Hair **LC-MS** Column: XTerra MSC_{18} (150 × 2.1 mm i.d., 3.5 µm). Mobile phase: 50 mmol/L ammonium formate (pH 3.0) : acetonitrile containing 0.05% formic acid (95 : 5 for 2 min to 10 : 90 over 16 min to 95 : 5 over 4 min for 6 min), flow rate, 0.2 mL/min. ESI, positive ion mode, full scan mode. Limit of quantification, 0.008 ng/mg, limit of detection, 0.0024 ng/mg [Klinzig *et al.* 2007].

Disposition in the Body Absorbed after oral administration, but there is thought to be considerable first-pass metabolism; rapidly absorbed after IM or SC injection. The major metabolic reaction is conjugation to form nalbuphine glucuronide (inactive); oxidation to 6-oxonalbuphine occurs, and the desalkyl derivative, 7,8-dihydro-14-hydroxynormorphine, has also been identified as a metabolite. Unchanged nalbuphine, its conjugates, and the 2 metabolites have been detected in the urine.

Therapeutic Concentration

A nurse had hair concentrations of nalbuphine of 5.07, 7.06, and 5.7 ng/mg [Klinzig *et al.* 2007].

Ten children undergoing general anaesthesia were administered 0.3 mg/kg by the rectal route. The mean peak plasma concentration was 24 ± 15 µg/L reached at 25 ± 11 min. The elimination half-life was 2.7 ± 0.7 h [Bessard *et al.* 1997].

A study with 28 participants reported a fetomaternal ratio of 0.74. Plasma concentrations ranged from 5.0 ± 79.2 µg/L in the maternal samples and from 3.0 ± 46.6 µg/L in umbilical cord samples [Nicolle *et al.* 1996].

Patients receiving 25 µg/kg/h IV nalbuphine had a steady-state concentration of 17.7 µg/L at ~4 h. After the infusion stopped, the plasma concentrations decline monoexponentially with a terminal half-life of 2 h [Dubé *et al.* 1988].

Following the oral administration of 60 mg nalbuphine to 10 healthy volunteers, a mean maximum plasma concentration of 21.4 µg/L was reached at 46.6 min [Aitkenhead *et al.* 1988].

Twenty-four healthy male volunteers were administered nalbuphine 10 mg IV over 2 min, 45 mg orally as a solution, or 45 mg as 2 separate tablet formulations. The following pharmacokinetic parameters were measured:

	C_{max} (µg/L)	t_{max} (h)	$t_{1/2}$ (h)
45 mg IV			2.3
45 mg as solution	14.4	0.94	7.4
45 mg formulation A	15.1	1.23	7.7
45 mg formulation B	15.5	1.11	6.9

[Lo *et al.* 1987].

A single subject administered 45 mg nalbuphine hydrochloride achieved a plasma concentration of 9.1µg/L at 1 h. The terminal half-life was 7.6 h [Lo *et al.* 1984].

Following a single oral dose of 30 mg to 3 subjects, a peak plasma concentration of ~0.015 mg/L was attained in 1 h. Following a single intramuscular dose of 10 mg to 6 subjects, peak plasma concentrations of 0.038–0.059 mg/L (mean 0.052) were attained in 15–30 min (Bullingham 1984).

Note For pharmacokinetic parameters in cardiac patients, see Lake *et al.* [1982].

Bioavailability 16.4–17.4% [Lo *et al.* 1987], 7.3 % [Lo *et al.* 1984], 11.8% [Aitkenhead *et al.* 1988].

Half-life Plasma half-life, approximately 5 h.

Clearance 1.42 L/min [Lo *et al.* 1984].

Note For a review of nalbuphine, see Errick and Heel [1983].

Dose 10 to 20 mg of nalbuphine hydrochloride parenterally, every 3 to 6 h.

Naled

Acaricide, Insecticide, Organophosphate

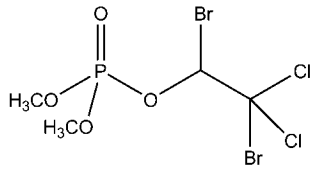
$C_4H_7Br_2Cl_2O_4P = 380.8$

CAS—300-76-5

IUPAC Name (1,2-Dibromo-2,2-dichloroethyl) dimethyl phosphate

Synonyms Dimethyl 1,2-dibromo-2,2-dichloroethyl phosphate; ENT-24988; OMS-75; phosphoric acid 1,2-dibromo-2,2-dichloroethyl dimethyl ester; RE-4355.

Proprietary Names *Alvora*; *Bromchlorphos*; *Bromochlorphos*; *Bromex*; *Dibrom*; *Dibromfos*; *Hibrom*; *Fly-Killer-D*; *Lucanal*; *Ortho-Dibrom*.



Chemical Properties A colourless solid or a straw-coloured liquid with a slightly pungent odour. Mp 26.5° to 27.5°. Bp 110° at 0.5 mmHg. It is soluble in aromatic hydrocarbons, chlorinated hydrocarbons, alcohols and ketones; sparingly soluble in mineral oils and petroleum solvents; practically insoluble in water (<1 mg/L at 20°) [O' Neil *et al.* 2006]. Log *P* (octanol/water), 1.38 [Hansch *et al.* 1995]. Unstable in the field environment but stable at 4° and 23° for at least 7 days when stored in hexane [Zhong, Latham 2001].

Quantification

***Other* GC** Environmental Samples. Column: DB-5 fused silica capillary (30 m × 0.25 mm i.d., 0.1 µm). Temperature programme: 120° for 0.5 min to 260° at 25°/min for 1 min. TSD. Limit of quantification, 10 µg/L, limit of detection, 1 µg/L [Zhong, Latham 2001].

LC-MS Fruit and Vegetables. Column: ODS. Mobile phase: acetic acid : ammonium acetate : methanol. ESI, positive ion mode, MRM acquisition mode. Limit of detection, 1 µg/kg [Ibuki *et al.* 2007].

Disposition in the Body Naled is readily absorbed through the skin, lungs and intestines into the bloodstream [EXTOXNET 1996].

Toxicity

Naled is moderately to highly toxic if ingested orally, with reported oral LD_{50} values of 91 to 430 mg/kg in rats and 330 to 375 mg/kg in mice. It is moderately toxic through contact with the skin, with reported dermal LD_{50} values of 1100 and 800 mg/kg in rabbits and rats, respectively. Acute exposure to naled may lead to the following symptoms: numbness, tingling sensations, incoordination, headache, dizziness, tremour, nausea, abdominal cramps, sweating, blurred vision, respiratory depression and slow heartbeat. Chronic exposure to naled may also cause the neurological and neuromuscular effects associated with cholinesterase inhibition [EXTOXNET 1996].

Nalidixic Acid

Antibacterial (Urinary)

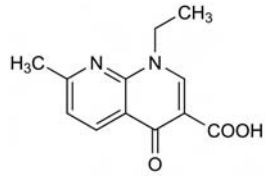
$C_{12}H_{12}N_2O_3 = 232.2$

CAS—389-08-2

IUPAC Name 1-Ethyl-1,4-dihydro-7-methyl-4-oxo-1,8-naphthyridine-3-carboxylic acid

Synonyms Nalidixinic acid; Win-18320.

Proprietary Names *Acidex*; *Acinal*; *Betaxina*; *Fardixon*; *Labydon*; *Lidinal*; *Lidixin*; *Nadiwil*; *Nalidixan*; *Nalidixin*; *Nalidoid*; *Naligram*; *Nalissina*; *Nalix*; *NegGram*; *Negram*; *Puromylon*; *Seltomylon*; *Unidixina*; *Uralgin*; *Uriben*; *Uri-Flor*; *Urigram*; *Urlix*; *Urogram*; *Wintomilon*; *Winlomylon*; *Wintomylon*. It is an ingredient of *Mictral*.

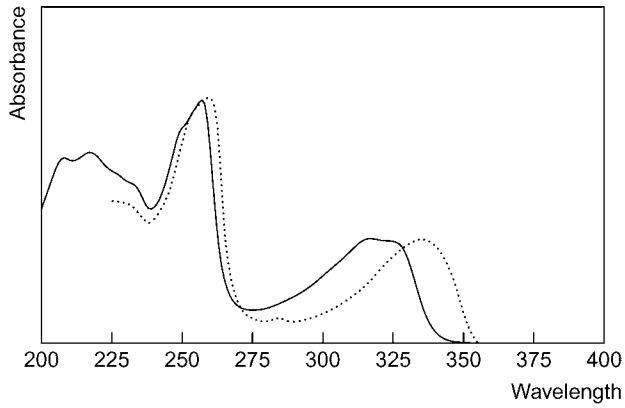


Chemical Properties An almost white or very pale yellow crystalline powder. Mp 229° to 230°. Practically insoluble in water; soluble 1 in 910 of ethanol and 1 in 35 of chloroform; very slightly soluble in ether; soluble in solutions of alkali hydroxides and carbonates. pK_a 6.0. Log *P* (octanol/water), 1.6.

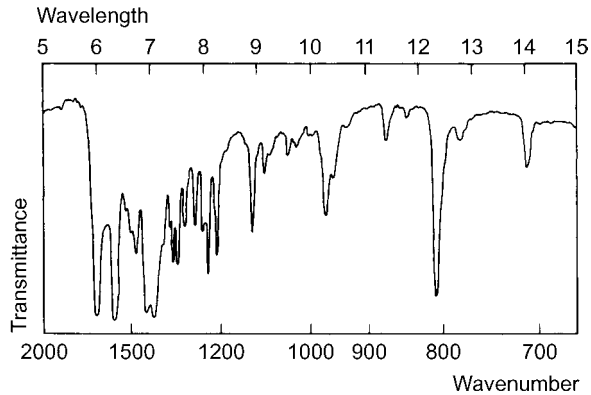
Thin-layer Chromatography System TD—R_f 0.39; system TE—R_f 0.02; system TF—R_f 0.31; system TAD—R_f 0.62; system TAE—R_f 0.63.

High Performance Liquid Chromatography System HY—RI 380; system HAA—retention time 16.0 min.

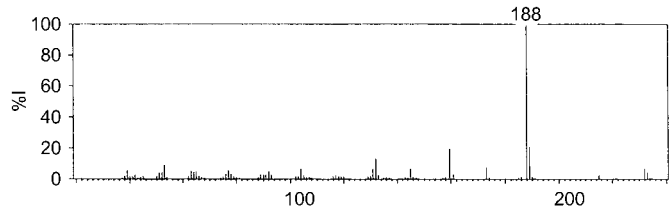
Ultraviolet Spectrum Aqueous acid—257 (A^1_1=1233b), 315 nm; aqueous alkali—258 (A^1_1=1120a), 334 nm.



Infrared Spectrum Principal peaks at wavenumbers 1613, 1704, 809, 1250, 1225, 1515 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 188, 189, 159, 132, 53, 173, 131, 145.



Quantification

Plasma **TLC** Fluorescence detection. Limit of detection, 200 µg/L [Hundt, Barlow 1981].

GC FID. Limit of detection, 5 mg/L [Roseboom *et al.* 1979].

HPLC For method of quantification for nalidixic acid and its metabolites, see Vree *et al.* [1993]. UV detection. Limit of detection, 500 µg/L for nalidixic acid, 7-hydroxynalidixic acid and 7-carboxynalidixic acid [Cuisinaud *et al.* 1980].

Urine **GC** FID. For method of quantification for nalidixic acid and 3,7-dicarboxynalidixic acid, see Wu *et al.* [1989].

HPLC UV and fluorimetric detection. For method of quantification for nalidixic acid and other quinolone antibacterials, see Duran Meras *et al.* [1997]. See Plasma [Vree *et al.* 1993]. See Plasma [Cuisinaud *et al.* 1980].

Disposition in the Body Nalidixic acid is readily absorbed after oral administration. The major metabolite, 7-hydroxynalidixic acid, is active; other metabolites include glucuronide conjugates of nalidixic acid and 7-hydroxynalidixic acid, and a 7-carboxy metabolite, all of which are inactive. About 80% of a dose is excreted in the urine in 8 h, mainly as glucuronide conjugates with about 2 to 3% as unchanged drug.

Therapeutic Concentration

Following a single oral dose of 1 g to 11 female subjects, a mean peak plasma concentration of nalidixic acid of 27.3 mg/L was attained in 1.5 h; concentrations of 7-hydroxynalidixic acid reached a maximum of about 10 mg/L within 1 h. After repeated oral administration of 1 g twice daily to the same subjects, a peak plasma concentration of 33 mg/L of nalidixic acid was reported on the seventh day. Urinary concentrations of nalidixic acid plus 7-hydroxynalidixic acid following single or multiple dose administration were in excess of about 200 mg/L for 8 h in all subjects, and in some cases >50 mg/L for 12 h [Ferry *et al.* 1981].

Toxicity Toxic effects have been associated with plasma concentrations >40 mg/L.

Half-life Plasma half-life, nalidixic acid and the 7-hydroxy metabolite about 7 h; increased in renal failure to about 20 h.

Volume of Distribution About 0.4 L/kg.

Protein Binding Nalidixic acid about 93%, 7-hydroxynalidixic acid about 60%.

Dose 2 to 4 g daily.

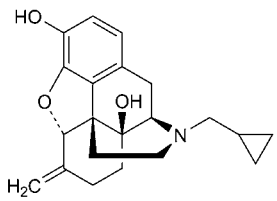
Nalmefene

Narcotic Antagonist

$C_{21}H_{25}NO_3$ = 339.4

CAS—55096-26-9

Synonyms (5α)-17-(Cyclopropylmethyl)-4,5-epoxy-6-methylenemorphinan-3,14-diol; JF-1; ORF-11676.



Chemical Properties A white to off white crystalline powder with Mp 188° to 190°. Soluble in water (140 mg/L at 25°). Log *P* (octanol/water), 2.66 [Meylan, Howard 1995]. Stable in plasma for at least 1 month at −25° [Xie *et al.* 2002].

Nalmefene Hydrochloride

$C_{21}H_{25}NO_3$,HCl = 375.9

CAS—58895-64-0

Synonyms Nalmetrene hydrochloride; 6-desoxy-6-methylene-naltrexone hydrochloride.

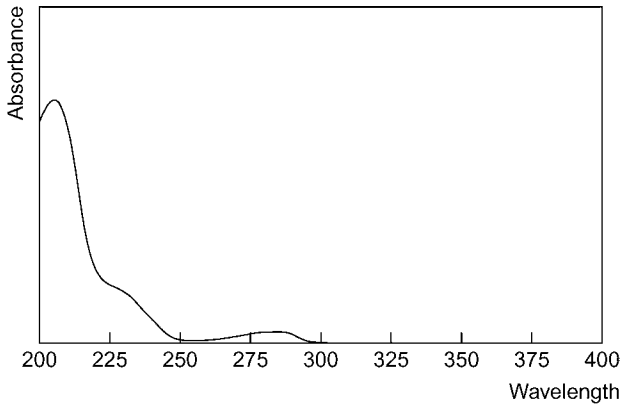
Proprietary Name *Revex*

Chemical Properties A white to off white crystalline powder with Mp 180° to 185° to a clear liquid. Very soluble in water and methanol; soluble in ethanol (86.2 g/L), acetonitrile (1.07 g/L), acetone (0.23 g/L), and chloroform (0.13 g/L). pK_a 7.63. Log *P* (octanol/water), −1.125. Revex was uniformly stable in injectable solutions for up to 72 h when kept at 4, 21 or 40° [Murthy, Brittain 1996].

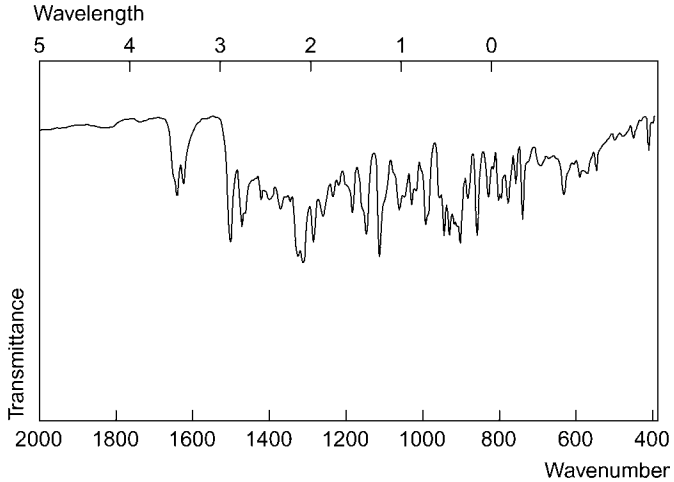
Thin-layer Chromatography Plates: silica gel 60 F_{254}. Solvent system: cyclohexane : chloroform : diethylamine (10 : 75 : 15). UV detection (λ = 254 nm). Reference compound: nalmefen, R_f 0.41; bisnalmefene, R_f 0.07 [Brittain 1996].

Gas Chromatography Column: HP1 (0.2 mm i.d., 0.33 µm). Temperature: 250°. Carrier gas: He, 0.9 mL/min. FID. RI: 2700 [Mills, Roberson 1993].

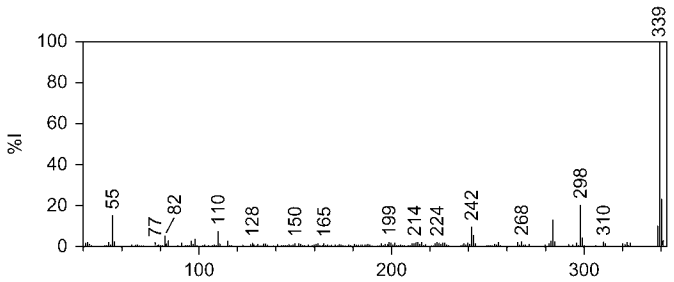
Ultraviolet Spectrum Methanol—211, 230, 285 nm (hydrochloride); aqueous acid (0.2 mol/L H_2SO_4)—284 nm; basic—298 nm.



Infrared Spectrum Principal peaks at wavenumber 1170, 904, 814, 1322, 1619, 1638 cm^{-1} (KBr pellet).



Mass Spectrum Principal ions at *m/z* 55, 339, 110, 36, 298, 82, 242, 96.



Quantification

Plasma **GC-MS** Column: HP-1 (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: CH_4:NH_3 (95 : 5). Temperature programme: 80° for 1 min to 280° at 30°/min. NCI, SIM acquisition mode. Retention time: 7.27 min. Limit of quantification, 0.5 µg/L [Xie *et al.* 2002].

HPLC Column: NovaPak phenyl (100 × 8 mm i.d., 4 µm). Mobile phase: acetonitrile : 5 mmol/L sodium pentanesulfonic acid monohydrate-0.0045% orthophosphoric acid (pH 3.1; 30 : 70), flow rate 1.2 mL/min. Electrochemical detection. Retention time: ~12 min. Limit of detection, 1 µg/L [Chou *et al.* 1993]. Column: µBondapak C_{18} (300 × 4 mm i.d.). Mobile phase: methanol : 0.05 mol/L tetramethylammonium hydroxide (25 : 75), flow rate 1.0 mL/min. Electrochemical detection. Limit of detection, 3 µg/L [Hsiao, Dixon 1983].

LC-MS Column: Zorbax Eclipse XDB C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 5 mmol/L ammonium acetate (75 : 26), flow rate 0.5 mL/min. TIS, MRM acquisition mode. Limit of quantification, 10 ng/L [Li *et al.* 2007].

Note For a radioimmunoassay for nalmefene in plasma, see Dixon *et al.* [1984].

Urine **HPLC** Column: µBondapak C_{18} (300 × 4 mm i.d.). Mobile phase: methanol : 0.05 mol/L tetramethylammonium hydroxide (25 : 75), flow rate 1.0 mL/min. Electrochemical detection. Limit of detection, 80 µg/L [Dixon *et al.* 1987].

Disposition in the Body Nalmefene is rapidly and almost completely absorbed following oral administration, but absorption is delayed after intramuscular and subcutaneous injection. It is metabolised in the liver, mainly to the inactive glucuronide conjugate; trace amounts of *N*-dealkylated metabolite have been detected. It is mainly excreted in urine (83%) with some of the dose excreted in the faeces. It may undergo enterohepatic recycling. Less than 5% of a dose is excreted unchanged in urine and 17% in faeces.

Therapeutic Concentration

Twenty-four healthy males (aged 19–46 years; mean, 29 years) were administered 2, 6, 12 or 24 mg doses of nalmefene hydrochloride after an overnight fast that continued for 4 h after administration. The peak plasma concentrations were ~12, 36, 85 and 110 µg/L for the 4 doses, respectively, observed by the end of infusion [Dixon *et al.* 1986].

Young, healthy individuals (mean age, 23.8 years) and elderly individuals (mean age, 70.7 years) were administered a 1 mg IV dose of nalmefene. Young (mean age 28.1 years) and elderly (mean age 68.3 years) individuals were also given a 2 mg IV dose. In both dose groups in the elderly there was a 30–40% smaller volume of distribution and a significantly shorter half-life [Frye *et al.* 1996].

Nine healthy male Chinese volunteers (aged 19–24 years) were administered a single dose of 30 µg nalmefene IV over a period of 5 min. There was considerable inter-individual variation, with the AUC_{0-t} ranging from 192.7–900.5 pg·h/mL [Li *et al.* 2007].

Half-life Oral: 11 h, IV: 8–9 h [Wang *et al.* 1998].

Volume of Distribution 8.5 L/kg.

Clearance 1.37 L/h/kg, decreased by as much as 30% in hepatic dysfunction [Wang *et al.* 1998].

Protein Binding 45%.

Dose The usual IV dose is 0.5 to 1 mg every 2 min up to 2 mg and orally 1 to 2 mg.

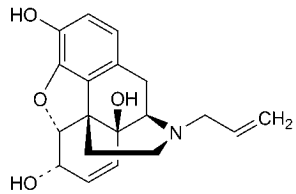
Nalorphine

Narcotic Antagonist

$C_{19}H_{21}NO_3$=11.4

CAS—62-67-9

Synonym (5α,6α)-7,8-Didehydro-4,5-epoxy-17-(2-propenyl)morphinan-3,6-diol



Chemical Properties Crystals. Mp 208°. Sparingly soluble in water and ether; soluble in ethanol, acetone, dilute alkalis and chloroform. pK_a 7.8 (20°). Log *P* (octanol/pH 7.4), 1.5. Extraction yield (chlorobutane), 0.3 [Demme *et al.* 2005].

Nalorphine Hydrobromide

$C_{19}H_{21}NO_3$, HBr = 392.3

CAS—1041-90-3

Proprietary Names *Lethidrone*; *Norfin*.

Chemical Properties A white to creamy-white crystalline powder. Mp ≈206°, with decomposition. Soluble 1 in 24 of water and 1 in 35 of ethanol. Aqueous solutions may deposit crystals of the dihydrate; the dihydrate is readily soluble in dehydrated alcohol but the solution rapidly yields a deposit of the anhydrous salt.

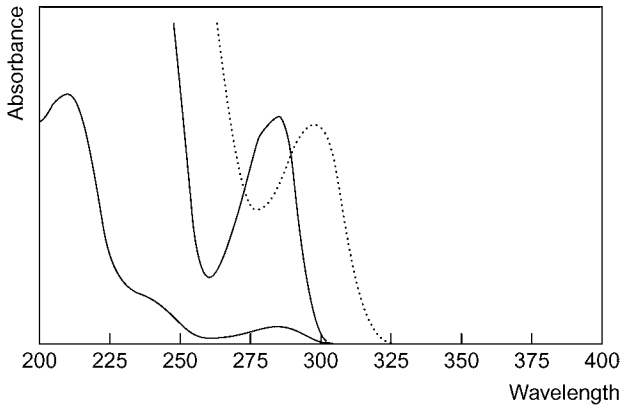
Nalorphine Hydrochloride

$C_{19}H_{21}NO_3$,HCl = 347.8

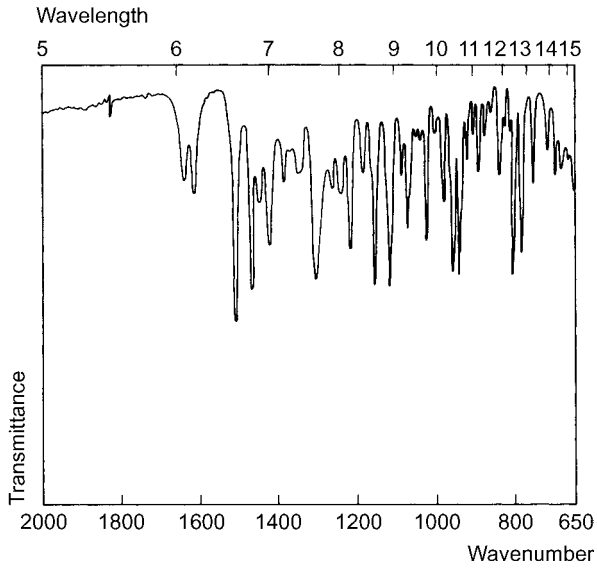
CAS—57-29-4

Proprietary Name *Nalline*
Chemical Properties A white crystalline powder that slowly darkens on exposure to air and light. Mp 260° to 263°. Soluble 1 in 8 of water and 1 in 35 of ethanol; practically insoluble in chloroform and ether; soluble in dilute solutions of alkali hydroxides.

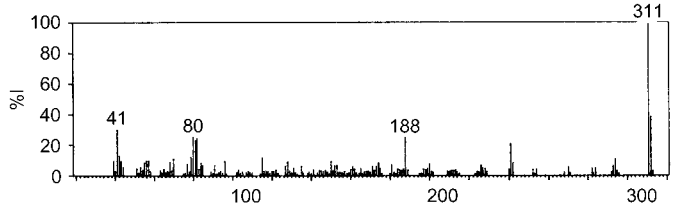
Colour Test Marquis test—violet.
Thin-layer Chromatography System TA—R_f 0.59; system TB—R_f 0.01; system TC—R_f 0.23; system TE—R_f 0.32; system TAE—R_f 0.57; system TAF—R_f 0.59; system TAG—R_f 0.29 (acidified iodoplatinate solution—positive).
Gas Chromatography System GA—RI 2620; system GB—not eluted.
High Performance Liquid Chromatography System HA—*k* 1.0; system HC—*k* 0.29; system HX—RI 260; system HY—RI 237; system HAA—retention time 4.8 min.
Ultraviolet Spectrum Aqueous acid—285 nm ($A^1_1 = 49a$); aqueous alkali—251 ($A^1_1 = 190a$), 298 nm ($A^1_1 = 81a$).



Infrared Spectrum Principal peaks at wavenumbers 1505, 1121, 1155, 1304, 805, 945 cm^{-1} (nalorphine hydrobromide , KBr disk).



Mass Spectrum Principal ions at *m/z* 311, 312, 41, 188, 80, 82, 81, 241.



Disposition in the Body Absorbed after oral administration but undergoes extensive first-pass metabolism. It is excreted in the urine mainly as metabolites and glucuronide conjugates, with ~2–6% of a dose as unchanged drug.
Toxicity The estimated minimum lethal dose is 200 mg. The administration of nalorphine to morphine addicts may be followed by a typical withdrawal syndrome.
Dose 5 to 10 mg of nalorphine hydrobromide IV, repeated if necessary.

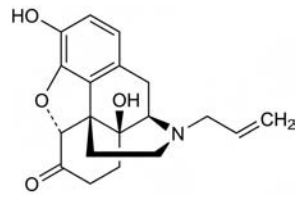
Naloxone

Narcotic Antagonist
$C_{19}H_{21}NO_4 = 327.4$
CAS—465-65-6
IUPAC Name (5α)-4,5-Epoxy-3,14-dihydroxy-17-(2-propenyl)morphinan-6-one
Synonym Allylnoroxymorphone

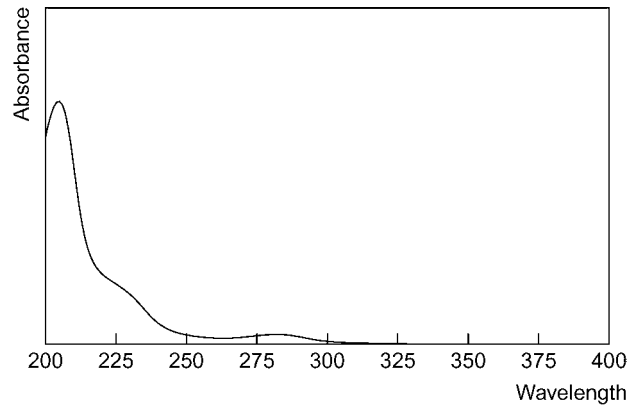


Chemical Properties Crystals. Mp 177° to 180°. Soluble in chloroform; practically insoluble in petroleum ether. pK_a 7.9. Log *P* (octanol/pH 7.4), 1.5. Extraction yield (chlorobutane), 0.9 [Demme *et al.* 2005].

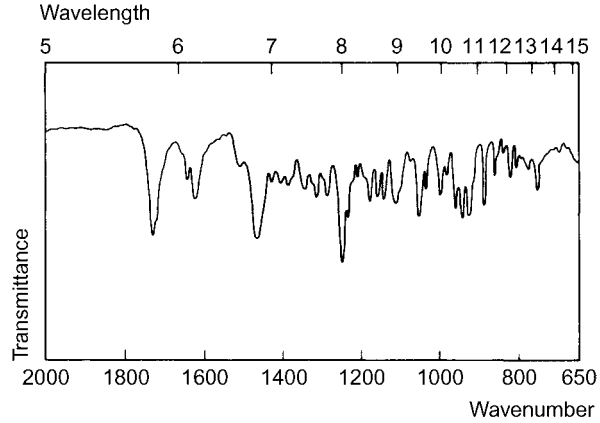
Naloxone Hydrochloride

$C_{19}H_{21}NO_4$, HCl = 363.8
CAS—357-08-4 (anhydrous); 51481-60-8 (dihydrate)
Proprietary Names *Nalone*; *Narcan*; *Narcanti*; *Naxolan*; *Zynox*.
Chemical Properties A white powder. Mp 200° to 205°. Soluble in water; slightly soluble in ethanol; practically insoluble in chloroform and ether.

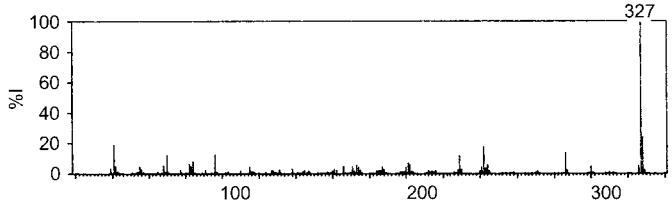
Colour Test Folin-Ciocalteu reagent—blue; Liebermann's reagent—black; Mandelin's test—violet→brown; Marquis test—brown→violet.
Thin-layer Chromatography System TA—R_f 0.65; system TB—R_f 0.09; system TC—R_f 0.66; system TE—R_f 0.47; system TAE—R_f 0.74; system TAG—R_f 0.63 (acidified Iodoplatinate Solution—positive).
Gas Chromatography System GA—RI 2715; system GB—not eluted.
High Performance Liquid Chromatography System HA—*k* 1.4; system HC—*k* 0.17; system HY—RI 238; system HZ—RT 2.0 min; system HAA—RT 14.0 min.
Ultraviolet Spectrum Aqueous acid—281 nm.



Infrared Spectrum Principal peaks at wavenumbers 1244, 1728, 940, 1230, 922, 1050 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 327, 328, 41, 242, 286, 96, 229, 70.



Quantification

Plasma **GC** [Meffin, Smith 1980].

HPLC Column: Nova-Pak phenyl (100 × 8 mm i.d., 4 µm). Mobile phase: acetonitrile : 5 mmol/L sodium pentanesulfonic acid (18 : 82). Electrochemical detection. Limit of detection, 3 µg/L [Albeck *et al.* 1989]. Electrochemical detection. Limit of detection, 2–5 µg/L [Derendorf *et al.* 1984].

Urine **GC** See Plasma [Meffin, Smith 1980].

HPLC See Plasma [Derendorf *et al.* 1984].

Note For a radioimmunoassay for the quantification of naloxone, see Hahn *et al.* [1983].

Disposition in the Body Naloxone is rapidly absorbed after oral administration but undergoes extensive first-pass metabolism. It is rapidly but incompletely excreted in the urine, mainly as conjugated metabolites, with ~30% of a dose being excreted in 6 h but only 60% being excreted in 72 h. Metabolites that have been identified include naloxone 3-glucuronide and the *N*-desalkyl and 6-hydroxy derivatives, together with their glucuronide conjugates.

Therapeutic Concentration

Following IV administration of 0.4 mg to 9 subjects, mean serum concentrations of 0.01 mg/L were reported after 2 min [Ngai *et al.* 1976].

During constant IV infusion of 0.02 mg/min in 3 subjects, steady-state plasma concentrations of 0.014, 0.015 and 0.030 mg/L were reported [Hahn *et al.* 1983].

Three subjects were given naloxone orally once daily. Peak plasma levels of 3.35 and 6.1 mg/L were achieved in the first subject with a dose of 12 and 16 mg, respectively; peak plasma levels for the second subject were: 7.3 and 8.0 mg/L after doses of 12 and 16 mg, respectively, and <5 mg/L after a dose of 16 mg for the third subject [Culpepper-Morgan *et al.* 1992].

Half-life Plasma half-life, ~1–2 h.

Volume of Distribution ~3 L/kg.

Clearance Plasma clearance, ~20–30 mL/min/kg.

Protein Binding ~40%.

Dose Naloxone hydrochloride 0.4 to 2 mg parenterally, repeated as necessary.

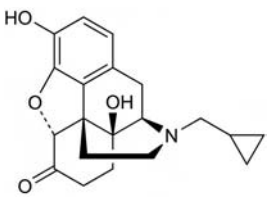
Naltrexone

Narcotic Antagonist

$C_{20}H_{23}NO_4$ = 341.4

CAS—16590-41-3

Synonyms (5α)-17-(Cyclopropylmethyl)-4,5-epoxy-3,14-dihydroxymorphinan-6-one; UM-792.



Chemical Properties Crystals. Mp 167° to 174°. Log *P* (octanol/water), 1.92 [Hansch *et al.* 1995]. Stable in human plasma at room temperature for at least 12 h. Extracted samples were unstable when stored at –20°, 4°, 25° and 37° for 48 h. Extracted samples were stable in an autosampler at 4° for 24 h, but not for 48 h [Clavijo *et al.* 2008]. Stable in human plasma at room temperature for up to 24 h. Extracted sample residues were stable for at least 5 days when stored at –20° or at least 2 days at ambient temperature in an autosampler. Stock solutions were stable for at least 22 h at room temperature and at least 115 days when stored at –20° [Slawson *et al.* 2007]. Stable in human plasma for 24 h at room temperature and following 2 freeze-thaw cycles [Huang *et al.* 1997].

Naltrexone Hydrochloride

$C_{20}H_{23}NO_4$,HCl = 377.9

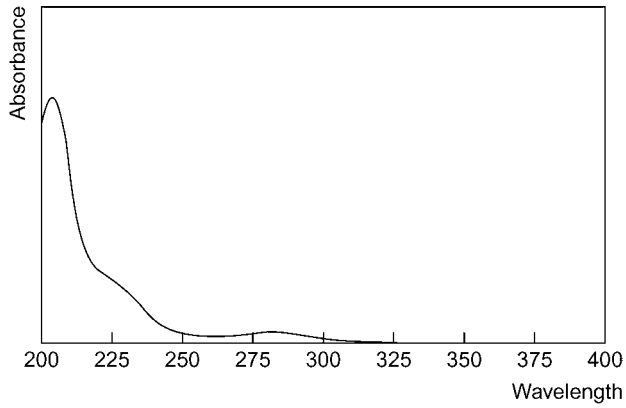
CAS—16676-29-2

Proprietary Names *Antaxone*; *Basinal*; *Celupan*; *Depade*; *Nalorex*; *Narcoral*; *Nemexin*; *Revia*; *Trexan*.

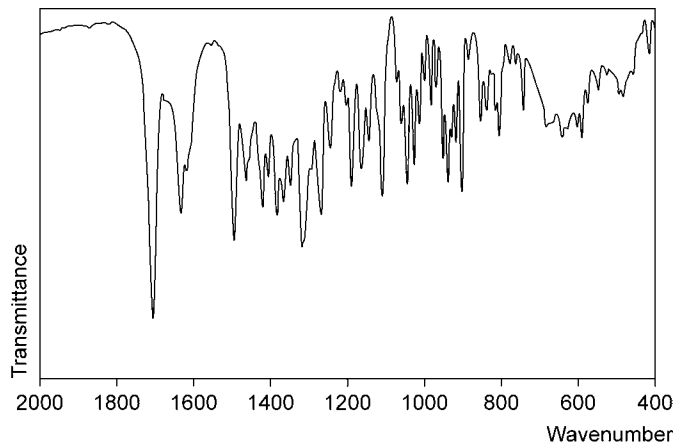
Chemical Properties White powder. Mp 274° to 276°. Soluble in water, dilute acids and alkali.

Gas Chromatography System GA—RI 2880; system GB—not eluted.

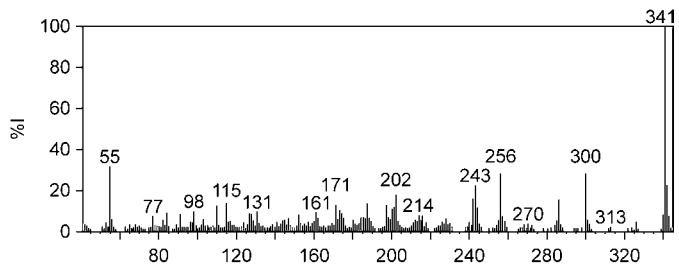
Ultraviolet Spectrum Aqueous acid—281 nm (A_1^1 = 34b); aqueous alkali—293 nm.



Infrared Spectrum Principal peaks at wavenumbers 1716, 1505, 1280, 1639, 1115, 909 cm^{-1} (naltrexone hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 341, 55, 256, 300, 243, 202, 342, 115.



Quantification

Blood **GC** Column: 3% OV-17 80/100 mesh on Gas Chrom Q (2 m × 2 mm i.d.). Carrier gas: H_2, 30 mL/min. Temperature: 230°. ECD and FID. Retention time: 7.4 min. Limit of detection not reported [Verebey *et al.* 1980]. Column: 3% OV-17 on Gas-Chrom Q (6′). Carrier gas: N_2, 60 mL/min. Temperature: 275°. Retention time: 9.6 or 10.75 min for the bis- or mono-TMS derivative. Limit of detection not reported [Verebely *et al.* 1975a].

LC-MS Column: Phenomenex Gemini C_{18} (100 × 2.0 mm i.d., 3 µm). Mobile phase: acetonitrile containing 0.1% formic acid : ammonium acetate buffer (pH 3.2, 15 : 85 for 9 min to 30 : 70 in 13 min to 80 : 20 in 10 min to 95 : 5 in 1 min), flow rate 150 µL/min. TIS, positive ion mode, MRM acquisition mode. Retention time: 2.8 min. Limit of detection, 0.0002 mg/L [Gergov *et al.* 2009].

Plasma **GC** Column: BP 10 (SGE, 25 m × 0.22 mm i.d.). Carrier gas: He, 3.2 mL/min. Temperature: 240°. NPD. Retention time: 18.06 min. Limit of detection, 6.0 µg/L [Kintz *et al.* 1989]. Column: 3% OV-7 on 100/120 mesh Gas Chrom Q (2.4 m × 2 mm i.d.). Carrier gas: Ar : CH_4 (95 : 5), 28 mL/min. Temperature: 203°. ECD. Limit of detection, <1 µg/L [Reuning *et al.* 1981]. See Blood [Verebey *et al.* 1980]. Column: 3% OV-22 on Supelcoport 80/100 mesh (6′ × 2 mm i.d.). Carrier gas: CH_4 : Ar (10 : 90), 35 mL/min. Temperature: 215°. ECD. Retention time: 7.27 min. Limit of detection, 5–10 pg [Verebey *et al.* 1976a].

GC-MS Column: Chrompack CP-Sil 5 CB (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.5 mL/min. Temperature programme: 100° to 310° at 40°/min for 6 min. SIM acquisition mode. Limit of detection, 0.1 µg/L [Toennes *et al.* 2004]. Limit of quantification, 2 µg/L, limit of detection, 1 µg/L [Chan *et al.* 2001;Chan *et al.* 2004]. Column: DB-1 (15 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He. Temperature programme: 130° to 285° at 20°/min. ECD, NICI. Limit of quantification, 0.1 µg/L [Huang *et al.* 1997]. Column: 5% phenylmethylsilicone (12.5 m × 0.2 mm i.d., 0.33 µm). Carrier gas: H_2, 10 psi. Temperature programme: 160° to 260° at 22°/min for 5 min. NICI. Limit of quantification, 0.1 µg/L [Nelson *et al.* 1993]. Column: DB-1 (20 m × 0.32 mm i.d., 1.0 µm). Carrier gas: H_2, 60–100 cm/s. Temperature programme: 130° for 0.5 min to 235° at 15°/min. NICI. Limit of quantification, 0.1 µg/L [Monti *et al.* 1991].

See also Wall *et al.* [1981a].

HPLC Column: Symmetry C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile: 0.06% triethylamine (pH 2.8, 8 : 92), flow rate 1.0 mL/min. UV detection (λ= 204 nm). Retention time: 3.95 min. k': 2.3. Limit of detection, 8 µg/L [Kambia *et al.* 2000]. Column: Perisorb RP-18 (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.1 mol/L disodium hydrogen orthophosphate (pH 3.5) : acetonitrile (85.5 : 14.5), flow rate 0.8 mL/min. Electrochemical detection. Retention time: 9.42 min. Limit of detection, 1 µg/L [Peh *et al.* 1997]. Column: YMC phenyl (100 × 4.6 mm i.d., 3 µm). Mobile phase: methanol: 50 mmol/L phosphoric acid (pH 3.2, 20 : 80), flow rate 1.2 mL/min. Electrochemical detection. Retention time: 5.0 min. Limit of quantification, 0.25 µg/L [Davidson *et al.* 1996]. Column: Supelcosil LC-18 DB (15 cm × 4.6 mm i.d., 5 µm). Mobile phase: 0.01 mol/L potassium phosphate (pH 3.0) : acetonitrile (85 : 15), flow rate 0.8 mL/min. Electrochemical detection. Retention time: 7.40 min. Limit of quantification, 5 µg/L [Zuccaro *et al.* 1991]. Column: Ultrex ODS silica (100 × 4.6 mm i.d., 3 µm). Mobile phase: 0.1 mol/L ammonium dihydrogenphosphate and 0.9 mmol/L octanesulfonic acid (pH 4.5). Electrochemical detection. Limit of detection, 50 µg/L [O'Connor *et al.* 1989].

See also Derendorf *et al.* [1984], Wall *et al.* [1984].

For an HPLC method for the detection of methylnaltrexone in plasma, see Osinski *et al.* [2002].

LC-MS Column: Luna Phenomenex (30 × 4.6 mm i.d., 5 µm). Mobile phase: methanol containing 0.1% acetic acid : 2 mmol/L ammonium acetate containing 0.1% acetic acid (40 : 60 to 95 : 5 at 4.5 min), flow rate 1.0 mL/min. APCI, MRM acquisition mode. Limit of quantification, 5 ng/L [Clavijo *et al.* 2008]. Column: Inertsil ODS3 or Betasil (50 × 3 mm i.d., 5 µm). Mobile phase: acetonitrile: water: formic acid (10 : 90 : 1 to 70 : 30 : 1 at 2 min to 10 : 90 : 1 at 2.1 min, or 90 : 10 : 1 to 50 : 50 : 1 at 1.0 min for 1 min to 90 : 10 : 1 at 2.1 min), flow rate 0.5 mL/min. ESI, positive ion mode, MRM acquision mode. Retention time: 1.32 or ≈2.2 min, respectively. Limit of detection, 200 ng/L [Naidong *et al.* 2002]. Column: DS-AQ (100 × 2 mm i.d., 5 µm). Mobile phase: 0.1% formic acid : methanol (85 : 15), flow rate 0.2 mL/min. ESI, SRM acquisition mode, CID. Limit of quantification, 0.1 µg/L [Slawson *et al.* 2007].

Serum **HPLC** Column: ODS-5-80 C_{18} (150 × 4.6 mm i.d.). Mobile phase: methanol: water: 85% phosphoric acid with 0.03 mmol/L octanesulfonic acid (50 : 50 : 0.1), flow rate 0.75 mL/min. UV detection (λ= 210 nm). Retention time: 6.7 min. Limit of detection not reported [Hurst *et al.* 1999].

Urine **GC** See Blood. Limit of detection, 10–20 µg/L [Verebey *et al.* 1980]. Column: 3% OV-17 on Gas Chrom Q 100/120 mesh (8′ × 2 mm i.d.). Carrier gas: Ar : CH_4 (95 : 5), 24 mL/min. Temperature: 203°. ECD. Retention time: 10.0 min. Limit of detection not reported [Malspeis *et al.* 1975]. See Blood [Verebely *et al.* 1975a]. Column: 3% OV-17 on Gas-Chrom Q 80/100 mesh (6′ × 2 mm i.d.). Carrier gas: He, 60 mL/min. Temperature: 270°. FID. Limit of detection, 0.02 mg/L [Verebely *et al.* 1975b]. Column: 3% OV-17 on Gas Chrom Q (6′ × 2 mm i.d.). Carrier gas: N_2, 24 mL/min. Temperature programme: 200° to 270° at 8°/min. FID. Limit of detection not reported [Cone *et al.* 1974].

GC-MS See Plasma [Monti *et al.* 1991]. Column: 2% OV-17 on 100/120 mesh Supelcoport (1.8 × 4 mm i.d.). EI ionisation at 70 eV. Limit of detection not reported [Wall *et al.* 1981a]. Column: 3% OV-7 on 100/120 mesh Gas Chrom Q (2.4 m × 2 mm i.d.). Carrier gas: Ar : CH_4 (95 : 5), 28 mL/min. Temperature: 203°. Limit of detection, 2 µg/L [Reuning *et al.* 1981]. Column: 2% OV-17 on 80/100 mesh Supelcoport (1.8 m × 4 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature: 240°. EI ionisation at 70 eV. Retention time: 13.7 min. Limit of detection, 1 µg/L [Wall, Brine 1981].

HPLC See Plasma. Limit of detection, 10 µg/L [Derendorf *et al.* 1984]. See Plasma [Wall *et al.* 1984].

LC-MS See Blood [Gergov *et al.* 2009].

Note For a TLC method for the measurement of naltrexone in urine, see Verebey *et al.* [1986]. For the measurement of naltrexone metabolites, see Cone *et al.* [1978].

Milk **GC-MS** See Plasma [Chan *et al.* 2001; Chan *et al.* 2004].

Saliva **GC** See Blood [Verebey *et al.* 1980].

Other **GC** Rabbit, Monkey and Rat Urine. Column: 3% QF-1 on 100/120 mesh Gas-Chrom Q (2 m × 2 mm i.d.). Carrier gas: He, 27 mL/min. Temperature: 300°. FID. Retention time: 4.9 min. Limit of detection, 0.025 mg/L [Dayton, Inturrisi 1976].

Disposition in the Body Rapidly and almost completely absorbed after oral administration. It is metabolised by reduction to 6β-naltrexol, which has weak activity [Dayton, Inturrisi 1976]; naltrexone and 6β-naltrexol are conjugated with glucuronic acid. About 40% of an oral dose is excreted in the urine in 24 h, with about 8% of the dose as naltrexone (mainly conjugated), 26% as 6β-naltrexol (mainly unconjugated), and about 4% as free 2-hydroxy-3-methoxy-6β-naltrexol. About 2% of a dose is eliminated in the faeces in 24 h, mainly as 6β-naltrexol.

Therapeutic Concentration

After a single oral dose of naltrexone to a single subject, a peak concentration of 15 µg/L naltrexone and 84 µg/L β-natraxol were reached at 2 and 4 h, respectively [Verebey *et al.* 1976a].

After a single oral dose of 100 mg to 4 subjects, peak plasma concentrations of 0.01–0.06 mg/L (mean 0.04) of naltrexone and 0.08–0.13 mg/L (mean 0.10) of 6β-naltrexol were attained in 1–2 h and 1–4 h, respectively [Verebey *et al.* 1976b].

Note For pharmacokinetic values for haemodialysis patients receiving naltrexone see Kambia *et al.* [2000]. Naltrexone in combination with brief motivational counselling may be effective to reduce heavy drinking among young adults [Leeman *et al.* 2008].

Toxicity Five patients have overdosed fatally on opioids while they had naltrexone implants, see Gibson *et al.* [2007]. See also Tait *et al.* [2008], Oliver *et al.* [2005], Miotto *et al.* [1997] or Schecter, Kauders [1975].

Half-life Plasma half-life, after oral administration, about 10 h for naltrexone and about 12 h for 6β-naltrexol; after IV administration, naltrexone about 3 h.

Volume of Distribution ≈20 L/kg.

Clearance Plasma clearance, ≈70 mL/min/kg.

Protein Binding ≈27% [Derendorf *et al.* 1984], 20.7 [Wall *et al.* 1981a].

Note For a review of the pharmacokinetics of naltrexone see Crabtree [1984] and for a review of the metabolism of naltrexone see Wall *et al.* [1981b].

Dose Usually 50 mg of naltrexone hydrochloride daily.

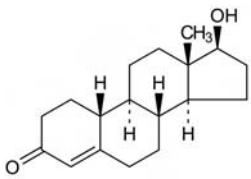
Nandrolone

Anabolic Steroid
$C_{18}H_{26}O_2 = 274.4$
CAS—434-22-0

IUPAC Name (8*R*,9*S*,10*R*,13*S*,14*S*,17*S*)-17-Hydroxy-13-methyl-2,6,7,8,9,10,11,12,14,15,16,17-dodecahydro-1*H*-cyclopenta[*a*]phenanthren-3-one
Synonyms (17β)-17-Hydroxyestr-4-en-3-one; nortestosterone.



Chemical Properties Crystals. Two polymorphic forms occur; Mp 112° and 124°. Soluble in ethanol, chloroform and ether. Log *P* (octanol/water), 2.6.

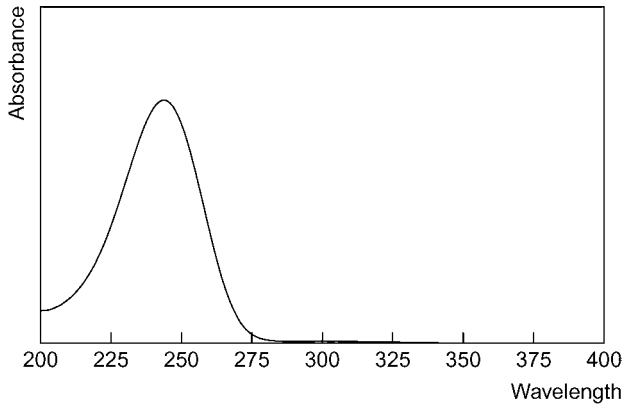
Nandrolone Decanoate

$C_{28}H_{44}O_3 = 428.7$
CAS—360-70-3
Synonym Nortestosterone decylate
Proprietary Names *Androlone-D*; *Deca-Durabol*; *Deca-Durabolin*; *Deca-Noralone*; *Hybolin Decanoate*; *Kabolin*; *Neo-Durabolic*; *Retabolil*.
Chemical Properties A white to creamy-white crystalline powder. Mp 32° to 35°. Practically insoluble in water; soluble 1 in 1 of ethanol; freely soluble in acetone, chloroform and ether.

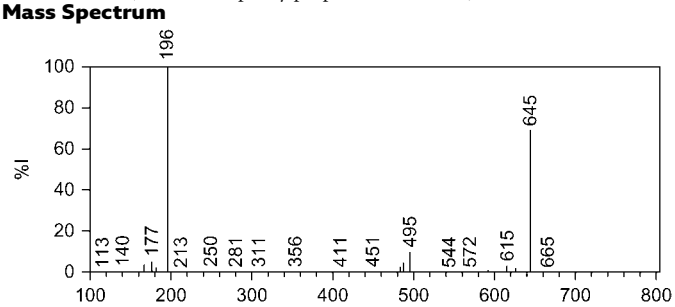
Nandrolone Phenylpropionate

$C_{27}H_{34}O_3 = 406.6$
CAS—62-90-8
Synonyms Nandrolone phenpropionate; 19-norandrostenolone phenylpropionate; nortestosteronum phenylpropionicum.
Proprietary Names *Activin*; *Androlone*; *Durabolin*; *Nandrolin*; *Noralone*; *Stenabolin*; *Superanabolon*.
Chemical Properties A white crystalline powder. Mp 95° to 96°. Practically insoluble in water; soluble 1 in 20 of ethanol; soluble in chloroform.

Thin-layer Chromatography system TP—decanoate R_f 0.88, phenylpropionate R_f 0.87; system TQ—decanoate R_f 0.49, phenylpropionate R_f 0.48; system TR—decanoate R_f 0.97, phenylpropionate R_f 0.97; system TS—decanoate R_f 0.95, phenylpropionate R_f 0.95.
Gas Chromatography System GA—RI 2395, nandrolone-TMS RI 2760; system GAR—RT 12.5 min.
Ultraviolet Spectrum Dehydrated alcohol—240 nm ($A_1^1 = 407$a) (nandrolone decanoate), 240 nm ($A_1^1 = 430$a) (nandrolone phenylpropionate).



Infrared Spectrum Principal peaks at wavenumbers 1679, 1733, 1205, 1178, 1255, 692 cm^{-1} (nandrolone phenylpropionate, KBr disk).
Mass Spectrum



Quantification
***Hair* GC-MS** Column: CP SIL 8 CB (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.2 mL/min. Temperature programme: 60° for 2 min to 310° at 15°/min for 2 min. MSD, positive ion mode [Gaillard *et al.* 2000]. Column: CP SIL 8 CB (30 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 1.1 mL/min. Temperature programme: 80° for 2 min to 310° at 15°/min for 14 min. Retention time: 17.3 min. Limit of detection, 0.08 pg/mg [Gaillard *et al.* 1999]. Column: HP Ultra 1 cross-linked methylsiloxane (25 m × 0.2 mm i.d., 0.33 μm). Carrier gas: He, 10 psi. Temperature programme: 180° for 0.1 min to 320° at 20°/min for 5.4 min. Limit of detection, 50 ng/g [Höld *et al.* 1999]. Column: HP5-MS capillary 5% phenylsiloxane 95% methylsiloxane (30 m × 0.25 mm i.d., 0.25 mm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 1 min to 295° at 30°/min for 6 min. EI ionisation. Retention time: 7.43 min. Limit of detection, 3 pg/mg [Kintz *et al.* 1999]. For a review of testing for anabolic steroids in hair, see Kintz [2003].
Disposition in the Body In humans, nandrolone is excreted in the urine mainly as the 2 metabolites 19-norandrosterone and 19-noretiocholanolone. In the horse, the major metabolites are 5α-estrane-3β,17α-diol, excreted mainly as the glucuronide conjugate, and its 17 β-epimer, which is excreted as the sulfate conjugate.
Dose By IM injection: 25 to 100 mg of nandrolone decanoate every 3 weeks; 25 to 50 mg of nandrolone phenylpropionate weekly.

Gaillard Y *et al.* (1999). Gas chromatographic-tandem mass spectrometric determination of anabolic steroids and their esters in hair: application in doping control and meat quality control. *J Chromatogr B Biomed Sci Appl* 735: 189–205.

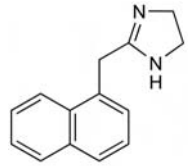
Naphazoline

Sympathomimetic
$C_{14}H_{14}N_2 = 210.3$
CAS—835-31-4

IUPAC Name 2-(Naphthalen-1-ylmethyl)-4,5-dihydro-1*H*-imidazole
Synonym 4,5-Dihydro-2-(1-naphthalenylmethyl)-1*H*-imidazole



Chemical Properties Mp about 120°. pK_a 10.9 (20°). Log *P* (chloroform/pH 7.4), −0.3.

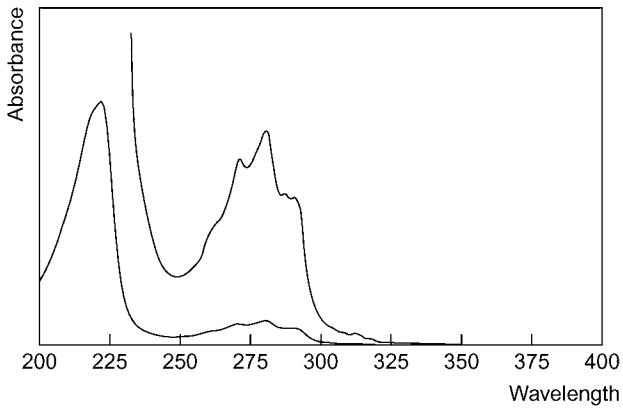
Naphazoline Hydrochloride

$C_{14}H_{14}N_2,HCl = 246.7$
CAS—550-99-2
Proprietary Names *Aconex*; *Ak-Con*; *Albalon*; *All Clear*; *Allerest*; *Allersol*; *Clear Eyes*; *Clera*; *Coldan*; *Degest*; *Isoftal*; *Murine*; *Nafazair*; *Napha Forte*; *Naphcon*; *Optazine*; *Privine*; *Rhino-Mex-N*; *Rhinon*; *Rhinoperd*; *Vasocon*.
Chemical Properties A white crystalline powder. Mp about 255° to 260°. Soluble 1 in 6 of water and 1 in 15 of ethanol; slightly soluble in chloroform; insoluble in benzene and ether.

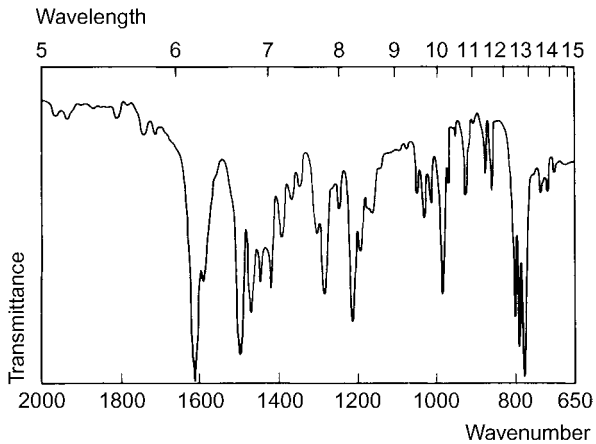
Naphazoline Nitrate

$C_{14}H_{14}N_2,HNO_3 = 273.3$
CAS—5144-52-5
Proprietary Names *Deltarhinol-Mono*; *Imidazyl*; *Privin*; *Rinazina*. It is an ingredient of *Antistin-Privine*.
Chemical Properties A white crystalline powder. Mp about 168°. Soluble 1 in 36 of water and 1 in 16 of ethanol; very slightly soluble in chloroform; practically insoluble in ether.

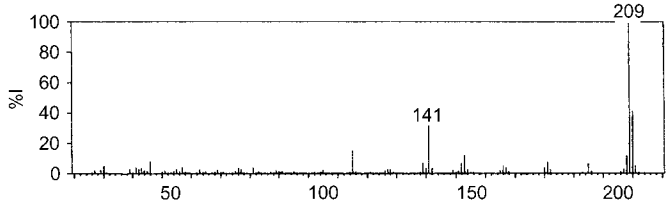
Colour Tests Mandelin's test—brown-violet; Marquis test—grey-green.
Thin-layer Chromatography System TA—R_f 0.14; system TB—R_f 0.03; system TC—R_f 0.06; system TE—R_f 0.27; system TAE—R_f 0.03; system TAF—R_f 0.52 (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, green).
Gas Chromatography System GA—RI 2100; system GC—RI 2457.
High Performance Liquid Chromatography System HA—*k* 2.4; system HX—RI 320; system HY—RI 263; system HAX—Retention time 9.1 min; system HAY—Retention time 4.8 min.
Ultraviolet Spectrum Aqueous acid—271, 281 (A_1^1=321a), 288, 291 nm. No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1615, 780, 1499, 791, 1211, 800 cm^{-1} (KBr disk).



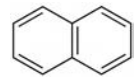
Mass Spectrum Principal ions at *m/z* 209, 210, 141, 115, 153, 208, 46, 181.



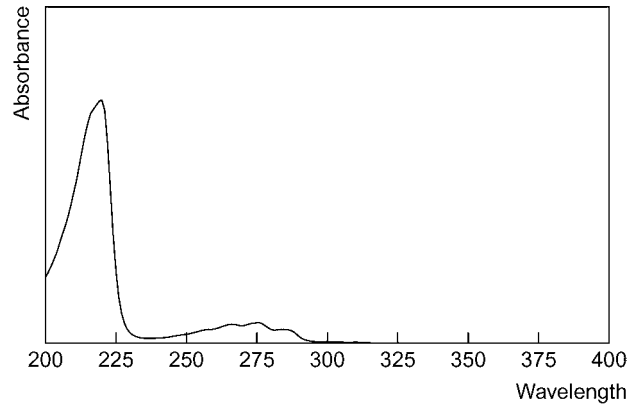
Disposition in the Body Systemic absorption has been reported following topical application of solutions of naphazoline. It is not used systemically but is readily absorbed from the gastrointestinal tract.
Toxicity The estimated minimum lethal dose is 10 mg, intranasally.
Use Naphazoline hydrochloride and nitrate are used as 0.05 to 0.1% aqueous solutions.

Naphthalene

Antiseptic, Anthelmintic
$C_{10}H_8 = 128.2$
CAS—91-20-3
Synonym Naphthalin

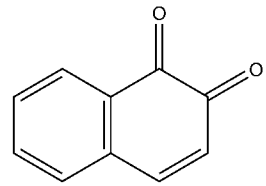


Chemical Properties Colourless transparent scales. Mp 80.2°. Bp 218°. Insoluble in water; soluble 1 in 13 of ethanol, 1 in 3.5 of benzene or toluene, 1 in 1.2 of carbon disulfide and 1 in 2 of chloroform or carbon tetrachloride; very soluble in ether. Log *P* (octanol/water), 3.3.
Gas Chromatography System GA—RI 1186.
High Performance Liquid Chromatography System HY—RI 558; system HAA—retention time 23.3 min.
Ultraviolet Spectrum Ethanol—266 (A_1^1=411b), 275 (A_1^1=454b), 286 nm (A_1^1=307b).



1,2-Naphthoquinone

Haemostatic
$C_{10}H_6O_2 = 158.2$
CAS—542-42-5
Synonyms 1,2-Naphthalenedione; β-naphthoquinone.

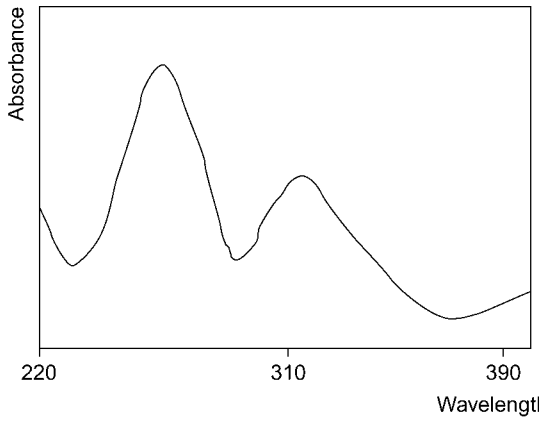


Chemical Properties Golden-yellow needles. Soluble in alcohol, benzene, ether, 5% NaOH, 5% $NaHCO_3$, and concentrated H_2SO_4 with a green colour; practically insoluble in water [O'Neil *et al.* 2006].

1,2-Naphthoquinone 2-Semicarbazone

$C_{10}H_6O_2, CH_3N_3I = 215.2$
CAS—31853-38-0
Synonym SCBN
Proprietary Names *Haemostop injection*; *Karbinon*; *Mediaven*; *Naftazone*.
Chemical Properties An orange-red microcrystalline powder. Mp 182° to 187° with decomposition. 1,2-Napthoquinone 2–semicarbazone is extracted by chloroform from aqueous alkaline solutions.

Colour Tests Ammonium molybdate test—grey-purple (limit of detection, 1.0 µg); sulfuric acid test—dull purple (limit of detection, 1.0 µg); sulfuric acid-formaldehyde test—dull purple (limit of detection, 1.0 µg).
Thin-layer Chromatography System T1—R_f 0.63 (located as a visible orange-brown spot; location reagent acidified iodoplatinate spray, positive reaction).
Gas Chromatography System G2/225—retention time 0.32 relative to diphenhydramine.
Ultraviolet Spectrum Methanol—272, 319 nm [Herber *et al.* 1995].



Mass Spectrum Principal ions at *m/z* 369, 394, 315, 370, 333, 395 (glucuronide) [Herber *et al.* 1995]

Disposition in the Body Up to 99.5% of an IV dose is excreted in the urine as sulfo- and glucuroconjugates. The oxo group is reduced first in the presence of NADPH or NADH, followed readily by glucuronidation of the phenolic moiety, leading to a 1β-*O*-glucuronide [Herber *et al.* 1995]

Toxicity IV administration of 2.5 g/kg naftazone to mice did not produce toxic symptoms.

Dose Up to 300 μg daily.

Herber R *et al.* (1995). Reduction and glucuronidation of naftazone by human and rat liver microsomes. *Drug Metab Dispos* 23: 1305–1314.

O'Neil MJ *et al.* (2006). *The Merck Index: an Encyclopedia of Chemicals, Drugs and Biologicals*, 14 edn. Whitehouse Station, NJ: Merck & Co. Inc.

Naproxen

Analgesic

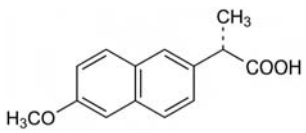
$C_{14}H_{14}O_3 = 230.3$

CAS—22204-53-1

IUPAC Name (2*S*)-2-(6-Methoxynaphthalen-2-yl)propanoic acid

Synonyms (α*S*)-6-Methoxy-α-methyl-2-naphthaleneacetic acid; naproxenum; RS-3540.

Proprietary Names *Arthrosin*; *Arthroxen*; *Condrotex*; *Laraflex*; *Laser*; *Napratec*; *Naprel*; *Naprex*; *Naprius*; *Naprobene*; *Naprocoat*; *Naprodil*; *Naprometin*; *Napromex*; *Napronet*; *Naproscript*; *Naproaian*; *Naprosyn(e)*; *Naproval*; *Naproxi*; *Napxen*; *Nycopren*; *Proxen*; *Rimoxyn*; *Timpron*; *Xenar*.



Chemical Properties A white crystalline powder. Mp 152° to 154° (crystals from acetone-hexane). Practically insoluble in water; soluble 1 in 25 of ethanol, 1 in 15 of chloroform, and 1 in 40 of ether. pK_a 4.2 (25°). Log *P* (octanol/water), 3.2.

Naproxen Sodium

$C_{14}H_{13}NaO_3 = 252.2$

CAS—26159-34-2

Synonym RS-3650

Proprietary Names *Aleve*; *Anaprox*; *Naprelan*; *Naprodil*; *Naprogesic*; *Naprorex*; *Naproso*; *Naprosyn*; *Naprovite*; *Synflex*.

Chemical Properties Mp 244° to 246° (crystals from acetone).

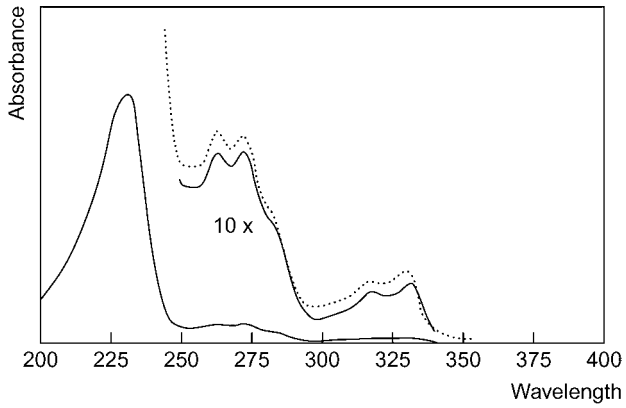
Colour Tests Liebermann's reagent—black-green; Marquis test—brown; sulfuric acid—orange.

Thin-layer Chromatography System TD—R_f 0.33; system TE—R_f 0.06; system TF—R_f 0.38; system TG—R_f 0.14; system TAD—R_f 0.44; system TAE—R_f 0.82; system TAJ—R_f 0.60; system TAK—R_f 0.75; system TAL—R_f 0.93 (Ludy Tenger reagent, orange).

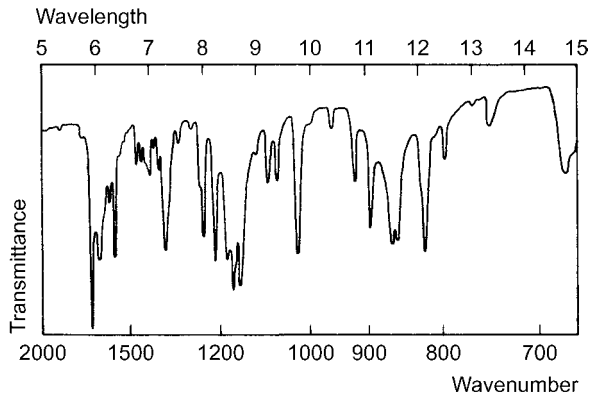
Gas Chromatography System GA—naproxen RI 2045, naproxen-Me RI 1980, M (O-desmethyl-)-Me_2 RI 1980, M (OH-)-Me_2 RI 1800; system GB—naproxen RI 2337, M (O-desmethyl-) RI 2396; system GD—naproxen-Me RRT 1.37 and RRT 1.18 (relative to *n*-$C_{16}H_{34}$); system GL—naproxen-Me RI 2120,M (O-desmethyl-)-Me_2 RI 2120, M (OH-)-Me_2 RI 1800.

High Performance Liquid Chromatography System HD—*k* 3.3; system HF—RRT 0.67 (relative to meclofenamic acid); system HX—RI 501; system HY—RI 468; system HZ—RT 6.8 min; system HAX—RT 7.0 min; system HAY—RT 7.2 min.

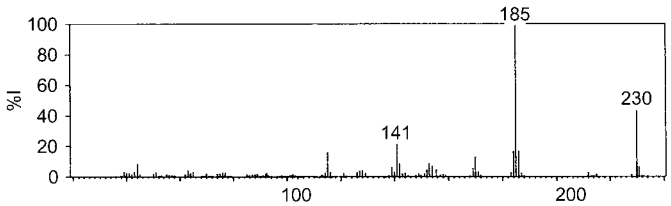
Ultraviolet Spectrum Aqueous acid—262 (A^1_1=208b), 272 (A^1_1=215b), 315 (A^1_1=52b), 328 nm (A^1_1=63b); aqueous alkali—261 (A^1_1=218b), 271 (A^1_1=218b), 316, 330 nm.



Infrared Spectrum Principal peaks at wavenumbers 1724, 1174, 1155, 1223, 1190, 1681 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 185, 230, 141, 186, 184, 115, 170, 153.



Quantification

Plasma **HPLC** For method of quantification for naproxen and 6-*O*-desmethylnaproxen and conjugates, see Andersen and Hansen [1992]. For method of quantification for naproxen, ibuprofen and diclofenac, see Blagbrough *et al.* [1992]. Limit of quantification, 1.5 mg/L for naproxen and 6-*O*-desmethylnaproxen and conjugates [Vree *et al.* 1992]. Fluorescence detection. Limit of detection, 100 μg/L for naproxen and 6-*O*-desmethylnaproxen [van Loenhout *et al.* 1982].

Serum **Spectrofluorimetry** Limit of detection, 500 μg/L [Anttila 1977].

UV spectrophotometry See Holzbecher *et al.* [1979].

GC FID. Limit of detection, 2 mg/L [Weber *et al.* 1981].

Urine **GC** FID. For method of quantification for naproxen and metabolites, see Wan and Matin [1979].

HPLC UV detection. Limit of detection, 3 ng for naproxen naproxen and nabumetone and its metabolite [Mikami *et al.* 2000]. UV detection. Limit of detection, 5 μg/L for naproxen and other NSAIDs [Hirai *et al.* 1997]. See Plasma [Andersen, Hansen 1992]. See Plasma [Vree *et al.* 1992]. See Plasma [van Loenhout *et al.* 1982].

Synovial Fluid **HPLC** For method of quantification for naproxen, ibuprofen and diclofenac, see Blagbrough *et al.* [1992].

Disposition in the Body Readily and almost completely absorbed after oral or rectal administration. Naproxen crosses the placenta and small amounts are found in breast milk; it also diffuses into synovial fluid. About 50% of a dose is excreted in the urine in 24 h and ~94% in 5 days together with ~1–2% in the faeces. Of the material excreted in the urine, ~60% is conjugated naproxen, 5% is 6-*O*-desmethylnaproxen, and 20% is conjugated desmethylnaproxen. <10% of the excreted material is unchanged drug.

Hydrolysis of conjugated naproxen has been reported during storage of urine samples, and assays carried out immediately after collection suggested that only very small amounts of unchanged drug were excreted [Upton *et al.* 1980.]

Therapeutic Concentration Plasma concentrations are dose-dependent at doses of up to 500 mg twice daily; at larger doses the increase in concentration is non-linear and renal clearance is accelerated.

Following single oral doses of 250 mg to 6 subjects, peak plasma concentrations of 26–51 mg/L (mean, 38) were attained in 2–4 h; peak plasma concentrations of 49–69 mg/L (mean, 60) were attained in 3 subjects, 2 h after a single oral dose of 500 mg; peak concentrations of the desmethyl metabolite were about 0.1–0.2 mg/L [Tomson *et al.* 1981.]

Toxicity

A serum concentration of 414 mg/L was reported in 1 subject 15 h after the ingestion of 25 g of naproxen; the only toxic effect was mild gastrointestinal distress [Fredell, Strand 1977].

A 15-year-old girl who had rapidly developed severe metabolic acidosis and seizures after ingesting ~50 × 275 mg naproxen sodium tablets (each containing 250 mg naproxen and 25 mg sodium) had a serum naproxen concentration of 12.9 g/L 14.5 h after the ingestion; serum bicarbonate levels returned to normal after 12.5 h [Martinez *et al.* 1989.]

Half-life Plasma half-life, 10–20 h (mean, 14).

Volume of Distribution About 0.16 L/kg.

Clearance Plasma clearance, 0.13 mL/min/kg.

Protein Binding >99% at normal therapeutic concentrations; decreased at higher plasma concentrations and in subjects with liver disease.

Note For a review of naproxen, see Brogden *et al.* [1979] and for a review of its pharmacokinetics, see Davies and Anderson [1997].

Dose Usually 0.5 to 1 g daily.

Andersen JV, Hansen SH (1992). Simultaneous quantitative determination of naproxen, its metabolite 6-O-desmethylnaproxen and their five conjugates in plasma and urine samples by high-performance liquid chromatography on dynamically modified silica. *J Chromatogr* 577: 325–333.

Naratriptan

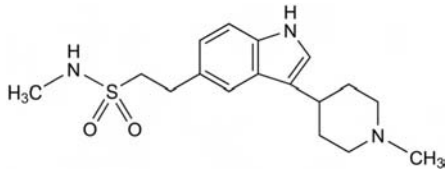
Antimigraine

$C_{17}H_{25}N_3O_2S = 335.4$

CAS—121679-13-8

IUPAC Name *N*-Methyl-3-(1-methyl-4-piperidinyl)-1*H*-indole-5-ethanesulfonamide

Synonym GR-85548X



Chemical Properties Crystals from ethyl acetate. Mp 170° to 171°.

Naratriptan Hydrochloride

$C_{17}H_{25}N_3O_2S,HCl = 371.9$

CAS—121679-19-4; 143388-64-1

Synonym GR-85548A

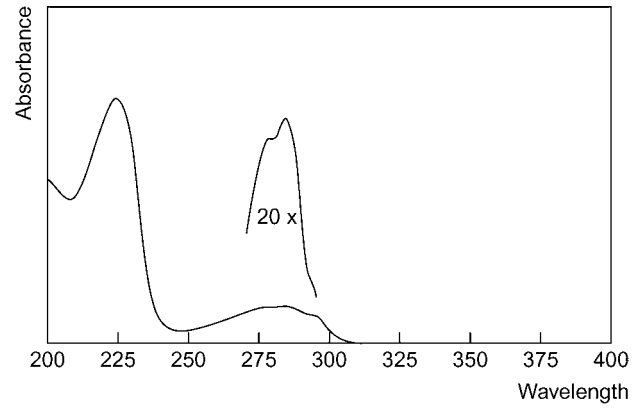
Proprietary Names *Amerge*; *Naramig*.

Chemical Properties Microcrystals. Mp 237° to 239°.

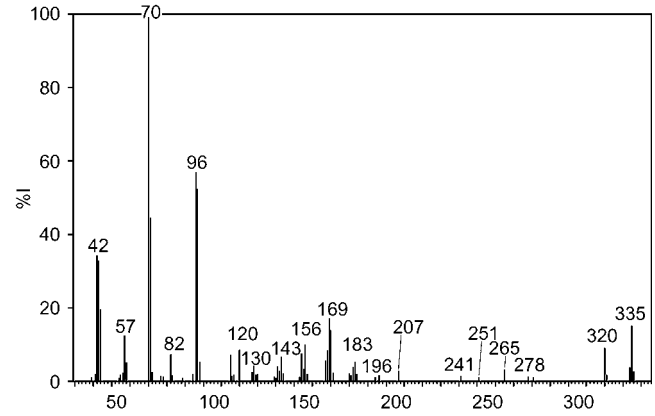
High Performance Liquid Chromatography System HZ—retention time 2.1 min.

Column: silica Alltech (150 × 2.1 mm i.d., 5 µm). Mobile phase: 20 mmol/L ammonium acetate (pH 4 to pH 2.7) : methanol : acetonitrile (80 : 10 : 10), flow rate 300 µL/min. IS: bufotemine. MS–MS detection (ESI, MRM with *m/z*: 336 to 98 for naratriptan and 205 to 160 for IS). Retention time: naratriptan, 2.71 min; IS, 2.35 min [Vishwanathan *et al.* 2000].

Ultraviolet Spectrum Aqueous acid (pH 2.38)—224, 278, 284, 295 nm; ethanol—285, 296 nm.



Mass Spectrum Principal ions at *m/z* 70, 96, 97, 71, 42, 43, 44, 169.



Quantification

Serum **HPLC–MS** MS–MS detection (ESI). Limit of detection, 0.1 µg/L [Vishwanathan *et al.* 2000].

Disposition in the Body Naratriptan is rapidly and well absorbed after administration, and undergoes some hepatic metabolism by a wide range of cytochrome P450 isoenzymes. Renal excretion is the main route of elimination and the drug is predominately excreted in urine, with 50% of the dose being recovered as the unchanged drug and 30% as the inactive metabolite. It displays linear pharmacokinetics over the therapeutic range and repeat administration does not lead to accumulation of the drug. Food does not alter the absorption.

Therapeutic Concentration

Seven adolescent migraine patients, aged between 12 and 16 years, were administered a single dose of 2.5 mg naratriptan outside a migraine attack. The mean naratriptan plasma concentration was 8.0 µg/L (range, 5.9 to 10.7) observed between 1.5 and 4 h after dosing [Christensen *et al.* 2001].

Bioavailability Men, 63%; women, 74%.

Half-life Approximately 4.5 to 5.5 h; prolonged in patients with renal and hepatic impairment.

Volume of Distribution 170 L.

Clearance Systemic, 6.6 mL/min/kg; reduced by 26% in the elderly and by 50% in renal impaired individuals.

Protein Binding 28 to 31% (concentration range, 50 to 1000 µg/L).

Note For a review of naratriptan use in migraine treatment, see Dulli [1999].

Dose Oral administration: initial dose is 2.5 mg in the UK; 1 to 2.5 mg in the US and a second dose if required. The maximum dose is 5 mg daily.

Christensen ML *et al.* (2001). Pharmacokinetics of naratriptan in adolescent subjects with a history of migraine. *J Clin Pharmacol* 41(2): 170–175.

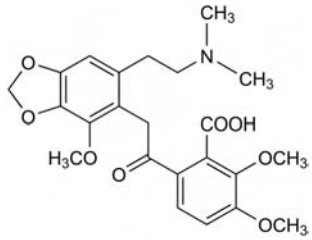
Narceine

Alkaloid

$C_{23}H_{27}NO_8 = 445.5$

CAS—131-28-2 (anhydrous)

IUPAC Name 6-[[6-[2-(Dimethylamino)ethyl]-4-methoxy-1,3-benzodioxol-5-yl]-acetyl]-2,3-dimethoxybenzoic acid



Chemical Properties An alkaloid present in opium. White silky crystals. Mp 176°. The anhydrous substance melts at about 138° and is very hygroscopic. Slightly soluble in water; soluble in ethanol; soluble in alkali hydroxide solutions and dilute mineral acids; practically insoluble in benzene, chloroform, ether and petroleum ether. pK_a 3.8 (20°). Log *P* (octanol/water), 2.0.

Narceine Hydrochloride

$C_{23}H_{27}NO_8$, HCl = 481.9
CAS—4901-03-5

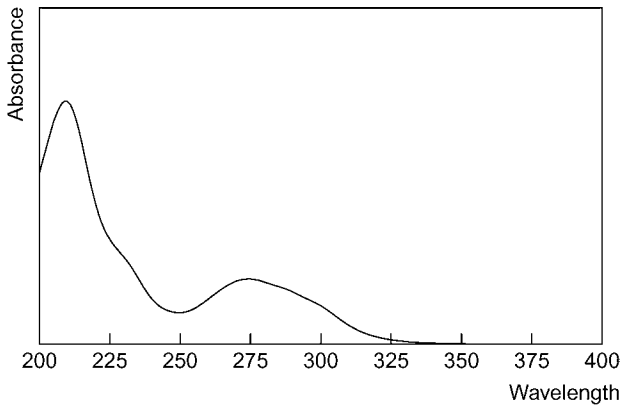
Chemical Properties Prismatic crystals. Mp 192° to 193°. Slightly soluble in hot water and ether; soluble in hot ethanol.

Colour Tests Liebermann's reagent—black; Mandelin's test—green-brown; Marquis test—brown→green.

Thin-layer Chromatography System TA—R_f 0.52; system TB—R_f 0.00; system TC—R_f 0.03; system TE—R_f 0.00; system TL—R_f 0.00; system TAE—R_f 0.34; system TAF—R_f 0.14; system TAJ—R_f 0.02; system TAK—R_f 0.01; system TAL—R_f 0.36 (acidified iodoplatinate solution, positive).

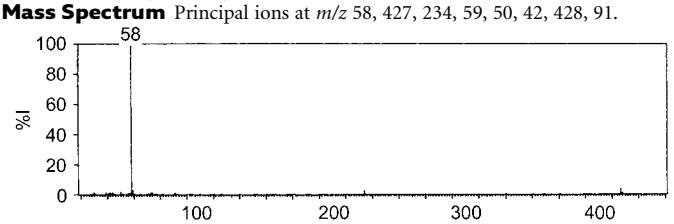
High Performance Liquid Chromatography System HA—*k* 0.7; system HX—RI 360.

Ultraviolet Spectrum Aqueous acid—277 nm (A_1^1=306a). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1253, 1582, 1060, 1090, 1000, 1047 cm^{-1} (KCl disk).

Mass Spectrum Principal ions at *m/z* 58, 427, 234, 59, 50, 42, 428, 91.



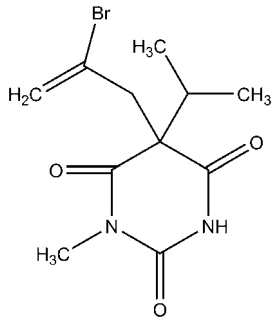
Narcobarbital

Barbiturate
$C_{11}H_{15}BrN_2O_3$ = 303.2

IUPAC Name 5-(2-Bromoprop-2-enyl)-1-methyl-5-propan-2-yl-1,3-diazinane-2,4,6-trione

Synonyms 5-(2-Bromoallyl)-5-isopropyl-1-methyl-barbituric acid; enibomal.

Proprietary Names *Eunarcon*; *Narcodorm*; *Narkotal*; *Venopan*.



Chemical Properties White powder. Slightly soluble in water; soluble 1 in 20 of ethanol; soluble in ether and chloroform. Narcobarbital may be isolated in the A2 fraction.

Disposition in the Body Narcobarbital is a very short-acting barbiturate.

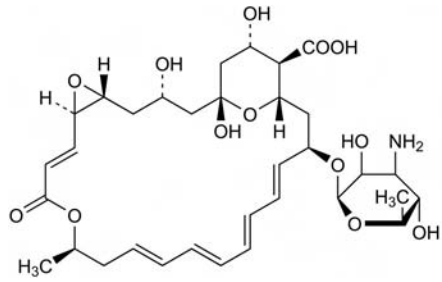
Dose Up to 1 g IV.

Natamycin

Antifungal
$C_{33}H_{47}NO_{13}$ = 665.7
CAS—7681-93-8

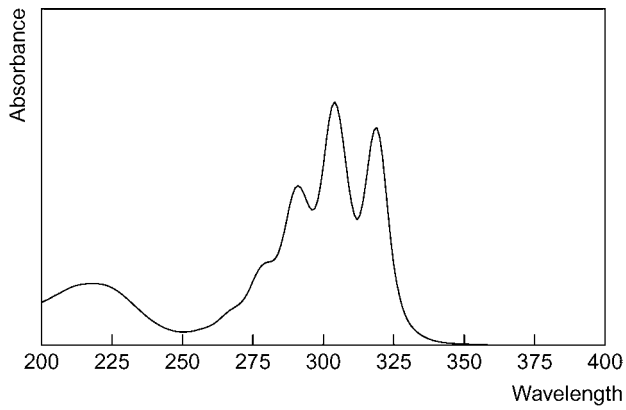
Synonyms Antibiotic A 5283; CL-12625; pimaricin; tennecetin.

Proprietary Names *Deronga Heilpaste*; *Natacyn*; *Natafucin*; *Pima Biciron N*; *Pimafucin(e)*.



Chemical Properties An antibiotic produced by the growth of *Streptomyces natalensis*. A white crystalline powder, which may discolour slightly on storage. Very slightly soluble in water and ethanol; practically insoluble in chloroform and ether; readily soluble in dilute acids and alkalis, forming salts. Log *P* (octanol/water), −3.7.

Ultraviolet Spectrum Acid methanol—290 (A_1^1=795b), 303 (A_1^1= 1250b), 318 nm (A_1^1=1145b).



Infrared Spectrum Principal peaks at wavenumbers 1062, 1002, 1563, 1709, 1101, 1258 cm^{-1} (KBr disk).

Uses Topically in concentrations of 2 to 5%; by inhalation in a dose of 7.5 mg daily.

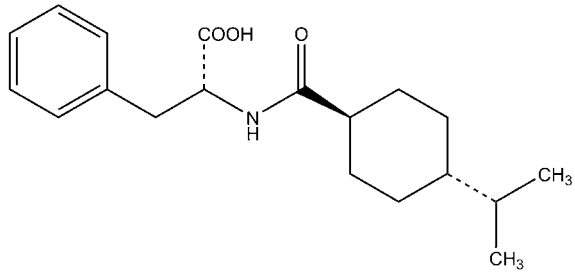
Nateglinide

Antidiabetic, Meglitinide
$C_{19}H_{27}NO_3$ = 317.4
CAS—105816-04-4

IUPAC Name (2*R*)-3-Phenyl-2-[(4-propan-2-ylcyclohexanecarbonyl)amino] propanoic acid

Synonyms A-4166; AY-4166; (−)-*N*-(*trans*-4-isopropylcyclohexyl-1-carbonyl)-D-phenylalanine; *N*-[[*trans*-4-(1-methylethyl)cyclohexyl]carbonyl]-D-phenylalanine; 3-phenyl-2-(4-propan-2-ylcyclohexyl)carbonylamino-propanoic acid; SDZ-DJN-608; YM-026.

Proprietary Names *Fastic*; *Starlix*; *Starsis*.



Chemical Properties White powder. Mp 129° to 130°. Freely soluble in methanol, ethanol and chloroform; soluble in ether; sparingly soluble in acetonitrile and octanol; practically insoluble in water. Log *P* (octanol/water), 3.82 [Wishart 2006].

Quantification

Plasma **HPLC** Column: C_{18} (250 × 3 mm i.d., 5 µm). Mobile phase: 0.1 mol/L potassium hydrogen phosphate (pH 4.0) : methanol : acetonitrile (700 : 80 : 300), flow rate 1.0 mL/min. Internal standard: carbamazepine. UV detection (λ = 210 nm). Retention times: nateglinide, 14.1 (internal standard, 6.7 min). Limit of quantification, 0.1 mg/L, limit of detection, 1 µg/L [Bauer *et al.* 2003]. Column: ODS-2 (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.02 mol/L ammonium acetate (pH 6.0) : acetonitrile (100 : 0 for 5 min to 80 : 20 at 10 min for 15 min to 65 : 35 at 35 min for 5 min to 55 : 45 at 55 min for 5 min to 0 : 100 at 70 min), flow rate 1.0 mL/min; UV detection (λ = 210 nm). Limit of quantification, 50 µg/L [Weaver *et al.* 2001].

Other **LC-MS** Rabbit Serum. Column: Zorbax Extend C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile: water: formic acid (80 : 20 : 1), flow rate 0.8 mL/min. Positive ion mode, SRM acquisition mode. Limit of quantification, 0.25 mg/L [He *et al.* 2004].

Disposition in the Body Nateglinide is rapidly absorbed after oral administration, taken prior to a meal, with peak plasma concentrations reached within 1 h. Administration of the drug with food results in delayed absorption and a decrease in the peak plasma concentration. It is metabolised to 9 known metabolites by hydroxylation and glucuronide conjugation, via CYP2C9 and CYP3A4. The major metabolites have less antidiabetic activity than nateglinide, but the isoprene minor metabolite has antidiabetic activity comparable to that of nateglinide. The drug and metabolites are rapidly eliminated within 6 h of dosing. Approximately 75% of the drug is recovered in urine, with 16% as the parent drug, and a small amount in faeces.

Therapeutic Concentration

Twenty male and female patients suffering from type 1 or type 2 diabetes (aged 21 to 70 years) and 20 healthy volunteers were administered a single 120 mg nateglinide dose after a 10 h fast. Peak plasma concentrations for the healthy volunteers reached 9 to 10 mg/L after 0.78 h and for the diabetic patients, 4.7 mg/L (on dialysis) and 7.39 mg/L (non-dialysis), attained after 0.95 and 0.8 h, respectively [Devineni *et al.* 2003].

Six healthy male subjects (mean age 30.5 years) were administered a radiolabelled nateglinide solution either as an oral dose of 120 mg or a 60 mg IV dose infused over 10 min. After a 3-week washout period, subjects received the radiolabelled dose by the alternative route of administration. The mean peak plasma concentration (5.69 mg/L) was reached 1 h after oral dosing [Weaver *et al.* 2001].

Eight healthy male subjects and eight patients suffering from cirrhosis (43 to 65 years old) were administered a single oral dose of 120 mg nateglinide. Mean peak plasma concentrations of 5.62 and 7.70 mg/L were reached 0.72 and 0.59 h after dosing, respectively [Choudhury *et al.* 2000].

Bioavailability Approximately 73%.

Half-life 1.5 h.

Volume of Distribution Approximately 10 L.

Clearance In healthy individuals, 7.29 L/h; diabetic patients, 7.38 L/h.

Distribution in Blood Blood : plasma ratio, 1 : 2.

Protein Binding Approximately 98%.

Dose 120 mg three times a day.

Nateplase

Thrombolytic

CAS—159445-63-3

IUPAC Name *N*-[N^2-(*N*-glycyl-L-alanyl)-L-arginyl]plasminogen activator (human tissue-type 1-chain form, protein moiety), glycoform β (major component) and plasminogen activator (human tissue-type 1-chain form, protein moiety), glycoform β mixture

Proprietary Name *Milyser*

Dose Used in acute myocardial infarction.

Nealbarbital

Barbiturate, Sedative

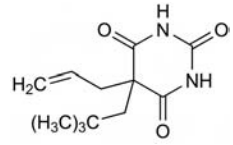
$C_{12}H_{18}N_2O_3$ = 238.3

CAS—561-83-1

IUPAC Name 5-(2-Methylbutan-2-yl)-5-prop-2-enyl-1,3-diazinane-2,4,6-trione

Synonyms Alneobarbital; 5-(2,2-dimethylpropyl)-5-(2-propenyl)-2,4,6(1*H*,3*H*,5*H*)-pyrimidinetrione; nealbarbitone; neallymalum.

Proprietary Names *Censedal*; *Nevental*.



Chemical Properties A white or slightly cream-coloured powder. Mp 155° to 157°. Soluble 1 in 5000 of water, 1 in 4 of ethanol, 1 in 80 of chloroform and 1 in 5 of ether; freely soluble in acetone; soluble in aqueous solutions of alkalis; practically insoluble in petroleum ether. pK_a 7.2 (20°). Log *P* (octanol/water), 2.1.

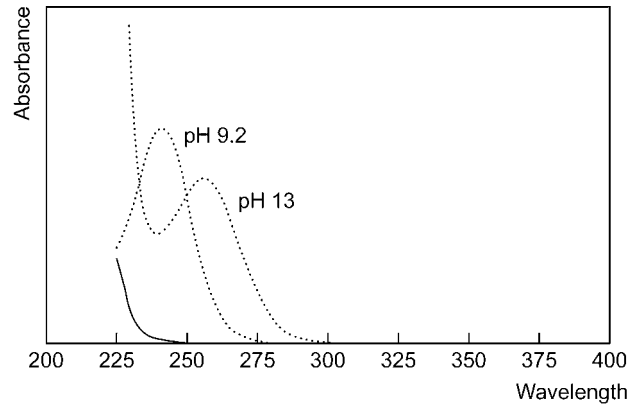
Gas Chromatography System GA—nealbarbital RI 1720; nealbarbital-Me_2 RI 1620; system GAJ—RRT 0.789 (relative to methylphenobarbital); system GF—RI 2460.

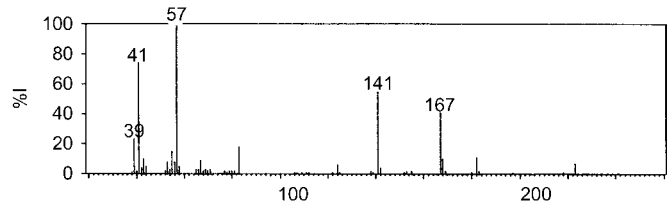
High Performance Liquid Chromatography System HG—*k* 10.22; system HH—*k* 6.19; system HX—RI 417; system HY—RI 382.

Ultraviolet Spectrum Borax buffer 0.05 mol/L (pH 9.2)—240 nm (A^1_1=396b); 1 mol/L sodium hydroxide (pH 13)—255 nm (A^1_1=303b).



Infrared Spectrum Principal peaks at wavenumbers 1695, 1752, 1265, 833, 1205, 775 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 57, 41, 141, 167, 39, 83, 55, 182.



Dose Nealbarbital has been given in doses of up to 200 mg as a hypnotic.

Nebivolol

β-*Blocker*

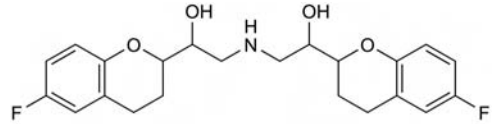
$C_{22}H_{25}F_2NO_4$ = 405.4

CAS—99200-09-6

IUPAC Name 1-(6-Fluoro-3,4-dihydro-2*H*-chromen-2-yl)-2-[[2-(6-fluoro-3,4-dihydro-2*H*-chromen-2-yl)-2-hydroxyethyl]amino]ethanol

Synonyms α,α′-[Iminobis(methylene)]bis[6-fluoro-3,4-dihydro-2*H*-1-benzopyran-2-methanol]; narbivolol; R-65824; R-67555.

Proprietary Name *Nebilet*



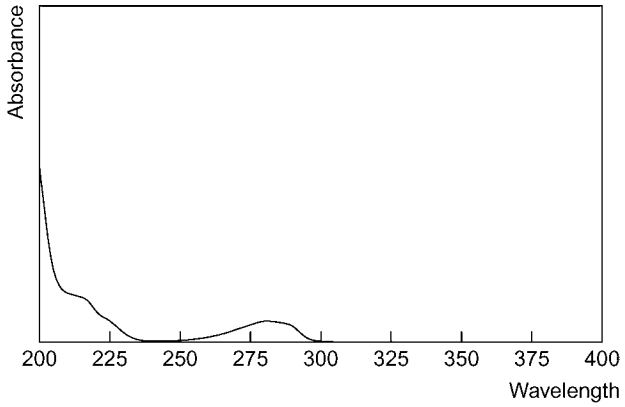
Chemical Properties Crystals. Mp 140.7°. pK_a (base), 8.22. Log *P* (octanol/water), 3.23; 4.03 (pH 11.8, 23°).

Nebivolol Hydrochloride

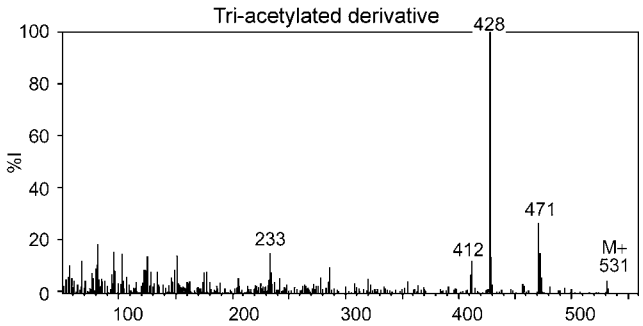
$C_{22}H_{26}ClF_2NO_4$ = 441.9

High Performance Liquid Chromatography Column: Chiralpak AD-RH (150 × 4.6 mm i.d., 5 μm). Mobile phase: 1-propanol, flow rate 0.5 mL/min. UV detection (λ=220 nm). Retention time: (+)-nebivolol, 13.17 min; (−)-nebivolol, 17.45 min [Aboul-Enein, Ali 2001].

Ultraviolet Spectrum Principal peaks at 217, 283 nm.



Mass Spectrum Principal ions at *m/z* 428, 471, 82, 103, 233, 151, 472, 412 (tri-acetylated derivative).



Quantification

Plasma **HPLC** Fluorescence detection. Limit of detection, 0.1 μg/L [Woestenborgh *et al* 1988].

Disposition in the Body The metabolism of nebivolol is complex with formation of numerous metabolites, and varies between individuals; they may be fast or slow metabolisers. Aromatic hydroxylation is the major pathway and also involved are alicyclic hydroxylation and glucuronidation pathways. Urinary and faecal excretion of unconjugated parent drug are <0.5% of a dose.

Therapeutic Concentration Peak plasma levels of 1 μg/L in fast metabolisers and 3 μg/L in slow metabolisers following a 5 mg oral dose.

Bioavailability 12% (fast metabolisers) and 96% (slow metabolisers).

Half-life 8 (fast metabolisers) to 27 (slow metabolisers) h.

Volume of Distribution 10.1 to 39.4 L/kg.

Clearance Total body, 51.6 L/h (healthy); 71.6 L/h (obese individuals).

Protein Binding 98%.

Dose A daily oral dose of 5 mg.

Aboul-Enein HY, Ali I (2001). HPLC enantiomeric resolution of nebivolol on normal and reversed amylose based chiral phases. *Pharmazie* 56: 214–216.

Woestenborgh R *et al.* (1988). In *Methodological Surveys in Biochemistry and Analysis*. US: Plenum Press, vol. 18, pp. 215–21.

Nedocromil

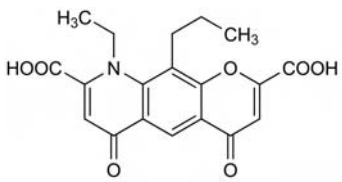
Antiasthmatic

$C_{19}H_{15}NO_7$ = 371.3

CAS—69049-73-6

IUPAC Name 9-Ethyl-6,9-dihydro-4,6-dioxo-10-propyl-4*H*-pyranol[3,2-g] quinoline-2,8-dicarboxylic acid

Synonym FPL-59002



Chemical Properties A yellow powder. Mp 298° to 300° (dec). Log *P* (octanol/water), 2.22.

Nedocromil Calcium

$C_{19}H_{15}CaNO_7$ = 411.5

CAS—101626-68-0

Synonym FPL-59002KC

Nedocromil Sodium

$C_{19}H_{15}NO_7,Na_2$ = 415.3

CAS—69049-74-7

Synonym FPL-59002KP

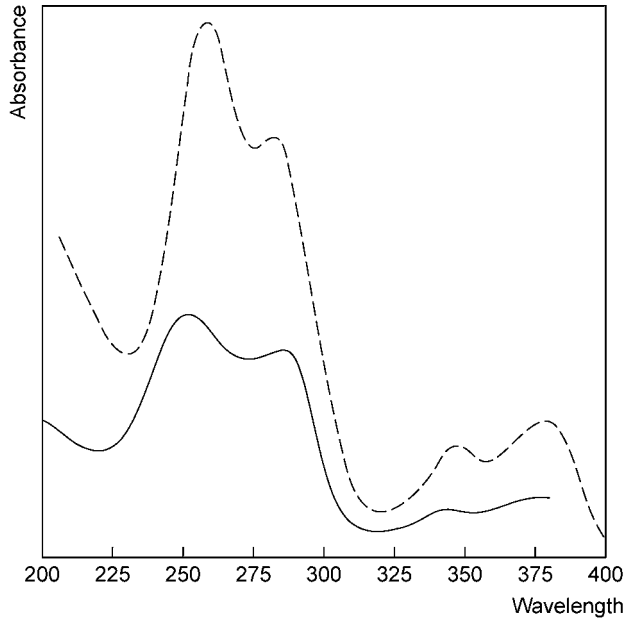
Proprietary Names *Alocril*; *Brionil*; *Cetimil*; *Halamid*; *Ildor*; *Irtan*; *Kovilen*; *Kovinal*; *Tilade*; *Tilarin*; *Tilavist*; *Rapitil*.

Chemical Properties A yellow powder. Soluble in water.

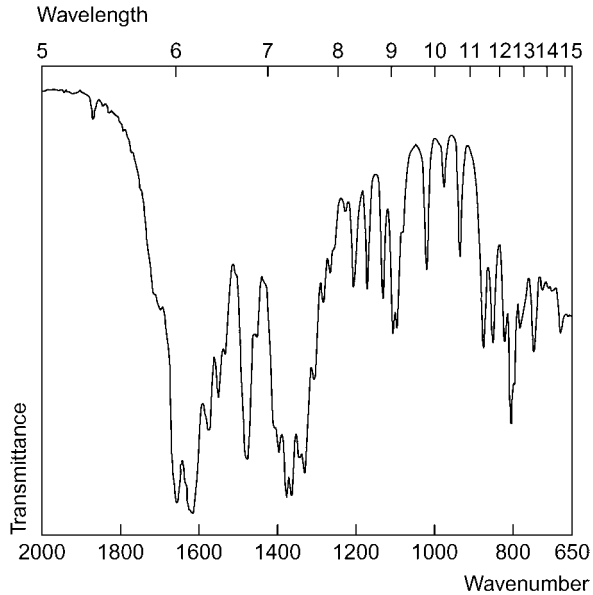
Thin-layer Chromatography System TE—R_f 0.00; system TF—R_f 0.00.

High Performance Liquid Chromatography System HX—RI 318.

Ultraviolet Spectrum Water—255, 286, 345, 378 nm.



Infrared Spectrum



Quantification

Urine **HPLC** Column: C_8 Spherisorb (250 × 4.6 mm i.d., 5 μm). Mobile phase: methanol : 45 mmol/L phosphate buffer : 0.5 mol/L dodecyl triethyl ammonium phosphate (550 : 447.6 : 2.4), (pH 2.3), flow rate 0.85 mL/min. Internal standard: sodium cromoglycate. UV detection (λ=256 nm). *k* value: 13.3 (retention time,

N

43.1 min); IS, *k* 8.5. Limit of quantification, 75 µg/L, limit of detection, 40 µg/L [Aswania *et al.* 1998]. UV detection (λ=253 nm). Limit of quantification, 20 µg/L [Baker *et al.* 1995].

Disposition in the Body A small amount of nedocromil (5% of dose) is absorbed after inhalation and excreted unchanged in urine and bile. Absorption is through the nasolacrimal duct rather than through the conjuctiva. It is reversibly bound to plasma proteins and therefore not metabolised. Accumulation does not occur. Approximately 80% of an IV dose is recovered in urine within 90 min. In healthy individuals, <10% of a dose is excreted in urine within 72 h.

Therapeutic Concentration

Healthy volunteers (6 men and 7 women, aged between 22 and 54 years) and those suffering from asthma (4 men and 8 women, 22 to 59 years old) were administered with 4 mg nedocromil sodium (inhaled). The mean peak plasma concentrations were 3.3 µg/L and 2.8 µg/L, respectively, and were reached after ~20 and 40 min, respectively [Neale *et al.* 1987].

Bioavailability 7 to 9% (2 to 3% oral; 5 to 6% respiratory).

Half-life 1.5 to 3.3 h.

Volume of Distribution 0.43 L/kg (after a 6 µg/kg, 30 min IV dose).

Clearance 10.2 ± 1.3 mL/min/kg (after a 6 µg/kg, 30 min IV dose).

Protein Binding About 89%.

Dose The usual dose is 4 mg inhaled four times daily and may be decreased to twice daily.

Nefazodone

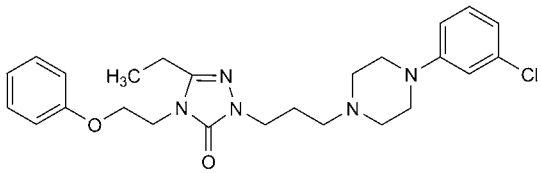
5-HT$_2$ Receptor Antagonist, Antidepressant

$C_{25}H_{32}ClN_5O_2$ = 470.0

CAS—83366-66-9

IUPAC Name 2-[3-[4-(3-Chlorophenyl)piperazin-1-yl]propyl]-5-ethyl-4-(2-phenoxyethyl)-1,2,4-triazol-3-one

Synonym 2-[3-[4-(3-Chlorophenyl)-1-piperazinyl]propyl]-5-ethyl-2,4-dihydro-4-(2-phenoxyethyl)-3*H*-1,2,4-triazol-3-one



Chemical Properties Non-hygroscopic white crystalline solid. Mp 83° to 84°. Freely soluble in chloroform; soluble in propylene glycol; slightly soluble in polyethylene glycol and water. pK_a 6.6. Log *P* (octanol/water), 5.0 [Meylan, Howard 1995]. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005]. Samples were stable on the laboratory bench and in the refrigerator for 60 days [Sreenivas Rao *et al.* 2001]

Nefazodone Hydrochloride

$C_{25}H_{32}ClN_5O_2$,HCl = 506.5

CAS—82752-99-6

Synonyms BMY-13754; 2-[3-[4-[(3-chlorophenyl)-1-piperazinyl]propyl]-5-ethyl-2,4-dihydro-4-(2-phenoxyethyl)-3*H*-1,2,4-triazol-3-one hydrochloride; MJ-13754-1.

Proprietary Names *Dutonin*; *Serzone*.

Chemical Properties Crystals from ethanol. Mp 175° to 177°.

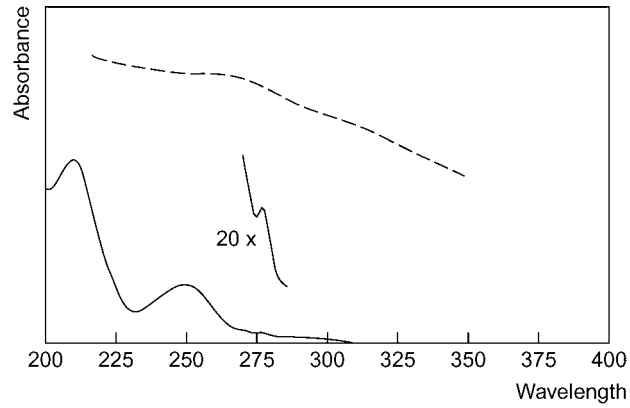
Gas Chromatography System GB—*m*-chlorophenylpiperazine (*m*CPP) RI 1806; system GT—RI 4510.

High Performance Liquid Chromatography System HZ—retention time 7.7 min.

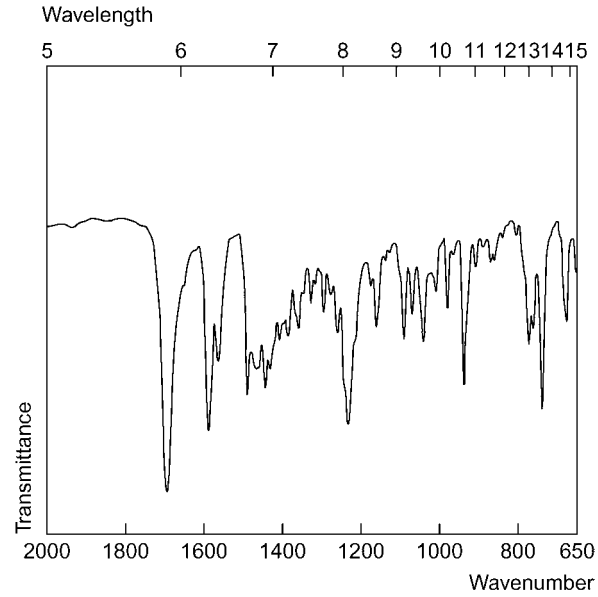
Column: Inertsil, ODS-3V (250 × 4.6 mm i.d., 5 µm). Mobile phase: 50 mmol/L potassium dihydrogen phosphate (pH 3.0) : acetonitrile : methanol (50 : 40 : 10), flow rate 1 mL/min. UV detection (λ = 220 nm). Retention time: 8.5 min [Sreenivas Rao *et al.* 2001].

Liquid Chromatography-Mass Spectrometry Column: Luna Phenylhexyl (150 × 4.6 mm i.d., 5 µm). Mobile phase: 5 mmol/L ammonium formate (pH 3.0) : acetonitrile (95 : 5 for 5 min to 40 : 60 in 30 min to 10 : 90 in 2 min to 95 : 5 in 1 min), flow rate 1.0 mL/min. ESI. Retention time: 30.44 min. Limit of detection not reported [Li *et al.* 2007].

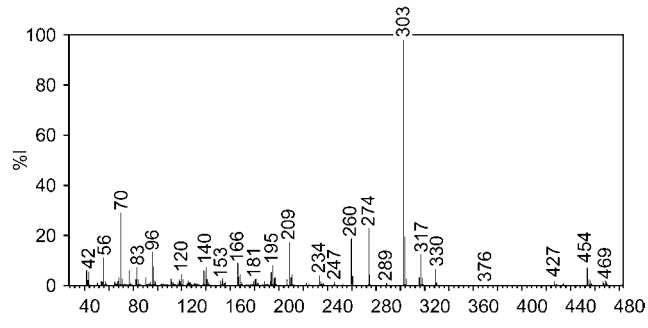
Ultraviolet Spectrum Aqueous acid (0.2 mol/L sulfuric acid)—245, 275 nm.



Infrared spectrum Principal peaks at wavenumbers: 1699, 1594, 1242 cm^{-1} (KBr disk).



Mass spectrum Principal ions at *m*/*z* 303, 274, 260, 69, 454, 209, 318, 469.



Quantification

***Plasma* HPLC** Column: Alphabond C_{18} (150 × 3.9 mm i.d., 10 µm). Mobile phase: acetonitrile : 50 mmol/L potassium dihydrogen phosphate (40 : 60), flow rate 1.0 mL/min. UV detection (λ = 205 nm). Retention time: 16.0 min. Limit of quantification, 200 µg/L [Dodd *et al.* 1999]. Column: Cyanopropyl (150 × 4.6 mm i.d., 5 µm). Mobile phase: 0.04 mol/L potassium phosphate buffer (pH 6.6) : acetonitrile : methanol (600 : 225 : 175), flow rate 1.4 mL/min. Electrochemical detection. Retention time: 3.2, 4.0 and 5.0 for nefazodone, hydroxynefazodone and *m*CPP, respectively. Limit of quantification, 0.9, 0.6 and 0.2 µg/L for nefazodone, hydroxynefazodone and *m*CPP, respectively [Franklin 1993]. Column: Zorbax phenyl (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol : 0.01 mol/L tetramethylammonium hydroxide with 0.01 mol/L dibasic ammonium phosphate (45 : 10 : 45), flow rate 1.0 mL/min. UV detection (λ = 254 nm). Limit of quantification, nefazodone and hydroxynefazodone 10 µg/L, *p*-hydroxynefazodone 20 µg/L, and *m*CPP 2.5 µg/L. Limit of detection, nefazodone and hydroxynefazodone 5 µg/L, *p*-hydroxynefazodone 10 µg/L, and *m*CPP 1 µg/L [Franc *et al.* 1991].

LC-MS Column: Luna C_8 (50 × 4.6 mm i.d., 5 µm). Mobile phase: 5 mmol/L ammonium formate : 0.05% trifluoroacetic acid : acetonitrile-methanol (50 : 50, 47 : 0.05 : 53), flow rate 1.35 mL/min. ESI, positive ion mode, SRM acquisition mode. Limit of quantification, 2 µg/L [Mao *et al.* 2007]. Column: Hypersil, C_{18} BDS (100 × 2.0 mm i.d., 3 µm). Mobile phase: acetonitrile : 10 mmol/L ammonium formate (pH 4; 45 : 55), flow rate 0.3 mL/min. I.S.: trazodone. APCI, positive ion mode, SIM acquisition mode (*m/z*: 470.4 [nefazodone], 486.2 [hydroxynefazodone], 458.1 [triazoledione], 197.0 [*m*CPP], and 372.0 [I.S.]). Retention time: nefazodone 4.47 min, hydroxynefazodone 2.80 min, triazoledione 2.34 min, *m*CPP 1.48 min, I.S. 1.77 min. Limit of quantification, 2.0 µg/L [Yao, Srinivas 2000]. Column: BDS Hypersil ODS (100 × 2 mm i.d., 3 µm). Mobile phase: acetonitrile : 10 mmol/L ammonium formate (pH 4; 45 : 55), flow rate 0.3 mL/min. API, positive ion mode. Limit of quantification, 2 µg/L [Yao *et al.* 1998].

Urine **GC-MS** Column: HP-1 capillary (12 m × 0.2 mm, i.d., 330 nm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 3 min to 310° at 30°/min for 8 min. EI ionisation at 70 eV, full scan mode. Limit of detection, <100 µg/L [Bickeboeller-Friedrich, Maurer 2001].

Breast Milk **HPLC** See Plasma [Dodd *et al.* 1999].

Disposition in the Body Rapidly and completely absorbed after oral administration, with peak plasma concentration reached within 0.5–2 h. Nefazodone undergoes extensive first-pass hepatic metabolism, with only 20% of a dose reaching the systemic circulation. It is extensively metabolised via *N*-dealkylation and aromatic hydroxylation and it is excreted via urine (55%) and faeces (25%) after additional glucuronidation. Less than 10% of the drug is present unchanged in the urine. Three active metabolites, hydroxynefazodone (the major metabolite), *m*CPP, and desethylhydroxynefazodone, have been identified. Nefazodone is metabolised by CYP3A4 but it is also an inhibitor of the enzyme [Stewart 2002].

Therapeutic Concentration The therapeutic concentration is variable and dose dependent. There is large intersubject variability [Barbhaiya *et al.* 1996a] with exposure at steady state being ~50% higher in elderly females (all extensive metabolisers) [Barbhaiya *et al.* 1996b].

Eighteen healthy males (aged 19 to 35 years) were administered a single oral dose of 50, 100 or 200 mg nefazodone hydrochloride after an overnight fast. Mean peak plasma concentrations of 84, 196 and 392 µg/L were observed for the single oral 50, 100 and 200 mg doses, respectively, attained at 0.9, 1.0 and 1.3 h, respectively, after dosing. A steady-state study was also carried out where a dose of 50, 100 or 200 mg was administered twice daily for 7 days after meals (final dose followed an overnight fast). The steady-state values were 72, 732 and 2047 µg/L for the 50, 100 and 200 mg doses reached 0.7, 0.9 and 1.2 h, respectively, after administration [Kaul *et al.* 1995].

Note For a pharmacokinetic study of a possible interaction of nefazodone with triazolam, see Barbhaiya *et al.* [1995]; with alprazolam, see Greene *et al.* [1995a]; and with lorazepam, see Greene *et al.* [1995b]. Nefazodone does not appear to interact with lithium [Laroudie *et al.* 1999].

Toxicity Instances of overdosage with up to 11 g of the drug have been reported without fatalities. Victims have manifested nausea, vomiting and somnolence.

A 27-year-old woman ingested 30 nefazodone 100 mg tablets. Her serum nefazodone concentration was 5.5 mg/L [Gaffney *et al.* 1998].

A 16-year-old girl took an overdose of 24 100 mg tablets. On admission to hospital, her plasma nefazodone concentration was 7.5 mg/L [Isbister, Hackett 2003].

Nefazodone is safe and well tolerated at oral doses of up to 450 mg three times daily [D'Amico *et al.* 1990]. Clinical overdoses of 3400 and 3600 mg produced no significant clinical/life-threatening symptoms [Fontaine 1992]. An overdose of 16 800 mg nefazodone resulted in no serious sequelae [Catalano *et al.* 1999]. See also Benson *et al.* [2000].However, caution is required when prescribing nefadozone in combination with other drugs that are meabolised by CYP3A4 or to patients with preexisting liver disease [Stewart 2002]. Some serious cases of hepatocellular injury have been described [Carvajal Garcia-Pando *et al.* 2002; Eloubeidi *et al.* 2000]. See also Schwetz [2002] and Lucena *et al.* [2003].

A 27-year-old developed hepatitis following nefazodone treatment [Schrader, Roberts-Thompson 1999].

In Canada in November 2003 the sale of Serzone (nefazodone) was discontinued by the manufacturer because of concerns of hepatotoxicity [Choi 2003].

Note For a case of serotonin syndrome in a 50-year-old man associated with fluoxetine in combination with nefazodone, see Smith and Wenegrat [2000]; in a 21-year-old woman associated with valproic acid and nefazodone, see Brazelton *et al.* [1997]. For a case of a 47-year-old man and a 48-year-old woman experiencing a selective deficit in the ability to perceive motion, see Horton and Trobe [1999].

Bioavailability 15–23% oral, regular release [Barbhaiya *et al.* 1996a; Barbhaiya *et al.* 1996c]; decreases by 18% when administered with food.

Half-life Dose dependent; nefazodone, 2–5 h (at dose of 200 mg twice daily); hydroxynefazodone, 2–4 h; desethylhydroxynefazodone, 18–33 h; *m*CPP, 4–9 h.

Volume of Distribution 0.22–0.87 L/kg.

Protein Binding Nefazodone and hydroxynefazodone, 98.4–99.8%; *m*CPP, 66–74%.

Note For a review of nefazodone, see Davis *et al.* [1997].

Dose Initially 50 to 100 mg twice daily, which may be increased to a maximum of 300 mg twice daily. In the elderly, the maximum dose is 100 to 200 mg twice daily.

Nefopam

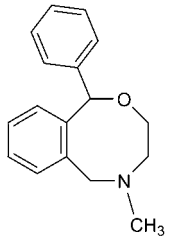
Analgesic, Benzoxazocine

$C_{17}H_{19}NO$=253.3

CAS—13669-70-0

IUPAC Name 5-Methyl-1-phenyl-1,3,4,6-tetrahydro-2,5-benzoxazocine

Synonym 3,4,5,6-Tetrahydro-5-methyl-1-phenyl-1*H*-2,5-benzoxazocine



Chemical Properties pK_a 9.2 [Sweetman 2007], 9.36 [Liu *et al.* 1987], 8.24 [Burton *et al.* 1990]. Log*P* (octanol/water), 3.05 [Meylan, Howard 1995]. Extraction yield (chlorobutane), 0.95 [Demme *et al.* 2005].

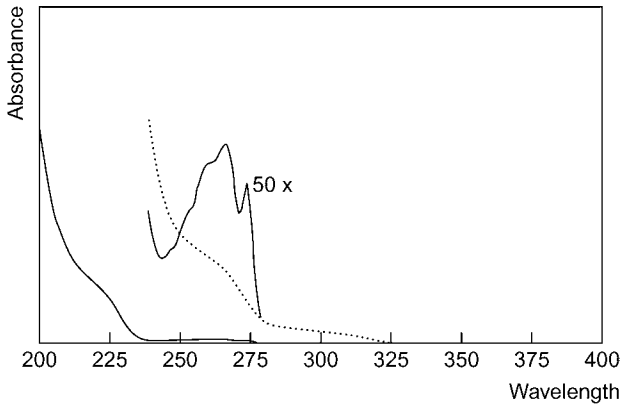
Nefopam Hydrochloride

$C_{17}H_{19}NO,HCl$ = 289.8

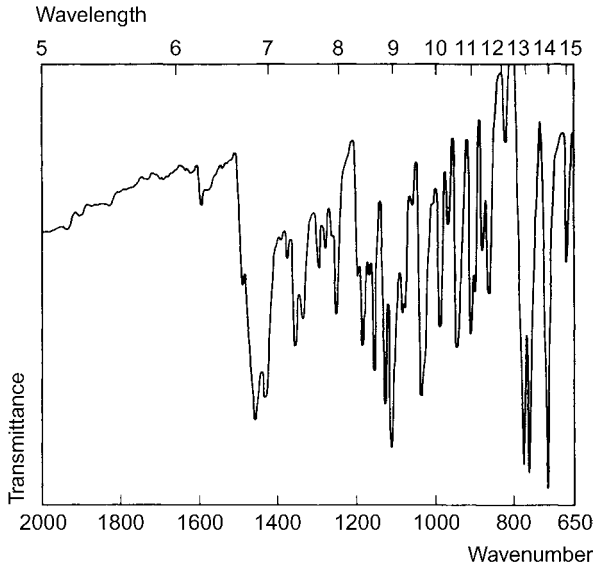
CAS—23327-57-3

IUPAC Name 5-Methyl-1-phenyl-1,3,4,6-tetrahydro-2,5-benzoxazocine hydrochloride
Proprietary Names *Acupan*; *Ajan*; *Nefadol*; *Nefam*; *Oxadol*; *Silentan*.
Chemical Properties A white crystalline powder. Mp ≈238° to 242°. Soluble in water, chloroform and methanol.

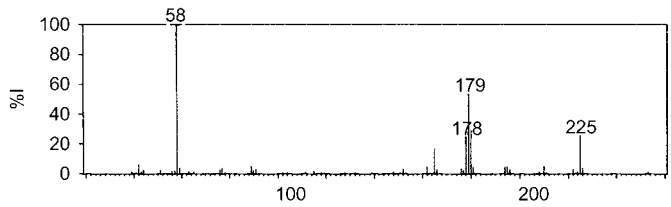
Colour Tests Liebermann's reagent—brown-orange→brown; Marquis test—orange→brown; sulfuric acid—orange.
Thin-layer Chromatography System TA—R_f 0.50; system TB—R_f 0.33; system TC—R_f 0.32; system TE—R_f 0.59; system TAE—R_f 0.30; system TAG—R_f 0.17.
Gas Chromatography System GA—nefopam RI 2035; system GB—nefopam RI 2106, M (nor-) RI 2116, M (OH-) RI 2266, M (nor-di-OH-) RI 2649; system GF—RI 2380.
High Performance Liquid Chromatography System HA—*k* 3.0; system HY—RI 313; system HAA—Retention time 12.7 min.
Ultraviolet Spectrum Aqueous acid—267 (A_1^1 = 29b), 275 nm.



Infrared Spectrum Principal peaks at wavenumbers 720, 760, 775, 1112, 1130, 1038 cm^{-1} (nefopam hydrochloride).



Mass Spectrum Principal ions at *m/z* 58, 179, 180, 225, 178, 165, 42, 210.



Quantification
Plasma **GC** Column: 3% OV-17 80/100 mesh Chromosorb W HP (1.80 m × 2 mm i.d.). Carrier gas: He, 30 mL/min. Temperature programme: 190° for 8.5 min to 240° at 30°/min for 3 min. Retention time: 7.6 min. NPFID. Limit of detection, 5 µg/L [Chang *et al.* 1981]. Column: 3% 100/120 mesh cyclohexanedimethyl succinate on Gas Chrom Q (1.82 m × 2 mm i.d.). Carrier gas: He, 40 mL/min. Temperature: 221°. FID. Limit of detection, 20 µg/L [Schuppan *et al.* 1978]. Column: 3% OV-225 on Gas-Chrom Q 100/120 mesh (0.90 m × 2 mm i.d.). Carrier gas: N_2, 25 mL/min. Temperature: 170°. FID. Limit of detection, 5 µg/L [Ehrsson, Eksborg 1977].

HPLC Column: Symmetry C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: 0.015 mol/L potassium dihydrogen phosphate-0.005 mol/L octane sulfonic acid (pH 3.7) : acetonitrile (77 : 33), flow rate 1.5 mL/min. UV detection (λ = 210 nm). Limit of detection, 1 µg/L [Aymard *et al.* 2002]. Column: Spherisorb S5W (150 × 4.6 mm i.d.). Mobile phase: 0.1 mol/L ammonium nitrate (pH 9.1) : acetonitrile (7 : 93), flow rate 1 mL/min. Electrochemical detection. Limit of quantification, 1 µg/L [Burton *et al.* 1990].

LC-MS Column: Hypurity C_{18} (150 × 2.1 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.1% formic acid (50 : 50), flow rate 0.3 mL/min. ESI, positive ion mode. Limit of quantification, 0.781 µg/L, limit of detection, 0.195 µg/L [Hoizey *et al.* 2006].
Urine **HPLC** See Plasma. Limit of detection, 5 µg/L [Aymard *et al.* 2002].
CSF **GC** See Plasma [Chang *et al.* 1981].
Milk **HPLC** Column: Zorbax CN (250 × 4.6 mm i.d., 7 µm). Mobile phase: acetonitrile : 0.01 mol/L sodium pentanesulfonic acid (pH 3.15; 50 : 55), flow rate 1.5 mL/min. UV detection (λ = 215 nm). Limit of detection, 1.6 µg/L [Liu *et al.* 1987].
Oral Fluid **GC** See Plasma [Chang *et al.* 1981].
Disposition in the Body Rapidly absorbed after oral administration. It is extensively metabolized with <5% of a dose being excreted unchanged in the urine; metabolites include desmethylnefopam and the *N*-glucuronide, and nefopam *N*-oxide. Approximately 87% of a dose is excreted in the urine and ~8% in the faeces in 5 days.
Therapeutic Concentration
Following a single oral dose of 90 mg, peak blood concentrations of 0.07–0.15 mg/L were reported at 1–3 h [Heel *et al.* 1980].
Toxicity
A postmortem blood concentration of 11.9 mg/L was reported in a suicide with nefopam overdose; in a second non-fatal overdose case, a plasma concentration of 3.8 mg/L was reported 3 h after ingestion, declining to 0.9 mg/L at 19 h [Piercy *et al.* 1981].

In a fatality involving the intentional ingestion of an unknown quantity of nefopam and dihydrocodeine, the plasma nefopam concentration was 4.3 mg/L 1 h after ingestion; the postmortem plasma concentration was 0.6 mg/L (corresponding dihydrocodeine concentrations were 5.9 and 1.7 mg/L) [Urwin, Smith 1999].

A 37-year-old woman died after self-administering a massive IV dose of nefopam (300 mg). Postmortem tissue concentrations, measured ~7–10 days after death, were as follows: heart blood 4.38 mg/L, liver 59.12 µg/g, kidney 14.57 µg/g, lung 44.07 µg/g, and myocardium 14.87 µg/g [Tracqui *et al.* 2002].
Half-life Plasma half-life, 3–8 h (mean 4).
Protein Binding Approximately 75%.
Milk : plasma 1.2 ± 0.7 [Liu *et al.* 1987].
Note For a review of nefopam, see Heel *et al.* [1980].
Dose 90 to 270 mg of nefopam hydrochloride daily.

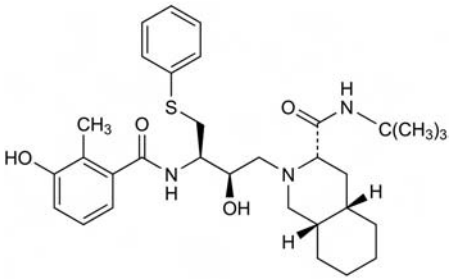
Nelfinavir

Protease Inhibitor, Antiretroviral
$C_{32}H_{45}N_3O_4S$ = 567.8
CAS—159989-64-7

IUPAC Name (3*S*,4*aS*,8*aS*)-*N*-Tert-butyl-2-[(2*R*,3*R*)-2-hydroxy-3-[(3-hydroxy-2-methylbenzoyl)amino]-4-phenylsulfanylbutyl]-3,4,4*a*,5,6,7,8,8*a*-octahydro-1*H*-isoquinoline-3-carboxamide

Synonyms AG-1346; (3*S*,4a*S*,8a*S*)-*N*-(1,1-dimethylethyl)decahydro-2-[(2*R*,3*R*)-2-hydroxy-3-[(3-hydroxy-2-methylbenzoyl)amino]-4-(phenylthio)butyl]-3-isoquinolinecarboxamide.

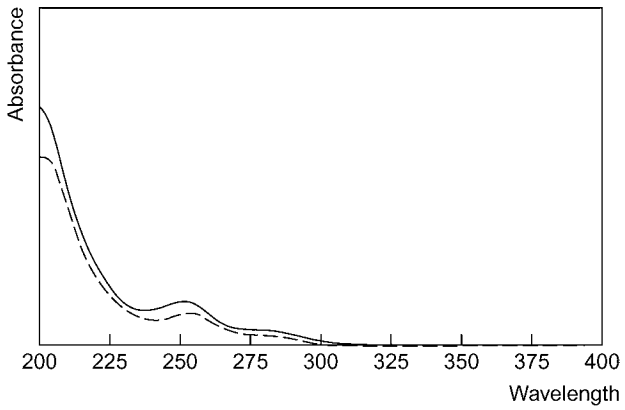


Chemical Properties White foam. Practically insoluble in water. pK_{a1} 6.00; pK_{a2} 11.06; pK_a −1.20 (mesilate). Log *P* (octanol/water), 4.1.

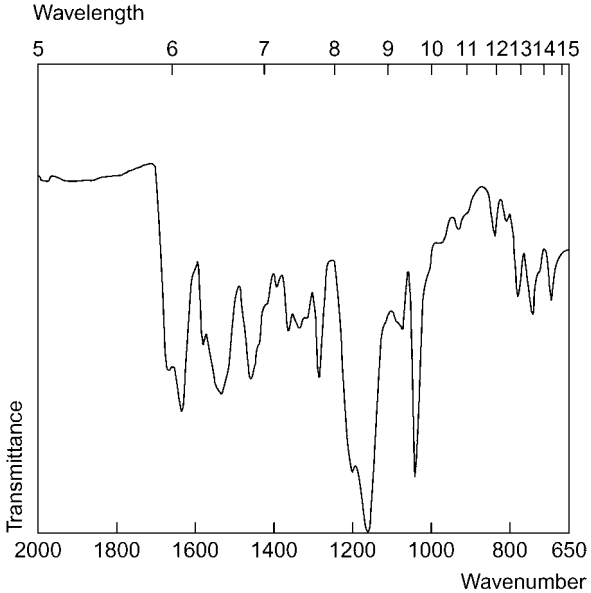
Nelfinavir Mesilate

$C_{32}H_{45}N_3O_4S$, CH_3SO_3H = 663.9
CAS—159989-65-8
Synonym AG-1343
Proprietary Name *Viracept*
Chemical Properties White powder. Solubility: 4.5 mg/mL in water, 2.6 mg/mL in 0.1 N HCl, 70 mg/g in glycerine, >100 mg/g in propylene glycol, >200 mg/g in PEG. Very soluble in methanol, ethanol, acetonitrile; practically insoluble in soybean oil and mineral oil.

High Performance Liquid Chromatography System HAC—*k* 17.3; system HAE—retention time 8.00 min.
Ultraviolet Spectrum Aqueous acid 252 nm.



Infrared Spectrum Principal peaks at wavenumbers 1639, 1536, 1460, 1285, 1158, 1040 cm^{-1}.



Quantification
Plasma **HPLC** UV detection (λ=254 nm). Limit of quantification, 0.05 mg/L [Aymard *et al.* 2000]. Column: ABZ-plus Supelcosil (250 × 4.6 mm i.d., 3 µm). Temperature: 45°. Mobile phase: 20 mmol/L potassium dihydrogen phosphate (pH 4) : methanol : acetonitrile (45 : 30 : 25), flow rate 1.0 mL/min. Internal standard: ritonavir. UV detection (λ=240 nm). Retention time: nelfinavir, 16.7 min; hydroxy-tert-butylamide metabolite, 7.2 min; IS, 12.7 min. Limit of quantification, 0.03 mg/L [Khaliq *et al.* 2000]. UV detection (λ=260 nm). Limit of quantification, 0.15 mg/L [Proust *et al.* 2000]. UV detection (λ=215 nm). Limit of quantification, 0.05 mg/L [Yamada *et al.* 2001].
Serum **HPLC** UV detection (λ=250 nm). Limit of detection, 0.4 mg/L [Simon *et al.* 2001].
Disposition in the Body Nelfinavir is well absorbed after oral administration, and this is enhanced by administration with food. It is oxidised by the cytochrome P450 isoenzymes CYP2C19 and CYP2D6, to a hydroxy-*tert*-butylamide metabolite with *in vitro* antiviral activity. Approximately 50% of the drug is eliminated by this means, but the activity of CYP2C19 may be impaired in patients with reduced liver function or disease. Nelfinavir may induce its own metabolism. Elimination of the metabolite is predominantly controlled by the isoenzyme CYP3A4. Eighty–seven percent of a 750 mg dose is recovered in faeces, 22% as nelfinavir and 78% as the oxidative metabolites. It is distributed in breast milk.
Therapeutic Concentration
Eight Caucasian HIV-positive patients with liver disease, a mean age of 35 years (range, 29 to 42 years), participated in the study. Two of the patients had already been receiving nelfinavir for >8 weeks (750 mg every 8 h) and three others had been taking stavudine (40 mg) and lamivudine (150 mg) every 12 h for 12 weeks or longer. For the new patients starting treatment with nelfinavir, they were administered a single dose of 500 mg or 750 mg and then twice or three times daily for multiple dosing. During the multiple dosing, nelfinavir was co-administered with lamivudine (150 mg every 12 h) and either zidovudine (300 mg every 12 h) or stavudine (40 mg every 12 h). One patient also received 1000 mg saquinavir every 12 h. Steady-state plasma concentrations were measured after 10 and 19 days of multiple dosing. After the 500 mg single dose, the mean peak plasma concentration was 1.72 mg/L; after the 750 mg single dose, 2.70 mg/L; 250 mg twice daily, 1.7 mg/L; 500 mg twice daily, 4.1 mg/L; 750 mg twice daily, 3.1 mg/L; 250 mg three times daily, 2.5 mg/L and 750 mg three times daily, 4.73 mg/L [Khaliq *et al.* 2000].
Half-life 3.5 to 5 h.
Volume of Distribution 2 to 7 L/kg.
Clearance Plasma, mean, 24 L/h. Also reported as 24 to 33 L/h after a single dose and 26 to 61 L/h after multiple doses.
Protein Binding >98%.
Note For an update on the use of Nelfinavir in HIV infection, see Bardsley-Elliot and Plosker [2000].
Dose Adult: 2.25 g daily in three divided doses. Children (2 to 13 years): 20 to 30 mg/kg body weight three times daily.

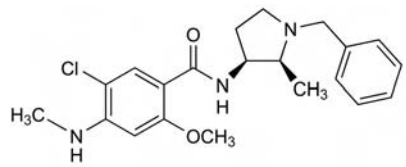
Nemonapride

Antipsychotic
$C_{21}H_{26}ClN_3O_2$ = 387.9
CAS—93664-94-9; 75272-39-8
IUPAC Name *cis*-*N*-(1-Benzyl-2-methyl-3-pyrrolidinyl)-5-chloro-4-(methylamine)-*o*-anisamide
Synonyms Emonapride; YM-09151-2.
Proprietary Name *Emilace*



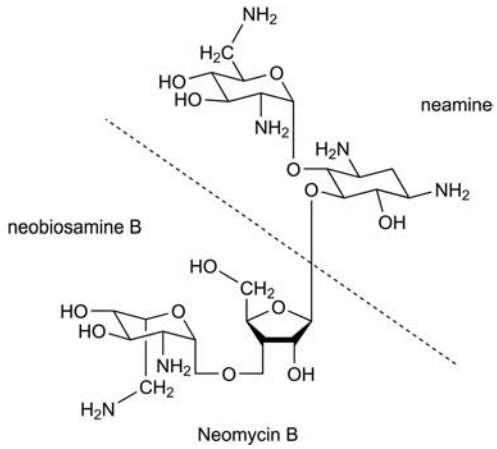
Chemical Properties Odourless, non-hygroscopic white crystals or crystalline powder. Mp 152° to 153°, also reported as 150°. Practically insoluble in water; freely soluble in glacial acetic acid and chloroform; sparingly soluble in methanol and ethanol; slightly soluble in ether. pK_a 0.40; 8.18. Log *P* (octanol/buffer pH 7.0), 3.20.
High Performance Liquid Chromatography System HAA—retention time 15.0 min.

Ultraviolet Spectrum Aqueous acid—285, 314 nm.
Infrared Spectrum Principal peaks at wavenumber 1624, 1602, 1284, 1244 cm^{-1}.
Mass Spectrum Principal ions at *m/z* 388, 310, 215, 198, 173, 91.
Quantification
Plasma **HPLC** Electrochemical detection. Limit of quantification, 0.25 μg/L for nemonapride and its active metabolite, desmethylnemonapride [Nagasaki *et al.* 1998].
Disposition in the Body The plasma concentration of the unchanged drug reaches its peak 2 to 3 h after oral administration. No unchanged drug is detected in urine during the 24 h after oral administration. The major urinary metabolites are produced by *N*-demethylation, debenzylation and oxidation of the α-position of the pyrrolidine ring.
Half-life 2.5 to 4.5 h.
Dose Orally 9 to 36 mg daily. Maximum dose is 60 mg.

Nagasaki T *et al.* (1998). High-performance liquid chromatographic determination of nemonapride and desmethylnemonapride in human plasma using an electrochemical detection. *J Chromatogr Biomed Sci Appl* 714: 293–298.

Neomycin

Antibiotic
$C_{23}H_{46}N_6O_{13}$ = 614.6 (neomycin B)
CAS—1404-04-2 (neomycin); 3947-65-7 (neomycin A); 119-04-0 (neomycin B); 66-86-4 (neomycin C)



Chemical Properties A mixture of the two isomers, neomycins B and C, with neomycin A (neamine), an inactive component and degradation product of neomycins B and C. Neomycin is obtained from certain selected strains of *Streptomyces fradiae*.

Neomycin Sulfate
CAS—1405-10-3
Synonyms Fradiomycin sulfate; neomycin.
Proprietary Names It is an ingredient of many proprietary preparations—see Sweetman [2009].
Chemical Properties A white to yellowish-white hygroscopic powder. Slowly soluble 1 in 1 of water; very slightly soluble in ethanol; practically insoluble in chloroform and ether.

Neomycin Undecylenate
CAS—1406-04-8
Synonym Neomycin undecenoate
Proprietary Name It is an ingredient of *Audicort*.
Chemical Properties A yellowish-white to pale yellow, waxy, unctuous powder. Practically insoluble in water; very soluble in ethanol; soluble in chloroform.

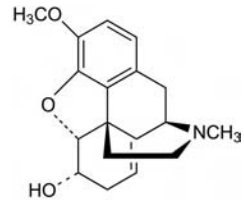
Thin-layer Chromatography System TA—R_f 0.00; system TAE—R_f 0.00 (acidified potassium permanganate solution, positive).
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.
Dose As an intestinal antiseptic, up to 12 g of neomycin sulfate daily, orally; it is also applied topically.

Sweetman SC, ed. (2009). *Martindale: The Complete Drug Reference*, 36 edn. London: Pharmaceutical Press.

Neopine

Alkaloid
$C_{18}H_{21}NO_3$ = 299.4
CAS—467-14-1

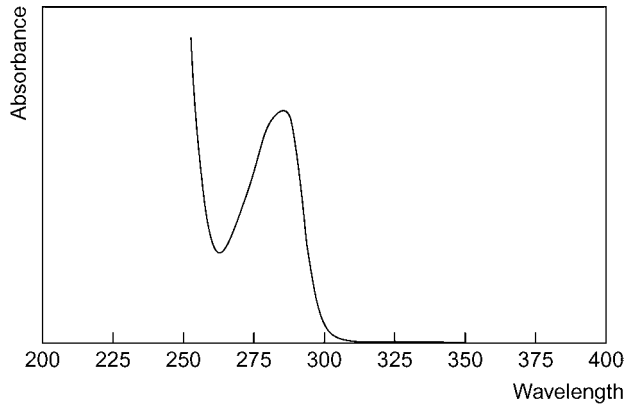
Synonym β-Codeine; (5α,6α)-8,14-didehydro-4,5-epoxy-3-methoxy-17-methyl morphinan-6-ol.
Note It has been incorrectly called hydroxycodeine.



Chemical Properties An alkaloid obtained from opium. Crystals. Mp about 127°. Slightly soluble in water; soluble in chloroform. Log *P* (octanol/water), 1.4.

Neopine Hydrobromide
$C_{18}H_{21}NO_3$,HBr = 380.3
Chemical Properties Crystals which darken at about 240° and decompose at 283°. Relatively insoluble in water, hence ease of separation from other opium alkaloids.

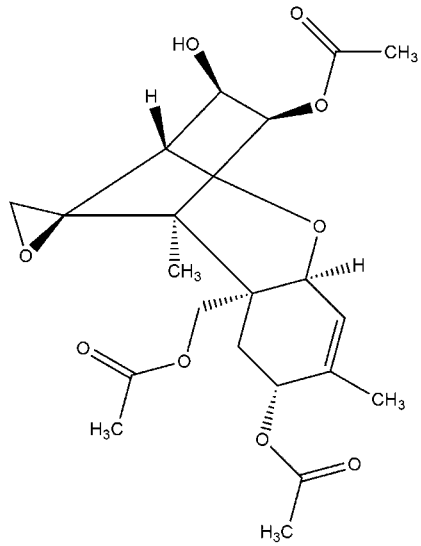
Colour Test Marquis test—blue-violet.
Thin-layer Chromatography System TA—R_f 0.35; system TB—R_f 0.05; system TC—R_f 0.12; system TL—R_f 0.04 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2395.
Ultraviolet Spectrum Aqueous acid—285 nm (A_1^1=39b). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1275, 1500, 1118, 1050, 1250, 782 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 299, 162, 229, 123, 59, 42, 44, 300.

Neosolaniol

Mycotoxin
$C_{21}H_{28}O_9$ = 424.4
Synonyms 8-Acetylneosolaniol; 3-hydroxy-4β,8-α,15-triacetoxy-12,13-epoxy-trichothec-9-ene; neosolaniol monoacetate; trichothecene analogue.



Quantification

Other **GC-MS** Foodstuffs Marketed in Germany. Limit of detection, 1–19 µg/kg [Schollenberger *et al.* 2005].

LC-MS Nigerian Maize. Limit of detection, 20–200 µg/kg [Adejumo *et al.* 2007]. Wheat. APCI, positive ion mode. Limit of quantification, 10–100 ppb [Berger *et al.* 1999].

Adejumo TO *et al.* (2007). Occurrence of *Fusarium* species and trichothecenes in Nigerian maize. *Int J Food Microbiol* 116: 350–357.

Berger U *et al.* (1999). Quantitative determination and structure elucidation of type A- and B-trichothecenes by HPLC/ion trap multiple mass spectrometry. *J Agric Food Chem* 47: 4240–4245.

Schollenberger M *et al.* (2005). Survey of *Fusarium* toxins in foodstuffs of plant origin marketed in Germany. *Int J Food Microbiol* 97: 317–326.

Neostigmine Bromide

Anticholinesterase

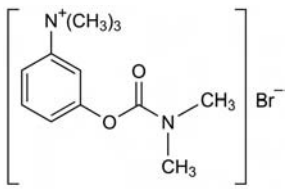
$C_{12}H_{19}BrN_2O_2$ = 303.2

CAS—59-99-4 (neostigmine); 114-80-7 (bromide)

IUPAC Name 3-[[(Dimethylamino)carbonyl]oxy]-*N*,*N*,*N*-trimethylbenzenaminium bromide

Synonyms Proserine bromide; synstigmine bromide.

Proprietary Names *Neoeserin*; *Normastigmin*; *Prostigmin(e)* (tablets).



Chemical Properties Colourless crystals or a white crystalline, slightly hygroscopic powder. Mp 171° to 176°, with decomposition. Soluble 1 in 0.5 of water, 1 in 8 of ethanol and 1 in 5 of chloroform; practically insoluble in ether. pK_a 12.0.

Neostigmine Methylsulfate

$C_{13}H_{22}N_2O_6S$ = 334.4

CAS—51-60-5

Synonym Proserinum

Proprietary Name *Glycostigmin*; *Intrastigmina*; *Normastigmin*; *Prostigmin(e)*; *Prostigmina*; *Robinul-Neostigmin(e)* (injection).

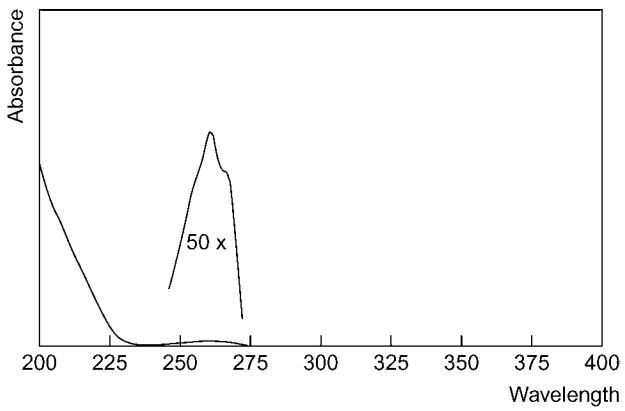
Chemical Properties Colourless crystals or a white crystalline powder. Mp 144° to 149°. Soluble 1 in 0.5 of water and 1 in 6 of ethanol.

Thin-layer Chromatography Neostigmine bromide: system TA—R_f 0.02. Neostigmine methylsulfate: system TB—R_f 0.00; system TE—R_f 0.00; system TF—R_f 0.00; system TAE—R_f 0.00 (acidified iodoplatinate solution, positive).

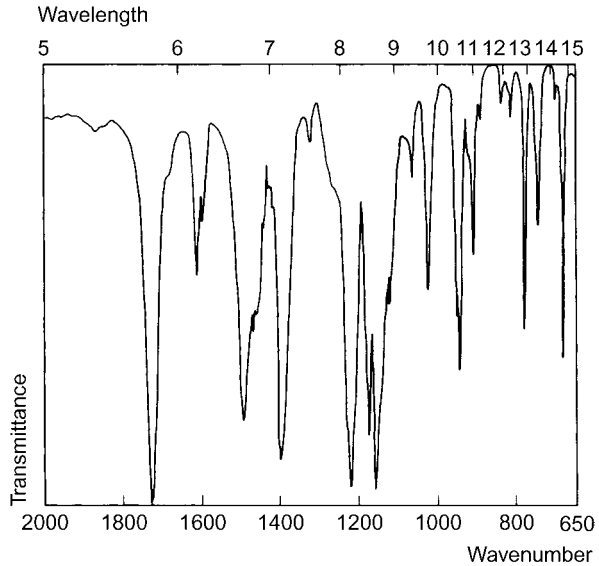
Gas Chromatography System GA—RI 1770.

High Performance Liquid Chromatography System HA—*k* 4.7 (tailing peak).

Ultraviolet Spectrum Aqueous acid—260 (A_1^1=16a), 266 nm. No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1711, 1215, 1154, 1176, 948, 690 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 72, 42, 208, 108, 65, 73, 66, 39.

Quantification

Plasma **GC** AFID. Limit of detection, 50 µg/L [Chan *et al.* 1976].

GC–MS Limit of detection, 1 µg/L [Aquilonius *et al.* 1979].

HPLC UV detection. Limit of detection, <2.6 µg/L [Varin *et al.* 1999].

Urine **MS** Limit of detection, 20 to 150 µg/L for neostigmine bromide and other quaternary ammonium compounds [Nisikawa *et al.* 1991].

Cerebrospinal Fluid **HPLC** See Plasma [Varin *et al.* 1999].

Disposition in the Body Neostigmine bromide is poorly absorbed after oral administration. It is metabolised by ester hydrolysis to form 3-hydroxytrimethylanilinium bromide, which is active. About 20% of an oral dose is excreted in the urine with <5% as unchanged drug; about 50% of an oral dose is eliminated in the faeces. After IM administration, about 80% of a dose is excreted in the urine in 24 h, with ~50% consisting of unchanged drug and 15% as the 3-hydroxytrimethylanilinium metabolite.

Therapeutic Concentration

After a single oral dose of 30 mg to 3 subjects, peak plasma concentrations of 0.004 to 0.009 mg/L were attained in 1 to 2 h [Aquilonius *et al.* 1979].

Following IV administration of 5 mg to 5 subjects, plasma concentrations of 0.84 to 6.25 mg/L were reported at 2 min [Williams *et al.* 1978].

Half-life Plasma half-life, about 1 h.

Volume of Distribution About 1 L/kg.

Clearance Plasma clearance, about 11 mL/min/kg.

Dose Usually 75 to 300 mg of neostigmine bromide daily, orally; 1 to 2.5 mg of neostigmine methylsulfate daily, given parenterally.

Aquilonius SM *et al.* (1979). A pharmacokinetic study of neostigmine in man using gas chromatography-mass spectrometry. *Eur J Clin Pharmacol* 15: 367–371.

Nevirapine

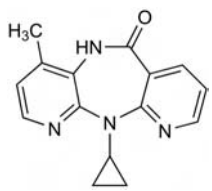
Non-Nucleoside Reverse Transcriptase Inhibitor, Antiretroviral

$C_{15}H_{14}N_4O$ = 266.3

CAS—129618-40-2

Synonyms BI-RG-587; BIRG-0587; 11-cyclopropyl-5,11-dihydro-4-methyl-6*H*-dipyrido[3,2-*b*:2′,3′-*e*]-[1,4]diazepin-6-one.

Proprietary Name *Viramune*

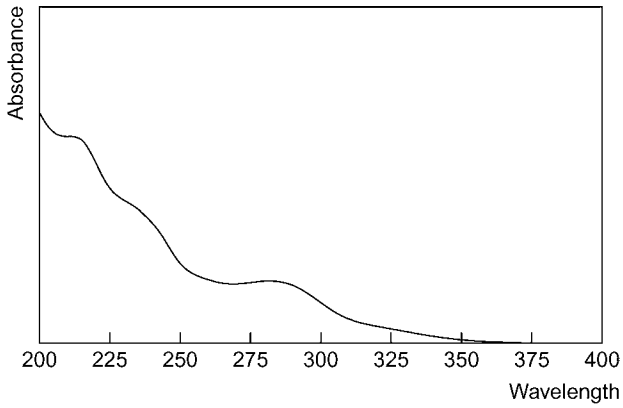


Chemical Properties Crystals from pyridine/water. Mp 247° to 249°. Highly soluble in water at pH <3 but solubility decreases to ~0.1 g/L at neutral pH. pK_a 2.8. Log *P* (octanol/water), 83.

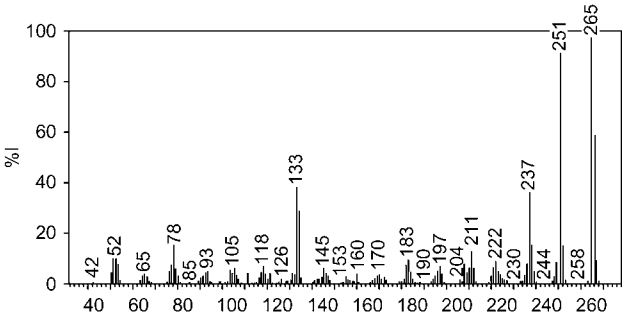
High Performance Liquid Chromatography System HAD—*k* 11.1.

Column: C_{18} Spherisorb (300 × 4.6 mm i.d., 3 µm). Mobile phase: 10 mmol/L phosphate buffer (pH 5) : acetonitrile (82 : 18) with 10 mmol/L triethylamine, flow rate 1.0 mL/min. UV detection (λ=240 nm). Retention time: 2.0 min [Lopez *et al.* 2001].

Ultraviolet Spectrum Aqueous acid—205, 216, 280 nm.



Mass Spectrum Principal ions at *m/z* 265, 251, 267, 133, 237, 135, 78, 211.



Quantification

Plasma **HPLC** UV detection (λ=260 nm). Limit of quantification, 0.1 mg/L [Aymard *et al.* 2000]. UV detection (λ=280 nm). Limit of quantification, 0.1 mg/L, limit of detection, 0.05 mg/L [Hollanders *et al.* 2000]. Column: RP LC-8 Supelco (150 × 4.6 mm i.d., 5 µm). Mobile phase: 25 mmol/L phosphate buffer (pH 6) : methanol : acetonitrile (63 : 21.5 : 15.5) with 25 mmol/L 1-butane-sulfonic acid, flow rate 1.0 mL/min. Internal standard: BIRH-414. UV detection (λ=280 nm). Retention time: nevirapine, 5.5 min; IS, 7.5 min. Limit of quantification, 0.025 mg/L [Pav *et al.* 1999]. Column: C_8 (150 × 4.6 mm i.d., 5 µm). Mobile phase: 25 mmol/L phosphate buffer (pH 5.5) : methanol : acetonitrile (7 : 2 : 1) with 25 mmol/L hexane-1-sulfonic acid, flow rate 1.0 mL/min. UV detection (λ=282 nm). Retention time: 9.5 min. Limit of quantification, 0.052 mg/L [van Heeswijk *et al.* 1998]. UV detection (λ=245, 280 nm). Limit of quantification, 0.01 mg/L [Jayaraj *et al.* 1992].

Serum **HPLC** UV detection (λ=250 nm). Limit of detection, 0.084 mg/L [Simon *et al.* 2001]. See Plasma [Pav *et al.* 1999].

Cerebrospinal Fluid **HPLC** See Plasma [Pav *et al.* 1999].

Milk **HPLC** See Plasma [Pav *et al.* 1999].

Disposition in the Body Nevirapine is readily absorbed after oral administration with a peak plasma concentration at 4 h. Absorption is not affected by food. The concentration of the drug in the CNS is 45% of that in plasma. It crosses the placenta and has been detected in breast milk. Nevirapine undergoes extensive metabolism in the liver mainly be the cytochrome P450 isoenzymes of the CYP3A family and the major metabolite is hydroxymethyl-nevirapine. It is excreted via urine as the glucuronide conjugates of the hydroxylated metabolites. The drug is widely distributed in body tissues and the CNS.

Therapeutic Concentration The therapeutic concentration is >1 mg/L.

Eighteen male and 3 HIV-1-infected female patients, aged between 19 and 46 years, with an absolute CD4 count <400/µL were administered with doses of 12.5, 25, 50, 100, 200 and 400 mg nevirapine after an overnight fast (3 patients for each dose). The mean peak plasma concentrations were 0.145, 0.416, 0.560, 1.215, 2.070 and 3.068 mg/L, respectively, to the doses, achieved after 1.0, 1.7, 3.7, 3.8, 2.0 and 2.25 h, respectively [Cheeseman *et al.* 1993].

Bioavailability Oral, about 93%.

Half-life 45 h which decreases on multiple dosing to 20 to 30 h over a 2- to 4-week period.

Volume of Distribution Steady state, 1.2 to 1.5 L/kg. Reported as 1.54 L/kg in females and 1.38 L/kg in males.

Clearance Oral, 0.27 to 0.52 mL/kg/min. Plasma, 3.96 L/h (after a 200 mg dose).

Protein Binding 60%.

Note For a safety profile of nevirapine, see Pollard *et al.* [1998].

Dose Adult: 200 mg once daily which can be increased to 400 mg daily after 2 weeks. Children under 50 kg (2 months to 8 years): 4 mg/kg increased to 7 mg/kg twice daily (maximum 400 mg daily). (8 to 16 years): 4 mg/kg once daily increased to twice daily (maximum 400 mg).

Nialamide

Antidepressant

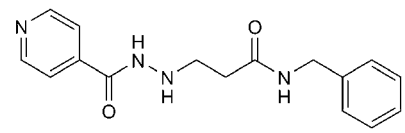
$C_{16}H_{18}N_4O_2$=98.3

CAS—51-12-7

IUPAC Name *N*-Benzyl-3-[2-(pyridine-4-carbonyl)hydrazinyl]propanamide

Synonym 4-Pyridinecarboxylic acid 2-[3-oxo-3-[(phenylmethyl)amino]propyl] hydrazide

Proprietary Names *Espril*; *Niamid(al)*; *Niaquitil*; *Nuredal*; *Nyazin*.



Chemical Properties A white crystalline powder. Mp 151° to 153°. Soluble 1 in 400 of water, 1 in 40 of ethanol, 1 in 150 of chloroform, and 1 in 10 of methanol; freely soluble in acidic solvents. Log *P* (octanol/pH 7.4), 0.9, (octanol/water), 0.87 [Hansch *et al.* 1995].

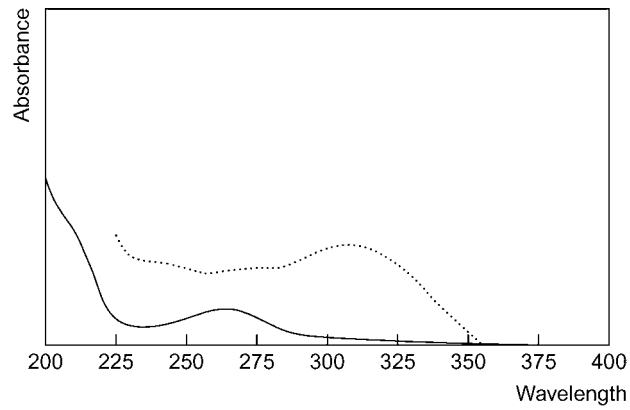
Colour Tests Liebermann's reagent—red-orange; Mandelin's test—red; Nessler's reagent—black.

Thin-layer Chromatography System TA—R_f 70; system TB—R_f 02; system TC—R_f 25; system TAE—R_f 68; system TAF—R_f 64; system TAG—R_f 0.04 (acidified iodoplatinate solution—positive; Dragendorff spray—positive; Marquis test—brown).

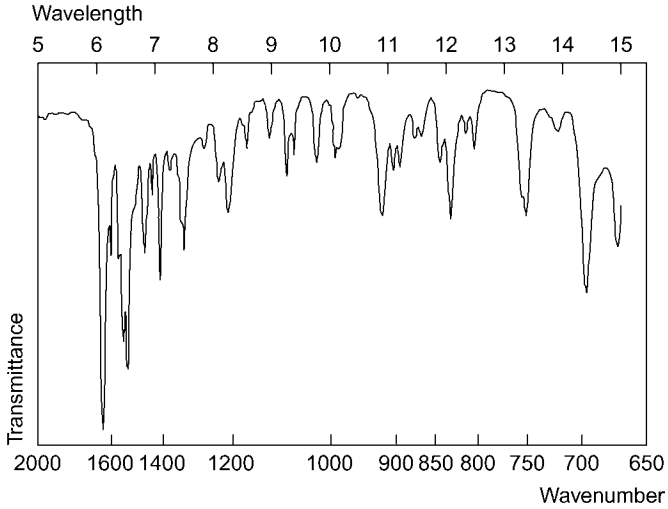
Gas Chromatography System GA—RI 1500.

High Performance Liquid Chromatography System HA—*k* 1.2 (tailing peak); system HX—RI 334.

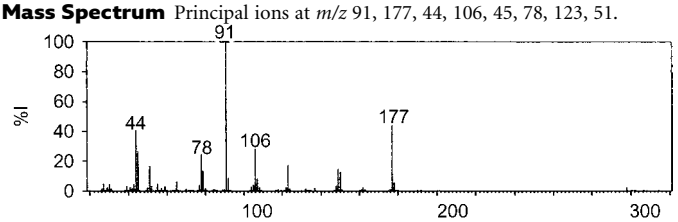
Ultraviolet Spectrum Aqueous acid—266 nm (A_1^1 = 193a); aqueous alkali—307 nm.



Infrared Spectrum Principal peaks at wavenumbers 1625, 1520, 1547, 698, 670, 1600 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 91, 177, 44, 106, 45, 78, 123, 51.



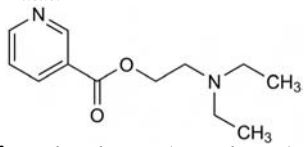
Disposition in the Body
Toxicity A dose of 5 g nialamide can be fatal in humans [Matell, Thorstrand 1967].
Dose 75 to 150 mg daily.

Hansch C *et al.* (1995). *Exploring QSAR: Hydrophobic, Electronic, and Steric Constants*. Washington, DC: American Chemical Society.
Matell G, Thorstrand C (1967). A case of fatal nialamid poisoning. *Acta Med Scand* 181: 79–82.

Nicametate

Vasodilator
$C_{12}H_{18}N_2O_2 = 222.3$
CAS—3099-52-3

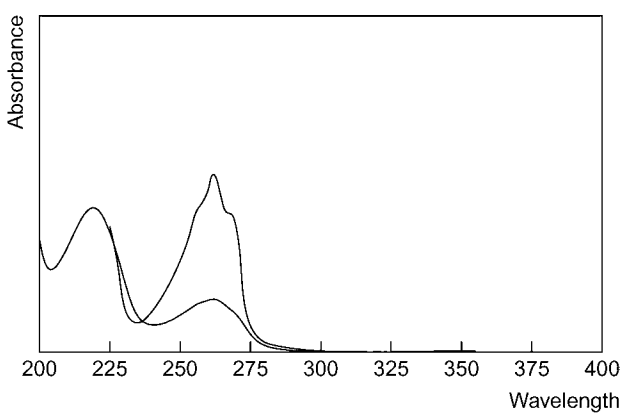
IUPAC Name 2-Diethylaminoethyl pyridine-3-carboxylate
Synonym 3-Pyridinecarboxylic acid 2-(diethylamino)ethyl ester
Proprietary Name *Eucast*



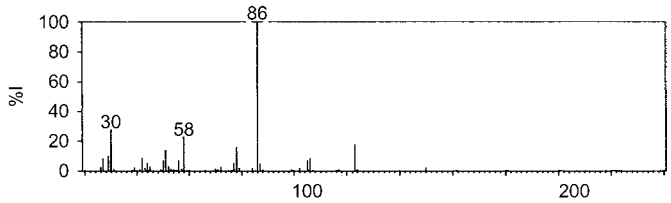
Chemical Properties A liquid. Log *P* (octanol/water), 1.3.

Nicametate Citrate
$C_{12}H_{18}N_2O_2,C_6H_8O_7,H_2O = 432.4$
CAS—1641-74-3
Proprietary Names *Euclidan*; *Nurtin*; *Soclidan*.
Chemical Properties A white crystalline powder.

Colour Test Cyanogen bromide—orange.
Thin-layer Chromatography System TA—R_f 0.56; system TB—R_f 0.41; system TC—R_f 0.35; system TE—R_f 0.68; system TL—R_f 0.20; system TAE—R_f 0.35 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—nicametate RI 1608, nicotinic acid RI 1335.
Ultraviolet Spectrum Aqueous acid—261 nm (A^1_1=120b).



Infrared Spectrum Principal peaks at wavenumbers 1729, 1283, 1594, 1130, 1116, 743 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 86, 30, 58, 123, 78, 51, 29, 42; nicotinic acid 123, 105, 78, 51, 106, 77, 124, 50.

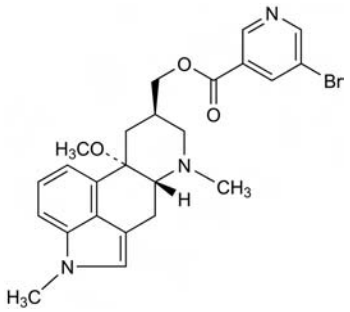


Disposition in the Body Slowly hydrolysed to nicotinic acid and diethylaminoethanol.
Dose 300 mg of nicametate citrate daily.

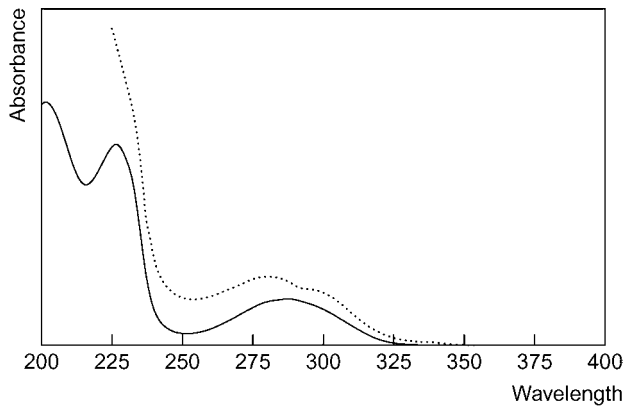
Nicergoline

Vasodilator
$C_{24}H_{26}BrN_3O_3 = 484.4$
CAS—27848-84-6

Synonyms FI-6714; (8β)-10-methoxy-1,6-dimethylergoline-8-methanol 5-bromo-3-pyridinecarboxylate; nicotergoline; nimergoline.
Proprietary Names *Cebran*; *Circo-Maren*; *Duracebrol*; *Ergobel*; *Ergolin*; *Ergotop*; *Fisifax*; *Memoq*; *Neugen*; *Nicer*; *Nicergobeta*; *Nicerium*; *Sermion*; *Varson*.



Chemical Properties A yellowish-white crystalline powder. Mp 136° to 138°. Practically insoluble in water; soluble in ethanol and chloroform; slightly soluble in ether.
Colour Tests Liebermann's reagent—black; Mandelin's test—violet-brown→brown; Marquis test—blue→grey; sulfuric acid—violet.
Thin-layer Chromatography System TA—R_f 0.64; system TAE—R_f 0.43; system TE—R_f 0.73 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—not eluted.
High Performance Liquid Chromatography System HAA—retention time 15.5 min.
Ultraviolet Spectrum Aqueous acid—286 nm; aqueous alkali—280 nm; ethanol—287 nm (A^1_1=200b).



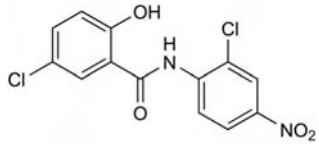
Infrared Spectrum Principal peaks at wavenumbers 1281, 751, 1718, 1306, 1075, 1103 cm^{-1} (KBr disk).
Quantification
Plasma **HPLC–MS** Limit of detection, 2 µg/L for nicergoline and its metabolites [Banno *et al.* 1991].
Radioimmunoassay Limit of detection, <60 ng/L [Bizollon *et al.* 1982].
Urine **HPLC** UV detection. For method of quantification for 10α-methoxy-9,10 dihydrolysergol, a metabolite of nicergoline, see Sioufi *et al.* [1992].
HPLC–MS Limit of detection, 10 µg/L for nicergoline and its metabolites [Banno *et al.* 1991].
Radioimmunoassay See Plasma [Bizollon *et al.* 1982].

Disposition in the Body Nicergoline is extensively metabolised, mainly by hydrolysis and N^1-demethylation, and is excreted in the urine as free and conjugated (glucuronide) metabolites.
Dose Usually 15 mg daily.

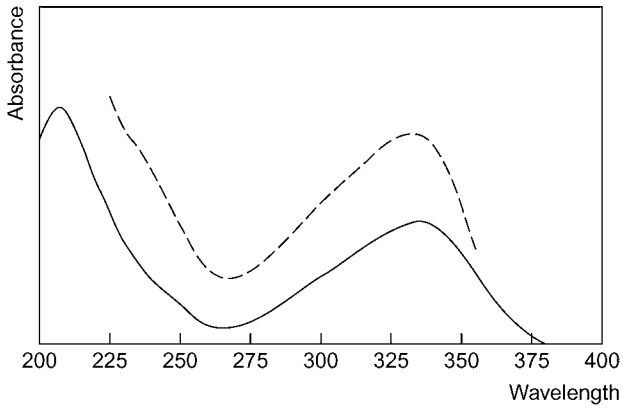
Banno K *et al.* (1991). Assay of nicergoline and three metabolites in human plasma and urine by high-performance liquid chromatography-atmospheric pressure ionization mass spectrometry. *J Chromatogr* 568: 375–384.
Bizollon CA *et al.* (1982). Radioimmunoassay of nicergoline in biological material. *Eur J Nucl Med* 7: 318–321.
Sioufi A *et al.* (1992). Determination of 10 alpha-methoxy-9,10-dihydrolysergol, a nicergoline metabolite, in human urine by high performance liquid chromatography. *Biomed Chromatogr* 6: 9–11.

Niclosamide

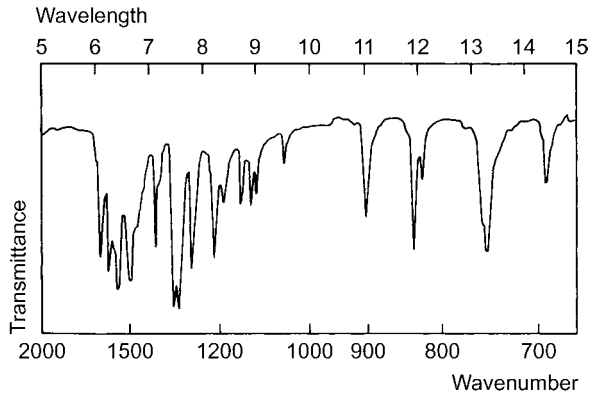
Anthelmintic
$C_{13}H_8Cl_2N_2O_4 = 327.1$
CAS—50-65-7
IUPAC Name 5-Chloro-*N*-(2-chloro-4-nitrophenyl)-2-hydroxybenzamide
Synonym Phenasale
Proprietary Names *Atenase*; *Kontal*; *Mansonil* (vet.); *Niclocide*; *Trédémine*; *Yomesan*.



Chemical Properties A cream-coloured powder. Mp 225° to 230°. Practically insoluble in water; soluble 1 in 150 of ethanol, 1 in 400 of chloroform and 1 in 350 of ether; soluble in acetone. Log *P* (octanol/water), 4.6.
Colour Tests Mandelin's test—green; methanolic potassium hydroxide—yellow.
Thin-layer Chromatography System TA—R_f 0.91; system TB—R_f 0.00; system TE—R_f 0.23; system TAE—R_f 0.93 (acidified iodoplatinate solution, positive).
High Performance Liquid Chromatography System HX—RI 723; system HAA—retention time 23.9 min.
Ultraviolet Spectrum Aqueous alkali—334, 377 nm; methanol—333 nm (A^1_1=527b).



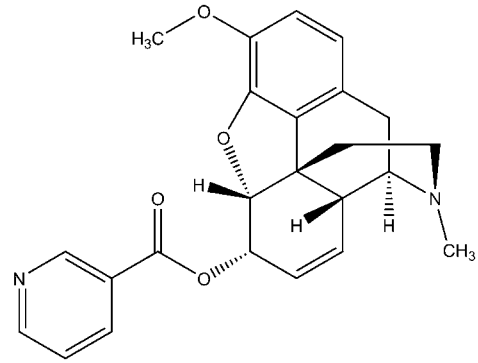
Infrared Spectrum Principal peaks at wavenumbers 1572, 1515, 1613, 1285, 1650, 1218 cm^{-1} (KBr disk).



Dose Usually 2 g as a single dose.

Nicocodine

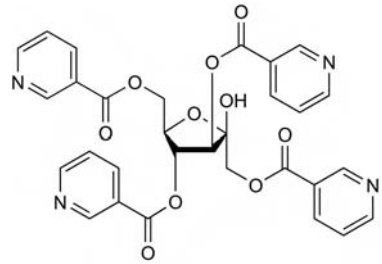
Narcotic, Antitussive
$C_{24}H_{24}N_2O_4 = 404.5$
CAS—3688-66-2
Synonyms 7,8-Dehydro-4,5-epoxy-3-methoxy-*N*-methyl-6-nicotinoyloxymorphinan; 3-O-methyl-6-O-nicotinoylmorphine; 6-nicotinoylcodeine.
Proprietary Names *Lyopect*; *Tusscodin*.



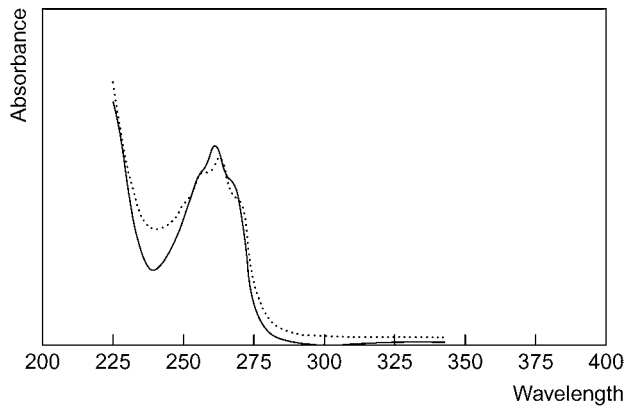
Chemical Properties Nicocodine is extracted by organic solvents from aqueous alkaline solutions.
Colour Tests Ammonium molybdate test—green→blue→green (limit of detection, 1 in 1000); sulfuric acid-formaldehyde test—purple→blue-purple (limit of detection, 1 in 1000); Vitali's test—yellow/yellow/orange (limit of detection, 1 in 1000).
Thin-layer Chromatography System T10—R_f 0.36 (location reagent acidified iodoplatinate spray, positive reaction).
Ultraviolet Spectrum Aqueous acid (0.1 N sulfuric acid)—261 and 267 nm with an inflextion at 256 nm.
Dose As the hydrochloride it is given orally in doses of 5 to 7.5 mg up to 3 times daily.

Nicofuranose

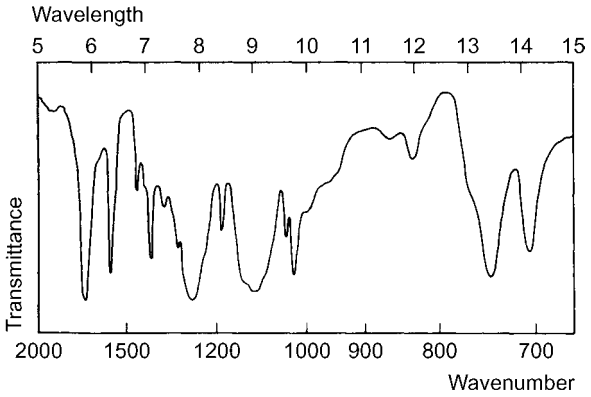
Vasodilator
$C_{30}H_{24}N_4O_{10} = 600.5$
CAS—15351-13-0
IUPAC Name [(2*R*,3*R*,4*S*,5*R*)-5-Hydroxy-3,4-bis(pyridine-3-carbonyloxy)-5-(pyridine-3-carbonyloxymethyl)oxolan-2-yl]methyl pyridine-3-carboxylate
Synonyms β-D-Fructofuranose-1,3,4,6-tetra-3-pyridinecarboxylate; tetranicotinoylfructofuranose; tetranicotinoylfructose.
Proprietary Name *Bradilan*



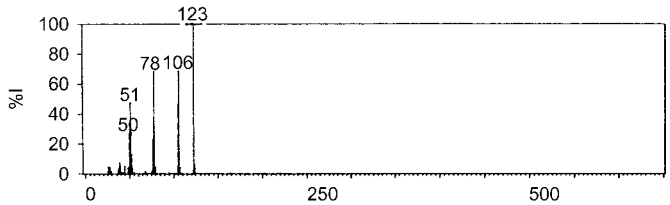
Chemical Properties A creamy-white crystalline powder. Mp 132° to 143°. Practically insoluble in water; soluble 1 in 4 of chloroform and 1 in 70 of methanol; sparingly soluble in dilute solutions of hydrochloric acid and sodium hydroxide. Log *P* (octanol/water), 0.1.
Colour Tests Add 50 mg to 5 mL of potassium cupritartrate solution and heat to boiling for 1 min—red precipitate; Fuse 50 mg with 10 mg of 2,4-dinitrochlorobenzene, cool, add about 3 mL of ethanol and 1 mL of 1 mol/L sodium hydroxide—intense red-violet colour
Thin-layer Chromatography System TA—R_f 0.61; system TB—R_f 0.42; system TC—R_f 0.70; system TL—R_f 0.61 (acidified iodoplatinate solution, positive).
Ultraviolet Spectrum Aqueous acid—262 nm (A^1_1=380b); aqueous alkali—263 nm.



Infrared Spectrum Principal peaks at wavenumbers 1721, 1271, 1107, 737, 1587, 1022 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 123, 106, 78, 51, 105, 50, 77, 52; nicotinic acid 123, 105, 78, 51, 106, 77, 124, 50.



Disposition in the Body Nicofuranose is slowly hydrolysed in the small intestine to nicotinic acid, which is readily absorbed.

Therapeutic Concentration

Following a single oral dose of 500 mg to 27 subjects, a mean peak plasma concentration of 0.72 mg/L was attained in 3 h [Salmi, Frey 1974].

Dose 1.5 to 3 g daily.

Salmi HA, Frey H (1974). Nicotinic acid plasma concentrations after ingestion of 1,3,4,6-tetranicotinoyl-fructo-furanose (tetranicotinoylfructose, nicofuranose). *Curr Ther Res* 16: 669–674.

Nicomorphine

Narcotic Analgesic

$C_{29}H_{25}N_3O_5$ = 495.5

CAS—639-48-5

Synonyms (5α,6α)-7,8-Didehydro-4,5-epoxy-17-methylmorphinan-3,6-diol di-3-pyridinecarboxylate (ester); morphine dinicotinate; morphine ester with nicotinic acid; morphine *bis*(nicotinate); morphine *bis*(pyridine-3-carboxylate); nicotinic acid morphine ester.

Proprietary Name *Gewalan*.

Chemical Properties Crystals. Mp 178° to 178.5°. Practically insoluble in water, soluble in ethanol.

Nicomorphine Hydrochloride

$C_{29}H_{25}N_3O_5$, HCl = 532.0

CAS—35055-78-8

Synonyms 3,6-Di-*O*-nicotinoylmorphine hydrochloride; (−)-(5*R*,6*S*)-4,5-epoxy-9*a*-methylmorphin-7-en-3,6-diyl dinicotinate hydrochloride.

Proprietary Name *MorZet*; *Vilan*.

Chemical Properties Soluble in water. Log *P* (octanol/water), 2.87 [Advanced Chemistry Development 2007].

Quantification

Blood **HPLC** Column: Hypersil 5 ODS (150 × 4.6 mm i.d., 5 µm). Mobile phase: water-tetramethylammonium hydroxide-acetonitrile : 7 mL 10% tetramethylammonium hydroxide (pH 4.0), total volume 300 mL plus 150 mL acetonitrile, flow rate 1.6 mL/min. UV detection (λ= 265 nm). Retention time 2.7 min. Limit of quantification, 9 µg/L [Koopman-Kimenai *et al.* 1995].

Serum **HPLC** Column: Hypersil 5 ODS (150 × 4.6 mm i.d., 5 µm). Mobile phase: water-tetramethylammonium hydroxide-acetonitrile : 7 mL 10% tetramethylammonium hydroxide (pH 4.0), total volume 300 mL plus 150 mL acetonitrile, flow rate 1.6 mL/min. UV detection (λ= 265 nm). Retention time 2.7 min. Limit of detection, 40 µg/L [Koopman-Kimenai *et al.* 1987].

Urine **HPLC** See Blood [Koopman-Kimenai *et al.* 1995].

Disposition in the Body After rectal administration, nicomorphine is rapidly absorbed and quickly metabolised to the active compounds 6-mononicotinoylmorphine, morphine and morphine-6-glucuronide.

Therapeutic Concentration

Eight female patients due to undergo elective gynaecological abdominal surgery were administered 20 mg nicomorphine IM into the deltoid muscle. 6-Mononicotinylmorphine was almost instantaneously formed, with a mean maximum plasma concentration of 55 µg/L at 0.16 h and an elimination half-life of 0.3 h. Morphine reached a mean maximum plasma concentration of 36 µg/L at 0.74 h and was eliminated with a half-life of 1.4 h. Morphine 3-glucuronide and morphine 6-glucuronide appeared almost simultaneously and reached a maximum concentration at 1.37 h. They were eliminated with half-lives of 3.66 and 2.54 h, respectively [Koopman-Kimenai *et al.* 1995].

Eight patients were administered 30 mg nicomorphine rectally. Levels of morphine, morphine 3-glucuronide and morphine 6-glucuronide reached 45 ± 12, 513 ± 125 and 84 ± 31 µg/L, respectively, at 0.53 ± 0.13, 1.19 ± 0.32 and 1.17 ± 0.36 min, respectively [Koopman-Kimenai *et al.* 1994].

IV administration of 30 mg nicomorphine to 6 patients, 20 mg nicomorphine to five patients and 10 mg to five patients resulted in mean peak plasma levels of 1.12, 0.567 and 0.74 mg/L, respectively, attained at at 1.6, 1 and 1 min, respectively. Levels of 6-mononicotinoylmorphine reached 777, 365 and 241 µg/L, respectively, attained at 1.67, 1 and 1 min, respectively; levels of morphine reached 159, 104 and 96.1 µg/L, respectively, attained at 7.83, 1 and 7.2 min, respectively [Koopman-Kimenai *et al.* 1993].

Bioavailability Rectal administration 88%; IM injection, 85%; IV injection 95%.

Half-life 0.32 ± 0.2 h.

Clearance Morphine, 162 mL/min; glucuronide derivatives, 81 mL/min.

Dose Daily dose: 5 to 10 mg orally, or 10 to 20 mg by IM, slow IV or SC injection. It may also be given rectally.

Nicorandil

Antianginal, Nitrovasodilator, Potassium Channel Activator

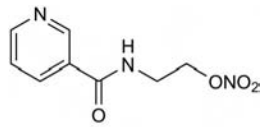
$C_8H_9N_3O_4$ = 211.2

CAS—65141-46-0

IUPAC Name 2-(Pyridine-3-carbonylamino)ethyl nitrate

Synonyms *N*-[2-(Nitrooxy)ethyl]-3-pyridine carboxamide; SG-75.

Proprietary Names *Adancor*; *Dancor*; *Ikorel*; *Perisalol*; *Sigmart*.



Chemical Properties A colourless to off-white crystalline powder. Mp 92° to 93°. Log *P* (octanol/water), 0.43.

High Performance Liquid Chromatography System HZ—retention time 2.2 min.

Column: C_8 Finepak SIL (250 × 4.6 mm i.d., 5 µm). Temperature: 30°. Mobile phase: methanol : water (15 : 85), flow rate 1.2 mL/min. IS: (*N*-[2-(nitrooxy)propyl]-3-pyridine carboxamide) chlorohydrate. UV detection (λ=230 nm). Retention time: nicorandil, 35.3 min; (*N*-(2-hydroxyethyl)nicotinamide), 11.1 min; IS, 59.7 min [Ojha, Pargal 1999].

Quantification

Blood **HPLC** Column: C_{18} µBondapak (300 × 3.9 mm i.d., 10 µm). Mobile phase: acetonitrile : water : 0.1 mol/L borate buffer (pH 8) (15 : 70 : 15), flow rate 1 mL/min. IS: SG-89. UV detection (λ=220 nm). Retention time: 8 min. Limit of detection, 3 µg/L [Tanikawa *et al.* 1993].

Plasma **GC–MS** Limit of detection, 0.1 to 0.25 µg/L [Frydman 1992].

HPLC Column: Phenyl Nucleosil (150 × 4.6 mm i.d., 5 µm). Mobile phase: 0.01 mol/L ammonium acetate buffer (pH 6.2) : acetonitrile (10 : 3), flow rate 1.0 mL/min. MS detection (APCI, full scan). Retention time: 6 min. Limit of quantification, 1.0 µg/L [Andrensek *et al.* 1999].

Disposition in the Body Nicorandil is rapidly and well absorbed from the gastrointestinal tract, but food can decrease the rate of absorption. There is no significant first-pass metabolism. It is extensively metabolised, mainly via denitration and there are two predominant biotransformation pathways: the formation of nicotamide through degradation of the side chain and the production of *N*-(2-hydroxyethyl)nicotinamide from denitration, which eventually degrades to nicotinic acid. Further metabolism of these products leads to non-toxic water-soluble vitamin B complex substances. The kidney is the major route of elimination, with 20% of an administrated dose being excreted in urine mainly as metabolites. <2% of the dose is excreted via the biliary route. Ten percent of the administered dose can be found in plasma but it is rapidly eliminated.

Therapeutic Concentration After a 5 mg dose, a plasma concentration of 64 µg/L is achieved; 10 mg dose, 107 µg/L; 20 mg dose, 261 µg/L; and a 40 mg dose, 490 µg/L. The maximum plasma concentration occurs 30 to 60 min after oral administration. 8 to 24 h after dosing, the mean plasma concentration remains in the range 0.8

to 1.5 µg/L. There is a linear relationship between dose and increase in maximum plasma concentration. Steady state is achieved 96 to 120 h after continuous dosing.
Bioavailability 75 to 80%.
Half-life Approximately 1 h.
Volume of Distribution 1.0 to 1.4 L/kg; also reported as 100 L.
Clearance The total body clearance is 0.87 to 1.15 L/min (52 to 69 L/h).
Protein Binding Weakly bound to albumin and other plasma proteins at ~25% (19% to albumin).
Dose The initial dose is 10 mg twice daily; the usual dose is 10 to 20 mg twice daily with a maximum of 30 mg twice daily.

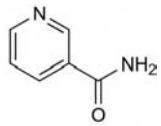
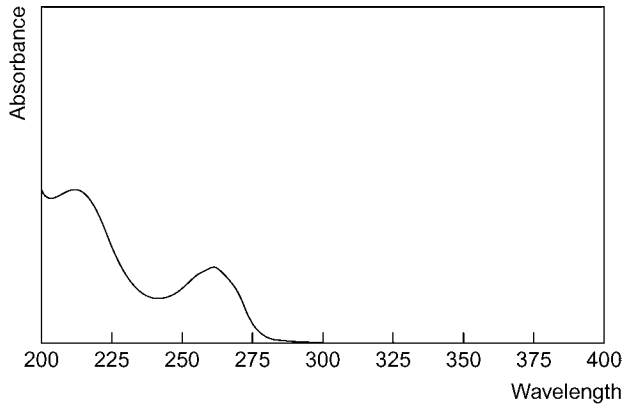
Nicotinamide

Vitamin
$C_6H_6N_2O$ = 122.1
CAS—98-92-0

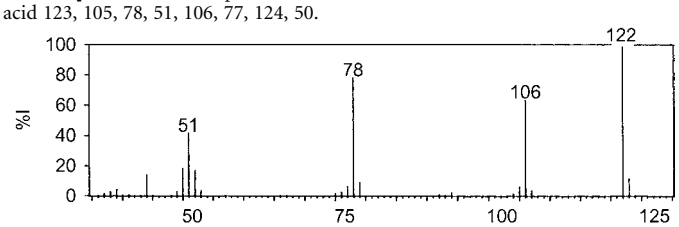
IUPAC Name 3-Pyridinecarboxamide
Synonyms Niacinamide; nicotinic acid amide; nicotylamide; vitamin PP.
Proprietary Names *Nacro*; *Nicobion*; *Nicotinoid*; *Nicovital*; *Papulex*; *Ucemine PP.*



Chemical Properties A white crystalline powder or colourless crystals. Mp 128° to 131°. Soluble 1 in 1 of water, 1 in 1.5 of ethanol and 1 in 10 of glycerol; slightly soluble in chloroform and ether. pK_a 3.3 (20°). Log *P* (octanol/water), −0.4.
Colour Tests Cyanogen bromide—orange; Nessler's reagent—brown-orange.
Thin-layer Chromatography System TA—R_f 0.54, streaking; system TB—R_f 0.00; system TC—R_f 0.21; system TE—R_f 0.40; system TL—R_f 0.27; system TAE—R_f 0.68; system TAF—R_f 0.66.
Gas Chromatography System GA—nicotinamide RI 1436, nicotinic acid RI 1335.
High Performance Liquid Chromatography System HX—RI 168.
Ultraviolet Spectrum Aqueous acid—261 nm (A^1_1=451a).



Infrared Spectrum Principal peaks at wavenumbers 1680, 1698, 703, 1618, 1594, 1026 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 122, 78, 106, 51, 50, 52, 44, 123; nicotinic acid 123, 105, 78, 51, 106, 77, 124, 50.



Quantification See also Nicotinic Acid.
Plasma **HPLC** For method of quantification for nicotinamide and *N*-methylnicotinamide, see Gillmor *et al.* [1999]. For method of quantification for nicotinamide and its metabolites, see Stratford, Dennis [1992]. Fluorescence detection. Limit of detection, <2 µg/L for *N*-methylnicotinamide [Somogyi *et al.* 1990].
Urine **HPLC** See Plasma [Stratford, Dennis 1992]. See Plasma [Somogyi *et al.* 1990].
Disposition in the Body It is excreted in the urine as unchanged drug, nicotinic acid, *N*-methylnicotinamide and nicotinuric acid. Nicotinamide is a metabolite of niketamide.
Therapeutic Concentration
In 15 subjects given 6 g of nicotinamide daily orally, a mean maximum plasma concentration of 1.166 mmol/L (range, 0.787 to 2.312) was achieved in 1 to 6 h (1 h in 54% of the subjects) [Bernier *et al.* 1998].
Twenty-two subjects given nicotinamide orally at a dose of 60 mg/kg (maximum 6 g) daily, had a mean peak plasma concentration of 0.793 mmol/L (range, 0.516 to 1.513) at 0.77 h (0.22 to 3.05); co-administration with domperidone did not significantly change these values [Bussink *et al.* 2002].
Dose Up to 250 mg daily.

Bernier J *et al.* (1998). Pharmacokinetics of nicotinamide in cancer patients treated with accelerated radiotherapy: the experience of the Co-operative Group of Radiotherapy of the European Organization for Research and Treatment of Cancer. *Radiother Oncol* 48: 123–133.

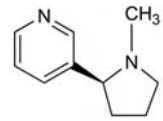
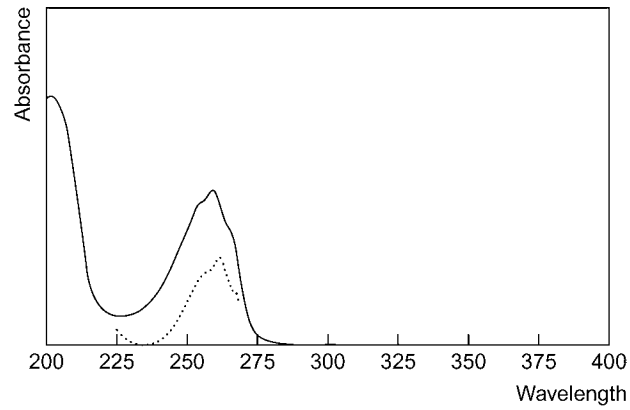
Nicotine

Insecticide, Aid to Smoking Cessation
$C_{10}H_{14}N_2$ = 162.2
CAS—54-11-5

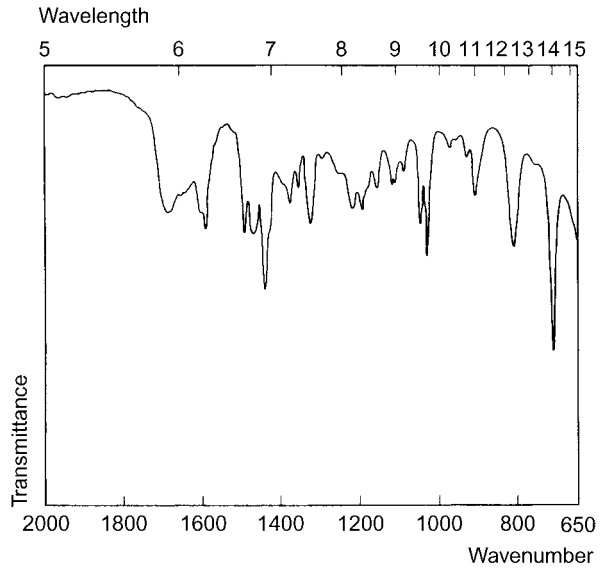
IUPAC Name 3-[(2*S*)-1-Methylpyrrolidin-2-yl]pyridine
Synonym 3-[(2*S*)-1-Methyl-2-pyrrolidinyl]pyridine
Proprietary Names *Commit*; *Habitrol*; *Nicabate*; *Nicoderm*; *Nicogum*; *Nicolan*; *Nicomax*; *Niconil*; *Nicopatch*; *Nicorette*; *Nicotinell*; *Nicotrans*; *Nicotrol*; *Nikofrenon*; *Nikotugg*; *NiQuitin*; *Prostep*; *Quit*; *Stoppers*; *Stubit*; *Tabazur* (anti-smoking preparations).



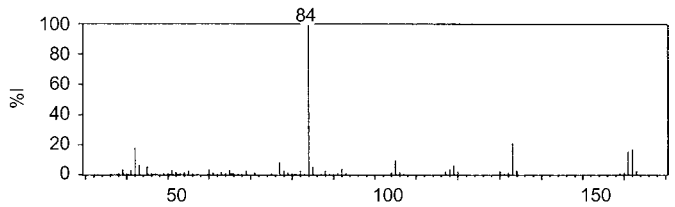
Chemical Properties An alkaloid obtained from the dried leaves of the tobacco plant, *Nicotiana tabacum* (Solanaceae). A colourless to pale yellow, very hygroscopic, oily liquid with an unpleasant pungent odour. It gradually becomes brown on exposure to air or light. Weight per millilitre ~1.01 g. Bp 247°, with decomposition. Refractive index 1.5280. Miscible with water below 60°; very soluble in ethanol, chloroform, petroleum ether, kerosene, oils and ether. pK_{a1} 3.2, pK_{a2}7.9 (25°). Log *P* (octanol/water), 1.2. Extraction yield (chlorobutane), 0.9 [Demme *et al.* 2005]. Serum samples stable at -20° for 3 months [Baumann *et al.* 2010].
Colour Test Cyanogen bromide—orange.
Thin-layer Chromatography System TA—R_f 0.54; system TB—R_f 0.39; system TC—R_f 0.35; system TE—R_f 0.61; system TL—R_f 0.13; system TX—R_f 0.04; system TY—R_f 0.01; system TAE—R_f 0.39; system TAF—R_f 0.22; system TAJ—R_f 0.09; system TAK—R_f 0.00; system TAL—R_f 0.11 (acidified iodoplatinate solution—positive; Dragendorff spray—positive).
Gas Chromatography System GA—RI 1350, RI 1715 M (cotinine); system GB—RI 1380, RI 1645 M (cotinine); system GC—RI 1573, RI 2111 M (cotinine); system GF—RI 1525, RI 2195 M (cotinine).
High Performance Liquid Chromatography System HA—*k* 1.1, *k* 0.2 M (cotinine); system HX—RI 69, RI 215 M (cotinine); system HZ—RT 1.73 min, M (cotinine) RT 1.71 min.
Ultraviolet Spectrum Aqueous acid—259 nm (A^1_1 = 338a); aqueous alkali—261 nm.



Infrared Spectrum Principal peaks at wavenumbers 712, 1022, 810, 1575, 1310, 1040 cm^{-1} (thin film).



Mass Spectrum Principal ions at *m/z* 84, 133, 42, 162, 161, 105, 77, 119 (nicotine); 98, 176, 42, 118, 41, 119, 51, 175 (cotinine); 84, 178, 161, 133, 118, –, –, – (nicotine-1′-*N*-oxide).



Quantification

Blood **LC-MS** Column: Atlantis dC_{18} (50 × 2.1 mm i.d., 3.0 µm). Mobile phase: 5 mmol/L ammonium acetate (pH 5.0) : acetonitrile (95 : 5 to 80 : 20 in 3 min to 10 : 90 in 2 min for 1 min), flow rate 0.3 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 0.35 µg/L for cotinine [Hegstad *et al.* 2009].

Plasma **GC** [Nystrom *et al.* 1997]. Column: Carbowax 1000 100/120 mesh (28 m × 0.3 mm i.d., 0.1 µm). Carrier gas: H_2, 50 cm/s. Temperature programme: 40° for 1 min to 80° at 30°/min for 2 min to 230° at 10°/min for 10 min. FID. Limit of detection, 5 µg/L for nicotine and cotinine and 15 µg/L for nicotine *N*-oxides [Stehlik *et al.* 1982]. Column: WCOT fused silica (12 m 0.2 mm i.d.). Carrier gas: He, 0.7 mL/min. Temperature: 180°. AFID. Retention time: 1.16 min. Limit of detection, 1 µg/L for nicotine and 5 µg/L for cotinine [Verebey *et al.* 1982].

GC-MS Ion-trap detection. Limit of quantification, 10 µg/L for nicotine and 5 µg/L for cotinine (liquid–liquid extraction) and 1 µg/L for nicotine and cotinine (solid-phase extraction) [Cognard, Staub 2003]. Limit of detection, 1.0 µg/L for nicotine and cotinine [Shin *et al.* 2002]. Column: 5% phenyl methyl silicone HP-5 (25 m × 0.31 mm i.d.). Carrier gas: He, 1.0 mL/min. Temperature programme: 70° for 1 min to 123° at 60°/min to 155° at 5.8°/min to 200° at 8°/min. EI ionisation at 70 eV. Limit of quantification, 1 µg/L for nicotine and 2 µg/L for cotinine and mecamylamine [Jacob, *et al.* 2000]. Column: Easy Wax bonded polyethylene glycol (25 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 100° for 1 min to 220° at 20°/min for 2 min. SIM acquisition mode. Limit of quantification, 0.5 µg/L [Davoli *et al.* 1998].

HPLC Column: Partisil-10 SCX cation exchange. Mobile phase: sodium phosphate buffer : methanol (pH 4.8, 92 : 8), flow rate 1.5 mL/min. UV detection (λ = 254 nm). Limit of detection, 10 µg/L for caffeine, 3′-hydroxycotinine and cotinine, and 20 µg/L for total 3′-hydroxycotinine [Ghosheh *et al.* 2000]. Column: Hichrome $5C_{18}$ (150 × 4.6 mm i.d., 5 µm). Mobile phase: 7% methanol : 2 mmol/L sodium dihydrogen phosphate : 0.1% phosphoric acid : 1 mmol/L heptanosulfonate sodium. UV detection (λ = 260 nm). Limit of quantification, 0.2 µg/L for nicotine and 1.0 µg/L for cotinine [Nakajima *et al.* 2000].

LC-MS Column: Discovery HS F5 (100 × 4.6 mm i.d., 3 µm). Mobile phase: 10 mmol/L ammonium acetate with 0.001% formic acid (pH 4.97) : methanol (85 : 15 to 24 : 76 in 11 min to 85 : 15 after 11.6 min for 3.4 min). ESI, MRM acquisition mode. Retention time: 7.23 min. Limit of quantification, 1.0 µg/L for nicotine and metabolites, 50 µg/L for cotinine-*N*-β-glucuronide, limit of detection, 0.25 µg/L for nicotine and metabolites, 25 µg/L for cotinine-*N*-β-glucuronide [Miller *et al.* 2010]. Mobile phase: 100 mmol/L ammonium formate (pH 3.0) : acetonitrile (15 : 85), flow rate 0.54 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention time: 4.64 min. Limit of quantification, 1 to 2 µg/L, limit of detection, 1 µg/L [Yue *et al.* 2010]. Column: Synergi Hydro RP (75 × 2.0 mm i.d., 4 µm). Mobile phase: 1 mmol/L ammonium acetate- 0.01% formic acid : 0.01% formic acid in acetonitrile (35 : 65), flow rate 400 µL/min. TIS. Limit of quantification, 1 µg/L, limit of detection, 0.5 µg/L [Shakleya, Huestis 2009]. Column: C_8 base select separation column. Mobile phase: acetonitrile : ammonium formate (pH 3.5). Limit of quantification, 50 µg/L (using APCI) and 1 µg/L (using ESI) for nicotine and cotinine [Beyer *et al.* 2007]. Column: Atlantis HILIC (100 × 0.3 mm i.d., 5 µm). Mobile phase: 7.5 mmol/L ammonium acetate : acetonitrile (23 : 77) containing 0.4% acetic acid, flow rate 15 µL/min. ESI, positive ion mode, SRM acquisition mode. Limit of quantification, 0.15 µg/L for deuterium-labelled D_2-nicotine and 0.25 µg/L for D_2-cotinine [Murphy *et al.* 2007]. See also Kim, Huestis [2006] and Taylor *et al.* [2004]

Serum **GC-MS** See Plasma [Cognard, Staub 2003]. Column: DB-5M5 (15 m × 0.32 mm i.d., 1.0 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 85° to 300° at 30°/min. EI ionisation, SIM acquisition mode. Limit of detection, 2 µg/L [Baskin *et al.* 1998]. Limit of quantification, 1.25 µg/L, limit of detection, 0.16 µg/L for nicotine and cotinine [James *et al.* 1998].

HPLC DAD. Nicotine and cotinine [Wiergowski *et al.* 2006]. Column: Supelcosil LC_8DB (250 × 4.6 mm i.d., 5 µm). Mobile phase: water-acetonitrile (96.4 : 3.6) containing 2 mL/L TEA and 0.012 mol/L sodium heptanosulfonate, dipotassium hydrogen phosphate and citric acid (pH 4.7) : water-acetonitrile (80.3 : 19.7) containing 2 mL/L TEA, 0.012 mol/L sodium heptanosulfonate, dipotassium hydrogen phosphate and citric acid (pH 5.2, 100 : 0 for 15 min to 50 : 50 at 20 min), flow rate 1.5 mL/min. UV detection (λ = 254 nm). Limit of detection, 10 µg/L for nicotine, 3 µg/L for cotinine *N*-oxide and 5 µg/L for cotinine, *trans*-3′-hydroxycotinine and norcotinine [Zuccaro *et al.* 1993].

LC-MS Column: X-Bridge C_{18} (150 × 2.1 mm i.d., 3.5 µm). Mobile phase: acetonitrile : water (20 : 80), flow rate 0.2 mL/min. CID, positive ion mode. Limit of quantification, 2 µg/L for nicotine and 5 µg/L for cotinine [Baumann *et al.* 2010]. See Plasma [Yue *et al.* 2010]. Column: Betasil Diol-100 (50 × 2.1 mm i.d., 5 µm). Mobile phase: 2 mmol/L ammonium formate in methanol : acetonitrile (35 : 65), flow rate 1.0 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 1.8 µg/L [Byrd *et al.* 2005]. Column: Polyhydroxyethyl A (100 cm × 4.6 mm i.d., 5 µm). Mobile phase: water : acetonitrile : ammonium formate : formic acid (200 : 1800 : 1.3 : 15), flow rate 1.0 mL/min. API, positive ion mode. Limit of quantification, 0.5–5 µg/L for nicotine and its metabolites [Moyer *et al.* 2002]. Column: Symmetry C_{18} (75 × 4.6 mm i.d., 3.5 µm). Mobile phase: methanol : 9.2 mmol/L ammonium acetate (pH 5.0, 30 : 70). APCI, MRM acquisition mode. Limit of detection, ~0.1 µg/L for cotinine [Bernert, Jr *et al.* 2000].

Note For a radioimmunoassay and a TLC method see Wielkoszynski *et al.* [2009].

Urine **GC** Column: HP 5% phenyl methyl silicone (25 m × 0.32 mm i.d., 0.52 µm). Temperature programme: 90° for 0.5 min to 180° at 25°/min to 220° at 10°/min to 275° at 25°/min. NPD. Limit of quantification, 1 µg/L for *trans*-3′-hydroxycotinine [Jacob *et al.* 1992]. FID. Limit of detection, 0.03 mg/L for nicotine and cotinine and 0.1 mg/L for nicotine *N*-oxides [Stehlik *et al.* 1982].

GC-MS Column: DB-5MS. EI ionisation. Limit of quantification, 0.2 µg/L for cotinine and 1.25 mg/L for phenylglyoxylic acid and mandelic acid [Wu *et al.* 2009]. Column: HP-5MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 14.5 psi. Temperature programme: 70° to 230° at 25°/min for 1 min. SIM acquisition mode. Limit of detection, 0.2 µg/L for nicotine, 0.5 µg/L for cotinine [Man *et al.* 2006]. Column: DB-1MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 32 cm/min. Temperature programme: 40° for 1 min to 130° at 70°/min for 1 min to 270° at 25°/min for 1 min. Limit of quantification, 0.10 mg/L for nicotine and cotinine and 1 mg/L for thiocyanate, limit of detection, 0.6 µg/L for nicotine and cotinine and 0.06 µg/L for thiocyanate [Toraño, van Kan 2003]. Limit of detection, 0.2 µg/L for nicotine and cotinine [Shin *et al.* 2002]. Column: DB-5 MS (15 m × m i.d., 1 µm). Carrier gas: He, 35 kPa. Temperature programme: 85° for 0.5 min to 300° at 30°/min. SIM acquisition mode. Limit of quantification, 20 µg/L for cotinine and 50 µg/L for *trans*-3′-hydroxycotinine [Ji *et al.* 1999]. See Serum [Baskin *et al.* 1998; James *et al.* 1998]. See also Jacob *et al.* [1992].

HPLC UV detection. Nicotine and its metabolites [Piekoszewski *et al.* 2009]. Column: LiChrospher 100 C_{18} (250 × 4 mm i.d., 5 µm). Mobile phase: phosphate buffer (pH 4.0) : acetonitrile (85 : 15 to 50 : 50 at 60 min), flow rate 1.0 mL/min. UV detection (λ = 260 nm). Retention time: 3.1 min. Limit of quantification, 50 µg/L [Rabbaa-Khabbaz *et al.* 2006]. See Serum [Wiergowski *et al.* 2006]. Column: reversed phase. Mobile phase: acetate buffer (0.03 mol/L sodium acetate and 0.1 mol/L acetic acid, pH 3.1) : acetonitrile containing 0.02 mol/L sodium octanosulfonate (78 : 22). Limit of detection, 5 µg/L for nicotine and 2 µg/L for cotinine [Doctor *et al.* 2004]. Column: C_8 Symmetry (150 × 3.9 mm i.d., 5 µm). Mobile phase: water : methanol : acetonitrile in potassium dihydrohen phosphate buffer (pH 3.4, 81 : 10 : 9), flow rate 1 mL/min. DAD (λ = 254 nm). Limit of detection, 5 µg/L [Ceppa *et al.* 2000]. UV detection. Limit of quantification, 5 µg/L for nicotine and 0.5 µg/L for cotinine [Oddoze *et al.* 1998]. Column LC_8DB (250 × 4.6 mm i.d., 5 µm). Mobile phase: water : acetonitrile (80 : 9) containing 5 mL TEA, 670 mg/L sodium heptanosulfonate, 0.034 mol/L potassium dihydrogen phosphate and 0.034 mol/L citric acid (pH 4.4), flow rate 1.6 mL/min. Nicotine and its metabolites [Zuccaro *et al.* 1995]. See also Maskarinec *et al.* [1978].

LC-MS See Plasma. Limit of quantification, 2.5 µg/L for nicotine and metabolites, 50 µg/L for cotinine-*N*-β-glucuronide, limit of detection, 1.0 µg/L for nicotine

and metabolites, 25 μg/L for cotinine-*N*-β-glucuronide [Miller *et al.* 2010]. See Plasma [Yue *et al.* 2010]. Column: Synergi 4 μm POLAR-RP 80A. Mobile phase: 5 mmol/L ammonium formate : methanol (55 : 45), flow rate 0.8 mL/min. ESI, positive mode. Limit of detection, 15–40 ng/L for nicotine, cotinine and related alkaloids [Kataoka *et al.* 2009]. Column: Phenomenex SCX (4.0 × 3.0 mm i.d., 4 μm). Mobile phase: 2 mmol/L ammonium acetate with 0.1% formic acid : methanol containing 2 mmol/L ammonium acetate with 0.1% formic acid : 100 mmol/L ammonium acetate with 0.1% formic acid (70 : 20 : 10 to 0 : 10 : 90 at 0.1 min to 70 : 20 : 10 at 0.7 min for 0.1 min to 10 : 80 : 10 at 1.9 min to 70 : 20 : 10 at 2 min), flow rate 0.6 mL/min except 0.8 mL/min at 0.1 min. ESI, MRM acquisition mode. Limit of quantification, 2.5 μg/L, limit of detection, 0.156 μg/L for cotinine [Chadwick, Keevil 2007]. Column: Restek pentafluorophenyl-propyl (100 × 3.2 mm i.d.). Mobile phase: 2 mmol/L ammonium acetate-10 mmol/L acetic acid in water : 2 mmol/L ammonium acetate-10 mmol/L acetic acid in 99.5% methanol (95 : 5 to 30 : 70 in 2 min), flow rate 1 mL/min to 600 μL/min after 2 min. API. Limit of quantification, 0.53 μg/L [Hoofnagle *et al.* 2006]. Limit of detection, 8 ng/mL for N^7-methylguanine. Cotinine also quantified [Chao *et al.* 2005]. See Serum [Moyer *et al.* 2002]; See also Heavner *et al.* [2005], Meger *et al.* [2002], Xu *et al.* [2004]. See also Hecht *et al.* [1999] and Tuomi *et al.* [1999].

Molecularly imprinted SPE-spectrophotometry Limit of quantification, 1.1 μmol/L [**Figueiredo *et al.* 2009**].

Meconium **HPLC** Column: Lichrosorb C_{18} (250 × 4.6 mm i.d., 5 μm). Mobile phase: water : methanol : acetate buffer (pH 4.66) : acetonitrile : acetic acid (pH 4.3, 50 : 29 : 20 : 2 : 1), flow rate 1.0 mL/min. DAD. Limit of detection, 10 μg/L [Baranowski *et al.* 1998]

Oral Fluid **GC-MS** See Urine [Toraño, van Kan 2003]. See Plasma [Shin *et al.* 2002].

HPLC See Serum [Wiergowski *et al.* 2006].

LC-MS See Urine [Kataoka *et al.* 2009]. See Serum [Bernert, Jr*et al.* 2000; Byrd *et al.* 2005].

Pericardial Fluid **LC-MS** See Blood [Hegstad *et al.* 2009].

Adipose Tissue **GC-MS** See Kidney [Urakawa *et al.* 1994].

Hair **GC** Column: HP-101 (12.5 m × 0.2 mm i.d., 0.2 μm). Temperature programme: 50° for 2.5 min to 210° at 9°/min. NPD. Retention time: 10.9 min. Limit of quantification, 1.5 μg/L [Mizuno *et al.* 1993].

GC-MS See Urine [Toraño, van Kan 2003]. Column: HP-1 methyl silicone (12 m × 0.2 mm i.d., 0.33 μm). Carrier gas: He, 30 cm/s. Temperature programme: 60° for 1 min to 150° at 30°/min for 3 min. SIM acquisition mode. Limit of detection, 0.02 μg/g [Zahlsen, Nilsen 1994].

HPLC See Serum [Wiergowski *et al.* 2006]. Column: Prodigy ODS(3) (150 × 4.6 mm i.d., 5 μm). Mobile phase: 50 mmol/L potassium dihydrogen phosphate : methanol : acetonitrile (93.5 : 2.5 : 4), flow rate 1.0 mL/min. Electrochemical detection. Limit of quantification, 0.1 ng/mg, limit of detection, <0.05 ng/mg [Mahoney, Al Delaimy 2001]. Column: LC_8DB (250 × 4.6 mm i.d., 5 μm). Mobile phase: water : acetonitrile (94.6 : 5.3) containing 3 mL/L TEA and 0.002 mol/L sodium heptanosulfonate, 0.018 mol/L dipotassium hydrogen phosphate and 0.013 mol/L citric acid (pH 4.7). UV detection (λ = 254 nm). Limit of detection, 0.2 ng/mg [Pichini *et al.* 1997].

Kidney **GC-MS** Column: Shimadzu CBP1 bonded methyl silicone (12 m × 0.53 mm i.d., 1.0 μm). Carrier gas: He, 40 mL/min. Temperature programme: 90° to 220° at 40°/min. EI ionisation, SIM acquisition mode. Limit of detection, 5 μg/g for nicotine and 10 μg/g for cotinine [Urakawa *et al.* 1994].

Liver **GC-MS** See Kidney [Urakawa *et al.* 1994].

Lung **GC-MS** See Kidney [Urakawa *et al.* 1994].

Muscle **GC-MS** See Kidney [Urakawa *et al.* 1994].

Nail Clippings **LC-MS** Column: Zorbax SB C_{18} (150 × 0.5 mm i.d., 3.5 μm). Mobile phase: methanol : water (35 : 65), flow rate 10 μL/min. ESI, positive ion mode. Limit of detection, 0.02 pg/mg for N′-nitrosonorcornitine [Stepanov, Hecht 2008]. Column: Zorbax SB C_{18} (150 × 0.5 mm i.d., 3.5 μm). Mobile phase: methanol : water (35 : 65), flow rate 10 μL/min. ESI, SRM acquisition mode. Limit of detection, 0.01 μg/g for nicotine, 0.012 μg/g for cotinine and 0.02 ng/g for 4-(methylnitrosamino)-1-(3-pyridyl)-1-butanol) [Stepanov *et al.* 2006].

Spleen **GC-MS** See Kidney [Urakawa *et al.* 1994].

Note For procedures to assess tobacco smoke exposure, see Dhar [2004].

Disposition in the Body Nicotine is readily absorbed from the gastrointestinal tract, the buccal mucosa, the respiratory tract and from intact skin; it is widely distributed throughout the tissues. Nicotine undergoes first-pass metabolism when administered orally, thus reducing its bioavailability. It is widely distributed, crossing the placental barrier and it is also found in breast milk. It is metabolised by oxidation via cytochrome P450 isozyme CYP2A6 to cotinine and nicotine-1′-*N*-oxide, followed by further degradation to produce hydroxycotinine, norcotinine, and a ring cleavage product. Approximately 5% is excreted unchanged in the urine in 24 h and ~10% as cotinine; the excretion of unchanged drug is decreased if the urine is alkaline.

Blood Concentration

In a group of 150 habitual smokers, nicotine concentrations in samples of plasma withdrawn 2 min after smoking were in the range 0.003–0.063 mg/L (mean, 0.019); corresponding cotinine concentrations ranged from 0.02–0.26 mg/L (mean, 0.22) [Kogan *et al.* 1981].

Six smokers received a single dose of nicotine (1 mg nasal spray; average dose absorbed 0.8 mg; range, 0.7–1.0) and 6 others smoked cigarettes (1 puff per min for 10 min; average dose absorbed 4.4 mg; range, 1.5–3.2); all subjects also received a 30 min IV infusion of nicotine (average dose 5.1 mg; range, 4.1–6.3) beginning 70 min after administration of the spray or commencement of smoking. In the subjects who received cigarettes, a mean peak plasma concentration of 0.0398 mg/L was attained at 8.2 min in arterial blood and 0.0186 mg/L at 11.9 min in venous blood. In the subjects who received nicotine intranasally, these values were 0.0104 mg/L in 4.7 min in arterial blood and 0.0054 mg/L in 24.8 min in venous blood. Mean peak plasma concentrations in arterial and venous blood after the IV infusion were 0.049 mg/L in 29 min and 0.0295 mg/L in 30 min, respectively [Gourlay, Benowitz 1997].

Ten non-smoking patients with ulcerative colitis received nicotine tartrate liquid enema at a dose of 3 mg nicotine base nightly for 1 week, then 6 mg for 3 weeks. Only 1 patient had a detectable peak nicotine concentration (0.0023 mg/L) and none had a detectable trough concentration; the mean trough plasma cotinine concentration was 0.012 mg/L [Sandborn *et al.* 1997].

A heavy smoker who abused lozenges containing nicotine (~240 lozenges of 0.4 mg nicotine each daily) had saliva and blood cotinine levels of 1.154 and 0.947 mg/L, respectively. At 20 min after his 70th 0.4 mg lozenge of the day, his plasma nicotine concentration was 0.0321 mg/L [Foulds *et al.* 1998].

In 8 non-smoking subjects who consumed 8 lozenges of 1.1 mg nicotine, mean nicotine levels increased from 0.0003–0.0064 mg/L [Foulds *et al.* 1998].

After 25 subjects were administered nicotine via transdermal patches (1 patch of 15 mg for 16 h coverage, or 2 different 21 mg 24 h patches; each patch applied for 3 consecutive days), mean minimum and maximum plasma nicotine concentrations of 0.00153 and 0.0123 mg/L were reported for the 15 mg patch, 0.013 and 0.0195 mg/L for the first 21 mg patch and 0.0119 and 0.0278 mg/L for the second 21 mg patch. The times taken to reach peak plasma concentration was 6.0, 8.0, and 2.8 h, respectively, for the 3 patches [Fant *et al.* 2000].

Plasma nicotine levels in 5 healthy subjects given nicotine as infusions over 0.5–5 min were dose dependent: 11.5–14.1 μg/L and 19.02–26.3 μg/L with a 0.75 and 1.5 mg dose, respectively. They were generally highest with the shortest infusion time at each dose. Oral fluid levels were highest at the longest infusion time for each dose (19.1–49.1 μg/L and 26–104 μg/L with the 0.75 and 1.5 mg doses, respectively) [Jenkins *et al.* 2005].

Average plasma and urine levels of nicotine in smokers were found to be 1263.1 μg/L and 1618 μg/L, respectively. Cotinine levels in plasma and urine were 379.4 and 865 μg/L, respectively [Massadeh *et al.* 2009].

Toxicity Nicotine is highly toxic and, in acute poisoning, death may occur within a few minutes because respiratory failure arises from paralysis of the respiratory muscles. The lethal dose for an adult is between 40 and 60 mg. Blood concentrations >5 mg/L may be fatal. The maximum permissible atmospheric concentration is 0.5 mg/m^3.

In 5 adults who ingested 20–25 g nicotine and died within 1 h, postmortem blood concentrations were between 11 and 63 mg/L (mean, 29) [Baselt, Cravey 1977].

Nine cases of self-poisoning associated with dermal exposure to 2–20 transdermal nicotine patches has been reported; all subjects recovered. Plasma nicotine/cotinine levels did not correlate with severity of toxicity [Woolf *et al.* 1996].

A report describes 36 exposures to transdermal nicotine in children aged under 16 years; 18 children had dermal exposure, and the other 18 children had bitten, chewed or swallowed part of a patch. Symptoms after dermal exposure were associated with an estimated dose of at least 10 mg nicotine [Woolf *et al.* 1997].

In 8 smokers who committed suicide, levels of nicotine and cotinine in blood were 115 and 405 μg/L and in urine 1940 and 1170 μg/L, respectively. Lower blood levels of nicotine and cotinine (33.2 and 140 μg/L, respectively) and lower urine levels (246 and 179 μg/L, respectively) were found in 5 smokers who did not commit suicide [Moriya, Hashimoto 2004].

Another study also found higher levels of nicotine and cotinine in smokers who committed suicide than in non-suicide smokers [Moriya *et al.* 2007]. High postmortem femoral muscle nicotine and cotinine levels of 213 and 488 μg/g, respectively, suggesting possible suicide, were found in an adipocere body drowned ~5 months earlier [Nishimura *et al.* 2009].

Nicotine and cotinine femoral blood levels of 0.6 and 2 mg/L were found in a subject who had cardiorespiratory failure induced by the additive effects of tramadol and nicotine following self-poisoning [Solarino *et al.* 2010a].

In a fatal poisoning caused by nicotine (as ingested tobacco leaves) and methomyl, nicotine levels in blood ranged from 222–733 μg/L. The stomach contained 170 g of greenish liquid containing a small amount of shredded tobacco leaves [Moriya, Hashimoto 2005].

Life-threatening nicotine intoxication is reported to occur after ingestion of more than 6 cigarettes. However, a case of non-life-threatening toxicity occurred in a 35-year-old man after ingestion of between 7 and 20 cigarettes [Metzler *et al.* 2005].

A 42-year-old man who was found dead had high postmortem femoral venous blood concentrations of nicotine and cotinine (2.2 mg/L) [Solarino *et al.* 2010b].

A 27-year-old nurse survived after self-administering an IV injection of 5 mL of cigarette soakage solution containing approximately 5.7 mg nicotine [Hagiya *et al.* 2010].

For other reports of suicide attempts with transdermal nicotine, see Engel, Parmentier [1993], Montalto *et al.* [1994] and Labelle, Boulay [1999].

Bioavailability ≈30% (oral).

Half-life After inhalation or parenteral administration, plasma half-life, nicotine 0.5–2 h, cotinine 6–16 h (mean, 11).

Volume of Distribution ≈1–3 L/kg.

Clearance Plasma clearance, 10–30 mL/min/kg.

Protein Binding ≈5%.

Note For a review of the clinical pharmacokinetics of the nicotine inhaler, see Schneider *et al.* [2001]; for a review of the pharmacology of nicotine and its therapeutic use in smoking cessation and neurodegenerative disorders, see Balfour, Fagerstrom [1996]; for a review of the clinical pharmacology of nicotine, see Zevin *et al.* [1998]; for a review of the metabolism of nicotine, see Kyerematen, Vesell [1991]; for a report of unintentional child poisonings from ingestion of conventional and novel tobacco products, see Connolly *et al.* [2010].

Dose As an aid to smoking withdrawal, dose depends on the level of smoking and formulation of preparation used.

Nicotinic Acid

Vitamin, Vasodilator

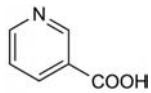
$C_6H_5NO_2$ = 123.1

CAS—59-67-6

IUPAC Name 3-Pyridinecarboxylic acid

Synonym Niacin

Proprietary Names *Hipocol*; *Natinate*; *Niacor*; *Niaspan*; *Nicangin*; *Nico-400*; *Nicobid*; *Nico-Span*; *Nicotinex*; *Pepevit*; *Slo-Niacin*.



Chemical Properties White or creamy-white crystals or crystalline powder. Mp 234° to 237°. Soluble 1 in 60 of water and 1 in 100 of ethanol; very slightly soluble in chloroform; insoluble in ether; freely soluble in boiling water and alcohol and in solutions of alkali hydroxides and carbonates. pK_a 2.0 (-N=), 4.8 (-COOH), (25°). Log *P* (octanol/water), 0.4.

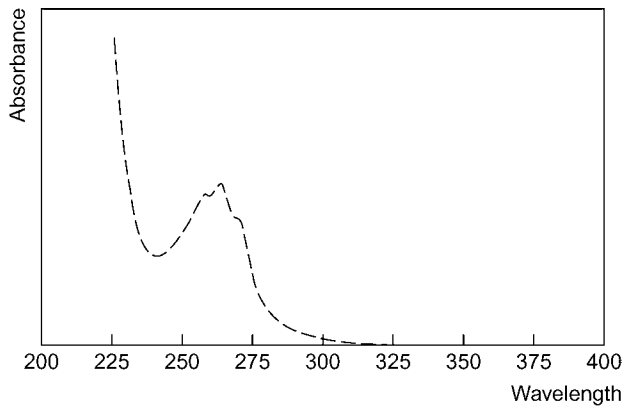
Colour Test Cyanogen bromide—orange.

Thin-layer Chromatography System TA—R_f 0.58; system TC—R_f 0.17; system TD—R_f 0.01; system TE—R_f 0.00; system TF—R_f 0.00; system TAD—R_f 0.04; system TAE—R_f 0.72; system TAJ—R_f 0.04; system TAK—R_f 0.10; system TAL—R_f 0.56.

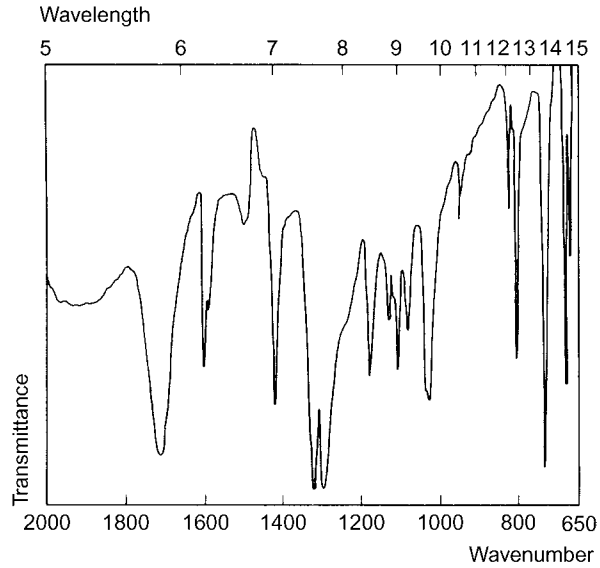
Gas Chromatography System GA—nicotinic acid RI 1335, nicotinic acid-(Me) RI 1390.

High Performance Liquid Chromatography System HAA—retention time 3.2 min.

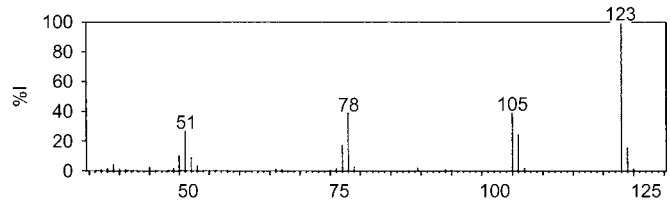
Ultraviolet Spectrum Methanol—263 nm (A^1_1=229a).



Infrared Spectrum Principal peaks at wavenumbers 1300, 744, 1710, 1042, 694, 1180 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 123, 105, 78, 51, 106, 77, 124, 50; *N*-methylnicotinamide 78, 106, 135, 136, 51, 50, 79, 52.



Quantification See also Nicotinamide.

Plasma **HPLC** For method of quantification for nicotinic acid, nicotinamide, and nicotinuric acid, see Miyauchi *et al.* [1993]. Limit of detection, 100 µg/L for nicotinic acid, 500 µg/L for nicotinuric acid, and 1 mg/L for nicotinamide [Takikawa *et al.* 1982]. UV detection. Limit of detection, 500 µg/L for nicotinic acid and nicotinuric acid [Hengen *et al.* 1978].

Urine **HPLC** See Plasma [Hengen *et al.* 1978].

Tissues **GC–MS** Limit of detection, <1 fmol for nicotinic, quinolinic, and picolinic acids [Smythe *et al.* 2002].

Disposition in the Body Readily absorbed after oral administration. Metabolised to *N*-methylnicotinamide, *N*-methyl-6-oxo-pyridine-3-carboxamide, *N*-methyl-4-oxopyridine-3-carboxamide, and by glycine conjugation to nicotinuric acid. It is rapidly excreted in the urine, and after administration of therapeutic doses about 34% is excreted unchanged in 6 h.

Nicotinic acid is a metabolite of nicergoline, nicotinamide, and nicotinyl tartrate.

Therapeutic Concentration

After a single oral dose of 300 mg to 5 subjects, peak plasma concentrations of 3.5 to 18.4 mg/L (mean, 9.3) were attained in about 40 min [Lesne *et al.* 1976].

Half-life Plasma half-life, about 0.3 to 0.8 h.

Distribution in Blood Plasma : whole blood ratio, 0.01.

Note For a review of the clinical pharmacology and pharmacokinetics of nicotinic acid, see Weiner [1979]; for a survey of nicotinic acid and its derivatives, see Hotz [1983]; for a review of the pharmacokinetics of nicotinic acid, see Gugler [1978].

Dose Up to 500 mg daily.

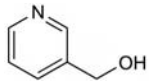
Smythe GA *et al.* (2002). Concurrent quantification of quinolinic, picolinic, and nicotinic acids using electron-capture negative-ion gas chromatography-mass spectrometry. *Anal Biochem* 301: 21–26.
Takikawa K *et al.* (1982). High-performance liquid chromatographic determination of nicotinic acid and its metabolites, nicotinuric acid and nicotinamide, in plasma. *J.Chromatogr* 233: 343–348.
Weiner M (1979). Clinical pharmacology and pharmacokinetics of nicotinic acid. *Drug Metab Rev* 9: 99–106.

Nicotinyl Alcohol

Vasodilator
C_6H_7NO = 109.1
CAS—100-55-0

IUPAC Name 3-Pyridinemethanol
Synonyms 3-Hydroxymethylpyridine; nicotinic alcohol; 3-pyridinemethanol; β-pyridylcarbinol.

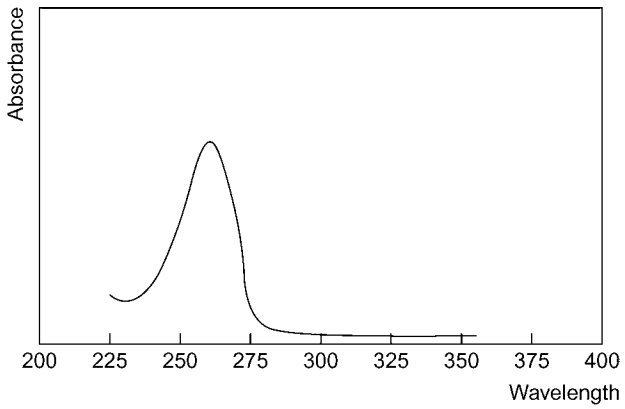


Chemical Properties A very hygroscopic liquid. Refractive index 1.5425. Freely soluble in water and ether; sparingly soluble in petroleum ether. Log *P* (octanol/water), 0.0.

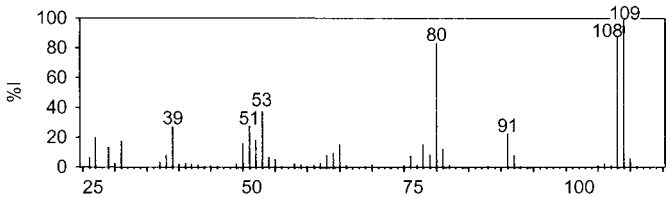
Nicotinyl Tartrate

$C_6H_7NO,C_4H_6O_6$ = 259.2
CAS—6164-87-0
Proprietary Names *Niltuvin*; *Radecol*; *Roniacol*; *Ronicol*.
Chemical Properties A white crystalline powder. Mp 147° to 148°. Soluble in water, ethanol and ether.

Thin-layer Chromatography System TA—R_f 0.56; system TB—R_f 0.04; system TC—R_f 0.17; system TE—R_f 0.45; system TL—R_f 0.22; system TAE—R_f 0.74; system TAF—R_f 0.69 (Dragendorff spray, positive; acidified iodoplatinate solution, positive).
Gas Chromatography System GA—nicotinyl alcohol RI 1215, nicotinic acid RI 1335.
High Performance Liquid Chromatography System HX—RI 55.
Ultraviolet Spectrum Aqueous acid—260 nm. No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 675, 1262, 1305, 1556, 1215, 788 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 109, 108, 80, 53, 51, 39, 91, 27; nicotinic acid 123, 105, 78, 51, 106, 77, 124, 50.

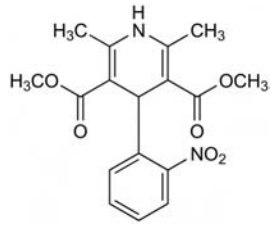


Disposition in the Body Nicotinyl tartrate is absorbed after oral administration and partly metabolised to nicotinic acid. It is excreted in the urine.
Dose The equivalent of 100 to 200 mg of nicotinyl alcohol daily; up to 600 mg daily given as a sustained-release preparation.

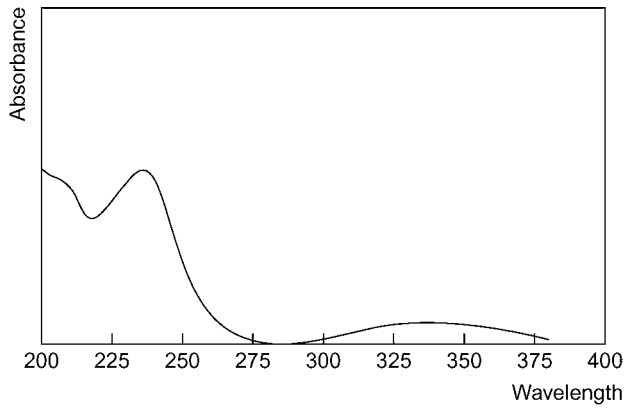
Nifedipine

Antianginal Vasodilator
$C_{17}H_{18}N_2O_6$ = 346.3
CAS—21829-25-4

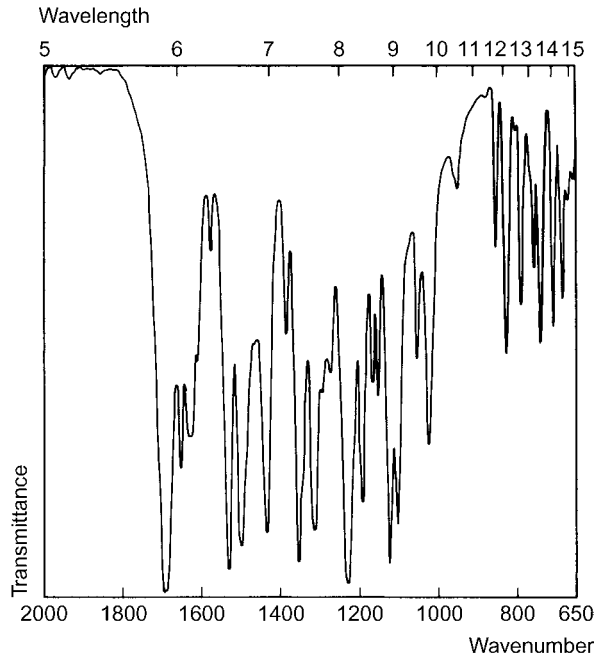
IUPAC Name Dimethyl 1,4-dihydro-2,6-dimethyl-4-(2-nitrophenyl)pyridine-3,5-dicarboxylate
Synonyms Bay-a-1040; nifedipina; nifedipinum.
Proprietary Names *Adalat(e)*; *Adipine*; *Angiopine*; *Calanif*; *Calcilat*; *Cardilate MR*; *Coracten*; *Coroday*; *Fortipine*; *Hypolar Retard*; *Nifed*; *Nifedical*; *Nifedipress*; *Nifedotard*; *Nifelease*; *Nifopress*; *Nimodrel*; *Nivaten*; *Pinifed*; *Procardia*; *Slofedipine*; *Systepin*; *Tensipine*; *Unipine XL*; *Vasofed*.



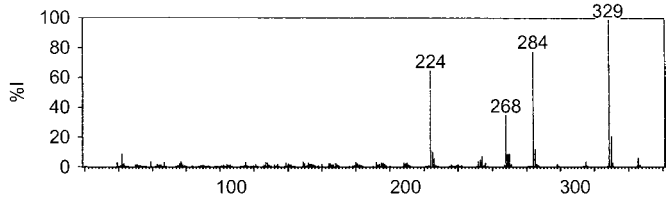
Chemical Properties A yellow crystalline powder. Mp 172° to 174°. Practically insoluble in water; slightly soluble in ethanol; soluble in acetone and chloroform. Log *P* (octanol/water), 2.2. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].
Colour Tests Methanolic potassium hydroxide—orange; sulfuric acid—orange.
Thin-layer Chromatography System TA—R_f 0.68; system TB—R_f 0.01; system TC—R_f 0.65; system TE—R_f 0.71; system TL—R_f 0.68; system TAE—R_f 0.79.
Gas Chromatography System GA—nifedipine RI 2545, M (dehydro-) RI 2250, M (dehydro-COOH-) RI 2290; system GB—nifedipine RI 2708, M (dehydro-) RI 2370; system GP—M (dehydro-) RI 2255, M (dehydro-2-COOH-)-Me RI 2695.
High Performance Liquid Chromatography System HA—*k* 0.2; system HX—RI 527; system HY—RI 464; system HZ—retention time 7.2 min; system HAA—retention time 19.5 min; system HAX—retention time 7.4 min; system HAY—retention time 7.9 min.
Ultraviolet Spectrum Aqueous acid—238 (A^1_1=595b), 338 nm (A^1_1=165b). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1690, 1225, 1527, 1120, 1496, 1310 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 329, 284, 224, 268, 330, 285, 225, 270.



Quantification

Plasma **GC** Limit of detection, 0.5 µg/L [Le Guellec *et al.* 1992]. ECD. Limit of detection, 1 µg/L for nifedipine and dimethyl 2,6-dimethyl-4-(2-nitrophenyl)pyridine-3,5-dicarboxylate [Dokladalova *et al.* 1982].

HPLC Limit of detection, 3 µg/L [Abou-Auda *et al.* 2000]. UV detection. Limit of detection, 1 µg/L [Grundy *et al.* 1994]. Limit of quantification, 7 µg/L [Thongnopnua, Viwatwongsa 1994]. UV detection. For method, see Sadanaga *et al.* [1982].

HPLC–MS Limit of quantification, 0.5 µg/L [Dankers *et al.* 1998].

Serum **GC–MS** Limit of detection, 2 µg/L [Martens *et al.* 1994].

HPLC UV detection. Limit of detection, 3 µg/L [Zaater *et al.* 2000]. For method, see Goldnik *et al.* [1996]. Comparison with GC. Limit of detection, 5 µg/L [Jankowski, Lamparczyk 1994].

Gingival Crevicular Fluid **GC** ECD. For method, see Ellis *et al.* [1993].

Disposition in the Body Rapidly and almost completely absorbed after oral or sublingual administration. It is completely metabolised, undergoing first-pass metabolism. It is found in breast milk. Between 70 and 90% of a dose is excreted in the urine in 24 h as inactive metabolites, including 5-methoxycarbonyl-2,6-dimethyl-4-(2-nitrophenyl)pyridine-3-carboxylic acid, dimethyl 2,6-dimethyl-4-(2-nitrophenyl)pyridine-3,5-dicarboxylate, and 2-hydroxymethyl-5-methoxycarbonyl-6-methyl-4-(2-nitrophenyl)pyridine-3-carboxylic acid, and its lactone derivative. Up to 15% of a dose is eliminated in the faeces as metabolites in 4 days.

Therapeutic Concentration

Following a single oral dose of 10 mg to 9 subjects, a mean peak plasma concentration of 0.07 mg/L was attained in about 0.6 h; in a further 3 subjects, absorption was much slower with peak plasma concentrations reported at 2 to 6 h [Foster *et al.* 1983].

Following single oral doses of 20, 40 and 60 mg to 8 hypertensive subjects, mean peak plasma concentrations of 0.06, 0.11, and 0.17 mg/L were reported at 1.6, 2.1, and 1.8 h, respectively [Banzet 1983].

Toxicity

A 57-year-old man who took 30 × 20 mg nifedipine retarded-release tablets developed hypotension, tachycardia and flushing; 10 h after the overdose, the nifedipine plasma concentration was 0.604 mg/L and that of the M-I metabolite was 0.110 mg/L [Ferner *et al.* 1990].

Bioavailability Between 45 and 75% for liquid-filled capsules but less for longer-acting formulations.

Half-life Plasma half-life, about 2 to 6 h.

Volume of Distribution About 0.8 L/kg.

Clearance Plasma clearance, about 7 mL/min/kg.

Protein Binding 92 to 98%.

Dose As the long-acting preparation, 10 to 90 mg daily; as liquid-filled capsules, 15 to 60 mg daily.

Nifekalant

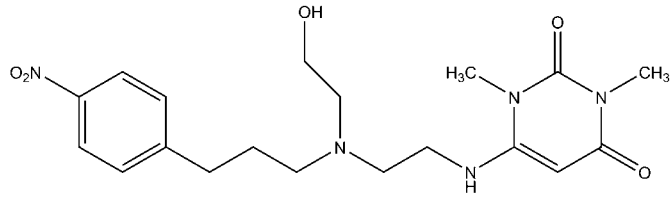
Antiarrhythmic, Potassium Channel Antagonist, Uracil

$C_{19}H_{27}N_5O_5$ = 405.5

CAS—130636-43-0

IUPAC Name 6-[2-[2-Hydroxyethyl-[3-(4-nitrophenyl)propyl]amino]ethylamino]-1,3-dimethylpyrimidine-2,4-dione

Synonym 6-[[2-[(2-Hydroxyethyl)[3-(4-nitrophenyl)propyl]amino]ethyl]amino]-1,3-dimethyl-2,-4(1*H*,3*H*)-pyrimidinedione



Chemical Properties Crystals. Mp 117.5° to 118.5°.

Nifekalant Hydrochloride

$C_{19}H_{27}N_5O_5$, HCl = 441.9

CAS—130656-51-8

IUPAC Name 6-[2-[2-Hydroxyethyl-[3-(4-nitrophenyl)propyl]amino]ethylamino]-1,3-dimethylpyrimidine-2,4-dione hydrochloride

Synonyms 6-[(2-{(2-Hydroxyethyl)[3-(*p*-nitrophenyl)propyl]amino}ethyl)amino]-1,3-dimethyluracil; MS-551.

Proprietary Name *Shinbit*

Chemical Properties Light yellow to yellow crystals. Mp 172° to 174°. Very soluble in water, slightly soluble in methanol, very slightly soluble in ethanol. Practically insoluble in ether. pK_a 7.05 [O'Neil *et al.* 2006].

Disposition in the Body Only the unchanged form is active and it undergoes glucuronate conjugation in the liver. Approximately 30% of the dose is excreted unchanged in the urine.

Therapeutic Concentration Approximately 0.5 mg/L. For a study investigating the IV administration of nifekalant in the prevention of ischaemia-induced ventricular tachyarrhythmia in patients with renal failure undergoing haemodialysis, see Myoishi *et al.* [2003].

Half-life Approximately 1.5 h.

Volume of Distribution Approximately 0.14 L/kg.

Protein Binding Between 86 to 96%.

Dose 300 µg/kg bodyweight by IV injection over 5 min with a maintenance dose of 400 µg/kg/h.

Myoishi M *et al.* (2003). Intravenous administration of nifekalant hydrochloride for the prevention of ischemia-induced ventricular tachyarrhythmia in patients with renal failure undergoing hemodialysis. *Circ J* 67: 898–900.
O'Neil MJ *et al.* (2006). *The Merck Index, An Encyclopedia of Chemicals, Drugs and Biologicals*, 14th edn. Whitehouse Station, NJ: Merck Research Laboratories.

Nifenazone

Analgesic

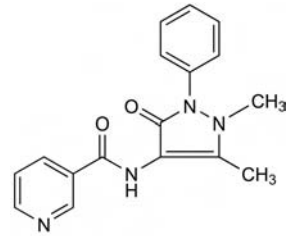
$C_{17}H_{16}N_4O_2$ = 308.3

CAS—2139-47-1

IUPAC Name *N*-(2,3-Dimethyl-5-oxo-1-phenyl-3-pyrazolin-4-yl)nicotinamide

Synonym Nicotinylamidoantipyrine

Proprietary Names *Neopiran*; *Nicopyron*; *Nicoreumal*; *Reumatosil*.



Chemical Properties A pale yellow crystalline powder. Slightly soluble in water and ether. Log *P* (octanol/water), 0.6.

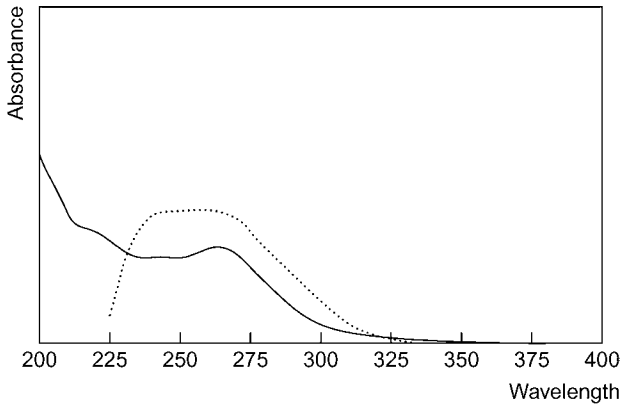
Colour Tests Cyanogen bromide—orange; ferric chloride—brown-red; Liebermann's reagent (100°)—yellow.

Thin-layer Chromatography System TA—R_f 0.57; system TB—R_f 0.00; system TE—R_f 0.36; system TAE—R_f 0.58 (acidified potassium permanganate solution, positive).

Gas Chromatography System GA—nifenazone RI 3080; M (desacetyl) RI 1955.

High Performance Liquid Chromatography System HD—*k* 0.1; system HW—*k* 0.45; system HX—RI 310.

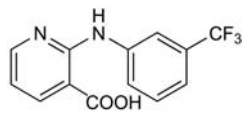
Ultraviolet Spectrum Aqueous acid—262 nm (A_1^1=502a).



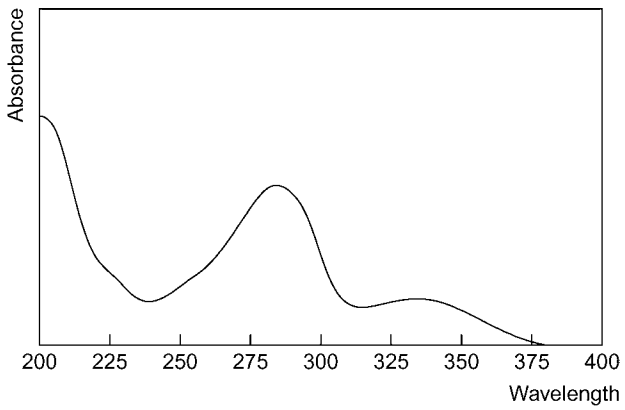
Infrared Spectrum Principal peaks at wavenumbers 1648, 1670, 1588, 1511, 1302, 1495 cm^{-1} (KBr disk).
Dose 0.5 to 1.5 g daily.

Niflumic Acid

Analgesic
$C_{13}H_9F_3N_2O_2$ = 282.2
CAS—4394-00-7
IUPAC Name 2-[[3-(Trifluoromethyl)phenyl]amino]-3-pyridinecarboxylic acid
Synonym UP-83
Proprietary Names *Actol*; *Flaminon*; *Flunir*; *Niflactol*; *Niflam*; *Niflugel*; *Nifluril*.



Chemical Properties Crystals. Mp 204°. Log *P* (octanol/water), 4.4.
Thin-layer Chromatography System TD—R_f 0.03; system TE—R_f 0.11; system TF—R_f 0.03; system TG—R_f 0.28; system TAD—R_f 0.15; system TAE—R_f 0.88; system TAJ—R_f 0.27; system TAK—R_f 0.56; system TAL—R_f 0.90 (Ludy Tenger reagent, orange-brown).
Gas Chromatography System GA—niflumic acid RI 2085; niflumic acid-Me RI 1955; System GD—methyl derivative retention time 1.38 relative to n-C_6H_{34}; system GL—niflumic acid-Me RI 1960; M (OH-)Me_2 RI 2140.
High Performance Liquid Chromatography System HV—retention time 0.93 relative to meclofenamic acid; system HX—RI 595; system HY—RI 530; system HAA—retention time 22.0 min.
Ultraviolet Spectrum Aqueous acid—255 (A_1^1=471b), 329 nm (A_1^1=202b); aqueous alkali—288 nm (A_1^1=788b).

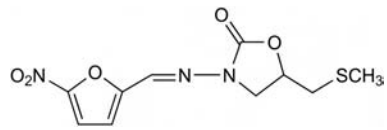


Mass Spectrum Principal ions at *m/z* 282, 236, 237, 281, 263, 145, 44, 93.
Quantification
Plasma **HPLC** For method, see Avgerinos and Malamataris [1990].
Urine **HPLC** For method, see Avgerinos and Malamataris [1990].
Dose 0.5 to 1 g daily.

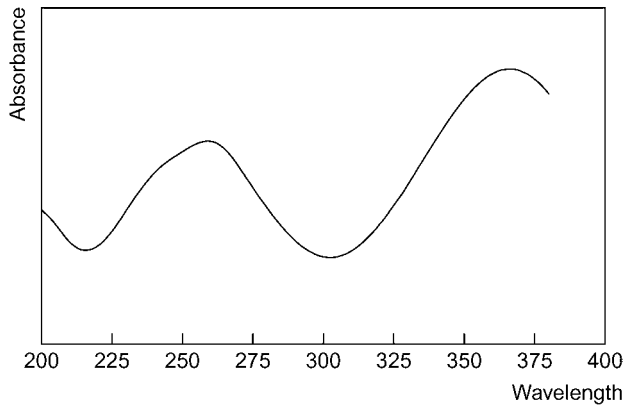
Avgerinos A, Malamataris S (1990). High-performance liquid chromatographic determination of niflumic acid in human plasma and urine. *J Chromatogr* 533: 271–274.

Nifuratel

Antimicrobial, Antiprotozoal
$C_{10}H_{11}N_3O_5S$ = 285.3
CAS—4936-47-4
IUPAC Name 5-[(Methylthio)methyl]-3-[[(5-nitro-2-furanyl)methylene]amino]-2-oxazolidinone
Synonyms Methylmercadone; thiodinone.
Proprietary Names *Inimur*; *Macmiror*; *Magmilor*; *Omnes*; *Polmiror*; *Tydantil*.



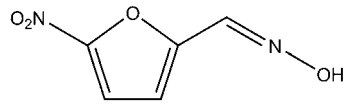
Chemical Properties A yellow crystalline powder. Mp 186° to 188°. Practically insoluble in water; soluble 1 in 400 of chloroform; sparingly soluble in acetone; soluble in dimethylformamide. Log *P* (octanol/water), 1.5.
Colour Tests Methanolic potassium hydroxide—orange; palladium chloride—black.
Thin-layer Chromatography System TA—R_f 0.73; system TB—R_f 0.00; system TE—R_f 0.67; system TF—R_f 0.43; system TAE—R_f 0.77 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2590.
High Performance Liquid Chromatography System HX—RI 432.
Ultraviolet Spectrum Aqueous acid—259 (A_1^1=452a), 367 nm.



Infrared Spectrum Principal peaks at wavenumbers 1748, 1253, 1232, 1520, 1027, 1126 cm^{-1} (KBr disk).
Dose 600 mg daily.

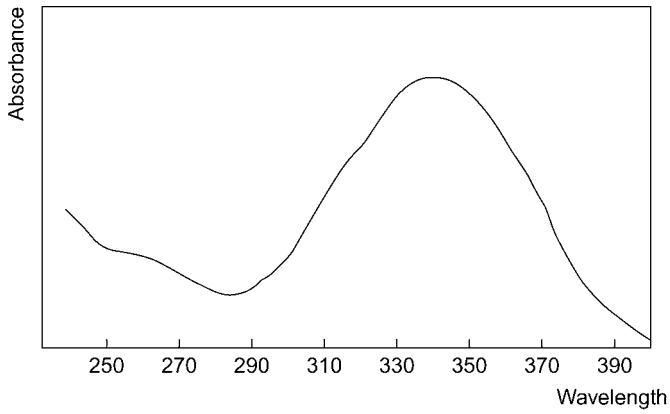
Nifuroxime

Antifungal, Antitrichomonal
$C_5H_4N_2O_4$ = 156.1
CAS—6236-05-1
Synonyms Anti-5-nitro-2-furaldoxime; anti-5-nitrofurfuraldehyde oxime; NF6; 5-nitro-2-furancarboxaldehyde oxime.
Proprietary Name *Micofur*. It is an ingredient of *Tricofuron*.



Chemical Properties A white-to-pale-yellow crystalline powder which darkens on standing; it also discolours on exposure to direct sunlight and on contact with alkaline material. Soluble 1 in 1000 of water, 1 in 25 of ethanol, and 1 in 11 of methanol; very soluble in dimethylformamide.
Colour Tests Ammonium vandate test—green, forming slowly (limit of detection, 0.5 µg); Vitali's test—pale yellow/pale yellow/brown (limit of detection, 0.5 µg).
Thin-layer Chromatography System T1—R_f 0.79 (location reagent acidified iodoplatinate spray, positive reaction).
Gas Chromatography System G2/225—retention time 0.99 (relative to codeine).

Ultraviolet Spectrum Aqueous acid (0.1 N sulfuric acid)—231 and 340 nm; neutral solution (1% dimethylformamide in water)—340 nm [Elsayed *et al.* 1980].



Infrared Spectrum Principal peaks at wavenumbers 1346, 811, 820, 1305, 1531 cm^{-1} (KBr disk).

Disposition in the Body

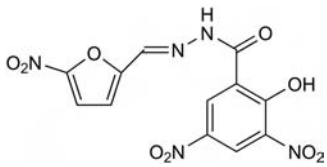
Toxicity When used in conjunction with furazolidine, there has been a report of cholestatic hepatitis [Engel *et al.* 1975] as well as generalised urticaria [Aaronson 1969].

Aaronson CM (1969). Generalized urticaria from sensitivity to nifuroxime. *JAMA* 210: 557–558.
Elsayed L *et al.* (1980). Simultaneous spectrophotometric determination of nifuroxime and furazolidone in pharmaceutical preparations. *J Assoc Off Anal Chem* 63: 992–995.
Engel JJ *et al.* (1975). Cholestatic hepatitis after administration of furan derivatives. *Arch Intern Med* 135: 733–735.

Nifursol

Antiprotozoal (Veterinary)
$C_{12}H_7N_5O_9$ = 365.2
CAS—16915-70-1

IUPAC Name 2-Hydroxy-3,5-dinitro-*N*-[(*E*)-(5-nitrofuran-2-yl)methylideneamino]benzamide
Synonym 3,5-Dinitro-2′-(5-nitrofurfurylidene)salicylohydrazide
Proprietary Name *Salfuride*

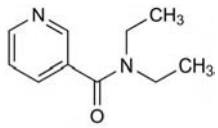


Chemical Properties A bright yellow crystalline powder. Mp 214° to 225°, with decomposition. Very slightly soluble in water, ethanol and chloroform; soluble 1 in 350 of acetone; practically insoluble in ether; slightly soluble in methanol.
Colour Test Methanolic potassium hydroxide—orange.
Thin-layer Chromatography System TA—R_f 0.86 (visible yellow spot; acidified potassium permanganate solution, positive).
Gas Chromatography System GA—not eluted.
Infrared Spectrum Principal peaks at wavenumbers 1251, 1281, 1606, 1176, 1674, 1566 cm^{-1} (KBr disk).

Nikethamide

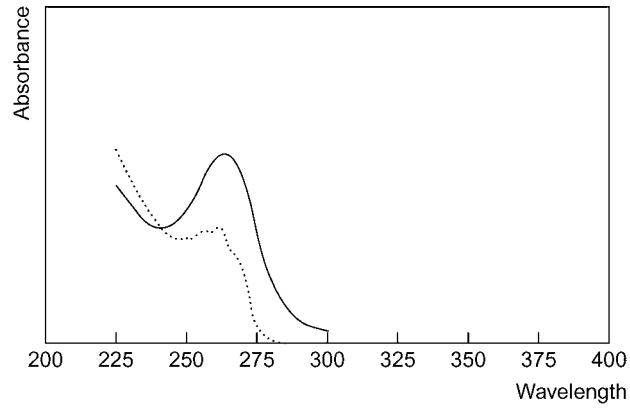
Respiratory Stimulant
$C_{10}H_{14}N_2O$ = 178.2
CAS—59-26-7

IUPAC Name *N,N*-Diethyl-3-pyridinecarboxamide
Synonyms Cardiamide; diethylamide nicotinic acid; nicethamidum; nicorine; nicotinoyldiaethylamidum; nikethylamide.
Proprietary Names *Coramin(e)*; *Cormed*; *Juvacor*; *Kardonyl*.

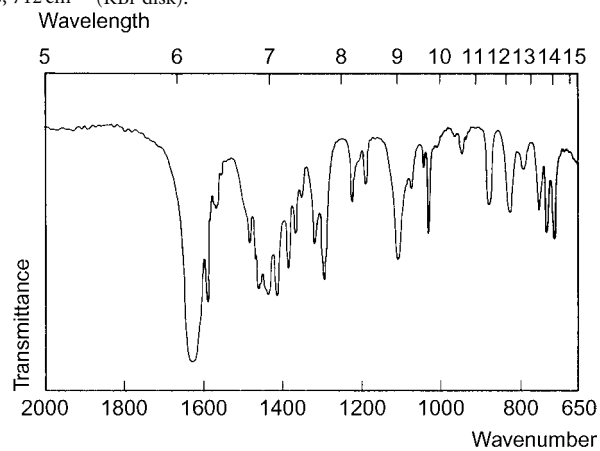


Chemical Properties A colourless or slightly yellow, oily liquid or crystalline solid. Relative density 1.060 to 1.066. Mp 23° to 25°. Bp 280°. Refractive index 1.524 to 1.526. Miscible with water, acetone, ethanol, chloroform and ether. pK_a 3.5 (20°). Log *P* (octanol/water), 0.3.

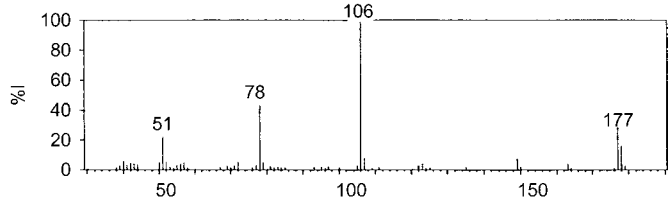
Colour Test Cyanogen bromide—orange.
Thin-layer Chromatography System TA—R_f 0.59; system TB—R_f 0.15; system TC—R_f 0.56; system TE—R_f 0.59; system TL—R_f 0.29; system TAE—R_f 0.71; system TAF—R_f 0.67; system TAJ—R_f 0.59; system TAK—R_f 0.19; system TAL—R_f 0.89 (Dragendorff spray, positive; acidified iodoplatinate solution, positive).
Gas Chromatography System GA—nikethamide RI 1525; M (nicotinamide) RI 1341, M (*N*-ethylnicotinamide) RI 1605; system GB—nikethamide RI 1569; M (nicotinamide) RI 1418; system GC—RI 1852; system GF—RI 1895.
High Performance Liquid Chromatography System HX—RI 304; system HY—RI 239.
Ultraviolet Spectrum Aqueous acid—264 nm (A^1_1=280a); aqueous alkali—256, 261 nm.



Infrared Spectrum Principal peaks at wavenumbers 1635, 1590, 1291, 1103, 1316, 712 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 106, 78, 177, 51, 178, 107, 149, 40; nicotinamide 122, 78, 106, 51, 50, 52, 44, 123.



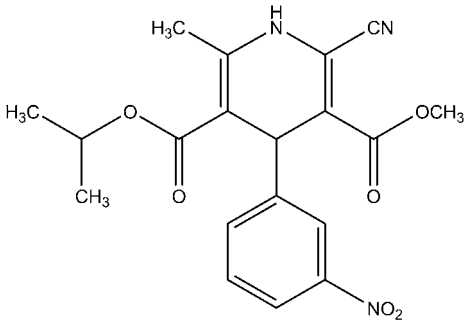
Quantification
Canine Blood GC FID. For method, see Lewis [1979].
Canine Urine GC FID. For method, see Lewis [1979].
Disposition in the Body Rapidly absorbed after oral or parenteral administration and metabolised by *N*-dealkylation to *N*-ethylnicotinamide and nicotinamide; rapidly excreted in the urine; the major urinary metabolite is *N*-ethylnicotinamide.
Dose 0.5 to 2 g IV, repeated if necessary.

Lewis JH (1979). Determination of nikethamide and N-ethylnicotinamide in the blood and urine of greyhounds. *J Chromatogr* 172: 295–302.

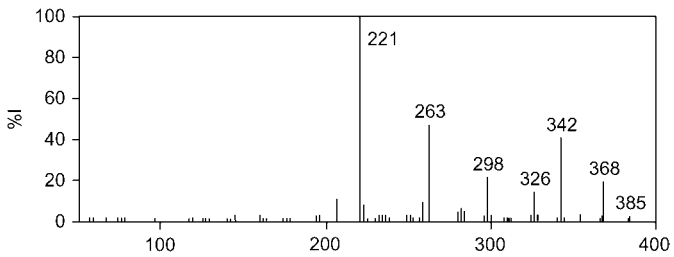
Nilvadipine

Antihypertensive, Calcium Channel Blocker, Dihydropyridine
$C_{19}H_{19}N_3O_6$ = 385.4
CAS—75530-68-6

IUPAC Name 3-*O*-Methyl 5-*O*-propan-2-yl 2-cyano-6-methyl-4-(3-nitrophenyl)-1,4-dihydropyridine-3,5-dicarboxylate
Synonyms CL-287389; 2-cyano-1,4-dihydro-6-methyl-4-(3-nitrophenyl)-3,5-pyridinedicarboxylic acid 3-methyl 5-(1-methylethyl) ester; FK-235; FR-34235; isopropyl 6-cyano-5-methoxycarbonyl-2-methyl-4-(3-nitrophenyl)-1,4-dihydropyridine-3-carboxylate; 5-isopropyl-3-methyl-2-cyano-1,4-dihydro-6-methyl-4-(*m*-nitrophenyl)-3,5-pyridinedicarboxylate; nivadipine; nivaldipine; SKF-102362.
Proprietary Names *Escor*; *Nivadil*; *Peroma*; *Tensan*.



Chemical Properties Yellow prisms. Mp 148° to 150° [O'Neil *et al.* 2006]. Log *P* (octanol/water), 1.73 [ACD 2007], >3 [von Nieciecki *et al.* 1992]. Photolabile. Stable in human plasma at 37° for up to 1 h [Tokuma *et al.* 1987a] and after freezing at –20° for 227 days [Tokuma *et al.* 1985]. Spiked plasma samples were stable for ~2 h under laboratory light. Stable in human plasma for at least 2 months at –20° and for 24 h at room temperature in an autosampler. After 3 freeze–thaw cycles, ~80% of the sample remained [Baranda *et al.* 2006].
Note For the identification of the photodegradation products of nilvadipine, see Mielcarek *et al.* [2000] and Augustyniak *et al.* [2001].
Mass Spectrum Principal ions at *m/z* 221, 263, 342, 298, 368, 326. [Mielcarek *et al* 2000].



Quantification

Plasma **GC-MS** Column: 5% phenylmethylsilicone fused silica capillary (12.5 m × 0.31 mm i.d., 0.52 µm). ECD, negative ion mode, SIM acquisition mode. Limit of detection not reported [Tokuma *et al.* 1987b]. Column: Ultra No. 2 5% phenylmethylsilicone fused silica capillary (25 m × 0.31 mm i.d., 0.52 µm). Carrier gas: He, 1.8 mL/min. ECD. Retention time: 5.8 min. Limit of detection, 0.5 µg/L [Tokuma *et al.* 1987a] Column: 5% phenylmethylsilicone fused silica capillary (12.5 m × 0.31 mm i.d., 0.52 µm). Carrier gas: He, 0.28 kg/cm^2. Temperature programme: 180° for 1 min to 250° at 20°/min to 285° at 10°/min. Positive ion–negative ion CI at 70 eV, SIM acquisition mode. Limit of detection, 0.01 µg/L [Tokuma *et al.* 1985].

HPLC Column: Daicel chiralpak OT(+) (+)-poly(triphenylmethyl methacrylate) polymer (25 cm × 4.6 mm i.d.). Mobile phase: methanol : water (95 : 5), flow rate 0.8 mL/min [Tokuma *et al.* 1987b].
Serum **LC-MS** Column: Luna RP-C_{18}(2) (150 × 2 mm i.d., 3.0 µm). Mobile phase: 0.1% methanoic acid-1 mmol/L ammonium formate (pH 2.7) : acetonitrile-0.1% formic acid-1 mmol/L ammonium formate (95 : 5; 80 : 20 for 3 min to 60 : 40 at 11 min to 30 : 70 at 12 min to 5 : 95 at 12.5 min for 1 min to 80 : 20 at 15.5 min). ESI, MRM acquisition mode. Limit of detection not reported [Baranda *et al.* 2006].
Urine **GC-MS** Following extractive methylation. Column: HP capillary cross-linked methylsilicone (12 m × 0.2 mm i.d., 330 nm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° to 300° at 30°/min. EI ionisation at 70 eV, full scan mode. Limit of detection, 10 µg/L [Maurer, Arlt 1999]. Column: Ultra No. 2 5% phenylmethylsilicone fused silica capillary (25 m × 0.31 mm, 0.52 µm). Carrier gas: He, 1.8 mL/min. ECD. Retention time: 5.8 min. Limit of detection, 0.5 µg/L [Tokuma *et al.* 1987a].
Disposition in the Body Nilvadipine is absorbed quickly and completely. It undergoes marked first-pass metabolism. Biotransformation occurs by almost complete oxidation of the dihydropyridine ring to the corresponding pyridine derivative (M1) and by subsequent splitting of the methyl ester (M3) and the isopropyl ester (M7) in the side chain. The metabolites are pharmacologically inactive. None of the other metabolites (such as the hydroxyl derivative of the isopropyl remnant [M5] or the dihydropyridine precursors of M7) play any significant role or can even be found in humans. Excretion is mainly via the kidneys; ~25% is excreted in the faeces. Approximately 60% is found in the urine within 24 h. Approximately 70% is found in urine and 15 to 20% in faeces within 72 h. Redistribution from tissues determines the rate of elimination, as opposed to rate of metabolism.

Therapeutic Concentration
Forty healthy male volunteers were randomly assigned to receive either placebo or 4, 8, 12, 16 or 20 mg nilvadipine orally. Mean maximum plasma levels were 2.00 ± 0.78, 3.03 ± 1.55, 5.97 ± 3.88, 15.7 ± 7.7 and 14.7 ± 8.6 µg/L, attained at 12.6 ± 4.3, 8.08 ± 2.29, 10.5 ± 1.8, 15.6 ± 6.4 and 12.4 2.3 h, respectively [Cheung *et al.* 1988].

Six healthy male volunteers (aged 20 to 24 years; weight 57 to 69 kg) were given a single oral dose of 4 mg followed by 4 mg every 12 h for 6 days after a washout period of at least 3 days. There was no significant difference in peak plasma concentrations and time to maximum (t_{max}) of single dosing or day 4 or day 6 of multiple dosing, although there was a 2-fold accumulation of trough concentration [Terakawa *et al.* 1988].

Six healthy male volunteers were given single 2, 4 or 6 mg oral doses of nilvadipine after an overnight fast. Mean maximum plasma levels of 1.48 ± 0.47, 3.48 ± 0.53 and 6.69 ± 1.54 µg/L, respectively, were attained at 1.08 to 1.50 h for each dose. The elimination half-life was independent of dose and averaged 11.0 ± 2.3 h [Terakawa *et al.* 1987a].
The bioavailability of nilvadipine was not affected by the presence of food, apart from a small increase in t_{max} with a larger meal, although this was clinically insignificant [Terakawa *et al.* 1987b].
Note For studies comparing the pharmacokinetics of the (*R*)- and (*S*)-stereoisomers, see Tokuma and Noguchi [1995] and Tokuma *et al.* [1987c].
Bioavailability 14 to 19%.
Half-life Approximately 11 h.
Protein Binding 97.5 to 98.7%.
Dose Up to 16 mg daily.

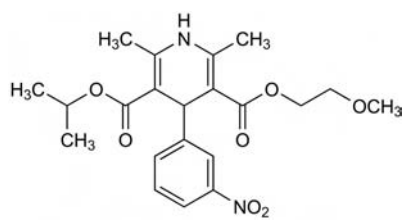
Nimodipine

Calcium Antagonist, Calcium Channel Blocker
$C_{21}H_{26}N_2O_7$ = 418.4
CAS—66085-59-4

IUPAC Name 3-*O*-(2-Methoxyethyl) 5-*O*-propan-2-yl 2,6-dimethyl-4-(3-nitrophenyl)-1,4-dihydropyridine-3,5-dicarboxylate
Synonyms Bay-e-9736; 1,4-dihydro-2,6-dimethyl-4-(3-nitrophenyl)-3,5-pyridinedicarboxylic acid 2-methoxyethyl-1-methylethyl ester.
Proprietary Names *Admon*; *Brainal*; *Calnit*; *Kenesil*; *Modus*; *Nimotop*; *Remontal*; *Periplum*.



Chemical Properties A yellow crystalline powder; crystals from petroleum ether/acetic ester. Mp 125°. Soluble in ethyl acetate, sparingly soluble in absolute alcohol and insoluble in water. Log *P* (octanol/water), 3.05. Exposure to light leads to formation of nitrophenylpyridine derivatives. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Thin-layer Chromatography System TB—R_f 0.01; system TE—R_f 0.78; system TAE—R_f 0.87.

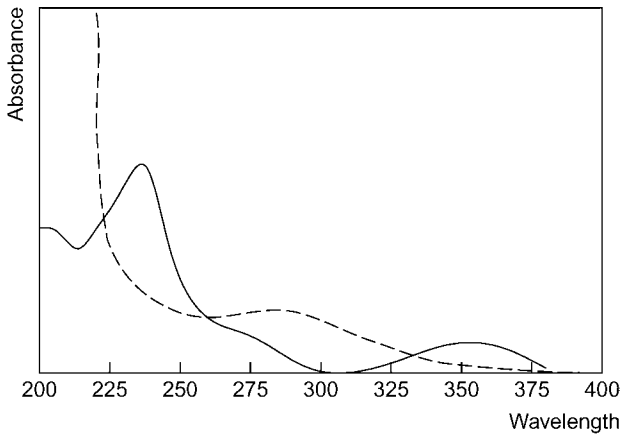
Gas Chromatography System GA—RI 2929; system GB—RI 3096; system GP—RI 2300 M (dehydro-desisopropyl-desmethoxyethyl)-Me_2,RI 2390 M (dehydro-desmethoxyethyl)-Me, RI 2645M (dehydro-desisopropyl-O-desmethyl-HOOC)-Me, RI 2655 M (dehydro-), RI 2665 M (dehydro-desisopropyl-O-desmethyl)-Me, RI 2740M (dehydro-O-desmethyl-HOOC-)-Me.

Column: HP1 methyl silicone (0.2 mm i.d., 0.33 µm). Temperature: 280°. Carrier gas: He, flow rate 0.9 mL/min. Detection: mass spectrometer. Retention index: 2961 [Mills, Roberson 1993].

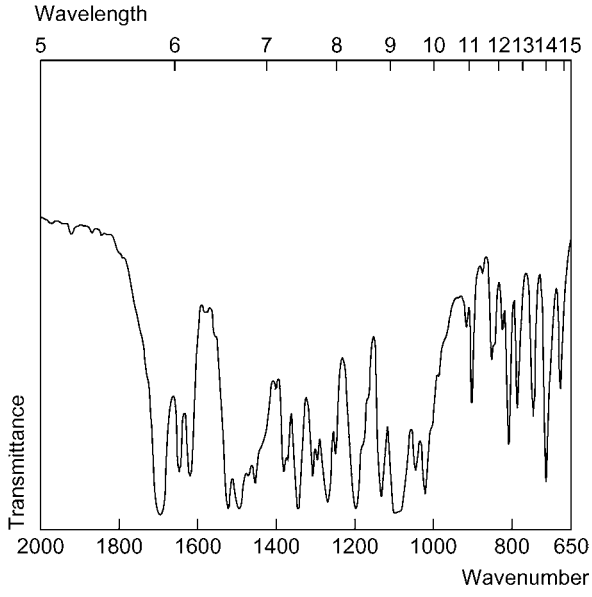
High Performance Liquid Chromatography System HX—RI 668; system HY—RI 584; system HZ—RI 17.7 min.

Column: ODS Hypersil (100 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 10 mmol/L potassium dihydrogen phosphate (pH 3.5, 70 : 30), flow rate 1 mL/min. UV detection (diode array). Retention time: 3.8 min [Mills, Roberson 1993].

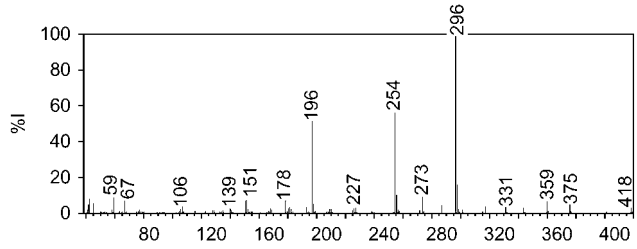
Ultraviolet Spectrum



Infrared Spectrum Principal peaks at wavenumber 1689, 1337, 1098 cm^{-1} (KBr pellet).



Mass Spectrum Principal ions at *m/z* 296, 254, 196, 273, 59, 67, 151, 178.



Quantification

Plasma **GC** ECD. Limit of detection, 1 µg/L [Krol *et al.* 1984].

HPLC Column: ODS Spherisorb (150 × 4.6 mm i.d., 3 µm). Mobile phase: (A) acetonitrile:water (57 : 43); (B) methanol : water (66 : 34), flow rate 0.5 mL/min. UV detection (λ=238 nm). Retention time: solvent (A) nimodipine, 12.19 min; pyridine analogue, 13.02 min; solvent (B) nimodipine, 17.33 min; pyridine analogue, 19.89 min. Limit of detection, 1 µg/L [Krol *et al.* 1984]. Limit of detection, 3 µg/L [Bach 1983].

Serum **GC** ECD. Limit of detection, 0.2 µg/L [Gengo *et al.* 1987].

GC–MS Limit of quantification, 0.1 µg/L [Fischer *et al.* 1993].

HPLC UV detection (λ=238 nm). Limit of quantification, 0.038 µg/L [Fischer *et al.* 1993]. See Plasma [Bach 1983].

Cerebrospinal Fluid **GC** See Plasma [Krol *et al.* 1984].

HPLC See Plasma [Krol *et al.* 1984].

Disposition in the Body Nimodipine is rapidly and readily absorbed after oral administration and undergoes hepatic metabolism. It is rapidly distributed throughout the body to tissues and organs. Metabolism occurs entirely in the liver and includes dehydrogenation to produce a pyridine analogue, followed by subsequent demethylation, ester hydrolysis and hydroxylation. Three metabolites have been isolated, the *O*-desmethyl metabolite which has slight activity and the pyridine and *O*-desmethyl pyridine metabolites which are both inactive. It is excreted mainly as metabolites in urine (50% of a dose excreted over 4 days) and faeces (32%). Virtually no unchanged drug is present in urine.

Therapeutic Concentration The serum therapeutic concentration is 10 to 50 µg/L. Six patients with biopsy-proven cirrhosis, 38 to 72 years old (mean, 55.3 years) and 5 healthy volunteers, aged between 42 and 68 years (mean, 52.4 years) were administered with a 60 mg oral dose after an overnight fast. The mean peak plasma concentration was 115.8 µg/L (range, 25.3 to 250.9 µg/L) for the patients with liver disease and 80.2 (between 58.5 and 126.5) µg/L for the healthy individuals. These concentrations were reached by 1.75 h (0.5 to 5.0 h) and 0.7 (0.25 to 1.0) h, respectively. Additionally, they were asked to take a 30 mg oral dose by sublingual administration. This meant that the actual dose received ranged between 8 and 18 mg. Peak concentrations of 12.4 (7.7 to 17.9) µg/L and 19 (4.6 to 53.6) µg/L were observed at 2.5 h (range, 1 to 10 h) and 1.3 (0.75 to 3.06) h for the patients and volunteers, respectively [Gengo *et al.* 1987].

Toxicity No specific or general toxic effects with therapeutic treatment, but cardiovascular problems may arise with higher doses.

Bioavailability 13%.

Half-life 9 h (with initial rapid phase with half-life around 1 to 2 h).

Volume of Distribution Steady state, 0.9 to 2.3 L/kg.

Clearance Plasma, 0.84 L/kg/h; 0.23 L/kg/h (patients with renal failure). Also, reported as 1.21 L/kg/h.

Distribution in Blood Erythrocytes : plasma ratio is unity.

Protein Binding 95 to 98%.

Note For a review of nimodipine, see Langley and Sorkin [1989]. For a review of the pharmacokinetics of nimodipine, see Parnetti [1995].

Dose Oral, 360 mg daily; IV, 1 mg/h initially, increased to 2 mg/h after 2 h.

Nimorazole

Antiprotozoal

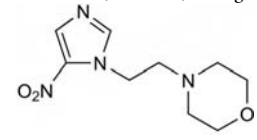
$C_9H_{14}N_4O_3$ = 226.2

CAS—6506-37-2

IUPAC Name 4-[2-(5-Nitro-1*H*-imidazol-1-yl)ethyl]morpholine

Synonym Nitrimidazine

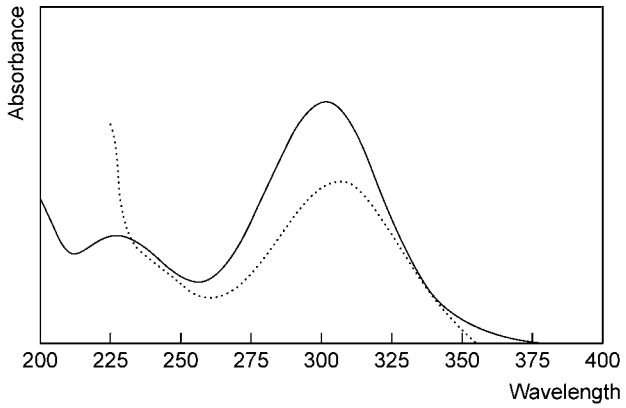
Proprietary Names *Acterol Forte*; *Esclama*; *Naxogin*.



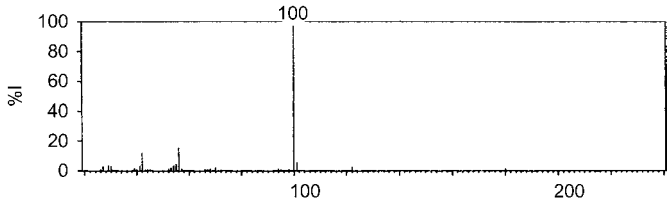
Chemical Properties A whitish crystalline powder. Mp about 110°. Soluble 1 in 33 of water; soluble in acetone, alcohols, chloroform and dilute acetic acid. Log *P* (octanol/water), 0.1.

Colour Test Dissolve 10 mg in 1 mL of methanol, add 10 mL of water, 10 mL of 6 mol/L sodium hydroxide containing 20 mg of alpha-naphthol and 10 mL of

12 mol/L sodium hydroxide, and heat for 30 min on a boiling water-bath—an intense brown colour develops.
Thin-layer Chromatography System TA—R_f 0.57; system TB—R_f 0.03; system TC—R_f 0.44; system TE—R_f 0.58; system TL—R_f 0.33; system TAE—R_f 0.60 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1803.
Ultraviolet Spectrum Aqueous acid—297 nm; aqueous alkali—305 nm.



Mass Spectrum Principal ions at *m/z* 100, 56, 42, 101, 55, 54, 41, 30.



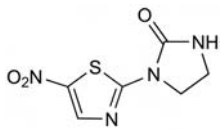
Note For studies of the pharmacokinetic properties of nimorazole, see Overgaard *et al.* [1983].
Dose Usually 2 g as a single dose.

Overgaard J *et al.* (1983). Studies of the pharmacokinetic properties of nimorazole. *Br J Cancer* 48: 27–34.

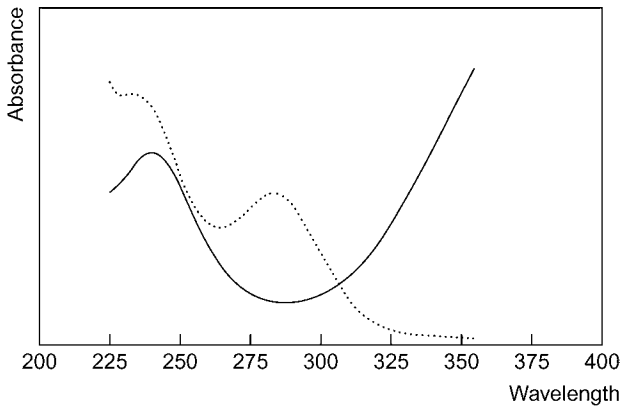
Niridazole

Anthelmintic
$C_6H_6N_4O_3S$ = 214.2
CAS—61-57-4

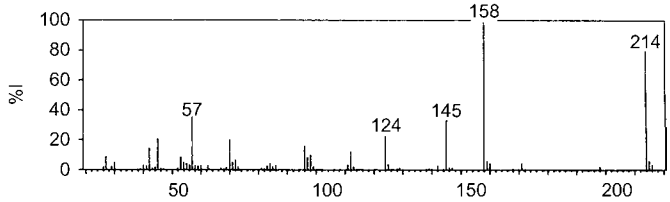
IUPAC Name 1-(5-Nitro-2-thiazolyl)-2-imidazolidinone
Synonym Ba-32644
Proprietary Name *Ambilhar*



Chemical Properties A yellow crystalline powder. Mp 260° to 264°. Practically insoluble in water, ethanol, acetone, chloroform and ether; soluble in dimethyl sulfoxide, dimethylformamide and pyridine. Log *P* (octanol/water), 1.0.
Colour Test Methanolic potassium hydroxide—yellow.
Thin-layer Chromatography System TA—R_f 0.54; system TB—R_f 0.01; system TC—R_f 0.44; system TL—R_f 0.53 (visible yellow spot.)
Ultraviolet Spectrum Aqueous acid—239 nm; aqueous alkali—233, 282 nm.



Mass Spectrum Principal ions at *m/z* 158, 214, 57, 145, 124, 45, 70, 96.



Quantification
Plasma **HPLC** UV detection. Limit of detection, 50 µg/L [Miller *et al.* 1978].
Serum **GC** FID. Limit of detection, 250 µg/L [Miller, Oake 1977].
Urine **GC** See Serum [Miller, Oake 1977].
HPLC See Plasma [Miller *et al.* 1978].
Disposition in the Body Niridazole is slowly absorbed after oral administration. It undergoes extensive first-pass metabolism in the liver to inactive metabolites. About 50% of a dose is excreted in the urine as metabolites in 48 h; niridazole is also excreted as metabolites in bile.
Therapeutic Concentration
After a single oral dose of 25 mg/kg, peak blood concentrations of unchanged drug of about 0.2 mg/L were attained in about 3 h, and peak blood concentrations of metabolites of about 5 to 10 mg/L were reported after 6 to 9 h [Faigle 1971].
Half-life Plasma half-life, 12 to 15 h.
Protein Binding Niridazole metabolites extensively bound.
Dose 25 mg/kg daily, orally, up to a maximum of 1.5 g daily.

Faigle JW (1971). Blood levels of a schistosomicide in relation to liver function and side effects. *Acta Pharmacol Toxicol (Copenh)* 29: 3233–239.

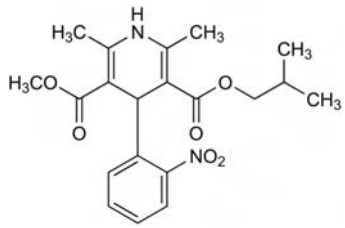
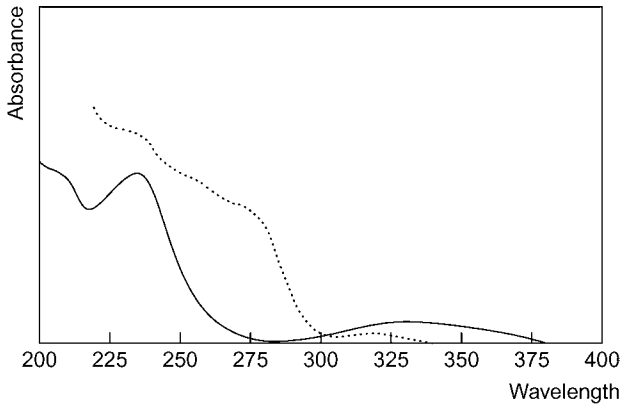
Nisoldipine

Calcium Antagonist, Calcium Channel Blocker
$C_{20}H_{24}N_2O_6$ = 388.4
CAS—63675-72-9

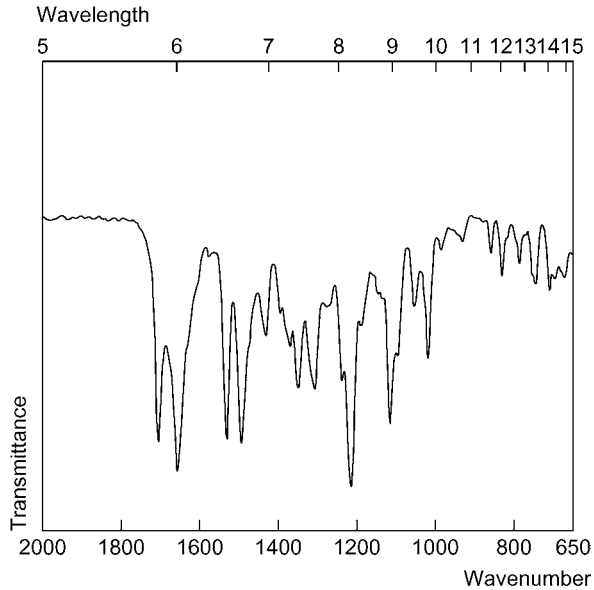
IUPAC Name 3-*O*-Methyl 5-*O*-(2-methylpropyl) 2,6-dimethyl-4-(2-nitrophenyl)-1,4-dihydropyridine-3,5-dicarboxylate
Synonyms Bay-k-5552; 1,4-dihydro-2,6-dimethyl-4-(2-nitrophenyl)-3,5-pyridinedicarboxylic acid methyl 2-methylpropyl ester.
Proprietary Names *Baymycard*; *Cornel*; *Sular*; *Syscor*; *Zadipina*.



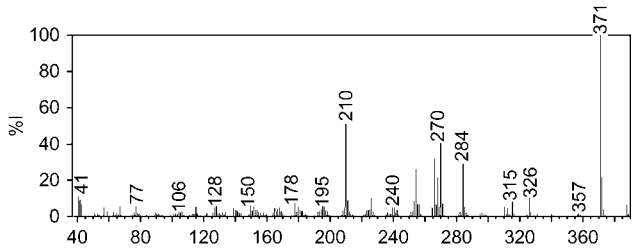
Chemical Properties Yellow crystals. Mp 151° to 152°. Practically insoluble in water; soluble in ethanol. Log *P* (octanol/water), 3.26. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].
Thin-layer Chromatography System TAE—R_f 0.86; system TB—R_f 0.45; system TE—R_f 0.85; system TF—R_f 0.65.
Gas Chromatography System GP—RI 2255 M (dehydro-desisobutyl-)-Me, RI 2450 M (dehydro-), RI 2615 M (dehydro-OH^-), RI 2695 M (dehydro-desisobutyl-2-$HOOC^-$)-Me_2.
Column: Ultra 1 (12.5 m × 0.2 mm i.d., 0.33 µm). Temperature programme: 100° for 1 min, to 280° at 35°/min, hold for 3 min. Injector and detector temperatures: 280° and 300°, respectively. Carrier gas: He; flow rate, 1.9 mL/min. IS: nitrendipine. MS detection (EI, SIM at *m/z* 270.2 and 371.35 for nisoldipine and *m/z* 360 for I. S.). Retention time: nisoldipine, 6.86 min; IS, 6.77 min [Marques *et al.* 2001].
Column: methyl silicone HP1 (0.2 mm i.d., 0.33 µm). Temperature: 250°. Carrier gas: He, flow rate 0.9 mL/min. MS detection. Retention index: 2139 [Mills, Roberson 1993].
High Performance Liquid Chromatography System HX—RI 690.
Column: C_{18} Supelcosil (250 × 4.6 mm i.d., 5 µm). Temperature: 30°. Mobile phase: methanol : water (containing 2 mmol/L sodium acetate buffer), (pH 5.0), flow rate 1 mL/min. Electrochemical detection. *k* value: 2.27 [Lopez *et al.* 2000].
Column: ODS Hypersil (100 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 10 mmol/L potassium dihydrogen phosphate, (pH 7.0), flow rate 1 mL/min. UV diode array detection. Retention time: 4.3 min [Mills, Roberson 1993].
Ultraviolet Spectrum Aqueous acid—235, 331 nm; basic—324 nm.



Infrared Spectrum Principal peaks at wavenumber 1647, 1485, 1210 cm^{-1} (KBr pellet).



Mass Spectrum Principal ions at *m/z* 371, 210, 270, 266, 284, 254, 268, 41.



Quantification

Plasma **GC** ECD. Limit of detection, 0.1 µg/L [Soons *et al.* 1990].

HPLC UV detection (λ=230 nm). Limit of quantification, 0.1 µg/L [Heinig *et al.* 1994].

Disposition in the Body Nisoldipine is well absorbed after oral administration from the gastrointestinal tract and the concentration of the active (+)-nisoldipine enantiomer is about 6 times higher than the inactive (−)-nisoldipine enantiomer. It is extensively metabolised in the gut wall and liver to five major urinary metabolites, which include BAYs-1869 and BAYs-4755. A hydroxylated derivative of the side chain appears to be the only active metabolite, having about 10% of the activity of the parent compound. Cytochrome P450 3A4 enzymes are believed to be involved. Between 60 and 80% of an administered dose is excreted in urine and the remainder in faeces, mostly as metabolites. <1% of a single dose is excreted unchanged.

Therapeutic Concentration

Four healthy male volunteers, 22 to 38 years old, were administered with a 40 mg dose of the controlled release formulation. The mean peak plasma concentration was 3.40 µg/L for the (+)-formulation drug and 0.37 µg/L for the (−)-drug 3 h after administration [Heinig *et al.* 1994].

Toxicity Studies have revealed that, when administered with grapefruit juice, nisoldipine mean peak plasma concentrations increase three-fold.

A 72-year-old woman with a history of depression was admitted because of severe shock, hypothermia and renal insufficiency. Routine screening revealed therapeutic drug concentrations of clomipramine (177 µg/L) and desmethylclomipramine (173 µg/L), but a nisoldipine serum concentration of 1544 µg/L was found. The patient was discharged 4 days later without sequelae [Louagie *et al.* 1998].

Bioavailability 5.5% (oral, modified release formulation). Ranges between 4 and 8%.

Half-life 2 h (beta phase) and 10 to 12 h (gamma phase). Terminal elimination half-life is 7 to 12 h.

Volume of Distribution 2.7 L/kg.

Protein Binding >99%.

Dose 10 to 40 mg daily.

Nitrazepam

Benzodiazepine, Hypnotic

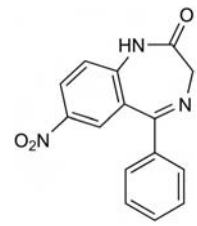
$C_{15}H_{11}N_3O_3 = 281.3$

CAS—146-22-5

IUPAC Name 7-Nitro-5-phenyl-1,3-dihydro-1,4-benzodiazepin-2-one

Synonyms 1,3-Dihydro-7-nitro-5-phenyl-2*H*-1,4-benzodiazepin-2-one; nitrazepamum; NSC-58775; Ro-4-5360; Ro-5-3059.

Proprietary Names *Alodorm*; *Apodorm*; *Arem*; *Dima*; *Dormalon*; *Dumolid*; *Eatan N*; *Imeson*; *Insoma*; *Insomin*; *Mogadan*; *Mogadon*; *Nelbon*; *Nitrados*; *Nitrazadon*; *Nitrazepol*; *Numbon*; *Ormodon*; *Paxadorm*; *Radedorm*; *Remnos*; *Serenade*; *Somnite*; *Sonebon*; *Sonotrat*; *Surem*; *Unisomnia*.



Chemical Properties A yellow crystalline powder. Mp 224° to 226° (crystals from ethanol). Practically insoluble in water, benzene and hexane; soluble 1 in 120 of ethanol, 1 in 45 of chloroform and 1 in 900 of ether; soluble in acetone and ethyl acetate. pK_{a1} 3.2, pK_{a2} 10.8 (20°). Log *P* (octanol/water), 2.25 [Capella-Peiró *et al.* 2002], (octanol/water pH 7.4), 2.1. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005]. Plasma samples stable for 3 weeks at 4° but there was deterioration at room temperature [Kelly *et al.* 1982].

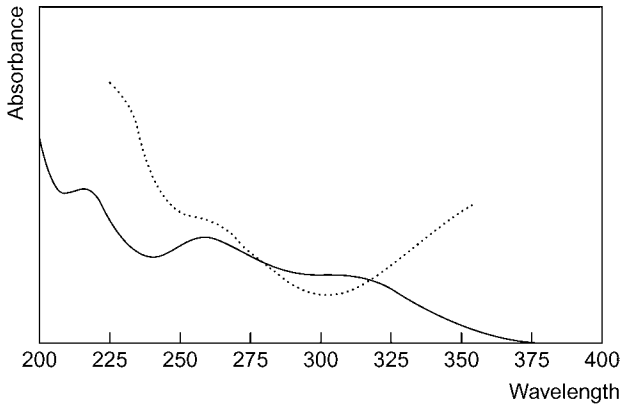
Colour Test Formaldehyde-sulfuric acid—orange.

Thin-layer Chromatography System TA—R_f 0.68; system TB—R_f 0.00; system TC—R_f 0.36; system TD—R_f 0.35; system TE—R_f 0.64; system TF—R_f 0.46; system TL—R_f 0.55; system TAD—R_f 0.53; system TAE—R_f 0.90; system TAF—R_f 0.86; system TAJ—R_f 0.53; system TAK—R_f 0.52; system TAL—R_f 0.92 (acidified iodoplatinate solution—positive; Dragendorff spray—positive).

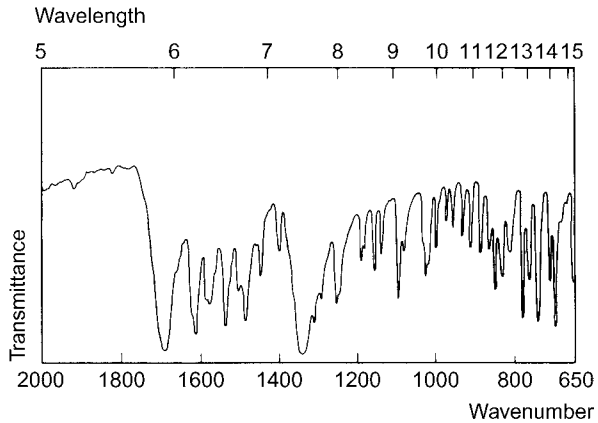
Gas Chromatography System GA—nitrazepam RI 2740, M (7-acetamido-) RI 3205, M (7-amino-) RI 2785, 2-amino-5-nitrobenzophenone RI 2388; system GB—nitrazepam RI 2915, nitrazepam-TMS RI 2642, M (7-amino-) RI 2878, M (7-amino-)-TMS_3 RI 2634; system GG—RI 3450.

High Performance Liquid Chromatography System HA—*k* 0.1; system HI—nitrazepam *k* 2.96, M (7-acetamido-) *k* 0.68, M (7-amino-) *k* 0.46; system HK—nitrazepam *k* 1.49, M (7-acetamido-) *k* 1.93, M (7-amino-) *k* 0.00; system HX—nitrazepam RI 448; system HY—RI 370; system HZ—RT 4.2 min; system HAA—RT 16.9 min; system HAF—RT 9.10 min; system HAL—RT 4.6 min; system HAM—RT 4.5 min; system HAX—RT 6.3 min; system HAY—RT 6.0 min; system HAZ—*k* 0.88; system HBH—*k* 3.22; system HBI—*k* 0.97.

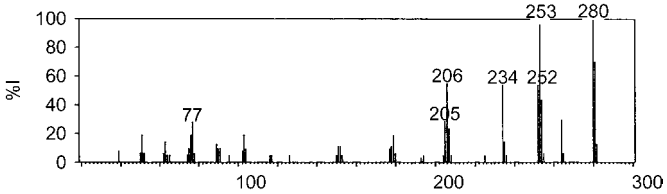
Ultraviolet Spectrum Methanolic acid—280 nm ($A^1_1 = 910$a).



Infrared Spectrum Principal peaks at wavenumbers 1690, 1610, 698, 1536, 745, 784 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 280, 253, 281, 206, 234, 252, 254, 264 (nitrazepam); 293, 265, 264, 292, 43, 222, 223, 294 (7-acetamidonitrazepam); 251, 222, 223, 250, 252, 195, 110, 97 (7-aminonitrazepam); 241, 77, 242, 105, 44, 43, 195, 57 (2-amino-5-nitrobenzophenone).



Quantification

Blood **GC** Columns: DB-1 and DB-1701 (15 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 120° for 1 min to 28° at 30°/min to 230° at 2°/min to 300° at 30°/min for 1 min or 120° for 1 min to 230° at 40°/min to 280° at 8°/min for 9 min. ECD. Limit of detection, 0.088 or 0.082 µmol/L [Gjerde *et al.* 1992]. Column: SE-54 5% phenyl methyl silicone (25 m × 0.31 mm i.d., 0.17 µm). Carrier gas: He, 2 to 3 mL/min. Temperature programme: 200° for 1 min to 290° at 10°/min. NPD or ECD. Retention time: 7.87 min. Limit of detection not reported [Lillsunde, Seppälä 1990].

GC-MS Column: HP-5 MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 120° to 295° at 10°/min for 5 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 6.49 µg/L, limit of detection, 2.14 µg/L [Papoutsis *et al.* 2010]. Column: DB5-MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° to 230° at 8°/min to 313° at 4°/min. EI ionisation at 70 eV or CI in positive ion mode. Limit of detection, 100 µg/L [Pirnay *et al.* 2002].

HPLC Column: Chromspher C_8 (100 × 3.0 mm i.d., 5 µm). Mobile phase: methanol : water (20 : 80 for 2 min to 30 : 70 at 2.20 min until 4 min to 40 : 60 at 4.4 min until 4.5 min to 43 : 57 at 5 min to 45 : 55 at 6 min to 52 : 48 at 7 min to 58 : 42 at 9.5 min to 75 : 25 at 10.5 min for 5 min to 20 : 80 at 15.3 min until 19 min), flow rate 0.7 mL/min. DAD (λ = 450 nm). Limit of quantification, 75 µg/L, limit of detection, 25 µg/L [Lambert *et al.* 1995]. Column: Nova-Pak phenyl-bonded (150 × 3.9 mm i.d., 4 µm). Mobile phase: acetonitrile : 40 mmol/L phosphate buffer (28 : 72), flow rate 0.8 mL/min. UV detection (λ = 240 nm). Limit of quantification, 0.01 mg/L, limit of detection, 8 µg/L [Robertson, Drummer 1995]. Column: Spherisorb S 5W (250 × 4.9 mm i.d.). Mobile phase: methanol : diethyl ether : 1.85 nmol/L perchloric acid (80 : 20 : 0.02), flow rate 2 mL/min. UV detection (λ = 280 nm). Retention time: 2.93 min. Limit of detection, 5 µg/L for nitrazepam and 7-acetamidonitrazepam and 50 µg/L for 7-aminonitrazepam [Kelly *et al.* 1982].

LC-MS Column: Restek Allure C_{18} (150 × 3.2 mm i.d., 5 µm). Mobile phase: 5 mmol/L ammonium acetate : acetonitrile : methanol (90 : 5 : 5 to 50 : 25 : 25 at 7 min to 10 : 45 : 45 at 27 min for 3 min to 95 : 5 : 5 at 31 min), flow rate 0.45 mL/min. APCI. Limit of quantification, 3 µg/L [Dussy *et al.* 2006]. Column: XTerra MS C_{18} (150 × 2.1 mm i.d., 3.5 µm). Mobile phase: 0.006 mol/L formic acid (pH 3.0) : methanol (70 : 30 to 60 : 40 at 5 min to 50 : 50 in 25 min to 40 : 60 at 30 min for 5 min to 70 : 30 at 36 min for 9 min), flow rate 0.2 mL/min. Limit of quantification, 0.7 µg/L, limit of detection, 0.2 µg/L [Smink *et al.* 2004].

Plasma **Spectrofluorimetry** Limit of detection, ~10 µg/L for nitrazepam and 25 µg/L for the sum of 7-amino- and 7-acetoamido-metabolites [Rieder 1973].

GC See Blood [Lillsunde, Seppälä 1990]. Column: 3% OV-17 on 100/120 mesh Chromosorb W or 3% SP-2250 on 100/120 mesh Supelcoport (1.5 or 1.8 m [5 or 6 ft] × 2 mm i.d.). Carrier gas: N_2, 40 mL/min. Temperature: 245° or 275°. ECD. Limit of detection, 1 µg/L for nitrazepam and 200 ng/L for its hydrolysis product [Kangas 1977].

HPLC Column: C_{18} (250 × 4.6 mm). Mobile phase: methanol : water (65 : 35), flow rate 1.0 mL/min. UV detection (λ = 230 nm). Nitrazepam and other benzodiazepines [Liang *et al.* 2009]. Column: Hisep (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.18 mol/L ammonium acetate buffer (pH 2.5, 15 : 85), flow rate 2 mL/min. UV detection (λ = 254 nm). Limit of quantification, 0.5 mg/L, limit of detection, 0.16 mg/L [Pistos, Stewart 2003]. Column: Nova-Pak C_{18} (4 µm). Mobile phase: acetonitrile : methanol : 10 nmol/L dipotassium hydrogen phosphate (pH 3.7, 30 : 2 : 100), flow rate 1.5 mL/min. DAD (λ = 240 nm). Limit of detection, 5 nmol/L [Akerman *et al.* 1996]. Column: Nova-Pak C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: 6 mmol/L phosphate buffer : acetonitrile : methanol (64 : 23 : 13), flow rate 1.3 mL/min. UV detection (λ = 242 nm). Limit of detection, 6.0 µg/L [Boukhabza *et al.* 1991]. Column: C_8 reversed phase (250 × 4.6 mm i.d., 10 µm). Mobile phase: methanol : 0.03 mol/L potassium dihydrogen phosphate (pH 4.5, 55 : 45), flow rate 1.1 mL/min. UV detection. Limit of detection, 5 µg/L [Ho *et al.* 1983]. See Blood [Kelly *et al.* 1982].

LC-MS Column: Merck LiChroCART (125 × 2 mm i.d.). Mobile phase: 5 mmol/L ammonium formate : acetonitrile (60 : 40 for 5.5 min to 10 : 90 in 8 min to 60 : 40 in 9.5 min for 10 min). APCI, SIM acquisition mode. Limit of quantification, 0.002 mg/L, limit of detection, 0.002 mg/L [Kratzsch *et al.* 2004].

Note For a radioimmunoassay for the measurement of nitrazepam see Dixon *et al.* [1979].

Serum **HPLC** Column: Hypersil Hypurity C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 50 mmol/L acetate buffer (pH 4.1, 60 : 40), flow rate 1.0 mL/min. Electrochemical detection. Limit of detection, 5 ng [Honeychurch *et al.* 2006]. Column: Symmetry Shield RP8 (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.1 mol/L potassium dihydrogen phosphate (40 : 60), flow rate 0.9 mL/min. UV detection (λ = 230 nm). Limit of detection, 1.0 µg/L [He *et al.* 2005]. Column: Kromasil C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: butanol : 0.06 mol/L SDS (pH 7, 5 : 95), flow rate 1.0 mL/min. UV detection (λ = 230 nm). Limit of detection, 4 µg/L [Capella-Peiró *et al.* 2002]. Column: TSK gel Super-ODS (100 × 4.6 mm i.d., 2 µm) or Hypersil ODS-C_{18} (100 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 5 mmol/L sodium dihydrogen phosphate (pH 6, 45 : 55), flow rate 0.65 mL/min. UV detection (λ = 254 nm). Limit of sensitivity and quantification for nitrazepam and other benzodiazepines, 4–10 times better using column 1 [Tanaka *et al.* 1996]. Column: Supelcosil C_8 DB 5 (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water : 0.5 mol/L monobasic potassium phosphate (370 : 600 : 30), flow rate 1.65 mL/min. UV detection (λ = 219 nm). Limit of quantification, 1 µg/L [Welk 1996]. See Plasma [Akerman *et al.* 1996]. See Blood [Kelly *et al.* 1982].

LC-MS Unison UK-C_{18} RP ODS (150 × 2 mm i.d., 3 µm). Mobile phase: 10 mmol/L aqueous ammonium formate containing 0.1% formic acid : methanol containing 0.1% formic acid (70 : 30 over 20 min to 20 : 80 over 5 min), flow rate 0.25 mL/min. MRM acquisition mode. Limit of quantification, 3.3 µg/L, limit of detection, 1.0 µg/L [Nakamura *et al.* 2009]. See Blood [Dussy *et al.* 2006]. Column: LiChrospher 60 RP-Select B (100 × 2.0 mm i.d., 5 µm). Mobile phase: methanol : water : acetonitrile (1 : 1 : 1), flow rate 100 µL/min. APCI, SRM acquisition mode. Limit of quantification, 2 µg/L [Kleinschnitz *et al.* 1996].

Urine **Spectrofluorimetry** See Plasma [Rieder 1973].

GC Column: DB-17 (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 80 kPa. Temperature programme: 150° for 1 min to 230° at 10°/min for 5 min to 300° at 10°/min for 9 min. ECD. Limit of detection, 160 µg/L [Guan *et al.* 1999]. Column: U-shaped borosilicate glass (1.5 m [5 ft] × 2 mm i.d.). Carrier gas: N_2, 40 mL/min. Temperature: 275°. ECD or AFID. Limit of detection, 0.2 µg/L for nitrazepam, 50 µg/L for metabolites [Kangas 1979].

HPLC See Serum [He *et al.* 2005].

LC-MS Column: Hypurity C_8 (150 × 3 mm i.d.). Mobile phase: 4 mmol/L ammonium acetate (pH 6.8) in methanol-water (5 : 95) : 1% propan-2-ol, 0.05% formic acid in methanol (100 : 0 for 1 min to 0 : 100 at 3 min for 1.5 min to 100 : 0 over 0.1 min for 1.4 min). TIS, MRM acquisition mode. Limit of quantification, 5 µg/L, limit of detection, 1.25 µg/L [Glover, Allen 2010]. Column: Polaris-C_{18}-A (150 × 2.1 mm i.d., 5 µm). Mobile phase: water : acetonitrile (20 : 80 to 90 : 10 at 4 min for 3 min to 20 : 80 at 7.1 min), flow rate 0.25 mL/min. ESI, SRM acquisition mode, positive ion mode. Limit of quantification, 0.5 µg/L, limit of detection, 0.07 µg/L for 7-aminonitrazepam [Kuang *et al.* 2009]. Column: Waters Symmetry C_{18} (100 × 2.1 mm i.d., 3.5 µm). Mobile phase: acetonitrile : 5 mmol/L ammonium acetate (pH 5, 10 : 90 to 30 : 70 at 5 min to 80 : 20 at 9 min to 10 : 90 at 9.1 min), flow rate 0.3 mL/min. ESI, MRM acquisition mode. Limit of quantification, 0.01 µmol/L for 7-aminonitrazepam [Hegstad *et al.* 2006]. See Serum [Kleinschnitz *et al.* 1996].

CE Capillary: fused silica (72 cm × 50 µm i.d.). Buffer: 60 mmol/L SDS–6 mmol/L phosphate borate (pH 8.5) : methanol (85 : 15). UV detection (λ = 220 nm). Limit of detection, 0.1–0.2 mg/L for nitrazepam and its metabolites [Tomita *et al.* 1993].

CE-MS Running buffer: methanol : water (50 : 50) containing 0.1% formic acid, flow rate 0.5 mL/min. ESI, TOF. Limit of quantification, 12.5 μg/L, limit of detection, 1.2 μg/L [Blas, McCord 2008].

Oral Fluid **LC-MS** Zorbax Eclipse XDB C_{18} (50 × 4.6 mm i.d., 1.8 μm). Mobile phase: 20 mmol/L ammonium formate : acetonitrile (50 : 50), flow rate 0.2 mL/min. ESI, MRM acquisition mode. Limit of quantification, 0.5 μg/L [Moore *et al.* 2007].

Hair **LC-MS** Mobile phase: 3 mmol/L ammonium formate and 0.001% formic acid in water : acetonitrile (65 : 35 to 20 : 80 after 13 min to 10 : 90 at 13.5 min until 16.5 min to 65 : 35 until 20 min), flow rate 0.3 mL/min. ESI, positive ion mode. Limit of quantification, 0.05 ng/30 mg, limit of detection, 0.03 ng/30 mg [Miller *et al.* 2006].

Disposition in the Body Nitrazepam is readily absorbed after oral administration. It crosses the blood–brain barrier and the placenta and is found in breast milk. The major metabolites, 7-aminonitrazepam and the 7-acetamido derivative, accumulate to some extent in plasma. Other metabolites include 2-amino-5-nitrobenzophenone and 2-amino-3-hydroxy-5-nitrobenzophenone; all the metabolites are inactive. After oral administration, ~50–70% of a dose is excreted in the urine in 120 h and up to 20% is eliminated in the faeces. Up to ~37% of a dose may be excreted in the first 24 h, with ~5–10% of the dose as free 7-acetamidonitrazepam, 5% as 7-aminonitrazepam, 5% as conjugated 2-amino-3-hydroxy-5-nitrobenzophenone, and 20% as unknown acidic compounds. Approximately 20% of an oral dose is found in the faeces. After IV administration, ~90% is excreted in the urine in 120 h and up to ~10% is eliminated in the faeces. Only a small amount (<4%) is excreted as unchanged nitrazepam after oral or IV administration.

Therapeutic Concentration In plasma, usually in the range 0.03–0.07 mg/L.

Following daily oral doses of 5 mg to 4 subjects, steady-state plasma nitrazepam concentrations of 0.035–0.044 mg/L (mean, 0.04) were reported; combined steady-state concentrations of the 7-amino and 7-acetamido metabolites were in the range 0.018–0.053 mg/L (mean, 0.03) [Rieder, Wendt 1973].

Following a single oral dose of 5 mg to 9 subjects, peak plasma concentrations of 0.028–0.045 mg/L (mean, 0.04) were attained in 0.5–4 h [Breimer *et al.* 1977].

Following single oral doses of 5 mg to 12 healthy subjects, peak concentrations in serum and oral fluid were 40.7 and 1.9 μg/L, respectively, at ~2.5 h [Kangas *et al.* 1979].

Toxicity Blood concentrations greater than 0.2 mg/L may produce toxic effects.

In 2 deaths caused by overdose of nitrazepam, postmortem urine concentrations of 5.9 and 6.0 mg/L were reported; in the first case alcohol was also present at a blood concentration of 2100 mg/L [Oliver, Smith 1974].

In a death caused by ingestion of up to 250 mg nitrazepam, postmortem blood and liver concentrations of 9 mg/L and 4 μg/g, respectively, were reported [Loveland 1974].

The following postmortem tissue concentrations of nitrazepam and 7-aminonitrazepam, respectively, were reported in a 52-year-old woman who died from drowning and cold exposure following nitrazepam overdose: aorta blood 0.741 and 0.498 mg/L, femoral vein blood 0.450 and 1.56 mg/L, CSF 0.074 and 0.098 mg/L, vitreous humour 0.099 and 0.032 mg/L, pericardial fluid 0.188 and 0.780 mg/L, bile 4.08 and 1.67 mg/L, urine 0.580 and 1.09 mg/L, cerebral cortex 3.49 and 2.55 μg/g, diencephalons 6.22 and 2.49 μg/g, cerebellum 2.17 and 5.11 μg/g, myocardium 2.77 and 0.816 μg/g, left lung 0.656 and 0.717 μg/g, right lung 1.27 and 1.01 μg/g, spleen 0.458 and 0.329 μg/g, liver 0.059 and 0.113 μg/g, kidney 0.077 and 1.21 μg/g, femoral muscle 2.12 and 1.04 μg/g, stomach contents (total amount) 201 and 20.9 mg [Moriya, Hashimoto 2003].

For other reports of nitrazepam overdose fatalities, see Brodsgaard *et al.* [1995] and Giusti, Chiarotti [1979]. For a report of post-mortem distribution and redistribution of nitrazepam and other benzodiazepines, see Robertson, Drummer [1998].

Half-life Plasma half-life, 18–38 h (mean, 28).

Volume of Distribution Approximately 2–3 L/kg, increased in elderly subjects.

Clearance Plasma clearance, ~1 mL/min/kg.

Protein Binding ~85–88%.

Note For a review of the pharmacokinetics of nitrazepam see Kangas, Breimer [1981].

Nitrendipine

Calcium Antagonist, Calcium Channel Blocker

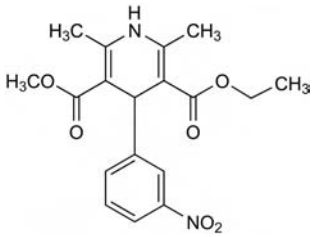
$C_{18}H_{20}N_2O_6 = 360.4$

CAS—39562-70-4

IUPAC Name 5-*O*-Ethyl 3-*O*-methyl 2,6-dimethyl-4-(3-nitrophenyl)-1,4-dihydropyridine-3,5-dicarboxylate

Synonyms Bay-e-5009; 1,4-dihydro-2,6-dimethyl-4-(3-nitrophenyl)-3,5-pyridinedicarboxylic ethyl methyl ester; nitrendipinum.

Proprietary Names *Bayotensin*; *Baypresol*; *Baypress*; *Bylotensin*; *Deiten*; *Gericin*; *Monopress*; *Nidrel*; *Niprina*; *Nitrendepat*; *Nitrepress*; *Subtension*; *Tensogradal*; *Trendinol*; *Vastensium*.



Chemical Properties A yellow crystalline powder. Mp 158°. Practically insoluble in water; sparingly soluble in absolute alcohol and methanol; freely soluble in ethyl acetate. Log *P* (octanol/water), 2.88. Exposure to light leads to formation of nitrophenylpyridine derivatives.

Thin-layer Chromatography System TB—R_f 0.02; system TE—R_f 0.80; system TAE—R_f 0.87.

Plate: silica gel 60 F_{254} (10 × 10 cm, 5 µm). Mobile phase: ethyl acetate : chloroform (1:9). UV detection (λ= 254 nm). R_f 0.68 [Tipre, Vavia 2001].

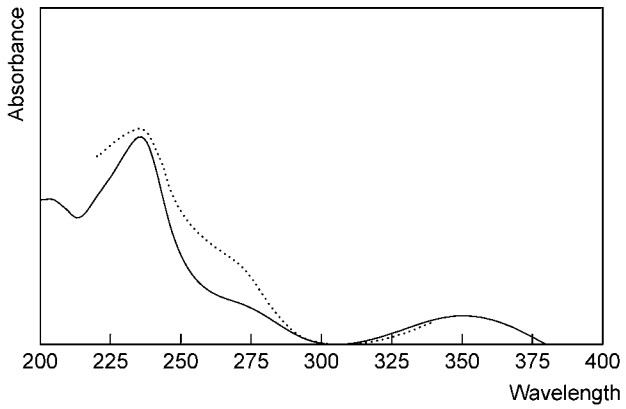
Gas Chromatography System GA—nitrendipine RI 2635, M (dehydro-desethyl-)–CO_2 RI 2275, M (dehydro-desmethyl-)–CO_2 RI 2330, M (dehydro-desethyl-OH-)–H_2O RI 2650, M (dehydro-desethyl-OH-)–H_2O RI 2690; system GP—M (dehydro-desethyl-)-Me RI 2300, M (dehydro-) RI 2370.

Column: DB1 fused-silica (40 m × 0.25 mm i.d., 0.25 mm). Temperature: 250°. Carrier gas: H_2, 32 cm/s. IS: amlodipine. Detection: ^{63}Ni ECD. Retention time: nitrendipine, 6.7 min; IS, 9.9 min [Monkman *et al.* 1996].

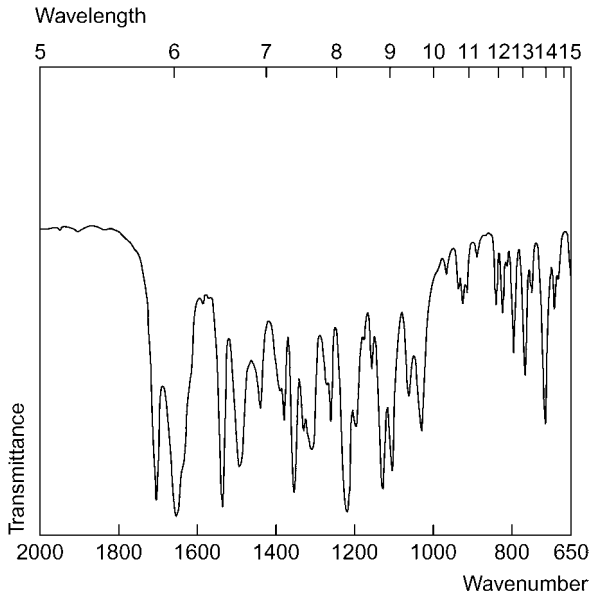
High Performance Liquid Chromatography System HX—RI 625; system HY—RI 554; system HAA—retention time 22.1 min.

Column: Lichrocart (125 × 4.0 mm i.d., 5 µm). Mobile phase: methanol : water : acetonitrile (45 : 45 : 10), flow rate 1.2 mL/min. UV detection (λ= 235 nm). Retention time: 5.94 min [Tipre, Vavia 2001].

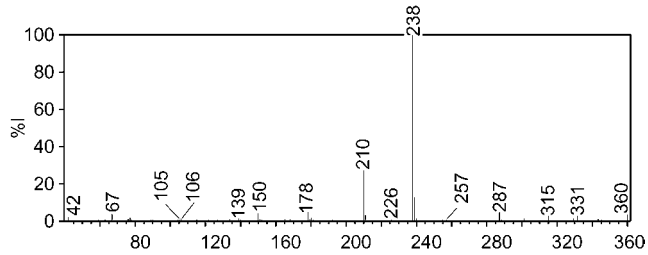
Ultraviolet Spectrum Aqueous acid—236, 203, 350 nm.



Infrared Spectrum Principal peaks at wavenumber 1640, 1203 and 896 cm^{-1} (KBr pellet).



Mass Spectrum Principal ions at *m/z* 238, 210, 239, 287, 150, 360, 178, 67.



Quantification

Blood **HPLC** UV detection. Limit of detection, 1 µg/L [Janis *et al.* 1983].

Plasma **GC-MS** Limit of quantification, <0.5 µg/L [Beck, Ryman 1985].

HPLC Column: ODS Jasco (250 × 4.0 mm i.d., 5 µm). Mobile phase: acetonitrile : 10 mmol/L potassium dihydrogen phosphate (pH 4.5), flow rate 1.5 mL/min. IS: felodipine. UV detection (λ= 250 nm). Retention time: nitrendipine, 6.93 min; IS, 12.20 min. Limit of detection, 15 µg/L [Patel *et al.* 1998].

Serum **GC-MS** Column: SE-52 fused silica capillary (25 m × 0.32 mm i.d., 0.26 µm). Temperature programme: 110° for 1 min to 320° at 30°/min. Carrier gas: CH_4. NICI, SIM at *m/z*: 360. Retention time: 6.7 min. Limit of quantification, 0.1 µg/L [Fischer *et al.* 1993].

Disposition in the Body Nitrendipine is well absorbed following oral administration and undergoes extensive first pass metabolism in the liver to inactive metabolites. Major routes of metabolism are dehydrogenation to the pyridine analogue, cleavage of ester groups by hydrolysis to carboxylic acids and hydroxylation of methyl groups with subsequent glucuronide conjugation in the bile. All 5 known metabolites are 1000 times less potent than the parent drug; hence the dihydropyridine ring is thought to be essential for activity. It is excreted as inactive polar metabolites, mainly in urine (80%) and a small amount in faeces (8%). <0.1% of an oral dose appears as unchanged drug in the urine.

Therapeutic Concentration

Twenty male and female patients with chronic renal failure and elevated diastolic blood pressure were involved in this study. Ten of the patients required maintenance haemodialysis, mean age of 63.7 years, and the other 10 were at the pre-dialysis stage, mean age of 55.6 years. All were administered with an oral dose of 5 mg nitrendipine as a solution. The peak plasma concentration for the patients undergoing dialysis was 17.3 (9.0–33.0) µg/L observed at 0.5 (0.25–3.0) h and for the non-dialysis patients, 12.4 (6.9–22.2) µg/L at 0.5 (0.25–2.5) h [Kierdorf *et al.* 1993].

Seven elderly hypertensive patients with chronic renal failure, mean age of 72 years (range, 56–87 years) and 6 control subjects with hypertension but normal renal function, mean age of 67 years (range, 48–85 years) were involved in the study. They were all administered with 20 mg nitrendipine, before breakfast, once daily for 7 days. For the patients, peak concentrations for the racemate drug were 39.1 (18.4–64.1) µg/L; for (*S*)-nitrendipine, 26.3 (12.5–40.4) µg/L; and for (*R*)-nitrendipine, 12.8 (5.9–23.7) µg/L. All were observed at 1.9 (0.5–3.0) h. In the control subjects, concentrations were 25.6 (10.9–36.4) µg/L, 16.7 (7.3–22.9) µg/L and 9.0 (3.6–13.5) µg/L for the racemate, (*S*)-nitrendipine and (*R*)-nitrendipine, respectively. Again all concentrations were observed at 1.7 (1.0–2.0) h [Soons *et al.* 1992].

Toxicity There is a potential for seizures precipitously following acute ingestion of large doses.

Bioavailability 10–23%. Depends partly on dosage form. Bioavailability of tablet relative to solution is ~75%.

Half-life 10–22 h.

Volume of Distribution 4–8 L/kg.

Clearance The total oral clearance from plasma is 81–87 L/h.

Protein Binding 98%.

Note For a general review of nitrendipine, see Goa and Sorkin [1987].

Dose 20 mg daily with a maximum of 40 mg.

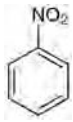
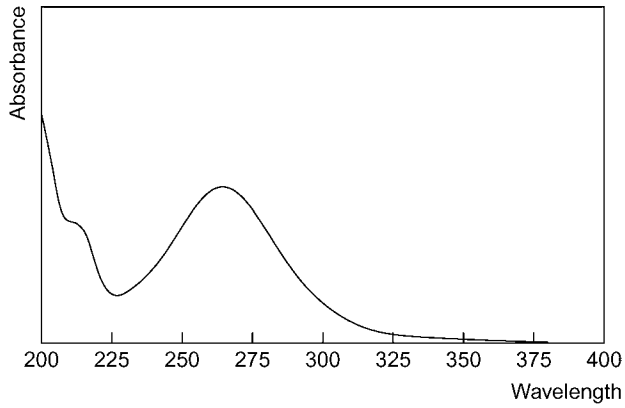
Nitrobenzene

Solvent
$C_6H_5NO_2$ = 123.1
CAS—98-95-3

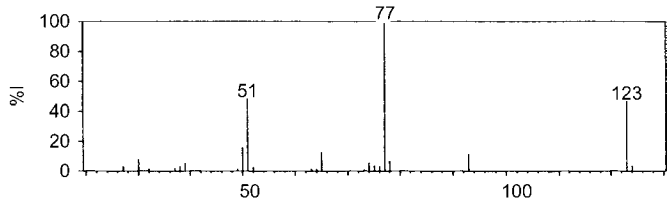
Synonyms Nitrobenzol; oil of Mirbane.



Chemical Properties A pale yellow, oily liquid. Mass per mL about 1.203 g. Bp 210° to 212°. Practically insoluble in water; freely soluble in alcohol, benzene, ether and oils. Log *P* (octanol/water), 1.8.
Ultraviolet Spectrum Ethanol—258 nm (A_1^1=697b).



Mass Spectrum Principal ions at *m/z* 77, 51, 123, 50, 65, 93, 30, 78.



Quantification

Urine **GC-MS** For method of quantification for nitrobenzene and other nitroaromatic compounds, see Bader *et al.* [1998].

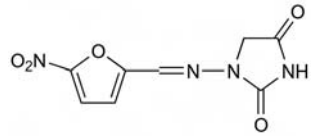
Nitrofurantoin

Antibacterial (Urinary)
$C_8H_6N_4O_5$ = 238.2
CAS—67-20-9 (anhydrous); 17140-81-7 (monohydrate)

IUPAC Name 1-[[(5-Nitro-2-furanyl)methylene]amino]-2,4-imidazolidinedione
Synonym Furadonium
Proprietary Names *Berkfurin*; *Cyantin*; *Furadantin(e)*; *Furadöine*; *Furan*; *Furatine*; *Ituran*; *Macrodantin*; *Nephronex*; *Nifuran*; *Nitrex*; *Novofuran*; *Trantoin*; *Urantoin*; *Urolong*. It is an ingredient of *Ceduran*.



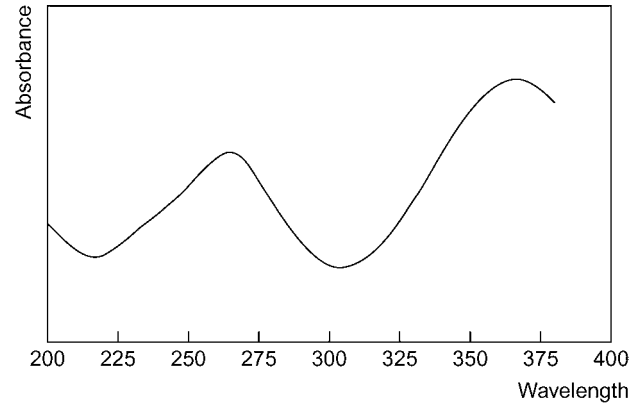
Chemical Properties Yellow crystals or fine powder. Discoloured by alkalis and by exposure to light. Mp about 271°. Soluble 1 in 5000 of water, 1 in 2000 of ethanol, 1 in 200 of acetone and 1 in 16 of dimethylformamide. pK_a 7.2 (25°). Log *P* (octanol/water), −0.5.

Nitrofurantoin Sodium

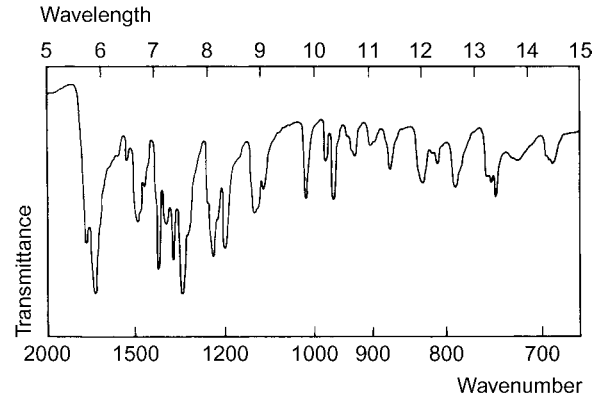
$C_8H_5N_4NaO_5$ = 260.1
CAS-54-87-5

Proprietary Name *Ivadantin*
Chemical Properties A yellow-orange coloured powder.

Colour Test Methanolic potassium hydroxide—yellow-orange.
Thin-layer Chromatography System TB—R_f 0.00; system TD—R_f 0.02; system TE—R_f 0.06; system TF—R_f 0.30; system TAD—R_f 0.33; system TAE—R_f 0.84; system TAJ—R_f 0.46; system TAK—R_f 0.09; system TAK—R_f 0.72.
High Performance Liquid Chromatography System HX—RI 319; system HY—RI 288; system HZ—retention time 2.4 min.
Ultraviolet Spectrum After solution in dimethylformamide and dilution with water—266, 367 nm (A_1^1=765a).



Infrared Spectrum Principal peaks at wavenumbers 1718, 1237, 1205, 1770, 1513, 1126 cm^{-1} (KBr disk).



Quantification

Plasma **HPLC** UV detection. Limit of detection, 0.01 mg/L [Muth *et al.* 1996]. UV detection. Limit of detection, 4 mg/L for aminofurantoin and cyanofurantoin [Hoener, Wolff 1980]. UV detection. Limit of detection, 20 µg/L [Vree *et al.* 1979].

Spectrofluorimetry For method, see Watari *et al.* [1980].

Urine **HPLC** UV detection. Limit of detection 0.38 mg/L. [Muth *et al.* 1996]. UV detection. For method of quantification for aminofurantoin and cyanofurantoin, see Hoener and Wolff [1980]. See Plasma [Vree *et al.* 1979].

Spectrofluorimetry See Plasma [Watari *et al.* 1980].

Disposition in the Body Nitrofurantoin is readily and almost completely absorbed after oral administration. About 40% of a dose is excreted in the urine unchanged in 24 h together with small amounts of the reduced metabolite, aminofurantoin.

Therapeutic Concentration

Following a single oral dose of 50 mg to 6 fasting subjects, peak plasma concentrations of 0.29 to 0.66 (mean, 0.43) mg/L were attained in 1 to 4 h [Hoener, Patterson 1981].

Half-life Plasma half-life, about 0.5 to 1 h.
Volume of Distribution About 0.6 L/kg.
Clearance Plasma clearance, about 10 mL/min/kg.
Distribution in Blood Plasma : whole blood ratio, 1.3.
Protein Binding About 60%.
Dose Usually 400 mg daily.

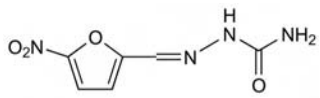
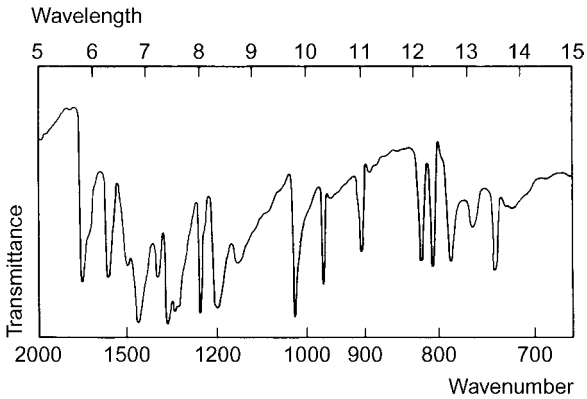
Nitrofurazone

Antibacterial
$C_6H_6N_4O_4$ = 198.1
CAS—59-87-0

IUPAC Name 2-[(5-Nitro-2-furanyl)methylene]hydrazinecarboxamide
Synonyms Furacilinum; nitrofural.
Proprietary Name *Furacin(e)*



Chemical Properties A lemon to brownish-yellow crystalline powder which slowly darkens on exposure to light and discolours in contact with alkalis. Mp 236° to 240°, with decomposition. Soluble 1 in 4200 of water, 1 in 590 of ethanol, 1 in 350 of propylene glycol; soluble in dimethylformamide; soluble in alkaline solutions; practically insoluble in chloroform and ether. pK_a 10.0. Log *P* (octanol/water), 0.2.
Colour Test Methanolic potassium hydroxide—red.
Thin-layer Chromatography System TB—R_f 0.00; system TE—R_f 0.41; system TF—R_f 0.11; system TAE—R_f 0.78; system TAJ—R_f 0.34; system TAK—R_f 0.36; system TAL—R_f 0.83.
High Performance Liquid Chromatography System HX—RI 316.
Ultraviolet Spectrum Aqueous acid—261 nm (A^1_1=610b); aqueous alkali—284 nm (A^1_1=475b).
Infrared Spectrum Principal peaks at wavenumbers 1023, 1250, 1200, 970, 1718, 1585 cm^{-1} (Nujol mull).

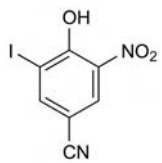


Uses Topically in a concentration of 0.2%; doses of 0.4 to 2 g daily have been given orally.

Nitroxinil

Anthelmintic (Veterinary)
$C_7H_3IN_2O_3$ = 290.0
CAS—1689-89-0

IUPAC Name 4-Hydroxy-3-iodo-5-nitrobenzonitrile
Synonym Nitroxynil

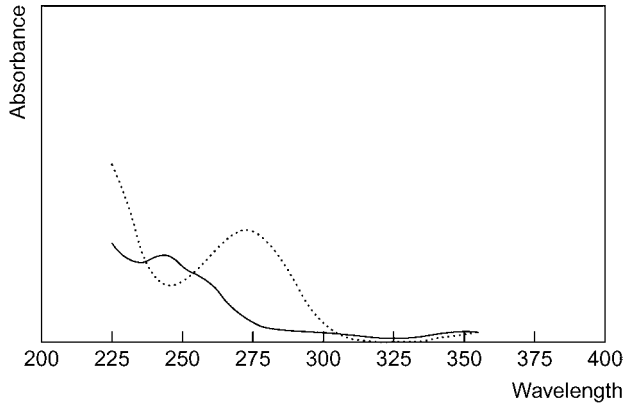


Chemical Properties A yellow powder. Mp 136° to 139°. Sparingly soluble in water; soluble 1 in 120 of ethanol and 1 in 60 of ether; soluble in solutions of alkali hydroxides. Log *P* (octanol/water), 3.2.

Nitroxinil Eglumine Salt

$C_7H_3IN_2O_3$, $C_8H_{19}NO_5$ = 499.3
CAS—27917-82-4
Proprietary Name *Trodax*
Chemical Properties Readily soluble in water.

Colour Tests Iodine test—positive; methanolic potassium hydroxide—yellow.
Thin-layer Chromatography System TA—R_f 0.83 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1754.
Ultraviolet Spectrum Aqueous acid—243, 350 nm; aqueous alkali—271 nm (A^1_1=660a).

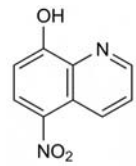


Infrared Spectrum Principal peaks at wavenumbers 1529, 1245, 1123, 730, 1309, 1600 cm^{-1} (KBr disk).

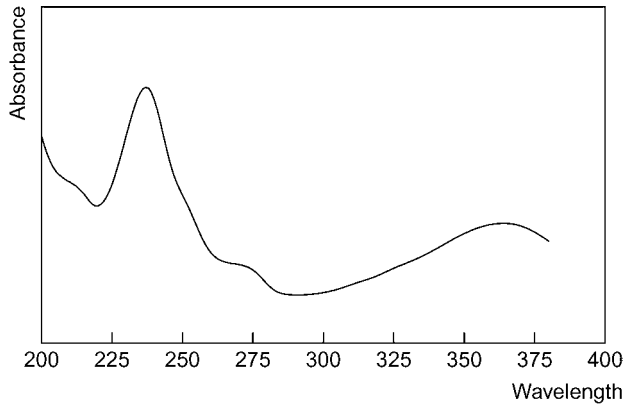
Nitroxoline

Antibacterial (Urinary)
$C_9H_6N_2O_3$ = 190.2
CAS—4008-48-4

IUPAC Name 5-Nitro-8-quinolinol
Proprietary Names *Nibiol*; *Uro-Coli.*



Chemical Properties A yellow crystalline powder. Mp 179° to 182°. Sparingly soluble in ethanol and ether; freely soluble in alkalis and hot hydrochloric acid. Log *P* (octanol/water), 2.0.
Colour Tests Mandelin's test—green; methanolic potassium hydroxide—yellow.
Thin-layer Chromatography System TA—R_f 0.13, streaking (visible yellow spot; acidified iodoplatinate solution, positive).
Ultraviolet Spectrum Aqueous acid—249 (A^1_1=1914a), 293 nm.



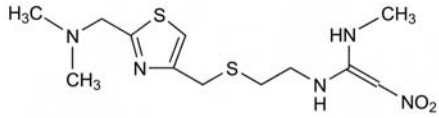
Infrared Spectrum Principal peaks at wavenumbers 1504, 1277, 1307, 1189, 1149, 1565 cm^{-1} (KBr disk).
Quantification
Plasma **HPLC** Absorbance detection (λ=436 nm). For method, see Sorel *et al.* [1981].
Urine **HPLC** See Plasma [Sorel *et al.* 1981].
Disposition in the Body Nitroxoline is readily and almost completely absorbed after oral administration. About 60% of a dose is excreted in the urine in 24 h, mainly as conjugated nitroxoline.
Dose 300 to 500 mg daily.

Sorel RH *et al.* (1981). High-performance liquid chromatographic analysis of nitroxoline in plasma and urine. *J Chromatogr* 222: 241–248.

Nizatidine

Histamine H_2-Receptor Antagonist, Ulcer-Healing Drug
$C_{12}H_{21}N_5O_2S_2 = 331.5$
CAS—76963-41-2

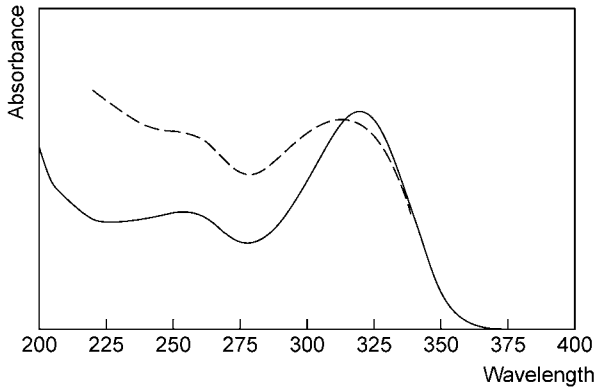
IUPAC Name *N*-[2-[[[2-[(Dimethylamino)methyl]-4-thiazolyl]methyl]thio]ethyl]-*N′*-methyl-2-nitro-1,1-ethenediamine
Synonyms LY-139037; ZE-101; ZL-101.
Proprietary Names *Antizid*; *Axid*; *Calmaxid*; *Cronizat*; *Distaxid*; *Gastrax*; *Naxidine*; *Nizax*; *Nizaxid*; *Panaxid*; *Tazac*; *Ulcosal*; *Ulxit*; *Zanizal*; *Zinga*.



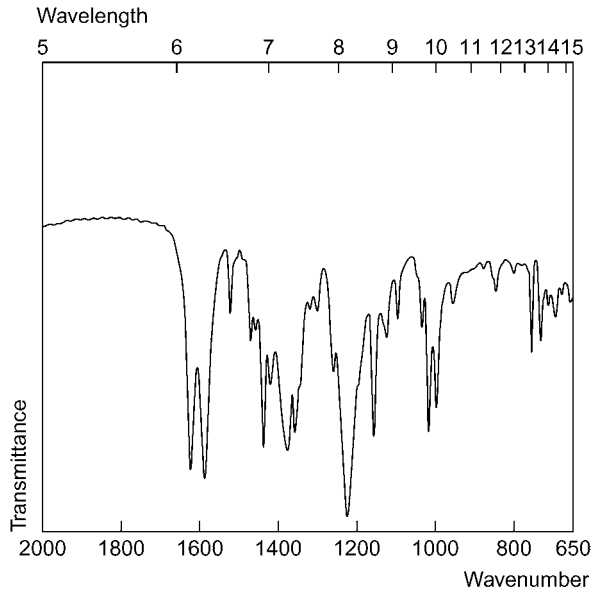
Chemical Properties A white to off-white crystalline solid. Mp 130° to 132°. Freely soluble in chloroform; soluble in methanol; sparingly soluble in water and buffered solutions; slightly soluble in ethyl acetate and isopropane; essentially insoluble in benzene, diethyl ether and octanol. pK_a 2.1, 6.8 (in aqueous media); 6.3, 8.4 (dimethylformamide). Log *P* (octanol/water), −0.43.
Thin-layer Chromatography System TB—R_f 0.00; system TE—R_f 0.28; system TAE—R_f 0.45.
High Performance Liquid Chromatography System HY—RI 178; system HAA—retention time 3.3 min; system HAX—RT 5.6 min; system HAY—RT 3.1 min.

Column: ODS-2 Inertsil (150 × 4.6 mm i.d., 5 µm). Mobile phase: 0.04 mol/L sodium dihydrogen phosphate : acetonitrile : methanol : triethylamine (345 : 20 : 35 : 0.7), flow rate 1 mL/min. IS: procaine hydrochloride. UV detection (λ=230 nm). Retention time: nizatidine, 18.6 min; IS, 10.7 min [Ho *et al.* 1999].

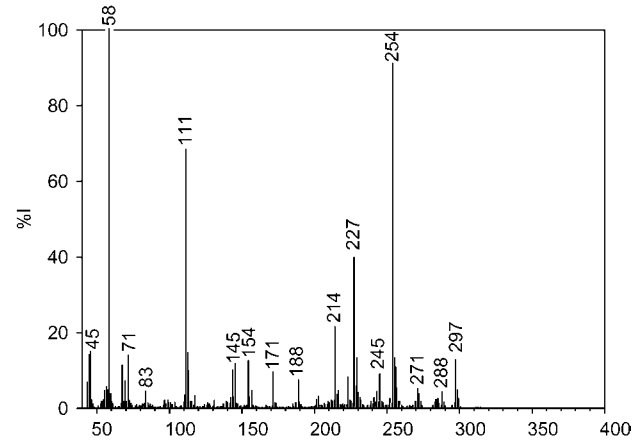
Column: Si-60 Lichrosorb (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol : water : 25% ammonia solution (1000 : 200 : 20 : 5), flow rate 2.0 mL/min. IS: ranitidine. UV detection (λ=320 nm). Retention time: nizatidine, 2.7 min; *N*-desmethylnizatidine, 4.2 min; nizatidine sulfoxide, 6.2 min; IS, 5.1 min [Tracqui *et al.* 1990].
Ultraviolet Spectrum Aqueous acid (0.2 mol/L H_2SO_4)—319, 254 nm; methanol—240, 325 nm; basic—313 nm; water—260, 314 nm.



Infrared Spectrum Principal peaks at wavenumber 1227, 1436, 1586 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 58, 254, 111, 227, 214, 45, 44, 71.



Quantification
***Plasma* HPLC** UV detection (λ=313 nm). Limit of detection, 0.01 mg/L [Knadler *et al.* 1986].
***Urine* HPLC** See Plasma [Knadler *et al.* 1986].
***Saliva* HPLC** See Plasma [Knadler *et al.* 1986].
Disposition in the Body Nizatidine is readily and almost completely absorbed after oral administration, and peak plasma concentrations are reached within 1 to 3 h. Absorption is increased by the presence of food and decreased by 10% in the presence of antacids such as aluminium hydroxide gel and magnesium silicate. It is partially metabolised by the liver, but does not inhibit the hepatic mixed function oxidase system. Three metabolites have been identified, nizatidine *N*-2-oxide, nizatidine *S*-oxide and *N*-2-monodesmethylnizatidine (60% activity of nizatidine). Nizatidine is widely distributed throughout the body and has been detected in breast milk (0.1% of the administered dose). 90% of an administered dose is excreted in urine, partly by active tubular secretion, with 60% as the unchanged drug. <6% of a dose is excreted in faeces.
Therapeutic Concentration The serum therapeutic concentration is 0.15 to 1.0 mg/L.

Five lactating and 5 non-lactating women, aged between 19 and 34 years, were administered with a single dose of 150 mg nizatidine and 150 mg every 12 h for a total of 5 doses (multiple dosing study). The mean peak plasma concentrations were 1.455 mg/L for the lactating women and 1.46 mg/L for the non-lactating women after the single dose. Both concentrations were reached at about 1.5 h. The multiple doses produced peak levels of 1.59 and 1.16 mg/L for the lactating and non-lactating women, respectively in 1.8 and 1.3 h [Obermeyer *et al.* 1990].

Toxicity Little experience with human overdosing.
Bioavailability >70%.
Half-life 1.3 to 1.6 h (prolonged in renal impairment).
Volume of Distribution Approximately 1.2 to 1.6 L/kg (single 150 mg dose); 1.1 to 1.9 L/kg (multiple doses).
Clearance Serum, 37.5 to 41.4 L/h (single 150 mg dose); 39.1 to 44.6 L/h (multiple doses). Plasma, 40 to 51 L/h.
Protein Binding 35%.
Distribution in Blood Plasma : blood cell ratio is 3 : 1.
Dose Orally: the usual daily dose is 150 to 600 mg. The total IV daily dose should not exceed 480 mg. Patients with renal impairment: 150 mg once or twice daily, or alternate days (creatinine clearance 20 to 50 mL/min) and 150 mg daily, alternate days or every third day (creatinine clearance <20 mL/min).

Ho C *et al.* (1999). Simultaneous high-performance liquid chromatographic analysis for famotidine, ranitidine HCl, cimetidine, and nizatidine in commercial products. *Drug Dev Ind Pharm* 25: 379–385.

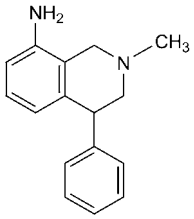
Obermeyer BD *et al.* (1990). Secretion of nizatidine into human breast milk after single and multiple doses. *Clin Pharmacol Ther* 47: 724–730.
Tracqui A *et al.* (1990). Determination of nizatidine and two of its main metabolites in human serum using high-performance liquid chromatography. *J Chromatogr* 529: 369–376.

Nomifensine

Antidepressant
$C_{16}H_{18}N_2 = 238.3$
CAS—24526-64-5

IUPAC Name 2-Methyl-4-phenyl-3,4-dihydro-1*H*-isoquinolin-8-amine
Synonym 1,2,3,4-Tetrahydro-2-methyl-4-phenyl-8-isoquinolinamine



Chemical Properties Mp 179° to 181°. Log *P* (octanol/water), 2.4. Derivatised samples are stable for 60 days at 4° [Vereczkey *et al.* 1976].

Nomifensine Maleate

$C_{16}H_{18}N_2$, $C_4H_4O_4$ = 354.4
CAS—32795-47-4

Proprietary Names *Alival*; *Merital*; *Psicronizer*.

Chemical Properties A white or slightly yellowish powder. Mp ≈195°. Soluble in dimethylformamide and methanol.

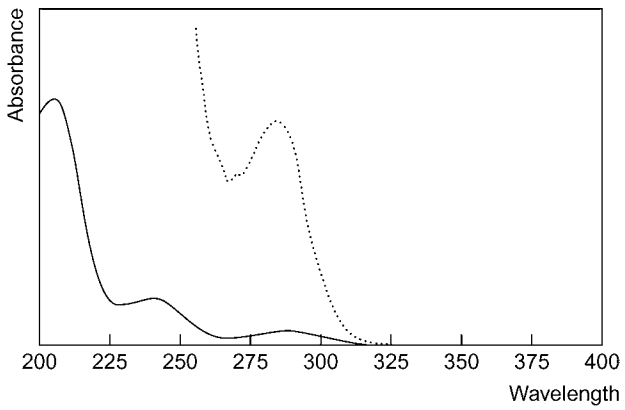
Colour Tests Coniferyl alcohol—yellow; diazotisation—red; Liebermann's reagent—orange; Marquis test—orange (slow).

Thin-layer Chromatography System TA—R_f 0.56; system TB—R_f 0.09; system TC—R_f 0.29; system TE—R_f 0.64; system TAE—R_f 0.53; system TAF—R_f 0.52; system TAG—R_f 0.31.

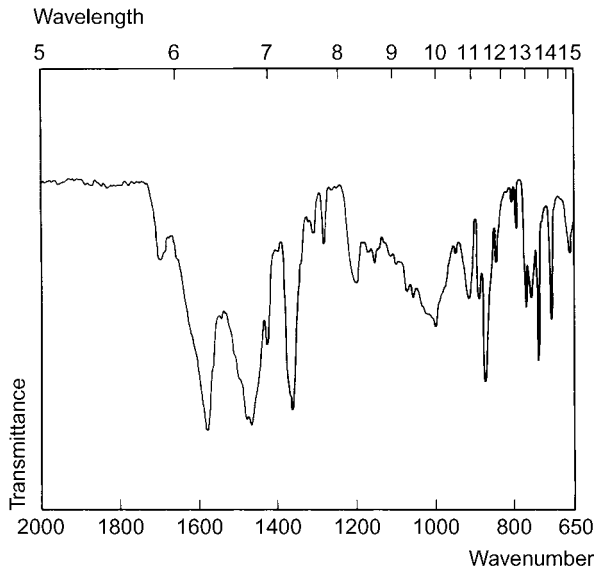
Gas Chromatography System GA—nomifensine RI 2130, M (OH-) RI 2450, M-isomer 1 RI 2505, M-isomer 2 RI 2590; system GB—RI 2239; system GF—RI 2670; system GM—RRT 0.850.

High Performance Liquid Chromatography System HA—*k* 0.9; system HF—*k* 0.42; system HX—RI 349; system HY—RI 296.

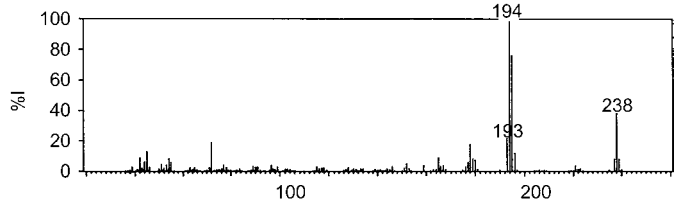
Ultraviolet Spectrum Aqueous alkali—284 nm (A^1_1 = 75b); methanol—241 (A^1_1 = 461b), 292 nm (A^1_1 = 124a).



Infrared Spectrum Principal peaks at wavenumbers: 1580, 877, 741, 1000, 708, 775 cm^{-1} (nomifensine maleate).



Mass Spectrum Principal ions at *m/z* 194, 195, 238, 193, 72, 178, 45, 196.



Quantification

Plasma **GC** Column: 3% OV-17 on 80/100 mesh HP Chrom WAW-DMCS (2 m × 2 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature programme: 180° to 265° at 3°/min. FID. Retention time: 12.25 min. Limit of quantification, 1 µg/L [Quaglio, Bellini 1984]. Column: 3% OV-101 on Chromosorb WHP 100/120 mesh (1.2 m × 2 mm i.d.). Carrier gas: He or N_2, 30 mL/min. Temperature: 215°. NPD. Limit of detection, 5 µg/L [McIntyre *et al.* 1981]. Column: OV-101 (50 m × 0.25 mm i.d.). Carrier gas: He, 2 mL/min. Temperature: 200°. Limit of detection, 2 µg/L [Bailey *et al.* 1977]. Column: 3% OV-25 on Chromosorb W-HP. Carrier gas: He, 30 mL/min. Temperature: 250°. NSD. Retention time: ~3 min. Limit of detection, 10 µg/L [Chamberlain, Hill 1977]. Column: 3% OV-17 100/120 mesh Chromosorb Q (2 m × 0.46 mm i.d.). Carrier gas: N_2, 40 mL/min. Temperature: 245°. ECD. Limit of detection, 1 µg/L [Vereczkey *et al.* 1976].

HPLC Column: µBondapak C_{18} (300 × 3.9 mm i.d., 10 µm). Mobile phase: 0.01 mol/L potassium phosphate buffer (pH 2.25) : methanol : dioxane (86.5 : 6.5 : 7), flow rate 2.2 mL/min. UV detection (λ = 210 nm). Limit of detection, 0.007 µmol/L for metabolites of nomifensine [Lindberg 1985].

Note For a radioimmunoassay method, see McIntyre *et al.* [1981].

Serum **GC** Column: 3% OV-17 on 80/100 mesh Chromosorb W HP (2 m × 2 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature: 250°. ECD. Retention time: 2.10 min. Limit of detection, 8 nmol/L [Lindberg *et al.* 1983].

HPLC Column: µBondapak C_{18} (300 × 3.9 mm i.d., 10 µm). Mobile phase: 0.05 mol/L potassium phosphate buffer (pH 3.5) : acetonitrile (74 : 26), flow rate 1.6 mL/min. UV detection (λ = 205 nm). Retention time: 4.15 min. *k'*: 2.0. Limit of detection, 8 nmol/L. [Lindberg *et al.* 1983].

Disposition in the Body Readily absorbed after oral administration. More than 99% of the dose is excreted within 48 h, ~96% is in urine and ~3% in faeces. Of the material excreted in the urine, ~60% is the glucuronide conjugate of nomifensine; the metabolites found in urine include 4′-hydroxynomifensine, which is active, 4′-hydroxy-3′-methoxynomifensine, and 3′-hydroxy-4′-methoxynomifensine, each of which accounts for ~7% of the dose. A further 4 metabolites, accounting for <1% of the dose, have also been identified and the remaining material is present as unidentified stable conjugates. After a single dose, <5% is usually excreted as unchanged drug. The proportion of free nomifensine found in the urine is dependent on the urinary pH, the time and temperature of storage of the sample, and the extraction procedure, because the glucuronide is readily hydrolysed if the pH is below 7.1 and the sample is not frozen.

Therapeutic Concentration A relationship between plasma concentration and clinical effect has not been established. Nomifensine is present in plasma mainly as the glucuronide conjugate; when both free and conjugated nomifensine concentrations are required to be measured, plasma samples must be deep-frozen immediately after collection to prevent hydrolysis. Steady-state concentrations are usually achieved within 5 days.

Five men (aged 23 to 41 years) and 1 woman (28 years old) were administered 100 mg nomifensine as a single dose or an IV infuson. Following the oral dose, a peak plasma concentration of 0.18 µmol/L was reached after 1.13 h. The peak concentration following the IV infusion was 1.21 µmol/L [Lindberg, Syvalahti 1986; Lindberg *et al.* 1986]

Following a single oral dose of 100 mg to 6 male subjects, peak plasma concentrations of 0.09–0.18 mg/L (mean 0.13) free nomifensine and 2.65–3.68 mg/L (mean 3.1) total nomifensine were attained in 1–2 h; after a single oral dose of 100 mg to 6 female subjects, the corresponding peak plasma concentrations were 0.03–0.05 mg/L (mean 0.04), and 1.95–3.32 mg/L (mean 2.6), for free and total nomifensine, respectively [McIntyre *et al.* 1982].

Following oral administration of 25 mg three times a day to 9 subjects for 6 days, plasma concentrations of 0.005 to 0.017 mg/L (mean 0.011) were reported 6 h after a dose [Bailey *et al.* 1977].

Toxicity Ingestion of 3.5 g has been reported without serious toxic effects.

A 37-year-old man took ~50 tablets, the majority of which were nomifensine. His plasma concentration was 833 µg/L [Horn *et al.* 1986].

In 26 cases of suspected overdose where the estimated mean dose was 1.15 g, there were few serious toxic reactions; of the subjects who had ingested only nomifensine, only one became comatose and all eventually recovered [Dawling *et al.* 1979].

In a fatality involving the ingestion of alcohol and nomifensine, the following postmortem concentrations of nomifensine were reported: blood 17 mg/L, kidney 141 µg/g, liver 32 µg/g, urine 400 mg/L; a blood alcohol concentration of 5000 mg/L was also reported [Reyfer *et al.* 1979].

A 28-year-old woman took 1.5 g nomifensine. Her plasma nomifensine concentration was 2780 µg/L on admission and 1915 µg/L the following morning. She made a complete recovery [Montgomery *et al.* 1978].

Note For cases of dyskinesia of the tongue following nomifensine, see Gibson [1981] and Sandyk [1987]; for acute renal failure following nomifensine overdose,

see Skinner and Ferner [1986] and Prescott *et al.* [1980]. Nomifensine has been associated with hepatitis [Vaz *et al.* 1984].

Half-life Plasma half-life 1.5–4 h; prolonged in severe renal impairment. Half-life approximately 4 h after oral or IV dose; half-life shortens to 2.11 h after dosing for 2 weeks [Lindberg *et al.* 1986]

Volume of Distribution 8.69 L/kg [Lindberg *et al.* 1986].

Protein Binding 60–75%.

Note For a review of nomifensine, see Brogden *et al.* [1979], Kinney [1985] or Pepper [1986].

Dose 75 to 200 mg of nomifensine maleate daily.

Noracymethadol

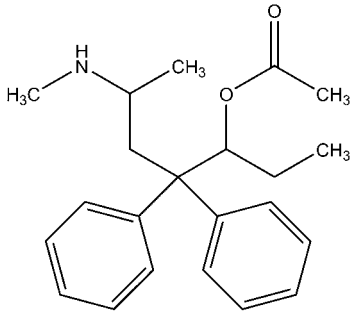
Narcotic Analgesic

$C_{22}H_{29}NO_2$ = 339.5

CAS—1477-39-0

IUPAC Name [6-Methylamino-4,4-di(phenyl)heptan-3-yl] acetate

Synonyms α-*dl*-3-Acetoxy-4,4-diphenyl-6-methylaminoheptane; α-*dl*-3-acetoxy-6-methylamino-4,4-diphenylheptane; ARC I-C-25; α-*dl*-4,4-diphenyl-6-methylamino-3-heptanol acetate; α-ethyl-β-[2-(methylamino)propyl]-β-phenylbenzeneethanol acetate; α-*dl*-6-(methylamino)-4,4-diphenyl-3-heptanol acetate.



Chemical Properties Soluble in dilute acetic acid. Noracymethadol is extracted by organic solvents from aqueous alkaline solutions.

Noracymethadol Hydrochloride

$C_{23}H_{27}NO_5$,HBr = 375.9

CAS—5633-25-0

Synonym NIH-7667

Chemical Properties Crystals from acetone and ether. Mp 216° to 217° [O'Neil *et al.* 2006].

Colour Tests Ammonium molybdate test—dull purple (limit of detection, 0.25 µg); ammonium vandate test—dull purple→grey-green (limit of detection, 0.25 µg); sulfuric acid-formaldehyde test—brown-purple (limit of detection, 0.25 µg); Vitali's test—brown (limit of detection, 0.25 µg).

Thin-layer Chromatography System T10—R_f 0.51 (location reagent acidified iodoplatinate spray, positive reaction).

Ultraviolet Spectrum Aqueous acid (0.1 N sulfuric acid)—253, 258, 269 nm.

Disposition in the Body

Therapeutic Concentration Single oral doses of 2.5 to 30 mg to postpartum patients were 3.25-times as potent as morphine with fewer undesirable effects [Gruber, Bapisti 1963].

Gruber CM,Jr Bapisti AJr (1963). Estimating the acceptability of morphine and noracymethadol in postpartum patients. *Clin Pharmacol Ther* 4: 172–181.

Noradrenaline

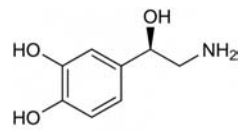
Catecholeamine, Sympathomimetic

$C_8H_{11}NO_3$ = 169.2

CAS—51-41-2

IUPAC Name 4-[(1*R*)-2-Amino-1-hydroxyethyl]-1,2-benzenediol

Synonyms *l*-Arterenol; levarterenol.



Chemical Properties Microcrystals. Mp 216.5° to 218°, with decomposition. Slightly soluble in water, ethanol and ether. pK_{a1} 8.6, pK_{a2} 9.8, pK_{a3} 12.0 (20°). Log *P* (octanol/water), −1.2.

Noradrenaline Acid Tartrate

$C_8H_{11}NO_3$,$C_4H_6O_6$,H_2O = 337.3

CAS—51-40-1 (anhydrous); 69815-49-2 (monohydrate)

Synonyms Norepinephrine tartrate.

Proprietary Names *Levophed*; *Noradrec*.

Chemical Properties A white or faintly grey, crystalline powder which darkens on exposure to air and light. Mp 102° to 104°, with decomposition. Soluble 1 in 2.5 of water and 1 in 300 of ethanol; practically insoluble in chloroform and ether.

Noradrenaline Hydrochloride

$C_8H_{11}NO_3$,HCl = 205.6

CAS—329-56-6

Proprietary Name *Arterenol*

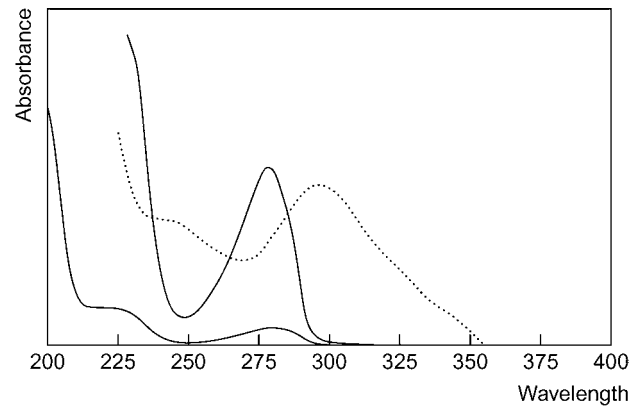
Chemical Properties Crystals. Mp about 145.2° to 146.4°. Freely soluble in water.

Colour Tests Ammoniacal silver nitrate (room temperature)—black; ferric chloride—green; Folin-Ciocalteu reagent—blue; Mandelin's test—orange; Marquis test—brown; methanolic potassium hydroxide—blue→orange; Nessler's reagent—black; potassium dichromate (method 1)—green→brown (30 s).

Thin-layer Chromatography System TA—R_f 0.00; system TB—R_f 0.00; system TC—R_f 0.00; system TE—R_f 0.03; system TL—R_f 0.00; system TC—R_f 0.00; system TAE—R_f 0.43 (acidified potassium permanganate solution, positive).

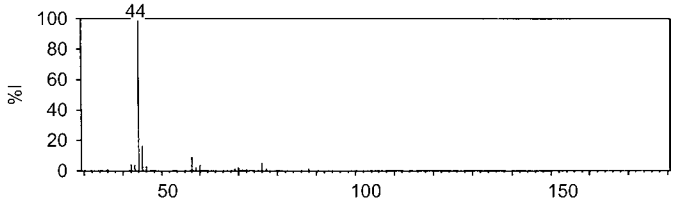
High Performance Liquid Chromatography System HB—*k* 0.10; system HY—RI 21; system HAA—retention time 2.8 min.

Ultraviolet Spectrum Aqueous acid—279 nm (A^{1}_{1}=160a); aqueous alkali—296 nm.



Infrared Spectrum Principal peaks at wavenumbers 1265, 1293, 1216, 1200, 1066, 1137 cm^{-1} (noradrenaline acid tartrate, KBr disk).

Mass Spectrum Principal ions at *m/z* 44, 45, 58, 76, 60, 43, 42, 46 (no peaks above 90); normetanephrine 153, 93, 30, 65, 152, 154, 125, 110.



Quantification

Plasma **GC** FID. For method, see Lovelady and Foster [1975].

HPLC Electrochemical detection. Limit of detection, 0.1 fmol [Forster, Macdonald 1999]. Electrochemical detection. Limit of detection, <10 pg for noradrenaline, adrenaline, dopamine and 3,4-dihydroxyphenylacetic acid [Wang *et al.* 1999].

RIA Limit of detection, 30 ng/L [Hörtnagl *et al.* 1977].

Serum **GC** See Plasma [Lovelady, Foster 1975].

Urine **GC** See Plasma [Lovelady, Foster 1975].

HPLC Electrochemical detection; comparison with GC–MS. For method for quantification of methodnoradrenaline and adrenaline, see Willemsen *et al.* [2001].

LC-MS Noradrenaline and other catecholamines. Limit of detection, 10 µg/L for noradrenaline [Kushnir *et al.* 2002]. Noradrenaline, adrenaline, dopamine and metanephrines. Limit of detection, 5 µg/L for catecholamines and 2.5 µg/L for metanephrines [Chan, Ho 2000].

Erythrocytes **GC** See Plasma [Lovelady, Foster 1975].

Disposition in the Body Noradrenaline is rapidly metabolised before reaching the systemic circulation and is therefore ineffective after oral administration. It is poorly absorbed after SC injection, and is widely distributed throughout the body. The principal metabolic reaction is *O*-methylation catalysed by catechol-*O*-methyltransferase to form normetanephrine; this is followed by oxidative deamination catalysed by monoamine oxidase, to form 4-hydroxy-3-methoxymandelic aldehyde which is converted to 4-hydroxy-3-methoxymandelic acid (vanillylmandelic acid) and to 4-hydroxy-3-methoxyphenyl glycol; the reaction sequence also occurs in reverse, producing 3,4-dihydroxymandelic acid which is methylated to 4-hydroxy-3-methoxymandelic acid; the metabolites are conjugated with glucuronic acid or sulfate or further metabolised. Up to about 16% of an IV dose is excreted unchanged in the urine together with methylated and deaminated metabolites in free and conjugated forms; negligible amounts of endogenous noradrenaline are excreted in the urine in normal subjects.

Noradrenaline is a metabolite of dopamine and levodopa.

Endogenous plasma concentrations are approximately in the range 0.1–0.3 µg/L.

Dose Initially, the equivalent of 8 to 12 µg/min of noradrenaline by IV infusion.

Chan EC, Ho PC (2000). High-performance liquid chromatography/atmospheric pressure chemical ionization mass spectrometric method for the analysis of catecholamines and metanephrines in human urine. *Rapid Commun Mass Spectrom* 14: 1959–1964.

Norandrostenediol

Anabolic Steroid

Synonym 19-Norandrostenediol

Quantification

Plasma **GC-MS** Column: UP Ultra-1 (17 m × 0.2 mm i.d., 0.11 µm). Carrier gas: He, 0.8 mL/min. Temperature programme: 180° to 230° at at 3°/min to 310° at 40°/min for 3 min. EI ionisation at 70 eV, SIM acquisition mode. Retention time: 8.9 min. Limit of quantification, 0.9 µg/L [Torrado *et al.* 2008a]. Column: HP-5 cross-linked methyl silicone (17 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° to 190° at 40°/min to 240° at 5°/min to 320° at 40°/min for 3 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 2.3 µg/L [Schrader *et al.* 2006].

Urine **GC-MS** Column: HP Ultra-1 (17 m × 0.2 mm i.d., 0.11 µm). Carrier gas: He, 0.8 mL/min. Temperature programme: 180° to 230° at 3°/min to 310° at 40°/min for 3 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 0.13 for the free fraction and 0.23 µg/L for the glucuronide fraction [Torrado *et al.* 2008b]. EI ionisation, SIM acquisition mode. Norandrostenediol metabolites (noranderosterone and noretiocholanolone) [Kintz *et al.* 1999].

Disposition in the Body Norandrostenediol is a hormone precursor and is metabolised in the liver to nortestosterone (nandrolone) after oral administration.

Therapeutic Concentration

Following the administration of 100 mg norandrostenediol as a capsule formulation to 8 healthy subjects, maximum total plasma levels (i.e. conjugated and unconjugated compounds) of norandrostenediol were 1.1 µg/L. Levels of metabolites were 4.0 µg/L for nandrolone, 154.8 µg/L for norandrosterone and 37.7 µg/L for noretiocholanolone. Administration of 25 mg norandrostenediol as sublingual tablets resulted in maximum plasma levels of 3.3 µg/L. Peak levels of nandrolone, norandrosterone and noretiocholanolone were 11.0, 106.3 and 28.5 µg/L, respectively [Schrader *et al.* 2006].

Torrado S *et al.* (2008b). Urinary metabolic profile of 19-norsteroids in humans: glucuronide and sulphate conjugates after oral administration of 19-nor-4-androstenediol. *Rapid Commun Mass Spectrom* 22: 3035–3042.

Norandrostenedione

Anabolic Steroid

$C_{18}H_{24}O_2$ = 272.4

CAS—734-32-7

IUPAC Name (8*R*,9*S*,10*R*,13*S*,14*S*)-13-Methyl-1,2,6,7,8,9,10,11,12,14,15,16-dodecahydrocyclopenta[*a*]phenanthrene-3,17-dione

Synonyms 4-Estrene-3,17-dione; estr-4-ene-3,17-dione; 19-norandrostenedione.

Proprietary Names *Androbolic*; *Androdyne*; *Androstat Pro Six*; *CycloROID*; *MHP Nor-Stak*; *Nortesten*.

Chemical Properties An almost white powder with Mp 165° (fine product) or an almost yellow powder with Mp 156° (crude product).

Quantification

Urine **GC-MS** EI ionisation, SIM acquisition mode. Norandrostenedione metabolites (norandrosterone and noretiocholanolone) [Kintz *et al.* 1999].

CE Buffer: 15 mmol/L Britton–Robinson buffer, 50 mmol/L sodium cholate and 0.1% Triton-X100 (pH 9.0). UV detection (λ= 241 nm). Limit of detection, 0.20–0.51 mg/L for norandrostenedione and other synthetic anabolic steroids [Zhang *et al.* 2009].

Disposition in the Body Norandrostenedione is a hormone precursor and after administration and absorption is converted to nortestosterone (nandrolone), especially in the liver. Conversion can also occur in the placenta.

Dose A dose of 100 to 250 mg 1 to 3 times daily is recommended for optimum effect.

Kintz P *et al.* (1999). [Norandrostenolone and noretiocholanolone: metabolite markers]. *Acta Clin Belg Suppl* 1: 68–73.

Zhang L *et al.* (2009). A new mixed micellar electrokinetic chromatography method for analysis of natural and synthetic anabolic steroids. *Talanta* 77: 1002–1008.

Norbolethone

Anabolic Steroid

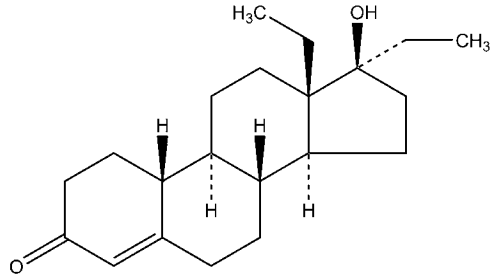
$C_{21}H_{32}O_2$ = 316.5

CAS—1235-15-0

IUPAC Name (8*R*,9*S*,10*R*,13*S*,14*S*,17*S*)-13,17-Diethyl-17-hydroxy-1,2,6,7,8,9,10,11,12,14,15,16-dodecahydrocyclopenta[a]phenanthren-3-one

Synonyms dl-13β,17α-Diethyl-17β-hydroxygon-4-en-3-one; (17α)-(±)-13-ethyl-17-hydroxy-18,19-dinor-pregn-4-en-3-one; Wy-3475.

Proprietary Name *Genabol*



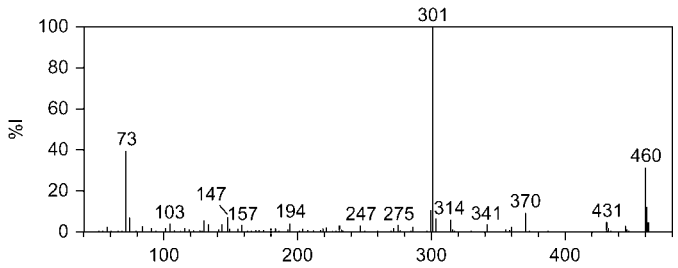
Chemical Properties Crystals. Mp 144° to 145°. Log *P* (octanol/water), 4.6 [Meylan, Howard 1995].

Note Norbolethone is synthesised by the same method used to produce tetrahydrogestrinone, the only difference being that norbolethone needs a longer reaction time to be formed.

***D*-Norbolethone**
Chemical Properties Crystals. Mp 175° to 176°.

***L*-Norbolethone**
Chemical Properties Crystals. Mp 172° to 175.5°.

Ultraviolet Spectrum Peak at 241 nm.
Mass Spectrum Principal ions at *m/z* 301, 73, 460, 302, 461, 300, 370, 147 (di-TMS derivative) [Catlin *et al.* 2002].



Quantification
Urine **GC-MS** Column: Agilent Technologies 6890/5973. Full scan mode. Limit of detection not reported [Catlin *et al.* 2002].

LC-MS Column:Macherey-Nagel Nucleodur C_{18} Pyramid (70 × 40 mm i.d., 5.0 µm). Mobile phase: acetonitrile : 5 mmol/L ammonium acetate containing 0.1% acetic acid (pH 3.5; 10 : 90 to 100 : 0 in 10 min), flow rate 800 µL/min. ESI, positive ion mode. Limit of detection, 50 µg/L [Thevis *et al.* 2005].

Other **LC-MS** Equine Urine. Column: Supelcosil LC-8-DB reversed phase (10 cm × 2.1 mm i.d., 3.0 µm). Mobile phase: 0.1% acetic acid : methanol (60 : 40 to 0 : 100 at 5 min for 5 min), flow rate 0.2 mL/min. API, ESI, positive ion mode, MRM acquisition mode. Limit of detection, 50 µg/L [Yu *et al.* 2005].

Catlin DH *et al.* (2002). Detection of norbolethone, an anabolic steroid never marketed, in athletes' urine. *Rapid Commun Mass Spectrom* 16: 1273–1275.

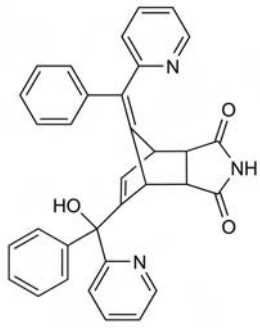
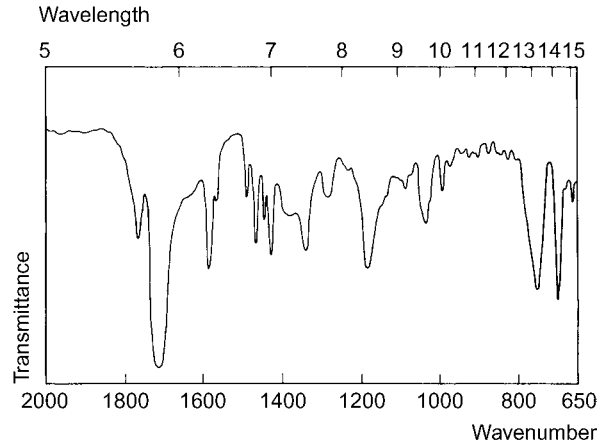
Norbormide

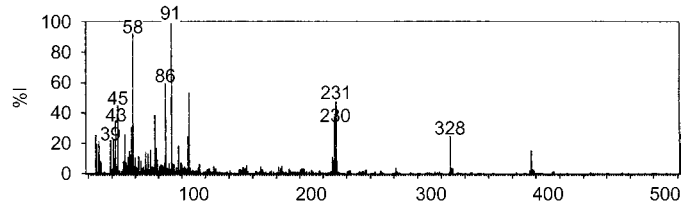
Rodenticide
$C_{33}H_{25}N_3O_3$ = 511.6
CAS—991-42-4
IUPAC Name 3a,4,7,7a-Tetrahydro-5-(hydroxyphenyl-2-pyridinylmethyl)-8-(phenyl-2-pyridinylmethylene)-4,7-methano-1*H*-isoindole-1,3(2*H*)-dione



Chemical Properties A white crystalline powder consisting of a mixture of stereoisomers. Mp 190° to 198°. Practically insoluble in water, ethanol and ether; very slightly soluble in chloroform. Log *P* (octanol/water), 3.2.
Colour Tests Koppanyi–Zwikker test—violet; Liebermann's reagent—green-brown.
Thin-layer Chromatography System TA—R_f 0.70; system TB—R_f 0.00; system TC—R_f 0.62; system TL—R_f 0.64 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2050.
Ultraviolet Spectrum Methanolic acid—238, 300 nm (A^{1}_{1}=136b).
Infrared Spectrum Principal peaks at wavenumbers 1708, 701, 751, 1590, 1190, 1754 cm^{-1} (KBr disk).

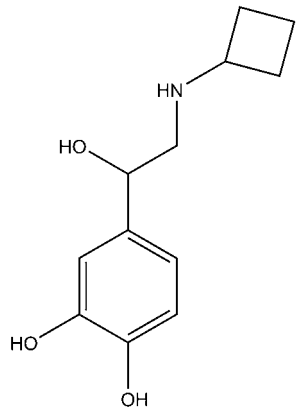


Mass Spectrum Principal ions at *m/z* 91, 58, 86, 106, 231, 45, 77, 230.



Norbudrine

Bronchodilator
$C_{12}H_{17}NO_3$ = 223.3
IUPAC Name 4-[2-(Cyclobutylamino)-1-hydroxyethyl]benzene-1,2-diol
Synonyms 2-Cyclobutylamino-1-(3,4-dihydoxyphenyl)-ethanol; *N*-cyclobutylnoradrenaline; norbudrina; norbutrine.



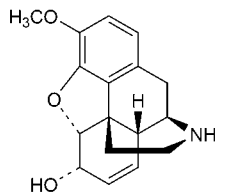
Norbudrine Hydrochloride
$C_{12}H_{17}NO_3$, HCl = 259.8
Synonym RD 9338
Chemical Properties Mp 170°, with decomposition. Very soluble in water; soluble 1 in 10 of ethanol.

Colour Tests Ammonium molybdate test—(yellow) grey-blue (limit of detection, 0.1 µg); ammonium vanadate test—(blue-green) light brown (limit of detection, 0.1 µg); sulfuric acid-formaldehyde test—orange (limit of detection, 0.5 µg); Vitali's test—orange/orange/brown (limit of detection, 0.5 µg).
Thin-layer Chromatography System T1—R_f 0.57 (location reagent potassium permanganate spray, positive reaction).
Ultraviolet Spectrum 0.1 N sulfuric acid—254 (E1%, 1 cm 128) and 285 nm (E1%, 1 cm 6).
Infrared Spectrum Principal peaks at wavenumbers 1247 or 1437, 1614, 1192 cm^{-1} (KBr disk) (Norbutrine base).

Norcodeine

Narcotic Analgesic
$C_{17}H_{19}NO_3$=85.3
CAS—467-15-2

IUPAC Name 3-Methoxy-6α-hydroxy-4,5α-epoxy-7,8-didehydromorphinan
Synonyms *N*-Demethylcodeine; (5α,6α)-7,8-didehydro-4,5-epoxy-3-methoxymorphinan-6-ol; normorphine 3-methyl ether.

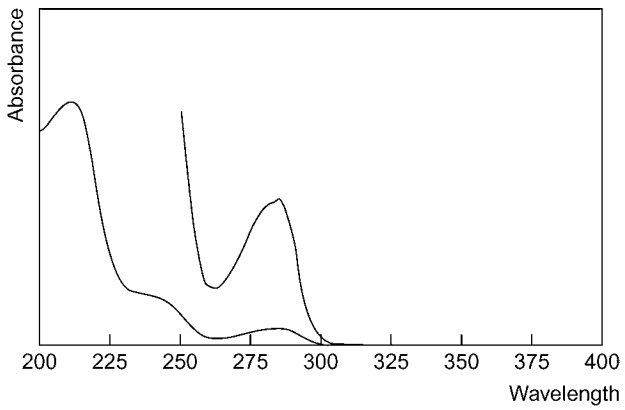


Chemical Properties Crystals. Mp 185°. Sparingly soluble in water and ether; freely soluble in ethanol; moderately soluble in acetone. pK_a 9.23 (25°). Log *P* (octanol/water), 0.69 [Avdeef *et al.* 1996].

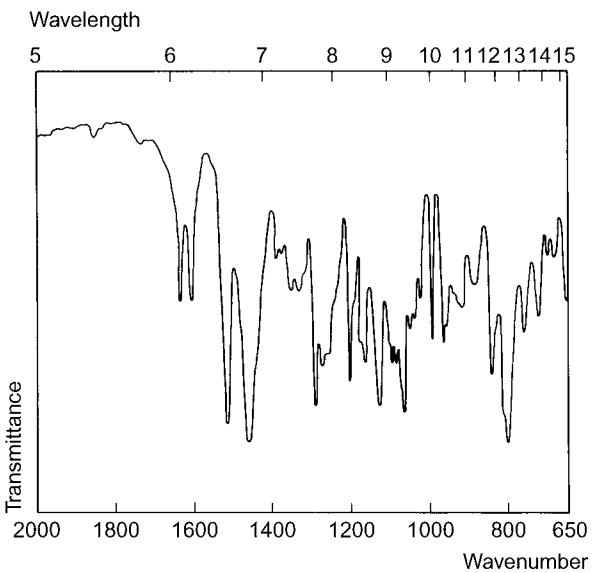
Norcodeine Hydrochloride

$C_{17}H_{19}NO_3$, HCl_3, H_2O = 375.8
CAS—14648-14-7 (anhydrous)
Chemical Properties Crystals. The anhydrous form decomposes at 309°. Sparingly soluble in cold water, more soluble in hot water; freely soluble in ethanol; almost insoluble in acetone.

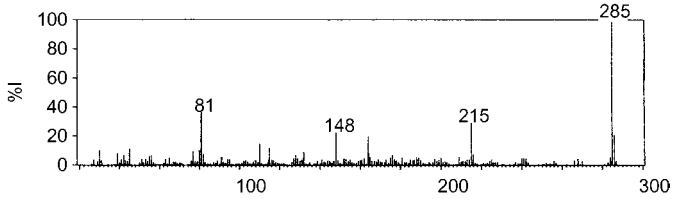
Colour Test Marquis test—yellow→violet.
Thin-layer Chromatography System TA—R_f 0.13; system TB—R_f 00; system TC—R_f 0.05 (acidified iodoplatinate solution—positive; Dragendorff spray—positive; Marquis test—blue-violet; ninhydrin spray—positive).
Gas Chromatography System GA—RI 2388; system GB—RI 2535.
High Performance Liquid Chromatography System HA—*k* 3.1 (tailing peak); system HC—*k* 3.51; system HY—RI 235.
Ultraviolet Spectrum Aqueous acid—284 nm. No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 800, 1515, 1065, 1130, 1290, 1205 cm^{-1} (KBr disk). Polymorphism may occur.



Mass Spectrum Principal ions at *m/z* 285, 81, 215, 148, 286, 164, 110, 115.



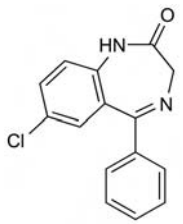
Quantification See under Codeine.
Disposition in the Body Norcodeine is a metabolite of codeine.

Avdeef A *et al.* (1996). Octanol-, chloroform-, and propylene glycol dipelargonat–water partitioning of morphine-6-glucuronide and other related opiates. *J Med Chem* 39: 4377–4381.

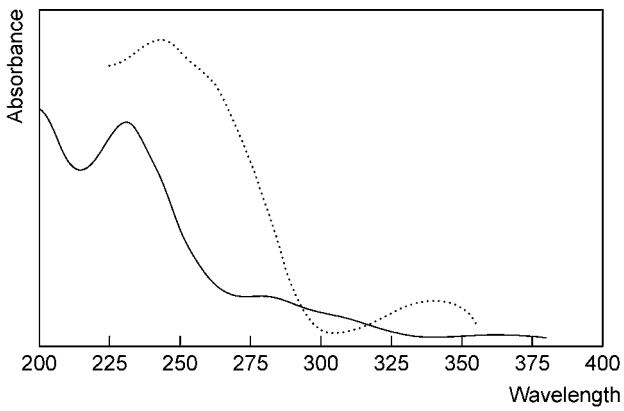
Nordazepam

Benzodiazepine, Tranquilliser
$C_{15}H_{11}ClN_2O$ = 270.7
CAS—1088-11-5

IUPAC Name 7-Chloro-5-phenyl-1,3-dihydro-1,4-benzodiazepin-2-one
Synonyms A-101; 7-chloro-1,3-dihydro-5-phenyl-2*H*-1,4-benzodiazepin-2-one; demethyldiazepam; desmethyldiazepam; *N*-desmethyldiazepam; DMDZ; nordiazepam; Ro-5-2180.
Proprietary Names *Calmday*; *Lomax*; *Madar*; *Nordaz*; *Praxadium*; *Sopax*; *Stilny*; *Tranxilium N*; *Vegesan*.

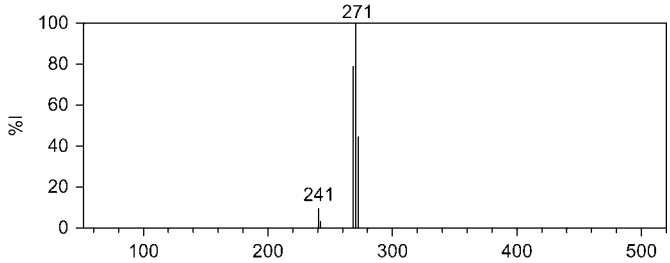


Chemical Properties A white or pale yellow crystalline powder. Mp 216° to 217° (crystals from acetone). Practically insoluble in water; slightly soluble in ethanol and chloroform. pK_{a1} 3.5, pK_{a2} 12.0. Log *P* (octanol/water), 2.93 [Mullett, Pawliszyn 2001]. Extraction yield (chlorobutane), 0.95 [Demme *et al.* 2005].
Colour Test Formaldehyde-sulfuric acid—orange.
Thin-layer Chromatography System TA—R_f 0.62; system TB—R_f 0.03; system TC—R_f 0.55; system TD—R_f 0.34; system TE—R_f 0.67; system TF—R_f 0.45; system TL—R_f 0.60; system TAD—R_f 0.57; system TAE—R_f 0.82; system TAF—R_f 0.83; system TAJ—R_f 0.53; system TAK—R_f 0.60; system TAL—R_f 0.92 (acidified iodoplatinate solution—positive; Dragendorff spray—positive).
Gas Chromatography System GA—nordazepam RI 2490, M (oxazepam) RI 2325; system GB—nordazepam RI 2625, M (oxazepam) RI 2438; system GF—nordazepam RI 3041, M (oxazepam) RI 2803.
High Performance Liquid Chromatography System HA—*k* 0.2; system HI—nordazepam *k* 8.00, M (oxazepam) *k* 4.62; system HK—nordazepam *k* 1.99, M (oxazepam) *k* 0.73; system HX—RI 470; system HY—RI 372; system HAK—RT 7.6 min; system HAL—nordazepam RT 7.9 min, M (oxazepam) RT 4.4 min; system HAX—nordazepam RT 6.7 min, M (oxazepam) RT 6.0 min; system HAY—nordazepam RT 6.8 min, M (oxazepam) RT 4.5 min; system HAZ—nordazepam *k* 1.88, M (oxazepam) *k* 1.23; system HBH—nordazepam *k* 8.97, M (oxazepam) *k* 5.42; system HBI—nordazepam *k* 1.89, M (oxazepam) *k* 1.25.
Ultraviolet Spectrum Aqueous acid—238 (A^{1}_{1} = 1140b), 283, 361 nm; aqueous alkali—240, 340 nm.



Infrared Spectrum Principal peaks at wavenumbers 1680, 700, 1602, 820, 738, 790 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 242, 269, 270, 241, 243, 271, 244, 272 (nordazepam); 257, 77, 268, 239, 205, 267, 233, 259 (oxazepam) .



Quantification See also under Diazepam.

Blood **GC-MS** Column: 100% methylsiloxane or 5% phenylsiloxane, 95% methylsiloxane. Carrier gas: 1.0 mL/min. Temperature programme: 140° for 0.5 min to 320° at 25°/min. SIM acquisition mode. Limit of detection, 12.5 µg/L [Goldberger *et al.* 2010]. Column: 5% diphenyldimethylsiloxane DB-5MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 2 mL/min. Temperature programme: 150° for 0.6 min to 230° at 40°/min to 310° at 10°/min. EI ionisation, SIM acquisition mode. Limit of quantification, 25 µg/L, limit of detection, 25 µg/L [Tiscione *et al.* 2008]. Column: DB5-MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° to 230° at 8°/min to 313° at 4°/min. EI ionisation at 70 eV or CI in positive ion mode. Limit of detection, 10 µg/L [Pirnay *et al.* 2002].

HPLC Column: Chromolith Performance RP-18e (100 × 4.6 mm i.d.). Mobile phase: 35 mmol/L phosphate buffer (pH 2.1) : acetonitrile (70 : 30), flow rate 2 mL/min. DAD (λ = 220 nm). Limit of quantification, 30 µg/L [Bugey, Staub 2004].

LC-MS Column: Acquity BEH Phenyl (100 × 2.1 mm i.d., 1.7 µm). Mobile phase: 0.1% formic acid in water : 0.1% formic acid in acetonitrile (80 : 20 for 0.25 min to 65 : 35 over 2.25 min for 2.5 min to 20 : 80 over 1 min to 80 : 20 over 0.01 min for 1.4 min), flow rate 0.5 mL/min. ESI, MRM acquisition mode. Limit of detection not reported [Gunn *et al.* 2010]. Column: Retek Allure C_{18} (150 × 3.2 mm i.d., 5 µm). Mobile phase: 5 mmol/L ammonium acetate : acetonitrile : methanol (90 : 5 : 5), flow rate 0.45 mL/min. DAD. Limit of quantification, 2 µg/L [Dussy *et al.* 2006].

Plasma **GC** Column: CPSIL 8 CB (25 × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 150° to 230° at 40°/min for 2 min to 250° at 5°/min for 1 min to 300° at 15°/min for 3 min. NPD. Limit of detection, 0.02 µmol/L [Reubsaet *et al.* 1998]. ECD. Limit of detection, 1 µg/L [Viala *et al.* 1978].

GC-MS Column: HP-1 capillary (12 m × 0.2 mm i.d., 330 nm). Carrier gas: He, 0.6 mL/min. Temperature programme: 100° for 2 min to 310° at 40°/min for 2.5 min. EI ionisation, SIM acquisition mode. Retention time: 6.80 min. Limit of quantification, 0.05 mg/L [Peters *et al.* 2005].

HPLC Column: C_{18}. UV detection. Limit of detection, 31.3 µg/L for nordazepam and 45.0 µg/L for diazepam [Mullett, Pawliszyn 2001]. Column: LiChrospher RP-Select B C_8 (125 × 3 mm i.d., 5 µm). Mobile phase: acetonitrile : 30 mmol/L phosphate buffer (pH 2.1, 30 : 70 for 5 min to 35 : 65 at 0.3 mL/min), flow rate 0.5 mL/min for 5 min to 0.3 mL/min at 30 min. DAD (λ = 254 nm). Retention time: 12.4 min. Limit of detection not reported [El Mahjoub, Staub 2000]. Nordazepam and diazepam [Atta-Politou *et al.* 1999].

LC-MS Column: XTerra MS C_{18} (150 × 2.1 mm i.d., 3.5 µm). Mobile phase: acetonitrile : water : 100 mmol/L ammonium formate (pH 3.0, 55 : 40 : 5), flow rate 0.125 mL/min. ESI, MRM acquisition mode. Retention time: 6.02 min. Limit of quantification, 20 µg/L, limit of detection, 10 µg/L [Marin *et al.* 2008; Marin, McMillin 2010]. Column: Merck LiChroCART (125 × 2 mm i.d.). Mobile phase: 5 mmol/L ammonium formate : acetonitrile (60 : 40 for 5.5 min to 10 : 90 in 8 min to 60 : 40 in 9.5 min for 10 min). APCI, SIM acquisition mode. Limit of quantification, 0.025 mg/L (SIM mode), limit of detection, <0.01 mg/L (scan mode)[Kratzsch *et al.* 2004].

Serum **GC-MS** SIM acquisition mode. Nordazepam, diazepam and oxazepam [Duthel *et al.* 1992].

HPLC Column: Supelcosil C_{18} (50 × 4.6 mm i.d., 5 µm). Mobile phase: water : methanol (52 : 48), flow rate 1.0 mL/min. UV detection (λ = 230 nm). Limit of detection, 100 µg/L [Mullett, Pawliszyn 2002]. Column: Supelcosil C_{18} (50 × 4.6 mm i.d., 5 µm). Mobile phase: water : methanol (54 : 46), flow rate 1.0 mL/min. UV detection (λ = 230 nm). Limit of quantification, 104.3 µg/L, limit of detection, 31.3 µg/L [Mullett, Pawliszyn 2001]. Column: µBondapak C_{18} (300 × 3.9 mm i.d., 10 µm). Mobile phase: flow rate 1.5 mL/min. DAD (λ = 254 nm). Limit of quantification, 107.5 µg/L, limit of detection, 29.8 µg/L [Ahrens *et al.* 2000].

LC-MS See Blood [Dussy *et al.* 2006; Gunn *et al.* 2010]. See Plasma [Marin *et al.* 2008; Marin, McMillin 2010].

Note For a radioimmunoassay for the measurement of nordazepam, see Dixon *et al.* [1979].

Urine **GC-MS** See Blood [Goldberger *et al.* 2010]. Column: DB-1 (15 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He. Temperature programme: 160° for 1 min to 280° at 20°/min for 3 min. NCI. Limit of detection not reported [Fitzgerald *et al.* 1993]. Column; methyl silicone (12.5 m). Temperature programme; 120° to 310°. Limit of quantification, 5 µg/L, limit of detection, 1 µg/L [West, Ritz 1993].

HPLC UV detection. Limit of detection, 100 µg/L [Mullett, Pawliszyn 2002]. Column: C_{18}. UV detection. Limits of detection, 33.1 µg/L for nordazepam and 52.9 µg/L for diazepam [Mullett, Pawliszyn 2001]. Column: Hypersil C18 (100 × 4.6 mm i.d., 3 µm). Mobile phase: 0.04 mol/L phosphate (pH 4)–0.4% octylamine : acetonitrile (73 : 27, 70 : 30, 65; 35 or 60 : 40), flow rate 1 mL/min. DAD (240 nm). Retention time: 14.3 min. Limit of detection, not reported [Segura *et al.* 2001]. Column: 60 RP select B (250 × 4 mm i.d., 5 µm) or LiChrospher 100 RP 8 (200 × 4 mm i.d., 8.5 µm). Mobile phase: 0.01 mol/L sodium phosphate buffer (pH 7.0) : acetonitrile (87.5 : 12.5 to 83.5 : 16.5 at 15 min to 80 : 20 over 8.5 min for 3 min to 75 : 25 in 1 min for 15 min), flow rate 1.0 mL/min. UV detection (λ = 230 nm). Limit of detection, 10 µg/L [Franzelius, Besserer 1993].

LC-MS Column: Hypurity C_8 (150 × 3 mm i.d.). Mobile phase: 4 mmol/L ammonium acetate (pH 6.8) in methanol-water (5 : 95) : 1% propan-2-ol, 0.05% formic acid in methanol (100 : 0 for 1 min to 0 : 100 at 3 min for 1.5 min to 100 : 0 over 0.1 min for 1.4 min). TIS, MRM acquisition mode. Limit of quantification, 2.5 µg/L, limit of detection, 1.25 µg/L [Glover, Allen 2010]. See Plasma [Marin *et al.* 2008; Marin, McMillin 2010]. Column: Shodex MSpak GF-310 4B (50 × 4.6 mm i.d., 6 µm). Mobile phase: 10 mmol/L ammonium acetate : acetonitrile (100 : 0 for 3 min to 0 : 100 from 3.01 to 6 min to 100 : 0 from 6.01 to 10 min for 5 min), flow rate 0.9 mL/min for 3 min to 0.3 mL/min until 10 min to 0.9 mL/min. ESI, positive ion mode. Limit of quantification, 0.5 µg/L, limit of detection, 0.1 µg/L [Umezawa *et al.* 2008].

Meconium **LC-MS** See Plasma [Marin *et al.* 2008; Marin, McMillin 2010].

Hair **GC-MS** Column: HP-Ultra 2 capillary (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 2 mL/min. Temperature programme: 70° for 2 min to 220° at 25°/min to 255° at 5°/min to 300° for 7 min. EI ionisation at 70 eV. Retention time: 14.2 min. Limit of detection, 0.1 ng/mg [Yegles *et al.* 1997]. Column: HP-5 MS 5% phenylsiloxane, 95% methylsiloxane (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 60° for 1 min to 290° at 30°/min for 2 min. NICI. Retention time: 9.04 min. Limit of detection, 0.001 ng/mg [Kintz *et al.* 1996].

LC-MS Mobile phase: 3 mmol/L ammonium formate and 0.001% formic acid in water : acetonitrile (65 : 35 to 20 : 80 after 13 min to 10 : 90 at 13.5 min until 16.5 min to 65 : 35 until 20 min), flow rate 0.3 mL/min. ESI, positive ion mode. Limit of quantification, 0.41 ng/30 mg, limit of detection, 0.24 ng/30 mg [Miller *et al.* 2006]. Column: Uptisphere ODB C_{18}. Mobile phase: 2 mmol/L formate buffer : acetonitrile. ESI. Limit of detection, <2 ng/g for nordazepam and other benzodiazepines [Chèze *et al.* 2005]. NICI. Nordazepam and oxazepam [Kintz *et al.* 1996; Vayssette *et al.* 1996].

Disposition in the Body Nordazepam is absorbed after oral administration, maximum blood concentrations being attained in 2–4 h; bioavailability is ~50%. It is metabolised to oxazepam and then to oxazepam glucuronide. Nordazepam is a metabolite of several benzodiazepines including chlordiazepoxide, clorazepate, diazepam, medazepam, and prazepam.

Therapeutic Concentration

Following daily oral doses of 20–30 mg to nine subjects for 10 days, plasma concentrations of 0.63–1.84 mg/L (mean, 1.1) were reported 10 h after a dose [Tognoni *et al.* 1975].

Following a single oral dose of 10 mg to 2 subjects, a mean peak plasma concentration of 0.17 mg/L was reported [Pacifici *et al.* 1982].

Toxicity

High concentrations of diazepam and nordazepam were found in 94 cases of driving under the influence of drugs. Mean, median and maximum levels of nordazepam were 1.5, 1.0 and 7.6 µg/g, respectively; corresponding diazepam levels were 2.0, 1.7 and 7.8 µg/g, respectively. In 86 cases, other drugs were also found [Jones *et al.* 2004].

In 20 deaths involving nordazepam, postmortem peripheral and heart blood levels were ~587 µg/L [Pos Pok *et al.* 2008].

Half-life The plasma half-life is very variable and values ranging from 25 to over 200 h have been reported. Mean values reported are usually in the range 40–100 h in normal subjects. The plasma half-life is prolonged in elderly subjects and in subjects with liver disease.

Volume of Distribution 0.5–2.5 L/kg, increased in elderly subjects.

Clearance Plasma clearance, ~0.1–0.3 mL/min/kg.

Distribution in Blood Plasma : whole blood ratio, 1.7.

Protein Binding ~97%.

Dose Nordazepam has been given in doses of up to 15 mg daily.

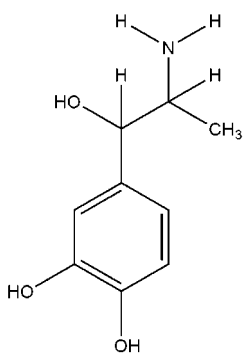
Nordefrin

Vasoconstrictor

$C_9H_{13}NO_3$ = 183.2

IUPAC Name 4-(2-Amino-1-hydroxypropyl)benzene-1,2-diol

Synonyms (±)-2-Amino-1-(3,4-dihydroxyphenyl)propan-1-ol; cordadride; *dl*-3,4-dihydroxynorephedrine; dihydroxyphenylaminopropanol; α-methylnoradrenaline; norhomoepinephrine.



Chemical Properties Mp 212° to 215° with decomposition.

Nordefrin Hydrochloride

$C_9H_{13}NO_3$, HCl = 219.7

Proprietary Names *Corbefrin*; *Corbasil*; *Lirotil*.

Chemical Properties A white crystalline powder which slowly darkens on exposure to air and light. Mp 175° to 180°. Soluble 1 in 1.5 of water and 1 in 12 of ethanol; almost insoluble in chloroform and ether.

Levonordefrin ((−)-isomer)

$C_9H_{13}NO_3$ = 183.2

Proprietary Name *Neo-Cobefrin*

Chemical Properties A white crystalline powder. Mp ~210°. Almost insoluble in water; slightly soluble in ethanol, ether, chloroform and acetone; soluble in aqueous solutions of mineral acids.

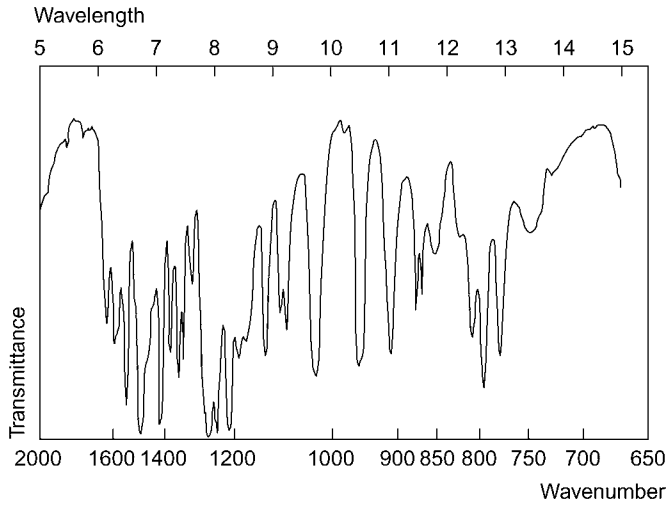
Note Nearly all the vasoconstrictor activity of nordefrin is possessed by levonordefrin.

Colour Test Ammonium molybdate—(brown) grey→green (limit of detection, 1.0 μg); ammonium vandate—(grey) orange (limit of detection, 1.0 μg); formaldehyde–sulfuric acid—faint orange (limit of detection, 1.0 μg); sulfuric acid—yellow (limit of detection, 1.0 μg); Vitali's test—yellow/orange/brown (limit of detection, 1.0 μg).

Thin-layer Chromatography System T1—R_f 0.33, streaking (potassium permanganate—positive).

Ultraviolet Spectrum Aqueous acid (0.05 mol/L sulfuric acid)—220 nm (A^1_1 = 330) and 280 (A^1_1 = 156) (maximum), 249 nm (minimum).

Infrared Spectrum Principal peaks at 1258, 1497, 1527, 775 or 1053 cm^{-1} (KBr disk).



Dose In a concentration of 1 in 10 000 in solutions of local anaesthetics.

Norelgestromin

Contraceptive, Progestational Steroid, Progestogen

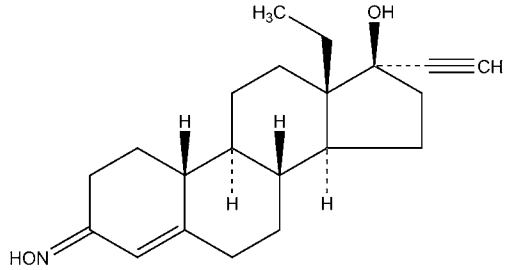
$C_{21}H_{29}NO_2$ = 327.5

CAS—53016-31-2

IUPAC Name (8*R*,9*S*,10*R*,13*S*,14*S*,17*R*)-13-Ethyl-17-ethynyl-3-hydroxyimino-1,2,6,7,8,9,10,11,12,14,15,16-dodecahydrocyclopenta[a]phenanthren-17-ol

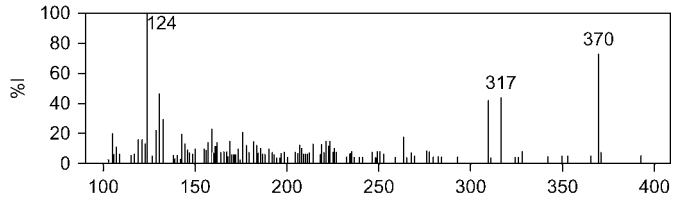
Synonyms 17-Deacetylnorgestimate; (17α)-13-ethyl-17-hydroxy-18,19-dinorpregn-4-en-20-yn-3-one oxime; levonorgestrel 3-oxime; 18-methylnorethindrone oxime; RWJ-10553.

Proprietary Names *Evra*; *Ortho-Evra* (combination drug).



Chemical Properties Crystals. Mp 112°.

Mass Spectrum



Quantification

Serum **LC-MS** Column: Inertsil phenyl (150 × 4.0 mm i.d., 5 µm). Mobile phase: water : acetonitrile (70 : 30 to 30 : 70 over 4 min), flow rate 1.0 mL/min. APCI, positive ion mode, SRM acquisition mode. Retention time: 8.5 min. Limit of quantification, 0.1 µg/L [Wong *et al.* 1999].

Disposition in the Body Norelgestromin is the primary active metabolite of norgestimate and is generally administered as a patch. Hepatic metabolism of norelgestromin occurs and metabolites include norgestrel, which is highly bound to sex-hormone-binding globulin (SHBG), as well as various hydroxylated and conjugated metabolites. Norelgestromin itself is not bound to SHBG. Elimination occurs via the renal and faecal pathways.

Therapeutic Concentration In the range 0.6 to 1.2 µg/L.

A total of 31 women were randomised to 1 of 4 treatment sequences where a combination patch of norelgestromin/ethinylestradiol was applied to different parts of the body for 7 days. The patch delivered 150 µg norelgestromin and 20 µg ethinylestradiol daily to the systemic circulation. Mean peak serum concentrations for norelgestromin were as follows:

Parameter	*Abdomen*	*Arm*	*Buttock*	*Torso*
C_{max} (µg/L)	0.88	1.18	1.17	1.07
Time (h)	72	72	72	72

The half-life was in the range 26 to 30 h [Abrams *et al.* 2002a].

A total of 31 women were administered a daily oral tablet containing 250 µg norgestimate and 35 µg ethinyl estradiol for 7 days. Mean peak serum concentration of norelgestromin on day 1 was 1.52 µg/L after 1.5 h and on day 7 was 2.00 µg/L after 1.2 h [Devineni *et al.* 2007].

The consecutive wearing of 2 patches did not affect serum concentrations of norelgestromin, which remained within the reference ranges of 0.6 to 1.2 µg/L [Abrams *et al.* 2001].

Half-life Elimination, 28 h.

Protein Binding More than 97%, to albumin.

Note For a protein-binding study of norelgestromin, see Hammond *et al.* [2003]; for a pharmacokinetic overview of norelgestromin, see Abrams *et al.* [2002b].

Dose A weekly patch containing 6 mg norelgestromin and 0.75 mg ethinyl estradiol is used for 3 weeks followed by a wash-out period of 1 week before starting a new cycle.

Abrams LS *et al.* (2001). Pharmacokinetics of norelgestromin and ethinyl estradiol delivered by a contraceptive patch (Ortho Evra/Evra) under conditions of heat, humidity, and exercise. *J Clin Pharmacol* 41: 1301–1309.

Norethandrolone

Anabolic Steroid

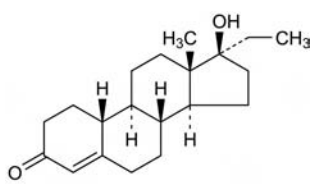
$C_{20}H_{30}O_2$ = 302.5

CAS—52-78-8

IUPAC Name (8*R*,9*S*,10*R*,13*S*,14*S*,17*S*)-17-Ethyl-17-hydroxy-13-methyl-1,2,6,7,8,9,10,11,12,14,15,16-dodecahydrocyclopenta[*a*]phenanthren-3-one

Synonyms 17α-Ethyl-19-nortestosterone; (17α)-17-hydroxy-19-norpregn-4-en-3-one.

Proprietary Name *Nilevar*



Chemical Properties A white crystalline powder. Mp about 135°. Insoluble in water; soluble 1 in 8 of ethanol, 1 in 5 of chloroform, and 1 in 3 of methanol; very soluble in acetone; soluble in benzene, ether and ethyl acetate. Log *P* (octanol/water), 3.8.

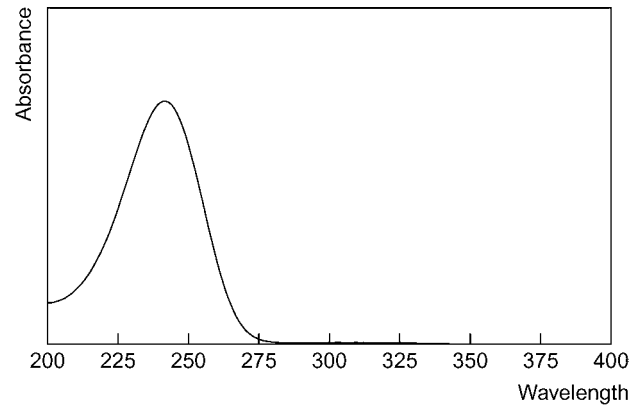
Colour Tests Antimony pentachloride—brown; naphthol–sulfuric acid—orange, green dichroism/red-orange; sulfuric acid—orange (green-yellow fluorescence under UV light).

Thin-layer Chromatography System TP—R_f 0.71; system TQ—R_f 0.20; system TR—R_f 0.95; system TS—R_f 0.78 (*p*-toluenesulfonic acid solution, positive).

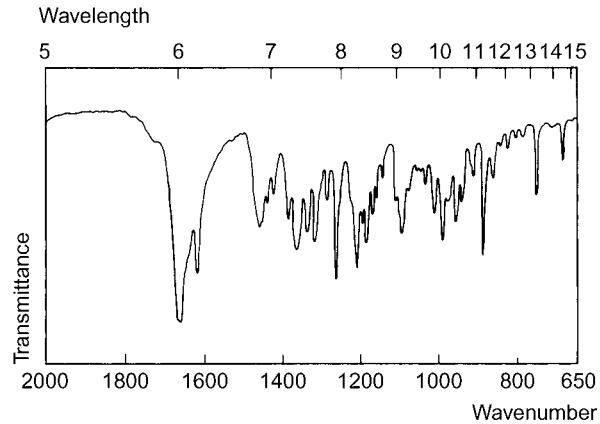
Gas Chromatography System GAI—Urinary metabolite: 17α-(2-hydroxyethyl)-5α-estran-3α,17β-diol RRT 1.078 (relative to 17α-methyl-5α-androstan-3β,17β-diol).

High Performance Liquid Chromatography System HATb—RRT 1.55 (relative to testosterone).

Ultraviolet Spectrum Methanol—240 nm (A_1^1=565a).



Infrared Spectrum Principal peaks at wavenumbers 1650, 1263, 1612, 1210, 894, 1185 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 302, 57, 85, 231, 91, 110, 79, 215.

Dose 10 to 30 mg daily.

Norethisterone

Progestational Steroid

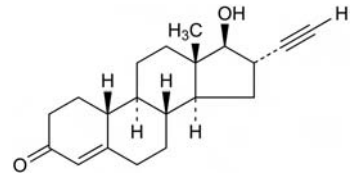
$C_{20}H_{26}O_2$ = 298.4

CAS—68-22-4

IUPAC Name (17α)-17-Hydroxy-19-norpregn-4-en-20-yn-3-one

Synonyms Ethinylnortestosterone; norethindrone; norpregneninolone.

Proprietary Names *Micronor*; *Micronovum*; *Norfor*; *Noriday*; *Norlutin*; *Nor-QD*; *Primolut N*; *Utovlan*.



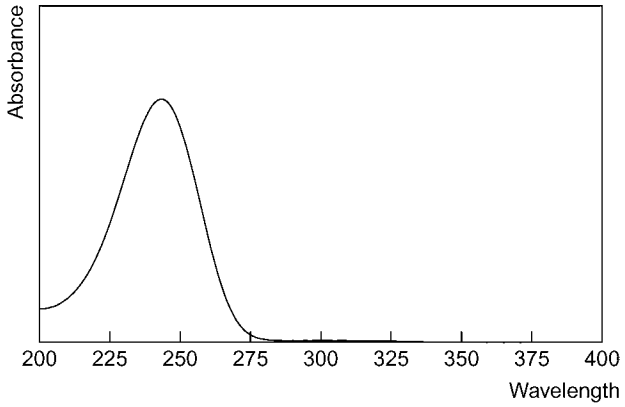
Chemical Properties Norethisterone is an ingredient of many proprietary preparations—see Sweetman [2009]. A white or creamy-white crystalline powder. Mp 201° to 208°. Practically insoluble in water; soluble 1 in 150 of ethanol, 1 in 30 of chloroform and 1 in 5 of pyridine; slightly soluble in ether. Log *P* (octanol/water), 3.0.

Norethisterone Acetate

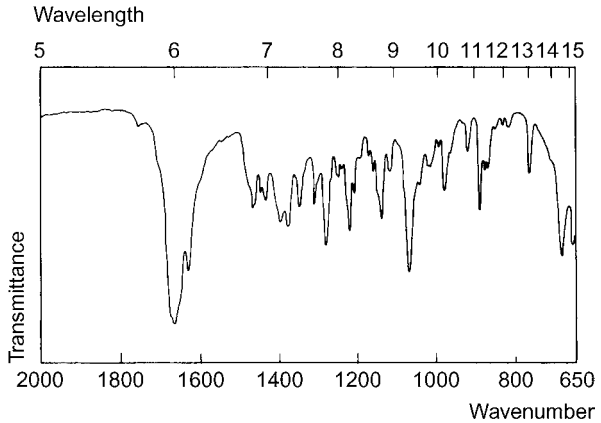
$C_{22}H_{28}O_3$ = 340.5
CAS—51-98-9

Synonym Norethindrone acetate
Proprietary Names *Milligynon*; *Norlutate*; *Primolut Nor*; *SH 420*.
Chemical Properties Norethisterone acetate is an ingredient of many proprietary preparations—see Sweetman [2009]. A white or creamy-white crystalline powder. Mp about 163°. Practically insoluble in water; soluble 1 in about 12 of ethanol, 1 in 4 of acetone, 1 in <1 of chloroform, 1 in 2 of dioxan and 1 in 18 of ether.

Colour Tests Antimony pentachloride—brown; naphthol–sulfuric acid—orange/orange-brown; sulfuric acid—orange (orange fluorescence under ultraviolet light).
Thin-layer Chromatography Norethisterone: System TB—R_f 0.20; system TE—R_f 0.76; system TF—R_f 0.57; system TP—R_f 0.71; system TQ—R_f 0.22; system TR—R_f 0.87; system TS—R_f 0.63, streaking may occur; system TAE—R_f 0.86. Norethisterone acetate: System TP—R_f 0.87; system TQ—R_f 0.39; system TR—R_f 0.98; system TS—R_f 0.90.
Gas Chromatography System GA—RI 2625.
High Performance Liquid Chromatography System HX—RI 536; system HY—RI 676; system HAA—retention time 24.0 min.
Ultraviolet Spectrum Ethanol—240 nm (A^1_1=570a).



Infrared Spectrum Principal peaks at wavenumbers 1649, 1068, 1617, 689, 1272, 660 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 43, 340, 298, 325, 91, 41, 231, 280 (norethisterone acetate).
Quantification
Plasma **GC–MS** Limit of detection, <0.1 µg/L [Pommier *et al.* 1996]. Limit of detection, <0.5 to 8 µg/L for norethisterone and its metabolites [Pommier *et al.* 1995]. For method of quantification for norethisterone metabolites, see Rizk *et al.* [1991].
Dose 5 to 25 mg of norethisterone or 2.5 to 15 mg of norethisterone acetate daily; doses of up to 60 mg daily have been given.

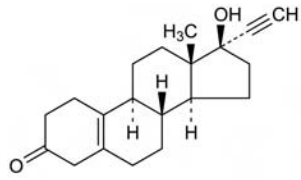
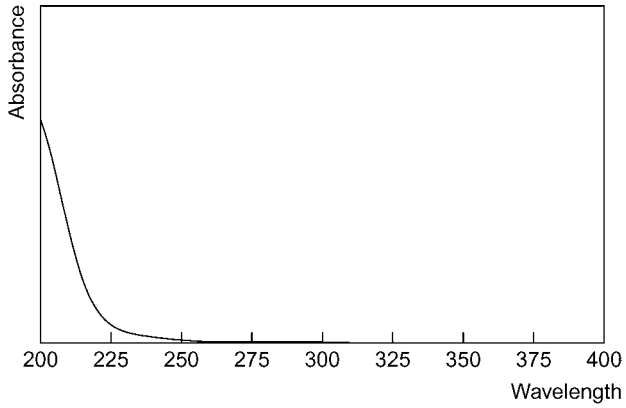
Noretynodrel

Progestational Steroid
$C_{20}H_{26}O_2$ = 298.4
CAS—68-23-5

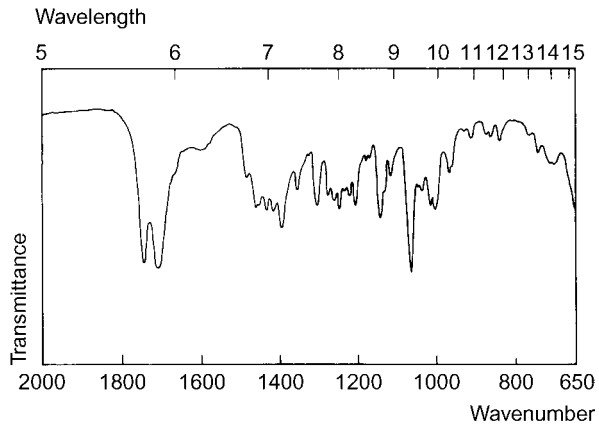
IUPAC Name (8*R*,9*S*,13*S*,14*S*,17*R*)-17-Ethynyl-17-hydroxy-13-methyl-1,2,4,6,7,8,9,11,12,14,15,16-dodecahydrocyclopenta[*a*]phenanthren-3-one
Synonym (17α)-17-Hydroxy-19-norpregn-5(10)-en-20-yn-3-one



Chemical Properties A white crystalline powder. Mp about 174° to 184°. Practically insoluble in water; soluble 1 in 30 of ethanol, 1 in 7 of chloroform and 1 in 60 of ether; soluble in acetone. Log *P* (octanol/water), 3.5.
Colour Tests Antimony pentachloride—green-brown; naphthol–sulfuric acid—orange-red/brown-red; sulfuric acid—orange (orange fluorescence under ultraviolet light); Dissolve 2 mg in 0.3 mL of a 0.5% solution of dinitrobenzene in ethanol and add 2 drops of benzalkonium chloride solution. Mix, and add 2 mL of dilute ammonia solution—intense violet immediately, changing to red-brown in about 5 min.
Thin-layer Chromatography System TP—R_f 0.79; system TQ—R_f 0.32; system TR—R_f 0.91; system TS—R_f 0.71.
Gas Chromatography System GA—RI 2551.
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.



Infrared Spectrum Principal peaks at wavenumbers 1066, 1690, 1729, 1140, 1008, 1242 cm^{-1} (KBr disk).

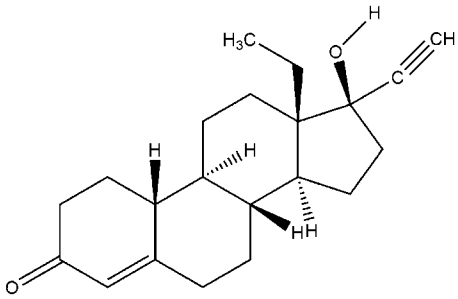


Mass Spectrum Principal ions at *m/z* 91, 215, 79, 105, 77, 55, 41, 298.
Dose 5 to 40 mg daily.

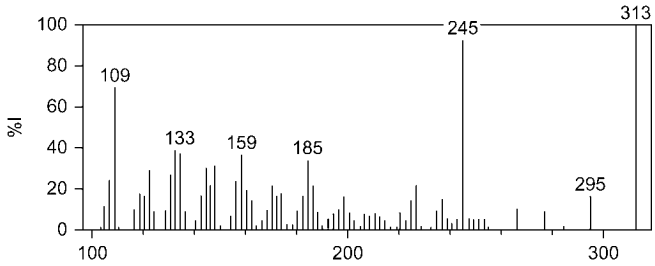
Norgestrel

Progestational Steroid
$C_{21}H_{28}O_2$ = 312.5

IUPAC Name (8*R*,9*S*,10*R*,13*S*,14*S*,17*R*)-13-Ethyl-17-ethynyl-17-hydroxy-1,2,6,7,8,9,10,11,12,14,15,16-dodecahydrocyclopenta[*a*]phenanthren-3-one
Synonyms 13β-Ethyl-17β-hydroxy-18,19-dinor-17α-pregn-4-en-20-yn-3-one; levonorgestrel; Wy 3707.
Proprietary Names It is an ingredient of *Anfertil*, *Duoluton*, *Follinyl*, *Gentrol*, *Microlut*, *Nordiol-21*, *Ovral*, *Ovran*, *Stediril*, *Uugynon*.



Chemical Properties A white crystalline powder. Mp 206° to 208.5°. Insoluble in water; slightly soluble in ethanol, chloroform, acetone and dioxin.
Thin-layer Chromatography System T26a—R_f 0.68; system 26b—R_f 0.24; system T26c—R_f 1.00 (*p*-toluenesulfonic acid—positive).
Ultraviolet Spectrum Methanol—maximum at 241 nm (A^1_1= 549).
Infrared Spectrum Principal peaks at 1070, 1620, and 1650 (KBr disk).
Mass Spectrum



Quantification

Plasma **LC-MS** Column: Hypersil BDS-C_{18} (50 × 2.1 mm i.d., 3 µm). Mobile phase: acetonitrile : water (69 : 31) containing 0.1% formic acid, flow rate 200 µL/min. ESI, positive ion mode, SRM acquisition mode. Limit of quantification, 0.25 µg/L [Zhao *et al.* 2008]. Column: Acquity UPLC BEH C_{18} (50 × 2 mm i.d., 1.7 µm). Mobile phase: 0.1% formic acid in acetonitrile : acetonitrile-water (50 : 50, 0 : 100 for 0.65 min to 60 : 40 at 1.85 min to 90 : 10 at 2.3 min to 0 : 100 at 2.35 min until 2.7 min), flow rate 0.75 mL/min to 1.0 mL/min at 2.3 min to 0.75 mL/min at 2.7 min. TIS, positive ion mode. Limit of detection, 0.1 µg/L [Licea-Perez *et al.* 2007]. Column: Phenomenex Luna phenyl-hexyl (150 × 2.0 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol : 0.1% formic acid (45 : 35 : 20), flow rate 0.3 mL/min. ESI, MRM acquisition mode. Retention time: 2.38 min. Limit of quantification, 0.265 µg/L [Theron *et al.* 2004].
Serum **LC-MS** Column: Phenomenex Luna C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : water (80 : 20) with 0.5% formic acid, flow rate 1.0 mL/min. APCI. Limit of quantification, 0.2 µg/L [Wu *et al.* 2000].
Note For a gel filtration or radioimmunoassay for the measurement of D-norgestrel in human milk, see Thomas *et al.* [1977].
Disposition in the Body Orally administred norgestrel is absorbed and slowly excreted; 21% of a dose is excreted in the urine in 24 h and a further 21% in the following 5 days
Toxicity Doses greater than 5 g/kg did not produce toxic symptoms in mice and rats.

Licea-Perez H *et al.* (2007). A semi-automated 96-well plate method for the simultaneous determination of oral contraceptives concentrations in human plasma using ultra performance liquid chromatography coupled with tandem mass spectrometry. *J Chromatogr B Analyt Technol Biomed Life Sci* 852: 69–76.

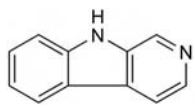
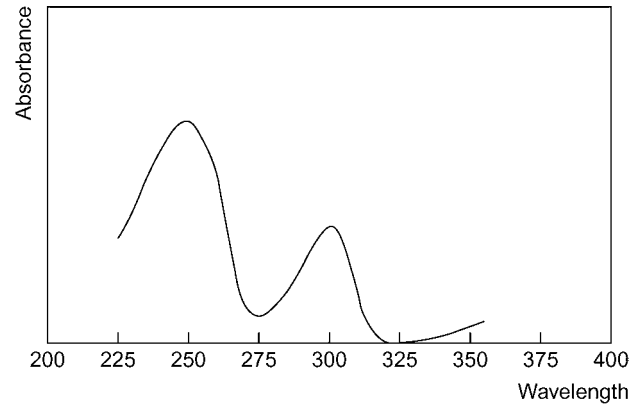
Norharman

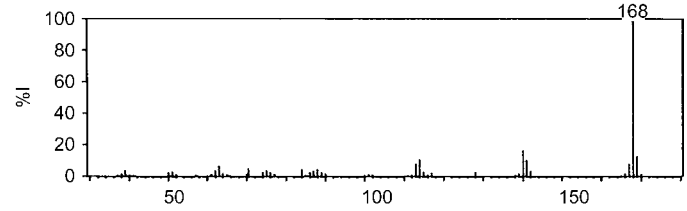
Putrefactive Base
$C_{11}H_8N_2$ = 168.2
CAS—244-63-3
IUPAC Name 9*H*-Pyrido[3,4-*b*]indole
Synonym β-Carboline



Chemical Properties Colourless crystals. Mp 199°. Soluble in hot water, ethanol and ether. Log *P* (octanol/water), 3.2.
Colour Tests Mandelin's test—green→yellow; Marquis test—green.
Thin-layer Chromatography System TA—R_f 0.64; system TB—R_f 0.00; system TC—R_f 0.30; system TL—R_f 0.33 (acidified iodoplatinate solution, positive).
Ultraviolet Spectrum Aqueous acid—247 (A^1_1=1723a), 300 nm.

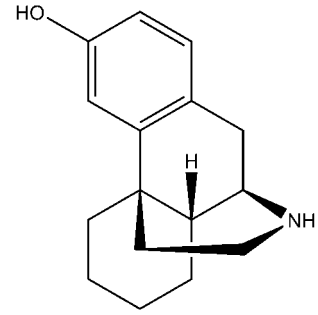


Infrared Spectrum Principal peaks at wavenumbers 1247, 731, 747, 1630, 813, 1280 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 168, 140, 169, 114, 141, 167, 113, 63.



Norlevorphanol

Narcotic Analgesic
$C_{16}H_{21}NO$ = 243.4
CAS—1531-12-0
Synonyms (–)-1,3,4,9,10,10a-Hexahydro-6-hydroxy-2*H*-10,4a-iminoethanophenanthrene; (–)-3-hydroxymorphinan; morphinan-3-ol.



Chemical Properties Crystals from acetone and methanol. Mp 270° to 272°. Norlevorphanol is extracted by organic solvents from aqueous ammoniacal solutions. Stock standard solutions were stable for 4 months at 5° and for 8 days at room temperature. Plasma samples were stable for 3 months at –20° and 3 days at room temperature [Kristensen 1998]. Plasma and urine samples stored at –20° for 16 weeks showed a loss of <5% [Chen *et al.* 1990].

Norlevorphanol Hydrobromide

$C_{23}H_{27}NO_5$, HBr = 324.3
CAS—63732-85-4
Synonym NIH-7539
Chemical Properties Crystals from water. Mp 222° to 224° [O'Neil *et al.* 2006].

(+)-Norlevorphanol

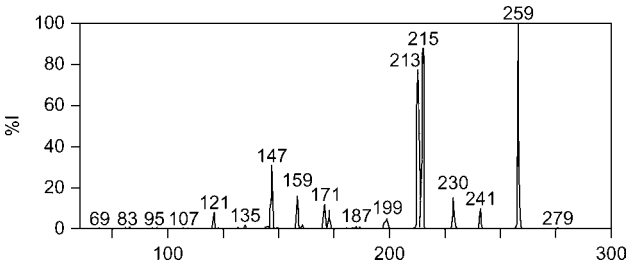
CAS—15676-23-0
Synonyms (9α,13α,14 a)-Morphinan-3-ol; nordextrorphan.

Chemical Properties Crystals from acetone. Mp 258° to 259° [O'Neil *et al.* 2006].

Colour Tests Ammonium molybdate test—blue→yellow-green (limit of detection, 0.25 μg); sulfuric acid-formaldehyde test—olive-green (limit of detection, 1.0 μg); Vitali's test—faint yellow/faint yellow/orange (limit of detection, 1.0 μg).

Thin-layer Chromatography System T1—R_f 0.12 (location reagent acidified iodoplatinate spray, positive reaction).

Mass Spectrum Principal ions at *m/z* 259, 215, 213, 147, 159, 230 Vengurlekar *et al* [2002].



Quantification

Plasma **HPLC** Column: Thermo Hypersil-Keystone phenyl (250 × 4.6 mm i.d., 5 μm). Mobile phase: methanol : acetonitrile : potassium hydrogen phosphate (20 : 30 : 50), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 230 nm, λ_{em} = 330 nm). Retention time: 6.1 min. Limit of quantification, 1 nmol/L [Lin *et al.* 2007]. Column: Spherisorb (15 cm × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : triethylamine : distilled water (17 : 0.06 : 82.94), flow rate 1 mL/min. Fluorescence detection (λ_{ex} = 230 nm, λ_{em} = 330 nm). Retention time: 4.2 min. Limit of detection, 0.5 μg/L [Chen *et al.* 1990]. Column: Macherey-Nagel Nucleosil (150 × 4.6 mm i.d., 5 μm). Mobile phase: 2 mmol/L laurylsulfate and 10 mmol/L sodium phosphate buffer (pH 2.1) : acetonitrile (59 : 41). Limit of detection, 10 μg/L [Mortimer *et al.* 1989]. Column: Polygosil C_8 (125 × 4 mm i.d., 5 μm). Mobile phase: acetonitrile : 0.05 mol/L perchloric acid-0.01 mol/L triethylamine (20 : 80), flow rate 2.0 mL/min. Fluorescence detection (λ_{ex} = 275 nm, λ_{em} = 305 nm). Retention time: 3.4 min. Limit of detection, 10 μg/L [Mascher 1987].

CE Capillary: fused silica (40.0 cm to the inlet, 75 μm i.d.). Running buffer: 50 mmol/L sodium borate (pH 9.4). UV detection (λ = 195 nm). Limit of quantification, 1.2 μg/L; limit of detection, 0.5 μg/L [Kristensen 1998].

Serum **HPLC** Column: Waters NovaPak C_{18} (150 × 3.9 mm i.d.). Mobile phase: 50 mmol/L potassium phosphate buffer (pH 3.0) : acetonitrile : triethylamine (66 : 34 : 0.05 to 78 : 22 : 0.05 at 10 min for 12 min), flow rate 0.5 mL/min. Diode array detection (λ = 205 nm). Retention time: 4.3 min. Limit of detection not reported [Carlsson *et al.* 2004].

Urine **HPLC** Column: Phenyl Spherisorb (15 cm × 4.6 mm i.d., 5 μm). Mobile phase: 1.5% glacial acetic acid and 0.1% triethylamine : acetonitrile (75 : 25), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 200 nm, no cut-off for emission). Limit of quantification, 47.8 μg/L; limit of detection, 2.43 μg/L [Bendriss *et al.* 2001]. Column: Phenyl (25 cm × 4.6 mm i.d., 5 μm). Mobile phase: methanol : acetonitrile : 10 mmol/L potassium phosphate buffer (pH 3.5; 20 : 25 : 55), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 228 nm, λ_{em} no cut off). Retention time: ≈5.2 min. Limit of detection, 60 μg/L [Ducharme *et al.* 1996]. Column: Spherisorb (15 cm × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : triethylamine : distilled water (17 : 0.06 : 82.94), flow rate 1 mL/min. Fluorescence detection (λ_{ex} = 230 nm, λ_{em} = 330 nm). Retention time: 4.2 min. Limit of detection, 0.5 μg/L [Chen *et al.* 1990].

LC-MS Column: Zorbax RX-C8 (15 cm × 2.1 mm i.d., 5 μm). Mobile phase: 15 mmol/L ammonium acetate (pH 4.75) : acetonitrile-methanol (50 : 50; 99 : 1 to 1 : 99 at 8 min), flow rate 0.5 mL/min. ESI, MRM acquisition mode, positive ion mode. Limit of quantification, 100 μg/L [Vengurlekar *et al.* 2002].

Other **HPLC** Human Liver Microsomes. Column: Hi-chrom phenyl (250 × 4.6 mm i.d.). Mobile phase: acetonitrile-methanol (250 : 200) : 10 mmol/L potassium phosphate buffer (pH 3.5; 50 : 50), flow rate 1 mL/min. Fluorescence detection (λ_{ex} = 280 nm, λ_{em} = 310 nm). Limit of detection not reported [Yu, Haining 2001].

LC-MS Rat Everted Gut Sacs. Column: Waters Symmetry C_{18} (150 × 2.1 mm i.d., 5 μm). Mobile phase: water : 1% formic acid : methanol (80 : 10 : 10 to 50 : 10 : 40 at 4 min to 25 : 10 : 65 at 8 min to 15 : 10 : 75 at 10 min to 80 : 10 : 10 at 11 min for 9 min), flow rate 0.2 mL/min. SIR acquisition mode, positive ion mode. Retention time: 7.6 min. Limit of detection, 2.5 nmol/L [Arellano *et al.* 2005].

Disposition in the Body Norlevorphanol is a product of (-)-3-phenoxy-*N*-methylmorphinan [Leinweber *et al.* 1981] and dextromethorphan metabolism via the action of CYP3A4, CYP2B6 or CYP2D6 [Yu, Haining 2001]. For phenotypic differences in dextromethorphan metabolism see Vetticaden *et al.* [1989] and Nagai *et al.* [1996].

Dose It is an intermediate in the synthesis of morphinan derivatives.

Normethadone

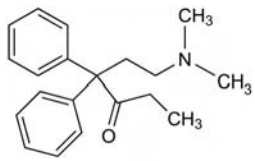
Narcotic Analgesic

$C_{20}H_{25}NO$ = 295.4

CAS—467-85-6

IUPAC Name 6-(Dimethylamino)-4,4-diphenyl-3-hexanone

Synonyms Desmethylmethadone; phenyldimazone.



Chemical Properties An oily liquid. pK_a 9.2. Log *P* (octanol/water), 3.8.

Normethadone Hydrochloride

$C_{20}H_{25}NO$, HCl = 331.9

CAS—847-84-7

Proprietary Name *Ticarda*

Chemical Properties Crystals. Mp 174° to 175°. Soluble in water and ethanol.

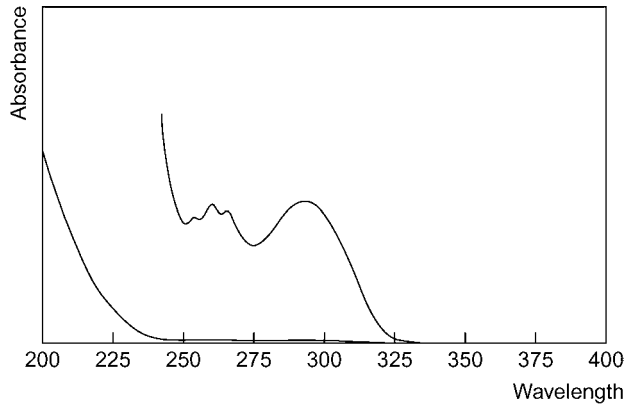
Colour Test Mandelin's test—yellow-green.

Thin-layer Chromatography System TA—R_f 0.56; system TB—R_f 0.40; system TC—R_f 0.34; system TAJ—R_f 0.19; system TAK—R_f 0.20; system TAL—R_f 0.78 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 2095.

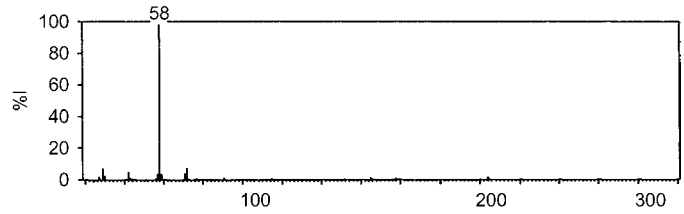
High Performance Liquid Chromatography System HC—*k* 0.53; system HY—RI 366.

Ultraviolet Spectrum Aqueous acid—253, 259, 265, 292 nm (A_1^1=19a).



Infrared Spectrum Principal peaks at wavenumbers 1711, 701, 1495, 1122, 1032, 760 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 58, 72, 29, 42, 71, 57, 59, 224.



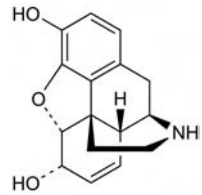
Normorphine

Narcotic Analgesic

$C_{16}H_{17}NO_3$ = 271.3

CAS—466-97-7

Synonyms Desmethylmorphine; (5α,6α)-7,8-didehydro-4,5-epoxymorphinan-3,6-diol.



Chemical Properties Crystals. Mp 273° to 277°. Slightly soluble in water and ethanol; practically insoluble in chloroform and ether. pK_a 9.8 (25°). Log *P* (ether/pH 7.0), −2.8.

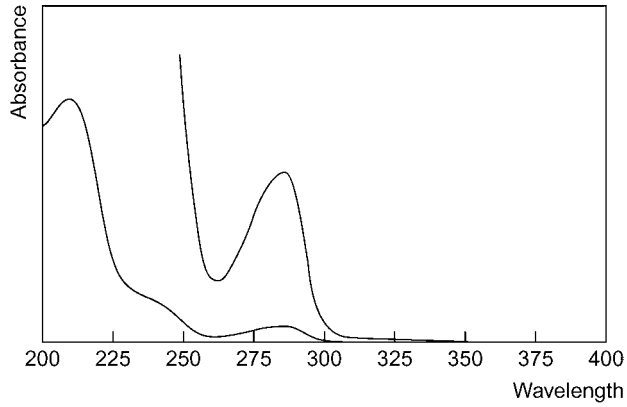
Colour Tests Mandelin's test—grey-green; Marquis test—violet.

Thin-layer Chromatography System TA—R_f 0.17; system TAJ—R_f 0.00; system TAK—R_f 0.00; system TAL—R_f 0.28 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 2459.

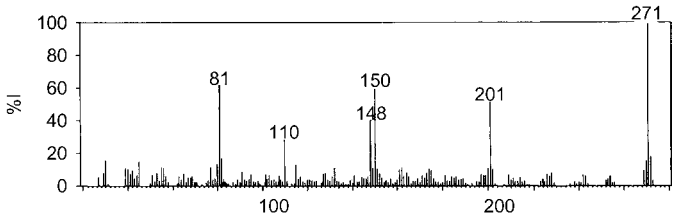
High Performance Liquid Chromatography System HA—*k* 2.9 (tailing peak); system HC—*k* 3.92; system HY—RI 133.

Ultraviolet Spectrum Aqueous acid—285 nm (A_1^1=57b).



Infrared Spectrum Principal peaks at wavenumbers 1312, 790, 1258, 1066, 1275, 1030 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 271, 81, 150, 201, 148, 110, 272, 82.



Quantification

Plasma **HPLC** Diode-array detection. Morphine and its metabolites.Limit of detection, 10 µg/L for normorphine [Wielbo *et al.* 1993]. Fluorometric detection. For method of quantification for morphine and its metabolites, including normorphine, see Glare *et al.* [1991]. Fluorescence detection. Limit of detection, <0.5 µg/L for morphine and its metabolites including normorphine [Venn, Michalkiewicz 1990].

HPLC–MS Morphine and its metabolites. Limit of detection, 0.3 µg/L for normorphine [Schanzle *et al.* 1999].

Serum **HPLC** See Plasma [Venn, Michalkiewicz 1990].

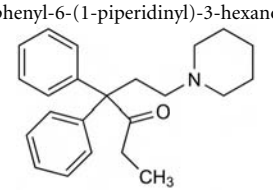
Norpipanone

Narcotic Analgesic

$C_{23}H_{29}NO$ = 335.5

CAS—561-48-8

IUPAC Name 4,4-Diphenyl-6-(1-piperidinyl)-3-hexanone



Chemical Properties Log *P* (octanol/water), 5.1.

Norpipanone Hydrochloride

$C_{23}H_{29}NO,HCl$ = 371.9

CAS—6033-41-6

Chemical Properties Crystals. Mp 181° to 182°. Soluble in water and ethanol.

Norpipanone Hydrobromide

$C_{23}H_{29}NO,HBr$ = 415.4

CAS—6033-42-7

Chemical Properties Crystals. Mp 192° to 193°. Soluble in water and ethanol.

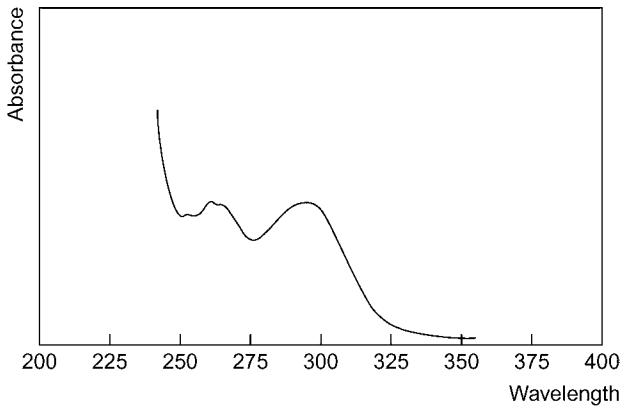
Colour Test Mandelin's test—brown→blue.

Thin-layer Chromatography System TA—R_f 0.68; system TB—R_f 0.58; system TC—R_f 0.50; system TE—R_f 0.80; system TL—R_f 0.38; system TAE—R_f 0.43 (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, dull orange).

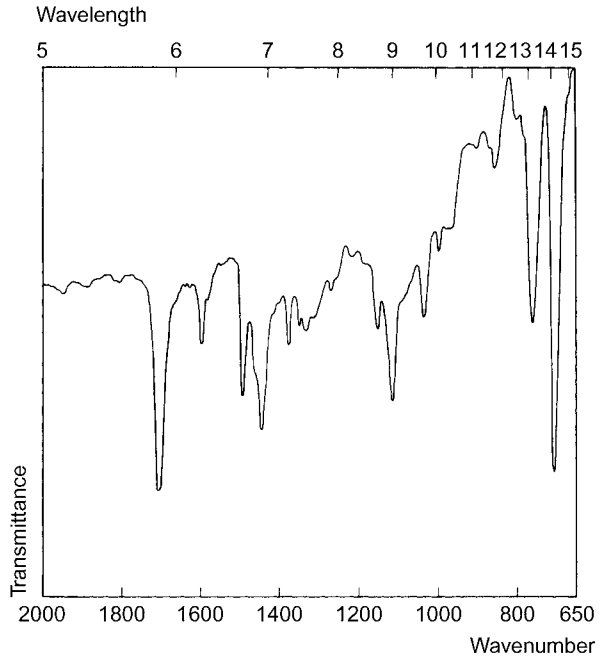
Gas Chromatography System GA—RI 2488.

High Performance Liquid Chromatography System HC—*k* 0.35; system HX—RI 466.

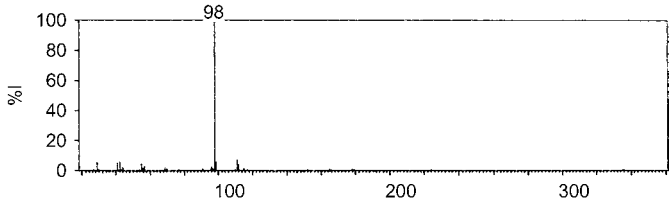
Ultraviolet Spectrum Aqueous acid—260 (A^{1}_{1}=17b), 294 nm.



Infrared Spectrum Principal peaks at wavenumbers 1705, 700, 1115, 1492, 1600, 1157 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 98, 111, 99, 42, 55, 41, 29, 112.



Dose Norpipanone hydrochloride has been given in doses of 18 mg daily.

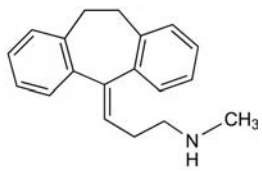
Nortriptyline

Antidepressant

$C_{19}H_{21}N$ = 263.4

CAS—72-69-5

Synonym 3-(10,11-Dihydro-5*H*-dibenzo[*a*,*d*]cyclohepten-5-ylidene)-*N*-methyl-1-propanamine



Chemical Properties pK_a 10.1. Log *P* (octanol/water), 4.51. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Nortriptyline Hydrochloride

$C_{19}H_{21}N$, HCl = 299.8

CAS—894-71-3

Synonyms 38489; nortriptylini hydrochloridum.

Proprietary Names *Acetexa*; *Allegron*; *Aventyl*; *Martimil*; *Norfenazin*; *Noritren*; *Norpress*; *Nortab*; *Norterol*; *Nortrilen*; *Ortrip*; *Pamelor*; *Sensaval*; *Vividyl*. It is an ingredient of *Motipress*; *Motival*.

Chemical Properties A white powder. Mp 213° to 215° (crystals from ether and ethanol). Soluble 1 in 50 of water, 1 in 10 of ethanol, and 1 in 5 of chloroform; practically insoluble in ether, acetone and benzene. pK_a 9.7. Log *P* (octanol/water pH 7.4), 1.63 [Meylan, Howard 1995].

Colour Tests Mandelin's test—brown→green; Marquis test—orange-brown; sulfuric acid—orange.

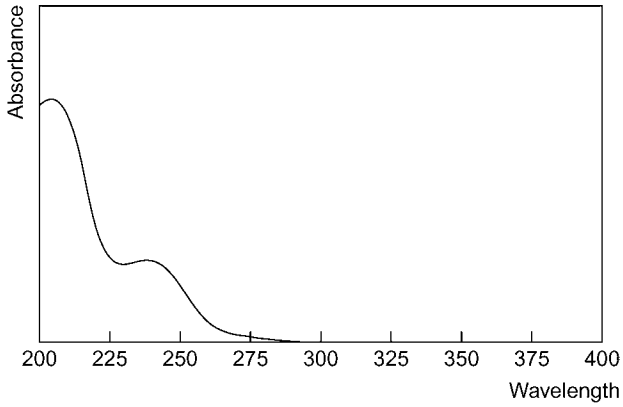
Thin-layer Chromatography System TA—R_f 0.34; system TB—R_f 0.27; system TC—R_f 0.16; system TAJ—R_f 0.01; system TAK—R_f 0.09; system TAL—R_f 0.68 (acidified iodoplatinate solution—positive; Dragendorff spray—positive; Marquis test—brown).

Gas Chromatography System GA—nortriptyline RI 2215, M (*cis*-10-OH-) RI 2375, M (*trans*-10-OH-) RI 2375, M (acetyl-) RI 2660; system GB—nortriptyline RI

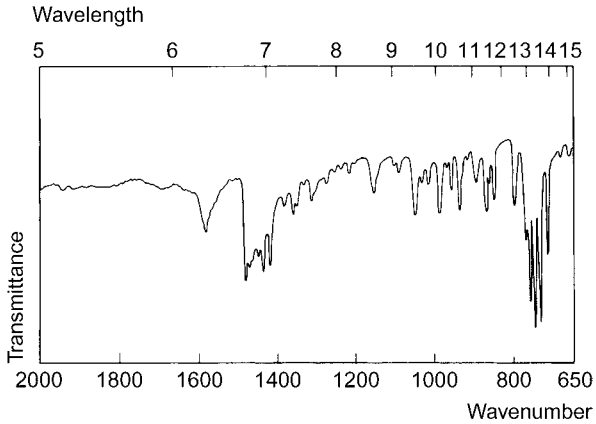
2304, M (*cis*-10-OH-) RI 2480, M (*trans*-10-OH-) RI 2494, M (norcyclobenzaprine) RI 2343, M (acetyl-) RI 2774, M (norcyclobenzaprine)-AC RI 2949; system GM—nortriptyline RRT 0.816, M (*cis*-10-OH-) RRT 1.261, M (*trans*-10-OH-) RRT 1.323, M (norcyclobenzaprine) RRT 0.880 (all relative to iprindole); system GS—RT 17.5 min.

High Performance Liquid Chromatography System HA—nortriptyline *k* 2.0, M (10-hydroxy-) *k* 1.8; system HF—*k* 4.58; system HY—RI 338; system HZ—RT 6.6 min; system HAA—RT 15.6 min; system HAM—not detected; system HAX—RT 13.7 min; system HAY—RT 6.8 min; system HAZ—*k* 1.71.

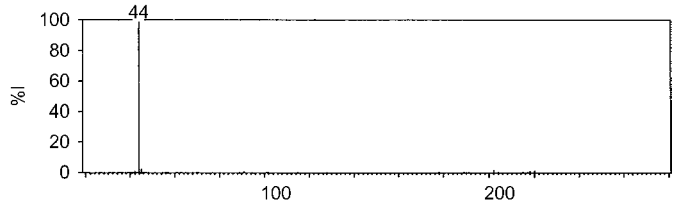
Ultraviolet Spectrum Aqueous acid—239 nm (A_1^1 = 517a). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 756, 742, 768, 720, 775, 1590 cm^{-1} (nortriptyline hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 44, 202, 45, 220, 218, 215, 91, – (nortriptyline); 44, 45, 26, 218, 215, 203, 202, 42 (10-hydroxynortriptyline).



Quantification See also under Amitriptyline.

Blood **GC-MS** Limits of detection, 0.02 mg/L for nortriptyline and 0.05 mg/L for amitriptyline [Melent'ev *et al.* 2007].

Plasma **GC** Column: Silica. Mobile phase: acetonitrile : 0.1 mol/L ammonium acetate (94 : 6). UV detection. Limit of detection, 10 µg/g for nortriptyline and 5 µg/g for amitriptyline [Kudo *et al.* 1997]. Column: HP 5890, DB-17 (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: N_2, 0.7 mL/min. Temperature programme: 140° to 220° at 20°/min to 270° at 2°/min. NPD. Limit of quantification, 125 µg/L [Ulrich, Martens 1997]. Column: Supelco SP2250 (30 m × 0.25 mm i.d., 0.2 µm) or HP-17 (25 m × 0.2 mm i.d., 0.17 mm). Carrier gas: Ar : CH_4 (95 : 5), 60 mL/min. Temperature programme: 200° to 275° over 22 min. NPD. Limits of quantification, 1 µg/L for nortriptyline and 3 µg/L for 10-hydroxynortriptyline [Anliker *et al.* 1992].

LC-MS Column: Sunfire C_{18} IS (20 × 2.1 mm i.d., 3.5 µm). Mobile phase: acetonitrile : 2 mmol/L ammonium formate (pH 3), flow rate 0.4 mL/min. ESI, positive ion mode. Retention time: 3.72 min. Limit of quantification, 2 µg/L [De Castro *et al.* 2008]. Column: RP-18 (150 × 2.1 mm i.d., 5 µm). Mobile phase: 0.01 mol/L ammonium acetate buffer (pH 5.5) : acetonitrile (50 : 50). ESI. Limit of detection, 0.1 µg/L for nortriptyline and other tricyclic antidepressants [Alves *et al.* 2007]. Column: Zorbax SB C_{18} (75 × 4.6 mm i.d., 3.5 µm). Mobile phase: acetonitrile : 25 mmol/L ammonium acetate buffer (pH 4.2, 40 : 60), flow rate 1.0 mL/min. APCI. Limit of quantification, 0.8 µg/L for nortriptyline and its metabolite 10-hydroxynortriptyline, limit of detection, 0.2 µg/L [Tybring *et al.* 1998]. Column: Hypersil (150 × 2.1 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.1 mol/L ammonium acetate (94 : 6), flow rate 0.4 mL/min. PICI. Limit of detection, 5 µg/g for nortriptyline and 2 µg/g for amitriptyline [Kudo *et al.* 1997].

Serum **GC** Column: HP-5 (25 m × 0.2 mm i.d., 0.33 µm). NPD. Limit of detection, 1.5 µg/L for nortriptyline; amitriptyline and hydroxyamitriptyline and 3 µg/L for 10-hydroxynortriptyline [Ulrich, Martens 1997].

HPLC Column: Spheri-5 C_{18} (100 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : phosphoric buffer (pH 2.36, 1 : 1), flow rate 1.0 mL/min. DAD (λ = 254 nm). Limit of quantification, 0.05 mg/L, limit of detection, 0.01 mg/L [Wozniakiewicz *et al.* 2008]. Column: C_{18}. Mobile phase: 0.15 mol/L SDS : 6% pentanol buffered (pH 7), flow rate 1.5 mL/min. Electrochemical detection. Limit of detection, 0.31 µg/L for nortriptyline and 0.25 µg/L for amitriptyline [Bose *et al.* 2005]. Column: Luna C_{18} (150 × 4.6 mm i.d., 3 µm). Mobile phase: acetonitrile : 0.01 mol/L triethylamine buffer (pH 3.0, 34 : 66), flow rate 0.85 mL/min. UV detection (λ = 242 nm). Limit of quantification, 2 µg/L [Olesen *et al.* 2000].

LC-MS Column: Hypersil Gold C_{18} (50 × 2.1 mm i.d.). Mobile phase: water : acetonitrile each with 0.1% formic acid. ESI. Limit of quantification, <22 µg/L, limit of detection, <15 µg/L for nortriptyline and other tricyclic antidepressants [Breaud *et al.* 2009].

Urine **GC-MS** Column: CP-SIL 5CB (10 m × 0.15 mm i.d., 0.12 µm). Carrier gas: H_2, 1 mL/min. Temperature programme: 110° for 0.5 min to 270° at 40°/min to 288° at 54°/min. EI ionisation, SIM acquisition mode. Limit of quantification, 50 µg/L, limit of detection, 25 µg/L [Rana *et al.* 2008].

Oral Fluid **LC-MS** See Plasma [De Castro *et al.* 2008].

Disposition in the Body Nortriptyline is readily absorbed after oral administration and undergoes first-pass metabolism. The main metabolic reactions are *N*-demethylation and 10-hydroxylation; glucuronide conjugation of nortriptyline and its metabolites also occurs. Up to 60% of the daily dose is excreted in the urine within 24 h, with <5% as unchanged drug, 30–50% as free or conjugated 10-hydroxynortriptyline, 6–15% as free and conjugated 10-hydroxydinortriptyline, and ~1% as dinortriptyline. Nortriptyline is a metabolite of amitriptyline.

Therapeutic Concentration In plasma, usually in the range 0.05–0.15 mg/L. Plasma concentrations vary considerably between individuals and are influenced by exposure to other drugs.

Following a single oral dose of 100 mg to 10 subjects, peak plasma concentrations of nortriptyline of 0.015–0.050 mg/L (mean, 0.03) and of 10-hydroxynortriptyline of 0.039–0.172 mg/L (mean, 0.10) were attained in 3–24 h [Nakano, Hollister 1978].

Following average daily oral doses of 82 mg to 62 subjects, the following steady-state plasma concentrations were reported: nortriptyline 0.03–0.34 mg/L (mean, 0.12), 10-hydroxynortriptyline 0.04–0.42 mg/L (mean, 0.16) and conjugated 10-hydroxynortriptyline 0.075–1.07 mg/L (mean, 0.37) [Dawling *et al.* 1982].

Toxicity Relatively few cases of serious intoxication have been attributed to nortriptyline in comparison to the tertiary amine tricyclic antidepressants. Toxic effects are usually associated with blood concentrations greater than 0.25 mg/L; concentrations above 1 mg/L may produce coma. Recovery has occurred after the ingestion of 2.5 g.

The following distribution was reported in nine fatal cases: blood 0 to 26 mg/L (mean, 11; 3 cases), kidney 7–94 µg/g (mean; 43, 5 cases), liver 8 to 220 µg/g (mean, 90; nine cases), urine 25–120 mg/L (mean, 76; 4 cases) [Bonnichsen *et al.* 1970]. Another fatal case has been reported [Rudorfer, Robins 1981].

Postmortem heart blood levels of 84.6 mg/L were found in a 31-year-old man who died after an overdose of nortriptyline [Rohrig, Prouty 1989].

A 42-year-old woman treated with nortriptyline 100 mg daily developed severe side effects and was found to have toxic serum levels (~2100 nmol/L). The patient was a poor metaboliser and treatment with a reduced dose of 25 mg daily was then given without adverse effect [Petersen, Brosen 1991].

A 62-year-old woman survived after an intentional overdose of nortriptyline despite having a peak plasma concentration of 2.29 mg/L; high levels (up to 2 mg/L) of (*E*)-10-hydroxynortriptyline were still detected for 4 to 5 days after drug intake [Franssen *et al.* 2003].

Bioavailability ~50–60%.

Half-life Plasma half-life, 15–90 h (mean, 30).

Volume of Distribution 14–40 L/kg (mean, 23).

Clearance Plasma, 7.2 mL/min/kg.

Protein Binding 90–95%.

Note For a review of tricyclic antidepressants, see Molnar, Gupta [1980]; for a review of the formation of active metabolites of psychotropic drugs, see Caccia, Garattini [1990].

Dose Usually, the equivalent of 30 to 100 mg nortriptyline daily; maximum 150 mg daily.

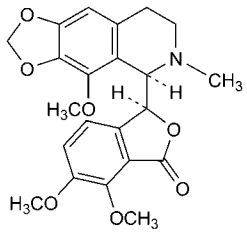
Noscapine

Cough Suppressant
$C_{22}H_{23}NO_7$=13.4
CAS—128-62-1

IUPAC Name (3*S*)-6,7-Dimethoxy-3-[(5*R*)-4-methoxy-6-methyl-7,8-dihydro-5*H*-[1,3]dioxolo[4,5-*g*]isoquinolin-5-yl]-3*H*-2-benzofuran-1-one
Synonyms (3*S*)-6,7-Dimethoxy-3-[(5*R*)-5,6,7,8-tetrahydro-4-methoxy-6-methyl-1,3-dioxolo[4,5-*g*]isoquinolin-5-yl]-1(3*H*)-isobenzofuranone; narcotine; lα-narcotine; noscapinum; NSC-5366.
Proprietary Names *Capval*; *Finipect*; *Nipaxon*; *Nitepax* (resin complex).

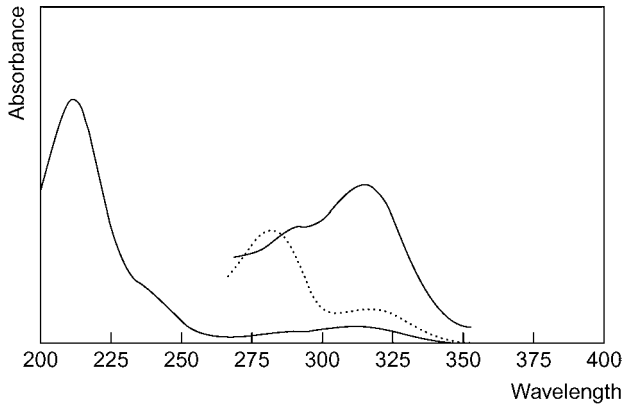


Chemical Properties An alkaloid obtained from opium. Colourless crystals or a fine white crystalline powder. Mp 176°, with decomposition. Practically insoluble in water; slightly soluble in ethanol and ether; soluble in acetone and chloroform. pK_{a1} 6.2 (20°). Log P (octanol/water), 2.0. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

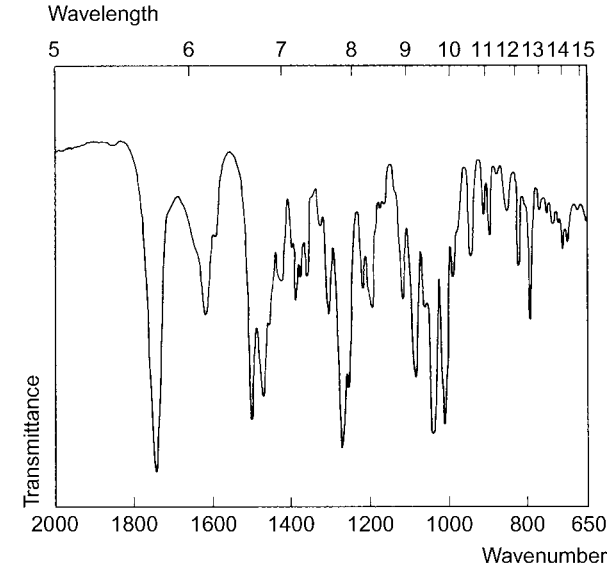
Noscapine Hydrochloride

$C_{22}H_{23}NO_7$, HCl, H_2O = 467.9
CAS—912-60-7 (anhydrous)
IUPAC Name 6,7-Dimethoxy-3-(4-methoxy-6-methyl-7,8-dihydro-5*H*-[1,3]dioxolo[4,5-*g*]isoquinolin-5-yl)-3*H*-2-benzofuran-1-one hydrate hydrochloride
Proprietary Names *Capval*; *Libronchin Prikkelhoest*; *Noscaflex*; *Roter Noscapect*; *Tuscalman*; *Tussanil N*.
Chemical Properties Hygroscopic, colourless crystals or a fine white crystalline powder. Mp ≈200°, with decomposition. Soluble 1 in 4 of water and 1 in 8 of ethanol; freely soluble in chloroform; practically insoluble in ether. Aqueous solutions may deposit the base on standing.

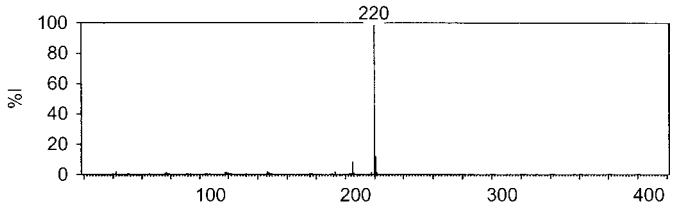
Colour Tests Liebermann's reagent—black; Marquis test—blue-violet (fades).
Thin-layer Chromatography System TA—R_f 0.64; system TB—R_f 0.21; system TC—R_f 0.74; system TE—R_f 0.78; system TL—R_f 0.64; system TAE—R_f 0.72; system TAF—R_f 0.75; system TAJ—R_f 0.65; system TAK—R_f 0.18; system TAL—R_f 0.93 (acidified iodoplatinate solution—positive).
Gas Chromatography System GA—RI 3145; system GB—RI 3358.
High Performance Liquid Chromatography System HA—*k* 0.3; system HC—*k* 0.15; system HS—*k* 0.01; system HX—RI 368; system HY—RI 289; system HAA—RT 12.8 min.
Ultraviolet Spectrum Aqueous acid—290, 312 (A_1^1 = 84a); aqueous alkali—281, 315 nm.



Infrared Spectrum Principal peaks at wavenumbers 1745, 1276, 1038, 1010, 1498, 1080 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 220, 221, 205, 147, 42, 193, 77, 118.



Quantification

Plasma **HPLC** Limit of quantification, ~7 µg/L [Chollet *et al.* 1997]. Column: Nucleosil C_{18} (100 × 4.6 mm i.d., 3 um). Mobile phase: 3 mmol/L dodecyl sulfate : acetonitrile in phosphate buffer (pH 2; 60 : 40), flow rate 1.0 mL/min. UV detection (λ = 310 nm). Limit of quantification, 9 µg/L [Johansson *et al.* 1988]. Column: LiChrosorb Si 60 (250 × 4 mm i.d., 5 µm). Mobile phase: hexane : methanol : chloroform : diethylamine (86.5 : 10.1 : 3.4 : 0.034), flow rate 1.0 mL/min. UV detection (λ = 310 nm). *k'*: 2.8. Limit of detection, 5 µg/L [Johansson *et al.* 1983].

LC-MS Column: Diamonsil C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : water : formic acid (70 : 30 : 0.5), flow rate 0.5 mL/min. APCI, SRM acquisition mode. Limit of quantification, 0.1 µg/L [Zhu *et al.* 2005].

Note For a spectrofluorimetry method in plasma and urine, see Vedsø [1961].

Serum **HPLC** Column: LiChrosorb CN (125 × 4 mm i.d., 5 µm). Mobile phase: methanol : 0.02 mol/L disodium hydrogen phosphate with 0.1 mol/L sodium perchlorate (pH 3.8; 25 : 75), flow rate 1.0 mL/min. UV detection (λ = 220 nm). Limit of detection, 1 µg/L [Haikala 1985]. Column: µBondapak C_{18} (300 × 3.9 mm i.d., 10 µm). Mobile phase: 0.6% potassium dihydrogen phosphate (pH 3.0) : acetonitrile (55 : 45), flow rate 0.9 mL/min. UV detection (λ = 254 nm). Limit of detection, 10 µg/L [Jensen 1983].

Disposition in the Body Rapidly absorbed after oral administration. Approximately 1% of a dose is excreted in the urine in 6 h as free and conjugated noscapine. See Tsunoda, Yoshimura [1981].

Therapeutic Concentration
Following a single oral dose of 150 mg to 5 subjects, peak plasma concentrations of 0.20–0.35 mg/L (mean 0.27) were attained in 0.5–2.5 h [Dahlström *et al.* 1982].
Protein Binding 93% to albumin and α_1-acid glycoprotein [Karlsson, Dahlström 1990].
Bioavailability Approximately 30%.
Half-life Plasma half-life, 1.5–4 h (mean 2.5).
Volume of Distribution 3–7 L/kg (mean 5) [Dahlström *et al.* 1982].
Clearance Plasma clearance, ~20 mL/min/kg.
Dose Up to 150 mg daily in divided doses.

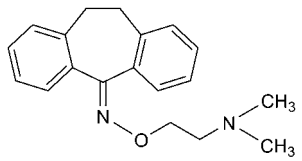
Noxiptiline

Antidepressant
$C_{19}H_{22}N_2O$ = 294.4
CAS—3362-45-6

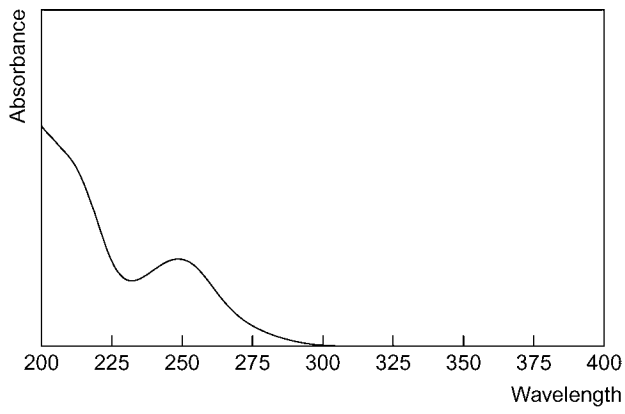
Synonyms Dibenzoxine; 10,11-dihydro-5*H*-dibenzo[*a*,*d*]cyclohepten-5-one-*O*-[2-(dimethylamino)ethyl]oxime; noxiptyline.



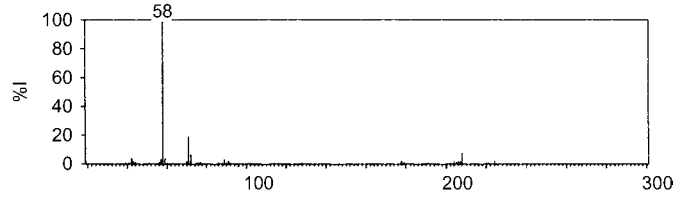
Chemical Properties Soluble in chloroform. Log *P* (octanol/water), 4.3.

Noxiptiline Hydrochloride
$C_{19}H_{22}N_2O$, HCl = 330.9
CAS—4985-15-3
Proprietary Names *Agedal*; *Nogédal*.
Chemical Properties White crystalline powder. Mp 189° to 191°. Soluble in water.

Colour Test Liebermann's reagent—black.
Thin-layer Chromatography System TA—R_f 0.53; system TAE—R_f 0.29; system TAG—R_f 0.18; system TB—R_f 0.43; system TC—R_f 0.35; system TE—R_f 0.66 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—noxiptyline RI 2270, M (dibenzocycloheptanone) RI 1850; system GB—M (OH-dibenzocycloheptanone)-H_2O RI 2200.
High Performance Liquid Chromatography System HF—*k* 1.63; system HY—RI 330.
Ultraviolet Spectrum Aqueous acid—250 nm (A_1^1 = 477a). No alkaline shift.



Mass Spectrum Principal ions at *m/z* 58, 71, 208, 72, 59, 42, 89, 57.



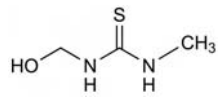
Quantification
Plasma **GC** Column: 1.5% V-17 on Gas Chrom Q (1.8 m × 0.3 cm i.d.). Carrier gas: N_2, 46 cm^3/min. Temperature: 230°. AFID. Limit of detection, 100 µg/L [Szyszko, Wejman 1981].
Urine **GC** See Plasma [Szyszko, Wejman 1981].
Dose The equivalent of 10 to 200 mg of noxiptiline daily.

Szyszko E, Wejman W (1981). Gas chromatographic determination of noxyptyline in substance, tablets and in biological material. *J Chromatogr* 219: 291–296.

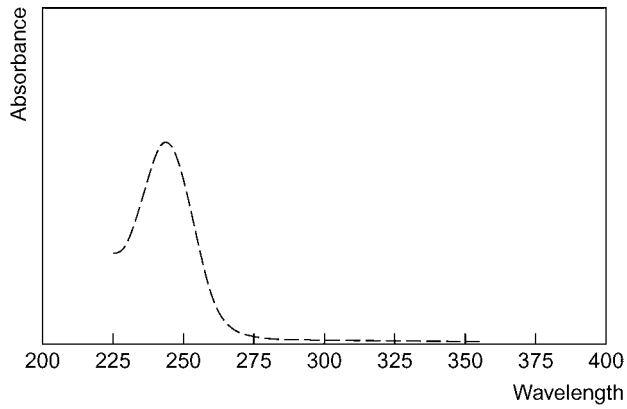
Noxytiolin

Antibacterial, Antifungal
$C_3H_8N_2OS$ = 120.2
CAS—15599-39-0

IUPAC Name [(Methylamino-λ^4-sulfanylidyne)methylamino]methanol
Synonyms *N*-(Hydroxymethyl)-*N'*-methylthiourea; noxythiolin.
Proprietary Name *Noxyflex-S*



Chemical Properties A white crystalline powder. Mp 88° to 90°. Soluble 1 in 10 of water; soluble in chloroform. Log *P* (octanol/water), −1.8.
Colour Test Palladium chloride—brown.
Thin-layer Chromatography System TA—R_f 0.74 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2370.
Ultraviolet Spectrum Methanol—244 nm (A_1^1=1180a).



Infrared Spectrum Principal peaks at wavenumbers 1558, 1042, 1230, 987, 1026, 1517 cm^{-1} (KBr disk).
Quantification
Serum **HPLC** For method, see Debruyne *et al.* [1985].
Use In concentrations of 1 to 2.5%.

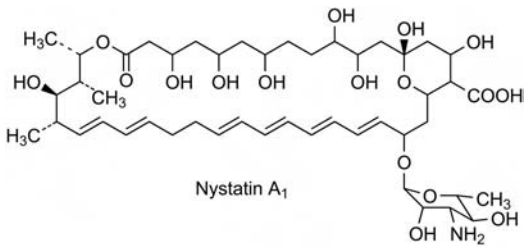
Debruyne D *et al.* (1985). Liquid chromatographic determination of noxytiolin and 1-methyl-2-thiourea in serum: application to pharmacokinetic studies in rabbits and humans. *J Pharm Sci* 74: 224–226.

Nystatin

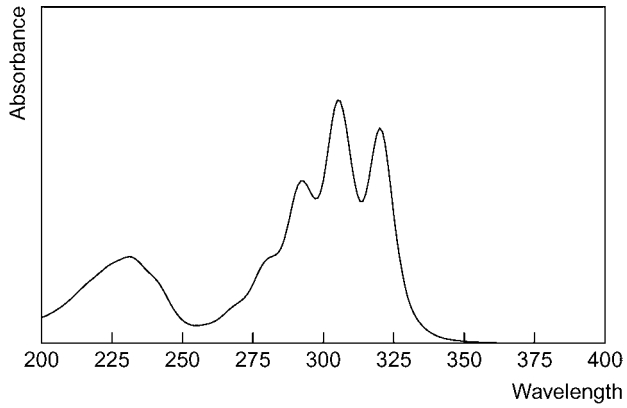
Antifungal
CAS—1400-61-9

IUPAC Name (4*E*,6*E*,8*E*,10*E*,14*E*,16*E*,18*S*,19*R*,20*R*,21*S*,35*S*)-3-[(2*S*,3*S*,4*S*,5*S*, 6*R*)-4Amino-3,5-dihydroxy-6-methyloxan-2-yl]oxy-19,25,27,29,32,33,35,37-octahydroxy-18,20,21-trimethyl-23-oxo-22,39-dioxabicyclo[33.3.1]nonatriaconta-4,6, 8, 10,14,16-hexaene-38-carboxylic acid

Synonyms Fungicidin; nistatina.
Proprietary Names *Nyspes*; *Nystan*; *Nystavescent*.



Chemical Properties Nystatin is an ingredient of many proprietary preparations—see Sweetman [2009]. A mixture of antifungal polyenes produced by the growth of certain strains of *Streptomyces noursei*, or by any other means. It consists largely of nystatin A. Approximate molecular formula: $C_{47}H_{75}NO_{17} = 926.1$. A yellow to light brown, hygroscopic powder. Very slightly soluble in water; sparingly soluble in ethanol; practically insoluble in chloroform and ether; freely soluble in dimethylformamide and formamide. Log *P* (octanol/water), 7.1.
Gas Chromatography System GA—RI 1945.
Ultraviolet Spectrum Aqueous alkali—291 (A_1^1=405b), 305 (A_1^1= 600b), 319 nm (A_1^1=530b).



Infrared Spectrum Principal peaks at wavenumbers 1067, 1000, 1570, 1175, 1316, 847 cm^{-1} (Nujol mull).
Uses Topically in preparations containing 100 000 units per g; orally in doses of 1500 000 to 4000 000 units daily.

Sweetman SC, ed. (2009). *Martindale: the Complete Drug Reference*, 36th edn. London: Pharmaceutical Press.

Obidoxime Chloride

Antidote (Organophosphate Insecticide Poisoning)

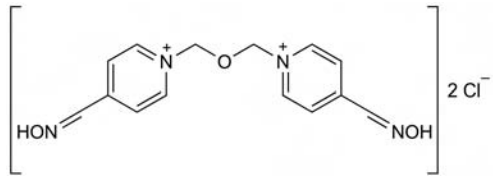
$C_{14}H_{16}Cl_2N_4O_3$ = 359.2

CAS—7683-36-5 (obidoxime); 114-90-9 (chloride)

IUPAC Name Oxo-[[1-[[4-(oxoazaniumylmethylidene)pyridin-1-yl]methoxymethyl]pyridin-4-ylidene]methyl]azanium dichloride

Synonyms BH-6; 1,1′-[oxybis(methylene)]bis[4-(hydroxyimino)methyl]pyridinium dichloride.

Proprietary Name *Toxogonin*

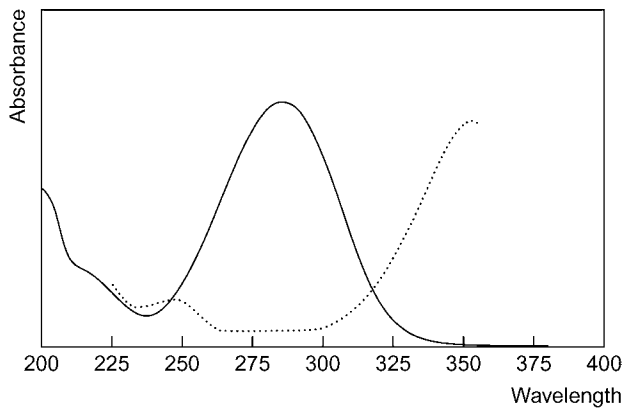


Chemical Properties White crystals, occurring in two interchangeable isomeric forms. Mp 225°, with decomposition. Freely soluble in water; slightly soluble in ethanol and methanol; practically insoluble in chloroform and ether. pK_a 7.6, 8.3 (25°). Log *P* (octanol/water), −2.0.

Colour Tests Mandelin's test—green→blue; methanolic potassium hydroxide—orange.

Thin-layer Chromatography System TA—R_f 0.01; system TB—R_f 0.00; system TC—R_f 0.00; system TE—R_f 0.00; system TL—R_f 0.00; system TAE—R_f 0.53; system TAF—R_f 0.08 (acidified iodoplatinate solution, positive).

Ultraviolet Spectrum Aqueous acid—285 nm (A^1_1=947a); aqueous alkali—353 nm (A^1_1=1440b).



Infrared Spectrum Principal peaks at wavenumbers 996, 1090, 1637, 1600, 1282, 847 cm^{-1} (KBr disk).

Quantification

***Serum* Polarography** Limit of detection, 4 mg/L [Korićanac *et al.* 1982].

***Urine* HPLC** UV detection (λ=288 nm). Limit of detection, 1.8 mg/L [Grasshoff *et al.* 2001].

Polarography See Serum [Korićanac *et al.* 1982].

Disposition in the Body Obidoxime chloride is poorly absorbed after oral administration. After IM administration, >80% of a dose is excreted unchanged in the urine in 24 h.

Therapeutic Concentration

Following IM doses of 2.5 to 10 mg/kg to 10 subjects, peak plasma concentrations of 6.3 to 26.5 mg/L were attained in about 20 min [Sidell, Groff 1970].

Obidoxime plasma levels of 35.9 to 71.8 mg/L were achieved when it was administered to 5 subjects as an IV bolus of 250 mg followed by continuous infusion of 750 mg/24 h [Thiermann *et al.* 1997].

Half-life Plasma half-life, about 1.4 h.

Distribution in Blood Plasma : whole blood ratio, 1.9.

Dose Obidoxime chloride has been given parenterally in doses of 250 mg.

Grasshoff C *et al.* (2001). Internal standard high-performance liquid chromatography method for the determination of obidoxime in urine of organophosphate-poisoned patients. *J Chromatogr B Biomed Sci Appl* 753: 203–208.

Ochratoxins

Isocoumarin Derivative, Mycotoxin

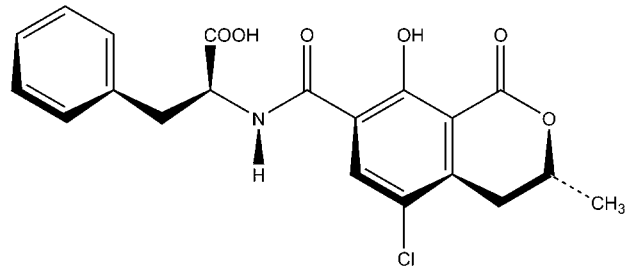
Ochratoxin A

$C_{20}H_{18}ClNO_6$ = 403.8

CAS—303-47-9

IUPAC Name (*R*)-*N*-[(5-Chloro-3,4-dihydro-8-hydroxy-3-methyl-1-oxo-1*H*-2-benzopyran-7-yl)carbonyl]-L-phenylalanine

Synonym OTA



Chemical Properties Crystals from xylene, Mp 169°; also reported as Mp 90° from benzene [O'Neil *et al.* 2006]. Secondary metabolite mainly produced by the fungi *Penicillium verrucosum* and *Aspergillus alutaceus* (formerly *ochraceus*), which are encountered in food crops grown in semitropical and temperate climates [Soleas *et al.* 2001]. It has also been observed that members of the *Aspergillus niger* section *nigri* have colonised grapes, wine and vine fruits [Magan, Aldred 2005]. When treated at 140° with 24% moisture content, OTA content in extruded barley meal is reduced by 53.7% after 30 s and 83.5% after 70 s residence time [Castells *et al.* 2006].

Ochratoxin B

$C_{20}H_{19}NO_6$ = 369.4

CAS—4825-86-9

IUPAC Name (*R*)-*N*-[(3,4-Dihydro-8-hydroxy-3-methyl-1-oxo-1*H*-2-benzopyran-7-yl)carbonyl]-L-phenylalanine

Synonym OTB

Chemical Properties Crystals from methanol, Mp 221°; also reported as 208° to 209° [O'Neil *et al.* 2006].

Ochratoxin C

$C_{22}H_{22}ClNO_6$ = 431.9

CAS—4865-85-4

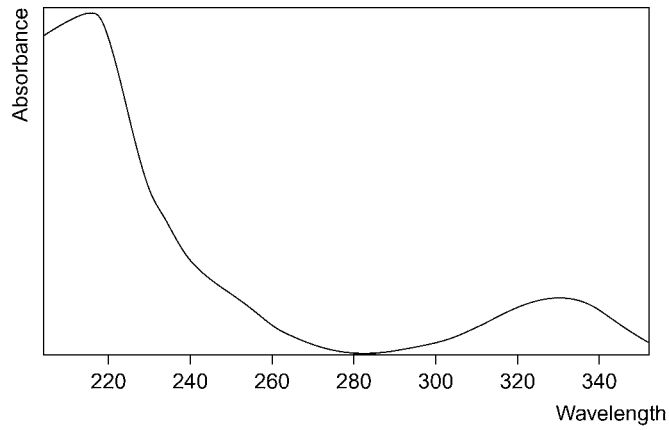
IUPAC Name (*R*)-*N*-[(5-Chloro-3,4-dihydro-8-hydroxy-3-methyl-1-oxo-1*H*-2-benzopyran-7-yl)carbonyl]-L-phenylalanine ethyl ester

Synonym OTC

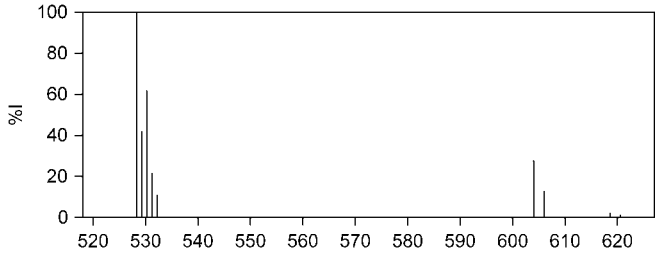
Chemical Properties Amorphous ethyl ester of OTA.

Thin-layer Chromatography Plates: fluorescent silica gel F_{254}. Solvent system: toluene : ethyl acetate : formic acid (6 : 3 : 1). UV detection (λ = 366 nm). Limit of detection, 0.1 μg/spot [Odhav, Naicker 2002].

Ultraviolet Spectrum



Mass Spectrum [Soleas *et al* 2001].



Quantification

Blood **HPLC** Column: Spherisorb C_{18} (250 × 4.6 mm i.d., 5 μm). Mobile phase: methanol : 9% glacial acetic acid (pH 2.3; 18 : 7), flow rate 1 mL/min. Post-column derivatisation with 25% ammonium hydroxide solution. Fluorescence detection (λ_{ex} = 390 nm, λ_{em} = 440 nm). Retention times: OTA 5 min; relative retention times (relative to OTA) ochratoxin-α 0.71, OTB 0.89, ochratoxin-α methyl ester 0.89, OTA methyl ester 1.32, OTB methyl ester 1.13, OTC 1.50, OTA propyl ester 1.76, OTA butyl ester 2.13. Limit of quantification, 5 pg/g [Zimmerli, Dick 1995].

Plasma **HPLC** Column: Lichrospher C_{18} (125 × 4.0 mm i.d., 5 μm). Mobile phase: acetonitrile : water : acetic acid (pH 3.16; 500 : 500 : 5), flow rate 0.5 mL/min. Fluorescence detection (λ_{ex} = 336 nm, λ_{em} = 464 nm). Retention time: ~9 min. Limit of detection, 0.2 μg/L [Peraica *et al.* 1999]. Column: C_{18} (250 × 3.2 mm i.d., 5 μm). Mobile phase: acetonitrile : methanol : 0.15 mol/L orthophosphoric acid (1 : 1 : 1), flow rate 0.8 mL/min. Fluorescence detection (λ_{ex} = 330 nm, λ_{em} = 470 nm). Retention time: 4.8 to 6.2 min. Limit of detection, 0.15 μg/L [Scott *et al.* 1998].

LC-MS Column: Inertsil ODS-2 (250 × 2.1 mm i.d., 5 μm). Mobile phase: 0.17% formic acid in acetonitrile : methanol : water (1 : 1 : 1), flow rate 0.2 mL/min. ESI, positive ion mode, SIM and MRM acquisition modes. Limit of detection, 0.5 ppb [Lau *et al.* 2000].

Serum **TLC** Plates: silica gel 60 (20 × 10 cm, 0.2 mm). Solvent system: benzene : methanol : acetic acid (8 : 1 : 1). Fluorescence detection (λ_{ex} = 333 nm, λ_{em} = 500 nm). Limit of quantification, 0.1 to 0.5 μg/L [Ruprich, Ostry 1993].

HPLC Column: Nucleosil C_{18} (250 × 4.6 mm i.d., 5 μm). Mobile phase: water : acetonitrile : glacial acetic acid (49.5 : 49.5 : 1), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 333 nm, λ_{em} = 460 nm). Retention time: 10.9 min. Limit of quantification, 0.05 μg/L [Dinis *et al.* 2007]. Column: Spherisorb C_{18} (250 × 4.6 mm i.d., 5 μm). Mobile phase: methanol : 9% glacial acetic acid (pH 2.3; 18 : 7), flow rate 1 mL/min. Post-column derivatisation with 25% ammonium hydroxide solution. Fluorescence detection (λ_{ex} = 390 nm, λ_{em} = 440 nm). Retention times: OTA 5 min; relative retention times (relative to OTA) ochratoxin-α 0.71, OTB 0.89, ochratoxin-α methyl ester 0.89, OTA methyl ester 1.32, OTB methyl ester 1.13, OTC 1.50, OTA propyl ester 1.76, OTA butyl ester 2.13. Limit of quantification, 5 ng/kg [Zimmerli, Dick 1995]. Column: Spherisorb C_{18} (150 × 4.6 mm i.d., 3 μm). Mobile phase: methanol : 0.1 mol/L potassium phosphate buffer (pH 7.5; 56 : 44), flow rate 0.8 mL/min. Fluorescence detection (λ_{ex} = 380 nm, λ_{em} = 450 nm). Retention time: OTA 10 min, OTA methyl ester 20 min. Limit of quantification, OTA 0.1 μg/L; limit of detection, OTA 0.05 μg/L [Breitholtz-Emanuelsson *et al.* 1994].

Urine **HPLC** Column: C_{18} (150 × 4.6 mm i.d.). Mobile phase: water : acetonitrile : acetic acid (111 : 87 : 2), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 332 nm, λ_{em} = 460 nm). Limit of quantification, 0.05 μg/L; limit of detection, 0.01 μg/L [Vatinno *et al.* 2007].

Milk **HPLC** Column: Lichrosorb C_{18} (250 × 4.0 mm i.d., 10 μm). Mobile phase: 2% acetic acid : acetonitrile : methanol (40 : 35 : 25), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 333 nm, λ_{em} = 443 nm). Retention times: OTA 7.3 min, aflatoxin M_1 3.1 min. Limit of quantification, OTA, aflatoxin M_1 0.01 μg/L [Navas *et al.* 2005].

Other **GC-MS** White Wine Samples. Column: DB-5MS (15 m × 0.25 mm i.d., 0.25 μm). Carrier gas: He, 3.7 mL/min. Temperature programme: 150° to 220° at 8°/min for 5 min to 290° at 25°/min. EI ionisation, SIM acquisition mode. Retention time: 14.5 min (silyl derivative). Limit of quantification, 1 μg/L; limit of detection, 0.1 μg/L [Soleas *et al.* 2001]. Food Samples. Column: Supelco PTE-5 fused silica capillary (10 m × 0.25 mm i.d., 0.25 μm). Carrier gas: H, 70 cm/s. Temperature programme: 60° for 2 min to 310° at 25°/min. NICI at 70 eV, MID. Limit of detection, 0.1 ppb (diazomethane derivative) [Jiao *et al.* 1992].

HPLC Rice and Dried Fruit Samples. Column: C_{18} (150 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : water : acetic acid (49.5 : 49.5 : 1), flow rate 0.8 mL/min. Fluorescence detection (λ_{ex} = 333 nm, λ_{em} = 464 nm). Retention time: approx. 9 min. Limit of quantification, 0.02 μg/kg for rice, 0.03 μg/kg for dried fruits and nuts [Zinedine *et al.* 2007]. Coffee Samples. Column: Nucleosil C_{18} (250 × 4.0 mm i.d., 5 μm). Mobile phase: acetonitrile : water : acetic acid (pH 3.0; 99 : 99 : 2), flow rate 0.8 mL/min. Fluorescence detection (λ_{ex} = 335 nm, λ_{em} = 475 nm). Limit of detection, 0.8 μg/kg [Fujii *et al.* 2006]. Spice Samples. Column: Lichrospher C_{18} (125 × 4.0 mm i.d., 5 μm). Mobile phase: acetonitrile : water : acetic acid (426 : 564 : 10). Fluorescence detection (λ_{ex} = 330 nm, λ_{em} = 460 nm). Retention time: 8.2 min. Limit of detection, 0.2 μg/kg [Fazekas *et al.* 2005]. Rice Samples. Column: NovaPak C_{18} (150 × 3.9 mm i.d., 5 μm). Mobile phase: acetonitrile : water : acetic acid (57 : 43 : 2), flow rate 0.5 mL/min. Fluorescence detection (λ_{ex} = 330 nm, λ_{em} = 440 nm). Limit of detection, 0.5 ppb [Park *et al.* 2005]. Maize Samples. Column: Lichrospher C_{18} (125 × 4.0 mm i.d., 5 μm). Mobile phase: methanol : water : acetic acid (70 : 30 : 2), flow rate 0.5 mL/min. Fluorescence detection (λ_{ex} = 336 nm, λ_{em} = 464 nm). Limit of detection, 0.25 μg/kg [Domijan *et al.* 2005]. White Wine and Grape Juice and Red Wine and Red Grape Juice Samples. Column: C_{18} (250 × 4.6 mm i.d., 5 μm). Mobile phase: 0.083 mol/L phosphoric acid : methanol : acetonitrile (1 : 1 : 1 for white wine and white grape juice; 433 : 283 : 283 for red wine and red grape juice), flow rates 0.8 mL/min for white wine and white grape juice; 1.0 mL/min for red wine and red grape juice. Fluorescence detection (λ_{ex} = 330 nm, λ_{em} = 470 nm). Limit of quantification, 20 ng/L for white wine, 40 ng/L for red wine and red and white grape juice; limit of detection, 4 ng/L for white wine, 8 ng/L for red wine and red and white grape juice [Ng *et al.* 2004]. Cereal-based Products. Column: Inertsil ODS-3 (250 × 4.0 mm i.d., 5 μm). Mobile phase: water : acetonitrile : acetic acid (50 : 49 : 1), flow rate 1 mL/min. Fluorescence detection (λ_{ex} = 333 nm, λ_{em} = 443 nm). Retention time: ~10 min. Limit of quantification, 0.13 μg/kg; limit of detection, 0.06 μg/kg [Biffi *et al.* 2004]. Dried Vine Fruit Samples. Column: SupelcoSil C_{18} (150 × 4.6 mm i.d., 3 μm). Mobile phase: acetonitrile : water : acetic acid (99 : 99 : 2), flow rate 0.6 mL/min. Fluorescence detection (λ_{ex} = 330 nm, λ_{em} = 440 nm). Retention time: 8.5 min. Limit of quantification, 0.1 μg/kg; limit of detection, 0.03 μg/kg [Lombaert *et al.* 2004]. Cocoa Bean Samples. Column: Tracer Extrasil ODS-2 (250 × 4.0 mm i.d., 5 μm). Mobile phase: methanol : acetonitrile : 5 mmol/L sodium acetate (pH 2.2; 29 : 29 : 42), flow rate 1.5 mL/min. Fluorescence detection (λ_{ex} = 225 nm, λ_{em} = 461 nm). Retention time: 5.7 min. Limit of quantification, 0.1 μg/kg, limit of detection, 0.04 μg/kg [Amezqueta *et al.* 2004]. Wine and Grape Juice Samples. Column: Microsorb C_{18} (250 × 4.6 mm i.d., 5 μm). Mobile phase: methanol : 9% acetic acid in water (72 : 28), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 335 nm, λ_{em} = 470 nm). Limit of detection, 21 ng/L [Rosa *et al.* 2004]. Ham Samples. Column: Extrasil ODS-2 (150 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : water : acetic acid (99 : 99 : 2), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 333 nm, λ_{em} = 460 nm). Limit of detection, 0.04 μg/kg (methyl ester derivative) [Chiavaro *et al.* 2002]. Beer Samples. Column: Hypersil BDS C_{18} (150 × 4.0 mm i.d., 3 μm). Mobile phase: acetonitrile : water : acetic acid (45 : 54 : 1), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 332 nm, λ_{em} = 462 nm). Retention time: 8.3 min. Limit of quantification, 10 μg/L, limit of detection, 3 μg/L [Tangni *et al.* 2002]. White Wine, Red Wine and Beer Samples. Column: Nucleosil C_{18} (250 × 4.0 mm i.d., 5 μm). Mobile phase: 3 mmol/L orthophosphoric acid in water (0.2 mL in 1 L, pH 3.1): 3 mmol/L orthophosphoric acid in acetonitrile (0.2 mL in 1 L, pH 3.4; 60 : 40 to 40 : 60 over 5 min for 10 min), flow rate 0.5 mL/min. UV detection (λ = 333 nm). Retention time: 19.2 min (methyl ester derivative). Limit of quantification, 0.1 μg/L; limit of detection, 0.05 μg/L [Soleas *et al.* 2001]. Baby Food samples. Column: C_{18} (250 × 4.7 mm i.d., 5 μm). Mobile phase: 0.011% glacial acetic acid : methanol (40 : 60 to 0 : 100 over 10 min to 40 : 60 over 1 min for 19 min), flow rate 1 mL/min. Post-column derivatisation with 25% ammonium hydroxide, flow rate 0.2 mL/min. Fluorescence detection (λ_{ex} = 390 nm, λ_{em} = 440 nm). Limit of quantification not reported [Burdaspal *et al.* 2001]. Pig-derived Pâté Samples. Column: Spherisorb ODS2 (250 × 3.0 mm i.d., 10 μm). Mobile phase: 5 mmol/L sodium acetate (pH 2.2) : methanol : acetonitrile (62 : 19 : 19), flow rate 1.5 mL/min. Fluorescence detection (λ_{ex} = 225 nm, λ_{em} = 461 nm). Retention time: ~24 min. Limit of quantification, 0.84 μg/kg, limit of detection, 0.56 μg/kg [Jimenez *et al.* 2001]. Grain and Cereal Samples. Column: Lichrospher C_{18} (125 × 4.0 mm i.d., 5 μm). Mobile phase: methanol : water (pH 2.3; 60 : 40). Fluorescence detection (λ_{ex} = 330 nm, λ_{em} = 500 nm). Retention time: 12.9 min. Limit of detection, 0.4 μg/L [Vrabcheva *et al.* 2000]. Column: Spherisorb ODS-2 (250 × 3.2 mm i.d.). Mobile phase: 0.1% orthophosphoric acid : acetonitrile (50 : 50), flow rate 0.5 mL/min. Fluorescence detection (λ_{ex} = 333 nm, λ_{em} = 470 nm). Limit of detection, 0.1 μg/kg [Scudamore *et al.* 1999]. Milk and Infant Formulas. Column: Spherisorb ODS-2 (150 × 4.6 mm i.d., 3 μm). Mobile phase: 10 mmol/L tetrabutylammonium bromide in methanol : potassium phosphate buffer (pH 7.5; 51 : 49), flow rate 0.8 mL/min. Fluorescence detection (λ_{ex} = 380 nm, λ_{em} = 450 nm). Limit of detection, 10 ng/L [Skaug 1999].

LC-MS Fungal Cultures. Column: Purospher C_{18} LichroCart 250-3. Mobile phase: methanol : 10 mmol/L ammonium acetate containing 20 μmol/L sodium acetate (20 : 80 for 4 min to 70 : 30 over 4 min for 18 min to 90 : 10 over 1 min for 4 min), flow rate 0.4 mL/min. ESI, positive ion mode. Retention times: OTA 15.4 min; aflatoxins G_2, G_1, B_2, B_1 13.5 min, 13.8 min, 14.2 min, 14.5 min, respectively; citrinine 14.5 min, sterigmatocystin 25.8 min. Limit of quantification, 200 ng [Tuomi *et al.* 2001]. Pig Kidney and Rye Flour. Column: Spherisorb ODS-1 (250 × 2.0 mm i.d., 5 μm). Mobile phase: acetonitrile : water : methanol : acetic acid (50 : 30 : 20 : 0.5), flow rate 0.25 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention time: 4.6 min (methyl ester derivative). Limit of detection, 0.02 μg/kg [Jorgensen, Vahl 1999].

Note For a review of LC-MS methods for the detection of OTA and related substances, see Zollner and Mayer-Helm [2006]; for chromatographic methods for the detection of OTA and related substances, see Valenta [1998]. For an enzyme immunoassay method for the detection of OTA and OTB, see Vrabcheva *et al.* [2000]; for OTA, see Fujii *et al.* [2006] and Kawamura *et al.* [1989]. For the HPLC analysis of OTA and its hydroxyl metabolite in urine, see Castegnaro *et al.* [1990]; for the determination of OTA and other mycotoxins using two-dimensional TLC, see Tapia [1985].

Disposition in the Body Readily absorbed after oral administration from the gastrointestinal tract, especially from the small intestine. Ochratoxins undergo some degree of first-pass metabolism and are extensively bound to serum albumin and other macromolecules, with only 0.02% remaining unbound. OTA crosses the

placental barrier in animal models and is found to be transferred to breast milk in humans. OTA is excreted into bile and urine and is hydrolysed to the non-toxic congener ochratoxin-α (i.e. the isocoumarin moiety lacking the phenylalanine group), which can, in turn, be absorbed; consequently, OTA undergoes enterohepatic circulation. *In vitro* studies in human liver microsomes have shown that OTA is oxidised to 4-OH-OTA epimers by cytochrome P450 enzymes. It has been suggested that OTA is a substrate for the family of organic anion transporter proteins that is found in numerous organ systems including the kidney.

Toxicity OTA was first detected in human serum samples collected in 1977 in Germany and in 1980 in former Yugoslavia. Epidemiological studies have shown that the presence of OTA in blood is associated with Balkan endemic nephropathy and/or urinary system tumours. Several further studies have found significantly higher blood serum or plasma levels of OTA in patients with kidney or urinary disorders compared with healthy people. However, intra-person variations of serum concentrations of OTA over time (as much as 10-fold) have been noted in several countries. In addition to differences seen in epidemiological studies, regional variations have been observed in healthy humans within several countries, which may be explained by differences in diet or climate. OTA is ubiquitous in human blood serum/plasma and indicates continuous exposure to the toxin, mainly from food intake [Scott 2005].

Estimated OTA intake can be calculated by multiplying the plasma concentration (in ng/mL) by a factor of 1.34 to obtain the intake in ng/kg bodyweight. However, the variations described when measuring concentrations in serum/plasma of healthy volunteers contribute to the variability when attempting to relate serum/plasma concentrations to dietary intake [Breitholtz *et al.* 1991]. The EU has set maximum permissible limits for OTA of 5 μg/kg in whole grain and 3 μg/kg for processed products [Scudamore 2005]. The provisional tolerable daily intake (TDI) established by the Joint FAO/WHO Expert Committee on Food Additives is 14 ng/kg bodyweight [JEFCA 1995].

In a study investigating ochratoxin levels in humans and a possible link to nephropathy, serum was collected from healthy individuals and individuals suffering from different kidney disorders and analysed. The mean serum concentrations of OTA were reported as follows:

Group	*Mean OTA (μg/L)*	*Lowest (μg/L)*	*Highest (μg/L)*
Healthy	0.53	0.12	2.0
Transplant recipients	0.47	0.20	1.0
Chronic glomerulonephritis	0.54	0.05–0.1	1.4
Renal calculus or cyst	0.49	0.17	1.0
Chronic renal failure	0.60	0.20	1.4
Patients on dialysis	1.4	0.18	14

[Breitholtz-Emanuelsson *et al.* 1994].

A group of 50 breast-lactating mothers and their infants who were breast-fed for at least 4 months were analysed for OTA concentrations in serum and breast milk. A total of 36 of these volunteers (72%) tested positive for OTA, with serum and breast milk mean concentrations of 4.28 and 1.89 μg/L, respectively. The corresponding OTA serum mean concentration in infants was 1.26 μg/L [Hassan *et al.* 2006].

In another study investigating the presence of OTA in human milk in relation to dietary intake, women with a high dietary intake of liver paste and cakes were more likely to have OTA-contaminated breast milk [Skaug *et al.* 2001].

OTA was detected in 38 out of 92 colostrum samples collected from women in the first 24 h postpartum, with a range of 0.2 to 7.3 μg/L [Kovacs *et al.* 1995].

Half-life Reported as 20 h during the first 6 days and 35.6 days from day 6 onwards.

Clearance Reported as 1.5 mL/kg·h.

Distribution in Blood Serum : blood ratio, 2.0.

Protein Binding >99%, predominantly to serum albumin, with also high affinity binding to macromolecules of lower molecular weight.

Note For proceedings of a workshop on OTA in food, see Supplement 1 to *Food Additives and Contamination*, volume 22 [2005]. For a study on the toxicokinetics of OTA in several species including humans, see Hagelberg *et al.* [1989].

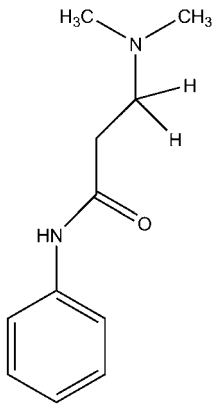
Octacaine

Anaesthetic (Local)

$C_{14}H_{22}N_2O = 234.3$

IUPAC Name 3-(Diethylamino)-*N*-phenylbutanamide

Synonym Diethylaminobutyranilide



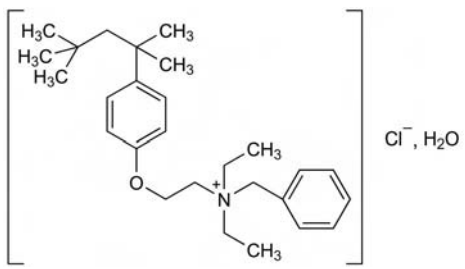
Chemical Properties White crystalline powder. Mp 46° to 47°. Soluble in chloroform, ethanol, ether and benzene. Extracted by chloroform from aqueous alkaline solutions.

Octacaine Hydrochloride
Proprietary Name It is an ingredient of *Risunal*.
Chemical Properties White crystalline powder. Mp 132° to 134°. Soluble in water and ethanol.

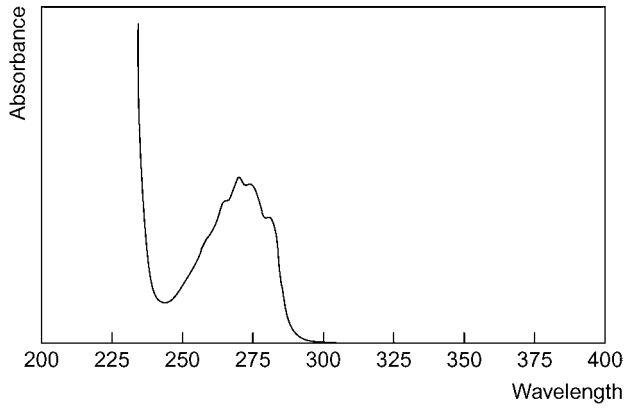
Colour Tests Ammonium molybdate test—faint blue (limit of detection, 1.0 µg); ammonium vanadate test—red (limit of detection, 0.25 µg); Vitali's test—–/–/bright yellow (limit of detection, 0.25 µg).
Thin-layer Chromatography System T1—R_f 0.56 (location reagent acidified iodoplatinate spray, positive reaction).
Gas Chromatography System G2/225—retention time 1.13 relative to diphenhydramine, retention time 0.25 relative to codeine.
Ultraviolet Spectrum Octacaine hydrochloride in 0.1 N sulfuric acid, maximum at 240 nm (E1%, 1 cm 430).
Infrared Spectrum Principal peaks at wavenumbers at 1538 or 1587, 1433 or 1656, 755, 1488 cm^{-1} (KBr disk).
Use Octacaine hydrochloride is used as a 5% ointment.

Octafonium Chloride

Cationic Disinfectant
$C_{27}H_{42}$, $ClNOH_2O$ = 450.1
CAS—15687-40-8 (anhydrous)
IUPAC Name (*Z*)-But-2-enedioate; dibutyltin(2+)
Synonyms Benzyldiethyl-{2-[4-(1,1,3,3-tetramethylbutyl)phenoxy]ethyl} ammonium chloride monohydrate; octaphonium chloride; phenoctide.



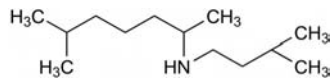
Chemical Properties A white crystalline powder. Soluble 1 in 5 of water; soluble in ethanol and chloroform.
Colour Tests Liebermann's reagent—black; Mandelin's test—violet-brown; Marquis test—grey-brown; sulfuric acid—grey-brown.
Thin-layer Chromatography System TA—R_f 0.15, streaking (Dragendorff spray, positive).
Gas Chromatography System GA—RI 2013.
Ultraviolet Spectrum Aqueous acid—269 (A_1^1=32a), 274, 281 nm; ethanol—263 (A_1^1=25b), 269 (A_1^1=30b), 274 (A_1^1=29b), 282 nm (A_1^1=25b).



Infrared Spectrum Principal peaks at wavenumbers 1240, 840, 760, 1515, 708, 1185 cm^{-1} (Nujol mull).

Octamylamine

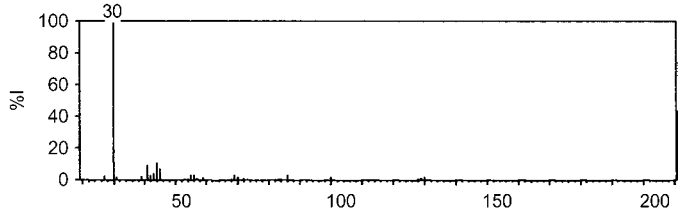
Antispasmodic
$C_{13}H_{29}N$ = 199.4
CAS—502-59-0
IUPAC Name 6-Methyl-*N*-(3-methylbutyl)heptan-2-amine
Synonym *N*-Isopentyl-1,5-dimethylhexylamine; octisamyl.



Chemical Properties An oily liquid. Log *P* (octanol/water), 5.0.

Octamylamine Hydrochloride
$C_{13}H_{29}N$,HCl = 235.8
CAS—5964-56-7
Proprietary Name *Octometine*
Chemical Properties White crystals. Mp 121°. Soluble in water, ethanol and ether.

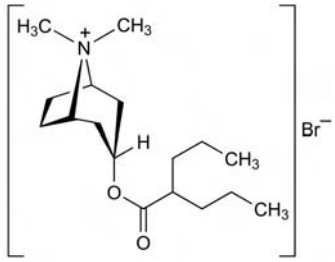
Thin-layer Chromatography System TA—R_f 0.22; system TB—R_f 0.28; system TC—R_f 0.11; system TL—R_f 0.25 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1303.
Mass Spectrum Principal ions at *m/z* 30, 44, 41, 45, 86, 55, 43, 69.



Dose Octamylamine hydrochloride is given in doses of 100 to 200 mg.

Octatropine Methylbromide

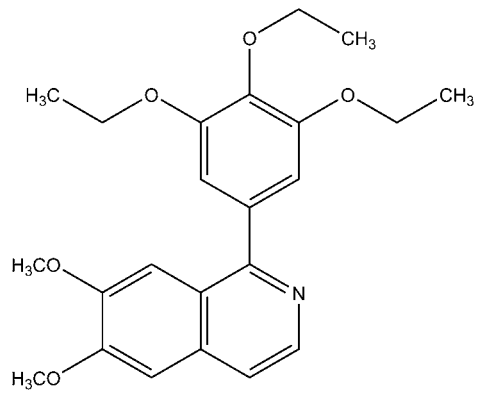
Anticholinergic
$C_{17}H_{32}BrNO_2$ = 362.3
CAS—80-50-2
IUPAC Name [(1*R*,5*S*)-8,8-Dimethyl-8-azoniabicyclo[3.2.1]octan-3-yl] 2-propylpentanoate bromide
Synonyms Anisotropine methobromide; anisotropine methylbromide; *endo*-8,8-dimethyl-3-[(1-oxo-2-propylpentyl)oxy]-8-azoniabicyclo-[3.2.1]octane bromide.
Proprietary Name *Valpin*



Chemical Properties A white, glistening, hygroscopic powder. Mp 329°. Soluble in water; freely soluble in ethanol and chloroform; practically insoluble in ether. Log *P* (octanol/water), 0.6.
Thin-layer Chromatography System TA—R_f 0.02 (acidified iodoplatinate solution, positive).
Infrared Spectrum Principal peaks at wavenumbers 1735, 1155, 1178, 1040, 1237, 1203 cm^{-1} (KBr disk).
Dose 30 to 150 mg daily.

Octaverine

Antispasmodic
$C_{23}H_{27}NO_5$ = 397.5
CAS—549-68-8
IUPAC Name 6,7-Dimethoxy-1-(3,4,5-triethoxyphenyl)isoquinoline
Synonyms Oktaverine; 1-(3,4,5-triethoxyphenyl)-6,7-dimethoxyisoquinoline.



Chemical Properties Free base. Insoluble in water. Octaverine is extracted by organic solvents from aqueous alkaline solutions.

Octaverine Hydrochloride

$C_{23}H_{27}NO_5$,HCl = 433.9
CAS—6775-26-4
IUPAC Name 6,7-Dimethoxy-1-(3,4,5-triethoxyphenyl)isoquinoline hydrochloride
Proprietary Name *Gastrolena-Sorbitol*
Chemical Properties Crystals. Mp 199° to 200°. Sparingly soluble in water (1 : 500). Aqueous solutions are acid to litmus [O'Neil *et al.* 2006].

Colour Tests Ammonium molybdate test—green (limit of detection, 0.1 µg); ammonium vanadate test—red (limit of detection, 0.1 µg); sulfuric acid-formaldehyde test—green→brown (limit of detection, 0.1 µg); Vitali's test—red-brown/brown/red-orange (limit of detection, 0.1 µg).
Thin-layer Chromatography System T10—R_f 0.75 (location reagent potassium permanganate spray, positive reaction).
Ultraviolet Spectrum Ethanol—247, 321, 358 nm.
Disposition in the Body
Therapeutic Concentration Octaverine (94 mg/L) is 4-times as active as papaverine in suppressing spontaneous contractions of the rat uterus [Goldberg, Shapero 1954a]. Octaverine (0.5 to 2.0 mg/kg) is twice as effective as papaverine at causing hypotension and counteracting adrenaline-induced hypertension in rabbits [Goldberg, Shapero 1954a].
Toxicity In mice, the LD_{50} is approximately 200 mg/kg [Goldberg, Shapero 1954b].

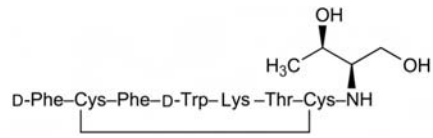
Goldberg AA, Shapero M (1954b). A comparative study of the spasmolytic activities of octaverine, perparine and papaverine. *J Pharm Pharmacol* 6: 171–177.
O'Neil MJ *et al.* (2006). *The Merck Index, An Encyclopedia of Chemicals: Drugs and Biologicals*, 14 edn. Whitehouse Station, NJ: Merck & Co., Inc.

Octreotide

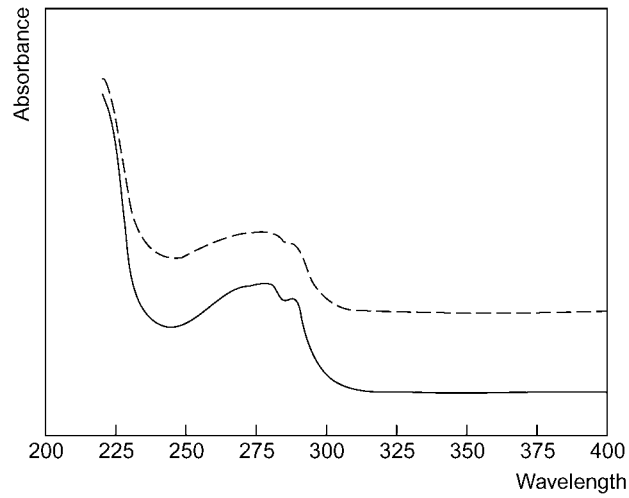
Somatostatin Analogue (Octopeptide)
$C_{49}H_{66}N_{10}O_{10}S_2$ = 1019.3
CAS—83150-76-9
IUPAC Name 10-(4-Aminobutyl)-19-[(2-amino-3-phenylpropanoyl)amino]-16-benzyl-*N*-(1,3-dihydroxybutan-2-yl)-7-(1-hydroxyethyl)-13-(1*H*-indol-3-ylmethyl)-6,9,12,15,18-pentaoxo-1,2-dithia-5,8,11,14,17-pentazacycloicosane-4-carboxamide
Synonyms D-Phenylalanyl-L-cysteinyl-L-phenylalanyl-D-tryptophyl-L-lysyl-L-threonyl-*N*-[2-hydroxy-1-(hydroxymethyl)propyl]-L-cysteinamide cyclic (2→7)-disulfide; SMS-201-995.
Proprietary Name *Longastatin*



Octreotide Acetate

$C_{49}H_{66}N_{10}O_{10}S_2.xC_2H_4O_2$
CAS—79517-01-4
Synonym SMS-201-995
Proprietary Name *Sandostatin*

High Performance Liquid Chromatography Column: Lichrospher-60 RP select B (125 × 4.0 mm i.d., 5 µm). Mobile phase: acetonitrile : 20 mmol/L phosphate buffer (pH 7.4, 35 : 65). UV detection (λ=210 nm). Retention time: 5.5 min [Kyaterekera *et al.* 1999].
Ultraviolet Spectrum Aqueous acid—280, 288 nm (no alkaline shift).



Disposition in the Body Octreotide is rapidly and completely absorbed after SC administration and peak plasma concentrations are reached within 30 min. It undergoes considerable hepatic metabolism, with 30 to 40% of a dose eliminated in this way. Between 11 and 33% of the dose is excreted unchanged in urine and <2% in faeces. It is distributed to body tissues.
Therapeutic Concentration The therapeutic range is 1 to 3 µg/L.
Fourteen acromegalic patients, male and female, aged between 35 and 59 years, were administered with 100 µg of octreotide SC. Peak plasma concentrations of 3.5 µg/L were reached after 27.4 min [Nicholls *et al.* 1990].
Eight healthy male volunteers were administered with IV doses of 25, 50, 100 and 200 µg octreotide. Peak plasma concentrations of 5.7, 9.6, 24.2 and 27.8 µg/L, respectively, were reached within 3.7, 4.1, 3.4 and 7.3 min. Subcutaneous doses were also administered at doses of 50, 100, 200 and 400 µg to the same individuals. Peak levels were observed to be 2.4, 4.4, 10.6 and 23.5 µg/L at 26, 26, 35 and 28 min, respectively [Kutz *et al.* 1986].
Toxicity It has been reported that one patient was accidentally overdosed with Sandostatin at a dose of 250 µg/h for 48 h instead of 25 µg/h, and no side-effects were experienced [Datapharm Communications Ltd 2002]
Half-life 1.5 h (prolonged in the elderly and those with renal failure).
Volume of Distribution 0.27 L/kg; also reported as 13.6 L.
Clearance Total body clearance, 9.6 L/h which may be increased to 18 L/h in patients with acromegaly and reduced to 4.5 L/h in those with chronic renal failure.
Protein Binding 65% (mainly to liprotein and to a lesser extent, albumin).
Distribution in Blood The drug is distributed mainly to the plasma component of blood. The amount of drug bound to blood cells is negligible.
Dose The initial dose is 50 µg once or twice daily which is gradually increased to 200 µg three times daily, if necessary.

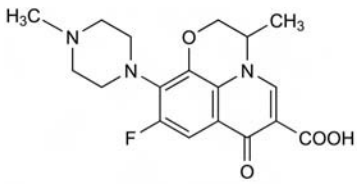
Ofloxacin

Quinolone Antibiotic, Antibacterial
$C_{18}H_{20}FN_3O_4 = 361.4$
CAS—82419-36-1; 83380-47-6

Synonyms DL-8280; 9-fluoro-2,3-dihydro-3-methyl-10-(4-methyl-1-piperazinyl)-7-oxo-7*H*-pyrido[1,2,3-*de*]-1,4-benzoxazine-6-carboxylic acid; HOE-280; ofloxacine.

Proprietary Names *Apo-Oflox*; *Bactoflox*; *Bioquil*; *Exocin*; *Floxal*; *Floxstat*; *Inoflox*; *Konovid*; *Megasin*; *Monoflocet*; *Occidal*; *Oflovir*; *O-Flox*; *Ofloxcin*; *Qinolon*; *Seracin*; *Tarivid*; *Trafloxal*.



Chemical Properties Colourless needles from ethanol. Mp 250° to 257°.

Levofloxacin (Ofloxacin *S*-(-)-form)

$C_{18}H_{20}FN_3O_4 = 361.4$
CAS—100986-85-4

Synonyms DR-3355; HR-355; RWJ-25213; *S*-(−)-ofloxacin.

Proprietary Names *Cravit*; *Quixin*; *Tavanic*.

Chemical Properties Hemihydrate needles from ethanol/ethyl ether. Mp 225° to 227°.

Ofloxacin Hydrochloride

Proprietary Name *Tarivid intravenous infusion*

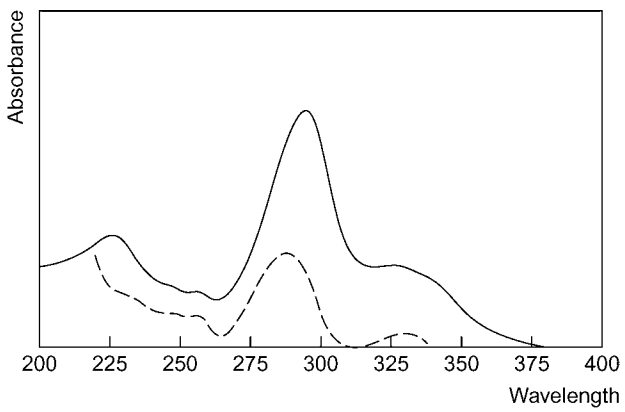
Thin-layer Chromatography System TE—R_f 0.00; system TF—R_f 0.00.

Plate: silica F_{254} (10 × 10 cm). Mobile phase: chloroform : methanol : triethylamine (3 : 1 : 1). Diastereometric L-leucinamide derivative of (−)-ofloxacin, R_f 0.57; (+)-ofloxacin derivative, 0.49 [Lehr, Damm 1988].

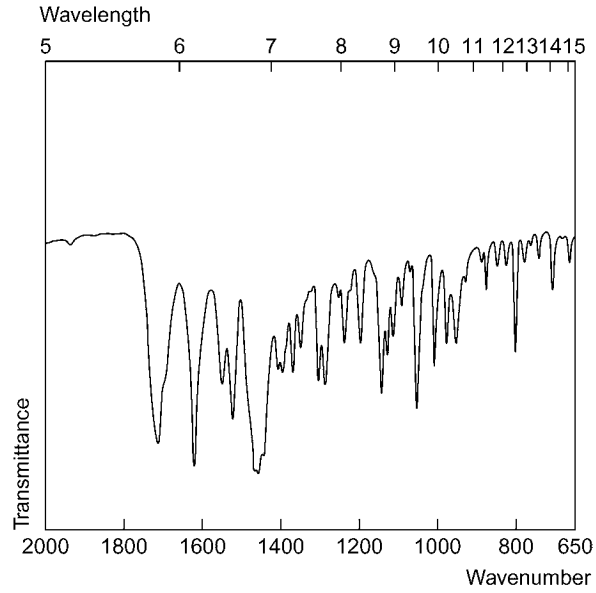
High Performance Liquid Chromatography System HX—RI 314; system HY—RI 260; system HZ—RRT 2.0 min; system HAA—retention time 8.6 min.

Column: ODS.A YMC (250 × 4.6 mm i.d., 5 µm). Mobile phase: 50 mmol/L phosphate buffer (pH 2.6) : acetonitrile (82 : 18), flow rate 1.5 mL/min. Fluorescence detection (λ_{ex}=290 nm, λ_{em}=460 nm). Retention time: 7 min [Immanuel *et al.* 2001].

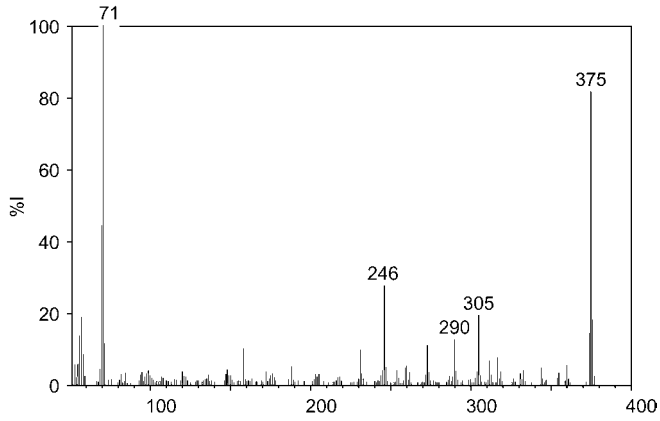
Ultraviolet Spectrum Aqueous acid —225, 226, 256, 326 nm; basic—288, 332 nm.



Infrared Spectrum Principal peaks at wavenumber 1459, 1621, 1713, 1086 cm^{-1} (KBr pellet).



Mass Spectrum Principal ions at *m/z* 71, 375, 70, 246, 305, 290 (ofloxacin-Me).



Quantification

***Plasma* HPLC** Limit of detection, 0.01 mg/L [Knoller *et al.* 1998]. Column: ET Resolvosil-BSA-7 (150 × 4 mm i. d.). Mobile phase: 0.2 mol/L phosphate buffer (pH 8) : propan-2-ol (97 : 3), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex}=298 nm, λ_{em}=458 nm). Retention time: (−)-ofloxacin, 5.2 min; (+)-ofloxacin, 7.5 min. Limit of detection, 0.003 mg/L [Lehr, Damm 1988].

***Serum* HPLC** Fluorescence detection (λ_{ex}=295 nm, λ_{em}=490 nm). Limit of detection, 10 µg/mL [Bottcher *et al.* 2001]. See Plasma. [Knoller *et al.* 1998].

***Urine* HPLC** See Plasma. [Knoller *et al.* 1998]. See Plasma. Limit of detection, 0.08 mg/L [Lehr, Damm 1988].

***Tissue* HPLC** See Serum [Bottcher *et al.* 2001].

Disposition in the Body Ofloxacin is absorbed rapidly after oral administration. The rate of absorption may be affected by food but not the extent. It is widely distributed in body fluids, including CSF, and tissue penetration is good. It also crosses the placenta and is distributed in breast milk. A small amount of the dose is metabolised to desmethyl ofloxacin (moderate activity) and *N*-oxide ofloxacin. Excretion is mainly via the kidneys, with about 80% of the dose being excreted as the unchanged drug in urine over 24 to 48 h and between 4 to 8% being excreted in faeces.

Bioavailability Approximately 100% after oral administration.

Therapeutic Concentration The serum therapeutic concentration range is 1.0 to 4.0 mg/L; trough, 0.05 to 5.0 mg/L and peak, 1.0 to 7.0 mg/L.

Half-life 5 to 8 h; renal impairment 15 to 60 h.

Protein Binding 25%.

Dose The dose varies between 200 and 400 mg daily, and may also be increased to 400 mg twice daily if necessary.

Bottcher S *et al.* (2001). An HPLC assay and a microbiological assay to determine levofloxacin in soft tissue, bone, bile and serum. *J Pharm Biomed Anal* 25: 197–203.

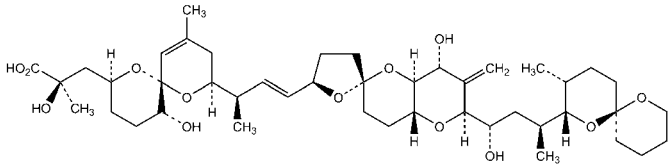
Okadaic Acid

Halochondrine, Protein Phosphatase Inhibitor, Phycotoxin
$C_{44}H_{68}O_{13}$ = 805.0
CAS—78111-17-8

IUPAC Name 9,10-Deepithio-9,10-didehydroacanthifolicin
Synonym Halochondrine A



Chemical Properties Crystals from dichloromethane/hexane. Mp 171° to 175°. Also reported as crystals from benzene–trichloromethane. Mp 164° to 166° [O'Neil *et al.* 2006]. Soluble in dimethyl sulfoxide, ethanol, methanol. First isolated from the black sponge *Holichondria okadaii* but essentially originates from 10 planktonic species of dinoflagellate belonging to the genera *Dinophysis* and *Phalacroma* and 6 benthic species of the genus *Prorocentrum;* it accumulates in bivalve shellfish and other marine life to cause diarrhetic shellfish poisoning (DSP) in consumers of contaminated seafood. More than 20 analogues of okadaic acid have been isolated, including a range of 7-*O*-acetylated derivatives (DTX-3 family), which may be produced in the shellfish by metabolism of the toxins. Other major analogues include 35-methylokadaic acid (known as dinophysistoxin, DTX-1 family) or an isomer of okadaic acid (DTX-2 family) [Holmes, Teo 2002]. DTX-3 originally described a group of DSP toxin derivatives in which saturated or unsaturated fatty acyl groups are attached to the 7-OH group of DTX-1. However, it has been shown that any of the parent toxins, okadaic acid, DTX-1 and DTX-2, can be acylated with a range of saturated and unsaturated fatty acids from C_{14} to C_{18} [Hallegraeff 1995; Wright 1995]. Ultraviolet exposure to an okadaic acid standard derivatised with anthryldiazomethane for 30 min prior to HPLC analysis resulted in a complete disappearance of the anthrylmethylokadaic acid peak. Peak area was inversely proportional to UV exposure time [Rawn *et al.* 2005].

Quantification

Other **HPLC** Shellfish Samples. Column: Nucleosil C_{18} (150 × 4.0 mm i.d., 5 µm) or Hypersil C_{18} (250 × 4.0 mm i.d., 5 µm). Mobile phase: acetonitrile : water (80 : 20 for Nucleosil, 85 : 15 for Hypersil), flow rate 1.1 mL/min. Fluorescence detection (λ_{ex} = 356 nm, λ_{em} = 440 nm). Limit of detection, 0.1 mg/kg hepatopancreas (Nucleosil column), 0.05 mg/kg hepatopancreas (Hypersil column; 1-bromoacetylpyrene derivative) [Gonzalez *et al.* 1998; 2000]. Phytoplankton Samples (*Dinophysis acuta*). Column: C_{18} (250 × 3.2 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol : water (80 : 5 : 15), flow rate 0.5 mL/min. Fluorescence detection (λ_{ex} = 365 nm, λ_{em} = 412 nm). Retention time: okadaic acid 22.2 min, DTX-2 25.2 min, DTX-2B and DTX-2C co-elute at 27.4 min, DTX-1 35.7 min. Limit of detection, okadaic acid 5 µg/L [Draisci *et al.* 1998a]. Shellfish Samples. Column: C_{18} (250 × 4.0 mm i.d., 5 µm). Mobile phase: acetonitrile : water (82 : 18), flow rate 1.1 mL/min. Fluorescence detection (λ_{ex} = 365 nm, λ_{em} = 412 nm). Limit of quantification, okadaic acid 1 mg/kg hepatopancreas, DTX-1 0.5 mg/kg hepatopancreas (9-anthrylmethyl derivative) [Aase, Rogstad 1997]. Mussel Samples. Column: C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water (75 : 25), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 365 nm, λ_{em} = 412 nm). Retention times: okadaic acid approx. 19.0 min, DTX-1 approx. 38 min (tetramethylammonium hydroxide derivatives). Limit of quantification, okadaic acid and DTX-1 70 µg/kg hepatopancreas, okadaic acid and DTX-1 15 µg/kg whole tissue [Lawrence *et al.* 1996]. Shellfish Samples. Column: C_{18} (250 × 4.0 mm i.d., 5 µm). Mobile phase: acetonitrile : water (80 : 20), 1.0 mL/min. Fluorescence detection (λ_{ex} = 254 nm, λ_{em} = 412 nm). Limit of quantification, okadaic acid, DTX-1, DTX-2, DTX-3, 7-*O*-acetylokadaic acid 0.1 mg/kg (9-anthrylmethyl derivatives) [Quilliam 1995]. Column: C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol : water (75 : 10 : 15), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex} = 365 nm, λ_{em} = 412 nm). Limit of detection, 0.05 mg/kg (9-anthrylmethyl derivative) [Lee *et al.* 1987].

LC-MS Cell Extracts. Column: C_{18} (150 × 2.1 mm i.d., 5 µm). Mobile phase: 2 mmol/L ammonium acetate (pH 5.8) : methanol (30 : 70 for 8 min to 20 : 80 over 22 min for 15 min), flow rate 0.2 mL/min. ESI, negative ion mode, SIM acquisition mode. Retention time: okadaic acid 5.4 min, methyl okadaate 15.7 min, norokadanone 14.9 min, 2-hydroxymethylallyl okadaate 12.4 min, 5-hydroxy-2-methylene-pent-3-enyl okadaate 17.2 min, 7-hydroxy-2,4-dimethyl-hepta-2,4-dienyl okadaate 24.2 min, 7-hydroxy-4-methyl-2-methylene-hept-4-enyl okadaate 25.8 min, 5,7-dihydroxy-2,4-dimethylene-heptyl okadaate 15.0 min, 5-hydroperoxy-7-hydroxy-2,4-dimethylene-heptyl okadaate 15.1 min, 4-formyl-2-methylene-pent-4-enyl okadaate (DTX-6) 13.1 min, 7-hydroxy-2-methyl-hepta-2,4-dienyl okadaate 20.5 min, 7-hydroxymethyl-2-methylene-octa-4,7-dienyl okadaate 28.1 min. Limit of quantification not reported [Paz *et al.* 2007]. Phytoplankton Samples. Column: C_{18} (150 × 2.1 mm i.d., 5 µm). Mobile phase: 1.0 mmol/L aqueous ammonium acetate : 1.0 mmol/L ammonium acetate in acetonitrile (60 : 40 to 55 : 45 over 0.5 min, to 25 : 75 over 0.1 min, held 5.49 min), flow rate 0.2 mL/min. ESI, negative ion mode, MRM acquisition mode. Retention times: okadaic acid 2.8 min, DTX-2 3.5 min, DTX-1 6.6 min. Limit of detection, 0.48 µg/kg [Fernandez Puente *et al.* 2004]. Shellfish Samples. Column: C_{18} (150 × 2.0 mm i.d., 5 µm). Mobile phase: acetonitrile-water (1 : 9) : acetonitrile-water (9 : 1) : 33 mmol/L ammonium hydroxide–500 mmol/L formic acid in water (85 : 5 : 10 for 2 min to 5 : 85 : 10 over 11 min for 12 min), flow rate 0.2 mL/min. ESI, negative ion mode, MRM acquisition mode. Retention times: okadaic acid 15.2 min, DTX-1 17.9 min, DTX-2 15.8 min. Limit of detection, 0.01 mg/kg [McNabb *et al.* 2005]. Column: C_8 (50 × 2.1 mm i.d., 3 µm). Mobile phase: 2 mmol/L ammonium formate : 50 mmol/L formic acid in acetonitrile (50 : 50), flow rate 0.25 mL/min. ESI, negative ion mode, SIM acquisition mode. Limit of detection, 41 µg/kg in mussels, 13 µg/kg in cockles, 26 µg/kg in oysters and scallops [Stobo *et al.* 2005]. Mussel and Clam Samples. Column: C_{18} (250 × 2.1 mm i.d., 5 µm). Mobile phase: acetonitrile : water (85 : 15) with 0.1% formic acid, flow rate 0.2 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention times: okadaic acid 5.1 min, DTX-1 5.5 min. Limit of detection, 5 µg/kg [Jorgensen *et al.* 2005]. Phytoplankton. Column: C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.01 mol/L aqueous trifluoroacetic acid-0.01% heptafluorobutyric acid (5 : 95 to 40 : 60 over 12 min to 70 : 30 over 5 min for 10 min), flow rate 0.7 mL/min. ESI, positive ion mode, MID. Retention times: okadaic acid ~24 min, DTX-1 ~29 min. Limit of detection, okadaic acid, DTX-1 1 ng on-column [Dahlmann *et al.* 2003]. Column: C_{18} (125 × 2.0 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.05% acetic acid (65 : 35), flow rate 0.2 mL/min. ESI, negative ion mode, SIM acquisition mode. Limit of detection, 0.01 µg/g digestive gland, 0.25 µg/100 g edible parts [Vale, Sampayo 2002]. Scallop Hepatopancreas. Column: Inertsil ODS-2 (150 × 2.1 mm i.d., 5 µm). Mobile phase: 1 mmol/L ammonium acetate : methanol (60 : 40 to to 0 : 100 over 20 min for 10 min), flow rate 0.2 mL/min. Sonic spray ionisation, negative ion mode. Retention times: okadaic acid 17.0 min, DTX-1 18.7 min. Limit of detection, okadaic acid, DTX-1 3 µg/L [Ito, Tsukada 2002]. Scallop Samples. Columns: (A) Symmetry C_{18} (150 × 2.1 mm i.d., 3.5 µm) for okadaic acid, DTX-1, pectenotoxins 6 and 2SA; (B) Capcellpak C_{18} (250 × 1.5 mm i.d., 5 µm) for palmitoyl derivatives of okadaic acid and DTX-1. Mobile phases: acetonitrile : 0.05% acetic acid (7 : 3) for column A; methanol : 2.5% acetic acid (98 : 2) for column B; flow rate 0.1 mL/min. ESI, negative ion mode, SIM acquisition mode. Limit of detection, , 5 and 10 g/kg for okadaic acid, 10 and 20 µg/kg for DTX-1, 20 and 40 µg/kg for okadaic acid palmitoyl derivative, 20 and 40 µg/kg for DTX-1 palmitoyl derivative, in muscle and digestive glands, respectively [Goto *et al.* 2001]. Bivalve Molluscs. Column: C_{18} (150 × 2.0 mm i.d., 5 µm). Mobile phase: acetonitrile : water (7 : 3) with 0.1% acetic acid, flow rate 0.2 mL/min. ESI, negative ion mode, SIM acquisition mode. Retention times: okadaic acid ~5.0 min, DTX-1 ~7.8 min (post-hydrolysis). Limit of detection, 5 ng/kg in the midgut gland [Suzuki, Yasumoto 2000]. Mussel Hepatopancreas Samples and Phytoplankton Samples. Column: C_{18} (300 × 1.0 mm i.d., 5 µm). Mobile phase: acetonitrile : water (80 : 20) with 0.1% trifluroacetic acid, flow rate 0.04 mL/min. API, positive ion mode, SIM acquisition mode. Retention times: okadaic acid 9.3 min, DTX-1 10.2 min, DTX-2 9.7 min, DTX-2B 9.9 min, DTX-2C 10.3 min, pectenotoxin-2 9.8 min, pectenotoxin-2SA 8.8 min, 7-*epi*-pectenotoxin-2SA 9.4 min, AC1 8.2 min. Limit of quantification not reported [Draisci *et al.* 1999]. Mussel Samples. Column: C_{18} (50 × 1.0 mm i.d., 5 µm). Mobile phase: acetonitrile : water (1 : 1) with 1 mmol/L ammonium acetate, flow rate 0.05 mL/min. ESI, negative ion mode, SRM acquisition mode. Retention time: 1.5 min. Limit of detection, 1 ng/g digestive tissue, 0.2 ng/g edible tissue [Holmes *et al.* 1999]. Phytoplankton Samples (*D. acuta*). Column: Vydac 218TP51 (250 × 1.0 mm i.d., 5 µm). Mobile phase: acetonitrile : water (60 : 40) with 0.1% trifluoroacetic acid, flow rate 0.04 mL/min. API, positive ion mode, SIM acquisition mode. Retention times: okadaic acid 6.1 min, DTX-2 6.6 min, DTX-2B 7.5 min, DTX-2C 8.3 min, DTX-1 8.5 min. Limit of quantification not reported [Draisci *et al.* 1998b]. Mussel Samples. Column: C_{18} (300 × 1.0 mm i.d., 5 µm). Mobile phase: acetonitrile : water (80 : 20) with 0.1% trifluoroacetic acid, flow rate 0.01 mL/min. API, positive ion mode, SRM acquisition mode. Limit of quantification, 0.2 µg/g for okadaic acid, DTX-1, DTX-2, DTX-2B [Draisci *et al.* 1995]. Column: C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water (90 : 10) with 0.1% trifluoroacetic acid, flow rate 0.8 mL/min. ESI, positive ion mode, SIM acquisition mode. Retention times: okadaic acid ~5.0 min, DTX-1 ~6.0 min. Limit of detection, 0.1 mg/L, equivalent to 0.2 µg/g hepatopancreas [Draisci *et al.* 1995].

CE Mussel Samples. Column: uncoated fused-silica capillary (total/effective length: 64.5/56 cm, 50 µm i.d.) Buffers: 12.5 mmol/L borate buffer (pH 9.2, CZE), with 20 mmol/L SDS (MEKC). UV detection (λ = 200 nm). Migration time: CZE 4.2 min, MEKC 4.2 min. Limit of quantification, 10 ng/g whole mussel tissue [Bouaicha *et al.* 1997]. Shellfish Samples. Column: uncoated fused-silica capillary (total/effective length: 37.5/28.5 cm, 50 µm i.d.). Buffer: 12.5 mmol/L borate buffer (pH 9.2) : 40 mmol/L SDS, 10% methanol. UV detection (λ = 200 nm). Migration times: okadaic acid 4.7 min, DTX-1 5.7 min. Limit of quantification, 6.25 mg/L [Consoli, Damerval 2001].

Note Okadaic acid is often measured by mouse bioassay. The mouse bioassay defines the mouse unit (MU) as the minimum amount of toxin needed to kill a 20 g mouse within 24 h: 1 MU is equivalent to 4 to 5 µg okadaic acid [Vieites *et al.* 1996]. For studies comparing HPLC-fluorimetric detection methods using different derivatisation agents, see James *et al.* [1999] and Mak *et al.* [2005]. For a study of

detailed profiles of 7-*O*-acyl esters of okadaic acid and DTX-2 in plankton and shellfish, see Vale [2006]. For the detection of okadaic acid by the protein phosphatase 2A inhibition assay, see Tubaro *et al.* [1996]. For an ultra-performance liquid chromatography–tandem mass spectrometry method for screening lipophilic marine toxins, including okadaic acid derivatives, pectenotoxin derivatives and yessotoxin derivatives, see Fux *et al.* [2007].

Disposition in the Body

Toxicity The regulatory limit set by the European Commission for okadaic acid in shellfish is 16 µg/100 g shellfish tissue. This also applies to analogues of okadaic acid.

Okadaic acid is a tumour promoter, an inducer of lipid peroxidation, and an inducer of cytotoxicity and apoptosis in cultured mammalian cells. At low concentrations, it significantly increases DNA methylation; thus it may interfere with gene regulation and expression and cellular proliferation and participate in epigenetically induced tumours by a gap junction intracellular communication inhibition mechanism [Matias, Creppy 1998].

Note For a study investigating okadaic acid placental transfer in pregnant mice, see Matias and Creppy [1996].

Dose Used as a biochemical tool as tumour promoter and probe of cellular regulation.

Olanzapine

Antipsychotic, Benzodiazepine

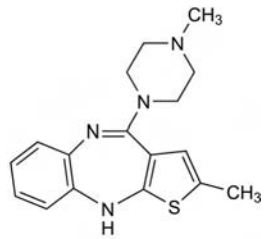
$C_{17}H_2ON_4S$ = 312.4

CAS—132539-06-1

IUPAC Name 2-Methyl-4-(4-methylpiperazin-1-yl)-5*H*-thieno[3,2-*c*][1,5]benzodiazepine

Synonyms LY-170053; 2-Methyl-4-(4-methyl-1-piperazinyl)-10*H*-thieno[2,3-*b*][1,5]benzodiazepine.

Proprietary Name *Zyprexa*.



Chemical Properties A yellow crystalline solid. Mp 195°. It is practically insoluble in water. Slightly soluble in dehydrated alcohol and in methanol; soluble in propyl alcohol; sparingly soluble in acetonitrile. pK_{a1}, 5.0; pK_{a2}, 7.4. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005]. Stock standard solutions were stable for 35 days in propan-2-ol and stored at -20°, also stable at -70° in human plasma and serum for at least 59 and 16 days, respectively [Berna *et al.* 1998].

Olanzapine Embonate

$C_{23}H_{16}O_6$,$C_{17}H_{20}N_4S$,H_2O = 718.8

CAS—221373-18-8

IUPAC Name 4-[(3-Carboxy-2-hydroxynaphthalen-1-yl)methyl]-3-hydroxynaphthalene-2-carboxylic acid; 2-methyl-4-(4-methylpiperazin-1-yl)-5*H*-thieno[3,2*c*][1,5]benzodiazepine; hydrate

Synonym Olanzapine pamoate

Proprietary Name *Zypadhera*

Gas Chromatography System GB—RI 2861, M (nor-) RI 2911; system GT—RI 2780.

Column: 5% phenyl silicone, 95% methyl silicone (HP 5MS; 15 m × 0.25 mm i.d., 0.25 mm). Temperature programme: 60° for 1 min to 300° at 20°/min for 3 min. Carrier gas: He, 1.0 mL/min. IS ethylmorphine. NPD. Retention time: 12.1 min for olanzapine, 10.8 min for IS [Elian 1998].

High Performance Liquid Chromatography System HZ—RT 1.8 min.

Column: YMC basic (150 × 4.6 mm i.d., 5 µm). Mobile phase: 75 mmol/L sodium phosphate (pH 7) : methanol : acetonitrile (48 : 26 : 26), flow rate 1.2 mL/min. Electrochemical detection. Retention time: 7.0 min [Catlow *et al.* 1995].

Ultraviolet Spectrum

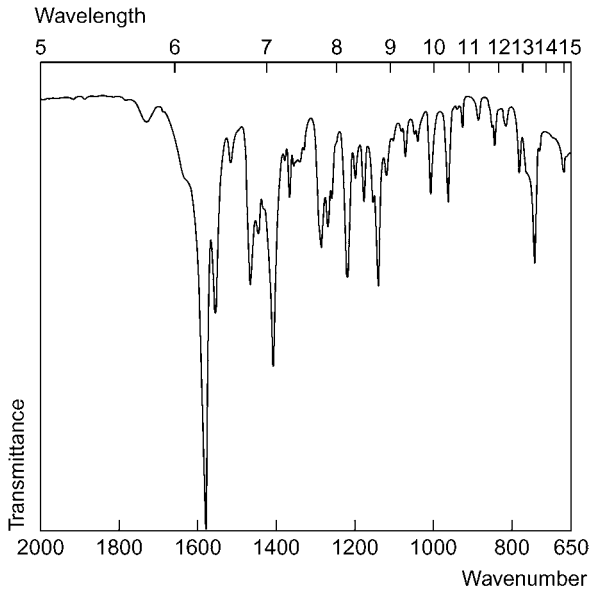
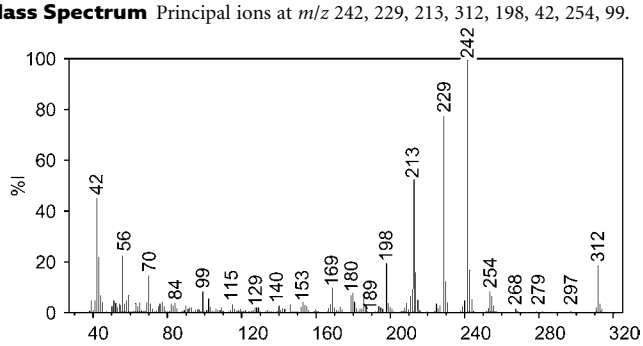
Infrared Spectrum



Mass Spectrum Principal ions at *m/z* 242, 229, 213, 312, 198, 42, 254, 99.



Quantification

Blood **GC** Column: Cross-linked fused silica (25 m × 0.2 mm i.d., 0.11 µm). Carrier gas: He, 195 kPa. Temperature programme: 180° for 1 min to 300° at 10°/min for 3 min. NPD. Retention time: 9.9 min. Limit of quantification, 218 µg/L, limit of detection, 66 µg/L [Sánchez de la Torre *et al.* 2005]. NPD. Limit of detection, 0.05 mg/L [Merrick *et al.* 2001].

GC-MS Columns (dual): Rtx-50, 50% phenylpolysiloxane, 50% methylpolysiloxane capillary column (30 m × 0.32 mm i.d., 0.25 µm); Rtx-200, cross-bond trifluropropylmethylpolysiloxane capillary column (30 m × 0.32 mm i.d., 0.25 µm). Temperature programme: 130° for 3 min, to 270° at 10°/min for 10 min to 295° at 10°/min for 5 min. Carrier gas: He, flow rate 3 mL/min. Internal standard: promazine. NPD. Retention time: 20.3 min for olanzapine and 15.1 min for IS (Rtx-200), 20.0 min for olanzapine and 15.8 min for IS (Rtx-50). Limit of quantification, 100 µg/L, limit of detection, 50 µg/L [Jenkins *et al.* 1998].

HPLC Column: Microsorb CN (100 × 4.6 mm i.d.). Mobile phase: acetonitrile : methanol : 50 mmol/L sodium phosphate buffer (pH 6.5, 5 : 28 : 67), flow rate 1.5 mL/min. IS clozapine. Retention time: 9.6 min for olanzapine and 12.5 min for IS. Limit of detection, 1 µg/L [Prieto, Hoffman 1997].

LC-MS Column: reversed phase Zorbax Extend-C_{18} (50 × 2.1 mm i.d., 5 µm). Mobile phase: 5 mmol/L ammonium hydroxide (pH 9.0)-acetonitrile (95 : 5) : acetonitrile (97 : 3 to 20 : 80 at 10 min for 0.5 min to 97 : 3), flow rate 0.2 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 0.005 mg/kg, limit of detection, 0.001 mg/kg [Nielsen, Johansen 2009]. Column: MetaChem Monochrom (150 × 4.6 mm i.d., 5 µm). APCI, MRM acquisition mode, positive ion mode [Berna *et al.* 2002].

Plasma **GC** Column: HP-5 fused silica (25 m × 0.2 mm i.d., 0.33 µm). Carrier gas: N_2, 0.7 mL/min. Temperature programme: 290° to 296° at 1°/min for 0.5 min. NPD. Limit of quantification, 1.0 µg/L, limit of detection, 0.3 µg/L [Ulrich 2005].

HPLC Electrochemical detection [Kobylinska *et al.* 2008]. Column: reversed phase C_8 (150 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 50 mmol/L phosphate buffer (pH 3.5, 27 : 73). Electrochemical detection. Olanzapine and its metabolite, *N*-desmethylolanzapine [Saracino *et al.* 2007]. Column: Spherisorb S5 C_6 (250 × 4.6 mm i.d.). Mobile phase: water : acetonitrile (55 : 45) containing 0.009 mol/L heptanosulfonic acid and 0.06 mol/L monobasic potassium phosphate (pH 2.7). UV detection (λ = 254 nm). Limit of quantification, 5 µg/L, limit of detection, 2 µg/L [D'Arrigo *et al.* 2006]. Column: C(8). Mobile phase: acetonitrile : 50 mmol/L phosphate buffer (pH 3.8). UV detection (λ = 260, 280 and 240 nm). Limit of quantification, 5 µg/L for olanzapine and other atypical antipsychotics [Titier *et al.* 2003]. Column: RP Select B (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.25% hydrogen phosphate-0.05% TEA (14 : 86), flow rate 1.0 mL/min. UV detection (λ = 270 nm). Retention time: 5.4 min. Limit of quantification, 1.5 µg/L, limit of detection, 1 µg/L [Dusci *et al.* 2002]. Column: reversed phase C_8 (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 15.4 mmol/L phosphate buffer (pH 3.8) containing 19.7 mmol/L TEA (20 : 80), flow rate 1.2 mL/min. Electrochemical detection. Retention time: 6.1 min. Limit of quantification, 3 µg/L, limit of detection, 1 µg/L for olanzapine and desmethylolanzapine [Raggi *et al.* 2001]. See Urine [Boulton *et al.* 2001]. See also Aravagiri *et al.* [1997], Catlow *et al.* [1995] and Xiao *et al.* [2001].

LC-MS Column: Luna C_{18} (50 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.02 mol/L ammonium acetate buffer (70 : 30) with 0.1% formic acid, flow rate 0.5 mL/min. TIS. Limit of quantification, 0.167 µg/L [Elshafeey *et al.* 2009]. Column: Inertsil reversed phase C_{18} ODS (100 × 3.0 mm i.d., 3.0 µm). Mobile phase: 10 mmol/L ammonium acetate buffer : acetonitrile (10 : 90), flow rate 0.8 mL/min. TIS, positive ion mode, MRM acquisition mode. Limit of quantification, 100 ng/L [Nirogi *et al.* 2006]. Column: Macherey-Nagel C_{18} (125 × 2 mm i.d., 3 µm). Mobile phase: 2.7 mmol/L formic acid-10 mmol/L ammonium acetate : acetonitrile (53 : 47), flow rate 0.16 mL/min. ESI, SIR acquisition mode. Limit of quantification, 1 µg/L [Zhou *et al.* 2004]. Column: Merck LiChroCART with Superspher 60 RP Select B stationary phase. Mobile phase: aqueous ammonium formate and acetonitrile. APCI [Kratzsch *et al.* 2003]. Column: Symmetry C_{18} (150 × 3 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.1% formic acid (20 : 80), flow rate 0.5 mL/min. ESI, positive ion mode, SRM acquisition mode. Limit of quantification, 5 µg/L, limit of detection, 2 µg/L [Kollroser, Schober 2002]. Column: MetaChem (150 × 4.6 mm i.d., 5 µm). Mobile phase: 100 mmol/L ammonium acetate : 20% propan-1-ol (80 : 20 for 0.1 min to 55 : 45 at 0.2 min to 30 : 70 at 5 min to 15 : 85 at 6 min to 80 : 20 at 6.1 min until 9 min), flow rate 1.0 mL/min. APCI, positive ion mode, MRM acquisition mode. Limit of quantification, 250 ng/L [Berna *et al.* 1998].

Serum **HPLC** Column: ODS Hypersil C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water : tetramethylethylenediamine (pH 6.5, 8 : 92 : 0 to 37.5 : 62.1 : 0.4 at 5 min to 8 : 92 : 0 at 15 min for 10 min), flow rate 1.3 mL/min. UV detection (λ = 254 nm). Retention time: 9.16 min. Limit of quantification, 10 µg/L for olanzapine, its metabolites and other antipsychotic drugs [Sachse *et al.* 2006]. Column: Spherisorb S5W (150 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 50 mmol/L ammonium acetate buffer (pH 9.9, 85 : 15), flow rate 1.1 mL/min. UV detection (λ = 257 nm). Relative retention time: 0.86 min. Limit of detection, 5 nmol/L [Olesen *et al.* 2001]. Column: Hypersil C_{18} ODS (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water : tetramethylethylenediamine (pH 6.5, 37 : 62.6 : 0.4), flow rate 1.5 mL/min. UV detection (λ = 254 nm). Retention time: 4.46 min. Limit of quantification, 10–20 µg/L for olanzapine and its demethylated metabolites [Weigmann *et al.* 2001]. Column: Spherisorb S5W (150 × 4.6 mm i.d.). Mobile phase: 50 mmol/L ammonium acetate buffer (pH 9.9) : methanol (15 : 85), flow rate 1.1 mL/min. UV detection (λ = 270 nm). Retention time: 3.58 min. Limit of quantification, 1.56 µg/L [Olesen, Linnet 1998].

LC-MS Column: monolithic C_{18} (50 × 4.6 mm). Mobile phase: methanol : 5 mmol/L acetate buffer (pH 3.9). Olanzapine and other antipsychotics and antidepressants [Kirchherr, Kühn-Velten 2006]. Column: Superspher RP-18 (125 × 3 mm i.d., 4 µm). Mobile phase: acetonitrile : 50 mmol/L ammonium formate buffer (pH 3.0, 25 : 75), flow rate 0.3 mL/min. APCI, positive ion mode, SIM acquisition mode. Limit of quantification, 1 µg/L [Bogusz *et al.* 1999]. Column: Phenomenex Luna phenyl hexyl (150 × 2 mm i.d., 5 µm). Mobile phases: acetonitrile-20 mol/L ammonium acetate (52 : 48) : formic acid-acetonitrile (0.1 : 100, 98 : 2), flow rate 0.4 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of detection not reported [Chin *et al.* 2004]. See Plasma [Berna *et al.* 1998].

Urine **GC** See Blood [Merrick *et al.* 2001].

GC-MS Limit of detection, <100 µg/L [Bickeboeller-Friedrich, Maurer 2001].

HPLC Column: Supelcosil LC-CN (250 × 4.6 mm i.d.). Mobile phase: methanol : acetonitrile : 50 mmol/L phosphate buffer (pH 6.0, 10 : 25 : 65), flow rate 1.0 mL/min. UV detection (λ = 214 nm). Limit of quantification, 1 µg/L, limit of detection, 0.75 µg/L [Boulton *et al.* 2001].

Bile **GC-MS** See Blood [Jenkins *et al.* 1998]

CSF **GC** See Blood [Merrick *et al.* 2001].

GC-MS See Blood [Jenkins *et al.* 1998].

Brain **GC** See Blood [Merrick *et al.* 2001].

Liver **GC** See Blood [Merrick *et al.* 2001].

Disposition in the Body

Olanzapine is well absorbed from the gastrointestinal tract and is eliminated extensively by first-pass metabolism, mainly by conjugative and oxidative pathways. Approximately 40% of the dose is metabolised before reaching systemic circulation. Food does not affect the rate or extent of absorption. It is extensively distributed and metabolised throughout the body: 7% of the dose is recovered in urine as the unchanged drug, indicating that it is highly metabolised. Approximately 57% of the dose is recovered in urine and 30% in faeces as metabolites. The main metabolites include the 10-*N*-glucuronide, *N*-desmethyl, 2-hydroxymethyl, 2-carboxy, *N*-desmethyl-2-carboxy and 4′-*N*-oxide derivatives of olanzapine; these lack pharmacological activity. Renal impairment has little effect on the pharmacokinetics.

Therapeutic Concentration The serum therapeutic concentration is 0.01–0.05 mg/L.

Fifteen elderly healthy individuals and 5 young were administered with 10 mg olanzapine. Peak concentrations were 9.23 µg/L at 8 h and 12.6 µg/L at 6.1 h, respectively [Calleghen et al 1995].

Six men were fasted overnight before receiving 15 mg olanzapine. Concentrations reached 13.3 μg/L, observed at 5.8 h. In comparison, 6 men administered the drug in a fed state produced levels of 13.8 μg/L approximately 4.7 h after dosing [Henry *et al.* 1995].

Thirty male non-smokers and 19 male smokers were administered with 9.5 mg and 10.5 mg olanzapine, respectively. Peak concentrations of 12.9 μg/L were observed at 6.1 h for the non-smokers and of 13.2 μg/L at 5.5 h for the smokers [Kisicki *et al.* 1995].

Olanzapine 5 mg was given to three groups of patients: 6 patients with hepatic impairment (creatinine clearance, >5.4 L/h/1.73 m^2), 6 patients with creatinine clearance <0.6 L/h/1.73 m^2 (drug given after haemodialysis) and 6 patients with creatinine clearance <0.6 L/h/1.73 m^2 (drug given before haemodialysis). Peak plasma concentrations were 5.9, 8.2 and 9.5 μg/L for the 3 groups, respectively, attained at 6.2, 5.2 and 4.2 h, respectively [Bergstorm *et al.*1996].

Four healthy individuals and eight patients with cirrhosis were administered 7.5 mg olanzapine. Peak plasma concentrations were 9.2 μg/L at 8 h for the healthy individuals and 7.7 μg/L at 6.6 h for the patients with cirrhosis [Thomasson *et al.* 1996].

In a study in patients stabilised on 20 mg olanzapine daily, steady-state maximum plasma levels after further treatment with olanzapine 20 mg daily for 20 days, 30 mg daily for 10 days followed by 40 mg daily for 10 days, or 40 mg daily for 20 days, were 57.8, 75.6, and 94.1 μg/L, respectively. The AUCs were 997, 1220, and 1630 ng.h/mL, respectively [Mitchell *et al.* 2006].

Median serum levels of olanazapine were 32.7 μg/L in 122 children and adolescent patients. Patients with anorexia receiving median doses of 7.5 mg had levels of 18.7 μg/L while those treated with median doses of 12.5 mg daily for schizophrenia had levels of 37.7 μg/L [Theisen *et al.* 2006].

A breast-feeding mother taking 15 mg (270 μg/kg) olanzapine daily had plasma levels of 24 μg/L Levels of olanzapine 12.2 and 11.5 ng/g (with and without additional hydrochloric acid extraction, respectively) were found in breast milk. Levels in the infant's plasma were below the limit of detection (<5 μg/L) [Lutz *et al.* 2008].

For a report of olanzapine excretion in breast milk, see [Croke *et al.* 2002]; for a study showing that the pharmacokinetics of olanzapine in adolescents and adults are similar, see Lobo *et al.* [2010]. For a pharmacokinetic and pharmacodynamic profile of olanzapine, see Callaghan *et al.* [1999].

Toxicity The minimum toxic concentration in blood is 0.1 mg/L.

A patient has recovered after an overdose of 800 mg olanzapine [Cohen *et al.* 1999].

A 29-year-old woman survived an acute overdose with 1110 mg of olanzapine that was associated with respiratory and cardiovascular adverse effects. Blood levels were not reported [Gardner *et al.* 1999].

A 22-year-old man who took 800 mg of olanzapine in a suicide attempt had maximum serum levels of 200 μg/L (approx. 20 times therapeutic levels at a dose of 10 mg). The effects of this overdose were sedation and mild anticholinergic symptoms [Bosch *et al.* 2000].

Severe non-fatal olanzapine toxicity has been reported in a 58-year-old woman who was found unconscious with two empty 28-tablet containers of olanzapine 10 mg. Whole blood levels of olanzapine were 0.41, 0.34, and 0.38 mg/L at ~4, 8 and 12 h after ingestion, respectively [Ballesteros *et al.* 2007].

A blood level of 800 pg/L olanzapine was found in a patient about 1 day after a non-fatal overdose with 550 mg olanzapine. The initial elimination half-life was 24 h for the first 3 days, followed by a second phase with a half-life of ~2.5 days [Lennestål *et al.* 2007].

A 59-year-old woman was found unresponsive in a hotel room and later died. At the scene were 2 empty bottles of Zyprexa (each bottle containing 30 tablets at 10 mg olanzapine each, filled only days earlier) and suicide notes. The blood concentration of olanzapine was 0.049 mg/L with 0.410 mg/L in the gastric contents [Elian 1998].

A 43-year-old male psychiatric outpatient died after ingesting 600 mg olanzapine. Analysis of postmortem blood and urine yielded olanzapine concentrations of 1238 and 6987 μg/L, respectively, which are far in excess of the therapeutic concentration [Stephens *et al.* 1998].

In a report of 2 deaths associated with olanzapine, blood levels were 0.237 and 0.675 μg/L and gastric content concentrations were 0.197 μg/L and 17.4 mg/L [Gerber, Cawthon 2000].

In 58 postmortem blood samples, mean olanzapine levels were 358 μg/L (10–5200 μg/L). Potential toxicity was considered at levels above 100 μg/L and postmortem blood levels as low as 160 μg/L were found in cases where death was caused by olanzapine toxicity [Robertson, McMullin 2000].

A 25-year-old man died from acute poisoning with olanzapine. Postmortem levels of olanzapine were found to be 0.40 mg/L in heart blood, 0.27 mg/L in carotid blood, 0.35 mg/L in urine, 0.61 mg/kg in liver and 0.33 mg/50 mL in gastric contents. Levels in the CSF were below the limit of detection (0.05 mg/L). Levels in the brain were 0.22 mg/kg in hippocampus, 0.86 mg/kg in midbrain, 0.16 mg/kg in amygdala, 0.39 mg/kg in caudate/putamen, 0.17 mg/kg in left frontal cortex and 0.37 mg/kg in right frontal cortex. Olanzapine was not detected in the cerebellum [Merrick *et al.* 2001].

A 40-year-old man who died after an overdose of olanzapine and citalopram had the following postmortem levels of olanzapine and citalopram, respectively: 1.38 and 3.35 mg/L in heart blood, 1.11 and 1.65 mg/L in femoral blood, 60.24 and 32.43 mg/L in urine, 6.47 and 10.71 mg/kg in liver, and 38.36 and 49.16 mg/kg in lung [Horak, Jenkins 2005].

In an analysis of 28 deaths involving olanzapine between 2004 and 2007, there were 6 where olanzapine was the only drug involved. Average olanzapine levels in these 6 were 3.2 mg/L in peripheral blood, 4.5 mg/L in central blood, 40 mg/kg in liver and 1.6 mg/L in vitreous humour. In 10 cases where death was not attributed to olanzapine, levels were 0.26, 0.29 and 0.78 mg/L for peripheral blood, central blood, and vitreous humour, respectively, and 5.6 mg/kg in liver. In 10 cases where death was attributed to olanzapine plus other drugs, levels were 0.59, 0.64 and 0.78 mg/L, respectively, for peripheral blood, central blood and vitreous humour, and 5.9 mg/kg in liver. Concentrations of olanzapine associated with toxicity were in the ranges 1.4–6.2, 1.1–7.4, and 1.1–2.1 mg/L, respectively, for peripheral blood, central blood and vitreous humour and 14–88 mg/kg for liver [Vance, McIntyre 2009].

For reports of olanzapine overdoses in children, see Bond, Thompson [1999], Catalano *et al.* [1999], Kochhar *et al.* [2002] and Yip *et al.* [1998].

Note For a review of olanzapine-associated toxicity and fatality in overdose, see Chue, Singer [2003].

Half-life A mean of 33.8 h (range, 30–60) for young, healthy individuals and 51.8 h for elderly individuals. The half-life tends to be longer in woman than in men.

Bioavailability ≈80%.

Volume of Distribution ≈1150 L (660–1790 L); 22 L/kg; also reported as 10–20 L/kg.

Clearance Plasma clearance ranges from 12–47 L/h with a mean of 25 L/h. Hepatic impairment may reduce clearance. It is generally 30% lower in women than men and 40% higher in smokers than non-smokers.

Protein Binding 93%, primarily to albumin and α_1-acid glycoprotein.

Dose Adults: usual oral dose is 10 mg daily, with a range between 5 and 20 mg. In the elderly, the starting dose may possibly be reduced to 5 mg daily. Patients with renal and/or hepatic impairment need a starting dose of 5 mg daily, only increased with caution.

Oleandomycin

Antibiotic

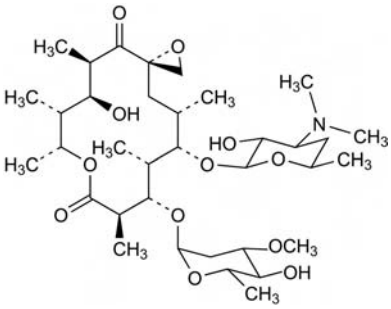
$C_{35}H_{61}NO_{12}$ = 687.9

CAS—3922-90-5

IUPAC Name (3*R*,5*R*,6*S*,7*S*,8*S*,9*S*,12*S*,13*R*,14*R*,15*R*)-6-[(2*S*,3*R*,4*S*,6*S*)-4-(Dimethylamino)-3-hydroxy-6-methyloxan-2-yl]oxy-14-hydroxy-8-[(2*R*,4*S*,5*S*,6*S*)-5-hydroxy-4-methoxy-6-methyloxan-2-yl]oxy-5,7,9,12,13,15-hexamethyl-2,11-dioxaspiro[2.13]hexadecane-10,16-dione

Synonym PA-105

Proprietary Names *Triolmicina Romicil*; *Landomycin*.



Chemical Properties An antimicrobial substance produced by the growth of *Streptomyces antibioticus*. A white amorphous powder. Moderately soluble in water; freely soluble in butanol, ethanol, acetone and methanol; soluble in dilute acids; practically insoluble in hexane, carbon tetrachloride and dibutyl ether. pK_a 8.8 (25°). Log *P* (octanol/water), 1.7.

Oleandomycin Phosphate

$C_{35}H_{61}NO_{12}$, H_3PO_4 = 785.9

CAS—7060-74-4

Chemical Properties A white crystalline powder. Soluble 1 in 2.5 of water and 1 in 3 of ethanol; slightly soluble in ether.

Colour Tests Mandelin's test—green; Marquis test—green.

Thin-layer Chromatography System TA—R_f 0.45 (acidified potassium permanganate solution, positive).

Ultraviolet Spectrum Aqueous acid—242 nm (A^{1}_{1}=7b).

Infrared Spectrum Principal peaks at wavenumbers 1111, 1052, 1075, 1010, 1162, 1190 cm^{-1} (oleandomycin phosphate).

Quantification

Serum **HPLC** UV detection. Limit of detection, <0.25 mg/L [Stubbs *et al.* 1986].

Urine **HPLC** UV detection. Limit of detection, <1 mg/L [Stubbs *et al.* 1986].

Dose Oleandomycin phosphate has been given in doses of 1 to 2 g daily.

Stubbs C *et al.* (1986). High-performance liquid chromatographic analysis of oleandomycin in serum and urine. *J Chromatogr* 353: 33–38.

Oleoresin of Capsicum

Capsaicinoid, Food Additive, Incapacitant

Synonyms OC; pepper spray.

Proprietary Names *Cap-Stun*; *Cap-Tor*; *MK4 First Defense*; *Pepperfoam 10%*; *Sabre Defence* (defence spray formulations). It is also an ingredient of *Sabre*.

Chemical Properties OC is a reddish-brown liquid extracted from dried ripe fruits of the genus *Capsicum*. The extracts are highly complex mixtures of over 100 natural compounds, all in varying concentrations. The total concentration of capsaicinoids in a pepper ranges from 0.1 to 2.0% (dry weight) and depends upon the variety of the pepper, the growing conditions, and the time of harvest. The typical capsaicinoid content of pepper spray formulations ranges from 1.2 to 12.6%. Capsaicin is the major ingredient of OC, closely followed by dihydrocapsaicin. Together, they make up more than 80% of the capsaicinoids in OC. Another major component of OC is a dihydroxycarotenone, thought to be involved in the irritant properties of OC. Further capsaicinoids in OC include nordihydrocapsaicin, homodihydrocapsaicin, homocapsaicin, nonanoic acid vanillylamide and decanoic acid vanillylamide. Owing to the potential for interproduct composition variations, more recent pepper spray formulations use pure capsaicin or its synthetic equivalent, nonivamide [Olajos, Salem 2001; Olajos, Stopford 2004].

Mass Spectrum [Haas *et al* 1997].

Quantification

Other **GC-MS** Pepper Spray. Column: methyl silicone capillary (30 m × 0.25 mm i.d., 0.25 µm). Temperature programme: 70° for 10 min to 320° at 8°/min. EI ionisation at 70 eV, SIM acquisition mode. Retention times: capsaicin 35.5 min, dihydrocapsaicin 35.8 min, nordihydrocapsaicin 34.6 min, homodihydrocapsaicin 36.7 min (underivatised samples). Limit of quantification not reported [Haas *et al.* 1997].

LC-MS Pepper Spray. Column: YMC Basic S-3 (50 × 2.0 mm i.d.). Mobile phase: 10 mmol/L ammonium formate (pH 4.2) : methanol (35 : 65 for 0.5 min to 10 : 90 over 1 min for 4 min), flow rate 0.35 mL/min. APCI, positive ion mode. Retention time: capsaicin 1.9 min (nitrobenzene diazonium tetrafluoroborate derivative). Limit of quantification not reported [Cavett *et al.* 2004]. Fresh Peppers, OC, and Pepper Spray Products. Column: MetaSil Basic RP (100 × 3.0 mm i.d., 3 µm). Mobile phase: stepwise gradient methanol : water containing 0.1% formic acid. Positive ion mode. Retention times: capsaicin 12.6 min, dihydrocapsaicin 15.8 min, octanoylvanillamide 8.4 min, nordihydrocapsaicin 11.8 min, nonivamide 12.6 min, homocapsaicin 16.1 min, homodihydrocapsaicin 17.5 min. Limit of quantification not reported [Reilly *et al.* 2001].

Note For a study comparing the chemical and elemental composition of 2 formulations of OC spray, see Haas *et al.* [1997]

Disposition in the Body Studies in rats have shown that capsaicin and capsaicinoids are rapidly absorbed from the gastrointestinal tract following intragastric administration. However, at the time of writing (2009), the uptake of OC via inhalation has not been studied in animals or humans. Animal studies have shown that capsaicin and capsaicinoids undergo metabolic conversion via both hepatic oxidative and non-oxidative pathways. Hydroxylation on the vanillyl ring moiety occurs, forming catechol metabolites. The alkyl chain of capsaicin is also susceptible to oxidative deamination. Other pathways include the hepatic mixed-function oxidase system forming highly reactive metabolites (epoxide, phenoxy and methyl radicals, and quinone-type compounds). The majority of capsaicin and capsaicinoid metabolites are excreted in urine, mostly as glucuronide conjugates.

Toxicity OC has remarkable irritant potency and very low toxicity when compared with other agents in the same class (CS or CN). When applied to ocular membranes, OC causes stinging, lacrimation and blepharospasm. The piquancy (or potency) of peppers is measured by the Scoville Organoleptic Test. This is a taste test based upon the greatest dilution of a pepper extract that can be detected by the human tongue and is measured in Scoville heat units (SHU). Pure capsaicin has a value of $\sim 15 \times 10^6$ SHU and standard US-grade pepper sprays have a range of 2×10^6 to 5.3×10^6 SHU. Every variety of pepper is thus graded, with the bell-pepper variety at the bottom of the scale with an SHU of zero. The inhalation toxicity of chemical warfare agents, military chemicals, and riot control agents is, by convention, expressed by the notation Ct. It is defined as the product of the concentration in mg/m^3 multiplied by the exposure time (t) in minutes ($mg_{\bullet}min/m^3$). The terms LCt_{50} and ICt_{50} describe the airborne dosages that are lethal (L) or incapacitating (I) to 50% of the exposed population. At the time of writing LCt_{50} and ICt_{50} values have yet to be determined. The minimum tolerated exposure is reported as $0.002\,mg/m^3$ while the minimum lethal exposure is estimated at $>100\,000\,mg_{\bullet}min/m^3$. Owing to poor water solubility, OC-containing formulations are usually made up of solvents as carriers together with some kind of propellant gas. It is worth noting that some solvents may contribute to unwanted effects of CS use, such as corneal erosion, skin blistering, or even neurotoxicity [Olajos, Salem 2001; Olajos, Stopford 2004]. Reviews of in-custody deaths from pepper spray exposure have concluded that pepper spray was unrelated to the causes of death where sufficient information was available [Steffee *et al.* 1995].

Olmesartan

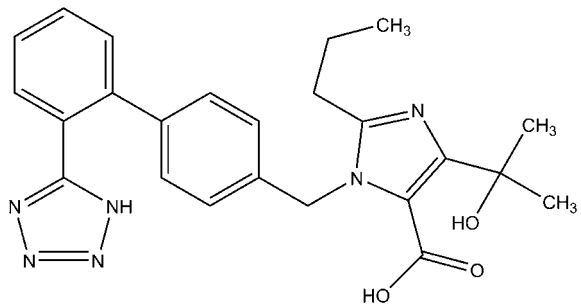
Angiotensin II Receptor Antagonist, Antihypertensive

$C_{24}H_{26}N_6O_3 = 446.5$

CAS—144689-24-7

IUPAC Name 5-(2-Hydroxypropan-2-yl)-2-propyl3-[[4-[2-(2*H*-tetrazol-5-yl) phenyl]phenyl]methyl]imidazole-4-carboxylic acid

Synonyms 4-(1-Hydroxy-1-methylethyl)-2-propyl-1-[[2′-(1*H*-tetrazol-5-yl) [1,1′-biphenyl]-4-yl]methyl]-1*H*-imidazole-5-carboxylic acid; RNH-6270.



Olmesartan Medoxomil

$C_{29}H_{30}N_6O_6 = 558.6$

CAS—144689-63-4

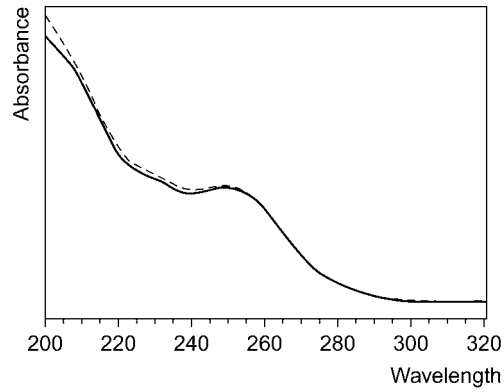
IUPAC Name (5-Methyl-2-oxo-1,3-dioxol-4-yl)methyl 5-(2-hydroxypropan-2-yl)-2-propyl-3-[[4-[2-(2*H*-tetrazol-5-yl)phenyl]phenyl]methyl]imidazole-4-carboxylate

Synonyms CS-866; 4-(1-hydroxy-1-methylethyl)-2-propyl-1-[[2′-(1*H*-tetrazol-5-yl)[1,1′-biphenyl]-4-yl]methyl]-1*H*-imidazole-5-carboxylic acid (5-methyl-2-oxo-1,3-dioxol-4-yl)methyl ester; (5-methyl-2-oxo-1,3-dioxolen-4-yl)methyl 4-(1-hydroxy-1-methylethyl)-2-propyl-1-[4-[2-(tetrazol-5-yl)phenyl]-phenyl] methylimidazole-5-carboxylate.

Proprietary Names *Benicar*; *Olmetec.*

Chemical Properties Crystals. Mp 180° to 182°. Practically insoluble in water; sparingly soluble in methanol.

Ultraviolet Spectrum NaOH/water (0.02 mol/L)—258 nm. Celebier and Altinoz [2007]



Quantification

Plasma **HPLC** Column: YMC-pack A-312 (150 × 6.0 mm i.d.). Mobile phase: acetonitrile : 0.05 mol/L ammonium acetate buffer (pH 3.75,; 28 : 72), flow rate 1.0 mL/min. Fluorescence detection ($\lambda_{ex} = 260$ nm, $\lambda_{em} = 370$ nm). Limit of quantification, 0.2 µg/L [Yoshihara *et al.* 2005].

LC-MS Column: Hypersil C_{18} (50 × 4.6 mm i.d., 3 µm). Mobile Phase: formic acid : methanol : water (0.5 : 70 : 30), flow rate 0.6 mL/min. API, ESI, MRM acquisition mode. Limit of quantification, 0.2 µg/L [Liu *et al.* 2007].

Urine **LC-MS** See Plasma. Limit of quantification, 5 µg/L [Liu *et al.* 2007].

Note For a UV-vis spectrophotometry method for the measurement of olmesartan in tablets, see Celebier and Altinoz [2007].

Disposition in the Body Olmesartan medoxomil is rapidly de-esterified *in vivo* and completely metabolised to the active acid olmesartan, the major metabolite in a reaction catalysed by both aryl esterase and albumin. At the time of writing (2008), no metabolites of olmesartan have been identified in humans. Approximately 5 to 12% of an administered dose is excreted in urine as olmesartan.

Therapeutic Concentration

Fifteen healthy subjects (aged 30.5 ± 7.0 years; weight 70.8 ± 8.8 kg) were administered a daily 20 mg oral dose of olmesartan medoxomil for 7 days. The mean maximum steady-state plasma concentration reached was 479.3 µg/L after 1.5 h. The average amount of administered dose of olmesartan excreted in urine was 9.5%. A separate study showed that the concomitant administration of olmesartan medoxomil with glibenclamide had no significant effects on the steady-state pharmacokinetics of either agent and was well tolerated and safe [Huber *et al.* 2006].

Single oral doses of 10 to 160 mg olmesartan medoxomil were administered to 25 healthy volunteers (aged 24 ± 4 years; weight 76 ± 8 kg). Peak plasma concentrations were as follows:

Dose (mg)	*C_{max} (µg/L)*	*Time (h)*
10	224	2.4
20	419	2.5
40	752	1.4
80	1095	2.0
160	2100	2.8

The elimination half-life in this study was found to be between 12 and 15 h [Schwocho, Masonson 2001].

Note For information on the influence of age and renal and hepatic function on the pharmacokinetics of olmesartan medoxomil, see von Bergmann *et al.* [2001]. For a general review of olmesartan medoxomil, see Brousil and Burke [2003].

Toxicity

Note For a study of olmesartan medoxomil and potential drug interactions, see Laeis *et al.* [2001].

Bioavailability Approximately 29%.

Half-life Elimination, approximately 15 h.

Volume of Distribution Approximately 35 L.

Clearance Approximately 1.39 L/h

Distribution in Blood Blood : plasma ratio 0.4 to 0.7.

Dose Initially, 10 mg daily, increased to 20 mg if necessary; maximum dose is 40 mg.

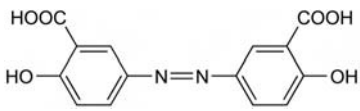
Olsalazine

Antiinflammatory, Aminosalicylate
$C_{14}H_{10}N_2O_6$ = 302.2
CAS—15722-48-2

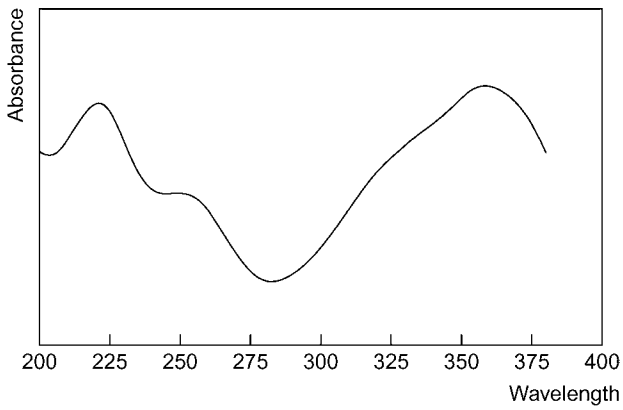
IUPAC Name 5-[(2*Z*)-2-(3-Carboxy-4-oxocyclohexa-2,5-dien-1-ylidene)hydrazinyl]-2-hydroxybenzoic acid
Synonyms 3,3′-Azobis(6-hydroxybenzoic acid); azodisal; CI mordant yellow 5; 5,5′-azobis(salicylic acid).



Olsalazine Sodium

$C_{14}H_8N_2Na_2O_6$ = 364.2
CAS—6054-98-4
IUPAC Name Disodium 5,5′-asodisalicylate
Synonyms Azodisal sodium; CI mordant yellow 5 disodium salt; CJ-91B; CL-14130; sodium azodisalicylate.
Proprietary Names *Dipentum*
Chemical Properties A yellow, fine, crystalline powder. Mp 240°. Sparingly soluble in water; soluble in dimethylsulfoxide; very slightly soluble in methanol; practically insoluble in ethanol, chloroform and ether.

Ultraviolet Spectrum Aqueous acid—358, 221, 249 nm.



Quantification

Serum **HPLC** Column: C_{18} Nucleosil (250 4 mm i.d., 10 µm). Mobile phase: methanol : phosphate buffer (pH 7.4, 52 : 48) with 0.02 mol/L TBA (tetrabutylammonium hydrogen sulfate). UV detection (λ=365 nm); fluorescence detection (λ_{ex}=312 nm, λ_{em}=469 nm). *k* values: olsalazine, 5.2; olsalazine-sulfate, 1.2. Limit of quantification, 0.5 µg/L [Ryde, Ahnfelt 1988].
Urine **HPLC** See Serum. Limit of quantification, 1 µg/L [Ryde, Ahnfelt 1988].
Disposition in the Body Olsalazine is not well absorbed after oral administration and almost the entire dose reaches its site of action in the colon intact. It is broken down by colonic bacteria flora into 5-aminosalicylic acid (mesalazine), some of which is absorbed and acetylated. Both mesalazine and its acetylated metabolite are absorbed from the colon. The presence of food has no significant effect on the absorption. 1 to 2% of the intact olsalazine absorbed is excreted, mainly in urine. A dose of olsalazine is almost completely metabolised by sulfate conjugate in the liver. Approximately 17 to 20% of the total dose is recovered in urine within 24 h of IV administration in patients with active inflammatory bowel disease, but this decreases for an oral dose. <5% of the ingested dose is recovered in faeces as the unchanged drug. Steady state concentrations of conjugated olsalazine are achieved within days of the start of administration. Approximately 0.1% of an oral dose of olsalazine is metabolised in the liver to olsalazine-*O*-sulfate (olsalazine-*S*) and 22 to 33% appears in the urine almost all as acetyl 5-aminosalicylate. Olsalazine-*S* has a half-life of 7 days and accumulates to steady state within 2 to 3 weeks.
Therapeutic Concentration
Seven healthy males, aged 27 to 44 years, administered with a 10 mg IV dose of olsalazine showed peak serum concentrations of 7.5 µg/L (range, 3.8 to 9.2 µg/L) by the end of the infusion.
Eight healthy male volunteers were administered with 1 g olsalazine with or without food, and also 2 g and 4 g in the fasting state. Mean peak serum concentrations of the parent drug were 2.3 (range, 1.1 to 4.6), 3.6, 5.9 (range, 3.9 to 9.8) and 32 (range, 14 to 47) µg/L, for the 1 g (with food), 1, 2 and 4 g (fasting) doses, respectively. Mean peak concentrations for olsalazine sulfate were 0.5, 1.2, 1.9 and 8.3 µg/L, respectively; 5-aminosalicyclic acid (5-ASA) 1.6, 1.2, 4.5 and 3.8 µg/L, respectively; *N*-acetyl-aminosalicyclic acid (ac-5-ASA) 3.2, 4.1, 10.0 and 9.1 µg/L, respectively. Peak olsalazine concentrations were observed approx. 1 h after administration of the parent drug, peak olsalazine sulfate concentrations after 4 h, and peak 5-ASA and ac-5-ASA at approx. 8 h [Ryde, Ahnfelt 1988].
Bioavailability Varies from 2.4, 1.9 to 4.8% after 1, 2 and 4 g doses, respectively.
Half-life Olsalazine, 0.9 to 1 h and the 5-aminosalicylic acid metabolite, 7 days.
Volume of Distribution Mean, 6.2 L.
Distribution in Blood Olsalazine does not enter the erythrocytes.
Protein Binding Olsalazine is bound >99% and the 5-aminosalicylic acid metabolite, 74%.
Dose The usual dose is 1 g daily with a maximum of 3 g daily.

Ryde EM, Ahnfelt NO (1988). The pharmacokinetics of olsalazine sodium in healthy volunteers after a single i.v. dose and after oral doses with and without food. *Eur J Clin Pharmacol* 34(5): 481–488.

Omalizumab

Antiallergic
CAS—242138-07-4

Synonym Rhu-Mab-325
Proprietary Name *Xolair*
Chemical Properties Recombinant humanised monoclonal antibody.
Disposition in the Body Readily absorbed after SC injection, with peak serum concentrations reached after 7 to 8 days. It is removed by IgG and IgE clearance processes in the liver. During treatment with omalizumab, the serum concentration of free IgE decreases but that of total IgE increases because the omalizumab–IgE complex has a slower elimination rate than free IgE.
Therapeutic Concentration In adults with allergic asthma, an initial dose of IV omalizumab (2.0 mg/kg) followed by 6 doses of 1.0 mg/kg administered over 77 days resulted in a mean peak serum concentration at steady state of 30.9 mg/L [Boulet *et al.* 1997]
Bioavailability Approximately 62%.
Half-life Serum elimination half-life, 1 to 4 weeks after SC or IV administration.
Volume of Distribution Approximately 3.6 L for free omalizumab and 2.25 L for the omalizumab–IgE complex.
Clearance Apparent, 7.32 mL/h.
Dose The dose depends on the patient's weight and pre-treatment serum IgE concentrations; regimens range from 75 to 300 mg every 4 weeks to 225 to 375 mg every 2 weeks. Omalizumab is given by SC injection, and not more than 150 mg should be given at one injection site.

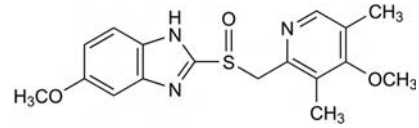
Omeprazole

Antiulcerative, Proton Pump Inhibitor
$C_{17}H_{19}N_3O_3S$ = 345.4
CAS—73590-58-6

IUPAC Name 6-Methoxy-2-[(4-methoxy-3,5-dimethylpyridin-2-yl)methylsulfinyl]-1*H*-benzimidazole
Synonyms H-168/68; 5-methoxy-2-[[(4-methoxy-3,5-dimethyl-2-pyridinyl) methyl]sulfinyl]-1*H*-benzimidazole.
Proprietary Names *Antra*; *Gastracid*; *Gastrogard*; *Gastroloc*; *Losec*; *Mepral*; *Mopral*; *Omebeta*; *Omepral*; *Omeprazen*; *Parizac*; *Pepticum*; *Prilosec*; *Zegerid*; *Zoltum.*



Chemical Properties A white or almost white powder. Mp 156°. It is very slightly soluble in water; soluble in alcohol, methyl alcohol and dichloromethane; very soluble in alkaline solutions. pK_a, 4.0. Log *P* (octanol/water), 2.23.

Omeprazole Magnesium

$C_{34}H_{36}N_6O_6S_2$, Mg = 713.1
CAS—95382-33-5
Chemical Properties A white or almost white, hygroscopic powder. Very slightly soluble in water; sparingly soluble in methyl alcohol; practically insoluble in heptane.

Omeprazole Sodium

$C_{17}H_{18}N_3O_3S$, Na = 367.4
CAS—95510-70-6

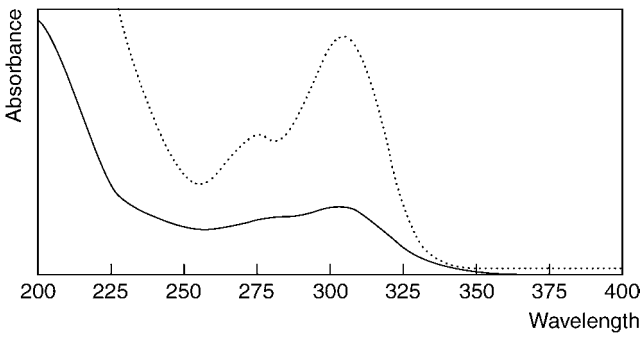
Chemical Properties A white or almost white hygroscopic powder. It is freely soluble in water and alcohol; soluble in propylene glycol; very slightly soluble in dichloromethane.

High Performance Liquid Chromatography System HAA—RT 14.1 min; system HZ—RT 2.8 min.

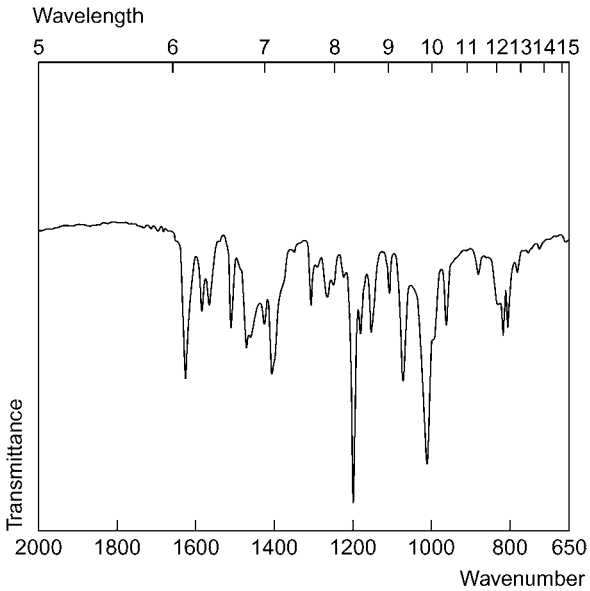
Column: Crestpak C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: 0.05 mol/L disodium hydrogen orthophosphate : acetonitrile (65 : 35, pH 6.5), flow rate 1 mL/min. IS: chloramphenicol. UV detection (λ = 302 nm). Retention time: omeprazole 6.3 min and I.S. 4.5 min [Yuen *et al.* 2001].

Column: C_{18} SG120 Capcell Pak (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.05 mol/L phosphate buffer (pH 8.5, 25 : 75), flow rate 0.8 mL/min. IS: phenacetin. UV detection (λ = 302 nm). Retention time: omeprazole 16.8 min, hydroxyomeprazole 6.6 min, omeprazole sulfone 11.5 min, IS 13.6 min [Kobayashi *et al.* 1992].

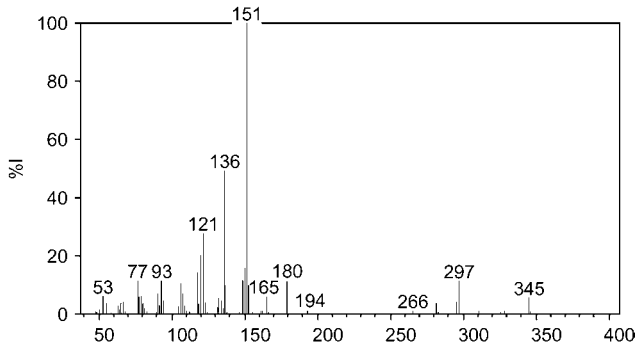
Ultraviolet Spectrum Aqueous acid (0.2 mol/L NH_2SO_4)—277, 303 nm; basic—279 nm.



Infrared Spectrum Principal peaks at wavenumber 1628, 1205, 1015 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 151, 136, 121, 180, 297, 77, 93, 194.



Quantification

Plasma **HPLC** Column: Zorbax C_8. Mobile phase: 0.1% triethylamine (pH 6.0) : acetonitrile (72 : 28), flow rate 1 mL/min. UV detection. Limit of quantification, 20.61 µg/L for omeprazole and other proton pump inhibitors [Bharathi *et al.* 2009]. Column: Zorbax C_{18} (150 × 3.0 mm i.d., 3.5 µm). Mobile phase: 22.0 mmol/L phosphate mono basic (pH 6.0)-methanol (90 : 10) : 22.0 mmol/L phosphate mono basic (pH 6.0)-acetonitrile-methanol (10 : 80 : 10, 74 : 26 to 34 : 66 at 13 min to 4 : 96 at 14 min for 1 min to 74 : 26 at 17 min), flow rate 0.55 mL/min to 0.56 mL/min at 13 min to 0.7 mL/min at 14 min for 1 min to 0.55 mL/min at 17 min. UV detection (λ = 302 nm). Retention time: 7.9 min. Limit of detection, 2 µg/L for omeprazole and its metabolites [Rezk *et al.* 2006]. Column: SK-W precolumn (35 × 4.6 mm i.d., 10 µm) or Inertsil DS-80A (150 × 4.6 mm i.d., 5 µm). Mobile phase: phosphate buffer : acetonitrile (pH 7.0, 92 : 8) or phosphate buffer : acetonitrile : methanol (pH 6.5, 65 : 30 : 5). UV detection (λ = 302 nm). Limit of quantification, 3 µg/L for omeprazole and its metabolites [Shimizu *et al.* 2006]. Column: Chromolith Performance RP-18e (100 × 4.6 mm i.d.). Mobile phase: 0.01 mol/L disodium hydrogen phosphate buffer : acetonitrile (pH 7.1, 73 : 27). UV detection (λ = 302 nm). Limit of quantification, 10 µg/L [Zarghi *et al.* 2006]. Column: amylose tris(3,5-dimethylphenylcarbamate) on APS- Nucleosil (150 × 4.6 mm i.d., 7 µm). Mobile phase: acetonitrile : water (60 : 40), flow rate 0.5 mL/min. UV detection (λ = 302 nm). Limit of detection, 0.0063 mg/L for each enantiomer [Cass *et al.* 2003]. See also Garcia-Encina *et al.* [1999], Orlando, Bonato [2003] and Yuen *et al.* [2001].

LC-MS Column: ODS 3. Mobile phase: 0.01 mol/L ammonium acetate : acetonitrile (40 : 60), flow rate 0.25 mL/min. Limit of quantification, 0.05 µg/L [Vittal *et al.* 2009]. Column: ODS. Mobile phase: methanol : 10 mmol/L ammonium acetate (60 : 40). Positive ion mode, SRM acquisition mode. Limit of quantification, 1.2 µg/L [Macek *et al.* 2007]. Column: ProntoSIL AQ C_{18}. Mobile phase: 10 mmol/L ammonium acetate (pH 7.25) : acetonitrile. SIM acquisition mode. Limit of quantification, 10 µg/L for omeprazole and omeprazole sulfone, and 5 µg/L for 5-hydroxyomeprazole [Hofmann *et al.* 2006]. Column: Betasil silica (50 × 3 mm i.d., 5 µm). Mobile phase: acetonitrile : water : formic acid (73.4 : 26.5 : 0.1), flow rate 1.5 mL/min. ESI. Limit of quantification, 2.5 µg/L for omeprazole and 5-hydroxyomeprazole [Song, Naidong 2006]. Column: Symmetry RP_8 (150 × 3.0 mm i.d., 5 µm). Mobile phase: 5 mmol/L ammonium hydroxide–formic acid (pH 8.2) : methanol (35 : 65), flow rate 400 µL/min. TIS. Limit of quantification, 400 ng/L, limit of detection, 2 to 15 ng/L for omeprazole and hydroxyomeprazole [Frerichs *et al.* 2005]. See also Wang *et al.* [2005] and Woolf, Matuszewski [1998].

CE Capillary: uncoated fused silica (57/50 cm total/effective length, 75 µm i.d.). Buffer: 20 mmol/L borate buffer: 30 mmol/L SDS (pH 9.5). DAD (λ = 300 nm). Limit of detection, 0.04–0.07 mg/L for omeprazole and its metabolites [Pérez-Ruiz *et al.* 2006].

Serum **HPLC** Column: C_{18}. Mobile phase: SDS : propan-2-ol (pH 7.0). UV detection (λ = 305 nm). Limit of quantification, <25 µg/L, limit of detection, <6 µg/L for omeprazole and its metabolites [Rambla-Alegre *et al.* 2009].

LC-MS Column: ReproSil Chiral-CA (250 × 2 mm i.d., 5 µm). Mobile phase: 2-propanol-acetic acid-diethylamine (100 : 4 : 1) : hexane (10 : 90 to 15 : 85 in 10 min for 1 min at 2 : 75 for 1 min to 10 : 90), flow rate 0.35 mL/min. Limit of detection, 0.2 µg/L for (*R*)-omeprazole, (*S*)-omeprazole and omeprazole sulfone, and 1 µg/L for (*R*)-5-hydroxyomeprazole and (*S*)-5-hydroxyomeprazole [Martens-Lobenhoffer *et al.* 2007].

Urine **HPLC** See Serum [Rambla-Alegre *et al.* 2009].

Liver **HPLC** Microsomes. Column: Superspher SI-60 (125 × 4.0 mm i.d., 4 µm). Mobile phase: dichloromethane : 5% ammonium hudroxide in methanol : 2-propanol (191 : 8 : 1), flow rate 1.5 mL/min. UV detection (λ = 302 nm). Limit of detection, 2 ng/L for omeprazole sulfone and 25 ng/L for hydroxyomeprazole [Andersson *et al.* 1993].

Disposition in the Body Omeprazole is rapidly absorbed after oral administration and absorption is not affected by the presence of food. It is almost completely metabolised in the liver, mainly by the cytochrome P450 isoform CYP2C19, and it is excreted in urine. Metabolites include omeprazole sulfone, 5-hydroxymethylomeprazole, 5-carboxyomeprazole and at least three other unidentified compounds. Distribution and elimination of the drug are both rapid. Approximately 80% of metabolites are excreted in urine, the rest in faeces.

Therapeutic Concentration

Ten healthy males, aged 23 to 40 years, were administered with 40 mg and 80 mg omeprazole orally on two separate occasions. The mean maximum concentration was 3.6 µmol/L (range, 2.34–5.54) for the 40-mg dose and 7.99 µmol/L (range, 5.02–12.71) for the 80-mg dose. These concentrations were observed at 0.2 h (range, 0.12–0.32). For the sulfone metabolite, mean concentrations were 0.7 µmol/L (range, 0.54–0.9) and 1.6 µmol/L (range, 1.09–2.37) for the 40- and 80-mg dose, respectively, attained at 0.38 h (range, 0.23–0.61) and 0.52 h (range, 0.33–0.84), respectively. For the hydroxy metabolite, mean concentrations were 2.13 µmol/L (range, 1.81–2.51) and 2.95 µmol/L (range, 2.37 to 3.68) for 40- and 80-mg doses, respectively, attained at 0.27 h (range, 0.18–0.41) and 0.27 h (range, 0.20–0.36), respectively [Andersson, Regårdh 1990].

Thirteen patients aged between 0.3 and 20 years old and undergoing treatment for acute gastrointestinal disease involving gastric acidity, mostly with normal hepatic and renal function, were given an IV median dose of 22 mg omeprazole (range, 6–40) (median 47.4 mg/1.73 m^2 [range, 36.9–60.2]). The mean maximum concentration observed was 0.58 µg/L (range, 0.23–1.66) at 2.0 h (range, 1.0–4.4) [Jacqz-Aigrain *et al.* 1994].

Toxicity

A 26-year-old woman ingested 16 omeprazole capsules (20-mg enteric-coated granules), which she had been prescribed for abdominal pain. She became drowsy, sweaty and complained of a headache. She was admitted to hospital and it was noted that she was flushed and tachycardic (110 beats/min). At 6 h after administration, no more abnormal signs were observed and after 24 h, only abdominal pain was still present. The initial plasma concentration was 1.01 mg/L [Ferner, Allison 1993].

In another case, a 40-year-old lorry driver was admitted to hospital 20 h after overdosing on 20 capsules (20-mg enteric-coated granules). He complained of drowsiness, blurred vision, dry mouth and a throbbing headache. Clinical examination showed that total blood count, creatinine, urea and electrolytes were normal. All symptoms had gone 32 h after ingestion [Ferner, Allison 1993].

Bioavailability Oral bioavailability increases from ~35%, after the first dose to ~50% after several doses.

Half-life 0.5–3 h.

Volume of Distribution 0.27–0.45 L/kg.

Clearance Systemic clearance, 0.23 L/kg/h.

Protein Binding ~95%.

Note For a review of the pharmacokinetics of omeprazole, see Howden [1991]; for a review of the pharmacology and the uses of omeprazole, see Wilde, McTavish [1994].

Dose The usual oral dose is 20 to 40 mg daily for peptic ulcer, gastro-oesophageal reflux and acid aspiration; up to 120 mg daily in Zollinger–Ellison syndrome. The dose is 0.7 to 1.4 mg/kg daily for children over 2 years, with a maximum of 40 mg.

Omethoate

Acaricide, Insecticide

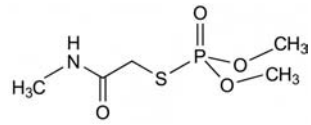
$C_5H_{12}NO_4PS$ = 213.2

CAS—1113-02-6

IUPAC Name 2-Dimethoxyphosphorylsulfanyl-*N*-methylacetamide

Synonyms Dimethoate-met; *O,O*-dimethyl-*S*-methylcarbamoylmethylphosphorothioate.

Proprietary Names *Bay-45432*; *Dimethoxon*; *Folimat*; *S-6876.*

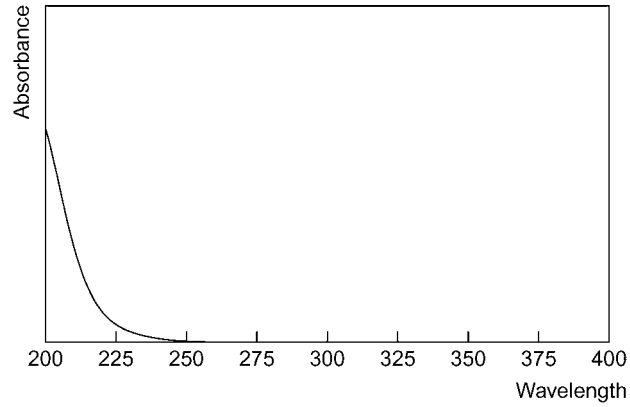


Chemical Properties A colourless to yellow oil. Mp −28° decomposes at 135°. Soluble in water, alcohol, acetone and many hydrocarbons; slightly soluble in diethyl ether; insoluble in petroleum ether. Log *P* (octanol/water), −0.74.

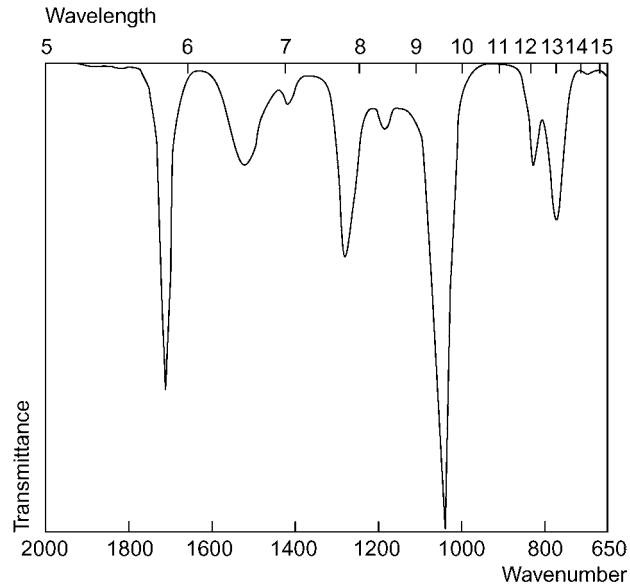
Thin-layer Chromatography System TX—R_f 0.00; system TY—R_f 0.00.

Gas Chromatography System GA—RI 1595; system GK—RRT 0.73 (relative to caffeine).

Ultraviolet Spectrum



Infrared Spectrum Principal peaks at wavenumbers 1046, 1714, 1278, 775, 2964, 599 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 110, 156, 109, 79, 58, 15, 47, 126.

Disposition in the Body Omethoate is eliminated in urine, mostly within 48 h after ingestion.

Toxicity The allowed daily intake is 0.3 µg/kg.

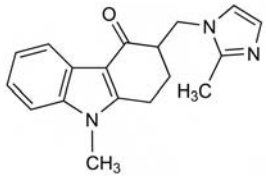
An adult female was admitted to hospital a few hours after ingestion of a pesticide. The omethoate blood level was determined on admission at 1.6 mg/L, fenthion was also detected at 2.9 mg/L. The patient remained clinically well and was discharged three days later [Tsatsakis *et al.* 1998.]

Tsatsakis AM *et al.* (1998). Clinical and toxicological data in fenthion and omethoate acute poisoning. *J Environ Sci Health B* 33(6): 657–670.

Ondansetron

5-HT_3 Receptor Antagonist, Antiemetic
$C_{18}H_{19}N_3O$ = 293.4
CAS—99614-02-5

IUPAC Name 9-Methyl-3-[(2-methylimidazol-1-yl)methyl]-2,3-dihydro-1*H*-carbazol-4-one
Synonyms GR-38032; 1,2,3,9-tetrahydro-9-methyl-3-[(2-methyl-1*H*-imidazol-1-yl)methyl]-4*H*-carbazol-4-one.

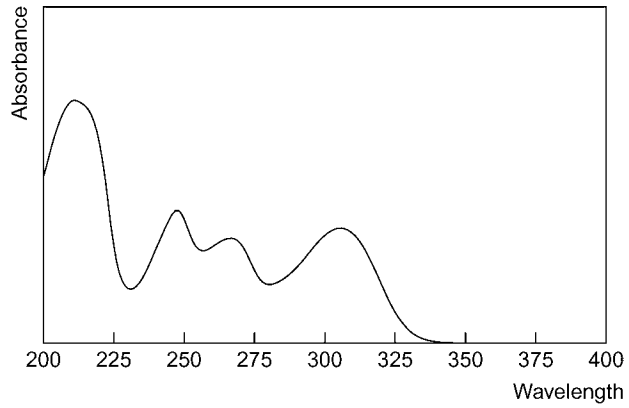


Chemical Properties Crystals from methanol. Mp 231° to 232°. Hydrochloride dihydrate; pK_a 7.4.

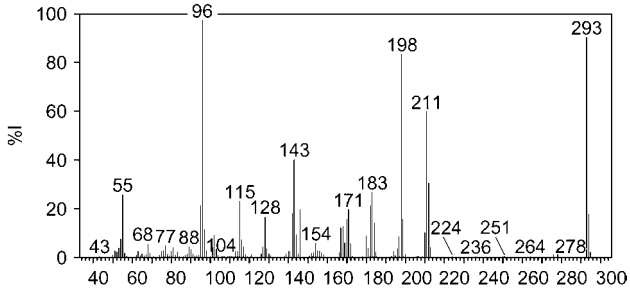
Ondansetron Hydrochloride Dihydrate

$C_{18}H_{19}N_3O$,HCl, $2H_2O$ = 365.9
CAS—99614-01-4
IUPAC Name 1,2,3,9-Tetrahydro-9-methyl-3-[(2-methyl-1*H*-imidazol-1-yl)methyl]-4*H*-carbazol-4-one hydrochloride dihydrate
Synonyms GR-38032F; GR-C507/75; SN-307.
Proprietary Names *Zofran*; *Zophren*.
Chemical Properties A white crystalline solid from water/isopropanol. Mp 178.5° to 179.5°. Soluble in aqueous solutions, but solubility decreases with pH >5.7.

High Performance Liquid Chromatography System HZ—retention time 2.9 min.
Ultraviolet Spectrum Aqueous acid (pH 2.8)—210, 248, 266, 310 nm.



Mass Spectrum Principal ions at *m/z* 96, 293, 198, 211, 143, 183, 55, 115.



Quantification
Plasma **HPLC** Column: RP C_{18} Spherisorb (100 × 4.6 mm i.d., 10 µm). Mobile phase: acetonitrile : 20 mmol/L sodium phosphate monobasic buffer (pH 3 with phosphoric acid) (60:40), flow rate 1.5 mL/min. IS: loxapine. UV detection (λ=305 nm). Retention time: ondansetron, 3.9 min; IS, 5.5 min. Limit of quantification, 0.5 µg/L [Depot *et al.* 1997]. Column: Spherisorb silica S3W (100 × 4.6 mm i.d., 3 µm). Temperature: 35°. Mobile phase: 25 mmol/L sodium acetate buffer (pH 4.2) : acetonitrile (6:4), flow rate 1 mL/min. UV detection (λ=305 nm). Retention time: 4–5 min. Limit of detection, 1 µg/L [Colthup *et al.* 1991].
Serum **HPLC** MS detection. Limit of detection 0.25 µg/L [Xu *et al.* 2000]. UV detection (λ=210 nm). Limit of quantification, 15 µg/L for each enantiomer, limit of detection, 7 µg/L [Liu, Stewart 1997]. Column: Chiralcel OD (250 × 4.6 mm i.d., 10 µm). Mobile phase: hexane : 95% ethanol : 2-propanol : acetonitrile (65 : 25 : 10 : 1), flow rate 1 mL/min. IS: prazosin. UV detection (λ=216 nm). Retention time: R(−)-ondansetron, 10.0 min; S(+)-ondansetron, 11.6 min; IS, 8.0 min. Limit of quantification, 10 µg/L for each enantiomer, limit of detection, 2.5 µg/L [Kelly *et al.* 1993].
Disposition in the Body Ondansetron is readily and completely absorbed after oral administration with peak plasma concentrations of 0.03 to 0.04 mg/L (after an 8 mg dose) being reached within 2 h. The drug is first detected in plasma after 30 min. It undergoes extensive hepatic metabolism with <5% being excreted via urine unchanged. At least 40% of a single dose is oxidised to 8-hydroxy-ondansetron in the liver, 20% to 7-hydroxy-ondansetron, <5% to 6-hydroxy-ondasetron and a little appears as *N*-demethyl-ondansetron. The metabolites have also been detected in faeces. These intermediates are glucuronide or sulfate conjugated before leaving the liver and being excreted in urine.
Therapeutic Concentration The serum therapeutic concentration range is 30 to 300 µg/L.

Twelve healthy male and female volunteers, aged between 26 and 69 years (mean age, 44.8 years) and 12 patients with mild, moderate and severe liver disease (4 for each), aged between 31 and 65 years (mean, 47.3), were administered with an 8 mg oral dose or an 8 mg IV dose. Peak plasma concentrations for the oral dose were 38.6, 40.1 and 43.0 µg/L for the mild, moderate and severe hepatically impaired patients, respectively, and 27.9 µg/L for the healthy individuals. These concentrations were observed at 1.25, 1.07, 1.5 and 1.9 h, respectively. Peak concentrations for the IV dose were 97.8 µg/L for the patients with mild liver disease, 115.0 µg/L moderate liver disease and 64.5 µg/L for those with severe liver disease, observed at 0.38, 0.25 and 0.31 h, respectively. The healthy individuals reached a peak at 129 µg/L in 0.22 h [**Figg *et al.* 1996**].

Bioavailability 60% (young healthy subjects), 65% (elderly); 85% (patients with cancer) and 100% (severe hepatic impairment).
Half-life 3 h (young healthy subjects), 5 h (elderly) and 15 to 32 h (severe hepatic impairment).
Volume of Distribution Approximately 140 to 160 L; also reported as 1.3 to 2.9 L/kg. 3.05 L/kg (mild liver disease); 3.36 L/kg (moderate); 3.86 L/kg (severe); 2.5 L/kg (healthy individuals).
Clearance 16.6 L/h (patients with mild liver disease); 15.9 L/h (moderate liver disease); 11.6 L/h (severe); 28.3 L/h (healthy volunteers).
Distribution in Blood Blood : plasma ratio is 0.83. It distributes into erythrocytes and circulates bound within.
Protein Binding 70 to 75%.
Dose Adult: 8 mg (orally) before treatment followed by 8 mg every 12 h. 16 mg daily (by rectum administration) or 32 mg (IV). Children: 5 mg/m^2 (IV) immediately before treatment and then 4 mg orally every 12 h. Alternatively, 100 µg/kg (maximum 4 mg) (over 2 years old).

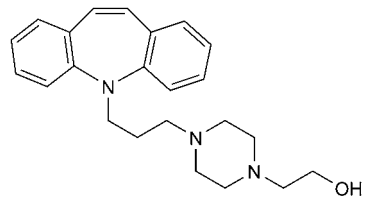
Opipramol

Antidepressant
$C_{23}H_{29}N_3O$ = 363.5
CAS—315-72-0

IUPAC Name 2-[4-(3-benzo[*b*][1]benzazepin-11-ylpropyl)piperazin-1-yl] ethanol
Synonym 4-[3-(5*H*-Dibenz[*b*,*f*]azepin-5-yl)propyl]-1-piperazine-ethanol



Chemical Properties Crystals. Mp 100° to 101°.

Opipramol Hydrochloride

$C_{23}H_{29}N_3O$, 2HCl = 436.4
CAS—909-39-7
Proprietary Name *Insidon*
Chemical Properties Light-yellow crystalline powder that develops a reddish tinge on prolonged exposure to light. Mp ≈210°, with decomposition. Soluble in

water and ethanol; sparingly soluble in acetone. pK_a 3.8. Log *P* (octanol/water), 3.41 [Meylan, Howard 1995]. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Colour Tests Forrest reagent—blue; Mandelin's test—yellow-green.

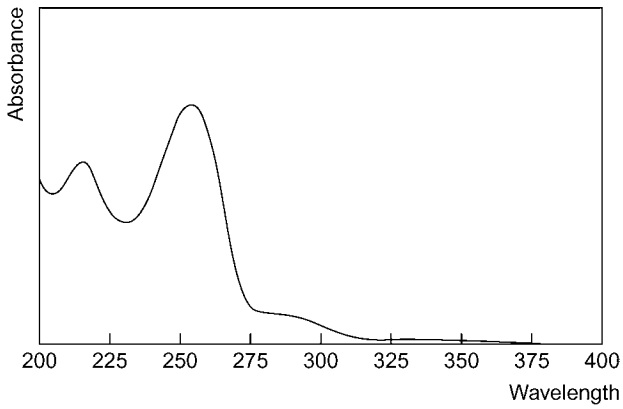
Thin-layer Chromatography System TA—R_f 0.54; system TAE—R_f 0.35; system TAF—R_f 0.39; system TAG—R_f 0.07; system TB—R_f 0.06; system TC—R_f 0.22; system TE—R_f 0.38 (acidified iodoplatinate solution, positive).

For a TLC double-radioisotope technique for the detection of opipramol in blood and other biological samples, see Riess [1977].

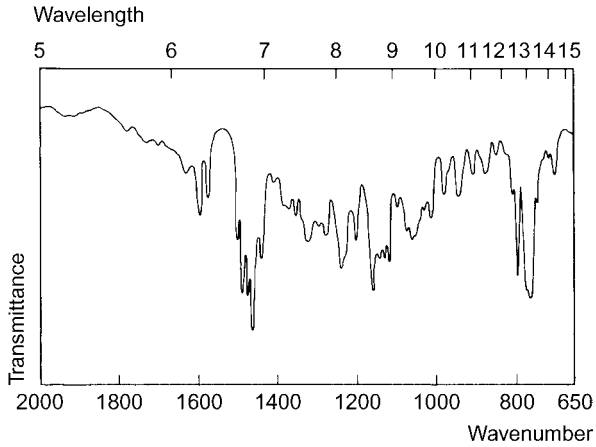
Gas Chromatography System GA—opipramol RI 3050, M (ring) RI 1985; system GB—opipramol RI 3219.

High Performance Liquid Chromatography System HAA—RT 14.2 min; system HA—*k* 2.2; system HF—*k* 1.63; system HX—RI 377; system HY—RI 340; system HZ—RT 3.9 min.

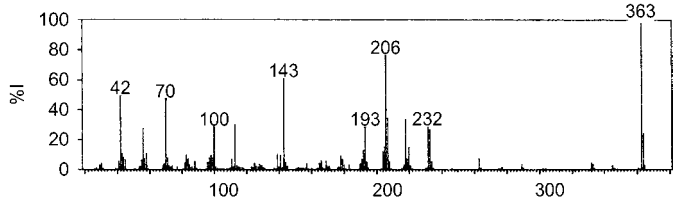
Ultraviolet Spectrum Aqueous acid—253 nm ($A_1^1 = 870$a). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 755, 1155, 790, 1237, 1115, 1126 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 363, 206, 143, 42, 70, 207, 218, 113.



Quantification

Plasma **HPLC** Column: Phenomenex Luna CN (150 × 4.6 mm i.d., 5 µm). Mobile phase: 20 mmol/L ammonium acetate : 20 mmol/L acetic acid : acetonitrile (240 : 60 : 700), flow rate 1.0 mL/min. Photometric detection. Retention time: 8.7 to 8.9 min. Limit of quantification, 250 ng/L [Kees *et al.* 2001].

LC-MS Column: Symmetry C_{18} (150 × 3 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.1% formic acid (28 : 72 for 4 min to 70 : 30 in 1 min for 3 min to 28 : 72 in 0.7 min), flow rate 0.6 mL/min. APCI, positive ion mode. Limit of quantification, 50 µg/L, limit of detection, 5 µg/L [Kollroser, Schober 2002].

Serum **LC-MS** Column: Chromolith Speed ROD C_{18} (50 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 5 mmol/L acetic acid (pH 3.9) in ammonia (20 : 80 to 70 : 30 at 4 min for 1 min to 20 : 80), flow rate 1.0 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 1.83 µg/L [Kirchherr, Kühn-Velten 2006]. Column: Uptisphere (12.5 cm × 2 mm i.d., 5 µm). Mobile phase: 50 mmol/L ammonium acetate (pH 4.0)-acetonitrile : acetonitrile (100 : 0), flow rate 200 µL/min. ESI, positive ion mode, SIM acquisition mode. Limit of quantification, 19 nmol/L [Gutteck, Rentsch 2003].

Disposition in the Body Readily absorbed after oral administration.

Therapeutic Concentration

Following the administration of a single oral dose of 50 mg opipramol hydrochloride to 20 healthy volunteers a mean peak plasma concentration of 15 µg/L was attained after ≈2 h [Kees *et al.* 2001].

Toxicity

Somnolence was reported in a 27-year-old subject following an overdose of opipramol; a maximum serum concentration of 0.115 mg/L was determined; ethanol was also detected [Pedersen *et al.* 1982].

In a fatality involving the intentional ingestion of an unknown quantity (up to 3 g) of opipramol dihydrochloride, postmortem tissue concentrations of opipramol dihydrochloride and deshdroxyethyl opipramol dihydrochloride, respectively, were: blood (heart) 29.6 and 5.2 mg/L; urine 19.1 and 4.7 mg/L; liver 260.7 and 50.6 µg/g; lung 68.9 and 24.0 µg/g; brain 113.5 and 5.1 µg/g; kidney 69.6 and 11.8 µg/g; muscle 9.1 and 1.5 µg/g [Skopp *et al.* 1996].

Dose 150 to 300 mg of opipramol hydrochloride daily.

Opium

Narcotic Analgesic

Synonyms Adormidera; blue bread seed poppy; chandu; gelinjik; gum opium; hashas; kheshkhash abu al noum; ikkanshu; madat; mawseed; O fang; O fu jung; opium crudum; O p'ien; papaver sominferum; pavot; poppy; raw opium; tengkoh; white poppy; ya p'ien; yu mi.

Proprietary Names It is an ingredient of *Bromocod N*; *BandO Supprettes No. 15A*; *Colchimax*; *Digestovital*; *Doveru*; *Lamaline*; *Pectyl*; *Stilpane*; *Tanagel*.

Street Names Ah-pen-yen; aunti; aunti emma; big O; black; black pill; black shit; black stuff; black tar opium; block; boulette; chandoo; chandu; China; Chinese molasses; Chinese tobacco; chocolate; cruz; dopium; Dover's deck; Dover's powder; dream gum; dream gun; dream stick; dreams; Dutch courage; easing powder; fi-donie; gee; God's medicine; goma; gondola; gong; goric; great tobacco; gum; guma; hard stuff; hocus; hop; hops; incense; Indonesian bud; joy plant; midnight oil; mira; mud; O; OP; ope; pen yan; pin gon; pin yen; pox; skee; tar; toxy; toys; when-shee; ze; zero.

Chemical Properties Opium is an air-dried latex obtained by incision from the unripe seed pods/capsules of *Papaver somniferum* (Papaveraceae). It varies in colour from yellow to dark brown and has a characteristic odour and a bitter taste. It is a non-homogeneous material containing poppy capsule fragments. It is sticky, tar-like and dark brown when fresh, and becomes brittle and hard as it ages. Prepared opium is a sticky dark product obtained as a result of various treatments of raw opium, e.g. water extraction, in order to make it suitable for smoking. It contains ~40 alkaloids, which constitute about 25% of the opium, up to 25% water, meconic acid, some lactic and sulfuric acids, albumin, mucilage, sugar, and some resinous and waxy-like substances. The principal active alkaloids are morphine (4 to 21%), codeine (0.7 to 3%), thebaine (0.2 to 1%), papaverine (0.5 to 1.3%), and noscapine (2 to 8%).

Colour Tests Froehde reagent→brown-black; Mecke's reagent→green-black.

Thin-layer Chromatography Plates: HPTLC silica gel F_{254} (10 × 20 cm, 0.1 mm). Solvent system: methanol : dichloromethane : hexane (100 : 0 : 0 to 50 : 50 : 0 to 0 : 100 : 0 to 0 : 0 : 100). Limit of detection, ethylmorphine, thebaine, papaverine, codeine1 µg; morphine, noscapine 2 µg [Pothier, Galand 2005].

Gas Chromatography Column: OV-1 or SE-54 cross-linked glass capillary (25 m × 0.27 mm i.d., 0.15 µm). Carrier gas: H_2, 110 cm/s (OV-1) or 65 cm/s (SE-54). Temperature programme: 150° to 280° at 9°/min. FID. Limit of detection not reported [Neumann 1984].

Note For a GC analysis of the headspace constituents of opium see [Buchbauer *et al.* 1994].

High Performance Liquid Chromatography Column: TSKgel ODS-120 A (250 × 4.6 mm i.d.) Mobile phase: acetonitrile : 10 mmol/L sodium 1-heptanesulfonate (pH 3.5; 20 : 80 to 30 : 70 at 15 min to 40 : 60 at 20 min for 5 min to 50 : 50 at 30 min to 20 : 80 at 35 min), flow rate 1 mL/min. DAD (λ = 284 nm). Limit of detection not reported [Yoshimatsu *et al.* 2005]. Column: Whatman 5 ODS-3 (125 × 3.2 mm) Mobile phase: methanol : phosphate-hexylamine buffer (pH 2.1; 2 : 98 for 3 min to 35 : 65 in 9.5 min for 4.5 min to 100 : 0 in 1 min for 4 min to 2 : 98 in 3 min), flow rate 0.76 mL/min for 14 min to 1.5 mL/min at 16 min for 3 min to 0.76 mL/min in 4 min for 5 min. DAD. Limit of detection, morphine 1.16 mg/L, papaverine 1.11 mg/L, codeine 1.18 mg/L, noscapine 0.94 mg/L, thebaine 1.10 mg/L [Lurie *et al.* 2003]. Column: Spherisorb CN (250 × 4.6 mm, 10 µm). Mobile phase: 1% aqueous ammonium acetate (pH 5.8) : acetonitrile : dioxane (100 : 10 : 5), flow rate 1.5 mL/min. UV detection (λ = 254 nm). Limit of detection not reported [Trenerry *et al.* 1995]. Column: MN-Nucleosil 7 C_6H_5 (250 × 4.0 mm i.d., 7 µm). Mobile phase: methanol-water (pH 3.2; 5 : 95) : methanol-water (pH 3.95; 70 : 30; 100 : 0 to 0 : 100 in 20 min for 12 min to 100 : 0 in 8 min), flow rate 1.5 mL/min. UV detection (λ = 280 nm). Limit of detection not reported [Ayyangar, Bhide 1988]. Column: silica (30 cm × 3.9 mm i.d.) Mobile phase: isooctane : diethyl ether : methanol : diethylamine : water (400 : 325 : 175 : 1.5 : 0.5), flow rate 2 mL/min. UV detection. Limit of detection not reported [Wijesekera *et al.* 1988]. Column: µBondapak phenyl (30 cm × 3.9 mm i.d., 10 µm). Mobile phase: 1% aqueous sodium acetate–7.0 mmol/L TEA : methanol (pH 11; 42 : 58), flow rate 1.0 mL/min. UV detection (λ = 254 nm). Limit of detection not reported [Ayyangar, Bhide 1986].

Supercritical Fluid Chromatography Column: LiChrosorb Si 60 (120 × 4.6 mm i.d., 5 µm) or aminopropyl bonded silica (230 × 4.6 mm, 10 µm). Mobile phase: carbon dioxide : methanol : methylamine : water (83.37 : 16.25 : 0.15 : 0.23). DAD. Limit of detection not reported [Janicot *et al.* 1988].

Capillary Electrophoresis Capillary: uncoated fused silica (700 × 50 µm i.d., effective length 55 cm). Buffer: 100 mmol/L sodium acetate (pH 3.1) : methanol (3 : 7). UV detection (λ = 224 nm). Limit of detection not reported [Mohana *et al.* 2005]. Capillary: fused silica (320 × 50 µm i.d., effective length 23.5 cm). Buffer: 25 mmol/L HP-β-CD and 75 mmol/L DM-β-cyclodextrin in CElixir Reagent B (pH 2.5). Limit of detection, morphine 1.16 mg/L, papaverine 1.11 mg/L, codeine 1.18 mg/L, noscapine 0.94 mg/L, thebaine 1.10 mg/L [Lurie *et al.* 2003]. Capillary: uncoated fused silica (700 × 50 µm i.d., 55 cm from detector). Buffer: 100 mmol/L sodium acetate (pH 3.1) : methanol (3 : 7). UV detection (λ = 224 nm). Limit of detection, morphine 850 µg/L, thebaine 450 µg/L, codeine and narcotine 500 µg/L, papaverine 550 µg/L [Reddy *et al.* 2003]. Capillary: fused silica (640 × 50 µm i.d., 55 cm to detector). DAD (λ = 214 nm). Limit of detection not reported [Bjornsdottir, Hansen 1995a]. Capillary: fused silica (550 × 50 µm i.d.). Buffer: 0.05 mol/L 6-ACA (pH 4.0) containing Tween 20 and SDS. Limit of detection, morphine 0.3 mg/L, noscapine 0.08 mg/L, normorphine 0.2 mg/L, thebaine 0.2 mg/L, codeine 0.2 mg/L, papaverine 0.2 mg/L [Bjornsdottir, Hansen 1995b]. Capillary: uncoated fused silica (700 × 50 µm i.d., effective length 450 mm). Buffer: DMF : 0.05 mol/L cetyltrimethylammonium bromide-0.01 mol/L potassium dihydrogen orthophosphate-0.01 mol/L sodium tetraborate (pH 8.6; 10 : 90). UV detection (λ = 254 nm). Limit of detection, not reported [Trenerry *et al.* 1995].

Note For a capillary electrophoresis method with electrochemiluminescence for the determination of opiate alkaloids in Chinese herbal medicines, see Gao *et al.* [2006]. For the detection and characterisation of reticuline as a marker of opium use, see Al Amri *et al.* [2004]. For a comparison of raw, prepared and dross opium, see [Lim and Kwok 1981] and for a summary of opium characterisation methods, see Remberg *et al.* [1994].

Quantification

***Blood* HPLC** Column: Hypersil BDS Phenyl Rocket (57 × 7.0 mm i.d., 3 µm). Mobile phase: water-methanol (90 : 10) : methanol-25 mmol/L TEA-30.3 mmol/L formic acid (100 : 0 to 50 : 50 in 10 min to 0 : 100 in 2 min for 1 min to 100 : 0 in 2 min), flow rate 2.0 mL/min. DAD (λ= 240 nm) or fluorescence detection (λ_{ex} = 280 nm, λ_{em} = 335 nm). Limit of detection, morphine 7.6 (DAD) and 3.3 µg/L, codeine 6.3 (DAD) and 2.3 µg/L, papaverine 1.6 µg/L (DAD), noscapine 4.1 µg/L (DAD) [Dams *et al.* 2002].

***Plasma* HPLC** Column: µBondaPak C_{18} reversed phase (300 × 4.0 mm i.d., 10 µm). Mobile phase: 5% methanol : 3% acetonitrile : 0.5 mmol/L sodium acetate : 0.012 mol/L potassium dihydrogen orthophosphate : 0.148 mmol/L phosphoric acid, flow rate 1.2 mL/min. Fluorescence detection (λ_{ex} = 235 nm, λ_{em} = 349 nm). Limit of detection, 20 µg/L [Ghazi-Khansari *et al.* 2006].

***Urine* GC-MS** Column: DB-5 cross-linked 5% phenylmethyl silicone (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 80° for 2 min to 310° at 16°/min for 5 min. SIM or scan acquisition mode. Limit of detection, morphine 20 µg/L, 6-monoacetyl morphine (6-MAM) 25 µg/L in SIM mode, morphine 50 µg/L, 6-MAM 200 µg/L in scan mode [Paterson, Cordero 2006]. Column: HP-1MS fused silica capillary (30 m × 0.25 mm i.d., 0.25 µm). Temperature programme: 120° for 1 min to 280° at 20°/min for 6 min. SIM acquisition mode. Limit of quantification, morphine 30 µg/L, codeine 40 µg/L; limit of detection, morphine 10 µg/L, codeine 15 µg/L [Liu *et al.* 2006]. Column: HP-5 MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 80° for 2 min to 290° at 16°/min for 5.37 min. SIM acquisition mode. Limit of detection, morphine 0.02 mg/L, codeine 0.02 mg/L, 6-MAM 0.02 mg/L [Paterson *et al.* 2000, 2005].

HPLC Column: Hypersil BDS Phenyl Rocket (57 × 7.0 mm i.d., 3 µm). Mobile phase: water-methanol (90 : 10) : methanol-25 mmol/L TEA-30.3 mmol/L formic acid (100 : 0 to 50 : 50 in 10 min to 0 : 100 in 2 min for 1 min to 100 : 0 in 2 min), flow rate 2.0 mL/min. UV (λ = 240 nm) or fluorescence detection (λ_{ex} = 280 nm, λ_{em} = 335 nm). Limit of detection not reported [Dams *et al.* 2002].

***Hair* GC-MS** Column: DB-1 MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.5 mL/min. Temperature programme: 150° for 2 min to 280° at 10°/min for 15 min. SIM acquisition mode. Limit of quantification, 0.03 µg/g; limit of detection, 0.016 µg/g [Sabzevari *et al.* 2004].

***Other* LC-MS** Water. Column: Synergi Polar-RP 80 Å (150 × 3 mm, 4 µm). Mobile phase: acetonitrile : 10 mmol/L ammonium formate (pH 4; 10 : 90 for 5 min to 80 : 20 within 13 min to 10 : 90 within 2 min for 10 min), flow rate 0.5 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, morphine 0.01, 0.005 and 0.001 µg/L in waste water (influent and effluent) and surface water, respectively; codeine 0.02, 0.01 and 0.002 µg/L in waste water (influent and effluent) and surface water, respectively [Hummel *et al.* 2006].

Toxicity

The following 7 cases describe deaths where morphine was detected postmortem.

Case 1: A 26-year-old man was found dead in his bed beside a bag of dried poppy capsules.

Case 2: A 19-year-old man was found dead in his home. For the previous 3 weeks he had injected amfetamine and consumed a large quantity of diazepam. In the previous 2 days he had drunk large quantities of tea made from poppy capsules.

Case 3: A 28-year-old man consumed a large quantity of tea made from poppy capsules and was found dead the next day.

Case 4: An 18-year-old man died shortly after arriving at a friend's home. He had a pot of poppy capsules and a syringe amongst his possessions.

Case 5: A 34-year-old man was found dead and a pot of poppy capsules was found in his flat. He had been prescribed 25 × 5 mg methadone tablets and 200 mL codeine syrup 3 days before death.

Case 6: A 33-year-old woman died after drinking tea made from boiled poppy capsules. She had been prescribed clobazam, clomipramine and levomepromazine 4 days before her death.

Case 7: A 25-year-old man was found dead in his flat. There were boiled poppy capsules and used syringes in his flat.

The following table shows the concentrations of morphine found upon postmortem examination. In all cases morphine was detected in the range normally seen in deaths among addicts following the intake of morphine or diamorphine.

Case	*Morphine (µmol/kg)*	
	Blood/muscle	*Liver*
1	B: 4.8	2.6
2	B: 0.3	0.7
3	B: 0.2	–
4	B: 6.7	2.5
5	B: 0.6	0.3
6	B: 3.3	6.6
7	M: 0.7	4.1

B, blood; M, muscle. [Steentoft *et al.* 1988].

Note For a study of arsenic levels in Indian opium eaters, see Narang *et al.* [1987]; for an overview of opium overdose in Iran, see Karbakhsh and Salehian [2007].

Dose Opium is intended only as the starting material for the manufacture of galenical preparations and is not dispensed as such. It is used as Prepared Opium (Ph. Eur 5.5), as Powdered Opium (USP 29), as Opium Tincture (BP 2005 or USP 29), or as Camphorated Opium Tincture (BP 2005) or Paregoric (USP 29) in various oral preparations. These have included Opiate Squill Linctus (BP 2005; Gee's linctus) for cough.

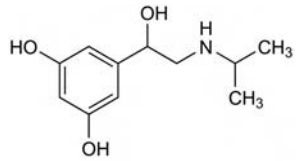
O

Orciprenaline

Sympathomimetic
$C_{11}H_{17}NO_3 = 211.3$
CAS—586-06-1

IUPAC Name 5-[1-Hydroxy-2-[(1-methylethyl)amino]ethyl]-1,3-benzenediol
Synonym Metaproterenol



Chemical Properties Crystals. Mp 100°. pK_a 9.0 (—OH), 10.1 (—NH—), 11.4 (—OH), (25°). Log *P* (octanol/water), 0.2. Extraction yield (chlorobutane), 0 [Demme *et al.* 2005].

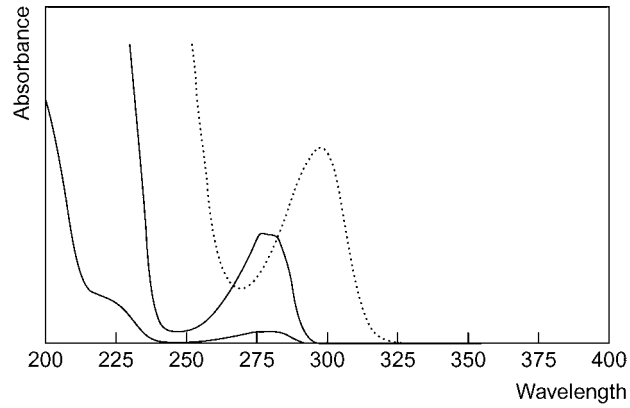
Orciprenaline Sulfate

$(C_{11}H_{17}NO_3)_2, H_2SO_4 = 520.6$
CAS—5874-97-5

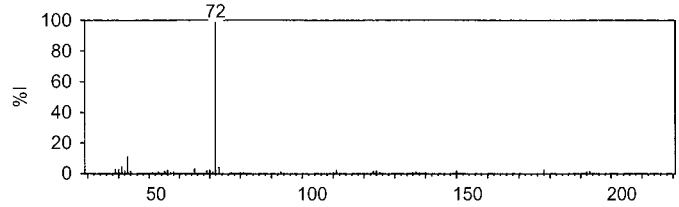
Proprietary Names *Alupent*; *Dosalupent*; *Metaprel.*
Chemical Properties A white crystalline powder. Mp about 205°. Soluble 1 in 2 of water and 1 in 1 of ethanol; practically insoluble in chloroform and ether.

Colour Tests *p*-Dimethylaminobenzaldehyde—orange/violet; Folin–Ciocalteu reagent—blue; Marquis test—yellow; potassium dichromate (method 1)—brown (slow).
Thin-layer Chromatography System TA—R_f 0.48; system TB—R_f 0.01; system TC—R_f 0.03; system TE—R_f 0.18; system TL—R_f 0.06; system TAE—R_f 0.21; system TAF—R_f 0.77 (acidified potassium permanganate solution, positive).
Gas Chromatography System GA—not eluted.
High Performance Liquid Chromatography System HX—RI 151; system HY—RI 131.

Ultraviolet Spectrum Aqueous acid—276 nm (A^1_1=89a); aqueous alkali—297 nm (A^1_1=155a).



Infrared Spectrum Principal peaks at wavenumbers 1086, 1173, 1605, 1010, 1305, 995 cm^{-1} (orciprenaline sulfate, KBr disk).
Mass Spectrum Principal ions at *m/z* 72, 43, 73, 41, 70, 65, 40, 39.



Quantification
Plasma **GC–MS** Limit of detection, 100 ng/L [Leis *et al.* 1990].
Dose 80 mg of orciprenaline sulfate daily.

Demme U *et al.* (2005). Systematic evaluation of 1-chlorobutane for liquid-liquid extraction of drugs. *Proceedings at the 12th TIAFT*, Seoul: 481–486.

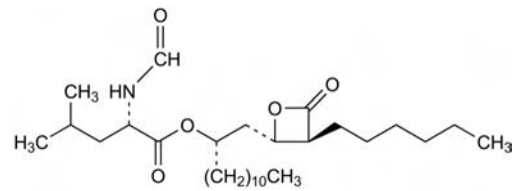
Orlistat

Antiobesity Agent, Gastric and Pancreatic Lipase Inhibitor
$C_{29}H_{53}NO_5 = 495.7$
CAS—96829-58-2

IUPAC Name [(2*S*)-1-[(2*S*,3*S*)-3-Hexyl-4-oxooxetan-2-yl]tridecan-2-yl] (2*S*)-2-formamido-4-methylpentanoate
Synonyms *N*-Formyl-L-leucine (1*S*)-1-[[(2*S*,3*S*)-3-hexyl-4-oxo-2-oxetanyl]-methyl] dodecyl ester; orlipastat; Ro-18-0647; Ro-18-0647/002; (−)-tetrahydrolipstatin.
Proprietary Name *Xenical*



Chemical Properties A white to off-white crystalline powder. Mp 40° to 43°. Practically insoluble in water; freely soluble in chloroform; very soluble in methanol and ethanol. pK_a is out of physiological range.
Quantification
Plasma **HPLC–MS** Column: Spherisorb C_6 (100 × 2 mm, 2 µm). Mobile phase: (A) acetonitrile : 0.1% formic acid (95 : 5), flow rate 150 µL/min; (B) methanol : water (85 : 15), flow rate 150 µL/min. Rapid change to 100% methanol at 300 µL/min for 3 min then re-equilibration with 85% methanol. MS–MS detection. Retention time: (A) 1.1 min; (B) 2.4 min. Limit of quantification, 0.3 µg/L [Wieboldt *et al.* 1998]. MS–MS detection. Limit of detection, 0.2 µg/L [Bennett *et al.* 1997].
Serum **HPLC–MS** Limit of detection, 0.25 µg/L [Xu *et al.* 2000].

Disposition in the Body Orlistat is not absorbed following oral administration and plasma concentrations of intact orlistat are non-measurable. There is no evidence of accumulation and no defined systemic pharmacokinetics. Metabolism may occur within the gastrointestinal wall. There are two metabolites M1 (4-member lactone ring hydrolysed) and M3 (M1 with *N*-formyl leucine moiety cleaved) which account for ~42% of the total plasma concentration. Elimination is mainly by faecal excretion of the unabsorbed drug, with ~97% of the administered dose excreted in this way, 83% of which is the unchanged drug. Cumulative renal excretion of total orlistat related material was <2% of the dose. Complete excretion occurs within 3 to 5 days. Orlistat, M1 and M3 are all subject to biliary excretion.

Therapeutic Concentration With therapeutic doses, detection of intact orlistat in plasma is difficult and concentrations are extremely low, <10 µg/L. Low plasma levels of M1 (26 µg/L) and M3 (108 µg/L) are observed 2 to 4 h after a therapeutic dose. <5 µg/L 8 h following administration with 360 mg orlistat.

Half-life Ranges between 1 and 2 h for the parent drug; for the metabolites ~2 h for M1 and 13.5 h for M3.

Volume of Distribution Cannot be determined because it is minimally absorbed and no definite systemic pharmacokinetics are observed.

Distribution in Blood Minimally partitions into erythrocytes.

Protein Binding >99%. Mainly lipoprotein and albumin.

Dose 120 mg three times a day.

Bennett PK *et al.* (1997). Quantitative determination of Orlistat (tetrahydrolipostatin, Ro 18-0647) in human plasma by high-performance liquid chromatography coupled with ion spray tandem mass spectrometry. *J Mass Spectrom* 32: 739–749.

Orphenadrine

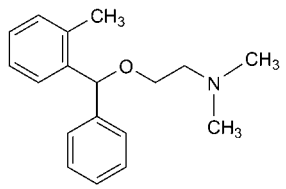
Anticholinergic

$C_{18}H_{23}NO = 269.4$

CAS—83-98-7

IUPAC Name *N*,*N*-Dimethyl-2-[(2-methylphenyl)phenylmethoxy]ethanamine

Synonyms Mephenamine; orphenadin.



Chemical Properties Liquid. pK_a 8.4. Log *P* (octanol/water), 3.8.

Orphenadrine Citrate

$C_{18}H_{23}NO, C_6H_8O_7 = 461.5$

CAS—4682-36-4

Proprietary Names *Banflex*; *Flexoject*; *Flexon*; *Myolin*; *Norflex*; *Orfenace*. It is an ingredient of *Norgesic* and *Orphengesic*.

Chemical Properties White crystalline powder. Mp 134° to 138°. Soluble 1 in 70 of water; slightly soluble in ethanol; practically insoluble in chloroform and ether.

Orphenadrine Hydrochloride

$C_{18}H_{23}NO, HCl = 305.8$

CAS—341-69-5

Synonym BS-5930

Proprietary Names *Biorphen*; *Disipal*; *Lysantin*; *Orfenal*.

Chemical Properties White crystalline powder. Mp 156° to 157°. Soluble 1 in 1 of water, 1 in 1 of ethanol, and 1 in 2 of chloroform; sparingly soluble in acetone and benzene; practically insoluble in ether.

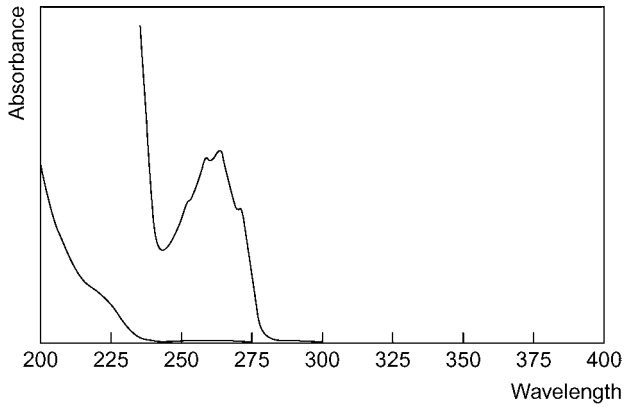
Colour Tests Mandelin's test—orange; Marquis test—yellow-orange; sulfuric acid—orange.

Thin-layer Chromatography System TA—R_f 0.55; system TB—R_f 0.48; system TC—R_f 0.33; system TE—R_f 0.68; system TL—R_f 0.16; system TAE—R_f 0.25; system TAF—R_f 0.49; system TAJ—R_f 0.14; system TAK—R_f 0.02; system TAL—R_f 0.47 (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, yellow).

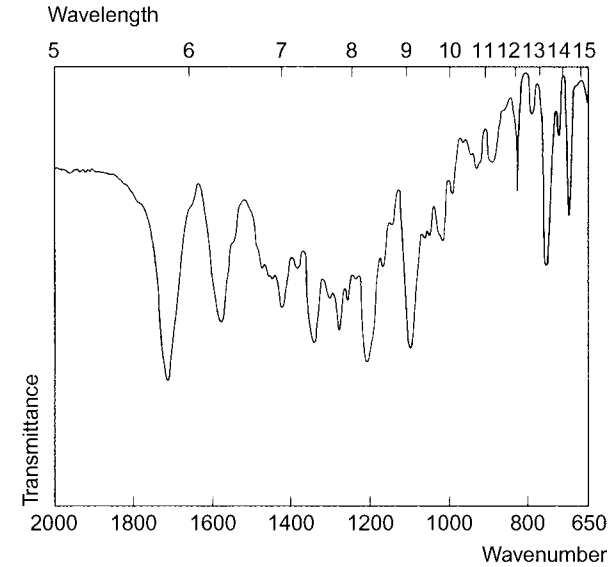
Gas Chromatography System GA—orphenadrine RI 1935, M (nor-) RI 1900, M (methylbenzophenone) RI 1700; system GB—orphenadrine RI 2014, M (nor-) RI 2007, M (methylbenzophenone) RI 1700; system GF—RI 2185.

High Performance Liquid Chromatography System HA—orphenadrine *k* 3.0, *N*-monodesmethylorphenadrine *k* 1.7, orphenadrine *N*-oxide *k* 1.1 (tailing peak); system HX—RI 418; system HY—RI 323; system HZ—RT 6.0 min.

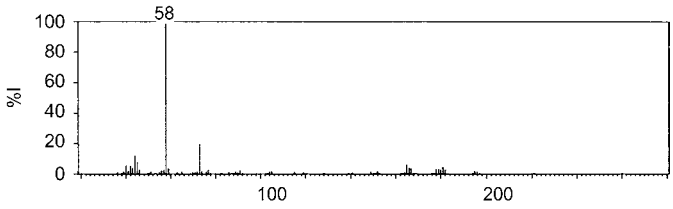
Ultraviolet Spectrum Aqueous acid—258, 264 nm ($A_1^1 = 24a$). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1718, 1216, 1108, 1285, 1585, 1265 cm^{-1} (orphenadrine citrate, KBr disk).



Mass Spectrum Principal ions at *m/z* 58, 73, 44, 45, 165, 42, 40, 181 (no peaks above 200); *N*-monodesmethylorphenadrine 44, 59, 165, 166, 181, 179, 178, 43; orphenadrine *N*-oxide 58, 181, 43, 45, 60, 44, 165, 73.



Quantification

Blood **GC** Column: DB-1 (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 3 mL/min. Temperature programme: 170° for 1 min to 280° at 10°/min. FID. Limit of detection, 136 µg/L [Nishikawa *et al.* 1997]. Column: DB-1 fused silica capillary (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 22 cm/s. Temperature programme: 100° to 280° at 8°/min. NPD. Retention time: 14.7 min. Limit of detection, 100–250 ng/L [Hattori *et al.* 1992]. Column: 2.5% OV-101 on Supelco Chromosorb AW DMCS 80/100 mesh (1 m × 2 mm i.d.). Temperature: 210°. FID. Limit of detection not reported [Wilkinson *et al.* 1983]. Column: 3.8% W-98 on 80/100 mesh AW-DMCS Chromosorb W (1.8 m × 3.5 mm i.d.). Carrier gas: N_2, 40 mL/min. Temperature: 220°. FID. Retention time: 2.1 min. Limit of detection not reported [Robinson *et al.* 1977].

Plasma **GC** Column: DB-17 (30 m × 0.53 mm i.d.). Carrier gas: N_2, 15 mL/min. Temperature: 220°. NPD. Limit of detection, ≈5 µg/L [Contin *et al.* 1987]. Column: 3% KOH plus 3% Carbowax 20M on 100/120 mesh Gas Chrom Q (1.3 and 1.5 m × 2.3 mm i.d.). Carrier gas: 30 mL/min. AFID. Retention time: 3.65 min. Limit of detection, 1 µg/L [Labout *et al.* 1977].

Urine **GC** See Blood [Nishikawa *et al.* 1997]. See Blood [Wilkinson *et al.* 1983]. See Plasma [Labout *et al.* 1977]. See Blood [Robinson *et al.* 1977].

Bile **GC** See Blood [Robinson *et al.* 1977].
Stomach Contents **GC** See Blood [Wilkinson *et al.* 1983]. See Blood [Robinson *et al.* 1977].
Kidney **GC** See Blood [Robinson *et al.* 1977].
Liver **GC** See Blood [Wilkinson *et al.* 1983]. See Blood [Robinson *et al.* 1977].
Lung **GC** See Blood [Robinson *et al.* 1977].
Spleen **GC** See Blood [Robinson *et al.* 1977].
Disposition in the Body Readily absorbed after oral administration and rapidly distributed. Up to ~60% of an oral dose is excreted in the urine in 3 days. During 24 h after dosage, under uncontrolled conditions, ~4% of a dose is excreted as unchanged drug, ~5% as *N*-monodesmethylorphenadrine (tofenacin), ~3% as *N,N*-didesmethylorphenadrine, ~3% as orphenadrine *N*-oxide, ~8% as a conjugate of 2-methylbenzhydryloxyacetic acid, and ~6% as a conjugate of 2-methylbenzhydrol. The urinary excretion appears to be dependent on urinary pH.
Therapeutic Concentration In plasma, usually 0.1–0.2 mg/L.
Toxicity The lethal dose is estimated to be >2 g. Blood concentrations >0.5 mg/L may cause toxic reactions and concentrations >5 mg/L may be lethal.

In a survey of 9 fatalities attributed to orphenadrine overdose, blood concentrations ranged from 1.1–37 mg/L (mean 15); in 5 cases the bile concentration was 85–234 mg/L (mean 150), and in 7 cases the urine concentration was 3–122 mg/L (mean 53). In 1 case in which a more complete analysis was reported, the concentrations were: blood 33 mg/L, bile 202 mg/L, brain 3.3 µg/g, kidney 15 µg/g, liver 23 µg/g, lung 19.5 µg/g, spleen 26.5 µg/g [Robinson *et al.* 1977].

In a fatality due to an orphenadrine overdose in which death occurred within 2.5 h of ingestion, the following postmortem concentrations were reported: blood 18.1 mg/L, liver 242 µg/g, urine 7 mg/L [Wilkinson *et al.* 1983].

A 38-year-old male whose death was attributed to massive ingestion of orphenadrine and clozapine with suicidal intent, had the following postmortem tissue concentrations: heart blood 183 and 44 mg/L (orphenadrine and clozapine, respectively), urine 331 and 245 mg/L, gastric contents – and 859 mg/L; the heart blood concentration of orphenadrine (183 mg/L) was the highest reported thus far in an acute intoxication [Fucci *et al.* 2001].

Half-life Plasma half-life, ~14 h.
Protein Binding ≈20%.
Dose 150 to 400 mg of orphenadrine hydrochloride daily.

Contin M *et al.* (1987). Simple and rapid GLC method for the determination of orphenadrine in human plasma. *Biomed Chromatogr* 2: 193–194.

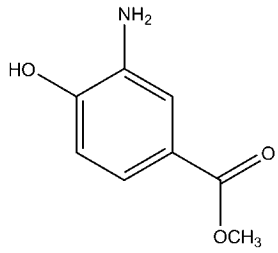
Orthocaine

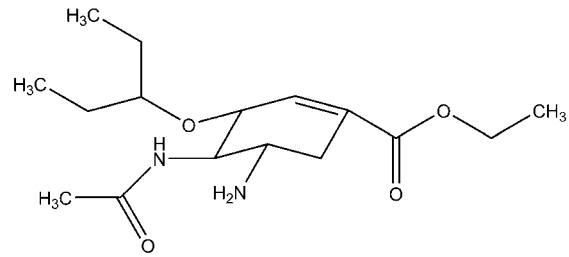
Anaesthetic (Local)
$C_8H_9NO_3$ = 167.2
CAS—536-25-4
IUPAC Name Methyl 3-amino-4-hydroxybenzoate
Synonyms Aminobenz; methyl aminoxybenzoate.
Proprietary Name *Orthoform*



Chemical Properties White crystalline powder. Mp 143°. Almost insoluble in water; soluble 1 in 7 ethanol and 1 in 50 of ether. Orthocaine is extracted by organic solvents from aqueous alkaline solutions.
Colour Tests Ammonium molybdate test—(dull green) brown, fading (limit of detection, 1.0 µg); ammonium vanadate test—(grey-brown) brown (limit of detection, 1.0 µg); *p*-dimethylaminobenzaldehyde test—yellow (limit of detection, 1.0 µg); Vitali's test—yellow→blue-grey/brown/dark brown (limit of detection, 1.0 µg).
Thin-layer Chromatography System T1—R_f 0.71 (location reagent: *p*-dimethylaminobenzaldehyde spray, yellow; potassium permanganate spray, positive reaction).
Ultraviolet Spectrum 0.1 N sulfuric acid—253 nm (E1%, 1 cm 836).
Disposition in the Body
Metabolism Owing to its insolubility, orthocaine penetrates the tissues very slowly. It is excreted largely in the conjugated form; a certain amount may be acetylated at the amino-group.
Toxicity The maximum amount stated to be safe for surface anaesthesia is 5 g.
Dose Doses of up to 3 g daily have been given but considerable risk attends its internal administration. Externally, it is employed as a dusting-powder or as a 5 or 10% ointment.

Oseltamivir

Antiviral, Ester, Neuraminidase Inhibitor
$C_{16}H_{28}N_2O_4$ = 312.4
CAS—196618-13-0
IUPAC Name Ethyl (3*R*,4*R*,5*S*)-4-acetamido-5-amino-3-pentan-3-yloxycyclohexene-1-carboxylate
Synonyms Ethyl (3*R*,4*R*,5*S*)-4-acetamido-5-amino-3-(1-ethylpropoxy)-1-cyclohexene-1-carboxylate; GS-4071.



Chemical Properties Pale solid. pK_a 7.7 (25°), 6.6 (70°) [Oliyai *et al.* 1998]. Log *P* (octanol/water), 0.36 oseltamivir, −2.1 metabolite [Oo *et al.* 2003a]. Low concentrations of oseltamivir in plasma at room temperature have been observed to decrease after 16 h by about 15 to 20%. It has been shown to be stable in plasma stored at –20° for up to 6 months and at room temperature for 60 min [Wiltshire *et al.* 2000].

Oseltamivir Phosphate

$C_{16}H_{28}N_2O_4$, H_3PO_4 = 410.4
CAS—204255-11-8
IUPAC Name Ethyl (3*R*,4*R*,5*S*)-4-acetamido-5-amino-3-(1-ethylpropoxy)-1-cyclohexene-1-carboxylate phosphate (1 : 1)
Synonyms GS-4104/002; oseltamivir, fosfato de; Ro-64-0796/002.
Proprietary Name *Tamiflu*
Chemical Properties White crystalline solid. Very soluble in water. Oral solutions of oseltamivir phosphate with sodium benzoate have been shown to be stable for up to 46 days [Albert, Bockshorn 2007].

High Performance Liquid Chromatography Column: C_{18} ODS-2 (150 × 4.6 mm i.d., 5 µm). Mobile phase: 50 mmol/L sodium acetate in acetonitrile-water (7.5 : 92.5) : 50 mmol/L sodium acetate in acetonitrile-water (60 : 40; 100 : 0 to 0 : 100 over 15 min), flow rate 1.5 mL/min. UV detection (λ = 220 nm). Retention time: oseltamivir 9.8 min, oseltamivir isomer 10.7 min, carboxylic acid 4.2 min, carboxylic acid isomer 3.6 min [Oliyai *et al.* 1998].
Quantification
Plasma **HPLC** Column: ODS-2 (150 × 4.6 mm i.d., 5 µm). Mobile phase: 50 mmol/L sodium acetate in acetonitrile : water (27 : 73), flow rate 2 mL/min. Fluorescence detection (λ_{ex} = 420 nm, λ_{em} = 472 nm). Derivatisation agent, naphthalene-2,3-dialdehyde. Retention times: oseltamivir 5.3 min, carboxylate 4.3 min. Limit of quantification, 50 µg/L; limit of detection, 20 µg/L [Eisenberg, Cundy 1998].

LC-MS Column: Nova-Pak CN HP (100 × 5 mm i.d., 4 µm). Mobile phase: methanol : 80 mmol/L aqueous formic acid (pH 3; 50 : 50), flow rate 0.5 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention times: oseltamivir 5 min, metabolite 3.5 min. Limit of quantification, oseltamivir 1 µg/L, metabolite 10 µg/L [Wiltshire *et al.* 2000].
Urine **LC-MS** Column: Nova-Pak CN HP (100 × 5 mm i.d., 4 µm). Mobile phase: methanol : 80 mmol/L aqueous formic acid (pH 3; 50 : 50), flow rate 0.5 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention time: oseltamivir 5 min, metabolite 3.5 min. Limit of quantification, oseltamivir 5 µg/L, metabolite 30 µg/L [Wiltshire *et al.* 2000].
Other **HPLC** Oral Solutions. Column: Nucleodur 100-5 C_{18} (250 × 4.0 mm i.d., 5 µm). Mobile phase: 50 mmol/L ammonium acetate : acetonitrile-50 mmol/L ammonium acetate (60 : 40; 90 : 10 to 0 : 100 over 20 min), flow rate 1.0 mL/min. UV detection (λ = 230 nm). Retention time: oseltamivir 14.9 min, oseltamivir isomer 16.0 min, oseltamivir carboxylic acid 7.2 min, oseltamivir carboxylic acid isomer 6.1 min. Limit of quantification, oseltamivir 16 mg/L, oseltamivir carboxylic acid 35 mg/L; limit of detection, oseltamivir 7 mg/L, oseltamivir carboxylic acid

10 mg/L [Albert, Bockshorn 2007]. Capsules. Column: Hypersil Gold (150 × 4.6 mm i.d.). Mobile phase: methanol : 0.1 mol/L phosphate buffer (pH 2.5; 50 : 50), flow rate 1.0 mL/min. UV detection (λ = 220 nm). Retention time: ~6.2 min. Limit of quantification not reported [Lindegardh *et al.* 2006]. Capsules. Column: Zorbax CN (150 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 0.04 mol/L formic acid (pH 3.0; 50 : 50), flow rate 1.2 mL/min. UV detection (λ = 226 nm). Retention time: oseltamivir phosphate 3.4 min. Limit of quantification, 30 mg/L [Joseph-Charles *et al.* 2007].

Disposition in the Body Pro-drug readily absorbed from the gastrointestinal tract. Approximately 80% of an orally administered dose of oseltamivir reaches the systemic circulation as the single active metabolite, oseltamivir carboxylic acid (Ro 64-0802 or GS4057). This conversion is mediated by hepatic and/or intestinal carboxylesterases. No other metabolites have been identified in humans. *In vitro* studies have shown that neither oseltamivir nor its metabolite interacts with CYP450 mixed-function oxidases or glucuronyltransferases. Measurable plasma concentrations of the metabolite are found within 30 min, reach peak concentrations in 2 to 3 h post-dose, and are roughly 20 times those of oseltamivir. Oseltamivir and its metabolite distribute well into the sites of influenza infection (lung, trachea, nasal mucosa and middle ear) and the concentration at these sites is high enough to inhibit viral replication. Elimination is exclusively by renal excretion, with 60 to 70% of an oral dose appearing in urine as the active metabolite, and <5% as oseltamivir. Renal clearance of oseltamivir and its metabolite exceeds the glomerular filtration rate, indicating that renal tubular secretion contributes to the elimination of the compound. Tubular secretion occurs via the anionic transport process. Less than 20% of an oral dose is recovered in faeces (equal proportions between oseltamivir and the active metabolite).

Therapeutic Concentration

A group of 36 healthy adult male volunteers (18 to 55 years) was administered single doses (20 to 1000 mg) of oral oseltamivir for 7 days. Mean peak plasma concentrations for oseltamivir and its active metabolite were reported as follows:

Dose (mg)	Oseltamivir		Metabolite	
	C_{max} (µg/L)	Time (h)	C_{max} (µg/L)	Time (h)
20	11.5	1.1	67.9	4.9
100	46.0	1.2	250	3.7
500	564	0.8	1682	3.7
1000	809	1.1	3955	3.8

[Massarella *et al.* 2000].

In a separate study, 18 healthy elderly volunteers (>65 years) were administered oral doses of 100, 150 and 200 mg oseltamivir twice daily for 7 days. Mean peak plasma concentrations were reported as follows:

Dose (mg)	Study day	Oseltamivir		Metabolite	
		C_{max} (µg/L)	Time (h)	C_{max} (µg/L)	Time (h)
100	1	95.4	0.93	432	3.8
	7	105	0.58	575	3.3
150	1	179	0.58	579	4.2
	7	192	0.58	897	3.5
200	1	302	0.5	796	3.7
	7	256	0.60	1293	2.8

[Massarella *et al.* 2000].

Two groups of 12 healthy children (group A: 3 to 5 years; group B: 1 to 2 years) were administered a single oral dose of oseltamivir (group A: 45 mg; group B: 30 mg) as a suspension after breakfast. Mean peak plasma concentrations were reported as follows:

	Oseltamivir		Metabolite	
	Group A	Group B	Group A	Group B
C_{max} (µg/L)	57	35	179	121
Time (h)	1.5	1.8	5.0	5.6

Oral clearance of the metabolite was found to be higher in group B than in group A [Oo *et al.* 2003b].

Eight healthy male volunteers were administered oseltamivir (150 mg) to 4 separate sites along the gastrointestinal tract: stomach, proximal small bowel (jejunum), distal small bowel (ileum), and the ascending colon. Pharmacokinetic parameters were reported as follows:

	Stomach	Jejunum	Ileum	Ascending colon
Oseltamivir				
C_{max} (µg/L)	99.5	104	132	48.6
Time (h)	0.5	0.61	0.56	0.84
Metabolite				
C_{max} (µg/L)	487	463	442	197
Time (h)	2.9	3.9	3.2	5.9

[Oo *et al.* 2003a].

Bioavailability Approximately 80%.

Half-life Oseltamivir, 1 to 3 h; oseltamivir carboxylic acid, 6 to 10 h (oral dose), 1.8 h (IV dose).

Volume of Distribution Steady state, 23 to 26 L.

Clearance Approximately 13 to 21.7 L/h; reduced to 1.5 to 7.5 L/h in patients with renal impairment.

Protein Binding Oseltamivir, 42%; oseltamivir carboxylic acid, <3%.

Dose Given as the phosphate, but doses are expressed in terms of the base. Oseltamivir phosphate 98.5 mg is equivalent to ~75 mg oseltamivir. For treatment, doses are given twice daily for 5 days, beginning as soon as possible (within 48 h) after the onset of symptoms. For post-exposure prophylaxis, doses are given once daily for 10 days (or longer in adults) and for up to 6 weeks during an epidemic; therapy should begin within 48 h of exposure. Dosage should be reduced in children and in patients with moderate renal impairment.

Ouabain

Cardiac Glycoside, Cardiotonic

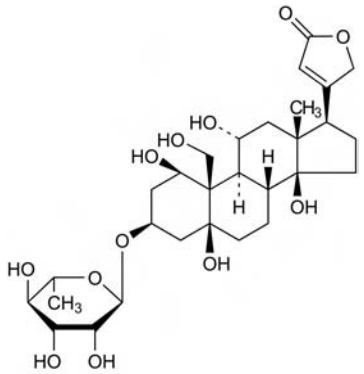
$C_{29}H_{44}O_{12}$, $8H_2O$ = 728.8

CAS—630-60-4 (anhydrous); 11018-89-6 (octahydrate)

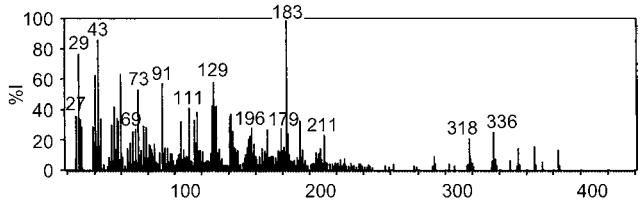
IUPAC Name 3-[(1*R*,3*S*,5*S*,8*R*,9*S*,10*R*,11*R*,13*R*,14*S*,17*R*)-1,5,11,14-Tetrahydroxy-10-(hydroxymethyl)-13-methyl-3-[(2*R*,3*R*,4*R*,5*R*,6*S*)-3,4,5-trihydroxy-6-methyloxan-2-yl]oxy-2,3,4,6,7,8,9,11,12,15,16,17-dodecahydro-1*H*-cyclopenta[*a*]phenanthren-17-yl]-2*H*-furan-5-one

Synonyms (1β,3β,5β,11α)-3-[(6-Deoxy-α-L-mannopyranosyl)oxy]-1,5,11,14,19-pentahydroxycard-20(22)-enolide; G-strophanthin; strophanthin-G; strophanthinum; strophanthoside-G; uabaina; ubaína.

Proprietary Names *Ouabaine Arnaud*; *Purostrophan*; *Strodival*; *Strophoperm*.



Chemical Properties A glycoside obtained from the seeds of *Strophanthus gratus* or from the wood of *Acokanthera schimperi* or *A. ouabaio* (Apocynaceae). Colourless crystals or white crystalline powder. Mp about 190°, with decomposition. Slowly soluble 1 in 75 of water, 1 in 5 of boiling water; soluble 1 in 100 of ethanol and 1 in 30 of methanol; soluble in amyl alcohol and dioxane; slightly soluble in chloroform, ether and ethyl acetate. Log *P* (octanol/water), −2.0.
Colour Test Sulfuric acidorange-brown (slow); perchloric acid solution, followed by examination under ultraviolet light—yellow-green fluorescence; *p*-anisaldehyde reagent—yellow.
Mass Spectrum Principal ions at *m/z* 183, 43, 29, 60, 41, 129, 91, 73.

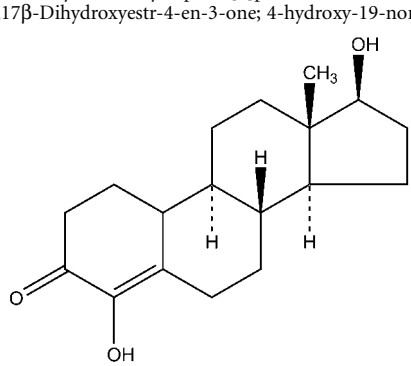


Quantification
Plasma **Radioimmunoassay** Limit of detection, 5 ng/L [Vakkuri *et al.* 2000]. Limit of detection, 50 ng/L [Selden, Smith 1972].
Urine **Radioimmunoassay** See Plasma [Selden, Smith 1972].
Disposition in the Body Irregularly absorbed after oral administration. About 30 to 60% of a dose is excreted in the urine in 24 h and about 25% is eliminated in the faeces in 3 days. Under steady-state conditions about 40% of the daily dose is excreted in the 24-hour urine.
Therapeutic Concentration
After a single IV dose of 0.5 mg to 3 subjects, a plasma concentration of about 0.012 mg/L was reported in 5 min; following daily IV administration of 0.25 mg to 3 subjects, steady-state plasma concentrations of about 0.0005 mg/L were attained on the 4th or 5th day [Selden, Smith 1972].
Half-life Plasma half-life, about 10 to 20 h.
Protein Binding About 5 to 10%.
Dose 250 to 500 µg IV; further injections of 100 µg may be given up to a total dose of 1 mg in 24 h.

Selden R, Smith TW (1972). Ouabain pharmacokinetics in dog and man. Determination by radioimmunoassay. *Circulation* 45: 1176–1182.
Vakkuri O *et al.* (2000). Radioimmunoassay of plasma ouabain in healthy and pregnant individuals. *J Endocrinol* 165: 669–677.

Oxabolone

Anabolic Steroid
$C_{18}H_{26}O_3$ = 290.4
CAS—4721-69-1
IUPAC Name (8*R*,9*S*,13*S*,14*S*,17*S*)-4,17-Dihydroxy-13-methyl-2,6,7,8,9,10,11,12,14,15,16,17-dodecahydro-1*H*-cyclopenta[a]phenanthren-3-one
Synonyms 4,17β-Dihydroxyestr-4-en-3-one; 4-hydroxy-19-nortestosterone.



Chemical Properties Mp 189°. Log *P* (octanol/water), 3.25 [Meylan, Howard 1995].

Oxabolone Cipionate
$C_{26}H_{38}O_4$ = 414.6
CAS—1254-35-9
IUPAC Name 4,17β-Dihydroxyestr-4-en-3-one 17-(β-cyclopentylpropionate)
Synonym FI-5852
Proprietary Names *Steranabol-Depot*; *Steranabol Ritardo.*

Ultraviolet Spectrum Peak at 275 nm
Disposition in the Body Oxabolone cipionate is absorbed slowly from SC or IM depots as the lipid-soluble ester. It is highly protein bound and carried in plasma by the sex-hormone-binding protein globulin. Once de-esterified, oxabolone is metabolised rapidly by hepatic mixed-function oxidases; the duration of the biological effects is determined almost entirely by the rate of absorption from SC or IM depots and on the de-esterification which precedes it.
Protein Binding Highly protein bound.
Dose 400–800 mg/week.

Meylan WM, Howard PH (1995). Atom/fragment contribution method for estimating octanol–water partition coefficients. *J Pharm Sci*,83–92.

Oxalates

Anion

Oxalic Acid
$C_2H_2O_4$ = 90.03
CAS—144-62-7
Synonym Ethanedioic acid
Chemical Properties pK_a 1.25 Log *P* (octanol/water), −2.22. Used in calico printing, bleaching leather, in metal polishes, as a reducing agent, in ceramics and pigments, in the paper industry, in photography, in process engraving, in rubber manufacture industry.

Sodium Oxalate
$C_2Na_2O_4$ = 134.0
CAS—62-76-0
Synonym Ethanedioic acid disodium salt
Chemical Properties White, odourless, crystalline powder. Soluble in water, insoluble in alcohol. Used for finishing textiles, tanning and finishing leather, in standardising potassium permanganate solution.

Calcium Oxalate
C_2CaO_4 = 128.1
CAS—563-72-4
Synonym Ethanedioic acid calcium salt
Chemical Properties The monohydrate appears as crystals. Loses all its water at 200°. Practically insoluble in water or acetic acid; soluble in dilute hydrochloric acid or nitric acid. Used in ceramic glazes, as carrier for separation of rare earth metals.

Potassium Oxalate
$C_2K_2O_4$ = 166.2
CAS—583-52-8
Chemical Properties Occurs as the monohydrate as colourless, odourless crystals. Loses its water at 160°. Soluble in water. Used on cleaning and bleaching straw, removing stains in photography, as an *in vitro* blood anticoagulant, in analytical chemistry.

Quantification
Plasma **HPLC** Column: AS4-A anion exchange. Mobile phase: 2 g/L EDTA (pH 5.0) and 3.0 mol/L sodium hydroxide, flow rate 0.6 mL/min. Enzyme reactor detection. Limit of detection, 0.68 µmol/L [Honow *et al.* 2002]. Column: Capcell Pak C_8 (150 × 6 mm i.d., 5 µm). Mobile phase: 80 mmol/L potassium dihydrogen phosphate : 5 mmol/L terta-*n*-butylammonium phosphate (pH 4.0), flow rate 1.0 mL/min. Electrochemical detection. Limit of detection, 10 µmol/L [Yamato *et al.* 1994]. Column: AS10 anion exchange. Mobile phase: 40 mmol/L sodium tetraborate (pH 9.4), flow rate 1.0 mL/min. Limit of detection, 0.5 µmol/L [Hagen *et al.* 1993]. Column: AS-4A anion exchanger (25 × 0.4 cm). Mobile phase: 1.4 mmol/L sodium carbonate : 1.8 mmol/L sodium bicarbonate, flow rate 2.0 mL/min. Electrochemical detection. Retention time: ~13.5 min. Limit of detection, 0.5 µmol/L [Petrarulo *et al.* 1993].
Serum **CE** Capillary: Fused silica (total/effective length 100/87.7 cm × 75 µm i.d.). Mobile phase: 250 mmol/L sodium chloride : 7.5 mmol/L cetyltrimethylammonium chloride (pH 2.2). UV detection (λ= 226 nm). Limit of detection, 0.04 mg/L [Hirokawa *et al.* 2004].
Urine **HPLC** Column: LiChrosorb RP18 (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.25% potassium dihydrogen phosphate : 2.5 mmol/L tetrabutylammonium hydrogen sulfate (pH 2.0). UV detection (λ= 210 nm). Limit of detection, 8.0 µmol/L [Khaskhali *et al.* 1996]. See Plasma [Yamato *et al.* 1994]. Column: AS10 anion exchange. Mobile phase: 40 mmol/L sodium tetraborate (pH 9.4), flow rate 1.0 mL/min. Limit of detection, 0.5 µmol/L [Hagen *et al.* 1993]. Column: Polypropylene minicolumn (50 × 7 mm i.d.). Mobile phase: 0.5% hydrogen phosphate, flow rate 0.7 mL/min. UV detection (λ= 214 nm). Retention time: 8 min. Limit of detection, 10 mg/L [Kataoka *et al.* 1990]. Column: C_{18} reversed phase (51 cm × 4.6 mm i.d.). Mobile phase: 3% methanol and 1% tetrahydrofuran in 0.35 mol/L ammonium acetate, flow rate 1.5 mL/min. UV detection (λ= 314 nm).

Limit of detection not reported [Koolstra *et al.* 1987]. Column; LiChrosorb RP-8 (100 × 4.6 mm i.d., 10 µm). Mobile phase: aqueous phosphate buffer (pH 7.0) : 10% methanol, flow rate 1 mL/min. Electrochemical detection. Limit of detection, 5 ng [Kok *et al.* 1984].

GC Column: Glass (2 m × 2 mm i.d.). Carrier gas: N_2. Temperature: 145°. Limit of detection, ~3 mg/L [Di Corcia *et al.* 1982].

CE See Serum [Hirokawa *et al.* 2004].

AAS Perkin-Elmer 575. Cu hollow cathode lamp (λ = 324.8 nm). Limit of detection, 7.9 µmol/L [Munoz Leyva *et al.* 1990].

Note For a method of determining oxalate in urine using alkylamine glass-bound barley oxalate oxidase, see Chandran *et al.* [2001]; for a photochemical method for the determination of oxalate in urine, see Leon *et al.* [1990]. A method employing oxalate oxidase and sensors based on the injection of a recognition element is described by Hong *et al.* [2003]. For a comparison of 6 methods for measuring urinary oxalate, see Zerwekh *et al.* [1983]; for a method of detecting calcium oxalate using alizarin red S stain, see Proia, Brinn [1985]; for a chemiluminescence method for detecting oxalate in blood, see Gaulier *et al.* [1998]; for the detection of fluphenazine in urine and blood using peroxyoxalate chemiluminescence, see Mann, Grayeski [1991].

Disposition in the Body Oxalic acid is the main product of ethylene glycol metabolism. It is present in rhubarb leaves. The normal concentration of oxalate in the blood is 60 to 230 µg/L [Konta *et al.* 1998].

Toxicity Oxalic acid is corrosive to tissue. When ingested, oxalic acid removes calcium from the blood so kidney damage can be expected as the calcium is removed in the form of calcium oxalate. The calcium oxalate obstructs the kidney tubules.

Inhalation exposure Oxalic acid is harmful if inhaled and can cause severe irritation and burns of the nose, throat and respiratory tract.

Oral exposure Highly toxic: oxalic acid may cause burns, nausea, severe gastroenteritis, vomiting, shock and convulsions. It may cause renal damage, as evidenced by bloody urine. The estimated fatal dose is 5 to 15 g.

Dermal exposure Can cause severe irritation and possible skin burns. It is absorbed through the skin.

Ocular exposure It is an eye irritant and may produce corrosive effects.

Chronic exposure May cause inflammation of the upper respiratory tract. Prolonged skin contact can cause dermatitis, cyanosis of the fingers and possible ulceration.

A 47-year-old man presented with acute renal failure caused by ingestion of an unknown amount of oxalate. His blood oxalate concentration was 302 µg/L [Konta *et al.* 1998].

A 49-year-old man was found unconscious in a hotel room. His serum ethylene glycol concentration was 0.24 mmol/L [Huhn, Rosenberg 1995].

A 58-year-old woman was administered a single 45 g dose of ascorbic acid, a metabolic precursor of oxalate. Her serum oxalate concentration following haemodialysis was 15.4 mg/L. Her plasma and urine oxalate concentrations were 2.3 and 11.6 mg/L, respectively. Postmortem examination of her kidneys revealed crystals that were bifringent under polarised light, many with a 'dumbell' or 'shock-of-wheat' configuration, characteristic of calcium oxalate deposition [Lawton *et al.* 1985].

Note For 4 cases of ethylene glycol poisoning, see Leth and Gregersen [2005]; for an account of massive crystalluria in a further 4 cases of ethylene glycol poisoning, see Jacobsen *et al.* [1982]; for a case of the oral manifestations of oxalosis following ileojejunal intestinal bypass, see Lapointe and Listrom [1988]; for historical accounts of oxalic acid poisoning, see Campbell [1982] and Clarke [1990]. For a fatal case of oxalic acid poisoning following the ingestion of sorrel (*Rumex crispus*), see Farre *et al.* [1989] and for a review of poisoning following ingestion of plants containing oxalate, see Sanz and Reig [1992].

Oxaliplatin

Antineoplastic

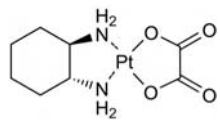
$C_8H_{14}N_2O_4Pt = 397.3$

CAS—61825-94-3

IUPAC Name Cyclohexane-1,2-diamine; oxalic acid; platinum

Synonyms (*SP*-4-2)-[(1*R*,2*R*)-1,2-Cyclohexanediamine-κ*N*,κ*N*′][ethanedioato-(2–)-κO^1,κO^2]platinum; NSC-266046; l-OHP; oxalatoplatin; oxalatoplatinum; RP-54780.

Proprietary Name *Eloxatin*



Chemical Properties Colourless, thin triangular plates with truncated vertices. Soluble in water at 7.9 g/L.

Quantification

Plasma **HPLC** Column: ODS-2 Inertsil (250 × 4.6 mm i.d.). Temperature: 40°. Mobile phase: acetonitrile : 10 mmol/L acetate buffer (pH 5.5, 5 : 95), flow rate 1 mL/min. UV detection (λ=290 nm). Retention time: 11.6 min. Limit of detection, 0.1 µg/L [Kizu *et al.* 1995].

Urine **HPLC** See Plasma [Kizu *et al.* 1995].

Disposition in the Body Biotransformation is extensive and no intact drug is detectable in plasma ultrafiltrate at the end of a 2-h infusion. Renal elimination is the major pathway. 50% or more of the platinum administered was recovered in urine within 1 to 5 days following administration. <5% is eliminated in faeces.

Therapeutic Concentration

The maximum plasma concentration of platinum following a constant rate infusion of oxaliplatin at 20 mg/m^2/day for 5 days was 330 to 720 µg/L [Lévi *et al.* 2000].

Half-life About 24 h.

Volume of Distribution Ranges between 582 and 812 L.

Clearance About 17.6 L/h.

Distribution in Blood Maximum platinum uptake in erythrocytes was 37% of the total platinum. Plasma ultrafiltrate : total plasma : erythrocytes ratio is ~1 : 4 : 3 at the end of a 2-h infusion.

Dose 130 mg/m^2 body surface.

Kizu R *et al.* (1995). A sensitive postcolumn derivatization/UV detection system for HPLC determination of antitumor divalent and quadrivalent platinum complexes. *Chem Pharm Bull* 43(1): 108–114.

Oxandrolone

Anabolic Steroid, Androgen

$C_{19}H_{30}O_3 = 306.4$

CAS—53-39-4

IUPAC Name (1*S*,3*aS*,3*bR*,5*aS*,9*aS*,9*bS*,11*aS*)-1-hydroxy-1,9*a*,11*a*-trimethyl-2,3,3*a*,3*b*,4,5,5*a*,6,9,9*b*,10,11-dodecahydroindeno[4,5-h]isochromen-7-one

Synonyms (5α,17β)-17-Hydroxy-17-methyl-2-oxa-androstan-3-one; NSC-67068; SC-11585.

Proprietary Names *Anavar*; *Lonavar*; *Oxandrin*; *Provitar*; *Vasorome*.

Chemical Properties White odourless crystalline powder with Mp 235° to 238°. It is soluble in water (1 in 5200), alcohol (1 in 57), acetone (1 in 69), chloroform (1 in <5) and ether (1 in 860). Log *P* (octanol/water), 2.58 [Meylan, Howard 1995].

Thin-layer Chromatography Plate: silica gel HF_{254} (5 × 20 cm). Mobile phase: chloroform : methanol : glacial acetic acid (94 : 5 : 1). Visualisation by iodine vapour. Detection by zonal scraping method. R_f 0.5. [Karim *et al.* 1973].

Gas Chromatography System GAG—RRT 1.17 (relative to testosterone); system GAI—RRT 1.111 (relative to 17α-methyl-5α-androstan-3β,17β-diol)α-methyl-5α-androstan-3β; system GAR—RT 13.7 min.

Gas Chromatography-Mass Spectrometry Column: 5% phenyl methyl silicone (HP Ultra-2, 25 m × 0.2 mm i.d., 0.33 µm). Temperature: 100° for 1 min to 220° at 16°/min to 300° at 3.8°/min for 10 min. Carrier gas: He, 0.6 mL/min. EI ionisation, SIM acquisition mode at *m/z*: 143.1, 363.3, 378.3). RT: (relative oxandrolone TMS derivative, RT 27.97 min) δ-hydroxy acid metabolite, 0.90; 16-α-hydroxyoxandrolone, 1.13; 16-β-hydroxyoxandrolone, 1.16; 17-epioxandrolone, 0.93. (Relative to 5α-androstan-17-one TMS-enol derivative, RT 17.95 min) oxandrolone, 1.56; δ-hydroxy acid metabolite, 1.40; 16-α-hydroxyoxandrolone, 1.77; 16-β-hydroxyoxandrolone, 1.81; 17-epioxandrolone, 1.44 [Massé *et al.* 1989].

High Performance Liquid Chromatography System HATb—RRT 0.75 (relative to testosterone).

Column: Zorbax ODS (5 cm × 4.6 mm i.d., 5 µm). Mobile phase: methanol : water (75 : 25). UV detection (λ = 210 nm). Retention time: 0.75. Limit of detection, 5 mg/L [Walters *et al.* 1990].

Infrared Spectrum Principal peaks at wavenumbers 1717, 1202, 1231, 1258 cm^{-1}.

Mass Spectrum Principal ions at *m/z* 291, 248, 43, 79, 91, 93, 107, 176.

Quantification

Plasma **GC-MS** Column: 1.5% OV-17 on 80-100 mesh Chromosorb W-HP 6′ × 4 mm i.d.). Carrier gas: He, 50.4 mL/min. Temperature: 240°. FID. Retention time: 5.3 min. Limit of detection not reported [Karim *et al.* 1973].

Urine **GC** Column: DB-1 (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 20 cm/s. Temperature programme: 200° for 4 min to 300° at 4°/min. FID. Limit of detection not reported [Harrison *et al.* 1989].

GC-MS Column: HP Ultra-2 5% phenyl methyl silicone (25 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 0.6 mL/min. Temperature programme: 100° for 1 min to 220° at 16°/min to 300° at 3.8°/min for 10 min. EI ionisation at 70 eV, MSD, SIM acquisition mode. Limit of detection 0.005 mg/L [Massé *et al.* 1989].

LC-MS Column: LiChroCART Purospher RP C_{18} (125 × 3 mm, 5 µm). Mobile phase: 5 mmol/L ammonium acetate- 0.01% acetic acid : 90% methanol (50 : 50 to 0 : 100 at 15 min for 3 min), flow rate 0.5 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of detection, 0.5 µg/L for oxandrolone metabolite 17-epioxandrolone [Leinonen *et al.* 2004].

Disposition in the Body Oxandrolone is rapidly absorbed from the gastrointestinal tract and excreted mainly in urine as metabolites; 16-β-hydroxyoxandrolone and 16-α-hydroxyoxandrolone (total, 3%), 17-epioxandrolone (8.4%) and a small amount as the δ-hydroxy acid metabolite, and the parent drug (35.8%). The drug is first detected in urine 2 h after dosing and can be detected for up to 72 h. A small amount is excreted in the faeces (≈2.8%) [Karim *et al.* 1973].

Therapeutic Concentration

The maximum plasma concentration of 0.417 mg/L was observed between 30 and 90 min following oral ingestion of a 10 mg dose. [Karim *et al.* 1973].

Toxicity Moderately toxic by ingestion and IP injection. When heated to decomposition temperature will emit acrid smoke and fumes.

Bioavailability 97%.

Half-life Biphasic plasma elimination: from 90 min to 4 h, and 33 min, and from 4 to 48 h, and 9 h.

Volume of Distribution 578 mL/kg.

Clearance Plasma clearance, 43 mL/h/kg.

Protein Binding 94–97%.

Dose The usual dose is 2.5 to 20 mg by mouth. Usual dose 5 to 10 mg daily in divided doses for 2 to 4 weeks.

Oxazepam

Benzodiazepine, Tranquilliser

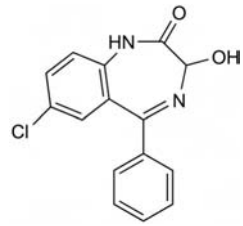
$C_{15}H_{11}ClN_2O_2$ = 286.7

CAS—604-75-1

IUPAC Name 7-Chloro-3-hydroxy-5-phenyl-1,3-dihydro-1,4-benzodiazepin-2-one

Synonyms 7-Chloro-1,3-dihydro-3-hydroxy-5-phenyl-2*H*-1,4-benzodiazepin-2-one; oxazepamum; Wy-3498.

Proprietary Names *Adumbran*; *Alepam*; *Alopam*; *Anxiolit*; *Azutranquil*; *Benzotran*; *Durazepam*; *Hilong*; *Limbial*; *Mirfudorm*; *Murelax*; *Noctazepam*; *Opamox*; *Oxabenz*; *Oxahexal*; *Oxamin*; *Oxanid*; *Oxapax*; *Oxepam*; *Praxiten*; *Serax*; *Serepax*; *Seresta*; *Serpax*; *Sigacalm*; *Sobril*; *Tranquo*; *Uskan*; *Zaxopam*.



Chemical Properties A white to pale yellow crystalline powder. Mp 205° to 206° to (crystals from alcohol). Practically insoluble in water; soluble 1 in 220 of ethanol, 1 in 270 of chloroform and 1 in 2200 of ether; soluble in dioxan. pK_{a1} 1.7, pK_{a2} 11.6 (20°). Log *P* (octanol/water), 2.24 [Capella-Peiró *et al.* 2002], 2.17 [Mullett, Pawliszyn 2001], (octanol/water pH 7.4), 2.2. Extraction yield (chlorobutane), 0.85 [Demme *et al.* 2005].

Colour Test Formaldehyde–sulfuric acid—orange.

Thin-layer Chromatography System TA—R_f 0.56; system TB—R_f 0.00; system TC—R_f 0.40; system TD—R_f 0.22; system TE—R_f 0.45; system TF—R_f 0.35; system TL—R_f 0.51; system TAD—R_f 0.42; system TAE—R_f 0.82; system TAF—R_f 0.91; system TAJ—R_f 0.47; system TAK—R_f 0.47; system TAL—R_f 0.89 (acidified iodoplatinate solution—positive; acidified potassium permanganate solution—positive).

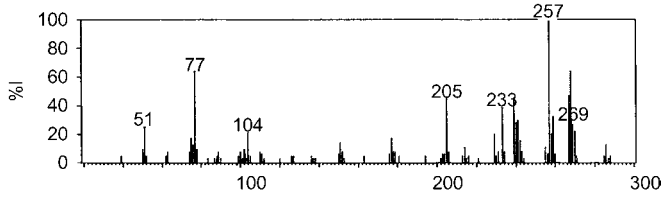
Mass Spectrum Principal ions at *m/z* 257, 77, 268, 239, 205, 267, 233, 259.



Quantification

Blood **GC** Columns: DB-1 and DB-1701 (15 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 120° for 1 min to 28° at 30°/min to 230° at 2°/min to 300° at 30°/min for 1 min or 120° for 1 min to 230° at 40°/min to 280° at 8°/min for 9 min. ECD. Limit of detection, 0.058 µmol/L (DB-1701) [Gjerde *et al.* 1992]. Column: SE-54 5% phenyl methyl silicone (25 m × 0.31 mm i.d., 0.17 µm). Carrier gas: He, 2–3 mL/min. Temperature programme: 200° for 1 min to 290° at 10°/min. NPD or ECD. Retention time: 6.28 min. Limit of detection not reported [Lillsunde, Seppälä 1990].

GC-MS Column: 100% methylsiloxane or 5% phenylsiloxane, 95% methylsiloxane. Carrier gas: 1.0 mL/min. Temperature programme: 140° for 0.5 min to 320° at 25°/min. SIM acquisition mode. Limit of detection, 12.5 µg/L [Goldberger *et al.* 2010]. Column: HP-5 MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 120° to 295° at 10°/min for 5 min. EI ionisation. [Papoutsis *et al.* 2010]. Column: 5% diphenyldimethylsiloxane DB-5MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 2 mL/min. Temperature programme: 150° for 0.6 min to 230° at 40°/min to 310° at 10°/min. EI ionisation, SIM acquisition mode. Limit of quantification, 10 µg/L, limit of detection, 5 µg/L [Tiscione *et al.* 2008]. Column: DB5-MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° to 230° at 8°/min to 313° at 4°/min. EI ionisation at 70 eV or CI in positive ion mode. Limit of detection, 10 µg/L [Pirnay *et al.* 2002].

HPLC Column: Chromolith Performance (RP-18e) (100 × 4.6 mm i.d.). Mobile phase: 35 mmol/L phosphate buffer (pH 2.1) : acetonitrile (70 : 30), flow rate 2 mL/min. DAD (λ= 220 nm). Limit of quantification, 30 µg/L [Bugey, Staub 2004]. Column: Lichrospher Select B (125 × 3 mm i.d.). Mobile phase: acetonitrile : 20 mmol/L potassium dihydrogen phosphate (pH 2.1, 30 : 70 to 35 : 65 at 30 min), flow rate 0.5 mL/min to 0.3 mL/min at 30 min. DAD (λ= 254 nm). Limit of quantification, 30 µg/L, limit of detection, 10 µg/L [El Mahjoub, Staub 2001a]. Column: Lichrospher Select B C_8 (125 × 3 mm i.d., 5 µm). Mobile phase: 20 mmol/L phosphate buffer (pH 2.1) : acetonitrile (65 : 35), flow rate 0.3 mL/min. UV detection (λ= 220 nm). Limit of quantification, 5 µg/L, limit of detection, 2 µg/L [El Mahjoub, Staub 2000a].

LC-MS MRM acquisition mode [Gunn *et al.* 2010]. Column: Restek Allure C_{18} (150 × 3.2 mm i.d., 5 µm). Mobile phase: 5 mmol/L ammonium acetate : acetonitrile : methanol (90 : 5 : 5), flow rate 0.45 mL/min. DAD. Limit of quantification, 2 µg/L [Dussy *et al.* 2006].

Plasma **GC** Column: CPSIL 8 CB (25 × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 150° to 230° at 40°/min for 2 min to 250° at 5°/min for 1 min to 300° at 15°/min for 3 min. NPD. Limit of detection, 0.45 µmol/L [Reubsaet *et al.* 1998]. See Blood [Lillsunde, Seppälä 1990]. Column: 3% OV-7 on Chromosorb W 80/100 mesh (1.8 m × 2 mm i.d.). Carrier gas: Ar : CH_4 (95 : 5), 40 mL/min. Temperature: 250°. ECD. Limit of detection, 10 µg/L [Giles *et al.* 1978].

HPLC Column: C_{18} (250 × 4.6 mm i.d.). Mobile phase: methanol : water (65 : 35), flow rate 1.0 mL/min. UV detection (λ= 230 nm). Limit of detection, 5 µg/L for oxazepam and other benzodiazepines [Liang *et al.* 2009]. Column: Hisep (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.18 mol/L ammonium acetate buffer (pH 2.5, 15 : 85), flow rate 2 mL/min. UV detection (λ= 254 nm). Limit of quantification, 0.5 mg/L, limit of detection, 0.16 mg/L [Pistos, Stewart 2003]. Column: Cyclobond 1-2000 RSP (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 1% triethylamine acetate buffer (pH 4.5) : water (18 : 8 : 73), flow rate 0.4 mL/min. DAD (λ= 230 nm). Limit of detection, 10 µg/L [Pham-Huy *et al.* 2002]. Column: C_{18} (300 × 3.9 mm i.d.). Mobile phase: methanol : phosphate buffer (pH 6, 50 : 50), flow rate 1.5 mL/min. UV detection (λ= 230 nm). Limit of detection, 30 µg/L [Zarghi, Jenabi 2001]. Column: LiChrospher Select B C_8 (125 × 3 mm i.d., 5 µm). Mobile phase: acetonitrile : 30 mmol/L phosphate buffer (pH 2.1, 30 : 70 for 5 min to 35 : 65 at 0.3 mL/min), flow rate 0.5 mL/min for 5 min to 0.3 mL/min at 30 min. DAD (λ= 254 nm). Retention time: 13.5 min. Limit of quantification, 60 µg/L, limit of detection, 18 µg/L [El Mahjoub, Staub 2000b]. See Urine [Azzam *et al.* 1998; Franzelius, Besserer 1993].

LC-MS Column: XTerra MS C_{18} (150 × 2.1 mm i.d., 3.5 µm). Mobile phase: acetonitrile : water : 100 mmol/L ammonium formate (pH 3.0, 55 : 40 : 5), flow rate 0.125 mL/min. ESI, MRM acquisition mode. Retention time: 4.93 min. Limit of quantification, 20 µg/L, limit of detection, 10 µg/L [Marin *et al.* 2008; Marin, McMillin 2010]. Column: Merck LiChroCART (125 × 2 mm i.d.). Mobile phase: 5 mmol/L ammonium formate : acetonitrile (60 : 40 for 5.5 min to 10 : 90 in 8 min to 60 : 40 in 9.5 min for 10 min). APCI, SIM acquisition mode. Limit of quantification, 0.025 mg/L, limit of detection, 0.001 mg/L [Kratzsch *et al.* 2004].

Serum **GC-MS** See Blood [Pirnay *et al.* 2002]. Column: SPB-1 (30 m × 0.75 mm i.d., 1.0 µm). Carrier gas: He, 0.2 bar. Temperature programme: 230° for 2 min to 280° at 7°/min for 2 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 1.5 ng/L, limit of detection, 1 ng/L [Duthel *et al.* 1992].

HPLC Column: Perfectsil Target ODS-3 reversed phase (125 × 4 mm i.d., 5 µm). Mobile phase: 0.05 mol/L ammonium dihydrogen phosphate buffer (pH 5.8) : methanol (50 : 50), flow rate 1.5 mL/min. UV detection (λ= 254 nm) [Kazemifard *et al.* 2007]. Column: Symmetry Shield RP8 (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.1 mol/L potassium dihydrogen phosphate (40 : 60), flow rate 0.9 mL/min. UV detection (λ= 230 nm). Limit of detection, 1.0 µg/L [He *et al.* 2005]. Column: Kromasil C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: butanol : 0.06 mol/L SDS (pH 7, 5 : 95), flow rate 1.0 mL/min. UV detection (λ= 230 nm). Limit of detection, 7 µg/L [Capella-Peiró *et al.* 2002]. Column: Supelcosil C_{18} (50 × 4.6 mm i.d., 5 µm). Mobile phase: water : methanol (52 : 48), flow rate 1.0 mL/min. UV detection (λ= 230 nm). Limit of detection, 750 µg/L [Mullett, Pawliszyn 2002]. Column: µBondapak C_{18} (300 × 3.9 mm i.d., 10 µm). Mobile phase: flow rate 1.5 mL/min. DAD (λ= 254 nm). Limit of quantification, 150.7 µg/L, limit of detection, 42 µg/L [Ahrens *et al.* 2000]. See Blood [El Mahjoub, Staub 2000a]. See Plasma [El Mahjoub, Staub 2000b]. See also Goldnik *et al.* [1993].

LC-MS See Blood [Gunn *et al.* 2010]. See Plasma [Marin *et al.* 2008; Marin, McMillin 2010].

Urine **GC** See Plasma [Reubsaet *et al.* 1998]. Column: DB-17 (15 m). Carrier gas: N_2. Temperature: 225°. ECD. Retention time: 1.42 min. Limit of detection, 0.13 ng [Beischlag, Inaba 1992].

GC-MS See Blood [Goldberger *et al.* 2010; Pirnay *et al.* 2002]. Column: polydimethylsiloxane. SIM or scan acquisition mode. Limit of detection, 1.0–1.7 µg/L (SIM) and 13–30 µg/L (scan mode) for oxazepam and other benzodiazepines [Borrey *et al.* 2001a; Borrey *et al.* 2001b]. Column: 5% phenylmethylsiloxane (25 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 0.5 mL/min. Temperature programme: 240° to 260° at 25°/min to 300° at 30°/min. SIM acquisition mode. Limit of detection, 0.1 mg/L [Black *et al.* 1994]. Column: DB-1 (15 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He. Temperature programme: 160° for 1 min to 280° at 20°/min for 3 min. NCI. Limit of detection not reported [Fitzgerald *et al.* 1993]. Column: methylsiloxane (12.5 m). Temperature programme; 120° to 310°. Limit of quantification, 3 µg/L, limit of detection, 1 µg/L [West, Ritz 1993]. Column: DB-5 (15 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 66 cm/s. Temperature programme: 210° to 300° at 20°/min for 1 min. EI ionisation, SIM acquisition mode. Limit of quantification, <10 µg/L, limit of detection, <10 µg/L [Dickson *et al.* 1992].

HPLC UV detection. Limit of detection, 750 µg/L [Mullett, Pawliszyn 2002]. Column: Supelcosil C_{18} (50 × 4.6 mm i.d., 5 µm). Mobile phase: water : methanol (54 : 46), flow rate 1.0 mL/min. UV detection (λ= 230 nm). Limit of quantification, 80.7 µg/L, limit of detection, 24.2 µg/L [Mullett, Pawliszyn 2001]. Column: Hypersil C_{18} (100 × 4.6 mm i.d., 3 µm). Mobile phase: 0.04 mol/L phosphate (pH 4)-0.4% octylamine : acetonitrile (73 : 27, 70 : 30, 65; 35 or 60 : 40), flow rate 1 mL/min. DAD (λ= 240 nm). Retention time: 10.45 min. Limit of quantification, 26.0 µg/L, limit of detection, 8.0 µg/L [Segura *et al.* 2001]. Hypersil BDS RP-C_{18} (250 × 4.0 mm i.d., 5.0 µm). Mobile phase: methanol : acetonitrile : 0.05 mol/L potassium dihydrogen phosphate (pH 3.5, 50 : 10 : 40), flow rate 1.2 mL/min. UV detection (λ= 232 nm). Retention time: 7.16 min. Limit of quantification, 10 µg/L [Azzam *et al.* 1998]. Column: LiChrospher 100 RP-C18(e) (250 × 4 mm i.d., 5 µm). Mobile phase: water : methanol : triethylamine (pH 5.5, 70 : 30 : 0.1), flow rate 0.7 mL/min. UV detection (λ= 240 nm). Limit of detection, 2 µg/L for oxazepam and other diazepam metabolites [Chiba *et al.* 1995]. Column: 60 RP-Select B (250 × 4 mm i.d., 5 µm) or LiChrospher 100 RP-C8 (200 × 4 mm i.d., 8.5 µm). Mobile phase: 0.01 mol/L sodium phosphate buffer (pH 7.0): acetonitrile (87.5 : 12.5 to 83.5 : 16.5 at 15 min to 80 : 20 over 8.5 min for 3 min to 75 : 25 in 1 min for 15 min), flow rate 1.0 mL/min. UV detection (λ= 230 nm). Limit of detection, 10 µg/L [Franzelius, Besserer 1993]. Column: Ultrabase C_{18} reversed phase (35 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : water (60 : 40), flow rate 0.5 mL/min. Fluorescence detection (λ_{ex}= 364 nm, λ_{em}= 469 nm). Limit of detection, 4 µg/L [Berrueta *et al.* 1993]. See also Goldnik *et al.* [1993].

LC-MS Column: Hypurity C_8 (150 × 3 mm i.d.). Mobile phase: 4 mmol/L ammonium acetate (pH 6.8) in methanol-water (5 : 95) : 1% propan-2-ol, 0.05% formic acid in methanol (100 : 0 for 1 min to 0 : 100 at 3 min for 1.5 min to 100 : 0 over 0.1 min for 1.4 min. TIS, MRM acquisition mode. Limit of quantification, 5 µg/L, limit of detection, 1.25 µg/L [Glover, Allen 2010]. See Plasma [Marin *et al.* 2008; Marin, McMillin 2010]. Column: Shodex MSpak GF-310 4B (50 × 4.6 mm i.d., 6 µm). Mobile phase: 10 mmol/L ammonium acetate : acetonitrile (100 : 0 for 3 min to 0 : 100 from 3.01 to 6 min to 100 : 0 from 6.01 to 10 min for 5 min), flow rate 0.9 mL/min for 3 min to 0.3 mL/min until 10 min to 0.9 mL/min. ESI, positive ion mode. Limit of quantification, 0.5 µg/L, limit of detection, 0.1 µg/L [Umezawa *et al.* 2008]. Column: Symmetry C_{18} (100 × 2.1 mm i.d., 3.5 µm). Mobile phase: acetonitrile : 5 mmol/L ammonium acetate (pH 5, 10 : 90 to 30 : 70 at 5 min to 80 : 20 at 9 min to 10 : 90 at 9.1 min), flow rate 0.3 mL/min. ESI, MRM acquisition mode. Limit of quantification, 0.01 µmol/L [Hegstad *et al.* 2006].

Meconium **LC-MS** See Plasma [Marin *et al.* 2008; Marin, McMillin 2010].

Oral Fluid **LC-MS** Limit of detection, 0.5–5 µg/L for oxazepam and other benzodiazepines [Moore *et al.* 2007].

Hair **GC-MS** Column: HP-Ultra 2 capillary (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 2 mL/min. Temperature programme: 70° for 2 min to 220° at 25°/min to 255° at 5°/min to 300° for 7 min. EI ionisation at 70 eV. Retention time: 9.6 min. Limit of detection, 0.2 ng/mg [Yegles *et al.* 1997]. Column: HP-5 MS 5% phenylsiloxane, 95% methylsiloxane (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 60° for 1 min to 290° at 30°/min for 2 min. NICI. Retention time: 9.28 min. Limit of detection, 0.005 ng/mg [Kintz *et al.* 1996].

O

HPLC Column: Lichrospher Select-B (125 × 3 mm i.d., 5 μm). Mobile phase: acetonitrile : 20 mmol/L potassium dihydrogen phosphate (pH 2.1, 30 : 70 to 35 : 65 in 30 min), flow rate 0.5 mL/min to 0.3 mL/min at 30 min. UV detection (λ = 254 nm). Limit of quantification, 0.3–0.45 ng/mg, limit of detection, 0.2 ng/mg [El Mahjoub, Staub 2001b].

LC-MS Mobile phase: 3 mmol/L ammonium formate and 0.001% formic acid in water : acetonitrile (65 : 35 to 20 : 80 after 13 min to 10 : 90 at 13.5 min until 16.5 min to 65 : 35 until 20 min), flow rate 0.3 mL/min. ESI, positive ion mode. Limit of quantification, 0.19 ng/30 mg, limit of detection, 0.11 ng/30 mg [Miller *et al.* 2006].

Disposition in the Body Oxazepam is readily absorbed after oral administration. It crosses the placenta and is found in breast milk. Approximately 70–80% of a single dose is excreted in the urine in 72 h, almost entirely as oxazepam glucuronide with only traces of unchanged oxazepam and other minor metabolites. Up to 10% of a dose is eliminated in the faeces, mostly as unchanged drug. Oxazepam is a metabolite of several benzodiazepines including chlordiazepoxide, clorazepic acid, demoxepam, desmethyldiazepam (nordazepam), diazepam, ketazolam, medazepam, prazepam, and temazepam.

Therapeutic Concentration In plasma, usually in the range 0.5–2 mg/L.
A single oral dose of 45 mg administered to 8 subjects produced serum oxazepam concentrations of 0.88–1.44 mg/L (mean, 1.1) in ~2 h, and oxazepam glucuronide concentrations of 0.7–1.4 mg/L (mean, 0.9) in 2–4 h. Daily oral doses of 10 mg every 6 h administered to 6 subjects produced serum oxazepam concentrations of 0.14–0.56 mg/L (mean, 0.3) 2 h after a dose, and oxazepam glucuronide concentrations of 0.22–0.40 mg/L (mean, 0.3) 4 h after the dose [Knowles, Ruelius 1972].

Toxicity Blood concentrations >2 mg/L may produce toxic effects.

Note For a report of oxazepam overdose associated with alcohol ingestion, see Weinberg *et al.* [1994]; for an assessment of the relative toxicity of benzodiazepines in overdose, see Buckley *et al.* [1995].

Half-life Plasma half-life, 4–15 h (mean, 8).

Volume of Distribution 0.5–2 L/kg.

Clearance Plasma clearance, ~1–2 mL/min/kg.

Distribution in Blood Plasma : whole blood ratio, ~0.9.

Protein Binding ~95%.

Note For a review of the clinical pharmacokinetics of oxazepam, see Greenblatt [1981].

Dose 30 to 120 mg daily.

Oxcarbazepine

Anticonvulsant

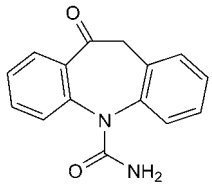
$C_{15}H_{12}N_2O_2 = 252.3$

CAS—28721-07-5

IUPAC Name 5-Oxo-6*H*-benzo[*b*][1]benzazepine-11-carboxamide

Synonyms 10,11-Dihydro-10-oxo-5*H*-dibenz[*b,f*]azepine-5-carboxamide; GP-47680; oxacarbazepine.

Proprietary Name *Trileptal*



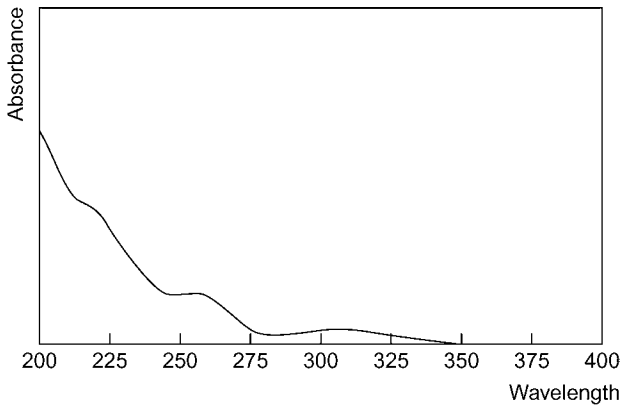
Chemical Properties White to faintly orange crystalline powder. Mp 215° to 216°. Practically insoluble in water, ether and ethanol; slightly soluble in chloroform, dichloromethane, acetone and methanol. Log *P* (octanol/water), 1.11 [Meylan, Howard 1995]. Extraction yield (chlorobutane), 0.9 [Demme *et al.* 2005]. Samples were stable in extraction solvent in the autosampler for at least 24 h [Mazzucchelli *et al.* 2007]. Stock solutions were stable for at least 6 months when stored at 4°. Plasma samples were stable following 3 freeze-thaw cycles and after 24 h at room temperature. Quality-control samples were stable for at least 30 days stored at –50°. Stable in the autosampler for 24 h [Nirogi *et al* 2006]. Stable for ≈1 year in plasma when stored at –70°. Not stable at –20° in human plasma. Stock solutions were stable for at least 3 months at 4°. Extracts were stable on the autosampler at 4° for at least 33 h [Souppart *et al* 2001].

Thin-layer Chromatography System TB—R_f 0.00; system TE—R_f 0.54; system TF—R_f 0.20; system TAE—R_f 0.78.

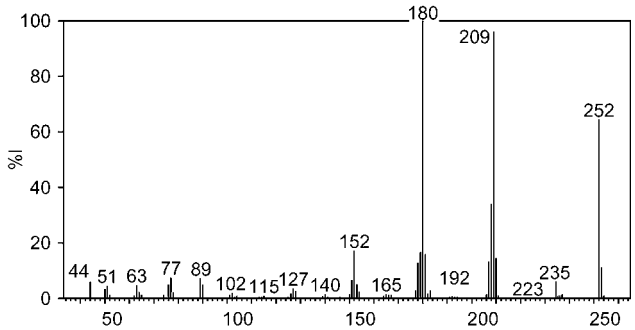
Gas Chromatography System GA—M (formylacridine) RI 2025, M (carbamazepine) RI 2285; system GB—oxcarbamazepine RI 2266, M (formylacridine) RI 2158, M (methylacridine) RI 2054, M (10-OH-) RI 2580, M (carbamazepine) RI 2435; system GAJ—M (carbamazepine) RRT 1.716 (relative to methylphenobarbital).

High Performance Liquid Chromatography System HX—RI 396; system HZ—oxcarbazepine RT 2.9 min, M (10-OH-) RT 2.2 min.

Ultraviolet Spectrum Aqueous acid—256, 306 nm.



Mass Spectrum Principal ions at *m/z* 180, 209, 252, 208, 152, 179, 181, 210.



Quantification

Blood **LC-MS** Column: LiChroCART (125 × 3 mm i.d., 5 µm). Mobile phase: 0.1% formic acid : acetonitrile-0.1% formic acid (95 : 5, 95 : 5 for 2 min to 30 : 70 for 2 min to 95 : 5 for 8 min), flow rate 0.4 mL/min. APCI, positive ion mode. Limit of detection, 0.05 mg/L [Klys *et al.* 2005].

Plasma **GC** Column: HP fused silica (30 m × 0.31 mm i.d., 1 µm). Carrier gas: H_2, 1.4 kg/cm^2. Temperature programme: 140 to 200° at 2 min to 240° at 30°/min. FID. Retention time: 8 min 45 s. Limit of detection, 10 µg/L and 25 µg/L for 10-hydroxycarbazepine and 10,11-dihydro-10-hydroxy-carbamazepine, respectively [von Unruh, Paar 1985].

GC-MS Column: HP 5% phenylmethyl silicone (25 m × 0.31 mm i.d., 0.17 µm). Carrier gas: He. Temperature: 250°. EI ionisation at 20 eV. Limit of detection, 0.1 µg/L and 1 µg/L for 10-hydroxycarbazepine and 10,11-dihydro-10-hydroxycarbamazepine, respectively [von Unruh, Paar 1986].

HPLC Column: XTERRA C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: 20 mmol/L potassium dihydrogen phosphate : acetonitrile : *n*-octylamine (76 : 24 : 0.05), flow rate 0.7 mL/min. UV detection (λ = 237 nm). Limit of quantification, 25 µg/L [Kimiskidis *et al.* 2007]. Column: Chiralcel ODR (250 × 4.6 mm i.d., 10 µm). Mobile phase: acetonitrile : 37.5 mmol/L potassium hexafluorophosphate (18 : 82 to 25 : 75), flow rate 0.5 mL/min. UV detection (λ = 210 nm). Limit of quantification, 0.1 mg/L, limit of detection, 0.05 mg/L [Mazzucchelli *et al.* 2007]. Column: Synergi Hydro-RP (250 × 4.6 mm i.d., 4 µm). Mobile phase: 0.01 mol/L potassium phosphate (pH 7.0) : methanol : acetonitrile 955 : 20 : 30), flow rate 1.1 mL/min. UV detection (λ = 240 nm). Retention time: 4.5 min. Limit of detection not reported [Juenke *et al.* 2006]. Column: Symmetry C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: water : methanol : acetonitrile (52 : 28 : 20), flow rate 1.0 mL/min. UV detection (λ = 230 nm). Limit of quantification, 50 µg/L, 100 µg/L for 10-hydroxycarbazepine [Nirogi *et al.* 2006]. Column: Synergi Hydro-RP (150 × 4 mm i.d., 4 µm). Mobile phase: 50 mmol/L potassium dihydrogen phosphate (pH 4.5) : acetonitrile-methanol (3 : 1, 65 : 35), flow rate 1.0 mL/min. Retention time: 7.06 min. Limit of quantification, 1.0 mg/L, limit of detection, 0.5 mg/L both for monohydroxycarbamazepine [Contin *et al.* 2005].

LC-MS Column: Phenomenex Luna C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water (50 : 50) with 20 mmol/L acetic acid, flow rate 1.0 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 20 ug/L [de Sousa Maia *et al.* 2007]. Column: Zorbax XD8 C_8 (150 × 4.6 mm i.d., 4 µm). Mobile phase: acetonitrile : 2 mmol/L formate buffer (pH 3.0; 15 : 85 to 60 : 40 over 30 min to 70 : 30 over 10 min for 5 min to 15 : 85 over 1 min for 4 min), flow rate 0.8 mL/min. ESI, positive ion mode, full scan mode. Limit of quantification, 0.4 mg/L [Breton *et al.* 2005]. Column: LiChroCART (125 × 2 mm i.d.). Mobile phase: 5 mmol/L aqueous ammonium formate (pH 3.0) : acetonitrile (60 : 40 for 4 min to 10 : 90 at 7 min to 60 : 40 at 10 min), flow rate 0.4 mL/min for the first 4 min, 0.6 mL/min for the next 3 min followed by 0.4 mL/min. APCI, SIM acquisition mode. Limit of quantification, 0.1 mg/L; limit of detection, 0.01 mg/L [Maurer *et al.* 2002].

CE Capillary: uncoated fused silica (48.5/40.0 total/effective length, 50 µm i.d.). Running buffer: 30 mmol/L phosphate buffer with 60 mmol/L SDS : methanol (80 : 20). UV detection (λ = 205 nm). Limit of quantification, 0.15 mg/L, limit of detection, 0.05 mg/L [Pucci *et al.* 2003].

Serum **HPLC** Column: Betasil C_6 (250 × 4.6 mm i.d., 5 µm). Mobile phase: 20 mmol/L phosphate buffer : acetonitrile (pH 3.0; 70 : 30), flow rate 1.3 mL/min. DAD (λ = 215 nm). Retention time: 16.05 min. Limit of quantification, 90 µg/L, limit of detection, 30.0 µg/L [Greiner, Haen 2007]. Column: Supelcosil LC-18 (25 cm × 4.6 mm i.d., 5 µm). Mobile phase: 30 mmol/L potassium phosphate buffer (pH 3.7) : acetonitrile (65 : 35), flow rate 1.2 mL/min. UV detection (λ = 230 nm). Limit of quantification, 0.75 mg/L, limit of detection, 0.25 mg/L [Greiner-Sosanko *et al.* 2007]. Column: Alltima 3C_{18} (15 × 0.46 cm). Mobile phase: methanol : acetonitrile : 25 mmol/L phosphate buffer containing 12.5 mmol/L sodium chloride (pH 6.2), flow rate 0.9 mL/min. UV detection (λ = 215 and 275 nm). Retention time: 6.3 min for hydroxycarbazepine. Limit of quantification, 0.017 mg/L, limit of detection, 0.01 mg/L [Vermeij, Edelbroek 2007]. Column: C_{18} Ultrabiosep (150 × 4.6 mm i.d., 5 µm). Mobile phase: 7.3 mmol/L sodium acetate buffer (pH 5.4) : acetonitrile (68 : 32), flow rate 2.0 mL/min. UV detection (λ = 240 nm). Retention time: 2.35 min. Limit of quantification, 0.58 mg/L [Levert *et al.* 2002a; Levert *et al.* 2002b]. Column: Superspher 60 RP-select B (125 × 4 mm i.d., 4 µm). Mobile phase: acetonitrile : 20 mmol/L potassium dihydrogen phosphate (20 : 80) containing 0.05% triethylamine (pH 6.3), flow rate 1.0 mL/min. UV detection (λ = 212 nm). Limit of quantification, 55 µg/L, limit of detection, 12 µg/L [Pienimäki *et al.* 1995]. Column: LiChrosorb RP-8 (25 × 0.4 cm i.d., 10 µm). Mobile phase: acetonitrile : water (18 : 82 to 23 : 77 for 15 min to 80 : 20 at 16 min for 2.5 min to 18 : 82 at 19.5 min for 2 min), flow rate 2.0 mL/min. UV detection (λ = 190 to 600 nm). Retention time: 9.2 min. Limit of detection not reported [Wad 1984].

LC-MS Column: Symmetry C_{18} (100 × 2.1 mm i.d., 3.5 µm). Mobile phase: acetonitrile : 0.02% formic acid (40 : 60), flow rate 350 µL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 3.9 µg/L [Paglia *et al.* 2007].

Urine **HPLC** Column: Chiralcel OC (250 × 4.6 mm i.d.). Mobile phase: *n*-hexane : ethanol : 2-propanol (18 : 2 : 1) with 0.1% glacial acetic acid, flow rate 1.0 min. UV detection (λ = 215 nm). Retention time: 10.6 min for *R*-(–)-MHD, 13.3 min for *S*-(+)-MHD. Limit of quantification 200 µg/L for 10-hydroxycarbazepine and 400 µg/L for the 10,11-dihydro-10-hydroxycarbamazepine metabolite [Volosov *et al.* 2000]. See Plasma. Limit of quantification, 0.625 mg/L [van Heiningen *et al.* 1991].

Hair **LC-MS** See Blood. Limit of detection, 0.5 ng/mg [Klys *et al.* 2005].

Disposition in the Body Oxcarbazepine is rapidly and well absorbed after oral administration and is widely distributed in the body. It is rapidly and extensively metabolised in the liver to 10,11-dihydro-10-hydroxycarbamazepine which possesses antiepileptic activity, and a monohydroxy derivative (MHD). The drug is mainly excreted in urine as the metabolites, with <1% as the unchanged drug. Faecal excretion accounts for <4% of a dose. Approximately 80% of a dose is excreted in urine as glucuronides of MHD (49%) or as unchanged MHD (27%) whereas conjugates of oxcarbazepine account for 13% of the dose [Schütz *et al.* 1986]. The drug and the monohydroxy metabolite cross the placenta and are distributed into breast milk.

Therapeutic Concentration The therapeutic serum concentration range of hydroxycarbazepine is 12–30 mg/L.

Twelve young, healthy (age range, 30–31 years) and 12 elderly (61–82 years) males were administered with a single dose of 300 mg oxcarbazepine on day 1 and 300 mg twice daily on days 5 to 12. Twelve young (18–32 years) and 12 elderly (60–79 years) females were administered with a single 600-mg dose on day 1, 150 mg twice daily on day 5, and 300 mg twice daily on days 6 to 11. The maximum plasma concentration after the single doses was 2.33 and 2.88 mg/L for the young and elderly males, respectively. These were observed at 4 (4–6) and 5 (4–10) h, respectively. For the young females, concentrations were 5.17 mg/L at 4 (2–12) h and for the elderly, 7.20 mg/L at 5 (3–20) h. For multiple dosing, the maximum concentrations were 8.49 and 12.03 mg/L at 2 (2–4) and 4 (2–8) h for the young and elderly males, respectively and 9.34 and 11.72 mg/L at 3 (2–4) h for the young and elderly females. [van Heiningen *et al.* 1991].

A healthy volunteer was administered a single oral dose of 300 mg oxcarbazepine. The plasma concentration of unchanged drug reached a maximum of 0.4 µg/g after 1 h of intake of the drug [Menge, Dubois 1983].

Note For the pharmacokinetic influence of oxcarbazepine on feldopine, see Zaccara *et al.* [1993]. For the pharmacokinetics of oxcarbazepine in the placenta, see Pienimäki *et al.* [1997]. For changes in disposition during pregnancy, see Mazzucchelli *et al.* [2006]. For the pharmacokinetics of enantiomers of 10-hydroxycarbazepine following oxcarbazepine, see Volosov *et al.* [1999].

Toxicity The toxic serum concentration is 45 mg/L.

Note For the postmortem distribution of hydroycarbazepine in 3 cases, see [Levine *et al.* 2004].

Half-life Oxcarbazepine, 1–2.5 h [Dickinson *et al.* 1989]; monohydroxy derivative, 8–14 h.

Volume of Distribution 3.94 L/kg; monohydroxy derivative, 49 L.

Clearance Oral, 2.5 L/kg/h [Dickinson *et al.* 1989].

Protein Binding ≈40% (primarily to albumin).

Dose The initial daily dose is 300 mg with a maintenance dose of 600 to 1200 mg. The dose may need to be reduced in those with moderate-to-severe renal impairment (dose halved).

Oxedrine

Sympathomimetic

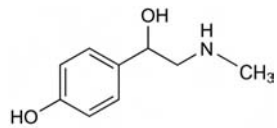
$C_9H_{13}NO_2$ = 167.2

CAS—94-07-5

IUPAC Name 4-Hydroxy-α-[(methylamino)methyl]benzenemethanol

Synonyms Oxyphenylmethylaminoethanol; sympaethaminum; synephrine.

Note *m*-Synephrine has been used as a synonym for phenylephrine.



Chemical Properties Crystals. Mp 184° to 185°. pK_a 9.3 (—OH), 10.2 (—NH—), (25°). Log *P* (octanol/water), −0.4.

Oxedrine Tartrate

$(C_9H_{13}NO_2)_2,C_4H_6O_6$ = 484.5

CAS—16589-24-5; 67-04-9 (±)

Synonym Aethaphenum tartaricum

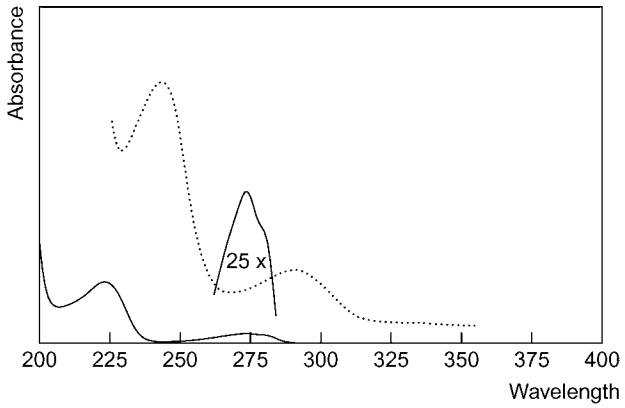
Proprietary Names *Dulcidrine*; *Sympatol*.

Chemical Properties Colourless crystals or white crystalline powder. Mp 188° to 190°, with some decomposition. Soluble 1 in 2 of water and 1 in 400 of ethanol; practically insoluble in chloroform and ether.

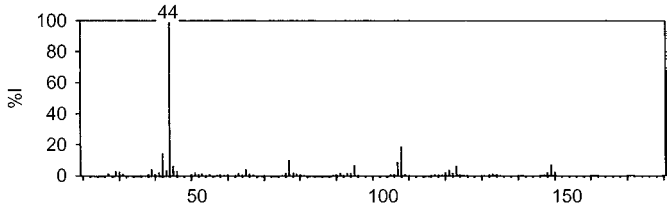
Thin-layer Chromatography System TA—R_f 0.25; system TB—R_f 0.04; system TC—R_f 0.01 (acidified potassium permanganate solution, positive).

High Performance Liquid Chromatography System HB—*k* 0.27.

Ultraviolet Spectrum Aqueous acid—273 nm (A^1_1=81a); aqueous alkali—241 (A^1_1=810b), 291 nm.



Infrared Spectrum Principal peaks at wavenumbers 835, 1510, 1054, 1271, 1098, 1611 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 44, 108, 42, 77, 107, 149, 95, 123.

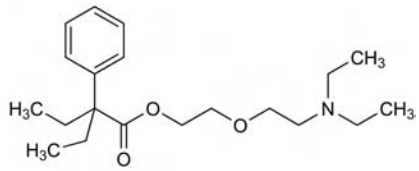


Dose Oxedrine tartrate has been given in doses of about 300 mg daily.

Oxeladin

Cough Suppressant
$C_{20}H_{33}NO_3$ = 335.5
CAS—468-61-1

IUPAC Name 2-[2-(Diethylamino)ethoxy]ethyl-α,α-diethylbenzeneacetate

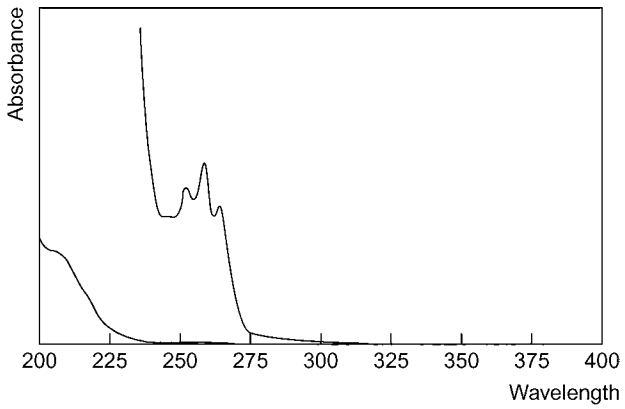


Chemical Properties A yellow oil. Practically insoluble in water; soluble in ethanol, acetone, toluene and ether. Log *P* (octanol/water), 4.3.

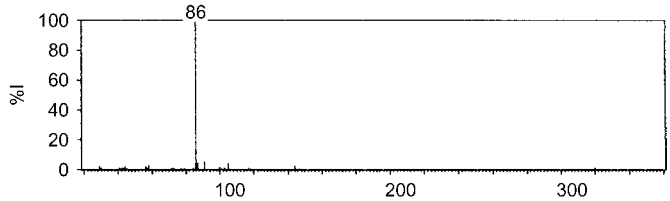
Oxeladin Citrate

$C_{20}H_{33}NO_3$, $C_6H_8O_7$ = 527.6
CAS—52432-72-1
Proprietary Names *Dorex-retard*; *Paxeladine*.
Chemical Properties A white crystalline powder. Mp 90° to 91°. Soluble in water.

Colour Test Marquis test—orange.
Thin-layer Chromatography System TA—R_f 0.50; system TB—R_f 0.51; system TC—R_f 0.22; system TE—R_f 0.67; system TL—R_f 0.19; system TAE—R_f 0.19 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2190.
High Performance Liquid Chromatography System HA—*k* 3.0.
Ultraviolet Spectrum Aqueous acid—252, 258, 264 nm.



Infrared Spectrum Principal peaks at wavenumbers 1731, 1128, 1221, 1100, 700, 1080 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 86, 91, 105, 87, 144, 58, 100, 56.

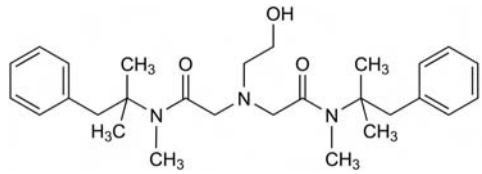


Dose 80 to 120 mg of oxeladin citrate daily.

Oxetacaine

Anaesthetic (Local)
$C_{28}H_{41}N_3O_3$ = 467.6
CAS—126-27-2

IUPAC Name 2-[2-Hydroxyethyl-[2-[methyl-(2-methyl-1-phenylpropan-2-yl)amino]-2-oxoethyl]amino]-*N*-methyl-*N*-(2-methyl-1-phenylpropan-2-yl)acetamide
Synonyms 2,2′-[(2-Hydroxyethyl)imino]bis[*N*-(1,1-dimethyl-2-phenylethyl)-*N*-methylacetamide]; oxethazaine.
Proprietary Names It is an ingredient of *Mucaine*, *Mucoxin*, *Mutesa*, *Muthesa*, *Oxaine* and *Tepilta*.

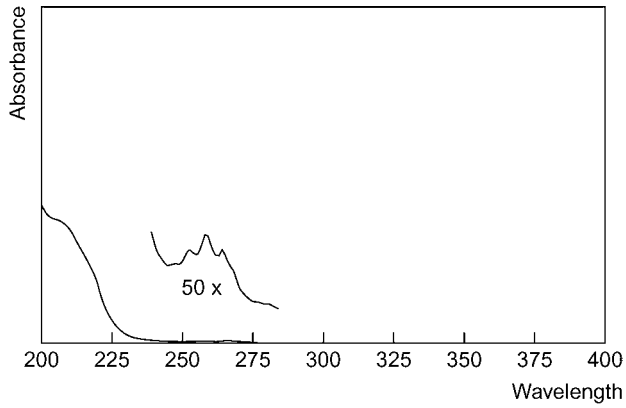


Chemical Properties A white crystalline powder. Mp about 104°. Insoluble in water; soluble in ethanol and in dilute acids. Log *P* (octanol/water), 3.4.

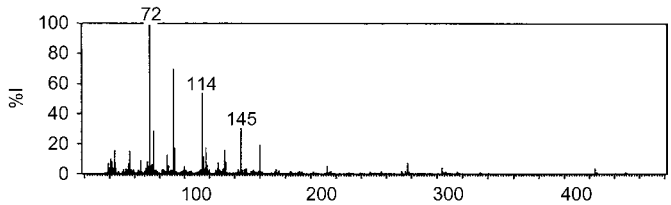
Oxetacaine Hydrochloride

CAS—13930-31-9 (xHCl)
Proprietary Name *Emoren*
Chemical Properties Mp 146° to 147°. Soluble in water.

Colour Tests Mandelin's test—violet-brown; Marquis test—red-brown.
Thin-layer Chromatography System TA—R_f 0.52; system TAE—R_f 0.61; system TB—R_f 0.10; system TC—R_f 0.07; system TE—R_f 0.38; system TL—R_f 0.15 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2525.
High Performance Liquid Chromatography System HR—*k* 4.14.
Ultraviolet Spectrum Aqueous acid—248, 252, 258, 264 nm.



Infrared Spectrum Principal peaks at wavenumbers 1645, 756, 707, 1219, 1101, 1068 cm^{-1}.
Mass Spectrum Principal ions at *m/z* 72, 91, 114, 145, 75, 160, 117, 92.



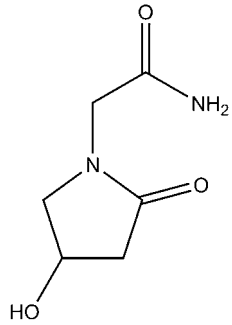
Dose 30 to 80 mg daily, orally.

O

Oxiracetam

Acetamide, Nootropic
$C_6H_{10}N_2O_3$ = 158.2
CAS—62613-82-5

IUPAC Name 2-(4-Hydroxy-2-oxopyrrolidin-1-yl)acetamide
Synonyms CGP-21690E; CT-848; ISF-2522; 4-hydroxy-2-oxo-1-pyrrolidineacetamide; hydroxypiracetam; 2-(4-hydroxypyrrolidin-2-on-1-yl)acetamido; oksirasetami; oxiracetamum; oxracetam.
Proprietary Names *Neupan*; *Neuractiv*; *Neuromet*.

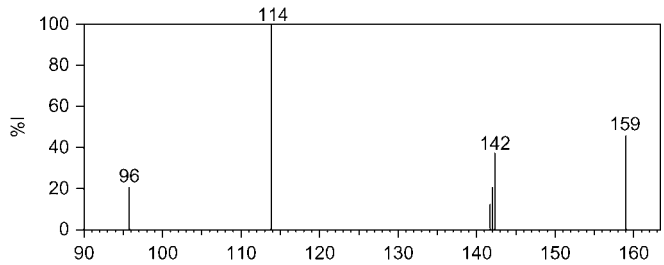


Chemical Properties White microcrystalline powder. Mp 165° to 168°. Log *P* (octanol/buffer pH 7.4) −2.25 [Gschwind *et al.* 1992].

(*R*)-Oxiracetam
Chemical Properties Crystals. Mp 135° to 136°.

(*S*)-Oxiracetam
Chemical Properties Crystals. Mp 135° to 136°.

Mass Spectrum Principal ions at *m/z* 114, 159, 142, 96, 141.



Quantification
Plasma **HPLC** Column switching system. UV detection (λ = 200 nm). Limit of quantification, 240 µg/L [Lecaillon *et al.* 1989].

LC-MS Column: Atlantis dC_{18} (50 × 3.0 mm i.d., 3 µm). Mobile phase: 0.1% acetic acid : methanol (99 : 1 to 20 : 80 over 1 min for 1 min), flow rate 0.3 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 0.2 mg/L [Son *et al.* 2004].

Serum **HPLC** Column: Bondapak NH_2 (300 × 4.6 mm i.d., 10 µm). Mobile phase: acetonitrile : water (80 : 20), flow rate 1.0 mL/min. UV detection (λ = 210 nm). Retention time: 6.3 min. Limit of detection, 1 µg/L [Jiao *et al.* 1994]. Column: Silica (250 × 4.5 mm i.d., 5 µm). Mobile phase: hexane : propan-2-ol : water (77 : 22.5 : 0.5), flow rate 2 mL/min. UV detection (λ = 230 nm). Retention time: 6.3 min (triphenylsilyl ether derivative). Limit of quantification, 9.7 µmol/L; limit of detection, 3.4 µmol/L [Visconti *et al.* 1987].

Urine **HPLC** Column: Bondapak NH_2 (300 × 4.6 mm i.d., 10 µm). Mobile phase: acetonitrile : water (80 : 20), flow rate 1.0 mL/min. UV detection (λ = 210 nm). Retention time: 6.3 min. Limit of detection, 20 µg/L [Jiao *et al.* 1994]. Column switching system. UV detection (λ = 200 nm). Limit of quantification, 12 mg/L [Lecaillon *et al.* 1989]. Column: Silica (250 × 4.5 mm i.d., 5 µm). Mobile phase: hexane : propan-2-ol : water (77 : 22.5 : 0.5), flow rate 2 mL/min. UV detection (λ = 230 nm). Retention time: 6.3 min (triphenylsilyl ether derivative). Limit of quantification, 190 µmol/L [Visconti *et al.* 1987].

Disposition in the Body Well absorbed from the gastrointestinal tract after oral administration, with peak plasma concentrations reached after 1 to 3 h. It undergoes relatively extensive distribution in extravascular spaces. It is mainly excreted by renal clearance, with ~84% recovered unchanged in the urine. Oxiracetam does penetrate the blood–brain barrier to some extent.

Therapeutic Concentration

Four healthy male volunteers (aged 20 to 26 years) were administered a single oral dose of 2 g oxiracetam. The mean peak serum concentration was 40 mg/L after 1.25 h. The same group was administered a 200 mg/min IV infusion of oxiracetam over 5 min. Urinary recoveries of the dose were 88 and 93% after 24 and 48 h, respectively. The corresponding recoveries after oral administration were 61 and 68%, respectively [Perucca *et al.* 1984].

A group of 18 elderly patients (aged 73 to 98 years) was administered 800 mg oxiracetam orally on day 1 and then every 12 h from day 2 evening until the morning of day 10. Mean peak plasma concentrations on days 1 and 10 were 22 mg/L and 31 mg/L, respectively, reached after 2 h. Peak plasma concentrations in healthy non-geriatric volunteers given the same regimen were 5 mg/L on day 1 and 9 mg/L on day 10. The difference was mainly attributed to low values of creatinine clearance in the geriatric patients [Lecaillon *et al.* 1990].

Six patients (aged 53 to 66 years) diagnosed as having probable Alzheimer's disease were administered 2 g oxiracetam as a daily IV infusion over 60 min for 7 consecutive days. At the end of infusion, mean oxiracetam concentrations were 88.1 mg/L in serum and 3.5 mg/L in CSF. One hour after the infusion, oxiracetam concentrations fell to 52.9 mg/L in serum and 2.8 mg/L in CSF. The relative CSF : serum partition was found to be 4.0% at the end of infusion, rising to 5.3% 1 h later. Furthermore, there was an indication that elimination kinetics in CNS compartment are slower than in serum [Parnetti *et al.* 1990].

Toxicity No adverse events were observed when oxiracetam was administered concomitantly with valproic acid, clobazam, or carbamazepine. The half-life of oxiracetam decreased to 3.35 h (range 2.72 to 4.60 h) [van Wieringen *et al.* 1990].
Bioavailability Approximately 75% (range 68 to 82%), also reported as 56%.
Half-life Healthy volunteers 8 h; patients with renal impairment 10 to 68 h.
Volume of Distribution Approximately 0.9 to 1.2 L/kg; steady state, 0.55 L/kg.
Clearance Approximately 78.7 to 95.5 mL/min.
Distribution in Blood Blood : plasma ratio, 0.65.
Dose Used as a nootropic in organic brain syndromes and senile dementia in doses of up to 2 g daily.

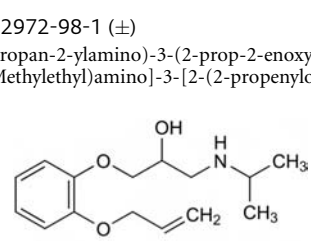
Oxprenolol

β-*Blocker*
$C_{15}H_{23}NO_3$ = 265.4
CAS—6452-71-7; 22972-98-1 (±)

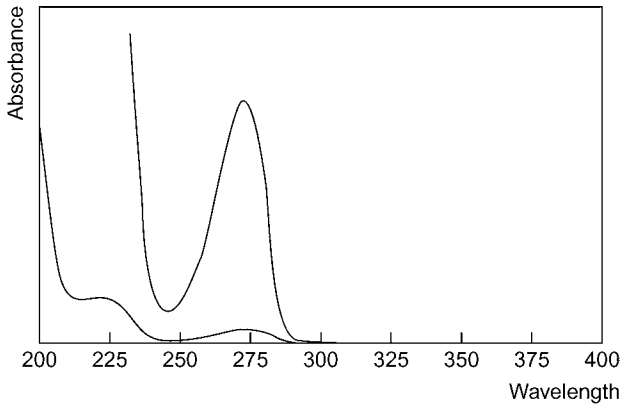
IUPAC Name 1-(Propan-2-ylamino)-3-(2-prop-2-enoxyphenoxy)propan-2-ol
Synonyms 1-[(1-Methylethyl)amino]-3-[2-(2-propenyloxy)phenoxy]-2-propanol; oxyprenolol.



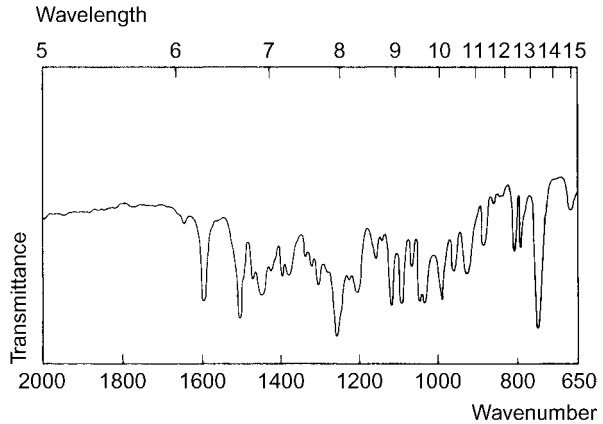
Chemical Properties Crystals. Mp 75° to 80°. pK_a 9.5. Log *P* (octanol/water), 2.1. Extraction yield (chlorobutane), 0.9 [Demme *et al.* 2005].

Oxprenolol Hydrochloride
$C_{15}H_{23}NO_3$, HCl = 301.8
CAS—6452-73-9; 22972-97-0 (±)
Proprietary Names *Apsolox*; *Laracor*; *Slow-Pren*; *Slow-Trasicor*; *Trasicor*. It is an ingredient of *Trasidrex*.
Chemical Properties A white to slightly cream-coloured crystalline powder. Mp 107° to 109°. Soluble 1 in <1 of water and 1 in 1.5 of ethanol; very slightly soluble in ether.

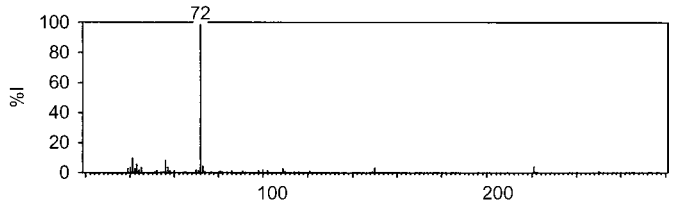
Colour Tests Liebermann's reagent—black; Mandelin's test—grey-violet; Marquis test—violet; sulfuric acid—orange-red (fluoresces under UV light at 350 nm).
Thin-layer Chromatography System TA—R_f 0.48; system TB—R_f 0.11; system TC—R_f 0.11; system TE—R_f 0.45; system TL—R_f 0.13; system TAE—R_f 0.20; system TAF—R_f 0.78 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—Oxprenolol RI 1870, Art RI 1985; M (desamino-OH-desalkyl-) RI 1700; system GB—oxprenolol RI 1972, Art RI 2062; system GF—RI 2270.
High Performance Liquid Chromatography System HA—*k* 1.3; system HX—RI 354; system HY—RI 284; system HZ—retention time 3.0 min; system HAA—RT 12.0 min.
Ultraviolet Spectrum Aqueous acid—273 nm (A^{1}_{1}=85a). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1258, 750, 1500, 1120, 1092, 1037 cm^{-1} (oxprenolol hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 72, 41, 56, 43, 221, 73, 57, 45.



Quantification

Blood **GC-MS** For method of quantification for oxprenolol and other β-blockers, see Black *et al.* [1996].

HPLC UV detection. Limit of detection, 10 µg/L [Tsuei *et al.* 1980].

Plasma **TLC** Limit of detection, 10 µg/L [Schäfer, Mutschler 1979].

HPLC UV detection. Oxprenolol and celiprolol. Limit of detection, <25 µg/L for oxprenolol [Braza *et al.* 1998]. UV detection. Limit of detection, 20 µg/L [Godbillon *et al.* 1985]. See Blood [Tsuei *et al.* 1980].

Serum **GC** ECD. Limit of detection, 2 pg [DeBruyne *et al.* 1979].

LC-MS Limit of detection, 18–44 µg/L for oxprenolol and other β-blockers [Hyotylainen *et al.* 1997].

Urine **GC-MS** See Blood Black *et al.* [1996].

HPLC See Blood [Tsuei *et al.* 1980].

LC-MS See Serum [Hyotylainen *et al.* 1997].

Disposition in the Body Readily absorbed after oral administration but subject to extensive first-pass metabolism. The major metabolite is oxprenolol glucuronide. About 70–90% of a dose is excreted in the urine in 24 h, with <5% as unchanged drug.

Therapeutic Concentration

Following a single oral dose of 40 mg to 7 subjects, peak blood concentrations of 0.09–0.24 mg/L (mean, 0.15) of oxprenolol and 0.11–0.35 mg/L (mean, 0.24) of oxprenolol glucuronide were attained in 0.5–1.5 h and 1–2.5 h, respectively [Dayer *et al.* 1983].

Following oral administration of 160 mg twice daily to 27 subjects, steady-state plasma concentrations of 0.1–1.8 mg/L (mean, 0.9) were reported, determined 1 h after a dose [Silke *et al.* 1983].

Toxicity

In a fatality attributed to oxprenolol overdose, a postmortem liver concentration of 58 µg/g was reported [Oliver, Watson 1977].

In a fatality in which death occurred 2 h after the ingestion of 4.5 g, the following postmortem concentrations were reported: blood 10 mg/L, brain 71 µg/g, liver 230 µg/g [Khan, Muscat-Baron 1977].

Half-life Plasma half-life, 1–3 h.
Volume of Distribution About 1 L/kg.
Protein Binding About 80%.
Dose 80 to 480 mg of oxprenolol hydrochloride daily.

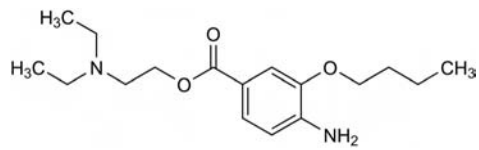
Oxybuprocaine

Anaesthetic (Local)
$C_{17}H_{28}N_2O_3$ = 308.4
CAS—99-43-4

IUPAC Name 2-(Diethylamino)ethyl-4-amino-3-butoxybenzoate
Synonym Benoxinate

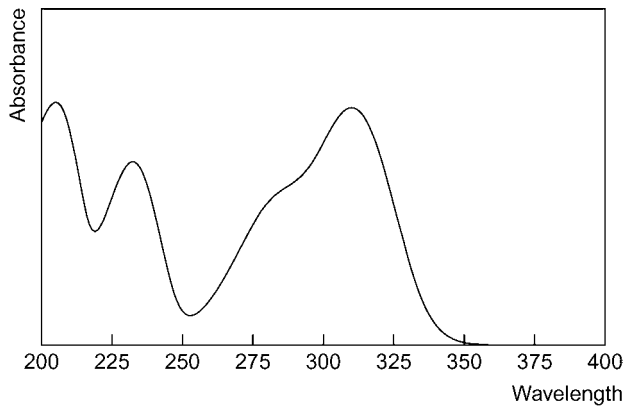


Chemical Properties Log *P* (octanol/water), 3.5.

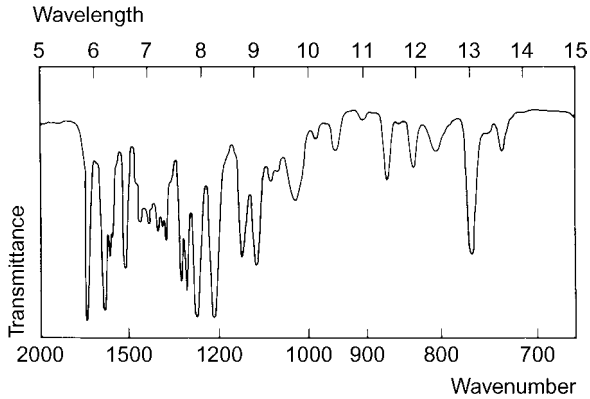
Oxybuprocaine Hydrochloride

$C_{17}H_{28}N_2O_3$, HCl = 344.9
CAS—5987-82-6
Proprietary Names *Cebesine*; *Conjuncain*; *Novesine*.
Chemical Properties White crystals or crystalline powder. Mp about 155° to 160°. Soluble 1 in 0.8 of water, 1 in 2.6 of ethanol and 1 in 2.5 of chloroform; practically insoluble in ether.

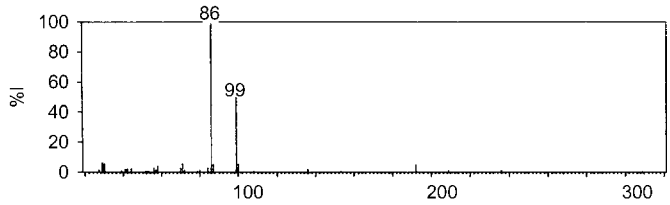
Colour Tests Coniferyl alcohol—orange; diazotisation—red.
Thin-layer Chromatography System TA—R_f 0.62; system TB—R_f 0.23; system TC—R_f 0.41; system TE—R_f 0.83; system TL—R_f 0.36; system TAE—R_f 0.54 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2471.
High Performance Liquid Chromatography System HQ—*k* 16.25; system HR—*k* 0.86; system HX—RI 405.
Ultraviolet Spectrum Aqueous acid—235 (A_1^1=437b), 298 nm; aqueous alkali—231, 310 nm.



Infrared Spectrum Principal peaks at wavenumbers 1709, 1214, 1261, 1613, 1294, 1311 cm^{-1} (oxybuprocaine hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 86, 99, 29, 30, 100, 71, 87, 192.



Quantification

Blood **GC** Surface ionisation detection. Limit of detection, 5 to 10 pg for oxybuprocaine and other local anaesthetics [Hattori *et al.* 1991].

Aqueous Humour **HPLC** Electrochemical detection. Oxybuprocaine and diclofenac. Limit of detection, 50 µg/L for oxybuprocaine [Kuhlmann *et al.* 1998].

Cerebrospinal Fluid **GC** See Blood [Hattori *et al.* 1991].

Use Oxybuprocaine hydrochloride is used as a 0.4% solution.

Hattori H *et al.* (1991). Determination of local anaesthetics in body fluids by gas chromatography with surface ionization detection. *J Chromatogr* 564: 278–282.

Kuhlmann O *et al.* (1998). Simultaneous determination of diclofenac and oxybuprocaine in human aqueous humor with HPLC and electrochemical detection. *J Pharm Biomed Anal* 17: 1351–1356.

Oxybutynin

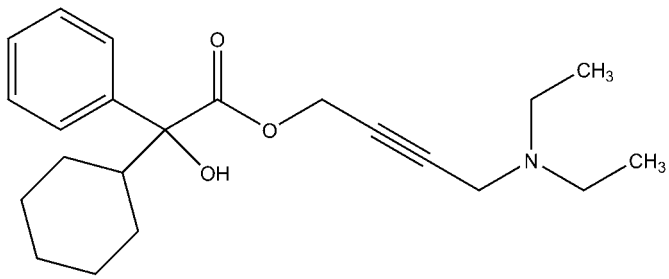
Antimuscarinic, Tertiary Amine, Treatment of Urinary Incontinence

$C_{22}H_{31}NO_3 = 357.5$

CAS—5633-20-5

IUPAC Name 4-Diethylaminobut-2-ynyl 2-cyclohexyl-2-hydroxy-2-phenylacetate

Synonyms α-Cyclohexyl-α-hydroxybenzeneacetic acid 4-(diethylamino)-2-butynyl ester; 4-(diethylamino)-2-butynyl phenylcyclohexaneglycolate; 4-(diethylamino)-2-butynyl α-phenylcyclohexaneglycolic acid ester; α-phenylcyclohexaneglycolic acid 4-(diethylamino)-2-butynyl ester.



Chemical Properties Soluble in water (77 mg/L, pH 1; 0.8 mg/L, pH 6; 0.012, pH >9.6). pK_a 8.04. Log *P* (octanol/water), 2.9 [O'Neil *et al.* 2006].

Oxybutynin Hydrochloride

$C_{22}H_{31}NO_3$, HCl = 393.9

CAS—1508-65-2

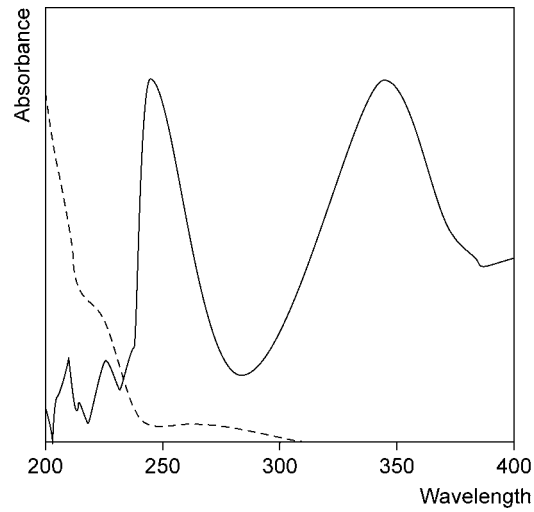
Synonyms 5058; MJ-4309-1; oxybutynin chloride.

Proprietary Names *Cystrin*; *Delak*; *Detrusan*; *Ditropan*; *Dresplan*; *Dridase*; *Driptane*; *Frenurin*; *Incontinol*; *Kentera*; *Lenditro*; *Lyrinel*; *Novitropan*; *Nu-Oxybutyn*; *Odranal*; *Oxi-Q*; *Oxitina*; *Oxybugamma*; *Oxyspas*; *Oxytrol*; *Oxyurin*; *Pollakisu*; *Retebem*; *Retemic*; *Retemicon*; *Reteven*; *Soxsup*; *Tropax*; *Urazol*; *Urequin*; *Uricont*; *Urotron*; *Uroxal*; *Zatur*.

Chemical Properties A white, practically odourless, crystalline powder. Mp 129° to 130°. Freely soluble in water and in alcohol; soluble in acetone; very soluble in chloroform and methyl alcohol; slightly soluble in ether; very slightly soluble in hexane.

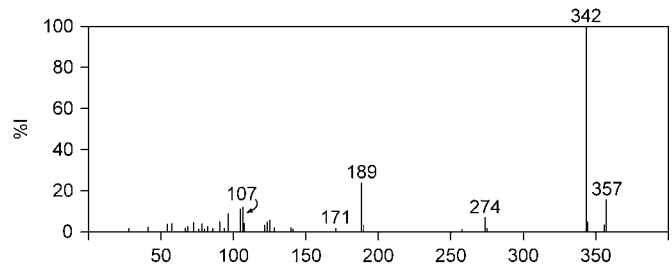
High Performance Liquid Chromatography Column: C_{18} (150 × 4.1 mm i.d., 5 µm). Mobile phase: methanol : water containing 30 mmol/L sodium octane sulfate and 7.5 mmol/L *N*,*N*-dimethyloctamine (pH 5; 65 : 35), flow rate 1.0 mL/min. UV detection (λ= 220 nm). Retention time: 7.9 min. Limit of quantification not reported [De Schutter, De Moerloose 1988].

Ultraviolet Spectrum See Varma *et al.* [2004].



Infrared Spectrum Principal peaks at wavenumbers 1743, 2069, 1210, 2563, 2480, 2250 to 3500 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 342, 189, 357, , 107, 274, 343 [Lindeke *et al.* [1981].



Quantification

Blood **LC-MS** Column: C_{18} (150 × 2.1 mm i.d.). Mobile phase: methanol : 10 mmol/L ammonium acetate (75 : 25), flow rate 0.2 mL/min. Tandem MS. Limit of quantification, 10 µg/L for oxybutynin and *N*-desethyloxybutynin [Mizushima *et al.* 2007a].

Plasma **GC** Column: cross-linked methylsilicone (12 m × 0.2 mm i.d.). Carrier gas: He, 0.3 mL/min. Temperature programme: 140° for 2 min to 280° at 8°/min. NPD. Limit of quantification, 3.5 nmol/L [Aaltonen *et al.* 1984].

GC-MS Column: DB-1 methylsilicone fused-silica (30 m × 0.32 mm i.d.). Carrier gas: He, 50 cm/s. Temperature: 250°. EI ionisation at 70 eV, SIM acquisition mode. Retention time: 3.0 min. Limit of quantification, 0.5 µg/L; limit of detection, 0.25 µg/L [Patrick *et al.* 1989].

HPLC Column: Cyano (100 mm, 5 µm). Mobile phase: methanol : 0.02 mol/L orthophosphoric acid buffer (pH 6.2; 40 : 60), flow rate 0.6 mL/min. Electrochemical detection. Retention times: oxybutynin 17 min, *N*-desethyloxybutynin 12 min. Limit of detection, 0.5 µg/L for oxybutynin, 5 µg/L for desethyloxybutynin [Hughes *et al.* 1992].

LC-MS See Blood. Limit of quantification, 0.2 µg/L for oxybutynin and *N*-desethyloxybutynin. Column: chiral AGP (100 × 4.0 mm i.d., 5 µm). Mobile phase: acetonitrile : 10 mmol/L ammonium acetate (pH 4.0; 11 : 89), flow rate 1.3 mL/min. Tandem MS. Limit of quantification, 0.075 µg/L for oxybutynin and *N*-desethyloxybutynin enantiomers [Mizushima *et al.* 2007a]. Column: C_{18} (150 × 2.0 mm i.d.). Mobile phase: acetonitrile : 10 mmol/L ammonium acetate (pH 3.0; 50 : 50), flow rate 0.2 mL/min. ESI, positive ion mode, SIM acquisition mode. Retention time: 3.2 min. Limit of quantification not reported [Zhang *et al.* 2005]. Column: C_{18} (50 × 2.0 mm i.d., 3 µm). Mobile phase: methanol : 0.01% formic acid (70 : 30), flow rate 0.2 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification not reported [Cho *et al.* 2005]. Column: C_8 (150 × 2.1 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.2% formic acid (44 : 56), flow rate 0.25 mL/min. ESI, positive ion mode, SRM acquisition mode. Retention time: 1.9 min. Limit of quantification not reported [de Jager *et al.* 2002]. Column: chiral AGP (150 × 2.0 mm i.d., 5 µm). Mobile phase: acetonitrile : 10 mmol/L ammonium formate (90 : 10), flow rate 0.15 mL/min. ESI. Limit of quantification, 0.5 µg/L [Zobrist *et al.* 2001].

Serum **GC-MS** Column: 3% OV-1 on GasChrom Q (80/100) (0.9 m × 2.0 mm i.d.). Carrier gas: He, 20 mL/min. Temperature programme: 220° isothermal. EI ionisation at 70 eV, SIM acquisition mode. Retention times: oxybutynin 2.2 min, *N*-desethyloxybutynin 1.9 min. Limit of detection, 0.5 µg/L [Lindeke *et al.* 1981].
Urine **GC-MS** See Serum [Lindeke *et al.* 1981].
Other **GC** Rat Liver. Column: 3% OV-17 on GasChrom Q (1.8 m × 2.0 mm i.d.). Carrier gas: N_2, 40 mL/min. Temperature: 230°. FID. Retention time: 4.7 min. Limit of quantification not reported [Lindeke *et al.* 1981].

HPLC Human Skin. Column: C_{18} (150 × 6.0 mm i.d.). Mobile phase: 0.02 mol/L potassium dihydrogen phosphate-0.005 mol/L hexane sulfonic acid-0.3% triethylamine (pH 4.5) : acetonitrile (50 : 50), flow rate 1.5 mL/min. UV detection (λ= 214 nm). Limit of quantification, 0.51 mg/L [Mizushima *et al.* 2007b]. Capsules, Tablets, and Syrup. Column: VP-ODS Shim-pack (250 × 4.6 mm i.d., 4.6 µm). Mobile phase: acetonitrile : 0.01 mol/L potassium dihydrogen phosphate : diethylamine (60 : 40 : 0.2), flow rate 1.5 mL/min. UV detection (λ= 220 nm). Retention time: 2.5 min. Limit of quantification, 5.64 µg/L, limit of detection, 1.69 µg/L [El Gindy 2005]. Tablet Dissolution Studies. Column: Cyano (250 × 4.6 mm i.d., 5 µm). Mobile phase: water-methanol-triethylamine (pH 3.5; 3200 : 800 : 0.9) : acetonitrile (60 : 40), flow rate 1.5 mL/min. UV detection (λ= 203 nm). Retention time: 6.8 min. Limit of quantification, 1.65 mg/L, limit of detection, 0.5 mg/L [Varma *et al.* 2004]. Column: Inertsil phenyl (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water : triethylamine (pH 3.8; 35 : 65 : 0.15). UV detection (λ= 220 nm). Limit of quantification, 0.28 mg/L [Sathyan *et al.* 2004]. Intravaginal Rings. Column: ODS (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.02 mol/L potassium phosphate buffer (pH 5.0; 45 : 55). UV detection (λ= 220 nm). Retention time: 2 min. Limit of quantification not reported [Malcolm *et al.* 2003]. Column: ODS (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.1% orthophoshoric acid (pH 2.5; 65 : 35), flow rate 1.6 mL/min. UV detection (λ= 220 nm). Retention time: 1.7 min. Limit of quantification not reported [Woolfson *et al.* 2003]. Transdermal Patch Residues. Column: Cosmosil 5CN-MS (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.02 mol/L potassium dihydrogen phosphate-0.005 mol/L sodium hexane sulfonate-0.3% triethylamine (pH 4.5) : acetonitrile (65 : 35), flow rate 1.2 mL/min. UV detection (λ= 220 nm). Limit of quantification, 60 µg/L [Zobrist *et al.* 2001]. Human Bladder Tissue. Column: C_{18} (250 × 4.5 mm i.d., 4.6 µm). Mobile phase: acetonitrile : water : 1 mol/L ammonium acetate (pH 7.0; 85 : 13 : 2), flow rate 0.5 mL/min. Electrochemical detection, UV detection (λ= 235 nm). Retention time: 18 min. Limit of quantification, 5 µg/L [Massoud *et al.* 1999]. Capsules, Tablets, and Syrup. Column: C_{18} (150 × 4.1 mm i.d., 5 µm). Mobile phase: methanol : 30 mmol/L sodium octane sulfate and 7.5 mmol/L *N*,*N*-dimethyloctamine (pH 5; 65 : 35), flow rate 1.0 mL/min. UV detection (λ= 220 nm). Retention time: 7.9 min. Limit of quantification not reported [De Schutter, De Moerloose 1988].
Note For UV spectrophotometric determination of oxybutynin, see Varma *et al.* [2004].

Disposition in the Body After oral doses of oxybutynin, peak plasma concentrations are reached within 1 h. Oxybutynin is also absorbed after application to the skin. Transdermal administration of oxybutynin avoids the extensive presystemic gastrointestinal and hepatic metabolism associated with other routes of administration. However, minimal presystemic metabolism occurs via a small amount of CYP3A4 present in the skin, resulting in the limited formation of the major active metabolite, *N*-desethyloxybutynin. It is a chiral compound with the *R*-enantiomer being mainly responsible for its antimuscarinic acitivity. Oxybutynin undergoes extensive first-pass metabolism, particularly by CYP3A4 (also CYP3A5) to *N*-desethyloxybutynin. Oxybutynin and its metabolites are excreted in the urine and faeces. Oxybutynin has been detected in breast milk. Evidence suggests that it may cross the blood–brain barrier.

Therapeutic Concentration

A group of 18 healthy young volunteers was administered oxybutynin either as a transdermal patch (applied to the lower abdomen, dose 36 mg over 96 h) or as an immediate-release tablet (5 mg). Peak oxybutynin plasma concentrations were as follows:

	Patch		Tablet	
	C_{max} (µg/L)	Time (h)	C_{max} (µg/L)	Time (h)
R-oxybutynin	1.2	48	2.2	1.0
R-desethyloxybutynin	1.2	48	15.5	1.0
S-oxybutynin	1.6	48	4.1	0.8
S-desethyloxybutynin	1.4	48	10.9	1.0

[Zobrist *et al.* 2001].

Three groups of volunteers (group A: healthy, mean age 29 years; group B: healthy elderly, mean 76 years; group C: elderly with urinary incontinence, mean age 79 years), were administered a single oral dose of 5 mg oxybutynin.

Peak plasma concentrations for oxybutynin and its *N*-desethyl metabolite in the three groups were as follows:

	Oxybutynin			N-Desethyl metabolite		
	Group A	Group B	Group C	Group A	Group B	Group C
C_{max} (µg/L)	13.4	16.7	32.0	68.9	57.9	63.7
Time (h)	0.76	0.69	0.60	1.0	1.4	1.0

Variations in values appeared to be a result of variation in the rate of absorption and the degree of first-pass metabolism [Hughes *et al.* 1992].

In a further study where group B was administered 5 mg oral oxybutynin 3 times daily for 14 days and group C was administered 5 mg twice daily for 14 days, peak plasma concentrations (C_{max}) for oxybutynin and its *N*-desethyl metabolite were:

	Oxybutynin		N-Desethyl metabolite	
	Group B	Group C	Group B	Group C
C_{max} (µg/L)	18.1	37.7	63.3	82.5
Time (h)	0.65	0.56	1.1	1.1

[Hughes *et al.* 1992].

A group of 24 healthy male subjects (aged 18 to 45 years old) were administered oxybutynin as either a 15 mg controlled-release tablet daily for 5 days (CR group) or as 5 mg immediate-release tablets three times daily for 5 days (IR group). Values for C_{max} for oxybutynin and its *N*-desethyl metabolite were reported as:

	Oxybutynin		N-Desethyl metabolite	
	CR group	IR group	CR group	IR group
C_{max} (µg/L)	5.7	7.5	31.2	57.9
Time (h)	9.2	6.5	8.3	1.8

[Reiz *et al.* 2007].

Toxicity Oxybutynin is a potent inhibitor of CYP3A4 and CYP2D6.
Bioavailability Approximately 6%.
Half-life 2–3 h.
Volume of Distribution 89.2 L after a 1 mg bolus IV administration and 192.9 L after a 5 mg infusion.
Clearance 26–34 L/h.
Protein Binding Both enantiomers bind strongly (>99%), principally to α_1-acid glycoprotein. *S*-Oxybutynin is bound to α_1-acid glycoprotein more strongly than the *R*-enantiomer and this is reflected in the enantioselective protein binding of this drug in plasma [Shibukawa *et al.* 2002a, b].
Note For a review of the clinical pharmacokinetics of different formulations of oxybutynin, see Guay [2003].

Dose Usual dosage of oxybutynin hydrochloride is 5 mg two or three times daily by mouth, increased to 5 mg four times daily if required. In elderly patients, lower doses of 2.5 or 3 mg twice daily initially, increased to 5 mg twice daily if necessary, may be adequate. Modified-release preparations of oxybutynin hydrochloride are also available. The initial dose is 5 mg once daily, increased by 5 mg at weekly intervals if necessary, up to a maximum of 20 or 30 mg daily, depending on the preparation. Oxybutynin is also given via a transdermal patch, which supplies 3.9 mg of oxybutynin daily.

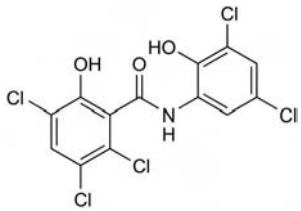
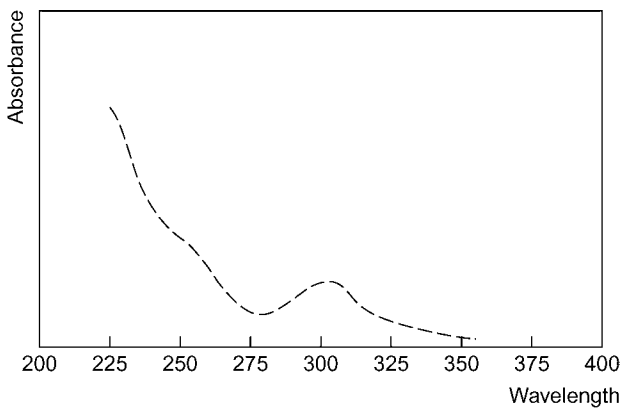
Oxyclozanide

Anthelmintic (Veterinary)
$C_{13}H_6Cl_5NO_3$ = 401.5
CAS—2277-92-1

IUPAC Name 2,3,5-Trichloro-*N*-(3,5-dichloro-2-hydroxyphenyl)-6-hydroxybenzamide
Proprietary Name *Zanil*



Chemical Properties A cream-coloured powder. Mp 209° to 211°. Very slightly soluble in water; soluble 1 in 20 of ethanol, 1 in 5 of acetone and 1 in 600 of chloroform; soluble in solutions of alkali hydroxides and carbonates. Log *P* (octanol/water), 6.0.
Colour Test Mandelin's test—violet→orange.
Thin-layer Chromatography System TA—R_f 0.87 (acidified potassium permanganate solution, positive).
Gas Chromatography System GA—not eluted.
Ultraviolet Spectrum Aqueous alkali—324 nm (A^1_1=338b); methanol—303 nm (A^1_1=188b).

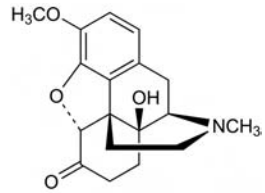


Infrared Spectrum Principal peaks at wavenumbers 1203, 1527, 1166, 1587, 1155, 1219 cm^{-1} (KBr disk).

Oxycodone

Narcotic Analgesic
$C_{18}H_{21}NO_4$ = 315.4
CAS—76-42-6

Synonyms 7,8-Dihydro-14-hydroxycodeinone; dihydrone; (5*R*,9*R*,13*S*,14*S*)-4,5α-Epoxy-14-hydroxy-3-methoxy-17-methylmorphinan-6-one; (5α)-4,5-epoxy-14-hydroxy-3-methoxy-17-methylmorphinan-6-one; oxycone; NSC-19043.



Chemical Properties Mp 218° to 220°. It is practically insoluble in water and ether; soluble in ethanol and chloroform. pK_a 8.9 (20°). Log *P* (octanol/water), 0.7. Extraction yield (chlorobutane), 0.95 [Demme *et al.* 2005].

Oxycodone Hydrochloride

$C_{18}H_{21}NO_4$, HCl,$3H_2O$ = 405.9
CAS—124-90-3 (anhydrous)
Synonym Thecodine
Proprietary Names *Endocodone*; *Endone*; *ETH-Oxydose*; *Eubine*; *Eukodal*; *Oxycod*; *OxyContin*; *Oxyfast*; *Oxygesic*; *OxyIR*; *OxyNorm*; *Percolone*; *Roxicodone*; *Supeudol*; *Targinact*. It is an ingredient of *Combunox*; *Endocet*; *Magnacet*; *Narvox*; *Percocet*; *Percodan*; *Perloxx*; *Pimalev*; *Roxicet*; *Roxilox*; *Roxiprin*; *Tylox*; *Xolox*.
Chemical Properties A white crystalline powder. Mp 270° to 272° (rods from water), with decomposition. It is soluble 1 in 10 of water, 1 in 60 of ethanol and 1 in 600 of chloroform; practically insoluble in ether.

Colour Test Marquis test—yellow→brown→violet.
Thin-layer Chromatography System TA—R_f 0.50; system TB—R_f 0.25; system TC—R_f 0.51; system TE—R_f 0.62; system TL—R_f 0.39; system TAE—R_f 0.30; system TAF—R_f 0.33; system TAJ—R_f 0.27; system TAK—R_f 0.01; system TAL—R_f 0.36 (acidified iodoplatinate solution—positive; Dragendorff spray—positive; Marquis test—violet.)

Plate: silica (10 × 20 cm). Mobile phase: propan-2-ol : acetic acid : water: 25% ammonia : methanol (20 : 1 : 1 : 3 : 10). UV detection. R_f 0.6 [Salomies, Salo 2000].

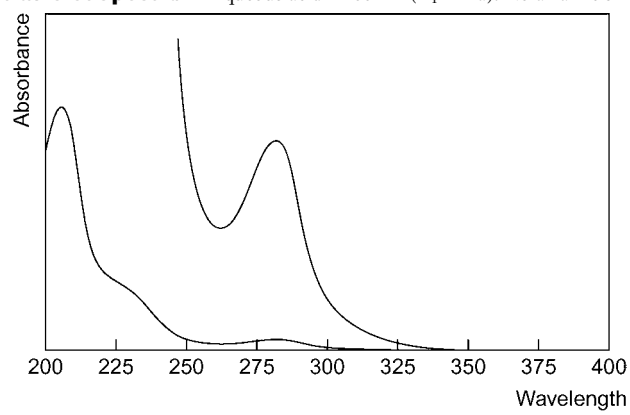
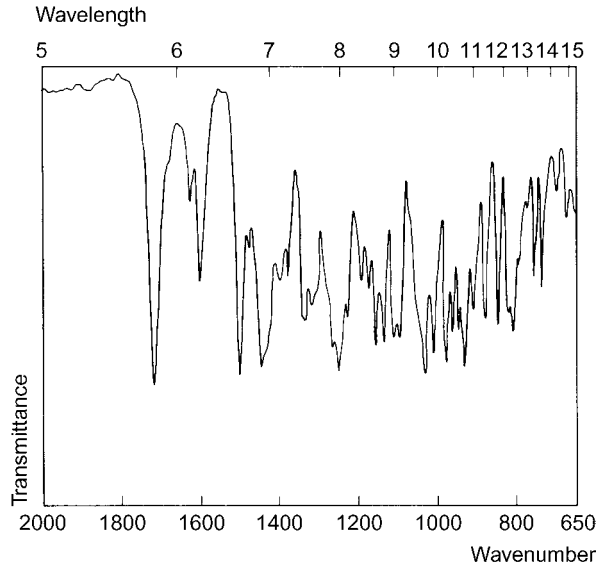
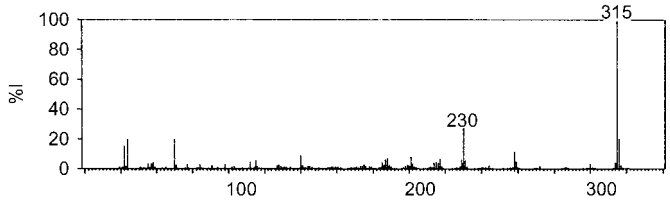
Ultraviolet Spectrum Aqueous acid—280 nm (A^1_1= 44a). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1719, 1501, 1033, 1255, 934, 980 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 315, 230, 316, 70, 44, 42, 258, 140 (oxycodone); 301, 216, 44, 42, 70, 302, 203, 57 (oxymorphone).



Quantification

Blood **GC-MS** Column: 100% methylsiloxane or 5% phenylsiloxane, 95% methylsiloxane. Carrier gas: 1.0 mL/min. Temperature programme: 140° for 0.5 min to 320° at 20°/min for 2 min. SIM acquisition mode. Limit of detection, 12.5 µg/L [Goldberger *et al.* 2010]. Column: DB-5 MS (30 m × 0.25 mm i.d., 0.25 µm). Temperature programme: 80° to 170° at 40°/min to 290° at 10°/min for 3.75 min. ESI. Limit of quantification, 1 mg/L, limit of detection, 1 mg/L [Antonides *et al.* 2007]. Column: DB-1 (15 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 60 cm/s. Temperature programme: 140° for 1 min to 220° at 50°/min to 305° at 10°/min for 0.5 min. EI ionisation. Retention time: 385 s. Limit of quantification, 10 µg/L, limit of detection, 2 µg/L [Meatherall 2005]. Column: HP-1MS capillary (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 62 cm/s. Temperature programme: 160° to 195° at 35°/min to 240° at 5°/min to 300° at 30°/min for 2 min. SIM acquisition mode. Limit of quantification, 20 µg/L [Ropero-Miller *et al.* 2002].

LC-MS Column: Waters HSS T3 (50 × 2.1 mm i.d., 3.0 µm). Mobile phase: 1% formic acid in water : 1% formic acid in acetonitrile (97 : 3 for 0.1 min to 80 : 20 at 2.5 min to 1 : 99 at 2.55 min for 0.45 min to 97 : 3 at 3.01), flow rate 0.6 mL/min. ESI, positive ion mode. Limit of quantification, 10 µg/L [Dahn *et al.* 2010]. Column: Genesis C_{18} reversed phase. Mobile phase: acetonitrile and ammonium acetate (pH 3.2). MRM acquisition mode. Oxycodone and other opioids [Gergov *et al.* 2009]. Column: Phenomenex Synergi reversed phase. Mobile phase: 10 mmol/L ammonium formate (pH 3) : acetonitrile. Limit of quantification, 0.5–4.09 µg/L, limit of detection, 0.16–1.2 µg/L for oxycodone and other opioids and metabolites [Al Asmari, Anderson 2007]. Oxycodone and other opioids and metabolites [Coles *et al.* 2007].

Plasma **GC** Column: Methyl silicone (HP-1) fused silica (25 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 0.5 mL/min. Temperature programme: 150° to 245° at 35°/min. NPD. Retention time: 12.8 min. Limit of quantification, 1.8 µg/L [Kapil *et al.* 1992].

HPLC Column Pyramid CC 250/4 C_{18} (5 µm). Mobile phase: acetonitrile : 20 mmol/L phosphate buffer (8 : 92), flow rate 1 mL/min. UV detection (λ = 205 nm). Limit of quantification, 2 µg/L [Cheremina *et al.* 2005]. Column: C_{18} (100 × 8 mm i.d.). Mobile phase: methanol : acetonitrile : 0.0133 mol/L phosphate buffer (pH 7.5, 23 : 2 : 75). Retention time: 9.6 min. Electrochemical detection. Limit of quantification, 14.2 nmol/L [Wright *et al.* 1998]. Electrochemical detection. Limit of detection, 10 µg/L [Smith *et al.* 1991]. Mobile phase: 0.01 mol/L potassium dihydrogen orthophosphate : methanol : acetonitrile (20 : 30 : 50), flow rate 1.0 mL/min. Electrochemical detection. Limit of detection, 2 µg/L [Schneider *et al.* 1984].

LC-MS See Blood [Dahn *et al.* 2010]. ESI. Limit of detection, 0.1 µg/L for oxycodone and 0.25 µg/L for noroxycodone [Neuvonen, Neuvonen 2008]. See Blood [Coles *et al.* 2007]. Column: Phenomex C_{12} MAX-RP (150 × 2 mm i.d., 4 µm). Mobile phase: ammonium formate buffer (pH 3.5) : acetonitrile. Oxycodone and other opioids [Musshoff *et al.* 2006]. ESI. Limit of quantification, 1 µg/L, estimated limit of detection, 33 ng/L [Dawson *et al.* 2002].

Serum **HPLC** Column: XTerra RP18 (50 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : acetonitrile : 5 mmol/L phosphate buffer (pH 8, 2 : 1 : 7). Electrochemical detection. Limit of quantification, 0.5 µg/L [Kokubun *et al.* 2005]

LC-MS See Blood [Coles *et al.* 2007; Dahn *et al.* 2010].

Urine **GC-MS** See Blood [Goldberger *et al.* 2010]. Column: DB-5MS (15 m × 0.249 mm i.d., 0.25 µm). Carrier gas: He. Temperature programme: 240° to 280° at 40°/min for 1.2 min. SIM acquisition mode. Limit of quantification, 40 µg/L, limit of detection, 40 µg/L [McKinley *et al.* 2007]. Column: DB-1 (15 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 60 cm/s. Temperature programme: 140° for 1 min to 220° at 50°/min to 290° at 10°/min for 0.5 min. EI ionisation, full scan mode. Retention time: 385 s. Limit of quantification, 25 µg/L, limit of detection, 10 µg/L [Meatherall 1999]. Column: DB-5 (15 m × 0.26 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 225° to 280° at 30°/min. SIM acquisition mode. Limit of detection, 1.2 µg/L [Smith *et al.* 1995].

LC-MS See Blood [Dahn *et al.* 2010]. Column: Acquity UPLC BEH C_{18} (50 × 2.1 mm i.d., 1.7 µm). Mobile phase: 5 mmol/L ammonium bicarbonate (pH 10.2) : methanol (95 : 5 for 0.15 min to 70 : 30 at 0.3 min to 50 : 50 in 2.7 min to 10 : 90 at 3.8 min until 4.2 min to 95 : 5 at 4.5 min for 0.5 min), flow rate 0.4 mL/min. ESI, MRM acquisition mode. Limit of quantification, 0.005 mg/L, limit of detection, 0.0016 mg/L [Berg *et al.* 2009]. See Blood [Coles *et al.* 2007; Gergov *et al.* 2009]. Column: Agilent Zorbax SB Phenyl (150 × 2.1 mm i.d., 5 µm). Mobile phase: 0.05% formic acid with 10 mmol/L ammonium acetate-0.05% formic acid in acetonitrile (95 : 5) : 0.05% formic acid in acetonitrile-0.05% formic acid with 10 mmol/L ammonium formate (95 : 5, 100 : 0 for 0.5 min to 82 : 18 at 3 min for 2.5 min to 100 : 0). ESI. Limit of quantification, 50 µg/L [Edinboro *et al.* 2005].

Meconium See Blood [Coles *et al.* 2007].

Oral Fluid **GC-MS** Column: DB-5 5% phenylsiloxane, 95% methylsiloxane (25 m × 0.2 mm i.d., 0.33 mm). Carrier gas: 1.5 mL/min. Temperature programme: 150° for 1.0 min to 245° at 20°/min for 8 min to 290° at 50°/min. EI ionisation, MSD. Limit of quantification, 2 µg/L, limit of detection, 3 µg/L [Jones *et al.* 2002].

Vitreous Humour **GC-MS** Limit of quantification, 50 µg/L, limit of detection, 10 µg/L [Knittel *et al.* 2009]. See Blood [Antonides *et al.* 2007].

Hair **GC-MS** See Oral Fluid [Jones *et al.* 2002].

Disposition in the Body Oxycodone is absorbed after oral administration and metabolised to some extent by *O*-demethylation to oxymorphone, which is active, and by *N*-demethylation to noroxycodone. Approximately 30–60% of a dose is excreted in the urine in 24 h as free and conjugated oxycodone, conjugated oxymorphone and noroxycodone. Oxymorphone is excreted mainly in the conjugated form and noroxycodone as the unconjugated. After multiple dosing, accumulation of the drug does not occur. Oxycodone is secreted in breast milk.

Therapeutic Concentration

Nine healthy, young, male and female volunteers were administered 0.14 mg/kg oxycodone hydrochloride once IM (equivalent to 0.11 mg/kg free base) in the first study and 0.28 mg/kg oxycodone chloride orally (equivalent to 0.22 mg/kg free base) in 2 additional studies at intervals of 2 weeks. The mean maximum plasma oxycodone concentration was 34 µg/L for the IM dose and 38 µg/L for the oral doses, observed within 1 h of administration. The peak noroxycodone concentration after the IM dose was 4.0 µg/L and after the oral doses,14.78 µg/L. These were observed at 1.75 h (range, 0.75–5.0) and 0.75 h (range, 0.25–2.0), respectively [Pöyhiä *et al.* 1992].

Twelve patients with moderate to severe cancer pain and a mean age of 58 years (range, 23–71) were administered 5 mL oxycodone hydrochloride (concentration 5 mg/mL, equivalent to 4.6 mg/mL base) as an IV infusion and 10 mg oxycodone hydrochloride every 4 h (equivalent to 9.1 mg base). A mean maximum plasma concentration of 34.6 µg/L (range, 17.0–62.2) was observed at 1.6 h for the oral dose. A steady-state concentration of 47.7 µg/L (range, 26.8–68.9) was observed at 1.04 h (range, 0.25–2.0). The minimum steady-state concentration was 23.5 µg/L (range, 10.4–43.1) [Leow *et al.* 1992].

Twenty-four healthy volunteers, aged 21–50 years (mean, 34.5) were administered either a 10-mg controlled-release oxycodone hydrochloride tablet every 12 h for 4 days or 5 mg of immediate-release oxycodone hydrochloride solution every 6 h for 4 days. Volunteers were fasted 2 h before and after drug administration. Steady-state concentrations were observed after 1 day of dosing and maintained until day 4. The mean maximum plasma oxycodone concentration after the controlled-release formulation was 15.1 µg/L, and after the immediate-release formulation, it was 15.6 µg/L. These concentrations were observed at 3.2 and 1.4 h, respectively [Reder *et al.* 1996].

In 28 subjects administered a single 20-mg oral controlled-release oxycodone tablet, mean maximum plasma concentrations of 23.2 µg/L for oxycodone, 15.2 µg/L for noroxycodone and 0.82 µg/L for oxymorphone occurred at 3.2, 4.3, and 4.5 h, respectively, after dosing. When compared for gender and age, young and elderly women (7 subjects in each group) had the highest oxycodone AUC values, the lowest oxymorphone AUC values and the greatest drug effect. Young and elderly men (7 subjects in each group) had the lowest oxycodone AUC values, the highest oxymorphone AUC values, and the lowest drug effect [Kaiko *et al.* 1996].

In 30 children aged 6–91 months, maximum plasma levels after 0.2 mg/kg oxycodone buccally or sublingually were 16 and 22 µg/L, respectively. In 12 of 15 children in each group, oxycodone reached the therapeutic concentration (12 µg/L). Elimination half-lives were 140 and 150 min, respectively [Kokki *et al.* 2006].

Toxicity The estimated minimum lethal dose is 500 mg. Prolonged use of oxycodone may lead to dependence of the morphine type. A toxic serum concentration is 0.2 mg/L and a probable lethal concentration, 0.6 mg/L.

A 28-year-old male heroin addict with acquired immunodeficiency syndrome (AIDS) died while in police custody. Toxic concentrations of oxycodone were found in femoral blood at a concentration of 1.2 mg/L and in his liver at 1.9 mg/kg. Traces of flunitrazepam were also detected in his blood. His death was determined to be caused by a combination of the toxic effects of both oxycodone and flunitrazepam [Drummer *et al.* 1994].

In a total of 9 deaths investigated by the Victorian Institute of Forensic Pathology, Australia, the mean femoral blood oxycodone concentration was 0.9 mg/L (range, 0.6–1.4). Oxycodone was not detected very often in the gastric contents. It was shown that oxycodone femoral blood concentrations of 0.6 mg/L or higher may result in death [Drummer *et al.* 1994].

A 45-year-old woman who was admitted to hospital after suffering generalised convulsion had been discovered next to a nearly full bottle of controlled-release oxycodone tablets; unfortunately the bottle was left near her bedside and approximately 20 min after her arrival, she ingested the remaining contents (when full, the bottle contained 100 tablets of 40 mg each). The patient developed CNS and respiratory depression, and IV naloxone and oral activated charcoal was administered. Naloxone proved inadequate and mechanical ventilation was required for 3 days before the patient recovered completely. Three serum oxycodone levels were noted: the initial and highest was 2400 µg/L 10 h after admission; the level declined to ~1000 µg/L at 15 h and 100 µg/L at 70 h [Schneir *et al.* 2002].

A 2-year-old child was admitted to hospital after exhibiting signs of rubbing of the mouth and staggering. She was discharged after a urine sample was found negative for drugs of abuse and tricyclic antidepressants, but she was found unresponsive and in cardiopulmonary arrest the next morning and she died despite efforts to resuscitate. Oxycodone was found at postmortem with levels of 1.36 mg/L in heart blood, 222.34 mg/L in gastric contents, 0.2 mg/kg in liver and 47.23 mg/L in urine [Armstrong *et al.* 2004].

A 10-month-old infant who went into cardiac arrest and died was found to have postmortem blood and liver oxycodone levels of 0.6 mg/L and 1.6 mg/kg, respectively [Levine *et al.* 2004].

In a review of a 6-year period at a toxicology laboratory, there were 67 cases where oxycodone had been detected and 36 of these were determined to involve controlled-release formulations and could be identified by 'ghost pills' (intact, but drug-free tablets). In these cases, postmortem levels were: 0.12–46 mg/L in heart blood, <0.1–13 mg/L in femoral blood, 0.11–6.1 mg/kg in liver, 2.5–122 mg/L in urine, 0.19–49 mg/L in bile, 0.24–0.82 mg/L in vitreous humour and 0.06–119 mg in gastric contents [Anderson *et al.* 2002].

A review of postmortem and coroner's reports from 10 countries for 2000 and 2001 revealed 88 cases of death caused by oxycodone or hydrocodone exposure, 24 of which were attributed to oxycodone alone. Mean and median postmortem oxycodone blood concentrations of 1.23 and 0.43 mg/L, respectively, were reported (range, 0.12–8.0); in 13 cases, the concentration was ≥0.5 mg/L. In seven cases in which death was attributed to a combination of oxycodone and hydrocodone, the mean concentrations were reported to be 0.34 and 0.14 mg/L, respectively [Spiller 2003].

In a review of 1014 fatalities involving oxycodone, postmortem oxycodone blood levels in those involving oxycodone plus other drugs were 0.93 mg/L (167 cases with controlled release oxycodone [OxyContin]) and 0.73 mg/L (in 579 cases not involving OxyContin). In cases where oxycodone was the only drug identified, levels were 1.55 and 1.70 mg/L for OxyContin (12 cases) and non-OxyContin formulations (15 cases), respectively [Cone *et al.* 2004].

In a review of 172 deaths involving the use of oxycodone, 18 were attributed to oxycodone, 117 to oxycodone combined with other drugs, and the rest from trauma (23), natural causes (9) and other drug(s; 5). The mean postmortem oxycodone blood levels were 0.69, 0.72 and 0.6 mg/L in the cases of oxycodone toxicity, combined drug toxicity and trauma, respectively. Mean oxycodone blood levels of 0.87 mg/L were found in cases attributed to natural causes or other drugs [Wolf *et al.* 2005].

In a review of 67 cases where oxycodone was detected at postmortem between 2000 and 2005, 30 cases were determined to be drug overdoses; of these oxycodone alone was responsible for 7 deaths and mean heart blood free oxycodone levels were 1.060 mg/L (range, 0.27–3.39). Mean oxycodone concentrations in the 23 cases of mixed drug overdoses was 0.82 mg/L (range, 0.014–3.8) [Thompson *et al.* 2008].

In a review of 10 oxycodone-positive postmortem cases, nine were drug-related fatalities. Although there was some overlap between levels of oxycodone in the 5 deaths attributed to oxycodone alone and the 4 deaths attibuted to oxycodone plus other drugs, blood oxycodone levels in those attributed to oxycodone alone were >1 mg/L; in those involving other drugs, blood oxycodone was <1 mg/L [Al Asmari *et al.* 2009].

For a review of controlled-release oxycodone (OxyContin) abuse and overdose, see Aquina *et al.* [2009].

Half-life Elimination, 2–3 h.

Note For reviews of the clinical pharmacokinetics and pharmacodynamics of oxycodone, see Pöyhiä *et al.* [1993] and Lugo, Kern [2004]; for a report on the role of metabolites in the pharmacokinetics and pharmacodynamics of oxycodone, see Lalovic *et al.* [2006]; for a review of the pharmacology and clinical use of oxycodone, see Ordóñez Gallego *et al.* [2007].

Dose The usual adult dose of conventional oral oxycodone hydrochloride preparations is 5 to 15 mg every 4 to 6 h.

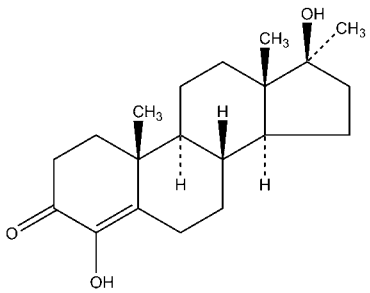
Oxymesterone

Anabolic Steroid, Androgen
$C_{20}H_{30}O_3$ = 318.5
CAS—145-12-0

IUPAC Name (8*R*,9*S*,10*R*,13*S*,14*S*,17*S*)-4,17-Dihydroxy-10,13,17-trimethyl-2,6,7,8,9,11,12,14,15,16-decahydro-1*H*-cyclopenta[a]phenanthren-3-one
Synonyms (17β)-4,17-Dihydroxy-17-methylandrost-4-en-3-one; 4,17β-dihydroxy-17α-methyl-3-oxo-androst-4-ene; 4-hydroxy-17α-methyltestosterone; 17α-methyl-4-androstene-4,17β-diol-3-one; oxymestrone.
Proprietary Names *Anamidol*; *Oranabol*; *Theranabol*.



Chemical Properties Crystals. Mp 169° to 171°. Practically insoluble in water. Soluble in chloroform, acetone and alcohol. Log *P* (octanol/water), 4.16 [Meylan, Howard 1995].
Mass Spectrum Principal ions at *m/z* 73, 534, 147, 143, 389, 444, 519 17-epi-Oxymesterone (Tris-TMS derivative).
Quantification
Urine **GC-MS** Column 1: HP5 SE54 fused silica capillary cross-linked 5% phenyl methylsilicone (17 m × 0.2 mm i.d., 0.3 μm). Carrier gas: He, 1 mL/min. Temperature programme: 200° to 300° at 5°/min. Column 2: OV 1 fused silica capillary cross-linked methylsilicone (20 m × 0.25 mm i.d., 0.33 μm). Carrier gas: He, 1 mL/min. Temperature programme: 200° to 300° at 5°/min. EI ionisation at 70 eV. Limit of detection not reported [Schanzer *et al.* 1992].
Disposition in the Body A 39-year-old male was administered 20 mg oxymesterone orally. The urinary excretion profile was analysed by GC-MS over 72 h. Oxymesterone and its epimer were detected with a total excretion of 16.2 and 0.27% of the administered steroid, respectively. The metabolite 17α-methyl-5α-androstane-3α,17β-diol and its 17β-methyl epimer were only detected after administration of 40 mg oxymesterone with a total excretion of 0.83 and 0.01% of the administered dose, respectively [Schanzer *et al.* 1992].
Toxicity

A previously well 18-year-old football player collapsed while training. He had just completed a 2 km run and was performing warm-down exercises when he had a cardiac arrest. Cardiopulmonary resuscitation was unsuccessful. Postmortem examination revealed that all organs were normal apart from the heart. It weighed 410 g but had a normal external appearance with some petechial haemorrhages. The coronary arteries and valves were all normal. The left ventricular free wall measured 13 mm, the interventricular septum measured 17 mm and the right ventricle measured 4 mm. Histological findings were consistent with hypertrophic cardiomyopathy. Oxymesterone glucuronide was detected in urine by GC-MS [Kennedy, Lawrence 1993].

A previously well 24-year-old man collapsed while playing football. Cardiopulmonary resuscitation was again unsuccessful. Six months previously the man had suffered a flu-like illness that had lasted 2 weeks. Soon after recovery he had commenced gymnasium work and had a sudden increase in muscle bulk. In the 2 months prior to his death he was irritable and prone to sudden rages. Postmortem examination revealed that all organs were normal apart from his heart, which weighed 440 g. There was a slight prominence on the left ventricle with petechial haemorrhages on the posterior surface. There were 2 haemorrhages on the anterior surface of the left ventricle consistent with cardiac puncture. The left ventricle free wall measured 17 mm, the interventricular septum was 12 mm, and the right ventricle was 6 mm. There was an extensive area of scarring on the interventricular septum (25 × 20 mm). Histological findings were consistent with a myocarditis. Oxymesterone glucuronide was detected in urine by GC-MS [Kennedy, Lawrence 1993].

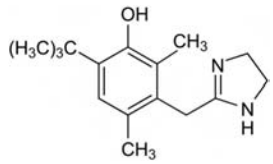
Oxymetazoline

Sympathomimetic
$C_{16}H_{24}N_2O$ = 260.4
CAS—1491-59-4

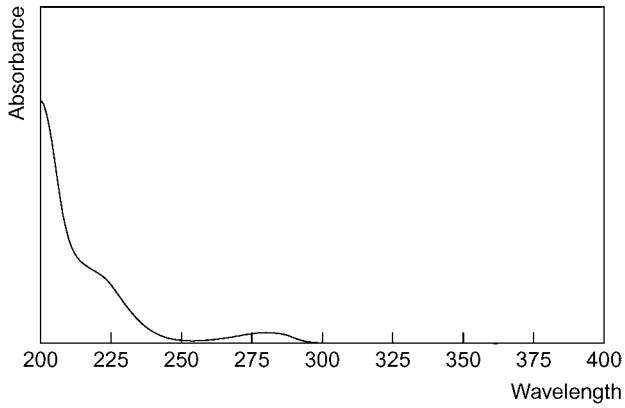
IUPAC Name 6-Tert-butyl-3-(4,5-dihydro-1*H*-imidazol-2-ylmethyl)-2,4-dimethylphenol
Synonym 3-[(4,5-Dihydro-1*H*-imidazol-2-yl)methyl]-6-(1,1-dimethylethyl)-2,4-dimethylphenol



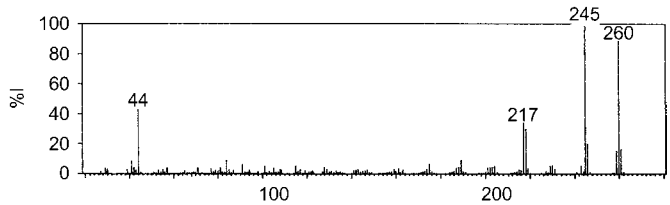
Chemical Properties Crystals. Mp 181° to 183°. Log *P* (octanol/water), 4.9.

Oxymetazoline Hydrochloride
$C_{16}H_{24}N_2O$, HCl = 296.8
CAS—2315-02-8
Proprietary Names *Afrazine*; *Afrin*; *Drixine*; *Durazol*; *Hazol*; *Iliadin-Mini*; *Nafrine*; *Nasivin*; *Rhinolitan*.
Chemical Properties A white, hygroscopic, crystalline powder. Mp 300° to 303°, with decomposition. Soluble 1 in 6.7 of water and 1 in 3.6 of ethanol; practically insoluble in benzene, chloroform and ether.

Colour Test Mandelin's test—green.
Thin-layer Chromatography System TA—R_f 0.09; system TB—R_f 0.01; system TC—R_f 0.01; system TE—R_f 0.34; system TL—R_f 0.01; system TAE—R_f 0.80; system TAJ—R_f 0.00; system TAK—R_f 0.01; system TAL—R_f 0.25 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2170.
High Performance Liquid Chromatography System HA—*k* 1.7.
Ultraviolet Spectrum Aqueous acid—280 nm (A^1_1=68a); aqueous alkali—303 nm (A^1_1=164b).



Infrared Spectrum Principal peaks at wavenumbers 1595, 1199, 1285, 1250, 1070, 765 cm^{-1} (oxymetazoline hydrochloride, KBr disk).
Mass Spectrum Principal ions at *m/z* 245, 260, 44, 217, 218, 246, 261, 259.

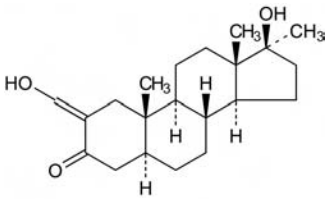


Use Oxymetazoline hydrochloride is used as a 0.05% solution.

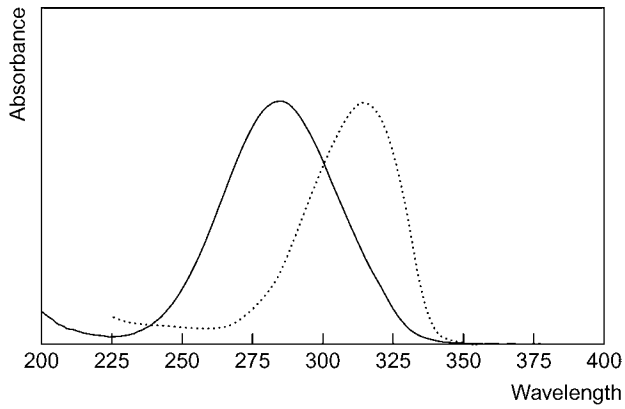
Oxymetholone

Anabolic Steroid
$C_{21}H_{32}O_3$ = 332.5
CAS—434-07-1

IUPAC Name (2*Z*,5*S*,8*R*,9*S*,10*S*,13*S*,14*S*,17*S*)-17-Hydroxy-2-(hydroxymethylidene)-10,13,17-trimethyl-1,4,5,6,7,8,9,11,12,14,15,16-dodecahydrocyclopenta[*a*]phenanthren-3-one
Synonym (5α,17β)-17-Hydroxy-2-(hydroxymethylene)-17-methylandrostan-3-one
Proprietary Names *Adroyd*; *Anadrol-50*; *Anapolon*; *Anasteron*; *Nastenon*; *Pardroyd*; *Plenastril*.



Chemical Properties A white to creamy-white crystalline powder. Mp 172° to 180°. Practically insoluble in water; soluble 1 in 50 of ethanol; freely soluble in chloroform; soluble in dioxan; slightly soluble in ether. Log *P* (octanol/water), 3.6.
Colour Tests Antimony pentachloride—brown; naphthol-sulfuric acid—brown/pink-orange; sulfuric acid—orange.
Thin-layer Chromatography System TA—R_f 0.95; system TE—R_f 0.09; system TP—R_f 0.69; system TQ—R_f 0.23; system TR—R_f 0.85; system TS—R_f 0.82; system TAJ—R_f 0.70; system TAK—R_f 0.74; system TAL—R_f 0.94; system TAM—R_f 0.86 (*p*-toluenesulfonic acid solution, positive).
Gas Chromatography System GA—oxymetholone RI 3005,oxymetholone enol-TMS_3 RI 2870; system GAI—urinary metabolites: 17α-methyl-5α-androstan-3α,17β-diol RRT 0.925,2-hydroxymethyl-17α-methyl-5-androstan-3,17-diol RRT 1.106, 2-hydroxymethyl-17α-methyl-5-androstan-3, 6, 17-triol RRT 1.180 (relative to 17α-methyl-5α-androstan-3β,17β-diol); system GAG—RRT 1.28 (relative to testosterone); system GAR—oxymetholone, retention time 13.7 min.
High Performance Liquid Chromatography System HATb—RRT 2.64 (relative to testosterone).
Ultraviolet Spectrum Methanolic acid—277 nm (A^{1}_{1}=300b); methanolic alkali—315 (A^{1}_{1}=547a).

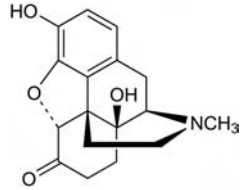


Infrared Spectrum Principal peaks at wavenumbers 1612, 1204, 1219, 1306, 1157, 935 cm^{-1} (KBr disk).
Quantification
Plasma **GC–MS** For method, see Cardoso *et al.* [2002].
Dose Usually 5 to 10 mg daily; doses of 100 to 350 mg daily may be given.

Cardoso CR *et al.* (2002). Validation of the determination of oxymetholone in human plasma analysis using gas chromatography-mass spectrometry. Application to pharmacokinetic studies. *J Chromatogr B Anal Technol Biomed Life Sci* 775: 1–8.

Oxymorphone

Narcotic Analgesic
$C_{17}H_{19}NO_4$ = 301.3
CAS—76-41-5
Synonyms 7,8-Dihydro-14-hydroxymorphinone; 4,5α-epoxy-3,14-dihydroxy-17-methylmorphinan-6-oneoximorphone; oxydimorphone.

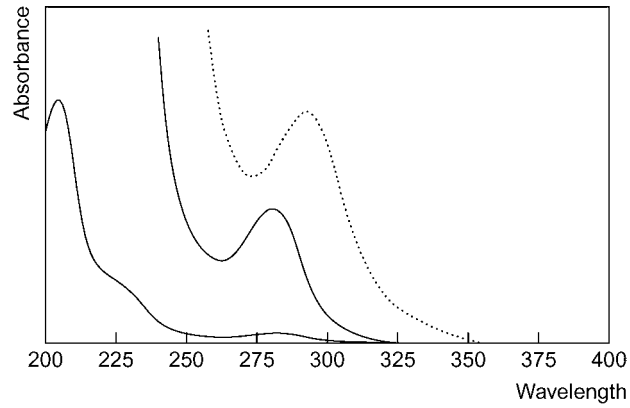


Chemical Properties Crystals. Mp 248° to 249°, with decomposition. Soluble in boiling acetone and chloroform; readily soluble in aqueous alkali; moderately soluble in boiling ethanol; sparingly soluble in benzene. pK_{a1} 8.17 [Sangster 1997], 8.5, pK_{a2} 9.3. Log *P* (octanol/water), 0.83 [Hansch *et al.* 1995], (octanol/pH 7.4), 0.

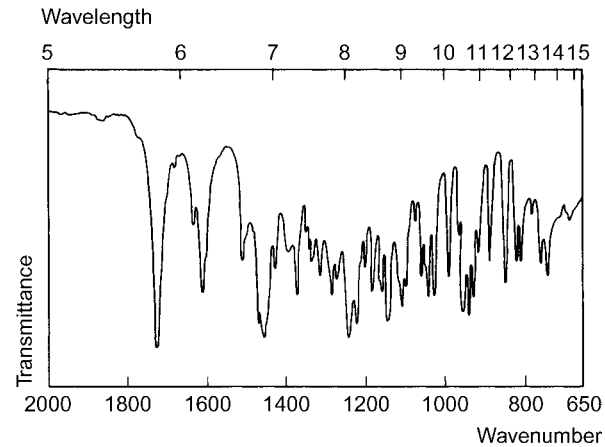
Oxymorphone Hydrochloride

$C_{17}H_{19}NO_4$, HCl = 337.8
CAS—357-07-3
Proprietary Names *Numorphan*; *Opana*.
Chemical Properties A white powder that darkens on exposure to light. Soluble 1 in 4 of water, 1 in 100 of ethanol and 1 in 25 of methanol; very slightly soluble in chloroform and ether.

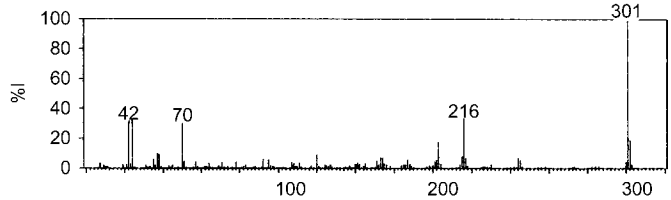
Colour Test Marquis test—grey-violet.
Thin-layer Chromatography System TA—R_f 0.48; system TB—R_f 0.10; system TC—R_f 0.37; system TE—R_f 0.33; system TL—R_f 0.30; system TAE—R_f 0.27; system TAF—R_f 0.36; system TAJ—R_f 0.13; system TAK—R_f 0.00; system TAL—R_f 0.13 (acidified iodoplatinate solution—positive; Dragendorff spray—positive; Marquis test—grey).
Gas Chromatography System GA—oxymorphone RI 2723, oxymorphone-TMS RI 2715, oxymorphone-TMS_2 RI 2728, oxymorphone-TMS_3 RI 2641, oxymorphone-oxime-TMS_3 RI 2748, M (nor-) not eluted, M (nor-enol, -TMS_2) RI 2788, M (nor-enol, -TMS_3) RI 2662, M (nor-enol-TMS_4) RI 2773, M (dihydro-) RI 2690.
Gas Chromatography-Mass Spectrometry Column: DB-5 (30 m × 0.25 mm i.d., 0.25 μm). Temperature programme: 130° for 1 min to 270° at 10°/min. Carrier gas: He. EI ionisation, full scan mode. RT: 20.5 min. [Nowatzke *et al.* 1999].
High Performance Liquid Chromatography System HA—*k* 6.7 (tailing peak); system HX—RI 217; system HY—RI 184.
Ultraviolet Spectrum Aqueous acid—281 nm (A^{1}_{1} = 34a); aqueous alkali—292 nm.



Infrared Spectrum Principal ions at wavenumbers 1730, 1240, 1225, 1145, 941, 953 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 301, 216, 44, 42, 70, 302, 203, 57.



Quantification

Blood **GC-MS** Column: DB-1 (15 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 60 cm/s. Temperature programme: 140° for 1 min to 220° at 50°/min to 305° at 10°/min for 0.5 min. EI ionisation. Retention time: 385 s. Limit of quantification, 10 µg/L; limit of detection, 2 µg/L [Meatherall 2005]. Column: HP-1MS capillary (30 m × 0.25 mm, 0.25 µm). Carrier gas: He, 62 cm/s. Limit of quantification, 5 to 20 µg/L [Ropero-Miller *et al.* 2002].

LC-MS Column: Waters HSS T3 (50 × 2.1 mm i.d., 3.0 µm). Mobile phase: 1% formic acid in water : 1% formic acid in acetonitrile (97 : 3 for 0.1 min to 80 : 20 at 2.5 min to 1 : 99 at 2.55 min for 0.45 min to 97 : 3 at 3.01), flow rate 0.6 mL/min. ESI, positive ion mode. Limit of quantification, 10 µg/L [Dahn *et al.* 2010]. Column: Phenomenex Synergi reversed phase. Mobile phase: 10 mmol/L ammonium formate (pH 3) : acetonitrile. Limit of quantification, 0.5 to 4.09 µg/L; limit of detection, 0.16 to 1.2 µg/L [Al Asmari, Anderson 2007].

Plasma **LC-MS** See Blood [Dahn *et al.* 2010]. Column: XBridge C18 (100 × 2.1 mm i.d., 3.5 µm). Mobile phase: 5 mmol/L ammonium formate (pH 9.4) : methanol (94 : 6 for 10 min to 45 : 55 for 3.5 min to 15 : 85 for 1.5 min to 94 : 6 for 10 min), flow rate 180 µL/min. ESI. Limit of detection, 0.1 µg/L for oxymorphone and 0.25 µg/L for noroxymorphone [Neuvonen, Neuvonen 2008]. Column: Phenomex C_{12} MAX-RP (150 × 2 mm, 4 µm). Mobile phase: water–acetonitrile (90 : 10)–5 mmol/L ammonium formate (pH 3.5) : water–acetonitrile (10 : 90)–5 mmol/L ammonium formate (pH 3.5; 100 : 0 for 5 min to 0 : 100 at 19 min for 7 min to 100 : 0 at 29 min for 6 min), flow rate 200 µL/min. TIS, positive ion mode, MRM acquisition mode. Limit of quantification, 2.9 µg/L, limit of detection; 0.8 µg/L [Musshoff *et al.* 2006].

Serum **LC-MS** See Blood [Dahn *et al.* 2010].

Urine **GC-MS** Column: DB-5MS bonded phase capillary (15 m × 0.249 mm i.d., 0.25 µm). Carrier gas: He. Temperature programme: 240° to 280° at 40°/min for 1.2 min. SIM acquisition mode. Limit of quantification, 40 µg/L, limit of detection; 20 µg/L [McKinley *et al.* 2007]. Column: DB-1 (15 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 60 cm/s. Temperature programme: 140° for 1 min to 220° at 50°/min to 290° at 10°/min for 0.5 min. EI ionisation, full scan mode. Retention time: 385 s. Limit of quantification, 25 µg/L, limit of detection; 10 µg/L [Meatherall 1999]. Column: DB-5 capillary (15 m × 0.26 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature: 260°. SIM acquisition mode. Limit of detection, 3.7 µg/L [Smith *et al.* 1995].

LC-MS See Blood [Dahn *et al.* 2010]. Column: Agilent Zorbax SB Phenyl (150 × 2.1 mm i.d., 5 µm). Mobile phase: 0.05% formic acid with 10 mmol/L ammonium acetate–0.05% formic acid in acetonitrile (95 : 5) : 0.05% formic acid in acetonitrile–0.05% formic acid with 10 mmol/L ammonium formate (95 : 5, 100 : 0 for 0.5 min to 82 : 18 at 3 min for 2.5 min to 100 : 0). ESI. Limit of quantification, 80 µg/L [Edinboro *et al.* 2005].

Disposition in the Body Oxymorphone is absorbed after oral administration. Approximately 50% of an oral dose is excreted in the urine in 5 days (mostly in the first 24 h), mainly as conjugated oxymorphone together with small quantities of unchanged drug and the conjugated 6α- and 6β-hydroxy metabolites. Oxymorphone is a metabolite of oxycodone.

Therapeutic Concentration

Two healthy male volunteers with a history of heroin abuse participated in the study. Prior to the study, each subject was required to test negative for morphine in urine for 3 consecutive days. Each volunteer was administered 1.5 mg and 3 mg IM oxymorphone. Peak plasma concentrations for subject 1 after 24 and 36 h were 164 µg/L and 91 µg/L, respectively, for the 1.5 mg dose and 435 µg/L and 120 µg/L, respectively, for the 3 mg dose. For subject 2, the levels at 24 and 36 h were 434 µg/L and 381 µg/L, respectively, for the 1.5 mg dose and 654 µg/L and 129 µg/L, respectively, for the 3 mg dose [Smith *et al.* 1995].

Toxicity The estimated minimum lethal dose is 50 mg. Prolonged use of oxymorphone may lead to dependence of the morphine type.

In a review of 33 deaths involving oxymorphone, mean postmortem central and peripheral blood levels were 0.15 mg/L. Liver concentrations ranged from 'none detected' to greater than 2 mg/L and most urine samples had levels greater than 0.5 mg/L [Garside *et al.* 2009].

Blood levels of 0.05 mg/L and 0.12 mg/L were found in two oxymorphone-related fatalities [McIntyre *et al.* 2009].

Note For a study of oxymorphone metabolism in human, rat, guinea pig, rabbit and dog, see Cone *et al.* [1983]. For reviews of the pharmacology, pharmacokinetics and use of oxymorphone and an extended-release oxymorphone preparation, see Prommer [2006] and Sloan, Barkin [2008].

Dose 0.5 to 1.5 mg of oxymorphone hydrochloride given parenterally; doses of 5 to 20 mg have been given orally.

Oxypertine

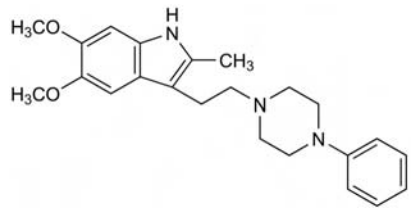
Tranquilliser

$C_{23}H_{29}N_3O_2 = 379.5$

CAS—153-87-7

IUPAC Name 5,6-Dimethoxy-2-methyl-3-[2-(4-phenyl-1-piperazinyl)ethyl]-1*H*-indole

Proprietary Names *Equipertine*; *Forit*; *Integrin*; *Opertil*.



Chemical Properties White crystalline powder. Slightly soluble in water and ethanol. Log *P* (octanol/water), 3.8.

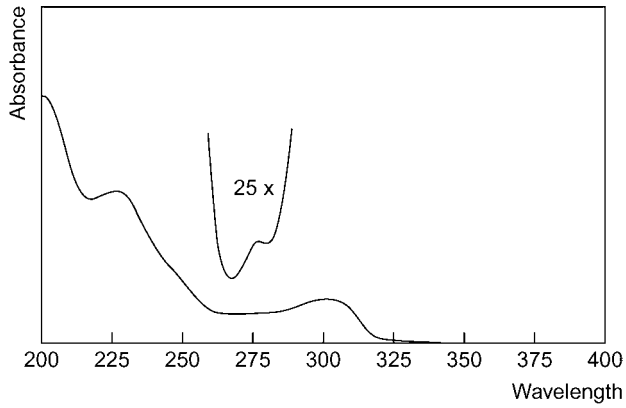
Colour Tests Liebermann's reagent—blue; Mandelin's test—grey; Marquis test—grey-green.

Thin-layer Chromatography System TA—R_f 0.68; system TAE—R_f 0.74; system TAG—R_f 0.58; system TB—R_f 0.04; system TC—R_f 0.65; system TE—R_f 0.78 (acidified iodoplatinate solution, positive).

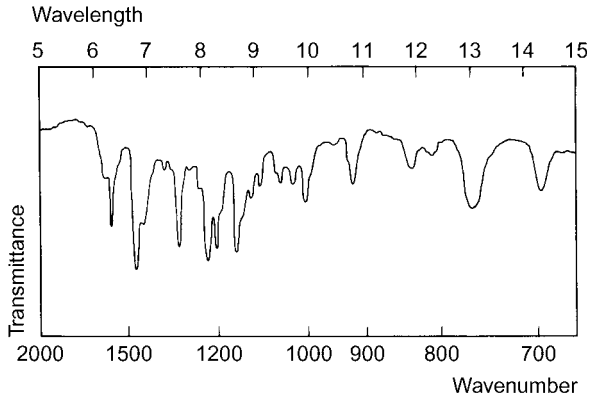
Gas Chromatography System GA—RI 2355.

High Performance Liquid Chromatography System HA—*k* 0.7; system HF—*k* 1.33; system HX—RI 402.

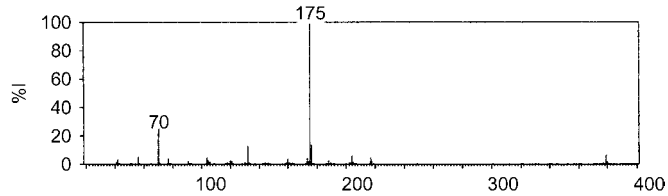
Ultraviolet Spectrum Aqueous acid—301 nm ($A^1_1 = 212b$). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1233, 1153, 1205, 1592, 762, 1003 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 175, 70, 176, 132, 379, 204, 56, 217.



Quantification

Plasma **GC** Column: CBP1-bonded methylsilicone (12 m × 0.53 mm i.d., 1 µm). Carrier gas: He, 20 mL/min. Temperature programme: 200° for 2 min to 300° at 10°/min. NPD. Limit of detection, 0.1 ng [Tokunaga *et al.* 1996].

Serum **HPLC** Column: Zorbax Sil (30 cm × 4 mm i.d., 7–8 µm). Mobile phase: methanol : acetic acid : sodium acetate (200 : 0.3 : 0.1), flow rate 0.8 mL/min. UV detection (λ = 252 nm). Retention time: 6.4 min. Limit of quantification, 20 µg/L [Minatogawa *et al.* 1983].

Dose Usually up to 300 mg daily.

Minatogawa Y *et al.* (1983). Determination of oxypertine in human serum by high-performance liquid chromatography. *J Chromatogr* 274: 413–416.

Tokunaga H *et al.* (1996). Screening of antipsychotic drugs by wide-bore capillary gas chromatography with nitrogen phosphorus detection–detection levels in plasma. *Nihon Hoigaku Zasshi* 50: 196–202.

O

Oxyphenbutazone

Analgesic

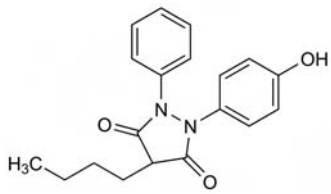
$C_{19}H_{20}N_2O_3$, H_2O = 342.4

CAS—129-20-4 (anhydrous); 7081-38-1 (monohydrate)

IUPAC Name 4-Butyl-1-(4-hydroxyphenyl)-2-phenyl-3,5-pyrazolidinedione

Synonyms G-27202; hydroxyphenylbutazone.

Proprietary Names *Imbun*; *Isobutil*; *Oxalid*; *Oxybutazone*; *Phlogase*; *Rheumapax*; *Tandearil*; *Tanderil*.



Chemical Properties A white to yellowish-white crystalline powder. Mp 96°. Monohydrate. Soluble in ethanol, methanol, chloroform, benzene and ether. Forms a water-soluble sodium salt. pK_a 4.7 (22°). Log *P* (octanol/water), 2.7.

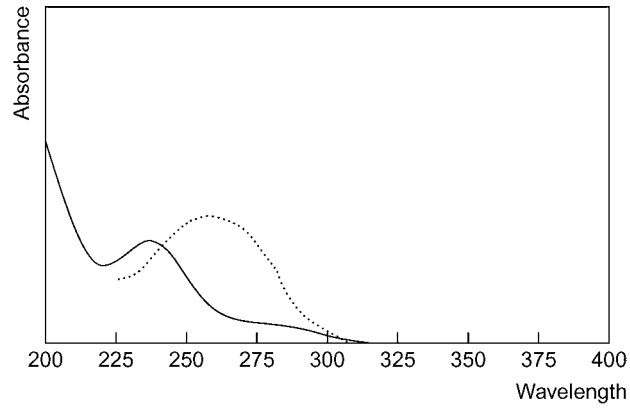
Colour Test Marquis test—yellow.

Thin-layer Chromatography System TA—R_f 0.77; system TB—R_f 0.00; system TD—R_f 0.52; system TE—R_f 0.09; system TF—R_f 0.62; system TG—R_f 0.25; system TAD—R_f 0.57; system TAE—R_f 0.90; system TAJ—R_f 0.56; system TAK—R_f 0.41; system TAL—R_f 0.92 (chromic acid solution, yellow; Ludy Tenger reagent, orange; mercurous nitrate spray, positive; acidified potassium permanganate solution, positive).

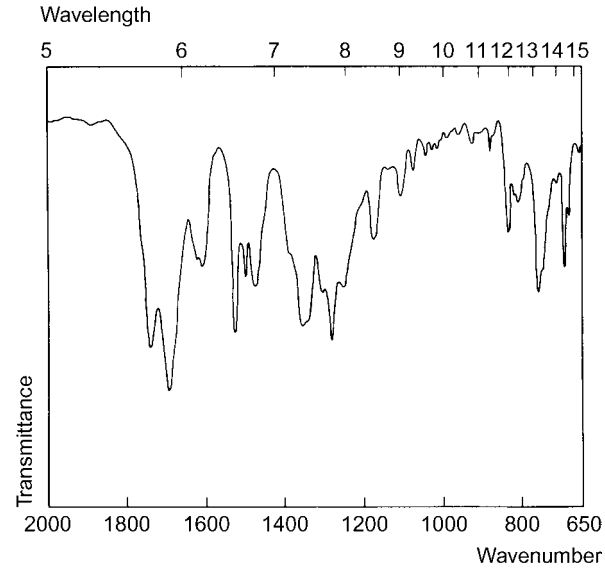
Gas Chromatography System GA—oxyphenbutazone— not eluted; oxyphenbutazone-Me_2 (isomer 1) RI 2545; oxyphenbutazone-Me_2 (isomer 2) RI 2720; system GD—methyl derivative RRT 2.11 (relative to *n*-$C_{16}H_{34}$).

High Performance Liquid Chromatography System HD—*k* 1.95; system HV—RRT 0.69 (relative to meclofenamic acid); system HX—RI 501; system HY—RI 459; system HZ—retention time 6.7 min.

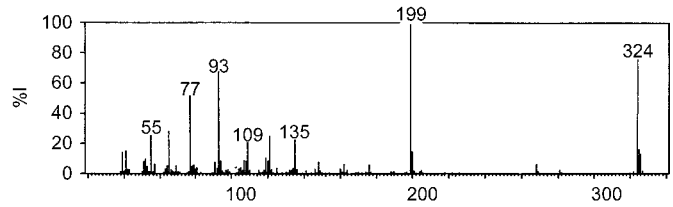
Ultraviolet Spectrum Aqueous acid—237 nm; aqueous alkali—254 nm (A^1_1=750a).



Infrared Spectrum Principal peaks at wavenumbers 1683, 1736, 1275, 1512, 765, 1600 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 199, 324, 93, 77, 65, 55, 121, 135.



Quantification See also Phenylbutazone.

Plasma **GC** AFID. Limit of detection, 2.5 mg/L [Bertrand *et al.* 1979].

HPLC UV detection. Limit of detection, 250 µg/L [Pound, Sears 1975].

Disposition in the Body Almost completely absorbed after oral administration. It is slowly metabolised by glucuronide conjugation and by hydroxylation; it is slowly excreted in the urine, <2% of a dose being excreted as unchanged drug and about 1 to 5% as the *O*-glucuronide conjugate in 24 h.

Oxyphenbutazone is a major metabolite of phenylbutazone.

Therapeutic Concentration

Following a single oral dose of 200 mg to 10 subjects, peak plasma concentrations of 11.4 to 43.7 mg/L were attained in 2 to 12 h [Bertrand *et al.* 1979].

Following daily oral doses of 300 to 400 mg to 6 subjects, steady-state plasma concentrations determined immediately before a dose ranged from 27 to 95 mg/L (mean, 62) [Weiner *et al.* 1967].

Toxicity The estimated minimum lethal dose is 5 g.

Half-Life Plasma half-life, about 2 to 3 days.

Volume of Distribution About 0.1 L/kg.

Protein Binding About 99%.

Dose Oxyphenbutazone has been given in doses of 100 to 800 mg daily.

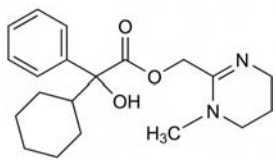
Oxyphencyclimine

Anticholinergic
$C_{20}H_{28}N_2O_3$ = 344.5
CAS—125-53-1

IUPAC Name (1-Methyl-5,6-dihydro-4*H*-pyrimidin-2-yl)methyl 2-cyclohexyl-2-hydroxy-2-phenylacetate
Synonym α-Cyclohexyl-α-hydroxybenzeneacetic acid (1,4,5,6-tetrahydro-1-methyl-2-pyrimidinyl)methyl ester
Proprietary Names *Antalcus*; *Zamanil*.

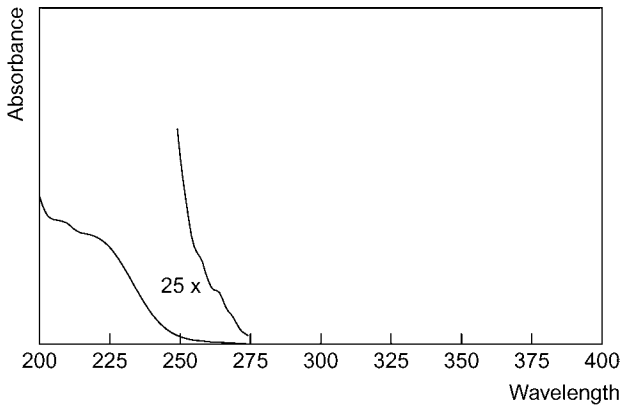


Chemical Properties Log *P* (octanol/water), 3.5.

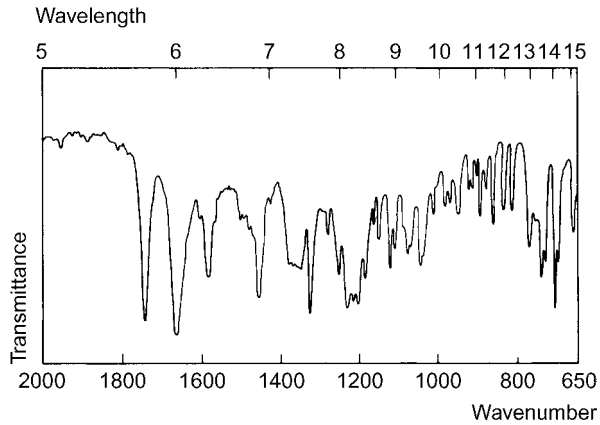
Oxyphencyclimine Hydrochloride

$C_{20}H_{28}N_2O_3$, HCl = 380.9
CAS—125-52-0
Proprietary Names *Daricon*; *Manir*; *Vagogastrin*. It is an ingredient of *Enarax* and *Vistrax*.
Chemical Properties A white crystalline powder. Mp 231° to 232° with decomposition. Soluble 1 in 100 of water, 1 in 75 of ethanol, 1 in 500 of chloroform, 1 in 3000 of ether and 1 in 20 of methanol.

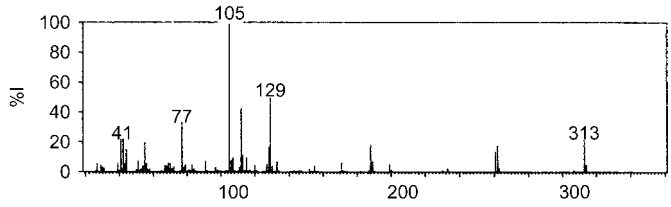
Colour Test Mandelin's test—grey-green.
Thin-layer Chromatography System TA—R_f 0.02; system TB—R_f 0.01; system TC—R_f 0.03; system TE—R_f 0.06; system TL—R_f 0.00; system TAE—R_f 0.02; system TAF—R_f 0.18; system TAJ—R_f 0.00; system TAK—R_f 0.01; system TAL—R_f 0.24 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1661 and RI 2250; system GF—RI 2900.
High Performance Liquid Chromatography System HA—*k* 2.8; system HX—RI 424.
Ultraviolet Spectrum Principal peak at 221 nm.



Infrared Spectrum Principal peaks at wavenumbers 1656, 1737, 1227, 705, 1201, 1211 cm^{-1} (oxyphencyclimine hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 105, 129, 112, 77, 42, 313, 41, 55.

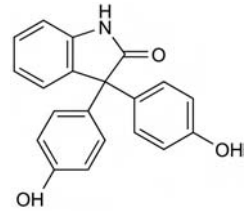


Dose 10 to 20 mg of oxyphencyclimine hydrochloride daily; up to 50 mg daily has been given.

Oxyphenisatine

Purgative
$C_{20}H_{15}NO_3$ = 317.3
CAS—125-13-3

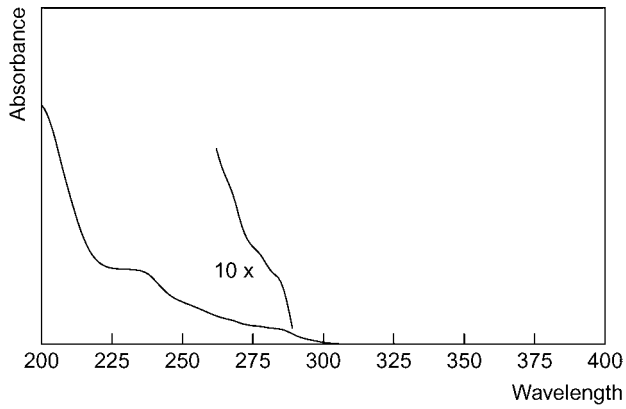
IUPAC Name 3,3-Bis[4-hydroxyphenyl]-1,3-dihydro-2*H*-indol-2-one
Synonym Dihydroxyphenylisatin
Proprietary Name *Veripaque*



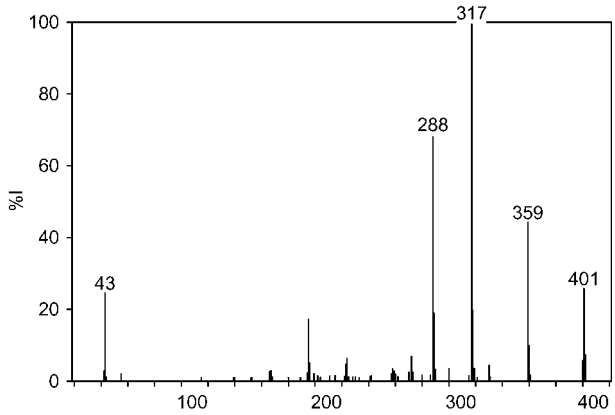
Oxyphenisatine Acetate

$C_{24}H_{19}NO_5$ = 401.4
CAS—115-33-3
Synonyms Acetphenolisatin; bisatin; diacetoxydiphenylisatin; diacetyldiphenolisatin; diasatin; diphesatin; isaphenin; oxyphenisatin acetate.
Chemical Properties A white crystalline powder. Mp about 242°. Practically insoluble in water, ether and dilute hydrochloric acid; soluble 1 in 70 of chloroform; slightly soluble in ethanol. Log *P* (octanol/water), 3.5.

Colour Tests Folin–Ciocalteu reagent—blue; Koppanyi–Zwikker test—violet; Liebermann's reagent—black; Mandelin's test—violet; Marquis test—violet; mercurous nitrate—black.
Thin-layer Chromatography System TA—R_f 0.82 (acidified potassium permanganate solution, positive).
Ultraviolet Spectrum Principal peak at 240 nm.



Infrared Spectrum Principal peaks at wavenumbers 1188, 1727, 1495, 1232, 1162, 1011 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 317, 288, 359, 401, 43, 318, 289, 196 (oxyphenisatine acetate).

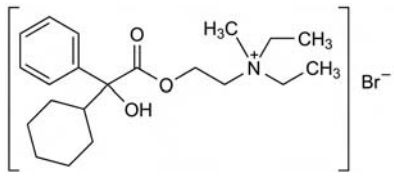


Dose Oxyphenisatine acetate has been given in a dose of 5 to 20 mg.

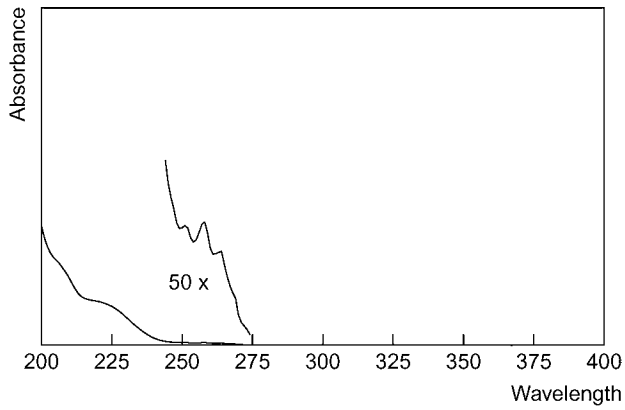
Oxyphenonium Bromide

Anticholinergic
$C_{21}H_{34}BrNO_3$ = 428.4
CAS—14214-84-7 (oxyphenonium); 50-10-2 (bromide)

IUPAC Name 2-[(Cyclohexylhydroxyphenylacetyl)oxy]-*N*,*N*-diethyl-*N*-methylethanaminium bromide
Synonyms Ba-5473; C-5473; spasmophen.
Proprietary Names *Antrenil*; *Antrenyl*.



Chemical Properties A white crystalline powder. Mp about 190°. Freely soluble in water; sparingly soluble in alcohol. Log *P* (octanol/water), 0.2.
Thin-layer Chromatography System TA—R_f 0.03; system TB—R_f 0.00; system TC—R_f 0.01; system TE—R_f 0.01; system TL—R_f 0.00; system TAE—R_f 0.02; system TAF—R_f 0.36 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—Art RI 2173.
High Performance Liquid Chromatography System HA—*k* 2.6 (tailing peak); system HX—RI 424.
Ultraviolet Spectrum Aqueous acid—252, 258 (A_1^1=5.3a), 264 nm.



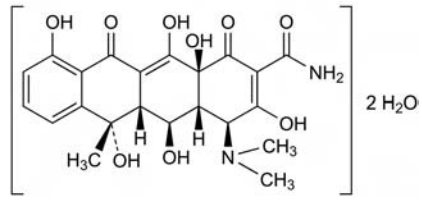
Infrared Spectrum Principal peaks at wavenumbers 1225, 1719, 729, 704, 1030, 1111 cm^{-1} (KBr disk).
Quantification
Plasma **GC** ECD. Limit of detection, 2 µg/L [Greving *et al.* 1977].
Urine **GC** ECD. Limit of detection, 200 µg/L [Greving *et al.* 1977].
Dose 20 to 40 mg daily.

Greving JE *et al.* (1977). Determination of oxyphenonium bromide in plasma and urine by means of ion-pair extraction, derivatization and gas chromatography-electron-capture detection. *J Chromatogr* 142: 611–619.

Oxytetracycline Dihydrate

Antibacterial
$C_{22}H_{24}N_2O_9$, $2H_2O$ = 496.5
CAS—79-57-2 (anhydrous); 6153-64-6 (dihydrate)

IUPAC Name (2*Z*,4*S*,4*aR*,5*S*,5*aR*,6*S*,12*aS*)-2-[Amino(hydroxy)methylidene]-4-(dimethylamino)-5,6,10,11,12*a*-pentahydroxy-6-methyl-4,4*a*,5,5*a*-tetrahydrotetracene-1,3,12-trione dihydrate
Synonyms [4*S*-(4α,4aα,5α,5aα,6β,12aα,)]-4-(Dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,5,6,10,12,12a,-hexahydroxy-6-methyl-1,11-dioxo-2-naphthacenecarboxamide dihydrate; 5-hydroxytetracycline; oxytetracycline; terrafungine.
Proprietary Names *Abbocin*; *Chemocycline* (tablets); *Galenomycin*; *Imperacin*; *Oxymed*; *Oxymycin*; *Terramycin* (tablets).



Chemical Properties A yellow to tan-coloured crystalline powder. Stable in air but darkens on exposure to strong sunlight. Soluble 1 in 4150 of water, 1 in 66 of dehydrated alcohol and 1 in 6250 of ether; sparingly soluble in ethanol; practically insoluble in chloroform; soluble in dilute acids and alkalis. pK_a 3.3, 7.3, 9.1 (25°). Log *P* (octanol/pH 7.5), −1.6.

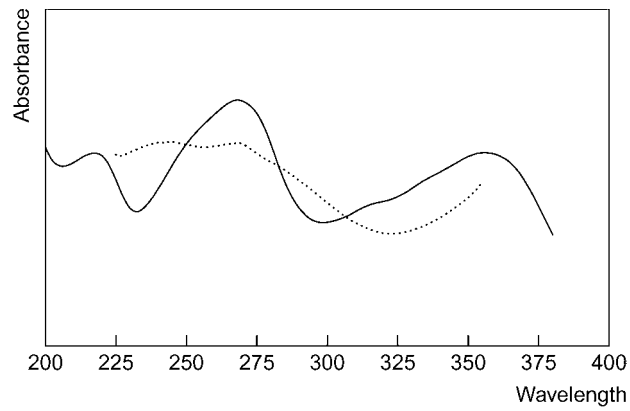
Oxytetracycline Calcium

$C_{44}H_{46}CaN_4O_{18}$ = 958.9
CAS—15251-48-6 (xCa)
Proprietary Names *Chemocycline* (syrup); *Terramycin* (syrup).
Chemical Properties A yellow to light brown crystalline powder. Practically insoluble in water; soluble in dilute solutions of sodium hydroxide.

Oxytetracycline Hydrochloride

$C_{22}H_{24}N_2O_9$,HCl = 496.9
CAS—2058-46-0
Proprietary Names *Macocyn*; *Terramycin* (capsules); *Unimycin*. It is an ingredient of *Bisolvomycin* and *Terra-Cortril*.
Chemical Properties A yellow, hygroscopic, crystalline powder, which darkens on exposure to sunlight or to moist air above 90°. It decomposes above 180°. Soluble 1 in 2 of water, 1 in 45 of ethanol and 1 in 45 of methanol; less soluble in dehydrated alcohol; practically insoluble in chloroform and ether. Solutions in water become turbid on standing owing to precipitation of oxytetracycline base.

Colour Tests Benedict's reagent—red; formaldehyde-sulfuric acid—brown-red; Liebermann's reagent—red; Mandelin's test—violet→red→orange; Marquis test—orange; sulfuric acid—violet-red.
Thin-layer Chromatography System TA—R_f 0.05, streaking; system TB—R_f 0.00; system TE—R_f 0.00; system TAD—R_f 0.00; system TAE—R_f 0.08 (location under ultraviolet light, orange fluorescence; acidified potassium permanganate solution, positive).
High Performance Liquid Chromatography System HX—RI 299; system HY—RI 260.
Ultraviolet Spectrum Aqueous acid—268 (A_1^1=400a), 352 nm; aqueous alkali—246, 269 nm.



Infrared Spectrum Principal peaks at wavenumbers 1616, 1584, 1665, 1235, 1180, 1138 cm^{-1} (oxytetracycline hydrochloride, KBr disk).

Quantification

Blood **Spectrofluorimetry** Limit of detection <100 µg/L [Scales, Assinder 1973].

Plasma **Spectrofluorimetry** See Blood [Scales, Assinder 1973].

Disposition in the Body Incompletely and irregularly absorbed after oral administration and widely distributed throughout the body. About 70% of a dose is excreted in the urine; biliary excretion also occurs.

Therapeutic Concentration

Following oral doses of 500 mg to 4 subjects, peak plasma concentrations of 1.2 to 3.4 mg/L (mean, 2.1) were attained in 2 to 3 h [Scales, Assinder 1973].

Half-life Plasma half-life, about 9 h, increased in renal impairment.

Protein Binding About 20 to 35%.

Dose Up to 3 g of oxytetracycline hydrochloride daily.

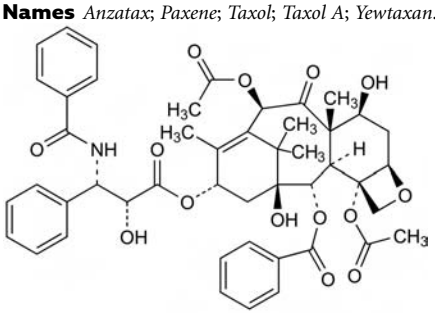
Scales B, Assinder DA (1973). Fluorometric estimation of oxytetracycline in blood and plasma. *J Pharm Sci* 62: 913–917.

Paclitaxel

Antineoplastic, Taxane
$C_{47}H_{51}NO_{14}$ = 853.9
CAS—33069-62-4

Synonyms [2a*R*-[2aα,4β,4aβ,6β,9α(α*R**,β*S**),11α,12α,12aα,12bα]]-β-(Benzoyl-amino)-α-hydroxybenzenepropanoic acid 6,12b-bis(acetyloxy)-12-(benzoyloxy)-2a,3,4,4a,5,6,9,10,11,12,12a,12b-dodecahydro-4,11-dihydroxy-4a,8,13,13-tetramethyl-5-oxo-7,11-methano-1*H*-cyclodeca-[3,4]benz[1,2-*b*]oxet-9-yl ester; BMS-181339-01; NSC-125973.

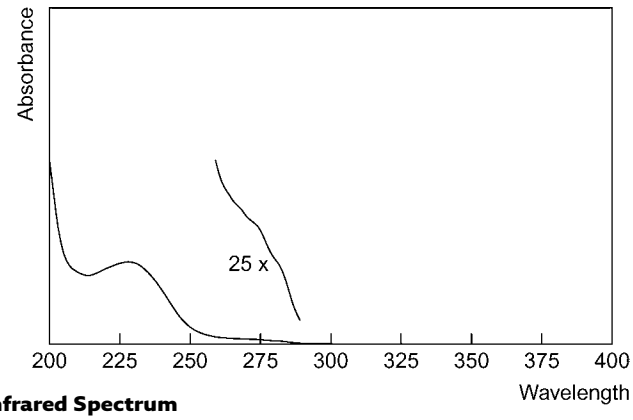
Proprietary Names *Anzatax*; *Paxene*; *Taxol*; *Taxol A*; *Yewtaxan*.



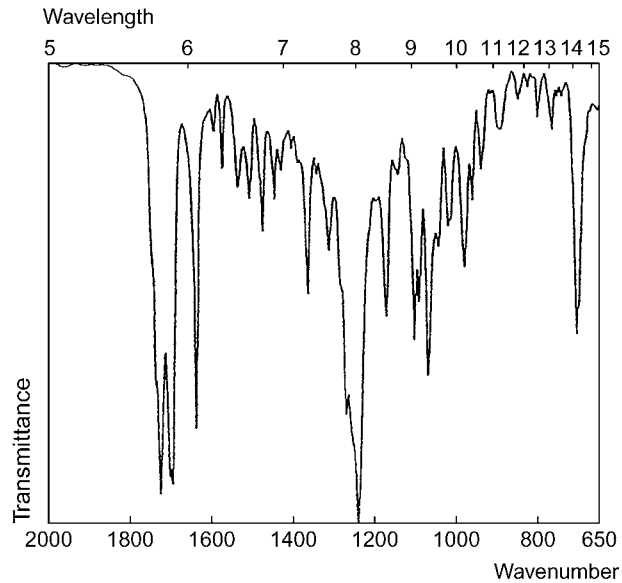
Chemical Properties White to off-white crystalline powder. Mp 216° to 217°, with decomposition. Virtually insoluble in water and shows poor solubility in most pharmaceutically approved solvents.

High Performance Liquid Chromatography Column: C_{18} Radial-Pak cartridge (100 × 8 mm i.d., 10 µm). Mobile phase: water : acetonitrile (65 : 35 to 0 : 100 exponentially over 20 min. IS: *N*-cyclohexylbenzamide. UV detection (λ = 227 nm). Retention time: paclitaxel, 19.5 min; IS, 12.5 min [Longnecker *et al.* 1987].

Ultraviolet Spectrum Aqueous acid—227, 273 nm.



Infrared Spectrum



Quantification

Plasma **HPLC** UV detection (λ = 227 nm). Limit of quantification, 5 µg/L [Supko *et al.* 1999]. UV detection (λ = 227 nm). Limit of quantification 25 µg/L [Martin *et al.* 1998]. Column: C_8 MOS Hypersil (150 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 0.02 mol/L acetate buffer (pH 4.5, 65 : 35), flow rate 2 mL/min. UV detection (λ = 227 nm). *k*: 5.5. Limit of detection, 0.10 µg/L [Rizzo *et al.* 1990].

Serum **LC-MS** Limit of detection, 0.25 µg/L [Xu *et al.* 2000].

Urine **HPLC** See Plasma. Limit of quantification, 40 µg/L [Martin *et al.* 1998].

Note For an ELISA for the quantification of paclitaxel, see Leu *et al.* [1992]. For a competitive inhibition enzyme immunoassay for the quantification of paclitaxel, see Grothaus *et al.* [1993].

Disposition in the Body Paclitaxel is not significantly absorbed after oral administration and is metabolised in the liver with the help of the cytochrome P450 isoforms CYP2C8 and CYP3A4. It undergoes extensive extravascular distribution and/or tissue binding, but does not cross the blood–brain barrier. Five metabolites, including 2 mono-hydroxylated and 1 di-hydroxylated derivatives, have been identified in humans. The major metabolite is 6α-hydroxytaxol; minor metabolites include 3′-*p*-hydroxypaclitaxel and 6α,3′-*p*-dihydroxypaclitaxel. <5–10% of a dose is excreted in urine as the unchanged drug and it has also been detected in bile (75% of a dose; mainly as its metabolites and ~20% unchanged).

Therapeutic Concentration

Thirty patients with advanced cancer were administered with either a single IV dose of 210, 250 or 300 mg/m^2 over 3 h. Peak plasma concentrations were reached by the end of infusion at 6, 9.2 and 14.2 µmol/L, respectively [Sonnichsen *et al.* 1994].

Thirty patients aged between 2.3 and 22.8 years were administered with doses of 200, 250, 350 and 420 mg/m^2 paclitaxel over 24 h. Peak concentrations ranged between 1.06 and 1.26 µmol/L, 0.31–1.56, 0.54–2.61 and 1.18–6.77 µmol/L, respectively, and were reached by the end of infusion [Sonnichsen *et al.* 1994].

Toxicity

The major clinical toxicity is myelosuppression which is dose-dependent and reversible. Dose-limiting myelosuppression without granulocyte colony-stimulating factor (G-CSF) was observed at 250 mg/m^2 and the dose-limiting toxicity for paclitaxel with G-CSF was neuropathy at 300 mg/m^2. Therefore, the maximum doses for paclitaxel when administered over a 3-h infusion with or without G-CSF support, are 250 and 210 mg/m^2, respectively [Schiller *et al.* 1994].

Half-life 3–50 h (non-linear pharmacokinetics, independent of dose and wide inter-patient variability).

Volume of Distribution 200–≈700 L/m^2.

Clearance Plasma, 11.6–24.0 L/h/m^2; mean, 0.42 L/m^2/day (from peritoneal cavity).

Protein Binding 88–98%.

Dose The dose varies between 100 and 175 mg/m^2 body surface by IV infusion over 3 h every 2 to 3 weeks depending on condition and response. Dose may be reduced by 20% in some cases.

Padimate

Sunscreen Agent
$C_{14}H_{21}NO_2$ = 235.3
CAS—14779-78-3; 21245-01-2.

IUPAC Name Pentyl 4-(dimethylamino)benzoate

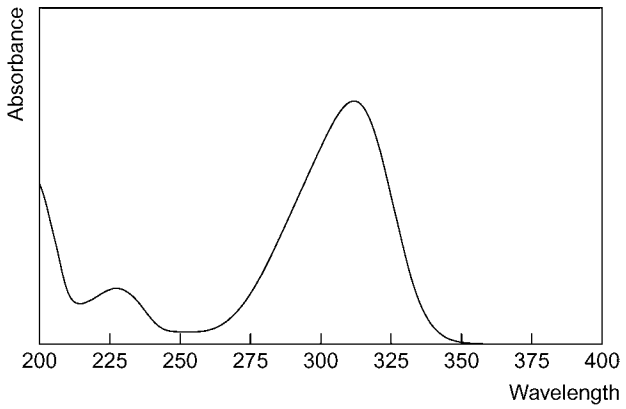
Synonyms Amyl dimethylaminobenzoate; isoamyl dimethylaminobenzoate; padimate A.

Proprietary Names *Chapstick*. It is an ingredient of *Chapstick Sun Block*, *Filter OTC* and *Vaseline Intensive Care Blockout*.
Note A mixture of pentyl, isopentyl and 2-methylbutyl 4-dimethylaminobenzoates.
Chemical Properties A yellow liquid. Practically insoluble in water; soluble in ethanol, chloroform and isopropyl alcohol.

Padimate O

$C_{17}H_{27}NO_2 = 277.4$
CAS—21245-02-3
Synonyms 2-Ethylhexyl 4-(dimethylamino)benzoate; octyl dimethyl PABA.
Proprietary Names *Banana Boat Dark Tanning*; *Chapstick*; *Escalol 507*; *Ice Lipbalm*; *Lipbalm with Sunscreen*; *Lip-Sed*; *Spectraban*. It is an ingredient of many proprietary preparations—see Sweetman [2009].
Chemical Properties A light yellow, mobile liquid. Practically insoluble in water; soluble in ethanol and isopropyl alcohol.

Colour Tests Aromaticity(method2)—yellow/orange;Liebermann'stest(100°)—blue.
Thin-layer Chromatography System TA—R_f 0.75 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1964.
Ultraviolet Spectrum Principal peaks at 231, 314 nm.



Quantification
Plasma **HPLC** UV detection. Padimate O and other sunscreen agents. Limit of detection, 50 µg/L for padimate O [Jiang *et al.* 1996].
Uses Topically in a concentration of 2.5%.

Jiang R *et al.* (1996). High-performance liquid chromatographic assay for common sunscreening agents in cosmetic products, bovine serum albumin solution and human plasma. *J Chromatogr B Biomed Appl* 682: 137–145.

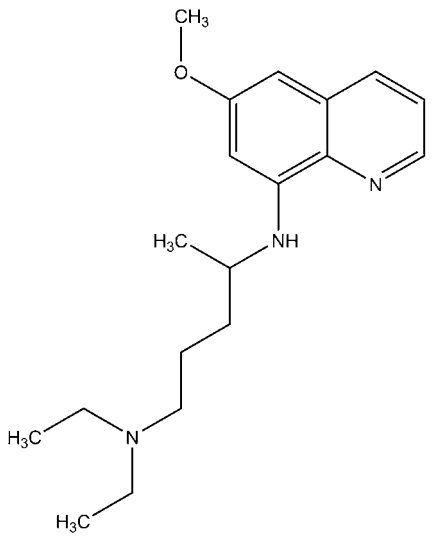
Pamaquin

Antimalarial
$C_{19}H_{29}N_3O,C_{23}H_{16}O_6 = 703.8$
IUPAC Name 1-*N*,1-*N*-diethyl-4-*N*-(6-methoxyquinolin-8-yl)pentane-1,4-diamine
Synonyms Aminoquin; 8-(4-diethylamino-1-methylbutylamino)-6-methoxyquinoline 2,2′-dihydroxy-1,1′-dinaphthylmethane-3,3′-dicarboxylate; gametocidum; pamachin; pamaquine; naphtoate; plasmoquinum; RP 4516; SN 971.
Proprietary Names *Plasmochin Naphthoate*; *Praequine*.

The following is the formula of the free base, 8-(4-diethylamino-1-methybutylamino)-6methoxyquinoline:

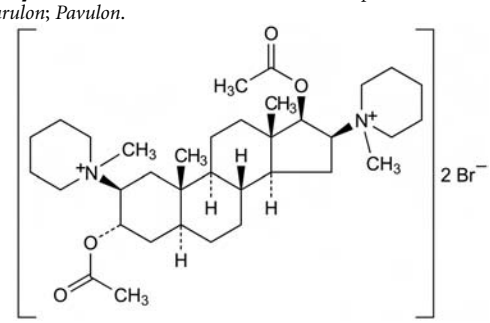


Chemical Properties A yellow-to-yellow-orange powder. Insoluble in water; soluble 1 in 20 of ethanol and 1 in 20 of acetone containing 5% of water. Pamaquin is extracted by organic solvents from aqueous solutions.
Colour Tests Ammonium molybdate test—pale blue (limit of detection, 1.0 µg); ammonium vanadate test—purple-brown (limit of detection, 0.5 µg); sulfuric acid-formaldehyde test—orange (limit of detection, 0.25 µg); Vitali's test—brown/yellow/orange (limit of detection, 1.0 µg).
Thin-layer Chromatography System T1—R_f 0.22 (location reagent diazotized *p*-niroaniline-sodium hydroxyide spray, positive reaction.
Ultraviolet Spectrum Pamaquin in 0.1 N sodium hydroxide, maxima at 238 nm (E1%, 1 cm 4775), 288 nm (E1%, 1 cm 566), about 298 nm (E1%, 1 cm 400) and 362 nm (E1%, 1 cm 400).
Infrared Spectrum Principal peaks at wavenumbers A 1458, B 1393, C 1355 (KBr disk).
Disposition in the Body In humans, pamaquin has been found to be metabolised fairly rapidly into 2 compounds which are excreted in the urine. One metabolite is unstable and can lead to methaemoglobinaemia, a toxic effect of pamaquin; it is suggested that this compound is 5-hydroxypamaquin, which may undergo reversible conversion to the iminoquinone. About 3% of a daily dose is excreted as this metabolite. The second metabolite is a stable, highly flurorescent compound.

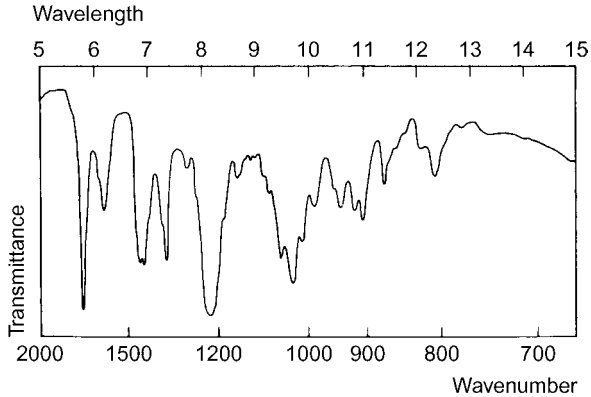
A 5,6-quinone metabolite of pamaquin has been found to be excreted by chickens; it is 16-times as active as pamaquin *in vitro*. The formation of this metabolite involves demethylation and oxidation.
Toxicity The margin between therapeutic and toxic doses is small, 30 mg daily having caused serious toxic effects. Toxic reactions may include methaemoglobinema, jaundice, and IV haemolysis with passage of blood pigments in the urine.
Dose Usually up to 20 mg daily.

Pancuronium Bromide

Muscle Relaxant
$C_{35}H_{60}Br_2N_2O_4 = 732.7$
CAS—15500-66-0
IUPAC Name [(2*S*,3*S*,5*S*,8*R*,9*S*,10*S*,13*S*,14*S*,16*S*,17*R*)-3-Acetyloxy-10,13-dimethyl-2,16-bis(1-methylpiperidin-1-ium-1-yl)-2,3,4,5,6,7,8,9,11,12,14,15,16,17-tetradecahydro-1*H*-cyclopenta[*a*]phenanthren-17-yl] acetate dibromide
Synonyms 1,1′,2β,3α,5α,16β,17β)-3,17-Bis(acetyloxy)androstane-2,16-diyl]bis[1-methylpiperidinium] dibromide; poncuronium bromide.
Proprietary Names *Bromurex*; *Curon-B*; *Minopres*; *Pancuron*; *Pancurox*; *Panlem*; *Parulon*; *Pavulon*.



Chemical Properties White, hygroscopic crystals or crystalline powder. Mp 215°. A solution in water is dextrorotatory. Soluble 1 in 1 of water, 1 in 5 of ethanol, 1 in 5 of chloroform, and 1 in 1 of methanol; practically insoluble in ether. Log *P* (octanol/water), −1.2.
Colour Test Antimony pentachloride—green.
Thin-layer Chromatography System TA—R_f 0.01; system TB—R_f 0.00; system TC—R_f 0.00; system TE—R_f 0.00; system TL—R_f 0.00; system TN—R_f 0.80; system TAE—R_f 0.00; system TAF—R_f 0.15 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—not eluted.
High Performance Liquid Chromatography System HAA—RT 3.0 min.
Ultraviolet Spectrum No significant absorption 230–360 nm.
Infrared Spectrum Principal peaks at wavenumbers 1225, 1745, 1031, 1056, 1013, 907 cm^{-1} (KBr disk; see below).



P

Quantification
Plasma **GC** Column: DB-5 (15 m × 0.32 mm i.d., 0.1 or 0.25 μm) or Ultra 2 cross-linked 5% phenylmethyl silicone (12.5 m × 0.31 mm i.d., 0.17 μm). NSD. Limit of detection, 2 μg/L [Furuta *et al.* 1988].

LC-MS CI, positive ion mode. Limit of detection, 5 μg/L [Baker *et al.* 1990].

Note For a spectrofluorimetry method in serum, see Wingard *et al.* [1979].

Urine **GC** See Plasma [Furuta *et al.* 1988].

MS EI ionisation at 70 eV, Retention time: 4.5 min. Limit of detection, 50 μg/L [Nisikawa *et al.* 1991].

Bile **GC** See Plasma [Furuta *et al.* 1988].

Disposition in the Body Pancuronium is metabolised by hydroxylation to 3-hydroxypancuronium, which is approximately half as active as pancuronium, and to a small extent to the 17-hydroxy and 3,17-dihydroxy derivatives, which are virtually inactive. In ~30 h ~37–44% of a dose is excreted in the urine unchanged, with 15% as the 3-hydroxy metabolite; ~11% of a dose is excreted in the bile [Agoston *et al.* 1973].

Therapeutic Concentration

After an IV injection of 4 mg to 6 subjects, plasma concentrations of ~0.6 mg/L were reported at 5 min, decreasing to 0.07 mg/L at 4 h [McLeod *et al.* 1976].

Toxicity

In the suicide of a 30-year-old man using IV administration of pancuronium bromide, postmortem concentrations were 1.6 and 1.5 mg/L in blood and urine, respectively; thiopental and thioridazine were also detected [Poklis, Melanson 1980].

The following postmortem concentrations were reported in a 25-year-old male anaesthesiologist who was found dead with an IV drip line connected to his leg and several empty ampoules of pancuronium, midazolam and buprenorphine nearby: concentrations of pancuronium and midazolam in blood were 0.3 and 0.1 μg/g and in urine 0.9 and 0.05 μg/g, respectively; death was attributed to pancuronium [Yashiki *et al.* 1992].

A 79-year-old man died 6 days after receiving a total of 105 mg pancuronium bromide by continuous IV infusion over 4 days. The plasma concentration post-infusion was 400 μg/L pancuronium and 400 μg/L 3-desacetylpancuronium; the next day these levels declined to 150 μg/L and 350 μg/L, respectively, and the level of 3-desacetylpancuronium was 240 and 110 μg/L on the third and fourth day post-infusion. The following postmortem tissue concentrations of pancuronium combined with its metabolite were reported: liver 6.38 μg/g, spleen 1.68 μg/g, kidneys 0.68 μg/g, lungs 0.40 μg/g, heart 0.60 μg/g, muscles 0.80 μg/g, gastrointestinal contents 16.67 μg/g [Vandenbrom, Wierda 1988].

Half-life Plasma half-life, ~2 h.

Volume of Distribution 0.1–0.4 L/kg.

Clearance Plasma clearance, ~1–2 mL/min/kg.

Protein Binding Approximately 87%.

Note For a review of the pharmacokinetics of muscle relaxants, see Ramzan *et al.* [1981].

Dose Initially 40 to 100 μg/kg IV

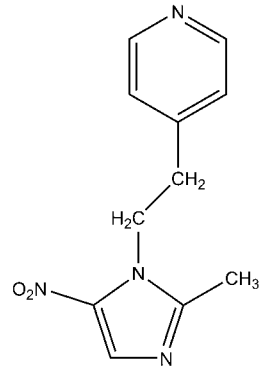
Panidazole

Antiamoebic

$C_{11}H_{12}N_4O_2 = 232.2$

IUPAC Name 4-[2-(2-Methyl-5-nitroimidazol-1-yl)ethyl]pyridine

Synonyms 2-Methyl-5-nitro-1-(2-pyrid-4-ylethyl)imidazole; 4-[2-(2-methyl-5-nitroimidazol-1-yl)ethyl]pyridine; WB-5040/2.



Chemical Properties A white crystalline powder. Mp 120° to 123°. Insoluble in water; slightly soluble in ethanol and other organic solvents; soluble in dilute acetic acid. Panidazole is extracted by chloroform from aqueous alkaline solutions.

Colour Test Vitali's test—red→dull violet (limit of detection, 1.0 μg).

Thin-layer Chromatography System T1—R_f 0.56 (location reagent acidified iodoplatinate spray, positive reaction).

Gas Chromatography System G2/225—retention time 1.82 (relative to diphenhydramine), retention time 0.41 (relative to codeine).

Ultraviolet Spectrum 0.1 N sulfuric acid—256 (E1%, 1 cm 420), 278 nm (E1%, 1 cm 296); inflexion at 261 nm (E1%, 1 cm 408), minima at 236 and 270 nm.

Infrared Spectrum Principal peaks at wavenumbers 1186, 1359, 1458, 1256, 1422, 1520cm^{-1} (KBr disk).

Pantoprazole

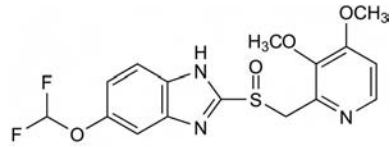
Proton Pump Inhibitor

$C_{16}H_{15}F_2N_3O_4S = 383.4$

CAS—102625-70-7

IUPAC Name 5-(Difluoromethoxy)-2-[[(3,4-dimethoxy-2-pyridinyl)methyl]sulfinyl]-1*H*-benzimidazole

Synonyms B8510-029; SK&F-96022.



Chemical Properties An off-white solid. Mp 139° to 140°. Freely soluble in water; practically insoluble in hexane; very slightly soluble in phosphate buffer (pH 7.4). pK_a 3.92; 8.19 (21° to 22°). Log *P* (octanol/buffer), 2.05 (pH 7.4); −0.26 (pH 11.4) (21–22°).

Pantoprazole Sodium Sesquihydrate

$C_{16}H_{14}F_2N_3NaO_4S,{}^3/_2H_2O = 432.5$

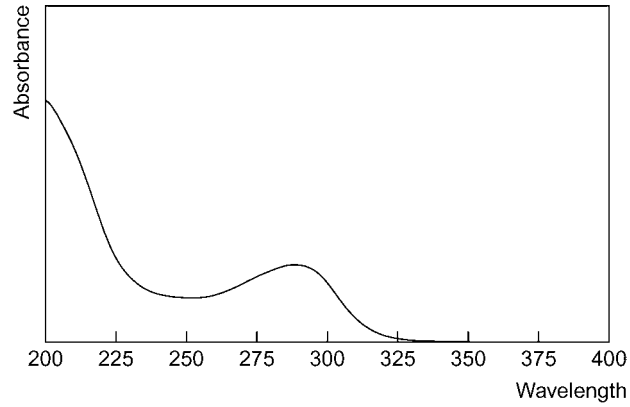
CAS—164579-32-2

Synonyms BY 1023; B8610-023; SK&F-96022-Z.

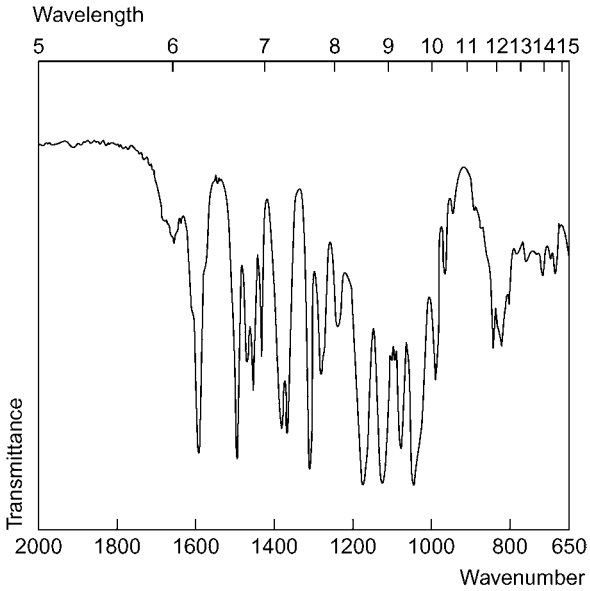
Proprietary Names *Pantozol*; *Protium*; *Protonix*.

Chemical Properties A white to off-white solid.

Ultraviolet Spectrum (Sodium Sesquihydrate) Aqueous acid—290 nm.



Infrared Spectrum Principal peaks at wavenumber 1590, 1493, 1277, 1170, 1122, 1041 cm^{-1}.



Quantification

Serum **HPLC** Column: RP-18 Hypersil (125 × 4.6 mm i.d., 5 µm). Mobile phase: (A : B) methanol : 10 mmol/L diammonium hydrogen phosphate buffer (pH 6.5), flow rate 1 mL/min. Elution programme: (43 : 57) for 2 min, to (83 : 17) in 17 min, to (100 : 0) in 2 min; to (43 : 57) in 7 min. UV detection (λ=290 nm). Retention time: pantoprazole, 16.5 min; sulfone metabolite, 13 min. Limit of detection, 0.004 mg/L [Huber *et al.* 1990].

Disposition in the Body Pantoprazole is rapidly absorbed after administration and almost exclusively metabolised in the liver. Co-administration with food delays absorption. It is extensively metabolised mainly via hepatic cytochrome P450 CYP2C19 isoenzyme. CYP34A, CYP2D6 and CYP2C9 metabolise the drug to a much lesser extent. The main metabolite is desmethylpantoprazole which is conjugated with sulfur and has been detected in plasma and urine. The metabolites are excreted primarily via renal elimination (~80%) and the remainder in faeces.

Therapeutic Concentration

Twelve healthy males, aged between 19 and 29 years, were administered with a 40 mg IV dose over 15 min or a 40 mg oral dose, both after an overnight fast. The mean peak plasma concentrations were 4.62 mg/L (range, 3.21 to 7.05) for the IV dose, observed at the end of the infusion and 2.09 (1.11 to 3.12) mg/L for the oral dose, observed 2 to 4 h after ingestion [Pue *et al.* 1993].

Bioavailability For the enteric coated tablet form, 77%.

Half-life 1 to 2 h in good metabolisers (pantoprazole); 6 h in poor metabolisers (drug); 1.5 h (metabolites).

Volume of Distribution 0.15 L/kg; apparent volume of distribution also reported as 11.0 to 23.6 L.

Clearance Plasma, 0.1 L/h/kg. Total, 7.6 to 14.0 L/h.

Distribution in Blood Pantoprazole and metabolites are essentially located in blood plasma with only negligible penetration in erythrocytes. Blood : plasma ratio is 0.55.

Protein Binding Approximately 98% (primarily to albumin).

Note For a general review of proton pump inhibitors, see Richardson *et al.* [1998].

Dose 20 or 40 mg daily.

Huber R *et al.* (1990). High-performance liquid chromatographic determination of the H+/K+ ATPase inhibitor (BY 1023/SK&F 96,022) and its sulphone metabolite in serum or plasma by direct injection and fully automated pre-column sample clean-up. *J Chromatogr* 529: 389–401.

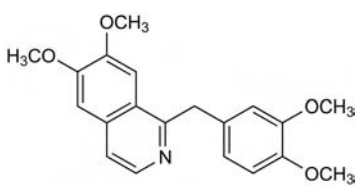
Papaverine

Antispasmodic

$C_{20}H_{21}NO_4$ = 339.4

CAS—58-74-2

IUPAC Name 1-[(3,4-Dimethoxyphenyl)methyl]-6,7-dimethoxyisoquinoline



Chemical Properties An alkaloid obtained from opium or prepared synthetically. Crystals or white crystalline powder. Mp 147°. Almost insoluble in water; soluble in hot benzene, glacial acetic acid and acetone; slightly soluble in chloroform, carbon tetrachloride and petroleum ether. pK_a 6.4 (25°). Log *P* (ether), 0.5.

Papaverine Hydrochloride

$C_{20}H_{21}NO_4$,HCl = 375.9

CAS—61-25-6

Proprietary Names *Albatran*; *Cerebid*; *Cerespan*; *Genabid*; *Oxadilene*; *Panergon*; *Pavabid*; *Pavacap*; *Pavacen*; *Pavakey*; *Pavarine*; *Pavased*; *Pavatine*; *Paverolan*; *Therapav*; *Vasal*; *Vasospan*.

Chemical Properties White crystals or crystalline powder. Mp 220° to 225° (from water). Soluble 1 in about 40 of water, 1 in 120 of ethanol and 1 in 10 of chloroform; practically insoluble in ether.

Papaverine Sulfate

$(C_{20}H_{21}NO_4)_2$,H_2SO_4,$5H_2O$ = 866.9

CAS—32808-09-6 (anhydrous)

Chemical Properties White crystals or crystalline powder. Soluble 1 in 2 of water, 1 in 20 of ethanol and 1 in 5000 of ether; slightly soluble in chloroform.

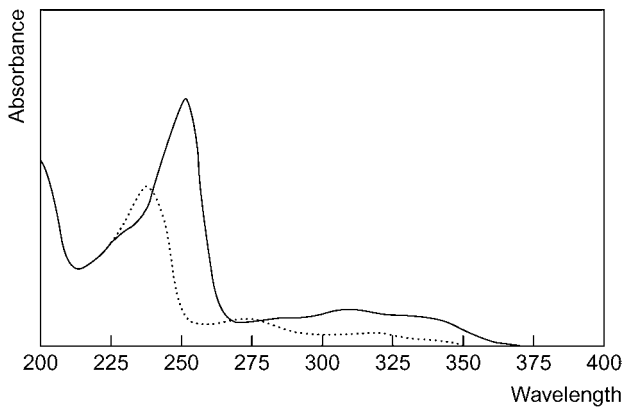
Colour Tests Liebermann's reagent—black; Mandelin's test—grey-green.

Thin-layer Chromatography System TA—R_f 0.61; system TB—R_f 0.08; system TC—R_f 0.65; system TE—R_f 0.69; system TL—R_f 0.47; system TAE—R_f 0.74; system TAF—R_f 0.74; system TAJ—R_f 0.66; system TAK—R_f 0.08; system TAL—R_f 0.93 (Dragendorff spray, positive; acidified iodoplatinate solution, positive).

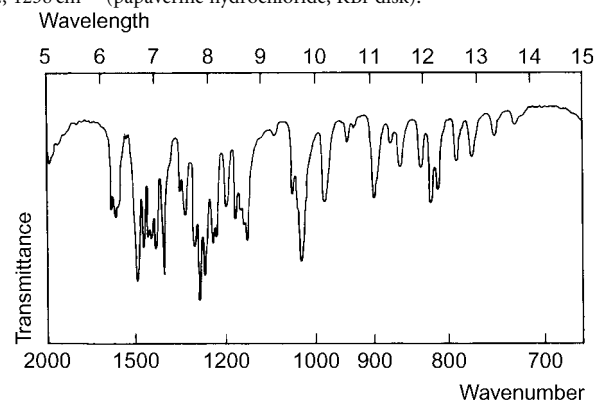
Gas Chromatography System GA—RI 2825; system GB—RI 2973.

High Performance Liquid Chromatography System HA—*k* 0.3; system HC—*k* 0.16; system HS—*k* 0.04; system HX—RI 363; system HY—RI 295; system HAA—retention time 12.1 min.

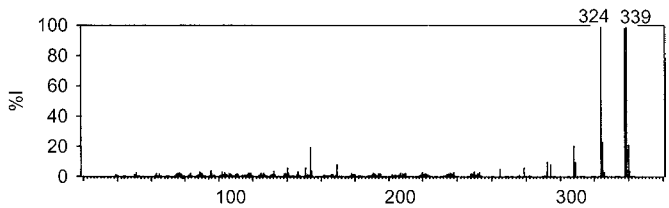
Ultraviolet Spectrum Aqueous acid—250 nm (A_1^1=1830a); aqueous alkali—236 (A_1^1=1994b), 277, 326 nm.



Infrared Spectrum Principal peaks at wavenumbers 1279, 1508, 1263, 1026, 1292, 1238 cm^{-1} (papaverine hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 339, 324, 338, 325, 340, 308, 154, 292.



Quantification

Blood **GC** AFID. Limit of detection, 5 µg/L [Bellia *et al.* 1978].

GC–MS Limit of detection, 5 µg/L [De Graeve *et al.* 1977].

HPLC UV detection. Limit of detection, 5 µg/L [Hoogewijs *et al.* 1981].

P

Plasma **HPLC** UV detection. Limit of detection, 2 µg/L [Pierson *et al.* 1979].
Disposition in the Body Readily and completely absorbed after oral administration but undergoes extensive first-pass metabolism. Metabolised by demethylation and glucuronic acid and sulfate conjugation of the resulting phenolic groups. About 50 to 80% of a dose is excreted in the urine in 48 h as conjugated phenolic metabolites, mostly 6-hydroxypapaverine (37% of the dose) and 4′-hydroxypapaverine (about 8.5% of the dose). <1% of a dose is excreted in the urine unchanged.
Therapeutic Concentration
After oral administration of single doses of 150 mg given as an elixir and tablets, respectively, to 6 subjects, mean peak plasma concentrations of 0.58 and 0.53 mg/L were attained in about 1 h [Meyer *et al.* 1980].
Half-life Plasma half-life, about 7 h, but there is wide variation and a biological half-life of 1 to 2 h is also reported.
Bioavailability About 30%.
Protein Binding About 90%.
Dose Up to 600 mg of papaverine hydrochloride daily.

Bellia V *et al.* (1978). Determination of papaverine in blood samples by gas chromatography using a flame-ionization and a nitrogen-phosphorus detector. *J Chromatogr* 161: 231–235.

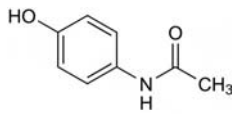
Paracetamol

Analgesic
$C_8H_9NO_2 = 151.2$
CAS—103-90-2

IUPAC Name *N*-(4-Hydroxyphenyl)acetamide
Synonyms Acetaminophen; *N*-acetyl-*p*-aminophenol.
Proprietary Names Paracetamol is an ingredient of *Anadin paracetamol*; *co-bucafAPAP*; *co-codamol*; *co-codAPAP*; *co-dydramol*; *co-hycodAPAP*; *co-methiamol*; *co-oxycodAPAP*; *co-proxamol*; *co-proxAPAP*; *Disprol*; *Galpamol*; *Mandanol*; *Medinol*; *Miradol*; *Obimol*; *Paldesic*; *Panadol*; *Salzone*.



Chemical Properties White crystals or crystalline powder. Mp 169.0° to 170.5°. Very slightly soluble in cold water, considerably more soluble in hot water; soluble in ethanol, methanol, dimethylformamide, ethylene dichloride, acetone and ethyl acetate; very slightly soluble in chloroform; slightly soluble in ether; practically insoluble in petroleum ether, pentane and benzene. pK_a 9.5 (25°). Log *P* (octanol/water), 0.5. Extraction yield (chlorobutane), 0 [Demme *et al.* 2005].
Colour Tests Ferric chloride—blue; Folin–Ciocalteu reagent—blue; Liebermann's reagent—violet; Nessler's reagent—brown (slow).
Potassium dichromate—boil 0.1 g with 1 mL hydrochloric acid for 3 min; add 10 mL of water cool, and add 0.05 mL 0.02 mol/L potassium dichromate—violet, developing slowly (which in contrast to phenacetin does not become red).
Thin-layer Chromatography System TA—R_f 0.95; system TB—Rf 0.00; system TD—R_f 0.15; system TE—R_f 0.45; system TF—R_f 0.32; system TAD—R_f 0.26; system TAE R_f 0.77; system TAJ—R_f 0.30; system TAK—R_f 0.05; system TAL—R_f 0.73 (acidified potassium permanganate solution—positive; ferric chloride—faint blue).

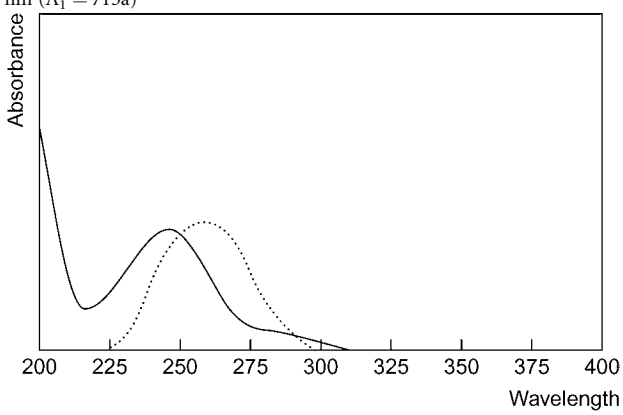
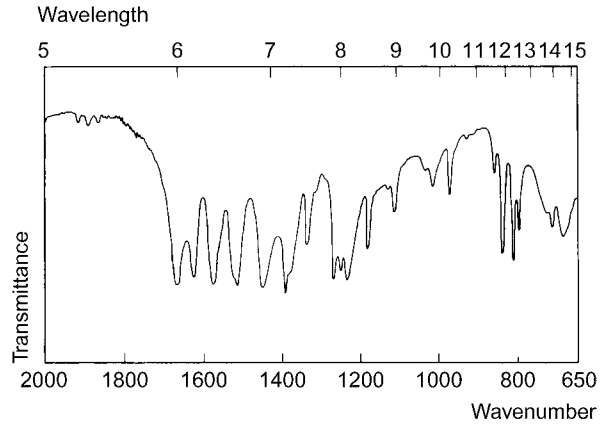
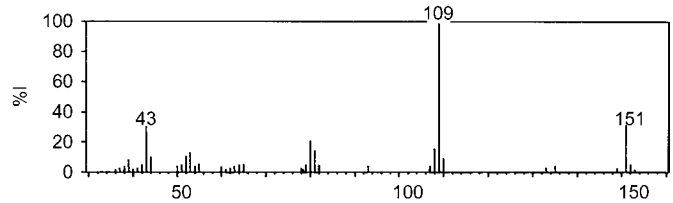
High Performance Liquid Chromatography System HD—*k* 0.1; system HW—*k* 0.32; system HX—RI 264; system HY—RI 241; system HZ—RT 1.9 min; system HAA—RT 5.6 min; system HAM—RT 2.0 min; system HAX—RT 4.8 min; system HAY—RT 3.7 min.
Ultraviolet Spectrum Aqueous acid—245 nm ($A^1_1 = 668a$); aqueous alkali—257 nm ($A^1_1 = 715a$)



Infrared Spectrum Principal peaks at wave numbers 1506, 1657, 1565, 1263, 1227, 1612 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 109, 151, 43, 80, 108, 81, 53, 52 (paracetamol); 141, 43, 183, 44, 140, 80, 108, 52 (cysteine conjugate); 43, 141, 183, 42, 87, 41, 140, 165 (mercapturic acid conjugate).



Quantification

Blood **GC** Column: HP-5 (25 m × 0.25 mm i.d., 0.33 µm). Temperature programme: 100° for 1 min to 300° at 10°/min for 14 min. FID. Limit of detection not reported [Lo *et al.* 1997].
GC-MS Column: SGE BPX5 (12 m × 0.15 mm i.d., 0.44 mm). Temperature programme: 80° for 1 min to 300° at 20°/min. Limit of detection not reported [Speed *et al.* 2001]. Limit of detection not reported [Takayasu *et al.* 1993].
HPLC Column: LC_8 Nova-Pak (150 mm). Mobile phase: acetonitrile : 0.005 mol/L phosphate buffer (pH 6.0, 1 : 9). DAD. Limit of detection not reported [Singer *et al.* 2007]. Column: Hypersil C_{18} (75 × 4.6 mm i.d., 3 µm). Mobile phase: 20 mmol/L ammonium formate buffer (pH 3.5) : methanol (96 : 4 for 5 min to 46 : 54 at 15 min to 10 : 90 at 16 min for 2 min to 96 : 4 at 19 min for 5 min), flow rate 0.8 mL/min until 15 min when 1.0 mL/min until 19 min to 0.8 mL/min. UV detection (λ= 254 nm). Limit of detection, 600 pg [Oliveira *et al.* 2002]. Column: LC-8DB (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol : 0.1 mol/L potassium dihydrogen phosphate : water (20 : 10 : 5 : 65), flow rate 1.1 mL/min. UV detection (λ= 245 nm). Limit of detection not reported [Pufal *et al.* 2000]. Column: ODS-Hypersil (200 × 2.1 mm i.d., 5 µm). Mobile phase: 2 mmol/L phosphate buffer : acetonitrile (95 : 5 to 50 : 50 over 20 min for 10 min, to 95 : 5 over 1 min), flow rate 0.4 mL/min. DAD (λ= 210 nm). Limit of detection not reported [Lo *et al.* 1997]. Apex ODS II (150 × 0.005 mm, 0.5 µm). Mobile phase: water : acetonitrile : glacial acetic acid (425 : 50 : 25). UV/VIS detection. Limit of detection not reported [Williams, Pounder 1997]. Column: Ultrasphere ODS (150 × 4.6 mm i.d.). Mobile phase: acetonitrile : 0.01 mol/L phosphoric acid (7 : 93), flow rate 1.0 mL/min. Electrochemical detection. Limit of detection, 0.1 mg/L [Whelpton *et al.* 1993]. See also Koves [1995] and West [1981].
Plasma **GC** Column: Chromosorb W HP 100/120 mesh (1.5 m × 4 mm i.d.). Carrier gas: N_2, 40 mL/min. Temperature: 235°. FID. Limit of detection, 10 mg/L [Huggett *et al.* 1981]. Column: 3% SP2100 on Supelsoport 100/120 mesh (1.5 m × 4 mm i.d.). Carrier gas: N_2, 50 mL/min. Temperature: 300°. ECD. Limit of quantification, 5 mg/L [Chan, McCann 1979]. Column: 3% SP 2250 on 80/100 mesh chromosorb W, AW/DMCS (2 m × 2 mm i.d.). FID. Limit of detection, >0.1 µg [Evans, Harbison 1977].
GC-MS Column: 3% OBV-17 on 100/120 mesh Gas Chrom Q (1.21 m × 2 mm i.d.). Carrier gas: He, 20 mL/min. Temperature: 180°. SIM acquisition mode. Limit of detection, 0.1 mg/L [Garland *et al.* 1977].
HPLC Column: RP-C_{18}. Mobile phase: 0.1% potassium dihydrogen orthophosphate : propan-2-ol : tetrahydrofuran (100 : 1.5 : 0.1). Spectrophotometric detection (λ= 254 nm) [Jensen *et al.* 2004]. Column: CLC C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water (55 : 45), flow rate 0.8 mL/min. UV detection (λ= 230 nm). Limit of quantification, 0.550 mg/L, limit of detection, 0.208 mg/L [Nagaralli *et al.* 2003]. Column: µBondipak C_{18} (300 × 3.9 mm i.d., 10 µm). Mobile phase: methanol : acetonitrile : 20 mmol/L orthophosphoric acid (pH 3.2, 2 : 4 : 94). UV detection. Retention time: 9.3 min. Limit of detection, 0.2 mg/L [al Obaidy *et al.* 1995]. Column: Nova-Pak C_{18} (100 × 8 mm i.d., 5 µm). Mobile phase: 0.1 mol/L potassium dihydrogen orthophosphate : acetic acid : propan-2-ol (100 : 0.1 : 0.75), flow rate 1.5 mL/min. UV detection (λ= 254 nm). Retention time: 11.8 min. Limit of detection, 1–2 ng [Lau, Critchley 1994]. See Blood [Whelpton *et al.* 1993].

Column: Spherisorb SI (250 × 4.6 mm i.d., 5 µm). Mobile phase: water-saturated chloroform : heptane : ethanol : acetic acid (225 : 700 : 75 : 1), flow rate 1.6 mL/min. UV detection (λ = 248 nm). Limit of detection, 50 µg/L [Buskin *et al.* 1982]. See also Douidar, Ahmed [1982], Kozer, Koren [2001], Munson *et al.* [1978], Palmer [1986], Rustum [1989] and Surmann [1980].

LC-MS Column: YMC-ODS-AQ C_{18} (100 × 2.0 mm i.d., 3 µm). Mobile phase: 0.3% acetic acid : methanol (100 : 0 for 3 min, to 2 : 98 for 1 min, to 100 : 0 for 1 min), flow rate 0.30 mL/min. MS-MS detection. Limit of quantification, 10 µg/L [Lou *et al.* 2010]. Column: Venusil Mp-C_{18} (50 × 4.6 mm i.d., 5 µm). Mobile phase: formic acid : 10 mmol/L ammonium acetate : methanol (1 : 40 : 60), flow rate 1.0 mL/min. ESI ionisation, MRM acquisition mode, MS-MS detection. Limit of quantification, 5.0 µg/L [Li *et al.* 2010]. Column: (150 × 2.1 mm i.d., 5 µm). Mobile phase: methanol : water with 0.5% formic acid (20 : 80). ESI, SRM acquisition mode, MS-MS detection. Limit of quantification, 0.2 mg/L [Feng *et al.* 2009]. Column: Zorbax SB C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : water : formic acid (80 : 20 : 0.5), flow rate 0.6 mL/min. APCI, SRM acquisition mode, MS-MS detection. Limit of quantification, 50 µg/L [Chen *et al.* 2005]. Column: Thermo Hypersil APS-2 Amino (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.4% glacial acetic acid in water (20 : 80), flow rate 1.0 mL/min. ESI, MRM acquisition mode, MS-MS detection. Limit of quantification, 0.1 mg/L [Yin *et al.* 2005]. See also Celma *et al.* [2000] and Matsumoto *et al.* [2003].

Serum **GC** See Plasma [Huggett *et al.* 1981]. Column: 2.8% OV-210 and 3.2% OV-1 on Chromosorb W HP 80/100 mesh (900 × 2 mm i.d.). Column: Carri (150 × 4.6 mm i.d.). Mobile phase: water: 1.1 mol/L ammonium acetate : methanol : 1 mol/L acetic acid (390 : 34 : 70 : 9), flow rate 1.17 mL/min. gas: N_2, 40 mL/min. Temperature: 120°. FID. Retention time: 1.9 min. Limit of detection, 7.5 mg/L [Kaa 1980]. Column: (150 × 4.6 mm i.d.). Mobile phase: water : 1 mol/L ammonium acetate : methanol : 1 mol/L acetic acid (390 : 34 : 70 : 9), flow rate 1.17 mL/min. ECD. Limit of quantification, 20 µg/L, limit of detection, 2 pg [Miner, Kissinger 1979].

HPLC Column: C_{18}. Mobile phase: 0.02 mol/L SDS. Electrochemical detection. Limit of detection, 0.83 µg/L [Bose *et al.* 2005]. Column: Chromolith RP-C_{18} (100 × 4.6 mm i.d.). Mobile phase: 0.1 mol/L potassium phosphate monobasic : acetonitrile (95 : 5), flow rate 9 mL/min. UV detection (λ = 220 nm). Limit of quantification, 3.75 mg/L, limit of detection, 1.25 mg/L [Pistos, Stewart 2004]. Column: TSK-GEL-ODS-80Tm (250 × 4.6 mm i.d.). Mobile phase: 50 mmol/L sodium acetate : methanol (93 : 7), flow rate 1.0 mL/min. Electrochemical detection. Limit of detection, 3 pmol/mg [Muldrew *et al.* 2002]. Column: Separon Six C_{18} (150 × 3.7 mm i.d., 5 µm). Mobile phase: methanol : 0.4% phosphoric acid. UV detection (λ = 254 nm). Limit of detection, 0.2 mg/L [Kotal *et al.* 1989]. Mobile phase: 4% acetonitrile : 12% acetic acid in water. Limit of detection, 2 mg/L [Osterloh, Yu 1988].

LC-MS Column: XTerra MS C_{18} (150 × 2.1 mm i.d., 3.5 µm). Mobile phase: acetonitrile : 10 mmol/L ammonium acetate (2 : 98 for 15 min to 25 : 75 over 14 min, for 20 to 50 min, to 2 : 98 over 20 min), flow rate 0.15 mL/min. Positive ion mode, SIM acquisition mode. Limit of detection, 1 mg/L [Hori *et al.* 2006].

Urine **GC** See Plasma [Chan, McCann 1979].

GC-MS See Blood [Takayasu *et al.* 1993].

HPLC Column: LiChroCART (250 × 4 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol : 0.05% trifluoroacetic acid in water (3 : 1 : 96 to 29 : 1 : 70 to 49 : 1 : 50), flow rate 1.2 mL/min. DAD. Limit of quantification, 0.44 mg/L, limit of detection, 0.15 mg/L [Baranowska *et al.* 2009]. See Serum. Limit of detection, 0.74 µg/L [Bose *et al.* 2005]. See Plasma [Jensen *et al.* 2004]. See Blood [Pufal *et al.* 2000]. UV detection [Di Girolamo *et al.* 1998]. Column: RP-18 (250 × 4 mm i.d., 5 µm). Mobile phase: water : acetonitrile : TEA (pH 2.5, 99.99 : 0.001 : 0.5), flow rate 1.7 mL/min. UV detection (λ = 254 nm). Limit of detection, 1 mg/L [Retaco *et al.* 1996]. See also al Obaidy *et al.* [1995], Douidar, Ahmed [1982], Lau, Critchley [1994], Wilson *et al.* [1982] and Wong *et al.* [1986].

LC-MS Column: ChromSpeed monolithic (50 × 4.6 mm i.d.). Mobile phase: 0.1% formic acid : acetonitrile with 0.1% formic acid (100 : 0 to 60 : 40), flow rate 2 mL/min. Limit of detection not reported [Johnson, Plumb 2005]. Column: Acquity (50 × 2.1 mm i.d., 1.7 µm). Mobile phase: 0.1% formic acid : acetonitrile with 0.1% formic acid (100 : 0 to 60 : 40), flow rate 500 µL/min. Limit of detection not reported [Johnson, Plumb 2005]. Column: Symmetry C_{18} (150 × 2.1 mm i.d., 3.5 µm). Mobile phase: 10 mmol/L ammonium acetate solution : acetonitrile (90 : 10 for 5 min, to 20 : 80 over 10 min for 10 min), flow rate 150 µL/min. ESI, SIM acquisition mode. Limit of quantification, 10 µg/L [Matsumoto *et al.* 2003].

CSF **HPLC** See Plasma [Kozer, Koren 2001]. See Blood [Pufal *et al.* 2000]. Partisil 5 ODS-3 (250 × 6.35 mm i.d., 5 µm). Mobile phase: methanol : water (25 : 75), flow rate 1.5 mL/min. UV detection (λ = 245 nm). Limit of detection, 2 µg/L [Bannwarth *et al.* 1992]. Mobile phase: 0.1 mol/L citrate/phosphate buffer : methanol (95 : 5), flow rate 2.7 mL/min. Electrochemical detection [Walsh *et al.* 1982].

Milk **HPLC** See Oral Fluid [Berlin *et al.* 1980].

Oral Fluid **HPLC** Column: TSkgel ODS-80Tm (250 × 4.6 mm i.d., 5 µm). Mobile phase: methanol, flow rate 1.0 mL/min. Fluorescence detection (λ_{em} = 560 nm, λ_{ex} = 540 nm). Limit of detection, 0.1 mg/L [Fujino *et al.* 2005]. See Urine. Mobile phase: water : acetonitrile : TEA (94 : 6 : 0.5), flow rate 1 mL/min. Limit of detection, 0.3 mg/L [Retaco *et al.* 1996]. See Plasma [al Obaidy *et al.* 1995]. Column: Bondapak C_{18}. Mobile phase: 0.05 mol/L sodium acetate (pH 4.0) : acetonitrile (93 : 10), flow rate 2.0 mL/min. Retention time: 3–5 min. Limit of detection, 0.5 mg/L [Berlin *et al.* 1980].

Stomach Contents **GC-MS** See Blood [Singer *et al.* 2007; Takayasu *et al.* 1993].

Vitreous Humour **HPLC** See Blood [Pufal *et al.* 2000; Singer *et al.* 2007].

Brain **HPLC** See Blood [Pufal *et al.* 2000].

Hair **HPLC** Column: Symmetry C_8 (250 × 4.6 mm i.d., 5 µm). Column: CP SIL8 CB (25 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.3 mL/min. Temperature programme: 50° for 2 min to 310° at 15°/min for 4.67 min. Mobile phase: acetonitrile : phosphate buffer (pH 3.8). UV detection. Limit of detection not reported [Gaillard, Pepin 1997].

Kidney **HPLC** See Blood [Pufal *et al.* 2000]. Column: Apex (3 µm). Mobile phase: distilled water : acetonitrile (86 : 14). UV detection (λ = 254 nm). Limit of detection, 50 µg/L [Colin *et al.* 1987]. See Blood [West 1981].

Liver **GC-MS** See Blood [Speed *et al.* 2001; akayasu *et al.* 1993].

Muscle **HPLC** See Blood [West 1981; Williams, Pounder 1997].

Disposition in the Body Small doses of paracetamol are readily absorbed but the absorption of larger doses varies considerably and is influenced by gastric emptying rate, the presence of food and the time of day. Paracetamol is widely distributed throughout most body fluids and is present in the saliva at concentrations paralleling those in plasma. It crosses the placenta and is found in breast milk. It undergoes first-pass metabolism and is metabolised mainly by conjugation to form glucuronides and ethereal sulfates; 3-hydroxylation also occurs followed by conjugation or *O*-methylation of the hydroxy group. Oxidation to a reactive metabolite thought to be acetylimino-*p*-benzoquinone occurs to a small extent with therapeutic doses but becomes more significant after larger doses, and this metabolite appears to be responsible for hepatic necrosis in paracetamol overdosage; it is normally detoxified by glutathione conjugation to form mercapturic acid and cysteine conjugates but after sources of glutathione are depleted, the free metabolite is available to bind covalently with liver cell protein; this binding occurs ~10–12 h after dosing. Approximately 90% of a therapeutic dose is excreted in the urine in 24 h; of the excreted material, 1–4% is unchanged, 20–30% is conjugated with sulfate, 40–60% is conjugated with glucuronic acid, 5–10% consists of the 3-hydroxy-3-sulfate, the 3-methoxyglucuronide and the 3-methoxy-3-sulfate metabolites, and ~5–10% consists of the mercapturic acid and cysteine conjugates; 3-methylthio-4-hydroxyacetanilide has also been identified at concentrations of <1%. Larger amounts of the mercapturic acid and cysteine conjugates are excreted in overdose.

Paracetamol is a metabolite of benorilate and phenacetin.

Therapeutic Concentration In plasma, usually in the range 10–20 mg/L. Plasma concentrations vary considerably between subjects. The glucuronide and sulfate conjugates accumulate in subjects with impaired renal function.

After a single oral dose of 1.5 g to 14 subjects, peak plasma paracetamol concentrations of 7.4–37 mg/L (mean, 24) were attained in 0.5–3 h (mean, 1.4) [Heading *et al.* 1973].

Following administration of 4 rectal doses of paracetamol, 20 mg/kg every 6 h, to 10 full-term neonates undergoing painful procedures or having painful conditions, mean peak serum concentrations were 10.79, 15.34 and 6.24 mg/L in the whole group, boys, and girls, respectively; the median time to peak serum concentration was 1.5 h after the first dose and 15 h for multiple doses. A starting dose of 30 mg/kg followed by 20 mg/kg rectally at intervals increasing from 6–8 h was proposed for neonates [van Lingen *et al.* 1999].

Of 24 children (over 25 kg) undergoing elective surgery and given paracetamol rectally at a dose of 1 or 40 mg/kg, most children in the 1 g group failed to attain therapeutic plasma levels whereas those in the 40 mg/kg group did (mean peak plasma concentration 7.8 vs. 15.9 mg/L attained at 3.8 and 2.6 h, respectively) [Howell, Patel 2003].

Toxicity The minimum lethal dose is ~10 g. Symptoms of hepatic damage do not occur for at least 12 h after overdosage but may not appear until 4–6 days later. Plasma concentrations have been used to indicate possible hepatic necrosis; at 4 h, hepatic necrosis is possible at concentrations of paracetamol of 120–300 mg/L, probable at concentrations above 300 mg/L, and unlikely at concentrations <120 mg/L. Similarly, at 12 h, concentrations above 120 mg/L indicate the probability of necrosis, concentrations of 50–120 mg/L indicate that it is possible, and concentrations below 50 mg/L indicate that it is unlikely.

The following postmortem tissue concentrations were reported in 3 deaths: 160, 200 and 387 mg/L in blood; 180, – and 900 mg/L in bile; –, – and 385 µg/g in liver; 200, – and 475 mg/L in liver blood; and 180, 620 and – mg/L in urine [Robinson *et al.* 1977].

A 6-year-old child died after receiving paracetamol overdosage over a period of 3 days. The prescribed dose for fever (associated with measles) had been 325 mg every 6 h, but the child's mother, believing paracetamol to be non-toxic, had progressively increased the dose, first in response to the fever and subsequently for abdominal pain (500 mg every 4 h for 48 h followed by 500 mg every 2–3 h for 12 h had been given). On admission to hospital 11 h after the last dose, the child's serum paracetamol concentration was 163 mg/L. Despite appropriate treatment, the child died on the 11th day [Blake *et al.* 1988].

Of 93 patients hospitalised for paracetamol toxicity, 80 were classified as suicidal and 13 had accidentally poisoned themselves in an attempt to relieve pain. Peak plasma levels were higher in the suicidal overdose group (mean, 121.7 mg/L) than in the accidental overdose group (64.5 mg/L) [Gyamlani, Parikh 2002].

Bioavailability 70–90%.

Half-life Plasma half-life after therapeutic doses, ~1–3 h in adults, ~5 h in neonates; plasma half-lives greater than ~4 h in adults are indicative of possible liver damage.

Volume of Distribution ~0.8–1.0 L/kg.
Clearance Plasma clearance, ~5 mL/min/kg.
Protein Binding In plasma, not bound at concentrations <60 μg/mL. In poisoned subjects, protein binding has been reported to vary between ~8 and 40%.
Dose Up to maximum of 4 g daily.
Note For a review of the pharmacokinetics of paracetamol, see Forrest *et al.* [1982]; for a review of its use in infants, see Arana *et al.* [2001]; for a review of paracetamol overdosage, see Kozer, Koren [2001].

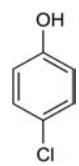
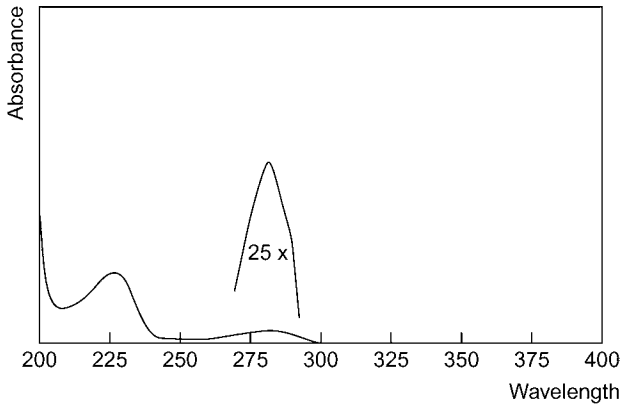
Parachlorophenol

Disinfectant
C_6H_5ClO = 128.6
CAS—106-48-9
IUPAC Name 4-Chlorophenol
Synonym *p*-Chlorophenol
Proprietary Names It is an ingredient of the proprietary preparations *Esofenol Ferri* and *Cresophene*.



Chemical Properties White or pink crystals. Mp about 43°. Soluble 1 in 60 of water; very soluble in ethanol, chloroform and ether. pK_a 9.2 (20°). Log *P* (octanol/water), 2.4.
Colour Test Ferric chloride—blue.
Gas Chromatography System GA—RI 1390.
Ultraviolet Spectrum Aqueous alkali—298 nm (A^1_1=194b); ethanol—284 (A^1_1=149b), inflexion at 291 nm.

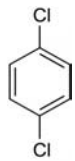


Mass Spectrum Principal ions at *m/z* 128, 130, 65, 39, 64, 63, 129, 99.

Paradichlorobenzene

Insecticide
$C_6H_4Cl_2$ = 147.0
CAS—106-46-7

IUPAC Name 1,4-Dichlorobenzene
Synonym Dichlorbenzol
Proprietary Names *Paracide*; *Para-zene*; *Paramoth*. It is an ingredient of *Cerumol*, *Cerumenol* and *Otoceril*.

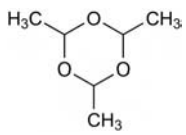


Chemical Properties Colourless shining crystals; slowly volatile in air. Mp 53° to 54°. Practically insoluble in water; soluble in most organic solvents. Log *P* (octanol/water), 3.4.
Ultraviolet Spectrum Ethanol—272 (A_1^1=27b), 265 (A_1^1=20b), 282 nm (A_1^1=17b).
Infrared Spectrum Principal peaks at wavenumbers 1012, 1091, 817, 1121, 951, 1000 cm^{-1}.
Mass Spectrum Principal ions at *m/z* 146, 148, 111, 75, 50, 150, 113, 147.
Disposition in the Body
Toxicity The estimated minimum lethal dose is 25 g and the maximum permissible atmospheric concentration is 75 ppm or 450 mg/m^3. Paradichlorobenzene is very irritant to the eyes, mucous membranes and skin, and it may cause narcosis.

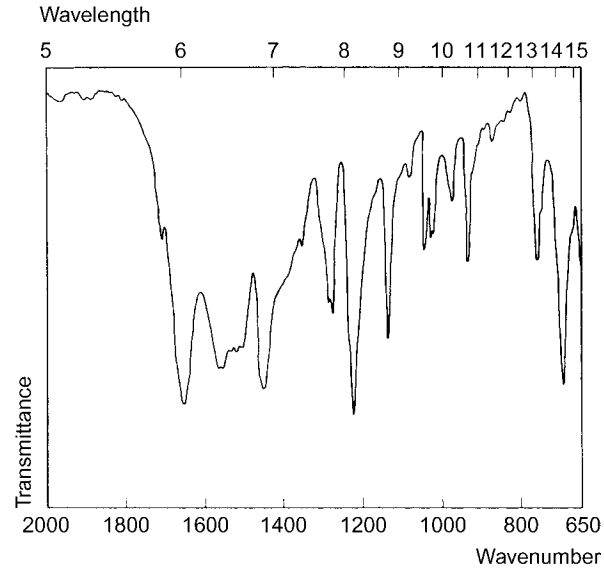
Paraldehyde

Anticonvulsant, Hypnotic, Sedative
$(C_2H_4O)_3$ = 132.2
CAS—123-63-7

IUPAC Name 2,4,6-Trimethyl-1,3,5-trioxane
Synonym Paracetaldehyde
Proprietary Name *Paral*
Note The trimer of acetaldehyde; 2,4,6-trimethyl-1,3,5-trioxane.



Chemical Properties A clear colourless or pale yellow liquid which decomposes and increases in toxicity on storage. Relative density 0.991–0.996. Mp 10° to 13°. Bp 123° to 126°. At low temperatures it solidifies to form a crystalline mass. Soluble 1 in 10 of water, but only 1 in 17 of boiling water; miscible with ethanol, chloroform and ether. Log *P* (octanol/water), 0.7.
Gas Chromatography System GA—paraldehyde RI 786, M acetaldehyde RI 372; system GI—paraldehyde RT 23.2 min, M acetaldehyde RT 0.7 min.
Infrared Spectrum Principal peaks at wavenumbers 1095, 1170, 946, 860, 846, 763 cm^{-1} (thin film).



Mass Spectrum Principal ions at *m/z* 43, 44, 87, 31, 45, 42, 131, 71; M acetaldehyde 29, 44, 43, 42, 26, 41, 28, 27.
Quantification
Blood GC Headspace analysis. Limit of detection, 2 mg/L [Anthony *et al.* 1978]. Headspace analysis after conversion to acetaldehyde. See Hancock *et al.* [1977].
Plasma GC See Blood [Anthony *et al.* 1978].
Serum GC See Hessel [1988].
Urine GC See Blood [Anthony *et al.* 1978].
Gastric Contents GC See Blood [Hancock *et al.* 1977].
Disposition in the Body Readily absorbed after oral, rectal or IM administration and distributed throughout the tissues. Probably metabolised by depolymerisation to acetaldehyde which is oxidised to acetic acid and ultimately to carbon dioxide. About 7% of an oral dose is exhaled unchanged in 4 h.
Therapeutic Concentration In plasma, usually in the range 30–100 mg/L. Concentrations in the CSF are about 70% of those in plasma.

After oral doses of 100 mg/kg, peak blood concentrations of 100–150 mg/L were attained in 0.5 h; following rectal administration of 100 mg/kg, peak blood concentrations of 50–100 mg/L were reported at 1.5–2 h [Anthony *et al.* 1978.]

Following an IM injection of 10 mL to 1 subject, a peak plasma concentration of 77 mg/L was attained in 1.2 h [Maes *et al.* 1969.]

Toxicity The minimum lethal dose has been estimated to be 25 mL orally and 12 mL rectally, although recovery has occurred after the ingestion of 125 mL. Toxic effects have been associated with blood concentrations of 200–400 mg/L. Blood concentrations of ≈500 mg/L, or less if alcohol has also been ingested, may be lethal. On storage, paraldehyde may depolymerise to acetaldehyde and acetic acid; severe acidosis and fatalities may follow the use of partly depolymerised material.

In 15 fatalities attributed to paraldehyde overdose, blood concentrations of 490–1600 mg/L were reported [Hayward, Boshell 1957.]

The following postmortem tissue concentrations were reported in 3 fatalities, 2 of which involved alcohol: blood 115, 480 and 140 mg/L, brain 150, 300 and 370 µg/g, kidney 190, 50 and 260 µg/g, liver 210, 200 and 600 µg/g, urine –, –, 130 mg/L [Rehling 1967].

Half-life Plasma half-life, 4–10 h.
Volume of Distribution About 1 L/kg.
Clearance Plasma clearance, about 2 mL/min/kg.
Dose 5 to 10 mL orally or by IM injection.

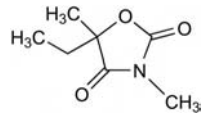
Paramethadione

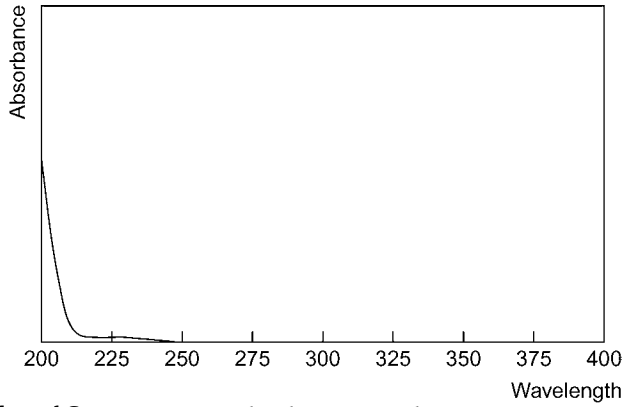
Anticonvulsant
$C_7H_{11}NO_3$ = 157.2
CAS—115-67-3

IUPAC Name 5-Ethyl-3,5-dimethyl-2,4-oxazolidinedione

Proprietary Name *Paradione*



Chemical Properties A clear colourless liquid. Refractive index, at 25°, 1.4485 to 1.4505. Sparingly soluble in water; freely soluble in ethanol, benzene, chloroform and ether. Log *P* (octanol/water), 1.1.
Colour Test Koppanyi-Zwikker test—violet.
Thin-layer Chromatography System TA—R_f 0.86; system TD—R_f 0.00; system TE—R_f 0.07; system TF—R_f 0.60; system TAD—R_f 0.56; system TAJ—R_f 0.87; system TAK—R_f 0.70; system TAL—R_f 0.94.
Gas Chromatography System GA—RI 1115; system GE—paramethadione RRT 0.06, *N*-desmethylparamethadione RRT 0.22 (both relative to phenytoin).
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.



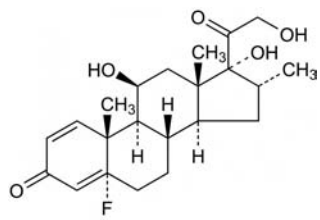
Infrared Spectrum Principal peaks at wavenumbers 1730, 1805, 1100, 1040, 1280, 1070 cm^{-1} (thin film).
Mass Spectrum Principal ions at *m/z* 43, 129, 57, 56, 41, 72, 39, 58.
Quantification
Serum **GC** FID. Limit of detection, 200 µg/L for paramethadione and 5-ethyl-5-methyloxazolidine-2,4-dione [Hoffman, Chun 1975].
Disposition in the Body Readily absorbed after oral administration. Metabolised by *N*-demethylation to 5-ethyl-5-methyloxazolidine-2,4-dione which is active and accumulates during chronic administration; 30 to 80% of a dose is excreted slowly in the urine as the *N*-desmethyl metabolite with <1% as unchanged drug.
Therapeutic Concentration
After a single oral dose of 300 mg to 3 subjects, peak serum concentrations of paramethadione of 5.4 to 7.6 mg/L (mean, 6.3) were attained in 0.5 to 1 h; concentrations of the *N*-desmethyl metabolite gradually increased to a plateau of 8.1 to 8.6 mg/L (mean, 8.4) at 32 h [Hoffman, Chun 1975].
Following oral administration of 900 mg daily to 2 subjects for 14 days, peak plasma concentrations of the *N*-desmethyl metabolite of about 240 mg/L were reported [Butler 1955].
Toxicity The estimated minimum lethal dose is 5 g.
Half-life Plasma half-life, paramethadione about 16 h after a single dose, *N*-desmethylparamethadione about 7 to 14 days during chronic administration.
Protein Binding Not significantly bound.
Dose 0.9 to 1.8 g daily.

Butler TC (1955). Metabolic demethylation of 3,5-dimethyl-5-ethyl 2,4-oxazolidinedione (paramethadione, paradione). *J Pharmacol Exp Ther* 113: 178–185.
Hoffman DJ, Chun AHC (1975). Paramethadione and metabolite serum levels in humans after a single oral paramethadione dose. *J Pharm Sci* 64: 1702–1703.

Paramethasone

Corticosteroid
$C_{22}H_{29}FO_5$ = 392.5
CAS—53-33-8

IUPAC Name (6*S*,8*S*,9*S*,10*R*,11*S*,13*S*,14*S*,16*R*,17*R*)-6-Fluoro-11,17-dihydroxy-17-(2-hydroxyacetyl)-10,13,16-trimethyl-7,8,9,11,12,14,15,16-octahydro-6*H*-cyclopenta[*a*]phenanthren-3-one
Synonym (6α,11β,16α)-6-Fluoro-11,17,21-trihydroxy-16-methylpregna-1,4-diene-3,20-dione

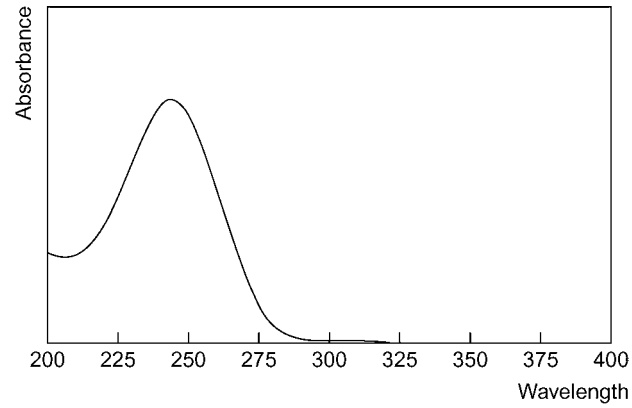


Chemical Properties Log *P* (octanol/water), 1.7.

Paramethasone Acetate

$C_{24}H_{31}FO_6$ = 434.5
CAS—1597-82-6
IUPAC Name 6α-Fluoro-16α-methylprednisolone 21-acetate
Proprietary names *Cordidene*; *Depodillar*; *Dilar*; *Haldrone*; *Metilar*; *Monocortin*; *Paramezone*.
Chemical Properties A white to creamy-white, fluffy, crystalline powder. Mp 228° to 241°, with decomposition. Practically insoluble in water; soluble in ethanol, acetone and ether; soluble 1 in 50 of chloroform.

Thin-layer Chromatography System TA—R_f 0.91; system TE—R_f 0.88; system TAJ—R_f 0.54; system TAK—R_f 0.39; system TAL—R_f 0.91; system TAM—R_f 0.91.
Ultraviolet Spectrum Paramethasone acetate: methanol—241 nm (A_1^1=500b).

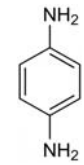


Infrared Spectrum Principal peaks at wavenumbers 1658, 1227, 1600, 905, 1745, 1034 cm^{-1} (Nujol mull).
Quantification
Plasma **HPLC** UV detection. For method of quantification for paramethasone and other corticosteroids, see Saito *et al.* [1979].
Urine **HPLC** See Plasma [Saito *et al.* 1979].
Dose Up to 12 mg of paramethasone acetate daily.

Saito Z *et al.* (1979). The high pressure liquid chromatography of corticoids. II. Analysis of synthetic corticoids in blood and urine (author's transl). *Nippon Naibunpi Gakkai Zasshi* 55: 1296–1306.

Paraphenylenediamine

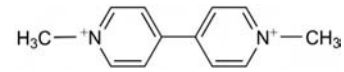
Dye
$C_6H_8N_2$ = 108.1
CAS—106-50-3
IUPAC Name Benzene-1,4-diamine
Synonyms 'Para'; *p*-phenylenediamine.



Chemical Properties White or reddish crystals. Mp 145° to 147°. Soluble 1 in 100 of water; soluble in ethanol, chloroform and ether. pK_a 6.2 (25°). Log *P* (octanol/water), −0.3.
Colour Tests Ferric chloride—green; Mandelin's test—yellow.
Thin-layer Chromatography System TA—R_f 0.61 (acidified iodoplatinate solution, positive).

Paraquat

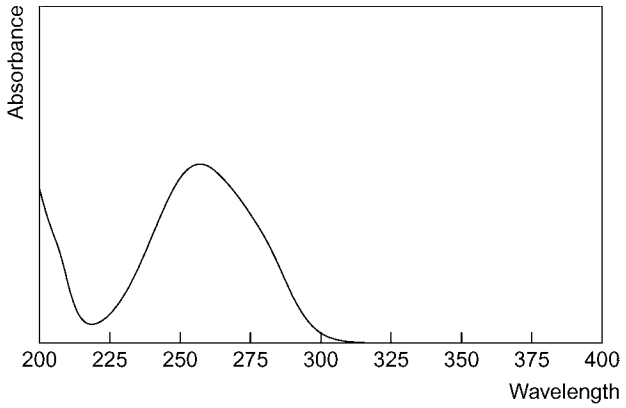
Herbicide
$C_{12}H_{14}N_2$ = 186.3
CAS—4685-14-7
IUPAC Name 1-Methyl-4-(1-methylpyridin-1-ium-4-yl)pyridin-1-ium
Synonyms 1,1′-Dimethyl-4,4′-bipyridinium; parakuat.



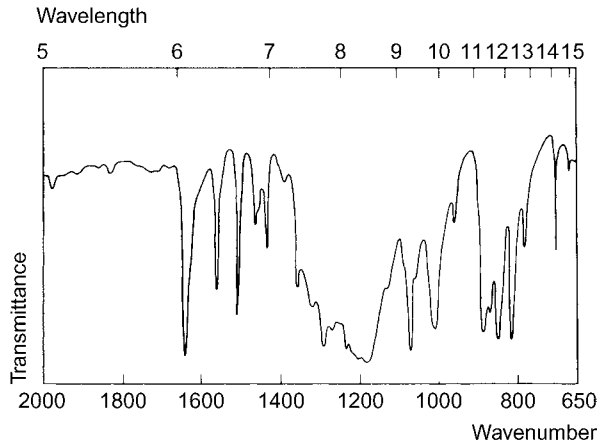
Chemical Properties Log *P* (octanol/water), −4.2.

Paraquat Dichloride
$C_{12}H_{14}Cl_2N_2 = 257.2$
CAS—1910-42-5
Proprietary Names *Dextrone X*; *Gramoxone*. It is an ingredient of *Dexuron*; *Pathclear*; *Weedol*.
Chemical Properties A white crystalline solid. Decomposes at ~300°. Very soluble in water. Hydrolysed by alkalis.

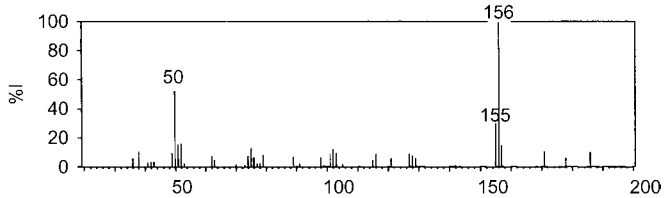
Note Unless otherwise stated, the analytical information given below refers to paraquat dichloride. For information on the monoene and diene reduction products for GC-MS analysis, see under Quaternary Ammonium Herbicides in Chapter 16.
Colour Test Sodium dithionite—blue.
Thin-layer Chromatography System TA—R_f 0.00; system TB—R_f 0.00; system TC—R_f 0.00; system TE—R_f 0.00; system TL—R_f 0.00; system TN—R_f 0.22; system TO—R_f 0.10; system TAB—R_f 0.00; system TAC—R_f 0.00; system TAE—R_f 0.00; system TAF—R_f 0.00 (acidified iodoplatinate solution—positive).
Gas Chromatography System GK—monoene reduction product RRT 0.36, diene reduction product RRT 0.58 (relative to caffeine).
High Performance Liquid Chromatography System HX—RI 00.
Ultraviolet Spectrum Aqueous acid—257 nm (A^1_1 = 693b).



Infrared Spectrum Principal peaks at wavenumbers 1174, 1638, 1064, 1229, 1284, 850 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 96, 42, 70, 72, 150, 122, 194, 43 (monoene reduction product); 96, 42, 148, 192, 94, 122, 134, 44 (diene reduction product).



Quantification

Blood **GC** Paraquat derivatives [Chen *et al.* 2008]. Thermionic specific detector. Limit of detection, 0.002 µg/L [Huang *et al.* 2008].

HPLC Column: Puresil C_{18}. Mobile phase: 10 mmol/L sodium octane sulfonate : 10 mmol/L triethylamine : 0.5 mol/L potassium bromide (pH 3.0), flow rate 1.0 ML/min. UV detection (λ = 290 nm). Limit of detection, 1 ng for paraquat and diquat [Fuke *et al.* 2002]. Column: Alluspher 100 RP-Select B (125 × 4.0 mm i.d., 5 µm). Mobile phase: 0.0125 mol/.L sodium hydroxide in water : 0.0125 mol/L sodium hydroxide in acetonitrile (90 : 10 to 10 : 90 in 15 min), flow rate 1.0 mL/min. DAD (λ = 220 to 300 nm). Limit of detection, 63 µg/L [Arys *et al.* 2000]. Column: µBondapak C_{18} (250 × 4.9 mm i.d., 10 µm). Mobile phase: 25% aqueous methanol : 10 mmol/L octane sulfonic acid : 13.4 mL/L *o*-orthophosphoric acid (pH 3.0), flow rate 1.3 mL/min. UV detection (λ = 254 nm). Limit of detection, 50 µg/L [Querée *et al.* 1985].

LC-MS Column: Atlantis dC_{18}. Mobile phase: 15 mmol/L heptafluorobutyric acid-20 mmol/L ammonium formate buffer (pH 3.3) : methanol (95 : 5 to 10 : 90 in 18 min), flow rate 0.2 mL/min. ESI, positive ion mode. Limit of quantification, 36.9 µg/L, limit of detection, 11.1 µg/L [Ariffin, Anderson 2006]. Column: Suplex pkb-100 (250 × 2.1 mm i.d., 5 µm). Mobile phase: heptafluorobutyric acid (pH 3.0) : acetonitrile 100 : 0 to 70 : 30 in 20 min). TIS, SRM acquisition mode. Limit of detection, 10 µg/L for paraquat and 5 µg/L for diquat [Lee *et al.* 2004].

Plasma **Colorimetry** Limit of detection, 50 µg/L [Jarvie, Stewart 1979].

TLC Stationary phase: Chromarod SII. Mobile phase: methanol : 2 mol/L hydrochloric acid (2 : 3). FID. Limit of detection, 50 ng [Ikebuchi *et al.* 1988].

GC Column: 3% Poly-A 135 on 80/100 mesh 01-1895 Supelcoport (1.8 m × 3.1 mm [6 ft × 0.125 in] i.d.). Carrier gas: O_2. Temperature: 190°. AFID. Retention time: 4 min 30 s. Limit of detection, 30 µg/L [van Dijk *et al.* 1977].

GC-MS Column: HP-5MS (30 m × 0.25 mm i.d., 0.1 µm). Carrier gas: He, 0.6 mL/min. Temperature programme: 80° for 1 min to 200° at 10°/min to 270° at 20°/min for 4 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of quantification, 0.1 mg/L, limit of detection, 0.05 mg/L for paraquat and diquat [de Almeida, Yonamine 2007].

HPLC Column: LiChrospher RP-18 (250 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 10 mmol/L sodium octane sulfonate in 0.05 mol/L orthophosphoric acid (40 : 60, pH 2.8). UV detection (λ = 258 nm). Limit of detection, 5 µg/L [Brunetto *et al.* 2003]. Column: ODS C_{18} (100 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : diethylamine-orthophosphoric acid buffer (pH 3, 10 : 90), flow rate 0.8 mL/min. UV detection (λ = 258 nm) Limit of quantification, 0.4 mg/L, limit of detection, 0.1 mg/L [Paixão *et al.* 2002]. Column: Zorbax RX-Silica (250 × 4.6 mm i.d., 5 µm). Mobile phase: 5 g/L sodium chloride : acetonitrile (96 : 4, pH 2.2), flow rate 1 mL/min. UV detection (λ = 260 nm). Limit of quantification, 0.1 mg/L [Taylor *et al.* 2001].

RIA Limit of detection, 5 µg/L [Levitt 1979].

Serum **HPLC** Column: Capcell Pak C_{18} UG120 (150 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 200 mmol/L phosphoric acid-0.1 mol/L diethylamine-12 mmol/L sodium 1-heptane sulfonate (1 : 4), flow rate 0.5 mL/min. UV detection (λ = 391 nm). Limit of quantification, 50 µg/L for paraquat and 100 µg/L for diquat [Hara *et al.* 2007]. Column: Inertsil ODS-3 (150 × 4.6 mm i.d., 5 µm). Mobile phase: 0.5% potassium bromide : 5% methanol containing 1 mL/L triethylamine (pH 3.0, 92 : 8), flow rate 1.0 mL/min. UV detection (λ = 256 nm). Limit of detection, 0.05 mg/L for paraquat and diquat [Ito *et al.* 2005]. See Plasma [Paixão *et al.* 2002]. Column: Inertsil ODS-2 (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.05 mol/L phosphate buffer (pH 2.0) containing 10 mmol/L sodium octane sulfonate (17 : 83), flow rate 1.0 mL/min. UV detection (λ = 280 nm). Limit of quantification, 0.1 mg/L [Lee *et al.* 1998]. Column: Microspher C_{18} (100 × 4.6 mm i.d., 3 µm). Mobile phase: 13.5 mL orthophosphoric acid : 10.3 mL diethylamine : 2.02 g sodium heptane sulfonate in 1000 mL water : methanol (80 : 20), flow rate 0.5 mL/min. UV detection (λ = 258 nm). Limit of quantification, 25 µg/L [Croes *et al.* 1993]. Mobile phase: 0.2 mol/L sodium dihydrogen phosphate (pH 3.0)-acetonitrile : 0.2 mol/L sodium dihydrogen phosphate (pH 3.0, 20 : 80), flow rate 1.0 mL/min. UV detection (λ = 290 nm). Limit of detection, 5 mg/L [Nakagiri *et al.* 1989].

LC-MS Column: Luna Polar RP (150 × 2.1 mm i.d.). Mobile phase: heptafluorobutyric acid : acetonitrile. TIS, positive ion mode, MRM acquisition mode. Retention time: 5.78 min. Limit of quantification, 5 µg/L for paraquat and 1 µg/L for diquat [Wang *et al.* 2008].

Note For a spectroscopy method, see Fuke *et al.* [1992]; for a radioimmunoassay see Fatori, Hunter [1980].

Urine **TLC** See Plasma [Ikebuchi *et al.* 1988].

GC See Blood. Limit of detection, 0.004 µg/L [Huang *et al.* 2008].

GC-MS See Plasma [de Almeida, Yonamine 2007].

LC-MS Column: HILIC silica (150 × 2.1 mm i.d., 5.0 µm). Mobile phase: 250 mmol/L ammonium formate (pH 3.7) : acetonitrile (60 : 40), flow rate 400 µL/min. ESI, positive ion mode, MRM acquisition mode. Limit of detection, 0.63 µg/L for paraquat, 0.13 µg/L for diquat [Whitehead *et al.* 2009]. See Blood [Lee *et al.* 2004].

ELISA Comparison with LC-MS [Koivunen *et al.* 2005].

Brain **HPLC** See Blood [Fuke *et al.* 2002].

Liver **HPLC** See Blood [Fuke *et al.* 2002]. UV detection. Limit of detection, 100 µg/L [Querée *et al.* 1985].

Tissues **HPLC** Column: ODS. Mobile phase: 0.5% potassium bromide : 5% methanol containing 1 mL/L triethylamine. UV detection (λ = 256 nm for paraquat and 310 nm for diquat). Limit of detection, 0.05 µg/g [Ito *et al.* 1993].

Disposition in the Body Less than 10% of paraquat is absorbed after ingestion. It is slowly excreted unchanged in the urine and faeces; detectable concentrations have been found in the urine for up to 26 days after acute ingestion.

Toxicity Several hundred fatalities caused by the accidental or suicidal ingestion of paraquat have occurred. The estimated minimum lethal dose is ~1 g. The maximum permissible atmospheric concentration is 0.1 mg/m^3 and the maximum acceptable daily intake is 2 μg/kg as the dichloride. Large amounts of paraquat produce death in a few hours or days from pulmonary oedema, haemorrhage and the toxic effects on the kidney, liver and heart. Smaller doses may result in death after a delay through progressive respiratory failure, and death may still ensue even after concentrations in blood or urine are almost undetectable. Tissue concentrations in fatal cases, therefore, vary considerably according to the length of survival after ingestion. Blood concentrations >~2 mg/L at 4 h and 0.1 mg/L at 24 h are likely to be lethal in most subjects but individual response is variable and some subjects with much higher concentrations have recovered.

In a review of 26 fatalities attributed to paraquat poisoning, the following postmortem tissue concentrations (mean, N) were reported:

	Death within 24 h	*Death within 1 to 7 days*	*Death after 8 days or more*
Blood (mg/L)	1.4–52 (14, 5)	0.2–4.4 (1.3, 8)	Not detected
Kidney (μg/g)	22.5–279 (79, 6)	1.4–74 (16, 10)	0.6–2.8 (1.5, 5)
Liver (μg/g)	8.8–141 (41, 6)	0.3–57.6 (8, 10)	0.2, 1.4 (2)
Lung (μg/g)	12.8–186 (78, 3)	1.6–21.4 (7, 6)	–
Urine (mg/L)	1210 (1)	4–15.8 (9, 3)	trace, 2.2 (2)

[Carson, Carson 1976].

In a review of 106 paraquat poisoning cases, of the 55 with known survival times, paraquat plasma levels in those who died within 1 day of ingestion were 2.3–636.6 mg/L (average, 127.6) while those who died 1–4 days after ingestion had plasma paraquat levels of 0.9–25.1 mg/L (average, 7). Those who died within 24 h of paraquat ingestion were likely to have plasma levels of more than 30 mg/L [Lee *et al.* 1999].

In a review of 375 patients who had ingested paraquat, 110 survived. The upper limit of plasma paraquat in survivors was 2.64 mg/L at 3 h and all patients with levels above 3.44 mg/L died. Minimum paraquat levels at deaths were low (0.12 mg/L at 5 h, 0.02 mg/L at 12 h and 0.01 mg/L at 24 h) [Gil *et al.* 2008].

A 71-year-old man who was admitted to hospital 2 days after ingesting Korean weed killer (and had ingested some more the evening before admission), died 6 days later after experiencing increasing respiratory distress. Serum paraquat measured on day 1 after admission was 0.7 mg/L; the quantity of paraquat ingested was ~90 mL of a 25% solution [Erickson *et al.* 1997].

A mother administered a paraquat solution to her 3 children (8 years, 6 years and 15 months) before taking an unknown amount of it herself. At 30 h after the ingestions, the serum paraquat concentrations of the children were 0.06, <0.006 and 0.025 mg/L, respectively. The children recovered following haemoperfusion and, in 2, plasmaphoresis and erythroporesis, but the mother died [Kalabalikis *et al.* 2001].

A crop-dusting accident resulted in the death of a worker who absorbed paraquat through the skin after sustaining 37% total body surface area burns. After 9.5 h of cutaneous exposure, a paraquat level of 169 mg/L was obtained at 20 h in blood [Gear *et al.* 2001].

In a fatality caused by massive ingestion of paraquat, the following postmortem concentrations were reported: blood 5.05 mg/L, urine 6.00 mg/L, stomach contents, 17.2 g/L, liver 4.86 μg/g, kidney 80.6 μg/g [Arys *et al.* 2000].

A 34-year-old woman had a blood paraquat level of 1.98 mg/L ~6 h after ingesting ~20 mL of 24% paraquat (Gramoxone). She developed multiple organ failure within 24 h and died on day 4 [Sittipunt 2005].

A 15-year-old girl survived after ingesting a potentially lethal dose of paraquat (~50 mL of a 20% preparation of paraquat hydrochloride) [Dinis-Oliveira *et al.* 2006].

An 81-year-old man died after minimal skin burn from paraquat exposure [Soloukides *et al.* 2007].

A 17-year-old woman at 36 weeks of gestation survived after attempting suicide by ingesting half a glass of 27.6% paraquat (Gramoxone). A male infant was delivered by emergency caesarean section and survived, but at age 10 months still had evidence of chronic lung disease [Chomchai, Tiawilai 2007].

For a case of fatal IV paraquat poisoning and a discussion of findings from other cases of IV poisoning, see Chen *et al.* [2009]; for a report of survival after a massive dose of paraquat, see Lalloo, Ambaram [2008]. Parathion

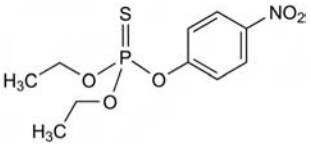
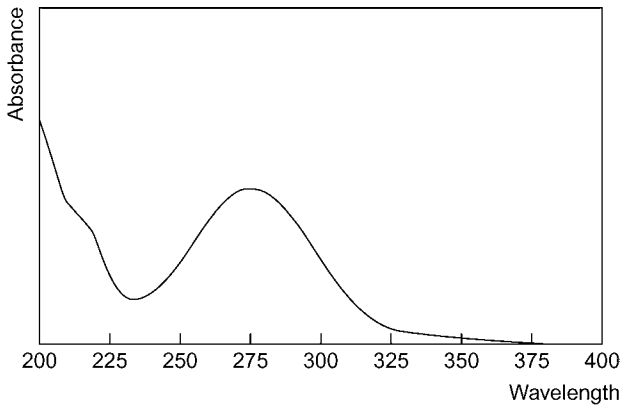
Insecticide
$C_{10}H_{14}NO_5PS = 291.3$
CAS—56-38-2

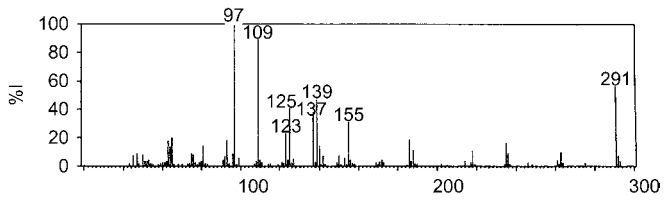
IUPAC Name Phosphorothioic acid *O*,*O*-Diethyl *O*-(4-nitrophenyl) ester
Proprietary Names *Alkron*; *Aphamite*; *Folidol*; *Fostex E*; *Fosferno 20*; *Niran*; *Nitrostigmine*; *Paraphos*; *Rhodiatox*; *Thiophos*.



Chemical Properties A pale yellow liquid which is decomposed by heat and darkens on exposure to light. Mp 6°. Bp 375°. Refractive index, at 25°, 1.5367. Practically insoluble in water; miscible with most organic solvents. It is rapidly hydrolysed in alkaline solution. Log *P* (octanol/water), 3.8. Extraction yield (chlorobutane), 1 (for both parathion ethyl and parathion methyl) [Demme *et al.* 2005].
Colour Tests Palladium chloride—brown; phosphorus test—yellow.
Thin-layer Chromatography System TW—parathion R_f 0.81, parathion methyl R_f 0.77; system TX—parathion ethyl R_f 0.41, parathion methyl R_f 0.30; system TY—parathion ethyl R_f 0.84, parathion methyl R_f 0.73.
Gas Chromatography System GA—parathion ethyl RI 1950; parathion methyl RI 1855; M (amino-) RI 1892; M (*p*-nitrophenol) RI 1525; paraoxon RI 1895; system GK—parathion ethyl RRT 1.04; parathion methylRRT 0.96 (both relative to caffeine).
High Performance Liquid Chromatography System HY—paraoxon RI 428; system HZ—parathion RT 35.5 min; paraoxonRT 6.5 min, paraoxon decomposition RT 3.7 min.
Ultraviolet Spectrum Ethanol—274 nm (A^1_1=343b).



Infrared Spectrum Principal peaks at wavenumbers 1020, 925, 1515, 1219, 1587, 970 cm^{-1}.
Mass Spectrum Principal ions at *m/z* 97, 109, 291, 139, 125, 137, 155, 123.



Quantification
Blood **GC-MS** Limit of detection, 0.01–0.03 µg/g for parathion-ethyl, parathion-methyl and other pesticides [Musshoff *et al.* 2002]. GC with ECD confirmed by GC-MS. For method for quantification of parathion and other pesticides, see García-Repetto *et al.* [2001]. Limit of detection, 0.02–0.05 µg/g [Musshoff *et al.* 1999].
Plasma **Radioimmunoassay** Limit of detection, 100 µg/L [Ercegovich *et al.* 1981].
Urine **GC** ECD. Limit of detection, 20 µg/L for 4-nitrophenol [Bradway, Shafik 1973].

HPLC For method for quantification of paranitrophenyl sulfate, see Oneto *et al.* [1995].
Disposition in the Body Parathion is activated in the liver by metabolism to paraoxon. Parathion and paraoxon are further metabolised to diethylthiophosphoric acid (DETP), diethylphosphoric acid (DEP), and 4-nitrophenol which are the major urinary excretion products although DETP and DEP are unstable in stored urine. Urinary 4-nitrophenol concentrations may be indicative of the extent of exposure to parathion. 4-Nitrophenol is rapidly excreted in the urine and is not detectable 48 h after exposure by inhalation or ingestion, but excretion is more prolonged after exposure of intact skin due to the much slower absorption of parathion by this route. Aminoparathion has been detected in postmortem blood and tissues.

Urinary 4-nitrophenol concentrations ranged from 0.4–13.2 mg/L in 23 occupationally-exposed asymptomatic workers and correlated well with serum-parathion concentrations which were in the range 0.003–0.20 mg/L [Roan *et al.* 1969].

Toxicity The estimated minimum lethal dose by inhalation or ingestion is 20 mg and the maximum permissible atmospheric concentration is 0.1 mg/m^3. Urinary concentrations of about 2 mg/L or more of 4-nitrophenol may be associated with severe toxicity. Numerous fatalities have occurred due to contamination of food by parathion and also from suicidal ingestion.

The following postmortem tissue concentrations were reported in 19 fatalities due to parathion poisoning (determined by a bioassay based on cholinesterase inhibition): blood 0.5–34 mg/L (mean, 9.0, 11 cases); brain 0.9–12.5 µg/g (mean, 4.9, 4 cases); kidney 0.2–11.9 µg/g (mean, 3.3, 9 cases); liver 0.08–120 µg/g (mean, 11, 13 cases); urine 0.4–78 mg/L (mean, 10, 10 cases) [Heyndrickx, De Clerc 1977].

In 2 fatalities due to parathion, the following postmortem tissue concentrations, mg/L or µg/g, were reported:

	Parathion	*Aminoparathion*
Blood	0.01, 0.15	0.27, 6.7
Bile	—, 0.63,	—, 0.31
Liver	ND, ND	0.47, 32
Urine	ND, —	0.02, —

(ND=not detected)
[Chan *et al.* 1983].

Half-life Derived from urinary excretion data, about 8 h.

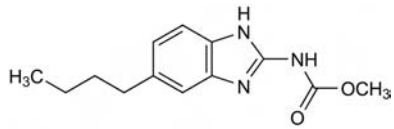
Parbendazole

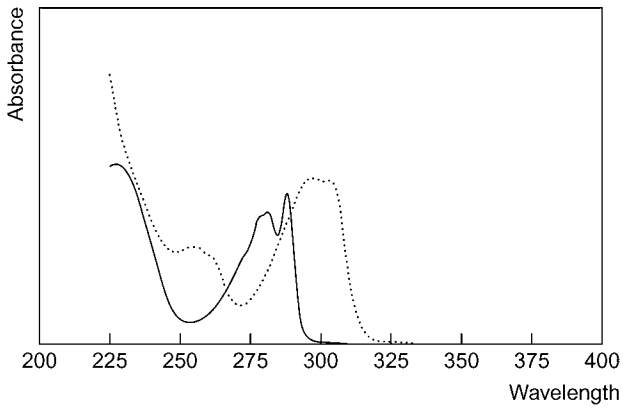
Anthelmintic (Veterinary)
$C_{13}H_{17}N_3O_2 = 247.3$
CAS—14255-87-9

IUPAC Name Methyl *N*-(6-butyl-1*H*-benzimidazol-2-yl)carbamate
Synonym (5-Butyl-1*H*-benzimidazol-2-yl)carbamic acid methyl ester
Proprietary Names *Helmatac*; *Verminum*; *WormGuard*.



Chemical Properties A white crystalline powder. Mp 225° to 227°, with decomposition. Practically insoluble in water; soluble 1 in 900 of ethanol and 1

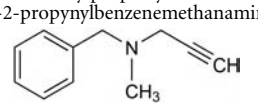
in 300 of chloroform; very slightly soluble in ether; soluble in dilute mineral acids. Log *P* (octanol/water), 3.6.
Colour Test Dissolve 5 mg in 5 mL of 0.1 mol/L hydrochloric acid and add 3 mg of *p*-phenylenediamine dihydrochloride; shake to dissolve and add 0.1 g of zinc powder. After mixing, allow to stand for 2 min and add 10 mL of ferric ammonium sulfate solution—a blue or violet-blue colour develops.
Thin-layer Chromatography System TA—R_f 0.70 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—not eluted.
High Performance Liquid Chromatography System HAA—retention time 18.2 min.
Ultraviolet Spectrum Aqueous acid—281, 288 nm (A_1^1=760a); aqueous alkali—254, 297 (A_1^1=816b), 303 nm.



Infrared Spectrum Principal peaks at wavenumbers 1626, 1600, 1274, 1093, 1100, 1193 cm^{-1} (KBr disk).

Pargyline

Antihypertensive
$C_{11}H_{13}N$ = 159.2
CAS—555-57-7
IUPAC Name *N*-benzyl-*N*-methylprop-2-yn-1-amine
Synonym *N*-Methyl-*N*-2-propynylbenzenemethanamine

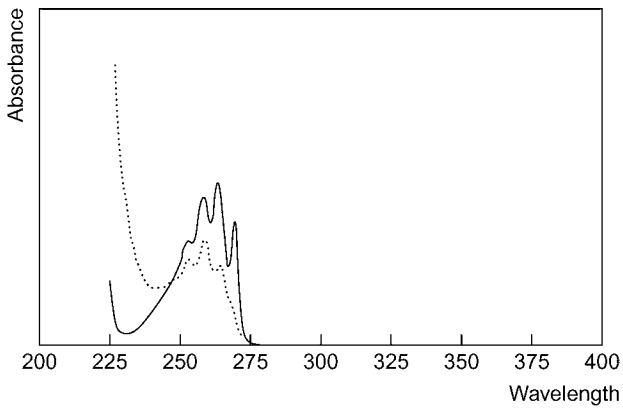


Chemical Properties pK_a 6.9. Log *P* (octanol/water), 2.0.

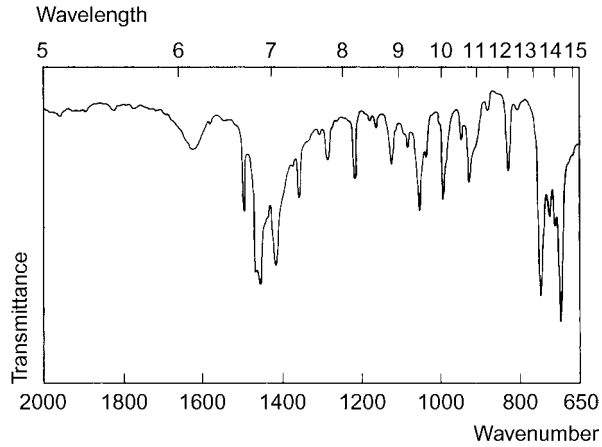
Pargyline Hydrochloride

$C_{11}H_{13}N,HCl$ = 195.7
CAS—306-07-0
Proprietary Name *Eutonyl*
Chemical Properties A white crystalline powder. Mp 154° to 155°; sublimation occurs when kept at raised temperatures. Soluble 1 in 0.6 of water, 1 in 5 of ethanol and 1 in about 7 of chloroform. Aqueous solutions are unstable.

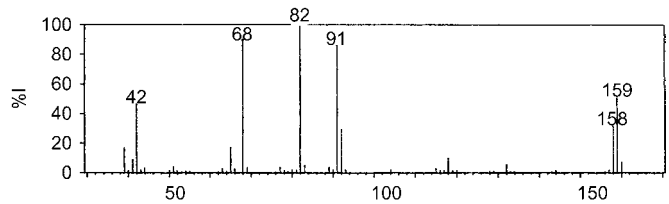
Thin-layer Chromatography System TA—R_f 0.70; system TE—R_f 0.60; system TAE—R_f 0.77; system TAJ—R_f 0.71; system TAK—R_f 0.20; system TAL—R_f 0.93 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1214; system GB—RI 1257; system GC—RI 1440.
High Performance Liquid Chromatography System HA—*k* 0.2; system HY—RI 203.
Ultraviolet Spectrum Aqueous acid—251, 256, 261 (A_1^1=16a), 268 nm; aqueous alkali—252, 257, 263 nm.



Infrared Spectrum Principal peaks at wavenumbers 697, 746, 714, 724, 1052, 1515 cm^{-1} (KBr disk).



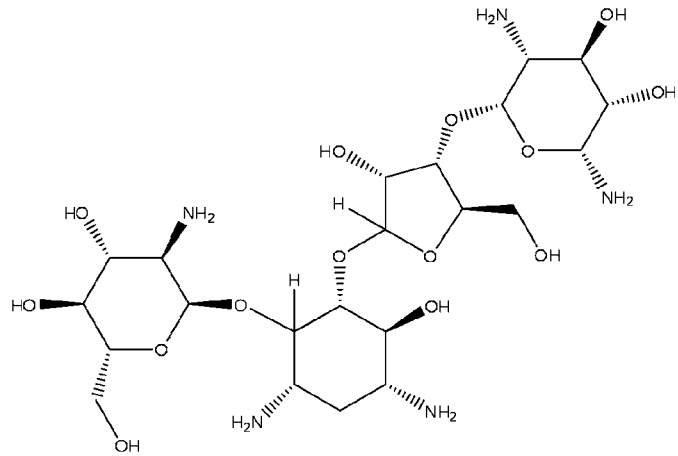
Mass Spectrum Principal ions at *m/z* 82, 68, 91, 159, 42, 158, 92, 65.



Dose Usually 25 to 50 mg of pargyline hydrochloride daily; maximum of 200 mg daily.

Paromomycin

Antibiotic
$C_{23}H_{45}N_5O_{14}$ = 615.6
CAS—7542-37-2
IUPAC Name (2*R*,3*S*,4*R*,5*R*,6*S*)-5-Amino-6-[(2*R*,3*S*,4*R*,6*S*)-4,6-diamino-2-[(3*R*,4*S*,5*R*)-4-[(2*R*,3*R*,4*R*,5*S*,6*S*)-3-amino-6-(aminomethyl)-4,5-dihydroxyoxan-2-yl]oxy-3-hydroxy-5-(hydroxymethyl)oxolan-2-yl]oxy-3-hydroxycyclohexyl]oxy-2-(hydroxymethyl)oxane-3,4-diol
Synonyms Antibiotic 1600; C 1448; FI 5853; D-glucosamine-deoxystreptamine-D-ribosediaminohexose.



Chemical Properties An antibiotic substance derived from cultures of certain *Streptomyces* species, one of which is *Streptomyces rimosus* forma *paromomycinus*. Amorphous white powder. Soluble in water; sparingly soluble in ethanol; moderately soluble in methanol.

Paromomycin Sulfate

Proprietary Names *Crestomicina*; *Gabbromycin(a)*; *Gabbroral*; *Humagel*; *Humatin*; *Humycin*; *Pargonyl*.
Chemical Properties Creamy-white to light-yellow hygroscopic powder. Soluble 1 in 1 of water; insoluble in ethanol, ether, and chloroform; soluble in dilute acids and solutions of alkali hydroxides.

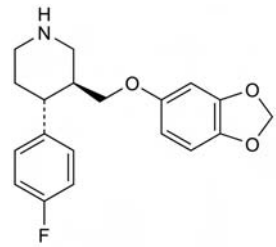
Colour Test Dissolve 10 mg in 5 mL of water, add 0.1 mL of pyridine and 2 mL of a 0.1% solution of ninhydrin, and heat at 70°. After 10 min the solution is a pale straw colour. Heat for a further 5 min at 100°— a deep purple colour develops.
Thin-layer Chromatography System T1—R_f 0.00 (location reagent potassium permanganate spray, positive reaction).

Schmitt and Mathis [1970] describe a system for the separation of antibiotics, including paromomycin sulfate.
Disposition in the Body Orally administered paromomycin is poorly absorbed. After the oral administration of 160 mg/kg of paromomycin to monkeys, about 3% of the dose was excreted in the urine in 24 h [Coffey *et al.* 1959].
Toxicity LD_{50} (oral): in mice >2275 mg/kg and in rats >1625 mg/kg.
Dose Up to 100,000 units/kg daily.

Coffey GL *et al.* (1959). Biological studies of paromomycin. *Antibiot Chemother* 9: 730–738.
Schmitt JP, Mathis C (1970). [Separation of antibiotics by thin-layer chromatography]. *Ann Pharm Fr* 28: 205–210.

Paroxetine

Antidepressant, Selective Serotonin Reuptake Inhibitor (SSRI)
$C_{19}H_{20}FNO_3$ = 329.4
CAS—61869-08-7
IUPAC Name (3S,4*R*)-3-(1,3-Benzodioxol-5-yloxymethyl)-4-(4-fluorophenyl) piperidine
Synonyms (3*S-trans*)-3-[(1,3-Benzodioxol-5-yloxy)methyl]-4-(4-fluorophenyl)piperidine; BRL-29060; FG-7051.

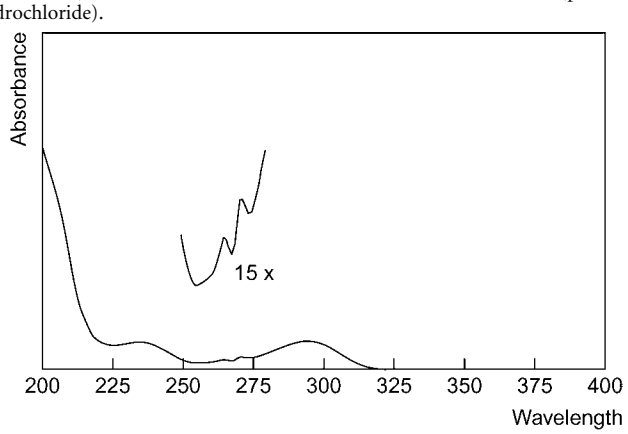


Chemical Properties pK_a 9.9. Log *P* (octanol/water), 3.95. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

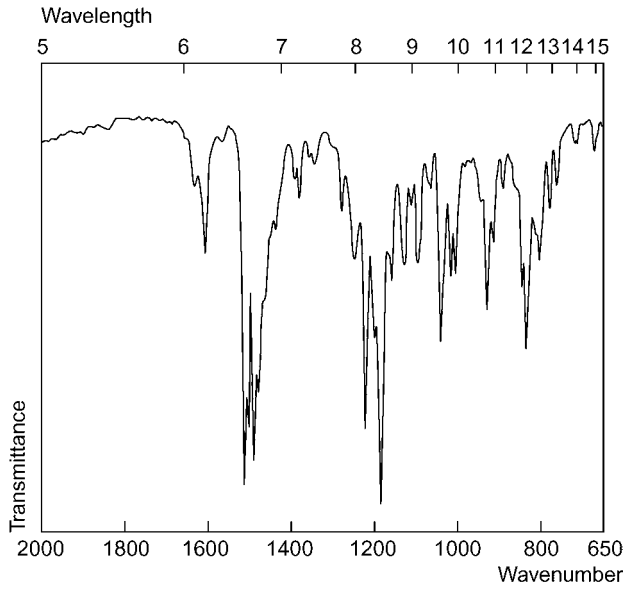
Paroxetine Hydrochloride Hemihydrate

$C_{19}H_{20}FNO_3$,HCl,$^1/_2H_2O$ = 369.85
CAS—110429-35-1
IUPAC Name (3*S*,4*R*)-3-[(1,3-Benzodioxol-5-yloxy)methyl]-4-(4-fluorophenyl)-piperidine hydrochloride hydrate
Synonyms BRL-29060A; (−)-*trans*-4-(4-fluorophenyl)-3-(3,4-methylenedioxyphenoxymethyl)piperidinehydrochloride hemihydrates; piperidine, 3-[(1,3-benzodioxol-5-yloxy)methyl]-4-(4-fluorophenyl)-, hydrochloride, hydrate (2 : 1).
Proprietary Names *Aropax*; *Casbol*; *Deroxat*; *Frosinor*; *Motivan*; *Paxil*; *PaxPar*; *Sereupin*; *Seroxat*; *Tagonis*.
Chemical Properties Crystals. Mp 129° to 131°.

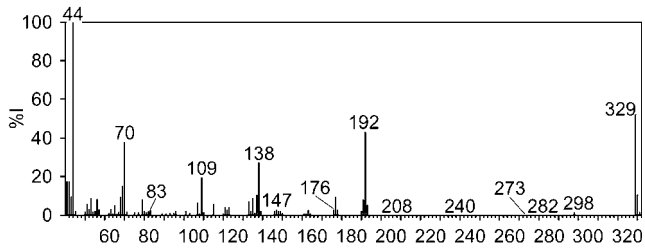
Thin-layer Chromatography System TB—R_f 0.04; system TE—R_f 0.40; system TAE—R_f 0.08.
Gas Chromatography System GB—RI 2691, M (desmethylenyl-3-methyl-) RI 2734, M (paroxetine) RI 2687; system GM—RRT 2.047 (relative to iprindole).
High Performance Liquid Chromatography System HX—RI 426; system HY—RI 337; system HZ—RT 5.6 min; system HAA—RT 15.3 min; system HAX—RT 11.1 min; system HAY—RT 5.8 min.
Ultraviolet Spectrum Aqueous acid (0.1 mol/L ammonium formate, pH 3)—295 nm; (0.025 mol/L sulfuric acid)—292.5, 234.5 nm; Aqueous acid (0.2 mol/L sulfuric acid)—233, 264, 270, 293 nm; basic—233, 264, 270, 292 nm (paroxetine hydrochloride).



Infrared Spectrum Principal peaks at wavenumbers 1185, 1512, 1490 cm^{-1} (paroxetine hydrochloride; KBr pellet).



Mass Spectrum Principal ions at *m/z* 44, 329, 192, 70, 138, 109, 176, 147.



Quantification

Blood **GC** Column: HP (25 m × 0.2 mm i.d., 0.11 µm). Carrier gas: He, 195 kPa. Temperature programme: 180° for 1 min, to 300° at 10°/min for 3 min. NPD detection. Limit of quantification, 376 µg/L, limit of detection, 113 µg/L [Martinez *et al.* 2004].

GC-MS Column: DB-5 MS (15 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 105° for 1 min, to 300° at 70°/min for 1.22 min. NICI, SRM acquisition mode. Limit of quantification, 20 µg/L, limit of detection, 20 ng/L [Deglon *et al.* 2010]. Column: HP-5 capillary (10 m × 0.25 mm i.d.). Temperature programme: 140° for 1 min to 300° at 20°/min for 3 min. EI ionisation, SIM acquisition mode [Singer, Jones 1997].

HPLC Column: LiChroCART (125 × 4 mm i.d., 5 µm). Mobile phase: water : 250 mmol/L phosphate buffer (pH 2.3) : methanol. DAD (λ= 220–350 nm) [Wille *et al.* 2009]. Fluorescence detection. Limit of quantification, 0.025 µmol/L [Kristoffersen *et al.* 1999].

LC-MS Column: C_{18}. Mobile phase: acetonitrile : 0.1% trifluoroacetic acid (50 : 50), flow rate 0.4 mL/min. ESI, SIM acquisition mode [Pufal, Sykutera 2008]. Column: XTerra RP-18. Mobile phase: acetonitrile : 4 mmol/L ammonium formate buffer (pH 3.2). ESI, MRM acquisition mode. Limit of quantification, 5 µg/L [Castaing *et al.* 2007].

Plasma **GC** ECD [Lai *et al.* 2000].

GC-MS Column: DB-5 MS (15 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.5 mL/min. Temperature programme: 160° for 1 min to 310° at 40°/min for 1 min. NICI. Limit of quantification, 0.469 µg/L [Leis *et al.* 2002]. Limit of quantification, 2 µg/L [Eap *et al.* 1998].

HPLC Column: LichroCART RP-C_{18} (125 × 4 mm i.d., 5 µm). Mobile phase: 0.05 mol/L phosphate buffer : methanol (pH 4.5, 55 : 45), flow rate 1.0 mL/min. UV detection (λ= 230 nm). Limit of detection, 20 µg/L [Chaves *et al.* 2009]. Column: Hypersil 120A (250 × 4.6 mm i.d., 5 µm). Mobile phase: 10 mmol/L sodium acetate buffer (pH 3.5) : tetrahydrofuran : acetonitrile (55 : 35 : 10), flow rate 2.0 mL/min. Fluorescence detection (λ_{ex}= 470 nm, λ_{em}= 530 nm). Limit of detection not reported [Khalil 2010]. Column: Nucleosil CN Mobile phase: acetonitrile : 10 mmol/L sodium acetate buffer (pH 3.5) : methanol (47 : 47 : 6), flow rate 1 mL/min. Fluorescence detection (λ_{ex}= 470 nm, λ_{em}= 530 nm). Limit of quantification, 4.14 µg/L, limit of detection, 1.37 µg/L [Darwish *et al.* 2009]. Column: LiChrospher 60 RP-select B (250 × 4 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol : 0.25

P

mol/L sodium acetate buffer (pH 4.5), flow rate 1.0 mL/min. UV detection (λ= 230 nm). Limit of quantification, 10 μg/L [Malfará *et al.* 2007]. Column: Phenomenex Luna C_{18} (250 × 3.0 mm i.d., 5 μm). Mobile phase: 25 mmol/L aqueous phosphate buffer (pH 2.5) : acetonitrile (66.7 : 33.3), flow rate 0.5 mL/min. Fluorescence detection (λ_{ex}= 294 nm, λ_{em}= 330 nm). Limit of detection, 1.2 μg/L [Mandrioli *et al.* 2007]. See also Brett *et al.* [1987], Chaves *et al.* [2007], Duverneuil *et al.* [2003], Erk, Biryol [2003], Foglia *et al.* [1997], Knoeller *et al.* [1995], Lopez-Calull, Dominguez [1999], Lucca *et al.* [2000], Naidong, Eerkes [2004], Onal, Oztunc [2006], Oztunc *et al.* [2002], Schatz, Saria [2000], Shin *et al.* [1998], Titier *et al.* [2003], Wille *et al.* [2005] and Zainaghi *et al.* [2003].

LC-MS Column: Aquity UPLC Hypersil Gold C_{18} (100 × 2.1 mm i.d., 1.9 μm). Mobile phase: acetonitrile : 0.1% glacial acetic acid (50 : 50), flow rate 0.350 mL/min. Limit of quantification, 26.8 μg/L [Bhatt, Shah 2010]. Column: BDS Hypersil C_{18}. Mobile phase: 0.2% formic acid in methanol : acetonitrile (65 : 35). ESI. Limit of detection not reported [Shah *et al.* 2010]. Column: Sunfire C_{18} (20 × 2.1 mm i.d., 3.5 μm). Mobile phase: acetonitrile : 2 mmol/L ammonium formate (pH 3), flow rate 0.4 mL/min. ESI, MRM acquisition mode. Limit of quantification, 2 μg/L [De Castro *et al.* 2008]. Column: C_{18}. Mobile phase: acetonitrile : 5 mmol/L ammonium formate (4 : 3). ESI, MRM acquisition mode. Limit of quantification, 0.05 μg/L [Jhee *et al.* 2007]. Column: Intersil-C_8 (150 × 2 mm i.d., 5 μm). Mobile phase: methanol : 10 mmol/L ammonium acetate (pH 5.0) : acetonitrile (70 : 20 : 10), flow rate 0.10 mL/min. Limit of quantification, 0.10 mg/L, limit of detection, 0.05 mg/L [Shinozuka *et al.* 2006]. See also Juan *et al.* [2005], Massaroti *et al.* [2005], Segura *et al.* [2003] and Zhu, Neirinck [2002].

Serum **GC-MS** Limit of detection, 0.1 μg/L [Misri *et al.* 2000].

HPLC Column: Nucleosil 100-Protect 1 (250 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : 25 mmol/L potassium dihydrogen phosphate buffer (pH 7.0, 40 : 60), flow rate 1 mL/min. UV detection (λ= 230 nm). Limit of detection not reported [Frahnert *et al.* 2003]. Column: Beckman RP-C_{18}. UV detection (λ= 200.4 nm). Limit of quantification, 20 μg/L [Tournel *et al.* 2001]. UV detection (λ= 225 nm). Limit of detection, 1 μg/L [Hendrick *et al.* 2001]. Column: (100 × 2 mm i.d., 3 μm). Mobile phase: 0.02 mol/L potassium phosphate monobasic : *N,N*-demethyloctylamine : acetonitrile, flow rate 0.6 mL/min. UV detection. Limit of detection, 2 μg/L [Stowe *et al.* 2000]. Column: C_8 (150 × 4.6 mm i.d., 5 μm). Mobile phase: 10 mmol/L phosphate buffer : acetonitrile (2 : 1). Fluorescence detection (λ_{ex}= 295 nm, λ_{em}= 365 nm). Limit of detection, 5 μg/L [Gupta 1994].

LC-MS Column: Chromolith Speed ROD C_{18} (50 × 4.6 mm i.d., 5 μm). Mobile phase: 5 mmol/L acetate buffer (pH 3.9), flow rate 1.0 mL/min. ESI, MRM acquisition mode. Limit of quantification, 1.07 μg/L [Kirchherr, Kühn-Velten 2006].

Urine **GC-MS** HP (12 m × 0.2 mm i.d., 330 nm). Carrier gas: He, 1 mL/min. Temperature programme: 100° to 310° at 30°/min. EI ionisation. Limit of detection, at least 100 μg/L [Maurer, Bickeboeller-Friedrich 2000].

LC-MS Column: Synergi 4u MAX-RP 80A (150 × 2 mm i.d., 4 μm). Mobile phase: acetonitrile : 0.02% formic acid (66 : 34), flow rate 0.25 mL/min. Limit of quantification, 0.7 μg/L, limit of detection, 2.20 μg/L [Segura *et al.* 2003].

Milk **GC-MS** See Serum [Misri *et al.* 2000].

HPLC UV detection [Hostetter *et al.* 2004]. See Serum [Stowe *et al.* 2000].

Oral Fluid **GC-MS** Column: Ultra 1 (16.5 m × 0.2 mm i.d., 0.11 μm). Carrier gas: He, 0.8 mL/min. Temperature programme: 70° for 2 min, to 160° at 30°/min to 170° at 5°/min to 200° at 20°/min 220° at 10°/min to 300° at 30°/min. EI ionisation, SIM acquisition mode [Pujadas *et al.* 2007].

HPLC Column: C_{18}. Mobile phase: 0.05 mol/L sodium phosphate buffer (pH 5.0) : acetonitrile. UV detection (λ= 205 nm). Limit of quantification, 4 μg/L, limit of detection, 1 μg/L [Tsuruta *et al.* 2007].

LC-MS See Plasma [De Castro *et al.* 2008]. Column: Luna C_{18} (150 × 4.6 mm i.d., 5 μm). Mobile phase: methanol : water: 0.1% formic acid, flow rate 0.5 mL/min. ESI. Limit of detection not reported [Doherty *et al.* 2007].

Stomach Contents **GC-MS** See Blood [Singer, Jones 1997].

Brain **HPLC** See Blood [Wille *et al.* 2009].

Hair **HPLC** See Blood [Wille *et al.* 2009].

LC-MS See Oral Fluid [Doherty *et al.* 2007]. Column: C_{18} (150 × 4.6 mm i.d.). Mobile phase: methanol : water : formic acid : trifluoroacetic acid, flow rate 0.5 mL/min. ESI [Smyth *et al.* 2006].

Liver **GC-MS** [Maurer *et al.* 2000]. See Blood [Singer, Jones 1997].

Disposition in the Body Paroxetine is readily absorbed after oral administration and undergoes extensive first-pass hepatic metabolism: *O*-demethylenation in a reaction regulated by CYP2D6 gives rise to a catechol-type metabolite that is further *O*-methylated and conjugated with glucuronic acid and sulfate. Peak plasma concentrations can be observed ~5 h after administration. Paroxetine is distributed throughout the body, including the CNS, with only 1% remaining in the plasma. It is excreted mainly as metabolites in urine (~64%) and faeces (~36%). Less than 2% of a dose is found in urine as the parent drug. It is distributed in breast milk and widely distributed throughout the body.

Therapeutic Concentration The serum therapeutic concentration range is 10–75 μg/L; peak, 15–150 μg/L.

Twelve patients with biopsy-proven alcoholic cirrhosis, aged 28–69 years, and 6 healthy individuals with no signs of liver disease, aged 26–60 years, were administered 30 mg paroxetine hydrochloride daily for 14 days. The maximum steady-state concentration observed for the patients was 4.49 μg/L, measured on days 13 and 14, and the minimum was 3.43 μg/L. For the healthy subjects, the maximum was 2.48 μg/L and the minimum 1.53 μg/L [Dalhoff *et al.* 1991].

Toxicity The toxic serum concentration ranges from 350–400 μg/L.

A young man was found at home shivering and incoherent, followed later by numerous seizures. Four hours after he was found, he suffered from full cardiac arrest and it was impossible for the paramedics to resuscitate him because his jaw was unusually stiff and the paramedics could not open his mouth to intubate him. Toxicological analysis showed a paroxetine subclavian blood concentration of 1.58 mg/L, 15.3 mg/kg in liver and 0.0101 mg/g in the gastric contents. His death was actually attributed to a combined toxicity of moclobemide and paroxetine. Moclobemide was found in his blood at a concentration of 18.5 mg/L, in liver at 28.5 mg/kg and in the gastric contents at 1.116 mg/g [Singer, Jones 1997].

A young nurse was found in her flat with a femoral blood paroxetine concentration of 0.176 mg/L. Doxepine and desmethyldoxepine were also detected [Musshoff *et al.* 1999].

Half-life 12–40 h.

Volume of Distribution 3–28 L/kg.

Protein Binding 95%.

Dose The usual dose is 10 or 20 mg daily, which may be increased to 50 or 60 mg in increments if necessary, with a maintenance dose of 40 mg daily. In the elderly and debilitated patients: maximum 40 mg daily. Those with severe renal or hepatic impairment: 20 mg.

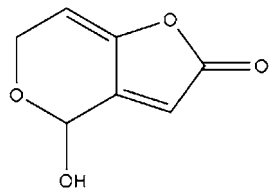
Patulin

Mycotoxin
$C_7H_6O_4 = 154.1$
CAS—149-29-1

IUPAC Name 4-Hydroxy-4,6-dihydrofuro[3,2-*c*]pyran-2-one
Synonyms Clavacin; clavatin; claviformin; expansine; 4-hydroxy-4*H*-furo[3,2-*c*]pyran-2(6*H*)-one; mycoin C3; penicidin.



Chemical Properties Toxic metabolite produced by several species of *Penicillium, Aspergillus* and *Byssochlamys*. The most commonly occurring fungus is *Penicillium expansum*, the apple blue mould rot, from which apple juices are the most important source of patulin in the human diet [Sforza *et al.* 2006]. Mp 110°, also reported as 105°–108°. Soluble in water and the common organic solvents apart from petroleum ether; very soluble in ethyl or amyl acetate. Log *P* (octanol/water), −2.4 [Meylan, Howard 1995]; 0.7 [Rychlik *et al.* 2004]. Unstable in alkali with loss of biological activity [O'Neil *et al* 2006]. Stable to heat in acidic media such as fruit juices [Li *et al.* 2007]. Juice extracts are quickly and easily derivatised with bis(trimethylsilyl) trifluoracetamide under mild conditions, and the trimethylsilyl ethers of the analytes are stable for at least several hours [Rupp, Turnipseed 2000]. Patulin is unstable in a basic environment and as a dry film [Trucksess, Tang 1999]. The silylation products of patulin are stable for at least 15 days if stored refrigerated at 4° [Suzuki *et al.* 1975].
Note For a study of the stability of patulin at a range of pH values at 25° see Brackett, Marth. [1979].
Thin-layer Chromatography Plates: RP-18 and KC-18. Solvent systems: A) methanol: water; B) acetonitrile: water; C) tetrahydrofuran: water. Location reagent: 4-(*p*-nitrobenzyl)pyridine for trichothecenes; UV detection (λ= 365 nm) for aflatoxins, ochratoxin A, citrinin; aluminium trichloride for sterigmatocystin; Azoene Fast Violet B for zearalenone; 3-methyl-2-benzthiazolinone hydrazone hydrochloride for patulin and penicillic acid. Solvent composition and R_f values reported as shown in the table below.

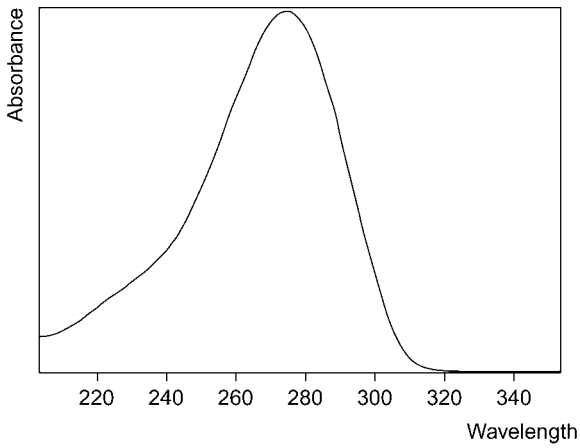
Ultraviolet Spectrum



Quantification

Serum **GC-MS** Column: DB-5 (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 2.0 mL/min. Temperature programme: 60° for 1 min to 250° at 10°/min. MID. Limit of detection, 200 ng/L [Rychlik 2003].

Other

Note For a TLC method for the quantification of patulin in apple juice see Betina [1985] or Gimeno, Martins [1983] and in cheese see Siriwardana, Lafont [1979].

GC Culture Filtrates of *Penicillium Urticae* NRRL 2159A. Column: Gas-Chrom Q coated with QF-1 or NPGS 80/100 mesh (1.88 m × 2.16 mm i.d.). Carrier gas: N_2, 30 mL/min (QF-1) or 27 mL/min. Temperature programme: 120° for 2 min to 200° at 4°/min for 4 min (QF-1) or 120° for 4 min to 200° at 4°/min for 16 min. FID. Retention time: ≈22.8 min on QF-1, 32.9 min on NPGS. Limit of detection, 12 mg/L for QF-1 [Ehman, Gaucher 1977]. Column: 10% DC-200 plus 15% QF-1 (1 : 1) on Gas-Chrom-Q (2.0 m × 3 mm i.d.). Carrier gas: N_2, 60 mL/min. Temperature: 175°. ECD. Retention time: 7.8 min [Suzuki *et al.* 1975].

GC-MS Apple Juice. Column: HP MS5 cross-linked 5% phenylmethylsilicone (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 2 min to 200° at 10°/min to 300° for 3 min. EI ionisation at 70 eV, SIM acquisition mode. Retention time: ≈10.1 min. Limit of quantification, 10 µg/L, limit of detection, 3 µg/L [Marks 2007]. SIM acquisition mode. Limit of detection, 1 µg/L [Llovera *et al.* 2005]. Column: DB-5 capillary (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 2.0 mL/min. Temperature programme: 60° for 1 min to 250° at 10°/min. EI ionisation at 70 eV. Limit of detection, 0.2 µg/L [Rychlik *et al.* 2004]. Column: HP Ultra 2 crosslinked 5% phenylmethylsilicone (25 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 2 min to 200° at 10°/min to 300° at 20°/min for 3 min. EI ionisation at 70 eV, MSD. Retention time ≈9.8 min. Limit of detection, 30 µg/L [Rupp, Turnipseed 2000]. Column: HP-5 MS cross-linked methylsilicone capillary (30 m × 0.25 mm i.d.). Carrier gas: He. Temperature programme: 80° for 1 min to 250° at 15°/min for 5 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, 4 µg/L [Llovera *et al.* 1999]. Column: DB-5 (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 2.0 mL/min. Temperature programme: 60° for 1 min to 250° at 10°/min. EI ionisation at 70 eV, MID. Retention time: 14.25 min. Limit of detection, 12 ng/L [Rychlik, Schieberle 1999]. Column: HP-5MS (30 m ×0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 50° for 2 min to 280° at 10°/min for 3 min. EI ionisation, SIM acquisition mode. Limit of quantification, 10 µg/L [Sheu, Shyu 1999].

HPLC Lactic Acid Bacteria. Column: SC-02-100 Prontosil C_{18} (100 × 2.1 mm i.d., 3 µm). Mobile phase: acetonitrile : water (1 : 99), flow rate 0.3 mL/min. UV detection (λ = 276 nm). Limit of detection, 25 µg/L [Fuchs *et al.* 2008]. Apple-Based Products. Column: Luna C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: water : acetonitrile (95 : 5), flow rate 0.5 mL/min. UV detection (λ = 276 nm). Retention time: ≈15 min. Limit of quantification, 0.3 µg/L, limit of detection, 0.1 µg/L [Gonzalez-Osnaya *et al.* 2007]. Column: XTerra MS C_{18} (100 × 2.1 mm i.d., 3.5 µm). Mobile phase: tetrahydrofuran : water (0.8 : 99.2), flow rate 0.2 mL/min. UV detection (λ = 276 nm). Retention time: 5.6 min. Limit of quantification, 23 µg/L, limit of detection, 8 µg/L [Li *et al.* 2007]. Column: Hypersil ODS C_{18} (125 × 4 mm i.d., 5 µm). Mobile phase: acetonitrile : water-acetic acid (99 : 1, 1 : 99 for 5 min to 10 : 90 for 10 min to 100 : 0 for 5 min to 1 : 99 for 10 min), flow rate 0.7 mL/min. DAD (276 nm). Retention time: 6.5 min. Limit of detection, 5 ppb [Mhadhbi *et al.* 2007]. Apple Juice. Column: Shim-Pack CLC-ODS (250 × 4 mm i. d., 5 µm). Mobile phase: water : ethanol-water (3 : 7, 84 : 16 for 19 min to 50 : 50 in 5 min for 14 min to 84 : 16 in 5 min for 7 min), flow rate 0.5 mL/min. DAD (λ = 230–320 nm). Retention time: 17.4 min. Limit of quantification, 7 µg/L, limit of detection, 3 µg/L [Iha & Sabino 2006]. Dried Figs. Column: Phenomenex C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: tetrahydrofuran : 3% acetonitrile (4 : 96), flow rate 0.5 mL/min. DAD (λ = 272 nm). Limit of detection, 0.1 ppb [Karaca, Nas 2006]. Apple-Based Products. Column: Synergi Hydro RP80 (250 × 4.6 mm i.d., 4 µm). Mobile phase: water : acetonitrile : 60% perchloric acid (990 : 10 : 1), flow rate 1.0 mL/min. UV detection (λ = 276 nm). Limit of detection, 12 µg/L [Arranz *et al.* 2005]. Conventional and Organic Fruit. Column: Synergi Hydro-RP (250 × 4.6 mm i.d., 4 µm). Mobile phase: water : acetonitrile : perchloric acid (96 : 4 : 0.1 for 18 min to 35 : 65 : 0 for 5 min), flow rate 1.0 mL/min. DAD (λ = 276 nm). Retention time: 13.7 min. Limit of quantification, 0.5 µg/kg [Piemontese *et al.* 2005]. Apple Juice. Column: Puresil C_{18} (250 × 4.6 mm i.d.). Mobile phase: 0.095% acetonitrile : acetonitrile (97 : 3), flow rate 1.0 mL/min. UV detection (λ = 276 nm). Retention time: ≈14.6 min. Limit of quantification, 10 µg/L, limit of detection, 4 µg/L [Watanabe, Shimizu 2005]. Column: Licrosphere 100 RP-18 (250 nm × 4 mm i.d.). Mobile phase: water : acetonitrile (99 : 1), flow rate 1.0 mL/min. UV detection (λ = 276 nm). Limit of detection, 20 µg/L [Bissessur *et al.* 2001]. Column: Phenomenex C_{18}(150 × 4 mm i.d., 5 µm). Mobile phase: water : acetonitrile (99 : 1), flow rate 1.0 mL/min. UV detection (λ = 250–300 nm). Retention time: 8 min. Limit of detection, <5 µg/L [Gökmen, Acar 1999]. Column: C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile-0.05% TFA (2 : 98) : acetonitrile-water (1 : 1, 100 : 0 for 22 min to 0 : 100 until 30 min to 100 : 0 until 45 min), flow rate 1.0 mL/min. UV detection (λ = 276 nm). Limit of detection, 5 µg/L [Trucksess, Tang 1999].

LC-MS Apple Juice. Column: Mightysil RP-18 (250 × 2 mm i.d., 5 µm). Mobile phase: water : acetonitrile (100 : 0 to 0 : 100 in 30 min), flow rate 0.2 mL/min. ESI, SIM acquisition mode. Limit of quantification, 5 pg, limit of detection, 2.5 pg [Ito *et al.* 2004]. Column: Zorbax Eclipse XDB C_{18} (12.5 × 4.6 mm i.d., 5 µm). Mobile phase: 10 mmol/L ammonium acetate : methanol : 10 mmol/L ammonium acetate (0 : 2 : 98), flow rate 0.5 mL/min. APCI, ESI, SIM acquisition mode. Limit of detection, 1.03–1.5 µg/L [Takino *et al.* 2003]. Column: Luna ODS C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water (10 : 90), flow rate 0.5 mL/min. APCI, positive and negative ion mode, full scan mode. Limit of detection, 4 µg/L [Sewram *et al.* 2000]. Column: Nucleosil RP18 (250 × 2.0 mm i.d., 5 µm). Mobile phase: acetonitrile : water (5 : 95 for 5 min to 95 : 5 within 20 min), flow rate 0.4 mL/min. ESI, negative ion mode. Retention time: 16.5 min. Limit of detection, 120 ng/L [Rychlik, Schieberle 1999].

Note For a review of GC-MS and LC-MS methods for the determination of patulin in food see Sforza *et al.* [2006].

CE Apple Juice. Column: Agilent (56 cm effective length, 75 µm i.d.). Running buffer: 33.3 mmol/L sodium tetraborate : 66.6 mmol/L SDS : 5% acetonitrile (pH 9.0). DAD (λ = 276 nm). Retention time: ≈9 min. Limit of quantification, 2.5 µg/L, limit of detection, 0.7 µg/L [Murillo *et al.* 2008]. Apple Juice Microemulsion. Column: Agilent (64.5/56 cm total/effective length, 75 µm i.d.). Running buffer: 33.3 mmol/L sodium tetraborate : 66.6 mmol/L SDS : 5% acetonitrile (pH 9.0). DAD (λ = 276 nm). Limit of quantification, 8.0 µg/L, limit of detection, 3.2 µg/L [Murillo-Arbizu *et al.* 2008]. Apple Cider. Column: fused silica capillary (50 cm effective length, 7.5 µm i.d.). Running buffer: 0.1 mol/L sodium tetraborate : 0.2 mol/L SDS : water (25 : 25 : 50, pH 9.0). DAD (λ = 273 nm). Limit of detection, 3.8 µg/L [Tsao, Zhou 2000].

Note For a review of chromatographic methods for the determination of patulin see Shephard, Leggott [2000].

Therapeutic Concentration

A healthy male volunteer (age, 36 years) consumed apple juice that contained ≈50 µg/L patulin. No patulin was detectable in the volunteer's serum before or after consumption [Rychlik 2003].

Toxicity Patulin can cause gastrointestinal hyperemia, bleeding, and ulcers in animals [Watanabe, Shimizu 2005]. The acute toxic effects in humans include nausea, vomiting, and other gastrointestinal trauma with accompanying kidney damage. Chronic exposure has been shown to induce the formation of cancerous tumours, cause genetic mutations, and cause embryonic developmental defects [Ito *et al.* 2004]. The WHO recommends to limit its content in food to 50 µg/kg [Sewram *et al.* 2000].

LD_{50} (SC) in mice, 10–15 mg/kg. LD_{50} (oral, SC and IP) in rats, 55, 11, and 10 mg/kg, respectively [McKinley *et al.* 1982].

Pecazine

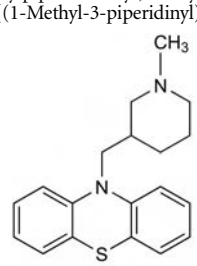
Tranquilliser

$C_{19}H_{22}N_2S = 310.5$

CAS—60-89-9

IUPAC Name 10-[(1-methylpiperidin-3-yl)methyl]phenothiazine

Synonyms Mepazine; 10-[(1-Methyl-3-piperidinyl)methyl]-10*H*-phenothiazine.



Chemical Properties pK_a 9.7 (24°). Log *P* (octanol/water), 5.4.

Pecazine Hydrochloride

$C_{19}H_{22}N_2S,HCl,H_2O = 364.9$

CAS—2975-36-2

Chemical Properties A white crystalline powder. Mp 180° to 181°. Very slightly soluble in water; freely soluble in dehydrated alcohol; soluble in chloroform; practically insoluble in ether and benzene.

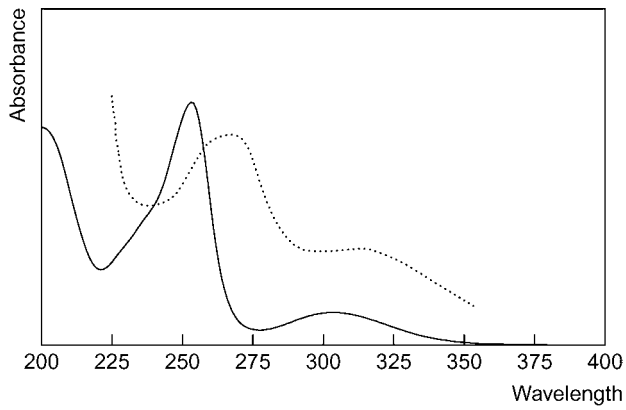
Colour Tests Mandelin's test—green→violet; Marquis test—violet.

Thin-layer Chromatography System TA—R_f 0.53; system TB—R_f 0.47; system TC—R_f 0.44; system TE—R_f 0.65; system TF—R_f 0.01; system TL—R_f 0.16; system TAE—R_f 0.27 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 2540; system GB—RI 2669.

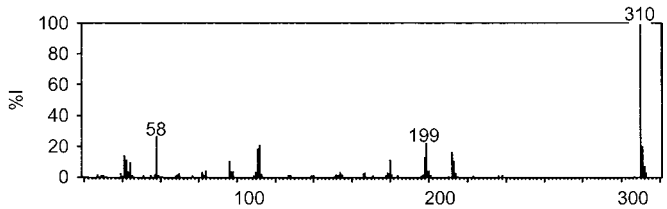
High Performance Liquid Chromatography System HA—*k* 3.9; system HX—RI 443; system HY—RI 382; system HAX—retention time 15.3 min; system HAY—retention time 7.0 min.

Ultraviolet Spectrum Aqueous acid—253 (A_1^1=892a), 300 nm; aqueous alkali—265 nm.



Infrared Spectrum Principal peaks at wavenumbers 750, 768, 1219, 1250, 1162, 1282 cm^{-1} (pecazine hydrochloride, KBr disk).

Mass Spectrum Principal ions at *m/z* 310, 58, 199, 112, 311, 111, 212, 41.

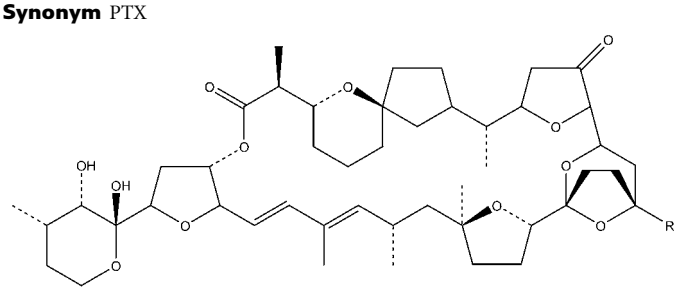


Dose Pecazine hydrochloride has been given in doses equivalent to 37.5 to 75 mg of the base daily.

Pectenotoxins

Polyether Macrolactone, Toxin

Synonym PTX



Chemical Properties Pectenotoxins (PTXs) were first isolated from scallops (*Patinopecten yessoensis*) cultivated in Japan. PTX-2 (methyl group at C-43 position), considered the main toxin in this group, is found in many species of the toxic dinoflagellate genus *Dinophysis*. The majority of the known PTX analogues are a result of bioconversion in shellfish or as artefacts during isolation [Suzuki *et al.* 2001; Yasumoto 2001]. These arise mainly from successive oxidation of the methyl group at the C-43 position, forming PTX-1 (hydroxymethyl at C-43), PTX-3

(aldehyde at C-43) and PTX-6 (carboxylic acid at C-43). PTX-2 is also rapidly metabolised to PTX-2 seco acid (PTX-2SA) and its epimer in most bivalve species. Further analogues include PTX-11 (hydroxyl at C-34), a natural metabolite in the dinoflagellate *Dinophysis acuta*, and PTX-12 (not characterised). Log *P* (octanol/water), 3.7 for PTX-2 [Takahashi *et al.* 2007].

Quantification

Other **HPLC** Dinoflagellate (*Dinophysis acuta*) and Mussel Samples. Column: C_{18} (250 × 3.2 mm i.d., 5 μm). Mobile phase: acetonitrile : methanol : water (80 : 5 : 15), flow rate 0.5 mL/min. Fluorescence detection ($\lambda_{ex} = 365$ nm, $\lambda_{em} = 412$ nm). Retention times: PTX-2SA 13.0 min, 7-*epi*-PTX-2SA 16.2 min, okadaic acid 15.5 min, dinophysistoxin-2 16.9 min (9-anthryldiazomethane [ADAM] derivatives). Limit of quantification not reported [James *et al.* 1999; Pavela-Vrancic *et al.* 2001]. Dinoflagellate Samples (*Dinophysis fortii*). Column: C_{18} (250 × 4.6 mm i.d., 5 μm). Mobile phase: methanol : water (6 : 4), flow rate 1.0 mL/min. Fluorescence detection ($\lambda_{ex} = 370$ nm, $\lambda_{em} = 440$ nm). Limit of detection, PTX-2 1 ng (4-[2-(6,7-dimethoxy-4-methyl-3-oxo-3,4-dihydroquinoxalinyl)ethyl]-1,2,4-triazoline-3,5-dione [DMEQ-TAD] derivative) [Sasaki *et al.* 1999]. Column: C_{18} (250 × 4.6 mm i.d., 5 μm). Mobile phase: acetonitrile : water (60 : 40) containing 0.1% trifluroacetic acid, flow rate 1.0 mL/min. UV detection ($\lambda = 235$ nm). Retention time: 6.6 min for PTX-2. Limit of quantification not reported [Draisci *et al.* 1996].

LC-MS Shellfish Samples. Column: C_{18} (100 × 2.1 mm i.d., 1.7 μm). Mobile phase: water : acetonitrile-water (95 : 5) both containing 2 mmol/L ammonium formate and 50 mmol/L formic acid (70 : 30 to 10 : 90 over 3 min for 1.5 min), flow rate 0.4 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention times: PTX-1 2.38 min, PTX-6 2.46 min, PTX-2SA 2.77 min, 7-*epi*-PTX-2SA 2.97 min, PTX-2 3.08 min. Limit of quantification, 0.16 μg/L, limit of detection, 47.7 ng/L for PTX-2 [Fux *et al.* 2007]. Column: C_8 (50 × 2.0 mm i.d., 3 μm). Mobile phase: water : acetonitrile–water (95 : 5) both containing 2 mmol/L ammonium formate and 50 mmol/L formic acid (70 : 30 to 10 : 90 over 8 min for 3 min), flow rate 0.2 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of detection, 10 μg/kg for PTX-2SA [Villar-Gonzalez *et al.* 2007]. Column: C_{18} (150 × 2.0 mm i.d., 5 μm). Mobile phase: acetonitrile-water (1 : 9) : acetonitrile-water (9 : 1) : 33 mmol/L ammonium hydroxide-500 mmol/L formic acid in water. (85 : 5 : 10 for 2 min to 5 : 85 : 10 over 11 min for 12 min), flow rate 0.2 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention times: 16.2 min for PTX-2, 14.7 min for PTX-2SA, 15.4 min for 7-*epi*-PTX-2SA, 13.7 min for PTX-1, 14.0 min for PTX-6, 14.5 min for PTX-11SA. Limit of detection, PTX-2 5 μg/kg [McNabb *et al.* 2005]. Column: C_8 (50 × 2.1 mm i.d., 3 μm). Mobile phase: water : acetonitrile-water (95 : 5) both containing 5 mmol/L ammonium acetate (80 : 20 to 0 : 100 over 12.5 min, for 5 min), flow rate 0.25 mL/min. API, positive and negative ion modes, SIM acquisition mode. Relative retention times: 1.47 for PTX-2, 1.26 for PTX-1 (relative to okadaic acid). Limit of detection, PTX-2 9–11 μg/kg [Stobo *et al.* 2005]. Dinoflagellate Samples (*D. acuta*). Column: C_{18} (150 × 2.1 mm i.d., 5 μm). Mobile phase: water with 1.0 mmol/L ammonium acetate: acetonitrile with 1.0 mmol/L ammonium acetate : (60 : 40 for 0.5 min to 25 : 75 over 5 min), flow rate 0.2 mL/min. ESI, negative ion mode, MRM acquisition mode. Retention times: 9.6 min for PTX-2, 4.1 min for 7-*epi*-PTX-2SA, 3.3 min for dinophysistoxin-2, 2.8 min for okadaic acid. Limit of quantification not reported [Puente *et al.* 2004]. Dinoflagllate Samples. Column: Hypersil C_8 (50 × 2.0 mm i.d., 3 μm). Mobile phase: water : acetonitrile-water (95 : 5), both containing 2 mmol/L ammonium formate and 50 mmol/L formic acid (50 : 50), flow rate 0.2 mL/min. ESI, positive ion mode (ammonium adduct ions), SIM acquisition mode. Retention times: 2.2 min for PTX-1, 3.5 min for PTX-4, 5.3 min for PTX-8, 2.5 min for PTX-6 , 3.6 min for PTX-7, 5.3 min for PTX-9, 4.8 min for PTX-2, 8.6 min for PTX-2b, 11.7 min for PTX-2c, 4.0 min for PTX-11, 6.5 min for PTX-11b, 8.1 min for PTX-11c. Limit of quantification not reported [Suzuki *et al.* 2003]. Shellfish Samples. Column: Lichrospher C_{18} (125 × 2.0 mm i.d., 5 μm). Mobile phase: acetonitrile : 0.05% acetic acid (65 : 35), 0.2 mL/min. ESI, negative ion mode, SIM acquisition mode. Retention times: 4.3 min for PTX-2SA, 5.1 min for 7-*epi*-PTX-2SA, 6.1 min for PTX-2, 4.7 min for okadaic acid. Limit of quantification not reported [Vale and de Sampayo 2002]. Column: Inertsil C_{18} (150 × 2.1 mm i.d., 5 μm). Mobile phase: 1.0 mmol/L ammonium acetate in water : methanol (60 : 40 to 0 : 100 over 20 min for 10 min), flow rate 0.2 mL/min. SSI, negative ion mode. Limit of detection, 6 μg/L for PTX-6 and yessotoxin, 1.3 μg/L for okadaic acid and dinophysistoxin [Ito, Tsukada 2002]. Column: C_{18} (150 × 2.0 mm i.d., 5 μm). Mobile phase: acetonitrile : 0.05% acetic acid (7 : 3), flow rate 0.1 mL/min. ESI, positive ion mode (ammonium ion adduct), SIM acquisition mode. Limits of detection in muscle and digestive glands, 40 and 80 μg/kg, respectively, for PTX-1, PTX-2, PTX-6 and PTX-2SA [Goto *et al.* 2001]. Dinoflagellate (*D. acuta*) and Greenshell and Blue Mussel Samples. Column: C_{18} (150 × 2.0 mm i.d., 5 μm). Mobile phase: acetonitrile : water (67 : 33) containing 50 mmol/L formic acid and 2 mmol/L ammonium formate, flow rate 0.1 mL/min. ESI, negative ion mode. Retention times: 15.8 min for PTX-2, 7.9 min for PTX-6; PTX-2SA and 7-*epi*-PTX2SA also detected. Limit of quantification not reported [Suzuki *et al.* 2001]. Shellfish Samples. Column: C_{18} (150 × 2.0 mm i.d., 5 μm). Mobile phase: acetonitrile : water (7 : 3) containing 0.1% acetic acid, flow rate 0.2 mL/min. ESI, negative ion mode, SIM acquisition mode. Limit of detection, 5 μg/kg [Suzuki, Yasumoto 2000].

Disposition in the Body

Toxicity PTXs were formerly included in the causative toxins associated with diarrhetic shellfish poisoning (DSP) because they were found in shellfish relating to DSP together with okadaic acid and dinophysistoxins. However, PTXs do not actually induce diarrhoea and are no longer included in the DSP group of toxins [Miles *et al.* 2006]. The LD_{50} of PTX-2 in mice by IP injection is reported as 219 μg/kg. Oral doses of up to 5000 μg/kg in mice did not produce overt toxic effects, possibly reflecting poor absorption from the gastrointestinal tract, or conversion in the gut to a less toxic material, such as PTX-2SA [Miles *et al.* 2004]. Studies have shown that PTX-2 exhibits nanomolar cytotoxicity against breast, colon and lung cancer lines [Spector *et al.* 1999].

P

Pemoline

CNS Stimulant

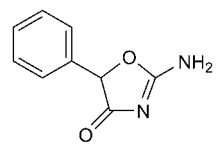
$C_9H_8N_2O_2 = 176.2$

CAS—2152-34-3

IUPAC Name 2-Amino-5-phenyl-1,3-oxazol-4-one

Synonyms 2-Amino-5-phenyl-4(5*H*)-oxazolone; phenilone; phenoxazole; phenylisohydantoin; phenylpseudohydantoin.

Proprietary Names *Cylert*; *Deltamine*; *Dynalert*; *Hyperilex*; *Nitan*; *PemADD*; *Sigmadyn*; *Senior*; *Stimul*; *Tradon*; *Volital*.



Chemical Properties White crystalline powder. Mp 256° to 257°, with decomposition. Practically insoluble in water, acetone, and ether; soluble 1 in 100 of propylene glycol. pK_a 10.5. Log *P* (octanol/water), 0.5. Extraction yield (chlorobutane), 0 [Demme *et al.* 2005].

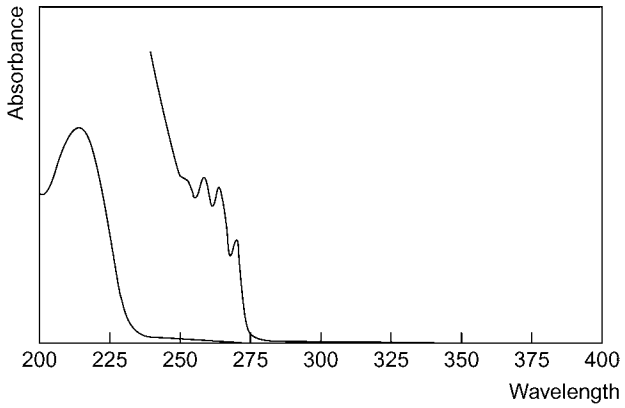
Colour Test Koppanyi–Zwikker test—violet.

Thin-layer Chromatography System TA—R_f 0.60; system TB—R_f 0.00; system TC—R_f 0.23; system TE—R_f 0.36; system TF—R_f 0.11; system TL—R_f 0.40; system TAE—R_f 0.81; system TAF—R_f 0.81 (Marquis reagent, yellow-brown; ninhydrin spray, positive; acidified potassium permanganate solution, positive).

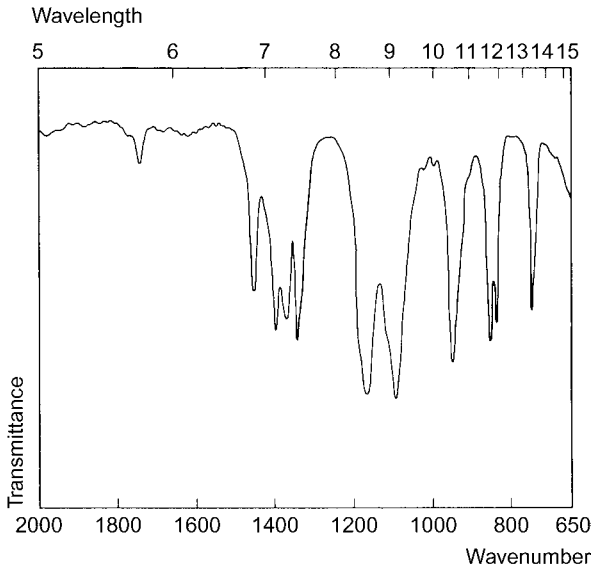
Gas Chromatography System GA—pemoline RI 1969, pemoline-Me_2 RI 1590, mandelic acid RI 1485; system GB—pemoline RI 2081.

High Performance Liquid Chromatography System HA—*k* 0.2; system HC—*k* 0.1; system HX—RI 307; system HY—RI 271.

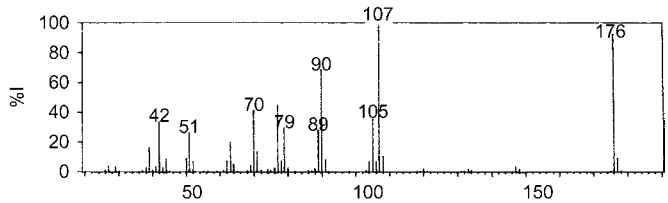
Ultraviolet Spectrum Aqueous acid—256 ($A^1_1 = 20a$), 262, 268 nm.



Infrared Spectrum Principal peaks at wavenumbers 1218, 1653, 695, 1560, 1137, 1275 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 107, 176, 90, 77, 70, 105, 42, 79; mandelic acid 107, 79, 77, 51, 152, 105, 50, 78; 5-phenyloxazolidine-2,4-dione 90, 177, 105, 77, 106, 51, 89, 50.



Quantification

Blood **GC** Column: 2%OV-17 on 100/120 mesh Gas-Chrom Q or 2% OV-225 on Chromosorb W-HP (1.8 m × 2 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature: 180° or 190°. FID. Limit of detection, 20 µg/L [van Boven, Daenens 1977].

Plasma **GC** Column: 3% phenylmethyl dimethyl silicone on 100/120 mesh (2 m × 2.5 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature: 180°. FID. Limit of detection, 20 µg/L [Libeer, Schepens 1978]. Column: SCOT (8 m × 0.5 mm i.d.). Carrier gas: He, 5 mL/min. Temperature: 190°. NPD. Limit of detection, 1 ng [Vermeulen *et al.* 1978].

GC-MS Column: 3% OV-101 Chromosorb W-HP 100/120 mesh (5′ × 2 mm i.d.). Carrier gas: N_2, 20 mL/min. Temperature: 240°. ECD. Retention time: 38.0 min. Limit of detection, 50 µg/L [Igwe, Blake 1981].

HPLC Column: Nucleosil C_{18} (12.5 cm, 5 µm). Mobile phase: 0.01 mol/L dibasic potassium phosphate buffer (pH 5.0) : acetonitrile (82 : 18), flow rate 1.0 mL/min. UV detection (λ = 215 nm). Retention time: 7.6 min. Limit of detection, 10 µg/L [Sallee *et al.* 1985]. Column: Nucleosil 7C_{18} (25 cm × 4 mm i.d., 7.5 µm). Mobile phase: acetonitrile : 0.01 mol/L acetate buffer (pH 4.0; 9 : 91), flow rate 1.0 mL/min. UV detection (λ = 218 nm). Retention time: 14.0 min. Limit of detection, 20 µg/L [Nishihara *et al.* 1984].

Serum **GC** AFID. Limit of detection, 50 µg/L [Hoffman 1979]. See Plasma [Libeer, Schepens 1978].

HPLC Column: µBondapak C_{18} (30 × 4 cm i.d.). Mobile phase: 0.01 mol/L phosphate buffer (pH 5.0) : acetonitrile (83 : 17), flow rate 2.0 mL/min. UV detection (λ = 215 nm). Limit of detection, 0.1 mg/L [Tomkins *et al.* 1980].

Urine **GC** Column: 5% OV-17 on 80/100 mesh Chromosorb 750 (0.8 × 1 mm i.d.). Carrier gas: He, 40 mL/min. Temperature programme: 100° to 25° at 30°/min for 4 min. NPD. Limit of detection, 0.1 mg/L [Krylov, Khlebnikova 1982]. See Serum [Hoffman 1979]. See Plasma [Libeer, Schepens 1978]. See Plasma. Limit of detection, 100 µg/L [Vermeulen *et al.* 1978]. See Blood [van Boven, Daenens 1977]. Column: 2% OV-17 and 1% OV 225 on Gas-Chrom Q (120 × 0.12 cm i.d.). Carrier gas: He, 5 mL/min. Temperature: 190°. NSD. Limit of detection, 500 µg/L [Vermeulen *et al.* 1977].

GC-MS See Plasma. Limit of detection, 100 µg/L [Igwe, Blake 1981].

HPLC See Plasma [Nishihara *et al.* 1984]. Column: LiChrosorb RP-8 (25 cm × 4.6 mm i.d.). Mobile phase: water : methanol (85 : 15), flow rate 2.0 mL/min. UV detection (λ = 220 nm). Retention time: 8.2 min. Limit of detection, 0.1–0.05 mg/L [Cartoni *et al.* 1980]. Column: Zorbax (25 cm × 2.1 mm i.d.). Mobile phase: *n*-hexane : isopropanol : concentrated ammonia (37 : 12 : 1), flow rate 0.5 mL/min. UV detection (λ = 254 nm). Limit of detection not reported [Cartoni, Natalizia 1976].

Saliva **HPLC** See Plasma [Nishihara *et al.* 1984]. See Plasma [Vermeulen *et al.* 1978].

Disposition in the Body Slowly absorbed after oral administration. Approximately 50% of a dose is excreted in the urine as unchanged drug in 48 h and ~4% as 5-phenyloxazolidine-2,4-dione; the remainder is excreted in the urine as conjugated pemoline and unidentified polar metabolites; mandelic acid is also a metabolite of pemoline. Less than 1% of a dose is eliminated in the faeces.

Therapeutic Concentration

After a single oral dose of 50 mg given to 3 subjects, peak plasma concentrations of 0.77 –1.22 mg/L (mean 1.0) were attained in about 2–3 h; peak concentrations in saliva of 0.47–0.75 mg/L (mean 0.59) were reported after 2–4 h; following administration of 37.5 mg to 1 subject, peak plasma and saliva concentrations of 0.89 and 0.58 mg/L, respectively, were attained in about 4 h [Vermeulen *et al.* 1979].

After daily oral doses of 37.5 and 75 mg to 28 hyperactive children for 7 days, mean plasma concentrations of about 2 and 4 mg/L respectively, were reported 3 h after the last dose [Tomkins *et al.* 1980].

Peak plasma concentrations of 4.3 (± 1.0) mg/L were attained in 2.8 (±1.8) h after a single 2 mg/kg oral dose of pemoline to 7 prepubescent boys [Sallee *et al.* 1985].

Toxicity Estimated minimum lethal dose is 2 g for an adult, 0.2 g for children up to 2 years (even though recovery has occurred following the ingestion of up to 1.8 g by young children).

Half-life Plasma half-life, ≈10–18 h.

Protein Binding ≈30% [Nishihara *et al.* 1984].

Dose Usually 40 mg daily; maximum of 120 mg daily.

Pempidine

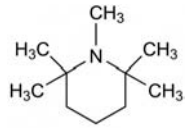
Antihypertensive

$C_{10}H_{21}N$ = 155.3

CAS—79-55-0

IUPAC Name 1,2,2,6,6-pentamethylpiperidin-1-ium

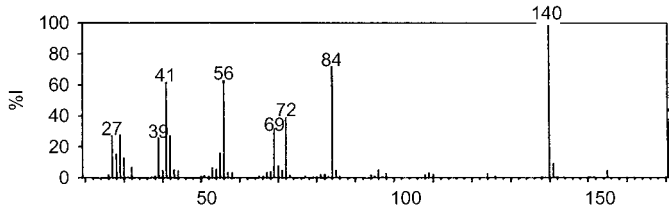
Synonym 1,2,2,6,6-Pentamethylpiperidine



Chemical Properties A liquid.

Pempidine Tartrate
$C_{10}H_{21}N,C_4H_6O_6 = 305.4$
CAS—546-48-5
Proprietary Names *Pempidil*; *Pempiten*; *Perolysen*; *Tenormal*; *Tensinol*; *Tensoral*.
Chemical Properties A white crystalline powder. Mp 160°. Soluble 1 in 2 of water and 1 in 14 of ethanol; very slightly soluble in acetone; practically insoluble in chloroform and ether.

Thin-layer Chromatography System TA—R_f 0.24; system TB—R_f 0.68; system TC—R_f 0.03; system TL—R_f 0.10 (acidified iodoplatinate solution, positive).
Infrared Spectrum Principal peaks at wavenumbers 1308, 1261, 1210, 1136, 1063, 675 cm^{-1} (pempidine tartrate, KBr disk).
Mass Spectrum Principal ions at *m/z* 140, 84, 56, 41, 72, 69, 29, 39.

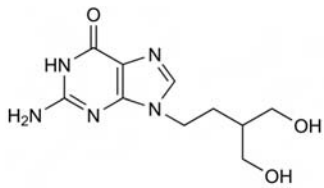


Dose 7.5 to 80 mg of pempidine tartrate daily.

Penciclovir

Antiviral
$C_{10}H_{15}N_5O_3 = 253.3$
CAS—39809-25-1

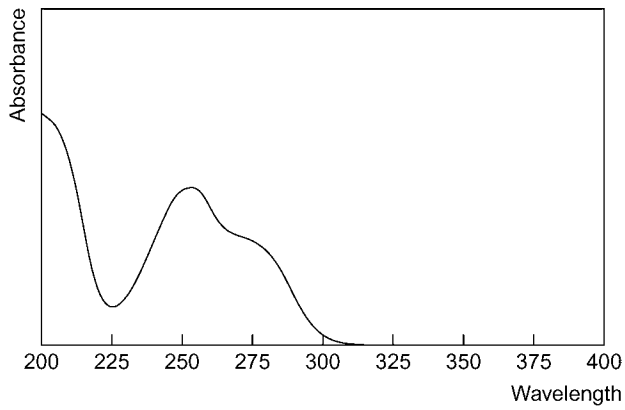
IUPAC Name 2-amino-9-[4-hydroxy-3-(hydroxymethyl)butyl]-3*H*-purin-6-one
Synonyms BRL-39123; PCV; 2-Amino-1,9-dihydro-9-[4-hydroxy-3-(hydroxymethyl)butyl]-6*H*-purin-6-one.
Proprietary Names *Denavir*; *Famvir*; *Vectavir*.



Chemical Properties White crystalline solid. Mp 275° to 277°. Also reported as colourless matted needles. Mp 272° to 275°. Soluble in water (1.7 mg/mL, 20°, pH 7). Log *P* (octanol/water), −1.62.

Penciclovir Sodium
$C_{10}H_{15}N_5O_3Na,H_2O = 294.3$
CAS—97845-62-0
Synonym BRL-39123A
Chemical Properties Crystalline solid. Soluble in water.

Ultraviolet Spectrum Principal peaks at 253, 278 nm.



Quantification
Plasma **HPLC** UV detection. Limit of quantification, 0.1 mg/L [Fowles, Pierce 1989].
Urine **HPLC** Limit of quantification, 50 mg/L, see Plasma [Fowles, Pierce 1989].
Disposition in the Body The drug is poorly absorbed from the gastrointestinal tract. For systemic use, it is usually administered orally as the prodrug, famciclovir, which is rapidly converted to penciclovir, producing peak plasma concentrations to the dose after 45 min to 1 h. Metabolites include a triphosphate derivative which is active. Minor metabolites include 6-deoxypenciclovir, monoacetylated penciclovir and monoacetylated 6-deoxypenciclovir. It is mainly excreted unchanged in the urine.
Therapeutic Concentration
Following the administration of a single 500 mg dose of famciclovir to 9 patients with normal renal function, mean peak plasma penciclovir concentrations were 2.83 mg/L (range, 1.30 to 3.82 mg/L) reached in 0.89 h (mean range, 0.5 to 1.5 h). Another 18 patients, split into three groups according to their renal impairment: mild, moderate and severe, were also administered the drug regimen. Mean peak plasma concentrations were 3.26 mg/L, 4.45 mg/L and 5.31 mg/L for the three groups, respectively, and reached in 0.79, 1.38 and 1.13 h (all mean times) [Boike *et al.* 1994].

Twenty healthy males (mean age, 36 years; range, 23 to 59 years), fasted from both fluids and solids for 10 hours pre-dosing, were administered 4 single oral doses of famciclovir (125, 250, 500 and 750 mg) on 4 separate days and at least one week apart. Penciclovir concentrations were detected 15 to 30 min after oral administration at all four dosages. Mean peak plasma penciclovir concentrations were 0.84 mg/L, 1.59 mg/L, 3.34 mg/L and 5.09 mg/L for the 125, 250, 500 and 750 mg dose, respectively, reached at 0.51, 0.75, 0.75 and 0.75 h, respectively [Pue *et al.* 1994].

Following the IV administration of 10, 15 or 20 mg/kg penciclovir over 60 min to 15 healthy male subjects, mean peak plasma concentrations were 12.1, 19.6 and 22.7 mg/L, respectively. Peak plasma concentrations coincided with the end of the infusion [Fowles *et al.* 1992].
Bioavailability About 77%.
Half-life In plasma, ≈2 h.
Volume of Distribution Reported as 111.9 L or 1.5 L/kg (mean values).
Clearance Reported as 25.5 to 32.0 L/h in young healthy subjects.
Protein Binding <20%.
Dose Topically as 1% cream every 2 h for 4 days in the treatment of herpes labialis. For systemic use, penciclovir is administered orally as the prodrug famciclovir.

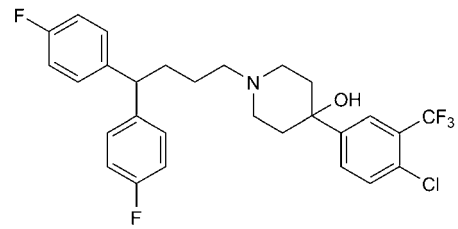
Penfluridol

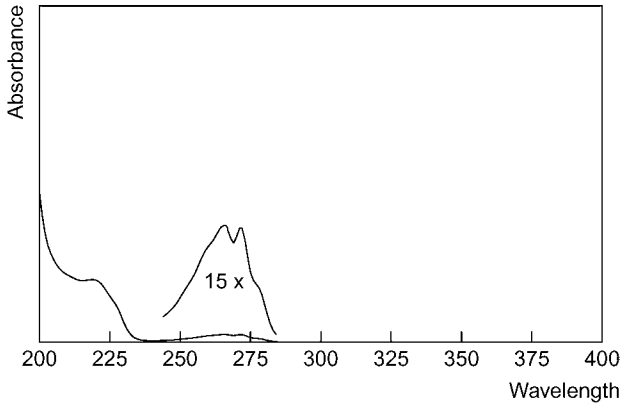
Tranquilliser
$C_{28}H_{27}ClF_5NO = 524.0$
CAS—26864-56-2

IUPAC Name 1-[4,4-Bis(4-fluorophenyl)butyl]-4-[4-chloro-3-(trifluoromethyl)phenyl]piperidin-4-ol
Synonym 1-[4,4-Bis(4-fluorophenyl)butyl]-4-[4-chloro-3-(trifluoromethyl) phenyl]-4-piperidinol
Proprietary Name *Semap*

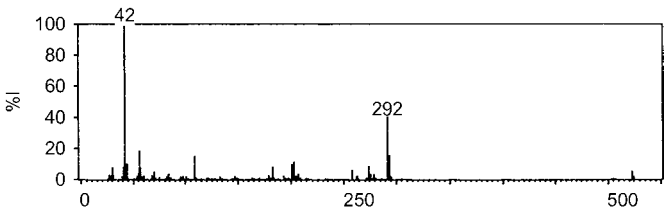


Chemical Properties White crystalline or microcrystalline powder. Mp 105° to 107°. Practically insoluble in water; very soluble in ethanol, acetone, and chloroform; freely soluble in ether. Log *P* (octanol/water), 2.7.
Colour Test Liebermann's reagent—brown.
Thin-layer Chromatography System TA—R_f 0.76; system TB—R_f 0.17; system TC—R_f 0.60; system TE—R_f 0.84; system TL—R_f 0.60; system TAE—R_f 0.72; system TAF—R_f 0.89 (Dragendorff spray).
Gas Chromatography System GA—penfluridol RI 3360, M (*N*-desalkyl-) RI 2210, M (*N*-desalkyl-oxo-)-2H_2O RI 1920, M (desamino-OH-) RI 2120, M (desamino-carboxy-) RI 2230.

High Performance Liquid Chromatography System HAA—RT 20.2 min; system HX—RI 659; system HY—RI 656; system HZ—RT 43.4 min.
Ultraviolet Spectrum Aqueous acid—267 ($A_1^1 = 47a$), 273 nm. No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1500, 1138, 1225, 1315, 1157, 825 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 42, 292, 56, 294, 109, 203, 201, 44.



Quantification
***Plasma* GC** Column: 3% OV-17 on 80/100 mesh (6′ × 0.25" i.d.). Carrier gas: Ar : CH_4 (95 : 5), 100 mL/min. Temperature: 280°. ECD. Retention time: 9 min. Limit of detection not reported [Jacobsson *et al.* 1976]. Column: 3% OV-3 (phenylmethyldimethylsilicone) on Gas Chrom Q 60/80 mesh (6′ × 3.5 mm i.d.). Carrier gas: Ar : CH_4 (95 : 5), 48 mL/min. Temperature: 275°. ECD. Retention time: 17 min. Limit of detection 1–2 µg/L [Cooper *et al.* 1975a].
***Hair* LC-MS** MRM acquisition mode. Limit of detection, <0.05 ng/mg [Weinmann *et al.* 2002].
Disposition in the Body Incompletely absorbed after oral administration. It has a very long duration of action. Approximately 5% of a dose is excreted in the urine in 7 days, mainly as 4,4′-bis(4-fluorophenyl)butyric acid; ~80% of a dose is eliminated in the faeces, mostly as unchanged drug.
Therapeutic Concentration
Following weekly oral administration of 30, 60 and 120 mg for 13 weeks to 7, 7 and 8 subjects, mean steady-state plasma concentrations of about 0.004 to 0.01, 0.006 to 0.012 and 0.008 to 0.025 mg/L were reported. In all subjects maximum concentrations were attained within 12 h of a dose; concentrations declined rapidly between 12 and 24 h followed by a much slower decline during the next 120 h and were still significant (about 0.001 mg/L) 168 h after the dose [Cooper *et al.* 1975b].

After 4 weeks of treatment of 20, 40, 60 or 80 mg penfluridol daily there was a tenfold variation in plasma levels in the 47 patients [Jacobsson *et al.* 1976].
Dose Usually 20 to 60 mg weekly, by mouth; doses of up to 120 mg weekly have been given.

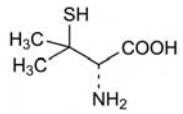
Penicillamine

Chelating Agent
$C_5H_{11}NO_2S = 149.2$
CAS—52-67-5

IUPAC Name (2*S*)-2-amino-3-methyl-3-sulfanylbutanoic acid
Synonyms (−)-β,β-Dimethylcysteine; 3,3-dimethyl-(*s*)-cysteine; D-3-mercaptovaline; D-penicillamine.

Proprietary Names *Adalken*; *Artamin*; *Atamir*; *Cuprimine*; *Cupripen*; *Depen*; *Distamine*; *Kelatin*; *Mercaptyl*; *Metalcaptase*; D-*Penamine*; *Pendramine*; *Rheumantin*; *Sufortan*; *Sufortanon*; *Trisorcin*; *Trolovol*.



Chemical Properties A white, finely crystalline powder. Mp 202° to 206°. Soluble 1 in 9 of water and 1 in 530 of ethanol; practically insoluble in chloroform and ether. pK_a 1.8, 7.9, 10.5. Log *P* (octanol/water), −1.8.

Penicillamine Hydrochloride
$C_5H_{11}NO_2S,HCl = 185.7$
CAS—2219-30-9
Proprietary Name *Pemine*
Chemical Properties A white, hygroscopic, finely crystalline powder. Mp about 175°, with decomposition. Soluble 1 in 1 of water, 1 in 1.5 of ethanol and 1 in 230 of chloroform; practically insoluble in ether.

Colour Tests Mandelin's test—yellow; palladium chloride—yellow.
Thin-layer Chromatography System TA—R_f 0.36; system TB—R_f 0.01; system TC—R_f 0.03; system TE—R_f 0.03; system TL—R_f 0.03; system TAE—R_f 0.44 (acidified iodoplatinate solution, positive).
Infrared Spectrum Principal peaks at wavenumbers 1595, 1525, 1615, 1550, 1090, 1055 cm^{-1} (Nujol mull). Two polymorphic forms occur.
Mass Spectrum Principal ions at *m/z* 75, 41, 57, 70, 43, 59, 56, 47.
Quantification
***Blood* HPLC** Electrochemical detection. Penicillamine, penicillamine disulfide and penicillamine glutathione mixed disulfide. Limit of detection, 30 µg/L for penicillamine disulfide [Yamashita, Rabenstein 1989]. Electrochemical detection. Limit of detection, 10 µg/L [Drummer *et al.* 1986]. Electrochemical detection. Limit of detection, 450 µg/L [Bergström *et al.* 1981].
***Plasma* HPLC** Electrochemical detection. Penicillamine, homocysteine, homocystine and disulfides [Rabenstein, Yamashita 1989]. See Blood [Yamashita, Rabenstein 1989]. Electrochemical detection. ***Serum* HPLC** Fluorescence detection. Limit of detection, 130 µg/L [Lankmayr *et al.* 1981].
***Urine* HPLC** See Plasma [Rabenstein, Yamashita 1989]. See Blood [Yamashita, Rabenstein 1989]. Limit of detection, 75 µg/L, see Blood [Bergström *et al.* 1981].
Reviews For reviews of assay methods, see Lecavalier and Crawhall [1981] and Kucharczyk and Shahinian [1981].
Disposition in the Body Readily but incompletely absorbed after oral administration. About 50% of an oral dose is excreted in the urine in 48 h with about 10% as unchanged drug, up to 25% as cysteine-penicillamine disulfide, about 15% as penicillamine disulfide and <10% as *S*-methyl-D-penicillamine; about 35% of an oral dose is eliminated in the faeces in 3 days. After IV administration, about 80% of the dose is excreted in the urine in 24 h; traces of penicillamine remain in the plasma after 48 h owing to protein binding.
Therapeutic Concentration
Following daily oral doses of 500 to 750 mg to 10 subjects, peak plasma concentrations of 1.7 to 5.6 mg/L (mean, 3.7) were attained 1.5 to 3 h after a dose [Butler *et al.* 1982].
Half-life Plasma half-life, about 2 to 6 h.
Protein Binding Up to 90%.
Note For further details of penicillamine metabolism and kinetics see Bergström *et al.* [1981] and Crawhall *et al.* [1979].
Dose 0.125 to 4 g daily.

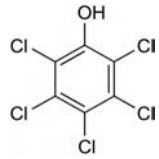
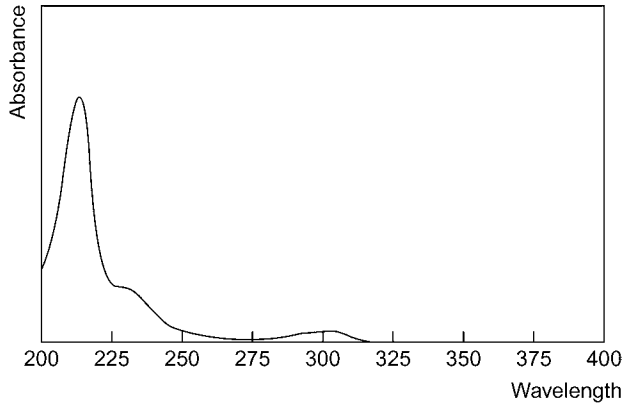
Pentachlorophenol

Preservative
C_6HCl_5O = 266.3
CAS—87-86-5

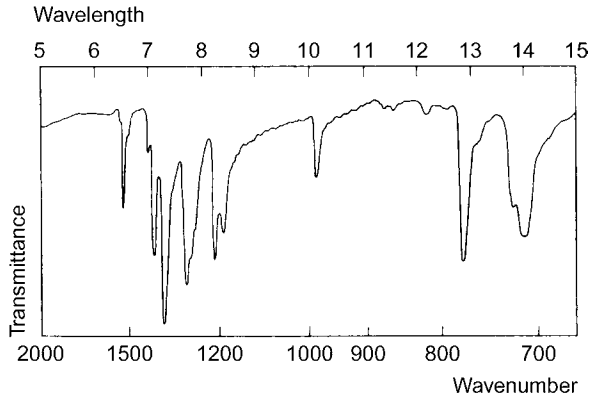
IUPAC Name 2,3,4,5,6–Pentachlorophenol
Synonyms PCP; penta.
Note The name PCP has also been used as a synonym for phencyclidine hydrochloride.



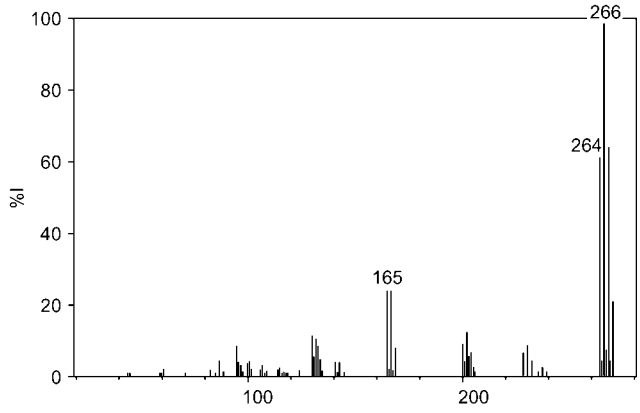
Chemical Properties White crystals. Mp 190° to 191°. Practically insoluble in water; freely soluble in ethanol and ether; soluble in benzene. pK_a 4.7 (25°). Log *P* (octanol/water), 5.1.
Colour Test Nitric acid, fuming—red/red/brown-violet.
Gas Chromatography System GA—pentachlorophenol RI 1760, pentachlorophenol-Me RI 1815.
Ultraviolet Spectrum Aqueous alkali—319 nm (A^1_1=194b); ethanol—295 (A^1_1=89b), 303 nm (A^1_1=115b).



Infrared Spectrum Principal peaks at wavenumbers 1307, 774, 1222, 711, 1196, 1553 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 266, 268, 264, 167, 165, 270, 202, 132.



Quantification
Blood **GC** ECD. Limit of detection, 1 µg/L [Needham *et al.* 1981].
Plasma **GC** ECD. Limit of detection, 10 µg/L [Rick *et al.* 1982].
Serum **GC** ECD [Noren, Sjovall 1987]. See Blood [Needham *et al.* 1981].
Urine **GC** See Plasma [Rick *et al.* 1982]. See Blood [Needham *et al.* 1981].
GC-MS SIM acquisition mode. Pentachlorophenol and other chlorophenols. Limit of detection for pentachlorophenol, 3.6 µg/L [Kontsas *et al.* 1995].
HPLC UV detection. Limit of detection, 30 µg/L [Pekari, Aitio 1982].
Postmortem Tissues **GC-MS** Pentachlorophenol and other chlorinated compounds [Wagner *et al.* 1991].
Disposition in the Body Readily absorbed after ingestion, inhalation or through intact skin. Pentachlorophenol and its oxidised metabolite, tetrachlorohydroquinone, are excreted in the urine in free and conjugated forms, with about 74% of a dose being excreted unchanged in 7 days. About 4% of a dose is eliminated in the faeces. Urinary concentrations in 130 pest-control operators exposed to pentachlorophenol ranged from 0.003–35.7 mg/L (mean, 1.8) [Bevenue *et al.* 1967].
Blood Concentration
Plasma concentrations of 0.99–9.1 mg/L were reported in 6 occupationally exposed subjects and blood concentrations of 0.34–6.0 mg/L were reported in 7 exposed workers [Bevenue *et al.* 1968].
A sample of 15 women with long-term (5–17 years) low exposure to pentachlorophenol contained in wood-preservative had a mean pentachlorophenol serum level of 43.6 µg/L [Peper *et al.* 1999].
Toxicity The estimated minimum lethal dose is 1 g and the maximum permissible atmospheric concentration is 0.5 mg/m^3. Blood concentrations >30 mg/L are usually toxic. Numerous fatalities after absorption, inhalation or ingestion have been reported.
In 2 fatalities, the following postmortem tissue concentrations (mg/L or µg/g) were reported: blood 113, 156; brain 14, 35; kidney –, 123; liver 94, 134; urine –, 520 [Mason *et al.* 1965].
In 1 fatality, the following postmortem tissue concentrations were reported: blood 173 mg/L, kidney 116 µg/g, liver 225 µg/g, urine 75 mg/L [Cretney 1976].
Half-life About 30 h.
Distribution in Blood Plasma : whole blood ratio, 1.8.
Protein Binding About 99%.

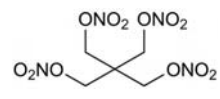
Pentaerithrityl Tetranitrate

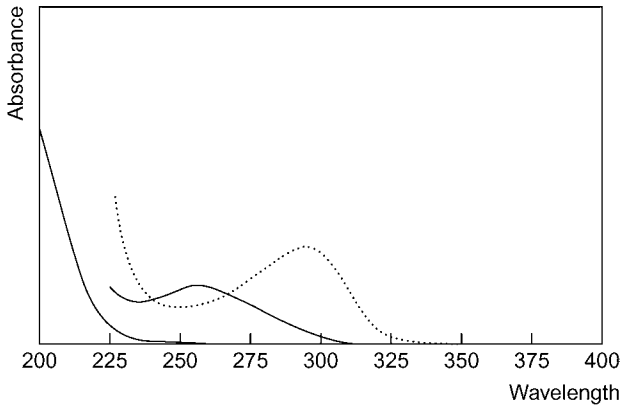
Antianginal Vasodilator
$C_5H_8N_4O_{12}$ = 316.1
CAS—115-77-5 (pentaerithrityl); 78-11-5 (tetranitrate)

IUPAC Name [3–Nitrooxy-2,2–bis(nitrooxymethyl)propyl]nitrate
Synonyms 2,2-Bis[(nitrooxy)methyl]-1,3-propanediol dinitrate (ester); erynite; nitropentaerythrol; nitropenthrite; pentaerythritol tetranitrate; pentanitrol.
Proprietary Names *Cardiacap*; *Dilcoran*; *Hasethrol*; *Lentrat*; *Mycardol*; *Neo-Corovas*; *Nirason S*; *Nitrodex*; *Nitropenton*; *Pentafin*; *Pentalong*; *Pentanitrine*; *Pentral 60*; *Pentrite*; *Pentritol*; *Pentryate*; *Pentylan*; *Peritrate*; *Pergitral*; *Perityl*; *Prevangor*; *Quintrate*; *Subicard*; *Terpate*; *Vasodiatol*.



Chemical Properties A white crystalline powder. Mp 140°. Practically insoluble in water; slightly soluble in ethanol and ether; soluble in acetone. Log *P* (octanol/water), 2.4.
Note For medicinal purposes pentaerithrityl tetranitrate is supplied diluted with an inert substance such as lactose because the undiluted compound may explode upon percussion or on exposure to heat.
Thin-layer Chromatography System TE—R_f 0.72; system TAE—R_f 0.92.

High Performance Liquid Chromatography System HX—RI 663 (pentaerithrityl tetranitrate); system HAA—retention time 23.1 (pentaerithrityl) min.
Ultraviolet Spectrum Aqueous acid—255 nm; aqueous alkali—294 nm.

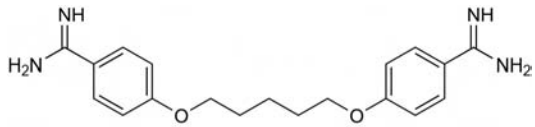


Mass Spectrum Principal ions at *m/z* 46, 76, 57, 55, 56, 60, 47, 97.
Quantification
Blood **GC** Pentaerithrityl tetranitrate and de-esterified metabolites. ECD. Limits of detection, 100 ng/L to 2 µg/L in blood [Neurath, Düünger 1977].
Plasma **GC-MS** Pentaerithrityl tetranitrate and its metabolites. Limit of detection, <50 ng/L [Stalleicken *et al.* 1997].
HPLC Limit of detection, 100 pg [Yu, Goff 1983].
Urine **GC** See Blood Neurath and Düünger [1977].
Disposition in the Body Incompletely absorbed from the gastro-intestinal tract; it may be absorbed through intact skin. The main metabolic reaction is stepwise de-esterification ultimately to pentaerithrityl. The nitrate ester metabolites may be conjugated with glucuronic acid. About 50 to 60% of a dose is excreted in the urine in 48 h, mainly as pentaerithrityl and pentaerithrityl mononitrate, with small amounts of the dinitrate ester. About 30 to 40% of a dose is eliminated in the faeces in 72 h, partly as unchanged drug, with the main metabolite present being pentaerithrityl, together with small quantities of the dinitrate and mononitrate esters.
Half-life About 7 h.
Protein Binding About 85%.
Dose 30 to 240 mg daily.

Neurath GB, Düünger M (1977). Blood levels of the metabolites of glyceryl trinitrate and pentaerythritol tetranitrate after administration of a two-step preparation. *Arzneimittelforschung* 27: 416–419.
Stalleicken D *et al.* (1997). Quantitative determination of pentaerythrityl tetranitrate and its metabolites in human plasma by gas chromatography/mass spectrometry. *Arzneimittelforschung* 47: 347–352.
Yu WC, Goff EU (1983). Determination of vasodilators and their metabolites in plasma by liquid chromatography with a nitrosyl-specific detector. *Anal Chem* 55: 29–32.

Pentamidine

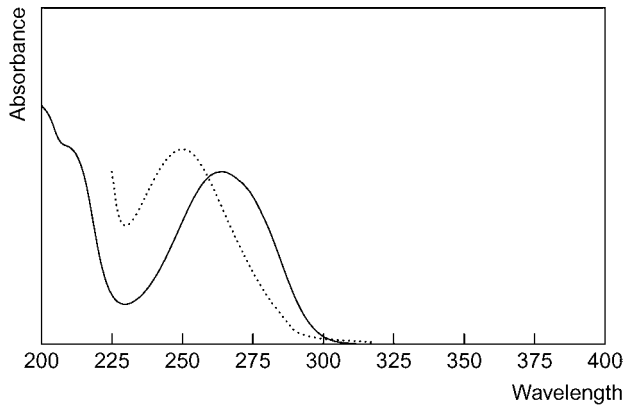
Antiprotozoal
$C_{19}H_{24}N_4O_2$ = 340.4
CAS—100-33-4
IUPAC Name 4-[5-(4-Carbamimidoylphenoxy)pentoxy]benzenecarboximidamide
Synonym 4,4′-[1,5-Pentanediylbis(oxy)]bisbenzenecarboximidamide



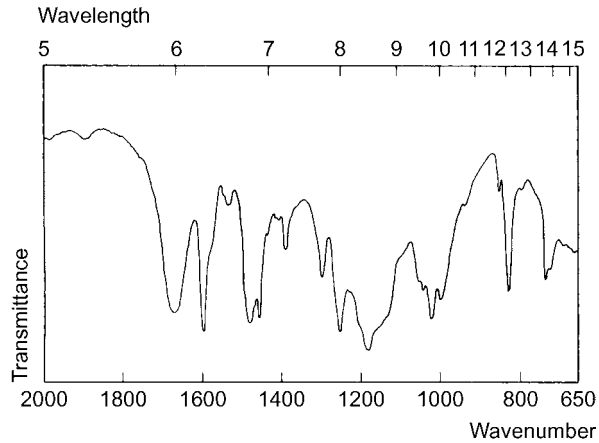
Chemical Properties Log *P* (octanol/water), 2.8.

Pentamidine Isetionate
$C_{19}H_{24}N_4O_2,2C_2H_6O_4S$ = 592.7
CAS—140-64-7
Synonyms Pentamidine di-isetionate; pentamidine isethionate
Proprietary Names *NebuPent*; *Pentacarinet*; *Pentam*; *Pentamina*; *Pneumopent*.
Chemical Properties White, hygroscopic crystals or powder. Mp about 180°. Soluble 1 in 10 of water; slightly soluble in ethanol; insoluble in acetone, chloroform and ether.

Pentamidine Mesilate
$C_{19}H_{24}N_4O_2,2CH_4O_3S$ = 532.6
CAS—6823-79-6
Synonyms Pentamidine dimethylsulfonate; pentamidine mesylate; pentamidine methanesulfonate.
Proprietary Name *Lomidine*
Chemical Properties A white or very faintly pink granular powder. Slightly soluble in water and ethanol; practically insoluble in chloroform and ether.
Thin-layer Chromatography System TA—R_f 0.01; system TB—R_f 0.01; system TC—R_f 0.00; system TL—R_f 0.00; system TAD—R_f 0.00; system TAE—R_f 0.00 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 3010.
Ultraviolet Spectrum Aqueous acid—262 nm (A^1_1=840a); aqueous alkali—249 nm.



Infrared Spectrum Principal peaks at wavenumbers (pentamidine isetionate) 1188, 1604, 1260, 1028, 1676, 1003 cm^{-1} (KBr disk).



Quantification
Blood **HPLC** Fluorescence detection. Limit of detection, 16 nmol/L [Ericsson, Rais 1990].
Plasma **HPLC** See Blood [Ericsson, Rais 1990]. UV detection. Limit of detection, 15 nmol/L [Dusci *et al.* 1987].
Urine **HPLC** Limit of detection, 27.7 nmol/L, see Blood [Ericsson, Rais 1990].
Disposition in the Body
Therapeutic Concentration
In 6 subjects treated for *Pneumocystis carinii* pneumonia with IV pentamidine isetionate 3 mg/kg given once daily as a 2 h IV infusion, the plasma concentration at the end of the first infusion was 249 (±80) µg/L; this value was 179 (±185) µg/L in a further 4 patients. In 9 patients undergoing haemodialysis, the mean peak plasma concentration was 275 (±184) µg/L after a 3 mg/kg dose and 227 (±110) µg/L after a 4 mg/kg dose [Conte 1991].
Dose Usually the equivalent of 2 to 4 mg/kg of pentamidine daily, by IM injection.

Conte JE (1991). Pharmacokinetics of intravenous pentamidine in patients with normal renal function or receiving hemodialysis. *J Infect Dis* 163: 169–175.

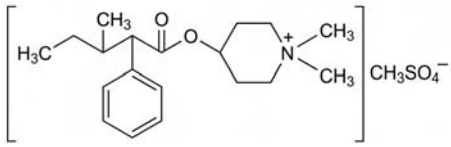
Ericsson O, Rais M (1990). Determination of pentamidine in whole blood, plasma, and urine by high-performance liquid chromatography. *Ther Drug Monit* 12: 362–365.

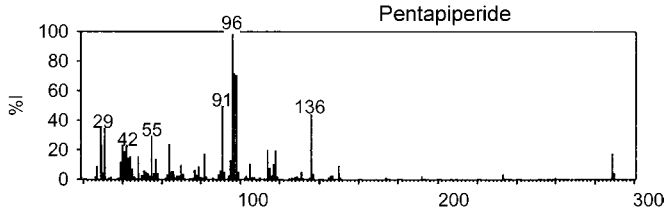
Pentapiperide Metilsulfate

Anticholinergic
$C_{19}H_{30}NO_2,CH_3SO_4$ = 415.5
CAS—7009-54-3 (pentapiperide); 26372-86-1 (pentapiperium); 7681-80-3 (pentapiperide metilsulfate or pentapiperium methylsulfate)

IUPAC Name (1,1-Dimethylpiperidin-1-ium-4-yl)3-methyl-2-phenylpentanoate; methyl sulfate
Synonyms 1,1-Dimethyl-4-(3-methyl-2-phenylvaleryloxy)piperidinium methylsulfate; pentapiperide methylsulfate; pentapiperium metilsulfate; valpipamate methylsulfate.
Note Pentapiperide metilsulfate and pentapiperium methylsulfate are identical but pentapiperide differs from pentapiperium in having one less methyl group.
Proprietary Names *Crilin*; *Crylène*.



Chemical Properties A white crystalline powder. Mp 140° to 148°. Freely soluble in water, chloroform and methanol; soluble in ethanol.
Colour Tests Liebermann's reagent—red-orange; Marquis test—orange.
Thin-layer Chromatography System TA—R_f 0.01; system TB—R_f 0.00; system TC—R_f 0.01; system TL—R_f 0.00 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—not eluted.
Ultraviolet Spectrum Aqueous acid —253, 258, 265 nm.
Infrared Spectrum Principal peaks at wavenumbers 1210, 1730, 1252, 755, 1008, 1162 cm^{-1} (Nujol mull).
Mass Spectrum Principal ions at *m/z* 96, 97, 98, 91, 136, 31, 29, 55.

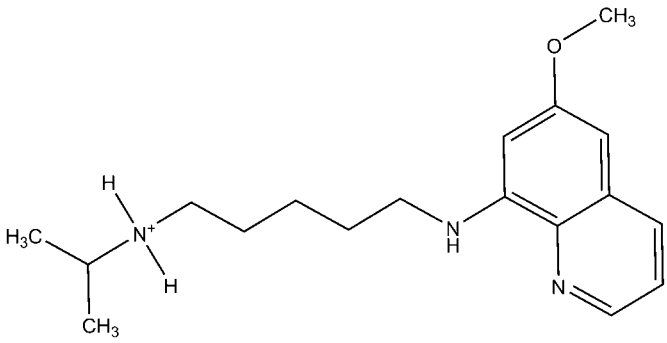


Dose 20 to 30 mg daily.

Pentaquin

Antimalarial
$C_{18}H_{27}N_3O$ = 301.4
CAS—86-78-2

IUPAC Name 5-[(6-Methoxyquinolin-8-yl)amino]pentyl-propan-2-ylazanium
Synonyms 8-(5-Isopropylaminopentylamino)-6-methoxyquinolone; SN 13276.



Chemical Properties pK_a 3.2 [Whichard *et al.* 1968]. Pentaquin is extracted by organic solvents from aqueous alkaline solutions.

Pentaquin Phosphate

$C_{18}H_{27}N_3O,H_2PO_4$ = 387.9
CAS—5428-64-8
Synonyms CB-11; hepagin; heptalin; Hoechst 10600.
Proprietary Name *Heptalgin*
Chemical Properties Yellow crystalline powder. Soluble 1 in 25 of water, almost insoluble in ethanol; insoluble in chloroform and ether. Log *P* (octanol/water) 4.52 [Meylan, Howard 1995].

Colour Tests Ammonium molybdate test—pale blue (limit of detection, 1.0 µg); ammonium vandate test—purple (limit of detection, 0.5 µg); sulfuric acid-formaldehyde test—orange (limit of detection, 0.25 µg); Vitali's test—grey-brown/yellow/yellow (limit of detection, 0.1 µg).
Thin-layer Chromatography System T1—R_f 0.20 (location reagent diazotised *p*-nitroaniline-sodium hydroxide spray, positive reaction).
Gas Chromatography System G2/225—retention time 1.70 (relative to codeine).
Ultraviolet Spectrum Aqueous acid (0.1 N sulfuric acid)—222, 265, 277, 331, 400 nm.
Disposition in the Body
Therapeutic Concentration
A dose of 60 mg pentaquin base per day concomitantly with 2 g of quinine sulfate per day prevented relapses of St Elizabeth strain *vivax* malaria [White *et al.* 1948] but did not prevent Chesson *vivax* malaria [Coatney *et al.* 1950].
Toxicity The toxic effects of pentaquin are similar to those of pamaquin, but are less likely to occur with therapeutic dosage [Coggeshall, Rice 1949; Craige *et al.* 1948]. Plasma concentrations are sustained longer with pentaquin [Eldin, Morcos 1952]. For a study of the toxicity of pentaquin in rhesus monkeys see Schmidt and Schmidt [1951].
Dose Up to 60 mg (base) daily [Alving *et al.* 1948].

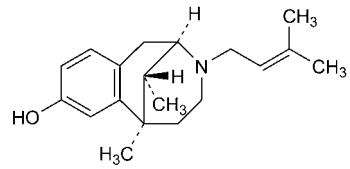
Pentazocine

Narcotic Analgesic
$C_{19}H_{27}NO$ = 285.4
CAS—359-83-1

Synonyms IH-7958; (2*R**,6*R**,11*R**)-1,2,3,4,5,6-Hexahydro-6,11-dimethyl-3-(3-methyl-2-butenyl)-2,6-methano-3-benzazocin-8-ol; NSC-107430; pentazocinum; Win 20228.
Proprietary Names *Fortal*; *Fortalgesic*; *Fortral*; *Fortralin*; *Ospronim*; *Pentalgina*; *Rafazocine*; *Sosegon*; *Sosenol*; *Talwin*; *Talwin NX*. It is an ingredient of *Emergent-Ez*, *Fortagesic* and *Talacen*. (Includes proprietary names of pentazocine salts.)



Chemical Properties White or pale tan-coloured powder. Mp 145.4° to 147.2°. Practically insoluble in water; soluble 1 in about 15 of ethanol, 1 in 2 of chloroform, and 1 in 33 of ether. pK_a 8.5, 10.0 (20°). Log *P* (octanol/pH 7.4), 2.0. Extraction yield (chlorobutane), 0.8 [Demme *et al.* 2005].

Pentazocine Hydrochloride

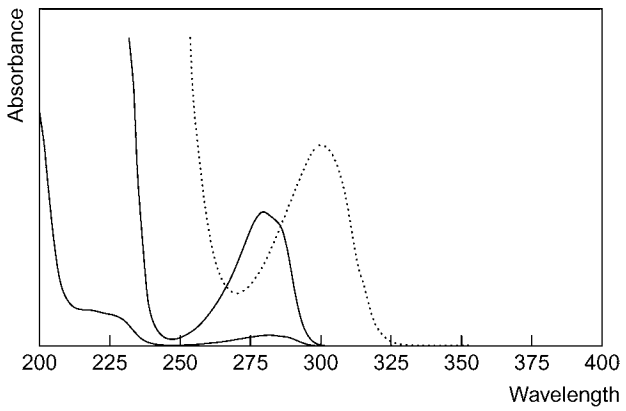
$C_{19}H_{27}NO,HCl$ = 321.9
CAS—2276-52-0; 64024-15-3
Chemical Properties White to pale cream-coloured crystalline powder. There are 2 forms, melting at ~218° and ~254°. Soluble 1 in 30 of water, 1 in 16 of ethanol, and 1 in 4 of chloroform; practically insoluble in ether.

Pentazocine Lactate

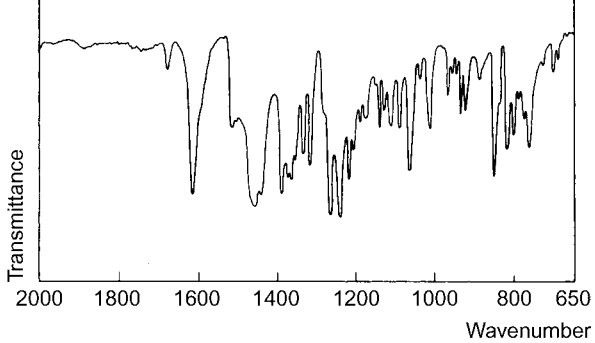
$C_{19}H_{27}NO,C_3H_6O_3$ = 375.5
CAS—17146-95-1
Chemical Properties White to cream-coloured powder. Soluble 1 in 25 of water, 1 in 12 of ethanol, 1 in 25 of chloroform, and 1 in 1500 of ether.

Colour Tests Folin–Ciocalteu reagent—blue; Mandelin's test—green; Marquis test—red→green.
Thin-layer Chromatography System TA—R_f 0.61; system TB—R_f 0.16; system TC—R_f 0.12; system TE—R_f 0.70; system TL—R_f 0.28; system TAE—R_f 0.34; system TAF—R_f 0.72; system TAJ—R_f 0.02; system TAK—R_f 0.03; system TAL—R_f 0.57 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—pentazocine RI 2280, pentazocine-AC RI 2330, pentazocine-PFP RI 2120, pentazocine-TFA RI 2075, pentazocine-TMS RI 2320, M (desalkyl-)-AC_2 RI 2380, M (OH-) RI 2545; system GB—pentazocine RI 2356, M (desalkyl-) RI 2019, M (OH-) RI 2649; system GC—RI 2225; system GF—RI 3030; system GM—RRT 0.870 (relative to iprindole).

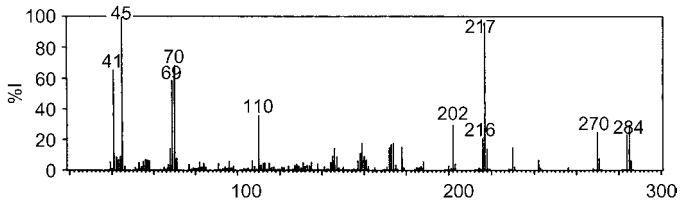
High Performance Liquid Chromatography System HA—k 1.8; system HC—k 0.67; system HX—RI 372; system HY—RI 288; system HZ—RT 3.8 min; system HAA—RT 12.5 min; system HAX—RT 9.9 min; system HAY—RT 5.5 min.
Ultraviolet Spectrum Aqueous acid—278 ($A_1^1 = 69a$); aqueous alkali—240 ($A_1^1 = 330a$), 300 nm ($A_1^1 = 106a$).



Infrared Spectrum Principal peaks at wavenumbers 1238, 1264, 1609, 1214, 854, 1054 cm^{-1} (KBr disk). Polymorphism may occur.



Mass Spectrum Principal ions at m/z 45, 217, 70, 41, 69, 110, 285, 202.



Quantification

Blood **GC** Column: 3% OV-17 on Chromosorb W HP 80/100 mesh (1.8 m × 4 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature: 220°. AFID. Retention time: 6.9 min. Limit of detection, 0.5 mg/L [Mackell, Poklis 1982]. Column: OV-17 Chromosorb WHP 80/100 mesh (1.8 m × 4 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature: 220°. FID or NPD. Retention time: 6.9 min. Limit of detection not reported [Poklis, Mackell 1982]. Column: 3% Dexil 300 on Gas-Chrom Q 100/120 mesh (1.8 m × 3.2 mm i.d.). Carrier gas: Ar: CH_4 (95 : 5), 50 mL/min. Temperature: 265°. ECD. Retention time: 4.8 min. Limit of detection, 0.5 µg/L [Swezey *et al.* 1978]. Column: OV-17 (180 × 0.3 cm i.d.). Carrier gas: N_2, 35 mL/min. Temperature: 245°. Limit of detection not reported [Gelbke *et al.* 1978]. Column: 2.5% SE-30 80/100 mesh Chromosorb G (2 m × 2 m long). Carrier gas: N_2, 60 mL/min. Temperature: 200°. FID. Retention time: 5.3 min. Limit of detection not reported [Beckett *et al.* 1970].

See also Berkowitz *et al.* [1969].

GC-MS SIM acquisition mode. Limit of detection 0.5 µg/L [Seno *et al.* 2000].

HPLC Column: Ultrasphere-ODS (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.05 mol/L citrate buffer (pH 4.0) : acetonitrile : pyridine : 70 : 30 : 0.2), flow rate 1.4 mL/min. Electrochemical detection. Limit of detection, 1 ng [Shibanoki *et al.* 1987].

LC-MS Mobile phase: acetonitrile : 10 mmol/L ammonium acetate solution (20 : 80, pH 4.0) containing 0.5% glycerol, flow rate 25 µL/min. FAB, SIM and scan acquisition mode. Limit of detection, 1 and 0.1 ng/g in scan and SIM mode, respectively [Imamura *et al.* 1999].

Plasma **GC** Column: BP 10 (SGE, 25 m × 0.22 mm i.d.). Carrier gas: N_2, 6.2 mL/min. Temperature programme: 200° to 270° at 10°/min for 23 min. NPD. Retention time: 8.88 min. Limit of detection, 4.5 µg/L [Kintz *et al.* 1990]. Column: Nucleosil (25 cm × 4.5 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.05 mol/L hydrogen phosphate (33 : 67), flow rate 1.0 mL/min. Fluorescence detection ($\lambda_{ex} = 278$ nm, $\lambda_{em} = 324$ nm). Retention time: 6.2 min. Limit of quantification, 4 µg/L; limit of detection, ≈1 µg/L [Moeller *et al.* 1990]. Column: 3% OV-17 Gas Chrom Q 120/140 mesh (1.8 m × 2 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature programme: 190° to 260° at 10°/min. Retention time: 4.5 min. Limit of detection not reported [Yeh *et al.* 1986]. See Blood [Swezey *et al.* 1978]. Column: 5% OV-17 on Gas Chrom Q 80/100 mesh. Carrier gas: N_2, 22 mL/min for FID, 30 mL/min for ECD. Temperature: 220° for FIB, 235° for ECD. Limit of detection, 8.0×10^{-17} mole/sec for PFB-pentazocine [Brötell *et al.* 1973]. Column: 10% OV-1 on 100/120 mesh Gas Chrom Q (1.5 m × 2 mm i.d.). Carrier gas: N_2, 50 mL/min. Temperature: 215°. ECD. Limit of quantification, 0.1–0.2 mg/L for HFB derivatives [Pittman & Davison 1973].

GC-MS Column: 3% SE-30 Gas-Chrom Q 100/120 mesh (1 m × 3 mm i.d.). Carrier gas: He, 25 mL/min. Temperature: 210°. EI ionisation at 50 eV. MID. Limit of detection, 2 µg/L [Agurell *et al.* 1974].

HPLC Column: LiChrosorb RP-18 (250 × 4 mm i.d., 10 µm). Mobile phase: 0.001 mol/L methanolic acetonitrile : 0.003 mol/L octane-1-sulfonic acid : sodium acetate (2 : 6 : 2), flow rate 1 mL/min. UV detection ($\lambda = 230$ nm). Retention time: 2.75 min. Limit of detection not reported [Misztal, Przyborowski 1991].

Serum **HPLC** Column: Prodigy ODS(3) 100A (150 × 3.2 mm i.d., 5 µm). Mobile phase: 10 mmol/L potassium dihydrogen phosphate (pH 5.8) : absolute ethanol (80 : 20), flow rate 0.7 mL/min. UV detection ($\lambda = 220$ nm). Limit of quantification, 20 µg/L, limit of detection, 15 µg/L [Ameyibor & Stewart 1997]. Column: Ultron ES-OVM (150 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : acetonitrile : 10 mmol/L potassium dihydrogen phosphate (pH 5.8; 20 : 5, 3 : 74.7), flow rate 1.0 mL/min. Fluorescence detection ($\lambda_{ex} = 275$ nm, $\lambda_{em} = 335$ nm). Limit of detection, 5 µg/L [Kelly *et al.* 1994]. Column: µBondapak phenyl (30 cm × 4 mm i.d.). Mobile phase: acetonitrile : 0.01% phosphoric acid-0.01% NaCl (35 : 65, pH 2.8), flow rate 1.5 mL/min. UV detection ($\lambda = 210$ nm). Limit of detection, 10 µg/L [Hackett *et al.* 1987].

Urine **GC** Column: 3% OV-17 on Gas-Chrom Q 80/100 mesh (1.8 m × 2 mm i.d.). Carrier gas: CH_4, 30 mL/min. Temperature programme: 150° to 250° at 10°/min. FID. Limit of detection not reported [Reid & Gerbeck 1981]. See Blood [Swezey *et al.* 1978]. Column: 2.5% SE 30 80/100 mesh chromosorb G (2 m × 0.25" i.d.). Carrier gas: N_2, 60 mL/min. Temperature: 220°. FID. Retention time: 9.5 min. Limit of detection not reported [Vaughan, Beckett 1974]. See Plasma [Beckett *et al.* 1970].

Cerebrospinal Fluid **GC-MS** See Plasma [Agurell *et al.* 1974].

Faeces **GC** See Plasma [Beckett *et al.* 1970].

Disposition in the Body Well absorbed after oral, IM, or rectal administration, but undergoes extensive first-pass metabolism after oral administration. Metabolism occurs mainly by extensive oxidation of the methyl groups of the dimethylallyl side-chain to produce the *cis*-hydroxy and the *trans*-carboxylic acid metabolites; the *trans*-hydroxy metabolite appears to be rapidly oxidised to the acid and is not detectable. Glucuronic acid conjugation of unchanged drug and metabolites also occurs; the 3-(3-hydroxy-3-methylbutyl) derivative has also been detected in the urine after overdoses. There is considerable inter-subject variation in the rate of metabolism, and smokers appear to metabolise 40% more pentazocine than non-smokers. After IM administration, 65–76% of a dose is excreted in the urine in 48 h. After an oral dose, up to 13% is excreted as unchanged drug and 12–30% as the conjugate in 24 h, the major proportion being excreted in the first 12 h [Beckett *et al.* 1970; Berkowitz 1971; Pittman 1970]. Less than 2% of a dose is eliminated in the faeces [Beckett *et al.* 1970; Burt, Beckett 1971]. Pentazocine crosses the placenta.

Therapeutic Concentration In plasma, usually in the range 0.05–0.20 mg/L. Blood concentrations may be erratic and more than one peak may occur after IM or oral administration.

Two volunteers were administered an IM injection of pentazocine. Over 1–6 h the pentazocine concentration in whole blood was 13.5–59.3 µg/L, and in urine it was 0.39–4.0 mg/L [Seno *et al.* 2000].

Four patients were administered 30 mg pentazocine IV for analgesia during surgery. At 1 min the blood concentration was 3.2 mg/L, falling to 137 µg/L at 30 min [Shibanoki *et al.* 1987].

Six healthy former drug abusers, aged between 21 and 55 years, were administered 40 or 80 mg IM pentazocine. Mean peak plasma concentrations at 15 min were 102 and 227 µg/L, respectively [Yeh *et al.* 1986].

After an IM dose of 45 mg given to 8 subjects, peak plasma concentrations of 0.11–0. 24 mg/L (mean 0.14) were attained in 1 h. After a single oral dose of 75 mg given to 5 subjects, peak plasma concentrations of 0.11–0.30 mg/L (mean 0.16) were attained in 1–3 h [Berkowitz *et al.* 1969].

Toxicity The estimated minimum lethal dose is 0.3 g, although recovery after ingestion of 1.2 g has been reported. Blood concentrations of 1 mg/L or more may be lethal. Some cases of abuse have been reported, resulting in a mild form of addiction. Pentazocine abuse has been reported to be widespread among 'street addicts' in the USA, in combination with tripelennamine ("T's and Blues').

A 26-year-old black female was found dead at home. Postmortem examination revealed the following pentazocine concentrations: stomach contents, 2.15 mg/g; blood, 41 mg/L; liver, 12.1 µg/g. Zopiclone was also found at the following concentrations: stomach contents, 0.15 mg/g; blood, 1.18 mg/L; liver 5.10 µg/g [van Bocxlaer *et al.* 1996].

In 2 fatalities due to pentazocine ingestion, the following postmortem tissue concentrations were reported: blood 9.2 and 3.3 mg/L, liver 43 and 34 µg/g, urine, –, 4.5 mg/L; ethanol was also detected in blood at concentrations of 200 and 1760 mg/L. Blood- and liver-pentazocine concentrations in other cases taken from the literature were reported to range from 0.8 to 38 mg/L and from 3 to 197 µg/g respectively [Poklis, Mackell 1982].

In 17 fatalities involving IV abuse of pentazocine and tripelennamine, pentazocine blood concentrations of 0 to 11 mg/L (mean, 3) were reported; tripelennamine concentrations ranged from 0–3.0 mg/L (mean, 0.5) [Monforte *et al.* 1983].

Note For a case in which there were problems with putrefaction in the detection of pentazocine, see De Zeeuw *et al.* [1977].

Bioavailability ≈20%.

Half-life Plasma half-life, ≈4 h.

Volume of Distribution ≈5 L/kg.

Clearance Plasma clearance, ≈18 mL/min/kg.

Distribution in Blood Plasma : whole blood ratio, ≈0.93.

Protein Binding ≈60% in control subjects and 48 to 75% in intracranial tumour or aneurysm patients [Ehrnebo *et al.* 1974].

Note For a review of pentazocine, see Goldstein [1985]. For a review of the pharmacokinetics of narcotic agonists-antagonists, see Bullingham *et al.* [1983].

Dose The equivalent of up to 600 mg of pentazocine daily, by mouth; up to 360 mg daily, given parenterally.

Pentetrazol

Respiratory Stimulant

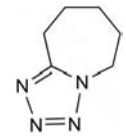
$C_6H_{10}N_4$ = 138.2

CAS—54-95-5

IUPAC Name 6,7,8,9-Tetrahydro-5*H*-tetrazolo[1,5-*a*]azepine

Synonyms Corazol; leptazol; pentamethazol; 1,5-pentamethylenetetrazole; pentazol; pentylenetetrazol.

Proprietary Names *Cardiazol*; *Cenalene-M*; *Coranormol*; *Corazole*; *Corvasol*; *Deumacard*; *Gewazol*; *Korazol*; *Metrazol*; *Phrenazol*; *Ventrazol*.



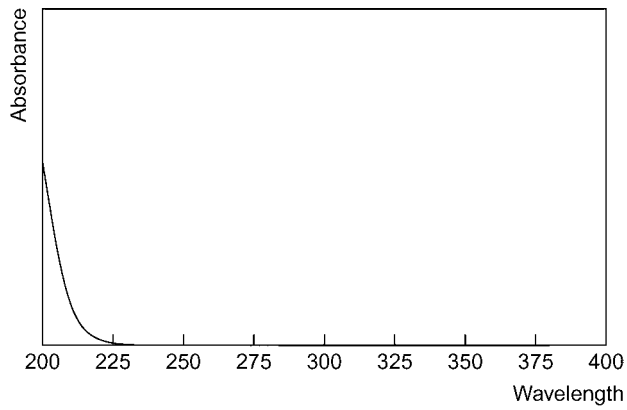
Chemical Properties Colourless crystals or white crystalline powder. Mp 57° to 60°. Soluble 1 in <1 of water, of ethanol, and of chloroform, and 1 in <4 of ether. Log *P* (octanol/water), 0.1.

Thin-layer Chromatography System TA—R_f 0.72; system TB—R_f 0.07; system TC—R_f 0.64; system TE—R_f 0.60; system TL—R_f 0.63; system TAE—R_f 0.72; system TAF—R_f 0.74; system TAJ—R_f 0.70; system TAK—R_f 0.41; system TAL—R_f 0.95 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 1550; system GB—RI 1579; system GC—RI 2021.

High Performance Liquid Chromatography System HX—RI 290.

Ultraviolet Spectrum No significant absorption, 230 to 360 nm.



Infrared Spectrum Principal peaks at wavenumbers 1535, 1115, 1250, 1000, 900, 800 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 55, 82, 41, 39, 54, 42, 56, 109.

Quantification

Plasma **GC** AFID. Limit of detection, 100 µg/L [Bo *et al.* 1979]. FID. Limit of detection, 500 µg/L [Jun *et al.* 1975].

Urine **GC** See Plasma [Jun *et al.* 1975].

Disposition in the Body Readily absorbed after oral or parenteral administration and rapidly metabolised. About 60% of an oral dose is excreted in the urine in 24 h with about 10% as unchanged drug and the remainder as metabolites.

Therapeutic Concentration

Following an oral dose of 100 mg to 3 subjects, who were taking the drug regularly, peak plasma concentrations of 1.5 to 3.1 mg/L (mean, 2.2) were attained in 1.3 to 5 h [Jun *et al.* 1975].

Dose Usually 100 mg parenterally.

Penthienate Methobromide

Anticholinergic

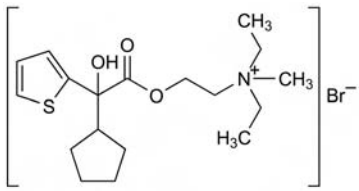
$C_{18}H_{30}BrNO_3S$ = 420.4

CAS—22064-27-3 (penthienate) ($C_{18}H_{30}NO_3S$); 60-44-6 (methobromide)

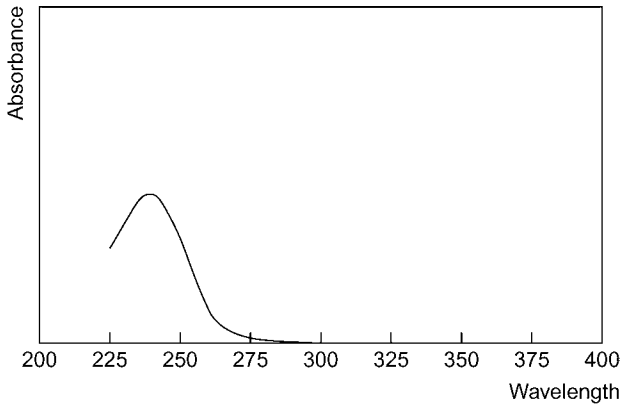
IUPAC Name 2-(2-Cyclopentyl-2-hydroxy-2-thiophen-2-ylacetyl)oxyethyl-diethyl-methylazanium bromide

Synonyms 2-[(Cyclopentylhydroxy-2-thienylacetyl)oxy]-*N*,*N*-diethyl-*N*-methylethanaminium bromide; penthienate bromide

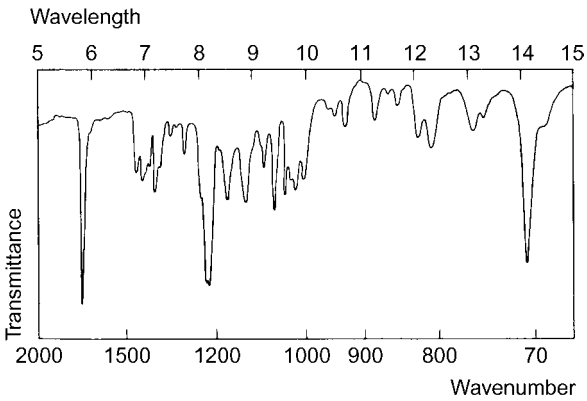
Proprietary Name *Monodral*



Chemical Properties A white crystalline powder. Mp about 125°. Soluble 1 in 5 of water; freely soluble in ethanol and chloroform; insoluble in ether. Log *P* (octanol/water), −0.5.
Colour Tests The following tests are performed on the nitrate: Liebermann's reagent—violet; Mandelin's test—violet; Marquis test—violet; sulfuric acid—orange.
Thin-layer Chromatography System TA—R_f 0.02; system TE—R_f 0.03; system TAE—R_f 0.09 (acidified iodoplatinate solution, positive).
High Performance Liquid Chromatography System HA—*k* 3.2.
Ultraviolet Spectrum Aqueous acid—238 nm (A^1_1=188a).



Infrared Spectrum Principal peaks at wavenumbers 1739, 1227, 1234, 704, 1064, 1130 cm^{-1} (KBr disk).

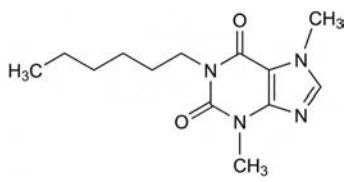


Dose 7.5 to 40 mg daily.

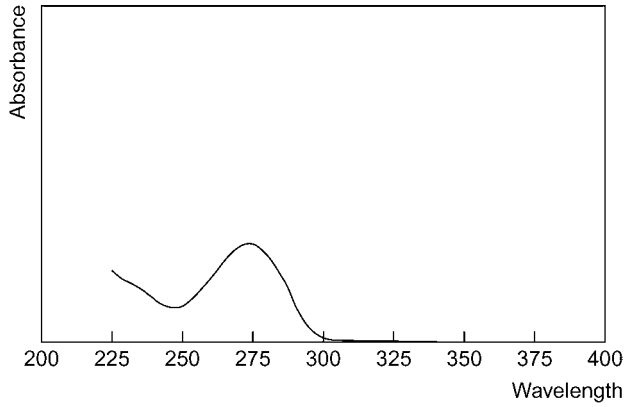
Pentifylline

Vasodilator
$C_{13}H_{20}N_4O_2$ = 264.3
CAS—1028-33-7

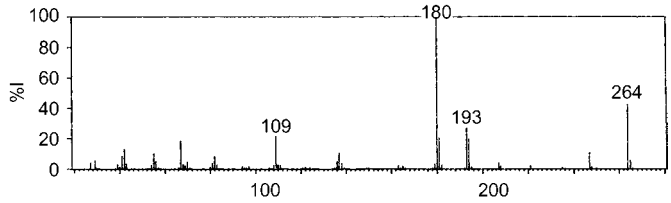
IUPAC Name 1-Hexyl-3,7-dimethylpurine-2,6-dione
Synonyms 1-Hexyl-3,7-dihydro-3,7-dimethyl-1*H*-purine-2,6-dione; 1-hexyltheobromine.
Proprietary Name *Cosaldon*



Chemical Properties A crystalline solid. Mp 82° to 83°. Practically insoluble in water; soluble in ethanol, chloroform and hydrochloric acid. Log *P* (octanol/water), 2.6.
Colour Test Amalic acid test—pink-orange/violet.
Thin-layer Chromatography System TA—R_f 0.55; system TB—R_f 0.06; system TC—R_f 0.66; system TE—R_f 0.66; system TL—R_f 0.46; system TAE—R_f 0.72 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—pentifylline RI 2240, M (OH-)-AC RI 2560, M (OH-) isomer-1 RI 2295, M (OH-) isomer-2 RI 2505, M (di-OH-)-H_2O isomer-1 RI 2250, M (di-OH-)-H_2O isomer-2 RI 2285, M (di-OH-) RI 2700.
Ultraviolet Spectrum Aqueous acid—275 nm (A^1_1=335b).



Infrared Spectrum Principal peaks at wavenumbers 1652, 1700, 1548, 1220, 760, 750 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 180, 264, 193, 109, 194, 181, 67, 42.

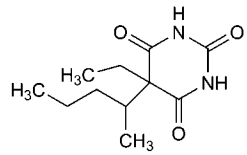


Dose Pentifylline has been given in doses of up to 800 mg daily.

Pentobarbital

Hypnotic, Barbiturate
$C_{11}H_{18}N_2O_3$ = 226.3
CAS—76-74-4

IUPAC Name 5-Ethyl-5-pentan-2-yl-1,3-diazinone-2,4,6-trione
Synonyms Aethaminalum; 5-ethyl-5-(1-methylbutyl)-2,4,6(1*H*,3*H*,5*H*)-pyrimidinetrione; mebubarbital; mebumal; pentobarbitalum; pentobarbitone.
Proprietary Name *Hypnol*



Chemical Properties Colourless crystals or a white crystalline powder. Mp 129° to 130° (from alcohol). A polymorphic form may occur, with an mp of about 115°; it gradually reverts to the more stable form on heating at about 110°. Very slightly soluble in water; soluble 1 in 4.5 of ethanol, 1 in 4 of chloroform and 1 in 10 of ether; very soluble in acetone and methanol. pK_a 8.0 (20°). Log *P* (octanol/buffer pH 7.4), 1.9. Extraction yield (chlorobutane), 0.2 [Demme *et al.* 2005].

Pentobarbital Calcium

$(C_{11}H_{17}N_2O_3)_2Ca$ = 490.6
CAS—7563-42-0 ($C_{11}H_{18}N_2O_3$,xCa)
Synonym Pentobarbitone calcium
Proprietary Name *Repocal*
Chemical Properties A fine white crystalline powder. Sparingly soluble in water; slightly soluble in ethanol; practically insoluble in ether.

Pentobarbital Sodium

$C_{11}H_{17}N_2NaO_3$ = 248.3
CAS—57-33-0
Synonyms Ethaminal sodium; mebumalnatrium; pentobarbitone sodium; soluble pentobarbitone.
Proprietary Names *Nembutal*; *Nova Rectal*; *Pentone*; *Petab*. It is an ingredient of *Cafatine PB* and *Cafergot-PB*.

P

Chemical Properties A white, hygroscopic, crystalline powder or granules. Decomposes at 127°. Freely soluble in water and ethanol; practically insoluble in benzene and ether. A solution in water slowly decomposes.

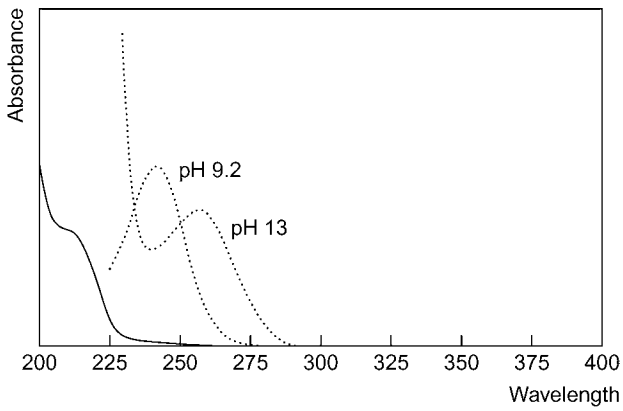
Colour Tests Koppanyi–Zwikker test—violet; mercurous nitrate—black; vanillin reagent—brown-red/violet.

Thin-layer Chromatography System TD—R_f 0.55; system TE—R_f 0.45; system TF—R_f 0.66; system TH—R_f 0.76; system TAD—R_f 0.59; system TAE—R_f 0.90 (mercuric chloride–diphenylcarbazone reagent, positive; mercurous nitrate spray, black; Zwikker's reagent, pink).

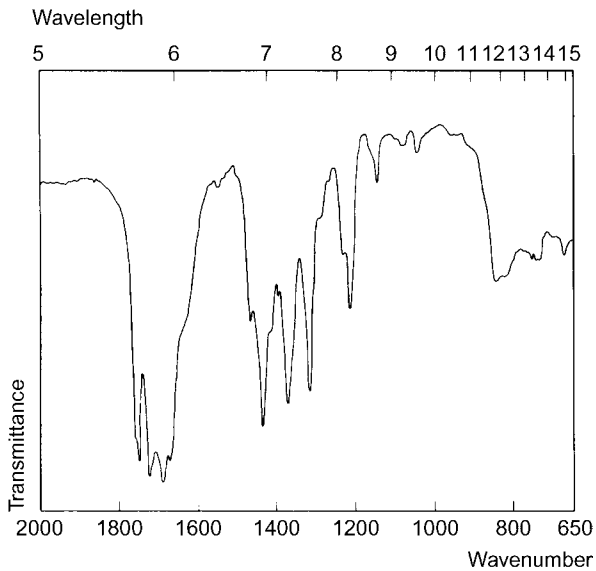
Gas Chromatography System GA—pentobarbital RI 1735, pentobarbital-Me_2 RI 1630, M (3′-OH-) RI 1955, M (3′-OH-)-Me_2 RI 1820; system GB—pentobarbital RI 1776, M (3′-OH-) RI 2039; system GF—RI 2465; system GAJ—RRT 0.803 (relative to methylphenobarbital).

High Performance Liquid Chromatography System HG—*k* 10.96; system HH—*k* 8.07; system HX—RI 424; system HY—RI 383; system HZ—retention time 4.1 min; system HAX—retention time 5.9 min; system HAY—retention time 5.6 min.

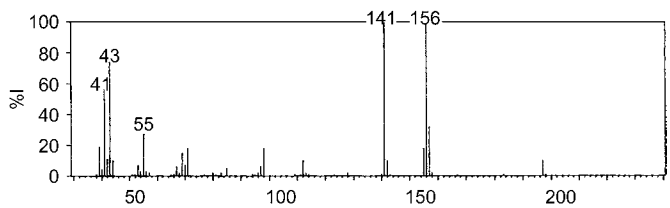
Ultraviolet Spectrum Borax buffer 0.05 mol/L (pH 9.2)—239 nm (A^1_1=438a); 1 mol/L sodium hydroxide (pH 13)—255 nm (A^1_1=327b).



Infrared Spectrum Principal peaks at wavenumbers 1685, 1719, 1744, 1315, 1218, 845 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 141, 156, 43, 41, 157, 55, 39, 98; 3′-hydroxypentobarbital 45, 156, 141, 69, 41, 43, 157, 55.



Quantification

Plasma **GC** FID. Limit of detection, 500 µg/L [Hulshoff *et al.* 1979].

GC-MS Pentobarbital and thiopental. Limits of detection, 5 µg/L for pentobarbitaland and 10 µg/L for thiopental [Martens-Lobenhoffer 1999].

Serum **GC** AFID. Limit of detection, 80 µg/L [Sun, Hoffman 1979].

See also under Amobarbital.

Disposition in the Body More than 90% of the sodium salt is absorbed after oral administration. About 80% of a dose is excreted in the urine in 5 days, with about 7% as (+)-3′-hydroxypentobarbital, 30% as the (−)-3′-hydroxy isomer, up to 13% as the *N*-hydroxy metabolite, 7 to 14% as the 3′-oxo metabolite, and about 10 to 15% as the 3′-carboxy derivative. About 1% of a dose is excreted in the urine unchanged.

Pentobarbital is a metabolite of thiopental.

Therapeutic Concentration In plasma, usually in the range 1 to 10 mg/L.

Following a single oral dose of 50 mg to 5 fasting subjects, peak plasma concentrations of 0.62 to 0.88 mg/L (mean 0.73) were attained in 1 h [Smith *et al.* 1973].

After an IV injection of 100 mg to 7 subjects, mean plasma concentrations of 3 mg/L were reported in 6 min [Ehrnebo 1974].

Toxicity The estimated minimum lethal dose is 1 g. Toxic effects are usually associated with blood concentrations greater than about 8 mg/L and concentrations of 12 mg/L or more may produce coma. Fatalities have been associated with plasma concentrations of 8 to 24 to 73 mg/L.

In 55 fatalities, the following postmortem concentrations were reported: blood 5 to 169 mg/L (mean, 30), liver 23 to 550 µg/g (mean, 130) [Baselt, Cravey 1977].

A 51-year-old veterinary official, who committed suicide by self-injecting pentobarbital, had the following postmortem tissue concentrations, 24 h after discovery of the corpse (mg/L or µg/g): peripheral blood 13.5, plasma from peripheral blood 21.7, urine 7.2, gastric contents 18.1 (0.7 mg total), vitreous humour 12.6, brain cortex 33.2, CSF 13.9, bile 67.4, liver 27.5; approximately 1.6 g of pentobarbital was thought to have been administered [Romain *et al.* 2003].

In 3 fatalities caused by pentobarbital, the following postmortem tissue distribution, mg/L or µg/g, was reported:

	Pentobarbital	*3′-Hydroxy metabolite*
Blood	51, 10, 25	ND, ND, 4
Bile	152, 148, 59	-, -, 13
Kidney (left)	46, 16, 38	4, 7, 7
Liver	165, 20, 46	5, 8, 9
Urine	7, 5, 62	-, 82, 65

(ND = not detected)
[Robinson, McDowall 1979].

Half-life Plasma half-life, about 15 to 50 h (mean, 27).

Volume of Distribution About 0.7 to 1 L/kg.

Clearance Plasma clearance, about 0.3 to 0.5 mL/min/kg.

Distribution in Blood Plasma : whole blood ratio, 0.93.

Saliva Plasma : saliva ratio, about 3.

Protein Binding About 60 to 70%.

Note For a review of the pharmacokinetics of hypnotic drugs, see Breimer [1977].

Dose 100 mg by mouth or up to 200 mg rectally, as a hypnotic.

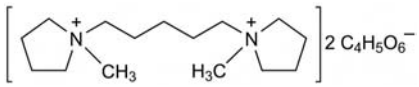
Pentolonium Tartrate

Antihypertensive

$C_{23}H_{42}N_2O_{12}$ = 538.6

CAS—144-44-5 (pentolonium); 52-62-0 (tartrate)

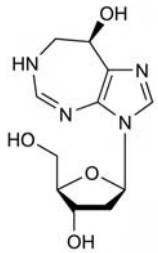
IUPAC Name 1-Methyl-1-[5-(1-methylpyrrolidin-1-ium-1-yl)pentyl]pyrrolidin-1-ium; 2,3,4-trihydroxy-4-oxobutanoate
Synonyms 1,1′-(1,5-Pentanediyl)bis[1-methylpyrrolidinium] salt with [*R*-(*R**, *R**)]-2,3-dihydroxybutanedioic acid (1:2); pentapyrrolidinium bitartrate; pentolinium tartrate.
Proprietary Names *Ansolysen*; *Pentilium*.



Chemical Properties A white powder. Mp 203°, with decomposition. Soluble 1 in 0.4 of water and 1 in 810 of ethanol; insoluble in chloroform and ether.
Thin-layer Chromatography System TA—R_f 0.00; system TB—R_f 0.00; system TC—R_f 0.00; system TE—R_f 0.00; system TL—R_f 0.00; system TAE—R_f 0.00; system TAF—R_f 0.01 (acidified iodoplatinate solution, positive).
High Performance Liquid Chromatography System HX—RI 48.
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.
Infrared Spectrum Principal peaks at wavenumbers 1299, 1256, 1064, 1208, 1129, 676 cm^{-1} (KBr disk).
Disposition in the Body Incompletely and irregularly absorbed after oral administration. Excreted in the urine as unchanged drug.
Dose 2.5 to 25 mg IV. Doses of 20 to 900 mg daily have been given by mouth.

Pentostatin

Antineoplastic
$C_{11}H_{16}N_4O_4 = 268.3$
CAS—53910-25-1
IUPAC Name (8*R*)-3-[(2*R*,4*S*,5*R*)-4-Hydroxy-5-hydroxymethyl)oxolan-2-yl]-7,8-dihydro-4H-imidiazo[4,5-*d*][1,3]diazepin-8-ol
Synonyms CI-825; CL-67310405; covidarabine; DCF; 2′-dCF; 2′-deoxycoformycin; (8*R*)-3-(2-deoxy-β-D-*erythro*-pentofuranosyl)-3,4,7,8-tetrahydroimidazole [4,5-*d*][1,3]diazepin-8-ol; NSC-218321; PD-81565.
Proprietary Name *Nipent*



Chemical Properties White crystals from methanol/water. Mp 220° to 225°; also reported as 204° to 209.5° with darkening at >150°. pK_a 5.2. Log *P* (octanol/water), −2.54.
Quantification
Plasma **Enzyme Inhibition Assay** Limit of quantification, 1 µg/L [Staubus *et al.* 1984].
Disposition in the Body Pentostatin penetrates the blood–brain barrier and the concentration in the cerebrospinal fluid reaches 10 to 12% of that observed in plasma within 2–4 h after an IV administration of a 5–30 mg/m^2 (0.25 mg/kg) dose. The drug is metabolised by phosphorylation to mono-, di- and triphosphate derivatives, and is recovered in urine unchanged. 50–96% of a single dose is excreted through the kidney in 24 h.
Therapeutic Concentration
An IV dose of 0.25–1 mg/kg (7.5–30 mg/m^2) generates peak plasma concentrations of 2–6 µmol/L observed at 1 h. No accumulation of the drug occurs with greater than 3 consecutive doses of 1 mg/kg pentostatin [Venner *et al.* 1981].
Toxicity
In early clinical trials, considerable toxicity was observed with the administration of pentostatin, affecting the kidneys (acute renal failure), central nervous system (depression, seizures and coma) and the immune system with severe and often fatal opportunistic infections. These are frequently associated with the higher doses; 10–20 mg/m^2 daily for 3–5 consecutive days) [Brogden, Sorkin 1993].
Half-life Plasma 3–15 h (measured with sampling for 24 h); may be increased in patients with impaired renal function.
Volume of Distribution 42.4 L (terminal phase); 36.9 L (steady state).
Clearance Total body plasma, 52.5–64 mL/min/m^2 (3.14–3.84 L/h/m^2); 27 mL/min/m^2 (1.6 L/h/m^2) in patients with renal impairment.
Protein Binding 1.9–4.9% (at therapeutic plasma concentrations).
Note For a review of the pharmacokinetics of pentostatin, see Brogden and Sorkin [1993].
Dose 4 mg/m^2 every 1 to 2 weeks.

Brogden RN, Sorkin EM (1993). Pentostatin. A review of its pharmacodynamic and pharmacokinetic properties, and therapeutic potential in lymphoproliferative disorders. *Drugs* 46: 652–677.

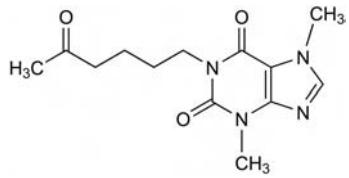
Venner PM *et al.* (1981). Levels of 2′-deoxycoformycin, adenosine, and deoxyadenosine in patients with acute lymphoblastic leukemia. *Cancer Res* 41: 4508–4511.

Pentoxifylline

Vasodilator
$C_{13}H_{18}N_4O_3 = 278.3$
CAS—6493-05-6
IUPAC Name 3,7-Dimethyl-1-(5-oxohexyl)purine-2,6-dione
Synonyms 3,7-Dihydro-3,7-dimethyl-1-(5-oxohexyl)-1*H*-purine-2,6-dione; oxpentifylline.
Proprietary Names *Torental*; *Trental*.



Chemical Properties White crystalline powder. Mp 102° to 105°. Soluble in water; sparingly soluble in ethanol; freely soluble in chloroform and methanol; slightly soluble in ether. pK_a 0.3. Log *P* (octanol/water), 0.3. Stable in breast milk when stored at –15° for 3 weeks [Bauza *et al.* 1984].
Colour Test Amalic acid test—pink/violet.
Thin-layer Chromatography System TAE—R_f 0.64; system TE—R_f 0.55.
Gas Chromatography System GA—RI 2406.
High Performance Liquid Chromatography System HAA—RT 11.5 min; system HX—RI 355; system HY—RI 274; system HZ—RT 2.1 min; system HAX—RT 5.0 min; system HAY—RT 4.2 min.
Ultraviolet Spectrum Aqueous acid—274 nm (A^{1}_{1} = 380a). No alkaline shift.
Infrared Spectrum Principal peaks at wavenumbers 1660, 1700, 1720, 1550, 762, 752 cm^{-1} (KBr disk).
Quantification
Blood **GC** Column: Restek RTX-50 (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 1.3 mL/min for 12 min to 3 mL/min over 5 min for 3.5 min. Temperature programme: 220° for 3 min to 280° at 10°/min for 2 min to 300° at 40°/min for 5.5 min. NPD. Limit of detection, 0.16 mg/L [Engelhart *et al.* 1997].
HPLC Column: LC-8-DB (25 cm × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water (24 : 76), flow rate 1.0 mL/min. UV detection (λ = 280 nm). Retention time: 6.4 min. Limit of detection, 5 µg/L [Grasela, Rocci, Jr. 1987].
Plasma **GC** Column: DB-5 phenylmethyl (30 × 0.32 mm i.d.). NPD. Limit of detection, 5 µg/L [Cleary *et al.* 1999]. Column; HP-ultra 2 cross-linked methylphenylsilicone (12.5 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 0.8 mL/min. Temperature programme: 130° for 1 min to 250° at 15°/min for 5 min. FID Retention time: 14.8 min. Limit of detection not reported [Suarez-Penaranda *et al.* 1998]. Column: 3% V-73 on Chromosorb W HP 100/120 mesh (25 m × 0.31 mm i.d., 0.52 µm). Carrier gas: He, 35 cm/s. Temperature: 250°. NSD. Limit of detection, 5 µg/L [Burrows 1987]. Column: 3% OV-1 on Chromosorb W HP 100/120 mesh (25 m × 0.31 mm i.d., 0.17 µm). Carrier gas: He, 43 cm/s. Temperature: 230°. NSD. Limit of detection, 2 µg/L [Burrows, Jolley 1985]. Column: 3% OV-25 on Chromosorb W HP 100/120 mesh (2 m × 1.75 mm i.d.). Carrier gas: He, 25 mL/min. Temperature: 235°. Retention time: 8.8 min. AFID. Limit of detection 3–10 µg/L for pentoxifylline and 5-hydroxyhexyl metabolite [Bryce, Burrows 1980].
HPLC Column: KR100-5-C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: 0.02 mol/L phosphoric acid (pH 4.0) : methanol : tetrahydrofuran (55 : 45 : 1), flow rate 1.0 mL/min. UV detection (λ = 273 nm). Limit of quantification, 12.5 µg/L, limit of detection, 3 µg/L [Wong *et al.* 1998]. Column: LiChrospher 100 RP-18 (5 µm). Mobile phase: water : dioxane : acetonitrile (87 : 6.5 : 6.5) with 0.5% acetic acid. UV detection (λ = 275 nm). Limit of detection, 25 µg/L [Mancinelli *et al.* 1992]. Column: Zorbax ODS (15 cm × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water: acetic acid (22 : 77.9 : 0.1), flow rate 0.75 mL/min. UV detection (λ = 274 nm). Limit of detection, 53 nmol/L [Lambert *et al.* 1989]. Column: LiChrosorb cyanopropyl (12.5 × 0.4 cm i.d., 5 µm). Mobile phase: acetonitrile : water (1 : 99), flow rate 1.0 mL/min. UV detection (λ = 280 nm). Limit of detection, 10 µg/L [Musch *et al.* 1989]. Column: µBondapak C_{18} (30 cm × 3.9 mm i.d.). Mobile phase; water : methanol (55 : 45), flow rate 1.5 mL/min. UV detection (λ = 273 nm). Retention time: 5.3 min. Limit of quantification, 10 µg/L, limit of detection, 5 µg/L [Garnier-Moiroux *et al.* 1987]. Column: LiChrosorb RP 18 (25 cm × 4.9 mm i.d., 10 µm). Mobile phase: methanol : water (48 : 52), flow rate 2.0 mL/min. UV detection (λ = 268 nm). Limit of detection, 10 µg/L for pentoxifylline and 5-hydroxyhexyl metabolite [Rieck, Platt 1984].
See also Chivers *et al.* [1981].
LC-MS Column: Phenomenex Luna $C_8(2)$ (150 × 1.0 mm i.d., 5 µm). Mobile phase: 0.5 mmol/L ammonium acetate (pH 3.5) : methanol (50 : 50). TIS, positive ion mode, MRM acquisition mode. Limit of detection, 1 µg/L [Kyle *et al.* 2005].
Serum **GC-MS** Column: HP1 (30 m × 0.53 mm i.d., 2.65 µm). Carrier gas: N_2, 25 mL/min. Temperature programme: 200° for 0.01 min to 250° at 10°/min for 7 min. NPD. Limit of detection, 2 and 10 µg/L for pentoxifylline and its major metabolite, respectively [Marko, Bauerová 1991].

P

HPLC Column: Octadecyl silane reversed phase (15 cm × 4.6 mm i.d.). Mobile phase: acetonitrile : water : acetic acid (18 : 81.9 : 0.1), flow rate 1.0 mL/min. UV detection (λ= 274 nm). Retention time: 8.0 min. Limit of detection not reported [Poondru *et al.* 2000].

Urine **GC** See Blood [Engelhart *et al.* 1997]. See Plasma. Limit of detection, 0.1–0.2 mg/L [Burrows, Jolley 1985].

HPLC Column: ODS Spherisorb (15 cm × 4.6 mm i.d., 5 µm). Mobile phase: 0.2 mol/L formic acid : tetrahydrofuran (93 : 7), flow rate 1 mL/min. UV detection (λ= 274 nm). Limit of detection not reported [Bryce *et al.* 1989]. See Plasma [Lambert *et al.* 1989]. Column: Spherisorb-ODS 1 (15 cm × 3 mm i.d., 5 µm). Mobile phase: methanol : 0.02 mol/L orthophosphoric acid (pH 4, 1 : 2.5), flow rate 1.0 mL/min. UV detection (λ= 274 nm). Retention time: 18 min. Limit of detection, 1 mg/L for CB-DMX [Bryce *et al.* 1985].

Bile **GC** See Blood [Engelhart *et al.* 1997].

Breast Milk **GC** Column: 3% OV-17 on Chromosorb W-HP 100/120 mesh. Carrier gas: He, 25 mL/min. Temperature: 245°. NPD. Retention time: ≈8 min. Limit of detection, 10 µg/L [Bauza *et al.* 1984].

Gastric Contents **GC-MS** Column: Column; HP-ultra 2 cross-linked methylphenylsilicone (12.5 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 0.8 mL/min. Temperature programme: 130° for 1 min to 250° at 15°/min for 5 min. EI ionisation at 70 eV, MSD. Retention time: 14.8 min. Limit of detection not reported [Suarez-Penaranda *et al.* 1998]. See Blood [Engelhart *et al.* 1997].

Disposition in the Body Readily absorbed after oral administration. It is extensively metabolised and several metabolites have been identified in the urine. About 60% of a dose is excreted in the urine as metabolites in 24 h, mostly in the first 4 h; the major urinary metabolite, 1-(3-carboxypropyl)-3,7-dimethylxanthine (inactive), accounts for about 80% of the material excreted in the urine; <1% is excreted as unchanged drug. Other metabolites include 1-(5-hydroxyhexyl)-3,7-dimethylxanthine, which is active and is the major metabolite detected in blood, 1-(5,6-dihydroxyhexyl)-3,7-dimethylxanthine, 1-(4,5-dihydroxyhexyl)-3,7-dimethylxanthine, 1-(4-carboxybutyl)-3,7-dimethylxanthine, 3-methyl-1-(5-oxohexyl)xanthine and 1-(5-hydroxyhexyl)-3-methylxanthine, all of which are inactive. Pentoxyfylline and its major metabolites are present in human milk 2 h after administration to the mother [Witter, Smith 1985].

Therapeutic Concentration

After a single oral dose of 400 mg to 16 fasting subjects, mean peak plasma concentrations of 1.3 mg/L of pentoxifylline and 1.8 mg/L of the 5-hydroxy metabolite were attained in 0.8 and 1.3 h, respectively [Wills *et al.* 1980].

After the administration of a 400 mg oral dose to the mother, 4 h later a 2.5 kg infant taking 4 oz of milk would have 1.69 ± 1.25 µg/kg pentoxyfylline [Witter, Smith 1985].

After the administration of 100, 200 and 400 mg pentoxyfylline to healthy volunteers mean maximum plasma concentrations of 272, 683 and 1607 µg/L were reached at 0.39, 0.41 and 0.29 h, respectively [Smith *et al.* 1986].

Note For the pharmacokinetics of pentoxifylline in patients with renal insufficiency see Paap *et al.* [1996].

Toxicity A 54-year-old male died after intentional ingestion of a massive overdose of pentoxifylline (estimated to be 20–24 g); plasma concentrations were as high as 32.5 g/L [Suarez-Penaranda *et al.* 1998].

Half-life Plasma half-life, pentoxifylline, about 1 h, 5-hydroxy metabolite about 1 h; 1-(3-carboxypropyl)-3,7-dimethylxanthine, derived from urinary excretion data, about 1.4 h.

Volume of Distribution ≈5 L/kg.

Clearance Plasma clearance, ≈70 mL/min/kg.

Distribution in Blood Plasma : whole blood ratio, ≈1.2.

Dose Usually 300 to 600 mg daily; sustained-release tablets are given in doses of 0.8 to 1.2 g daily.

Perazine

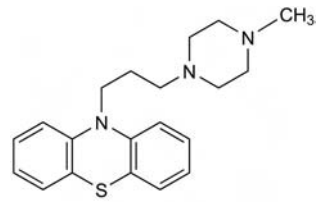
Tranquilliser

$C_{20}H_{25}N_3S$ = 339.5

CAS—84-97-9

IUPAC Name 10-[3-(4-Methylpiperazin-1-yl)propyl]phenothiazine

Synonyms 10-[3-(4-Methyl-1-piperazinyl)propyl]-10*H*-phenothiazine; pemazine; P-725.



Chemical Properties Crystals. Mp 51° to 53°. pK_a 8.0. Log *P* (octanol/pH 7.4), 2.9. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005] Serum samples were stable for up to 8 h at room temperature and up to 2 weeks when stored at 4° and -20° [Tanaka *et al.* 2007]. Standard solutions are stable for several months at -20° in the dark [Sachse *et al.* 2006].

Perazine Dimalonate

$C_{20}H_{25}N_3S,2C_3H_4O_4$ = 547.6

CAS—14777-25-4

Proprietary Name *Taxilan*

Chemical Properties A white crystalline powder. Mp 114° to 116°. Soluble 1 in 1 of water, 1 in 33 of ethanol, and 1 in 250 of chloroform.

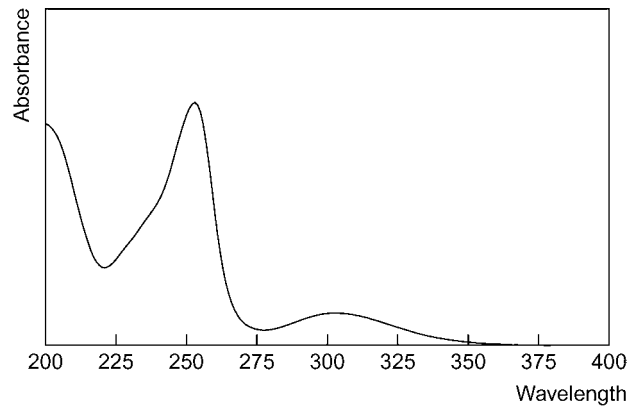
Colour Tests Formaldehyde-sulfuric acid—red-violet; Forrest reagent—brown-orange; FPN reagent—brown-orange; Mandelin's test—green→violet; Marquis test—violet; Sulfuric acid—violet.

Thin-layer Chromatography System TA—R_f 0.48; system TB—R_f 0.25; system TC—R_f 0.37; system TE—R_f 0.47; system TL—R_f 0.03; system TAE—R_f 0.21; system TAF—R_f 0.23 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—perazine RI 2798; M (OH-) RI 3175; M (phenothiazine) RI 2120.

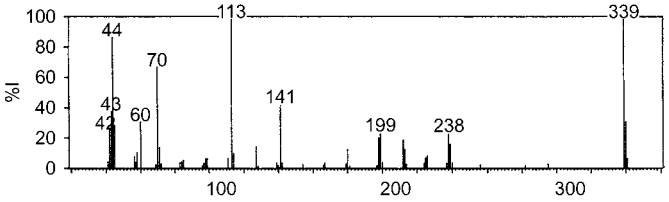
High Performance Liquid Chromatography System HX—RI 403; system HY—RI 371; system HZ—RT 6.3 min.

Ultraviolet Spectrum Aqueous acid—251 (A^1_1 = 875a), 300 nm[Breyer 1969].



Infrared Spectrum Principal peaks at wavenumbers 748, 1279, 1244, 1163, 1143, 1570 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 113, 339, 44, 70, 141, 43, 60, 340.



Quantification

Blood **GC-MS** Column: HP-5MS (30 m × 0.25 mm i.d., 0.25 µm). Temperature programme: 80° for 1 min to 300° at 10°/min for 5 min. Limit of detection not reported [Musshoff *et al.* 1998].

HPLC Column: Hypersil ODS C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water : tetramethylethylenediamine (8 : 92 : 0 to 37.5 : 62.1 : 0.4 at 5 min for 10 min to 8 : 92 : 0 at 15 min for 10 min), flow rate 1.3 mL/min. UV detection (λ = 254 nm). Retention time: 19.6 min. Limit of detection, 50 µg/L [Sachse *et al.* 2006]. Column: Lichrosorb RP8 (250 × 4.0 mm i.d., 5 µm). Mobile phase: acetonitrile : potassium phosphate buffer (pH 2.3, 30 : 70), flow rate 1.0 mL/min. DAD. Limit of detection not reported [Musshoff *et al.* 1998].

Plasma **GC** Column: 3% XE-60 on 80/100 mesh GasChrom Q (1.83 m × 4 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature: 240°. FID. Retention time: 0.41 min. Limit of detection, 100 µg/L [Vanderheeren, Theunis 1976].

HPLC Column: SymmetryShield RP8 (150 × 2.1 mm i.d., 3.5 µm). Mobile phase: 10 mmol/L ammonium formate and 0.1% formic acid : acetonitrile (70 : 30 to 0 : 100 at 15 min), flow rate 0.2 mL/min. UV detection (λ = 250 nm). Limit of detection, 0.104 mg/L [Marumo *et al.* 2005]. Column: Nucleosil $5C_{18}$ (25 × 0.46 cm i.d.). Mobile phase: perchloric acid (pH 2.5) : acetonitrile (60 : 40), flow rate 1.2 mL/min. Electrochemical detection. Retention time: 6.4 min. Limit of detection, 1 µg/L [Breyer-Pfaff *et al.* 1988]

Serum **GC** Column: 3% OV-17 Gaschrom Q 100/120 mesh (1.9 m × 4 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature: 270°. FID. Limit of detection, 20 µg/L [Schley *et al.* 1978].

HPLC Column: Inersil ODS-SP C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol : 30 mmol/L sodium dihydrogen phosphate (pH 5.6, 300 : 200 : 500), flow rate 0.9 mL/min. UV detection (λ = 250 nm). Retention time: 21.1 min. Limit of quantification, 4.6 µg/L [Tanaka *et al.* 2007].

LC-MS Column: Chromolith Speed ROD C_{18} (50 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 5 mmol/L acetic acid (pH 3.9) in ammonia (20 : 80 to 70 : 30 at 4 min for 1 min to 20 : 80), flow rate 1.0 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 7.3 µg/L [Kirchherr, Kühn-Velten 2006].

Note For a TLC method for the detection of perazine in serum, see Kresse *et al.* [1980].

HPLC See Blood [Musshoff *et al.* 1998].

Disposition in the Body Perazine is absorbed after oral administration but undergoes extensive metabolism by demethylation, sulfoxidation, *N*-oxidation and aromatic hydroxylation, followed by conjugation with glucuronic acid. Approximately 15 to 30% of an oral dose is excreted in the urine, mainly as conjugated phenolic metabolites. CYP1A2 and CYP3A4 are the main P450 isoforms catalysing 5-sulfoxidation (32 and 30%, respectively), while CYP2C19 is the main isoenzyme involved in *N*-demethylation (68%) [Wójcikowski *et al.* 2004].

Therapeutic Concentration Following daily oral doses of 300 to 400 mg given to 14 subjects for at least 4 days, plasma concentrations of 0.02–0.34 mg/L (mean 0.11) perazine and 0.04–0.54 mg/L (mean 0.17) desmethyl metabolite were reported [Breyer, Villumsen 1976].

Toxicity Perazine has been associated with acute toxic hepatitis [Pantel, Schroder 1996].

A 22-year-old woman who died after ingesting perazine had the following postmortem tissue concentrations: heart blood 9.6 µg/g, muscle 4.1 µg/g, brain 32 µg/g, liver 176 µg/g, kidney 64 µg/g and lungs 83 µg/g. Analytical results led to the assumption that 14 to 30 Taxilan 100-mg tablets had been ingested, probably intentionally [Kaferstein *et al.* 2000].

A 51-year-old woman who committed suicide by ingesting perazine and moclobemide had blood concentrations of 1.27 and 49.9 mg/L, respectively; some metabolites were also detected in the blood [Musshoff *et al.* 1998].

Note For a case of acute psychotic disorder following perazine, see Hesslinger *et al.* [1996].

Protein Binding ≈94–97%.

Dose Usually the equivalent of 25 to 600 mg perazine daily; up to 1000 mg daily in resistant cases.

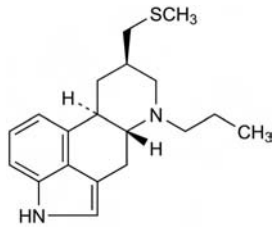
Pergolide

Dopaminergic Agent, Antiparkinsonian

$C_{19}H_{26}N_2S$ = 314.5

CAS—66104-22-1

Synonyms LY-141B; (8β)-8-[(Methylthio)methyl]-6-propylergoline.



Chemical Properties Mp 206° to 209°. pK_a 7.8. Log *P* (octanol/water), 4.02; log *P* (chloroform/water, pH 2.19), 6.14.

Pergolide Mesilate

$C_{19}H_{26}N_2S,CH_3SO_3H$ = 410.6

CAS—66104-23-2

Synonym LY-127809

Proprietary Names *Celance*; *Nopar*; *Permax*.

Chemical Properties A white to off-white crystalline powder. Mp 225°; also reported as 258° to 260° (decomposition). Sparingly soluble in dimethylformamide and methanol; slightly soluble in water, 0.01 mol/L hydrochloric acid, chloroform, acetonitrile, dichloromethane and dehydrated ethanol; very slightly soluble in acetone; practically insoluble in 0.1 mol/L sodium hydroxide and 0.1 mol/L hydrochloric acid and ether. Log *P* (chloroform/water, pH 4.02), 119.6.

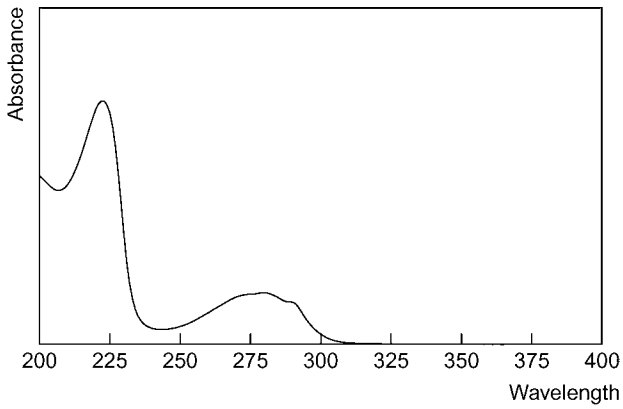
Colour Test Neubauer rhode—deep purplish blue.

Thin-layer Chromatography Plate: silica gel 60 F_{254}. Mobile phase: methanol : $CHCl_3$: acetone : NH_4OH (7 : 63 : 27 : 3). UV detection (λ = 254 and 280 nm). R_f 0.70 [Rubin *et al.* 1981].

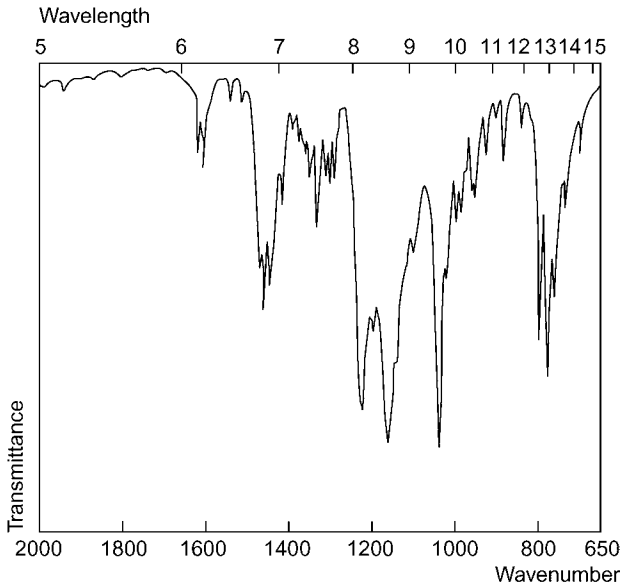
High Performance Liquid Chromatography System HZ—retention time 5.4 min.

Column: ODS Hypersil (100 × 4.6 mm i.d., 5 µm). Mobile phase: methanol, flow rate 0.5 mL/min. UV diode array detection. Retention time: 3.6 min [Mills, Roberson 1993].

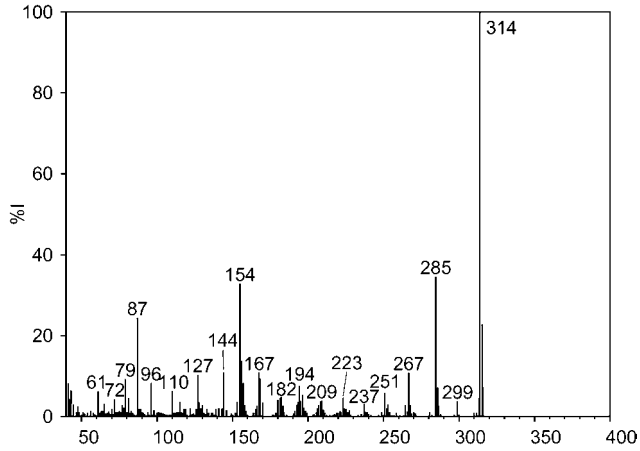
Ultraviolet Spectrum (Pergolide mesylate) Aqueous acid (0.2 mol/L H_2SO_4)—222, 279 nm; (methanol)—280 nm; (dehydrated ethanol)—281 nm; basic—279 nm.



Infrared Spectrum Principal peaks at wavenumbers (pergolide mesilate) 1456, 1157, 1038 and 775 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 314, 285, 154, 87, 315, 155, 144, 167.



Disposition in the Body Pergolide is rapidly absorbed after oral administration from the gastrointestinal tract and appears in plasma 15–30 min after dosing. Ten metabolites have been identified including *N*-despropylpergolide, pergolide sulfoxide and pergolide sulfone. It is known that these are not produced by β-glucuronidation or sulfate conjugation. It is excreted mainly as the metabolites in urine (55% of an administered dose), 40% in faeces, 5% in expired carbon dioxide and the remainder is absorbed.

Therapeutic Concentration

Three healthy male volunteers, aged 31, 42 and 47 years, were administered a dose equivalent to 0.138 mg pergolide base. Peak plasma concentrations of 1.8 mg/L were reached within 1–2 h. The dose was completely cleared within 4–5 days [Rubin *et al.* 1981].

Toxicity

Overdoses of 60 mg on one day, 19 mg daily for 3 days, and 14 mg daily for 23 days have occurred. Vomiting, hypotension, agitation, severe hallucinations, severe involuntary movements and tingling sensations were observed. Another patient administered with 7 mg pergolide, instead of 0.7 mg suffered from palpitations and hypotension [Eli Lilly and Company Ltd].

Protein Binding 90%.

Dose The initial dose is 50 μg daily for 2 days. This may be increased over the next 12 days as 100–150 μg steps every third day. Further increases of 250 μg every third day until an optimal therapeutic dosage is reached. The usual maintenance dose is 2 to 2.5 mg daily.

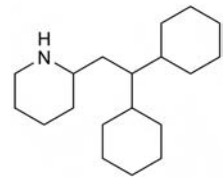
Perhexiline

Antianginal

$C_{19}H_{35}N = 277.5$

CAS—6621-47-2

IUPAC Name 2-(2,2-Dicyclohexylethyl)piperidine



Chemical Properties Log *P* (octanol/water), 7.5.

Perhexiline Maleate

$C_{19}H_{35}N,C_4H_4O_4 = 393.6$

CAS—6724-53-4

Proprietary Names *Pexid*; *Pexsig*.

Chemical Properties A white crystalline powder. Mp 188° to 191°. Slightly soluble in water; soluble in chloroform and methanol.

Thin-layer Chromatography System TA—R_f 0.41; system TB—R_f 0.57; system TC—R_f 0.08; system TE—R_f 0.59; system TL—R_f 0.06; system TAE—R_f 0.08 (acidified iodoplatinate solution, strong reaction).

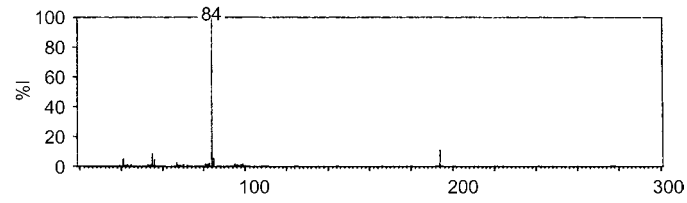
Gas Chromatography System GA—Perhexiline RI 2245; M (OH-) RI 2485; M (diOH-) RI 2660; M (diOH-)-H_2O RI 2510.

High Performance Liquid Chromatography System HA—*k* 0.2.

Ultraviolet Spectrum No significant absorption, 230 to 360 nm.

Infrared Spectrum Principal peaks at wavenumbers (perhexiline maleate) 1582, 873, 990, 730, 1029, 1081 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 84, 194, 55, 85, 56, 41, 30, 99.



Quantification

Plasma **GC** AFID. Limit of detection, 20 μg/L [Grgurinovich 1983].

HPLC UV detection. Perhexiline and its monohydroxy metabolite. Limits of detection, 0.03 mg/L for perhexiline and 0.02 mg/L for its monohydroxy metabolite [Grgurinovich 1997]. ECD. Perhexiline and its monohydroxy metabolites. Limits of detection, 0.1 mg/L (perhexiline) and 0.025 mg/L (metabolites) [Cooper *et al.* 1986]. Fluorescence detection. Limit of detection, 5 μg/L [Horowitz *et al.* 1981].

Urine **HPLC** See Plasma [Cooper *et al.* 1986].

Bile **HPLC** See Plasma [Cooper *et al.* 1986].

Disposition in the Body Incompletely absorbed after oral administration. It is metabolised by hydroxylation to mono- and dihydroxylated derivatives which are slowly excreted in the urine and faeces; very little unchanged drug is excreted in the urine.

Therapeutic Concentration

After a single oral dose of 150 mg given to 5 subjects, peak plasma concentrations of 0.02 to 0.12 mg/L (mean, 0.07) were attained in about 6 h; following a single oral dose of 300 mg to the same subjects, peak plasma concentrations of 0.14 to 0.44 mg/L (mean, 0.27) were reported at 7 h; absorption was considerably delayed in one subject with both doses [Horowitz *et al.* 1981].

Following chronic oral doses of 100 to 400 mg daily to 14 subjects, minimum steady-state plasma-perhexiline concentrations of 0.35 to 2.8 mg/

L (mean, 1.07) were reported; steady-state plasma concentrations of the major monohydroxylated metabolite ranged from 1.25 to 7.4 mg/L (mean, 3.8). Steady-state plasma concentrations in 13 subjects who had been receiving similar daily doses but had developed toxic effects were: perhexiline 2.2 to 6.5 mg/L (mean, 3.8), monohydroxy metabolite 0.6 to 3.8 mg/L (mean, 1.6) [Singlas *et al.* 1978].

Forty subjects receiving perhexiline maleate 400 mg daily for 3 days followed by 200 mg daily thereafter had widely varying plasma perhexiline levels at 72 to 96 h (mean, 0.46 mg/L; range, 0.11 to 1.77) [Stewart *et al.* 1996].

Half-life Plasma half-life, about 2 to 6 days; the rate of elimination appears to be decreased in subjects with toxic effects, and may be dose-dependent.

Dose 100 to 400 mg of perhexiline maleate daily.

Pericyazine

Tranquilliser

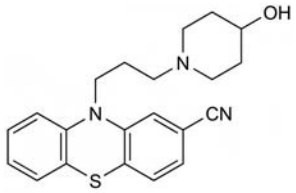
$C_{21}H_{23}N_3OS = 365.5$

CAS—2622-26-6

IUPAC Name 10-[3-(4-Hydroxypiperidin-1-yl)propyl]phenothiazine-2-carbonitrile

Synonyms 10-[3-(4-Hydroxy-1-piperidinyl)propyl]-10*H*-phenothiazine-2-carbonitrile; periciazine; propericiazine; RP-8909; SKF-20716.

Proprietary Names *Aolept*; *Neulactil*; *Neuleptil*.



Chemical Properties A yellow crystalline powder. Mp 116° to 117°. Practically insoluble in water; soluble in ethanol and acetone; freely soluble in chloroform; slightly soluble in ether. Log *P* (octanol/water), 3.5.

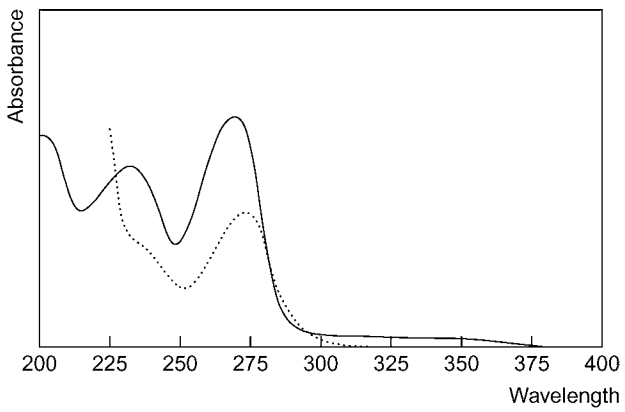
Colour Tests Formaldehyde-sulfuric acid—red; Forrest reagent—brown-orange; FPN reagent—orange; Mandelin's test—red; Marquis test—red.

Thin-layer Chromatography System TA—R_f 0.58; system TB—R_f 0.04; system TC—R_f 0.16; system TE—R_f 0.51; system TL—R_f 0.18; system TAE—R_f 0.46; system TAF—R_f 0.61 (acidified iodoplatinate solution, positive).

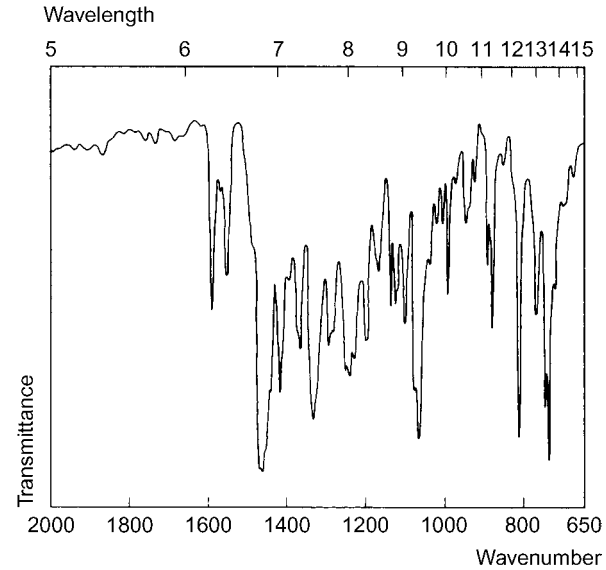
Gas Chromatography System GA—pericyazine RI 3260, M (ring) RI 2555; system GB—RI 3486.

High Performance Liquid Chromatography System HA—*k* 1.3; system HX—RI 410; system HY—RI 356; system HZ—retention time 4.4 min; system HAX—retention time 10.2 min; system HAY—retention time 5.1 min.

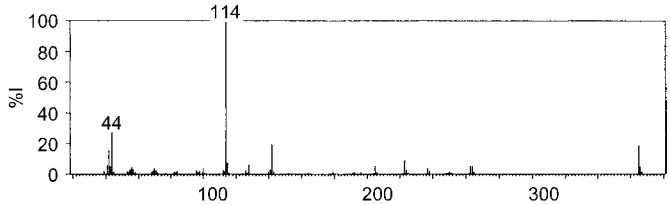
Ultraviolet Spectrum Aqueous acid—232, 268 nm (A^1_1=761a); aqueous alkali—272 nm.



Infrared Spectrum Principal peaks at wavenumbers 736, 1066, 811, 746, 1245, 1260 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 114, 44, 142, 365, 42, 223, 115, 205.



Dose 15 to 30 mg daily for severe anxiety or behaviour disorders; initially 75 mg daily in psychoses increasing up to 300 mg daily in severe cases.

Perindopril

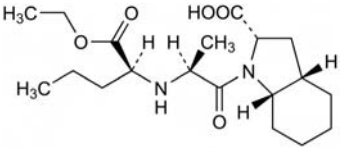
Antihypertensive

$C_{19}H_{32}N_2O_5 = 368.5$

CAS—82834-16-0

IUPAC Name (2*S*,3a*S*,7a*S*)-1-[(2*S*)-2-[[(2*S*)-1-Ethoxy-1-oxopentan-2-yl]amino]propanoyl]-2,3,3a,4,5,6,7,7a-octahydroindole-2-carboxylic acid

Synonyms (2*S*,3a*S*,7a*S*)-1-[(2*S*)-2-[[(1*S*)-1-(Ethoxycarbonyl)butyl]amino]-1-oxopropyl]octahydro-1*H*-indole-2-carboxylic acid; McN-A-2833; S-9490.



Perindoprilat

$C_{17}H_{28}N_2O_5 = 340.4$

CAS—95153-31-4

Synonym S-9780

Perindopril Erbumine (Perindopril Tert-Butylamine)

$C_{19}H_{32}N_2O_5,C_4H_{11}N = 441.6$

CAS—107133-36-8

Synonyms MCN-A-2833-109; S-9490-3.

Proprietary Names *Aceon*; *Coversum*; *Coversyl*; *Procaptan*.

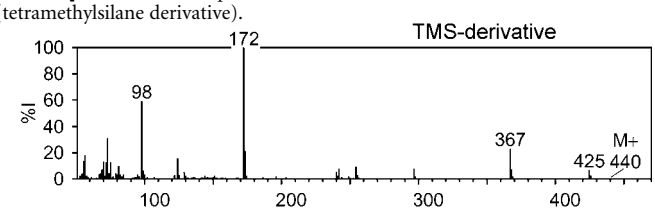
Chemical Properties White crystalline powder. Freely soluble in water, alcohol and chloroform.

Thin-layer Chromatography System TE—R_f 0.06 (perindopril), R_f 0.03 (perindoprilat); system TF—R_f 0.00 (perindopril), R_f 0.00 (perindoprilat).

Gas Chromatography System GP—RI 2450perindopril-ME; RI 2470 M (perindoprilat)-ME3; RI 2560 M (perindoprilat-H_2O)-ME3.

High Performance Liquid Chromatography System HX—perindoprilat RI 314; system HZ—perindoprilat retention time 1.6 min; system HAA—retention time 13.7 min.

Mass Spectrum Principal ions at *m/z* 172, 98, 73, 367, 173, 56, 124, 55 TMS, (tetramethylsilane derivative).



Quantification
Plasma **GC-MS** Limit of detection, 2 μg/L [Diez Ibañez *et al.* 1989].
Disposition in the Body Perindopril is rapidly and extensively absorbed after oral administration and approx. 30 to 50 % is hydrolysed to the active drug perindoprilat. Other metabolites include perindopril and perindoprilat glucuronides, dehydrated perindopril and the diastereoisomers of dehydrated perindoprilat. Peak plasma concentrations of perindopril are reached within 1 h and of perindoprilat in 3 to 4 h. The metabolism of perindopril to perindoprilat is affected by the presence of food in the gastro-intestinal tract. Around 75% of the dose is excreted in urine as perindopril, perindoprilat and other metabolites, and the remainder in faeces. Only 4 to 12% of the dose is recovered as unchanged drug in urine. Excretion is reduced in those with renal impairment.
Therapeutic Concentration
Twelve healthy males, 19 to 33 years old, were administered a single 4 mg oral dose of perindopril erbumine after 12 h fasting or during breakfast. Peak plasma perindopril concentrations were 64.2 μg/L for those in the fasted state and 52.4 μg/L for those in the fed state. These levels were reached within 0.9 and 1.1 h, respectively. The peak concentrations of the metabolite, pendoprilat were 4.7 and 3.6 μg/L in the fasted and fed individuals, observed 3.6 to 3.9 h after administration [Lecocq *et al.* 1990].
Bioavailability Perindopril, 65 to 70%; perindoprilat, 25%.
Half-life Perindopril: 2.9 h (fasted individuals) and 3.4 h (fed). Perindoprilat: 10.9 h (fasted) and 12.0 h (fed). For perindoprilat, the distribution half-life is also reported to be 5 h with an elimination half-life of 25 to 30 h.
Volume of Distribution Perindoprilat, 0.2 L/kg; also reported as 4.3 L/kg.
Clearance Perindoprilat, 4.9 L/h.
Protein Binding Perindopril, 60%; perindoprilat, <30% (concentration dependent).
Note For a review of the pharmacokinetics of ACE (angiotensin-converting enzyme) inhibitors, see Song and White [2002].
Dose 2 to 4 mg daily with a maximum of 8 mg daily.

Diez Ibañez MA *et al.* (1989). Gas chromatographic-mass spectrometric study of deacetylation and oxidation of 2-acetylaminofluorene by rat liver epithelial cell lines upon cocarcinogen induction. *J Chromatogr* 488: 237–248.

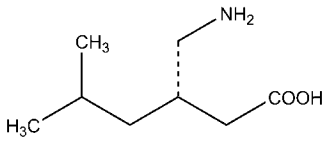
Perospirone

Antipsychotic
$C_{23}H_{30}N_4O_2S$ = 426.6
CAS—150915-41-6

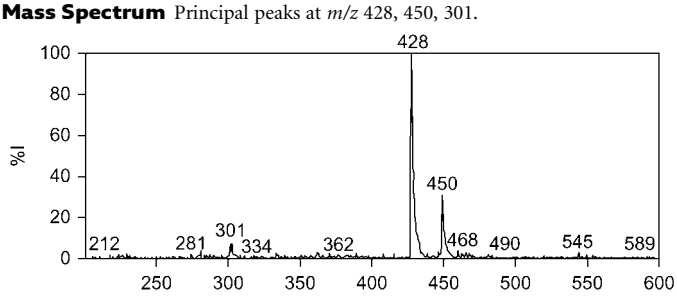
IUPAC Name (3a*S*,7a*R*)-2-[4-[4-(1,2-Benzothiazol-3-yl)piperazin-1-yl]butyl]-3a,4,5,6,7,7a-hexahydroisoindole-1,3-dione
Synonyms (3a*R*,7a*S*)-rel-2-[4-[4-(1,2-Benzisothiazol-3-yl)-1-piperazinyl] butyl]hexahydro-1*H*-isoindole-1,3(2*H*)-dione; *cis*-*N*-[4-[4-(1,2-benzisothiazol-3-yl)-1-piperazinyl]butyl]-1,2-cyclohexanedicarboximide.



Chemical Properties Stock solutions were stable at –40° for at least a month. Stable in plasma for 24 h at 4°, 1 month at –40°, and for 1 month after 3 freeze–thaw cycles [Ma *et al.* 2007].

Perospirone Hydrochloride
$C_{23}H_{30}N_4O_2S.HCl$ = 463.1
CAS—129273-38-7
Synonym SM-9018
Chemical Properties Mp 192° to 193°.

Mass Spectrum Principal peaks at *m/z* 428, 450, 301.



Quantification
Plasma **HPLC** Column: C_{18} STR ODS-II (150 × 4.6 mm i.d., 5 μm). Mobile phase: 0.05 mol/L phosphate buffer (pH 4.6) : 6 mol/L perchloric acid : acetonitrile (58 : 0.5 : 41.5), flow rate 0.6 mL/min. Fluorescence detection (λ_{ex} = 315 nm, λ_{em} = 405 nm). Limit of quantification, 0.1 μg/L, limit of detection, 0.06 μg/L [Yasui-Furukori *et al.* 2003].

LC-MS Column: Acquity BEH C_{18} (100 × 2.1 mm i.d., 1.7 μm). Mobile phase: acetonitrile : 30 mmol/L ammonium acetate (62 : 38), flow rate 0.3 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 50 ng/L; limit of detection, 5 ng/L [Li *et al.* 2007]. Column: Xterra C_{18} (100 × 2.1 mm i.d., 3.5 μm). Mobile phase: methanol : 10 mmol/L ammonium acetate (84 : 16), flow rate 0.25 mL/min. ESI, SIM acquisition mode. Limit of quantification, 0.1 μg/L [Ma *et al.* 2007]
Disposition in the Body Metabolism of perospirone occurs mainly in the liver, catalysed by CYP3A4 and, to a lesser extent, CYP2C8 and CYP2D6. The active metabolite hydroxyperospirone may play a role in the antipsychotic action.
Therapeutic Concentration
Twelve healthy Chinese volunteers (6 male, 6 female) received an oral dose of 8 mg perospirone hydrochloride. The mean peak plasma concentration was 2.79 ± 0.78 μg/L at 1.79 ± 0.45 h. The elimination half-life was 6.78 ± 1.38 [Ma *et al.* 2007].
A study of 10 schizophrenic patients receiving 16 mg perosprirone twice daily monitored plasma concentrations before and up to 12 h after administration. The mean peak plasma concentration was 8.8 μg/L at 0.8 h. The elimination half-life was 1.9 h. The active metabolite hydroxyperospirone reached a mean peak plasma concentration of 29.4 μg/L at 1.1 h [Yasui-Furukori *et al.* 2004]
Note For pharmacokinetic parameters of perospirone in combination with carbamazepine, itraconazole and tandospirone, see Masui *et al.* [2006a] and Masui *et al.* [2006b], respectively.
Clearance 423 ± 156 L/h [Ma *et al.* 2007].
Dose Oral dose, 8 to 48 mg once daily.

Li KY *et al.* (2007). Ultra-performance liquid chromatography-tandem mass spectrometry for the determination of atypical antipsychotics and some metabolites in in vitro samples. *J Chromatogr B Analyt Technol Biomed Life Sci* 850: 581–585.

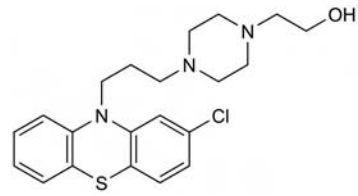
Perphenazine

Tranquilliser
$C_{21}H_{26}ClN_3OS$ = 404.0
CAS—58-39-9

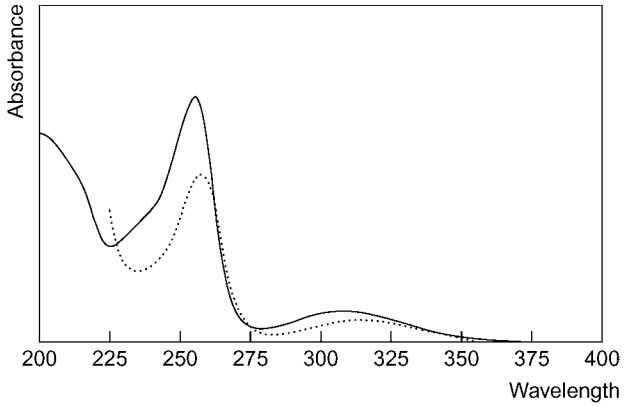
IUPAC Name 2-[4-[3-(2-Chlorophenothiazin-10-yl)propyl]piperazin-1-yl] ethanol
Synonyms 4-[3-(2-Chloro-10*H*-phenothiazin-10-yl)propyl]-1-piperazineethanol; chlorpiprazine; chlorpiprozine; perphenazinum.
Proprietary Names *Decentan*; *Fentazin*; *Peratsin*; *Perphenan*; *Phenazine*; *Trilafon*; *Trilifan*. It is an ingredient of *Etrafon*, *Triavil*, *Triptafen*.



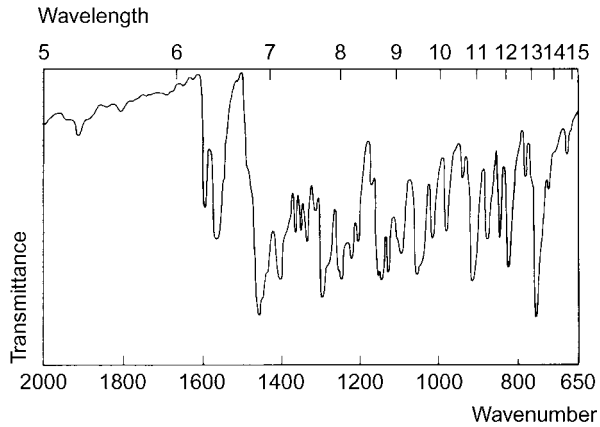
Chemical Properties A white or creamy-white powder, sensitive to light. Mp 94° to 110°. Practically insoluble in water; soluble 1 in 20 of ethanol, 1 in 1 of chloroform, and 1 in 80 of ether. pK_a 7.8 (24°). Log *P* (octanol/pH 7.0), 3.1. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].
Colour Tests Formaldehyde–sulfuric acid—violet; Forrest reagent—violet-red; FPN reagent—violet-red; Liebermann's reagent—red-brown; Mandelin's test—violet; Marquis test—violet.
Thin-layer Chromatography System TA—R_f 0.55; system TB—R_f 0.07; system TC—R_f 0.29; system TE—R_f 0.42; system TL—R_f 0.09; system TAE—R_f 0.40; system TAF—R_f 0.40; system TAJ—R_f 0.00; system TAK—R_f 0.03; system TAL—R_f 0.56 (acidified iodoplatinate solution—positive; Dragendorff spray—positive; FPN reagent—pink; Marquis test–pink; ninhydrin spray—positive).
Gas Chromatography System GA—perphenazine RI 3380, M (ring) RI 2100; system GB—RI 3594.
High Performance Liquid Chromatography System HA—*k* 1.9; system HX—RI 428; system HY—RI 395; system HZ—RT 7.2 min; system HAA—RT

16.0 min; system HAX—RT 13.1 min; system HAY—RT 6.3 min; system HAZ—*k* 3.28.

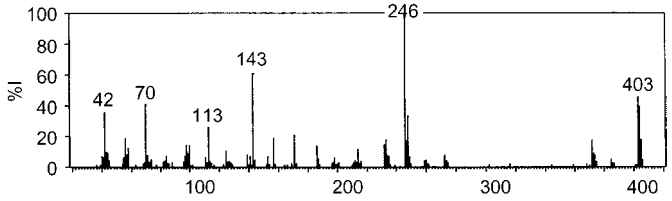
Ultraviolet Spectrum Aqueous acid—254 ($A_1^1 = 805a$), 307; aqueous alkali—257 ($A_1^1 = 791a$), 310 nm.



Infrared Spectrum Principal peaks at wavenumbers 757, 1294, 917, 1145, 1247, 1155 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 246, 143, 403, 70, 404, 42, 248, 113.



Quantification

Blood **GC** Column: HP-5 (25 m × 0.32 mm i.d., 0.17 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 100° for 1 min to 200° at 30°/min to 260° at 10°/min to 300° at 20°/min. NPD, EI ionisation. Limit of quantification, 0.2 mg/L [Levine *et al.* 1999]. Column: JJ CQ 100/120 mesh BS (0.9 m × 4 mm i.d.). Carrier gas: Ar : CH_4 20 mL/min. Temperature: 250°. Limit of quantification, 0.2 µg/L [Hansen, Larsen 1974]. Column: JJ CQ 100/120 mesh BS (0.9 m × 4 mm i.d.). Carrier gas: Ar : CH_4 20 mL/min. Temperature: 250°. Limit of detection, 10 µg/L [Larsen, Naestoft 1973].

LC-MS Column: Zorbax Stable Bond Cyano (50 × 2.1 mm i.d., 3.5 µm). Mobile phase: methanol-acetonitrile-20 mmol/L ammonium formate buffer (pH 4, 2 : 8 : 90) : methanol-acetonitrile-20 mmol/L ammonium formate buffer (pH 4, 24 : 36 : 40, 80 : 20 to 20 : 80 in 4.5 min for 2.5 min to 80 : 20 for 2.5 min). TIS, MRM acquisition mode. Retention time: 5.9 min. Limit of detection, 0.8 µg/L [Roman *et al.* 2008].

Plasma **GC** Column: CBP1-bonded methyl silicone (12 m × 0.53 mm i.d., 1 µm). Carrier gas: He, 20 mL/min. Temperature programme: 200° for 2 min to 300° at 10°/min. Limit of detection, 50 µg/L [Tokunaga *et al.* 1996]. Column: 1% OV-17 Chromosorb W on 100/120 mesh (2 m × 4 mm i.d.). Carrier gas: Ar : CH_4 (95 : 5), 50 mL/min. Temperature: 280°. Limit of detection, 5 µg/L [Cooper *et al.* 1979]. Column; OV-17 on Celite JJ CQ 100/120 mesh (1.5 m × 4 mm i.d.). Carrier gas: Ar : CH_4 (90 : 10) 60 mL/min. Temperature: 305°. ECD. Limit of quantification, 0.2 µg/L [Larsen, Naestoft 1975].

HPLC Column; Nucleosil C_{18} (120 × 4.6 mm i.d., 5 µm). Mobile phase: 0.01 mol/L potassium dihydrogen phosphate buffer with 5 mmoll/L tetramethylammonium chloride (pH 2.4) : acetonitrile : methanol (70 : 26 : 4), flow rate 1.0 mL/min. Electrochemical detection. Retention time: 15.01 min. Limit of quantification, 0.5 µg/L [Foglia *et al.* 1995]. Column: C_{18} (20 × 4.6 mm i.d.). Mobile phase: methanol : water : methylene dichloride : ammonia (200 : 40 : 10 : 3), flow rate 1.0 mL/min. UV detection (λ = 257 nm). Retention time: 2.1 min. Limit of quantification, <0.5 nmol/L [Larsen *et al.* 1985].

Note For a radioimmunoassay in plasma, see Midha *et al.* [1981].

Serum **HPLC** Column: S5 CN Spherisorb (150 × 4.6 mm i.d.). Mobile phase: 10 mmol/L ammonium acetate buffer : methanol (1 : 9), flow rate 0.6–1.7 mL/min. UV detection (λ = 256 and 245 nm). Limit of quantification, 1 nmol/L [Angelo, Petersen 2001]. Column: µBondapak C_{18} (300 × 3.9 mm i.d.). Mobile phase: 0.01 mol/L dodecylhydrogensulfate in acetonitrile : water : acetic acid (65 : 35 : 3). UV detection (λ = 257 nm). Limit of detection, 0.3 µg/L [Larsson, Forsman 1983].

Bile **GC** See Blood [Levine *et al.* 1999]

Gastric Contents **GC** See Blood [Levine *et al.* 1999].

Kidney **GC** See Blood [Levine *et al.* 1999].

Liver **GC** See Blood [Levine *et al.* 1999].

Disposition in the Body Perphenazine is absorbed after oral administration but subject to first-pass metabolism. Small amounts are found in breast milk. The main metabolic reactions are oxidation to the sulfoxide, which may have some pharmacological activity, *N*-dealkylation to form the *N*-deshydroxyethyl metabolite, *N*-oxidation, cleavage of the piperazine ring and phenolic hydroxylation, followed by glucuronide conjugation. After oral administration, ~1–2% of the daily dose is excreted in the urine as unchanged drug, with approx. 13% as the sulfoxide and 30% as perphenazine glucuronide; after chronic administration of perphenazine enantate IM, excretion of unchanged drug and the sulfoxide is increased to ~6% and 22% of the dose, respectively.

Therapeutic Concentration

A 22-year-old mother was admitted because of postpartum psychosis. At a 24 h intake of 24 mg perphenazine (480 µg/kg), the drug concentration in the milk was 7.8 nmol/L (3.2 µg/L). The 24 h milk production was 510 mL, thus 1.59 µg perphenazine (0.45 µg/kg) would have been passed on to the child [Olesen *et al.* 1990].

After daily oral doses of 12–48 mg to 16 subjects, steady-state plasma concentrations of 0.0003–0.025 mg/L (mean 0.004 mg/L) of perphenazine and 0.0004–0.018 mg/L (mean 0.004 mg/L) of the sulfoxide were reported [Hansen, Larsen 1977].

Toxicity

The following postmortem tissue concentrations were reported in a fatality caused by ingestion of ~1 g perphenazine: blood 3 mg/L, brain 11 µg/g, liver 149 µg/g; a blood-alcohol concentration of 1700 mg/L was also reported [Cravey 1980].

A 34-year-old woman whose death was attributed to suicide by means of multiple drug intoxication was found to have a heart blood concentration of 4.4 mg/L perphenazine and 950 mg/L valproic acid at postmortem. The distribution of perphenazine was as follows:

Specimen	*Concentration (mg/L or mg/kg)*
Bile	40
Blood (peripheral)	3.5
Kidney	23
Liver	57
Stomach (mg)	230

[Levine *et al.* 1999]

Bioavailability Approximately 60–80%.

Half-life Approximately 8–12 h in plasma.

Volume of Distribution 10–35 L/kg.

Clearance Approximately 12–38 mL/min/kg from plasma.

Note For a study of the pharmacological profile of perphenazine metabolites, see Sweet *et al.* [2000].

Dose Usually 12 to 24 mg daily; up to 64 mg daily has been given.

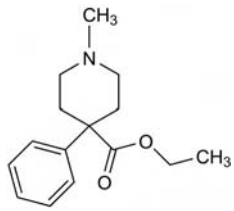
Pethidine

Narcotic Analgesic
$C_{15}H_{21}NO_2 = 247.3$
CAS—57-42-1

IUPAC Name Ethyl 1-methyl-4-phenylpiperidine-4-carboxylate
Synonyms Isonipecaine; meperidine; 1-methyl-4-phenyl-4-piperidinecarboxylic acid ethyl ester.

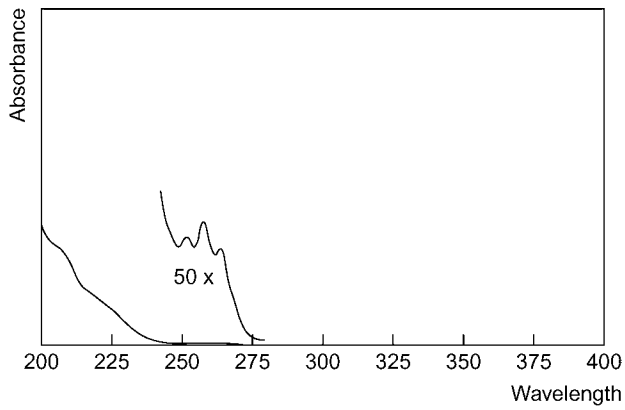


Chemical Properties An oily liquid which slowly crystallises. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

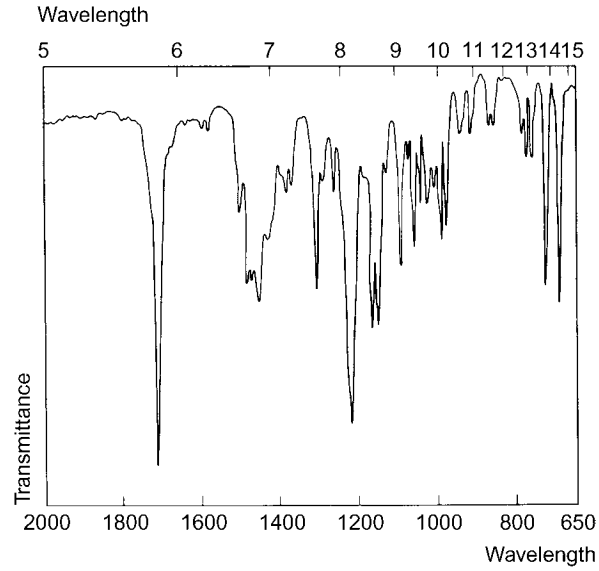
Pethidine Hydrochloride

$C_{15}H_{21}NO_2$,HCl = 283.8
CAS—50-13-5
Proprietary Names *Alodan*; *Centralgine*; *Demerol*; *Dispadol*; *Dolantine*; *Dolantin (a)*; *Dolestine*; *Dolosal*; *Mefedina*; *Pethoid*. It is an ingredient of *Mepergan*; *Meprozin*; *Pamergan P100*.
Chemical Properties A white crystalline powder. Mp 186° to 189°. Soluble in water, acetone and ethyl acetate; slightly soluble in alcohol, isopropanol; practically insoluble in ether and benzene. pK_a 8.7 (20°). Log *P* (octanol/water), 2.7.

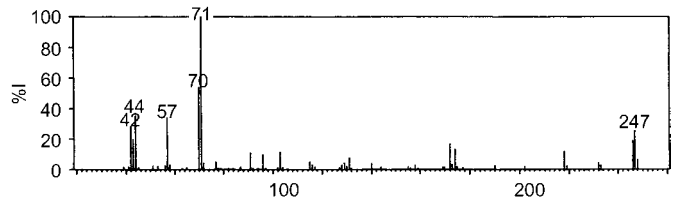
Colour Tests Liebermann's reagent—red-orange; Marquis test—orange.
Thin-layer Chromatography System TA—R_f 0.52; system TB—R_f 0.37; system TC—R_f 0.34; system TE—R_f 0.60; system TL—R_f 0.11; system TAE—R_f 0.34; system TAF—R_f 0.40; system TAJ—R_f 0.14; system TAK—R_f 0.06; system TAL—R_f 0.72 (acidified iodoplatinate solution—positive; Dragendorff spray—positive; Marquis test—brown).
Gas Chromatography System GA—pethidine RI 1754, M (nor-) RI 1885, M (nor-)-AC RI 2240, M (OH-) RI 2045, M (OH-)-AC RI 2205, M (nor-OH-)-AC_2 RI 2600; system GB—pethidine RI 1809, M (nor-) RI 1842, M (nor-)-AC RI 2256, M (OH-) RI 2145; system GC—RI 2025; system GF—RI 1995; system GM—pethidine RRT 0.319, M (nor-) RRT 0.357 (both relative to iprindole).
High Performance Liquid Chromatography System HA—pethidine *k* 2.8 (tailing peak), M (nor-) *k* 1.7 (tailing peak), pethidinic acid *k* 2.8 (tailing peak); system HC—pethidine *k* 0.55, M (nor-) *k* 2.04; system HX—RI 345; system HY—RI 281; system HZ—RT 3.2 min; system HAA—RT 11.8 min; system HAX—RT 9.2 min; system HAY—RT 4.8 min.
Ultraviolet Spectrum Aqueous acid—251, 257 (A_1^1 = 8.5a), 263 nm. No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1708, 1218, 1166, 1148, 688, 730cm^{-1} (pethidine hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 71, 70, 44, 57, 42, 247, 43, 246 (pethidine); 57, 233, 42, 56, 158, 43, 160, 103 (norpethidine); 71, 70, 57, 43, 219, 42, 218, 44 (pethidinic acid).



Quantification

Blood **GC** Column: 2% polyethylene glycol and 2% potassium hydroxide on 100/120 mesh (1.8 m × 2 mm i.d.). Carrier gas: N_2, 30 mL/min. NPD. Limit of detection, 5 µg/L for pethidine and 2.5 µg/L for norpethidine [Jacob *et al.* 1982].

GC-MS Column: CP-SIL 8CB-MS. Carrier gas: He, 1.6 mL/min. Temperature programme: 100° for 1 min to 290° at 20°/min. EI ionisation at 70 eV. Limit of detection, 0.5 µg/L [Ishii *et al.* 2003]. SIM acquisition mode. Limit of detection, 0.2 µg/L [Ishii *et al.* 2001].

HPLC Column: C_{18} (10 µm). Mobile phase: methanol : 25 mmol/L potassium dihydrogen phosphate (90 : 10), flow rate 1.0 mL/min. UV detection (λ = 254 nm). Limit of detection, 0.05 mg/L [Wang *et al.* 1999].

LC-MS Mobile phase: Phenomenex Gemini C_{18} (100 × 2.0 mm i.d., 3 µm). Mobile phase: acetonitrile with 0.1% formic acid : ammonium acetate (pH 3.2, 15 : 85 for 9 min to 30 : 70 in 13 min to 80 : 20 in 10 min to 95 : 5 in 1 min), flow rate 150 µL/min. Positive ion mode, MRM acquisition mode. Limit of detection, 0.0002 mg/L [Gergov *et al.* 2009].

Plasma **GC** Column: 3% OV-17 Gas Chrom Q 100/120 mesh (1.8 m × 2 mm i.d.). Temperature programme: 210° for 2 min to 270° at 15°/min for 10 min. NPD. Retention time: 1.69 min. Limit of quantification, 5 µg/L for pethidine and norpethidine [Kintz *et al.* 1989]. Column: 3% OV-17 on Gas-Chrom Q 100/120 mesh (1.5 m × 2.0 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature: 260°. Limit of detection, 20 µg/L for pethidine and norpethidine [Hartvig, Fagerlund 1983]. See Blood [Jacob *et al.* 1982].

GC-MS Limit of detection, 170 ng/L for pethidine and 500 ng/L for norpethidine [Todd *et al.* 1979].

Serum **GC-MS** See Plasma [Todd *et al.* 1979].

HPLC Column: Supelcosil LC-PCN (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 15 mmol/L phosphate buffer (pH 7.0) : methanol (55 : 25 : 20), flow rate 2.5 mL/min. UV detection (λ = 205 nm). Limit of detection, 2 µg/L [Meatherall *et al.* 1985]

Urine **GC** NPD. Limits of detection, 0.007–0.015 mg/L for pethidine, and some stimulants, narcotics and anti-oestrogens [Qiu *et al.* 2009]. Carrier gas: N_2, 1.0 mL/min. Temperature programme: 100° for 0.5 min to 300° at 20°/min for 3 min. NPD. Limit of detection, <1 µg/L [Myung *et al.* 1999]. FID. Limit of detection, 20 µg/L for pethidine and its metabolites [Hu *et al.* 1994]. Column: SE-54 (24 m × 0.24 mm i.d., 0.25 µm). Temperature programme: 100° to 250° at 10°/min for 8 min. FID. Limit of detection, 20 µg/L [Liu *et al.* 1994]. Column: SP2250 on Chromosorb W (80-100 mesh). NPD. Pethidine and its metabolites [Chan *et al.* 1991]. See Blood [Jacob *et al.* 1982].

GC-MS Limit of detection, 20 ng [Song *et al.* 1999]. Limit of detection, 20 µg/L for pethidine and its metabolites [Hu *et al.* 1994]. Pethidine and its metabolites [Liu *et al.* 1994]. Column: 3% OV-17 on Gas-Chrom Q 80/100 mesh (9.0 m × 2.0 mm i.d.). Carrier gas: He, 30 mL/min. Temperature programme: 205° for 2 min to 235° at 10°/min. MID. Limit of detection, 500 µg/L for pethidinic acid and norpethidinic acid [Lindberg *et al.* 1978]. See Blood [Ishii *et al.* 2001; Ishii *et al.* 2003].

HPLC See Serum [Meatherall *et al.* 1985].

LC-MS See Blood [Gergov *et al.* 2009].

Milk **GC-MS** Column: HP-1 Ultra (12 m × 0.2 mm i.d.). Temperature programme: 120° for 30 s to 250° at 30°/min for 4 min. Limit of detection, 20 µg/L [Borgatta *et al.* 1997].

Disposition in the Body Pethidine is readily absorbed after oral administration and rapidly and extensively distributed throughout the tissues. It undergoes considerable first-pass metabolism; bioavailability is ~55%. The major metabolites are the *N*-demethylated derivative norpethidine and the hydrolysis product pethidinic acid, and its conjugates. Norpethidine is about half as active an analgesic and about twice as toxic as pethidine; it may accumulate in the plasma on chronic administration, particularly in subjects with renal failure. The excretion of pethidine and its metabolites is dependent on the urinary pH. In normal subjects, ~70% of a dose is excreted in the urine in 24 h, up to 10% as unchanged drug, 10% as norpethidine, 20% as pethidinic acid, 16% as conjugated pethidinic acid, 8% as norpethidinic acid and 10% as conjugated norpethidinic acid; other metabolites identified in the urine in minor amounts include the *N*-hydroxy and *N*-hydroxyphenyl derivatives and pethidine *N*-oxide. Urinary excretion of pethidine and norpethidine may both be enhanced to ~30% of a dose if the urine is acid; in alkaline urine, <5% is excreted as pethidine and norpethidine. In pregnant women and in women taking oral contraceptives, the excretion of unchanged pethidine appears to be increased; less unchanged drug is eliminated in older subjects; excretion of pethidine is delayed in subjects with cirrhosis. Pethidine and norpethidine are distributed in the CSF. Pethidine crosses the placenta and is excreted in breast milk. Pethidine is a metabolite of phenoperidine.

Therapeutic Concentration In plasma, usually in the range 0.2–0.8 mg/L. Higher plasma concentrations are found in elderly subjects.

Following a single oral dose of 50 mg to 6 subjects, a mean peak serum concentration of 0.14 mg/L was attained in 2 h; after an IM injection of 50 mg to the same subjects, a mean peak serum concentration of 0.20 mg/L in 1 h was reported, and a mean serum concentration of 0.52 mg/L was obtained 1 min after an IV injection of 50 mg [Stambaugh *et al.* 1976].

Following multiple oral doses of 75 to 100 mg to four subjects, plasma pethidine concentrations of 0.16 to 0.54 mg/L (mean, 0.36) and norpethidine concentrations of 0.13 to 0.48 mg/L (mean, 0.27) were reported 1 to 4 h after a dose [Szeto, Inturrisi 1976].

Toxicity The estimated minimum lethal dose is 1 g. Toxic effects are usually associated with blood concentrations greater than 2 mg/L, but fatalities involving pethidine are uncommon.

Half-life Plasma half-life, pethidine 3 to 6 h, increased in neonates and in renal impairment; norpethidine ~20 h.

Bioavailability ≈55%

Volume of Distribution ≈4.4 L/kg.

Clearance Plasma clearance, ~17 mL/min/kg; decreased in subjects with liver disease and in the elderly.

Distribution in Blood Plasma : whole blood ratio, ~0.9.

Protein Binding ≈50–60%.

Note For reviews of the pharmacokinetics of pethidine, see Edwards *et al.* [1982] and Mather, Meffin [1978]; for a general review of pethidine, see Latta *et al.* [2002].

Dose Usually 50 to 150 mg of pethidine hydrochloride, by mouth or 25 to 100 mg by IM injection every 4 h.

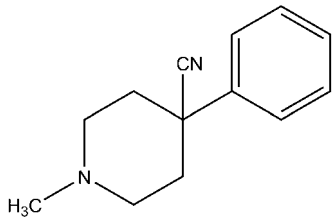
Pethidine Intermediate A

Narcotic Intermediate

$C_{13}H_{16}N_2 = 200.3$

IUPAC Name 1-Methyl-4-phenylpiperidine-4-carbonitrile

Synonym 4-Cyano-1-methyl-4-phenylpiperidine



Chemical Properties White powder. Soluble in dilute acetic acid and organic solvents. Pethidine intermediate A is extracted by organic solvents from aqueous alkaline solutions.

Thin-layer Chromatography System T1—R_f 0.52 (location reagent acidified iodoplatinate spray, positive reaction).

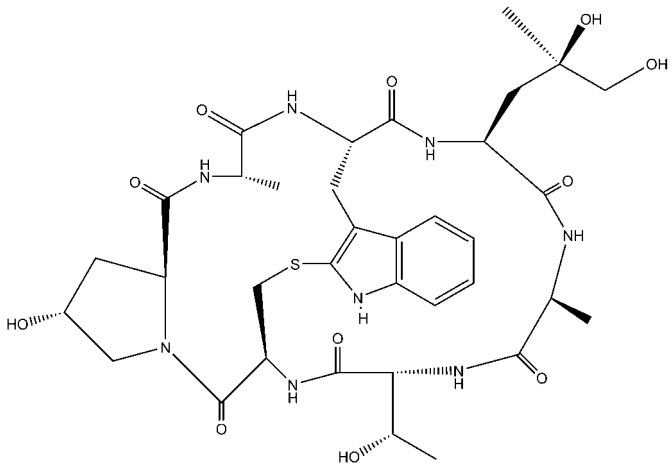
Phallotoxin

Toxin

$C_{35}H_{48}N_8O_{11}S = 788.9$

CAS—17466-45-4

Synonyms Phalloidin; phalloidine.



Chemical Properties Hexahydrate, needles from water. Mp 280° to 282°. More soluble in hot water as opposed to cold; freely soluble in methanol, ethanol, butanol and pyridine. Log *P* (octanol/water), −5.58 [Meylan, Howard 1995]. Phalloidin is the best known of the toxins isolated from the poisonous green fungus *Amanita phalloides,* also known as the green death cap or deadly agaric.

Capillary Electrophoresis Capillary: fused silica (84 cm length), Running buffer: aqueous solution of 20 mmol/L ammonium formate (pH 10.8). ESI, negative ion mode, SIM acquisition mode. Limit of detection, phalloidin 17 nmol/L, phallacidin 41 nmol/L [Rittgen *et al.* 2008].

Quantification

Serum **HPLC** Column: Develosil RP AQUEOUS. Mobile phase: acetonitrile containing 0.01 mol/L ammonium acetate (pH 5.0). UV detection (λ = 295, 302,and 230 nm). Limit of detection, 0.2 mg/L [Nishizawa, Yamaura 2003]. Column: Lichrosorb RP-18 (125 × 4 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.01 mol/L acetic acid-ammonium acetate buffer (pH 5.0; 7 : 93 for 7 min to 25 : 75 at 30 min), flow rate 1 mL/min. UV detection (λ = 302 nm). Retention time: 27.8 min. Limit of detection, 5 ng [Caccialanza *et al.* 1985].

Urine **HPLC** Column: Inertsil ODS-3 (150 × 4.6 mm i.d.). Mobile phase: 0.01 mol/L ammonium acetate buffer (pH 5.0) : chloroform (84 : 16), flow rate 1.0 mL/min. DAD. Limit of detection not reported [Gonmori, Yoshioka 2003]. Column: Lichrosorb RP-18 (125 × 4 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.01 mol/L acetic acid-ammonium acetate buffer (pH 5.0; 7 : 93 for 7 min to 25 : 75 at 30 min),

flow rate 1 mL/min. UV detection (λ = 302 nm). Retention time: 27.8 min. Limit of detection, 5 ng Caccialanza *et al.* 1985.

Other **HPTLC** *A. phalloides*. Plates: Silicagel 60 for nano-TLC (10 × 10 cm). Solvent system: chloroform : methanol : acetic acid : water (75 : 33 : 5 : 7.5) or 2-butanol : ethylacetate : water (56 : 48 : 20). Visualisation with 1 mL cinnamaldehyde in 100 mL methanol in a tank of fuming hydrochloric acid. Limit of detection, 500 mg/kg [Stijve, Seeger 1979].

HPLC *A. phalloides*. Column: Reversed phase Ultrasphere ODS (250 × 4.6 mm i. d., 5 µm). Mobile phase: 0.02 mol/L aqueous ammonium acetat-acetonitrile (pH 5.0, 90 : 10) : 0.02 mol/L aqueous ammonium acetate-acetonitrile (pH 5.0, 76 : 24; 100 : 0 for 4 min to 43 : 57 for 16 min to 0 : 100 for 10 min to 100 : 0), flow rate 1 mL/min. UV detection (λ = 214 and 295 nm). Limit of detection, 10 µg/L [Enjalbert *et al.* 1992].

Note For a study of the distribution of amatoxins and phallotoxins in *A. phalloides*, see Enjalbert *et al.* [1999].

Disposition in the Body

Toxicity

A 56-year-old man was admitted to hospital 42 h after mushroom ingestion. His main complaints of nausea and vomiting had begun 12 h after the ingestion. His laboratory findings were normal apart from the renal and liver function and cardiac markers, which were all elevated. The patient was treated with activated charcoal, high-dose IV penicillin G, and IV silibinin (5 mg/kg bolus and 20 mg/kg/24 h continuous infusion for 3 days). Because of the elevated cardiac enzymes, he was also given acetylsalicylic acid and metoprolol. After 480 h, the majority of the patient's biochemical parameters had returned to normal. The patient was discharged but with a haemodialysis schedule as a result of chronic renal failure [Unverir *et al.* 2007].

Note For a report on acetylcysteine as a life-saving antidote in *A. phalloides* poisoning, see Montanini *et al.* [1999]. For a report of amanita toxicosis in a dog, see Puschner *et al.* [2007]. For a review of the clinical characteristics of amanita and non-amanita mushroom poisoning in Turkish children, see Erguven *et al.* [2007];in Turkish adults see Yilmaz *et al.* [2006]. For a review investigating the geographical distribution of mushroom poisoning in Japan, see Gonmori and Yoshioka [2003].

Phanquinone

Antiamoebic, Antibacterial

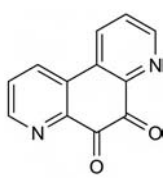
$C_{12}H_6N_2O_2$ = 210.2

CAS—84-12-8

IUPAC Name 4,7-Phenanthroline-5,6-dione

Synonyms Ciba 11925; phanquone.

Proprietary Name *Entobex*

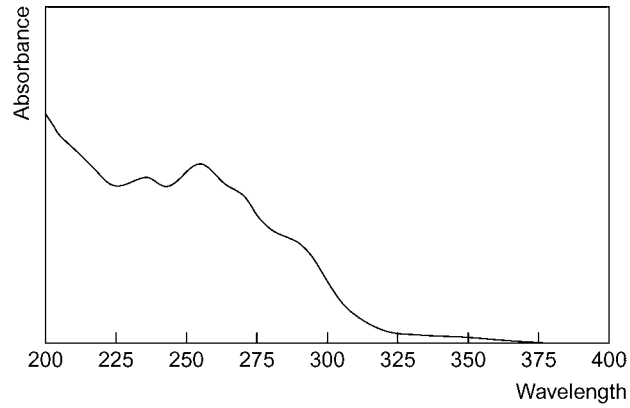


Chemical Properties An orange crystalline powder. Mp 295°, with decomposition. Slightly soluble in water; practically insoluble in ethanol and chloroform; soluble in dilute mineral acids. Log *P* (octanol/water), 1.2.

Colour Tests Marquis test—yellow; methanolic potassium hydroxide—yellow→brown-violet.

Thin-layer Chromatography System TA—R_f 0.49; system TB—R_f 0.03; system TC—R_f 0.45; system TE—R_f 0.54; system TL—R_f 0.17; system TAE—R_f 0.86; system TAJ—R_f 0.11; system TAK—R_f 0.00; system TAL—R_f 0.00 (acidified iodoplatinate solution, positive).

Ultraviolet Spectrum Aqueous acid—265 (A_1^1=500a), 272 (A_1^1=500a), 292 nm (A_1^1=480b).



Infrared Spectrum Principal peaks at wavenumbers 1700, 1283, 1584, 1275, 1683, 950 cm^{-1} (KBr disk).

Quantification

Biological Fluids **GC** Limit of detection, 15 µg/L [Degen *et al.* 1976].

Dose 150 to 300 mg daily.

Degen PH *et al.* (1976). The determination of phanquone in biological material by gas-liquid chromatography. *J Chromatogr* 118: 363–370.

Phenacaine

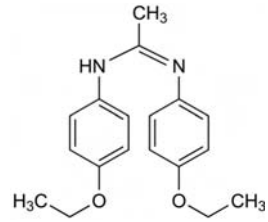
Anaesthetic (Local)

$C_{18}H_{22}N_2O_2$ = 298.4

CAS—101-93-9

IUPAC Name *N,N′*-Bis(4-ethoxyphenyl)ethanimidamide

Synonym Phenetidylphenacetin



Chemical Properties Log *P* (octanol/water), 5.6.

Phenacaine Hydrochloride Monohydrate

$C_{18}H_{22}N_2O_2$,HCl,H_2O = 352.9

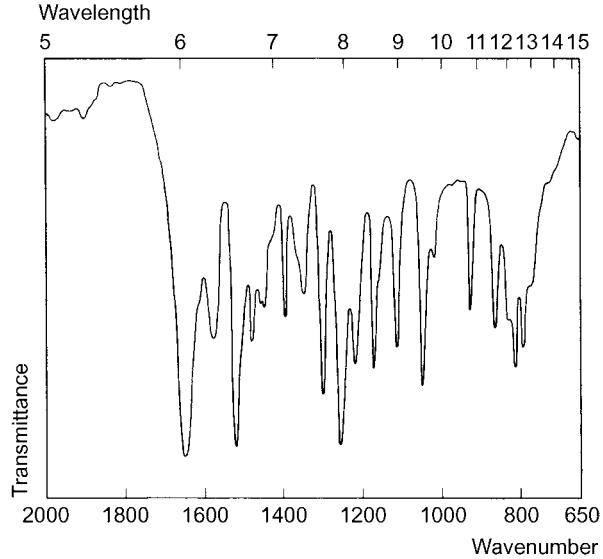
CAS—620-99-5 (anhydrous); 6153-19-1 (monohydrate)

Proprietary Name *Holocaine*

Chemical Properties White crystals. Mp 190° to 192°. Soluble 1 in 50 of water; freely soluble in ethanol and chloroform; insoluble in ether.

Gas Chromatography System GA—RI 2617.

Infrared Spectrum Principal peaks at wavenumbers 1646, 1520, 1256, 1300, 1046, 815 cm^{-1} (KBr disk).



Uses Phenacaine hydrochloride has been used as a 1% aqueous solution or as a 1 or 2% ointment.

Phenacemide

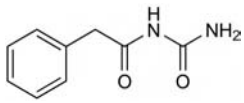
Anticonvulsant

CAS—63-98-9

IUPAC Name *N*-carbamoyl-2-phenylacetamide

Synonyms *N*-(aminocarbonyl)benzeneacetamide; carbamidum phenylaceticum; phenacetylurea.

Proprietary Name *Phenurone*



Chemical Properties $C_9H_{10}N_2O_2$=178.2. A white crystalline powder. Mp about 212° to 216°. Very slightly soluble in water; slightly soluble in acetone, ethanol, chloroform, ether and methanol. Log *P* (octanol/water), 0.9.

Colour Tests Liebermann's reagent—red-orange; Nessler's reagent—brown-orange (slow).

Thin-layer Chromatography System TD—R_f 0.22; system TE—R_f 0.65; system TF—R_f 0.40; system TAD—R_f 0.50.

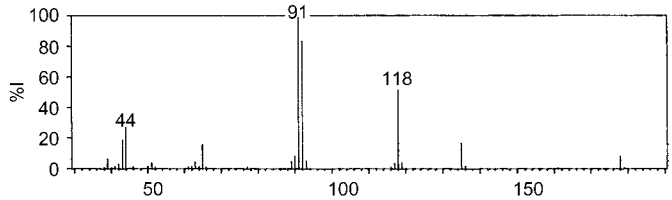
Gas Chromatography System GA—RI 1473.

High Performance Liquid Chromatography System HX—RI 339; system HY—RI 266.

Ultraviolet Spectrum Methanol—258 (A_1^1=18a), 265 nm.

Infrared Spectrum Principal peaks at wavenumbers 1660, 1090, 716, 1618, 1170, 970 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 91, 92, 118, 44, 43, 135, 65, 178.



Disposition in the Body Well absorbed after oral administration. It is extensively metabolised to inactive metabolites, principally by *p*-hydroxylation of the phenyl ring; the metabolites are excreted in the urine.

Toxicity The estimated minimum lethal dose is 5 g.

Dose 1.5 to 3 g daily.

Phenacetin

Analgesic

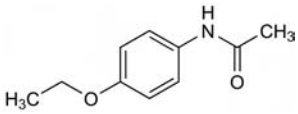
$C_{10}H_{13}NO_2$ = 179.2

CAS—62-44-2

IUPAC Name *N*-(4-Ethoxyphenyl)acetamide

Synonyms *p*-Acetiphenetidide; aceto-*p*-phenetidide; acetophenetidin; acetylphenetidin; fenacetina; paracetophenetidin.

Proprietary Names It is an ingredient of *APC tablets* and was included in *Gripponyl*, *Hemagene Tailleur*, *Polypirine* and *Cratodin Rectal*.



Chemical Properties White glistening crystalline scales or fine white crystalline powder. Mp 134° to 135°. Soluble 1 in 1300 of water, 1 in 15 of ethanol, 1 in 14 of chloroform and 1 in 90 of ether. pK_a 2.2. Log *P* (octanol/water), 1.6.

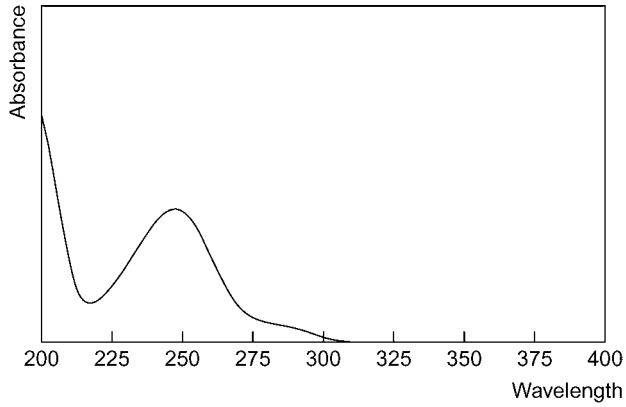
Colour Tests Liebermann's reagent—violet; boil 0.1 g with 1 mL of hydrochloric acid for 3 min, dilute with 10 mL of water, cool, filter, and add one drop of 0.02 mol/L potassium dichromate to the filtrate—violet→red.

Thin-layer Chromatography System TD—R_f 0.38; system TE—R_f 0.68; system TF—R_f 0.37; system TAD—R_f 0.52; system TAE—R_f 0.83; system TAJ—R_f 0.58; system TAK—R_f 0.41; system TAL—R_f 0.89 (acidified potassium permanganate solution, positive). See also under Paracetamol.

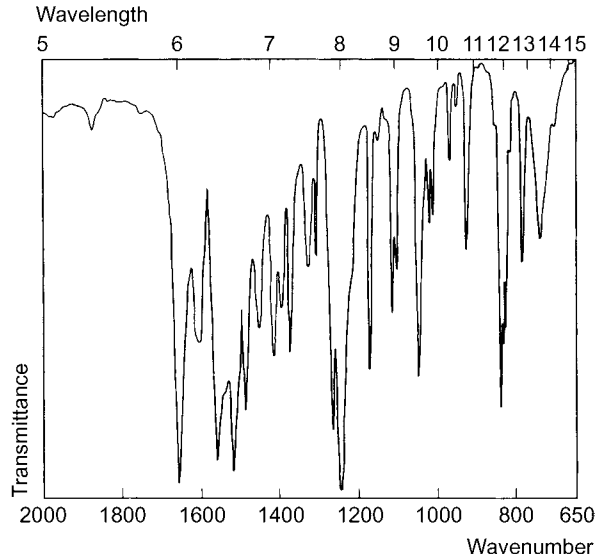
Gas Chromatography System GA—phenacetin RI 1675, M (hydroquinone) RI 1240, M (p-phenetidine) RI 1275, paracetamol RI 1687; system GB—RI 1730; system GF—RI 2325.

High Performance Liquid Chromatography System HD—phenacetin *k* 0.6, paracetamol *k* 0.1; system HW—phenacetin *k* 4.40, paracetamol *k* 0.30; system HX—phenacetin RI 377, paracetamol RI 264; system HY—phenacetin RI 335, paracetamol RI 241; system HZ—phenacetin retention time 3.0 min, paracetamol retention time 1.9 min.

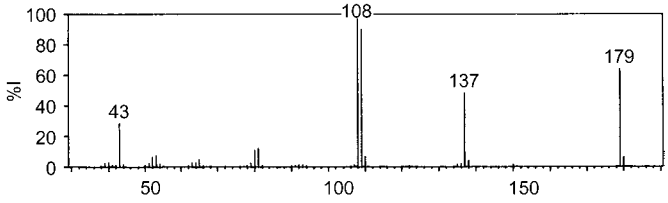
Ultraviolet Spectrum Aqueous acid—244 nm (A_1^1=649a). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1244, 1655, 1513, 1555, 1265, 836 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 108, 109, 179, 137, 43, 81, 80, 110; paracetamol 109, 151, 43, 80, 108, 81, 53, 52.



Quantification

Plasma **GC** FID. Phenacetin and paracetamol. Limit of detection, <100 µg/L [Evans, Harbison 1977].

GC-MS Limit of detection, 1 pg [Murray, Boobis 1991]. Phenacetin and paracetamol. Limit of detection, 1 µg/L for phenacetin and 100 µg/L for paracetamol [Garland *et al.* 1977].

HPLC UV detection. Phenacetin and paracetamol. Limit of detection, 500 µg/L [Gotelli *et al.* 1977].

See also under Paracetamol.

Disposition in the Body Readily absorbed after oral administration, but subject to extensive first-pass metabolism. It is metabolised mainly in the liver by *O*-dealkylation to paracetamol and acetaldehyde, followed by conjugation of the paracetamol with sulfate or glucuronic acid (see under Paracetamol); other reactions are deacetylation to phenetidine (*p*-ethoxyaniline), *N*-, 2-, and α-hydroxylation forming mainly 2-hydroxyphenetidine and also 2-hydroxyphenacetin, sulfate conjugation of deacetylated metabolites, and glutathione conjugation to form *S*-(1-acetamido-4-hydroxyphenyl)cysteine and its corresponding mercapturic acid.

2-Hydroxyphenetidine appears to be the nephrotoxic metabolite and is possibly involved in the formation of methaemoglobinaemia. As the dose is increased so the percentage of the dose which is deacetylated is increased, producing proportionately

P

more phenetidine and 2-hydroxyphenetidine; production of these metabolites is also increased by concomitant administration of aspirin, caffeine, and codeine. Phenacetin is not hepatotoxic despite being converted to paracetamol; this is because the enzyme systems which convert paracetamol to its toxic metabolite are also involved in the conversion of phenacetin to paracetamol and the two conversions therefore compete, resulting in reduced paracetamol oxidation. Phenacetin metabolism is stimulated by cigarette smoking. The extent of *O*-dealkylation appears to be genetically determined. About 80 to 90% of a dose is excreted in the urine in 24 h with 50 to 80% of the dose as the sulfate and glucuronide conjugates of paracetamol, 6 to 8% as 2-hydroxyphenetidine sulfate, about 2% as *S*-(1-acetamido-4-hydroxyphenyl)cysteine, about 0.3% as phenetidine and 2-hydroxyphenacetin, 0.2% as unchanged drug, and 2 to 3% as unconjugated paracetamol.

Therapeutic Concentration

After a single oral dose of 0.9 g to 9 subjects, peak plasma-phenacetin concentrations of 0.2 to 7.4 mg/L (mean, 2.3) were attained in 1 to 2 h, and peak plasma-paracetamol concentrations of 3.1 to 11.9 mg/L (mean, 7.9) were attained in 2 to 3.5 h; plasma-phenacetin concentrations were reported to be lower in 9 smokers [Pantuck *et al.* 1974].

Toxicity The estimated minimum lethal dose is 5 g. Prolonged use of phenacetin is associated with analgesic nephropathy; it may also produce haemolytic anaemia and methaemoglobinaemia.

In a fatality involving the intentional overdosage of a preparation containing codeine, aspirin, phenacetin and caffeine, a blood–phenacetin concentration of 136 mg/L was reported; the codeine and salicylate blood concentrations were 5.3 and 265 mg/L respectively [Wright *et al.* 1975].

Half-life Plasma half-life, phenacetin 0.7 to 1.5 h, paracetamol 1.5 to 3 h.

Volume of Distribution About 1 to 2 L/kg.

Clearance Plasma clearance, about 20 mL/min/kg.

Distribution in Blood Plasma : whole blood ratio, 0.93.

Protein Binding About 30%.

Note For a review of the general properties of phenacetin, see Clissold [1986].

Dose Phenacetin has been given as a single dose of 300 to 600 mg; maximum daily dose of 3 g.

P

Phenadoxone

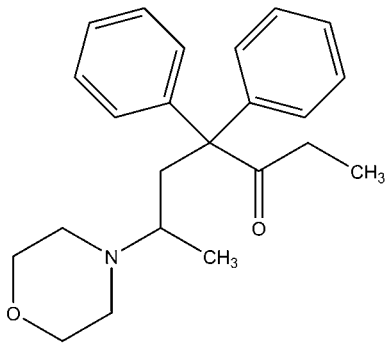
Narcotic Analgesic

$C_{23}H_{29}NO_2$ = 351.5

CAS—467-84-5

IUPAC Name 6-Morpholin-4-yl-4,4-di(phenyl)heptan-3-one

Synonyms Heptaxone; morphodone; 6-morpholino-4,4-diphenylheptan-3-one; 6-(4-morpholinyl)-4,4-diphenyl-3-heptanone; 6-tetrahydrooxazine-4,4-diphenyl-3-heptanone.



Chemical Properties Mp 75° to 76°. Log *P* (octanol/water) 4.2 [National Institutes of Health 2008], 1.56 [Meylan, Howard, 1995]. Phenadoxone is extracted by organic solvents from aqueous alkaline solutions; hydrolysis of biological material is required to improve yield.

Phenadoxone Hydrochloride

$C_{23}H_{29}NO_2$,HCl = 387.9

CAS—545-91-5

Synonyms CB-11; hepagin; heptalin; heptazone; Hoechst 10600.

Proprietary Name *Heptalgin*

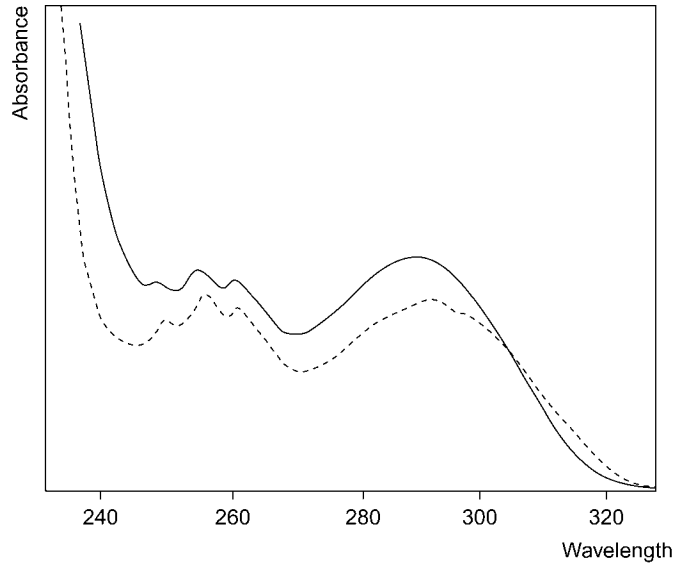
Chemical Properties A colourless crystalline powder. Mp 224° to 225° (dec). Soluble 1 in 25 of water and 1 in 10 of ethanol; very soluble in chloroform; almost insoluble in benzene and ethyl acetate. pKa (25°) 6.7 in 40% alcohol [O'Neil *et al.* 2006].

Colour Test Ammonium vandate test—deep green→blue (limit of detection, 0.5 μg).

Thin-layer Chromatography System T10—R_f 0.77 (location reagent acidified iodoplatinate spray, positive reaction).

Gas Chromatography System G2/225—retention time 1.60 (relative to codeine); system G4—retention time 0.96 (relative to codeine).

Ultraviolet Spectrum Ethanol—259, 296 nm; aqueous acid (0.1 N sulfuric acid)—253, 259, 266, 292 nm.



Note For a review of the pharmacology of phenadoxone, see Basil *et al.* [1950].

Dose Up to 50 mg orally, up to 15 mg SC or IM.

Phenaglycodol

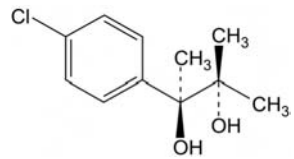
Tranquilliser

$C_{11}H_{15}ClO_2$ = 214.7

CAS—79-93-6

IUPAC Name 2-(4-Chlorophenyl)-3-methylbutane-2,3-diol

Proprietary Name *Felixyn*



Chemical Properties A crystalline solid. Mp 77° to 78°. Practically insoluble in water; soluble in ethanol.

Colour Tests Liebermann's reagent—brown; Mandelin's test—blue.

Thin-layer Chromatography System TE—R_f 0.71; system TAE—R_f 0.84.

Ultraviolet Spectrum Ethanol—259, 266 (A^1_1=13.5a), 275 nm.

Infrared Spectrum Principal peaks at wavenumbers 1095, 1085, 1015, 1180, 807, 830 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 43, 59, 155, 121, 156, 31, 157, 158.

Quantification

Blood **UV spectrophotometry** [Wallace 1968].

Urine **UV spectrophotometry** See Blood [Wallace 1968].

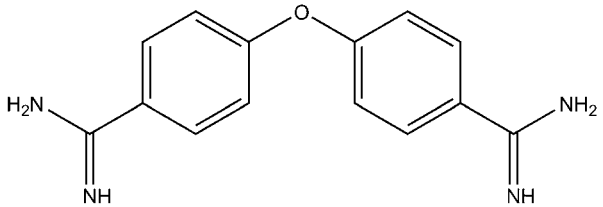
Dose 0.9 to 1.2 g daily.

Wallace JE (1968). Determination of phenaglycodol in biologic specimens by ultraviolet spectrophotometry. *J Pharm Sci* 57: 426–429.

Phenamidine

Antiprotozoal (Veterinary)
$C_{14}H_{14}N_4O = 254.3$
CAS—101-62-2

IUPAC Name 4-(4-Carbamimidoylphenoxy)benzenecarboximidamide
Synonyms 4,4′-Diamidinodiphenyl ether; 4,4′-oxybisbenzenecarboximidamide; 4,4′-oxydibenzamidine.



Chemical Properties Irregular plates from water. Mp 215° to 216°. Log *P* (octanol/water) 2.7 [National Institutes of Health 2008], 1.56 [Meylan, Howard 1995]. Phenamidine is extracted by organic solvents from aqueous alkaline solutions.

Phenamidine Isethionate

$C_{14}H_{14}N_4O,2C_2H_6O_4S = 506.6$
CAS—620-90-6
Synonym M 736; B 736.
Proprietary Name *Lomadine*
Chemical Properties White crystals or powder. Mp 225° (dec). Soluble 1 in 1.4 of water and 1 in 300 of ethanol; insoluble in ether and chloroform

Thin-layer Chromatography System T10—R_f 0.04, streaking (location reagent acidified iodoplatinate spray, positive reaction).
Ultraviolet Spectrum Aqueous acid (0.1 N sulfuric acid)—265 nm.
Quantification
Serum **CE** Capillary: fused silica (570 mm × 75 μm i.d., length to detector 500 mm). Buffer: 25 mmol/L citrate. UV detection (λ = 200 nm). Retention time: 8.6 min. Limit of detection, 0.25 mg/L [Rabanal *et al.* 2000].
Urine **CE** See Serum. Retention time: 8.0 min. [Rabanal *et al.* 2000].
Disposition in the Body
Toxicity Phenamidine is usually well tolerated when used in single doses in the treatment of babesiasis in animals [Groves, Vanniasingham 1970]. The repeated use of large doses in the treatment of demodectic mange in dogs has caused toxic symptoms, probably associated with hepatic damage due to a cumulative effect. For case studies, see Nye *et al.* [1950], Koutz [1952] and van Heerden [1981].
Dose Horses and cattle: 0.03 mL of a 40% solution/kg bodyweight; dogs: 0.3 mL of a 5% solution/kg bodyweight.

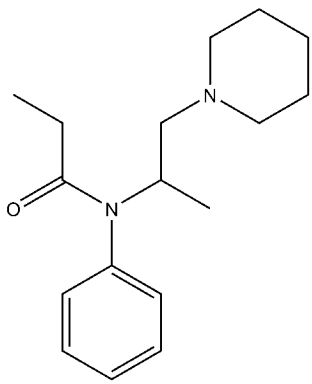
Phenampromide

Narcotic Analgesic
$C_{17}H_{26}N_2O = 274.4$
IUPAC Name *N*-Phenyl-*N*-(1-piperidin-1-ylpropan-2-yl)propanamide
Synonyms DEA No. 9638; EINECS 204-967-1; fenampromide; *N*-(1-methyl-2-piperidinoethyl)propionanilide; phenampromid.

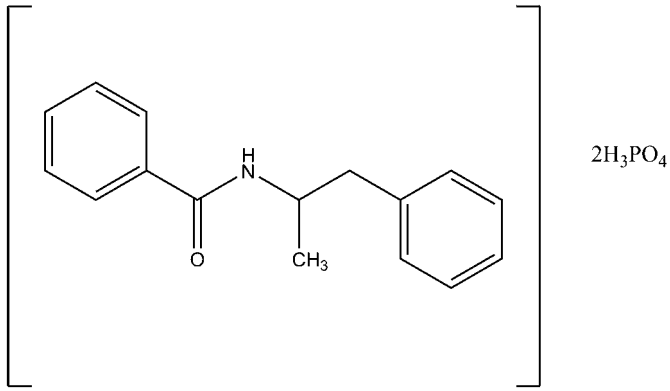


Chemical Properties Bp 124° to 128° at 0.2 mmHg. Refractive index 1.518. Log *P* (octanol/water) 2.8 [National Institutes of Health 2008]. Phenampromide is extracted by organic solvents from aqueous alkaline solutions. (–)-Phenampromide has greater analgesic efficacy than the (+)-enantiomer [Portoghese 1965].
Thin-layer Chromatography System T10—R_f 0.73 (location reagent acidified iodoplatinate spray, positive reaction).
Ultraviolet Spectrum Aqueous acid (0.1 N sulfuric acid)—250, 257 nm with inflexions at 260, 262 and 266 nm.

National Institutes of Health. Phenampromid. http://pubchem.ncbi.nlm.nih.gov/summary/summary.cgi?cid=8523&loc=ec_rcs (accessed 1 July 2008).
Portoghese PS (1965). Stereochemical studies on medicinal agents II. Absolute configuration of (–)-phenampromide. *J Med Chem* 8: 147–150.

Phenatine

Central Stimulant
$C_{15}H_{16}N_2O,2H_3PO_4 = 436.3$
IUPAC Name *N*-(1-Phenylpropan-2-yl)pyridine-3-carboxamide; phosphoric acid
Synonyms *N*-(α-Methylphenethyl)pyridine-3-carboxamide diphosphate; nicotinic acid β-phenylisopropylamide diphosphate.

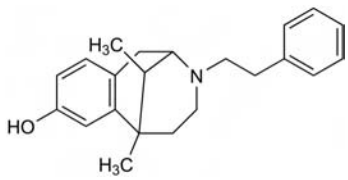


Chemical Properties Colourless crystals or a white crystalline powder. Mp 162° to 166°. Soluble in water and ethanol; almost insoluble in ether. The base, $C_{15}H_{16}N_2O$, occurs as crystals with a Mp of 99° to 100°; insoluble in water and soluble in chloroform. Phenatine is extracted by organic solvents from aqueous alkaline solutions.
Colour Test Sulfuric acid–formaldehyde test—orange (limit of detection, 0.5 μg).
Thin-layer Chromatography System T1—R_f 0.69 (location reagent acidified iodoplatinate spray, positive reaction).
Gas Chromatography System G2/225—retention time 2.00 (relative to diphenhydramine), retention time 0.43 (relative to codeine); system G4/225—retention time 0.89 (relative to codeine).
Ultraviolet Spectrum 0.1 N sulfuric acid—262 nm (E1%, 1 cm 275), minimum at 242 nm.
Infrared Spectrum Principal peaks at wavenumbers 1650, 1527, 704, 749 cm^{-1} (KBr disk).
Dose Up to 600 mg daily.

Phenazocine

Narcotic Analgesic
$C_{22}H_{27}NO = 321.5$
CAS—127-35-5

Synonyms 1,2,3,4,5,6-Hexahydro-6,11-dimethyl-3-(2-phenethyl)-2,6-methano-3-benzazocin-8-ol; phenethylazocine; phenobenzorphan.



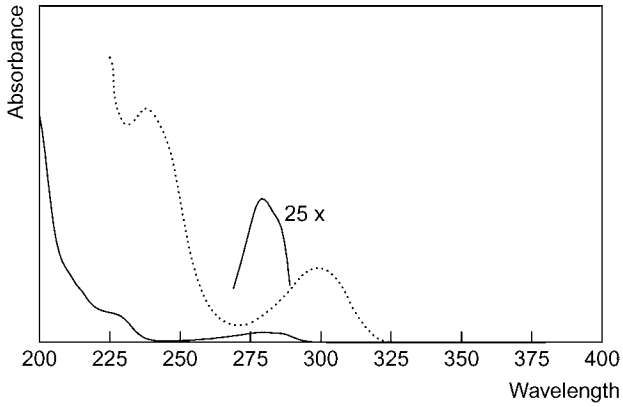
Chemical Properties Crystals. Mp 181° and Mp about 159°. pK_a 8.5. Log *P* (octanol/water), 5.2.

Phenazocine Hydrobromide

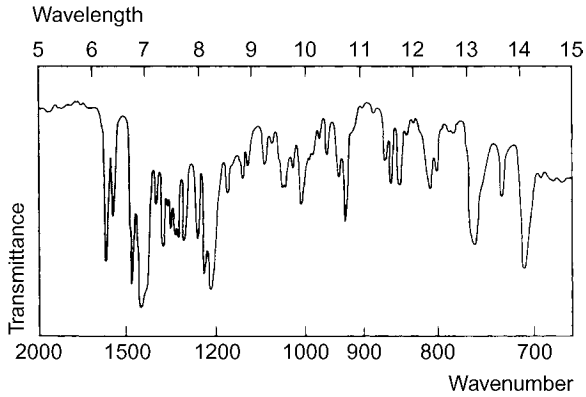
$C_{22}H_{27}NO,HBr,{}^1/_2H_2O = 411.4$
CAS—1239-04-9 (anhydrous)

Proprietary Name *Narphen*
Chemical Properties A white microcrystalline powder, which can exist in 3 polymorphic forms. Mp about 166° to 170°. Soluble 1 in 350 of water, 1 in 45 of ethanol and 1 in 140 of chloroform; practically insoluble in ether.

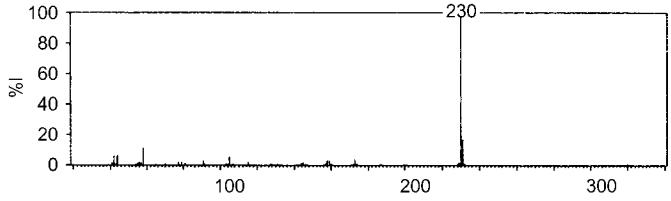
Colour Test Marquis test—brown.
Thin-layer Chromatography System TA—R_f 0.68; system TB—R_f 0.16; system TC—R_f 0.39; system TE—R_f 0.74; system TL—R_f 0.49; system TAE—R_f 0.50; system TAF—R_f 0.81; system TAJ—R_f 0.26; system TAK—R_f 0.20; system TAL—R_f 0.90 (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, brown).
Gas Chromatography System GA—RI 2686; system GB—RI 2833.
High Performance Liquid Chromatography System HA—*k* 1.3; system HC—*k* 0.3; system HX—RI 409; system HY—RI 299.
Ultraviolet Spectrum Aqueous acid—278 nm (A^1_1=64a); aqueous alkali—238, 298 nm.



Infrared Spectrum Principal peaks at wavenumbers (phenazocine hydrobromide, Nujol mull) 1224, 1497, 1241, 705, 1613, 758 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 230, 231, 58, 44, 42, 105, 173, 159.



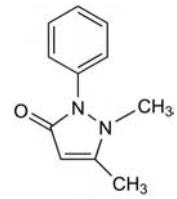
Disposition in the Body Readily absorbed after oral, sublingual or IM administration; metabolised in the liver.
Toxicity The estimated minimum lethal dose is 0.2 g. Phenazocine is addictive although tolerance develops more slowly and to a lesser extent than with morphine.
Dose Usually 5 mg of phenazocine hydrobromide every 4 to 6 h; single doses of 20 mg may be given.

Phenazone

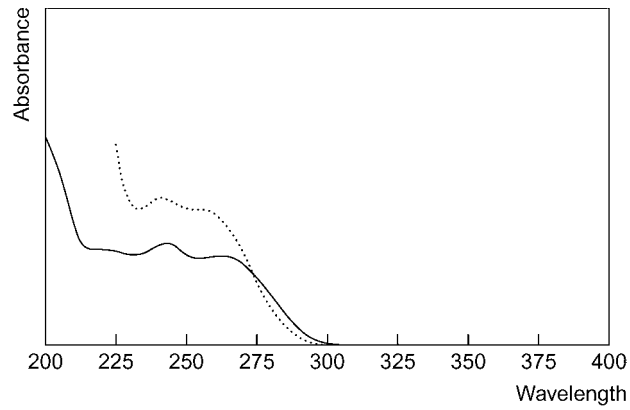
Analgesic
$C_{11}H_{12}N_2O$ = 188.2
CAS—60-80-0

IUPAC Name 1,5-Dimethyl-2-phenylpyrazol-3-one
Synonyms Analgésine; antipyrin(e); azophenum; 1,2-dihydro-1,5-dimethyl-2-phenyl-3*H*-pyrazol-3-one; fenazona; phenazonum; phenyldimethylpyrazolone.

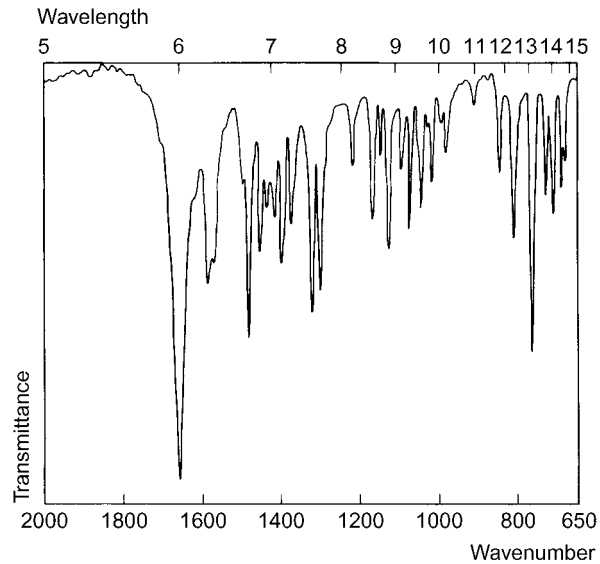
Proprietary Names *Aequiton-P*; *Aurone*; *Erasol*; *Migrane-Kranit-mono*; *Oto-Phen*; *Tropex*. It is an ingredient of *Allergen*; *Auralgan*, *Auralgicin*; *Auroto*, *Otocalm* and *Tympagesic*.



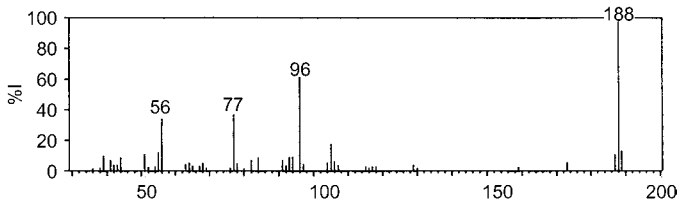
Chemical Properties Small, colourless crystals or white crystalline powder. Mp 111° to 113°. Soluble 1 in <1 of water, 1 in 1.3 of ethanol, 1 in 1 of chloroform and 1 in 43 of ether. pK_a 1.5 (25°). Log *P* (octanol/pH 7.4), 0.4. Extraction yield (chlorobutane), 0.35 [Demme *et al.* 2005].
Colour Tests *p*-Dimethylaminobenzaldehyde (100°, 5 min)—red/violet; ferric chloride—red; Liebermann's reagent (100°)—orange; Mandelin's test—green; nitrous acid—green.
Thin-layer Chromatography System TA—R_f 0.65; system TB—R_f 0.04; system TD—R_f 0.18; system TE—R_f 0.45; system TF—R_f 0.14; system TAD—R_f 0.50; system TAE—R_f 0.66; system TAF—R_f 0.66; system TAJ—R_f 0.51; system TAK—R_f 0.18; system TAL—R_f 0.83 (ferric chloride solution, red-brown; acidified iodoplatinate solution, positive; mercuric chloride–diphenylcarbazone reagent, positive; acidified potassium permanganate solution, positive; Van Urk reagent, pink).
Gas Chromatography System GA—phenazone RI 1835, M (4-OH-) RI 1855; system GB—RI 1951; system GF—RI 2445.
High Performance Liquid Chromatography System HA—*k* 0.2; system HD—*k* 0.1; system HW—*k* 0.95; system HX—RI 333; system HY—RI 299; system HZ—RT 2.1 min; system HAX—RT 5.4 min; system HAY—RT 4.5 min.
Ultraviolet Spectrum Aqueous acid—230 nm (A^1_1=590a); aqueous alkali—242 (A^1_1=494a), 256 nm.



Infrared Spectrum Principal peaks at wavenumbers 1660, 770, 1318, 1305, 1590, 1580 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 188, 96, 77, 56, 105, 189, 55, 51; norphenazone 174, 77, 91, 105, 132.



Quantification

Plasma **GC** AFID. Limit of detection, 1 mg/L [Abernethy *et al.* 1981].

HPLC UV detection. Phenazone and its major metabolites [Lanchote *et al.* 1997]. UV detection. Limit of detection, 500 µg/L [Campbell *et al.* 1979].

LC-MS Limit of detection, 0.3 µg/L [Coolen *et al.* 1999].

RIA Limit of detection, 10 µg/L [Chang *et al.* 1976].

Urine **HPLC** Phenazone and its metabolites [Sarkar *et al.* 1992]. Phenazone metabolites [Palette *et al.* 1991]. UV detection. Phenazone, 3-hydroxymethylphenazone, 4-hydroxyphenazone and norphenazone. Limit of detection, 1–2 mg/L [Eichelbaum *et al.* 1981].

Biological Fluids **HPLC** Phenazone sulfo- and glucuro-conjugated metabolites [Palette *et al.* 1994].

Saliva **HPLC** [Gartzke, Jager 1991].

RIA See Plasma [Chang *et al.* 1976].

Disposition in the Body Rapidly and completely absorbed after oral administration. It is widely distributed in body fluids, with saliva and breast milk levels being about the same as those found in plasma. It is metabolised to 3-hydroxymethylphenazone, 4-hydroxyphenazone, and norphenazone, followed by glucuronic acid conjugation; demethylation also occurs. The rate of biotransformation is variable and appears to be genetically determined. Phenazone and its metabolites are excreted in the urine mainly as glucuronides, although sulfate conjugation has also been reported. About 30–40% of a dose is excreted in the urine in 48 h as conjugated 4-hydroxyphenazone, 10–40% as the 3-hydroxymethyl derivative, up to about 20% as norphenazone, 3–6% as 4,4′-dihydroxyphenazone, 8–12% as 4,5-dioxypyrazoline, and <5% as unchanged drug; 3-carboxyphenazone has also been identified in the urine. A total of about 95% of a dose is excreted in the urine in 4 days.

Therapeutic Concentration

After a single oral dose of 10 mg/kg to 5 subjects, peak plasma concentrations of 10–15.5 mg/L (mean, 13.4) were attained in 1 h. Concentrations in saliva were similar to those in plasma [van Boxtel *et al.* 1976].

Toxicity The estimated minimum lethal dose is 5 g, but fatalities from acute poisoning are rare. Prolonged therapeutic administration may give rise to agranulocytosis.

In a suicide due to ingestion of phenazone, a postmortem blood concentration of 110 mg/L was reported; alcohol was also detected in the blood at a concentration of 260 mg/L [Péclet, Rousseau 1981].

During the course of a clinical trial of the efficacy of oxerutins in venous ulceration, an 87-year-old woman died within 2 h of the IV injection of phenazone 500 mg (administered over 10 min). Postmortem analysis revealed a blood phenazone concentration of 22 mg/L and the cause of death was certified as 'cardiac arrest following injection of antipyrine' [Travers 1991].

Half-life Plasma half-life, about 7–15 h (mean, 10); increased in subjects with renal impairment or hypothyroidism and in the elderly, decreased in subjects with hyperthyroidism; the half-life is also readily influenced by concomitant administration of other drugs.

Volume of Distribution About 0.6 L/kg.

Clearance Plasma clearance, about 0.7 mL/min/kg.

Distribution in Blood Plasma : whole blood ratio, about 0.93.

Protein Binding <10%.

Note For a review of the pharmacokinetics of phenazone, see Vital-Durand *et al.* [1988].

Dose Phenazone has been given in doses of 300 to 600 mg; maximum daily dose of 4 g.

Phenazopyridine

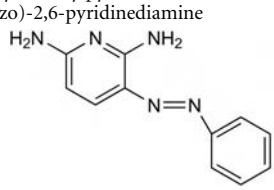
Analgesic

$C_{11}H_{11}N_5$ = 213.2

CAS—94-78-0

IUPAC Name 3-Phenyldiazenylpyridine-2,6-diamine

Synonym 3-(Phenylazo)-2,6-pyridinediamine



Chemical Properties Mp 139°. Log *P* (octanol/water), 2.8.

Phenazopyridine Hydrochloride

$C_{11}H_{11}N_5$,HCl = 249.7

CAS—136-40-3

Proprietary Names *Phenazo*; *Pyridacil*; *Pyridium*. It is an ingredient of *Azo Gantanol*, *Azo Gantrisin*, *Azo-Mandelamine*, *Azotrex*, and *Uromide*.

Chemical Properties A light or dark red to dark violet crystalline powder. Mp about 235°, with decomposition. Soluble 1 in 300 of cold water, 1 in 20 of boiling water, 1 in about 60 of ethanol, and 1 in about 330 of chloroform; very slightly soluble in ether; soluble in glacial acetic acid. Phenazopyridine hydrochloride readily forms supersaturated aqueous solutions which deposit slowly on storage.

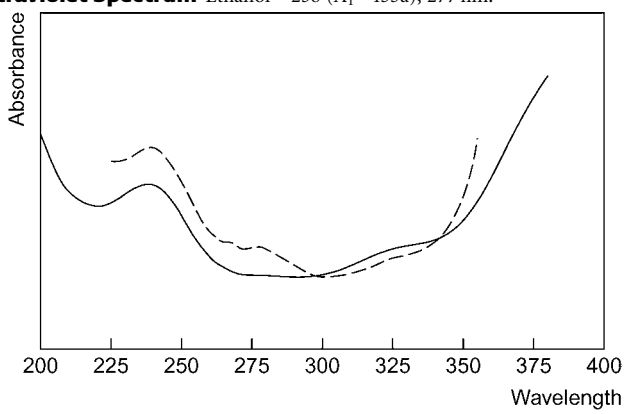
Colour Tests Mandelin's test—green; Marquis test—red.

Thin-layer Chromatography System TA—R_f 0.59; system TB—R_f 0.01; system TC—R_f 0.50; system TE—R_f 0.70; system TL—R_f 0.53; system TAE—R_f 0.80; system TAJ—R_f 0.46; system TAK—R_f 0.56; system TAL—R_f 0.91 (acidified potassium permanganate solution, positive).

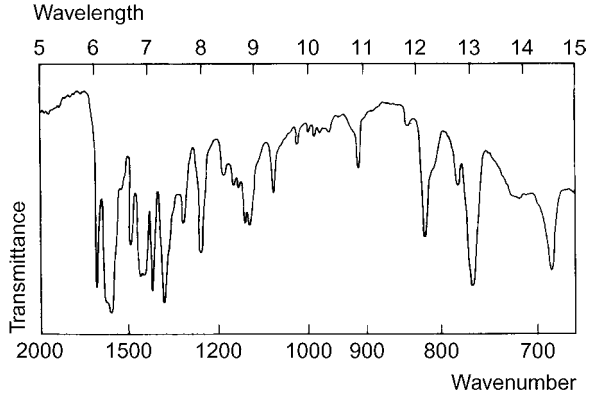
Gas Chromatography System GA—phenazopyridine RI 2245, 4-aminophenol RI 1265, aniline RI 1158; system GB—RI 2370.

High Performance Liquid Chromatography System HY—RI 314.

Ultraviolet Spectrum Ethanol—238 (A_1^1=455a), 277 nm.

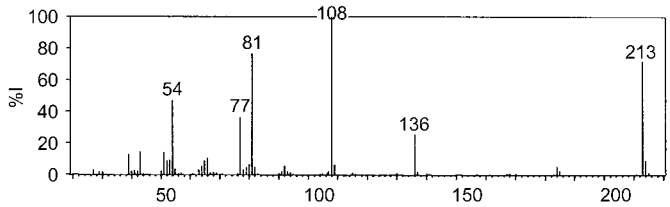


Infrared Spectrum Principal peaks at wavenumbers 1585, 1656, 762, 685, 1248, 1493 cm^{-1} (Nujol mull).



P

Mass Spectrum Principal ions at *m/z* 108, 81, 213, 54, 77, 136, 51, 43; 4-aminophenol 109, 80, 53, 81, 108, 52, 54, 110.



Disposition in the Body Absorbed after oral administration. Rapidly eliminated by the kidneys, giving an orange-red colour to the urine; about 90% of a dose is excreted in the urine in 24 h, of which 7% is aniline, 20% is *N*-acetyl-4-aminophenol, 25% is 4-aminophenol, and 45% is unchanged drug.

Toxicity Methaemoglobinaemia and acute renal failure have been reported after overdoses.

Dose Usually 600 mg of phenazopyridine hydrochloride daily.

Phencyclidine

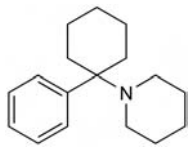
Hallucinogen

$C_{17}H_{25}N$ = 243.4

CAS—77-10-1

IUPAC Name 1-(1-Phenylcyclohexyl)piperidine

Street Names Angel dust, PCP. For other names applied to illicitly used phencyclidine and phencyclidine hydrochloride, see Sweetman [2007].



Chemical Properties Crystals. Mp 46° to 46.5°. pK_a 8.5. Log *P* (octanol/water), 4.7. Extraction yield (chlorobutane), 0.9 [Demme *et al.* 2005].

Phencyclidine Hydrochloride

$C_{17}H_{25}N,HCl$ = 279.9

CAS—956-90-1

Synonyms CI-395; CN-25253-2; GP-121; NSC-40902; PCP.

Chemical Properties A white crystalline powder. Mp 233° to 235°. Soluble 1 in 6 of water, 1 in 7 of ethanol and 1 in 2 of chloroform; very slightly soluble in ether.

Phencyclidine Hydrobromide

Chemical Properties Crystals. Mp 214° to 218°.

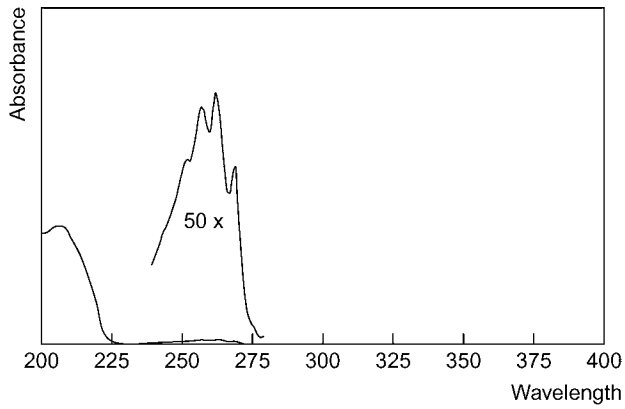
Colour Test *p*-Dimethylaminobenzaldehyde (100°, 3 min)—red.

Thin-layer Chromatography System TA—R_f 0.59; system TB—R_f 0.73; system TC—R_f 0.35; system TE—R_f 0.84; system TL—R_f 0.66; system TAE—R_f 0.23; system TAF—R_f 0.69; system TAJ—R_f 0.24; system TAK—R_f 0.04; system TAL—R_f 0.48 (acidified iodoplatinate solution—positive).

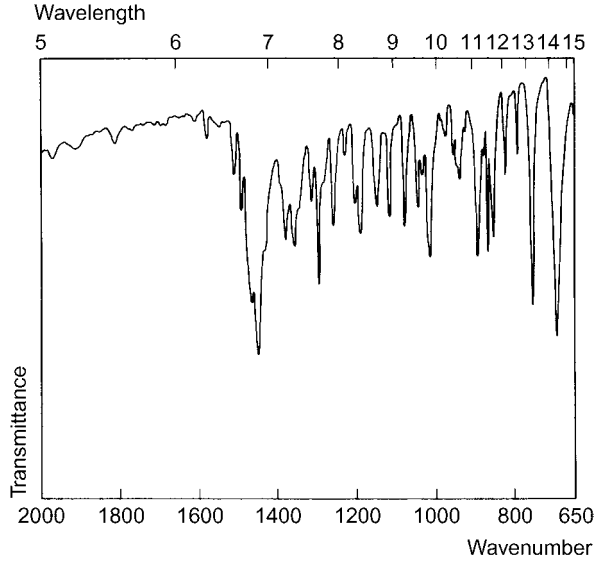
Gas Chromatography System GA—RI 1900; system GB—RI 1981; system GF—RI 2150.

High Performance Liquid Chromatography System HA—*k* 2.4 (tailing peak); system HX—RI 375; system HY—RI 285.

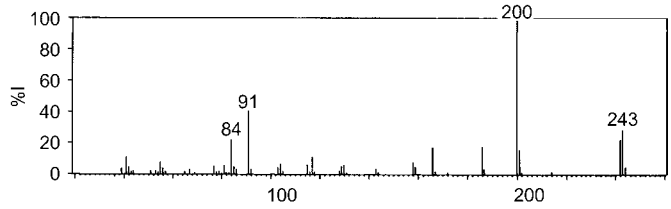
Ultraviolet Spectrum Aqueous acid—252, 258, 263 (A_1^1 = 13.5a), 270 nm.



Infrared Spectrum Principal peaks at wavenumbers 700, 760, 1298, 1020, 892, 869 cm^{-1} (phencyclidine hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 200, 91, 243, 242, 84, 186, 166, 201 (phencyclidine); 91, 216, 77, 259, –, –, –, – (1-(1-phenylcyclohexyl)-4-hydroxypiperidine); 200, 91, 84, 86, 186, 259, –, – (4-phenyl-4-piperidinocyclohexanol).



Quantification

Blood **GC** Column: DB-1 (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 3 mL/min. Temperature programme: 150° for 1 min to 280° at 10°/min. NPD. Retention time: 8.3 min. Limit of detection, 0.75 µg/L [Ishii *et al.* 1996].

GC-MS SIM acquisition mode [Ferguson, Garg 2010]. EI ionisation. Limit of detection, 0.05 µg/L. SIM acquisition mode. Limit of detection, 0.01 µg/L (whole blood) [Ishii *et al.* 2000].

Immunoassay For an immunoassay for phencyclidine and other drugs including amfetamines and methadone, see Klinger *et al.* [1990].

Plasma **GC** Column: BP 10 SGE (25 m × 0.22 mm i.d.). Carrier gas: N_2, 6.2 mL/min. Temperature programme: 200° to 270° at 10°/min for 23 min. NPD. Retention time: 6.42 min. Limit of detection, 1.2 µg/L [Kintz *et al.* 1990]. Column: 3% OV-17 on 80/100 mesh Chromosorb W HP (2 m × 2 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature programme: 220° for 8 min to 270° at 50°/min for 1 min. NPD. Limit of detection, 5 ng/L [Pitts *et al.* 1980].

HPLC FID (λ_{ex}= 380 nm, λ_{em}= 445 nm). Phencyclidine, methadone and their metabolites [Derendorf, Garrett 1983].

LC-MS Column: Alltima C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 5 mmol/L formic acid (10 : 90 for 2 min to 25 : 75 in 16 min to 35 : 65 in 0.1 min to 100 : 0 in 12 min), flow rate 1.0 mL/min. MRM acquisition mode, positive-ion mode. Limit of quantification, 1.3 µg/L, limit of detection, 0.22 µg/L [Sergi *et al.* 2009].

Immunoassay See Blood [Klinger *et al.* 1990].

Serum **GC** Column: SP-2250 on 80/100 Supelco mesh (1.84 m × 2 mm i.d.). Carrier gas: He, 30 mL/min. Temperature: 220°. NPD. Limit of detection, 0.5 µg/L [Werner *et al.* 1986]. Column: 3% OV-17 on Gas Chrom Q 100/120 mesh (1.8 m [6′] × 2 mm i.d.). Carrier gas: He, 26 mL/min. Temperature: 192°. NPD. Retention time: 2.8 min. Limit of detection, 5 µg/L [Miceli *et al.* 1981]. See Plasma [Pitts *et al.* 1980].

Radioimmunoassay Limit of detection, <0.5 µg/L [Owens *et al.* 1982]. See Blood [Klinger *et al.* 1990]

Urine **GC** Column: HP5 (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 1.5 mL/min. Temperature programme: 140° to 300° at 20°/min. PDHID. Limit of detection, 0.07 mg/L [Casari, Andrews 2001]. See Blood [Ishii *et al.* 1996]. Column: Chromosorb W AW-DMCS 80/100 mesh (914 × 2 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature: 230°. NPD. Retention time: 1.29 min. Limit of detection, 15 µg/L [Kandiko *et al.* 1990]. SE-30 3% on Gas-Chrom Q 100/120 mesh (1.83 m × 2 mm i.d.). Carrier gas: CH_4, 16 mL/min. Temperature: 190°. CI at 70 eV, SIM acquisition mode. Relative retention time: 0.79. Limit of detection, 10 µg/L for phencyclidine and 50 µg/L for metabolites [Cone *et al.* 1981]. See Serum [Miceli *et al.* 1981]. See Plasma [Pitts *et al.* 1980].

GC-MS See Blood [Ferguson, Garg 2010; Ishii *et al.* 2000]. Column: J &W DB-5MS (15 m × 0.25 mm i.d., 0.25 µm). Temperature programme: 115° for 1 min to

300° at 30°/min for 2 min. Comparisons of SIM, SIS, or full scan mode. Limit of detection not reported [Vorce *et al.* 2000]. Column: cross-linked 5% phenyl methyl silicone (12 × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 50 mL/min. Temperature programme: 120° for 1 min to 190° at 40°/min for 6 min. Limit of quantification, 1.38 µg/L, limit of detection, 0.47 µg/L [Stevenson *et al.* 1992].

LC-MS Column: XTerra MS C_{18} (50 × 3.0 mm i.d., 2.5 µm). Mobile phase: 5 mmol/L ammonium acetate with 0.05% acetic acid : acetonitrile (96 : 4 to 88 : 12 at 8 min to 74 : 26 at 8.5 min to 63 : 37 at 14 min to 20 : 80 at 14.1 min for 2.2 min to 96; 4 at 16.4 min for 3.7 min), flow rate 0.8 mL/min. TIS, MRM acquisition mode. Retention time: 11.1 min. Limit of detection, 0.0766 µg/L [Feng *et al.* 2007].

CSF **GC** See Serum [Miceli *et al.* 1981].

Oral Fluid **GC** See Plasma [Pitts, Jr. *et al.* 1980].

LC-MS Column: Allure PFP Propyl LC (50 × 2.1 mm i.d., 5 µm). Mobile phase: 0.1% formic acid-2 mmol/L ammonium acetate-2% acetonitrile : 0.1% formic acid-2 mmol/L ammonium acetate-10% HPLC grade water in acetonitrile (90 : 10 for 0.5 min to 65 : 35 over 1.5 min for 2 min to 5 : 5 in 1 min to 2 : 98 in 1 min for 2 min to 90 : 10 for 3 min), flow rate 800 µL/min. ESI, positive ion mode. Limit of quantification, 0.4 µg/L, limit of detection, 0.2 µg/L [Fritch *et al.* 2009]. See Plasma [Sergi *et al.* 2009].

Vitreous Humour **GC** FID [Jenkins, Oblock 2008].

Hair **GC-MS** Column: cross-linked methylsilicone TC-1 (15 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 4 psi. Temperature programme: 80° for 0.5 min to 280° at 15°/min. Limit of quantification, 0.2 ng/mg [Nakahara *et al.* 1997].

Tissues **GC** See Plasma [Pitts *et al.* 1980].

Note For a review of the analysis of phencyclidine and its metabolites, see Veselovskaia *et al.* [1999].

Disposition in the Body Phencyclidine is a drug of abuse that is self-administered orally, IV, by nasal insufflation, or by smoking impregnated plant material. The main metabolic reaction is hydroxylation and 2 metabolites have been identified in the urine as glucuronide conjugates: 4-phenyl-4-piperidinocyclohexanol and 1-(1-phenylcyclohexyl)-4-hydroxypiperidine (PCHP). The product of *N*-dealkylation (1-phenylcyclohexylamine) has also been identified in urine, together with an oxidised derivative, 5-(1-phenylcyclohexylamino)valeric acid. Approximately 73% of a dose is excreted in the urine and 5% is eliminated in the faeces in 10 days, of which ~16% of the dose is unchanged and 30% is conjugated hydroxylated metabolites; the rate of excretion of unchanged drug is increased in acidic urine.

Concentration in Blood

Following an oral dose of 1 mg, given to 5 subjects, a mean peak plasma concentration of 0.0027 mg/L was reported at 2.5 h [Cook *et al.* 1982].

Toxicity Blood concentrations in the region of 0.1 mg/L produce abnormal behaviour and concentrations of ~0.3 mg/L or more cause severe toxic symptoms, which may be followed by death although there is considerable intersubject variation. Many deaths have resulted, not from the toxic effects of phencyclidine itself, but from the effects of irrational behaviour caused by the drug. In 53 cases of death reported in the literature as not directly caused by phencyclidine, blood concentrations ranged from 0.01–2.1 mg/L (mean, 0.36); in 22 of these cases urine concentrations ranged from 0.1–10.6 mg/L (mean, 2.1); alcohol was also present in a number of these cases. In one study of postmortem phencyclidine blood concentrations, most were in the range 0.01–9.0 mg/L [Budd, Liu 1982].

In 9 deaths directly attributable to phencyclidine overdose, the following postmortem concentrations were reported: blood 0.3–12 mg/L (mean, 2.4; 8 cases), brain 0.1–32 µg/g (mean, 7.3; 6 cases), liver 0.9–80 µg/g (mean, 20; 9 cases) and urine 0.4–48.6 mg/L (mean, 21.7; 5 cases) [Cravey *et al.* 1979].

A 28-year-old man survived a massive overdose of phencyclidine, despite plasma concentrations reaching a maximum of 1.879 mg/L 2 days after admission to hospital (the highest recorded so far in a survivor). On hospital day 11 (13 days after the ingestion), he passed 2 plastic bags (1 of which was ruptured) via his rectum and his CSF phencyclidine concentration was 0.245 mg/L; the patient made a rapid neurological recovery starting on hospital day 12 [Jackson 1989].

In a 29-year-old man who swallowed a plastic bag containing phencyclidine, serum levels were persistently elevated for several weeks, with the patient remaining in a coma for 24 days. On hospital day 20, following nasogastric administration of oral colonic lavage solution on days 11–14, a plastic bag (presumed to have contained phencyclidine) was passed via the rectum; the serum phencyclidine levels declined and the patient recovered neurological function. The following course of serum phencyclidine concentrations was reported: 0.85 mg/L on day 4, 1.01 mg/L on day 7, 1.69 mg/L on day 10, 1.65 mg/L on day 14, 1.16 mg/L on day 16, 0.57 mg/L on day 18, 0.62 mg/L on day 21 and 0.06 mg/L on day 23 [Young, Crapo 1992].

Half-life Plasma half-life, 7–46 h (mean, 17), increased up to 4 days in severe poisoning cases.

Volume of Distribution ≈6 L/kg.

Distribution in Blood Plasma : whole blood ratio, ~1.0.

Protein Binding ≈65–80%.

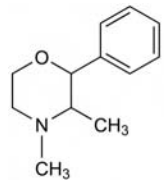
Phendimetrazine

Anorectic

$C_{12}H_{17}NO$ = 191.3

CAS—634-03-7

IUPAC Name 3,4-Dimethyl-2-phenylmorpholine



Chemical Properties pK_a 7.6. Log *P* (octanol/water), 1.7.

Phendimetrazine Tartrate

$C_{12}H_{17}NO,C_4H_6O_6$ = 341.4

CAS—50-58-8

Synonyms Phendimetrazine acid tartrate; phendimetrazine bitartrate.

Proprietary Names *Adipost*; *Adphen*; *Anoran*; *Anorex*; *Bacarate*; *Bontril*; *Dyrexan-OD*; *Melfiat*; *Obalan*; *Obesan-X*; *Obex-LA*; *Plegine*; *Prelu-2*; *Rexigen Forte*; *Statobex*; *Trimstat*; *Trimtabs*; *Wehless*; *Weightrol*; *X-trozine*.

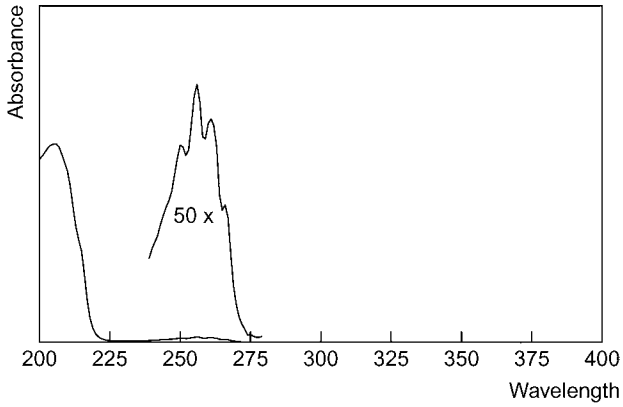
Chemical Properties A white crystalline powder. Freely soluble in water; very slightly soluble in ethanol; practically insoluble in acetone, benzene, chloroform and ether.

Colour Test Liebermann's reagent—red-orange.

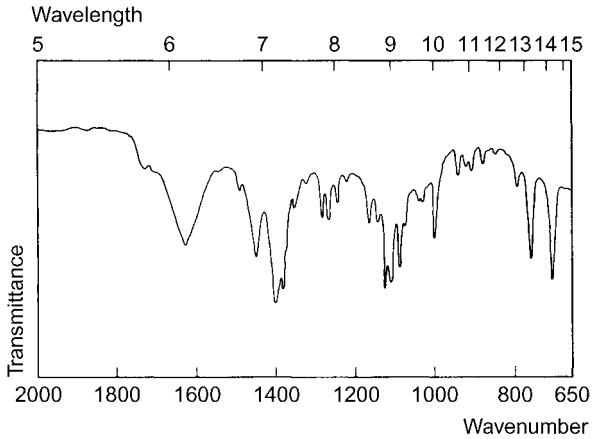
Thin-layer Chromatography System TA—R_f 0.57; system TB—R_f 0.36; system TC—R_f 0.51; system TE—R_f 0.62; system TL—R_f 0.24; system TAE—R_f 0.49; system TAF—R_f 0.41 (Dragendorff spray, positive; acidified iodoplatinate solution, positive; acidified potassium permanganate solution, positive). See also Phenmetrazine.

Gas Chromatography System GA—phendimetrazine RI 1334, phenmetrazine RI 1432; system GB—phendimetrazine RI 1504, phenmetrazine RI 1483; system GC—phendimetrazine RI 1735, phenmetrazine RI 1873.

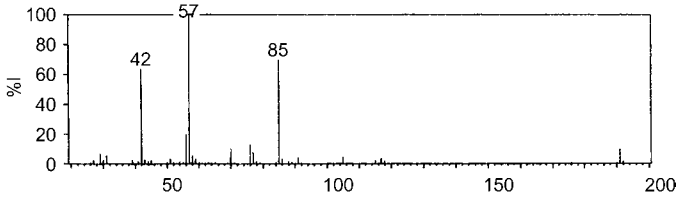
High Performance Liquid Chromatography System HA—*k* 0.9 phendimetrazine; *k* 1.7 phenmetrazine; system HC—*k* 0.3; system HX—phendimetrazine RI 263; phenmetrazine RI 258; system HY—phendimetrazine RI 218; phenmetrazine RI 241.
Ultraviolet Spectrum Aqueous acid—251, 257 (A_1^1=12.7a), 261, 267 nm. No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1120, 1105, 697, 1083, 752, 1630 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 57, 85, 42, 56, 76, 191, 70, 77; phenmetrazine 71, 42, 56, 43, 177, 77, 178, 105.



Quantification
Plasma **GC** FID. Phendimetrazine and other CNS stimulants [Kintz *et al.* 1989]. AFID. Limit of detection, 2 µg/L [Rudolph *et al.* 1983].
Serum **GC** See Plasma [Rudolph *et al.* 1983]. AFID. Phendimetrazine and phenmetrazine. Limit of detection, 10 µg/L [Long *et al.* 1982].
Urine **GC** See Plasma [Kintz *et al.* 1989]; [Rudolph *et al.* 1983]. See Serum [Long *et al.* 1982].
Disposition in the Body Readily absorbed after oral administration. Metabolised by *N*-demethylation to phenmetrazine, which is active, and by *N*-oxidation. About 5 to 30% of a dose is excreted in the urine unchanged in 24 h together with up to 30% as phenmetrazine and 20% as the *N*-oxide.
Therapeutic Concentration
Following a single oral dose of 35 mg to 20 subjects, a mean peak plasma concentration of about 0.07 mg/L was attained in about 1 h [Rudolph *et al.* 1983].
Toxicity
A blood concentration of 300 µg/L was reported in a fatality attributed to phendimetrazine [Hood *et al.* 1988].
Half-life Plasma half-life, about 2 to 3 h.
Dose Usually 70 to 105 mg of phendimetrazine tartrate daily; maximum of 210 mg daily.

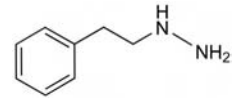
Phenelzine

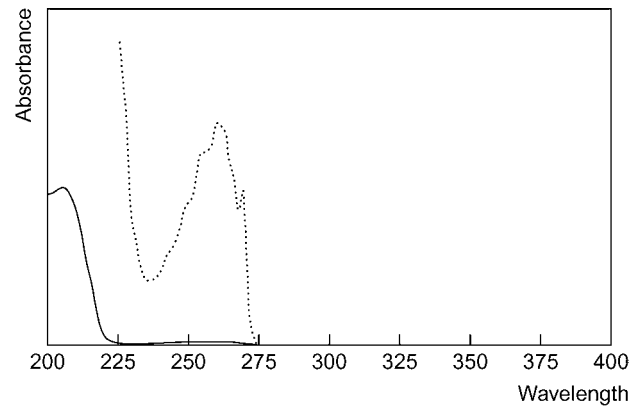
Antidepressant, Monoamine Oxidase Inhibitor
$C_8H_{12}N_2$ = 136.2
CAS—51-71-8
IUPAC Name Phenethylhydrazine
Synonym (2-Phenethyl)hydrazine



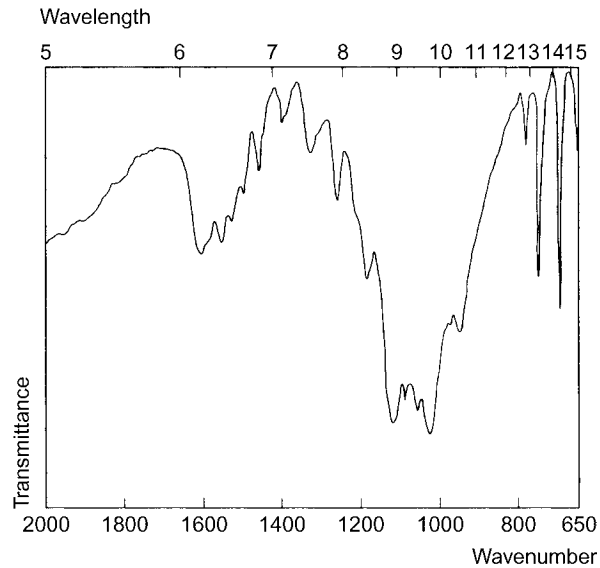
Chemical Properties Practically insoluble in water; soluble in chloroform and ether. Log *P* (octanol/water) 1.0.

Phenelzine Sulfate
$C_8H_{12}N_2,H_2SO_4$ = 234.3
CAS—156-51-4
Proprietary Names *Nardelzine*; *Nardil*.
Chemical Properties A white or yellowish-white powder or pearly platelets. Mp 164° to 168°. Soluble 1 in 7 of water; practically insoluble in ethanol, chloroform and ether.

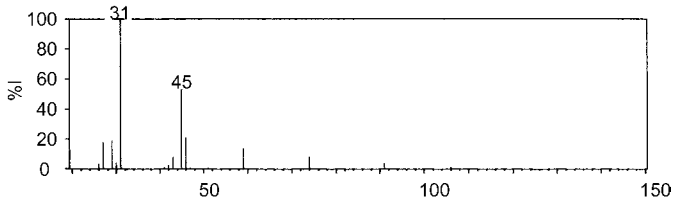
Colour Tests Benedict's reagent—orange; Liebermann's reagent—orange; Mandelin's test—brown; Nessler's reagent—black; palladium chloride—black.
Thin-layer Chromatography System TA—R_f 0.77; system TB—R_f 0.37; system TC—R_f 0.12; system TE—R_f 0.83; system TAE—R_f 0.29; system TAF—R_f 0.82; system TAG—R_f 0.63 (acidified iodoplatinate solution—positive; Dragendorff spray—positive; Marquis test—brown; Ninhydrin (spray)—positive).
Gas Chromatography System GA—RI 1335; system GB—RI 1278; system GC—RI 1460.
High Performance Liquid Chromatography System HA—*k* 1.0; system HB—*k* 5.91; system HC—*k* 0.37; system HX—RI 184.
Ultraviolet Spectrum Aqueous acid—247, 252, 257 (A_1^1= 12.9a), 263 nm.



Infrared Spectrum Principal peaks at wavenumbers 1016, 1108, 1050, 1080, 940, 699 cm^{-1} (phenelzine sulfate, KBr disk).



Mass Spectrum Principal ions at *m/z* 31, 45, 46, 29, 27, 59, 74, 43.



Quantification

Plasma **GC** Column: OV-17 (25 m × 0.32 mm i.d., 0.15 µm). Carrier gas: He, 4.0 mL/min. Temperature programme: 170° to 300° at 32°/min. NSD. Limit of detection, <1 µg/L [Lichtenwalner *et al.* 1988]. Column: 10% OV-17 on gas chrom Q (2 m × 1.88 mm i.d.). Temperature: 240°. AFID. Limit of detection, 2 µg/L [McGilveray *et al.* 1982].

GC-MS Column: 1% OV-17 (1.8 m). Carrier gas: N_2, 30 mL/min. Temperature: 190°. Limit of quantification, 2 µg/L [Jindal *et al.* 1980].ECD [Cooper *et al.* 1978].

Urine **GC** Column: 10% m/m FFAP on Gas-Chrom Q 80/100 mesh (2 m × 2 mm i.d.). Carrier gas: N_2, 40 mL/min. Temperature: 150°. FID. Limit of detection, 50 µg/L [Caddy, Stead 1977].

GC-MS Column: SE-54 fused silica capillary (15 m × 0.255 mm i.d., 0.25 µm). Carrier gas: He, 2 mL/min. Temperature programme: 105° for 0.5 min to 300° at 25°/min for 10 min. ECD. Limit of detection, <10 pg [Rao *et al.* 1987].

Brain **GC** See Urine [Rao *et al.* 1987].

Disposition in the Body Phenelzine is readily absorbed after oral administration and widely distributed throughout the body. It is believed to be metabolised by acetylation, followed by glutamine conjugation, producing phenylacetylglutamine. Aromatic hydroxylation and conjugation with glucuronic acid may also occur. <5% of a dose is excreted in the urine unchanged.

Therapeutic Concentration

Following a single oral dose of 50 mg phenelzine solution in 1 subject, a peak plasma concentration of 0.05 mg/L was reported at 0.25 h [McGilveray *et al.* 1982].

Following a single oral dose of 30 mg in 1 subject, a peak plasma concentration of 0.002 mg/L was attained in 2 h. In a subject who had been receiving daily oral doses of 30 mg for 6 weeks, a trough steady-state plasma concentration of 0.0002 mg/L was reported [Cooper *et al.* 1978].

Toxicity

In a fatality attributed to phenelzine and alcohol, postmortem urine concentrations were phenelzine 58 mg/L, alcohol 1700 mg/L; in a second subject who took a non-fatal overdose, blood and plasma concentrations of 1.5 and 1.26 mg/L phenelzine, respectively, were reported 12 h after ingestion [Caddy, Stead 1978].

Phenelzine was held to be the cause of death in 2 subjects, even though other drugs were present in elevated concentrations. The postmortem blood concentration in the first was 3.1 mg/L and a total of 62 g was found in the stomach contents. Postmortem tissue concentrations in the second were blood 0.68 mg/L, urine 4.60 mg/L, and the antemortem serum concentration was 0.72 mg/L [Lichtenwalner *et al.* 1995].

Half-life Plasma half-life, ~7 h.

Dose The equivalent of 45 to 60 mg phenelzine daily.

Phenethylamine

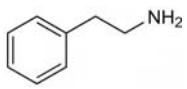
Putrefactive Base

$C_8H_{11}N = 121.2$

CAS—64-04-0

IUPAC Name 2-Phenylethanamine

Synonym β-Aminoethylbenzene; benzeneethanamine



Chemical Properties A strongly basic liquid which absorbs carbon dioxide from the air. Bp 194° to 195°. Soluble in water; freely soluble in ethanol and ether. pK_a 10.0 (19°). Log *P* (octanol/water), 1.4.

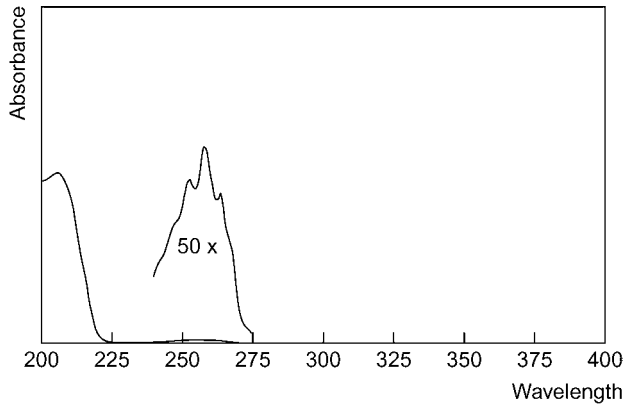
Colour Test Marquis test—orange.

Thin-layer Chromatography System TA—R_f 0.49; system TB—R_f 0.28; system TC—R_f 0.28; system TE—R_f 0.54; system TL—R_f 0.39; system TAE—R_f 0.44; system TAJ—R_f 0.03; system TAK—R_f 0.16; system TAL—R_f 0.50 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 1111.

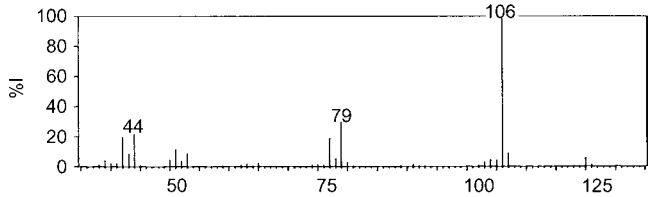
High Performance Liquid Chromatography System HA—*k* 1.2; system HB—*k* 3.60; system HC—*k* 1.3.

Ultraviolet Spectrum Aqueous acid—242 (A^1_1=15b), 247 (A^1_1=17.2b), 252 (A^1_1=19.8b), 257 (A^1_1=21.3b), 263 nm (A^1_1=16b).



Infrared Spectrum Principal peaks at wavenumbers 695, 745, 755, 942, 1146, 1608 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 30, 91, 65, 92, 51, 39, 121, 103.



Disposition in the Body Phenethylamine is the putrefactive base obtained from phenylalanine by decarboxylation.

P

Pheneticillin

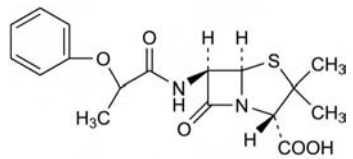
Antibiotic

$C_{17}H_{20}N_2O_5S = 364.4$

CAS—147-55-7

IUPAC Name (2*S*,5*R*,6*R*)-3,3-Dimethyl-7-oxo-6-(2-phenoxypropanoylamino)-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid

Synonyms (2*S*,5*R*,6*R*)-3,3-Dimethyl-7-oxo-6-[(1-oxo-2-phenoxypropyl) amino]-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid; penicillin B; phenethicillin; α-phenoxyethylpenicillin.



Chemical Properties pK_a 2.7 (25°). Log *P* (octanol/water), 2.2.

Pheneticillin Potassium

$C_{17}H_{19}KN_2O_5S = 402.5$

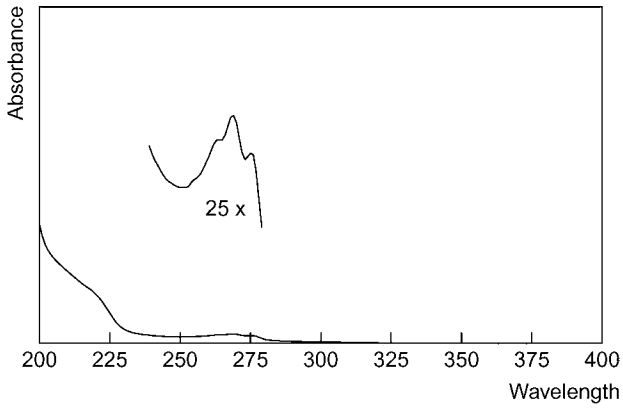
CAS—132-93-4

Synonym Phenethicillin potassium

Proprietary Names *Alfacillin*; *Brocosil*; *Broxil*; *Chemipen*; *Darcil*; *Dramcillin-S*; *Maxipen*; *Optipen*; *Peniplus*; *Penorale*; *Penova*; *Pensig*; *Syncillin*; *Synthecilline*; *Synthepen*.

Chemical Properties A white, fine, crystalline powder. Mp 230° to 232°, with decomposition. Soluble 1 in 1.5 of water, 1 in 85 of ethanol, and 1 in 800 of dehydrated alcohol; slightly soluble in chloroform; practically insoluble in ether.

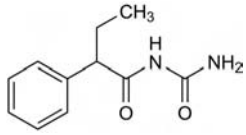
Ultraviolet Spectrum Pheneticillin potassium: aqueous acid—271 (A^1_1=44b), 275 nm. No alkaline shift.



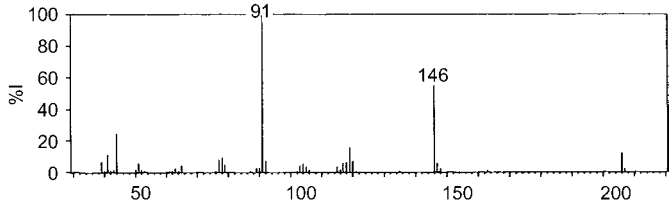
Infrared Spectrum Principal peaks at wavenumbers 1610, 1778, 1510, 1238, 1690, 752 cm^{-1} (pheneticillin potassium, KBr disk).
Dose The equivalent of 1 to 2 g of pheneticillin daily.

Pheneturide

Anticonvulsant
$C_{11}H_{14}N_2O_2 = 206.2$
CAS—90-49-3
IUPAC Name *N*-Carbamoyl-2-phenylbutanamide
Synonyms *N*-(Aminocarbonyl)-α-ethylbenzeneacetamide; EPA; ethylphenacemide; PBU.
Proprietary Names *Benuride*; *Laburide*.



Chemical Properties A white crystalline powder. Practically insoluble in water and ether; slightly soluble in ethanol; very soluble in glacial acetic acid. Log *P* (octanol/water), 1.6.
Colour Test Nessler's reagent—orange-brown (slow).
Thin-layer Chromatography System TA—R_f 0.76; system TD—R_f 0.38; system TE—R_f 0.71; system TF—R_f 0.53; system TAD—R_f 0.59.
Gas Chromatography System GA—RI 1465.
High Performance Liquid Chromatography System HE—*k* 6.8.
Ultraviolet Spectrum Chloroform—259 (A^{1}_{1} = 18b), 265 nm (A^{1}_{1s} = 11b).
Infrared Spectrum Principal peaks at wavenumbers 1672, 1700, 1093, 694, 1176, 1615 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 91, 146, 44, 119, 206, 41, 78, 77.



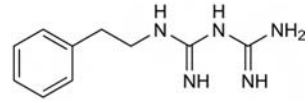
Quantification

Plasma **TLC-UV spectrophotometry** [Galeazzi *et al.* 1979].
HPLC UV detection. Pheneturide and other anticonvulsants. Limit of detection, 1.4 mg/L [Christofides, Fry 1980].
Serum **TLC-UV spectrophotometry** see Plasma. Limit of detection, 500 µg/L [Galeazzi *et al.* 1979].
HPLC See Plasma [Christofides, Fry 1980].
Urine **TLC-UV spectrophotometry** See Plasma [Galeazzi *et al.* 1979].
Disposition in the Body Slowly absorbed after oral administration. Pheneturide is thought to be completely metabolised as only traces of unchanged drug have been found in the urine. It may induce its own metabolism.
Toxicity Pheneturide has been reported to be less likely to cause toxic effects than phenacemide, to which it is chemically related.
Half-life Plasma half-life, 30–90 h (mean, 54) after single doses and about 40 h after chronic administration.
Volume of Distribution About 3 L/kg.
Clearance Plasma clearance, ≈0.7 mL/min/kg.
Dose Pheneturide has been given in doses of 0.6 to 1 g daily.

Christofides JA, Fry DE (1980). Measurement of anticonvulsants in serum by reversed-phase ion-pair liquid chromatography. *Clin Chem* 26: 499–501.
Galeazzi RL *et al.* (1979). Pharmacokinetics of phenylethylacetylurea (pheneturide), an old antiepileptic drug. *J Pharmacokinet Biopharm* 7: 453–462.

Phenformin

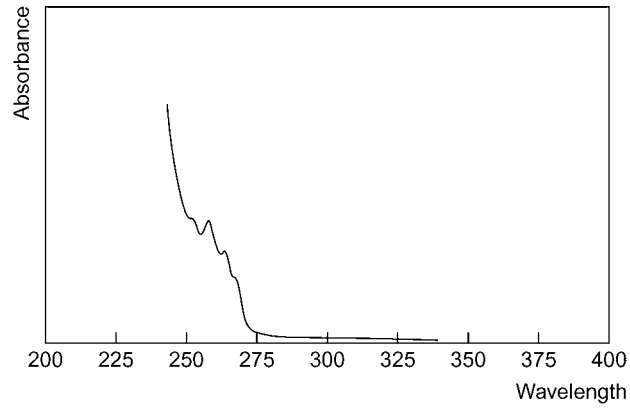
Antidiabetic
$C_{10}H_{15}N_5 = 205.3$
CAS—114-86-3
IUPAC Name 1-(Diaminomethylidene)-2-phenethylguanidine
Synonyms Fenformina; phenethyldiguanide β-PEBG; *N*-(2-phenylethyl)imidodicarbonimidic diamide; PEDG.



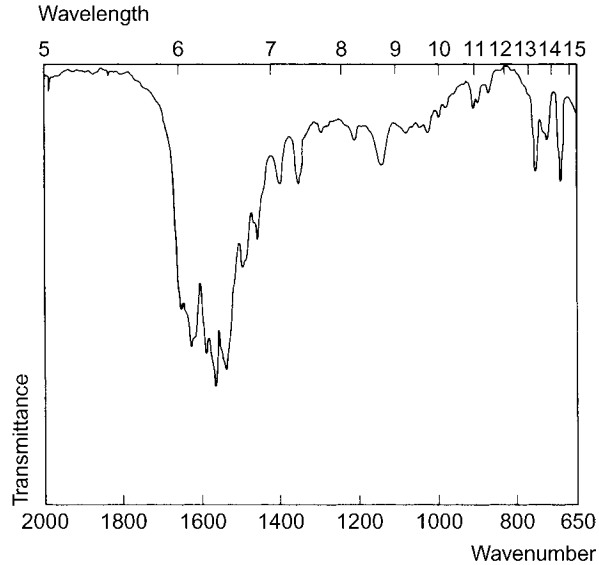
Chemical Properties pK_a 2.7, 11.8 (32°). Log *P* (octanol/water), −0.8.

Phenformin Hydrochloride

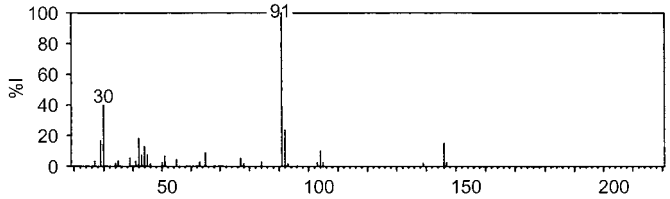
$C_{10}H_{15}N_5$,HCl = 241.7
CAS—834-28-6
Proprietary Names *Azucaps*; *Debei*; *Debein*; *Debeuna*; *Debeone*; *Debinyl*; *Dibotin*; *Dipar*; *Feguanide*; *Glucopostin*; *Insoral*; *Lentobetic*; *Meltrol*; *Normoglucina*.
Chemical Properties A white crystalline powder. Mp 175° to 178°. Soluble 1 in 8 of water and 1 in 15 of ethanol; practically insoluble in chloroform and ether.
Colour Tests Mandelin's test—green; Marquis test—orange→brown.
Thin-layer Chromatography System TA—R_f 0.03; system TB—R_f 0.00; system TC—R_f 0.00; system TL—R_f 0.00; system TAJ—R_f 0.00; system TAK—R_f 0.03; system TAL—R_f 0.29 (Marquis reagent, positive).
High Performance Liquid Chromatography System HX—RI 250.
Ultraviolet Spectrum Aqueous acid—251 (A^{1}_{1} = 11a), 258 (A^{1}_{1} = 11a), 264, 267 nm.



Infrared Spectrum Principal peaks at wavenumbers 1568, 1537, 1590, 1625, 1650, 1500 cm^{-1} (phenformin hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 91, 30, 92, 42, 29, 146, 44, 104 (no peaks above 150).



Quantification

Plasma **GC** ECD. Phenformin and other biguanides. Limit of detection, <1 µg/L in plasma [Matin *et al.* 1975].

HPLC UV detection. Limit of detection, 10 µg/L in plasma [Hill, Chamberlain 1978].

Serum **HPLC** Fluorimetric detection. Phenformin and buformin [Kobayashi *et al.* 1988].

Urine **GC** See Plasma [Matin *et al.* 1975].

HPLC UV detection. Phenformin and 4-hydroxyphenformin. Limit of detection, 1 mg/L for phenformin and 500 µg/L for 4-hydroxyphenformin [Oates *et al.* 1980]. See Plasma [Hill, Chamberlain 1978].

Disposition in the Body Well absorbed after oral administration. The major metabolic reaction is aromatic hydroxylation to form 4-hydroxyphenformin which is then conjugated with glucuronic acid. Up to about 50% of a dose is excreted in the urine in 24 h, about two-thirds in the form of unchanged drug and one-third as the hydroxy metabolite.

Therapeutic Concentration

Following a single oral dose of 50 mg to 8 subjects, peak plasma concentrations of 0.08–0.18 mg/L (mean, 0.13) were attained in about 3 h; plasma concentrations were higher in 4 subjects who were poor metabolisers of debrisoquine in comparison with the four extensive metabolisers [Oates *et al.* 1983].

Following daily oral doses of 50 mg three times a day to 8 subjects, plasma concentrations of 0.10–0.24 mg/L (mean, 0.18) were reported 2 h after a dose [Karam *et al.* 1974].

Toxicity

A 44-year-old woman ingested 1.5 g in slow-release capsules and died 30 h later. A postmortem blood concentration of 3 mg/L and liver concentration of 60 µg/g were reported [Bingle *et al.* 1970].

Half-life Plasma half-life, 10–15 h.

Protein Binding About 12–20%.

Note For a review of phenformin-induced lactic acidosis, see Kwong and Brubacher [1998].

Dose 50 to 100 mg of phenformin hydrochloride daily.

Bingle JP *et al.* (1970). Fatal self-poisoning with phenformin. *Brit Med J* 3: 752.

Hill HM, Chamberlain J (1978). Determination of oral anti-diabetic agents in human body fluids using high-performance liquid chromatography. *J Chromatogr* 149: 349–358.

Phenglutarimide

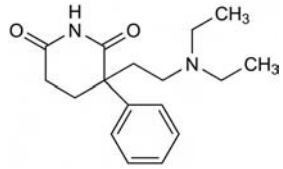
Anticholinergic, Antiparkinsonian

$C_{17}H_{24}N_2O_2$ = 288.4

CAS—1156-05-4

IUPAC Name 3-(2-Diethylaminoethyl)-3-phenylpiperidine-2,6-dione

Synonym 3-[2-(Diethylamino)ethyl]-3-phenyl-2,6-piperidinedione



Chemical Properties Crystals. Mp 125° to 127°. Log *P* (octanol/water), 1.9.

Phenglutarimide Hydrochloride

$C_{17}H_{24}N_2O_2$,HCl = 324.8

CAS—1674-96-0

Proprietary Names *Aturbal*; *Aturbane*.

Chemical Properties A white crystalline powder. Mp 168° to 172° and also 176° to 177°, with decomposition. Soluble 1 in 1 of water and 1 in 1.5 of ethanol; very slightly soluble in ether.

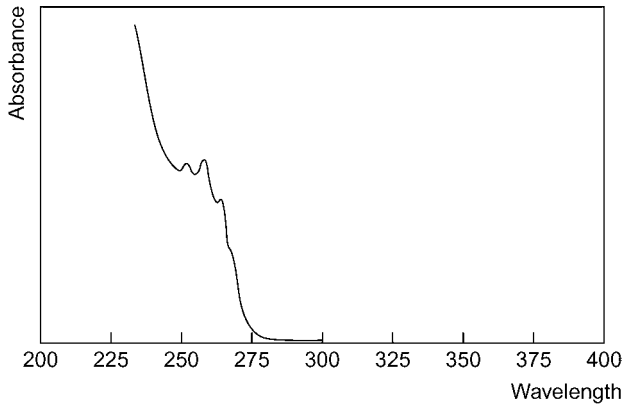
Colour Tests Koppanyi–Zwikker test—violet; Liebermann's reagent—red-orange.

Thin-layer Chromatography System TA—R_f 0.40; system TB—R_f 0.17; system TC—R_f 0.08; system TL—R_f 0.08 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—Phenglutarimide RI 2235, M (desethyl-) RI 2370.

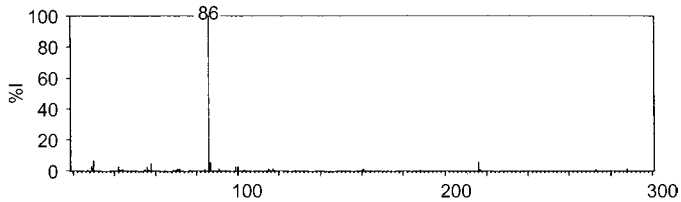
High Performance Liquid Chromatography System HA—*k* 2.9.

Ultraviolet Spectrum Aqueous acid—251, 257 (A_1^1=13.3a), 263 nm.



Infrared Spectrum Principal peaks at wavenumbers 1698, 1194, 1181, 1250, 700, 1150 cm^{-1} (phenglutarimide hydrochloride, KBr disk).

Mass Spectrum Principal ions at *m/z* 86, 30, 216, 87, 58, 100, 99, 56.



Dose Phenglutarimide hydrochloride has been given in doses of 10 to 50 mg daily.

Phenindamine

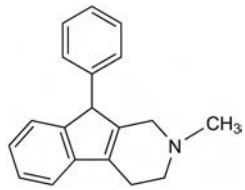
Antihistamine

$C_{19}H_{19}N$ = 261.4

CAS—82-88-2

IUPAC Name 2-Methyl-9-phenyl-1,3,4,9-tetrahydroindeno[2,1-*c*]pyridine

Synonyms Nu-1504; 2,3,4,9-tetrahydro-2-methyl-9-phenyl-1*H*-indeno[2,1-*c*]pyridine.



Chemical Properties Crystals. Mp 90° to 91°. pK_a 8.3 (25°). Log *P* (octanol/water), 4.2.

Phenindamine Tartrate

$C_{19}H_{19}N,C_4H_6O_6$ = 411.5

CAS—569-59-5

Proprietary Names *Nolahist*; *Thephorin*.

Chemical Properties A white voluminous powder. Mp 160°, with decomposition. Soluble 1 in 70 of water and 1 in 300 of ethanol; practically insoluble in chloroform and ether.

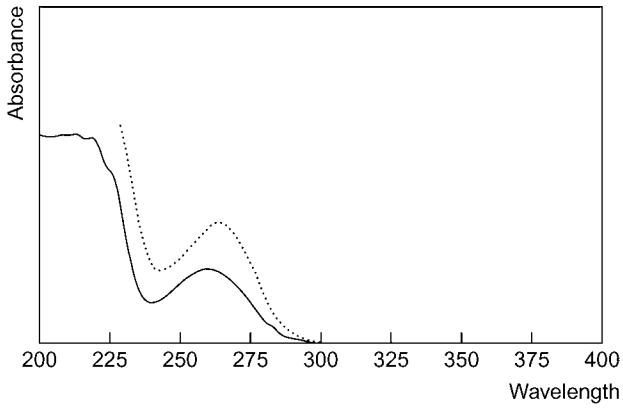
Colour Tests Mandelin's test—green; Marquis test—grey-green.

Thin-layer Chromatography System TA—R_f 0.63; system TB—R_f 0.45; system TC—R_f 0.57; system TE—R_f 0.68; system TL—R_f 0.21; system TAD—R_f 0.41; system TAF—R_f 0.49; system TAJ—R_f 0.37; system TAK—R_f 0.02; system TAL—R_f 0.82 (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, grey-brown).

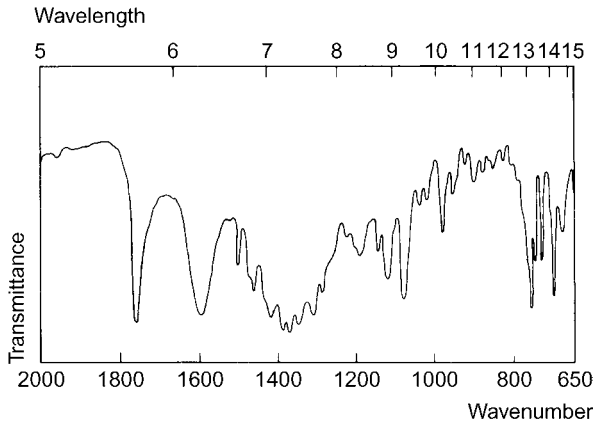
Gas Chromatography System GA—Phenindamine RI 2165, M (OH-) RI 2300, M (*N*-oxide) RI 2230, M (nor-) RI 2210, M (nor-OH-) RI 2590; system GB—RI 2245; system GC—RI 2926; system GF—RI 2515.

High Performance Liquid Chromatography System HA—*k* 2.5; system HX—RI 397.

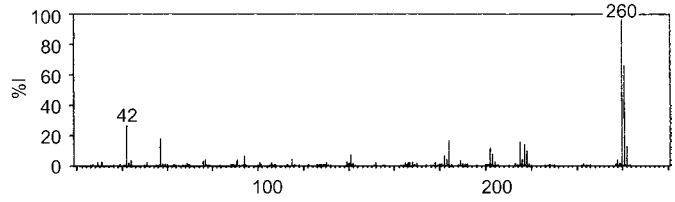
Ultraviolet Spectrum Aqueous acid—259 nm (A_1^1=347a); aqueous alkali—263 nm (A_1^1=385a).



Infrared Spectrum Principal peaks at wavenumbers 1751, 1302, 1585, 752, 1072, 693 cm^{-1} (phenindamine tartrate, KBr disk).



Mass Spectrum Principal peaks at *m/z* 260, 261, 42, 57, 184, 215, 217, 262.

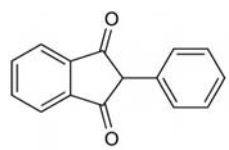


Dose Up to 150 mg of phenindamine tartrate daily.

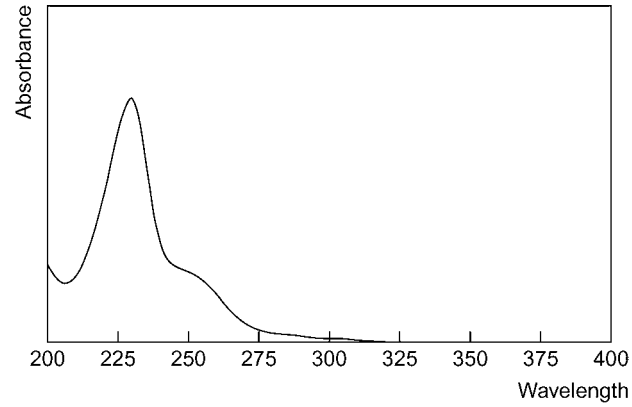
Phenindione

Anticoagulant
$C_{15}H_{10}O_2$ = 222.2
CAS—83-12-5

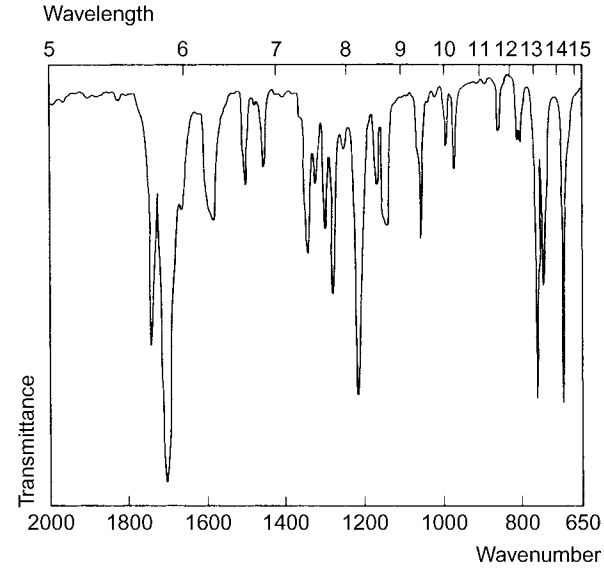
IUPAC Name 2-Phenylindene-1,3-dione
Synonyms Phenylindanedione; 2-phenyl-1*H*-indene-1,3(2*H*)-dione; phenylinium PID.
Proprietary Names *Danilone*; *Dindevan*; *Fenilin*; *Hedulin*; *Pindione*; *Rectadione*.



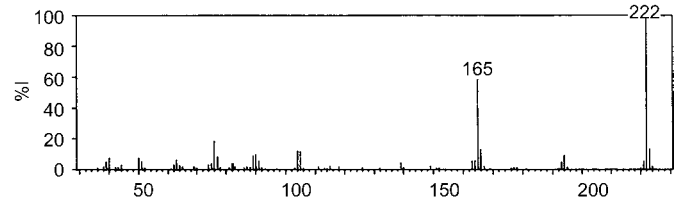
Chemical Properties Soft, white or creamy-white or pale yellow crystals or crystalline powder. Mp 149° to 151°. Very slightly soluble in water; soluble 1 in about 125 of ethanol, 1 in 6.5 of chloroform, and 1 in 110 of ether; soluble in methanol, benzene, and acetone; forms yellow to red solutions. pK_a 4.1. Log *P* (octanol/water), 2.9.
Colour Tests Methanolic potassium hydroxide—red; sulfuric acid—violet.
Thin-layer Chromatography System TD—R_f 0.65; system TE—R_f 0.21; system TF—R_f 0.56; system TAD—R_f 0.70.
Gas Chromatography System GA—RI 2055.
High Performance Liquid Chromatography System HAA—retention time 18.1 min.
Ultraviolet Spectrum Aqueous alkali—278 (A^1_1=1310a), 330 nm (A^1_1=400b).



Infrared Spectrum Principal peaks at wavenumbers 1700, 700, 766, 1219, 1740, 1280 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 222, 165, 76, 223, 166, 105, 104, 90.



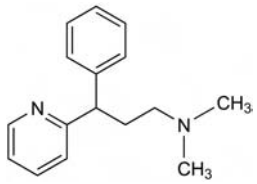
Quantification
Serum **Polarography** Limit of detection, 4 mg/L [Jacobsen, Klevan 1972].
Disposition in the Body Well absorbed after oral administration. The urine may be coloured red-orange due to the excretion of a metabolite.
Toxicity Fatalities have occurred after therapeutic doses.
Half-life Plasma half-life, about 6 h.
Dose Maintenance, 25 to 150 mg daily.

Jacobsen E, Klevan KH (1972). Electroreduction and polarographic determination of 2-phenylindan-1,3-dione in serum. *Anal Chim Acta* 62: 405–413.

Pheniramine

Antihistamine
$C_{16}H_{20}N_2$ = 240.3
CAS—86-21-5

IUPAC Name *N*,*N*-dimethyl-3-phenyl-3-pyridin-2-ylpropan-1-amine
Synonyms *N*,*N*-Dimethyl-γ-phenyl-2-pyridinepropanamine; prophenpyridamine



Chemical Properties A slightly yellow oily liquid. Practically insoluble in water; soluble in ethanol, benzene, chloroform and ether. pK_a 4.2, 9.3 (25°). Log *P* (octanol/water), 3.2.

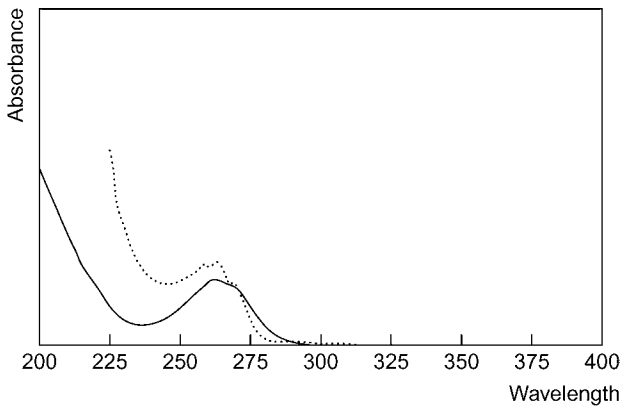
Pheniramine Aminosalicylate

$C_{16}H_{20}N_2,C_7H_7NO_3 = 393.5$
CAS—3269-83-8
Chemical Properties Crystals. Mp 142°, with decomposition. Soluble 1 in 10 of water; freely soluble in ethanol; sparingly soluble in ethyl acetate, ether and acetone.

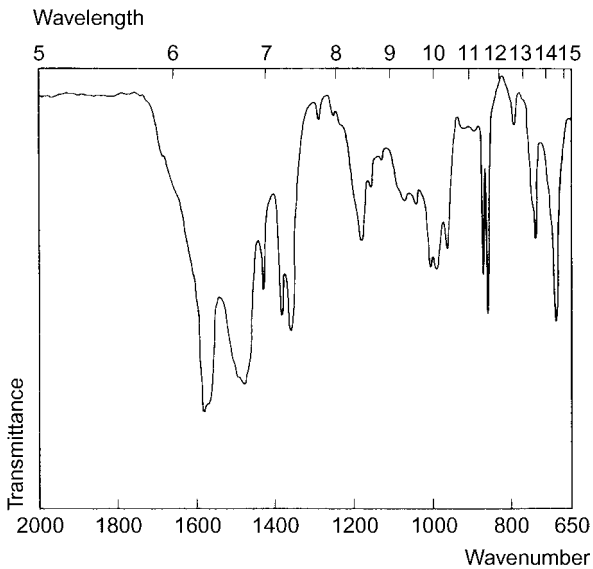
Pheniramine Maleate

$C_{16}H_{20}N_2,C_4H_4O_4 = 356.4$
CAS—132-20-7
Proprietary Names *Avil*; *Daneral*; *Fenamine*; *Inhiston*.
Chemical Properties A white crystalline powder. Mp 107°. Soluble 1 in 0.3 of water, 1 in 2.5 of ethanol and 1 in 1.5 of chloroform; slightly soluble in ether and benzene.

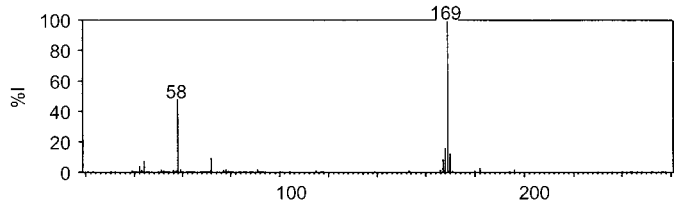
Colour Tests Cyanogen bromide—orange; Liebermann's reagent—red-orange.
Thin-layer Chromatography System TA—R_f 0.45; system TB—R_f 0.35; system TC—R_f 0.13; system TE—R_f 0.46; system TL—R_f 0.03; system TAE—R_f 0.14; system TAF—R_f 0.26 (Dragendorff spray, positive; acidified iodoplatinate solution, positive).
Gas Chromatography System GA—pheniramine RI 1805, M (nor-) RI 2080; system GB—pheniramine RI 1874, M (nor-) RI 1890; system GF—RI 2100.
High Performance Liquid Chromatography System HA—*k* 4.1; system HX—RI 283; system HY—RI 206; system HAX—retention time 9.5 min; system HAY—retention time 4.5 min.
Ultraviolet Spectrum Aqueous acid—261 (A^1_1=305a), 266 nm (A^1_1=310a); aqueous alkali—258, 263 (A^1_1=206a), 268 nm.



Infrared Spectrum Principal peaks at wavenumbers 1584, 690, 860, 870, 990, 1010 cm^{-1} (pheniramine maleate, KBr disk).



Mass Spectrum Principal ions at *m/z* 169, 58, 168, 170, 72, 167, 44, 42 (no peaks above 200).



Quantification
Blood **GC** AFID. Limit of detection, 50 µg/L [Querée *et al.* 1979].
Serum **GC-MS** Pheniramine and loratadine. Limit of detection for pheniramine, 0.5 µg/L [Martens 1995].
Urine **GC** See Blood [Querée *et al.* 1979].
Tissues **GC** See Blood [Querée *et al.* 1979].
Disposition in the Body Absorbed after oral administration. About 17% of a dose is excreted in the urine as unchanged drug in 24 h, increasing to 23% over a period of 6 days; after chronic oral administration about 24% is excreted daily as monodesmethylpheniramine, and 0.5% as didesmethylpheniramine.
Therapeutic Concentration
After a single oral dose of 75 mg to 6 subjects, blood concentrations of 0.01 to 0.19 mg/L (mean, 0.11) were reported at 2 h [Querée *et al.* 1979].
Toxicity The estimated minimum lethal dose is 25 mg/kg.
In a fatality due to pheniramine overdose, the following postmortem tissue concentrations were reported: blood 1.9 mg/L, brain 5.3 µg/g, kidney 4.0 µg/g, liver 6.6 µg/g, urine 149 mg/L; in a second fatality in which methadone, pentobarbital, phenobarbital and alcohol had also been ingested, postmortem blood and liver concentrations of 30 mg/L and 115 µg/g, respectively, were reported [Querée *et al.* 1979]
In a fatality due to the ingestion of 3.75 g of pheniramine, the following postmortem tissue concentrations were reported: blood 10.7 mg/L, bile 109 mg/L, liver 33 µg/g, urine 362 mg/L [Chan, Allender 1983].
Note For a review of the clinical pharmacokinetics of antihistamines, see Paton and Webster [1985].
Dose Up to 90 mg of pheniramine maleate daily.

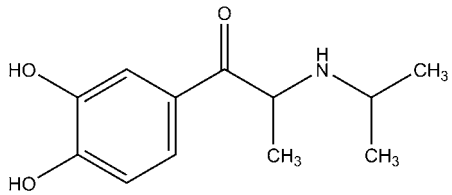
Phenisonone

Bronchodilator
$C_{12}H_{17}NO_3 = 223.3$
IUPAC Name 1-(3,4-Dihydroxyphenyl)-2-(propan-2-ylamino)propan-1-one
Synonym 3,4-Dihydroxy-α-(isopropylamino)propiophenone



Chemical Properties Insoluble in water and organic solvents. Phenisonone is extracted by organic solvents from aqueous alkaline solutions.

Phenisonone Hydrobromide

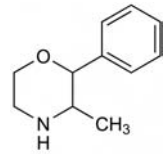
$C_{12}H_{17}NO_3,HBr = 304.2$
Proprietary Name *Dapanone*
Chemical Properties Crystals. Mp 141° to 143°. Soluble 1 in 3.3 of water and 1 in 4 of ethanol; insoluble in ether and chloroform. Aqueous solutions are unstable.

Colour Tests Ammonium molybdate test—(yellow) blue-green (limit of detection, 0.5 µg); ammonium vanadate test—(green) yellow (limit of detection, 1.0 µg); sulfuric acid-formaldehyde test—yellow (limit of detection, 0.5 µg); Vitali's test—yellow/brown/brown (limit of detection, 1.0 µg).
Thin-layer Chromatography System T1—R_f 0.30, streaking (location reagent potassium permanganate spray, positive reaction).
Ultraviolet Spectrum 0.1 N sulfuric acid—233 (E1%, 1 cm 473), 284 (E1%, 1 cm 409) and 313 nm (E1%, 1 cm 350); water—233 (E1%, 1 cm 38.2), 284 nm (E1%, 1 cm 32.5) (hydrobromide).

Phenmetrazine

Anorectic
$C_{11}H_{15}NO = 177.2$
CAS—134-49-6

IUPAC Name 3-Methyl-2-phenylmorpholine



Chemical Properties A liquid. pK_a 8.4 (25°). Log *P* (octanol/water), 1.5.

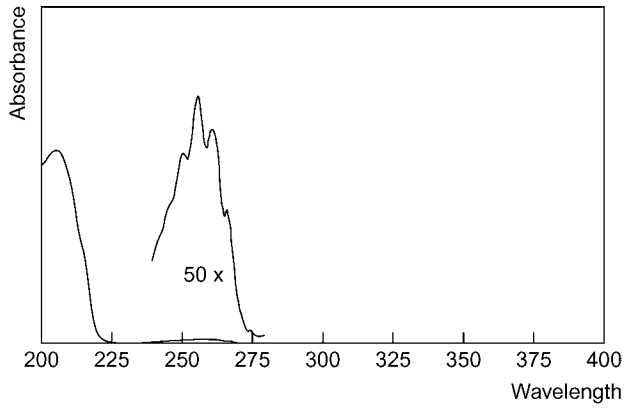
Phenmetrazine Hydrochloride

$C_{11}H_{15}NO,HCl = 213.7$
CAS—1707-14-8
Synonym Oxazimédrine
Proprietary Name *Preludin*
Chemical Properties A white crystalline powder. Mp 182°. Soluble 1 in 0.4 of water, 1 in 2 of ethanol and 1 in 2 of chloroform; sparingly soluble in ether.

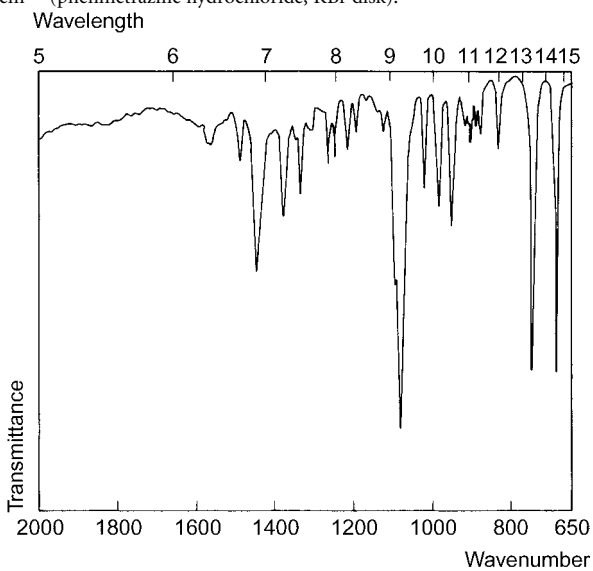
Phenmetrazine Teoclate

$C_{11}H_{15}NO,C_7H_7ClN_4O_2 = 391.9$
CAS—13931-75-4
Synonyms Phenmetrazine 8-chlorotheophyllinate; phenmetrazine theoclate.
Chemical Properties A white powder. Soluble in water and ethanol; slightly soluble in acetone and ether.

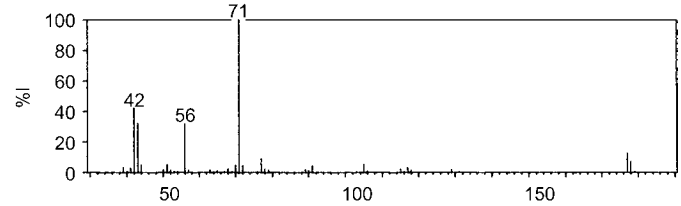
Colour Test Liebermann's reagent—red-orange.
Thin-layer Chromatography System TA—R_f 0.50; system TB—R_f 0.14; system TC—R_f 0.27; system TE—R_f 0.46; system TL—R_f 0.14; system TAE—R_f 0.34; system TAF—R_f 0.45; system TAJ—R_f 0.20; system TAK—R_f 0.08; system TAL—R_f 0.60 (acidified iodoplatinate solution, positive; acidified potassium permanganate solution, positive).
Gas Chromatography System GA—phenmetrazine RI 1432, phenmetrazine-TFA RI 1530, phenmetrazine-TMS RI 1620, phenmetrazine-AC RI 1810, M (OH-) isomer 1 RI 1830, M (OH-) isomer 2 RI 1865, M (OH-methoxy-) RI 1900, M (OH-) isomer 1-AC_2 RI 2150, M (OH-) isomer 2-AC_2 RI 2200, M (OH-methoxy-)-AC_2RI 2320; system GB—phenmetrazine RI 1483; system GC—RI 1873.
High Performance Liquid Chromatography System HA—*k* 1.7; system HX—RI 258; system HY—RI 241.
Ultraviolet Spectrum Aqueous acid—250, 256 (A_1^1= 13.3a), 261, 263, 267 nm.



Infrared Spectrum Principal peaks at wavenumbers 1083, 757, 695, 965, 990, 1030 cm^{-1} (phenmetrazine hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 71, 42, 56, 43, 177, 77, 178, 105.



Quantification
Serum **GC** AFID. Phendimetrazine and phenmetrazine. Limit of detection, 10 µg/L [Long *et al.* 1982].
Urine **GC** NPD. Phenmetrazine, phentermine and amfetamines [Jonsson *et al.* 1996]. See Serum [Long *et al.* 1982].
GC-MS Limit of detection, 0.2–0.5 mg/L [Dasgupta, Mahle 1997; Dasgupta *et al.* 1998]. Limit of quantification, 50 µg/L [Kronstrand *et al.* 1996].
Disposition in the Body Readily absorbed after oral administration. About 70% of a dose is excreted in the urine in 24 h with about 19% as unchanged drug, 19% as the lactam (5-methyl-3-oxo-6-phenylmorpholine), 12% as free 4-hydroxyphenmetrazine, 10% as conjugated 4-hydroxyphenmetrazine and about 5% as the *N*-oxide.
Phenmetrazine is a metabolite of phendimetrazine.
Therapeutic Concentration
After a single oral dose of 75 mg given to 5 subjects, peak plasma concentrations of 0.10–0.24 mg/L (mean 0.16) were attained in about 2 h. Following a single oral dose of 75 mg of a slow-release preparation, average peak plasma concentrations of about 0.07 mg/L were reported at 5 h; concentrations remained almost constant over the period 5–24 h [Quinn *et al.* 1967].
Toxicity Estimated minimum lethal dose for children up to 2 years of age, 200 mg. Large doses and prolonged treatment may lead to severe mental depression and dependence of the amfetamine type.
In a fatality following IV overdosage, the following postmortem distribution was reported: blood 4 mg/L, bile 7 mg/L, liver 5 µg/g, urine 24 mg/L [Norheim 1973].
The following postmortem tissue concentrations were reported in 12 fatalities: blood 0.1–4.9 mg/L (mean, 1.1), bile 0.2–23 mg/L (mean, 5.5), brain 0.1–15 µg/g (mean, 2.9), kidney 0.1–8 µg/g (mean, 1.5), liver 0.1–20 µg/g (mean, 3.1), urine 0.1–90 mg/L (mean, 21) [Gottschalk, Baselt 2000].
Half-life Plasma half-life, ≈8 h.
Dose 25 to 75 mg of phenmetrazine hydrochloride daily.

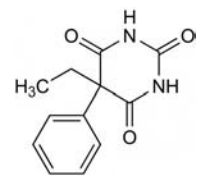
Phenobarbital

Hypnotic, Sedative, Barbiturate
$C_{12}H_{12}N_2O_3 = 232.2$
CAS—50-06-6

IUPAC Name 5-Ethyl-5-phenyl-1,3-diazinane-2,4,6-trione
Synonyms 5-Ethyl-5-phenyl-2,4,6(1*H*,3*H*,5*H*)-pyrimidinetrione; fenobarbital; phenemalum; phenobarbitalum; phenobarbitone; phenylethylbarbituric acid; phenylethylmalonylurea.
Proprietary Names *Aparoxal*; *Comizial*; *Edhanol*; *Fenemal*; *Fenocriz*; *Gardenal (e)*; *Kaneuron*; *Luminal(e)*; *Luminaletas*; *Luminalette*; *Luminaletten*; *Neurobiol*; *Phenaemal*; *Phenaemaletten*; *Solfoton*. It is an ingredient of many proprietary preparations [Sweetman 2002].



Chemical Properties Colourless crystals or a white crystalline powder which may exhibit polymorphism. Mp 174° to 178°. Soluble 1 in 1000 of water, 1 in 8 of ethanol, 1 in 40 of chloroform, 1 in 13 of ether and 1 in about 700 of benzene. pK_a 7.4 (25°). Log *P* (octanol/water), 1.5.

Phenobarbital Sodium

$C_{12}H_{11}N_2NaO_3$ = 254.2
CAS—57-30-7

Synonyms Phenemalnatrium; phenobarbitone sodium; sodium phenylethylbarbiturate; soluble phenobarbitone.

Proprietary Names *Garnenal(e)*; *Luminal(e)*. It is an ingredient of *Garoin*.

Chemical Properties A white hygroscopic powder, granules, or flakes. Mp about 175°. Soluble 1 in about 1 of water and 1 in about 10 of ethanol; practically insoluble in chloroform and ether.

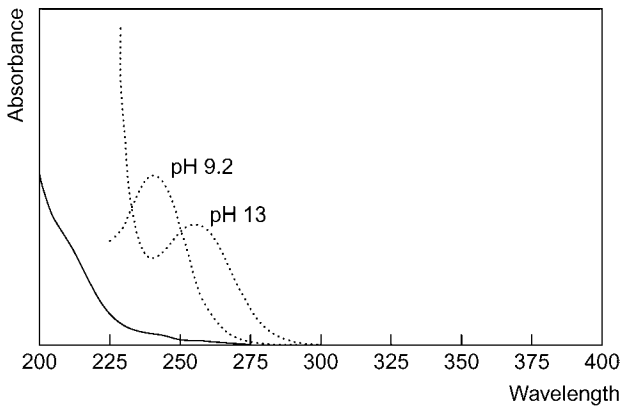
Colour Tests Koppanyi–Zwikker test—violet; Liebermann's reagent—red-orange; mercurous nitrate—black.

Thin-layer Chromatography System TD—R_f 0.47; system TE—R_f 0.28; system TF—R_f 0.65; system TH—R_f 0.38; system TAD—R_f 0.53; system TAE—R_f 0.85 (mercuric chloride–diphenylcarbazone reagent, positive; mercurous nitrate spray, black; Zwikker's reagent, pink).

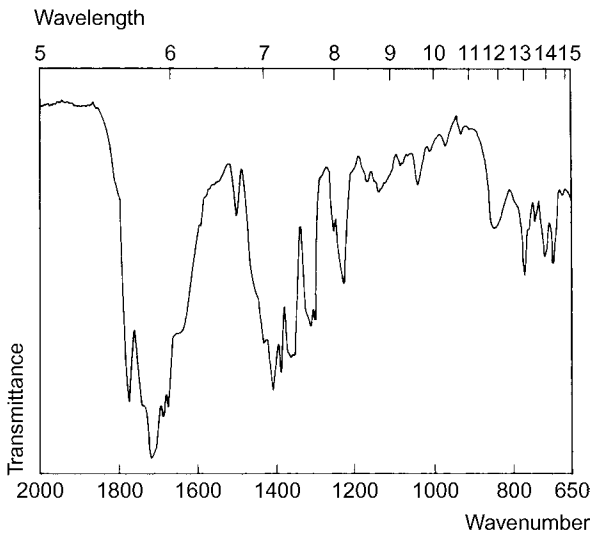
Gas Chromatography System GA—phenobarbital RI 1953, M (4-OH-) RI 2295, phenobarbital-Me_2 RI 1855, M (4-OH-)-Me_3 RI 2200; system GB—phenobarbital RI 2031, M (4-OH-) RI 2378; system GE—RRT 0.74 (relative to phenytoin); system GF—RI 2960; system GAJ—RRT 1.150 (relative to methylphenobarbital).

High Performance Liquid Chromatography System HE—*k* 2.76; system HG—*k* 3.09; system HH—*k* 1.23; system HX—RI 379; system HY—RI 335; system HZ—retention time 3.0 min; system HAA—retention time 14.0 min; system HAK—not detected; system HAM—retention time 2.8 min; system HAX—retention time 5.6 min; system HAY—retention time 4.7 min; system HAZ—phenobarbital *k* 0.39, M (4-OH-) *k* 0.14.

Ultraviolet Spectrum Borax buffer 0.05 mol/L (pH 9.2)—239 nm (A_1^1=452a); 1 mol/L sodium hydroxide (pH 13)—254 nm (A_1^1=342b).



Infrared Spectrum Principal peaks at wavenumbers 1712, 1684, 1670, 1770, 1310, 1300 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 204, 117, 146, 161, 77, 103, 115, 118; 4-hydroxyphenobarbital 219, 248, 148, 220, 120, 218, 133, 64.

Biological Samples **HPLC** Phenobarbital and other barbiturates [Tanaka *et al.* 1997].

Disposition in the Body Readily absorbed after oral administration. The major metabolites are *N*-glucopyranosylphenobarbital and 4-hydroxyphenobarbital, together with its glucuronide conjugate. Other metabolites include two dihydrodiol compounds and hydroxymethylphenylbarbituric acid. During chronic dosing, up to about 25% of a dose is excreted in the urine in 24 h as unchanged drug and up to about 17% as total 4-hydroxyphenobarbital, about half of which is the glucuronide conjugate. Urinary excretion of unchanged drug is increased when the urine is alkaline or when the urinary volume is increased; the excretion of conjugated 4-hydroxyphenobarbital is reduced in patients with liver disease. After a single dose, about 80 to 90% is excreted in the urine in 16 days; the *N*-glucoside accounts for about 30% of a single dose. Phenobarbital crosses the placenta and is found in breast milk.

Phenobarbital is a metabolite of methylphenobarbital and primidone.

Therapeutic Concentration In plasma, usually in the range 2 to 30 mg/L. However, there is considerable intersubject variation and there does not appear to be any correlation between plasma concentration and clinical effect. Concentrations in CSF reach about 50% of those in plasma.

Following a single oral dose of 100 mg to 6 subjects, peak serum concentrations of 2.1 to 3.8 mg/L (mean, 2.9) were attained in 0.5 to 4 h (mean, 1.5) [Wilensky *et al.* 1982].

Following daily oral doses of 100 mg to 10 subjects for 15 days, serum concentrations of 10.6 to 22.1 mg/L (mean, 17) were reported 12 h after a dose [Luoma *et al.* 1982].

Toxicity The estimated minimum lethal dose is 1.5 g although recovery has occurred after ingestion of as much as 16 g. Toxic effects have been associated with blood concentrations of 4 to 17 to 90 mg/L and fatalities with concentrations of 4 to 45 to 120 mg/L. However, a degree of tolerance may develop in chronic dosing.

Blood concentrations ranged from 10 to 300 mg/L (mean 86) in 113 fatalities attributed to phenobarbital overdose [Parker *et al.* 1970].

In 20 fatalities caused by phenobarbital overdose, the following postmortem concentrations were reported: blood 15 to 540 mg/L (mean, 113), brain 0 to 833 µg/g (mean, 135), kidney 17 to 867 µg/g (mean, 152), liver 24 to 1450 µg/g (mean, 236), spleen 0 to 850 µg/g (mean, 137) [Sunshine, Hackett 1957].

Bioavailability Almost 100%.

Half-life Plasma half-life, about 90 to 100 h in adults, prolonged in neonates and reduced to about 65 to 70 h in children; increased in subjects with liver disease.

Volume of Distribution About 0.5 L/kg.

Clearance Plasma clearance, about 0.06 mL/min/kg.

Distribution in Blood Plasma : whole blood ratio, 0.93.

P

Saliva Plasma : saliva ratio, about 3.
Protein Binding About 50%.
Dose 60 to 180 mg daily.

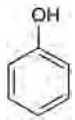
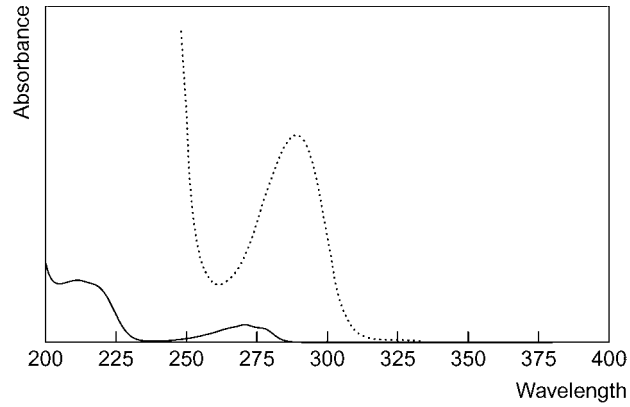
Phenol

Disinfectant, Anaesthetic (Topical)
C_6H_5O = 94.11
CAS—108-95-2

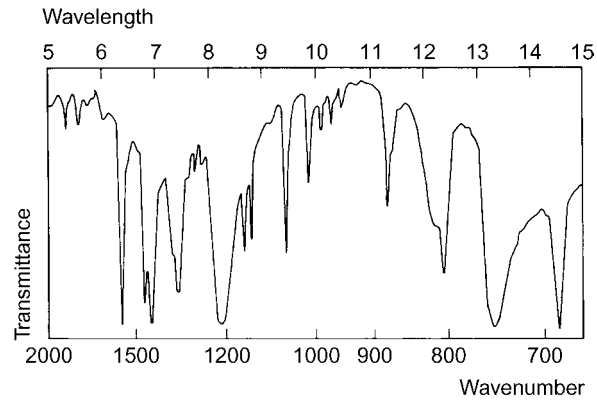
IUPAC Name Phenol
Synonyms Carbolic acid; fenol; hydroxybenzene; oxybenzene; phenyl hydrate; phenylic acid.
Proprietary Names *Chloraseptic*; *Phenaseptic*; *Septosol*.



Chemical Properties Colourless or faintly pink, deliquescent crystals or crystalline masses, becoming pink on storage. Mp 40° to 41°. Commercial products may contain impurities which raise the bp to about 182°. Soluble 1 in about 15 of water, 6 in 1 of ethanol, 2 in 1 of chloroform and 5 in 1 of ether; soluble in glycerol. pK_a 10.0 (25°). Log *P* (octanol/water), 1.5.
Caution Phenol is caustic to the skin.
Colour Tests *p*-Dimethylaminobenzaldehyde—orange/violet; ferric chloride—blue; Folin–Ciocalteu reagent—blue; Liebermann's reagent—green; potassium dichromate (method 1)—yellow→brown (2 min).
Gas Chromatography System GA—RI 981.
High Performance Liquid Chromatography System HAA—retention time 13.4 min.
Ultraviolet Spectrum Aqueous acid—270 nm (A_1^1=172b); aqueous alkali—287 nm (A_1^1=281a).



Infrared Spectrum Principal peaks at wavenumbers 690, 755, 1235, 1595, 1497, 811 cm^{-1} (Nujol mull).



Mass Spectrum Principal ions at *m/z* 94, 66, 39, 65, 40, 55, 38, 95.
Quantification
Plasma **GC-MS** [Harrison *et al.* 1991].
Serum **GC-MS** Limit of detection, 1 mg/L [Hart, Dasgupta 1997].
Urine **GC** Phenol and other phenolic compounds. Limit of detection, 0.1 to 0.2 mg/L [Bieniek 1996]. Limit of detection, 1 mg/L [Ahmed, Hale 1994]. FID [Rick *et al.* 1982]. FID [Baldwin *et al.* 1981].

Phenol and *p*-cresol [Birkett *et al.* 1995]. Fluorescence detection. Limit of detection, 10 ppb [Jen, Tsai 1994]. Fluorimetric detection. Phenol, hydroquinone, and catechol [Lee 1993]. UV detection. Limit of detection, <500 µg/L [Eadsforth, Coveney 1984].
Faeces **HPLC** See Urine [Birkett *et al.* 1995].
Disposition in the Body Rapidly absorbed from the gastrointestinal tract and readily penetrates the skin. It is metabolised by conjugation to yield phenyl glucuronide and phenyl sulfate; small amounts are oxidised to catechol and quinol which are also conjugated. Oxidation of these metabolites to quinones may tint the urine green. Acid-labile phenol conjugates are present endogenously in serum at concentrations of about 0.1 mg/L. Phenol is a metabolite of benzene. Endogenous phenol concentrations in urine average about 5 to 10 mg/L.
Toxicity Phenol denatures and precipitates cellular proteins and thus may cause rapid poisoning. The minimum lethal dose by mouth is about 1 g. Severe and even fatal poisoning may also arise from absorption of phenol from open wounds or through the intact skin. The maximum permissible atmospheric concentration is 5 ppm.

In a fatality due to the deliberate ingestion of a mixture containing phenol, the following postmortem tissue concentrations were reported: blood, phenol 56 mg/L, alcohol 300 mg/L; liver, phenol 74 µg/g. In a second fatality due to accidental percutaneous absorption, postmortem blood concentrations of 27 mg/L of phenol and 300 mg/L of alcohol were reported [Soares, Tift 1982].

In a fatality resulting from the ingestion of phenol, the following postmortem concentrations were reported: blood 130 mg/L, urine 47 mg/L, bile 187 mg/L, brain 486 µg/g, kidney 331 µg/g, muscle 204 µg/g, liver 228 µg/g, stomach content 668 mg [Lo Dico *et al.* 1989].

In a fatality due to accidental dermal exposure to phenol, the following postmortem concentrations were reported: blood 4.7 mg/L, unhydrolysed liver 3.3 µg/g, hydrolysed liver 7.1 µg/g [Lewin, Cleary 1982].

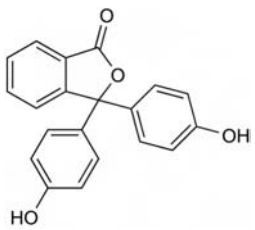
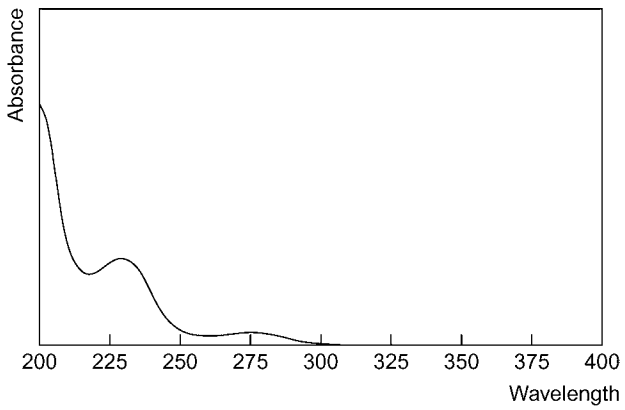
Phenolphthalein

Purgative
$C_{20}H_{14}O_4 = 318.3$
CAS—77-09-8

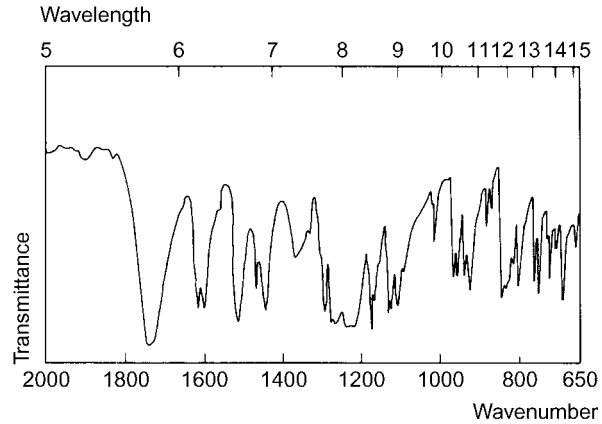
IUPAC Name 3,3-Bis(4-hydroxyphenyl)-2-benzofuran-1-one
Synonyms 3,3-Bis(4-hydroxyphenyl)-1-(3*H*)-isobenzofuranone; dihydroxyphthalophenone; fenolftaleina.
Proprietary Names *Alophen Pills*; *Bonomint*; *Brooklax*; *Easylax*; *Euchessina*; *Laxen Busto*; *Laxettes*; *Laxicaps P*; *Nylax*; *Purmolax*; *Regulim*; *Sure Lax*. It is an ingredient of *Agarol* and *Alophen*. For a list of other preparations which contain phenolphthalein, see Sweetman [2002].



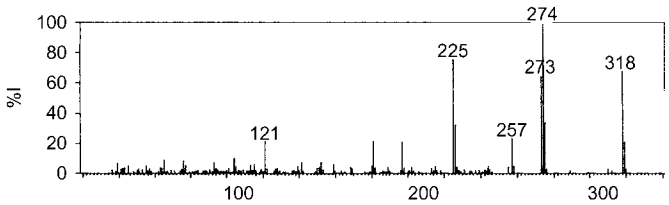
Chemical Properties A white or yellowish-white crystalline or amorphous powder. Mp 258° to 262°. Practically insoluble in water; soluble 1 in 12 of ethanol and 1 in about 100 of ether; soluble in dilute solutions of alkali hydroxides. pK_a 9.7 (25°). Log *P* (octanol/water), 2.4. Extraction yield (chlorobutane), 0.7 [Demme *et al.* 2005].
Colour Test Folin–Ciocalteu reagent—blue.
Thin-layer Chromatography System TD—R_f 0.38; system TE—R_f 0.53; system TF—R_f 0.59; system TAD—R_f 0.39; system TAE—R_f 0.86 (acidified potassium permanganate solution, positive).
High Performance Liquid Chromatography System HX—RI 436; system HZ—retention time 4.2 min.
Ultraviolet Spectrum Methanol—277 nm (A^1_1=150a).



Infrared Spectrum Principal peaks at wavenumbers 1740, 1178, 1230, 1265, 1278, 1510 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 274, 225, 318, 273, 275, 226, 257, 121.



Quantification
Serum **Colorimetry** [Morris, Powell 1979].
Urine **Colorimetry** See Serum [Morris, Powell 1979].
Disposition in the Body Poorly absorbed after oral administration (up to about 15%), and partly excreted in the bile as the active glucuronide, and in the urine; if the urine is alkaline the excreted compound will impart a red colour. The greater part of the ingested material is eliminated in the faeces in both free and conjugated forms.
Toxicity Phenolphthalein is usually non-toxic even in relatively large doses, although fatalities have occurred in young children after ingestion of 0.6 to 1.8 g.

> A 32-year-old woman (suspected of being a chronic abuser of laxatives) eventually died due to massive liver necrosis after ingesting an unknown quantity of Nylax tablets containing phenolphthalein. The serum-phenolphthalein concentration on the day after hospital admission was 0.4 µg/L [Sidhu *et al.* 1989].

Dose 50 to 300 mg.

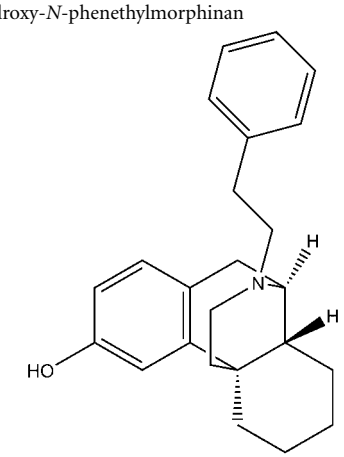
Phenomorphan

Narcotic
$C_{24}H_{29}NO = 347.5$
CAS—468-07-5

Synonym 3-Hydroxy-*N*-phenethylmorphinan



Chemical Properties Phenomorphan is extracted by organic solvents from aqueous ammoniacal solutions; hydrolysis of biological material is required to improve yield.

Phenomorphan Hydrobromide

$C_{24}H_{29}NO,HBr = 428.4$

Chemical Properties Mp 289° to 292°.

Colour Test Ammonium molybdate test—blue (limit of detection, 0.25 µg); Vitali's test—yellow/yellow/orange (limit of detection, 0.25 µg).

Thin-layer Chromatography System T1—R_f 0.72 (location reagent acidified iodoplatinate spray, positive reaction).

Ultraviolet Spectrum Ethanol—280 nm and inflexions at about 230 and 288 nm; 0.1 N sodium hydroxide—242, 300 nm; 0.1 N sulphuric acid—279 nm (E1%, 1 cm 43.7) and an inflexion at about 284 nm (E1%, 1 cm 41).

Phenoperidine

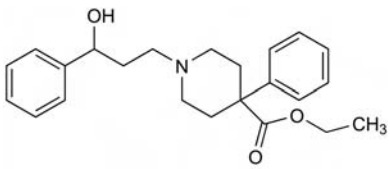
Narcotic Analgesic

$C_{23}H_{29}NO_3 = 367.5$

CAS—562-26-5

IUPAC Name Ethyl 1-(3-hydroxy-3-phenylpropyl)-4-phenylpiperidine-4-carboxylate

Synonym 1-(3-Hydroxy-3-phenylpropyl)-4-phenyl-4-piperidinecarboxylic acid ethyl ester



Chemical Properties Log *P* (octanol/water), 4.0. Plasma samples were stable for 7 days at –20° [Chan *et al.* 1981].

Phenoperidine Hydrochloride

$C_{23}H_{29}NO_3,HCl = 403.9$

CAS—3627-49-4

IUPAC Name Ethyl 1-(3-hydroxy-3-phenylpropyl)-4-phenylpiperidine-4-carboxylate hydrochloride

Proprietary Names *Lealgin*; *operidine*; *R 1406*.

Note Operidine has been used as a synonym for pethidine hydrochloride in Japan Pharmacopeia.

Chemical Properties A white crystalline powder. Mp 200° to 202°. Soluble 1 in 50 of water, 1 in 10 of ethanol (90%) and 1 in 3 of chloroform; practically insoluble in ether.

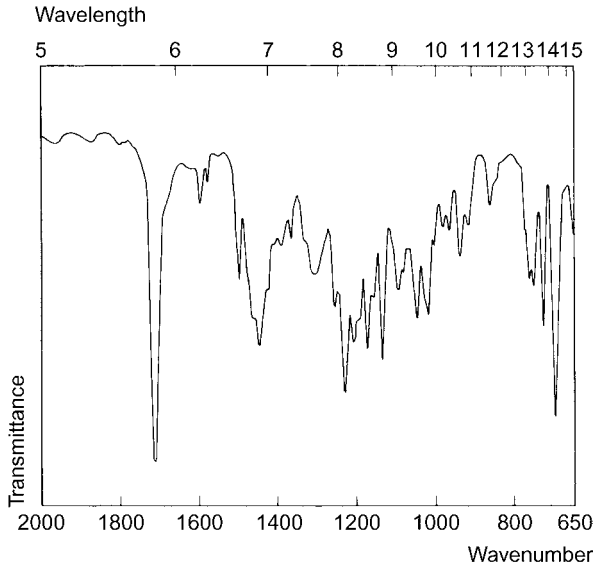
Colour Test Marquis test—red.

Thin-layer Chromatography System TA—R_f 0.71; system TB—R_f 0.26; system TC—R_f 0.64; system TE—R_f 0.76; system TAE—R_f 0.70; system TAF—R_f 0.82; system TAG—R_f 0.58 (acidified iodoplatinate solution—positive; Dragendorff spray—positive; Marquis test—faint red). See also Pethidine monograph.

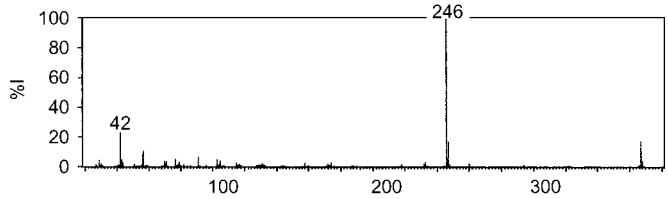
Gas Chromatography System GA—phenoperidine RI 2872, norpethidine RI 1885, pethidine RI 1754; system GB—phenoperidine RI 2983, norpethidine RI 1842, pethidine RI 1809.

High Performance Liquid Chromatography System HA—phenoperidine *k* 0.8, norpethidine *k* 1.7 (tailing peak), pethidine *k* 2.8 (tailing peak); system HC—phenoperidine *k* 0.10, norpethidine *k* 2.04, pethidine *k* 0.55; system HX—RI 434. See also Pethidine monograph.

Infrared Spectrum Principal peaks at wavenumbers 1710, 698, 1230, 1136, 1175, 1205 cm^{-1} (phenoperidine hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 246, 42, 367, 247, 57, 56, 91, 77 (phenoperidine); 57, 233, 42, 56, 158, 43, 160, 103 (norpethidine); 71, 70, 44, 57, 42, 247, 43, 246 (pethidine).



Quantification

***Plasma* GC** Column: SGE BP 10 (25 m × 0.22 mm i.d.). Carrier gas: N_2, 6.2 mL/min. Temperature programme: 200° to 270° at 10°/min for 23 min. NSD. Limit of detection, 0.9 µg/L [Kintz *et al.* 1990]. Column: Alltech 3% OV-17 Gas Chrom Q 100/120 mesh (1.8 m × 2 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature programme: 210° for 2 min to 270° at 15°/min for 10 min. NSD. Retention time: 14.35 min. Limit of detection, 1.2 µg/L [Kintz *et al.* 1989]. Column: 3% OV-1 or 10% SP-2100 on Supelcoport 80/100 mesh (1 m × 4 mm o.d.). Carrier gas: N_2, 30 mL/min. Temperature: 350°. NPD. Retention time: 3 or 6 min, respectively, for the two columns. Limit of detection, 2 µg/L [Chan *et al.* 1981].

Disposition in the Body Phenoperidine is absorbed from the gastrointestinal tract but there is extensive first-pass metabolism; bioavailability is ~30%. It is metabolised to pethidine and norpethidine. Up to ~5% of a dose is excreted unchanged in the urine, with ~18% as norpethidine and 2% as pethidine, in 2–3 days. The urinary excretion of unchanged phenoperidine is increased to ~7% when the urine is acidified.

Therapeutic Concentration

After a single IV dose of 2 mg administered to five patients during general anaesthesia, a mean plasma concentration of 0.02 mg/L was reported at 2 min [Milne *et al.* 1980].

Half-life Plasma half-life, ~1 h.

Volume of Distribution ~2 L/kg.

Clearance Plasma clearance, ~20 mL/min/kg.

Protein Binding ~80%.

Dose Phenoperidine hydrochloride 0.5 to 1 mg IV; with assisted ventilation, an initial IV dose of 2 to 5 mg may be given.

Phenothiazine

Anthelmintic (Veterinary)

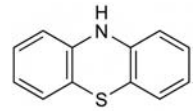
$C_{12}H_9NS = 199.3$

CAS—92-84-2

IUPAC Name 10H-Phenothiazine

Synonyms Bibenzothiazine; thiodiphenylamine.

Proprietary Names *AFI-Tiazin*; *Antiverm*; *Fentiazin*; *Helmetina*; *Lethelmin*; *Nemazine*; *Orimon*; *Phenegic*; *Phenoverm*; *Phenovis*; *Phenoxur*; *Reconox*; *Souframine*; *Vermitin*.



Chemical Properties A yellow crystalline powder. Slowly oxidised in air and darkens on exposure to light acquiring a greenish-brown tint. Mp about 185°. Practically insoluble in water and chloroform; freely soluble in benzene; soluble 1 in 60 of ethanol and 1 in 5 of acetone. pK_a 2.5. Log *P* (octanol/water), 4.2.

Colour Tests Ferric chloride—green; formaldehyde-sulfuric acid—red-violet; Forrest reagent—orange; FPN reagent—orange; Liebermann's reagent—green; sulfuric acid—green.

Thin-layer Chromatography System TA—R_f 0.79; system TB—R_f 0.11; system TC—R_f 0.79; system TE—R_f 0.82; system TL—R_f 0.71; system TAE—R_f 0.82; system TAF—Tf 89; system TAJ—R_f 0.90; system TAK—R_f 0.77; system TAL—R_f 0.96.

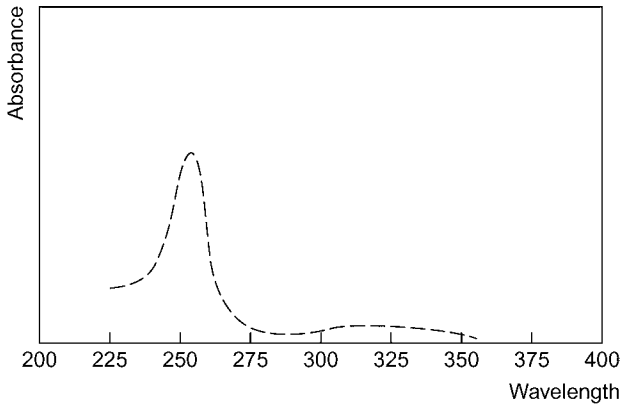
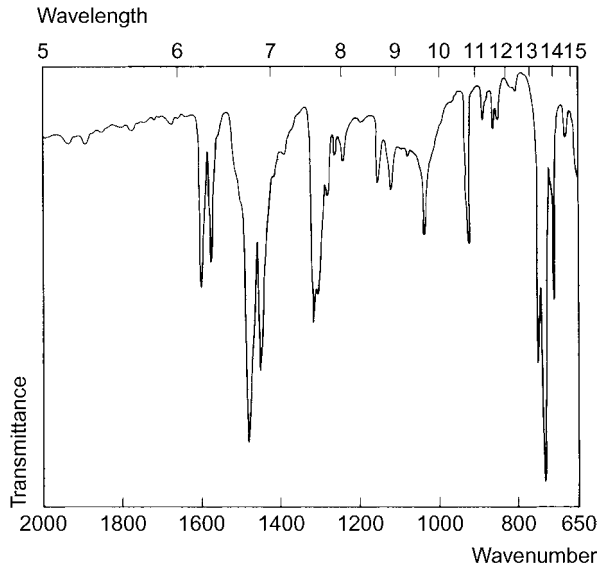
High Performance Liquid Chromatography System HA—*k* 0.1; system HX—RI 665; system HY—RI 637; system HAA—retention time 14.1 min (phenothiazine ring), retention time 14.3 min (phenothiazine ring).

Ultraviolet Spectrum Ethanol—254 (A^{1}_{1}=2160b), 317 nm (A^{1}_{1}=266b).



Infrared Spectrum Principal peaks at wavenumbers 735, 750, 1310, 710, 1300, 1590 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 199, 167, 198, 166, 99, 154, 69, 77.

Phenoxybenzamine

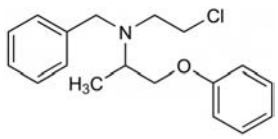
Antihypertensive

$C_{18}H_{22}ClNO$ = 303.8

CAS—59-96-1

IUPAC Name *N*-Benzyl-*N*-(2-chloroethyl)-1-phenoxypropan-2-amine

Synonyms 688-A; bensylyt; *N*-(2-chloroethyl)-*N*-(1-methyl-2-phenoxyethyl) benzenemethanamine.



Chemical Properties Crystals. Mp 38° to 40°. Soluble in benzene. Log *P* (octanol/water), 4.6.

Phenoxybenzamine Hydrochloride

$C_{18}H_{22}ClNO,HCl$ = 340.3

CAS—63-92-3

Proprietary Names *Dibenyline*; *Dibenzyline*; *Dibenzyran*.

Chemical Properties A white crystalline powder. Mp 137° to 141°. Soluble 1 in 25 of water, 1 in 9 of ethanol and 1 in 9 of chloroform; practically insoluble in ether. Neutral and alkaline solutions are unstable.

Caution Phenoxybenzamine hydrochloride in powder form should not be allowed to come into contact with eyes or skin, as it may cause irritation.

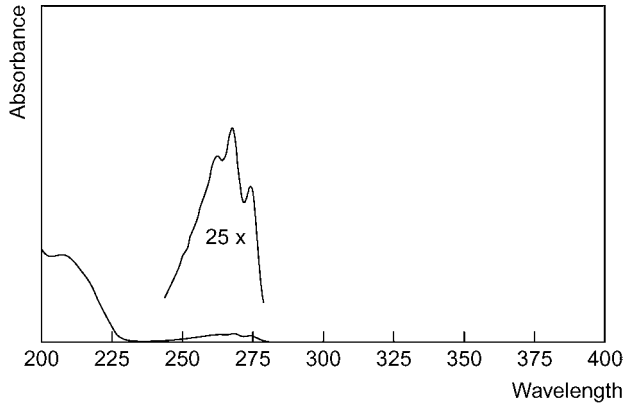
Colour Tests Mandelin's test—green→violet; Marquis test—violet.

Thin-layer Chromatography System TA—R_f 0.73; system TB—R_f 0.63; system TC—R_f 0.76; system TE—R_f 0.87; system TL—R_f 0.68; system TAE—R_f 0.84; system TAF—R_f 0.97; system TAJ—R_f 0.65; system TAK—R_f 0.04; system TAL—R_f 0.51 (acidified iodoplatinate solution, positive).

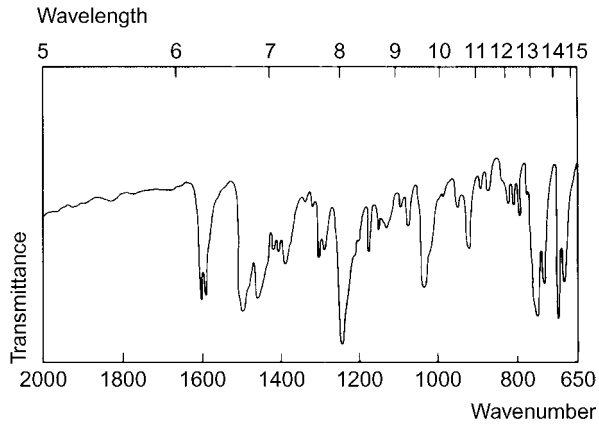
Gas Chromatography System GA—RI 2235; system GB—RI 2332; system GF—RI 2600.

High Performance Liquid Chromatography System HA—*k* 0.1; system HX—RI 396.

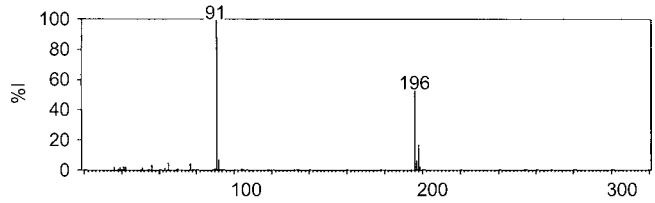
Ultraviolet Spectrum Aqueous acid—262, 268 (A_1^1=48a), 274 nm.



Infrared Spectrum Principal peaks at wavenumbers 1240, 750, 698, 1494, 1598, 1586 cm^{-1} (phenoxybenzamine hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 91, 196, 198, 92, 197, 65, 77, 56.



Dose 10 to 60 mg of phenoxybenzamine hydrochloride daily; up to 200 mg daily has been given.

Phenoxymethylpenicillin

Antibiotic

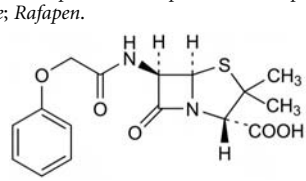
$C_{16}H_{18}N_2O_5S$ = 350.4

CAS—87-08-1

IUPAC Name (2*S*,5*R*,6*R*)-3,3-Dimethyl-7-oxo-6-[(2-phenoxyacetyl)amino]-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid

Synonyms Fenoximetilpenicilina; penicillin V; phenomycilline.

Proprietary Names *Acipen V*; *Compocillin*; *Fenospen*; *Kopen*; *Meracilina*; *Ospen*; *Pen-V*; *Pen-Vee*; *Rafapen*.



Chemical Properties An antimicrobial acid produced by the growth of certain strains of *Penicillium notatum* or related organisms. A white crystalline powder. Mp

P

120° to 128°, with decomposition. Soluble 1 in 1700 of water, 1 in 7 of ethanol and 1 in 6 of acetone; soluble in chloroform. pK_a 2.7 (25°). Log *P* (octanol/water), 2.1.

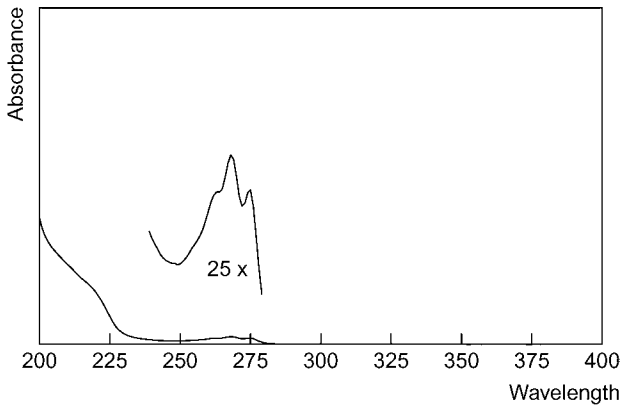
Phenoxymethylpenicillin Calcium

$(C_{16}H_{17}N_2O_5S)_2Ca,2H_2O = 774.9$
CAS—147-48-8 (anhydrous); 73368-74-8 (dihydrate)
Synonym Penicillin V calcium
Proprietary Names *Calcipen*; *Calvepen*; *Milcopen*.
Chemical Properties A white, finely crystalline powder. Slowly soluble 1 in 20 of water.

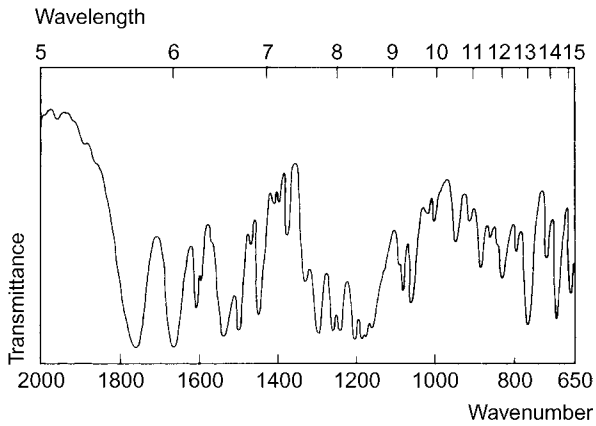
Phenoxymethylpenicillin Potassium

$C_{16}H_{17}KN_2O_5S = 388.5$
CAS—132-98-9
Synonyms Fenoximetilcilina potassica; penicillin V potassium.
Proprietary Names *Acipen*; *Apocillin*; *Apo-Pen-VK*; *Apsin VK*; *Arcasin*; *Beepen-VK*; *Betapen-VK*; *Brunocillin*; *Calciopen*; *Cilicaine VK*; *Cliacil*; *Colipen VK*; *Copen*; *Darocillin*; *Deltacillin*; *Distaquaine V-K*; *Fenoxicillin*; *InfectoCillin*; *Isocillin*; *Ledercillin VK*; *Len V.K*; *LPV*; *Mack Pen*; *Megacillin(e)*; *Milcopen*; *Nadopen-V*; *NovoPen-VK*; *Oracilin*; *Oracilline*; *Ospen*; *Pen*; *Penbene*; *Penhexal VK*; *Peni-Oral*; *Penstad*; *Pen-V*; *Pen-Vee-K*; *Pen-Ve-Oral*; *Pen-Vi-K*; *PVFK*; *PVK*; *Robicillin VK*; *Rocilin*; *Tikacillin*; *V-Cil-K*; *V-Cillin K*; *Veekay*; *Veetids*; *Vepenicillin*.
Note *Megacillin* is also used as a proprietary name for benzylpenicillin potassium or benzathine benzylpenicillin and *Megacilline* for clemizole penicillin. *Oracilline*, *Pen-V* and *Pen-Vee* are also used as proprietary names for benzathine phenoxymethylpenicillin and *Arcasin* is used for cisapride.
Chemical Properties A white crystalline powder. Soluble 1 in 1.5 of water and 1 in 150 of ethanol; practically insoluble in ether; insoluble in acetone.

Ultraviolet Spectrum Phenoxymethylpenicillin potassium : water—268 (A^1_1 = 31b), 275 nm (A^1_1 = 25b).



Infrared Spectrum Principal peaks at wavenumbers 1754, 1660, 1181, 1202, 1174, 1532 cm^{-1} (KBr disk).



Quantification

Plasma **HPLC** UV detection. Limit of detection, 0.1 mg/L [Krauwinkel, Volkers-Kamermans 1996].
Serum **HPLC** UV detection. Phenoxymethylpenicillin and other penicillins. Limit of detection, <0.5 mg/L [Mendez-Alvarez *et al.* 1991]. Limit of detection, 30 µg/L [Lindberg *et al.* 1984].
Disposition in the Body Rapidly but incompletely absorbed after oral administration; peak plasma concentrations are attained ≈2 h after a dose. About 20–35% of an oral dose is excreted in the urine unchanged in 24 h and ≈34% is excreted as penicilloic acid in the same period.
Half-life Plasma half-life, ≈0.5 h.
Protein Binding About 80%.
Dose 0.5 to 3 g daily.

Krauwinkel WJ, Volkers-Kamermans NJ (1996). Determination of penicillin-V in human plasma by high-performance liquid chromatography and solid-phase extraction. *J Chromatogr B Biomed Appl* 679: 129–135.

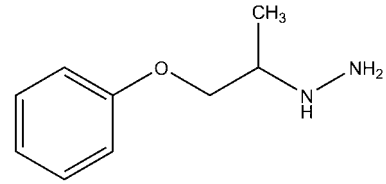
Phenoxypropazine

Monoamine Oxidase Inhibitor, Antidepressant
$C_9H_{14}N_2O = 166.2$
CAS—3818-37-9
IUPAC Name 1-(Phenoxy)propan-2-ylhydrazine
Synonyms Fenoxipropazinum; 1-methyl-2-phenoxyethyl)hydrazine.



Chemical Properties Log *P* (octanol/water) 1.4 [National Institutes of Health 2008]. Phenoxypropazine is extracted by organic solvents from aqueous alkaline solutions.

Phenoxypropazine Maleate

$C_9H_{14}N_2O,C_4H_4O_4 = 282.3$
CAS—3818-37-9
Synonyms HP 1275; phenoxypropazine hydrogen maleate.
Proprietary Name *Drazine*
Chemical Properties Prismatic needles from isopropanol. A white crystalline powder. Mp 107° to 110°. Very soluble in water; soluble in ethanol or isopropanol.
Colour Tests Ammonium molybdate test—(grey) blue (limit of detection, 0.5 µg); ammonium vandate test—(brown) brown (limit of detection, 0.5 µg); sulfuric acid-formaldehyde test—pale red (limit of detection, 0.5 µg); Vitali's test—brown→yellow/yellow/yellow (limit of detection, 1.0 µg).
Thin-layer Chromatography System T1—R_f 0.52 (location reagent acidified iodoplatinate spray, white).
Gas Chromatography System G2/120—retention time 1.5 (relative to ephedrine).
Ultraviolet Spectrum Aqueous acid (0.1 N sulfuric acid)—263, 268, 319 nm.
Infrared Spectrum Maleate: Principal peaks at wavenumbers 1465, 1500, 1582, 760, and 1353 cm^{-1} (KBr disk).
Disposition in the Body Phenoxypropazine is structurally similar to amphetamine [Davis, Horlington 1964].
Therapeutic Concentration The efficacy of phenoxypropazine has been demonstrated in the treatment of depression that is sufficiently severe to warrant hospitalisation [Leahy *et al.* 1963], an effect that was comparable with amitryptiline [Rose *et al.* 1963] and improved by the concomitant administration of chlordiazepoxide [Rose 1964]. It has also been shown to be effective against milder forms of depression [Imlah 1963].
Toxicity See under phenelzine. LD_{50} (oral) in mice: 460 mg/kg.
Dose Up to 20 mg daily.

Davis RA, Horlington M (1964). Effects of reserpine pretreatment on the protective action of amphetamine and phenoxypropazine in the phenylbenzoquinone-induced writhing syndrome in mice. *Nature* 201: 306–307.

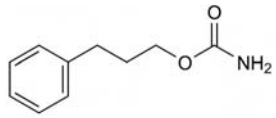
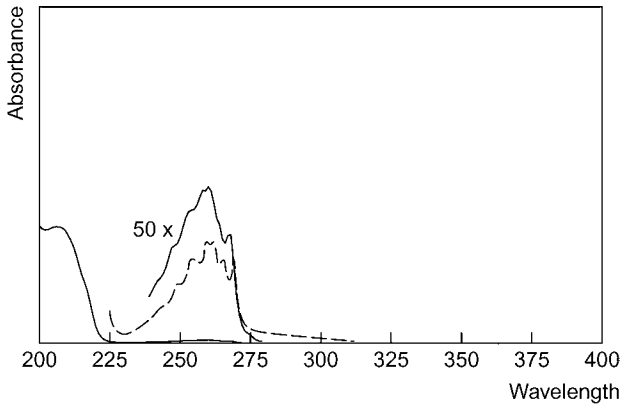
Phenprobamate

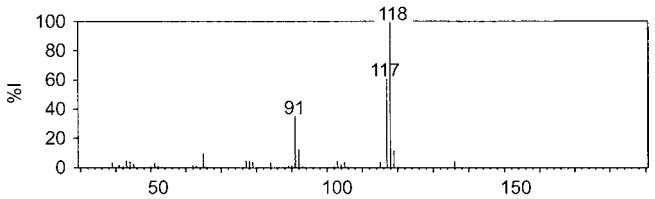
Skeletal Muscle Relaxant, Tranquilliser
$C_{10}H_{13}NO_2 = 179.2$
CAS—673-31-4
IUPAC Name 3-Phenylpropyl carbamate
Synonyms Benzenepropanol carbamate; MH-532; proformiphen.
Proprietary Names *Extacol*; *Gamaquil*; *Spantol*.



Chemical Properties A fine, white, crystalline powder. Mp 101° to 104°. Practically insoluble in water; soluble in ethanol and chloroform; slightly soluble in ether. Log *P* (octanol/water), 2.0.
Colour Test Marquis test—red-brown.
Thin-layer Chromatography System TA—R_f 0.75; system TD—R_f 0.47; system TE—R_f 0.73; system TF—R_f 0.55; system TAD—R_f 0.60; system TAE—R_f 0.82 (furfuraldehyde reagent, positive).
Gas Chromatography System GA—RI 1520.
Ultraviolet Spectrum Ethanol—254, 259 (A_1^1= 11.6b), 261 (A_1^1= 11.6b), 265 nm, 269 nm.



Infrared Spectrum Principal peaks at wavenumbers 1690, 1088, 1064, 700, 1605, 1623 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 118, 117, 91, 92, 119, 65, 77, 103.



Quantification
Blood **TLC** Phenprobamate and metabolites [Schatz, Jahn 1966].
Plasma **HPLC** UV detection [Sun *et al.* 1987].
Urine **TLC** See Blood [Schatz, Jahn 1966].
Disposition in the Body Rapidly absorbed after oral administration and metabolised by oxidative degradation of the side chain and *p*-hydroxylation of the phenyl ring. About 7% of a dose is excreted unchanged in the urine in 48 h and ≈76% as metabolites, mostly as hippuric acid and free and conjugated 3-hydroxyphenprobamate. The 3-hydroxy metabolite, which is active, is present in blood at concentrations greater than those of unchanged drug.
Half-life Plasma half-life, 5–8 h.
Dose 1.2 to 2.4 g daily.

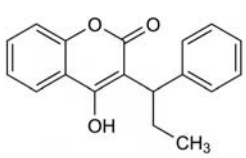
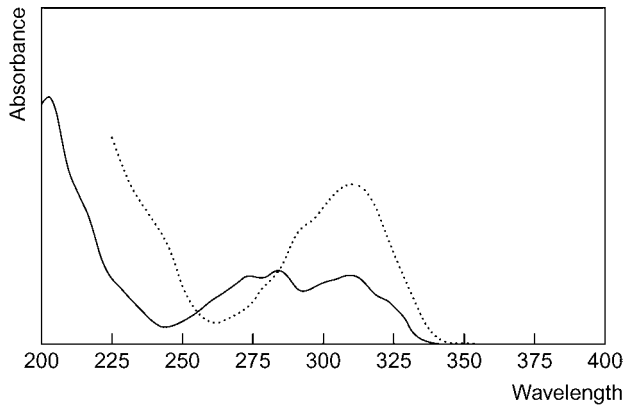
Phenprocoumon

Anticoagulant
$C_{18}H_{16}O_3$ = 280.3
CAS—435-97-2

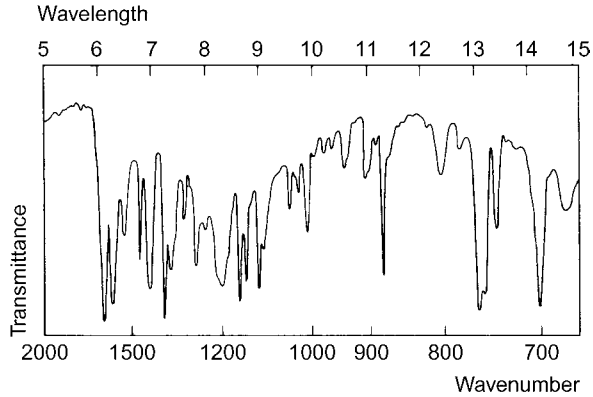
IUPAC Name 2-Hydroxy-3-(1-phenylpropyl)chromen-4-one
Synonym 4-Hydroxy-3-(1-phenylpropyl)-2*H*-1-benzopyran-2-one; phenylpropylhydroxycoumarin
Proprietary Names *Falithrom*; *Liquamar*; *Marcoumar*; *Marcumar*; *Marcuphen*; *Phenpro*.



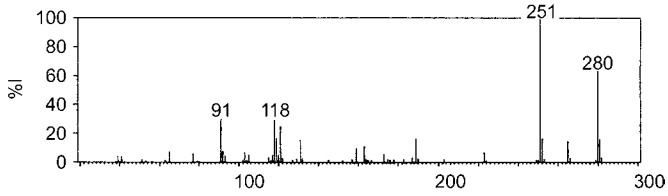
Chemical Properties A fine white crystalline powder. Mp 179° to 180°. Practically insoluble in water; soluble in chloroform, methanol and solutions of alkali hydroxides. Log *P* (octanol/water), 3.6. Extraction yield (chlorobutane), 0.2 [Demme *et al.* 2005].
Thin-layer Chromatography System TD—R_f 0.62; system TE—R_f 0.19; system TF—R_f 0.58; system TAD—R_f 0.61; system TAE—R_f 0.93.
Gas Chromatography System GA—phenprocoumon isomer 1-Me RI 2375, isomer 2-Me RI 2395; M (OH-)isomer-1 Me_2 RI 2655; isomer-2 Me_2 RI 2675, isomer 3 Me_2 RI 2705; M (OH-methoxy)Me_2 RI 2770.
High Performance Liquid Chromatography System HX—RI 616; system HZ—retention time 12.6 min.
Ultraviolet Spectrum Aqueous alkali—310 nm (A_1^1= 540b); methanol—285 (A_1^1= 394a), 310 nm (A_1^1= 440a).



Infrared Spectrum Principal peaks at wavenumbers 1656, 759, 696, 1613, 1163, 1113 cm^{-1} (Nujol mull).



Mass Spectrum Principal ions at *m/z* 251, 280, 118, 91, 121, 119, 252, 189.



Quantification
Plasma **TLC–fluorescence densitometry** Limit of detection, 5 µg/L [Haefelfinger 1979].
GC FID. Limit of detection, 125 µg/L [Midha *et al.* 1976].

LC-MS Phenprocoumon, warfarin, and acenocoumarol. Limit of detection, 1 µg/L (phenprocoumon and warfarin) and 10 µg/L (acenocoumarol) [Kollroser, Schober 2002].
Serum **HPLC** [Petersen *et al.* 1993].
Urine **HPLC** See Plasma [de Vries, Schmitz-Kummer 1994]. Phenprocoumon and its metabolites [Edelbroek *et al.* 1990]. See Plasma [De Vries *et al.* 1982].
Breast Milk **HPLC** See Plasma [de Vries, Schmitz-Kummer 1994].
Disposition in the Body Well absorbed after oral administration. The *S*-enantiomer is stated to be considerably more potent as an anticoagulant than the *R*-form but there appears to be little difference in pharmacokinetic properties. Phenprocoumon is thought to be excreted almost entirely as a glucuronide conjugate with <10% of the dose as unchanged drug.

Therapeutic Concentration

Following an IV injection of 3 mg to 1 subject, a plasma concentration of 0.8 mg/L was reported at 5 min; in a subject receiving daily doses of 1.6 mg, a steady-state plasma concentration of 1.8 mg/L was reported [Haefelfinger 1979].

Half-life Plasma half-life, 3–9 days (mean, 5).

Volume of Distribution 0.1–0.2 L/kg.

Clearance Plasma clearance, ≈0.01 mL/min/kg.

Protein Binding >99%.

Note For a review of the clinical pharmacokinetics of oral anticoagulants, see Kelly and O'Malley [1979].

Dose Maintenance, 0.75 to 4.5 mg daily.

Phensuximide

Anticonvulsant

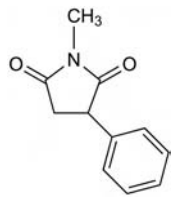
$C_{11}H_{11}NO_2$ = 189.2

CAS—86-34-0

IUPAC Name 1-Methyl-3-phenylpyrrolidine-2,5-dione

Synonym Fensuximid

Proprietary Names *Lifene*; *Milontin*; *Mirontin*; *Succitimal*.



Chemical Properties A white crystalline powder. Mp 71° to 73°. Soluble 1 in 250 of water, 1 in 20 of ethanol, 1 in 1.5 of chloroform and 1 in 35 of ether; readily soluble in methanol. Log *P* (octanol/water), 1.0.

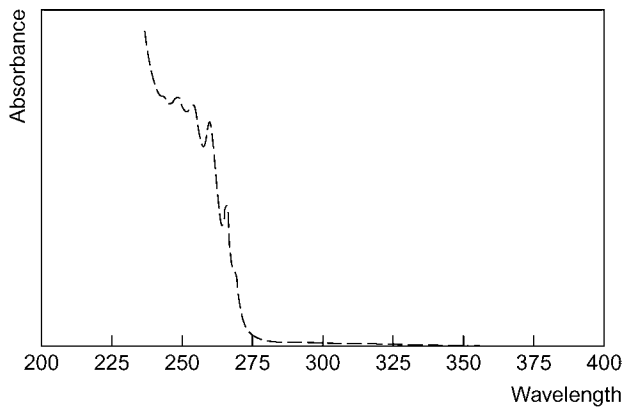
Colour Test Liebermann's reagent—red-orange.

Thin-layer Chromatography System TA—R_f 0.75; system TD—R_f 0.71; system TE—R_f 0.77; system TF—R_f 0.59; system TAD—R_f 0.72; system TAJ—R_f 0.81; system TAK—R_f 0.71; system TAL—R_f 0.96 (acidified potassium permanganate solution, positive).

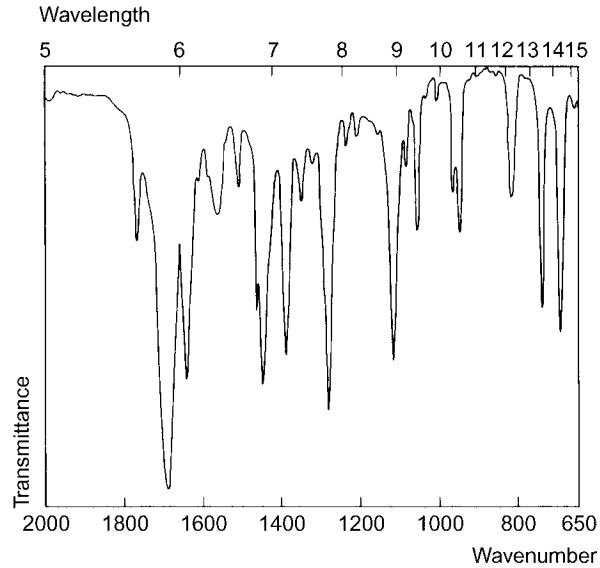
Gas Chromatography System GA—RI 1634; system GE—retention time 0.4 relative to phenytoin.

High Performance Liquid Chromatography System HY—RI 347.

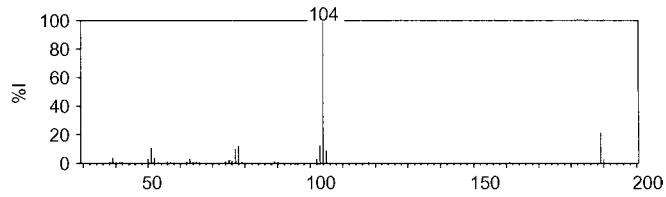
Ultraviolet Spectrum Ethanol—247 (A^1_1=17.2b), 252 (A^1_1=16.2b), 258 (A^1_1=14.5b), 264 nm (A^1_1=9.6b).



Infrared Spectrum Principal peaks at wavenumbers 1686, 1275, 1637, 1111, 695, 751 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 104, 189, 103, 78, 51, 77, 105, 52.



Quantification

Plasma **GC** FID. Limit of detection, 2.5 mg/L [van der Kleijn *et al.* 1973].

Serum **GC** FID. Phensuximide and other succinimide anticonvulsants. Limit of detection, 1 to 5 mg/L for phensuximide [Bonitati 1976].

Urine **GC** See Plasma [van der Kleijn *et al.* 1973].

Disposition in the Body Readily absorbed after oral administration and rapidly metabolised to the *N*-desmethyl derivative, which is active. About 27% of a dose is excreted in the urine in 48 h, mostly as 4′-hydroxyphensuximide and its conjugate.

Therapeutic Concentration

After a single oral dose of 1 g to 12 subjects, peak plasma concentrations of 10.6 to 15.6 mg/L were attained in 0.5 to 1.5 h [Glazko, Dill 1972].

Following daily oral doses of 3 g to 5 subjects with intractable seizures, steady-state plasma concentrations of 3.9 to 7.9 mg/L (mean, 5.7) of phensuximide and 1.5 to 2.1 mg/L (mean, 1.7) of *N*-desmethylphensuximide, were reported [Porter *et al.* 1977].

Toxicity The estimated minimum lethal dose is 5 g.

Half-life Plasma half-life, 4 to 12 h (mean, 8).

Protein Binding Not significantly bound.

Dose 0.5 to 3 g daily.

Bonitati J (1976). Gas-chromatographic analysis for succinimide anticonvulsants in serum: macro- and micro-scale methods. *Clin Chem* 22: 341–345.

Phentermine

Anorectic

$C_{10}H_{15}N$ = 149.2

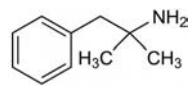
CAS—122-09-8

IUPAC Name 2-Methyl-1-phenylpropan-2-amine

Synonym α,α-Dimethylbenzeneethanamine

Note Phentermine is an isomer of metamfetamine.

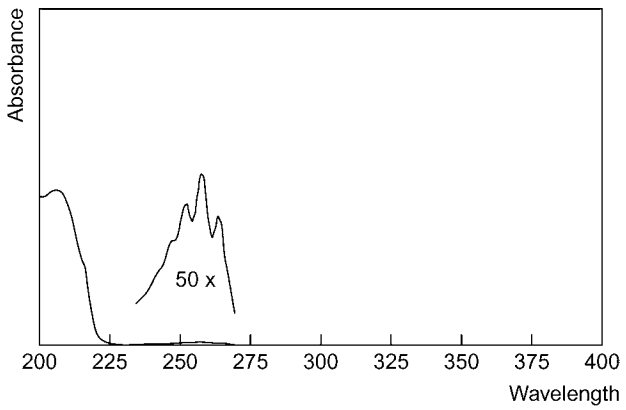
Proprietary Names *Duromine*; *Ionamin(e)*; *Mirapront* (all as resin complexes).



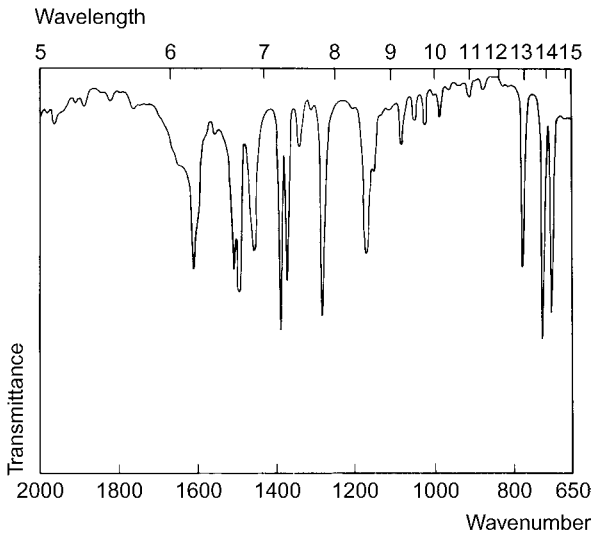
Chemical Properties A colourless oily liquid. Slightly soluble in water; soluble in ethanol, chloroform and ether. pK_a 10.1. Log *P* (octanol/water), 1.9.

Phentermine Hydrochloride
$C_{10}H_{15}N,HCl = 185.7$
CAS—1197-21-3
Proprietary Names *Adipex-P*; *Fastin*; *Panbesy*; *Pronidin*; *Umine*.
Chemical Properties A white crystalline powder. Mp 198°. Very soluble in water, ethanol and chloroform; practically insoluble in ether.

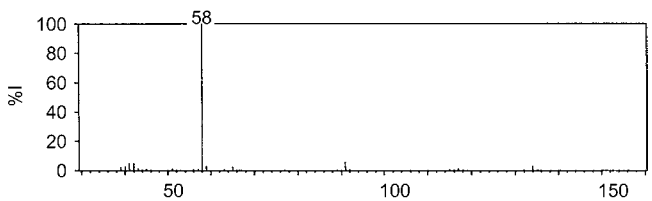
Colour Test Marquis test—orange.
Thin-layer Chromatography System TA—R_f 0.46; system TB—R_f 0.26; system TC—R_f 0.24; system TE—R_f 0.48; system TL—R_f 0.12; system TAE—R_f 0.11; system TAF—R_f 0.78; system TAJ—R_f 0.02; system TAK—R_f 0.05; system TAL—R_f 0.36 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—phentermine RI 1155, phentermine-TFA RI 1100, phentermine-PFP RI 1305, phentermine-TMS RI 1195, phentermine-AC RI 1510; system GB—RI 1191; system GC—RI 1450.
High Performance Liquid Chromatography System HA—*k* 0.6; system HB—*k* 19.46; system HC—*k* 0.86; system HY—RI 245; system HZ—retention time 2.4 min.
Ultraviolet Spectrum Aqueous acid—247, 251, 257 (A_1^1=13.9b), 263 nm. No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 730, 1285, 705, 1495, 1610, 1510 cm^{-1} (phentermine hydrochloride, KCl disk).



Mass Spectrum Principal ions at *m/z* 58, 91, 42, 41, 134, 65, 59, 40.



Quantification
Blood **GC** FID. Amfetamine and phentermine. Limit of detection, 10 µg/L in blood [O'Brien *et al.* 1972].

Plasma **HPLC** Fluorescence detection. Phentermine and fenfluramine [Kaddoumi *et al.* 2001]. UV detection. Phentermine and other sympathomimetic amines. Limits of detection, about 0.3 to 23 pmol [Kaddoumi *et al.* 2001].
Serum **HPLC** Phentermine and other amfetamine-related drugs. Limits of detection, 0.01 to 0.03 mg/L (UV detection, single wavelength) or 0.05 to 0.1 mg/L (diode-array detection); also MS detection [Bogusz *et al.* 1997].
HPLC-MS Phentermine and other amfetamine-related drugs. Limits of detection,1 to 5 µg/L [Bogusz *et al.* 2000].
Urine **GC** NPD. Phentermine and amfetamines. Limit of quantification for phentermine, 0.07 mg/L [Jonsson *et al.* 1996]. FID. Phentermine, chlorphentermine, and mephentermine [Beckett, Brookes 1971]. See Blood [O'Brien *et al.* 1972].
GC-MS Phentermine and other amfetamine-related drugs [Namera *et al.* 2002]. Phentermine and fenfluramine [Palmer *et al.* 2000].
HPLC See Serum [Bogusz *et al.* 1997].
Disposition in the Body Readily absorbed after oral administration. About 70 to 80% of a dose is excreted in the urine as unchanged drug in 24 h together with small amounts of the *N*-hydroxy and nitroso metabolites and traces of free and conjugated 4-hydroxyphentermine.
Phentermine is a metabolite of mephentermine.
Therapeutic Concentration
The following postmortem tissue concentrations were reported in a subject who had been receiving daily oral doses of 40 mg of a slow-release preparation and who died of natural causes: blood 0.9 mg/L, bile 6.5 mg/L, liver 4 µg/g, urine 50 mg/L [Price 1974].
Following single oral doses of 0.375 mg/kg, peak blood concentrations of about 0.1 mg/L were attained in about 4 h [Hinsvark *et al.* 1973].
Toxicity
In a fatality involving the ingestion of phentermine, the following postmortem tissue concentrations were reported: blood 7.6 mg/L, kidney 16 µg/g, liver 14 µg/g, urine 88 mg/L; amobarbital and ethchlorvynol were also detected in blood at concentrations of 10 mg/L and 12 mg/L, respectively [Levine *et al.* 1984].
Half-life Plasma half-life, about 19 to 24 h.
Volume of Distribution About 3 to 4 L/kg.
Dose 15 to 30 mg daily as the resin complex; 15 to 37.5 mg daily as the hydrochloride.

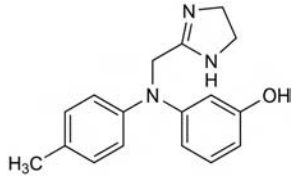
Phentolamine

Antihypertensive
$C_{17}H_{19}N_3O = 281.4$
CAS—50-60-2
IUPAC Name 3-[*N*-(4,5-dihydro-1*H*-imidazol-2-ylmethyl)-4-methylanilino] phenol
Synonyms C-7337; 3-[[(4,5-dihydro-1*H*-imidazol-2-yl)methyl](4-methylphenyl)amino]-phenol



Chemical Properties A white crystalline powder. Mp 174° to 175°. pK_a 7.7. Log *P* (octanol/water), 3.4.

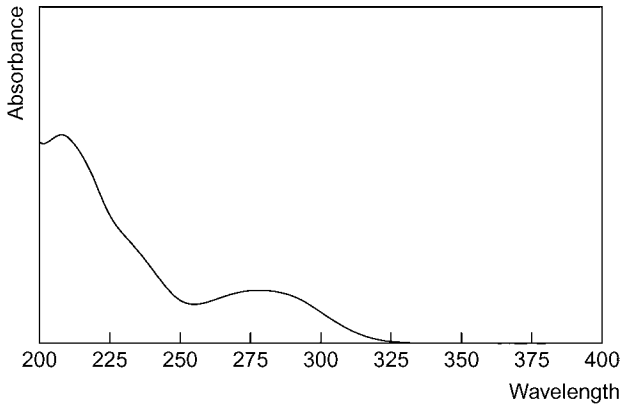
Phentolamine Hydrochloride

$C_{17}H_{19}N_3O,HCl = 317.8$
CAS—73-05-2
Chemical Properties A white or faintly cream-coloured crystalline powder. Mp 239° to 240°. Soluble 1 in 50 of water and 1 in about 70 of ethanol; very slightly soluble in chloroform and ether; practically insoluble in acetone. Solutions in water foam on shaking.

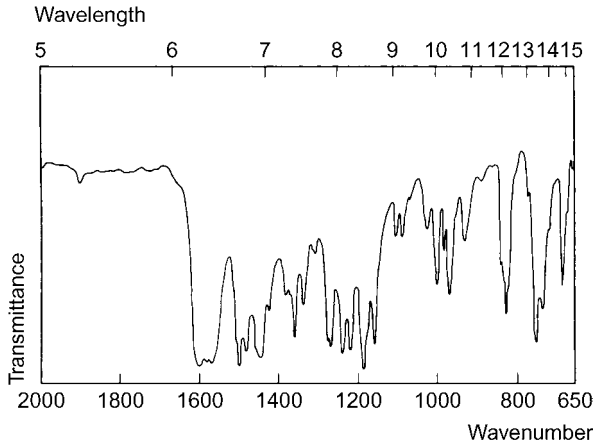
Phentolamine Mesilate

$C_{17}H_{19}N_3O,CH_3SO_3H = 377.5$
CAS—65-28-1
Synonyms Phentolamine mesylate; phentolamine methanesulfonate.
Proprietary Names *Q-Tech*; *Regitine*; *Rogitine*; *Z-Max*.
Chemical Properties A white, slightly hygroscopic, crystalline powder. Mp 177° to 181°. Soluble 1 in 1 of water, 1 in 4 of ethanol and 1 in 700 of chloroform.

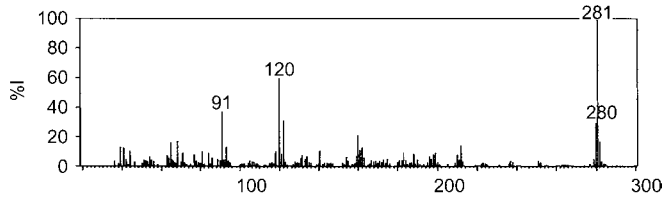
Colour Tests Mandelin's test—blue-green; Marquis test—yellow.
Thin-layer Chromatography System TA—R_f 0.32; system TB—R_f 0.01; system TC—R_f 0.03; system TE—R_f 0.33; system TL—R_f 0.02; system TAE—R_f 0.06; system TAJ—R_f 0.00; system TAK—R_f 0.01; system TAL—R_f 0.34 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—not eluted.
High Performance Liquid Chromatography System HA—*k* 1.7; system HX—RI 368; system HZ—retention time 3.0 min.
Ultraviolet Spectrum Aqueous acid—278 nm; aqueous alkali—291 nm.



Infrared Spectrum Principal peaks at wavenumbers 1195, 1508, 1610, 1580, 1592, 1247 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 281, 120, 91, 122, 280, 160, 68, 282.



Quantification

Plasma **GC** ECD. Phentolamine and conjugates. Limit of detection, 5 µg/L (phentolamine in plasma) [Sioufi *et al.* 1981].

HPLC UV detection. Phentolamine metabolite. Limit of detection, 200 µg/L [Godbillon, Carnis 1981].

Urine **GC** Limit of detection, 25 µg/L (phentolamine and conjugates in urine), see Plasma [Sioufi *et al.* 1981].

HPLC See Plasma [Godbillon, Carnis 1981].

Dose 5 to 10 mg of phentolamine mesilate IV. Phentolamine hydrochloride has been given orally in doses of 200 to 300 mg daily.

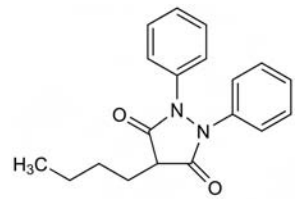
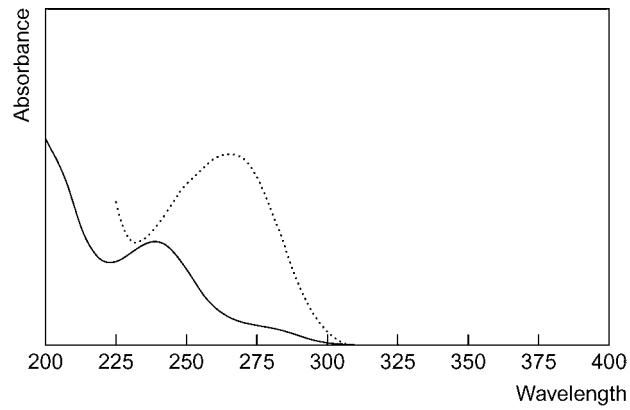
Phenylbutazone

Analgesic
$C_{19}H_{20}N_2O_2 = 308.4$
CAS—50-33-9

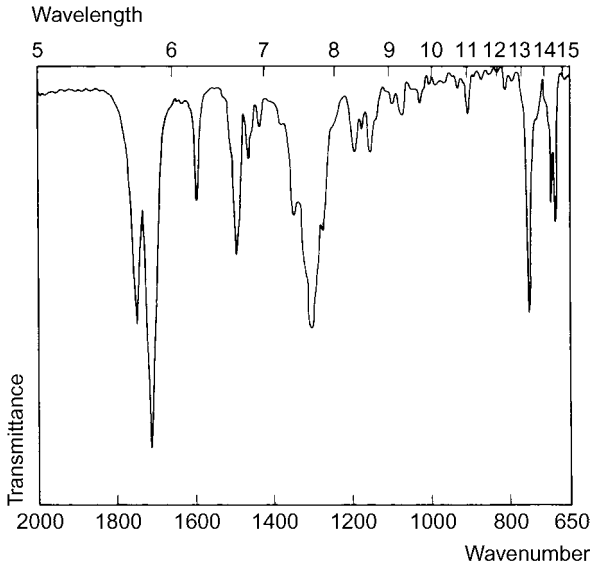
IUPAC Name 4-Butyl-1,2-diphenylpyrazolidine-3,5-dione
Synonyms Butadione; fenilbutazona.
Proprietary Names *Aflamina*; *Ambene*; *Basireuma*; *Bresal*; *Buta*; *Butacote*; *Butadion*; *Butazolidina*; *Butazolidin(e)*; *Butazolon*; *Butazona*; *Butazone*; *Butazonil*; *Carudol*; *Delbulasa*; *Demoplas*; *Exrheudon OPT*; *Feniben*; *Fezona*; *Inflazone*; *Kadol*; *Peralgin*; *Rudesol*; *Tisatin*.



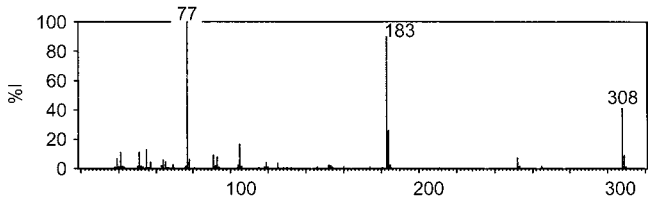
Chemical Properties A fine, white, crystalline powder. Mp 105°. Practically insoluble in water; soluble 1 in 28 of ethanol, 1 in 1.25 of chloroform and 1 in 15 of ether; freely soluble in acetone; soluble in alkaline solutions. pK_a 4.4 (20°). Log *P* (octanol/pH 7.4), 0.7; (octanol/water), 3.2.
Colour Tests Liebermann's reagent (100°)—brown; Mandelin's test—violet.
Thin-layer Chromatography System TA—R_f 0.79; system TD—R_f 0.78; system TE—R_f 0.65; system TF—R_f 0.68; system TG—R_f 0.23; system TAD—R_f 0.76; system TAE—R_f 0.87; system TAJ—R_f 0.90; system TAK—R_f 0.76; system TAL—R_f 0.97 (chromic acid solution, brown; Ludy Tenger reagent, orange; mercurous nitrate spray, positive; acidified potassium permanganate solution, positive).
Gas Chromatography System GA—phenylbutazone RI 2367, phenylbutazone-Me RI 2290, oxyphenbutazone not eluted; system GB—RI 2472; system GD—phenylbutazone RRT 2.05, oxyphenbutazone RRT 2.11, both as methyl derivatives relative to *n*-$C_{16}H_{34}$; system GF—RI 2860; system GL—phenylbutazone-Me RI 2290, M (OH-alkyl)-Me RI 2500.
High Performance Liquid Chromatography System HD—phenylbutazone *k* 6.5, oxyphenbutazone *k* 1.95; system HV—phenylbutazone RRT 0.95, oxyphenbutazone RRT 0.7, both relative to meclofenamic acid; system HX—phenylbutazone RI 672, oxyphenbutazone RI 501; system HY—phenylbutazone RI 643, oxyphenbutazone RI 459; system HZ—phenylbutazone RT 19.5 min, oxyphenbutazone RT 6.7 min; system HAA—RT 24.1 min.
Ultraviolet Spectrum Aqueous acid—237 nm (A^1_1 = 456a); aqueous alkali—264 nm (A^1_1 = 660a).



Infrared Spectrum Principal peaks at wavenumbers 1714, 1300, 1755, 755, 1492, 1275 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 77, 183, 308, 184, 105, 55, 51, 41; oxyphenbutazone 199, 324, 93, 77, 65, 55, 121, 135.



Quantification

Blood **GC** Limit of detection, 1 mg/L [Budd 1982].

Plasma **GC** See Blood [Budd 1982]. ECD. Sensitivity, 10 µg/L [Sioufi *et al.* 1978].

HPLC UV detection. Phenylbutazone, oxyphenbutazone and other NSAIDs. Limit of detection, 0.05 mg/L [Caturla, Cusido 1992]. UV detection. Phenylbutazone and other NSAIDs [Owen *et al.* 1987]. UV detection. Phenylbutazone, oxyphenbutazone and 3′-hydroxyphenylbutazone. Limit of detection, 5.5 mg/L for phenylbutazone [Aarons, Higham 1980]. UV detection. Phenylbutazone, oxyphenbutazone and 3′-hydroxyphenylbutazone. Limit of detection, 50 µg/L [Marunaka *et al.* 1980].

Serum **HPLC** UV detection. Limit of detection, 0.1 mg/L and 1 mg/L for phenylbutazone and oxyphenbutazone, respectively [Simmons *et al.* 1995].

Urine **GC** See Blood [Budd 1982].

HPLC See Plasma [Marunaka *et al.* 1980].

Bile **GC** See Blood [Budd 1982].

Disposition in the Body Readily absorbed after oral or rectal administration and slowly absorbed after IM injection. The major metabolic reactions are *C*-glucuronidation at the 4-position of the pyrazolidine ring and 4-hydroxylation of one of the phenyl rings to form the active metabolite, oxyphenbutazone; 3-hydroxylation of the butyl side-chain to form 3′-hydroxyphenylbutazone, and formation of 4,3′-dihydroxyphenylbutazone also occur. About 61% of a dose is slowly excreted in the urine over a period of about 21 days, together with up to 27% in the faeces. Of the material excreted in the urine, the 4-*C*-glucuronide of phenylbutazone accounts for ≈40%, free phenylbutazone and free oxyphenbutazone ≈1%, 4,3′-dihydroxyphenylbutazone ≈6%, 3′-hydroxyphenylbutazone ≈3%, and the remainder consists of the *C*-glucuronide of 3′-hydroxyphenylbutazone (≈12%), oxyphenbutazone *O*-glucuronide and 2 other metabolites.

Therapeutic Concentration In plasma, usually in the range 50–100 mg/L.

Following single oral doses of 100, 300 and 600 mg to 6 subjects, peak plasma concentrations of 12.5–17.1 mg/L (mean, 14), 30.8–46.3 mg/L (mean, 38), and 51.2–88.1 mg/L (mean, 75), respectively, were obtained in 1–7 h (mean, 3) [Sioufi *et al.* 1980].

After daily oral doses of 100, 200, and 300 mg to 7 subjects, mean steady-state plasma concentrations of 52, 83, and 95 mg/L, respectively, were reported; in 3 subjects given 400 mg daily, the mean steady-state concentration was 99 mg/L [Orme *et al.* 1976].

Following daily oral doses of 200 mg to 1 subject for 7 days, the following plasma concentrations were found: phenylbutazone about 50 mg/L, oxyphenbutazone about 20 mg/L, and 3′-hydroxyphenylbutazone about 12 mg/L [Midha *et al.* 1974].

Toxicity The estimated minimum lethal dose is 5 g. Toxic effects during treatment are frequent and may occur even when the dose does not exceed 400 mg daily; they are usually associated with plasma concentrations above 100 mg/L. A considerable number of deaths have occurred, especially from blood disorders.

In a fatality due to an accidental overdose by a 5-year-old child, the following postmortem concentrations were reported: blood 400 mg/L, bile 475 mg/L, kidney 250 µg/g, liver 250 µg/g [Lam, Chien 1976].

A plasma concentration of 670 mg/L was reported in 1 subject, one day after ingestion of 8 g. The concentration of phenylbutazone declined rapidly with a half-life of 23 h but concentrations of 3′-hydroxyphenylbutazone were unusually high and exceeded those of unchanged drug after 48 h; the subject recovered after about 3 days [Prescott *et al.* 1980].

A racetrack worker ingested at least 17 g of phenylbutazone (intended for equine use) over a 24-h period in an attempt to treat toothache. He had a serum-phenylbutazone concentration of 900 mg/L and a serum-oxyphenbutazone concentration of 60 mg/L approximately 8 h after presentation [Newton, Rose 1991].

Half-life Plasma half-life, phenylbutazone 2–5 days (mean, 3), but dose-dependent and increased in subjects with renal failure and in the elderly; oxyphenbutazone about 2–3 days, 3′-hydroxyphenylbutazone ≈32 h.

Distribution in Blood Plasma : whole blood ratio, 1.8.

Protein Binding About 99% at therapeutic concentrations; decreased at higher concentrations when the binding sites become saturated.

Note For a review of the pharmacokinetics of phenylbutazone, see Aarbakke [1978].

Dose Initially 300 to 600 mg daily; maintenance, 100 to 400 mg daily.

Phenylephrine

Sympathomimetic

$C_9H_{13}NO_2 = 167.2$

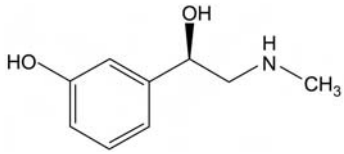
CAS—59-42-7

IUPAC Name 3-[(1*R*)-1-Hydroxy-2-(methylamino)ethyl]phenol

Synonyms (α*R*)-3-Hydroxy-α-[(methylamino)methyl]benzenemethanol; neosynephrine; *m*-synephrine.

Note Synephrine has been used as a synonym for oxedrine.

Proprietary Name It is an ingredient of *Vibrocil*.



Chemical Properties A white or almost white crystalline powder. Mp about 174°. Slightly soluble in water and ethanol; sparingly soluble in methanol; soluble in dilute mineral acids and solutions of alkali hydroxides. pK_a 8.9 (–OH), 10.1 (–NH–), (20°). Log *P* (octanol/water), −0.3.

Phenylephrine Hydrochloride

$C_9H_{13}NO_2.HCl = 203.7$

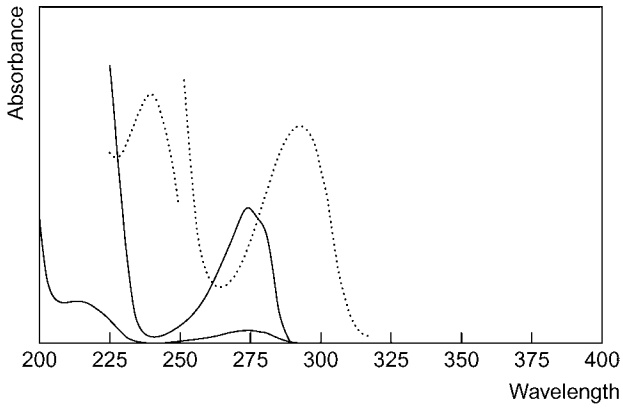
CAS—61-76-7

Synonyms Mesatonum; metaoxedrini chloridum.

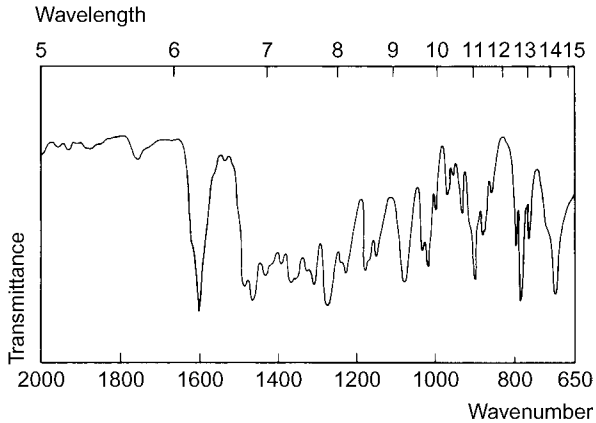
Proprietary Names *Ak-Dilate*; *Ak-Nefrin*; *Albalon*; *Analux*; *Dionephrine*; *Fenox*; *Isonefrine*; *Isopto Frin*; *Mydfrin*; *Neofrin*; *Neo-Mydrial*; *Neo-Synephrine*; *Ocu-Phrin*; *Phenoptic*; *Prefrin*; *Rectacaine*; *Releif*; *Rhinall*; *Ricobid D*; *Sinex*; *Visadron*; *Vistafrin*. It is an ingredient of many preparations for the relief of nasal congestion – see Sweetman [2002] or the latest edition of the British National Formulary.

Chemical Properties A white crystalline powder. Mp 140° to 145°. A solution in water is laevorotatory. Soluble 1 in 2 of water and 1 in 4 of ethanol.

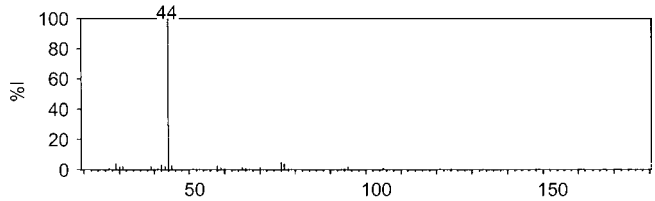
Colour Tests Mandelin's test—brown; Marquis test—red.
Thin-layer Chromatography System TA—R_f 0.33; system TB—R_f 0.01; system TC—R_f 0.01; system TE—R_f 0.12; system TL—R_f 0.00; system TAE—R_f 0.08; system TAF—R_f 0.67; system TAJ—R_f 0.00; system TAK—R_f 0.00; system TAL—R_f 0.22 (acidified potassium permanganate solution, positive).
Gas Chromatography System GC—RI 1934.
High Performance Liquid Chromatography System HA—*k* 1.3; system HC—*k* 1.6; system HX—RI 80; system HY—RI 79.
Ultraviolet Spectrum Aqueous acid—273 nm (A_1^1=110a); aqueous alkali—238 (A_1^1=534a), 291 nm (A_1^1=182a).



Infrared Spectrum Principal peaks at wavenumbers 1594, 1273, 784, 696, 1304, 900 cm^{-1} (phenylephrine hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 44, 76, 77, 29, 45, 42, 95, 65.



Quantification
Plasma **GC** ECD. Limit of detection, 12.5 µg/L [Dombrowski *et al.* 1973].
HPLC Electrochemical detection. Phenylephrine and its conjugates. Limits of detection, 2 µg/L for phenylephrine and 25 µg/L for its conjugates [Gumbhir, Mason 1996]. Fluorescence detection. Limit of detection, 0.5 µg/L [Chien, Schoenwald 1985].
Serum **HPLC** Coulometric detection. Limit of detection, about 0.3 µg/L [Vuma, Kanfer 1996]. Fluorescence detection. Limit of detection, 5 µg/L [Yamaguchi *et al.* 1994].
Urine **GC-MS** Phenylephrine and four metabolites [Ibrahim *et al.* 1983].
Aqueous humour **HPLC** UV detection. Phenylephrine and tropicamide [Galmier *et al.* 2000].
Disposition in the Body Readily absorbed after oral administration, but undergoes extensive first-pass metabolism; bioavailability about 38%. It is metabolised by conjugation with sulfate and glucuronic acid and by oxidative deamination to *m*-hydroxymandelic acid (MHMA) and *m*-hydroxyphenylglycol (MHPG). About 80% of an oral dose is excreted in the urine in 24 h, mainly as sulfate conjugates of phenylephrine and MHPG; about 30% of a dose is excreted as unconjugated MHMA.
Therapeutic Concentration
After a single oral dose of 9 mg of ^{3}H-labelled phenylephrine hydrochloride to 6 subjects, peak plasma concentrations of 0.23 to 0.47 mg/L (mean, 0.31) of total phenylephrine and metabolites were attained in 1 to 2 h [Cavallito *et al.* 1963].

Following a single oral dose of 1 mg to 3 subjects, a mean peak plasma concentration of unconjugated phenylephrine of 0.0009 mg/L was attained in about 1.3 h [Hengstmann, Goronzy 1982].
Toxicity The estimated minimum lethal dose, for children up to 2 years is 100 mg intranasally and for adults is 1 g.
Half-life Plasma half-life, about 2 to 3 h.
Volume of Distribution About 5 L/kg.
Clearance Plasma clearance, about 30 mL/min/kg.
Dose 30 to 40 mg of phenylephrine hydrochloride daily, orally.

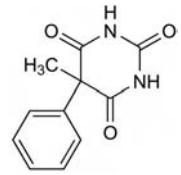
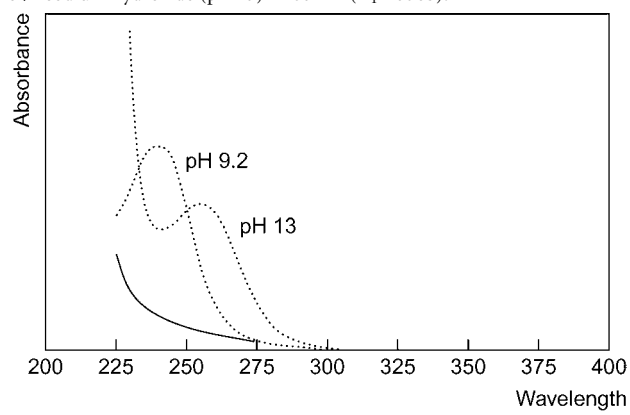
Phenylmethylbarbituric Acid

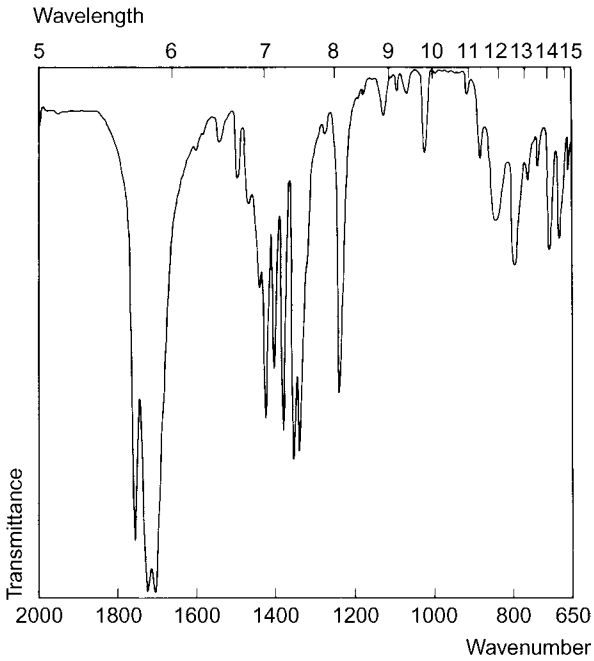
Anticonvulsant, Barbiturate
$C_{11}H_{10}N_2O_3$ = 218.2
CAS—76-94-8
IUPAC Name 5-Methyl-5-phenyl-1,3-diazinane-2,4,6-trione
Synonyms Heptobarbitalum (distinguish from heptabarbital); 5-methyl-5-phenyl-2,4,6(1*H*,3*H*,5*H*)-pyrimidinetrione.
Proprietary Name *Rutonal*



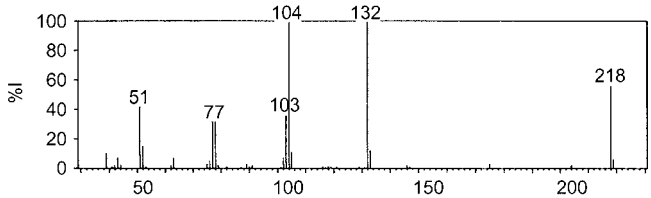
Chemical Properties A white crystalline powder. Mp about 226°. Practically insoluble in water; soluble 1 in 60 of ethanol; soluble in ether and aqueous solutions of alkalis. pK_a 7.7 (25°). Log *P* (octanol/water), 0.9.
Colour Test Liebermann's reagent—red-orange.
Thin-layer Chromatography System TD—R_f 0.29; system TE—R_f 0.24; system TF—R_f 0.61; system TH—R_f 0.27 (mercurous nitrate spray, black; Zwikker's reagent, pink).
Gas Chromatography System GA—phenylmethylbarbituric acid RI 1880, phenylmethylbarbituric acid-Me_2 RI 1790; system GAJ—RRT 1.087 (relative to methylphenobarbital).
High Performance Liquid Chromatography System HG—*k* 1.50; system HH—*k* 0.90.
Ultraviolet Spectrum Borax buffer 0.05 mol/L (pH 9.2)—238 nm (A_1^1= 494b); 1 mol/L sodium hydroxide (pH 13)—253 nm (A_1^1=350b).



Infrared Spectrum Principal peaks at wavenumbers 1702, 1720, 1751, 1240, 802, 716 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 104, 132, 218, 51, 103, 77, 78, 52.

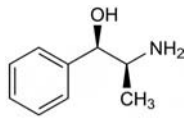


Dose Phenylmethylbarbituric acid has been given in doses of 400 mg daily.

Phenylpropanolamine

Sympathomimetic
$C_9H_{13}NO$ = 151.2
CAS—14838-15-4

IUPAC Name (1*S*,2*R*)-2-Amino-1-phenylpropan-1-ol
Synonyms (α*S*)-*rel*-α-[(1*R*)-1-Aminoethyl]benzenemethanol; DL-norephedrine



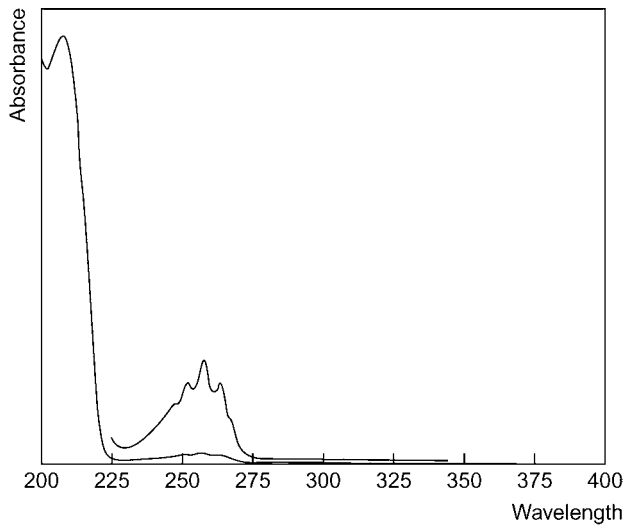
(+)-Form

Chemical Properties Mp about 101°. pK_a 9.4 (20°). Log *P* (octanol/water), 0.7.

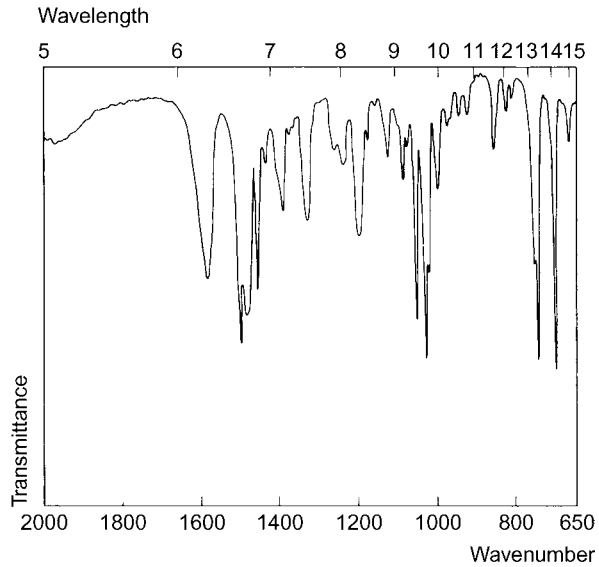
Phenylpropanolamine Hydrochloride

$C_9H_{13}NO,HCl$ = 187.7
CAS—154-41-6
Synonym Mydriatin
Proprietary Names *Acutrim*; *Appedrine*; *Capton Diet*; *Centapp*; *Control*; *Dexatrim*; *Fansia*; *Fasupond*; *Just One Per Day*; *Kontexin*; *Merex*; *Monydrin*; *Phenoxine*; *Phenyldrine*; *Procol*; *Propagest*; *Recatol mono*; *Restaslim*; *Rinexin*; *Slimomin*; *Spray-U-Thin*; *Stay Trim*; *Unitrol*. It is an ingredient of many preparations for the relief of cold and cough symptoms – see Sweetman [2002] or the latest edition of the British National Formulary.
Chemical Properties A white to creamy-white crystalline powder. Mp 190° to 194°. Soluble 1 in 1 of water and 1 in about 7 of ethanol; practically insoluble in chloroform and ether.

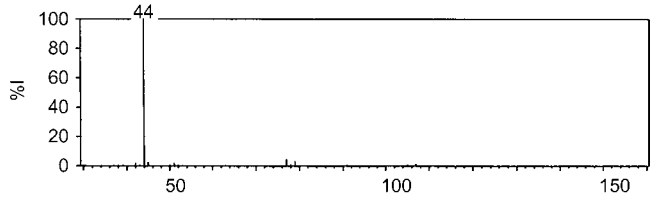
Thin-layer Chromatography System TA—R_f 0.44; system TB—R_f 0.04; system TC—R_f 0.04; system TAJ—R_f 0.01; system TAK—R_f 0.02; system TAL—R_f 0.29 (Dragendorff spray, positive; FPN reagent, violet; acidified iodoplatinate solution, positive; Marquis reagent, yellow; ninhydrin spray, positive; acidified potassium permanganate solution, positive).
Gas Chromatography System GA—RI 1313; system GB—RI 1353; system GC—RI 1383.
High Performance Liquid Chromatography System HA—*k* 0.9; system HB—*k* 3.90; system HC—*k* 0.7; system HY—RI 201.
Ultraviolet Spectrum Aqueous acid—251, 257 (A_1^1=11.7a), 262 nm. No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 700, 746, 1030, 1500, 1055, 1590 cm^{-1} (phenylpropanolamine hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 44, 77, 79, 51, 45, 42, 107, 105.



Quantification
Plasma **GC** ECD. Limit of detection, 1 µg/L [Crisologo *et al.* 1984].
HPLC UV detection. Phenylpropanolamine enantiomers. Limit of detection, <10 µg/L [Stockley *et al.* 1991]. UV detection. Limit of detection, 0.4 µg/L [Yamashita *et al.* 1990]. Fluorescence detection. Limit of detection, 5 µg/L [Mason, Amick 1981].
Urine **HPLC** Limit of detection, 8 µg/L, see Plasma [Yamashita *et al.* 1990].
Disposition in the Body Absorbed after oral administration. More than 90% of a dose is excreted in the urine as unchanged drug in 24 h, together with small

amounts of hippuric acid. Phenylpropanolamine is a metabolite of amfetamine, diethylpropion, and ephedrine.

Therapeutic Concentration

Following a single oral dose of 25 mg to 12 subjects, a mean peak plasma concentration of about 0.08 mg/L was attained in about 2 h [Mason, Amick 1981].

Toxicity

In a fatality due to a phenylpropanolamine overdose, the following postmortem tissue concentrations were reported: blood 48 mg/L, brain 86 µg/g, liver 460 µg/g [Cravey, Baselt 2002].

A 9-month-old infant died due to non-intentional overdosage with over-the-counter cough and cold preparations. Postmortem analysis revealed the following phenylpropanolamine levels: heart blood 1.4 mg/L, liver 0.5 mg/kg; elevated blood levels of pseudoephedrine and dextromethorphan were also found [Gunn *et al.* 2001].

Half-life Plasma half-life, about 4 h.

Dose 75 to 200 mg of phenylpropanolamine hydrochloride daily.

Phenylpropylmethylamine

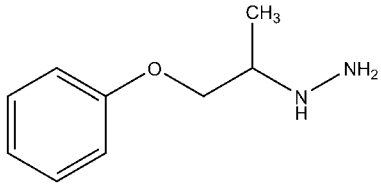
α-Adrenoceptor Agonist, Decongestant

$C_{10}H_{15}N$ = 149.2

CAS—93-88-9

IUPAC Name 2-Methyl-2-phenylpropan-1-amine

Synonyms *N*,β-Dimethylbenzeneethanamine; *dl-N*,β-dimethylphenyethylamine; 1-methylamino-2-methyl-2-phenylethane; 1-methylamino-2-phenylpropane; *dl-N*-methyl-2-phenylpropylamine; phenpromethamine; vonedrine.



Chemical Properties Volatile liquid. Bp 205° to 210°. Refractive index 1.51. Slightly soluble in water (1.2 g/100 mL). Freely soluble in alcohol, ether and benzene. Log *P* (octanol/water) 1.8 [National Institutes of Health 2008]. Phenylpropylmethylamine is extracted by organic solvents from aqueous alkaline solutions.

Phenylpropylmethylamine Hydrochloride

$C_{10}H_{15}N,HCl$ = 185.7

Proprietary Name *Vonedrine hydrochloride*

Chemical Properties Mp 144° to 148°.

Colour Test Sulfuric acid-formaldehyde test—orange→brown (limit of detection, 0.25 µg).

Thin-layer Chromatography System T1—R_f 0.30 (location reagent Marquis reagent, positive reaction; ninhydrin spray, positive reaction; potassium permanganate spray, positive reaction).

Ultraviolet Spectrum Aqueous acid (0.1 N sulfuric acid)—252, 257, 263 nm

National Institutes of Health. Phenylpropylmethylamine http://pubchem.ncbi.nlm.nih.gov/summary/summary.cgi?cid=210602&loc=ec_rcsv. (accessed 27 June 2008).

Phenyltoloxamine

Antihistamine

$C_{17}H_{21}NO$ = 255.4

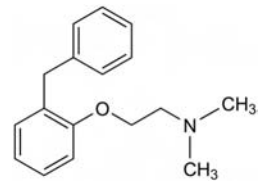
CAS—92-12-6

IUPAC Name 2-(2-Benzylphenoxy)-*N*,*N*-dimethylethanamine

Synonyms C-5581H; *N*,*N*-dimethyl-2-[2-(phenylmethyl)phenoxy]ethanamine; phenyltolyloxamine; PRN.

Note Phenyltoloxamine is a structural isomer of diphenhydramine.

Proprietary Name It is an ingredient of *Pholtex.*



Chemical Properties An oily liquid. pK_a 9.1. Log *P* (octanol/water), 3.8.

Phenyltoloxamine Citrate

$C_{17}H_{21}NO,C_6H_8O_7$ = 447.5

CAS—1176-08-5

Proprietary Names It is an ingredient of *Aceta-Gesic*, *Anabar*, *Codipront*, *Comhist LA*, *Mobigesic*, *Momentum*, *Naldecon*, *Nalex-A*, *Percogesic*, *Phenylgesic*, *Poly-Histine*, *Sinutab Nightime* and *Tetra-Mag*.

Chemical Properties Crystals. Mp 138° to 140°. Soluble in water.

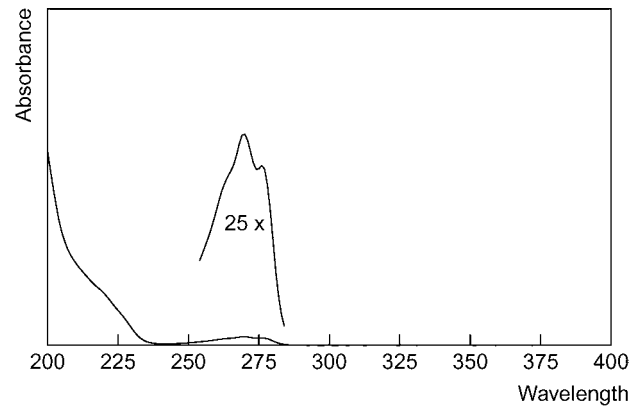
Colour Tests Mandelin's test—green; Marquis test—violet.

Thin-layer Chromatography System TA—R_f 0.53; system TB—R_f 0.38; system TC—R_f 0.48; system TE—R_f 0.67; system TL—R_f 0.15; system TAE—R_f 0.32; system TAJ—R_f 0.27; system TAK—R_f 0.15; system TAL—R_f 0.69 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—phenyltoloxamine RI 1940, M ((*N*-oxide)-ME_2 NOH) RI 1500, M (nor-) RI 2140, M (*O*-desalkyl-) RI 1680, M (*O*-desalkyl-OH-) RI 2220, M (OH-) isomer 1 RI 2280, M (OH-) isomer 2 RI 2300, M (nor-OH-) isomer 1 RI 2320, M (nor-OH-) isomer 2 RI 2340, M (OH-methoxy-) RI 2320, M (desamino-OH-) RI 1830; system GB—phenyltoloxamine RI 2030, M ((*N*-oxide)-ME_2 NOH) RI 1580, M (nor-) RI 2002, M (*O*-desalkyl-) RI 1724, M (nor-OH-) isomer 1 RI 2398, M (nor-OH-) isomer 2 RI 2402, M (desamino-OH-) RI 1928.

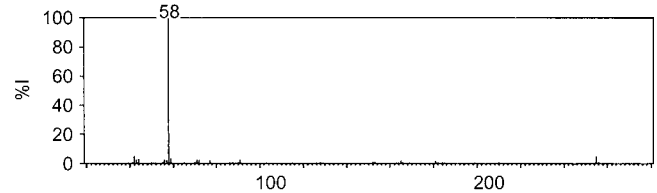
High Performance Liquid Chromatography System HA—*k* 3.1; system HX—RI 415.

Ultraviolet Spectrum Aqueous acid—270 (A^1_1=73b), 276 nm.



Infrared Spectrum Principal peaks at wavenumbers 1245, 1491, 752, 1030, 697, 1111 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 58, 255, 42, 71, 59, 44, 181, 165.



Dose 75 to 200 mg of phenyltoloxamine citrate daily.

Phenytoin

Anticonvulsant

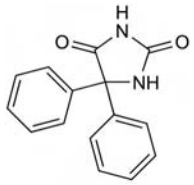
$C_{15}H_{12}N_2O_2$ = 252.3

CAS—57-41-0

IUPAC Name 5,5-Diphenylimidazolidine-2,4-dione

Synonyms Diphenylhydantoin; fenitoína; phenantoinum; phenytoinum.

Proprietary Names *Aurantin*; *Dantoin*; *Di-Hydan*; *Dilantin*; *Diphantoine*; *Diphenylan*; *Epanutin*; *Epelin*; *Epilan-D*; *Epilantine*; *Epinat*; *Hidantal*; *Hydantin*; *Neosidantoina*; *Phenhydan*; *Pyorédol*; *Sinergina*; *Zentropil*.



Chemical Properties A white crystalline powder. Mp 295° to 298°. Practically insoluble in water; soluble 1 in ~60 of ethanol, 1 in 500 of chloroform, 1 in ~30 of acetone and 1 in 600 of ether; soluble in solutions of alkali hydroxides. pK_a 8.3 (25°). Log *P* (octanol/water), 2.5. Extraction yield (chlorobutane), 0.5 [Demme *et al.* 2005].

Phenytoin Sodium

$C_{15}H_{11}N_2NaO_2 = 274.3$
CAS—630-93-3

Synonyms Diphenin; phenytoinum natricum; sodium diphenylhydantoin; soluble phenytoin.

Proprietary Name It is an ingredient of *Garoin*.

Chemical Properties A white, slightly hygroscopic, crystalline powder that on exposure to air absorbs carbon dioxide with the liberation of phenytoin. Soluble 1 in ~66 of water and 1 in 10.5 of alcohol; practically insoluble in chloroform and ether. In aqueous solution it is partly hydrolysed to the base and turbidity develops.

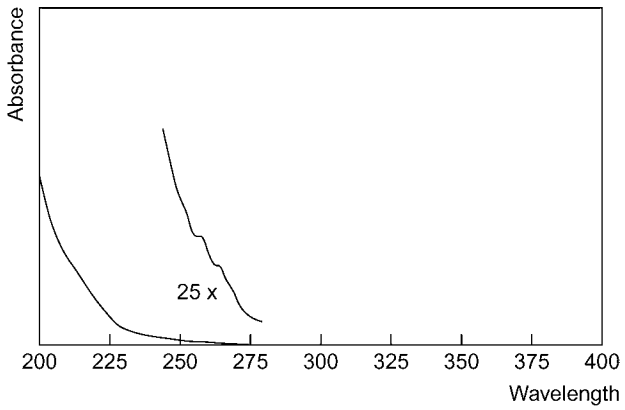
Colour Tests Koppanyi–Zwikker test—violet; Liebermann's reagent—red-orange; mercurous nitrate—black.

Thin-layer Chromatography System TD—R_f 0.33; system TE—R_f 0.41; system TF—R_f 0.55; system TAD—R_f 0.53; system TAE—R_f 0.86; system TAJ—R_f 0.48; system TAK—R_f 0.84; system TAL—R_f 0.96 (mercuric chloride-diphenylcarbazone reagent—positive; mercurous nitrate spray—black).

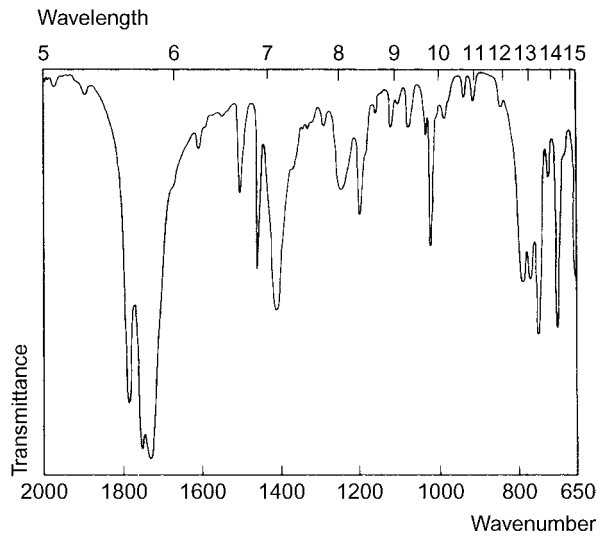
Gas Chromatography System GA—phenytoin RI 2320, M (OH-)RI 2795, phenytoin-Me RI 2245, M (4-OH-)-Me_2 RI 2720, M (4-OH-methoxy-) RI 2770, M (4-OH-methoxy-)-Me_2 RI 2740. Phenytoin is used as the reference substance in System GE.

High Performance Liquid Chromatography System HE—*k* 9.71; system HX—RI 431; system HY—RI 381; system HZ—RT 3.7 min; system HAA—RT 16.3 min; system HAK—not detected; system HAM—RT 3.5 min; system HAX—RT 6.1 min; system HAY—RT 5.3 min; system HAZ—*k* 0.60.

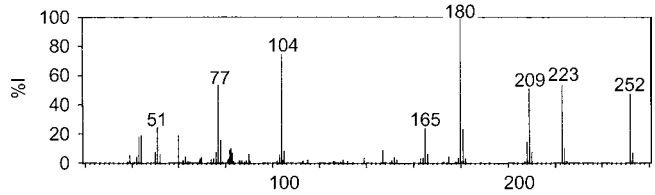
Ultraviolet Spectrum Methanol—258 (A_1^1 = 27a), 264 nm (A_1^1 = 16a).



Infrared Spectrum Principal peaks at wavenumbers 1720, 1740, 1774, 748, 698, 785 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 180, 104, 223, 77, 209, 252, 51, 165 (phenytoin); 239, 196, 268, 120, 197, 225, 77, 104 (5-(4-hydroxyphenyl)-5-phenylhydantoin [HPPH]).



Quantification

Blood **GC-MS** Column: 5% phenylmethylpolysiloxane (12 m × 0.15 mm i.d., 0.4 µm). Temperature programme: 80° for 1 min to 300° at 20°/min. Limit of detection, 0.5 mg/L [Speed *et al.* 2000].

Plasma **GC** Column: DB 1 (30 m × 0.25 mm i.d., 0.1 µm). Carrier gas: N_2, 12 psi. Temperature programme: 90° for 4 min to 170° at 15°/min to 240° at 6°/min to 300° at 15°/min for 1 min. TSD. Limit of quantification, 0.05 mg/L [Queiroz *et al.* 2002]. Column: 1.5% OV17, 1.95 OV210 (2 m × 2 mm i.d.). FID. Limit of detection, 200 µg/L [Zarghi *et al.* 1999]. Column: 3% OV-225 on Chromosorb W HP (100/120 mesh). Carrier gas: N_2, 35 mL/min. Temperature: 234°. FID, Limit of detection, 1 mg/L [Gordos *et al.* 1977].

GC-MS Column: DB-5MS (30 m × 0.25 mm i.d., 0.5 µm). Carrier gas: He, 1.5 kg/cm^2. Temperature programme: 270° for 1 min to 300° at 10°/min for 1 min. Limit of quantification, 2.5 mg/L [Nelson *et al.* 1998].

HPLC Column: RP-18E (100 × 3 mm i.d., 3 mm). Mobile phase: 0.1 mol/L phosphate buffer (pH 6.5) : methanol : acetonitrile (77 : 20 : 3), flow rate 2.1 mL/min. UV detection (λ = 210 nm). Retention time: 12.0 min. Limit of quantification, 2.2 mg/L [Heideloff *et al.* 2010]. Column: Shimdazu Shimpack XR-ODS (50 × 4.6 mm i.d., 2.2 µm). Mobile phase: 20 mmol/L acetate buffer (pH 5.6) : methanol-acetonitrile-tetrahydrofuran (61.3 : 32.2 : 6.5; 86 : 14 for 2 min to 77 : 23 at 5 min for 4 min to 64 : 36 at 12 min to 59 : 41 at 16.5 min to 86 : 14 at 17.5 min for 3.5 min), flow rate 0.8 mL/min. APCI, SIM acquisition mode. Limit of quantification, 0.5 µg/L, limit of detection, 0.63 µg/L [Subramanian *et al.* 2008]. Column: LiChrospher 100 RP-18 C_{18} (125 × 4 mm i.d., 5 µm). Mobile phase: water : acetonitrile (78 : 22), flow rate 1.0 mL/min. UV detection (λ = 220 nm). Limit of quantification, 125 µg/L [Queiroz *et al.* 2008]. Column: Supelcosil LC-18. Mobile phase: 0.01 mol/L phosphate buffer : methanol : acetonitrile (pH 7.5, 65 : 18 : 17), flow rate 1 mL/min. UV detection (λ = 220 nm) [Matar *et al.* 1999]. Column: Spherisorb ODS2. Mobile phase: acetonitrile : methanol : potassium phosphate buffer (18 : 18 : 70). Retention time 9.9 min. UV detection (λ = 210 nm). Limit of quantification, 50 µg/L [Bhatti *et al.* 1998]. See also Andresen *et al.* [1993], Christofides, Fry [1980], Maya *et al.* [1992], Romanyshyn *et al.* [1994], Sawchuk, Cartier [1980] and Shimoyama *et al.* [1998].

LC-MS Column: C_{18} (150 × 3 mm i.d., 3 µm). Mobile phase: water-methanol (95 : 5) : water-methanol (10 : 90) both with 0.1% formic acid (100 : 0 to 20 : 80 in 3 min for 2 min to 100 : 0 at 6 min), flow rate 0.3 mL/min. ESI, positive ion mode. Limit of quantification, 12.2 µg/L [Zhang *et al.* 2008].

Serum **HPLC** See Plasma [Heideloff *et al.* 2010]. Column: Alltima 3C_{18} (150 × 4.6 mm i.d.) Mobile phase: acetonitrile : methanol : 25 mmol/L phosphate buffer (14.5 : 19.5 : 66), flow rate 0.9 mL/min. DAD (λ = 215 or 275 nm). Retention time: 15.65 min. Limit of quantification, 0.065 mg/L, limit of detection, 0.039 mg/L [Vermeij, Edelbroek 2007]. Column: Hypersil ODS Nova-Pak C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: 10 µmol/L phosphate buffer : methanol : acetonitrile : acetone (pH 7.0, 55 : 22 : 12 : 11). UV detection (λ = 210 nm). Retention time: 9.97 min. Limit of quantification, 200 µg/L [Patil, Bodhankar 2005]. Column: C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : water : glacial acetic acid (67 : 33 : 1), flow rate 1 mL/min. UV detection (λ = 230 nm). Limit of quantification, 0.05 mg/L [Kishore *et al.* 2003]. Column: Hypersil C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: 7.3 mmol/L sodium acetate buffer (pH 5.4) : acetonitrile (68 : 32), flow rate 2.0 mL/min. UV detection (λ = 240 nm). Limit of quantification, ~3 mg/L [Levert *et al.* 2002].

See also Christofides, Fry [1980], Hannak *et al.* [1992], Kouno *et al.* [1993], Lensmeyer *et al.* [1997], Liu *et al.* [1993], May *et al.* [1998] and Rambeck *et al.* [1994].

Urine **HPLC** Column: reversed phase C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.01 mol/L phosphate buffer (pH 6.0, 60 : 40), flow rate 1 mL/min. DAD (λ = 210 nm). Limit of quantification, 300 µg/L, limit of detection, 80 µg/L [Santagati *et al.* 2005]. See Plasma [Maya *et al.* 1992; Sawchuk, Cartier 1980]. See Serum [Liu *et al.* 1993].

Breast Milk **HPLC** Column: Develosil C_8-5 (150 × 4.6 mm i.d.). Mobile phase: 0.5% potassium dihydrogen phosphate (pH 4.5) : acetonitrile (70 : 30), flow rate 1.0 mL/min. UV detection (λ = 254 nm). Limit of detection, 0.025 mg/L [Shimoyama *et al.* 1998].

Oral Fluid **HPLC** Column: ODS-Hypersil (250 × 2 mm i.d., 3 µm). Mobile phase: 0.01 mol/L potassium phosphate buffer (pH 7.0) : acetonitrile : methanol (110 : 50 : 30), flow rate 0.2 mL/min. DAD (215, 254 and 285 nm). Limit of detection, 0.78 mg/L [Liu *et al.* 1993].

Hair **HPLC** Column: S5 ODS2 (100 × 4.6 mm i.d.). Mobile phase: acetonitrile : water (20 : 80), flow rate 2.0 mL/min. UV detection (λ = 220 nm). Limit of detection, 0.63 µg/g [Tsatsakis *et al.* 2000]. Column: reversed phase. Mobile phase: acetonitrile : methanol : water (9 : 37 : 54). UV detection (λ = 214 nm). Limit of detection, 2 ng/mg [Mei, Williams 1997].

Liver **GC-MS** See Blood [Speed *et al.* 2000].

Disposition in the Body Phenytoin is slowly but almost completely absorbed after oral administration; the rate of absorption is variable, being prolonged after large doses, and bioavailability may vary considerably between different formulations. It is metabolised mainly by P450 isozyme CYP2C9 and to a lesser extent by CYP2C19. Metabolism is affected by genetic polymorphism. Phenytoin undergoes enterohepatic recirculation. Approximately 50–70% of a dose may be excreted as free or conjugated HPPH in 24 h; the excretion of this metabolite is dose dependent and decreases as the dose is increased. Phenytoin hydroxylation is capacity limited and is, therefore, readily inhibited by agents that compete for its metabolic pathways. <5% of a dose is excreted as unchanged drug. Minor metabolites include 5-(3-hydroxyphenyl)-5-phenylhydantoin, 3,4-dihydro-3,4-dihydroxyphenytoin, catechol, and 3-*O*-methylcatechol. Up to ~15% of a dose may be eliminated in the faeces. Phenytoin crosses the placenta; low concentrations are found in breast milk

Therapeutic Concentration In plasma, usually in the range 10–20 mg/L.

In 332 adults treated for epilepsy with phenytoin for an average of 7.7 months, the average optimised dose was 305.8 mg (range, 100–500) daily, which produced an average steady-state serum concentration of 62.7 µmol/L (range, 15–133) [Valodia *et al.* 1999].

Following daily oral doses of 300 mg, mean steady-state plasma concentrations of 1.3–6.6 mg/L (mean, 3.6) were reported in 5 subjects with short phenytoin half-lives, in comparison with mean steady-state plasma concentrations of 5.0–27.2 mg/L (mean, 13.4) in 4 subjects with long phenytoin half-lives; the corresponding concentrations of HPPH were 1.3–2.7 mg/L (mean, 2.0) and 0.7–1.3 mg/L (mean, 1.0), respectively [Glazko *et al.* 1982].

A single oral dose of 15 mg/kg phenytoin produced a peak serum concentration of 11.95 mg/L at 7.26 h in 19 healthy subjects. To achieve a target serum concentration of 15 mg/L, an oral loading dose of 18.7 mg/kg was needed in males and 24.8 mg/kg in females; a peak serum concentration of 23.89 mg/L was attained in 9.71 h in males and 21.46 mg/L was attained in 7.71 h in females [Ratanakorn *et al.* 1997].

Toxicity The estimated minimum lethal dose is 5 g but few deaths from overdosage have been reported. Side effects have been associated with plasma concentrations greater than 20 mg/L and severe toxic effects with concentrations greater than 40 mg/L. Fatalities have been associated with blood concentrations >70 mg/L.

A $4^1/_2$-year-old girl ingested 2 g phenytoin; 24 h later, her blood concentration was found to be 94 mg/L. She died on the third day and postmortem concentrations were blood 45 mg/L, brain 78 µg/g, kidney 112 µg/g and liver 272 µg/g [Laubscher 1966].

In 9 patients displaying signs of phenytoin toxicity during the course of therapy, initial serum concentrations ranged from 34–57.5 mg/L. In 3 patients, concentrations remained relatively constant for 2–5 days before declining steadily; in the remaining 6 patients levels declined almost linearly. In 7 patients, levels declined between 4.6 and 5.9 mg/L per day [Chua *et al.* 2000].

A 15-year-old boy survived despite having a peak serum level of 100.8 mg/L after ingesting 19.6 g (15 g verifiable; 392 mg/kg) phenytoin sodium in a suicide attempt [Mellick *et al.* 1989].

Following an apparent suicide attempt by an adult non-epileptic man who ingested an unkown amount of phenytoin, an unusual absorption profile was observed. Twelve hours after the ingestion, the serum phenytoin concentration was 45 mg/L. This steadily increased, reaching a maximum of 114 mg/L 4 days later, fluctuated at ~100 mg/L for a week and then slowly declined to undetectable levels over the following week. The protracted absorption appeared to result from the presence of a large concretion of phenytoin in the gastrointestinal tract, slowly disintegrating and dissolving and also from the patient's diminished intestinal motility [Chaikin, Adir 1987].

Half-life Plasma half-life varies considerably within the approximate range of 7 to 42 h; it is dose dependent, increasing as the dose increases; at steady state it is ~22 h.

Volume of Distribution ≈0.5–1.2 L/kg.

Distribution in Blood Plasma : whole blood ratio, ~1.6.

Saliva Plasma : saliva ratio, ~10.

Protein Binding ≈90%.

Pholcodine

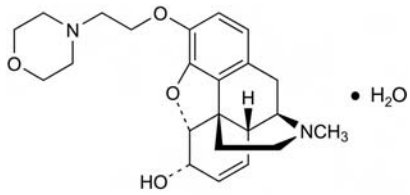
Cough Suppressant

$C_{23}H_{30}N_2O_4,H_2O = 416.5$

CAS—509-67-1 (anhydrous)

Synonyms (5α,6α)-7,8-Didehydro-4,5-epoxy-17-methyl-3-[2-(4-morpholinyl)-ethoxy]morphinan-6-ol monohydrate; folcodina; MEM; morpholinylethylmorphine; pholcodinum.

Proprietary Names *Benylin Childrens Dry Coughs*; *Evaphol*; *Expulin Dry Cough*; *Famel Linctus*; *Galenphol*; *Hill's Balsam Dry Cough*; *Pavacol-D*; *Pholcomed*; *Tixylix Daytime*. It is an ingredient of many proprietary preparations, see Sweetman [2002].



Chemical Properties Colourless crystals or a white crystalline powder. Mp 91°. Soluble 1 in 50 of water and 1 in 3 of dehydrated alcohol; soluble in benzene and chloroform. pK_a 8.0, 9.3 (37°). Log *P* (octanol/water), 0.6.

Pholcodine Tartrate

$C_{23}H_{30}N_2O_4,2C_4H_6O_6,3H_2O = 752.7$

Chemical Properties A white crystalline powder. Soluble 1 in 8 of water; very slightly soluble in ethanol; slightly soluble in chloroform and ether.

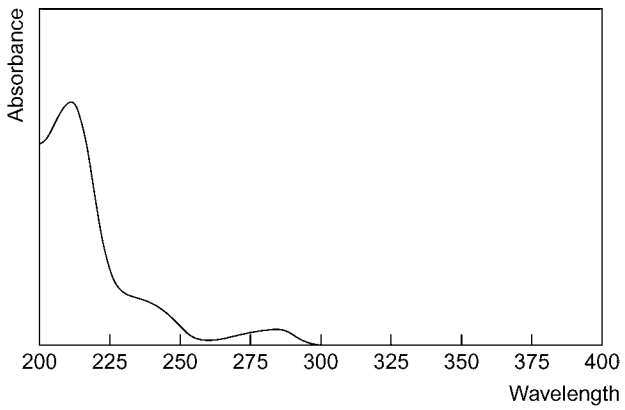
Colour Tests Liebermann's reagent—black; Marquis test—violet.

Thin-layer Chromatography System TA—R_f 0.36; system TB—R_f 0.03; system TC—R_f 0.18; system TE—R_f 0.25; system TL—R_f 0.02; system TAE—R_f 0.15 (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis Reagent, violet).

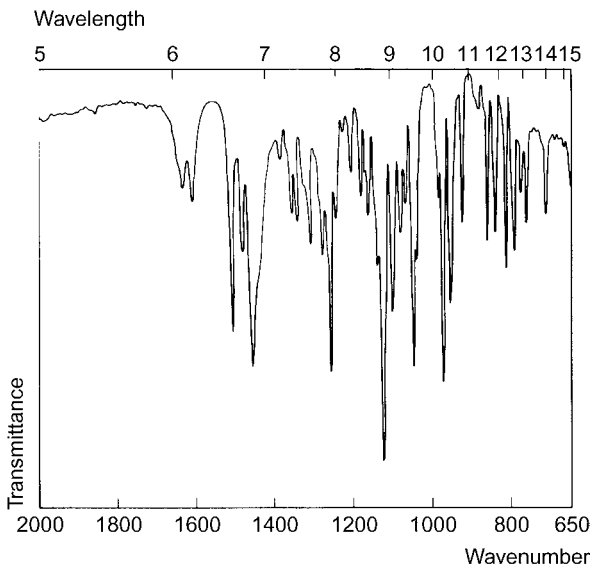
Gas Chromatography System GA—phocoldine RI 3070, phocoldine-AC RI 3260, phocoldine-PFP RI 2980, phocoldine-TFA RI 2800, phocoldine-TMS RI 3140; system GB—pholcodine RI 3348, pholcodine-TMS RI 3410.

High Performance Liquid Chromatography System HA—*k* 6.0 (tailing peak); system HC—*k* 1.63; system HX—RI 65; system HY—RI 92; system HAA—retention time 2.7 min.

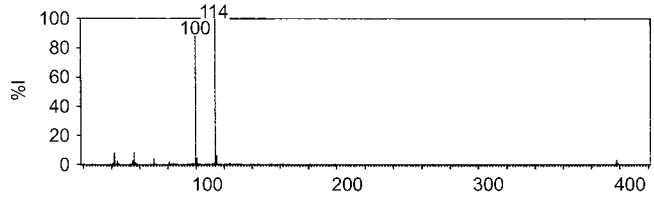
Ultraviolet Spectrum Aqueous acid—283 nm (A_1^1=40a). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1118, 969, 1250, 1043, 1500, 1098 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 114, 100, 56, 42, 115, 101, 70, 398.



Quantification

Blood **GC-MS** Pholcodine and other opioids [Krogh *et al.* 1993].

HPLC Comparison with EMIT. Pholcodine and other opioids., Limits of detection, 4 to 20 µg/L [Low, Taylor 1995]. Fluorescence and electrochemical detection. Pholcodine and its metabolites [Johansen *et al.* 1992].

Hair **GC-MS** See Urine [Maurer, Fritz 1990].

Disposition in the Body Pholcodine is partly metabolised to morphine and other metabolites; it also forms a glucuronic acid conjugate. About 29% of an oral dose is excreted in the urine as unchanged pholcodine and a further 15% as the glucuronide; about 0.5 to 1% is excreted in the urine as morphine glucuronide. Other metabolites have been identified as desmorpholinohydroxy-, nordesmorpholinohydroxy-, hydroxy-, oxo-, nor- and noroxo-pholcodine.

Therapeutic Concentration

Six healthy subjects received single oral doses of 20 and 60 mg pholcodine (with 3 weeks between the doses) and subsequently received 20 mg pholcodine orally every 8 h for 10 days. After single doses pholcodine was absorbed rapidly (t_{max}=1.6 h), with the mean peak plasma concentration being 12.8 µg/L after the 20-mg dose and 26.3 µg/L after the 60-mg dose. Multiple dosing did not alter the pharmacokinetics [Chen *et al.* 1988].

Note For interpretation of GC–MS opiate results in the presence of pholcodine, see Meadway *et al.* [2002].

Dose Usually up to 40 mg daily.

Pholedrine

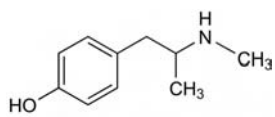
Sympathomimetic

$C_{10}H_{15}NO = 165.2$

CAS—370-14-9

IUPAC Name 4-[2-(Methylamino)propyl]phenol

Synonyms Isodrine; sympropaminum.

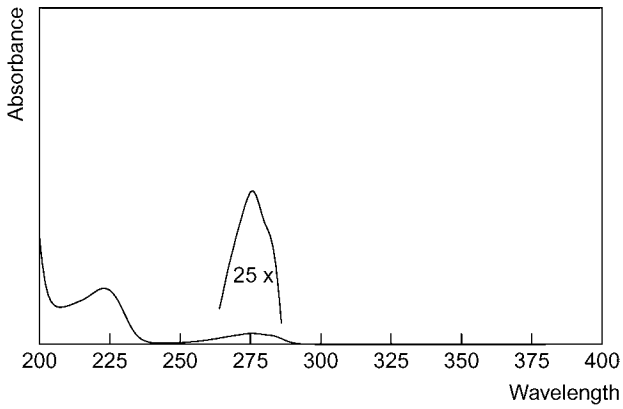


Chemical Properties Crystals. Mp 162° to 163°. Slightly soluble in water; soluble in ethanol and ether. pK_a 9.4 (25°). Log *P* (octanol/water), 1.7. Extraction yield (chlorobutane), 0 [Demme *et al.* 2005].

Pholedrine Sulfate

$(C_{10}H_{15}NO)_2,H_2SO_4 = 428.5$
CAS—6114-26-7
Synonym Pholedrine sulfate
Proprietary Name *Paredrinol*; *Pulsotyl*; *Veritol*
Chemical Properties A white crystalline powder. Mp about 320° to 323°, with decomposition. Soluble 1 in 20 of water; practically insoluble in ethanol, chloroform and ether.

Colour Test Marquis test—grey→green.
Thin-layer Chromatography System TA—R_f 0.29; system TB—R_f 0.03; system TC—R_f 0.03; system TE—R_f 0.27; system TL—R_f 0.03; system TAE—R_f 0.09 (acidified potassium permanganate solution, positive).
Gas Chromatography System GA—RI 1490.
High Performance Liquid Chromatography System HX—RI 205.
Ultraviolet Spectrum Aqueous acid—275 nm (A^1_1=82a); aqueous alkali—238 (A^1_1=640b), 295 nm (A^1_1=150b).



Infrared Spectrum Principal peaks at wavenumbers 1258, 1513, 1274, 1590, 1610, 810 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 58, 30, 107, 59, 77, 56, 42, 43.
Quantification
Plasma **Radioimmunoassay** [Peinhardt 1997].
Serum **HPLC** Amperometric detection [Peinhardt 1999].
Disposition in the Body
Toxicity
In a fatality involving the ingestion of pholedrine, the following postmortem concentrations were reported: blood 15 µg/g, kidney 122 µg/g, liver 73 µg/g [Hammer *et al.* 1980].
Dose Pholedrine sulfate has been given parenterally in doses of up to 20 mg.

Phosgene

Halocarbon, Vesicant, War Gas
$COCl_2 = 98.9$
CAS—75-44-5
IUPAC Name Carbonyl Chloride
Synonyms Carbonic dichloride; carbonyl chloride; chloroformyl chloride.
Chemical Properties Colourless, highly toxic gas; suffocating odour; when much diluted with air, there is an odour reminiscent of mouldy hay. Condenses at ~0° to a clear, colourless fuming liquid. Mp −118°. Bp (760 mmHg) 8.2°. Slightly soluble in water and slowly hydrolysed by it; freely soluble in benzene, toluene, glacial acetic acid and most liquid hydrocarbons [O'Neil *et al.* 2006]. Thermal decomposition studies of phosgene in air have shown that phosgene decomposes by 60% at 500°, 90% at 600°, and 100% at 800° with chlorine as a decomposition by-product formed only at 700° or above [Noweir *et al.* 1973]. It is widely used as an intermediate in industrial processes, in the preparation of isocyanates, polycarbonates, polyurethanes, aniline dyes and pesticides. It may also be formed by the thermal decomposition of chlorinated hydrocarbons (e.g. polyvinylchloride), and high concentrations may be released in fires [Bjerre 1984]. It is highly reactive toward amino, hydroxyl and thiol groups [Noort *et al.* 2000] It is known to be generated photochemically from organochlorine precursors [Hatch *et al.* 2001]. It has also been widely reported that phosgene was first used as a chemical warfare agent in 1915 during the First World War.
Colour Tests Paper soaked in alcoholic or carbon tetrachloride solution containing 10% of a mixture of equal parts of *p*-dimethylaminobenzaldehyde and colourless diphenylamine, then dried, will turn from yellow to deep orange in the presence of phosgene [O'Neil *et al.* 2006]. Several reagents when dissolved in *o*-dichlorobenzene will react when exposed to phosgene [Linch *et al.* 1965], described as shown in the table below.
Mass Spectrum Principal ions at *m/z* 154, 153, 182, 121, 69, 155, 77, 110 (dimercaptotoluene derivative) ; 151, 96, 123, 69 (aminothiophenol derivative); 83, 141, 55, 41, 42, 100, 125, 86 (bis(2-hydroxymethylpiperidine) derivative) [Muir *et al* 2005].
Quantification
Other **GC** Air Samples. Column: DB-5 fused silica capillary (30 m × 0.32 mm i.d.). Carrier gas: He, 24 mL/min. Temperature programme: 150° for 16 min to 190 at 16°/min for 16 min. FID. Retention time: ~15 min (tetra-*n*-butyl urea derivative). Limit of quantification not reported [Hendershott 1986].
GC-MS Air Samples and Synthetic GasMixtures. Column: DB-1701 capillary (25 m × 0.25 mm i.d., 0.25 µm). Temperature programme: 40° for 1 min to 280° at 20°/min for 1 min. EI ionisation at 70 eV, SIM acquisition mode. Retention time: phosgene 3,4-dimercaptotoluene derivative 12.2 min; phosgene 2-aminothiophenol derivative 13.4 min. Limit of detection, phosgene 3,4-dimercaptotoluene derivative 3 ng/m^3, phosgene 2-aminothiophenol derivative 3 ng/m^3[Muir *et al.* 2005].
Note For a method for the monitoring of toxic compounds in air using a handheld ion trap mass spectrometer, see Keil *et al.* [2008]; for purity analysis of phosgene by quantitative ^{13}C NMR spectroscopy, see Henderson and Cullinan [2007]; for the detection of phosgene using fluorescence resonance energy transfer, see Zhang and Rudkevich [2007]; for the LC-MS detection of phosgene in blood *in vitro* as a glutathione adduct, see Fabrizi *et al.* [2003], or as a pentapeptide fragment adduct of albumin or haemoglobin, see Noort *et al.* [2000]; for the detection of phosgene in air using ion mobility spectrometry, see Bocos-Bintintan *et al.* [2002]; for a spectrophotometric method for the determination of phosgene in air, see Dangwal [1994]; for a GC study comparing different column packings for phosgene analysis, see Esposito *et al.* [1977]; for a colorimetric method for the quantification of phosgene in air, see Thompson *et al.* [1976].
Disposition in the Body
Toxicity A concentration of 0.1 ppm phosgene has been recommended by several agencies in the USA and Europe as a safe workplace time-weighted average

Reagent structure		*Solution colour*	
Component A	*Component B*	*Initial*	*After phosgene exposure*
p-Dimethyl aminobenzaldehyde	*N*-Phenyl-β-naphthylamine	Colourless-slight yellow	Orange
p-Dimethyl aminobenzaldehyde	*N*-Methyl-α-naphthylamine	Slight violet	No change
p-Dimethyl aminobenzaldehyde	Diphenyl-*p*-phenylene-diamine	Violet	Red-Brown
p-Dimethyl aminobenzaldehyde	4,4′-Dimethoxydiphenylamine	Colourless	Yellow
p-Dimethyl aminobenzaldehyde	Diphenylamine	Near colourless	Yellow
o-Chlorobenzaldehyde	*N*-Phenyl-β-naphthylamine	Colourless	Yellow
o-Chlorobenzaldehyde	Diphenylamine	Colourless	Faint yellow
o-Chlorobenzaldehyde	Diphenyl-*p*-phenylene-diamine	Brown	No change
m-Diethylaminophenol	Nitroso-*m*-diethylaminophenol	Faint brown	No change
4,4` -Bis(dimethylamino) benzophenone	–	Faint violet	Deep blue
4,4` -Bis(dimethylamino) benzophenone	Dimethylaniline	Faint blue	Deep blue
4,4` -Bis(dimethylamino) benzophenone	2,4-Dinitrophenol	Faint blue	Blue
4,4` -Bis(diethylamino)benzophenone	–	Faint blue	Blue-green

exposure for repeated 8 h per work day [Pauluhn *et al.* 2007]. The lethal exposure for humans is ~800 ppm for 2 min [Cucinell 1974]. Phosgene is capable of damaging a variety of biological materials in an oxidant-like fashion, its activity resulting from at least 2 separate chemical reactions: acylation and hydrolysis. Acylation, the more important mechanism, results from the reaction of phosgene with nucleophilic moieties such as amino, hydroxyl, and sulfhydryl groups of tissue macromolecules. This results in the denaturation of proteins and lipids, irreversible alterations of membrane structures, and disruption of enzyme and other cell functions. In addition, hydrolysis of phosgene results in hydrochloric acid formation on moist membranes, which may provoke irritation and tissue damage [Borak, Diller 2001; Pauluhn *et al.* 2007].

Symptoms of poisoning, which may be delayed for up to 24 h (and rarely 72 h), include burning of the eyes and throat, cough, dyspnoea, cyanosis, pulmonary congestion, and oedema. Death may result from anoxia. It has been observed that among those affected who die, 80% may be expected to die during the first 24–48 h post-exposure [Karalliedde *et al.* 2000]. Exposure to 50 ppm may be rapidly fatal. Massive exposure may cause intravascular haemolysis, thrombus formation and immediate death. Exertional dyspnoea may persist for months after exposure to high concentrations. After inhalation of phosgene or absorption from the skin, treatment consists of complete rest and inhalation of oxygen. The mouth, eyes, nose and skin should be irrigated with copious amounts of water. Oral or parenteral corticosteroids have been used for bronchospasm, but the role of inhaled corticosteroids is considered to be controversial. Antibacterials may reduce respiratory infections [Sweetman 2007]. Premedication with hexamethylenetetramine (HMT) has been reported to be effective in protecting humans against a lethal dose of phosgene; however, this is limited at higher doses of phosgene and the necessary high HMT doses cause side effects [Diller 1980].

Note For case histories of acute lung injury in humans after phosgene inhalation, see Lim *et al.* [1996] and Snyder *et al.* [1992]. For a review of the concentration–effect relationship of phosgene exposure in humans, see Diller [1978], [1985a]. For a case study of contact dermatitis caused by phosgene (chlorophenyl)hydrazones found in bleached sweaters, see Kojima *et al.* [1990] and Kojima and Momma [1989]. For proceedings of a conference on phosgene poisoning, see Diller [1985b]. For a review on vesicants, see McManus and Huebner [2005].

Phthalylsulfacetamide

Antibacterial, Sulfonamide

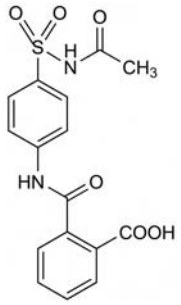
$C_{16}H_{14}N_2O_6S = 362.4$

CAS—131-69-1

IUPAC Name 2-[[4-(Acetylsulfamoyl)phenyl]carbamoyl]benzoic acid

Synonyms 2-[[[4-[(Acetylamino)sulfonyl]phenyl]amino]carbonyl]benzoic acid; ftalicetimida; phthaloylsulfacetamide; phthalylsulfacetamide; sulfanilacetamidum phthalylatum.

Proprietary Names *Enterocid*; *Enterosulfamid*; *Enterosulfon*; *Talecid*; *Thalacet*; *Rabalan*; *Sterathal*.



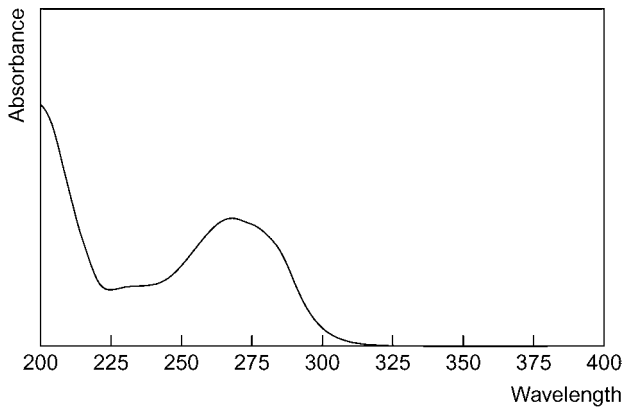
Chemical Properties White or creamy-white crystals or crystalline powder. Mp 196°. Very slightly soluble in water; slightly soluble in ethanol; soluble in acetone; freely soluble in solutions of alkali hydroxides. Log *P* (octanol/water), 1.3.

Colour Test Copper sulfate (method 1)—blue.

Thin-layer Chromatography System TD—R_f 0.00; system TE—R_f 0.00; system TF—R_f 0.00; system TAD—R_f 0.00.

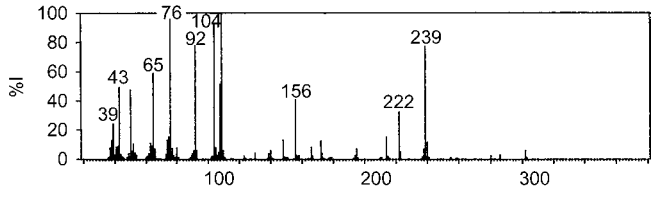
Gas Chromatography See Sulfacetamide.

Ultraviolet Spectrum Aqueous acid—268 nm (broad); aqueous alkali—265 nm (broad).



Infrared Spectrum Principal peaks at wavenumbers 1170, 1681, 1527, 837, 1302, 1592 cm^{-1}.

Mass Spectrum Principal ions at *m/z* 109, 76, 104, 92, 239, 65, 108, 43.



Dose 6 to 12 g daily.

P

Phthalylsulfathiazole

Antibacterial, Sulfonamide

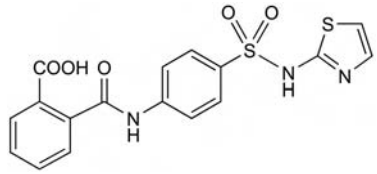
$C_{17}H_{13}N_3O_5S_2$ = 403.4

CAS—85-73-4

IUPAC Name 2-[[4-(1,3-Thiazol-2-ylsulfamoyl)phenyl]carbamoyl]benzoic acid

Synonyms Ftalilsulfatiazol; phthalazolum; phthalylsulfathiazole; sulfaphtalylthiazol; 2-[[[4-[(2-thiazolylamino)sulfonyl]phenyl]amino]carbonyl]benzoic acid.

Proprietary Names *AFI-Ftalyl*; *Entexidina*; *Ftalazol*; *Intestiazol*; *Kaotalil*; *Sulfathalidine*; *Sulfalyl*; *Taleudron*; *Talidine*; *Thalazole*; *Ultratiazol*.



Chemical Properties White or yellowish-white crystals, or powder, which darken on prolonged exposure to light. Effervesces at 244° to 250°. Mp 272° to 277°, with decomposition. Practically insoluble in water, chloroform and ether; soluble 1 in 600 of ethanol; freely soluble in dimethylformamide and solutions of alkali hydroxides and carbonates, and in hydrochloric acid. Log *P* (octanol/water), 0.9.

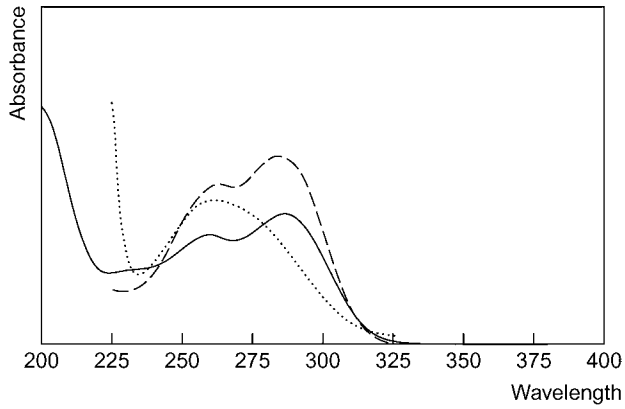
Colour Test Copper sulfate (method 1)—green.

Thin-layer Chromatography System TD—R_f 0.00; system TE—R_f 0.00; system TF—R_f 0.00; system TT—R_f 0.02; system TU—R_f 0.04; system TV—R_f 0.04; system TAD—R_f 0.00; system TAJ—R_f 0.00; system TAK—R_f 0.04; system TAL—R_f 0.42.

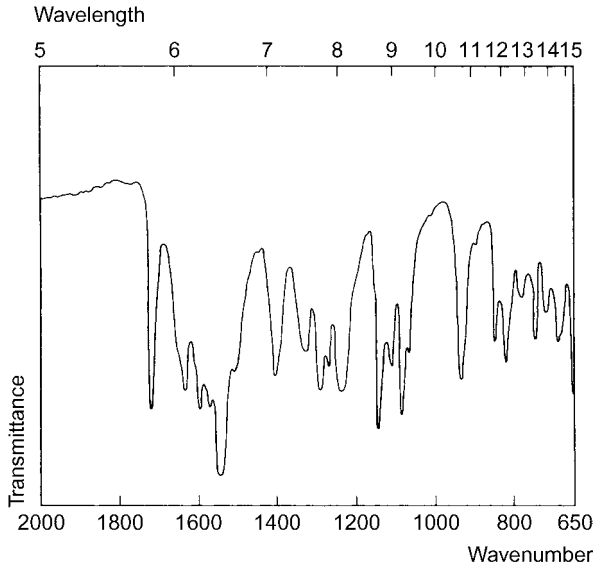
Gas Chromatography See Sulfathiazole.

High Performance Liquid Chromatography System HU—*k* 14.0.

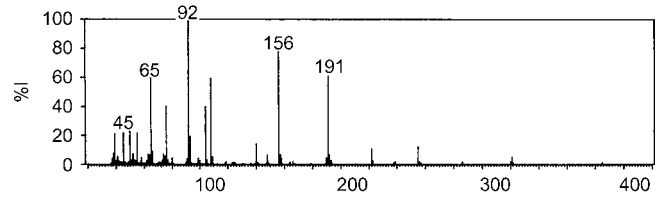
Ultraviolet Spectrum Aqueous acid—282; aqueous alkali—260 nm ($A^{1\%}_1$=600a); methanol—260 nm ($A^{1\%}_1$=497a), 288 nm ($A^{1\%}_1$=648a).



Infrared Spectrum Principal peaks at wavenumbers 1532, 1142, 1084, 1710, 1585, 1560 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 92, 156, 191, 65, 108, 76, 104, 50.



Disposition in the Body Only about 5% of a dose is absorbed after oral administration and blood concentrations are therefore very low compared to other sulfonamides, usually <15 mg/L. It is slowly hydrolysed to sulfathiazole in the gastro-intestinal tract.

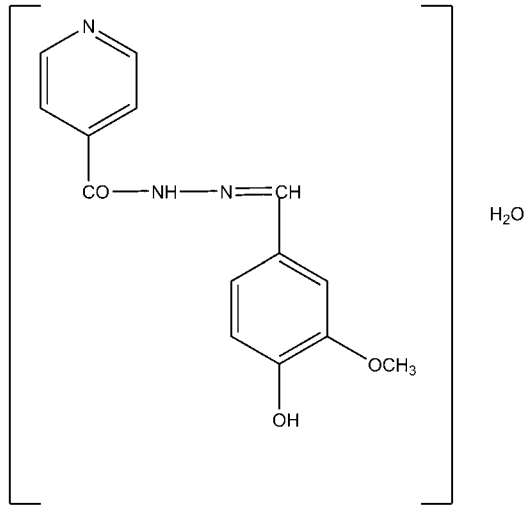
Dose 2 to 12 g daily.

Phthivazid

Tuberculostatic

$C_{14}H_{13}N_3O_3$ = 289.3

Synonyms Ftivazide; *N′*-[4-hydroxy-3-methoxybenzylidene)methyl]pyridine-4-carbohydrazide monohydrate; isonicotinic acid vanillylidenehydrazide.



Chemical Properties A light-yellow crystalline powder. Almost insoluble in water; slightly soluble in ethanol; freely soluble in inorganic acids and alkalis; soluble in glacial acetic acid. Extracted by chloroform from aqueous alkaline solutions.

Colour Tests Dissolve 50 mg, heating slightly, in 10 mL of ethanol; cool and add a few drops of 2 N sodium hydroxide—the light yellow colour of the solution darkens to canary yellow. Acidify with dilute hydrochloric acid—the solution becomes almost colourless and then acquires a yellow colour.

To 50 mg add 50 mg of dinitrochlorobenzene and 3 mL of ethanol; boil for 2 to 3 minutes, cool and add 2 drops of 2N sodium hydroxide—a brownish red colour develops, which becomes more intense on standing.

Thin-layer Chromatography System T1—R_f 0.60 (location reagent potassium permanganate spray, positive reaction).

Gas Chromatography System G2/225—no peaks within 30 min; system G4/225—no peaks within 30 min.

Ultraviolet Spectrum Phthivazid in 0.1 N sulfuric acid, maxima at 228 (E1%, 1 cm 670), 273 (E1%, 1 cm 537) and 307 nm (E1%, 1 cm 359), minima at 246 and 297 nm; in ethanol maxima at 275 (E1%, 1 cm 360) and 333 nm (E1%, 1 cm 830), minimum at 250 nm.

Infrared Spectrum Principal peaks at wavenumbers 1282 or 1590, 1668, 1506 cm^{-1} (KBr disk).

Dose Up to 2 g daily.

Physostigmine

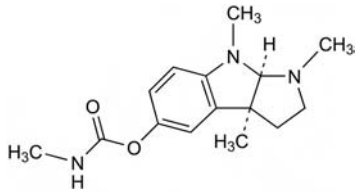
Anticholinesterase

$C_{15}H_{21}N_3O_2$ = 275.3

CAS—57-47-6

IUPAC Name [(3a*R*,8b*S*)-3,4,8b-Trimethyl-2,3a-dihydro-1*H*-pyrrolo[2,3-b]indol-7-yl] *N*-methylcarbamate

Synonyms Eserine; (3a*S*-*cis*)-1,2,3,3a,8,8a-hexahydro-1,3a,8-trimethylpyrrolo[2,3-*b*]-indol-5-ol methylcarbamate ester; physostigmina.



Chemical Properties An alkaloid obtained from the calabar bean (ordeal bean; chopnut), the seed of *Physostigma venenosum* (Leguminosae). Colourless crystals, or a white microcrystalline powder. Mp 105° to 106°; also unstable, low-melting form, mp 86° to 87°. Soluble 1 in 75 of water, 1 in 10 of ethanol, 1 in 1 of chloroform and 1 in 30 of ether. Physostigmine, its salts and their aqueous solutions become red on exposure to heat, light, air and on contact with traces of metals, owing to the formation of rubreserine; the change is less rapid in acid solution. pK_a 1.8, 7.9 (25°). Log *P* (octanol/water), 1.6.

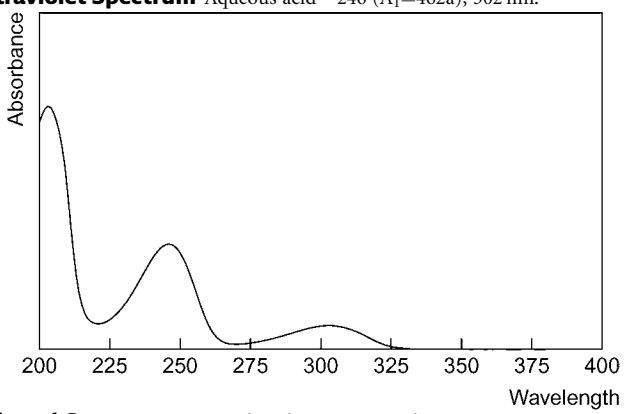
Physostigmine Salicylate

$C_{15}H_{21}N_3O_2,C_7H_6O_3 = 413.5$
CAS—57-64-7
Synonym Eserine salicylate
Proprietary Names *Anticholium*; *Antilirium*.
Chemical Properties Colourless or white crystals or white powder. Mp 185° to 187°. Soluble 1 in 75 to 1 in 90 of water, 1 in 16 of ethanol, 1 in 6 of chloroform, and 1 in 250 of ether.

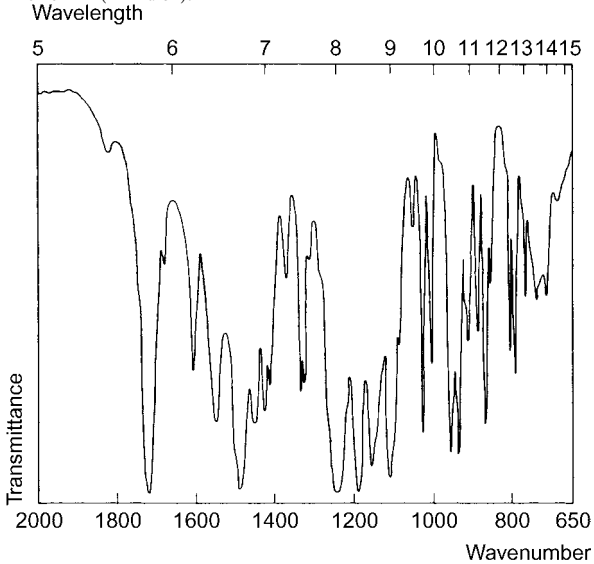
Physostigmine Sulfate

$(C_{15}H_{21}N_3O_2)_2,H_2SO_4 = 648.8$
CAS—64-47-1
Synonym Eserine sulfate
Chemical Properties A white deliquescent, microcrystalline powder. Mp 140°. Soluble 1 in 4 of water and 1 in 0.4 of ethanol; soluble in chloroform; very slightly soluble in ether.

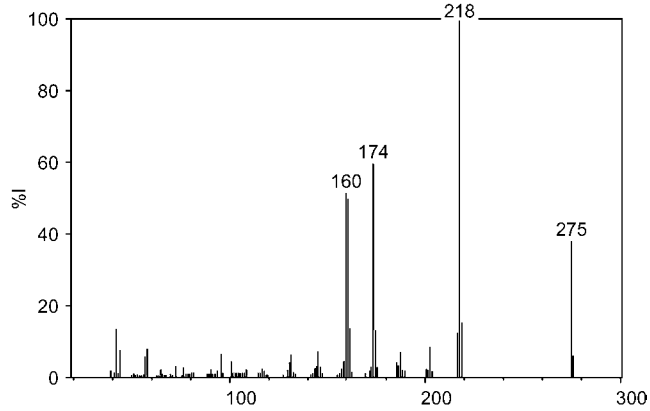
Colour Test Mandelin's test—yellow-brown.
Thin-layer Chromatography System TA—R_f 0.55; system TB—R_f 0.12; system TC—R_f 0.36; system TE—R_f 0.55; system TL—R_f 0.18; system TAE—R_f 0.40; system TAF—R_f 0.38; system TAJ—R_f 0.18; system TAK—R_f 0.03; system TAL—R_f 0.50 (acidified potassium permanganate solution, positive).
Gas Chromatography System GA—RI 1804, RI 2035 and RI 2190.
High Performance Liquid Chromatography System HA—*k* 2.6; system HX—RI 296; system HY—RI 240; system HZ—retention time 2.2 min.
Ultraviolet Spectrum Aqueous acid—246 (A^{1}_{1}=462a), 302 nm.



Infrared Spectrum Principal peaks at wavenumbers 1724, 1243, 1200, 1495, 1120, 1162 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 218, 174, 160, 161, 275, 219, 175, 162.



Quantification
Blood **HPLC** Electrochemical detection. Physostigmine and eseroline [Lawrence, Yatim 1990].
Plasma **HPLC** See Blood [Lawrence, Yatim 1990]. Fluorescence detection. Limit of detection, 100 ng/L [Elsayed *et al.* 1989]. Electrochemical detection. Limit of detection, 500 ng/L [Unni *et al.* 1989]. Electrochemical detection. Limits of detection, 25 to 50 pg/mol [Whelpton, Moore 1985]. Electrochemical detection. Limit of detection, 500 ng/L [Whelpton 1983].
Serum **HPLC** Fluorescence detection. Physostigmine and eseroline. Limit of detection, 2 µg/L for physostigmine and 5 µg/L for eseroline [Quinn, Stewart 1991].
Cerebrospinal Fluid **HPLC** See Blood [Lawrence, Yatim 1990]. See Plasma [Unni *et al.* 1989].
Disposition in the Body Readily absorbed after oral or SC administration and from mucous membranes. Physostigmine readily penetrates the CNS. It is rapidly hydrolysed by cholinesterases and most of a dose is destroyed in 2 h. Very little is excreted in the urine.
Therapeutic Concentration
After a single SC injection of 1 mg of physostigmine salicylate (equivalent to 0.67 mg base) to one subject, a peak plasma concentration of 0.0036 mg/L was achieved after 15 min [Whelpton 1983].
After a single oral dose of 4 mg of physostigmine salicylate to one subject, a peak plasma concentration of about 0.001 mg/L was attained in 0.75 h [Gibson *et al.* 1985].
Toxicity Fatalities have occurred following ingestion of 6 mg of physostigmine orally and administration of 1.2 mg IV. The ingestion of 6 calabar beans by a child has proved fatal.

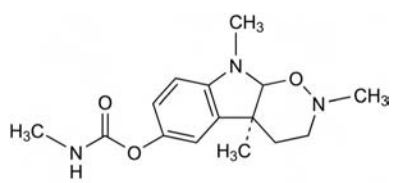
Physostigmine Aminoxide

Anticholinesterase
$C_{15}H_{21}N_3O_3 = 291.3$
CAS—25573-43-7
IUPAC Name [(4a*S*,9a*S*)-2,4a,9-Trimethyl-4,9a-dihydro-3*H*-oxazino[6,5-b]indol-6-yl] *N*-methylcarbamate
Synonyms Eseridine; eserine aminoxide; (4a*S*-*cis*)-2,3,4,4a,9,9a-hexahydro-2,4a,9-trimethyl-1,2-oxazino[6,5-*b*]indol-6-ol methylcarbamate ester; physostigmine *N*-oxide.



Chemical Properties Crystals. Mp 129°. Practically insoluble in water; soluble in ethanol, chloroform, benzene, acetone and ether. Log *P* (octanol/water), 2.1.

Physostigmine Aminoxide Salicylate

$C_{15}H_{21}N_3O_3,C_7H_6O_3 = 429.5$
CAS—5995-96-0

P

Synonyms Eseridine salicylate; eserine aminoxide salicylate; physostigmine *N*-oxide salicylate.
Proprietary Name *Geneserine 3*
Chemical Properties Crystals which become red on exposure to heat, light and air. Mp 90°.

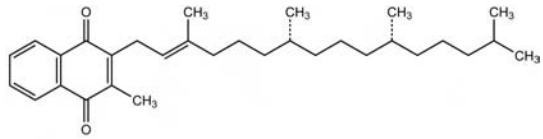
Thin-layer Chromatography System TA—R_f 0.31 (acidified potassium permanganate solution, positive).
Ultraviolet Spectrum Aqueous acid—241 (A^1_1=411b), 300 nm.
Infrared Spectrum Principal peaks at wavenumbers 1720, 1250, 1204, 1268, 1495, 1289 cm^{-1} (KBr disk).
Quantification
Plasma **HPLC-MS** Limit of detection, 25 ng/L [Pruvost *et al.* 2000].
Dose Physostigmine aminoxide salicylate has been given in doses of 9 mg daily.

Pruvost A *et al.* (2000). Fully automated determination of eserine N-oxide in human plasma using on-line solid-phase extraction with liquid chromatography coupled with electrospray ionization tandem mass spectrometry. *J Mass Spectrom* 35: 625–633.

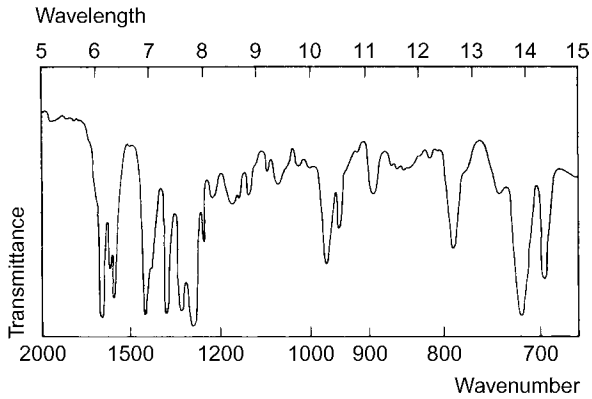
Phytomenadione

Vitamin
$C_{31}H_{46}O_2$ = 450.7
CAS—84-80-0

IUPAC Name 2-Methyl-3-[(*E*)-3,7,11,15-tetramethylhexadec-2-enyl]naphthalene-1,4-dione
Synonyms 2-Methyl-3-[(2*E*,7*R*,11*R*)-3,7,11,15-tetramethyl-2-hexadecenyl]-1,4-naphthalenedione; methylphytylnaphthochinonum; phylloquinone; phytonadione; vitamin K_1.
Proprietary Names *Aquamephyton*; *Kanakion*; *Kanavit*; *Konakion*; *Mephyton*; *Vitamin K*.



Chemical Properties A clear, deep yellow, very viscous oil which is stable in air but decomposes on exposure to light. Sp. gr. about 0.967. Refractive index 1.5255 to 1.5285. Practically insoluble in water; soluble 1 in 70 of ethanol; more soluble in dehydrated alcohol; sparingly soluble in methanol; freely soluble in chloroform and ether. Log *P* (octanol/water), 11.7.
Colour Test Methanolic potassium hydroxide—green-yellow→violet→brown.
Gas Chromatography System GA—RI 3287.
Ultraviolet Spectrum Methanol—244, 249 (A^1_1=394a), 263 (A^1_1=350b), 270 (A^1_1=349a), 331 nm (A^1_1=68a).
Infrared Spectrum Principal peaks at wavenumbers 1285, 1650, 714, 1587, 690, 1610 cm^{-1}.



Quantification
Plasma **HPLC** Fluorescence detection. Phytomenadione and vitamins A and E, and beta-carotene. Limit of detection, 0.04 µg/L for phytomenadione [Jakob, Elmadfa 1995]. Fluorescence detection. Phytomenadione, its epoxides, and menaquinone-4. Limit of detection, 30 to 50 ng/L [Hirauchi *et al.* 1988]. Fluorescence detection. Limit of detection, 0.05 µg/L [Haroon *et al.* 1986]. UV detection. Limit of detection, 500 pg [Shearer *et al.* 1982].
Serum **HPLC** Fluorescence detection. Limit of detection,about, 20 ng/L MacCrehan, Schonberger 1995]. Fluorescence detection. Phytomenadione. Limit of detection, 30 pg/inj. [Cham *et al.* 1989].
Liver **HPLC** Fluorescence detection. Phytomenadione and menaquinone [Usui *et al.* 1989].
Disposition in the Body Absorbed from the gastro-intestinal tract in the presence of bile. Rapidly metabolised and excreted as conjugates in the urine, bile and faeces. Endogenous plasma concentrations are usually in the range 0.0001 to 0.0007 mg/L.

Therapeutic Concentration
Phytomenadione given in a dose of 10 mg as a mixed micellar preparation to 30 subjects, produced a mean maximum plasma concentration of 67 µg/L (range, 16 to 113) after 9.2 h (range, 2 to 24) after IM injection [Soedirman *et al.* 1996].

Phytomenadione given by i.v. injection to 18 neonates at a dose of 0.3 mg/kg, resulted in a mean blood concentration of 191.3 µg/L after 22.9 h; a further blood sample taken after 111.8 h from 10 of the neonates revealed a concentration of 98.7 µg/L [Raith *et al.* 2000].
Half-life Plasma half-life, about 2 h.
Dose Initially 2.5 to 25 mg by SC or IM injection, or 5 to 20 mg by mouth.

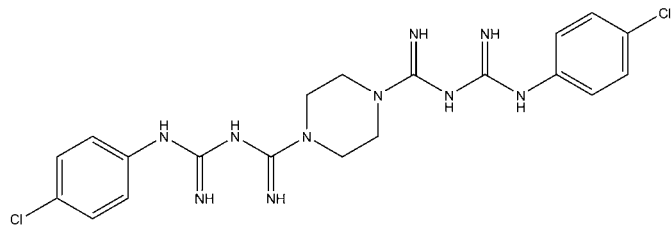
Picloxydine

Disinfectant
$C_{20}H_{24}C_{l2}N_{10}$ = 475.4
IUPAC Name 1-*N*′,4-*N*′-Bis[*N*′-(4-chlorophenyl)carbamimidoyl]piperazine-1,4-dicarboximidamide
Synonyms Bisguanizine; 1,4-di(*p*-chlorophenylguanidinoformimidoyl)piperazine; pikloxidin.



Chemical Properties White amorphous powder. Mp 247° to 251° with decomposition. Very sparingly soluble water and organic solvents. Picloxydine is extracted by chloroform : isopropanol (3 : 1) from aqueous alkaline solutions.

Picloxydine Dihydrochloride
Chemical Properties White crystalline solid. Mp 274° to 278° with decomposition. Soluble 1 in 500 of water; very slightly soluble in ethanol, methanol and acetone; insoluble in ether and chloroform.

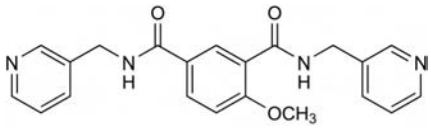
Picloxydine Digluconate
Proprietary Name It is an ingredient of *Resiguard*.
Chemical Properties A colourless or pale-yellow gel which melts to a clear yellow liquid at about 33°. Soluble in water and warm methanol; insoluble in ether and chloroform.

Thin-layer Chromatography System T1—R_f 0.10; R_f 0.33, streaking (location reagent acidified iodoplatinate spray, positive reaction).
Gas Chromatography System G2/225—no peaks within 30 min; system G4/225—no peaks within 30 min.
Ultraviolet Spectrum pH 4.6 buffer—233 (E1%, 1 cm 571), 253 nm (E1%, 1 cm 610).
Infrared Spectrum Principal peaks at wavenumbers 1000, 1560, 1570, 1650 cm^{-1} (KBr disk) (picloxydine dihydrochloride).
Use In a disinfectant fluid concentrate containing 1% as the digluconate.
Disposition in the Body
Toxicity LD_{50} in rats, >5 g/kg (oral).

Picotamide

Anticoagulant, Antithrombotic
$C_{21}H_{20}N_4O_3$ = 376.4
CAS—32828-81-2

IUPAC Name 4-Methoxy-1-*N*,3-*N*-bis(pyridin-3-ylmethyl)benzene-1,3-dicarboxamide
Synonyms G-137; 4-methoxy-*N*,*N*′-bis(3-pyridinylmethyl)-1,3-benzenedicarboxamide.



Chemical Properties A white or almost white crystalline powder. Mp 124°. Slightly soluble in water; soluble in ethanol, methanol and dichloromethane. It dissolves in dilute mineral acids. Log *P* (octanol/water), 1.53.

Picotamide Monohydrate

$C_{21}H_{20}N_4O_3,H_2O = 394.4$
Synonym Picotamidum monohydricum
Proprietary Name *Plactidil*

Thin-layer Chromatography Plate: Merck F-254 silica gel plates (0.25 mm). Mobile phase: (A) chloroform : methanol (9 : 1); (B) methanol : concentrated ammonia (100 : 105); (C) benzene : ethylacetate : acetic acid (2 : 1 : 0.1); (D) ethylacetate : ethanol (2 : 1). UV detection (λ=254 nm). Picotamide monohydrate (A) R_f 0.41; Picotamide (B) R_f 0.60; (C) R_f 0.0; (D) R_f 0.21 [Orzalesi *et al.* 1989].
High Performance Liquid Chromatography Column: LiChrosorb RP-Select B C_8 (250 × 4 mm i.d., 5 µm). Mobile phase: acetonitrile : 50 mmol/L sodium dihydrogen phosphate (pH 5.5; 28 : 72), flow rate 1 mL/min. IS: bamifylline. UV detection (λ=230 nm). Retention time: picotamide, 10 min; IS, 7 min [Fossati *et al.* 1992].

Column: Spherisorb S5 ODS1 (250 × 40 mm, 6 mm i.d.). Mobile phase: methanol : phosphate buffer (pH 7.9; 60 : 40), flow rate 0.8 mL/min. Retention time: 9.35 min. Limit of detection, 0.1 µg[Orzalesi *et al.* 1989].

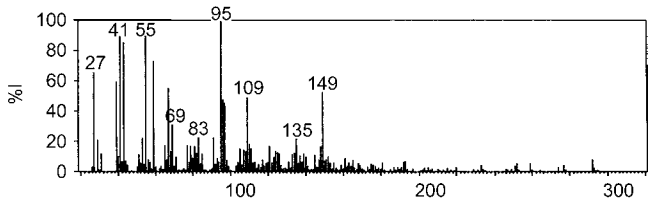
Quantification
Blood **HPLC** UV detection (λ=230 nm). Limit of quantification, 5 µg/L [Fossati *et al.* 1992].
Urine **HPLC** Limit of quantification, 1 µg/L, see Blood [Fossati *et al.* 1992].
Dose Initial daily dose, 900 to 1200 mg; maintenance dose of 300 to 600 mg daily.

Fossati T *et al.* (1992). Determination of picotamide in human plasma and urine by high-performance liquid chromatography. *J Chromatogr* 577: 382–386.
Orzalesi G *et al.* (1989). *Int J Pharm* 52: 225–229.

Picrotoxin

Respiratory Stimulant
$C_{30}H_{34}O_{13} = 602.6$
CAS—124-87-8

Synonym Cocculin
Chemical Properties An active principle from the seeds of *Anamirta cocculus* (=*A. paniculata*) (Menispermaceae). The fruits of *A. cocculus* are sometimes known as 'fish berries' or 'Levant berries'. Colourless, flexible, shining prismatic crystals or white microcrystalline powder. Mp 203°. Soluble 1 in 350 of water and 1 in 16 of ethanol; soluble in glacial acetic acid and solutions of acids and alkali hydroxides; slightly soluble in chloroform and ether. Log *P* (octanol/water), −2.8.
Colour Tests Dissolve in sulfuric acid—yellow→red-brown (slow); add 1 drop of nitric acid, fuming, to the material—blue-green, discharged by excess acid.
Infrared Spectrum Principal peaks at wavenumbers 1780, 1755, 1795, 1123, 990, 1162 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 95, 55, 41, 43, 59, 27, 39, 67.

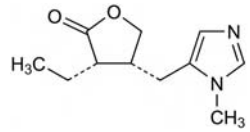


Dose Picrotoxin was formerly given in doses of 3 to 6 mg IV.

Pilocarpine

Parasympathomimetic
$C_{11}H_{16}N_2O_2 = 208.3$
CAS—92-13-7

IUPAC Name (3*S*,4*R*)-3-Ethyl-4-[(3-methylimidazol-4-yl)methyl]oxolan-2-one
Synonym (3*S*-*cis*)-3-Ethyldihydro-4-[(1-methyl-1*H*-imidazol-5-yl)methyl]-2(3*H*)-furanone
Proprietary Names *Ocusert Pilo*; *Pilocarpol*; *Piloftal*; *Pilomann-Ol*; *Piloplex*.



Chemical Properties An alkaloid obtained from the leaves of jaborandi, *Pilocarpus microphyllus* (Rutaceae) and other species of *Pilocarpus*. A viscous, hygroscopic, colourless, oily liquid or crystals. Mp about 34°. Soluble in water, ethanol and chloroform; sparingly soluble in ether and benzene. pK_a 1.6, 7.1 (15°). Log *P* (octanol/water), 0.1.

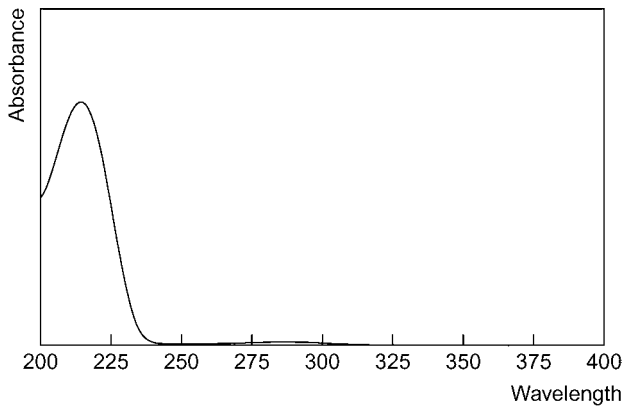
Pilocarpine Hydrochloride

$C_{11}H_{16}N_2O_2,HCl = 244.7$
CAS—54-71-7
Proprietary Names *Adsorbocarpine*; *Akarpine*; *Asthenopin*; *Borocarpin-S*; *Isopto Carpine*; *Diocarpine*; *Dropilton*; *Glaucocarpine Liocarpina*; *Miocarpine*; *Mi-Pilo*; *Ocu-Carpine*; *Pilax*; *Pilo*; *Pilocar*; *Pilocarcil*; *Pilogel*; *Pilomann*; *Pilopt*; *Piloptic*; *Pilostat*; *Pilo-Stulln*; *Pilotonina*; *PV Carpine*; *Salagen*; *Sno Pilo*; *Spersacarpin(e)*; *Storzine*; *Vistacarpin*. It is an ingredient of *E-Pilo* and *PE*.
Chemical Properties Hygroscopic, colourless crystals or white crystalline powder. Mp 204° to 205°. Soluble 1 in <1 of water, 1 in 3 of ethanol and 1 in 360 of chloroform; practically insoluble in ether.

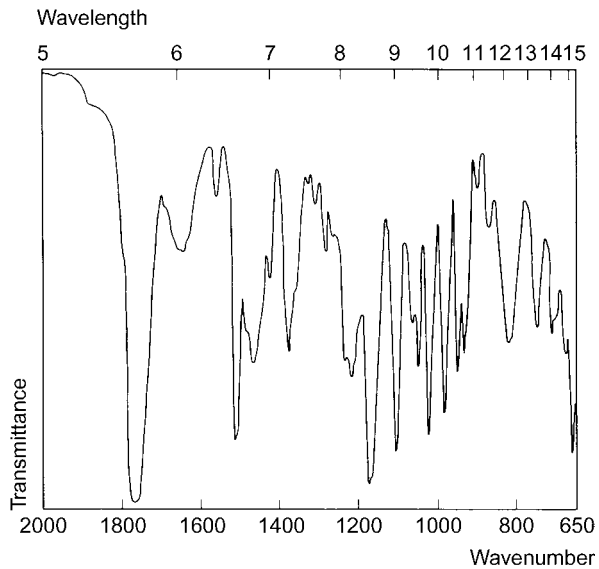
Pilocarpine Nitrate

$C_{11}H_{16}N_2O_2,HNO_3 = 271.3$
CAS—148-72-1
Proprietary Names *Chibro-Pilocarpine*; *Licarpin*; *Pilagan*; *Pilo*; *Pilopos*.
Chemical Properties Colourless crystals or white crystalline powder. Mp 173° to 174°, with decomposition. Soluble 1 in 4 of water and 1 in 75 of ethanol; insoluble in chloroform and ether.

Thin-layer Chromatography System TA—R_f 0.53; system TB—R_f 0.00; system TC—R_f 0.32; system TE—R_f 0.44; system TL—R_f 0.12; system TAE—R_f 0.52; system TAF—R_f 0.45; system TAJ—R_f 0.22; system TAK—R_f 0.00; system TAL—R_f 0.44 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2014.
High Performance Liquid Chromatography System HAA—retention time 4.6 min; system HY—RI 158.

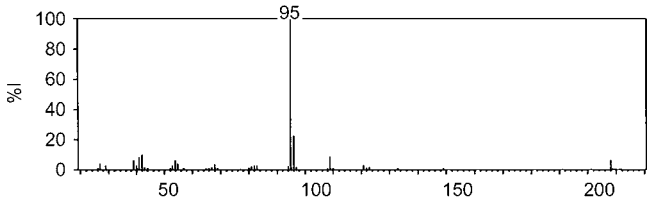


Infrared Spectrum Principal peaks at wavenumbers 1752, 1168, 1104, 660, 1505, 1020 cm^{-1} (thin film).



P

Mass Spectrum Principal ions at *m/z* 95, 96, 42, 109, 41, 208, 54, 39.



Quantification

Plasma **GC-MS** Pilocarpic acid. Limit of detection, <1 µg/L [Birk *et al.* 1998].

HPLC Limit of detection, 10 µg/L [Weaver *et al.* 1992].

HPLC-MS Pilocarpine, isopilocarpine, pilocarpic acid and isopilocarpic acid [van de Merbel *et al.* 1998].

Urine **HPLC-MS** See Plasma [van de Merbel *et al.* 1998].

Biological Fluids **HPLC** Limit of detection, 1 µg/L [Aromdee *et al.* 1996].

Therapeutic Concentration

Eighteen subjects receiving a single oral dose (2.5 to 20 mg) of pilocarpine had a mean peak plasma concentration of 20.5 µg/L (range, 12.5 to 33.2) at 1.21 h (0.50 to 1.87); the mean peak plasma concentration in 8 patients with renal failure receiving a similar dose was 30.9 µg/L (range, 12.7 to 47.0) at 0.61 h (range, 0.57 to 0.65) [St Peter *et al.* 2000].

Eight subjects given 15 mg of a controlled-release pilocarpine formulation every 12 h for 3 doses had a mean peak plasma concentration of 8.2 µg/L approx. 1 h after the first dose and 11.5 µg/L after the third dose; 24 h after the final dose the level had declined to 0.06 µg/L [Lockhart *et al.* 1996].

Uses Pilocarpine hydrochloride is used as a 0.5 to 5% ophthalmic solution and in the treatment of xerostomia/xerophthalmia.

Aromdee C *et al.* (1996). Sensitive high-performance liquid chromatographic assay for pilocarpine in biological fluids using fluorescence derivatisation. *J Chromatogr B Biomed Appl* 677: 313–318.

Weaver ML *et al.* (1992). High-performance liquid chromatographic determination of pilocarpine in plasma. *J Chromatogr* 581: 293–296.

Piminodine

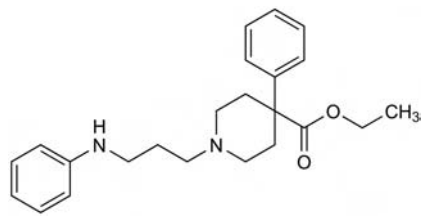
Narcotic Analgesic

$C_{23}H_{30}N_2O_2$ = 366.5

CAS—13495-09-5

IUPAC Name Ethyl 1-(3-anilinopropyl)-4-phenylpiperidine-4-carboxylate

Synonym 4-Phenyl-1-[3-(phenylamino)propyl]-4-piperidinecarboxylic acid ethyl ester



Chemical Properties Log *P* (octanol/water), 4.8.

Piminodine Esilate

$C_{23}H_{30}N_2O_2.C_2H_6O_3S$ = 476.6

CAS—7081-52-9

Synonyms Piminodine esylate; piminodine ethanesulfonate.

Chemical Properties A colourless crystalline powder. Mp 128° to 135°. Slightly soluble in water and ether; soluble 1 in 6 of ethanol and 1 in 2 of chloroform.

Colour Test Marquis test—orange.

Thin-layer Chromatography System TA—R_f 0.67; system TB—R_f 0.36; system TC—R_f 0.64; system TE—R_f 0.88; system TL—R_f 0.59; system TAE—R_f 0.63; system TAF—R_f 0.77; system TAJ—R_f 0.51; system TAK—R_f 0.24; system TAL—R_f 0.90 (acidified iodoplatinate solution, positive; acidified potassium permanganate solution, positive).

Gas Chromatography System GA—RI 2884.

High Performance Liquid Chromatography System HA—*k* 1.0.

Ultraviolet Spectrum Aqueous acid—247, 253, 257, 263 nm.

Mass Spectrum Principal ions at *m/z* 246, 45, 42, 366, 58, 57, 43, 106.

Dose Piminodine esilate has been given in doses of 25 to 50 mg orally and 10 to 20 mg parenterally.

Pimozide

Tranquilliser

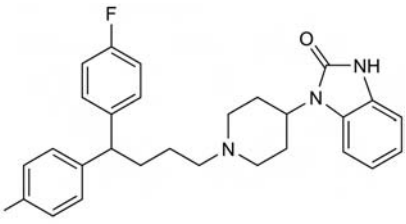
$C_{28}H_{29}F_2N_3O$ = 461.6

CAS—2062-78-4

IUPAC Name 3-[1-[4,4-Bis(4-fluorophenyl)butyl]piperidin-4-yl]- 1*H*-benzimidazol-2-one

Synonyms 1-[1-[4,4-Bis(4-fluorophenyl)butyl]-4-piperidinyl]-1,3-dihydro-2*H*-benzimidazol-2-one; R-6238.

Proprietary Names *Antolan*; *Opiran*; *Orap*; *Pizide*.



Chemical Properties A colourless microcrystalline powder. Mp 214° to 218°. Practically insoluble in water; soluble 1 in 1000 of ethanol, ether and methanol, 1 in 10 of chloroform and 1 in 100 of acetone. pK_a 7.3. Log *P* (octanol/water), 6.3. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

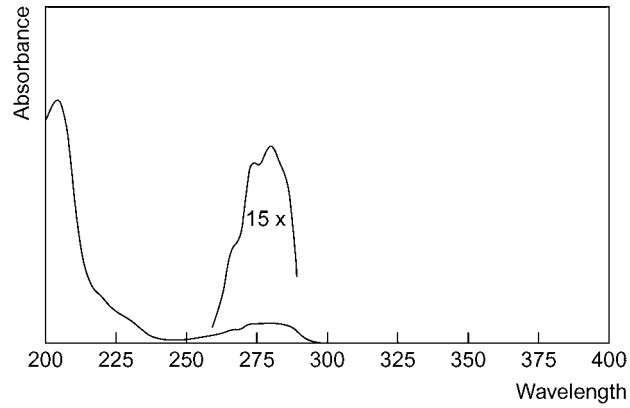
Colour Tests Koppanyi–Zwikker test—violet; Liebermann's reagent—brown; Mandelin's test—brown; Marquis test—violet.

Thin-layer Chromatography System TA—R_f 0.71; system TB—R_f 0.03; system TC—R_f 0.60; system TE—R_f 0.71; system TL—R_f 0.40; system TAE—R_f 0.73; system TAF—R_f 0.82 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—pimozide RI 3870, M (*N*-desalkyl-) RI 2415, M (benzimidazolone) RI 1950, M (desamino-OH-) RI 2120, M (Desamino-Carboxy-) RI 2130; system GB—not eluted.

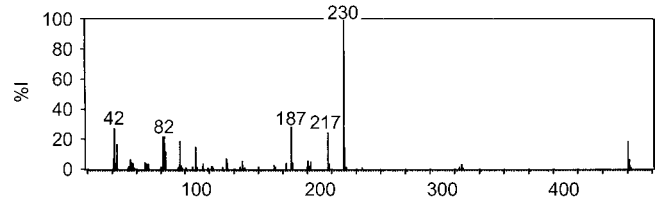
High Performance Liquid Chromatography System HA—*k* 0.7; system HX—RI 504; system HZ—retention time 11.9 min; system HAA—retention time 17.2 min.

Ultraviolet Spectrum Acid isopropyl alcohol—273, 280 nm (A^1_1=145a).



Infrared Spectrum Principal peaks at wavenumbers 1695, 1505, 753, 1220, 1230, 825 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 230, 187, 42, 217, 83, 82, 461, 96.



Quantification

Plasma **GC** FID. Limit of detection, 30 µg/L [Quaglio *et al.* 1982].

HPLC Fluorescence detection. Limit of detection, 1 µg/L [Kerbusch *et al.* 1997]. Fluorescence detection. Limit of detection, <5 µg/L [Miyao *et al.* 1983].

Radioimmunoassay Limit of detection, 50 pg [Michiels *et al.* 1975].

Disposition in the Body Readily but slowly absorbed after oral administration. About 40% of a dose is excreted in the urine in 4 days. Two metabolites which have been identified in the urine are 4-bis(4-fluorophenyl)butyric acid and 1-(4-piperidyl)benzimidazolin-2-one. Very little unchanged drug is excreted in the urine. Both unchanged drug and the butyric acid metabolite are eliminated in the faeces.

Therapeutic Concentration

Following a single oral dose of 6 mg to 9 subjects, a mean peak plasma concentration of about 0.004 mg/L was attained in 4 to 12 h (mean, 8) [McCreadie *et al.* 1979].

Half-life Plasma half-life, about 2 days.
Note For a review of pimozide, see Pinder *et al.* [1976].
Dose 2 to 20 mg daily.

Demme U *et al.* (2005). Systematic evaluation of 1-chlorobutane for liquid-liquid extraction of drugs. *Proceedings of the 12th TIAFT*, Seoul: 481–486.

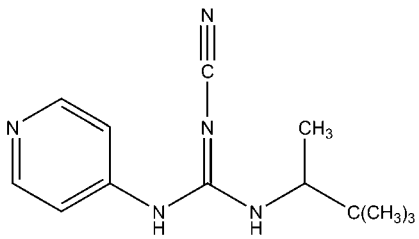
Pinacidil

Antihypertensive, Guanidine, Potassium Channel Activator
$C_{13}H_{19}N_5 = 245.3$
CAS—60560-33-0

IUPAC Name 3-Cyano-2-(3,3-dimethylbutan-2-yl)-1-pyridin-4-ylguanidine
Synonyms *N*-Cyano-*N*"-4-pyridinyl-*N*"-(1,2,2-trimethylpropyl)guanidine; (±)-2-cyano-1-(4-pyridyl)-3-(1,2,2-trimethylpropyl)guanidine; P-1134; pinacidilum; pinasidiili.



Chemical Properties Very soluble in water (31.9 g/L). Log *P* (octanol/water), 1.06 [Meylan, Howard 1995].

Pinacidil Monohydrate

$C_{13}H_{19}N_5,H_2O = 263.3$
CAS—85371-64-8
Proprietary Name *Pindac*
Chemical Properties Crystals. Mp 164° to 165°. Soluble in water (166 mg/L). Log *P* (octanol/water), 2.55 [Meylan, Howard 1995].

Quantification

Plasma **HPLC** Column: LiChrosolv RP select B (250 × 4.0 mm i.d., 5 µm). Mobile phase: methanol : 10 mmol/L dipotassium phosphate (pH 7.5; 51 : 49), flow rate 1.1 mL/min. UV detection (λ = 254 nm). Retention time: 9.0 min. Limit of quantification, 1 µg/L [Bareggi *et al.* 1999]. Column: C_8 (250 × 4.6 mm i.d., 6 µm). Mobile phase: methanol : 0.05 mol/L ammonium bicarbonate (pH 8; 50 : 50), flow rate 1 mL/min. Scintillation counting. Retention time: pinacidil 13 to 15 min, pinacidil-*N*-oxide 8 to 10 min, polar metabolites 2 to 5 min. Limit of detection, 5 µg/L [DeLong *et al.* 1988].
Serum **HPLC** Column: Hypersil ODS (100 × 4.0 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.01 mol/L diammonium hydrogen phosphate (33 : 67), flow rate 1.0 mL/min. UV detection (λ = 254 nm). Limit of quantification, not reported [Ward *et al.* 1984].
Urine **HPLC** Column: Hypersil ODS (100 × 4.0 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.01 mol/L diammonium hydrogen phosphate (20 : 80), flow rate 1.0 mL/min. UV detection (λ = 294 nm). Limit of quantification not reported [Ward *et al.* 1984].
Disposition in the Body Well absorbed from the gastrointestinal tract. Bioavailability is increased when administered with food, resulting in an increase in peak serum concentration of ~45%. Eliminated mainly by renal excretion of hepatic metabolites, the principal one being the pyridine-*N*-oxide form. Urinary excretion over 24 h accounts for 86% of a dose, with <4% recovered in faeces. Urinary recovery as unchanged pinacidil and its oxide metabolite accounts for ~10% and 60% of a dose, respectively; the remainder is excreted as free and conjugated analogues of pinacidil and metabolites.
Therapeutic Concentration Reported as ~80 to 300 µg/L in serum [Ward *et al.* 1984].

A group of 18 healthy volunteers (age: 22 to 48 years) was administered either half a 25 mg pinacidil slow-release tablet (group A) or a 12.5 mg standard slow-release capsule (group B) every 12 h for 6 days and on the morning of day 7. Mean peak plasma concentrations for groups A and B were 69.7 and 64.4 µg/L attained after 2.4 and 2.9 h, respectively. No significant difference was observed between the 2 formulations [Bareggi *et al.* 1999].

In a multicentre trial, 406 hypertensive patients were administered pinacidil orally twice daily in doses of 12.5 to 75 mg for varying periods of time. Mean plasma concentrations of pinacidil and its pyridine-*N*-oxide metabolite were reported as follows:

Dose (mg)	*Compound*	*Plasma Concentration (µg/L)*
12.5	Pinacidil	69.1
	Pinacidil-*N*-oxide	63.6
37.5	Pinacidil	190.0
	Pinacidil-*N*-oxide	109.2
75	Pinacidil	318.2
	Pinacidil-*N*-oxide	177.9

Age, race, and estimated creatinine clearance significantly influenced the plasma clearance of pinacidil [Goldberg *et al.* 1989].
Toxicity Facial flushing, uncomfortable chest sensation and distressing postural hypotension have been observed with serum concentrations above 300 µg/L [Ward *et al.* 1984].
Bioavailability Approximately 57%.
Half-life Approximately 3.4 h for pinacidil and 3.9 h for pinacidil-*N*-oxide.
Volume of Distribution Apparent, 90.3 L.
Clearance Plasma, 31 L/h in patients <45 years of age and 27 L/h in patients >60 years.
Distribution in Blood Blood : plasma ratio, 0.8 to 0.9.
Protein Binding Approximately 40%.
Dose Administered as oral doses of 12.5 mg to 75 mg twice daily.

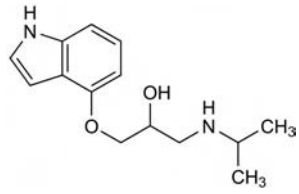
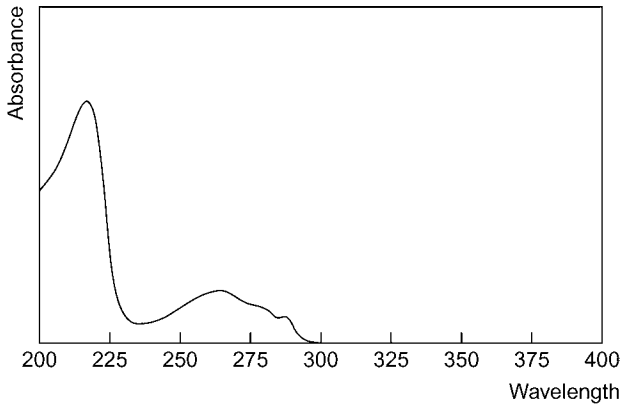
Pindolol

β-*Blocker*
$C_{14}H_{20}N_2O_2 = 248.3$
CAS—13523-86-9

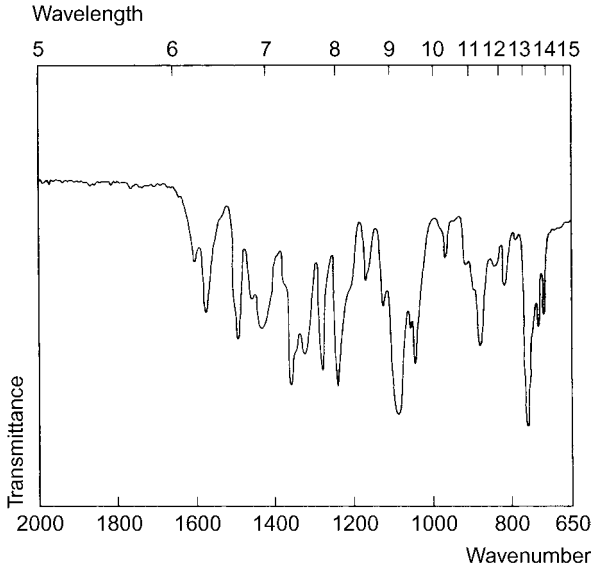
IUPAC Name 1-(1*H*-Indol-4-yloxy)-3-(propan-2-ylamino)propan-2-ol
Synonyms 1-(1*H*-Indol-4-yloxy)-3-[(1-methylethyl)amino]-2-propanol; prindolol; prinodolol; LB-46.
Proprietary Names *Apo-Pindol*; *Barbloc*; *Betapindol*; *durapindol*; *Hexapindol*; *Novo-Pindol*; *Nu-Pindol*; *Pinden*; *Pindocor*; *Pindol*; *Pindoptan*; *Pinloc*; *Pinsken*; *Viskeen*; *Visken*; *Viskene*; *Vypen*. It is an ingredient of *Viskaldix*, *Viskazide* and *Viskenit*.



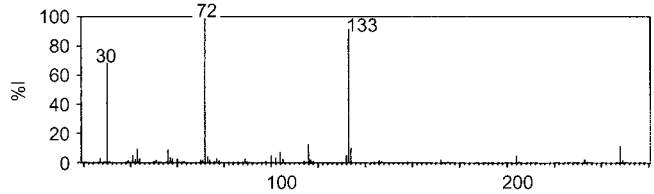
Chemical Properties A white or almost white crystalline powder. Mp 171° to 173°. Practically insoluble in water; slightly soluble in dehydrated alcohol, methanol and chloroform; soluble in mineral acids. pK_a 9.7 (24°). Log *P* (octanol/pH 7.0), −0.9. Extraction yield (chlorobutane), 0.4, 0.2 [Demme *et al.* 2005].
Colour Tests *p*-Dimethylaminobenzaldehyde—red/violet; Liebermann's reagent—blue-green; Mandelin's test—green; Marquis test—yellow→brown.
Thin-layer Chromatography System TA—R_f 0.49; system TB—R_f 0.02; system TC—R_f 0.05; system TE—R_f 0.43; system TL—R_f 0.08; system TAE—R_f 0.18; system TAF—R_f 0.78; system TAJ—R_f 0.00; system TAK—R_f 0.06; system TAL—R_f 0.56.
Gas Chromatography System GA—RI 2245; system GB—RI 2335.
High Performance Liquid Chromatography System HA—*k* 1.2; system HX—RI 300; system HY—RI 253; system HZ—RT 2.4 min; system HAA—RT 8.6 min.
Ultraviolet Spectrum Aqueous acid—264 (A^1_1 = 292b), 287 nm; methanol—264 (A^1_1 = 330a), 287 nm (A^1_1 = 182a). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 768, 1096, 1250, 1288, 1053, 890 cm^{-1}.



Mass Spectrum Principal peaks at *m/z* 72, 133, 30, 116, 248, 134, 56, 41.



Quantification

Plasma **GC** ECD. Limit of detection, 500 ng/L [Guerret 1980].

HPLC Fluorescence detection [Beal, Tett 1998]. Electrochemical detection [Telting-Diaz *et al* 1991]. UV or fluorescence detection. Pindolol and other β-blockers [Musch *et al.* 1989; Shields *et al.* 1986]. Fluorescence detection. Limit of detection, 2 µg/L [Bangah *et al.* 1980; Smith 1987].

Serum **HPLC** Fluorescence detection. Pindolol enantiomers. Limit of detection, 1.2 µg/L (R+) and 4.3 µg/L (R–) [Zhang *et al.* 1995]. Limit of detection, 2 µg/L [Chmielowiec *et al.* 1991].

Urine **HPLC** See Plasma [Beal, Tett 1998]. Limit of detection, 21 µg/L (R+) and 76 µg/L (R–) [Zhang *et al.* 1995]. See Plasma [Shields *et al.* 1986].

Disposition in the Body Well absorbed after oral administration. Metabolised by conjugation with glucuronic acid and sulfate. About 20–30% of an oral dose is excreted in the urine in 24 h as unchanged drug.

Therapeutic Concentration

After a single oral dose of 5 mg given to 12 subjects, peak plasma concentrations of 0.02–0.08 mg/L (mean, 0.04) were attained in 0.5–3 h [Gugler *et al.* 1974].

After daily oral dosing of 6 subjects with 5 mg three times a day, a mean steady-state plasma concentration of 0.015 mg/L was reported [Gugler, Bodem 1978].

Half-life Plasma half-life, 2–4 h.

Volume of Distribution About 1–2 L/kg.

Clearance Plasma clearance, about 7 mL/min/kg.

Distribution in Blood Plasma : whole blood ratio, 1.5.

Protein Binding 40–70%.

Note For a review of the pharmacokinetics of the β-blocking agents, see Johnsson and Regärdh [1976].

Dose Up to 45 mg daily.

Pioglitazone

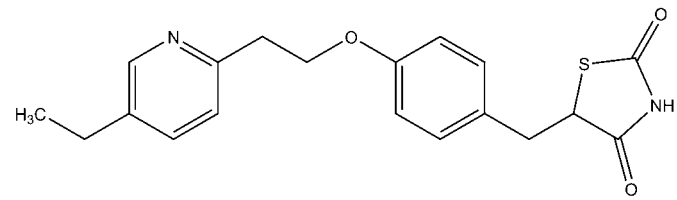
Antidiabetic, Thiazolidinedione

$C_{19}H_{20}N_2O_3S = 356.4$

CAS—111025-46-8

IUPAC Name 5-[[4-[2-(5-Ethylpyridin-2-yl)ethoxy]phenyl]methyl]-1,3-thiazolidine-2,4-dione

Synonyms AD-4833; 5-[[4-[2-(5-ethyl-2-pyridinyl)ethoxy]phenyl]methyl]-2,4-thiazoilidinedione; (±)-5-{*p*-[2-(5-ethyl-2-pyridyl)ethoxy]benzyl}-2,4-thiazolidinedione; U-7210E.



Chemical Properties Colourless needles from DMF and water. Mp 183° to 184°. pK_a 6.35 in acidic media, 5.56 in basic media [Giaginis *et al.* 2007]. Log *P* (octanol/water), 3.31 [Giaginis *et al.* 2007]. Parent compound and metabolites stable in serum and urine for at least 2 months at –20° [Yamashita *et al.* 1996].

Pioglitazone Hydrochloride

$C_{19}H_{20}N_2O_3S,HCl = 392.9$

CAS—112529-15-4

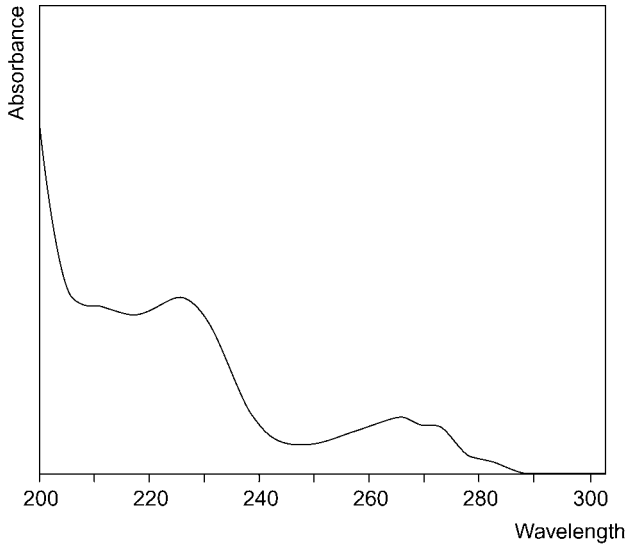
Synonym U-72107A

Proprietary Names *Actos*; *Cereluc*; *Diabestat*; *Diaglit*; *Glita*; *Glizone*; *Glustin*; *G-Tase*; *Higlucem*; *Opam*; *Pepar*; *P-Glitz*; *Pioglit*; *Piomed*; *Piosafe*; *Piotamax*; *Piozulin*; *Prialta*; *Tiazac*; *Zactos*; *Zypi*.

Chemical Properties Colourless prisms from ethanol. Mp 193° to 194°. Soluble in DMF; slightly soluble in ethanol; very slightly soluble in acetone, acetonitrile; practically insoluble in water; insoluble in ether.

High Performance Liquid Chromatography Column: Hichrom-RPB (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.01 mol/L potassium dihydrogen phosphate (pH 6.0; 50 : 50), flow rate 1.0 mL/min. UV detection (λ = 225 nm). Retention times: 8.7 min pioglitazone; 3.4 min, 5.6 min and 18.0 min for impurities I, II, III, respectively. Limit of detection not reported [Kumar *et al.* 2004]. Column: C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.05 mol/L ammonium formate buffer (pH 4.1; 55 : 45), flow rate 1.0 mL/min. UV detection (λ = 266 nm). Retention time: 6.1 min. Limit of quantification, 125 µg/L, limit of detection, 41.7 µg/L [Jedlicka *et al.* 2004]. Column: Zorbax XDB C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 10 mmol/L disodium hydrogen phosphate (pH 7.1; 34 : 66) containing 5 mmol/L SDS, flow rate 1.0 mL/min. UV detection (λ = 226 nm). Retention time: 7.8 min. Limit of quantification, 10 µg/L; limit of detection, 3 µg/L [Kolte *et al.* 2004].

Ultraviolet Spectrum Methanol : acetonitrile (30 : 70)—226, 266 nm.



Infrared Spectrum Principal peaks at wavenumbers 3082, 2964, 1736, 1690, 1472, 1331, 1254, 1040, 841, 728 cm^{-1} (KBr disc).

Mass Spectrum Principal ions at *m/z* 150, 134, 121, 356.

Quantification

Plasma **HPLC** Column: C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : acetonitrile : 10 mmol/L potassium phosphate buffer (pH 2.6, 40 : 12 : 48), flow rate 1.2 mL/min. UV detection (λ = 269 nm). Retention time: 8.2 min. Limit of quantification, 50 µg/L [Sripalakit *et al.* 2006].

LC-MS Column: C_{18} (50 × 2.0 mm i.d., 3 µm). Mobile phase: acetonitrile : water (60 : 40) with 10 mmol/L ammonium acetate and 0.02% trifluoroacetic acid, flow rate 0.2 mL/min. ESI, positive ion mode, MRM acquisition mode. Retention time: pioglitazone 1.72 min, keto-metabolite 1.09 min, hydroxy-metabolite 0.93 min. Limit of quantification, 0.5 µg/L [Lin *et al.* 2003]. Column: C_{18} (50 × 4.6 mm i.d., 5 µm). Mobile phase: 10 mmol/L ammonium acetate in acetonitrile-water (10 : 90) : water-acetonitrile (10 : 90; 50 : 50), flow rate 1.35 mL/min. ESI, positive ion mode, SRM acquisition mode. Retention time: 1.9 min. Limit of quantification, 9 µg/L [Xue *et al.* 2003]. Column: Zorbax SB-C_{18} (75 × 4.6 mm i.d., 3.5 µm). Mobile phase: methanol : ammonium acetate (1 : 1), flow rate 1.0 mL/min. API, positive ion mode, MRM acquisition mode. Limit of quantification, pioglitazone 10 µg/L, hydroxy-metabolite 0.99 µg/L [Wong *et al.* 2004].

Serum **HPLC** Column: Inertsil ODS-2 (150 × 4.6 mm i.d., 5 µm). Mobile phase: methanol-0.05 mol/L phosphate buffer (pH 6.0, 1 : 9) : methanol-acetonitrile-0.05 mol/L phosphate buffer (pH 6.0, 2 : 4 : 4; 80 : 20 to 55 : 45 over 18 min, to 0 : 100 over 24 min for 7 min), flow rate 1.0 mL/min. UV detection (λ = 269 nm). Retention time: ~9 min. Limit of detection, pioglitazone, its keto- and hydroxyl-metabolites 0.01 mg/L, minor metabolites 0.02 to 0.05 mg/L [Yamashita *et al.* 1996]. Column: Zorbax RX-C_8 (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water-3 mL/L acetic acid (pH 5.5; 40 : 60), flow rate 1.2 mL/min (0 to 10 min) and 1.6 mL/min (10 to 20 min). UV detection (λ = 269 nm). Retention time: ~14.2 min. Limit of quantification, pioglitazone, its keto- and hydroxy-metabolites 0.2 mg/L, minor metabolites 0.2 to 0.5 mg/L [Zhong, Williams 1996].

Urine **HPLC** Column: Inertsil ODS-2 (150 × 4.6 mm i.d., 5 µm). Mobile phase: methanol–0.05 mol/L phosphate buffer (pH 6.0; 1 : 9) : methanol-acetonitrile-0.05 mol/L phosphate buffer (pH 6.0, 2 : 4 : 4; 95 : 5 to 0 : 100 over 42 min for 7 min), flow rate 1.0 mL/min. UV detection (λ = 269 nm). Retention time: ~42 min. Limit of detection, pioglitazone, its keto- and hydroxy-metabolites 0.1 mg/L, minor metabolites 0.2 to 0.5 mg/L [Yamashita *et al.* 1996].

Other **HPLC** Tablets. Column: Hypersil ODS-C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water : acetic acid (pH 5.5; 75 : 25 : 0.3), flow rate 0.5 mL/min. UV detection (λ = 230 nm). Retention time: 8.5 min. Limit of detection, 9.9 µg/L [Shankar *et al.* 2005]. Column: Zorbax XDB C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 10 mmol/L disodium hydrogen phosphate (pH 7.1; 34 : 66) containing 5 mmol/L SDS, flow rate 1.0 mL/min. UV detection (λ = 226 nm). Retention time: 7.8 min. Limit of quantification, 10 µg/L; limit of detection, 3 µg/L [Kolte *et al.* 2004].

CE Tablets. Capillary: fused silica (34.5 cm × 50 µm i.d.). Buffer: 20 mmol/L sodium borate (pH 9.3)-50 mmol/L SDS : acetonitrile (80 : 20). UV detection (λ = 210 nm). Limit of quantification, 0.74 mg/L; limit of detection, 0.29 mg/L [Radhakrishna *et al.* 2002].

Disposition in the Body Rapidly absorbed after oral doses, with peak plasma concentrations occurring within 2 h. It is extensively metabolised in the liver by oxidation and hydroxylation of aliphatic methylene groups, primarily by CYP2C8 and CYP3A4 to form 5 primary metabolites and 2 secondary metabolites. These include both active (keto- and hydroxy-derivatives) and inactive metabolites. Three of the metabolites have pharmacological activity and have an anti-hyperglycaemic potency ~40 to 60% of that of pioglitazone. Secondary metabolic pathways involve CYP2C9 and CYP1A1/2. Approximately 15 to 30% of a pioglitazone dose is recovered in urine as metabolites. Renal elimination of unchanged pioglitazone is negligible. It is presumed that the remainder is excreted in bile either unchanged or as metabolites and eliminated in the faeces.

Therapeutic Concentration

Twelve healthy young adults (mean age 23 years) were administered pioglitazone 15 or 30 mg/day for 8 days. Peak plasma concentrations for the 2 doses at steady state were 0.7 and 1.7 mg/L reached at 2.5 and 3 h, respectively. Following the same regimen, plasma concentrations obtained in healthy elderly volunteers (mean age 70 years) were 0.7 and 1.2 mg/L, respectively, for the 2 doses, reached at 4.8 and 3.7 h, respectively [Ogiwara *et al.* 1997].

A group of 24 healthy male volunteers was administered a single oral dose of 30 mg pioglitazone. A mean peak plasma concentration of 1.6 mg/L was reached at 1.5 h [Sripalakit *et al.* 2006].

Toxicity When pioglitazone is given with gemfibrozil, an inhibitor of CYP2C8, there is a 3-fold increase in the AUC of pioglitazone; a decrease in pioglitazone dose may be needed if it is given with gemfibrozil or similar CYP2C8 inhibitors. Equally, rifampicin, a potent inducer of CYP540, halves the AUC of pioglitazone when given concomitantly, and the pioglitazone dose may need to be increased. Studies have shown that AUC values for pioglitazone and its 2 major metabolites (keto- and hydroxy-forms) decrease with increasing impairment of renal function [Edwards, Eckland 1999].

Bioavailability >80%.

Half-life Pioglitazone, up to 7 h; active metabolites, up to 24 h.

Protein Binding >99%, predominantly to albumin.

Dose Given as pioglitazone hydrochloride but doses are expressed in terms of the base; pioglitazone hydrochloride 1.1 mg is equivalent to ~1 mg pioglitazone. The usual dose is 15 or 30 mg once daily. This may be increased to a maximum of 45 mg once daily if necessary. It may be taken with or without food.

Pipamazine

Antiemetic

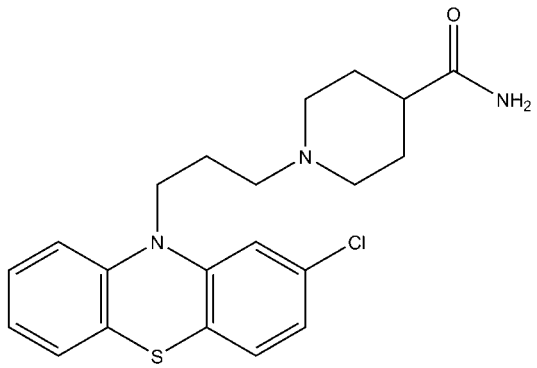
$C_{21}H_{24}ClN_3OS$ = 402

CAS—84-04-8

IUPAC Name 1-[3-(2-Chlorophenothiazin-10-yl)propyl]piperidine-4-carboxamide

Synonyms 10-[3-(4-Carbamoylpiperidino)propyl]-2-chlorophenothiazine; 10-[3-(4-carbamoylpiperidin-1-yl)propyl]-2-chlorophenothiazine; 2-chloro-10-[3-(4-carbamoylpiperidinyl)propyl]phenothiazine; 1-[3-(2-chlorophenothiazin-10-yl)propyl]isonipecotamide; 1-[3-(2-chloro-10*H*-phenothiazin-10-yl)propyl]-4-piperidinecarboxamide; EINECS 201-512-9; mometine; nometine; SC-9387.

Proprietary Names *Mornidine*; *Nausidol*.



Chemical Properties Crystals from 2-propanol and petroleum ether. Mp ≈140°. Soluble 1 in 500 of water, 1 in 60 of ethanol, 1 in 200 of ether and 1 in 5 of chloroform. Log *P* (octanol/water) 4.1 [National Institutes of Health 2008]. Pipamazine is extracted by organic solvents from aqueous organic solvents.

Pipamazine Hydrochloride

$C_{21}H_{24}ClN_3OS,HCl = 438.4$

Chemical Properties Crystals. Mp ≈196° to 197° with formation of bubbles [O'Neil *et al.* 2006].

Colour Tests Ammonium molybdate test—purple (limit of detection, 0.1 µg); ammonium vandate test—green→purple (limit of detection, 0.1 µg); Vitali's test—purple→yellow/yellow/yellow (limit of detection, 0.1 µg); sulfuric acid–formaldehyde test—purple (limit of detection, 0.1 µg).

Thin-layer Chromatography System T1—R_f 0.62 (location reagent acidified iodoplatinate spray, positive reaction); system T6—R_f 0.83 (the spot may be converted on the plate to the sulfoxide, R_f 0.53; location of both spots under ultraviolet light).

Ultraviolet Spectrum Aqueous acid (0.01 N hydrochloric acid)—255 nm.

Infrared Spectrum Principal peaks at wavenumbers 1644, 1455, 747 cm^{-1} (KBr disk).

Dose Up to 30 mg daily.

National Institutes of Health (2008). *Pipamazine*. http://pubchem.ncbi.nlm.nih.gov/summary/summary.cgi?cid=67618loc=ec_rcs. (accessed 27 June 2008).

Pipamperone

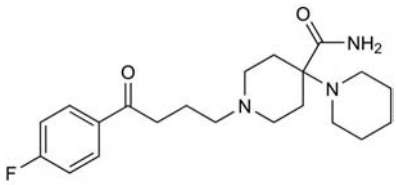
Tranquilliser

$C_{21}H_{30}FN_3O_2 = 375.5$

CAS—1893-33-0

IUPAC Name 1-[4-(4-Fluorophenyl)-4-oxobutyl]-4-piperidin-1-ylpiperidine-4-carboxamide

Synonyms 1′-[4-(4-Fluorophenyl)-4-oxobutyl]-[1,4′-bipiperidine]-4′-carboxamide; floropipamide; R-3345.



Chemical Properties Log *P* (octanol), 2.4; (octanol/water), 2.0. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Pipamperone Hydrochloride

$C_{21}H_{30}FN_3O_2,2HCl = 448.4$

CAS—2448-68-2

Proprietary Names *Dipiperon*; *Piperonil*.

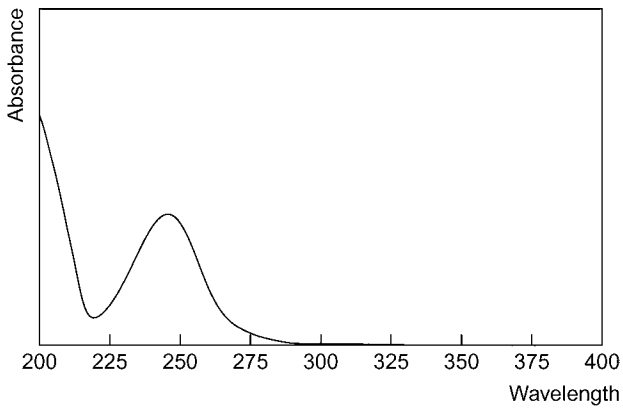
Chemical Properties Crystals. Mp 124.5° to 126.0°.

Thin-layer Chromatography System TA—R_f 0.56; system TB—R_f 0.01; system TC—R_f 0.12; system TE—R_f 0.43; system TL—R_f 0.08; system TAE—R_f 0.33; system TAF—R_f 0.61 (acidified potassium permanganate solution, positive).

Gas Chromatography System GA—pipamperone RI 3040, M (OH-) RI 3250.

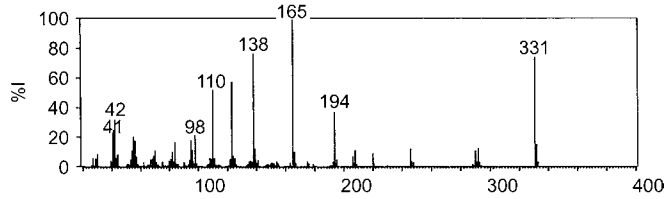
High Performance Liquid Chromatography System HX—RI 299; system HY—RI 241; system HZ—retention time 2.7 min; system HAA—retention time 10.9 min.

Ultraviolet Spectrum Aqueous acid—248 nm (A_1^1=315a).



Infrared Spectrum Principal peaks at wavenumbers 1660, 1685, 1600, 1239, 1157, 1212 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 165, 138, 331, 123, 110, 194, 42, 41.



Quantification

Blood **GC** SID. Pipamperone and other butyrophenones. Limit of detection, about 0.1 nmol/L [Seno *et al.* 1993].

Plasma **HPLC** UV detection. Limit of detection, 2 µg/L [Luhmann *et al.* 1992].

Urine **GC** See Blood [Seno *et al.* 1993].

Disposition in the Body

Therapeutic Concentration

Pipamperone dihydrochloride (≡120 mg pipamperone), given as either a reference tablet or one of two test tablets, to 24 subjects as a single oral dose, produced mean maximum plasma concentrations of 0.266 mg/L (range, 0.161 to 0.455) for the reference product, 0.266 mg/L (range, 0.087 to 0.509) for one of the test products and 0.263 mg/L (range, 0.123 to 0.502) for the other. The time taken to reach maximum plasma concentrations was 1 h for all preparations [Potgieter *et al.* 2002].

Mean plasma concentrations of 0.04403 (±0.01744) mg/L were attained 1.5 h after a single oral dose of 40 mg to 12 subjects [Luhmann *et al.* 1992].

Dose The equivalent of 120 to 360 mg of pipamperone daily.

Demme U *et al.* (2005). Systematic evaluation of 1-chlorobutane for liquid-liquid extraction of drugs. *Proceedings of the 12th TIAFT*, Seoul 481–486.

Seno H *et al.* (1993). Determination of some butyrophenones in body fluids by gas chromatography with surface ionization detection. *Nippon Hoigaku Zasshi* 47: 367–371.

Pipazetate

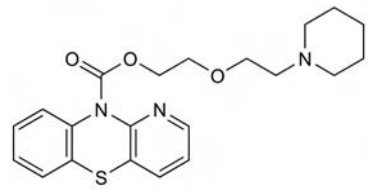
Cough Suppressant

$C_{21}H_{25}N_3O_3S = 399.5$

CAS—2167-85-3

IUPAC Name 2-(2-Piperidin-1-ylethoxy)ethyl pyrido[3,2-b][1,4]benzothiazine-10-carboxylate

Synonyms D-254; pipazethate; piperestazine; 10*H*-pyrido[3,2-*b*][1,4]benzothiadiazine-10-carboxylic acid 2-(2-piperidinoethoxy)ethyl ester.



Chemical Properties Log *P* (octanol/water), 4.9.

Pipazetate Hydrochloride

$C_{21}H_{25}N_3O_3S,HCl = 436.0$

CAS—6056-11-7

Proprietary Names *Selvigon*; *Selvjgon*; *Transpulmin*; *Lenopect*; *Theratuss*.

Chemical Properties A white crystalline powder. Mp 160° to 161°. Very soluble in water; soluble in ethanol and methanol. Practically insoluble in acetone.

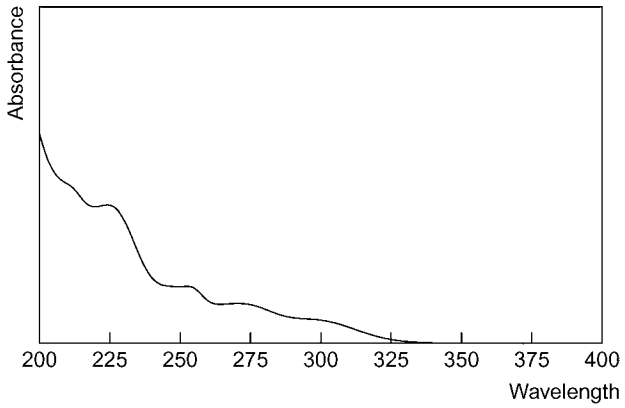
Colour Tests Aromaticity (method 2)—colourless/yellow; Liebermann's test—brown (→red at 100°).

Thin-layer Chromatography System TA—R_f 0.47; system TB—R_f 0.17; system TC—R_f 0.13; system TE—R_f 0.48; system TL—R_f 0.06; system TAE—R_f 0.12 (acidified iodoplatinate solution, positive).

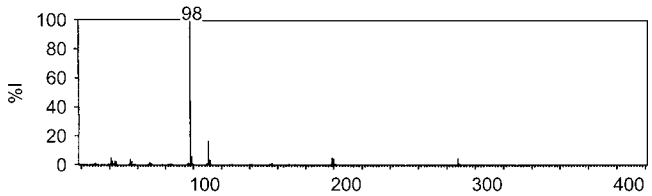
Gas Chromatography System GA—RI 2037.

High Performance Liquid Chromatography System HA—*k* 5.4; system HX—RI 385.

Ultraviolet Spectrum Aqueous acid—251 nm (A_1^1=210a).



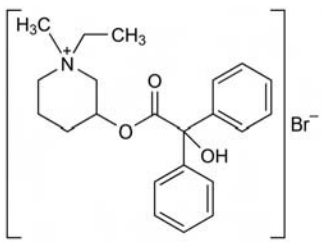
Infrared Spectrum Principal peaks at wavenumbers 1717, 1225, 1315, 1300, 1095, 1050 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 98, 111, 99, 199, 41, 288, 200, 55.



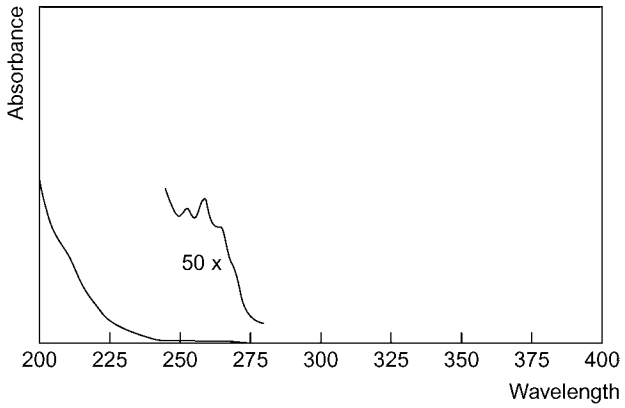
Dose Pipazetate hydrochloride has been given in doses of 60 to 120 mg daily.

Pipenzolate Bromide

Anticholinergic
$C_{22}H_{28}BrNO_3 = 434.4$
CAS—13473-38-6 (pipenzolate); 125-51-9 (bromide)
IUPAC Name (1-Ethyl-1-methylpiperidin-1-ium-3-yl) 2-hydroxy-2,2-diphenylacetate bromide
Synonyms 1-Ethyl-3-[(hydroxydiphenylacetyl)-oxy]-1-methylpiperidinium bromide; JB-323; pipenzolate methobromide; pipenzolone bromide.
Proprietary Names *Expal*; *Ila-med m*; *Piptal*; *Poliptal*; *Propedil*. It is an ingredient of *Finprod*, *Pedriachol* and *Piptalin*.



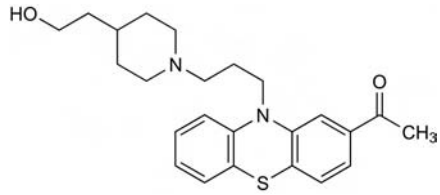
Chemical Properties A white crystalline powder. Mp 179° to 180°. Freely soluble in water. Log *P* (octanol/water), −0.3.
Colour Tests The following tests are performed on pipenzolate nitrate. Mandelin's test—orange→green; Marquis test—orange→green→blue.
Thin-layer Chromatography System TA—R_f 0.04 (acidified iodoplatinate solution, positive).
Ultraviolet Spectrum Aqueous acid—252, 258 (A_1^1=11a), 262 nm.



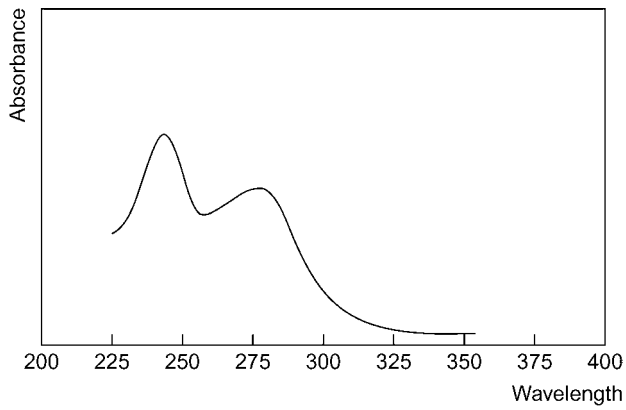
Infrared Spectrum Principal peaks at wavenumbers 1726, 698, 1220, 1160, 763, 1055 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 105, 111, 77, 96, 97, 183, 42, 51.
Dose Usually 20 to 25 mg daily.

Piperacetazine

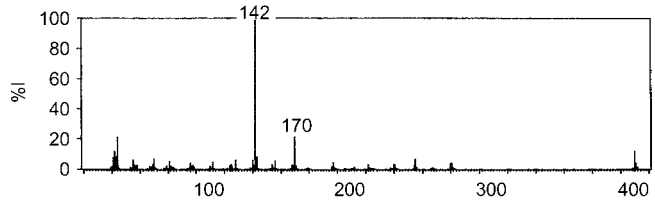
Tranquilliser
$C_{24}H_{30}N_2O_2S = 410.6$
CAS—3819-00-9
IUPAC Name 1-[10-[3-[4-(2-Hydroxyethyl)piperidin-1-yl]propyl]phenothiazin-2-yl]ethanone
Synonyms 1-[10-[3-[4-(2-Hydroxyethyl)-1-piperidinyl]propyl]-10*H*-phenothiazin-2-yl]ethanone; PC-1421.
Proprietary Name *Quide*



Chemical Properties A yellow granular powder. Mp 100° to 110°. Practically insoluble in water; soluble 1 in 11 of ethanol, 1 in 1.3 of chloroform and 1 in 1200 of ether. Log *P* (octanol/water), 5.1.
Colour Tests Formaldehyde-sulfuric acid—blue-violet; Forrest reagent—red; FPN reagent—brown-orange; Mandelin's test—green→red→violet; Marquis test—red; sulfuric acid—yellow→red.
Thin-layer Chromatography System TA—R_f 0.56; system TB—R_f 0.06; system TC—R_f 0.19; system TL—R_f 0.17; system TAJ—R_f 0.04; system TAK—R_f 0.00; system TAL—R_f 0.30 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—not eluted.
High Performance Liquid Chromatography System HA—*k* 1.9.
Ultraviolet Spectrum Aqueous acid—243, 278 nm.



Infrared Spectrum Principal peaks at wavenumbers 1675, 1222, 1269, 1592, 748, 1560 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 142, 170, 44, 410, 42, 143, 43, 41.

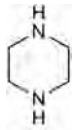


Dose 20 to 160 mg daily.

Piperazine

Anthelmintic
$C_4H_{10}N_2 = 86.1$
CAS—110-85-0
IUPAC Name Piperazine
Proprietary Names *Lombrimade*; *Lu-Peracina*; *Ortovermin*; *Oxiurazina*; *Overpon*; *Pipemed*; *Piperazil*; *Pipercream*; *Pipermel*; *Pipertox*; *Pipervermin*; *Pirzinol*; *Trivermon*; *Verfid*; *Vermilen*; *Vermin*; *Versol*.

P



Chemical Properties Crystals. Mp 106°. Soluble in water and ethanol; practically insoluble in ether. pK_a 5.7, 9.8 (20°). Log *P* (octanol/water), −1.5.

Piperazine Adipate

$C_4H_{10}N_2,C_6H_{10}O_4 = 232.3$
CAS—142-88-1
Proprietary Names *Adelmintex*; *Antepar*; *Entacyl*; *Vermi*.
Chemical Properties A white crystalline powder. Mp 256° to 257°. Soluble 1 in 18 of water; practically insoluble in ethanol, chloroform and ether.

Piperazine Calcium Edetate

$C_4H_{10}N_2,C_{10}H_{14}CaN_2O_8 = 416.4$
CAS—12002-30-1
Synonym Piperazine calcium edathamil
Chemical Properties Freely soluble in water; very slightly soluble in ethanol and chloroform; practically insoluble in ether.

Piperazine Citrate

$(C_4H_{10}N_2)_3,2C_6H_8O_7,xH_2O = 642.7$ (anhydrous)
CAS—144-29-6 (anhydrous); 41372-10-5 (hydrate)
Synonym Hydrous tripiperazine dicitrate
Proprietary Names *Antepar*; *Citrazine*; *Citropiperazina*; *Ectodyne*; *Helmifar*; *Pipermed*; *Piprine*; *Pripsen Elixir*; *Tasnon*; *Veriga*; *Verimex*; *Vermex*; *Worm*; *Wormex*; *Wormilex*.
Chemical Properties A fine, white, crystalline or granular powder. Mp about 190°. Soluble 1 in 1.5 of water; practically insoluble in ethanol, chloroform and ether.

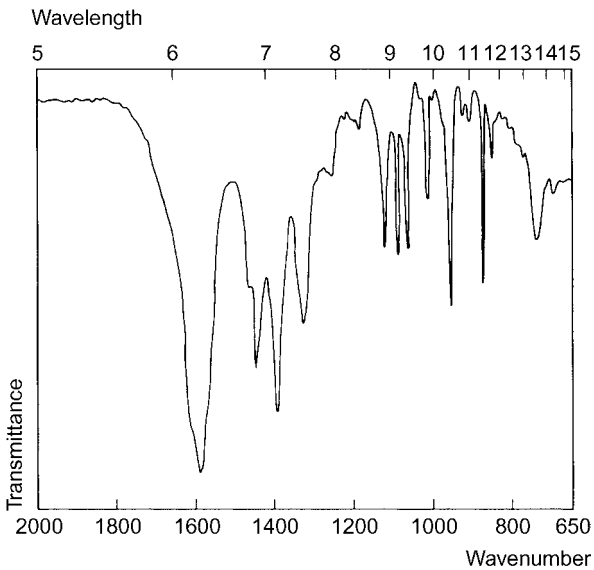
Piperazine Hydrate

$C_4H_{10}N_2,6H_2O = 194.2$
CAS—142-63-2
Synonyms Diethylenediamine; hexahydropyrazine; piperazidine.
Proprietary Names *Antelmina*; *Antepar*; *Ascarin*; *Desparasil*; *Pipralen*; *Solucamphre*; *Vermifran*; *Vermifuge*.
Chemical Properties Colourless, glassy, deliquescent crystals. Mp about 43°. Soluble 1 in 3 of water and 1 in 1 of ethanol; very slightly soluble in ether.

Piperazine Phosphate

$C_4H_{10}N_2,H_3PO_4,H_2O = 202.1$
CAS—14538-56-8 (anhydrous); 18534-18-4 (monohydrate)
Proprietary Name It is an ingredient of *Pripsen*.
Chemical Properties A white crystalline powder. Soluble 1 in about 60 of water; practically insoluble in ethanol, chloroform and ether; soluble in dilute hydrochloric acid.

Colour Test Simon's test—blue.
Thin-layer Chromatography System TA—R_f 0.05; system TB—R_f 0.01; system TC—R_f 0.01; system TL—R_f 0.00; system TAE—R_f 0.01; system TAF—R_f 0.04 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 813.
Ultraviolet Spectrum No significant absorption, 230–360 nm.
Infrared Spectrum Principal peaks at wavenumbers 1592, 955, 870, 1080, 1055, 1115 cm^{-1} (piperazine citrate, KBr disk).

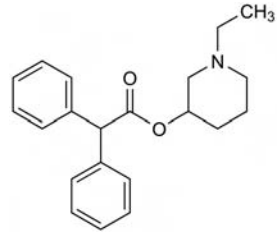


Mass Spectrum Principal ions at *m/z* 44, 100, 41, 60, 29, 27, 30, 86 (piperazine adipate).
Quantification
Urine **Colorimetry** [Hanna, Tang 1973].
GC Limit of detection, 20 and 1 µg/L with NSD or MSD, respectively [Skarping *et al.* 1986].
Disposition in the Body Readily absorbed after oral administration and excreted in the urine as unchanged drug and metabolites. There is wide variation in the rate of excretion between individuals, 15–75% of a dose being excreted in 24 h.
Toxicity Toxic effects are rare and are usually due to accumulation after large doses. Three children had symptoms of toxicity after doses of 6, 9 and 12 g but they subsequently recovered.
Dose The equivalent of 4 g of piperazine hydrate as a single dose, or 2 g daily for 7 days.

Hanna S, Tang A (1973). Human urinary excretion of piperazine citrate from syrup formulations. *J Pharm Sci* 62: 2024–2025.
Skarping G *et al.* (1986). Determination of piperazine in working atmosphere and in human urine using derivatization and capillary gas chromatography with nitrogen- and mass-selective detection. *J Chromatogr* 370: 245–258.

Piperidolate

Anticholinergic
$C_{21}H_{25}NO_2 = 323.4$
CAS—82-98-4
IUPAC Name (1-Ethylpiperidin-3-yl) 2,2-diphenylacetate
Synonyms JB-305; α-phenylbenzeneacetic acid 1-ethyl-3-piperidinyl ester.

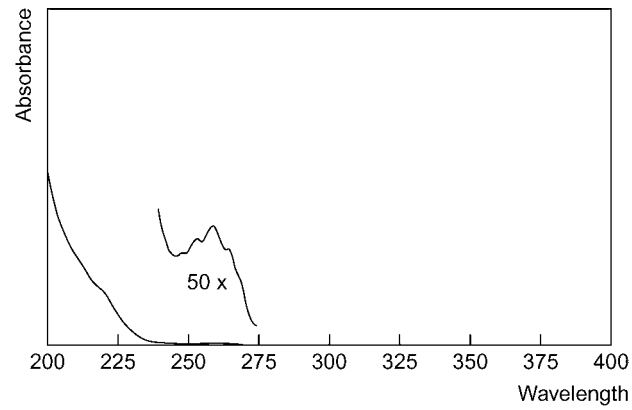


Chemical Properties A liquid. Bp 191° to 192°. Log *P* (octanol/water), 4.7.

Piperidolate Hydrochloride

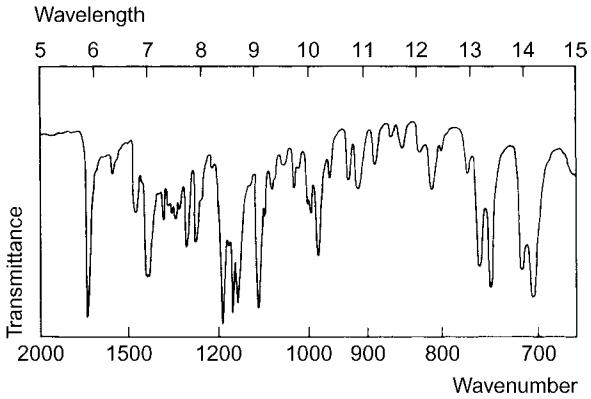
$C_{21}H_{25}NO_2,HCl = 359.9$
CAS—129-77-1
Proprietary Name *Dactil*
Chemical Properties A white or cream-coloured powder. Mp 195° to 196°. Soluble 1 in about 18 of water, 1 in about 52 of ethanol, 1 in about 4 of chloroform and 1 in about 5 of methanol.

Colour Tests Liebermann's reagent—orange-brown; Mandelin's test—brown; Marquis test—orange.
Thin-layer Chromatography System TA—R_f 0.69; system TB—R_f 0.55; system TC—R_f 0.81; system TE—R_f 0.82; system TL—R_f 0.55; system TAE—R_f 0.54; system TAF—R_f 0.52; system TAJ—R_f 0.49; system TAK—R_f 0.11; system TAL—R_f 0.64 (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, yellow).
Gas Chromatography System GA—RI 2318; system GF—RI 2660.
High Performance Liquid Chromatography System HA—*k* 1.7; system HX—RI 429.
Ultraviolet Spectrum Aqueous acid—252, 258 (A_1^1=13.4a), 264 nm. No alkaline shift.

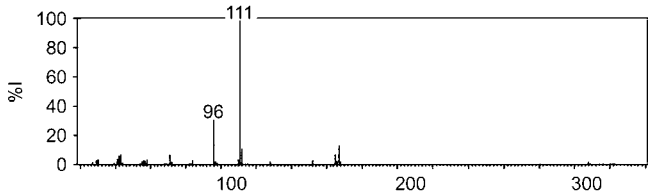


Infrared Spectrum Principal peaks at wavenumbers 1192, 1715, 1163, 1101, 700, 1149 cm^{-1} (piperidolate hydrochloride, KBr disk).

P



Mass Spectrum Principal ions at *m/z* 111, 96, 167, 112, 165, 71, 43, 42.

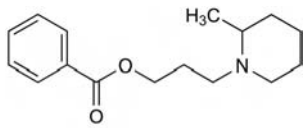


Dose 200 mg of piperidolate hydrochloride daily.

Piperocaine

Anaesthetic (Local)
$C_{16}H_{23}NO_2$ = 261.4
CAS—136-82-3

IUPAC Name 3-(2-Methylpiperidin-1-yl)propyl benzoate
Synonym 2-Methyl-1-piperidinepropanol benzoate

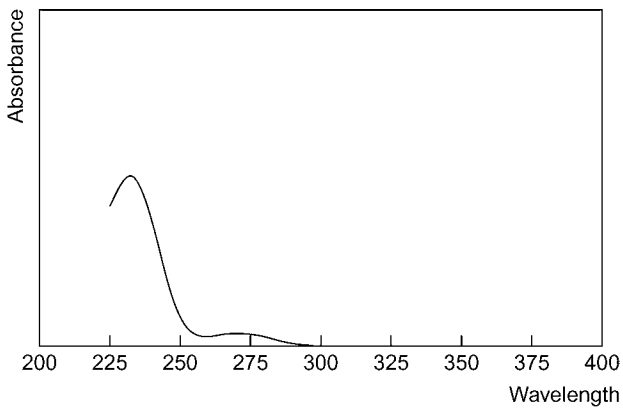


Chemical Properties Log *P* (octanol/water), 3.8.

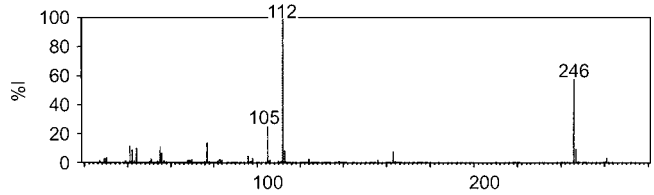
Piperocaine Hydrochloride

$C_{16}H_{23}NO_2$,HCl = 297.8
CAS—533-28-8
Proprietary Name *Metycaine Hydrochloride*
Chemical Properties Small white crystals or white crystalline powder. Mp 167° to 169°. Soluble 1 in 1.5 of water and 1 in 4.5 of ethanol; soluble in chloroform; practically insoluble in ether.

Thin-layer Chromatography System TA—R_f 0.55; system TB—R_f 0.53; system TC—R_f 0.37; system TE—R_f 0.76; system TL—R_f 0.27; system TAE—R_f 0.24; system TAF—R_f 0.56 (Dragendorff spray, positive; Acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1980.
High Performance Liquid Chromatography System HQ—*k* 4.59; system HX—RI 357; system HY—RI 312.
Ultraviolet Spectrum Aqueous acid—231, 274 nm.



Infrared Spectrum Principal peaks at wavenumbers 1278, 1703, 711, 1115, 1310, 1040 cm^{-1} (piperocaine hydrochloride, KBr disk).
Mass Spectrum Principal ions at *m/z* 112, 246, 105, 77, 55, 41, 44, 247.

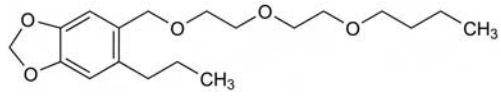


Uses Piperocaine hydrochloride is used in concentrations of 0.5 to 10%.

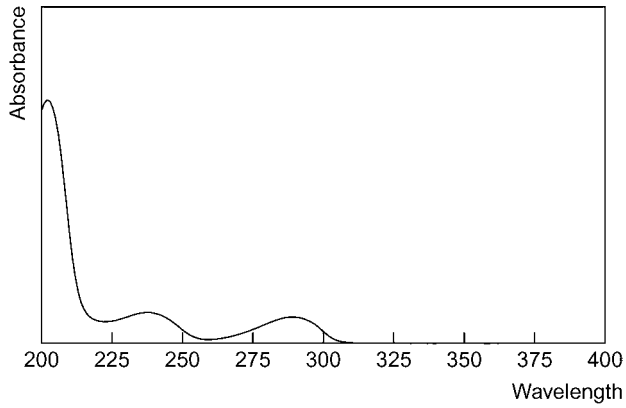
Piperonyl Butoxide

Insecticide Synergist
$C_{19}H_{30}O_5$ = 338.4
CAS—51-03-6

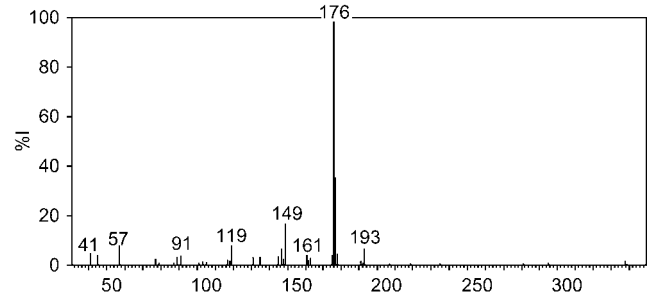
IUPAC Name 5-[2-(2-Butoxyethoxy)ethoxymethyl]-6-propyl-1,3-benzodioxole
Synonym ENT 14250
Proprietary Names *Butacide*; *Nusyn-noxfish*; *Prentox*; *Pybuthrin*; *Synpren-fish*.



Chemical Properties A yellow-pale brown oily liquid. Mp <25° and Bp 180°. Miscible with methanol, ethanol, benzene, freons, geons, other organic solvents and oils. Very slightly soluble in water (14.3 mg/L at 25°). Log *P* (octanol/water), 4.75.
Gas Chromatography System GA—RI 2376.
High Performance Liquid Chromatography System HAA—retention time 27.6 min.



Mass Spectrum Principal ions at *m/z* 176, 177, 149, 57, 119, 193, 41, 147.



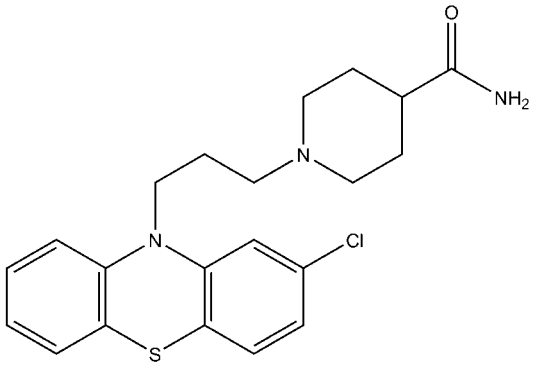
Disposition in the Body Piperonyl is eliminated as the glucuronide or amino acid derivative.
Toxicity Gastrointestinal tract effects and mild CNS depression: coma, convulsions, hepatic and renal damage. Poison via skin contact; moderately toxic by ingestion and i.p. routes.

Piperoxan

Benzodioxane, α_2-Adrenoceptor Antagonist, Antihypertensive, Diagnostic Aid (Pheochromocytoma)
$C_{14}H_{19}NO_2$ = 233.3
CAS—59-39-2

P

IUPAC Name 1-(2,3-Dihydro-1,4-benzodioxin-2-ylmethyl)piperidine
Synonyms Benzodioxane; fourneau; 2-piperidinomethyl-1,4-benzodioxan; 2-piperidinomethyl-1,4-benzodioxan; piperoxane; US 2056046.



Chemical Properties Bp 193°. Log *P* (octanol/water) 2.4 [National Institutes of Health 2008]. Piperoxan is extracted by organic solvents from aqueous alkaline solutions.

Piperoxan Hydrochloride (*dl*-Form)

$C_{14}H_{19}NO_2$,HCl = 269.8
CAS—4546-39-8
Synonyms Compound 933 F; fourneau 933.
Proprietary Name *Benodaine*
Chemical Properties White crystalline powder. Mp 232° to 237°. Soluble 1 in 3.5 water and 1 in 12 of ethanol. Almost insoluble in ether, soluble in chloroform.

Colour Tests Ammonium molybdate test—blue-green (limit of detection, 0.1 µg); ammonium vandate test—green (limit of detection, 0.1 µg); Vitali's test—–/–/faint red (limit of detection, 0.1 µg); sulfuric acid–formaldehyde test—deep purple (limit of detection, 0.1 µg).
Thin-layer Chromatography System T1—R_f 0.65 (location reagent acidified iodoplatinate spray, positive reaction).
Gas Chromatography System G2/225—retention time 0.98 relative to diphenylhydramine; system G4—retention time 0.96 relative to diphenhydramine.
UV Spectrum Aqueous acid (0.1 N sulfuric acid)—274 nm.
Dose Up to 20 mg IV.
Note For a study of piperoxan in paradoxical sleep, see Gaillard [1983].

Gaillard JM (1983). Biochemical pharmacology of paradoxical sleep. *Br J Clin Pharmacol* 16 (suppl2): 205S–230S.

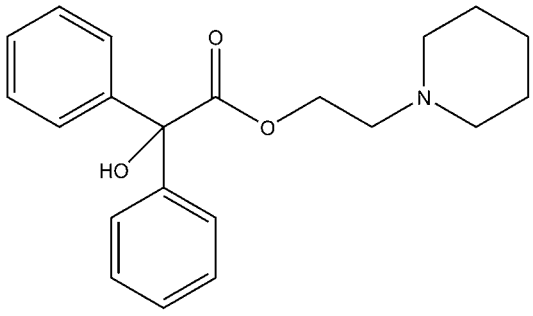
P

Pipethanate

Antimuscarinic, Antispasmodic, Tranquilliser
$C_{21}H_{25}NO_3$ = 339.4
CAS—4546-39-8
IUPAC Name 2-Piperidin-1-ylethyl 2-hydroxy-2,2-di(phenyl)acetate
Synonyms Benzilic acid 1-piperidineethanol ester; α-hydroxy-α-phenylbenzeneacetic acid 2-(1-piperidinyl)ethyl ester; pentamethate; 1-piperidineethanol benzilate; 2-(1-piperidino)ethyl benzilate; β-piperidylethyl benzilate; piperilate.



Chemical Properties Log *P* (octanol/water) 3.5 [National Institutes of Health 2008]. Pipethanate is extracted by organic solvents from aqueous alkaline solutions.

Pipethanate Hydrochloride

$C_{21}H_{25}NO_3$,HCl = 375.9
CAS—4544-15-4
Proprietary Names *Daipisate*; *Norticon*; *Pensanate*; *Pipenale*; *Sycotrol*.
Chemical Properties Crystals from acetone or ethanol. Mp 170° to 171°. Log *P* (octanol/water) 1.07 [Meylan, Howard 1995].

Pipethanate Ethobromide

$C_{23}H_{30}BrNO_3$ = 448.4
CAS—23182-46-9
Synonyms Ethylpipethanate bromide; piperilate ethobromide.
Proprietary Names *Nospasmin*; *Panpurol*; *Spalgin*; *Spasmodene*; *Spasmodil*.
Chemical Properties Pipethanate ethobromide is an antimuscarinic with actions similar to those of atropine. It has been used in the symptomatic treatment of visceral spasms in doses by mouth of up to 160 mg daily in divided doses. Pipethanate ethobromide has also been given IM or IV in doses of 10 to 20 mg daily and rectally in doses of 60 or 120 mg daily.

Colour Tests Ammonium molybdate test—orange (limit of detection, 1.0 µg); sulfuric acid–formaldehyde test—yellow→green→blue (limit of detection, 1.0 µg).
Thin-layer Chromatography System T1—R_f 0.68 (location reagent acidified iodoplatinate spray, positive reaction).
Gas Chromatography System G2/225—retention time 1.30 relative to codeine.

Column: DB-1 non-polar fused silica capillary (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 22 cm/s. Temperature programme: 100° to 280° at 8°/min. SID and NPD. Retention time, 21.0 min. Limit of detection, 20–50 pg [Hattori *et al.* 1992].
Ultraviolet Spectrum Aqueous acid (0.1 N sulfuric acid)—252, 258, 262 nm.
Quantification
Blood **GC** Column: DB-1 non-polar fused silica capillary (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 22 cm/s. Temperature programme: 100° to 280° at 8°/min. SID and NPD. Retention time, 21.0 min. Limit of detection, 1 to 2.5 µg/L [Hattori *et al.* 1992].
Urine **GC** Column: DB-1 non-polar fused silica capillary (30 m × 0.32 mm i.d., 0.25 µm). Carrier gas: He, 22 cm/s. Temperature programme: 100° to 280° at 8°/min. SID and NPD. Retention time, 21.0 min. Limit of detection, 1 to 2.5 µg/L [Hattori *et al.* 1992].
Dose Up to 18 mg daily.

Hattori H *et al.* (1992). Determination of diphenylmethane antihistaminic drugs and their analogues in body fluids by gas chromatography with surface ionization detection. *J Chromatogr* 581: 213–218.

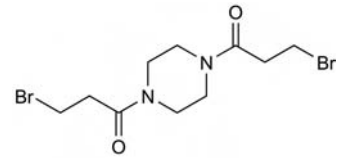
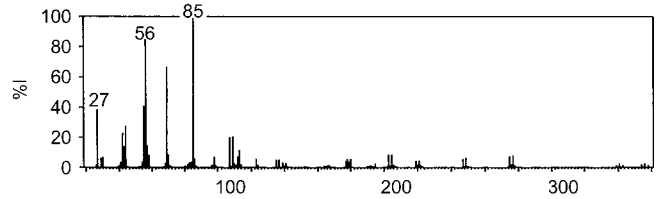
Pipobroman

Antineoplastic
$C_{10}H_{16}Br_2N_2O_2$ = 356.1
CAS—54-91-1
IUPAC Name 3-Bromo-1-[4-(3-bromopropanoyl)piperazin-1-yl]propan-1-one
Synonym 1,4-Bis-(3-bromo-1-oxopropyl)piperazine
Proprietary Names *Amedel*; *Vercite 25*; *Vercyte*.



Chemical Properties A white crystalline powder. Mp 106° to 107°. Soluble 1 in 230 of water, 1 in 35 of ethanol, 1 in 4.8 of chloroform and 1 in 530 of ether; soluble in acetone. Log *P* (octanol/water), 0.4.
Colour Test Add 2 mg to 2 mL of water and heat to dissolve; add 2 mL of hydroxylamine hydrochloride solution and 2 mL of 3 mol/L sodium hydroxide, mix, and allow to stand for 30 min; acidify with dilute hydrochloric acid and add 2 mL of a 9% ferric chloride solution—red–orange.
Thin-layer Chromatography System TA—R_f 0.66; system TB—R_f 0.02; system TC—R_f 0.58; system TL—R_f 0.41 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1811.
Ultraviolet Spectrum No significant absorption, 230 to 360 nm.
Infrared Spectrum Principal peaks at wavenumbers 1626, 1219, 1003, 1266, 923, 892 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 85, 56, 69, 55, 27, 44, 42, 109.

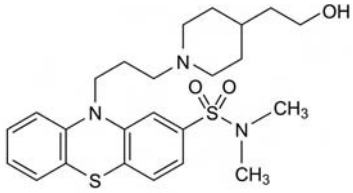


Dose Initially 1 to 1.5 mg/kg daily, orally; maintenance, 7 to 175 mg daily.

Pipotiazine

Tranquilliser
$C_{24}H_{33}N_3O_3S_2 = 475.7$
CAS—39860-99-6

IUPAC Name 10-[3-[4-(2-Hydroxyethyl)piperidin-1-yl]propyl]-*N*,*N*-dimethylphenothiazine-2-sulfonamide
Synonyms 10-[3-[4-(2-Hydroxyethyl)-1-piperidinyl]propyl]-*N*,*N*-dimethyl-10*H*-phenothiazine-2-sulfonamide; pipothiazine; RP-19366.
Proprietary Name *Piportil*



Chemical Properties Log *P* (octanol/water), 4.4.

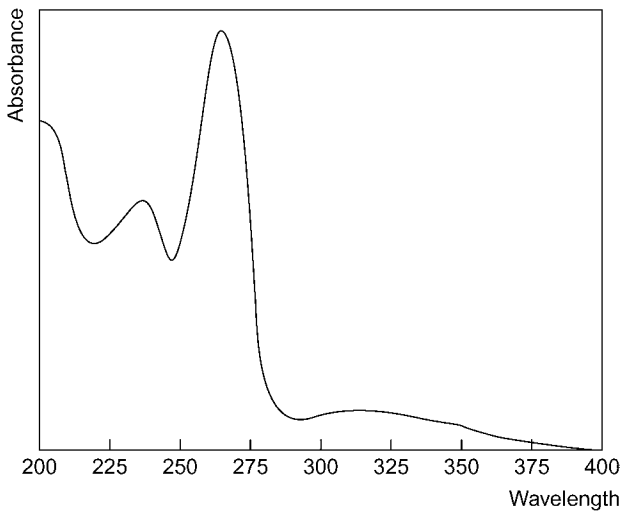
Pipotiazine Palmitate

$C_{40}H_{63}N_3O_4S_2 = 714.1$
CAS—37517-26-3
Synonym Pipothiazine palmitate; RP-19552.
Proprietary Names *Lonseren*; *Piportil L4*.
Chemical Properties A pale yellow crystalline powder. Practically insoluble in water; sparingly soluble in ethanol; freely soluble in chloroform and ether.

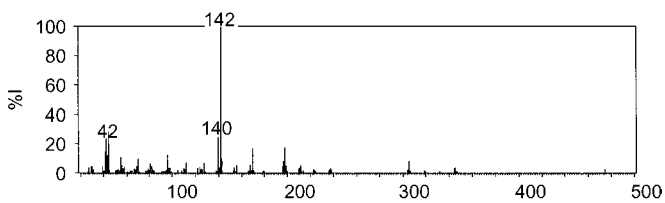
Pipotiazine Undecylenate

$C_{35}H_{51}N_3O_4S_2 = 641.9$
Synonym RP-19551
Proprietary Name *Piportil M2*.

Thin-layer Chromatography System TA—R_f 0.66; system TB—R_f 0.03; system TC—R_f 0.32; system TE—R_f 0.53; system TL—R_f 0.21; system TAE—R_f 0.40; system TAF—R_f 0.59.
Gas Chromatography System GA—RI 2932; system GB—not eluted.
High Performance Liquid Chromatography System HX—RI 431; system HAA—retention time 14.7 min.
Ultraviolet Spectrum Pipotiazine palmitate: ethanol—265 (A^{1}_{1}=500b), 315 nm.



Infrared Spectrum Principal peaks at wavenumbers 1165, 1735, 710, 745, 1250, 955 cm^{-1} (pipotiazine palmitate, solution in carbon tetrachloride–carbon disulfide).
Mass Spectrum Principal ions at *m/z* 142, 44, 140, 42, 198, 170, 41, 96.



Quantification
Plasma **GC** ECD. Limit of detection, 10 µg/L [Cooper, Lapierre 1981].
HPLC [Ogden *et al.* 1989]. Fluorescence detection. Limit of detection, 250 ng/L for plasma [Le Roux *et al.* 1982].
Urine **HPLC** Limit of detection, 2 µg/L for urine, see Plasma [Le Roux *et al.* 1982].

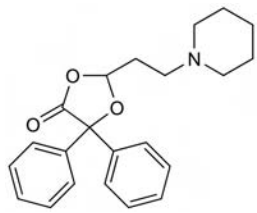
Disposition in the Body Pipotiazine palmitate is very slowly absorbed from the site of IM injections and gradually releases pipotiazine into the body. After oral administration of pipotiazine, about 1% of a dose is excreted in the urine unchanged in 24 h.
Therapeutic Concentration
Following monthly IM injections of 25 to 112.5 mg to 5 subjects, plasma concentrations of 0.018 to 0.058 mg/L (mean, 0.038) were reported immediately before a dose [Cooper, Lapierre 1981].
Dose Usually 10 to 20 mg of pipotiazine daily, orally. Pipotiazine palmitate is given IM in doses of 25 to 200 mg, at intervals of about 4 weeks.

Cooper SF, Lapierre YD (1981). Gas–liquid chromatographic determination of pipotiazine in plasma of psychiatric patients. *J Chromatogr* 222: 291–296.
Le Roux Y *et al.* (1982). High-performance liquid chromatographic determination of pipotiazine in human plasma and urine. *J Chromatogr* 230: 401–408.
Ogden DA *et al.* (1989). Determination of pipothiazine in human plasma by reversed-phase high-performance liquid chromatography. *J Pharm Biomed Anal* 7: 1273–1280.

Pipoxolan

Antispasmodic
$C_{22}H_{25}NO_3 = 351.4$
CAS—23744-24-3

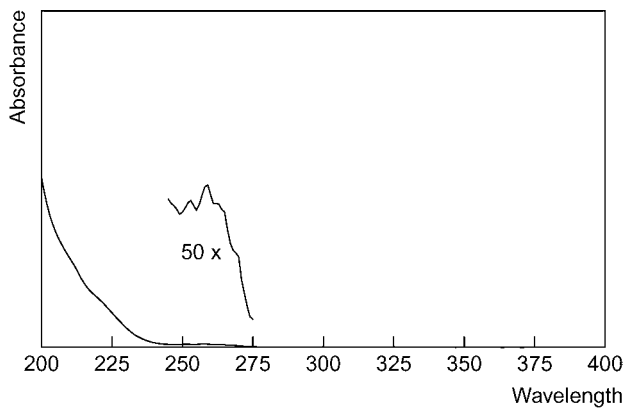
IUPAC Name 5,5-Diphenyl-2-(2-piperidin-1-ylethyl)-1,3-dioxolan-4-one
Synonym BR-18



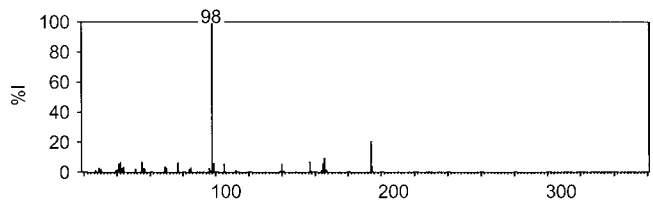
Pipoxolan Hydrochloride

$C_{22}H_{25}NO_3$,HCl = 387.9
CAS—18174-58-8
Proprietary Name *Rowapraxin*
Chemical Properties A white crystalline powder. Mp 207° to 209°. Soluble in water.

Colour Tests Liebermann's reagent—brown; Mandelin's test—green→brown; Marquis test—violet→grey; sulfuric acid—red.
Thin-layer Chromatography System TA—R_f 0.77; system TB—R_f 0.53; system TC—R_f 0.68; system TL—R_f 0.56 (acidified iodoplatinate solution, positive).



Infrared Spectrum Principal peaks at wavenumbers 1786, 1176, 1205, 1111, 1149, 698 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 98, 194, 166, 157, 55, 42, 165, 99.



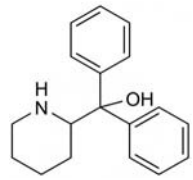
Dose Pipoxolan hydrochloride has been given in doses of 20 to 90 mg daily.

P

Pipradrol

CNS Stimulant
$C_{18}H_{21}NO$ = 267.4
CAS—467-60-7

IUPAC Name Diphenyl(piperidin-2-yl)methanol
Synonyms Alpha-pipradrol; α,α-diphenyl-2-piperidinemethanol; MRD-108; pipradol.

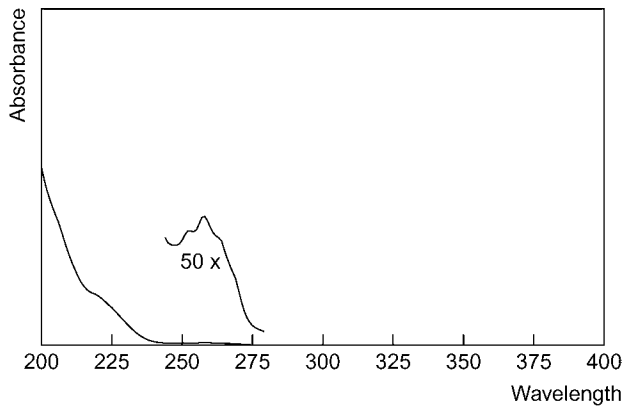


Chemical Properties Log *P* (octanol/water), 3.4.

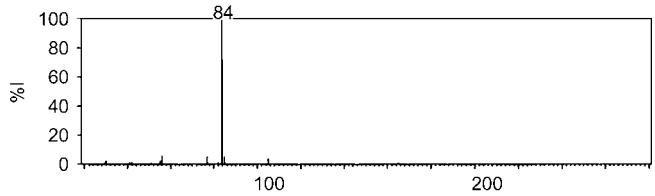
Pipradrol Hydrochloride

$C_{18}H_{21}NO,HCl$ = 303.8
CAS—71-78-3
Proprietary Names *Meratran*; *Stimolag*. It is an ingredient of *Alertonic*.
Chemical Properties Small white crystals or white crystalline powder. Mp 308° to 309° (crystals from butanone). Soluble 1 in 60 of hot water, 1 in 35 of ethanol, 1 in 1000 of chloroform and 1 in 8 of methanol; practically insoluble in ether.

Colour Test Marquis test—yellow-orange.
Thin-layer Chromatography System TA—R_f 0.54; system TB—R_f 0.59; system TC—R_f 0.38; system TE—R_f 0.81; system TL—R_f 0.39; system TAE—R_f 0.19; system TAF—R_f 0.79. (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, red-brown; ninhydrin spray, positive.)
Gas Chromatography System GA—RI 2145; system GB—RI 2242; system GC—RI 2478.
High Performance Liquid Chromatography System HA—*k* 1.2; system HC—*k* 0.69; system HX—RI 355.
Ultraviolet Spectrum Aqueous acid—252, 258 nm (A_1^1=17a). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 701, 740, 690, 1585, 1300, 1065 cm^{-1} (pipradrol hydrochloride, KBr disk).
Mass Spectrum Principal ions at *m/z* 84, 56, 85, 77, 105, 55, 30, 42.

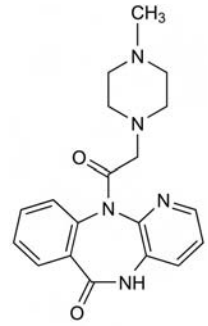


Dose Pipradrol hydrochloride has been given in doses of 2 to 6 mg daily.

Pirenzepine

Treatment of Gastric Ulcers, Antiulcerative
$C_{19}H_{21}N_5O_2$ = 351.4
CAS—28797-61-7

IUPAC Name 11-[2-(4-Methylpiperazin-1-yl)acetyl]-5*H*-pyrido[2,3-*b*][1,4]benzodiazepin-6-one
Synonyms 5,11-Dihydro-11-[(4-methyl-1-piperazinyl)acetyl]-6*H*-pyrido[2,3-*b*]-[1,4]benzodiazepin-6-one; LS-519

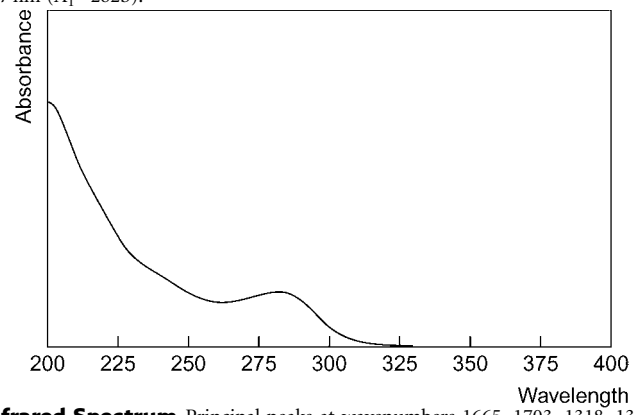


Chemical Properties pK_a 2.1, 8.1. Log *P* (octanol/water), 1.7.

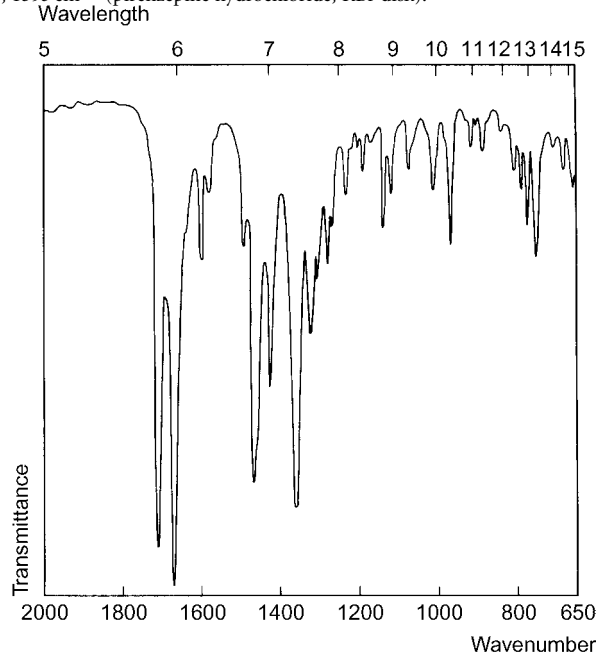
Pirenzepine Hydrochloride

$C_{19}H_{21}N_5O_2,2HCl$ = 424.3
CAS—29868-97-1
Synonym LS-519-cl2
Proprietary Names *Cevanil*; *Duogastral*; *Frazim*; *Gastricur*; *Gastrol*; *Gastropin*; *Gastropiren*; *Gastrosed*; *Gastrozepin(a)*; *Ulcepin*; *Ulcin*; *Ulcoprotect*; *Ulcosafe*; *Leblon*; *Maghen*; *Tabe*.
Chemical Properties A white crystalline powder. Mp 248° to 253°, with decomposition. Freely soluble in water; practically insoluble in ether; very slightly soluble in methanol.

Thin-layer Chromatography System TB—pirenzepine R_f 0.00; M (desamide) R_f 0.04; M (*N*-desmethyl) R_f 0.00; system TE—pirenzepine R_f 0.16; M (desamide) R_f 0.70; M (*N*-desmethyl) R_f 0.03; system TAE—pirenzepine R_f 0.18; M (desamide) R_f 0.81; M (*N*-desmethyl) R_f 0.04.
High Performance Liquid Chromatography System HA—*k* 2.7; system HX—pirenzepine RI 293; M (desamide) RI 373;M (*N*-desmethyl) RI 291.
Ultraviolet Spectrum Aqueous acid—280 (A_1^1=237a); aqueous alkali—297 nm (A_1^1=282b).

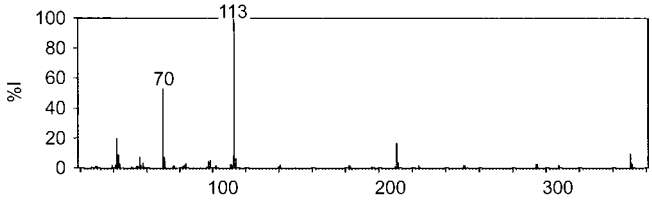


Infrared Spectrum Principal peaks at wavenumbers 1665, 1703, 1318, 1300, 1278, 1593 cm^{-1} (pirenzepine hydrochloride, KBr disk).



P

Mass Spectrum Principal ions at *m/z* 113, 70, 42, 211, 351, 43, 71, 56.



Quantification

Plasma **HPLC** Limit of detection, 2.5 µg/L [Meineke *et al.* 1986].

Radioimmunoassay Limit of detection, 0.25 µg/L in plasma [Tanswell *et al.* 1986].

Urine **Radioimmunoassay** Limit of detection, 4 µg/L in urine, see Plasma [Tanswell *et al.* 1986].

Disposition in the Body Incompletely absorbed after oral administration. Excreted in the urine and faeces largely as unchanged drug with <10% of a dose as the desmethyl metabolite.

Therapeutic Concentration

Following a single oral dose of 50 mg to 87 subjects, a mean peak plasma concentration of 0.05 mg/L was attained in 2 h [Bozler, Hammer 1980].

Bioavailability About 20 to 30%.

Half-life Plasma half-life, about 11 h.

Clearance Plasma clearance, about 3.5 mL/min/kg.

Protein Binding About 10%.

Dose 100 to 150 mg of pirenzepine hydrochloride daily.

Bozler G, Hammer R (1980). An international pharmacokinetic study on pirenzepine following a single oral dose. *Scand J Gastroenterol* 15: 27–33.

Meineke I *et al.* (1986). Sensitive high-performance liquid chromatographic determination of pirenzepine in plasma. *J Chromatogr* 375: 369–375.

Tanswell P *et al.* (1986). Automated monoclonal radioimmunoassays for pirenzepine, a selective muscarinic receptor antagonist, in plasma and urine. *J Immunol Methods* 93: 247–258.

Piritramide

Narcotic Analgesic

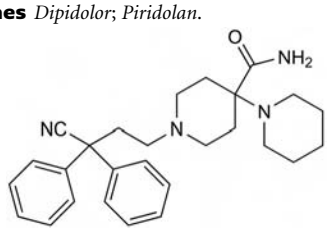
$C_{27}H_{34}N_4O = 430.6$

CAS—302-41-0

IUPAC Name 1-(3-Cyano-3,3-diphenylpropyl)-4-piperidin-1-ylpiperidine-4-carboxamide

Synonyms 1′-(3-Cyano-3,3-diphenylpropyl)-[1,4′-bipiperidine]-4′-carboxamide; pirinitramide.

Proprietary Names *Dipidolor*; *Piridolan*.



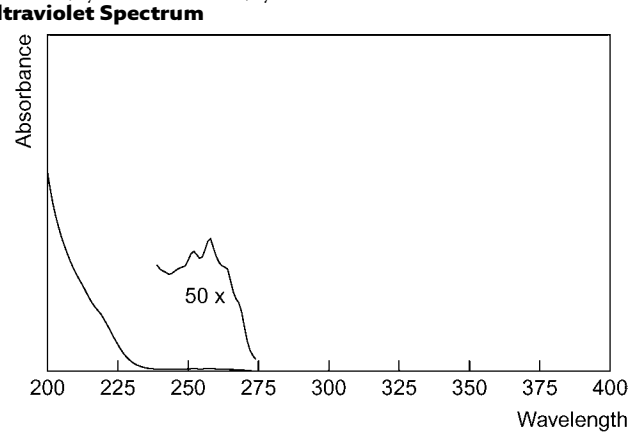
Chemical Properties Crystalline powder. Mp 149° to 150°. Soluble in dilute acetic acid. Log *P* (octanol/water), 3.9. Extraction yield (chlorobutane), 0.9 [Demme *et al.* 2005]. Stability was verified after 3 freeze-thaw cycles, although it was advisable to store plasma samples at -80° for no longer than 6 months due to slight degradation [Kahlich *et al.* 2006].

Thin-layer Chromatography System TA—R_f 0.70; system TAE—R_f 0.73; system TAF—R_f 0.74; system TAG—R_f 0.42; system TB—R_f 0.01; system TC—R_f 0.45; system TE—R_f 0.61 (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, orange; ninhydrin spray, positive).

Gas Chromatography System GA—RI 3560.

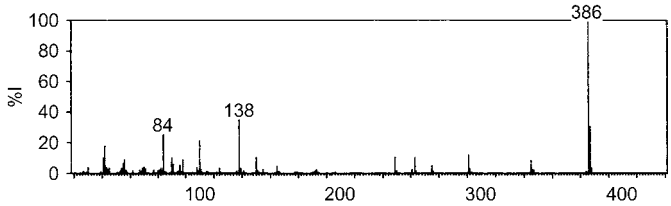
High Performance Liquid Chromatography System HA—*k* 0.6; system HC—*k* 0.1; system HX—RI 377; system HY—RI 343.

Ultraviolet Spectrum



Infrared Spectrum Principal peaks at wavenumbers 1669, 701, 757, 1087, 1190, 1592 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 386, 138, 387, 84, 110, 42, 301, 263.



Quantification

Plasma **GC** Column: OV-1 (4 m × 0.32 mm i.d., 0.5 µm). Carrier gas: He, 4.2 mL/min. Temperature: 260°. NPD. Limit of detection, 1.5 µg/L [Kietzmann *et al.* 1996]. Column: J & W DB-1 (30 m × 0.53 mm i.d., 1.5 µm). Carrier gas: He, 19 mL/min. Temperature programme: 290° for 9 min to 310° at 50°/min for 10 min. NPD. Limit of detection, 1–2 µg/L [Michaelis *et al.* 1991].

LC-MS Column: C_{18} Grom Sil 120 ODS-3 CP (150 × 2 mm i.d., 5 µm). Mobile phase: water : acetonitrile : formic acid (70 : 30 : 0.1), flow rate 200 µL/min. ESI, positive ion mode, SRM acquisition mode. Limit of quantification, 0.5 µg/L, limit of detection, 0.05 µg/L [Kahlich *et al.* 2006]. Column: Phenomenex C_{12} MAX-RP (150 × 2 mm i.d., 4 µm). Mobile phase: water-acetonitrile (90 : 10) with 5 mmol/L ammonium formate (pH 3.5) : water-acetonitrile (10 : 90) with 5 mmol/L ammonium formate (pH 3.5, 100 : 0 for 5 min to 0 : 100 at 19 min for 7 min to 100 : 0 in 3 min for 6 min), flow rate 200 µL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 2.6 µg/L, limit of detection, 1.1 µg/L [Musshoff *et al.* 2006].

Serum **LC-MS** Merck Supersphere 100 RP-18 (125 × 4 mm i.d.). Mobile phase: 0.02% trifluoroacetic acid : methanol (55 : 45 to 30 : 70 in 0.5 min for 10 min), flow rate 0.8 mL/min. APCI, positive ion mode. Retention time: 5.6 min. Limit of detection, 0.3 µg/L [Martens-Lobenhoffer, Römhild 2003]

Urine **GC** See Plasma [Kietzmann *et al.* 1996].

LC-MS See Plasma [Kahlich *et al.* 2006].

Hair **LC-MS** Phenomenex C_{12} Synergi Max-RP (150 × 2 mm i.d., 4 µm). Mobile phase: water-acetonitrile (90 : 10) with 5 mmol/L ammonium formate (pH 3.5) : water-acetonitrile (10 : 90) with 5 mmol/L ammonium formate (pH 3.5, 100 : 0 for 5 min to 0 : 100 at 19 min for 7 min to 100 : 0 in 3 min for 6 min), flow rate 200 µL/min. TIS, ESI, positive ion mode. Limit of quantification, 9.1 pg/mg, limit of detection, 2.2 pg/mg [Musshoff *et al.* 2007].

Protein Binding ≈94% [Kietzmann *et al.* 1996].

Volume of Distribution 4.7 L/kg.

Clearance 7.8 mL/min/kg.

Note For the pharmacokinetics of piritramide in patients see Kietzmann *et al.* [1997], Bouillon *et al.* [1999], or Bouillon *et al.* [2004].

Piroxicam

Analgesic

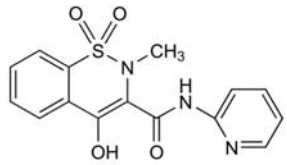
$C_{15}H_{13}N_3O_4S = 331.3$

CAS—36322-90-4

IUPAC Name (3E)-3-[Hydroxy-(pyridin-2-ylamino)methylidene]-2-methyl-1,1-dioxo-1λ⁶,2-benzothiazin-4-one

Synonyms CP-16171; 4-hydroxy-2-methyl-*N*-2-pyridinyl-2*H*-1,2-benzothiazine-3-carboxamide 1,1-dioxide

Proprietary Names *Antiflog*; *Brexidol*; *Brexin(e)*; *Candyl*; *Cycladol*; *Fasax*; *Felden(e)*; *Fexicam*; *Flamatrol*; *Flexase*; *Flexirox*; *Geroxicam*; *Inflaced*; *Jenapirox*; *Larapam*; *Olcam*; *Pericam*; *Piro*; *Pirocam*; *Piroflam*; *Piroxil*; *Piroxistad*; *Proxalyoc*; *Zofora*; *Sasulen*; *Zunden*.



Chemical Properties Crystals. Mp 198° to 200°. Practically insoluble in water; slightly soluble in dehydrated ethanol and aqueous alkaline solutions. pK_a 6.3. Log *P* (octanol/water), 3.1. Extraction yield (chlorobutane), 0 [Demme *et al.* 2005].

Colour Tests Koppanyi–Zwikker test (omit pyrrolidine)—orange; Liebermann's reagent—yellow.

Thin-layer Chromatography System TB—M (5-hydroxy) R_f 0.00; system TD—piroxicam R_f 0.51, M (5-hydroxy) R_f 0.08; system TE—piroxicam R_f 0.17, M (5-hydroxy-) R_f 0.03; system TF—piroxicam R_f 0.38, M (5-hydroxy-) R_f 0.18; system TAD—R_f 0.71; system TAE—piroxicam R_f 0.88, M (5-hydroxy-) R_f 0.88; system TAJ—R_f 0.69; system TAK—R_f 0.45; system TAL—R_f 0.94.

Serum **HPLC** See Plasma [Streete 1989]. UV detection. Limit of detection, 500 µg/L [Fraser, Woodbury 1983].

Urine **HPLC** UV detection. Piroxicam and other NSAIDs. Limit of detection, 50 µg/L [Hirai *et al.* 1997]. See Plasma [Avgerinos *et al.* 1995; Milligan 1992].

Bile **HPLC** See Plasma [Milligan 1992].

Synovial Fluid **HPLC** See Plasma [de Jager *et al.* 1999].

Subcutaneous Tissue **HPLC** See Plasma [de Jager *et al.* 1999].

Synovial Capsule **HPLC** See Plasma [de Jager *et al.* 1999].

Disposition in the Body Readily absorbed after oral or rectal administration. It is extensively metabolised to inactive metabolites; the major metabolite is produced by hydroxylation of the pyridyl ring and exists free and conjugated with glucuronic acid. About 10% of an oral dose is excreted in the urine as unchanged drug in 8 days.

Therapeutic Concentration Piroxicam accumulates on repeated administration; steady-state plasma concentrations are attained after approximately 7 days. The normal therapeutic level is between 5 and 10 mg/L.

Following oral administration of 40 mg to 20 subjects, peak plasma concentrations of 1.7 to 6.8 mg/L (mean, 4.3) were reported; multiple peak concentrations were observed in 16 subjects, suggesting possible enterohepatic circulation. After daily oral administration of 10, 20, and 30 mg to 5 subjects for 14 days, maximum steady-state plasma concentrations of 2.1 to 4.3 (mean, 3.2), 3.6 to 6.5 (mean, 4.5), and 9.0 to 16.5 (mean, 11.7) mg/L were reported [Hobbs, Twomey 1979].

Administration of 20 mg piroxicam daily for at least 4 weeks to 85 osteoarthritis patients produced mean steady-state free plasma concentrations of 0.057 mg/L when all patients were considered and 0.004 to 0.117 mg/L in newly diagnosed patients (fraction of unbound piroxicam was 0.87%) [Hundal, Rugstad 1993].

Toxicity

After ingesting approximately 1800 mg of piroxicam, a 54-year-old woman had a maximum serum concentration of 241.6 mg/L (measured at about 12 h after the overdosage), which is about 30 times the normal therapeutic level (5 to 10 mg/L) [Mosvold *et al.* 1984].

Half-life Plasma half-life, about 30 to 60 h, increased in elderly subjects.

Volume of Distribution About 0.1 L/kg.

Clearance Plasma clearance, about 0.03 mL/min/kg.

Protein Binding About 99%.

Note For a review of the pharmacokinetics of piroxicam, see Brogden *et al.* [1984].

Dose Usually 20 mg daily; doses of 40 mg daily may be given for 7 days.

Avgerinos A *et al.* (1995). Extractionless high-performance liquid chromatographic method for the simultaneous determination of piroxicam and 5′-hydroxypiroxicam in human plasma and urine. *J Chromatogr B Biomed Appl* 673: 142–146.

Pivampicillin

Antibiotic

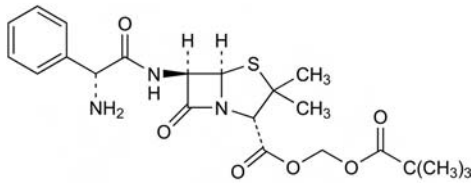
$C_{22}H_{29}N_3O_6S$ = 463.5

CAS—33817-20-8

IUPAC Name 2,2-Dimethylpropanoyloxymethyl (2*S*,5*R*,6*R*)-6-[[(2*R*)-2-amino-2-phenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate

Synonyms (2*S*,5*R*,6*R*)-6-[[(2*R*)-Aminophenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (2,2-dimethyl-1-oxopropoxy)methyl ester; MK-191

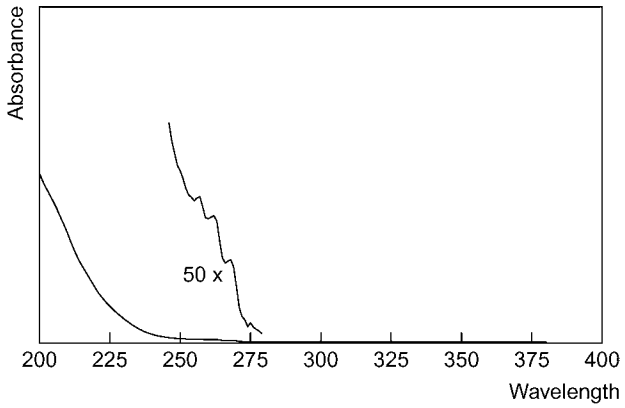
Proprietary Names *Lervipan*; *Pondocil*; *Pondocillin*; *Proampi*.



Chemical Properties pK_a 7.0.

Pivampicillin Hydrochloride
$C_{22}H_{29}N_3O_6S,HCl = 500.0$
CAS—26309-95-5
Proprietary Name *Pivamiser*; *Pondocil*; *Sanguicillin*.
Chemical Properties A white, hygroscopic, crystalline powder. Soluble 1 in 2 of water and 1 in 1.5 of chloroform; very slightly soluble in ether.

High Performance Liquid Chromatography System HAA—retention time 15.8 min.
Ultraviolet Spectrum Aqueous acid—256, 261, 268 nm; aqueous alkali—257, 311 nm.



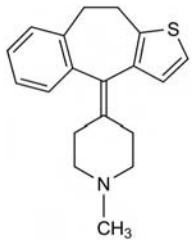
Infrared Spectrum Principal peaks at wavenumbers 1760, 1742, 1104, 1683, 972, 1150 cm^{-1} (KBr disk).
Disposition in the Body
Therapeutic Concentration
Ten cystic fibrosis patients given pivampicillin 50 mg/kg daily alone or combined with pivmecillinam 40 mg/kg daily for 14 days displayed mean peak pivampicillin serum concentrations of 6.0 mg/L and 6.9 mg/L, respectively, 2 h after oral dosing [Johansen *et al.* 1999].
Dose 1 to 2 g daily.

Johansen HK *et al.* (1999). Randomised trial of pivampicillin plus pivmecillinam vs. pivampicillin in children and young adults with chronic obstructive pulmonary disease and infection with Haemophilus influenzae. *Curr Med Res Opin* 15: 300–309.

Pizotifen

Antimigraine, Antihistamine (Sedating)
$C_{19}H_{21}NS = 295.4$
CAS—15574-96-6

Synonyms BC-105; 4-(9,10-dihydro-4*H*-benzo[4,5]cyclohepta[1,2-*b*]thien-4-ylidene)-1-methylpiperidine; pizotyline.

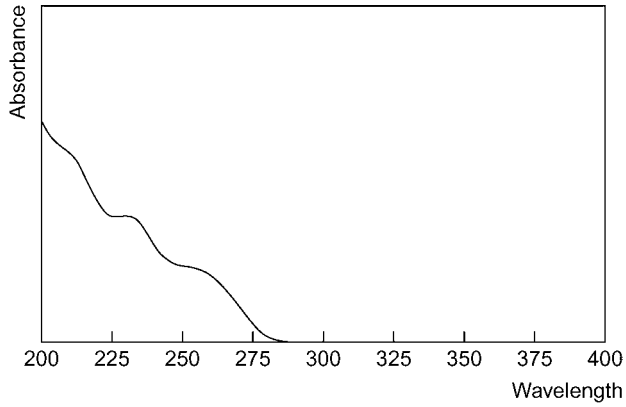


Chemical Properties A white to yellow crystalline powder. Mp 261° to 263°, with decomposition. Soluble in dilute acetic acid and in chloroform : methanol (1 : 1). pK_a 7.0. Log *P* (octanol/water), 5.2.

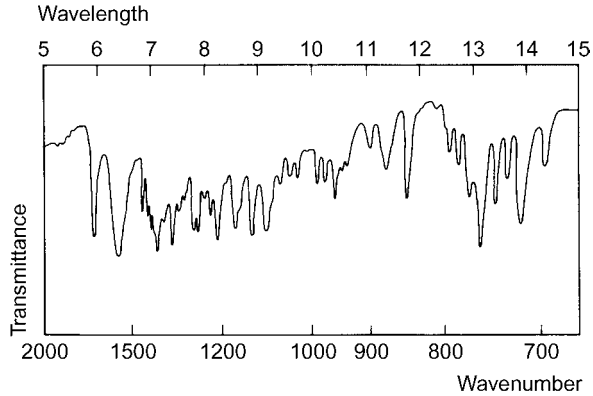
Pizotifen Malate
$C_{19}H_{21}NS,C_4H_6O_5 = 429.5$
CAS—5189-11-7

Proprietary Names *Anorsia*; *Litec*; *Mosegor*; *Pizomed*; *Sandomigran*; *Sanmigran*; *Sanomigran*; *Zofen*.
Chemical Properties Crystals. Mp 185° to 186°, with decomposition.

Colour Tests Liebermann's reagent—black; Mandelin's test—violet→green; Marquis test—orange→red; sulfuric acid—orange-yellow→violet.
Thin-layer Chromatography System TA—R_f 0.48; system TB—R_f 0.45; system TE—R_f 0.64; system TAE—R_f 0.28. (Acidified iodoplatinate solution, positive.)
Gas Chromatography System GA—RI 2375.
High Performance Liquid Chromatography System HA—*k* 3.4; system HX—RI 435; system HZ—retention time 6.6 min; system HAA—retention time 15.2 min.



Infrared Spectrum Principal peaks at wavenumbers 1577, 756, 1212, 1703, 1124, 1274 cm^{-1} (KBr disk).

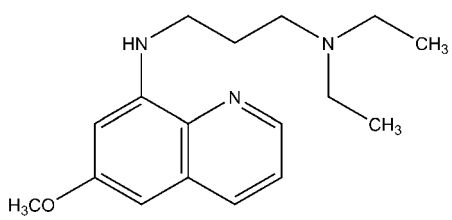


Disposition in the Body Absorbed after oral administration. Peak blood concentrations of total radioactivity were attained in 5 to 7 h after a single oral dose of 1 mg of ^{3}H-pizotifen. About 62% of a dose is excreted in the urine and 24% is eliminated in the faeces in 120 h, with about 36% of the dose being excreted in the first 24 h.
Half-life Derived from urinary excretion data (total radioactivity), about 26 h.
Dose The equivalent of 0.5 to 6 mg of pizotifen daily.

Plasmocide

Antimalarial
$C_{17}H_{25}N_3O = 287.4$
CAS—551-01-9

IUPAC Name *N,N*-Diethyl-*N*′-(6-methoxyquinolin-8-yl)propane-1,3-diamine
Synonyms Antimalarine; *N,N*-diethyl-N′-(6-methoxy-8-quinolinyl)-1,3-propanediamine; 8-(3-diethylaminopropylamino)-6-methoxyquinoline; 710-F; fourneau 710; 6-methoxy-8-(3-diethylaminopropylamino)quinoline; rhodoquine; SN-3115.



Chemical Properties Oily liquid. Bp_1 182°. Log *P* (octanol/water) 3.6 [National Institutes of Health 2008]. Plasmocide is extracted by organic solvents from aqueous alkaline solutions.

Plasmocide Dihydrochloride

$C_{17}H_{25}N_3O,2HCl$ =360.32

Chemical Properties Yellow crystals. Mp 218° to 220°. Slightly soluble in water, alcohol.

Plasmocide Diphosphate

Chemical Properties Yellow crystals. Mp 169° to 171°. Slightly soluble in water, alcohol.

Colour Tests Ammonium molybdate test—pale blue (limit of detection, 1.0 µg); ammonium vandate test—purple→orange (limit of detection, 0.5 µg); sulfuric acid–formaldehyde test—orange (limit of detection, 0.25 µg); Vitali's test—yellow/brown/yellow-brown (limit of detection, 0.1 µg).

Thin-layer Chromatography System T1—R_f 0.35 (location reagent acidified iodoplatinate spray, positive reaction).

Disposition in the Body

Toxicity For a review of antimalarial drugs and glucose-6-phosphate dehydrogenase deficiency, see Beutler and Duparc [2007].

Dose Up to 60 mg daily.

Beutler E, Duparc S (2007). Glucose-6-phosphate dehydrogenase deficiency and antimalarial drug development. *Am J Trop Med Hyg* 77: 779–789.

National Institutes of Health (2008). *Plasmocid*. http://pubchem.ncbi.nlm.nih.gov/summary/summary.cgi?cid=120202&loc=ec_rcs. (accessed 27 June 2008) 2008.

Poldine Metilsulfate

Anticholinergic

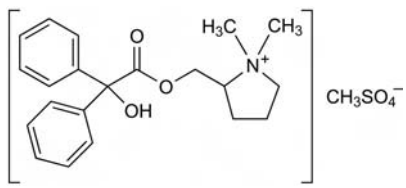
$C_{21}H_{26}NO_3,CH_3SO_4$ = 451.5

CAS—596-50-9 (poldine); 545-80-2 (metilsulfate)

IUPAC Name (1,1-Dimethylpyrrolidin-1-ium-2-yl)methyl-2-hydroxy-2,2-diphenylacetate; methyl sulfate

Synonyms 2-[[(Hydroxydiphenylacetyl)oxy]methyl]-1,1-dimethylpyrrolidinium methyl sulfate; IS-499; MeN-R-726-47; poldine methosulfate; poldine methylsulfate.

Proprietary Names *Nactate*; *Nacton*.



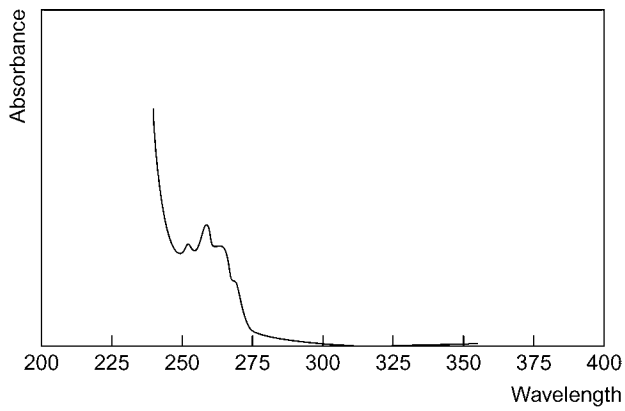
Chemical Properties A white to creamy-white crystalline powder. Mp 154° to 155°. Soluble 1 in 1 of water, 1 in 20 of ethanol and 1 in 1000 of chloroform; practically insoluble in ether. Log *P* (octanol/water), 0.9.

Colour Tests Mandelin's test—orange→green→violet; Marquis test—orange→green→blue.

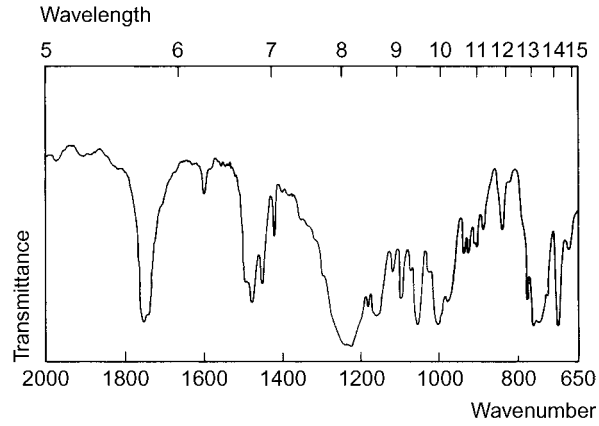
Thin-layer Chromatography System TA—R_f 0.02. (Acidified iodoplatinate solution, positive.)

High Performance Liquid Chromatography System HA—*k* 3.3 (tailing peak).

Ultraviolet Spectrum Aqueous acid—252, 258 nm (A^1_1=10.5a). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1222, 701, 1061, 1008, 765, 1751 cm^{-1} (KBr disk).



Dose 8 to 16 mg daily.

Polythiazide

Diuretic

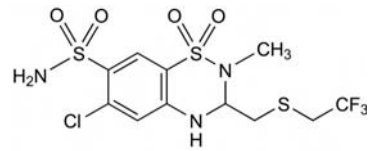
$C_{11}H_{13}ClF_3N_3O_4S_3$ = 439.9

CAS—346-18-9

IUPAC Name 6-Chloro-2-methyl-1,1-dioxo-3-(2,2,2-trifluoroethylsulfanylmethyl)-3,4-dihydro-1λ^6,2,4-benzothiadiazine-7-sulfonamide

Synonym 6-Chloro-3,4-dihydro-2-methyl-3-[[(2,2,2-trifluoroethyl)thio]methyl]-2*H*-1,2,4-benzothiadiazine-7-sulfonamide 1,1-dioxide

Proprietary Names *Drenusil*; *Nephril*; *Renese*.



Chemical Properties A white crystalline powder. Mp about 214°, with decomposition. Practically insoluble in water and chloroform; soluble 1 in 40 of ethanol; soluble in acetone and methanol. Log *P* (octanol/water), 1.9.

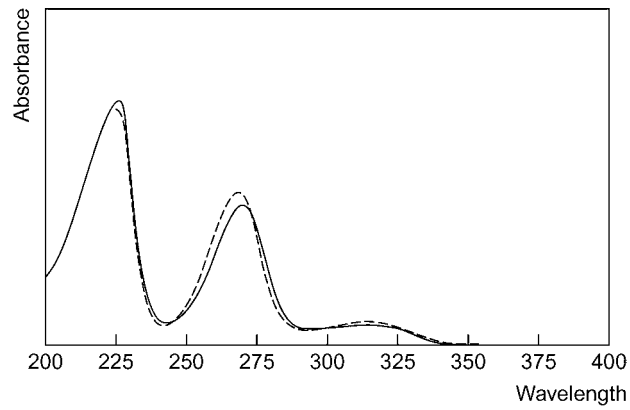
Colour Tests Koppanyi–Zwikker test—violet; Liebermann's reagent—red-brown; palladium chloride—orange; sulfuric acid—orange.

Thin-layer Chromatography System TD—R_f 0.22; system TE—R_f 0.63; system TF—R_f 0.60; system TAD—R_f 0.32; system TAJ—R_f 0.35; system TAK—R_f 0.08; system TAL—R_f 0.70.

Gas Chromatography System GA—polythiazide RI 2380, polythiazide-ME3 RI 2985; system GX—polythiazide-ME3 retention time 11.0 min.

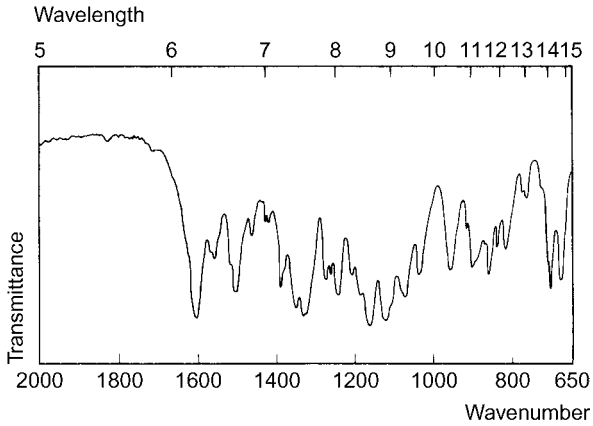
High Performance Liquid Chromatography System HN—*k* 15.09.

Ultraviolet Spectrum Methanol—268 (A^1_1=500a), 317 nm.

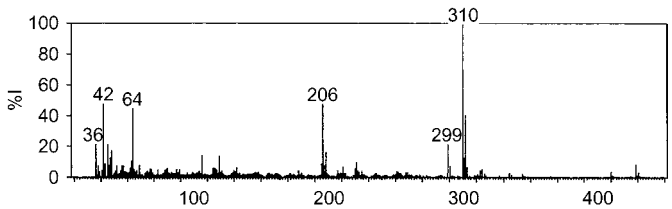


Infrared Spectrum Principal peaks at wavenumbers 1162, 1120, 1597, 1071, 1240, 1500 cm^{-1} (KBr disk).

P



Mass Spectrum Principal ions at *m/z* 310, 206, 42, 64, 312, 299, 45, 48.

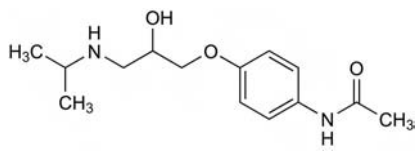


Quantification
Plasma **GC** ECD. Limit of detection, 200 ng/L [Hobbs, Twomey 1978].
HPLC Spectrophotometric detection. Limit of detection, 0.5 µg/L [Dokladalova *et al.* 1981].
Disposition in the Body Well absorbed after oral administration. About 20% of a single oral dose is excreted in the urine as unchanged drug in 48 h.
Therapeutic Concentration
After a single oral dose of 1 mg to 18 subjects, peak plasma concentrations of 0.002 to 0.007 mg/L (mean, 0.004) were attained in 5 to 12 h [Hobbs, Twomey 1978].
Half-life Plasma half-life, about 26 h.
Protein Binding About 80 to 85%.
Dose 1 to 4 mg daily.

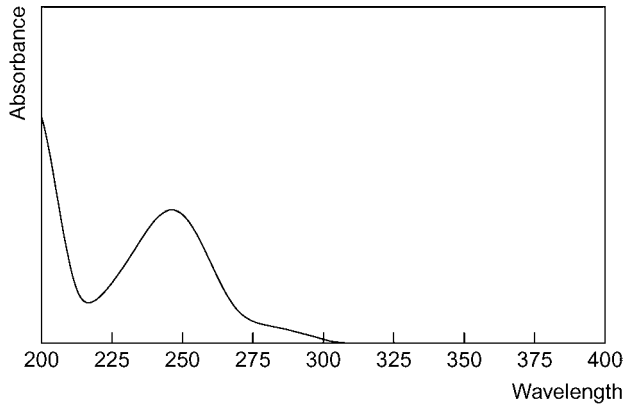
Dokladalova J *et al.* (1981). Determination of polythiazide and prazosin in human plasma by high-performance liquid chromatography. *J Chromatogr* 224: 33–41.
Hobbs DC, Twomey TM (1978). Kinetics of polythiazide. *Clin Pharmacol Ther* 23: 241–246.

Practolol

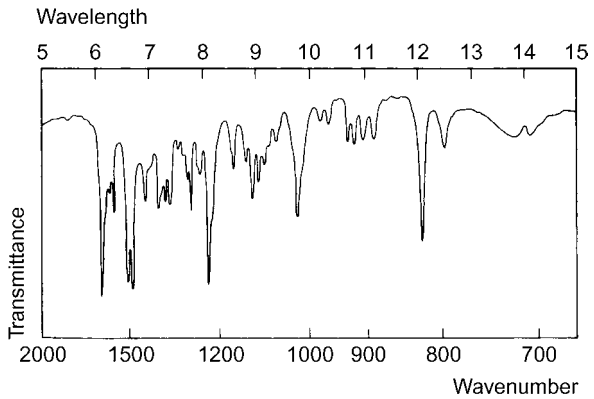
β-*Blocker*
$C_{14}H_{22}N_2O_3$ = 266.3
CAS—6673-35-4; 23313-50-0 (±)
IUPAC Name *N*-[4-[2-Hydroxy-3-(propan-2-ylamino)propoxy]phenyl]acetamide
Synonyms AY-21011; *N*-[4-[2-hydroxy-3-[(1-methylethyl)amino]propoxy]phenyl]acetamide; ICI-50172.
Proprietary Name *Dalzic*; *Eraldin*.



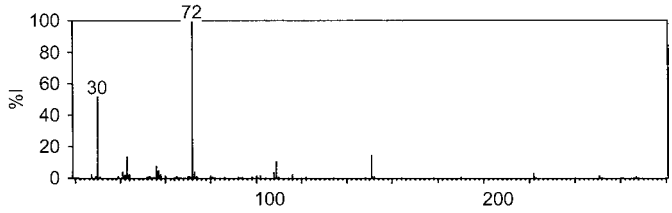
Chemical Properties A fine, white powder. Mp 134° to 136°. Soluble 1 in 400 of water, 1 in 40 of ethanol and 1 in 200 of chloroform; very soluble in dilute solutions of acetic acid. pK_a 9.5 (20°). Log *P* (octanol/pH 8.0), −1.3.
Colour Test Liebermann's reagent—black.
Thin-layer Chromatography System TA—R_f 0.45; system TB—R_f 0.00; system TC—R_f 0.01; system TL—R_f 0.04. (Acidified potassium permanganate solution, positive.)
Gas Chromatography System GA—not eluted; system GB—RI 2440.
High Performance Liquid Chromatography System HA—*k* 0.5.
Ultraviolet Spectrum Aqueous acid—243 nm (A^1_1=467a); methanol—248 nm (A^1_1=620a).



Infrared Spectrum Principal peaks at wavenumbers 1642, 1497, 1234, 1515, 822, 1019 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 72, 30, 151, 43, 109, 56, 57, 108.



Quantification
Blood **Spectrofluorimetry** Limit of detection, 200 µg/L [Bodem, Chidsey 1972].
Plasma **GC** ECD. Limit of detection, 10 µg/L [Besager, Harvengt 1975].
HPLC Practolol and other beta-blockers [Musch *et al.* 1989]. UV detection. Limit of detection, 30 ng/mL [Mehta, Calvert 1983].
Urine **Spectrofluorimetry** See Blood [Bodem, Chidsey 1972].
GC See Plasma [Besager, Harvengt 1975].
Disposition in the Body Completely absorbed after oral administration and almost entirely excreted in the urine as unchanged drug. Up to about 70% of a dose is excreted in the urine in 24 h.
Therapeutic Concentration
After a single oral dose of 200 mg to 13 subjects, a mean peak plasma concentration of 1.3 mg/L was attained in 2 h [Castleden *et al.* 1975].
Daily oral doses of 200 mg, 400 mg, and 800 mg to 8 subjects produced mean steady-state serum concentrations of 1.6, 2.9, and 4.5 mg/L, respectively [Alderman *et al.* 1973].
Toxicity The use of practolol has been restricted by serious adverse effects, notably the oculomucocutaneous syndrome. This is characterised by adverse effects on the skin, eyes and mucous membranes, deafness, systemic lupus erythematosus and sclerosing peritonitis.
Half-life Plasma half-life, 10 to 13 h.
Volume of Distribution About 1.6 L/kg.
Clearance Plasma clearance, about 2 mL/min/kg.
Protein Binding <10%.
Dose Practolol has been given in doses of 0.2 to 1.2 g daily.

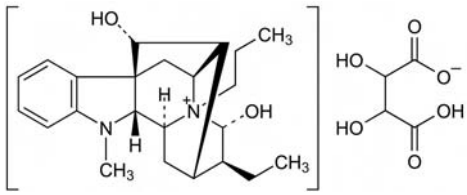
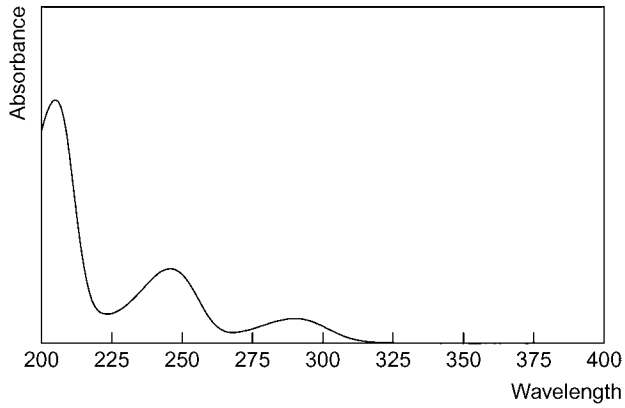
Prajmalium Bitartrate

Antiarrhythmic
$C_{23}H_{33}N_2O_2,C_4H_5O_6 = 518.6$
CAS—35080-11-6 (prajmalium); 2589-47-1 (bitartrate)
Synonyms (17*R*,21α)-17,21-Dihydroxy-4-propylajmalinium hydrogen tartrate; GT-1012; NPAB.
Proprietary Names *Neo Aritmina*; *Neo-Gilurytmal*; *Neorythmin*.



Chemical Properties A white to pale yellow powder. Mp 149° to 152°. Soluble in water; readily soluble in ethanol, glacial acetic acid and dilute mineral acids; moderately soluble in chloroform; practically insoluble in ether.
Colour Tests Liebermann's reagent—red; Mandelin's test—red.
Thin-layer Chromatography System TA—R_f 0.59; system TAE—R_f 0.08. (Acidified potassium permanganate solution, positive.)
Gas Chromatography System GA—prajmalium RI 2925; M (OH-) Art RI 3130, M (methoxy-) Art RI 2895, M (OH-methoxy-) Art RI 3200.
High Performance Liquid Chromatography System HA—*k* 2.2 (tailing peak); system HY—RI 340.
Ultraviolet Spectrum Aqueous acid—246, 290 nm.



Quantification
Plasma **GC** AFID. Limit of detection, 5 µg/L [Thoma *et al.* 1981].
HPLC Fluorescence detection. Limit of detection, about 5 µg/L [Grundevik, Persson 1982].

Disposition in the Body
Therapeutic Concentration
Following oral administration of 20 mg four times a day to 8 subjects, steady-state plasma concentrations of 0.08 to 0.55 mg/L (mean, 0.2) were reported [Trompler *et al.* 1983].
Half-life Plasma half-life, about 7 h.
Dose 20 to 40 mg daily.

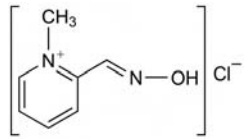
Pralidoxime Chloride

Cholinesterase Reactivator, Antidote (Nerve Gas and Organophosphate Insecticide Poisoning)
$C_7H_9ClN_2O = 172.6$
CAS—6735-59-7 (pralidoxime); 51-15-0 (chloride)
IUPAC Name [(*E*)-(1-Methylpyridin-2-ylidene)methyl]-oxoazanium chloride
Synonyms Chloride oxime; 2-[(hydroxyimino)methyl]-1-methylpyridinium chloride; 2-PAM chloride; 2-PAMCl; pyraloxime chloride; 2-pyridine aldoxime methochloride.
Proprietary Name *Protopam Chloride*



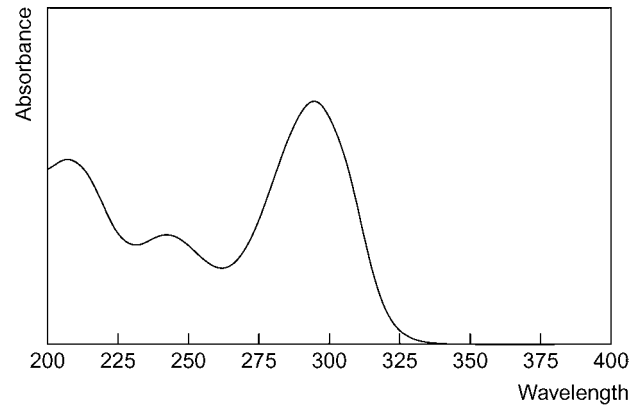
Chemical Properties A white or pale yellow crystalline powder. Mp 235° to 238°, with decomposition. Soluble 1 in <2 of water and 1 in 100 of ethanol. pK_a 8.0 (20°).

Pralidoxime Iodide
$C_7H_9IN_2O = 264.1$
CAS—94-63-3
Synonyms PAM; P-2-AM; 2-PAM iodide; 2-PAMI; pamium; pyraloxime iodide; 2-pyridine aldoxime methiodide.
Chemical Properties A yellow, hygroscopic, crystalline powder. Mp 225° to 226°, with decomposition. Soluble 1 in 20 of water; practically insoluble in ethanol, chloroform and ether. Aqueous solutions are unstable.

Pralidoxime Mesilate
$C_8H_{12}N_2O_4S = 232.3$
CAS—154-97-2
Synonyms 2-PAMM; pralidoxime mesylate; pralidoxime methanesulfonate; P2S; 2-pyridine aldoxime methyl mesilate.
Chemical Properties A colourless or white, hygroscopic, crystalline or granular powder. Mp 155°. Soluble 1 in 2 of water and 1 in 12 of ethanol; practically insoluble in chloroform and ether.

Pralidoxime Metilsulfate
$C_8H_{12}N_2O_5S = 248.3$
CAS—1200-55-1
Synonym Pralidoxime methylsulfate
Proprietary Name *Contrathion*
Chemical Properties A white crystalline powder. Mp about 111°. Very soluble in water; slightly soluble in chloroform.

Thin-layer Chromatography System TA—R_f 0.05; system TB—pralidoxime mesilate R_f 0.00; system TE—pralidoxime mesilate R_f 0.00; system TF—pralidoxime mesilate R_f 0.00; system TAE—pralidoxime mesilate R_f 0.00 (acidified iodoplatinate solution, positive).
High Performance Liquid Chromatography System HAA—retention time 2.9 min.
Ultraviolet Spectrum Aqueous acid—242, 292 nm; aqueous alkali—332, inflexion at 280 nm.

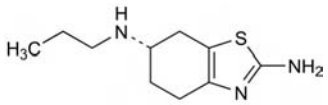


Disposition in the Body Pralidoxime chloride is slowly absorbed from the gastro-intestinal tract; the mesilate is more readily absorbed. After IV administration as the chloride, about 86% of a dose is excreted in the urine in 24 h, mostly in the first 3 h. After oral administration as the mesilate, about 30% of a dose is excreted in the 24-h urine. 1-Methyl-2-cyanopyridinium ion has been detected in urine as a metabolite.
Half-life Plasma half-life, about 1 h.
Volume of Distribution About 0.6 L/kg.
Clearance Plasma clearance, about 7 mL/min/kg.
Protein Binding Not significantly bound.
Dose 1 to 2 g of pralidoxime chloride parenterally, repeated if necessary; up to 15 g daily, orally.

Pramipexole

Antiparkinsonian, Dopamine D_2 Agonist
$C_{10}H_{17}N_3S = 211.3$
CAS—104632-26-0

IUPAC Name (6*S*)-6-*N*-Propyl-4,5,6,7-tetrahydro-1,3-benzothiazole-2,6-diamine
Synonyms (*S*)-2-Amino-4,5,6,7-tetrahydro-6-(propylamino)benzothiazole; SUD919Y; U-98528E.

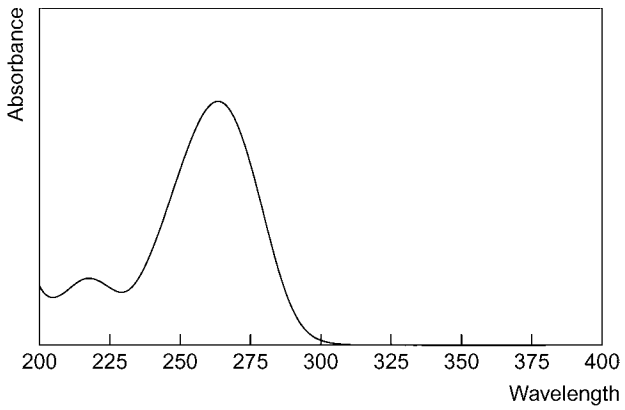


Chemical Properties White to off-white crystals. pKa_1 5.0; pKa_2 9.6. Log *P* (octanol/water), 0.87. Extraction yield (chlorobutane), 0 [Demme *et al.* 2005].

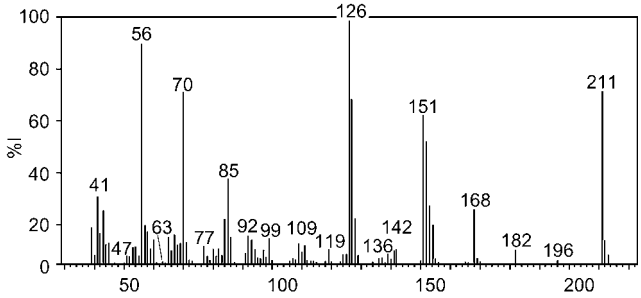
Pramipexole Dihydrochloride Monohydrate

$C_{10}H_{17}N_3S,2HCl,H_2O = 302.3$
CAS—191217-81-9
Synonyms PNU-98528-E; SND-919-CL-2Y.
Proprietary Names *Mirapex*; *Mirapexin*; *Sifrol*.
Chemical Properties White to off-white crystals. Mp 296° to 301°. Soluble in water (>20%); 8% soluble in methanol; 0.5% soluble in ethanol; practically insoluble in dichloromethane.

High Performance Liquid Chromatography Column: Zorbax Rx C_8 (250 × 4.6 mm, 5 µm). Mobile phase: 10.2 g potassium dihydrogen phosphate, 10.2 g sodium acetate and 4.5 g heptanesulfonic acid sodium salt in 3 L water, pH 3.5, flow rate 1.2 mL/min. Electrochemical and UV detection (λ = 286 nm). Retention time: 14.4 min [Lau *et al.* 1996a].
Ultraviolet Spectrum Aqueous acid (pH 2.38)—216, 264 nm.



Mass Spectrum Principal ions at *m/z* 126, 56, 70, 211, 127, 151, 152, 85.



Quantification
Plasma **HPLC** Electrochemical (plasma) detection. Limit of detection, 0.05 µg/L [Lau *et al.* 1996b]. Limit of quantification, 0.05 µg/L [Wright *et al.* 1997].
LC-MS MS-MS detection. Limit of quantification, 0.05 µg/L [Lau *et al.* 1996a].
Urine **HPLC** UV detection. Limit of detection, 10 µg/L [Lau *et al.* 1996a]. See Plasma. Limit of quantification, 10 µg/L, [Wright *et al.* 1997].
Disposition in the Body Pramipexole is readily, rapidly and completely absorbed from the gastrointestinal tract. It is widely and extensively distributed throughout the body. Metabolism is minimal. More than 90% of the dose is excreted unchanged in urine via renal tubular secretion. Steady state is achieved by 2 days. No metabolites have been identified in plasma or urine.
Therapeutic Concentration
Sixteen healthy males (aged 19.5–52.1 years, mean, 28 years) and females (42.6–53.7 years, mean age, 48.3 years) were administered 0.125, 0.5, 1.0 and 1.5 mg doses of pramipexole dihydrochloride monohydrate every 8 h. The maximum steady state concentrations, when measured, reached 0.39, 1.65, 3.55 and 5.44 µg/L for the males at doses 0.125, 0.5, 1.0 and 1.5 mg. For the females, these concentrations were 0.50, 2.12, 4.63 and 7.17 µg/L, respectively. These concentrations were observed by day 3 [Wright *et al.* 1997].
Toxicity
No clinical experience with massive overdose. One patient with a 10 year history of schizophrenia took 11 mg daily for 2 days (2–3 times the recommended amount) and showed no adverse reaction [Datapharm Communications 2002].
Bioavailability 90%.
Half-life Men, 11.6 h; women, 14.1 h; also reported as 8–12 h.
Volume of Distribution Men, 7.34 L/kg; women, 7.01 L/kg; also reported as 400 L.
Clearance Total 500 mL/min. Renal clearance is ≈400 mL/min (3 times higher than the glomerular filtration rate) or 5.5 mL/min/kg. Clearance is ≈30% lower in women compared with men, elderly compared with young people and those with Parkinson's disease compared with healthy people. It is ≈75% lower for people with renal impairment.
Distribution in Blood The erythrocyte : plasma ratio is 2.
Protein Binding 15%.
Dose 125 to 500 µg three times daily. Maximum 4.5 mg daily.

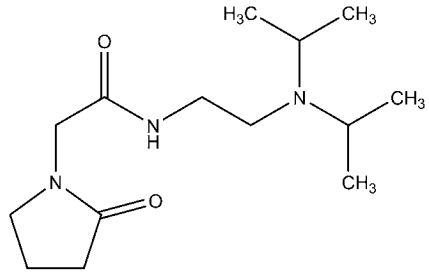
Pramiracetam

Acetamide, Nootropic
$C_{14}H_{27}N_3O_2 = 269.4$
CAS—68497-62-1
IUPAC Name *N*-[2-(Di(propan-2-yl)amino)ethyl]-2-(2-oxopyrrolidin-1-yl) acetamide
Synonyms Amacetam; *N*-[2-[bis(1-methylethyl)amino]ethyl]-2-oxo-1-pyrolidineacetamide; *N*-[2-(diisopropylamino)ethyl]-2-oxo-1-pyrrolidineacetamide.



Chemical Properties Mp 47° to 48° (monohydrate). Bp 162° to 164°.

Pramiracetam Sulfate

$C_{14}H_{27}N_3O_2,H_2SO_4 = 367.5$
CAS—72869-16-0
IUPAC Name *N*-[2-(Diisopropylamino)ethyl]-2-oxo-1-pyrrolidineacetamide sulfate
Synonyms Amacetam sulphate; CI-879; pramiracetam sulphate; pramiracetam, sulfato de.
Proprietary Names *Neupramir*; *Pramistar*; *Remen*.

Quantification
Plasma **GC** Column: 3% OV-225 on 100-120 mesh Gas-Chrom Q (1.22 m × 2 mm i.d.). Carrier gas: N_2, 8 mL/min. Temperature: 225°. NPD. Retention time: 6.8 min. Limit of detection, 20 µg/L [Chang, Young 1983].
HPLC Column: Spherisorb ODS (100 mm, 3 µm). Mobile phase: acetonitrile : 0.07 mol/L potassium phosphate buffer (pH 5.5; 30 : 70). UV detection (λ = 215 nm). Limit of detection, 0.1 mg/L [Auteri *et al.* 1992].
Disposition in the Body Oral absorption of pramiracetam is moderately rapid, with peak plasma concentrations reached 2 to 3 h post-dose. The drug is widely distributed into tissues and >90% of a dose is excreted in the urine.
Therapeutic Concentration
A group of 12 healthy volunteers was administered single oral doses (400, 800, 1200 or 1600 mg) of pramiracetam in gelatine capsules. Mean peak plasma concentrations were reported as follows:

	400 mg	*800 mg*	*1200 mg*	*1600 mg*
C_{max} (mg/L)	2.71	5.40	6.13	8.98
Time (h)	2.30	2.80	3.20	3.20

[Chang *et al.* 1985].

P

A group of 11 healthy volunteers was administered single oral doses (600 mg) of pramiracetam in either an aqueous solution or tablet formulation. Mean peak plasma concentrations were 6.8 and 5.8 mg/L for the solution and tablet form reached after 4.7 and 4.3 h, respectively [Auteri *et al.* 1992].

Half-life Approximately 4.5 to 6.5 h.
Volume of Distribution Apparent, 1.8 to 2.9 L/kg.
Clearance 1.8 to 3.0 mL/kg/min.
Distribution in Blood CSF : plasma ratio, 0.12 to 0.38.
Dose Used in age-related memory impairment and senile dementia, in doses equivalent to 600 mg of pramiracetam twice daily by mouth. It has also been tried, without much success, as an adjunct to electroconvulsive therapy in severe depression.

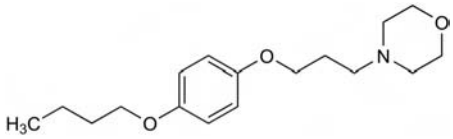
Pramocaine

Anaesthetic (Local)
$C_{17}H_{27}NO_3$ = 293.4
CAS—140-65-8

IUPAC Name 4-[3-(4-Butoxyphenoxy)propyl]morpholine
Synonyms Pramoxine; proxazocain.

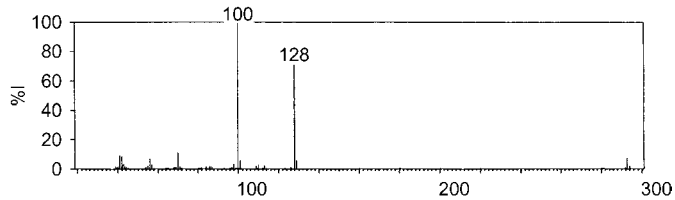


Chemical Properties Log *P* (octanol/water), 3.4.

Pramocaine Hydrochloride

$C_{17}H_{27}NO_3$,HCl = 329.9
CAS—637-58-1
Proprietary Names *Anti Itch*; *Balsabit*; *PramOtic*; *Prax*; *Proctofoam-NS*; *Tronotene*; *Tronothane*.
Chemical Properties A white crystalline powder. Mp 181° to 183°. Freely soluble in water and ethanol; soluble 1 in 35 of chloroform; very slightly soluble in ether.

Colour Test Marquis test—yellow→green.
Thin-layer Chromatography System TA—R_f 0.70; system TB—R_f 0.43; system TC—R_f 0.55; system TE—R_f 0.73; system TL—R_f 0.41; system TAE—R_f 0.62; system TAF—R_f 0.60; system TAJ—R_f 0.59; system TAK—R_f 0.20; system TAL—R_f 0.90. (Dragendorff spray, positive; Acidified iodoplatinate solution, positive; Marquis reagent, green.)
Gas Chromatography System GA—RI 2281; system GF—RI 2600.
High Performance Liquid Chromatography System HA—*k* 0.6; system HR—*k* 2.48; system HX—RI 415; system HZ—retention time 6.5 min.
Ultraviolet Spectrum Aqueous acid—286 nm (A^1_1=80c). No alkaline shift.
Infrared Spectrum Principal peaks at wavenumbers 1510, 1230, 1118, 1210, 824, 1635 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 100, 128, 70, 41, 42, 293, 56, 101.

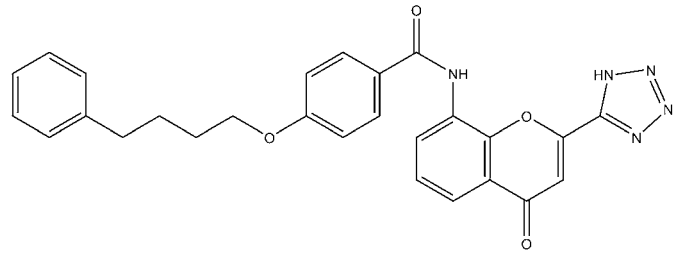


Uses Pramocaine hydrochloride is used as a 1% cream or jelly.

Pranlukast

Amide, Antiasthmatic, Leukotriene D_4 Antagonist
$C_{27}H_{23}N_5O_4$ = 481.5
CAS—103177-37-3

IUPAC Name *N*-[4-oxo-2-(2*H*-tetrazol-5-yl)chromen-7-yl]-4-(4-phenylbutoxy)benzamide
Synonyms ONO-1078; ONO-RS-411; *N*-[4-oxo-2-(1*H*-tetrazol-5-yl)-4*H*-1-benzopyran-8-yl]-*p*-(4-phenylbutoxy)benzamide; 8-[4-(4-phenylbutoxy)benzamido]-2-(tetrazol-5-yl)-4*H*-1-benzopyran-4-one; 8-[*p*-(4-phenylbutoxy)benzoyl]amino-2-(5-tetrazolyl)-4-oxo-4*H*-1-benzopyran.
Proprietary Names *Azlaire*; *Onon*.



Chemical Properties Crystals (hemihydrate). Mp 244° to 245°.
Quantification
Plasma **HPLC** Column: C_{18} (300 × 4.6 mm i.d.). Mobile phase: 0.07 mol/L ammonium formate buffer : acetonitrile (55 : 45), flow rate 1.0 mL/min. UV detection (λ = 262 nm). Limit of quantification, 10 µg/L [Brocks *et al.* 1996a].

LC-MS Column: Hypersil BDS C_{18} (30 × 2.0 mm i.d., 3 µm). Mobile phase: 20 mmol/L ammonium acetate : methanol (75 : 25 for 0.3 min to 30 : 70 over 0.1 min for 2 min to 10 : 90 over 0.1 min for 0.8 min), flow rate 300 µL/min. ESI, negative ion mode, SRM acquisition mode. Limit of quantification, pranlukast 10 µg/L, hydroxylated metabolites 1 µg/L [Marchese *et al.* 1998].

Disposition in the Body A minimum of 12.5% of an oral dose of pranlukast administered after food is absorbed from the gastrointestinal tract, with peak plasma concentrations reached after 2 to 6 h. The absorption of oral pranlukast is characterised by an apparent lag-time of 1 to 2 h. Bioavailability is increased when the drug is administered just before or after a meal. Furthermore, the bioavailability is greater after evening than after morning administration. An *in vitro* study has demonstrated that pranlukast is metabolised mainly to mono- and dihydroxylated molecules and their glucuronide conjugates by CYP enzymes. However, in a clinical setting, pranlukast appears to have low potential for drug–drug interactions via this system although caution is recommended when pranlukast is co-administered with drugs that inhibit or are predominantly metabolised by CYP3A4. The majority of an oral dose is eliminated by faecal excretion (87% as unchanged drug, 12% as metabolites) within 72 h. Less than 0.25% of an oral dose is excreted renally, predominantly as metabolites (>95%).

Therapeutic Concentration

A group of 37 healthy volunteers (19 young, 18 elderly) was administered a 300 mg oral dose of pranlukast 30 min after breakfast. Mean peak plasma concentrations in the young and elderly were 673 and 632 µg/L, respectively, after 4.5 h for both groups. There appeared to be a delay in the absorption of pranlukast in both groups, as quantifiable levels of the drug 1 h post-dose could only be measured in a few subjects [Brocks *et al.* 1996a].

In a dose-ranging study, six groups of 8 healthy male volunteers were administered oral doses of pranlukast (112.5 to 675 mg) twice daily (morning and evening) for 8 days. Mean peak plasma concentrations were reported as follows:

Dose twice daily	*Day*	*C_{max} (µg/L)*	*Time (h)*
112.5 mg	1	291	4.0
	8	445	5.3
337.5 mg	1	438	5.0
	8	631	4.5
675.0 mg	1	898	3.5
	8	1010	2.5

A great disparity between the morning trough concentration on the last day of dosing and the concentration measured 12 h after the last dose was observed, suggesting that the pharmacokinetics of pranlukast are influenced by the time of dose administration. It has been observed that the absorption of lipophilic compounds is often more rapid in the early morning than when the drug is administered during the evening [Brocks *et al.* 1996b].

Following administration of 300 mg pranlukast as an oral tablet to a healthy volunteer, peak plasma concentrations of pranlukast and 3 of its hydroxylated metabolites were 1320, 293, 337 and 12.9 µg/L, respectively [Marchese *et al.* 1998].

Half-life Approximately 4.5 h (range: 2 to 9 h).
Protein Binding Approximately 99%.
Dose Used in the management of asthma in adults at a usual dose of 225 mg pranlukast hydrate twice daily. In children with asthma, and weighing at least 12 kg, a dose of 3.5 mg/kg twice daily may be used, up to no more than the adult dose. In the management of allergic rhinitis, a dose of 225 mg twice daily is usually used in adults.

Pravastatin

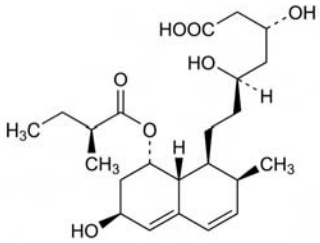
HMG-CoA Reductase Inhibitor, Antihyperlipoproteinaemic

$C_{23}H_{36}O_7$ = 425.5

CAS—81093-37-0

IUPAC Name (3*R*,5*R*)-7-[(1*S*,2*S*,6*S*,8*S*,8a*R*)-6-Hydroxy-2-methyl-8-[(2*S*)-2-methylbutanoyl]oxy-1,2,6,7,8,8a-hexahydronaphthalen-1-yl]-3,5-dihydroxyheptanoic acid

Synonym (β*R*,δ*R*,1*S*,2*S*,6*S*,8*S*,8a*R*)-1,2,6,7,8,8a-Hexahydro-β,δ,6-trihydroxy-2-methyl-8-[(2*S*)-2-methyl-1-oxobutoxy]-1-naphthaleneheptanoic acid



Chemical Properties Log *P* (octanol/water), −0.23 (pravastatin sodium).

Pravastatin Sodium

$C_{23}H_{35}O_7Na$ = 446.5

CAS—81131-70-6

Synonyms CS-514; eptastatin sodium; 3β-hydroxycompactin sodium; SQ-31000.

Proprietary Names *Elisor*; *Lipostat*; *Liprevil*; *Mevalotin*; *Oliprevin*; *Pravachol*; *Pravaselect*; *Selectin*; *Selipran*; *Vasten*.

Chemical Properties A hygroscopic white to off-white crystalline powder. Freely soluble in water and methanol; relatively insoluble in chloroform, ether, acetone and acetonitrile.

Pravastatin Lactone

$C_{23}H_{34}O_6$ = 406.5

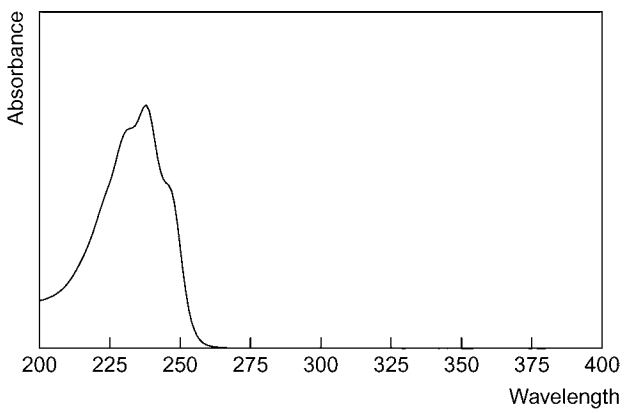
Chemical Properties Colourless plate-like crystals. Mp 138° to 142°.

High Performance Liquid Chromatography Column: ODS Hypersil (100 × 4.6 mm i.d., 5 µm). Mobile phase: methanol, flow rate 0.5 mL/min. UV diode array detection. Retention time: pravastatin sodium, 2.9 min [Mills, Roberson 1993].

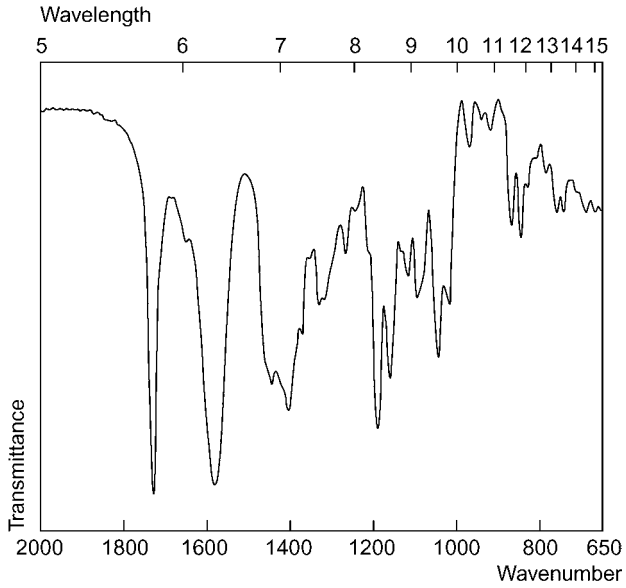
Column: ODS-2 Inertsil (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : ammonium acetate (0.01 mol/L) (60 : 40) containing 0.02% glacial acetic acid and 0.06% triethylamine, flow rate, 1 mL/min. MS detection (NIAPCI, *m/z* 423). Retention time: 2.1 min; metabolite, 2.5 min [Kawabata *et al.* 1998].

Column: RP C_{18} endcapped Purospher (250 × 4.0 mm i.d., 5 µm) with an RP C_{18} LiChrospher 100 (4 × 4 mm i.d., 5 µm). Mobile phase: sodium dihydrogen phosphate (20 mmol/L containing 1 mmol/L dodecyl sulfate):acetonitrile (65 : 35), adjusted to pH 2 with phosphoric acid, flow rate 1 mL/min. IS: triamcinolone acetonide. UV detection (λ=239 nm). Retention time: pravastatin, 6.8 min; IS, 11.0 min [Otter *et al.* 1998].

Ultraviolet Spectrum (Sodium salt) methanol—230, 237, 245 nm; aqueous acid—238 nm; basic—238 nm.(Lactone) methanol—230, 237, 245 nm.



Infrared Spectrum (Sodium salt) Principal peaks at wavenumbers 1727, 1579, 1187 cm^{-1} (KBr disk).



Quantification

Plasma **GC-MS** Limit of detection, 0.3 µg/L [Funke *et al.* 1989].

HPLC MS detection. Limit of quantification, 0.625 µg/L [Kawabata *et al.* 1998]. UV detection (λ=239 nm). Limit of quantification, 2 µg/L [Otter, Mignat 1998].

Serum **GC-MS** Limit of quantification ,0.5 µg/L for pravastatin and its metabolites [Pan *et al.* 1990]. See Plasma [Funke *et al.* 1989].

HPLC MS–MS detection. Limit of quantification, 0.5 µg/L for the drug and analytes [Mulvana *et al.* 2000].

Disposition in the Body Pravastatin is rapidly absorbed after oral administration and peak plasma concentrations are observed 1 to 1.5 h after dosing. Approx. 34% of a dose is absorbed after ingestion. It undergoes extensive hepatic metabolism to a 3-α-hydroxy isomeric compound (SQ-31906; R-416), which has one-tenth to one-fortieth the activity of the parent compound, and a 3-α,5-β,6-β-trihydroxy isomeric metabolite (SQ-31945). Peak plasma concentrations of the metabolite, SQ-31906, are observed between 0.9 and 1.3 h after ingestion of pravastatin. It is excreted mainly in faeces (approx. 70%) via bile and also, urine (20%) with 80% of urine excretion being completed within the first 12 h. The drug and/or its metabolites may accumulate in patients with renal or hepatic insufficiency. A negligible amount of the drug is distributed into breast milk.

Therapeutic Concentration

Twenty healthy male volunteers, 19 to 36 years old (mean, 25), fasted overnight and were administered an oral daily dose of 40 mg pravastatin, followed by an additional 1 h fast. The mean peak plasma concentration was 64.1 µg/L observed 1.05 h after ingestion [Pan *et al.* 1990].

Sixteen healthy males (18 to 40 years old) were administered a 20 mg single dose after an 8 h fast and fasted for another 4 h after ingestion or alternatively, co-administered with 40 mg twice daily propranolol. The peak plasma drug concentrations were 38.4 and 29.1 µg/L, respectively. The peak concentration for the metabolite SQ-31906 was 16.4 µg/L for pravastatin alone and 7.8 µg/L for co-administration with propranolol. Peak concentrations for the metabolite, SQ-31945, were 5.3 and 4.4 µg/L, respectively. All peak concentrations were reached within 1 to 1.4 h [Pan *et al.* 1991].

Bioavailability 17%.

Half-life 1.3 to 2.6 h (pravastatin); 0.8 to 1.3 h (metabolites).

Volume of Distribution 0.46 L/kg at steady state.

Protein Binding 50%.

Dose The usual dose is 10 to 40 mg daily.

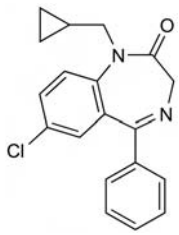
Prazepam

Benzodiazepine, Tranquilliser
$C_{19}H_{17}ClN_2O$ = 324.8
CAS—2955-38-6

IUPAC Name 7-Chloro-1-(cyclopropylmethyl)-5-phenyl-3*H*-1,4-benzodiazepin-2-one
Synonyms 7-Chloro-1-(cyclopropylmethyl)-1,3-dihydro-5-phenyl-2*H*-1,4-benzodiazepin-2-one; prazepamum; W-4020.
Proprietary Names *Centrax*; *Demetrin*; *Lysanxia*; *Pozapam*; *Prasepine*; *Prazene*; *Reapam*; *Trepidan*.



Chemical Properties A white crystalline powder. Mp 145° to 146° (crystals from methanol). Soluble in ethanol, chloroform, and dilute mineral acids. pK_a 2.7. Log *P* (octanol/pH 7.4), 3.7. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].
Colour Test Formaldehyde–sulfuric acid—orange.
Thin-layer Chromatography System TA—R_f 0.65; system TB—R_f 0.36; system TC—R_f 0.74; system TD—R_f 0.64; system TE—R_f 0.81; system TF—R_f 0.55; system TL—R_f 0.63; system TAD—R_f 0.72; system TAE—Rf 0.84; system TAF—R_f 0.89; system TAJ—R_f 0.75; system TAK—R_f 0.69; system TAL—R_f 0.94 (acidified iodoplatinate solution—positive; acidified potassium permanganate—positive).

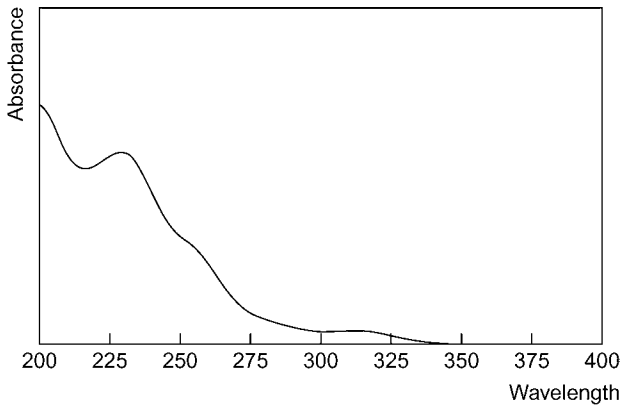
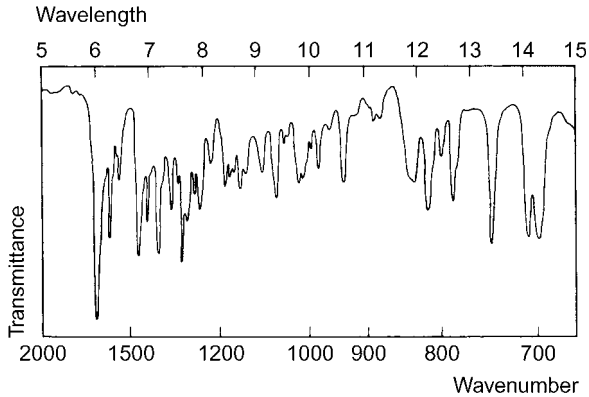
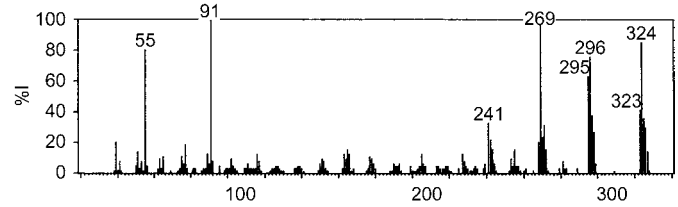
Ultraviolet Spectrum Aqueous acid—240 (A_1^1= 1760a), 285, 360 nm.



Infrared Spectrum Principal peaks at wavenumbers 1667, 1316, 740, 694, 1602, 704 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 91, 269, 324, 55, 296, 295, 323, 297 (prazepam); 242, 269, 270, 241, 243, 271, 244, 272 (nordazepam); 257, 55, 311, 77, 259, 313, 44, 312 (3-hydroxyprazepam); 257, 77, 268, 239, 205, 267, 233, 259 (oxazepam).



Quantification

Serum **GC** Column: 3% SP-2250 on Supelcoport 100/120 mesh (2 m). Carrier gas: N_2, 20 mL/min. Temperature: 260°. ECD, SIM acquisition mode. Limit of detection, 1 µg/L [Nau *et al.* 1978].

LC-MS Column: Unison UK-C_{18} ODS (150 × 2 mm i.d., 3 µm) or Cadenza CD-C_{18} ODS (150 × 2.0 mm i.d., 3 µm). Mobile phase: 10 mmol/L aqueous ammonium formate-0.1% formic acid : methanol-0.1% formic acid (70 : 30 to 20 : 80 at 20 min for 5 min), flow rate 0.25 mL/min. ESI. Limit of detection, 0.3–11.4 µg/L [Nakamura *et al.* 2009].

Disposition in the Body Prazepam is slowly and variably absorbed after oral administration. Desmethyldiazepam (nordazepam) is the major metabolite found in plasma and accounts for most of the activity. Prazepam is excreted in the urine mainly as glucuronide conjugates of oxazepam and 3-hydroxyprazepam, with only trace amounts of desmethyldiazepam or unchanged drug. Up to ~20% of a dose is excreted in the urine in 24 h and ~60% over a period of 7 days; ~7% of a dose is eliminated in the faeces in 48 h. Desmethyldiazepam is found in breast milk after administration of prazepam.
Therapeutic Concentration After a single oral dose of 30 mg to 10 subjects, peak plasma concentrations of 0.19–0.40 mg/L (mean, 0.3) desmethyldiazepam were reported in 2–8 h; a second peak plasma concentration was reported for each subject. Following oral administration of 20 mg three times a day for 3 days to 5 subjects, plasma concentrations averaged 0.8 mg/L 12 h after the final dose [Brodie *et al.* 1981].
Half-life Plasma half-life, ~40 to 100 h for desmethyldiazepam, but there is considerable intersubject variation (see Nordazepam monograph).
Volume of Distribution Desmethyldiazepam, 0.5–2.5 L/kg, increased in elderly subjects.
Clearance Plasma clearance, ~0.1–0.3 mL/min/kg for desmethyldiazepam.
Distribution in Blood Plasma : whole blood ratio, desmethyldiazepam ~1.7.
Milk Plasma : breast milk ratio, desmethyldiazepam 9.6.
Protein Binding Desmethyldiazepam, ~97%.
Dose 10 to 60 mg daily.

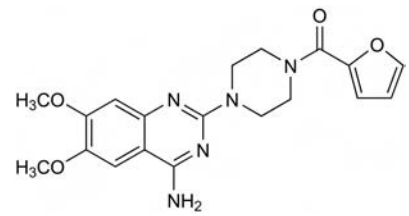
Prazosin

Antihypertensive
$C_{19}H_{21}N_5O_4$ = 383.4
CAS—19216-56-9

IUPAC Name [4-(4-Amino-6,7-dimethoxyquinazolin-2-yl)piperazin-1-yl]-(furan-2-yl)methanone
Synonym 1-(4-Amino-6,7-dimethoxy-2-quinazolinyl)-4-(2-furanylcarbonyl)-piperazine; furazosin



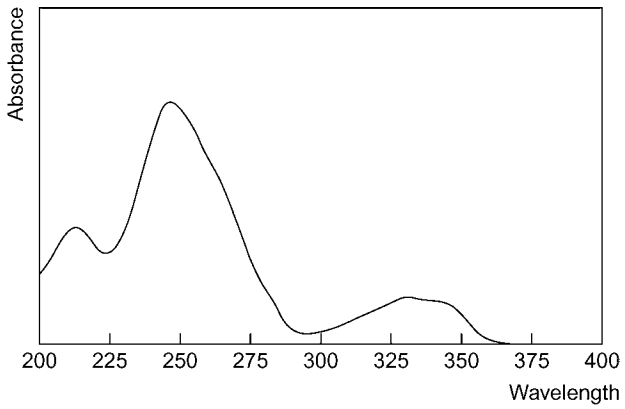
Chemical Properties Crystals. Mp 278° to 280°. pK_a 6.5.

Prazosin Hydrochloride

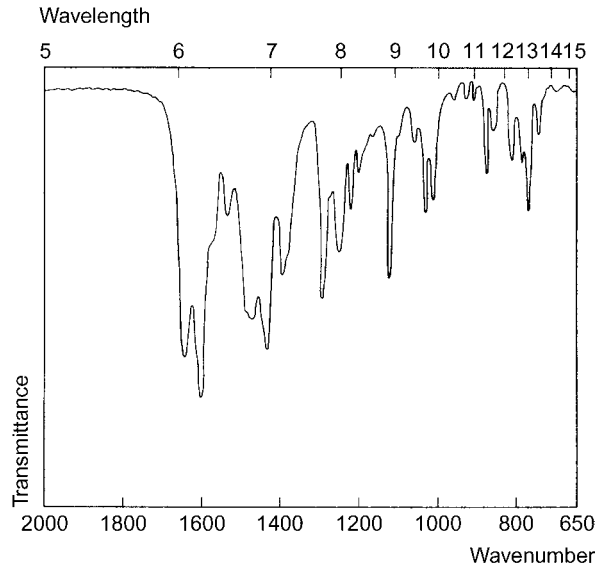
$C_{19}H_{21}N_5O_4$,HCl = 419.9
CAS—19237-84-4
Synonym CP-12299-1

Proprietary Names *Adversuten*; *Alphavase*; *Alpress*; *Apo-Prazo*; *Duramipress*; *Hexapress*; *Hypovase*; *Hyprosin*; *Hypotens*; *Minipress*; *Mipraz*; *Novo-Prazin*; *Nu-Prazo*; *Parabowl*; *Patsolin*; *Peripress*; *Prasig*; *Pratsiol*; *Prazac*; *Prazocor*; *Prazohexal*; *Pressin*.
Chemical Properties A white to tan-coloured powder. Mp about 264°, with decomposition. Very slightly soluble in water; slightly soluble in ethanol and methanol; practically insoluble in acetone and chloroform.

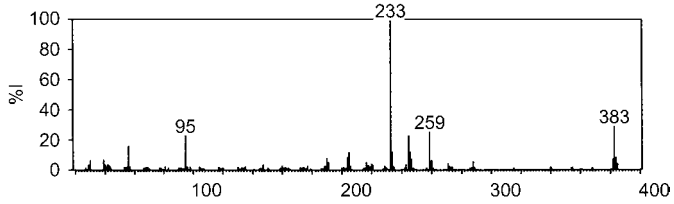
Colour Test Liebermann's reagent—brown-pink (→red-orange at 100°).
Thin-layer Chromatography System TA—R_f 0.60; system TB—R_f 0.01; system TC—R_f 0.47; system TE—R_f 0.59; system TL—R_f 0.49; system TAE—R_f 0.68; system TAF—R_f 0.74; system TAJ—R_f 0.39; system TAK—R_f 0.00; system TAL—R_f 0.54.
Gas Chromatography System GA—Not eluted.
High Performance Liquid Chromatography System HA—*k* 0.8; system HX—RI 352; system HZ—retention time 2.5 min; system HAA—retention time 10.6 min.
Ultraviolet Spectrum Aqueous acid—247 (A_1^1=1470b), 331 nm (A_1^1=281b); aqueous alkali—252 (A_1^1=1642b), 345 nm (A_1^1=150b).



Infrared Spectrum Principal peaks at wavenumbers 1603, 1643, 1293, 1125, 1252, 1540 cm^{-1} (prazosin hydrochloride).



Mass Spectrum Principal ions at *m/z* 233, 383, 259, 245, 95, 56, 246, 234.



Quantification
Blood **HPLC** Fluorescence detection. Limit of detection, 1 µg/L [Lin *et al.* 1980].
Plasma **HPLC** See Blood [Lin *et al.* 1980]. Fluorescence detection. Limit of detection, 500 mg/L [Reece 1980].
Urine **HPLC** See Blood [Lin *et al.* 1980].
Disposition in the Body Readily absorbed after oral administration; bioavailability about 60%. Extensively metabolised by 6-*O*- and 7-*O*-demethylation and glucuronic acid conjugation; <5% of a dose is excreted in the urine as unchanged drug in 24 h.

Therapeutic Concentration
After single oral doses of 0.5 mg and 1.5 mg given to 5 subjects, peak plasma concentrations of 0.001 to 0.005 mg/L (mean, 0.003) and 0.004 to 0.009 mg/L (mean, 0.006), respectively, were attained in 1 to 3 h [Dynon *et al.* 1980].

Following oral administration of 0.5 mg three times a day to 8 subjects, mean steady-state plasma concentrations of 0.001 to 0.007 mg/L (mean, 0.003) were reported; after dosing with 2 mg three times a day in 7 subjects, mean steady-state plasma concentrations were 0.008 to 0.019 mg/L (mean 0.013) [Grahnén *et al.* 1981].
Half-life Plasma half-life, about 3 h.
Volume of Distribution About 0.6 L/kg.
Clearance Plasma clearance, about 3 mL/min/kg.
Distribution in Blood Plasma : whole blood ratio, 1.4.
Protein Binding About 95%.
Note For a review of the pharmacokinetics of prazosin, see Jaillon [1980].
Dose 0.5 to 20 mg of prazosin hydrochloride daily.

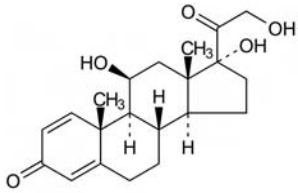
$C_{21}H_{28}O_5$ = 360.4
CAS—50-24-8 (anhydrous); 52438-85-4 (sesquihydrate)
IUPAC Name (8*S*,9*S*,10*R*,11*S*,13*S*,14*S*,17*R*)-11,17-dihydroxy-17-(2-hydroxyacetyl)-10,13-dimethyl-7,8,9,11,12,14,15,16-octahydro-6*H*-cyclopenta[a]phenanthren-3-one
Synonyms 1,2-Dehydrohydrocortisone; deltahydrocortisone; Δ^1-hydrocortisone; hydroretrocortine; metacortandralone; (11β)-11,17,21-trihydroxypregna-1,4-diene-3,20-dione.
Proprietary Names *Codelcortone*; *Cortalone*; *Decaprednil*; *Decortin H*; *Delta-Cortef*; *Deltacortril*; *Deltasolone*; *Flamasone*; *Hydeltra*; *Hydrodeltalone*; *Klismacort*; *Meticortolone*; *Paracortol*; *Precortilon*; *Precortisyl*; *Prednelan*; *Solone*; *Sterolone*.



Chemical Properties A white hygroscopic crystalline powder. Mp 240° to 241°, with decomposition. Soluble 1 in 1300 of water, 1 in 30 of ethanol, 1 in 27 of dehydrated alcohol, 1 in 180 of chloroform and 1 in 50 of acetone; soluble in dioxan and methanol. Log *P* (octanol/water), 1.6.

Prednisolone Acetate
$C_{23}H_{30}O_6$ = 402.5
CAS—52-21-1
Synonym Prednisolone 21-acetate
Proprietary Names *Deltastab*; *Econopred*; *Pred Forte*; *Pred Mild*; *Ultracortenol.*
Chemical Properties A white crystalline powder. Mp 237° to 239°, with decomposition. Practically insoluble in water; soluble 1 in 120 of ethanol, 1 in 170 of dehydrated alcohol and 1 in 150 of chloroform; slightly soluble in acetone.

Prednisolone Pivalate
$C_{26}H_{36}O_6$ = 444.6
CAS—1107-99-9
Synonyms Prednisolone 21-pivalate; prednisolone trimethylacetate.
Proprietary Name *Ultracortenol*
Chemical Properties A white crystalline powder. Mp 233° to 236°. Practically insoluble in water; soluble 1 in 150 of ethanol and 1 in 16 of chloroform.

Prednisolone Sodium Phosphate
$C_{21}H_{27}Na_2O_8P$ = 484.4
CAS—125-02-0
Synonym Prednisolone 21-(disodium orthophosphate)
Proprietary Names *Codelsol*; *Hefasolon*; *Hydeltrasol*; *Inflamase*; *Metreton*; *Prednesol*; *Predsol*; *Solucort*; *Solu-Predalone*.
Chemical Properties A white or slightly yellow hygroscopic powder or granules. Soluble 1 in 3 or 1 in 4 of water, 1 in 1000 of dehydrated alcohol and 1 in 13 of methanol; practically insoluble in chloroform.

Prednisolone Steaglate
$C_{41}H_{64}O_8$ = 684.9
CAS—5060-55-9
Synonym Prednisolone 21-stearoylglycolate
Proprietary Name *Sintisone*
Chemical Properties A white powder. Mp 105° to 107°. Soluble in ethanol, acetone and methanol.

P

Prednisolone Succinate

$C_{25}H_{32}O_8$ = 460.5
CAS—2920-86-7; 1715-33-9 (sodium salt)
Synonym Prednisolone 21-hydrogen succinate
Proprietary Name *Solu-Dacortin (sodium salt)*
Chemical Properties A fine creamy-white powder with friable lumps. Mp about 205°, with decomposition. Very slightly soluble in water; soluble 1 in about 6 of ethanol and 1 in about 250 of ether; soluble in acetone; very slightly soluble in chloroform.

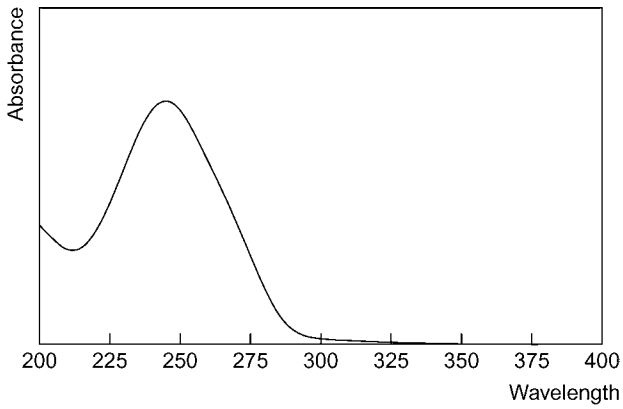
Prednisolone Tebutate

$C_{27}H_{38}O_6,H_2O$ = 476.6
CAS—7681-14-3 (anhydrous)
Synonyms Prednisolone butylacetate; prednisolone 21-(3,3-dimethylbutyrate); prednisolone tertiary-butylacetate.
Proprietary Names *Codelcortone TBA*; *Hydeltra-TBA*.
Chemical Properties A white to slightly yellow hygroscopic powder. Very slightly soluble in water; sparingly soluble in ethanol and methanol; soluble in acetone; freely soluble in chloroform and dioxan.

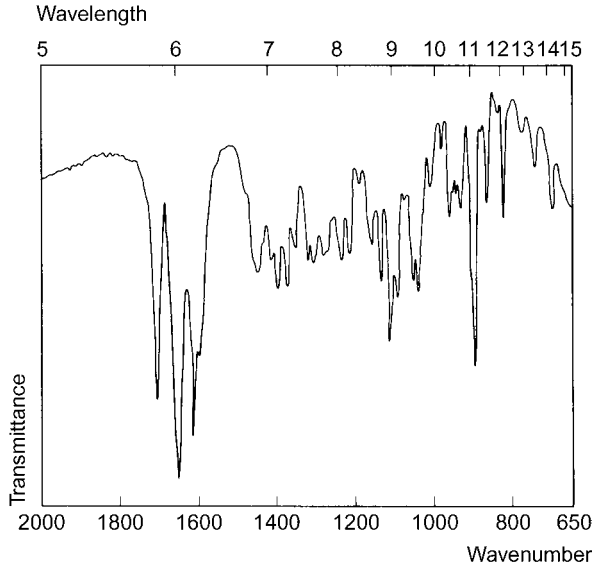
Colour Tests Naphthol-sulfuric acid—brown/brown; sulfuric acid—orange-pink.
Thin-layer Chromatography System TB—R_f 0.00; system TE—R_f 0.41; system TF—R_f 0.24; system TP—R_f 0.20; system TQ—R_f 0.00; system TR—R_f 0.02, streaking may occur; system TS—R_f 0.00; system TAE—R_f 0.86; system TAJ—R_f 0.19; system TAK—R_f 0.03; system TAL—R_f 0.65; system TAM—R_f 0.54. (DPST solution.)

System TP—pivalate R_f 0.69; system TQ—pivalate R_f 0.04; system TR—pivalate R_f 0.44; system TS—pivalate R_f 0.00 (DPST solution).

System TP—sodium phosphate R_f 0.00; system TQ—sodium phosphate R_f 0.00; system TR—sodium phosphate R_f 0.00; system TS—sodium phosphate R_f 0.00.
High Performance Liquid Chromatography System HT—*k* 8.4; system HX—RI 401; system HY—RI 361; system HZ—RT 2.5 min; system HAA—RT 14.1 min.
Ultraviolet Spectrum Ethanol—240 nm (A_1^1=415a).



Infrared Spectrum Principal peaks at wavenumbers 1654, 1612, 1708, 887, 1112, 1085 cm^{-1} (KBr disk).



Mass Spectrum Principal peaks at *m/z* 121, 122, 91, 147, 225, 43, 135, 120.
Quantification
Plasma **GC-MS** Prednisolone and prednisone [Matin, Amos 1978].

HPLC Prednisolone and other corticosteroids. Limit of detection, 10 µg/L [al-Habet, Rogers 1989]. UV detection. Prednisolone, prednisone and hydrocortisone. Limit of detection, 5 µg/L [Rose, Jusko 1979]. UV detection. Limit of detection, 10 µg/L [Hartley, Brocklebank 1982].
Serum **RIA** Limit of detection, 10 µg/L [Olivesi *et al.* 1983].
Urine **HPLC** See Plasma. Limit of detection, 25 µg/L [al-Habet, Rogers 1989]. See Plasma [Rose, Jusko 1979].
Saliva **HPLC** See Plasma. Limit of detection, 10 µg/L [al-Habet, Rogers 1989]. See Plasma [Rose, Jusko 1979].
Dose Usually 5 to 60 mg of prednisolone daily.

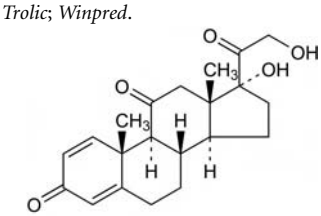
Prednisone

Corticosteroid
$C_{21}H_{26}O_5$ = 358.4
CAS—53-03-2
IUPAC Name (8*S*,9*S*,10*R*,13*S*,14*S*,17*R*)-17-Hydroxy-17-(2-hydroxyacetyl)-10,13-dimethyl-6,7,8,9,12,14,15,16-octahydrocyclopenta[a]phenanthrene-3,11-dione
Synonyms 1,2-Dehydrocortisone; deltacortisone; deltadehydrocortisone; 17,21-dihydroxypregna-1,4-diene-3,11,20-trione; metacortandracin; NSC-10023.
Proprietary Names *Colisone*; *Contancyl*; *Dacortin*; *Deltacortone*; *Deltason(e)*; *Meprosona-F*; *Meticorten*; *Ofisolona*; *Orasone*; *Panafcort*; *Paracort*; *Predeltin*; *Predicor*; *Prednicort*; *Prednicorten*; *Prednidib*; *Prednitone*; *Promifen*; *Pulmison*; *Rectodelt*; *Sterapred*; *Trolic*; *Winpred*.

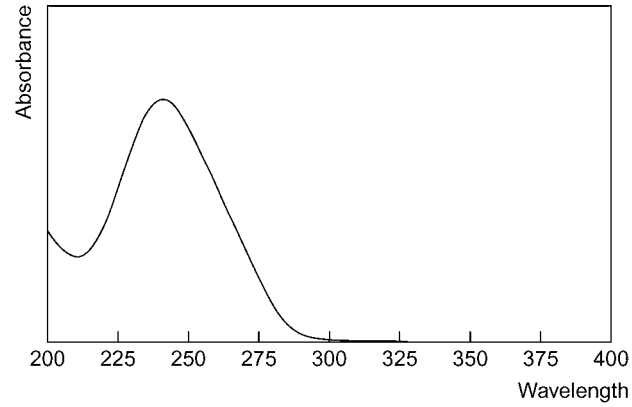


Chemical Properties A white crystalline powder. Mp 233° to 235°, with decomposition. Practically insoluble in water; soluble 1 in about 150 of ethanol, 1 in 300 of dehydrated alcohol and 1 in 200 of chloroform; slightly soluble in methanol. Log *P* (octanol/water), 1.5.

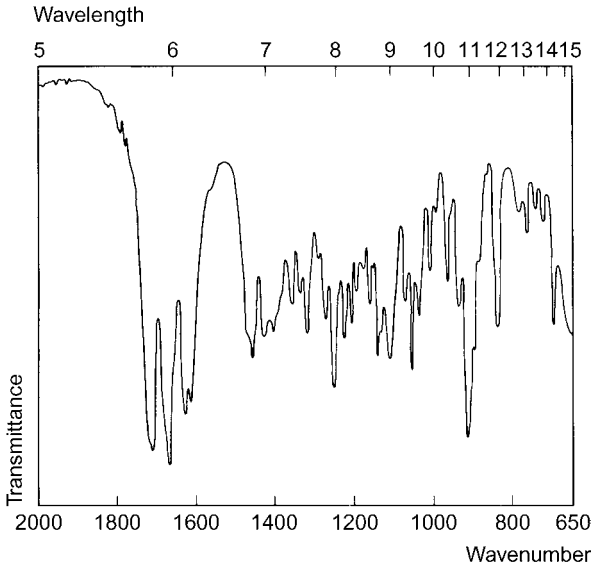
Prednisone Acetate

$C_{23}H_{28}O_6$ = 400.5
CAS—125-10-0
Synonym Prednisone 21-acetate
Chemical Properties A white crystalline powder. Mp 226° to 232°, with decomposition. Practically insoluble in water; soluble 1 in about 120 of ethanol, 1 in 160 of dehydrated alcohol and 1 in 6 of chloroform.

Colour Tests Naphthol-sulfuric acid—brown/orange; sulfuric acid—yellow (green fluorescence under UV light).
Thin-layer Chromatography System TB—R_f 0.00; system TE—R_f 0.45; system TF—R_f 0.28; system TP—R_f 0.41; system TQ—R_f 0.00; system TR—R_f 0.10; system TS—R_f 0.00; system TAE—R_f 0.84; system TAJ—R_f 0.33; system TAK—R_f 0.04; system TAL—R_f 0.74; system TAM—R_f 0.60 (DPST solution).
High Performance Liquid Chromatography System HT—*k* 3.4; system HX—RI 250; system HY—RI 340; system HZ—retention time 2.6 min; system HAA—retention time 14.2 min.
Ultraviolet Spectrum Ethanol—240 nm (A_1^1=420a).



Infrared Spectrum Principal peaks at wavenumbers 1668, 1707, 904, 1622, 1610, 1246 cm^{-1} (KBr disk).

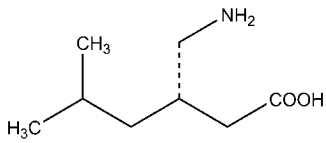


Quantification See under Prednisolone.
Dose Usually 5 to 60 mg daily.

Pregabalin

Antiepileptic
$C_8H_{17}NO_2 = 159.2$
CAS—148553-50-8

IUPAC Name (3*S*)-3-(Aminomethyl)-5-methylhexanoic acid
Synonyms (*S*)-(+)-4-Amino-3-(2-methylpropyl)butanoic acid; CI-1008; (*S*)-(+)-3-Isobutyl-γ-aminobutyric acid; PD-144723.
Proprietary Name *Lyrica*



Chemical Properties A white crystalline solid. Mp 186° to 188°. pK_{a1} 4.2, pK_{a2} 10.6 [Wishart 2006]. Log *P* (octanol/water), 0.844 [Wishart 2006]. Pregabalin was stable for 3 to 4 weeks under all conditions examined (4° and –20°), except for room temperature [Berry, Millington 2005].

Quantification

Plasma **HPLC** Column: Hypersil 5 MOS (25 cm × 4 mm i.d.). Mobile phase: acetate buffer (pH 4.6) : acetonitrile (50 : 50), flow rate 1.9 mL/min. UV detection (λ = 340 nm). Limit of quantification, 0.2 mg/L for the picrylsulfonic acid derivative [Berry, Millington 2005].

Serum **HPLC** Column: reversed phase packed with Alltina $3C_{18}$ (15 × 0.46 cm i.d.). Mobile phase: methanol : acetonitrile : 20 mmol/L phosphate buffer (pH 7.0; 8 : 17.5 : 74.5), flow rate 0.8 mL/min. Fluorescence detection (λ_{ex} = 330 nm, λ_{em} = 450 nm). Limit of quantification, 0.13 mg/L; limit of detection, 44 µg/L for the *o*-phtaldialdehyde derivative [Vermeij, Edelbroek 2004].

Disposition in the Body Rapidly absorbed after administration and mainly (>90%) eliminated as the parent drug in urine.

Therapeutic Concentration

A group of patients with doses escalated to 600 mg/day had serum concentrations of 2.8 to 8.2 mg/L at steady state [Berry, Millington 2005].

Male and female patients (n = 38) suffering from degrees of renal insufficiency were administered a single dose of 50 mg pregabalin after an 8 h fast. Mean peak plasma concentrations were 1.86, 1.53, 1.90, 1.69 and 1.24 mg/L after 1.0, 1.29, 1.93, 1.0 and 3.18 h for patients with creatinine clearance of >60, 30–60, 15–29 and <15 mL/min, and on haemodialysis, respectively [Randinitis *et al.* 2003].

Healthy male and female volunteers were administered single doses of pregabalin ranging from 1 to 300 mg. Peak plasma concentrations, ranging from 0.038 to 9.46 mg/L, were observed within 1.3 h [Busch *et al.* 1998].

Toxicity

A 29-year-old male epileptic was found in a coma. He had left a suicide note, had slashed his wrists, and had taken approx. 11.5 g pregabalin and 32 g lamotrigine. He was admitted to hospital and was found to have plasma serum levels of approximately 62 and 45 mg/L pregabalin and lamatrogine, respectively, after 1 day. He was administered a loading dose of phenytoin followed by 100 mg three times a day. He was discharged after 28 days in hospital, 19 of which were spent in critical care [Braga, Chidley 2007].

Bioavailability Approximately 90%.
Half-life 4.6 to 6.8 h.
Protein Binding Does not bind to plasma proteins.
Dose 150 to 600 mg/day orally.

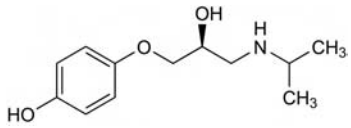
Prenalterol

Sympathomimetic
$C_{12}H_{19}NO_3 = 225.3$
CAS—57526-81-5

IUPAC Name 4-[(2*S*)-2-Hydroxy-3-(propan-2-ylamino)propoxy]phenol
Synonym 4-[(2*S*)-2-Hydroxy-3-[(1-methylethyl)amino]propoxy]phenol



Chemical Properties pK_a 9.5 (ammonium ion), 10.0 (phenol). Log *P* (octanol/water), 0.9.

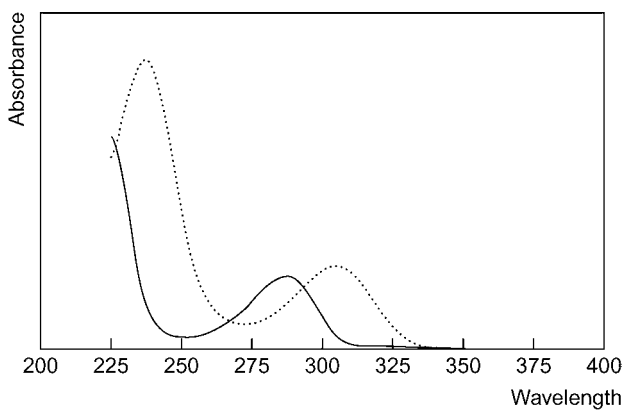
Prenalterol Hydrochloride

$C_{12}H_{19}NO_3$,HCl = 261.7
CAS—61260-05-7
Synonym CGP-7760B; H-133/22; (–)H-80/62.
Proprietary Names *Hyprenan*; *Varbian*.
Chemical Properties A white crystalline powder. Mp about 128°. Freely soluble in water and ethanol; slightly soluble in acetone; very slightly soluble in ether.

Thin-layer Chromatography System TA—R_f 0.47; system TB—R_f 0.01; system TC—R_f 0.09; system TD—R_f 0.02; system TE—R_f 0.25; system TF—R_f 0.02. (Dragendorff spray, positive; Ferric chloride solution, violet; Acidified iodoplatinate solution, positive; Marquis reagent, green→black; acidified potassium permanganate solution, positive.)

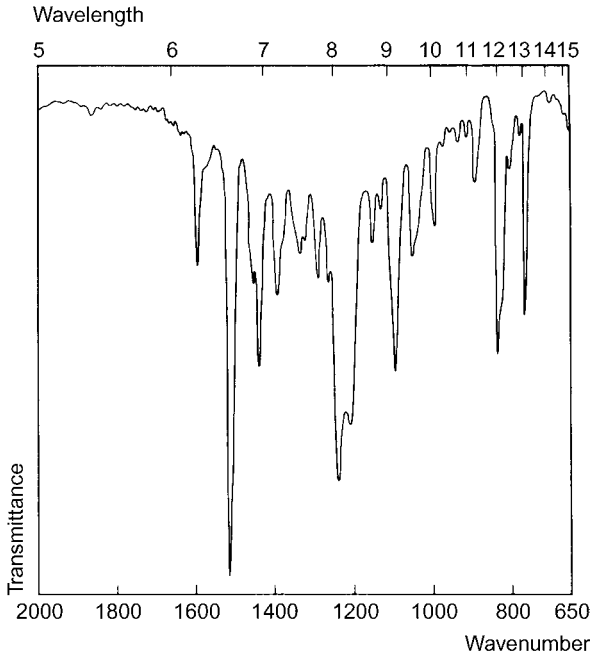
Gas Chromatography System GA—RI 1933.

Ultraviolet Spectrum Aqueous acid—287 nm (A_1^1=105a); aqueous alkali—235 (A_1^1=444b), 305 nm.

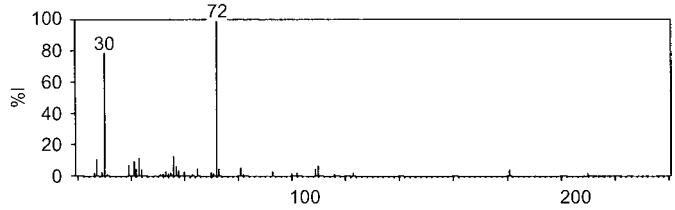


Infrared Spectrum Principal peaks at wavenumbers 1518, 1242, 1213, 1099, 840, 772 cm^{-1} (prenalterol hydrochloride, KBr disk).

P



Mass Spectrum Principal ions at *m/z* 72, 30, 56, 43, 27, 41, 39, 110.



Quantification
Plasma **GC** ECD. Limit of detection, 2 µg/L [Degen, Ervik 1981].
GC-MS Limit of detection, 1 µg/L [Ervik *et al.* 1982].
HPLC UV and fluorescence detection. Prenalterol and other beta-blockers [Musch *et al.* 1989]. Fluorescence detection. Limit of detection, 1 µg/L [Oddie *et al.* 1982].
Urine **GC** See Plasma [Degen, Ervik 1981].
GC-MS See Plasma [Ervik *et al.* 1982].

Disposition in the Body Rapidly and completely absorbed after oral administration, but subject to extensive first-pass metabolism. The main metabolic reaction is conjugation with sulfate at the phenol position; minor metabolites formed are β-(4-hydroxyphenoxy)lactic acid and prenalterol glucuronide. About 90% of a dose is excreted in the urine in 24 h. After an IV dose, about 60% is excreted unchanged with about 35% as the sulfate; after oral administration, about 15% is excreted unchanged, with about 80% as the sulfate.
Bioavailability About 25%.
Half-life Plasma half-life, about 2 h.
Volume of Distribution About 3.5 L/kg.
Clearance Plasma clearance, about 20 mL/min/kg.
Distribution in Blood Plasma : whole blood ratio, about 0.9.
Protein Binding <5%.
Dose 0.5 mg of prenalterol hydrochloride per min by IV infusion, to a total of not more than 20 mg.

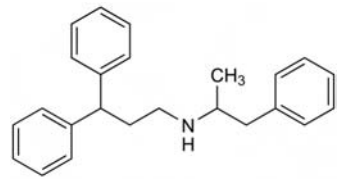
Prenylamine

Antianginal
$C_{24}H_{27}N$ = 329.5
CAS—390-64-7

IUPAC Name 3,3-Diphenyl-*N*-(1-phenylpropan-2-yl)propan-1-amine
Synonyms B-436; *N*-(1-methyl-2-phenylethyl)-γ-phenylbenzenepropanamine
Proprietary Name *Elecor*



Chemical Properties Mp 36.5° to 37.5°. Log *P* (octanol/water), 6.0.

Prenylamine Lactate
$C_{24}H_{27}N,C_3H_6O_3$ = 419.6
CAS—69-43-2
Proprietary Names *Angormin*; *Bismetin*; *Carditin-Same*; *Coredamin*; *Corontin*; *Crepasin*; *Daxauten*; *Hostaginan*; *Incoran*; *Irrorin*; *Lactamin*; *Plactamin*; *Reocorin*; *Roinin*; *Seccidin*; *Sedolatan*; *Segontin(e)*; *Synadrin*.
Chemical Properties A white crystalline powder. Mp 140° to 142°. Soluble 1 in about 200 of water, 1 in 5 of ethanol and 1 in 2 of chloroform; very soluble in glacial acetic acid.

Colour Tests Mandelin's test—green; Marquis test—red.
Thin-layer Chromatography System TA—R_f 0.68; system TB—R_f 0.55; system TC—R_f 0.68; system TE—R_f 0.84; system TL—R_f 0.56; system TAE—R_f 0.43; system TAF—R_f 0.85; system TAJ—R_f 0.47; system TAK—R_f 0.63; system TAL—R_f 0.90. (Acidified iodoplatinate solution, positive.)

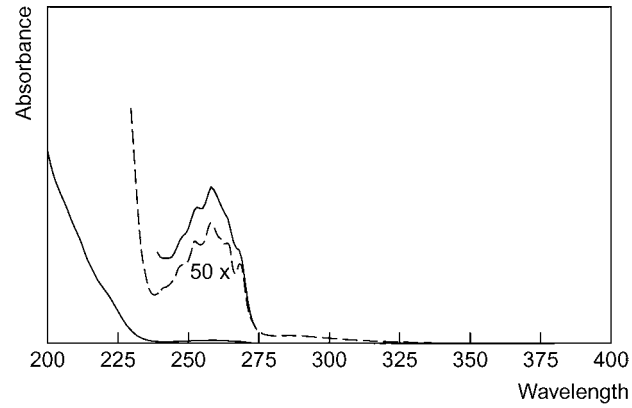
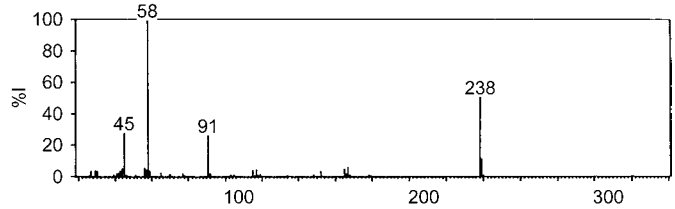
Ultraviolet Spectrum Methanol—253, 258 (A^1_1=18.8a), 268 nm.



Infrared Spectrum Principal peaks at wavenumbers 700, 747, 1136, 1027, 1592, 1075 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 58, 238, 91, 45, 239, 167, 165, 56.



Quantification
Plasma **HPLC** Fluorimetric detection. *R*- and *S*-prenylamine. Limit of detection, 1 µg/L in plasma [Gietl *et al.* 1988].
Serum **GC** FID. Prenylamine and metabolites. Limits of detection, 10 to 50 µg/L [Eichelbaum *et al.* 1973].
Urine **GC** See Serum [Eichelbaum *et al.* 1973].
HPLC Limit of detection, 2 µg/L in urine, see Plasma [Gietl *et al.* 1988].

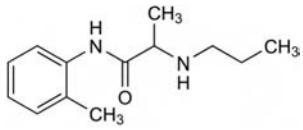
Disposition in the Body Readily absorbed after oral administration but extensively metabolised. Numerous metabolites, including traces of amfetamine, have been detected in the urine; some unchanged drug is eliminated in the faeces.
Half-life Plasma half-life, about 7 h.
Protein Binding About 97%.
Dose The equivalent of 180 to 300 mg of prenylamine daily.

Eichelbaum M *et al.* (1973). A specific and sensitive method for the analysis of prenylamine and its derivatives in biological materials. *Arzneimittelforschung* 23: 74–77.
Gietl Y *et al.* (1988). Simultaneous determination of R- and S-prenylamine in plasma and urine by reversed-phase high-performance liquid chromatography. *J Chromatogr* 426: 304–314.

Prilocaine

Anaesthetic (Local)
$C_{13}H_{20}N_2O$ = 220.3
CAS—721-50-6

IUPAC Name *N*-(2-Methylphenyl)-2-(propylamino)propanamide
Synonym Propitocaine

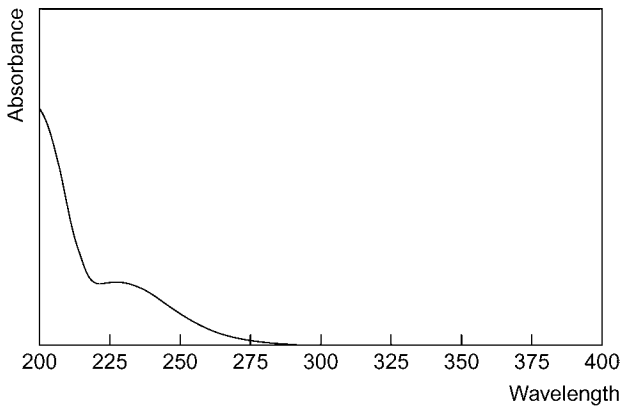


Chemical Properties A white crystalline powder. Mp 37° to 38°. Freely soluble in ethanol, chloroform and ether. pK_a 7.9 (25°). Log *P* (octanol/water), 2.1. Extraction yield (chlorobutane), 0.95 [Demme *et al.* 2005].

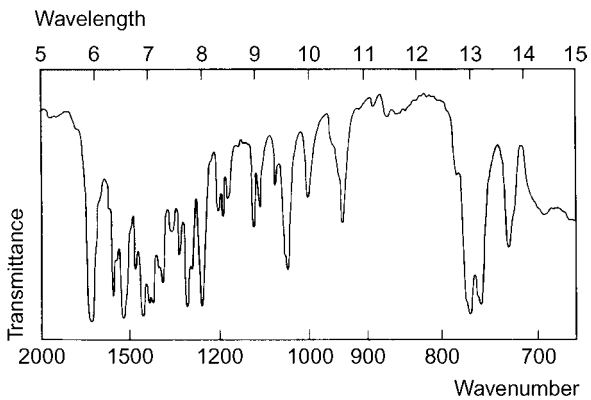
Prilocaine Hydrochloride

$C_{13}H_{20}N_2O,HCl = 256.8$
CAS—1786-81-8
Synonyms Astra-1512; L-67.
Proprietary Names *Citanest*; *Citocaina*; *Xylonest*. It is an ingredient of *EmLa*.
Chemical Properties A white crystalline powder. Mp 167° to 168°(crystals from ethanol and isopropyl ether). Soluble 1 in 5 of water, 1 in 6 of ethanol and 1 in 175 of chloroform; practically insoluble in ether.

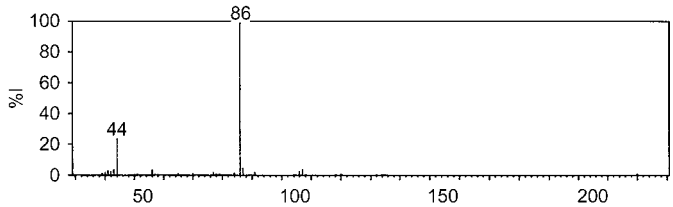
Colour Test Mandelin's test—violet.
Thin-layer Chromatography System TA—R_f 0.77; system TB—R_f 0.29; system TC—R_f 0.64; system TE—R_f 0.75; system TL—R_f 0.60; system TAE—R_f 0.62; system TAF—R_f 0.79; system TAJ—R_f 0.50; system TAK—R_f 0.22; system TAL—R_f 0.69.
Gas Chromatography System GA—prilocaine RI 1823, M (OH-) RI 2155, M (OH-desacyl-) RI 1160, prilocaine-AC RI 2060, M (desacyl-)-AC RI 1350; system GQ—retention time 5.7 min.
High Performance Liquid Chromatography System HA—*k* 1.0; system HQ—*k* 1.38; system HZ—retention time 2.7 min.
Ultraviolet Spectrum Methanol—230 nm (A_1^1=295a).



Infrared Spectrum Principal peaks at wavenumbers 1695, 1543, 766, 754, 1299, 1258 cm^{-1} (prilocaine hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 86, 44, 87, 107, 43, 106, 56, 41.



Quantification

Blood **GC-MS** Prilocaine and other local anaesthetics [Watanabe *et al.* 1998].
Plasma **GC-MS** (SIM, *m/z* 86). Limit of quantification, 100 µg/L, limit of detection is 80 µg/L [Ohshima, Takayasu 1999]. Limit of detection, 10 mg/L [Bachmann-Mennenga *et al.* 1991]. Prilocaine enantiomers [Tucker *et al.* 1990].
Serum **HPLC** UV detection. Prilocaine enantiomers. Limit of quantification, 10 µg/L [Siluveru, Stewart 1996].
Urine **GC-MS** See Plasma [Ohshima, Takayasu 1999].
Biological Samples **GC** Nitrogen sensitive detection. Prilocaine and other local anaesthetics [Lau *et al.* 1991].
Disposition in the Body Metabolised by hydrolysis and hydroxylation resulting in deacetylated and hydroxylated metabolites which are excreted mainly as conjugates. About 35% of a dose is excreted in the urine as 4-hydroxy-2-methylaniline (*p*-hydroxytoluidine), 3% as 6-hydroxy-2-methylaniline, 1% as 2-methylaniline (*o*-toluidine), and less than 5% as unchanged drug. Prilocaine crosses the placenta and is excreted in breast milk.
Therapeutic Concentration In plasma, usually in the range 1 to 5 mg/L. 4-Hydroxy-2-methylaniline has been detected in plasma at concentrations similar to those of prilocaine.

In 30 patients receiving 40 mL of a 0.5% solution of prilocaine IV, the mean peak plasma concentration was 4.4 mg/L reached immediately after release of the tourniquet [Simon *et al.* 1997].

After the epidural administration of 200, 400, and 600 mg to 10 subjects, mean peak plasma concentrations determined within 10 to 20 min were 1.69, 2.67, and 4.47 mg/L, respectively; after the intercostal administration of 20 mL of a 2% solution, the mean peak concentration was 4.5 mg/L [Scott *et al.* 1972].

Toxicity Toxic effects are usually associated with plasma concentrations greater than 5 mg/L. 4-Hydroxy-2-methylaniline is thought to be responsible for the methaemoglobinaemia which may occur after large doses.
Half-life Plasma half-life, about 1 to 2 h.
Distribution in Blood Plasma : whole blood ratio, 0.80.
Protein Binding About 50%.
Dose Maximum dose of prilocaine hydrochloride, 400 mg, or 300 mg in solutions with felypressin.

Bachmann-Mennenga B *et al.* (1991). Ultrafiltration as a fast and simple method for determination of free and protein bound prilocaine concentration. Clinical study following high-dose plexus anesthesia. *Arzneimittelforschung* 41: 520–524.

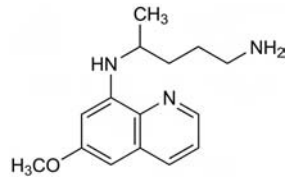
Primaquine

Antimalarial
$C_{15}H_{21}N_3O = 259.4$
CAS—90-34-6
IUPAC Name 4-*N*-(6-Methoxyquinolin-8-yl)pentane-1,4-diamine
Synonyms N^4-(6-Methoxy-8-quinolinyl)-1,4-pentadiamine; primachin.

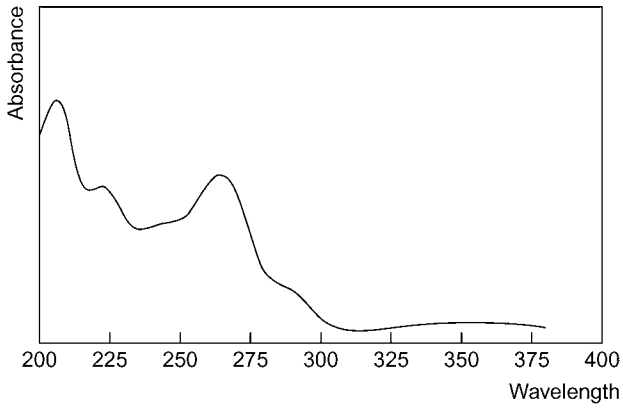


Chemical Properties A viscous liquid. Moderately soluble in water; soluble in ether. Log *P* (octanol/water), 3.2.

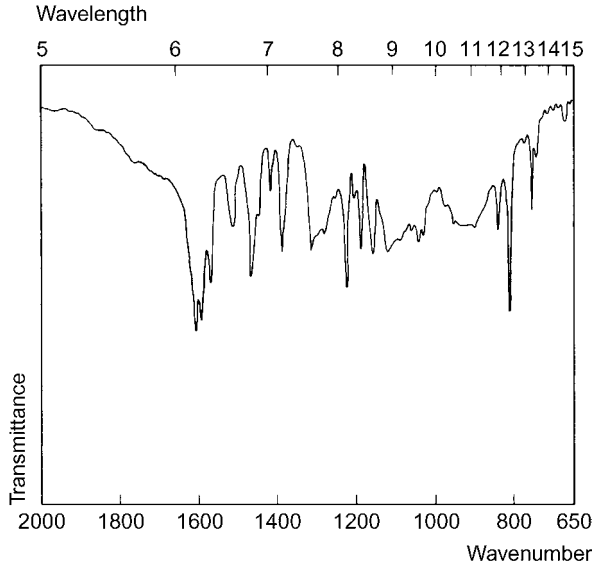
Primaquine Phosphate

$C_{15}H_{21}N_3O,2H_3PO_4 = 455.3$
CAS—63-45-6
Proprietary Name *Primacin*
Chemical Properties An orange-red crystalline powder. Mp 197° to 198°. Soluble 1 in about 15 of water; practically insoluble in ethanol, chloroform and ether.

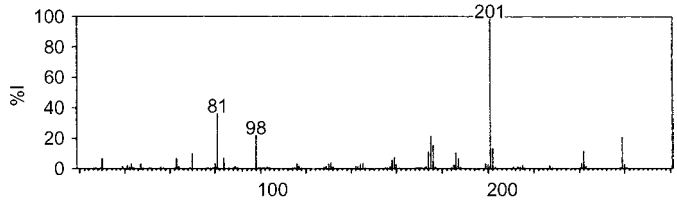
Colour Tests Mandelin's test—violet→orange; Marquis test—orange; Dissolve 10 mg in 5 mL of water and add 1 mL of a 5% solution of ceric ammonium sulfate in dilute nitric acid—violet (distinction from chloroquine).
Thin-layer Chromatography System TA—R_f 0.19; system TB—R_f 0.13; system TC—R_f 0.05; system TL—R_f 0.15 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2314.
High Performance Liquid Chromatography System HA—*k* 1.4; system HY—RI 276.
Ultraviolet Spectrum Aqueous acid—265 (A^1_1= 579a), 282 (A^1_1= 574a), 334 nm.



Infrared Spectrum Principal peaks at wavenumbers 1611, 1595, 815, 1230, 1572, 1170 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 201, 81, 98, 175, 259, 176, 202, 242.



Quantification
Blood **GC** ECD. Limit of detection, 10 µg/L [Rajagopalan *et al.* 1981].
HPLC UV detection. Primaquine and carboxyprimaquine [Dua *et al.* 1996].
Plasma **GC-MS** [Greaves *et al.* 1979].
HPLC See Blood [Dua *et al.* 1996]. Electrochemical detection. Primaquine and carboxyprimaquine. Limit of detection, 5 µg/L for primaquine and 20 µg/L for carboxyprimaquine [Dean *et al.* 1994]. Carboxyprimaquine and *N*-acetylprimaquine. Limit of detection, 75 µg/L for carboxyprimaquine and 10 µg/L for *N*-acetylprimaquine [Mihaly *et al.* 1984]. UV detection. Limit of detection, 1 µg/L [Ward *et al.* 1983].
Urine **GC-MS** See Plasma [Greaves *et al.* 1979].
HPLC See Plasma [Mihaly *et al.* 1984].
Disposition in the Body Readily absorbed after oral administration. It is extensively metabolised by oxidation to carboxyprimaquine which is the major plasma metabolite. Other reactions which may occur are demethylation and oxidation to the 5,6-diol, which is then converted to an active quinone, *N*-dealkylation to 8-amino-6-methoxyquinoline, and *N*-acetylation. Less than 5% of a dose is excreted in the urine unchanged in 24 h.

Therapeutic Concentration
Following a single oral dose of 45 mg to 5 subjects, peak plasma concentrations of 0.13–0.18 mg/L (mean, 0.15) were attained in 2–3 h; peak plasma concentrations of carboxyprimaquine of 1.1–1.8 mg/L (mean, 1.4) were attained in 2–12 h (mean, 7) [Mihaly *et al.* 1984].
Half-life Plasma half-life, about 4–10 h (mean, 7).
Volume of Distribution About 3–4 L/kg.
Distribution in Blood Plasma : whole blood ratio, 0.80
Protein Binding Extensively bound.
Dose The equivalent of 15 to 45 mg of primaquine daily.

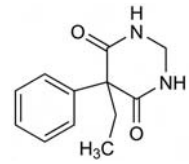
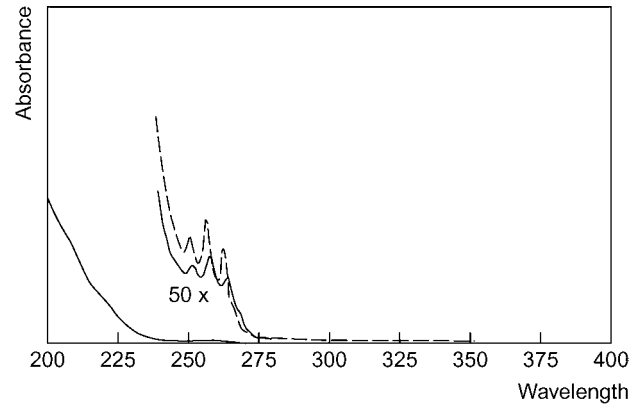
Primidone

Anticonvulsant
$C_{12}H_{14}N_2O_2$ = 218.3
CAS—125-33-7

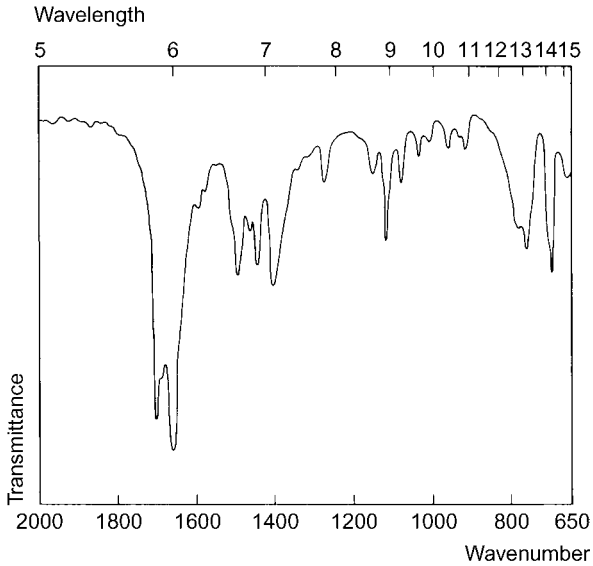
IUPAC Name 5-Ethyl-5-phenyl-1,3-diazinane-4,6-dione
Synonyms 5-Ethyldihydro-5-phenyl-4,6(1*H*,5*H*)-pyrimidinedione; hexamidinum; primaclone; primidonum.
Proprietary Names *Cyral*; *Liskantin*; *Midone*; *Mylepsin*; *Mylepsinum*; *Mysoline*; *Prysoline*; *Resimatil*; *Sertan*.
Note The name Hexamidine is applied to a compound with antibacterial and fungistatic properties.



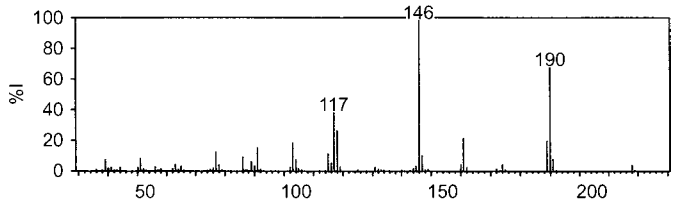
Chemical Properties A white crystalline powder. Mp 281° to 282°. Soluble 1 in 2000 of water and 1 in 170 of ethanol; practically insoluble in most other organic solvents. Log *P* (octanol/water), 0.9. Extraction yield (chlorobutane), 0 [Demme *et al.* 2005].
Thin-layer Chromatography System TA—R_f 0.88; system TD—R_f 0.08; system TE—R_f 0.41; system TF—R_f 0.23; system TAD—R_f 0.28; system TAE—R_f 0.76; system TAJ—R_f 0.29; system TAK—R_f 0.60; system TAL—R_f 0.86 (mercuric chloride–diphenylcarbazone reagent, positive; mercurous nitrate spray, positive).
Gas Chromatography System GA—primidone RI 2250, M (phenobarbital) RI 1953, M (phenylethylmalondiamide (PEMA)) RI 1884, M (diamide) RI 1935, M (acetyl-) RI 2115; system GB—primidone RI 2384, primidone-Me_2 RI 2161, M (PEMA) RI 1996, M (acetyl-) RI 2189; system GE—primidone RRT 0.89, M (phenobarbital) RRT 0.74, and M (PEMA) RRT 0.65 (all relative to phenytoin); system GAJ—primidone RRT 1.674, M (PEMA) RRT 1.074 (both relative to methylphenobarbital).
High Performance Liquid Chromatography System HE—primidone *k* 1.35, M (phenobarbital) *k* 2.76; system HX—RI 322; system HY—RI 288; system HZ—retention time 2.1 min; system HAA—retention time 11.1 min; system HAM—retention time 2.2 min.
Ultraviolet Spectrum Methanol—252, 258 (A^1_1=9.7c), 264 nm.



Infrared Spectrum Principal peaks at wavenumbers 1662, 1705, 1496, 700, 765, 1120 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 146, 190, 117, 118, 161, 189, 103, 91; phenobarbital 204, 117, 146, 161, 77, 103, 115, 118; phenylethylmalondiamide 163, 148, 91, 103, 117, 120, 44, 77.



Quantification

Blood **GC-MS** Primidone and other anticonvulsants [Speed *et al.* 2000].

Plasma **GC** Thermionic specific detection. Primidone and other anticonvulsants. Limits of quantification, 0.05 to 0.2 mg/L [Queiroz *et al.* 2002].

HPLC UV detection. Primidone and other anticonvulsants [Romanyshyn *et al.* 1994]. UV detection. Primidone and phenobarbital. Limit of detection, about 550 µg/L for primidone [Christofides, Fry 1980].

Serum **GC-MS** Primidone, phenobarbital, 4-hydroxyphenobarbital and phenylethylmalondiamide. Limits of detection, between 1.4 and 3.7 µg/L [Nau *et al.* 1980].

HPLC Photodiode-array detection. Primidone and other anticonvulsants [Liu *et al.* 1993]. See Plasma [Christofides, Fry 1980].

Urine **GC-MS** See Serum [Nau *et al.* 1980].

HPLC See Serum [Liu *et al.* 1993].

Saliva **GC-MS** See Serum [Nau *et al.* 1980].

HPLC See Serum [Liu *et al.* 1993].

Liver **GC-MS** See Blood [Speed *et al.* 2000].

Tissues **GC-MS** See Serum [Nau *et al.* 1980].

Disposition in the Body Readily absorbed after oral administration. Rapidly metabolised to phenylethylmalondiamide (PEMA) and more slowly metabolised to phenobarbital; both metabolites are active anticonvulsants. Aromatic hydroxylation to form 4-hydroxyphenobarbital also occurs followed by glucuronic acid conjugation. The formation of phenobarbital is stimulated by phenytoin. During chronic treatment, about 92% of the daily dose is excreted in the urine in 24 h, of which 15 to 65% (mean, 42%) is unchanged drug, 16 to 65% (mean, 45%) is PEMA, and 1 to 8% (mean, 5%) is phenobarbital or its hydroxylated metabolites and conjugates. Primidone is widely distributed in all organs and tissues. It crosses the blood–brain barrier and placental barrier and is excreted in breast milk.

Therapeutic Concentration In plasma, usually in the range 5 to 12 mg/L but there is considerable intersubject variation. At the beginning of treatment there is a delay of several days before phenobarbital appears in the plasma. Concentrations of phenobarbital and PEMA accumulate during chronic treatment, and steady-state plasma-phenobarbital concentrations are often used to monitor therapy.

After daily oral dosing of a number of subjects at various dose levels, steady-state plasma concentrations were as follows: 26 subjects at 250 mg per day, 0 to 13 mg/L (mean, 3.2); 26 subjects at 500 mg per day, 1 to 14 mg/L (mean, 6.7); 78 subjects at 750 mg per day, 2 to 23 mg/L (mean, 8.7); 52 subjects at 1000 mg per day, 3 to 20 mg/L (mean, 10.5); 9 subjects at 1250 mg per day, 10 to 19 mg/L (mean, 14.7). In 30 subjects given primidone but no barbiturate, the mean primidone concentration was 9.2 mg/L and the mean phenobarbital concentration was 31 mg/L [Booker *et al.* 1970].

Following oral doses of 75 to 250 mg three times a day to 7 subjects, the following steady-state serum concentrations were reported: primidone 5.0 to 13.4 mg/L (mean, 8.3), phenobarbital 3.3 to 34.6 mg/L (mean, 12.6), PEMA 1.4 to 9.9 mg/L (mean, 4.6) [Cloyd *et al.* 1981].

Toxicity The estimated minimum lethal dose is 5 g but instances of survival after the ingestion of 25 to 30 g have been reported. Toxic effects are usually associated with plasma concentrations greater than 10 mg/L and concentrations greater than 50 mg/L may be lethal.

In a fatality due to primidone ingestion, postmortem blood concentrations of 65 mg/L of primidone and 3 mg/L of phenobarbital were reported [Wright, Baselt 2000].

Serum concentrations of 95 mg/L of primidone and 175 mg/L of phenobarbital were reported about 12 h after a non-fatal suicide attempt by a 10-year-old epileptic subject; the corresponding urine concentrations were 1570 and 50 mg/L, respectively [Cate, Tenser 1975].

Half-life Plasma half-life, primidone about 10 to 15 h, phenobarbital 50 to 150 h, PEMA 24 to 48 h.

Volume of Distribution In children after oral dosing, about 0.6 L/kg.

Clearance Plasma clearance, after oral administration, about 0.7 mL/min/kg.

Saliva Plasma : saliva ratio, about 1.0.

Protein Binding <20%.

Dose Initially 125 mg daily, increasing to 0.5 to 1.5 g daily.

P

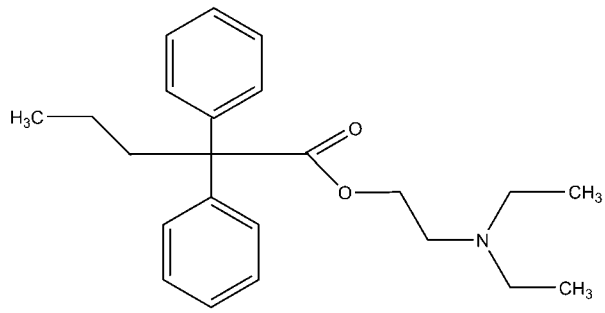
Proadifen

Non-specific Synergist

$C_{23}H_{31}NO_2 = 353.5$

IUPAC Name 2-Diethylaminoethyl 2,2-diphenylpentanoate

Synonyms 2-Diethylaminoethyl α,α-diphenylpentanoate; propyladiphenine.



Proadifen Hydrochloride

$C_{23}H_{31}NO_2,HCl = 389.5$

Synonyms RP 5171; SKF 525-A; U 5446.

Chemical Properties White crystalline powder. Mp 122° to 123°. Soluble in water. Extracted by organic solvents from aqueous alkaline solutions.

Thin-layer Chromatography System T1—R_f 0.70 (location reagent acidified iodoplatinate spray, positive reaction).

Ultraviolet Spectrum Proadifen hydrochloride in 0.1 N sulfuric acid, maxima at 252 (E1%, 1 cm 16.3), 259 (E1%, 1 cm 14.8), 264 (E1%, 1 cm 12.1), 270 (E1%, 1 cm 7.3), 327 (E1%, 1 cm 4.9) and 337 nm (E1%, 1 cm 4.4).

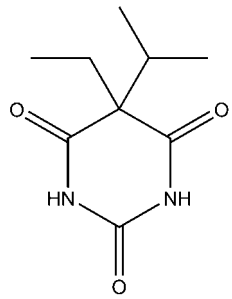
Probarbital

Barbiturate

$C_9H_{14}N_2O_3$ = 198.2

IUPAC Name (1,3-Dimethyl-4-phenylazepan-4-yl) propanoate

Synonyms DEA Number 9643; 1,3-dimethyl-4-phenyl-4-propionyloxyazacycloheptane; EINECS 201-006-8.



Chemical Properties Log *P* (octanol/water) 0.9 [National Institutes of Health 2008].

Probarbital Sodium

Synonym Ethypropymalnatrium

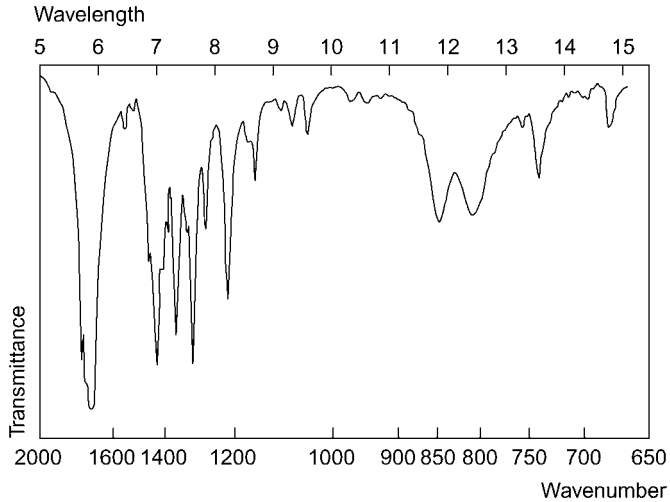
Proprietary Name *Ipral sodium*

Chemical Properties White hygroscopic powder. Very soluble in water, slightly soluble in ethanol, insoluble in ether and chloroform. Aqueous solutions slowly decompose.

Thin-layer Chromatography System T10—R_f 0.24 (location reagents: mercurous nitrate spray, black; Zwikker's reagent spray, pink).

Gas Chromatography System G1/180—retention time 0.44 relative to diphenhydramine; system G7—retention time 1.1 relative to barbitone.

Infrared Spectrum



Disposition in the Body

Toxicity The estimated minimum lethal dose is 2 g. It is an intermediate-acting barbiturate.

Dose 250 mg.

National Institutes of Health (2008). *Probarbitone.* http://pubchem.ncbi.nlm.nih.gov/summary/summary.cgi?cid=6455&loc=ec_rcs. (accessed 27 June 2008).

Probenecid

Uricosuric

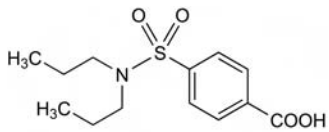
$C_{13}H_{19}NO_4S$ = 285.4

CAS—57-66-9

IUPAC Name 4-(Dipropylsulfamoyl)benzoic acid

Synonym 4-[(Dipropylamino)sulfonyl]benzoic acid

Proprietary Names *Bencid*; *Benemid(e)*; *Benuryl*; *Probalan*; *Probecid*; *Proben*; *Procid*.



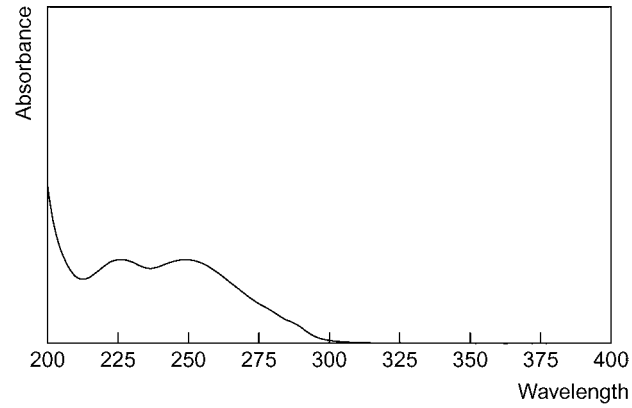
Chemical Properties A white crystalline powder. Mp 194° to 196°. Practically insoluble in water and dilute acids; soluble 1 in 25 of ethanol and 1 in 12 of acetone; soluble in chloroform and dilute alkalis. pK_a 3.4 (20°). Log *P* (octanol/water), 3.2.

Thin-layer Chromatography System TD—R_f 0.13; system TE—R_f 0.05; system TF—R_f 0.23; system TAD—R_f 0.24; system TAE—R_f 0.87; system TAJ—R_f 0.28; system TAK—R_f 0.71; system TAL—R_f 0.90.

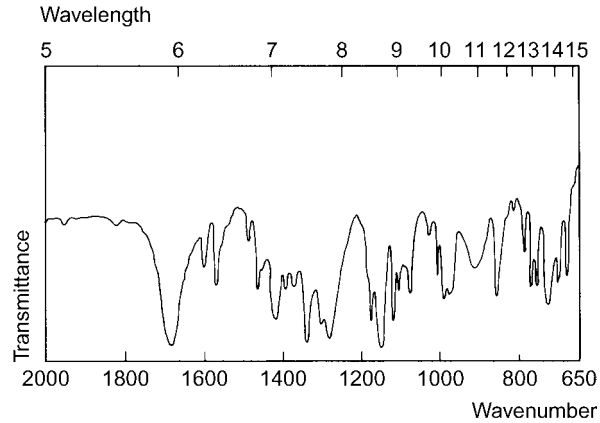
Gas Chromatography System GA—RI 2336.

High Performance Liquid Chromatography System HX—RI 526; system HY—RI 507; system HZ—retention time 7.8 min.

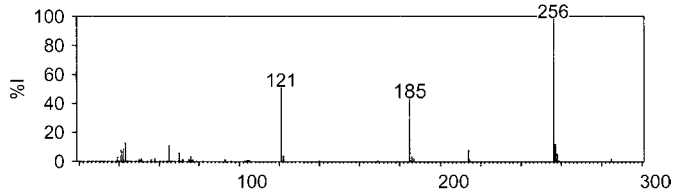
Ultraviolet Spectrum Ethanolic acid—248 nm (A_1^1=332a).



Infrared Spectrum Principal peaks at wavenumbers 1683, 1156, 1285, 1307, 1125, 1180 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 256, 121, 185, 43, 257, 65, 42, 214.



Quantification

Plasma **Spectrofluorimetry** Plasma [Cunningham *et al.* 1978].

GC ECD. Limit of detection, 20 µg/L [Roos *et al.* 1980].

HPLC Probenecid and its metabolites [Vree *et al.* 1992]. UV detection. Limit of detection, 500 µg/L [Hekman *et al.* 1980].

Urine **HPLC** See Plasma [Vree *et al.* 1992]. Probenecid and its glucuronide [Hansen-Moller, Schmit 1991]. See Plasma [Hekman *et al.* 1980].

Cerebrospinal Fluid **GC** See Plasma [Roos *et al.* 1980].

Disposition in the Body Readily absorbed after oral administration. Metabolised by side-chain oxidation, glucuronic acid conjugation and *N*-dealkylation. Up to about 90% of a dose is excreted in the urine, the major urinary metabolite, probenecid acyl glucuronide, accounting for up to 50% of a dose; up to 25% of a dose is excreted as hydroxylated and carboxylic acid metabolites, and 5 to 15% as *N*-dealkylated metabolites. About 5 to 10% of a dose is excreted as unchanged drug but this appears to be variable, increasing with increasing urinary pH values and urinary flow.

Therapeutic Concentration

Following single oral doses of 0.5, 1.0 and 2.0 g to 5 subjects, mean peak plasma concentrations of 35.3, 69.6, and 149 mg/L were reported at 3 to 4 h [Selen *et al.* 1982].

After daily oral administration of 0.5 g four times a day to 19 subjects for 4 weeks, a mean plasma concentration of 22.5 mg/L was reported [Cunningham *et al.* 1981].

Toxicity Probenecid is relatively non-toxic and recovery has occurred after the ingestion of 47 g.

A 36-year-old man died after deliberately ingesting approximately 75 g of probenecid. Postmortem tissue concentrations were highest in serum (710 mg/L) and the liver (550 µg/g); ethanol was also detected in blood (1.3 g/L) [McIntyre *et al.* 1992].

Half-life Plasma half-life, 4 to 17 h (dose-dependent).

Volume of Distribution About 0.1 to 0.2 L/kg.

Protein Binding About 90%.

Note For a review of the clinical pharmacokinetics of probenecid, see Cunningham *et al.* [1981].

Dose 0.5 to 2 g daily.

Procainamide

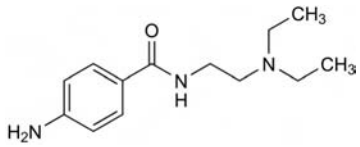
Antiarrhythmic

$C_{13}H_{21}N_3O = 235.3$

CAS—51-06-9

IUPAC Name 4-Amino-*N*-(2-diethylaminoethyl)benzamide

Synonym Procaine amide



Chemical Properties pK_a 9.2 (20°). Log *P* (ethyl acetate/pH 7.4), −1.5; (octanol/water), 0.9. Extraction yield (chlorobutane), 0.1 [Demme *et al.* 2005].

Procainamide Hydrochloride

$C_{13}H_{21}N_3O,HCl = 271.8$

CAS—614-39-1

Synonym Novocainamidum

Proprietary Names *Biocoryl*; *Novocamid*; *Procamide*; *Procan SR*; *Procanbid*; *Procapan*; *Pronestyl*.

Chemical Properties A white to tan-coloured, hygroscopic crystalline powder. Mp 165° to 169°. Soluble 1 in 0.25 of water, 1 in 2 of ethanol and 1 in 140 of chloroform; slightly soluble in acetone; practically insoluble in ether.

Colour Tests Coniferyl alcohol—orange; diazotisation—red; ninhydrin—yellow.

Thin-layer Chromatography System TA—R_f 0.49; system TB—R_f 0.01; system TC—R_f 0.05; system TE—R_f 0.39; system TAE—R_f 0.17; system TAF—R_f 0.33; system TAG—R_f 0.09 (acidified iodoplatinate solution—positive).

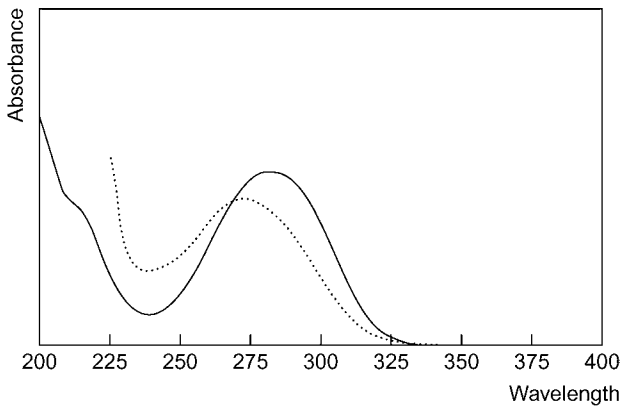
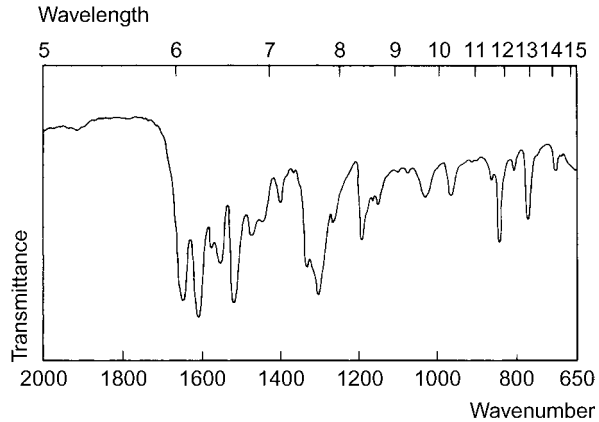
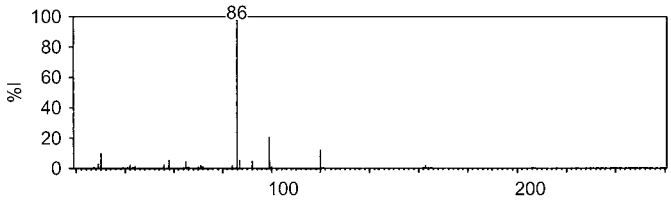
Ultraviolet Spectrum Aqueous alkali—275 nm ($A^1_1 = 693a$).



Infrared Spectrum Principal peaks at wavenumbers 1600, 1512, 1639, 1297, 1545, 1570 cm^{-1} (procainamide hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 86, 99, 120, 30, 92, 87, 58, 65 (procainamide); 86, 58, 99, 56, 162, 132, 149, 205 (*N*-acetylprocainamide).



Quantification

Plasma **HPLC** Column: Ultraspher octyl C_8 (250 × 4.6 mm i.d., 5 µm). Mobile phase: water : methanol : acetic acid : TEA (pH 5.5, 78 : 22 : 1 : 0.01), flow rate 1.3 mL/min. UV detection (λ = 280 nm). Retention time, 4 min. Limit of quantification, 4 µg/L, limit of detection, 2 µg/L [Lessard *et al.* 1998]. Column: Spherisorb hexyl (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol : 15 mmol/L potassium dihydrogen phosphate plus 0.01% TEA (pH 3.0, 10 : 10 : 80), flow rate 1.0 mL/min. UV detection (λ = 230 nm). Limit of quantification, 0.4 mg/L [Verbesselt *et al.* 1991]. Column: Nucleosil C_{18} (150 × 4.8 mm i.d., 5 µm). Mobile phase: methanol : acetic acid : triethylamine : water (200: 10 : 5 : 785), flow rate 0.2 mL/min. Fluorescence detection (λ_{ex} = 290 nm, λ_{em} = 335 nm). Limit of detection, 100 µg/L [Raphanaud *et al.* 1986]. Column: silica (250 mm, 10 µm). Mobile phase: 3.0 pmol/L ammonium hydroxide : 0.05 mol/L ammonium nitrate : methanol (1 : 12 : 87), flow rate 2.0 mL/min. UV detection (λ = 254 nm). Limit of detection, 500 µg/L [Bridges, Jennison 1983]. Column: alkylphenyl (300 × 4 mm i.d.). Mobile phase: acetonitrile : phosphate buffer (60 : 40), flow rate 2.0 mL/min. UV detection (λ = 280 nm). Retention time: 4.4 min. Limit of detection, 50 µg/L [Lai *et al.* 1980]. See also Carr *et al.* [1976].

Serum **GC** Column: 5% OV-17 on 100/120 mesh Gas Chrom Q (1.0 m × 4 mm i.d.). Carrier gas: Ar : CH_4 (95 : 5), 40 mL/min. Temperature: 235°. ECD. Limit of detection, 100 ng [Ludden *et al.* 1978].

HPLC Column: IBM phenyl (150 × 4.5 mm i.d., 5 µm). Mobile phase: 0.075 mol/L acetate buffer (pH 4.3) : acetonitrile (20 : 3), flow rate 1 mL/min. UV detection (λ = 270 nm). Limit of detection, 50 µg/L [Coyle *et al.* 1987].

Urine **HPLC** See Serum [Coyle *et al.* 1987]. See Plasma. Limit of detection, 500 µg/L [Lai *et al.* 1980].

Disposition in the Body Procainamide is readily absorbed after oral administration and widely distributed throughout the body; bioavailability is 75–95%. The major metabolite, *N*-acetylprocainamide (acecainide), has similar pharmacological activity to procainamide; the acetylation of procainamide is subject to genetic polymorphism. Up to ~80% of a dose is excreted in the urine of normal subjects in 24 h, ~50–60% as unchanged drug and up to ~30% as *N*-acetylprocainamide (less in slow acetylators). Other metabolites include monodesethylprocainamide and monodesethyl-*N*-acetylprocainamide.

Therapeutic Concentration There is considerable intersubject variation in plasma concentrations. The therapeutic effect has been correlated with plasma concentrations of ~4–10 mg/L procainamide and 5–30 mg/L combined procainamide and *N*-acetylprocainamide. *N*-Acetylprocainamide may accumulate during chronic administration in fast acetylators and in subjects with renal impairment.

After a single oral dose of 1 g to 5 normal subjects, peak plasma procainamide concentrations of 3.5–5.3 mg/L (mean, 4.2) were attained in 1–2 h; concentrations of *N*-acetylprocainamide reached a peak of 0.6–2.1 mg/L (mean, 1.6) in 3–8 h [Giardina *et al.* 1976].

The following steady-state plasma concentrations were reported in 10 subjects receiving maintenance treatment: procainamide 2.6 to 20.7 mg/L (mean, 10.6), *N*-acetylprocainamide 4.6 to 43.6 mg/L (mean, 15.9) and monodesethyl-*N*-acetylprocainamide 0.4 to 11.9 mg/L (mean, 2.7) [Ruo *et al.* 1981].

Following IV infusion of 84–374 mg/h procainamide to 34 subjects, steady-state plasma procainamide concentrations of 1.7–17 µg/mL (mean, 6.5) and

N-acetylprocainamide concentrations of 1.1–20 µg/mL (mean, 5.7) were reported [Lima *et al.* 1979].

Subjects received 1, 2 or 4 g procainamide daily by mouth, given either in 4 divided doses as a conventional-release capsule or in 2 divided doses as an extended-release tablet. The peak plasma concentrations of procainamide after twice daily and 4 times daily administration, respectively, were 2.74 and 2.77 mg/L for all dose levels (at 4.0 and 2.0 h). Corresponding values for *N*-acetylprocainamide were 2.61 and 2.92 mg/L (at 4.4 and 2.6 h) [Yang *et al.* 1996].

Toxicity Toxic effects are usually associated with plasma-procainamide concentrations of ~12 mg/L or more and fatalities with concentrations >20 mg/L. As little as 200 mg IV can be fatal.

In 4 fatalities attributed to procainamide intoxication in subjects receiving therapeutic doses, plasma procainamide concentrations shortly before death ranged from 17.6–25.2 mg/L [Koch-Weser, Klein 1971].

The following postmortem concentrations were reported in a fatality attributed to procainamide: blood 114 mg/L, liver 283 µg/g and urine 556 mg/L [Kopjak, Jennison 1976].

A 14-year-old boy had a serum procainamide level of 63 mg/L and an *N*-acetylprocainamide level of 80.4 mg/L ~2.5 h after intentionally ingesting ~21 g procainamide; after 43 h, the levels were 0.3 and 0.6 mg/L for procainamide and *N*-acetylprocainamide, respectively [White *et al.* 2002]

Half-life Plasma half-life: procainamide ~3 h in normal subjects, increased in subjects with renal failure or with heart disease; *N*-acetylprocainamide ~6–9 h.

Volume of Distribution ≈2 L/kg.

Clearance Plasma clearance, ~5–15 mL/min/kg.

Protein Binding ≈15%.

Note For a review of the clinical pharmacokinetics of procainamide, see Karlsson [1978].

Dose Maintenance, 0.5 to 1 g of procainamide hydrochloride, by mouth, every 4 to 6 h.

Procaine

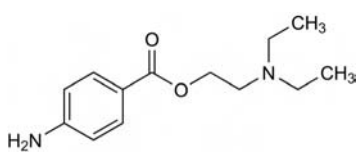
Anaesthetic (Local)

$C_{13}H_{20}N_2O_2 = 236.3$

CAS—59-46-1

IUPAC Name 2-Diethylaminoethyl 4-aminobenzoate

Synonym Ethocaine



Chemical Properties Mp 61°. Soluble 1 in 200 of water (when freshly precipitated); soluble in ethanol, benzene, chloroform and ether. pK_a 9.0 (20°). Log *P* (octanol/water), 2.1. Extraction yield (chlorobutane), 0.9 [Demme *et al.* 2005].

Procaine Hydrochloride

$C_{13}H_{20}N_2O_2,HCl = 272.8$

CAS—51-05-8

Synonyms Allocaine; novocainum; procaini hydrochloridum; procainii chloridum; procainum chloride; syncaine.

Proprietary Names *Geroaslan H3*; *Gerovital H3*; *Lenident*; *Novanaest*; *Novocain*; *Procaneural*; *Syntocaine*; *Venocaina*.

Chemical Properties Colourless crystals or a white crystalline powder. Mp 153° to 156°. Soluble 1 in 1 of water, 1 in 30 of ethanol and 1 in 30 of dehydrated alcohol; slightly soluble in chloroform; practically insoluble in ether.

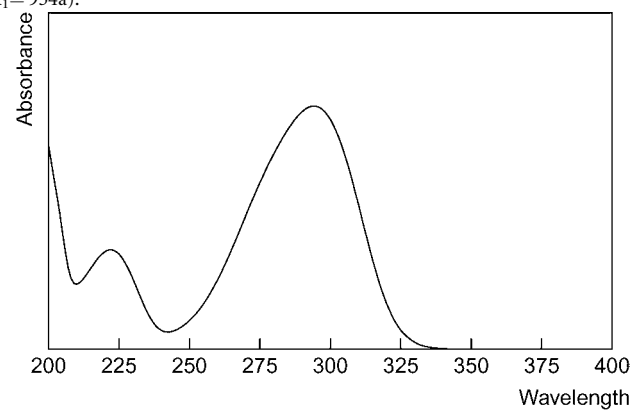
Colour Test Diazotisation—red-orange.

Thin-layer Chromatography System TA—R_f 0.54; system TB—R_f 0.05; system TC—R_f 0.31; system TE—R_f 0.71; system TL—R_f 0.30; system TAE—R_f 0.36; system TAF—R_f 0.42; system TAJ—R_f 0.06; system TAK—R_f 0.00; system TAL—R_f 0.22 (Dragendorff spray, positive; acidified iodoplatinate solution, positive; ninhydrin spray, positive).

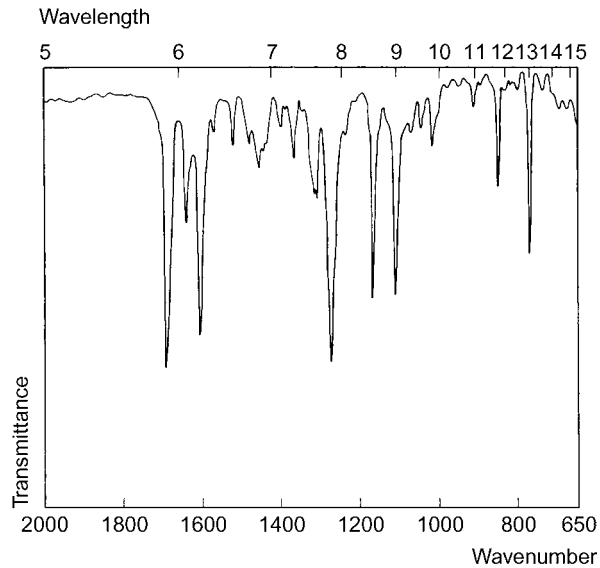
Gas Chromatography System GA—procaine RI 2010, procaine-AC RI 2350, 4-aminobenzoic acid RI 1547; system GF—RI 2580; system GQ—retention time 6.8 min.

High Performance Liquid Chromatography System HA—*k* 1.9; system HQ—*k* 0.00; system HX—RI 264; system HY—RI 225; system HAA—RT 5.2 min; system HAX—RT 7.3 min; system HAY—RT 4.0 min.

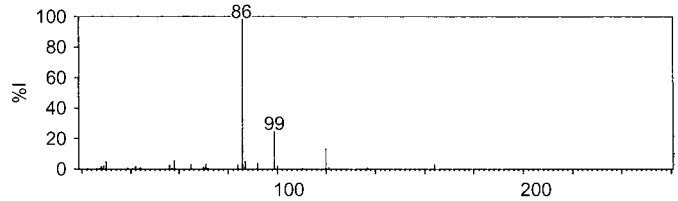
Ultraviolet Spectrum Aqueous acid—294, 222 nm; methanol—296 nm ($A^{1\%}_{1cm}$ = 954a).



Infrared Spectrum Principal peaks at wavenumbers 1690, 1274, 1605, 1174, 1116, 772 cm^{-1} (procaine hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 86, 99, 120, 58, 87, 30, 92, 71; 4-aminobenzoic acid 137, 120, 92, 65, 39, 138, 121, 63.



Quantification
Blood **GC** SID. Limit of detection, 5–10 pg per injection for procaine and other local anaesthetics [Hattori *et al.* 1991].
Plasma **GC** FID. Limit of detection, 0.1 mg/L for procaine and chloroprocaine [Smith *et al.* 1978]. FID. For method, see Green *et al.* [1974].
GC-MS SIM, *m/z* 86. Limit of quantification, 100 µg/L, limit of detection, 80 µg/L [Ohshima, Takayasu 1999].
Serum **GC** NPD. Limit of detection, ≈60–70 pg per injection for procaine and other local anaesthetics [Terada *et al.* 1996].
Urine **GC–MS** SIM, *m/z* 86. Limit of quantification, 100 µg/L, limit of detection, 80 µg/L [Ohshima, Takayasu 1999].
Cerebrospinal Fluid **GC** SID. Limit of detection, 5–10 pg per injection for procaine and other local anaesthetics [Hattori *et al.* 1991].

Disposition in the Body Poorly absorbed from mucous membranes; readily absorbed after parenteral administration and rapidly hydrolysed in the plasma to 4-aminobenzoic acid and diethylaminoethanol. About 80% of the 4-aminobenzoic acid is excreted unchanged or conjugated in the urine, together with about 30% of the diethylaminoethanol, the remainder being metabolised in the liver; about 2% of a dose is excreted in the urine as unchanged drug.

Therapeutic Concentration
A mean steady-state plasma concentration of 12.7 mg/L was reported during the continuous IV infusion of 1.0 mg/kg/min to 6 subjects; following continuous IV infusion of 1.5 mg/kg/min to a further 6 subjects, a mean steady-state plasma concentration of 42.7 mg/L was reported [Seifen *et al.* 1979].

Toxicity
Following IV injection to 10 subjects until convulsions were induced (total dose 18–55 mg/kg), plasma concentrations of 21–86 mg/L (mean 49) of procaine and 0.6–80 mg/L (mean 23) of 4-aminobenzoic acid were reported [Usubiaga *et al.* 1966].
Following the accidental IV injection of 4 g to 1 subject, a peak blood concentration of 96 mg/L was reported; the subject recovered [Wikinski *et al.* 1970].

Half-life Plasma half-life, ≈0.1 h.
Protein Binding ≈6%.
Dose Up to 1 g of procaine hydrochloride may be administered by injection with adrenaline.

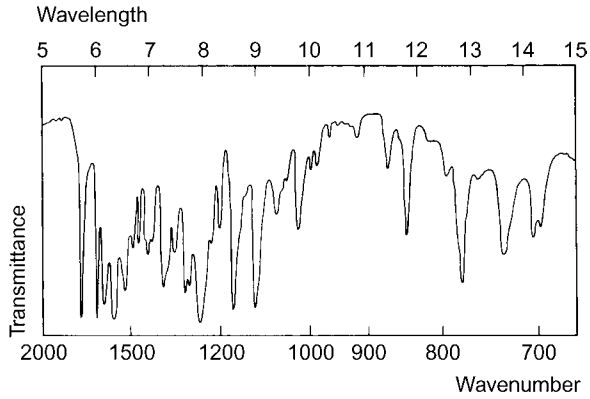
Procaine Benzylpenicillin

Antibacterial
$C_{13}H_{20}N_2O_2,C_{16}H_{18}N_2O_4S,H_2O$ = 588.7
CAS—54-35-3 (anhydrous); 6130-64-9 (monohydrate)

IUPAC Name 2-Diethylaminoethyl 4-aminobenzoate; (2*S*,5*R*,6*R*)-3,3-dimethyl-7-oxo-6-[(2-phenylacetyl)amino]-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid; hydrate
Synonyms Benzylpenicillin novocaine; (2*S*,5*R*,6*R*)-3,3-Dimethyl-7-oxo-6-[(phenylacetyl)amino]-4-thia-1-aza-bicyclo[3.2.0]heptane-2-carboxylic acid compound with 2-(diethylamino)ethyl 4-aminobenzoate (1:1) monohydrate; penicillin G procaine; procaine penicillin; procaine penicillin G.
Proprietary Names *Aqucilina*; *Atracilina*; *Ayercillin*; *Cilicaine*; *Crysticillin AS*; *Farmaproina*; *Fradicilina*; *Jenacillin O*; *Novocillin*; *Pfizerpen AS*; *Probecilin*; *Procillin*; *Wycillin*. It is an ingredient of *Bicillin*.
Note *Bicillin* is also used as a proprietary name for benzathine benzylpenicillin.
Chemical Properties A white crystalline powder. Mp 106° to 110°, with decomposition. Soluble 1 in 200 of water, 1 in 30 of ethanol and 1 in 60 of chloroform; very slightly soluble in ether.
Ultraviolet Spectrum Aqueous acid—278 (A_1^1=53b); aqueous alkali—280 (A_1^1=256b); methanol—295 nm (A_1^1=367b).
Infrared Spectrum Principal peaks at wavenumbers 1266, 1600, 1779, 1692, 1176, 1120 cm^{-1} (KBr disk).

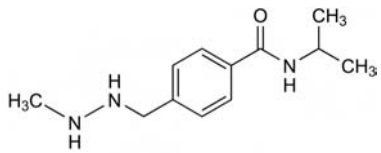


Dose 300 to 600 mg daily, by deep IM injection.

Procarbazine

Antineoplastic
$C_{12}H_{19}N_3O$ = 221.3
CAS—671-16-9

IUPAC Name 4-[(2-Methylhydrazinyl)methyl]-*N*-propan-2-ylbenzamide
Synonyms Ibenzmethyzin; *N*-(1-methylethyl)-4-[(2-methylhydrazino)methyl] benzamide; MIH; Ro-4-6467.

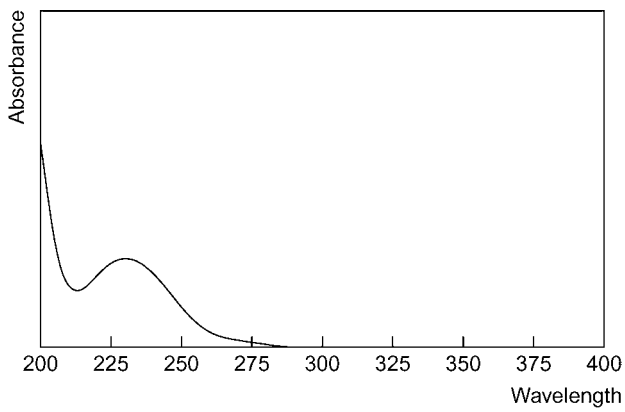


Chemical Properties pK_a 6.8. Log *P* (octanol/water), 0.1.

Procarbazine Hydrochloride

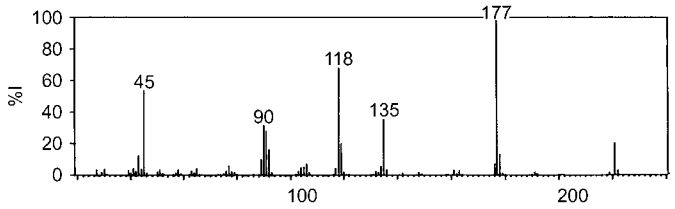
$C_{12}H_{19}N_3O,HCl$ = 257.8
CAS—366-70-1
Proprietary Names *Matulane*; *Natulan*.
Chemical Properties A white to pale yellow crystalline powder. Mp 223° to 226°, with decomposition. Freely soluble in water; sparingly soluble in ethanol; slightly soluble in chloroform; practically insoluble in ether; soluble in methanol. Solutions in water are unstable.

Colour Tests Liebermann's reagent (100°)—blue (15 s); Nessler's reagent (room temperature)—black; palladium chloride—black.
Thin-layer Chromatography System TA—R_f 0.49; system TB—R_f 0.02; system TC—R_f 0.10; system TE—R_f 0.80; system TL—R_f 0.04; system TAD—R_f 0.68; system TAE—R_f 0.88; system TAJ—R_f 0.34; system TAK—R_f 0.03; system TAL—R_f 0.90. (Acidified potassium permanganate solution, positive.)
Gas Chromatography System GA—RI 1990.
Ultraviolet Spectrum Aqueous acid—232 nm (A_1^1=570a).



Infrared Spectrum Principal peaks at wavenumbers 1632, 1555, 1661, 1301, 861, 1176 cm^{-1} (procarbazine hydrochloride, KBr disk).
Mass Spectrum Principal ions at *m/z* 177, 118, 45, 135, 90, 91, 221, 119.

P



Quantification

Plasma **GC–MS** Limit of detection, 10 µg/L for procarbazine and metabolites [Gorsen *et al.* 1980].

HPLC UV detection. For method for quantification of procarbazine metabolites, see Shiba and Weinkam [1982]. Electrochemical detection. Limit of detection, 10 ng [Rucki, Moros 1980].

Urine **HPLC** Electrochemical detection. Limit of detection, 10 ng [Rucki, Moros 1980].

Disposition in the Body Readily absorbed after oral administration; peak plasma concentrations are attained in 0.5 to 1 h. Rapidly metabolised to active azo derivatives and by oxidation to *N*-isopropylterephthalamic acid. Up to about 75% of a dose is excreted in the urine with about 5% of a dose consisting of unchanged drug.

Dose Initially the equivalent of 50 mg of procarbazine daily, increasing to 250 or 300 mg daily.

Gorsen RM *et al.* (1980). Analysis of procarbazine and metabolites by gas chromatography-mass spectrometry. *J Chromatogr* 221: 309–318.

Prochlorperazine

Tranquilliser

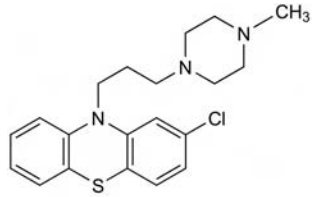
$C_{20}H_{24}ClN_3S = 373.9$

CAS—58-38-8

IUPAC Name 2-Chloro-10-[3-(4-methylpiperazin-1-yl)propyl]phenothiazine

Synonyms Chlormeprazine; 2-chloro-10-[3-(4-methyl-1-piperazinyl)propyl]-10*H*-phenothiazine; prochlorpemazine; proclorperazine.

Proprietary Names *Compazine*; *Compro*; *Stemetil* (suppositories).



Chemical Properties Clear, pale-yellow, viscous liquid that is sensitive to light. Very slightly soluble in water; freely soluble in ethanol, chloroform, and ether. pK_a 8.1 (24°). Log *P* (octanol/water), 4.9. Plasma samples were stable for 24 h at 4° and room temperature, and when stored for 20 days at –20°. Stock solutions were stable for at least 1 month and there was no significant deterioration following 3 freeze-thaw cycles [Yan *et al.* 2009].

Prochlorperazine Edisilate

$C_{20}H_{24}ClN_3S,C_2H_6O_6S_2 = 564.1$

CAS—1257-78-9

Synonyms Prochlorperazine edisylate; prochlorperazine ethanedisulfonate.

Proprietary Name *Compazine*

Chemical Properties White to very light-yellow, crystalline powder. Soluble 1 in 2 of water and 1 in 1500 of ethanol; practically insoluble in chloroform and ether.

Prochlorperazine Maleate

$C_{20}H_{24}ClN_3S,2C_4H_4O_4 = 606.1$

CAS—84-02-6

Synonyms Prochlorperazine dihydrogen maleate; prochlorperazine dimaleate.

Proprietary Names *Anti-Naus*; *Buccastem*; *Compazine*; *Dhaperazine*; *Meterazine*; *Mitil*; *Proclozine*; *Proziere*; *Scripto-Metic*; *Stemetil* (tablets); *Stemzine*.

Chemical Properties White or pale-yellow, crystalline powder. Mp 228°. Practically insoluble in water, ethanol, and ether; slightly soluble in warm chloroform.

Prochlorperazine Mesilate

$C_{20}H_{24}ClN_3S,2CH_3SO_3H = 566.2$

CAS—51888-09-6

Synonyms Prochlorperazine dimethanesulfonate; prochlorperazine mesylate; prochlorperazine methanesulfonate.

Proprietary Name *Stemetil* (injection and syrup).

Chemical Properties White powder. Mp about 242°. Soluble 1 in less than 0.5 of water and 1 in 40 of ethanol; slightly soluble in chloroform; practically insoluble in ether.

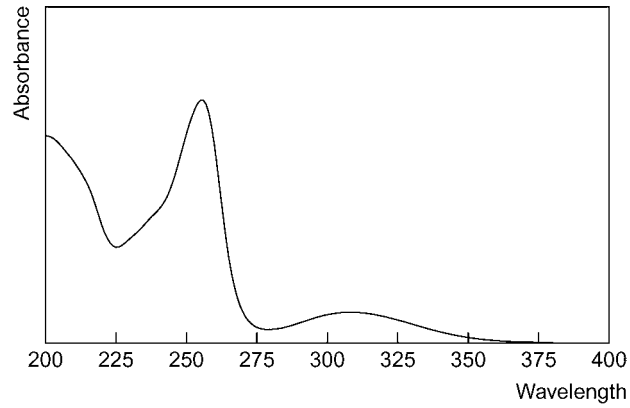
Colour Tests Formaldehyde–sulfuric acid—red-violet; Forrest reagent—red; FPN reagent—red; Mandelin's test—brown→violet; Marquis test—violet.

Thin-layer Chromatography System TA—R_f 0.49; system TAE—R_f 0.26; system TAF—R_f 0.26; system TAG—R_f 0.07; system TB—R_f 0.34; system TC—R_f 0.37; system TE—R_f 0.55 (acidified iodoplatinate solution, positive).

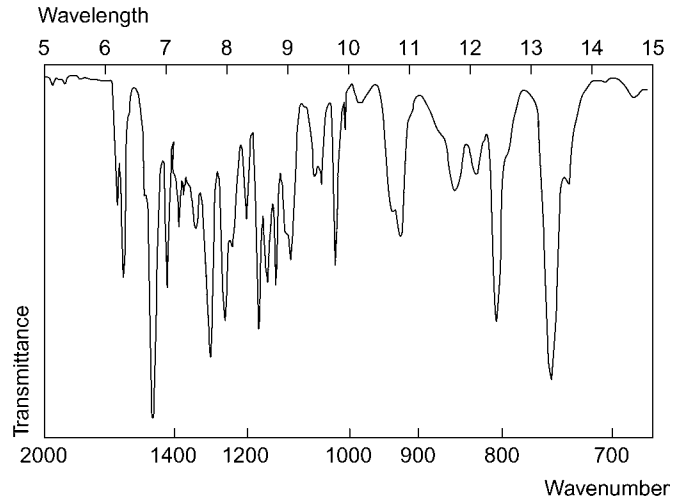
Gas Chromatography System GA—prochlorperazine RI 2954; M (*N*-oxide) RI 2100; system GB—prochlorperazine RI 3129; M (*N*-oxide) RI 2356; M (norsulfoxide) RI 3571; M (sulfoxide) RI 3758.

High Performance Liquid Chromatography System HA—*k* 3.9; system HX—RI 450; system HY—RI 323; system HZ—retention time 10.4 min.

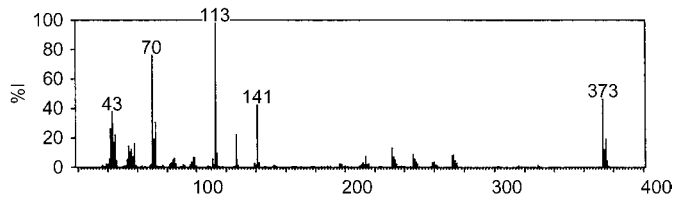
Ultraviolet Spectrum Aqueous acid—254 ($A_1^1 = 875$a), 305 nm.



Infrared Spectrum Principal peaks at wavenumbers 752, 1280, 1569, 1165, 1242, 1145 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 113, 70, 373, 141, 43, 72, 42, 127.



Quantification

Plasma **HPLC** Column: SymmetryShield RP8 (150 × 2.1 mm i.d., 3.5 µm). Mobile phase: 10 mmol/L ammonium formate and 0.1% formic acid : acetonitrile (70 : 30 to 0 : 100 at 15 min), flow rate 0.2 mL/min. UV detection (λ = 250 nm). Limit of detection, 0.052 mg/L [Marumo *et al.* 2005]. Column: Spherisorb C_8 reversed phase. Mobile phase: acetonitrile : methanol : buffer (60 : 15 : 25). Limit of quantification, 10 µg/L, limit of detection, 2 mg/L [Mou *et al.* 1997]. Column: Octyl (150 × 4.6 mm i.d.). Mobile phase: acetonitrile : phosphoric acid : diethylamine (70 : 0.08 : 0.08, pH 2.3). Electrochemical detection. Limit of detection, 10 µg/L [Sridhar *et al.* 1994]. Electrochemical detection. [McKay *et al.* 1982]. Column:

Spherisorb (15 cm × 4.6 mm i.d., 5 µm). Mobile phase: 0.1 mol/L aqueous dipotassium hydrogen phosphate (pH 6.5) : acetonitrile : methanol (7 : 6 : 4). Electrochemical detection. Limit of detection, ≈200 ng/L [Sankey *et al.* 1982].

LC-MS Column: Thermo Hypersil-Hypurity C_{18} (150 × 2.1 mm i.d., 5 µm). Mobile phase: 10 mmol/L ammonium acetate (pH 3.6) : methanol : acetonitrile (27 : 68 : 5), flow rate 0.22 mL/min. ESI, MSD, SIM acquisition mode. Limit of quantification, 0.2 µg/L [Yan *et al.* 2009].

Note For a radioimmunoassay in plasma see Midha *et al.* [1983] and for a spectrofluorometric method see Tompsett [1968].

***Serum* HPLC** Column: Inersil ODS-SP C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol : 30 mmol/L sodium dihydrogen phosphate (pH 5.6, 300 : 200 : 500), flow rate 0.9 mL/min. UV detection (λ = 250 nm). Retention time: 43.2 min. Limit of quantification, 4.9 µg/L [Tanaka *et al.* 2007].

***Urine* HPLC** Column: LiChrosorb C_8 (150 × 4.6 mm i.d.). Mobile phase: acetonitrile : water : acetic acid : triethylamine (40 : 40 : 20 : 2), flow rate 0.5 mL/min. UV detection (λ = 250 nm). Limit of quantification, 190.2 µg/L, limit of detection, 57.1 µg/L [Cruz-Vera *et al.* 2009]. See Plasma. Limit of detection, 0.025 mg/L [Marumo *et al.* 2005].

Disposition in the Body Absorbed after oral administration but extensively metabolised.

Therapeutic Concentration

After a single oral dose of 12.5 mg to 1 subject, a peak plasma concentration of about 0.0008 mg/L was attained in 6 h [Sankey *et al.* 1982].

High plasma levels of prochlorperazine (>600 µg/L) were sustained for up to 24 h in patients treated with 135 mg/m^2 by IV infusion given over 2 h, as a doxorubicin-efflux blocker [Sridhar *et al.* 1994].

Toxicity Serum concentrations of 1.2–1.6 mg/L were found in 4 cases of non-fatal overdose [Tompsett 1968].

Dose Usually 15 to 30 mg of prochlorperazine maleate daily, as an antiemetic; 50 to 100 mg daily for the treatment of psychoses.

Procyclidine

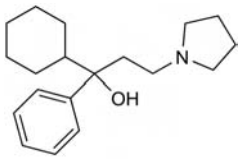
Anticholinergic

$C_{19}H_{29}NO$ = 287.4

CAS—77-37-2

IUPAC Name 1-Cyclohexyl-1-phenyl-3-pyrrolidin-1-ylpropan-1-ol

Synonym α-Cyclohexyl-α-phenyl-1-pyrrolidinepropanol



Chemical Properties Crystals. Mp 85.5° to 86.5° (crystals from petroleum ether). Log *P* (octanol/water), 4.8. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Procyclidine Hydrochloride

$C_{19}H_{29}NO,HCl$ = 323.9

CAS—1508-76-5

Proprietary Names *Arpicolin*; *Kemadren*; *Kemadrin*; *Muscinil*; *Osnervan*; *Procyclid*.

Chemical Properties A white crystalline powder. Mp 226° to 227° (crystals from ethanol and ethyl acetate), with decomposition. Soluble 1 in about 40 of water, 1 in 15 of ethanol and 1 in 6 of chloroform; very slightly soluble in ether.

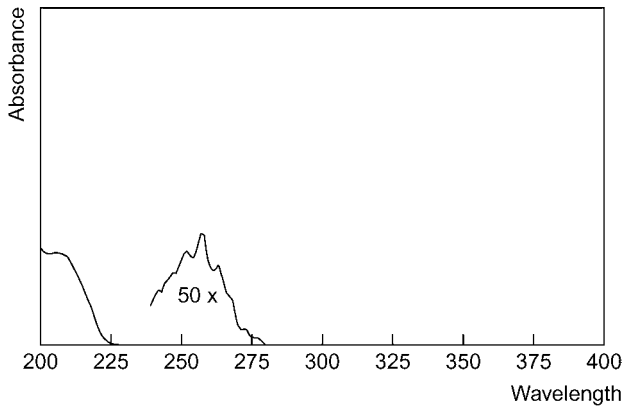
Colour Tests Mandelin's test—black; Marquis test—violet; sulfuric acid—yellow.

Thin-layer Chromatography System TA—R_f 0.48; system TB—R_f 0.62; system TC—R_f 0.31; system TE—R_f 0.74; system TL—R_f 0.23; system TAE—R_f 0.20; system TAF—R_f 0.68; system TAJ—R_f 0.00; system TAK—R_f 0.00; system TAL—R_f 0.36 (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, violet-brown).

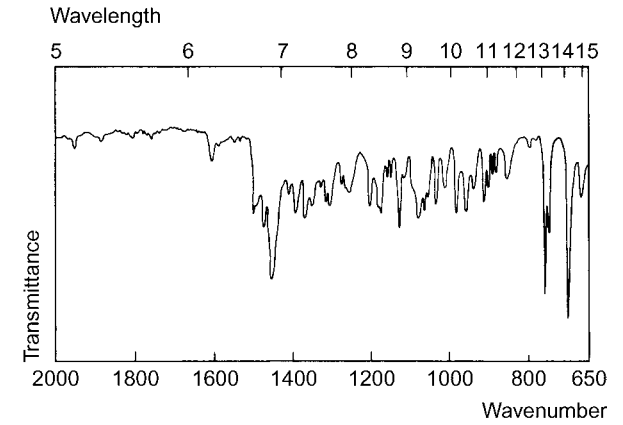
Gas Chromatography System GA—procyclidine RI 2156, M (oxo-)-H_2O RI 2490; system GB—procyclidine RI 2261, M (OH-isomer-1) RI 2487, M (OH-isomer-2) RI 2517, M (oxo-)-H_2O RI 2669; system GF—RI 2485.

High Performance Liquid Chromatography System HA—*k* 2.0; system HX—RI 406; system HZ—RT 6.2 min; system HAX—not eluted after 20 min; system HAY—RT 4.7 min.

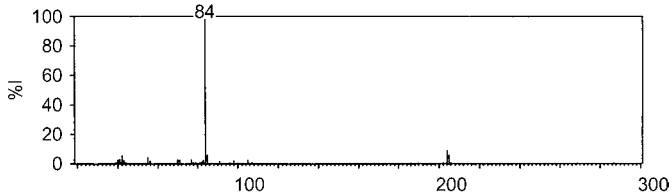
Ultraviolet Spectrum Aqueous acid—251, 257 (A_1^1 = 6.9a), 263 nm.



Infrared Spectrum Principal peaks at wavenumbers 700, 756, 746, 1128, 1075, 1175 cm^{-1} (procyclidine hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 84, 204, 205, 85, 42, 55, 105, 77.



Quantification

***Blood* GC** AFID. Limit of detection, 100 µg/L [Missen *et al.* 1978].

***Plasma* GC** AFID. Limit of detection 20 µg/L [Dean *et al.* 1980].

***Urine* GC** See Plasma [Dean *et al.* 1980].

***Biological Fluids* GC** Flame thermionic detection. Limit of detection, 50–100 ng/L for procyclidine, cycrimine and trihexyphenidyl [Owen *et al.* 1989].

Disposition in the Body Absorbed after oral administration. It rapidly disappears from the tissues. Metabolised by hydroxylation of the benzyl or cyclohexyl rings and then conjugated with glucuronic acid.

Therapeutic Concentration

Following a single oral dose of 10 mg to 6 subjects, a mean peak plasma concentration of 0.12 mg/L was reported; in 5 of the subjects the peak concentrations were attained in about 1 h, whereas in the sixth subject the time to peak concentration was 8 h [Whiteman *et al.* 1985].

In 6 patients undergoing therapy with daily oral doses of 10–30 mg, mean steady-state blood concentrations of 0.15–0.63 mg/L were reported [Missen *et al.* 1978].

Toxicity

In 2 fatalities involving procyclidine, postmortem tissue concentrations were: blood 4 and 4.4 mg/L, liver 15 and 11 μg/g, urine 7 and 1.8 mg/L; in the second case benzatropine and chlorpromazine were also detected [Ashton 1980].

Bioavailability About 75%.

Half-life Plasma half-life, 8–16 h (mean 12).

Volume of Distribution About 1 L/kg.

Clearance Plasma clearance, ≈1 mL/min/kg.

Dose 7.5 to 30 mg of procyclidine hydrochloride daily; up to 60 mg daily has been given.

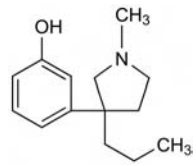
Profadol

Narcotic Analgesic

$C_{14}H_{21}NO$ = 219.3

CAS—428-37-5

IUPAC Name 3-(1-Methyl-3-propylpyrrolidin-3-yl)phenol



Profadol Hydrochloride

$C_{14}H_{21}NO,HCl$ = 255.8

CAS—2324-94-9

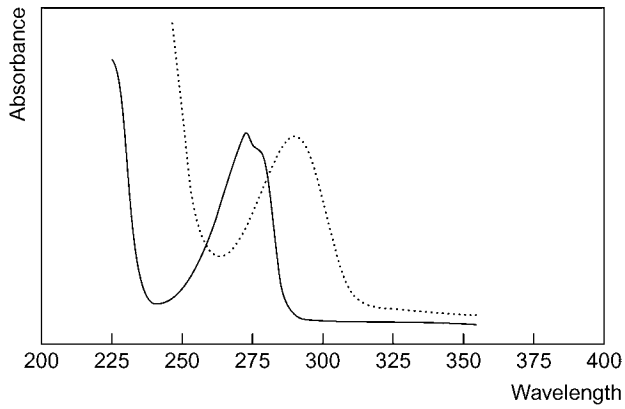
Chemical Properties A white solid. Mp 145° to 146°. Soluble in water and chloroform.

Colour Tests Folin–Ciocalteu reagent—blue; Liebermann's reagent—black; Mandelin's test—blue-green→green; Marquis test—orange→red-brown.

Thin-layer Chromatography System TA—R_f 0.42; system TB—R_f 0.08; system TC—R_f 0.06; system TL—R_f 0.08. (Acidified iodoplatinate solution, positive.)

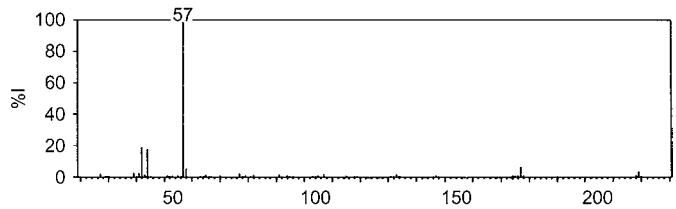
Gas Chromatography System GA—RI 1748.

Ultraviolet Spectrum Aqueous acid—272 nm (A_1^1=87b); aqueous alkali—237, 290 nm.



Infrared Spectrum Principal peaks at wavenumbers 1575, 1590, 1234, 752, 702, 1267 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 57, 42, 44, 177, 58, 219, 133, 107.



Profenamine

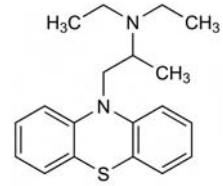
Anticholinergic

$C_{19}H_{24}N_2S$ = 312.5

CAS—522-00-9

IUPAC Name *N*,*N*-Diethyl-1-phenothiazin-10-ylpropan-2-amine

Synonyms *N*,*N*-Diethyl-α-methyl-10*H*-phenothiazine-10-ethanamine; ethopropazine; isothazine; phenopropazine.



Chemical Properties Crystals. Mp 53° to 55°. pK_a 9.6 (20°). Log *P* (octanol/water), 4.8.

Profenamine Hibenzate

$C_{19}H_{24}N_2S,C_{14}H_{10}O_4$ = 554.7

Synonym Profenamine hybenzate

Chemical Properties A white crystalline powder. Mp about 188°, with decomposition. Practically insoluble in water; slightly soluble in methanol.

Profenamine Hydrochloride

$C_{19}H_{24}N_2S,HCl$ = 348.9

CAS—1094-08-2

Synonyms Profenamini hydrochloridum; prophenamini chloridum.

Proprietary Name *Parsitan*

Chemical Properties A white crystalline powder, which darkens in colour on exposure to light. Mp 223° to 225°, with some decomposition. Soluble 1 in 400 of water at 20° and 1 in 20 at 40°, 1 in 35 of ethanol and 1 in 7 of chloroform; sparingly soluble in acetone; practically insoluble in ether and benzene.

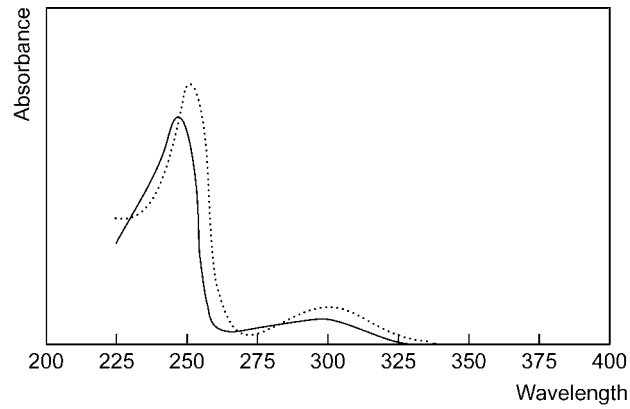
Colour Tests Formaldehyde-sulfuric acid—red-violet; Forrest reagent—pink; FPN reagent—orange→yellow; Liebermann's reagent—red-brown; Mandelin's test—green→violet; Marquis test—violet.

Thin-layer Chromatography System TA—R_f 0.67; system TB—R_f 0.64; system TC—R_f 0.47; system TE—R_f 0.83; system TL—R_f 0.66; system TAE—R_f 0.31; system TAF—R_f 0.55; system TAJ—R_f 0.22; system TAK—R_f 0.10; system TAL—R_f 0.57. (Dragendorff spray, positive; FPN reagent, pink; acidified iodoplatinate solution, positive; Marquis reagent, orange; ninhydrin spray, positive.)

Gas Chromatography System GA—profenamine RI 2340, M (bis-desethyl-)-AC RI 2450, M (bis-desethyl-OH-)-AC_2 RI 2900, M (desethyl-)-AC RI 2515, M (desethyl-OH-)-AC_2 RI 2880; system GF—RI 2775.

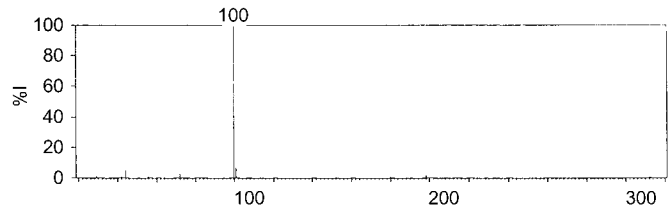
High Performance Liquid Chromatography System HA—*k* 2.4; system HX—RI 444; system HY—RI 338; system HAX—retention time 16.6 min; system HAY—retention time 8.3 min.

Ultraviolet Spectrum Aqueous acid—250 (A_1^1=881a), 299 nm; aqueous alkali—253, 302 nm.



Infrared Spectrum Principal peaks at wavenumbers 748, 1248, 1590, 1282, 1568, 1125 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 100, 101, 44, 72, 198, 180, 42, 29.

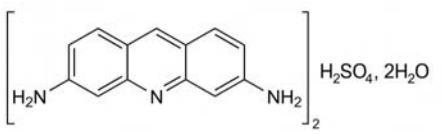


Dose 50 to 500 mg of profenamine hydrochloride daily.

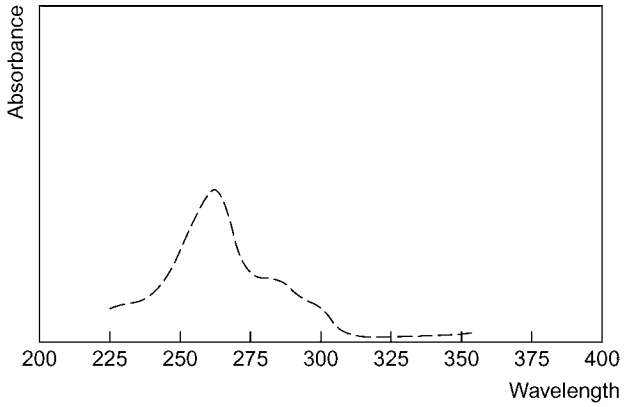
Proflavine Hemisulfate

Disinfectant, Antiseptic (Topical)
$(C_{13}H_{11}N_3)_2,H_2SO_4,2H_2O = 552.6$
CAS—92-62-6 (proflavine); 553-30-0 (sulfate, anhydrous)

IUPAC Name (6-Aminoacridin-3-yl)azanium sulfate
Synonyms Neutral proflavine sulfate; proflavine hemisulfate.



Chemical Properties An orange to red, hygroscopic, crystalline powder. Soluble 1 in 300 of water, 1 in 1 of boiling water, and 1 in 35 of glycerol; very slightly soluble in ethanol; practically insoluble in chloroform and ether. A saturated solution in water is deep orange in colour and gives a green fluorescence when freely diluted. Proflavine: pK_a 8.1 (20°). Proflavine: Log *P* (octanol/water), 1.8.
Colour Tests Mandelin's test—green; Marquis test—yellow→orange.
Thin-layer Chromatography System TA—R_f 0.16.
Ultraviolet Spectrum Ethanol—261 nm (A^1_1 = 1091b).

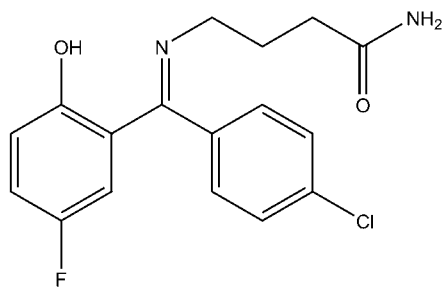


Infrared Spectrum Principal peaks at wavenumbers 1605, 1625, 1125, 1160, 1218, 1263 cm^{-1} (KBr disk).

Progabide

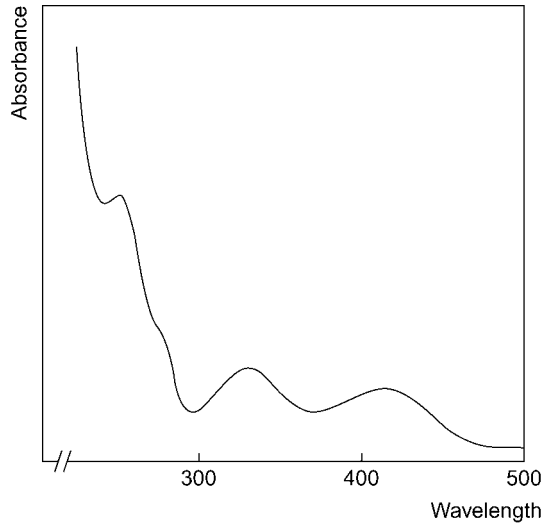
Anticonvulsant, GABA Analogue, GABA Receptor Agonist
$C_{17}H_{16}ClFN_2O_2 = 334.8$
CAS—62666-20-0

IUPAC Name 4-[[(*Z*)-(4-chlorophenyl)-(3-fluoro-6-oxo-1-cyclohexa-2,4-dienylidene)methyl]amino]butanamide
Synonyms 4-(4′-Chloro-5-fluoro-2-hydroxybenzhydrylideneamino)butyramide; 4-[[α-(*p*-chlorophenyl)-5-fluoro-2-hydroxybenzylidene]amino]butyramide; 4-[[(4-chlorophenyl)(5-fluoro-2-hydroxyphenyl)methylene]amino]butanamide; 4-[[α-(*p*-chlorophenyl)-5-fluorosalicylidene]amino]butyramide; halogabide; SL-76.002.
Proprietary Name *Gabrene*

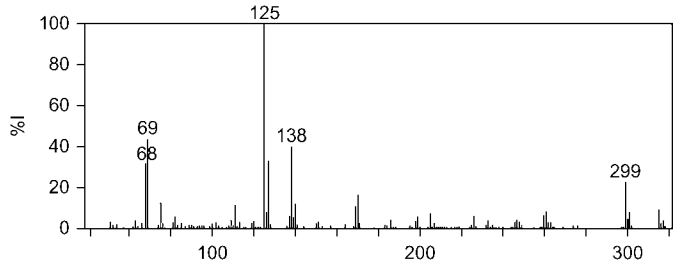


Chemical Properties Crystals. Mp 133° to 135°. Soluble in water (70.9 mg/L), increased solubility with decreasing pH. Log *P* (octanol/water), 3.09. Stable in solutions at pH 6 to 7 [Farraj *et al.* 1988].
High Performance Liquid Chromatography Column: Spherisorb ODS1 (247 × 4.5 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol : McIlvaine buffer (pH 5.25; 35 : 30 : 35), flow rate 1.7 mL/min. UV detection (λ = 255 nm). Retention time: progabide, 3.7 min; progabide acid, 2.6 min [Farraj *et al.* 1987].

Ultraviolet Spectrum Methanol—332, 250, 210 nm [Farraj *et al* 1987].



Mass Spectrum Principal ions at *m/z* 125, 69, 138, 511, 68, 458 [Gillet *et al* 1982].



Quantification

Plasma **HPLC** Column: Nucleosil C_{18} (300 × 4.6 mm i.d., 5 µm). Mobile phase: phosphate buffer (9.0 g potassium dihydrogen phosphate and 0.14 g disodium hydrogenphosphate heptahydrate in 1 L water, pH 5.05) : methanol : acetonitrile : 0.15 mol/L sodium chloride (36 : 27 : 27 : 10), flow rate 2.5 mL/min. UV detection (λ = 340 nm). Retention time: progabide, 7.9 min; progabide acid (PGA), 6.9 min. Limit of detection, progabide 20 µg/L, PGA 8 µg/L [Decourt *et al.* 1990]. Column: Spherisorb ODS1 (247 × 4.5 mm i.d., 5 µm). Mobile phase: acetonitrile : methanol : McIlvaine buffer (pH 5.25; 35 : 30 : 35), flow rate 1.4 mL/min. UV detection (λ = 255 nm). Retention time: progabide 5.4 min, PGA 4.2 min. Limit of quantification, progabide 30 µg/L, PGA 100 µg/L [Farraj *et al.* 1987].

GC-MS Column: Gas-Chrom Q 3% V-17 (2 m × 2 mm i.d.). Carrier gas: N_2, 40 mL/min. Temperature: 230°. ECD. Limit of detection, 1 µg/L [Gillet *et al.* 1982].

Urine **GC-MS** Column: Gas-Chrom Q 3% V-17 (2 m × 2 mm i.d.). Carrier gas: N_2, 40 mL/min. Temperature: at 230°. ECD. Limit of detection not reported [Gillet *et al.* 1982].

Disposition in the Body Progabide is a GABA analogue pro-drug. Progabide is absorbed after oral administration with peak plasma levels reached after 2 to 3 h. The plasma half-life is 10 to 12 h and the compound is mostly metabolised, with only trace amounts being found in the urine. It is transformed by deamidation to its acid form PGA ([α-(chloro-4′-phenyl)-fluoro-5-hydroxy-2-benzylidene-amino]-4-butonate sodium; SL 75102) or can be cleaved at the imine link to yield the carrier moiety and GABAmide, which is further metabolised to GABA. PGA also undergoes the same metabolic transformation to GABA. The metabolites and GABA appear in the CNS and peripherally a few minutes after administration. Steady-state plasma levels are achieved in 2 to 4 days [Bergmann 1985].

Therapeutic Concentration A single 300 mg oral dose will result in a mean maximum plasma concentration of 1350 µg/L at ~2 h. The maximum allowable doses in the USA were 45 mg/kg/day in FDA-approved clinical trials [Bergmann 1985].

Twenty therapy-resistant epileptic patients were enrolled in a double-blind trial. Daily oral doses of progabide ranging from 19.3 to 36 mg/kg resulted in plasma concentrations ranging from <50 to 1476 µg/L [Martinez-Lage *et al.* 1984].

Fifty-two adult epileptic outpatients were administered daily doses of 30 to 45 mg/kg progabide in addition to other therapy and were monitored over a period of 6 to 12 months. Differences were observed in therapeutic effect between patients. Subgroup A (14; the responders) showed a persistent therapeutic response with a reduction in seizure frequency consistently >50%, which was associated with blood concentrations of progabide and

PGA of 689 and 1012 µg/L, respectively. Subgroup B (21; the non-responders) had a reduction in seizure frequency of <50%, which was associated with blood concentrations of progabide and PGA of 256 and 633 µg/L, respectively. Subgroup C (17; the fluctuant responders) showed varying degrees of reduction in seizure frequency over the period. For this subgroup, a satisfactory response was associated with progabide and PGA blood concentrations of 718 and 1266 µg/L, while lack of therapeutic efficacy was associated with concentrations of 748 µg/L for PGA and 432 µg/L for progabide [Benassi *et al.* 1988].

Four groups of 6 healthy volunteers were administered oral doses of valproic acid (500 mg, group 1), phenytoin (100 mg, group 2), carbamazepine (400 mg, group 3), or phenobarbital (100 mg, group 4) on day 1 of the study. From day 5 to 19, progabide was administered at a dosage of 600 mg three times daily. Blood concentrations of progabide and PGA were measured at days 13, 15 and 17, and were found to be steady within the groups but differed considerably among the 4 groups (290 to 736 µg/L for progabide, 748 to 1641 µg/L for PGA) [Bianchetti *et al.* 1987].

Toxicity Liver disorders, indicated by elevation of liver enzyme values, have been reported to occur in ~9% of patients receiving progabide, usually in the first few months of treatment, and have progressed to jaundice, hepatitis, encephalopathy and death in some patients.

Half-life Approximately 10 to 12 h.

Protein Binding Progabide 98.5%, PGA 99.8%; mainly to serum albumin [Hamberger *et al.* 1987].

Dose In the range 15 to 60 mg/kg/day.

Progesterone

Progestational Steroid

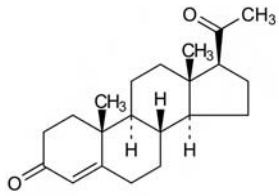
$C_{21}H_{30}O_2$ = 314.5

CAS—57-83-0

IUPAC Name (8*S*,9*S*,10*R*,13*S*,14*S*,17*S*)-17-Acetyl-10,13-dimethyl-1,2,6,7,8,9,11,12,14,15,16,17-dodecahydrocyclopenta[a]phenanthren-3-one

Synonyms Corpus luteum hormone; luteal hormone; luteine; pregn-4-ene-3,20-dione; pregnenedione; progestin.

Proprietary Names *Crinone*; *Cutifitol*; *Cyclogest*; *Esolut*; *Estima*; *Evapause*; *Gesterol*; *Gestone*; *Lugesteron*; *Progeffik*; *Progenar*; *Progestan*; *Progestasert*; *Progestilin*; *Progestogel*; *Progestol*; *Progestosol*; *Prolidon*; *Proluton*; *Prometrium*; *Prontogest*; *Utrogest*; *Utrogestan*.



Chemical Properties Colourless crystals or a white or slightly yellowish-white crystalline powder. There are two forms, one known as the α-form melts at 127° to 131° and the other, known as β-progesterone, at about 121°. Practically insoluble in water; soluble 1 in 8 of ethanol, 1 in less than 1 of chloroform and 1 in 16 of ether. Log *P* (octanol/water), 3.9.

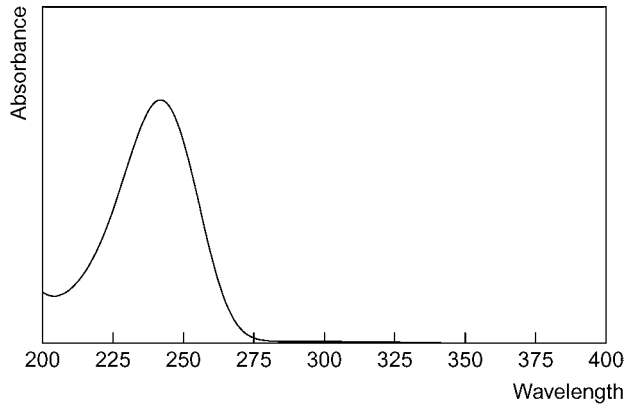
Colour Tests Naphthol-sulfuric acid—brown/yellow; sulfuric acid—yellow (green fluorescence under UV light).

Thin-layer Chromatography System TB—R_f 0.36; system TE—R_f 0.79; system TF—R_f 0.56; system TP—R_f 0.81; system TQ—R_f 0.20; system TR—R_f 0.99; system TS—R_f 0.95; system TAE—R_f 0.83; system TAF—R_f 0.89; system TAJ—R_f 0.76; system TAK—R_f 0.68; system TAL—R_f 0.95; system TAM—R_f 0.97.

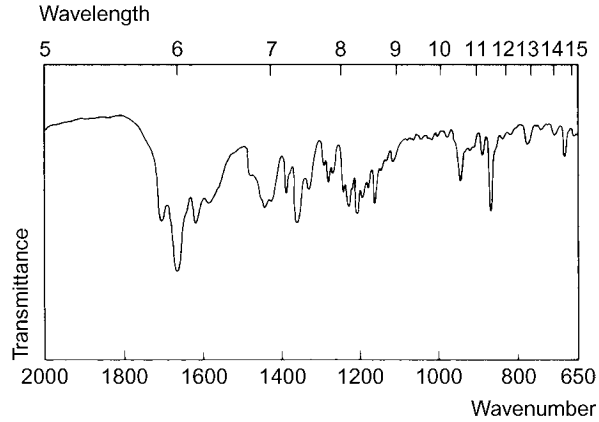
Gas Chromatography System GA—RI 2793.

High Performance Liquid Chromatography System HX—RI 672; system HY—RI 698; system HAA—retention time 23.8 min.

Ultraviolet Spectrum Dehydrated alcohol—240 nm (A^1_1=540a).



Infrared Spectrum Principal peaks at wavenumbers 1662, 1614, 1700, 872, 1209, 1232 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 124, 43, 314, 79, 91, 229, 272, 105.

Dose Up to 50 mg daily by IM injection.

Proguanil

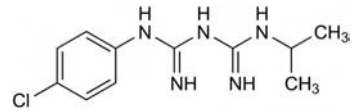
Antimalarial

$C_{11}H_{16}ClN_5$ = 253.7

CAS—500-92-5

IUPAC Name (1*E*)-1-[Amino-(4-chloroanilino)methylidene]-2-propan-2-yl-guanidine

Synonyms Chloriguane; chlorguanide; chloroguanide; *N*-(4-chlorophenyl)-*N*′-(1-methylethyl)imidodicarbonimidic diamide; proguanide.



Chemical Properties Colourless crystals. Mp 129°. pK_a 2.3, 10.4 (22.5°). Log *P* (octanol/water), 2.5.

Proguanil Hydrochloride

$C_{11}H_{16}ClN_5$,HCl = 290.2

CAS—637-32-1

Synonyms Bigumalum; M-4888; RP-3359; SN-12837.

Proprietary Names *Paludrine*. It is an ingredient of *Malarone*.

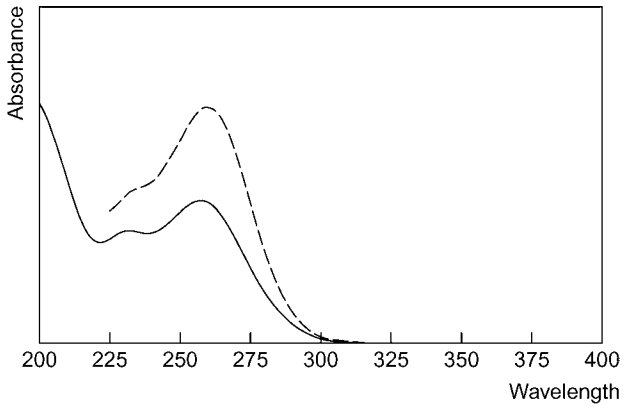
Chemical Properties A white crystalline powder. Mp 243° to 244°. Soluble 1 in 110 of water and 1 in 40 of ethanol; practically insoluble in chloroform and ether.

Colour Test To 10 mL of a saturated solution of proguanil hydrochloride add 1 drop of 10% copper sulfate solution and 2.5 mL of dilute ammonia solution and shake well; add 5 mL of toluene and shake again—toluene layer is violet-red.

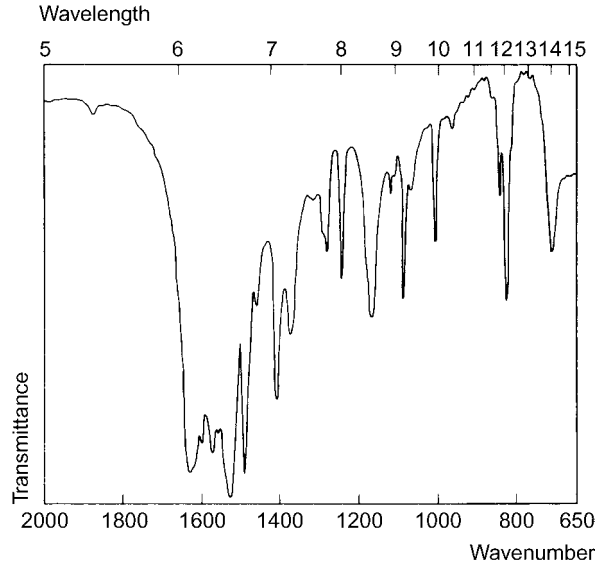
Thin-layer Chromatography System TA—R_f 0.03; system TB—R_f 0.00; system TC—R_f 0.01; system TE—R_f 0.18; system TL—R_f 0.01; system TAE—R_f 0.07; system TAF—R_f 0.79 (acidified iodoplatinate solution, positive).

High Performance Liquid Chromatography System HX—RI 379; system HZ—RT 3.8 min; system HAA—RT 13.6 min.

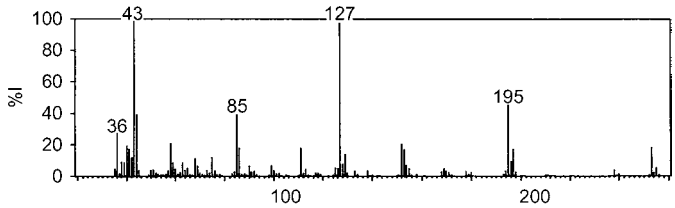
Ultraviolet Spectrum Methanol—259 nm (A^1_1= 886b).



Infrared Spectrum Principal peaks at wavenumbers 1534, 1635, 1492, 1575, 1600, 1170 cm^{-1} (proguanil hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 43, 127, 195, 85, 44, 36, 152, 58.



Quantification

Blood **HPLC** Limit of detection, 50 nmol/L [Bergqvist *et al.* 1998a]. Proguanil, cycloguanil and 4-chlorophenylbiguanide (in blood dried on sampling paper). Limit of detection, 125 nmol/L for proguanil [Bergqvist *et al.* 1998b]. Proguanil, cycloguanil and 4-chlorophenylbiguanide (in blood dried on filter paper). Limit of detection, ≈12 µg/L for proguanil [Kolawole *et al.* 1995].

Plasma **HPLC** Limit of detection, 20 nmol/L [Bergqvist *et al.* 1998a]. Limit of detection, 1 µg/L for proguanil, cycloguanil and 4-chlorophenylbiguanide [Kusaka *et al.* 1996]. Proguanil, cycloguanil and 4-chlorophenylbiguanide. Limit of detection, ≈12 µg/L for proguanil [Kolawole *et al.* 1995]. UV detection. Proguanil, chloroquine and their metabolites. Limit of detection, 9 µg/L for proguanil [Chaulet *et al.* 1994].

Serum **HPLC** UV detection. Limit of detection, 60 µg/L for proguanil, cycloguanil and 4-chlorophenylbiguanide [Moody *et al.* 1980].

Urine **HPLC** For method, see Bergqvist *et al.* [1998a]. Limit of detection, 5 µg/L for proguanil, cycloguanil and 4-chlorophenylbiguanide [Kusaka *et al.* 1996]. UV detection. Proguanil, chloroquine and their metabolites. Limit of detection, 9 µg/L for proguanil [Chaulet *et al.* 1994].

Erythrocytes **HPLC** UV detection. Proguanil, chloroquine and their metabolites. Limit of detection, 9 µg/L for proguanil [Chaulet *et al.* 1994].

Disposition in the Body Readily absorbed after oral administration; peak plasma concentrations are attained in ≈3 h. About 60% of a dose is excreted in the urine unchanged, together with ≈30% as the active metabolite cycloguanil; 4-chlorophenylbiguanide is also a metabolite.

Therapeutic Concentration

Six healthy subjects given proguanil 200 mg daily, orally, for 7 days, co-administered with dapsone (10 mg), had peak plasma concentrations of 151 µg/L 3.5 h after the final dose; the peak plasma concentration of cycloguanil was 55.5 µg/L after 6 h [Edstein *et al.* 1990].

Children given proguanil 100–300 mg daily, orally (mean, 7 mg/kg daily) for 3 days after having received atovaquone (250–750 mg; mean, 17 mg/kg daily) for 3 days, had peak plasma concentrations of 306 µg/L 6 h after the final dose; the peak plasma concentration of cycloguanil was 44.3 µg/L after 6 h [Sabchareon *et al.* 1998].

Protein Binding ≈75%.

Dose 100 to 300 mg of proguanil hydrochloride daily.

Bergqvist Y *et al.* (1998a). Improved validated assay for the determination of proguanil and its metabolites in plasma, whole blood, and urine using solid-phase extraction and high-performance liquid chromatography. *Ther Drug Monit* 20: 325–330.

Proheptazine

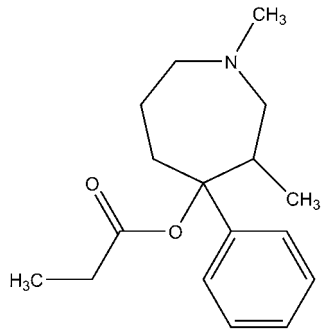
Opiate, Narcotic

$C_{17}H_{25}NO_2$ = 275.4

CAS—77-14-5

IUPAC Name (1,3-Dimethyl-4-phenylazepan-4-yl) propanoate

Synonyms DEA Number 9643; dimepheprimine; DL-α-1,3-dimethyl-4-phenyl-4-propionoxyazacycloheptane; 1,3-dimethyl-4-phenyl-4-propionoxyhexamethylenimine; EINECS 201-006-8; hexahydro-1,3-dimethyl-4-phenyl-1*H*-azepin-4-ol propanoate (ester); 4-phenyl-4-propionoxy-1,3-dimethylazacycloheptane; 4-propionoxy-1,3-dimethyl-4-phenylhexamethylenimine; WY-757.



Chemical Properties Liquid [O'Neil *et al.* 2006]. White crystals. Soluble in dilute acetic acid. Log *P* (octanol/water) 3 [National Institutes of Health 2008].

Proheptazine Hydrobromide

$C_{17}H_{25}NO_2$,HBr = 356.3

Chemical Properties Crystals from acetone and methanol. Soluble 1 to 2% in water at 25° [O'Neil *et al.* 2006].

Proheptazine Hydrochloride

$C_{17}H_{25}NO_2$,HCl = 311.9

Chemical Properties Crystals.

Colour Tests Ammonium molybdate test—blue-grey (limit of detection, 0.25 µg); ammonium vandate test—greyish-purple, fading (limit of detection, 0.25 µg) ; sulfuric acid–formaldehyde—dull orange (limit of detection, 0.25 µg).

Thin-layer Chromatography System T1—R_f 0.40 (location reagent acidified iodoplatinate spray, positive reaction).

Gas Chromatography System G2/225—retention time 0.48 relative to diphenhydramine; system G4—retention time 0.46 relative to diphenhydramine.

National Institutes of Health (2008). *Proheptazine*. http://pubchem.ncbi.nlm.nih.gov/summary/summary.cgi?cid=60969&loc=ec_rcs. (accessed 30 June 2008).

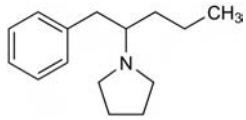
Prolintane

CNS Stimulant
$C_{15}H_{23}N$ = 217.4
CAS—493-92-5

IUPAC Name 1-(1-Phenylpentan-2-yl)pyrrolidine
Synonym 1-[1-(Phenylmethyl)butyl]pyrrolidine

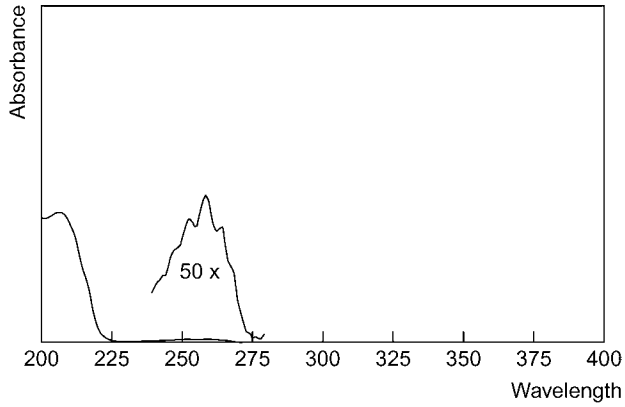


Chemical Properties Log *P* (octanol/water), 4.3.

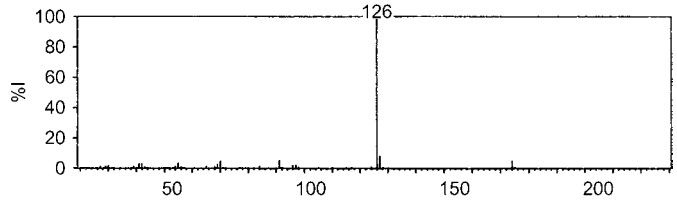
Prolintane Hydrochloride

$C_{15}H_{23}N,HCl$ = 253.8
CAS—1211-28-5
Proprietary Names *Catorid*; *Catovit N*; *Promotil*. It is an ingredient of *Katovit* and *Villescon*.
Chemical Properties A white powder. Mp about 133° to 134°. Soluble in water, ethanol and chloroform; practically insoluble in ether.

Colour Tests Liebermann's reagent—red-orange; Mandelin's test—red; Marquis test—orange→brown.
Thin-layer Chromatography System TA—R_f 0.50; system TB—R_f 0.67; system TC—R_f 0.32; system TE—R_f 0.79; system TL—R_f 0.25; system TAE—R_f 0.22 (Dragendorff spray, positive; acidified iodoplatinate solution, positive; Marquis reagent, orange-brown; acidified potassium permanganate solution, positive).
Gas Chromatography System GA—prolintane RI 1634; M (oxo-) RI 1895;M (OH-phenyl-) RI 2135, M (OH-phenyl-)-AC RI 2110, M (OH-methoxy-phenyl-)-AC RI 2115; M (oxo-OH-alkyl-) RI 2200, M (oxo-OH-alkyl-)-AC RI 2255; M (oxo-OH-methoxy-phenyl-) RI 2240, M (oxo-OH-methoxy-phenyl-)-AC RI 2360; M (oxo-di-OH-)-AC_2 RI 2485, M (oxo-di-OH-phenyl-) RI 2475, M (oxo-di-OH-phenyl-)-AC_2 RI 2450, M (oxo-OH-phenyl-)-AC RI 2275, M (oxo-di-OH-methoxy-)-AC_2 RI 2560, M (di-OH-phenyl-)-AC_2 RI 2295, M (tri-OH-)-AC_3 RI 2630, system GB—prolintane RI 1660; system GC—prolintane RI 1849.
High Performance Liquid Chromatography System HA—*k* 2.0; system HC—*k* 1.3; system HX—RI 370.
Ultraviolet Spectrum Aqueous acid—252, 258 (A_1^1=8.6a), 264 nm.



Infrared Spectrum Principal peaks at wavenumbers 776, 714, 752, 1501, 1141, 1020 cm^{-1} (prolintane hydrochloride, KBr disk).
Mass Spectrum Principal ions at *m/z* 126, 127, 174, 91, 70, 69, 55, 42.

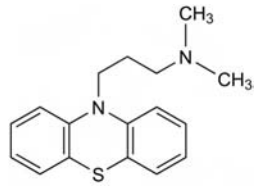


Dose 20 mg of prolintane hydrochloride daily.

Promazine

Tranquilliser
$C_{17}H_{20}N_2S$ = 284.4
CAS—58-40-2

IUPAC Name *N*,*N*-Dimethyl-3-phenothiazin-10-ylpropan-1-amine
Synonyms A-145; *N*,*N*-dimethyl-10*H*-phenothiazine-10-propanamine; RP-3276; Wy-1094.



Chemical Properties An oily liquid. pK_a 9.4 (25°). Log *P* (octanol/pH 7.4), 2.5. Extraction yield (promazine), 1 [Demme *et al.* 2005].

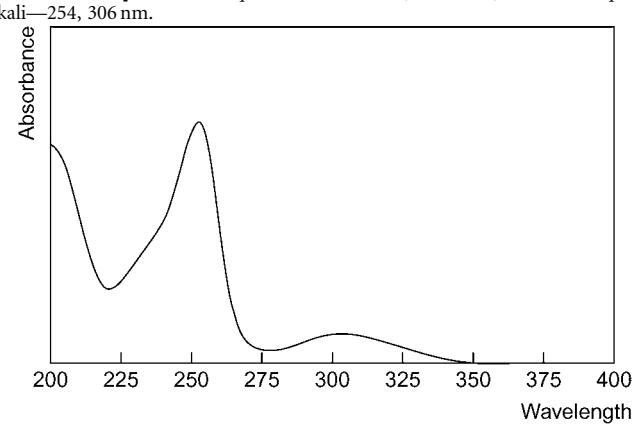
Promazine Embonate

$(C_{17}H_{20}N_2S)_2,C_{23}H_{16}O_6$ = 957.2
Synonym Promazine pamoate
Proprietary Names *Protactyl (suspension)*; *Sparine (suspension)*.

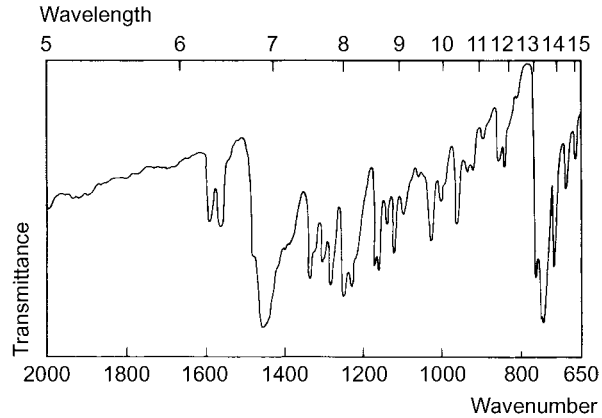
Promazine Hydrochloride

$C_{17}H_{20}N_2S,HCl$ = 320.9
CAS—53-60-1
Synonym Propazinum
Proprietary Names *Liranol*; *Prazine*; *Promabec*; *Promanyl*; *Promwill*; *Protactyl (injection and tablets)*; *Sparine (injection and tablets)*; *Talofen*.
Chemical Properties A white or slightly yellow, slightly hygroscopic, crystalline powder. It is affected by air and light and traces of heavy metals. Decomposed solutions may be coloured pink, red or blue. Mp 181°, with decomposition. Soluble 1 in 3 of water, 1 in 2 of ethanol and 1 in 2 of chloroform; soluble in methanol; practically insoluble in ether and benzene.

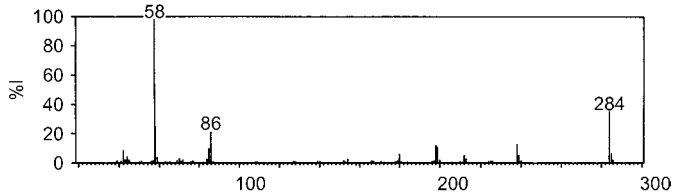
Colour Tests Formaldehyde-sulfuric acid—red; Forrest reagent—red-brown; FPN reagent—red-brown; Liebermann's reagent—green-brown; Mandelin's test—green→violet; Marquis test—violet.
Thin-layer Chromatography System TA—R_f 0.44; system TB—R_f 0.38; system TC—R_f 0.30; system TE—R_f 0.62; system TL—R_f 0.11; system TAE—R_f 0.18; system TAF—R_f 0.35; system TAJ—R_f 0.06; system TAK—R_f 0.02; system TAL—R_f 0.41. (Dragendorff spray, positive; FPN reagent, pink; acidified iodoplatinate solution, positive; Marquis reagent, red; ninhydrin spray, positive.)
Gas Chromatography System GA—Promazine RI 2315, M (nor-) RI 2405, M (sulfoxide) RI 2705, M (phenothiazine) RI 2120, M (OH-) RI 2685; system GB—promazine RI 2425, M (nor-) RI 2452, M (sulfoxide) RI 2840, M (norsulfoxide) RI 2875, M (phenothiazine) RI 2130, M (OH-) RI 2781, M (nor-OH-) RI 2797; system GF—RI 2745.
High Performance Liquid Chromatography System HA—*k* 5.9; system HX—RI 407; system HY—RI 326; system HZ—retention time 5.9 min.
Ultraviolet Spectrum Aqueous acid—251 (A_1^1=1055a), 302 nm; aqueous alkali—254, 306 nm.



Infrared Spectrum Principal peaks at wavenumbers 751, 1250, 1234, 1287, 770, 1162 cm^{-1} (promazine hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 58, 284, 86, 238, 198, 199, 85, 42.



Quantification

Blood **GC** SID. Limit of detection, 250 to 500 ng/L for promazine and other phenothiazines [Hattori *et al.* 1992].

Plasma **HPLC** Electrochemical detection. For method, see Larsimont *et al.* [1998].

Urine **GC** SID. Limit of detection, 250 to 500 ng/L for promazine and other phenothiazines [Hattori *et al.* 1992].

Dose Usually up to 400 mg of promazine hydrochloride daily; maximum of 1 g daily.

Demme U *et al.* (2005). Systematic evaluation of 1-chlorobutane for liquid-liquid extraction of drugs. *Proceedings of the 12th TIAFT*, Seoul: 481–486.

Hattori H *et al.* (1992). Sensitive determination of phenothiazines in body fluids by gas chromatography with surface ionization detection. *J Chromatogr* 579(2): 247–252.

Larsimont V *et al.* (1998). Validated high-performance liquid chromatographic assay for the determination of promazine in human plasma. Application to pharmacokinetic studies. *J Chromatogr B Biomed Sci Appl* 719: 222–226.

Promethazine

Antihistamine

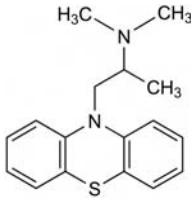
$C_{17}H_{20}N_2S$ = 284.4

CAS—60-87-7

IUPAC Name *N*,*N*-Dimethyl-1-phenothiazin-10-ylpropan-2-amine

Synonym *N*,*N*,α-Trimethyl-10*H*-phenothiazine-10-ethanamine

Proprietary Names *Fenergan Creme*; *Phenergan*.



Chemical Properties A crystalline solid. Mp 60°. pK_a 9.1 (25°). Log *P* (octanol/pH 7.4), 2.9. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Promethazine Hydrochloride

$C_{17}H_{20}N_2S,HCl$ = 320.9

CAS—58-33-3

Synonyms Diprazinum; proazamine chloride; promethazini hydrochloridum; promethazinium chloride.

Proprietary Names *Anergan*; *Atosil*; *Fenergan*; *Histantil*; *Insomn-Eze*; *Pamergan*; *Phenergan*; *Phenhalal*; *Prothiazine*; *Q-Mazine*; *Sominex*; *Ziz*. It is an ingredient of *Medised*, *Mepergan*, *Night Nurse*, *Pamergan P100*, *Phensedyl Plus*and *Tixylix Night-Time*.

Chemical Properties A white or faintly yellow, crystalline powder, which is slowly oxidised on prolonged exposure to air, becoming blue in colour. Mp 230° to 232° (crystals from ethylene dichloride), with some decomposition. Soluble 1 in 0.6 of water, 1 in 9 of ethanol and 1 in 2 of chloroform; practically insoluble in acetone, ether and ethyl acetate.

Promethazine Teoclate

$C_{17}H_{20}N_2S,C_7H_7ClN_4O_2$ = 499.0

CAS—17693-51-5

Synonyms Promethazine chlorotheophyllinate; promethazine theoclate.

Proprietary Names *Avomine*.

Chemical Properties A white powder. Very slightly soluble in water; soluble 1 in 70 of ethanol and 1 in 2.5 of chloroform; practically insoluble in ether.

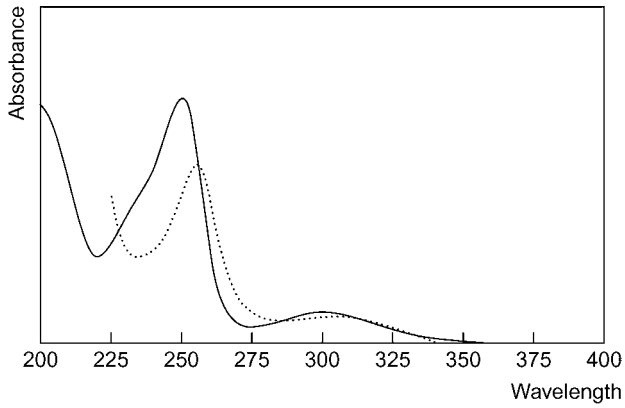
Colour Tests Formaldehyde-sulfuric acid—blue–violet; Forrest reagent—red; FPN reagent—orange; Mandelin's test—green→violet; Marquis test—violet.

Thin-layer Chromatography System TA—R_f 0.50; system TB—R_f 0.36; system TC—R_f 0.35; system TE—R_f 0.65; system TL—R_f 0.17; system TAE—R_f 0.30; system TAF—R_f 0.44. (Dragendorff spray, positive; FPN reagent, positive; acidified iodoplatinate solution, positive; Marquis reagent, violet; ninhydrin spray, positive.)

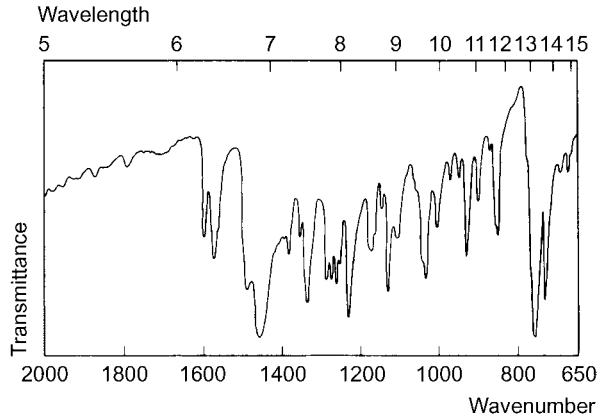
Gas Chromatography System GA—promethazine RI 2259, M (nor-) RI 2250, M (phenothiazine) RI 2020, M (sulfoxide) RI 2710, M (nor-OH-) RI 2580, M (OH-) RI 2590; system GB—promethazine RI 2383, M (nor-) RI 2333, M (phenothiazine) RI 2120, M (sulfoxide) RI 2797, M (norsulfoxide) RI 2732, M (nor-OH-) RI 2717; system GC—RI 2546; system GF—RI 2675.

High Performance Liquid Chromatography System HA—*k* 5.0; system HX—RI 409; system HY—RI 324; system HZ—retention time 5.7 min; system HAA—retention time 14.5 min; system HAX—retention time 13.2 min; system HAY—retention time 6.4 min.

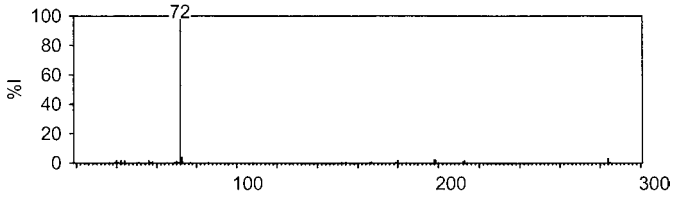
Ultraviolet Spectrum Aqueous acid—249 (A_1^1=1032a), 298 nm; aqueous alkali—254, 305 nm.



Infrared Spectrum Principal peaks at wavenumbers 758, 1229, 733, 1129, 1259, 1287 cm^{-1} (promethazine hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 72, 73, 284, 198, 213, 199, 180, 56; *N*-monodesmethylpromethazine (M (nor-))58, 213, 198, 180, 214, 57, 212, 270.



Quantification

Blood **HPLC** UV detection. Promethazine, *N*-monodesmethylpromethazine and promethazine sulfoxide. Limit of detection, 200 ng/L for promethazine [Taylor, Houston 1982].

Plasma **HPLC** UV detection. Promethazine and its metabolites. Limit of detection, 1 µg/L for promethazine [Vanapalli *et al.* 2001]. Electrochemical detection. Limit of detection, 200 ng/L [Wallace *et al.* 1981].

Serum **HPLC** UV detection. Limit of detection, 2 µg/L for promethazine enantiomers [Liu, Stewart 1997]. Coulometric electrochemical detection. Promethazine and other neuroleptics. Limit of detection, 0.1 µg/L for promethazine [Bagli *et al.* 1994]. Electrochemical detection. Limit of quantification, 0.2 µg/L [Fox, McLoughlin 1993]. Electrochemical detection. Limit of detection, 200 ng/L [Wallace *et al.* 1981].

Postmortem Samples **HPLC** UV detection. For method for quantification of promethazine and metabolites, see Allender and Archer [1984].

Disposition in the Body Readily absorbed after oral administration but bioavailability is low because of extensive first-pass metabolism. About 2% of a dose is excreted in the urine unchanged. It is excreted slowly via urine and bile. The major urinary metabolite is the sulfoxide; glucuronic acid conjugation also occurs. *N*-Monodesmethylpromethazine has been detected in plasma and urine. Promethazine crosses the blood–brain and placental barriers and it is excreted in breast milk.

Therapeutic Concentration

Following an oral dose of 25 mg to 10 subjects, a mean peak blood concentration of 0.005 mg/L was attained in 2 h; saliva concentrations averaged 0.008 mg/L consistently from 1 to 6 h after administration. After an IM dose of 25 mg to the same subjects, mean peak concentrations of 0.022 mg/L at 4 h and 0.003 mg/L at 2 h were reported for blood and saliva, respectively [DiGregorio, Ruch 1980].

Following single oral doses of 25 mg to 7 subjects, peak blood concentrations of 0.002 to 0.018 mg/L were attained in 1.5 to 3 h [Taylor *et al.* 1983].

Toxicity The estimated minimum lethal dose is 200 mg/kg.

In 2 fatalities involving the ingestion of promethazine, the following postmortem tissue concentrations were reported (mg/L or μg/g):

	Promethazine	*Promethazine sulfoxide*	*N-Monodesmethyl-promethazine*
Blood	5.2, 2.4	3.1, 0.8	0.8, 1.2
Bile	82.6, 11.6	23.5, 27.0	14.5, 3.0
Liver	30.6, 23.2	8.4, 5.4	6.3, 16.2
Urine	6.0, 14.0	26.0, 42.0	1.0, 3.0

Other drugs were detected in both cases [Allender, Archer 1984].

Half-life Plasma half-life, 10 to 15 h.
Volume of Distribution About 13 L/kg.
Clearance Plasma clearance, about 16 mL/min/kg.
Distribution in Blood Plasma:whole blood ratio, 1.5.
Protein Binding About 75 to 93%.
Dose 20 to 100 mg of promethazine hydrochloride daily.

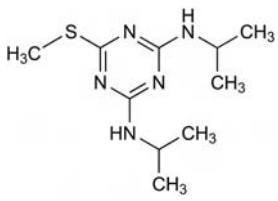
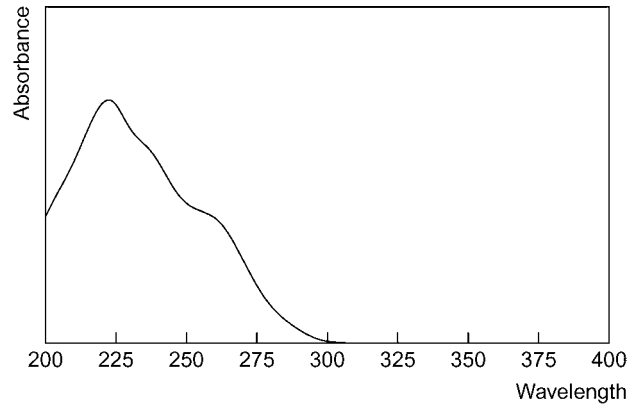
Prometryne

Herbicide
$C_{10}H_{19}N_5S$ = 241.4
CAS—7287-19-6

IUPAC Name 6-Methylsulfanyl-2-*N*,4-*N*-di(propan-2-yl)-1,3,5-triazine-2,4-diamine
Synonyms *N*,*N*′-Bis(1-methylethyl)-6-methylthio-1,3,5-triazine-2,4-diamine; prometryn.
Proprietary Names *Caparol*; *Gesagard*.



Chemical Properties A white crystalline solid. Mp 118° to 120°. Practically insoluble in water; readily soluble in organic solvents. pK_a 4.1. Log *P* (octanol/water), 3.5.
Thin-layer Chromatography System TA—R_f 0.76; system TX—R_f 0.32; system TY—R_f 0.31 (Dragendorff spray, positive).
Gas Chromatography System GA—RI 1930.
High Performance Liquid Chromatography System HAA—retention time 21.9 min.

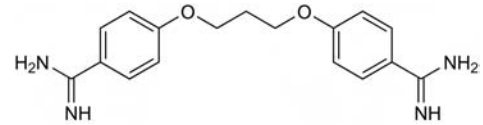


Infrared Spectrum Principal peaks at wavenumbers 1510, 1592, 1171, 1299, 809, 1217 cm^{-1} (KBr disk).

Propamidine

Antibacterial, Antifungal
$C_{17}H_{20}N_4O_2$ = 312.4
CAS—104-32-5

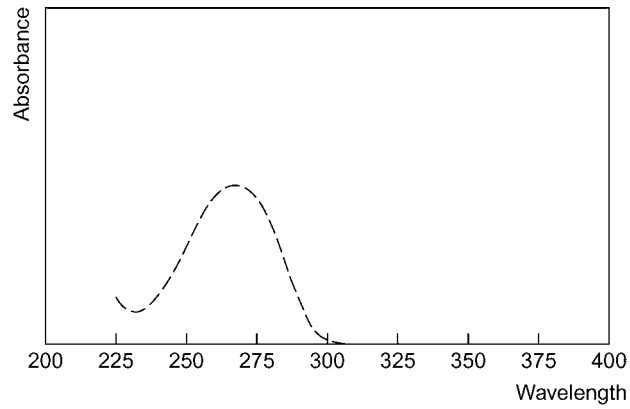
IUPAC Name 4-[3-(4-Carbamimidoylphenoxy)propoxy]benzenecarboximidamide
Synonym 4,4′-[1,3-Propanediylbis(oxy)]bisbenzenecarboximidamide



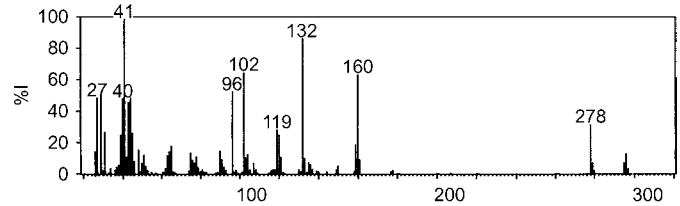
Chemical Properties Log *P* (octanol/water), 1.8.

Propamidine Isetionate
$C_{17}H_{20}N_4O_2,2C_2H_6O_4S$ = 564.6
CAS—140-63-6
Synonym Propamidine isethionate
Proprietary Name *Brolene*
Chemical Properties A white, granular, hygroscopic powder. Mp 235°. Soluble 1 in 5 of water and 1 in 33 of ethanol; practically insoluble in organic solvents.

Thin-layer Chromatography System TA—R_f 0.01; system TB—R_f 0.01; system TC—R_f 0.01; system TL—R_f 0.01 (acidified iodoplatinate solution, positive).
Ultraviolet Spectrum Ethanol—267 nm (A^1_1=1224b).



Infrared Spectrum Principal peaks at wavenumbers 1200, 1219, 1613, 1048, 1280, 1495 cm^{-1} (propamidine isetionate, KBr disk).
Mass Spectrum Principal ions at *m/z* 41, 132, 102, 160, 96, 29, 27, 44.

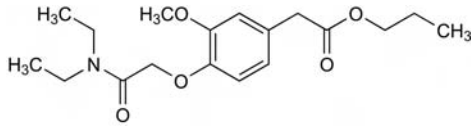


Uses Propamidine isetionate is used in concentrations of 0.1 to 0.15%.

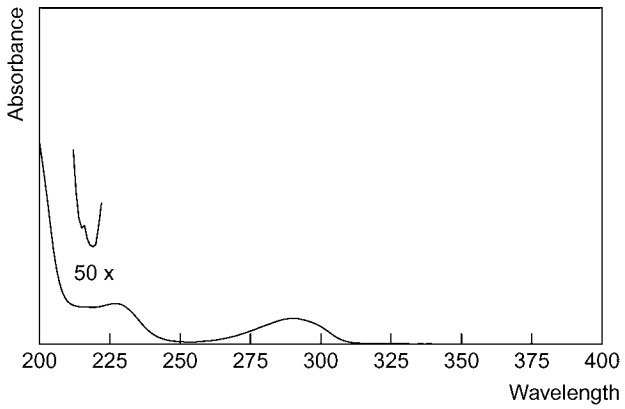
Propanidid

Anaesthetic (General)
$C_{18}H_{27}NO_5$ = 337.4
CAS—1421-14-3

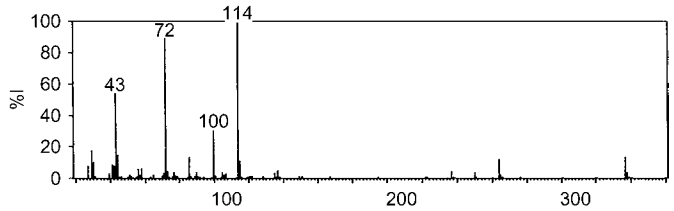
IUPAC Name Propyl 2-[4-[2-(diethylamino)-2-oxoethoxy]-3-methoxyphenyl] acetate
Synonym 4-[2-(Diethylamino)-2-oxoethoxyl]-3-methoxybenzeneacetic acid propyl ester
Proprietary Names *Epontol*; *Inductol*; *Panitol*; *Sombrevin*.



Chemical Properties A pale greenish-yellow, hygroscopic, viscous liquid. Bp 210° to 212°. Very slightly soluble in water; miscible with ethanol, chloroform and ether. Log *P* (octanol/water), 2.4.
Colour Tests Aromaticity (method 2)—yellow/orange; Liebermann's test—black.
Thin-layer Chromatography System TA—R_f 0.66; system TB—R_f 0.20; system TC—R_f 0.70; system TE—R_f 0.72; system TL—R_f 0.55; system TAE—R_f 0.80 (Dragendorff spray, positive).
Gas Chromatography System GA—RI 2433.
Ultraviolet Spectrum Ethanol—280 nm (A^1_1=82a).



Infrared Spectrum Principal peaks at wavenumbers 1258, 1508, 1637, 1142, 1724, 1220 cm^{-1} (thin film).
Mass Spectrum Principal ions at *m/z* 114, 72, 43, 100, 29, 44, 337, 86.



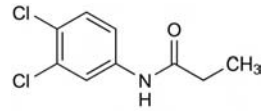
Disposition in the Body Rapidly metabolised by hydrolysis and demethylation to inactive metabolites which are excreted in the urine. About 90% of a dose is excreted in the urine in 2 h and up to 6% is eliminated in the faeces.
Therapeutic Concentration
Following IV administration of 7 mg/kg to 10 subjects, a mean serum concentration of about 14 mg/L was reported at 1 min [Doenicke *et al.* 1968].
Half-life Plasma half-life, about 0.2 h.
Protein Binding About 75%.
Dose Usually 5 to 10 mg/kg IV.

Doenicke A *et al.* (1968). Experimental studies of the breakdown of Epontol: determination of propanidid in human serum. *Br J Anaesth* 40: 415–428.

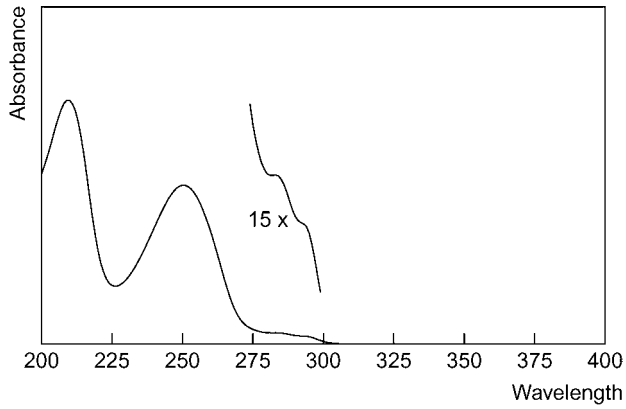
Propanil

Herbicide, Nematocide
$C_9H_9Cl_2NO$ = 218.1
CAS—709-98-8

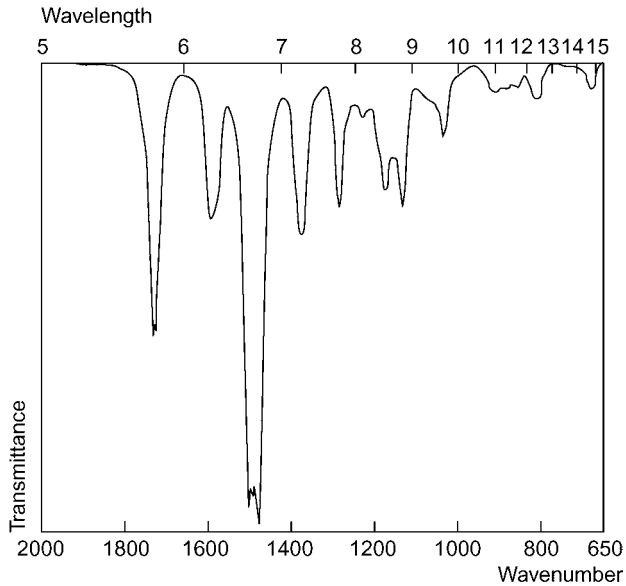
IUPAC Name *N*-(3,4-Dichlorophenyl)propanamide
Synonyms Bay 30130; Cekupropanil; DCPA; DPA; FW-734; S10145.
Proprietary Names *Arrosol*; *ChemRice*; *Dropaven*; *Erban*; *Herbax*; *Propanex*; *Riselect*; *Rogue*; *Stam*; *Stampede*; *Strel*; *Surcopur*; *Surpur*; *Vertac*.



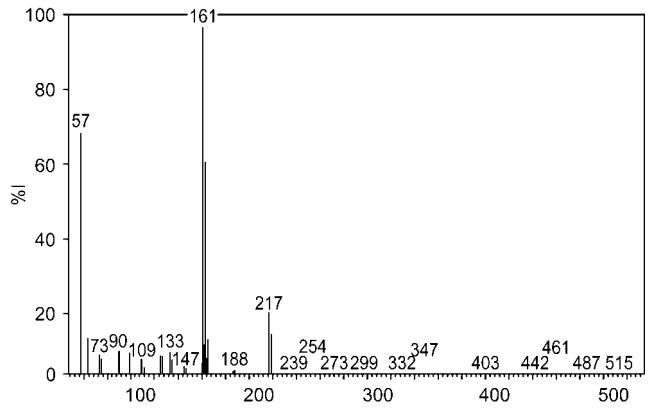
Chemical Properties A white crystalline solid. Mp 91° to 93° (the technical state is brownish in colour). Soluble in water (19.73 mg/L at 25°), toluene, isopropanol and xylene, and very soluble in benzene (70 g/L at 25°), ethanol (1100 g/L at 25°), acetone (1700 g/L at 25°), cyclohexane (350 g/L at 20°) and methyl ethyl ketone (250 g/L at 20°). Log *P* (octanol/water), 3.07.
Gas Chromatography System GK—RRT 0.94 (relative to caffeine).



Infrared Spectrum Principal peaks at wavenumbers 1729, 1282, 1590, 1136 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 161, 57, 163, 217, 219, 63, 165, 90.



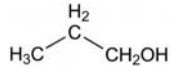
P

Disposition in the Body Propanil is absorbed into the bloodstream after ingestion and metabolised in the liver to aniline derivatives: 3,4-dichloroaniline and *N*-hydroxy-3,4-dichloroaniline. Metabolism is responsible for the formation of methaemoglobin. Propanil is lipid/fat soluble. It is recovered in faeces and urine.

Propanol

Solvent
C_3H_7OH = 60.1.
CAS—71-23-8

IUPAC Name Propan-1-ol
Synonyms Normal propyl alcohol; primary propyl alcohol; propyl alcohol.
Proprietary Name *Satinazid*

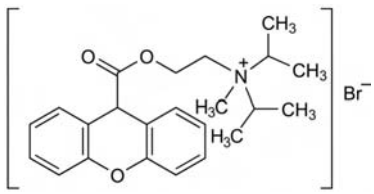


Chemical Properties A clear, colourless, flammable liquid. Weight per mL about 0.804 g. Bp about 96°. Miscible with water, ethanol, chloroform and ether. pK_a 16.1. Log *P* (octanol/water), 0.3.
Colour Test Potassium dichromate (method 2)—green.
Gas Chromatography System GA—RI 571; system GI—retention time 5.5 min.
Mass Spectrum Principal ions at *m/z* 31, 59, 42, 60, 27, 29, 45, 41.

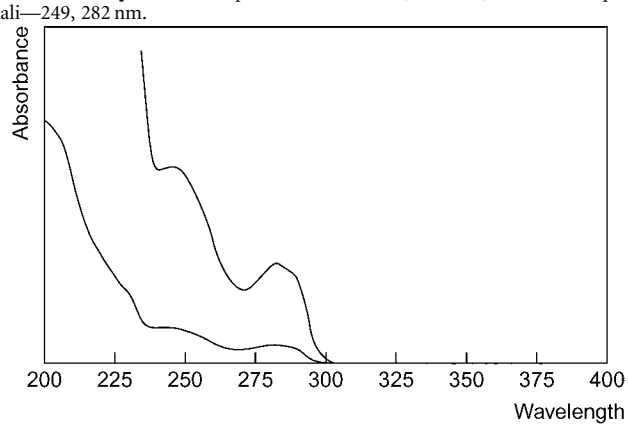
Propantheline Bromide

Anticholinergic
$C_{23}H_{30}BrNO_3$ = 448.4
CAS—298-50-0 (propantheline); 50-34-0 (bromide)

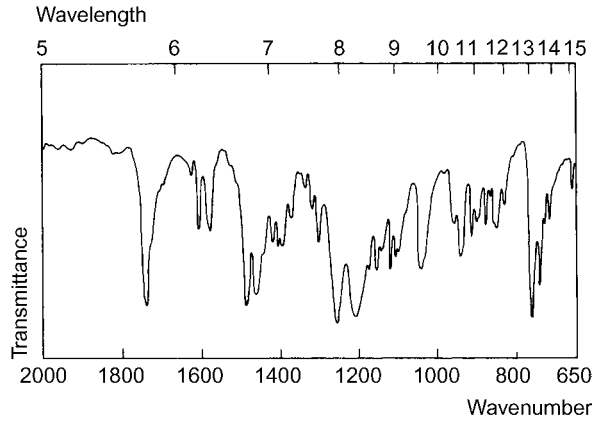
IUPAC Name Methyl-di(propan-2-yl)-[2-(9H-xanthene-9-carbonyloxy)ethyl] azanium bromide
Synonym *N*-Methyl-*N*-(1-methylethyl)-*N*-[2-[(9*H*-xanthen-9-ylcarbonyl)oxy] ethyl]-2-propanaminium bromide
Proprietary Names *Bropantil*; *Ercoril*; *Ercotina*; *Pantheline*; *Pro-Banthine*; *Propantel*; *Propanthel*.



Chemical Properties A white or yellowish-white powder. Mp 159° to 160°. Very soluble in water, ethanol and chloroform; practically insoluble in ether and benzene. Log *P* (octanol/water), 2.5.
Note The dust is irritant to mucous membranes.
Colour Tests The following tests are performed on the nitrate: Mandelin's test—orange; Marquis test—orange.
Thin-layer Chromatography System TA—propantheline bromide R_f 0.04; system TB—propantheline bromide R_f 0.00; system TC—propantheline bromide R_f 0.04; system TE—propantheline bromide R_f 0.04, xanthanoic acid R_f 0.05; system TF—xanthanoic acid R_f 0.08; system TL—R_f 0.00; system TAE—propantheline bromide R_f 0.03, xanthanoic acid R_f 0.87; system TAF—propantheline bromide R_f 0.31; system TAJ—R_f 0.00; system TAK—R_f 0.00; system TAL—R_f 0.20 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—not eluted.
High Performance Liquid Chromatography System HA—*k* 4.4; system HX—RI 454 (propantheline bromide), RI 499 (xanthanoic acid).
Ultraviolet Spectrum Aqueous acid—243 (A^1_1=103a), 281 nm; aqueous alkali—249, 282 nm.



Infrared Spectrum Principal peaks at wavenumbers 1255, 761, 1208, 1733, 745, 1158 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 86, 181, 43, 44, 41, 114, 42, 152 (propantheline).
Quantification
Plasma **GC–MS** Limit of detection, 5 µg/L [Ford *et al.* 1977].
Serum **HPLC** UV detection. Limit of detection, 2 µg/L [Moses *et al.* 1983].
Urine **GC–MS** Limit of detection, 10 µg/L [Ford *et al.* 1977].
MS Limit of detection, 20 to 150 µg/L for propantheline bromide and other quaternary ammonium compounds [Nisikawa *et al.* 1991].
Disposition in the Body Poorly absorbed after oral administration due to decomposition in the small intestine. It undergoes extensive metabolism mainly by hydrolysis and glucuronide conjugation; aromatic hydroxylation also occurs. About 50 to 65% of an oral dose is excreted in the urine in 24 h with <10% as unchanged drug. The major urinary metabolite is xanthanoic acid glucuronide conjugate; other metabolites include free xanthanoic acid, hydroxyxanthanoic acid, propantheline and hydroxypropantheline.
Therapeutic Concentration Following single oral doses of 30 mg and 60 mg to 6 subjects, peak plasma concentrations of 0.0 to 0.038 mg/L (mean 0.024) and 0.033 to 0.162 mg/L (mean 0.06), respectively, were attained in about 0.5 to 1 h [Vose 1980].
Half-life Plasma half-life, 1 to 3 h.
Clearance Plasma clearance, about 20 mL/min/kg.
Dose Usually 75 mg daily; maximum of 120 mg daily.

Ford GC *et al.* (1977). The measurements of propantheline ion in biological fluids after administering propantheline bromide to man. *Biomed Mass Spectrom* 4: 94–97.

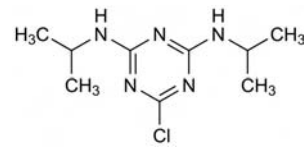
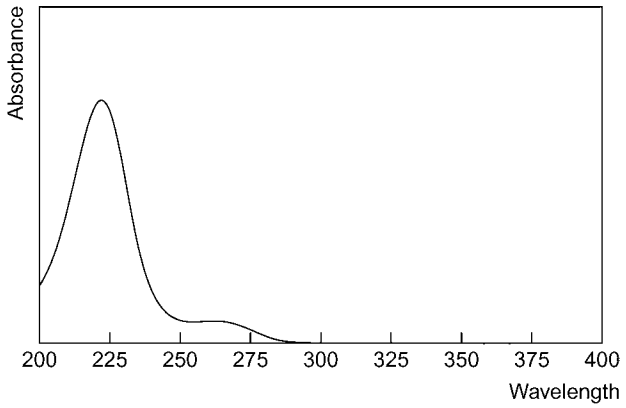
Propazine

Herbicide
$C_9H_{16}ClN_5$ = 229.7
CAS—139-40-2

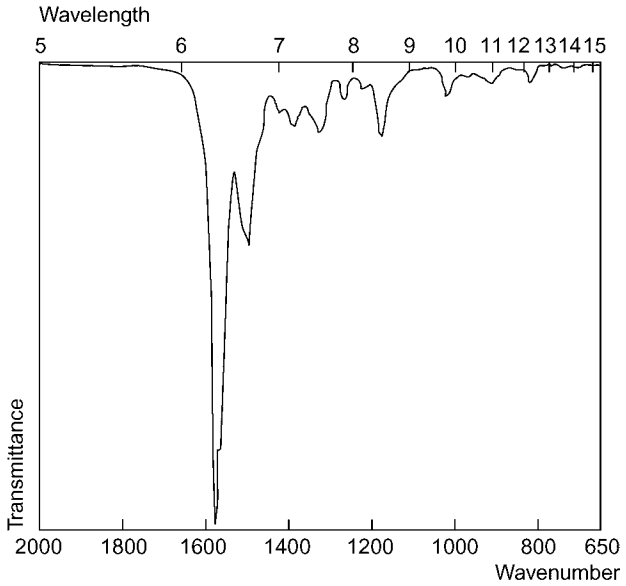
IUPAC Name 6-Chloro-2-*N*,4-*N*-di(propan-2-yl)-1,3,5-triazine-2,4-diamine
Synonyms 6-Chloro-*N*,*N*′-bis(1-methylethyl)-1,3,5-triazine-2,4-diamine; G-30028; Geigy 30028.
Proprietary Names *Gesamil*; *Milocep*; *Milogard*; *Milo-Pro*; *Plantulin*; *Primatol P*; *Propazin*; *Propinex*; *Prozinex*.



Chemical Properties A colourless crystalline solid. Mp 213°. Practically insoluble in water (5 mg/L at 20°, 8.6 mg/L at 22°). Slightly soluble in benzene (6.2 g/kg at 20°), diethyl ether (5.0 g/kg at 20°), carbon tetrachloride (2.5 g/kg at 20°) and toluene (6.2 g/kg at 20°). pK_a 1.7 (21°). Log *P* (octanol/water), 2.93.
Gas Chromatography System GA—RI 1738.



Infrared Spectrum Principal peaks at wavenumbers 1571, 1496, 1173, 1323 cm^{-1}.

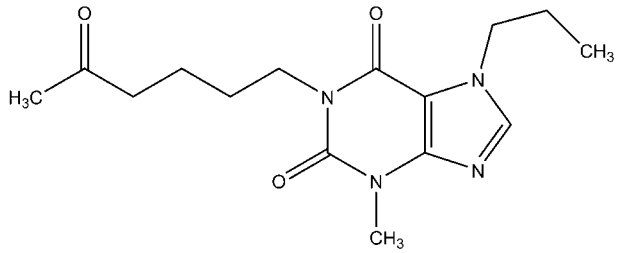


Mass Spectrum Principal ions at *m/z* 58, 214, 229, 43, 172, 187, 216, 69.
Disposition in the Body Propazine is readily absorbed into the bloodstream after ingestion and metabolised in the body. It is excreted in both urine (≈65%) and faeces (25%).
Toxicity Slightly toxic by ingestion.

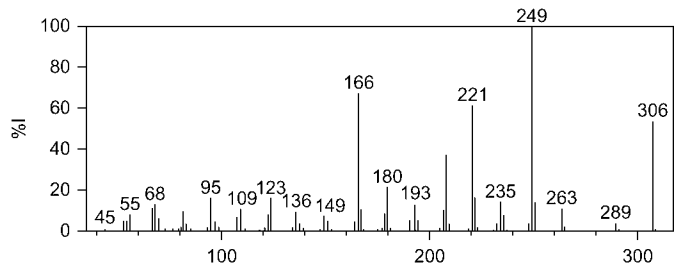
Propentofylline

Adenosine A_1 Antagonist, Nootropic, Xanthine Derivative
$C_{15}H_{22}N_4O_3$ = 306.4
CAS—55242-55-2

IUPAC Name 3-Methyl-1-(5-oxohexyl)-7-propylpurine-2,6-dione
Synonyms Albert-285; 3,7-dihydro-3-methyl-1-(5-oxohexyl)-7-propyl-1*H*-purine-2,6-dione; HOE-285; HWA-285; 3-methyl-1-(5-oxohexyl)-7-propylxanthine; 1-(5′-oxohexyl)-3-methyl-7-propyl-xanthine; propentofilina; propentofyllin; propentofylliini; propentofyllinum.
Proprietary Names *Hextol*; *Karsivan*.



Chemical Properties Mp 69° to 70°. Soluble in water, ethanol and DMSO. Log *P* (octanol/water), 1.52 [Meylan, Howard 1995].
Mass Spectrum Principal ions at *m/z* 249, 166, 221, 306 (3-Methyl-1-(5-hydroxyhexyl)-7-propylxanthine); 166, 209, 221, 180, 308, 123, 95, 45.



Quantification
Plasma **GC** Column: Cross-linked 5% phenylmethylsilicone (25 m × 0.2 mm i.d., 0.11 µm). Carrier gas: He, 1.08 mL/min. Temperature programme: 180° to 220° at 10°/min to 280° at 3°/min. NPD. Retention time: 20.6 min. Limit of detection, 5 µg/L [Kwon *et al.* 1998].
GC-MS Column: Cross-linked 5% phenylmethylsilicone (25 m × 0.2 mm i.d., 0.11 µm). Carrier gas: He, 1.08 mL/min. Temperature programme: 180° to 220° at 10°/min to 280° at 3°/min. EI ionisation at 70 eV. Retention time: 20.6 min. Limit of detection, 5 µg/L [Kwon *et al.* 1998].
Serum **HPLC** Column switching system. UV detection (λ = 270 nm). Retention time: ~21 min. Limit of detection, 0.13 µmol/L [Kuroda *et al.* 1999].
Disposition in the Body Undergoes extensive first-pass metabolism, forming 3-methyl-1-(5-hydroxyhexyl)-7-propylxanthine, the main active metabolite, and at least 2 further minor metabolites.
Therapeutic Concentration
Ten healthy young volunteers (mean age 22 years) were administered 200 mg oral propentofylline in the fasted state. Mean peak plasma concentrations for propentofylline and its hydroxyl metabolite were 828 and 269 µg/L attained at 2.2 and 2.5 h, respectively [Kwon *et al.* 1998].
Half-life Approximately 45 min.
Dose Has been investigated in cerebrovascular disorders including dementia. It is also used in veterinary medicine as a vasodilator (peripheral and cerebral). For the treatment of cognitive dysfunction in dogs, a daily dose of ~10 mg/kg bodyweight (range 8–12) is administered, either in a single dosage unit or preferably in multiple dosage units, which accumulate to 1–20 mg/kg bodyweight per day.

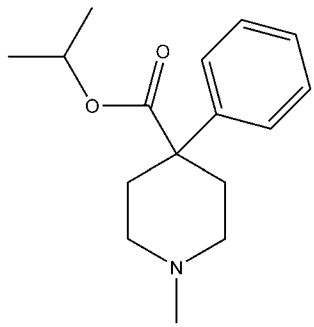
Properidine

Narcotic Analgesic
$C_{16}H_{23}NO_2$ = 261.4
CAS—561-76-2

IUPAC Name Propan-2-yl methyl-4-phenylpiperidine-4-carboxylate
Synonyms DEA Number 9644; EINECS 209-222-4; gevelina; ipropethidine; isopedine; isopropyl 1-methyl-4-phenylisonipecotate; isopropyl 1-methyl-4-phenylpiperidine-4-carboxylate.



Chemical Properties Log *P* (octanol/water) 3.97 [Meylan, Howard 1995]; 3.1 [National Institutes of Health 2008]. Properidine is extracted by organic solvents from aqueous alkaline solutions.

Properidine Hydrochloride
$C_{16}H_{23}NO_2$,HCl = 297.9
Synonym NU 896
Proprietary Name *Dolisina B*

Colour Tests Sulfuric acid–formaldehyde test—dull orange (limit of detection, 1.0 µg).
Thin-layer Chromatography System T1—R_f 0.53 (location reagent acidified iodoplatinate spray, positive reaction).

P

Gas Chromatography System G2/225—retention time 0.75 relative to diphenhydramine; system G4—retention time 0.65 relative to diphenhydramine.
Ultraviolet Spectrum Aqueous acid (0.1 N sulfuric acid)—251, 257, 263 nm.

Meylan WM, Howard PH (1995). Atom/fragment contribution method for estimating octanol-water partition coefficients. *J Pharm Sci* 84: 83–92.

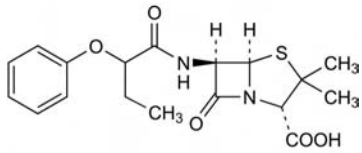
Propicillin

Antibacterial
$C_{18}H_{22}N_2O_5S$ = 378.4
CAS—551-27-9

IUPAC Name (2*S*,5*R*,6*R*)-3,3-dimethyl-7-oxo-6-(2-phenoxybutanoylamino)-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid
Synonyms (2*S*,5*R*,6*R*)-3,3-Dimethyl-7-oxo-6-[(1-oxo-2-phenoxybutyl) amino]-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid; α-phenoxypropylpenicillin.

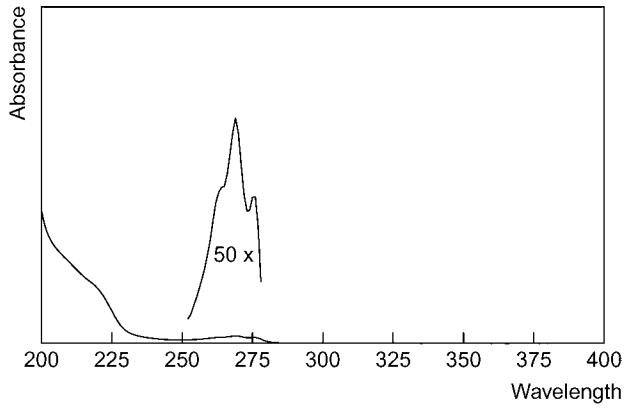


Chemical Properties pK_a 2.7 (25°). Log *P* (octanol/water), 2.6.

Propicillin Potassium

$C_{18}H_{21}KN_2O_5S$ = 416.5
CAS—1245-44-9
Synonyms Potassium α-phenoxypropylpenicillin; BRL-284; PA-248.
Proprietary Names *Baycillin*; *Oricillin*; *Propibay*; *Ultrapen*.
Chemical Properties A white, hygroscopic, finely crystalline powder. Mp 195° to 197°, with decomposition. Soluble 1 in about 1 of water, 1 in about 25 of ethanol and 1 in 65 of dehydrated alcohol; practically insoluble in chloroform and ether.

Ultraviolet Spectrum Propicillin potassium: water—269 (A^1_1=27b), 276 nm (A^1_1=21.5b).

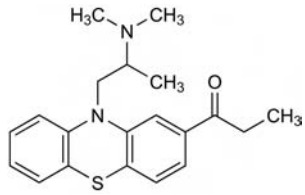


Infrared Spectrum Principal peaks at wavenumbers 1600, 1757, 1669, 1224, 1314, 750 cm^{-1} (propicillin potassium, KBr disk).
Dose The equivalent of 0.5 to 1.5 g of propicillin daily.

Propiomazine

Antihistamine, Sedative
$C_{20}H_{24}N_2OS$ = 340.5
CAS—362-29-8

IUPAC Name 1-[10-[2-(Dimethylamino)propyl]phenothiazin-2-yl]propan-1-one
Synonyms 1-[10-[2-(Dimethylamino)propyl]-10*H*-phenothiazin-2-yl]-1-propanone; Wy-1359.



Chemical Properties pK_a 6.6. Log *P* (octanol/water), 4.8.

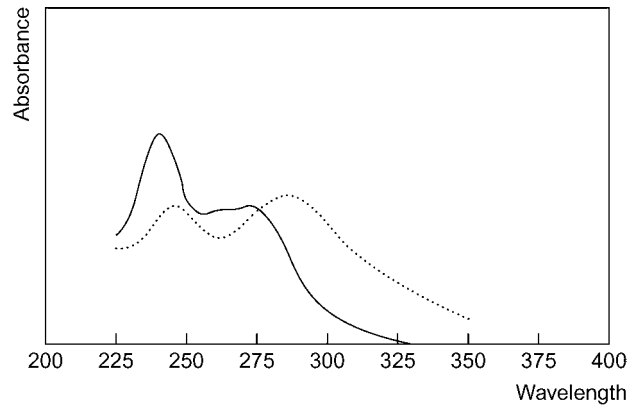
Propiomazine Hydrochloride

$C_{20}H_{24}N_2OS,HCl$ = 376.9
CAS—1240-15-9
Proprietary Name *Largon*
Chemical Properties A yellow powder. Soluble 1 in <1 of water, 1 in 6 of ethanol and 1 in 2 of chloroform; practically insoluble in ether and benzene.

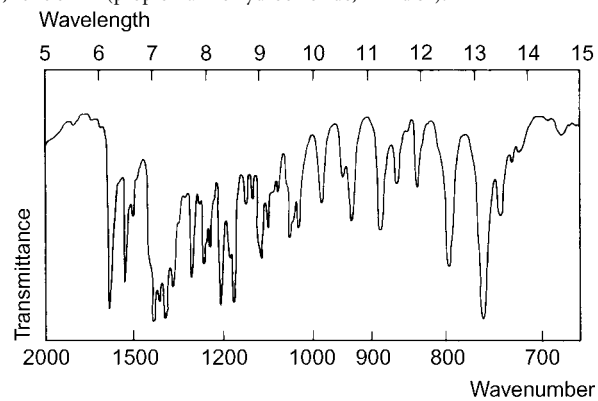
Propiomazine Maleate

$C_{20}H_{24}N_2OS,C_4H_4O_4$ = 456.6
CAS—3568-23-8
Synonym Propiomazine hydrogen maleate
Proprietary Name *Propavan*
Chemical Properties A yellow microcrystalline powder. Mp 160° to 161° (from propan-2-ol). Soluble 1 in 500 of water, 1 in 60 of ethanol and 1 in 140 of dehydrated alcohol.

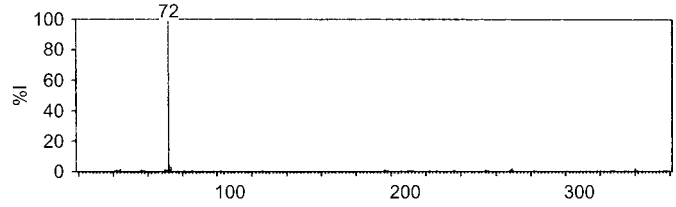
Colour Tests Formaldehyde-sulfuric acid—blue–violet; Forrest reagent—red; FPN reagent—pink–orange→red→fades; Liebermann's reagent—violet; Mandelin's test—violet; Marquis test—red–violet.
Thin-layer Chromatography System TA—R_f 0.55; system TB—R_f 0.34; system TC—R_f 0.42; system TE—R_f 0.68; system TL—R_f 0.26; system TAE—R_f 0.30; system TAF—R_f 0.52; system TAJ—R_f 0.34; system TAK—R_f 0.16; system TAL—R_f 0.81 (location under UV light, pink fluorescence; Dragendorff spray, positive; FPN reagent, yellow; acidified iodoplatinate solution, positive; Marquis reagent, red).
Gas Chromatography System GA—RI 2738; system GF—RI 3225.
High Performance Liquid Chromatography System HA—*k* 2.1; system HX—RI 440; system HY—RI 359; system HAX—retention time 14.1 min; system HAY—retention time 7.1 min.
Ultraviolet Spectrum Aqueous acid—241 (A^1_1=749a), 273, 360 nm; aqueous alkali—243, 283 nm.



Infrared Spectrum Principal peaks at wavenumbers 754, 1653, 1221, 1186, 1575, 1316 cm^{-1} (propiomazine hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 72, 73, 340, 269, 197, 71, 70, 56.



Quantification

Plasma **GC** AFID. Limit of detection, 10 to 20 µg/L for propiomazine and *N*-monodesmethylpropiomazine [Hartvig *et al.* 1980].

Disposition in the Body Slowly absorbed after oral administration. Metabolised by *N*-demethylation.

Therapeutic Concentration

After a single oral dose of 50 mg to one subject, a peak serum concentration of about 0.05 mg/L was attained in 2 to 3 h. In several subjects, low concentrations (<0.01 mg/L) of *N*-monodesmethylpropiomazine were also observed [Hartvig *et al.* 1981].

Bioavailability About 33%.

Half-life Plasma half-life, 2 to 15 h (mean 9).

Volume of Distribution About 2 to 3 L/kg.

Clearance Plasma clearance, 3 to 10 mL/min/kg (mean 5).

Dose The equivalent of 25 to 50 mg of propiomazine daily, orally.

Hartvig P *et al.* (1980). Determination of propiomazine and its N-demethyl metabolite in plasma by gas chromatography with alkali flame ionization detection. *J Chromatogr* 183: 229–233.
Hartvig P *et al.* (1981). *Curr Ther Res* 29: 351–362.

Propofol

Anaesthetic

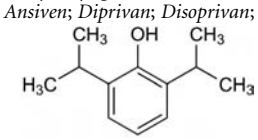
$C_{12}H_{18}O$ = 178.3

CAS—2078-54-8

IUPAC Name 2,6-Di(propan-2-yl)phenol

Synonyms 2,6-Bis(1-methylethyl)phenol; ICI-35868; disoprofol.

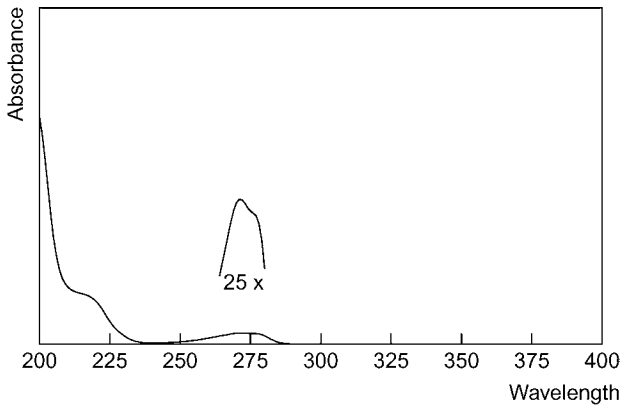
Proprietary Names *Ansiven*; *Diprivan*; *Disoprivan*; *Rapinovet*.



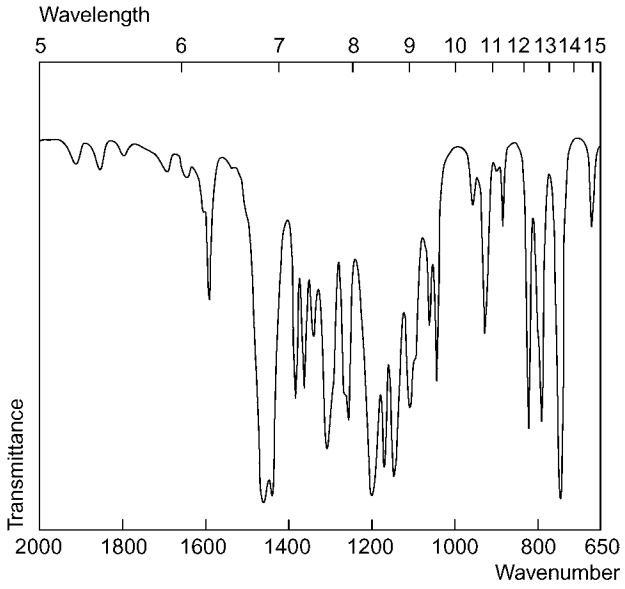
Chemical Properties Mp 19°. Very slightly soluble in water. pK_a 11.1. Log *P* (octanol/water), 3.79. Extraction yield (chlorobutane), 0.95 [Demme *et al.* 2005].

High Performance Liquid Chromatography System HZ—retention time 35.0 min; system HAX—retention time 10.1 min; system HAY—retention time 15.2 min.

Ultraviolet Spectrum Aqueous acid—271 nm; basic—240, 291 nm.



Infrared Spectrum Principal peaks at wavenumbers 1461, 1202, 748 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 163, 178, 91, 117, 41, 164, 77, 121 (propofol); *m/z* 235, 73, 250, 207, 161, 115, 128, 177 (TMS (tetramethylsilane) derivative).

Quantification

Blood **HPLC** Electrochemical detection. Limit of detection, 0.02 mg/L [Mazzi, Schinella 1990].

Plasma **GC–MS** Limit of detection, 0.02 µg/L [Stetson *et al.* 1993].

Serum **HPLC** UV detection (λ=270 nm). Limit of detection, 0.1 mg/L [Pavan *et al.* 1992]. Coulometric detection. Limit of detection, 0.08 mg/L [Uebel *et al.* 1990].

Disposition in the Body Propofol is rapidly absorbed and distributed from circulation into the tissues. Extensive tissue distribution occurs. It has a two-phase distribution, with the second phase being the slower phase when significant hepatic metabolism (conjugation) takes place before excretion via urine. Inactive conjugates of propofol are formed and its corresponding quinol. Also detected in urine is the unchanged drug, propofol glucuronide, 1-glucuronide, 4-glucuronide and the 4-sulfate conjugates of 2,6-diisopropyl 1,4-quinol. Approximately 2% of a dose is excreted in faeces. Propofol crosses the placental barrier and is also excreted in breast milk. It is extensively distributed and rapidly cleared from the body.

Therapeutic Concentration Sedation can be maintained at serum concentrations of 0.001 to 0.004 mg/L.

Seven male patients, 38 to 67 years old, admitted for oral or neck surgery, were administered a dose between 403 and 1800 mg to reach a state of anaesthesia. Doses were administered at a maintenance infusion rate of 3.5 and 6.1 mg/kg lean body mass/h and after 15 min of infusion, blood concentrations were relatively stable ranging between 1.5 and 2.5 mg/L [Morgan *et al.* 1990].

Toxicity The toxic blood concentration is 0.22 mg/L, as noted from abuse.

A 29-year-old female committed suicide by IV injection of 400 mg propofol. Postmortem concentrations were 0.22 mg/L in femoral blood and 1.4 mg/kg in liver. [Drummer 1992].

Half-life 2 to 4 min (first phase); 30 to 60 min (second phase); 3 to 12 h (terminal half-life).

Volume of Distribution Steady state, 171 to 349 L; elimination, 209 to 1008 L. Also reported as 2 to 12 L/kg and 60 L/kg.

Clearance Total, 94 to 139 L/h.

Protein Binding >95% (haemoglobin, erythrocytes and other serum proteins); hypoalbuminaemia may increase free fraction.

Dose Adults: Induction of anaesthesia: 1.5 to 2.5 mg/kg. Maintenance of anaesthesia: 25 to 50 mg repeated according to response, or 4 to 12 mg/kg/h. Children >3 years: 9 to 15 mg/kg/h. Sedation: 0.3 to 4.5 mg/kg/h.

Propoxycaine

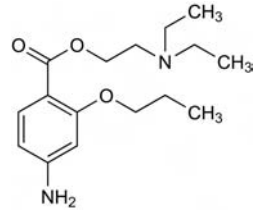
Anaesthetic (Local)

$C_{16}H_{26}N_2O_3$ = 294.4

CAS—86-43-1

IUPAC Name 2-Diethylaminoethyl 4-amino-2-propoxybenzoate

Synonym 4-Amino-2-propoxybenzoic acid 2-diethylaminoethyl ester



Chemical Properties pK_a 8.6. Log *P* (octanol/water), 1.5.

Propoxycaine Hydrochloride

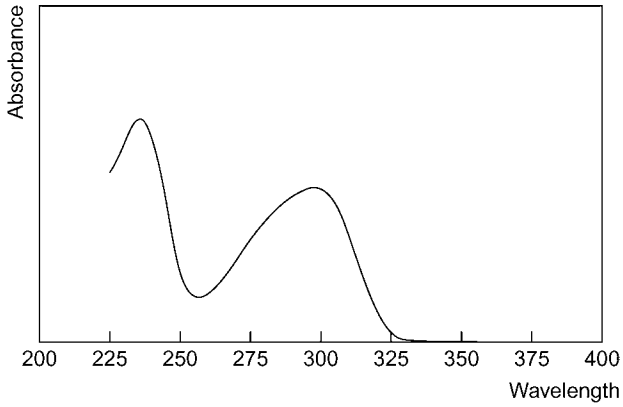
$C_{16}H_{26}N_2O_3$,HCl = 330.9

CAS—550-83-4

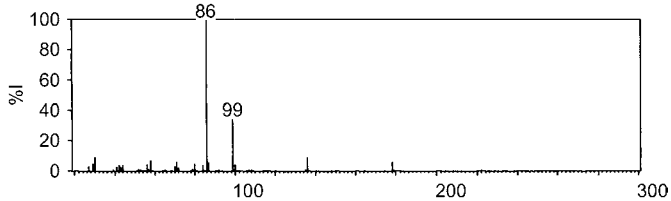
Proprietary Names It is an ingredient of *Ravocaine* and *Novocain*.

Chemical Properties A white crystalline powder which discolours on prolonged exposure to light and air. Mp 148° to 150°. Soluble 1 in 2 of water, 1 in 10 of ethanol and 1 in 80 of ether; practically insoluble in acetone and chloroform.

Colour Tests Coniferyl alcohol—orange; diazotisation—red; Mandelin's test—brown.
Thin-layer Chromatography System TA—R_f 0.58; system TB—R_f 0.03; system TC—R_f 0.33; system TL—R_f 0.28; system TAJ—R_f 0.11; system TAK—R_f 0.00; system TAL—R_f 0.45 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2335.
High Performance Liquid Chromatography System HQ—*k* 1.10.
Ultraviolet Spectrum Aqueous acid—235 (A^1_1=270b), 298 nm.



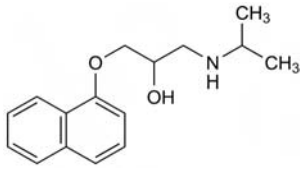
Infrared Spectrum Principal peaks at wavenumbers 1605, 1278, 1246, 1670, 1210, 1700 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 86, 99, 136, 30, 58, 178, 87, 71.



Uses Propoxycaine hydrochloride has been used as a 0.5% solution.

Propranolol

β-*Adrenoceptor Antagonist*
$C_{16}H_{21}NO_2$ = 259.3
CAS—525-66-6; 13013-17-7 (±)
IUPAC Name 1-naphthalen-1-yloxy-3-(propan-2-ylamino)propan-2-ol

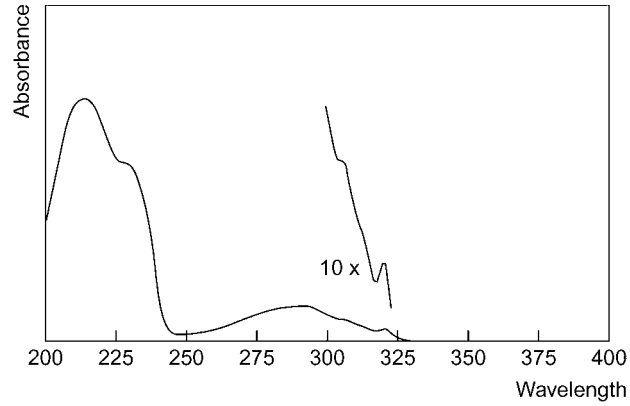


Chemical Properties Crystals. Mp 96° (crystals from cyclohexane). pK_a 9.5 (24°). Log *P* (octanol/water pH 7.4), 1.2. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

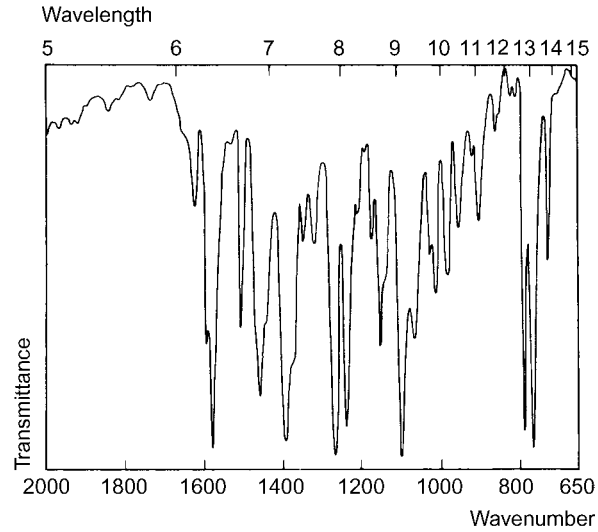
Propranolol Hydrochloride

$C_{16}H_{21}NO_2$,HCl = 295.8
CAS—318-98-93506-09-0 (±)
Synonyms AY-64043; ICI-45520; NSC-91523; propranololi hydrochloridum.
Proprietary Names *Adrexan*; *Angilol*; *Apsolol*; *Avlocardyl*; *Bedranol*; *Berkolol*; *Betachron*; *Beta-Prograne*; *Betadur CR*; *Cardinol*; *Dociton*; *Efektolol*; *Elbrol*; *Half Beta-Prograne*; *Half Betadur*; *Half Inderal*; *Indobloc*; *Hemipralon*; *Inderal*; *Lopranol LA*; *Obsidan*; *Probeta LA*; *Propabloc*; *Propanix*; *Prophylux*; *Proprnur*; *Syprol*; *Tiperal*. It is an ingredient of *Indereti*c; *Inderex*; *Inderide*.
Chemical Properties A white powder. Mp 163° to 164° (crystals from propan-1-ol). Soluble 1 in 20 of water and ethanol; slightly soluble in chloroform; practically insoluble in ether, benzene and ethyl acetate.

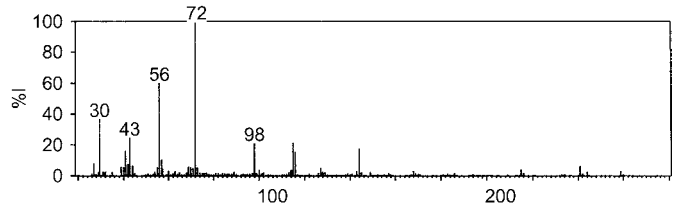
Colour Tests Mandelin's test—green; Marquis test—green.
Thin-layer Chromatography System TA—R_f 0.50; system TB—R_f 0.06; system TC—R_f 0.10; system TE—R_f 0.49; system TL—R_f 0.07; system TAE—R_f 0.21; system TAF—R_f 0.79; system TAJ—R_f 0.00; system TAK—R_f 0.05; system TAL—R_f 0.49 (acidified iodoplatinate solution—positive).
Gas Chromatography System GA—propranolol RI 2147, M (1-naphthol-) RI 1505, M (desamino-OH-) RI 2065; system GB—propranolol RI 2234, M (4-OH-) RI 2546, M (1-naphthol-) RI 1534.
High Performance Liquid Chromatography System HA—propranolol *k* 1.3, M (4-hydroxy-) *k* 1.1; system HX—RI 377; system HY—RI 299; system HZ—RT 3.7 min; system HAA—RT 13.1 min; system HAM—not detected; system HAV—*k* 2.3; system HAX—RT 9.2 min; system HAY—RT 4.9 min.
Ultraviolet Spectrum Aqueous acid—288 (A^1_1= 222a), 305, 319 nm; methanol—290 (A^1_1= 240a), 306 (A^1_1= 143a), 319 nm (A^1_1= 86a). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1103, 1270, 772, 1580, 795, 1240 cm^{-1} (propranolol hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 72, 56, 30, 43, 98, 115, 144, 41 (propranolol); 72, 30, 116, 56, 43, 160, 41, 158 (4-hydroxypropranolol).



Quantification

Blood **GC-MS** Column: DB-1 (25 m × 0.2 mm i.d., 0.25 µm). Carrier gas: He, 0.6 mL/min. Temperature programme: 140° for 2.5 min to 300° at 20°/min for 5 min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, 0.01 mg/L [Black *et al.* 1996].

HPLC UV and ESI-ion trap MS detection [Buszewski *et al.* 2009]. Column: LiChrospher RP-8 ADS (25 × 4.6 mm i.d., 25 µm). Mobile phase: 10 mmol/L phosphate buffer (pH 3.0) : acetonitrile : methanol (70 : 15 : 15), flow rate 1.0 mL/min. DAD (λ= 280 nm). Limit of detection, 50 µg/L [Mislanova, Hutta 2001].

Plasma **GC** Column: OV7 phenyl methyl silicone with 20% phenyl (2 m × 2 mm i.d.). Carrier gas: N_2, 40 mL/min. Temperature programme: 190° for 3 min to 270° at 3°/min. FID. Limit of detection, 50 µg/L [Quaglio *et al.* 1992]. ECD. Limit of detection, <1 µg/L [Kates, Jones 1977].

GC-MS Column: HP methyl silicone (12 m × 0.22 mm i.d., 0.33 µm) or phenyl methyl silicone (12 m × 0.22 mm i.d., 0.22 µm). Temperature programme: 200° to 300° at 3°/min. Limit of detection, 10 µg/L, limit of detection, with FID, 50 µg/L [Quaglio *et al.* 1993].

HPLC Column: Hypurity C_{18} (250 × 4.6 mm, i.d., 5 µm). Mobile phase: acetonitrile : phosphate buffer (pH 3.8), flow rate 1.0 mL/min. DAD (λ= 220 nm). Limit of detection, 5–10 µg/L [Delamoye *et al.* 2004]. Column: Altex C_{18}. Mobile phase: acetonitrile : water : phosphoric acid : triethylamine (58 : 42 : 0.1 : 0.06). Fluorescence detection (λ_{ex}= 280 nm, λ_{em}= 325 nm) [Wu *et al.* 1997]. Column: Hypersil CN (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : aqueous acetic acid (1%) containing 0.2% triethylamine (35 : 65, pH 3.6), flow rate 1.5 mL/min. Fluorescence detection (λ_{ex}= 230 nm, λ_{em}= 340 nm). Retention time 9.5 min. Limit of quantification, 5 µg/L, limit of detection, 2 µg/L [Rekhi *et al.* 1995]. Column: β-cyclodextrin (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : absolute ethanol : glacial acetic acid : triethylamine (96 : 4 : 0.4 : 0.3), flow rate 1.0 mL/min. Retention time: 16–18 min. Fluorescence detection (λ_{ex}= 222 nm, λ_{em}= 340 nm). Limit of detection, ~1.5 µg/L [Pham-Huy *et al.* 1995]. See also Nation *et al.* [1978] and Spahn-Langguth *et al.* [1991].

LC-MS Column: MSpak GF-310 (50 × 4.6 mm i.d., 6 µm). Mobile phase: 10 mmol/L ammonium acetate : acetonitrile (100 : 0 for 3 min to 0 : 100 at 4 min until 9.5 min), flow rate 0.55 mL/min. ESI, SRM acquisition mode. Limit of quantification, 10 µg/L. Limit of detection, 3 µg/L [Umezawa *et al.* 2008]. Column: Chirobiotic V (250 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : acetic acid : triethylamine (100 : 0.05 : 0.04 to 100 : 0.05 : 0.1 within 25 min to 100 : 0.05 : 0.04 for 5 min), flow rate 1 mL/min. APCI, SIM acquisition mode. Limit of detection, 0.03 µg/L [Siluk *et al.* 2007]. Column: LiChroCART (125 × 2 mm i.d.). Mobile phase: 5 mmol/L aqueous ammonium formate (pH 3.0) : acetonitrile (80 : 20 for 2.2 min to 60 : 40 at 2.21 min until 5.5 min to 10 : 90 at 5.51 min until 8 min to 80 : 20 at 8.01 min until 10 min), flow rate 0.4 mL/min for 5.5 min to 0.7 mL/min at 5.51 mL/min to 6.5 mL/min at 8.01 min to 0.4 mL/min at 9.51 min. APCI, positive ion mode, SIM acquisition mode. Limit of detection, 0.01 mg/L [Maurer *et al.* 2004].

Note For a radioimmunoassay for the quantification of propranolol see Mould *et al.* [1981].

Serum **HPLC** Limit of detection, 4 µg/L [Rumiantsev, Ivanova 1995]. See Plasma [Rekhi *et al.* 1995].

LC-MS Column: Hypersil BDS-C_{18}. Mobile phase: acetonitrile : methanol : water : acetic acid (15 : 15 : 70 : 1). Limit of detection, 0.1 to 1.2 µg/L [Kataoka *et al.* 1999].

Urine **GC-MS** Column: HP-5 (14 m × 0.2 mm i.d., 0.33 µm). Temperature programme: 30° for 2 min to 220° at 15°/min for 1 min to 260° at 5°/min to 320° at 15°/min for 3 min. Limit of detection, 40 µg/L [Hartonen, Riekkola 1996]. See Blood [Black *et al.* 1996]. Column: HP-1 (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 90° to 260° at 10°/min. EI ionisation, SIM acquisition. Limit of detection, 1 µmol/L for the acetyl conjugate of *N*-desisopropylpropranolol (1-acetamino-3-(1-naphthyloxy)-2-propanol) [Noda *et al.* 1995].

HPLC Column: reversed phase. Mobile phase: acetonitrile : methanol : 0.05% trifluoroacetic acid. DAD [Baranowska *et al.* 2009]. See Blood [Buszewski *et al.* 2009]. See Plasma [Pham-Huy *et al.* 1995]. Column: Chiracel OD (250 × 4.6 mm i.d., 10 µm). Mobile phase: hexane : ethanol : diethylamine (91 : 9 : 0.1), flow rate 1.0 mL/min. Fluorescence detection (λ_{ex}= 240 nm, λ_{em}= 320 nm). Limit of detection, 0.1 mg/L [Herring, Johnson 1993]. See Plasma [Spahn-Langguth *et al.* 1991]. See also Pritchard *et al.* [1979].

LC-MS See Serum [Kataoka *et al.* 1999]

Note For a review of HPLC methods for propranolol and other β-blockers, see Egginger *et al.* [1993].

Disposition in the Body Propranolol is rapidly and almost completely absorbed after oral administration but undergoes extensive first-pass metabolism with considerable intersubject variation. It is very soluble in lipids. It is rapidly distributed throughout the body with highest levels being found in the lungs, liver, kidney, brain and heart. It crosses the placenta; it is excreted in breast milk. Metabolic reactions include ring hydroxylation, *N*-demethylation, oxidative deamination and conjugation. In 48 h, ~10% of a dose is excreted in the urine as propranolol glucuronide and <4% as unchanged drug. Metabolites found in the urine, in free and conjugated forms, include naphthoxylactic acid (14–22% of the dose in 48 h) and the active metabolite, 4-hydroxypropranolol and its glucuronide (5–8% of the dose); propranolol glycol, *N*-desisopropylpropranolol, and naphthoxyacetic acid each account for <2% of the dose and 4-hydroxypropranolol sulfate accounts for ~18% of the dose. After IV doses, a greater proportion of naphthoxylactic acid (up to 40% of the dose) is excreted in the urine and 4-hydroxypropranolol is not found in the urine. <5% of a dose is eliminated in the faeces.

Therapeutic Concentration In plasma, usually in the range 0.05–1 mg/L. However, there is considerable intersubject variation and a correlation between plasma propranolol concentration and therapeutic effect has not been established.

After a single oral dose of 80 mg propranolol administered to 6 subjects, the following mean peak concentrations of drug and metabolites were found in the plasma after 2 h: propranolol 0.05 mg/L, naphthoxylactic acid 0.53 mg/L, 4-hydroxypropranolol 0.009 µg/mL, naphthoxyacetic acid 0.024 µg/mL, propranolol glycol 0.005 mg/L [Schneck *et al.* 1980].

Following oral administration of 160 mg twice a day to 12 subjects, mean steady-state plasma concentrations of 0.38 mg/L propranolol and 0.03 mg/L 4-hydroxypropranolol were reported [Charles *et al.* 1982].

Administration of a single 40-mg dose of propranolol hydrochloride either sublingually or orally to 14 severely hypertensive patients produced mean peak plasma concentrations of 0.147 mg/L at 34 min and 0.041 mg/L at 52 min [Mansur *et al.* 1998].

Toxicity Toxic effects have been associated with plasma concentrations >2 mg/L and fatalities with concentrations >4 mg/L.

In a suicide attributed to propranolol overdose, the following concentrations were found: blood 14 mg/L, brain 67 µg/g, liver 171 µg/g and urine 0.9 mg/L; alcohol was also present [Kristinsson, Johannesson 1977].

In a fatality resulting from the ingestion of 9.6 g of propranolol, in which death occurred 8 h after ingestion, the following postmortem tissue concentrations were reported: blood 20 mg/L, brain 6 µg/g, kidney 26 µg/g, liver 10 µg/g and lung 69 µg/g [Jones *et al.* 1982].

In a postmortem performed 5 days after a 60-year-old man was found dead near an empty box of Inderal, the following propranolol concentrations were reported: blood 7 mg/L, urine 0.28 mg/L and gastric contents 2000 mg/L; death was attributed to cardiocirculatory failure resulting from the suicidal ingestion of a massive dose of Inderal [Fucci, Offidani 2000].

Bioavailability 10–50% (mean, 30).

Half-life Plasma half-life, 3–6 h (dose-dependent elimination has been reported).

Volume of Distribution ≈4 L/kg.

Clearance Plasma clearance, ~10–20 mL/min/kg.

Distribution in Blood Plasma : whole blood ratio, ~1.3.

Protein Binding ≈90%.

Note For a review of the pharmacokinetics of long-acting propranolol, see Nace, Wood [1987]; see also Routledge, Shand [1979] and Silber *et al.* [1983]

Dose Propranolol hydrochloride 30 to 400 mg daily.

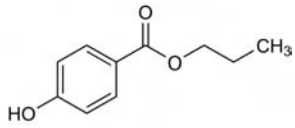
Propyl Hydroxybenzoate

Preservative
$C_{10}H_{12}O_3$ = 180.2
CAS—94-13-3

IUPAC Name Propyl 4-hydroxybenzoate
Synonyms 4-Hydroxybenzoic acid propyl ester; propagin; propyl parahydroxybenzoate; propylis oxybenzoas; propylparaben.
Proprietary Names *Nipasol M*; *Propyl Parasept*; *Solbrol P.* It is an ingredient of *Nipasept* and *Nipastat.*

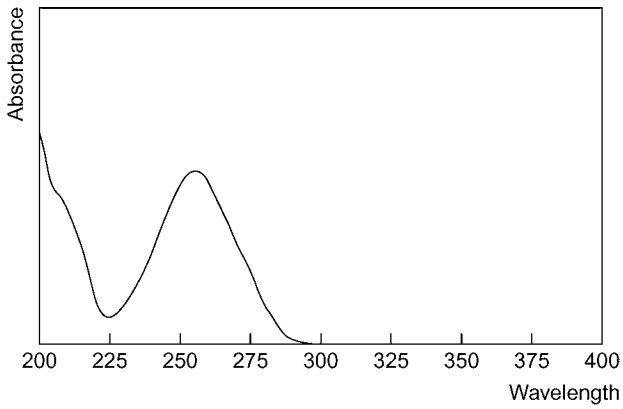


Chemical Properties Colourless crystals or a white crystalline powder. Mp 96° to 97°. Soluble 1 in 2500 of cold water, 1 in 400 of boiling water, 1 in 1.5 of ethanol, 1 in 4 of chloroform and 1 in 3 of ether. pK_a 8.4 (22°). Log *P* (octanol/water), 3.0.

Sodium Propyl Hydroxybenzoate

$C_{10}H_{11}NaO_3$ = 202.2
CAS—35285-69-9
Synonyms Sodium propylparaben; soluble propyl hydroxybenzoate.
Proprietary Name *Nipasol M Sodium*
Chemical Properties A white, hygroscopic, crystalline powder. Soluble 1 in 1 of water, 1 in 50 of ethanol and 1 in 2 of ethanol (50%).

Thin-layer Chromatography System TE—R_f 0.53; system TF—R_f 0.67; system TAD—R_f 0.56; system TAE—R_f 0.90.
Gas Chromatography System GA—RI 1567.
High Performance Liquid Chromatography System HX—RI 473; system HY—RI 458; system HAA—RT 18.3 min.
Ultraviolet Spectrum Aqueous acid—255 nm (A_1^1= 877b); aqueous alkali—296 nm (A_1^1= 1324b).

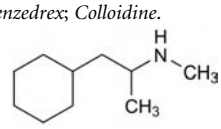


Infrared Spectrum Principal peaks at wavenumbers 1276, 1165, 1220, 1317, 1665, 1600 cm^{-1} (KBr disk).

Propylhexedrine

Sympathomimetic, Anorectic
$C_{10}H_{21}N$ = 155.3
CAS—101-40-6; 3595-11-7 (±)

IUPAC Name 1-Cyclohexyl-*N*-methylpropan-2-amine
Synonyms *N*,α-Dimethylcyclohexaneethanamine; hexahydrodesoxyephedrine; propylhexed.
Proprietary Names *Benzedrex*; *Colloidine.*

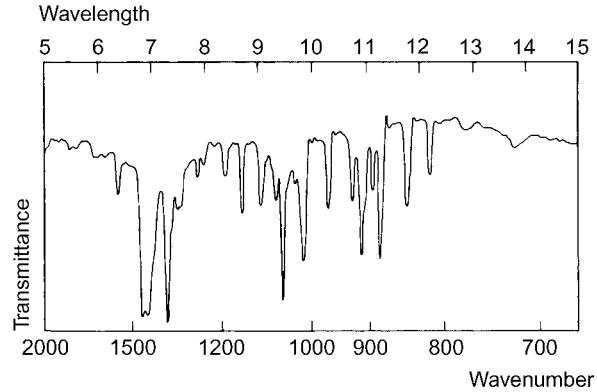


Chemical Properties A clear colourless liquid which slowly volatilises at room temperature and absorbs carbon dioxide from the air. Mass per mL 0.853–0.861 g. Bp about 204°. Very slightly soluble in water; miscible with ethanol, chloroform and ether. pK_a 10.7 (25°). Log *P* (octanol/water), 3.5.

Propylhexedrine Hydrochloride

$C_{10}H_{21}N$,HCl = 191.7
CAS—1007-33-6; 6192-95-6 (±)
Proprietary Name *Eventin(e)*
Chemical Properties A crystalline solid. Mp 127° to 128°, with decomposition. Soluble in water, ethanol and chloroform; slightly soluble in ether.

Thin-layer Chromatography System TA—R_f 0.26; system TB—R_f 0.34; system TE—R_f 0.34; system TAE—R_f 0.14; system TAJ—R_f 0.00; system TAK—R_f 0.24; system TAL—R_f 0.65 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—propylhexedrine RI 1175, propylhexedrine-TFA RI 1385, propylhexedrine-PFP RI 1385, propylhexedrine-AC RI 1570, M (OH-) RI 1475, M (OH-)-AC_2 RI 1915; system GB—RI 1192; system GC—RI 1500.
Ultraviolet Spectrum No significant absorption, 230–360 nm.
Infrared Spectrum Principal peaks at wavenumbers 1058, 1015, 885, 913, 1153, 966 cm^{-1} (propylhexedrine hydrochloride, Nujol mull).



Mass Spectrum Principal ions at *m/z* 58, 140, 67, 72, 83, 81, 155, 156.
Quantification
Serum **HPLC** Propylhexedrine and other sympathomimetics and amfetamines. Limit of detection, 0.01–0.03 mg/L (UV detection single wavelength) and 0.05–0.1 mg/L (DAD) [Bogusz *et al.* 1997].
LC–MS Limit of detection, 1–5 µg/L for propylhexedrine and other sympathomimetics and amfetamines [Bogusz *et al.* 2000].
Urine **HPLC** See Serum [Bogusz *et al.* 1997].
Disposition in the Body Norpropylhexedrine, cyclohexylacetoxime and *cis/trans*-4-hydroxypropylhexedrine have been identified as urinary metabolites.
Toxicity The estimated minimum lethal dose for children up to 2 years of age is 200 mg.

In a fatality attributed to propylhexedrine ingestion, the following postmortem tissue concentrations were reported: blood 35 mg/L, bile 20 mg/L, brain 24 µg/g, kidney 30 µg/g, liver 36 µg/g, lung 50 µg/g, urine 60 mg/L [Riddick, Reisch 1981].

The following postmortem tissue concentrations were reported in 2 fatalities involving IV abuse: blood 1.8 and 2.7 mg/L, kidney 1.5 and 9.5 µg/g, liver 2.8 and 11.8 µg/g, urine 12.6 mg/L (first case) [Sturner *et al.* 1974].

In a fatality attributed to acute IV propylhexedrine abuse, postmortem tissue concentrations were: blood 2 mg/L, bile 9.4 mg/L, kidney 4.0 µg/g, liver 7.4 µg/g, urine 69.5 mg/L [DiMaio, Garriott 1977].

Note For a review of propylhexedrine, see Wesson [1986].
Dose Usually 75 to 100 mg of propylhexedrine hydrochloride daily.

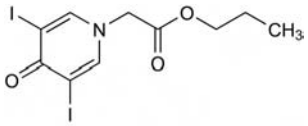
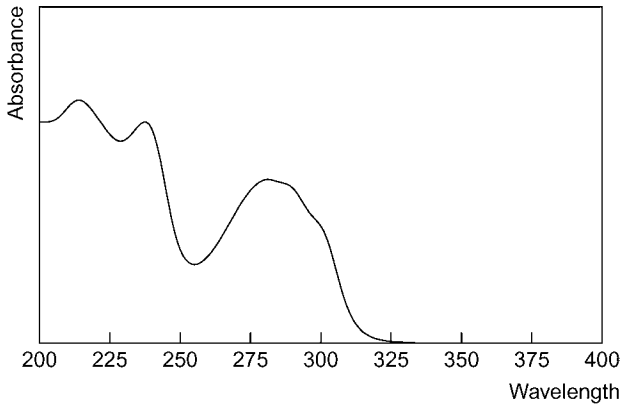
Propyliodone

Diagnostic Aid (Radiopaque Medium)
$C_{10}H_{11}I_2NO_3$ = 447.0
CAS—587-61-1

IUPAC Name Propyl 2-(3,5-diiodo-4-oxopyridin-1-yl)acetate
Synonyms 3,5-Diiodo-4-oxo-1(4*H*)-pyridineacetic acid propyl ester; propiodone.
Proprietary Name *Dionosil*



Chemical Properties A white crystalline powder. Mp 186° to 187°. Practically insoluble in water; soluble 1 in 500 of ethanol and 1 in 150 of chloroform; soluble in acetone and ether. Log *P* (octanol/water), 2.1.
Colour Test Iodine test—positive.
Thin-layer Chromatography System TA—R_f 0.81 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—not eluted.
Ultraviolet Spectrum Dehydrated alcohol—239 (A^1_1=320a), 281 nm (A^1_1=260a).

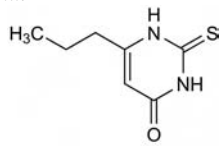


Infrared Spectrum Principal peaks at wavenumbers 1730, 1200, 1567, 1608, 751, 1227 cm^{-1} (KBr disk).
Uses Administered as a 50% aqueous suspension or as a 60% oily suspension.

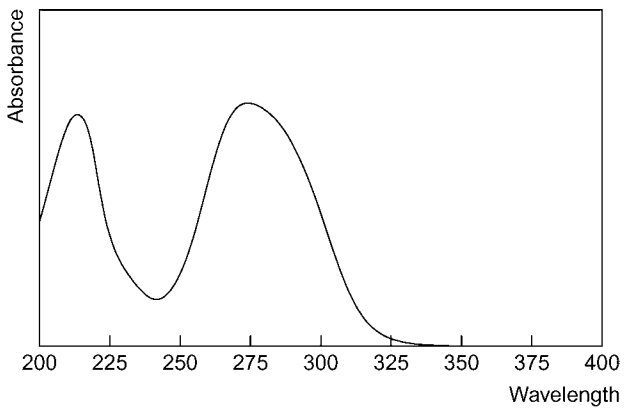
Propylthiouracil

Antihyperthyroid
$C_7H_{10}N_2OS$ = 170.2
CAS—51-52-5

IUPAC Name 6-Propyl-2-sulfanylidene-1*H*-pyrimidin-4-one
Synonym 2,3-Dihydro-6-propyl-2-thioxo-4(1*H*)pyrimidinone
Proprietary Names *Propacil*; *Propycil*; *Propylthiocil*; *Propyl-Thyracil*; *Prothiucil*; *Thyreostat II*; *Tiotil*.



Chemical Properties White or pale cream-coloured crystals or crystalline powder. Mp 219° to 221°. Soluble 1 in about 900 of water, 1 in about 60 of ethanol and 1 in 60 of acetone; slightly soluble in chloroform and ether; soluble in solutions of alkali hydroxides. pK_a 8.3 (20°). Log *P* (octanol/water), 1.0.
Ultraviolet Spectrum Aqueous acid—275 nm (A^1_1= 987b); aqueous alkali—260 nm (A^1_1= 703a).



Infrared Spectrum Principal peaks at wavenumbers 1658, 1563, 1193, 1625, 1166, 1241 cm^{-1} (KBr disk).
Quantification
Blood **HPLC** UV detection. Limit of detection, 300 µg/L [Kim 1983].
Plasma **HPLC** Limit of detection, 40 µg/L [Cannell *et al.* 1991].
Serum **RIA** Limit of detection, 2.5 ng [Cooper *et al.* 1981].
Disposition in the Body Rapidly and almost completely absorbed after oral administration; concentrated in the thyroid. Metabolised by conjugation with glucuronic acid and sulfate. Less than 10% of a dose is excreted in the urine as unchanged drug.
Therapeutic Concentration
Following a single oral dose of 400 mg to 17 subjects, serum concentrations of 1.6–7.5 mg/L (mean 4.2) were reported at 1 h [Kampmann, Hansen 1981a].
A single oral administration of 300 mg to 7 subjects produced peak plasma concentrations of 3.50 mg/L about 2 h after a conventional-release tablet and 0.50–1.25 mg/L about 3 h after sustained-release tablets [Kabanda *et al.* 1996].
Half-life Plasma half-life, ≈1–2 h, increased in renal failure.
Volume of Distribution About 0.4 L/kg.
Clearance Plasma clearance, ≈4 mL/min/kg.
Protein Binding ≈80%.
Note For a review of the pharmacokinetics of antithyroid drugs, see Kampmann and Hansen [1981b].
Dose Initially 200 to 600 mg daily; maintenance, 50 to 200 mg daily.

Cannell GR *et al.* (1991). Selective liquid chromatographic assay for propylthiouracil in plasma. *J Chromatogr* 564: 310–314.

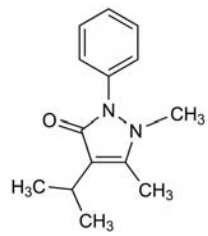
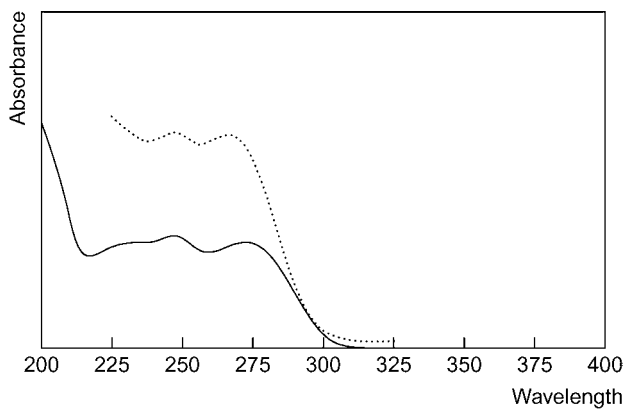
Propyphenazone

Analgesic
$C_{14}H_{18}N_2O$ = 230.3
CAS—479-92-5

IUPAC Name 1,5-Dimethyl-2-phenyl-4-propan-2-ylpyrazol-3-one
Synonyms 1,2-Dihydro-1,5-dimethyl-4-(1-methylethyl)-2-phenyl-3*H*-pyrazol-3-one; isopropylantipyrine; isopropylphenazone; propifenazona.
Proprietary Names *Cibalgina*; *Demex*; *Dim-Antos*; *Eufibron*; *Isoprochin P*; *Pireuma*.

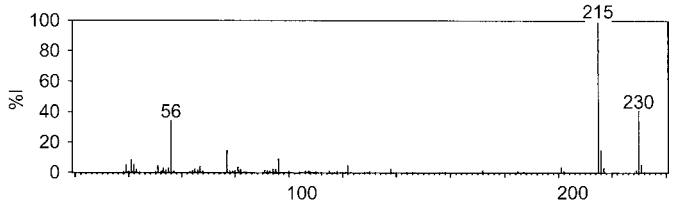


Chemical Properties White crystals or white crystalline powder. Mp 103°. Soluble 1 in 400 of water; freely soluble in ethanol and chloroform; soluble in ether. Log *P* (octanol/water), 1.9. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].
Colour Tests Ferric chloride—orange; Liebermann's reagent (100°)—blue (red with water).
Thin-layer Chromatography System TA—R_f 0.71; system TB—R_f 0.32; system TD—R_f 0.61; system TE—R_f 0.74; system TF—R_f 0.49; system TAD—R_f 0.65; system TAE—R_f 0.81 (acidified potassium permanganate solution, positive).
Gas Chromatography System GA—RI 1920; system GB—RI 2030; system GF—RI 2310.
High Performance Liquid Chromatography System HD—*k* 1.3; system HW—*k* 11.0; system HX—RI 441; system HY—RI 370; system HZ—retention time 4.7 min.
Ultraviolet Spectrum Aqueous acid—240 nm (A^1_1=400a); aqueous alkali—245 (A^1_1=385b), 265 nm.



P

Infrared Spectrum Principal peaks at wavenumbers 1650, 1618, 1131, 1590, 1500, 750 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 215, 230, 56, 77, 216, 96, 41, 39.



Quantification
***Plasma* HPLC** UV detection. Limit of detection, 100 µg/L [Rouan *et al.* 1992].
Dose Propyphenazone has been given in doses of 0.3 to 1.5 g daily.

Demme U *et al.* (2005). Systematic evaluation of 1-chlorobutane for liquid-liquid extraction of drugs. *Proceedings of the 12th TIAFT*, Seoul: 481–486.

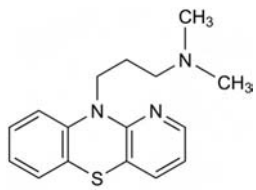
Prothipendyl

Tranquilliser
$C_{16}H_{19}N_3S$ = 285.4
CAS—303-69-5
IUPAC Name *N,N*-Dimethyl-3-pyrido[3,2-*b*][1,4]benzothiazin-10-ylpropan-1-amine
Synonyms *N,N*-Dimethyl-10*H*-pyrido[3,2-*b*][1,4]benzothiazine-10-propanamine; phrenotropin.
Proprietary Name *Dominal*.

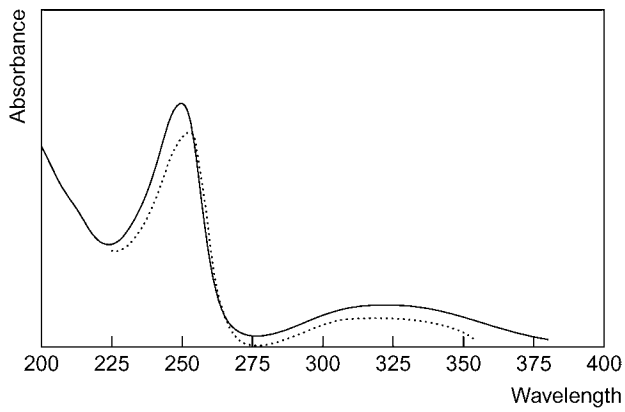


Chemical Properties pK_a 2.3 (25°). Log *P* (octanol/water), 4.0. Extraction yield (chlorobutane), 0.95 [Demme *et al.* 2005].

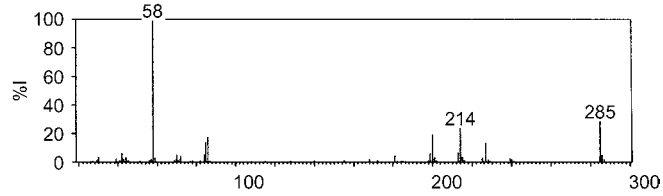
Prothipendyl Hydrochloride

$C_{16}H_{19}N_3S,HCl,H_2O$ = 339.9
CAS—1225-65-6 (anhydrous)
Chemical Properties A crystalline powder. Mp 108° to 112°. Freely soluble in water and methanol; practically insoluble in ether.

Colour Test Marquis test—orange.
Thin-layer Chromatography System TA—R_f 0.47; system TAE—R_f 0.15; system TAF—R_f 0.29; system TAG—R_f 0.09; system TB—R_f 0.43; system TC—R_f 0.23; system TE—R_f 0.59 (acidified iodoplatinate solution—positive; Dragendorff spray—positive; FPN reagent—yellow; Marquis test—orange).
Gas Chromatography System GA—prothipendyl RI 2345, M (OH-) RI 2720, M (OH-)(ring) RI 2800, M (ring) RI 2045, M (sulfoxide) RI 2750; system GF—RI 2800.
High Performance Liquid Chromatography System HA—*k* 4.4; system HX—RI 388.
Ultraviolet Spectrum Aqueous acid—242 nm (A^1_1 = 928a); aqueous alkali—250 nm (A^1_1 = 909a), 320 nm (A^1_1 = 163b).



Infrared Spectrum Principal peaks at wavenumbers 757, 1295, 780, 1592, 1162, 1110 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 58, 285, 214, 200, 86, 227, 85, 213.

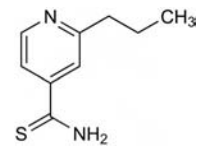


Quantification
***Plasma* HPLC** Chrompack CP sphere C_8 (100 × 3.0 mm i.d.). Mobile phase: 0.05 mol/L sodium dihydrogen phosphate : acetonitrile (30 : 70, pH 2.2), flow rate 0.8 mL/min. UV detection (λ = 210 nm). Limit of detection not reported [Debailleul *et al.* 1991].
Disposition in the Body
Toxicity
In 2 cases of fatal poisoning with prothipendyl, the highest concentrations were found in the liver (1.2–1.8 mg/g) and kidney (0.6 mg/g), which far exceeded those found in blood (which in one death, was 200 times over the therapeutic range). It was suggested that more than 4 g prothipendyl is fatal [Wu *et al.* 1994].
Dose The equivalent of up to 960 mg of prothipendyl daily.

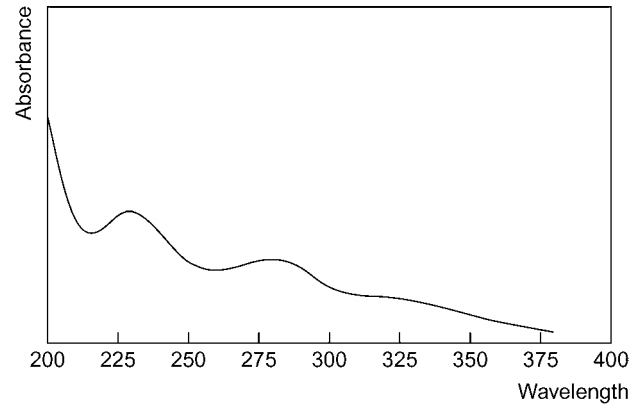
Debailleul G *et al.* (1991). HPLC quantification of zolpidem and prothipendyl in a voluntary intoxication. *J Anal Toxicol* 15: 35–37.
Demme U *et al.* (2005). Systematic evaluation of 1-chlorobutane for liquid-liquid extraction of drugs. *Proceedings of the 12th TIAFT*, Seoul: 481–486.
Wu M *et al.* (1994). *[Suicide with prothipendyl]. Arch Kriminol* 193: 158–162.

Protionamide

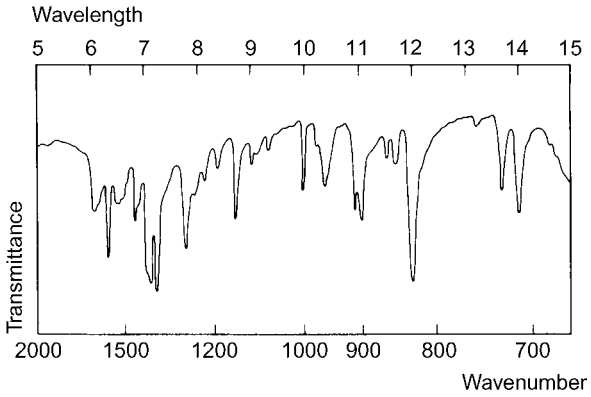
Tuberculostatic
$C_9H_{12}N_2S$ = 180.3
CAS—14222-60-7
IUPAC Name 2-Propylpyridine-4-carbothioamide
Synonyms 2-Propyl-4-pyridinecarbothioamide; prothionamide.
Proprietary Names *Ektebin*; *Peteha*; *Trevintix*.



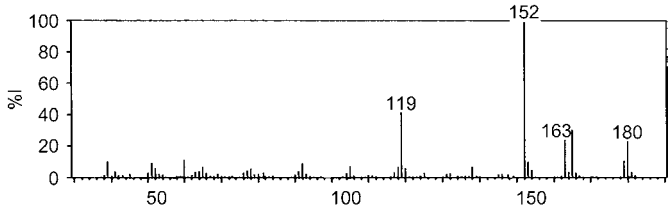
Chemical Properties Yellow crystals or crystalline powder. Mp 142°. Practically insoluble in water; soluble 1 in 30 of ethanol, 1 in 200 of chloroform, 1 in 300 of ether and 1 in 16 of methanol; soluble in acetone. Log *P* (octanol/water), 2.0.
Colour Tests Nessler's reagent—brown-orange; palladium chloride—brown.
Thin-layer Chromatography System TA—R_f 0.66; system TAE—R_f 0.77; system TL—R_f 0.57; system TB—R_f 0.01; system TC—R_f 0.38 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1816.
Ultraviolet Spectrum Ethanol—291 nm (A^1_1=390b).



Infrared Spectrum Principal peaks at wavenumbers 828, 1590, 1284, 902, 1148, 710 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 152, 119, 165, 163, 180, 60, 179, 153.



Quantification
Plasma **HPLC** UV detection. Limit of detection, 10 µg/L [Jenner, Ellard 1981].
Serum **HPLC** UV detection. Limit of detection, 27 µg/L [Bartels, Bartels 1998]. UV detection. Limit of detection, 10 µg/L [Jenner, Ellard 1981].
Urine **HPLC** UV detection. Limit of detection, 10 µg/L [Jenner, Ellard 1981].
Disposition in the Body Readily absorbed after oral administration. Metabolised to the sulfoxide and excreted in the urine mainly as metabolites.
Therapeutic Concentration
Following a single oral dose of 500 mg to 10 subjects, mean peak plasma concentrations of 3 mg/L of unchanged drug and 2.7 mg/L of the sulfoxide were attained in 1 h [Pütter 1972].
Dose Usually 0.5 to 1 g daily.

Bartels H, Bartels R (1998). Simple, rapid and sensitive determination of protionamide in human serum by high-performance liquid chromatography. *J Chromatogr B Biomed Sci Appl* 707: 338–341.

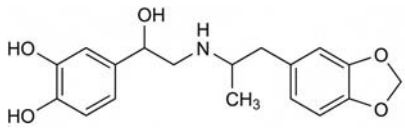
Protokylol

Bronchodilator
$C_{18}H_{21}NO_5$ = 331.4
CAS—136-70-9
IUPAC Name 4-[2-[1-(1,3-Benzodioxol-5-yl)propan-2-ylamino]-1-hydroxyethyl]benzene-1,2-diol
Synonyms 4-[2-[[2-(1,3-Benzodioxol-5-yl)-1-methylethyl]amino]-1-hydroxyethyl]-1,2-benzenediol; protochylol.

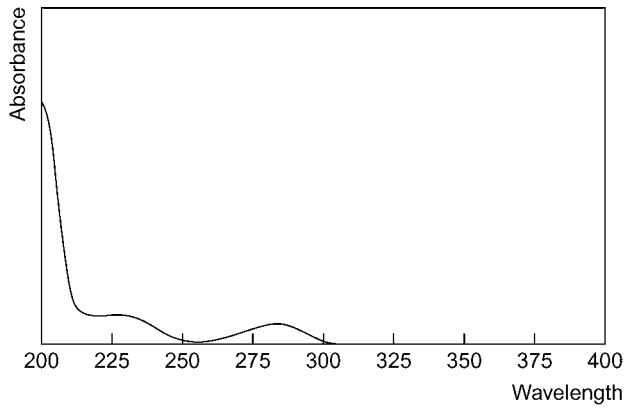


Chemical Properties Log *P* (octanol/water), 1.8.

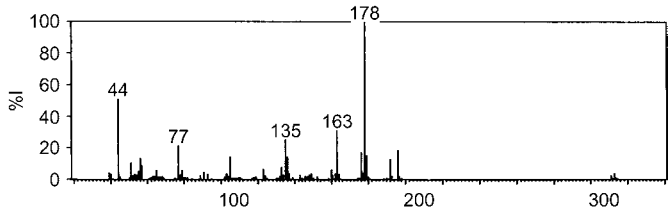
Protokylol Hydrochloride
$C_{18}H_{21}NO_5$,HCl = 367.8
CAS—136-69-6
Synonym JB-251
Proprietary Names *Caytime*; *Ventaire*.
Chemical Properties A white crystalline powder. Mp 126° to 127°. Soluble in water.

Colour Tests Ammoniacal silver nitrate—red-grey/brown; ferric chloride—green; Folin–Ciocalteu reagent—blue; Liebermann's reagent—black; Mandelin's test—yellow→brown; Marquis test—grey-green; methanolic potassium hydroxide—orange→yellow; Nessler's reagent—black; potassium dichromate—brown→red-brown (on warming).

Thin-layer Chromatography System TA—R_f 0.65; system TB—R_f 0.01; system TC—R_f 0.03; system TL—R_f 0.06; system TAJ—R_f 0.00; system TAK—R_f 0.02; system TAL—R_f 0.48 (acidified potassium permanganate solution, positive).
Gas Chromatography System GA—RI 1487.
High Performance Liquid Chromatography System HA—*k* 3.1 (tailing peak).
Ultraviolet Spectrum Aqueous acid—281 nm (A_1^1=168b).



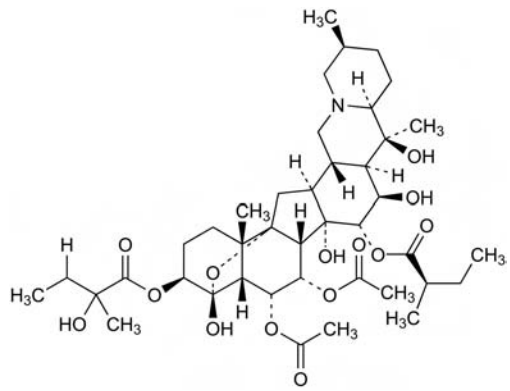
Infrared Spectrum Principal peaks at wavenumbers 1492, 1250, 1271, 1227, 1036, 1128 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 178, 44, 163, 135, 77, 196, 176, 179.



Dose Protokylol hydrochloride has been given in doses of 8 to 16 mg daily.

Protoveratrine A and B

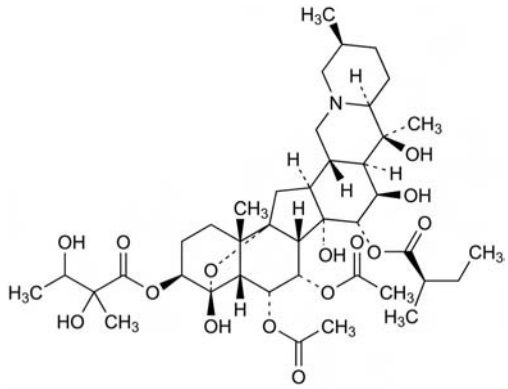
Antihypertensive
$C_{41}H_{63}NO_{14}$ = 793.9
CAS—143-57-7
IUPAC Name [3β(*S*),4α,6α,7α,15α(*R*),16β]-4,9-Epoxycevane-3,4,6,7,14,15,16,20-octol 6,7-diacetate
Proprietary Name *Protalba*



Chemical Properties An alkaloid obtained from the roots and rhizomes of white veratrum, *Veratrum album* (Liliaceae). White crystals. Mp 267° to 269°, with decomposition. Practically insoluble in water; soluble in hot ethanol and in chloroform.

Protaveratrine B
$C_{41}H_{63}NO_{15}$ = 809.9
CAS—124-97-0
IUPAC Name [3β(2*R*,3*R*),4α,6α,7α,15α(*R*),16β]-4,9-Epoxycevane-3,4,6,7,14,15,16,20-octol 6,7-diacetate
Synonyms Neoprotoveratrine; veratetrine.

P

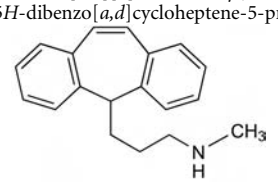


Protoveratrines A and B
CAS—8053-18-7
Proprietary Names *Provell*; *Tensatrin*.
Chemical Properties A white crystalline powder with a strong sternutatory action. Mp 256° to 262°, with decomposition. Practically insoluble in water; soluble in chloroform; very slightly soluble in ether. It is rapidly decomposed in alkaline and alcoholic solutions.

Thin-layer Chromatography Protoveratrine A: System TA—R_f 0.72. Protoveratrine B: System TA—R_f 0.70 (acidified iodoplatinate solution, positive; acidified potassium permanganate solution, positive).
Gas Chromatography System GA—protoveratrines A and B, RI 2465.
Infrared Spectrum Principal peaks at wavenumbers 1742, 1200, 1182, 1240, 1150, 1055 cm^{-1} (protoveratrines A and B, KCl disk).
Dose Protoveratrines A and B have been given in a dose of 1.6 to 6 mg daily.

Protriptyline

Tricyclic Antidepressant
$C_{19}H_{21}N$ = 263.4
CAS—438-60-8
IUPAC Name 3-(5*H*-Dibenzo[*a*,*d*][7]annulen-5-yl)-*N*-methylpropan-1-amine
Synonym *N*-Methyl-5*H*-dibenzo[*a*,*d*]cycloheptene-5-propanamine

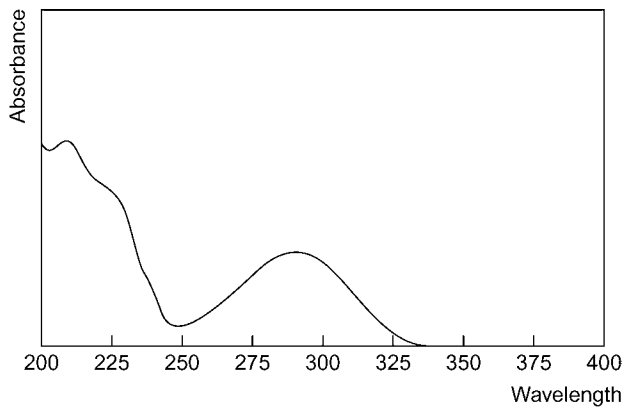


Chemical Properties Log *P* (octanol/water), 4.9.

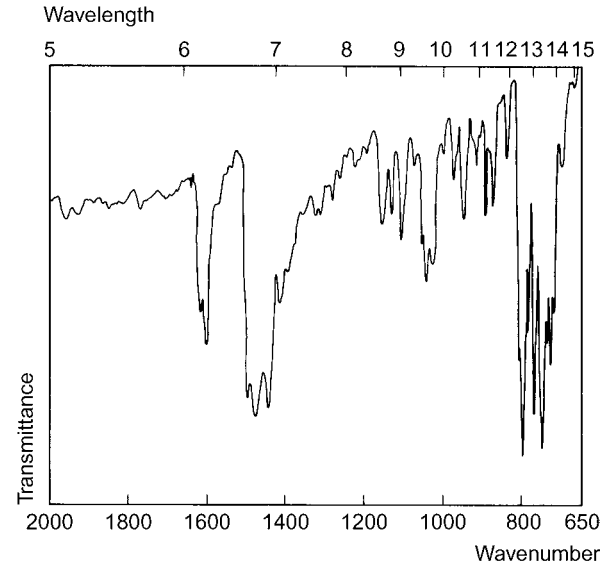
Protriptyline Hydrochloride

$C_{19}H_{21}N,HCl$ = 299.8
CAS—1225-55-4
Proprietary Names *Concordin(e)*; *Triptil*; *Vivactil*.
Note The name *Vivactil* has also been applied to a vitamin/amino acid preparation.
Chemical Properties A white to yellowish powder. Mp ≈169° to 171°. Soluble 1 in 2 of water, 1 in 3.5 of ethanol and 1 in 2.5 of chloroform; practically insoluble in ether. pK_a 8.2.

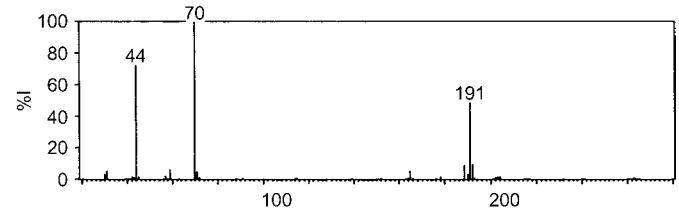
Colour Tests Mandelin's test—violet-brown; Marquis test—green; sulfuric acid—green.
Thin-layer Chromatography System TA—R_f 0.19; system TB—R_f 0.18; system TC—R_f 0.07; system TE—R_f 0.38; system TAE—R_f 0.6; system TAF—R_f 0.69; system TAG—R_f 0.02 (acidified iodoplatinate solution—positive).
Gas Chromatography System GA—RI 2253; system GB—RI 2329, M (nor-) RI 2343; system GF—RI 2590; system GM—RRT 0.878.
High Performance Liquid Chromatography System HA—*k* 2.10; system HF—*k* 3.60; system HX—RI 418; system HY—RI 362.
Ultraviolet Spectrum Methanolic acid—292 nm (A_1^1 = 530a). No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 792, 750, 768, 1490, 730, 1595 cm^{-1} (protriptyline hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 70, 44, 191, 192, 188, 59, 165, 71 (protriptyline) ; 44, 70, 179, 178, 207, 280, 250, 236 (10,11-dihydro-10,11-dihydroxyprotriptyline) ; 70, 44, 207, 178, 279, 249, –, – (10-hydroxyprotriptyline).



Quantification
Plasma **GC-MS** Column: 3% OV-17 or 1% SE-30 on 100/120 mesh Gas Chrom Q (500 × 6 mm o.d.). Carrier gas: He, 30 mL/min. Temperature programme: 180° to 220°. EI ionisation at 70 eV. Limit of detection, 10 µg/L [Biggs *et al.* 1976].

HPLC Column: µBondapak C_{18} (300 × 4 mm i.d.). Mobile phase: acetonitrile : 45 mmol/L potassium dihydrogen phosphate (pH 3.0; 35 : 65), flow rate 1.5 mL/min. UV detection (λ = 235 nm). Retention time: 8.2 min. Limit of detection, 60 µg/L [Hackett, Dusci 1979].

Serum **GC** Column: 3% OV-225 on 100/120 mesh Supelcoport (1 m × 2 mm i.d.). Carrier gas: N_2, 25 mL/min. Temperature programme: room temperature to 250° at 2°/min. NPD. Retention time: 0.93 min. Limit of detection, 10 to 20 µg/L [Kristinsson 1981]. Column: SPB-1 100% polymethylsiloxane (60 m × 0.75 mm i.d., 1.0 µm). Carrier gas: He, 8 mL/min. Temperature: 260°. NSD. Retention time: ~7 min. Limit of detection, 25 µg/L [Rifai *et al.* 1988].

Disposition in the Body Protriptyline is slowly but well absorbed after oral administration; bioavailability is 75–90% (10–25% first-pass metabolism). It is metabolised by oxidation to form the 10-hydroxy and 10,11-dihydro-10,11-dihydroxy derivatives and 5,10-dihydro-10-formylanthracen-5-ylpropylamine; glucuronic acid conjugation also occurs. Approximately 50% of a dose is excreted in the urine in 16 days, with only small amounts of unchanged drug; 2% of a dose is eliminated in the faeces.

Therapeutic Concentration In plasma, usually in the range 0.07–0.25 mg/L.
After a single oral dose of 30 mg in 8 subjects, peak plasma concentrations of 0.010–0.022 mg/L (mean, 0.014) were attained in 6–12 h [Biggs *et al.* 1976; Ziegler *et al.* 1978].
Following daily oral doses of 40 mg to 30 subjects, steady-state plasma concentrations of 0.11–0.38 mg/L (mean, 0.22) were reported [Moody *et al.* 1977].

Toxicity Toxic effects are associated with plasma concentrations greater than 0.5 mg/L; concentrations above 1 mg/L may be lethal.
Half-life Plasma half-life, during chronic dosing, ~3–8 days (mean, 4).
Volume of Distribution ~22 L/kg.
Clearance Plasma clearance, 2–5 mL/min/kg.
Protein Binding ~92%.
Note For a review of tricyclic antidepressants see Molnar, Gupta [1980].
Dose 15 to 60 mg of protriptyline hydrochloride daily.

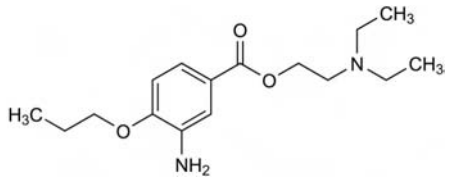
Proxymetacaine

Anaesthetic (Local)
$C_{16}H_{26}N_2O_3$ = 294.4
CAS—499-67-2

IUPAC Name 2-Diethylaminoethyl 3-amino-4-propoxybenzoate
Synonyms 3-Amino-4-propoxybenzoic acid 2-(diethylamino)ethyl ester; proparacaine.

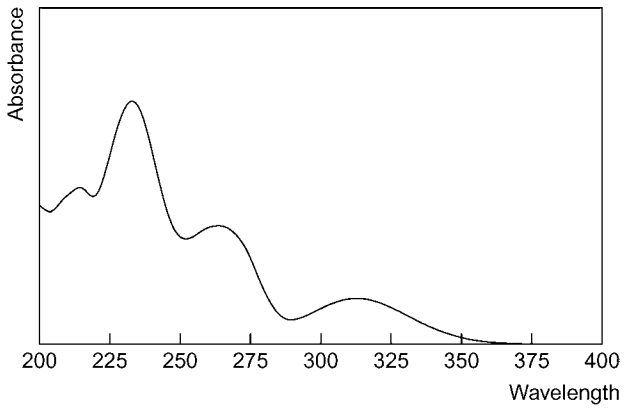


Chemical Properties Log *P* (octanol/water), 3.2.

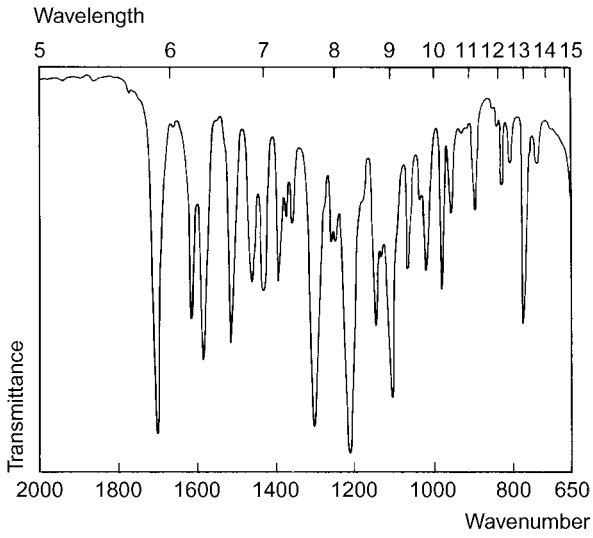
Proxymetacaine Hydrochloride

$C_{16}H_{26}N_2O_3$,HCl = 330.9
CAS—5875-06-9
Proprietary Names *Ak-Taine*; *Alcaine*; *Anestalcon*; *Diocaine*; *Kéracaine*; *Ocu-Caine*; *Ophthaine*; *Ophthetic*; *Parcaine*; *Visonest*.
Chemical Properties A white or faintly buff-coloured crystalline powder. It discolours on heating or exposure to air and solutions exposed to air become yellow and then dark brown. Mp 182° to 183°. Soluble 1 in 30 of water and 1 in 50 of ethanol; practically insoluble in ether; soluble in chloroform and methanol.

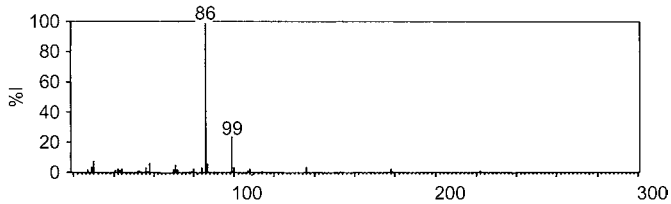
Colour Tests Coniferyl alcohol—orange; diazotisation—red; ninhydrin—yellow.
Thin-layer Chromatography System TA—R_f 0.62; system TB—R_f 0.26; system TC—R_f 0.41; system TL—R_f 0.35 (acidified iodoplatinate solution, positive; Van Urk reagent, yellow).
Gas Chromatography System GA—RI 2323.
High Performance Liquid Chromatography System HA—*k* 2.1; system HQ—*k* 1.38; system HY—RI 269.
Ultraviolet Spectrum Water—231 nm, 268 nm (A_1^1=326b), 310 nm (A_1^1=182a).



Infrared Spectrum Principal peaks at wavenumbers 1213, 1708, 1305, 1104, 1590, 1520 cm^{-1} (proxymetacaine hydrochloride, KCl disk).



Mass Spectrum Principal ions at *m/z* 86, 99, 30, 87, 58, 71, 136, 100.

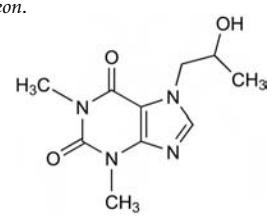


Use Proxymetacaine hydrochloride is used as a 0.5% ophthalmic solution.

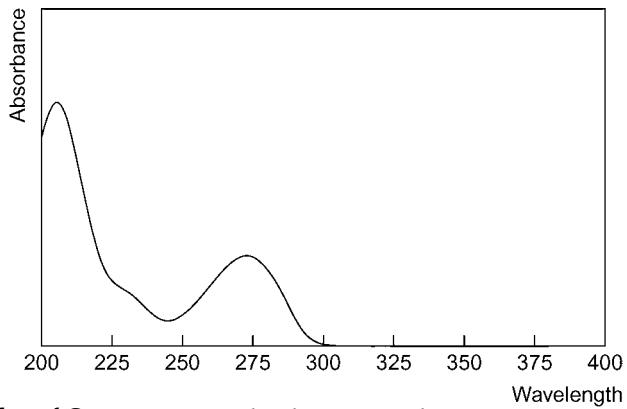
Proxyphylline

Xanthine Bronchodilator
$C_{10}H_{14}N_4O_3$ = 238.2
CAS-603-00-9

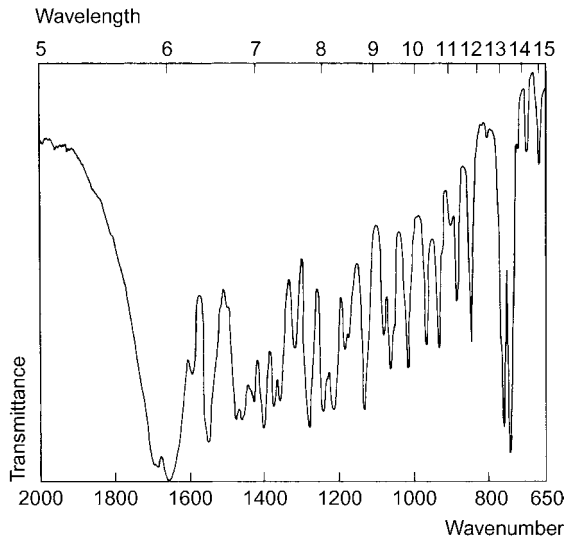
IUPAC Name 7-(2-Hydroxypropyl)-1,3-dimethylpurine-2,6-dione
Synonym 3,7-Dihydro-7-(2-hydroxypropyl)-1,3-dimethyl-1*H*-purine-2,6-dione
Proprietary Names *Brontyl*; *Neofyllin*; *Pantafillina*; *Purofilina*; *Spantin*; *Spasmolysin*; *Thean*; *Theon*.



Chemical Properties A white crystalline powder. Mp 135° to 136°. Soluble 1 in 1 of water, 1 in 12 of ethanol, 1 in 6 of chloroform and 1 in 500 of ether. Log *P* (octanol/water), −0.8.
Colour Test Amalic acid test—yellow/violet.
Thin-layer Chromatography System TA—R_f 0.58; system TB—R_f 0.02; system TC—R_f 0.33; system TE—R_f 0.49; system TL—R_f 0.29; system TAE—R_f 0.71 (acidified potassium permanganate solution, positive).
Gas Chromatography System GA—RI 2103.
High Performance Liquid Chromatography System HA—*k* 0.1; system HX—RI 293.
Ultraviolet Spectrum Aqueous acid—273 nm (A_1^1=372a). No alkaline shift.

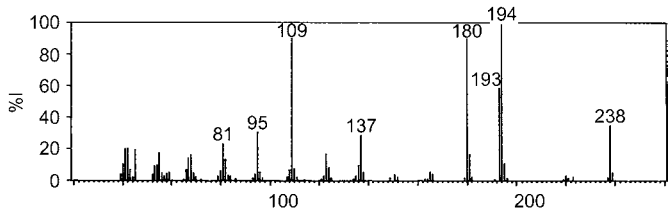


Infrared Spectrum Principal peaks at wavenumbers 1656, 1690, 750, 1538, 763, 1282 cm^{-1} (KBr disk).



P

Mass Spectrum Principal ions at *m/z* 194, 180, 109, 193, 238, 95, 137, 81.



Quantification

Plasma **GC** ECD. Limit of detection, 100 µg/L [Arbin *et al.* 1976].

HPLC Limit of detection, 0.2 mg/L for (*R*)- and (*S*)-proxyphylline [Ruud-Christensen *et al.* 1989].

Serum **HPLC** UV detection. Limit of detection, 12 µg/L [Selvig, Bjerve 1977].

Disposition in the Body Proxyphylline is rapidly and completely absorbed after oral administration. More than 95% of a dose is excreted in the urine in 96 h with about 30% as unchanged drug, 58% as 1-methyl-7-(2-hydroxypropyl)xanthine, 10% as proxyphylline glucuronide and 2% as 1-methyl-7-(2-hydroxypropyl) uric acid.

Therapeutic Concentration

After a single oral dose of 400 mg given to 5 subjects, plasma concentrations of 7 to 13 (mean 10) mg/L were attained in 1 h. Oral dosing of 5 subjects with 400 mg three times a day for 5 days, produced peak plasma concentrations of 12 to 25 (mean 18) mg/L on the 5th day [Graffner *et al.* 1973].

Half-life Plasma half-life, 8 to 12 (mean 9) h.

Volume of Distribution About 0.6 L/kg.

Clearance Plasma clearance, about 0.8 mL/min/kg.

Dose Usually 900 mg daily.

Arbin A *et al.* (1976). Determination of proxyphylline and dyphylline in capillary blood samples by means of electron capture gas chromatography. *Acta Pharm Suec* 13: 235–240.

Graffner C *et al.* (1973). Pharmacokinetic studies on proxyphylline administered intravenously and orally to man. *Acta Pharm Suec* 10: 425–434.

Ruud-Christensen M *et al.* (1989). High-performance liquid chromatographic determination of (R)-and (S)-proxyphylline in human plasma. *J Chromatogr* 491: 355–366.

Selvig K, Bjerve KS (1977). Determination of serum proxiphylline by high-pressure liquid chromatography. *Scand J Clin Lab Invest* 37: 373–378.

Pseudoephedrine

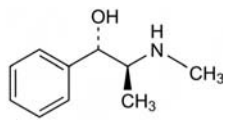
Sympathomimetic

$C_{10}H_{15}NO = 165.2$

CAS—90-82-4

IUPAC Name (1*S*,2*S*)-2-(Methylamino)-1-phenylpropan-1-ol

Synonyms *d*-ψ-Ephedrine; *d*-isoephedrine; (α*S*)-α-[(1*S*)-1-(methylamino) ethyl]benzenemethanol.



Chemical Properties An alkaloid obtained from Ephedra spp. It is a stereoisomer of ephedrine. Mp 118.0° to 118.7° (crystals from ether). Sparingly soluble in water; freely soluble in ethanol and ether. pK_a 9.8. Log *P* (octanol/water), 0.9. Extraction yield (chlorobutane), 0.2 [Demme *et al.* 2005].

Pseudoephedrine Hydrochloride

$C_{10}H_{15}NO,HCl = 201.7$

CAS—345-78-8

Proprietary Names *Afrin*; *Allermed*; *Bronalin Decongestant*; *Cenafed*; *Contac*; *Decofed*; *DeFed*; *Dimetapp Decongestant*; *Dorcol Children's Decongestant*; *Drixoral Non-Drowsy*; *Efidac*; *Galpseud*; *Genaphed*; *Halofed*; *Seudotabs*; *Silfedrine*; *Sinustop Pro*; *Sudafed*; *Triaminic Decongestant*. It is an ingredient of many proprietary preparations [Sweetman 2002].

Chemical Properties White crystals or powder. Mp 182.5° to 183.5°. A solution in water is dextrorotatory. Soluble 1 in 1.6 of water, 1 in 4 of ethanol and 1 in 60 of chloroform; very slightly soluble in ether.

Pseudoephedrine Sulfate

$(C_{10}H_{15}NO)_2,H_2SO_4 = 428.5$

CAS—7460-12-0

Synonym Sch-4855

Proprietary Names *Drixora*; *Afrinol*.

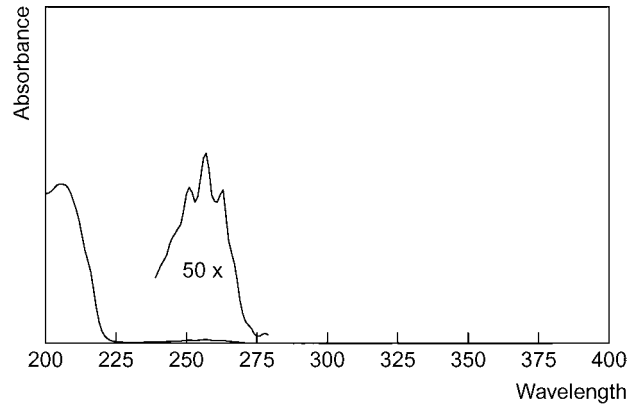
Chemical Properties A white crystalline powder. Mp 174° to 179°. A solution in water is dextrorotatory. Soluble in water.

Thin-layer Chromatography System TA—R_f 0.33; system TB—R_f 0.05; system TC—R_f 0.04; system TE—R_f 0.17; system TL—R_f 0.63; system TAE—R_f 0.09; system TAJ—R_f 0.00; system TAK—R_f 0.01; system TAL—R_f 0.30 (acidified potassium permanganate solution, positive).

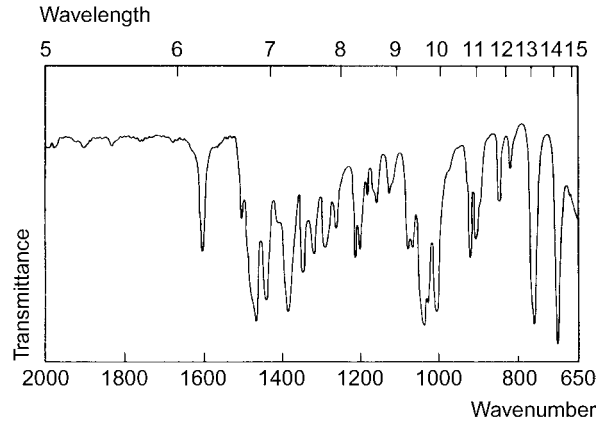
Gas Chromatography System GA—RI 1365; system GB—RI 1410; system GC—RI 1543.

High Performance Liquid Chromatography System HA—pseudoephedrine *k* 1.2, norpseudoephedrine *k* 1.0; system HB—*k* 5.90; system HC—*k* 1.77; system HX—RI 237; system HY—RI 230.

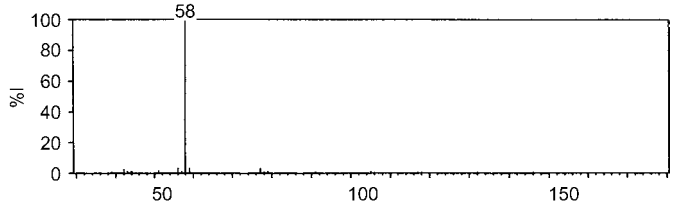
Ultraviolet Spectrum Aqueous acid—251, 257 (A_1^1= 11.9a), 263 nm. No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 704, 1036, 764, 1005, 1210, 1595 cm^{-1} (pseudoephedrine hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 58, 77, 59, 56, 51, 42, 105, 91.



Quantification

Plasma **GC** ECD. Pseudoephedrine and norpseudoephedrine. Limit of detection, 20 µg/L for pseudoephedrine [Lo *et al.* 1981].

HPLC Spectrophotometric detection. Limit of quantification, 5.8 µg/L [Macek *et al.* 2002]. Limit of detection, 12 µg/L [Guo *et al.* 1999]. Fluorescence detection. Limit of quantification, 1 µg/L for pseudoephedrine and ephedrine [Shao *et al.* 1995].

RIA Limit of detection, 0.2–2.5 µg/L [Findlay *et al.* 1981].

Serum **GC** ECD. Limit of detection, 20 µg/L [Sun, Leveque 1979].

Urine **GC** NPD. For method for quantification of pseudoephedrine and other ephedrines, see Van Eenoo *et al.* [2001]. ECD. For method for quantification of pseudoephedrine and norpseudoephedrine, see Lo *et al.* [1981].

HPLC UV detection. Imaz *et al* 2005]. Limit of quantification, 0.5 mg/L for pseudoephedrine and other ephedrines [van der Merwe *et al.* 1994]. ECD. For method for quantification of pseudoephedrine and norpseudoephedrine, see Lo *et al.* [1981].

Disposition in the Body Rapidly and completely absorbed after oral administration. Up to about 90% of a dose is excreted unchanged in the urine in 24 h with <1% as norpseudoephedrine (cathine) (pH-dependent).

Therapeutic Concentration

After a single oral dose of 180 mg to 3 subjects, peak plasma concentrations of 0.72–0.81 mg/L were attained in 2–3 h [Kuntzman *et al.* 1971].

Following oral administration of 60 mg 4 times a day to 17 subjects, maximum steady-state plasma concentrations of 0.41–0.79 mg/L (mean 0.55) were reported about 1.5 h after a dose [Perkins *et al.* 1980].

Toxicity Toxic effects have occurred after single doses of 60 mg.

The following postmortem tissue concentrations were reported in a fatality involving pseudoephedrine: blood 19 mg/L, brain 22 µg/g, liver 33 µg/g, urine 105 mg/L [*Registry of Human Toxicology*, 1978].

Half-life Plasma half-life, 5–8 h but may be increased when the urine is alkaline and decreased when it is acid.

Volume of Distribution About 3 L/kg.

Dose Usually 180 to 240 mg of pseudoephedrine hydrochloride daily.

Demme U *et al.* (2005). Systematic evaluation of 1-chlorobutane for liquid-liquid extraction of drugs. *Proceedings of the 12th TIAFT*, Seoul: 481–486.

Pseudomorphine

Morphine Impurity

$C_{34}H_{36}N_2O_6,3H_2O = 622.7$

CAS—125-24-6 (anhydrous); 6472-73-7 (trihydrate)

IUPAC Name (5′α,6′α)-7,7′,8,8′-Tetradehydro-4,5:4′,5′-diepoxy-17,17′-dimethyl-[2,2′-bimorphinan]-3,3′,6,6′-tetrol

Synonyms 2,2′-Bimorphine; oxydimorphine.

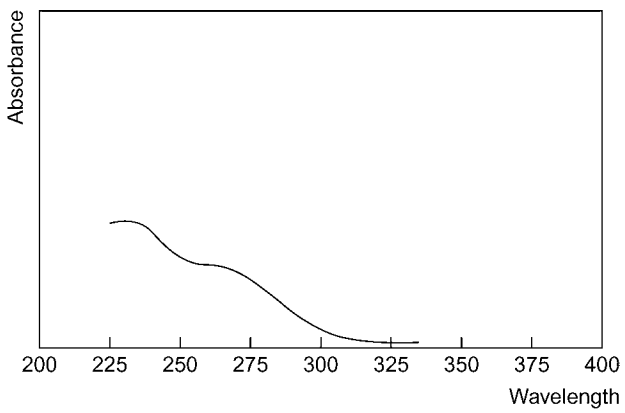
Chemical Properties White crystals (trihydrate). Becomes anhydrous at 150°. Mp 327°, with decomposition. Practically insoluble in water, ethanol and ether; soluble in dilute hydrochloric acid, dilute acetic acid and pyridine (pseudomorphine trihydrate).

Colour Test Marquis test—green.

Thin-layer Chromatography System TA—R_f 0.46; system TB—R_f 0.00; system TC—R_f 0.00; system TL—R_f 0.00; system TAJ—R_f 0.00; system TAK—R_f 0.00; system TAL—R_f 0.02 (acidified iodoplatinate solution, positive).

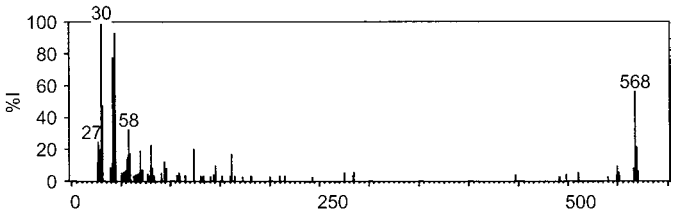
Gas Chromatography System GA—RI 2770.

Ultraviolet Spectrum Aqueous acid—231 nm (A^1_1 = 308b).



Infrared Spectrum Principal peaks at wavenumbers 1118, 1098, 1069, 1044, 1195, 1210 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 30, 44, 42, 568, 31, 58, 27, 81.



Note Pseudomorphine may be found as an oxidation product of morphine in decomposed viscera.

Psilocin

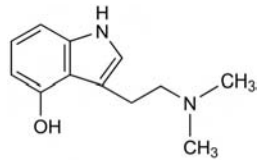
Hallucinogen

$C_{12}H_{16}N_2O = 204.3$

CAS—520-53-6

IUPAC Name 3-[2-(Dimethylamino)ethyl]-1*H*-indol-4-ol

Synonyms 4-Hydroxy-*N*,*N*-dimethyltryptamine; psilocin.



Chemical Properties An indole alkaloid obtained from the Mexican mushroom (teonanácatl) *Psilocybe mexicana* (Agaricaceae). White crystals. Mp 173° to 176°. Soluble in ethanol and dilute acetic acid. Unstable in solution, especially alkaline solution. Log *P* (octanol/water), 1.5.

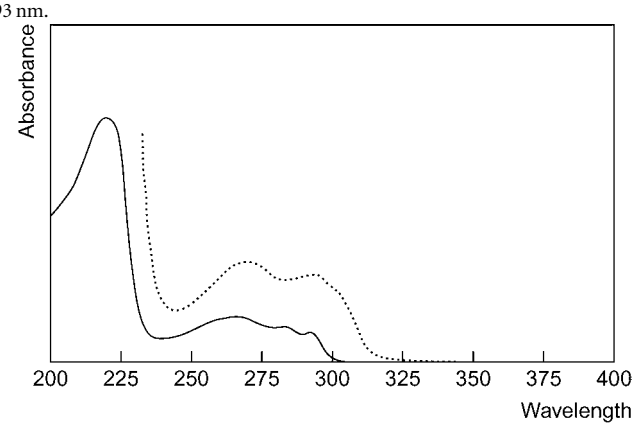
Colour Test Marquis test—green-brown.

Thin-layer Chromatography System TA—R_f 0.39; system TB—R_f 0.05, psilocin-ethyl R_f 0.09; system TC—psilocin R_f 0.09, psilocin-ethyl R_f 0.15; system TE—psilocin R_f 0.47, psilocin-ethyl *k* 0.65; system TL—psilocin R_f 0.09, psilocin-ethyl *k* 0.25; system TAE—psilocin R_f 0.14, psilocin-ethyl *k* 0.15; system TAF—psilocin R_f 0.48, psilocin-ethyl *k* 0.67 (van Urk reagent—faint blue).

Gas Chromatography System GA—psilocin RI 1985, psilocin-AC RI 2270, psilocin-AC_2 RI 2340; system GB—RI 2080.

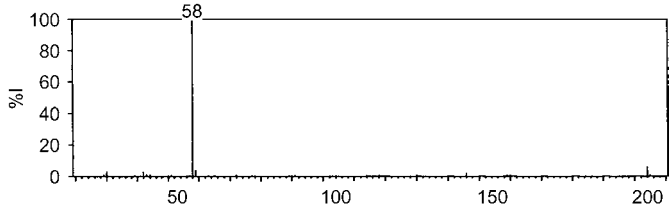
High Performance Liquid Chromatography System HA—*k* 3.1 (tailing peak); system HX—RI 240; system HY—RI 226.

Ultraviolet Spectrum Aqueous acid—266, 283, 292 nm; aqueous alkali—270, 293 nm.



Infrared Spectrum Principal peaks at wavenumbers 836, 1261, 1236, 1042, 1061, 733 cm^{-1}.

Mass Spectrum Principal ions at *m/z* 58, 204, 59, 42, 30, 146, 77, 44.



Quantification

Plasma **GC-MS** Column: HP Ultra-1 (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 5.0 mL/min. Temperature programme: 200° to 250° at 5°/min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, 5 µg/L [Sticht, Kaferstein 2000].

HPLC Column: Supersphere 60RP select B (250 × 4 mm i.d., 5 µm). Mobile phase: 0.1 mol/L sodium acetate-0.1 mol/L citric acid-0.03 mmol/L sodium EDTA (pH 4.1) : acetonitrile (83 : 17), flow rate 700 µL/min. Electrochemical detection.

P

Limit of quantification, 10 µg/L [Lindenblatt *et al.* 1998]. Electrochemical detection [Hasler *et al.* 1997].

Urine **GC-MS** Column: DB-5 (25 m × 0.32 mm i.d., 0.17 µm). Carrier gas: He, 5 psi (34.9 kPa). Temperature programme: 70° to 240° at 20°/min for 2 min. ECD, SIM acquisition mode. Limit of quantification, 10 µg/L [Grieshaber *et al.* 2001]. See Plasma [Sticht, Kaferstein 2000].

LC-MS Column: Hypersil GOLD (100 × 2.1 mm i.d., 5 µm). Mobile phase: 1% acetonitrile in 10 mmol/L formic acid : 60% acetonitrile in 10 mmol/L formic acid (100 : 0 to 0 : 100 to 100 : 0 at 10 min for 4 min), flow rate 200 µL/min. ESI, positive ion mode, SRM acquisition mode. Retention time: ~5 min. Limit of detection, 4 µg/L [Björnstad *et al.* 2009].

Disposition in the Body Psilocin is absorbed from the gastrointestinal tract. It is a metabolite of psilocybine. An oral dose of several milligrams may produce hallucinations and related effects.

Björnstad K *et al.* (2009). A multi-component LC-MS/MS method for detection of ten plant-derived psychoactive substances in urine. *J Chromatogr B Analyt Technol Biomed Life Sci* 877: 1162–1168.
Grieshaber AF *et al.* (2001). The detection of psilocin in human urine. *J Forensic Sci* 46: 627–630.

Lindenblatt H *et al.* (1998). Quantitation of psilocin in human plasma by high-performance liquid chromatography and electrochemical detection: comparison of liquid–liquid extraction with automated on-line solid-phase extraction. *J Chromatogr B Biomed Sci Appl* 709: 255–263.
Sticht G, Kaferstein H (2000). Detection of psilocin in body fluids. *Forensic Sci Int* 113: 403–407.

Psilocybine

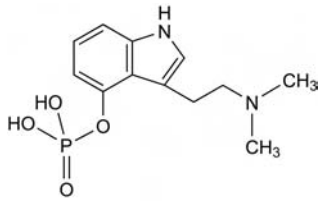
Hallucinogen

$C_{12}H_{17}N_2O_4P$ = 284.3

CAS—520-52-5

IUPAC Name 3-[2-(Dimethylamino)ethyl]-1H-indol-4-ol dihydrogen phosphate ester

Synonyms CY-39; 4-phosphoryloxy-*N*,*N*-dimethyltryptamine; psilocybin.



Chemical Properties The main indole alkaloid present in the sacred Mexican mushroom (teonanácatl), *Psilocybe mexicana* (Agaricaceae). In the UK, psilocybine is present in the indigenous mushroom *Psilocybe semilanceata* (magic mushroom; liberty cap). Psilocybine is also present in the mushrooms *Stropharia cubensis* and *Conocybe* spp. White crystals. Mp 185° to 195° (crystals from boiling methanol), with decomposition. Soluble in 20 parts boiling water and in 120 parts boiling methanol; practically insoluble in chloroform and benzene. Log *P* (octanol/water), 1.00.

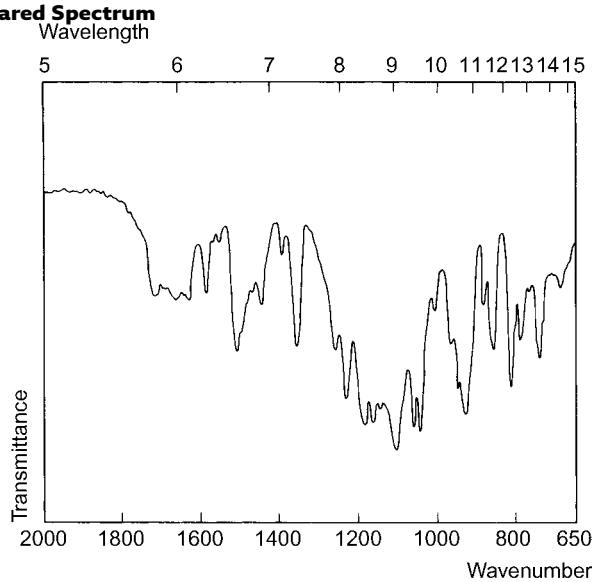
Colour Test Marquis test—orange.

Thin-layer Chromatography System TA—R_f 0.05; system TB—R_f 0.00; system TE—R_f 0.00; system TL—R_f 0.00; system TAE—R_f 0.80; system TAF—R_f 0.01 (van Urk reagent—grey-violet).

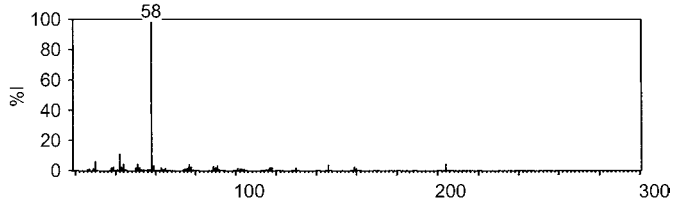
Gas Chromatography System GA—RI 2046; system GAM—RT 6.9 min.

High Performance Liquid Chromatography System HY—RI 185; system HBF—*k* 3.20.

Infrared Spectrum



Mass Spectrum



Quantification

Blood **GC-MS** Column: HP Ultra-1 (12 m × 0.2 mm i.d., 0.33 µm). Carrier gas: He, 5.0 mL/min. Temperature programme: 200° to 250° at 5°/min. EI ionisation at 70 eV, SIM acquisition mode. Limit of detection, 5 µg/L [Sticht, Kaferstein 2000].

Plasma **HPLC** Column: Superspher 60RP select B (250 × 4 mm i.d., 5 µm). Mobile phase: 0.1 mol/L sodium acetate-0.1 mol/L citric acid-0.03 mmol/L sodium EDTA (pH 4.1) : acetonitrile (83 : 17), flow rate 700 µL/min. Electrochemical detection. Limit of quantification, 10 µg/L [Lindenblatt *et al.* 1998]. Electrochemical detection [Hasler *et al.* 1997].

Urine **GC-MS** Column: DB-5 (25 m × 0.32 mm i.d., 0.17 µm). Carrier gas: He, 5 psi (34.9 kPa). Temperature programme: 70° to 240° at 20°/min for 2 min. ECD, SIM acquisition mode. Limit of quantification, 10 µg/L [Grieshaber *et al.* 2001]. See Blood [Sticht, Kaferstein 2000].

Disposition in the Body Psilocybine is absorbed from the gastrointestinal tract; hallucinogenic effects usually occur within 30 min of ingestion with a duration of effect of ~6 h. It is rapidly dephosphorylated to psilocin, which appears to be the psychoactive compound.

Therapeutic Concentration

Six healthy volunteers were administered a single 10–20 mg (mean, 0.22 mg/kg bodyweight) oral dose or a 1 mg IV psilocybin. After the oral dose, the mean peak plasma psilocin concentration was 8.2 µg/L at 105 min and the peak 4-hydroxyindole-3-acetic acid concentration was 150 µg/L at 113 min. After the IV dose, the mean psilocin concentration was 12.9 µg/L 1.9 min after administration [Hasler *et al.* 1997].

Toxicity

In 2 young men who ingested 4–5 g of 'magic mushroom', the majority of psilocybin was metabolised to psilocin and excreted as the glucuronide. Psilocin was detected in serum at a concentration of 0.018 mg/L (free psilocin) and 0.052 mg/L (total). The concentration of free psilocin in urine was 0.23 mg/L, with a total amount of 1.76 mg/L. It was noted that they showed unstable and sluggish walking, inarticulate speech, enlarged pupils, dazed consciousness, depression and retarded behaviour 5–6 h after ingestion [Sticht, Kaferstein 2000].

Note For a study of the renal excretion profiles of psilocin in man following oral administration of psilocybin, see Hasler *et al.* [1997].

Grieshaber AF *et al.* (2001). The detection of psilocin in human urine. *J Forensic Sci* 46: 627–630.
Hasler F *et al.* (1997). Determination of psilocin and 4-hydroxyindole-3-acetic acid in plasma by HPLC-ECD and pharmacokinetic profiles of oral and intravenous psilocybin in man. *Pharm Acta Helv* 72: 175–184.
Lindenblatt H *et al.* (1998). Quantitation of psilocin in human plasma by high-performance liquid chromatography and electrochemical detection: comparison of liquid–liquid extraction with automated on-line solid-phase extraction. *J Chromatogr B Biomed Sci Appl* 709: 255–263.
Sticht G, Kaferstein H (2000). Detection of psilocin in body fluids. *Forensic Sci Int* 113: 403–407.

Pulegium Oil

Essential Oil

Synonym Pennyroyal oil

Chemical Properties An oil obtained by distillation from fresh pennyroyal herb, *Mentha pulegium* (Labiatae); it contains not less than 85% of pulegone ($C_{10}H_{18}O$=152.2). A yellow to greenish-yellow oil with aromatic mint-like odour. Refractive index 1.482 to 1.487. Slightly soluble in water; soluble 1 in 3 of ethanol (70%); soluble in ether and chloroform. Pulegium oil is volatile and may be isolated by distillation.

Colour Tests Mix a drop with a drop of sulphuric acid—orange; mix a drop with a drop of fuming nitric acid—deep yellow.

Disposition in the Body Pulegone has been shown in rabbits to be reduced first to pulegol and then to menthol; both of these compounds may be excreted as glucuronides.

Toxicity The effect of the oil on a particular individual is unpredictable; a teaspoonful has caused convulsions and 15 mL of pennyroyal essence (about 1 in 10 of the oil) has resulted in coma.

A healthy female, aged 24, in the third month of pregnancy, took pulegium oil (dose unknown). The drug produced abortion, vaginal bleeding, haemolytic anaemia, and acute tunular necrosis of the kidney, with death from uraemia on the 14th day.

Pumactant

Pulmonary Surfactant

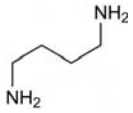
Synonym ALEC

Chemical Properties Dipalmitoylphosphatidylcholine and egg phosphatidylglycerol in a 7:3 (w/w) ratio. Fine crystalline powder.
Note For a study of pumactant for treatment of respiratory distress syndrome in neonates, see Ainsworth *et al.* [2000]; for a review of natural versus synthetic surfactants in neonatal respiratory distress syndrome, see Halliday [1996].

Ainsworth SB *et al.* (2000). Pumactant and poractant alfa for treatment of respiratory distress syndrome in neonates born at 25-29 weeks' gestation: a randomised trial. *Lancet* 355: 1387–1392.
Halliday HL (1996). Natural vs synthetic surfactants in neonatal respiratory distress syndrome. *Drugs* 51: 226–237.

Putrescine

Putrefactive Base
$NH_2[CH_2]_4NH_2 = 88.2$
CAS—110-60-1
IUPAC Name Butane-1,4-diamine
Synonyms 1,4-Butanediamine; tetramethylenediamine.

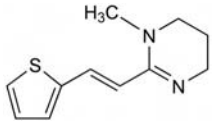


Chemical Properties Crystals with a strong odour. Mp 23° to 24°. Bp 158° to 160°. Very soluble in water. pK_a 10.8 (20°). Log *P* (octanol/water), −0.7.
Colour Test Ninhydrin—violet.
Thin-layer Chromatography System TA—R_f 0.09 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 930.
Infrared Spectrum Principal peaks at wavenumbers 1118, 874, 1288, 923, 1026, 1036 cm^{-1} (KBr disk).
Quantification
Serum **GC** FID. Limit of detection, 0.5 to 0.6 ng/injection for putrescine and cadaverine [Khuhawar *et al.* 1999].
Urine **GC** NPD. For method for quantification of putrescine and other polyamines and their metabolites, see Muskiet *et al.* [1984].
HPLC Limit of detection, 2 to 10 µg/L for putrescine and other polyamines [Molins-Legua *et al.* 1999].
Cancer Cell Homogenates **HPLC** Fluorescence detection. Putrescine and other natural polyamines and monoacetyl conjugates. Limit of detection, 30 to 130 fmol for putrescine [Weiss *et al.* 1997].

Khuhawar MY *et al.* (1999). Capillary gas chromatographic determination of putrescine and cadaverine in serum of cancer patients using trifluoroacetylacetone as derivatizing reagent. *J Chromatogr B, Biomed Sci Appl* 723: 17–24.
Molins-Legua C *et al.* (1999). Urine polyamines determination using dansyl chloride derivatization in solid-phase extraction cartridges and HPLC. *Analyst* 124: 477–482.
Muskiet FA *et al.* (1984). Total polyamines and their non-alpha-amino acid metabolites simultaneously determined in urine by capillary gas chromatography, with nitrogen-phosphorus detector; and some clinical applications. *Clin Chem* 30: 687–695.
Weiss T *et al.* (1997). High-resolution reversed-phase high-performance liquid chromatography analysis of polyamines and their monoacetyl conjugates by fluorescence detection after derivatization with N-hydroxysuccinimidyl 6-quinolinyl carbamate. *Anal Biochem* 247: 294–304.

Pyrantel

Anthelmintic
$C_{11}H_{14}N_2S = 206.3$
CAS—15686-83-6
IUPAC Name 1-Methyl-2-[(*E*)-2-thiophen-2-ylethenyl]-5,6-dihydro-4*H*-pyrimidine
Synonyms Pirantel; (*E*)-1,4,5,6-tetrahydro-1-methyl-2-[2-(2-thienyl)ethenyl] pyrimidine.



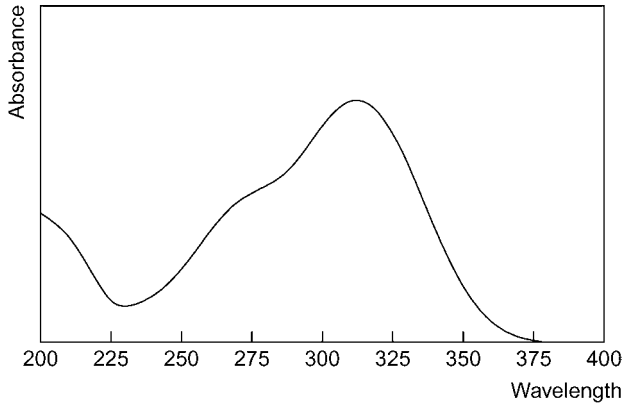
Chemical Properties Crystals. Mp 178° to 179°. pK_a 11.0 (20°). Log *P* (octanol/water), 3.1.

Pyrantel Embonate

$C_{11}H_{14}N_2S,C_{23}H_{16}O_6 = 594.7$
CAS—22204-24-6
Synonyms Pyrantel pamoate; CP-10423-16.
Proprietary Names *Anthel*; *Antiminth*; *Ascarical*; *Banminth* (vet.); *Bantel*; *Canex* (vet.); *Combantrin*; *Early Bird*; *Helmex*; *Helmintox*; *Lombriareu*; *Nemex* (vet.); *Pin-Rid*; *Pin-X*; *Pirantrim*; *Pyral*; *Pyrantrin*; *Pyrapam*; *Reese's Pinworm*; *Strongid* (vet.); *Trilombrin*.
Chemical Properties A yellow to tan-coloured crystalline powder. Practically insoluble in water, ethanol and methanol; soluble in dimethyl sulfoxide.

Pyrantel Tartrate

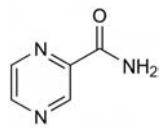
$C_{11}H_{14}N_2S,C_4H_6O_6 = 356.4$
CAS—33401-94-4
Synonym CP-10423-18
Chemical Properties A white to pale greenish-yellow, crystalline powder. Mp 148° to 150°. Soluble 1 in 5 of water and 1 in 9 of methanol; slightly soluble in chloroform; practically insoluble in ether.
Colour Tests Liebermann's reagent—black; Mandelin's test—violet; Marquis test—blue-violet; sulfuric acid—orange→violet.
Thin-layer Chromatography System TA—R_f 0.06 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—not eluted.
High Performance Liquid Chromatography System HX—RI 299.
Ultraviolet Spectrum Methanolic acid—315 nm (A^1_1=920a).



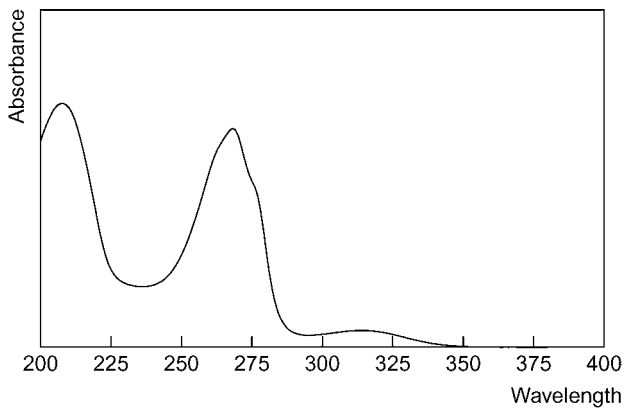
Infrared Spectrum Principal peaks at wavenumbers 1640, 1605, 1305, 1208, 1132, 1065 cm^{-1} (pyrantel tartrate, KBr disk).
Mass Spectrum Principal ions at *m/z* 205, 42, 135, 173, 206, 123, 145, 45.
Dose The equivalent of 10 to 20 mg/kg of pyrantel, as a single dose.

Pyrazinamide

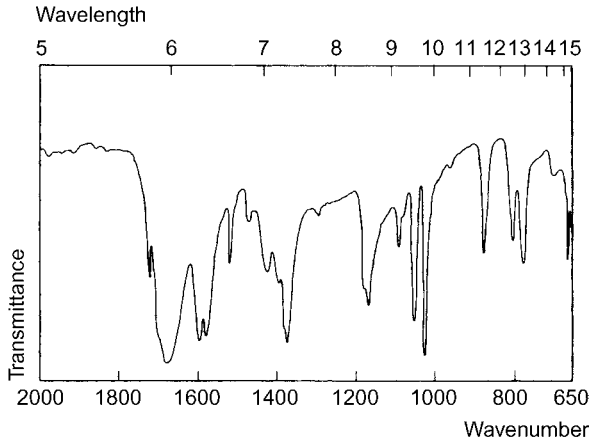
Tuberculostatic
$C_5H_5N_3O = 123.1$
CAS—98-96-4
IUPAC Name Pyrazine-2-carboxamide
Synonyms Pyrazinecarboxamide; pyrazinoic acid amide; D-50.
Proprietary Names *Braccopiral*; *Pirafoid*; *Piraldina*; *Piraside*; *Pirazer*; *Pirilene*; *Pramide*; *Premox*; *Pyrafat*; *Pyratab*; *PZA*; *Rozide*; *Tebezide*; *Tebrazid*; *Tisamid*; *Zinamide*.



Chemical Properties A white crystalline powder. Mp 189° to 191°; begins to sublime at 60°. Soluble 1 in about 60 of water and 1 in 175 of dehydrated ethanol, 1 in 135 of chloroform, 1 in 1000 of ether and 1 in 72 of methanol. pK_a 0.5. Log *P* (octanol/water), −0.6.
Colour Test Nessler's reagent—brown-orange.
Thin-layer Chromatography System TA—R_f 0.63; system TB—R_f 0.03; system TC—R_f 0.42; system TE—R_f 0.54; system TL—R_f 0.46; system TAD—R_f 0.44; system TAE—R_f 0.71; system TAF—R_f 0.70.
Gas Chromatography System GA—RI 1250.
High Performance Liquid Chromatography System HAA—retention time 3.8 min.
Ultraviolet Spectrum Aqueous acid—269 (A^1_1=659a), 312 nm. No alkaline shift.



Infrared Spectrum Principal peaks at wavenumbers 1685, 1020, 1600, 1584, 1050, 1165 cm^{-1} (KBr disk).



Quantification

Blood **HPLC** UV detection. Limit of detection, 0.11 ng/5 µL for pyrazinamide, 0.2 ng/5 µL for isoniazid and 13 ng/5 µL for rifampicin [Khuhawar, Rind 2002].

Plasma **HPLC** UV detection. For method, see Conte *et al.* [2000]. For method for quantification of pyrazinamide, rifampicin and isoniazid, see Smith *et al.* [1999]. For method for quantification of pyrazinamide and its metabolites, see Kraemer *et al.* [1998]. Limit of detection, 0.2 mg/0.2 mL [Revankar *et al.* 1994]. UV detection. For method for quantification of pyrazinamide, rifampicin and isoniazid, see Walubo *et al.* [1994].

Serum **GC–MS** Pyrazinamide, pyrazine-2-carboxylic acid and 5-hydroxypyrazine-2-carboxylic acid. Limit of detection, 10 µg/L for pyrazinamide [Roboz *et al.* 1978].

HPLC Limit of detection, about 90 µg/L for pyrazinamide and other antituberculosis drugs [Gennaro *et al.* 2001].

Urine **GC–MS** Limit of detection, about 90 µg/L for pyrazinamide and other antituberculosis drugs [Gennaro *et al.* 2001].

Bronchoalveolar Lavage **HPLC** UV detection. For method, see Conte *et al.* [2000].

Alveolar Cells **HPLC** UV detection. For method, see Conte *et al.* [2000].

Disposition in the Body Pyrazinamide is well absorbed after oral administration. It is metabolised by hydrolysis to pyrazine-2-carboxylic acid and subsequent hydroxylation to 5-hydroxypyrazine-2-carboxylic acid. In 24 h, about 30 to 40% of a dose is excreted in the urine as pyrazine-2-carboxylic acid and <4% as unchanged drug; the 5-hydroxy metabolite is also excreted in the urine.

Therapeutic Concentration

After an oral dose of 3 g to one subject, a peak serum concentration of 134 mg/L was attained in 1 h; the serum concentration of pyrazine-2-carboxylic acid was 20 to 30 mg/L after the first hour and the concentration of 5-hydroxypyrazine-2-carboxylic acid ranged between 3 and 8 mg/L over a period of 12 h [Roboz *et al.* 1978].

Half-life Plasma half-life, 4 to 10 h.

Protein Binding About 50%.

Dose 20 to 35 mg/kg to a maximum of 3 g daily.

Conte JE *et al.* (2000). High-performance liquid chromatographic determination of pyrazinamide in human plasma, bronchoalveolar lavage fluid, and alveolar cells. *J Chromatogr Sci* 38: 33–37.

Pyrazophos

Fungicide

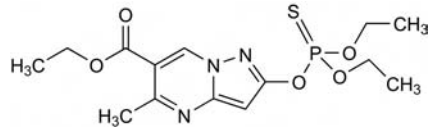
$C_{14}H_{20}N_3O_5PS = 373.4$

CAS—13457-18-6

IUPAC Name Ethyl 2-diethoxyphosphinothioyloxy-5-methylpyrazolo[1,5-a]pyrimidine-6-carboxylate

Synonyms 2-[(Diethoxyphosphinothioyl)oxy]-5-methylpyrazolo[1,5-*a*]pyrimidine-6-carboxylic acid ethyl ester; HOE 2873; W11099.

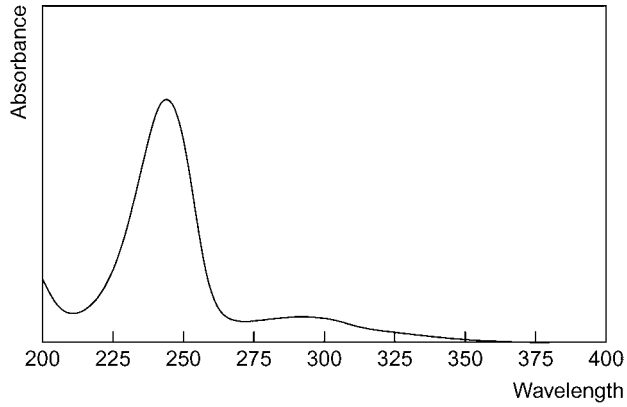
Proprietary Names *Afugan*; *Curamil*; *Missile*; *Pokon Mildew Spray*; *Siafos*.



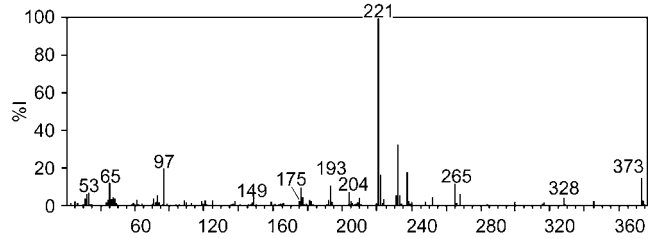
Chemical Properties A yellow oil. Mp 38° to 40°. Soluble in water (4.2 mg/L at 20°), acetone (1212 g/L at 25°), toluene (>980 g/L at 25°), ethyl acetate (898 g/L at 25°), ethanol (95 g/L at 25°) and hexane (11 g/L at 25°); readily soluble in most organic solvents. Log *P* (octanol/water), 3.80.

Thin-layer Chromatography System TX—R_f 0.32; system TY—R_f 0.47.

Gas Chromatography System GA—RI 2590.



Mass Spectrum Principal ions at *m/z* 221, 232, 97, 237, 373, 65, 265, 193.



Disposition in the Body

Toxicity The allowed daily intake is 0.004 mg/kg bodyweight.

Pyrethrum

Insecticide, Scabicide

$C_{(20-22)}H_{(28,30)}O_{(3,5)} = 316–374$

CAS—8000-33-47

Synonyms Pyrethrum flower; chrysantheme insecticide; insektenbluten; pyrethriflos.

Proprietary Names *Allethrin*; *Anerin*; *Buhach*; *Chrysanthenum Cinerariaefolium*; *Cypermethrin*; *Dalmatian Insect Powder*; *Decamethrin*; *Firmotox*; *Flucythrinate*; *Moskill*; *Ofirmotox*; *Parexan*; *Persian Insect Powder*; *Piretro*; *Prothrin*; *Resmethrin*.

	R^1	R^2
Pyrethrin-I	CH_3	$CH{=}CH_2$
Pyrethrin-II	$COOCH_3$	$CH{=}CH_2$
Cinerin-I	CH_3	CH_3
Cinerin-II	$COOCH_3$	CH_3

Chemical Properties Pyrethrum extract is a mixture of three naturally occurring esters of chrysanthemic acid (Pyrethrins I: pyrethrin 1, cinerin 1 and jasmolin

1) and three esters of pyrethric acid (Pyrethrins II: pyrethrin 2, cinerin 2 and jasmolin 2) with the molecular weight varying between 316 and 374. It is a pale yellow to brown viscous liquid or oil. Practically insoluble in water but soluble in liquid paraffin and most organic solvents including alcohol, kerosene, nitromethane, petroleum ether, carbon tetrachloride and ethylene dichloride.

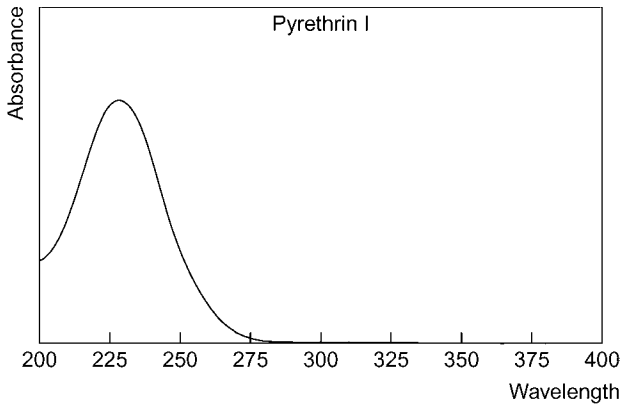
Pyrethrin I

$C_{21}H_{28}O_3 = 328.5$
CAS—121-21-1
Synonyms Chrysanthemummonocarboxylic acid pyrethrolone ester; pyrethronyl (+)-*trans*-chrysanthemate.
Chemical Properties A viscous liquid with solubility as for the pyrethrum extract.

Pyrethrin II

$C_{22}H_{28}O_5 = 372.5$
CAS—121-29-9
Synonyms Pyrethrine; pyrethronyl (+)-pyrethrate.
Chemical Properties A viscous liquid with solubility as for the pyrethrum extract.

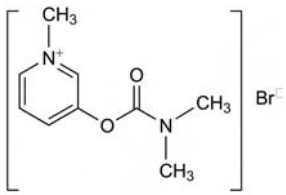
Gas Chromatography System GK—Pyrethrin I RRT 1.27, pyrethrin II RRT 1.59 (both relative to caffeine).
Ultraviolet Spectrum Ethanol—225 nm (Pyrethrin I) and 229 nm (Pyrethrin II).



Disposition in the Body Pyrethrum is absorbed through the stomach, intestines and the skin fairly slowly and more quickly through the lungs during respiration. It is metabolised to chrysanthemumic acid and alcohol which can be further metabolised to aldehyde and acid or conjugated with glucuronide. It is excreted in urine and faeces. The metabolites are less toxic than the parent compound. Pyrethrins I and II are excreted unchanged in faeces and the other pyrethrum components undergo rapid destruction and detoxification in the liver and gastrointestinal tract.
Toxicity The lowest lethal oral dose for children is 750 mg/kg bodyweight and for adults, 1000 mg/kg. The allowed daily intake is 0.04 mg/kg bodyweight.

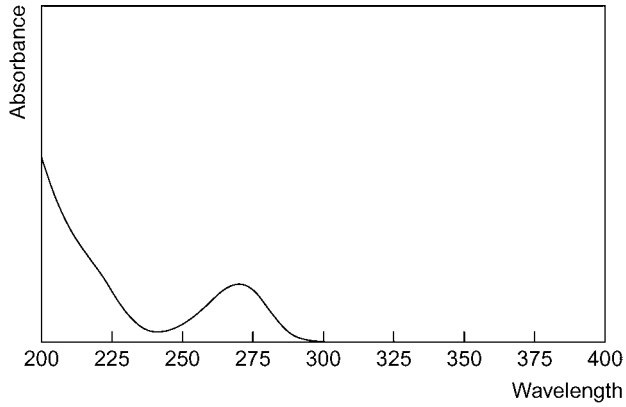
Pyridostigmine Bromide

Anticholinesterase
$C_9H_{13}BrN_2O_2 = 261.1$
CAS—155-97-5 (pyridostigmine); 101-26-8 (bromide)
IUPAC Name (1-Methylpyridin-1-ium-3-yl) *N*,*N*-dimethylcarbamate
Synonym 3-[[(Dimethylamino)carbonyl]oxy]-1-methylpyridinium bromide
Proprietary Names *Mestinon*; *Regonol*.

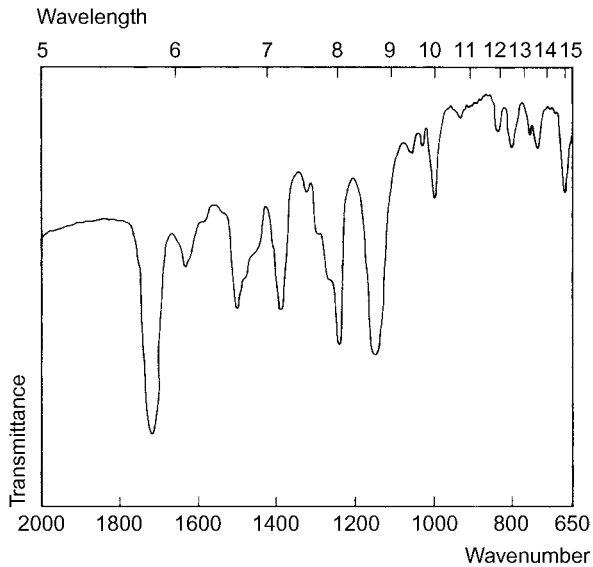


Chemical Properties A white, deliquescent, crystalline powder. Mp 152° to 154°. Soluble 1 in >1 of water, 1 in >1 of ethanol and 1 in 1 of chloroform; practically insoluble in ether, acetone and benzene. Log *P* (octanol/water), −3.7.
Thin-layer Chromatography System TA—R_f 0.04; system TB—R_f 0.00; system TE—R_f 0.00; system TF—R_f 0.00; system TAE—R_f 0.00 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 1515.
High Performance Liquid Chromatography System HA—*k* 6.3 (tailing peak); system HX—RI 65; system HZ—retention time 1.8 min; system HAA—retention time 3.2 min.

Ultraviolet Spectrum Aqueous acid—270 nm (A_1^1=186a).



Infrared Spectrum Principal peaks at wavenumbers 1728, 1156, 1249, 1500, 1630, 1010 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 72, 39, 42, 38, 94, 56, 51, 81.
Quantification
Blood **HPLC** Limit of detection, 40 µg/L [Ellin *et al.* 1982].
Plasma **GC** AFID. Limit of detection, 5 µg/L [Chan *et al.* 1976].
GC–MS Limit of detection, 50 µg/L [Aquilonius *et al.* 1980].
HPLC–MS Limit of detection, 1 µg/L [Malcolm *et al.* 1990].
Urine **HPLC** Limit of detection, 40 µg/L [Ellin *et al.* 1982].
Disposition in the Body Pyridostigmine bromide is poorly and irregularly absorbed after oral administration and may undergo significant first-pass metabolism. Up to about 16% of an oral dose is excreted in the urine unchanged, together with small amounts of 3-hydroxy-*N*-methylpyridinium. After IV administration, up to about 90% is excreted in the urine unchanged.
Therapeutic Concentration In plasma, usually in the range 0.05 to 0.1 mg/L. After a single oral dose of 120 mg to 5 subjects, peak plasma concentrations of about 0.04 to 0.07 mg/L were attained in 1 to 2 h [Aquilonius *et al.* 1980].
Following daily oral doses of 60 to 660 mg to 6 subjects, maximum steady-state plasma concentrations of 0.04 to 0.08 mg/L were reported [Calvey, Chan 1977].
Half-life Plasma half-life, 0.3 to 2 h, increased in subjects with renal disease.
Volume of Distribution About 1 L/kg.
Clearance Plasma clearance, about 8 to 16 mL/min/kg.
Dose Usually 0.3 to 1.2 g daily.

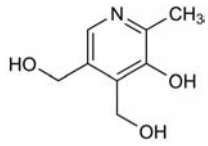
Pyridoxine

Vitamin
$C_8H_{11}NO_3$ = 169.2
CAS—65-23-6

IUPAC Name 4,5-Bis(hydroxymethyl)-2-methylpyridin-3-ol
Synonyms Adermine; 5-hydroxy-6-methyl-3,4-pyridinedimethanol; pyridoxol; vitamin B_6.

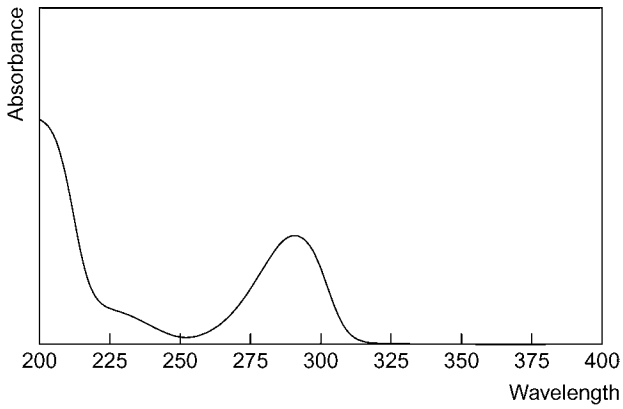


Chemical Properties pK_a 5.0 (–N), 9.0 (–OH), (25°). Log *P* (octanol/water), −0.8 (pyridoxine).

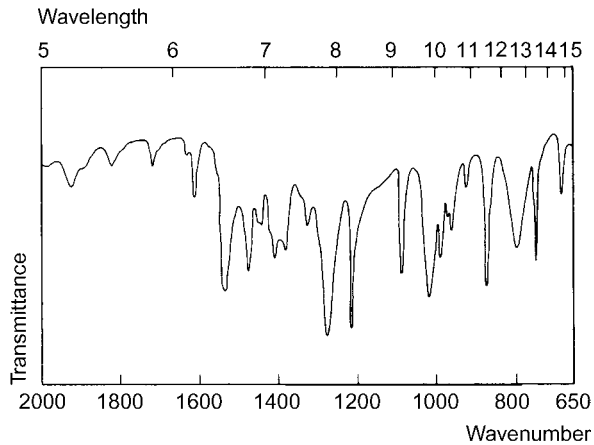
Pyridoxine Hydrochloride

$C_8H_{11}NO_3$,HCl = 205.6
CAS—58-56-0
Proprietary Names *Aminoxin*; *Anacrodyne*; *Bécilan*; *Bedoxine*; *Beesix*; *Benadon*; *Bonasanit*; *Carthamex*; *Complument*; *Conductasa*; *Dermo 6*; *Heksavit*; *Hexobion*; *Lactosec*; *Memosprint*; *Metadoxil*; *Pyroxin*; *Surfoxide*; *Vicotrat*; *Vita-B6*; *Xanturenasi*.
Chemical Properties A white crystalline powder or crystals. Mp 205° to 212°, with decomposition. Soluble 1 in 5 of water and 1 in about 90 of ethanol; practically insoluble in chloroform and ether; sparingly soluble in acetone.

Colour Test Mandelin's Test—blue→grey-green.
Thin-layer Chromatography System TA—R_f 0.59; system TB—R_f 0.00; system TC—R_f 0.08; system TE—R_f 0.15; system TL—R_f 0.05; system TAE—R_f 0.75; system TAF—R_f 0.67 (acidified potassium permanganate solution, positive).
High Performance Liquid Chromatography System HAA—retention time 2.9 min; system HX—RI 65.
Ultraviolet Spectrum Aqueous acid—290 nm (A^{1}_{1}=523a); phosphate buffer (pH 6.88)—254 nm (A^{1}_{1}=219a), 324 (A^{1}_{1}=426a).



Infrared Spectrum Principal peaks at wavenumbers 1277, 1212, 1015, 1540, 870, 1086 cm^{-1} (pyridoxine hydrochloride, KBr disk).



Mass Spectrum Principal ions at *m/z* 151, 94, 122, 106, 51, 53, 149, 150.
Quantification
Plasma **HPLC** Fluorescence detection. For method for quantification of pyridoxine, pyridoxal 5′-phosphate, pyidoxal, pyridoxamine and pyridoxamine 5′-phosphate, see Bisp *et al.* [2002]. Fluorescence detection. For method for quantification of pyridoxal and pyridoxal 5′-phosphate, see Kimura *et al.* [1996]. Fluorescence detection. Limit of detection, 50 fmol for pyridoxal 5′-phosphate [Kurioka *et al.* 1993]. Fluorescence detection. Limit of detection, 2 µg/L for pyridoxal [Mascher 1993]. Fluorescence detection. For method for quantification of pyridoxal 5′-phosphate, see Hirose *et al.* [1990]. UV detection. Limit of detection, 300 µg/L for pyridoxine, pyridoxal and 4-pyridoxic acid [O'Reilly *et al.* 1980].
Urine **HPLC** UV detection. Limit of detection, 500 µg/L for pyridoxine, pyridoxal and 4-pyridoxic acid [O'Reilly *et al.* 1980].
Disposition in the Body Pyridoxine is absorbed from the gastro-intestinal tract and converted to the active form, pyridoxal phosphate. It is excreted in the urine, mainly as 4-pyridoxic acid.
Protein Binding In plasma, pyridoxine not significantly bound, pyridoxal phosphate almost completely bound.
Dose 20 to 200 mg of pyridoxine hydrochloride daily.

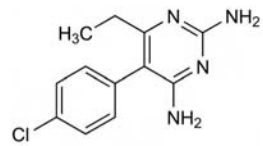
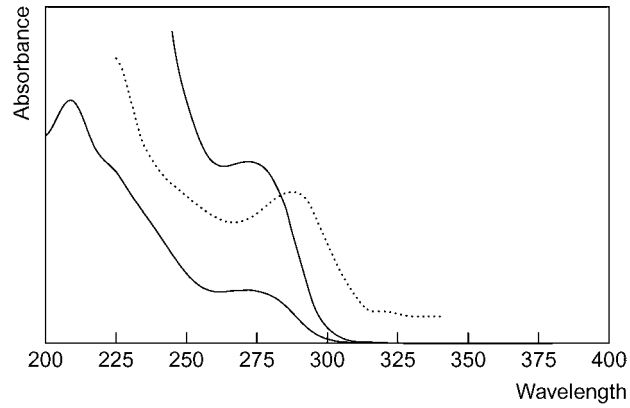
Pyrimethamine

Antimalarial
$C_{12}H_{13}ClN_4$ = 248.7
CAS—58-14-0

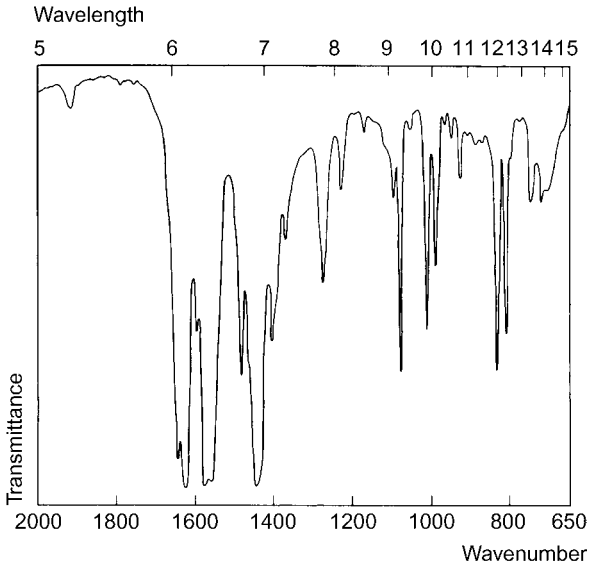
IUPAC Name 5-(4-Chlorophenyl)-6-ethylpyrimidine-2,4-diamine
Synonym 5-(4-Chlorophenyl)-6-ethyl-2,4-pyrimidinediamine
Proprietary Names *Daraprim*; *Erbaprelina*; *Malocide*. It is an ingredient of *Fansidar*, *Maloprim*, *Madomine*; *Supacox* (vet.), *Vivaxine* and *Whitsyn S* (vet.).



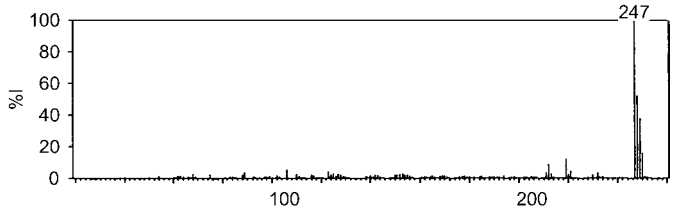
Chemical Properties A white crystalline powder. Mp 233°; Mp 240° to 242° (copper block). Practically insoluble in water; soluble 1 in 200 of ethanol and 1 in 125 of chloroform; slightly soluble in acetone; soluble in warm dilute mineral acids. pK_a 7.3 (20°). Log *P* (octanol/water), 2.7.
Thin-layer Chromatography System TA—R_f 0.61; system TB—R_f 0.02; system TC—R_f 0.31; system TE—R_f 0.58; system TL—R_f 0.21; system TAE—R_f 0.66 (acidified iodoplatinate solution, positive).
Gas Chromatography System GA—RI 2138.
High Performance Liquid Chromatography System HA—*k* 1.0; system HY—RI 289; system HAA—RT 12.5 min.
Ultraviolet Spectrum Aqueous acid—272 nm (A^{1}_{1}= 320a); aqueous alkali—286 nm (A^{1}_{1}= 381b).



Infrared Spectrum Principal peaks at wavenumbers 1628, 1575, 1640, 1075, 835, 805 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 247, 248, 249, 250, 219, 212, 106, 221.



Quantification

Blood **HPLC** Limit of detection, 1–10 mg/L when sample dried on filter paper [Green *et al.* 2002].

Plasma **GC** ECD. Limit of detection, 5 µg/L [Midskov 1984].

HPLC UV detection. Pyrimethamine and sulfadoxine. Limit of detection, 10 µg/L for pyrimethamine [Astier *et al.* 1997]. UV detection. Limit of detection, 3 µg/L [Na-Bangchang *et al.* 1997]. UV detection. Pyrimethamine and other antimalarials. Limit of detection, 15 µg/L for pyrimethamine [Eljaschewitsch *et al.* 1996]. Enzyme inhibition analysis. For method, see Roberts *et al.* [1995]. UV detection. For method for quantification of pyrimethamine, sulfadoxine and mefloquine, see Bergqvist *et al.* [1991]. Limit of detection, 1 µg/L [Le Liboux *et al.* 1991]. UV detection. Limit of detection, 10 µg/L for pyrimethamine and mefloquine [Guenzi *et al.* 1989]. Fluorescence detection. Limit of detection, 10 µg/L [Timm, Weidekamm 1982].

Urine **GC** ECD. Limit of detection, 5 µg/L [Midskov 1984].

Disposition in the Body Pyrimethamine is well absorbed after oral administration, and very slowly excreted in the urine, ≈20% of a dose being excreted in 7 days.

Therapeutic Concentration

A single oral dose of 50 mg given to 5 subjects produced a peak plasma concentration of 0.21–0.43 (mean 0.34) mg/L in 2–4 h, followed by a slow decline over several days [Donno *et al.* 1980].

Six subjects given 8 weekly doses of 12.5 mg pyrimethamine plus 100 mg dapsone, had a pyrimethamine peak plasma concentrations of 116.2 µg/L 3.7 h after the last dose [Edstein *et al.* 1990].

In 3 severely ill patients with advanced AIDS (acquired immunodeficiency syndrome), maximum plasma pyrimethamine concentrations were 254, 34 and 610 µg/L after receiving maintenance doses of 0.5, 1.4 and 1.6 mg/kg, respectively, for cerebral toxoplasmosis (lower end of therapeutic range: 750 mg/L) [Winstanley *et al.* 1995].

Toxicity Children have died following ingestion of 0.4–1 g.

Accidental prolonged overdosage with pyrimethamine (30 mg daily instead of the usual dose of 3 mg daily, for 10 days) in a 7-week-old infant treated for toxoplasmosis produced initial plasma concentrations of 6.22 mg/L. Plasma levels were still within the normal therapeutic range 7 days after stopping therapy [Tracqui *et al.* 1993].

Half-life Plasma half-life, about 4 days.

Dose Up to 75 mg daily.

Astier H *et al.* (1997). Simultaneous determination of pyrimethamine and sulphadoxine in human plasma by high-performance liquid chromatography after automated liquid-solid extraction. *J Chromatogr B, Biomed Sci Appl* 698: 217–223.

Pyriproxyfen

Insecticide

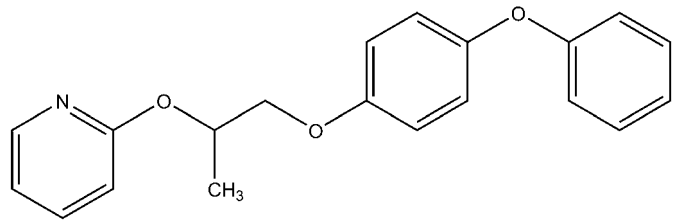
$C_{20}H_{19}NO_3$ = 321.4

CAS—95737-68-1

IUPAC Name 2-[1-[4-(Phenoxy)phenoxy]propan-2-yloxy]pyridine

Synonyms 2-[1-Methyl-2-(4-phenoxyphenoxy)ethoxy]pyridine; 4-phenoxyphenyl (*RS*)-2-(2-pyridyloxy)propyl ether; S-9318; S-31183.

Proprietary Name *Sumilarv*



Chemical Properties A pale yellow liquid. Mp 46°. Log *P* (octanol/water), 5.55 [Meylan, Howard 1995].

Quantification

Other **LC-MS** Fruit. Column: Phenomenex Luna C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: 10 mmol/L ammonium formate in methanol : 10 mmol/L ammonium formate in water (70 : 30 to 90 : 10 in 10 min for 10 min to 70 : 30 at 30 min), flow rate 0.6 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 2 µg/kg [Soler *et al.* 2007]. Column: Phenomenex Luna C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : water (70 : 30 to 90 : 10 at 35 min), flow rate 0.6 mL/min. ESI, positive ion mode, full scan mode. Limit of quantification, 0.2 mg/kg; limit of detection, 0.05 mg/L [Soler *et al.* 2005]. Column: Phenomenex Luna C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : water (70 : 30 for 5 min to 90 : 10 from 20 to 40 min), flow rate 0.6 mL/min. ESI, positive ion mode, full scan and MRM acquisition mode. Limit of quantification, 0.05 mg/kg [Soler *et al.* 2004]. Column: Luna C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : water (40 : 60 for 5 min to 80 : 20 at 8 min for 10 min to 90 : 10 at 20 min for 5 min), flow rate 0.8 mL/min. APCI, positive ion mode, full scan and SIM acquisition mode. Limit of quantification, 8 µg/kg [Blasco *et al.* 2002].

CE Fruit and Vegetables. Capillary: fused silica (total/effective length 60/50 cm, 75 µm i.d.). Buffer: 20 mmol/L phosphate buffer (pH 2.3) containing 25 mmol/L SDS and 10% methanol. DAD (λ = 230 nm). Limit of quantification, 8, 6, and 7 µg/kg for sweeping, normal stacking with reversed migration and water plug, and stacking with reversed migration and removal of sample matrix using polarity switching, respectively. Limit of detection, 0.3, 0.04, 0.01 and 0.01 mg/L for conventional injection, sweeping, normal stacking with reversed migration and water plug, and stacking with reversed migration and removal of sample matrix using polarity switching, respectively [Juan-Garcia *et al.* 2007]. Capillary: fused silica (total/effective length 57/50 cm, 75 µm). Buffer: 6 mmol/L sodium tetraborate decahydrate containing 75 mmol/L cholic acid sodium solution (pH 9.2). DAD (λ = 214 nm). Limit of quantification, 0.5 mg/kg; limit of detection, 0.1 mg/L for solid-phase extraction [Juan-Garcia *et al.* 2005].

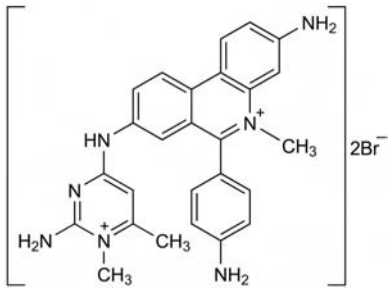
Soler C *et al.* (2007). Capabilities of different liquid chromatography tandem mass spectrometry systems in determining pesticide residues in food. Application to estimate their daily intake. *J Chromatogr A* 1157: 73–84.

Pyritidium Bromide

Trypanocide (Veterinary)
$C_{26}H_{27}Br_2N_7$ = 597.4
CAS—3616-05-5 (pyritidium); 14222-46-9 (bromide)

IUPAC Name 8-[(2-Amino-1,6-dimethylpyrimidin-4-ylidene)amino]-6-(4-aminophenyl)-5-methylphenanthridin-5-ium-3-amine bromide hydrobromide
Synonyms 3-Amino-8-(2-amino-1,6-dimethylpyrimidinium-4-ylamino)-6-(4-amino-phenyl)-5-methylphenanthridinium dibromide; pyrithidium bromide.

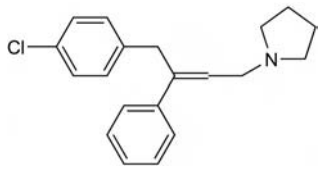


Chemical Properties A brick-red to reddish-purple, hygroscopic powder. Soluble 1 in 40 of water and 1 in 1900 of ethanol.
Thin-layer Chromatography System TA—R_f 0.01 (location under ultraviolet light, yellow fluorescence; Acidified iodoplatinate solution, positive).
Ultraviolet Spectrum Aqueous acid—256 (A^1_1=425a), 313 nm (A^1_1=813a).
Infrared Spectrum Principal peaks at wavenumbers 1615, 1642, 1515, 1250, 1562, 1298 cm^{-1} (KBr disk).

Pyrrobutamine

Antihistamine
$C_{20}H_{22}ClN$ = 311.9
CAS—91-82-7

IUPAC Name 1-[(*E*)-4-(4-chlorophenyl)-3-phenylbut-2-enyl]pyrrolidine
Synonym 1-[4-(4-Chlorophenyl)-3-phenyl-2-butenyl]pyrrolidine
Proprietary Name *Pyronil*

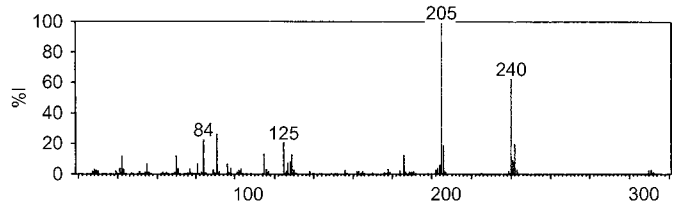


Chemical Properties An oily liquid. On standing gives crystals. Mp 48° to 49°. pK_a 8.8 (25°). Log *P* (octanol/water), 6.3.

Pyrrobutamine Phosphate

$C_{20}H_{22}ClN,2H_3PO_4$ = 507.8
CAS—135-31-9
Proprietary Name It is an ingredient of *Co-Pyronil*
Chemical Properties A white crystalline powder. Mp 129° to 130°. Soluble in water; soluble 1 in 20 of ethanol; practically insoluble in chloroform and ether. pK_a 8.8, 5.2.

Colour Tests Liebermann's reagent—brown; Mandelin's test—violet; Marquis test—grey-violet.
Thin-layer Chromatography System TA—R_f 0.54; system TB—R_f 0.54; system TC—R_f 0.37; system TE—R_f 0.71; system TL—R_f 0.18; system TAE—R_f 0.25; system TAF—R_f 0.66; system TAJ—R_f 0.24; system TAK—R_f 0.25; system TAL—R_f 0.86 (Dragendorff spray, positive; Acidified iodoplatinate solution, positive; Marquis reagent, grey).
Gas Chromatography System GA—pyrrobutamine RI 2419; M (oxo-) RI 2920; system GF—RI 2815.
High Performance Liquid Chromatography System HA—*k* 2.8; system HX—RI 477.
Infrared Spectrum Principal peaks at wavenumbers 995, 1018, 1087, 772, 1492, 820 cm^{-1} (pyrrobutamine phosphate, KBr disk).
Mass Spectrum Principal ions at *m/z* 205, 240, 91, 84, 125, 242, 206, 186.

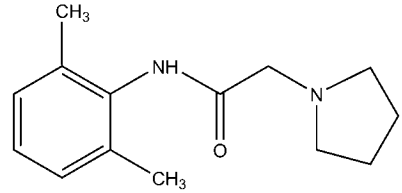


Dose 30 to 90 mg of pyrrobutamine phosphate daily.

Pyrrocaine

Anaesthetic (Local)
$C_{14}H_{20}N_2O$ = 232.3

IUPAC Name *N*-(2,6-Dimethylphenyl)-2-pyrrolidin-1-ylacetamide
Synonyms 2,6-Dimethyl-α-pyrrolidin-1-ylacetanilide; *N*-(pyrrolidin-1-ylacetyl)-2,6-xylidine.



Chemical Properties Pyrrocaine melts at 84°. Soluble 1 in 350 of water, 1 in 20 of ether, and 1 in 7 of methanol. Pyrrocaine is extracted by ether from aqueous alkaline solutions.

Pyrrocaine Hydrochloride

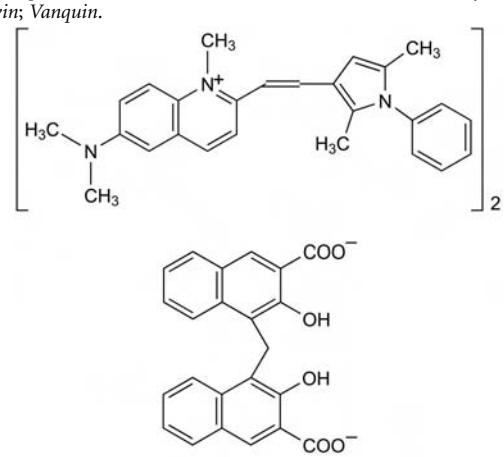
Synonym EN-1010
Proprietary Name *Dynacaine*
Chemical Properties White crystalline powder. Mp 200° to 205°. Soluble 1 in 1.5 of water and 1 in 12 of ethanol; soluble in chloroform; almost insoluble in ether.

Thin-layer Chromatography System T1—R_f 0.71 (location reagent acidified iodoplatinate spray, positive reaction).
Gas Chromatography System G2/225—retention time 1.32 relative to diphenhydramine, retention time 0.31 relative to codeine.
Ultraviolet Spectrum 0.1 N hydrochloric acid—263 nm (E1%, 1 cm 17) (pyrrocaine hydrochloride).
Infrared Spectrum Principal peaks at wavenumbers 775, 1219, 1450, 1492, 1515, 1667 cm^{-1} (pyrrocaine hydrochloride) (KBr disk) .
Disposition in the Body
Toxicity LD_{50} in mice 480 mg/kg (oral).
Dose Usually 1 to 2 mL of a 2% solution.

Pyrvinium Embonate

Anthelmintic
$C_{52}H_{56}N_6,C_{23}H_{14}O_6$ = 1151.4
CAS—3546-41-6

IUPAC Name 4-[(3-Carboxylato-2-hydroxynaphthalen-1-yl)methyl]-3-hydroxynaphthalene-2-carboxylate; 2-[2-(2,5-dimethyl-1-phenylpyrrol-3-yl)ethenyl]-*N*,*N*,1-trimethylquinolin-1-ium-6-amine
Synonyms 6-(Dimethylamino)-2-[2-(2,5-dimethyl-1-phenyl-1*H*-pyrrol-3-yl) ethenyl]-1-methylquinolinium salt with 4,4′-methylenebis[3-hydroxy-2-naphthalenecarboxylic acid] (2:1); pyrvinium pamoate; viprynium embonate; viprynium pamoate.
Proprietary Names *Molevac*; *Pamovin*; *Pamoxan*; *Povan*; *Povanyl*; *Pyrcon*; *Pyr-Pam*; *Pyrvin*; *Vanquin*.



Chemical Properties A bright orange or orange-red to almost black, crystalline powder. Mp 210° to 215° (softens at 190°). Practically insoluble in water and ether; very slightly soluble in ethanol; slightly soluble in chloroform and methoxyethanol; freely soluble in glacial acetic acid.

Pyrvinium Chloride

$C_{26}H_{27}N_3$,HCl = 418.0
CAS—548-84-5
Synonyms Viprynium chloride; SN-4395.
Chemical Properties Deep-red powder. Mp 249° to 251°, with decomposition. Sparingly soluble in water.
Colour Tests Mandelin's test—yellow; Marquis test—yellow
Thin-layer Chromatography System TA—R_f 0.67 (acidified potassium permanganate solution, weak reaction).
Ultraviolet Spectrum 2-Methoxyethanol—239, 358 nm (A_1^1=380b).
Infrared Spectrum Principal peaks at wavenumbers 1592, 1618, 1294, 1188, 1500, 1513 cm^{-1} (KBr disk).
Dose The equivalent of 5 mg/kg of pyrvinium as a single dose.

Quazepam

Benzodiazepine, Sedative, Hypnotic

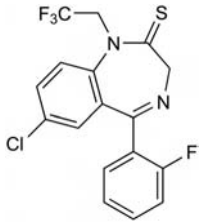
$C_{17}H_{11}ClF_4N_2S = 386.8$

CAS—36735-22-5

IUPAC Name 7-Chloro-5-(2-fluorophenyl)-1-(2,2,2-trifluoroethyl)-3*H*-1,4-benzodiazepine-2-thione

Synonym Sch-16134

Proprietary Names *Doral*; *Dormalin*; *Dorme*; *Oniria*; *Prosedar*; *Quazium*; *Quiedorm*; *Selepam*.



Chemical Properties Off-white to yellowish powder with Mp 137.5° to 139°. It is insoluble in water; soluble in alcohol. Log *P* (octanol/water), 4.03.

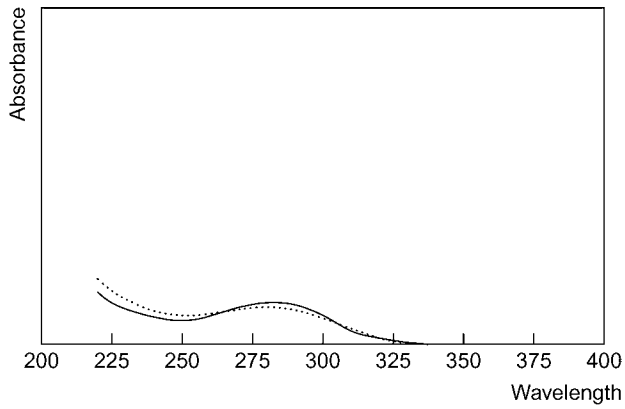
Thin-layer Chromatography System TA—(quazepam) R_f 0.74, (quazepam-CFTB) R_f 0.79, (M2-oxo-) R_f 0.78, (M3-hydroxy-2-oxo-) R_f 0.71, (M3-hydroxy-*N*-dealkyl-2-oxo-) R_f 0.67, (M-*N*-dealkyl-2-oxo-) R_f 0.75; system TAD—(quazepam) R_f 0.78, (quazepam-CFTB) R_f 0.80, (M2-oxo-) R_f 0.70, (M3-hydroxy-2-oxo-) R_f 0.58, (M3-hydroxy-*N*-dealkyl-2-oxo-) R_f 0.35, (M-*N*-dealkyl-2-oxo-) R_f 0.60; system TAE—(quazepam) R_f 0.87, (quazepam-CFTB) R_f 0.77, (M2-oxo-) R_f 0.87, (M3-hydroxy-2-oxo-) R_f 0.88, (M3-hydroxy-*N*-dealkyl-2-oxo-) R_f 0.88, (M-*N*-dealkyl-2-oxo-) R_f 0.88; system TAF—(quazepam) R_f 0.96, (quazepam-CFTB) R_f 0.93, (M-2-oxo-) R_f 0.90, (M3-hydroxy-2-oxo-) R_f 0.90, (M-3-hydroxy-*N*-dealkyl-2-oxo-) R_f 0.89, (M-*N*-dealkyl-2-oxo-) R_f 0.88; system TAG—(quazepam) R_f 0.76, (quazepam-CFTB) R_f 0.73, (M2-oxo-) R_f 0.71, (M3-hydroxy-2-oxo-) R_f 0.59, (M3-hydroxy-*N*-dealkyl-2-oxo-) R_f 0.38, (M-*N*-dealkyl-2-oxo-) R_f 0.58; system TB—(quazepam) R_f 0.44, (quazepam-CFTB) R_f 0.44, (M2-oxo-) R_f 0.16, (M3-hydroxy-2-oxo-) R_f 0.02, (M3-hydroxy-*N*-dealkyl-2-oxo-) R_f 0, (M-*N*-dealkyl-2-oxo-) R_f 0.2; system TC—(quazepam) R_f 0.77, (quazepam-CFTB) R_f 0.77, (M-2-oxo-) R_f 0.89, (M-3-hydroxy-2-oxo-) R_f 0.55, (M-3-hydroxy-*N*-dealkyl-2-oxo-) R_f 0.30, (M-*N*-dealkyl-2-oxo-) R_f 0.56; system TD—(quazepam)R_f 0.78, (quazepam-CFTB) R_f 0.74, (M2-oxo-) R_f 0.59, (M3-hydroxy-2-oxo-) R_f 0.42, (M3-hydroxy-*N*-dealkyl-2-oxo-) R_f 0.15, (M-*N*-dealkyl-2-oxo-) R_f 0.34; system TE—(quazepam) R_f 0.83, (quazepam-CFTB) R_f 0.85, (M2-oxo-) R_f 0.80, (M3-hydroxy-2-oxo-) R_f 0.69, (M3-hydroxy-*N*-dealkyl-2-oxo-) R_f 0.49, (M-*N*-dealkyl-2-oxo-) R_f 0.72; system TF—(quazepam) R_f 0.71, (quazepam-CFTB) R_f 0.73, (M-2-oxo-) R_f 0.83, (M3-hydroxy-2-oxo-) R_f 0.57, (M3-hydroxy-*N*-dealkyl-2-oxo-) R_f 0.28, (M-*N*-dealkyl-2-oxo-) R_f 0.45.

Gas Chromatography System GA—RI 2440; M (2-oxo--) RI 2255; system GB—RI 2576; system GZ—retention time 6.8 min.

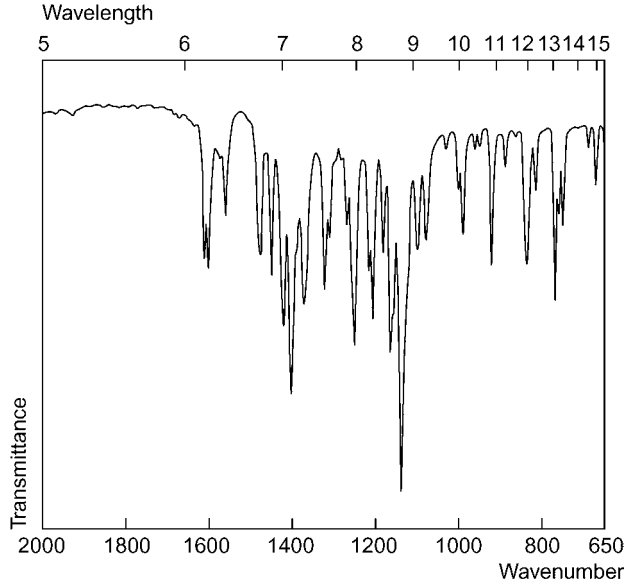
High Performance Liquid Chromatography System HAX—retention time 11.9 min; system HAY—retention time 17.7 min; system HY—RI 766; system HZ—retention time 37.5 min.

Column: Si-10 porous silica (300 × 4 mm, 10 µm). Mobile phase: ethanol, flow rate 0.5 mL/min. UV detection. Retention time: 2.7 min [Mills, Roberson 1993].

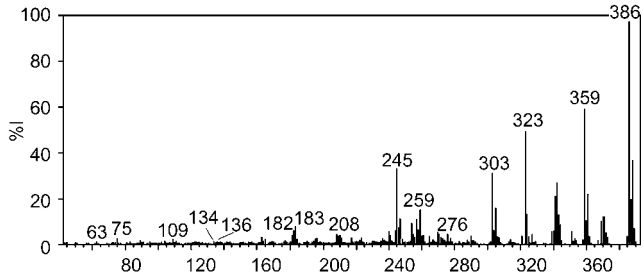
Ultraviolet Spectrum Aqueous acid (0.2 M H_2SO_4)—283 nm; basic—281 nm.



Infrared Spectrum Principal peaks at wavenumbers 1141, 1405, and 1253 cm^{-1} (KBr pellet).



Mass Spectrum Principal ions at *m/z* 386, 359, 323, 245, 303, 388, 342.



Quantification

Blood **HPLC** Column: Nova-Pak, C_{18} (75 × 3.9 mm i.d.). Mobile phase: methanol : 2 mmol/L phosphate buffer (pH 7.2, 60 : 40), flow rate 1 mL/min. IS: diazepam. UV detection (λ= 265 nm). Retention time: quazepam, 17.6 min; IS, 8.1 min. Limit of quantification, 2 µg/L [Gupta, Ellinwood, Jr. 1988].

Plasma **GC** Column: WSCOT CP-Sil 5 (25 m × 0.5 mm i.d., 1 µm). Carrier gas: He, 0.4 bar. Temperature: 220°. ECD. Retention time: 20.5 min. Limit of detection, 0.2 µg/L [Bun *et al.* 1986]. Column: 3% OV-25 on 80/100 mesh Supelcoport (1.83 m × 2 mm i.d.). Carrier gas: N_2, 28 mL/min. Temperature: 220°. ECD. Retention time: 6.8 min. Limit of quantification, 0.75 µg/L [Hilbert *et al.* 1984b].

Serum **LC-MS** ESI. Limit of detection, 0.3–11.4 µg/L [Nakamura *et al.* 2009]

For an enzyme immunoassay in serum see Huang, Moody [1995].

Urine **GC-MS** Column: 5% OV-101 Chromosorb G HP 100/120 mesh (60 cm × 2 mm i.d.). Carrier gas: N_2, 30 mL/min. Temperature: 100° to 310° at 30°/min. EI ionisation at 70 eV. Limit of detection not reported [Maurer, Pfleger 1987].

Disposition in the Body Quazepam is readily and rapidly absorbed from the gastrointestinal tract after oral administration. It is distributed widely throughout the body into most body tissues and fluids, and metabolised extensively in the liver. The principal active metabolites are 2-oxo-quazepam (half-life 40 h), *O,N*-desalkyl-2-oxo-quazepam (half-life, 69 h) and 3-hydroxy-2-oxoquazepam glucuronide. It is excreted in urine (31%) and faeces (23%), mainly as the conjugated metabolites. Only trace amounts of the unchanged drug are present in urine. Elimination is prolonged in the elderly. Steady state is achieved by day 7 and maintained up to 14 days due to slow elimination. Quazepam and its metabolites readily cross the blood–brain barrier.

Therapeutic Concentration The serum therapeutic concentration range is 10–150 µg/L.

Two healthy male volunteers were administered 15 mg quazepam sublingually. Maximum plasma concentrations of 44.1 and 38.9 µg/L were attained at 1.27 and 1.73 h, respectively [Gupta, Ellinwood, Jr. 1988].

Six healthy males were administered 25 mg quazepam in solution. Peak plasma concentration of the unchanged drug was 148 µg/L and observed at 1.5 h post-dosing [Zampaglione *et al.* 1985].

Ten geriatric patients were administered a 15 mg tablet of quazepam. Mean peak plasma concentration was 29.3 µg/L reached at 2.7 h [Hilbert *et al.* 1984a].

Toxicity Quazepam has the same toxic potential as the benzodiazepines.

Half-life 39 h.

Bioavailability ≈80%.
Volume of Distribution At bedtime, 5 L/kg and in the morning, 8.6 L/kg.
Clearance The total body clearance is 890 mL/min.
Protein Binding >95%.
Note Active metabolites accumulate with chronic use.
Dose An oral dose of 15 mg is administered at bedtime which may be reduced to 7.5 mg in the elderly and debilitated.

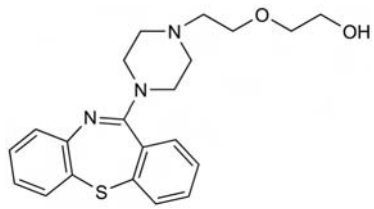
Quetiapine

Antipsychotic
$C_{21}H_{25}N_3O_2S = 383.5$
CAS—111974-69-7

IUPAC Name 2-[2-(4-Benzol[*b*][*p*1,5]benzothiazepin-6-ylpiperazin-1-yl)ethoxy] ethanol
Synonym 2-[2-(4-Dibenzo[*b,f*][1,4]thiazepin-11-yl-1-piperazinyl)ethoxy]ethanol

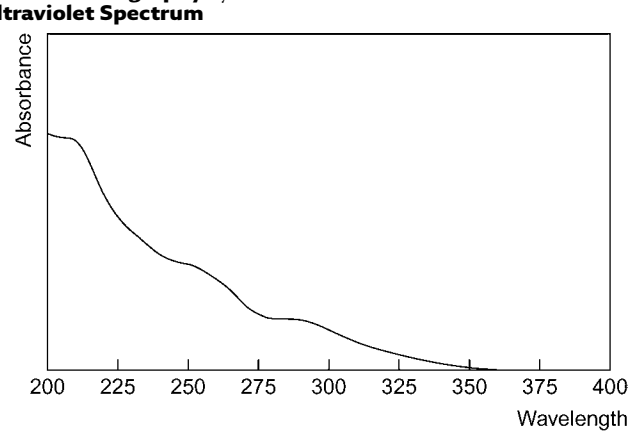


Chemical Properties White to off-white crystalline powder. It is moderately soluble in water. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005]. Standard solutions were stable after 4 freeze-thaw cycles and at room temperature for 2 h. Plasma samples were stable for 2 h following alkinisation and for 24 h at 10° [Barrett *et al.* 2007]. Standard solutions are stable for several months at –20° in the dark [Sachse *et al.* 2006]. Standard solutions in methanol were stable for 3 months when stored at –20°. Samples were stable for at least 30 days when stored at –20°, following freeze-thaw cycles and for 24 h at 20° [Zhou *et al.* 2004]. Stable in plasma for 15 months at –20° and after 8 freeze-thaw cycles [Davis *et al.* 1999].

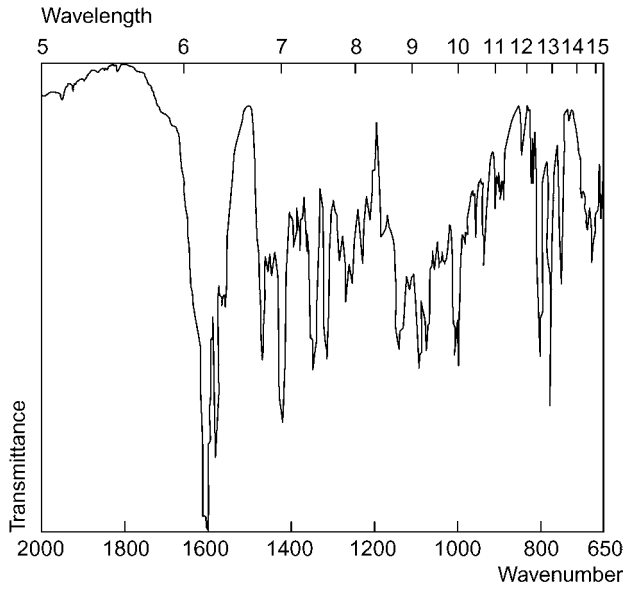
Quetiapine Fumarate

$(C_{21}H_{25}N_3O_2S)_2C_4H_4O_4 = 883.1$
CAS-111974-72-2
Synonym ICI-204636
Proprietary Name *Seroquel*
Chemical Properties Crystals from ethanol. Mp 172° to 173°. pKa_1 3.3; pKa_2 6.8. Stable in plasma for 12 months at –20° or –70° and after 3 freeze-thaw cycles [Pullen *et al.* 1992].

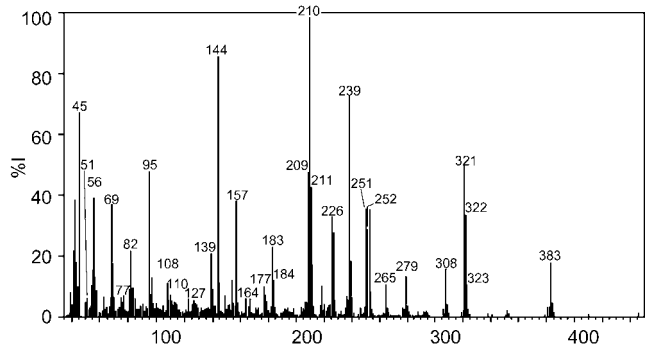
Gas Chromatography System GB—RI 3400.
Ultraviolet Spectrum



Infrared Spectrum Principal peaks at wavenumbers 1600, 1575, 1410, 765 cm^{-1}.



Mass Spectrum Principal ions at *m/z* 210, 144, 239, 45, 321, 209, 95, 211.



Quantification

Blood **GC** Column: HP-5 (15 m × 0.25 mm i.d., 0.25 µm) and HP-35 (15 m × 0.32 mm i.d., 0.32 µm). Temperature programme: 140° for 0.5 min to 300° at 10°/min for 10.5 min. NPD. Limit of quantification, 0.1 mg/L [Anderson, Fritz 2000].

GC-MS Column: HP-5MS (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1.0 mL/min. Temperature programme: 140° to 300° at 30°/min for 7.17 min. MSD, SIM acquisition mode. Limit of quantification, 0.1 mg/L, limit of detection, 0.05 mg/L [Flammia *et al.* 2006].

HPLC Column: Hypersil ODS C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : water: tetramethylethylenediamine (8 : 92 : 0 : 0: to 37.5 : 62.1 : 0.4 at 5 min for 10 min to 8 : 92 : 0 at 15 min for 10 min), flow rate, 1.3 mL/min. UV detection (λ= 254 nm). Retention time: 13.86 min. Limit of detection, 20 µg/L [Sachse *et al.* 2006]. Column: XTerra MS C_8 (150 × 2.1 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.1 mol/L ammonium hydroxide (20 : 80 for 4 min to 60 : 40 over 3 min for 6 min), flow rate, 0.4 mL/min. DAD (λ= 258 nm). Retention time: 9.1 min. Limit of detection, 0.1 mg/L [Hopenwasser *et al.* 2004].

Plasma **GC-MS** Column: cross-linked methylsilicone (30 m × 0.25 mm i.d., 0.1 µm). Carrier gas: He, 0.75 mL/min. Temperature programme: 190° for 1.6 min to 295° at 30°/min for 8.9 min. EI ionisation at 70 eV, SIM acquisition mode at *m/z*: 322 and 340. Retention time: TMS (tetramethylsilane) derivatives: quetiapine, 10.1 min; 7-hydroxyquetiapine, 13.0 min. Limit of quantification, 15 µg/L [Pullen *et al.* 1992].

HPLC Column: Chromsep C_8 (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 30 mmol/L phosphate buffer containing 0.5% triethylamine (pH 3.0, 30 : 70), flow rate, 1.0 mL/min. UV detection (λ= 238 nm). Limit of quantification, 1.5 µg/L, limit of detection, 0.5 µg/L [Mercolini *et al.* 2007]. Column: Varian ResElut C_8 (!50 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 10.5 mmol/L phosphate buffer (pH 3.5) containing 0.12% triethylamine (30 : 70), flow rate 1.2 mL/min. UV detection (λ= 254 nm). Retention time: 7.3 min. Limit of quantification, 2.5 µg/L, limit of detection, 0.8 µg/L [Saracino *et al.* 2006]. Column: Zorbax Stablebond phenyl (150 × 2.1 mm i.d., 5 µm). Mobile phase: 20 mmol/L

phosphate buffer (30 mmol/L potassium chloride, pH 7.4) : methanol : acetonitrile (40 : 10 : 50), flow rate 0.25 mL/min. Electrochemical detection. Retention time: 7.8 min. Limit of quantification, 2.5 µg/L [Davis *et al.* 1999]. Column: ODS Hypersil (250 × 4.6 mm i.d., 5 µm); Mobile phase: acetonitrile : methanol : 5 mmol/L potassium phosphate (pH 7.0; 2 : 1 : 2), flow rate 1 mL/min. UV detection (λ = 250 nm). Retention time: quetiapine, 9.7 min; 7-hydroxyquetiapine, 4.0 min. Limit of quantification, 2 µg/L [Pullen *et al.* 1992].

LC-MS Column: Atlantis dC_{18} (100 × 3.0 mm i.d., 3 µm). Mobile phase: acetonitrile : methanol : 0.01 mol/L ammonium acetate (pH 3.5, 31 : 19 : 50), flow rate 0.4 mL/min. ESI, positive ion mode, SRM acquisition mode, CID. Limit of quantification, 1.0 µg/L, limit of detection, 0.3 µg/L [Barrett *et al.* 2007]. Column: Kromasil C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: 1.7 mmol/L formic acid and 5.8 mmol/L ammonium acetate : acetonitrile (65 : 35), flow rate 0.95 mL/min. ESI, SIR acquisition mode. Limit of quantification, 10 µg/L, limit of detection, 0.3 µg/L [Li *et al.* 2004]. Column: Macherey-Nagel C_{18} (125 × 2.0 mm i.d., 3 µm). Mobile phase: 2.7 mmol/L formic acid and 10 mmol/L ammonium acetate : acetonitrile (53 : 47), flow rate 0.16 mL/min. ESI, positive ion mode, SIR acquisition mode. Limit of detection, 1.0 µg/L [Zhou *et al.* 2004].

Serum **HPLC** Column: RP-18e (100 × 4.6 mm i.d.). Mobile phase: methanol : 0.1% trifluoroacetic acid (15 : 85 to 35 : 65 over 7 min to 100 : 0 for 3 min), flow rate 3.0 mL/min. MSD. Retention time: 5.8 min. Limit of detection, 0.2 nmol/L [Bellomarino *et al.* 2009]. Column: Nucleosil 100-5-Protect 1 (250 × 4.6 mm i.d., 5 µm). Mobile phase: 25 mmol/L potassium dihydrogenphosphate (pH 7.0) : acetonitrile (60 : 40), flow rate, 1.0 mL/min. UV detection (λ = 230 nm). Retention time: 11.7 min. Limit of detection not reported [Frahnert *et al.* 2003]. Column: Spherisorb S5W (150 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 20 mmol/L ammonium acetate buffer (pH 5.0, 99 : 1), flow rate 1.0 mL/min. UV detection (λ = 257 nm). Limit of detection, 10.3 nmol/L [Hasselstrøm, Linnet 2003].

LC-MS Column: C_{18} (50 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 5 mmol/L acetic acid (pH 3.9, 20 : 80 to 70 : 30 over 4 min for 1 min), flow rate 1.0 mL/min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 0.17 µg/L [Kirchherr, Kühn-Velten 2006].

Disposition in the Body Quetiapine is well and rapidly absorbed following oral administration. It is widely distributed throughout the body and extensively metabolised in the liver by sulfoxidation, carboxylic acid formation on the ethoxyethanol side chain and 7-hydroxylation. At least 20 metabolites have been detected but only 7-hydroxyquetiapine has significant pharmacological activity. CYP3A4 is the main isoenzyme responsible for cytochrome P450-mediated metabolism. Elimination is mainly through hepatic metabolism. The drug is excreted as its inactive metabolite: 73% in urine and 20% in faeces. One percent of an administrated dose is excreted unchanged. Only small quantities are excreted in the breast milk [Lee *et al.* 2004]. Peak plasma concentrations are observed within 1.5–2 h after administration. Steady state is achieved within 2 days of the dose. Linear pharmacokinetics are observed.

Therapeutic Concentration The effective dose is 200–750 mg daily. The therapeutic concentration is 0.4 mg/L.

Twenty-four healthy male Thai volunteers were administered 200 mg quetiapine as 2 separate preparations. The mean maximum plasma concentration was 811.3 µg/L reached at 1.1 h following Seroquel and 886.6 µg/L at 1.08 h following Quantia200 [Mahatthanatrakul *et al.* 2008].

A patient receiving a dose of 150 mg quetiapine fumarate had a maximum plasma concentration of 437 ± 173 µg/L at 2 h [Davis *et al.* 1999].

Twelve hospitalised patients with schizophrenia were administered increasing doses of quetiapine over 21 days. A 75-mg oral dose produced a peak serum concentration of 0.278 mg/L on the last day of treatment. [Fabre, Jr. *et al.* 1995].

Toxicity The lethal concentration is 7 mg/L.

A 34-year-old female ingested ≈24 g quetiapine. Approximately 2 h after admission her plasma concentration was 22 mg/L which decreased with a $t_{1/2}$ of 4.1 h. Interestingly there was a small increase in quetiapine concentration between 24 and 37 h, suggesting redistribution from tissues. The patient recovered after 2 days [Bodmer *et al.* 2008].

The distribution of quetiapine was investigated in 20 postmortem cases. The quetiapine mean and range of concentrations in each tissue were as follows: peripheral blood, 7.7 mg/L (0.14–37 mg/L, n = 17); heart blood, 23.6 mg/L (0.53–76 mg/L, n = 4); liver, 71 mg/kg (1.1–510 mg/kg, n = 19); bile, 44 mg/L (6.0–96 mg/L, n = 4); urine, 15 mg/L (1.9–37 mg/L, n = 8); gastric, 897 mg total (3.5–3960 mg, n = 7); and vitreous humour, 1.4 mg/L (0.2–3.2 mg/L, n = 5). The mean of all blood concentrations in 18 cases in which quetiapine contributed to the cause of death was 7.95 mg/L (0.4–76 mg/L) [Flammia *et al.* 2006].

The postmortem concentrations from 8 cases are shown in the table below (mg/L or mg/kg). Quetiapine was the cause of death in case 2.

A physically healthy 40-year-old female with an extensive psychiatric history was being treated with 100 mg quetiapine fumarate twice daily as well as clonazepam, chloral hydrate and valproic acid. After being discharged from hospital (after treatment for another overdose) she overdosed on 3000 mg quetiapine fumerate. Upon admission at hospital, she was drowsy, confused, suffering from hypotension, tachycardia and was mildly obtunded; other symptoms were also present. She was treated with activated charcoal and after 90 min was more obtunded and could not continue with this treatment. The serum quetiapine concentration was 1.824 mg/L. She became progressively worse but improved after systolic blood pressure support and saline solution. Eight hours after overdosing, serum concentration was 0.963 mg/L; 22 h, 0.180 mg/L; 42 h, 0.015 mg/L and 48 h, 0.005 mg/L. The drug was still detectable after 7 days. Tachycardia persisted until 42 h after overdosing [Pollak, Zbuk 2000].

A 40-year-old male was found decomposed in a hotel room. Postmortem examination revealed the following quetiapine concentrations: 49 mg/L in heart blood, 112 mg/kg in liver, 7.6 mg total gastric content, 4.0 mg/kg in spleen. Other substances detected in the heart blood were: alprazolam (2.6 mg/L), fluoxetine (2.1 mg/L), norfluoxetine (2.1 mg/L), prochlorperazine (0.83 mg/L) and ethanol (0.41 g%) [Anderson, Fritz 2000].

A young female who overdosed with 10 000 mg quetiapine was initially treated with gastric lavage and activated charcoal within 75 min of overdosing. Serum drug concentrations reached 12.7 mg/L. Her level of consciousness decreased 180 min after ingestion requiring intubation for 240 min. Alertness was regained at 16 h but her persistent tachycardia was not resolved until 42 h after ingestion. A full recovery was made [Harmon *et al.* 1998].

Note For a review of postmortem cases see Parker, McIntyre [2005].

Half-life 6–7 h; also reported as 2.7–9.3 h.

Bioavailability 100% bioavailability of tablets relative to solution. Absolute bioavailability 9%.

Volume of Distribution 10 L/kg.

Protein Binding 83%.

Milk : Plasma Ratio 0.29 [Rampono *et al.* 2007].

Quinagolide

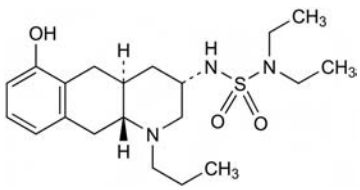
Prolactin Inhibitor, Dopaminergic Agent

$C_{20}H_{33}N_3O_3S = 395.6$

CAS—87056-78-8

IUPAC Name (3*S*,4a*S*,10a*R*)-3-(Diethylsulfamoylamino)-6-hydroxy-1-propyl-3,4,4a,5,10,10a-hexahydro-2*H*-benzo[*g*]quinolin

Synonym (3*R*,4a*R*,10a*S*)-*rel*-*N*,*N*-Diethyl-*N*′-(1,2,3,4,4a,5,10,10a-octahydro-6-hydroxy-1-propylbenzo[*g*]quinolin-3-yl)sulfamide



Chemical Properties A beige powder. Mp 122.5° to 124°.

Quinagolide Hydrochloride

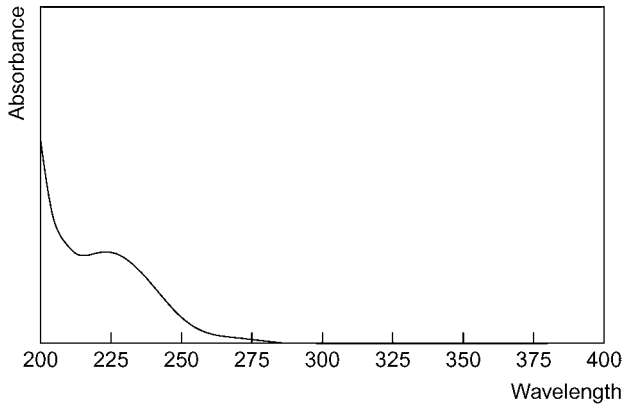
$C_{20}H_{33}N_3O_3S$, HCl = 432.0

CAS—94424-50-7

Proprietary Name *Norprolac*

Chemical Properties Crystals. Mp 234° to 236°.

UV Spectrum



Disposition in the Body Quinagolide is rapidly and well absorbed from the gastro-intestinal tract. There is extensive first-pass metabolism to the *N*-desethyl analogue which is biologically active and the *N*,*N*-didesethyl analogue. 95% of the drug is excreted as its metabolites with approximately equal amounts of a dose appearing in urine and in faeces. Excretion occurs in urine as sulfate or glucuronide conjugates of quinagolide and its metabolites and in faeces as the unconjugated forms.

Bioavailability 100% after oral administration.

Half-life 11.5 h after a single dose and 17 h at steady state.

Volume of Distribution Approximately 100 L after single a oral dose.

Protein Binding About 90%.

Dose 25 to 150 µg daily. Maximum 300 µg.

Quinapril

Antihypertensive

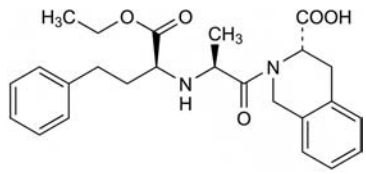
$C_{25}H_{30}N_2O_5 = 438.5$

CAS—85441-61-8

IUPAC Name (3*S*)-2-[(2*S*)-2-[[(2*S*)-1-Ethoxy-1-oxo-4-phenylbutan-2-yl]amino]-propanoyl]-3,4-dihydro-1*H*-isoquinoline-3-carboxylic acid

Synonym (3*S*)-2-[(2*S*)-2-[[(1*S*)-1-(Ethoxycarbonyl)-3-phenylpropyl]amino]-1-oxopropyl]-1,2,3,4-tetrahydro-3-isoquinolinecarboxylic acid

Proprietary Names *Accuretic* (Quinapril with Hydrochlorothiazide); *Acequide*; *Koretic*.



Chemical Properties Log *P* (octanol/water), 3.72.

Quinaprilat (Diacid of Quinapril)

$C_{23}H_{26}N_2O_5 = 410.5$

CAS—82768-85-2

Synonym CI-928

Chemical Properties Hydrate crystals from methanol–ethyl ether. Mp 166° to 168°.

Quinapril Hydrochloride

$C_{25}H_{30}N_2O_5$, HCl = 475.0

CAS—82586-55-8

Synonyms CI-906; PD-109452-2.

Proprietary Names *Accupril*; *Accuprin*; *Accupro*; *Acequin*; *Acuitel*; *Korec*; *Quinazil*.

Chemical Properties Crystals from ethyl acetate–toluene. Mp 120° to 130°. Also reported as white crystalline solid (from acetonitrile). Mp 119° to 121.5°.

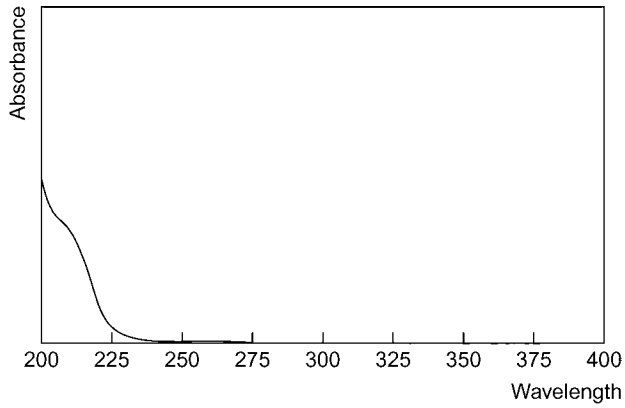
Gas Chromatography System GP—quinapril-ME RI 3110; M (quinaprilate)-ME_3 RI 3080; M (quinaprilate-H_2O)-ME_3 RI 3310.

Gas Chromatography-Mass Spectrometry Column: fused-silica capillary DB-1 (10 m × 0.32 mm i.d., 0.25 µm). Temperature programme: 150° for 0.1 min, to 300° at 25°/min for 1.5 min. Injector temperature: 70° to 300° at 10°/min, held for 5 min. Carrier gas: He. NICI, SIM at *m/z* 302 for quinapril and 288 for quinaprilat. Retention times: quinapril, 6.20 min; quinaprilat, 6.15 min [Hammes *et al.* 1995].

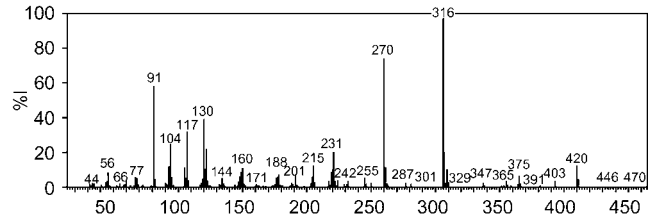
High Performance Liquid Chromatography System HZ—retention time 5.4 min; system HAA—retention time 16.8 min.

Column: C_{18} μBondapak (300 × 3.9 mm i.d., 10 μm). Column temperature: 30°. Mobile phase: 1-propanol: acetonitrile: phosphoric acid (0.01 mol/L) (20:15:78), flow rate 1.0 mL/min. UV detection (λ=206 nm). Retention times: quinapril, 7.6 min; quinaprilat, 5.7 min [Prieto *et al.* 2001].

UV Spectrum



Mass Spectrum Principal ions at *m/z* 316, 270, 91, 130, 117, 104, 132, 231.



Quantification

Plasma **GC** ECD. Limit of detection 10 μg/L [Ferry *et al.* 1987].

GC-MS Limit of quantification, 0.05 μg/L for quinapril and quinaprilat [Goto *et al.* 1992a]. Limit of quantification, 0.2 μg/L for dioxopiperazine metabolites of quinapril, limit of detection, 0.1 μg/L [Goto *et al.* 1992b].

Urine **GC** ECD. Limit of detection 50 μg/L [Ferry *et al.* 1987].

GC-MS Limit of quantification, 0.5 μg/L for quinapril and quinaprilat [Goto *et al.* 1992a]. Limit of quantification, 1.0 μg/L for dioxopiperazine metabolites of quinapril, limit of detection, 0.5 μg/L [Goto *et al.* 1992b].

HPLC UV detection (λ= 206 nm). Limit of quantification, 190 μg/L for quinapril and 160 μg/L for quinaprilat, limit of detection, 60 μg/L for quinapril and 50 μg/L for quinaprilat [Prieto *et al.* 2001].

Disposition in the Body Approximately 60% of a dose is absorbed after oral administration and is metabolised mainly in the liver to quinaprilat and inactive metabolites. Peak plasma concentrations of the active metabolite are reached within 2 h of administration. Up to 60% of the dose is excreted in urine as the unchanged drug, quinaprilat and inactive metabolites. The remainder is excreted in faeces. Elimination of quinaprilat is reduced in elderly patients (>65 years).

Therapeutic Concentration

Twelve patients with terminal renal failure were involved in the study, 6 of whom were on maintenance haemodialysis (at 4 h, three times a week), mean age 58.5 years (range, 25–71 years) and 6 on continuous peritoneal dialysis (CAPD) treatment (4 exchanges daily), mean 50.2 years old (range, 32–68 years). Patients were administered a single oral dose of 2.5 mg quinapril. Peak plasma concentrations for those undergoing haemodialysis were 83.5 (range, 45.8–103.2) μg/L observed at 4 h and for those being treated by CAPD, 64.3 (47.1–83.8) μg/L at 4.7 (4–8) h [Wolter, Fritschka 1993].

Twenty-two normotensive subjects, aged 18–75 years, were divided into 3 groups according to their creatinine clearance rates and treated with 20 mg quinapril hydrochloride on day 1 and on days 4 to 10. The dose was administered after an 8 h fast which was continued for another 4 h after dosing. Group 1: creatinine clearance, >60 mL/min (6 subjects); group 2: 30–59 mL/min (6 subjects); group 3: <29 mL/min (10 subjects). For the single dose, peak plasma quinapril concentrations reached 153, 136 and 161 μg/L for groups 1, 2 and 3, respectively. These were observed at 0.75, 0.8 and 1.29 h, respectively. The peak quinaprilat concentrations were 607, 663 and 885 μg/L at 1.88, 2.25 and 3.57 h, respectively, for groups 1, 2 and 3. For the multiple dosing, peak drug concentrations for groups 1, 2 and 3, were 149, 115 and 211 μg/L observed at 0.75, 1.0 and 1.07 h, respectively. The metabolite concentrations were 578, 686 and 1330 μg/L at 1.75, 2.33 and 2.43 μg/L for the 3 groups, respectively. These concentrations were measured on day 10 [Halstenson *et al.* 1992].

Bioavailability Quinapril, 60%.

Half-life Quinapril, ≈1 h; quinaprilat, 3 h (increased in those with creatinine clearance ≤40 mL/min).

Volume of Distribution 0.31 L/kg (range 0.18–0.52 L/kg) for patients undergoing haemodialysis; 0.3 (0.26–0.4) L/kg for those undergoing continuous peritoneal dialysis treatment.

Clearance Quinapril, 111 L/h; quinaprilat 13 L/h.

Protein Binding 97% (quinapril and its metabolites).

Dose Hypertension: An initial dose of 10 mg once daily is administered. In the elderly, those with renal impairment and those taking diuretics: 2.5 mg. The usual maintenance dose is 20 to 40 mg daily. Heart failure: initially 2.5 mg daily followed by a maintenance dose of 10 to 20 mg.

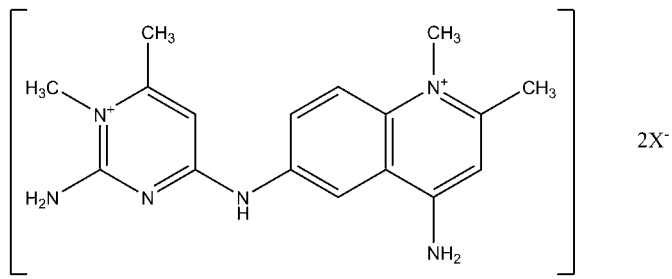
Quinapyramine

Trypanocide (Veterinary)

Synonyms 4-Amino-6-[(2-amino-1,6-dimethyl-4(1*H*)-pyrimidinylidene) amino]-1,2-dimethylquinolinium conjugate monoacid; 4-amino-6-[(2-amino-1,6-dimethyl-4-pyrimidinyl)amino]-1,2-dimethylquinoline salts; 4-amino-6-[(2-amino-6-methyl-4-pyrimidinyl)amino]-1-methylquinaldinium methosalts; 4-amino-6-(2-amino-6-methyl-4-pyrimidylamino)quinaldine-1,1′-dimethosalts; M-7555.

Proprietary Name *Antrycide*



Quinapyramine Dimethosulfate

$C_{19}H_{28}N_6O_8S_2$

Chemical Properties The 1,1′-dimetho(methylsulphate) salt of quinapyramine. White crystalline powder. Mp 266°, with decomposition. Soluble 1 in 2 of water; almost insoluble in ethanol, ether, and chloroform. The quinapyramine salts are quaternary ammonium compounds.

Quinapyramine Dichloride

$C_{17}H_{22}Cl_2$, $N_{62}H_2O$ = 417.3

Chemical Properties White crystalline powder. Mp 310°, with decomposition. Soluble 1 in 850 of water and 1 in 50 of boiling water; almost insoluble in ethanol, ether, and chloroform.

Quinapyramine Diiodide

Chemical Properties Pale-cream needles, Mp 312° to 313° with decomposition. Sparingly soluble in water.

Colour Test Vitali's test—blue-grey/yellow/orange (limit of detection, 1.0 μg).

Thin-layer Chromatography System T1—R_f 0.02 (location reagent acidified iodoplatinate spray, positive reaction).

Ultraviolet Spectrum Quinapyramine sulfate in 0.1 mol/L sulfuric acid, maxima at 248 (A^1_1 415), 297 (A^1_1 771), 325 nm (A^1_1 218).

Disposition in the Body The 1,1′-dimethochloride dihyrate salt is absorbed very much more slowly than the 1,1′-dimetho(methylsulphate), so the 2 salts are commonly used prophylactically as 'pro-salt R.F', a mixture of 4 parts of the chloride to 3 of the sulfate. Rapid absorption of the sulfate gives an initial high blood-level which is maintained by slow release from the chloride depot at the injection site.

Toxicity Overdose causes tremours, inco-ordination, increase in respiration and heart rate, and dementia. Acute inflammation of the gastrointestinal tract and nephrosis have been found postmortem.

Dose 4.4 mg/kg SC.

Quinethazone

Diuretic

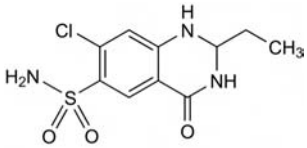
$C_{10}H_{12}ClN_3O_3S$ = 289.7

CAS—73-49-4

IUPAC Name 7-Chloro-2-ethyl-4-oxo-2,3-dihydro-1*H*-quinazoline-6-sulfonamide

Synonyms Chinethazonum; 7-chloro-2-ethyl-1,2,3,4-tetrahydro-4-oxo-6-quinazolinesulfonamide; CL-36010.

Proprietary Names *Aquamox*; *Hydromox*.



Chemical Properties A white to yellowish-white, crystalline powder. Mp 250° to 252°. Very slightly soluble in water; slightly soluble in ethanol; freely soluble in solutions of alkali hydroxides and carbonates. pK_a 9.3, 10.7. Log *P* (octanol/water), 0.2.

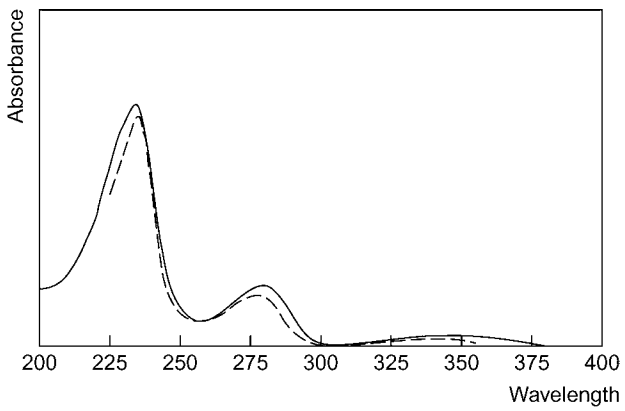
Colour Test Koppanyi–Zwikker test—violet.

Thin-layer Chromatography System TA—R_f 0.75; system TAD—R_f 0.15; system TD—R_f 0.04; system TE—R_f 0.40; system TF—R_f 0.21; system TAJ—R_f 0.11; system TAK—R_f 0.06; system TAL—R_f 0.56 (location under ultraviolet light, blue fluorescence; acidified iodoplatinate solution, positive).

Gas Chromatography System GA—not eluted.

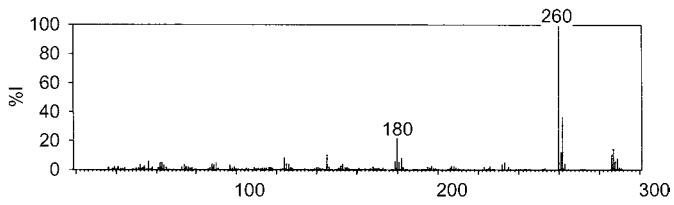
High Performance Liquid Chromatography System HN—*k* 0.67.

Ultraviolet Spectrum Ethanol—234 (A_1^1=1532a), 278, 345 nm.



Infrared Spectrum Principal peaks at wavenumbers 1600, 1650, 1160, 960, 1510, 1040 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 260, 262, 180, 287, 261, 145, 286, 124.



Quantification

Urine **HPLC** UV detection. Average limit of detection, 1 mg/L for quinethazone and other diuretics [Cooper *et al.* 1989].

Dose 50 to 200 mg daily.

Cooper SF *et al.* (1989). Comprehensive screening procedure for diuretics in urine by high-performance liquid chromatography. *J Chromatogr* 489: 65–88.

Quinidine

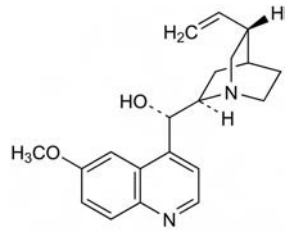
Antiarrhythmic

$C_{20}H_{24}N_2O_2$, $2H_2O$ = 360.5

CAS—56-54-2 (anhydrous); 63717-04-4 (dihydrate)

IUPAC Name (*S*)-[(2*R*,5*H*)-5-Ethenyl-1-azabicyclo[2.2.2]octan-2-yl]-(6-methoxyquinolin-4-yl)methanol dihydrate

Synonyms Chinidinum; (9*S*)-6′-Methoxycinchonan-9-ol; quinidina.



Chemical Properties A dextrorotatory stereoisomer of quinine, obtained from the bark of species of *Cinchona* (Rubiaceae). Commercial samples may contain 20 to 30% of hydroquinidine. A white amorphous powder or acicular crystals. Mp 174° to 175° (anhydrous). The anhydrous alkaloid is soluble 1 in about 2000 of cold water, 1 in 800 of boiling water, 1 in 36 of alcohol, 1 in 1.6 of chloroform and 1 in 56 of ether; very soluble in methanol; practically insoluble in petroleum ether. pK_a 4.2, 8.8 (20°). Log *P* (octanol/water), 3.4. Extraction yield (chlorobutane), 0.95 [Demme *et al.* 2005].

Quinidine Bisulfate

$C_{20}H_{24}N_2O_2$, H_2SO_4, $4H_2O$ = 494.6

CAS—747-45-5 (anhydrous); 6151-39-9 (tetrahydrate)

Proprietary Names *Biquin*; *Biquinate*; *Kiditard*; *Kinidin(e)*; *Kiniduron*; *Quini*; *Quiniduran*; *Quinidurule*.

Chemical Properties Colourless crystals. Soluble 1 in 8 of water and 1 in 3 of ethanol; practically insoluble in ether.

Quinidine Gluconate

$C_{20}H_{24}N_2O_2$, $C_6H_{12}O_7$ = 520.6

CAS—7054-25-3

Proprietary Names *Quinaglute*; *Quinate*.

Chemical Properties A white powder. Mp 175.0° to 176.5°. Soluble 1 in 9 of water and 1 in 60 of alcohol.

Quinidine Polygalacturonate

$C_{20}H_{24}N_2O_2$, $(C_6H_{10}O_7)_x$, xH_2O

CAS—27555-34-6 (anhydrous); 65484-56-2 (hydrate)

Proprietary Names *Cardioquin(e)*; *Galactoquin*.

Chemical Properties An amorphous powder. Mp 180°, with decomposition. The anhydrous product is sparingly soluble in water; insoluble in ethanol, chloroform, ether, acetone, dioxane and methanol.

Quinidine Sulfate

$(C_{20}H_{24}N_2O_2)_2$, H_2SO_4, $2H_2O$ = 783.0

CAS—50-54-4 (anhydrous); 6591-63-5 (dihydrate)

Synonyms Chinidini sulfas; chinidin sulfate; chinidinum sulfuricum; quinidini sulfas.

Proprietary Names *Kinidin*; *Quinicardina*; *Quinicardine*; *Quinidex*; *Quinora*; *Systodin*.

Chemical Properties White acicular crystals or fine white powder, darkening on exposure to light. Mp about 207°, with decomposition. Soluble 1 in about 90 of water (1 in 15 boiling water), 1 in 10 of ethanol, 1 in 3 of methanol and 1 in 12 of chloroform; insoluble in ether and benzene.

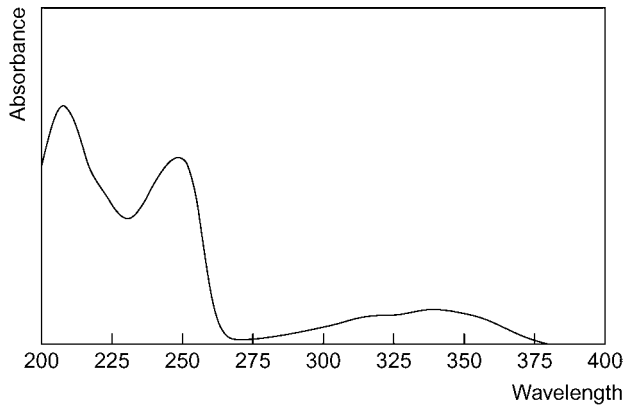
Colour Tests Sulfuric acid—yellow (fluoresces under UV light); Thalleioquin test—green.

Thin-layer Chromatography System TA—R_f 0.51; system TB—R_f 0.04; system TC—R_f 0.12; system TE—R_f 0.49; system TL—R_f 0.06; system TAE—R_f 0.30; system TAF—R_f 0.63; system TAJ—R_f 0.00; system TAK—R_f 0.02; system TAL—R_f 0.68 (location under UV light, blue fluorescence; Dragendorff spray, positive; acidified iodoplatinate solution, positive).

Gas Chromatography System GA—quinidine RI 2790, M (*N*-oxide) RI 2950; system GB—quinidine RI 2979, M (*N*-oxide) RI 3086.

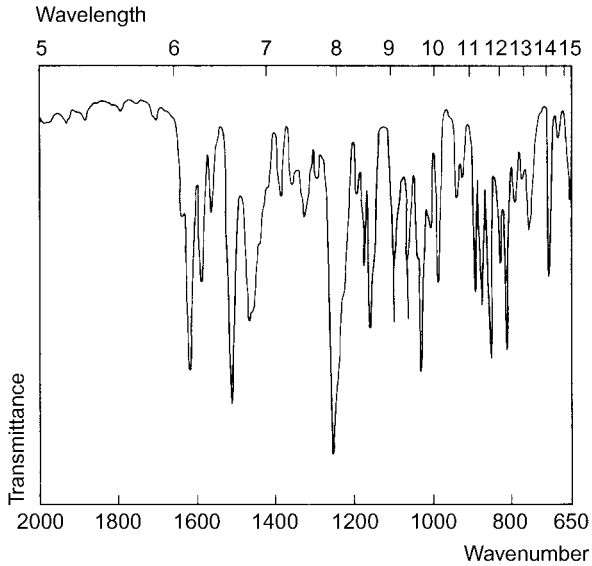
High Performance Liquid Chromatography System HA—*k* 2.1; system HX—RI 322; system HY—RI 245; system HZ—RT 2.6 min; system HAA—RT 11.0 min; system HAX—RT 8.7 min; system HAY—RT 4.6 min.

Ultraviolet Spectrum Aqueous acid—250 (A_1^1= 959a), 317, 345 nm; aqueous alkali—280, 330 nm.

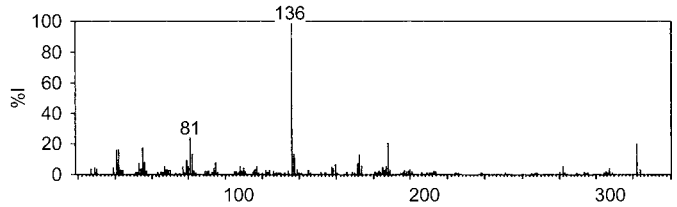


Q

Infrared Spectrum Principal peaks at wavenumbers 1258, 1514, 1619, 1040, 860, 820 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 136, 81, 322, 188, 55, 42, 41, 172.



Quantification

Plasma **HPLC** UV and fluorescence detection. Quinidine and diltiazem. Limit of quantification, 4 µg/L for quinidine [Carignan *et al.* 1995]. For method, see Brandsteterova *et al.* [1994]. Fluorescence detection. Limit of quantification, 3.6 µg/L for quinidine and its metabolites [Nielsen *et al.* 1994]. Fluorescence detection. For method for quantification of quinidine and quinine, see Edstein *et al.* [1990]. UV detection. Limit of detection, 500 µg/L for quinidine and other antiarrhythmic agents [Bridges, Jennison 1983]. Fluorescence detection. Quinidine, hydroquinidine and 2 quinidine metabolites. Limit of detection, 50 µg/L for quinidine [Pershing *et al.* 1982]. Fluorescence and UV detection. Quinidine, hydroquinidine and quinidine metabolites. Limit of detection, 10 µg/L for quinidine [Guentert *et al.* 1980].

Serum **GC** AFID. For method for quantification of quinidine and other antiarrhythmic agents, see Kessler *et al.* [1982].

HPLC UV detection. Limit of detection, 0.1 mg/L for quinidine and metabolites [Hoyer *et al.* 1991].

Urine **HPLC** Fluorescence detection. Limit of quantification, 3.6 µg/L for quinidine and its metabolites [Nielsen *et al.* 1994]. Fluorescence and UV detection. Quinidine, hydroquinidine and quinidine metabolites. Limit of detection, 10 µg/L for quinidine [Guentert *et al.* 1980].

Disposition in the Body Rapidly absorbed after oral administration and undergoes first-pass metabolism in the liver. Extensively metabolised, mainly by the cytochrome P450 isoenzyme CYP3A4. The major metabolites, 3-hydroxyquinidine and quinidin-2′-one, appear to be pharmacologically active. Hydroquinidine, which may occur in quinidine as an impurity at concentrations of up to ≈30%, has similar pharmacological activity to quinidine. About 10–30% of a dose is excreted in the urine as unchanged drug in 48 h and the remainder is mostly excreted in the urine as metabolites; *O*-desmethylquinidine accounts for ≈2% of a dose; quinidine-10,11-dihydrodiol and an *N*-oxide metabolite have been detected in plasma and urine. The proportion of unchanged drug is dependent on the urinary pH, being decreased if the urine is alkaline.

Quinidine crosses the placenta and is excreted in breast milk.

Therapeutic Concentration In plasma, usually in the range 2–6 mg/L; there is, however, considerable intersubject variation. Concentrations appear to be higher in subjects with congestive heart failure.

After single oral doses of 4.5 mg/kg of quinidine sulfate to 10 subjects, peak plasma concentrations of 0.9–1.8 mg/L (mean 1.2) were attained in about 50 min [Guentert *et al.* 1979].

Following daily oral doses of 8–19 mg/kg (mean 12) to 5 subjects, steady-state serum concentrations of 0.5–2.5 mg/L (mean 1.8) of quinidine, 0.38–0.94 mg/L (mean 0.55) of 3-hydroxyquinidine and 0.02–0.12 mg/L (mean 0.07) of quinidin-2′-one, were reported; following daily oral doses of 8.6–13.3 mg/kg (mean 10.7) to 8 subjects with mild renal dysfunction, steady-state serum-quinidine concentrations ranged from 1.4–3.6 mg/L (mean 2.3) [Drayer *et al.* 1978].

Toxicity Plasma concentrations greater than 6 mg/L are progressively associated with toxicity, and concentrations of about 15 mg/L may cause toxic reactions in about 50% of patients; concentrations in excess of about 30 mg/L may be lethal.

The following postmortem tissue concentrations were reported in one fatality: blood 75 mg/L, brain 11 µg/g, kidney 89 µg/g, liver 145 µg/g, spleen 136 µg/g, urine 52 mg/L; 3-hydroxyquinidine, and lactone conjugates of quinidine and 3-hydroxyquinidine were also detected [Leferink *et al.* 1977].

In a fatality involving the ingestion of about 5 g of a sustained-release preparation by a 2-year-old child, the following postmortem tissue concentrations were reported: blood 45 mg/L, kidney 180 µg/g, liver 220 µg/g; death occurred 28 h after ingestion [McBay, Turk 1972].

Bioavailability About 70–80% but there is considerable intersubject variation.

Half-life Plasma half-life, about 4–12 h (mean 7).

Volume of Distribution About 2–3 L/kg, decreased in subjects with congestive heart failure.

Clearance Plasma clearance, ≈5 mL/min/kg.

Distribution in Blood Plasma : whole blood ratio, ≈1.0.

Protein Binding Quinidine about 75–95%, 3-hydroxyquinidine ≈60% and quinidin-2′-one ≈55%.

Note For a review of the pharmacokinetic interactions of antimalarial agents, see Giao and de Vries [2001]. For a general review of quinidine, see Grace and Camm [1998]. For a review of the pharmacokinetics of quinine and quinidine in malaria, see White [1987]. For a review of the pharmacokinetics of quinidine, see Ochs *et al.* [1980].

Dose Usually 0.6 to 1.6 g of quinidine sulfate daily.

Quinine

Antimalarial

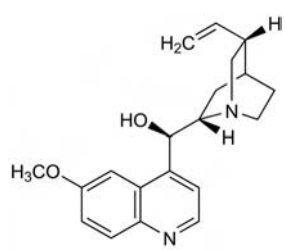
$C_{20}H_{24}N_2O_2$, $3H_2O$ = 378.5

CAS—130-95-0 (anhydrous)

IUPAC Name (8α,9*R*)-6′-Methoxycinchonan-9-ol trihydrate

Synonyms Chinina; chininum; quinina.

Proprietary Name It is an ingredient of *Nicobrevin*.



Chemical Properties The chief alkaloid of various species of Cinchona (Rubiaceae). It is a laevorotatory stereoisomer of quinidine. A white, slightly

efflorescent, flaky, granular or microcrystalline powder. Mp 57°. The anhydrous form is soluble 1 in 1900 of water, 1 in 760 of boiling water, 1 in 0.8 of alcohol, 1 in 80 of benzene, 1 in 1.2 of chloroform, 1 in 250 of dry ether and 1 in 20 of glycerol; almost insoluble in petroleum ether. pK_a 4.1, 8.5 (20°). Log *P* (octanol/water), 3.4. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Quinine Bisulfate

$C_{20}H_{24}N_2O_2$, H_2SO_4, $7H_2O$ = 548.6
CAS—549-56-4 (anhydrous); 6183-68-2 (heptahydrate)
Synonyms Chininum bisulfuricum; neutral quinine sulfate; quinine acid sulfate; quinine bisulphate; quinini bisulfas.
Proprietary Names *Biquin*; *Biquinate*; *Myoquin*; *Quinbisul*.
Chemical Properties Colourless crystals or white crystalline powder. It effloresces in dry air and becomes yellow when exposed to light. Soluble 1 in 8 of water, 1 in 50 of ethanol and 1 in 625 of chloroform.

Quinine Dihydrobromide

$C_{20}H_{24}N_2O_2$, 2HBr, $3H_2O$ = 540.3
Synonyms Neutral quinine hydrobromide; quinine acid hydrobromide.
Chemical Properties Yellowish or white crystals or powder. Soluble 1 in 7 of water; soluble in ethanol; practically insoluble in ether.

Quinine Dihydrochloride

$C_{20}H_{24}N_2O_2$, 2HCl = 397.3
CAS—60-93-5
Synonyms Chinini dihydrochloridum; neutral quinine hydrochloride; quinine acid hydrochloride; quinini dihydrochloridum.
Chemical Properties A white powder. Soluble 1 in about 0.6 of water, 1 in about 12 of ethanol and 1 in 7 of chloroform; very slightly soluble in ether.

Quinine Ethyl Carbonate

$C_{23}H_{28}N_2O_4$ = 396.5
CAS—83-75-0
Synonyms Euquinina; euquinine; quinine etabonate.
Chemical Properties White masses of silky crystals which darken on exposure to light. Mp 91° to 95°. Very slightly soluble in water; soluble 1 in 2 of ethanol, 1 in 1 of chloroform and 1 in 10 of ether.

Quinine Hydrobromide

$C_{20}H_{24}N_2O_2$, HBr, $2H_2O$ = 441.4
CAS—549-49-5 (anhydrous)
Synonyms Basic quinine hydrobromide; chinini bromidum; quinine monohydrobromide.
Chemical Properties White, silky, efflorescent crystals which darken on exposure to light. Soluble 1 in about 55 of water, 1 in 0.7 of ethanol and 1 in 1 of chloroform, the solution in chloroform being turbid due to separation of water.

Quinine Hydrochloride

$C_{20}H_{24}N_2O_2$, HCl, $2H_2O$ = 396.9
CAS—130-89-2 (anhydrous); 6119-47-7 (dihydrate)
Synonyms Basic quinine hydrochloride; chinini hydrochloridum; chinini chloridum; chininium chloratum; chininum hydrochloricum; quinine monohydrochloride.
Proprietary Names *Kinin*; *Surquina*.
Chemical Properties Colourless, fine, silky, acicular crystals which effloresce in dry air and gradually become yellowish on exposure to light. Soluble 1 in 16 of water (1 in 0.5 of boiling water), 1 in 1 of ethanol, 1 in 7 of glycerol, 1 in about 350 of ether and 1 in about 1 of chloroform to give a turbid solution.

Quinine Salicylate

$C_{20}H_{24}N_2O_2$, $C_7H_6O_3$, H_2O = 480.6
CAS—750-90-3 (anhydrous)
Chemical Properties White silky crystals or a crystalline powder; it becomes pink on storage. Very slightly soluble in water; soluble 1 in 24 of ethanol and 1 in 25 of chloroform.

Quinine Sulfate

$(C_{20}H_{24}N_2O_2)_2$, H_2SO_4, $2H_2O$ = 783.0
CAS—804-63-7 (anhydrous); 6119-70-6 (dihydrate)
Synonyms Basic quinine sulphate; chinini sulfas; chininum sulfuricum; quinine sulphate.
Proprietary Names *Q200*; *Q300*; *Quinate*; *Quinoc*; *Quinoctal*; *Quinora*; *Quinsul*.
Chemical Properties Colourless acicular crystals or a white crystalline powder, becoming brown on exposure to light. Soluble 1 in about 810 of water (1 in 32 of boiling water) and 1 in 120 of ethanol; slightly soluble in chloroform and ether; readily soluble in a 2:1 mixture of chloroform and dehydrated alcohol.

Colour Tests Sulfuric acid—yellow (fluoresces under UV light); Thalleioquin test—green.
Thin-layer Chromatography System TA—R_f 0.51; system TB—R_f 0.02; system TC—R_f 0.11; system TE—R_f 0.45; system TL—R_f 0.04; system TAE—R_f 0.26; system TAF—R_f 0.65 (location under UV light, blue fluorescence; Dragendorff spray, positive; acidified iodoplatinate solution, positive).
Gas Chromatography System GA—quinine RI 2800, quinine-AC RI 2760, M (OH-)-AC_2 RI 3195, M (*N*-oxide)-AC RI 2945, M (di-OH-dihydro-)-AC_3 RI 3360.

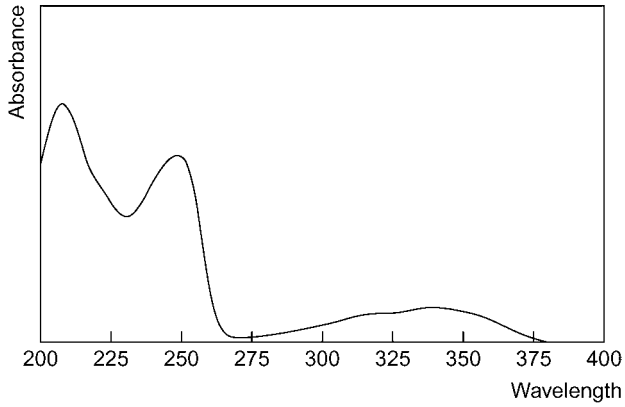
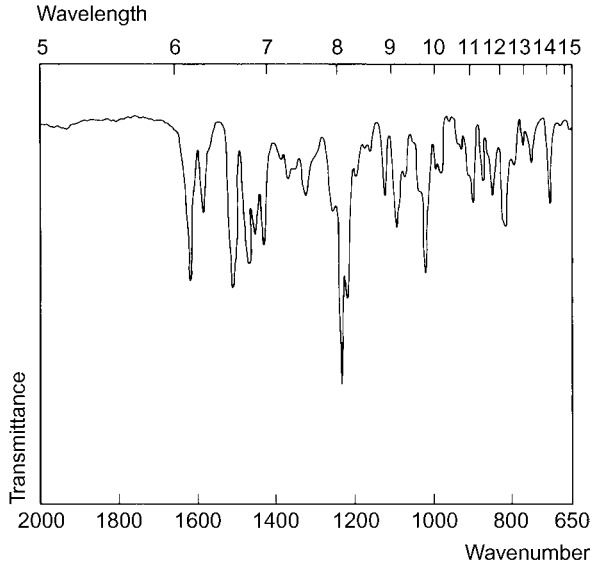
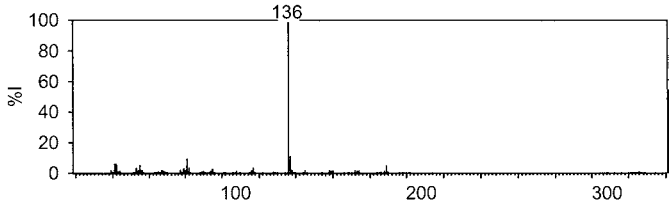
Ultraviolet Spectrum Aqueous acid—250 (A^1_1 = 959a), 317, 346 nm; aqueous alkali—280, 330 nm.



Infrared Spectrum Principal peaks at wavenumbers 1235, 1215, 1510, 1619, 1030, 1105 cm^{-1} (KBr disk).



Mass Spectrum Principal ions at *m/z* 136, 137, 81, 42, 41, 189, 55, 117.



Quantification

Blood **HPLC** UV and fluorescence detection. Limit of quantification, 0.1 mg/L (on filter paper) [Kolawole, Mustapha 2000]. Fluorescence detection. Quinine and chloroquine and related compounds in whole blood (or dried on filter paper). Limit of quantification, 50 µg/L for quinine [Croes *et al.* 1994]. Fluorescence detection. Limit of detection, 50 nmol/L in whole blood and dried samples [Ericsson *et al.* 1993].

Plasma **HPLC** Fluorescence detection. Limit of quantification, 0.024–0.081 µmol/L for quinine and its metabolites [Mirghani *et al.* 2001]. UV and fluorescence detection. Limit of quantification, 0.1 mg/L [Kolawole, Mustapha 2000]. Fluorescence detection. Limit of quantification, 4.5 nmol/L for 3-hydroxyquinine [Mirghani *et al.* 1998]. UV detection. Limit of detection, 10 µg/L [Babalola *et al.* 1993]. Fluorescence detection. Quinine and chloroquine. Limit of detection, ≈23 µg/L for quinine [Chaulet *et al.* 1993]. Fluorescence detection. For method, see Dua *et al.* [1993]. Fluorescence detection. Limit of detection, 2 nmol/L [Ericsson *et al.* 1993]. Fluorescence detection. For method for quantification of quinine and quinidine, see Edstein *et al.* [1990].

Spectrofluorimetry See Hall *et al.* [1973].

Serum **HPLC** Fluorescence detection. Quinine and chloroquine and related compounds. Limit of quantification, 50 µg/L for quinine [Croes *et al.* 1994].

Q

Fluorescence detection. See Dua *et al.* [1993]. UV detection. For comparison with spectrofluorometric method, see Galloway *et al.* [1990].

Urine **GC–MS** See Hall *et al.* [1973].

HPLC Fluorescence detection. Limit of quantification, 0.024–0.081 µmol/L for quinine and its metabolites [Mirghani *et al.* 2001]. UV detection. Limit of detection, 10 µg/L [Babalola *et al.* 1993]. Fluorescence detection. Quinine and chloroquine. Limit of detection, ≈23 µg/L for quinine [Chaulet *et al.* 1993]. Fluorescence detection. Limit of detection, 50 nmol/L [Ericsson *et al.* 1993].

Spectrofluorimetry See Hall *et al.* [1973].

Saliva **HPLC** UV detection. Limit of detection, 10 µg/L [Babalola *et al.* 1993].

Erythrocytes **HPLC** Fluorescence detection. Quinine and chloroquine. Limit of detection, about 23 µg/L for quinine [Chaulet *et al.* 1993].

Red Blood Cells **HPLC** Fluorescence detection. See Dua *et al.* [1993].

Disposition in the Body Readily absorbed after oral administration but more slowly absorbed after IM or SC doses. Hydroquinine may occur in quinine as an impurity at concentrations up to ≈10%. Metabolised by oxidation to hydroxylated metabolites, mainly the 2-hydroxyquinoline and 6-hydroxyquinoline derivatives, 3-hydroxyquinine, and the corresponding dihydro compounds; quinine-10,11-epoxide and quinine-10,11-dihydrodiol have also been detected in urine. Up to ≈20% of a single dose is excreted in the urine in 24 h with <5% as unchanged drug. <5% of a dose is eliminated in the faeces. The urinary excretion of quinine is increased when the urine is acid; quinine is excreted to some extent in the bile and saliva. Quinine crosses the placenta and is excreted in breast milk.

Therapeutic Concentration In plasma, usually in the range 3–7 mg/L. Malarial infection inhibits hepatic metabolism and thus plasma concentrations resulting from a given dose will vary according to the severity of the infection.

Single oral doses of 300 mg quinine bisulfate administered to 8 healthy subjects and to 8 patients with chronic renal failure on haemodialysis, resulted in mean maximum plasma concentrations of 2.60 mg/L in healthy subjects and 4.56 mg/L in dialysis patients; the time to reach peak concentrations was similar in both groups (1.6 vs 1.9 h) [Roy *et al.* 2002].

Following a single oral dose of quinine sulfate 600 mg to 4 healthy subjects, a mean maximum concentration of 2.88 mg/L was attained in the plasma at 2.75 h and 0.90 mg/L in the saliva at 4.25 h [Babalola *et al.* 1996].

Oral doses of 540 mg, given 8-hourly for 3 days to 11 subjects, resulted in a mean peak plasma concentration of 4 mg/L after 72 h [Hall *et al.* 1973].

Toxicity The estimated minimum lethal dose is 8 g. Blood concentrations greater than about 10 mg/L may cause toxic effects and can be lethal.

Fatal quinine poisoning occurred in three young females, and the following postmortem concentrations (mg/L or µg/g) were reported: blood –, 11, –; kidney 300, 96, 410; liver 1500, 39, 150; spleen 600, 87, –; urine –, –, 860 [Walker GW, personal communication, 1964].

In a fatality involving the ingestion of 32.5 g of quinine sulfate, postmortem brain and liver concentrations of 292 and 3000 µg/g, respectively, were reported [Andrtauskas *et al.* 1974].

Half-life Plasma half-life, 4–15 h (mean 9); it appears to be increased during malarial infection.

Volume of Distribution About 2 L/kg; reduced in malaria infection.

Distribution in Blood Plasma : whole blood ratio, ≈0.93 in normal subjects. In malarial subjects, the plasma concentration rises but this does not seem to be accompanied by a rise in the amount taken up by erythrocytes; under these conditions there may be twice as much in the plasma as in the erythrocytes.

Protein Binding In plasma, 70% in healthy subjects increasing to 90% or higher in malaria infection.

Note For a review of the pharmacokinetics of quinine, chloroquine and amodiaquine, see Krishna and White [1996]. For a review of the pharmacokinetics of quinine and quinidine in malaria, see White [1987]; for a review of the pharmacokinetic interactions of antimalarial agents, see Giao and de Vries [2001]. For a toxicity study of quinine when given with doxycycline and mefloquine, see Karbwang *et al.* [1994].

Dose 1.8 g of quinine sulfate or other salt, by mouth daily, for 7 days for treatment of falciparum malaria. For nocturnal leg cramps 200 to 300 mg of sulfate or bisulfate at night.

Quinisocaine

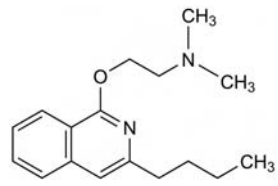
Anaesthetic (Local)

$C_{17}H_{24}N_2O$ = 272.4

CAS—86-80-6

IUPAC Name 2-(3-Butylisoquinolin-1-yl)oxy-*N*,*N*-dimethylethanamine

Synonyms 2-[(3-Butyl-1-isoquinolinyl)oxy]-*N*,*N*-dimethylethanamine; chinisocaine; dimethisoquin.



Chemical Properties A liquid. Bp 155° to 157°. Log *P* (octanol/water), 4.4.

Quinisocaine Hydrochloride

$C_{17}H_{24}N_2O$, HCl = 308.9

CAS—2773-92-4

Proprietary Names *Haenal*; *Isochinol*; *Pruralgan*; *Pruralgin*; *Quotane*.

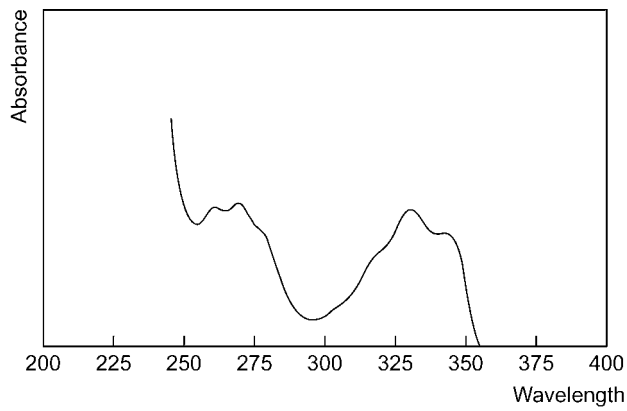
Chemical Properties A white crystalline powder. Mp 144° to 148°. Soluble 1 in 8 of water, 1 in 3 of ethanol and 1 in 2 of chloroform; practically insoluble in ether.

Thin-layer Chromatography System TA—R_f 0.61; system TB—R_f 0.55; system TC—R_f 0.46; system TL—R_f 0.28; system TAJ—R_f 0.25; system TAK—R_f 0.13; system TAL—R_f 0.66 (acidified iodoplatinate solution, positive).

Gas Chromatography System GA—RI 2030.

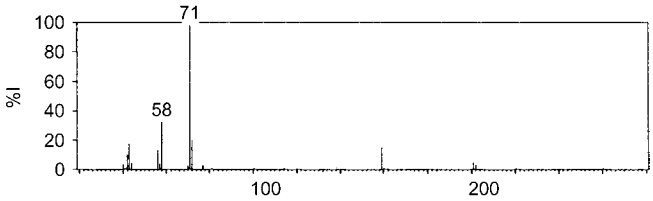
High Performance Liquid Chromatography System HA—*k* 2.2; system HR—*k* 11.24.

Ultraviolet Spectrum Aqueous acid—261, 269 (A_1^1=159a), 331 nm.



Infrared Spectrum Principal peaks at wavenumbers 1576, 1631, 1499, 1155, 1115, 751 cm^{-1} (KBr disk).

Mass Spectrum Principal ions at *m/z* 71, 58, 72, 43, 159, 56, 42, 201.



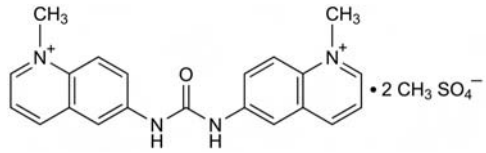
Use Quinisocaine hydrochloride is used in a concentration of 0.5%.

Quinuronium Sulfate

Antiprotozoal (Veterinary)
$C_{23}H_{26}N_4O_9S_2$ = 566.6
CAS—135-14-8

IUPAC Name 1,3-Bis(1-methylquinolin-1-ium-6-yl)urea; methyl sulfate
Synonyms SN-5870; 6,6′-Ureylenebis[1,1′-dimethylquinolinium]sulfate.

Proprietary Names *Acaprin*; *Atral*; *Babesan*; *Baburan*; *Pirevan*; *Pyroplasmin*; *Zothelone*.

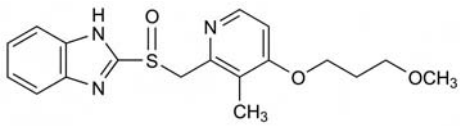


Chemical Properties A creamy-white to yellow, crystalline powder. Mp 237°, with decomposition. Very soluble in water; very slightly soluble in organic solvents. On heating, aqueous solutions darken and some decomposition may occur.
Colour Test Aromaticity (method 2)—yellow/orange.
Thin-layer Chromatography System TA—R_f 0.00 (acidified iodoplatinate solution, positive).
Ultraviolet Spectrum Aqueous acid—274 ($A^{1\%}_{1cm}$=1527a), 323, 359 nm.
Infrared Spectrum Principal peaks at wavenumbers 1210, 1248, 1276, 1572, 1025, 1525 cm^{-1} (KBr disk).

Rabeprazole

Proton Pump Inhibitor
$C_{18}H_{21}N_3O_3S = 359.4$
CAS—117976-89-3

IUPAC Name 2-[[4-(3-Methoxypropoxy)-3-methylpyridin-2-yl]methylsulfinyl]-1*H*-benzimidazole
Synonyms LY-307640; 2-[[[4-(3-methoxypropoxy)-3-methyl-2-pyridinyl]methyl]sulfinyl]-1*H*-benzimidazole; pariprazole.

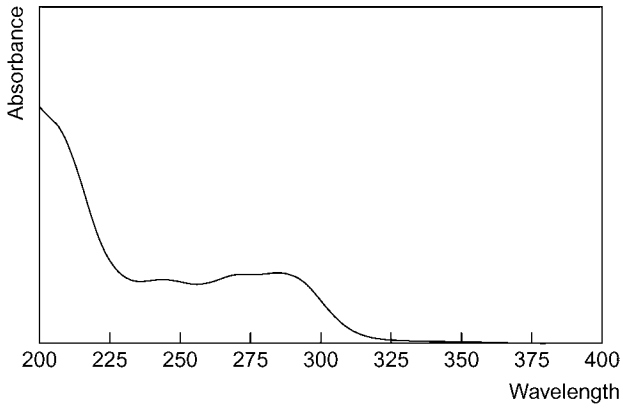


Chemical Properties White crystals. Mp 99° to 100°.

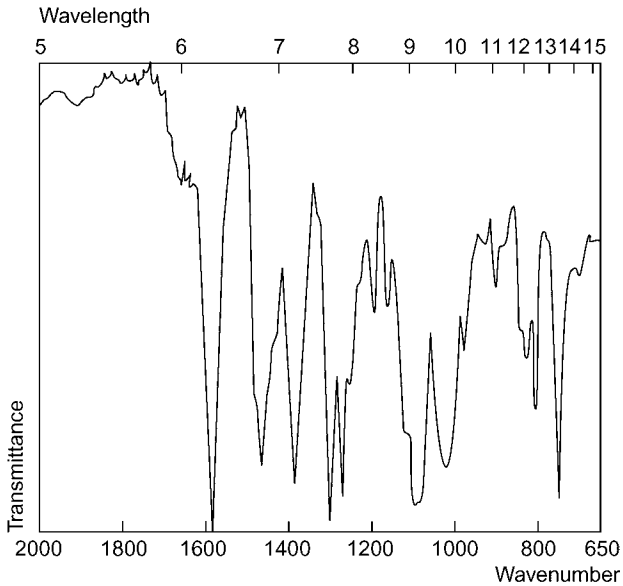
Rabeprazole Sodium

$C_{18}H_{20}N_3NaO_3S = 381.4$
CAS—117976-90-6
Synonyms E-3810; SHKA.
Proprietary Names *AcipHex*; *Pariet*.
Chemical Properties A white to slightly yellowish white, crystalline solid. Mp 140° to 141°. Very soluble in water and methanol; freely soluble in ethanol, chloroform and ethyl acetate; insoluble in ether and *n*-hexane.

High Performance Liquid Chromatography Column: C_8 Inertsil (150 × 4.6 mm i.d., 5 µm). Column temperature: 40°. Mobile phase: acetonitrile: phosphate buffer (0.1 mol/L, pH 7.0) (28:72), flow rate 1.4 mL/min. UV detection (λ=288 nm). Retention times: rabeprazole sodium, 6.5 min; demethylated metabolite, 2.8 min; demethylated thioether metabolite, 6.0 min; sulfone metabolite, 8.0 min; thioether metabolite, 19.7 min [Nakai *et al.* 1994].
Ultraviolet Spectrum Aqueous base (0.01 mol/L NaOH)—292 nm.



Infrared Spectrum Principal peaks at wavenumbers 1584, 1298, 1462, 1081 cm^{-1}.



Quantification
Plasma **HPLC** UV detection (λ=290 nm). Limit of quantification, 0.03 mg/L [Mano *et al.* 1996]. UV detection (λ=288 nm). Limit of quantification, 5 µg/L for the drug and 20 µg/L for the metabolites [Nakai *et al.* 1994].
Disposition in the Body Rabeprazole is well absorbed (at least 30%) and can be detected in the plasma within 1 h. Food delays absorption. It is extensively and rapidly metabolised; this is regulated by the CYP2C19 isoenzyme in the liver and to some extent by CYP3A4. The primary metabolite is the rabeprazole thioether. Other metabolites are sulfone E3810, desmethyl E3810, desmethylated thioether E3810 and thioether carboxylic acid E3810. 90% of the administered drug is excreted in urine with 30% as the thioether carboxylic acid metabolite and its glucuronide. No unchanged rabeprazole has been recovered in urine or faeces. Renal excretion accounts for 30 to 35%. There is no accumulation following multiple dosing.
Therapeutic Concentration A maximum plasma concentration of 0.406 mg/L can be achieved with a single 20 mg dose of rabeprazole. A maximum concentration of 0.418 mg/L is reached after 40 mg for 7 days. Time to reach maximum plasma concentration is about 3.1 h [Prakash, Faulds 1998].

Six healthy volunteers were administered with doses between 10 and 80 mg rabeprazole sodium. The maximum plasma concentration reached for the 20 mg dose was 0.406 mg/L, observed after 3.5 h. The 80 mg dose produced concentrations of ≈1.4 mg/L at 4 h; 40 mg dose ≈0.9 mg/L at 3.5 h; and the 10 mg dose, ≈0.15 mg/L at 4.5 h [Nakai *et al.* 1994].

Bioavailability 52%.
Half-life 1 to 2 h.
Clearance 35.3 L/h; 4.37 to 8.40 mL/min/kg.
Protein Binding 96.3%.
Dose 20 mg daily.

Mano N *et al.* (1996). Plasma direct injection high-performance liquid chromatographic method for simultaneously determining E3810 enantiomers and their metabolites by using flavoprotein-conjugated column. *J Pharm Sci* 85: 903–907.

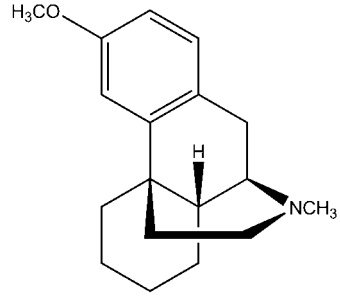
Prakash A, Faulds D (1998). Rabeprazole. *Drugs* 55(2): 261–267.

Racemethorphan

Narcotic, Antitussive
$C_{18}H_{25}NO = 271.4$
CAS—510-53-2

Synonyms Deoxydihydrothebacodine; *dl-cis*-1,2,3,9,10,10a-hexahydro-6-methoxy-11-methyl-4*H*-10-4a-iminoethanophenanthrene; *dl-cis*-1,3,4,9,10,10a-hexahydro-6-methoxy-11-methyl-2*H*-10-4a-iminoethanophenanthrene; methorphan; (±)-3-methoxy-17-methylmorphinan.



Chemical Properties Log *P* (octanol/water) 3.97 [Meylan, Howard 1995]; 3.6 [National Institutes of Health 2008]. Racemethorphan is extracted by organic solvents from aqueous alkaline solutions.

Racemethorphan Hydrobromide

$C_{18}H_{25}NO,HBr = 352.3$
CAS—6031-86-3
Synonym Ro-1-5470
Chemical Properties Crystals.

Racemethorphan Hydrobromide (*d*-Form)

CAS—125-69-9
Synonym Demorphan hydrobromide; dextromethorphan hydrobromide; Ro-1-5470/5.
Proprietary Names *Benylin*; *Canfodion*; *Cosylan*; *Hihustan*.
Chemical Properties Crystals. Mp 122° to 124°. Solubility in water 1.5% at 25°, 5% at 50° and 25% at 85°. Solubility 25% in 95% ethanol at room temperature, 10% in glycerol. Soluble in propylene glycol and chloroform, practically insoluble in ether. Long range stability of aqueous solutions obtained by adjusting the pH to 4–5.6. Reacts with alkalis forming the free base which is practically insoluble in water [O'Neil *et al.* 2006].

Racemethorphan Hydrobromide (*l*-Form)
CAS—125-68-8
Synonyms Levomethorphan hydrobromide; Ro-1-5470/6; Ro 1-7788.
Chemical Properties Crystals. Mp 124° to 126°.

Colour Test Ammonium molybdate test—blue→green (limit of detection, 0.25 μg).
Thin-layer Chromatography System T1—R_f 0.25 (location reagent acidified iodoplatinate spray, positive reaction).
Gas Chromatography System G2/225—Retention time 0.50 relative to codeine
Ultraviolet Spectrum Ethanol—220–221, 281, 289 nm; aqueous acid (0.1 N sulfuric acid)—277 nm with an inflexion at 283 nm.

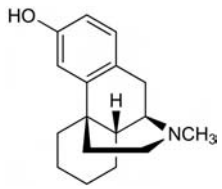
Racemoramide

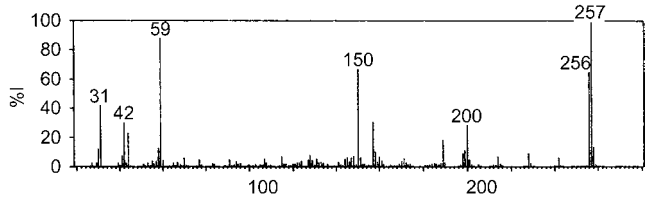
Narcotic Analgesic
$C_{25}H_{32}N_2O_2$ = 392.5
IUPAC Name 3-Methyl-4-morpholino-2,2-diphenylbutyrl)pyrrolidine
Synonyms NIH 7421; R 610; SKF 5137.
Proprietary Name *Eupharma*.
Chemical Properties A white crystalline powder. A racemic mixture of dextromoramide (shown) and levomoramide.
Thin-layer Chromatography System T1—R_f 0.70 (acidified iodoplatinate spray—positive reaction).
Gas Chromatography System G2/225—RT 4.70 min (relative to codeine).
Ultraviolet Spectrum Aqueous acid (0.05 mol/L sulfuric acid)—253.5 and 264 nm (maxima) 267 and 270 nm (minor inflexions).
Dose Up to 20 mg.

Racemorphan

Narcotic Analgesic
$C_{17}H_{23}NO$ = 257.4
CAS—297-90-5
Synonyms 17-Methylmorphinan-3-ol; methorphinan.

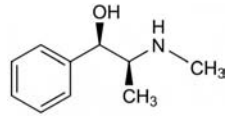


Chemical Properties White powder. Mp 251° to 253°. Soluble in dilute acetic acid.
Thin-layer Chromatography System TA—R_f 0.34; system TAG—R_f 0.02; system TB—R_f 0.14; system TC—R_f 0.09 (Dragendorff spray, positive, acidified iodoplatinate solution, positive).
Gas Chromatography System GA—racemetorphan RI 2138; M (nor--) RI 2193; system GB—racemetorphan RI 2237; M (nor--) RI 2244; M (OH-) RI 2420.
Ultraviolet Spectrum Aqueous acid—279 (A^1_1 = 79a); aqueous alkali—240 (A^1_1 = 339a), 299 nm (A^1_1 = 119a)
Infrared Spectrum Principal peaks at wavenumbers 1242, 1280, 1580, 1495, 1505, 760 cm^{-1} (KBr disk).
Mass Spectrum Principal ions at *m/z* 257, 59, 150, 256, 31, 157, 42, 200.



Racephedrine

Sympathomimetic
$C_{10}H_{15}NO$ = 165.2
CAS—90-81-3
IUPAC Name 2-(Methylamino)-1-phenylpropan-1-ol
Synonyms *dl*-Ephedrine; [α-(methylamino)ethyl]benzenemethanol; racemic ephedrine.
Proprietary Name It is an ingredient of *Riddofan*.



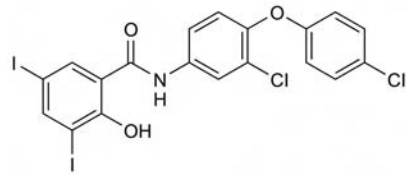
Chemical Properties Crystals. Mp 75°. Soluble in water, ethanol, chloroform and ether. Log *P* (octanol/water), 0.7.
Note For analytical data, see under Ephedrine.

Racephedrine Hydrochloride
$C_{10}H_{15}NO,HCl$ = 201.7
CAS—134-71-4
Proprietary Names *Efetonina*; *Ephetonin*.
Chemical Properties Fine white crystals or powder. Mp 189°. Soluble 1 in about 4 of water and 1 in about 4 of ethanol; practically insoluble in ether.

Dose 50 to 200 mg of racephedrine hydrochloride daily.

Rafoxanide

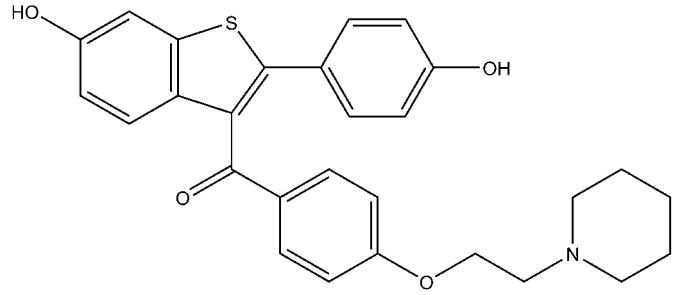
Anthelmintic (Veterinary)
$C_{19}H_{11}Cl_2I_2NO_3$ = 626.0
CAS—22662-39-1
IUPAC Name *N*-[3-Chloro-4-(4-chlorophenoxy)phenyl]-2-hydroxy-3,5-diiodobenzamide
Synonym MK-990
Proprietary Names *Flukanide*; *Flukex*; *Ranide*; *Ridafluke*.



Chemical Properties A greyish-white to brown powder. Mp 168° to 170°. Practically insoluble in water; soluble 1 in 25 of acetone, 1 in 40 of chloroform, 1 in 35 of ethyl acetate and 1 in 200 of methanol. Log *P* (octanol/water), 8.1.
Colour Test Iodine test—positive.
Thin-layer Chromatography System TA—R_f 0.89 (acidified potassium permanganate solution, positive).
Gas Chromatography System GA—not eluted.
Ultraviolet Spectrum Methanolic acid—280 (A^1_1=243b), 335 nm (A^1_1=149a).
Infrared Spectrum Principal peaks at wavenumbers 1215, 1562, 1592, 1257, 1087, 1275 cm^{-1} (KBr disk).

Raloxifene

Antiosteoporotic, Benzothiophene, Bone Modulator, Selective Oestrogen Receptor Modulator
$C_{28}H_{27}NO_4S$ = 473.6
CAS—84449-90-1
IUPAC Name [6-Hydroxy-2-(4-hydroxyphenyl)-1-benzothiophen-3-yl]-[4-(2-piperidin-1-ylethoxy)phenyl]methanone
Synonyms 6-Hydroxy-2-(*p*-hydroxyphenyl)benzo[b]thien-3-yl-*p*-(2-piperidinoethoxy)phenyl ketone; keoxifene; LY-139481.



Chemical Properties Crystals from acetone. Off-white to pale yellow non-volatile solid. Mp 143° to 147°. Very slightly soluble in water. pK_{a1} 8.95, pK_{a2} 9.83, pK_{a3} 10.91. Log *P* (octanol/water), 3.12 [Trontelj *et al.* 2005], 5.75 [Wishart 2006].

Raloxifene Hydrochloride
$C_{28}H_{27}NO_4S,HCl$ = 510.0
CAS—82640-04-8
Synonyms Keoxifene hydrochloride; LY-156758.

Proprietary Names *Bonmax*; *Celvista*; *Estroact*; *Evista*; *Ketidin*; *Optruma*; *Oseofem*; *Ralista*; *Raxeto*.
Chemical Properties Crystals from methanol/water. Mp 258°.

High Performance Liquid Chromatography Column: Nucleosil C_{18} (250 × 4.0 mm i.d., 5 µm). Mobile phase: acetonitrile : 50 mmol/L phosphate buffer (pH 3.0; 36 : 64), flow rate 0.7 mL/min. UV detection (λ = 287 nm) and colorimetric detection. Retention time: 9 min. Limit of quantification, 0.61 and 0.34 mg/L for UV and colorimetric detection, respectively, limit of detection, 0.2 and 0.11 mg/L, for UV and colorimetric detection, respectively [Trontelj *et al.* 2005].
Ultraviolet Spectrum Neutral—287 nm.
Quantification
***Plasma* HPLC** Column: C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 10 mmol/L sodium dodecyl sulfate (pH 7; 11 : 9). UV detection (λ = 286 nm). Limit of quantification not reported [Perez-Ruiz *et al.* 2004].

LC-MS Column: C_{18} (50 × 2.0 mm i.d.). Mobile phase: 0.1% formic acid in acetonitrile : 0.1% formic acid in water (10 : 90 for 0.25 min to 31 : 69 over 4.75 min to 63 : 37 over 1 min to 100 : 0 over 1 min for 3 min), flow rate 0.5 mL/min for 7 min to 0.8 mL/min over 1 min for 2 min. ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 0.088 µg/L for raloxifene, 0.2 µg/L for raloxifene 6-glucuronide, 1.6 µg/L for raloxifene 4′-glucuronide [Trontelj *et al.* 2007]. Column: C_{18} (30 × 1.0 mm i.d., 3 µm). Mobile phase: methanol : acetonitrile : water (28 : 32 : 30) containing 5 mmol/L ammonium acetate, flow rate 0.5 mL/min. MRM acquisition mode. Retention time: 8 min. Limit of quantification, 38 µg/L [Zweigenbaum, Henion 2000].

CE Column: fused silica capillary (total/effective length: 80/50 cm, 75 µm). UV detection (λ = 286 nm). Limit of quantification, 20.5 µg/L; limit of detection, 6.1 µg/L [Perez-Ruiz *et al.* 2004].
***Other* HPLC** Human Tissues. Column: C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: 5 mmol/L ammonium acetate : acetonitrile (80 : 20 to 50 : 50 over 25 min). UV detection (λ = 290 nm). Retention time: raloxifene monosulfate 6 min; raloxifene disulfate 8 min. Limit of quantification not reported [Falany, Falany 2007]. Rat Lung. Column: Cosmosil C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile: 0.05 mol/L ammonium acetate (pH 4.0; 33 : 67), flow rate 1.0 mL/min. UV detection (λ = 289 nm). Retention time: 5.2 min. Limit of quantification, 0.008 mg/L [Yang *et al.* 2007]. Rat Liver. Column: C_{18} (150 × 4.6 mm i.d.). Mobile phase: 10 mmol/L ammonium acetate : methanol (70 : 30 to 20 : 80 over 40 min for 20 min). UV detection (λ = 254 nm). Retention time: raloxifene 43.1 min; dihydroxyraloxifene 33.0 min; piperidine-OH/c-ring-OH 34.7 min; piperidine-OH/piperidine-OH 36.9 min; OH in a or b-ring 38.9 min; OH in a or b-ring 40.0 min; c-ring-OH 42.0 min. Limit of quantification not reported [Van Liempd *et al.* 2006]. Tablets. Column: Nucleosil C_{18} (250 × 4.0 mm i.d., 5 µm). Mobile phase: acetonitrile : 50 mmol/L phosphate buffer (pH 3.0; 36 : 64), flow rate 0.7 mL/min. UV detection (λ = 287 nm) and colorimetric detection. Retention time: 9 min. Limit of quantification, 0.61 and 0.34 mg/L for UV and colorimetric detection, respectively; limit of detection, 0.2 and 0.11 mg/L for UV and colorimetric detection, respectively [Trontelj *et al.* 2005]. Column: C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 10 mmol/L sodium dodecyl sulfate (pH 7; 11 : 9). UV detection (λ = 286 nm). Limit of quantification not reported [Perez-Ruiz *et al.* 2004]. Cultured Cells. Column: C_{18} (150 × 4.6 mm i.d., 5 µm). Mobile phase: methanol : 0.25% perchloric acid-0.25% ethanoic acid (20 : 80 to 75 : 25 over 40 min), flow rate 0.7 mL/min. UV detection (λ = 280 nm). Retention time: ~28 min. Limit of quantification not reported [Toader *et al.* 2003]. Rat Plasma. Column: LiChrosorb C_8 or Zorbax C_8 (10 µm). Mobile phase: 0.1 mol/L sodium acetate buffer (pH 4.0) : acetonitrile (50 : 50), flow rate 2 mL/min. Electrochemical detection. Retention time: 5.8 min. Limit of quantification not reported [Lindstrom *et al.* 1984].

CE Tablets. Column: fused silica capillary (total/effective length: 80/50 cm, 75 µm). UV detection (λ = 286 nm). Limit of quantification, 20.5 µg/L, limit of detection, 6.1 µg/L [Perez-Ruiz *et al.* 2004].
Disposition in the Body Raloxifene is rapidly absorbed from the gastrointestinal tract, with peak plasma concentrations reached within 0.5 h. It is metabolically activated and distributed as the active form in various tissues, including the liver, lungs, spleen, bone, uterus and kidneys. It undergoes extensive first-pass metabolism, forming the raloxifene conjugates 4′-glucuronide (M2), 6-glucuronide (M1) and 4′,6-diglucuronide. Very small amounts of the parent compound are found in the circulation. No other metabolites of raloxifene are formed, indicating that it is not metabolised by the CYP enzyme system. Raloxifene is primarily eliminated in the bile and excreted via the faeces, with small amounts excreted in urine. Raloxifene undergoes enterohepatic circulation.
Therapeutic Concentration
Ten healthy male volunteers and 10 renally impaired patients were administered a single oral dose of two 60 mg tablets of raloxifene hydrochloride (a total of 111.42 mg of the free raloxifene base) after an overnight fast. Mean peak plasma raloxifene concentrations for the healthy group and renally impaired group were 0.7 and 1.0 µg/L, reached at 6 and 8 h, respectively [Czock *et al.* 2005].

A group of 47 postmenopausal women with osteoporosis taking a daily dose of 60 mg raloxifene were assessed for plasma concentrations of raloxifene and its metabolites M1 and M2. These were reported together with coefficients of variation (CV%) as 1.97 µg/L (63%), 204 µg/L (79%), and 43.6 µg/L (81%) for raloxifene, M2 and M1, respectively. The large interindividual variations are thought to reflect genetic polymorphisms in gene for UDP-glucuronosyltransferase (UGT), as the glucuronidation efficiency of various UGT polymorphic variants can affect the clearance of raloxifene and thereby its plasma concentrations [Trontelj *et al.* 2007].
Toxicity Colestyramine reduces the absorption and enterohepatic recycling of raloxifene, and they should not be given together. Raloxifene may decrease the efficacy of warfarin.
Bioavailability Approximately 60% is absorbed, but owing to extensive first-pass metabolism the absolute bioavailability is 2% [Clemett, Spencer 2000].
Half-life Approximately 27.7 h [Clemett, Spencer 2000].
Volume of Distribution 2348 L [Clemett, Spencer 2000].
Clearance Approximately 44.1 L/h/kg (range, 40 to 60) [Clemett, Spencer 2000].
Protein Binding More than 95%, primarily to albumin and α_1-acid glycoprotein. It does not bind to sex-hormone-binding globulin.
Dose Raloxifene is used in doses of 60 mg daily by mouth for the prevention and treatment of postmenopausal osteoporosis.

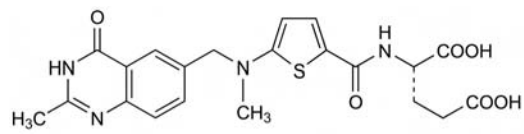
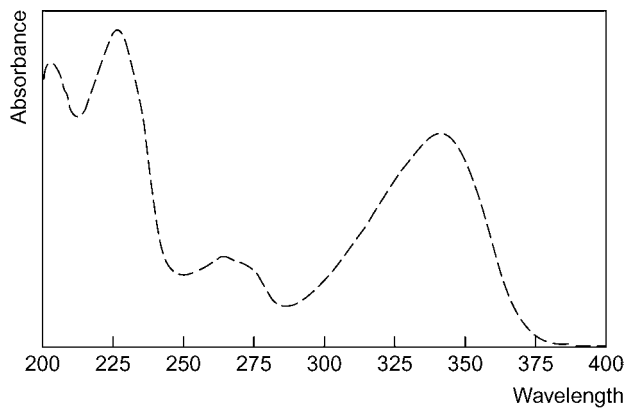
Raltitrexed

Antineoplastic
$C_{21}H_{22}N_4O_6S$ = 458.5
CAS—112887-68-0
IUPAC Name (2*S*)-2-[[5-[Methyl-[(2-methyl-4-oxo-1*H*-quinazolin-6-yl)methyl]amino]thiophene-2-carbonyl]amino]pentanedioic acid
Synonyms *N*-[[5-[[(1,4-Dihydro-2-methyl-4-oxo-6-quinazolinyl)methyl]-methylamino]-2-thienyl]carbonyl]-L-glutamic acid; ICI-D-1694; ZD-1694.
Proprietary Name *Tomudex*



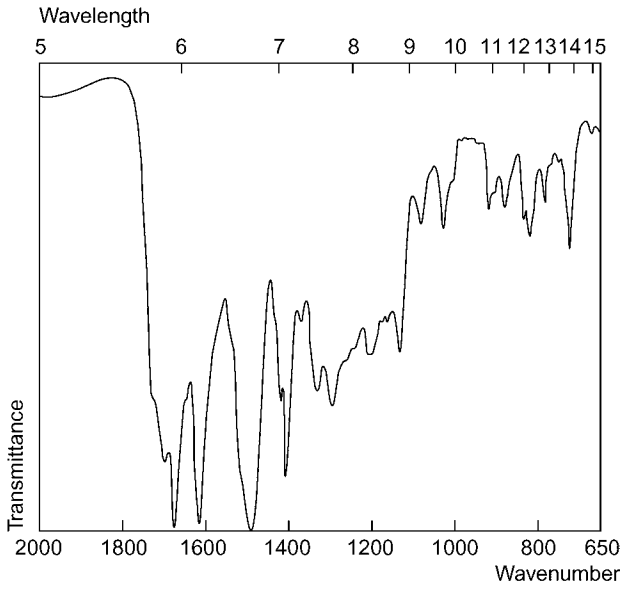
Chemical Properties Pale yellow powder. Soluble in water.

Raltitrexed Monohydrate
Chemical Properties Crystals. Mp 180° to 184°.
Ultraviolet Spectrum



R

Infrared Spectrum



Disposition in the Body Following IV administration of raltitrexed, triphasic pharmacokinetics are displayed. There is a rapid decline from peak plasma concentration followed by a slow terminal elimination phase. The maximum plasma concentration is reached within 15 min. The drug is actively transported into cells and metabolised to active polyglutamate forms. The reminder of the dose is excreted unchanged with approx. 50% of the dose appearing in urine and 15% in faeces. No accumulation occurs of the drug after multiple dosing.

Therapeutic Concentration

The peak plasma concentration after a 3 mg/m^2 dose was 833 µg/L. The mean observed peak plasma concentration in cancer patients was 700.6 µg/L [Beale *et al.* 1998].

Toxicity

Increasing the dosage above 3 mg/m^2, increases the incidence of life threatening or fatal toxicity [ABPI Data Sheets].

Bioavailability Following IP administration, it is fully bioavailable. Following oral administration, 10 to 20%.

Half-life 8 days (257 h).

Volume of Distribution Steady state, 548 L.

Clearance Following a 3 mg/m^2 dose clearance is 51.6 mL/min and the renal clearance is 25.1 mL/min. It is reduced in those with renal impairment by 25%.

Protein Binding 93%.

Dose 3 mg/m^2 IV every 3 weeks.

Beale P *et al.* (1998). Metabolism, excretion and pharmacokinetics of a single dose of [14C]-raltitrexed in cancer patients. *Cancer Chemother Pharmacol* 42: 71–76.

Ramelteon

Propanamide, Melatonin Antagonist, Sedative

$C_{16}H_{21}NO_2 = 259.3$

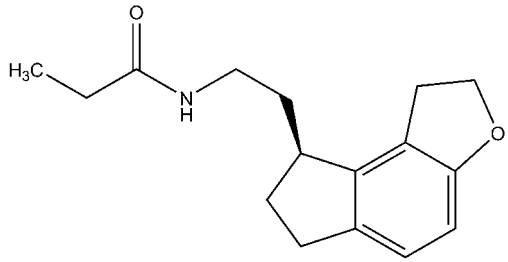
CAS—196597-26-9

IUPAC Name (−)-*N*-{2-[(8*S*)-1,6,7,8-Tetrahydro-2*H*-indeno[5,4-*b*]furan-8-yl] ethyl}propanamide

Synonym TAK-375

Proprietary Name *Rozerem*

Chemical Properties Crystals. Mp 113° to 115°. Log *P* (octanol/water), 2.4 [Wishart 2006].



Quantification

Serum **LC-MS** Column: C_{18} (150 × 2.0 mm i.d.). Mobile phase: 5 mmol/L ammonium acetate : acetonitrile : methanol (60 : 30 : 10), flow rate 0.2 mL/min. TIS, positive ion mode, MRM acquisition mode. Limit of quantification, ramelteon 0.05 µg/L, metabolites 0.5 µg/L [Karim *et al.* 2006].

Disposition in the Body Rapidly and extensively absorbed after oral administration. Absorption is reduced when administered with food. It undergoes extensive first-pass metabolism. The primary metabolic pathway of ramelteon is oxidation to hydroxyl and carbonyl groups via CYP1A2 and, to a lesser degree, the CYP2C subfamily and CYP3A4, followed by glucuronidation. Four main metabolites are formed, only one of which (MII, oxidation of indene ring) is active (melatonin MT_1 and MT_2 receptor affinity is about one fifth to one tenth of the parent drug and it is 17- to 25-fold less potent than ramelteon in *in vitro* functional assays). Approximately 84% of the drug is eliminated in the urine, with 4% excreted in the faeces. Negligible urinary excretion (<2%) of unchanged drug occurs. Renal clearance of ramelteon is reduced in elderly patients.

Therapeutic Concentration

Five groups of 12 healthy volunteers were administered a single oral dose of either 4, 8, 16, 32 or 64 mg ramelteon following an overnight fast. Mean peak serum concentrations and half-life values of ramelteon and its metabolite MII were reported as follows:

Parameter	*Analyte*	*Ramelteon single dose (mg)*				
		4	**8**	**16**	**32**	**64**
C_{max} (µg/L)	Ramelteon	1.15	5.73	6.92	14.4	25.9
	MII	34.4	73.0	129	284	463
Time (h)	Ramelteon	0.78	0.75	0.78	0.88	0.94
	MII	0.88	0.94	1.06	1.06	1.28
Half-life h)	Ramelteon	0.83	1.36	1.28	1.59	1.90
	MII	2.27	2.62	2.56	3.17	3.39

Half-life values were observed to be dose dependent [Karim *et al.* 2006].

A total of 48 volunteers, 24 men and 24 women divided into 2 groups (young, aged 18 to 35 years; elderly, aged 60 to 79 years) were administered a single 16 mg oral dose of ramelteon 90 min after a light breakfast. Mean peak serum concentrations of ramelteon and MII together with other pharmacokinetic variables were reported as:

	Young male	*Young female*	*Elderly male*	*Elderly female*
Ramelteon				
C_{max} (µg/L)	5.9	7.9	12.0	11.2
Time (h)	1.6	1.6	1.5	1.3
Oral clearance (L/min)	59	56	33	25
MII				
C_{max} (µg/L)	103	118	125	125
Half-life (h)	2.2	2.3	3.1	3.0

Results were also presented as follows:

	All young	*All elderly*	*All male*	*All female*
Ramelteon				
C_{max} (µg/L)	6.9	11.6	8.9	9.6
Time (h)	1.6	1.4	1.5	1.4
Oral Clearance (L/min)	58	29	46	40
MII				
C_{max} (µg/L)	110	125	114	121
Half-life (h)	2.3	3.0	2.6	2.6

Differences in values between young and elderly groups were attributed to known reduced clearance of CYP1A4 substrate drugs in elderly subjects [Greenblatt *et al.* 2007].

Toxicity Drug interactions may occur with inhibitors or inducers of CYP1A4, CYP3A4 and the CYP2C subfamily. Co-administration of ramelteon with fluvoxamine (CYP1A2 inhibitor) resulted in a 190-fold increase in the AUC for ramelteon, whereas co-administration of ramelteon with rifampicin (CYP1A4 inducer) resulted in an 80% reduction in the AUC for ramelteon and MII. However, co-administration of ramelteon with theophylline (CYP1A2 substrate) or dextromethorphan (CYP2D6 substrate) had no clinically significant effect on exposure to ramelteon [Takeda Pharmaceuticals 2008].

Bioavailability Less than 2%.

Half-life Approximately 1 to 2 h.

Volume of Distribution Approximately 73.6 L.

Clearance Reported as ~58 L/min in young adults; reduced to 29 L/min in the elderly.
Protein Binding Approximately 82%, primarily to albumin.
Note For reviews of ramelteon, see Borja, Daniel [2006] and McGechan *et al* [2005].
Dose Usual dose is 8 mg by mouth taken within 30 min of bedtime; it should not be taken with or immediately after a high-fat meal.

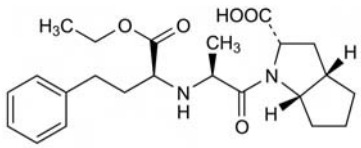
Ramipril

Antihypertensive
$C_{23}H_{32}N_2O_5$ = 416.5
CAS—87333-19-5

IUPAC Name (2*S*,3a*S*,6a*S*)-1-[(2*S*)-2-[[(2*S*)-1-Ethoxy-1-oxo-4-phenylbutan-2-yl]amino]propanoyl]-3,3a,4,5,6,6a-hexahydro-2*H*-cyclopenta[b]pyrrole-2-carboxylic acid
Synonyms (2*S*,3a*S*,6a*S*)-1-[(2*S*)-2-[[(1*S*)-1-(Ethoxycarbonyl)-3-phenylpropyl]amino]-1-oxopropyl]octahydrocyclopenta[*b*]pyrrole-2-carboxylic acid; HOE-498; ramiprilum.
Proprietary Names *Acovil*; *Altace*; *Cardace*; *Delix*; *Pramace*; *Quark*; *Ramace*; *Triatec*; *Tritace*; *Unipril*; *Vespril*. It is also an ingredient of *Arelix*; *Composto*; *Delix Plus* and *Triapin*.



Chemical Properties Needle-shaped crystals (from ether). Mp 109°. Soluble in methyl alcohol; sparingly soluble in water. Log *P* (octanol/water), 3.32 for ramipril; 0.22 for ramiprilat.

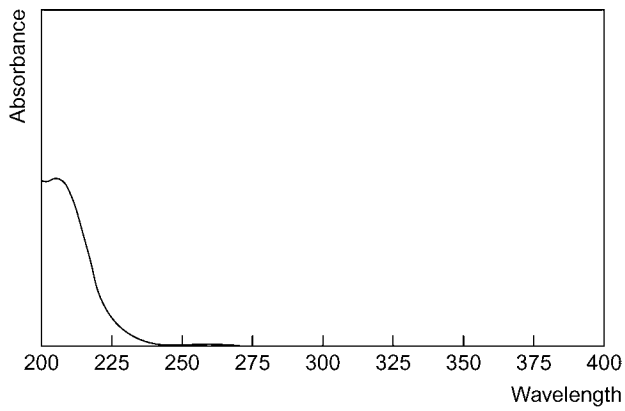
Ramiprilat

$C_{21}H_{28}N_2O_5$ = 388.5
CAS—87269-97-4

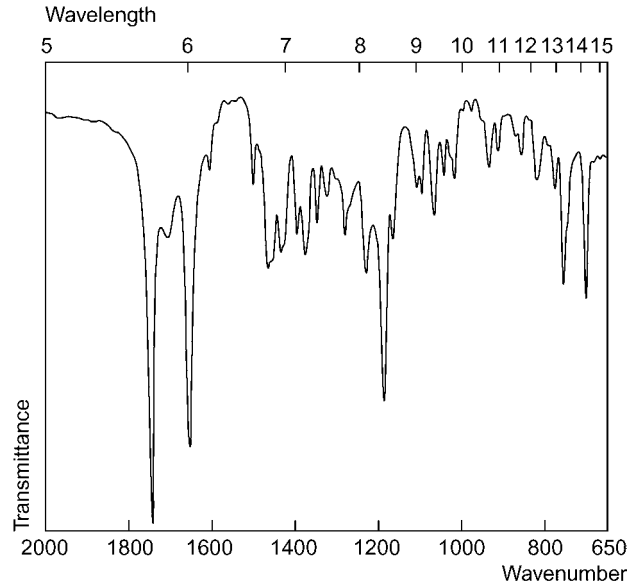
Gas Chromatography System GP—RI 2880 ramipril-ME; RI 2865 M (ramiprilat)-ME3; RI 2925 M (ramiprilate-H_2O)-ME3.
High Performance Liquid Chromatography System HAA—RT 15.7 min; system HZ—RT 4.2 min.

Column: LC-8 Supelcosil (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.1 mol/L0.1 mol/Lsodium perchlorate solution, pH 2.5, flow rate 1.5 mL/min. IS: clobazam. UV detection (λ= 210 nm). Retention times: ramipril, 5.1 min; IS, 3.4 min [Belal *et al.* 2001].

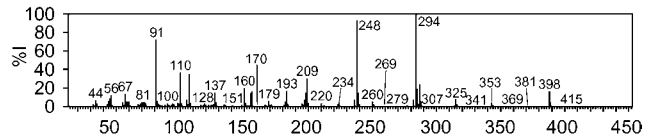
Ultraviolet Spectrum Aqueous acid (0.2 mol/L H_2SO_4)—252, 258 nm; basic—252, 258, 267 nm.



Infrared Spectrum Principal peaks at wavenumbers 1743, 1652, 1187, 756 cm^{-1} (KBr pellet).



Mass Spectrum Principal ions at *m/z* 294, 248, 91, 110, 117, 209, 160, 297.



Disposition in the Body Ramipril is rapidly absorbed after oral administration, with 54–65% of the dose absorbed. Absorption is not affected by the presence of food. It is metabolised in the liver to the active drug ramiprilat, a dicarboxylic acid, by hydrolysis, as well as ramipril glucuronide, ramiprilat glucuronide and diketopiperazine derivatives. Peak plasma concentrations of the parent drug are reached within 0.25 and 1 h and for the metabolite, ramiprilat, 2–4 h. The drug is excreted mainly in urine (60%) and faeces (40%) with little unchanged drug detected. The drug is rapidly cleared from the blood and distributed to all body tissues especially to the liver, kidneys and lungs where high concentrations are found. The drug can still be detected in serum up to 24 h after dosing.

Therapeutic Concentration

Twelve healthy male volunteers were administered 2.5 mg ramipril orally, IV and ramiprilat 2.5 mg IV on three separate occasions, after an overnight fast. The peak plasma ramipril concentration after the oral ramipril dose was 6.2 µg/L and 2.7 µg/L for the metabolite, ramiprilat. These were observed at 48 and 151 min, respectively. The peak drug concentration was 261 µg/L after the IV dose and 14 µg/L for the metabolite at 5.3 and 158 min, respectively. For the ramiprilat dose, the peak concentration was 301 µg/L at 6.9 min [van Griensven *et al.* 1995].

Bioavailability Ramipril, 28%; ramiprilat, 44%.
Half-life Ramipril, 1–2 h; ramiprilat, 9–18 h.
Volume of Distribution Ramipril, 90 L.
Clearance Ramiprilat clearance reduced in renal impairment.
Protein Binding Ramipril, 73%; ramiprilat, 56%.
Dose 1.25 to 5 mg daily with a maximum of 10 mg daily.

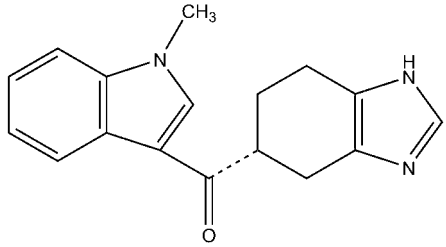
Ramosetron

5-HT_3 Receptor Antagonist, Antiemetic
$C_{17}H_{17}N_3O$ = 279.3
CAS—132036-88-5

IUPAC Name (1-Methylindol-3-yl)-[(5*R*)-4,5,6,7-tetrahydro-3*H*-benzimidazol-5-yl]methanone
Synonyms (*R*)-5-[(1-Methylindol-3-yl)carbonyl]-4,5,6,7-tetrahydrobenzimidazole; (1-methyl-1*H*-indol-3-yl)[(5*R*)-4,5,6,7-tetrahydro-1*H*-benzimidazol-5-yl]methanone; Nor-YM-060.



Chemical Property Foam

Ramosetron Hydrochloride
$C_{17}H_{17}N_3O,HCl = 315.8$
CAS—132907-88-5
Synonym YM-060
Proprietary Name *Nasea*
Chemical Properties A slightly yellowish-white, odourless crystalline powder. Mp 215° to 230°. Soluble in water.

High Performance Liquid Chromatography Column: Crestpak C_{18} S-10 (150 × 4.0 mm i.d.). Mobile phase: acetonitrile : 3% triethylamine hydrogen phosphate (pH 2.0; 15 : 85), flow rate 2 mL/min. UV detection. Retention time: ramosetron, 7.3 min; nor-ramosetron, 3.7 min. Limit of quantification not reported [Ishiwata *et al.* 1995].

Quantification
***Plasma* HPLC** Column: TSK-gel ODS-80-Tm (250 × 4.6 mm i.d.). Mobile phase: 0.1 mol/L potassium biphosphate : 0.1 mol/L phosphoric acid : acetonitrile (3 : 3 : 2), flow rate 1.0 mL/min. UV detection (λ = 311 nm). Limit of detection, 0.2 µg/L [Miura *et al.* 1994].
***Urine* HPLC** See Plasma. Column: Cosmosil $_5C_{18\ AR}$ (250 × 4.6 mm i.d.). Limit of detection, 1 µg/L [Miura *et al.* 1994].

Disposition in the Body Ramosetron has no effect on CYP1A2, CYP2C9, CYP2C19, CYP2D6, CYP2E1 or CYP3A4 [Niwa *et al.* 2006].

Therapeutic Concentration A dose of 6 µg/kg ramosetron has proved effective at preventing postoperative vomiting in the paediatric population after strabismus surgery [Fujii *et al.* 2005] and tonsillectomy [Fujii, Tanaka 2003]. A plasma concentration of 1.68 µg/L was obtained 4 h after IV administration of 0.4 mg of ramosetron [Miura *et al.* 1994].

Dose Ramosetron is given for its antiemetic properties in the management of nausea and vomiting induced by cancer chemotherapy. The usual dose is 300 µg once daily IV, or 100 µg once daily by mouth. A dose of 6 µg/kg is used in children to reduce postoperative vomiting.

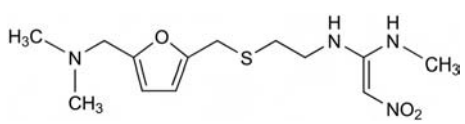
Ranitidine

Histamine H_2-Receptor Antagonist
$C_{13}H_{22}N_4O_3S = 314.4$
CAS—66357-35-5

IUPAC Name (*E*)-1-*N*′-[2-[[5-(Dimethylaminomethyl)furan-2-yl]methylsulfanyl]ethyl]-1-*N*-methyl-2-nitroethene-1,1-diamine
Synonym *N*-[2-[[[-5-[(Dimethylamino)methyl]-2-furanyl]methyl]thio]ethyl]-*N*′-methyl-2-nitro-1,1-ethenediamine



Chemical Properties A solid. Mp 69° to 70°. pK_a 2.3, 8.2. Log *P* (octanol/water), 0.3. Extraction yield (chlorobutane), 0 [Demme *et al.* 2005].

Ranitidine Hydrochloride
$C_{13}H_{22}N_4O_3S,HCl = 350.9$
CAS—66357-59-3
Synonyms AH-19065; ranitidini hydrochloridum.
Proprietary Names *Ausran*; *Azantac*; *Azuranit*; *Digestosan*; *Gertac*; *Ranaps*; *Rani*; *Ranic*; *Ranihexal*; *Raniplex*; *Raniprotect*; *Ranitic*; *Ranopine*; *Ranoxyl*; *Rantec*; *Sostril*; *Ulcidine*; *Ulcirex*; *Ulsal*; *Xanomel*; *Zaedoc*; *Zandin(e)*; *Zantac*; *Zantic*; *Zidac*.

Chemical Properties A yellowish-grey powder. Mp 133° to 134°. Freely soluble in water and acetic acid; soluble in methanol; sparingly soluble in ethanol; practically insoluble in chloroform.

Ranitidine Bismuth Citrate
$C_{13}H_{22}N_4O_3S.C_6H_5BiO_7 = 712.5$
CAS—128345-62-0
IUPAC Name Compound with bismuth (3+)citrate (1:1)
Synonyms GR-122311X; ranitidine bismutrex.
Proprietary Names *Pylorid*; *Tritec*.

Thin-layer Chromatography System TA—R_f 0.50; system TE—R_f 0.30; system TAJ—R_f 0.02; system TAK—R_f 0.00; system TAL—R_f 0.10.

For method for quantification of ranitidine and metabolites, see Carey *et al.* [1981]. UV detection. Limit of detection, 5 μg/L for ranitidine, 15 μg/L for desmethylranitidine [Mihaly *et al.* 1980].
Biological Fluids **RIA** Limit of detection, 2 μg/L [Jenner *et al.* 1981].
Disposition in the Body Readily absorbed after oral administration. It is metabolised by *N*-oxidation, *S*-oxidation and demethylation, its major metabolite being ranitidine *N*-oxide, but is excreted mainly as unchanged drug. After oral administration, about 30% is excreted unchanged in the urine in 24 h (dose-dependent), together with small amounts of the metabolites; after an IV dose, about 70–80% is excreted unchanged in the urine in 24 h, mainly by active tubular secretion. Ranitidine crosses the placenta and is excreted in breast milk.

The pharmacokinetics of the ranitidine component of ranitidine bismuth citrate is dose-proportional and similar to that observed after administration of ranitidine alone. Ranitidine bismuth citrate is rapidly absorbed and dissociates into ranitidine and bismuth compounds after oral administration. About 0.5% of the bismuth dose is absorbed and accumulates in plasma after repeated dosing (peak plasma concentration around 19 μg/L) and is eliminated via urine. Bismuth absorption is increased more than proportionally with the dose at 1600 mg. Low levels of bismuth can be detected in plasma and urine up to 5 months after the last dose. Because of the risk of bismuth accumulation, ranitidine bismuth citrate is not suitable for those with renal impairment or for long-term maintenance therapy.

Therapeutic Concentration

Following single oral administration of an over-the-counter 75-mg preparation of ranitidine to 19 children with heartburn, a median peak plasma concentration of 0.477 mg/L was attained in 2.5 h [Orenstein *et al.* 2002].

A study of IV ranitidine administration to 23 critically ill children revealed that a mean bolus dose of 1.37 mg/kg rapidly reduced gastric acidity, producing a peak plasma concentration of 0.373 mg/L at 2.3 h. Subsequent administration of ranitidine as a continuous IV infusion to 18 of the same subjects showed that a dose of 0.17 mg/kg/h and steady-state concentration of 0.287 mg/L was associated with gastric pH control. It was determined that a loading dose of 0.45 mg/kg followed by a continuous infusion of 0.15 mg/kg/h would be necessary to achieve a steady-state concentration of 0.287 mg/L [Lugo *et al.* 2001].

A total of 60 healthy males, aged between 19 and 40 years, were administered with either a 200, 400, 800 or 1600 mg dose of ranitidine bismuth citrate (equal number of volunteers for each dose), after an overnight fast and followed by a further 4 h after ingestion. The peak plasma ranitidine concentrations were 182, 480, 956 and 1983 μg/L for the doses, respectively, and these were observed between 1 and 5 h. The peak bismuth concentrations were 2.89, 2.85, 3.31 and 11.6 μg/L for the 200, 400, 800 and 1600 mg dose, respectively, and were reached 0.25–1.0 h after ingestion [Koch 1996].

Bioavailability About 50% but there is considerable intersubject variability.
Half-life Plasma half-life, about 2–3 h, increased in elderly subjects, and in renal impairment.
Volume of Distribution 1–2 L/kg.
Clearance Plasma clearance, about 10 mL/min/kg.
Protein Binding About 15%.
Note For a review of ranitidine bismuth citrate in the treatment of *Helicobacter pylori* infection and duodenal ulcer, see Vondracek [1998]; for a general review of ranitidine, see Grant *et al.* [1989]; for a review of the drug interaction potential of ranitidine, see Klotz and Kroemer [1991].
Dose The equivalent of 150 to 600 mg of ranitidine daily. Ranitidine bismuth citrate is used in a 7 day triple therapy regimen: 400 mg twice daily or 14 day dual therapy with clarithromycin, amoxicillin and/or metronidazole. It is not used in those with moderate to severe renal impairment.

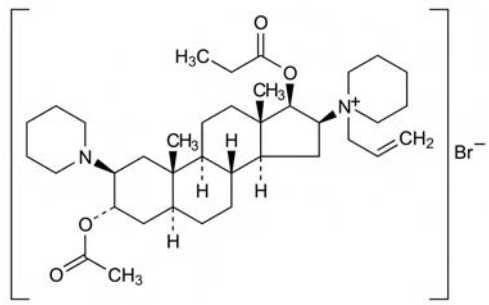
Rapacuronium Bromide

Anaesthetic
$C_{37}H_{61}N_2O_4,Br = 677.8$
CAS—156137-99-4

IUPAC Name [(2*S*,3*S*,5*S*,8*R*,9*S*,10*S*,13*S*,14*S*,16*S*,17*R*)-3-acetyloxy-10,13-dimethyl-2-piperidin-1-yl-16-(1-prop-2-enylpiperidin-1-ium-1-yl)-2,3,4,5,6,7,8,9,11,12,14,15,16,17-tetradecahydro-1*H*-cyclopenta[a]phenanthren-17-yl] propanoate bromide
Synonyms 1-[(2β,3α,5α,16β,17β)-3-(Acetyloxy)-17-(1-oxopropoxy)-2-(1-piperidinyl)androstan-16-yl]-1-(2-propenyl)piperidinium bromide; Org-9487.
Proprietary Name *Raplon*



Disposition in the Body Rapacuronium rapidly enters the neuromuscular junction (its effect compartment) and is subsequently rapidly cleared from the plasma. After IM injection, peak plasma concentrations are observed at 4 and 5 min in infants and children, respectively. After 30 min, <25% of a dose has been absorbed. It is metabolised by spontaneous hydrolysis and/or hepatic metabolism. The major metabolite is 3-desacetylrapacuronium and represents 10% of the drug plasma concentration. Rapacuronium is excreted by the hepatic and renal pathways; 22% of the drug and metabolite is excreted in urine over a 24 h period.

Therapeutic Concentration

Ten patients undergoing elective surgery, aged 18 to 57 years (mean 28 years) were treated with fentanyl and propofol to induce anaesthesia. They were then treated with rapacuronium as an IV bolus dose of 1.5 mg/kg, followed by an infusion of 3.4 mg/kg/h for 45 min, to maintain a neuromuscular block of 83%, and in the final 15 min, 2.5 mg/kg/h. 10 min after the beginning of the infusion, peak plasma concentrations were 5979 μg/L for the drug and 340 μg/L for its metabolite; 60 min afterwards the concentrations were 5029 and 650 μg/L for the drug and metabolite, respectively. However, 240 min after the infusion period had finished, the plasma concentrations were 89 and 205 μg/L, respectively [Van den Broek *et al.* 1994].

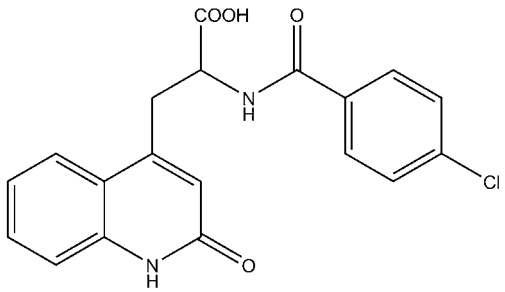
Toxicity Rapacuronium is associated with bronchospasm which may lead to death.
Bioavailability IM bioavailability, 56%.
Half-life Approximately 90 min (range, 72 to 184 min).
Volume of Distribution Total apparent, 221 (124 to 285) mL/kg (healthy individuals); 331 (284 to 488) mL/kg (patients with cirrhosis); steady state, 0.193 to 0.457 L/kg; lower in those with chronic renal failure compared to those with normal function and in men compared with women.
Clearance Plasma, 4.77 mL/min/kg (infants and children); 5.3 mL/min/kg (healthy adults); 6.9 mL/min/kg (patients with cirrhosis).
Dose The recommended dose is 1.5 to 2.5 mg/kg as a rapid IV bolus after anaesthetic induction.

Van den Broek L *et al.* (1994). Pharmacodynamics and pharmacokinetics of an infusion of Org 9487, a new short-acting steroidal neuromuscular blocking agent. *Br J Anaesth* 73: 331–335.

Rebamipide

Propionic Acid, Antiulcerative
$C_{19}H_{15}ClN_2O_4 = 370.8$
CAS—90098-04-7; 111911-87-6.

IUPAC Name 2-[(4-Chlorobenzoyl)amino]-3-(2-oxo-1*H*-quinolin-4-yl)propanoic acid
Synonyms α-[(4-Chlorobenzoyl)-amino]-1,2-dihydro-2-oxo-4-quinolinepropanoic acid; 2-(4-chlorobenzoylamino)-3-[2(1*H*)-quinolinon-4-yl]propionic acid; OPC-12759; proamipide.
Proprietary Name *Mucosta*



Chemical Properties White powder. Mp 288° to 290°. Soluble in DMF; very slightly soluble in methanol and ethanol; practically insoluble in ether and water [Shin *et al.* 2004].

(–)-Rebamipide

Chemical Properties Colourless needles from DMF. Mp 305° to 306°.

(+)-Rebamipide

Chemical Properties Colourless needles from DMF. Mp 305° to 306°.

High Performance Liquid Chromatography Column: C_{18} (250 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 10 mmol/L phosphate buffer (pH 2.5; 50 : 50), flow rate 1.0 mL/min. Fluorescence detection ($\lambda_{ex} = 330$ nm, $\lambda_{em} = 380$ nm). Retention time: 5.4 min. Limit of quantification, 2 µg/L [Shin *et al.* 2004].

Quantification

Plasma **HPLC** Column: YMC Pack A-303 ODS (250 × 4.6 mm i.d., 10 µm). Mobile phase: acetonitrile : tetrahydrofuran : acetic acid : water (32 : 3 : 1 : 64), flow rate 1.2 mL/min. Fluorescence detection ($\lambda_{ex} = 330$ nm, $\lambda_{em} = 375$ nm). Retention time: 6.2 min. Limit of quantification, 0.01 mg/L; limit of detection, 10 µg/L [Shioya, Shimizu 1988].

LC-MS Column: Inertsil ODS-3 (150 × 2.1 mm i.d., 5 µm). Mobile phase: methanol : water : formic acid (75 : 25 : 0.1), flow rate 0.2 mL/min.ESI, positive ion mode, MRM acquisition mode. Limit of quantification, 1 µg/L [Hasegawa *et al.* 2003].

Serum **HPLC** Column: TSK-gel ODS (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 5 mmol/L sodium sulfate : tetrahydrofuran : acetic acid (750 : 1250 : 20 : 6), flow rate 1.0 mL/min. Fluorescence detection ($\lambda_{ex} = 330$ nm, $\lambda_{em} = 375$ nm). Limit of quantification, 0.01 mg/L [Naito *et al.* 1996]. Column: ODS-80 TM (150 × 6.0 mm i.d.). Mobile phase: acetonitrile : 5 mmol/L sodium sulfate (3 : 5) with 1% acetic acid and 0.3% tetrahydrofuran, flow rate 1.5 mL/min. Fluorescence detection ($\lambda_{ex} = 330$ nm, $\lambda_{em} = 370$ nm). Retention time: 9.5 min. Limit of quantification, 20 µg/L [Miyake *et al.* 2006].

Urine **HPLC** Column: YMC Pack A-303 ODS (250 × 4.6 mm i.d., 10 µm). Mobile phase: acetonitrile : tetrahydrofuran : acetic acid : water (32 : 3 : 1 : 64), flow rate 1.2 mL/min. Fluorescence detection ($\lambda_{ex} = 330$ nm, $\lambda_{em} = 375$ nm). Retention time: 6.2 min. Limit of quantification, 0.5 mg/L; limit of detection, 10 µg/L [Shioya, Shimizu 1988].

Gastric Mucosa **HPLC** Column: TSK-gel ODS (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 5 mmol/L sodium sulfate : tetrahydrofuran : acetic acid (750 : 1250 : 20 : 6), flow rate 1.0 mL/min. Fluorescence detection ($\lambda_{ex} = 330$ nm, $\lambda_{em} = 375$ nm). Limit of quantification, 0.3 µg/g [Naito *et al.* 1996].

Disposition in the Body Poorly absorbed in the systemic circulation following oral administration owing to its low solubility and low membrane permeability.

Therapeutic Concentration

Twenty-nine patients with chronic gastritis (aged 20 to 89 years) were administered a single oral dose of 100 mg rebamipide. The mean peak rebamipide concentration in gastric mucosa between 30 and 120 min after ingestion was 60.0 µg/g. The corresponding rebamipide serum concentration was 0.25 µg/mL. The gastric/serum ratio was reported as 1221 [Naito *et al.* 1996].

Two groups of 14 volunteers were administered a single dose of 100 mg rebamipide in either granules or tablets. Following administration of the granule formulation, the mean peak plasma concentration was 241.8 µg/L after 2.5 h, with a plasma elimination half-life of 1.97 h. Corresponding values for the tablet formulation were 216.2 µg/L after 2.4 h, with a half-life of 1.94 h [Hasegawa *et al.* 2003].

Twenty healthy volunteers were administered single doses of either 100, 200 or 300 mg rebamipide. Mean peak gastric mucosa, gastric mucus and serum rebamipide concentrations were reported as follows:

Specimen	*Dose (mg)*	C_{max}	*Time (h)*
Mucosa (µg/g tissue)	100	244.7	1.9
	200	143.4	1.0
	300	186.7	1.1
Mucus (µg/mL)	100	75.8	1.1
	200	119.2	1.0
	300	372.0	1.1
Serum (µg/mL)	100	0.28	2.5
	200	0.36	2.4
	300	0.49	2.8

[Akamatsu *et al.* 2002].

Half-life Approximately 2 h.
Dose Usual dose of 100 mg by mouth three times daily. It has also been used rectally for the treatment of intestinal inflammation. Rebamipide eye drops are under investigation in the treatment of dry eye.

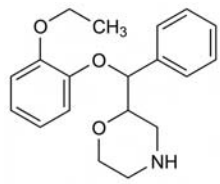
Reboxetine

Antidepressant
$C_{19}H_{23}NO_3 = 313.4$
CAS—71620-89-8; 98769-81-4
IUPAC Name (2*R*)-2-[(*R*)-(2-Ethoxyphenoxy)phenylmethyl]morpholine



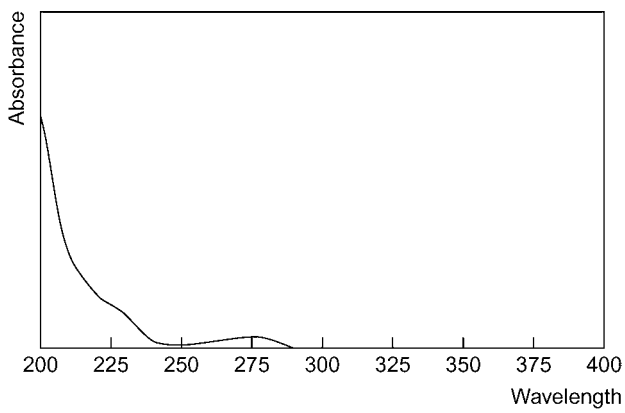
Chemical Properties Mp 170° to 171°. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005].

Reboxetine Methanesulfonate (Mesylate)

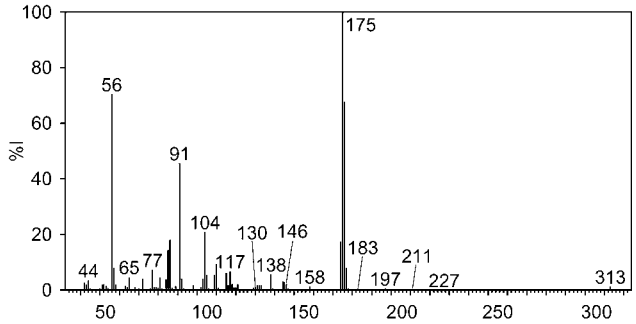
$C_{19}H_{23}NO_3,CH_3SO_3H = 409.5$
CAS—98769-82-5
Synonyms FCE-20124; PNU-155950E.
Proprietary Names *Edronax*; *Prolift*; *Vestra*.
Chemical Properties Mp 145° to 146°.

High Performance Liquid Chromatography Column: Zorbax phenyl (150 × 3.0 mm i.d.). Mobile phase: acetonitrile : 10 mmol/L phosphate buffer (pH 4.9, 27 : 73), flow rate 0.5 mL/min. UV detection (λ= 210 nm). Retention time: 13.0 min [Ohman *et al.* 2001].

Ultraviolet Spectrum Aqueous acid (0.025 mol/L sulfuric acid)—276.5 nm.



Mass Spectrum Principal peaks at *m/z* 175, 56, 176, 91, 104, 86, 174, 85.



Quantification

Blood **GC-MS** Column: DB-5MS (15 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He 1 mL/min. Temperature: 300° for 1 min. Limit of detection, 20 ng/L [Déglon *et al.* 2010].

HPLC Column: Partisphere C_8 (110 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 10 mmol/L phosphate buffer (pH 2.3, 64 : 36), flow rate 0.45 mL/min. UV detection (λ = 210 nm). Limit of quantification, 10 µg/L. [Edwards *et al.* 1995].

Plasma **HPLC** Column: Hypersil Phenyl 120A (250 × 4.6 mm i.d., 5 µm). Mobile phase: sodium acetate buffer (pH 3.5) : tetrahydrofuran : acetonitrile (55 : 35 : 10), flow rate 2.0 mL/min. Fluorescence detection (λ_{ex} = 470 nm, λ_{em} = 530 nm). Limit of quantification, 1.7 µg/L. Limit of detection, 0.5 µg/L [Khalil 2010]. Fluorimetric detection. Limit of quantification, 11 µg/L, limit of detection, 4 µg/L [Ragg *et al.* 2002]. UV detection (λ = 210 nm). Limit of quantification, 10 µg/L [Coulomb *et al.* 2000]. Mobile phase: 0.1 mol/L dibasic ammonium phosphate buffer (pH 7.5) : tetrahydrofuran (53.5 : 46.5). Fluorescence detection (λ_{ex} = 260 nm, λ_{em} = 315 nm). Limit of quantification, 1.1 µg/L [Denolle *et al.* 1999]. Fluorescence detection (λ_{ex} = 260 nm, λ_{em} = 315 nm). Column: LiChroCART Supersphere 60 RP-8 (250 × 4.6 mm i.d., 4 µm). Mobile phase: 0.1 mol/L dibasic ammonium phosphate buffer (pH 7.5) : tetrahydrofuran (53.5 : 46.5), flow rate 0.5 mL/min. Fluorescence detection (λ_{ex} = 260 nm, λ_{em} = 315 nm). Limit of quantification, 1 µg/L [Frigerio *et al.* 1994].

Serum **GC-MS** Column: Uptisphere C_{18} (125 × 2 mm i.d., 5 µm). Mobile phase: acetonitrile : 50 mmol/L ammonium acetate buffer (pH 4)-acetonitrile (60 : 40, 100 : 0), flow rate 200 µL/min. ESI, positive ion mode, SIM acquisition mode. Limit of quanification, 19 nmol/L [Gutteck, Rentsch 2003].

HPLC Column: Nucleosil 100-Protect 1. Mobile phase: acetonitrile : potassium dihydrogen phosphate buffer [Frahnert *et al.* 2003]. Column: Lichrospher CN (250 × 4.6 mm i.d.). Mobile phase: acetonitrile : 0.008 mol/L aqueous potassium phosphate buffer (pH 6.4, 50 : 50). UV detection (λ = 273 or 226 nm). Limit of quantification, 15 µg/L and 4 µg/L [Härtter *et al.* 2000].

Urine **HPLC** See Blood [Edwards *et al.* 1995].

Disposition in the Body Reboxetine is rapidly and well absorbed from the gastrointestinal tract and peak plasma levels occur in ~2 h. The presence of food decreases the peak concentration reached and lengthens the time to reach this. The drug is metabolised by dealkylation, hydroxylation and oxidation followed by glucuronide or sulfate conjugation. Traces of hydroxyl, desethyl and 3-morpholine metabolites have been identified in plasma as well as glucuronide and sulfate conjugates of these. Elimination is mainly renal via urine (78%) with 10% excreted as the unchanged drug. Pharmacokinetics is linear. Multiple dosing and gender do not affect the pharmacokinetics. Steady-state concentrations are reached within 4 days.

Therapeutic Concentration

Nine healthy males, 19–29 years (mean, 23), were administered a single oral dose of 4-mg reboxetine and 2 mg (*R,R*)-enantiomer after an overnight fast. The peak plasma concentration after parent drug administration was 109 µg/L observed at 1.9 h for reboxetine, 77 µg/L at 1.8 h for the (*R,R*)-enantiomer and 35 µg/L for the (*S,S*)-enantiomer 2.3 h. The peak concentration of the (*R,R*)-enantiomer observed after its administration was 75 µg/L at 1.4 h [Denolle *et al.* 1999].

Six patients with mild renal dysfunction (mean age 54 years; creatinine clearance 60–80 mL/min), 6 with moderate dysfunction (mean age 45 years; creatinine clearance 30–50 mL/min), 6 with severe dysfunction (mean age 55 years; creatinine clearance 10–20 mL/min) and healthy volunteers were administered a 4-mg dose reboxetine after an overnight fast and continued fasting for 4 h after dosing. Peak plasma concentrations were 151, 176, 203 and 111 µg/L for the 4 groups, attained at 1.83, 1.08, 1.58 and 2.4 h, respectively [Coulomb *et al.* 2000].

Bioavailability 60%.

Half-life 13–15 h.

Volume of Distribution Reboxetine 32 L; at steady state: 0.39 L/kg (*R,R*)-(−)-reboxetine and 0.92 L/kg (*S,S*)-(+)-reboxetine.

Clearance Plasma, 2.21 L/h.

Protein Binding Approximately 97%, primarily to α_1-acid glycoprotein; 92% in the elderly.

Dose A usual dose of 8 mg daily. Maximum 12 mg.

Remifentanil

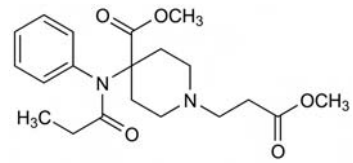
Analgesic

$C_{20}H_{28}N_2O_5$ = 376.5

CAS—132875-61-7

IUPAC Name Methyl 1-(3-methoxy-3-oxopropyl)-4-(*N*-propanoylanilino) piperidine-4-carboxylate

Synonyms GI-87084; 4-(methoxycarbonyl)-4-[(1-oxopropyl)phenylamino]-1-piperidinepropanoic acid methyl ester; remifentanyl.



Chemical Properties White to off-white lyophilised powder. Extraction yield (chlorobutane), 1 [Demme *et al.* 2005]. Stability of remifentanil in acetonitrile stock solutions stored at 4° was at least 18 months [Grosse *et al.* 1994]. Unstable at room temperature. Blood samples should be extracted by organic solvent to avoid degradation [Zhang *et al.* 2008]. Plasma samples were stable in the autosampler (5°) for 12 h, at room temperature for 24 h and for 1 month at –70° [Bossù *et al.* 2006]. Stable in blood for 1 month when stored at –20° [Bender *et al.* 1999].

Remifentanil Hydrochloride

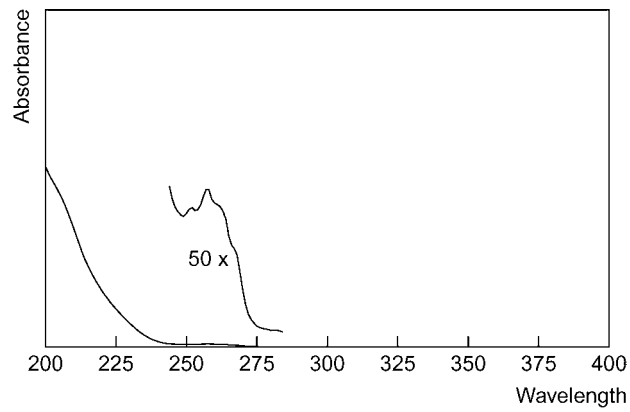
$C_{20}H_{28}N_2O_5$,HCl = 412.9

IUPAC Name 4-(Methoxycarbonyl)-4-[(1-oxopropyl)phenylamino]-1-piperidinepropanoic acid methyl ester hydrochloride

Synonym GI-87084B

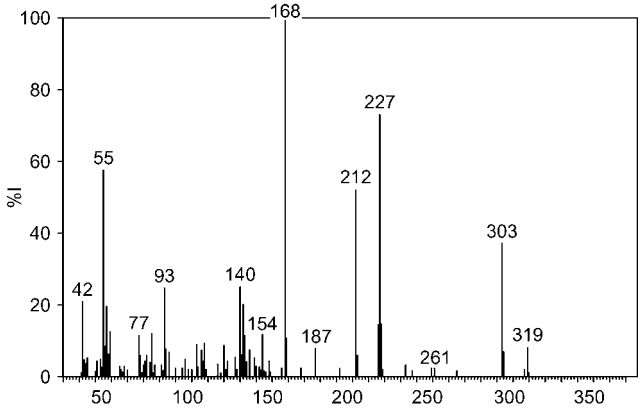
Chemical Properties pK_a 7.1.

Ultraviolet Spectrum



R

Mass Spectrum Principal ions at *m/z* 168, 227, 55, 212, 303, 140, 93, 42.



Quantification

Blood **GC-MS** Column: RTx-1 dimethylpolysiloxane (30 m × 0.25 mm i.d., 0.25 µm). Carrier gas: He, 1 mL/min. Temperature programme: 130° to 210° at 50°/min to 280° at 6°/mL to 320° at 50°/min for 2 min. EI ionisation, SIM acquisition mode. Limit of quantification, 0.1 µg/L [Grosse *et al.* 1994].

HPLC Column: Zorbax SB-CN (250 × 4.6 mm i.d., 5 µm). Temperature: 30°. Mobile phase: acetonitrite : methanol : water : 0.03 mol/L phosphate buffer (pH 3.0; 14 : 28 : 52 : 6), flow rate 1.5 mL/min. UV detection (λ= 210 nm). RT: remifentanil, 8.5 min; carboxylic acid metabolite, 4.5 min. Limit of quantification, 1 µg/L [Selinger *et al.* 1994].

LC-MS Column: Phenomenex Gemini C_{18} (100 × 2.0 mm i.d., 3 µm). Mobile phase: acetonitrile containing 0.1% formic acid : ammonium acetate buffer (85 : 15 for 9 min to 30 : 7- in 13 min to 80 : 20 in 10 min to 95 : 5 in 1 min), flow rate 150 µL/min. TIS, MRM acquisition mode. Retention time: 8.5 min. Limit of detection, 0.5 ng/L [Gergov *et al.* 2009]. Mobile phase: acetonitrile : chloroform (1 : 1) containing 2 mmol/L ammonium acetate, flow rate 0.3 mL/min. TIS, positive ion mode. Limit of quantification 0.1 µg/L [Bender *et al.* 1999].

Plasma **LC-MS** Column: XTerra MS C_{18} (50 × 2.1 mm i.d., 5 µm). Mobile phase: methanol : 10 mmol/L ammonium acetate (65 : 35), flow rate 0.3 mL/min. TIS, positive ion mode, MRM acquisition mode. Limit of detection, 0.5 µg/L [Zhang *et al.* 2009]. Column: Intersil ODS-3 (50 × 2.1 mm i.d., 3 µm). Mobile phase: acetonitrile : chloroform (50 : 50) containing 2 mmol/L ammonium acetate, flow rate 0.3 mL/min. Positive ion mode, full scan mode. Limit of quantification, 0.5 µg/L [Zhang *et al.* 2008]. Column: XTerra MS C_8 (150 × 2.1 mm i.d., 5 µm). Mobile phase: water : methanol : acetonitrile (86 : 10 : 4) containing 0.1% formic acid, flow rate 0.2 mL/min. ESI, positive ion mode, SIR acquisition mode. Limit of quantification, 0.5 µg/L, limit of detection, 0.18 µg/L [Bossù *et al.* 2006].

Other **HPLC** Rat Blood. Column: RP C_8 column (150 × 4.6 mm i.d., 5 µm). Mobile phase: acetonitrile : 0.05 mol/L sodium hydrogen phosphate buffer (pH 3.5; 27 : 73) with 300 µl/L TEA, flow rate 1.5 mL/min. UV detection (λ= 210 nm). Retention time: 6 min. Limit of detection, 2.5 µg/L [Haidar *et al.* 1996].
