 77.



Dose Cyclopentobarbital has been given in a dose of 100 to 200 mg.

Cyclopentolate

Anticholinergic
$C_{17}H_{25}NO_3 = 291.4$
CAS—512-15-2
IUPAC Name 2-Dimethylaminoethyl 2-(1-hydroxycyclopentyl)-2-phenylacetate
Synonym α-(1-Hydroxycyclopentyl)benzeneacetatic acid 2-(dimethylamino) ethyl ester

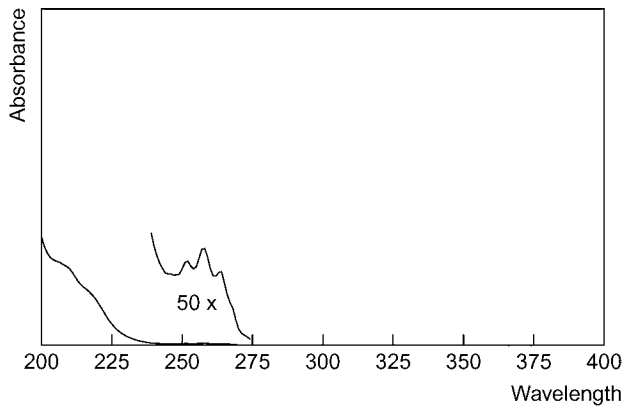


Chemical Properties pK_a 7.9. Log *P* (octanol/water), 2.5.

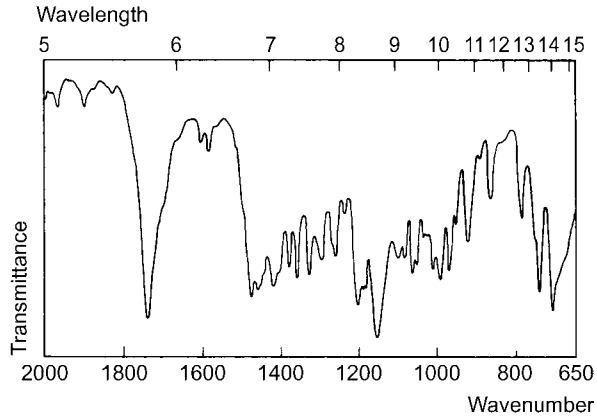
Cyclopentolate Hydrochloride

$C_{17}H_{25}NO_3$, HCl = 327.9
CAS—5870-29-1
Proprietary Names *Cyclogyl*; *Cyclopen*; *Mydplegic*; *Mydrilate*; *Skiacol P.O.S*; *Zyklolat*.
Chemical Properties A white crystalline powder. Mp 135° to 138°. Soluble 1 in less than 1 of water and 1 in 5 of ethanol; practically insoluble in ether.

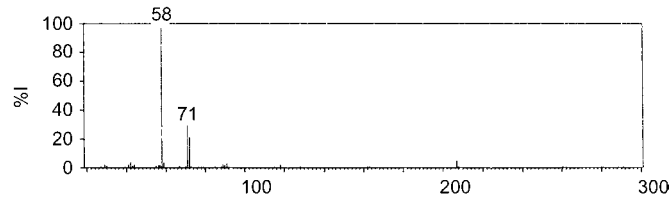
Colour Test Mandelin's test—brown.
Thin-layer Chromatography System TA—R_f 0.57; system TB—R_f 0.32; system TC—R_f 0.39; system TE—R_f 0.64; system TL—R_f 0.26; system TAE—R_f 0.46; system TAJ—R_f 0.23; system TAK—R_f 0.02; system TAL—R_f 0.42.
Gas Chromatography System GA—cyclopentolate RI 2022, cyclopentolate-H_2O RI 2000; system GB—cyclopentolate RI 2092, cyclopentolate-H_2O RI 1551.
High Performance Liquid Chromatography System HA—*k* 1.6 (tailing peak); system HX—RI 353; system HY—RI 287; system HZ—retention time 3.2 min.
Ultraviolet Spectrum Aqueous acid—252 (A^1_1=5a), 258 (A^1_1=6a), 264 nm (A^1_1=5a). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1148, 1733, 704, 1199, 735, 990 cm^{-1} (cyclopentolate hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 58, 71, 72, 207, 42, 91, 59, 118; cyclopentolate-H_2O *m/z* 58, 71, 91, 115, 129, 273.



Disposition in the Body

Therapeutic Concentration

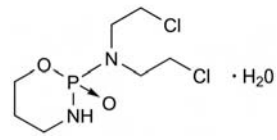
Eight healthy volunteers were administered 30 mL 1% cyclopentolate hydrochloride or cyclopentolate polygalacturonate in saline or acetate buffer in one eye. Peak plasma concentrations of 3 mg/L were reached within 30 min with both formulations [Lahdes *et al.* 1993].

Half-life Elimination, 111 min.
Use Cyclopentolate hydrochloride is used as a 0.5 to 1% ophthalmic solution.

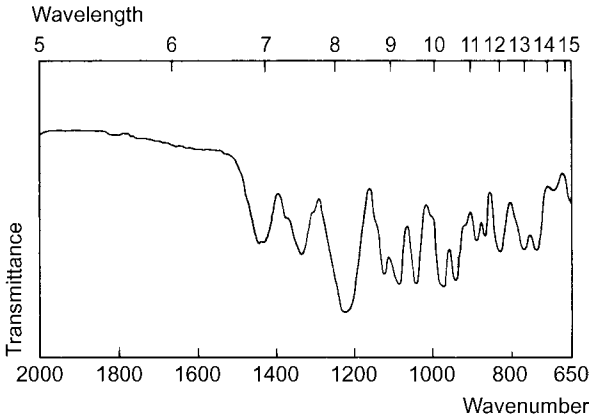
Lahdes K *et al.* (1993). Plasma concentrations and ocular effects of cyclopentolate after ocular application of three formulations. *Br J Clin Pharmacol* 35(5): 479–483.

Cyclophosphamide

Antineoplastic
$C_7H_{15}Cl_2N_2O_2P$, H_2O = 279.1
CAS—50-18-0 (anhydrous); 6055-19-2 (monohydrate)
IUPAC Name *N*,*N*-Bis(2-chloroethyl)-2-oxo-1,3,2λ^5-oxazaphosphinan-2-amine
Synonym *N*,*N*-Bis(2-chloroethyl)tetrahydro-2*H*-1,3,2-oxazaphosphorin-2-amine-2-oxide monohydrate
Proprietary Names *Cytoxan*; *Endoxan(a)*; *Procytox*; *Sendoxan*.



Chemical Properties A fine, white, crystalline powder which discolours on exposure to light. Mp 41° to 45°. It liquefies upon loss of its water of crystallisation. In aqueous solutions, at temperatures above 30°, hydrolysis occurs with removal of chlorine. Soluble 1 in 25 of water and 1 in 1 of ethanol; slightly soluble in benzene, ethylene glycol, carbon tetrachloride, and dioxane; sparingly soluble in ether and acetone. Log *P* (octanol/water), 0.6.
Colour Test Phosphorus test—yellow precipitate.
Thin-layer Chromatography System TAE—R_f 0.74.
Gas Chromatography System GA—cyclophosphamide RI 2065, cyclophosphamide-HCl RI 1975.
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.
Infrared Spectrum Principal peaks at wavenumbers 1225, 1044, 975, 1088, 945, 1128 cm^{-1} (KBr disk).



Quantification

Plasma **GC** NPD. Limit of quantification, 5 mg/L. Limit of detection, 1 mg/L Huitema *et al.* 2001]. NPD [Kalhorn *et al.* 1999]. AFID. Cyclophosphamide metabolites (phosphoramide mustard and nornitrogen mustard) [Juma *et al.* 1980]. AFID. Limit of detection, 10 µg/L [Van den Bosch, De Vos 1980]. AFID. Limit of detection, 10 µg/L [Facchinetti *et al.* 1978].

HPLC Fluorescence detection (λ_{ex}=350 nm; λ_{em}=550 nm). Limit of quantification, 60 µg/L [Griskevicius *et al.* 2002]. UV detection (λ = 276 nm). Limit of quantification, 50 µg/L. Limit of detection, 40 µg/L [Huitema *et al.* 2000]. Limit of detection, 15 µg/L and 30 µg/L metabolites [Baumann *et al.* 1999].

Urine **GC** See Plasma [Facchinetti *et al.* 1978].

GC-MS Limit of detection, >0.25 mg/L [Sessink *et al.* 1993].

HPLC-MS Cyclophosphamide, 4-ketocyclophosphamide and carboxyphosphamide, limit of detection, 10 pg [Bahr, Schulten 1981].

Disposition in the Body Well absorbed after oral administration. The parent drug is inactive, but is converted into active metabolites by the liver. The drug and metabolites are widely distributed in the body. It is oxidised to 4-hydroxycyclophosphamide, which is in equilibrium with aldophosphamide, both of which are cytotoxic. 4-Hydroxycyclophosphamide can be oxidised further to 4-ketocyclophosphamide (inactive). Aldophosphamide may be converted to the cytotoxic metabolites phosphoramide mustard and acrolein, or oxidised to inactive carboxyphosphamide. Carboxyphosphamide may be converted to nornitrogen mustard, an active alkylating agent at acid pH. Up to 95% of a dose is excreted in the urine, mostly during the first 48 h, with up to 25% as unchanged drug and the rest as metabolites. Small amounts are excreted in the bile and faeces.

Therapeutic Concentration

After a single IV dose of 9.4 mg/kg to a patient, a plasma concentration of about 26 mg/L of cyclophosphamide was attained immediately after injection, and this fell to about 13 mg/L after 2 h. After single IV doses of 9 to 12 mg/kg and 40 mg/kg, peak plasma concentrations of unbound alkylating metabolites of about 0.3 to 2 mg/L (8 studies) and about 2 to 6 mg/L (7 studies), respectively, were achieved, usually after 2 to 3 h [Bagley, Jr*et al.* 1973].

Six male and female patients, mean age 52.8 years, were administered an IV bolus of 0.3 to 0.75 (mean, 0.55) g/m^2 cyclophosphamide. 1 h after dose, the mean serum concentration of *R*-cyclophosphamide was 13.49 mg/L and *S*-cyclophosphamide 12.89 mg/L; and 2.08 and 2.25 mg/L 20 h after dosing [Corlett, Chrystyn 1996].

Bioavailability >75%.

Half-life Plasma half-life, about 3 to 12 h (mean 7).

Volume of Distribution About 0.7 L/kg.

Clearance Plasma clearance, about 1 mL/min/kg.

Saliva Plasma : saliva ratio, about 1.6.

Protein Binding Cyclophosphamide about 12 to 24%, alkylating metabolites about 50 to 60%.

Note For a review of the pharmacokinetics of cyclophosphamide, see Grochow, Colvin [1979].

Dose Regimens usually range from 2 to 6 mg/kg daily, orally or intravenously, to 60 to 80 mg/kg as a single IV dose every 3 to 4 weeks.

Cycloserine

Antibiotic, Tuberculostatic

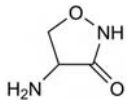
$C_3H_6N_2O_2$ = 102.1

CAS—68-41-7

IUPAC Name D-4-Amino-3-isoxazolidinone

Synonym D-Cycloserine

Proprietary Names *Closina*; *Seromycin*.

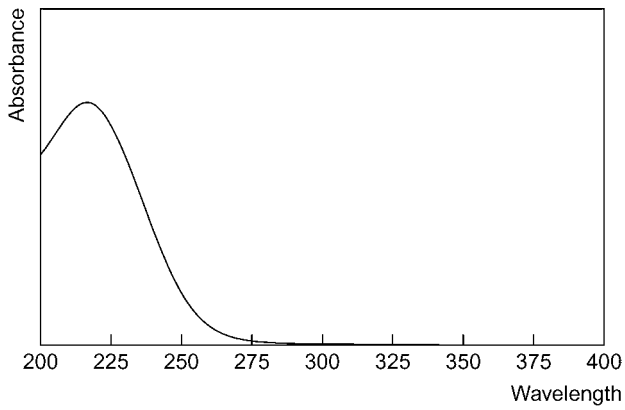


Chemical Properties An antimicrobial substance produced by the growth of certain strains of *Streptomyces orchidaceus* or *S. garyphalus*, or obtained by synthesis. A white or pale yellow, hygroscopic, crystalline powder. It is unstable in neutral or acid solutions. Mp 155° to 156°, with decomposition. Soluble 1 in 10 of water and 1 in 50 of ethanol; slightly soluble in chloroform, ether, and propylene glycol. pK_a 4.5, 7.4 (25°). Log *P* (octanol/water), −1.7.

Colour Test Mercurous nitrate—black.

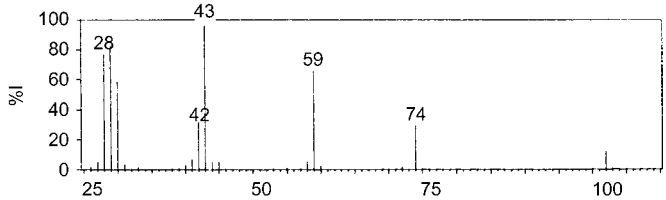
Thin-layer Chromatography System TA—R_f 0.44; system TB—R_f 0.01; system TC—R_f 0.01; system TL—R_f 0.02 (acidified iodoplatinate solution, positive).

Ultraviolet Spectrum No significant absorption, 230 to 360 nm.



Infrared Spectrum Principal peaks at wavenumbers 1577, 1550, 1526, 1620, 934, 877 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 43, 29, 28, 59, 30, 42, 74, 102



Quantification

Plasma **HPLC** Fluorescence detection (λ_{ex}=381 nm; λ_{em}=450 nm). Limit of detection, 10 mg/L [David *et al.* 2001].

Disposition in the Body Readily absorbed after oral administration and widely distributed throughout body fluids and tissues. About 65% of a dose is excreted in the urine unchanged in 72 h, mostly in the first 24 h.

Therapeutic Concentration

After oral administration of 750 mg, divided into three 6-hourly doses to 11 subjects, followed by a single dose of 500 mg the next morning, peak serum concentrations of 22 to 34 mg/L (mean 28) were reported 2 to 4 h after the last dose [Mattila *et al.* 1969].

Toxicity

A female subject who ingested a non-fatal overdose of 3 g, had a peak plasma concentration of 91 mg/L on admission to hospital; following

peritoneal dialysis for 20 h, the plasma concentration declined to 25 mg/L [Atkins *et al.* 1965].
Half-life Plasma half-life, 4 to 30 h (mean 10).
Protein Binding <20%.
Dose 0.25 to 1 g daily.

Atkins R *et al.* (1965). Acute poisoning by cycloserine. *Brit Med J* 1: 907–908.
David V *et al.* (2001). Determination of cycloserine in human plasma by high-performance liquid chromatography with fluorescence detection, using derivatization with p-benzoquinone. *J Chromatogr B Biomed Sci Appl* 761(1): 27–33.

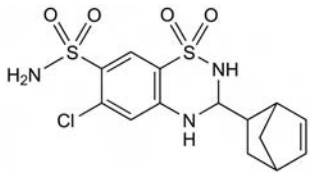
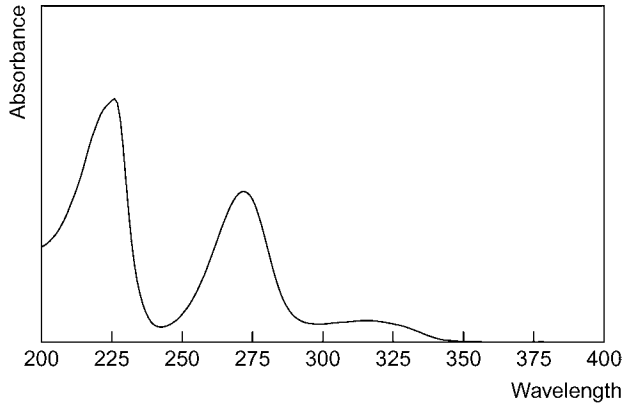
Cyclothiazide

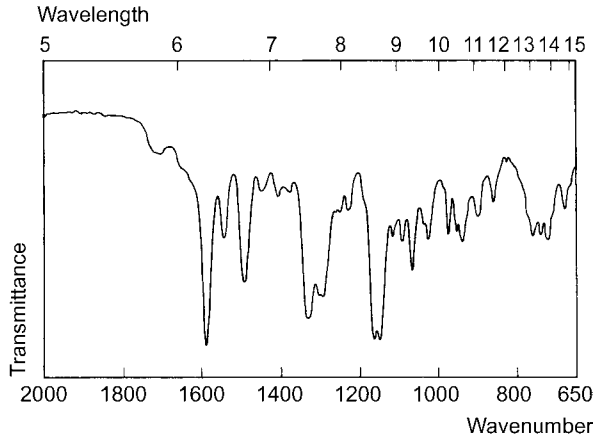
Diuretic
$C_{14}H_{16}ClN_3O_4S_2$ = 389.9
CAS—2259-96-3
IUPAC Name 3-Bicyclo[2.2.1]hept-5-en-2-yl-6-chloro-3,4-dihydro-2*H*-1,2,4-benzothiadiazine-7-sulfonamide 1,1-dioxide
Proprietary Names *Anhydron*; *Doburil*.



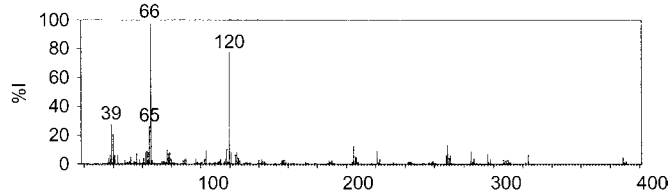
Chemical Properties A white powder. Mp 217° to 225°. Practically insoluble in water; soluble 1 in 70 of ethanol and 1 in 30 of methanol; freely soluble in acetone; practically insoluble in chloroform and ether. Log *P* (octanol/water), 2.0.
Colour Tests Koppanyi–Zwikker test—violet; Liebermann's reagent—brown; sulfuric acid—orange→red-brown.
Thin-layer Chromatography System TA—R_f 0.77; system TD—R_f 0.18; system TE—R_f 0.59; system TF—R_f 0.60; system TAD—R_f 0.26 (acidified potassium permanganate solution, positive).
High Performance Liquid Chromatography System HN—*k* 10.78,*k* 11.91, and *k* 12.81; system HY—RI 433.
Ultraviolet Spectrum Aqueous acid—272 (A^1_1=549b), 314 nm.



Infrared Spectrum Principal peaks at wavenumbers 1596, 1153, 1168, 1307, 1500, 1075 cm^{-1} (KBr disk).



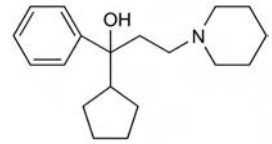
Mass Spectrum Principal ions at *m/z* 66, 120, 39, 65, 269, 205, 118, 77.



Dose 1 to 2 mg daily; up to 6 mg daily may be given.

Cycrimine

Anticholinergic
$C_{19}H_{29}NO$ = 287.4
CAS—77-39-4
IUPAC Name 1-Cyclopentyl-1-phenyl-3-piperidinopropan-1-ol

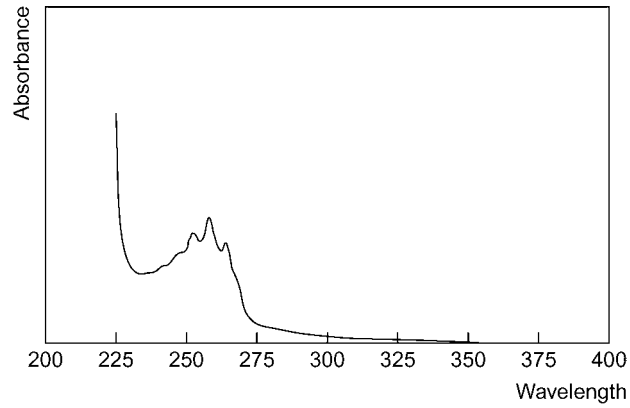


Chemical Properties Mp 90° to 96°. Log *P* (octanol/water), 2.0 (hydrochloride).

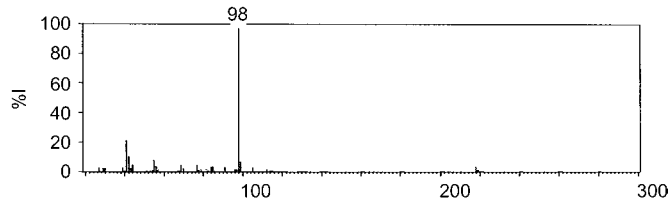
Cycrimine Hydrochloride

$C_{19}H_{29}NO$, HCl = 323.9
CAS—126-02-3
Synonym Cycriminium chloride
Proprietary Name *Pagitane Hydrochloride*
Chemical Properties A white solid. Mp about 242°, with decomposition. Soluble 1 in 175 of water, 1 in 50 of ethanol, and 1 in 35 of chloroform; practically insoluble in ether.

Colour Tests Liebermann's reagent—red-orange; Mandelin's test—red-brown; Marquis test—orange→red.
Thin-layer Chromatography System TA—R_f 0.66; system TB—R_f 0.67; system TC—R_f 0.61; system TL—R_f 0.60 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2114.
Ultraviolet Spectrum Aqueous acid—251, 256 (A^1_1=6b), 263 nm.



Infrared Spectrum Principal peaks at wavenumbers 696, 1117, 755, 751, 1030, 1298 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 98, 41, 42, 55, 99, 77, 69, 44.



Quantification

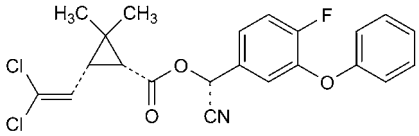
Biological Fluids **GC-MS** Flame thermionic detection. Limit of detection, 50 to 100 ng/L [Owen *et al.* 1989].
Dose Usually 3.75 to 20 mg of cycrimine hydrochloride daily.

Owen JA *et al.* (1989). Capillary gas chromatography of trihexyphenidyl, procyclidine and cycrimine in biological fluids. *J Chromatogr* 494: 135–142.

Cyfluthrin

Pyrethroid Insecticide
$C_{22}H_{18}Cl_2FNO_3 = 434.3$
CAS—68359-37-5

IUPAC Name Cyano-(4-fluoro-3-phenoxy-phenyl)methyl-3-(2,2-dichloroethenyl)-2,2-dimethylcyclopropane-1-carboxylate
Synonyms β-Cyfluthrin; BAY FCR 1272; BAY-VI-1704; cyfoxylate; FCR 1272; FCR 4545.
Proprietary Names *Attatox*; *Baythroid*; *Baythroid H*; *Bulldock*; *Contur*; *Eulan SP*; *Laser*; *Renounce*; *Responsar*; *Solfac*; *Tempo*; *Tempo H*.



Chemical Properties Yellowish-brown oil. Mp 60°. It is soluble in water (0.002 g/L at 20°), 2-propanol (20 to 50 g/L), methylene chloride (>200 g/L), hexane (10 to 20 g/L) and toluene. Log *P* (octanol/water) 5.95. Stock solutions were stable at –18° for at least 6 months. Urine samples were stable at –21° for >1 year. Derivatised samples were stable for 1 month at 4° [Leng, Gries 2005]. Unstable in plasma [Leng *et al.* 1997a].
Thin-layer Chromatography System TX—R_f 0.37; system TY—R_f 0.89.
Gas Chromatography System GA—RI 2749.
Gas Chromatography-Mass Spectrometry Column: HP-5MS cross-linked 5% diphenyl 95% dimethylpolysiloxane. Carrier gas: He, 1.0 mL/min. Temperature: 180° for 2 min to 280° at 5°/min. Column: BGB-172 20% tert-butyldimethylsilyl-β-cyclodextrin in 15% diphenyl and 85% dimethylpolysiloxane. Carrier gas: He, 1.0 mL/min. Temperature programme: 160° for 2 min to 220° at 1°/min for 60 min to 230° at 5°/min. ECD or MSD, EI ionisation at 70 eV, full scan mode. Details regarding retention time are shown in the table below.

Configuration				*Retention time (min)*	
1C	3C	αC	1C/3C	HP-5MS	BGB-172

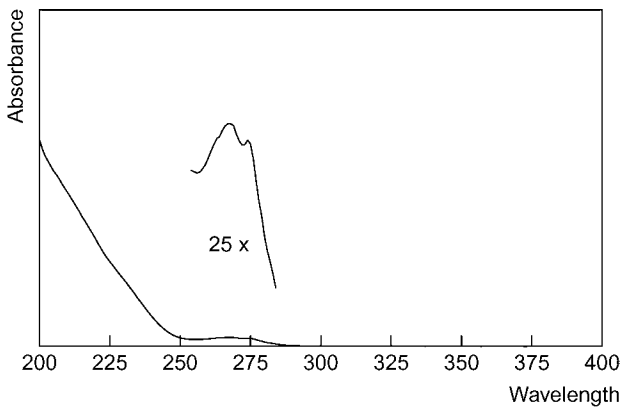
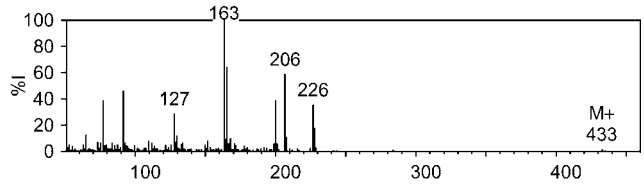
[Liu, Gan 2004]

High Performance Liquid Chromatography Column: chiral stationary phase on stainless steel (250 × 4.6 mm i.d.). Mobile phase: *n*-hexane : 1,2-dichloromethane : 2-propanol (96.8 : 3 : 0.2), flow rate 1.0 mL/min. UV and CD detection (λ = 230 nm). k'_1/k'_2: 10.45/11.07, 12.80/13.15, 13.54/14.13, 15.83/17.22 for (α*R*)(*1R*)*cis*/(α*S*)(*1S*)*cis*, (α*R*)(*1S*)*cis*/(α*S*)(*1R*)*cis*, (α*R*)(*1R*)*trans*/(α*S*)(*1S*)*trans*, and (α*R*)(*1S*)*trans*/(α*S*)(*1R*)*trans*, respectively [Tan *et al.* 2007]. See also Girelli *et al.* [2002].
Ultraviolet Spectrum



Mass Spectrum Principal peaks at *m/z* 163, 206, 226, 127



Quantification
Blood **GC-MS** Column: DB5-MS 5% phenylmethylpolysiloxane (30 m × 250 µm i.d., 1 µm). Carrier gas: He, 1 mL/min. Temperature programme: 70° to 300° at 10°/min for 10 min. EI ionisation at 70 eV, MSD, SIM acquisition mode. Limit of detection, 3.1 to 98.0 µg/L [Ostrea, Jr. *et al.* 2006]. Column: DB-1 (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 60° for 3 min to 200° at 10°/min for 5 min to 240° at 5°/min for 45 min. SIM acquisition mode. Limit of quantification, 2 µg/L, limit of detection, 1 µg/L [Ramesh, Ravi 2004a]. Column: Column: DB-1 (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 60° for 3 min to 200° at 10°/min for 5 min to 240° at 5°/min for 45 min. NCI, SIM acquisition mode. Limit of quantification, 20 ng/L, limit of detection, 5 ng/L [Ramesh, Ravi 2004b].
Plasma **GC-MS** ECD. Limit of detection, 5 µg/L for DCCA and FPBA [Leng *et al.* 1997a].
Serum **GC-MS** See Blood [Ramesh, Ravi 2004b].
Urine **GC-MS** Column: Rtx 65 medium polar fused silica capillary (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He. Temperature programme: 60° for 1 min to 150° at 8°/min to 300° at 30°/min for 5 min. EI ionisation at 70 eV, positive or negative ion mode. Limit of detection, 0.05 µg/L for *cis*- and *trans*-DCCA and 0.02 µg/L for FPBA with positive ion mode, 0.02 µg/L for *cis*- and *trans*-DCCA, and 0.005 µg/L for FPBA with negative ion mode [Leng, Gries 2005]. Column: 5% phenyl methylpolysiloxane (60 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 21 p.s.i. Temperature programme: 90° for 1 min to 150° at 6°/min for 7 min to 200° at 10°/min for 12 min to 270° at 20°/min for 10 min. EI ionisation at 70 eV, SIM acquisition mode. Retention time: 33.2 min for FPBA. Limit of detection, 0.5 µg/L for FPBA [Angerer, Ritter 1997]. MSD. Limit of detection, 0.5 µg/L for DCCA and FPBA [Leng *et al.* 1997a]. Column: DB 5 MS fused silica capillary (30 m × 0.25 mm i.d., 0.1 µm). Carrier gas: He, 100 kPa. Temperature programme: 70° for 1 min to 140° at 20°/min for 1 min to 270° at 10°/min for 1 min. EI ionisation at 70 eV, MID acquisition mode. Limit of detection, 0.5 µg/L [Leng *et al.* 1997b].
Meconium **GC-MS** Column: DB-5MS 5% phenyl methyl polysiloxane capillary (30 m × 0.25 mm i.d., 1 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 70° for 1 min to 280° at 10°/min for 10 min. EI ionisation, SIM acquisition mode. Limit of detection, 0.39 µg/g [Bielawski *et al.* 2005].
Hair **GC-MS** See Blood. Limit of detection, 30.5–488.0 ng/g [Ostrea, Jr. *et al.* 2006].
Other **GC-MS** Water and Fish. Column: DB5 or DB17 MS (60m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 80° for 1 min to 210° at 15°/min for 10 min to 290° at 2°/min for 14 min. ECD. Limit of detection, 2 ng/L in water and 3.0 ng/g in fish [Mekebri *et al.* 2008]. White Wine. Column: SLB-5MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 30 cm/s. Temperature programme: 40° to 300° at 3°/min. EI ionisation, scan acquisition mode. Limit of detection, 124 µg/L [Mondello *et al.* 2008]. Vegetables. Column: SPB-5 fused silica capillary (30 m × 0.25 mm i.d., 0.25 µm). Temperature programme: 80° to 200° at 8°/min to 210° at 1°/min to 270° at 1.2°/min. ITMS, SIM acquisition mode. Limit of quantification, 21 ng/g, limit of detection, 10 ng/g [González-Rodriguez *et al.* 2008]. Soil. Column: HP-5 capillary (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 60° for 2 min to 210° at 20°/min to 270° at 3°/min for 7 min. EI ionisation at 70 eV or NCI or ECD (for ECD carrier gas: N_2, 1.3 mL/min), full scan, SIM or MS/MS acquisition mode. Limit of detection, 1.9, 1.3 and 0.47 ng/g for EI in full scan, SIM and MS/MS mode, respectively, 0.44, and 0.18 ng/g for NCI in full scan and SIM and 2.6 ng/g for ECD [Esteve-Turrillas *et al.* 2006]. Bovine Fat. Column: DB-608 (30 m × 0.53 mm i.d., 0.83 µm). Carrier gas: He, 1 mL/min. Temperature programme: 100° for 1.5 min to 280° at 20°/min for 27 min. ECD. Retention time: 20.2, 20.35 and 20.61 min. Limit of quantification, 38.9 µg/kg, limit of detection, 11.7 µg/kg [Akre, MacNeil 2006]. Water, Vegetable and Fruit. Column: HP-5 MS 5% phenyl methyl siloxane (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 90° for 5 min to 265° at 30°/min to 300° at 4°/min for 4.42 min. EI ionisation at 50 eV, SIM acquisition mode. Limit of detection, 2.0 µg/L and 0.025 µg/g [Beltran *et al.* 2003]. Fruit and Vegetables. Column: DB-1 capillary (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 1.5 mL/min. Temperature programme: 80° for 1 min to 250° at 25°/min for 30 min to 270° at 15°/min for 2 min to 80° at 25°/min. ECD. Column: HP MS-5 (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.4 mL/min. Temperature programme: 80° for 1 min to 250° at 25°/min for 23 min to 270° at 25°/min for 2 min. EI ionisation at 70 eV. Limit of quantification, 0.01 and 0.02 µg/g for ECD and EI ionisation, respectively [Sannino *et al.* 2003]. Fats and Oils. CBP-1 methyl silicone fused silica capillary (25 m × 0.2 mm i.d., 0.25 µm). Carrier gas: N_2, 1.2 mL/mmin. Temperature: 250°. ECD. Limit of detection, 2 µg/L [Ramesh, Balasubramanian 1998]. Vegetables. Column: HP 50 + cross-linked 50% phenyl 50% methylsilicone fused silica (15 m × 0.53 mm, 1 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 50° for 2 min to 180° at 10°/min to 270° at 5°/min

C

for 20 min. ECD. Limit of detection, 0.1 μg/g [Di Muccio *et al.* 1997]. Column: HP-1 (5 m × 0.53 mm i.d., 2.65 μm). Carrier gas: CH_4:Ar, 5.0 mL/min. Temperature programme: 230° for 2 min to 260° at 2°/min for 5 min. ECD. Retention time: 13.7 min. Limit of detection, 3–30 ng/g [Pang *et al.* 1994].

HPLC Soil. Column: Chiralcel OD (250 × 4.6 mm i.d., 10 μm). Mobile phase: *n*-hexane : isopropanol (100 : 0.1), flow rate 1.0 mL/min. UV detection (λ = 230 nm). Limit of detection, <0.03 μg/g [Li *et al.* 2008]. Tomato. Column: Gemini C_{18} (150 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : water (66 : 34 for 18 min to 75 : 25 in 1 min to 90 : 10 in 1 min), flow rate 1.4 mL/min for 18 min to 1.5 mL/min. Chemiluminescence detection. Limit of quantification, 0.044 mg/L, limit of detection, 0.017 mg/L [Galera *et al.* 2006]. Soil. Column: silica gel (250 × 4.6 mm i.d., 5 μm). Mobile phase: *n*-hexane : 2-propanol (100 : 0.06), flow rate 1.0 mL/min. UV detection (λ = 230 nm). Limit of detection, 0.05 μg/g [Li *et al.* 2003]. Column: glycidoxypropylsilanised silica gel (150 × 4.6 mm i.d., 5 μm).UV detection (λ = 230 nm). Limit of detection, <0.01 mg/L [Dondi *et al.* 1999].

Disposition in the Body Cyfluthrin is rapidly metabolised in the liver via plasma esterase hydrolysis and metabolites include *cis*-(3(2,2-dichlorovinyl)-2,2-dimethylcyclopropane-carboxylic acid (*cis*-DCCA), *trans*-DCCA and 4-fluoro-3-phenoxybenzoic acid (FPBA). It is eliminated fairly quickly in urine (~60%) and faeces (~20%) within 24 h. 98% of the dose is eliminated within 48 h.

Toxicity Moderately toxic and irritant to human skin, especially facial skin. Toxic effects have a delay of 1 to 2 h after exposure.

A 64-year-old male was found unconscious at home with 1 empty bottle and 1 half-filled bottle containing emulsion (with 35 mL cyfluthrin). Analysis showed that there was a concentration of 10 mg/L cyfluthrin in his blood, and 14 mg cyfluthrin in his stomach, 0.004 mg/g cyfluthrin in the liver, and 7 mg/L in his urine [Hon *et al.* 1988].

Note For a review of the neurobehavioural toxicology of pyrethroid insecticides, see Wolansky and Harrill [2008].

Half-life *cis*-DCCA, 6.9 h; *trans*-DCCA, 6.2 h; FPBA, 5.3 h.

Cyprenorphine

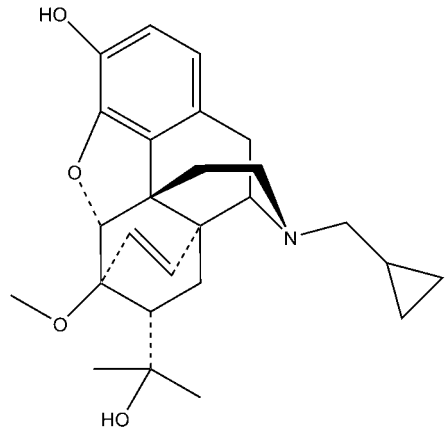
Opioid Derivative, Narcotic Antagonist

$C_{26}H_{33}NO_4$ = 423.6

CAS—4406-22-8

IUPAC Name *N*-Cyclopropylmethyl-7,8-dihydro-7α-(1-hydroxy-1-methylethyl)-O6-methyl-6,14-endo-ethenomorphine

Synonyms *N*-Cyclopropylmethyl-19-methylnororvinol; M 285.



Chemical Properties Mp 234°. Soluble 1 in 2500 of water; readily soluble in ethanol, ether, and chloroform. Extracted by organic solvents from aqueous alkaline solutions.

Cyprenorphine Hydrochloride

Chemical Properties White crystalline powder. Mp 254° to 255°. Soluble 1 in 30 of water and 1 in 16 of ethanol.

Colour Tests Ammonium molybdate test—bluish-purple→blue→dull green (limit of detection, 0.1 μg); sulfuric acid–formaldehyde test—bluish-grey→yellow-brown (limit of detection, 0.1 μg); Vitali's test—faint orange (limit of detection, 1.0 μg).

Thin-layer Chromatography System T1—R_f 0.75 (location reagents: acidified iodoplatinate spray, positive reaction; Marquis reagent, grey).

Ultraviolet Spectrum Aqueous acid (0.1 N hydrochloric acid)—287 nm; aqueous alkali (0.1 N sodium hydroxide)—301 nm.

Note Cyprenorphine is a highly potent narcotic antagonist with actions similar to those of nalorphine. It has been used to antagonise the effects of acetorphine and etorphine.

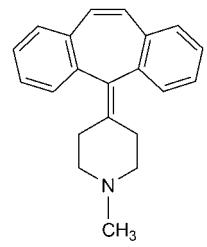
Cyproheptadine

5-HT Receptor Antagonist, Antihistamine

$C_{21}H_{21}N$ = 287.4

CAS—129-03-3

Synonym 4-(5*H*-Dibenzo[*a*,*d*]cyclohepten-5-ylidene)-1-methylpiperidine



Chemical Properties Crystals. Mp ≈113°. Log *P* (octanol/water) 4.69 [Sangster 1997], 4.92 [Gil-Agusti *et al.* 2001], (octanol/pH 7.4), 3.2. Stock solutions in methanol were stable for at least 3 months if stored at 4° [Hasegawa *et al.* 2006].

Cyproheptadine Hydrochloride

$C_{21}H_{21}N$, HCl, $1^1/_2H_2O$ = 350.9

CAS—969-33-5 (anhydrous); 41354-29-4 (sesquihydrate)

Proprietary Names *Antegan*; *Nuran*; *Periactin(e)*; *Periactinol*; *Vimicon*.

Chemical Properties White to slightly yellow, crystalline powder. Mp 214° to 216°, with decomposition. Soluble 1 in 275 of water, 1 in 35 of ethanol, 1 in about 16 of chloroform and 1 in 1.5 of methanol; practically insoluble in ether.

Colour Tests Mandelin's test—violet-brown; Marquis test—grey-green; sulfuric acid—violet.

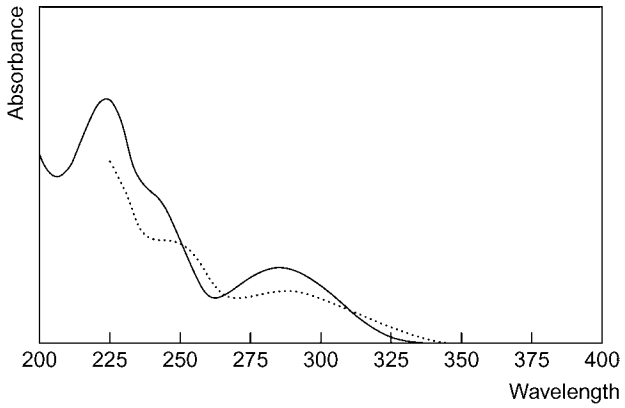
Thin-layer Chromatography System TA—R_f 0.51; system TAE—R_f 0.30; system TAF—R_f 0.50; system TL—R_f 0.13; system TB—R_f 0.45; system TC—R_f 0.44; system TE—R_f 0.64 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—cyproheptadine RI 2355, M (OH-) RI 3060, M (nor-) RI 2400, M (oxo-) RI 2960, M (nor-OH-) RI 2450; system GB—cyproheptadine RI 2460, M (nor-OH-)-H_2O RI 2608; system GC—RI 2307; system GF—RI 2710.

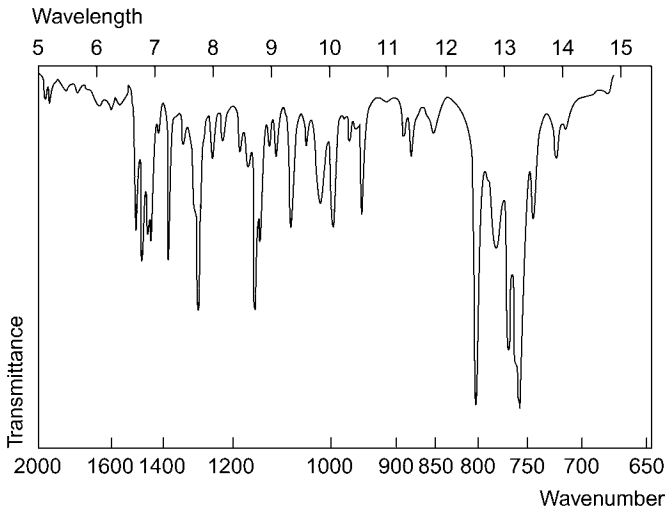
High Performance Liquid Chromatography System HA—*k* 3.2; system HAA—RT 15.0 min; system HY—RI 354; system HZ—RT 6.5 min.

Column: ODS-2 (120 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : water (60 : 40). UV detection (λ = 285 nm). Retention time: 8.7 min. Limit of detection, 65 µg/L [Gil-Agusti *et al.* 2001].

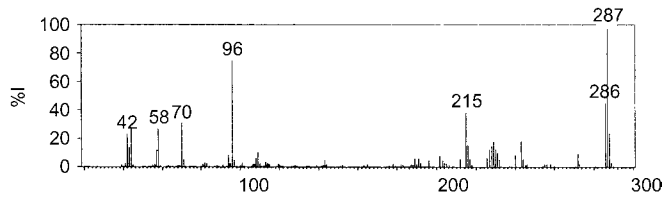
Ultraviolet Spectrum Aqueous acid—286 nm (A_1^1 = 433a); aqueous alkali—284 nm (A_1^1 = 377b).



Infrared Spectrum Principal peaks at wavenumbers 777, 756, 815, 786, 1640, 960 cm^{-1} (cyproheptadine hydrochloride), (KBr disk).



Mass Spectrum Principal ions at *m/z* 287, 96, 286, 215, 70, 44, 58, 42; M (OH^-) *m/z* 303, 203, 202, 217, 304, 205; M (nor-) *m/z* 273, 215, 216, 231, 229, 272; M (oxo-) *m/z* 229, 215, 202, 242, 301, 258; M (nor-OH-)-H_2O *m/z* 271, 272, 270, 165, 193, 241.



Quantification

Blood **GC-MS** Column: HP-5 fused silica capillary (25 m × 0.32 mm i.d., 0.17 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 1 min to 200° at 30°/min to 260° at 10°/min to 300° at 20°/min for 8 min. EI ionisation. Limit of detection, 0.13 mg/L [Levine *et al.* 1998].

Plasma **GC** Column: 3% OV-17 on Gas-Chrom Q 80/100 mesh (91 cm × 2 mm i.d.). Carrier gas: He, 30 mL/min. Temperature: 250°. NPD. Retention time: 2.4 min. Limit of detection, 6.25 µg/L [Hucker, Hutt 1983b]. Column: 3% SP-2250 Supelcoport on 80/100 mesh (0.91 m × 2 mm i.d.). Carrier gas: He, 30 mL/min. Temperature: 230°. Retention time, 4.2 min. Limit of detection, 3 µg/L [Hucker, Hutt 1983a].

GC-MS Column: DB-1MS fused silica capillary (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 2.0 mL/min. Temperature programme: 120° for 1 min to 300° at 20°/min. EI ionisation at 70 eV, positive ion mode. Limit of detection, 0.2 µg/L [Hasegawa *et al.* 2006].

Urine **GC** See Plasma [Hucker, Hutt 1983a].

GC-MS See Blood [Levine *et al.* 1998]. Column: HP capillary cross-linked methylsilicone (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 3 min to 310° at 30°/min for 5 min. EI ionisation at 70 eV. Limit of detection not reported [Maurer, Pfleger 1988].

HPLC Column: octyl-ODP (150 × 6 mm i.d.). Mobile phase: acetate buffer : methanol (56 : 44, pH 3.6), flow rate 1.4 mL/min. UV detection (λ = 254 nm). Retention time: 8.3 min. Limit of quantification 50 µg/L, limit of detection, 15 µg/L [Kountourellis, Ebete 1995].

Bile **GC-MS** See Blood [Levine *et al.* 1998].

CSF **GC-MS** See Blood [Levine *et al.* 1998].

Gastric Contents **GC-MS** See Blood [Levine *et al.* 1998].

Kidney **GC-MS** See Blood [Levine *et al.* 1998].

Liver **GC-MS** See Blood [Levine *et al.* 1998].

Other **HPLC** Rat Tissue. Column: Partisil 10/25 ODS C_{18}. Mobile phase: methanol : 0.03mol/L potassium dihydrogen phosphate (60 : 40), flow rate 1.4mL/min. UV detection (λ = 210 nm). Limit of detection, 0.5 µg/g [Chow, Fischer 1987].

Disposition in the Body Absorbed after oral administration and extensively distributed throughout the tissues. Metabolised by aromatic-ring hydroxylation, *N*-demethylation, heterocyclic-ring oxidation, and glucuronic-acid conjugation; the major metabolite in urine is a quaternary ammonium glucuronide conjugate. About 67 to 77% of a dose is excreted in the urine in 6 days, the remainder being eliminated in the faeces. Of the excreted material, 58 to 65% is conjugated with glucuronic acid, 9 to 11% is conjugated with sulfate, 20 to 26% is excreted as polar material not hydrolysable by glucuronidase or sulfatase, and ~5% is unconjugated.

Therapeutic Concentration

After giving 8 mg cyproheptadine via the oral and sublingual route to 5 subjects, mean maximum plasma concentrations of 30.0 and 4.0 µg/L were reached at 4.0 and 9.6 h, respectively [Gunja *et al.* 2004].

After a single oral dose of 5 mg to 2 subjects, peak plasma concentrations of cyproheptadine metabolites of 0.036 and 0.05 mg/L were attained in 6 to 9 h; unchanged drug was not detected [Hintze *et al.* 1975].

Toxicity

A 28-year-old male was found dead. The heart blood concentration of cyproheptadine was 0.46 mg/L and ethanol was detected at 0.9 g/L. Cyproheptadine was also detected at concentrations of 8.1 mg/L, 1.8 mg/kg, 7.6 mg/kg, 0.75 mg/L and 2.3 mg in bile, kidney, liver, urine and stomach contents, respectively [Levine *et al.* 1998].

Half-life 16 h [Paton, Webster 1985].

Dose 12 to 16 mg of anhydrous cyproheptadine hydrochloride daily; maximum of 32 mg daily.

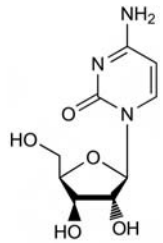
Cytarabine

Antineoplastic

$C_9H_{13}N_3O_5$ = 243.2

CAS—147-94-4

IUPAC Name 4-Amino-1-[(2*R*,3*S*,4*S*,5*R*)-3, 4-dihydroxy-5-(hydroxymethyl) oxolan-2-yl]pyrimidin-2-one
Synonyms 4-Amino-1-β-D-arabinofuranosyl-2(1*H*)-pyrimidinone; arabinosylcytosine; Ara-C; cytosine arabinoside.
Proprietary Names *Alexan*; *Aracytin(e)*; *Cytosar*; *Cytosar-U*; *Udicil*.

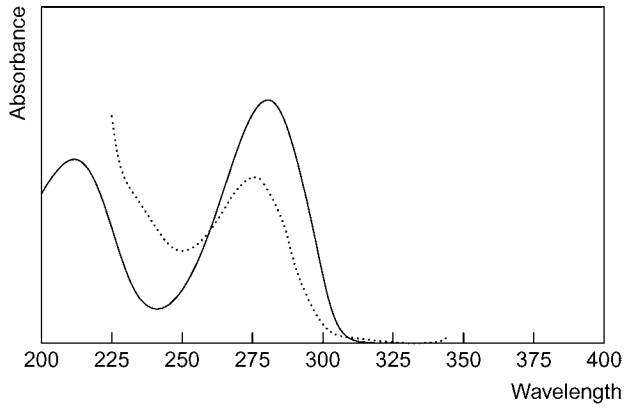


Chemical Properties A white crystalline powder. Mp 212° to 213°. Soluble 1 in 10 of water, 1 in 1000 of ethanol, and 1 in 1000 of chloroform. pK_a 4.3. Log *P* (octanol/water), −2.5.

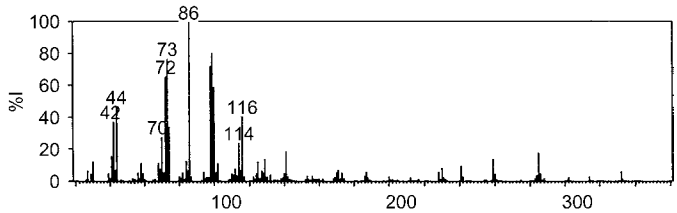
Cytarabine Hydrochloride

$C_9H_{13}N_3O_5$, HCl = 279.7
CAS—69-74-9
Chemical Properties A white crystalline powder. Soluble 1 in 1 of water; less soluble in organic solvents.

Thin-layer Chromatography System TA—R_f 0.05; system TB—R_f 0.00; system TC—R_f 0.01; system TL—R_f 0.01; system TAD—R_f 0.00; system TAE—R_f 0.69 (acidified potassium permanganate solution, positive).
Ultraviolet Spectrum Aqueous acid—280 nm (A^1_1=555a); aqueous alkali—274 nm.



Infrared Spectrum Principal peaks at wavenumbers 1075, 1027, 1145, 1109, 1178, 1002 cm^{-1} (KBr disk).
Mass Spectrum



Quantification
Plasma **GC** AFID. Limit of detection, 40 µg/L [Boutagy, Harvey 1978].

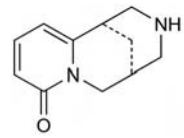
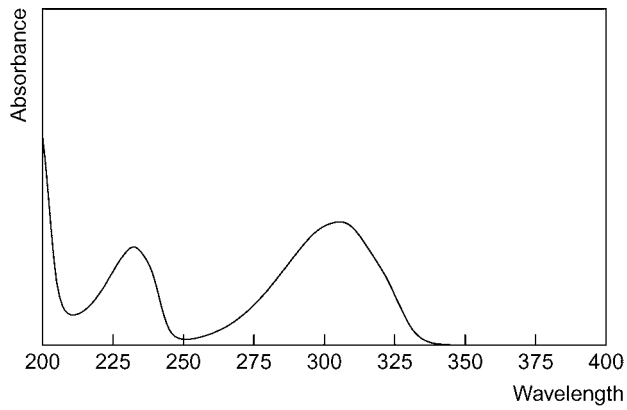
Cytisine

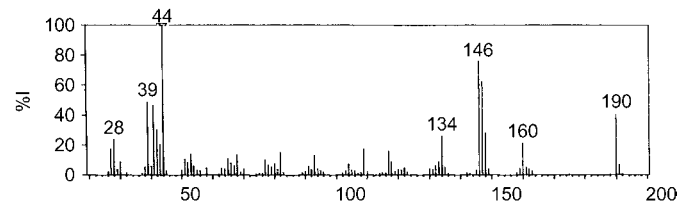
Alkaloid
$C_{11}H_{14}N_2O$ = 190.2
CAS—485-35-8
Synonyms Baptitoxine; cytiton; (1*R*)-1,2,3,4,5,6-hexahydro-1,5-methano-8*H*-pyrido[1,2-*a*][1,5]diazocin-8-one; laburnine; sophorine; ulexine.



Chemical Properties An alkaloid found in all parts of the laburnum, *Laburnum anagyroides* (Leguminosae), particularly in the pods and seeds, and in some other leguminous plants. A white or slightly yellowish crystalline powder. Mp 154° to 157°. Soluble 1 in 1.3 of water, 1 in 13 of acetone, 1 in 30 of benzene, 1 in 10 of ethyl acetate, 1 in 3.5 of ethanol, and 1 in 2 of chloroform; practically insoluble in petroleum ether. Log *P* (octanol/water), 0.6.
Thin-layer Chromatography System TA—R_f 0.40; system TB—R_f 0.01; system TC—R_f 0.10; system TL—R_f 0.02 (acidified iodoplatinate solution, positive).
Ultraviolet Spectrum Aqueous acid—232, 302 nm (A^1_1=344b).



Infrared Spectrum Principal peaks at wavenumbers 1650, 1540, 1565, 1140, 790, 1311 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 44, 146, 147, 39, 41, 190, 42, 148.



Quantification
Blood **UV-Vis** [Richards, Stephens 1970].
Disposition in the Body
Toxicity Cytisine is a highly toxic alkaloid which resembles nicotine in its actions. Fatalities have occurred after the ingestion of laburnum seeds, but recovery is more usual.

In a fatality due to the ingestion of laburnum seeds (estimated amount ingested 50 mg), a blood concentration of 6.8 mg/L of cytisine was reported; the stomach contained 23 laburnum pods [Richards, Stephens 1970].

Note For reviews of laburnum poisoning in children, see Mitchell [1951], and Bramley, Goulding [1981].

Dactinomycin

Antineoplastic

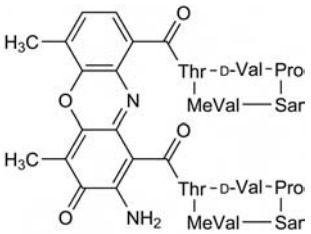
$C_{62}H_{86}N_{12}O_{16}$ = 1255.5

CAS—50-76-0

IUPAC Name 2-Amino-4,6-dimethyl-3-oxo-1-*N*,9-*N*-bis[7,11,14-trimethyl-2,5,9,12, 15-pentaoxo-3,10-di(propan-2-yl)-8-oxa-1,4,11,14-tetrazabicyclo[14.3.0]nonadecan-6-yl]phenoxazine-1,9-dicarboxamide

Synonyms Actinomycin C_1; actinomycin D; [2-amino-*N*,*N*′-bis[hexadecahydro-2,5,9-trimethyl-6,13-bis(1-methylethyl)-1,4,7,11,14-pentaoxo-1*H*-pyrrolo-[2,1-i][1,4,7,10,13]oxatetra-azacyclohexadecin-10-yl]-4,6-dimethyl-3-oxo]-3*H*-phenoxazine-1,9-dicarboxamide; meractinomycin; NSC-3053.

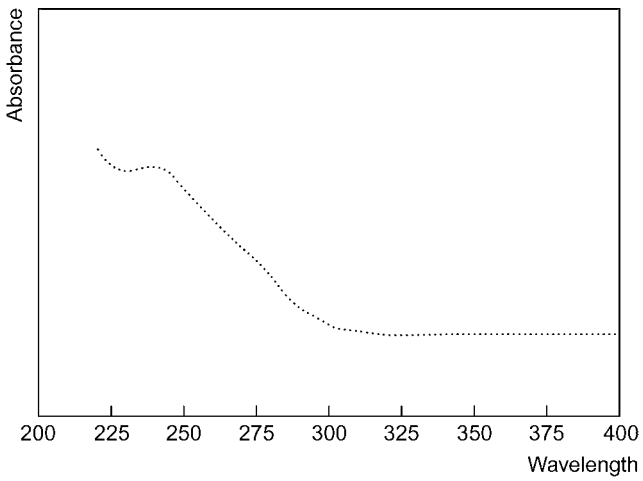
Proprietary Names *Cosmegen*



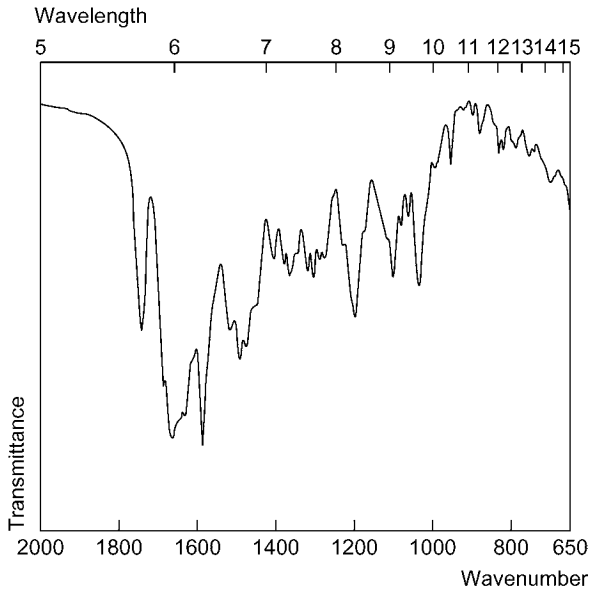
Chemical Properties A bright red, somewhat hygroscopic, crystalline powder. Crystals from absolute alcohol. Mp 241.5° to 243°, with decomposition. Dilute solutions are very sensitive to light. It is soluble in water at 10°, slightly soluble in water at 37°; freely soluble in ethanol; very slightly soluble in ether. Log *P* (octanol/water), −0.91.

High Performance Liquid Chromatography Column: ODS Hypersil Si-10 (300 × 4.0 mm i.d., 10 µm). Mobile phase: methanol with 1% NHOH : methylene chloride (2:98), flow rate 2 mL/min. UV detection. Retention time: 5.0 min [Mills, Roberson 1993].

Ultraviolet Spectrum Ethanol—240 nm.



Infrared Spectrum Principal peaks at wavenumbers 1745, 1668, 1590, 1195 cm^{-1} (KBr pellets).



Disposition in the Body Dactinomycin is rapidly distributed following IV administration and concentrates in bone marrow and nucleated cells. It does not cross the blood–brain barrier. The drug undergoes minimal metabolism and is slowly excreted in urine (about 10% as unchanged drug) and via bile in faeces (about 50% as the unchanged drug).

Half-life Plasma, 36 h.

Dose Usually 500 µg IV daily for a maximum of 5 days.

Mills T, Roberson JC (1993). *Instrumental Data for Drug Analysis*, 2nd edn. Boca Raton: CRC Press, 1: 580–581

Danazol

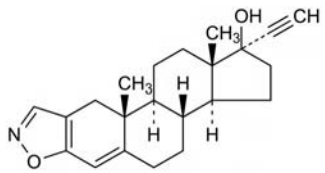
Androgen

$C_{22}H_{27}NO_2$ = 337.5

CAS—17230-88-5

Synonyms 17α-Pregna-2,4-dien-20-yno[2,3-*d*]isoxazol-17β-ol; win-17757.

Proprietary Names *Azol*; *Cyclomen*; *Danatrol*; *Danazant*; *Danocrine*; *Danokrin*; *Danol*; *Ladazol*; *Mastodanatrol*; *Winobanin*.



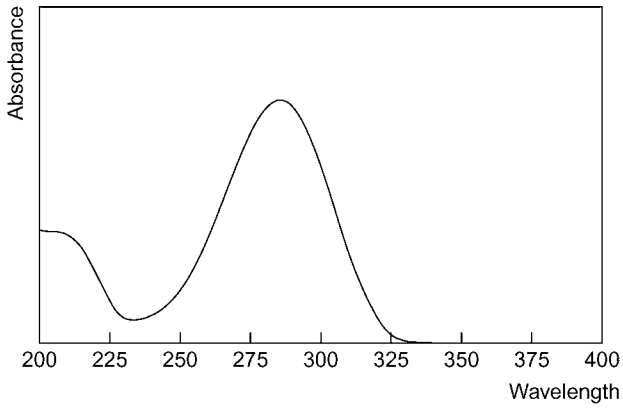
Chemical Properties A white or pale yellow crystalline powder. Mp 224.4° to 226.8°, with decomposition. It is practically insoluble in water and in light petroleum; sparingly soluble in ethanol and in benzene; freely soluble in chloroform; slightly soluble in ether; soluble in acetone. Log *P* (octanol/water), 4.21.

Gas Chromatography Column: 3% OV-1 Chromosorb WHP 80/100 mesh (4 feet × $\frac{1}{4}$ inch). Temperature: 280°. Carrier gas: N_2, flow rate 32 mL/min. Detection: flame ionisation. Retention index: 3126 [Mills, Roberson JC 1993].

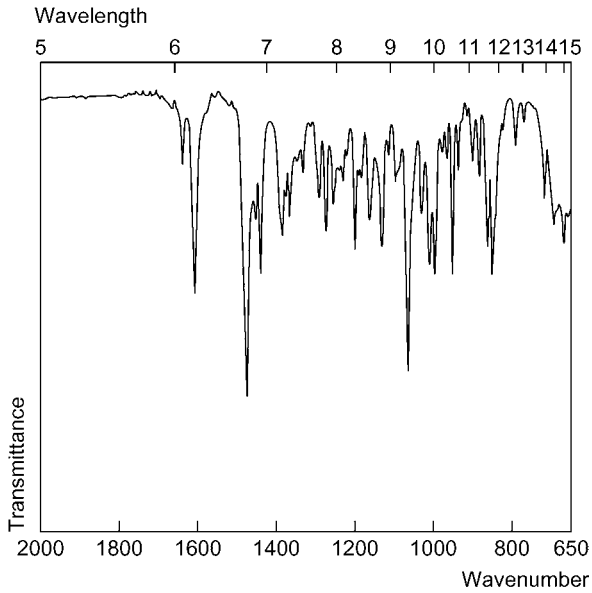
High Performance Liquid Chromatography System HY—RI 711.

Column: ODS Hypersil Si-10 (300 × 4.0 mm i.d., 10 µm). Mobile phase: methanol with 1% NHOH : methylene chloride (10:90), flow rate 2 mL/min. UV detection (λ=254 nm). Retention time: 5.5 min [Mills, Roberson JC 1993].

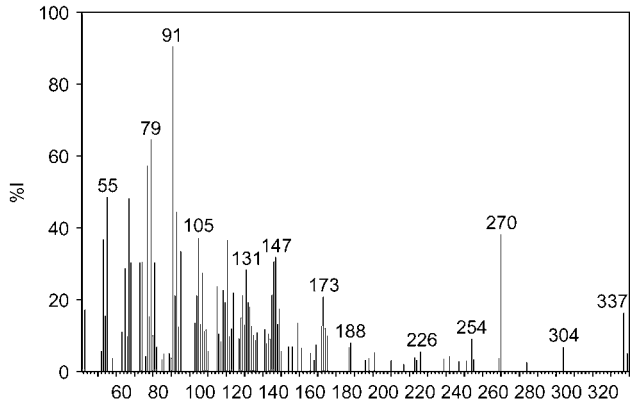
Ultraviolet Spectrum Ethanol—228, 254 nm.



Infrared Spectrum Principal peaks at wavenumbers 1597, 1470, 1062, 843 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 91, 79, 77, 55, 67, 93, 270, 105, 147, 131, 337.



Quantification
Plasma **HPLC** UV detection. Limit of detection, 2 µg/L [Hooper *et al.* 1987].
Serum **HPLC** Column: (1)-C_8 (Spherisorb, 150 × 3.9 mm i.d., 5 µm); (2)-ODS-2 (Spherisorb, 150 × 4.6 mm, 5 µm). Mobile phase: acetonitrile : water (55:45), flow rate 1.6 mL/min. UV detection (λ=285 nm). Retention time: 9.5 min. Limit of detection, 1 µg/L [Selinger *et al.* 1990]. UV detection. Limit of detection, 1.5 µg/L [Nygard *et al.* 1987].
Disposition in the Body Danazol is absorbed following oral administration; absorption is increased markedly if taken with food. It is metabolised in the liver to inactive metabolites, including 2-hydroxymethylethisterone, that are then excreted in urine.

Therapeutic Concentration
Twenty-four healthy females, aged between 18 and 41 years (mean 26 years), were administered with 50, 100, 200 or 400 mg doses after an overnight fast, for 3 weeks. Steady state plasma concentrations were 83, 115, 183 and 193 µg/L, respectively, observed after 1 to 2 h [Potts *et al.* 1980].
Fifteen healthy, sterile, pre-menopausal females, aged 18 to 45 years, were orally administered with a single dose of 200 mg danazol on two separate occasions, 14 days apart. Mean peak serum concentrations reached 51.5 µg/L on the first treatment at 2.3 h and 54.3 µg/L at 2.7 h on the second occasion [Selinger *et al.* 1990].
Fifteen healthy young males, aged 18 to 26 years (mean 22.3 years), were administered with 400 mg danazol following an overnight fast; two different formulations were used. The peak plasma concentrations ranged from 34.1 to 170 (mean 73.6) µg/L for formulation produced by Alphapharm and 30.8 to 143 (mean 69.6) µg/L for the Winthrop formulation. These were observed at 2 h and 2.47 h, respectively, for the two formulations [Hooper *et al.* 1991].
Half-life Plasma half-life, 4.5 h (healthy women); 9.4 h (healthy males).
Clearance Total body, mean, 710 L/h (healthy males).
Note For a review of danazol, see Potts *et al.* [1980].
Dose Up to 800 mg daily.

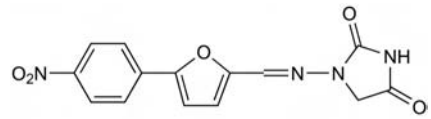
Dantrolene

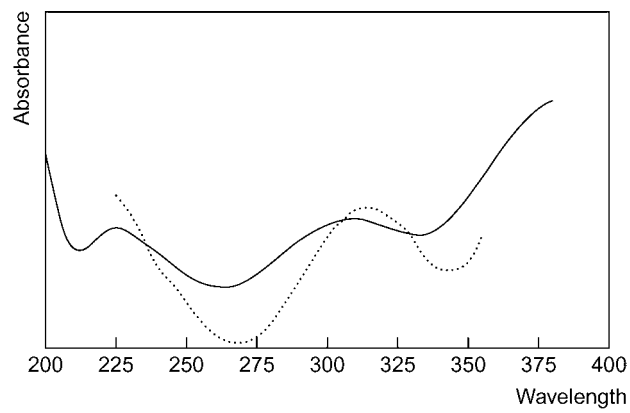
Muscle Relaxant
$C_{14}H_{10}N_4O_5 = 314.3$
CAS—7261-97-4
IUPAC Name 1-[[[5-(4-Nitrophenyl)-2-furanyl]methylene]amino]-2,4-imidazolidinedione



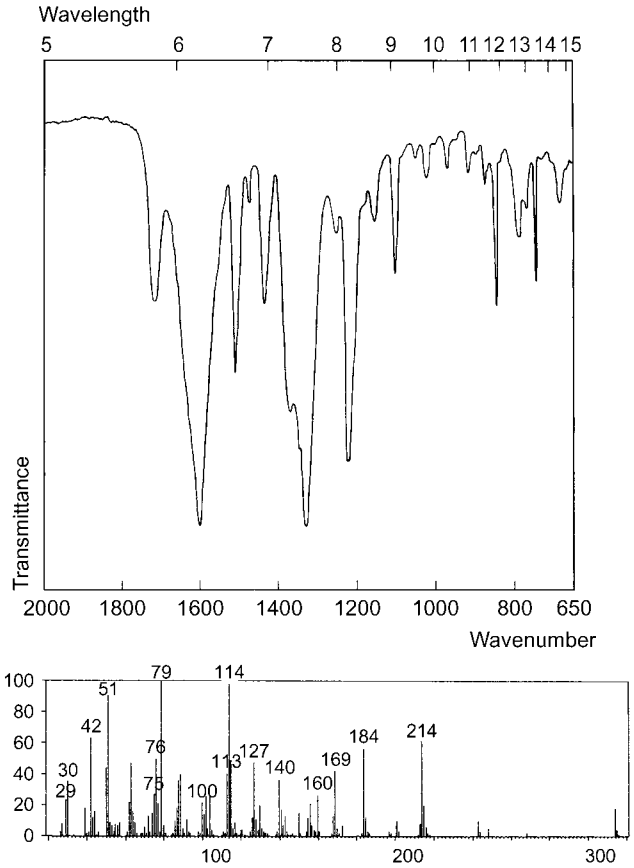
Chemical Properties Crystals. Mp 279° to 280°. Practically insoluble in water. pK_a 7.5. Log *P* (octanol/water), 1.7.

Dantrolene Sodium
$C_{14}H_9N_4NaO_5.3\frac{1}{2}H_2O = 399.3$
CAS—14663-23-1 (anhydrous); 24868-20-0 (hemiheptahydrate)
Proprietary Names *Dantamacrin*; *Dantrium*.
Chemical Properties An orange powder. Slightly soluble in water; its solubility increases in alkaline solution. Soluble 1 in 40 to 1 in 50 of acetone, and 1 in 25 of propylene glycol.

Thin-layer Chromatography System TD—R_f 0.19; system TE—R_f 0.09; system TF—R_f 0.36; system TAD—R_f 0.50; system TAJ—R_f 0.46; system TAK—R_f 0.24; system TAL—R_f 0.90.
High Performance Liquid Chromatography System HZ—retention time 4.0 min; system HAX—retention time 6.0 min; system HAY—retention time 5.2 min.
Ultraviolet Spectrum Dantrolene sodium: aqueous alkali—314 nm (A^1_1=487b).



Infrared Spectrum Principal peaks at wavenumbers 1600, 1225, 1510, 850, 1713, 1108 cm^{-1} (dantrolene sodium, KBr disk).



Quantification

Blood **Spectrofluorimetry** Limit of detection, 100 µg/L [Hollifield, Conklin 1973].

Plasma **Spectrofluorimetry** See Blood [Hollifield, Conklin 1973].

HPLC Metabolite [Wuis *et al.* 1990]. UV detection. Dantrolene, 5-hydroxydantrolene and *p*-acetamidodantrolene, limit of detection, 20 mg/L [Wuis *et al.* 1982].

Urine **Spectrofluorimetry** See Blood [Hollifield, Conklin 1973].

HPLC See Plasma [Wuis *et al.* 1990]; [Wuis *et al.* 1982].

Bile **Spectrofluorimetry** Limit of detection, 400 mg/L [Hollifield, Conklin 1973].

Tissues **Spectrofluorimetry** see Bile [Hollifield, Conklin 1973].

Disposition in the Body Slowly and incompletely absorbed after oral administration. Metabolised by oxidation to 5-hydroxydantrolene, which is active, and by reduction followed by acetylation to form the *p*-acetamido derivative. About 20% of an oral dose is excreted in the urine as metabolites, mainly the 5-hydroxy derivative; <5% of a dose is excreted in the urine as unchanged drug; up to about 50% of a dose may be excreted in the bile.

Therapeutic Concentration

Following a single oral dose of 100 mg to 8 subjects, peak plasma concentrations of 0.7 to 1.7 mg/L (mean 1.2) of dantrolene and 0.2 to 0.5 mg/L (mean 0.4) of 5-hydroxydantrolene were attained in about 1 to 8 h and 1 to 22 h, respectively [Meyler *et al.* 1979].

In 4 subjects receiving daily oral doses of 25 to 50 mg 2 to 4 times a day, plasma-dantrolene concentrations were fairly stable and remained between about 0.03 and 0.1 mg/L; concentrations in an additional 2 subjects fluctuated between about 0.03 and 0.2 mg/L; plasma concentrations of 5-hydroxydantrolene and *p*-acetamidodantrolene ranged from about 0.1 to 0.3 mg/L [Vallner *et al.* 1979].

Toxicity Fatalities due to liver damage have been reported.

Half-life Plasma half-life, dantrolene 4 to 22 h (mean 9), 5-hydroxydantrolene 8 to 29 h (mean 16).

Note For a review of the pharmacokinetics of dantrolene, see Pinder *et al.* [1977].

Dose Initially 25 mg of dantrolene sodium daily, increased to a maximum of 400 mg daily.

Dantron

Purgative

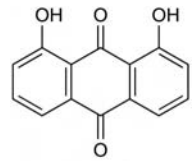
$C_{14}H_8O_4 = 240.2$

CAS—117-10-2

IUPAC Name 1,8-Dihydroxy-9,10-anthracenedione

Synonyms Antrapurol; chrysazin; chryzacin; danthron; dianthon; dioxyanthrachinonum.

Proprietary Names *Dorbane*; *Duolax*; *Modane*; *Roydan*. It is an ingredient of *Dorbanex*, *Dorbantyl*, *Doxidan*, *Normacol X*, and *Normax*.



Chemical Properties An orange crystalline powder. Mp 193° to 197°. Almost insoluble in water; soluble 1 in 2500 of ethanol, 1 in 30 of chloroform, and 1 in 500 of ether; very slightly soluble in aqueous solutions of alkali hydroxides. Log *P* (octanol/water), 3.9.

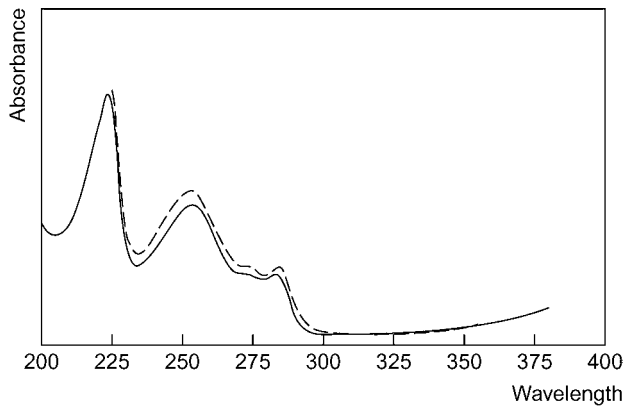
Colour Test When dissolved in sulfuric acid—red; dilution with water—yellow precipitate.

Thin-layer Chromatography System TD—R_f 0.80; system TE—R_f 0.43; system TF—R_f 0.69; system TAD—R_f 0.78.

Gas Chromatography System GA—dantron-Me RI 2435, dantron-Me_2 RI 2475, dantron-AC RI 2460, dantron-AC_2 RI 2595, dantron-TMS RI 2465, dantron-TMS_2 RI 2530; system GB—dantron-TMS RI 2574, dantron-TMS_2 RI 2611.

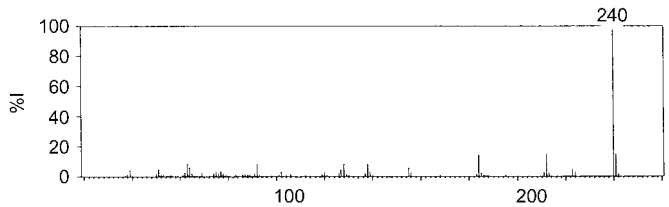
High Performance Liquid Chromatography System HY—RI 603.

Ultraviolet Spectrum Methanol—252 (A^{1}_{1}=915a), 283 nm; alkaline methanol—280 nm (A^{1}_{1}=510a).



Infrared Spectrum Principal peaks at wavenumbers 1264, 740, 1620, 1597, 1152, 1197 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 240, 212, 241, 184, 138, 92, 128, 63.



Dose 50 to 150 mg daily.

Dapsone

Antileprotic

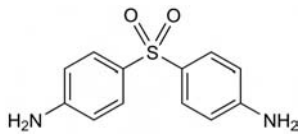
$C_{12}H_{12}N_2O_2S = 248.3$

CAS—80-08-0

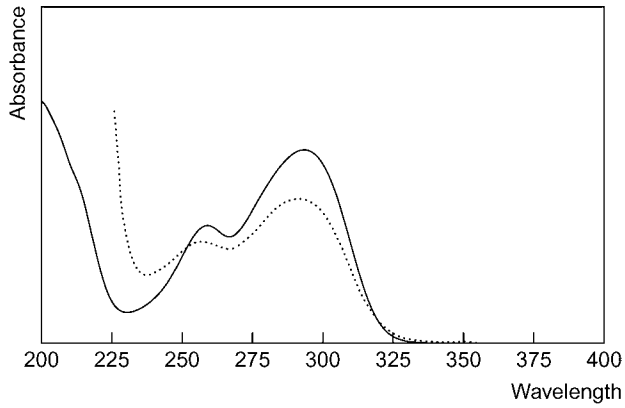
IUPAC Name 4-(4-Aminophenyl)sulfonylaniline

Synonyms DADPS; DDS; diaphenylsulfone; disulone; 4,4′-sulfonylbisbenzeneamine; sulphonyldianiline.

Proprietary Names *Avlosulfon*; *Cryosulfone*; *Diphenasone*; *Disulone*; *Eporal*; *Navophone*. It is an ingredient of *Maloprim*.



Chemical Properties A white or slightly yellowish-white crystalline powder. It discolours on exposure to light but this is not accompanied by significant decomposition. Mp 175° to 181°. Soluble 1 in 7000 of water and 1 in about 36 of ethanol; soluble in acetone and dilute mineral acids. pK_a 1.3, 2.5. Log *P* (octanol/water), 2.0.
Gas Chromatography System GA—RI 2880.
High Performance Liquid Chromatography System HY—RI 298; system HZ—retention time 2.6 min; system HAA—retention time 12.6 min.
Ultraviolet Spectrum Aqueous acid—288 nm (A^1_i=350b); aqueous alkali—256, 292 nm.



Infrared Spectrum Principal peaks at wavenumbers 1150, 1276, 1592, 1107, 685, 1633 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 108, 248, 140, 65, 92, 141, 109, 80.
Quantification
Blood **HPLC** Limit of quantification, 20 mg/L for dapsone and 15 mg/L for monoacetyldapsone [Ronn *et al.* 1995].
Plasma **TLC** Limit of detection, 20 mg/L [Ahmad, Rogers 1980].
GC ECD. Dapsone and monoacetyldapsone [Burchfield *et al.* 1973].
HPLC UV detection (λ = 295 nm). Limit of detection, 0.002 mg/L for dapsone, 0.047 mg/L for hydroxylaminodapsone [Kwadijk, Torano 2002]. UV detection. Dapsone and monoacetyldapsone. Limit of detection, 5 mg/L [Jones, Ovenell 1979].
Serum **HPLC** Electrochemical detection. UV detection (λ = 295 nm). Limit of detection, 25 mg/L [Moncrieff 1994]. UV detection. Dapsone and monoacetyldapsone. Limit of detection, 200 mg/L [Zuidema *et al.* 1980].
Saliva **TLC** See Plasma [Ahmad, Rogers 1980].
HPLC Limit of detection, 0.2 mg/L [Moncrieff 1994].
Other **HPLC** Raw Material, Dosage Forms, Biological Fluids. Limit of detection, 10 pg using fluorescence detection, 250 pg using UV detection [Mannan *et al.* 1977].
Disposition in the Body Slowly and almost completely absorbed after oral administration and widely distributed throughout the body. It is acetylated to monoacetyldapsone, the extent of which is genetically determined. It is also metabolised by *N*-oxidation to mono-*N*-hydroxydapsone, together with glucuronic acid and sulfate conjugation of dapsone and the metabolites. Enterohepatic recycling occurs. About 70–90% of a dose is excreted in the urine, about 10–20% as unchanged drug, about 50% as dapsone conjugates, and about 30% as *N*-oxidation products (mostly conjugated). Small amounts are eliminated in the faeces. About 30–50% of a single dose is excreted in the urine within 24 h and more than 70% in 3 days, but there is wide individual variation.
Therapeutic Concentration
After a single oral dose of 50 mg to 6 subjects, plasma concentrations of dapsone were 1.02 to 1.44 mg/L (mean 1.24) in 3 slow acetylators, and 1.03 to 1.48 mg/L (mean 1.23) in 3 rapid acetylators, after 4 h. The concentrations of monoacetyldapsone were 0.15 to 0.38 mg/L (mean 0.25) in the slow acetylators and 0.63 to 1.66 mg/L (mean 0.98) in the rapid acetylators, after 4 h [Biggs, Levy 1971].
Toxicity Toxic effects are likely to occur at serum concentrations above 10 mg/L. In 1 case of fatal overdosage, a 22-month-old child died 55 h after ingesting about 5 g of dapsone. The concentrations in the plasma and cerebrospinal fluid were 150 mg/L and 33 mg/L, respectively, 42 h after ingestion. Postmortem concentrations were: blood 135 mg/L, brain 90 µg/g, liver 165 µg/g, and urine 400 mg/L [Davies 1950].
Half-life Plasma half-life, 10–50 h (mean 24).
Protein Binding Dapsone 50–80%, monoacetyldapsone 98–100%.
Dose 50 to 100 mg daily.

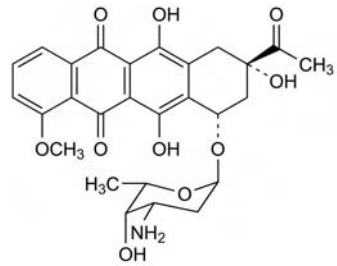
Daunorubicin

Antineoplastic
$C_{27}H_{29}NO_{10}$ = 527.5
CAS—20830-81-3
IUPAC Name (7*S*,9*S*)-9-Acetyl-7-[(2*R*,4*S*,5*S*,6*S*)-4-amino-5-hydroxy-6-methyloxan-2-yl]oxy-6,9,11-trihydroxy-4-methoxy-8,10-dihydro-7*H*-tetracene-5,12-dione
Synonyms (8*S*-*cis*)-8-Acetyl-10-[(3-amino-2,3,6-trideoxy-α-L-*lyxo*-hexopyranosyl)oxy]-7,8,9,10-tetrahydro-6,8,11-trihydroxy-1-methoxy-5,12-naphthacenedione; daunomycin; leukaemomycin C; RP-13057; rubidomycin.
Proprietary Name *Cerubidin*



Chemical Properties Mp 208° to 209°. pK_a 10.3. Log *P* (octanol/water), 1.83.

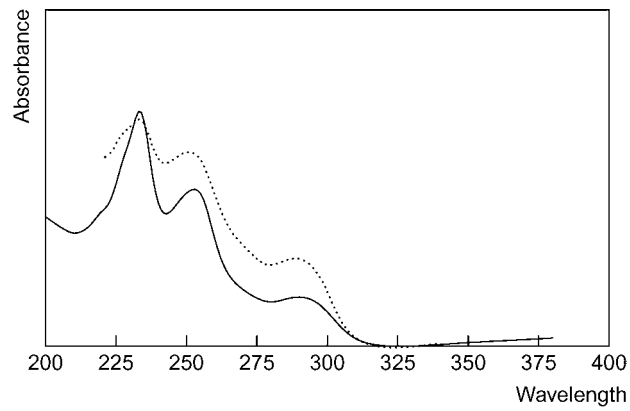
Daunorubicin Hydrochloride

$C_{27}H_{29}NO_{10}$,HCl = 564.0
CAS—23541-50-6
Proprietary Names *Cerubidine*; *Daunoblastin*; *Ondena*.
Chemical Properties An orange-red, hygroscopic crystalline powder. Decomposes at 188° to 190°. It is freely soluble in water, methanol and aqueous alcohol; slightly soluble in ethanol; very slightly soluble in chloroform; practically insoluble in acetone, chloroform, ether and benzene.

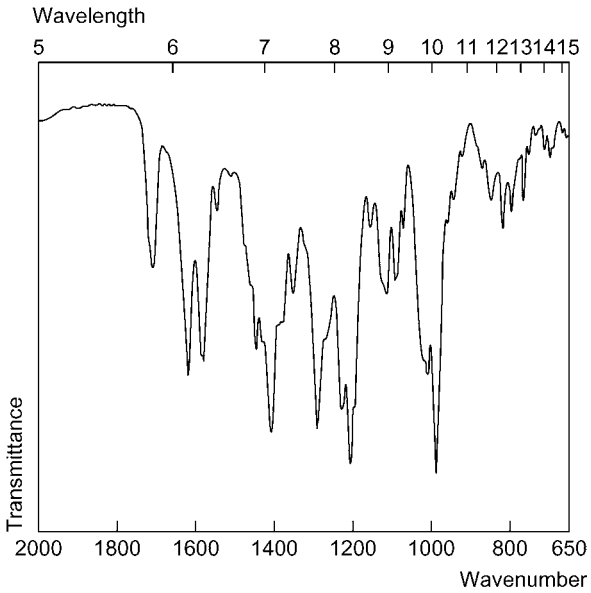
Daunorubicin Lactate

$C_{27}H_{29}NO_{10}$,$C_6H_8O_7$ = 719.6
Proprietary Name *Daunoxome*

High Performance Liquid Chromatography Column: ODS Hypersil Si-10 (300 × 4 mm i.d., 10 µm). Mobile phase: methanol with 1% NHOH : methylene chloride (10:90), flow rate 2 mL/min. UV detection (λ=254 nm). Retention time: 4.0 min [Mills, Roberson 1993].
Ultraviolet Spectrum Ethanol—234, 251, 288 nm



Infrared Spectrum Principal peaks at wavenumbers 1703, 1618, 1576, 1407 cm^{-1} (KBr pellets).



Mass Spectrum Principal ions at *m/z* 43, 398, 337, 72, 309, 95, 362, 217.

Quantification

Plasma **HPLC** Fluorescence detection. Daunorubicin and metabolites, limit of detection, 5 µg/L [Galettis *et al.* 1994]. Fluorescence detection. Daunorubicin and metabolites, detection range, 200 to 900 µg/L in plasma [de Jong *et al.* 1990]. Electrochemical detection. Daunorubicin and metabolites, limit of detection, <10 µg/L in plasma [Akpofure *et al.* 1982].

Other Biological Fluids **HPLC** See Plasma [Akpofure *et al.* 1982].

Tissue **HPLC** See Plasma [de Jong *et al.* 1990].

Disposition in the Body Conventional formulations of daunorubicin are rapidly distributed into body tissues following IV administration, particularly liver, lungs, kidneys, spleen and heart. It does not cross the blood–brain barrier. It is rapidly metabolised in the liver and excreted in bile (about 40%) and urine as the unchanged drug and metabolites. The major metabolite, daunorubicinol, has antineoplastic activity. A liposomal formulation of daunorubicin is also available that differs in its pharmacokinetic characteristics. Following IV administration it remains largely confined within the vascular fluid volume and therefore plasma clearance is higher. The values below apply to the conventional formulation.

Therapeutic Concentration

Patients diagnosed with a variety of disseminated solid malignancies with normal renal function, were administered either with an 80 mg/m^2 IV dose or with 120 mg/m^2. Plasma concentrations after 15, 30 and 60 min were 400, 290 and 250 µg/L, respectively, for the 80 mg/m^2 dose and 650, 400 and 320 µg/L for the 120 mg/m^2 dose [Alberts *et al.* 1971].

Toxicity Cardiotoxicity, both acute and chronic, is the main major dose-limiting adverse effect. It is more likely to occur if the total cumulative dose exceeds 550 mg/m^2 in adults or 300 mg/m^2 in children.

Daunorubicin concentrations were measured at autopsy in 2 subjects who died 16 and 19 h after receiving doses of 120 mg/m^2 and 140 mg/m^2, respectively. The following concentrations of the two doses in different organs were: 18.4 and 38 µg/g (kidney), 10.0 and 13.0 µg/g (spleen), 8.3 and 12.0 µg/g (liver), 6.5 and 10.0 µg/g (lung), 4.4 and 6.5 µg/g (heart), 4.0 and 7.3 µg/g (ileum) [Alberts *et al.* 1971].

Half-life Plasma, daunorubicin, 18.5 h; daunorubicinol, 26.7 h.

Volume of Distribution Approximately 1000 L; 1055 L or 619 L/m^2 (80 mg/m^2); 897 L or 511 L/m^2 (120 mg/m^2).

Clearance Plasma clearance, 230 mL/min.

Dose Usually up to 45 mg/m^2 body surface IV daily to a maximum cumulative dose of 550 mg/m^2.

Debrisoquine

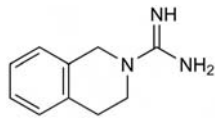
Antihypertensive

$C_{10}H_{13}N$ = 175.2

CAS—1131-64-2

IUPAC Name 3,4-Dihydro-2(1*H*)-isoquinolinecarboximidamide

Synonym Isocaramidine



Chemical Properties pK_a 11.9. Log *P* (octanol/water), 0.8.

Debrisoquine Sulfate

$(C_{10}H_{13}N_3)_2.H_2SO_4$ = 448.5

CAS—581-88-4

Proprietary Name *Declinax*

Chemical Properties A white crystalline powder. Mp about 274°, with decomposition. Soluble 1 in 40 of water; very slightly soluble in ethanol; practically insoluble in chloroform and ether.

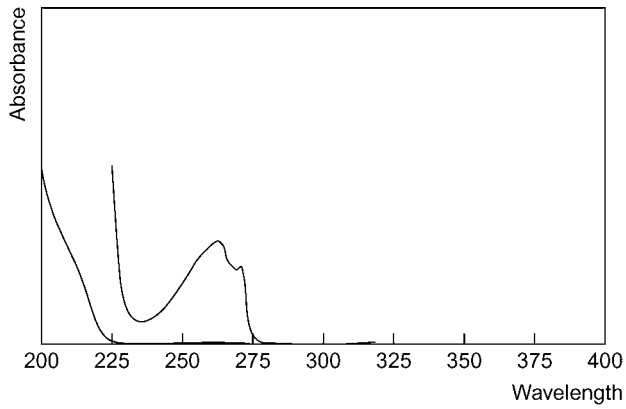
Colour Tests Mandelin's test—green; Marquis test—red-brown.

Thin-layer Chromatography System TA—R_f 0.01; system TB—R_f 0.00; system TC—R_f 0.00; system TL—R_f 0.00; system TAJ—R_f 0.00; system TAK—R_f 0.03; system TAL—R_f 0.36 (acidified iodoplatinate solution, positive).

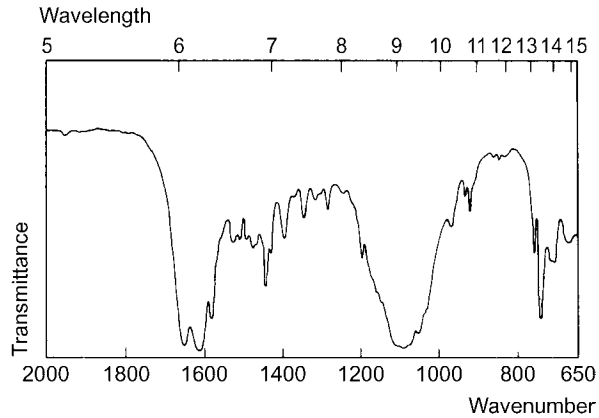
Gas Chromatography System GA—not eluted; system GB—not eluted.

High Performance Liquid Chromatography System HA—*k* 1.2; system HY—RI 245.

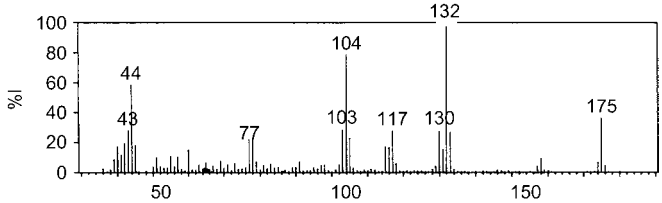
Ultraviolet Spectrum Aqueous acid—262 (A_1^1=17.7a), 270 nm. No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1614, 1090, 1650, 1583, 750, 715 cm^{-1} (debrisoquine sulfate, KBr disk).



Mass Spectrum Principal ions at *m/z* 132, 104, 44, 175, 103, 117, 43, 130.



Quantification
Blood **GC** AFID. Debrisoquine and 4-hydroxydebrisoquine, limit of detection, 3 µg/L [Lennard *et al.* 1977].
Plasma **GC** See Blood [Lennard *et al.* 1977].
GC-MS Limit of detection, 1 µg/L for debrisoquine and 5 µg/L for 4-hydroxydebrisoquine [Malcolm, Marten 1976].
Urine **GC** ECD [Idle *et al.* 1979] and see Blood [Lennard *et al.* 1977].
HPLC [Pereira *et al.* 2000]. Fluorescence detection (λ_{ex}=208 nm; λ_{em}=562 nm). Limit of quantification, 50 µg/L. Limit of detection, 30 µg/L for drug and 20 µg/L for metabolite [Frye, Branch 1996; Bozkurt *et al.* 1993].
Saliva **GC** See Blood [Lennard *et al.* 1977].
Disposition in the Body Rapidly absorbed after oral administration. The main metabolic reaction is 4-hydroxylation; aromatic hydroxylation at positions 5, 6, 7, and 8 also occurs and acidic ring-opened metabolites are also formed. There is no evidence of glucuronic acid conjugation in man. The extent of 4-hydroxylation of debrisoquine is genetically determined. About 75% of a dose is excreted in the urine in 24 h. Excretion of unchanged drug ranges from 8 to 80% of a dose. About 90% of the population are extensive metabolisers of debrisoquine and, in these subjects, about 10 to 40% of a dose is excreted as 4-hydroxydebrisoquine; the remaining 10% are poor metabolisers and excrete less than 2% as the 4-hydroxy metabolite. Acidic ring-opened metabolites account for up to 15% of a dose and the 5-, 6-, 7-, and 8-hydroxy metabolites for about 7%. About 12% of a dose is eliminated in the faeces.
Therapeutic Concentration
Following a single oral dose of 20 mg to 3 subjects, peak plasma concentrations of 0.010, 0.013, and 0.024 mg/L of debrisoquine were reported at 1.5 to 3.5 h; peak concentrations of the 4-hydroxy metabolite averaging 0.035 mg/L were attained in 1.5 to 2.5 h. The 4-hydroxy metabolite was eliminated more rapidly than debrisoquine and was not detectable after 24 h [Silas *et al.* 1978].
Maximum steady-state plasma concentrations of 0.015 to 0.18 mg/L (mean 0.08), and 0 to 0.05 mg/L (mean 0.02) for debrisoquine and 4-hydroxydebrisoquine respectively, were reported in 13 patients receiving daily oral doses of 40 mg [Silas *et al.* 1977].
Half-life Plasma half-life, debrisoquine about 16 to 30 h, 4-hydroxydebrisoquine about 10 h.
Distribution in Blood Plasma : whole blood ratio, 0.45.
Protein Binding About 25%.
Dose The equivalent of 10 to 120 mg of debrisoquine daily; up to 300 mg or more daily may be given.

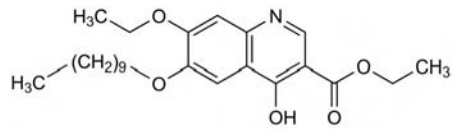
Decamethonium Bromide

Muscle Relaxant
$C_{16}H_{38}Br_2N_2$ = 418.3
CAS—156-74-1 (decamethonium); 541-22-0 (bromide)
Synonyms C-10; *N,N,N,N′,N′,N′*-hexamethyl-1,10-decanediaminium dibromide.
Proprietary Name *Syncurine*
Chemical Properties A white, hygroscopic, crystalline powder. Mp about 265°, with decomposition. Freely soluble in water and ethanol; very slightly soluble in chloroform; practically insoluble in ether. Log *P* (octanol/water), −4.8.
Thin-layer Chromatography System TA—R_f 0.00; system TN—R_f 0.56; system TO—R_f 0.16. System TA—R_f 0.00 decamethonium; system TB—R_f 0.00 decamethonium; system TC—R_f 0.00 decamethonium; system TE—R_f 0.00 decamethonium; system TL—R_f 0.00 decamethonium; system TAE—R_f 0.00 decamethonium; system TAF—R_f 0.02 decamethonium (acidified iodoplatinate solution, positive).
High Performance Liquid Chromatography System HX—RI 56 (decamethonium).
Ultraviolet Spectrum Aqueous acid—227 nm (A^1_1=584b).
Infrared Spectrum Principal peaks at wavenumbers 1627, 910, 965, 1030, 1136, 1063 cm^{-1} (KBr disk).
Dose Initially 2 to 2.5 mg by IV injection.

Decoquinate

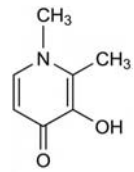
Coccidiostat (Veterinary)
$C_{24}H_{35}NO_5$ = 417.5
CAS—18507-89-6
IUPAC Name 6-Decyloxy-7-ethoxy-4-hydroxy-3-quinolinecarboxylic acid ethyl ester
Synonym M&B 15497
Proprietary Name *Deccox*



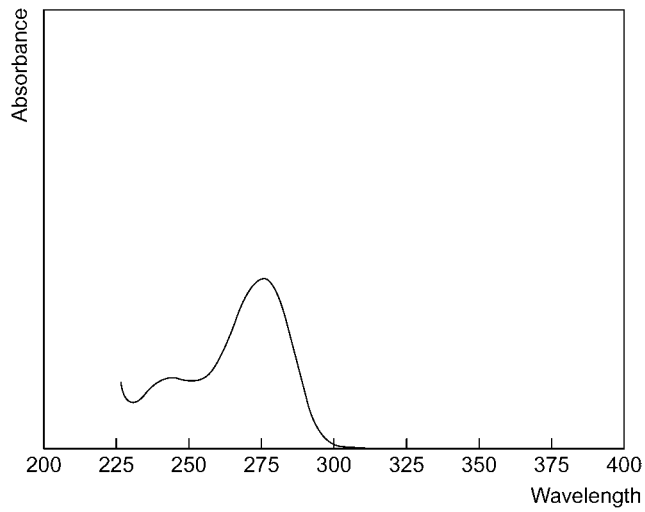
Chemical Properties A cream to buff-coloured microcrystalline powder. Mp about 242°. Practically insoluble in water and ethanol; slightly soluble in chloroform and ether; soluble in acetone. Log *P* (octanol/water), 7.8.
Colour Tests Liebermann's reagent—orange (slow); Mandelin's test—red-brown.
Gas Chromatography System GA—not eluted.
Ultraviolet Spectrum Methanolic acid—265 nm (A^1_1=1000b).
Infrared Spectrum Principal peaks at wavenumbers 1695, 1613, 1497, 1263, 1205, 1558 cm^{-1} (KBr disk).

Deferiprone

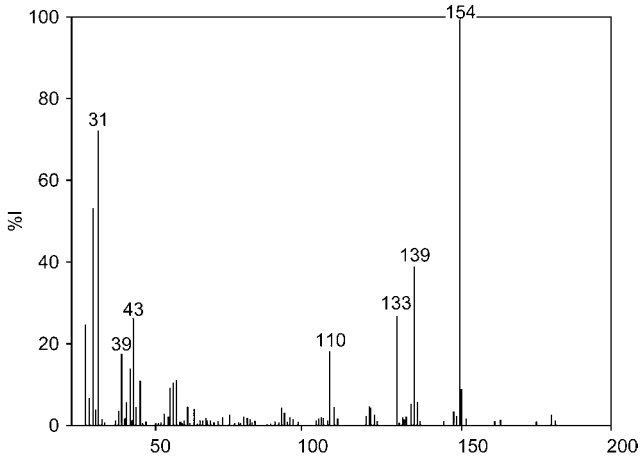
Iron Chelator
$C_7H_9NO_2$ = 139.2
CAS—30652-11-0
IUPAC Name 3-Hydroxy-1,2-dimethylpyridin-4-one
Synonyms BRN-1447108; CP20; 1,2-dimethyl-3-hydroxypyrid-4-one; L1.
Proprietary Name *Kelfer*



Chemical Properties Mp 271° to 273°. Maximum water solubility of 16–18 g/L at 24°. pK_a 3.5. Log *P* (octanol/water), −0.77; log *P* (*n*-octanol/Tris HCl, pH 7.4), 0.0009.
High Performance Liquid Chromatography Column: Hypercarb-PGC (100 × 4.6 mm i d., 7 µm). Mobile phase: 10 mmol/L phosphate buffer (pH 2.9) containing 2 mmol/L EDTA and acetonitrile (88 : 12). UV detection (λ=275 nm). Retention time: 4 min [Singh *et al.* 1991].
Ultraviolet Spectrum Aqueous acid—279 nm.



Mass Spectrum Principal ions at *m/z* (Deferiprone-*O*-methylated metabolite) 154, 31, 29, 139, 133, 43, 27.



Quantification

Plasma **HPLC** Column: Hypercarb (Shandon, 100 × 4.7 mm i.d., 7 µm). Mobile phase: 10 mmol/L disodium phosphate and 2 mmol/L EDTA (pH 3), flow rate 1.0 mL/min. UV detection (λ=280 nm). Retention time: 5.38 min. Limit of detection, 0.5 mg/L [Klein *et al.* 1991].

Serum **Bioassay** Limit of detection, 0.5 mg/L [Pope *et al.* 1997].

Urine **HPLC** UV detection (λ=280 nm). Limit of detection, 120 mg/L [Kontoghiorghes *et al.* 1990].

Saliva **Bioassay** See Serum [Pope *et al.* 1997].

Disposition in the Body Deferiprone is rapidly absorbed and >85% of an administered dose is metabolised in the liver by glucuronidation to a conjugate lacking chelating properties. Deferiprone is excreted mainly in urine (~80% recovered) as the parent drug, its conjugate and bound to iron. Only a small proportion of the drug is found unchanged in urine within 24 h. Excretion of the glucuronide is slower than that of the parent drug. Other metabolites include an *O*-methyl metabolite, 2-hydroxylmethyl metabolite and its glucuronide.

Therapeutic Concentration

Four males and 5 females with homozygous β-thalassemia, aged between 11 and 18.5 years, were administered with a mean dose of 75.7 ± 1.73 mg/kg deferiprone daily for 3–13 months. A mean peak plasma concentration of 11.3 mg/L was reached within 1 h [Pope *et al.* 1997].

Half-life 1–2.5 h.

Volume of Distribution Steady state, 1.55–1.73 L/kg; healthy volunteers, 72.8 L/kg; patients with β-thalassemia, 115.1 L/kg.

Clearance Healthy volunteers, 34.8 L/h; patients with β-thalassemia, 39.6 L/h.

Protein Binding 24.8–42.6% depending on dose administered.

Dose A usual dose of 25 mg/kg is administered three times a day, with a maximum of 100 mg/kg daily.

Klein J *et al.* (1991). A high-performance liquid chromatographic method for the measurement of the iron chelator 1,2-dimethyl-3-hydroxypyridin-4-one in human plasma. *Ther Drug Monit* 13: 51–54.

Deflazacort

Antiinflammatory

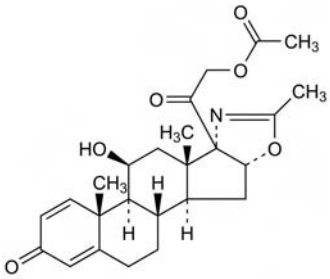
$C_{25}H_{31}NO_6$ = 441.5

CAS—14484-47-0

IUPAC Name (11β,16β)-21-(Acetyloxy)-11-hydroxy-2′-methyl-5′*H*-pregna-1,4-dieno[17,16-*d*]oxazole-3,20-dione

Synonyms L5458; DL-458-IT; MDL-458.

Proprietary Names *Azacort*; *Calcort*; *Deflan*; *Dezacor*; *Flantadin*; *Lantadin: Oxazacort*; *Zamane*.

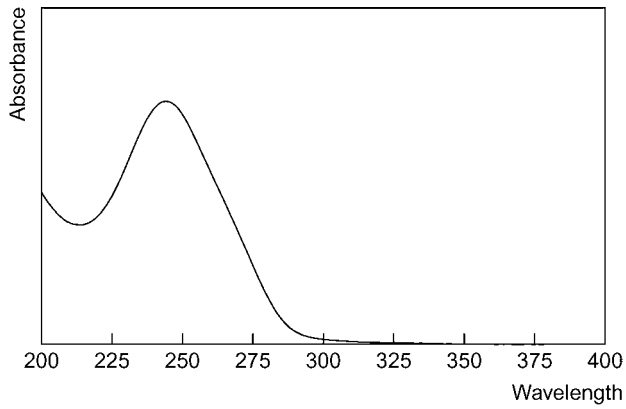


Chemical Properties White crystals (acetone:hexane). Mp 255° to 256.5°. Log *P* (octanol/water), 1.31.

High Performance Liquid Chromatography

Column: ODS (Hypersil, 250 × 4.6 mm i. d., 5 µm). Temperature 40°. Mobile phase: isopropanol : 0.05 mol/L acetate buffer (solvent A, pH 4.5) (10:90). Solvent A composition decreased from 90% to 30% for 25 min and held for 5 min, increased to 90% for 5 min and held for 15 min. Retention time: 21-hydroxydeflazacort, 6.1 min; deflazacort-6-β-hydroxide, 28.3 min [Hitara *et al.* 1994].

Ultraviolet Spectrum Methanol—242 nm.



Quantification

Plasma **HPLC** UV detection. Detection range, 1.0 to 500 µg/L for metabolite, 21-desacetyldeflazacort [Rao *et al.* 1996].

Urine **HPLC** Column: 5-ODS (Hypersil, 200 × 4.6 mm i.d., 5 µm at 30°, or Spherisorb, 150 × 4.6 mm i.d., 5 µm at 20°). Mobile phase: water : tetrahydrofuran (77:23) flow rate 1.0 mL/min (Hypersil) or (80:20) 1.2 mL/min flow rate (Spherisorb). UV detection (λ=245 nm). k values: deflazacort, 15.5 (Hypersil), 13.8 (Spherisorb); 21-hydroxydeflazacort, 4.6, 3.8. Limit of detection, 0.4 µg/L [Santos-Montes *et al.* 1994].

Disposition in the Body Deflazacort is well absorbed from the gastrointestinal tract and is immediately converted by plasma esterases to its active metabolite, 21-desacetyldeflazacort with further metabolism to deflazacort-6-β-hydroxide. Elimination is mainly via the kidneys, with 70% of the administrated dose recovered in the urine and the remaining 30% in faeces.

Therapeutic Concentration

Twenty-three healthy males, ~25 years old, were orally administered with 3, 6 and 36 mg doses of deflazacort (tablets and aqueous suspensions). Peak plasma concentrations of active metabolite, 21-desacetyldeflazacort, were 10.4 ± 5.0, 19.8 ± 7.5, 132.6 ± 52.5 µg/L, respectively, and were reached within 1.5 to 2 h [Rao *et al.* 1996].

Bioavailability Approximately 68%.

Half-life 1.9 to 2.3 h.

Volume of Distribution Deflazacort-6-β-hydroxide, 83 L.

Clearance 83.9 ± 24.5 (36 mg dose) to 97.1 ± 47.7 L/h (3 mg dose).

Protein Binding 40%

Note For a review of pharmacokinetics data see Rao *et al.* [1996].

Dose By oral administration, initial dose up to 120 mg/kg body weight and a usual maintenance dose of 3 to 18 mg/kg. Between 0.25 and 1.5 mg/kg body weight for children.

Hirata H *et al.* (1994). Simultaneous determination of deflazacort metabolites II and III, cortisol, cortisone, prednisolone and prednisone in human serum by reversed-phase high-performance liquid chromatography. *J Chromatogr B Biomed Appl* 658(1): 55–61.

Dehydrochloromethyltestosterone

Anabolic Steroid

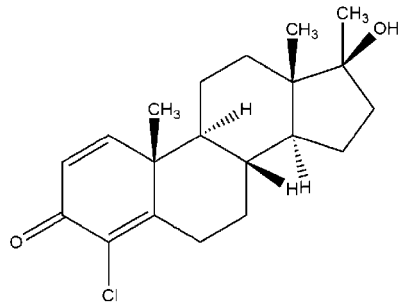
$C_{20}H_{27}O_2Cl$ = 334.9

CAS—2446-23-3

IUPAC Name (8*R*,9*S*,10*R*,13*S*,14*S*,17*S*)-4-Chloro-17-hydroxy-10,13,17-trimethyl-7,8,9,11,12,14,15,16-octahydro-6*H*-cyclopenta[a]phenanthren-3-one

Synonyms Chlorodehydromethyltestosterone; 4-chloro-17β-hydroxy-17α-methylandrost-1,4-dien-3-one; turinabol.

Proprietary Name *Oral-Turinabol*



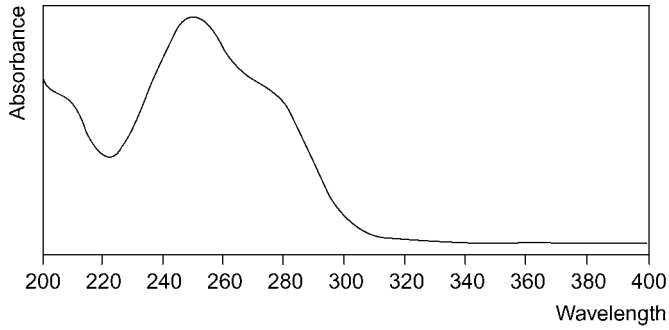
Note Prohormone of the anabolic steroid boldenone.

Gas Chromatography Column: HP-5 5% phenylmethylsilicone (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 175° for 1 min to 280° at 15°/min. FID. Limit of detection not reported [Wisniewski, Hays 2006].

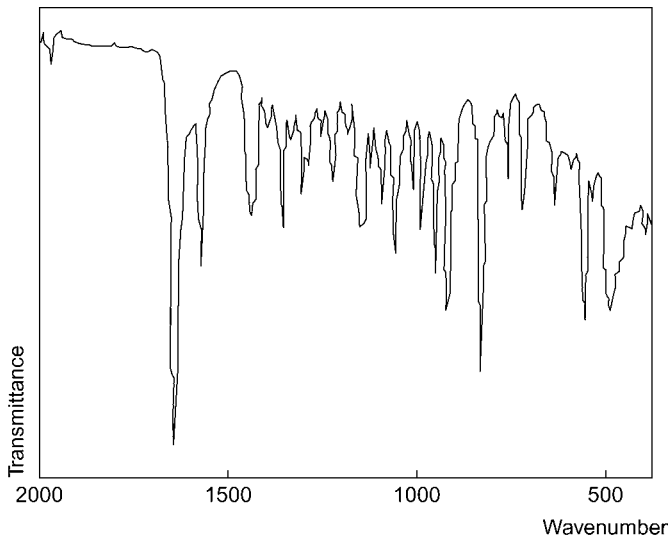
Gas Chromatography-Mass Spectrometry Column: HP-5 5% phenylmethylsilicone (15 m × 0.22 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 150° for 0.5 min to 300° at 30°/min for 1 min. EI ionisation, scanning acquisition mode. Limit of detection not reported [Wisniewski, Hays 2006]

High Performance Liquid Chromatography Column: Waters Xterra RP18 (150 × 4.6 mm i.d., 3.5 µm). Mobile phase: water : acetonitrile (80 : 20 for 3 min to 55 : 45 at 5 min for 8 min to 35 : 65 at 16 min for 10 min to 10 : 90 at 31 min for 9 min). UV detection (λ = 225 nm). Limit of detection not reported [Wisniewski, Hays 2006]

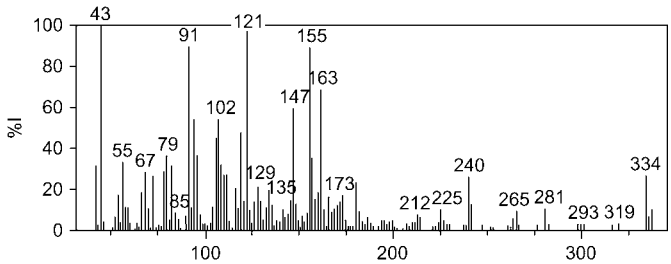
Ultraviolet Spectrum Peak at 250 nm.



Infrared Spectrum



Mass Spectrum Principal ions at *m/z* 240, 478, 143, 455, 373, 333, 263 (di-TMS derivative).



Quantification

Urine **GC-MS** Column 1: HP5 fused silica capillary cross-linked 5% phenylmethylsilicone SE54 (17 m × 0.2 mm i.d., 0.3 µm). Carrier gas: He, 1 mL/min. Temperature programme: 200° to 300° at 5°/min. Column 2: Fused silica capillary column cross-linked methyl silicone OV1 (20 m × 0.25 mm i.d., 0.33 µm). Carrier gas: He, 1 mL/min. Temperature programme: 200° to 300° at 5°/min. EI ionisation at 70 eV. Limit of detection not reported [Schanzer *et al.* 1992]. Column: Carlo Erba Model 2900 capillary SE-54 (30 m × 0.32 mm i.d.) Carrier gas: He, 3.0 mL/min. Temperature programme: 100° for 10 min to 200° at 25°/min to 280° at 2.5°/min. EI ionisation at 25 eV. Limit of detection, 1 µg/L [Durbeck *et al.* 1983].

HPLC Column: Merck Lichrosorb (R) RP18 (100 × 4.0 mm i.d., 5 µm). Mobile phase: acetonitrile : water (30 : 70 to 80 : 20 after 20 min), flow rate 1.0 mL/min. Limit of detection not reported [Schanzer *et al.* 1992]

LC-MS Column: LiChroCART Purospher RP C_{18} (125 × 3 mm i.d., 5 µm). Mobile phase: 5 mmol/L ammonium acetate–0.01% acetic acid : 90% methanol (50 : 50 to 0 : 100 at 15 min for 3 min), flow rate 0.5 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of detection, 0.4 µg/L for the metabolite, 6β-hydroxy-4-chloro-dehydromethyltestosterone [Leinonen *et al.* 2004]

Disposition in the Body Urinary metabolites include the epimer 6β-hydroxy-, 16β-dihydroxy-, 6,12-dihydroxy-, and the 6β,16β-dihydroxy metabolites.

Therapeutic Concentration

A healthy male volunteer (32 years old, 62 kg) was administered 20 mg dehydrochloromethyltestosterone orally. No parent compound was detected in urine over 72 h after dosage. However, the 17β-methyl epimer was detected and the total excretion reported was 0.18% of the applied dose [Schanzer *et al.* 1992].

A single dose of 25 mg oral turinabol was administered to male adults (26 to 48 years). Urine samples were collected every 2 h after administration for at least a week. The main urinary metabolites included 6β-hydroxyturinabol, 16β-hydroxyturinabol, and 6β,16β-dihydroxyturinabol, making up about 15% of the administered dose. The fate of the remaining 85% was unknown but was assumed to be partly stored in fat or muscular tissues since, under certain stress situations, it may be remobilised and excreted even after a long period of time (6 to 12 months) [Durbeck *et al.* 1983].

Toxicity

A 32-year-old man underwent radical orchiectomy for a tumour on the right testicle. Upon histological examination the tumour was identified as an intratesticular leiomyosarcoma. The patient reported a 5-year history of the systematic use of high-dose dehydrochloromethyltestosterone (Oral-Turinabol) that began when the patient was 18 years of age and ceased 9 years before presentation [Froehner *et al.* 1999].

Dose 40 or 60 mg per day, taken in divided doses.

Durbeck HW *et al.* (1983). GC and capillary column GC/MS determination of synthetic anabolic steroids. II. 4-chloro-methandienone (oral turinabol) and its metabolites. *J Chromatogr Sci* 21: 405–410.

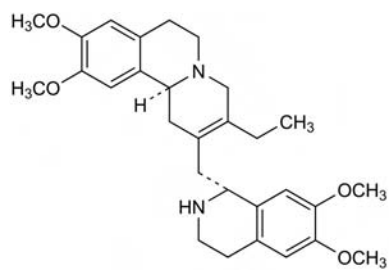
Dehydroemetine

Antiprotozoal

$C_{29}H_{38}N_2O_4$ = 478.6

CAS—4914-30-1

IUPAC Name 2,3-Didehydro-6′,7′,10,11-tetramethoxyemetan



Chemical Properties Log *P* (octanol/water), 5.2.

Dehydroemetine Hydrochloride

$C_{29}H_{38}N_2O_4$,2HCl = 551.6

CAS—2228-39-9

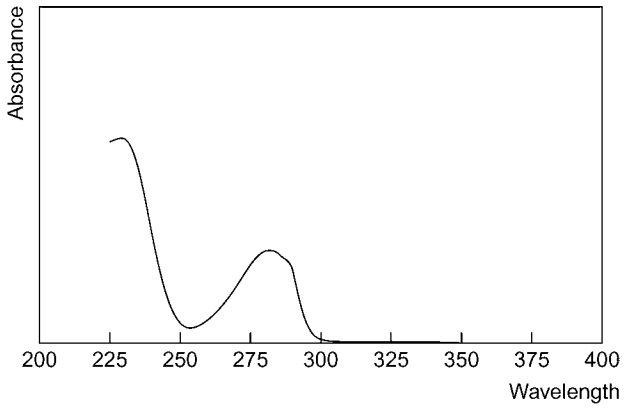
Proprietary Name *Dametine*

Chemical Properties A white crystalline powder. Soluble 1 in 30 of water.

Colour Test Marquis test—orange.

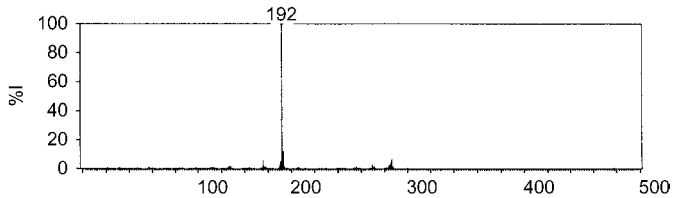
Thin-layer Chromatography System TA—R_f 0.43; system TB—R_f 0.06; system TC—R_f 0.21; system TL—R_f 0.02 (acidified iodoplatinate solution, positive).

Ultraviolet Spectrum Aqueous acid—230 (A^{1}_{1}=290a), 283 nm.



Infrared Spectrum Principal peaks at wavenumbers 1121, 1222, 1508, 1252, 1205, 1022 cm^{-1} (dehydroemetine hydrochloride, KBr disk).

Mass Spectrum Principal ions at *m/z* 192, 193, 287, 176, 191, 286, 270, 285.



Dose 60 to 180 mg of dehydroemetine hydrochloride daily, IM.

Dehydroepiandrosterone

Endogenous Steroid

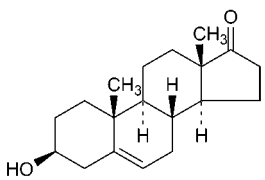
$C_{19}H_{28}O_2$ = 288.4

CAS—53-43-0

IUPAC Name 3β-3-Hydroxyandrost-5-en-17-one

Synonyms Dehydroisoandrosterone; DHEA; prasterone.

Proprietary Names *Astenile*; *Deandros*; *Diandrone*; *Psicosterone*.



Chemical Properties Dimorphous needles with Mp 140° to 141° or leaflets with Mp 152° to 153°. Soluble in water (solubility is 63.45 mg/L at 25°), benzene, alcohol, ether; sparingly soluble in chloroform and petroleum ether. Log *P* (octanol/water) 3.23 [Hansch *et al.* 1995]. Stable in saliva after 3 freeze-thaw cycles and for at least 6 months at –20° [Higashi *et al.* 2007b].

Dehydroepiandrosterone Sodium Sulfate

$C_{19}H_{27}NaO_5S$ = 390.5

CAS—1099-87-2

Synonyms DHA-S sodium; DHEAS; prasterone sodium sulfate; sodium dehydroepiandrosterone sulfate.

Proprietary Name *Mylis*

Chemical Properties White crystalline powder. Mp 154°. Soluble in methanol; slightly soluble in water and absolute ethanol; practically insoluble in acetone, chloroform and benzene. Stable in plasma when incubated with lithium heparin or EDTA for 16 h at 37° [Jones, James 1985].

Dehydroepiandrosterone Sodium Sulfate Dihydrate

$C_{19}H_{27}NaO_5S,2H_2O$ = 426.6

Dehydroepiandrosterone Sulfate

$C_{19}H_{28}O_5S$ = 368.5

CAS—651-48-9

Synonyms DHA-S; dehydroepiandrosterone sulfate; prasterone sulfate.

Dehydroepiandrosterone Enanthate

$C_{26}H_{40}O_3$ = 400.6

CAS—23983-43-9

Synonyms Dehydroepiandrosterone heptanoate; prasterone enanthate; prasterone heptanoate.

Thin-layer Chromatography Plate: silica gel G-Merck (20 × 20 cm). Mobile phase: hexane : ether : acetic acid (1 : 9 : 0.1). Developed with colour developing reagents. R_f 0.60 [Frye *et al.* 2000].

Gas Chromatography System GA—DHEA RI 2530, DHEA-H_2O RI 2595, DHEA enol-TMS_2 RI 2580; system GAR—DHEA RT 11.8 min.

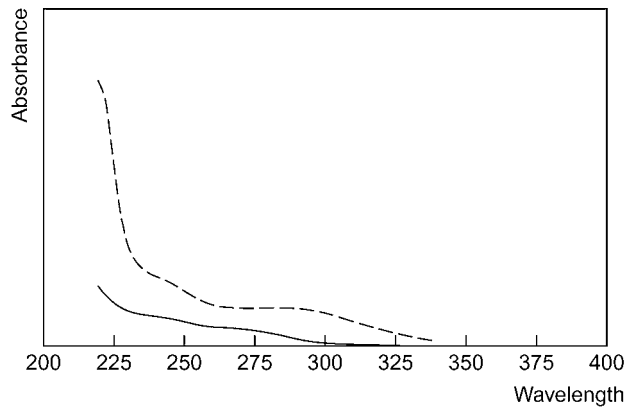
Column: 5% phenyl 95% methylsiloxane (30 m × 0.25 mm i.d., 0.25 µm). Temperature programme: 150° for 1 min to 295° at 30°/min for 8 min. Carrier gas: He, 1.0 mL/min. EI ionisation. Retention time: dehydroepiandrosterone, 7.04 min; testosterone, 7.38 min [Kintz *et al.* 1999]

Gas Chromatography-Mass Spectrometry Column: HP1 methyl silicone (0.2 mm, 0.33 µm). Temperature: 280°. Carrier gas: He, 0.9 mL/min. RI: 2588 [Mills, Roberson 1993].

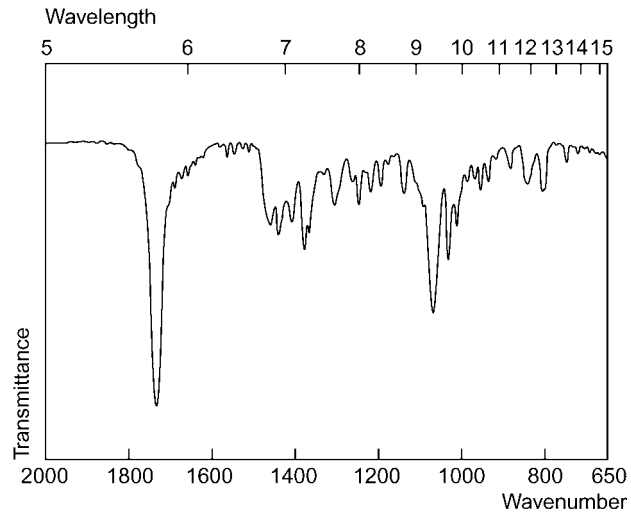
High Performance Liquid Chromatography System HATb—RRT 1.13 (relative to testosterone).

Column: ODS Hypersil (100 × 4.6 mm, 5 µm). Mobile phase: methanol : aqueous 0.01 mol/L dihydrogen potassium phosphate buffer (pH 3.5; 90 : 10), 1 mL/min flow rate. DAD. Retention time: 2.4 min. [Mills, Roberson 1993].

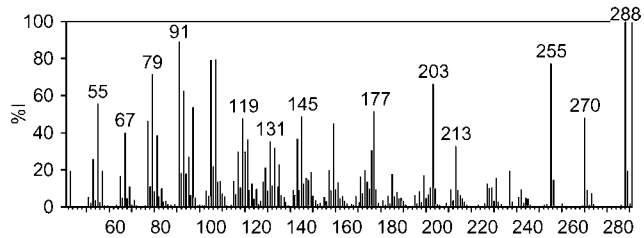
Ultraviolet Spectrum



Infrared Spectrum Principal peak at wavenumbers 1725, 1372, 1062 cm^{-1} (KBr pellets).



Mass Spectrum Principal ions at *m/z* 288, 91, 107, 105, 255, 203, 93, 55.



Quantification

Plasma **GC-MS** Column: 5% phenylmethylsilicone (30 m × 4.6 mm i.d., 0.25 µm). Carrier gas: He, 1.2 mL/min. Temperature programme: 120° for 3 min to 310° at 40°/min to 120° at 10°/min. EI ionisation at 70 eV, full scan or SIM acquisition mode. Limit of quantification, 2 nmol/L, limit of detection, 0.8 nmol/L [Diallo *et al.* 2004]. Column: Phenomenex ZEBRON ZB-50 (15 m × 0.25 mm i.d., 0.15 µm). Carrier gas:

He. Temperature programme: 180° for 3.25 min to 270° at 40°/min to 280° at 5°/min to 310° at 40°/min for 2.5 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection not reported [Hert *et al.* 2004]. Column: OV-1 fused silica (25 m × 0.15 mm i.d., 0.1 µm). Carrier gas: He, 1.8 bar. Temperature programme: 50° for 6 min to 230° at 30°/min for 2 min to 290° at 3°/min. EI ionisaton at 70 eV, MSD, SIM acquisition mode. Limit of detection, 10 pg on column [Wudy *et al.* 1992]. FAB, negative ion mode. Limit of detection, 500 µg/L for DHEA-S [Gaskell *et al.* 1983].

HPLC Column: Zorbax C_{18} (150 × 4.6 mm i.d., 3.5 µm). Mobile phase: 5.0 mmol/L tetrabutylammonium dihydrogenphosphate (pH 3.4) : acetonitrile : methanol (60 : 10 : 30 to 55 : 10 : 35 at 15 min to 15 : 10 : 75 at 17 min for 1 min to 60 : 10 : 30 at 20 min), flow rate 1.0 mL/min. UV detection (λ = 240 nm). Limit of quantification 10 µg/L, limit of detection, 3 µg/L [Marwah *et al.* 1999].

LC-MS Column: Shodex MS Pak PK-2A (10 × 2.0 mm i.d.) followed by Capcell Pak C_{18} UG 120 (150 × 1.5 mm i.d., 5 µm). Mobile phase: 0.1% triethylamine (pH 6.4) : 0.1% triethylamine in 90% acetonitrile (100 : 0 for 10 min to 70 : 30 at 10.1 min to 50 : 50 at 15 min to 20 : 80 at 20 min for 2 min to 70 : 30 at 25 min for 5 min), flow rate 100 µL/min. ESI, negative ion mode. Limit of detection, 5 nmol/L for DHEA-S [Cho *et al.* 2006].

Serum **GC-MS** Column: DB-5MS capillary (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 180° to 235° at 10°/min to 310° at 6°/min for 4.15 min. EI ionisation at 70 eV, positive ion mode, SIM acquisition mode. Retention time: 12.65 min. Limit of quantification, 0.1 µg/L, limit of detection, 0.09 µg/L [Magnisali *et al.* 2008]. Column: Zebron ZB-50 (15 m × 0.25 mm i.d., 0.15 µm). Temperature programme: 120° for 1 min to 220° at 40°/min to 240° at 2.9°/min to 310° at 40°/min for 2 min. SIM acquisition mode. Retention time: 7.1 min. Limit of detection, 2.7 pg [Hill *et al.* 2005].

HPLC Column: Wakosil 5C4 (300 × 4.0 mm i.d.). Mobile phase: acetonitrile : water (70 : 30), flow rate 0.8 mL/min. Fluorescence detection (λ_{ex} = 495 nm, λ_{em} = 516 nm). Retention time: 7.69 min. Limit of detection, 1.2 pg/L [Katayama *et al.* 1998].

LC-MS Column: Develosil ODS-HG-5 (150 × 2.0 mm i.d., 5 µm). Mobile phase: acetonitrile : 5 mmol/L ammonium formate (30 : 70), flow rate 0.15 mL/min. ESI, negative ion mode. Limit of quantification, 0.05 mg/L for DHEA-S [Mitamura *et al.* 2003]. Column: Econosphere C_{18} (150 × 4 mm i.d., 5 µm). Mobile phase: methanol : 0.2 mol/L ammonium acetate (60 : 40). TSI, negative ion mode, SIM acquisition mode. Limit of detection, 670 µg/L [Shackleton *et al.* 1990].

Urine **GC-MS** Column: HP-1 fused silica cross-linked methylsilicone (17 m × 0.2 mm i.d., 0.11 mm). Carrier gas: He, 40 cm/s. Temperature programme: 180° for 0.3 min to 231° at 3/min to 310° at 30°/min for 1.07 min. Retention time: ≈13 min. Limit of detection not reported [Uralets, Gillette 2000]. Column: HP-1 methylsilicobe fused silica (17 or 25 m × 0.22 mm, 0.11 µm). Temperature programme: 170° to 230° at 3.0°/min to 300° at 30°/min for 3.67 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection not reported [Dehennin *et al.* 1998].

LC-MS Column: XBridge C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: 1% acetic acid : acetonitrile (74 : 26 to 70.5 : 29.5 in 14 min for 16 min., flow rate 1.0 mL/min. ESI, negative ion mode, full scan mode. Limit of detection, 5.0 µg/L [Strahm *et al.* 2008].

Oral Fluid **GC-MS** Column: 1% OV-1 on Gas Chrom Q 100/120 (3 m × 3 mm i.d.) or OV-1 glass (25 m × 0.25 mm i.d.). Carrier gas: He, 20 mL/min. Temperature: 250°. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, 0.9 nmol/L for DHEA-S [Finlay *et al.* 1982].

LC-MS Column: J'sphere ODS H-80 (150 × 2.0 mm i.d., 4 µm). Mobile phase: acetonitrile : 10 mmol/L ammonium formate (1 : 1), flow rate 0.2 mL/min. ESI, positive ion mode, SRM acquisition mode. Limit of quantification, 25 ng/L, 100 ng/L for DHEA-S, limit of detection, 13 ng/L, [Higashi *et al.* 2007a; Higashi *et al.* 2007b].

Hair **GC-MS** Column: HP-5MS 5% phenyl 95% methylsiloxane (30 m × 0.25 mm i.d., 0.25 mm). Carrier gas: He, 1.0 mL/min. Temperature programme: 150° for 1 min to 295° at 30°/min for 8 min. EI ionisation. Limit of detection, 0.5 ng/g [Kintz *et al.* 1999]. Column: cross-linked methylsilicone (17 m × 0.2 mm i.d., 0.11 µm). Carrier gas: He, 121 kPa. Temperature programme: 220° for 2 min to 240° at 4°/min for 5 min to 310° at 15°/min for 3.33 min. EI ionisation at 70 eV, MSD, scan and SIM acquisition mode. Relative retention time: 0.69. Limit of detection, 0.2 ng/g [Choi, Chung 1999].

Other **GC-MS** Microsomal Fractions. Column: DB-17MS (15 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 14 psig. Temperature programme: 100° for 0.5 min to 325° at 30°/min to 325° at 2°/min for 5 min. EI ionisation at 70 eV, full mass scan. Limit of detection not reported [Miller *et al.* 2004].

Note For a review of FAB-MS for the measurement of steroids, see [Gaskell 1990].

Disposition in the Body DHEA and DHEA-S are widely distributed throughout the body. DHEA is metabolised to androsterone and etiocholanolone, the most abundant metabolites found in urine after a single oral dose. Other metabolites include androstenedione, a product from 3β-hydrosteroid dehydrogenase (HD), and testosterone (17β-HD). Men and women metabolise DHEA and DHEA-S differently, which may result in varying concentrations of other androgenic and estrogenic steroids being detected in the body.

Therapeutic Concentration

Six healthy men and 7 women were administered with a single and multiple doses of 200 mg dehydroepiandrosterone. Men: peak plasma concentrations of 22.4 ± 1.6 µg/L DHEA, 7015 ± 625 µg/L DHEA-S were reached within 1.3 ± 0.6 h and 3.3 ± 1.8 h, respectively. Women: peak plasma concentrations of 27.2 ± 2.9 µg/L DHEA and 7467 ± 645 µg/L DHEA-S were seen 1.4 ± 0.7 and 2.1 ± 0.7 h after administration. After multiple dosing, peak plasma concentrations and time to peak remained relatively constant [Frye *et al.* 2000].

Toxicity Dehydroepiandrosterone sodium sulfate and its dihydrate have low toxicity at 4 mg/kg with gastrointestinal and skin effects, for example, rashes and haemorrhages. It is moderately toxic by IP and SC routes, and can be a poison by the IV route.

Half-life DHEA: (men) 6 to 7.5 h, (women) 7 to 11.5 h; DHEA-S: (men and women) 20 to 27 h.

Dose In general, 25 to 50 mg daily is recommended as a supplementation dose for a normal population, but body builders are recommended up to 1000 mg daily by some suppliers.

Delapril

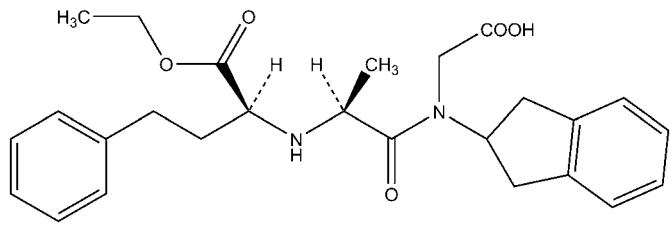
ACE Inhibitor, Antihypertensive

$C_{26}H_{32}N_2O_5$ = 452.5

CAS—83435-66-9

IUPAC Name 2-[2,3-Dihydro-1*H*-inden-2-yl-[(2*S*)-2-[[(2*S*)-1-ethoxy-1-oxo-4-phenylbutan-2-yl]amino]propanoyl]amino]acetic acid

Synonyms Alindapril; *N*-[(1*S*)-1-(ethoxycarbonyl)-3-phenylpropyl]-L-alanyl-*N*-(2,3-dihydro-1*H*-inden-2-yl)glycine; *N*-[*N*-[(*S*)-1-(ethoxycarbonyl)-3-phenylpropyl]-L-alanyl]-*N*-(indan-2-yl)glycine; ethyl (*S*)-2-[[(*S*)-1-[(carboxymethyl)-2-indanylcarbamoyl]ethyl]amino]-4-phenylbutyrate; indalapril.



Delapril Hydrochloride

$C_{26}H_{32}N_2O_5$,HCl = 489.0
CAS—83435-67-0
Synonyms CV-3317; REV-6000A.
Proprietary Names *Adecut*; *Beniod*; *Cupressin*; *Delacard*; *Delaket*; Delakete; *Trinordiol*.
Chemical Properties Colourless plates. Mp 166° to 170°. Log *P* (octanol/water), 4.77 [ACD 2007]. Stable in human plasma at room temperature for at least 4 h and for at least 3 months frozen at -15° [Ito *et al.* 1985].

Quantification

Serum **HPLC** Column: LS-410 octadecyl bonded silica (300 × 4 mm i.d., 10 µm). Mobile phase: 0.1 mol/L potassium dihydrogen phosphate : acetonitrile (55 : 45), flow rate 0.7 mL/min. UV detection (λ = 210 nm). Limit of quantification, 10 µg/L [Ito *et al.* 1985].
Urine **HPLC** See Serum. Limit of quantification, 50 µg/L [Ito *et al.* 1985].
Disposition in the Body Delapril is converted to an active diacid derivative (M1), which, in turn, is converted to an active 5-hydroxyindane diacid (M3). The diketopiperazine metabolite (M2) is inactive. Urinary excretion of delapril and its metabolites is 55.7% of the administered dose, mainly as M1 (21.4%) and M3 (30.4%). M1 is more lipophilic than the other ACE inhibitors, with a log *P* (octanol/water), of 1.97. After the single oral administration of increasing doses of delapril (3 to 60 mg) to healthy volunteers, it is rapidly absorbed. There was a correlation between the dose and the levels of M1. Urinary excretion of delapril and its metabolites is 55.7% of the administered dose, mainly as M1 (21.4%) and M3 (30.4%). Food intake has little effect on the absorption of the drug [Razzetti, Acerbi 1995].

Therapeutic Concentration

Eighteen healthy male volunteers (age 21 to 45 years; weight 57 to 87 kg) and 16 healthy elderly subjects (age 65 to 73 years; weight, 51 to 97 kg) were administered 30 mg delapril or 10 mg manidipine in combination or a fixed combination tablet of the same doses. Mean maximum plasma concentrations of delapril, M1, M2 and M3 were 194 ± 70, 382 ± 149, 132 ± 23 and 171 ± 40 µg/L attained at 1.0, 1.75, 2.0 and 2.0 h, respectively, after the extemporary combination. Mean maximum plasma concentrations of delapril, M1, M2, and M3 were 170 ± 68, 365 ± 116, 138 ± 31 and 173 ± 44 µg/L at 1.0, 1.5, 1.75 and 2.0 h, respectively, after the fixed combination. Mean peak plasma concentrations in young and elderly subjects after single and repeated doses were as follows:

	Single dose		*Repeated dose*	
	Young	*Elderly*	*Young*	*Elderly*
Delapril				
C_{max} (µg/L)	173 ± 69	138 ± 81	199 ± 85	169 ± 101
t_{max} (h)	1.0	1.5	1.0	1.0
M1				
C_{max} (µg/L)	357 ± 127	387 ± 140	365 ± 170	452 ± 202
t_{max} (h)	1.5	2.0	1.25	2.0

[Stockis *et al.* 2003]

Six healthy volunteers were administered 60 mg delapril. High plasma levels of M1 were observed followed by M3. Levels of M2 and unchanged delapril were low. The mean maximum plasma concentrations of M1 and M3 were 1.2 and 0.43 mg/L at 1.39 and 1.67 h, respectively [Razzetti, Acerbi 1995].

Sixteen healthy male volunteers (mean age, 26.3 years; mean weight, 71.3 kg) were administered 30 mg delapril and 2.5 mg indapamide once or once daily for 7 days. Mean maximum plasma concentrations of M1, M2 and M3 were 895, 142 and 259 µg/L, attained at 1, 1.41 and 1.47 h, respectively, after the single dose and 1073, 166 and 242 µg/L, attained at 0.9, 1.27 and 1.25 h, respectively, after multiple doses [Hutt *et al.* 1994].

Food and renal impairment have been shown to have no effect on the pharmacokinetics of the prodrug, but renal impairment influences the plasma profiles of the active metabolites. The plasma concentrations and area under curve values of M1 and M3 are higher in patients with renal impairment than in healthy volunteers [Minamisawa *et al.* 1990; Onoyama *et al.* 1988; Singlas, Fillastre 1991].

The repeated administration of 30 mg delapril for 7 days to 9 elderly patients with essential hypertension resulted in increased plasma concentrations and AUCs compared with healthy adults, although this could have been caused by age-related decreases in renal and hepatic function. Mean peak plasma concentrations for delapril, M1 and M3 were 489 ± 139, 635 ± 56 and 229 ± 21 ng/mL attained at 1.1 ± 0.1, 1.2 ± 0.1 and 1.9 ± 0.1 h, respectively [Shionoiri *et al.* 1987].

Note For an update and review of the pharmacokinetics of ACE inhibitors, see Song and White [2002].
Half-life 0.3, 1.21 and 1.4 h for delapril, M1 and M3, respectively [Kelly, O'Malley 1990].

Dose 30 to 60 mg daily in 2 separate doses.

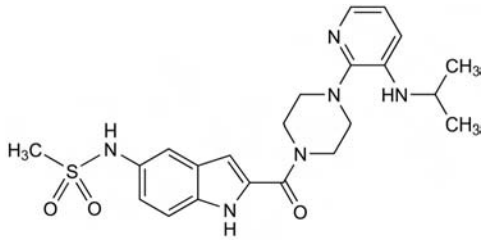
Delavirdine

Antiviral
$C_{22}H_{28}N_6O_3S$ = 456.6
CAS—136817-59-9
IUPAC Name 1-[3-[(1-Methylethyl)amino]-2-pyridinyl]-4-[[5-[(methylsulfonyl)amino]-1*H*-indol-2-yl]carbonyl]piperazine
Synonym U-90152



Chemical Properties Crystals from ethyl acetate and hexane. Mp 226° to 228°. pK_a 4.5.

Delavirdine Monomethanesulfonate

$C_{22}H_{28}N_6O_3S.CH_4O_3S$ = 552.7
CAS—147221-93-0
Synonyms Delavirdine mesylate; U-90152S.
Proprietary Name *Rescriptor*

High Performance Liquid Chromatography System HAE—retention time 6.30 min.

Column: cyano (DuPont Zorbax SB CN). Mobile phase: 10 mmol/L potassium dihydrogen phosphate (pH 6) : acetonitrile (67:33). Fluorescence detection (λ_{ex}=295 nm, λ_{em}=418 nm). Retention time: delavirdine, 7.9 min; desalkyl delavirdine, 2.7 min [Borin *et al.* 1997].

Quantification

Plasma **HPLC** UV detection (λ=260 nm). Limit of quantification, 75 µg/L [Proust *et al.* 2000]. Column: Zorbax SB C_{18} (75 × 4.6 mm, 3.5 µm). Mobile phase: 25 mmol/L citrate buffer : acetonitrile (82:18), (pH 2.7). flow rate 1.5 mL/min. Fluorescence detection (λ_{ex}=300 nm, λ_{em}=425 nm). Retention time: 19.2 min. Limit of quantification, 50 µg/L. Limit of detection, 10 µg/L [Veldkamp *et al.* 1999].
Serum **HPLC** UV detection. Limit of detection, 110 µg/L [Simon *et al.* 2001].
Disposition in the Body Delavirdine is rapidly absorbed after oral administration and is extensively metabolised in the liver by the cytochrome P450 3A isoenzymes. Absorption is at least 45%. It is excreted as the metabolites in urine and faeces with <5% as the unchanged drug in urine.

Therapeutic Concentration

Thirteen HIV (human immunodeficiency virus)-positive volunteers, with a mean CD4 count of 260 cells/mm^3 (range 192 to 402 cells/mm^3) and mean age of 39 years (range, 24 to 50 years) were administered 300 mg delavirdine mesylate orally every 8 h for 30 days, 2 h after or 1 h before meals. Steady state concentrations were observed by day 11 and averaged 19 µg/L for

delavirdine and 2.6 µg/L for desalkyl delavirdine. For the parent drug, peak plasma concentrations reached 31 (22 to 44) µg/L on day 15, 26 (20 to 36) µg/L on day 16 and 28 (18 to 40) µg/L on day 30. These concentrations were observed at 1.0 (1.0 to 1.5), 2.0 (0.75 to 2.5) and 0.75 to 1.0 h, respectively. For desalkyl delavirdine, peak concentrations were 3.2 (2.9 to 4.2), 2.8 (2.3 to 4.0) and 2.8 (2.5 to 4.5) µg/L for days 15, 16 and 30 observed at approx. 2.5 h (0.75 to 6.0 h) [Borin *et al.* 1997].

Half-life 2 to 11 h.

Protein Binding 98%.

Dose The usual dose is 400 mg three times daily.

Deltamethrin

Ectoparasiticide, Insecticide

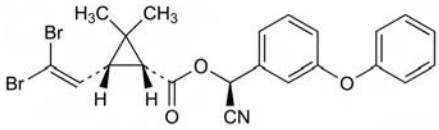
$C_{22}H_{19}Br_2NO_3 = 505.2$

CAS—52918-63-5

IUPAC Name *(S)*-α-Cyano-3-phenoxybenzyl-(1*R*)-*cis*-3-(2,2-dibromovinyl)-2,2-dimethylcyclopropanecarboxylate

Synonyms Decamethrin; deltamethrine; esbecythrin; FMC-45498; NRDC-161; OMS 1998; RU-22974.

Proprietary Names *Butofin*; *Butoss*; *Butox*; *Cislin*; *Crackdown*; *Cresus*; *Decis*; *Decis-Prime*; *Delsekte*; *Hunter*; *K-Othrin*; *K-Otek*.



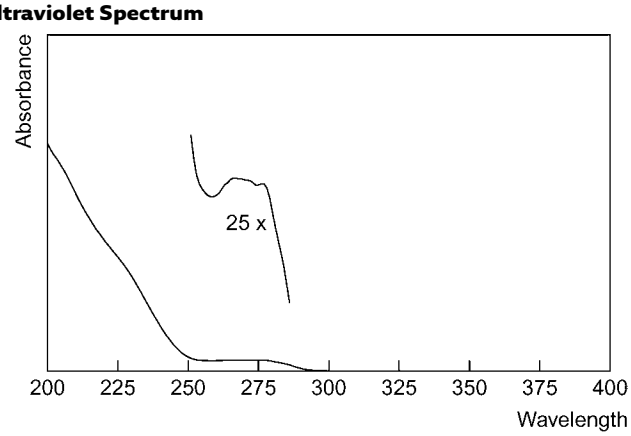
Chemical Properties A colourless, crystalline powder or white/slightly beige powder. Mp 98° to 101°. It is soluble in kerosene and isoalkanes (<0.5 g/100 g at 20°), isopropanol (<0.6 g/100 g at 20°), ethanol (1.5 g/100 g at 20°), xylene (25 g/100 g at 20°), methylene chloride (70 g/100 g at 20°), toluene (250 g/L at room temperature), acetone (500 g/L at room temperature), benzene and dimethyl sulfoxide (450 g/L at room temperature), cyclohexane (750 g/L at room temperature), and dioxane (900 g/L at room temperature); practically insoluble in water (2 µg/L at 20°). Log *P* (octanol/water), 4.6 (25°).

Thin-layer Chromatography System TX—R_f 0.40; system TY—R_f 0.90; system TZ—R_f 0.95; system TAA—R_f 0.72.

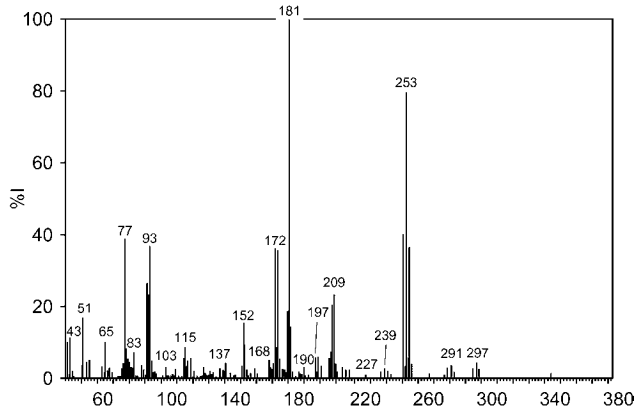
Plate: silica gel G (0.25 mm). Mobile phase: cyclohexane:toluene (6:4). Developed by spraying with 20% sodium hydroxide solution, 1% copper (II) acetate solution, and 1% phosphomolybdic acid solution, and 0.1% o-toluidine reagent 5 min later. Rf 0.31 [Patil *et al.* 1992].

Gas Chromatography System GA—deltamethrin RI 2900, M (COOH-)-Me RI 1540, M (desacyl-)-HCN RI 1700, M (desacyl-)-Me RI 2590; system GKD—retention time 5.8 min.

Ultraviolet Spectrum



Mass Spectrum



Quantification

Plasma **GC** Limit of detection, 2 mg/L [Junting, Chuichang 1991].

Urine **GC** Limit of detection, 200 mg/L [Wu *et al.* 1994] and see Plasma.

GC-MS Limit of detection for the metabolites, 0.3 to 0.5 µg/L [Angerer, Ritter 1997]. Limit of detection, 0.2 µg/L [Kuhn *et al.* 1996].

Disposition in the Body Deltamethrin is hydrolysed by liver microsomal enzymes to three metabolites: 3-(2,2-dibromovinyl)-2,2-cyclopropane carboxylic acid, 3-phenoxy-benzylhydroxy-ethyl acetate, and 3-phenoxylbenzoic acid. All three metabolites have been detected in urine.

Toxicity There have been many cases of dermal deltamethrin poisoning due to inadequate handling of the chemical during agricultural use. Cases of accidental and suicidal poisoning have also been observed with oral doses between 2 and 250 mg/kg. A dose of 100 to 250 mg/kg can result in coma, even though short-lived (15 to 20 min). The allowed daily intake is 0.01 mg/kg.

Demecarium Bromide

Anticholinesterase

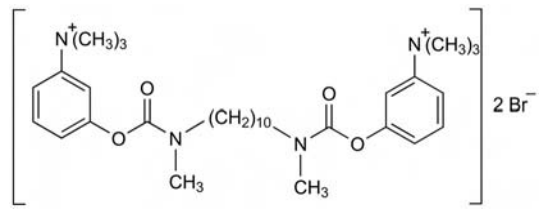
$C_{32}H_{52}Br_2N_4O_4 = 716.6$

CAS—56-94-0

IUPAC Name Trimethyl-[3-[methyl-[10-[methyl-[3-(trimethylazaniumyl)phenoxy] carbonylamino]decyl]carbamoyl]oxyphenyl]azanium dibromide

Synonyms BC-4; 3,3′-[1,10-decanediylbis[(methylimino)carbonyloxy]]bis[*N,N,N*-trimethylbenzeneaminium]dibromide.

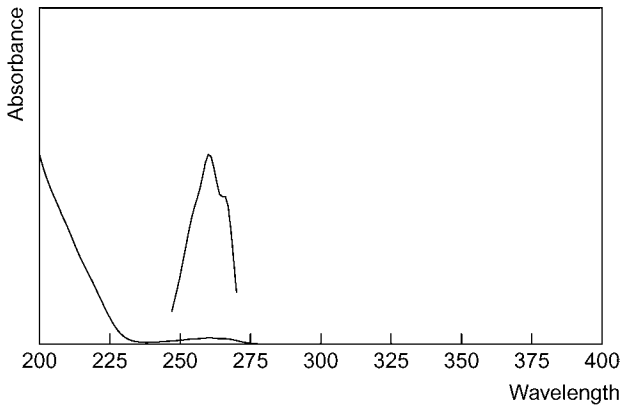
Proprietary Names *Humorsol*; *Tosmilen(e)*.



Chemical Properties A white or slightly yellow, slightly hygroscopic, crystalline powder. Mp 162° to 167°, with decomposition. Freely soluble in water and ethanol; sparingly soluble in acetone; insoluble in ether. Log *P* (octanol/water), −1.8.

Thin-layer Chromatography System TA—R_f 0.00 (acidified iodoplatinate solution, positive).

Ultraviolet Spectrum Aqueous acid—259 (A^{1}_{1}=14b), 265 nm. No alkaline shift.

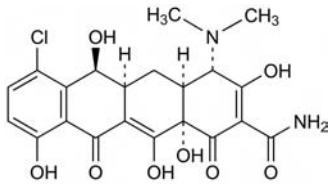


Infrared Spectrum Principal peaks at wavenumbers 1724, 1216, 1149, 1178, 1124, 943 cm^{-1} (KBr disk).
Use As a 0.25 to 0.5% ophthalmic solution.

Demeclocycline

Antibacterial
$C_{21}H_{21}ClN_2O_8$ = 464.9
CAS—127-33-3

IUPAC Name (2*Z*,4*S*,4a*S*,5a*S*,6*S*, 12a*S*)-2-Amino(hydroxy)methylidene]-7-chloro-4-(dimethylamino)-6,10,11,12*a*-tetrahydroxy-4*a*,5,5*a*,6-tetrahydro-4*H*-tetracene-1,3,12-trione
Synonyms [4*S*-(4α,4aα,5aα,6β,12aα)]-7-Chloro-4-(dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,6,10,12,12a-pentahydroxy-1,11-dioxo-2-naphthacenecarboxamide; demethylchlortetracycline; DMCT; RP-10192.
Proprietary Name *Ledermycin* (drops and syrup)

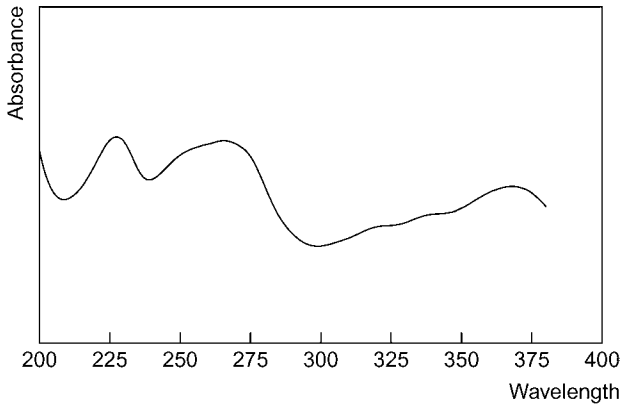


Chemical Properties A yellow crystalline powder. Sparingly soluble in water; soluble 1 in 200 of ethanol and 1 in 40 of methanol; soluble in dilute hydrochloric acid and in solutions of alkali hydroxides and carbonates. pK_a 3.3, 7.2, 9.3 (25°). Log *P* (octanol/pH 7.5), −1.3.

Demeclocycline Hydrochloride

$C_{21}H_{21}ClN_2O_8$,HCl = 501.3
CAS—64-73-3

Proprietary Names *Declomycin*; *Ledermycin(e)* (capsules and tablets). It is an ingredient of *Declostatin* and *Deteclo*.
Chemical Properties A yellow, amphoteric, crystalline powder. Soluble 1 in 30 to 1 in 60 of water, 1 in 45 to 1 in 200 of ethanol and 1 in 50 of methanol; practically insoluble in chloroform and ether; soluble in aqueous solutions of alkali hydroxides and carbonates.
Colour Tests Benedict's reagent—red; formaldehyde-sulfuric acid—orange→brown-red; Mandelin's test—violet-brown; Marquis test—yellow→green; Nessler's reagent—brown; sulfuric acid—brown-blue.
Thin-layer Chromatography System TA—R_f 0.05, streaking; system TAJ—R_f 0.00; system TAK—R_f 0.00; system TAL—R_f 0.04 (location under ultraviolet light, orange fluorescence; acidified potassium permanganate solution, positive).
High Performance Liquid Chromatography System HY—RI 273.
Ultraviolet Spectrum Aqueous acid—268 nm (A^1_1=398a); aqueous alkali—241 nm (A^1_1=364b), 276 nm (A^1_1=304b), 388 nm (A^1_1=385b).

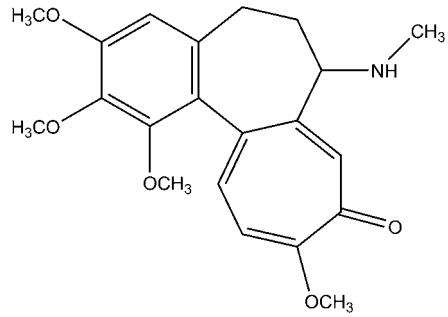


Infrared Spectrum Principal peaks at wavenumbers 1616, 1573, 1660, 1190, 1298, 1315 cm^{-1} (KBr disk).
Disposition in the Body Readily absorbed after oral administration and slowly excreted in the urine.
Half-life Plasma half-life, about 10 to 15 h.
Protein Binding 40 to 90%.
Dose Usually 600 mg of demeclocycline hydrochloride daily; up to 1.2 g daily has been given.

Demecolcine

Coumarin, Antimitotic
$C_{21}H_{25}NO_5$ = 371.4
CAS—477-30-5

IUPAC Name Deacetylmethylcolchicine
Synonyms Colchamine; desacetylmethylcolchicine; 6,7-dihydro-1,2,3,10-tetramethoxy-7-(methylamino)benzo[a]heptalen-9(5*H*)-one; *N*-methyl-*N*-desacetylcolchicine; omaine; Santavy's substance F.
Proprietary Name *Colcemid*



Chemical Properties Demecolcine is an alkaloid isolated from the corms of the meadow saffron, *Colchicum autumnale* (Liliaceae). Pale-yellow crystals. Mp 186°. Soluble 1 in 50 of water; soluble in ethanol, ether and chloroform. Extracted by organic solvents from aqueous alkaline solutions.
Colour Tests Ammonium molybdate test—green→yellow (limit of detection, 0.05 μg); ammonium vanadate test—brown-purple→yellow (limit of detection, 0.025 μg); Vitali's test—yellow→purple/brown/red-violet (limit of detectio,n 0.05 μg).
Thin-layer Chromatography System T1—R_f 0.56 (location reagent *p*-dimethylaminobenzaldehyde spray, positive reaction).
High Performance Liquid Chromatography Column: C_{18} (150 × 4.6 mm i.d., 5 μm). Mobile phase: 0.1 mol/L potassium dihydrogen phosphate buffer with 5 mmol/L 1-pentanesulfonic acid : methanol : acetonitrile (60 : 26.6 : 13.4, pH 6.0). UV detection (λ = 254 nm and 350 nm). Retention time: 8.2 min. Limit of quantification not reported [Ko *et al.* 1990].
Infrared Spectrum Principal peaks at wavenumbers 1241 or 1562, 1582, 1090 cm^{-1} (KBr disk).
Quantification
Other **HPLC** Plant Samples (Jordanian *Colchicum* species). Column: C_{18} LichroCart (125 × 4.0 mm i.d., 5 μm). Mobile phase: acetonitrile : 3% aqueous acetic acid (10 : 90 for 11 min to 60 : 40 over 4 min to 10 : 90 over 5 min), flow rate 1.0 mL/min. UV detection (λ = 245 nm). Retention times: (–)-demecolcine 8.8 min, (–)-cochicine 10.5 min. Limit of quantification not reported [Alali *et al.* 2007]. Corns, Stems and Leaves of *Colchicum auntumnale* L. species. Column: C_{18} (250 × 4.6 mm i.d., 10 μm). Mobile phase: 0.02 mol/L phosphate buffer (pH 7.5) : methanol-acetonitrile-0.02 mol/L phosphate buffer (pH 7.5; 38 : 35 : 27; 50 : 50 for 10 min to 20 : 80 over 6 min for 5 min), flow rate 1.0 mL/min. UV detection (λ = 353 nm). Limit of quantification, <1 mg/kg for dried corms or stems and <3 mg/kg for dried leaves [Vicar *et al.* 1993].
Dose Up to 10 mg daily.

Alali FQ *et al.* (2007). Determination of (–)-demecolcine and (–)–colchicine content in selected Jordanian *Colchicum* species. *Pharmazie* 62: 739–742.

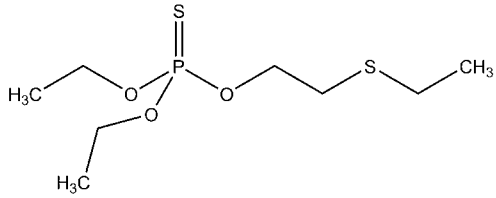
Demeton-*O*

Anticholinesterase, Insecticide, Organophosphate
$C_8H_{19}O_3PS_2$ = 258.3
CAS—8065-48-3 (demeton)

IUPAC Name Diethyl 2-ethylthioethyl phosphorothionate
Synonyms Demeton (mixture of demeton-O and demeton-S); mercaptofos; phosphorothioic acid O,O-diethyl O-[2-(ethylthio)ethyl] ester.
Proprietary Names *Systox* (mixture of demeton-O and demeton-S).



Chemical Properties Oily liquid. $Bp_{1.2}$ 128°. Extracted by organic solvents from aqueous acid or alkaline solutions.

Demeton-*O*-methyl

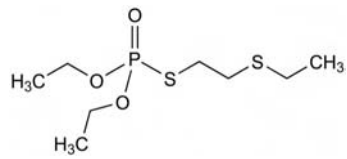
Synonyms Demeton-methyl (mixture of demeton-O-methyl and demeton-S-methyl); SPOC compound; thionate.
Proprietary Name *Metasystox* (mixture of demeton-O-methyl and demeton-S-methyl).
Chemical Properties Yellowish-brown oil. $Bp_{0.15}$ 74°. Soluble 1 in about 3000 of water. In solution or upon storage, 30% of demeton-O-methyl is transformed into demeton-S-methyl. Extracted by organic solvents from aqueous acid or alkaline solutions.

Thin-layer Chromatography System T16—R_f 0.60 demeton-O (location reagent bromophenol blue spray followed by 5% aqueous acetic acid spray, mauve).
Gas Chromatography System GA—RI 1576 demeton-O.
Disposition in the Body Demeton-O and demeton-O-methyl are very readily absorbed by all routes; they have a particularly high percutaneous toxicity. They exert a direct inhibitory action on cholinesterase and are rapidly hydrolysed in tissues.
Toxicity The estimated acute lethal dose in humans is 5 g, but exposure to as little as 300 mg daily may be dangerous.

Demeton-*S*

Insecticide
$C_8H_{19}O_3PS_2 = 258.3$
CAS—126-75-0

IUPAC Name 1-Diethoxyphosphorylsulfanyl-2-ethylsulfanylethane
Synonyms *O,O*-Diethyl-*S*-2-ethylthioethyl phosphorothioate; isosystox; mercaptofos teolovy.



Chemical Properties A colourless oil. Soluble 1 in 500 of water; soluble in most organic solvents. Log *P* (octanol/water), 2.09 [Meylan, Howard 1995].

Demeton-*S*-(Me)

$C_6H_{15}O_3PS_2 = 230.3$
CAS—919-86-8
Synonyms Metaisosystox; methyl-mercaptofos teolovy.
Note The name demeton-methyl used to be applied to a mixture of demeton-*S*-methyl and demeton-*O*-methyl but this mixture has been replaced by demeton-*S*-methyl.
Proprietary Names *Azotox*; *Demetox*; *DSM*; *Duratox*; *Metasystox 55*.
Chemical Properties A pale yellow oil of low viscosity. In solution or upon storage, demeton-*S*-methyl is oxidised to the sulfoxide and the sulfone. Refractive index 1.5065. Soluble 1 in 300 of water; soluble in most organic solvents.

Colour Test Palladium chloride—brown-orange; phosphorus test—yellow.
Thin-layer Chromatography system TE—(-methyl) R_f 0.81; system TX—(-methyl) R_f 0.18; system TY—(-methyl) R_f 0.13; system TAE—(-methyl) R_f 0.86.
Gas Chromatography System GA—demeton-S RI 1684, demeton-S-methyl RI 1628, demeton-S-methylsulfone RI 1866, demeton-S-methylsulfoxide RI 1860; system GK—RRT 0.70 (relative to caffeine).
High Performance Liquid Chromatography System HY—demeton-S-methyl RI 353.
Infrared Spectrum Principal peaks at wavenumbers 1020, 1250, 775, 793, 826, 1190 cm^{-1} (demeton-S-methyl).
Mass Spectrum Principal ions at *m/z* 88, 60, 109, 142, 79, 47, 111, 61 (demeton-S-methyl).
Disposition in the Body Demeton-S and demeton-S-methyl are very readily absorbed by all routes and have a particularly high toxicity following percutaneous absorption. They are rapidly hydrolysed in the tissues to the corresponding sulfoxide and sulfone.
Toxicity Demeton-S and demeton-S-methyl exert a direct inhibitory action on cholinesterase. The estimated minimum lethal dose is 5 g but exposure to 300 mg daily may be dangerous.

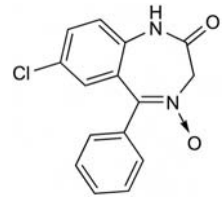
In a fatality due to the ingestion of demeton-S-methyl, the following postmortem tissue concentrations were reported: blood 10 mg/L, bile 58 mg/L, kidney 5 µg/g, liver 17 µg/g and urine 121 mg/L [Hall, Carson 1970].

Hall RA, Carson ED (1970). *TIAFT Bull* 76.
Meylan WM, Howard PH (1995). Atom/fragment contribution method for estimating octanol-water partition coefficients. *J Pharm Sci* 84: 83–92.

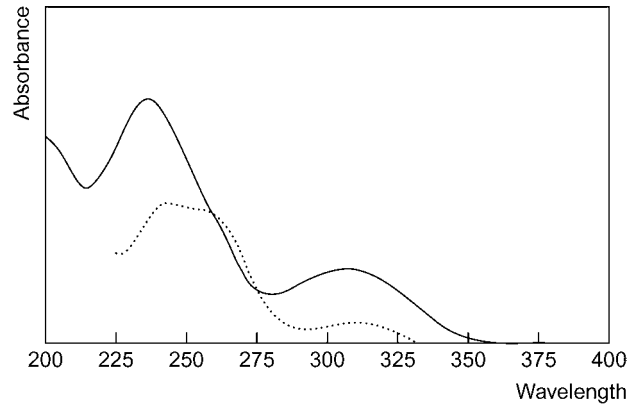
Demoxepam

Tranquilliser
$C_{15}H_{11}ClN_2O_2 = 286.7$
CAS—963-39-3

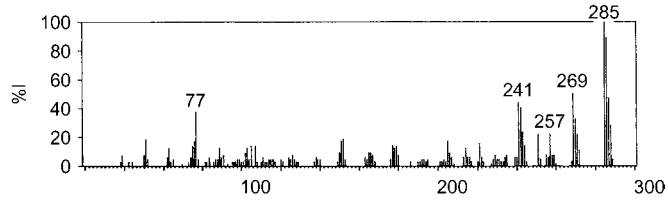
IUPAC Name 7-Chloro-4-hydroxy-5-phenyl-3*H*-1,4-benzodiazepin-2-one
Synonyms Chlordiazepoxide lactam; 7-chloro-1,3-dihydro-5-phenyl-2*H*-1,4-benzodiazepin-2-one 4-oxide; demossepam.



Chemical Properties A white crystalline powder. Soluble in chloroform. pK_a 4.5, 10.6. Log *P* (octanol/pH 7.4), 1.5.
Colour Test Formaldehyde–sulfuric acid—orange.
Thin-layer Chromatography System TA—R_f 0.63; system TB—R_f 0.00; system TC—R_f 0.35; system TD—R_f 0.15; system TE—R_f 0.41; system TF—R_f 0.24; system TL—R_f 0.51; system TAD—R_f 0.42; system TAE—R_f 0.81; system TAF—R_f 0.83 (acidified iodoplatinate solution, positive; acidified potassium permanganate solution, positive).
Gas Chromatography System GA—demoxepam RI 2529, M oxazepam RI 2325; system GB—demoxepam RI 2806, M oxazepam RI 2438; system GG—demoxepam RI 3043, M oxazepam RI 2803.
High Performance Liquid Chromatography System HI—demoxepam *k* 2.42, M oxazepam *k* 4.62; system HK—demoxepam *k* 0.03, M oxazepam *k* 0.73; system HX—RI 416; system HY—RI 341; system HZ—RT 3.1 min.
Ultraviolet Spectrum Aqueous acid—237, 305 nm; aqueous alkali—243, 255, 310 nm; methanol—236 ($A^1_1 = 1340$b), 310 nm.



Infrared Spectrum Principal peaks at wavenumbers 1678, 690, 1240, 1265, 755, 717 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 285, 286, 269, 287, 241, 242, 77, 270.



Quantification

Blood **TLC** Spectrofluorometry. Limit of detection, 0.1–0.2 µg [Stronjny *et al.* 1977].
Plasma **TLC** See Blood [Stronjny *et al.* 1977].
HPLC Limit of detection, 0.075–0.125 mg/L [Garretty *et al.* 1998]. Column: C_{18} reversed phase. Limit of detection, 0.05 mg/L [Divoll *et al.* 1982].
Serum **TLC** Fluorescence densiometry ($\lambda = 430$ nm). Limit of detection, 0.01 mg/L [Sun 1978].

GC-MS Column: 5% OV-225 on 80/100 mesh Gas Chrom Q (1.21 m × 4 mm i.d.). Carrier gas: Ar : CH_4 (95 : 5), 50 mL/min. Temperature: 265°. ECD. Retention time: 4.4 min. Limit of detection, 0.8 ng/injection [Sun, Hoffman 1978].

HPLC Column: C_{18} reverse-phase. Mobile phase: phosphate buffer (pH 6.0) : methanol : acetonitrile (45 : 35 : 20). UV detection (λ = 254 nm). Limit of detection, 20 mg/L [Haver *et al.* 1986]. Column: C_{18} reversed phase. Mobile phase: 60 mmol/L ammonium acetate (pH 7.69) : 60 mmol/L acetic acid (pH 2.8) : acetonitrile. Limit of detection, 0.05–0.10 mg/L [Lensmeyer *et al.* 1982]. Column: reversed phase. Retention time, ~2 min. Limit of detection, ~100 pg [Brinkman *et al.* 1981]. Column: reversed phase. UV detection. Limit of quantification, 50 µg/L [Good, Andrews 1981]. Column: reversed phase. Mobile phase: acetonitrile : methanol : acetate buffer (pH 5.0, 200 : 225 : 500), flow rate 2 mL/min. UV detection (λ = 240 nm) [Foreman *et al.* 1980].

Urine **LC-MS** Column: REMEDi HS. Limit of detection, 250 ng [Essien *et al.* 1996].

Disposition in the Body Demoxepam is well absorbed after oral administration. Approximately 10% of a dose is excreted in the urine in 24 h and ~60% in 7 days, including ~27% as unchanged demoxepam and ~5% as conjugated oxazepam. Other urinary metabolites include the 5-(4-hydroxyphenyl) and 9-hydroxy derivatives. Approximately 15% of the dose is eliminated in the faeces in 7 days, with ~2% as desmethyldiazepam.

Demoxepam is a metabolite of chlordiazepoxide.

Therapeutic Concentration

Following a single oral dose of 20 mg of demoxepam given to 6 subjects, peak plasma concentrations of 0.50–0.74 µg/mL (mean 0.6) were attained in 2–8 h [Schwartz *et al.* 1971].

Half-life Plasma half-life, 14–95 h (mean 40).

Denatonium Benzoate

Alcohol Denaturant

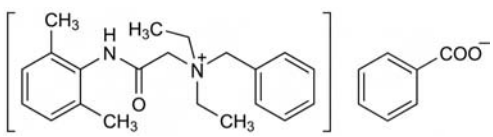
$C_{28}H_{34}N_2O_3$ = 446.6

CAS—3734-33-6

IUPAC Name Benzyl-[2-(2,6-dimethylanilino)-2-oxoethyl]-diethylazanium benzoate

Synonym *N*-[2-[(2,6-Dimethylphenyl)amino]-2-oxoethyl]-*N*,*N*-diethylbenzenemethanaminium benzoate

Proprietary Name *Bitrex*



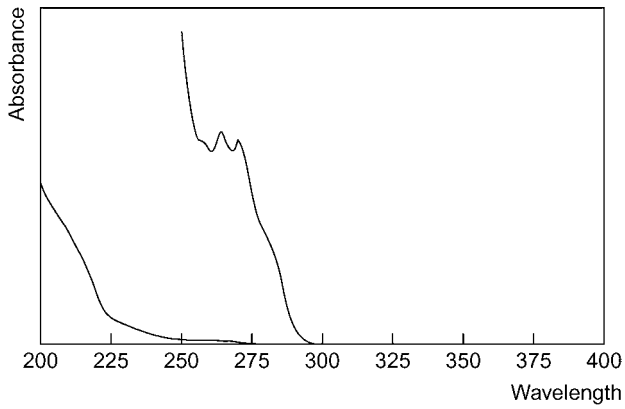
Chemical Properties A white crystalline powder. Mp 166° to 170°. Soluble in water; soluble 1 in about 2 of ethanol and 1 in about 3 of chloroform; sparingly soluble in acetone; practically insoluble in ether. Log *P* (octanol/water), 1.8.

Colour Test Mandelin's test—violet.

Thin-layer Chromatography System TA—R_f 0.10; system TB—R_f 0.00; system TE—R_f 0.03; system TF—R_f 0.25; system TAE—R_f 0.01 (acidified iodoplatinate solution, positive).

High Performance Liquid Chromatography System HX—RI 422.

Ultraviolet Spectrum Aqueous acid—263 (A^1_1=36b), 269 nm.



Infrared Spectrum Principal peaks at wavenumbers 1550, 1596, 1680, 719, 704, 757 cm^{-1}.

Denopamine

β_1-Adrenoceptor Agonist, Cardiotonic

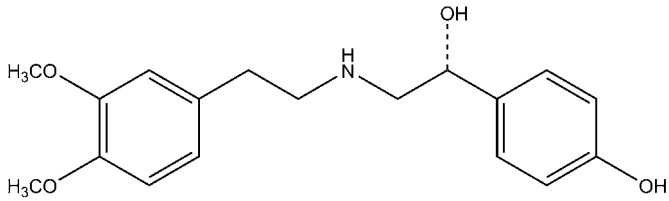
$C_{18}H_{23}NO_4$ = 317.4

CAS—71771-90-9

IUPAC Name 4-[(1*R*)-2-[2-(3,4-Dimethoxyphenyl)ethylamino]-1-hydroxyethyl] phenol

Synonyms (−)-(*R*)-α-[[(3,4-Dimethoxyphenethyl)amino]methyl]-*p*-hydroxybenzyl alcohol; (α*R*)-α-[[[2-(3,4-dimethoxyphenyl)ethyl]amino]methyl]-4-hydroxybenzenemethanol; (−)-(*R*)-1-(4-hydroxyphenyl)-2-(3,4-dimethoxyphenethylamino) ethanol; TA-064.

Proprietary Names *Carguto*; *Kalgut*.



Chemical Properties pK_{a1} 8.2 [Nishi *et al.* 1995], pK_{a2} 10.0 [Ishibuchi *et al.* 1997]. Log *P* (octanol/water), 1.73 [ACD 2007].

l-Denopamine Hydrochloride

$C_{18}H_{23}NO_4$,HCl = 353.9

Chemical Properties Crystals from isopropanol. Mp 138° to 139.5°.

dl-Denopamine Hydrochloride

Chemical Properties Crystals from isopropanol and isopropyl ether. Mp 164° to 167°.

High Performance Liquid Chromatography Column: ULTRON ES-CD, cyclodextrin immobilised chiral stationary phases (150 × 6 mm i.d., 5 µm). Mobile phase: tetrahydrofuran with 50 mmol/L phosphate buffer (pH 4.6), flow rate 1 mL/min. UV detection (λ = 220 nm). Limit of detection not reported [Nishi *et al.* 1995].

Capillary Electrophoresis Capillary: uncoated fused silica (total/effective length 50/37 cm, 75 µm i.d.). Buffer: acidic solution containing uncharged cyclodextrins. DAD (λ = 210 to 220 nm). Limit of detection not reported [Ishibuchi *et al.* 1997]. Capillary: fused silica (total/effective length 57/50 cm, 75 µm i.d.). DAD (λ = 210 to 220 nm). Limit of detection, not reported [Nishi *et al.* 1995].

Mass Spectrum Principal ions at *m/z* 252 and 297 (*O*-TMS derivative).

Quantification

Plasma **GC-MS** Column: 1.5% OV-1 on 100/120 Mesh Gas Chrom Q or 1.5% OV-17 on 100/120 mesh Shimalite W (500 × 3 mm i.d.). Carrier gas: He, 35 mL/min. EI ionisation at 30 eV, SIM acquisition mode. Limit of detection not reported [Suzuki *et al.* 1983].

HPLC Column: Macherey Nagel Nucleosil 5C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.1 mol/L dipotassium hydrogen phosphate (pH 5.5; 27 : 100), flow rate 0.9 mL/min. Electrochemical detection. Limit of detection, 2 µg/L [Tagawa *et al.* 1990]. Column: Waters radial Pack C_{18} (100 × 8 mm i.d., 10 µm). Mobile phase: water : methanol : acetonitrile (16 : 3 : 1) containing 1% ethanol and 2% triethylamine, flow rate 1.5 mL/min. UV detection (λ = 280 nm). Limit of detection not reported [Suzuki *et al.* 1983].

Urine **GC-MS** Column: cross-linked methylsilicone fused silica (25 m × 0.2 mm i.d., 0.11 µm). Carrier gas: He, 80 mL/min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection not reported [Suzuki *et al.* 1985]. See Plasma [Suzuki *et al.* 1983].

HPLC See Plasma [Suzuki *et al.* 1983].

Disposition in the Body Denopamine undergoes oxidative 3′- or 4′-*O*-demethylation and/or *m*-hydroxylation followed by *m*- or *p*-catechol *O*-methyltransferase methylation to form 5 metabolites. Approximately 30 to 40% of an orally administered dose is excreted in the urine within 24 h as free and conjugated denopamine and conjugates of the 5 metabolites.

Therapeutic Concentration

The time to peak plasma concentration was the only pharmacokinetic value that was significantly different when 9 healthy male volunteers were compared with 11 haemodialysis patients. This could be attributed to intestinal oedema caused by water retention or forced immobility during haemodialysis. Mean peak plasma concentrations were as follows:

Patients	C_{max} (μg/L)	t_{max} (h)	$t_{1/2}$ (h)
Haemodialysis	14.9 ± 3.7	3.0 ± 0.5	4.1 ± 0.8
Interdialysis	19.1 ± 9.5	2.9 ± 0.9	6.1 ± 0.7
Healthy volunteers	15.5 ± 1.6	0.9 ± 0.2	4.0 ± 0.9

[Nakahama *et al.* 1991]

In healthy volunteers administered denopamine, the plasma concentrations increased rapidly, reaching a maximum at approximately 0.5 to 2 h, and declined with an elimination half-life of approx. 4 h. Mean peak plasma concentrations were as follows:

Treatment	C_{max} (μg/L)	t_{max} (h)	$t_{1/2}$ (h)
2 × 5 mg tablet	19.2 ± 2.4	0.83 ± 0.17	4.02 ± 0.88
1 × 10 mg tablet	15.5 ± 1.6	0.89 ± 0.16	4.00 ± 0.93
5% fine granules (200 mg)	16.9 ± 1.3	0.50 ± 0.00	3.67 ± 0.61

[Tagawa *et al.* 1990].

The minimal effective plasma level (5.5 to 8.8 μg/L) can be obtained by the oral administration of 10 mg three times daily at 15 to 30 min after administration [Bito *et al.* 1988].

Half-life Approximately 4 h.

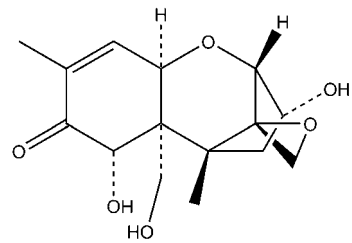
Deoxynivalenol

Epoxysesquiterpenoid, Mycotoxin
$C_{15}H_{20}O_6$ = 296.3
CAS—51481-10-8

IUPAC Name 12,13-Epoxy-3,7,15-trihydroxytrichothec-9-en-8-one
Synonyms C09747; dehydronivalenol; desoxynivalenol; DON; LMPR01030038; vomitoxin.



Chemical Properties Non-fluorescent type B trichothecene mycotoxin is associated primarily with *Fusarium graminearum* and *F. culmorum*, both of which are important plant pathogens. Surveys have shown that DON occurs predominantly in grains such as wheat, barley, oats, rye, and maize, and less often in rice, sorghum and triticale [WHO/JECFA 2002]. Fine needles from ethyl acetate/petroleum ether. Mp 151° to 153° [O'Neil *et al.* 2006]. Log *P* (octanol/water), −0.71 [Weiss *et al.* 2003]. When an aqueous solution of DON was treated with 10 mg of activated carbon, between 1.83 and 98.93% of the DON was sequestered. Neither hydrated sodium calcium aluminosilicate or sepiolate were effective in binding DON [Galvano *et al.* 1998]. In degradation studies, DON and nivalenol (NIV) solution tests were shown to be relatively stable in buffer solutions over the pH range 1–10. Quite harsh conditions (pH 12, high salt concentration, 80°, prolonged exposure) were needed to achieve substantial breakdown [Lauren, Smith 2001]. Solutions of DON and NIV in acetonitrile were shown to be stable at temperatures up to 25° for at least 24 months, while long-term storage of DON and NIV in ethyl acetate or as thin-film at temperatures above freezing should be avoided [Widestrand, Pettersson 2001]. The use of low-dose gamma irradiation to destroy DON present on grain was shown to be unsuitable because of the high irradiation dose required for destruction of the toxin (>50 kGy) [O'Neill *et al.* 1993].

Thin-layer Chromatography Plates: RP-18 and KC-18. Solvent systems: (A) methanol : water; (B) acetonitrile : water; (C) tetrahydrofuran : water. Location reagent: 4-(*p*-nitrobenzyl)pyridine for trichothecenes; UV (λ = 365 nm) for aflatoxins, ochratoxin A, citrinin; aluminium trichloride for sterigmatocystin; Azoene Fast Violet B for zearalenone; 3-methyl-2-benzthiazolinone hydrazone hydrochloride for patulin and penicillic acid. Solvent composition and R_f values were reported as follows:

	Mobile phase solvent ratio, R_f value

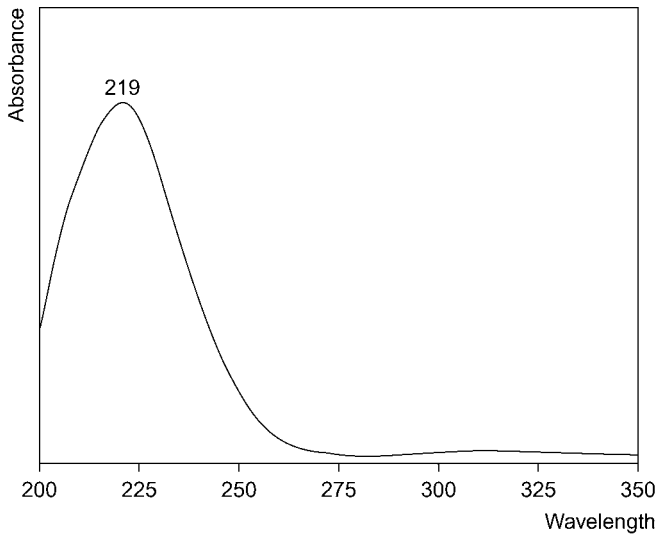
[Abramson *et al.* 1989].

Gas Chromatography-Mass Spectrometry Column: HP-5MS (30 m × 0.25 mm, 0.25 μm). Carrier gas: He, 2.0 mL/min. Temperature programme: 80° for 2 min to 200° at 35°/min for 5 min. EI ionisation at 70 eV, positive ion mode, SIM acquisition mode (FID also used). Retention time: 17.5 min (*N*,*O*-bis(trimethylsilyl)acetamide : trimethylchlorosilane : *N*-trimethylsilylimidazole derivative). Limit of quantification not reported [Krska *et al.* 2004]. Column: DB-5MS (30 m × 0.5 mm, 0.25 μm). Temperature programme: 150° for 1 min to 280° at 3°/min. EI ionisation at 70 eV, positive ion mode, SIM acquisition mode. Retention times: DON 9.7 min, 7-acetyl-DON 9.8 min, 4-acetyl-NIV 9.8 min, 3-acetyl-NIV 9.88 min, 15-acetyl-NIV 9.94 min, NIV 10.0 min, 3,15-diacetyl-DON 10.5 min, 4,15-diacetyl-NIV 10.7 min (TMS-ether derivatives). Limit of quantification not reported [Rodrigues-Fo *et al.* 2002]. Column: BP-1 methylsilicone (25 m × 0.33 mm i.d., 0.5 μm). Carrier gas: He, 3.0 mL/min. Temperature programme: 150° to 300° at 15°/min. EI ionisation at 70 eV, positive ion mode, SIM acquisition mode. Retention time: 5.7 min (trifluoroacetyl ester derivative). Limit of detection, 10 pg [Wreford, Shaw 1988].

High Performance Liquid Chromatography Column: C_{18} (150 × 4.6 mm i.d., 3 μm). Mobile phase: acetonitrile : water (1 : 1), flow rate 0.4 mL/min. UV detection (λ = 219 nm). Limit of quantification not reported [Krska *et al.* 2004].

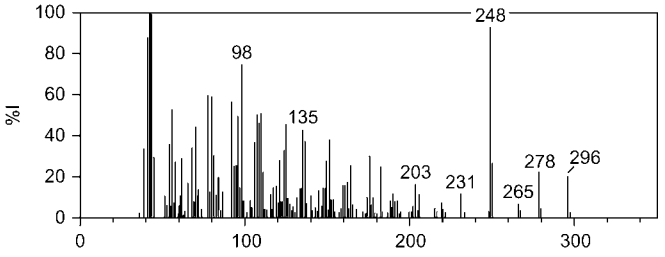
Liquid Chromatography-Mass Spectrometry Column: C_8 (150 × 3.0 mm i.d., 5 μm). Mobile phase: methanol : water both containing 0.1 mol/L ammonium acetate (20 : 80 to 80 : 20 over 18 min), flow rate 0.5 mL/min. ESI, positive ion mode, full-scan and SIM acquisition mode, MRM acquisition mode. Limit of quantification not reported [Krska *et al.* 2004].

Ultraviolet Spectrum Ethanol—218 nm[Krska *et al.* 2004; Kuronen 1989].



Infrared Spectrum See Krska *et al.* [2004].

Mass Spectrum



Quantification

Blood **GC-MS** Column: BP-5 (12 m × 0.22 mm i.d., 0.25 μm). Carrier gas: He, 8 psi. Temperature programme: 90° for 2 min to 180° at 20°/min to 240° at 5°/min for 2 min. CI, negative ion mode, SIM acquisition mode. Limit of detection, 2 to 7 ppb for DON, NIV, T-2, HT-2, T-2 tetraol, diacetoxyscirpenol, scirpentriol, 15-MAS (heptafluorobutyrylimidazole derivatives) [Black *et al.* 1986].

Urine **GC-MS** Column: BP-1 methylsilicone (25 m × 0.2 mm i.d., 0.25 μm). Carrier gas: He, 15 psi. Temperature programme: 160° for 1 min to 275° at 10°/min, for 5 min. EI ionisation at 70 eV, positive ion mode, SIM. Limit of detection, DON, NIV, T-2, HT-2, T-2 tetraol, diacetoxyscirpenol, scirpentriol and 2 to7 ppb for15-MAS (heptafluorobutyrylimidazole derivatives) [Black *et al.* 1986].

LC-MS Column: C_{18} (250 × 4.6 mm i.d., 5 μm). Mobile phase: water : methanol (10 : 90 to 20 : 90 over 45 min), flow rate 1.0 mL/min. ESI, positive ion mode, SIR. Retention time: 15.8 min. Limit of detection, 4 μg/L [Meky *et al.* 2003].

Faeces **GC** Column: DB-5 (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 40 cm/s. Temperature programme: 50° for 2 min to 205° at 40°/min for 10 min to 222° at 1°/min to 280° at 10°/min for 5 min. ECD (^{63}Ni). Limit of quantification not reported (*N*,*O*-bis(trimethylsilyl)acetamide : trimethylchlorosilane : *N*-trimethylsilylimidazole derivative) [Sundstol, Pettersson 2003].

Other **TLC** Maize Samples. Plates: silica gel. Solvent system: chloroform : methanol (94 : 6). Location reagent 20% aluminium chloride in methanol. Heat for 15 min at 110° to 120°. UV detection (λ = 365 nm). Limit of quantification not reported [Schaafsma *et al.* 1998]. Wheat and Maize Samples. Plates: precoated silica gel 60 (20 × 20 cm), dipped in 15% aluminium chloride solution, air-dried, activated at 105° for 1 h. Solvent system: chloroform : acetone: propan-2-ol (8 : 1 : 1). Plate heated at 120° for 7 min. UV detection. R_f 0.6 (blue fluorescent spot). Limit of quantification, 40 μg/kg in wheat and 100 μg/kg in maize [Fernandez *et al.* 1994; Trucksess *et al.* 1984].

GC Pig Plasma and Urine. Column: glass packed with 3% OV-17 on 100-120 mesh Supelcoport (1.8 m × 2.0 mm i.d.). Carrier gas: He, 35 mL/min. Temperature programme: 165° isothermal. ECD (Ni^{63}). Retention times: DON 6 min, T-2 tetraol 5 min, scirpenetriol 4.5 min (trifluoroacetic acid derivatives). Limit of detection, <25 ppb [Rood *et al.* 1986]. Bovine Urine and Faeces, Milk Samples. Column: glass packed with 3% OV-17 on 100-120 mesh Supelcoport (1.8 m × 2.0 mm i.d.). Carrier gas: Ar-CH_4 (95 : 5), 35 mL/min. Temperature programme: 220° isothermal. ECD (Ni^{63}). Limit of detection, 50 ppb for DON and its de-epoxy metabolite (TMS derivatives) in urine and faeces; 1 μg/L in milk [Dahlem *et al.* 1986; Swanson *et al.* 1986].

GC-MS Soy Sauce Samples. Column: DB-5MS (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He. Temperature programme: 140° for 2 min to 275° at 7°/min for 2 min to 290° at 30°/min for 5 min. Limit of detection, 7 μg/kg for DON, 15-acetyl-DON and T-2 triol; between 3 and 14 μg/kg for 3-acetyl-DON, NIV, fusarenone-X, T-2, HT-2, T-2 tetraol, scirpenetriol, 15-monoacetoxyscirpenol, diacetoxyscirpenol and neosolaniol [Schollenberger *et al.* 2007]. Food Samples. Column: Rtx-200 (60 m × 0.25 mm i.d., 0.1 μm). Carrier gas: He, 1.3 mL/min. Temperature programme: 115° for 5 min, to 125° at 50°/min to 300° at 5°/min for 10 min. EI at 70 eV, positive ion mode. Retention times: DON 24.6 min, 3-acetyl-DON 28.8 min, 15-acetyl-DON 28.3 min, NIV 26.9 min, fusarenone-X 26.4 min, diacetoxyscirpenol 29.4 min, neosolaniol 30.1 min, HT-2 33.7 min, T-2 34.5 min. Limit of quantification, DON 0.30 μg/kg, 3-acetyl-DON 0.26 μg/kg, 15-acetyl-DON 0.19 μg/kg, NIV 0.28 μg/kg, fusarenone-X 0.16 μg/kg, diacetoxyscirpenol 0.36 μg/kg, neosolaniol 0.37 μg/kg, HT-2 0.26 μg/kg, T-2 0.18 μg/kg [Schothorst *et al.* 2005]. Grain Samples. Column: DB-5MS (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He. Temperature programme: 80° to 245° at 60°/min for 3 min to 260° at 3°/min to 270° at 10°/min for 7 min. EI ionisation at 70 eV, positive ion mode, SIM acquisition mode. Limit of quantification, 30 μg/kg for DON, 3-acetyl-DON, fusarenone-X and diacetoxyscirpenol; 20 μg/kg for HT-2 and T-2; 30 μg/kg for nivalenol (*N*,*O*-bis (trimethylsilyl)acetamide : trimethylchlorosilane : *N*-trimethylsilylimidazole derivatives) [Jestoi *et al.* 2004]. Food Samples. Column: 5% phenylmethyl siloxane capillary (30 m × 0.32 mm i.d., 0.25 μm). Carrier gas: He. Temperature programme: 70° to 170° at 25°/min to 300° at 5°/min for 2 min. Limit of detection, 7 ng/g (trimethylsilylimidazole : trimethylchlorosilane derivative) [Cirillo *et al.* 2003]. Barley and Wheat Samples. Column: fused silica capillary (30 m × 0.25 mm i.d.). Carrier gas: He, 2.0 mL/min. Temperature programme: 120° for 5 min to 280 at 8°/min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, 0.5 ng for DON, 0.25 ng for NIV (TMS : ether derivatives) [Yumbe-Guevara *et al.* 2003]. Fungal Cultures. Column: HP-5 (30 m × 0.25 mm i.d., 0.10 μm). Carrier gas: He, 40 cm/s. Temperature programme: 80° for 1 min to 160° at 40°/min to 205° at 4°/min to 240° at 8°/min to 300° at 40°/min for 3 min. Electron ionisation, positive ion mode and CI, negative ion mode. Retention indices for pentafluoropropionyl (PFP) derivatives: DON-PFP_3 1418, nivalenol-PFP_4 1279, 15-acetyl-DON-PFP_2 1634, 3-acetyl-DON-PFP_2 1640. Limit of detection, 15 to 30 pg (EI), 10 to 30 pg (CI) [Nielsen, Thrane 2001]. Barley Samples. Column: Rtx-200 (30 m × 0.25 μm i.d., 0.25 μm). Carrier gas: He, 0.75 mL/min. Temperature programme: 90° for 0.2 min to 210° at 30°/min to 300° at 6°/min. EI ionisation at 70 eV, positive ion mode, SIM acquisition mode. Retention times: DON 12.3 min, 3-acetyl-DON 13.8 min, fusarenone-X 14.8 min, diacetoxyscirpenol 14.0 min, 15-MAS 13.8 min, T-2 17.9 min, scirpentriol 12.9 min, zearalenone 17.6 min. Limit of detection, 0.1 to 0.5 mg/kg [Onji *et al.* 1998]. Beer Samples. Column: DB-5 (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 22 psi. Temperature programme: 80° for 1 min to 180° at 50°/min to 280° at 5°/min for 5 min. EI ionisation at 42 eV, positive ion mode, SIM acquisition mode. Limit of detection, DON 0.1 to 1.5 μg/L, NIV 0.01 to 0.3 μg/L, α- and β-zearalenol 2.5 to 3.0 μg/L, zearalenone 1.5 to 2.0 μg/L [Scott *et al.* 1993]. 'Yellow Rain' Powder Sample. Column: glass packed with 3% OV-17 on 100-120 mesh Chromosorb (1.0 m × 2.0 mm i.d.). Carrier gas: He, 25 mL/min. Temperature programme: 180° to 260° at 12°/min for 5 min. EI ionisation at 70 eV, positive ion mode, SIM acquisition mode. Retention times: DON 2.3 min, T-2 6.2 min, HT-2 5.5 min, zearalenone 6.5 min, diacetoxyscirpenol 4.0 min (TMS derivatives). Limit of quantification not reported [Rosen, Rosen 1982].

HPLC *In vitro* Gastric Juice Samples. Column: C_{18} (100 × 3.0 mm i.d., 5 μm). Mobile phase: acetonitrile : water (10 : 90), flow rate 0.2 mL/min. UV detection (λ = 218 nm). Limit of quantification, 0.05 mg/L [Sabater-Vilar *et al.* 2007]. Apical or basolateral media samples. Column: C_{18} (100 × 4.6 mm i.d., 5 μm). Mobile phase: water : acetonitrile (90 : 10), flow rate 0.6 mL/min. UV detection (λ = 220 nm). Retention time: 4.6 min. Limit of quantification, media from the upper compartment 10 μg/L, media from the lower compartment 20 μg/L; limit of detection, media from the upper compartment 3 μg/L, media from the lower compartment; 6 μg/L [Sergent *et al.* 2006]. Grain Samples. Column: C_{18} (100 × 4.6 mm i.d., 5 μm). Mobile phase: methanol : water (12 : 88), flow rate 1.5 mL/min. UV detection (λ = 220 nm). Limit of quantification, 5 μg/kg [Ramirez *et al.* 2006]. Column: C_{18} (250 × 4.0 mm i.d., 5 μm). Mobile phase: acetonitrile : water (65 : 35) containing 0.75% acetic acid, flow rate 1.0 mL/min.

D

Fluorescence detection ($\lambda_{ex} = 292$ nm, $\lambda_{em} = 425$ nm). Limit of detection, 0.4 μg/kg for DON and HT-2, 0.2 μg/kg for NIV and diacetoxyscirpenol, 1.0 μg/kg for15-acetyl-DON and 3-acetyl-DON, 0.6 μg/kg for fusarenone-X and T-2 (coumarin-3-carbonyl derivatives) [Dall'Asta *et al.* 2004; Mateo *et al.* 2001]. Column: C_{18} (10 μm). Mobile phase: deoxygenated methanol : 40 mmol/L borate buffer (35 : 65), flow rate 1.0 mL/min. Electrochemical detection. Retention time: 3.6 min. Limit of detection, 25 μg/L [Sylvia *et al.* 1986]. Wheat Samples. Column: C_{18} (250 × 4.6 mm i.d.). Mobile phase: methanol: water (23 : 77), flow rate 1.0 mL/min. UV detection ($\lambda = 229$ nm). Retention time: 10.2 min. Limit of detection, 30 ppb [Chang *et al.* 1984].

LC-MS Corn Silage Samples. Column: C_{18} (150 × 2.1 mm i.d., 5 μm). Mobile phase: acetonitrile : water acidified with 0.5% acetic acid (pH 3; 5 : 95 to 50 : 50 over 15 min to 80 : 20 over 10 min), flow rate 0.3 mL/min. ESI, positive and negative ion modes, SIM acquisition mode. Retention times: DON 6.9 min, aflatoxin B_1 15.4 min, citrinin 16.7 min, fumonisin B_1 15.1 min, gliotoxin 14.2 min, ochratoxin A 20.3 min, zearalenone 20.4 min. Limit of quantification, DON 5 ppb, gliotoxin 6.5 ppb, zearalenone 20 ppb; for aflatoxin B_1, citrinin, fumonisin B_1 and ochratoxin A1.5 ppb [Richard *et al.* 2007]. Food Samples. Column: C_{80} (150 × 2.1 mm i.d., 4 μm). Mobile phase: methanol : water (10 : 90 for 1 min to 80 : 20 over 26 min), flow rate 0.2 mL/min. ESI, negative ion mode, MRM acquisition mode. Limit of detection, DON and norDON A 2.5 μg/kg, norDON B and C 1 μg/kg [Bretz *et al.* 2006]. Fungal cultures. Column: C_{18} (150 × 3.0 mm i.d., 3.5 μm). Mobile phase: water : methanol–10 mmol/L ammonium acetate–20 μmol/L sodium acetate (70 : 30 to 50 : 50 over 1 min to 40 : 60 over 9.5 min to 15 : 85 over 1 min for 7 min), flow rate 0.3 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention times: DON 5.6 min, NIV 3.9 min, de-epoxy-DON 7.0 min, verrucarol 7.7 min, neosolaniol 6.7 min, aflatoxin G_2 9.4 min, aflatoxin B_2 11.4 min, aflatoxin G_1 10.5 min, aflatoxin B_1 12.5 min, diacetoxyscirpenol 12.7 min, ochratoxin A 16.8 min, T-2 toxin 17.6 min, verrucarin A 17.5 min, roridin A 17.7 min, zearalenone 18.9 min, sterigmatocystin 19.5 min. Limit of detection, DON 15 μg/L, other compounds 0.04 to 75 μg/L [Delmulle *et al.* 2006]. Pig Urine. Column: Synergi Polar-RP (150 × 4.6 mm i.d., 4 μm). Mobile phase: water : acetonitrile : methanol (82 : 9 : 9 to 40 : 60 : 0 over 25 min), flow rate 1.0 mL/min. APCI, negative ion mode, SIM acquisition mode. Retention times: DON 5.4 min, de-epoxy metabolite 7 min. Limit of quantification, DON 25 ng/g, de-epoxy metabolite 25 ng/g [Razzazi-Fazeli *et al.* 2003]. Wheat Samples. Column: C_{18} (125 × 2.0 mm i.d., 3 μm). Mobile phase: methanol : water (25 : 75 to 2 : 98 over 12 min), flow rate 0.25 mL/min. API, positive ion mode, full-scan. Limit of quantification, DON and neosolaniol 50 ppb, NIV and 15-acetyl-DON 100 ppb, fusarenone-X 40 ppb, 3-acetyl-DON 25 ppb, diacetoxyscirpenol 20 ppb, HT-2 10 ppb, T-2 60 ppb [Berger *et al.* 1999] Rat Urine and Faeces. Column: C_{18} (250 × 4.6 mm i.d.). Mobile phase: methanol : 0.1 mol/L ammonium acetate (20 : 80 to 70 : 30 over 20 min for 5 min), flow rate 1.5 mL/min. TSI, positive and negative ion modes, multiple ion detection. Limit of detection, DON 150 pg, de-epoxy-DON 300 pg, scirpentriol 150 pg, de-epoxy-scirpentriol 300 pg, MAS 50 pg [Voyksner *et al.* 1987].

Note For an LC-MS method for the quantification of multiple mycotoxins in a variety of nuts and dried fruits, see Spanjer *et al.* [2008]; in infant foods, see Lattanzio *et al.* [2008]. For the determination of 39 mycotoxins in wheat and maize by LC-MS, see Sulyok *et al.* [2006]; for type A and B trichothecenes in cereals by LC-MS, see Klotzel *et al.* [2005]; for 17 mycotoxins using HPLC-DAD, see Kuronen [1989]; Jimenez, Mateo [1997]. For a purity assessment study of mycotoxin standards comparing UV, HPLC-UV, GC-ECD, GC-FID, GC-MS, LC-MS, DSC, NMR and FT-IR methods, see Krska *et al.* [2005]. For an ELISA method used for screening beers on the European market, see Papadopoulou-Bouraoui *et al.* [2004]. For a method using supercritical fluid extraction coupled with HPLC or GC-ECD for the analysis of DON and related compounds in wheat samples, see Josephs *et al.* [1998].

Disposition in the Body At the time of writing, there is no DON toxicokinetic information available in humans. Animal studies have shown that the oral bioavailability of trichothecenes is generally low as a result of physiological instability and first-pass metabolism. After oral administration of DON to rats, the major metabolic route is de-epoxidation to the corresponding methylene derivative and glucuronidation, generally to less toxic substances. DON and its metabolites are primarily excreted via faeces but also occur in the urine (65% and 25%, respectively, within 4 days).

Toxicity LD_{50} in mice (mg/kg): 70.0 [Yoshizawa, Morooka 1975]; also reported as 76.7 [Morooka *et al.* 1972]. Provisional maximum tolerable daily intake (PMTDI) 1 μg/kg bodyweight [WHO/JECFA 2002].

> Urine samples were collected from 11 individuals from Linxian County, China, a rural Chinese population with a staple diet of wheat and maize. It is also an area known for its high rates of oesophageal cancer and studies suggest that this disease may be etiologically associated with mycotoxin exposure. The mean levels of DON detected in the urine samples were 37 μg/L and 12 μg/L from the high- and low-risk areas for DON exposure and oesophageal cancer, respectively. From animal studies and assuming a 60 kg person produces 1 L urine/day, and a 40% recovery of DON in human samples, the levels detected in the high- and low-risk populations may represent a daily exposure ranging from 1.9 to 13.0 and 0.6 to 2.5 μg/kg, respectively [Meky *et al.* 2003].

Note For an overview of some major mycotoxins, including DON, see Richard [2007]. For a review of DON toxicology and potential effects on humans, see Pestka and Smolinski [2005]; Rotter *et al.* [1996]; Sudakin [2003]. For proceedings of a conference on trichothecenes with a special focus on DON, see ISLI Europe Natural Toxin Task Force [2004].

Dose It has been reported that DON (and more generally, trichothecenes) has been used as an agent of biological or chemical warfare ('yellow rain') [Mirocha *et al.* 1983; Rosen, Rosen 1982; Stark 2005].

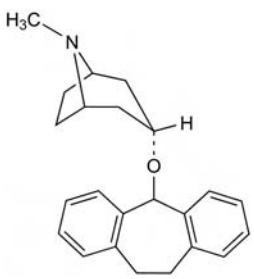
Deptropine

Antihistamine

$C_{23}H_{27}NO = 333.5$

CAS—604-51-3

Synonyms Dibenzheptropine; *endo*-3-[(10,11-Dihydro-5*H*-dibenzo[*a*,*d*]cyclohepten-5-yl)oxy]-8-methyl-8-azabicyclo[3.2.1]octane.



Chemical Properties Log *P* (octanol/water), 5.3.

Deptropine Citrate

$C_{23}H_{27}NO,C_6H_8O_7 = 525.6$

CAS—2169-75-7

Proprietary Names *Brontine*. It is an ingredient of *Brontisol*.

Chemical Properties A white to off-white microcrystalline powder. Very slightly soluble in water and ethanol; soluble 1 in 100 of methanol; practically insoluble in chloroform and ether.

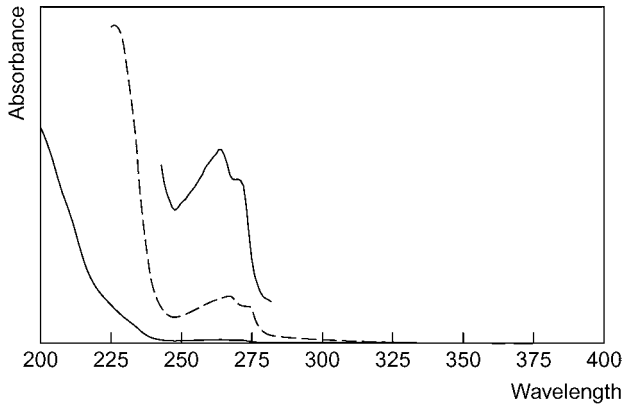
Colour Tests Mandelin's test—yellow; Marquis test—yellow.

Thin-layer Chromatography System TA—R_f 0.13; system TB—R_f 0.26; system TC—R_f 0.04; system TE—R_f 0.36; system TL—R_f 0.01; system TAE—R_f 0.01 (acidified potassium permanganate solution, positive).

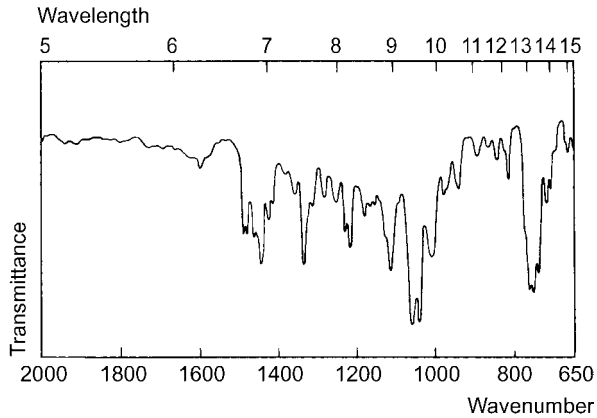
Gas Chromatography System GA—RI 2615.

High Performance Liquid Chromatography System HA—*k* 5.0 (tailing peak); system HX—RI 471; system HZ—retention time 10.3 min.

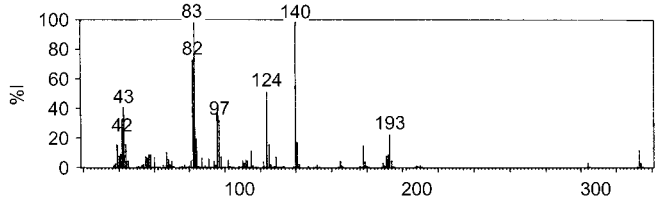
Ultraviolet Spectrum Methanol—266 (A_1^1=18.6b), 272 nm.



Infrared Spectrum Principal peaks at wavenumbers 1059, 1040, 751, 760, 738, 1114 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 83, 140, 82, 124, 43, 96, 97, 42.



Dose 2 mg of deptropine citrate daily.

Dequalinium Chloride

Antibacterial, Antifungal

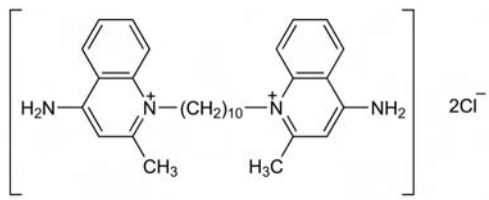
$C_{30}H_{40}Cl_2N_4 = 527.6$

CAS—6707-58-0 (dequalinium); 522-51-0 (chloride)

IUPAC Name 1-[10-(4-Amino-2-methylquinolin-1-ium-1-yl)decyl]-2- methylquinolin-1-ium-4-amine dichloride

Synonyms Decalinium chloride; decaminum; 1,1′-(1,10-decanediyl)bis-[4-amino-2-methylquinolinium chloride].

Proprietary Names *Dequadin*; *Dequavagyn*; *Labosept*; *Optipect Halstabletten*; *Phylletten*; *Sorot*.



Chemical Properties A creamy-white powder. Mp about 315°, with decomposition. Slightly soluble in water; soluble 1 in 30 of boiling water, 1 in 60 of methanol and 1 in 200 of propylene glycol. Log *P* (octanol/water), 4.3.

Dequalinium Acetate

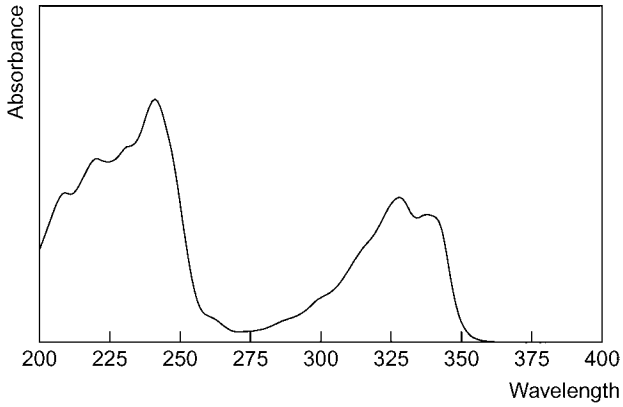
$C_{34}H_{46}N_4O_4 = 574.8$
CAS—4028-98-2

Chemical Properties A white or pinkish-buff, slightly hygroscopic powder. Mp about 280°, with decomposition. Soluble 1 in 2 of water and 1 in 12 of ethanol.

Colour Tests Aromaticity (method 2)—red/brown-violet; Liebermann's reagent—yellow (→orange at 100°).

Thin-layer Chromatography System TA—R_f 0.03 (acidified iodoplatinate solution, positive).

Ultraviolet Spectrum Water—240 nm (A_1^1=812b), 326 nm (A_1^1=469b), 335 nm (A_1^1=406b); aqueous acid—241, 330 nm.



Infrared Spectrum Principal peaks at wavenumbers 1605, 1660, 765, 1560, 1540, 1307 cm^{-1} (KCl disk).

Dose Lozenges containing 250 µg of dequalinium chloride are available.

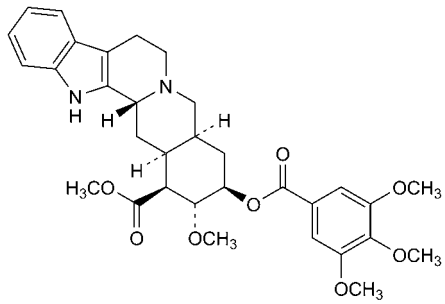
Deserpidine

Antihypertensive

$C_{32}H_{38}N_2O_8 = 578.7$
CAS—131-01-1

Synonyms Canescine; 11-demethoxyreserpine; methyl-(3β,16β,17α,18β,20α)-17-methoxy-18-[(3,4,5-trimethoxybenzoyl)oxy]-3,20-yohimban-16-carboxylate.

Proprietary Names *Harmonyl*. It is an ingredient of *Enduronyl*.



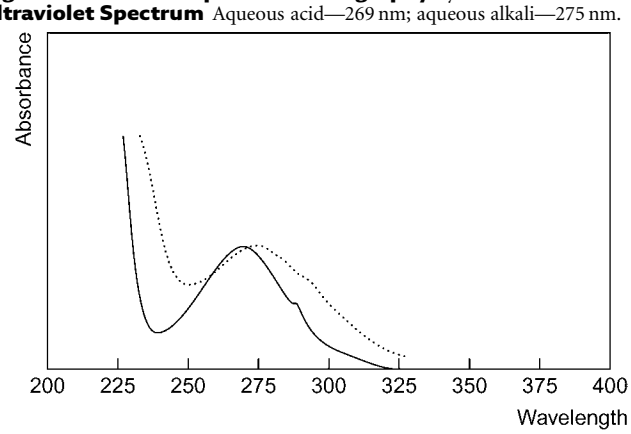
Chemical Properties An alkaloid isolated from the root of *Rauwolfia canescens* (Apocynaceae). Crystals. Mp 230° to 234°, with decomposition. Practically insoluble in water; soluble in hot ethanol and chloroform. Log *P* (octanol/water) 3.2.

Colour Tests Mandelin's test—blue→green; Marquis test—grey-green.

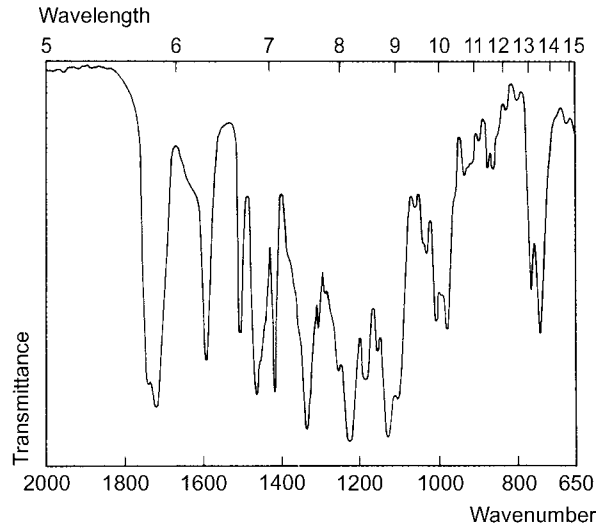
Thin-layer Chromatography System TA—R_f 0.72; system TAE—R_f 0.73; system TAG—R_f 0.66; system TB—R_f 0.03; system TC—R_f 0.77; system TE—R_f 0.81 (acidified iodoplatinate solution, positive).

High Performance Liquid Chromatography System HA—*k* 0.4.

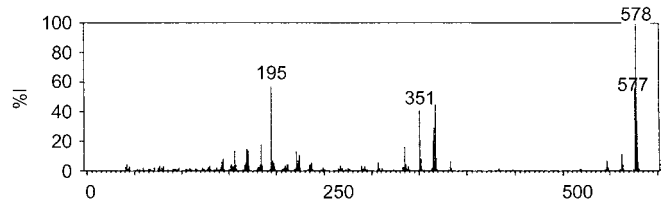
Ultraviolet Spectrum Aqueous acid—269 nm; aqueous alkali—275 nm.



Infrared Spectrum Principal peaks at wavenumbers 1225, 1127, 1715, 1100, 1184, 1590 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 578, 195, 577, 367, 351, 579, 366, 365.



Dose 0.25 to 1 mg daily.

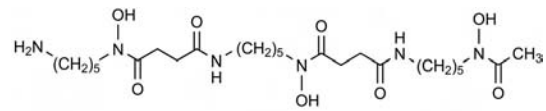
Desferrioxamine

Chelating Agent

$C_{25}H_{48}N_6O_8 = 560.7$
CAS—70-51-9

IUPAC Name *N*′-[5-[[4-[[5-(Acetylhydroxyamino)pentyl]amino]-1,4-dioxobutyl]-hydroxyamino]pentyl]-*N*-(5-aminopentyl)-*N*-hydroxybutanediamide

Synonyms Deferoxamine; DFM; DFOM.



Chemical Properties Log *P* (octanol/water), −2.5.

Desferrioxamine Mesilate

$C_{25}H_{48}N_6O_8,CH_3SO_3H = 656.8$
CAS—138-14-7

Synonyms Deferoxamine mesilate; desferrioxamine B mesilate; desferrioxamine methanesulfonate.

Proprietary Name *Desferal*

Chemical Properties A white to cream-coloured powder. Soluble 1 in 5 of water and 1 in 20 of ethanol; practically insoluble in dehydrated alcohol, chloroform and ether.

Colour Test Mandelin's test—blue→violet.

Thin-layer Chromatography System TA—R_f 0.08, streaking (acidified potassium permanganate solution, positive).

Ultraviolet Spectrum No significant absorption, 230 to 360 nm.

Infrared Spectrum Principal peaks at wavenumbers 1628, 1195, 1562, 1265, 1149, 1041 cm^{-1} (KBr disk).

Quantification

Plasma **HPLC** UV detection (λ=430 nm). Limit of quantification, 1.0 mg/L desferrioxamine, 5.0 mg/L ferrioxamine, limit of detection, 0.313 mg/L desferrioxamine, 0.039 mg/L ferrioxamine [Kraemer, Breithaupt 1998].

Disposition in the Body Poorly absorbed after oral administration. It specifically chelates ferric iron to an octahedral complex, ferrioxamine, which is readily excreted in the urine. Theoretically, 100 mg of desferrioxamine can chelate approximately 8.5 mg of iron. About 13 to 65% of a ^{59}Fe-labelled dose is excreted in the urine in 24 h.

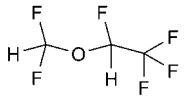
Dose In acute iron poisoning: 5 g of desferrioxamine mesilate by mouth, with 2 g IM, and up to 15 mg/kg/h by IV infusion.

Kraemer HJ, Breithaupt H (1998). Quantification of desferrioxamine, ferrioxamine and aluminoxamine by post-column derivatization high-performance liquid chromatography. Non-linear calibration resulting from second-order reaction kinetics. *J Chromatogr B Biomed Sci Appl* 710: 191–204.

Desflurane

Anaesthetic (General)
$C_3H_2F_6O = 168.0$
CAS—57041-67-5

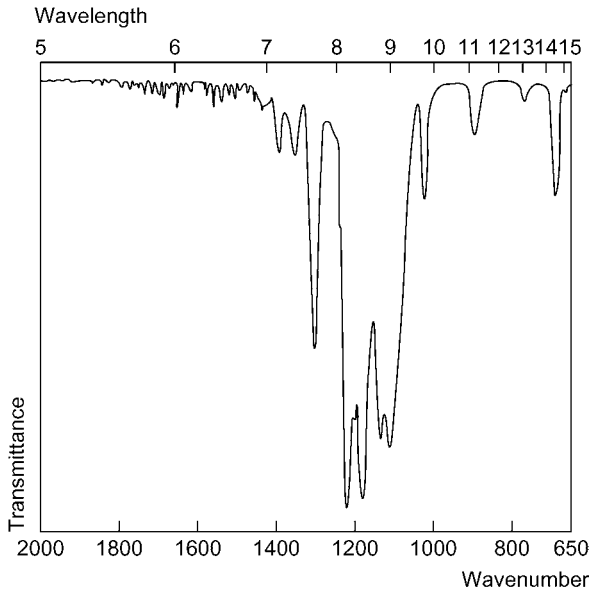
IUPAC Name 2-(Difluoromethoxy)-1,1,1,2-tetrafluoroethane
Synonym (±)-2-(Difluoromethyl)-1,2,2,2-tetrafluoroethyl ether
Proprietary Name *Suprane*



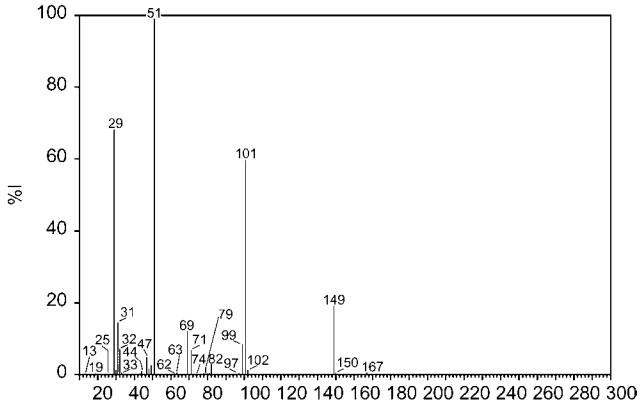
Chemical Properties A non-flammable colourless volatile liquid with a slight non-pungent odour. Mp −126°. Bp 23.5°. Density 1.44. Log *P* (oil/gas) 18.7 (37°), Log *P* (blood/gas), 0.424 (37°) [Caldwell 1994], 0.45 [Chidiac 2004], Log *P* (octanol/water), 1.20, Log *P* (fat/blood), 27.2, Log *P* (brain/blood), 1.29 [Yasuda *et al.* 1989]. Stable in soda lime [Pihlainen, Ojanpera 1998].

Gas Chromatography Column: Octakis (3-*O*-butanoyl-2,6-di-*O*-*n*-pentyl)-γ-cyclodextrin on polysiloxane SE-54 (1 m × 24 mm i.d. or 1 m × 6 mm i.d.). Carrier gas: N_2, 1 or 3 bar for the first and second column, respectively. Temperature: 100°. FID [Juza *et al.* 1997].

Infrared Spectrum Principal peaks at wavenumbers 1219, 1180, 1112, 1135, 1304, 696 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 51, 29, 101, 149, 31, 69, 99, 32.



Quantification
Blood **GC** Column: HP-5 (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: N_2, 3.0 mL/min. Temperature programme: 40° to 200° at 15°/min for 4.33 min. FID. Limit of detection not reported [Lu *et al.* 2004]. Column: PoraPLOT Q (25 m × 0.32 mm, 10 µm). Carrier gas: He, 3.8 mL/min. Temperature programme: 30° for 2 min to 250° at 15°/min for 5 min. FID, FTIR. Reference compound: diethyl ketone. Relative retention time: 0.65. Limit of detection, 0.13 mg/L [Ojanperä *et al.* 1998].

GC-MS Column: DB-5 capillary (60 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 40 cm/s. Temperature programme: 35° for 3.5 min to 120° at 40°/min for 0.68 min. EI ionisation at 70 eV, full scan and SIM acquisition modes. Retention time: 2.82 min. Limit of quantification, 9.2 mg/L, limit of detection, 2.3 mg/L [Yang *et al.* 2001].

Disposition in the Body Absorption, distribution and elimination after inhalation are more rapid than for other halogenated anaesthetics such as isoflurane or halothane. This is due to the low blood/gas coefficient of desflurane. About 0.02% of administered desflurane is metabolised in the liver; trifluoroacetic acid has been detected in the serum and urine of patients given desflurane. The majority of desflurane is excreted mainly unchanged through the lungs. A very small amount diffuses through the skin.

Therapeutic Concentration
The mean maximum serum concentration of trifluoroacetic acid in 13 subjects was 0.38 µmol/L at 24 h after exposure to desflurane for a mean of 6.81 h. Concentrations remained elevated for 6 days after exposure. [Sutton *et al.* 1991].

Toxicity Desflurane use is associated with carbon monoxide production and sympathetic activation [Berry *et al.* 1999; Umbrain *et al.* 2002].

Note For adult cases of desflurane-induced hepatotoxicity, see Martin *et al.* [1995], Berghaus *et al.* [1999], Chung *et al.* [2003] or Tung *et al.* [2005]. For a paediatric case of hepatotoxicity in a 15-month-old with Mobius syndrome, see Côté and Bouchard [2007].

Clearance Plasma, 4.6 L/min; pulmonary, 4.11 L/min.

Note For reviews of desflurane, see Koblin [1992] and Caldwell [1994]. For a review of the analytical toxicology of fluorinated inhalation anaesthetics, see Pihlainen and Ojanpera [1998].

Dose Using a calibrated vaporiser, concentrations of 4 to 11% are required for induction of anaesthesia. For maintenance, concentrations between 2 and 6% (in nitrous oxide); 2.5 to 8.5% (in oxygen or oxygen-enriched air); maximum, 17%.

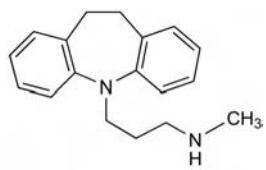
Desipramine

Antidepressant
$C_{18}H_{22}N_2 = 266.4$
CAS—50-47-5

IUPAC Name 10,11-Dihydro-*N*-methyl-*5H*-dibenz[*b,f*]azepine-5-propanamine
Synonyms Desmethylimipramine; DMI.

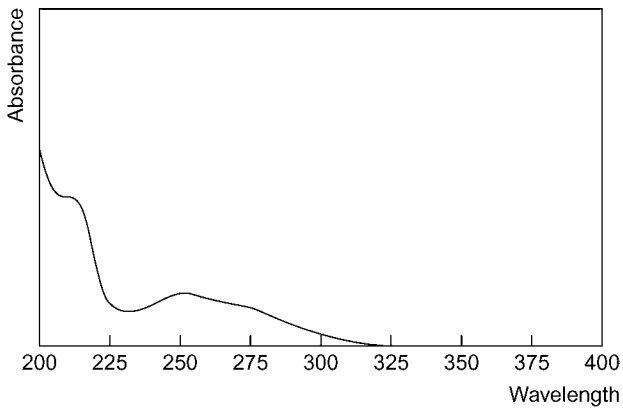


Chemical Properties pK_a 10.4 [Sangster 1997]. Log *P* (octanol/water), 4.9 [Hansch *et al.* 1995]. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

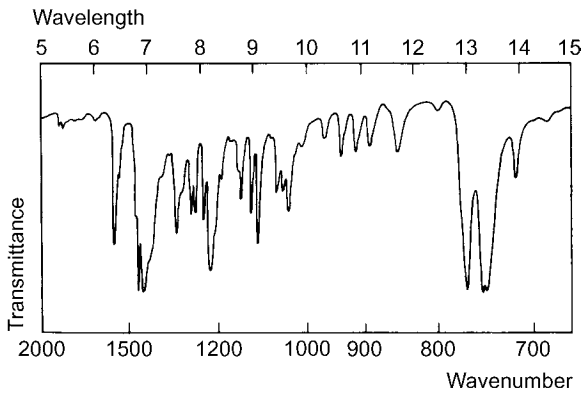
Desipramine Hydrochloride

$C_{18}H_{22}N_2$,HCl = 302.8
CAS—58-28-6
Synonyms Desipramini hydrochloridum; EX-4355; G-35020; JB-8181; NSC-114901; RMI-9384A.
Proprietary Names *Deprexan*; *Norpramin*; *Nortimil*; *Pertofran(e)*; *Petylyl*.
Chemical Properties A white crystalline powder. Mp 215° to 216°. Soluble 1 in 20 of water, 1 in 20 of ethanol and 1 in ~4 of chloroform; practically insoluble in ether; freely soluble in methanol, 10.2 (24°). Log *P* (octanol/water), 2.94 [Meylan, Howard 1995], (octanol/pH 7.4), 1.4.

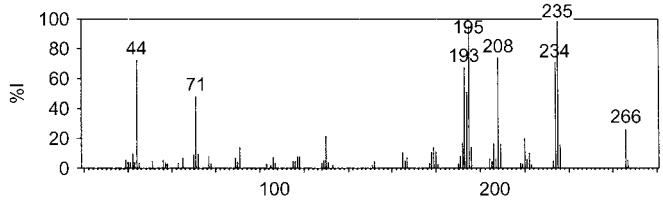
Colour Test Forrest reagent—blue; Mandelin's test—yellow→blue.
Thin-layer Chromatography System TA—R_f 0.26; system TB—R_f 0.19; system TC—R_f 0.11; system TE—R_f 0.40; system TL—R_f 0.03; system TAE—R_f 0.07; system TAF—R_f 0.71; system TAJ—R_f 0.07; system TAK—R_f 0.23; system TAL—R_f 0.72 (acidified iodoplatinate solution, positive; Dragendorff spray, positive; FPN reagent, blue; Marquis test, blue).
Gas Chromatography System GA—desipramine RI 2235, M (2-OH-) RI 2553, M (ring) RI 1930, M (ring-OH-) RI 2240, M (ring-di-OH-) RI 2600, M (acetyl-) RI 2670, M (ring-OH-methoxy-) RI 2390; system GB—desipramine RI 2338, M (2-OH-) RI 2669, M (10-OH-) RI 2521, M (ring) RI 2014, M (OH-ring) RI 2335, M (di-OH-) RI 2995, M (acetyl-) RI 2811, M (OH-methoxy-) RI 2749; system GM—desipramine RRT 0.896 (relative to iprindole); system GS—RT 18.7 min.
High Performance Liquid Chromatography System HA—desipramine *k* 2.1, didesmethylimipramine *k* 1.3, M (2-OH-) *k* 1.2; system HF—*k* 3.60; system HX—RI 424; system HY—RI 361; system HZ—RT 5.9 min; system HAA—RT 14.9 min; system HAM—RT 9.1 min; system HAX—RT 13.0 min; system HAY—RT 6.3 min; system HAZ—desipramine *k* 1.52, M (2-OH-) *k* 0.39.
Ultraviolet Spectrum Aqueous acid—250 nm (A^1_1 = 308a). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 746, 741, 763, 1230, 1590, 1104 cm^{-1} (desipramine hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 235, 195, 208, 44, 234, 193, 194, 71; 2-hydroxydesipramine 44, 209, 211, 250, 210, 224, 42, 251.



Quantification See also under Imipramine.
Blood **GC** Column: cross-linked methylsilicone (25 m × 4.6 mm i.d., 0.11 µm). Carrier gas: He, 195 kPa. Temperature programme: 180° for 1 min to 300° at 10°/min for 3 min. NPD. Limit of quantification, 130 µg/L, limit of detection, 39 µg/L [Martinez *et al.* 2002].
Plasma **GC** Column: 5% phenyl methyl silicone capillary (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 0.8 mL/min. Temperature programme: 150° to 300° at 10°/min. NPD. Relative retention time: 0.923. Limit of quantification, 13.3 µg/L, limit of detection, 4.0 µg/L [de la Torre *et al.* 1998]. Column: DB-17 (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: N_2, 0.7 mL/min. Temperature programme: 260° for 1 min. NPD detection. Limit of quantification, 90 µg/L [Ulrich, Martens 1997]. Carrier gas: N_2, 17 mL/min. Temperature: 243°. AFID. Limit of detection, 1 µg/L [Antal *et al.* 1980].
GC-MS Column: Ultra-1 cross-linked methyl silicone (8 m × 0.31 mm i.d., 0.17 mm). Carrier gas: He, 28 cm/s. Temperature programme: 150° to 240° at 30°/min for 7 min to 300° at 10°/min. Limit of quantification, 25 µg/L [Way *et al.* 1998].
HPLC Column: Nova-Pack C_{18} (150 × 3.9 mm i.d., 4 µm). Mobile phase: acetonitrile : 0.02 mol/L TEA (pH 5.5, 35 : 65), flow rate 1.0 mL/min. UV detection (λ = 215 nm). Limit of detection, 1 µg/L [Bakkali *et al.* 1999]. Column: Nova-Pak C_{18}. Mobile phase: phosphate buffer with 50% acetonitrile and ~0.2% diethylamine (pH 8). UV detection (λ = 242 nm). Limit of detection, 20 µg/L [Theurillat, Thormann 1998]. Column: Reversed phase. Mobile phase: acetonitrile : 0.1 mol/L potassium dihydrogen phosphate (pH 6.0, 30 : 70), flow rate 2 mL/min. Electrochemical detection. Limit of quantification, 3 µg/L [Chen *et al.* 1997]. Column: Supelco PCN. Mobile phase: acetonitrile : methanol : 0.015 mol/L phosphate buffer (120 : 35 : 100). Limit of quantification, 25 nmol/L [Elm, Hansen 1995]. Column: reversed phase C_{18}. Electrochemical detection. Limit of detection, 0.3 µg/L [Koyama *et al.* 1993]. See also Foglia *et al.* [1991] and Queiroz *et al.* [1995].
LC-MS Column: Sunfire C_{18} IS (20 m × 2.1 mm i.d., 3.5 µm). Mobile phase: acetonitrile : 2 mmol/L ammonium formate (pH 3). ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 2 µg/L [de Castro *et al.* 2008]. Column: RP-18 column (150 × 2.1 mm, 5 µm). Mobile phase: 0.01 mol/L ammonium acetate buffer (pH 5.5) : acetonitrile (50 : 50). Limit of detection, 100 ng/L [Alves *et al.* 2007]. Column: Inertsil C_8. Mobile phase: methanol : 10 mmol/L ammonium acetate (pH 5.0) : acetonitrile (70 : 20 : 10), flow rate 0.1 mL/min. Limit of detection, 30–630 µg/L [Shinozuka *et al.* 2006]. Column: SB-C_{18} (15 m × 2.1 mm i.d., 3 µm). Mobile phase: 3 mmol/L ammonium acetate (pH 3.3) : acetonitrile (66 : 34), flow rate 1.4 mL/min. API-TOF, positive ion mode. Limit of quantification, 2 µg/L [Zhang *et al.* 2000].
Serum **GC** See Plasma [Antal *et al.* 1980].
HPLC Column: octyl reversed phase C_8 (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : phosphate buffer (pH 3, 50 : 50), flow rate 1.0 mL/min. UV detection (λ = 254 nm). k': 2.282. Limit of detection, ~10 µg/L [Segatti *et al.* 1991].
Urine **HPLC** See Plasma [Chen *et al.* 1997].
Disposition in the Body Desipramine is well absorbed after oral administration. It is metabolised by aromatic hydroxylation and possibly hydroxylamine formation; *N*-demethylation to form didesmethylimipramine may occur to a minor extent. 2-Hydroxydesipramine, the major metabolite, is active. Less than 5% of a dose is excreted in urine in 24 h as unchanged drug; the urinary excretion of unchanged drug is pH dependent and is increased in acidic urine; the hydroxylated metabolites are excreted mainly as glucuronide conjugates. The extent of 2-hydroxylation is genetically determined. Desipramine is the major active metabolite of imipramine and lofepramine.
Therapeutic Concentration Plasma concentrations vary considerably between individual subjects.

After administration of a single oral dose of 50 mg to 4 subjects, peak plasma-desipramine concentrations of 0.008–0.015 mg/L (mean 0.012) were attained in 3–6 h; peak plasma concentrations of 2-hydroxydesipramine of 0.011–0.013 mg/L were attained in ~2–4 h [DeVane *et al.* 1981].

Following daily oral doses of ~2.5 mg/kg to 47 subjects, minimum steady-state plasma concentrations of 0.02–0.88 mg/L (mean 0.17) desipramine and 0.007–0.13 mg/L (mean 0.04) 2-hydroxydesipramine were reported [Bock *et al.* 1983].

Of 34 elderly patients treated for depression with desipramine for 4 weeks at a fixed dosage regimen, 12 non-responders received a second period of treatment at an increased dose. In 16 patients aged over 74 years, a daily dose of 2.45 mg/kg resulted in a mean plasma level of 0.118 mg/L for desipramine and 0.072 mg/L for hydroxydesipramine; in 45 patients aged less than 60 years (including some patients from previously published work), a daily dose of 2.6 mg/kg resulted in a mean plasma level of 0.142 mg/L for desipramine and 0.041 mg/L for hydroxydesipramine. A plasma concentration of 0.105 mg/L significantly separated responders from non-responders, although the response rate was still low relative to rates in prior studies of younger patients [Nelson *et al.* 1995].

Toxicity Plasma concentrations >0.4 mg/L may produce toxic effects. Fatalities are comparatively rare but may occur with plasma concentrations >10 mg/L.

Recovery has occurred in 2 subjects after the ingestion of up to 2 g; peak plasma concentrations of 1.56 mg/L and 1.58 mg/L were reported [Biggs *et al.* 1977].

In a fatal case, a blood concentration of 3 mg/L and a liver concentration of 140 µg/g were reported [Baselt, Cravey 1977].

The following postmortem concentrations were found after the death of a 2-year-old child: blood 8 mg/L, liver blood 22 mg/L, bile 67 mg/L, urine 2 mg/L [Robinson *et al.* 1979].

Note For a review of tricyclic antidepressant overdose, see Kerr *et al.* [2001].
Half-life Plasma half-life, 10–35 h.
Protein Binding ≈70–90%.
Note For a review of the clinical pharmacokinetics of imipramine and desipramine, see Sallee, Pollock [1990]. For a review of the pharmacokinetics of tricyclic antidepressants see Molnar, Gupta [1980].
Dose Desipramine hydrochloride 25 to 200 mg daily; up to 300 mg daily has been given.

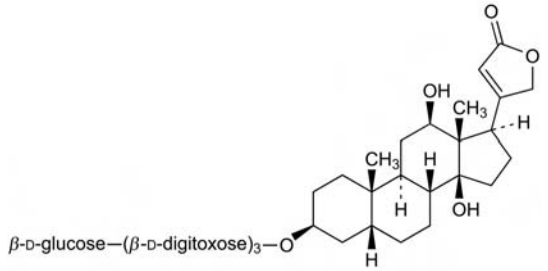
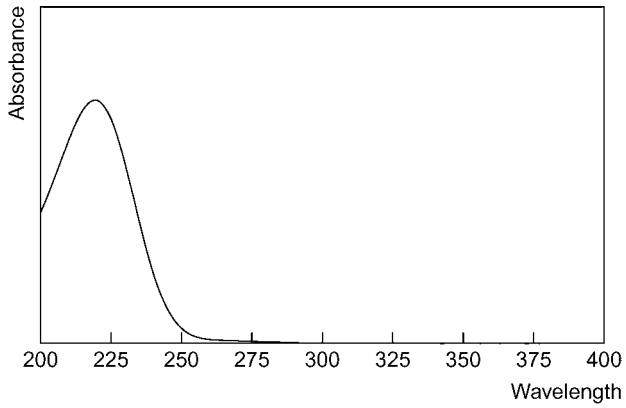
Deslanoside

Cardiac Glycoside
$C_{47}H_{74}O_{19}$ = 943.1
CAS—17598-65-1

IUPAC Name 3-[(3*S*,5*R*,8*R*,9*S*,10*S*,12*R*,13*S*,14*S*,17*R*)-12,14-Dihydroxy-3-[(2*R*,4*S*,5*S*,6*R*)-4-hydroxy-5-[(2*S*,4*S*,5*S*,6*R*)-4-hydroxy-5-[(2*S*,4*S*,5*S*,6*R*)-4-hydroxy-6-methyl-5-[(2*S*,3*R*,4*S*,5*S*,6*R*)-3,4,5-trihydroxy-6-(hydroxymethyl)oxan-2-yl]oxyoxan-2-yl]oxy-6-methyloxan-2-yl]oxy-6-methyloxan-2-yl]oxy-10,13-dimethyl-1,2,3,4,5,6,7,8,9,11,12,15,16,17-tetradecahydrocyclopenta[*a*]phenanthren-17-yl]-2*H*-furan-5-one
Synonyms Deacetyl-lanatoside C; desacetyl-lanatoside C; (3β,5β,12β)-3-[(*O*-β-D-Glucopyranosyl-(1→4)-*O*-2,6-dideoxy-β-D-*ribo*-hexopyranosyl-(1→4)-*O*-2,6-dideoxy-β-D-*ribo*-hexopyranosyl-(1→4)-2,6-dideoxy-β-D-*ribo*-hexopyranosyl)oxy]-12,14-dihydroxycard-20(22)-enolide.
Proprietary Names *Cedilanid-D*; *Cedilanid(e)*; *Desace*.
Note The name Cedilanid(e) is also applied to preparations of lanatoside C.



Chemical Properties White hygroscopic crystals or crystalline powder. Mp about 220°. Practically insoluble in water; soluble 1 in 2500 of ethanol and 1 in 200 of methanol; very slightly soluble in chloroform; practically insoluble in ether.
Colour Test Dissolve 2 to 3 mg in 5 mL of a solution containing 0.5 mL of a 9% ferric chloride solution and 100 mL of acetic acid; underlay with 5 mL of sulfuric acid—intense blue in the acetic acid layer and a brown ring free from red at the junction of the two liquids (see also Lanatoside C). (Perchloric acid solution, followed by examination under UV light, blue fluorescence; *p*-anisaldehyde reagent, blue.)
Ultraviolet Spectrum Principal peak at 221 nm.



Disposition in the Body Incompletely absorbed after oral administration and metabolised to digoxin. After IV administration, about 80% of a single dose is excreted in the urine in 72 h, mostly as unchanged drug, and about 10% of a dose is eliminated in the faeces. During maintenance treatment, about 30% of a daily dose is excreted in the 24-h urine. After oral administration digoxin accounts for about 50% of the total urinary excretion material.

Deslanoside is a metabolite of lanatoside C.

Therapeutic Concentration

After an IV dose of 400 µg given to 5 subjects, a mean plasma concentration of 0.03 mg/L was reported at 15 min, declining to 0.001 mg/L at 48 h; after an oral dose of 800 µg given to 5 subjects, a mean peak plasma concentration of 0.003 mg/L was attained in 2 h [Marzo *et al.* 1982].

Half-life Plasma half-life, about 33 h.
Distribution in Blood Plasma : whole blood ratio, 1.4.
Protein Binding Weakly bound.
Dose For rapid digitalisation, 0.8 to 1.6 mg intravenously.

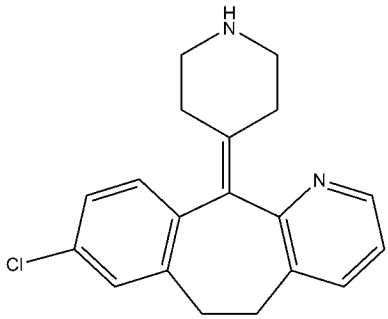
Marzo A *et al.* (1982). Pharmacokinetics of deslanoside C-3H administered orally to healthy volunteers. *Farmaco Prat* 37(1): 28–37.

Desloratadine

Antihistamine, Histamine H_1-Antagonist, Piperidine Derivative
$C_{19}H_{19}ClN_2$ = 310.8
CAS—100643-71-8

IUPAC Name
Synonyms 8-Chloro-6,11-dihydro-11-(4-piperdinylidene)-5*H*-benzo[5,6]cyclohepta[1,2-b]pyridine; descarboethoxyloratadine; desloratadin; desloratadina; Sch-34117.

Proprietary Names *Aerius*; *Aviant*; *Azomyr*; *Claramax*; *Desalex*; *Deslorat*; *Esparflin*; *Frenaler*; *Hexaler*; *Mailen*; *Neo Larmax*; *Neoclaritine*; *Neohysticlar*; *Novo Alerpriv*; *Rinaid*; *Rinofilax*. It is also an ingredient in *Clarinex-D*.

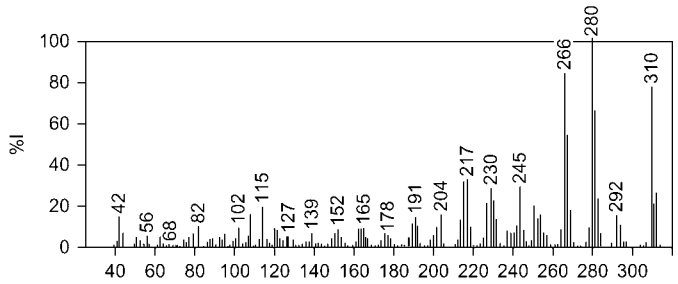


Chemical Properties Crystals. Mp 150° to 151°. Slightly soluble in water; very soluble in ethanol, propylene glycol. Log *P* (octanol/water), 3.2 [Wishart 2006]. Stable in stock solutions for up to 274 days. Stable in human plasma samples for 162 h at room temperature [Shen *et al.* 2006].

High Performance Liquid Chromatography Column: Diamonsil BDS C_{18} (150 × 5.0 mm i.d., 5 µm). Mobile phase: methanol : 0.03 mol/L heptanesulfonic acid sodium : glacial acetic acid (70 : 30 : 4), flow rate 1.0 mL/min. UV detection (λ = 247 nm). Retention time: 5.4 min. Limit of quantification, 0.1 mg/L [Qi *et al.* 2005].

Mass Spectrum

Prinipal ions at *m/z* 280, 266, 310, 281, 267, 217, 216, 245.



Quantification

Plasma **LC-MS** Column: Betasil Silica-100 (100 × 2.0 mm i.d., 5 µm). Mobile phase: 25 mmol/L ammonium acetate in 1% formic acid : 25 mmol/L ammonium acetate in methanol (15 : 85), flow rate 0.3 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention time: 1.4 min. Limit of quantification, 0.1 ng/L [Shen *et al.* 2007]. Column: C_{18} (50 × 2.0 mm i.d., 5 µm). Mobile phase: 5 mmol/L ammonium formate : methanol-acetonitrile (3 : 2; 50 : 50), flow rate 0.2 mL/min. Retention time: desloratadine 1.42 min, 3-hydroxydesloratadine 1.19 min. Limit of quantification, 0.05 µg/L for desloratadine and 3-hydroxydesloratadine [Xu *et al.* 2007]. Column: C_{18} (50 × 2.1 mm i.d., 5 µm). Mobile phase: 10 mmol/L ammonium formate with 0.2% formic acid : 10 mmol/L ammonium formate in methanol with 0.2% formic acid (20 : 80 for 0.5 min to 90 : 10 over 2.8 min for 0.5 min), flow rate 0.25 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 0.955 pg for desloratadine, 1.05 pg for 3-hydroxydesloratadine[Shen *et al.* 2006]. Column: C_{18} (50 × 2.1 mm i.d., 1.7 µm). Mobile phase: 10 mmol/L ammonium formate with 0.2% formic acid : 10 mmol/L ammonium formate in methanol with 0.2% formic acid (20 : 80 for 0.25 min to 90 : 10 over 1.4 min for 0.25 min), flow rate 0.5 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, desloratadine 478 pg, 3-hydroxyloratadine 525 pg [Shen *et al.* 2006]. Column: C_{18} (50 × 4.6 mm i.d.). Mobile phase: acetonitrile : 3 mmol/L ammonium acetate (80 : 20), flow rate 0.8 mL/min. ESI, positive ion mode, SIM acquisition mode. Retention time: 2.37 min. Limit of quantification, 0.05 µg/L [Yeh *et al.* 2004]. See also [Yang *et al.* 2003].

Serum **HPLC** Column: Cyanopropyl (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 12 mmol/L ammonium acetate (pH 3.55; 45 : 55), flow rate 1.5 mL/min. UV detection (λ = 243 nm). Limit of quantification, 0.15 µg/L; limit of detection, 0.045 µg/L [Emara *et al.* 2007].

Other **HPLC** Tablets. Column: Diamonsil BDS C_{18} (150 × 5.0 mm i.d., 5 µm). Mobile phase: methanol : 0.03 mol/L heptanesulfonic acid sodium : glacial acetic acid (70 : 30 : 4), flow rate 1.0 mL/min. UV detection (λ = 247 nm). Retention time: 5.4 min. Limit of quantification, 0.1 mg/L [Qi *et al.* 2005]. Canine Plasma. Column: Hypersil CN (150 × 5.0 mm i.d., 5 µm). Mobile phase: methanol : acetonitrile: 0.01 mol/L potassium dihydrogen phosphate (pH 5.5, 35 : 35 : 30), flow rate 0.8 mL/min. UV detection (λ = 241 nm). Retention time: desloratadine 9.5 min, *N*-methyldesloratadine 11.0 min. Limit of quantification, 5 µg/L [Liu *et al.* 2004].

Disposition in the Body Desloratadine is the major, active metabolite of loratadine. It is rapidly absorbed following oral administration, with peak plasma concentrations occurring after ≈3 h. It is extensively metabolised to its principal active metabolite, 3-hydroxydesloratadine, which is subsequently deactivated by glucuronidation. Other metabolites include the 5- and 6-hydroxy forms of desloratadine, which are further conjugated. The CYP isoenzyme involved in the metabolism has not yet been identified but CYP3A4 and CYP2D6 are unlikely to be extensively involved. Approximately 40% of an administered dose is excreted as metabolites in urine and 45% in the faeces. Desloratadine is excreted into breast milk. Although ≈20% of African Americans and 6 to 7% of the general population are slow metabolisers of desloratadine, the clinical significance of this is unknown.

Therapeutic Concentration

Two groups of children (group A: aged 2 to 5 years; group B: aged 6 to 11 years) were administered desloratadine syrup (0.5 mg/L) orally via syringe. Group A were administered the equivalent of 1.25 mg desloratadine and group B 2.5 mg. Peak plasma concentrations for desloratadine and 3-hydroxydesloratadine as well as some pharmacokinetic parameters were reported as follows:

Parameter	*Group A*	*Group B*
Desloratadine		
C_{max} (µg/L)	2.68	2.23
Time (h)	3.17	3.67
Half-life (h)	16.4	19.4
Clearance (L/h)	35.8	73.7
Volume of distribution (L)	707	1619
3-Hydroxydesloratadine		
C_{max} (µg/L)	0.644	0.764
Time (h)	4.89	4.44
Half-life (h)	26.2	28.1

[Gupta *et al.* 2007a].

Two groups of subjects (group A: 9 with normal hepatic function, group B: 12 with moderate hepatic impairment) were administered desloratadine 5 mg once daily for 10 days. Peak plasma concentrations of desloratadine and 3-hydroxydesloratadine on day 10 were as follows:

	Group A	*Group B*
Desloratadine		
C_{max} (µg/L)	6.47	7.94
Time (h)	5.61	4.13
3-Hydroxydesloratadine		
C_{max} (µg/L)	1.20	1.30
Time (h)	5.72	5.75

Healthy volunteers in Group A were phenotyped as poor metabolisers and normal metabolisers. Plasma concentrations on day 10 were reported as:

	Normal	*Poor*
Desloratadine		
C_{max} (µg/L)	3.88	11.7
Time (h)	4.75	7.33
3-Hydroxydesloratadine		
C_{max} (µg/L)	1.69	0.219
Time (h)	5.42	6.33

In a separate analysis of the data, in subjects with moderate hepatic impairment, the mean peak plasma concentration of desloratadine on day 10 of African American subjects was ≈1.5 times that found in Caucasian subjects. In healthy African American volunteers, the increase was approximately 3-fold when compared with healthy Caucasian subjects [Gupta *et al.* 2007b].

Eight healthy Chinese men (aged 23 years) were administered a single oral dose of 10 mg desloratadine. The mean peak plasma concentration was 6.8 µg/L after 1.85 h [Yeh *et al.* 2004].

In a dose-ranging study, 20 healthy male volunteers (3 Caucasians, 17 African Americans) were administered single doses of desloratadine: 5, 7.5, 10 or 20 mg. Peak plasma concentrations were 2.18, 3.03, 3.80, and 8.08 µg/L for the escalating doses, respectively, all attained within 3 h [Gupta *et al.* 2002].

Toxicity Desloratadine was a 4-fold weaker inhibitor of the intestinal wall p-glycoprotein (pGp) transport system *in vitro* than loratadine and, therefore, has a lower potential for intestinal pGp-mediated drug interactions [Cayen *et al.* 2000].

Half-life Approximately 21 h.

Volume of Distribution Approximately 3643 L.

Clearance Approximately 120 L/h.

Protein Binding Approximately 82 to 87%.

Dose Given by mouth in a dose of 5 mg once daily.

Desmetryne

Herbicide

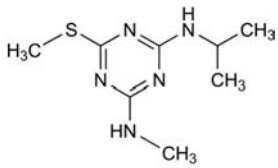
$C_8H_{15}N_5S = 213.3$

CAS—1014-69-3

IUPAC Name 4-*N*-Methyl-6-methylsulfanyl-2-*N*-propan-2-yl-1,3,5-triazine-2,4-diamine

Synonym 2-Isopropylamino-4-methylamino-6-methylthio-1,3,5-triazine

Proprietary Name *Semeron 25 WP*

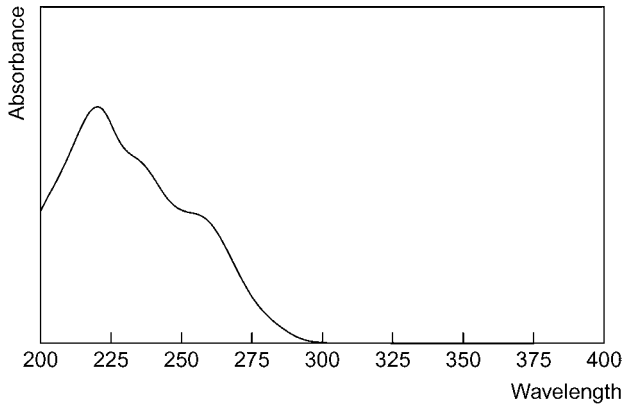


Chemical Properties A white crystalline solid. Mp 84° to 86°. Very slightly soluble in water; readily soluble in organic solvents. pK_a 4.0. Log *P* (octanol/water), 2.4.

Thin-layer Chromatography System TA—R_f 0.73; system TX—R_f 0.21; system TY—R_f 0.16 (Dragendorff spray, positive).

Gas Chromatography System GA—RI 1800; system GK—RRT 0.95 (relative to caffeine).

Ultraviolet Spectrum Aqueous acid—258 nm (A_1^1=450b).



Infrared Spectrum Principal peaks at wavenumbers 1531, 1587, 1258, 806, 1292, 1163 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 213, 57, 58, 198, 82, 171, 43, 99.

Desomorphine

Narcotic Analgesic

$C_{17}H_{21}NO_2 = 271.4$

CAS—427-00-9

IUPAC Name 4,5-Epoxy-3-hydroxy-*N*-methylmorphinan

Synonym Dihydrodesoxymorphine

Chemical Properties Forms rectangular plates from an acetone : water mixture. Mp 189° (anhydrous base). Soluble in acetone and ethyl acetate.

Desomorphine Hydrobromide

Proprietary Name *Permonid*

Colour Tests Ammonium molybdate test—deep purple→blue→green→yellow (limit of detection, 0.1 µg); ammonium vanadate test—grey-purple (limit of detection, 1.0 µg); sulfuric acid–formaldehyde test—purple (limit of detection, 0.1 µg); Vitali's test—yellow/yellow/orange.

Thin-layer Chromatography System T1—R_f 0.29 (location reagent acidified iodoplatinate spray, positive reaction).

Gas Chromatography System G2/225—retention time 0.78 relative to codeine; system G4—retention time 0.66 relative to codeine.

Ultraviolet Spectrum Aqueous acid (0.1 N sulfuric acid)—277 nm, inflexions at 225 nm and 282 nm.

Toxicity The estimated minimum lethal dose in man is ~200 mg. Desomorphine has been reported to have greater addiction-producing properties than morphine.

Desonide

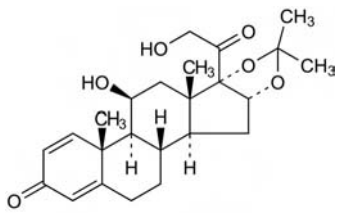
Antiinflammatory Corticosteroid

$C_{24}H_{32}O_6 = 416.5$

CAS—638-94-8

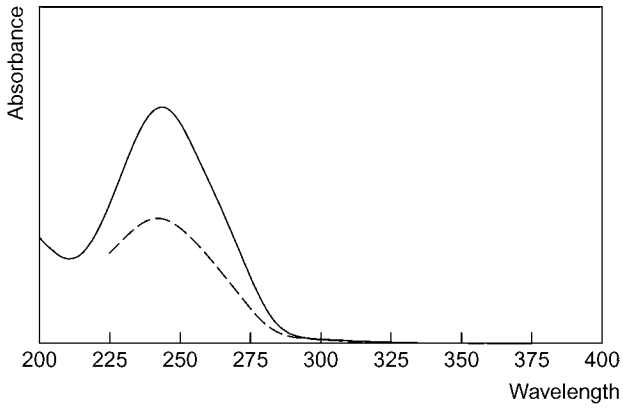
Synonyms Desfluorotriamcinolone acetonide; (11β,16α)-11,21-dihydroxy-16,17-[(1-methylethylidene)bis(oxy)]pregna-1,4-diene-3,20-dione; 16-hydroxyprednisolone-16,17-acetonide.

Proprietary Names *Apolar*; *Locapred*; *Tridesilon*; *Tridésonit*.



Chemical Properties White powder or crystals. Log *P* (octanol/water), 2.8.

Ultraviolet Spectrum Methanol—243 nm (A_1^1=450b).

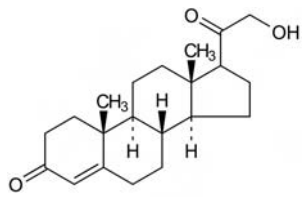


Infrared Spectrum Principal peaks at wavenumbers 1639, 1052, 1612, 1086, 1265, 1694 cm^{-1}.
Use Topically as a 0.05% cream or ointment.

Desoxycortone

Corticosteroid
$C_{21}H_{30}O_3$ = 330.5
CAS—64-85-7

IUPAC Name (8*S*,9*S*,10*R*,13*S*,14*S*,17*S*)-17-(2-Hydroxyacetyl)-10,13-dimethyl-1,2,6,7,8,9,11,12,14,15,16,17-dodecahydrocyclopenta[*a*]phenanthren-3-one
Synonyms Decortone; deoxycorticosterone; deoxycortone; desoxycorticosterone; 21-hydroxypregn-4-ene-3,20-dione; 21-hydroxyprogesterone.



Chemical Properties Crystals. Mp 141° to 142°. Freely soluble in ethanol and acetone. Log *P* (octanol/water), 2.9.

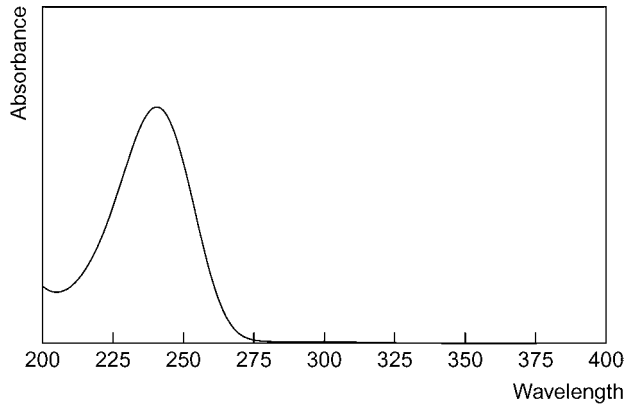
Desoxycortone Acetate

$C_{23}H_{32}O_4$ = 372.5
CAS—56-47-3
Proprietary Names *Cortiron*; *Doca*; *Percorten*; *Syncortyl*. It is an ingredient of *Plex-Hormone*.
Chemical Properties Colourless crystals or white or creamy-white crystalline powder. Mp 155° to 161°. Practically insoluble in water; soluble 1 in 50 of ethanol, 1 in 30 of acetone, 1 in 1.5 of chloroform and 1 in 170 of ether; slightly soluble in dioxane and propylene glycol.

Desoxycortone Pivalate

$C_{26}H_{38}O_4$ = 414.6
CAS—808-48-0
Synonyms Desoxycortone trimethylacetate; desoxycorticosterone pivalate.
Proprietary Name *Percorten M*
Chemical Properties A white or creamy-white crystalline powder. Mp 198° to 206°. A solution in dioxan is dextrorotatory. Practically insoluble in water; soluble 1 in 350 to 1 in 500 of ethanol, 1 in 3 of chloroform and 1 in 60 of dioxan; slightly soluble in ether.

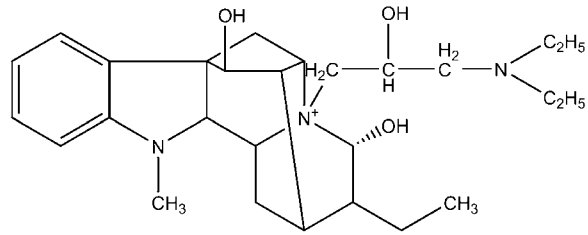
Colour Tests Antimony pentachloride—orange; naphthol-sulfuric acid—orange-red/blue-black; sulfuric acid—yellow (green-yellow fluorescence under ultraviolet light).
Thin-layer Chromatography Desoxycortone acetate: system TP—R_f 0.86; system TQ—R_f 0.52; system TR—R_f 0.98; system TS—R_f 0.95; system TAJ—R_f 0.78; system TAK—R_f 0.71; system TAL—R_f 0.96; system TAM—R_f 0.91 (DPST solution).
Ultraviolet Spectrum Desoxycortone acetate: ethanol—240 nm (A_1^1=445a).



Infrared Spectrum Principal peaks at wavenumbers 1242, 1667, 1744, 1718, 1203, 1610 cm^{-1} (desoxycortone acetate, KBr disk).
Mass Spectrum Principal ions at *m/z* 43, 55, 299, 91, 147, 79, 253, 271 (desoxycortone acetate).
Dose Usually 1 to 5 mg of desoxycortone acetate daily, intramuscularly; sublingual doses of 2 to 10 mg daily have also been given.

Detajmium

Antiarrhythmic
$C_{27}H_{42}N_3O_3$ = 456.7
CAS—47719-70-0
Synonym 4-[3-(Diethylamino)-2-hydroxypropyl]ajmalinium

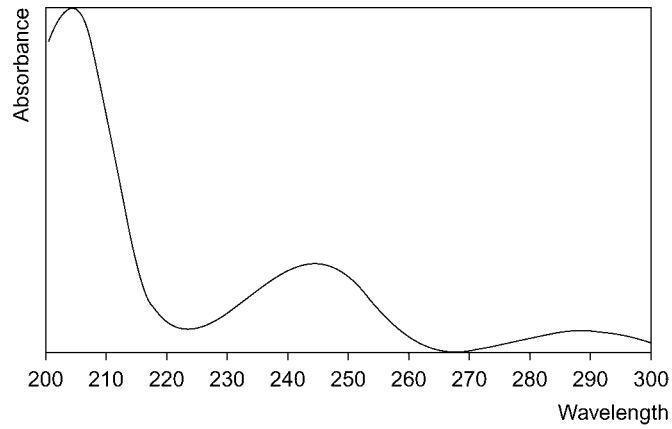


Chemical Properties Extraction yield (chlorobutane), 0.9 [Demme *et al.* 2005].
Note Commercially available detajmium is a mixture of 4 stereoisomers.

Detajmium Bitartrate

$C_{31}H_{47}N_3O_9,H_2O$ = 623.7
CAS—53862-81-0 (monohydrate); 33774-52-6 (anhydrous).
Synonym 4-[3-(Diethylamino)-2-hydroxypropyl]ajmalinium hydrogen tartrate monohydrate
Proprietary Name *Tachmalcor*

Ultraviolet Spectrum 205, 245 nm [Tenczer *et al.* 1994].



Mass Spectrum Principal ions at *m/z* 86, 365, 369, 112, 144, 196, 158, 366.
Quantification
Blood **GC-MS** Column: Fused quartz silica SE-54 capillary (25 m × 0.32 mm i.d., 0.3 µm). Carrier gas: He, 1.7 mL/min. Temperature programme: 75° to 300° at 15°/min. EI ionisation. Limit of detection not reported [Tenczer *et al.* 1994].

HPLC Column: Lichrospher 60 RP Select B (125 × 4 mm i.d.). Mobile phase: acetonitrile : 0.07% orthophosphoric acid (16 : 84), flow rate 1.5 mL/min. Fluorescence detection (λ_{ex} = 296 nm, λ_{em} = 358 nm). Limit of quantification, 50 µg/L [Tenczer *et al.* 1994].

Serum **HPLC** Column: RP18 (125 × 4 mm i.d., 5 µm) Mobile phase: methanol : 0.1 mol/L phosphate buffer (pH 3.5; 26 : 74), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 247 nm, λ_{em} = 353 nm). Limit of quantification, 1 µg/L [Oertel *et al.* 1999].

Disposition in the Body Metabolised by hydroxylation of the indole ring with subsequent *O*-methylation, reduction as well as oxidation of the C_{21} hydroxy function and cleavage of the *N*-alkyl side chain.

Toxicity

A 14-year-old female collapsed with asystolia after ingestion of an unknown amount of detajmium. Postmortem examination revealed a detajmium concentration of 12 mg/L. Six further cases of detajmium fatalities had the following blood concentrations:

	Age (years)	*Sex*	*Detajmium in blood (mg/L)*
Case 1	23	Female	35
Case 2	18	Female	12
Case 3	42	Female	25
Case 4	36	Female	1.5
Case 5	71	Male	2.0
Case 6	16	Female	28

[Tenczer *et al.* 1994].

Dose Orally, from 75 to 300 mg detajmium bitartrate daily.

Demme U *et al.* (2005). Systematic evaluation of 1-chlorobutane for liquid–liquid extraction of drugs. *Proceedings of the 12th TIAFT*, Seoul: 481–486.

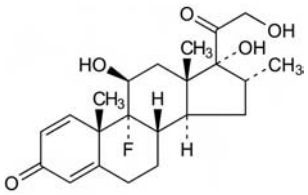
Dexamethasone

Corticosteroid
$C_{22}H_{29}FO_5$ = 392.5
CAS—50-02-2

IUPAC Name (8*S*,9*R*,10*S*,11*S*,13*S*,14*S*,16*R*,17*R*)-9-Fluoro-11,17-dihydroxy-17-(2-hydroxyacetyl)-10,13,16-trimethyl-6,7,8,11,12,14,15,16-octahydrocyclopenta[*a*]phenanthren-3-one

Synonyms Desamethasone; 9α-fluoro-16α-methylprednisolone; (11β,16α)-9-fluoro-11,17,21-trihydroxy-16-methylpregna-1,4-diene-3,20-dione.

Proprietary Names *Aeroseb-Dex*; *Decaderm*; *Decadron (elixir and tablets)*; *Decalix*; *Decaspray*; *Dexacortisyl*; *Dexalocal*; *Dexasone (tablets)*; *Dexone*; *Dezone (tablets)*; *Fortecortin (tablets)*; *Hexadrol (tablets)*; *Maxidex*; *Millicorten*; *Miral*; *Oradexon (tablets)*. It is an ingredient of *Maxitrol*.



Chemical Properties Dexamethasone is a synthetic glucocorticoid and is an isomer of betamethasone. A white crystalline powder. Mp 268° to 271°, with decomposition. A solution in dioxan is dextrorotatory. Practically insoluble in water; soluble 1 in 42 of ethanol and 1 in 165 of chloroform; soluble in acetone; sparingly soluble in methanol; very slightly soluble in ether. Log *P* (octanol/water), 1.8.

Dexamethasone Acetate

$C_{24}H_{31}FO_6$ = 434.5
CAS—1177-87-3 (anhydrous); 55812-90-3 (monohydrate)

Synonym Dexamethasone 21-acetate
Proprietary Names *Decadron-LA*; *Dexacen-La-8*; *Dexasone L.A.*; *Fortecortin (suspension for injection)*.
Chemical Properties A white powder. Mp about 225°, with decomposition. Practically insoluble in water; soluble 1 in 40 of ethanol, 1 in 25 of dehydrated alcohol, 1 in 33 of chloroform, and 1 in 1000 of ether; freely soluble in acetone and methanol.

Dexamethasone Isonicotinate

$C_{28}H_{32}FNO_6$ = 497.6
CAS—2265-64-7
Synonym Dexamethasone 21-isonicotinate
Proprietary Names *Auxison(e)*. It is an ingredient of *Dexa-Rhinaspray*.
Chemical Properties Crystals. Mp 250° to 252°.

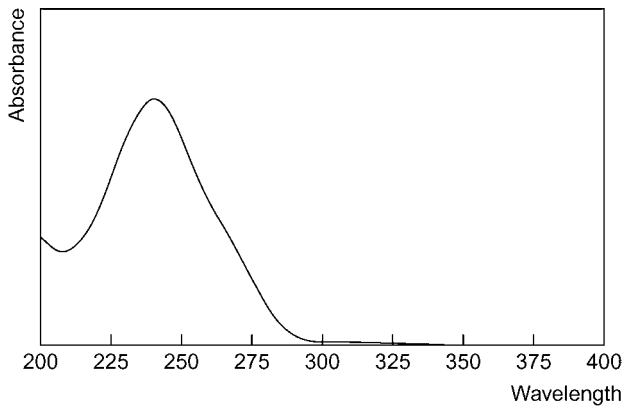
Dexamethasone Sodium Phosphate

$C_{22}H_{28}FNa_2O_8P$ = 516.4
CAS—2392-39-4
Synonym Sodium 9α-fluoro-16α-methylprednisolone 21-phosphate
Proprietary Names *Dalaron*; *Decadron (injection)*; *Decasone*; *Dexacen-4*; *Dexasone (injection)*; *Dezone (injection)*; *Fortecortin (injection)*; *Hexadrol (injection)*; *Novadex*; *Oradexon (injection)*; *Savacort-D*; *Turbinaire Decadron*.
Chemical Properties A white or slightly yellow, very hygroscopic, crystalline powder. Mp 233° to 235°. Soluble 1 in 2 of water; sparingly soluble in dehydrated alcohol; practically insoluble in chloroform and ether.

Dexamethasone Tebutate

$C_{28}H_{39}FO_6$ = 490.6
CAS—24668-75-5
Synonyms Dexamethasone butylacetate; dexamethasone TBA; dexamethasone tertiary butylacetate.
Proprietary Name *Decadron-TBA*
Chemical Properties Practically insoluble in water; soluble in ethanol and acetone.

Colour Tests Antimony pentachloride—green; naphthol-sulfuric acid—yellow-green/yellow; sulfuric acid—orange-pink.
Thin-layer Chromatography System TP—R_f 0.32; system TQ—R_f 0.08; system TR—R_f 0.00; system TS—R_f 0.00; system TAJ—R_f 0.38; system TAK—R_f 0.07; system TAL—R_f 0.75; system TAM—R_f 0.66 (DPST solution).
Gas Chromatography System GA—RI 2970.
High Performance Liquid Chromatography System HT—*k* 4.8; system HY—RI 381; system HZ—retention time 3.4 min; system HAA—retention time 13.1 min.
Ultraviolet Spectrum Methanol—240 nm (A_1^1=385a).



Infrared Spectrum Principal peaks at wavenumbers 1663, 896, 1622, 1695, 1052, 1603 cm^{-1}.
Mass Spectrum Principal ions at *m/z* 121, 122, 315, 43, 147, 223, 135, 41.
Quantification
Plasma **GC–MS** Limit of detection, 0.1 µg/L [Girault *et al.* 1990].

HPLC UV detection (λ=240 nm). Limit of quantification, 15 µg/L [Schild, Charles 1994]. UV detection. Limit of detection, 10 ng [Cham *et al.* 1980].

Serum **HPLC** For method, see McWhinney *et al.* [1996].
Urine **HPLC** See Serum McWhinney *et al.* [1996].
Synovial fluid **GC–MS** See Plasma [Girault *et al.* 1990].
Tissues **GC–MS** See Plasma [Girault *et al.* 1990].

HPLC See Plasma [Cham *et al.* 1980].

Disposition in the Body Rapidly absorbed after oral administration. Up to 65% of a dose is excreted in the urine in 24 h, mainly as metabolites.

Therapeutic Concentration

Seven extremely low birth weight infants, mean gestational age 25.6 weeks, suffering from bronchoplumonary dysplasia, were administered an IV bolus dose of 0.369 mg/kg dexamethasone sodium phosphate. A mean peak concentration of 250.5 µg/L was reached [Charles *et al.* 1993].

Half-life Plasma half-life, about 2 to 5 h.
Volume of Distribution About 1 L/kg.
Distribution in Blood Plasma : whole blood ratio, 1.2.
Protein Binding About 67%.
Dose 0.5 to 9 mg daily.

Cham B *et al.* (1980). High performance liquid chromatographic assay of dexamethasone in plasma and tissue. *Ther Drug Monit* 2: 373–377.

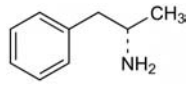
Schild PN, Charles BG (1994). Determination of dexamethasone in plasma of premature neonates using high-performance liquid chromatography. *J Chromatogr B Biomed Sci Appl* 658: 189–192.

Dexamfetamine

Central Stimulant, Anorectic
$C_9H_{13}N$ = 135.2
CAS—51-64-9
IUPAC Name (α*S*)-α-Methylbenzene-ethanamine
Synonyms Dexamphetamine, dextroamphetamine.
Proprietary Names It is an ingredient of *Biphetamine* and *Durophet*.
Note For analytical data and quantification, see under Amfetamine.



Chemical Properties pK_a 9.9. Log *P* (octanol/water), 1.8.

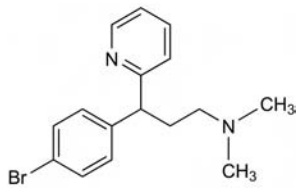
Dexamfetamine Phosphate
$C_9H_{13}N,H_3PO_4$ = 233.2
CAS—7528-00-9
Synonyms Dextroamphetamine phosphate; monobasic dextroamphetamine phosphate.
Chemical Properties A white crystalline powder. Soluble 1 in 20 of water; slightly soluble in ethanol; practically insoluble in chloroform and ether.

Dexamfetamine Sulfate
$(C_9H_{13}N)_2,H_2SO_4$ = 368.5
CAS—51-63-8
Synonym Dextro amfetamine sulfate
Proprietary Names *Dexampex*; *Dexedrine*; *Diphylets*; *Ferndex*. It is an ingredient of *Dexamyl* and *Eskatrol*.
Chemical Properties A white or almost white crystalline powder. Mp >300°. Soluble 1 in 9 to 1 in 10 of water and 1 in 800 of ethanol; practically insoluble in ether.

Disposition in the Body Well absorbed after oral administration. It is approximately twice as potent as amfetamine. For information on metabolism, excretion and pharmacokinetics, see under Amfetamine.
Dose 5 to 60 mg dexamphetamine sulfate, daily.

Dexbrompheniramine

Antihistamine
$C_{16}H_{19}BrN_2$ = 319.2
CAS—132-21-8
IUPAC Name (+)-γ-(4-Bromophenyl)-*N*,*N*-dimethyl-2-pyridinepropanamine



Chemical Properties An oily liquid.

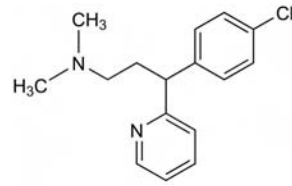
Dexbrompheniramine Maleate
$C_{16}H_{19}BrN_2,C_4H_4O_4$ = 435.3
CAS—2391-03-9
Proprietary Names It is an ingredient of *Disophrol*, *Drixoral* and *Halin*.
Chemical Properties A white crystalline powder. Mp 103° to 113°. Soluble 1 in 1.2 of water, 1 in 2.5 of ethanol and 1 in 2 of chloroform; very slightly soluble in ether. For analytical data, see under Brompheniramine.

Disposition in the Body See under Brompheniramine. Dexbrompheniramine is approximately twice as potent as brompheniramine.
Toxicity
The following postmortem concentrations of dexbrompheniramine were reported in a fatality involving the ingestion of dexbrompheniramine and 3 other drugs: blood 0.2 mg/L, liver 4.5 µg/g [Baselt, Gross 1977].
Dose Usually 8 mg of dexbrompheniramine maleate daily; up to 18 mg daily has been given in sustained-release preparations.

Baselt RC, Gross EM (1977). *J Anal Toxicol* 1: 168–170.

Dexchlorphenamine

Antihistamine
$C_{16}H_{19}ClN_2$ = 274.8
CAS—25523-97-1
IUPAC Name (3*S*)-3-(4-Chlorophenyl)-*N*,*N*-dimethyl-3-pyridin-2-ylpropan-1-amine
Synonyms (+)-γ-(4-Chlorophenyl)-*N*,*N*-dimethyl-2-pyridinepropanamine; dexchlorpheniramine.



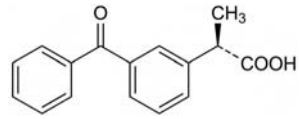
Chemical Properties An oily liquid. Soluble in chloroform.

Dexchlorphenamine Maleate
$C_{16}H_{19}ClN_2,C_4H_4O_4$ = 390.9
CAS—2438-32-6
Proprietary Names *Destral*; *Polaramin(e)*.
Chemical Properties A white crystalline powder. Mp 113° to 115°. Soluble 1 in 1.1 of water, 1 in 2 of ethanol and 1 in 1.7 of chloroform; very slightly soluble in ether. For analytical data, see under Chlorphenamine.

Disposition in the Body See under Chlorphenamine. Dexchlorphenamine is more potent than chlorphenamine.
Dose 6 to 8 mg of dexchlorphenamine maleate daily; up to 18 mg daily has been given in sustained-release preparations.

Dexketoprofen

NSAID
$C_{16}H_{14}O_3$ = 254.3
CAS—22161-81-5
IUPAC Name (*S*)-(+)-2-(3-Benzoylphenyl)propionic acid



Chemical Properties A white to off-white crystalline powder. Mp 92° to 97°. Practically insoluble in water; freely soluble in alcohol, acetone and dichloromethane.

Dexketoprofen Trometamol
$C_{16}H_{14}O_3.C_4H_{11}NO_3$ = 375.4
CAS—156604-79-4
Proprietary Names *Enantyrum*; *Ketesse*; *Nosatal*; *Quiralem*; *Sympal*; *Viaxel*.
Chemical Properties A white crystalline powder. Mp 103° to 107°. Very soluble in water, methanol and dimethyl sulfoxide; fairly soluble in ethanol; slightly soluble in isopropyl alcohol; virtually insoluble in chloroform, ethyl ether and hexane. For analytical data, see under Ketoprofen.

Quantification
Plasma **HPLC** Limit of quantification, 0.01 mg/L (reverse-phase column), 0.08 mg/L (chiral column) [Barbanoj *et al.* 1998].
Disposition in the Body Dexketoprofen is rapidly absorbed and metabolised to produce an acyl-glucuronide conjugate metabolite, which is easily hydrolysed in plasma and alkali conditions. The drug is excreted in urine as the conjugate and also

as the unaltered form when the glucuronide undergoes hydrolysis, so the metabolic transfer is reversed. Between 73% and 82% of a dose is recovered in urine within the first 12 h.

Therapeutic Concentration

Nine healthy males and 9 females, aged between 19 and 34 years, were administered a single dose of dexketoprofen (25 mg) and a single dose of dexketoprofen trometamol (25 mg), equivalent to 25 mg dexketoprofen. For dexketoprofen, peak plasma concentrations of 2.02 ± 0.69 mg/L were reached within 0.5 to 3 h. For dexketoprofen trometamol, peak concentrations were 3.70 ± 0.72 mg/L 0.25 to 0.75 h after administration [Barbanoj *et al.* 1998].

Toxicity Gastrointestinal toxicity can occur with potentially life threatening bleeding and perforations.

Half-life 1.2 to 2.5 h.

Volume of Distribution Approximately 0.25 L/kg.

Clearance Approximately 0.10 L/kg/h.

Protein Binding 99.2%.

Dose The usual dose is 12.5 mg every 4 to 6 h or 25 mg every 8 h. A maximum dose of 75 mg daily may be administered. In the elderly, a maximum dose of 50 mg daily may be given.

Barbanoj MJ *et al.* (1998). Pharmacokinetics of dexketoprofen trometamol in healthy volunteers after single and repeated oral doses. *J Clin Pharmacol* 38: 33S–40S.

Dexmedetomidine

Analgesic, Anxiolytic, Sedative

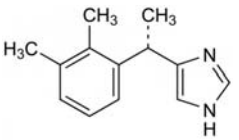
$C_{13}H_{16}N_2 = 200.3$

CAS—113775-47-6

IUPAC Name 4-[(1*S*)-1-(2,3-Dimethylphenyl)ethyl]-*1H*-imidazole

Synonyms D-form of medetomidine; MPV-1440; (*S*)-medetomidine.

Proprietary Name *Precedex*



Quantification

Serum **GC–MS** Limit of quantification, 0.01 µg/L [Vuorilehto *et al.* 1989].

Disposition in the Body

Therapeutic Concentration

Nine healthy male volunteers, mean age 23 years, were fasted overnight and supplied with a standard light breakfast prior to treatment with a transdermal patch (625 µg dexmedetomide base) which was placed on the forehead for 12 h or an IV dose of dexmedetomide hydrochloride. The IV dose was administered at a constant-rate infusion of 2 µg/kg for over 5 min. The mean peak plasma concentration for the transdermal patch was 0.51 µg/L (range 0.21–0.79 µg/L) observed at 6 (3–8) h. For the IV dose, a peak concentration of ~3.5 µg/L was reached by the end of the infusion [Kivistö *et al.* 1994].

Six healthy males, 21–23 years old, were administered 0.5, 1.0 and 1.5 µg/kg doses of dexmedetomide after an overnight fast and standard light breakfast. At least 48 h was allowed between each dose. The peak plasma concentrations were 0.137, 0.257 and 0.335 µg/L for the 3 doses observed at 1.66, 1.57 and 1.63 h [Scheinin *et al.* 1992].

Half-life Mean, 2.1 h.

Volume of Distribution Apparent, mean, 2.30 L/kg.

Clearance Total plasma, mean, 0.80 L/min.

Kivistö KT *et al.* (1994). Pharmacokinetics and pharmacodynamics of transdermal dexmedetomidine. *Eur J Clin Pharmacol* 46(4): 345–349.

Scheinin H *et al.* (1992). Pharmacodynamics and pharmacokinetics of intramuscular dexmedetomidine. *Clin Pharmacol Ther* 52: 537–546.

Vuorilehto L *et al.* (1989). Picogram level determination of medetomidine in dog serum by capillary gas chromatography with negative ion chemical ionization mass spectrometry. *J Chromatogr* 497: 282–287.

Dexpanthenol

Vitamin B Activity

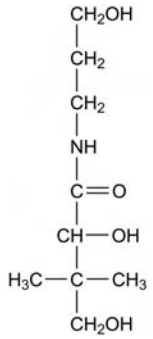
$C_9H_{19}NO_4 = 205.3$

CAS—81-13-0

IUPAC Name 2,4-Dihydroxy-*N*-(3-hydroxypropyl)-3,3-dimethylbutanamide

Synonyms Dextro-pantothenyl alcohol; pantothenol.

Proprietary Names *Bepanthen(e)*; *Ilopan*; *Motilyn*; *Panthoderm*.



Chemical Properties A clear, colourless or slightly yellow, hygroscopic, viscous liquid. Freely soluble in water, ethanol and methanol; soluble 1 in 70 of chloroform and 1 in 200 of ether. Log *P* (octanol/water), −1.9.

Thin-layer Chromatography System TA—R_f 0.70 (acidified potassium permanganate solution, positive, developing slowly).

Gas Chromatography System GA—RI 1807.

Ultraviolet Spectrum No significant absorption, 230 to 360 nm.

Infrared Spectrum Principal peaks at wavenumbers 1629, 1035, 1064, 1520, 1282, 1250 cm^{-1} (thin film).

Dose Dexpanthenol has been given in doses of 250 to 500 mg intramuscularly.

Dexrazoxane

Cardioprotective

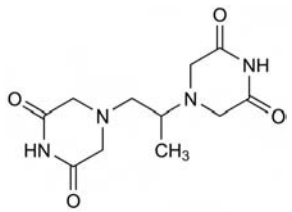
$C_{11}H_{16}N_4O_4 = 268.3$

CAS—24584-09-6

IUPAC Name 4-[(2*S*)-2-(3,5-Dioxopiperazin-1-yl)propyl]piperazine-2,6-dione

Synonyms ADR-529; ICRF-187; (+)-(*S*)-4,4′-(1-methyl-1,2-ethanediyl)bis-2,6-piperazinedione; NSC-169780; 2,6-piperazinedione.

Proprietary Names *Cardioxane*; *Eucardian*; *Zinecard*.



Chemical Properties A whitish crystalline powder. Mp 191° to 197°. Sparingly soluble in water (approx. 14 g/L) and 0.1 mol/L hydrochloric acid; slightly soluble in ethanol, methanol; practically insoluble in non-polar organic solvents. pK_a 2.1. Log *P* (octanol/water), 0.025.

High Performance Liquid Chromatography Column: ODS2 (LKB Spherisorb, 3 µm). Mobile phase: ammonium formate (0.15 mol/L, pH 7.4) : methanol, composition increased linearly from 0 to 8% in 10 min, then to 80% in 20 min. flow rate 1 mL/min. Retention times: dexrazoxane, 17.1 min; diacid–diamide derivative, 3.7 min; monoacid–monoamide derivatives, 4.8 min; 4.1 min [Burke *et al.* 1991].

Disposition in the Body Dexrazoxane is distributed rapidly throughout the body and is hydrolysed by dihydropyrimidine amidohydrolase (DHPase) to 1-ring and 2-ring open EDTA (ethylenediaminetetra-acetate)-like products. Metabolites (active) include a diacid–diamide cleavage product and the two monoacid–monoamide ring products. Dexrazoxane is excreted in urine as the unchanged drug and the metabolites. Approximately 42% of a dose is recovered in urine.

Therapeutic Concentration

Mean peak plasma concentrations can be detected at the end of a 15-min infusion and reach 0.0365 mg/L with a 500 mg/m^2 dose. [Zinecard (dexrazoxane for injection) prescribing information.]

Toxicity Haematological toxicity can occur, caused by chemotherapy, but is more common in dexrazoxane-treated patients. Dose-limiting leucopenia has been observed with doses >4000 mg/m^2 dexrazoxane (on its own) but there is no evidence of cumulative toxicity.

Half-life 2.1 to 2.5 h.

Volume of Distribution 22.0 to 22.4 L/m^2 (or 0.5 to 1.3 L/kg), tends to be higher in children compared with adults.

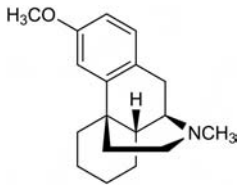
Clearance Between 6.25 and 7.88 L/h/m^2, tends to be higher in children than adults.
Protein Binding <2%.
Dose In the USA: dexrazoxane is administered with doxorubicin or epirubicin in a 10:1 ratio; 500 mg/m^2 dose of dexrazoxane with 50 mg/m^2 doxorubicin or 1000 mg/m^2 with 100 mg/m^2 epirubicin. In Europe: the ratio is 20:1 with a maximum dose of 1000 mg/m^2 each cycle.

Burke TG *et al.* (1991). Characterization of the aqueous decomposition products of (+)1,2-bis(3,5-dioxopiperazinyl-1-yl)-propane (ICRF-187) by liquid chromatographic and mass spectral analysis. *J Pharm Sci* 80: 338–340.
Pharmacie and UpJohn Company, Zinecard (dexrazoxane for injection) prescribing information.

Dextromethorphan

Antitussive, Cough Suppressant
$C_{18}H_{25}NO = 271.4$
CAS—125-71-3

IUPAC Name (+)-3-Methoxy-17-methylmorphinan
Synonyms Deoxydihydrothebacodine; methorphan.

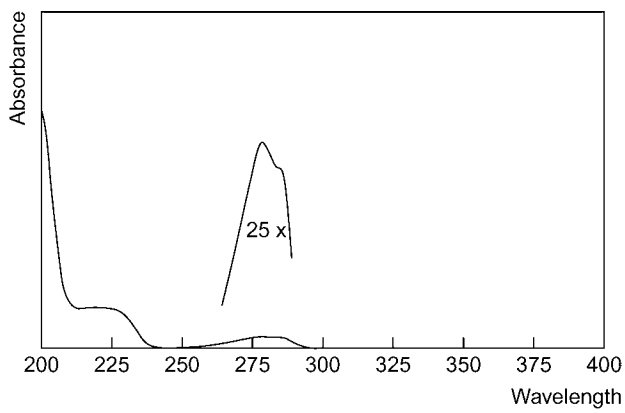


Chemical Properties An almost white or slightly yellow crystalline powder. Mp 109° to 113°. Practically insoluble in water; freely soluble in chloroform. Log *P* (octanol/water), 3.97 [Meylan, Howard 1995].

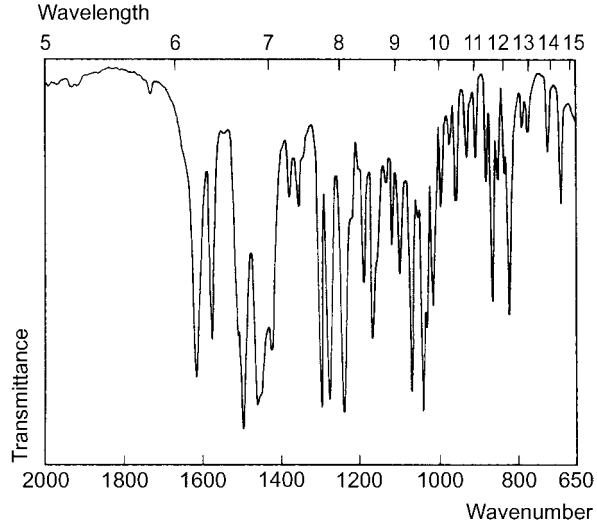
Dextromethorphan Hydrobromide

$C_{18}H_{25}NO,HBr,H_2O = 370.3$
CAS—125-69-9 (anhydrous); 6700-34-1 (monohydrate)
Synonyms Ro-1-5470/5; demorphan hydrobromide.
Proprietary Names *Benylin Adult*; *Benylin DM*; *Benylin Dry Coughs Non-Drowsy*; *Benylin Pediatric*; *Creo-Terpin*; *Delsym*; *DexAlone*; *Diabe-Tuss DM*; *Franolyn Sedative*; *Hold DM*; *Nirolex for Dry Coughs*; *Pertussin*; *Robitussin for Dry Coughs*; *Robitussin Junior*; *Silphen DM*; *Strepsils Cough*; *Suppress*; *Trocal*; *Vicks Vapospray for Dry Coughs*. It is an ingredient of many proprietary preparations, see Sweetman [2007].
Chemical Properties A white crystalline powder. Mp 122° to 124°, with decomposition. Soluble in water: 1 in 60 to 1 in 65 at 25°, 1 in 20 at 50°, 1 in 4 at 85°; also soluble 1 in 10 of glycerol and 1 in 10 of ethanol; freely soluble in chloroform with the separation of water; practically insoluble in ether. pK_a 8.3.

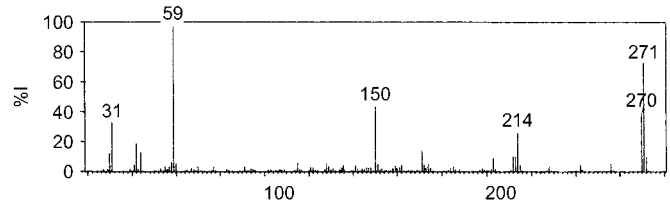
Colour Tests Aromaticity (method 2)—yellow/orange-red; Liebermann's reagent—black.
Thin-layer Chromatography System TA—R_f 0.33; system TB—R_f 0.42; system TC—R_f 0.18; system TE—R_f 0.47; system TL—R_f 0.06; system TAE—R_f 0.10; system TAF—R_f 0.42 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—dextromethorphan RI 2138, dextrorphan RI 2240.
High Performance Liquid Chromatography System HA—dextromethorphan 5.6 (tailing peak), dextrorphan 4.7 (tailing peak); system HX—RI 377; system HY—RI 298; system HAA—RT 13.3 min.
Ultraviolet Spectrum Aqueous acid—278 nm ($A_1^1 = 70$a). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1496, 1242, 1040, 1300, 1280, 1070 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 59, 271, 150, 270, 31, 214, 42, 171; dextrorphan 59, 257, 150, 256, 31, 76, 42, 157.



Quantification

Blood **LC-MS** [Liang *et al.* 2009].
Plasma **GC-MS** Limit of detection, 10 ng/L [Bagheri *et al.* 2005].

HPLC Column: phenyl. Mobile phase: methanol : acetonitrile : 10 mmol/L potassium dihydrogen phosphate buffer (pH 3.5; 20 : 30 : 50, with the addition of 0.02% TEA). Limit of quantification, 1 nmol/L [Lin *et al.* 2007]. Column: C_{18} Tracer Excel (150 × 4.0 mm i.d., 3 µm). Mobile phase: 0.01 mol/L potassium dihydrogen phosphate buffer (pH 3)-methanol-tetrahydrofuran (68.5 : 31 : 0.5) : methanol-tetrahydrofuran (93.25 : 6.75). Fluorometric detection. Limit of quantification, 10 µg/L [Afshar *et al.* 2004]. Column: Spherisorb CN (250 × 4.6 mm i.d., 3 µm). Fluorescence detection (λ_{ex} = 220 nm, λ_{em} = 305 nm). Limit of quantification, 5 µg/L [Härtter *et al.* 1996]. Limit of detection, 20 µg/L. Fluorescence detection [Gillilan *et al.* 1980].

LC-MS Limit of quantification, 10 ng/L [Eichhold *et al.* 2007], 5 ng/L [Eichhold *et al.* 1997a]. 50 ng/L [Eichhold *et al.* 1997b].

Note For spectrofluorimetric quantification of dextrophan, a metabolite of dextromethorphan, see Ramachander *et al.* [1977].
Serum **GC** Limit of detection, 1 µg/L, ECD [Barnhart, Massad 1979].
Urine **GC** Column: HP-1 capillary (17 m × 0.22 mm). FID. Limit of quantification, 0.37 µmol/L, limit of detection, 0.30 µmol/L [Wu *et al.* 2003].

GC-MS Limit of detection, 10 ng [Xu *et al.* 1993].

HPLC Column: reversed phase C_{18} (150 × 4.6 mm). Mobile phase: acetonitrile : 0.01 mol/L phosphate buffer (pH 6.0, 60 : 40), flow rate 1 mL/min. UV detection (λ = 210 nm). Limit of quantification, 1.6 mg/L, limit of detection, 0.5 mg/L [Santagati *et al.* 2005]. Column: phenyl and nitrile. Mobile phase: aqueous solution containing 1.5% acetic acid and 0.1% TEA : acetonitrile (75 : 25). Fluorescence detection. Limit of detection, 0.01 µmol/L [Bendriss *et al.* 2001]. Column: C-4. Fluorescence detection. Limit of quantification, ~50 µg/L [Mistry *et al.* 1998]. Column: phenyl. Fluorescence detection (λ_{ex} = 280 nm, λ_{em} = 310 nm). Limit of detection, 0.023 mg/L [Cai *et al.* 1997]. Column: Alltima C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: 1 mmol/L SDS in acetonitrile : 0.01 mol/L sodium dihydrogen phosphate (pH 2.5, 40.5 : 59.5). Fluorescence detection. Limit of quantification, 25 µg/L [Bartoletti *et al.* 1996]. See also Jones *et al.* [1996], Lam, Rodriguez [1993], Marshall *et al.* [1992] and Park *et al.* [1984].

LC-MS Column: Keystone Prism (50 × 2.0 mm i.d., 5 µm). Mobile phase: methanol : water containing 0.1% trifluroacetic acid (pH 3, 5 : 65 or 27 : 73), flow rate 0.4 mL/min. Limit of quantification, 1 µg/L [Constanzer *et al.* 2005].
Liver **GC** Column: capillary. ECD [Salsali *et al.* 1999].

Disposition in the Body Dextromethorphan is well absorbed after oral administration. It is metabolised by *N*- and *O*-demethylation followed by sulfate or glucuronic acid conjugation; *O*-Demethylation involves P450 isoenzyme CYP2D6. The major metabolite is dextrorphan, (+)-3-hydroxy-*N*-methylmorphinan, which has some activity; (+)-3-hydroxymorphinan has also been identified. Approximately 50% of a dose is excreted in the urine in 24 h, mostly as the glucuronide and sulfate conjugates of the metabolites; approx. 8% of a dose is excreted as unchanged drug in 6 h.

Therapeutic Concentration

Following a single oral dose of 30 mg dextromethorphan to 6 subjects, a mean peak plasma concentration of 0.38 mg/L conjugated dextrorphan was attained in 2 h [Ramachander *et al.* 1977].

After an oral dose of 20 mg dextromethorphan hydrobromide given to 12 subjects, peak serum concentrations of <0.001–0.008 mg/L (mean 0.0018) dextromethorphan were attained in ~2.5 h [Barnhart, Massad 1979].

Toxicity The estimated minimum lethal dose is 0.5 g.

Of 2 cases of death following dextromethorphan intake in young people, the first was by suicide.

In the first case, an 18-year-old girl was found dead, with 2 empty bottles that had contained 30 mg tablets of dextromethorphan in her handbag (the quantity of tablets was not stated). The following concentrations in blood and liver, respectively, were reported: dextromethorphan 9.2 and 31.2 µg/g, dextrorphan 2.9 and 11.5 µg/g.

In the second case, it was not known whether the overdose was intentional. In a 27-year-old man, the following concentrations in blood and liver, respectively, were reported: dextromethorphan 3.3 and 230 µg/g, dextrorphan 1.5 and 29.2 µg/g [Rammer *et al.* 1988].

Half-life Reported as 3.2–3.6 h in rapid metabolisers.

Volume of Distribution Reported as 255–316 L/kg

Dose Up to 120 mg of dextromethorphan hydrobromide daily in divided doses.

Dextromoramide

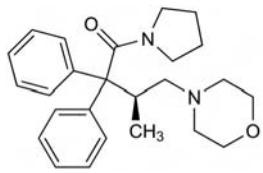
Narcotic Analgesic

$C_{25}H_{32}N_2O_2$=392.5

CAS—357-56-2

IUPAC Name 1-[(3*S*)-3-Methyl-4-(4-morpholinyl)-1-oxo-2,2-diphenylbutyl] pyrrolidine

Synonyms Dextrodiphenopyrine; *d*-moramid; pyrrolamidol; *R*-875; SKF-5137.



Chemical Properties A white amorphous or microcrystalline powder. Mp 180° to 184°. Practically insoluble in water; solubility (g/100 mL): in ethanol 50, in methanol 40, in acetone 50, in ethyl acetate 40, in benzene 5, in chloroform 5; slightly soluble in ether.

Dextromoramide Tartrate

$C_{25}H_{32}N_2O_2,C_4H_6O_6$ = 542.6

CAS—2922-44-3

Synonyms Dextromoramide acid tartrate; dextromoramide hydrogen tartrate; dextromoramidi tartras.

Proprietary Names *Dimorlin*; *Jetrium*; *Palfium*; *Palphium*.

Chemical Properties A white amorphous or crystalline powder. Mp 189° to 192°, with slight decomposition. Soluble 1 in 1 of ethanol, 1 in 1 of acetone, 1 in 25 of water, and 1 in 40 of methanol; slightly soluble in chloroform and isopropyl alcohol; very slightly soluble in ether. Log *P* (octanol/water), 3.61.

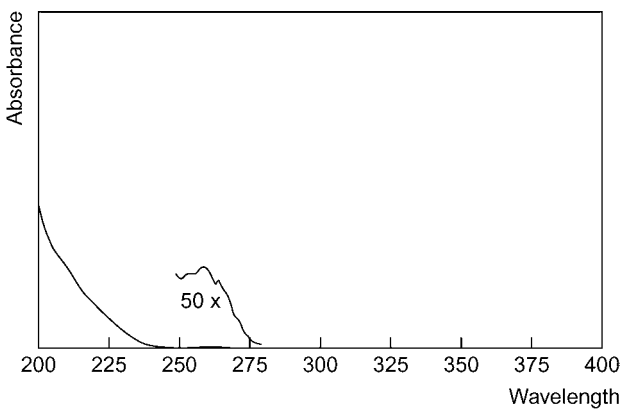
Colour Test Liebermann's reagent (100°)—green.

Thin-layer Chromatography System TA—R_f 0.73; system TB—R_f 0.42; system TC—R_f 0.71; system TE—R_f 0.79; system TL—R_f 0.60; system TAE—R_f 0.72; system TAF—R_f 0.78 (Dragendorff spray, positive; acidified iodoplatinate solution, positive).

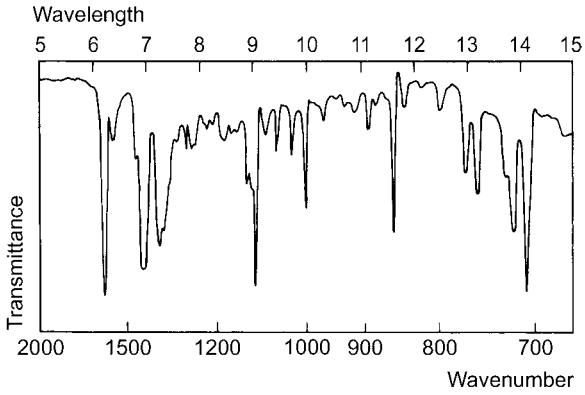
Gas Chromatography System GA—dextromoramide RI 2940, M (OH-) RI 3095, M (OH-)-AC RI 3210, M (methoxy-) RI 3269; system GB—dextromoramide RI 3094, M (OH-) RI 3310; system GC—RI 3625.

High Performance Liquid Chromatography System HA—*k* 0.7; system HC—*k* 0.09; system HX—RI 440; system HY—RI 390; system HAA—RT 15.8 min.

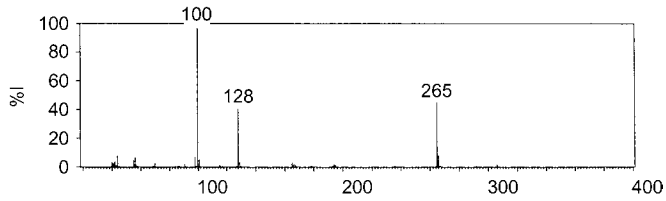
Ultraviolet Spectrum Aqueous acid—254, 259 (A_1^1 = 10.6a), 264 nm. No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1623, 703, 1107, 717, 858, 1002 cm^{-1} (Nujol mull).



Mass Spectrum Principal ions at *m/z* 100, 265, 128, 266, 44, 98, 56, 101.



Quantification

Blood **HPLC** DAD [Rop *et al.* 1993]. UV detection (λ= 215 nm) [Rop *et al.* 1992].

Plasma **GC** NSD. Limit of quantification, 10 µg/L [Kintz *et al.* 1990b].

GC-MS Column: BP1 capillary (25 m). SIM acquisition mode. Limit of detection, 0.5 µg/L [Kintz *et al.* 1990a].

HPLC Column: Supelcosil LC-ABZ. Mobile phase: 25 mmol/L potassium dihydrogen phosphate buffer (pH 2.5) : acetonitrile (80 : 20). UV detection (λ= 206 nm) [Ufkes *et al.* 1998]. See Blood [Rop *et al.* 1992].

Urine **GC-MS** See Plasma. Limit of detection, 0.3 µg/L[Kintz *et al.* 1990a].

Disposition in the Body Dextromoramide is absorbed after oral administration. Metabolic reactions may include *N*-oxidation, hydroxylation and amide hydrolysis; it is possible that 2-hydroxydextromoramide is a major metabolite. Excreted in the urine, partly as unchanged drug.

Therapeutic Concentration

In 3 patients with cancer who received IV treatment with 5 mg dextromoramide, one to three times daily, the plasma level on the fourth day of treatment was 0.01385 mg/L just before the first daily dose and 0.08428 mg/L just after dosing. In 1 patient, the whole blood concentration was undetectable just before the dose and was 0.076 mg/L 30 min after dosing [Rop *et al.* 1992].

Toxicity The estimated minimum lethal dose is 500 mg. Fatalities have occurred at blood concentrations greater than 0.04 mg/L.

In a fatality resulting from the abuse of dextromoramide and propoxyphene, the postmortem whole blood concentrations were 0.194 mg/L dextromoramide, 0.614 mg/L propoxyphene and 1.1 mg/L norpropoxyphene [Rop *et al.* 1993].

A 38-year-old man was found in his car suffering from a heart attack. Serum analysis confirmed the presence of dextromoramide (Palfium), methadone and lidocaine (lignocaine). The serum concentrations at admission to the hospital were 1.9 mg/L dextromoramide, 0.4 mg/L methadone, and 0.4 mg/L lidocaine [Brewer 1990].

In 2 fatalities involving overdose resulting from the abuse of dextromoramide, the whole blood concentrations were 0.9843 mg/L and 0.871 mg/L [Kintz *et al.* 1989a].

The following postmortem tissue concentrations were reported in a 31-year-old female who died after IV injection of dextromoramide: blood 1.526 mg/L, bile 0.494 mg/L, gastric contents (30 mL) 0.018 mg, kidney 0.131 µg/g, brain 0.065 µg/g, liver 0.391 µg/g; no other drugs were detected [Kintz *et al.* 1989b].

Dose The equivalent of 5 to 20 mg of dextromoramide, repeated as necessary.

Dextropropoxyphene

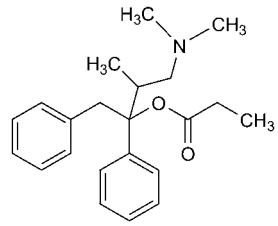
Narcotic Analgesic

$C_{22}H_{29}NO_2$ = 339.5

CAS—469-62-5

IUPAC Name [(2*S*,3*R*)-4-(Dimethylamino)-3-methyl-1,2-di(phenyl)butan-2-yl] propanoate

Synonyms (α*S*)-α-[(1*R*)-2-(Dimethylamino)-1-methylethyl]-α-phenylbenzene ethanol propanoate; propoxyphene.



Chemical Properties Crystals. Mp 75° to 76°. Very slightly soluble in water. pK_a 6.3. Log *P* (octanol/water) 4.2 [Hansch *et al.* 1995]. Unaffected by strong-alkali treatment [Amalfitano *et al.* 1996].

Dextropropoxyphene Hydrochloride

$C_{22}H_{29}NO_2$,HCl = 375.9

CAS—1639-60-7

Synonym Propoxyphene hydrochloride

Proprietary Names *Algaphan*; *Algodex*; *Antalvic*; *Daraphen*; *Darvon*; *Depronal*; *Depronal SA*; *Develin*; *Dolene*; *Dolocap*; *Erantin*; *Mardon*; *Novopropoxyn*; *Pro-65*; *Proxagesic*; *SK-65*; *642 Tablets*. It is an ingredient of *Cosalgesic*; *Dextrogesic*; *Distalgesic*.

Chemical Properties White or slightly yellow powder. Mp 163° to 169°. Soluble 1 in 0.3 of water, 1 in 1.5 of ethanol, and 1 in 0.6 of chloroform; soluble in acetone; practically insoluble in benzene and ether.

Dextropropoxyphene Napsilate

$C_{22}H_{29}NO_2$,$C_{10}H_8O_3S$,H_2O = 565.7

CAS—17140-78-2 (anhydrous); 26570-10-5 (monohydrate)

Synonym Propoxyphene napsilate

Proprietary Names *Darvon-N*; *Doloxene*. It is an ingredient of *Darvocet-N*; *Distalgesic Soluble*; *Dolasan* and *Napsalgesic*.

Chemical Properties White powder. Mp 158° to 165°. Practically insoluble in water; soluble 1 in 13 to 1 in 15 of ethanol, and 1 in 3 of chloroform; soluble in acetone and methanol.

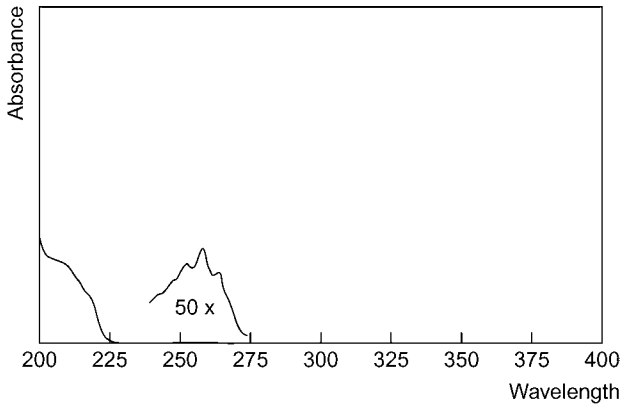
Colour Tests Liebermann's reagent—brown; Mandelin's test—grey-brown; Marquis test—black-violet→green.

Thin-layer Chromatography System TA—R_f 0.68; system TB—R_f 0.59; system TC—R_f 0.55 (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, violet).

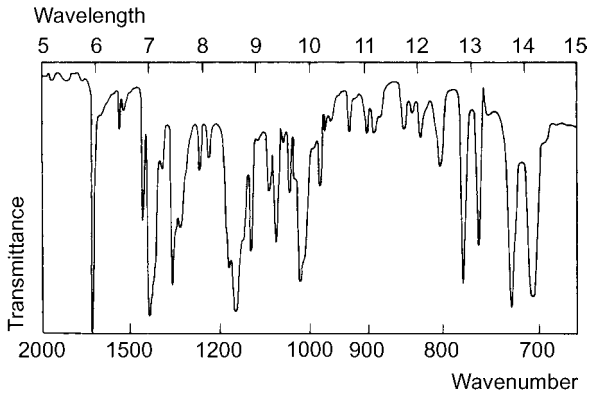
Gas Chromatography System GA—dextropropoxyphene RI 2188, norpropoxyphene RI 2214, M (nor-amide) RI 2526, M (nor-*N*-proponyl-) RI 2400, M (nor-)-AC RI 2365; system GB—dextropropoxyphene RI 2268norpropoxyphene RI 2487, M (nor-amide) RI 2673, M (nor-N-proponyl-) RI 2514; system GAS—dextropropoxyphene RI 1938; system GC—dextropropoxyphene RI 2173; system GF—dextropropoxyphene RI 2370, norpropoxyphene RI 3025; system GM—RT relative to iprindole: dextropropoxyphene RT 1.220, norpropoxyphene RT 1.248, M (nor-amide) RT 1.969, M (nor-*N*-proponyl-) RT 1.300.

High Performance Liquid Chromatography System HA—dextropropoxyphene *k* 1.9, norpropoxyphene *k* 1.3; system HAA—RT 15.8 min; system HC—*k* 0.19; system HY—RI 374; system HZ—RT 7.6 min.

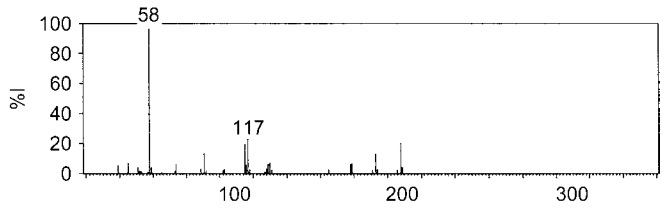
Ultraviolet Spectrum Aqueous acid—252, 257 (A^1_1 = 12a), 263 nm. No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1730, 1175, 725, 704, 776, 1026 cm^{-1} (Nujol mull).



Mass Spectrum Principal ions at *m/z* 58, 117, 208, 115, 193, 91, 179, 130 (no peaks above 210); norpropoxyphene44, 208, 117, 58, 193, 130, 57, 29.



Quantification

Blood **GC-MS** Column: CP SIL 8 CB (25 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.3 mL/min. Temperature programme; 130° for 1 min to 10° at 25°/min for 6.8 min to 280° at 25°/min for 2.2 min. SIM acquisition mode. Retention time: 9.5 min. Limit of detection, 0.07 mg/L [Gaillard, Pépin 1998].

Plasma **GC** Column: 3% OV-17 on 100/120 mesh Chromsorb Q (1.8 m × 2.0 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature: 235°. NPD. Limit of detection, 6 µg/L [Kintz *et al.* 1990]. Column: 3% SP-2250 on Supelcoport 100/120 mesh (1.2 m × 2 mm i.d.). Carrier gas: H_2, 30 mL/min. Temperature programme: 210° for 4 min to 260° at 8°/min for 2 min. NSD. Relative retention time: 0.6, 1.1 for NDPX. Limit of detection, 50 µg/L, 100 µg/L for NDPX [Margot *et al.* 1983]. Column: 3% OV-17 Chromosorb W AW DMCS, 80/100 mesh (1.8 m × 2.0 mm i.d.). Carrier gas: N_2, 40 mL/min. Temperature: 180°. FID. Retention time: 12.1 min, 82.0 min for norpropoxyphene. Limit of quantification, 20 µg/L [Cleemann 1977]. Column: 3% SE-30 Gas-Chrom Q 80/100 mesh (6′ × 2 mm i.d.). Carrier gas: He, 33 mL/min. Temperature: 216°. FID. Limit of detection, 0.04 µg on column [Verebely, Inturrisi 1973].

HPLC Column: µ-Bondapak C_{18} (30 cm × 3.9 mm i.d.). Mobile phase: acetonitrile : 2 mmol/L sulfuric acid (1 : 1), flow rate 1.5 mL/min. UV detection (λ = 205 nm). Retention time: 5.7 min. Limit of detection, 20 µg/L [Kunka *et al.* 1985].

Urine **GC** Column: DB-5 MS 5% phenyl silicone (15 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 2 mL/min. Temperature programme: 100° to 280° at 15°/min for 5 min. FID. Relative retention time: 0.905. Limit of quantification, 90 µg/L [Amalfitano *et al.* 1996]. See Plasma [Margot *et al.* 1983]. See Plasma [Verebely, Inturrisi 1973].

Breast Milk **HPLC** See Plasma [Kunka *et al.* 1985].

Hair **GC-MS** See Blood. Limit of detection, 0.05 µg/g [Gaillard, Pépin 1998].

HPLC Column: Select B (125 × 4 mm i.d). Mobile phase: acetonitrile : phosphate buffer (pH 2.3; 24 : 76), flow rate 1.5 mL/min. UV detection (λ = 200 to 360 nm). Limit of detection, <1.0 µg/g for dextropropoxyphene and 1.5 µg/g for norpropoxyphene [Mersch *et al.* 1997].

Note For an article on the thermal decomposition of propoxyphene during GC analysis, see Millard *et al.* [1980].

Disposition in the Body Readily and completely absorbed but undergoes considerable first-pass metabolism; bioavailability about 40%. Rapidly distributed and concentrated in the brain, lungs, liver and kidneys. The main metabolic reaction is *N*-demethylation which produces norpropoxyphene (NDPX), the major metabolite, and also dinorpropoxyphene which is dehydrated to cyclic dinorpropoxyphene. Norpropoxyphene has less than half the activity of dextropropoxyphene. In 24 h, about 35% of a dose is excreted in urine with about 13% of the dose as norpropoxyphene and up to 5% as unchanged drug. A total of 60–70% of a dose is excreted in urine in about 5 days; about 18% of the dose may be eliminated in the faeces over the same period.

Therapeutic Concentration In plasma, usually in the range 0.05 to 0.75 mg/L. Peak plasma concentrations of dextropropoxyphene of 0.17 to 0.37 mg/L (mean 0.23) were attained 2 h after administration of a single oral dose of 130 mg to 6 subjects; peak norpropoxyphene concentrations of 0.19 to 0.42 mg/L (mean 0.27) were attained in 4 h [Verebely, Inturrisi 1974].

After daily oral dosing of 195 mg to 3 subjects, steady-state plasma concentrations were: dextropropoxyphene 0.24 to 0.75 mg/L (mean 0.4); norpropoxyphene 0.6 to 3.0 mg/L (mean 1.5) [Verebely, Inturrisi 1973].

Toxicity The estimated minimum lethal dose is 0.5 g. Blood concentrations in the region of 1 mg/L are likely to cause toxic reactions; concentrations of ≥2 mg/L may be lethal. In fatalities in which dextropropoxyphene is involved, it is common to find much greater concentrations in the liver and lungs than in the blood. Addicts can ingest 10 times the normal dosage before showing toxicity, whereas children show toxic symptoms after only 1/20 of the normal dose.

In a review of several fatalities, blood concentrations in 23 cases ranged from 1 to 60 mg/L (mean 13) and liver concentrations in 73 cases ranged from 5 to 550 µg/g (mean 97) [Cravey *et al.* 1974].

In 6 fatalities attributed to dextropropoxyphene overdose, the postmortem tissue concentrations, mg/L or µg/g (mean, *N*) shown below were reported.

	Dextropropoxyphene	*Norpropoxyphene*
Blood	1.1–4.9 (3.5, *6*)	1.4–5.9 (3.5, *6*)
Brain	2.8–25.2 (14, *4*)	4–9.1 (6, *4*)
Liver	5.7–229 (117, *6*)	24.2–73.2 (50, *6*)
Urine	1.5–60.2 (17, *5*)	1.6–287 (68, *5*)

[McBay 1976].

Thirty hair samples from deceased drug addicts were analysed and the mean dextropropoxyphene concentration was 8.7 µg/g (range, 0.24 to 27.41) and mean norpropoxyphene 24.1 µg/g (range, 0.36 to 68.94) [Gaillard, Pépin 1998].

Half-life Plasma half-life, dextropropoxyphene 8 to 24 h (mean 15), norpropoxyphene 20 to 50 h (mean 29).

Volume of Distribution ≈16 L/kg.

Clearance Plasma clearance, ≈15 mL/min/kg.

Protein Binding ≈70 to 80%.

Note For a review of dextropropoxyphene pharmacokinetics and overdose, see [Young 1983].

Dose Usually 195 to 260 mg of dextropropoxyphene hydrochloride, or 300 to 400 mg of the napsilate, daily.

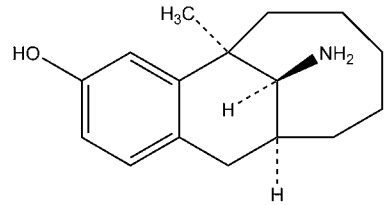
Dezocine

Narcotic Analgesic, Opioid Receptor Antagonist
$C_{16}H_{23}NO$ = 245.4
CAS—53648-55-8
Synonyms (5*R*,11*S*,13*S*)-13-Amino-5,6,7,8,9,10,11,12-octahydro-5-methyl-5,11-methanobenzocyclodecen-3-ol; Wy-16225.
Proprietary Name *Dalgan*



Chemical Properties Solid. Log *P* 3.97 [Wishart 2006].

Dezocine Hydrobromide

$C_{16}H_{23}NO,HBr$ = 326.3
Chemical Properties Crystalline powder. Mp 269° to 270°. Soluble in water.

Quantification

***Plasma* HPLC** Column: µBondapak C_{18} (120 × 3.9 mm i.d., 10 µm). Mobile phase: water : methanol : butanol : phosphoric acid (650 : 289 : 10 : 1), flow rate 0.8 to 1.0 mL/min. Electrochemical detection. Limit of detection, 1 to 2 µg/L [Locniskar, Greenblatt 1986].
Disposition in the Body Readily absorbed following IM administration. It appears to be metabolised in the liver and excreted mainly as the glucuronide conjugate in the urine.

Therapeutic Concentration

Pharmacokinetics of IV dezocine and the bioavailability of IM and SC dezocine were evaluated in healthy male volunteers. In study 1, 12 volunteers were administered 5, 10 or 20 mg IV doses over a period of 5 min. In study 2, 24 volunteers were administered 10 mg IV or IM dezocine. In the third study, 24 volunteers were given 10 mg dezocine IV or SC. Results of study 1 are summarised below:

	Dose		
	5 mg	***10 mg***	***20 mg***
Half-life (h)	2.60	2.60	2.80
Volume of distribution (L/kg)	11.8	11.2	9.40
Total clearance (L/h/kg)	3.13	2.96	2.49

In the second study, the mean peak serum concentration after IM injection reached 18.9 µg/L after 0.57 h. In study 3, the mean peak serum concentration after SC injection reached 11.1 µg/L after 1.2 h [Locniskar *et al.* 1986].

Bioavailability Approximately 97%.
Half-life Approximately 2.7 h.
Volume of Distribution Approximately 10.8 L/kg.
Clearance Approximately 2.86 L/h/kg.
Protein Binding 91.6 ± 0.8%.
Dose Dezocine is administered in opioid-dependent subjects maintained on oral methadone (30 mg daily) as IM injections ranging from 7.5 to 60 mg.

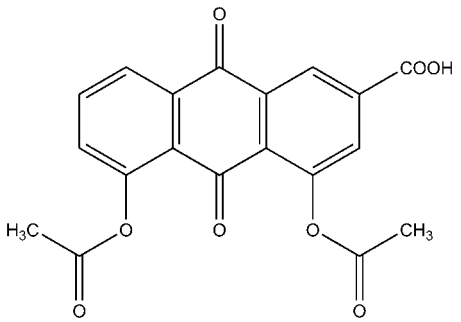
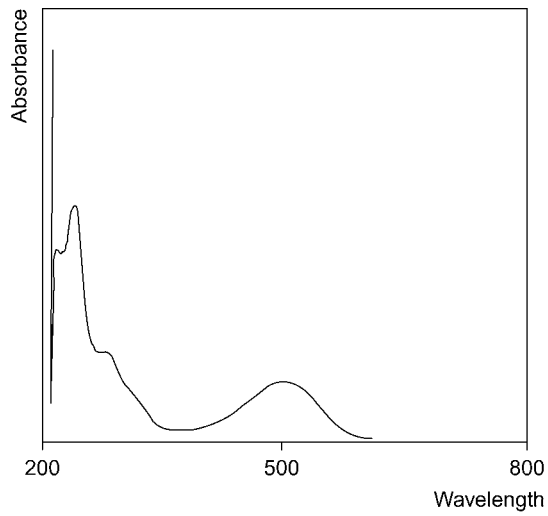
Diacerein

Antiarthritic, Antiinflammatory, Interleukin I Inhibitor
$C_{19}H_{12}O_8$ = 368.3
CAS—13739-02-1

IUPAC Name 4,5-Diacetyloxy-9,10-dioxoanthracene-2-carboxylic acid
Synonyms 4,5-bis(Acetyloxy)-9,10-dihydro-9,10-dioxo-2-anthracenecarboxylic acid; DAR; diacerhein; 1,8-diacetoxy-3-carboxyanthraquinone; diacetylrhein; 9,10-dihydro-4,5-dihydroxy-9,10-dioxo-2-anthroic acid diacetate; SF-277.
Proprietary Names *Artrodar*; *Fisiodar*.



Chemical Properties Yellow plates. Mp 217° to 218°. Log *P* (octanol/water), 2.42 [Meylan, Howard 1995], 1.99 [ACD 2007]. At room temperature, degradation to rhein proceeds stoichiometrically. In acid-stressed samples, 40% of the drug at room temperature and 85 to 90% at 37° degrades to rhein. Stable to the effect of temperature and UV light; 73.5% of diacerein was recovered after oxidative stress [Giannellini *et al.* 2005].
High Performance Liquid Chromatography Column: RP Luna C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: 0.1 mol/L phosphoric acid : methanol (40 : 60), flow rate 1.0 mL/min. UV detection (λ = 254 nm). Limit of detection not reported [Giannellini *et al.* 2005].
Liquid Chromatography-Mass Spectrometry Column: RP Luna C_8 (50 × 2.0 mm i.d., 3 µm). Mobile phase: 0.05% formic acid in acetonitrile : 0.05% formic acid (10 : 90 to 90 : 10 at 25 min), flow rate 0.2 mL/min. Limit of detection not reported [Giannellini *et al.* 2005].
Ultraviolet Spectrum 0.1 mol/l NaOH—241, 277 and 502 nm [Borgmann *et al.* 2007].



Quantification
Plasma **HPLC** Column: Nucleosil C_{18}. Mobile phase: acetonitrile : McIlvaine buffer (0.1 mol/L citric acid : 0.2 mol/L disodium phosphate [98 : 2], pH 2.2; 47 : 53), flow rate 1.0 mL/min. Photometric detection (λ = 432 nm). Limit of detection, 0.1 mg/L [Debord *et al.* 1994].
Urine **HPLC** See Plasma [Debord *et al.* 1994].
Disposition in the Body Readily absorbed following IM administration. It appears to be metabolised in the liver to the active metabolite rhein and excreted mainly as the glucuronide conjugate in the urine. Rhein is a naturally occurring hydroxyanthroquinone present in rhubarb.
Therapeutic Concentration
A study involving 12 healthy subjects and 16 patients with various degrees of renal failure was undertaken to determine the influence of renal function on the pharmacokinetics of diacerein. Group I consisted of 6 males and 6 females (aged 41 to 59 years; weight 48 to 84 kg) with normal creatinine clearance of between 68 and 111 mL/min. Group II contained 1 female and 7 males with mild renal insufficiency (aged 31 to 67 years; weight 50 to 95 kg), creatinine clearance 33 to 56 mL/min. Group III contained 2 females and 6 males with severe renal insufficiency (aged 35 to 63 years; weight 47 to 93 kg), creatinine clearance 10 to 27 mL/min. Each group fasted overnight and received a single oral dose of 50 mg diacerein. Peak plasma concentrations of rhein did not change significantly relative to the degree of impairment as seen in the following:

	Rhein plasma concentration		
	Group I	***Group II***	***Group III***
Mean peak concentration (mg/L)	3.2	3.6	3.5
t_{max} (h)	2.2	2.7	2.7

[Debord *et al.* 1994].

Toxicity For a case report of fatal hepatitis from the administration of diacerein, see Renan *et al.* [2001] (no levels reported).
Bioavailability Rhein, approx. 35%.
Half-life In healthy subjects, 4.3 h; 7 to 8 h with repeated administration [Nicolas *et al.* 1998].
Volume of Distribution Rhein, approx. 13.3 L (28 subjects weighing 47–95 kg) [Debord *et al.* 1994].
Clearance Rhein, approx. 0.13 L/h.
Protein Binding Approximately 99%.
Dose 50 mg twice daily orally. Doses should be halved in patients with creatinine clearance less than 30 mL/min.

Diamfenetide

Anthelmintic (Veterinary)

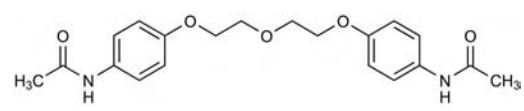
$C_{20}H_{24}N_2O_5$ = 372.4

CAS—36141-82-9

IUPAC Name *N*-[4-[2-[2-(4-Acetamidophenoxy)ethoxy]ethoxy]phenyl]acetamide

Synonyms Diamphenethide; *N*,*N*′-[oxybis(2,1-ethanediyloxy-4,1-phenylene)] bisacetamide.

Proprietary Name *Coriban*

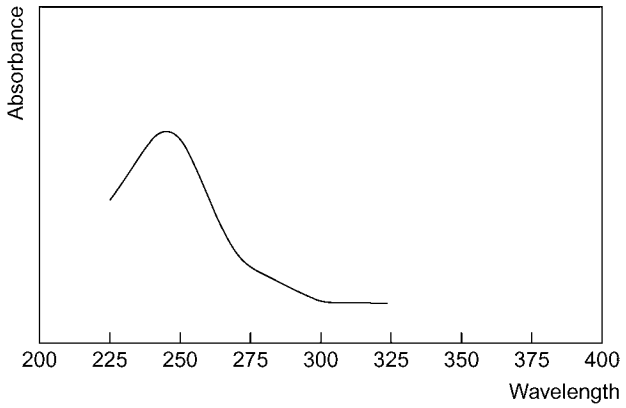


Chemical Properties A white to pale buff-coloured powder. Practically insoluble in water; soluble 1 in 160 of ethanol, 1 in 500 of chloroform and 1 in 150 of methanol; practically insoluble in ether. Log *P* (octanol/water), 1.8.

Colour Test Mandelin's test—grey-green.

Thin-layer Chromatography System TA—R_f 0.81 (acidified iodoplatinate solution, positive).

Ultraviolet Spectrum Aqueous acid—244 nm.

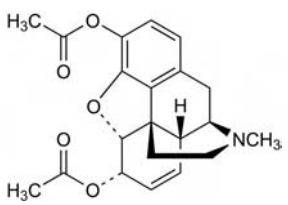


Infrared Spectrum Principal peaks at wavenumbers 1653, 1508, 1529, 1238, 1136, 1597 cm^{-1} (KBr disk).

Diamorphine

Narcotic Analgesic
$C_{21}H_{23}NO_5$ = 369.4
CAS—561-27-3

IUPAC Name (5α,6α)-7,8-Didehydro-4,5-epoxy-17-methylmorphinan-3,6-diol diacetate (ester)
Synonyms Acetomorphine; diacetylmorphine; heroin.

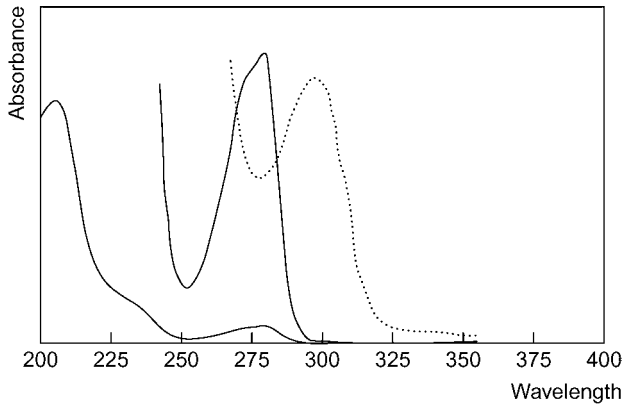


Chemical Properties White crystals. Mp 173°. It is rapidly hydrolysed by alkalis. Soluble 1 in 1700 of water, 1 in 31 of ethanol, 1 in 1.5 of chloroform and 1 in 100 of ether. pK_a 7.6 (23°) Log *P* (ether/water pH 7.0), 0.2.

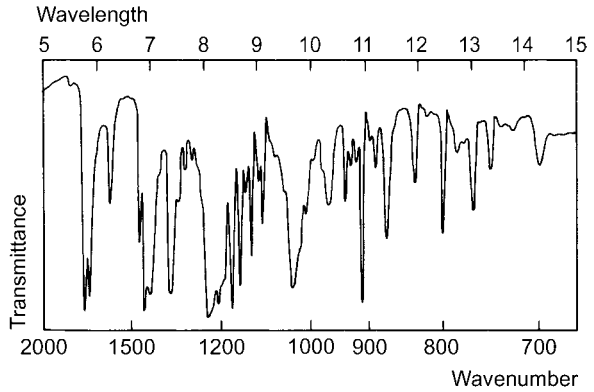
Diamorphine Hydrochloride

$C_{21}H_{23}NO_5$,HCl,H_2O = 423.9
CAS—1502-95-0 (anhydrous)
Proprietary Names *Diagesil*; *Diamorf*.
Chemical Properties An almost white crystalline powder. Mp 243° to 244°. Soluble 1 in 2 of water, 1 in 11 of ethanol and 1 in 1.6 of chloroform; insoluble in ether. Diamorphine hydrolyses in aqueous solution to 3-*O*- and 6-*O*-monoacetylmorphine and morphine to a significant extent at room temperature.

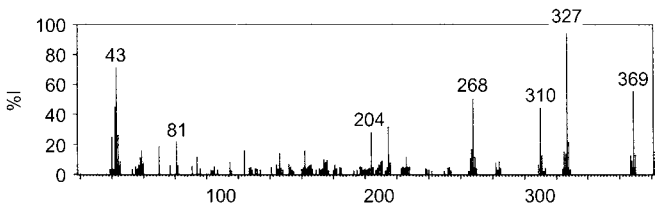
Colour Test Liebermann's reagent—black; Mandelin's test—blue-grey; Marquis test—violet.
Thin-layer Chromatography System TA—R_f 0.47; system TB—R_f 0.15; system TC—R_f 0.38; system TE—R_f 0.49; system TL—R_f 0.04; system TAE—R_f 0.26; system TAF—R_f 0.33; system TAJ—R_f 0.25; system TAK—R_f 0.05; system TAL—R_f 0.64 (acidified iodoplatinate solution—positive; Dragendorff spray—positive; Marquis test—violet).
Gas Chromatography System GA—RI 2615, M (6-monoacetylmorphine) RI 2525, M (3-monoacetylmorphine) RI 2495, M (morphine) RI 2445; system GB—RI 2769, M (6-monoacetylmorphine) RI 2646, M (3-monoacetylmorphine) RI 2625, M (morphine) RI 2564; system GAK—RT 14.2 min.
High Performance Liquid Chromatography System HA—*k* 3.0 (tailing peak), M (6-monoacetylmorphine) *k* 3.6 (tailing peak), M (morphine) 3.8 (tailing peak); system HC—*k* 0.66, M (6-monoacetylmorphine) *k* 0.80, M (morphine) *k* 1.30; system HS—*k* 0.35, M (6-monoacetylmorphine) *k* 1.00, M (morphine) *k* 5.16; system HX—RI 340; system HY—RI 282; system HAX—RT 7.9 min; system HAY—RT 4.1 min; system HBC—RT 2.9 min.
Ultraviolet Spectrum Aqueous acid—279 nm (A^{1}_{1}= 46a); aqueous alkali—299 nm (A^{1}_{1}= 69a)



Infrared Spectrum Principal peaks at wave numbers 1245, 1764, 1178, 1215, 911, 1736 cm^{-1} (diamorphine hydrochloride, Nujol mull). Two polymorphic forms may occur.



Mass Spectrum Principal ions at *m/z* (diamorphine) 327, 43, 369, 268, 310, 42, 215, 204; (6-monoacetylmorphine) 327, 268, 42, 43, 215, 44, 328, 269; (morphine) 285, 162, 42, 215, 286, 124, 44, 284.



Quantification

Blood **GC** Column: 2% OV-17 (2.13 m × 4.0 mm i.d.). Carrier gas: N_2, 65 mL/min. Temperature: 250°. AFID. Limit of detection, 100 µg/L [Smith, Cole 1975].

GC-MS Column: XTerra C_{18}. MRM acquisition mode, positive ion mode. Limit of quantification, 0.0007–0.02 mg/L [Karinen *et al.* 2009]. Column: 95% dimethylpolysiloxane, 5% diphenylpolysiloxane Rtx (15 m × 25 mm i.d., 0.1 µm). Carrier gas: He, 1.2 mL/min. Temperature programme: 150° for 1 min to 200° at 12.5°/min for 15 s to 290° at 30°/min for 4 min. SIM acquisition mode. Limit of quantification, 1 µg/L [Goldberger *et al.* 1993].

HPLC Column: LiChrosorb Si-60 (300 × 4 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol (pH 7, 75 : 25), flow rate 80 mL/h. UV detection (λ= 218 nm). Limit of detection, 12.5 µg/L [Umans *et al.* 1982].

LC-MS Column: Gemini C_{18} reversed phase (100 × 2.0 mm i.d., 3 µm). Mobile phase: acetonitrile : ammonium acetate (pH 3.2, 15 : 85 for 9 min to 30 : 70 in 13 min to 80 : 20 in 10 min to 95 : 5 in 1 min), flow rate 150 µL/min. TIS, MRM acquisition mode. Limit of quantification, 0.008 mg/L, limit of detection, 0.002 mg/L [Gergov *et al.* 2009].

Plasma **GC-MS** Column: HP-1 (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 1 mL/min. Temperature programme: 70° for 1 min to 220° at 35°/min for 0.25 min to 250° at 10°/min for 3 min. MSD, SIM acquisition mode. Limit of detection, 1 µg/L [Wang *et al.* 1994]. See Blood [Goldberger *et al.* 1993].

HPLC Column: Spherisorb C18 ODS-2 (125 × 2 mm i.d., 3 µm). Mobile phase: water containing 8.5 g *o*-phosphoric acid (85%) and 0.39 g hexylamine/

1000 g : acetonitrile-water containing 8.5 g *o*-phosphoric acid and 1.1 g hexylamine/1000 g (98 : 2 to 97.5 : 2.5 at 2.5 min to 82.5 : 17.5 at 2.8 min to 97.5 : 2.5 in 3.5 min to 92.5 : 7.5 at 6 min to 85.5 : 14.5 at 7.5 min to 75 : 25 at 11 min), flow rate 0.2 mL/min. DAD (λ= 210 nm). Limit of quantification, 25 µg/L [Bourquin *et al.* 1997].

LC-MS Column: Zorbax reversed phase (150 × 4.6 mm i.d., 5 µm). Mobile phase: 5 mmol/L ammonium formate (pH 4.0) : acetonitrile (97 : 3 for 2 min to 87 : 13 at 2.6 min to 84.5 : 15.5 at 8 min to 20 : 80 at 8.1 min until 11 min to 97 : 3 at 11.1 min until 15 min), flow rate 1.0 mL/min. TIS, MRM acquisition mode. Retention time: 8.0 min. Limit of quantification, 5 µg/L [Rook *et al.* 2005].

Serum **HPLC** Column: Supelcosil LC-Si (250 × 2.1 mm i.d., 5 µm). Mobile phase: methanol : acetonitrile : water : formic acid (59.8 : 5.2 : 34.65 : 0.35), flow rate 230 µL/min. API. Limit of quantification, 0.5 µg/L [Zuccaro *et al.* 1997].

Urine **GC-MS** See Plasma [Wang *et al.* 1994]. Column: HP-1 (12 m × 0.2 mm i.d., 0.33 µm). Temperature programme: 120° for 1 min to 220° at 20°/min to 260° at 5°/min to 280° at 20°/min for 2 min. EI ionisation, SIM acquisition mode. Limit of detection, 50 µg/L [De Giovanni, Strano Rossi 1994]. See Blood [Goldberger *et al.* 1993].

HPLC Column: Silica (200 × 2 mm i.d., 3 µm). Mobile phase: dichloromethane : pentane : diethylamine : methanol. Limit of detection, 4–20 µg/L [Low, Taylor 1995]. Column: Supelcosil LC-18-DB (5 µm). Mobile phase: 0.1 mol/L sodium hydrogen phosphate : methanol (pH 7.3, 67.5 : 32.5), flow rate 1.0 mL/min Electrochemical detection. Retention time: 8.22 min. Limit of detection, 250 µg/L [Sawyer *et al.* 1988].

LC-MS See Blood [Gergov *et al.* 2009].

Meconium **GC-MS** See Salem *et al.* [2001].

Oral Fluid **GC-MS** See Plasma [Wang *et al.* 1994]. See Blood [Goldberger *et al.* 1993].

Brain **GC-MS** See Blood. Limit of quantification, 0.002–0.06 µg/g [Karinen *et al.* 2009].

Hair **GC-MS** Column: Restek Rtx-5 MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 1 min to 260° at 15°/min to 290° at 7°/min for 6 min. Limit of quantification, 0.02 ng/mg [Pichini *et al.* 1999]. See Plasma. Limit of detection, 0.1 ng/mg [Wang *et al.* 1994]. See Polettini *et al.* [1993].

LC-MS Column: Zorbax phenyl (50 × 2.1 mm i.d., 3 µm). Mobile phase: acetonitrile-methanol-20 µmol/L formate buffer (pH 3.0, 10 : 10 : 80) : acetonitrile-methanol-20 µmol/L formate buffer (pH 3.0, 35 : 35 : 30; 100 : 0 to 35 : 65 from 0.5 to 0.7 min to 100 : 0 in 2 min), flow rate 0.25 mL/min. ESI. Limit of detection not reported [Kronstrand *et al.* 2004].

Other **GC** Illicit Heroin Samples. Column: 2.5% OV-1 or SE-52 on 80/100 mesh Chromosorb G (2 m × 2 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature programme: 240° for 2 min to 280° at 24°/min for 6 min. Limit of detection not reported [Machata, Vycudilik 1980].

HPLC Column: µBondapak C_{18} (25 × 4.6 cm i.d.). Mobile phase: acetonitrile : water : phosphoric acid with 0.02 mol/L methanesulfonic acid (pH 2.2, 12 : 87 : 1), flow rate 3.0 mL/min. UV detection (λ= 254 nm). Limit of detection, 0.5 g/L [Lurie *et al.* 1982].

Disposition in the Body Diamorphine is readily absorbed after oral administration or by injection. Following injection, it is rapidly hydrolysed to 6-monoacetylmorphine in blood and then more slowly metabolised to morphine, which is the major active metabolite; normorphine is also formed to a minor extent. Small quantities of codeine are occasionally seen in the urine of addicts, but this is thought to arise from the presence of acetylcodeine as an impurity in illicit heroin samples. The blood concentration of morphine depends on the route of administration of the drug, the dose, time since the last dose and the individual's metabolism. Orally administered diamorphine undergoes extensive first-pass metabolism to morphine. All metabolites may be conjugated with glucuronic acid. Up to 80% of a dose is excreted in the urine in 24 h, mainly as morphine 3-glucuronide, with ≈5–7% of the dose as free morphine, 1% as 6-monoacetylmorphine, 0.1% as unchanged drug and trace amounts of other metabolites. After inhalation, 14–20% of the dose appears in the urine; morphine metabolites are excreted in the bile. Diamorphine crosses the blood–brain barrier within 15–20 s and achieves relatively high brain levels; 68% of an IV dose is absorbed into the brain.

Therapeutic Concentration Because of its rapid hydrolysis, diamorphine is difficult to detect in plasma. Morphine plasma concentrations are usually in the range 0.01–0.07 mg/L.

Twenty-six newborn premature neonates, with a gestational age of 26–40 weeks (mean, 30.7), were administered with a loading dose of 50 µg/kg diamorphine over a 30 min period followed by a 15 µg/kg/h IV infusion for 14–149 h (mean, 60.2). The mean steady-state plasma morphine concentration after the 15 µg/kg/h dose was 62.5 µg/L (range, 20–98) [Barrett *et al.* 1991].

Nineteen newborn infants of 24–41 weeks of gestation (mean, 29.7) who were on ventilation were administered with a loading dose of 50 µg/kg or 200 µg/kg diamorphine followed by 15 µg/kg/h as an IV infusion. The mean steady-state plasma morphine concentration was 86 µg/L after the 50 µg/kg and 200 µg/kg doses. The steady-state morphine concentration was 86 µg/L (ranges, 20–215 for the 50 µg/kg loading dose; 14–146 for the 200 µg/kg dose). For morphine 3-glucuronide, steady state was 703 µg/L (ranges 135–1237 and 45 to 1401 for the 2 loading doses, respectively) and for morphine 6-glucuronide, 48 µg/L (ranges, 35–91 and 11–120 µg/L, respectively) [Barrett *et al.* 1996].

Toxicity Diamorphine is 2–3 times more potent than morphine. The estimated minimum lethal dose is 200 mg, but addicts may be able to tolerate up to 10 times as much; fatalities have occurred after doses of 10 mg.

A 17-year-old pregnant girl, a known drug abuser, was found dead in a public toilet with needle puncture marks. A postmortem carried out 48 h after death showed massive brain and lung oedema associated with an acute intoxication. In her femoral vein blood a 6-monoacetylmorphine concentration of 4 µg/L was detected as well as 280 µg/L morphine and 20 µg/L codeine. In her urine 1170 µg/L of 6-monoacetylmorphine was found. These were all consistent with a recent heroin intake. 6-Monoacetylmorphine, morphine, morphine 3-glucuronide and codeine were all detected in the fetus's amniotic fluid, brain and lung at high concentrations [Skopp *et al.* 1998].

A 40-year-old man with a long history of drug abuse was found dead after an overdose of heroin. Heroin was detected at a concentration of 0.109 mg/L in blood and 17 ng/g in gastrointestinal contents. Its metabolite, 6-monoacetylmorphine, was found at concentrations of 0.168 mg/L and 12 ng/g, respectively, and morphine at 1.14 mg/L and 425 ng/g, respectively. Morphine was also found in urine at a concentration of 3.65 mg/L [Rop *et al.* 1997].

Of 10 deaths resulting from heroin overdoses via non-injection routes, 4 involved inhalation ('chasing'), 4 involved nasal administration ('snorting') and 2 involved oral ingestion. In 1 case, the person was observed to smoke a heroin cigarette and then snort heroin immediately before losing conciousness. In 9 of the cases, venipuncture marks were detected at postmortem. The median blood morphine concentration was 0.31 mg/L (range, 0.06–0.99). Drugs other than morphine were also detected in 7 cases (alcohol (4), cocaine (2), dothiepin, methadone and paracetamol (1 each)) [Darke, Ross 2000].

A 46-year-old man died after injecting heroin into his penis. The concentration of morphine in body fluids at postmortem were blood 0.68 mg/L, urine 0.49 mg/L, bile 0.32 mg/L and vitreous humour 0.062 mg/L; ethanol was also detected in these fluids [Winek *et al.* 1999].

Of 10 deaths involving heroin body-packers, four had blood concentrations <1 mg/L. In five others, concentrations were 4.4, 6.7, 35.8, 39.4 and 52.6 mg/L. One victim, who died of peritonitis, had no detectable morphine in the blood [Wetli *et al.* 1997].

Half-life Plasma half-life, diamorphine ≈3 min, morphine ≈2–3 h.

Volume of Distribution Morphine ≈3–5 L/kg.

Clearance Plasma clearance, morphine ≈15–20 mL/min/kg; newborn infants (24–41 weeks of gestation), 4.6 mL/min/kg.

Protein Binding Morphine ≈20–35%.

Note For a review of the pharmacokinetics and pharmacodynamics of smoked heroin, see Jenkins *et al.* [1994]; for a review of the metabolism and excretion of diamorphine, see Boerner [1975]. For a review of fatal heroin overdose, see Darke, Zador [1996]; for reports of heroin use when driving, see Ceder, Jones [2002].

Dose For acute pain, 5 to 10 mg diamorphine hydrochloride every 4 h by SC or IM injection.

Diampromide

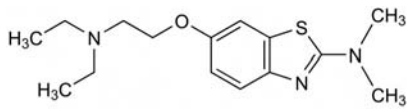
Narcotic
$C_{21}H_{28}N_2O$ = 324.5
CAS—552-25-0

IUPAC Name *N*-[2-(Methylphenethylamino)propyl]propionanilide
Chemical Properties Extracted by organic solvents from aqueous alkaline solutions.
Colour Test Sulfuric acid–formaldehyde test—orange (limit of detection, 1.0 μg).
Thin-layer Chromatography System T1—R_f 0.42 (location reagent acidified iodoplatinate spray, positive reaction).
Ultraviolet Spectrum Aqueous acid (0.1 N sulfuric acid)—225, 257, 263 nm.

Diamthazole

Antifungal
$C_{15}H_{23}N_3OS$ = 293.4
CAS—95-27-2

IUPAC Name 6-[2-(Diethylamino)ethoxy]-*N*,*N*-dimethyl-2-benzothiazolamine
Synonyms Amycazol; dimazole.

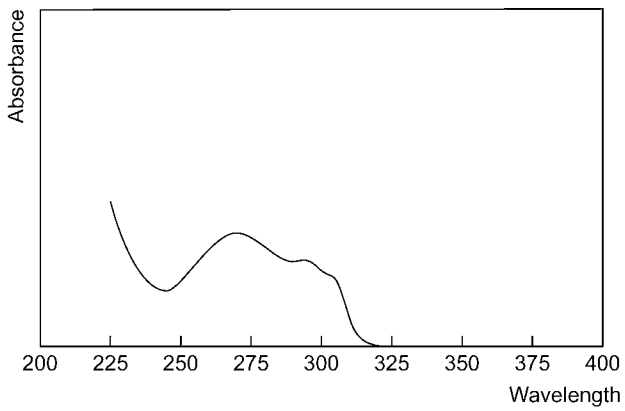


Chemical Properties Log *P* (octanol/water), 2.5 (hydrochloride).

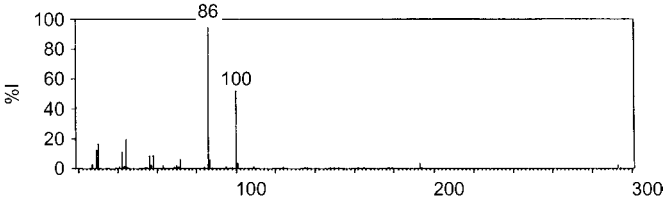
Diamthazole Hydrochloride

$C_{15}H_{23}N_3OS,2HCl$ = 366.4
CAS—136-96-9
Proprietary Name *Asterol*
Chemical Properties A white, hygroscopic, crystalline powder. Mp 240° to 243°. Soluble in water, ethanol and methanol; very slightly soluble in chloroform and ether.

Colour Test Liebermann's reagent—green.
Thin-layer Chromatography System TA—R_f 0.52; system TB—R_f 0.30; system TC—R_f 0.30 (acidified iodoplatinate solution, positive).
Ultraviolet Spectrum Aqueous acid—270 (A^1_1=370b), 293 nm.



Infrared Spectrum Principal peaks at wavenumbers 1015, 1041, 667, 1548, 1602, 1190 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 86, 100, 44, 30, 29, 42, 58, 56.

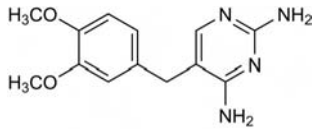


Use Diamthazole hydrochloride has been used in a concentration of 5%.

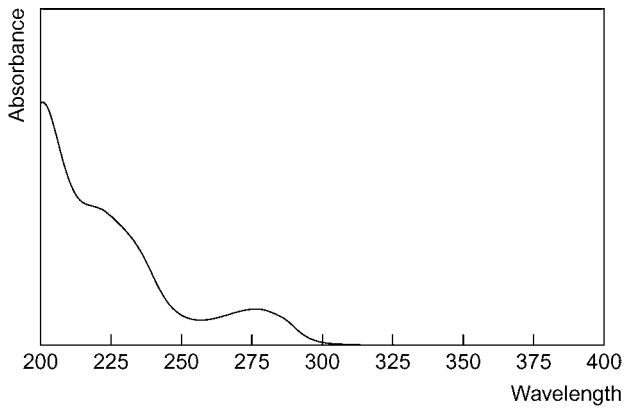
Diaveridine

Coccidiostat (Veterinary)
$C_{13}H_{16}N_4O_2$ = 260.3
CAS—5355-16-8

IUPAC Name 5-[(3,4-Dimethoxyphenyl)methyl]-2,4-pyrimidinediamine
Proprietary Name It is an ingredient of *Saquadil*.



Chemical Properties A white or creamy-white crystalline powder. Mp 233°. Very slightly soluble in water and ethanol; soluble 1 in 600 of chloroform. Log *P* (octanol/water), 1.0.
Colour Tests Mandelin's test—green; Marquis test—grey→violet-brown.
Thin-layer Chromatography System TA—R_f 0.58 (acidified iodoplatinate solution, positive).
High Performance Liquid Chromatography System HAA—retention time 7.0 min.
Ultraviolet Spectrum Aqueous acid—276 nm (A^1_1=300a).

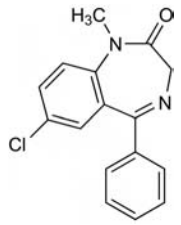


Infrared Spectrum Principal peaks at wavenumbers 1630, 1645, 1598, 1250, 1510, 1570 cm^{-1} (KBr disk).

Diazepam

Anxiolytic, Benzodiazepine, Tranquilliser
$C_{16}H_{13}ClN_2O$ = 284.8
CAS—439-14-5

IUPAC Name 7-Chloro-1,3-dihydro-1-methyl-5-phenyl-3*H*-1,4-benzodiazepin-2-one
Synonyms Diazepamum; LA-III; NSC-77518; Ro-5-2807; Wy-3467.
Proprietary Names *Antenex*; *Anxicalm*; *Apozepam*; *Dialar*; *Diapam*; *Diazemuls*; *Diazep*; *Ducene*; *Faustan*; *Gewacalm*; *Hexalid*; *Lamra*; *Medipam*; *Novazam*; *Novodipam*; *Pro-Pam*; *Psychopax*; *Rimapam*; *Serenack*; *Stesolid*; *Tensium*; *Tranquase*; *Umbrium*; *Valaxona*; *Valclair*; *Valiquid*; *Valium*; *Vivol*.



Chemical Properties A white or yellow crystalline powder. Mp 125° to 126°. Slightly soluble in water; soluble 1 in 25 of ethanol, 1 in 2 of chloroform, and 1 in 39 of ether. pK_{a1} 3.5 [Krogh *et al.* 1997], pK_{a2}3.3 (20°). Log *P* (octanol/water), 2.8

[Capella-Peiró *et al.* 2002], 3.08 [Mullett, Pawliszyn 2001], (octanol/water pH 7.4), 2.7. Extraction yield (chlorobutane), 0.95 [Demme *et al.* 2005].

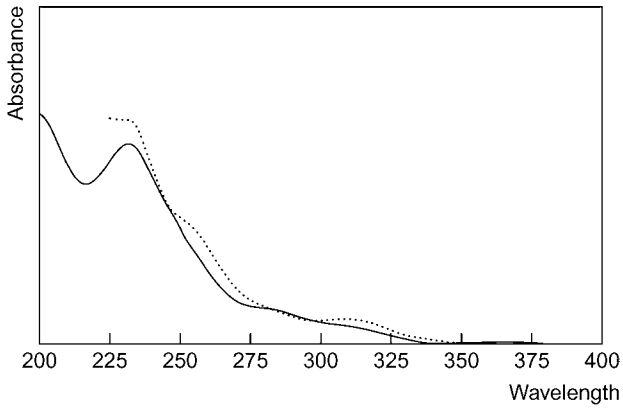
Colour Test Formaldehyde-sulfuric acid—orange.

Thin-layer Chromatography System TA—R_f 0.75; system TB—R_f 0.27; system TC—R_f 0.73; system TD—R_f 0.58; system TE—R_f 0.76; system TF—R_f 0.49; system TL—R_f 0.59; system TAD—R_f 0.72; system TAE—R_f 0.82; system TAF—R_f 0.85; system TAJ—R_f 0.67; system TAK—R_f 0.48; system TAL—R_f 0.96 (acidified iodoplatinate solution—positive; Dragendorff spray—positive; FPN reagent—yellow; Marquis test—yellow).

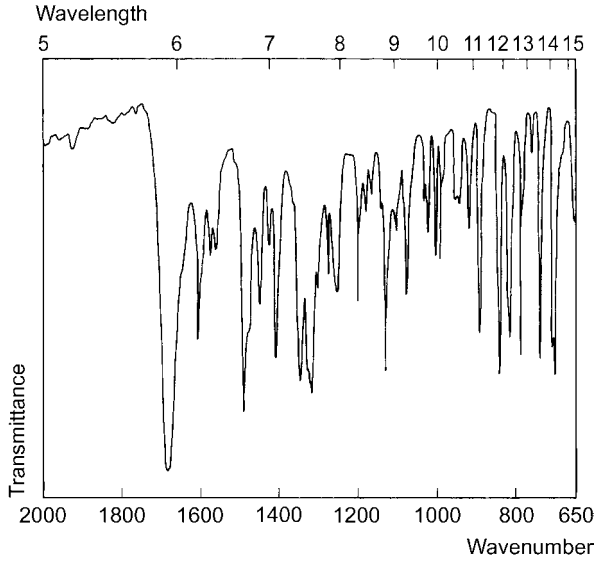
Gas Chromatography System GA—diazepam RI 2428, M (nordazepam[desmethyldiazepam or nordiazepam]) RI 2490, M (oxazepam) RI 2325, M (temazepam) RI 2595; system GB—diazepam RI 2556, M (nordazepam) RI 2625, M (oxazepam) RI 2438, M (temazepam) RI 2727; system GF—RI 3045; system GG—diazepam RI 2940, M (nordazepam) RI 3041, M (oxazepam) RI 2803, M (temazepam) RI 3125. (Nordazepam, oxazepam and temazepam are metabolites of diazepam).

High Performance Liquid Chromatography System HA—diazepam *k* 0.1, M (nordazepam) *k* 0.2; system HI—diazepam *k* 9.47, M (nordazepam) *k* 8.00, M (oxazepam) *k* 4.62, M (temazepam) *k* 5.68; system HJ—diazepam *k* 2.29; system HK—diazepam *k* 2.49, M (nordazepam) *k* 1.99, M (oxazepam) *k* 0.73, M (temazepam) *k* 0.60; system HX—RI 528; system HY—RI 429; system HZ—RT 8.4 min; system HAA—RT 20.3 min; system HAF—RT 29.8 min; system HAL—RT 13.2 min; system HAM—diazepam RT 10.3 min, M (oxazepam) RT 3.4 and M (oxazepam) RT 4.4 min; system HAX—diazepam RT 7.7 min, M (nordazepam) RT 6.7 min, M (oxazepam) RT 6.0 min, M (temazepam) RT 8.9 min; system HAY—diazepam RT 8.8 min, M (nordazepam) RT 6.8 min, M (oxazepam) RT 4.5 min, M (temazepam) RT 6.7 min; system HAZ—*k* 2.25; system HBH—diazepam *k* 10.4, M (nordazepam) *k* 8.97, M (oxazepam) *k* 5.42, M (temazepam) *k* 6.80; system HBI—diazepam *k* 2.29, M (nordazepam) *k* 1.89, M (oxazepam) *k* 1.25, M (temazepam) *k*1.49.

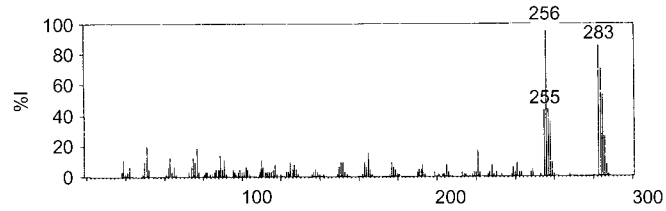
Ultraviolet Spectrum Aqueous acid—242 (A^1_1= 1020a), 284, 366 nm.



Infrared Spectrum Principal peaks at wavenumbers 1681, 1313, 705, 840, 1125, 740 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 256, 283, 284, 285, 257, 255, 258, 286 (diazepam); 242, 269, 270, 241, 243, 271, 244, 272 (nordazepam); 257, 77, 268, 239, 205, 267, 233, 259 (oxazepam); 271, 273, 300, 272, 256, 77, 255, 257(temazepam).



Quantification

Blood **GC** Columns: DB-1 and DB-1701 (15 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 120° for 1 min to 28° at 30°/min to 230° at 2°/min to 300° at 30°/min for 1 min or 120° for 1 min to 230° at 40°/min to 280° at 8°/min for 9 min. ECD. Limit of detection, 0.084 or 0.096 µmol/L [Gjerde *et al.* 1992]. Column: SE-54 5% phenyl methyl silicone (25 m × 0.31 mm i.d., 0.17 µm). Carrier gas: He, 2–3 mL/min. Temperature programme: 200° for 1 min to 290° at 10°/min. NPD or ECD. Retention time: 5.57 min. Limit of detection not reported [Lillsunde, Seppälä 1990].

GC-MS Column: 100% methylsiloxane or 5% phenylsiloxane-95% methylsiloxane. Carrier gas: 1.0 mL/min. Temperature programme: 140° for 0.5 min to 320° at 25°/min. SIM acquisition mode. Limit of detection, 12.5 µg/L [Goldberger *et al.* 2010]. Column: HP-5 MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 120° to 295° at 10°/min for 5 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification and limit of detection, 117 and 38.6 µg/L, respectively [Papoutsis *et al.* 2010]. Column: 5% diphenyldimethylsiloxane DB-5MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 2 mL/min. Temperature programme: 150° for 0.6 min to 230° at 40°/min to 310° at 10°/min. EI ionisation, SIM acquisition mode. Limit of quantification, 25 µg/L, limit of detection, 25 µg/L [Tiscione *et al.* 2008]. Column: DB-5 cross-linked 5% phenylmethylsiloxane (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 50° for 2 min to 180° at 30°/min to 280° at 5°/min for 19 min. Full scan mode. Retention time: 21.1 min. Limit of detection, 0.05 mg/L [Paterson *et al.* 2004]. Column: DB5-MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° to 230° at 8°/min to 313° at 4°/min. EI ionisation at 70 eV or CI in positive ion mode. Limit of detection, 10 µg/L [Pirnay *et al.* 2002]. Column: HP-5 MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 120° to 295° at 10°/min for 5 min. EI ionisation [Papoutsis *et al.* 2010]. Column: BPX5 capillary (15 m × 0.32 mm i.d., 0.25 µm). SIM acquisition mode. Limit of detection, 0.2–20 µg/L [Inoue *et al.* 2000].

HPLC Column: Chromolith Performance (RP-18e) (100 × 4.6 mm). Mobile phase: 35 mmol/L phosphate buffer (pH 2.1) : acetonitrile (70 : 30), flow rate 2 mL/min. DAD (λ= 220 nm). Limit of quantification, 30 µg/L [Bugey, Staub 2004]. Column: Lichrospher select B (125 × 3 mm). Mobile phase: acetonitrile : 20 mmol/L potassium dihydrogen phosphate (pH 2.1, 30 : 70 to 35 : 65 at 30 min), flow rate 0.5 mL/min to 0.3 mL/min at 30 min. DAD (λ= 254 nm). Limit of quantification, 30 µg/L, limit of detection, 10 µg/L [El Mahjoub, Staub 2001a]. Column: Lichrospher Select B C_8 (125 × 3 mm i.d., 5 µm). Mobile phase: 20 mmol/L phosphate buffer (pH 2.1) : acetonitrile (65 : 35), flow rate 0.3 mL/min. UV detection (λ= 220 nm). Limit of quantification, 5 µg/L, limit of detection, 2 µg/L [El Mahjoub, Staub 2000a].

LC-MS Column: Acquity BEH Phenyl (100 × 2.1 mm i.d., 1.7 µm). Mobile phase: 0.1% formic acid in water : 0.1% formic acid in acetonitrile (80 : 20 for 0.25 min to 65 : 35 over 2.25 min for 2.5 min to 20 : 80 over 1 min to 80 : 20 over 0.01 min for 1.4 min), flow rate 0.5 mL/min. ESI, MRM acquisition mode. Limit of detection not reported [Gunn *et al.* 2010]. Column: Restek Allure C_{18} (150 × 3.2 mm i.d., 5 µm). Mobile phase: 5 mmol/L ammonium acetate : acetonitrile : methanol (90 : 5 : 5 to 50 : 25 : 25 at 7 min to 10 : 45 : 45 at 27 min for 3 min to 95 : 5 : 5 at 31 min), flow rate 0.45 mL/min. APCI. Limit of quantification, 2 µg/L [Dussy *et al.* 2006]. Column: XTerra MS C_{18} (150 × 2.1 mm i.d., 3.5 µm). Mobile phase: 0.006 mol/L formic acid (pH 3.0) : methanol (70 : 30 to 60 : 40 at 5 min to 50 : 50 in 25 min to 40 : 60 at 30 min for 5 min to 70 : 30 at 36 min for 9 min), flow rate 0.2 mL/min. Limit of quantification, 13.34.0 µg/L, limit of detection, 4.0 µg/L [Smink *et al.* 2004].

Plasma **GC** NPD. Limit of detection, 20–115 nmol/L. [Ugland *et al.* 2000]. Column: CPSIL 8 CB (25 × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 150° to 230° at 40°/min for 2 min to 250° at 5°/min for 1 min to 300° at 15°/min for 3 min. NPD. Limit of detection, 0.01 µmol/L [Reubsaet *et al.* 1998]. Column: DB-1 methyl silicone (30 m × 0.2 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature: 300°. NPD. Limit of detection, 100 nmol/L [Krogh *et al.* 1997]. Column: Ultra 2 5% phenyl methyl silicone (25 m × 0.32 mm i.d., 0.52 µm). Carrier gas: He, 2.1 mL/min. Temperature programme: 210° to 285° at 2.5°/min. NPD. Retention time: 0.722. Limit of quantification, 2 µg/L [Gaillard *et al.* 1993].

GC-MS Column: HP-1 capillary (12 m × 0.2 mm i.d., 330 nm). Carrier gas: He, 0.6 mL/min. Temperature programme: 100° for 2 min to 310° at 40°/min for 2.5 min. EI ionisation, SIM acquisition mode. Retention time: 6.68 min. Limit of quantification, 0.05 mg/L [Peters *et al.* 2005].

HPLC Column: LC-18 DB (250 × 4.6 mm i.d., 5 µm). Mobile phase: 5 µmol/L potassium dihydrogen phosphate buffer solution (pH 6.0) : methanol : diethyl ether (55 : 40 : 5), flow rate 0.8 mL/min. UV detection (λ= 245 nm). Limit of quantification, 30 and 50 µg/L [Borges *et al.* 2009]. Column: C_{18} (250 × 4.6 mm i.d.). Mobile phase: methanol : water (65 : 35), flow rate 1.0 mL/min. UV detection (λ= 230 nm) [Liang *et al.* 2009]. Column: Chromolith Performance RP-18e (100 × 4.6 mm i.d.).

Mobile phase: 10 µmol/L phosphate buffer (pH 2.5) methanol : acetonitrile (63 : 10 : 27), flow rate 2 mL/min. Limit of quantification, 2 µg/L [Rouini *et al.* 2008]. Column: Kromasil C_8 (250 × 5 mm i.d., 5 µm). Mobile phase: methanol : acetonitrile : 0.05 mol/L ammonium acetate. Limit of quantification, 0.07–1.57 mg/L, limit of detection, 0.02–0.47 mg/L [Uddin *et al.* 2008].

LC-MS Column: XTerra MS C_{18} (150 × 2.1 mm i.d., 3.5 µm). Mobile phase: acetonitrile : water : 100 mmol/L ammonium formate (pH 3.0, 55 : 40 : 5), flow rate 0.125 mL/min. ESI, MRM acquisition mode. Retention time: 7.75 min. Limit of quantification, 20 µg/L, limit of detection, 10 µg/L [Marin *et al.* 2008; Marin, McMillin 2010]. Column: XTerraMS C8 (100 × 2.1 mm, i.d., 3.5 µm). Mobile phase: 2 mmol/L ammonium formate buffer (pH 3) : acetonitrile (99 : 1 to 98 : 2 from 2 to 3 min to 5 : 95 at 3.1 min until 7.5 min to 99 : 1 at 8 min for 3 min), flow rate 0.2 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention time: 7 to 7.5 min. Limit of quantification, 1 µg/L, limit of detection, 0.1 µg/L [Abbara *et al.* 2008]. Column: Merck LiChroCART (125 × 2 mm i.d.). Mobile phase: 5 mmol/L ammonium formate : acetonitrile (60 : 40 for 5.5 min to 10 : 90 in 8 min to 60 : 40 in 9.5 min for 10 min). APCI, SIM acquisition mode. Limit of quantification, 0.1 mg/L, limit of detection, 0.01 mg/L [Kratzsch *et al.* 2004].

Serum **GC-MS** Column: HP-5 MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 60° for 1 min to 280° at 10°/min for 20 min. EI ionisation at 70 eV. Retention time: 23.1 min. Limit of quantification, 0.025 mg/L, limit of detection, <0.025 mg/L [Maresova *et al.* 2008]. Column: SPB-1 (30 m × 0.75 mm i.d., 1.0 µm). Carrier gas: He, 0.2 bar. Temperature programme: 230° for 2 min to 280° at 7°/min for 2 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 3.0 ng/L, limit of detection, 2.0 ng/L [Duthel *et al.* 1992].

HPLC See Blood [Dussy *et al.* 2006]. Column: Symmetry Shield RP8 (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.1 mol/L potassium dihydrogen phosphate (40 : 60), flow rate 0.9 mL/min. UV detection (λ = 230 nm). Limit of detection, 1.0 µg/L [He *et al.* 2005]. Column: Kromasil C_{18}(150 × 4.6 mm i.d., 5 µm). Mobile phase: butanol : 0.06 mol/L SDS (pH 7, 5 : 95), flow rate 1.0 mL/min. UV detection (λ = 230 nm). Limit of detection, 10 µg/L [Capella-Peiró *et al.* 2002]. Column: Supelcosil C_{18} (50 × 4.6 mm i.d., 5 µm). Mobile phase: water : methanol (52 : 48), flow rate 1.0 mL/min. UV detection (λ = 230 nm). Limit of detection, 46 µg/L [Mullett, Pawliszyn 2002]. Column: Supelcosil C_{18} (50 × 4.6 mm i.d., 5 µm). Mobile phase: water : methanol (54 : 46), flow rate 1.0 mL/min. UV detection (λ = 230 nm). Limit of quantification, 150.0 µg/L, limit of detection, 45.0 µg/L [Mullett, Pawliszyn 2001]. See Blood [El Mahjoub, Staub 2000a]. Column: µBondapak C_{18} (300 × 3.9 mm i.d., 10 µm). Mobile phase: flow rate 1.5 mL/min. DAD (λ = 254 nm). Limit of quantification, 127.6 µg/L, limit of detection, 35.7 µg/L [Ahrens *et al.* 2000]. Column: TSK gel Super-ODS (100 × 4.6 mm i.d., 2 µm) or Hypersil ODS-C_{18} (100 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 5 µmol/L sodium dihydrogen phosphate (pH 6, 45 : 55), flow rate 0.65 mL/min. UV detection (λ = 254 nm) [Tanaka *et al.* 1996]. Column: Supelcosil C_8 DB 5 (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water : 0.5 mol/L monobasic potassium phosphate (370 : 600 : 30), flow rate 1.65 mL/min. UV detection (λ = 219 nm). Limit of quantification, 1 µg/L [Welk 1996]. Column: Chromspher C_8 (100 × 3.0 mm i.d., 5 µm). Mobile phase: methanol : water (20 : 80 for 2 min to 30 : 70 at 2.2 min until 4 min to 40 : 60 at 4.4 min until 4.5 min to 43 : 57 at 5 min to 45 : 55 at 6 min to 52 : 48 at 7 min to 58 : 42 at 9.5 min to 75 : 25 at 10.5 min for 5 min to 20 : 80 at 15.3 min until 19 min), flow rate 0.7 mL/min. DAD (λ = 450 nm). Limit of quantification, 30 µg/L, limit of detection, 10 µg/L [Lambert *et al.* 1995]. See also Goldnik *et al.* [1993].

LC-MS See Plasma [Marin *et al.* 2008; Marin, McMillin 2010]. Unison UK-C_{18} RP ODS (150 × 2 mm i.d., 3 µm). Mobile phase: 10 mmol/L aqueous ammonium formate containing 0.1% formic acid : methanol containing 0.1% formic acid (70 : 30 over 20 min to 20 : 80 over 5 min), flow rate 0.25 mL/min. MRM acquisition mode. Limit of quantification, 6.8 µg/L, limit of detection, 2.0 µg/L [Nakamura *et al.* 2009]. Column: LiChrospher 60-RP select B (100 × 2.0 mm i.d., 5 µm). Mobile phase: methanol : water : acetonitrile (1 : 1 : 1), flow rate 100 µL/min. APCI, SRM acquisition mode. Limit of quantification, 2 µg/L [Kleinschnitz *et al.* 1996].

Urine **GC** See Plasma [Ugland *et al.* 2000]. Column: DB-17 (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 80 kPa. Temperature programme: 150° for 1 min to 230° at 10°/min for 5 min to 300° at 10°/min for 9 min. ECD. Limit of detection, 160 µg/L [Guan *et al.* 1999]. See Plasma. Limit of detection, 0.01–0.45 µmol/L [Reubsaet *et al.* 1998]. Column: DB-17 (15 m). Carrier gas: N_2. Temperature: 225°. ECD. Retention time: 2.07 min. Limit of detection, 0.13 ng [Beischlag, Inaba 1992].

HPLC See Plasma [Uddin *et al.* 2008]. Column: Inertsil C_8 (250 × 4 mm i.d., 5 µm). Mobile phase: ammonium acetate : 0.05 mol/L methanol : acetonitrile (33 : 57 : 10). UV detection (λ = 240 nm). Limit of detection, 2.6–12.6 ng [Samanidou *et al.* 2007]. Column: Hypersil C_{18} (100 × 4.6 mm i.d., 3 µm). Mobile phase: 0.04 mol/L phosphate (pH 4)-0.4% octylamine : acetonitrile (73 : 27, 70 : 30, 65; 35 or 60 : 40), flow rate 1 mL/min. DAD (λ = 240 nm). Retention time: 17.9 min. Limit of detection not reported [Segura *et al.* 2001]. Hypersil BDS RP_{18} (250 × 4.0 mm i.d., 5.0 µm). Mobile phase: methanol : acetonitrile : 0.05 mol/L potassium dihydrogen phosphate (pH 3.5, 50 : 10 : 40), flow rate 1.2 mL/min. UV detection (λ = 232 nm). Retention time: 11.6 min. Limit of quantification, 10 µg/L [Azzam *et al.* 1998]. See Serum [Kleinschnitz *et al.* 1996]. Column: LiChrospher 100 RP-18(e) (250 × 4 mm i.d., 5 µm). Mobile phase: water : methanol : triethylamine (pH 5.5, 70 : 30 : 0.1), flow rate 0.7 mL/min. UV detection (λ = 240 nm). Limit of detection, 2 µg/L [Chiba *et al.* 1995].

GC-MS See Blood [Goldberger *et al.* 2010].

LC-MS Column: Hypurity C_8 (150 × 3 mm i.d.). Mobile phase: 4 mmol/L ammonium acetate (pH 6.8) in methanol-water (5 : 95) : 1% propan-2-ol, 0.05% formic acid in methanol (100 : 0 for 1 min to 0 : 100 at 3 min for 1.5 min to 100 : 0 over 0.1 min for 1.4 min). TIS, MRM acquisition mode. Limit of quantification, 5 µg/L, limit of detection, 2.5 µg/L [Glover, Allen 2010]. See Plasma [Marin *et al.* 2008; Marin, McMillin 2010]. Column: Shodex MSpak GF-310 4B (50 × 4.6 mm i.d., 6 µm). Mobile phase: 10 mmol/L ammonium acetate : acetonitrile (100 : 0 for 3 min to 0 : 100 from 3.01 to 6 min to 100 : 0 from 6.01 to 10 min for 5 min), flow rate 0.9 mL/min for 3 min to 0.3 mL/min until 10 min to 0.9 mL/min. ESI, positive ion mode. Limit of quantification, 0.5 µg/L, limit of detection, 0.1 µg/L [Umezawa *et al.* 2008]. Column: Symmetry C_{18} (100 × 2.1 mm i.d., 3.5 µm). Mobile phase: acetonitrile : 5 mmol/L ammonium acetate (pH 5, 10 : 90 to 30 : 70 at 5 min to 80 : 20 at 9 min to 10 : 90 at 9.1 min), flow rate 0.3 mL/min. ESI, MRM acquisition mode. Limit of quantification, 0.01 µmol/L [Hegstad *et al.* 2006]. See Serum [Kleinschnitz *et al.* 1996].

CE-MS Running buffer: methanol : water (50 : 50) containing 0.1% formic acid, flow rate 0.5 mL/min. ESI, TOF. Limit of quantification, 12.5 µg/L, limit of detection, 1.1 µg/L [Blas, McCord 2008].

Meconium **LC-MS** See Plasma [Marin *et al.* 2008; Marin, McMillin 2010].

Oral Fluid **HPLC** See Plasma [Uddin *et al.* 2008]

Hair **GC-MS** Column: HP-Ultra 2 capillary (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 2 mL/min. Temperature programme: 70° for 2 min to 220° at 25°/min to 255° at 5°/min to 300° for 7 min. EI ionisation at 70 eV. Retention time: 13.1 min. Limit of detection, 0.01 ng/mg. [Yegles *et al.* 1997].

HPLC Column: Lichrospher select-B (125 × 3 mm i.d., 5 µm). Mobile phase: acetonitrile : 20 mmol/L potassium dihydrogen phosphate (pH 2.1, 30 : 70 to 35 : 65 in 30 min), flow rate 0.5 mL/min to 0.3 mL/min at 30 min. UV detection (λ = 254 nm). Limit of quantification, 0.3–0.45 ng/mg, limit of detection, 0.2 ng/mg [El Mahjoub, Staub 2001b].

LC-MS Mobile phase: 3 mmol/L ammonium formate and 0.001% formic acid in water : acetonitrile (65 : 35 to 20 : 80 after 13 min to 10 : 90 at 13.5 min until 16.5 min to 65 : 35 until 20 min), flow rate 0.3 mL/min. ESI, positive ion mode. Limit of quantification, 0.22 ng/30 mg, limit of detection, 0.13 ng/30 mg [Miller *et al.* 2006].

Disposition in the Body Diazepam is rapidly and completely absorbed after oral administration, with peak plasma level occurring within ~30–90 min. The main metabolic reactions are *N*-demethylation, 3-hydroxylation and glucuronic acid conjugation. The major active metabolite is desmethyldiazepam (nordazepam), which accumulates during chronic dosing; other metabolites include oxazepam and temazepam, both of which are active. The formation of nordazepam and oxazepam is catalysed by the P450 isozymes CYP2C19 and CYP3A. Only small traces of unchanged diazepam are excreted in the urine and the relative amounts of metabolites are variable and appear to be dose dependent. Approximately 70% of a dose is excreted in the urine, mainly as oxazepam glucuronide and conjugated nordazepam, together with smaller amounts of conjugated temazepam. Approximately 10% of the dose may be eliminated in the faeces. Diazepam and its metabolites cross the blood–brain barrier and the placenta; they are also found in breast milk.

Diazepam is a metabolite of ketazolam and medazepam.

Therapeutic Concentration In plasma, usually in the range 0.1–2.5 mg/L. After discontinuation of chronic therapy, concentrations of nordazepam may be substantially higher than diazepam and both unchanged drug and metabolite are still detectable 7 days after cessation of dosing.

Following a single oral dose of 10 mg to 4 subjects, peak blood concentrations of 0.14–0.19 mg/L (mean, 0.15) were attained in 1–1.5 h; average peak concentrations of 0.03 mg/L of nordazepam were attained after 24 h [Kaplan *et al.* 1973].

After chronic daily oral dosing of 5 mg twice daily to 15 subjects, steady-state plasma concentrations were: diazepam 0.09–0.37 mg/L (mean, 0.23), nordazepam 0.13–0.46 mg/L (mean, 0.29), oxazepam 0.01–0.03 mg/L (mean, 0.02), temazepam 0.01–0.05 mg/L (mean, 0.03) [Zingales 1973].

After intranasal administration of diazepam to nine healthy subjects (20 mg/mL solution; 100 µL into one nostril ≡ 2 mg dose), a mean serum plasma concentration of 0.039 mg/L was attained in 18 min; this equated to 32.9% of the concentration that was attained 10 min after the same dose given IV to the same subjects [Gizurarson *et al.* 1999].

Toxicity Toxic effects may be produced by blood concentrations >1.5 mg/L; fatalities caused by diazepam alone are rare but may occur at blood concentrations >5 mg/L.

In a review of 914 drug-related deaths in which diazepam was involved, it was found to be the sole cause of death in only 2 cases; postmortem concentrations of diazepam in these 2 cases were blood 5 and 19 mg/L, liver 13 µg/g in the first case [Finkle *et al.* 1979].

In a fatality from diazepam and alcohol ingestion, postmortem tissue diazepam concentrations were: blood 1.3 mg/L, bile 4.5 mg/L, brain 2.4 µg/g, kidney 11.7 µg/g, liver 11.4 µg/g, urine 6.6 mg/L [Simon 1976].

Half-life Plasma half-life, diazepam 20–100 h (mean, 48); nordazepam, ~40–100 h but there is considerable intersubject variation (see Nordazepam monograph). The plasma half-life appears to be increased in elderly subjects and neonates, and in subjects with liver disease; sex differences have also been suggested.

Volume of Distribution Diazepam and nordazepam, 0.5–2.5 L/kg; increased in elderly subjects.
Clearance Plasma clearance, diazepam ~0.3–0.5 mL/min/kg, nordazepam ~0.1–0.3 mL/min/kg.
Distribution in Blood Plasma : whole blood ratio, diazepam 1.8, nordazepam 1.7.
Protein Binding Diazepam 98–99%, nordazepam ~97%.
Note For reviews of the clinical pharmacokinetics of diazepam, see Friedman *et al.* [1992] and Mandelli *et al.* [1978].
Dose Usually 5 to 30 mg daily.
